Renesas Electronics
www.renesas.com

Rev.1.10 Feb, 2025

Notice

1. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation or any other use of the circuits, software, and information in the design of your product or system. Renesas Electronics disclaims any and all liability for any losses and damages incurred by you or third parties arising from the use of these circuits, software, or information.
2. Renesas Electronics hereby expressly disclaims any warranties against and liability for infringement or any other claims involving patents, copyrights, or other intellectual property rights of third parties, by or arising from the use of Renesas Electronics products or technical information described in this document, including but not limited to, the product data, drawings, charts, programs, algorithms, and application examples.
3. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
4. You shall be responsible for determining what licenses are required from any third parties, and obtaining such licenses for the lawful import, export, manufacture, sales, utilization, distribution or other disposal of any products incorporating Renesas Electronics products, if required.
5. You shall not alter, modify, copy, or reverse engineer any Renesas Electronics product, whether in whole or in part. Renesas Electronics disclaims any and all liability for any losses or damages incurred by you or third parties arising from such alteration, modification, copying or reverse engineering.
6. Renesas Electronics products are classified according to the following two quality grades: “Standard” and “High Quality”. The intended applications for each Renesas Electronics product depends on the product’s quality grade, as indicated below.
   "Standard": Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; industrial robots; etc.
   "High Quality": Transportation equipment (automobiles, trains, ships, etc.); traffic control (traffic lights); large-scale communication equipment; key financial terminal systems; safety control equipment; etc.

   Unless expressly designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not intended or authorized for use in products or systems that may pose a direct threat to human life or bodily injury (artificial life support devices or systems; surgical implantations; etc.), or may cause serious property damage (space system; undersea repeaters; nuclear power control systems; aircraft control systems; key plant systems; military equipment; etc.). Renesas Electronics disclaims any and all liability for any damages or losses incurred by you or any third parties arising from the use of any Renesas Electronics product that is inconsistent with any Renesas Electronics data sheet, user’s manual or other Renesas Electronics document.
7. No semiconductor product is absolutely secure. Notwithstanding any security measures or features that may be implemented in Renesas Electronics hardware or software products, Renesas Electronics shall have absolutely no liability arising out of any vulnerability or security breach, including but not limited to any unauthorized access to or use of a Renesas Electronics product or a system that uses a Renesas Electronics product. RENESAS ELECTRONICS DOES NOT WARRANT OR GUARANTEE THAT RENESAS ELECTRONICS PRODUCTS, OR ANY SYSTEMS CREATED USING RENESAS ELECTRONICS PRODUCTS WILL BE INVULNERABLE OR FREE FROM CORRUPTION, ATTACK, VIRUSES, INTERFERENCE, HACKING, DATA LOSS OR THEFT, OR OTHER SECURITY INTRUSION (“Vulnerability Issues”). RENESAS ELECTRONICS DISCLAIMS ANY AND ALL RESPONSIBILITY OR LIABILITY ARISING FROM OR RELATED TO ANY VULNERABILITY ISSUES. FURTHERMORE, TO THE EXTENT PERMITTED BY APPLICABLE LAW, RENESAS ELECTRONICS DISCLAIMS ANY AND ALL WARRANTIES, EXPRESS OR IMPLIED, WITH RESPECT TO THIS DOCUMENT AND ANY RELATED OR ACCOMPANYING SOFTWARE OR HARDWARE, INCLUDING BUT NOT LIMITED TO THE IMPLIED WARRANTIES OF MERCHANTABILITY, OR FITNESS FOR A PARTICULAR PURPOSE.
8. When using Renesas Electronics products, refer to the latest product information (data sheets, user’s manuals, application notes, “General Notes for Handling and Using Semiconductor Devices” in the reliability handbook, etc.), and ensure that usage conditions are within the ranges specified by Renesas Electronics with respect to maximum ratings, operating power supply voltage range, heat dissipation characteristics, installation, etc. Renesas Electronics disclaims any and all liability for any malfunctions, failure or accident arising out of the use of Renesas Electronics products outside of such specified ranges.
9. Although Renesas Electronics endeavors to improve the quality and reliability of Renesas Electronics products, semiconductor products have specific characteristics, such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Unless designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not subject to radiation resistance design. You are responsible for implementing safety measures to guard against the possibility of bodily injury, injury or damage caused by fire, and/or danger to the public in the event of a failure or malfunction of Renesas Electronics products, such as safety design for hardware and software, including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult and impractical, you are responsible for evaluating the safety of the final products or systems manufactured by you.
10. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. You are responsible for carefully and sufficiently investigating applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive, and using Renesas Electronics products in compliance with all these applicable laws and regulations. Renesas Electronics disclaims any and all liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
11. Renesas Electronics products and technologies shall not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations. You shall comply with any applicable export control laws and regulations promulgated and administered by the governments of any countries asserting jurisdiction over the parties or transactions.
12. It is the responsibility of the buyer or distributor of Renesas Electronics products, or any other party who distributes, disposes of, or otherwise sells or transfers the product to a third party, to notify such third party in advance of the contents and conditions set forth in this document.
13. This document shall not be reprinted, reproduced or duplicated in any form, in whole or in part, without prior written consent of Renesas Electronics.
14. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products.

(Note1) “Renesas Electronics” as used in this document means Renesas Electronics Corporation and also includes its directly or indirectly controlled subsidiaries.

(Note2) “Renesas Electronics product(s)” means any product developed or manufactured by or for Renesas Electronics.

Trademarks

Renesas and the Renesas logo are trademarks of Renesas Electronics Corporation. All trademarks and registered trademarks are the property of their respective owners.

Trademarks (continued)

For the “Cortex” notation, it is used as follows;
— Arm® Cortex®-A55
— Arm® Cortex®-M33
Note that in each section of the Manual, this may be noted as Cortex-A55 and Cortex-M33 respectively.

Examples of trademark or registered trademark used in the document of RZ/V2N;
CoreLink™: CoreLink is a trademark of Arm Limited.
CoreSight™: CoreSight is a trademark of Arm Limited.
Mali™: Mali is a trademark of Arm Limited.
TrustZone®: TrustZone is a trademark of Arm Limited.
Neon™: Neon is a trademark of Arm Limited.
Temper™: Temper is a trademark of Arm Limited.
OpenGL ES™: OpenGL ES is a trademark of Khronos Group, Inc.
eMMC™: eMMC is a trademark of MultiMediaCard Association
PCIe®: PCIe is a registered trademark of PCI-SIG, Inc.
PCI Express®: PCI Express is a registered trademark of PCI-SIG, Inc.
MIPI®: MIPI is a registered trademark of MIPI Alliance, Inc.
CSI-2®: CSI-2 is a registered trademark of MIPI Alliance, Inc.
DSI®: DSI is a registered trademark of MIPI Alliance, Inc.
I3C®: I3C is a registered trademark of MIPI Alliance, Inc.

Note that in each section of the Manual, trademark notation of ® and TM may be omitted.
All other trademarks and registered trademarks are the property of their respective owners.

Notes on the Use of Specific Technologies

1. You are required to obtain a license for the use of the technologies listed in the table below (hereinafter referred to as the “specific technology” or “specific technologies”), that are used in this LSI chip. You shall correctly obtain a license for the use of each specific technology that is in use or available for use and maintain the validity of all such licenses for as long as any of your products incorporating this LSI chip continue to be manufactured, sold, or in use. In addition, if you manufacture and supply products that incorporate this LSI chip for sale under the trademark of a third party (OEM supply), you are requested to notify such third parties that obtaining licenses for the use of the specific technologies will be required.

Technology Name
SD
H.264
H.265

2. Renesas Electronics do not grant any rights to you, and make no warranties of any kind, including but not limited to warranties of merchantability and compatibility with specific purposes and warranties of non-infringement of third party rights. In the event that you receive a claim from a third party due to your failure to correctly obtain a license to use a specific technology, you shall resolve the claim at your own responsibility and expense. Renesas Electronics shall not be liable for any damages, liabilities, or costs that may be incurred by you or any third party.

General Precautions in the Handling of Microprocessing Unit and Microcontroller Unit Products

The following usage notes are applicable to all Microprocessing unit and Microcontroller unit products from Renesas. For detailed usage notes on the products covered by this document, refer to the relevant sections of the document as well as any technical updates that have been issued for the products.

1. Precaution against Electrostatic Discharge (ESD)
   A strong electrical field, when exposed to a CMOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop the generation of static electricity as much as possible, and quickly dissipate it when it occurs. Environmental control must be adequate. When it is dry, a humidifier should be used. This is recommended to avoid using insulators that can easily build up static electricity. Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work benches and floors must be grounded. The operator must also be grounded using a wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions must be taken for printed circuit boards with mounted semiconductor devices.
2. Processing at power-on
   The state of the product is undefined at the time when power is supplied. The states of internal circuits in the LSI are indeterminate and the states of register settings and pins are undefined at the time when power is supplied. In a finished product where the reset signal is applied to the external reset pin, the states of pins are not guaranteed from the time when power is supplied until the reset process is completed. In a similar way, the states of pins in a product that is reset by an on-chip power-on reset function are not guaranteed from the time when power is supplied until the power reaches the level at which resetting is specified.
3. Input of signal during power-off state
   Do not input signals or an I/O pull-up power supply while the device is powered off. The current injection that results from input of such a signal or I/O pull-up power supply may cause malfunction and the abnormal current that passes in the device at this time may cause degradation of internal elements. Follow the guideline for input signal during power-off state as described in your product documentation.
4. Handling of unused pins
   Handle unused pins in accordance with the directions given under handling of unused pins in the manual. The input pins of CMOS products are generally in the high-impedance state. In operation with an unused pin in the open-circuit state, extra electromagnetic noise is induced in the vicinity of the LSI, an associated shoot-through current flows internally, and malfunctions occur due to the false recognition of the pin state as an input signal become possible.
5. Clock signals
   After applying a reset, only release the reset line after the operating clock signal becomes stable. When switching the clock signal during program execution, wait until the target clock signal is stabilized. When the clock signal is generated with an external resonator or from an external oscillator during a reset, ensure that the reset line is only released after full stabilization of the clock signal. Additionally, when switching to a clock signal produced with an external resonator or by an external oscillator while program execution is in progress, wait until the target clock signal is stable.
6. Voltage application waveform at input pin
   Waveform distortion due to input noise or a reflected wave may cause malfunction. If the input of the CMOS device stays in the area between V_{IL} (Max.) and V_{IH} (Min.) due to noise, for example, the device may malfunction. Take care to prevent chattering noise from entering the device when the input level is fixed, and also in the transition period when the input level passes through the area between V_{IL} (Max.) and V_{IH} (Min.).
7. Prohibition of access to reserved addresses
   Access to reserved addresses is prohibited. The reserved addresses are provided for possible future expansion of functions. Do not access these addresses as the correct operation of the LSI is not guaranteed.
8. Differences between products
   Before changing from one product to another, for example to a product with a different part number, confirm that the change will not lead to problems. The characteristics of a microprocessing unit or microcontroller unit products in the same group but having a different part number might differ in terms of internal memory capacity, layout pattern, and other factors, which can affect the ranges of electrical characteristics, such as characteristic values, operating margins, immunity to noise, and amount of radiated noise. When changing to a product with a different part number, implement a system-evaluation test for the given product.

How to Use This Manual

1. Objective and Target Users

This manual was written to explain the hardware functions and electrical characteristics of this LSI to the target users, i.e. those who will be using this LSI chip in the design of application systems. Target users are expected to understand the fundamentals of electrical circuits, logic circuits, and microcomputers.

This manual is structured to cover the following items: an overview of the product, descriptions of the CPU, system control functions, and peripheral functions, electrical characteristics of the device, and usage notes.

When designing an application system that includes this LSI chip, take all points to note into account. Points to note are given in their contexts, at the final parts of each of the sections, and in the section giving usage notes.

The list of revisions is a summary of major points of revision or addition for this and earlier versions. It does not cover all revised items. For details on the revised points, see the actual locations in the manual.

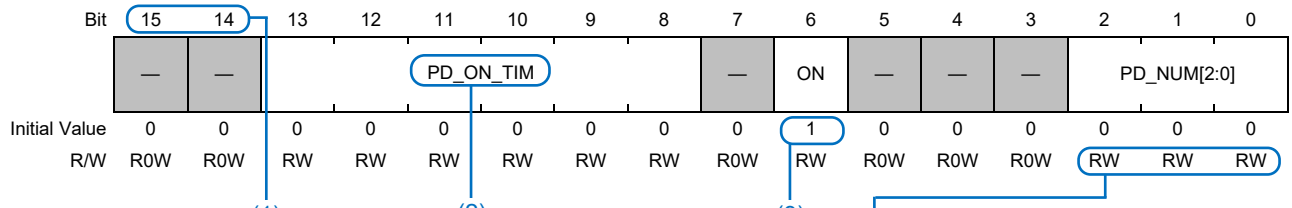
This manual is a simplified version. Please contact a Renesas Electronics sales representative for the detailed version of the manual.

---

2. Description of Registers

Each register description includes a bit chart, illustrating the arrangement of bits, and a table of bits, describing the meanings of the bit settings. The standard format and notation for use with bit charts and tables are described below.

[Bit Chart]



[Table of Bits]

Bit	Bit Name	Initial Value	R/W	Description
15, 14	—	All 0	R0W	Reserved These bits are read as 0b. The write value should be 0b.
13 to 8	PD_ON_TIM	0h	RW	Set the power-on time for power domain unit.
7	—	0h	R0W	Reserved These bits are read as 0b. The write value should be always 0b.
6	ON	1h	RW	Writing to this register starts the process of turning on/off the power domain. 0b: Power off 1b: Power on
5 to 3	—	All 0	R0W	Reserved These bits are read as 0b. The write value should be always 0b.
2 to 0	PD_NUM[2:0]	0h	RW	Specify the power domain to be turned on/off. 000b: The power on/off process does not start. 001b: The processing target is PD_1. 010b: The processing target is PD_2. 100b: The processing target is PD_3. Settings other than the above are prohibited.

Note: The bit names and statements in the above figure and table are examples and have nothing to do with the main contents of this manual.

(1) Bit

Indicates the bit number or numbers.
In the case of a 64-bit register, the bits are arranged in order from 63 to 0.
In the case of a 32-bit register, the bits are arranged in order from 31 to 0.

(2) Bit name

Indicates the name of the bit or bit field.
When the number of bits must be clearly indicated for a bit field, appropriate notation is included (e.g., PD_NUM[2:0]).
Certain kinds of bits, such as those of timer counters, are not assigned bit names. In such cases, the entry under “Bit Name” is blank (e.g., PD_ON_TIM).
A reserved bit is indicated by “—”. Make sure to use the specified values when writing to such bits or fields. Otherwise, the correct operation of this LSI chip is not guaranteed.

(3) Initial value

Indicates the initial value of each bit.

0:	The initial value is 0.
1:	The initial value is 1.
x/—:	The initial value is undefined.

(4) R/W

For each bit and bit field, this entry indicates whether the bit or field is readable, writable, or both, and whether writing to and reading from the bit or field are impossible.

The notation is as follows:

RW:	The bit or field is readable and writable.
RW0:	The bit or field is readable and writable with 0. Writing 1 is invalid.
RW1:	The bit or field is readable and writable with 1. Writing 0 is invalid.
R0W:	The bit or field is readable as 0 and writable.
R1W:	The bit or field is readable as 1 and writable.
R:	The bit or field is readable. Writing is invalid.
R0W0:	The bit or field is readable as 0 and writable with 1. Writing 1 is invalid.
R0W1:	The bit or field is readable as 0 and writable with 1. Writing 0 is invalid.
R1W0:	The bit or field is readable as 1 and writable as 0. Writing 1 is invalid.
R1W1:	The bit or field is readable as and writable as 1. Writing 0 is invalid.
RCW0:	The bit or field is readable and writable with 0. Reading the bit initializes it. Writing 1 is invalid.
RCW1:	The bit or field is readable and writable with 1. Reading the bit initializes it. Writing 0 is invalid.

(5) Description

Describes the function of the bit or field and specifies the values for writing.

Note: Access to reserved addresses is prohibited.
Do not access these addresses. In case of access, correct operation of this LSI chip is not guaranteed.

Note: Access to the unavailable units is prohibited (see the product lineup). Use the related registers in the initial state.

3. Notation of Numbers and Symbols

Number notation: Binary numbers are given as XXXXb (or B'XXXX, b'XXXX), hexadecimal numbers are given as XXXXh (or H'XXXX, h'XXXX, 0xXXXX), and decimal numbers are given as XXXX.

Table of Contents

SECTION 1 OVERVIEW

1.1 Overview

1.1.1 Features

This LSI includes 1.8 GHz Quad Arm® Cortex®-A55 on-chip FPU, Neon™, L1-caches and L3-cache, 200MHz Arm® Cortex®-M33 on-chip FPU and DSP-extension, DRP-AI, Mali™-G31 (GE3D), Mali™-C55 (ISP), 1.5 MB of on-chip SRAM, 2ch GbEthernet MAC, 1ch USB2.0, USB3.2 Gen 2x1, 2-MIPI® CSI-2® camera input interface, 1-MIPI® DSI® video output interface, PCIe® Gen3 2Lane (EP/RC), various communication interfaces such as xSPI, eMMC™, I2S (TDM), I3C®, PDM, and security functions.

■ CPU

- On-chip Quad 64-bit Arm® Cortex®-A55 Core processors

  Application processing (up to 1.8 GHz)

- 32-bit Arm® Cortex®-M33 processor

  System management (up to 200 MHz)

■ Accelerator engines

- AI accelerator (dynamically reconfigurable processor for AI (DRP-AI (AI-MAC+DRP)))
- 3D graphics engine (GE3D) (option)
- Image signal processor (ISP) (option)
- Image scaling unit (ISU)
- Video codec unit (VCD)

■ On-chip SRAM and external memory interfaces

- On-chip shared SRAM (1.5-Mbyte on-chip SRAM with ECC)
- External DDR memory interface

  1-channel memory controller for LPDDR4-3200 or LPDDR4X-3200 with a 32-bit bus width
- xSPI interface
- SDHI (eMMC/SD (1-, 4-, 8-bit bus width) supported)

■ Boot

- Selectable boot CPU from Cortex®-M33 or Cortex®-A55

■ Extended-function timers

- 32-bit general-purpose timer (16 ch.)
- 32-bit CMTW (8 ch.)

■ Various communication/storage/network interfaces

- Ethernet (2 ch.: 10/100/1000 BASE)
- USB2.0 (1 ch.: Host/Function)
- USB3.2 Gen2 × 1 (1 ch.: Host-only)
- PCIe Gen3 (1, 2 lanes × 1 pair)
- MIPI CSI-2 (2 ch.: 1, 2, or 4 lanes)
- MIPI DSI (1 ch.: 1, 2, or 4 lanes)
- CAN/CANFD (compliant with ISO11898-1) (6 ch.)
- SCI (10 ch.: UART/SPI/I2C-host)
- SPI (3 ch.)
- I2C (9 ch.)
- I3C (1 ch.)

■ Audio

- Asynchronous sampling rate converter unit (SCU) (up to 192 kHz)
- DMAC for Audio (ADMAC) is available to transfer audio formats of I2S with SCU.
- Flexible audio clock generator (ADG) for audio functions.
- I2S (TDM) input/output interfaces (half-duplex 10 ch.; full-duplex 5 ch.)
- SPDIF input/output interfaces (3 ch.)
- Pulse density modulation (PDM) input interfaces (6 ch.)

■ Analog/Digital converter (ADC) and sensors

- 2.5 Msps 12-bit ADC (24 ch.)
- Internal temperature sensors (2 ch.)

■ Security

- Hardware cryptographic engine (option)

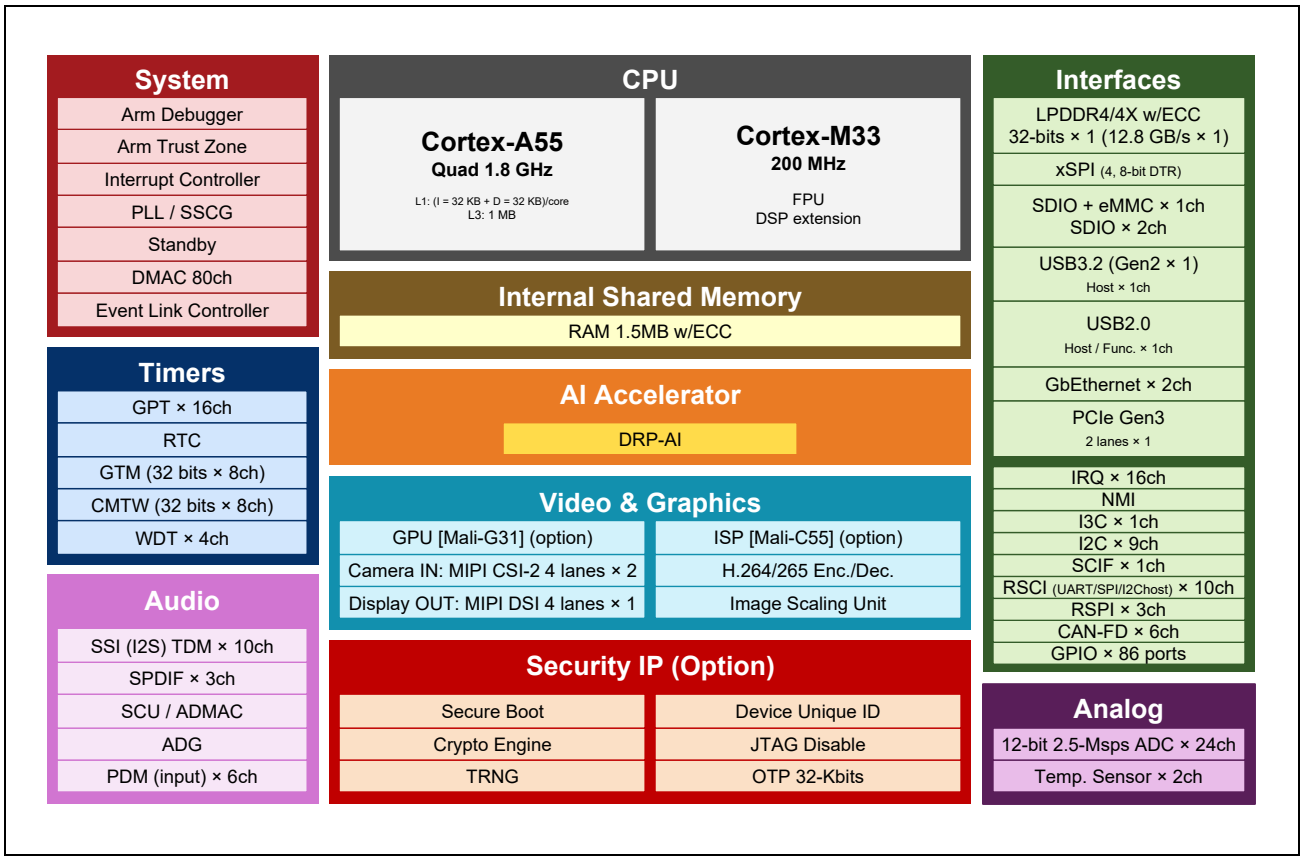


Figure 1.1-1 Diagram of Functional Overview

1.1.2 Product Lineup

Table 1.1-1 Product Lineup

Group	Name	Part Number	GE3D	Security	ISP
RZ/V2N	RZ/V2N	R9A09G056N41GBG	N/A	N/A	N/A
		R9A09G056N42GBG	Available (Mali-G31)		
		R9A09G056N45GBG	N/A	Available	
		R9A09G056N46GBG	Available (Mali-G31)		
	RZ/V2NP	R9A09G056N43GBG	N/A	N/A	Available (Mali-C55)
		R9A09G056N44GBG	Available (Mali-G31)		
		R9A09G056N47GBG	N/A	Available	
		R9A09G056N48GBG	Available (Mali-G31)		

Note: "#ACx" or "#BCx" is added to the end of part numbers. "#ACx" is packaged in the individual tray, and "#BCx" is packaged in the full carton.

1.1.3 Functions

The following tables list the functions of this LSI.

Table 1.1-2 CPU

Item	Description
Application Processor Cortex-A55 (CA55)	• Arm Cortex-A55 Quad Core 1.8 GHz with 0.9 V, 1.1 GHz with 0.8 V • L1 I-cache 32 Kbytes (with parity) and D-cache 32 Kbytes (with ECC) per core • L2 cache: 0 Kbyte • L3 cache: 1 Mbyte (with ECC)*1 • MMU supported • Neon™ and FPU supported • Cryptographic extension supported (for security-supported products only) • Armv8-A architecture
System Manager Cortex-M33 (CM33)	• Arm Cortex-M33 processor 200 MHz • FPU supported • DSP extension supported • Security extension supported • Armv8-M architecture
Debug Interface	• Arm® CoreSight® architecture • JTAG and SWD interfaces supported • ETF: Total of 52 Kbytes for program flow tracing • JTAG disabling supported (option)
Boundary Scan	• Boundary scan based on IEEE 1149.1 via the JTAG interface is supported. • Note that some module pins are not available on this boundary scan.

Note 1. The maximum operating frequency of the L3 cache is 1.26 GHz.

Table 1.1-3 Accelerator Engines

Item	Description
AI accelerator (DRP-AI)	• DRP-AI (AI-MAC + DRP) • Up to 4 dense TOPS • Up to 15 sparse TOPS
3D Graphics Engine (GE3D) (option)	• Arm Mali-G31 • One single-pixel shader core • 8-Kbyte L2 cache • OpenGL ES™ 1.1, 2.0, and 3.2 supported • OpenCL 2.0 full profile supported
Image Signal Processor Unit (ISP) (option*) *RZ/V2NP only	• Arm Mali-C55 • 1 unit, supporting 4K • Maximum pixel rate: 630 Mpixels/s • Supports the functions below: – Black level correction – WB gain – Defect pixel correction – Color correction – Gamma correction – Edge enhancement and sharpness filter – Down-scaling and cropping – Dynamic range correction – 2-exprosure HDR – Shading correction • Supports input formats: RAW8, 10, 12, 14, 16, 20 • Supports output formats: YUV422, YUV420, RGB
Image Scaling Unit (ISU)	• Scaling down function with bilinear interpolation • Input image size (max): 4096 × 4096 • Output image size (max): 4096 × 4096 • Supports color format: RGB/ARGB, YCbCr/YUV, RAW (Grayscale)
Video Codec Unit (VCD)	• H.264/H.265 codec module • Support for encoding and decoding – H.264/AVC (High Profile, level 4.2; Main Profile, level 4.2; Baseline Profile, level 4.2) – H.265/HEVC (Main Profile, level 5) • Maximum size – (H.264) 1920 × 1080 × 60 fps*1 – (H.265) 3840 × 2160p × 30 fps*1 • I-/P-slice supported for H.264/H.265 encoding and decoding

Note 1. Maximum frame rate for this size. The number of streams can be defined within this specification by software.

Table 1.1-4 On-chip SRAM and External Memory Interfaces

Item	Description
System RAM	• 1.5 Mbytes (with ECC)
External Bus Controller for LPDDR4/4X SDRAM (DDR)	• 1 channel • Support for LPDDR4-3200 and LPDDR4X-3200 • Bus width: 32-bits • In line ECC (16 ECC regions) supported (support for error detection interrupts) • Memory size: Up to 8 Gbytes • Auto-refresh, self-refresh, and IO retention supported • Memory access protection for secure regions using TZC-400 (Arm® TrustZone® supported)
xSPI Controller (xSPI)	• 1 channel (2 chip select signals) • Compliant with the xSPI protocol • Protocol mode 1, 4, or 8 pins with SDR or DDR (1S-1S-1S, 4S-4D-4D, 8D-8D-8D)*1 2 or 4 pins with SDR (1S-2S-2S, 2S-2S-2S, 1S-4S-4S, 4S-4S-4S) • Support for XiP mode • Support for up to 256-Mbyte address space (support for up to 128M bytes per channel address space in boot sequence)
SD Card Host Interface/ Multimedia Card Interface (SD/MMC)	• 3 channels • Channel 0 supports SDHI and e-MMC. • Channels 1 and 2 support SDHI. • SD memory I/O card interface (1-bit or 4-bit SD bus) • SD, SDHC and SDXC SD memory card access supported • Compliant with SD specification version 3.01 • Default, high-speed, UHS-I/SDR50, SDR104 and DDR50 transfer modes supported • Error check function: CRC7 (command), CRC16 (data) • Support for card detection and write protection • MMC interface (1-bit, 4-bit, or 8-bit MMC bus) • e-MMC device access supported • Compliant with eMMC 4.51 • High-speed, HS200 and HS-DDR transfer modes supported

Note 1. DDR access without XSPI0_DS is not supported for 4S-4D-4D and 8D-8D-8D.

Table 1.1-5 Boot

Item	Description
Boot	• Boot CPU selectable as CA55 and CM33 • CM33 boot – Boot mode 2: Booting from a serial flash memory connected to the xSPI bus space – Boot mode 3: Booting from SCIF download • CA55 boot – Boot mode 0: Booting from eSD – Boot mode 1: Booting from eMMC – Boot mode 2: Booting from a serial flash memory connected to the xSPI bus space – Boot mode 3: Booting from SCIF download *Note:* 1.8 V or 3.3 V selectable for eMMC and xSPI interfaces.

Table 1.1-6 System, Data Transfer, Enhanced Interrupt Controller Unit, Clock Functions

Item	Description
Direct Memory Access Controller (DMAC)	• 80 channels • Transfer modes: Single transfer mode and block transfer mode • LINK mode (DMA transfer under descriptor control) supported • Transfer size: 1, 2, 4, 8, 16, 32, 64, or 128 bytes • Transfer request: Software trigger, external DMA requests (DREQ) and interrupt requests from peripheral functions • A specific DMA transfer interval can be specified to adjust the bus occupancy.
Clock Pulse Generator (CPG)	• Generates the clocks from an external clock or external resonator (24 MHz). – Maximum CA55 clock: 1.8 GHz (0.9 V), 1.1GHz (0.8 V) – Maximum CM33 clock: 200 MHz – Maximum DDR clock: 800 MHz (LPDDR4/4X-3200) – Maximum GE3D clock: 630 MHz – Maximum ISP clock: 630 MHz – Maximum H.264/H.265 clock: 400 MHz – Maximum system bus clock: 400 MHz • SSC (spread spectrum clock) supported
Interrupt Controller (GIC)	• Arm® CoreLink® generic interrupt controller (GIC-600) for CA55 • 32 priority levels available • Nested vectored interrupt controller (NVIC) for CM33 • External Interrupt pins (NMI, IRQ0 to IRQ15, and TINT0 to TINT31) • On-chip peripheral Interrupts: Priority level set for each module
Event Link Controller (ELC)	• Up to 461 event signals can be interlinked with the operation of modules. • In particular, the operation of timer modules can be started by input event signals. • Event-linked operation of signals of 16 port pins,P60 to 67 and P80 to 87, is to be possible.
Error Controller	• Error events from CPU and peripherals are captured and merged to interrupt with mask for CA55 and CM33 respectively. • System reset can be generated by error events.
Message Handling Unit (MHU)	• Message handling function between each core of CA55 and CM33 • Assert interrupts to inform messages and responses from/to every core

Table 1.1-7 Various Communication/Storage/Network Interfaces (1/3)

Item	Description
USB3.2 Host (USB3)	• 1 channel • Compliant with USB3.2 Gen2 × 1 • Maximum rate: 10 Gbps • Support for control, bulk, interrupt, and isochronous transfer • Internal dedicated DMA
USB2.0 Host/Function (USB2)	• 1 channel (Host/Function) • Compliant with USB2.0 • Support for On-The-Go (OTG) functionality (ch. 0 only) • Support for control, bulk, interrupt, and isochronous transfer • Internal dedicated DMA
PCIe Express® 3.0 (PCIE)	• PCIe Gen3 • Root complex or Endpoint selectable • Lane configuration selectable from below: – 1 or 2 lanes × 1 channel
MIPI CSI-2 Interface with camera image processing (CRU)	• 2 channels • Number of lanes: 1, 2, or 4 lanes per channel • Maximum bandwidth: 2.1 Gbps per lane • Support for the throughput up to 4K RAW12 30 fps • Support for 4 virtual channels selected from VC0 to VC15 • Support for input data formats: – YUV422 8 bits or 10 bits – RGB444, RGB555, RGB565, RGB666, RGB888 – RAW6, RAW7, RAW8, RAW10, RAW12, RAW14, RAW16, RAW20 – YUV420 8-bits or 10-bits (image processing not supported) – Legacy YUV420 8-bits (image processing not supported) – YUV420 8-bits or 10-bits (chroma shifted pixel sampling) (image processing not supported) – User defined byte-based data • The other formats from the MIPI CSI-2 interface can also be output without image processing. • Generic long packet data types 1 to 4 • User defined 8-bit data types 1 to 8
MIPI DSI Interface with LCD controller (LCDC)	• 1 channel • Number of lanes: 1, 2, or 4 lanes • Support for the throughput up to 1920 × 1200 RGB888 60 fps • Support for the throughput up to 1280 × 1024 RGB888 120 fps • Maximum bandwidth: 1.5 Gbps per lane • Support for 2-plane blending (with the ability to blend 2 differently sized images) • Support for image processing: – Dither processing (RGB666) – Clipping – RGB gamma correction LUT • Support for input data formats: – RGB565, RGB666, RGB888 – ARGB1555, ARGB4444, ARGB8888 – YUV (YcbCr) 444 8-bits, YUV (YcbCr) 422 8-bits, YUV (YcbCr) 420 8-bits • Support for output data formats: – RGB666, RGB888

Table 1.1-7 Various Communication/Storage/Network Interfaces (2/3)

Item	Description
Gigabit Ethernet Interface (GBETH)	• 2 channels • Compliant with IEEE802.3 • Compliant with IEEE802.1Qav, IEEE802.1Qat, and IEEE802.1AS • Compliant with IEEE1588-2008 with nano second timer in ch. 0 (main) and ch. 1 (sub) • Support for 10BASE, 100BASE, and 1000BASE • Support for full duplex and half duplex • Support for RGMII and MII Interfaces
CANFD Interface (CANFD)	• 6 channels • CAN-FD ISO 11898-1 (2015) compliant • Support for up to 8 MHz with payload transfer • Message buffer – 64 transmit message buffers per channel – 256 shared buffers for RXMB and FIFO buffers per channel
I3C Bus Interface (I3C)	• 1 channel • Support for 1.2 V and 1.8 V • Master or Slave mode selectable • Support for the multi-master • Compliant with MIPI I3C v1.0 and I3C Basic v1.0 The following functions are not supported: – Bridge device (I3C v1.0 and I3C Basic v1.0) – Asynchronous timing control async mode 2 & 3 (I3C v1.0) • Support for DMAC and event linking
I2C Bus Interface (RIIC)	• 9 channels • Master or Slave mode selectable • Support for the multi-master • Support for Standard mode (100 kHz), Fast mode (400 kHz), and Fast mode+ (1 MHz) • Support for DMAC and event linking
Renesas Serial Communication Interface (RSCI)	• 10 channels • 6 communication modes – Asynchronous interfaces – 8-bit clock synchronous interface – Simple IIC (host-only) – Simple SPI (with one chip select signal) – Smart card interface – Simple LIN (expanded SCIX mode) • 32-stage FIFO registers for transmission and reception • Clock source selectable from among four internal clock signals • Bit rate specifiable with the on-chip baud rate generator • Full-duplex and half-duplex communications • Data length: 7 to 9 bits • Bit-rate modulation • Double speed mode • Loopback function to enable self-diagnosis • Support for DMAC and event linking • Support for CRC calculation by the CRC unit

Table 1.1-7 Various Communication/Storage/Network Interfaces (3/3)

Item	Description
Renesas Serial Peripheral Interface (RSPI)	• 3 channels • SPI transfer facility The MOSI (master out slave in), MISO (master in slave out), SSL (slave select, 4 channels available), and RSPCK (SPI clock) signals enable serial transfer through SPI operation (four lines). The MOSI, MISO, and RSPCK signals enable clock-synchronous operation (three lines). Capable of handling serial transfer as a master or slave. • Data formats Switching between MSB first and LSB first The number of bits in each transfer can be changed to any number of bits from 8 to 16, or 20, 24, or 32 bits. 32-bit × 16-stage buffers for transmission and reception. Up to four frames can be transmitted or received in a single transfer operation (with each frame having up to 32 bits). • Buffered structure Independent 16 stages and channels for MOSI and MISO Double buffers for both transmission and reception • RSPCK can be stopped automatically with the reception buffer full for master reception. • Support for DMAC and event link • Support for CRC calculation by the CRC unit
CRC Calculator (CRC)	• 1 channel • CRC code generation for arbitrary amounts of data in 8-, 16-, or 32-bit units • Select any of four generating polynomials: – X32+X26+X23+X22+X16+X12+X11+X10+X8+X7+X5+X4+X2+X+1 (CRC-32) – X32+X28+X27+X26+X25+X23+X22 +X20+X19+X18+X14+X13+X11+X10+X9+X8+X6+1 (CRC-32C) – X16+X15+X2+1(CRC-16) – X16+X12+X5+1 (CRC-CCITT) – X8+X2+X+1 (CRC-8) • Support for RSCI and RSPI interfaces
Serial Communication Interface with FIFO (SCIF)	• 1 channel • Asynchronous mode • Simultaneous transmission and reception (full-duplex communication) supported • Dedicated baud-rate generator • Separate 16-byte FIFO registers for transmission and reception

Table 1.1-8 Extended-Function Timers

Item	Description
General-Purpose Timer (GPT)	• 32 bits × 16 channels • Counting up or down (sawtooth-wave), counting up and down (triangle-wave) selectable for all channels • 2 input/output pins per channel • 2 output compare/input capture registers per channel • For the 2 output compare/input capture registers of each channel, 4 registers are provided as buffer registers and are capable of operating as comparison registers when buffering is not in use. • In output compare operation, buffer switching can be at peaks or troughs, enabling the generation of laterally asymmetrically PWM waveforms. • Registers for setting up frame intervals on each channel (with capability for generating interrupts on overflow or underflow) • Enabling synchronized operation of the several counters between 2 units • Modes of synchronized operation (synchronized, or displaced by desired times for phase shifting) • Generation of dead times in PWM operation • Automatic generation of three-phase PWM waveforms incorporating dead times through the combination of three counters • Starting, clearing, and stopping counters in response to external or internal triggers • Internal trigger sources: Software and compare-match • Generation of triggers for A/D converter conversion • Digital noise filter functions for signals on the input capture and external trigger pins • Event linking by the ELC • Support for phase counting mode
Port Output Enable for GPT (POEG)	• Controlling the output disable for GPT waveform output • Initiation by input level detection of GTETRG pins • Initiation by an output disable request from GPT • Initiation by detection of oscillation stopping or by software
Compare Match Timer W (CMTW)	• 32 bits × 8 channels • Compare-match, input-capture input, and output-comparison output are available (ch. 0 to ch. 3) • Interrupt requests can be output in response to compare-match, input-capture, and output-comparison events
Watchdog Timer (WDT)	• 4 channels • A counter underflow can reset the LSI.
General Timer (GTM)	• 32 bits × 8 channels • Two operating modes: – Interval timer mode – Free-running comparison mode
Real Time Clock (RTC)	• A 100-year calendar from 2000 to 2099 • BCD code display • Clock source is an oscillator dedicated to RTC (32.768-kHz) • Automatic adjustment function for leap years • Alarm function

Table 1.1-9 Audio

Item	Description
Sampling Rate Converter Unit (SCU)	• 10 channels • Sampling rate: Up to192 kHz • Asynchronous/synchronous sampling rate conversions are available. • Support for resolutions of up to 24 bits • High-sound-quality type (THD + N*1 is −132 dB) and general-sound-quality type (THD + N*1 is −96 dB) • Automatically generates antialiasing filter coefficients • Four modules support one, two, four, six, or eight channels, and six modules support one or two channels. *Note 1.* Total harmonic distortion plus noise
Audio Clock Generator Unit (ADG)	• Supplies clock signals to the SSIU, SCU and SPDIF module.
Direct Access Memory Controller for Audio (ADMAC)	• Allows transfer of L/R data via I2S • 29 channels • Controls data transfer between the audio modules (SSIU, SCU)
Serial Sound Interface Unit (SSIU)	• 10 channels for half-duplex communication with transmit or receive function • 5 channels for full-duplex communication (full-duplex pairing: ch. 0 & 9, ch.1 & 2, ch. 3 & 4, ch. 5 & 6, ch. 7 & 8) • Support for I2S, monaural, and TDM audio formats • Support for master and slave functions • Generation of programmable word clocks and bit clocks • Multi-channel formats • Support for 8, 16, 18, 20, 22, 24, and 32-bit data formats • Support for WS (word select) signal continuation with which the WS signal is not stopped • Support for DMAC
SPDIF Interface (SPDIF)	• 3 channels • Support for the IEC 60958 standard (stereo and consumer use modes only) • Sampling frequencies of 32 kHz, 44.1 kHz, and 48 kHz • Audio word sizes of 16 to 24 bits per sample • Bi-phase mark encoding • Double buffered data • Parity encoded serial data • Support for DMAC
Pulse Density Modulation (PDM)	• 6 channels • Direction: Input • Sampling rate: 8, 10, 12, 15, 16, 20, 24, 25, 30, 40, or 48 kHz • Capable of filtering 1-bit digital input data and converting them into 20-bit or 16-bit digital data • Support for the stereo microphone (L/R sampling by rising/falling clock edge) • Support for the sound activity detector to wake up CPU from WFI • Support for DMAC

Table 1.1-10 12-bit Analog to Digital Converter

Item	Description
A/D Converter (ADC0)	• 24 channels • Resolution: 12 bits • Input range: 0 V to 1.8 V • Conversion rate: 2.5 Msps, 2.0 Msps, 1.0 Msps, 0.5 Msps, 0.25 Msps • Operation mode: Single scan, continuous scan, group scan • Condition for starting A/D conversion – Software trigger – Asynchronous trigger: External ADTRG trigger supported – Synchronous trigger: ELC and GPT timers • Interrupt sources: A/D scan end, window compare match, compare match/mismatch, data register overwrite

Table 1.1-11 Internal Sensors

Item	Description
Temperature Sensor Unit (TSU)	• 2 channels for internal temperature • Includes a 12-bit A/D convertor per unit • Resolution: 0.0625°C/code • Rang: −40°C to 125°C • Precision: ±5°C • Conversion rate: 14.9 ksps • Operation mode: Single scan • Condition for starting measurement – Software trigger – Synchronous trigger: ELC • Interrupt sources: Conversion end, window compare match

Table 1.1-12 Security

Item	Description
Trusted Secure IP (option)	• Security algorism – Common key encryption: AES – Non-common key encryption: RSA, ECC • Other features – TRNG (true-random number generator) – Hash value generation: SHA-1, SHA-224, SHA-256, GHASH – Support for unique ID

Table 1.1-13 General-Purpose I/O Pins

Item	Description
General-purpose I/O ports (GPIO)	• Multiple I/O pins: 86 pins • Selectable: Pulling up or down by register settings • Selectable: N-ch. open-drain mode, Schmitt mode • 3.3-V tolerant pins available for use: 75 • 1.8-V tolerant pins available for use: 2 • Selectable IO-voltages for eight power blocks (7 blocks: 1.8 V or 3.3 V; 1 block: 1.2 V or 1.8 V)

Table 1.1-14 Power Supply Voltage

Item	Description
Power supply voltage	• VDD (core): 0.8 V • VDD (CA55): 0.8 V or 0.9 V • VDD (ADC, TSU, OTP): 1.8 V • VDD (DDR IO): 1.1 V, 0.6 V (only 0.6 V: for LPDDR4X) • VDD (MIPI DPHY): 1.2 V, 1.8 V (only 1.8 V: for MIPI CSI-2) • VDD (others): 1.8 V, 3.3 V

Table 1.1-15 Temperature Range

Item	Description
Junction temperature (Tj)	• −40°C to +125°C

Table 1.1-16 Quality Level

Item	Description
Quality level	• Industrial usage, etc.

Table 1.1-17 Package

Item	Description
Package	• 840-pin FCBGA, 15-mm square, 0.50-mm pitch

1.1.4 Block Diagram

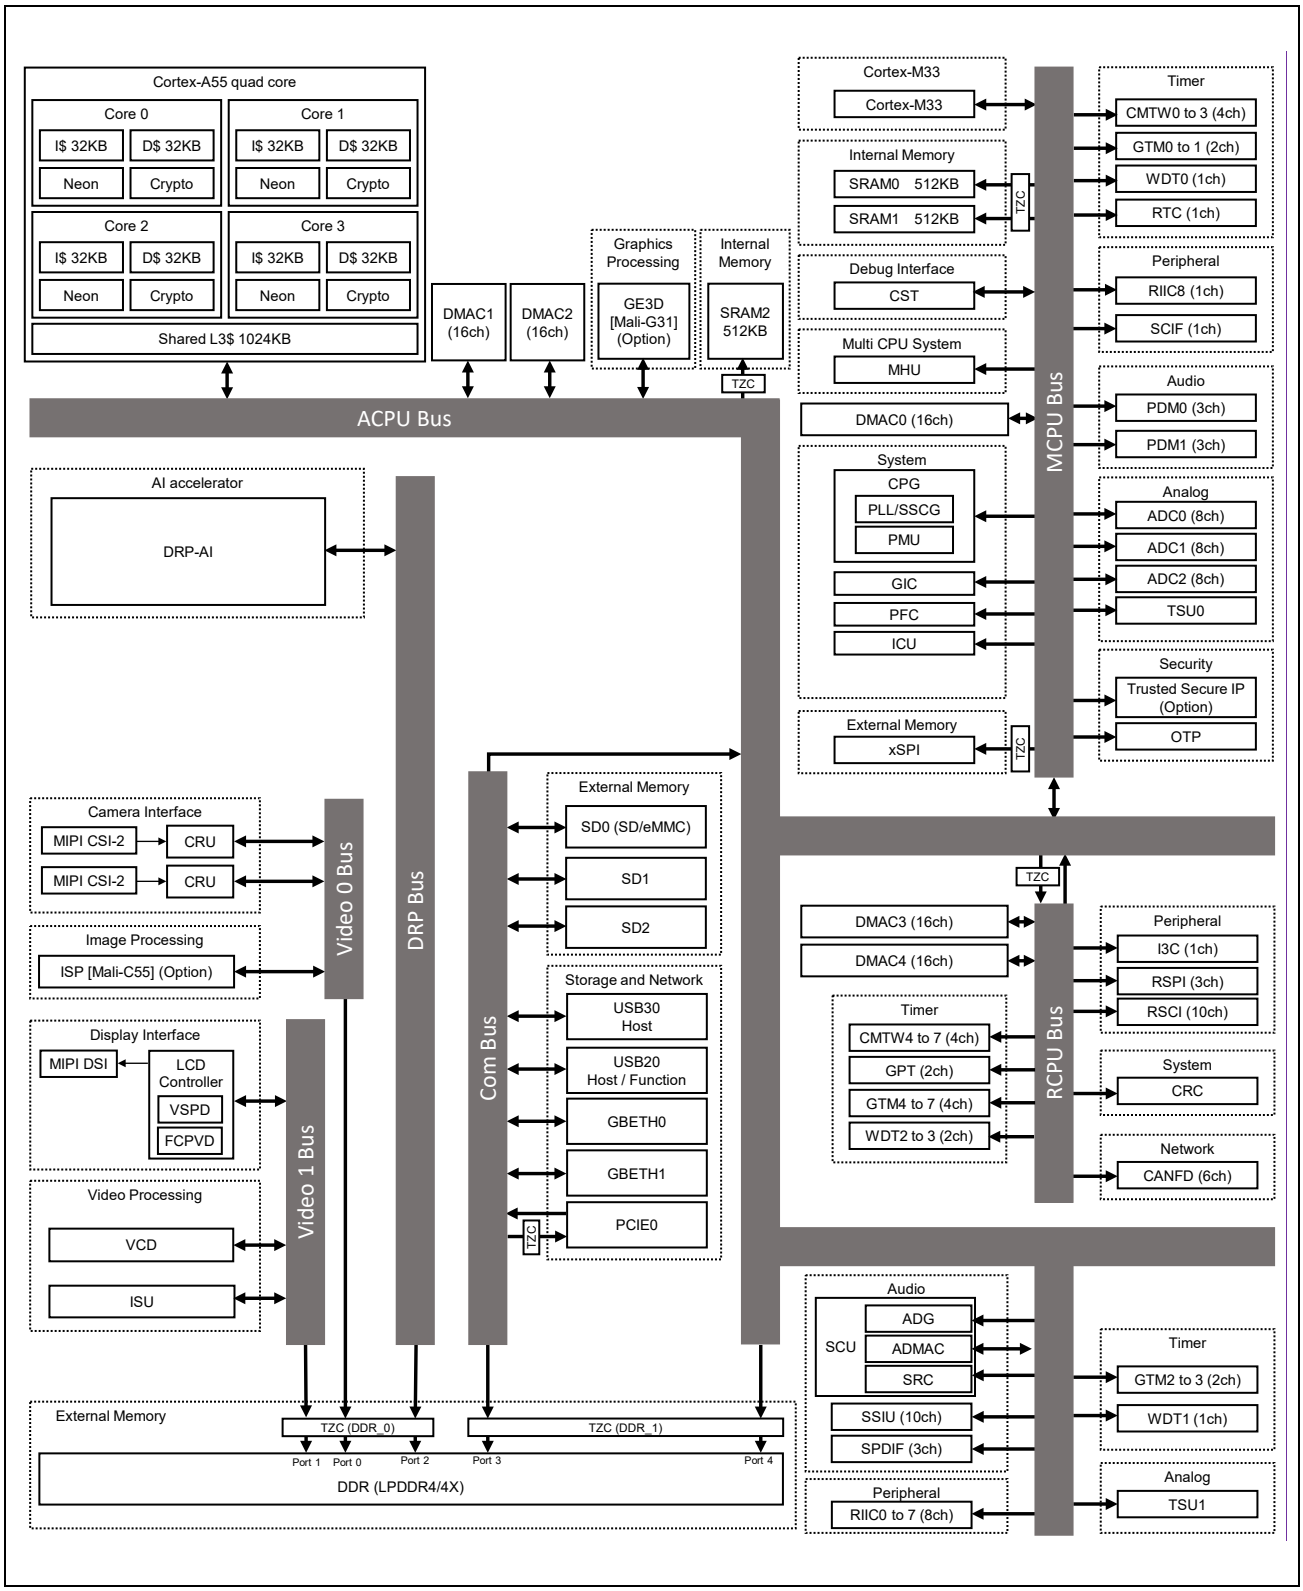

Figure 1.1-2 Block Diagram

Table 1.1-18 List of Units (1/2)

Unit Name	Unit Number	Function
ADC	ADC0 to ADC2	A/D converter
ADG	—	Audio clock generator
ADMAC	—	DMAC for audio
CA55	—	Arm Cortex-A55
CANFD	CANFD0	CAN-FD interface
CM33	—	Arm Cortex-M33
CMTW	CMTW0 to CMTW7	Compare match timer
CPG	—	Clock pulse generator
CRC	—	CRC operation unit
CRU	CRU0, CRU1	Camera data receive unit (MIPI CSI-2 interface)
CST	—	Debug interface (Arm CoreSight)
DDR	DDR0	LPDDR4/4X controller
DMAC	DMAC0 to DMAC4 (each 16 ch.)	Direct memory access (DMA) controller
DRP-AI	DRP0 and AI-MAC	AI accelerator
ELC	—	Event link controller
GBETH	GBETH0, GBETH1	Gigabit Ethernet interface
GE3D	—	3D graphics engine
GIC	—	Generic interrupt controller
GPT	GPT0, GPT1 (each 16 ch.)	General purpose timer
GTM	GTM0 to GTM7	General timer
GPV	—	Global programmers view
I3C	I3C0	I3C bus interface
ICU	—	Interrupt control unit
ISP	—	Image signal processor
ISU	—	Image scaling unit
LCDC	—	LCD controller
MHU	—	Message handling unit
OTP	—	One time programmable memory
PCIE	PCIE0	PCIe Express 3.0 interface
PCU	—	Power control unit
PDM	PDM0, PDM1	Pulse density modulation (PDM) interface
PFC	—	Pin function controller
POEG	POEG0, POEG1	Port output enable for GPT
PMU	—	Power management unit
PWC	—	Power sequence controller
RIIC	RIIC0 to RIIC8	I2C bus interface
RSCI	RSCI0 to RSCI9	Serial communication interface
RSPI	RSPI0 to RSPI2	Serial peripheral interface
RTC	—	Real time clock
SCIF	SCIF0	Serial communication interface with FIFO
SD	SD0 to SD2	SD/MMC host interface
Secure IP	—	Trusted secure IP

Table 1.1-19 List of Units (2/2)

Unit Name	Unit Number	Functional Overview
SRAM	SRAM0 to SRAM2	SRAM
SRC	—	Sampling rate controller
SSIU	—	Serial sound interface unit
SYC	—	System counter
SYS	—	System controller
SYSTEM BUS	—	Internal bus
ACPU Bus	—	A bus connected to Cortex-A55, DDR memory controllers, SRAM, and its peripheral units
RCPU Bus	—	A bus connected to its peripheral units
MCPU Bus	—	A bus connected to Cortex-M33, SRAM, its peripheral units, and the system control units
DRP Bus	—	A bus connected to DRP-AI and DDR memory controllers
Video 0 Bus Video 1 Bus	—	A bus connected to image processing units and DDR memory controllers
COM Bus	—	A bus connected to communication interface units and DDR memory controllers
TSU	TSU0, TSU1	Temperature sensor unit
TZC	—	CoreLink™ TrustZone Address Space Controller
USB2	USB20	USB2.0 host / function interface
USB3	USB30	USB3.2 host interface
VCD	—	H.265/H.264 multi codec
WDT	WDT0 to WDT3	Watchdog timer
xSPI	xSPI0	xSPI controller

SECTION 1 OVERVIEW

1.2 Pin

This section describes the pins of this LSI.

Table 1.2-2 List of External Pins (12/12)

Pin Name	Input / Output	Voltage (V)	I/O Power Group	Initial Value*7	I/O Type	Pin State when not in Use
VDD1218_I3C	—	1.2/1.8	—	—	—	Open*6
VDD18_PWC	—	1.8	—	—	—	Always in use
V_{SS}	—	—	—	—	—	Always in use

Note 1. This voltage is the IO buffer voltage. The amplitude is different between LP (low power) mode and HS (high speed) mode. For details, refer to the *MIPI Alliance Specification for D-PHY Version 1.2*.

Note 2. Pull-up or pull-down resistors are integrated in the IO buffers. For the resistance values, refer to the DC characteristics in **10.1 Electrical Characteristics**.

Note 3. This pin is compliant with the JTAG specification.

Note 4. See **Figure 1.2-2** for how to connect the USBVBUS.

Note 5. VDD09_CA55 and PLDVDD09_PLLCA55 should be at the same voltage.

Note 6. When these power supplies are open, the corresponding signal pins should be open. When supplying power, follow the instructions in the table.

Note 7. The initial value indicates the status during a reset (QRESN = 0) and immediately after release from the reset state (QRESN = 1).

Note 8. When using these pins at 1.1 V, DDRx_VDDQLP should be connected to DDRx_VDDQ. (x = 0)

Note 9. All unconnected lanes must be terminated during compliance test.

Note 10. Connect an external resistor (6.2 kΩ). For details, refer to the *RZ/V2N Group PCB Design Guidelines*.

Note 11. A load switch or similar component should be added so that voltage is applied to the USB20_VUBUSIN pin after power is supplied for USB20.

1.2.2.2 List of Multiplexed Functional Pins

For details on pin functions, reter to **1.2.3 Pin Functions of Functional Blocks**.

Note that RSCI has multiple functions assigned to one pin (Example: TXDn_MOSIn_SDAn). Refer to **7.3 RSCI** for details.

1.2.3 Pin Functions of Functional Blocks

Table 1.2-4 List of Pin Functions (1/7)

Classification	Pin Name	I/O	Function
Clock	QXTAL	Out	24-MHz main clocks. These pins are to connect a 24-MHz crystal oscillator. When an external clock signal is used, the QXTAL pin should be open.
	QEXTAL	In	
	EMXTAL	Out	Reserved pins. The EMXTAL pin should be open. The EMEXTAL pin should be connected to V_{ss}.
	EMEXTAL	In	
	RTXOUT	Out	32.768-kHz real-time clocks. These pins are to connect a 32.768-kHz crystal oscillator. When an external clock signal is used, the RTXOUT pin should be open.
	RTXIN	In	
	AUDIO_XTAL	Out	4- to 48-MHz audio clocks. These pins are to connect a crystal oscillator. When an external clock signal is used, the clock frequency is allowed 50-MHz max. and the Audio_XTAL pin should be open.
	AUDIO_EXTAL	In	
	AUDIO_CLKB	In	Max. 50-MHz audio clock B
	AUDIO_CLKC	In	Max. 50-MHz audio clock C
	AUDIO_CLKOUT	Out	Max. 25-MHz audio clock out
Boot mode control	BOOTSELCPU	In	Select the cold boot CPU. Low: CM33, High: CA55
	BOOTPLLCA_1	In	Input the CA55 frequency at the CA55 cold boot. BOOTPLLCA_[1:0] = [Low:Low]:1.1 GHz BOOTPLLCA_[1:0] = [Low:High]: 1.5 GHz*1 BOOTPLLCA_[1:0] = [High:Low]: 1.6 GHz*1 BOOTPLLCA_[1:0] = [High:High]: 1.7 GHz*1 *Note 1.* Enabled when VDD09_CA55 is at 0.9 V.
	BOOTPLLCA_0	In	
	MD_BOOT4	In	Select the boot mode [4] (reserved) Fix the pin to the low level.
	MD_BOOT3	In	Select the operation mode [3] Low: Normal mode, High: Debug mode
	MD_BOOT2	In	Select the boot device IO voltage Low: 3.3 V, High: 1.8 V *Note*: Enabled in boot mode 1 and boot mode 2 only
	MD_BOOT1	In	Input the boot mode select signal. MD_BOOT[1:0] = [Low:Low]: eSD*1 (boot mode 0) MD_BOOT[1:0] = [Low:High]: eMMC*1 (boot mode 1) MD_BOOT[1:0] = [High:Low]: xSPI (boot mode 2) MD_BOOT[1:0] = [High:High]: SCIF download (boot mode 3) *Note 1.* Enable CA55 cold boot only
	MD_BOOT0	In	
	MD_CLKS	In	Select SSCG OFF or ON Low: OFF, High: ON
System controller	QRESN	In	Input the reset signal. The reset state is entered when this signal goes low.
	QBYPASS	In	Select Main CLK oscillation mode Low: Crystal, High: External clock
	BSCANP	In	Select boundary scan mode Low: Not selected, High: Selected
Interrupt	NMI	In	Input interrupt trigger signal to all CPUs
	IRQ0 to 15	In	Input the external interrupt request signals
	TINT0 to 31	In	Input the external interrupt request signals

Table 1.2-4 List of Pin Functions (2/7)

Classification	Pin Name	I/O	Function
Power controller	QRESNSEL	In	Select the internal reset signal to be generated Low: Generated by the PWC High: Generated by the QRESN
	PWEN0	Out	Power enable for 1.8-V power supply to OTP and ADC (active high)*2
	PWEN1	Out	Power enable for 1.8-V power supply to MIPI-DSI and MIPI-CSI2 (active high)*2
	PWEN2	Out	Power enable for 1.2-V power supply to MIPI-DSI (active high)*2
Debugger interface	TMS_SWDIO	I/O	Test mode select pin. Functions as the SWDIO pin in serial wire debug (SWD) mode.
	TCK_SWCLK	In	Test clock pin. Functions as the SWCLK pin in serial wire debug (SWD) mode.
	TDO	Out	Test data output pin.
	TDI	In	Test data input pin.
	TRSTN	In	Test reset pin.
Direct memory access controller (DMAC)	DREQ0 to 4	In	Input DMAC request signal from the external device
	DACK0 to 4	Out	Output the acknowledge signal which indicates acceptance of DMAC request to the external device
	TEND0 to 4	Out	Output DMAC end signal
Watchdog timer (WDT)	WDTUDFCM	Out	Output the CM33_WDT underflow error signal with active low. This pin sets Nch open drain mode. (Register setting is possible.)
	WDTUDFCA	Out	Output the CA55_WDT underflow error signal with active low. This pin sets Nch open drain mode. (Register setting is possible.)
SCIF download interface	SCIF_RXD	In	UART receive pin for SCIF
	SCIF_TXD	Out	UART transfer pin for SCIF
12-bit A/D converter interface	ANIn00 to ANIn07	In	Input the ADC signals (n = 0 to 2)
	ADCn_ADTRG	In	Input the ADC trigger signal (n = 0 to 2)
Expanded serial peripheral interface (xSPI)	XSPI0_CKP	Out	Clock output pins. CKP and CKN waves have opposite phase.
	XSPI0_CKN	Out	
	XSPI0_DS	I/O	Read data strobe / Write data mask
	XSPI0_IO0 to 7	I/O	Input/output data 0 to data 7
	XSPI0_CS0N	Out	Output the chip select signal for the channel 0. Low: Selected, High: Not selected
	XSPI0_RESET0N	Out	Output the reset status signal for the channel 0. Low: reset status
	XSPI0_RSTO0N	In	Input the reset status signal from the channel 0
	XSPI0_INT0N	In	Input the interrupt signal from the channel 0
	XSPI0_ECS0N	In	Input the error correction status from the channel 0
	XSPI0_WP0N	Out	Output the write-protection signal for the channel 0
	XSPI0_CS1N	Out	Output the chip select signal for the channel 1 Low: Selected, High: Not selected
	XSPI0_RESET1N	Out	Output the reset status signal for the channel 1 Low: reset status
	XSPI0_RSTO1N	In	Input the reset status signal from the channel 1
	XSPI0_INT1N	In	Input the interrupt signal from the channel 1
	XSPI0_ECS1N	In	Input the error correction status from the channel 1
	XSPI0_WP1N	Out	Output the write-protection signal for the channel 1

Table 1.2-4 List of Pin Functions (3/7)

Classification	Pin Name	I/O	Function
DDR memory interface channel 0	DDRn_DQA0 to 15, DDRn_DQB0 to 15	I/O	DRAM data bits and strobes
	DDRn_DMIA0 to 1, DDRn_DMIB0 to 1	I/O	DRAM data bits and strobes
	DDRn_DQSAT0 to 1, DDRn_DQSBT0 to 1	I/O	DRAM data bits and strobes
	DDRn_DQSAC0 to 1, DDRn_DQSBC0 to 1	I/O	DRAM data bits and strobes
	DDRn_CKEA0 to 1, DDRn_CKEB0 to 1	I/O	DRAM address bits and command bits
	DDRn_CAA0 to 5, DDRn_CAB0 to 5	I/O	DRAM address bits and command bits
	DDRn_CSA0 to 1, DDRn_CSB0 to 1	I/O	DRAM address bits and command bits
	DDRn_CKAT, DDRn_CKBT	I/O	DRAM address bits and command bits
	DDRn_CKAC, DDRn_CKBC	I/O	DRAM address bits and command bits
	DDRn_RESETN	Out	Output DRAM reset signal
	DDRn_DTEST	I/O	Digital observation pin
	DDRn_ATEST	I/O	Voltage reference for receivers and analog test point for debug
	DDRn_ZN	—	Connect calibration external reference resistor (120Ω ± 1%)
SD/eMMC interface	SD0CLK	Out	Output the clock signal to external SD/eMMC device
	SD0CMD	I/O	Input/output the command code from/to external SD/eMMC device
	SD0DAT0 to 7	I/O	Input/output data 0 to data 7
	SD0RSTN	Out	Output the reset signal to external eMMC device
	SD0WP	In	Input the write-protection signal from external SD device
	SD0CD	In	Input the card-detect signal from external SD slot
	SD0PWEN	Out	Output the power-enable signal to power supply IC for SD device Low: Disabled, High: Enabled
	SD0IOVS	Out	Output the IO voltage level signal to SD device Low: 3.3 V, High: 1.8 V
SD interface	SD1CLK, SD2CLK	Out	Output the clock signals to external SD device
	SD1CMD, SD2CMD	Out	Input/output the command code from/to external SD device
	SD1DAT0 to 3, SD2DAT0 to 3	I/O	Input/output data 0 to data 3
	SD1WP, SD2WP	In	Input the write-protection signals from external SD device
	SD1CD, SD2CD	In	Input the card-detect signals from external SD slot
	SD1PWEN, SD2PWEN	Out	Output the power-enable signals to the power supply IC for SD device Low: Disabled, High: Enabled
	SD1IOVS, SD2IOVS	Out	Output the IO voltage level signals to SD device Low: 3.3 V, High: 1.8 V

Table 1.2-4 List of Pin Functions (4/7)

Classification	Pin Name	I/O	Function
USB2.0 channel 0	USB20_DP	I/O	USB2.0 D+ signal
	USB20_DM	I/O	USB2.0 D− signal
	USB20_OTGID	In	Input OTG ID (pulled up by the internal resistor) Low: Host, High: Peripheral
	USB20_VUBUSIN	In	Input USB VBUS detect signal*1
	USB20_OTGEXICEN	Out	OTG power supply IC control pin
	USB20_VBUSEN	Out	VBUS control signal (active high)
	USB20_OVRCURN	In	Overcurrent detection (active low)
	USB20_TXRTUNE	In	USB transmitter tune pin. This analog signal connects to an external resistor (200Ω ±1%) that adjusts the USB PHY's high-speed source impedance.
USB3.2 channel 0	USB30_DP	I/O	USB2.0 D+ signals
	USB30_DM	I/O	USB2.0 D− signals
	USB30_RX0M	In	USB3.2 super-speed plus differential receive pair (negative)
	USB30_RX0P	In	USB3.2 super-speed plus differential receive pair (positive)
	USB30_TX0M	Out	USB3.2 super-speed plus differential transfer pair (negative)
	USB30_TX0P	Out	USB3.2 super-speed plus differential transfer pair (positive)
	USB30_VBUSEN	Out	VBUS control signals (active high)
	USB30_OVRCURN	In	Overcurrent detection (active low)
	USB3_USRESREF	—	USB3 reference resistor with 200Ω (1%, 100 ppm/°C) to V_{SS}
	USB30_TXRTUNE	—	USB transmitter tune pin. This analog signal connects to an external resistor (200Ω ±1%) that adjusts the USB PHY's high-speed source impedance.
PCIe Gen3	PCIE_TXDPL0	Out	PCIe TX data (positive) of Lane 0
	PCIE_TXDNL0	Out	PCIe TX data (negative) of Lane 0
	PCIE_TXDPL1	Out	PCIe TX data (positive) of Lane 1
	PCIE_TXDNL1	Out	PCIe TX data (negative) of Lane 1
	PCIE_RXDPL0	In	PCIe RX data (positive) of Lane 0
	PCIE_RXDNL0	In	PCIe RX data (negative) of Lane 0
	PCIE_RXDPL1	In	PCIe RX data (positive) of Lane 1
	PCIE_RXDNL1	In	PCIe RX data (negative) of Lane 1
	PCIE_REFCLKP0	In	Differential reference clock (positive)
	PCIE_REFCLKN0	In	Differential reference clock (negative)
	PCIE0_RSTOUTB	Out	Output the reset signal

Table 1.2-4 List of Pin Functions (5/7)

Classification	Pin Name	I/O	Function
Gb Ethernet channel 0, 1	ET0_MDIO, ET1_MDIO	I/O	Management data I/O
	ET0_MDC, ET1_MDC	Out	Management data clocks
	ET0_RXCTL_RXDV, ET1_RXCTL_RXDV	In	RX control/data valid
	ET0_TXCTL_TXEN, ET1_TXCTL_TXEN	Out	TX control/data enable
	ET0_TXER, ET1_TXER	Out	TX data error (MII mode)
	ET0_RXER, ET1_RXER	In	RX data error (MII mode)
	ET0_RXC_RXCLK, ET1_RXC_RXCLK	In	RX clocks
	ET0_TXC_TXCLK, ET1_TXC_TXCLK	I/O	TX clocks
	ET0_CRS, ET1_CRS	In	Carrier sense (MII mode)
	ET0_COL, ET1_COL	In	Collision detection (MII mode)
	ET0_TXD0, ET1_TXD0	Out	TX data 0
	ET0_TXD1, ET1_TXD1	Out	TX data 1
	ET0_TXD2, ET1_TXD2	Out	TX data 2
	ET0_TXD3, ET1_TXD3	Out	TX data 3
	ET0_RXD0, ET1_RXD0	In	RX data 0
	ET0_RXD1, ET1_RXD1	In	RX data 1
	ET0_RXD2, ET1_RXD2	In	RX data 2
	ET0_RXD3, ET1_RXD3	In	RX data 3
	ET0_PHYINTR, ET1_PHYINTR	In	PHY interrupt signals
MIPI-DSI	DSI_DPCLK	Out	Output clocks (positive)
	DSI_DNCLK	Out	Output clocks (negative)
	DSI_DPDATA0 to 3	Out	TX data 0 to TX data 3 (positive)
	DSI_DNDATA0 to 3	Out	TX data 0 to TX data 3 (negative)
	DSI_VREG0P4V	—	Connect this pin to V_{SS} via a 2.2-nF capacitor
MIPI-CSI2 channel n (n = 0, 1)	CSIn_CLKP	In	Input clocks (positive)
	CSIn_CLKN	In	Input clocks (negative)
	CSIn_DATA0P to CSIn_DATA3P	In	RX data 0 to RX data 3 (positive)
	CSIn_DATA0N to CSIn_DATA3N	In	RX data 0 to RX data 3 (negative)

Table 1.2-4 List of Pin Functions (6/7)

Classification	Pin Name	I/O	Function
CANFD interface channel n (n = 0 to 5)	CRXn	In	RX data 0 to RX data 5
	CTXn	Out	TX data 0 to TX data 5
	CRXDPn	Out	RX data 0 to RX data 5 phase signal
	CTXDPn	Out	TX data 0 to TX data 5 phase signal
Serial peripheral interface (RSPI) channel x (x = A, B, C)	RSPCKx	I/O	Synchronous clock signal
	MOSIx	I/O	Data of Main-Out / Sub-In
	MISOx	I/O	Data of Main-In / Sub-Out
	SSLx0 to 3	I/O*3	Chip select pins
Serial communication interface (RSCI) channel n (n = 0 to 9)	RXDn	In	Input the receive data (asynchronous mode / clock synchronous mode / simple SPI mode / smart card mode)
	TXDn	Out	Output the transmission data (asynchronous mode / clock synchronous mode / simple SPI mode / smart card mode)
	SCKn	I/O	Clock pins (clock synchronous mode / simple SPI mode / smart card mode)
	CTSnN	In	Input the start of transmission as the hardware flow control signals (asynchronous mode / clock synchronous mode)
	RTSnN	Out	Output the reception as the hardware flow control signals (asynchronous mode / clock synchronous mode)
	MOSIn	I/O	Data of Main-Out / Sub-In (simple SPI mode)
	MISOn	I/O	Data of Main-In / Sub-Out (simple SPI mode)
	SCLn	I/O	I2C clocks (simple I2C mode)
	SDAn	I/O	I2C data (simple I2C mode)
	SSn	In	Input chip selector (simple SPI mode)
	DEn	Out	Output driver enable signal for half duplex (asynchronous mode)
I2C bus interface (RIIC) channel n (n = 0 to 8)	SCLn	I/O	Clock pins with Nch open drain
	SDAn	I/O	Data pins with Nch open drain
I3C bus interface (I3C)	SCL30	I/O	Clock pin
	SDA30	I/O	Data pin
General purpose timer (GPT)	GTIOC0A to 15A, GTIOC0B to 15B, GTIOC0AN to 15AN, GTIOC0BN to 15BN	I/O	Input capture for pulse width, output timer compare, and output PWM signals “nX” and “nXN” are anti-phase signals (X = A or B, n = 0 to 15).
	GTETRGA to GTETRGH	In	Input disable-output request signals for GPT outputs
Compare match timer (CMTW) channel n (n = 0 to 3)	TICn0, TICn1	In	Input capture signals
	TOCn0, TOCn1	Out	Output compare signals
Pulse density modulation interface (PDM) channel n (n = 0 to 6)	PDMDAT00 to 02, PDMDAT10 to 12	In	Input PDM data
	PDMCLK00 to 02, PDMCLK10 to 12	Out	Output PDM sampling clocks
Serial sound interface (SSIU) channel n	SSIn_SDATA	I/O	Serial sound data (TDM supported) (n = 0 to 9)*4
	SSIn_SCK	I/O	Serial clock (n = 0 to 7, 9)*4
	SSIn_WS	I/O	Word select (n = 0 to 7, 9)*4
SPDIF channel n (n = 0 to 2)	SPDIFn_OUT	Out	Output SPDIF data
	SPDIFn_IN	In	Input SPDIF data

Table 1.2-4 List of Pin Functions (7/7)

Classification	Pin Name	I/O	Function
I/O ports	P00 to P15	I/O	General purpose input/output pins with 3.3-V tolerance.
	P20 and P21	I/O	General purpose input/output pins included with I3C functions with 1.8-V tolerance.
	P30 to P47	I/O	General purpose input/output pins with 3.3-V tolerance.
	P50 to P57	I/O	General purpose input/output pins with 3.3-V tolerance.
	P60 to P67	I/O	General purpose input/output pins with 3.3-V tolerance. Selectable to use ELC function pins/groups.
	P70 to P77	I/O	General purpose input/output pins with 3.3-V tolerance.
	P80 to P87	I/O	General purpose input/output pins with 3.3-V tolerance. Selectable to use ELC function pins/groups.
	P90 to P92	I/O	General purpose input/output pins without 3.3-V tolerance.
	P93 to PA7	I/O	General purpose input/output pins with 3.3-V tolerance.
	PB0 to PB5	I/O	General purpose input/output pins without 3.3-V tolerance.

Note 1. Since this LSI has a resistor mounted between the USB20_VUBUSIN pin and V_{SS}, connect the pin to the USVBUS pin via a 30-kΩ (±1%) resistor. The schematic diagram is shown in **Figure 1.2-2**.

Note 2. QRESNSEL should be at the low level.

Note 3. SSLx1 to SSLx3 are output only.

Note 4. Half duplex: Ch. 0 to 9
Full duplex: Pairing ch. 0&9, 1&2, 3&4, 5&6, and 7&8
For details of SSI8, refer to **8.5 Serial Sound Interface Unit (SSIU)**.

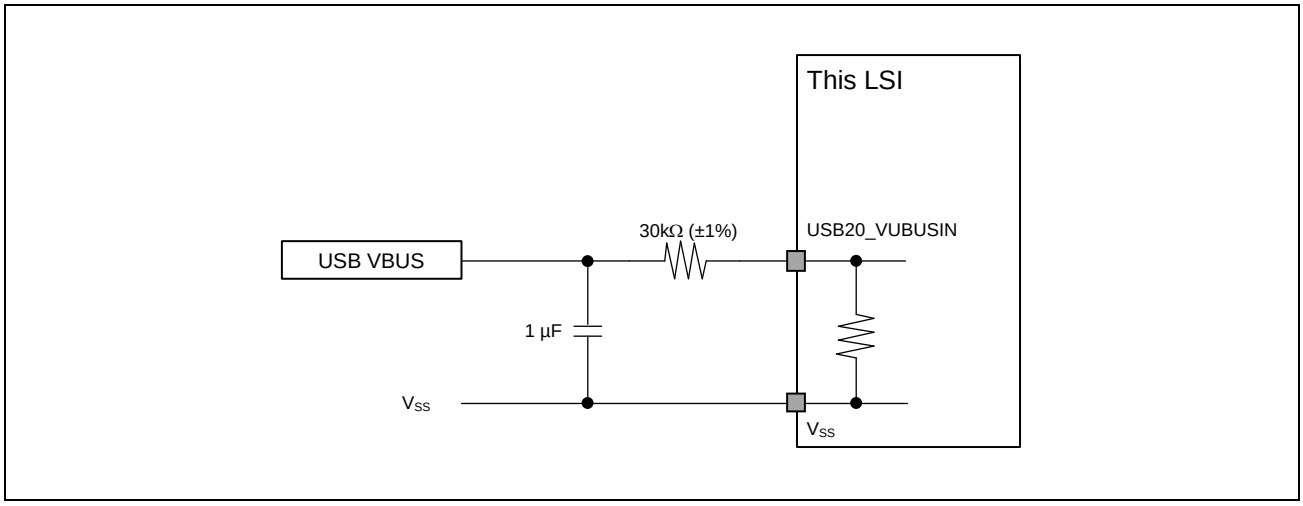

Figure 1.2-2 Connection Diagram of Resistor to USB20_VUBUSIN

SECTION 1 OVERVIEW

1.3 Clocks

This section describes the clocks of this LSI.

1.3.1 Overview

The main functions of the CPG are to generate and control clocks for the respective units, to generate and control resets, to control booting, to control low power consumption, and to control the power supply domain.

Table 1.3-1 Types and Overview of Unit Clocks

Function	Subset	Details
Clock Pulse Generator	CPG	Clock generating and control functions
		Reset sequential control functions
		Boot sequential control functions
Power Management Unit	PMU	Power sequential control functions

1.3.2 Clock Generating and Control Functions

The following functions are provided.

- The clocks to be supplied to various units are generated from external input clocks or PLL output clocks. Especially when the CA55 is cold boot, the CA55 operating frequency by the external pin is set.
- The selection of frequency divider ratio is implemented (the setting can be changed by the register).
- The clock path is selected by the clock selector (the setting can be changed by the register).
- Clock supply ON/OFF control (the setting can be changed by register)
- SSCG control of PLL, multiplication ratio setting, ON/OFF control (the setting can be changed by the register)

Table 1.3-2 PLL Overview

PLL	Details	Initial Frequency	SSCG Default Value
PLLCM33	For the MCPU bus and various units (PD_AWO area)	1,600 MHz	OFF (fixed)
PLLCLN	For buses other than the MCPU bus and various units	1,600 MHz	OFF (fixed)
PLLDTY	For buses other than the MCPU bus and various units	1,600 MHz	Depends on MD_CLKS
PLLCA55	CA55	1,700 MHz*1	Depends on MD_CLKS
PLLVDO	CRU / ISP / GE3D / CA55	1,260 MHz	Depends on MD_CLKS
PLLETH	GBETH / DRP-AI / DSI	1,000 MHz	OFF (fixed)
PLLDSI	DSI / LCDC	297 MHz	OFF (fixed)
PLLDDR0	For DDR ch. 0	800 MHz	OFF (fixed)
PLLGPU	GE3D	1,260 MHz	ON (fixed)
PLLDRP	DRP-AI / CA55	1,260 MHz	Depends on MD_CLKS

Note 1. When the CA55 is cold boot, the value is set by the external pin. The operation frequency of CA55 is selected by the BOOTPLLCA_0 and BOOTPLLCA_1 settings.

1.3.3 Clock Pin Specifications

Table 1.3-3 List of Pin Functions (1/2)

Pin Name	Input/ Output	Function	Frequency*1	Supply Source/ Destination Unit
LSI clock				
QXTAL	Output	24 MHz main clock	24 MHz	CPG
QEXTAL	Input	24 MHz main clock	24 MHz	CPG
RTXOUT	Output	32.768 kHz real-time clock	32.768 kHz	RTC
RTXIN	Input	32.768 kHz teal-time clock	32.768 kHz	RTC
AUDIO_XTAL	Output	4 to 48 MHz audio clock (Internal OSC mode)	48 MHz	ADG
AUDIO_EXTAL	Input	4 to 48 MHz audio clock (Internal OSC mode) 4 to 50 MHz audio clock (Input clock from the external device)	50 MHz	ADG
AUDIO_CLKB*2	Input	4 to 50 MHz audio clock-in	50 MHz	ADG
AUDIO_CLKC*2	Input	4 to 50 MHz audio clock-in	50 MHz	ADG
AUDIO_CLKOUT*2	Output	2 to 25 MHz audio clock-out (Half frequency of input clock)	25 MHz	ADG
Debugger interface				
TCK_SWCLK	Input	Test clock pin for the on-chip emulator functions as the SWCLK pin in serial wire debug (SWD) mode	20 MHz	CST
Expanded serial peripheral interface (xSPI)				
XSPI0_CKP*3	Output	Clock output pins (positive)	133 MHz	xSPI
XSPI0_CKN*3	Output	Clock output pins (negative)	133 MHz	xSPI
SD/MMC interface				
SD0CLK	Output	Output the clock signal to external SD/MMC device	200 MHz	SD0
SD interface				
SD1CLK	Output	Output the clock signal to external SD device	200 MHz	SD1
SD2CLK	Output	Output the clock signal to external SD device	200 MHz	SD2
PCIe Gen3				
PCIE_REFCLKP0	I/O	Differential reference clock (positive), 100 MHz ±300 ppm	100 MHz	PCIE0
PCIE_REFCLKN0	I/O	Differential reference clock (negative), 100 MHz ±300 ppm	100 MHz	PCIE0
Gbit Ethernet ch. 0				
ET0_MDC	Output	Output management data clocks	2.5 MHz	GBETH0
ET0_RXC_RXCLK	Input	RX clocks	125 MHz	GBETH0
ET0_TXC_TXCLK	I/O	TX clocks	125 MHz	GBETH0
GbEthernet ch. 1				
ET1_MDC	Output	Output management data clocks	2.5 MHz	GBETH1
ET1_RXC_RXCLK	Input	RX clocks	125 MHz	GBETH1
ET1_TXC_TXCLK	I/O	TX clocks	125 MHz	GBETH1
MIPI-DSI				
DSI_DPCLK	Output	Output clocks (positive)	750 MHz	DSI
DSI_DNCLK	Output	Output clocks (negative)	750 MHz	DSI
MIPI-CSI2 ch. n (n = 0, 1)				
CSIn_CLKP	Input	Input clocks (positive)	1050 MHz	CRUn
CSIn_CLKN	Input	Input clocks (negative)	1050 MHz	CRUn
Serial peripheral interface (RSPI) ch. n (n = 0, 1, 2)				
RSPCKn	I/O	Synchronous clock signal	50 MHz	RSPIn

Table 1.3-3 List of Pin Functions (2/2)

Pin Name	Input/ Output	Function	Frequency*1	Supply Source/ Destination Unit
Serial communication interface (RSCI) ch. n (n = 0 to 9)				
SCKn	I/O	Clock pins (simple SPI mode)	37.5 MHz	RSCIn
SCLn	I/O	I2C clocks (simple I2C mode)	400 kHz	RSCIn
I2C bus interface (RIIC) ch. n (n = 0 to 8)				
SCLn	I/O	Clock pins with N-ch open drain	1 MHz	RIICn
I3C bus interface (I3C)				
SCL30	I/O	Clock pin	3 MHz	I3C0
Pulse density modulation interface (PDM) ch. n (n = 0 to 5)				
PDMCLK00	Output	Output PDM sampling clocks	2.4 MHz	PDM0
PDMCLK01	Output	Output PDM sampling clocks	2.4 MHz	PDM0
PDMCLK02	Output	Output PDM sampling clocks	2.4 MHz	PDM0
PDMCLK10	Output	Output PDM sampling clocks	2.4 MHz	PDM1
PDMCLK11	Output	Output PDM sampling clocks	2.4 MHz	PDM1
PDMCLK12	Output	Output PDM sampling clocks	2.4 MHz	PDM1
Serial sound interface (SSIU) ch. n (n = 0 to 9)				
SSIn_SCK	I/O	Output clocks	12.5 MHz	SSIU

Note 1. The clock frequencies are either variable or fixed. In the case of the variable clocks, the maximum frequencies which can be output are listed for the output clocks and the maximum frequencies which can be input to this LSI are listed for the input clocks.

Note 2. For use of these pins, the function selection of multiplexed function pins is required. For details, refer to **4.2 Pin Function Controller (PFC)**.

Note 3. CKP and CKN waves have opposite phase.

SECTION 1 OVERVIEW

1.4 Reset

This section describes resets of this LSI.

1.4.1 Overview

Each reset source generates a reset signal. The types of reset are described below.

For further details regarding the resets, see **4.4 Clock Pulse Generator (CPG)**.

1.4.1.1 System Reset (External QRESN Pin, PWC)

Asserting the reset signal on the external QRESN pin initializes the whole LSI. However, the timing of release of the CPG internal reset following de-assertion of the reset signal on the external QRESN pin differs according to the state of the QRESNSEL pin.

- QRESNSEL = High: Release is immediate.
- QRESNSEL = Low: Release is at the time of release from the internal reset by the PWC function.

1.4.1.2 Debug Reset (Software Reset by CoreSight)

When the external QRESN, TRSTN, and MD_BOOT3 pins are at the high level, the JTAG debugger is capable of resetting the CoreSight module (except the DAP) and Cortex-A55.

1.4.1.3 Error Reset

A reset can be generated in response to the maskable error sources. Generation of a reset in response to the main sources of errors due to the system such as a WDT timeout error, ECC error in internal SRAM, or a bus access error, as well as to error sources in individual units, is possible.

1.4.1.4 Resetting of Individual Units

Switching reset signals for individual units off and on can be realized by switching a reset pin for the unit off and on according to enable conditions. Sources of control for switching reset sources off and on are listed below.

- Off and on control by a register setting
- Reset control in a boot sequence
- Debug reset control
- CA55 cold reset control
- CM33 cold reset control

1.4.1.5 CA55 Reset

The CA55 has several types of reset, differing in terms of hardware or software control and the CA55 reset signal through which control is applied. At the time of a reset, the 4 cores and the cluster require handshake control by the individual P-channels.

■ **Hardware control: by the CPG**

System cold reset (by the function or the debugger),
WDT error cold reset

■ **Software control: by the CM33**

Cold reset (normal/debug mode), warm reset (cluster, core 0/1/2/3)

1.4.1.6 CM33 Reset

The CM33 has several types of reset, differing in terms of hardware or software control and the CM33 reset signal through which control is applied.

■ **Hardware control: by the CPG**

System cold reset, WDT error cold reset

■ **Software control:**

Cold reset (normal/debug mode), warm reset

SECTION 1 OVERVIEW

1.5 Interrupts

This section describes the interrupt functions of this LSI.

1.5.1 Overview

The interrupt controller accepts interrupt requests from peripheral modules and from external pins including the external DMA request pins. An interrupt accepted by the interrupt controller is set either as an interrupt for the CPU or as an activating trigger signal for the DMAC and ELC.

Table 1.5-1 Interrupt Overview

Item		Description
Interrupts	Interrupt destinations	• CA55 cores 0, 1, 2, and 3 • CM33 • Five DMAC units • ELC
	Peripheral function interrupts	Interrupts from peripheral modules detected by edge or level
	External pin interrupts	• Interrupts from pins: IRQ0 to IRQ15 • Number of sources: 16 • Detection: One of four methods can be set for each source. Low level, falling edge, rising edge, both rising and falling edges. • Digital noise filter supported
	Interrupt between CPU cores	Mutual interrupts between the four CA55 cores and CM33 with or without safety.
	Error events	Error events from the CPU and peripherals are captured and merged to interrupts with masking. All are masked in the initial state (no interrupts will be generated).
	DMAC control	Interrupts can be assigned as DMA activation sources.
	External DMA request	• DREQ (external DMA request) pins can output DACK (DMA acknowledgement) signals and TEND signals when DMA transfer is completed. • Number of sources: 5 (one per DMAC unit) • Digital noise filter supported
Non maskable interrupts	NMI pin interrupts	• Interrupts from NMI pin • Interrupt detection: Falling edge, rising edge • Digital noise filter supported
Restoration from the sleep state		Restoration due to non-maskable interrupt and non-masked interrupt sources

1.5.2 Overview of the ICU

The interrupts of this LSI are controlled by the interrupt control unit (ICU). An overview of the ICU function is given below. For details, see **4.6 Interrupt Controller**.

1.5.2.1 Interrupt Control

- Interrupt output for individual CPUs

  This LSI has a large number of interrupts, which are classified as follows. As stated, some interrupts are not assigned in common to all of the CA55 and CM33.

  - Interrupts common to all CPUs (common)
  - Independent interrupts for the CA55 and CM33 (system)
  - Interrupts other than those listed above
    Each interrupt for the CA55 cores is assigned as an SPI because the number of interrupts the CA55 supports is fewer than the maximum of 960 interrupts (single).
    Interrupts for the CM33 are selectable by software, and fewer than 480 interrupts are assigned as SPIs (select).

Table 1.5-2 Assignment of Interrupts to the Three Types of CPU

SPI No.	CA55	CM33
0 to 251	Common	
252 to 352	SYSTEM(CA55)	SYSTEM(CM33)
353 to 479	SINGLE(CA55)	SELECT(CM33)
480 to 959		—

- Control of error interrupts
  - Generation of an extended pseudo error interrupt under software control
  - This error interrupt signal is connected as a single interrupt to the CM33 and CA55, respectively.
- The software interrupt is generated by writing to a register in the ICU.
- The ICU applies masking control of the interrupt for the CM33 by using the MASK signal externally input to the ICU.

1.5.2.2 Event Source Control

- Bundled RAM error interrupt control: the error source can be checked by reading a register.
- Bundled bus error interrupt control: the error source can be checked by reading a register.
- Bundled GPT control: the error source can be checked by reading a register.
- Control of error interrupt assignment to the CA55 and CM33 cores
  - Error interrupts for the CA55 cores
    All error events can be bundled into one interrupt for notification of a CA55. Masking an interrupt so that it is not conveyed is also possible.
  - Error interrupts for the CM33 cores
    All error events can be bundled into one interrupt for notification of a CM33. Masking an interrupt so that it is not conveyed is also possible.

  Units that produce error event signals
  CA55, CM33, SRAM, SYSTEM BUS, DDR, ICU, CPG, GPT, WDT, and ADC
- Retention of the error source flags in the SYS register
- Input selection control of TINT

  Pin functions multiplexed on 86 pins can be used as TINT interrupts. Interrupts from TINT0 to TINT31 are selectable.
- Exclusive output control of signals as interrupt signals or DMAC triggers

  The control when a source is assigned as both an interrupt and a DMA request is exclusive, and either an interrupt or DMA request will be enabled.
- Exclusive output control of signals as interrupt signals or event triggers

  The control when a source is assigned as both an interrupt and an event signal output is exclusive, and either an interrupt or event signal output will be enabled.

1.5.2.3 DMAC Control

- DMA request signals are output from the ICU to the DMAC.
- The ICU has functionality to assign the target units per DMAC channel, and outputs the events for the assigned units as DMA requests.
- Ack signals from the DMAC are output from the ICU to some units.
- The generation of software DMAC requests is controlled by writing to a register in the ICU.
- The channel settings are cleared in response to the DMAC transfer completion interrupt.
- The channel settings are controlled to be the same for a DMAC request.

1.5.2.4 Event Output Control

- Event signals that are input to the ICU are output to the target units.
- The ICU has functionality to assign the target units for event output, and outputs the event signals for the assigned units.
- The generation of software events is controlled by writing to a register in the ICU.

1.5.2.5 Error Output

The ICU outputs the underflow error produced by the WDT and errors for which the source is other than the WDT to the CPG.

The CPG uses these signals to control the system reset and resets for individual CPUs as well as the external WDTUDFCM and WDTUDFCA pins in response to underflow errors of the WDT for the CM33 and CA55.

1.5.2.6 Register Access Security Control

Registers in the ICU are classified into two groups (Gr0 and Gr1) and security control can be applied per group.

1.5.3 System Configuration Related to Interrupts

Figure 1.5-1 is a schematic diagram of the system related to interrupts in this LSI.

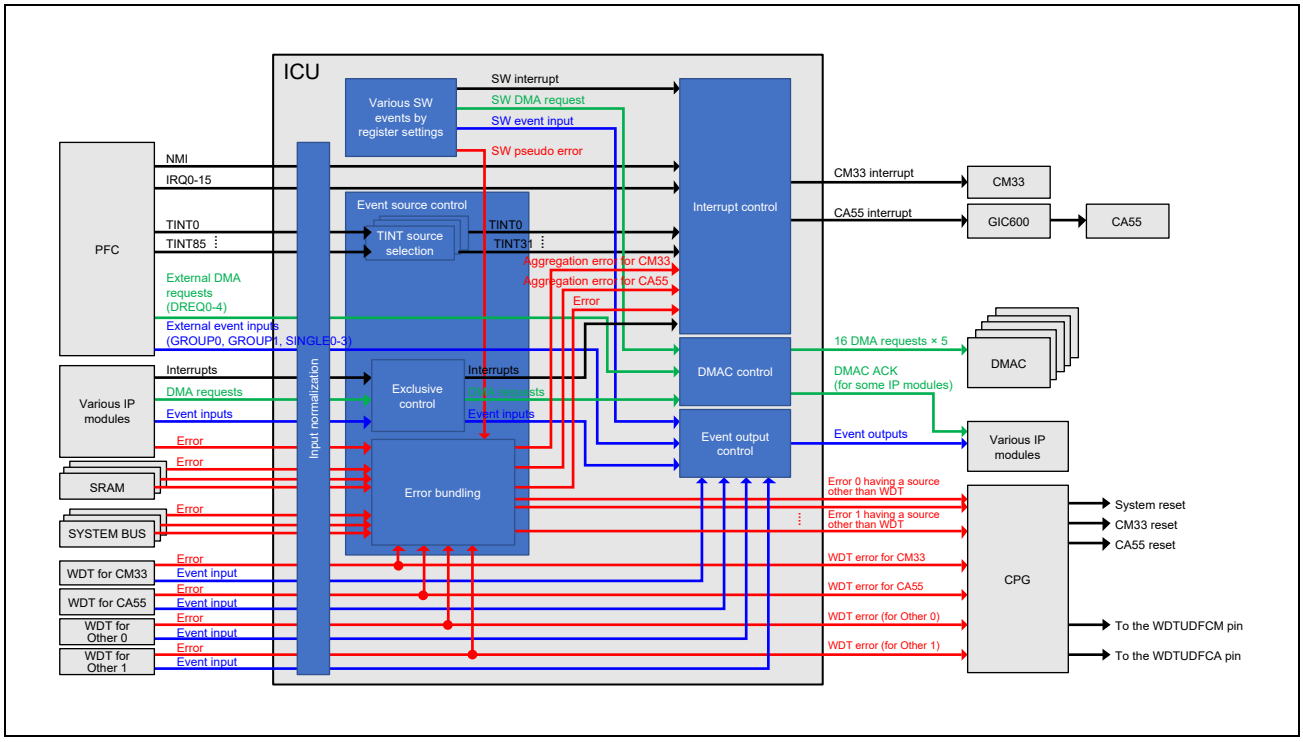

Figure 1.5-1 Schematic Diagram of the System Related to Interrupts

1.5.4 Error Processing

1.5.4.1 Notifying the CA55 and CM33 Cores of Errors

All error events can be aggregated as interrupts for conveyance to the CA55 and CM33 cores.

Masking an interrupt so that it is not conveyed is also possible. The CPU to which the interrupt was conveyed checks the error source retention register to identify the source of the error, and proceeds with processing corresponding to the source.

1.5.4.2 Resets Due to Errors

Table 1.5-3 shows the relationship between errors for which the source is a WDT or other than a WDT and each type of reset, and the WDTUDFCM and WDTUDFCA pins. In the CPG, whether a reset is applied to the CPU, a system reset is applied to the whole chip, or the WDTUDFCM and WDTUDFCA pins are asserted can be selected by masking.

Table 1.5-3 Errors and Resets

Error Source	CA55 Cold Reset	CM33 Cold Reset	System Reset	Asserting WDTUDFCA (Hardware Control)	Asserting WDTUDFCM (Hardware Control)
WDT for CA55 (all cores)	✓	—	✓	✓	—
WDT for CM33	—	✓	✓	—	✓
WDT for Other 0	—	—	✓	—	—
WDT for Other 1	—	—	✓	—	—
Error 0 having a source other than a WDT	—	—	✓	—	—
Error 1 having a source other than a WDT	—	—	✓	—	—
…	—	—	✓	—	—
Error N having a source other than a WDT	—	—	✓	—	—

SECTION 1 OVERVIEW

1.6 Power Management

This section describes the power management of this LSI.

1.6.1 Overview

The PMU controls the power off sequence except for the PD_AWO area.

When the CM33 is coldbooted, the power supply to areas other than the PD_AWO area can be shut down.

When the CA55 is coldbooted, the power must be always on in all power supply areas.

1.6.2 Power Domain

The power domain is classified into two main units. For details, see **4.4 Clock Pulse Generator (CPG)** and **4.5 Power Management Unit (PMU)**.

Table 1.6-1 PD_AWO (Always On)

Item	Target Unit
System	SYSTEM BUS, CPG, ICU, PFC, ROM, OTP, CST, secure IP, TSU (1 ch.), DMAC (16 ch.), TZC, etc.
CPU	Cortex-M33 (FPU/DSP extension)
SRAM	1 Mbyte
Timer	GTM (2 ch.), CMTW (4 ch.), WDT (1 ch.), RTC
Interface	xSPI, RIIC (1 ch.), SCIF (1 ch.), GPIO (86 pins)/IRQ/NMI, ADC (24 ports), PDM (6 ch.)

Table 1.6-2 PD_OTHERS (Including PD_CA55 and PD_DDR)

Item	Target Unit
System	SYSTEM BUS, CPG, PFC, TSU (1 ch.), DMAC (64 ch.), TZC, etc.
CPU	Cortex-A55
AI accelerator	DRP-AI
Video & Graphics	GE3D*1, ISP*1, VCD, ISU, CRU, DSI, LCDC
Audio	ADG, SCU, ADMAC, SSIU, SPDIF
SRAM	512 Kbytes
Timer	GTM (6 ch.), CMTW (4 ch.), WDT (3 ch.), GPT (16 ch.)
Interface	DDR (1 ch.), eMMC/SD (1 ch.), SD (2 ch.), USB3 (1 ch.), USB2 (2 ch.), GBETH (2 ch.), PCIE, I3C0 (1 ch.), RIIC (8 ch.), RSCI (10 ch.), RSPI (3 ch.), CANFD (6 ch.)

Note 1. These units are optional.

CAUTION

The state where PD_AWO = OFF and PD OTHERS = ON is prohibited.

To avoid the power to be accidentally supplied in the above state, measures such as placing a diode between the AWO-OTHERS power supplies on the mounting board are required.

1.6.3 Lower Power Management

The low-power management of the system is supported. In some low-power modes, handshake control is performed with the CPU.

- PD_OTHERS area power control
- SRAM power-saving mode control
- Cortex-A55 sleep mode
- Cortex-M33 sleep mode
- Module standby mode
- Low frequency mode
- Software standby mode

For the operation procedure, refer to **4.4 Clock Pulse Generator (CPG)**.

SECTION 1 OVERVIEW

1.7 Internal Bus

This section describes the internal bus configuration of this LSI.

1.7.1 Overview

1.7.1.1 Features

The bus system of this LSI provides a physical address space of 64 Gbytes (address bus width of 36 bits). The internal bus of this LSI incorporates Arm CoreLink NIC-400, etc., and controls the following bus functions.

Security control:

Security attribute re-setting and security level determination

Address translation:

35-bit or 36-bit address space access

Interrupt generation:

AXI bus error interrupt generation

Unit state detection:

Slave unit stop state detection

NOTE

The security control function is only valid for secure products. For information on secure products, please contact our sales representative.

1.7.1.2 LSI Internal Bus Configuration

The internal bus of the LSI consists of the ACPU bus, RCPU bus, MCPU bus, DRP bus, Video 0 bus, Video 1 bus, and COM bus. The configuration of the buses is shown in **1.1 Overview**.

ACPU bus:

A bus connected to CA55, DDR memory controllers, SRAM, and its peripheral units

RCPU bus:

A bus connected to peripheral units

MCPU bus:

A bus connected to CM33, SRAM, its peripheral units, and the system control units

DRP bus:

A bus connected to DRP-AI and DDR memory controllers

Video 0 bus and Video 1 bus:

A bus connected to image processing units and DDR memory controllers

COM bus:

A bus connected to communication interface units and DDR memory controllers

1.7.2 Accessible Areas

In the bus system of this LSI, each bus master unit can only access the areas that are used for register access or data transfer. **Table 1.7-1** shows the areas that can be accessed from each master.

Table 1.7-1 Accessible Areas (1/3)

Slave Unit	Master Unit																			
	CA55 (Main)	CA55 (Peripheral)	CM33 (C-AHB)	CM33 (S-AHB)	DMAC (0,1,2,3,4)	CST (AXI-AP)	CST (ETR)	GE3D (Mali-G31)	ISU	DRP-AI	SD (0,1,2)	PCIE0	USB30	USB20	GBETH (0,1)	CRU (Statistics 0,1, Video 0,1)	ISP (FR Video Out, Temper, Video In)	LCDC	DSI	VCD

Note: Using paths marked with × in the table is prohibited. If access to such a path is attempted, incorrect operation may occur.

Note: For details on access control of each unit and bus, refer to CPG (MSTOP Registers) and SYS (Master Access Control/Slave Access Control Registers).

Remarks: ✓: Accessible path, ×: Prohibited path

Note 1. The CA55 peripheral IF can only access the PCIE0 register regions (1340_0000h to 1340_FFFFh).

1.7.3 Bus System Control

1.7.3.1 Security Control

1.7.3.1.1 Re-Setting the Security Attribute Output from Bus Masters

This facility is for re-setting the security attributes of bus transactions that are by bus master units. Specifically, use the master access control register (SYS_MSTACCCTLn) to re-set the security attributes. For details on the SYS_MSTACCCTLn register, see **4.3 System Controller (SYS)**.

NOTE

The bus transaction signals ARPROT[1:0] and AWPROT[1:0] indicate the security attributes, which can be used to protect against illicit transactions.

- ARPROT[0] and AWPROT[0] being 0 or 1 respectively indicate non-privileged access or privileged access.
- ARPROT[1] and AWPROT[1] being 0 or 1 respectively indicate secure access or non-secure access.

The ARPROT and AWPROT signals are prescribed in as part of the AXI protocol. For details, see the AMBA AXI and ACE Protocol Specifications published by Arm Ltd.

Use the SYS_MSTACCCTLn register to make the following settings.

- Selection of security attribute source

  Selection of whether to use the unchanged values of ARPROT[1:0] or AWPROT[1:0] of the ARPROT[2:0] or AWPROT[2:0] signals, which are output from the bus master units, or to re-set ARPROT[1:0] or AWPROT[1:0] according to the settings of the SYS_MSTACCCTL register
- Value to be re-set for ARPROT[1:0] or AWPROT[1:0]

1.7.3.1.2 Determining the Security Levels of Bus Slaves

This facility is for enabling or disabling access to a bus slave unit by comparing the security attribute that is input to the bus slave unit in a bus transaction with the security setting of the given slave. The security level can be set in one of the following ways. The applicable way depends on the slave.

- Setting by using the SL[1:0] bits in the slave control register (SYS_SLVACCCTLn)
  For details on the SYS_SLVACCCTLn register, see **4.3 System Controller (SYS)**.
- Setting by using the nsaid_wr_en[31:16] and nsaid_rd_en[15:0] bits in the region ID access register (REGION_ID_ACCESS_<n>: n = 0 to 2) of the TrustZone address space controller (TZC). For details on the TZC, see **3.5 TrustZone Address Space Controller (TZC)**.

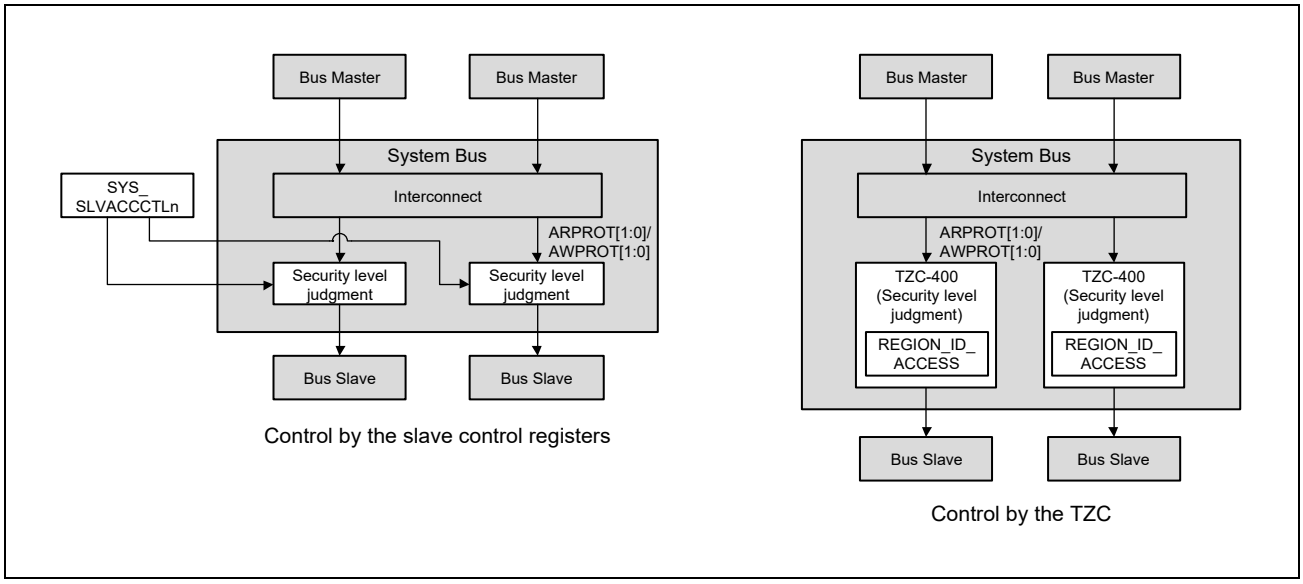

Figure 1.7-1 Security Level Determination Ways

NOTE

The bus transaction signals ARPROT[1:0] and AWPROT[1:0] indicate the security attributes, which can be used to protect against illicit transactions.

- ARPROT[0] and AWPROT[0] being 0 or 1 respectively indicate non-privileged access or privileged access.
- ARPROT[1] and AWPROT[1] being 0 or 1 respectively indicate secure access or non-secure access.

The ARPROT and AWPROT signals are prescribed in as part of the AXI protocol. For details, see the AMBA AXI and ACE Protocol Specifications published by Arm Ltd.

Table 1.7-2 shows the correspondence between the settings of the slave control register and the security levels for input transactions. **Table 1.7-3** shows the correspondence between the settings of the region ID access register of the TZC and the security levels for input bus transactions.

If comparison indicates that access is disabled, a bus error is generated in response to the corresponding attempted bus transaction. Stopping of a slave unit is detected by reference to the module stop state (MSTOP) setting in the CPG. Attempted access to a slave unit in the module stop state leads to a bus error.

Table 1.7-2 Security Levels Set by Using the Slave Control Register

	Security Attribute for Input Bus Transactions			
Setting of SL[1:0]	Non-privileged Non-secure	Privileged Non-secure	Non-privileged Secure	Privileged Secure
00b	Access allowed	Access allowed	Access allowed	Access allowed
01b	Access not allowed	Access allowed	Access allowed	Access allowed
10b	Access not allowed	Access not allowed	Access allowed	Access allowed
11b	Access not allowed	Access not allowed	Access not allowed	Access allowed

Table 1.7-3 Security Levels Set by Using the TZC

Setting of nsaid_wr_en[31:16] and nsaid_rd_en[15:0]	Security Attribute for Input Bus Transactions			
	Non-privileged Non-secure	Privileged Non-secure	Non-privileged Secure	Privileged Secure
000Fh	Access allowed	Access allowed	Access allowed	Access allowed
000Bh	Access not allowed	Access allowed	Access allowed	Access allowed
0003h	Access not allowed	Access not allowed	Access allowed	Access allowed
0002h	Access not allowed	Access not allowed	Access not allowed	Access allowed

1.7.3.2 Address Translation

1.7.3.2.1 36-Bit Address Space Access

This LSI has bus master units that can handle up to a 36-bit address space and bus master units that can only handle up to a 32-bit address space (actual size of 4 Gbytes). This function enables a bus master unit that can only handle up to a 32-bit address space (actual size of 4 Gbytes) to access an address space of greater than 4 Gbytes. The target bus master units are as follows.

1. Up to a 35-bit address space (access to DDR)
   - SD0, SD1, SD2
   - GBETH0, GBETH1
   - USB20
   - USB30
   - VCD
   - DSI
   - LCDC
   - ISP (FR Video out and Temper™)
2. Up to a 36-bit address space (access to DDR and PCIE0)
   - DMAC0, DMAC1, DMAC2, DMAC3, DMAC4

This function translates bus transaction addresses that are output from a bus master unit in 1-Gbyte units according to the settings of the address offset registers (SYS_AOFn), as shown in the figure below. For details on the SYS_AOFn registers, see **4.3 System Controller (SYS)**.

- In the SYS_AOF registers, set bits [35:30] or [34:30] of the remapping destination address in each 1-Gbyte space corresponding to bits [31:30] of the address that is output from the bus master unit.
- Select the 6-bit value of the SYS_AOF register corresponding to the upper two bits (bits [31:30]) of the 32-bit address that is output from the bus master unit.
- In the selected 6-bit value, use the lower two bits to overwrite bits [31:30] of the original address that was output from the bus master unit, and add the upper four or three bits as bits [35:32] or [34:32] to the original address.

CAUTION

- For the bus master up to a 35-bit address space, the most significant bit([5]) of the SYS_AOF register must always be set to 0.
- When a transaction with [35] bit set to 1 is issued from the bus master up to a 35-bit address space, the operation is not guaranteed.

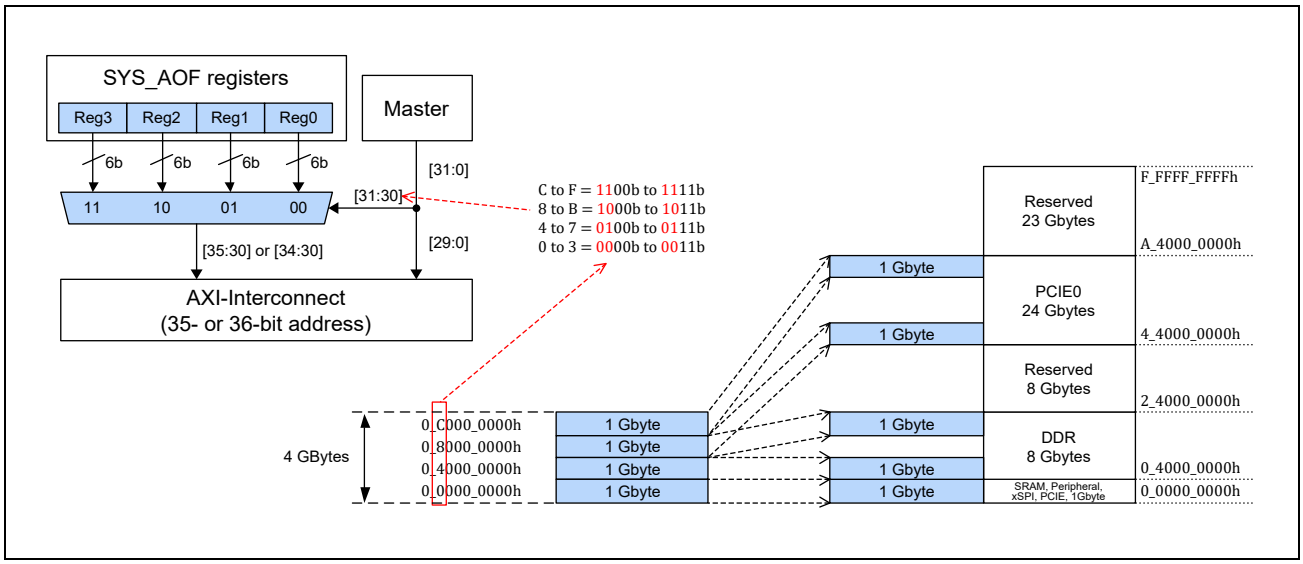

Figure 1.7-2 Address Space Extension (Overview)

CAUTION

When accessing DRAM from these bus master units, accesses that exceed a 4-Gbyte boundary are prohibited.

1.7.3.2.2 36-Bit Address Space Access for CM33

This LSI also supports a 36-bit address space for CM33. The hardware reallocates the CM33 address space to the address map of the LSI device as a whole. After that, it handles address space extension in units of 256 Mbytes. **Figure 1.7-3** shows reallocation from the CM33 address space to the address map of the LSI device as a whole. **Figure 1.7-4** shows the address space extension from the address map of the LSI device as a whole to spaces extending beyond 4 Gbytes.

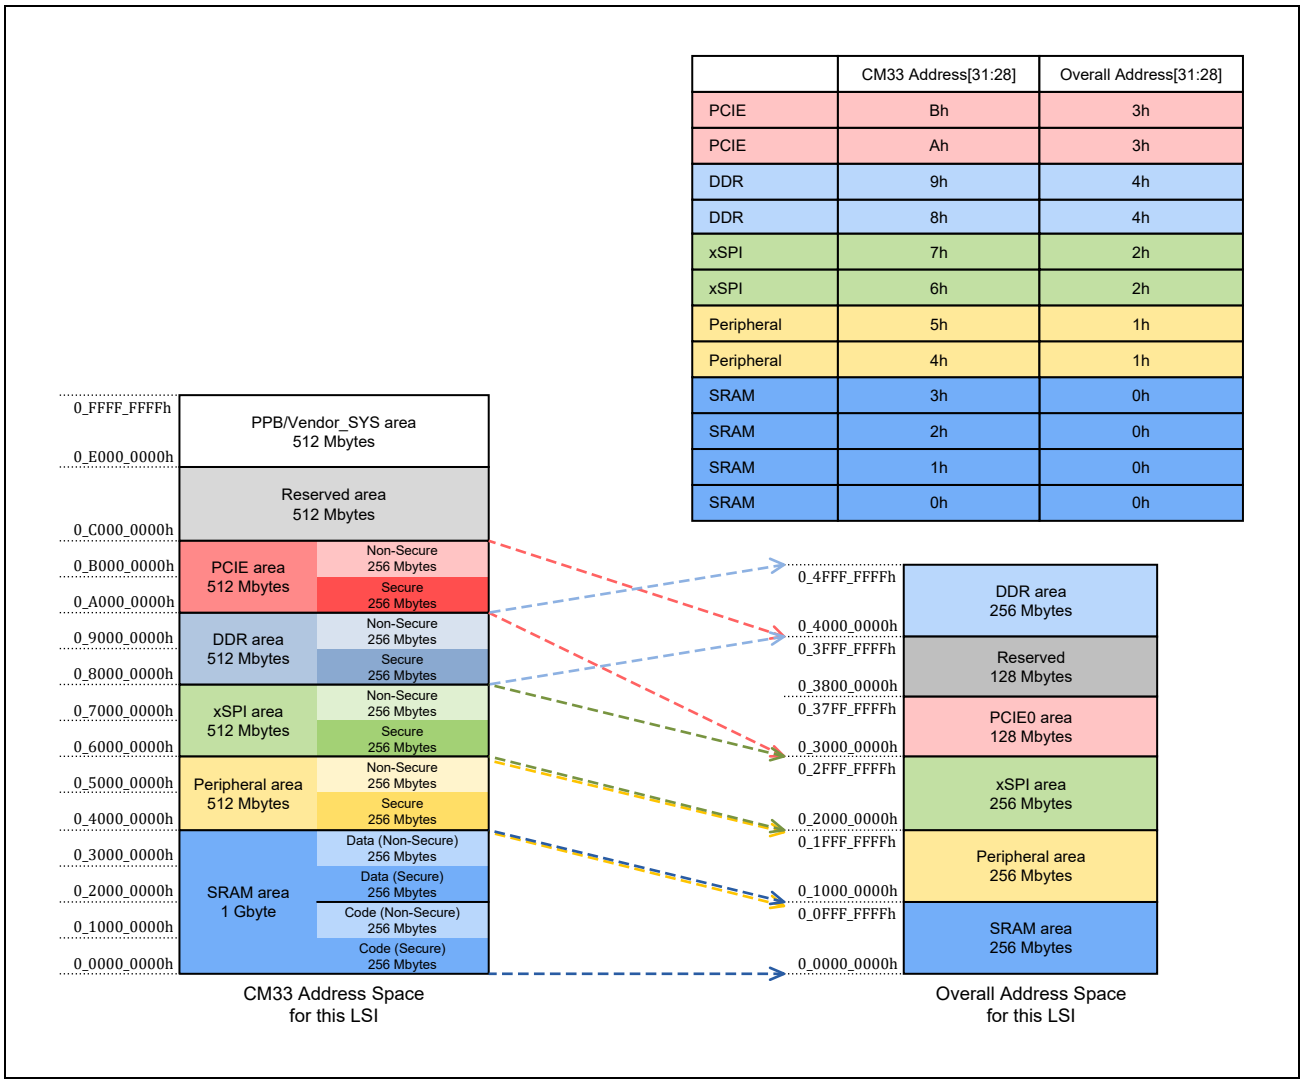

Figure 1.7-3 Reallocation from CM33 Address Space to Overall Address Space (Overview)

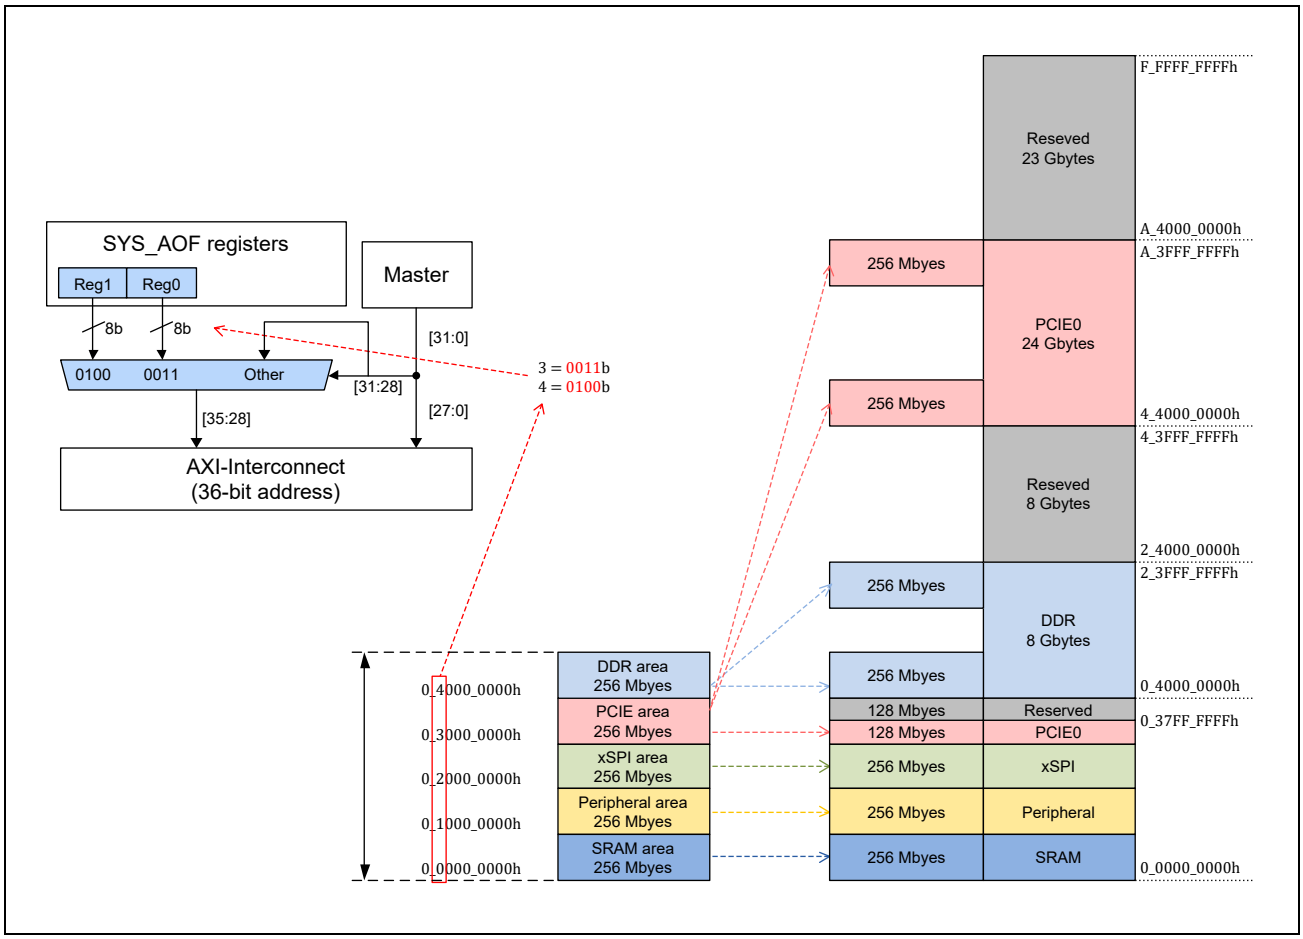

Figure 1.7-4 Address Space Extension for CM33 (Overview)

1.7.3.3 Bus Error Interrupt Generation

This LSI generates a bus error interrupt when any of the following conditions is met.

- A bus error is generated when access is disabled by the security setting.
- A bus error is generated when access to a slave unit in the module stop state (MSTOP) is attempted.
- A bus error is generated by a slave unit.

This function is supported for all bus master units included in this LSI.

Bus error interrupts are controlled (retained, cleared, and gathered into a single signal) by the interrupt control circuit (ICU). For details, including the types of the bus errors, see **4.6 Interrupt Controller**.

NOTE

This function cannot distinguish between a bus error generated when access is disabled by the security setting and a bus error generated due to other causes.

If bus errors occur consecutively, they will be notified to the CPU once, unless cleared.

In addition to the above bus error, an ERRINT interrupt is generated in any of the following cases.

- When the response to a write transaction with the bufferable attribute from the CM33 C-AHB interface is ERROR.
- When the response to a write transaction with the bufferable attribute from the CM33 S-AHB interface is ERROR.

1.7.3.4 Control Register

The control registers of the internal bus of this LSI (GPV: Global Programmers View) are described below. For details of the GPV, refer to the Arm CoreLink NIC-400 Network Interconnect Technical Reference Manual and the Arm CoreLink QoS-400 Network Interconnect Advanced Quality of Service.

In this section, slave interface registers for the QoS control are described.

- Slave Interface Register

  For the slave interfaces, the inclusion or non-inclusion of each control register is classified. Table **1.7-4** lists the inclusion and non-inclusion of registers.

Table 1.7-4 Inclusion and Non-inclusion of Slave Interface Registers

Address Offset	Register Name	Register Inclusion Classification
0020h	sync_mode	—
0024h	fn_mod2	—
0028h	fn_mod_ahb	—
002Ch	fn_mod_lb	—
0040h	wr_tidemark	—
0100h	read_qos	✓
0104h	write_qos	✓
0108h	fn_mod	✓
010Ch	qoc_cntl	✓
0110h	max_ot	✓
0114h	max_comb_ot	✓
0118h	aw_p	✓
011Ch	aw_b	✓
0120h	aw_r	✓
0124h	ar_p	✓
0128h	ar_b	✓
012Ch	ar_r	✓
0130h	target_fc	✓
0134h	ki_fc	✓
0138h	qos_range	✓

The following subsections list the slave interface registers of each GPV.

1.7.3.4.1 GPV_ACPU

GPV_ACPU is the GPV of ACPU Bus. GPV_ACPU is described below.

Table 1.7-5 lists the slave interface registers.

Table 1.7-5 Slave Interface Registers for GPV_ACPU

Interface Name	Base Address
S_CA55 (Main)	0_14A4_2000h (54A4_2000h*1, 44A4_2000h*2)
S_CA55 (Peripheral)	0_14A4_3000h (54A4_3000h*1, 44A4_3000h*2)
S_GE3D	0_14A4_4000h (54A4_4000h*1, 44A4_4000h*2)
S_DMAC1	0_14A4_5000h (54A4_5000h*1, 44A4_5000h*2)
S_DMAC2	0_14A4_6000h (54A4_6000h*1, 44A4_6000h*2)
S_AXI_MCPU_ACPU*3	0_14A4_7000h (54A4_7000h*1, 44A4_7000h*2)
S_AXI_RCPU_ACPU*4	0_14A4_8000h (54A4_8000h*1, 44A4_8000h*2)

Note 1. CM33 Address Space Non-Secure

Note 2. CM33 Address Space Secure

Note 3. This interface controls transactions from MCPU Bus to ACPU Bus.

Note 4. This interface controls transactions from RCPU Bus to ACPU Bus.

1.7.3.4.2 GPV_RCPU

GPV_RCPU is the GPV of RCPU Bus. GPV_RCPU is described below.

Table 1.7-6 lists the slave interface registers.

Table 1.7-6 Slave Interface Registers for GPV_RCPU

Interface Name	Base Address
S_DMAC3	0_1214_2000h (5214_2000h*1, 4214_2000h*2)
S_DMAC4	0_1214_3000h (5214_3000h*1, 4214_3000h*2)

Note 1. CM33 Address Space Non-Secure

Note 2. CM33 Address Space Secure

1.7.3.4.3 GPV_MCPU

GPV_MCPU is the GPV of MCPU Bus. GPV_MCPU is described below.

Table 1.7-7 lists the slave interface registers.

Table 1.7-7 Slave Interface Registers for GPV_MCPU

Interface Name	Base Address
S_CST (AXI-AP)	0_1124_2000h (5124_2000h*1, 4124_2000h*2)
S_CST (ETR)	0_1124_3000h (5124_3000h*1, 4123_2000h*2)
S_CM33 (C-AHB)	0_1124_4000h (5124_4000h*1, 4124_2000h*2)
S_CM33 (S-AHB)	0_1124_5000h (5124_5000h*1, 4125_2000h*2)
S_DMAC0	0_1124_6000h (5124_6000h*1, 4126_2000h*2)

Note 1. CM33 Address Space Non-Secure

Note 2. CM33 Address Space Secure

1.7.3.4.4 GPV_VIDEO0

GPV_VIDEO0 is the GPV of Video0 Bus. GPV_VIDEO0 is described below.

Table 1.7-8 lists the slave interface registers.

Table 1.7-8 Slave Interface Registers for GPV_VIDEO0

Interface Name	Base Address
S_CRU0 (Statistics)	0_1614_2000h (5614_2000h*1, 4614_2000h*2)
S_CRU0 (Video)	0_1614_3000h (5614_3000h*1, 4614_3000h*2)
S_CRU1 (Statistics)	0_1614_4000h (5614_4000h*1, 4614_4000h*2)
S_CRU1 (Video)	0_1614_5000h (5614_5000h*1, 4614_5000h*2)
S_ISP (FR Video Out)	0_1614_8000h (5614_8000h*1, 4614_8000h*2)
S_ISP (Temper)	0_1614_9000h (5614_9000h*1, 4614_9000h*2)
S_ISP (Video In)	0_1614_A000h (5614_A000h*1, 4614_A000h*2)

Note 1. CM33 Address Space Non-Secure

Note 2. CM33 Address Space Secure

1.7.3.4.5 GPV_VIDEO1

GPV_VIDEO1 is the GPV of Video1 Bus. GPV_VIDEO1 is described below.

Table 1.7-9 lists the slave interface registers.

Table 1.7-9 Slave Interface Registers for GPV_VIDEO1

Interface Name	Base Address
S_VCD	0_1654_2000h (5654_2000h*1, 4654_2000h*2)
S_DSI	0_1654_3000h (5654_3000h*1, 4654_3000h*2)
S_ISU	0_1654_4000h (5654_4000h*1, 4654_4000h*2)
S_LCDC	0_1654_5000h (5654_5000h*1, 4654_5000h*2)

Note 1. CM33 Address Space Non-Secure

Note 2. CM33 Address Space Secure

1.7.3.4.6 GPV_COM

GPV_COM is the GPV of COM Bus. GPV_COM is described below.

Table 1.7-10 lists the slave interface registers.

Table 1.7-10 Slave Interface Registers for GPV_COM

Interface Name	Base Address
S_GBETH0	0_15E4_2000h (55E4_2000h*1, 45E4_2000h*2)
S_GBETH1	0_15E4_3000h (55E4_3000h*1, 45E4_3000h*2)
S_USB30 (Host)	0_15E4_5000h (55E4_5000h*1, 45E4_5000h*2)
S_PCIE0	0_15E4_6000h (55E4_6000h*1, 45E4_6000h*2)
S_SD0	0_15E4_8000h (55E4_8000h*1, 45E4_8000h*2)
S_SD1	0_15E4_9000h (55E4_9000h*1, 45E4_9000h*2)
S_SD2	0_15E4_A000h (55E4_A000h*1, 45E4_A000h*2)
S_USB20	0_15E4_B000h (55E4_B000h*1, 45E4_B000h*2)

Note 1. CM33 Address Space Non-Secure

Note 2. CM33 Address Space Secure

1.7.3.4.7 GPV_DRP

GPV_DRP is the GPV of DRP Bus. GPV_DRP is described below.

Table 1.7-11 lists the slave interface registers.

Table 1.7-11 Slave Interface Registers for GPV_DRP

Interface Name	Base Address
S_DRP-AI (Feature 0)	0_1904_4000h (5904_4000h*1, 4904_4000h*2)
S_DRP-AI (Feature 1)	0_1904_5000h (5904_5000h*1, 4904_5000h*2)
S_DRP-AI (Weight 0)	0_1904_6000h (5904_6000h*1, 4904_6000h*2)
S_DRP-AI (Weight 1)	0_1904_7000h (5904_7000h*1, 4904_7000h*2)

Note 1. CM33 Address Space Non-Secure

Note 2. CM33 Address Space Secure

SECTION 1 OVERVIEW

1.8 Address Map

This section describes the address space of this LSI.

1.8.1 Overall Address Space

Figure 1.8-1 shows the overall address space of this LSI and **Table 1.8-1** shows the detailed address space.

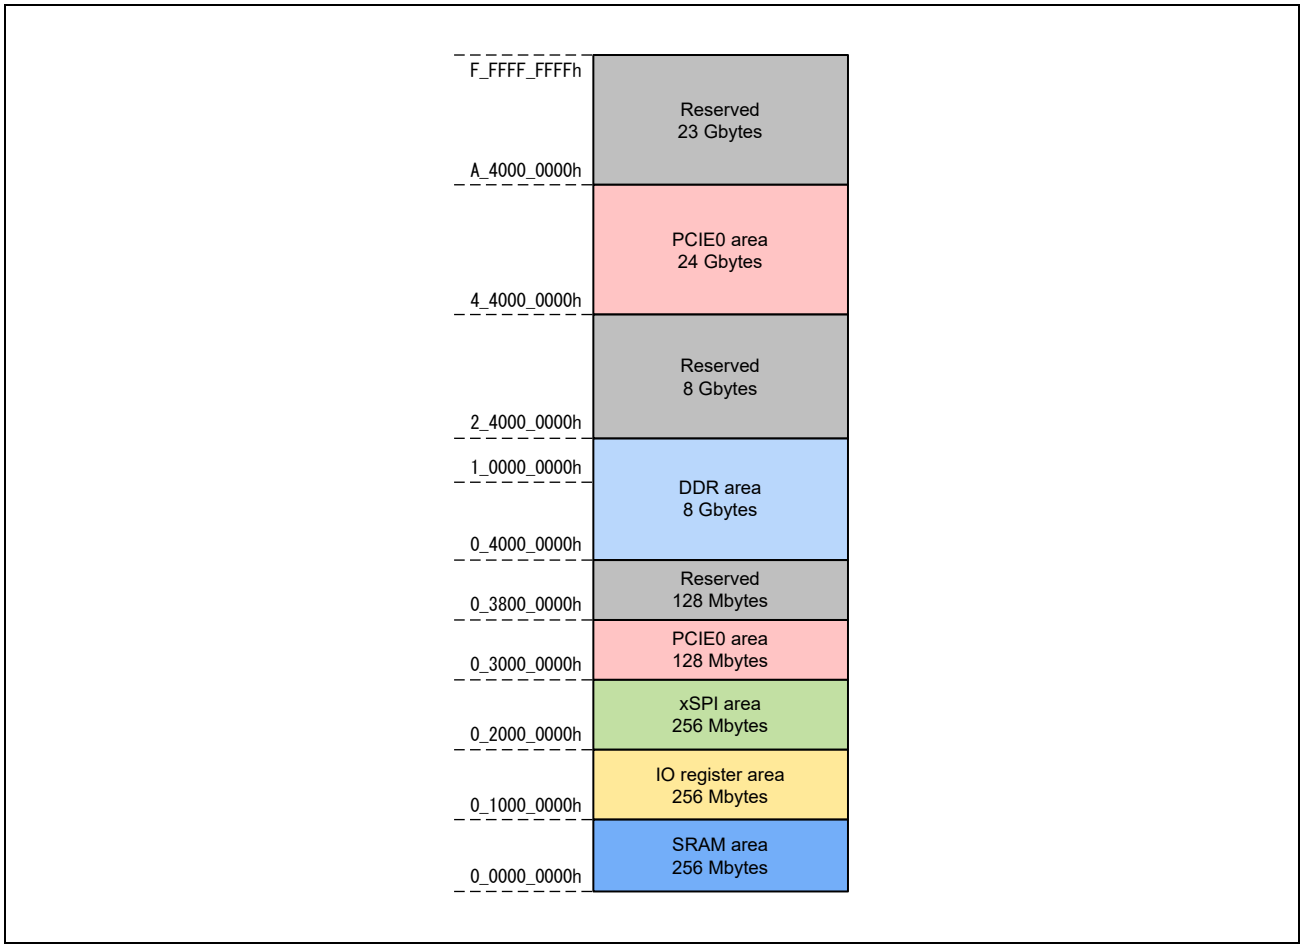

Figure 1.8-1 Overall Address Space

Some bus master units of this LSI require 35-bit or 36-bit address space access to access an address space of greater than 4 Gbytes in the whole 64-Gbyte address space of this LSI. For details, see **1.7 Internal Bus**.

The areas listed in **Table 1.8-1** are accessible by the CA55. Address space extension is needed for access to areas requiring addresses with widths of 33 or more bits.

The CM33 address space for this LSI differs from the overall address space. It is the same as the address space of the default memory map of CM33. For details, see **1.8.2 CM33 Address Space**.

Table 1.8-1 Detailed Address Space (1/6)

Start Address	End Address	Size		Space	Remarks
A_4000_0000h	F_FFFF_FFFFh	23	Gbytes	Reserved	*1
4_4000_0000h	A_3FFF_FFFFh	24	Gbytes	PCIE0 (Mem)	
2_4000_0000h	4_3FFF_FFFFh	8	Gbytes	Reserved	*1
0_4000_0000h	2_3FFF_FFFFh	8	Gbytes	DDR (Mem)	
0_3800_0000h	0_3FFF_FFFFh	128	Mbytes	Reserved	*1
0_3000_0000h	0_37FF_FFFFh	128	Mbytes	PCIE0 (Mem)

Note 1. Access to the reserved areas is prohibited. If access to the reserved area is attempted, incorrect operation may occur.

1.8.2 CM33 Address Space

Figure 1.8-2 shows the default memory map of CM33 and an overview of the CM33 address space for this LSI, and **Table 1.8-2** shows the detailed address space. For the concept of the secure and non-secure states, see **2.2 CPU**.

In this LSI, addresses 0000_0000h to 1FFF_FFFFh are used as the code (program) area and addresses 2000_0000h to 3FFF_FFFFh are used as the data area in the 1-Gbyte SRAM area (0000_0000h to 3FFF_FFFFh).

In this LSI, the hardware automatically translates the addresses in the CM33 address space to those in the overall address space of this LSI (see **1.7.3.2.2 36-Bit Address Space Access for CM33**).

Users can therefore write programs using the addresses in the address space shown in **Figure 1.8-2** and **Table 1.8-2**, without considering the overall address space.

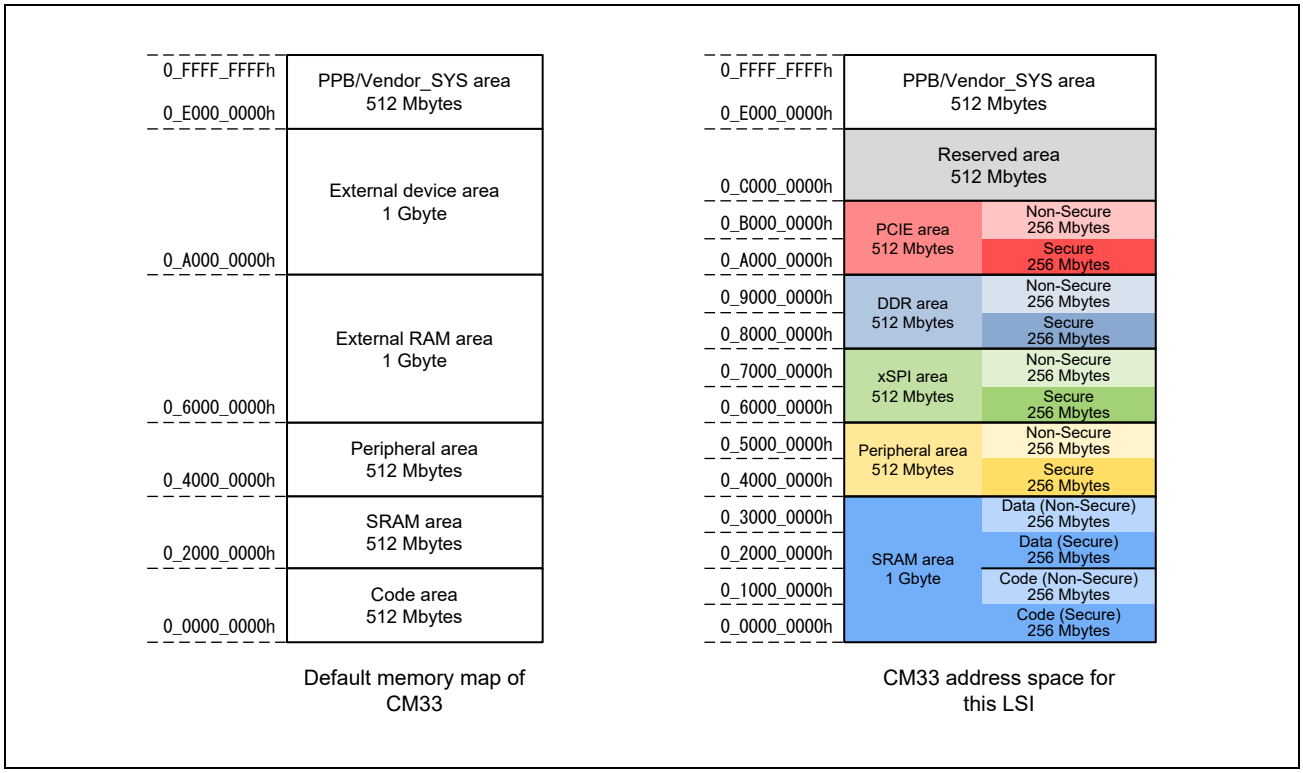

Figure 1.8-2 Overview of CM33 Address Space

Table 1.8-2 Detailed Address Space of CM33 (1/12)

Start Address	End Address	Size		Space	Remarks

Note 1. Access to the reserved areas is prohibited. If access to the reserved area is attempted, incorrect operation may occur.

Note 2. For details on the PPB/Vendor_SYS area, refer to “Arm Cortex-M33 Processor Technical Reference Manual”.

SECTION 1 OVERVIEW

1.9 Boot Operation

This section describes the boot operation of this LSI.

Boot mode is determined by the settings on external pins or at the time of release from the reset state. This LSI has three types of boot mode: CPU (CA55 or CM33) normal execution mode, boundary scan mode, and debug mode.

1.9.1 CPU (CA55 or CM33) Normal Execution Mode

The LSI has two types of execution method: CM33 cold boot and CA55 cold boot. BOOTSELCPU controls the CPU from which a cold boot is initiated. **Table 1.9-1** describes BOOTSELCPU.

During a CM33 cold boot, booting from either the serial flash memory or through SCIF downloading is selectable. During a CA55 cold boot, booting from any among an embedded SD memory (eSD), eMMC, serial flash memory, or through SCIF downloading is selectable. The MD_BOOT0 and MD_BOOT1 pins control the device from which booting is initiated. For booting from the eMMC and the serial flash memory, the interface voltage is set to 3.3 V or 1.8 V by MD_BOOT2. **Table 1.9-2** describes MD_BOOT0, MD_BOOT1, and MD_BOOT2.

Table 1.9-1 Boot CPU Selection Pin

Signal Name	Function	Description
BOOTSELCPU	Boot CPU selection	Selects whether to initiate a cold boot from the CA55 or CM33 0: CM33 cold boot 1: CA55 cold boot

Table 1.9-2 Boot Device Selection Pins

Signal Name			Mode	Selected Module	Selected Device	CA55 Boot	CM33 Boot
MD_ BOOT_2	MD_ BOOT_1	MD_ BOOT_0					
x	0	0	Boot mode 0	SD ch0	eSD (3.3 V for execution)*2	Supported*1	Not supported
0	0	1	Boot mode 1	SD ch0	eMMC (IO voltage is 3.3 V.)	Supported*1	Not supported
1	0	1	Boot mode 1	SD ch0	eMMC (IO voltage is 1.8 V.)	Supported*1	Not supported
0	1	0	Boot mode 2	xSPI ch0	Serial flash memory (IO voltage is 3.3 V.)	Supported*1	Supported*1
1	1	0	Boot mode 2	xSPI ch0	Serial flash memory (IO voltage is 1.8 V.)	Supported*1	Supported*1
x	1	1	Boot mode 3	SCIF ch0	SCIF download	Supported	Supported

Note 1. In the boot modes other than SCIF download mode, if reading or writing data from the opposite device fails, the mode shifts to SCIF download mode. If SCIF download mode processing fails, an infinite loop occurs within the built-in ROM and the boot processing ends. (In this case, SCIF ch0 outputs “SCIF Download mode due to parameter error”.)

Note 2. The standard that eSD Boot conforms to is defined in *SD Specification Part 1 eSD Addendum (Version 2.10)*.
When using this mode, eSD should be mounted on a board. This mode can be used with an SD card only for evaluation purposes. Note that the error reset function cannot be used when operating with an SD card.

1.9.1.1 Operation of Booting

1.9.1.1.1 Boot Mode 0 (eSD)

Embedded SD Boot (hereafter eSD boot) performs boot processing from the loader program stored in the eSD device connected to channel 0 of the SD/MMC host interface (hereafter SD0).

In execution in this mode, the voltage is 3.3 V and the width of the data bus is always 4 bits. The controller (SD0) for the device to be used in booting is in the module standby state at the time of execution. Execution of the ROM program proceeds after release from module standby, and involves setting the CPG, selecting of the clock that produces the external clock signal, and initializing SD0.

When the LSI starts up in this mode, the following processing is performed.

1. Setting peripheral modules (SD0, PFC).
2. Connecting the eSD device.
3. Issuing a read command to the eSD device from SD0, getting the loader program size block from sector 1, and storing it at 0_0810_1E00h of the SRAM.
4. Getting the following information from the loader program size block stored in step 3.
   (A) Loader program size
   (B) Loader program load address
   (C) Loader program destination address
5. According to the information obtained in step 4, deploying the loader program for the loader program size (A) from the eSD device to the loader program destination address (C) in the SRAM.
6. Initializing SD0.
7. The device information and boot results are stored in the SRAM.
8. If the processing up to step 7 is completed normally, the program counter is moved to the loader program destination address and the loader program obtained from the eSD is executed.

(1) Information on related pins

Table 1.9-3 lists interface signals with the external device in boot mode 0 (eSD).

Table 1.9-3 External Interface Signals in Boot Mode 0

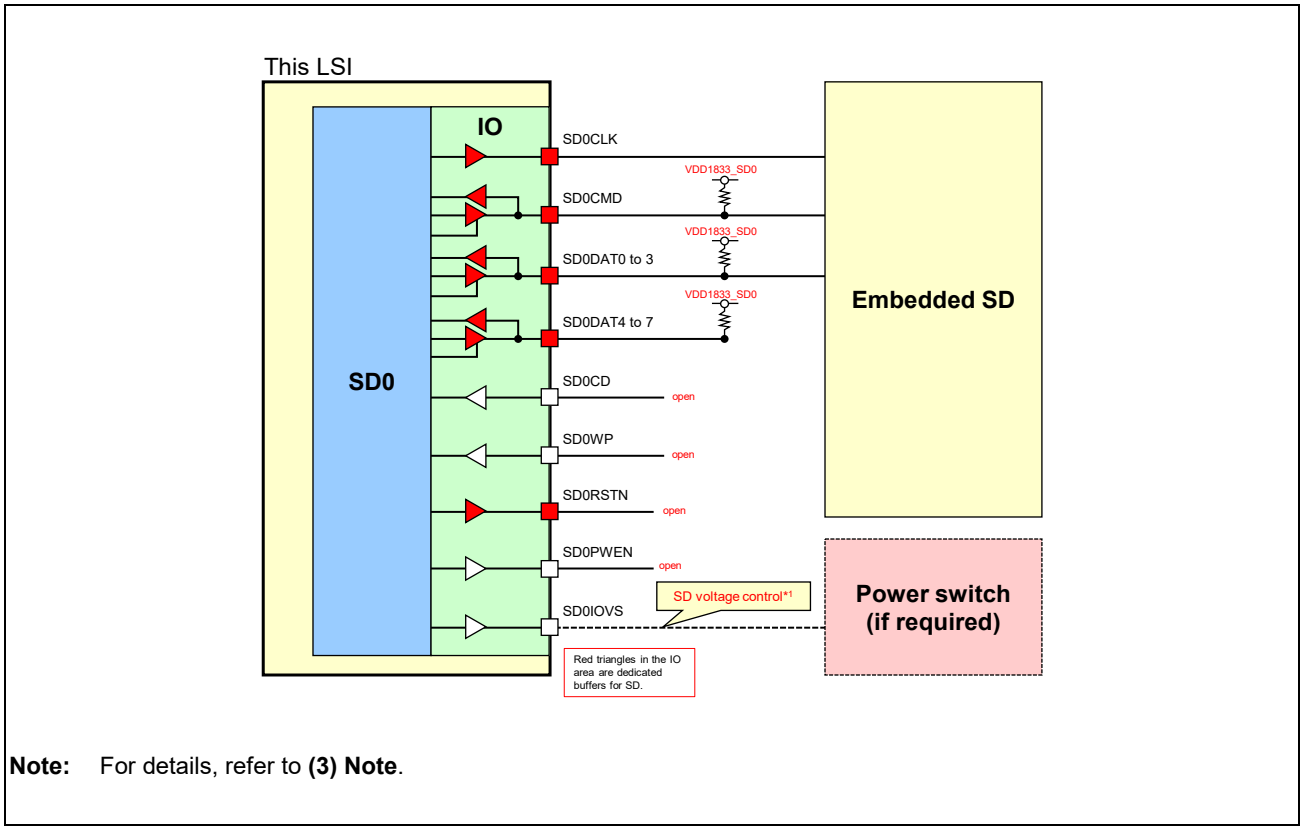
Pin Name	Input/Output	Function
SD0CLK	Output	SD clock
SD0CMD	I/O	SD command/response
SD0DAT0	I/O	SD data 0
SD0DAT1	I/O	SD data 1
SD0DAT2	I/O	SD data 2
SD0DAT3	I/O	SD data 3

Note: Sharing of the bus between the embedded SDIO and an 8-bit SD bus is not supported.

(2) External connection

Figure 1.9-1 is a schematic diagram of the connections of the IO pins of SD0 and the external device.
The boot program does not monitor the states of SD0CD and SD0WP.

SD0PWEN and SD0IOVS are not controlled by the boot program. Control the SD power supply enable with a signal different from SD0PWEN. Also, control the SD0IOVS pin as necessary in the program after boot operation.



Note: For details, refer to **(3) Note**.

Figure 1.9-1 Schematic Diagram of Connections for Boot Mode 0

(3) Note

Boot operation using SD card is available for evaluation purposes only.

To speed up the access after booting, handshaking with the other devices, changing to 1.8 V if required, and access between the LSI and the SD card is made by the user program. At this time, changing of voltage is handled by transfer among this device, the other device, and the power management IC or power switch. However, changing of speed is executed by the user program stored in the SD card because it is dependent on the user system.

Figure 1.9-2 is a schematic diagram of the connections when the voltage is to be changed after booting.

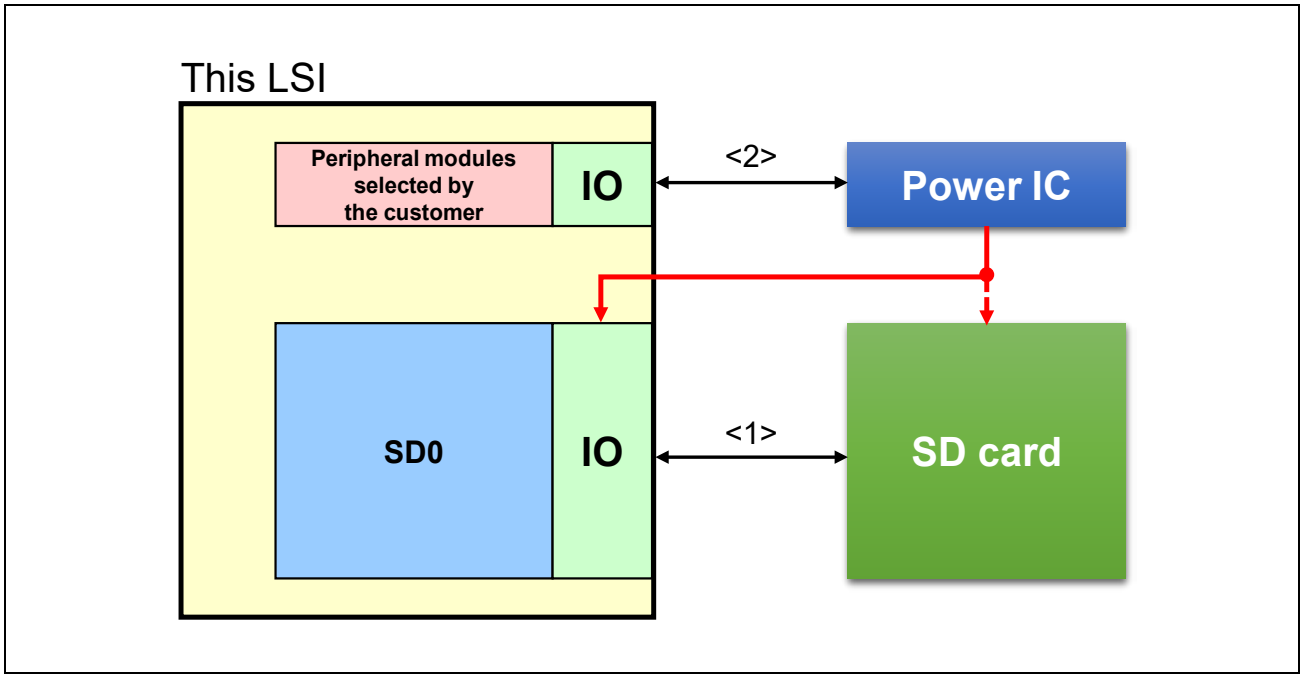


Figure 1.9-2 Schematic Diagram of SD Voltage Control in Boot Mode 0

1.9.1.1.2 Boot Mode 1 (eMMC)

eMMC Boot performs boot processing from the loader program stored in the eMMC device connected to channel 0 of the SD/MMC host interface (hereafter SD0).

When eMMC is selected as the boot device, the width of the data bus is limited to 8 bits. The controller (SD0) for the device to be used in booting is in the module standby state at the time of execution. Execution of the ROM program proceeds after release from module standby, and involves setting the CPG, selecting of the clock that produces the external clock signal, and initializing SD0.

When the LSI starts up in this mode, the following processing is performed.

1. Setting peripheral modules (SD0, PFC, GTM0).
2. Setting the IO buffer (drive strength etc.) at 1.8 V or 3.3 V.
3. Starting the alternative boot operation mode of the eMMC device.
   Read access begins from sector 0 of the partition selected by the [179] field (PARTITION_CONFIG) of the extended CSD (EXT_CSD) register in the eMMC device. For details, refer to **(3) Alternative Boot Operation**.
4. Dummy reading from sector 0, getting the loader program size block from sector 1, and storing it at 0_0810_1E00h of the SRAM.
5. Getting the following information from the loader program size block stored in step 4.
   (A) Loader program size
   (B) Loader program load address
   (C) Loader program destination address
6. According to the information obtained in step 5, deploying the loader program for the sector 2 loader program size (A) from the eMMC device to the loader program destination address (C) in the SRAM.
7. Initializing SD0.
8. The device information and boot results are stored in the SRAM.
9. If the processing up to step 8 is completed normally, the program counter is moved to the loader program destination address and the loader program obtained from the eMMC is executed.

(1) Information on related pins

Table 1.9-4 lists interface signals with the external devices in boot mode 1 (eMMC).

Table 1.9-4 External Interface Signals in Boot Mode 1

Pin Name	Input/Output	Function
SD0CLK	Output	eMMC clock
SD0CMD	I/O	eMMC command/response
SD0DAT0	I/O	eMMC data 0
SD0DAT1	I/O	eMMC data 1
SD0DAT2	I/O	eMMC data 2
SD0DAT3	I/O	eMMC data 3
SD0DAT4	I/O	eMMC data 4
SD0DAT5	I/O	eMMC data 5
SD0DAT6	I/O	eMMC data 6
SD0DAT7	I/O	eMMC data 7
SD0RSTN	Output	eMMC reset

Note: Booting from an MMC card is not supported.

Note: The only supported data width is 8 bits; that is, booting through a 1-bit or 4-bit interface is not supported.

(2) External connection

Figure 1.9-3 is a schematic diagram of the connection with eMMC.
The states of SD0CD and SD0WP are not used by the boot program.

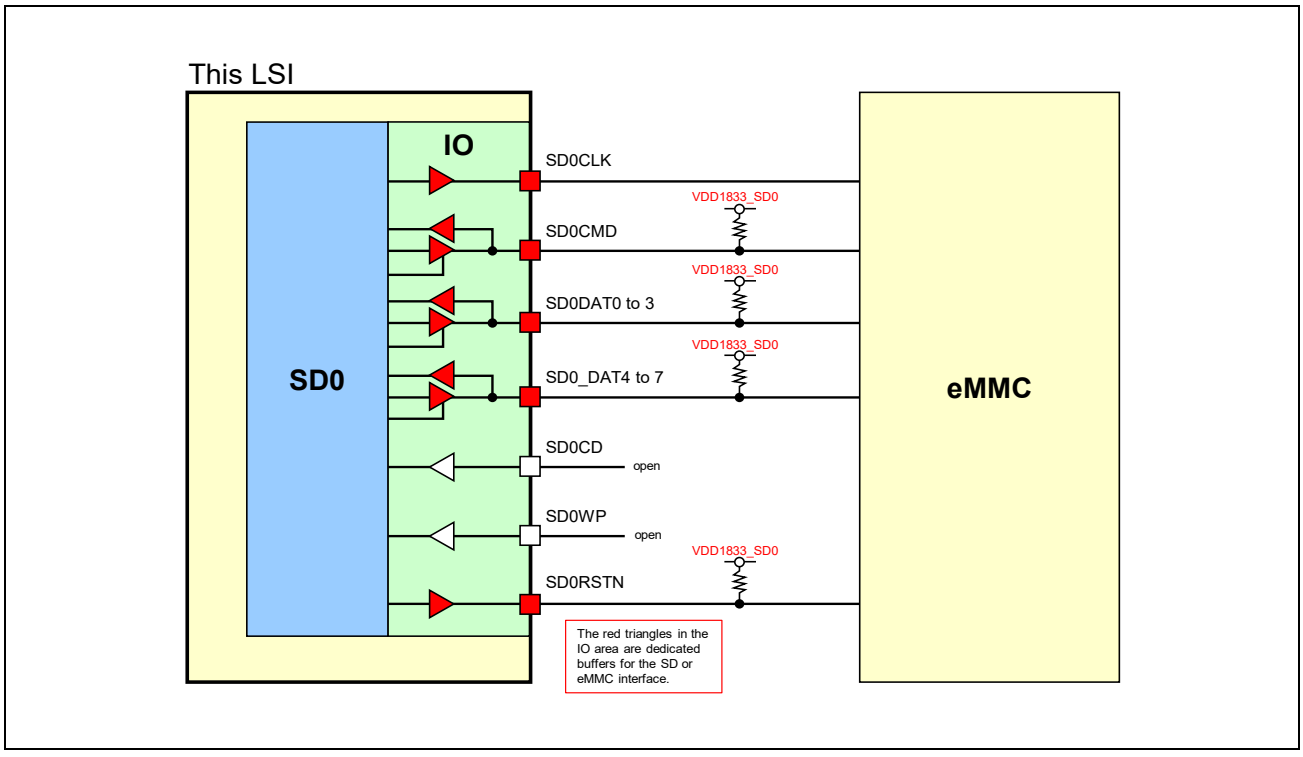

Figure 1.9-3 Schematic Diagram of Connections for Boot Mode 1

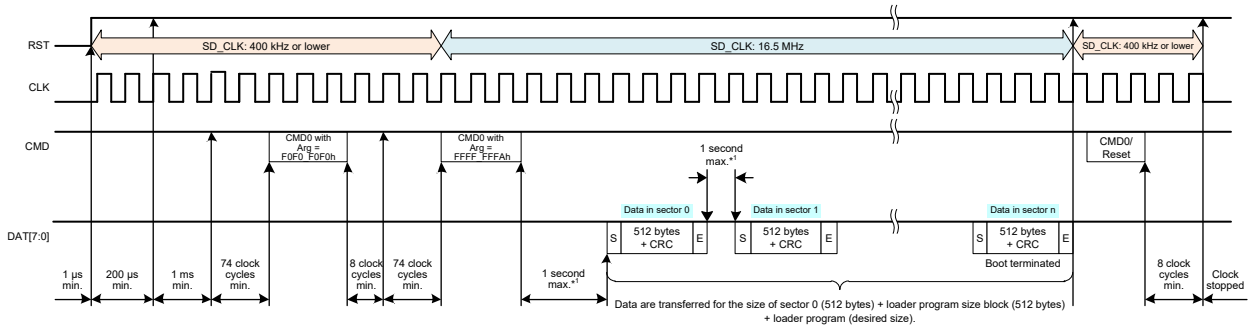
(3) Alternative Boot Operation

Figure 1.9-4 shows the alternative boot operation to read the loader program. This boot program sets up the registers in SD0 so that the SD0 operates with an 8-bit bus width when booting from the eMMC device. On the eMMC device side, the data bus width in the alternative boot operation is determined by the setting of the BOOT_BUS_WIDTH[177] field in the extended CSD register. To boot up from the eMMC device correctly, set up the extended CSD register in the eMMC device as shown in **Table 1.9-6** when writing a program to the eMMC device.



- This CPU accesses the eMMC device with a data bus width of 8 bits in the alternative boot operation. The data bus width of the eMMC device can be specified in the BOOT_BUS_WIDTH[177] field of the extended CSD register. When writing a loader program to the eMMC device, specify the 8-bit bus width in this field.
- The eMMC device sequentially outputs data from sector 0 of the partition selected in the PARTITION_CONFIG[179] field of the extended CSD register in the alternative boot operation.
- This CPU does not detect Boot Ack.
  The output of Boot Ack from the eMMC device can be specified in the PARTITION_CONFIG[179] field. Be sure to stop the output of Boot Ack by using this field.

Note 1. For a maximum of one second, the BRE, ERR3, and ERR1 bits of the SD_INFO2 register are polled to check whether data have been received, a timeout has occurred, and a CRC error has occurred, respectively.
<Normal operation>
SD_INFO2.BRE = 1
Data are transferred from SD_BUF to the SRAM.
<Error>
CRC error: SD_INFO2.ERR1 = 1
The loader program is read from a reserved area.
Timeout error: SD_INFO2.ERR3 = 1
Execution of the boot program for eMMC is terminated.

Figure 1.9-4 Alternative Boot Operation to Read the Loader Program

Table 1.9-5 Setting of the Data Bus Width in Alternative Boot Operation

Field in Extended CSD Register of eMMC Device	Setting
BOOT_BUS_WIDTH [177]	Bits 1 and 0: BOOT_BUS_WIDTH = 10b (The bus width is set to 8 bits in alternative boot operation.)

■ Partitions

An eMMC device has multiple partitions (**Figure 1.9-5**). The partition used for booting can be specified in the PARTITION_CONFIG[179] field of the extended CSD (EXT_CSD) register. To boot up correctly, specify the boot partition in the extended CSD (EXT_CSD) register of the eMMC device as shown in **Table 1.9-7** when writing a program to the eMMC device.

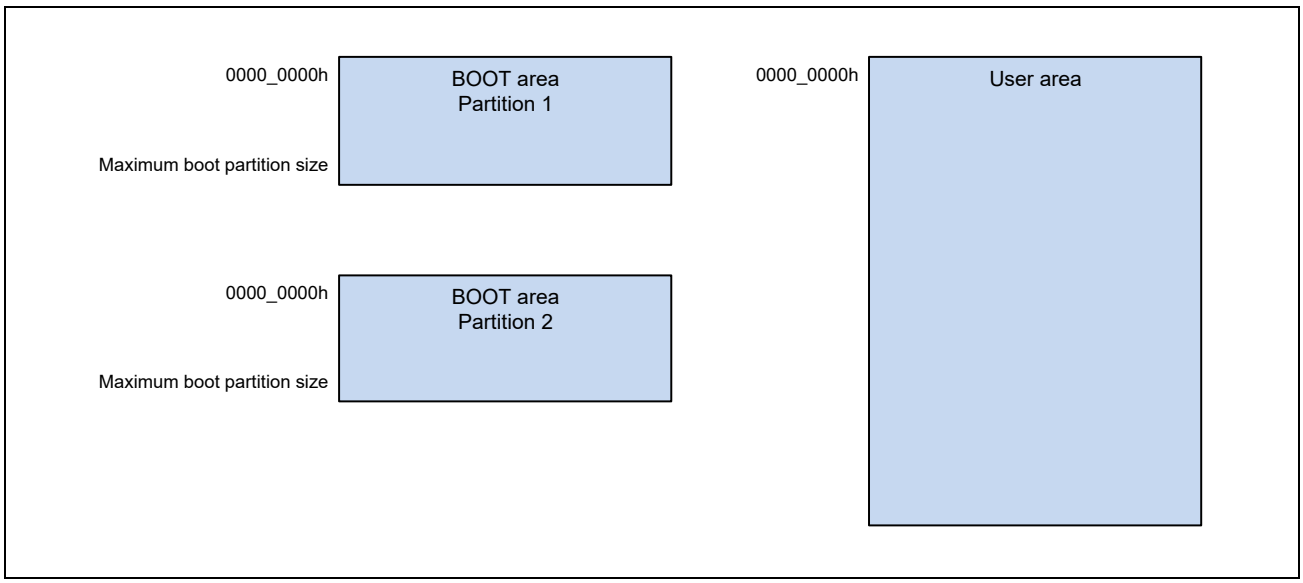


Figure 1.9-5 Partitions in the eMMC Device

Table 1.9-6 Boot Partition Setting in the Alternative Boot Operation

Field in Extended CSD Register of eMMC Device	Setting
PARTITION_CONFIG [179]	• Set bit 6 (BOOT_ACK) to 0b (the eMMC device does not output a boot acknowledge in the alternative boot operation). • Specify the boot partition in bits 5 to 3 (BOOT_PARTITION_ENABLE). 000b: Booting is disabled. 001b: Booting from sector 0 in boot partition 1 in the boot operation. 010b: Booting from sector 0 in boot partition 2 in the boot operation. 011b to 110b: Reserved 111b: Booting from sector 0 in the user area in the boot operation.

1.9.1.1.3 Boot Mode 2 (Serial Flash Memory)

xSPI Boot performs boot processing from the loader program stored in the serial flash memory connected to channel 0 of the xSPI interface.

This mode is for execution from a user program stored in an externally connected single, quad, or octa flash device. Starting up is accompanied by handshaking through the SPI protocol with the single, quad, or octa flash device, so the ROM boot program controls the pins labeled ■ in the figures of **(2) External connection**, and subsequent access is controlled by the stored user program.

When the LSI starts up in this mode, the following processing is performed.

1. Release from xSPI module standby.
2. Setting peripheral modules (xSPI0, PFC, GTM0).
3. Setting the IO buffer (drive strength etc.) at 1.8 V or 3.3 V.
4. Getting the loader program size block stored at the start address (0_2000_0000h) of the external address space from xSPI, and storing it at 0_0810_1E00h of the SRAM.
5. Getting the following information from the loader program size block stored in step 4.
   (A) Loader program size
   (B) Loader program load address
   (C) Loader program destination address
6. According to the information in step 5, deploying the loader program for the loader program size (A) to the loader program destination address (C) in the SRAM.
7. The device information and boot results are stored in the SRAM.
8. If the processing up to step 7 is completed normally, the program counter is moved to the loader program destination address and the loader program obtained from the serial flash memory is executed.

(1) Information on related pins

Table 1.9-7 lists interface signals with the external devices in boot mode 2 (serial flash memory).

Table 1.9-7 External Interface Signals in Boot Mode 2

Pin Name	Input/Output	Function
XSPI0_CKP	Output	xSPI clock (positive)
XSPI0_CKN	Output	xSPI clock (negative)
XSPI0_CS0N	Output	xSPI chip selection
XSPI0_DS	I/O	xSPI read data strobe/write data mask
XSPI0_IO0	I/O	xSPI data 0
XSPI0_IO1	I/O	xSPI data 1
XSPI0_IO2	I/O	xSPI data 2
XSPI0_IO3	I/O	xSPI data 3
XSPI0_IO4	I/O	xSPI data 4
XSPI0_IO5	I/O	xSPI data 5
XSPI0_IO6	I/O	xSPI data 6
XSPI0_IO7	I/O	xSPI data 7
XSPI0_RESET0N	Output	xSPI master reset
XSPI0_RSTO0N	Input	xSPI slave reset
XSPI0_INT0N	Input	xSPI interrupt
XSPI0_ECS0N	Input	xSPI error correction

(2) External connection

Figure 1.9-6 is a schematic diagram of the connection with a single SPI memory, **Figure 1.9-7** with a quad SPI memory, and **Figure 1.9-8** with a flash memory (octal).

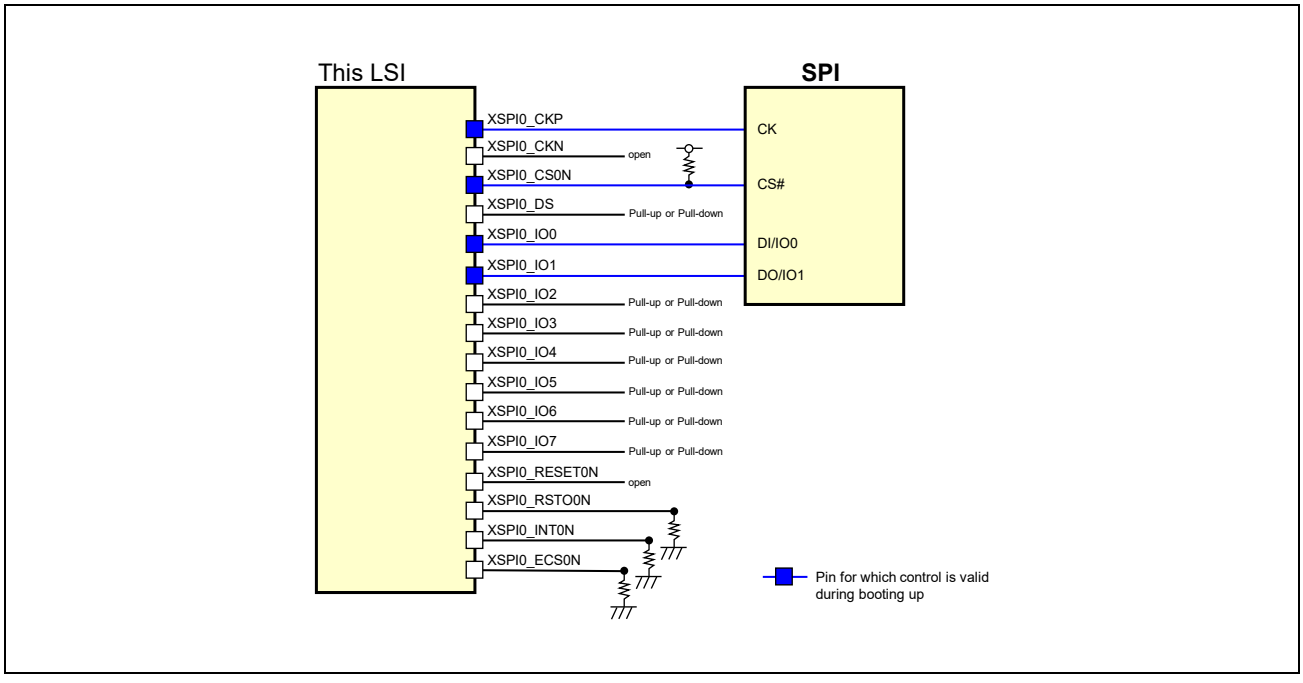

Figure 1.9-6 Schematic Diagram of Connection with a Single SPI Device in Boot Mode 2

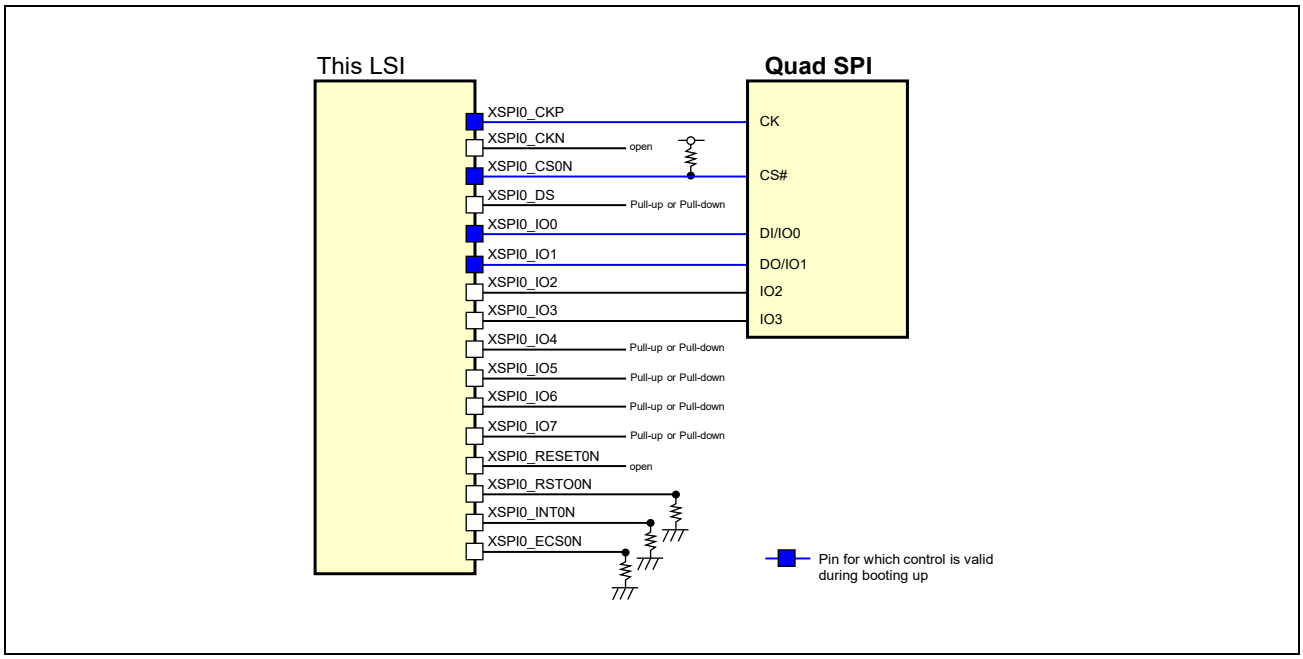

Figure 1.9-7 Schematic Diagram of Connection with a Quad SPI Device in Boot Mode 2

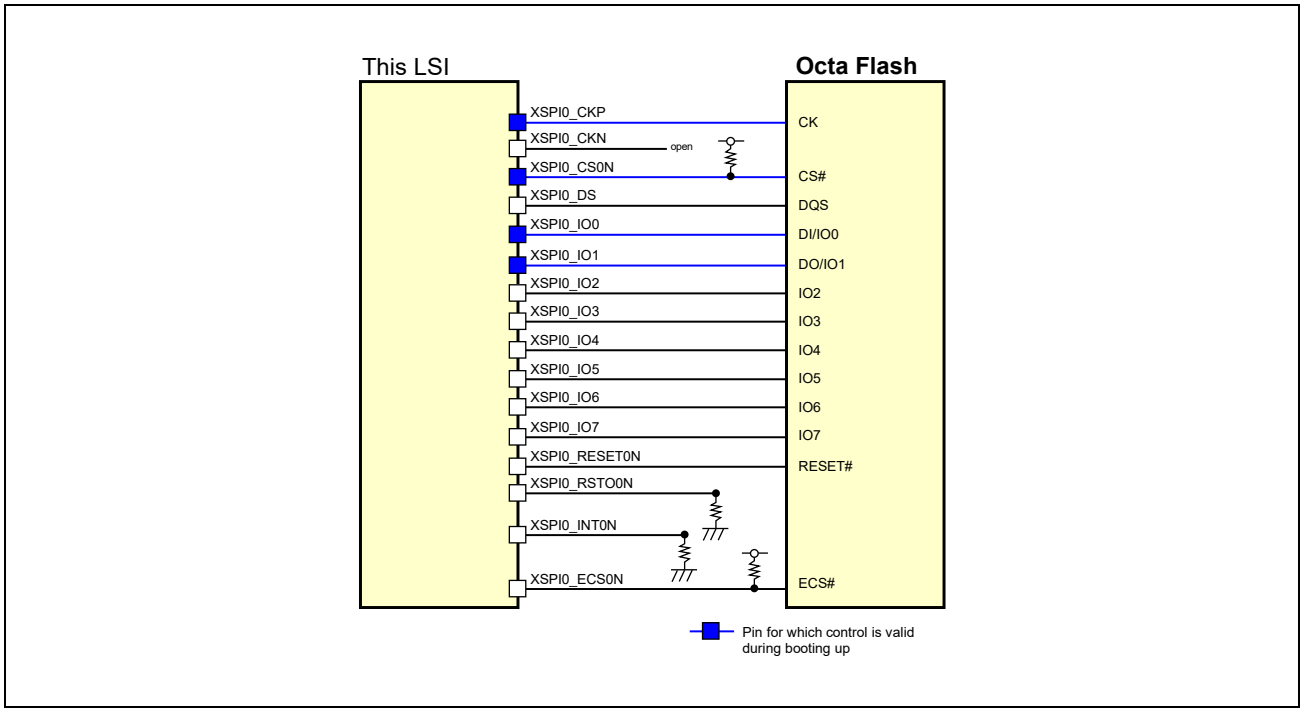

Figure 1.9-8 Schematic Diagram of Connection with an Octa Flash Device in Boot Mode 2

1.9.1.1.4 Boot Mode 3 (SCIF Download)

This mode connects the RS232C port of this LSI to an external PC and downloads data stored in the PC.

If an external PC does not have RS-232C ports, the connection is made via a serial-to-USB conversion chip mounted on a board or in the cable.

When the LSI starts up in this mode, the following processing is performed.

1. Setting up the necessary peripheral modules (SCIF channel 0 and PFC) and specifying the parameters for communications.

   When the LSI becomes ready for data reception, the boot program outputs the following message to the SCIF.
   "SCIF Download mode"

2. Upon receiving the Motorola S0 record sent from the external host PC through the SCIF, the boot program converts the S3 record to binary data and copies the data to the addresses 0_0001_2000h to 0_0002_EFFEh (up to 116 Kbytes) of the SRAM.

   The boot program outputs the following message to the SCIF.
   "-- Load Program to System RAM ----------"

3. Upon receiving the S7 record, the boot program outputs the following message to the SCIF and terminates copying to the SRAM.
   "-- Start Boot Program on System RAM ---------"

   After that, execution branches to the address 0_0001_2000h of the SRAM.

(1) Supported file format

Prepare the files used in this mode so that it meets the following specifications.

- SRECORD format
- The S0 record must always be generated
  (because the boot program requires an S0 record as a trigger for the reception processing)
- S0, S3, and S7 only
- The role of each format:
  S0, S7: Only use the byte count and checksum fields
  S3: Transfer boot parameters and boot loader in the record

(2) When the file format is out of specifications

If the data in the Motorola S records sent from the external host PC satisfies any of the following error conditions, the corresponding error message is output to the SCIF and copying to the SRAM is aborted.

— An S1 or S2 record is received: "Invalid Record Type Error!!! "

— An address outside the SRAM area is specified: "Address Error!!! "

— An illegal character code is found: "Invalid Character Error!!! "

— An illegal byte count is found: "Invalid Byte Count Error!!! "

The data transmission and reception operation in SCIF communications (asynchronous) is shown in **Figure 1.9-9**.

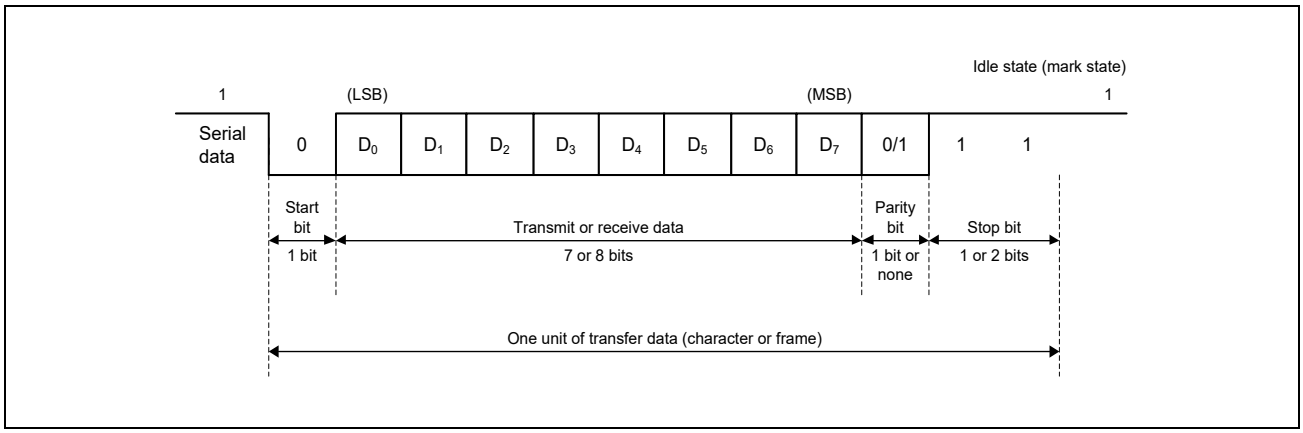

Figure 1.9-9 Data Transmission and Reception Operation in SCIF Communications

(1) Information on related pins

Table 1.9-8 lists interface signals with the external devices in boot mode 3 (SCIF download).

Table 1.9-8 External Interface Signals in Boot Mode 3

Pin Name	Input/Output	Function
SCIF_RXD	Input	SCIF received data
SCIF_TXD	Output	SCIF transmitted data

(2) External connection

Figure 1.9-10 is a schematic diagram of the connections for downloading through the SCIF.

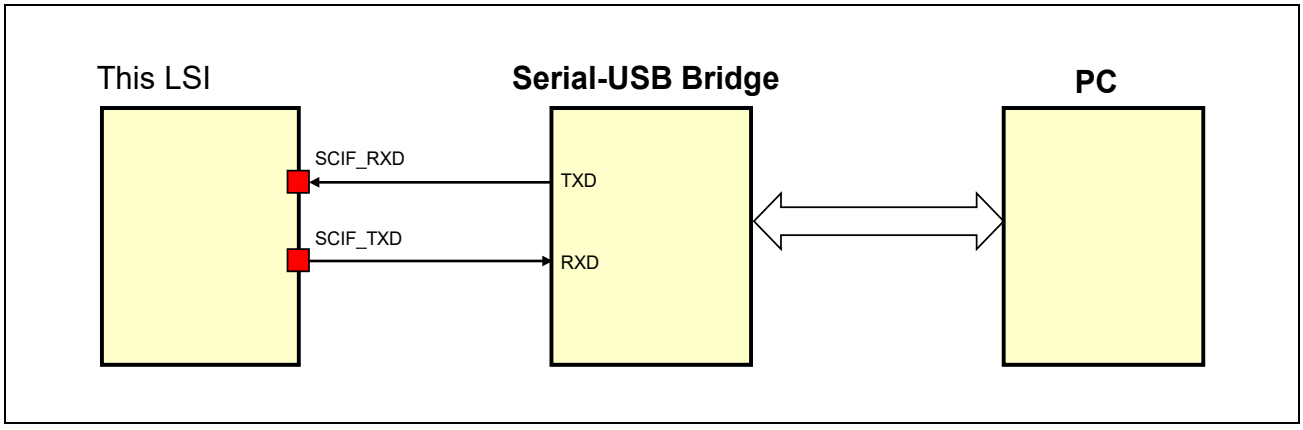

Figure 1.9-10 Schematic Diagram of Connections for Boot Mode 3

1.9.1.2 Allocation of the Loader Program

1.9.1.2.1 Boot Mode 0 (eSD)

(1) Allocation in eSD V2.0 (Single Partition)

Figure 1.9-11 shows the allocation of the loader program size blocks and loader programs in the eSD device conforming to the eSD V2.0 standard. To prevent read-disturb errors, up to seven loader program size blocks and loader programs can be multiplexed and written to the eSD device.

The loader program size blocks are allocated to sectors 1 to 7. In a loader program size block, the loader program size is stored in the first four bytes and the signature AA55h is stored in the last two bytes. **Figure 1.9-12** shows the structure of the loader program size data. Be sure to store the loader program size in 4-byte little endian.

The following describes the operation of transferring the loader program.

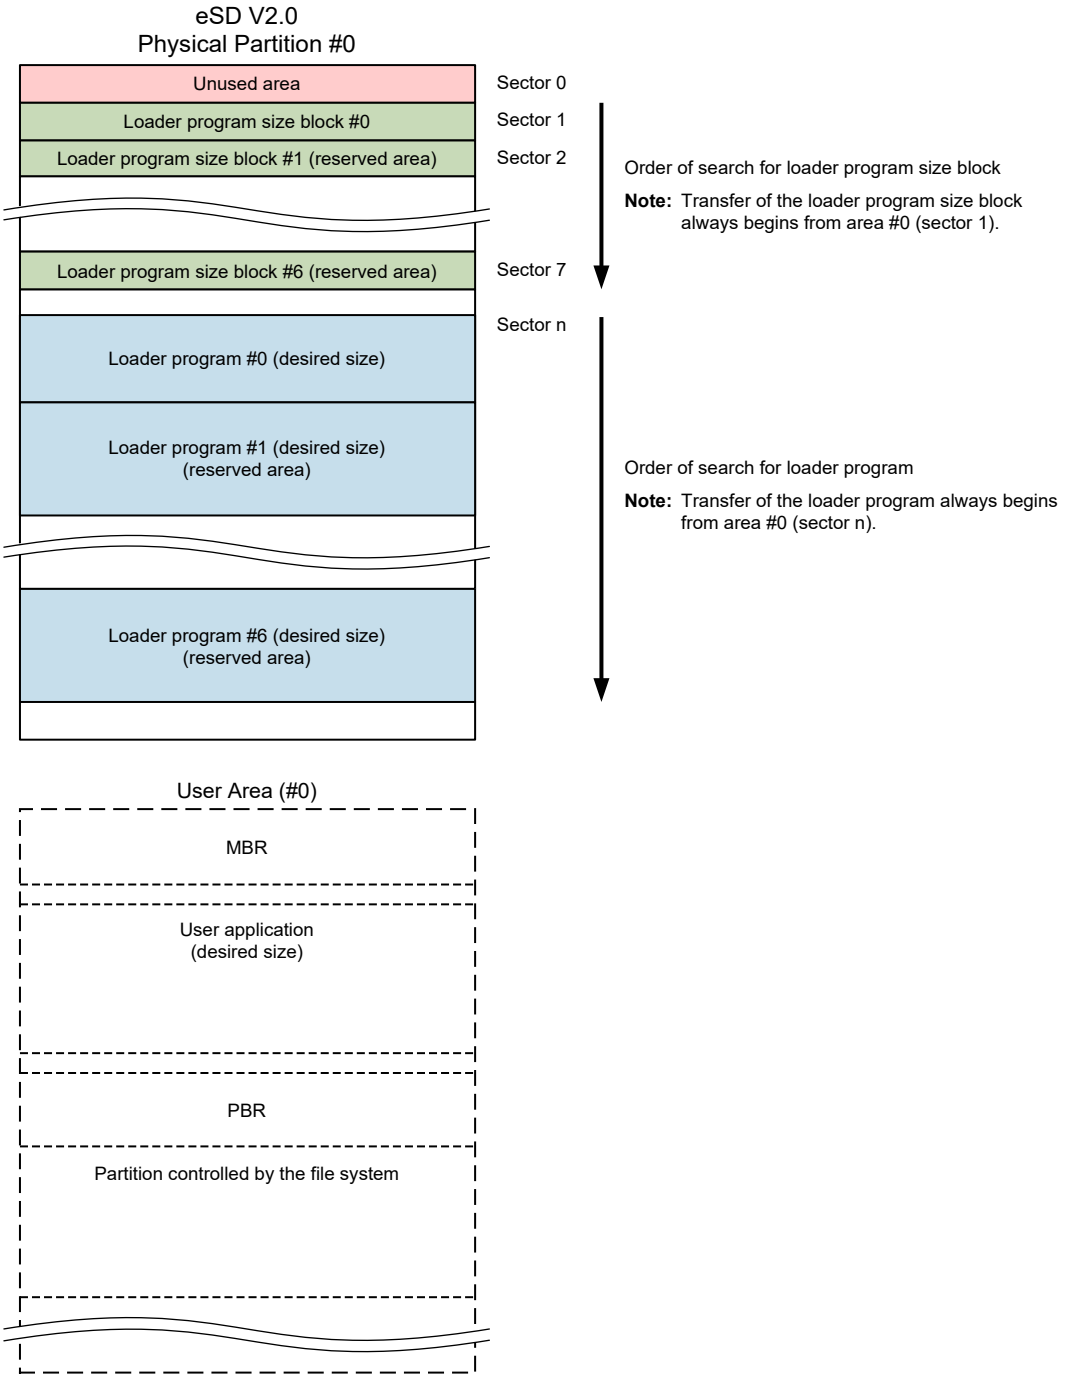
(1) The loader program size block is transferred from sector 1 in physical partition #0 of the eSD device to the SRAM.
If a communication error occurs during data transfer, read access is retried up to three times per area. If the retry processing is repeated three times during the transfer of the loader program size block in a single area, another loader program size block is transferred from the next multiplexed area.

(2) The signature in the transferred loader program size block is checked. When the signature matches the expected value (AA55h), the size of the loader program data is obtained from the loader program size block and the processing for transferring the loader program is executed.
If the signature does not match the expected value, another loader program size block is transferred from the next multiplexed area.

(3) The transfer of the loader program begins from the loader program load address in physical partition #0 of the eSD device. The loader program is transferred to the SRAM for the obtained loader program size.
If a communication error occurs during data transfer, read access is retried up to three times per area. If the retry processing is repeated three times during the loader program transfer in a single area, another loader program is transferred from the next multiplexed area.

NOTE

Even when the loader size block is transferred from a multiplexed (reserved) area, the transfer of the loader program always begins from the area for loader program #0.



Note 1. Write the same data to loader program size block areas #0 to #6.

Note 2. Write the same data to loader program areas #0 to #6.

Note 3. The start sector location of the loader program is calculated as follows.
Loader program load address + obtained size (number of sectors) × n

Figure 1.9-11 Allocation of Loader Programs in the eSD Device Conforming to the eSD V2.0 Standard

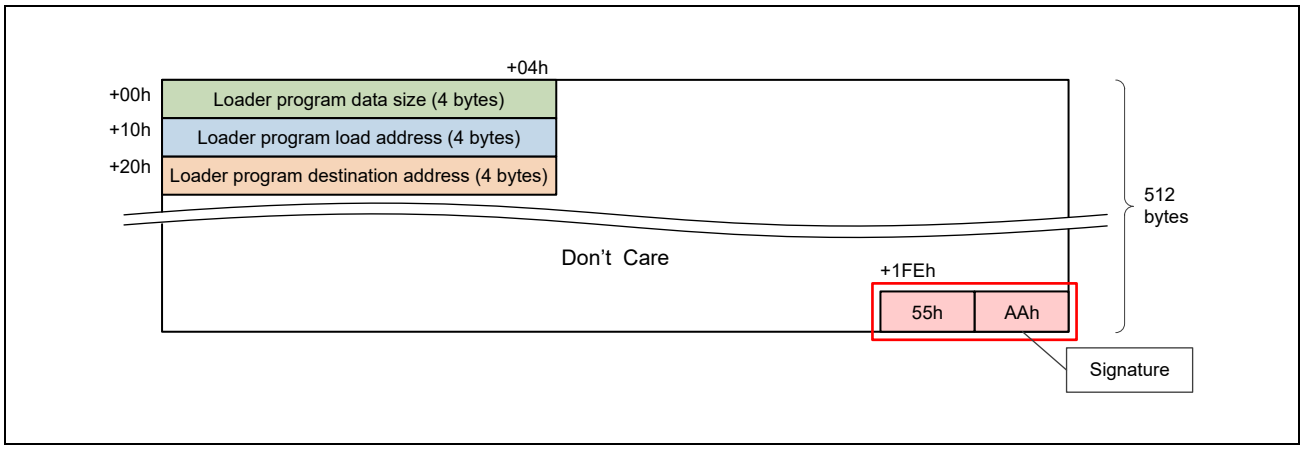


Figure 1.9-12 Structure of the Loader Program Size Block

NOTE

Store the loader program data size in 4-byte little endian.

(2) Allocation in eSD V2.1 (Multi Partitions)

Figure 1.9-13 shows the allocation of the loader program size blocks and loader programs in the eSD device conforming to the eSD V2.1 standard. To prevent read-disturb errors, up to seven loader program size blocks and loader programs can be multiplexed and written to the eSD device

The specifications and allocation of loader program size blocks are the same as those in eSD V2.0. For the structure of the loader program size block, see **Figure 1.9-12**.

The following describes the operation of transferring the loader program.

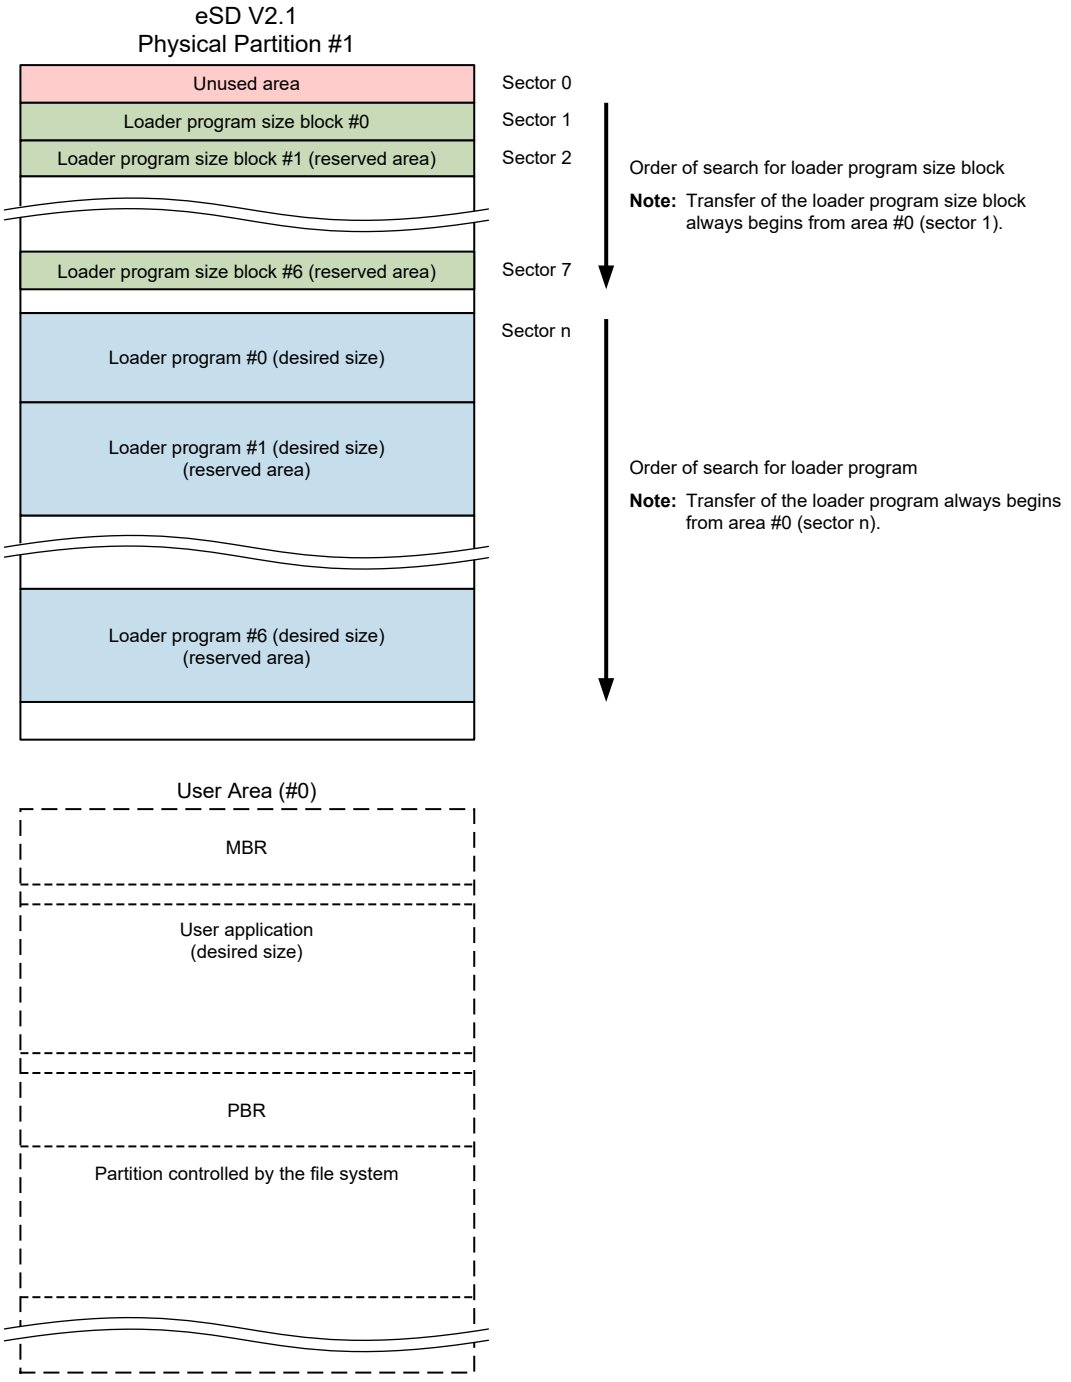
(1) The loader program size block is transferred from sector 1 in physical partition #1 of the eSD device to the SRAM.
If a communication error occurs during data transfer, read access is retried up to three times per area. If the retry processing is repeated three times during the transfer of the loader program size block in a single area, another loader program size block is transferred from the next multiplexed area.

(2) The signature in the transferred loader program size block is checked. When the signature matches the expected value (AA55h), the size of the loader program data is obtained from the loader program size block and the processing for transferring the loader program is executed. If the signature does not match the expected value, another loader program size block is transferred from the next multiplexed area.

(3) The transfer of the loader program begins from the loader program load address in physical partition #1 of the eSD device. The loader program is transferred to the SRAM for the obtained loader program size.
If a communication error occurs during data transfer, read access is retried up to three times per area. If the retry processing is repeated three times during the loader program transfer in a single area, another loader program is transferred from the next multiplexed area.

NOTE

Even when the loader size block is transferred from a multiplexed (reserved) area, the transfer of the loader program always begins from the area for loader program #0.



Note 1. Write the same data to loader program size block areas #0 to #6.

Note 2. Write the same data to loader program areas #0 to #6.

Note 3. The start sector location of the loader program is calculated as follows.
Loader program load address + obtained size (number of sectors) × n

Figure 1.9-13 Allocation of Loader Programs in the eSD Device Conforming to the eSD V2.1 Standard

(3) How to Distinguish between eSD V2.0 (Single Partition) and V2.1 (Multi Partitions)

This boot program first assumes that an eSD device supporting multi partitions is connected and begins loader program transfer from physical partition #1. If an error regarding a command for multi partitions shown in the following table occurs, the boot program assumes that an eSD device with a single partition is connected and transfers the loader program from physical partition #0.

Table 1.9-9 Errors Regarding Commands for Multi Partitions

No.	Issued Command	Command Function	Error	Remarks
1	CMD43 (SELECT_PARTITION)	Selects physical partition #1.	Multi partitions are not supported.	
2	CMD45 (QUERY_PARTITION)	Obtains the physical partition ID.	The specified partition does not exist.	

1.9.1.2.2 Boot Mode 1 (eMMC)

Figure 1.9-14 shows the allocation of the loader program in the eMMC device conforming to the MMCA 4.4 standard.

In the loader program size block, the loader program size is stored in the first four bytes and the signature AA55h is stored in the last two bytes. **Figure 1.9-15** shows the structure of the loader program size data. Be sure to store the loader program size in 4-byte little endian.

The transfer of the loader program begins from the first address (sector 0) of the boot partition. A dummy read from sector 0 is done, and then the size of the loader program data is obtained from the data read from sector 1.

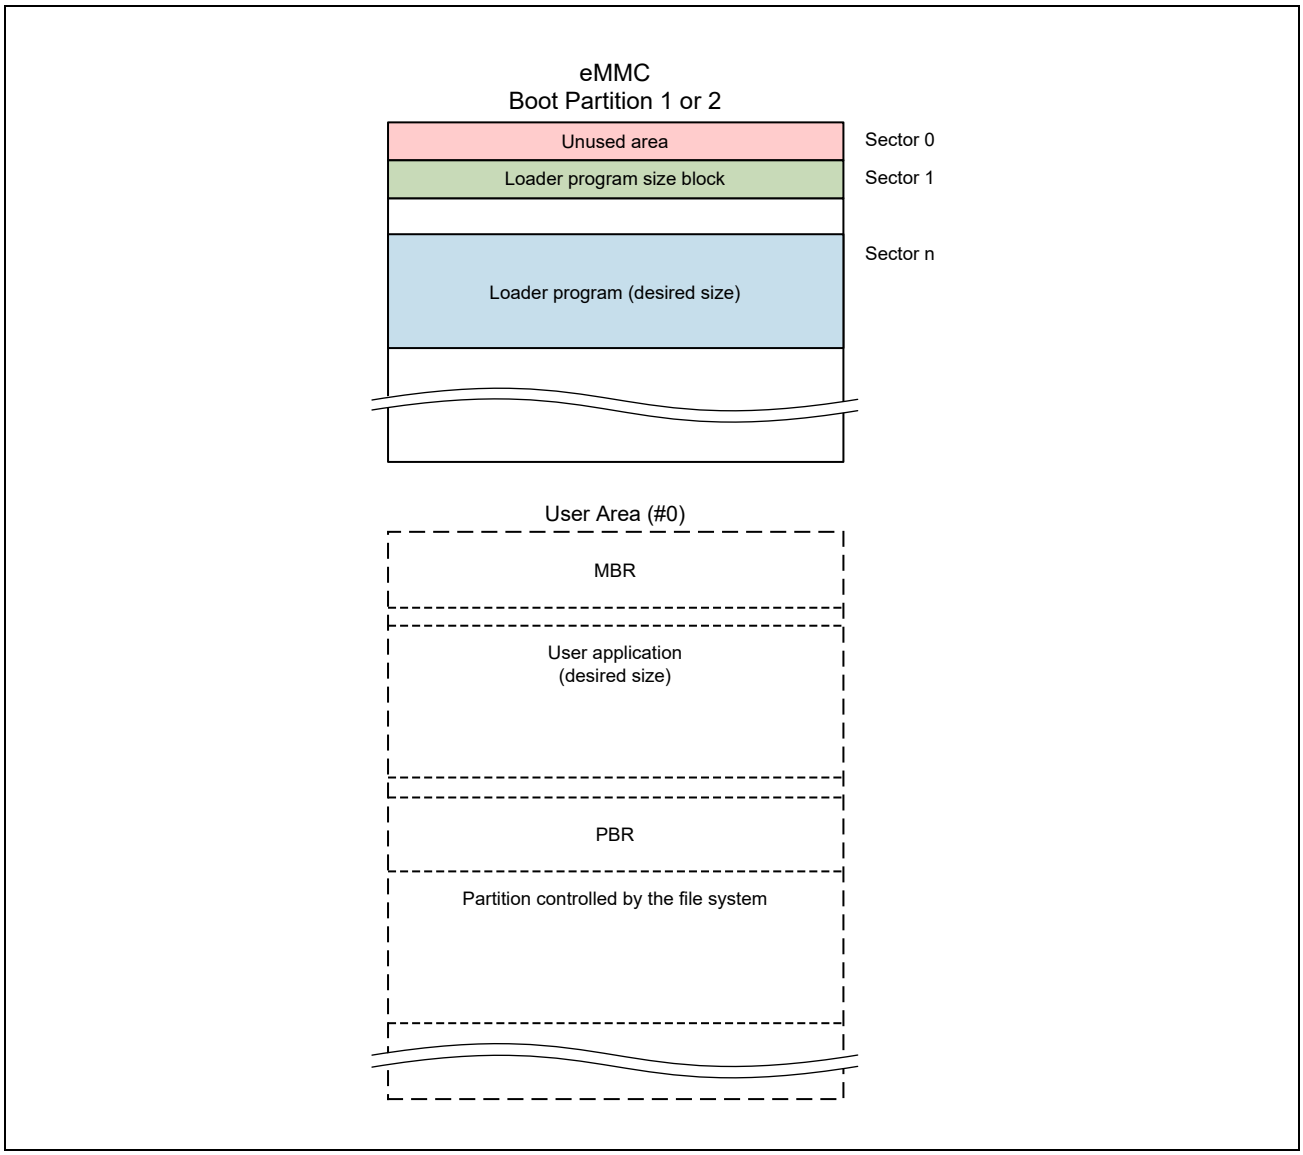


Figure 1.9-14 Allocation of Loader Program in the eMMC Device

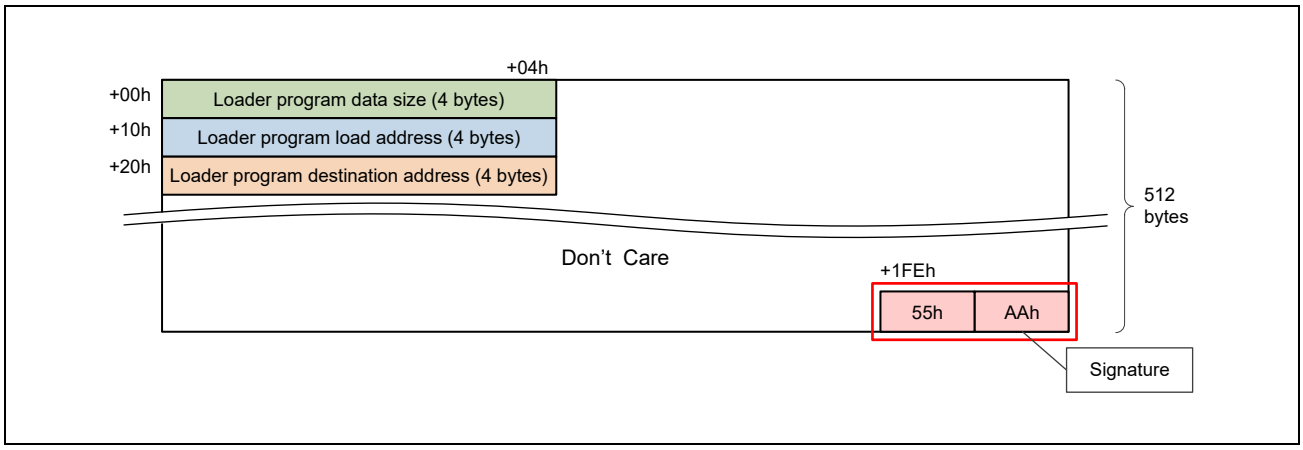

Figure 1.9-15 Structure of the Loader Program Size Block

In the eMMC device, the loader program is read from the partition specified by the BOOT_PARTITION_ENABLE bits in the PARTITION_CONFIG (ECSD[179]) field of the extended CSD register. Write the loader program to the partition selected by this register. **Table 1.9-10** shows the specifications of the extended CSD register.

Table 1.9-10 Specifications of the Extended CSD Register

No.	Field Name	Bit Name	Setting	Remarks
1	PARTITION_CONFIG (ECSD[179])	BOOT_PARTITION_ENABLE bits [5:3]	0h: Device not enabled for boot (default) 1h: Boot partition 1 enabled for boot 2h: Boot partition 2 enabled for boot 7h: User area enabled for boot	

Allocate partitions as follows.

- Store the loader program in boot partition 1.
- Store the application program in boot partition 2.
- Allocate the user area to a partition controlled by the file system.

1.9.1.2.3 Boot Mode 2 (Serial Flash Memory)

Figure 1.9-16 shows the allocation of the loader program size block and loader program in the serial flash memory.

In the loader program size block, the loader program size is stored in the first four bytes and the signature AA55h is stored in the last two bytes. **Figure 1.9-17** shows the structure of the loader program size data. Be sure to store the loader program size in 4-byte little endian.

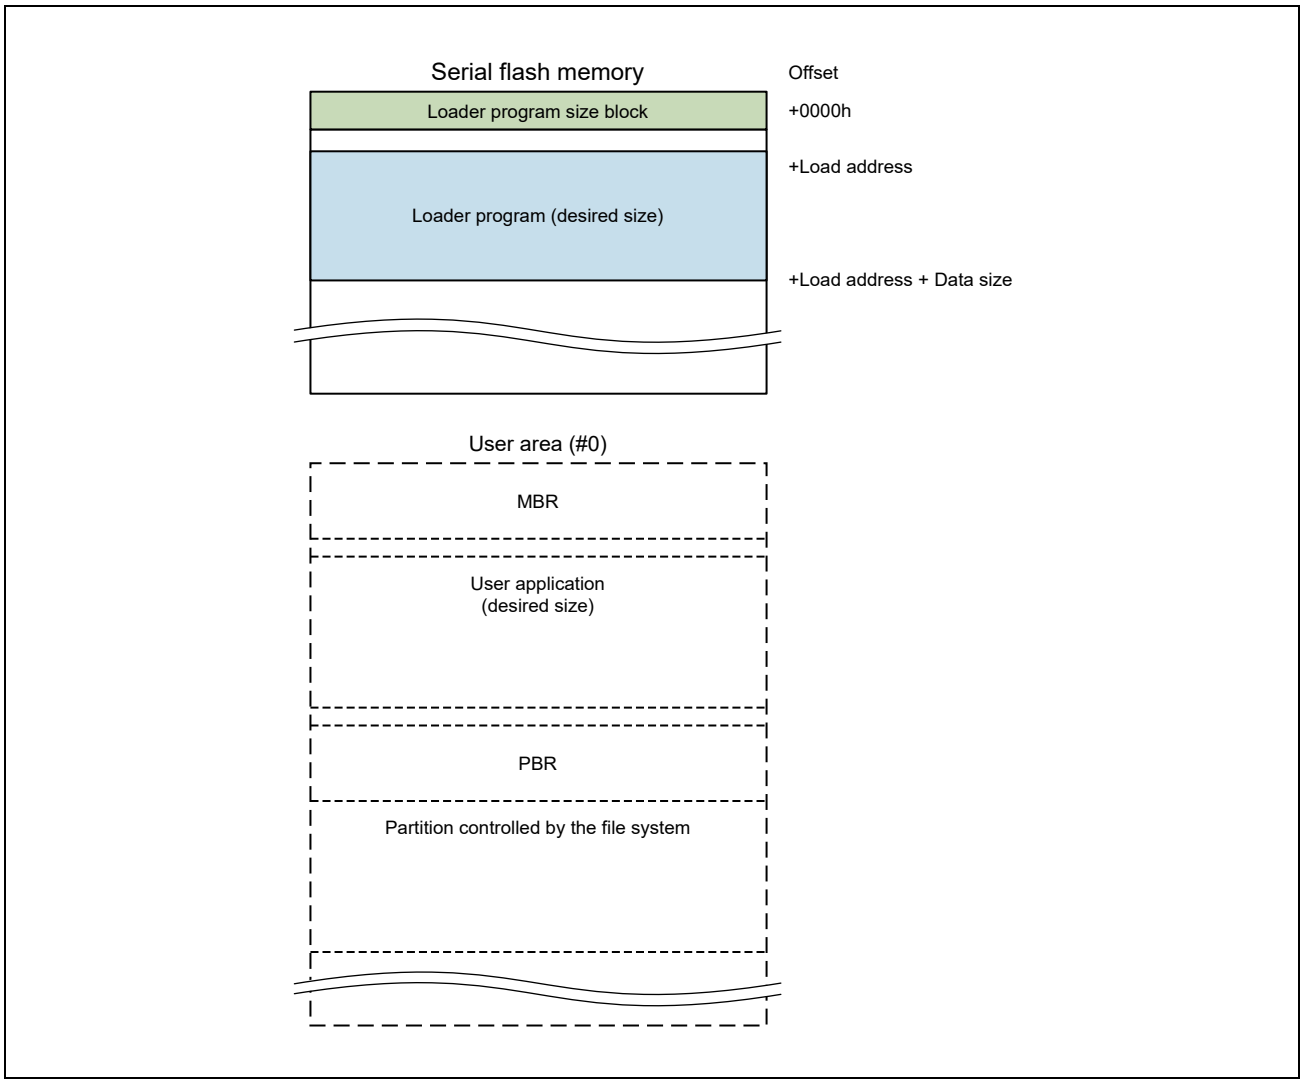

Figure 1.9-16 Allocation of Loader Program in the Serial Flash Memory Device

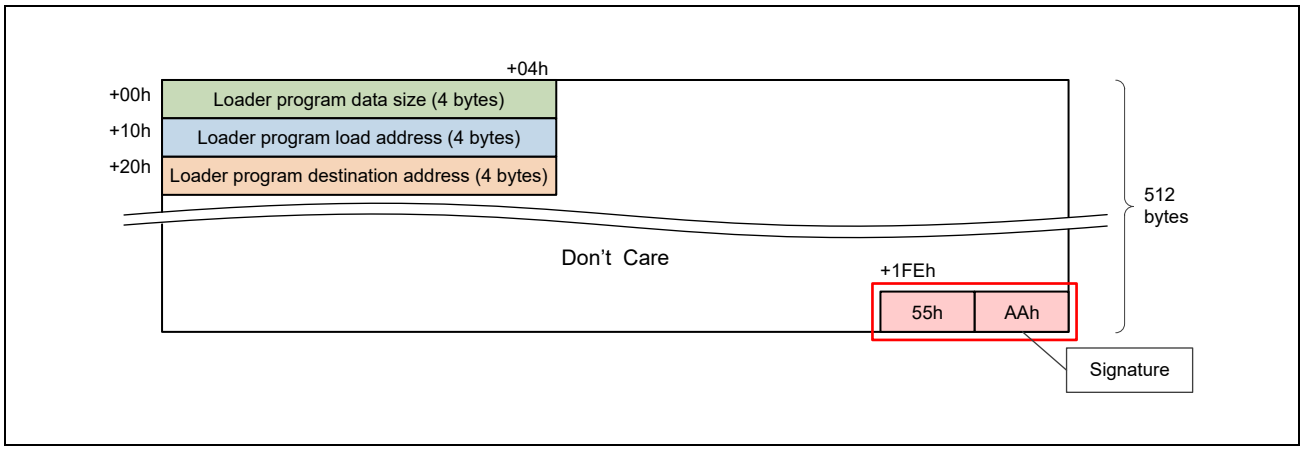

Figure 1.9-17 Structure of the Loader Program Size Block

1.9.1.2.4 Boot Mode 3 (SCIF Download)

In the loader program size block (512 bytes), the loader program size is stored in the first four bytes and the signature AA55h is stored in the last two bytes. Be sure to store the loader program size in 4-byte little endian.

The offset addresses in the SRAM for storing the file (the loader program) downloaded in this mode are as follows:

- CA55 cold boot: 0_0810_2000h
- CM33 cold boot: 0_2800_2000h

1.9.2 Boundary Scan Mode

Table 1.9-11 shows the pin that is related to the boundary scan.

Table 1.9-11 Boundary Scan Mode Pin

Pin Name	Function	Description
BSCANP	Boundary scan setting	0: Normal operation 1: Inter-LSI connection test on the user board (in the board)

The boundary scan mode is used to conduct connection tests between other ICs that connect to the external pins of this LSI, and it is enabled when BSCANP is high.

Five pins of the JTAG are used to control when this mode is enabled. This LSI has functionality to limit access for increased security when accessing from a debugger via the JTAG, however, no limitation is applied in the boundary scan mode.

1.9.3 Debug Mode

The LSI has pins for applying control that is different from that for the normal mode when debugging is to proceed. **Table 1.9-12** lists the relationships between the mode and the state of MD_BOOT3.

Table 1.9-12 Debug-Related Pins

MD_BOOT3	Mode	Overview of Operation
0	Normal operation	Normal operation mode
1	Debug mode	A mode for making a debugger connection and debugging the functions of the LSI.

Note 1. The level on the pin is captured by SYS on the rising edge of PRST_N. Setting of MD_BOOT3 to 1 is required to be in advance on the rising edge of PRST_N even if the JTAG connection is made in the midst of execution after booting up.

SECTION 2 PROCESSORS

2.1 Processors Overview

This LSI is equipped with 2 CPUs.

- Cortex®-A55 Quad (CA55)
- Cortex®-M33 (CM33)

The CA55 is intended for application processing, the CM33 for system control.

For details on each CPU, see **2.2 CPU**.

In addition, this LSI is configured with the AI accelerator (DRP-AI).

The DRP-AI consists of the AI-MAC and the dynamic re-configurable processor (DRP0).

See **2.3 AI Accelerator (DRP-AI)** for details on these processors.

SECTION 2 PROCESSORS

2.2 CPU

2.2.1 Overview

This LSI has following CPUs.

- Quad 64-bit Arm® Cortex®-A55 processors (Application processing)
- 32-bit Arm® Cortex®-M33 processor (System management)

2.2.2 Application Processors Cortex-A55 (CA55)

The CA55 is a core block equipped with quad Cortex-A55 cores. For details on the functions including interrupts of the CA55, see the Arm® Cortex®-A55 Core Technical Reference Manual and related documents in **2.2.2.5 Function Reference**. For details of interrupt type and control, see **4.6 Interrupt Controller**.

2.2.2.1 Features

The CA55 incorporates an extensively redesigned microarchitecture system that improves performance across the board while being very competitive in area and power efficiency.

Table 2.2-1 Function Summary

	Description
CPU	• Cortex-A55 r2p0 (ARMv8-A) quad cores
Cache memory	• L1$ (I/D) = 32 KB (Parity) / 32 KB (ECC) • L2$ = None • L3$ = 1024 KB (ECC)
Maximum operating frequency	• CPU — Core: Over Drive 1800 MHz*1 Normal Drive 1100 MHz*1 — Cluster: Over Drive 1260 MHz*1 Normal Drive 1100 MHz*1
Interrupt controller	• External interrupt controller*2

Note 1. For details of Over Drive, refer to **10.1 Electrical Characteristics**.

Note 2. Interrupts generated in the system of this LSI are conveyed to GIC-600 via the ICU. For the various settings and setting procedures for the GIC, refer to the *GIC-600 Generic Interrupt Controller Technical Reference Manual* and **4.6 Interrupt Controller**.

Table 2.2-2 Core Configuration

	Value	Description
L1 instruction cache size	32 KB	L1 instruction cache = 32 KB (Parity)
L1 data cache size	32 KB	L1 data cache = 32 KB (ECC)
L3 cache size	1024 KB	L3 cache = 1024 KB (ECC)
ECC or parity core cache protection	Included	Support for core cache ECC
Advanced SIMD and floating-point support (including dot product instruction support)	Included	Support for Neon™ FPU engine
Cryptographic extension	Included (optional)	Support for cryptography engine
AArch32	N/A	Not supported
Big endian	N/A	Not supported

Table 2.2-3 Cluster Configuration

Item	Initial Value	Description	Switching Timing
AA64nAA32[0]	1b	For core 0. Fixed to 1 (AArch64).	—
AA64nAA32[1]	1b	For core 1. Fixed to 1 (AArch64).	—
AA64nAA32[2]	1b	For core 2. Fixed to 1 (AArch64).	—
AA64nAA32[3]	1b	For core 3. Fixed to 1 (AArch64).	—
CFGEND[0]	0b	For core 0. Fixed to 0 (little endian).	—
CFGEND[1]	0b	For core 1. Fixed to 0 (little endian).	—
CFGEND[2]	0b	For core 2. Fixed to 0 (little endian).	—
CFGEND[3]	0b	For core 3. Fixed to 0 (little endian).	—
CLUSTERIDAFF2[7:0]	0h	For core 0. The value is fixed.	—
CLUSTERIDAFF3[7:0]	0h	For core 1. The value is fixed.	—
CRYPTODISABLE	—	Fixed to 1 and 0 respectively for secure and normal products.	—
RVBARADDR0[39:2]	OTP setting	For core 0. The value can be changed.	Cold, cluster, core 0 reset
RVBARADDR1[39:2]	00_0204_0000h	For core 1. The value can be changed. The default is the start address of CA55 SRAM0 (corresponding to 00_0810_0000h).	Cold, cluster, core 1 reset
RVBARADDR2[39:2]	00_0204_0000h	For core 2. The value can be changed. The default is the start address of CA55 SRAM0 (corresponding to 00_0810_0000h).	Cold, cluster, core 2 reset
RVBARADDR3[39:2]	00_0204_0000h	For core 3. The value can be changed. The default is the start address of CA55 SRAM0 (corresponding to 00_0810_0000h).	Cold, cluster, core 3 reset
GICCDISABLE	0b	Fixed to 0 (CPU interface enabled)	—
ASTARTMP[39:20]	0_0100h	Start address of PP IF*1. The value can be changed.	Cold, cluster reset
AENDMP[39:20]	0_01FFh	End address of PP IF*1. The value can be changed.	Cold, cluster reset

Note 1. PP IF stands for Peripheral Port Interface.
For details, see the Arm® Cortex®-A55 Core Technical Reference Manual and related documents.

The settings by the configuration pins are reflected when a reset is applied to the target core. For the types of reset and the areas to be reset, see **Table 2.2-4**. The configuration pins are RVBARADDR0/1/2/3 for specifying the base addresses and ASTARTMP and AENDMP for specifying the areas of PP IF.

The procedure for changing RVBARADDR0/1/2/3 is given below.

1. Transfer the program to the changed base address.
2. Write the base address to the SYS_ACPU_CFG_RVAL0/1/2/3 and SYS_ACPU_CFG_RVAH0/1/2/3 registers.
3. Apply a reset for core 0/1/2/3.

The procedure for changing ASTARTMP and AENDMP is given below.

1. Write ASTARTMP to the SYS_ACPU_CFG_SMPH and SYS_ACPU_CFG_SMPL registers.
2. Write AENMP to the SYS_ACPU_CFG_EMPH and SYS_ACPU_CFG_EMPL registers.
3. Apply a reset for the cluster.

CAUTION

When ASTARTMP or AENDMP is changed, note the points below.

- When AENDMP <= ASTARTMP, the PP IF is not used.
- When ASTARTMP < AENDMP, the PP IF is used. The lower limit address of the peripheral area includes the setting value of ASTARTMP; the upper limit address of the peripheral area does not include the setting value of ASTARTMP. The upper limit address is set by subtracting 1 byte from AENDMP.

2.2.2.2 Resets

Table 2.2-4 shows the supported types of reset and the areas that are reset by the respective types. For the procedures of handling the individual resets, see **2.2.2.2.1 Cold Reset** and the subsequent parts. See the Arm® DynamIQ™ Shared Unit Technical Reference Manual and Arm® Cortex®-A55 Core Technical Reference Manual.

Table 2.2-4 Areas to be Reset

Reset Function	Areas to be Reset
Cold reset	Entire area
Cluster warm reset	Entire area of the cluster + core 0 (and cores 1, 2, and 3 in quad-core devices) except for the debug, RAS, and ETM registers
Core warm reset	Entire area of the target core except for the debug, RAS, and ETM registers
Debug reset	Debug block

The P-Channels can be used to control safety in resetting. For details on the P-Channels, see the AMBA® Low Power Interface Specification Arm® Q-Channel and P-Channel Interfaces. For details on registers for controlling the P-Channel and reset pins, see **4.4 Clock Pulse Generator (CPG)**. **Table 2.2-5** shows the supported power modes for each P-Channel. Transitions to power modes other than those listed in the table below are not supported.

Table 2.2-5 Supported Power Modes

PSTATE	Power Mode
CLUSTERPSTATE[6:0]	• 100_1000b (ON) • 000_0000b (OFF)
COREPSTATE0[5:0]	• 00_1000b (ON) • 00_0001b (OFF_EMU) • 00_0000b (OFF)
COREPSTATE1[5:0]	• 00_1000b (ON) • 00_0001b (OFF_EMU) • 00_0000b (OFF)
COREPSTATE2[5:0]	• 00_1000b (ON) • 00_0001b (OFF_EMU) • 00_0000b (OFF)
COREPSTATE3[5:0]	• 00_1000b (ON) • 00_0001b (OFF_EMU) • 00_0000b (OFF)

2.2.2.2.1 Cold Reset

A cold reset is applied at any of the following cases.

(a) The sequence of a power-on reset by the CPG is executed (in CA55 boot mode).
(b) The WDT counter has underflowed.
(c) Software control by the CM33 is applied.

For details on (a) and (b) reset, see **4.4 Clock Pulse Generator (CPG)** and **5.4 Watchdog Timer (WDT)**, respectively. To apply a cold reset by case (c) reset, follow the procedure below. The CPU column shows the CPU which executes processing. At the time of reading in the Processing column, continue polling until the expected value is obtained.

Table 2.2-6 Procedure for Applying Cold Reset

Step	CPU	Register Name	Processing	Value
1	CA55	Execute a power-down sequence described in the Technical Reference Manual (TRM) on all powered-on cores.		
2	CM33	CPG_LP_CA55_CTL6	READ	****_****_****_****_****_****_****_0000b
3	CM33	CPG_LP_CA55_CTL2	WRITE	****_****_*000_0001_****_****_*000_0001b
		CPG_LP_CA55_CTL3	WRITE	****_****_*000_0001_****_****_*000_0001b
4	CM33	CPG_LP_CA55_CTL2	READ	****_***1_0000_0001_****_***1_0000_0001b
		CPG_LP_CA55_CTL3	READ	****_***1_0000_0001_****_***1_0000_0001b
5	CM33	CPG_LP_CA55_CTL2	WRITE	****_****_*000_0000_****_****_*000_0000b
		CPG_LP_CA55_CTL3	WRITE	****_****_*000_0000_****_****_*000_0000b
6	CM33	CPG_LP_CA55_CTL2	READ	****_***0_0000_0000_****_***0_0000_0000b
		CPG_LP_CA55_CTL3	READ	****_***0_0000_0000_****_***0_0000_0000b
7	CM33	CPG_LP_CA55_CTL1	WRITE	****_****_****_****_****_****_****_0000_0001b
8	CM33	CPG_LP_CA55_CTL1	READ	****_****_****_****_****_****_**10_0000_0001b
9	CM33	CPG_LP_CA55_CTL1	WRITE	****_****_****_****_****_****_****_0000_0000b
10	CM33	CPG_LP_CA55_CTL1	READ	****_****_****_****_****_****_**00_0000_0000b
11	Other	CPG_RST_0	WRITE	**11_1111_1111_1111_**00_0000_0000_0000b
12	Other	CPG_RST_1	WRITE	****_****_****_*111_****_****_****_*000b
13	Other	CPG_RSTMON_0	READ	****_****_****_***1_1111_1111_1111_1111b

Note: Processing from step 1 to 10 is a recommended procedure to minimize the impact on the system.

Note: Writing to bits with * is prohibited (read-modify-write operations are required).

The control procedure for releasing the cold reset by (c) to start core 0 is as follows.

Table 2.2-7 Procedure for Releasing Cold Reset to Start Core 0

Step	CPU	Register Name	Processing	Value
1	Other	CPG_RSTMON_0	READ	****_****_****_***1_1111_1111_1111_1111b
2	Other	CPG_LP_CA55_CTL1	WRITE	****_****_****_****_****_****_1001_0001b
3	Other	CPG_LP_CA55_CTL2	WRITE	****_****_****_****_****_****_*001_0001b
4	Other	CPG_RST_1	WRITE	****_****_****_*111_****_****_****_*111b
5	Other	CPG_RSTMON_0	READ	****_****_****_***0_0011_1111_1111_1111b
6	Other	CPG_RST_0	WRITE	**11_1111_1111_1111_**11_1111_1111_1111b
7	Other	CPG_RSTMON_0	READ	****_****_****_***0_0000_0000_0000_0000b
8	Other	CPG_LP_CA55_CTL1	READ	****_****_****_****_****_**10_1001_0001b
9	Other	CPG_LP_CA55_CTL2	READ	****_****_****_****_****_***1_0001_0001b
10	Other	CPG_LP_CA55_CTL1	WRITE	****_****_****_****_****_**10_1001_0000b
11	Other	CPG_LP_CA55_CTL1	READ	****_****_****_****_****_**00_1001_0000b
12	Other	CPG_LP_CA55_CTL2	WRITE	****_****_****_****_****_***1_0001_0000b
13	Other	CPG_LP_CA55_CTL2	READ	****_****_****_****_****_***0_0001_0000b

Note: Writing to bits with * is prohibited (read-modify-write operations are required).

The procedure for starting another core (core x) after the startup of core 0 is as follows.

Table 2.2-8 Procedure for Starting Core x

Step	CPU	Processing
1	Other	Release the cold reset to start the cluster according to **Table 2.2-7**.
2	Any	Set the COREPREQx bit of CPG_LP_CA55_CTLn to 1b and the COREPSTATEx bits to 00_1000b.
3	Any	Check that the COREPDENYx bit of CPG_LP_CA55_CTLn is 0b and the COREPACCEPTx bit is 1b.
4	Any	Set the COREPREQx bit of CPG_LP_CA55_CTLn to 0b.
5	Any	Check that the COREPDENYx bit of CPG_LP_CA55_CTLn is 0b and the COREPACCEPTx bit is 0b.

Note: CPG_LP_CA55_CTLn: CPG_LP_CA55_CTL2 for core 0/1; CPG_LP_CA55_CTL3 for core 2/3.

2.2.2.2.2 Core Warm Reset

There are the two types of core warm reset: internal and external resets. The former requires software control by the CA55 itself and the latter requires software control by the CA55 and CM33. Though the CA55 handles an internal reset in the same way as an external reset, if you intend to reset a single core, using an internal reset is recommended because handling this requires fewer steps than an external reset. An external reset is mainly used as part of a cluster warm reset, which is described in **2.2.2.2.3 Cluster Warm Reset**.

To apply an internal reset, follow the procedure below.

Table 2.2-9 Core Warm Reset (Internal)

Step	CPU	Register Name	Processing	Value
1	CA55	RMR_EL3.RR	Write	1b
2	CA55	—	WFI	—

Release from an internal reset is automatic following application of the reset. No specific processing is required. For details, see the Arm® DynamIQ™ Shared Unit Technical Reference Manual and Arm® Cortex®-A55 Core Technical Reference Manual.

Application of the reset requires transition of the core power mode to OFF or EMU_OFF by the P-channel pin. The following describes the reset sequence for each core using the sequence for setting the power mode to OFF. Read the power mode as EMU_OFF when placing each core into this state.

The control procedure for applying an external reset to core 0 is as follows.

Table 2.2-10 Core 0 Warm Reset (External Reset Procedure)

Step	CPU	Register Name	Processing	Value
1	CA55	Execute a power-down sequence*1 on core 0.		
2	Any	CPG_LP_CA55_CTL6	READ	****_****_****_****_****_****_****_***0b
3	Any	CPG_LP_CA55_CTL2	WRITE	****_****_****_****_****_****_****_*000_0001b
4	Any	CPG_LP_CA55_CTL2	READ	****_****_****_****_****_****_***1_0000_0001b
5	Any	CPG_LP_CA55_CTL2	WRITE	****_****_****_****_****_****_****_*000_0000b
6	Any	CPG_LP_CA55_CTL2	READ	****_****_****_****_****_****_***0_0000_0000b
7	Any	CPG_RST_0	WRITE	****_****_***1_****_****_****_***0_****b
8	Any	CPG_RSTMON_0	READ	****_****_****_****_****_****_****_***1_****b

Note: Steps 1 and 2 are a recommended procedure to minimize the impact on the system.

Note: Writing to bits with * is prohibited (read-modify-write operations are required).

Note 1. For details, refer to the Arm® Cortex®-A55 Core Technical Reference Manual.

The control procedure for releasing the core warm reset to start core 0 is as follows.

Table 2.2-11 Core 0 Warm Reset (External Reset Release Procedure)

Step	CPU	Register Name	Processing	Value
1	Any	CPG_LP_CA55_CTL2	WRITE	****_****_****_****_****_****_*001_0001b
2	Any	CPG_RST_0	WRITE	***1_1111_1111_1111_**11_1111_1111_1111b
3	Any	CPG_RSTMON_0	READ	****_****_****_***0_0000_0000_0000_0000b
4	Any	CPG_LP_CA55_CTL2	READ	****_****_****_****_****_***1_0001_0001b
5	Any	CPG_LP_CA55_CTL2	WRITE	****_****_****_****_****_****_*001_0000b
6	Any	CPG_LP_CA55_CTL2	READ	****_****_****_****_****_***0_0001_0000b

Note: Writing to bits with * is prohibited (read-modify-write operations are required).

The control procedure for applying an external reset to core 1 is as follows.

Table 2.2-12 Core 1 Warm Reset (External Reset Procedure)

Step	CPU	Register Name	Processing	Value
1	CA55	Execute a power-down sequence*1 on core 1.		
2	Any	CPG_LP_CA55_CTL6	READ	****_****_****_****_****_****_****_**0*b
3	Any	CPG_LP_CA55_CTL2	WRITE	****_****_*000_0001_****_****_****_****b
4	Any	CPG_LP_CA55_CTL2	READ	****_***1_0000_0001_****_****_****_****b
5	Any	CPG_LP_CA55_CTL2	WRITE	****_****_*000_0000_****_****_****_****b
6	Any	CPG_LP_CA55_CTL2	READ	****_***0_0000_0000_****_****_****_****b
7	Any	CPG_RST_0	WRITE	****_****_**1*_****_****_****_**0*_****b
8	Any	CPG_RSTMON_0	READ	****_****_****_****_****_****_**1*_****b

Note: Steps 1 and 2 are a recommended procedure to minimize the impact on the system.

Note: Writing to bits with * is prohibited (read-modify-write operations are required).

Note 1. For details, refer to the Arm® Cortex®-A55 Core Technical Reference Manual.

The control procedure for releasing the core warm reset to start core 1 is as follows.

Table 2.2-13 Core 1 Warm Reset (External Reset Release Procedure)

Step	CPU	Register Name	Processing	Value
1	Any	CPG_LP_CA55_CTL2	WRITE	****_****_*001_0001_****_****_****_****b
2	Any	CPG_RST_0	WRITE	***1_1111_1111_1111_**11_1111_1111_1111b
3	Any	CPG_RSTMON_0	READ	****_****_****_***0_0000_0000_0000_0000b
4	Any	CPG_LP_CA55_CTL2	READ	****_***1_0001_0001_****_****_****_****b
5	Any	CPG_LP_CA55_CTL2	WRITE	****_****_*001_0000_****_****_****_****b
6	Any	CPG_LP_CA55_CTL2	READ	****_***0_0001_0000_****_****_****_****b

Note: Writing to bits with * is prohibited (read-modify-write operations are required).

The control procedure for applying an external reset to core 2 is as follows.

Table 2.2-14 Core 2 Warm Reset (External Reset Procedure)

Step	CPU	Register Name	Processing	Value
1	CA55	Execute a power-down sequence*1 on core 2.		
2	Any	CPG_LP_CA55_CTL6	READ	****_****_****_****_****_****_****_*0**b
3	Any	CPG_LP_CA55_CTL3	WRITE	****_****_****_****_****_****_*000_0001b
4	Any	CPG_LP_CA55_CTL3	READ	****_****_****_****_****_***1_0000_0001b
5	Any	CPG_LP_CA55_CTL3	WRITE	****_****_****_****_****_****_*000_0000b
6	Any	CPG_LP_CA55_CTL3	READ	****_****_****_****_****_***0_0000_0000b
7	Any	CPG_RST_0	WRITE	****_****_*1**_****_****_****_*0**_****b
8	Any	CPG_RSTMON_0	READ	****_****_****_****_****_****_*1**_****b

Note: Steps 1 and 2 are a recommended procedure to minimize the impact on the system.

Note: Writing to bits with * is prohibited (read-modify-write operations are required).

Note 1. For details, refer to the Arm® Cortex®-A55 Core Technical Reference Manual.

The control procedure for releasing the core warm reset to start core 2 is as follows.

Table 2.2-15 Core 2 Warm Reset (External Reset Release Procedure)

Step	CPU	Register Name	Processing	Value
1	Any	CPG_LP_CA55_CTL3	WRITE	****_****_****_****_****_****_*001_0001b
2	Any	CPG_RST_0	WRITE	***1_1111_1111_1111_**11_1111_1111_1111b
3	Any	CPG_RSTMON_0	READ	****_****_****_***0_0000_0000_0000_0000b
4	Any	CPG_LP_CA55_CTL3	READ	****_****_****_****_****_***1_0001_0001b
5	Any	CPG_LP_CA55_CTL3	WRITE	****_****_****_****_****_****_*001_0000b
6	Any	CPG_LP_CA55_CTL3	READ	****_****_****_****_****_***0_0001_0000b

Note: Writing to bits with * is prohibited (read-modify-write operations are required).

The control procedure for applying an external reset to core 3 is as follows.

Table 2.2-16 Core 3 Warm Reset (External Reset Procedure)

Step	CPU	Register Name	Processing	Value
1	CA55	Execute a power-down sequence*1 on core 3.		
2	Any	CPG_LP_CA55_CTL6	READ	****_****_****_****_****_****_****_0***b
3	Any	CPG_LP_CA55_CTL3	WRITE	****_****_*000_0001_****_****_****_****b
4	Any	CPG_LP_CA55_CTL3	READ	****_***1_0000_0001_****_****_****_****b
5	Any	CPG_LP_CA55_CTL3	WRITE	****_****_*000_0000_****_****_****_****b
6	Any	CPG_LP_CA55_CTL3	READ	****_***0_0000_0000_****_****_****_****b
7	Any	CPG_RST_0	WRITE	****_****_1***_****_****_****_0***_****b
8	Any	CPG_RSTMON_0	READ	****_****_****_****_****_****_1***_****b

Note: Steps 1 and 2 are a recommended procedure to minimize the impact on the system.

Note: Writing to bits with * is prohibited (read-modify-write operations are required).

Note 1. For details, refer to the Arm® Cortex®-A55 Core Technical Reference Manual.

The control procedure for releasing the core warm reset to start core 3 is as follows.

Table 2.2-17 Core 3 Warm Reset (External Reset Release Procedure)

Step	CPU	Register Name	Processing	Value
1	Any	CPG_LP_CA55_CTL2	WRITE	****_****_*001_0001_****_****_****_****b
2	Any	CPG_RST_0	WRITE	***1_1111_1111_1111_**11_1111_1111_1111b
3	Any	CPG_RSTMON_0	READ	****_****_****_***0_0000_0000_0000_0000b
4	Any	CPG_LP_CA55_CTL3	READ	****_***1_0001_0001_****_****_****_****b
5	Any	CPG_LP_CA55_CTL3	WRITE	****_****_*001_0000_****_****_****_****b
6	Any	CPG_LP_CA55_CTL3	READ	****_***0_0001_0000_****_****_****_****b

Note: Writing to bits with * is prohibited (read-modify-write operations are required).

2.2.2.2.3 Cluster Warm Reset

There are the two types of cluster warm reset: normal and immediate resets. Both require software control by the CA55 and CM33. Though the CA55 handles an immediate reset in the same way as a normal reset, an immediate reset should only be used for debugging because handling this may cause a deadlock.

The control procedure for applying a normal reset while cores 0/1/2/3 are started up is as follows.

If there is any core that is not started up, do not perform steps 1 to 5 on this core.

Table 2.2-18 Cluster Warm Reset (Normal Reset Procedure)

Step	CPU	Register Name	Processing	Value
1	CA55	Execute a power-down sequence*1 on all powered-on cores 0/1/2/3.		
2	Other	CPG_LP_CA55_CTL6	READ	****_****_****_****_****_****_****_0000b
3	Other	CPG_LP_CA55_CTL2	WRITE	****_****_*000_0001_****_****_*000_0001b
		CPG_LP_CA55_CTL3	WRITE	****_****_*000_0001_****_****_*000_0001b
4	Other	CPG_LP_CA55_CTL2	READ	****_***1_0000_0001_****_***1_0000_0001b
		CPG_LP_CA55_CTL3	READ	****_***1_0000_0001_****_***1_0000_0001b
5	Other	CPG_LP_CA55_CTL2	WRITE	****_****_*000_0000_****_****_*000_0000b
		CPG_LP_CA55_CTL3	WRITE	****_****_*000_0000_****_****_*000_0000b
6	Other	CPG_LP_CA55_CTL2	READ	****_***0_0000_0000_****_***0_0000_0000b
		CPG_LP_CA55_CTL3	READ	****_***0_0000_0000_****_***0_0000_0000b
7	Other	CPG_LP_CA55_CTL1	WRITE	****_****_****_****_****_****_****_0000_0001b
8	Other	CPG_LP_CA55_CTL1	READ	****_****_****_****_****_****_**10_0000_0001b
9	Other	CPG_LP_CA55_CTL1	WRITE	****_****_****_****_****_****_****_0000_0000b
10	Other	CPG_LP_CA55_CTL1	READ	****_****_****_****_****_****_**00_0000_0000b
11	Other	CPG_RST_0	WRITE	**11_1111_1111_1111_**10_1101_0000_1111b
12	Other	CPG_RST_1	WRITE	****_****_****_*111_****_****_****_*001b
13	Other	CPG_RSTMON_0	READ	****_****_****_***1_1001_0010_1111_0000b

Note: Writing to bits with * is prohibited (read-modify-write operations are required).

Note 1. For details, refer to the Arm® Cortex®-A55 Core Technical Reference Manual.

When applying an immediate reset, perform only steps 11 to 13 of the normal reset sequence.

The control procedure for releasing the cluster warm reset to start core 0 is as follows.

Table 2.2-19 Cluster Warm Reset (Normal Reset Release and Core 0 Startup Procedure)

Step	CPU	Register Name	Processing	Value
1	Other	CPG_LP_CA55_CTL1	WRITE	****_****_****_****_****_****_1001_0001b
2	Other	CPG_LP_CA55_CTL2	WRITE	****_****_****_****_****_****_*001_0001b

7	Other	CPG_LP_CA55_CTL1	READ	****_****_****_****_****_**10_1001_0001b
8	Other	CPG_LP_CA55_CTL2	READ	****_****_****_****_****_***1_0001_0001b
9	Other	CPG_LP_CA55_CTL1	WRITE	****_****_****_****_****_****_1001_0000b
10	Other	CPG_LP_CA55_CTL1	READ	****_****_****_****_****_**00_1001_0000b
11	Other	CPG_LP_CA55_CTL2	WRITE	****_****_****_****_****_****_*001_0000b
12	Other	CPG_LP_CA55_CTL2	READ	****_****_****_****_****_***0_0001_0000b

Note: Writing to bits with * is prohibited (read-modify-write operations are required).

2.2.2.2.4 Debug Reset

Debug resets can only be applied under software control.

To apply a debug reset, follow the procedure below.

Table 2.2-20 Procedure for Applying Debug Reset

Step	CPU	Register Name	Processing	Value
1	Any	CPG_RST_1	WRITE	****_****_****_*001_****_****_****_*110b
2	Any	CPG_RSTMON_0	READ	****_****_****_***0_0010_0000_0000_0000b

Note: Writing to bits with * is prohibited (read-modify-write operations are required).

To release from the debug reset state, follow the procedure below.

Table 2.2-21 Procedure for Releasing Debug Reset

Step	CPU	Register Name	Processing	Value
1	Any	CPG_RST_1	WRITE	****_****_****_*001_****_****_****_*111b
2	Any	CPG_RSTMON_0	READ	****_****_****_***0_0000_0000_0000_0000b

Note: Writing to bits with * is prohibited (read-modify-write operations are required).

2.2.2.3 Interrupts

Table 2.2-22 lists the interrupt output signals.

Table 2.2-22 Interrupt Output Signals

Port name	Type*3	Pulse / Level	INT ID*2
nVCPUMNTIRQ[3:0]	PPI	Level	PPI : 25
nCNTHPIRQ[3:0]	PPI	Level	PPI : 26
nCNTPNSIRQ[3:0]	PPI	Level	PPI : 30
nCNTPSIRQ[3:0]	PPI	Level	PPI : 29
nCNTVIRQ[3:0]	PPI	Level	PPI : 27
nCNTHVIRQ[3:0]	PPI	Level	PPI : 28
nFAULTIRQ[4:1]	SPI	Level	—
nFAULTIRQ[0]	SPI	Level	—
nERRIRQ[4:1]	SPI	Level	—
nERRIRQ[0]	SPI	Level	—
CTIIRQ[3:0]	PPI	Level*1	PPI : 24
nCLUSTERPMUIRQ	SPI	Level	—
nPMUIRQ[3:0]	PPI	Level	PPI : 23
nCOMMIRQ[3:0]	PPI	Level	PPI : 22

Note 1. These signals are configured as level interrupt because this LSI is intended to use software control. To clear the interrupt, use the CTIAPPCLEAR register.

Note 2. For details of INT ID of SPI, see **4.6 Interrupt Controller**. The interrupts classified as PPI under the Type column can also be used as SPI.

Note 3. For details on PPI and SPI interrupts, see **4.6.2 Generic Interrupt Controller (GIC).**

2.2.2.4 Low Power Consumption Mode

The CA55 supports two standby modes.

- Core wait for interrupt (WFI)
- Core wait for event (WFE)

For details on each mode, see the Arm® Cortex®-A55 Core Technical Reference Manual and related documents.

The CA55 enters standby mode immediately after the execution of a WFI/WFE instruction.

2.2.2.4.1 Application Sleep Mode

This LSI defines the procedure for the CA55 to execute WFI/WFE instructions as the application sleep mode. This mode allows the CA55 to move to the low-power consumption mode safely without adversely affecting the system.

For the sequence for transition to this mode, see **4.4 Clock Pulse Generator (CPG)**.

2.2.2.5 Function Reference

For details on the functions of the DynamIQ™ Shared Unit and CA55, see the documents listed below.

- Arm® DynamIQ Shared Unit Technical Reference Manual
- Arm® Cortex®-A55 Core Technical Reference Manual
- Arm® Cortex®-A55 Core Advanced SIMD and Floating-point Support Technical Reference Manual
- Arm® Cortex®-A55 Core Cryptographic Extension Technical Reference Manual

For details on clock and the controls, see **4.4 Clock Pulse Generator (CPG)**.

2.2.2.6 Boot Procedure

The procedure for booting the CA55 is the same as that for releasing the cold reset.

Before releasing the cold reset, the following steps are required.

1. Set the configuration settings controllable by the SYS*[1].
2. Set the clock supply*[2].

Note 1. Related SYS registers
SYS_ACPU_CFG_SMPH / L
SYS_ACPU_CFG_EMPH / L
SYS_ACPU_CFG_RVAHx / Lx (x = 0 to 3)

Note 2. Related CPG registers (see **4.4 Clock Pulse Generator (CPG)** for the settings of PLLs and dividers.)
CPG_CLKON_0
CPG_CLKMON_0

When starting the CA55 with debug mode enabled, check that it has been released from reset (perform step 7 in **Table 2.2-7**) and then set the connection with CoreSight (CST) to the communication ready state.

2.2.2.7 CoreSight Connection

The CA55 performs local communications with CST using the ATB, APB, and timestamp interfaces. Though power-down is supported in this LSI, since the CA55 and CST belong to a different power domain, the two states are defined for the availability of communications.

- Communication ready state
- Communication interrupted state (default setting)

When powering down, place these interfaces in the communication interrupted state. When performing communications with the CST, place them in the communication ready state.

Since the ATB and timestamp interfaces have power-down registers, use software control to place these interfaces in the communication interrupted state.

The APB interface has Q-channel for power control, but use of this function is prohibited. Therefore, to place this interface in the communication interrupted state, use the isolation cells which are implemented at the boundaries of the power domains.

The procedure for transition to the communication ready state is given below.

Table 2.2-23 Procedure for Transition to Communication Ready State

Step	CPU	Processing
1	Any	Write 1b to the CSYSREQ_ATx (x = 0/1/2/3) and CSYSREQ_TS bits of the CPG_LP_CA55_CTL7 register.
2	Any	Check that the CSYSACK_ATx and CSYSACK_TS bits of the CPG_LP_CA55_CTL7 register are 1b.
3	Any	Write 1b to the LPI_ATB_REQ_CA55x bit (x = 0/1/2/3) of the CPG_LP_CST_CTL2 registers.*1
4	Any	Check that the LPI_ATB_ACK_CA55x bit (x = 0/1/2/3) of the CPG_LP_CST_CTL2 register is 1b.

Note 1. Controlling the timestamp interface of the CST is not required because it is common to all CPUs.

The procedure for transition to the communication interrupted state is given below.

Table 2.2-24 Procedure for Transition to Communication Interrupted State

Step	CPU	Processing
1	Any	Write 0b to the CSYSREQ_ATx (x = 0/1/2/3) and CSYSREQ_TS bits of the CPG_LP_CA55_CTL7 register.
2	Any	Check that the CSYSREQ_ATx (x = 0/1/2/3) and CSYSREQ_TS bits of the CPG_LP_CA55_CTL7 register are 0b.
3	Any	Write 0b to the LPI_ATB_REQ_CA55x bit (x = 0/1/2/3) of the CPG_LP_CST_CTL2 register.*1
4	Any	Check that the LPI_ATB_ACK_CA55x bit (x = 0/1/2/3) of the CPG_LP_CST_CTL2 register is 0b.

Note 1. Controlling the timestamp interface of the CST is not required because it is common to all CPUs.

2.2.3 System CPU Cortex-M33 (CM33)

The CM33 is a core block equipped with an Arm Cortex-M33 CPU.

For details on the functions of the CM33, see the Arm® Cortex®-M33 Processor Technical Reference Manual.

Refer to **1.8.2 CM33 Address Space** for CM33 address space.

2.2.3.1 Features

The CM33 processor is a highly energy-efficient processor that is intended for a microcontroller and deeply embedded applications. The processor is based on the Armv8-M architecture. For details on the functions of the CM33, see the Arm® Cortex®-M33 Processor Technical Reference Manual.

Table 2.2-25 Functional Overview

	Description
CPU	• Cortex-M33 r0p4 (ARMv8-M)
Maximum operating frequency	• 200 MHz
Interrupt controller	• NVIC (Nested Vectored Interrupt Controller)*1

Note 1. Interrupts generated in the system of this LSI are conveyed to the internal NVIC of Cortex-M33 via the ICU. For the various settings and setting procedures, refer to the *Arm® Cortex®-M33 Processor Technical Reference Manual* and **4.6.1 Interrupt Control Unit (ICU)**.

Table 2.2-26 CM33 Configuration

Description	Configuration
CPU	Cortex-M33 r0p4 (ARMv8-M)
Floating-point	Single-precision floating-point only.
DSP extension	Armv8-M DSP Extension supported
Security extension	Armv8-M security extension
Non-secure protected memory regions	16 regions
Secure protected memory regions	16 regions
Security attribution unit (SAU)	8 regions
Interrupts	480 interrupts
Number of bits of interrupt priority	8 bits are supported. 256 levels of priority are implemented.
Debug watchpoints and breakpoints	Full set 4 data watchpoint comparators and 8 breakpoint comparators
ITM and data watchpoint and trace (DWT) trace functionality	Complete ITM and DWT trace
Embedded trace macrocell (ETM)	ETM instruction execution trace
Micro trace buffer (MTB)	MTB is not supported.
Cross trigger interface (CTI)	CTI is included.
Wakeup interrupt controller (WIC)	WIC is included.
External coprocessor interface	Coprocessor hardware is not supported.

Table 2.2-27 Initial Settings of CM33 Configuration Pins

Item	Initial Value	Description	Switching Timing
CFGSSTCALIB [25:0]	0000_3D08h	Secure SysTick calibration. The value is fixed.	—
CFGNSSTCALIB [25:0]	0000_3D08h	Non-Secure SysTick calibration. The value is fixed.	—
INITSVTOR[31:7]	0000_0000h	Secure Reset Vector. The value can be changed.*1	Cold / warm reset
INITNSVTOR[31:7]	1800_0000h	Non-Secure Reset Vector. The value can be changed.*1	Cold / warm reset

Note 1. Change the setting in accord with the setting of IDAU.

2.2.3.2 Resets

2.2.3.2.1 Reset Functions and Areas

The table below lists the reset functions supported by the CM33 and the corresponding areas to be reset. Supply the clock before releasing the reset.

Table 2.2-28 Supported Reset Combinations

Reset Function	Areas to be Reset
Cold reset	Entire area
Warm reset	Cortex-M33 excluding the debug module

2.2.3.2.2 Cold Reset

A cold reset is applied at any of the following cases.

(a) The power-on reset sequence is executed (in CA55 boot mode).
(b) The WDT counter has underflowed.
(c) Software control by the other CPU is applied.

For details on (a) and (b), see **4.4 Clock Pulse Generator (CPG)** and **5.4 Watchdog Timer (WDT)**. The procedure for applying a cold reset by case (c) is given below. The CPU column shows the CPU which executes processing. The Value column shows the setting at the time of writing and the expected value at the time of reading. When reading, continue polling until the expected value is obtained.

Table 2.2-29 Procedure for Applying Cold Reset

Step	CPU	Register Name	Processing	Value
1	CM33	Execute system MPU sleep.*1		
2	Other	CPG_LP_CM33CTL0	Read	****_****_****_****_****_****_***1_***1b
3	Other	CPG_RST_1	Write	****_****_**11_1***_****_****_**00_0***b
4	Other	CPG_RSTMON_0	Read	****_****_****_111*_****_****_****_****b

Note: Writing to bits with * is prohibited (read-modify-write operations are required).

Note 1. The CM33 cannot be controlled when the WDT count underflow interrupt or LOCKUP is detected. If this is the case, skip this step.

The procedure for releasing the cold reset is as follows. The booting procedure differs depending on the operating mode (normal mode or debug mode).

Table 2.2-30 Procedure for Releasing Cold Reset (Normal mode)

Step	CPU	Register Name	Processing	Value
1	Other	CPG_RSTMON_0	Read	****_****_****_111*_****_****_****_****b
2	Other	CPG_RST_1	Write	****_****_**11_1***_****_****_**00_1***b
3	Other	CPG_RSTMON_0	Read	****_****_****_110*_****_****_****_****b
4	Other	CPG_RST_1	Write	****_****_**11_1***_****_****_**11_1***b
5	Other	CPG_RSTMON_0	Read	****_****_****_000*_****_****_****_****b

Note: Writing to bits with * is prohibited (read-modify-write operations are required).

Table 2.2-31 Procedure for Releasing Cold Reset (Debug mode)

Step	CPU	Register Name	Processing	Value
1	Other	CPG_LP_CM33CTL1	Write	****_****_****_****_**1*_****_****_****b
2	Other	CPG_CM33_CTL	Write	****_****_****_****_****_****_****_***1b
3	Other	CPG_RSTMON_0	Read	****_****_****_111*_****_****_****_****b
4	Other	CPG_RST_1	Write	****_****_**11_1***_****_****_**00_1***b
5	Other	CPG_RSTMON_0	Read	****_****_****_110*_****_****_****_****b
6	Other	CPG_RST_1	Write	****_****_**11_1***_****_****_**11_1***b
7	Other	CPG_RSTMON_0	Read	****_****_****_000*_****_****_****_****b
8	-	Sets registers regarding debug from CST via D-AHB		
9	Other	CPG_CM33_CTL	Write	****_****_****_****_****_****_****_***0b

Note: Writing to bits with * is prohibited (read-modify-write operations are required).

Before releasing the cold reset, the following steps are required.

1. Set the configuration settings controllable by the SYS*[1].
2. Set the clock supply*[2].

Note 1. Related SYS registers
SYS_MCPU_CFGx (x = 2 to 5)

Note 2. Related CPG registers (see **4.4 Clock Pulse Generator (CPG)** for the settings of PLLs and dividers.)
CPG_CLKON_1
CPG_CLKMON_0

2.2.3.2.3 Warm Reset

When applying a warm reset, the WFI instruction*[1] is used to guarantee that no transaction is issued. For the procedure for applying a warm reset, see “CM33 Warm Reset Operation Procedure” in **4.4 Clock Pulse Generator (CPG)**. In this LSI, hardware control is used to clear INT_MASK and release the warm reset. After the WFI has been issued, the CM33 is automatically restored.

Note 1. Correct operation is not guaranteed if the WFE instruction is executed.

2.2.3.3 Interrupts

2.2.3.3.1 Interrupt Pins

Table 2.2-32 lists the interrupt input pins and the interrupt output pins, respectively.

Table 2.2-32 Interrupt Output Pins

Port Name	Interrupt Content	Pulse / Level
CTIIRQ [1:0]	CTI interrupt output	Level
LOCKUP*1	Processor is in Lockup state	Level
FPIXC	Inexact	Level
FPIDC	Input denormal	Level
FPOFC	Overflow	Level
FPUFC	Underflow	Level
FPDZC	Divide-by-zero	Level
FPIOC	Invalid operation	Level
ERRINT_C*2	C-AHB bridge error interrupt	Pulse
ERRINT_S*2	S-AHB bridge error interrupt	Pulse

Note 1. LOCKUP is a signal that is asserted when the Cortex-M33 hangs. If LOCKUP is detected, executing a cold reset is recommended. For the conditions for asserting LOCKUP, refer to the ARM®v8-M Architecture Reference Manual.

Note 2. ERRINT_C and ERRINT_S exist as pins, but these pins are unavailable because they are not used within the IP.

2.2.3.4 Address Space

For details on the address space, refer to the Arm® Cortex®-M33 Processor Technical Reference Manual.

2.2.3.4.1 IDAU Setting

The CM33 includes an Implementation Defined Attribution Unit (IDAU). It supports two security maps. The security attribute settings are valid on release from the cold reset, and dynamic switching is not supported. In this LSI, CM33 Config Register 4 is used to select a security map. The initial setting of IDAUZERONS is 0. **Table 2.2-33** shows the security attributes assigned by the IDAU.

Table 2.2-33 IDAU Security Attributes

Area No.	Security Attribute IDAUZERONS = 0 (default)	Security Attribute IDAUZERONS = 1	Lower-limit Address	Upper-limit Address
0	Secure	Non-secure	0000_0000h	0FFF_FFFFh
1	Non-secure	Secure	1000_0000h	1FFF_FFFFh
2	Secure	Non-secure	2000_0000h	2FFF_FFFFh
3	Non-secure	Secure	3000_0000h	3FFF_FFFFh
4	Secure	Non-secure	4000_0000h	4FFF_FFFFh
5	Non-secure	Secure	5000_0000h	5FFF_FFFFh
6	Secure	Non-secure	6000_0000h	6FFF_FFFFh
7	Non-secure	Secure	7000_0000h	7FFF_FFFFh
8	Secure	Non-secure	8000_0000h	8FFF_FFFFh
9	Non-secure	Secure	9000_0000h	9FFF_FFFFh
10	Secure	Non-secure	A000_0000h	AFFF_FFFFh
11	Non-secure	Secure	B000_0000h	BFFF_FFFFh
12	Secure	Non-secure	C000_0000h	CFFF_FFFFh
13	Non-secure	Secure	D000_0000h	DFFF_FFFFh
14	Secure	Non-secure	E000_0000h	EFFF_FFFFh
15	Non-secure	Secure	F000_0000h	FFFF_FFFFh

2.2.3.5 Description of Functions

For the registers and functions of Cortex-M33, refer to the Arm® Cortex®-M33 Processor Technical Reference Manual and Arm®v8-M Architecture Reference Manual.

2.2.3.6 Low Power Consumption Mode

2.2.3.6.1 Supported Low Power Consumption Modes

The CM33 supports the core wait for interrupt (WFI) and core wait for event (WFE) instructions. For the details, refer to the Arm® Cortex®-M33 Processor Technical Reference Manual.

The CM33 also supports three sleep modes that are enabled by a combination of the internal register SCR.DEEPSLEEP and the CPG_LP_CM33CTL0 register (WIC interface). The combinations are shown below.

Table 2.2-34 Low Power Consumption Mode Settings

Name	SCR.DEEPSLEEP	CPG_LP_CM33CTL0 Register	Note
Standard standby	0b	CM33_LP_CTL24 = 0b CM33_LP_CTL25 = 0b	Standard low power consumption mode using WFI/WFE. This LSI uses this mode with a warm reset.
Deep standby	1b	CM33_LP_CTL24 = 0b CM33_LP_CTL25 = 0b	This LSI uses this mode in CM33 sleep mode.
WIC standby	1b	CM33_LP_CTL24 = 1b CM33_LP_CTL25 = 1b	This LSI uses this mode in software standby mode.
—	0b	CM33_LP_CTL24 = 1b CM33_LP_CTL25 = 1b	Not supported

2.2.3.6.2 Method for Executing System MPU Sleep Mode

System MPU sleep mode of this LSI is a low power consumption mode that uses the WFI or WFE instruction of the Cortex-M33. For control over transition to this mode, see **4.4 Clock Pulse Generator (CPG)**.

2.2.3.6.3 Method for Executing Software Standby Mode

Software standby mode of this LSI is an ultra-low power consumption mode that stops all modules other than the WIC of the CM33. For control over transition to this mode, see **4.4 Clock Pulse Generator (CPG)**. The WFE instruction cannot be used because return from this mode is interrupt-driven.

For the Q-channel specifications, refer to the AMBA® Low Power Interface Specification ARM® Q-Channel and P-Channel Interfaces. The specifications specific to the CM33 are given below.

Table 2.2-35 Q-channel Control Specifications

Domain	Item	Description
FPU	QACTIVE assertion condition	• The FPU is enabled by the CPACR register. • The FPU is processing instructions
	Power-up condition	• The CM33 is operating normally. (Q_EXIT is retained while the CM33 is not started)
	Power-down condition	• Q-REQUEST is issued while QACTIVE is negated.
Debug	QACTIVE assertion condition	• When PPB access to the debug module occurs (such access is not executed and is retained until the debug domain enters Q-RUN). • The DEMCR.TRACE bit is set. • The BPU is enabled. • The ETM is enabled. • The ITM, WDT, and ETM are active (trace data remains).
	Power-up condition	• The CM33 is operating normally. (Q_EXIT is retained while the CM33 is not started)
	Power-down condition	• Q-REQUEST is issued while QACTIVE is negated.

Note: The software standby sequence requires powering down each domain before issuing the WFI instruction.

(1) SysTick Timers

The SysTick timers in the CM33 are described below.

- There is one Secure SysTick timer and one Non-secure SysTick timer.
- The count cycle of SysTick timers is common to Secure and Non-secure.
- A reference clock for counting by a SysTick timer is implemented in this LSI.
- The configuration of Systick timers is a fixed value. The values are reflected in register SYST_CALIB*[1] of the Cortex-M33. For the settings, see **Table 2.2-27**. The settings of the 24 lower-order bits and the 25th bit are reflected in TENMS and SKEW, respectively. The setting of the 26th bit is reflected in NOREF, but set the bit to 0b because a reference clock is implemented in this LSI.

Note 1. For details on the SYST_CALIB register, refer to the Arm®v8-M Architecture Reference Manual.

(2) Usage of FPU

When using the FPU of the CM33, the FPU must be enabled by using CPACR of an internal register after setting the state of Q-channel of the FPU domain to Q-RUN (in this LSI, Q-channel of the FPU domain is set to the Q-STOPPED state by default).

The registers for controlling Q-channel of the FPU domain are included in the CPG. For details, refer to the list of the CPG registers.

For details on the Q-channel control specifications of the FPU domain, see **Table 2.2-35**.

(3) Usage of the Debug Function

Using the debug function of Cortex-M33 requires setting the state of Q-channel of the debug domain to Q-RUN (the initial state of Q-channel of the debug domain differs depending on the boot mode).

The registers for controlling Q-channel of the debug domain are included in the CPG. For details, see **4.4 Clock Pulse Generator (CPG)**.

For details on the Q-channel control specifications of the debug domain, see **Table 2.2-35**.

(4) Restrictions of Functions

The CM33 has some restrictions on the functions due to specification of this LSI. **Table 2.2-36** lists the restrictions on the functions.

Table 2.2-36 List of Restrictions of Functions

No.	Description
1	Non-support for EPPB In this LSI, the CST is accessible via the system bus. Therefore, operation for access to the CST by the EPPB is not guaranteed.
2	Non-support for WFE instruction in warm reset and software standby In this LSI, operation of the WFE instruction is not guaranteed while a warm reset is being executed. Return from software standby mode is interrupt-driven. Return by an event is not supported.
3	Non-support for NMI This LSI assumes that NMIs are processed not only by the CM33 but also by other CPUs. Therefore, the NMI function of the CM33 is not supported. The function is implemented as maskable interrupt as with other CPUs.
4	Systick timer accuracy In this LSI, dynamic switching of the frequency of CLK0 is possible, but the timer accuracy is not guaranteed when there is a dynamic frequency switchover during the measurement period.
5	Debugging-disabled period Since the internal debug module is stopped while in software standby mode during debug mode, debugging is disabled during this period.

SECTION 2 PROCESSORS

2.3 AI Accelerator (DRP-AI)

This section describes the functions of the AI accelerator (DRP-AI).

2.3.1 Functional Overview

The AI accelerator contains a DRP (DRP0) and an AI-MAC, which are called DRP-AI. It uses the information on the hierarchical memory system to perform AI inference and store the results.

The DRP-AI is an AI accelerator that can execute AI inference independently of the CPU. The DRP-AI works by the DRP-AI driver reading the descriptor for converting trained AI models by the DRP-AI translator.

Table 2.3-1 Related Tools

Tool Name	Description
DRP-AI translator	Conversion tool to be provided separately.
DRP-AI driver	Linux device driver to be provided separately. (Packed in DRP-AI Support Package)

2.3.1.1 Features

Both DRP0 and AI-MAC consist of core logic and DMA controller (DMAC).

Table 2.3-2 DRP0 Configuration

	Description
DRP core	• Dynamically reconfigurable processor core – Contains 96 processing elements. – Supports software controlled upper frequency limit.
DMAC	• DMA controller – One 256-bit AXI master interface for data transfer. It is shared by 4 DMA channels. – One 64-bit AXI slave interface for register access. – Supports 40-bit address extension. (base address shift and address conversion)

Table 2.3-3 AI-MAC Configuration

	Description
AI-MAC core	• Matrix multiply-accumulate operation unit for AI – Contains 2048 MAC (multiplier-accumulator) with INT8 format. – Contains 3-MB local memory. 1 MB for weight and bias data, and 2 MB for feature map data. – Supports sparse execution. – Supports software controlled upper frequency limit.
DMAC (EXT-DMAC0/1, AI-DMAC0/1)	• DMA controller – Two 256-bit AXI master interfaces for weight and bias data (read only).3 DMA channels are assigned to the fixed interface. – Two 256-bit AXI master interfaces for feature map data. Each interface is shared by 2 DMA channels. – One 64-bit AXI slave interface for register access. – Supports 40-bit address extension. (base address shift and address conversion)

2.3.1.2 Block Diagram

The block diagram of DRP-AI is as follows.

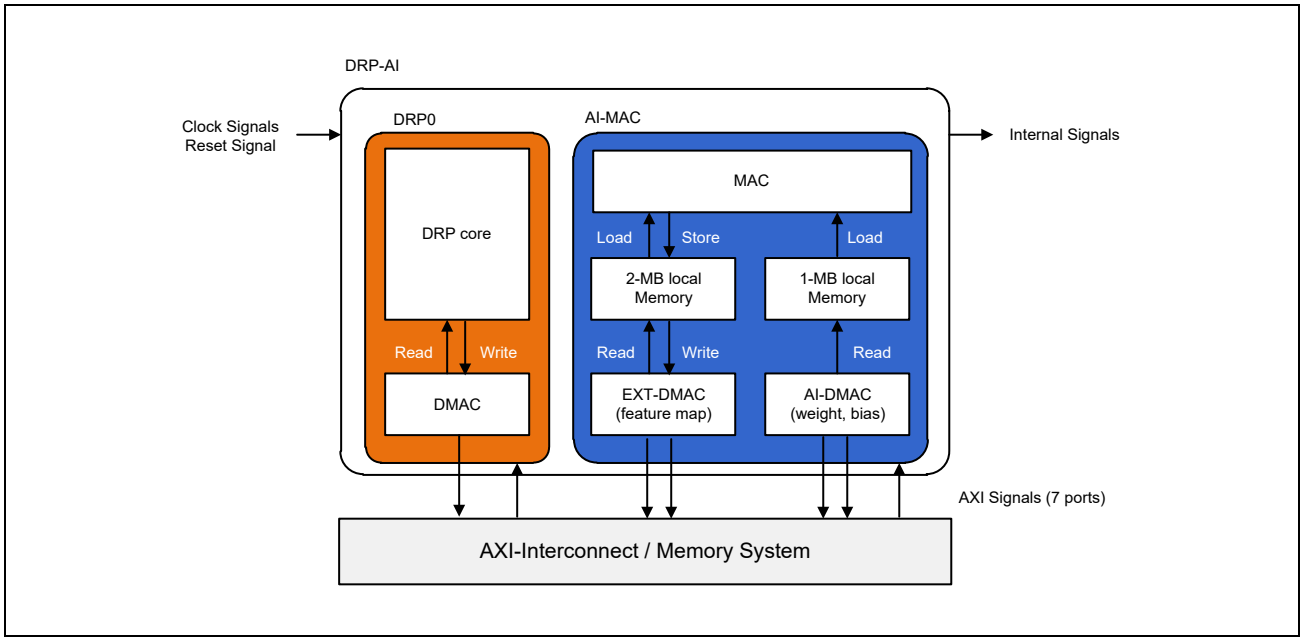

Figure 2.3-1 Block Diagram of DRP-AI

2.3.1.3 Register List

The following table shows the DRP-AI register list. The registers are supported in AI-MAC and DRP0, respectively.

AI-MAC

Register Name	Abbreviation	Initial Value	Offset Address	Access Size [bits]
AI-MAC Clock Switch Configuration Register	DRPAI_MAC_EXD0_STPC_CLKSW_CONFIG	007F_0001h	01_D864h	32

DRP0

Register Name	Abbreviation	Initial Value	Offset Address	Access Size [bits]
DRP Minimum Clock Dividing Register	DRPAI_DRP_MINDIV	0000_0002h	39_8000h	32

For the register base address, see **Table 2.3-4**.

Table 2.3-4 Register Base Addresses

Unit Name	Base Address Name	Base Address
DRP-AI (AI-MAC)	<DRPAI_MAC_base>	0_1680_0000h (5680_0000h*1, 4680_0000h*2)
DRP-AI (DRP0)	<DRPAI_DRP_base>	0_1700_0000h (5700_0000h*1, 4700_0000h*2)

Note 1. CM33 address space (non-secure)

Note 2. CM33 address space (secure)

2.3.2 Register Description

2.3.2.1 AI-MAC Clock Switch Configuration Register (DRPAI_MAC_EXD0_STPC_CLKSW_CONFIG)

This register sets the minimum division ratio of clock divider and sets the clock selector for the AI-MAC.

Access Size : 32 bits
Address : <DRPAI_MAC_base> + 01_D864h
Initial Value : 007F_0001h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	DIVFIX[6:0]						
Initial Value	0	0	0	0	0	0	0	0	0	1	1	1	1	1	1	1
R/W	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 23	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
22 to 16	DIVFIX[6:0]	7Fh	RW	Select the clock frequency 0: Reserved 1-2: MCLK input >3: Divided clock (The source is the DCLKIN input.) The division ratio is {DIVFIX-1}.
15 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
0	-	1h	R	Reserved This register is readable. When writing, be sure to write 1b.

2.3.2.2 DRP Minimum Clock Dividing Register (DRPAI_DRP_MINDIV)

This register sets the minimum division ratio of clock divider for the DRP.

Access Size : 32 bits
Address : <DRPAI_DRP_base> + 39_8000h
Initial Value : 0000_0002h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	-	-	-	-	-	-	-	-	-	RegMinDiv[6:0]						
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0
R/W	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 7	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
6 to 0	RegMinDiv[6:0]	2h	RW	{Minimum division ratio of clock divider} -1 This bit controls the clock frequency in DRP DFC mode. If this value is greater than that of application, this value is applied. NOTE: Do not set the value less than 02h.

2.3.3 Function Description

For details on the function including latest supported features, see the User's Manual of DRP-AI translator.

2.3.4 Operation

2.3.4.1 Inference Operation Example on DRP-AI

The following figure shows the inference operation example. The DRP-AI can perform AI inference with the DRP0 and AI-MAC. This operation is performed automatically by reading the descriptor thorough the DRP-AI driver after kicking the API. When AI inference is completed, the DRP-AI sends the interrupt flag to the CPU. Use the driver provided by Renesas to operate this unit.

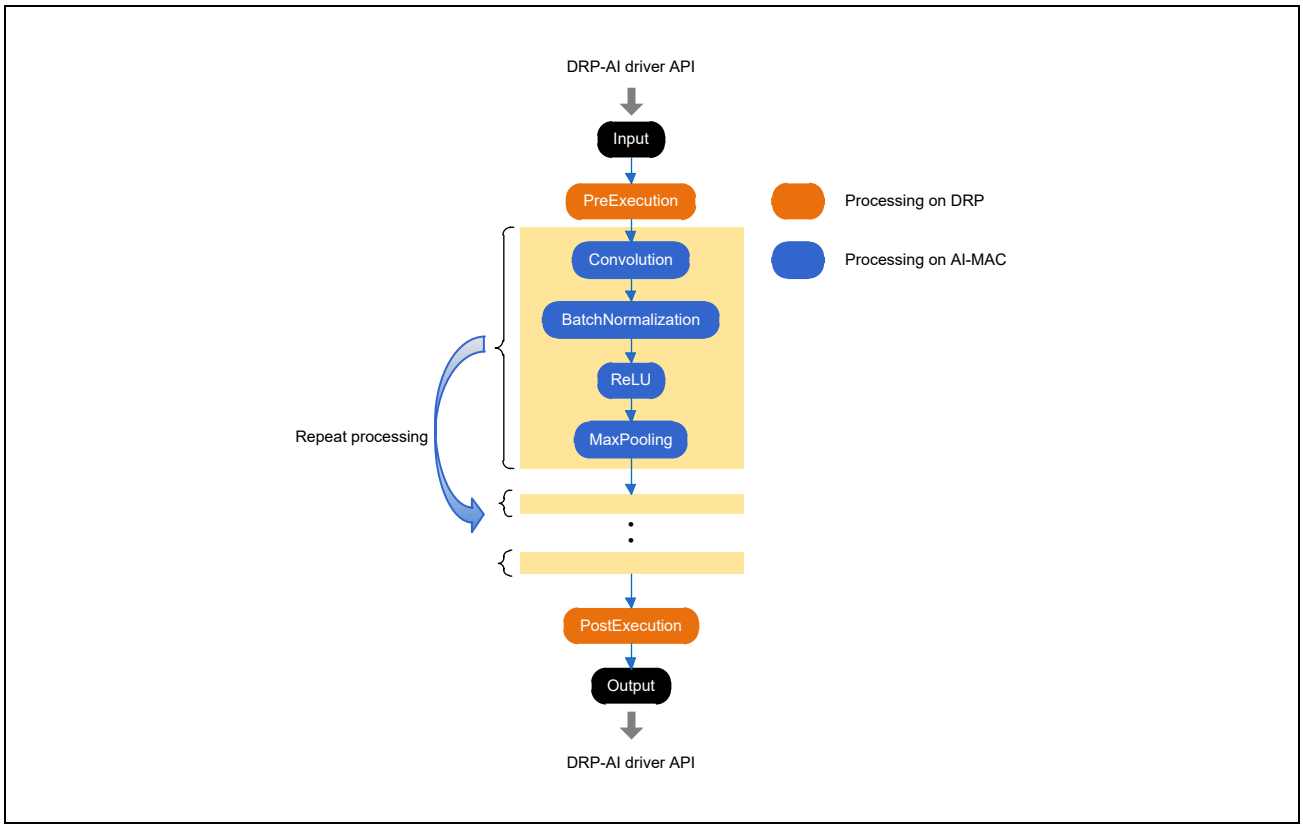

Figure 2.3-2 Inference Operation Example on DRP-AI

2.3.4.2 Event-Linked Operation

The DRP-AI supports the event-linked operation. The following figure shows an example. This operation makes DRP-AI wait to start processing until an event occurs after the DRP-AI driver kicks the API. The external module can send the event by using the registers and it will be detected by sync-table in the descriptor. When AI inference is completed, the DRP-AI can send the event signal to the external module.

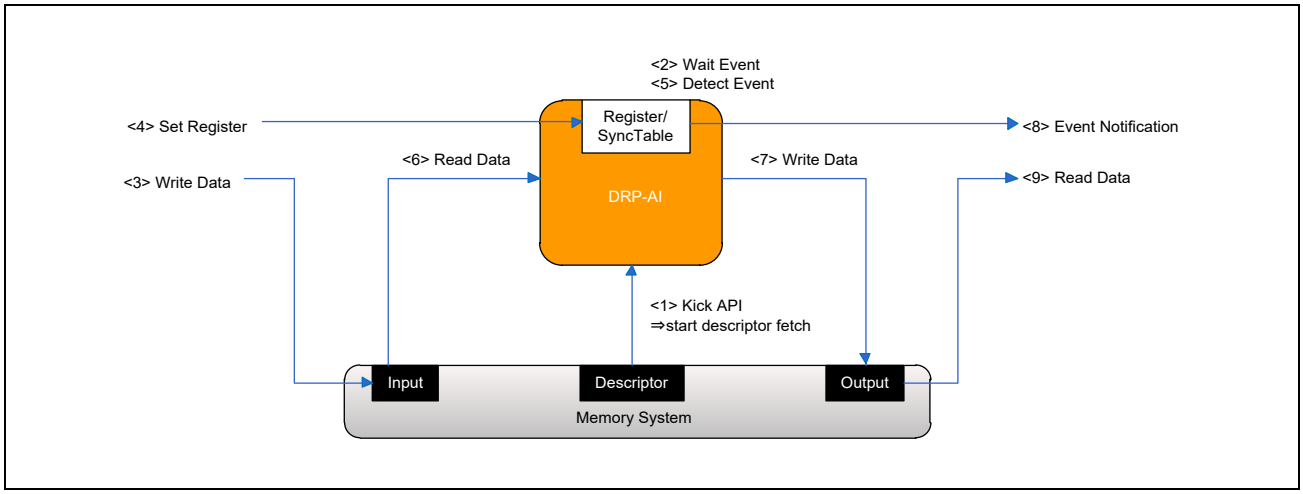

Figure 2.3-3 Event-Linked Operation Example on DRP-AI

2.3.5 Interrupt

The following table shows the list of interrupts. The DRP-AI driver refers them.

Table 2.3-5 List of Interrupt Pins

Pin Name	Input/Output	Function
ERRINT	Output	Error interrupt notification from the DRP.
NMLINT	Output	Normal interrupt notification from the DRP. This means the completion of DMA transfer.
ELCO	Output	Event output notification from the DRP. The source is same as NMLINT.
MAC_ERRINT	Output	Error interrupt notification from the AI-MAC.
MAC_NMLINT	Output	Normal interrupt notification from the AI-MAC. This means the completion of DMA transfer.
MAC_ELCO	Output	Event output notification from the AI-MAC. The source is same as MAC_NMLINT.

2.3.6 Usage Notes

2.3.6.1 Upper Frequency Limit

Both DRP0 and AI-MAC support software-controlled upper frequency limit for suppressing the power consumption. For details, see the following table. If the API supports the same functionality, use it instead of directly accessing the following registers.

Table 2.3-6 Control Registers and Their Bit Fields for Upper Frequency Limit

Block	Control Register	Bit Field
DRP0	DRPAI_DRP_MINDIV	RegMinDiv
AI-MAC	DRPAI_MAC_EXD0_STPC_CLKSW_CONFIG	DIVFIX

SECTION 3 MEMORY

3.1 Memory Overview

This LSI has a 3-channel SRAM (SRAM0 to SRAM2).

Each SRAM size is 512 KB for a total of 1.5 MB SRAM. See **3.2 SRAM** for details on SRAM.

In addition, this LSI also has a 128-KB ROM that is used to store the boot firmware. See **3.3 ROM** for details on ROM.

The LPDDR4/4X controller (DDR) is used to connect external memory.

This unit conforms to the following standards.

- LPDDR4 (JEDEC STANDARD JESD209-4D)
- LPDDR4X (JEDEC STANDARD JESD209-4-1A)

See **3.4 LPDDR4/4X Controller (DDR)** for details.

This LSI is equipped with seven TrustZone address space controllers (TZCs) to ensure safe memory access.

See **3.5 TrustZone Address Space Controller (TZC)** for details.

SECTION 3 MEMORY

3.2 SRAM

3.2.1 Overview

This LSI has three 512-Kbyte areas of on-chip RAM for use as the CM33 and CA55 working areas.

Each of on-chip RAM incorporates an ECC function, which allows the detection and correction of 1-bit errors and the detection of 2-bit errors. When a 1-bit or 2-bit error occurs, the address where the error occurred can be stored in an ECC error address register.

Table 3.2-1 shows the relationship between the unit number and the base address in RAM area.

Table 3.2-1 Relationship between Unit Number and Address <SRAMm_base> (m = 0 to 2)

Unit Number	Channel Number	RAM Area Base Address <SRAMm_base>	RAM Area Base Address (Code Area) <SRAMm_base>	RAM Area Base Address (Data Area) <SRAMm_base>
SRAM0	2	0_0800_0000h	1800_0000h*1, 0800_0000h*2	3800_0000h*1, 2800_0000h*2
SRAM1	2	0_0808_0000h	1808_0000h*1, 0808_0000h*2	3808_0000h*1, 2808_0000h*2
SRAM2	4	0_0810_0000h	1810_0000h*1, 0810_0000h*2	3810_0000h*1, 2810_0000h*2

Note 1. CM33 address space (non-secure)

Note 2. CM33 address space (secure)

Note 3. SRAM0 and SRAM1 are for MCPU, SRAM2 is for ACPU.

3.2.1.1 SRAMm (m = 0, 1)

The data bus width is 64 bits. This is divided into two channels as shown in **Figure 3.2-1**, with detection handled in each 32-bit channel.

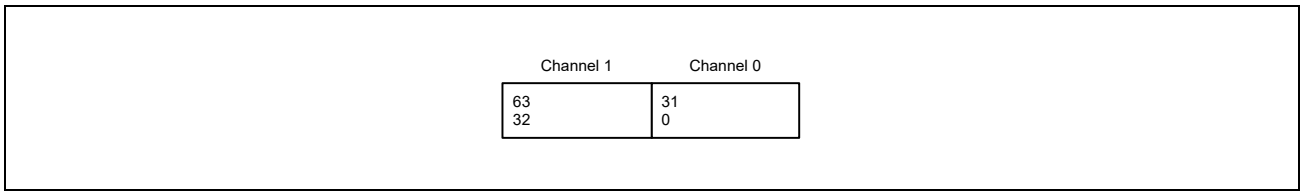

Figure 3.2-1 Division for ECC Processing for SRAMm (m = 0, 1)

Table 3.2-2 Relationship between Each Channel and Address for SRAMm (m = 0, 1)

Channel Number	Address
Ch. 0	<SRAMm_base> + 20h × k
Ch. 1	<SRAMm_base> + 20h × k + 04h

Note: k = 0, 1, 2, …, 65535

Note: <SRAMm_base>: See **Table 3.2-1**.

3.2.1.2 SRAMm (m = 2)

The data bus width is 128 bits. This is divided into four channels as shown in **Figure 3.2-2**, with detection handled in each 32-bit channel.

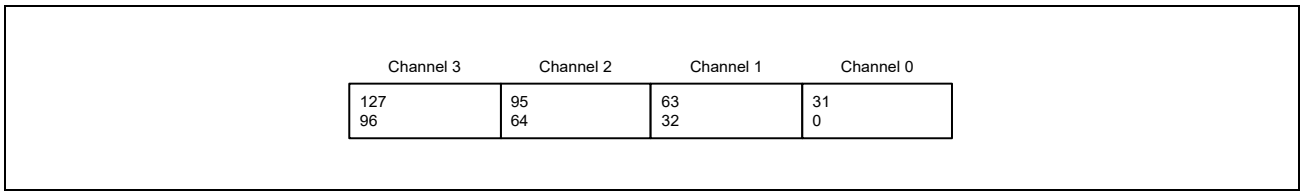

Figure 3.2-2 Division for ECC Processing for SRAMm (m = 2)

Table 3.2-3 Relationship between Each Channel and Address for SRAMm (m = 2)

Channel Number	Address
Ch. 0	<SRAMm_base> + 20h × k
Ch. 1	<SRAMm_base> + 20h × k + 04h
Ch. 2	<SRAMm_base> + 20h × k + 08h
Ch. 3	<SRAMm_base> + 20h × k + 0Ch

Note: k = 0, 1, 2, …, 32767

Note: <SRAMm_base>: See **Table 3.2-1**.

3.2.1.3 Features

- Error detection and correction
  - Detection and correction of 1-bit errors and detection of 2-bit errors are possible.
  - An error involving 3 or more bits cannot be correctly handled and may result in erroneous detection and correction.
- Control of error detection and correction
  - Error detection and correction, and correction of 1-bit errors can respectively be enabled or disabled.
- Capture of the addresses where errors occurred
  - When a 1-bit or 2-bit error is detected, the address where the error was encountered is stored in an ECC error address register. Each channel has eight ECC error address registers.
- Interrupt request
  - An interrupt request can be generated on the detection of a 1-bit error (selectable as enabled or disabled).
  - An interrupt request can be generated on the detection of a 2-bit error (selectable as enabled or disabled).
  - An overflow interrupt is generated from each channel on detection of an error when all ECC error address registers contain values.

3.2.2 RAM Registers

The base addresses for the respective channels are as follows.

Table 3.2-4 Register Base Addresses

Base Register Name	Unit Name	Base Address
<SRAM0_base>	SRAM0	0_1101_0000h (5101_0000h*1, 4101_0000h*2)
<SRAM1_base>	SRAM1	0_1102_0000h (5102_0000h*1, 4102_0000h*2)
<SRAM2_base>	SRAM2	0_1480_0000h (5480_0000h*1, 4480_0000h*2)

Note 1. CM33 address space (non-secure)

Note 2. CM33 address space (secure)

3.2.2.1 List of Registers

SRAM0, SRAM1's registers are listed below.

Register Name	Abbreviation	Initial Value	Offset Address	Access Size [bits]
ECC Control Registers_n	SRAMm_CTL_n	0000_0010h	0000h + n x 0040h	32
ECC Error Address Registers 0_n	SRAMm_EAD0_n	0000_0000h	0010h + n x 0040h	32
ECC Error Address Registers 1_n	SRAMm_EAD1_n	0000_0000h	0014h + n x 0040h	32
ECC Error Address Registers 2_n	SRAMm_EAD2_n	0000_0000h	0018h + n x 0040h	32
ECC Error Address Registers 3_n	SRAMm_EAD3_n	0000_0000h	001Ch + n x 0040h	32
ECC Error Address Registers 4_n	SRAMm_EAD4_n	0000_0000h	0020h + n x 0040h	32
ECC Error Address Registers 5_n	SRAMm_EAD5_n	0000_0000h	0024h + n x 0040h	32
ECC Error Address Registers 6_n	SRAMm_EAD6_n	0000_0000h	0028h + n x 0040h	32
ECC Error Address Registers 7_n	SRAMm_EAD7_n	0000_0000h	002Ch + n x 0040h	32

Note: n: Channel number (n = 0, 1)

SRAM2's registers are listed below.

Register Name	Abbreviation	Initial Value	Offset Address	Access Size [bits]
ECC Control Registers_n	SRAMm_CTL_n	0000_0010h	0000h + n x 0040h	32
ECC Error Address Registers 0_n	SRAMm_EAD0_n	0000_0000h	0010h + n x 0040h	32
ECC Error Address Registers 1_n	SRAMm_EAD1_n	0000_0000h	0014h + n x 0040h	32
ECC Error Address Registers 2_n	SRAMm_EAD2_n	0000_0000h	0018h + n x 0040h	32
ECC Error Address Registers 3_n	SRAMm_EAD3_n	0000_0000h	001Ch + n x 0040h	32
ECC Error Address Registers 4_n	SRAMm_EAD4_n	0000_0000h	0020h + n x 0040h	32
ECC Error Address Registers 5_n	SRAMm_EAD5_n	0000_0000h	0024h + n x 0040h	32
ECC Error Address Registers 6_n	SRAMm_EAD6_n	0000_0000h	0028h + n x 0040h	32
ECC Error Address Registers 7_n	SRAMm_EAD7_n	0000_0000h	002Ch + n x 0040h	32

Note: n: Channel number (n = 0 to 3)

3.2.3 RAM Register Descriptions

3.2.3.1 ECC Control Registers_n (SRAMm_CTL_n) (n: SRAMm Channel Number)

Each ECC control register_n is used to control the ECC function in the corresponding channel n.

After writing the initial value to the entire usage area of the on-chip RAM, set the given ECERVF bits to 1b to enable error detection. Be sure to write 01b to the corresponding EMCA[1:0] bits to enable writing to an ECERVF bit.

For writing the initial value to the on-chip RAM areas, see **3.2.5 Initializing the Detection-Usage Areas of the On-Chip RAM**.

Access Size : 32 bits

Address : <SRAMm_base> + 0000h + n x 0040h

Initial Value : 0000_0010h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ECDEDF7	ECSEDF7	ECDEDF6	ECSEDF6	ECDEDF5	ECSEDF5	ECDEDF4	ECSEDF4	ECDEDF3	ECSEDF3	ECDEDF2	ECSEDF2	ECDEDF1	ECSEDF1	ECDEDF0	ECSEDF0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	EMCA[1:0]		-	-	ECOVFF	ECER2C	ECER1C	-	-	ECERVF	EC1ECP	EC2EDIC	EC1EDIC	ECER2F	ECER1F	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0
R/W	RW	RW	R	R	R	RW	RW	R	R	RW	RW	RW	RW	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	ECDEDF7	0h	R	These bits hold the address of the (x + 1)th error to have been detected. These bits are cleared to 0b under the following condition: Clearing ECER2F or ECER1F in the SRAMm_CTL_n register.
30	ECSEDF7	0h	R	
29	ECDEDF6	0h	R	
28	ECSEDF6	0h	R	
27	ECDEDF5	0h	R	
26	ECSEDF5	0h	R	
25	ECDEDF4	0h	R	
24	ECSEDF4	0h	R	
23	ECDEDF3	0h	R	
22	ECSEDF3	0h	R	
21	ECDEDF2	0h	R	
20	ECSEDF2	0h	R	
19	ECDEDF1	0h	R	
18	ECSEDF1	0h	R	
17	ECDEDF0	0h	R	
16	ECSEDF0	0h	R	
15, 14	EMCA[1:0]	0h	RW	Enable Writing to ECERVF 01b: Enabled Others: Disabled These bits are always read as 00b.
13, 12	-	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
11	ECOVFF	0h	R	ECC Overflow Detection Flag This bit is set to 1b and an overflow interrupt is output on detection of an error when the ECC error address registers (SRAMm_EADp_n (p = 0 to 7)) all contain data. An overflow interrupt is output even if the error is detected while the setting of this bit is already 1b. This bit is cleared to 0b under any of the following conditions. 1. Power-on reset 2. Writing 1b to the corresponding ECER2C bit or ECER1C bit 3. Setting the ECC error detection enable bit to “disabled” (ECERVF = 0b)

Bit	Bit Name	Initial Value	R/W	Description
10	ECER2C	0h	RW	2-Bit Error Detection Flag Clear 0b: The internal state does not change. 1b: The corresponding 2-bit error detection flag ECER2F is cleared. This bit is always read as 0b.
9	ECER1C	0h	RW	1-Bit Error Detection Flag Clear 0b: The internal state does not change. 1b: The corresponding 1-bit error detection flag ECER1F is cleared. This bit is always read as 0b.
8, 7	-	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
6	ECERVF	0h	RW	ECC Error Detection Enable 0b: Disables error detection. 1b: Enables error detection. 1-bit error correction (EC1ECP) and interrupt control (EC2EDIC and EC1EDIC) are only possible when error detection is enabled. Note: To write to this bit, the corresponding EMCA[1:0] bits must be set to 01b.
5	EC1ECP	0h	RW	1-Bit Error Correction Enable 0b: The error is corrected when a 1-bit error is detected. 1b: The error is not corrected when a 1-bit error is detected.
4	EC2EDIC	1h	RW	2-Bit Error Detection Interrupt Control 0b: An interrupt is not generated when a 2-bit error is detected. 1b: An interrupt is generated when a 2-bit error is detected. The interrupt is only generated when the corresponding 2-bit error detection flag (ECER2F) changes from 0 to 1.
3	EC1EDIC	0h	RW	1-Bit Error Detection Interrupt Control 0b: An interrupt is not generated when a 1-bit error is detected. 1b: An interrupt is generated when a 1-bit error is detected. The interrupt is only generated when the corresponding 1-bit error detection flag (ECER1F) changes from 0 to 1.
2	ECER2F	0h	R	2-Bit Error Detection Flag 0b: A 2-bit error has not occurred. 1b: A 2-bit error has occurred. This bit is cleared to 0b under any of the following conditions. 1. Power-on reset 2. Writing 1b to the corresponding ECER2C bit 3. Setting the ECC error detection enable bit to "disabled" (ECERVF = 0b)
1	ECER1F	0h	R	1-Bit Error Detection Flag 0b: A 1-bit error has not occurred. 1b: A 1-bit error has occurred. This bit is cleared to 0b under any of the following conditions. 1. Power-on reset 2. Writing 1b to the corresponding ECER1C bit 3. Setting the ECC error detection enable bit to "disabled" (ECERVF = 0b)
0	-	0h	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.

3.2.3.2 ECC Error Address Registers p_n (SRAMm_EADp_n) (n: SRAMm Channel Number) (p = 0 to 7)

When a 1- or 2-bit error occurs, up to eight error addresses are sequentially stored in the registers from SRAMm_EAD0_n to SRAMm_EAD7_n.

When a 2-bit error is detected while only 1-bit error addresses were stored up to SRAMm_EAD7_n, SRAMm_EAD7_n is overwritten by the address of the 2-bit error. Otherwise, it will not be overwritten. For details, see **3.2.6.4 ECC Error Address Register Overwrite Conditions**.

Access Size : 32 bits
Address : <SRAMm_base> + 0010h + n x 0040h + p x 0004h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ECEAD0[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ECEAD0[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	ECEAD0[31:0]	0h	R	These bits hold the address of the (x + 1)th error having been detected. These bits are cleared to 0b under the following condition: Clearing ECER2F or ECER1F in the SRAMm_CTL_n register.

3.2.4 Initializing the ECC Function

Initialize the ECC by following the procedure below to enable the ECC function.

1. Set the VECCEN bit in the ECCRAM setting register corresponding to the RAM area for which the ECC function is to be enabled to 1b.
2. Write the value to the entire usage area of the RAM for which the ECC function is to be enabled. The initial value can be any 32-bit value.
3. Set the ECERVF bits in the ECC control registers_n to 1b to enable error detection. Then, set the respective bits to control 1-bit error correction and interrupts.

For notes on the settings of registers of this module, see **3.2.6.1 Notes on Setting the Registers of This Module**.

ECC is initially enabled in SRAM0 by hardware control at booting.

3.2.5 Initializing the Detection-Usage Areas of the On-Chip RAM

Before using the ECC function, write the initial value to the entire usage area of the on-chip RAM for which the ECC function is to be enabled. The initial value can be any value. Since the detection of ECC errors is handled in 32-bit units in each channel, the initial value should also be written in 32-bit units.

Enabling error detection without initialization may cause an ECC error due to unintended reading.

Examples of Operations that May Lead to Errors

1. When writing is to proceed in 8- or 16-bit units, reading the 32-bit value from the given address and then writing the data
2. If the locations are not initialized, an ECC error may occur when the 32-bit value is read. For details on writing in 8- or 16-bit units, see **3.2.6.2 8- or 16-Bit Access**.
3. When the CPU cache is enabled, if a cache miss occurs in writing, the cache being refilled by a 1-line unit
   At this time if data are not initialized, an ECC error may occur because data are read in 1-line (32-byte) units.

3.2.6 Usage Notes

3.2.6.1 Notes on Setting the Registers of This Module

Ensure that none of the bus masters proceeds with access to the on-chip RAM areas while the registers listed in **3.2.2 RAM Registers** are being set up.

3.2.6.2 8- or 16-Bit Access

The ECC function for the on-chip RAM areas handles error detection in 32-bit units. Accordingly, when access is to be in 8- or 16-bit units, the operations proceed as follows.

3.2.6.2.1 8- or 16-bit reading

a) The 32 bits of data are read and the ECC is used to determine whether or not an error is present.

b) The 8 or 16 bits of data are then returned to the bus master that issued the read request.

3.2.6.2.2 8- or 16-bit writing

a) The 32 bits of data from the address that contains the location for writing are read and the ECC is used to determine whether or not an error is present.

b) The 32 bits of data that have been read are then overwritten with the 8- or 16-bit data.

c) The ECC value for the overwritten 32-bit data in (b) is added by writing it to the RAM.

3.2.6.3 Numbers of Cycles for Reading from or Writing to a RAM Area with the ECC Function Enabled

The numbers of cycles for reading from or writing to an on-chip RAM area with the ECC function enabled are as follows.

3.2.6.3.1 Reading

The number of cycles for reading in 8- or 16-bit and 32-bit units when the ECC function is enabled is one cycle of SRAM_0_ACLK, SRAM_1_ACLK or SRAM_2_ACLK longer than when the ECC function is disabled.

3.2.6.3.2 Writing

The number of cycles for writing in 8- or 16-bit units when the ECC function is enabled is two cycles of SRAM_0_ACLK, SRAM_1_ACLK or SRAM_2_ACLK longer than when the ECC function is disabled. The number of cycles for writing in 32-bit units when the ECC function is enabled is the same as when the ECC function is disabled.

3.2.6.4 ECC Error Address Register Overwrite Conditions

If a new ECC error occurs with the ECC error address stored up to SRAMm_EAD7_n, SRAMm_EAD7_n may or may not be overwritten. The conditions to be overwritten are shown below.

Error Address Storage Status Up to <REG_base> EAD7_n	New ECC Error	<REG_base>EAD7_n Overwrite	Overflow Interrupt
Only 1-bit error	1-bit error	Not overwritten	Occurred
Only 1-bit error	2-bit error	Overwritten	Occurred
Only 2-bit error	1-bit error	Not overwritten	Occurred
Only 2-bit error	2-bit error	Not overwritten	Occurred
1-bit error and 2-bit error	1-bit error	Not overwritten	Occurred
1-bit error and 2-bit error	2-bit error	Not overwritten	Occurred

SECTION 3 MEMORY

3.3 ROM

This section describes the functions of the ROM.

3.3.1 Functional Overview

This ROM is a boot ROM, which stores the boot F/W.

The ROM has a capacity of 128 KB (CA55 ROM, CM33 ROM).

Figure 3.3-1 shows the connection diagram of the ROM.

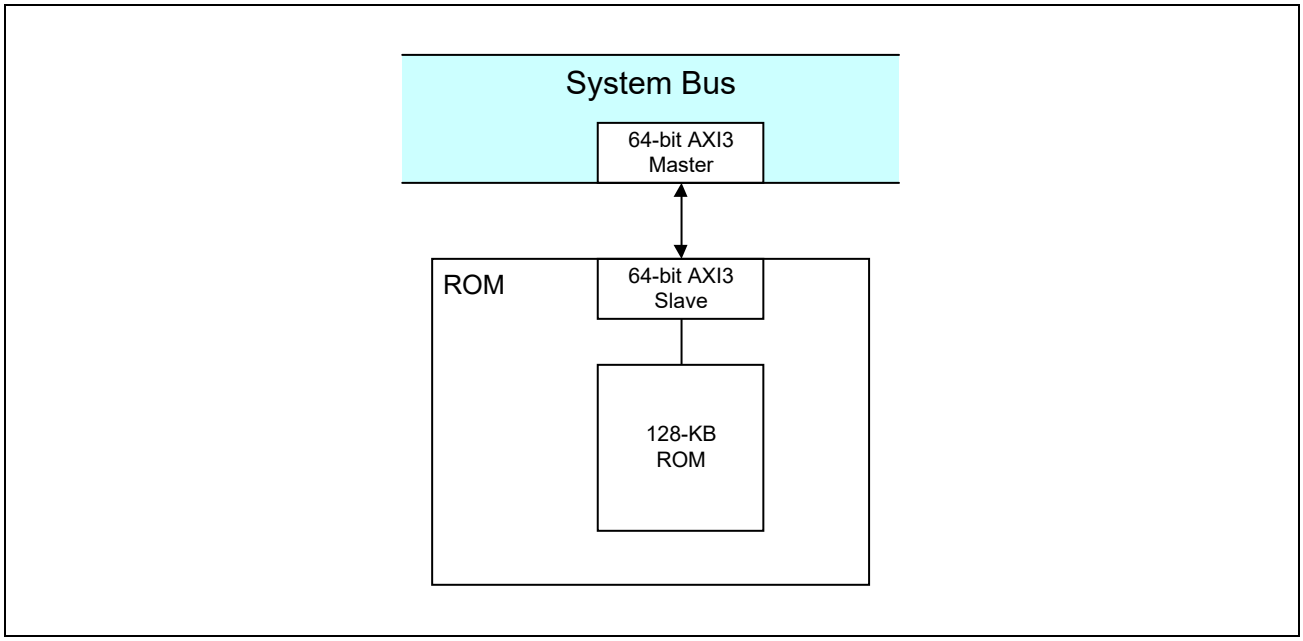

Figure 3.3-1 Schematic of ROM Connection

SECTION 3 MEMORY

3.4 LPDDR4/4X Controller (DDR)

This manual is a simplified version. For more information, refer to the User's Manual Additional Document.

3.4.1 Overview

This section describes the features of the DDR unit of this LSI.

This unit is an external bus controller for LPDDR4 and LPDDR4X. This unit supports LPDDR4-3200 and LPDDR4X-3200. The interface bus width is 32 bits. It supports the in-line ECC feature.

It is composed of the DDR controller block (MC) and the DDR PHY block (PHY).

For the setup of this block, refer to the Linux software package of this LSI, which contains the DDR setup codes.

3.4.1.1 Features

This unit supports the following specifications.

- LPDDR4 (JEDEC STANDARD JESD209-4D)
- LPDDR4X (JEDEC STANDARD JESD209-4-1A)

Table 3.4-1 lists the features of this unit.

Table 3.4-1 LPDDR4/4X Controller Features (1/2)

Feature	Description
DRAM I/F	• LPDDR4: 3200 Mbps (1600 MHz) • LPDDR4X: 3200 Mbps (1600 MHz) • Width: 32 bits (16 bits per channel) • Rank: 1, 2 • Density: Up to 8 GB (byte mode not supported)
MC	• Fully pipelined command, read and write data interfaces to the controller. • Advanced bank look-ahead features for high memory throughput. • A programmable register interface to control memory parameters and protocols including auto pre-charge. • Full initialization of memory on controller reset. • Supports the Weighted Round-Robin arbitration schema for arbitrating request from the ports. • ECC function for single bit and double bit error reporting, single bit error correction, and programmable removal of ECC storage. • Built-in self-test (BIST) for external DRAM memories.
PHY	For more information, refer to the User's Manual Additional Document.
Low power	• Multiple low power states (power-down, self-refresh, I/O retention) • Automatic or software interface

3.4.1.2 Block Diagram

Figure 3.4-1 shows a block diagram.

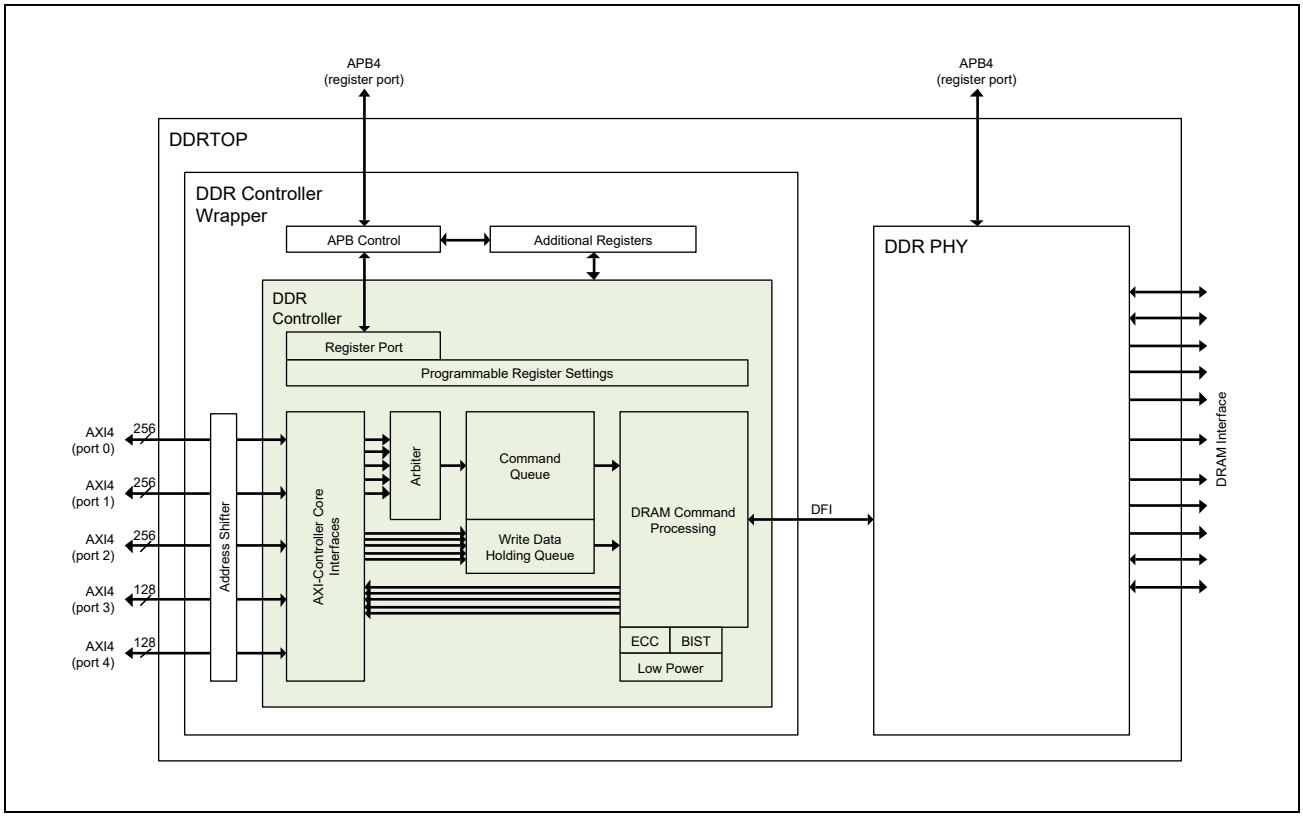

Figure 3.4-1 Block Diagram

3.4.1.3 External Pins

Table 3.4-2 lists the external pins of this unit.

Table 3.4-2 External Pins (1/2)

Pin Name	Input/Output	Description
DDRm_ZN	—	Calibration external reference resistor
DDRm_RESETN	Output	DRAM reset
DDRm_CKEA0	I/O	DRAM clock enable (rank 0)
DDRm_CKEA1	I/O	DRAM clock enable (rank 1)
DDRm_CAA0	I/O	DRAM command/address
DDRm_CAA1	I/O	DRAM command/address
DDRm_CKAT	I/O	DRAM clock (positive)
DDRm_CKAC	I/O	DRAM clock (negative)
DDRm_CSA0	I/O	DRAM chip select (rank 0)
DDRm_CSA1	I/O	DRAM chip select (rank 1)
DDRm_CAA2	I/O	DRAM command/address
DDRm_CAA3	I/O	DRAM command/address
DDRm_CAA4	I/O	DRAM command/address
DDRm_CAA5	I/O	DRAM command/address
DDRm_DQA0	I/O	DRAM data
DDRm_DQA1	I/O	DRAM data
DDRm_DQA2	I/O	DRAM data
DDRm_DQA3	I/O	DRAM data
DDRm_DQA4	I/O	DRAM data
DDRm_DQA5	I/O	DRAM data
DDRm_DQA6	I/O	DRAM data
DDRm_DQA7	I/O	DRAM data
DDRm_DMIA0	I/O	DRAM data mask inversion
DDRm_DQSAT0	I/O	DRAM data strobe (positive)
DDRm_DQSAC0	I/O	DRAM data strobe (negative)
DDRm_DQA8	I/O	DRAM data
DDRm_DQA9	I/O	DRAM data
DDRm_DQA10	I/O	DRAM data
DDRm_DQA11	I/O	DRAM data
DDRm_DQA12	I/O	DRAM data
DDRm_DQA13	I/O	DRAM data
DDRm_DQA14	I/O	DRAM data
DDRm_DQA15	I/O	DRAM data
DDRm_DMIA1	I/O	DRAM data mask inversion
DDRm_DQSAT1	I/O	DRAM data strobe (positive)
DDRm_DQSAC1	I/O	DRAM data strobe (negative)
DDRm_CKEB0	I/O	DRAM clock enable (rank 0)
DDRm_CKEB1	I/O	DRAM clock enable (rank 1)
DDRm_CAB0	I/O	DRAM command/address
DDRm_CAB1	I/O	DRAM command/address
DDRm_CKBT	I/O	DRAM clock (positive)

Table 3.4-2 External Pins (2/2)

Pin Name	Input/Output	Description
DDRm_CKBC	I/O	DRAM clock (negative)
DDRm_CSB0	I/O	DRAM chip select (rank 0)
DDRm_CSB1	I/O	DRAM chip select (rank 1)
DDRm_CAB2	I/O	DRAM command/address
DDRm_CAB3	I/O	DRAM command/address
DDRm_CAB4	I/O	DRAM command/address
DDRm_CAB5	I/O	DRAM command/address
DDRm_DQB0	I/O	DRAM data
DDRm_DQB1	I/O	DRAM data
DDRm_DQB2	I/O	DRAM data
DDRm_DQB3	I/O	DRAM data
DDRm_DQB4	I/O	DRAM data
DDRm_DQB5	I/O	DRAM data
DDRm_DQB6	I/O	DRAM data
DDRm_DQB7	I/O	DRAM data
DDRm_DMIB0	I/O	DRAM data mask inversion
DDRm_DQSBT0	I/O	DRAM data strobe (positive)
DDRm_DQSBC0	I/O	DRAM data strobe (negative)
DDRm_DQB8	I/O	DRAM data
DDRm_DQB9	I/O	DRAM data
DDRm_DQB10	I/O	DRAM data
DDRm_DQB11	I/O	DRAM data
DDRm_DQB12	I/O	DRAM data
DDRm_DQB13	I/O	DRAM data
DDRm_DQB14	I/O	DRAM data
DDRm_DQB15	I/O	DRAM data
DDRm_DMIB1	I/O	DRAM data mask inversion
DDRm_DQSBT1	I/O	DRAM data strobe (positive)
DDRm_DQSBC1	I/O	DRAM data strobe (negative)

Note: m = 0

3.4.2 Registers

Table 3.4-3 lists the base addresses of the DDR controller.

Table 3.4-3 Register Base Addresses

Base Register Name	DDR Ch.	The Base Address
<DDR_MEMC0_base>	DDR0	0_1E00_0000h (5E00_0000h*1, 4E00_0000h*2)

Note 1. CM33 address space (non-secure)

Note 2. CM33 address space (secure)

3.4.2.1 List of Registers

The registers are listed below.

[m = 0]

Register Name	Abbreviation	Initial Value	Offset Address	Access Size [bits]
DENALI_CTL_00 Register	DDR_MEMCm_DENALI_CTL_00	0000_0000h	0000h	8, 16, 32
Reserve	-	-	0004h to 03F3h	-
DENALI_CTL_253 Register	DDR_MEMC_DENALI_CTL_253	0000_0000h	03F4h	8, 16, 32
DENALI_CTL_254 Register	DDR_MEMC_DENALI_CTL_254	0000_0000h	03F8h	8, 16, 32
DENALI_CTL_255 Register	DDR_MEMC_DENALI_CTL_255	0000_0000h	03FCh	8, 16, 32
DENALI_CTL_256 Register	DDR_MEMC_DENALI_CTL_256	0000_0000h	0400h	8, 16, 32
DENALI_CTL_257 Register	DDR_MEMC_DENALI_CTL_257	0000_0000h	0404h	8, 16, 32
DENALI_CTL_258 Register	DDR_MEMC_DENALI_CTL_258	0000_0000h	0408h	8, 16, 32
DENALI_CTL_259 Register	DDR_MEMC_DENALI_CTL_259	0000_0000h	040Ch	8, 16, 32
DENALI_CTL_260 Register	DDR_MEMC_DENALI_CTL_260	0000_0000h	0410h	8, 16, 32
DENALI_CTL_261 Register	DDR_MEMC_DENALI_CTL_261	0000_0000h	0414h	8, 16, 32
DENALI_CTL_262 Register	DDR_MEMC_DENALI_CTL_262	0000_0000h	0418h	8, 16, 32
DENALI_CTL_263 Register	DDR_MEMC_DENALI_CTL_263	0000_0000h	041Ch	8, 16, 32
DENALI_CTL_264 Register	DDR_MEMC_DENALI_CTL_264	0000_0000h	0420h	8, 16, 32
DENALI_CTL_265 Register	DDR_MEMC_DENALI_CTL_265	0000_0000h	0424h	8, 16, 32
DENALI_CTL_266 Register	DDR_MEMC_DENALI_CTL_266	0000_0000h	0428h	8, 16, 32
DENALI_CTL_267 Register	DDR_MEMC_DENALI_CTL_267	0000_0000h	042Ch	8, 16, 32
DENALI_CTL_268 Register	DDR_MEMC_DENALI_CTL_268	0000_0000h	0430h	8, 16, 32
DENALI_CTL_269 Register	DDR_MEMC_DENALI_CTL_269	0000_0000h	0434h	8, 16, 32
Reserve	-	-	0438h to 04F7h	-
DENALI_CTL_318 Register	DDR_MEMCm_DENALI_CTL_318	0000_0000h	04F8h	8, 16, 32
DENALI_CTL_319 Register	DDR_MEMCm_DENALI_CTL_319	0000_0000h	04FCh	8, 16, 32
Reserve	-	-	0500h to 05F7h	-
DENALI_CTL_382 Register	DDR_MEMCm_DENALI_CTL_382	0000_0000h	05F8h	8, 16, 32
DENALI_CTL_383 Register	DDR_MEMCm_DENALI_CTL_383	0000_0000h	05FCh	8, 16, 32
DENALI_CTL_384 Register	DDR_MEMCm_DENALI_CTL_384	0000_0000h	0600h	8, 16, 32
DENALI_CTL_385 Register	DDR_MEMCm_DENALI_CTL_385	0000_0000h	0604h	8, 16, 32
DENALI_CTL_386 Register	DDR_MEMCm_DENALI_CTL_386	0000_0000h	0608h	8, 16, 32
DENALI_CTL_387 Register	DDR_MEMCm_DENALI_CTL_387	0000_0000h	060Ch	8, 16, 32
Reserve	-	-	0610h to 0B2Fh	-

Register Name	Abbreviation	Initial Value	Offset Address	Access Size [bits]
DENALI_CTL_716 Register	DDR_MEMCm_DENALI_CTL_716	0000_0000h	0B30h	8, 16, 32
DENALI_CTL_717 Register	DDR_MEMCm_DENALI_CTL_717	0000_0000h	0B34h	8, 16, 32
DENALI_CTL_718 Register	DDR_MEMCm_DENALI_CTL_718	0000_0000h	0B38h	8, 16, 32
DENALI_CTL_719 Register	DDR_MEMCm_DENALI_CTL_719	0000_0000h	0B3Ch	8, 16, 32
DENALI_CTL_720 Register	DDR_MEMCm_DENALI_CTL_720	0000_0000h	0B40h	8, 16, 32
DENALI_CTL_721 Register	DDR_MEMCm_DENALI_CTL_721	0000_0000h	0B44h	8, 16, 32
DENALI_CTL_722 Register	DDR_MEMCm_DENALI_CTL_722	0000_0000h	0B48h	8, 16, 32
DENALI_CTL_723 Register	DDR_MEMCm_DENALI_CTL_723	0000_0000h	0B4Ch	8, 16, 32
DENALI_CTL_724 Register	DDR_MEMCm_DENALI_CTL_724	0000_0000h	0B50h	8, 16, 32
DENALI_CTL_725 Register	DDR_MEMCm_DENALI_CTL_725	0000_0000h	0B54h	8, 16, 32
DENALI_CTL_726 Register	DDR_MEMCm_DENALI_CTL_726	0000_0000h	0B58h	8, 16, 32
DENALI_CTL_727 Register	DDR_MEMCm_DENALI_CTL_727	0000_0000h	0B5Ch	8, 16, 32
DENALI_CTL_728 Register	DDR_MEMCm_DENALI_CTL_728	0000_0000h	0B60h	8, 16, 32
DENALI_CTL_729 Register	DDR_MEMCm_DENALI_CTL_729	0000_0000h	0B64h	8, 16, 32
DENALI_CTL_730 Register	DDR_MEMCm_DENALI_CTL_730	0000_0000h	0B68h	8, 16, 32
DENALI_CTL_731 Register	DDR_MEMCm_DENALI_CTL_731	0000_0000h	0B6Ch	8, 16, 32
Reserve	-	-	0B70h to 1FFFh	-
MCAR_CTL Register	DDR_MEMCm_MCAR_CTL	0000_0000h	2000h	8, 16, 32
MCAR_MON Register	DDR_MEMCm_MCAR_MON	0000_0000h	2004h	8, 16, 32
MCAR_AXCTL0 Register	DDR_MEMCm_MCAR_AXCTL0	0000_0000h	2008h	8, 16, 32
MCAR_AXCTL1 Register	DDR_MEMCm_MCAR_AXCTL1	0000_0000h	200Ch	8, 16, 32
MCAR_AXCTL2 Register	DDR_MEMCm_MCAR_AXCTL2	0000_0000h	2010h	8, 16, 32

3.4.2.2 Register Description

3.4.2.2.1 DENALI_CTL_00 Register (DDR_MEMCm_DENALI_CTL_00)

Access Size : 8, 16, 32 bits
Offset Address : <DDR_MEMCm_base> + 0000h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	start
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
0	start	0h	RW	Triggers controller initialization and normal operation. Prior to setting this parameter to 1b, the controller will not issue any commands to the DRAM memories or respond to any signal activity except for reading and writing parameters and accepting traffic that the customer may send into the Controller core queues. Once this parameter is set to 1b, the controller will respond to inputs from the ASIC and begin to process memory access commands. Note that resetting this parameter to 0b will not shut off traffic. Note: Until the initialization complete interrupt (bit [1]) will be set to 1b in the int_status_init parameter and the dfi_init_complete signal is asserted from the PHY, commands will not be accepted into the Controller core command queue. Note: It is imperative that the controller is driving the dfi_reset_n_pZ and dfi_cke_pZ signals before this parameter is asserted. 0b: Controller is not in active mode. 1b: Initiate active mode for the controller.

3.4.2.2.2 DENALI_CTL_253 Register (DDR_MEMCm_DENALI_CTL_253)

Access Size : 8, 16, 32 bits

Address : <DDR_MEMC_base> + 03F4h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	non_ecc_region_end_addr_0[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	non_ecc_region_start_addr_0[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
28 to 16	non_ecc_region_end_addr_0[12:0]	0h	RW	Set the ending address of the soft-designated non-ECC region 0. The address written is 1 MB aligned.
15 to 13	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
12 to 0	non_ecc_region_start_addr_0[12:0]	0h	RW	Set the base address of the soft-designated non-ECC region 0. The address written is 1 MB aligned.

3.4.2.2.3 DENALI_CTL_254 Register (DDR_MEMCm_DENALI_CTL_254)

Access Size : 8, 16, 32 bits

Address : <DDR_MEMC_base> + 03F8h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	non_ecc_region_end_addr_1[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	non_ecc_region_start_addr_1[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
28 to 16	non_ecc_region_end_addr_1[12:0]	0h	RW	Set the ending address of the soft-designated non-ECC region 1. The address written is 1 MB aligned.
15 to 13	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
12 to 0	non_ecc_region_start_addr_1[12:0]	0h	RW	Set the base address of the soft-designated non-ECC region 1. The address written is 1 MB aligned.

3.4.2.2.4 DENALI_CTL_255 Register (DDR_MEMCm_DENALI_CTL_255)

Access Size : 8, 16, 32 bits

Address : <DDR_MEMC_base> + 03FCh

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	non_ecc_region_end_addr_2[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	non_ecc_region_start_addr_2[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
28 to 16	non_ecc_region_end_addr_2[12:0]	0h	RW	Set the ending address of the soft-designated non-ECC region 2. The address written is 1 MB aligned.
15 to 13	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
12 to 0	non_ecc_region_start_addr_2[12:0]	0h	RW	Set the base address of the soft-designated non-ECC region 2. The address written is 1 MB aligned.

3.4.2.2.5 DENALI_CTL_256 Register (DDR_MEMCm_DENALI_CTL_256)

Access Size : 8, 16, 32 bits

Address : <DDR_MEMC_base> + 0400h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	non_ecc_region_end_addr_3[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	non_ecc_region_start_addr_3[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
28 to 16	non_ecc_region_end_addr_3[12:0]	0h	RW	Set the ending address of the soft-designated non-ECC region 3. The address written is 1 MB aligned.
15 to 13	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
12 to 0	non_ecc_region_start_addr_3[12:0]	0h	RW	Set the base address of the soft-designated non-ECC region 3. The address written is 1 MB aligned.

3.4.2.2.6 DENALI_CTL_257 Register (DDR_MEMCm_DENALI_CTL_257)

Access Size : 8, 16, 32 bits

Address : <DDR_MEMC_base> + 0404h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	non_ecc_region_end_addr_4[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	non_ecc_region_start_addr_4[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
28 to 16	non_ecc_region_end_addr_4[12:0]	0h	RW	Set the ending address of the soft-designated non-ECC region 4. The address written is 1 MB aligned.
15 to 13	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
12 to 0	non_ecc_region_start_addr_4[12:0]	0h	RW	Set the base address of the soft-designated non-ECC region 4. The address written is 1 MB aligned.

3.4.2.2.7 DENALI_CTL_258 Register (DDR_MEMCm_DENALI_CTL_258)

Access Size : 8, 16, 32 bits

Address : <DDR_MEMC_base> + 0408h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	non_ecc_region_end_addr_5[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	non_ecc_region_start_addr_5[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
28 to 16	non_ecc_region_end_addr_5[12:0]	0h	RW	Set the ending address of the soft-designated non-ECC region 5. The address written is 1 MB aligned.
15 to 13	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
12 to 0	non_ecc_region_start_addr_5[12:0]	0h	RW	Set the base address of the soft-designated non-ECC region 5. The address written is 1 MB aligned.

3.4.2.2.8 DENALI_CTL_259 Register (DDR_MEMCm_DENALI_CTL_259)

Access Size : 8, 16, 32 bits

Address : <DDR_MEMC_base> + 040Ch

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	non_ecc_region_end_addr_6[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	non_ecc_region_start_addr_6[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
28 to 16	non_ecc_region_end_addr_6[12:0]	0h	RW	Set the ending address of the soft-designated non-ECC region 6. The address written is 1 MB aligned.
15 to 13	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
12 to 0	non_ecc_region_start_addr_6[12:0]	0h	RW	Set the base address of the soft-designated non-ECC region 6. The address written is 1 MB aligned.

3.4.2.2.9 DENALI_CTL_260 Register (DDR_MEMCm_DENALI_CTL_260)

Access Size : 8, 16, 32 bits

Address : <DDR_MEMC_base> + 0410h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	non_ecc_region_end_addr_7[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
28 to 16	non_ecc_region_end_addr_7[12:0]	0h	RW	Set the ending address of the soft-designated non-ECC region 7. The address written is 1 MB aligned.
15 to 13	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
12 to 0	non_ecc_region_start_addr_7[12:0]	0h	RW	Set the base address of the soft-designated non-ECC region 7. The address written is 1 MB aligned.

3.4.2.2.10 DENALI_CTL_261 Register (DDR_MEMCm_DENALI_CTL_261)

Access Size : 8, 16, 32 bits
Address : <DDR_MEMC_base> + 0414h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	non_ecc_region_end_addr_8[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	non_ecc_region_start_addr_8[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
28 to 16	non_ecc_region_end_addr_8[12:0]	0h	RW	Set the ending address of the soft-designated non-ECC region 8. The address written is 1 MB aligned.
15 to 13	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
12 to 0	non_ecc_region_start_addr_8[12:0]	0h	RW	Set the base address of the soft-designated non-ECC region 8. The address written is 1 MB aligned.

3.4.2.2.11 DENALI_CTL_262 Register (DDR_MEMCm_DENALI_CTL_262)

Access Size : 8, 16, 32 bits
Address : <DDR_MEMC_base> + 0418h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	non_ecc_region_end_addr_9[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	non_ecc_region_start_addr_9[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
28 to 16	non_ecc_region_end_addr_9[12:0]	0h	RW	Set the ending address of the soft-designated non-ECC region 9. The address written is 1 MB aligned.
15 to 13	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
12 to 0	non_ecc_region_start_addr_9[12:0]	0h	RW	Set the base address of the soft-designated non-ECC region 9. The address written is 1 MB aligned.

3.4.2.2.12 DENALI_CTL_263 Register (DDR_MEMCm_DENALI_CTL_263)

Access Size : 8, 16, 32 bits

Address : <DDR_MEMC_base> + 041Ch

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	non_ecc_region_end_addr_10[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	non_ecc_region_start_addr_10[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
28 to 16	non_ecc_region_end_addr_10[12:0]	0h	RW	Set the ending address of the soft-designated non-ECC region 10. The address written is 1 MB aligned.
15 to 13	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
12 to 0	non_ecc_region_start_addr_10[12:0]	0h	RW	Set the base address of the soft-designated non-ECC region 10. The address written is 1 MB aligned.

3.4.2.2.13 DENALI_CTL_264 Register (DDR_MEMCm_DENALI_CTL_264)

Access Size : 8, 16, 32 bits

Address : <DDR_MEMC_base> + 0420h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	non_ecc_region_end_addr_11[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	non_ecc_region_start_addr_11[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
28 to 16	non_ecc_region_end_addr_11[12:0]	0h	RW	Set the ending address of the soft-designated non-ECC region 11. The address written is 1 MB aligned.
15 to 13	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
12 to 0	non_ecc_region_start_addr_11[12:0]	0h	RW	Set the base address of the soft-designated non-ECC region 11. The address written is 1 MB aligned.

3.4.2.2.14 DENALI_CTL_265 Register (DDR_MEMCm_DENALI_CTL_265)

Access Size : 8, 16, 32 bits

Address : <DDR_MEMC_base> + 0424h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	non_ecc_region_end_addr_12[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	non_ecc_region_start_addr_12[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
28 to 16	non_ecc_region_end_addr_12[12:0]	0h	RW	Set the ending address of the soft-designated non-ECC region 12. The address written is 1 MB aligned.
15 to 13	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
12 to 0	non_ecc_region_start_addr_12[12:0]	0h	RW	Set the base address of the soft-designated non-ECC region 12. The address written is 1 MB aligned.

3.4.2.2.15 DENALI_CTL_266 Register (DDR_MEMCm_DENALI_CTL_266)

Access Size : 8, 16, 32 bits

Address : <DDR_MEMC_base> + 0428h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	non_ecc_region_end_addr_13[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	non_ecc_region_start_addr_13[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
28 to 16	non_ecc_region_end_addr_13[12:0]	0h	RW	Set the ending address of the soft-designated non-ECC region 13. The address written is 1 MB aligned.
15 to 13	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
12 to 0	non_ecc_region_start_addr_13[12:0]	0h	RW	Set the base address of the soft-designated non-ECC region 13. The address written is 1 MB aligned.

3.4.2.2.16 DENALI_CTL_267 Register (DDR_MEMCm_DENALI_CTL_267)

Access Size : 8, 16, 32 bits

Address : <DDR_MEMC_base> + 042Ch

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	non_ecc_region_end_addr_14[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	non_ecc_region_start_addr_14[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
28 to 16	non_ecc_region_end_addr_14[12:0]	0h	RW	Set the ending address of the soft-designated non-ECC region 14. The address written is 1 MB aligned.
15 to 13	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
12 to 0	non_ecc_region_start_addr_14[12:0]	0h	RW	Set the base address of the soft-designated non-ECC region 14. The address written is 1 MB aligned.

3.4.2.2.17 DENALI_CTL_268 Register (DDR_MEMCm_DENALI_CTL_268)

Access Size : 8, 16, 32 bits

Address : <DDR_MEMC_base> + 0430h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	non_ecc_region_end_addr_15[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	non_ecc_region_start_addr_15[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
28 to 16	non_ecc_region_end_addr_15[12:0]	0h	RW	Set the ending address of the soft-designated non-ECC region 15. The address written is 1 MB aligned.
15 to 13	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
12 to 0	non_ecc_region_start_addr_15[12:0]	0h	RW	Set the base address of the soft-designated non-ECC region 15. The address written is 1 MB aligned.

3.4.2.2.18 DENALI_CTL_269 Register (DDR_MEMCm_DENALI_CTL_269)

Access Size : 8, 16, 32 bits

Address : <DDR_MEMC_base> + 0434h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	non_ecc_region_enable[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
15 to 0	non_ecc_region_enable[15:0]	0h	RW	Enables each soft-designated non-ECC region. Bit [0] correlates to region 0, bit [1] correlates to region 1, etc. For each region: 0b: Disable this region 1b: Enable this region

3.4.2.2.19 DENALI_CTL_318 Register (DDR_MEMCm_DENALI_CTL_318)

Access Size : 8, 16, 32 bits

Offset Address : <DDR_MEMCm_base> + 04F8h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	device3_byte0_cs0[3:0]				-	-	-	-	device2_byte0_cs0[3:0]			
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	RW	RW	RW	RW	R	R	R	R	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	device1_byte0_cs0[3:0]				-	-	-	-	device0_byte0_cs0[3:0]			
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	RW	RW	RW	RW	R	R	R	R	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
27 to 24	device3_byte0_cs0[3:0]	0h	RW	Defines the byte location of byte0 in the memory datapath for device 3 for chip select 0. Used for MRRs to identify where data will be returned. Bit [0] correlates to byte [0] of the memory data path, bit [1] correlates to byte [1] of the memory data path, etc. Note: Only 1 bit may be set to 1b at any time to indicate which bit holds the byte 0 information. If this device is not relevant, no bits should be set to 1b. For each bit: 0b: This bit does NOT correlate to byte 0 for device 3 1b: This bit DOES correlate to byte 0 for device 3
23 to 20	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
19 to 16	device2_byte0_cs0[3:0]	0h	RW	Defines the byte location of byte0 in the memory datapath for device 2 for chip select 0. Used for MRRs to identify where data will be returned. Bit [0] correlates to byte [0] of the memory data path, bit [1] correlates to byte [1] of the memory data path, etc. Note: Only 1 bit may be set to 1b at any time to indicate which bit holds the byte 0 information. If this device is not relevant, no bits should be set to 1b. For each bit: 0b: This bit does NOT correlate to byte 0 for device 2 1b: This bit DOES correlate to byte 0 for device 2
15 to 12	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
11 to 8	device1_byte0_cs0[3:0]	0h	RW	Defines the byte location of byte0 in the memory datapath for device 1 for chip select 0. Used for MRRs to identify where data will be returned. Bit [0] correlates to byte [0] of the memory data path, bit [1] correlates to byte [1] of the memory data path, etc. Note: Only 1 bit may be set to 1b at any time to indicate which bit holds the byte 0 information. If this device is not relevant, no bits should be set to 1b.. For each bit: 0b: This bit does NOT correlate to byte 0 for device 1 1b: This bit DOES correlate to byte 0 for device 1
7 to 4	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
3 to 0	device0_byte0_cs0[3:0]	0h	RW	Defines the byte location of byte0 in the memory datapath for device 0 for chip select 0. Used for MRRs to identify where data will be returned. Bit [0] correlates to byte [0] of the memory data path, bit [1] correlates to byte [1] of the memory data path, etc. Note: Only 1 bit may be set to 1b at any time to indicate which bit holds the byte 0 information. If this device is not relevant, no bits should be set to 1b. For each bit: 0b: This bit does NOT correlate to byte 0 for device 0 1b: This bit DOES correlate to byte 0 for device 0

3.4.2.2.20 DENALI_CTL_319 Register (DDR_MEMCm_DENALI_CTL_319)

Access Size : 8, 16, 32 bits

Offset Address : <DDR_MEMCm_base> + 04FCh

Initial Value : 0000_0000h

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
27 to 24	device3_byte0_cs1[3:0]	0h	RW	Defines the byte location of byte0 in the memory datapath for device 3 for chip select 1. Used for MRRs to identify where data will be returned. Bit [0] correlates to byte [0] of the memory data path, bit [1] correlates to byte [1] of the memory data path, etc. Note: Only 1 bit may be set to 1b at any time to indicate which bit holds the byte 0 information. If this device is not relevant, no bits should be set to 1b. For each bit: 0b: This bit does NOT correlate to byte 0 for device 3 1b: This bit DOES correlate to byte 0 for device 3
23 to 20	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
19 to 16	device2_byte0_cs1[3:0]	0h	RW	Defines the byte location of byte0 in the memory datapath for device 2 for chip select 1. Used for MRRs to identify where data will be returned. Bit [0] correlates to byte [0] of the memory data path, bit [1] correlates to byte [1] of the memory data path, etc. Note: Only 1 bit may be set to 1b at any time to indicate which bit holds the byte 0 information. If this device is not relevant, no bits should be set to 1b. For each bit: 0b: This bit does NOT correlate to byte 0 for device 2 1b: This bit DOES correlate to byte 0 for device 2
15 to 12	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
11 to 8	device1_byte0_cs1[3:0]	0h	RW	Defines the byte location of byte0 in the memory datapath for device 1 for chip select 1. Used for MRRs to identify where data will be returned. Bit [0] correlates to byte [0] of the memory data path, bit [1] correlates to byte [1] of the memory data path, etc. Note: Only 1 bit may be set to 1b at any time to indicate which bit holds the byte 0 information. If this device is not relevant, no bits should be set to 1b. For each bit: 0b: This bit does NOT correlate to byte 0 for device 1 1b: This bit DOES correlate to byte 0 for device 1
7 to 4	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
3 to 0	device0_byte0_cs1[3:0]	0h	RW	Defines the byte location of byte0 in the memory datapath for device 0 for chip select 1. Used for MRRs to identify where data will be returned. Bit [0] correlates to byte [0] of the memory data path, bit [1] correlates to byte [1] of the memory data path, etc. Note: Only 1 bit may be set to 1b at any time to indicate which bit holds the byte 0 information. If this device is not relevant, no bits should be set to 1b. For each bit: 0b: This bit does NOT correlate to byte 0 for device 0 1b: This bit DOES correlate to byte 0 for device 0

3.4.2.2.21 DENALI_CTL_382 Register (DDR_MEMCm_DENALI_CTL_382)

Access Size : 8, 16, 32 bits

Offset Address : <DDR_MEMCm_base> + 05F8h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

	-	-	-	-	-	axi0_w_priority[2:0]			-	-	-	-	-	axi0_r_priority[2:0]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	RW	RW	RW	R	R	R	R	R	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
24	axi1_fixed_port_priority_enable	0h	RW	Defines the priority scheme used by AXI port 1. 0b: Priority is defined per-command by the value of the axi1_ARQOS / axi1_AWQOS incoming signals. 1b: Priority is defined per-port by the axi1_r_priority and axi1_w_priority parameters. The priority value should be defined during initialization by programming the priority parameters. The user may change either/both of the priority values during normal operation when the Controller is idle. To do so, the user should de-assert the axi1_fixed_port_priority_enable parameter, change the axi1_r_priority and/or axi1_ w_priority parameters, and then assert the axi1_fixed_port_priority_enable parameter.
23 to 11	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
10 to 8	axi0_w_priority[2:0]	0h	RW	Sets the priority of write commands from AXI port 0. According to the AXI specification, a value of 0 on the axi0_AWQOS signal is the lowest priority and a value of 7 is the highest priority. However, this unit will invert this signal inside the Controller core and use 0 as the highest priority. If the axi0_fixed_port_priority_enable parameter is set to 1, this parameter will be used to define the priority for write commands from port 0. If the axi0_fixed_port_priority_enable parameter is cleared to 0, this parameter will be ignored and the priority will be defined by the value of the axi0_AWQOS incoming signal. This parameter may only be changed during initialization or when the Controller is idle with no data in the port FIFOs and the axi0_fixed_port_priority_enable parameter is cleared to 0. The Controller will use a rising edge of the axi0_fixed_port_priority_enable parameter to capture the new value of this parameter into AXI port 0.
7 to 3	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
2 to 0	axi0_r_priority[2:0]	0h	RW	Sets the priority of read commands from AXI port 0. According to the AXI specification, a value of 0 on the axi0_ARQOS signal is the lowest priority and a value of 7 is the highest priority. However, this unit will invert this signal inside the Controller core and use 0 as the highest priority. If the axi0_fixed_port_priority_enable parameter is set to 1, this parameter will be used to define the priority for read commands from port 0. If the axi0_fixed_port_priority_enable parameter is cleared to 0, this parameter will be ignored and the priority will be defined by the value of the axi0_ARQOS incoming signal. This parameter may only be changed during initialization or when the Controller is idle with no data in the port FIFOs and the axi0_fixed_port_priority_enable parameter is cleared to 0. The Controller will use a rising edge of the axi0_fixed_port_priority_enable parameter to capture the new value of this parameter into AXI port 0.

R/W	R	R	R	R	R	RW	RW	RW	R	R	R	R	R	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 11	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
10 to 8	axi4_w_priority [2:0]	0h	RW	Sets the priority of write commands from AXI port 4. According to the AXI specification, a value of 0 on the axi4_AWQOS signal is the lowest priority and a value of 7 is the highest priority. However, this unit will invert this signal inside the Controller core and use 0 as the highest priority. If the axi4_fixed_port_priority_enable parameter is set to 1, this parameter will be used to define the priority for write commands from port 4. If the axi4_fixed_port_priority_enable parameter is cleared to 0, this parameter will be ignored and the priority will be defined by the value of the axi4_AWQOS incoming signal. This parameter may only be changed during initialization or when the Controller is idle with no data in the port FIFOs and the axi4_fixed_port_priority_enable parameter is cleared to 0. The Controller will use a rising edge of the axi4_fixed_port_priority_enable parameter to capture the new value of this parameter into AXI port 4.
7 to 3	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
2 to 0	axi4_r_priority [2:0]	0h	RW	Sets the priority of read commands from AXI port 4. According to the AXI specification, a value of 0 on the axi4_ARQOS signal is the lowest priority and a value of 7 is the highest priority. However, this unit will invert this signal inside the Controller core and use 0 as the highest priority. If the axi4_fixed_port_priority_enable parameter is set to 1, this parameter will be used to define the priority for read commands from port 4. If the axi4_fixed_port_priority_enable parameter is cleared to 0, this parameter will be ignored and the priority will be defined by the value of the axi4_ARQOS incoming signal. This parameter may only be changed during initialization or when the Controller is idle with no data in the port FIFOs and the axi4_fixed_port_priority_enable parameter is cleared to 0. The Controller will use a rising edge of the axi4_fixed_port_priority_enable parameter to capture the new value of this parameter into AXI port 4.

3.4.2.2.27 DENALI_CTL_716 Register (DDR_MEMCm_DENALI_CTL_716)

Access Size : 8, 16, 32 bits

Offset Address : <DDR_MEMCm_base> + 0B30h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	axi0_priority0_relative_priority [3:0]				-	-	-	-	wrr_param_value_err[3:0]			
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	RW	RW	RW	RW	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	weighted_round_robin_weight_sharing[1:0]		-	-	-	-	-	-	-	weighted_round_robin_latency_control
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	RW	RW	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
27 to 24	axi0_priority0_relative_priority [3:0]	0h	RW	Holds the relative priority of AXI port 0 for priority 0 commands in weighted round robin arbitration.
23 to 20	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
19 to 16	wrr_param_value_err[3:0]	0h	R	Reports errors/warnings from the weighted round-robin arbitration. This parameter is read-only. Bit [3] = The port ordering parameter values for paired ports is not sequential. Bit [2] = The relative priority values for any of the ports paired through the weighted_round_robin_weight_ sharing parameter are not identical. Bit [1] = Any of the relative priority parameters have been programmed to a zero value. Bit [0] = The port ordering parameters do not all contain unique values. For each bit: 0b: No error 1b: Error
15 to 10	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
9 to 8	weighted_round_robin_weight_sharing[1:0]	0h	RW	Indicates that the port pair is tied together in arbitration decisions in weighted round-robin arbitration. Bit [0] controls ports 0 and 1, bit [1] controls port 2 and 3, etc. For each port pair: 0b: The represented ports are treated independently in arbitration. 1b: The represented ports are tied together for arbitration.
7 to 1	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
0	weighted_round_robin_latency_control	0h	RW	Controls the weighted round-robin latency option. 0b: Counters only count when their port has a command waiting to be processed. 1b: Counters are always running.

3.4.2.2.28 DENALI_CTL_717 Register (DDR_MEMCm_DENALI_CTL_717)

Access Size : 8, 16, 32 bits

Offset Address : <DDR_MEMCm_base> + 0B34h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R	R	R	R	RW	RW	RW	RW	R	R	R	R	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
27 to 24	axi0_priority4_relative_priority [3:0]	0h	RW	Holds the relative priority of AXI port 0 for priority 4 commands in weighted round robin arbitration.
23 to 20	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
19 to 16	axi0_priority3_relative_priority [3:0]	0h	RW	Holds the relative priority of AXI port 0 for priority 3 commands in weighted round robin arbitration.
15 to 12	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
11 to 8	axi0_priority2_relative_priority [3:0]	0h	RW	Holds the relative priority of AXI port 0 for priority 2 commands in weighted round robin arbitration.
7 to 4	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
3 to 0	axi0_priority1_relative_priority [3:0]	0h	RW	Holds the relative priority of AXI port 0 for priority 1 commands in weighted round robin arbitration.

3.4.2.2.29 DENALI_CTL_718 Register (DDR_MEMCm_DENALI_CTL_718)

Access Size : 8, 16, 32 bits

Offset Address : <DDR_MEMCm_base> + 0B38h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	RW	RW	RW	RW	R	R	R	R	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
26 to 24	axi0_port_ordering[2:0]	0h	RW	Reassigned port order for port 0. Used in weighted round-robin arbitration to modify the order than the ports are scanned when multiple commands are at the same priority level and have the same relative priorities.
23 to 20	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
19 to 16	axi0_priority7_relative_priority [3:0]	0h	RW	Holds the relative priority of AXI port 0 for priority 7 commands in weighted round robin arbitration.
15 to 12	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
11 to 8	axi0_priority6_relative_priority [3:0]	0h	RW	Holds the relative priority of AXI port 0 for priority 6 commands in weighted round robin arbitration.
7 to 4	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
3 to 0	axi0_priority5_relative_priority [3:0]	0h	RW	Holds the relative priority of AXI port 0 for priority 5 commands in weighted round robin arbitration.

3.4.2.2.30 DENALI_CTL_719 Register (DDR_MEMCm_DENALI_CTL_719)

Access Size : 8, 16, 32 bits

Offset Address : <DDR_MEMCm_base> + 0B3Ch

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	axi1_priority1_relative_priority [3:0]				-	-	-	-	axi1_priority0_relative_priority [3:0]			
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	RW	RW	RW	RW	R	R	R	R	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	axi0_priority_relax[9:0]									
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
27 to 24	axi1_priority1_relative_priority [3:0]	0h	RW	Holds the relative priority of AXI port 1 for priority 1 commands in weighted round robin arbitration.
23 to 20	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
19 to 16	axi1_priority0_relative_priority [3:0]	0h	RW	Holds the relative priority of AXI port 1 for priority 0 commands in weighted round robin arbitration.
15 to 10	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
9 to 0	axi0_priority_relax[9:0]	000h	RW	Holds the counter value for AXI port 0 at which the priority relax condition is triggered in weighted round robin arbitration.

3.4.2.2.31 DENALI_CTL_720 Register (DDR_MEMCm_DENALI_CTL_720)

Access Size : 8, 16, 32 bits

Offset Address : <DDR_MEMCm_base> + 0B40h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	RW	RW	RW	RW	R	R	R	R	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
27 to 24	axi1_priority5_relative_priority [3:0]	0h	RW	Holds the relative priority of AXI port 1 for priority 5 commands in weighted round robin arbitration.
23 to 20	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
19 to 16	axi1_priority4_relative_priority [3:0]	0h	RW	Holds the relative priority of AXI port 1 for priority 4 commands in weighted round robin arbitration.
15 to 12	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
11 to 8	axi1_priority3_relative_priority [3:0]	0h	RW	Holds the relative priority of AXI port 1 for priority 3 commands in weighted round robin arbitration.
7 to 4	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
3 to 0	axi1_priority2_relative_priority [3:0]	0h	RW	Holds the relative priority of AXI port 1 for priority 2 commands in weighted round robin arbitration.

3.4.2.2.32 DENALI_CTL_721 Register (DDR_MEMCm_DENALI_CTL_721)

Access Size : 8, 16, 32 bits

Offset Address : <DDR_MEMCm_base> + 0B44h

Initial Value : 0000_0000h

R/W	R	R	R	R	RW	RW	RW	RW	R	R	R	R	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 19	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
18 to 16	axi1_port_ordering[2:0]	0h	RW	Reassigned port order for port 1. Used in weighted round-robin arbitration to modify the order than the ports are scanned when multiple commands are at the same priority level and have the same relative priorities.
15 to 12	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
11 to 8	axi1_priority7_relative_priority [3:0]	0h	RW	Holds the relative priority of AXI port 1 for priority 7 commands in weighted round robin arbitration.
7 to 4	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
3 to 0	axi1_priority6_relative_priority [3:0]	0h	RW	Holds the relative priority of AXI port 1 for priority 6 commands in weighted round robin arbitration.

3.4.2.2.33 DENALI_CTL_722 Register (DDR_MEMCm_DENALI_CTL_722)

Access Size : 8, 16, 32 bits

Offset Address : <DDR_MEMCm_base> + 0B48h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
27 to 24	axi2_priority1_relative_priority [3:0]	0h	RW	Holds the relative priority of AXI port 2 for priority 1 commands in weighted round robin arbitration.
23 to 20	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
19 to 16	axi2_priority0_relative_priority [3:0]	0h	RW	Holds the relative priority of AXI port 2 for priority 0 commands in weighted round robin arbitration.
15 to 10	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
9 to 0	axi1_priority_relax[9:0]	000h	RW	Holds the counter value for AXI port 1 at which the priority relax condition is triggered in weighted round robin arbitration.

3.4.2.2.34 DENALI_CTL_723 Register (DDR_MEMCm_DENALI_CTL_723)

Access Size : 8, 16, 32 bits

Offset Address : <DDR_MEMCm_base> + 0B4Ch

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R	R	R	R	RW	RW	RW	RW	R	R	R	R	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
27 to 24	axi2_priority5_relative_priority [3:0]	0h	RW	Holds the relative priority of AXI port 2 for priority 5 commands in weighted round robin arbitration.
23 to 20	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
19 to 16	axi2_priority4_relative_priority [3:0]	0h	RW	Holds the relative priority of AXI port 2 for priority 4 commands in weighted round robin arbitration.
15 to 12	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
11 to 8	axi2_priority3_relative_priority [3:0]	0h	RW	Holds the relative priority of AXI port 2 for priority 3 commands in weighted round robin arbitration.
7 to 4	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
3 to 0	axi2_priority2_relative_priority [3:0]	0h	RW	Holds the relative priority of AXI port 2 for priority 2 commands in weighted round robin arbitration.

3.4.2.2.35 DENALI_CTL_724 Register (DDR_MEMCm_DENALI_CTL_724)

Access Size : 8, 16, 32 bits

Offset Address : <DDR_MEMCm_base> + 0B50h

Initial Value : 0000_0000h

R/W	R	R	R	R	RW	RW	RW	RW	R	R	R	R	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 19	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
18 to 16	axi2_port_ordering[2:0]	0h	RW	Reassigned port order for port 2. Used in weighted round-robin arbitration to modify the order than the ports are scanned when multiple commands are at the same priority level and have the same relative priorities.
15 to 12	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
11 to 8	axi2_priority7_relative_priority [3:0]	0h	RW	Holds the relative priority of AXI port 2 for priority 7 commands in weighted round robin arbitration.
7 to 4	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
3 to 0	axi2_priority6_relative_priority [3:0]	0h	RW	Holds the relative priority of AXI port 2 for priority 6 commands in weighted round robin arbitration.

3.4.2.2.36 DENALI_CTL_725 Register (DDR_MEMCm_DENALI_CTL_725)

Access Size : 8, 16, 32 bits

Offset Address : <DDR_MEMCm_base> + 0B54h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
27 to 24	axi3_priority1_relative_priority [3:0]	0h	RW	Holds the relative priority of AXI port 3 for priority 1 commands in weighted round robin arbitration.
23 to 20	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
19 to 16	axi3_priority0_relative_priority [3:0]	0h	RW	Holds the relative priority of AXI port 3 for priority 0 commands in weighted round robin arbitration.
15 to 10	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
9 to 0	axi2_priority_relax[9:0]	000h	RW	Holds the counter value for AXI port 2 at which the priority relax condition is triggered in weighted round robin arbitration.

3.4.2.2.37 DENALI_CTL_726 Register (DDR_MEMCm_DENALI_CTL_726)

Access Size : 8, 16, 32 bits

Offset Address : <DDR_MEMCm_base> + 0B58h

Initial Value : 0000_0000h

R/W	R	R	R	R	RW	RW	RW	RW	R	R	R	R	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
27 to 24	axi3_priority5_relative_priority [3:0]	0h	RW	Holds the relative priority of AXI port 3 for priority 5 commands in weighted round robin arbitration.
23 to 20	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
19 to 16	axi3_priority4_relative_priority [3:0]	0h	RW	Holds the relative priority of AXI port 3 for priority 4 commands in weighted round robin arbitration.
15 to 12	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
11 to 8	axi3_priority3_relative_priority [3:0]	0h	RW	Holds the relative priority of AXI port 3 for priority 3 commands in weighted round robin arbitration.
7 to 4	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
3 to 0	axi3_priority2_relative_priority [3:0]	0h	RW	Holds the relative priority of AXI port 3 for priority 2 commands in weighted round robin arbitration.

3.4.2.2.38 DENALI_CTL_727 Register (DDR_MEMCm_DENALI_CTL_727)

Access Size : 8, 16, 32 bits

Offset Address : <DDR_MEMCm_base> + 0B5Ch

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	axi3_port_ordering[2:0]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	axi3_priority7_relative_priority [3:0]				-	-	-	-	axi3_priority6_relative_priority [3:0]			
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	RW	RW	RW	RW	R	R	R	R	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 19	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
18 to 16	axi3_port_ordering[2:0]	0h	RW	Reassigned port order for port 3. Used in weighted round-robin arbitration to modify the order than the ports are scanned when multiple commands are at the same priority level and have the same relative priorities.
15 to 12	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
11 to 8	axi3_priority7_relative_priority [3:0]	0h	RW	Holds the relative priority of AXI port 3 for priority 7 commands in weighted round robin arbitration.
7 to 4	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
3 to 0	axi3_priority6_relative_priority [3:0]	0h	RW	Holds the relative priority of AXI port 3 for priority 6 commands in weighted round robin arbitration.

3.4.2.2.39 DENALI_CTL_728 Register (DDR_MEMCm_DENALI_CTL_728)

Access Size : 8, 16, 32 bits

Offset Address : <DDR_MEMCm_base> + 0B60h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	axi4_priority1_relative_priority [3:0]				-	-	-	-	axi4_priority0_relative_priority [3:0]			
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	RW	RW	RW	RW	R	R	R	R	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
27 to 24	axi4_priority1_relative_priority [3:0]	0h	RW	Holds the relative priority of AXI port 4 for priority 1 commands in weighted round robin arbitration.
23 to 20	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
19 to 16	axi4_priority0_relative_priority [3:0]	0h	RW	Holds the relative priority of AXI port 4 for priority 0 commands in weighted round robin arbitration.
15 to 10	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
9 to 0	axi3_priority_relax[9:0]	000h	RW	Holds the counter value for AXI port 3 at which the priority relax condition is triggered in weighted round robin arbitration.

3.4.2.2.40 DENALI_CTL_729 Register (DDR_MEMCm_DENALI_CTL_729)

Access Size : 8, 16, 32 bits

Offset Address : <DDR_MEMCm_base> + 0B64h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

	-	-	-	-	axi4_priority3_relative_priority [3:0]				-	-	-	-	axi4_priority2_relative_priority [3:0]			
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	RW	RW	RW	RW	R	R	R	R	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
27 to 24	axi4_priority5_relative_priority [3:0]	0h	RW	Holds the relative priority of AXI port 4 for priority 5 commands in weighted round robin arbitration.
23 to 20	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
19 to 16	axi4_priority4_relative_priority [3:0]	0h	RW	Holds the relative priority of AXI port 4 for priority 4 commands in weighted round robin arbitration.
15 to 12	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
11 to 8	axi4_priority3_relative_priority [3:0]	0h	RW	Holds the relative priority of AXI port 4 for priority 3 commands in weighted round robin arbitration.
7 to 4	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
3 to 0	axi4_priority2_relative_priority [3:0]	0h	RW	Holds the relative priority of AXI port 4 for priority 2 commands in weighted round robin arbitration.

3.4.2.2.41 DENALI_CTL_730 Register (DDR_MEMCm_DENALI_CTL_730)

Access Size : 8, 16, 32 bits

Offset Address : <DDR_MEMCm_base> + 0B68h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	axi4_port_ordering[2:0]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	axi4_priority7_relative_priority [3:0]				-	-	-	-	axi4_priority6_relative_priority [3:0]			
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	RW	RW	RW	RW	R	R	R	R	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 19	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
18 to 16	axi4_port_ordering[2:0]	0h	RW	Reassigned port order for port 4. Used in weighted round-robin arbitration to modify the order than the ports are scanned when multiple commands are at the same priority level and have the same relative priorities.
15 to 12	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
11 to 8	axi4_priority7_relative_priority [3:0]	0h	RW	Holds the relative priority of AXI port 4 for priority 7 commands in weighted round robin arbitration.
7 to 4	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
3 to 0	axi4_priority6_relative_priority [3:0]	0h	RW	Holds the relative priority of AXI port 4 for priority 6 commands in weighted round robin arbitration.

3.4.2.2.42 DENALI_CTL_731 Register (DDR_MEMCm_DENALI_CTL_731)

Access Size : 8, 16, 32 bits

Offset Address : <DDR_MEMCm_base> + 0B6Ch

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	axi4_priority_relax[9:0]									
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
9 to 0	axi4_priority_relax[9:0]	000h	RW	Holds the counter value for AXI port 4 at which the priority relax condition is triggered in weighted round robin arbitration.

3.4.2.2.43 MCAR_CTL Register (DDR_MEMCm_MCAR_CTL)

Access Size : 8, 16, 32 bits

Offset Address : <DDR_MEMCm_base> + 2000h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	dfi_init_start
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	set_axctl	-	-	-	-	-	-	-	block_fm_norm_req
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
16	dfi_init_start	0h	RW	Override dfi_init_start signal.
15 to 9	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
8	set_axctl	-	W	Load the settings of MCAR_AXCTL* registers to MC. This bit is always read as 0.
7 to 1	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
0	block_fm_norm_req	0h	RW	Controls the FM arbiter. If the fm_ovride_control parameter is set to 1, this bit will limit the FM to only read / write commands.

3.4.2.2.44 MCAR_MON Register (DDR_MEMCm_MCAR_MON)

Access Size : 8, 16, 32 bits

Offset Address : <DDR_MEMCm_base> + 2004h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	refresh_in_process	q_almost_full
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	port_busy[4:0]				
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
17	refresh_in_process	0h	R	Active-high bit that indicates that the controller is executing a refresh command. This bit is asserted when a refresh command is sent to the DRAM memories and remains asserted until the refresh command has completed.
16	q_almost_full	0h	R	Indicates that the command queue has reached the value set in the q_fullness parameter.
15 to 5	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
4 to 0	port_busy[4:0]	00h	R	This bits contain 1 bit per port. This bits will only be low when the controller is not reading data, writing data or processing a command for that port.

3.4.2.2.45 MCAR_AXCTL0 Register (DDR_MEMCm_MCAR_AXCTL0)

Access Size : 8, 16, 32 bits

Offset Address : <DDR_MEMCm_base> + 2008h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	axi0_arprot_ctl[2:0]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	axi0_awcobuf	-	-	-	-	-	axi0_awprot_ctl[2:0]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	RW	R	R	R	R	R	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 19	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
18 to 16	axi0_arprot_ctl [2:0]	0h	RW	Control axi0_ARPROT of MCTOP. Bit [2] = 0b: Control by axi0_ARPROT port. Bit [2] = 1b: Control by bit [1:0].
15 to 9	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
8	axi0_awcobuf	0h	RW	AXI port 0 coherent bufferable selection. If the axi0_AWCACHE signal is set to 1 for Bufferable operation, this signal determines exactly what type of bufferable response is returned to the user interface. For guaranteed data coherency across all ports, the user should send all commands with axi0_AWCOBUF set to 1. 0b: Response returned when command and data have been received by the port. 1b: Response returned when command accepted into the MC core command queue and all associated data has been received by the AXI data port.
7 to 3	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
2 to 0	axi0_awprot_ctl [2:0]	0h	RW	Control axi0_AWPROT of MC. Bit [2] = 0b: Control by axi0_AWPROT port. Bit [2] = 1b: Control by bit [1:0].

3.4.2.2.46 MCAR_AXCTL1 Register (DDR_MEMCm_MCAR_AXCTL1)

Access Size : 8, 16, 32 bits

Offset Address : <DDR_MEMCm_base> + 200Ch

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	axi1_arprot_ctl[2:0]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	axi1_awcobuf	-	-	-	-	-	axi1_awprot_ctl[2:0]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	RW	R	R	R	R	R	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 19	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
18 to 16	axi1_arprot_ctl [2:0]	0h	RW	Control axi1_ARPROT of MCTOP. Bit [2] = 0b: Control by axi1_ARPROT port. Bit [2] = 1b: Control by bit [1:0].
15 to 9	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
8	axi1_awcobuf	0h	RW	AXI port 1 coherent bufferable selection. If the axi1_AWCACHE signal is set to 1b for Bufferable operation, this signal determines exactly what type of bufferable response is returned to the user interface. For guaranteed data coherency across all ports, the user should send all commands with axi1_AWCOBUF set to 1b. 0b: Response returned when command and data have been received by the port. 1b: Response returned when command accepted into the MC core command queue and all associated data has been received by the AXI data port.
7 to 3	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
2 to 0	axi1_awprot_ctl [2:0]	0h	RW	Control axi1_AWPROT of MC. Bit [2] = 0b: Control by axi1_AWPROT port. Bit [2] = 1b: Control by bit [1:0].

3.4.2.2.47 MCAR_AXCTL2 Register (DDR_MEMCm_MCAR_AXCTL2)

Access Size : 8, 16, 32 bits

Offset Address : <DDR_MEMCm_base> + 2010h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	axi2_arprot_ctl[2:0]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	axi2_awcobuf	-	-	-	-	-	axi2_awprot_ctl[2:0]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	RW	R	R	R	R	R	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 19	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
18 to 16	axi2_arprot_ctl[2:0]	0h	RW	Control axi2_ARPROT of MCTOP. Bit [2] = 0b: Control by axi2_ARPROT port. Bit [2] = 1b: Control by bit [1:0].
15 to 9	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
8	axi2_awcobuf	0h	RW	AXI port 2 coherent bufferable selection. If the axi2_AWCACHE signal is set to 1b for Bufferable operation, this signal determines exactly what type of bufferable response is returned to the user interface. For guaranteed data coherency across all ports, the user should send all commands with axi2_AWCOBUF set to 1b. 0b: Response returned when command and data have been received by the port. 1b: Response returned when command accepted into the MC core command queue and all associated data has been received by the AXI data port.
7 to 3	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
2 to 0	axi2_awprot_ctl[2:0]	0h	RW	Control axi2_AWPROT of MC. Bit [2] = 0b: Control by axi2_AWPROT port. Bit [2] = 1b: Control by bit [1:0].

3.4.2.2.48 MCAR_AXCTL3 Register (DDR_MEMCm_MCAR_AXCTL3)

Access Size : 8, 16, 32 bits
Offset Address : <DDR_MEMCm_base> + 2014h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	axi3_arprot_ctl[2:0]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	axi3_awcobuf	-	-	-	-	-	axi3_awprot_ctl[2:0]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	RW	R	R	R	R	R	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 19	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
18 to 16	axi3_arprot_ctl [2:0]	0h	RW	Control axi3_ARPROT of MCTOP. Bit [2] = 0b: Control by axi3_ARPROT port. Bit [2] = 1b: Control by bit [1:0].
15 to 9	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
8	axi3_awcobuf	0h	RW	AXI port 3 coherent bufferable selection. If the axi3_AWCACHE signal is set to 1 for Bufferable operation, this signal determines exactly what type of bufferable response is returned to the user interface. For guaranteed data coherency across all ports, the user should send all commands with axi3_AWCOBUF set to 1b. 0b: Response returned when command and data have been received by the port. 1b: Response returned when command accepted into the MC core command queue and all associated data has been received by the AXI data port.
7 to 3	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
2 to 0	axi3_awprot_ctl [2:0]	0h	RW	Control axi3_AWPROT of MC. Bit [2] = 0b: Control by axi3_AWPROT port. Bit [2] = 1b: Control by bit [1:0].

3.4.2.2.49 MCAR_AXCTL4 Register (DDR_MEMCm_MCAR_AXCTL4)

Access Size : 8, 16, 32 bits
Offset Address : <DDR_MEMCm_base> + 2018h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	axi4_arprot_ctl[2:0]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	axi4_awcobuf	-	-	-	-	-	axi4_awprot_ctl[2:0]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	RW	R	R	R	R	R	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 19	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
18 to 16	axi4_arprot_ctl [2:0]	0h	RW	Control axi4_ARPROT of MCTOP. Bit [2] = 0b: Control by axi4_ARPROT port. Bit [2] = 1b: Control by bit [1:0].
15 to 9	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
8	axi4_awcobuf	0h	RW	AXI port 4 coherent bufferable selection. If the axi4_AWCACHE signal is set to 1 for Bufferable operation, this signal determines exactly what type of bufferable response is returned to the user interface. For guaranteed data coherency across all ports, the user should send all commands with axi4_AWCOBUF set to 1. 0b: Response returned when command and data have been received by the port. 1b: Response returned when command accepted into the MC core command queue and all associated data has been received by the AXI data port.
7 to 3	-	All 0	R	Reserved The write value should follow those listed in the DDRTOP Application Note.
2 to 0	axi4_awprot_ctl [2:0]	0h	RW	Control axi4_AWPROT of MC. Bit [2] = 0b: Control by axi4_AWPROT port. Bit [2] = 1b: Control by bit [1:0].

3.4.3 Function Description

3.4.3.1 Multi-Port Arbiter

The Arbiter is responsible for arbitrating requests from the ports and sending requests to the Controller core. Each transaction received at the Arbiter logic has an associated priority, which works with each port's arbitration logic to determine how ports issue requests to the Controller core. This unit supports the Weighted Round-Robin arbitration scheme.

The Arbiter logic routes read data from the Controller core to the appropriate port. The requesting port is assumed able to receive the data. Write data from each port is connected directly to its own write data interface in the Controller core, allowing the ports to independently pass write data to the Controller core buffers.

3.4.3.1.1 Arbitration Overview

The weighted round-robin arbitration scheme is a three-step arbitration system. All commands are routed into priority groups based on the priority of the requests. Then, within each priority group, requests are serviced according to the "weight" (relative priority) of each port. Finally, each priority group presents a single command to the priority select module, which passes the highest priority command on to the Controller core.

This arbitration scheme also supports two additional features. For situations where the priority and the relative priority for multiple commands are identical, a port ordering system in included whereby the user may adjust the order in which the ports are considered. Secondly, for situations where two ports may be related, a mechanism is included which allows a pair of ports to share arbitration bandwidth for bandwidth efficiency.

Weighted round-robin arbitration is a complex arbitration scheme. To understand the operation, each concept must be first understood individually. **3.4.3.1.2 Understanding Round-Robin Operation** through **3.4.3.1.5 Understanding Port Ordering** describe the various components of weighted round-robin arbitration. Note that the examples may utilize a greater number of ports and a larger number of priority levels than are available in this unit. This is done intentionally for explanation.

3.4.3.1.2 Understanding Round-Robin Operation

Round-robin operation is the simplest form of arbitration and is ideal for systems that do not require requests to be treated preferentially to maintain bandwidth or minimize latency. This scheme uses a counter that rotates through the port numbers, incrementing every time a port request is granted.

If the port that the counter is referencing has an active request, and the Controller core command queue is not full, then this request will be sent to the Controller core. If there is not an active request for that port, then the port will be skipped and the next port will be checked. The counter will increment by one whenever any request has been processed, regardless of which port's request was arbitrated.

Round-robin arbitration ensures that each port's requests can be successfully arbitrated into the Controller core every N cycles, where N is the number of ports in this unit. No port will ever be locked out, and any port can have its requests serviced on every cycle as long as all other ports are quiet and the command queue is not full.

An example of the round-robin scheme is shown in **Table 3.4-4**. Cycles 0, 2, and 6 show the system behavior when the command queue is full. Cycles 8 and 11 show the system behavior when the port addressed by the arbitration counter does not have an active request. In particular, note cycle 11: The port addressed by the arbitration counter (0) is not requesting, so the counter scans through the other ports, in incrementing order, to find an active request. Port 2 is requesting and therefore wins arbitration, but the counter only increments to port 1 which was the next port in the sequence. All other cycles show normal behavior.

Table 3.4-4 Round-Robin Operation Example

Cycle	Port Addressed by the Arbitration Counter	Ports Requesting				Command Queue Full?	Arbitration Winner	Value of Counter at Next Cycle
		P0	P1	P2	P3			
0	0	Y	Y	Y	Y	Yes	None	0
1	0	Y	Y	Y	Y	No	P0	1
2	1	—	Y	Y	Y	Yes	None	1
3	1	Y	Y	Y	Y	No	P1	2
4	2	Y	—	Y	Y	No	P2	3
5	3	Y	—	—	Y	No	P3	0
6	0	Y	—	Y	—	Yes	None	0
7	0	Y	—	Y	—	No	P0	1
8	1	—	—	Y	—	No	P2	2
9	2	—	—	Y	Y	No	P2	3
10	3	Y	—	—	Y	No	P3	0
11	0	—	—	Y	—	No	P2	1

3.4.3.1.3 Understanding Transaction Priority

Priorities may be associated with each command or with the requesting port, depending on the value of the axiY_fixed_port_priority_enable parameter. If the axiY_fixed_port_priority_enable parameter is set to 1, all commands from port Y will use the priority defined in the axiY_r_priority or axiY_w_priority parameters. If the axiY_fixed_port_priority_enable parameter is cleared to 0, the priority will be specified with each incoming command through the axiY_ARQOS and axiY_AWQOS signals. Internally, all commands are organized into priority groups based on their priority setting. All commands within a priority group are treated equally for arbitration unless a port has exceeded its allocated bandwidth. The priority value is also used by the placement logic inside the Controller core when filling the command queue.

To use per-port priorities, the user must program the axiY_r_priority and axiY_w_priority parameters and assert the axiY_fixed_port_priority_enable parameter to 1 before the start parameter is set. If the user wants to change these values when the system is idle, the axiY_fixed_port_priority_enable parameter must be cleared to 0, the parameters may be changed, and then the axiY_fixed_port_priority_enable parameter must be set to 1 again.

To use per-port priorities, the user must program the axiY_r_priority and axiY_w_priority parameters and assert the axiY_fixed_port_priority_enable parameter to 1 before the start parameter is set. If the user wants to change these values when the system is idle, the axiY_fixed_port_priority_enable parameter must be cleared to 0, the parameters may be changed, and then the axiY_fixed_port_priority_enable parameter must be set to 1 again.

For the axiY_r_priority and axiY_w_priority parameters, a value of 0 is the highest priority and a value of 7 is the lowest priority. For the axiY_ARQOS and axiY_AWQOS signals, a value of 7 is the highest priority and a value of 0 is the lowest priority; however, this unit will invert this signal inside the Controller core and use 0 as the highest priority and 7 as the lowest priority. The user may program at priority level 0; however, it is best to reserve this priority value so that the placement queue can elevate to this level through aging.

3.4.3.1.4 Understanding Relative Priority

Inside each priority group, the relative priority is used to determine arbitration. This unit contains 8 identical priority groups with logic that selects between the requests from all commands at that priority level. The relative priority parameters axiY_priorityZ_relative_priority (where Y is the port number and Z is the priority group) “weight” the ports for each level and determine how the priority group will be arbitrated. **Figure 3.4-2** shows this type of arbitration system.

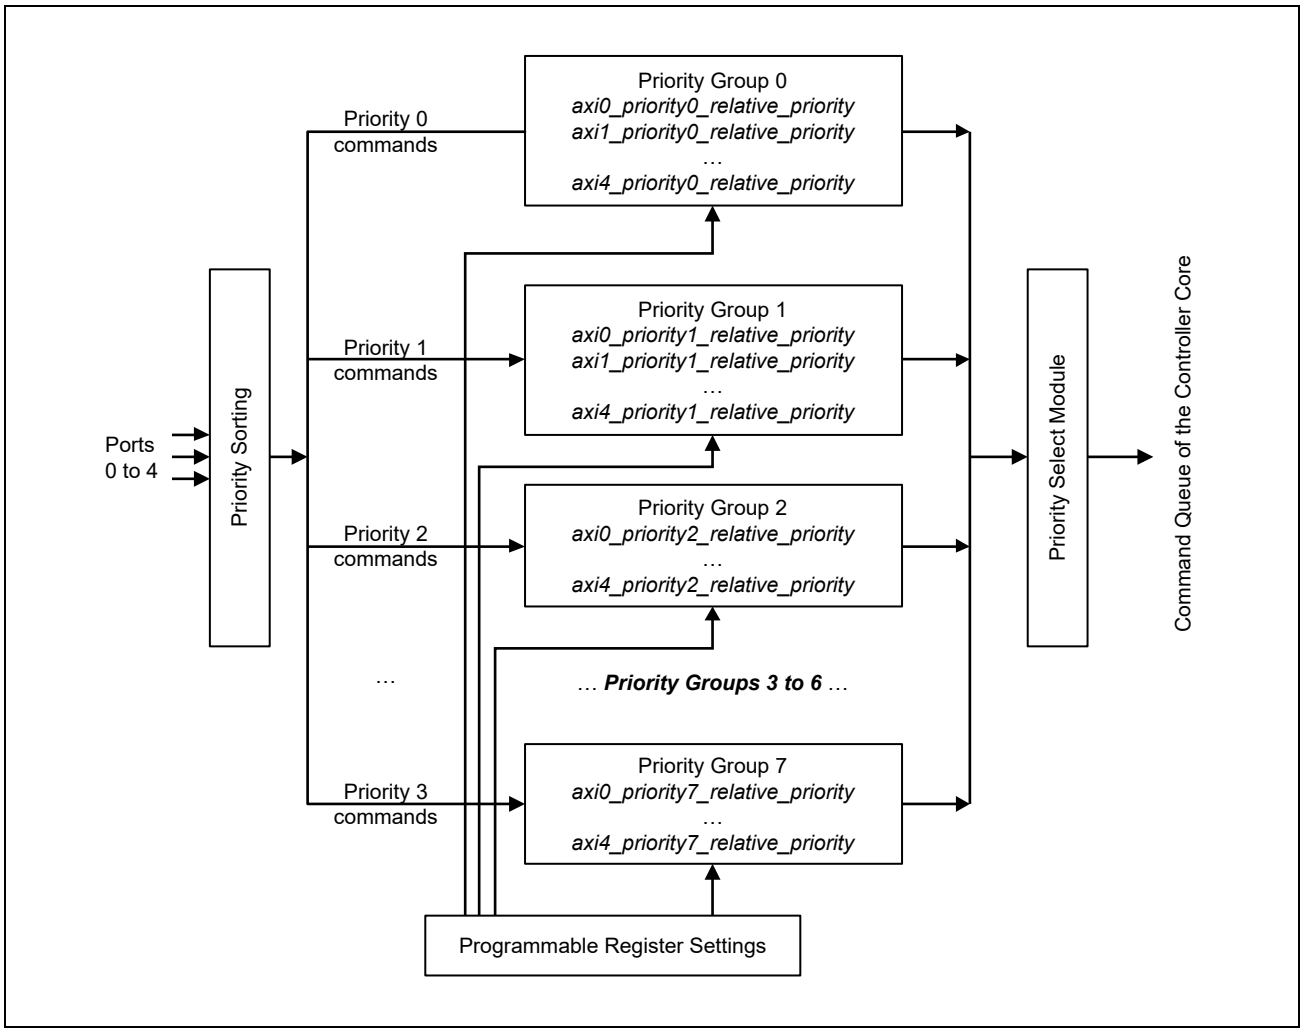

Figure 3.4-2 Weighted Round-robin Priority Group Structure

By using the relative priority concept, the arbitration is skewed in favor of certain ports based on user programming. Note that the relative priority parameters have a minimum acceptable value of 1 to prevent port lockout. A 0 value will cause an error condition.

If the relative priorities are all programmed to the same value within any priority group, then the arbitration will mimic a version of simple round-robin scheme within that priority group. Instead of incrementing whenever any request is processed, the simple round-robin counter will only increment to the next port after the value in the axiY_priorityZ_relative_priority parameter number of requests are processed.

Each port Y for priority level Z will be allocated the ratio of that port’s relative priority parameter (axiY_priorityZ_relative_priority) to the sum of all requesting port’s relative priority values. If a particular port is not requesting, then it is not included in the sum calculation, which means that the arbitration will be split with relative proportions among the requesting ports.

As an example, consider a system with 4 ports where all requests are at priority 0. This system is described in **Table 3.4-5**.

Table 3.4-5 Relative Priority Example

Controller Parameter	System A
axi0_priority_relative_priority	1
axi1_priority_relative_priority	2
axi2_priority_relative_priority	3
axi3_priority_relative_priority	4

For this system, port 0 will be serviced 1/(1+2+3+4) = 1/10 of the time and Port 3 will be serviced 4/(1+2+3+4) = 4/10 of the time. However, if Port 2 is not actively requesting, then port 0 will be serviced 1/(1+2+4) = 1/7 of the time and port 3 will be serviced 4/(1+2+4) = 4/7 of the time.

In order to ensure that relative priorities are maintained, there is a weight counter for each port within each priority group. These counters track the number of transactions accepted for that port in that priority group. When any counter value reaches the programmed relative port priority, the scan order for that priority group will be internally modified. The port that has met its relative priority will be dynamically positioned to the bottom of the scan order (and its counter will be reset), allowing other ports a preferential position.

For ports that are not expected to issue requests at a certain priority level, the associated relative priority parameter should be programmed to 1h. This allows for minimum allocation without the risk of lock out in case a command appears.

3.4.3.1.5 Understanding Port Ordering

With simple round-robin arbitration, the ports are scanned based on their port number in incrementing order in the system. Assuming that the command queue is not full, the port referenced by the counter is examined for valid incoming transactions. If there is an active request, it will be accepted. Otherwise, the next port in the scan order will be checked, and its request accepted.

For this unit with weighted round-robin arbitration, the user has the option of adjusting the order that the ports are scanned. This is useful if requests from certain ports are more critical, or if a specific order may reduce contention between ports.

The axiY_port_ordering parameters are used to set this new scan order. A value of 000b gives the highest listing in the scan order, and a value of 111b is the lowest listing in the scan order.

If the 5 axiY_port_ordering parameters are programmed with unique values, then the scan order will be modified to proceed sequentially in this new order. If any of the port ordering parameters have the same value, then those ports will still be equal in the arbitration test. In this case, the port number will select between these ports, with the lower-numbered port automatically being selected first.

To demonstrate this concept, consider a system with 8 ports and the two port orders as shown in **Table 3.4-6**. For System B, the port ordering parameters all contain unique values, so the resulting order is entirely based on the values of the parameters. For System C, three ports have the same programmed values for the port order. For these three ports, the port number sets the order. Remaining ports follow the port ordering parameters.

Table 3.4-6 Port Ordering Example

Controller Parameter	System B	System C
axi0_port_ordering	3	3
axi1_port_ordering	4	0
axi2_port_ordering	5	5
axi3_port_ordering	6	6
axi4_port_ordering	7	7
axi5_port_ordering	0	1
axi6_port_ordering	2	0
axi7_port_ordering	1	0
Port Scan Order	P5-P7-P6-P0-P1-P2-P3-P4	P1-P6-P7-P5-P0-P2-P3-P4

If all of the port ordering parameters are programmed with the same value, then the scan order will default to the numbered port order.

3.4.3.1.6 Weighted Round-Robin Arbitration Summary

The Controller weighted round-robin arbitration system combines the concepts of round-robin operation, priority, relative priority and port ordering. The incoming commands are separated into priority groups based on their priority. Within each priority group, the relative priority values are examined to determine the arbitration winner. If the relative priority values are identical and no individual command can be selected, then the scan order is used to select between the requests. In the end, the highest priority command, from the highest relative priority port, with the highest location in the scan order will be selected and sent to the Controller core.

As an example, consider the system described in **Table 3.4-7**. The counters refer to the counters that exist for each port within each priority group to ensure that relative priorities are maintained. For simplification, the command queue is considered to never be full and commands are only received at priority level 0. The behavior is shown in **Table 3.4-8**. The highest port in the scan order that is requesting always wins arbitration, and the scan order is dynamically modified when any port counter reaches its allocated relative priority value. Note that if the command queue was considered, then cycles where the command queue was full would not have any arbitration winner and therefore, the counter values and scan order would not change on that cycle.

Table 3.4-7 System D Specifications

Controller Parameter	Port 0	Port 1	Port 2	Port 3
axiY_priority0_relative_priority	4	3	2	1
axiY_port_ordering	0	1	2	3

Table 3.4-8 System D Operation

Cycle	Ports Requesting				Arbitration Winner	Next Counter				Next Scan Order
	P0	P1	P2	P3		P0	P1	P2	P3	
	—	—	—	—	—	—	—	—	—	P0-P1-P2-P3
0	Y	—	—	Y	P0	1	0	0	0	P0-P1-P2-P3
1	Y	—	Y	Y	P0	2	0	0	0	P0-P1-P2-P3
2	Y	Y	Y	Y	P0	3	0	0	0	P0-P1-P2-P3
3	Y	Y	Y	Y	P0	4	0	0	0	P1-P2-P3-P0
4	Y	Y	Y	Y	P1	0	1	0	0	P1-P2-P3-P0
5	Y	Y	Y	Y	P1	0	2	0	0	P1-P2-P3-P0
6	Y	Y	Y	Y	P1	0	3	0	0	P2-P3-P0-P1
7	Y	—	Y	Y	P2	0	0	1	0	P2-P3-P0-P1
8	Y	—	Y	Y	P2	0	0	2	0	P3-P0-P1-P2
9	Y	—	—	Y	P3	0	0	0	1	P0-P1-P2-P3
10	Y	—	Y	Y	P0	1	0	0	0	P0-P1-P2-P3
11	—	—	Y	Y	P2	1	0	1	0	P0-P1-P2-P3
12	—	—	Y	Y	P2	1	0	2	0	P0-P1-P3-P2

If the same system also contains two ports that only request at priority level 1, then the system behavior will be slightly altered. The addition of these 2 ports creates the second priority group structure that adds to the arbitration complexity. **Table 3.4-9** describes this system. The bold texts the priority level change for P4 and P5.

Again, for simplification, the command queue is considered to never be full and it is assumed that commands from ports 0, 1, 2 and 3 are only received at priority level 0. The behavior is shown in **Table 3.4-10**. Note that if any of the priority 0 ports (P0, P1, P2, P3) are requesting, the system behavior will match the behavior when there is only one priority group, as in **Table 3.4-8**. Ports 4 and 5 can only win arbitration when no higher-priority commands exist.

Table 3.4-9 System E Specifications

Controller Parameter	Port 0	Port 1	Port 2	Port 3	**Port 4**	**Port 5**
axiY_priority0_relative_priority	4	3	2	1	**1**	**1**
axiY_priority1_relative_priority	1	1	1	1	**3**	**2**
axiY_port_ordering	0	1	2	3	**4**	**5**

3.4.3.1.7 Priority Relaxing

From **Table 3.4-10**, it is evident that commands at lower priority levels will not win arbitration in weighted round-robin arbitration unless there are no higher priority requests. This could mean that, in a situation where high priority requests are being received continuously, lower priority requests could be locked out indefinitely. To avoid this scenario and control the arbitration latency for lower-priority commands, it is possible to disable priority groups temporarily. This is known as priority relaxing, and it is a time-controlled function.

Each higher priority group will be temporarily disabled when the pre-set counter value for the lower priority group has been reached and a request is waiting. The axiY_priority_relax parameters set the counter value for port Y at which the priority relax condition will be triggered.

The timing counters inside each port are controlled by the weighted_round_robin_latency_control parameter. When the latency control bit is set to 1b, the timing counters are free-running. Any timing counter may hit its axiY_priority_relax parameter value at any point. When this occurs, higher-priority groups are disabled to allow a waiting request for this port to be processed. This results in a random latency for each port, but the maximum latency is fixed at the axiY_priority_relax parameter value. If the current port does not have any commands waiting when the timing counter hits the relax value, then the counter will be reset and the Arbiter will function normally.

When the weighted_round_robin_latency_control parameter is cleared to 0b, the timing counters only count while that port has a waiting request that is not being processed. In this case, when the port's axiY_priority_relax parameter value is reached, all priority groups at priority levels higher than the waiting request are disabled. This port's command is granted arbitration and is moved through to the Controller core.

Since the priority relax parameters and counters are associated with individual ports, it is possible that multiple priority relax counters could reach their specified value simultaneously. In this case, the lower priority command will be arbitrated first and then the higher priority command. This situation could alter the arbitration latency slightly, causing it to be longer than the expected value in the priority relax parameter.

Consider the System F as described in **Table 3.4-11**. The same conditions apply as for the previous example. The command queue is considered to never be full, commands from ports 0, 1, 2 and 3 are only received at priority level 0, and commands from ports 4 and 5 are only received at priority 1.

Table 3.4-11 System F Specifications

Controller Parameter	Port 0	Port 1	Port 2	Port 3	**Port 4**	**Port 5**
axiY_priority0_relative_priority	4	3	2	1	**1**	**1**
axiY_priority1_relative_priority	1	1	1	1	**2**	**2**
axiY_port_ordering	0	1	2	3	**5**	**4**

Table 3.4-12 shows the system behavior. The exact settings of the latency control and priority relax parameters are not shown. Instead, the "Relaxed Ports" column indicates which, if any, ports have hit their priority relax values. The following cycles are important to observe:

- Cycles 1 and 7: A port relaxes while a higher priority request and a higher scan order request are both present. The relaxed port still wins arbitration.
- Cycle 4: Two ports of the same priority relax. The higher scan order request wins arbitration.
- Cycle 5: Two ports of different priorities relax. The lower priority port that relaxed wins arbitration. The higher priority port that relaxed will maintain its relax condition, and win arbitration in the next cycle.

Table 3.4-12 System F Operation

Cycle	Ports Requesting						Relaxed Ports	Arbitration Winner	Next Counter						Next Scan Order
	P0	P1	P2	P3	**P4**	**P5**			P0	P1	P2	P3	**P4**	**P5**	
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	Priority 0: P0-P1-P2-P3 Priority 1: P5-P4
0	—	—	Y	—	**Y**	**Y**	—	P2	0	0	1	0	**0**	**0**	P0-P1-P2-P3 P5-P4
1	—	—	Y	—	**Y**	**Y**	P5	P5	0	0	1	0	**0**	**1**	P0-P1-P2-P3 P4-P5
2	—	—	Y	—	**Y**	**Y**	—	P2	0	0	2	0	**0**	**0**	P0-P1-P3-P2 P4-P5
3	—	Y	—	—	**Y**	**Y**	—	P1	0	1	0	0	**0**	**0**	P0-P1-P3-P2 P4-P5
4	Y	—	—	—	**Y**	**Y**	P4, P5	P4	0	1	0	0	**1**	**0**	P0-P1-P3-P2 P4-P5
5	Y	—	—	—	**Y**	**Y**	P0, P5	P5	0	1	0	0	**1**	**1**	P0-P1-P3-P2 P4-P5
6	Y	—	—	—	**Y**	—	P0	P0	1	1	0	0	**1**	**0**	P0-P1-P3-P2 P4-P5
7	Y	—	—	—	**Y**	**Y**	P4	P4	1	1	0	0	**2**	**0**	P0-P1-P3-P2 P5-P4
8	Y	Y	Y	—	—	**Y**	—	P0	2	1	0	0	**0**	**0**	P0-P1-P3-P2 P5-P4
9	—	Y	Y	Y	—	**Y**	—	P1	2	2	0	0	**0**	**0**	P0-P1-P3-P2 P5-P4
10	—	Y	Y	Y	—	**Y**	P2	P2	2	2	1	0	**0**	**0**	P0-P1-P3-P2 P5-P4

Priority relaxing allows low priority commands to be able to move through the Arbiter to the Controller core. This will ensure that the system can meet maximum latency requirements.

3.4.3.1.8 Port Pairing

This unit Arbiter incorporates a feature which allows adjacent ports to be grouped together and considered jointly for arbitration. The weighted_round_robin_weight_sharing parameter controls this function, with 1 bit per pair of ports in this unit. Bit [0] controls ports 0 and 1, bit [1] controls ports 2 and 3, etc. If this unit interfaces to an odd number of ports, the highest numbered port is excluded from the port pairing system.

Since the ports are grouped together, their relative priorities are not considered separately. Referring to **3.4.3.1.4 Understanding Relative Priority**, the general formula for port priority allocation is the ratio of that port's relative priority parameter (axiY_priorityZ_relative_priority) to the sum of all requesting port's relative priority values. In this case, the relative priority value of only one of the paired ports is used for the sum calculation. This means that the bandwidth will be divided differently among the ports.

If the port pair is at the top of the scan order, and either of the ports is requesting, then the requesting port will win arbitration. If both are requesting, port ordering is used to determine which port wins arbitration. Note that when the ports are paired, their scan order can never be altered and they will always remain together in the scan order. Their counters increment together, and so when they reach their relative priority value, the port pair will dynamically be placed at the bottom of the scan order for that priority group.

In order for port weight sharing to be used, the relative priority parameters for the port pair must be programmed to the same value and the port order of the paired ports should be sequential. If either condition is not followed, an error bit will be set to 1.

Consider System G as described in **Table 3.4-13**. Again, for simplification, the command queue is considered to never be full, commands from ports 0, 1, 2 and 3 are only received at priority level 0 and commands from ports 4 and 5 are always at priority 1. However, now ports 0 and 1 and ports 4 and 5 are paired.

Table 3.4-13 System G Specifications

Controller Parameter	Port 0	Port 1	Port 2	Port 3	**Port 4**	**Port 5**
axiY_priority0_relative_priority	3	3	2	2	**1**	**1**
axiY_priority1_relative_priority	1	1	1	1	**2**	**2**
axiY_port_ordering	0	1	2	3	**5**	**4**
weighted_round_robin_weight_sharing	1 (Paired)		0 (Not Paired)		**1 (Paired)**	

Table 3.4-14 shows the system behavior with port pairing. Since ports 4 and 5 are still at a lower priority, they will be ignored unless none of the higher priority ports (P0, P1, P2, or P3) are requesting. Note the following points:

- When either port of a port pair wins arbitration, the counters for both ports of the pair increment.
- In Cycle 3, the port pair P0/P1 reaches its allocated relative priority. Note that the port pair dynamically moves to the bottom of the scan order.
- In Cycle 8, the port pair P4/P5 reaches its allocated relative priority. However, since these are the only requests at priority 1, the scan order does not change.

Table 3.4-14 System G Operation

Cycle	Ports Requesting						Arbitration Winner	Next Counter						Next Scan Order
	P0	**P1**	P2	P3	**P4**	**P5**		P0	P1	P2	P3	**P4**	**P5**	
	—	—	—	—	—	—	—	—	—	—	—	—	—	Priority 0: P0-P1-P2-P3 Priority 1: P4-P5
0	Y	—	Y	—	—	—	P0	1	1	0	0	0	0	P0-P1-P2-P3 P5-P4
1	Y	—	Y	—	—	Y	P0	2	2	0	0	0	0	P0-P1-P2-P3 P5-P4
2	—	—	Y	—	—	Y	P2	2	2	1	0	0	0	P0-P1-P2-P3 P5-P4
3	Y	Y	—	Y	—	Y	P0	3	3	1	0	0	0	P2-P3-P0-P1 P5-P4
4	—	Y	—	Y	—	Y	P3	0	0	1	1	0	0	P2-P3-P0-P1 P5-P4
5	—	Y	—	Y	—	Y	P3	0	0	1	2	0	0	P2-P0-P1-P3 P5-P4
6	—	Y	—	—	—	Y	P1	1	1	1	0	0	0	P2-P0-P1-P3 P5-P4
7	—	—	—	—	—	Y	P5	1	1	1	0	1	1	P2-P0-P1-P3 P5-P4
8	—	—	—	—	Y	—	P4	1	1	1	0	2	2	P2-P0-P1-P3 P5-P4
9	—	—	—	—	Y	Y	P5	1	1	1	0	1	1	P2-P0-P1-P3 P5-P4
10	—	Y	Y	—	Y	Y	P2	1	1	2	0	1	1	P0-P1-P3-P2 P5-P4
11	—	Y	—	—	Y	Y	P1	2	2	0	0	1	1	P0-P1-P3-P2 P5-P4

3.4.3.1.9 Error Conditions

With the programming complexities of the weighted round-robin arbitration scheme, an error reporting mechanism is included to notify users of illegal programming scenarios. These error conditions will each set a bit in the wrr_param_value_err parameter to 1. The potential error conditions are:

- Bit [0] = The 5 axiY_port_ordering parameters do not all contain unique values.
- Bit [1] = Any of the axiY_priorityZ_relative_priority parameters have been programmed with a zero value. A 0 value leads to unknown behavior. The minimum allowable value is 1.
- Bit [2] = Any ports, whose related bit of the weighted_round_robin_weight_sharing parameter is set to 1, do not have the same values in their axiY_priorityZ_relative_priority parameters.
- Bit [3] = For ports whose related bit of the weighted_round_robin_weight_sharing parameter is set to 1, the values of the axiY_port_ordering parameters are not sequential.

If bit [0], [2], or [3] is set to 1 in the wrr_param_value_err parameter, and any of the ports are paired in the weighted_round_robin_weight_sharing parameter, then all weight sharing data will be ignored during this unit initialization and the ports will be prioritized by port number. If port pairing is not being used, but the bit [0] error condition is set to 1, then ports with a non-unique port ordering are prioritized by port number.

Remark The user is strongly cautioned against modifying the values of the port ordering or relative priority parameters during active port usage.

3.4.3.1.10 Programmable Options for Weighted Round Robin Arbitration

This unit's weighted round-robin arbitration scheme provides a great deal of programmable control for the user. The parameters are referenced throughout this section and are summarized here for clarity:

- axiY_fixed_port_priority_enable (5 parameters, 1 for each port Y)
- axiY_r_priority (5 parameters, 1 for each port Y)
- axiY_w_priority (5 parameters, 1 for each port Y)
- axiY_priorityZ_relative_priority (8 parameters for each port Y)
- axiY_port_ordering (5 parameters, 1 for each port Y)
- axiY_priority_relax (5 parameters, 1 for each port Y)
- weighted_round_robin_latency_control
- weighted_round_robin_weight_sharing
- wrr_param_value_err

3.4.3.2 Non-ECC Regions

This unit supports the use of ECC regions. This feature allows the user to specify regions of memory that will not include ECC protection even if the ecc_enable parameter is programmed to a non-zero value. This unit allows the user to specify 16 such regions. For each region, the user will specify the starting address and the ending address in the non_ecc_region_start_addr_X and the non_ecc_region_end_addr_X parameters with a 1 MB granularity. In addition, each region has an associated bit in the non_ecc_region_enable parameter that must be set to allow that address range to be used as a region.

Remark 1. A transaction that crosses a non-ECC region and an ECC region boundary is illegal and an interrupt will fire. However, this unit will treat such a transaction as if the entire address is outside of any non-ECC regions.

Remark 2. Between the address in this section, ADDR, and the system bus address, SYS_ADDR, the following equation hold.
ADDR = SYS_ADDR − 0_4000_0000h

Table 3.4-15 Non-ECC Region Usage Lookup Table

All addresses within a non-ECC region?	Is the region enabled in the non_ecc_region_enable parameter?	What ECC checking will occur?	Refer to:
Yes	Yes	None	Case A
Yes	No	In-line ECC, if the ecc_enable parameter is non-zero	Case B
No	Not relevant	In-line ECC, if the ecc_enable parameter is non-zero	Case B

Case A: For read operations, a tag will be generated to track a transaction that is to memory addresses within a non-ECC region. When the data is read from memory, if the ecc_enable parameter is programmed to a non-zero value, the ECC error detection and correction logic will be disabled temporarily for this transaction. A write operation will proceed as if the ECC logic is disabled. Any read/modify/write operations that would have occurred for proper ECC calculation will be bypassed, and no ECC information will be stored.

Case B: The read or write operation will proceed as if the non-ECC region feature is not available. If the ecc_enable parameter is programmed to a non-zero value, the in-line ECC logic will operate to check the data for ECC.

3.4.3.2.1 Programming Restrictions

The following restrictions occur on setting up regions:

- The starting address of a region may not be greater than the ending address of the same region.
- The region definitions should not be changed unless the Controller is idle with no active transactions.
- The regions may not overlap.
- Enabled regions may not be adjacent and should be at least 2 MB apart.

3.4.3.2.2 Non-ECC Region Parameters

Relevant parameters are listed in **Table 3.4-16**.

Table 3.4-16 Non-ECC Region Parameters

Parameter	Description
non_ecc_region_enable	Enables each soft-designated non-ECC region. Bit [0] correlates to region 0, bit [1] correlates to region 1, etc. For each region: 0b: Disable this region 1b: Enable this region
non_ecc_region_start_addr_X	Set the base address of the soft-designated non-ECC region X. The address written is 1 MB aligned.
non_ecc_region_end_addr_X	Set the ending address of the soft-designated non-ECC region X. The address written is 1 MB aligned.

3.4.4 Operation

For more information, refer to the User's Manual Additional Document.

3.4.5 Interrupt

3.4.5.1 Interrupt List

Table 3.4-17 shows interrupt signals of this unit.

Table 3.4-17 Interrupt List

Interrupt Signal	Description	Pulse/ Level	Min Pulse	Active Level	Clock
controller_int	Interrupt signal from the controller. This is a level-sensitive signal which will be asserted when the controller detects any interrupt conditions. An interrupt will only cause the controller_int signal to be asserted if the associated bit is set in the int_status_master parameter and cleared in the int_mask_master parameter (and the uppermost bit of the int_mask_master parameter is cleared to 0).	Level	—	High	DfiClk
DDR_CH0_perf_mon_data_ status[1:0]	Performance monitor signal for ch0. Single cycle pulse per event. [0] = Uncorrectable ECC error detected on read data. [1] = ECC data correction has occurred on read data.	Pulse	1 cycle	High	DfiClk
DDR_CH1_perf_mon_data_ status[1:0]	Performance monitor signal for ch1. Single cycle pulse per event. [0] = Uncorrectable ECC error detected on read data. [1] = ECC data correction has occurred on read data.	Pulse	1 cycle	High	DfiClk

3.4.5.1.1 controller_int

This unit supports a full system of interrupts to alert the user of any issues the Controller encounters. Interrupts are reported by the setting of bits in the int_status_master parameter and the individual int_status_<group> parameters. If any bits are set in the group parameter, the associated bit will be set in the int_status_master parameter. Individual interrupts must be cleared by writing to the bit in the int_ack_<group> parameter, which will then update the int_status_<group> parameter and may clear the bit in the int_status_master parameter. Interrupts may be masked individually in the int_mask_<group> parameter, groups of interrupts may be masked in the int_mask_master parameter, or all interrupts may be masked by setting the uppermost bit of the int_mask_master parameter to 1. See **Table 3.4-18** for the correlation of bits in the master and group parameters, and all subsequent tables for the individual bits of each group.

Table 3.4-18 Groups of controller_int (1/2)

Logic Group	Bit in the int_status_master and int_mask_master Parameters	Name of the Group Status Parameter	Name of the Group Mask Parameter	Name of the Group Acknowledge Parameter
Not Connected	31 to 16	n/a	n/a	n/a
Reserved	15	—	—	—
Mode Registers	14	int_status_mode	int_mask_mode	int_ack_mode
Initialization	13	int_status_init	int_mask_init	int_ack_init
Reserved	12, 11	—	—	—
DFI	10	int_status_dfi	int_mask_dfi	int_ack_freq
Reserved	9	—	—	—
BIST Logic	8	int_status_bist	int_mask_bist	int_ack_bist
Miscellaneous Logic	7	int_status_misc	int_mask_misc	int_ack_misc

Table 3.4-18 Groups of controller_int (2/2)

Logic Group	Bit in the int_status_master and int_mask_master Parameters	Name of the Group Status Parameter	Name of the Group Mask Parameter	Name of the Group Acknowledge Parameter
User Interface	6	int_status_userif	int_mask_userif	int_ack_userif
Training	5	int_status_training	int_mask_training	int_ack_training
Reserved	5 to 3	—	—	—
Low Power Control	2	int_status_lowpower	int_mask_lowpower	int_ack_lowpower
ECC	1	int_status_ecc	int_mask_ecc	int_ack_ecc
Timeout	0	int_status_timeout	int_mask_timeout	int_ack_timeout

Table 3.4-19 Bits of the Mode Registers Group

Bit	Description
7 to 4	Reserved
3	The register interface-initiated mode register write has completed and another mode register write may be issued.
2	The requested mode register read has completed. The chip and data can be read in the peripheral_mrr_data parameter.
1	Reserved
0	An MRR error has occurred. Error information can be found in the mrr_error_status parameter.

Table 3.4-20 Bits of the Initialization Group

Bit	Description
7 to 2	Reserved
3	The state machine is in the power on software initialization state during initialization.
2	Reserved
1	The MC initialization has been completed.
0	The memory reset is valid on the DFI bus.

Table 3.4-21 Bits of the DFI Group

Bit	Description
7, 6	Reserved
5	The DFI tINIT_COMPLETE value has timed out. This value is specified in the tdfi_init_complete parameter.
4	The user-initiated DLL resynchronization has completed.
3	A state change has been detected on the dfi_init_complete signal after initialization.
2	Error received from the PHY on the DFI bus.
1	A DFI PHY Master Interface error has occurred. Error information can be found in the phymstr_error_status parameter.
0	A DFI update error has occurred. Error information can be found in the update_error_status parameter.

Table 3.4-22 Bits of the BIST Logic Group

Bit	Description
7 to 1	Reserved
0	The BIST operation has been completed.

Table 3.4-23 Bits of the Miscellaneous Logic Group

Bit	Description
15 to 12	Reserved
11	The S/W requested refresh operation has resulted in a status bit being set.
10 to 8	Reserved
7	The refresh operation has resulted in a status bit being set.
6	A temperature alert condition (low or high temp) has been detected.
5	The last automatic MRR of MR4 indicated a change in the device temperature or refresh rate (TUF bit set).
4	The controller has entered the software-requested mode.
3	The assertion of the inhibit_dram_cmd parameter has successfully inhibited the command queue.
2 to 0	Reserved

Table 3.4-24 Bits of the User Interface Group

Bit	Description
31 to 8	Reserved
7	The user has programmed an invalid setting associated with core words per burst. Examples: Setting the mem_dp_reduction parameter when burst length = 2.
6	A wrap cycle crossing a DRAM page has been detected. This is unsupported and may result in memory data corruption.
5 to 3	Reserved
2	An error occurred on the port command channel.
1	Multiple accesses outside the defined PHYSICAL memory space have occurred.
0	A memory access outside the defined PHYSICAL memory space has occurred.

Table 3.4-25 Bits of the Training Group

Bit	Description
31 to 16	Reserved
15	A DQS oscillator measurement has been detected to be out of variance.
14	A DQS oscillator measurement overflow has been detected.
13	The DQS oscillator has updated the base values.
12	The software-requested DQS oscillator measurement has completed.
11	The ZQ calibration operation has resulted in a status bit being set. Refer to the zq_status_log parameter for more information.
10 to 0	Reserved

Table 3.4-26 Bits of the Low Power Control Group

Bit	Description
15 to 4	Reserved
3	A Low Power Interface (LPI) timeout error has occurred.
2, 1	Reserved
0	The low power operation has been completed.

Table 3.4-27 Bits of the ECC Group

Bit	Description
15 to 9	Reserved
8	An ECC correctable error has been detected in a scrubbing read operation.
7	The scrub operation triggered by setting the ecc_scrub_start parameter has completed.
6	One or more ECC writeback commands could not be executed.
5, 4	Reserved
3	Multiple uncorrectable ECC events have been detected.
2	An uncorrectable ECC event has been detected.
1	Multiple correctable ECC events have been detected.
0	A correctable ECC event has been detected.

Table 3.4-28 Bits of the Timeout Group

Bit	Description
31 to 20	Reserved
19	The auto-refresh max deficit timeout has expired.
18	Reserved
17	The low power interface wakeup timeout has expired.
16	The DFI update FM timeout has expired.
15	A DQS oscillator request timeout has been detected.
14	The MRR temperature check FM timeout has expired.
13 to 10	Reserved
9	The ZQ calstart FM timeout has expired.
8	The ZQ callatch FM timeout has expired.
7	The ZQ cal init, cs, cl, or reset FM timeout has expired.
6 to 0	Reserved

3.4.5.1.2 DDR_CHn_perf_mon_data_status[1:0] (n = 0, 1)

This unit has a mechanism to notify the user that a correctable or uncorrectable ECC error has been detected on the read data. This signal is the edge type interrupt when it has occurred.

- Bit 0 is asserted to 1 for 1 DfiClk when an uncorrectable ECC error has been detected on the read data.
- Bit 1 is asserted to 1 for 1 DfiClk when ECC data correction has occurred on the read data.

3.4.6 Usage Notes

This unit has the following restrictions.

Table 3.4-29 Restrictions

Item	Restriction
Period of DRAM inaccessibility	It has the period of DRAM inaccessibility to execute the periodic training. It is 1,280 core clock cycles every 134,217,728 core clock cycles. So, it depends only on the Bit Rate (the frequency of the core clock). It is below: 3200 Mbps: 1.6 µs every 167 ms
Density when ECC function is enabled	When the ECC function is enabled, 1/8 is used for the ECC code, so the usable density is 7/8.
LPDDR4	Not support the followings; Refresh Management (RFM), Scaling Level (SCL).
LPDDR4X	Not support the followings; Single-ended mode for Clock and Strobe.

SECTION 3 MEMORY

3.5 TrustZone Address Space Controller (TZC)

3.5.1 Overview

This LSI has nine address space controllers (TZCs) to realize memory access in a safe area. It performs security checks on transactions to memory or peripherals. Transactions must meet security requirements to access memory or peripherals. This is an IP (“CoreLink™ TrustZone Address Space Controller TZC-400”) provided by Arm, for details on the functions of TZC-400, see the relevant Technical Reference Manual.

3.5.1.1 Features

The TZC works between TrustZone system ACE-Lite masters and ACE-Lite slaves to filter bus access from master to slave. It performs filtering based on the security requirements specified in the address space.

Each TZC is installed on the interface of the following modules of this LSI.

- xSPI
- SRAM0, SRAM1, and SRAM2
- RCPU Bus
- DDR
- PCIE

For details on the internal bus, refer to **1.7 Internal Bus**.

The TZC provides the following key features:

- The ability to define up to eight address regions in the area map.
- A default base region to cover all remaining portions of the address map.
- Software programmable security access permissions for each address region through an APB interface. This includes the default base region, Region 0.
- Filter units only allow data transfer between an ACE-Lite master and an ACE-Lite slave if the security status of the ACE-Lite transaction and its identity match the security settings of the memory region it addresses.
- Common region configuration register settings shared between multiple filter units.
- Normal path for accesses with a much higher outstanding access support.
- Identity-based filtering of Non-secure accesses.
- Reporting and interrupt signaling that is configurable from software to manage failed permission checks. You can program the TZC to assert TZCINT_* (* = XSP, MSRM, ASRM, ACRCB, DDR00, DDR01, PCI) when an access fails its security check.
- Gate keeper to allow or block accesses to each filter unit.
- Support for 256 outstanding transactions on the normal paths.

3.5.1.2 Block Diagram

Figure 3.5-1 shows a block diagram.

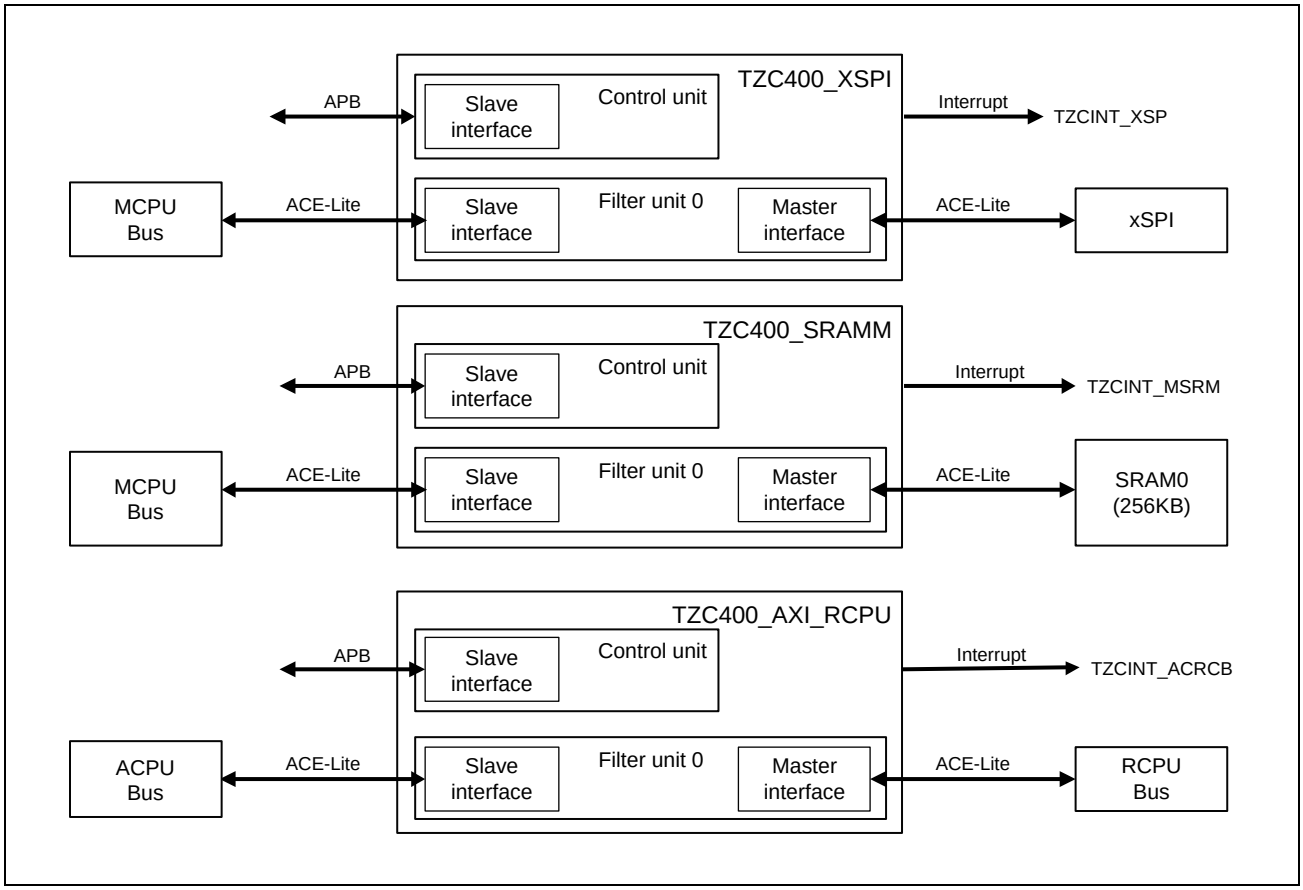

Figure 3.5-1 Block Diagram (1/3)

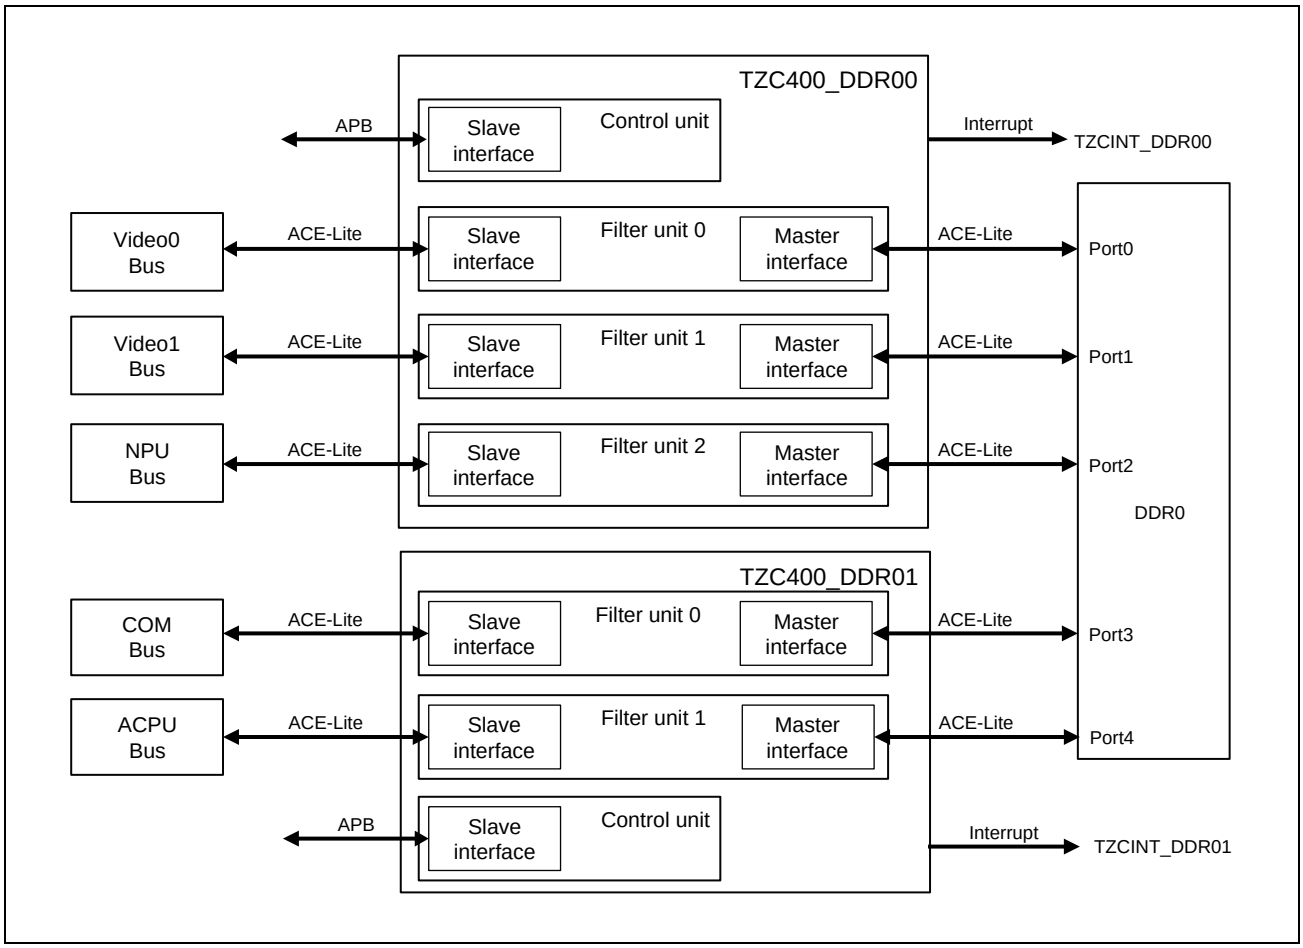

Figure 3.5-1 Block Diagram (2/3)

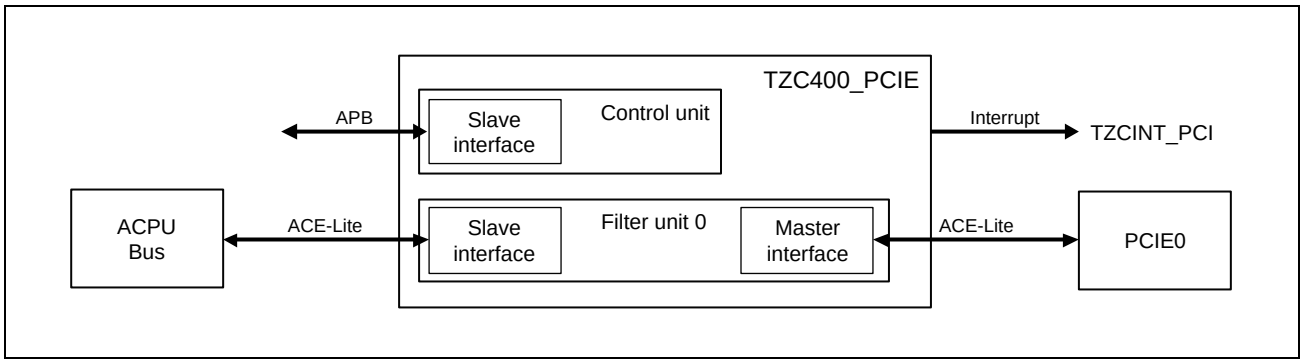

Figure 3.5-1 Block Diagram (3/3)

Filter units perform security checks. Each filter unit has an ACE-Lite slave interface and an ACE-Lite master interface. All filter units operate from one set of shared region configuration registers. This ensures consistency across all filter units.

The number of filter units of TZC installed on each interface is as follows.

- xSPI: 1 filter unit
- SRAM0, SRAM1: 2 filter units
- SRAM2: 1 filter unit
- RCPU bus: 1 filter unit
- DDR: 1 TZC, 3 filter units and 2 filter units
  - filter unit 0: Access from the Video0 Bus passes
  - filter unit 1: Access from the Video1 Bus passes
  - filter unit 2: Access from the DRP Bus passes
  - filter unit 0: Access from the COM Bus passes
  - filter unit 1: Access from the ACPU Bus passes
- PCIE: 1 filter unit

3.5.1.3 External Pins

In the TZC, there are no external pins.

3.5.2 Register Configuration

The base address of the TZC associated with each module is as follows:

- TZC400_XSPI: xSPI

  0_1047_0000h (CA55 Address Space)
  4047_0000h (CM33 Address Space Secure)
  5047_0000h (CM33 Address Space Non-Secure)

- TZC400_SRAMM: SRAM0 and SRAM1 (1 MB)

  0_1046_0000h (CA55 Address Space)
  4046_0000h (CM33 Address Space Secure)
  5046_0000h (CM33 Address Space Non-Secure)

- TZC400_SRAMA: SRAM2 (512 KB)

  0_13CB_0000h (CA55 Address Space)
  43CB_0000h (CM33 Address Space Secure)
  53CB_0000h (CM33 Address Space Non-Secure)

- TZC400_AXI_RCPU: RCPU Bus

  0_13CA_0000h (CA55 Address Space)
  43CA_0000h (CM33 Address Space Secure)
  53CA_0000h (CM33 Address Space Non-Secure)

- TZC400_DDR00: DDR0 (Video0, Video1, DRP Bus)

  0_13C6_0000h (CA55 Address Space)
  43C6_0000h (CM33 Address Space Secure)
  53C6_0000h (Cortex-M33 Address Space Non-Secure)

- TZC400_DDR01: DDR0 (COM, ACPU Bus)

  0_13C7_0000h (CA55 Address Space)
  43C7_0000h (CM33 Address Space Secure)
  53C7_0000h (CM33 Address Space Non-Secure)

- TZC400_PCIE: PCIE

  0_13CC_0000h (CA55 Address Space)
  43CC_0000h (CM33 Address Space Secure)
  53CC_0000h (CM33 Address Space Non-Secure)

For details on the functions of TZC-400, see the relevant Technical Reference Manual. (ARM® CoreLink™ TZC-400 TrustZone® Address Space Controller Technical Reference Manual, Revision: r0p1)

3.5.3 Register Descriptions

For details on the functions of TZC-400, see the relevant Technical Reference Manual. (ARM® CoreLink™ TZC-400 TrustZone® Address Space Controller Technical Reference Manual, Revision: r0p1)

The TZC has registers to specify the address area where access is controlled. Refer to Overall Address Space (**1.8 Address Map**) for the addresses specified in these registers.

3.5.4 Operation

For details on the functions of TZC-400, see the relevant Technical Reference Manual. (ARM® CoreLink™ TZC-400 TrustZone® Address Space Controller Technical Reference Manual, Revision: r0p1)

When accessing the bus using this unit, check the settings of SYS, CPG, and each TZC.

3.5.5 Usage Note

For details on the functions of TZC-400, see the relevant Technical Reference Manual. (ARM® CoreLink™ TZC-400 TrustZone® Address Space Controller Technical Reference Manual, Revision: r0p1)

SECTION 4 SYSTEM

4.1 System Overview

This section describes the units that control the overall system of this LSI.

■ Pin Function Controller (PFC) (See 4.2)

Controls the external pins (GPIO control, switching of multi-function pins, setting of drive strength, etc.) of this LSI.

■ System Controller (SYS) (See 4.3)

Controls each unit (TZC control, address extension, setting of each unit, etc.).

■ Clock Pulse Generator (CPG) (See 4.4)

Performs clock/reset control, boot control, and low power control for each unit.

■ Power Management Unit (PMU) (See 4.5)

The power supply of this LSI is roughly classified into two power supply domains (PD_AWO, PD_OTHERS).

Controls each power domain and enable signals of various power supplies.

■ Interrupt Controller (See 4.6)

The Interrupt Control Uniti (ICU) manages and controls interrupt signals.

In addition, the ICU is equipped with an Event Link Controller, and by outputting each event signal to an arbitrary unit, the load on the CPU is reduced.

In this section, GIC and MHU function details will also be described.

■ DMA Controller (DMAC) (See 4.7)

The LSI contains a total of 80 channels of DMAC. See the ICU description for DMAC allocation.

■ Trusted Secure IP (See 4.8)

Controls security of this LSI. This unit is an optional function.

■ Debug Interface (See 4.9)

This LSI equips Arm® CoreSight™. The CST unit controls the debugger connection.

SECTION 4 SYSTEM

4.2 Pin Function Controller (PFC)

This section describes the functions of the PFC (IO_TOP).

4.2.1 Overview

The PFC unit serves as the interface between the external pins of the LSI and the given units within the LSI via the IO block (1.2-V to 1.8-V/1.8-V/3.3-V I/O buffers and 1.2-V to 1.8-V OSC buffers) and also controls the mode of the IO block.

The external pins of the LSI are classified into dedicated pins and pins having multiplexed functions (multiplexed pins), and the PFC controls selection from among the multiplexed functions or of operation as general-purpose I/O (GPIO) port pins.

The multiplexed pins are assigned to the external pins of the LSI (P00 to PB5) as described in **1.2 Pin**. For the names of the multiplexed signals (functions) which can be selected for the respective multiplexed pins, refer to the list of multiplexed pins in **1.2 Pin**.

CAUTION

When making the settings, do not select the same multiplexed function for several different external pins.

Table 4.2-1 Overview

Function	Description
Pin function controller	• GPIO control • Switching between functions multiplexed on the pins • Switching the drive strength of the pins • Switching the slew rate of the pins • Pull-up/down control of the pins • Input enable control of the pins • Output enable control of the pins • N-ch. open drain control of the pins • Schmitt control of the pins • OSC mode switching • Reset latch function • Digital noise filter control
Event link controller	• ELC_GPIO control

4.2.1.1 GPIO Control and Switching between Functions Multiplexed on the Pins

The PFC supports general-purpose I/O (GPIO) port pins.

The external pins have the following functions.

- GPIO output value control (PFC_P_mn register)
- GPIO input/output enable (PFC_PM_mn register)
- GPIO input pin monitoring (PFC_PIN_mn register)

Additionally, the signals to be connected to an I/O buffer can be switched to GPIO operation or to any of the available settings from among mode 1 to mode 15.

- Mode switching (PFC_PMC_mn register)
- Function switching (PFC_PFC_mn register)

The table below shows the relationship between port mode (GPIO) and control mode (multiplexed function) and the PFC_P_mn, PFC_PM_mn, PFC_PMC_mn, and PFC_PFC_mn registers as port control registers. For details of each register, see **4.2.2 Register Description**.

Table 4.2-2 GPIO Control and Switching between Functions Multiplexed on the Pins

	PMC_mn = 0 (Initial Value) (Port Mode)				PMC_mn = 1 (Control Mode)	
External Pin	PM_mn = 11b	PM_mn = 10b	PM_mn = 01b	PM_mn = 00b (Initial Value)	PFC_mn = 0000b (Initial Value)	PFC_mn = 0001b to 1111b
Multiplexed pins	P_mn is output. Input enabled	P_mn is output. Input disabled	External pin input	Hi-Z	Hi-Z	Mode 1 to 15

4.2.1.2 Switching and Controlling the Pins

The PFC has functionality for switching and controlling the signals to be connected to the I/O buffers.

The functionality for switching and controlling the signals consists of the following items. For details of each register, see **4.2.2 Register Description**.

- Switching the drive strength of the pins (PFC_IOLH_mn register)
- Switching the slew rate of the pins (PFC_SR_mn register)
- Pull-up/down control of the pins (PFC_PUPD_mn register)
- Input enable control of the pins (PFC_IEN_mn register)
- Output enable control of the pins (PFC_OEN_mn register)
- N-ch. open drain control of the pins (PFC_NOD_mn register)
- Schmitt control of the pins (PFC_SMT_mn register)

4.2.1.3 OSC Mode Switching

The PFC has functionality for internally handling switching the mode of the main oscillator (between crystal oscillator mode and external clock reception mode). For details of each register, see **4.2.2 Register Description**.

- OSC mode switching register (PFC_OSCBYPS register)

The targets for control by the PFC_OSCBYPS register are the RTC oscillator and audio oscillator.

For the main oscillator, the mode is switched by the signal on the external QBYPASS pin, instead of the OSCBYPS register.

4.2.1.4 Reset Latch Function

The PFC has a reset latch function for the mode pins (configuration pins).

The latches retain the values of the mode pins at the time of a system reset (QRESN = low). For details, see **4.2.3.5 RST_LATCH**.

The targets of retention by the reset latch are as follows.

- MD_BOOT0
- MD_BOOT1
- MD_BOOT2
- MD_BOOT3
- MD_BOOT4
- BOOTSELCPU
- BOOTPLLCA_0
- BOOTPLLCA_1
- MD_CLKS
- QBYPASS
- QRESNSEL

4.2.1.5 Digital Noise Filter Control

The PFC has a digital noise filter function, which allows the blocking of transient pulses such as those which are input from an external pin due to noise. For details of each register, see **4.2.2 Register Description**.

The targets for digital noise filter control are as follows.

- Dedicated NMI pin
- Input direction line for GPIO
- External TINT interrupt
- Multiplexed IRQ function
- Multiplexed DREQ function
- Port event control pins (the targets for PFC_ELC_GPIO register control described in **4.2.1.6 Event Link Controller**)

The digital noise filter control has the following functions and these can be set by registers.

- Use or non-use of the filter (PFC_FILONOFF register)
- Number of stages of the filter (PFC_FILNUM register)
- Sampling interval of the filter (PFC_FILCLKSEL register)

Remark The above registers include those for NMI, GPIO, and TINT, for IRQ, and for DREQ.

The digital noise filter settings for the target pins for port event control are fixed to the following.

- Use or non-use of the filter: Use
- Number of stages of the filter: 3
- Sampling interval of the filter: 1/1 (no division)

4.2.1.6 Event Link Controller

The PFC has PFC_ELC_GPIO registers for port event control. For details of each register, see **4.2.2 Register Description**. For the targets for control by the PFC_ELC_GPIO registers, see **Table 4.2-5**.

The PFC_ECL_GPIO registers has the following functions.

- Port group specification (PFC_ELC_PGRg register)
- Port group control (PFC_ELC_PGCg register)
- Port buffer (PFC_ELC_PDBFg register)
- Event connection port specification (PFC_ELC_PELs register)
- Input edge detection control (PFC_ELC_DPTC register)
- Port event control (ELC_ELSR2 register)

4.2.1.7 Functional Block Diagram

Figure 4.2-1 is a functional block diagram of the PFC.

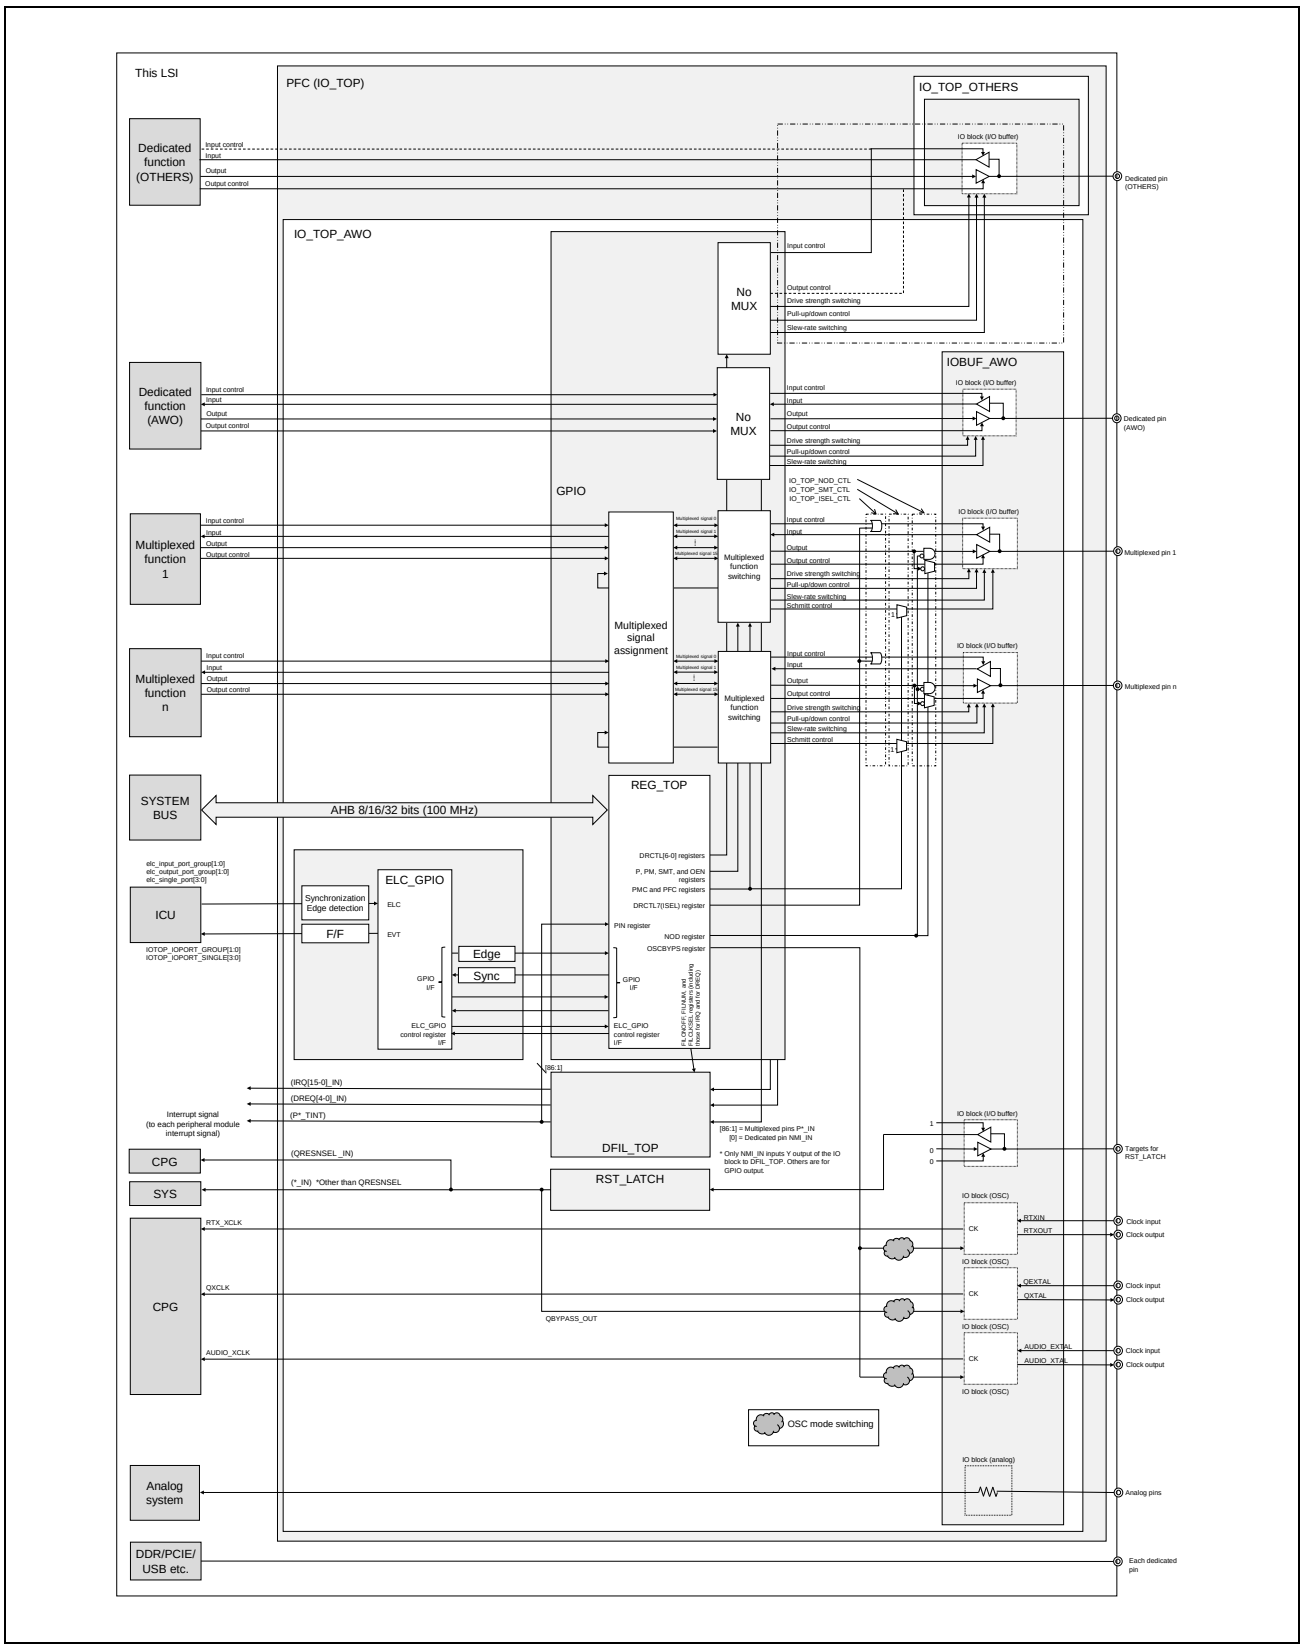

Figure 4.2-1 Functional Block Diagram

4.2.2 Register Description

The base address of the PFC register is shown below.

Table 4.2-3 Register Base Addresses

Base Address Name	Base Address
<PFC_base>	0_1041_0000h (5041_0000h*1, 4041_0000h*2)

Note 1. CM33 address space (non-secure)

Note 2. CM33 address space (secure)

4.2.2.1 List of Registers

The table below lists the registers.

Register Name	Abbreviation	Initial Value	Offset Address	Access Size [bits]
Port Registers	PFC_P_mn	00h	0020h	8
Port Mode Registers	PFC_PM_mn	0000h	0140h	8, 16
Port Mode Control Registers	PFC_PMC_mn	00h	0220h	8
Port Function Control Registers	PFC_PFC_mn	0000_0000h	0480h	8, 16, 32
Port Pin Input Registers	PFC_PIN_mn	xxh	0820h	8
IOLH Switching Registers	PFC_IOLH_mn	0x0x_0x0xh	1018h	8, 16, 32
Slew-Rate Switching Registers	PFC_SR_mn	0x0x_0x0xh	1418h	8, 16, 32
IEN Switching Registers	PFC_IEN_mn	0x0x_0x0xh	1818h	8, 16, 32
PU/PD Switching Registers	PFC_PUPD_mn	0000_0000h	1C28h	8, 16, 32
Digital Noise Filter (FILONOFF) Registers	PFC_FILONOFF_mn	0000_0000h	2008h	8, 16, 32
Digital Noise Filter (FILNUM) Registers	PFC_FILNUM_mn	0000_0000h	2408h	8, 16, 32
Digital Noise Filter (FILCLKSEL) Registers	PFC_FILCLKSEL_mn	0000_0000h	2808h	8, 16, 32
ISEL Control Registers	PFC_ISEL_mn	0000_0000h	2D00h	8, 16, 32
N-ch Open Drain Control Registers	PFC_NOD_mn	0000_0000h	3028h	8, 16, 32
Schmitt Control Registers	PFC_SMT_mn	0000_0000h	3500h	8, 16, 32
Port Group Specification Registers	PFC_ELC_PGRg	00h	3800h	8
Port Group Control Registers	PFC_ELC_PGCg	88h	3802h	8
Port Buffer Registers	PFC_ELC_PDBFg	00h	3804h	8
Event Connection Port Specification Registers	PFC_ELC_PEL	80h	380Ch	8
Input Edge Detection Control Register	PFC_ELC_DPTC	00h	3810h	8
Port Event Control Register	PFC_ELC_ELSR2	00h	3811h	8
Reserve	-	-	3812h to 3BFFh	-
OSC Bypass Mode Switching Register	PFC_OSCBYPS	001C_0707h	3C00h	8, 16, 32
Write Protect Register	PFC_PWPR	0000_00A0h	3C04h	8, 16, 32
IRQ Digital Noise Filter (FILONOFF) Register	PFC_FILONOFF_IRQ	0000_0000h	3C08h	8, 16, 32
IRQ Digital Noise Filter (FILNUM) Register	PFC_FILNUM_IRQ	0000_0000h	3C0Ch	8, 16, 32
IRQ Digital Noise Filter (FILCLKSEL) Register	PFC_FILCLKSEL_IRQ	0000_0000h	3C10h	8, 16, 32
DMAC_REQ Digital Noise Filter (FILONOFF) Register	PFC_FILONOFF_DMAC_REQ	0000_0000h	3C14h	8, 16, 32
DMAC_REQ Digital Noise Filter (FILNUM) Register	PFC_FILNUM_DMAC_REQ	0000_0000h	3C18h	8, 16, 32
DMAC_REQ Digital Noise Filter (FILCLKSEL) Register	PFC_FILCLKSEL_DMAC_REQ	0000_0000h	3C1Ch	8, 16, 32
Reserve	-	-	3C20h to 3C3Fh	-
OEN Switching Register	PFC_OEN	0000_003Fh	3C40h	8, 16, 32

For the correspondence between ports and the respective control registers, see the table below.

4.2.2.2 Port Registers (PFC_P_mn)

These registers set output values on the GPIO pins. For the correspondence with the ports, see **Table 4.2-6**.

Access Size : 8 bits
Offset Address : Refer to the table
Initial Value : 00h

Bit	7	6	5	4	3	2	1	0
	P_m7	P_m6	P_m5	P_m4	P_m3	P_m2	P_m1	P_m0
Initial Value	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
7	P_m7	0h	RW	Sets the value of the GPIO pin. 0b: Outputs low 1b: Outputs high
6	P_m6	0h	RW	Sets the value of the GPIO pin. 0b: Outputs low 1b: Outputs high
5	P_m5	0h	RW	Sets the value of the GPIO pin. 0b: Outputs low 1b: Outputs high
4	P_m4	0h	RW	Sets the value of the GPIO pin. 0b: Outputs low 1b: Outputs high
3	P_m3	0h	RW	Sets the value of the GPIO pin. 0b: Outputs low 1b: Outputs high
2	P_m2	0h	RW	Sets the value of the GPIO pin. 0b: Outputs low 1b: Outputs high
1	P_m1	0h	RW	Sets the value of the GPIO pin. 0b: Outputs low 1b: Outputs high
0	P_m0	0h	RW	Sets the value of the GPIO pin. 0b: Outputs low 1b: Outputs high

4.2.2.3 Port Mode Registers (PFC_PM_mn)

These registers set the input/output of the GPIO pins. For the correspondence with the ports, see **Table 4.2-7**.

Access Size : 8, 16 bits
Offset Address : Refer to the table
Initial Value : 0000h

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PM_m7[1:0]		PM_m6[1:0]		PM_m5[1:0]		PM_m4[1:0]		PM_m3[1:0]		PM_m2[1:0]		PM_m1[1:0]		PM_m0[1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
15 to 14	PM_m7[1:0]	0h	RW	Sets the input/output of the GPIO pin. 00b: Hi-Z 01b: Input mode 10b: Output mode (input disabled) 11b: Output mode (input enabled)
13 to 12	PM_m6[1:0]	0h	RW	Sets the input/output of the GPIO pin. 00b: Hi-Z 01b: Input mode 10b: Output mode (input disabled) 11b: Output mode (input enabled)
11 to 10	PM_m5[1:0]	0h	RW	Sets the input/output of the GPIO pin. 00b: Hi-Z 01b: Input mode 10b: Output mode (input disabled) 11b: Output mode (input enabled)
9 to 8	PM_m4[1:0]	0h	RW	Sets the input/output of the GPIO pin. 00b: Hi-Z 01b: Input mode 10b: Output mode (input disabled) 11b: Output mode (input enabled)
7 to 6	PM_m3[1:0]	0h	RW	Sets the input/output of the GPIO pin. 00b: Hi-Z 01b: Input mode 10b: Output mode (input disabled) 11b: Output mode (input enabled)
5 to 4	PM_m2[1:0]	0h	RW	Sets the input/output of the GPIO pin. 00b: Hi-Z 01b: Input mode 10b: Output mode (input disabled) 11b: Output mode (input enabled)
3 to 2	PM_m1[1:0]	0h	RW	Sets the input/output of the GPIO pin. 00b: Hi-Z 01b: Input mode 10b: Output mode (input disabled) 11b: Output mode (input enabled)
1 to 0	PM_m0[1:0]	0h	RW	Sets the input/output of the GPIO pin. 00b: Hi-Z 01b: Input mode 10b: Output mode (input disabled) 11b: Output mode (input enabled)

Table 4.2-7 Corresponding Pins and Offset Addresses of PFC_PM_mn

Offset Address	Register Name	Bits 15 and 14	Bits 13 and 12	Bits 11 and 10	Bits 9 and 8	Bits 7 and 6	Bits 5 and 4	Bits 3 and 2	Bits 1 and 0

0154h	PFC_PM_2A	PA7	PA6	PA5	PA4	PA3	PA2	PA1	PA0
0156h	PFC_PM_2B	—	—	PB5	PB4	PB3	PB2	PB1	PB0

The PFC_PM_mn register settings when using the event link controller are as listed below. For details, refer to **4.6 Interrupt Controller** of the functional specification.

Table 4.2-8 Register Settings when ELC is Used

Operation	Relevant Interface between PFC and ICU	Direction of I/F	PFC_PM_mn Register Setting
(1) Single input port operation upon event generation	IOTOP_IOPORT_SINGLE[3:0]	Output	01b
(2) Single output port operation upon event input	elc_single_port[3:0]	Input	10b (or 11b*1)
(3) Input port group operation upon event generation	IOTOP_IOPORT_GROUP[1:0]	Output	01b
(4) Input port group operation upon event input	elc_input_port_group[1:0]	Input	01b
(5) Output port group operation upon event input	elc_output_port_group[1:0]	Input	10b (or 11b*2)

Note 1. 11b when the setting of ELC_PELs.PSM = 1xb (at the time of even input, toggled output).

Note 2. 11b when the setting of ELC_PGCg.PGCO = 010b (at the time of even input, toggled output).

4.2.2.4 Port Mode Control Registers (PFC_PMC_mn)

These registers set switching between the multiplexed pin functions and GPIO. The registers can be write-protected by the PFC_PWPR register. For the correspondence with the ports, see **Table 4.2-9**.

Access Size : 8 bits
Offset Address : Refer to the table
Initial Value : 00h

Bit	7	6	5	4	3	2	1	0
	PMC_m7	PMC_m6	PMC_m5	PMC_m4	PMC_m3	PMC_m2	PMC_m1	PMC_m0
Initial Value	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
7	PMC_m7	0h	RW	Sets switching between the multiplexed functions of the GPIO pins. 0b: Port mode (GPIO) 1b: Control mode (multiplexed function)
6	PMC_m6	0h	RW	Sets switching between the multiplexed functions of the GPIO pins. 0b: Port mode (GPIO) 1b: Control mode (multiplexed function)
5	PMC_m5	0h	RW	Sets switching between the multiplexed functions of the GPIO pins. 0b: Port mode (GPIO) 1b: Control mode (multiplexed function)
4	PMC_m4	0h	RW	Sets switching between the multiplexed functions of the GPIO pins. 0b: Port mode (GPIO) 1b: Control mode (multiplexed function)
3	PMC_m3	0h	RW	Sets switching between the multiplexed functions of the GPIO pins. 0b: Port mode (GPIO) 1b: Control mode (multiplexed function)
2	PMC_m2	0h	RW	Sets switching between the multiplexed functions of the GPIO pins. 0b: Port mode (GPIO) 1b: Control mode (multiplexed function)
1	PMC_m1	0h	RW	Sets switching between the multiplexed functions of the GPIO pins. 0b: Port mode (GPIO) 1b: Control mode (multiplexed function)
0	PMC_m0	0h	RW	Sets switching between the multiplexed functions of the GPIO pins. 0b: Port mode (GPIO) 1b: Control mode (multiplexed function)

Note: When switching multiplexed pins in control mode or switching between control mode and port mode, start by setting PM_mn = 00b and PMC_mn = 0b to place the pins in the Hi-Z state and then set the other registers appropriately before switching the functions in order to avoid contention of the signals with those of other-party devices.

Table 4.2-9 Corresponding Pins and Offset Addresses of PFC_PMC_mn

Offset Address	Register Name	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0

4.2.2.6 Port Pin Input Registers (PFC_PIN_mn)

These are read-only registers that allow the monitoring of input values on the input pins. Writing to these registers has no effect. For the correspondence with the ports, see **Table 4.2-11**.

Access Size : 8 bits
Offset Address : Refer to the table
Initial Value : xxh

Bit	7	6	5	4	3	2	1	0
	PIN_m7	PIN_m6	PIN_m5	PIN_m4	PIN_m3	PIN_m2	PIN_m1	PIN_m0
Initial Value	x	x	x	x	x	x	x	x
R/W	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7	PIN_m7	x	R	The initial value "x" is a value of the Y pin of the IO block when the IE pin of the IO block = 0 (depends on the IO block type). Refer to **Figure 4.2-2**.
6	PIN_m6	x	R	The initial value "x" is a value of the Y pin of the IO block when the IE pin of the IO block = 0 (depends on the IO block type). Refer to **Figure 4.2-2**.
5	PIN_m5	x	R	The initial value "x" is a value of the Y pin of the IO block when the IE pin of the IO block = 0 (depends on the IO block type). Refer to **Figure 4.2-2**.
4	PIN_m4	x	R	The initial value "x" is a value of the Y pin of the IO block when the IE pin of the IO block = 0 (depends on the IO block type). Refer to **Figure 4.2-2**.
3	PIN_m3	x	R	The initial value "x" is a value of the Y pin of the IO block when the IE pin of the IO block = 0 (depends on the IO block type). Refer to **Figure 4.2-2**.
2	PIN_m2	x	R	The initial value "x" is a value of the Y pin of the IO block when the IE pin of the IO block = 0 (depends on the IO block type). Refer to **Figure 4.2-2**.
1	PIN_m1	x	R	The initial value "x" is a value of the Y pin of the IO block when the IE pin of the IO block = 0 (depends on the IO block type). Refer to **Figure 4.2-2**.
0	PIN_m0	x	R	The initial value "x" is a value of the Y pin of the IO block when the IE pin of the IO block = 0 (depends on the IO block type). Refer to **Figure 4.2-2**.

x: Undefined value

4.2.2.7 IOLH Switching Registers (PFC_IOLH_mn)

These registers set the drive strength of the IO block. For the correspondence with the ports, see **Table 4.2-12** and **Table 4.2-13**.

Access Size : 8, 16, 32 bits
Offset Address : Refer to the table
Initial Value : 0x0x_0x0xh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	IOLH_m3[1:0]		-	-	-	-	-	-	IOLH_m2[1:0]	
Initial Value	0	0	0	0	0	0	x	x	0	0	0	0	0	0	x	x

R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	-	All 0	RW	Reserved Whenever it is read, 0 is read. The written value should always be 0b.
25, 24	IOLH_m3[1:0]	x	RW	Sets the drive strength of the GPIO pin. The drive strength value varies depending on the I/O types.
23 to 18	-	All 0	RW	Reserved Whenever it is read, 0 is read. The written value should always be 0b.
17, 16	IOLH_m2[1:0]	x	RW	Sets the drive strength of the GPIO pin. The drive strength value varies depending on the I/O types.
15 to 10	-	All 0	RW	Reserved Whenever it is read, 0 is read. The written value should always be 0b.
9, 8	IOLH_m1[1:0]	x	RW	Sets the drive strength of the GPIO pin. The drive strength value varies depending on the I/O types.
7 to 2	-	All 0	RW	Reserved Whenever it is read, 0 is read. The written value should always be 0b.
1, 0	IOLH_m0[1:0]	x	RW	Sets the drive strength of the GPIO pin. The drive strength value varies depending on the I/O types.

x: Undefined value

“Higher-Order Address” and “Lower-Order Address” at the offset addresses correspond respectively to the left-side 32-bit units and right-side 32 bit-units of the map below.

Table 4.2-12 Corresponding Pins and Offset Addresses of PFC_IOLH_mn

Offset Address	Register Name	Higher-Order Address				Lower-Order Address			
		Bits 25 and 24	Bits 17 and 16	Bits 9 and 8	Bits 1 and 0	Bits 25 and 24	Bits 17 and 16	Bits 9 and 8	Bits 1 and 0

Note 1. WDTUDFCA and WDTUDFCM are reset in response to the assertion of the ERROR_RESETn signal from the CPG. They are not reset in response to the assertion of the external QRESN pin.

Note 2. Group A output impedance

I/O voltage	00b	10b	01b	11b
3.3 V	150Ω	75Ω	38Ω	25Ω
1.8 V	130Ω	65Ω	33Ω	22Ω

Note 3. Group B output impedance

I/O voltage	00b	10b	01b	11b
3.3 V	65Ω	55Ω	44Ω	33Ω
1.8 V	50Ω	40Ω	33Ω	25Ω

Note 4. Group D output impedance

I/O voltage	00b	10b	01b	11b
1.8 V	110Ω	55Ω	30Ω	20Ω
1.2 V	150Ω	75Ω	38Ω	25Ω

4.2.2.8 Slew-Rate Switching Registers (PFC_SR_mn)

These registers set the slew rate of the IO block. For the correspondence with the ports, see **Table 4.2-14** and **Table 4.2-15**.

Access Size : 8, 16, 32 bits
Offset Address : Refer to the table
Initial Value : 0x0x_0x0xh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	SR_m3	-	-	-	-	-	-	-	SR_m2
Initial Value	0	0	0	0	0	0	0	x	0	0	0	0	0	0	0	x
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	SR_m1	-	-	-	-	-	-	-	SR_m0
Initial Value	0	0	0	0	0	0	0	x	0	0	0	0	0	0	0	x
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	-	All 0	RW	Reserved Whenever it is read, 0 is read. The written value should always be 0b.
24	SR_m3	x	RW	Sets the slew rate of the GPIO pin. 0b: Fast 1b: Slow
23 to 17	-	All 0	RW	Reserved Whenever it is read, 0 is read. The written value should always be 0b.
16	SR_m2	x	RW	Sets the slew rate of the GPIO pin. 0b: Fast 1b: Slow
15 to 9	-	All 0	RW	Reserved Whenever it is read, 0 is read. The written value should always be 0b.
8	SR_m1	x	RW	Sets the slew rate of the GPIO pin. 0b: Fast 1b: Slow
7 to 1	-	All 0	RW	Reserved Whenever it is read, 0 is read. The written value should always be 0b.
0	SR_m0	x	RW	Sets the slew rate of the GPIO pin. 0b: Fast 1b: Slow

x: Undefined value

“Higher-Order Address” and “Lower-Order Address” at the offset addresses correspond respectively to the left-side 32-bit units and right-side 32 bit-units of the map below.

Table 4.2-14 Corresponding Pins and Offset Addresses of PFC_SR_mn

		Higher-Order Address				Lower-Order Address

Note 1. WDTUDFCA and WDTUDFCM are reset in response to the assertion of the ERROR_RESETn signal from the CPG. They are not reset in response to the assertion of the external QRESN pin.

4.2.2.9 IEN Switching Registers (PFC_IEN_mn)

These registers control inputs on the multiplexed pins other than those in use for GPIO. These registers also control the dedicated input pins. For the correspondence with the ports, see **Table 4.2-16** and **Table 4.2-17**.

Access Size : 8, 16, 32 bits
Offset Address : Refer to the table
Initial Value : 0x0x_0x0xh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	IEN_m3	-	-	-	-	-	-	-	IEN_m2
Initial Value	0	0	0	0	0	0	0	x	0	0	0	0	0	0	0	x
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	IEN_m1	-	-	-	-	-	-	-	IEN_m0
Initial Value	0	0	0	0	0	0	0	x	0	0	0	0	0	0	0	x
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	-	All 0	RW	Reserved Whenever it is read, 0 is read. The written value should always be 0b.
24	IEN_m3	x	RW	Controls the input of pins for multiplexed functions other than GPIO and dedicated pins. 0b: Input disabled 1b: Input enabled
23 to 17	-	All 0	RW	Reserved Whenever it is read, 0 is read. The written value should always be 0b.
16	IEN_m2	x	RW	Controls the input of pins for multiplexed functions other than GPIO and dedicated pins. 0b: Input disabled 1b: Input enabled
15 to 9	-	All 0	RW	Reserved Whenever it is read, 0 is read. The written value should always be 0b.
8	IEN_m1	x	RW	Controls the input of pins for multiplexed functions other than GPIO and dedicated pins. 0b: Input disabled 1b: Input enabled
7 to 1	-	All 0	RW	Reserved Whenever it is read, 0 is read. The written value should always be 0b.
0	IEN_m0	x	RW	Controls the input of pins for multiplexed functions other than GPIO and dedicated pins. 0b: Input disabled 1b: Input enabled

x: Undefined value

“Higher-Order Address” and “Lower-Order Address” at the offset addresses correspond respectively to the left-side 32-bit units and right-side 32 bit-units of the map below.

Table 4.2-16 Corresponding Pins and Offset Addresses of PFC_IEN_mn

Offset Address	Register Name	Higher-Order Address				Lower-Order Address			
		Bit 24	Bit 16	Bit 8	Bit 0	Bit 24	Bit 16	Bit 8	Bit 0
181Ch / 1818h	PFC_IEN_03	—	—	—	—	—	—	—	TMS_SWDIO

4.2.2.10 PU/PD Switching Registers (PFC_PUPD_mn)

These registers set pulling up and down by the IO block of signals on pins. For the correspondence with the ports, see **Table 4.2-18** and **Table 4.2-19**.

Access Size : 8, 16, 32 bits
Offset Address : Refer to the table
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	PUPD_m3[1:0]		-	-	-	-	-	-	PUPD_m2[1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	PUPD_m1[1:0]		-	-	-	-	-	-	PUPD_m0[1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	-	All 0	RW	Reserved Whenever it is read, 0 is read. The written value should always be 0b.
25, 24	PUPD_m3[1:0]	0h	RW	Sets the pull-up/down control of the GPIO pin. 0xb: Pull-up/down not selected 10b: Pull-down selected 11b: Pull-up selected
23 to 18	-	All 0	RW	Reserved Whenever it is read, 0 is read. The written value should always be 0b.
17 ,16	PUPD_m2[1:0]	0h	RW	Sets the pull-up/down control of the GPIO pin. 0xb: Pull-up/down not selected 10b: Pull-down selected 11b: Pull-up selected
15 to 10	-	All 0	RW	Reserved Whenever it is read, 0 is read. The written value should always be 0b.
9, 8	PUPD_m1[1:0]	0h	RW	Sets the pull-up/down control of the GPIO pin. 0xb: Pull-up/down not selected 10b: Pull-down selected 11b: Pull-up selected
7 to 2	-	All 0	RW	Reserved Whenever it is read, 0 is read. The written value should always be 0b.
1, 0	PUPD_m0[1:0]	0h	RW	Sets the pull-up/down control of the GPIO pin. 0xb: Pull-up/down not selected 10b: Pull-down selected 11b: Pull-up selected

“Higher-Order Address” and “Lower-Order Address” at the offset addresses correspond respectively to the left-side 32-bit units and right-side 32 bit-units of the map below.

Table 4.2-18 Corresponding Pins and Offset Addresses of PFC_PUPD_mn

Note 1. WDTUDFCA and WDTUDFCM are reset in response to the assertion of the ERROR_RESETn signal from the CPG. They are not reset in response to the assertion of the external QRESN pin.

4.2.2.11 Digital Noise Filter (FILONOFF) Registers (PFC_FILONOFF_mn)

These registers set whether or not to use the digital noise filter. For the correspondence with the ports, see **Table 4.2-20**.

Access Size : 8, 16, 32 bits
Offset Address : Refer to the table
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	FILONOFF_m3	-	-	-	-	-	-	-	FILONOFF_m2
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	FILONOFF_m1	-	-	-	-	-	-	-	FILONOFF_m0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	-	All 0	RW	Reserved Whenever it is read, 0 is read. The written value should always be 0b.
24	FILONOFF_m3	0h	RW	Sets whether or not to use the digital noise filter for the GPIO pin. 0b: No filter 1b: With filter
23 to 17	-	All 0	RW	Reserved Whenever it is read, 0 is read. The written value should always be 0b.
16	FILONOFF_m2	0h	RW	Sets whether or not to use the digital noise filter for the GPIO pin. 0b: No filter 1b: With filter
15 to 9	-	All 0	RW	Reserved Whenever it is read, 0 is read. The written value should always be 0b.
8	FILONOFF_m1	0h	RW	Sets whether or not to use the digital noise filter for the GPIO pin. 0b: No filter 1b: With filter
7 to 1	-	All 0	RW	Reserved Whenever it is read, 0 is read. The written value should always be 0b.
0	FILONOFF_m0	0h	RW	Sets whether or not to use the digital noise filter for the GPIO pin. 0b: No filter 1b: With filter

NOTE

Before setting these registers, disable interrupt detection handled by the ICU.

“Higher-Order Address” and “Lower-Order Address” at the offset addresses correspond respectively to the left-side 32-bit units and right-side 32 bit-units of the map below.

Table 4.2-20 Corresponding Pins and Offset Addresses of PFC_FILONOFF_mn

		Higher-Order Address				Lower-Order Address

4.2.2.12 Digital Noise Filter (FILNUM) Registers (PFC_FILNUM_mn)

These registers set the number of stages of the digital noise filter. For the correspondence with the ports, see **Table 4.2-21**.

Access Size : 8, 16, 32 bits
Offset Address : Refer to the table
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	FILNUM_m3 [1:0]		-	-	-	-	-	-	FILNUM_m2 [1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	FILNUM_m1 [1:0]		-	-	-	-	-	-	FILNUM_m0 [1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	-	All 0	RW	Reserved Whenever it is read, 0 is read. The written value should always be 0b.
25, 24	FILNUM_m3 [1:0]	0h	RW	Sets the number of stages of the digital noise filter for the GPIO pin. 00b: 4 stages 01b: 8 stages 10b: Setting prohibited 11b: 16 stages
23 to 18	-	All 0	RW	Reserved Whenever it is read, 0 is read. The written value should always be 0b.
17, 16	FILNUM_m2 [1:0]	0h	RW	Sets the number of stages of the digital noise filter for the GPIO pin. 00b: 4 stages 01b: 8 stages 10b: Setting prohibited 11b: 16 stages
15 to 10	-	All 0	RW	Reserved Whenever it is read, 0 is read. The written value should always be 0b.
9, 8	FILNUM_m1 [1:0]	0h	RW	Sets the number of stages of the digital noise filter for the GPIO pin. 00b: 4 stages 01b: 8 stages 10b: Setting prohibited 11b: 16 stages
7 to 2	-	All 0	RW	Reserved Whenever it is read, 0 is read. The written value should always be 0b.
1, 0	FILNUM_m0 [1:0]	0h	RW	Sets the number of stages of the digital noise filter for the GPIO pin. 00b: 4 stages 01b: 8 stages 10b: Setting prohibited 11b: 16 stages

NOTE

Before setting these registers, disable interrupt detection handled by the ICU.

“Higher-Order Address” and “Lower-Order Address” at the offset addresses correspond respectively to the left-side 32-bit units and right-side 32 bit-units of the map below.

Table 4.2-21 Corresponding Pins and Offset Addresses of PFC_FILNUM_mn

		Higher-Order Address				Lower-Order Address			
Offset Address	Register Name	Bit 24	Bit 16	Bit 8	Bit 0	Bit 24	Bit 16	Bit 8	Bit 0

4.2.2.13 Digital Noise Filter (FILCLKSEL) Registers (PFC_FILCLKSEL_mn)

These registers set the sampling interval to be input to the digital noise filter. The sampling interval is the time obtained by frequency division for the SHCLK (IOTOP_0_SHCLK) input clock. For the correspondence with the ports, see **Table 4.2-22**.

Access Size : 8, 16, 32 bits
Offset Address : Refer to the table
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	FILCLKSEL_m3 [1:0]		-	-	-	-	-	-	FILCLKSEL_m2 [1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	FILCLKSEL_m1 [1:0]		-	-	-	-	-	-	FILCLKSEL_m0 [1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	-	All 0	RW	Reserved Whenever it is read, 0 is read. The written value should always be 0b.
25, 24	FILCLKSEL_m3 [1:0]	0h	RW	Sets the sampling interval to be input to the digital noise filter for the GPIO pin. 00b: Divided by 4 01b: Divided by 32 10b: Divided by 128 11b: Divided by 256
23 to 18	-	All 0	RW	Reserved Whenever it is read, 0 is read. The written value should always be 0b.
17, 16	FILCLKSEL_m2 [1:0]	0h	RW	Sets the sampling interval to be input to the digital noise filter for the GPIO pin. 00b: Divided by 4 01b: Divided by 32 10b: Divided by 128 11b: Divided by 256
15 to 10	-	All 0	RW	Reserved Whenever it is read, 0 is read. The written value should always be 0b.
9, 8	FILCLKSEL_m1 [1:0]	0h	RW	Sets the sampling interval to be input to the digital noise filter for the GPIO pin. 00b: Divided by 4 01b: Divided by 32 10b: Divided by 128 11b: Divided by 256
7 to 2	-	All 0	RW	Reserved Whenever it is read, 0 is read. The written value should always be 0b.
1, 0	FILCLKSEL_m0 [1:0]	0h	RW	Sets the sampling interval to be input to the digital noise filter for the GPIO pin. 00b: Divided by 4 01b: Divided by 32 10b: Divided by 128 11b: Divided by 256

NOTE

Before setting these registers, disable interrupt detection handled by the ICU.

“Higher-Order Address” and “Lower-Order Address” at the offset addresses correspond respectively to the left-side 32-bit units and right-side 32 bit-units of the map below.

Table 4.2-22 Corresponding Pins and Offset Addresses of PFC_FILCLKSEL_mn

		Higher-Order Address				Lower-Order Address			
Offset Address	Register Name	Bit 24	Bit 16	Bit 8	Bit 0	Bit 24	Bit 16	Bit 8	Bit 0

4.2.2.14 ISEL Control Registers (PFC_ISEL_mn)

These registers control the IE pin of the IO block (**Figure 4.2-2**). For the correspondence with the ports, see **Table 4.2-23**.

Access Size : 8, 16, 32 bits
Offset Address : Refer to the table
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	ISEL_m3	-	-	-	-	-	-	-	ISEL_m2
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	ISEL_m1	-	-	-	-	-	-	-	ISEL_m0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	-	All 0	RW	Reserved Whenever it is read, 0 is read. The written value should always be 0b.
24	ISEL_m3	0h	RW	Controls the IE pin of IO block. 0b: The IE pin of IO block is controlled by the PM_mn register when PMC_mn = 0 (port mode) and by the multiplexed function when PMC_mn = 1 (control mode). 1b: The IE pin of IO block is forcibly enabled (IE ON).
23 to 17	-	All 0	RW	Reserved Whenever it is read, 0 is read. The written value should always be 0b.
16	ISEL_m2	0h	RW	Controls the IE pin of IO block. 0b: The IE pin of IO block is controlled by the PM_mn register when PMC_mn = 0 (port mode) and by the multiplexed function when PMC_mn = 1 (control mode). 1b: The IE pin of IO block is forcibly enabled (IE ON).
15 to 9	-	All 0	RW	Reserved Whenever it is read, 0 is read. The written value should always be 0b.
8	ISEL_m1	0h	RW	Controls the IE pin of IO block. 0b: The IE pin of IO block is controlled by the PM_mn register when PMC_mn = 0 (port mode) and by the multiplexed function when PMC_mn = 1 (control mode). 1b: The IE pin of IO block is forcibly enabled (IE ON).
7 to 1	-	All 0	RW	Reserved Whenever it is read, 0 is read. The written value should always be 0b.
0	ISEL_m0	0h	RW	Controls the IE pin of IO block. 0b: The IE pin of IO block is controlled by the PM_mn register when PMC_mn = 0 (port mode) and by the multiplexed function when PMC_mn = 1 (control mode). 1b: The IE pin of IO block is forcibly enabled (IE ON).

NOTE

When PMC_mn = 1b or the event link controller is to be used, setting ISEL_mn = 1b is prohibited.

“Higher-Order Address” and “Lower-Order Address” at the offset addresses correspond respectively to the left-side 32-bit units and right-side 32 bit-units of the map below.

Table 4.2-23 Corresponding Pins and Offset Addresses of PFC_ISEL_mn

		Higher-Order Address				Lower-Order Address			
Offset Address	Register Name	Bit 24	Bit 16	Bit 8	Bit 0	Bit 24	Bit 16	Bit 8	Bit 0

Note 1. WDTUDFCA and WDTUDFCM are reset in response to the assertion of the ERROR_RESETn signal from the CPG. They are not reset in response to the assertion of the external QRESN pin.

NOTE

- Use WDTUDFCA and WDTUDFCM with N-ch. open drain outputs (NOD_05[0] = 1b, NOD_05[8] = 1b) and include an external pull-up resistor.
- When the pin function RIIC is selected, the pin is forcibly set to N-ch. open drain output. At this time, the setting value of PFC_NOD_mn should be 0 (N-ch. open drain OFF).
- When the pin function RSCI is selected, the setting value of PFC_NOD_mn should be 1 (N-ch. open drain ON), if the Simple I2C mode of RSCI is used.
- When the pin function I3C is selected, the I3C bus interface has a function to switch the pin output to N-ch. open drain or CMOS. At this time, the setting value of PFC_NOD_mn should be 0 (N-ch. open drain OFF).

4.2.2.16 Schmitt Control Registers (PFC_SMT_mn)

These registers control the Schmitt-trigger inputs for the multiplexed pins. For the correspondence with the ports, see **Table 4.2-26**.

Access Size : 8, 16, 32 bits
Offset Address : Refer to the table
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	SMT_m3	-	-	-	-	-	-	-	SMT_m2

Note 1. P20 and P21 are fixed to Schmitt ON.

4.2.2.17 Port Group Specification Registers (PFC_ELC_PGRg)

Remark Index g = 1 is for the multiplexed pins P6n and g = 2 is for the multiplexed pins P8n (n = 0 to 7).

These registers set the group for I/O ports.

NOTE

This group is hereafter called a “port group”. Each port (corresponding 1 bit) is called a “single port”.

Access Size : 8 bits
Offset Address : Refer to the table
Initial Value : 00h

Bit	7	6	5	4	3	2	1	0
	PGR7	PGR6	PGR5	PGR4	PGR3	PGR2	PGR1	PGR0
Initial Value	0	0	0	0	0	0	0	0

0	PGR0	0h	RW	0b: Port group is not specified. 1b: Port group is specified.

Table 4.2-27 PFC_ELC_PGRg Offset Addresses

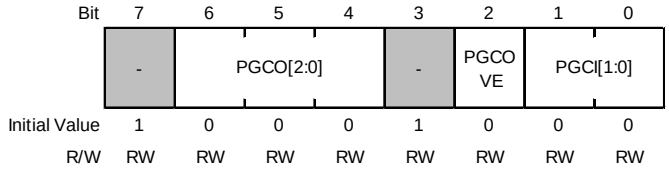
Offset Address	Register Name
3800h	PFC_ELC_PGR1
3801h	PFC_ELC_PGR2

4.2.2.18 Port Group Control Registers (PFC_ELC_PGCg)

Remark Index g = 1 is for the multiplexed pins P6n and g = 2 is for the multiplexed pins P8n (n = 0 to 7).

These registers specify the output format of the signals which are externally output from the ports at the time of input of the event signal for the port group which is set for output. For an input port group, these registers enable or disable overwriting of the PFC_PDBFg register and set the condition for event generation (a change in the signal which is externally input).

Access Size : 8 bits
Offset Address : Refer to the table
Initial Value : 88h



Bit	Bit Name	Initial Value	R/W	Description
7	-	1h	RW	Reserved Whenever it is read, 1b is read. The written value should always be 1b.
6 to 4	PGCO[2:0]	0h	RW	000b: Outputs 0 when an event is input 001b: Outputs 1 when an event is input 010b: Toggle (inverted) output when an event is input (PM_mn[1:0] of the corresponding pin should be set to 11b) 011b: Outputs the buffer value (PDBFg register) when an event is input 1xxb: Setting prohibited
3	-	1h	RW	Reserved Whenever it is read, 1 is read. The written value should always be 1b.
2	PGCOVE	0h	RW	0b: Disables overwriting to the PDBFg register After the CPU read of the PDBFg register is executed, the PDBFg register is updated only by the occurrence of the first event. The PDBFg register is not updated by the occurrence of an event until the next CPU read is executed. 1b: Enables overwrite to the PDBFg register Regardless of the CPU read of the PDBFg register, the PDBFg register is updated by the occurrence of an event.
1, 0	PGCI[1:0]	0h	RW	00b: Detects the rising edge of the external input signal and generates an event. 01b: Detects the falling edge of the external input signal and generates an event. 1xb: Detects both the rising and falling edges of the external input signal and generates an event.

Table 4.2-28 PFC_ELC_PGCg Offset Addresses

Offset Address	Register Name
3802h	PFC_ELC_PGC1
3803h	PFC_ELC_PGC2

4.2.2.19 Port Buffer Registers (PFC_ELC_PDBFg)

Remark Index g = 1 is for the multiplexed pins P6n and g = 2 is for the multiplexed pins P8n (n = 0 to 7).

These 8-bit registers are paired with the PFC_PGRg registers.

Access Size : 8 bits
Offset Address : Refer to the table
Initial Value : 00h

Bit	7	6	5	4	3	2	1	0
	PDBF7	PDBF6	PDBF5	PDBF4	PDBF3	PDBF2	PDBF1	PDBF0
Initial Value	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
7	PDBF7	0h	RW	The following operations are performed depending on the input/output of the port. - When the port is an output port: The value written to the PDBFg register is transferred to the P_mn register. - When the port is an input port: The signal value of the external pin is transferred to the PDBFg register. Writing to the bits specified for the input port group is disabled.
6	PDBF6	0h	RW	The following operations are performed depending on the input/output of the port. - When the port is an output port: The value written to the PDBFg register is transferred to the P_mn register. - When the port is an input port: The signal value of the external pin is transferred to the PDBFg register. Writing to the bits specified for the input port group is disabled.
5	PDBF5	0h	RW	The following operations are performed depending on the input/output of the port. - When the port is an output port: The value written to the PDBFg register is transferred to the P_mn register. - When the port is an input port: The signal value of the external pin is transferred to the PDBFg register. Writing to the bits specified for the input port group is disabled.
4	PDBF4	0h	RW	The following operations are performed depending on the input/output of the port. - When the port is an output port: The value written to the PDBFg register is transferred to the P_mn register. - When the port is an input port: The signal value of the external pin is transferred to the PDBFg register. Writing to the bits specified for the input port group is disabled.
3	PDBF3	0h	RW	The following operations are performed depending on the input/output of the port. - When the port is an output port: The value written to the PDBFg register is transferred to the P_mn register. - When the port is an input port: The signal value of the external pin is transferred to the PDBFg register. Writing to the bits specified for the input port group is disabled.
2	PDBF2	0h	RW	The following operations are performed depending on the input/output of the port. - When the port is an output port: The value written to the PDBFg register is transferred to the P_mn register. - When the port is an input port: The signal value of the external pin is transferred to the PDBFg register. Writing to the bits specified for the input port group is disabled.
1	PDBF1	0h	RW	The following operations are performed depending on the input/output of the port. - When the port is an output port: The value written to the PDBFg register is transferred to the P_mn register. - When the port is an input port: The signal value of the external pin is transferred to the PDBFg register. Writing to the bits specified for the input port group is disabled.
0	PDBF0	0h	RW	The following operations are performed depending on the input/output of the port. - When the port is an output port: The value written to the PDBFg register is transferred to the P_mn register. - When the port is an input port: The signal value of the external pin is transferred to the PDBFg register. Writing to the bits specified for the input port group is disabled.

Table 4.2-29 PFC_ELC_PDBFg Offset Addresses

Offset Address	Register Name
3804h	PFC_ELC_PDBF1
3808h	PFC_ELC_PDBF2

4.2.2.20 Event Connection Port Specification Registers (PFC_ELC_PELs)

Remark Index s = 0 to 3 is for four single ports.

These registers specify the single ports to which events are linked and set the operation at the time of event input and the condition for event generation. In this LSI, a total of four single ports can be set for any bit of the multiplexed pins P6n and P8n (n = 0 to 7).

Access Size : 8 bits
Offset Address : Refer to the table
Initial Value : 80h

Bit	7	6	5	4	3	2	1	0
	-	PSM[1:0]		PSP[1:0]		PSB[2:0]		
Initial Value	1	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
7	-	1h	RW	Reserved Whenever it is read, 1b is read. The written value should always be 1b.
6, 5	PSM[1:0]	0h	RW	- When the port is set for output: Specifies the port output data. 00b: Outputs 0 when an event is input 01b: Outputs 1 when an event is input 1xb: Toggle (inverted) output when an event is input (PM_mn[1:0] of the corresponding pin should be set to 11b) - When the port is set for input: Selects the event output edge. 00b: Detects the rising edge and outputs an event. 01b: Detects the falling edge and outputs an event. 1xb: Detects both the rising and falling edges and outputs an event.
4, 3	PSP[1:0]	0h	RW	00b: Setting prohibited 01b: Multiplexed pin P6n (n = 0 to 7) (corresponds to the PGR1 register). 10b: Multiplexed pin P8n (n = 0 to 7) (corresponds to the PGR2 register). 11b: Setting prohibited
2 to 0	PSB[2:0]	0h	RW	Specifies the bit number of the eight I/O ports.

Table 4.2-30 PFC_ELC_PELs Offset Addresses

Offset Address	Register Name
380Ch	PFC_ELC_PEL0
380Dh	PFC_ELC_PEL1
380Eh	PFC_ELC_PEL2
380Fh	PFC_ELC_PEL3

4.2.2.21 Input Edge Detection Control Register (PFC_ELC_DPTC)

Remark Index s = 0 to 3 is for four single ports.

This register specifies enabling or disabling of input edge detection in the single ports to which events are linked.

When single ports s (s = 0 to 3: for four single ports) are specified by the PFC_ELSR2 register, input edge detection must be enabled for the corresponding single ports.

Access Size : 8 bits
Address : <PFC_base> + 3810h
Initial Value : 00h

Bit	7	6	5	4	3	2	1	0
	-	-	-	-	PTC3	PTC2	PTC1	PTC0
Initial Value	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
7 to 4	-	All 0	RW	Reserved Whenever it is read, 0 is read. The written value should always be 0b.
3	PTC3	0h	RW	0b: Single input ports, input edge detection disabled 1b: Single input ports, input edge detection enabled
2	PTC2	0h	RW	0b: Single input ports, input edge detection disabled 1b: Single input ports, input edge detection enabled
1	PTC1	0h	RW	0b: Single input ports, input edge detection disabled 1b: Single input ports, input edge detection enabled
0	PTC0	0h	RW	0b: Single input ports, input edge detection disabled 1b: Single input ports, input edge detection enabled

NOTE

The PFC_ELC_DPTC register controls edge detection at the time of single input port operation upon event generation. This has no effect at the time of single output port operation upon event input.

In single input port operation upon event generation,

- When ELC_DPTC.PTCs = 0, the setting has no effect even if an effective edge is input from an external pin.
- When ELC_DPTC.PTCs = 1, the event signal is output to the ICU at the time of event output edge detection specified by the ELC_PELs.PSM bit, if an effective edge is input from an external pin.

4.2.2.22 Port Event Control Register (PFC_ELC_ELSR2)

This register specifies enabling or disabling of each function of the port event controller to which events are linked. When the following peripheral functions are specified by the PFC_ELSR2 register, the corresponding functions must be enabled.

- Input port groups 1 and 2

  g = 1: for the multiplexed pins P6n; g = 2: for the multiplexed pins P8n (n = 0 to 7)

- Single ports 0 to 3

  s = 0 to 3: for four single ports

Access Size : 8 bits
Address : <PFC_base> + 3811h
Initial Value : 00h

Bit	7	6	5	4	3	2	1	0
	PES3	PES2	PES1	PES0	PEG2	PEG1	-	-
Initial Value	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
7	PES3	0h	RW	0b: Single ports, event link function disabled 1b: Single ports, event link function enabled
6	PES2	0h	RW	0b: Single ports, event link function disabled 1b: Single ports, event link function enabled
5	PES1	0h	RW	0b: Single ports, event link function disabled 1b: Single ports, event link function enabled
4	PES0	0h	RW	0b: Single ports, event link function disabled 1b: Single ports, event link function enabled
3	PEG2	0h	RW	0b: Input port group g, event link function disabled 1b: Input port group g, event link function enabled
2	PEG1	0h	RW	0b: Input port group g, event link function disabled 1b: Input port group g, event link function enabled
1, 0	-	All 0	RW	Reserved Whenever it is read, 0 is read. The written value should always be 0b.

4.2.2.23 OSC Bypass Mode Switching Register (PFC_OSCBYPS)

This register switches the bypass mode for the RTC oscillator and audio oscillator.

Access Size : 8, 16, 32 bits

Address : <PFC_base> + 3C00h

Initial Value : 001C_0707h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	OSCSF2[1:0]		OSCSF1[1:0]		-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	1	1	1	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	OSCPW2	OSCPW1	OSCPW0	-	-	-	-	-	OSCBYPS2	OSCBYPS1	OSCBYPS0
Initial Value	0	0	0	0	0	1	1	1	0	0	0	0	0	1	1	1
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 22	-	All 0	RW	Reserved Whenever it is read, 0 is read. The written value should always be 0b.
21, 20	OSCSF2[1:0]	1h	RW	Reserved Whenever it is read, 1 is read. The written value should always be 1b.
19, 18	OSCSF1[1:0]	3h	RW	Controls the SF[1:0] pins (select frequency pins) of the OSC and the OSCSF1 bit corresponds to the Audio OSC. Frequency Range 00b: (SF0, SF1) = (0, 0) 32 KHz to 1 MHz 10b: (SF0, SF1) = (0, 1) 1.1 MHz to 12 MHz 01b: (SF0, SF1) = (1, 0) 12.1 MHz to 24 MHz 11b: (SF0, SF1) = (1, 1) 24.1 MHz to 48 MHz
17 to 11	-	All 0	RW	Reserved Whenever it is read, 0 is read. The written value should always be 0b.
10	OSCPW2	1h	RW	Reserved Whenever it is read, 1 is read. The written value should always be 1b.
9	OSCPW1	1h	RW	Controls the power down mode of the OSC [(E0, TE) = (0, 0)]; the OSCPW0 bit corresponds to the RTC OSC and the OSCPW1 bit to the Audio OSC. 0b: Power down mode OFF (either the crystal oscillator mode or the external clock receive mode, depending on the OSCBYPS bit corresponding to each OSC). 1b: Power down mode ON (the power down mode is selected regardless of the OSCBYPS bit corresponding to each OSC.)
8	OSCPW0	1h	RW	Controls the power down mode of the OSC [(E0, TE) = (0, 0)]; the OSCPW0 bit corresponds to the RTC OSC and the OSCPW1 bit to the Audio OSC. 0b: Power down mode OFF (either the crystal oscillator mode or the external clock receive mode, depending on the OSCBYPS bit corresponding to each OSC). 1b: Power down mode ON (the power down mode is selected regardless of the OSCBYPS bit corresponding to each OSC.)
7 to 3	-	All 0	RW	Reserved Whenever it is read, 0 is read. The written value should always be 0b.
2	OSCBYPS2	1h	RW	Reserved Whenever it is read, 1 is read. The written value should always be 1b.
1	OSCBYPS1	1h	RW	Controls the bypass mode of the OSC; the OSCBYPS0 bit corresponds to the RTC OSC and the OSCBYPS1 bit to the Audio OSC. 0b: Bypass mode OFF (the crystal oscillator mode) 1b: Bypass mode ON (the external clock receive mode)
0	OSCBYPS0	1h	RW	Controls the bypass mode of the OSC; the OSCBYPS0 bit corresponds to the RTC OSC and the OSCBYPS1 bit to the Audio OSC. 0b: Bypass mode OFF (the crystal oscillator mode) 1b: Bypass mode ON (the external clock receive mode)

The table below lists switching of the mode for the RTC oscillator and audio oscillator.

Table 4.2-31 Bypass Modes for RTC Oscillator and Audio Oscillator

OSCBYPS	OSCPW	Mode
0b	0b	Crystal oscillator mode
1b	0b	External clock receive mode
X	1b	Power-down mode

The main oscillator is controlled by the reset latch output of the external QBYPASS pin, instead of the PFC_OSCBYPS register.

Table 4.2-32 Bypass Modes for Main Oscillator

QBYPASS	Mode
Low	Crystal oscillator mode
High	External clock receive mode

4.2.2.24 Write Protect Register (PFC_PWPR)

This register enables or disables writing to the PFC_PFC or PFC_PMC registers and the PFC_OEN registers.

Access Size : 8, 16, 32 bits
Address : <PFC_base> + 3C04h
Initial Value : 0000_00A0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	REGWE_A	REGWE_B	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	1	0	1	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
7	-	1h	RW	Reserved Whenever it is read, 1b is read. The written value should always be 1b.
6	REGWE_A	0h	RW	Controls writing to PFC and PMC, which are write-protected in the initial state. 0b: Disables writing to the PFC and PMC registers. 1b: Enables writing to the PFC and PMC registers.
5	REGWE_B	1h	RW	Controls writing to the OEN register, which is initially write-enabled. 0b: Disables writing to the OEN register. 1b: Enables writing to the OEN register.
4 to 0	-	All 0	RW	Reserved Whenever it is read, 0 is read. The written value should always be 0b.

4.2.2.25 IRQ Digital Noise Filter (FILONOFF) Register (PFC_FILONOFF_IRQ)

This register sets whether or not to use the digital noise filter for the IRQ function.

The register function is the same as that of the PFC_FILONOFF register.

Access Size : 8, 16, 32 bits

Address : <PFC_base> + 3C08h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	IRQ15	-	IRQ14	-	IRQ13	-	IRQ12	-	IRQ11	-	IRQ10	-	IRQ9	-	IRQ8
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31	-	0h	RW	Reserved Whenever it is read, 0 is read. The written value should always be 0b.
30	IRQ15	0h	RW	Sets whether or not to use the digital noise filter for the IRQ function. 0b: No filter 1b: With filter
29	-	0h	RW	Reserved Whenever it is read, 0 is read. The written value should always be 0b.
28	IRQ14	0h	RW	Sets whether or not to use the digital noise filter for the IRQ function. 0b: No filter 1b: With filter
27	-	0h	RW	Reserved Whenever it is read, 0 is read. The written value should always be 0b.
26	IRQ13	0h	RW	Sets whether or not to use the digital noise filter for the IRQ function. 0b: No filter 1b: With filter
25	-	0h	RW	Reserved Whenever it is read, 0 is read. The written value should always be 0b.
24	IRQ12	0h	RW	Sets whether or not to use the digital noise filter for the IRQ function. 0b: No filter 1b: With filter
23	-	0h	RW	Reserved Whenever it is read, 0 is read. The written value should always be 0b.
22	IRQ11	0h	RW	Sets whether or not to use the digital noise filter for the IRQ function. 0b: No filter 1b: With filter
21	-	0h	RW	Reserved Whenever it is read, 0 is read. The written value should always be 0b.
20	IRQ10	0h	RW	Sets whether or not to use the digital noise filter for the IRQ function. 0b: No filter 1b: With filter
19	-	0h	RW	Reserved Whenever it is read, 0 is read. The written value should always be 0b.
18	IRQ9	0h	RW	Sets whether or not to use the digital noise filter for the IRQ function. 0b: No filter 1b: With filter
17	-	0h	RW	Reserved Whenever it is read, 0 is read. The written value should always be 0b.
16	IRQ8	0h	RW	Sets whether or not to use the digital noise filter for the IRQ function. 0b: No filter 1b: With filter

Bit	Bit Name	Initial Value	R/W	Description
15	-	0h	RW	Reserved Whenever it is read, 0 is read. The written value should always be 0b.
14	IRQ7	0h	RW	Sets whether or not to use the digital noise filter for the IRQ function. 0b: No filter 1b: With filter
13	-	0h	RW	Reserved Whenever it is read, 0 is read. The written value should always be 0b.
12	IRQ6	0h	RW	Sets whether or not to use the digital noise filter for the IRQ function. 0b: No filter 1b: With filter
11	-	0h	RW	Reserved Whenever it is read, 0 is read. The written value should always be 0b.
10	IRQ5	0h	RW	Sets whether or not to use the digital noise filter for the IRQ function. 0b: No filter 1b: With filter
9	-	0h	RW	Reserved Whenever it is read, 0 is read. The written value should always be 0b.
8	IRQ4	0h	RW	Sets whether or not to use the digital noise filter for the IRQ function. 0b: No filter 1b: With filter
7	-	0h	RW	Reserved Whenever it is read, 0 is read. The written value should always be 0b.
6	IRQ3	0h	RW	Sets whether or not to use the digital noise filter for the IRQ function. 0b: No filter 1b: With filter
5	-	0h	RW	Reserved Whenever it is read, 0 is read. The written value should always be 0b.
4	IRQ2	0h	RW	Sets whether or not to use the digital noise filter for the IRQ function. 0b: No filter 1b: With filter
3	-	0h	RW	Reserved Whenever it is read, 0 is read. The written value should always be 0b.
2	IRQ1	0h	RW	Sets whether or not to use the digital noise filter for the IRQ function. 0b: No filter 1b: With filter
1	-	0h	RW	Reserved Whenever it is read, 0 is read. The written value should always be 0b.
0	IRQ0	0h	RW	Sets whether or not to use the digital noise filter for the IRQ function. 0b: No filter 1b: With filter

NOTE

The IRQ function can be used as an interrupt or an event for the ELC. Before setting this register, disable the IRQ function depending on the purpose for which it is to be used.

- If the IRQ function is to be used as an interrupt, disable the function by using the interrupt controller of the CPU.
- If the IRQ function is to be used as an event for the ELC, disable the function by using the event output source select register (EVTSELx) of the ICU.

4.2.2.26 IRQ Digital Noise Filter (FILNUM) Register (PFC_FILNUM_IRQ)

This register sets the number of stages of the digital noise filter for the IRQ function.

The register function is the same as that of the PFC_FILNUM register.

Access Size : 8, 16, 32 bits
Address : <PFC_base> + 3C0Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31, 30	IRQ15[1:0]	0h	RW	Sets the number of stages of the digital noise filter for the IRQ function. 00b: 4 stages 01b: 8 stages 10b: Setting prohibited 11b: 16 stages
29, 28	IRQ14[1:0]	0h	RW	Sets the number of stages of the digital noise filter for the IRQ function. 00b: 4 stages 01b: 8 stages 10b: Setting prohibited 11b: 16 stages
27, 26	IRQ13[1:0]	0h	RW	Sets the number of stages of the digital noise filter for the IRQ function. 00b: 4 stages 01b: 8 stages 10b: Setting prohibited 11b: 16 stages
25, 24	IRQ12[1:0]	0h	RW	Sets the number of stages of the digital noise filter for the IRQ function. 00b: 4 stages 01b: 8 stages 10b: Setting prohibited 11b: 16 stages
23, 22	IRQ11[1:0]	0h	RW	Sets the number of stages of the digital noise filter for the IRQ function. 00b: 4 stages 01b: 8 stages 10b: Setting prohibited 11b: 16 stages
21, 20	IRQ10[1:0]	0h	RW	Sets the number of stages of the digital noise filter for the IRQ function. 00b: 4 stages 01b: 8 stages 10b: Setting prohibited 11b: 16 stages
19, 18	IRQ9[1:0]	0h	RW	Sets the number of stages of the digital noise filter for the IRQ function. 00b: 4 stages 01b: 8 stages 10b: Setting prohibited 11b: 16 stages
17, 16	IRQ8[1:0]	0h	RW	Sets the number of stages of the digital noise filter for the IRQ function. 00b: 4 stages 01b: 8 stages 10b: Setting prohibited 11b: 16 stages

Bit	Bit Name	Initial Value	R/W	Description
15, 14	IRQ7[1:0]	0h	RW	Sets the number of stages of the digital noise filter for the IRQ function. 00b: 4 stages 01b: 8 stages 10b: Setting prohibited 11b: 16 stages
13, 12	IRQ6[1:0]	0h	RW	Sets the number of stages of the digital noise filter for the IRQ function. 00b: 4 stages 01b: 8 stages 10b: Setting prohibited 11b: 16 stages
11, 10	IRQ5[1:0]	0h	RW	Sets the number of stages of the digital noise filter for the IRQ function. 00b: 4 stages 01b: 8 stages 10b: Setting prohibited 11b: 16 stages
9, 8	IRQ4[1:0]	0h	RW	Sets the number of stages of the digital noise filter for the IRQ function. 00b: 4 stages 01b: 8 stages 10b: Setting prohibited 11b: 16 stages
7, 6	IRQ3[1:0]	0h	RW	Sets the number of stages of the digital noise filter for the IRQ function. 00b: 4 stages 01b: 8 stages 10b: Setting prohibited 11b: 16 stages
5, 4	IRQ2[1:0]	0h	RW	Sets the number of stages of the digital noise filter for the IRQ function. 00b: 4 stages 01b: 8 stages 10b: Setting prohibited 11b: 16 stages
3, 2	IRQ1[1:0]	0h	RW	Sets the number of stages of the digital noise filter for the IRQ function. 00b: 4 stages 01b: 8 stages 10b: Setting prohibited 11b: 16 stages
1, 0	IRQ0[1:0]	0h	RW	Sets the number of stages of the digital noise filter for the IRQ function. 00b: 4 stages 01b: 8 stages 10b: Setting prohibited 11b: 16 stages

NOTE

The IRQ function can be used as an interrupt or an event for the ELC. Before setting this register, disable the IRQ function depending on the purpose for which it is to be used.

- If the IRQ function is to be used as an interrupt, disable the function by using the interrupt controller of the CPU.
- If the IRQ function is to be used as an event for the ELC, disable the function by using the event output source select register (EVTSELx) of the ICU.

4.2.2.27 IRQ Digital Noise Filter (FILCLKSEL) Register (PFC_FILCLKSEL_IRQ)

This register sets the sampling interval to be input to the digital noise filter for the IRQ function. The sampling interval is the time obtained by frequency division for the SHCLK input clock.

The register function is the same as that of the PFC_FILCLKSEL register.

Access Size : 8, 16, 32 bits
Address : <PFC_base> + 3C10h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	IRQ15[1:0]		IRQ14[1:0]		IRQ13[1:0]		IRQ12[1:0]		IRQ11[1:0]		IRQ10[1:0]		IRQ9[1:0]		IRQ8[1:0]

7, 6	IRQ3[1:0]	0h	RW	Sets the sampling interval to be input to the digital noise filter for the IRQ function. 00b: Divided by 4 01b: Divided by 32 10b: Divided by 128 11b: Divided by 256
5, 4	IRQ2[1:0]	0h	RW	Sets the sampling interval to be input to the digital noise filter for the IRQ function. 00b: Divided by 4 01b: Divided by 32 10b: Divided by 128 11b: Divided by 256
3, 2	IRQ1[1:0]	0h	RW	Sets the sampling interval to be input to the digital noise filter for the IRQ function. 00b: Divided by 4 01b: Divided by 32 10b: Divided by 128 11b: Divided by 256
1, 0	IRQ0[1:0]	0h	RW	Sets the sampling interval to be input to the digital noise filter for the IRQ function. 00b: Divided by 4 01b: Divided by 32 10b: Divided by 128 11b: Divided by 256

NOTE

The IRQ function can be used as an interrupt or an event for the ELC. Before setting this register, disable the IRQ function depending on the purpose for which it is to be used.

- If the IRQ function is to be used as an interrupt, disable the function by using the interrupt controller of the CPU.
- If the IRQ function is to be used as an event for the ELC, disable the function by using the event output source select register (EVTSELx) of the ICU.

4.2.2.28 DMAC_REQ Digital Noise Filter (FILONOFF) Register (PFC_FILONOFF_DMAC_REQ)

This register sets whether or not to use the digital noise filter for the DREQ function.

The register function is the same as that of the PFC_FILONOFF register.

Access Size : 8, 16, 32 bits

Address : <PFC_base> + 3C14h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	-	All 0	RW	Reserved Whenever it is read, 0 is read. The written value should always be 0b.
8	DMAC_REQ4	0h	RW	Sets whether or not to use the digital noise filter for the DREQ function. 0b: No filter 1b: With filter
7	-	0h	RW	Reserved Whenever it is read, 0 is read. The written value should always be 0b.
6	DMAC_REQ3	0h	RW	Sets whether or not to use the digital noise filter for the DREQ function. 0b: No filter 1b: With filter
5	-	0h	RW	Reserved Whenever it is read, 0 is read. The written value should always be 0b.
4	DMAC_REQ2	0h	RW	Sets whether or not to use the digital noise filter for the DREQ function. 0b: No filter 1b: With filter
3	-	0h	RW	Reserved Whenever it is read, 0 is read. The written value should always be 0b.
2	DMAC_REQ1	0h	RW	Sets whether or not to use the digital noise filter for the DREQ function. 0b: No filter 1b: With filter
1	-	0h	RW	Reserved Whenever it is read, 0 is read. The written value should always be 0b.
0	DMAC_REQ0	0h	RW	Sets whether or not to use the digital noise filter for the DREQ function. 0b: No filter 1b: With filter

NOTE

Before setting this register, disable the function by using the DMAx source select register y (DMxSELy) of the ICU.

4.2.2.29 DMAC_REQ Digital Noise Filter (FILNUM) Register (PFC_FILNUM_DMAC_REQ)

This register sets the number of stages of the digital noise filter for the DREQ function.

The register function is the same as that of the PFC_FILNUM register.

Access Size : 8, 16, 32 bits

Address : <PFC_base> + 3C18h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-

1, 0	DMAC_REQ0 [1:0]	0h	RW	Sets the number of stages of the digital noise filter for the DREQ function. 00b: 4 stages 01b: 8 stages 10b: Setting prohibited 11b: 16 stages

NOTE

Before setting this register, disable the function by using the DMAx source select register y (DMxSELy) of the ICU.

4.2.2.30 DMAC_REQ Digital Noise Filter (FILCLKSEL) Register (PFC_FILCLKSEL_DMAC_REQ)

This register sets the sampling interval to be input to the digital noise filter for the DREQ function. The sampling interval is the time obtained by frequency division for the SHCLK input clock.

The register function is the same as that of the PFC_FILCLKSEL register.

Access Size : 8, 16, 32 bits

Address : <PFC_base> + 3C1Ch

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	-	All 0	RW	Reserved Whenever it is read, 0 is read. The written value should always be 0b.
9, 8	DMAC_REQ4 [1:0]	0h	RW	Sets the sampling interval to be input to the digital noise filter of the DREQ function. 00b: Divided by 4 01b: Divided by 32 10b: Divided by 128 11b: Divided by 256
7, 6	DMAC_REQ3 [1:0]	0h	RW	Sets the sampling interval to be input to the digital noise filter of the DREQ function. 00b: Divided by 4 01b: Divided by 32 10b: Divided by 128 11b: Divided by 256
5, 4	DMAC_REQ2 [1:0]	0h	RW	Sets the sampling interval to be input to the digital noise filter of the DREQ function. 00b: Divided by 4 01b: Divided by 32 10b: Divided by 128 11b: Divided by 256
3, 2	DMAC_REQ1 [1:0]	0h	RW	Sets the sampling interval to be input to the digital noise filter of the DREQ function. 00b: Divided by 4 01b: Divided by 32 10b: Divided by 128 11b: Divided by 256
1, 0	DMAC_REQ0 [1:0]	0h	RW	Sets the sampling interval to be input to the digital noise filter of the DREQ function. 00b: Divided by 4 01b: Divided by 32 10b: Divided by 128 11b: Divided by 256

NOTE

Before setting this register, disable the function by using the DMAx source select register y (DMxSELy) of the ICU.

4.2.2.31 OEN Switching Register (PFC_OEN)

This register sets the direction (input or output) of the IO block.

Access Size : 8, 16, 32 bits

Address : <PFC_base> + 3C40h

Initial Value : 0000_003Fh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	OEN5	OEN4	OEN3	OEN2	OEN1	OEN0
Initial Value	0	0	0	0	0	0	0	0	0	0	1	1	1	1	1	1
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	-	All 0	RW	Reserved Whenever it is read, 0 is read. The written value should always be 0b.
5	OEN5	1h	RW	Controls the OE pin of IO block for the following dedicated pins (3ST attribute). The values in parentheses indicate the corresponding bits. XSPI0_CKP (OEN5 bit) XSPI0_CKN (OEN4 bit) XSPI0_CS0N (OEN3 bit) XSPI0_RESET0N (OEN2 bit) 0b: OE of IO block is ON (enabled). 1b: OE of IO block is OFF (disabled).
4	OEN4	1h	RW	Controls the OE pin of IO block for the following dedicated pins (3ST attribute). The values in parentheses indicate the corresponding bits. XSPI0_CKP (OEN5 bit) XSPI0_CKN (OEN4 bit) XSPI0_CS0N (OEN3 bit) XSPI0_RESET0N (OEN2 bit) 0b: OE of IO block is ON (enabled). 1b: OE of IO block is OFF (disabled).
3	OEN3	1h	RW	Controls the OE pin of IO block for the following dedicated pins (3ST attribute). The values in parentheses indicate the corresponding bits. XSPI0_CKP (OEN5 bit) XSPI0_CKN (OEN4 bit) XSPI0_CS0N (OEN3 bit) XSPI0_RESET0N (OEN2 bit) 0b: OE of IO block is ON (enabled). 1b: OE of IO block is OFF (disabled).
2	OEN2	1h	RW	Controls the OE pin of IO block for the following dedicated pins (3ST attribute). The values in parentheses indicate the corresponding bits. XSPI0_CKP (OEN5 bit) XSPI0_CKN (OEN4 bit) XSPI0_CS0N (OEN3 bit) XSPI0_RESET0N (OEN2 bit) 0b: OE of IO block is ON (enabled). 1b: OE of IO block is OFF (disabled).

Bit	Bit Name	Initial Value	R/W	Description
1	OEN1	1h	RW	Controls the direction (MII/RGMII) of IO block for ET0/1_TXC_TXCLK (IO attribute). The values in parentheses indicate the corresponding bits. ET1_TXC_TXCLK (OEN1 bit) ET0_TXC_TXCLK (OEN0 bit) 0b: The direction of IO block is OUT (output); RGMII mode. 1b: The direction of IO block is IN (input), MII mode.
0	OEN0	1h	RW	Controls the direction (MII/RGMII) of IO block for ET0/1_TXC_TXCLK (IO attribute). The values in parentheses indicate the corresponding bits. ET1_TXC_TXCLK (OEN1 bit) ET0_TXC_TXCLK (OEN0 bit) 0b: The direction of IO block is OUT (output); RGMII mode. 1b: The direction of IO block is IN (input), MII mode.

NOTE

- OEN0 and OEN1
  When switching between the MII and RGMII of GBETH0 and GBETH1, the register setting on the IP side of GBETH0 and GBETH1 is used, but this does not control the direction of the I/O buffer. Use this register to switch the direction of the IO block. For the setting procedure, see **6.3 Gigabit Ethernet (GBETH)**.
- When setting the OEN0 and OEN1 bits to 0 (to set the direction of the IO block as an output), set the clock switching register bit of the CPG listed in the table below to 0 (PLLETH+OSC path side).

Table 4.2-33 CPG Register for OEN0 and OEN1 Bits

OEN Bit	OSCPW	Clock Switching Register (CPG)
OEN1	ET1_TXC_TXCLK	CPG_SSEL1.SELCTL0 bit
OEN0	ET0_TXC_TXCLK	CPG_SSEL0.SELCTL2 bit

4.2.3 Functional Description

This section describes the functional details of the PFC.

4.2.3.1 IO Block

4.2.3.1.1 List of IO blocks

The table below lists the IO blocks. For the pins and the corresponding registers, see **4.2.2 Register Description**.

Table 4.2-34 IO Blocks

Classification	Drive Strength Switching	Pull-Up/Down Switching	Power Supply Voltage Switching	CMOS/ Schmitt Switching	Slew-Rate Switching	OSC Mode Switching	Input Frequency Switching
1.8-V/3.3-V bidirectional buffer*1	✓	✓	✓	✓	✓	—	—
1.8-V dedicated buffer (bidirectional)	✓	✓	—	—	—	—	—
1.8-V dedicated buffer (OSC)	—	—	—	—	—	✓	✓*2
1.8-V analog buffer	—	—	—	—	—	—	—
Power supply control (3.3-V system)	—	—	—	—	—	—	—
Power supply control (1.8-V system)	—	—	—	—	—	—	—

Note 1. All Pxx pins (with the exceptions of P2x, P90, P91, P92, and PBx) have a 3.3-V tolerance. Even when 1.8 V is being supplied for the power group, 3.3-V signals can be captured. When N-ch. open drain outputs are specified by the PFC_NOD_mn register, 3.3-V signals can be output by pulling them up to 3.3 V.

Note 2. The RTC oscillator is excluded.

4.2.3.1.2 Power domains

The table below lists the power domains of the respective functional blocks within the PFC. For multiple power supplies, the domains are divided into the layers IO_TOP_AWO and IO_TOP_OTHERS to have a structure where IOBUF on which the I/O buffers are mounted is separately allocated to AWO and OTEHRS.

Table 4.2-35 Supported PFC Power Supplies

Items	Power Domain
Core logics	AWO
I/O buffers for multiplexed pins	AWO
I/O buffers for dedicated pins of the IP in AWO	AWO
I/O buffers for dedicated pins of the IP in OTHERS	OTHERS

4.2.3.2 IO_TOP_ISEL_CTL

In port mode (PMC_mn = 0b), input control of the IO block is controlled by the PFC_PM_mn register. The input mode can also forcibly be set by the PFC_ISEL_mn register.

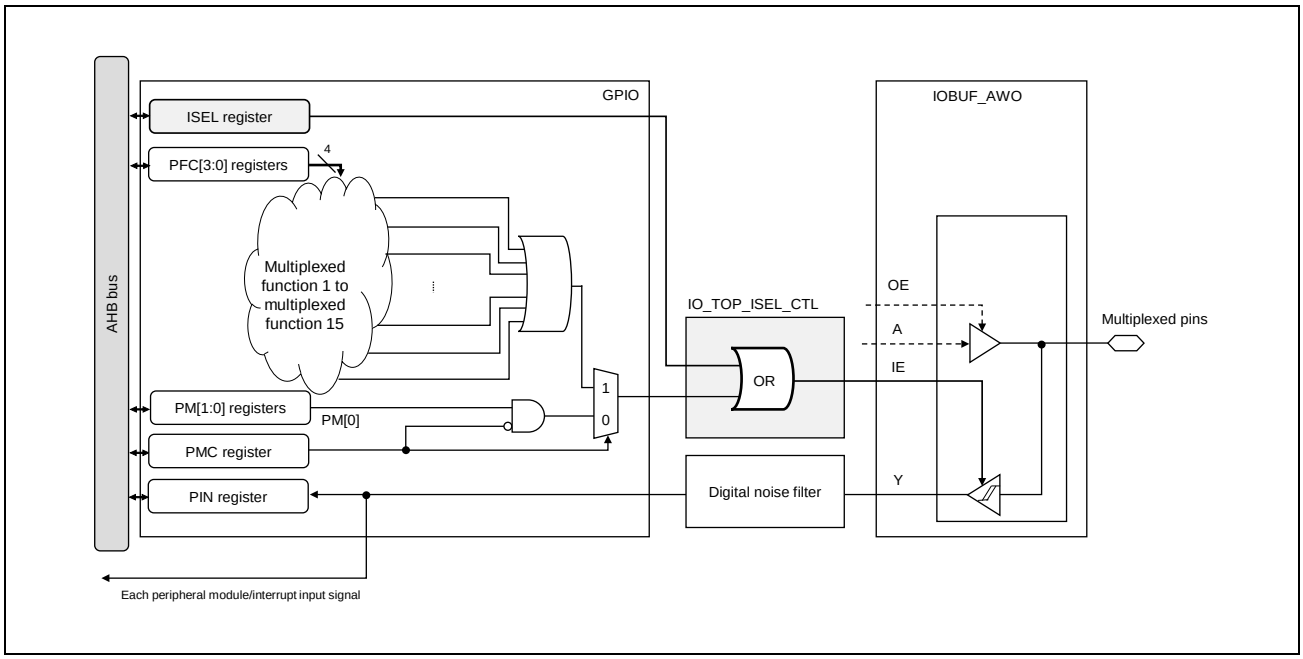

Figure 4.2-2 IO_TOP_ISEL_CTL Block Diagram

NOTE

When PMC_mn = 1b or the event link controller is to be used, setting ISEL_mn = 1b is prohibited.

4.2.3.3 IO_TOP_SMT_CTL

In control mode (PMC_mn = 1b), the Schmitt input signal (IS) of the IO block can be switched by using the PFC_SMT_mn register.

- The multiplexed pin functions are the targets for switching.
- When the function from RIIC0 to RIIC8 is selected, set the Schmitt input signal (IS) of the IO block to the high level to enable the Schmitt function, regardless of the setting of the PFC_SMT_mn register.
- The I3C0 function does not apply. The I3C0 function is determined by the setting of the PFC_SMT_mn register.

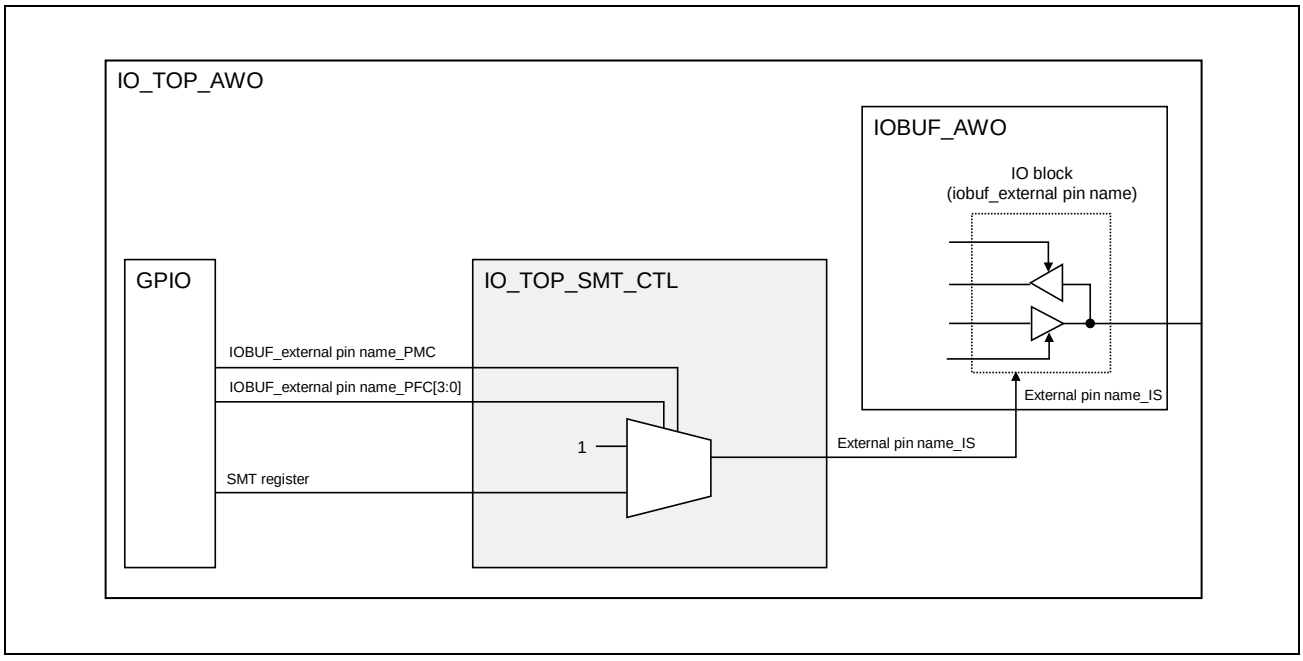

Figure 4.2-3 IO_TOP_SMT_CTL Block Diagram

4.2.3.4 IO_TOP_NOD_CTL

In control mode (PMC_mn = 1b), control can be switched to N-ch. open-drain output by using the PFC_NOD_mn register.

When the value of the PFC_NOD_mn register is 1b, it controls the data input signal (A) of the IO block as well as the output data enable signal (OE). The control circuit is allocated to a later stage than the multiplexed function switching circuit of GPIO so that N-ch. open drain outputs can also be controlled in port mode.

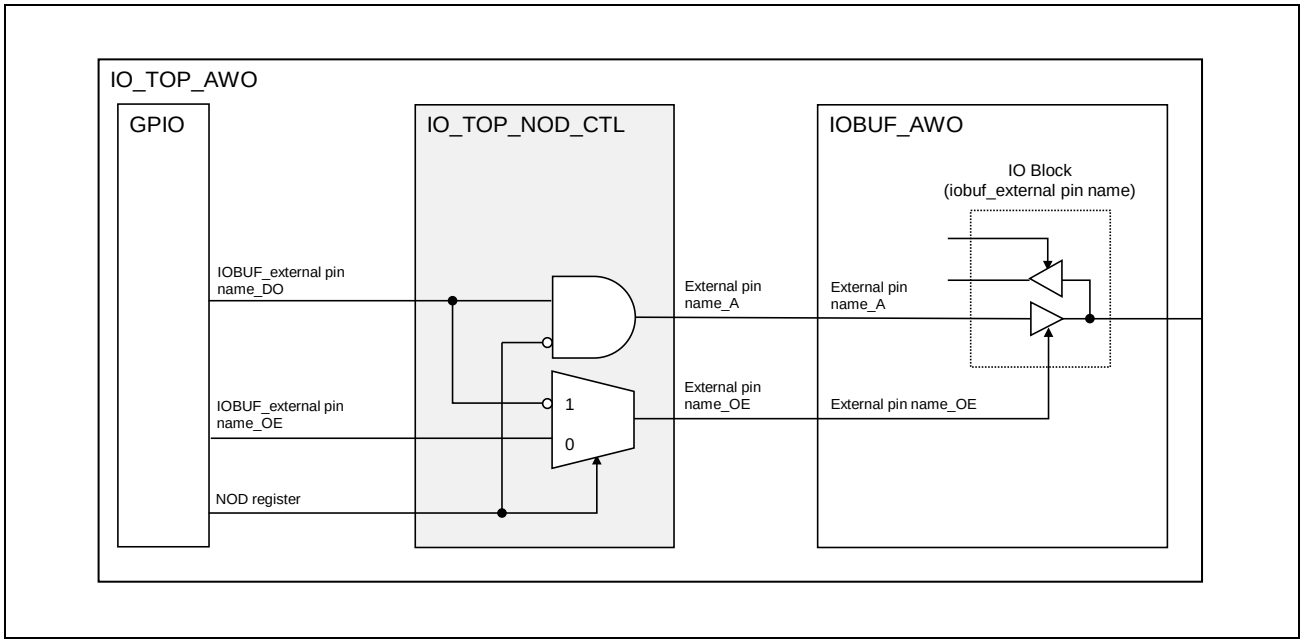

Figure 4.2-4 IO_TOP_NOD_CTL Block Diagram

4.2.3.5 RST_LATCH

RST_LATCH captures data on the corresponding pins during a system reset (QRESN = low) and passes the data to the SYS or CPG. The data are retained through release from the system reset (QRESN = high).

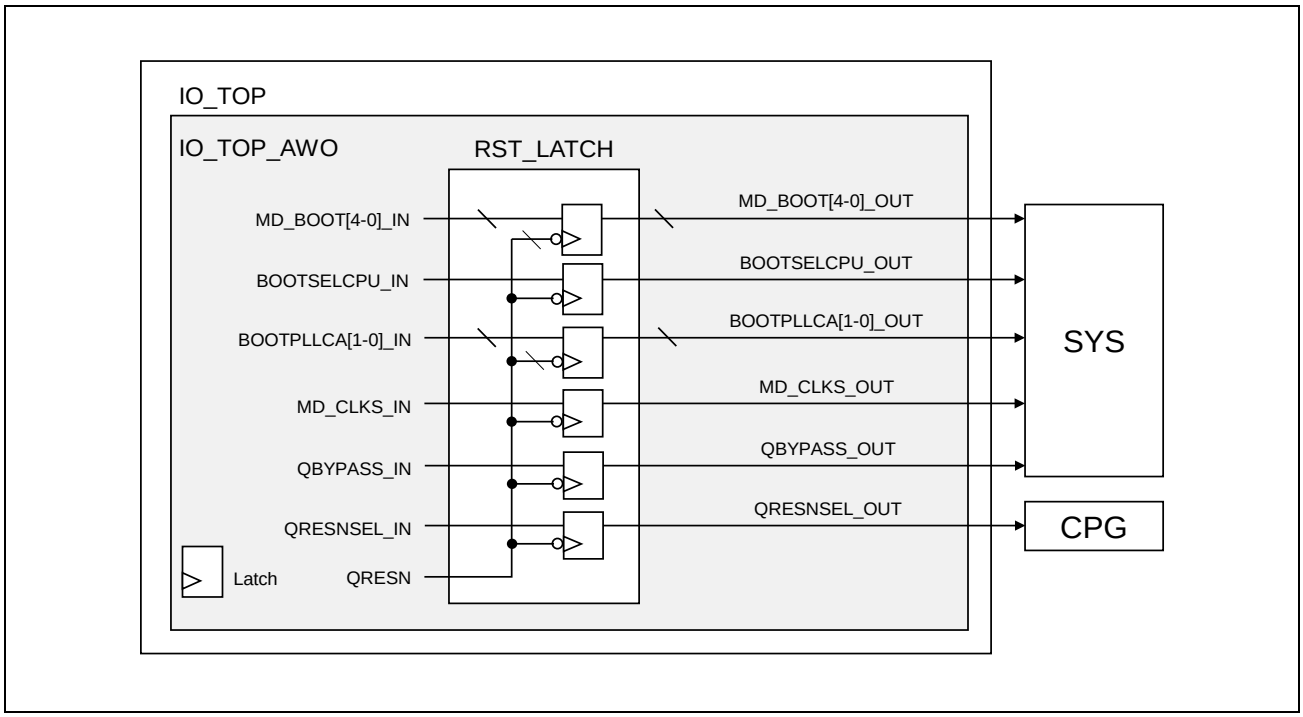

Figure 4.2-5 Schematic Diagram of RST_LATCH

The figure below shows the timing chart (an example of MD_CLKS_IN).

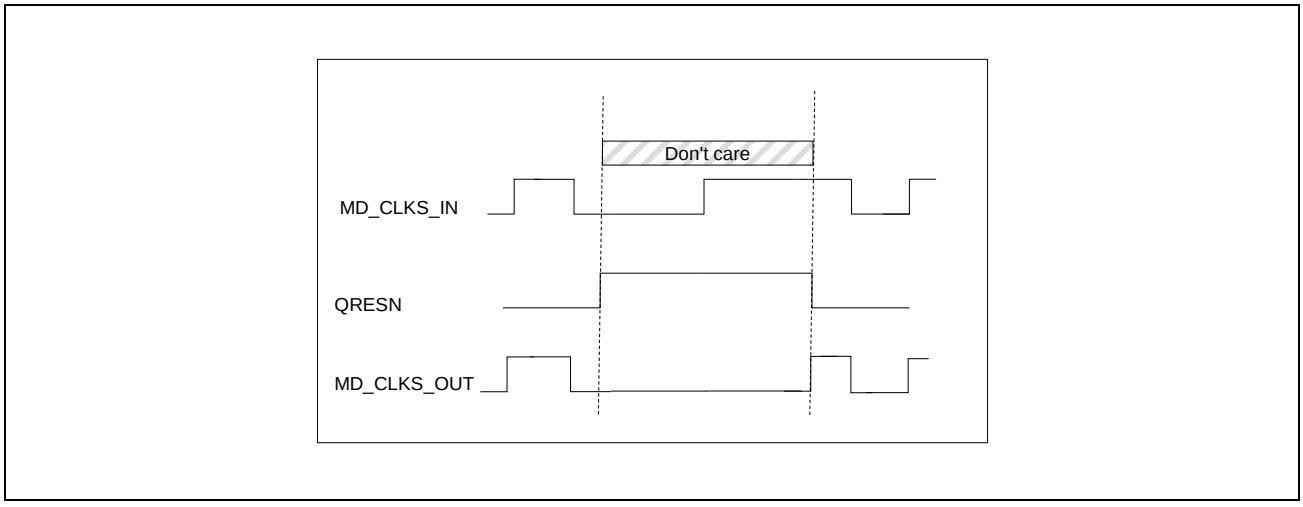

Figure 4.2-6 RST_LATCH (MD_CLKS_IN) Timing Chart

4.2.3.6 DFIL_TOP

The PFC has a digital noise filter function.

The PFC_FILONOFF_mn register sets whether or not to use the digital noise filter, the PFC_FILNUM_mn register sets the number of stages of the filter, and the PFC_FILCLKSEL_mn register sets the sampling interval of the filter.

Among the targets for control listed in **4.2.1.5 Digital Noise Filter Control**, the targets for digital noise filter control by DFIL_TOP are as follows (that is, all except for the port event control pin functions).

- Dedicated NMI pin
- Input direction line for GPIO
- External TINT interrupt
- Multiplexed IRQ function
- Multiplexed DREQ function

4.2.4 Operation Procedure

4.2.4.1 Control of Dedicated and Multiplexed Pins

1. Set the PFC_IOLH_mn, PFC_SR_mn, PFC_IEN_mn, PFC_PUPD_mn, PFC_NOD_mn, and PFC_OEN registers for the desired functions.

Remark Changing the setting of the PFC_OEN register requires manipulation of the PWPR.REGWE_B bit.
- Before changing the setting of the PFC_OEN register: Set the PWPR.REGWE_B bit to 1b.
- After changing the setting of the PFC_OEN register: Set the PWPR.REGWE_B bit to 0b.

4.2.4.2 Multiplexed Pins (in Port Mode): GPIO Control and Control of the Pins

1. Check that the value of the PFC_PMC_mn register is 0b.

Remark Changing the setting of the PFC_PMC_mn register requires manipulation of the PWPR.REGWE_A bit.
- Before changing the setting of the PFC_PMC_mn register: Set the PWPR.REGWE_A bit to 1b.
- After changing the setting of the PFC_PMC_mn register: Set the PWPR.REGWE_A bit to 0b.

2. Set the input/output of GPIO by using the PFC_PM_mn register.
3. Set output values on GPIO by using the PFC_P_mn register.
4. Input values on the input pins can be monitored by using the PFC_PIN_mn register.
5. Set the PFC_IOLH_mn, PFC_SR_mn, PFC_ISEL_mn, PFC_PUPD_mn, PFC_NOD_mn, and PFC_SMT_mn registers for the desired functions.

4.2.4.3 Multiplexed Pins (in Control Mode): Switching between Functions Multiplexed on the Pins and Control of the Pins

1. Check that the value of the PFC_PMC_mn register is 1b.

Remark Changing the setting of the PFC_PMC_mn register requires manipulation of the PWPR.REGWE_A bit.
- Before changing the setting of the PFC_PMC_mn register: Set the PWPR.REGWE_A bit to 1b.

2. Set the multiplexed function mode by using the PFC_PFC_mn register.

Remark Changing the setting of the PFC_PFC_mn register requires manipulation of the PWPR.REGWE_A bit.
- Before changing the setting of the PFC_PFC_mn register: Set the PWPR.REGWE_A bit to 1b.
  If the PWPR.REGWE_A bit has been set to 1b in step 1, re-setting is not required.
- After changing the setting of the PFC_PFC_mn register: Set the PWPR.REGWE_A bit to 0b.

3. Set the PFC_IOLH_mn, PFC_SR_mn, PFC_IEN_mn, PFC_PUPD_mn, PFC_NOD_mn, and PFC_SMT_mn registers for the desired functions.

Remark When making the settings, do not select the same multiplexed function for several different external pins.

The table below lists the assignment of the multiplexed IRQ and DREQ functions.

For example, the IRQ0 multiplexed function can be assigned to the external P00, P30, P50, P70, P90, or PB1 pin. However, do not assign it to two or more external pins.

Similarly, the DREQ0 multiplexed function can be assigned to P02, P03, or P15, but do not assign it to two or more external pins.

Table 4.2-36 Assignment of IRQ and DMAC_REQ

Pin	IRQ (Mode 13)	DREQ (Mode 15)

4.2.4.4 OSC Mode Switching

1. Each register of OSCBYPS handles switching the mode between crystal oscillator mode and external clock receive mode for the RTC oscillator and audio oscillator.

Remark Since the main oscillator requires determination of the mode before the CPU starts up (before the PLL starts up), it is controlled by the external QBYPASS pin.

4.2.4.5 Reset Latch Function

No procedure is required for this function. Data on the corresponding pins are captured during a system reset (QRESN = low) and retained through release from the system reset (QRESN = high).

4.2.4.6 Digital Noise Filter Control

1. Set the PFC_FILONOFF_mn, PFC_FILNUM_mn, PFC_FILCLKSEL_mn, PFC_FILONOFF_IRQ, PFC_FILNUM_IRQ, PFC_FILCLKSEL_IRQ, PFC_FILONOFF_DMAC_REQ, PFC_FILNUM_DMAC_REQ, and PFC_FILCLKSEL_DMAC_REQ registers for the desired functions.

4.2.4.7 Event Link Controller — Port Event Control (PFC_ELC_GPIO)

The I/O port pins that can be assigned to event linking are the multiplexed pins P6n and P8n (n = 0 to 7).

1. Set the following PFC_ELC_GPIO registers for the desired functions.
   PFC_ELC_PGRg, PFC_ELC_PGCg, PFC_ELC_PDBFg, PFC_ELC_PELs, PFC_ELC_DPTC, and PFC_ELC_ELSR2 registers

Remark The event link controller can only be used while PFC_PMC_mn = 0b (in port mode).

There are two types of event link: an event link to a single port and an event link to a port group.

- Single Port: An event can be connected to eight I/O ports.
  Set the bits of the I/O ports to which events are linked by specification with the use of the PFC_ELC_PELs register.
- Port Group: An event can be connected to a port group consisting of the desired bits in the same eight I/O ports.
  Set the bits of the I/O ports to which events are linked by specification with the use of the PFC_ELC_PGRg register.

(1) to (6) below describe operations of a single port and a port group and (7) describes an example of operation.

(1) Single Input Port Operation upon Event Generation

For a single input port, an event is generated when a change in the signal as the condition for event generation is detected on the external pin that is connected (the event output is a pulse for one SHCLK cycle). The condition for event generation is set by the PSM bit of the PFC_ELC_PELs register. **Figure 4.2-7** shows an example of event link operation by a single input port.

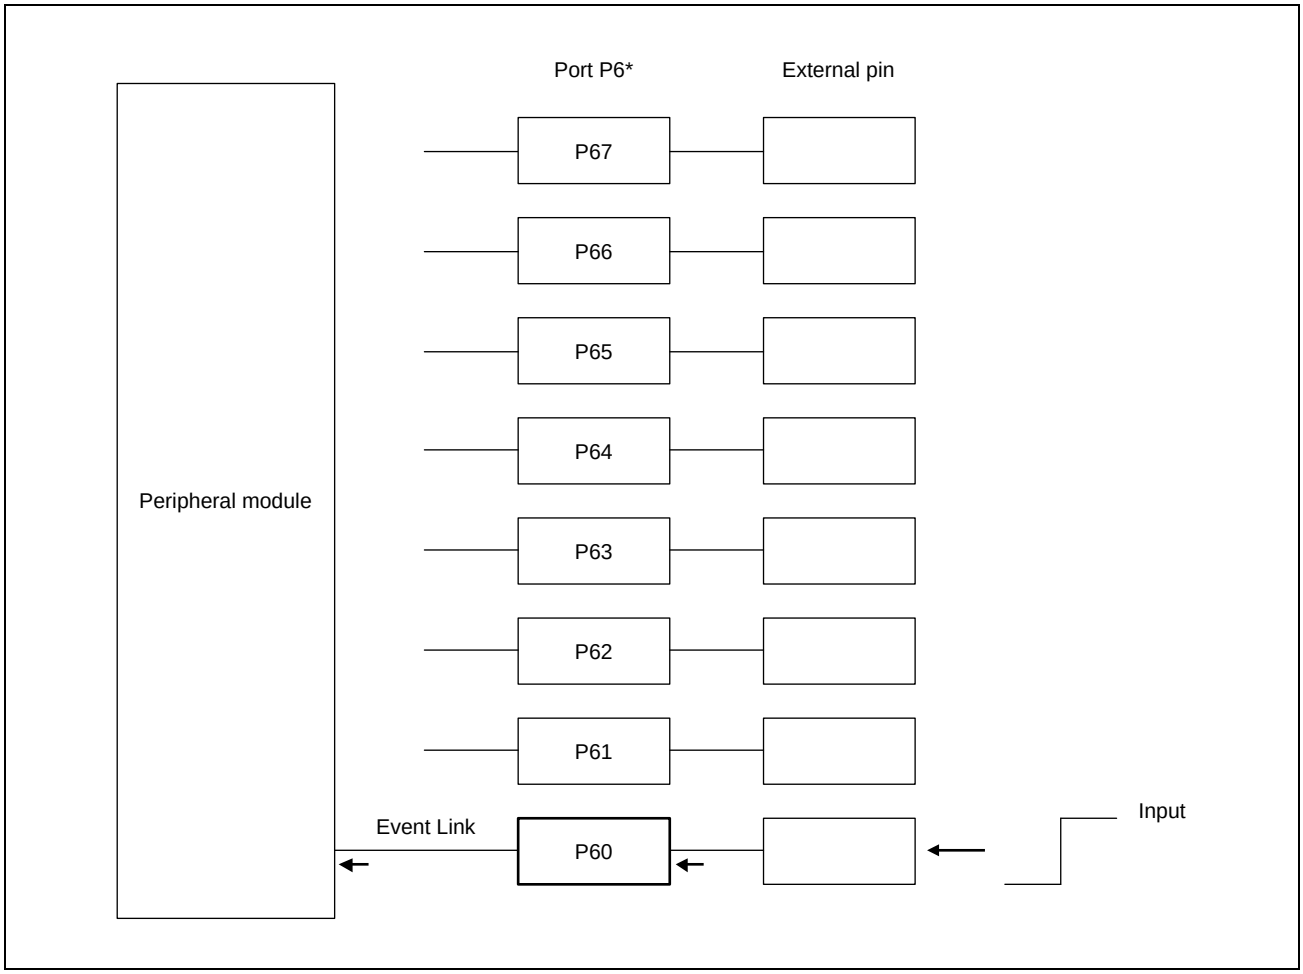

Figure 4.2-7 Single Input Port Operation

(2) Single Output Port Operation upon Event Input

For a single output port, the external pin output changes in the assigned way in response to the input of an event signal (the rising edge condition). The change in the external pin output is set by the PSM bit of the PFC_ELC_PELs register. **Figure 4.2-8** shows an example of event link operation by a single output port.

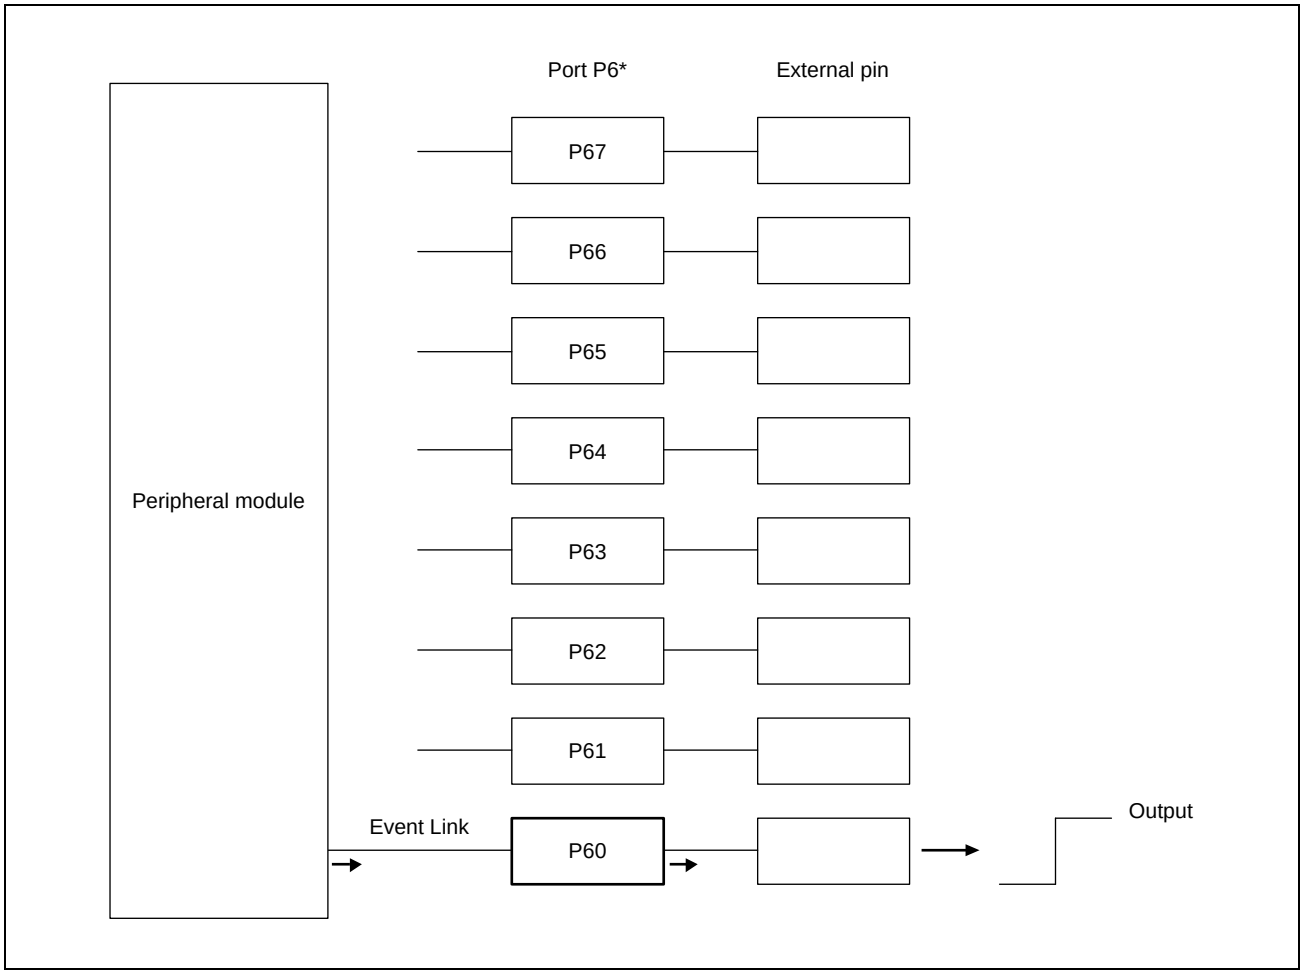

Figure 4.2-8 Single Output Port Operation

NOTE

In single output port operation, if the same port is specified by the ELC_PELs.PSB bit for four single ports and different port output data are specified by the ELC_PELs.PSM bits for the single ports for which the same port has been specified, contention among port outputs may arise depending on the timing of event input.

(3) Input Port Group Operation upon Event Generation

In an input port group, an event is generated when the change in the signal that has been selected as the condition for event operation is detected on one of the external pins that is connected to the port group. The condition for event generation is set by the PGCI bit of the PFC_ELC_PGCg register.

(4) Input Port Group Operation upon Event Input

When an event signal (the rising edge condition) is input to an input port group, the signal value on the external pin at the time of event input is transferred to the PFC_ELC_PDBFg register. Furthermore, if another event is input to the input port group, operation proceeds in accord with the setting of the PGCOVE bit of the PFC_ELC_PGCg register. **Figure 4.2-9** shows an example of operation.

- ELC_PGCg.PGCOVE = 0b (overwriting of the PFC_ELC_PDBFg register is disabled)
  If the value which has been transferred to the PFC_ELC_PDBFg register at the time of the previous event input has already been read by the CPU, the signal value on the external pin will be transferred to the PFC_ELC_PDBFg register. If it has not been read, the value on the external pin will not be transferred and the input event will be invalid.
- ELC_PGCg.PGCOVE = 1b (overwriting of the PFC_ELC_PDBFg register is enabled)
  If another event is input to the input port group, the signal value on the external pin will be transferred to the PFC_ELC_PDBFg register.

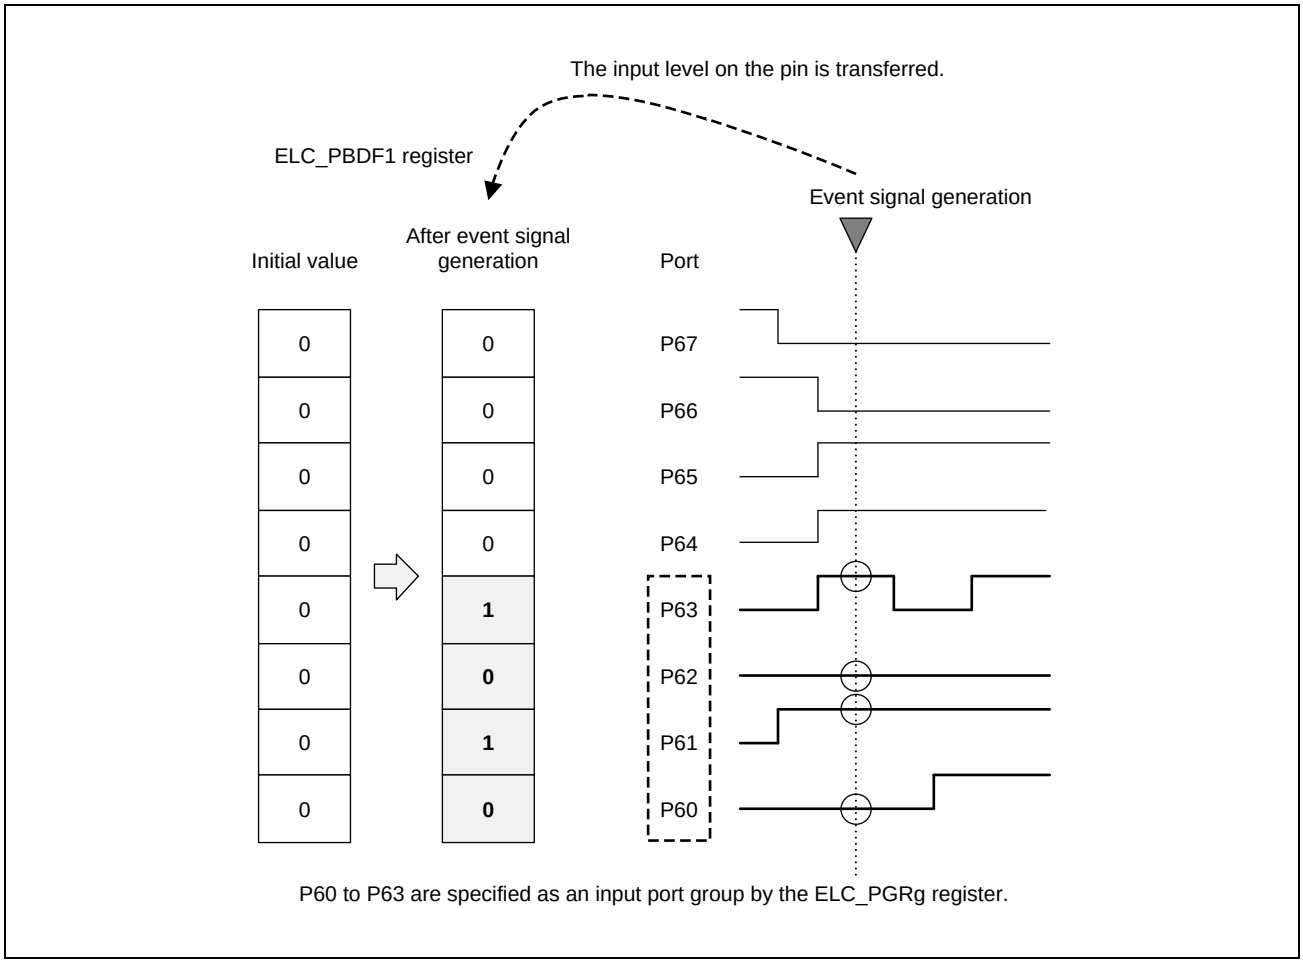

Figure 4.2-9 Input Port Group Operation

(5) Output Port Group Operation upon Event Input

When an event signal (the rising edge condition) is input to an output port group while the setting of the PGCO bits of the PFC_ELC_PGCg register is 000b, 001b, or 010b, the PFC_P_mn register for the bits specified as a group by the ELC_PGRg register is changed to the value set by the PGCO bits.

When an event signal (the rising edge condition) is input to the output port group while the setting of the PGCO bits of the PFC_ELC_PGCg register is 011b, the PFC_ELC_PDBFg register value will be transferred to the PFC_P_mn register for the bits specified as a group by the PFC_ELC_PGRg register. **Figure 4.2-10** shows an example of output port group operation at the time of event input when ELC_PGCg.PGCO = 011b.

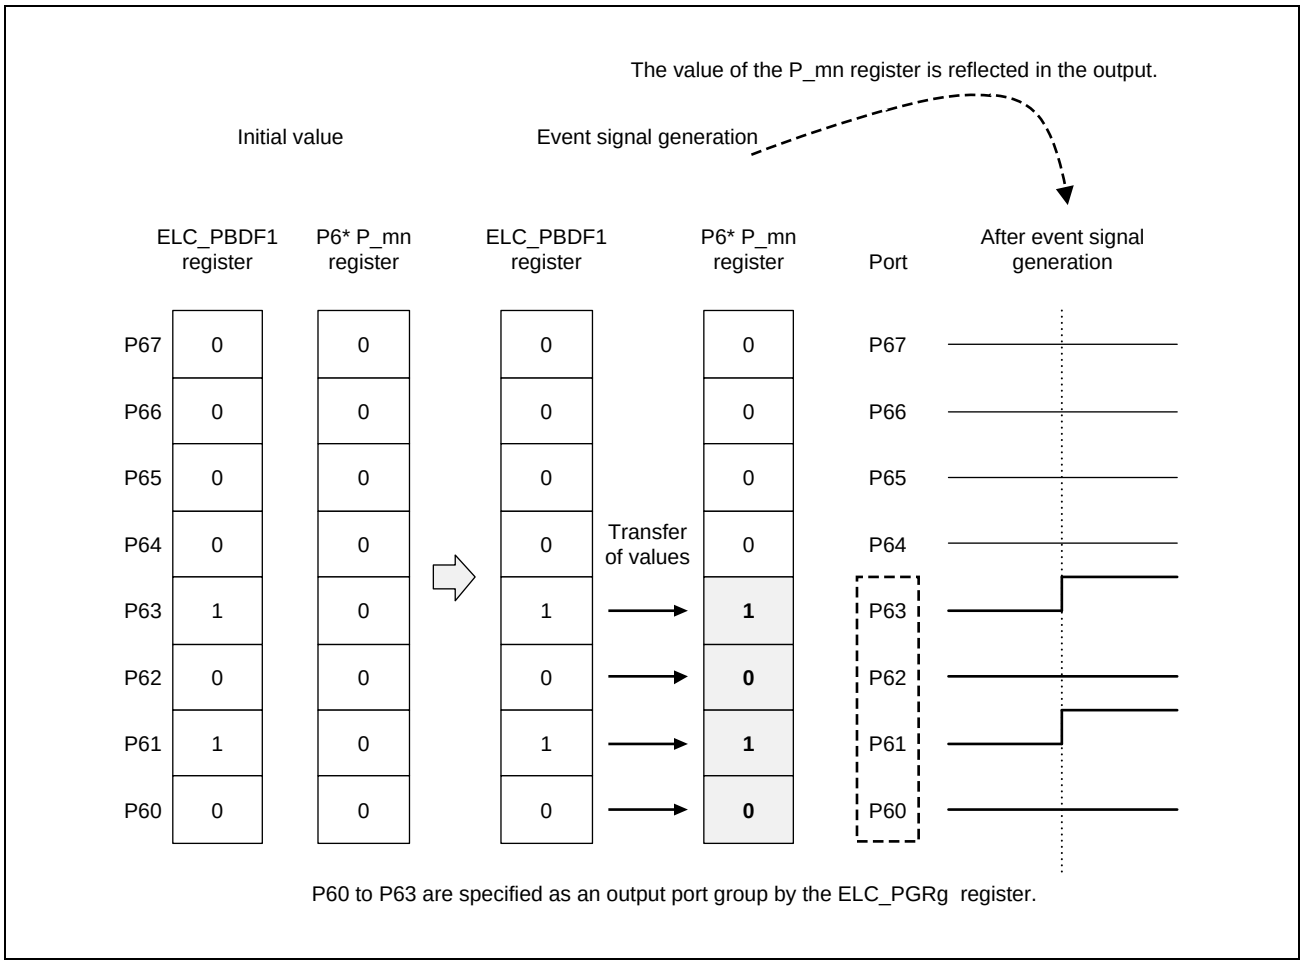

Figure 4.2-10 Output Port Group Operation

(6) Restrictions on Writing to PFC_P_mn and PFC_ELC_PDBFg Registers by a CPU

Event linking is subject to the restrictions on the CPU writing to the PFC_P_mn and PFC_ELC_PDBFg registers.

Remark 1. For the bits of a port specified as members of an output port group, writing to the associated bits of the PFC_P_mn register has no effect.

Remark 2. For the bits of a port specified as members of an input port group, writing to the associated bits of the PFC_ELC_PDBFg register has no effect.

(7) Example of operation

a) Set up operation of the module to which events are linked. To link events, the ELC and relevant modules must be enabled. If the ELC and relevant modules are stopped due, for example, to a low-power mode setting, the module cannot operate.

b) If an event is linked to a port, set the registers associated with the port.

- I/O port settings
  - PFC_P_mn register: Sets the initial value of the output port.
  - PFC_PM_mn register: Sets the I/O direction of the port.
- ELC settings
  - PFC_ELC_PGRg register: When ports are to be used as a port group, set the ports to be in the group in bit units.
  - PFC_ELC_PGCg register: Sets up operation of the port group.
  - PFC_ELC_PELs register: When ports are to be used as single ports, set the bit numbers of the ports, port operation at the time of event input, and the condition for event generation.
  - PFC_ELC_DPTC register: Sets input edge detection for single ports.
  - PFC_ELC_ELSR2 register: Sets the functions of the port event controller to which events are linked.

*** Setting the PFC_ELC_PDBFg register**

- Output port group
  Before setting the PFC_ELC_PDBFg register, set the PFC_ELC_PGCg register. The PFC_ELC_PGCg register must be changed before changing the PFC_P_mn register.
- Input port group
  Setting the PFC_ELC_PDBFg register is not required. However, its value after a reset is 0b, so if you want to check a change from high to low level in response to event input, set the PFC_ELC_PDBFg register for the target port to 1b.

4.2.4.8 Switching Power in the OTHERS Area Power Domain from ON to OFF

Switching power from ON to OFF

Due to this operation, the output levels to external devices are retained even after the OTHERS area is turned off.

1. Access the registers to make preparations for setting port mode (GPIO).
   - When the direction of the I/O buffer is to be “input”:
     Set the PFC_PM_mn register so that the GPIO setting is for input mode.
   - When the direction of the I/O buffer is to be “output”:
     Set the PFC_PM_mn register so that the GPIO setting is for output mode.
     Set the bits of the PFC_P_mn register to the values you want to have output.

2. Set the PFC_PMC_mn register to 0 to set port mode (GPIO).

Remark Changing the setting of the PFC_PMC_mn register requires manipulation of the PWPR.REGWE_A bit.
- Before changing the setting of the PFC_PMC_mn register: Set the PWPR.REGWE_A bit to 1b.
- After changing the setting of the PFC_PMC_mn register: Set the PWPR.REGWE_A bit to 0b.

Switching power from OFF to ON

Same as the normal power-on sequence.

SECTION 4 SYSTEM

4.3 System Controller (SYS)

This section describes the functions of the system controller (SYS) of this LSI.

4.3.1 Functional Overview

4.3.1.1 Functions

- This module provides product information on the LSI chip, descriptions of the states of the external pins, and the states of essential information at the time of booting up from OTP memory.
- Trust zone control
  - Control over privileged or non-privileged (normal) access by all bus masters
  - Control over secure/non-secure management by all bus masters
  - Setting the security levels for each of the slaves (access control)
  - Control over security within SYS itself for the setting registers covered by the above rows
  - Control by registers within SYS itself over each of the slaves and associated access control
  - Control by registers within SYS itself of access to units that do not currently have bus access
- Extended access by specific masters to addresses beyond the 4-GB space
  - Units to access DDR:
  - Address[31:30] (up to 4 GB) → Address[34:30] (up to 32 GB)/in 1-GB units
    - ISP
    - VCD
    - MIPI DSI
    - LCDC
    - SD0/SD1/SD2
    - USB20
    - USB30
    - GBETH0/GBETH1
  - Units to access DDR and PCIE:
  - Address[31:30] (up to 4 GB) → Address[35:30] (up to 64 GB)/in 1-GB units
    - DMAC0/DMAC1/DMAC2/DMAC3/DMAC4
  - Address[31:28] (up to 4 GB) → Address[35:28] (up to 64 GB)/in 256-MB units
    - CM33

- Control of settings and states for some units
  - Target units
    - SRAM, GBETH, PCIE, CM33, CA55, xSPI, TSU
- WDT control
  - Control of stopping the WDT from the CoreSight section
  - Control of stopping a specified channel of the WDT from the CPU

4.3.2 Connection Schematic Diagram

Figure 4.3-1 is a schematic view of the external connections of SYS with other blocks.

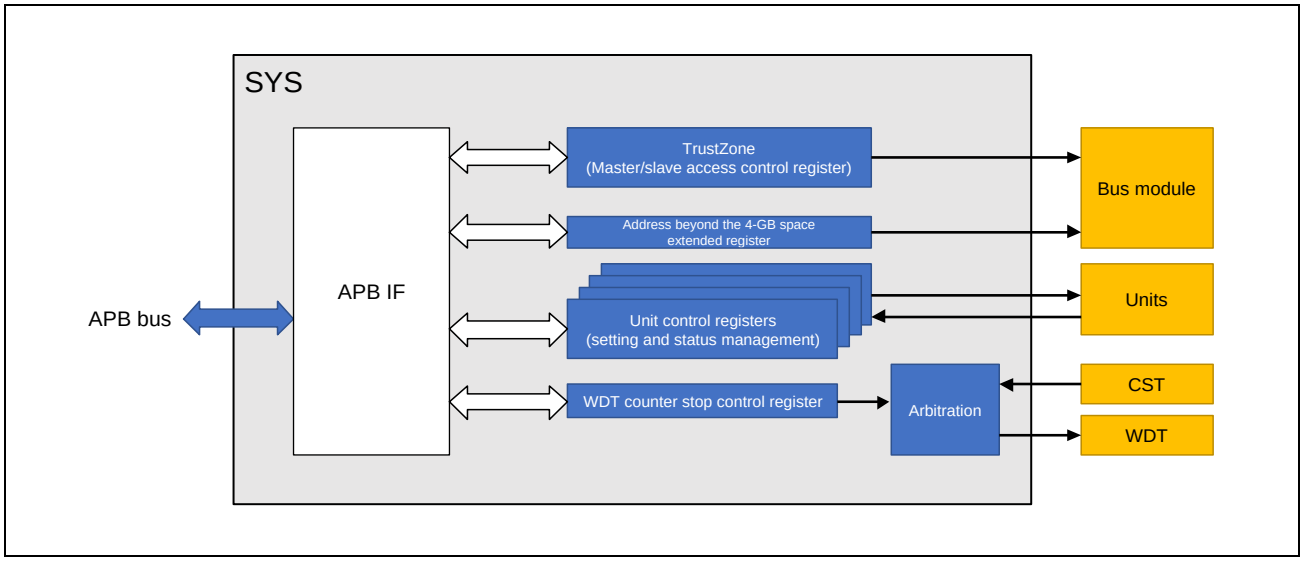

Figure 4.3-1 SYS Connection Schematic Diagram

4.3.3 Registers

The base address of the SYS register is shown below.

Table 4.3-1 Register Base Addresses

Base Address Name	Base Address
<SYS_base>	0_1043_0000h (5043_0000h*1, 4043_0000h*2)

Note 1. CM33 address space (non-secure)

Note 2. CM33 address space (secure)

4.3.3.1 List of Registers

The registers are listed below.

Register Name	Abbreviation	Initial Value	Offset Address	Access Size [bits]
Master Access Control Register 0	SYS_MSTACCCTL0	0000_0000h	0000h	32
Master Access Control Register 1	SYS_MSTACCCTL1	0000_0000h	0004h	32
Reserve	-	-	0008h to 000Bh	-
Master Access Control Register 3	SYS_MSTACCCTL3	00AA_AAAAh	000Ch	32
Master Access Control Register 4	SYS_MSTACCCTL4	0000_00AAh	0010h	32
Master Access Control Register 5	SYS_MSTACCCTL5	00AA_00AAh	0014h	32
Master Access Control Register 6	SYS_MSTACCCTL6	0000_AAAAh	0018h	32
Master Access Control Register 7	SYS_MSTACCCTL7	0000_00AAh	001Ch	32
Master Access Control Register 8	SYS_MSTACCCTL8	AAAA_AAAAh	0020h	32
Reserve	-	-	0024h to 0027h	-
Master Access Control Register 10	SYS_MSTACCCTL10	00AA_AAAAh	0028h	32
Master Access Control Register 11	SYS_MSTACCCTL11	0000_00AAh	002Ch	32
Master Access Control Register 12	SYS_MSTACCCTL12	0000_00AAh	0030h	32
Master Access Control Register 13	SYS_MSTACCCTL13	0000_00AAh	0034h	32
Master Access Control Register 14	SYS_MSTACCCTL14	0000_00AAh	0038h	32
Master Access Control Register 15	SYS_MSTACCCTL15	0000_00AAh	003Ch	32
Reserve	-	-	0040h to 0043h	-
Master Access Control Register 17	SYS_MSTACCCTL17	0000_00AAh	0044h	32
Master Access Control Register 18	SYS_MSTACCCTL18	AAAA_AAAAh	0048h	32
Reserve	-	-	004Ch to 00FFh	-
Slave Access Control Register 0	SYS_SLVACCCTL0	0000_0000h	0100h	32
Slave Access Control Register 1	SYS_SLVACCCTL1	0000_0003h	0104h	32
Slave Access Control Register 2	SYS_SLVACCCTL2	0000_0000h	0108h	32
Slave Access Control Register 3	SYS_SLVACCCTL3	0000_0000h	010Ch	32
Slave Access Control Register 4	SYS_SLVACCCTL4	0000_0000h	0110h	32
Slave Access Control Register 5	SYS_SLVACCCTL5	0000_0000h	0114h	32
Slave Access Control Register 6	SYS_SLVACCCTL6	0000_0000h	0118h	32
Slave Access Control Register 7	SYS_SLVACCCTL7	0000_0000h	011Ch	32
Slave Access Control Register 8	SYS_SLVACCCTL8	0000_0000h	0120h	32
Slave Access Control Register 9	SYS_SLVACCCTL9	0000_0000h	0124h	32
Slave Access Control Register 10	SYS_SLVACCCTL10	0000_0000h	0128h	32
Slave Access Control Register 11	SYS_SLVACCCTL11	0000_0000h	012Ch	32
Slave Access Control Register 12	SYS_SLVACCCTL12	0000_0000h	0130h	32

Register Name	Abbreviation	Initial Value	Offset Address	Access Size [bits]
Slave Access Control Register 13	SYS_SLVACCCTL13	0000_0000h	0134h	32
Slave Access Control Register 14	SYS_SLVACCCTL14	0000_0000h	0138h	32
Slave Access Control Register 15	SYS_SLVACCCTL15	0000_0000h	013Ch	32
Reserve	-	-	0140h to 014Bh	-
Slave Access Control Register 19	SYS_SLVACCCTL19	0000_0000h	014Ch	32
Slave Access Control Register 20	SYS_SLVACCCTL20	0000_0000h	0150h	32
Slave Access Control Register 21	SYS_SLVACCCTL21	0000_000Ah	0154h	32

4.3.3.2 Register Description

4.3.3.2.1 Master Access Control Register 0 (SYS_MSTACCCTL0)

This register controls the privileged/normal access and secure/non-secure access for each of the bus masters.

Access Size : 32 bits

Address : <SYS_base> + 0000h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SXRDMC0_ARSEL	-	SXRDMC0_ARNS	SXRDMC0_ARPU	SXRDMC0_AWSEL	-	SXRDMC0_AWNS	SXRDMC0_AWPU	SXADMC1_ARSEL	-	SXADMC1_ARNS	SXADMC1_ARPU	SXADMC1_AWSEL	-	SXADMC1_AWNS	SXADMC1_AWPU
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	R	RW	RW	RW	R	RW	RW	RW	R	RW	RW	RW	R	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SXADMC00_ARSEL	-	SXADMC00_ARNS	SXADMC00_ARPU	SXADMC00_AWSEL	-	SXADMC00_AWNS	SXADMC00_AWPU	SXMDMC_ARSEL	-	SXMDMC_ARNS	SXMDMC_ARPU	SXMDMC_AWSEL	-	SXMDMC_AWNS	SXMDMC_AWPU

R/W	RW	R	RW	RW	RW	R	RW	RW	RW	R	RW	RW	RW	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31	SXRDMC0_ARSEL	0h	RW	DMAC3 read access security attribute source selection 0b: The setting of the master DMAC3 is selected for ARPROT[1:0]. 1b: SXRDMC0_ARPU is selected for ARPROT[0] and SXRDMC0_ARNS is selected for ARPROT[1]. Changing the setting of this register while the target master is operating is prohibited. Change the register setting before starting access on the master side.
30	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
29	SXRDMC0_ARNS	0h	RW	DMAC3 read access secure attribute 0b: Secure 1b: Non-secure Changing the setting of this register while the target master is operating is prohibited. Change the register setting before starting access on the master side.
28	SXRDMC0_ARPU	0h	RW	DMAC3 read access privilege attribute 0b: Non-privileged access 1b: Privileged access Changing the setting of this register while the target master is operating is prohibited. Change the register setting before starting access on the master side.
27	SXRDMC0_AWSEL	0h	RW	DMAC3 write access security attribute source selection 0b: The setting of the master DMAC4 (RCPU) is selected for AWPROT[1:0]. 1b: SXRDMC0_AWPU is selected for AWPROT[0] and SXRDMC0_AWNS is selected for AWPROT[1]. Changing the setting of this register while the target master is operating is prohibited. Change the register setting before starting access on the master side.
26	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
25	SXRDMC0_AWNS	0h	RW	DMAC3 write access secure attribute 0b: Secure 1b: Non-secure Changing the setting of this register while the target master is operating is prohibited. Change the register setting before starting access on the master side.
24	SXRDMC0_AWPU	0h	RW	DMAC3 write access privilege attribute 0b: Non-privileged access 1b: Privileged access Changing the setting of this register while the target master is operating is prohibited. Change the register setting before starting access on the master side.

Bit	Bit Name	Initial Value	R/W	Description
23	SXADMC1_ARSEL	0h	RW	DMAC2 read access security attribute source selection 0b: The setting of the master DMAC2 is selected for ARPROT[1:0]. 1b: SXADMC1_ARPU is selected for ARPROT[0] and SXADMC1_ARNS is selected for ARPROT[1]. Changing the setting of this register while the target master is operating is prohibited. Change the register setting before starting access on the master side.
22	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
21	SXADMC1_ARNS	0h	RW	DMAC2 read access secure attribute 0b: Secure 1b: Non-secure Changing the setting of this register while the target master is operating is prohibited. Change the register setting before starting access on the master side.
20	SXADMC1_ARPU	0h	RW	DMAC2 read access privilege attribute 0b: Non-privileged access 1b: Privileged access Changing the setting of this register while the target master is operating is prohibited. Change the register setting before starting access on the master side.
19	SXADMC1_AWSEL	0h	RW	DMAC2 write access security attribute source selection 0b: The setting of the master DMAC2 is selected for AWPROT[1:0]. 1b: SXADMC1_AWPU is selected for AWPROT[0] and SXADMC1_AWNS is selected for AWPROT[1]. Changing the setting of this register while the target master is operating is prohibited. Change the register setting before starting access on the master side.
18	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
17	SXADMC1_AWNS	0h	RW	DMAC2 write access secure attribute 0b: Secure 1b: Non-secure Changing the setting of this register while the target master is operating is prohibited. Change the register setting before starting access on the master side.
16	SXADMC1_AWPU	0h	RW	DMAC2 write access privilege attribute 0b: Non-privileged access 1b: Privileged access Changing the setting of this register while the target master is operating is prohibited. Change the register setting before starting access on the master side.
15	SXADMC00_ARSEL	0h	RW	DMAC1 read access security attribute source selection 0b: The setting of the master DMAC1 is selected for ARPROT[1:0]. 1b: SXADMC00_ARPU is selected for ARPROT[0] and SXADMC00_ARNS is selected for ARPROT[1]. Changing the setting of this register while the target master is operating is prohibited. Change the register setting before starting access on the master side.
14	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
13	SXADMC00_ARNS	0h	RW	DMAC1 read access secure attribute 0b: Secure 1b: Non-secure Changing the setting of this register while the target master is operating is prohibited. Change the register setting before starting access on the master side.
12	SXADMC00_ARPU	0h	RW	DMAC1 read access privilege attribute 0b: Non-privileged access 1b: Privileged access Changing the setting of this register while the target master is operating is prohibited. Change the register setting before starting access on the master side.
11	SXADMC00_AWSEL	0h	RW	DMAC1 write access security attribute source selection 0b: The setting of the master DMAC1 is selected for AWPROT[1:0]. 1b: SXADMC00_AWPU is selected for AWPROT[0] and SXADMC00_AWNS is selected for AWPROT[1]. Changing the setting of this register while the target master is operating is prohibited. Change the register setting before starting access on the master side.
10	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

Bit	Bit Name	Initial Value	R/W	Description
9	SXADMC00_AWNS	0h	RW	DMAC1 write access secure attribute 0b: Secure 1b: Non-secure Changing the setting of this register while the target master is operating is prohibited. Change the register setting before starting access on the master side.
8	SXADMC00_AWPU	0h	RW	DMAC1 write access privilege attribute 0b: Non-privileged access 1b: Privileged access Changing the setting of this register while the target master is operating is prohibited. Change the register setting before starting access on the master side.
7	SXMDMC_ARSEL	0h	RW	DMAC0 read access security attribute source selection 0b: The setting of the master DMAC0 is selected for ARPROT[1:0]. 1b: SXMDMC_ARPU is selected for ARPROT[0] and SXMDMC_ARNS is selected for ARPROT[1]. Changing the setting of this register while the target master is operating is prohibited. Change the register setting before starting access on the master side.
6	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
5	SXMDMC_ARNS	0h	RW	DMAC0 read access secure attribute 0b: Secure 1b: Non-secure Changing the setting of this register while the target master is operating is prohibited. Change the register setting before starting access on the master side.
4	SXMDMC_ARPU	0h	RW	DMAC0 read access privilege attribute 0b: Non-privileged access 1b: Privileged access Changing the setting of this register while the target master is operating is prohibited. Change the register setting before starting access on the master side.
3	SXMDMC_AWSEL	0h	RW	DMAC0 write access security attribute source selection 0b: The setting of the master DMAC0 is selected for AWPROT[1:0]. 1b: SXMDMC_AWPU is selected for AWPROT[0] and SXMDMC_AWNS is selected for AWPROT[1]. Changing the setting of this register while the target master is operating is prohibited. Change the register setting before starting access on the master side.
2	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
1	SXMDMC_AWNS	0h	RW	DMAC0 write access secure attribute 0b: Secure 1b: Non-secure Changing the setting of this register while the target master is operating is prohibited. Change the register setting before starting access on the master side.
0	SXMDMC_AWPU	0h	RW	DMAC0 write access privilege attribute 0b: Non-privileged access 1b: Privileged access Changing the setting of this register while the target master is operating is prohibited. Change the register setting before starting access on the master side.

4.3.3.2.2 Master Access Control Register 1 (SYS_MSTACCCTL1)

This register controls the privileged/normal access and secure/non-secure access for each of the bus masters.

Access Size : 32 bits
Address : <SYS_base> + 0004h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Initial Value	0	0	0	0	0	0	0	0	1	0	1	0	1	0	1	0
R/W	R	R	R	R	R	R	R	R	RW	R	RW	RW	RW	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
7	SXDSI_ARSEL	1h	RW	DSI read access security attribute source selection 0b: The setting of the master DSI is selected for ARPROT[1:0]. ARPROT[1:0] is fixed to 10b. 1b: SXDSI_ARPU is selected for ARPROT[0] and SXDSI_ARNS is selected for ARPROT[1]. Changing the setting of this register while the target master is operating is prohibited. Change the register setting before starting access on the master side.
6	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
5	SXDSI_ARNS	1h	RW	DSI read access secure attribute 0b: Secure 1b: Non-secure Changing the setting of this register while the target master is operating is prohibited. Change the register setting before starting access on the master side.
4	SXDSI_ARPU	0h	RW	DSI read access privilege attribute 0b: Non-privileged access 1b: Privileged access Changing the setting of this register while the target master is operating is prohibited. Change the register setting before starting access on the master side.
3	SXDSI_AWSEL	1h	RW	DSI write access security attribute source selection 0b: The setting of the master DSI is selected for AWPROT[1:0]. AWPROT[1:0] is fixed to 10b. 1b: SXDSI_AWPU is selected for AWPROT[0] and SXDSI_AWNS is selected for AWPROT[1]. Changing the setting of this register while the target master is operating is prohibited. Change the register setting before starting access on the master side.
2	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
1	SXDSI_AWNS	1h	RW	DSI write access secure attribute 0b: Secure 1b: Non-secure Changing the setting of this register while the target master is operating is prohibited. Change the register setting before starting access on the master side.
0	SXDSI_AWPU	0h	RW	DSI write access privilege attribute 0b: Non-privileged access 1b: Privileged access Changing the setting of this register while the target master is operating is prohibited. Change the register setting before starting access on the master side.

4.3.3.2.12 Master Access Control Register 13 (SYS_MSTACCCTL13)

This register controls the privileged/normal access and secure/non-secure access for each of the bus masters.

Access Size : 32 bits
Address : <SYS_base> + 0034h
Initial Value : 0000_00AAh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
7	SXGPU_ARSEL	1h	RW	GE3D read access security attribute source selection 0b: ARPROT[1:0] always becomes 10b. 1b: SXGPU_ARPU is selected for ARPROT[0] and SXGPU_ARNS is selected for ARPROT[1]. Changing the setting of this register while the target master is operating is prohibited. Change the register setting before starting access on the master side.
6	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
5	SXGPU_ARNS	1h	RW	GE3D read access secure attribute 0b: Secure 1b: Non-secure Changing the setting of this register while the target master is operating is prohibited. Change the register setting before starting access on the master side.
4	SXGPU_ARPU	0h	RW	GE3D read access privilege attribute 0b: Non-privileged access 1b: Privileged access Changing the setting of this register while the target master is operating is prohibited. Change the register setting before starting access on the master side.
3	SXGPU_AWSEL	1h	RW	GE3D write access security attribute source selection 0b: AWPROT[1:0] always becomes 10b. 1b: SXGPU_AWPU is selected for AWPROT[0] and SXGPU_AWNS is selected for AWPROT[1]. Changing the setting of this register while the target master is operating is prohibited. Change the register setting before starting access on the master side.
2	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
1	SXGPU_AWNS	1h	RW	GE3D write access secure attribute 0b: Secure 1b: Non-secure Changing the setting of this register while the target master is operating is prohibited. Change the register setting before starting access on the master side.
0	SXGPU_AWPU	0h	RW	GE3D write access privilege attribute 0b: Non-privileged access 1b: Privileged access Changing the setting of this register while the target master is operating is prohibited. Change the register setting before starting access on the master side.

4.3.3.2.14 Master Access Control Register 15 (SYS_MSTACCCTL15)

This register controls the privileged/normal access and secure/non-secure access for each of the bus masters.

Access Size : 32 bits
Address : <SYS_base> + 003Ch
Initial Value : 0000_00AAh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	SXVCP_ARSEL	-	SXVCP_ARNS	SXVCP_ARPU	SXVCP_AWSEL	-	SXVCP_AWNS	SXVCP_AWPU
Initial Value	0	0	0	0	0	0	0	0	1	0	1	0	1	0	1	0
R/W	R	R	R	R	R	R	R	R	RW	R	RW	RW	RW	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
7	SXVCP_ARSEL	1h	RW	VCD read access security attribute source selection 0b: The setting of the master VCD is selected for ARPROT[1:0]. ARPROT[1:0] is fixed to 10b. 1b: SXVCP_ARPU is selected for ARPROT[0] and SXVCP_ARNS is selected for ARPROT[1]. Changing the setting of this register while the target master is operating is prohibited. Change the register setting before starting access on the master side.
6	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
5	SXVCP_ARNS	1h	RW	VCD read access secure attribute 0b: Secure 1b: Non-secure Changing the setting of this register while the target master is operating is prohibited. Change the register setting before starting access on the master side.
4	SXVCP_ARPU	0h	RW	VCD read access privilege attribute 0b: Non-privileged access 1b: Privileged access Changing the setting of this register while the target master is operating is prohibited. Change the register setting before starting access on the master side.
3	SXVCP_AWSEL	1h	RW	VCD write access security attribute source selection 0b: The setting of the master VCP is selected for AWPROT[1:0]. AWPROT[1:0] is fixed to 10b. 1b: SXVCP_AWPU is selected for AWPROT[0] and SXVCP_AWNS is selected for AWPROT[1]. Changing the setting of this register while the target master is operating is prohibited. Change the register setting before starting access on the master side.
2	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
1	SXVCP_AWNS	1h	RW	VCD write access secure attribute 0b: Secure 1b: Non-secure Changing the setting of this register while the target master is operating is prohibited. Change the register setting before starting access on the master side.
0	SXVCP_AWPU	0h	RW	VCD write access privilege attribute 0b: Non-privileged access 1b: Privileged access Changing the setting of this register while the target master is operating is prohibited. Change the register setting before starting access on the master side.

4.3.3.2.15 Master Access Control Register 17 (SYS_MSTACCCTL17)

This register controls the privileged/normal access and secure/non-secure access for each of the bus masters.

Access Size : 32 bits

Address : <SYS_base> + 0044h

Initial Value : 0000_00AAh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

	SXDRM1_ARSEL	-	SXDRM1_ARNS	SXDRM1_ARPU	SXDRM1_AWSEL	-	SXDRM1_AWNS	SXDRM1_AWPU	SXDRM0_ARSEL	-	SXDRM0_ARNS	SXDRM0_ARPU	SXDRM0_AWSEL	-	SXDRM0_AWNS	SXDRM0_AWPU
Initial Value	1	0	1	0	1	0	1	0	1	0	1	0	1	0	1	0
R/W	RW	R	RW	RW	RW	R	RW	RW	RW	R	RW	RW	RW	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31	SXDRW1_ARSEL	1h	RW	DRP-AI (Weight 1) read access security attribute source selection 0b: The setting of the master DRP-AI (Weight 1) is selected for ARPROT[1:0]. ARPROT[1:0] is fixed to 10b. 1b: SXDRW1_ARPU is selected for ARPROT[0] and SXDRW1_ARNS is selected for ARPROT[1]. Changing the setting of this register while the target master is operating is prohibited. Change the register setting before starting access on the master side.
30	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
29	SXDRW1_ARNS	1h	RW	DRP-AI (Weight 1) read access secure attribute 0b: Secure 1b: Non-secure Changing the setting of this register while the target master is operating is prohibited. Change the register setting before starting access on the master side.
28	SXDRW1_ARPU	0h	RW	DRP-AI (Weight 1) read access privilege attribute 0b: Non-privileged access 1b: Privileged access Changing the setting of this register while the target master is operating is prohibited. Change the register setting before starting access on the master side.
27	-	1h	RW	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
26	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
25	-	1h	RW	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
24	-	0h	RW	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
23	SXDRW0_ARSEL	1h	RW	DRP-AI (Weight 0) read access security attribute source selection 0b: The setting of the master DRP-AI (Weight 0) is selected for ARPROT[1:0]. ARPROT[1:0] is fixed to 10b. 1b: SXDRW0_ARPU is selected for ARPROT[0] and SXDRW0_ARNS is selected for ARPROT[1]. Changing the setting of this register while the target master is operating is prohibited. Change the register setting before starting access on the master side.
22	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

Bit	Bit Name	Initial Value	R/W	Description
21	SXDRW0_ARNS	1h	RW	DRP-AI (Weight 0) read access secure attribute 0b: Secure 1b: Non-secure Changing the setting of this register while the target master is operating is prohibited. Change the register setting before starting access on the master side.
20	SXDRW0_ARPU	0h	RW	DRP-AI (Weight 0) read access privilege attribute 0b: Non-privileged access 1b: Privileged access Changing the setting of this register while the target master is operating is prohibited. Change the register setting before starting access on the master side.
19	-	1h	RW	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
18	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
17	-	1h	RW	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
16	-	0h	RW	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
15	SXDRM1_ARSEL	1h	RW	DRP-AI (Feature 1) read access security attribute source selection 0b: The setting of the master DRP-AI (Feature 1) is selected for ARPROT[1:0]. ARPROT[1:0] is fixed to 10b. 1b: SXDRM1_ARPU is selected for ARPROT[0] and SXDRM1_ARNS is selected for ARPROT[1]. Changing the setting of this register while the target master is operating is prohibited. Change the register setting before starting access on the master side.
14	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
13	SXDRM1_ARNS	1h	RW	DRP-AI (Feature 1) read access secure attribute 0b: Secure 1b: Non-secure Changing the setting of this register while the target master is operating is prohibited. Change the register setting before starting access on the master side.
12	SXDRM1_ARPU	0h	RW	DRP-AI (Feature 1) read access privilege attribute 0b: Non-privileged access 1b: Privileged access Changing the setting of this register while the target master is operating is prohibited. Change the register setting before starting access on the master side.
11	SXDRM1_AWSEL	1h	RW	DRP-AI (Feature 1) write access security attribute source selection 0b: The setting of the master DRP-AI (Feature 1) is selected for AWPROT[1:0]. AWPROT[1:0] is fixed to 10b. 1b: SXDRM1_AWPU is selected for AWPROT[0] and SXDRM1_AWNS is selected for AWPROT[1]. Changing the setting of this register while the target master is operating is prohibited. Change the register setting before starting access on the master side.
10	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
9	SXDRM1_AWNS	1h	RW	DRP-AI (Feature 1) write access secure attribute 0b: Secure 1b: Non-secure Changing the setting of this register while the target master is operating is prohibited. Change the register setting before starting access on the master side.
8	SXDRM1_AWPU	0h	RW	DRP-AI (Feature 1) write access privilege attribute 0b: Non-privileged access 1b: Privileged access Changing the setting of this register while the target master is operating is prohibited. Change the register setting before starting access on the master side.
7	SXDRM0_ARSEL	1h	RW	DRP-AI (Feature 0) read access security attribute source selection 0b: The setting of the master DRP-AI (Feature 0) is selected for ARPROT[1:0]. ARPROT[1:0] is fixed to 10b. 1b: SXDRM0_ARPU is selected for ARPROT[0] and SXDRM0_ARNS is selected for ARPROT[1]. Changing the setting of this register while the target master is operating is prohibited. Change the register setting before starting access on the master side.

Bit	Bit Name	Initial Value	R/W	Description
6	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
5	SXDRM0_ARNS	1h	RW	DRP-AI (Feature 0) read access secure attribute 0b: Secure 1b: Non-secure Changing the setting of this register while the target master is operating is prohibited. Change the register setting before starting access on the master side.
4	SXDRM0_ARPU	0h	RW	DRP-AI (Feature 0) read access privilege attribute 0b: Non-privileged access 1b: Privileged access Changing the setting of this register while the target master is operating is prohibited. Change the register setting before starting access on the master side.
3	SXDRM0_AWSEL	1h	RW	DRP-AI (Feature 0) write access security attribute source selection 0b: The setting of the master DRP-AI (Feature 0) is selected for AWPROT[1:0]. AWPROT[1:0] is fixed to 10b. 1b: SXDRM0_AWPU is selected for AWPROT[0] and SXDRM0_AWNS is selected for AWPROT[1]. Changing the setting of this register while the target master is operating is prohibited. Change the register setting before starting access on the master side.
2	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
1	SXDRM0_AWNS	1h	RW	DRP-AI (Feature 0) write access secure attribute 0b: Secure 1b: Non-secure Changing the setting of this register while the target master is operating is prohibited. Change the register setting before starting access on the master side.
0	SXDRM0_AWPU	0h	RW	DRP-AI (Feature 0) write access privilege attribute 0b: Non-privileged access 1b: Privileged access Changing the setting of this register while the target master is operating is prohibited. Change the register setting before starting access on the master side.

4.3.3.2.17 Slave Access Control Register 0 (SYS_SLVACCCTL0)

This register sets the security level for each of the slaves. For details, see **4.3.4.1 Security Level Setting**.

Access Size : 32 bits
Address : <SYS_base> + 0100h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	MPSYS_SL [1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
1, 0	MPSYS_SL [1:0]	3h	R	Security control is applied to the slave SYS.

4.3.3.2.19 Slave Access Control Register 2 (SYS_SLVACCCTL2)

This register sets the security level for each of the slaves. For details, see **4.3.4.1 Security Level Setting**.

Access Size : 32 bits
Address : <SYS_base> + 0108h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	MPICU1_SL [1:0]		MPICU0_SL [1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
3, 2	MPICU1_SL [1:0]	0h	RW	Security control is applied to the slave ICU.
1, 0	MPICU0_SL [1:0]	0h	RW	Security control is applied to the slave ICU.

4.3.3.2.20 Slave Access Control Register 3 (SYS_SLVACCCTL3)

This register sets the security level for each of the slaves. For details, see **4.3.4.1 Security Level Setting**.

Access Size : 32 bits
Address : <SYS_base> + 010Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	MXMDMC_SL [1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
1, 0	MXMDMC_SL [1:0]	0h	RW	Security control is applied to the slave DMAC0.

4.3.3.2.21 Slave Access Control Register 4 (SYS_SLVACCCTL4)

This register sets the security level for each of the slaves. For details, see **4.3.4.1 Security Level Setting**.

Access Size : 32 bits
Address : <SYS_base> + 0110h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	MPMSRM1_SL [1:0]		MPMSRM0_SL [1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
3, 2	MPMSRM1_SL [1:0]	0h	RW	Security control is applied to the slave SRAM1 control register.
1, 0	MPMSRM0_SL [1:0]	0h	RW	Security control is applied to the slave SRAM0 control register.

4.3.3.2.22 Slave Access Control Register 5 (SYS_SLVACCCTL5)

This register sets the security level for each of the slaves. For details, see **4.3.4.1 Security Level Setting**.

Access Size : 32 bits
Address : <SYS_base> + 0114h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	MPCST_SL [1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
1, 0	MPCST_SL [1:0]	0h	RW	Security control is applied to the slave CST.

4.3.3.2.23 Slave Access Control Register 6 (SYS_SLVACCCTL6)

This register sets the security level for each of the slaves. For details, see **4.3.4.1 Security Level Setting**.

Access Size : 32 bits
Address : <SYS_base> + 0118h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	MPMHU_SL [1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
1, 0	MPMHU_SL [1:0]	0h	RW	Security control is applied to the slave MHU.

4.3.3.2.24 Slave Access Control Register 7 (SYS_SLVACCCTL7)

This register sets the security level for each of the slaves. For details, see **4.3.4.1 Security Level Setting**.

Access Size : 32 bits
Address : <SYS_base> + 011Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	MPMOST1_SL [1:0]		MPMOST0_SL [1:0]		MOMCMT3_SL [1:0]		MOMCMT2_SL [1:0]		MOMCMT1_SL [1:0]		MOMCMT0_SL [1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
11, 10	MPMOST1_SL [1:0]	0h	RW	Security control is applied to the slave GTM1.
9, 8	MPMOST0_SL [1:0]	0h	RW	Security control is applied to the slave GTM0.
7, 6	MOMCMT3_SL [1:0]	0h	RW	Security control is applied to the slave CMTW3.
5, 4	MOMCMT2_SL [1:0]	0h	RW	Security control is applied to the slave CMTW2.
3, 2	MOMCMT1_SL [1:0]	0h	RW	Security control is applied to the slave CMTW1.
1, 0	MOMCMT0_SL [1:0]	0h	RW	Security control is applied to the slave CMTW0.

4.3.3.2.25 Slave Access Control Register 8 (SYS_SLVACCCTL8)

This register sets the security level for each of the slaves. For details, see **4.3.4.1 Security Level Setting**.

Access Size : 32 bits
Address : <SYS_base> + 0120h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	MOMWDT_SL [1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
1, 0	MOMWDT_SL [1:0]	0h	RW	Security control is applied to the slave WDT0.

4.3.3.2.26 Slave Access Control Register 9 (SYS_SLVACCCTL9)

This register sets the security level for each of the slaves. For details, see **4.3.4.1 Security Level Setting**.

Access Size : 32 bits
Address : <SYS_base> + 0124h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	MORTC_SL [1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
1, 0	MORTC_SL [1:0]	0h	RW	Security control is applied to the slave RTC.

4.3.3.2.27 Slave Access Control Register 10 (SYS_SLVACCCTL10)

This register sets the security level for each of the slaves. For details, see **4.3.4.1 Security Level Setting**.

Access Size : 32 bits
Address : <SYS_base> + 0128h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	MORTR_SL [1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
1, 0	MORTR_SL [1:0]	0h	RW	Security control (R-only) is applied to the slave RTC.

4.3.3.2.28 Slave Access Control Register 11 (SYS_SLVACCCTL11)

This register sets the security level for each of the slaves. For details, see **4.3.4.1 Security Level Setting**.

Access Size : 32 bits
Address : <SYS_base> + 012Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	SPI_REG_SL [1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
1, 0	SPI_REG_SL [1:0]	0h	RW	Security control is applied to the register of the slave xSPI.

4.3.3.2.29 Slave Access Control Register 12 (SYS_SLVACCCTL12)

This register sets the security level for each of the slaves. For details, see **4.3.4.1 Security Level Setting**.

Access Size : 32 bits
Address : <SYS_base> + 0130h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	MHGPO_SL [1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
1, 0	MHGPO_SL [1:0]	0h	RW	Security control is applied to the slave PFC.

4.3.3.2.30 Slave Access Control Register 13 (SYS_SLVACCCTL13)

This register sets the security level for each of the slaves. For details, see **4.3.4.1 Security Level Setting**.

Access Size : 32 bits
Address : <SYS_base> + 0134h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	MPPDM1_SL [1:0]		MPPDM0_SL [1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
3, 2	MPPDM1_SL [1:0]	0h	RW	Security control is applied to the slave PDM1.
1, 0	MPPDM0_SL [1:0]	0h	RW	Security control is applied to the slave PDM0.

4.3.3.2.31 Slave Access Control Register 14 (SYS_SLVACCCTL14)

This register sets the security level for each of the slaves. For details, see **4.3.4.1 Security Level Setting**.

Access Size : 32 bits
Address : <SYS_base> + 0138h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	MOADC_SL [1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
1, 0	MOADC_SL [1:0]	0h	RW	Security control is applied to the slave ADC0, ADC1, ADC2.

4.3.3.2.32 Slave Access Control Register 15 (SYS_SLVACCCTL15)

This register sets the security level for each of the slaves. For details, see **4.3.4.1 Security Level Setting**.

Access Size : 32 bits
Address : <SYS_base> + 013Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	MPMTSU0_SL [1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
1, 0	MPMTSU0_SL [1:0]	0h	RW	Security control is applied to the slave TSU0.

4.3.3.2.33 Slave Access Control Register 19 (SYS_SLVACCCTL19)

This register sets the security level for each of the slaves. For details, see **4.3.4.1 Security Level Setting**.

Access Size : 32 bits
Address : <SYS_base> + 014Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	MOSCF_SL [1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
1, 0	MOSCF_SL [1:0]	0h	RW	Security control is applied to the slave SCIF.

4.3.3.2.34 Slave Access Control Register 20 (SYS_SLVACCCTL20)

This register sets the security level for each of the slaves. For details, see **4.3.4.1 Security Level Setting**.

Access Size : 32 bits
Address : <SYS_base> + 0150h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	MOMI2C_SL [1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
1, 0	MOMI2C_SL [1:0]	0h	RW	Security control is applied to the slave RIIC8.

4.3.3.2.35 Slave Access Control Register 21 (SYS_SLVACCCTL21)

This register sets the security level for each of the slaves. For details, see **4.3.4.1 Security Level Setting**.

Only 10b and 11b can be set. Settings of 00b and 01b are prohibited.

Access Size : 32 bits
Address : <SYS_base> + 0154h
Initial Value : 0000_000Ah

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	MPTM33_SL [1:0]		MPTSPI_SL [1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	1	0	1	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
3, 2	MPTM33_SL [1:0]	2h	RW	Security control is applied to the slave TZC(SRAM0, SRAM1).
1, 0	MPTSPI_SL [1:0]	2h	RW	Security control is applied to the slave TZC(xSPI).

4.3.3.2.36 Slave Access Control Register 22 (SYS_SLVACCCTL22)

This register sets the security level for each of the slaves. For details, see **4.3.4.1 Security Level Setting**.

Only 10b and 11b can be set. Settings of 00b and 01b are prohibited.

Access Size : 32 bits
Address : <SYS_base> + 0158h
Initial Value : 0000_02AAh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	MXMGPV_SL [1:0]	
Initial Value	0	0	0	0	0	0	1	0	1	0	1	0	1	0	1	0
R/W	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
9 to 2	-	AAh	RW	Reserved Whenever it is read, AAh is read. The write value should always be AAh.
1, 0	MXMGPV_SL [1:0]	2h	RW	Security control is applied to GPV_MCPU.

4.3.3.2.37 Slave Access Control Register 32 (SYS_SLVACCCTL32)

This register sets the security level for each of the slaves. For details, see **4.3.4.1 Security Level Setting**.

Access Size : 32 bits
Address : <SYS_base> + 0180h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	MXADMC1_SL [1:0]		MXADMC0_SL [1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
3, 2	MXADMC1_SL [1:0]	0h	RW	Security control is applied to the slave DMAC2.
1, 0	MXADMC0_SL [1:0]	0h	RW	Security control is applied to the slave DMAC1.

4.3.3.2.38 Slave Access Control Register 33 (SYS_SLVACCCTL33)

This register sets the security level for each of the slaves. For details, see **4.3.4.1 Security Level Setting**.

Access Size : 32 bits
Address : <SYS_base> + 0184h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	MPASRM_SL [1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
1, 0	MPASRM_SL [1:0]	0h	RW	Security control is applied to the slave SRAM2 control register.

4.3.3.2.39 Slave Access Control Register 35 (SYS_SLVACCCTL35)

This register sets the security level for each of the slaves. For details, see **4.3.4.1 Security Level Setting**.

Access Size : 32 bits
Address : <SYS_base> + 018Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	MPSYC_SL [1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
1, 0	MPSYC_SL [1:0]	0h	RW	Security control is applied to the slave SYC.

4.3.3.2.40 Slave Access Control Register 36 (SYS_SLVACCCTL36)

This register sets the security level for each of the slaves. For details, see **4.3.4.1 Security Level Setting**.

Access Size : 32 bits
Address : <SYS_base> + 0190h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	MPAOST1_SL [1:0]		MPAOST0_SL [1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
3, 2	MPAOST1_SL [1:0]	0h	RW	Security control is applied to the slave GTM3.
1, 0	MPAOST0_SL [1:0]	0h	RW	Security control is applied to the slave GTM2.

4.3.3.2.41 Slave Access Control Register 37 (SYS_SLVACCCTL37)

This register sets the security level for each of the slaves. For details, see **4.3.4.1 Security Level Setting**.

Access Size : 32 bits
Address : <SYS_base> + 0194h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	MOAWDT_SL [1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
1, 0	MOAWDT_SL [1:0]	0h	RW	Security control is applied to the slave WDT1.

4.3.3.2.42 Slave Access Control Register 38 (SYS_SLVACCCTL38)

This register sets the security level for each of the slaves. For details, see **4.3.4.1 Security Level Setting**.

Access Size : 32 bits
Address : <SYS_base> + 0198h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MOAI2C7_SL [1:0]		MOAI2C6_SL [1:0]		MOAI2C5_SL [1:0]		MOAI2C4_SL [1:0]		MOAI2C3_SL [1:0]		MOAI2C2_SL [1:0]		MOAI2C1_SL [1:0]		MOAI2C0_SL [1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
15, 14	MOAI2C7_SL [1:0]	0h	RW	Security control is applied to the slave RIIC7.
13, 12	MOAI2C6_SL [1:0]	0h	RW	Security control is applied to the slave RIIC6.
11, 10	MOAI2C5_SL [1:0]	0h	RW	Security control is applied to the slave RIIC5.
9, 8	MOAI2C4_SL [1:0]	0h	RW	Security control is applied to the slave RIIC4.
7, 6	MOAI2C3_SL [1:0]	0h	RW	Security control is applied to the slave RIIC3.
5, 4	MOAI2C2_SL [1:0]	0h	RW	Security control is applied to the slave RIIC2.
3, 2	MOAI2C1_SL [1:0]	0h	RW	Security control is applied to the slave RIIC1.
1, 0	MOAI2C0_SL [1:0]	0h	RW	Security control is applied to the slave RIIC0.

4.3.3.2.43 Slave Access Control Register 39 (SYS_SLVACCCTL39)

This register sets the security level for each of the slaves. For details, see **4.3.4.1 Security Level Setting**.

Access Size : 32 bits
Address : <SYS_base> + 019Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	MXSD2_SL[1:0]		MXSD1_SL[1:0]		MXSD0_SL[1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
5, 4	MXSD2_SL[1:0]	0h	RW	Security control is applied to the slave SD2.
3, 2	MXSD1_SL[1:0]	0h	RW	Security control is applied to the slave SD1.
1, 0	MXSD0_SL[1:0]	0h	RW	Security control is applied to the slave SD0.

4.3.3.2.44 Slave Access Control Register 40 (SYS_SLVACCCTL40)

This register sets the security level for each of the slaves. For details, see **4.3.4.1 Security Level Setting**.

Access Size : 32 bits
Address : <SYS_base> + 01A0h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	MPU2P0_SL [1:0]		-	-	MHU2H0_SL [1:0]		-	-	MPU3P0_SL [1:0]		-	-	MXU3H0_SL [1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	RW	RW	R	R	RW	RW	R	R	RW	RW	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 14	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
13, 12	MPU2P0_SL [1:0]	0h	RW	Security control is applied to the PHY0 slave USB2.0 interface.
11, 10	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
9, 8	MHU2H0_SL [1:0]	0h	RW	Security control is applied to the slave USB 2.0 host/function interface.
7, 6	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
5, 4	MPU3P0_SL [1:0]	0h	RW	Security control is applied to the channel 0 slave USB 3.2 interface.
3, 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
1, 0	MXU3H0_SL [1:0]	0h	RW	Security control is applied to the PHY0 slave USB3.2 interface.

4.3.3.2.45 Slave Access Control Register 41 (SYS_SLVACCCTL41)

This register sets the security level for each of the slaves. For details, see **4.3.4.1 Security Level Setting**.

Access Size : 32 bits
Address : <SYS_base> + 01A4h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	MXGBE1_SL [1:0]		MXGBE0_SL [1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
3, 2	MXGBE1_SL [1:0]	0h	RW	Security control is applied to the channel 1 slave GBETH.
1, 0	MXGBE0_SL [1:0]	0h	RW	Security control is applied to the channel 0 slave GBETH.

4.3.3.2.46 Slave Access Control Register 43 (SYS_SLVACCCTL43)

This register sets the security level for each of the slaves. For details, see **4.3.4.1 Security Level Setting**.

Access Size : 32 bits
Address : <SYS_base> + 01ACh
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	MPDDP0_SL [1:0]		-	-	MPDDM0_SL [1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	RW	RW	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
5, 4	MPDDP0_SL [1:0]	0h	RW	Security control is applied to the slave DDR PHY0.
3, 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
1, 0	MPDDM0_SL [1:0]	0h	RW	Security control is applied to the slave DDR0.

4.3.3.2.47 Slave Access Control Register 44 (SYS_SLVACCCTL44)

This register sets the security level for each of the slaves. For details, see **4.3.4.1 Security Level Setting**.

Access Size : 32 bits
Address : <SYS_base> + 01B0h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	MPCRU1_SL [1:0]		MPCRU0_SL [1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
3, 2	MPCRU1_SL [1:0]	0h	RW	Security control is applied to the slave CRU1.
1, 0	MPCRU0_SL [1:0]	0h	RW	Security control is applied to the slave CRU0.

4.3.3.2.48 Slave Access Control Register 45 (SYS_SLVACCCTL45)

This register sets the security level for each of the slaves. For details, see **4.3.4.1 Security Level Setting**.

Access Size : 32 bits
Address : <SYS_base> + 01B4h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	MXISP_SL[1:0]		MPISP_SL[1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
3, 2	MXISP_SL[1:0]	0h	RW	Security control is applied to the slave ISP (AXI).
1, 0	MPISP_SL[1:0]	0h	RW	Security control is applied to the slave ISP (APB).

4.3.3.2.49 Slave Access Control Register 46 (SYS_SLVACCCTL46)

This register sets the security level for each of the slaves. For details, see **4.3.4.1 Security Level Setting**.

Access Size : 32 bits
Address : <SYS_base> + 01B8h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	MPISU_SL[1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
1, 0	MPISU_SL[1:0]	0h	RW	Security control is applied to the slave ISU.

4.3.3.2.50 Slave Access Control Register 47 (SYS_SLVACCCTL47)

This register sets the security level for each of the slaves. For details, see **4.3.4.1 Security Level Setting**.

Access Size : 32 bits
Address : <SYS_base> + 01BCh
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	MPDSL_SL [1:0]		MPDSD_SL [1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
3, 2	MPDSL_SL[1:0]	0h	RW	Security control is applied to the slave DSI (PHY).
1, 0	MPDSD_SL [1:0]	0h	RW	Security control is applied to the slave DSI (LINK).

4.3.3.2.51 Slave Access Control Register 48 (SYS_SLVACCCTL48)

This register sets the security level for each of the slaves. For details, see **4.3.4.1 Security Level Setting**.

Access Size : 32 bits
Address : <SYS_base> + 01C0h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	MPLCD_SL [1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
1, 0	MPLCD_SL[1:0]	0h	RW	Security control is applied to the slave LCDC

4.3.3.2.52 Slave Access Control Register 49 (SYS_SLVACCCTL49)

This register sets the security level for each of the slaves. For details, see **4.3.4.1 Security Level Setting**.

Access Size : 32 bits
Address : <SYS_base> + 01C4h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	MXGPU_SL [1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
1, 0	MXGPU_SL [1:0]	0h	RW	Security control is applied to the slave GE3D

4.3.3.2.53 Slave Access Control Register 50 (SYS_SLVACCCTL50)

This register sets the security level for each of the slaves. For details, see **4.3.4.1 Security Level Setting**.

Access Size : 32 bits
Address : <SYS_base> + 01C8h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	MPVCC_SL [1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
1, 0	MPVCC_SL [1:0]	0h	RW	Security control is applied to the slave VCD

4.3.3.2.54 Slave Access Control Register 51 (SYS_SLVACCCTL51)

This register sets the security level for each of the slaves. For details, see **4.3.4.1 Security Level Setting**.

Access Size : 32 bits
Address : <SYS_base> + 01CCh
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	MPADMC_SL [1:0]		MPSSIUDMC_SL[1:0]		MPSSIU_SL [1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
5, 4	MPADMC_SL [1:0]	0h	RW	Security control is applied to the slave ADMAC.
3, 2	MPSSIUDMC_SL[1:0]	0h	RW	Security control is applied to the slave SSIU (DMAC).
1, 0	MPSSIU_SL [1:0]	0h	RW	Security control is applied to the slave SSIU.

4.3.3.2.55 Slave Access Control Register 52 (SYS_SLVACCCTL52)

This register sets the security level for each of the slaves. For details, see **4.3.4.1 Security Level Setting**.

Access Size : 32 bits
Address : <SYS_base> + 01D0h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	MOSPD2_SL [1:0]		MOSPD1_SL [1:0]		MOSPD0_SL [1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
5, 4	MOSPD2_SL [1:0]	0h	RW	Security control is applied to the slave SPDIF2
3, 2	MOSPD1_SL [1:0]	0h	RW	Security control is applied to the slave SPDIF1
1, 0	MOSPD0_SL [1:0]	0h	RW	Security control is applied to the slave SPDIF0

4.3.3.2.56 Slave Access Control Register 53 (SYS_SLVACCCTL53)

This register sets the security level for each of the slaves. For details, see **4.3.4.1 Security Level Setting**.

Access Size : 32 bits
Address : <SYS_base> + 01D4h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	MPADG_SL [1:0]		MPSCUDMC_SL[1:0]		MPSCU_SL [1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
5, 4	MPADG_SL [1:0]	0h	RW	Security control is applied to the slave ADG
3, 2	MPSCUDMC_SL[1:0]	0h	RW	Security control is applied to the slave SCU (DMAC)
1, 0	MPSCU_SL [1:0]	0h	RW	Security control is applied to the slave SCU

4.3.3.2.57 Slave Access Control Register 54 (SYS_SLVACCCTL54)

This register sets the security level for each of the slaves. For details, see **4.3.4.1 Security Level Setting**.

Access Size : 32 bits
Address : <SYS_base> + 01D8h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	MXDRS_SL [1:0]		MXDRA_SL [1:0]		-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
5, 4	MXDRS_SL [1:0]	0h	RW	Security control is applied to the slave DRP-AI (DRP0).
3, 2	MXDRA_SL [1:0]	0h	RW	Security control is applied to the slave DRP-AI (AI-MAC).
1, 0	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

4.3.3.2.58 Slave Access Control Register 55 (SYS_SLVACCCTL55)

This register sets the security level for each of the slaves. For details, see **4.3.4.1 Security Level Setting**.

Access Size : 32 bits
Address : <SYS_base> + 01DCh
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	MXGIC_SL[1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
1, 0	MXGIC_SL[1:0]	0h	RW	Security control is applied to the slave GIC

4.3.3.2.59 Slave Access Control Register 56 (SYS_SLVACCCTL56)

This register sets the security level for each of the slaves. For details, see **4.3.4.1 Security Level Setting**.

Access Size : 32 bits
Address : <SYS_base> + 01E0h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	-	-	-	-	-	-	-	-	-	-	-	-	-	-	MPMTSU1_SL [1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
1, 0	MPMTSU1_SL [1:0]	0h	RW	Security control is applied to the slave TSU1

4.3.3.2.60 Slave Access Control Register 57 (SYS_SLVACCCTL57)

This register sets the security level for each of the slaves. For details, see **4.3.4.1 Security Level Setting**.

Only 10b and 11b can be set. Settings of 00b and 01b are prohibited.

Access Size : 32 bits
Address : <SYS_base> + 01E4h
Initial Value : 0000_20AAh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	MPTPCI_SL [1:0]		-	-	-	-	MPTDD00_SL [1:0]		MPTDD01_SL [1:0]		MPTR8_SL[1:0]		MPTA55_SL [1:0]	
Initial Value	0	0	1	0	0	0	0	0	1	0	1	0	1	0	1	0
R/W	R	R	RW	RW	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 14	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
13, 12	MPTPCI_SL [1:0]	2h	RW	Security control is applied to the slave TZC(PCIe).
11 to 8	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
7, 6	MPTDD00_SL [1:0]	2h	RW	Security control is applied to the slave TZC(DDR00).
5, 4	MPTDD01_SL [1:0]	2h	RW	Security control is applied to the slave TZC(DDR01).
3, 2	MPTR8_SL[1:0]	2h	RW	Security control is applied to the slave TZC(RCPU Bus).
1, 0	MPTA55_SL [1:0]	2h	RW	Security control is applied to the slave TZC(SRAM2).

4.3.3.2.61 Slave Access Control Register 58 (SYS_SLVACCCTL58)

This register sets the security level for each of the slaves. For details, see **4.3.4.1 Security Level Setting**.

Only 10b and 11b can be set. Settings of 00b and 01b are prohibited.

Access Size : 32 bits

Address : <SYS_base> + 01E8h

Initial Value : 000A_AAAAh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	1	0	1	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Initial Value	1	0	1	0	1	0	1	0	1	0	1	0	1	0	1	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 20	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
19 to 10	-	2AAh	RW	Reserved Whenever it is read, 2AAh is read. The write value should always be 2AAh.
9, 8	MXACGPV_SL [1:0]	2h	RW	Security control is applied to GPV_ACPU.
7, 6	MXCMGPV_SL [1:0]	2h	RW	Security control is applied to GPV_COM.
5, 4	MXDPGPV_SL [1:0]	2h	RW	Security control is applied to GPV_DRP.
3, 2	MXV1GPV_SL [1:0]	2h	RW	Security control is applied to GPV_VIDEO1.
1, 0	MXV0GPV_SL [1:0]	2h	RW	Security control is applied to GPV_VIDEO0.

4.3.3.2.62 Slave Access Control Register 64 (SYS_SLVACCCTL64)

This register sets the security level for each of the slaves. For details, see **4.3.4.1 Security Level Setting**.

Access Size : 32 bits
Address : <SYS_base> + 0200h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
15, 14	MOPOE7_SL [1:0]	0h	RW	Security control is applied to the slave POEG1D control register.
13, 12	MOPOE6_SL [1:0]	0h	RW	Security control is applied to the slave POEG1C control register.
11, 10	MOPOE5_SL [1:0]	0h	RW	Security control is applied to the slave POEG1B control register.
9, 8	MOPOE4_SL [1:0]	0h	RW	Security control is applied to the slave POEG1A control register.
7, 6	MOPOE3_SL [1:0]	0h	RW	Security control is applied to the slave POEG0D control register.
5, 4	MOPOE2_SL [1:0]	0h	RW	Security control is applied to the slave POEG0C control register.
3, 2	MOPOE1_SL [1:0]	0h	RW	Security control is applied to the slave POEG0B control register.
1, 0	MOPOE0_SL [1:0]	0h	RW	Security control is applied to the slave POEG0A control register.

4.3.3.2.65 Slave Access Control Register 67 (SYS_SLVACCCTL67)

This register sets the security level for each of the slaves. For details, see **4.3.4.1 Security Level Setting**.

Access Size : 32 bits
Address : <SYS_base> + 020Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-

Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
7, 6	MORCMT3_SL [1:0]	0h	RW	Security control is applied to the slave CMTW7 control register.
5, 4	MORCMT2_SL [1:0]	0h	RW	Security control is applied to the slave CMTW6 control register.
3, 2	MORCMT1_SL [1:0]	0h	RW	Security control is applied to the slave CMTW5 control register.
1, 0	MORCMT0_SL [1:0]	0h	RW	Security control is applied to the slave CMTW4 control register.

4.3.3.2.66 Slave Access Control Register 68 (SYS_SLVACCCTL68)

This register sets the security level for each of the slaves. For details, see **4.3.4.1 Security Level Setting**.

Access Size : 32 bits
Address : <SYS_base> + 0210h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
3, 2	MORWDT1_SL [1:0]	0h	RW	Security control is applied to the control registers of WDT3 within the SYS unit.
1, 0	MORWDT0_SL [1:0]	0h	RW	Security control is applied to the control registers of WDT2 within the SYS unit.

4.3.3.2.67 Slave Access Control Register 80 (SYS_SLVACCCTL80)

This register sets the security level for each of the slaves. For details, see **4.3.4.1 Security Level Setting**.

Access Size : 32 bits
Address : <SYS_base> + 0240h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	I3C_SL[1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
1, 0	I3C_SL[1:0]	0h	RW	Security control is applied to the control registers of I3C0 within the SYS unit.

4.3.3.2.68 Slave Access Control Register 81 (SYS_SLVACCCTL81)

This register sets the security level for each of the slaves. For details, see **4.3.4.1 Security Level Setting**.

Access Size : 32 bits
Address : <SYS_base> + 0244h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CANFD_SL [1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
1, 0	CANFD_SL[1:0]	0h	RW	Security control is applied to the control registers of CANFD within the SYS unit.

4.3.3.2.69 Slave Access Control Register 87 (SYS_SLVACCCTL87)

This register sets the security level for each of the slaves. For details, see **4.3.4.1 Security Level Setting**.

Access Size : 32 bits
Address : <SYS_base> + 025Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	ACPU_SL[1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
1, 0	ACPU_SL[1:0]	0h	RW	Security control is applied to the control registers of CA55 within the SYS unit.

4.3.3.2.70 Slave Access Control Register 89 (SYS_SLVACCCTL89)

This register sets the security level for each of the slaves. For details, see **4.3.4.1 Security Level Setting**.

Access Size : 32 bits
Address : <SYS_base> + 0264h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	MCPU_SL[1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
1, 0	MCPU_SL[1:0]	0h	RW	Security control is applied to the control registers of CM33 within the SYS unit.

4.3.3.2.71 Slave Access Control Register 91 (SYS_SLVACCCTL91)

This register sets the security level for each of the slaves. For details, see **4.3.4.1 Security Level Setting**.

Access Size : 32 bits
Address : <SYS_base> + 026Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	LSI_SL[1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
1, 0	LSI_SL[1:0]	0h	RW	Security control is applied to the control registers of LSI within the SYS unit.

4.3.3.2.72 Slave Access Control Register 92 (SYS_SLVACCCTL92)

This register sets the security level for each of the slaves. For details, see **4.3.4.1 Security Level Setting**.

Access Size : 32 bits
Address : <SYS_base> + 0270h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	AOF_SL[1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
1, 0	AOF_SL[1:0]	0h	RW	Security control is applied to the control registers of AOF within the SYS unit.

4.3.3.2.73 Slave Access Control Register 93 (SYS_SLVACCCTL93)

This register sets the security level for each of the slaves. For details, see **4.3.4.1 Security Level Setting**.

Access Size : 32 bits
Address : <SYS_base> + 0274h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	GPREG_SL [1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
1, 0	GPREG_SL[1:0]	0h	RW	Security control is applied to the control registers of GPREG within the SYS unit.

4.3.3.2.74 LSI Mode Signal Register (SYS_LSI_MODE)

This register indicates the states of external pins of the LSI chip.

Access Size : 32 bits

Address : <SYS_base> + 0300h

Initial Value : 000x_xx0xh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	SEC_EN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	x
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	STAT_MD_CLKS	STAT_BOOTPLLCA55[1:0]		STAT_BOOTSELECTER	STAT_DEBUGEN	-	-	-	-	-	-	STAT_MD_BOOT[2:0]		
Initial Value	0	0	x	x	x	x	x	x	0	0	0	0	0	x	x	x
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
16	SEC_EN	x	R	This register indicates whether this LSI support the security function or not. 0b: Not supported 1b: Available
15, 14	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
13	STAT_MD_CLKS	x	R	This register indicates the states of the external MD_CLKS pin. The values are refreshed on the rising edge of PRST_N. However, this register is not updated when a reset has been generated within the LSI chip. Although SYS is temporarily reset, latched data from the states of pins in IOTOP are not updated, with the result that updating does not proceed after release of the reset. This bit controls switching of SSCG on or off for PLLDTY, PLLCA55, PLLVDO, and PLLDRP. 0b: SSCG off 1b: SSCG on
12, 11	STAT_BOOTPLLCA55[1:0]	x	R	This register indicates the states of the external BOOTPLLCA_0 and BOOTPLLCA_1 pins. The values are refreshed on the rising edge of PRST_N. However, this register is not updated when a reset has been generated within the LSI chip. Although SYS is temporarily reset, latched data from the states of pins in IOTOP are not updated, with the result that updating does not proceed after release of the reset. Bit 0: BOOTPLLCA_0 Bit 1: BOOTPLLCA_1
10	STAT_BOOTSELECTER	x	R	This register indicates the states of the external BOOTSELCPU pin. The values are refreshed on the rising edge of PRST_N. However, this register is not updated when a reset has been generated within the LSI chip. Although SYS is temporarily reset, latched data from the states of pins in IOTOP are not updated, with the result that updating does not proceed after release of the reset. 0b: CM33 cold boot 1b: CM55 cold boot
9	STAT_DEBUGEN	x	R	This register indicates the states of the external MD_BOOT3 pin. The values are refreshed on the rising edge of PRST_N. However, this register is not updated when a reset has been generated within the LSI chip. Although SYS is temporarily reset, latched data from the states of pins in IOTOP are not updated, with the result that updating does not proceed after release of the reset. 0b: Normal operation 1b: Debugging is by an ARM debugger connected through the JTAG pins.
8	-	x	R	Reserved Whenever it is read, the undefined value is read.
7 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

Bit	Bit Name	Initial Value	R/W	Description
2 to 0	STAT_MD_BOOT[2:0]	x	R	This register indicates the states of the external MD_BOOT2, MD_BOOT1, and MD_BOOT0 pins. The values are refreshed on the rising edge of PRST_N. However, this register is not updated when a reset has been generated within the LSI chip. Although SYS is temporarily reset, latched data from the states of pins in IOTOP are not updated, with the result that updating does not proceed after release of the reset. Bit 0: MD_BOOT0 Bit 1: MD_BOOT1 Bit 2: MD_BOOT2

Note: x: Undefined value

4.3.3.2.75 LSI Device ID Register (SYS_LSI_DEVID)

This register indicates the device ID of the LSI.

Access Size : 32 bits
Address : <SYS_base> + 0304h
Initial Value : x867_D447h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DEV_ID[31:28]				DEV_ID[27:0]											
Initial Value	x	x	x	x	1	0	0	0	0	1	1	0	0	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DEV_ID[27:0]															
Initial Value	1	1	0	1	0	1	0	0	0	1	0	0	0	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	DEV_ID[31:28]	x	R	These bits are for the products individual number (product revision)
27 to 0	DEV_ID[27:0]	867_D447h	R	These bits are for the products individual number (28-bit fixed value) 867_D447h

Note: x: Undefined value

4.3.3.2.76 LSI Product Register (SYS_LSI_PRR)

This register indicates the product information of LSI.

Access Size : 32 bits
Address : <SYS_base> + 0308h
Initial Value : 0000_00xxh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	ISP_DIS	-	-	-	GPU_DIS
Initial Value	0	0	0	0	0	0	0	0	0	0	0	x	0	0	0	x
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
4	ISP_DIS	x	R	This bit indicates whether the ISP exists. 1b: The ISP does not exist. 0b: The ISP exists.
3 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
0	GPU_DIS	x	R	This bit indicates whether GE3D exists. 1b: GE3D does not exist. 0b: GE3D exists.

Note: x: Undefined value

4.3.3.2.77 TSU0 Trimming Register 0 (SYS_LSI_OTPTSU0TRMVAL0)

This register indicates the trimming information for TSU0.

Access Size : 32 bits
Address : <SYS_base> + 0320h
Initial Value : xxxx_xxxxh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TSU0_TRMVAL0[31:16]															
Initial Value	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TSU0_TRMVAL0[15:0]															
Initial Value	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	TSU0_TRMVAL0[31:0]	x	R	TSU0 trimming information 0 monitor register (LT) This register is for reading trimming information for use in measurement at low temperatures by TSU0; the trimming information is stored in OTP memory. The value read is used in a calculation for correction following temperature measurement. Bit 31 to 28: Reserved Bit 27 to 16: Measurement temperature code in measurement at low temperatures Bit 15 to 12: Reserved Bit 11 to 0: TSU0 measurement data in measurement at low temperatures (output code)*1

Note: x: Undefined value

Note 1. These bits indicate a value for 19Bh to E43h.

4.3.3.2.78 TSU0 Trimming Register 1 (SYS_LSI_OTPTSU0TRMVAL1)

This register indicates the trimming information for TSU0.

Access Size : 32 bits
Address : <SYS_base> + 0324h
Initial Value : xxxx_xxxxh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TSU0_TRMVAL1[31:16]															
Initial Value	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TSU0_TRMVAL1[15:0]															
Initial Value	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	TSU0_TRMVAL1[31:0]	x	R	TSU0 trimming information 1 monitor register (HT) This register is for reading trimming information for use in measurement at high temperatures by TSU0; the trimming information is stored in OTP memory. The value read is used in a calculation for correction following temperature measurement. Bit 31 to 28: Reserved Bit 27 to 16: Measurement temperature code in measurement at high temperatures Bit 15 to 12: Reserved Bit 11 to 0: TSU0 measurement data in measurement at high temperatures (output code)*1

Note: x: Undefined value

Note 1. These bits indicate a value for 19Bh to E43h.

4.3.3.2.79 TSU1 Trimming Register 0 (SYS_LSI_OTPTSU1TRMVAL0)

This register indicates the trimming information for TSU1.

Access Size : 32 bits
Address : <SYS_base> + 0330h
Initial Value : xxxx_xxxxh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TSU1_TRMVAL0[31:16]															
Initial Value	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TSU1_TRMVAL0[15:0]															
Initial Value	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	TSU1_TRMVAL0[31:0]	x	R	TSU1 trimming information 0 monitor register (LT) This register is for reading trimming information for use in measurement at low temperatures by TSU1; the trimming information is stored in OTP memory. The value read is used in a calculation for correction following temperature measurement. Bit 31 to 28: Reserved Bit 27 to 16: Measurement temperature code in measurement at low temperatures Bit 15 to 12: Reserved Bit 11 to 0: TSU1 measurement data in measurement at low temperatures (output code)*1

Note: x: Undefined value

Note 1. These bits indicate a value for 19Bh to E43h.

4.3.3.2.80 TSU1 Trimming Register 1 (SYS_LSI_OTPTSU1TRMVAL1)

This register indicates the trimming information for TSU1.

Access Size : 32 bits
Address : <SYS_base> + 0334h
Initial Value : xxxx_xxxxh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TSU1_TRMVAL1[31:16]															
Initial Value	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TSU1_TRMVAL1[15:0]															
Initial Value	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	TSU1_TRMVAL1[31:0]	x	R	TSU1 trimming information 1 monitor register (HT) This register is for reading trimming information for use in measurement at high temperatures by TSU1; the trimming information is stored in OTP memory. The value read is used in a calculation for correction following temperature measurement. Bit 31 to 28: Reserved Bit 27 to 16: Measurement temperature code in measurement at high temperatures Bit 15 to 12: Reserved Bit 11 to 0: TSU1 measurement data in measurement at high temperatures (output code)*1

Note: x: Undefined value

Note 1. These bits indicate a value for 19Bh to E43h.

4.3.3.2.81 Address Offset Register n (SYS_AOFn) (n = 0 to 4, 16 to 19, 21, 22, 24, 25)

For details on respective registers, see **Table 4.3-2**.

Access Size : 32 bits

Address : <SYS_base> + 0500h + n x 0004h

Initial Value : 0302_0100h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	OFS11_<unit>[5:0]						-	-	OFS10_<unit>[5:0]					
Initial Value	0	0	0	0	0	0	1	1	0	0	0	0	0	0	1	0
R/W	R	R	RW	RW	RW	RW	RW	RW	R	R	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	OFS01_<unit>[5:0]						-	-	OFS00_<unit>[5:0]					
Initial Value	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0
R/W	R	R	RW	RW	RW	RW	RW	RW	R	R	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31, 30	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
29 to 24	OFS11_<unit>[5:0]	3h	RW	Address value converted to bits [34:30] when the address [31:30] = 11 The master unit is a 32-bit address (4-GB space) master. Corresponding to bits [31:30] of the address on the master side (indicating 1-GB units), access to an address that has been converted to an address space indicated by bits [34:30] is possible. Accordingly, access to an address space beyond 4 GB is possible. Changing the setting of this register while the target master is operating is prohibited. Change the register setting while access on the master side is stopped.
23, 22	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
21 to 16	OFS10_<unit>[5:0]	2h	RW	Address value converted to bits [34:30] when the address [31:30] = 10 The master unit is a 32-bit address (4-GB space) master. Corresponding to bits [31:30] of the address on the master side (indicating 1-GB units), access to an address that has been converted to an address space indicated by bits [34:30] is possible. Accordingly, access to an address space beyond 4 GB is possible. Changing the setting of this register while the target master is operating is prohibited. Change the register setting while access on the master side is stopped.
15, 14	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
13 to 8	OFS01_<unit>[5:0]	1h	RW	Address value converted to bits [34:30] when the address [31:30] = 01 The master unit is a 32-bit address (4-GB space) master. Corresponding to bits [31:30] of the address on the master side (indicating 1-GB units), access to an address that has been converted to an address space indicated by bits [34:30] is possible. Accordingly, access to an address space beyond 4 GB is possible. Changing the setting of this register while the target master is operating is prohibited. Change the register setting while access on the master side is stopped.
7, 6	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
5 to 0	OFS00_<unit>[5:0]	0h	RW	Address value converted to bits [34:30] when the address [31:30] = 00 The master unit is a 32-bit address (4-GB space) master. Corresponding to bits [31:30] of the address on the master side (indicating 1-GB units), access to an address that has been converted to an address space indicated by bits [34:30] is possible. Accordingly, access to an address space beyond 4 GB is possible. Changing the setting of this register while the target master is operating is prohibited. Change the register setting while access on the master side is stopped.

Table 4.3-2 Relationship between SYS_AOFn and Supported Units

Offset Address	SYS_AOFn	Bit Name <unit>	Supported units
0500h	SYS_AOF0	VCD	VCD
0504h	SYS_AOF1	DSI	DSI
0508h	SYS_AOF2	LCDC	LCDC
050Ch	SYS_AOF3	ISPFR	ISP (FR)
0510h	SYS_AOF4	ISPTEM	ISP (Temper)
0540h	SYS_AOF16	SDHI_0	SD0
0544h	SYS_AOF17	SDHI_1	SD1
0548h	SYS_AOF18	SDHI_2	SD2
054Ch	SYS_AOF19	USB2H_0	USB20 (Host)
0554h	SYS_AOF21	USB2F	USB20 (Func)
0558h	SYS_AOF22	USB3_0	USB30
0560h	SYS_AOF24	GBETH_0	GBETH0
0564h	SYS_AOF25	GBETH_1	GBETH1

4.3.3.2.82 Address Offset Register n (SYS_AOFn) (n = 32)

This is the address-extension register for the CM33 core. It only controls extension in 256-MB units for the CM33 core. For details, refer to **1.7.3.2.2 36-Bit Address Space Access for CM33**.

Access Size : 32 bits
Address : <SYS_base> + 0580h
Initial Value : 0000_0403h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	OFS0100_MCPU_S[7:0]								OFS0011_MCPU_S[7:0]							
Initial Value	0	0	0	0	0	1	0	0	0	0	0	0	0	0	1	1
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
15 to 8	OFS0100_MCPU_S[7:0]	4h	RW	Address value converted to bits [35:28] when the address [31:28] of CM33 = 0100. The master CM33 is a 32-bit address (4-GB space) master. Corresponding to bits [31:28] of the address on the master side (indicating 256-MB units), access to an address that has been converted to an address space indicated by bits [35:28] is possible. Accordingly, access to an address space beyond 4 GB is possible. Changing the setting of this register while the target master is operating is prohibited. Change the register setting while access on the master side is stopped.
7 to 0	OFS0011_MCPU_S[7:0]	3h	RW	Address value converted to bits [35:28] when the address [31:28] of CM33 = 0011. The master CM33 is a 32-bit address (4-GB space) master. Corresponding to bits [31:28] of the address on the master side (indicating 256-MB units), access to an address that has been converted to an address space indicated by bits [35:28] is possible. Accordingly, access to an address space beyond 4 GB is possible. Changing the setting of this register while the target master is operating is prohibited. Change the register setting while access on the master side is stopped.

4.3.3.2.83 Address Offset Register n (SYS_AOFn) (n = 33, 42, 43, 48, 49)

For details on respective registers, see **Table 4.3-3**.

Access Size : 32 bits

Address : <SYS_base> + 0584h + (m-33) * 0004h

Initial Value : 0302_0100h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	OFS11_<unit>[5:0]						-	-	OFS10_<unit>[5:0]					
Initial Value	0	0	0	0	0	0	1	1	0	0	0	0	0	0	1	0
R/W	R	R	RW	RW	RW	RW	RW	RW	R	R	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	OFS01_<unit>[5:0]						-	-	OFS00_<unit>[5:0]					
Initial Value	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0
R/W	R	R	RW	RW	RW	RW	RW	RW	R	R	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31, 30	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
29 to 24	OFS11_<unit>[5:0]	3h	RW	Address value converted to bits [35:30] when the address [31:30] = 11 The master unit is a 32-bit address (4-GB space) master. Corresponding to bits [31:30] of the address on the master side (indicating 1-GB units), access to an address that has been converted to an address space indicated by bits [35:30] is possible. Accordingly, access to an address space beyond 4 GB is possible. Changing the setting of this register while the target master is operating is prohibited. Change the register setting while access on the master side is stopped.
23, 22	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
21 to 16	OFS10_<unit>[5:0]	2h	RW	Address value converted to bits [35:30] when the address [31:30] = 10 The master unit is a 32-bit address (4-GB space) master. Corresponding to bits [31:30] of the address on the master side (indicating 1-GB units), access to an address that has been converted to an address space indicated by bits [35:30] is possible. Accordingly, access to an address space beyond 4 GB is possible. Changing the setting of this register while the target master is operating is prohibited. Change the register setting while access on the master side is stopped.
15, 14	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
13 to 8	OFS01_<unit>[5:0]	1h	RW	Address value converted to bits [35:30] when the address [31:30] = 01 The master unit is a 32-bit address (4-GB space) master. Corresponding to bits [31:30] of the address on the master side (indicating 1-GB units), access to an address that has been converted to an address space indicated by bits [35:30] is possible. Accordingly, access to an address space beyond 4 GB is possible. Changing the setting of this register while the target master is operating is prohibited. Change the register setting while access on the master side is stopped.
7, 6	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
5 to 0	OFS00_<unit>[5:0]	0h	RW	Address value converted to bits [35:30] when the address [31:30] = 00 The master unit is a 32-bit address (4-GB space) master. Corresponding to bits [31:30] of the address on the master side (indicating 1-GB units), access to an address that has been converted to an address space indicated by bits [35:30] is possible. Accordingly, access to an address space beyond 4 GB is possible. Changing the setting of this register while the target master is operating is prohibited. Change the register setting while access on the master side is stopped.

Table 4.3-3 Relationship between SYS_AOFn and Supported Units

Offset Address	SYS_AOFn	Bit Name <unit>	Supported units
0584h	SYS_AOF33	MCPU_DMAC	DMAC0
05A8h	SYS_AOF42	RCPU_DMAC0	DMAC3
05ACh	SYS_AOF43	RCPU_DMAC1	DMAC4
05C0h	SYS_AOF48	ACPU_DMAC0	DMAC1
05C4h	SYS_AOF49	ACPU_DMAC1	DMAC2

4.3.3.2.84 CA55 Peripheral Port Region Start Address Low Register (SYS_ACPU_CFG_SMPL)

This register is used to identify the start address of the peripheral port area.

Access Size : 32 bits
Address : <SYS_base> + 0600h
Initial Value : 1000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ASTARTMP[11:0]												-	-	-	-
Initial Value	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 20	ASTARTMP [11:0]	100h	RW	Lower 12 bits of start address of the peripheral port area (ASTARTMP [11:0])
19 to 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

4.3.3.2.85 CA55 Peripheral Port Region Start Address High Register (SYS_ACPU_CFG_SMPH)

This register is used to identify the start address of the peripheral port area.

Access Size : 32 bits
Address : <SYS_base> + 0604h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	ASTARTMP[19:12]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
7 to 0	ASTARTMP [19:12]	0h	RW	Higher 8 bits of start address of the peripheral port area (ASTARTMP [19:12])

4.3.3.2.86 CA55 Peripheral Port Region End Address Low Register (SYS_ACPU_CFG_EMPL)

This register is used to identify the end address of the peripheral port area.

Access Size : 32 bits
Address : <SYS_base> + 0608h
Initial Value : 1FF0_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	AENDMP[11:0]												-	-	-	-
Initial Value	0	0	0	1	1	1	1	1	1	1	1	1	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 20	AENDMP[11:0]	1FFh	RW	Lower 12 bits of end address of the peripheral port area (AENDMP [11:0])
19 to 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

4.3.3.2.87 CA55 Peripheral Port Region End Address High Register (SYS_ACPU_CFG_EMPH)

This register is used to identify the end address of the peripheral port area.

Access Size : 32 bits
Address : <SYS_base> + 060Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	AENDMP[19:12]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
7 to 0	AENDMP[19:12]	0h	RW	Higher 8 bits of end address of the peripheral port area (AENDMP [19:12])

4.3.3.2.88 CA55 Core 0 Reset Vector Address Low Configuration Register (SYS_ACPU_CFG_RVAL0)

This register sets the reset vector address of CA55 core 0.

Access Size : 32 bits
Address : <SYS_base> + 0624h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RVBARADDR[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RVBARADDR[15:2]														-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	RVBARADDR [31:2]	0h	RW	This indicates bits 31 to 2 of the lower-order part of the reset vector address for CA55 core 0. Apply a reset (cold, cluster warm, or core warm reset) following every change to the vector address setting. For a sequence of each reset, see **2.2 CPU**.
1, 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

4.3.3.2.89 CA55 Core 0 Reset Vector Address High Configuration Register (SYS_ACPU_CFG_RVAH0)

This register sets the reset vector address of CA55 core 0.

Access Size : 32 bits
Address : <SYS_base> + 0628h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	RVBARADDR[39:32]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
7 to 0	RVBARADDR [39:32]	0h	RW	This indicates bits 39 to 32 of the upper-order part of the reset vector address for CA55 core 0. Apply a reset (cold, cluster warm, or core warm reset) following every change to the vector address setting. For a sequence of each reset, see **2.2 CPU**.

4.3.3.2.90 CA55 Core 1 Reset Vector Address Low Configuration Register (SYS_ACPU_CFG_RVAL1)

This register sets the reset vector address of CA55 core 1.

Access Size : 32 bits
Address : <SYS_base> + 062Ch
Initial Value : 0810_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RVBARADDR[31:16]															
Initial Value	0	0	0	0	1	0	0	0	0	0	0	1	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RVBARADDR[15:2]														-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	RVBARADDR [31:2]	204_0000h	RW	This indicates bits 31 to 2 of the lower-order part of the reset vector address for CA55 core 1. Apply a reset (cold, cluster warm, or core warm reset) following every change to the vector address setting. For a sequence of each reset, see **2.2 CPU**.
1, 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

4.3.3.2.91 CA55 Core 1 Reset Vector Address High Configuration Register (SYS_ACPU_CFG_RVAH1)

This register sets the reset vector address of CA55 core 1.

Access Size : 32 bits
Address : <SYS_base> + 0630h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	RVBARADDR[39:32]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
7 to 0	RVBARADDR [39:32]	0h	RW	This indicates bits 39 to 32 of the upper-order part of the reset vector address for CA55 core 1. Apply a reset (cold, cluster warm, or core warm reset) following every change to the vector address setting. For a sequence of each reset, see **2.2 CPU**.

4.3.3.2.92 CA55 Core 2 Reset Vector Address Low Configuration Register (SYS_ACPU_CFG_RVAL2)

This register sets the reset vector address of CA55 core 2.

Access Size : 32 bits
Address : <SYS_base> + 0634h
Initial Value : 0810_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RVBARADDR[31:16]															
Initial Value	0	0	0	0	1	0	0	0	0	0	0	1	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RVBARADDR[15:2]														-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	RVBARADDR [31:2]	204_0000h	RW	This indicates bits 31 to 2 of the lower-order part of the reset vector address for CA55 core 2. Apply a reset (cold, cluster warm, or core warm reset) following every change to the vector address setting. For a sequence of each reset, see **2.2 CPU**.
1, 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

4.3.3.2.93 CA55 Core 2 Reset Vector Address High Configuration Register (SYS_ACPU_CFG_RVAH2)

This register sets the reset vector address of CA55 core 2.

Access Size : 32 bits
Address : <SYS_base> + 0638h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	RVBARADDR[39:32]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
7 to 0	RVBARADDR [39:32]	0h	RW	This indicates bits 39 to 32 of the upper-order part of the reset vector address for CA55 core 2. Apply a reset (cold, cluster warm, or core warm reset) following every change to the vector address setting. For a sequence of each reset, see **2.2 CPU**.

4.3.3.2.94 CA55 Core 3 Reset Vector Address Low Configuration Register (SYS_ACPU_CFG_RVAL3)

This register sets the reset vector address of CA55 core 3.

Access Size : 32 bits
Address : <SYS_base> + 063Ch
Initial Value : 0810_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RVBARADDR[31:16]															
Initial Value	0	0	0	0	1	0	0	0	0	0	0	1	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RVBARADDR[15:2]														-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	RVBARADDR [31:2]	204_0000h	RW	This indicates bits 31 to 2 of the lower-order part of the reset vector address for CA55 core 3. Apply a reset (cold, cluster warm, or core warm reset) following every change to the vector address setting. For a sequence of each reset, see **2.2 CPU**.
1, 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

4.3.3.2.95 CA55 Core 3 Reset Vector Address High Configuration Register (SYS_ACPU_CFG_RVAH3)

This register sets the reset vector address of CA55 core 3.

Access Size : 32 bits
Address : <SYS_base> + 0640h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	RVBARADDR[39:32]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
7 to 0	RVBARADDR [39:32]	0h	RW	This indicates bits 39 to 32 of the upper-order part of the reset vector address for CA55 core 3. Apply a reset (cold, cluster warm, or core warm reset) following every change to the vector address setting. For a sequence of each reset, see **2.2 CPU**.

4.3.3.2.96 CM33 Config Register 2 (SYS_MCPU_CFG2)

This register indicates the secure vector address.

Access Size : 32 bits
Address : <SYS_base> + 080Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	INITSVTOR[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	INITSVTOR[15:7]									-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 7	INITSVTOR [31:7]	0h	RW	This register indicates a secure vector address. The address value before a cold reset of the CM33 must be confirmed.
6 to 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

4.3.3.2.97 CM33 Config Register 3 (SYS_MCPU_CFG3)

This register indicates the non-secure vector address.

Access Size : 32 bits
Address : <SYS_base> + 0810h
Initial Value : 1800_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	INITNSVTOR[31:16]															
Initial Value	0	0	0	1	1	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	INITNSVTOR[15:7]									-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 7	INITNSVTOR [31:7]	30_0000h	RW	This register indicates a non-secure vector address. The address value before a cold reset of the CM33 must be confirmed.
6 to 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

4.3.3.2.98 CM33 Config Register 4 (SYS_MCPU_CFG4)

This register switches the IDAU security map.

Access Size : 32 bits
Address : <SYS_base> + 0814h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	IDAUZERONS
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
0	IDAUZERONS	0h	RW	Security map switching signal for IDAU 0b: Area 0 is secured. 1b: Area 0 is not secured.

4.3.3.2.99 CM33 Lock Register (SYS_MCPU_CFG5)

This register controls authorization to change vector addresses.

Access Size : 32 bits
Address : <SYS_base> + 0818h
Initial Value : 0007_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	LOCKNSVTOR	LOCKSVTAIRCR
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	RW	R	R	R	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 19	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
18 to 16	-	7h	RW	Reserved The written value should always be 7h.
15 to 9	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
8	-	0h	RW	Reserved The written value should always be 0b.
7 to 5	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
4 to 2	-	0h	RW	Reserved The written value should always be 0b.
1	LOCKNSVTOR	0h	RW	This bit controls authorization to change non-secure vector addresses. 0b: Change is possible. 1b: Change is not possible.
0	LOCKSVTAIRCR	0h	RW	This bit controls authorization to change secure vector addresses. 0b: Change is possible. 1b: Change is not possible.

4.3.3.2.100 xSPI CS0 Start Address Register (SYS_SPI_STAADDCS0)

This register sets the start address of xSPI CS0.

Access Size : 32 bits
Address : <SYS_base> + 0900h
Initial Value : 2000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	XSPI_STARTADDRCS0[31:16]															
Initial Value	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	XSPI_STARTADDRCS0[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	XSPI_STARTADDRCS0[31:0]	2000_0000h	RW	Start address of xSPI CS0. The initial value is for a 128 MB dual device. For a 256 MB single device, the value should be set to 2000_0000h.

4.3.3.2.101 xSPI CS0 End Address Register (SYS_SPI_ENDADDCS0)

This register sets the end address of xSPI CS0.

Access Size : 32 bits
Address : <SYS_base> + 0904h
Initial Value : 27FF_FFFFh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	XSPI_ENDADDRCS0[31:16]															
Initial Value	0	0	1	0	0	1	1	1	1	1	1	1	1	1	1	1
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	XSPI_ENDADDRCS0[15:0]															
Initial Value	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	XSPI_ENDADDRCS0[31:0]	27FF_FFFFh	RW	End address of xSPI CS0. The initial value is for a 128 MB dual device. For a 256 MB single device, the value should be set to 2FFF_FFFFh.

4.3.3.2.102 xSPI CS1 Start Address Register (SYS_SPI_STAADDCS1)

This register sets the start address of xSPI CS1.

Access Size : 32 bits
Address : <SYS_base> + 0908h
Initial Value : 2800_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	XSPI_STARTADDRCS1[31:16]															
Initial Value	0	0	1	0	1	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	XSPI_STARTADDRCS1[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	XSPI_STARTADDRCS1[31:0]	2800_0000h	RW	Start address of xSPI CS1. The initial value is for a 128 MB dual device. For a 256 MB single device, the value should be set to 0000_0000h (CS1 is not used).

4.3.3.2.103 xSPI CS1 End Address Register (SYS_SPI_ENDADDCS1)

This register sets the end address of xSPI CS1.

Access Size : 32 bits
Address : <SYS_base> + 090Ch
Initial Value : 2FFF_FFFFh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	XSPI_ENDADDRCS1[31:16]															
Initial Value	0	0	1	0	1	1	1	1	1	1	1	1	1	1	1	1
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	XSPI_ENDADDRCS1[15:0]															
Initial Value	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	XSPI_ENDADDRCS1[31:0]	2FFF_FFFFh	RW	End address of xSPI CS1. The initial value is for a 128 MB dual device. For a 256 MB single device, the value should be set to 0000_0000h (CS1 is not used).

4.3.3.2.104 SRAM0 ECC Setting Register (SYS_SRAM0_ECC)

This register selects enabling or disabling correction by ECC of errors in the SRAM0.

Access Size : 32 bits
Address : <SYS_base> + 0B00h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	VECCEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
0	VECCEN	0h	RW	This bit selects enabling or disabling correction by ECC of errors in the SRAM0. 0b: ECC function in the internal RAM is disabled. 1b: ECC function in the internal RAM is enabled.

4.3.3.2.105 SRAM0 Access Control Register (SYS_SRAM0_EN)

This register is used to control access to the SRAM0.

Access Size : 32 bits
Address : <SYS_base> + 0B04h
Initial Value : 0000_0003h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	VLWEN	VCEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
1	VLWEN	1h	RW	This bit selects enabling or disabling writing to the SRAM0. 0b: Writing to the internal RAM is disabled. 1b: Writing to the internal RAM is enabled. The setting at the time of actual usage is 1b.
0	VCEN	1h	RW	This bit selects enabling or disabling access to the SRAM0. 0b: Access to the internal RAM is disabled. 1b: Access to the internal RAM is enabled. The setting at the time of actual usage is 1b.

4.3.3.2.106 SRAM1 ECC Setting Register (SYS_SRAM1_ECC)

This register selects enabling or disabling correction by ECC of errors in the SRAM1.

Access Size : 32 bits
Address : <SYS_base> + 0B14h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	VECCEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
0	VECCEN	0h	RW	This bit selects enabling or disabling correction by ECC of errors in the SRAM1. 0b: ECC function in the internal RAM is disabled. 1b: ECC function in the internal RAM is enabled.

4.3.3.2.107 SRAM1 Access Control Register (SYS_SRAM1_EN)

This register is used to control access to the SRAM1.

Access Size : 32 bits
Address : <SYS_base> + 0B18h
Initial Value : 0000_0003h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	VLWEN	VCEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
1	VLWEN	1h	RW	This bit selects enabling or disabling writing to the SRAM1. 0b: Writing to the internal RAM is disabled. 1b: Writing to the internal RAM is enabled. The setting at the time of actual usage is 1b.
0	VCEN	1h	RW	This bit selects enabling or disabling access to the SRAM1. 0b: Access to the internal RAM is disabled. 1b: Access to the internal RAM is enabled. The setting at the time of actual usage is 1b.

4.3.3.2.108 SRAM2 ECC Setting Register (SYS_SRAM2_ECC)

This register selects enabling or disabling correction by ECC of errors in the SRAM2.

Access Size : 32 bits
Address : <SYS_base> + 0B28h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	VECCEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
0	VECCEN	0h	RW	This bit selects enabling or disabling correction by ECC of errors in the SRAM2. 0b: ECC function in the internal RAM is disabled. 1b: ECC function in the internal RAM is enabled.

4.3.3.2.109 SRAM2 Access Control Register (SYS_SRAM2_EN)

This register is used to control access to the SRAM2.

Access Size : 32 bits
Address : <SYS_base> + 0B2Ch
Initial Value : 0000_0003h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	VLWEN	VCEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
1	VLWEN	1h	RW	This bit selects enabling or disabling writing to the SRAM2. 0b: Writing to the internal RAM is disabled. 1b: Writing to the internal RAM is enabled. The setting at the time of actual usage is 1b.
0	VCEN	1h	RW	This bit selects enabling or disabling access to the SRAM2. 0b: Access to the internal RAM is disabled. 1b: Access to the internal RAM is enabled. The setting at the time of actual usage is 1b.

4.3.3.2.110 WDT0 Control Register (SYS_WDT0_CTRL)

This register controls WDT0.

Access Size : 32 bits

Address : <SYS_base> + 0C00h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	WDTSTOPMASK
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	bp_halted
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31	-	0h	RW	Reserved The written value should always be 0b.
30 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
16	WDTSTOPMASK	0h	RW	Control over inhibition of stopping WDT0 from the CoreSight module during debugging 0b: Counting for WDT0 is stopped when debugging The CSTDBG signal is transmitted from CoreSight to WDT0. 1b: Counting for WDT0 is not stopped when debugging. The CSTDBG signal is not transmitted from CoreSight to WDT0.
15 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
0	bp_halted	0h	RW	This bit selects validation or invalidation of forcible stopping of the counter for WDT0. 0b: Counter is operated. 1b: Counter is stopped and its counter value is held.

4.3.3.2.111 WDT1 Control Register (SYS_WDT1_CTRL)

This register controls WDT1.

Access Size : 32 bits
Address : <SYS_base> + 0C0Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	WDTSTOPMASK
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	bp_halted
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31	-	0h	RW	Reserved The written value should always be 0b.
30 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
16	WDTSTOPMASK	0h	RW	Control over inhibition of stopping WDT1 from the CoreSight module during debugging 0b: Counting for WDT1 is stopped when debugging The CSTDBG signal is transmitted from CoreSight to WDT1. 1b: Counting for WDT1 is not stopped when debugging. The CSTDBG signal is not transmitted from CoreSight to WDT1.
15 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
0	bp_halted	0h	RW	This bit selects validation or invalidation of forcible stopping of the counter for WDT1. 0b: Counter is operated. 1b: Counter is stopped and its counter value is held.

4.3.3.2.112 WDT2 Control Register (SYS_WDT2_CTRL)

This register controls WDT2.

Access Size : 32 bits

Address : <SYS_base> + 0C04h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	WDTSTOPMASK
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	bp_halted
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31	-	0h	RW	Reserved The written value should always be 0b.
30 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
16	WDTSTOPMASK	0h	RW	Control over inhibition of stopping WDT2 from the CoreSight module during debugging 0b: Counting for WDT2 is stopped when debugging The CSTDBG signal is transmitted from CoreSight to WDT2. 1b: Counting for WDT2 is not stopped when debugging. The CSTDBG signal is not transmitted from CoreSight to WDT2.
15 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
0	bp_halted	0h	RW	This bit selects validation or invalidation of forcible stopping of the counter for WDT2. 0b: Counter is operated. 1b: Counter is stopped and its counter value is held.

4.3.3.2.113 WDT3 Control Register (SYS_WDT3_CTRL)

This register controls WDT3.

Access Size : 32 bits

Address : <SYS_base> + 0C08h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	WDTSTOPMASK
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	bp_halted
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31	-	0h	RW	Reserved The written value should always be 0b.
30 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
16	WDTSTOPMASK	0h	RW	Control over inhibition of stopping WDT3 from the CoreSight module during debugging 0b: Counting for WDT3 is stopped when debugging The CSTDBG signal is transmitted from CoreSight to WDT3. 1b: Counting for WDT3 is not stopped when debugging. The CSTDBG signal is not transmitted from CoreSight to WDT3.
15 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
0	bp_halted	0h	RW	This bit selects validation or invalidation of forcible stopping of the counter for WDT3. 0b: Counter is operated. 1b: Counter is stopped and its counter value is held.

4.3.3.2.114 GBETH0 Config Register (SYS_GBETH0_CFG)

This register controls the configuration of GBETH0.

Access Size : 32 bits
Address : <SYS_base> + 0F00h
Initial Value : 0001_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	PHY_INTF_TYPE[2:0]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	MAC_SPEED [1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 19	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
18 to 16	PHY_INTF_TYPE[2:0]	1h	RW	PHY interface mode setting of GBETH0 000b: MII 001b: RGMII Others: Setting is prohibited
15 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
1, 0	MAC_SPEED [1:0]	0h	R	Indeicates the transfer speed of GBETH0 00b: 1 Gbps 01b: Setting is prohibited 10b: 10 Mbps 11b: 100 Mbps

4.3.3.2.115 GBETH1 Config Register (SYS_GBETH1_CFG)

This register controls the configuration of GBETH1.

Access Size : 32 bits
Address : <SYS_base> + 0F04h
Initial Value : 0001_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	PHY_INTF_TYPE[2:0]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	MAC_SPEED [1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 19	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
18 to 16	PHY_INTF_TYPE[2:0]	1h	RW	PHY interface mode setting of GBETH1 000b: MII 001b: RGMII Others: Setting is prohibited
15 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
1, 0	MAC_SPEED [1:0]	0h	R	Indeicates the transfer speed of GBETH1 00b: 1 Gbps 01b: Setting is prohibited 10b: 10 Mbps 11b: 100 Mbps

4.3.3.2.116 PCIE INTX Ch 0 Register (SYS_PCIE_INTX_CH0)

This register controls the INTX-transmitting triggers for PCIE channel 0 when it is operating as an endpoint (EP).

Access Size : 32 bits
Address : <SYS_base> + 1000h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	INTX_EP_F1	INTX_EP_F0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
1	INTX_EP_F1	0h	RW	INTx transmission In operation as an endpoint (EP), setting the INTX transmission trigger for function 1 to 1 sends asserted INTX and setting it to 0 de-asserts INTX.
0	INTX_EP_F0	0h	RW	INTx transmission In operation as an endpoint (EP), setting the INTX transmission trigger for function 0 to 1 sends asserted INTX and setting it to 0 de-asserts INTX.

4.3.3.2.117 PCIE MSI Ch 0 Register 1 (SYS_PCIE_MSI1_CH0)

This register controls the MSI-issuing triggers for PCIE channel 0 when it is operating as an endpoint (EP).

Access Size : 32 bits
Address : <SYS_base> + 1004h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	UI_EXTMSI_VAL4	UI_EXTMSI_VAL3	UI_EXTMSI_VAL2	UI_EXTMSI_VAL1	UI_EXTMSI_VAL0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
4	UI_EXTMSI_VAL4	0h	RW	MSI-issuing 4 In EP operation, setting the MSI-issuing trigger to 1 leads to MSI transmission.
3	UI_EXTMSI_VAL3	0h	RW	MSI-issuing 3 In EP operation, setting the MSI-issuing trigger to 1 leads to MSI transmission.
2	UI_EXTMSI_VAL2	0h	RW	MSI-issuing 2 In EP operation, setting the MSI-issuing trigger to 1 leads to MSI transmission.
1	UI_EXTMSI_VAL1	0h	RW	MSI-issuing 1 In EP operation, setting the MSI-issuing trigger to 1 leads to MSI transmission.
0	UI_EXTMSI_VAL0	0h	RW	MSI-issuing 0 In EP operation, setting the MSI-issuing trigger to 1 leads to MSI transmission.

4.3.3.2.118 PCIE MSI Ch 0 Register 2 (SYS_PCIE_MSI2_CH0)

This register sets the PCIE channel 0 MSI vector.

Access Size : 32 bits
Address : <SYS_base> + 1008h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	UI_EXTMSI_VEC3[4:0]					-	-	-	UI_EXTMSI_VEC2[4:0]				
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	R	R	R	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	UI_EXTMSI_VEC1[4:0]					-	-	-	UI_EXTMSI_VEC0[4:0]				
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	R	R	R	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
28 to 24	UI_EXTMSI_VEC3[4:0]	0h	RW	MSI vector setting Setting of the vector value for the MSI issued by MSI-issuing 3
23 to 21	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
20 to 16	UI_EXTMSI_VEC2[4:0]	0h	RW	MSI vector setting Setting of the vector value for the MSI issued by MSI-issuing 2
15 to 13	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
12 to 8	UI_EXTMSI_VEC1[4:0]	0h	RW	MSI vector setting Setting of the vector value for the MSI issued by MSI-issuing 1
7 to 5	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
4 to 0	UI_EXTMSI_VEC0[4:0]	0h	RW	MSI vector setting Setting of the vector value for the MSI issued by MSI-issuing 0

4.3.3.2.119 PCIE MSI Ch 0 Register 3 (SYS_PCIE_MSI3_CH0)

This register sets the PCIE channel 0 MSI vector.

Access Size : 32 bits
Address : <SYS_base> + 100Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	UI_EXTMSI_VEC4[4:0]				
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
4 to 0	UI_EXTMSI_VEC4[4:0]	0h	RW	MSI vector setting Setting of the vector value for the MSI issued by MSI-issuing 4

4.3.3.2.120 PCIE MSI Ch 0 Register 4 (SYS_PCIE_MSI4_CH0)

This register sets the function number of PCIE channel 0 MSI.

Access Size : 32 bits
Address : <SYS_base> + 1010h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	UI_EXTMSI_FUNC3 [2:0]			-	-	-	-	-	UI_EXTMSI_FUNC2 [2:0]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	RW	RW	RW	R	R	R	R	R	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	UI_EXTMSI_FUNC1 [2:0]			-	-	-	-	-	UI_EXTMSI_FUNC0 [2:0]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	RW	RW	RW	R	R	R	R	R	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
26 to 24	UI_EXTMSI_FUNC3[2:0]	0h	RW	MSI function number setting Setting of the function number for MSI issued by MSI-issuing 3
23 to 19	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
18 to 16	UI_EXTMSI_FUNC2[2:0]	0h	RW	MSI function number setting Setting of the function number for MSI issued by MSI-issuing 2
15 to 11	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
10 to 8	UI_EXTMSI_FUNC1[2:0]	0h	RW	MSI function number setting Setting of the function number for MSI issued by MSI-issuing 1
7 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
2 to 0	UI_EXTMSI_FUNC0[2:0]	0h	RW	MSI function number setting Setting of the function number for MSI issued by MSI-issuing 0

4.3.3.2.121 PCIE MSI Ch 0 Register 5 (SYS_PCIE_MSI5_CH0)

This register sets the function number of PCIE channel 0 MSI.

Access Size : 32 bits
Address : <SYS_base> + 1014h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	UI_EXTMSI_FUNC4[2:0]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
2 to 0	UI_EXTMSI_FUNC4[2:0]	0h	RW	MSI function number setting Setting of the function number for MSI issued by MSI-issuing 4

4.3.3.2.122 PCIE PME Ch 0 Register (SYS_PCIE_PME_CH0)

This register controls PME messages for PCIE channel 0.

Access Size : 32 bits
Address : <SYS_base> + 1018h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	CFG_PMCSR_PME_STATUS_F1	CFG_PMCSR_PME_STATUS_F0	-	-	-	-	-	-	-	PME_TIM
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	RW	RW	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
9	CFG_PMCSR_PME_STATUS_F1	0h	RW	PME_STATUS setting Setting the PM_PME message issuing trigger to 1 leads to the message being issued. This is for use with function 1.
8	CFG_PMCSR_PME_STATUS_F0	0h	RW	PME_STATUS setting Setting the PM_PME message issuing trigger to 1 leads to the message being issued. This is for use with function 0.
7 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
0	PME_TIM	0h	RW	Clock for a PM_PME messages This is used at the time of sending PM_PME messages. Setting of 0 or 1 is reflected in the clock after an interval of from 100 to 150 ms.

4.3.3.2.123 PCIE ACK Ch 0 Register (SYS_PCIE_ACK_CH0)

This register controls ACK for PCIE channel 0.

Access Size : 32 bits
Address : <SYS_base> + 101Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	D3_EVENT_ACK_F1	D3_EVENT_ACK_F0	-	-	-	-	-	-	-	TURN_OFF_EVENT_ACK
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	RW	RW	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
9	D3_EVENT_ACK_F1	0h	RW	This handles reply to a request for a transition to a non-D0 state (L1) in response to the ACK for a D3 transition. Setting this bit to 1 sends PM_Request_Ack. This is for use with function 1.
8	D3_EVENT_ACK_F0	0h	RW	This handles reply to a request for a transition to a non-D0 state (L1) in response to the ACK for a D3 transition. Setting this bit to 1 sends PM_Request_Ack. This is for use with function 0.
7 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
0	TURN_OFF_EVENT_ACK	0h	RW	TURN_OFF_EVENT message reception ACK When a PME_Turn_off message is received, setting the PME_TO_Ack message transmission trigger to 1 sends the message.

4.3.3.2.124 PCIE Misc Function Ch 0 Register (SYS_PCIE_MISC_CH0)

This register controls ASPM and FLR for PCIE channel 0.

Access Size : 32 bits
Address : <SYS_base> + 1020h
Initial Value : 000x_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	FLR_REQ[1:0]		FLR_RESET [1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	x	x	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	ALLOW_ENTER_L1
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 20	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
19, 18	FLR_REQ[1:0]	x	R	Function level request This indicates a function level reset request from RC. Bit 0: function 0, bit 1: function 1
17, 16	FLR_RESET [1:0]	0h	RW	Function level reset This resets functions (clears the configuration register). Bit 0: function 0, bit 1: function 1
15 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
0	ALLOW_ENTER_L1	0h	RW	ASPM L1 transition enable 0b: Transition inhibited 1b: Transition enabled

Note: x: Undefined value

4.3.3.2.125 PCIE MODE Ch 0 Register (SYS_PCIE_MODE_CH0)

This register controls switching of PCIE channel 0 between the root complex (RC) and EP modes.

Access Size : 32 bits
Address : <SYS_base> + 1024h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	MODE_PORT
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
0	MODE_PORT	0h	RW	RC/EP switching 0b: EP 1b: RC

4.3.3.2.126 ADC Config Register (SYS_ADC_CFG)

This register controls the power of ADC.

Access Size : 32 bits
Address : <SYS_base> + 1600h
Initial Value : 0000_0001h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	sy_mstp_ada
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
0	sy_mstp_ada	1h	RW	A/D converter power control 0b: The A/D converter is active. 1b: The A/D converter power is turned off (default).

4.3.3.2.127 General Register n (SYS_GPREG_n) (n = 0 to 3)

These are general registers n.

Access Size : 32 bits
Address : <SYS_base> + 1700h + n x 0004h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GPREGn[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GPREGn[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	GPREGn[31:0]	0h	RW	General-purpose register n It is a 32-bit register. It is possible to write any value, read the written value.

4.3.4 Functional Description

4.3.4.1 Security Level Setting

The SYS_SLVACCCTLx registers handle setting of the level of access security for all slaves.

Four types of access are possible.

(1) Non-secure & normal

(2) Non-secure & privileged

(3) Secure & normal

(4) Secure & privileged

- When the *_SL bits are 00b, all four types of access (1), (2), (3), and (4) are allowed.
- When the *_SL bit is 01b, only (1) is rejected, and (2), (3), and (4) are allowed.
- When the *_SL bit is 10b, (1) and (2) are rejected, and (3) and (4) are allowed.
- When the *_SL bit is 11b, (1), (2), and (3) are rejected, and only (4) is allowed.

Set the privileged/normal access and secure/non-secure access for each of the bus masters according to the security level of each of the slaves. The SYS_MSTACCCTLx register is used to control access to respective masters.

For details, refer to **1.7 Internal Bus**.

Table 4.3-4 shows the relation between the registers and bits for use in re-setting the security attributes and the target masters for control.

Table 4.3-4 List of Register Bits for Use in Re-setting of Security Attributes (1/2)

Target Master for Control*1	Control Register	Write Access Control Bits*2			Read Access Control Bits*3		
		Bit for use in re-setting the security attributes immediately below		Bit for use in selecting the security attribute source	Bit for use in re-setting the security attributes immediately below		Bit for use in selecting the security attribute source
		AWPROT[0]	AWPROT[1]		ARPROT[0]	ARPROT[1]

DRP-AI (Feature 1)	SYS_MSTACCTL18	Bit 8: AWPU	Bit 9: AWNS	Bit 11: AWSEL	Bit 12: ARPU	Bit 13: ARNS	Bit 15: ARSEL
DRP-AI (Weight 0)	SYS_MSTACCTL18	—	—	—	Bit 20: ARPU	Bit 21: ARNS	Bit 23: ARSEL
DRP-AI (Weight 1)	SYS_MSTACCTL18	—	—	—	Bit 28: ARPU	Bit 29: ARNS	Bit 31: ARSEL

Note 1. Re-setting of security attributes for the Cortex-A55, Cortex-M33, and CoreSight bus masters is not possible.

Note 2. The values set in AWPU and AWNS are effective when the setting of the corresponding AWSEL bit is 1b.

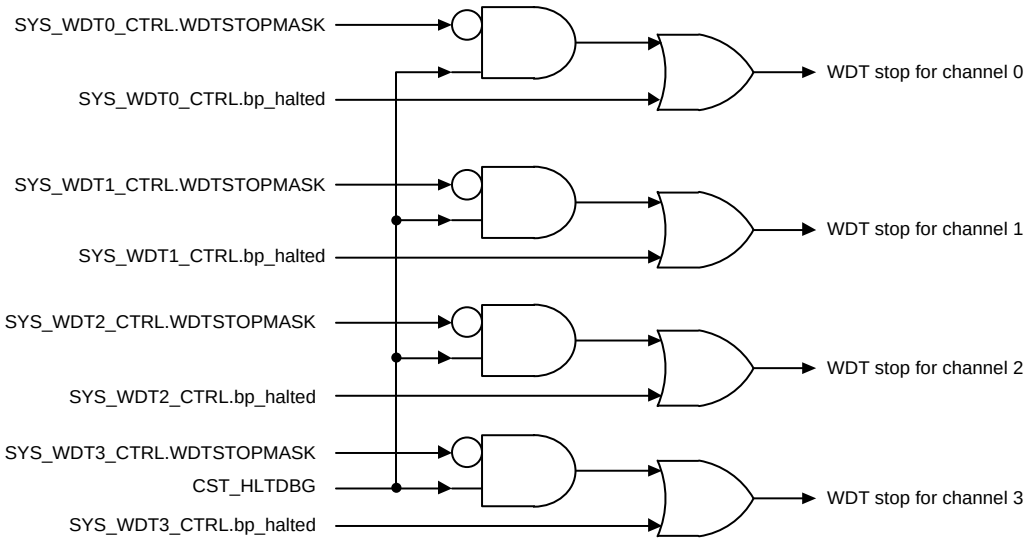
Note 3. The values set in ARPU and ARNS are effective when the setting of the corresponding ARSEL bit is 1b.

Note 4. When the setting of AWSEL for use in control of the USB2.0 module is 0b, the values in AWPROT[0] and ARPROT[0] are the same as the value of HPROT[1] output from the USB2.0 module, and the values of AWPROT[1] and ARPROT[1] are always 1b. For control of HPROT[1] in the USB2.0 module, see **6.5 USB 2.0 Interface**. The HPROT signal is prescribed in the AHB-Lite protocol. For details, see the *AMBA 3 AHB-Lite Protocol Specification* published by Arm Ltd.

Note 5. AWSEL and ARSEL for use in control of the ISU and CRU should be set to 1b. Set AWPU, AWNS, ARPU, and ARNS for the desired security attributes. Operation is not guaranteed if AWSEL and ARSEL are set to 0b.

4.3.4.2 Stopping of Counting by WDTm

Each SYS_WDTm_CTRL register can control the stopping of counting by WDTm. The configuration of the circuit for this function is shown below.



Note: CST_HLTDBG: Debugging enable input from CST

Figure 4.3-2 Circuit Diagram for WDT Logic

When CST_HLTDBG is asserted, the WDTSTOPMASK bits do not stop WDT.

bp_halted bits can stop WDT specified by the register setting regardless of CST_HLTDBG.

SECTION 4 SYSTEM

4.4 Clock Pulse Generator (CPG)

This section describes the clock pulse generator (CPG) of this LSI chip.

This manual is a simplified version. For more information, refer to the User's Manual Additional Document.

4.4.1 Overview

The CPG mainly handles the generation and control of clock signals for the IP modules, the generation and control of resets, and control over booting, low power consumption, and the power supply domains.

Table 4.4-1 Overview

Function	Description
Generation and control of clock signals	Clock control
Generation and control of resets	Reset control
Control over booting	Control of booting
Control over the power supply domains	Control over the sequence of turning power off (Refer to **4.5 Power Management Unit (PMU)** for details.)
Control over low power consumption	Control over handshaking with the CPUs and the stopping of clock signals

4.4.1.1 Functions for the Generation and Control of Clock Signals

- Generation of clock signals to be supplied to the various units from an externally input clock signal or PLL output clock signal
- Frequency selection by register settings
- Selection of clock supply routes by register settings that set up the use of the clock selectors
- Control of turning clock supplies on and off by register settings
- Control of the frequencies of the clock signals to be supplied to the CA55 in boot modes
- Control by register settings of the spread spectrum clock generator (SSCG), the multiplication factor settings for the PLL clock signals, and turning the clock signals on and off

- The CPG has eleven PLLs. Their respective roles are as follows.
  - PLLCM33 (default SSCG setting: fixed to off):
    For the system bus in the PD_AWO domain and the various units in that domain
  - PLLCLN (default SSCG setting: fixed to off):
    For the system bus and various units for which the SSCG function is not available
  - PLLDTY (the level on the external MD_CLKS pin determines the default SSCG setting):
    For the system bus and various units for which the SSCG function is available
  - PLLCA55 (the level on the external MD_CLKS pin determines the default SSCG setting):
    For the CA55
  - PLLVDO (the level on the external MD_CLKS pin determines the default SSCG setting):
    For the CRU, ISP, and CA55
  - PLLETH (default SSCG setting: fixed to off):
    For the GBETH, DRP-AI, and DSI
  - PLLDSI (default SSCG setting: fixed to off):
    For the DSI and LCDC
  - PLLDDR0 (default SSCG setting: fixed to off):
    For DDR channel 0
  - PLLGPU (default SSCG setting: fixed to on):
    Generation and control of clock signals for the GE3D
  - PLLDRP (the level on the external MD_CLKS pin determines the default SSCG setting):
    For the CA55 and DRP-AI

4.4.1.2 Function for the Generation and Control of Resets

The CPG generates reset signals in response to each of the reset source factors. The types of reset are described below.

- System reset (external pin)
- Debug reset (software reset by CoreSight)
- Software reset (control over the resetting of individual units)
- Error reset
- CM33 warm reset control
- Control over switching the resetting of individual units off and on
- Reset control by the power sequence controller (PWC)

4.4.1.3 Function for the Control of Booting

The CPG controls booting of the system. The following four boot modes are available.

- CM33 boot (normal mode)
- CM33 boot (debug mode)
- CA55 boot (normal mode)
- CA55 boot (debug mode)

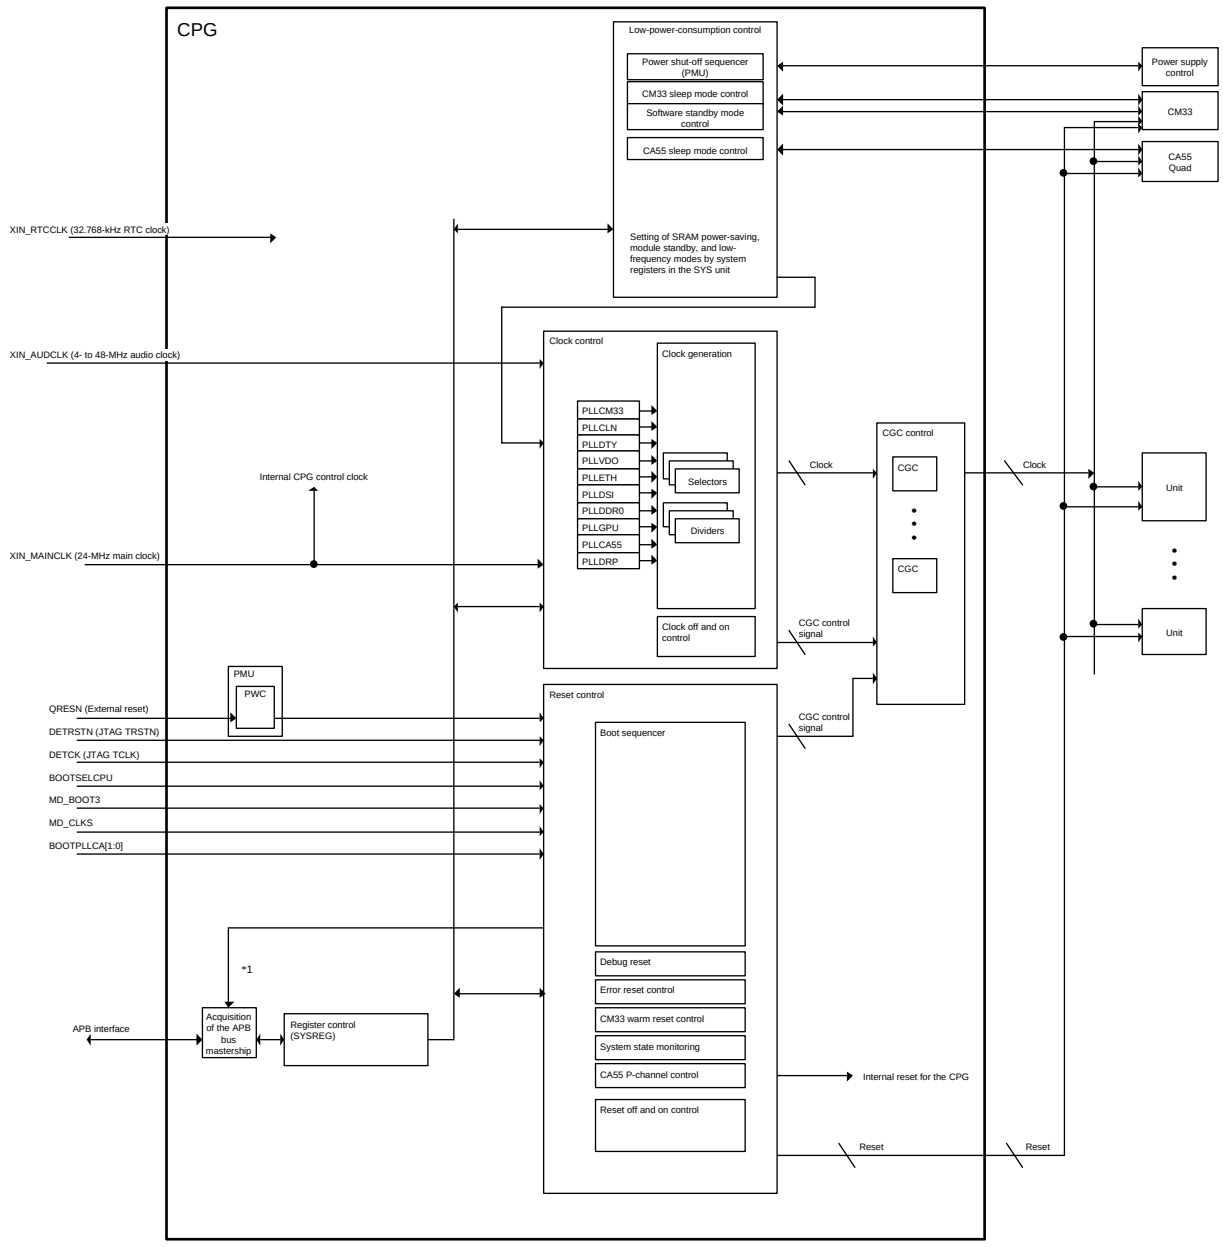
4.4.1.4 Function for the Control over the Power Supply Domains

The CPG uses its power management unit (PMU) to control the sequence of turning power off in the PD_OTHERS domain. Refer to **4.5 Power Management Unit (PMU)** for details.

4.4.1.5 Function for the Control over Low Power Consumption

- The CPG controls low power consumption for the system.
  The CPG controls handshaking with the CPUs in some low-power-consumption modes.
- The types of low-power-consumption mode are described below.
  - Control over power supplies in the PD_OTHERS domain
  - Control over the SRAM power-saving mode
  - Module standby mode
  - Low-frequency mode
  - CA55 sleep mode
  - CM33 sleep mode
  - Software standby mode

4.4.1.6 Functional Block Diagram



Note 1. This is for forcibly modifying the initial setting information such as units to be booted, PLLs to be booted, control over the frequencies for the CA55, settings of the PLLCA55, setting for PLL SSCGs, and control over CM33 waiting.

Figure 4.4-1 CPG Functional Block Diagram

4.4.2 List of Clock Signals

Table 4.4-2 List of Clock Signals (1/14)

Unit	Signal Name	Clock Symbol	IP Clock Frequency [MHz]*2	Clock Supply Source	Gearing Type Dynamic/Static	Value of CPG Signals after a Reset	Incorporating or Not Incorporating SSCG*4	CGC*1	Power Domain	Description
SYS	SYS_0_PCLK	OSCϕ	24	Main OSC	—	24	—	None	AWO	APB clock
DMAC0	DMAC_0_ACLK	I7ϕ	200, 100, 50, 25, 6	PLLCM33	Dynamic	200	×	On	AWO	Clock input for AXI
DMAC1	DMAC_1_ACLK	P7ϕ	400, 200, 100, 50, 13	PLLDTY	Dynamic	400	✓	Off	OTHERS	Clock input for AXI
DMAC2	DMAC_2_ACLK	P7ϕ	400, 200, 100, 50, 13	PLLDTY	Dynamic	400	✓	Off	OTHERS	Clock input for AXI
DMAC3	DMAC_3_ACLK	P11ϕ	200, 100, 50, 25, 6	PLLDTY	Dynamic	200	✓	Off	OTHERS	Clock input for AXI
DMAC4	DMAC_4_ACLK	P11ϕ	200, 100, 50, 25, 6	PLLDTY	Dynamic	200	✓	Off	OTHERS	Clock input for AXI
ICU	ICU_0_PCLK_I	P1ϕ	100	PLLCM33	—	100	×	On	AWO	APB bus clock
CRC	CRC_0_clk_crc	P4ϕ	200	PLLCLN	—	200	×	off	OTHERS	CRC clock
CA55	CA55_0_CORECLK[0]	I0ϕ	CA55 frequency (variable)*3	PLLCA55	—	1800	✓	None	CA55	Core clock
CA55	CA55_0_CORECLK[1]	I1ϕ	CA55 frequency (variable)*3	PLLCA55	—	1800	✓	None	CA55	Core clock
CA55	CA55_0_CORECLK[2]	I2ϕ	CA55 frequency (variable)*3	PLLCA55	—	1800	✓	None	CA55	Core clock
CA55	CA55_0_CORECLK[3]	I3ϕ	CA55 frequency (variable)*3	PLLCA55	—	1800	✓	None	CA55	Core clock
CA55	CA55_0_SCLK	I5ϕ	CA55 frequency (variable)*3	PLLCA55_PLLDTY_PLLDRP	—	1800	✓	Off	CA55	DSU clock
CA55	CA55_0_PCLK	I7ϕ	200, 100, 50, 25, 6	PLLCM33	Dynamic	200	×	Off	CA55	APB interface clock for debugging
CA55	CA55_0_ATCLK	ATϕ	400, 200, 100, 50, 13	PLLCM33	Dynamic	400	×	Off	CA55	ATB interface clock
CA55	CA55_0_GICCLK	P8ϕ	200, 100, 50, 25, 6	PLLDTY	Dynamic	200	✓	Off	CA55	GIC interface clock
CA55	CA55_0_PERIPHCLK	I4ϕ	CA55 frequency (variable)*3	PLLCA55	—	450	✓	None	CA55	Miscellaneous logic clock
CA55	CA55_0_ACLK	P7ϕ	400, 200, 100, 50, 13	PLLDTY	Dynamic	400	✓	Off	CA55	Bus clock
CA55	CA55_0_TSCLK	OSCϕ	24	Main OSC	—	24	—	Off	CA55	Time stamp interface clock
CM33	CM33_CLK0	I7ϕ	200, 100, 50, 25, 6	PLLCM33	Dynamic	200	×	None	AWO	Main clock
CM33	CM33_CLK1	OSCϕ	24	Main OSC	—	24	—	On	AWO	Time stamp interface clock
GIC	GIC_0_gicclk	P8ϕ	200, 100, 50, 25, 6	PLLDTY	Dynamic	200	✓	Off	OTHERS	GIC clock [bus clock]
SRAM0	SRAM_0_ACLK	I7ϕ	200, 100, 50, 25, 6	PLLCM33	Dynamic	200	×	On	AWO	AXI clock [bus clock]
SRAM1	SRAM_1_ACLK	I7ϕ	200, 100, 50, 25, 6	PLLCM33	Dynamic	200	×	On	AWO	AXI clock [bus clock]

Table 4.4-2 List of Clock Signals (2/14)

Unit	Signal Name	Clock Symbol	IP Clock Frequency [MHz]*2	Clock Supply Source	Gearing Type Dynamic/Static	Value of CPG Signals after a Reset	Incorporating or Not Incorporating SSCG*4	CGC*1	Power Domain	Description

Note: For more information, refer to the User's Manual Additional Document.

Note 1. On: CGC available; initial value: On
Off: CGC available; initial value: Off
None: CGC not available
Clock name: A CGC is shared by the stated clock signal.

Note 2. The maximum operating frequency of PLL and the frequency after passing the divider at that time are listed.

Note 3. At the time of a CA55 cold boot, the gear ratio and the clock source for CA55 SCLK are determined according to the settings of OTP memory. The oscillation frequency of PLLCA55 is determined according to the value from the BOOTPLLCA_0 or

BOOTPLLCA_1 pin. See the table below (the settings are in MHz). Operation is not guaranteed if the setting exceeds the maximum frequency.

CORECLK:	Clock source is always PLLCA55.	
	Normal drive (ND):	1.1 GHz max.
	Overdrive (OD):	1.8 GHz max.
PERIPHCLK:	Clock source is always PLLCA55.	
	Normal drive (ND):	275 MHz max.
	Overdrive (OD):	450 MHz max.
SCLK:	Clock source is PLLCA55 / PLLDTY / PLLDRP.	
	Normal drive (ND):	1.1 GHz max. (Clock source is fixed to PLLCA55)
	Overdrive (OD):	1.26 GHz max. (Clock source is selectable)

Note 4. The legend of the SSCG is as follows:
—: Not applicable
×: Not incorporating
✓: Incorporating

Clock Source	PLLCA55	PLLCA55	PLLCA55	PLLCA55	PLLCA55	PLLDTY	PLLDRP
PLL Oscillation Frequency	1100	1500	1600	1700	1800	1600	1260
Clock gearing division ratio: 1	1100	1500	1600	1700	1800	1600	1260
Clock gearing division ratio: 2	550	750	800	850	900	800	630
Clock gearing division ratio: 4	275	375	400	425	450	400	315
Clock gearing division ratio: 8	138	188	200	213	225	200	158
Clock gearing division ratio: 16	69	94	100	106	112	100	79
Clock gearing division ratio: 32	34	47	50	53	56	50	39
Variable CORECLK	1100, 550, 275, 138	1500, 750, 375, 188	1600, 800, 400, 200	1700, 850, 425, 213	1800, 900, 450, 225	—	—
Variable PERIPHCLK	275, 138, 69, 34	375, 188, 94, 47	400, 200, 100, 50	425, 213, 106, 53	450, 225, 112, 56	—	—

TSU0	TSU_0_PRESETN	Type B	Unit reset
TSU1	TSU_1_PRESETN	Type B	Unit reset
OTP	OTPC_0_RESET_N	Type B	Unit reset
DRP-AI	DRPAI_0_ARESETN	Type B	Unit reset

Note: For more information, refer to the User's Manual Additional Document.

Note 1. Reset Control Circuit Type
<Type A>
Clock operation is not stopped after release from the reset state. This does not apply to this LSI.
<Type B>
To avoid contention between clock and reset signals, the unit clock of the domain to which a given reset signal belongs is stopped after release from the reset state. (Note that clock signals for some units are not stopped.)
<CA55 reset>
This is a reset control circuit exclusively for use with the CA55. The circuit proceeds with control compliant with the reset constraints during CA55 cold reset by hardware.
<CM33 reset>
This is a reset control circuit exclusively for use with the CM33. The circuit proceeds with control compliant with the reset constraints during CM33 cold reset by hardware.
<CST reset>
This is a reset control circuit exclusively for use with the CST. The circuit proceeds with control by following the conditions for resetting the debug system.

4.4.4 Registers

The base addresses for the CPG registers (SYSREG) are given below.

Table 4.4-4 Register Base Addresses

Base Address Name	Base Address
<CPG_base>	0_1042_0000h (5042_0000h*1, 4042_0000h*2)

Note 1. CM33 address space (non-secure)

Note 2. CM33 address space (secure)

NOTE

- The initial values of these registers are those before forcibly modifying them by hardware (initial values following a reset). For the bits to be forcibly modified by hardware, the note “The setting is to be forcibly modified by hardware,” is added in the following sections.
- Write the values read from reserved bits to them by using a read–modify–write operation.
- When writing to a bit with a write enable bit, set the corresponding xxxx_WEN bit to 1 at the same time.

The CPG registers are listed in the table below.

Register Name	Abbreviation	Initial Value	Offset Address	Access Size [bits]
Reserve	-	-	0000h to 000Fh	-
PLLCM33 Monitor Registers	CPG_PLLCM33_MON	0000_0000h	0010h	32
Reserve	-	-	0014h to 001Fh	-
PLLCLN Standby Control Registers	CPG_PLLCLN_STBY	0000_0000h	0020h	32
Reserve	-	-	0024h to 002Fh	-
PLLCLN Monitor Registers	CPG_PLLCLN_MON	0000_0000h	0030h	32
Reserve	-	-	0034h to 003Fh	-
PLLDTY Standby Control Registers	CPG_PLLDTY_STBY	0000_0004h	0040h	32
Reserve	-	-	0044h to 004Fh	-
PLLDTY Monitor Registers	CPG_PLLDTY_MON	0000_0000h	0050h	32
Reserve	-	-	0054h to 005Fh	-
PLLCA55 Standby Control Registers	CPG_PLLCA55_STBY	0000_0004h	0060h	32
PLLCA55 Output Clock Setting Register 1	CPG_PLLCA55_CLK1	0000_3E82h	0064h	32
PLLCA55 Output Clock Setting Register 2	CPG_PLLCA55_CLK2	000C_1E01h	0068h	32
Reserve	-	-	006Ch to 006Fh	-
PLLCA55 Monitor Registers	CPG_PLLCA55_MON	0000_0000h	0070h	32
Reserve	-	-	0074h to 007Fh	-
PLLVDO Standby Control Registers	CPG_PLLVDO_STBY	0000_0004h	0080h	32
Reserve	-	-	0084h to 008Fh	-
PLLVDO Monitor Registers	CPG_PLLVDO_MON	0000_0000h	0090h	32
Reserve	-	-	0094h to 009Fh	-
PLLETH Standby Control Registers	CPG_PLLETH_STBY	0000_0000h	00A0h	32
Reserve	-	-	00A4h to 00AFh	-
PLLETH Monitor Registers	CPG_PLLETH_MON	0000_0000h	00B0h	32
Reserve	-	-	00B4h to 00BFh	-
PLLDSI Standby Control Registers	CPG_PLLDSI_STBY	0000_0000h	00C0h	32
PLLDSI Output Clock Setting Register 1	CPG_PLLDSI_CLK1	0000_3182h	00C4h	32
PLLDSI Output Clock Setting Register 2	CPG_PLLDSI_CLK2	000C_1803h	00C8h	32
Reserve	-	-	00CCh to 00CFh	-
PLLDSI Monitor Registers	CPG_PLLDSI_MON	0000_0000h	00D0h	32
Reserve	-	-	00D4h to 00DFh	-
PLLDDR0 Standby Control Registers	CPG_PLLDDR0_STBY	0000_0000h	00E0h	32

Register Name	Abbreviation	Initial Value	Offset Address	Access Size [bits]
Reserve	-	-	00E4h to 00EFh	-
PLLDDR0 Monitor Registers	CPG_PLLDDR0_MON	0000_0000h	00F0h	32
Reserve	-	-	00F4h to 011Fh	-
PLLGPU Standby Control Registers	CPG_PLLGPU_STBY	0000_0004h	0120h	32
PLLGPU Output Clock Setting Register 1	CPG_PLLGPU_CLK1	0000_3482h	0124h	32
PLLGPU Output Clock Setting Register 2	CPG_PLLGPU_CLK2	000C_1A01h	0128h	32
Reserve	-	-	012Ch to 012Fh	-
PLLGPU Monitor Registers	CPG_PLLGPU_MON	0000_0000h	0130h	32
Reserve	-	-	0134h to 013Fh	-
PLLDRP Standby Control Registers	CPG_PLLDRP_STBY	0000_0004h	0140h	32
PLLDRP Output Clock Setting Register 1	CPG_PLLDRP_CLK1	0000_3482h	0144h	32
PLLDRP Output Clock Setting Register 2	CPG_PLLDRP_CLK2	000C_1A01h	0148h	32
Reserve	-	-	014Ch to 014Fh	-
PLLDRP Monitor Registers	CPG_PLLDRP_MON	0000_0000h	0150h	32
Reserve	-	-	0154h to 02FFh	-
Static Mux Control Register 0	CPG_SSEL0	0000_1000h	0300h	32

4.4.4.1 pllname Standby Control Registers (CPG_pllname_STBY)

[pllname]

PLLCM33, PLLCLN, PLLDTY, PLLCA55, PLLVDO, PLLETH, PLLDSI, PLLDDR0, PLLGPU, PLLDRP

These registers control the standby states of the individual PLLs.

Access Size : 32 bits
Offset Address : Refer to the table.
Initial Value : Refer to the table.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	SSC_EN_WEN	-	RESETB_WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R/W	R	R	R	R	R	R	R	R	R	R	RW	RW	R	RW	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
20	-	0h	W	The read value is undefined Reserved. The write value should always be 0b.
19	-	0h	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
18	SSC_EN_WEN	0h	W	pllname write enable for SSC_EN
17	-	0h	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
16	RESETB_WEN	0h	W	pllname write enable for RESETB
15 to 6	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
5 to 4	-	0h	RW	Reserved. The write value should always be 0b.
3	-	0h	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
2	SSC_EN	x	RW	pllname SSCG on/off setting 0b: SSCG off 1b: SSCG on
1	-	0h	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	RESETB	x	RW	pllname reset setting 0b: Reset state 1b: Active (reset released state))

x: Undefined value

Note: Regarding the initial value, refer to **Table 4.4-5**.

For details on the registers such as offset addresses, refer to the table below.

Table 4.4-5 Details on the CPG_pllname_STBY Registers such as Offset Addresses

Register Name	Offset Address	Initial Value	SSC_EN Bit
CPG_PLLCM33_STBY	Reserved	Reserved	Reserved
CPG_PLLCLN_STBY	020h	0000_0000h*1	Reserved
CPG_PLLDTY_STBY	040h	0000_0004h*1	Enable
CPG_PLLCA55_STBY	060h	0000_0004h*1	Enable
CPG_PLLVDO_STBY	080h	0000_0004h*1	Enable
CPG_PLLETH_STBY	0A0h	0000_0000h	Reserved
CPG_PLLDSI_STBY	0C0h	0000_0000h	Reserved
CPG_PLLDDR0_STBY	0E0h	0000_0000h	Enable
CPG_PLLGPU_STBY	120h	0000_0004h	Enable
CPG_PLLDRP_STBY	140h	0000_0004h*1	Enable

Note 1. The setting is to be forcibly modified by hardware.
The settings may differ depending on the boot mode.

4.4.4.2 pllname Output Clock Setting Registers 1 (CPG_pllname_CLK1)

[pllname]

PLLCM33, PLLCLN, PLLDTY, PLLCA55, PLLVDO, PLLETH, PLLDSI, PLLDDR0, PLLGPU, PLLDRP

These registers set the clocks output by the individual PLLs.

Access Size : 32 bits
Offset Address : Refer to the table.
Initial Value : Refer to the table.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DIV_K[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DIV_M[9:0]										DIV_P[5:0]					
Initial Value	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	DIV_K[15:0]	0h	RW	pllname delta-sigma modulator (DSM) setting
15 to 6	DIV_M[9:0]	x	RW	pllname main-divider setting
5 to 0	DIV_P[5:0]	x	RW	pllname pre-divider setting

x: Undefined value

Note: Regarding the initial value, refer to **Table 4.4-6**.

For details on the registers such as offset addresses, refer to the table below.

Table 4.4-6 Details on the CPG_pllname_CLK1 Registers such as Offset Addresses

Register Name	Offset Address	Initial Value
CPG_PLLCM33_CLK1	Reserved	Reserved
CPG_PLLCLN_CLK1	Reserved	Reserved
CPG_PLLDTY_CLK1	Reserved	Reserved
CPG_PLLCA55_CLK1	064h	0000_3E82h*1
CPG_PLLVDO_CLK1	Reserved	Reserved
CPG_PLLETH_CLK1	Reserved	Reserved
CPG_PLLDSI_CLK1	0C4h	0000_3182h
CPG_PLLDDR0_CLK1	Reserved	Reserved
CPG_PLLGPU_CLK1	124h	0000_3482h
CPG_PLLDRP_CLK1	144h	0000_3482h*2

Note 1. The setting is to be forcibly modified by hardware.
The settings may differ depending on the boot mode.

Note 2. When this clock is to be used as the source clock for CA55 SCLK, the frequency is fixed to 1260 MHz so making the setting is prohibited. When the clock is not to be used as the source clock, making the setting is possible (for up to 1260 MHz).

For the register settings, refer to the table below.

Table 4.4-7 CPG_pllname_CLK1 Register Settings

Bit	Bit Name	Description
31 to 16	DIV_K	For setting the delta-sigma modulator (DSM)*1 The values in the range from −32,768 to 32,767 (decimal numbers) that satisfy the condition in Note 2 are specifiable as two's complements. 1000_0000_0000_0000b: k = −32,768 1000_0000_0000_0001b: k = −32,767 1000_0000_0000_0010b: k = −32,766 ⋮ 0111_1111_1111_1101b: k = +32,765 0111_1111_1111_1110b: k = +32,766 0111_1111_1111_1111b: k = +32,767
15 to 6	DIV_M	For setting the main divider*1 The values in the range from 64 to 533 that satisfy the conditions in Notes 2 and 3 are specifiable as unsigned binary numbers. 10'b11_1111_1111 to 10'b10_0001_0110 ("m" = 534): Setting prohibited 10_0001_0101b: Division value "m" = 533 10_0001_0100b: Division value "m" = 532 ⋮ 00_0100_0001b: Division value "m" = 65 00_0100_0000b: Division value "m" = 64 00_0011_1111b to 00_0000_0000b: Setting prohibited
5 to 0	DIV_P	For setting the pre-divider*1 The values in the range from 1 to 4 that satisfy the conditions in Notes 2 and 3 are specifiable. 11_1111b to 00_00_0101b: Setting prohibited 00_0100b: Division value "p" = 4 (FFREF = 6 MHz) 00_0011b: Division value "p" = 3 (FFREF = 8 MHz) 00_0010b: Division value "p" = 2 (FFREF = 12 MHz) 00_0001b: Division value "p" = 1 (FFREF = 24 MHz) 00_0000b: Setting prohibited

Note 1. Changing a setting requires resetting the corresponding PLL. For details on the procedure for doing so, refer to **4.4.9.4 Procedure for Setting PLLs**.

Note 2. Refer to the expressions to calculate the PLL oscillation frequency (F_{FVCO}) and output frequency (F_{FOUT}) in **4.4.5.3.5 PLL settings**.

Note 3. Refer to the table of the allowed range of PLL frequencies in **4.4.5.3.5 PLL settings**.

4.4.4.3 pllname Output Clock Setting Registers 2 (CPG_pllname_CLK2)

[pllname]

PLLCM33, PLLCLN, PLLDTY, PLLCA55, PLLVDO, PLLETH, PLLDSI, PLLDDR0, PLLGPU, PLLDRP

These registers set the clocks output by the individual PLLs.

Access Size : 32 bits
Offset Address : Refer to the table.
Initial Value : Refer to the table.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-

R/W	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	DIV_S[2:0]		
Initial Value	0	0	x	x	x	x	x	x	0	0	0	0	0	x	x	x
R/W	R	R	RW	RW	RW	RW	RW	RW	R	R	R	R	R	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
23 to 16	-	x	RW	Reserved. When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
15, 14	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
13 to 8	-	x	RW	Reserved. When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
7 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
2 to 0	DIV_S[2:0]	x	RW	pllname divider S setting

x: Undefined value

Note: Regarding the initial value, refer to **Table 4.4-8**.

For details on the registers such as offset addresses, refer to the table below.

Table 4.4-8 Details on the CPG_pllname_CLK2 Registers such as Offset Addresses

Register Name	Offset Address	Initial Value
CPG_PLLCM33_CLK2	Reserved	Reserved
CPG_PLLCLN_CLK2	Reserved	Reserved
CPG_PLLDTY_CLK2	Reserved	Reserved
CPG_PLLCA55_CLK2	068h	000C_1E01h*1
CPG_PLLVDO_CLK2	Reserved	Reserved
CPG_PLLETH_CLK2	Reserved	Reserved
CPG_PLLDSI_CLK2	0C8h	000C_1803h
CPG_PLLDDR0_CLK2	Reserved	Reserved
CPG_PLLGPU_CLK2	128h	000C_1A01h
CPG_PLLDRP_CLK2	148h	000C_1A01h*2

Note 1. The setting is to be forcibly modified by hardware.
The settings may differ depending on the boot mode.

Note 2. When this clock is to be used as the source clock for CA55 SCLK, the frequency is fixed to 1260 MHz so making the setting is prohibited. When the clock is not to be used as the source clock, making the setting is possible (for up to 1260 MHz).

Table 4.4-9 CPG_pllname_CLK2 Register Settings

Bit	Bit Name	Description
2 to 0	DIV_S	For setting divider S*1 The values in the range from 0 to 6 (decimal numbers) are specifiable. 111b: Setting prohibited 110b: Division value “s” = 6 (Division ratio = 64) 101b: Division value “s” = 5 (Division ratio = 32) 100b: Division value “s” = 4 (Division ratio = 16) 011b: Division value “s” = 3 (Division ratio = 8) 010b: Division value “s” = 2 (Division ratio = 4) 001b: Division value “s” = 1 (Division ratio = 2) 000b: Division value “s” = 0 (Division ratio = 1)

Note 1. For details on DIV_M (“m”) and DIV_P (“p”), refer to PLL output clock setting registers 1 (CPG_pllname_CLK1).

4.4.4.4 pllname Monitor Registers (CPG_pllname_MON)

[pllname]

PLLCM33, PLLCLN, PLLDTY, PLLCA55, PLLVDO, PLLETH, PLLDSI, PLLDDR0, PLLGPU, PLLDRP

These registers are used to read the states of the individual PLLs

Access Size : 32 bits
Offset Address : Refer to the table.
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	PLLn_LOCK	-	-	-	PLLn_RESETB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
4	PLLn_LOCK	0h	R	pllname locked-state monitor 0b: PLL not locked in 1b: PLL is locked in
3 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	PLLn_RESETB	0h	R	pllname operating mode monitor 0b: Reset state (standby mode) 1b: Normal mode

For details on the offset addresses, refer to the table below.

Table 4.4-10 CPG_pllname_MON Offset Addresses

Register Name	Offset Address
CPG_PLLCM33_MON	010h
CPG_PLLCLN_MON	030h
CPG_PLLDTY_MON	050h
CPG_PLLCA55_MON	070h
CPG_PLLVDO_MON	090h
CPG_PLLETH_MON	0B0h
CPG_PLLDSI_MON	0D0h
CPG_PLLDDR0_MON	0F0h
CPG_PLLGPU_MON	130h
CPG_PLLDRP_MON	150h

4.4.4.5 Static Mux Control Registers (CPG_SSELm) (m = 0 to 2)

These registers control the static multiplexors. For details on the registers, refer to **Table 4.4-11** and block diagrams of the clock system.

Access Size : 32 bits

Address : <CPG_base> + 0300h + m x 0004h

Initial Value : Refer to the table.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	SELCTL3WEN	-	-	-	SELCTL2WEN	-	-	-	SELCTL1WEN	-	-	-	SELCTL0WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	W	R	R	R	W	R	R	R	W	R	R	R	W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

R/W	R	R	R	RW	R	R	R	RW	R	R	R	RW	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
28	SELCTL3WEN	0h	W	Write enable for SELCTL3
27 to 25	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
24	SELCTL2WEN	0h	W	Write enable for SELCTL2
23 to 21	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
20	SELCTL1WEN	0h	W	Write enable for SELCTL1
19 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
16	SELCTL0WEN	0h	W	Write enable for SELCTL0
15 to 13	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
12	SELCTL3	x	RW	Refer to **Table 4.4-11**.
11 to 9	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
8	SELCTL2	x	RW	Refer to **Table 4.4-11**.
7 to 5	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
4	SELCTL1	x	RW	Refer to **Table 4.4-11**.
3 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	SELCTL0	x	RW	Refer to **Table 4.4-11**.

x: Undefined value

Note: Regarding the initial value, refer to **Table 4.4-11**.

Table 4.4-11 Specifications of the CPG_SSELm Registers

Register Name	SELCTL0	SELCTL1	SELCTL2	SELCTL3
CPG_SSEL0	SMUX2_CA55_SCLK1*1 0b: SMUX2_CA55_SCLK0 (default) 1b: PLLCA55	SMUX2_CA55_SCLK0*1 0b: PLLDRP (default) 1b: PLLDTY	SMUX2_GBE0_TXCLK 0b: CSDIV_2to100_PLLETH_GBE0 (default) 1b: ET0_TXC_TXCLK	SMUX2_GBE0_RXCLK 0b: CSDIV_2to100_PLLETH_GBE0 1b: ET0_RXC_RXCLK (default)

Note 1. The setting is initialized by setting the CPG_OTHERS_INI.OTHERS_RST bit to 1.

Note 2. The setting is to be forcibly modified by hardware.
The settings may differ depending on the boot mode.

4.4.4.7 Static Gear Control Registers (CPG_CSDIVm) (m = 0, 1)

These registers control the static gears (counter type). For details on the registers, refer to **Table 4.4-13** and block diagrams of the clock system.

Access Size : 32 bits
Address : <CPG_base> + 0500h + m x 0004h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	DIVCTL 3WEN	-	-	-	DIVCTL 2WEN	-	-	-	DIVCTL 1WEN	-	-	-	DIVCTL 0WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	W	R	R	R	W	R	R	R	W	R	R	R	W

	-	-	DIVCTL3[1:0]		DIVCTL2[3:0]				-	-	DIVCTL1[1:0]		-	-	DIVCTL0[1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	RW	RW	RW	RW	RW	RW	R	R	RW	RW	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
28	DIVCTL3WEN	0h	W	Write enable for DIVCTL3
27 to 25	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
24	DIVCTL2WEN	0h	W	Write enable for DIVCTL2
23 to 21	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
20	DIVCTL1WEN	0h	W	Write enable for DIVCTL1
19 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
16	DIVCTL0WEN	0h	W	Write enable for DIVCTL0
15, 14	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
13, 12	DIVCTL3[1:0]	0h	RW	Refer to **Table 4.4-13**.
11 to 8	DIVCTL2[3:0]	0h	RW	Refer to **Table 4.4-13**.
7, 6	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
5 to 4	DIVCTL1[1:0]	0h	RW	Refer to **Table 4.4-13**.
3, 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
1, 0	DIVCTL0[1:0]	0h	RW	Refer to **Table 4.4-13**.

Table 4.4-13 Specifications of the CPG_CSDIVm Registers

Register Name	DIVCTL0	DIVCTL1	DIVCTL2	DIVCTL3
CPG_CSDIV0	CSDIV_2to100_PLLETH_GBE0 00b: 1/2 01b: 1/10 10b: 1/100 Others: Setting prohibited	CSDIV_2to100_PLLETH_GBE1 00b: 1/2 01b: 1/10 10b: 1/100 Others: Setting prohibited	CSDIV_16to128_PLLETH_LPCLK 00b: 1/16 01b: 1/32 10b: 1/64 11b: 1/128 DIVCTL2[3:2] is reserved. When writing, read modify write is needed.	CSDIV_2to16_PLLCM33_XSPI 00b: 1/2 01b: 1/4 10b: 1/8 11b: 1/16
CPG_CSDIV1	CSDIV_8to10_PLLCM33_ADC_PCLK*1 0b: 1/8 1b: 1/10 DIVCTL0[1] is reserved. When writing, read modify write is needed.	CSDIV_2to16_PLLCM33_ADC_ADCLK*1 00b: 1/2 01b: 1/4 10b: 1/8 11b: 1/16	CSDIV_2to32_PLLDSI 0000b: 1/2 0001b: 1/4 0010b: 1/6 0011b: 1/8 ⋮ 1101b: 1/28 1110b: 1/30 1111b: 1/32	Reserved

Note 1. ADC_ADCLK frequency follows the table below.

ADC_ADCLK frequency	CPG_CSDIV1.DIVCTL0	CPG_CSDIV1.DIVCTL1
50 MHz	0b	00b
40 MHz	1b	00b
20 MHz	1b	01b
10 MHz	1b	10b
5 MHz	1b	11b

CAUTION

These registers do not cover dynamic gearing.

4.4.4.8 CGC Control Registers (CPG_CLKON_m) (m = 0 to 24)

These registers control CGCs to switch clock signals on and off. For details on the registers, refer to **Table 4.4-14** to **Table 4.4-18** and block diagrams of the clock system.

Access Size : 32 bits

Address : <CPG_base> + 0600h + m x 0004h

Initial Value : Refer to the table.

Note 1. The setting is to be forcibly modified by hardware.
The settings may differ depending on the boot mode.

Table 4.4-18 Specifications of the CPG_CLKON_m Registers (m = 20 to 24)

Spec.	CPG_CLKON_20	CPG_CLKON_21	CPG_CLKON_22	CPG_CLKON_23	CPG_CLKON_24
Offset address	0650h	0654h	0658h	065Ch	0660h
Initial value	0000_0000h	0000_0000h	0000_F000h	0000_0003h	0000_07FFh
CLK0_ON	CGC_VIDEO1_AXI_CLK630DG_ISU*1	Reserved	Audio master clock output by ADG for SSI ch0*2	System clock supplied to the DVC ch0 module of SCU*2	System clock supplied to the SSIU modules other than the below*2
CLK1_ON	CGC_DRP_AXI_CLK400DG_DRP*1	Reserved	Audio master clock output by ADG for SSI ch1*2	System clock supplied to the DVC ch1 module of SCU*2	System clock supplied to the SSI ch0 module of SSIU*2
CLK2_ON	CGC_COM_AXI_CLK400DG_ACP*1	Reserved	Audio master clock output by ADG for SSI ch2*2	System clock supplied to the CTU/MIX ch0 module of SCU*2	System clock supplied to the SSI ch1 module of SSIU*2
CLK3_ON	CGC_COM_AXI_CLK200DG_ACP*1	Reserved	Audio master clock output by ADG for SSI ch3*2	System clock supplied to the CTU/MIX ch1 module of SCU*2	System clock supplied to the SSI ch2 module of SSIU*2
CLK4_ON	Reserved	Reserved	Audio master clock output by ADG for SSI ch4*2	System clock supplied to the SRC ch0 module of SCU*2	System clock supplied to the SSI ch3 module of SSIU*2
CLK5_ON	CGC_COM_AXI_CLK200DF*1	Reserved	Audio master clock output by ADG for SSI ch5*2	System clock supplied to the SRC ch1 module of SCU*2	System clock supplied to the SSI ch4 module of SSIU*2
CLK6_ON	CGC_AXI_TZCDDR_0_CLK100DG_ACP_PCLK0*1	Reserved	Audio master clock output by ADG for SSI ch6*2	System clock supplied to the SRC ch2 module of SCU*2	System clock supplied to the SSI ch5 module of SSIU *2
CLK7_ON	CGC_AXI_TZCDDR_0_CLK100DG_ACP_PCLK1*1	Reserved	Audio master clock output by ADG for SSI ch7*2	System clock supplied to the SRC ch3 module of SCU*2	System clock supplied to the SSI ch6 module of SSIU*2
CLK8_ON	CGC_AXI_TZCDDR_0_CLK400DG_ACP_ACLK0*1	Reserved	Audio master clock output by ADG for SSI ch8*2	System clock supplied to the SRC ch4 module of SCU*2	System clock supplied to the SSI ch7 module of SSIU*2
CLK9_ON	CGC_AXI_TZCDDR_0_CLK400DG_ACP_ACLK1*1	Reserved	Audio master clock output by ADG for SSI ch9*2	System clock supplied to the SRC ch5 module of SCU*2	System clock supplied to the SSI ch8 module of SSIU*2
CLK10_ON	CGC_AXI_TZCDDR_0_CLK400DG_DRP_ACLK2*1	Reserved	Audio master clock output by ADG for SPDIF ch0*2	System clock supplied to the SRC ch6 module of SCU*2	System clock supplied to the SSI ch9 module of SSIU*2
CLK11_ON	CGC_AXI_TZCDDR_0_CLK400DG_ACP_ACLK3*1	Reserved	Audio master clock output by ADG for SPDIF ch1*2	System clock supplied to the SRC ch7 module of SCU*2	Reserved
CLK12_ON	CGC_AXI_TZCDDR_0_CLK400DG_ACP_ACLK4*1	Reserved	Audio master clock output by ADG for SPDIF ch2*2	System clock supplied to the SRC ch8 module of SCU*2	Reserved
CLK13_ON	Reserved	Reserved	Reserved	System clock supplied to the SRC ch9 module of SCU*2	Reserved
CLK14_ON	Reserved	Reserved	Reserved	System clock supplied to the SCU modules other than the above*2	Reserved
CLK15_ON	Reserved	Reserved	Reserved	Reserved	Reserved

Note 1. The setting is to be forcibly modified by hardware.
The settings may differ depending on the boot mode.

Note 2. For details, refer to **8.1 Audio Overview**.

4.4.4.9 Dynamic Gear/Mux Status Monitor Register (CPG_CLKSTATUS0)

This register monitors the states of the dynamic gears/multiplexors.

Access Size : 32 bits
Address : <CPG_base> + 0700h
Initial Value : Undefined

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	DDIV4CTL0_STS
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	x
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DDIV3CTL3_STS	DDIV3CTL2_STS	DDIV3CTL1_STS	DDIV3CTL0_STS	DDIV2CTL3_STS	DDIV2CTL2_STS	-	DDIV2CTL0_STS	DDIV1CTL3_STS	DDIV1CTL2_STS	DDIV1CTL1_STS	DDIV1CTL0_STS	DDIV0CTL3_STS	DDIV0CTL2_STS	DDIV0CTL1_STS	DDIV0CTL0_STS
Initial Value	x	x	x	x	x	x	0	x	x	x	x	x	x	x	x	x
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
16	DDIV4CTL0_STS	x	R	CDDIV_2to4_PLLVDO_CRU1 State monitor for completion of switching 0b: Switching has been completed. 1b: Switching has not been completed (in the busy state).
15	DDIV3CTL3_STS	x	R	CDDIV_2to4_PLLVDO_CRU0 State monitor for completion of switching 0b: Switching has been completed. 1b: Switching has not been completed (in the busy state).
14	DDIV3CTL2_STS	x	R	CDDIV_2to64_PLLDTY_RCPU State monitor for completion of switching 0b: Switching has been completed. 1b: Switching has not been completed (in the busy state).
13	DDIV3CTL1_STS	x	R	CDDIV_2to64_PLLGPU State monitor for completion of switching 0b: Switching has been completed. 1b: Switching has not been completed (in the busy state).
12	DDIV3CTL0_STS	x	R	CDDIV_2to64_PLLVDO_ISU State monitor for completion of switching 0b: Switching has been completed. 1b: Switching has not been completed (in the busy state).
11	DDIV2CTL3_STS	x	R	CDDIV_2to64_PLLVDO_ISP State monitor for completion of switching 0b: Switching has been completed. 1b: Switching has not been completed (in the busy state).
10	DDIV2CTL2_STS	x	R	CDDIV_2to64_PLLDTY_DRP State monitor for completion of switching 0b: Switching has been completed. 1b: Switching has not been completed (in the busy state).
9	-	0h	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
8	DDIV2CTL0_STS	x	R	CDDIV_2to16_CA55PERI State monitor for completion of switching 0b: Switching has been completed. 1b: Switching has not been completed (in the busy state).
7	DDIV1CTL3_STS	x	R	CDDIV_1to8_CLK1800_PLLCA55_CA55_3 State monitor for completion of switching 0b: Switching has been completed. 1b: Switching has not been completed (in the busy state).

Bit	Bit Name	Initial Value	R/W	Description
6	DDIV1CTL2_STS	x	R	CDDIV_1to8_CLK1800_PLLCA55_CA55_2 State monitor for completion of switching 0b: Switching has been completed. 1b: Switching has not been completed (in the busy state).
5	DDIV1CTL1_STS	x	R	CDDIV_1to8_CLK1800_PLLCA55_CA55_1 State monitor for completion of switching 0b: Switching has been completed. 1b: Switching has not been completed (in the busy state).
4	DDIV1CTL0_STS	x	R	CDDIV_1to8_CLK1800_PLLCA55_CA55_0 State monitor for completion of switching 0b: Switching has been completed. 1b: Switching has not been completed (in the busy state).
3	DDIV0CTL3_STS	x	R	CDDIV_1to8_PLLCA55_SCLK State monitor for completion of switching 0b: Switching has been completed. 1b: Switching has not been completed (in the busy state).
2	DDIV0CTL2_STS	x	R	CDDIV_2to64_PLLDTY_ACPU State monitor for completion of switching 0b: Switching has been completed. 1b: Switching has not been completed (in the busy state).
1	DDIV0CTL1_STS	x	R	CDDIV_2to64_PLLCM33 State monitor for completion of switching 0b: Switching has been completed. 1b: Switching has not been completed (in the busy state).
0	DDIV0CTL0_STS	x	R	CDDIV_2to64_PLLCM33_CST400 State monitor for completion of switching 0b: Switching has been completed. 1b: Switching has not been completed (in the busy state).

x: Undefined value

4.4.4.10 CGC Monitor Registers (CPG_CLKMON_m) (m = 0 to 10)

These registers monitor the states of the individual clock signals in terms of whether they are on or off. For details on the registers, refer to **Table 4.4-19** to **Table 4.4-21** and block diagrams of the clock system.

Remark The initial values of the CPG_CLKON_m registers are reflected in these registers. When the initial value of a CPG_CLKON_m register bit is 1 (the clock signal is on and supplied), the initial value of the corresponding CPG_CLKMON_m register bit is also 1 (the clock signal is on).

Access Size : 32 bits

Address : <CPG_base> + 0800h + m x 0004h

Initial Value : xxxx_xxxxh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

4.4.4.11 Reset Control Registers (CPG_RST_m) (m = 0 to 17)

These registers control resetting the individual units. (0b: Reset on, 1b: Reset off)

For details on the registers, refer to **Table 4.4-22** to **Table 4.4-25**.

Access Size : 32 bits

Address : <CPG_base> + 0900h + m x 0004h

Initial Value : Refer to the table.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RSTB15_WEN	RSTB14_WEN	RSTB13_WEN	RSTB12_WEN	RSTB11_WEN	RSTB10_WEN	RSTB9_WEN	RSTB8_WEN	RSTB7_WEN	RSTB6_WEN	RSTB5_WEN	RSTB4_WEN	RSTB3_WEN	RSTB2_WEN	RSTB1_WEN	RSTB0_WEN

The settings may differ depending on the boot mode.

4.4.4.12 Reset Monitor Registers (CPG_RSTMON_m) (m = 0 to 8)

These registers monitor the individual reset signals. For details on the registers, refer to **Table 4.4-26** to **Table 4.4-28**.

Remark The initial values of the CPG_RST_m registers are reflected in these registers. When the initial value of a CPG_RST_m register bit is 1 (the reset is on and the target unit is in the reset state), the initial value of the corresponding CPG_RSTMON_m register bit is also 1 (the target unit is in the reset state).

Access Size : 32 bits

Address : <CPG_base> + 0A00h + m x 0004h

Initial Value : xxxx_xxxxh

Bit	Bit Name	Initial Value	R/W	Description
31	RST31_MON	x	R	Reset monitor. For the target signal, refer to **Table 4.4-26** to **Table 4.4-28**. 0b: The target unit is released from the reset state. 1b: The target unit is in the reset state.
30	RST30_MON	x	R	Reset monitor. For the target signal, refer to **Table 4.4-26** to **Table 4.4-28**. 0b: The target unit is released from the reset state. 1b: The target unit is in the reset state.
29	RST29_MON	x	R	Reset monitor. For the target signal, refer to **Table 4.4-26** to **Table 4.4-28**. 0b: The target unit is released from the reset state. 1b: The target unit is in the reset state.
28	RST28_MON	x	R	Reset monitor. For the target signal, refer to **Table 4.4-26** to **Table 4.4-28**. 0b: The target unit is released from the reset state. 1b: The target unit is in the reset state.
27	RST27_MON	x	R	Reset monitor. For the target signal, refer to **Table 4.4-26** to **Table 4.4-28**. 0b: The target unit is released from the reset state. 1b: The target unit is in the reset state.
26	RST26_MON	x	R	Reset monitor. For the target signal, refer to **Table 4.4-26** to **Table 4.4-28**. 0b: The target unit is released from the reset state. 1b: The target unit is in the reset state.
25	RST25_MON	x	R	Reset monitor. For the target signal, refer to **Table 4.4-26** to **Table 4.4-28**. 0b: The target unit is released from the reset state. 1b: The target unit is in the reset state.
24	RST24_MON	x	R	Reset monitor. For the target signal, refer to **Table 4.4-26** to **Table 4.4-28**. 0b: The target unit is released from the reset state. 1b: The target unit is in the reset state.
23	RST23_MON	x	R	Reset monitor. For the target signal, refer to **Table 4.4-26** to **Table 4.4-28**. 0b: The target unit is released from the reset state. 1b: The target unit is in the reset state.
22	RST22_MON	x	R	Reset monitor. For the target signal, refer to **Table 4.4-26** to **Table 4.4-28**. 0b: The target unit is released from the reset state. 1b: The target unit is in the reset state.
21	RST21_MON	x	R	Reset monitor. For the target signal, refer to **Table 4.4-26** to **Table 4.4-28**. 0b: The target unit is released from the reset state. 1b: The target unit is in the reset state.
20	RST20_MON	x	R	Reset monitor. For the target signal, refer to **Table 4.4-26** to **Table 4.4-28**. 0b: The target unit is released from the reset state. 1b: The target unit is in the reset state.

Bit	Bit Name	Initial Value	R/W	Description
19	RST19_MON	x	R	Reset monitor. For the target signal, refer to **Table 4.4-26** to **Table 4.4-28**. 0b: The target unit is released from the reset state. 1b: The target unit is in the reset state.
18	RST18_MON	x	R	Reset monitor. For the target signal, refer to **Table 4.4-26** to **Table 4.4-28**. 0b: The target unit is released from the reset state. 1b: The target unit is in the reset state.
17	RST17_MON	x	R	Reset monitor. For the target signal, refer to **Table 4.4-26** to **Table 4.4-28**. 0b: The target unit is released from the reset state. 1b: The target unit is in the reset state.
16	RST16_MON	x	R	Reset monitor. For the target signal, refer to **Table 4.4-26** to **Table 4.4-28**. 0b: The target unit is released from the reset state. 1b: The target unit is in the reset state.
15	RST15_MON	x	R	Reset monitor. For the target signal, refer to **Table 4.4-26** to **Table 4.4-28**. 0b: The target unit is released from the reset state. 1b: The target unit is in the reset state.
14	RST14_MON	x	R	Reset monitor. For the target signal, refer to **Table 4.4-26** to **Table 4.4-28**. 0b: The target unit is released from the reset state. 1b: The target unit is in the reset state.
13	RST13_MON	x	R	Reset monitor. For the target signal, refer to **Table 4.4-26** to **Table 4.4-28**. 0b: The target unit is released from the reset state. 1b: The target unit is in the reset state.
12	RST12_MON	x	R	Reset monitor. For the target signal, refer to **Table 4.4-26** to **Table 4.4-28**. 0b: The target unit is released from the reset state. 1b: The target unit is in the reset state.
11	RST11_MON	x	R	Reset monitor. For the target signal, refer to **Table 4.4-26** to **Table 4.4-28**. 0b: The target unit is released from the reset state. 1b: The target unit is in the reset state.
10	RST10_MON	x	R	Reset monitor. For the target signal, refer to **Table 4.4-26** to **Table 4.4-28**. 0b: The target unit is released from the reset state. 1b: The target unit is in the reset state.
9	RST9_MON	x	R	Reset monitor. For the target signal, refer to **Table 4.4-26** to **Table 4.4-28**. 0b: The target unit is released from the reset state. 1b: The target unit is in the reset state.
8	RST8_MON	x	R	Reset monitor. For the target signal, refer to **Table 4.4-26** to **Table 4.4-28**. 0b: The target unit is released from the reset state. 1b: The target unit is in the reset state.
7	RST7_MON	x	R	Reset monitor. For the target signal, refer to **Table 4.4-26** to **Table 4.4-28**. 0b: The target unit is released from the reset state. 1b: The target unit is in the reset state.
6	RST6_MON	x	R	Reset monitor. For the target signal, refer to **Table 4.4-26** to **Table 4.4-28**. 0b: The target unit is released from the reset state. 1b: The target unit is in the reset state.
5	RST5_MON	x	R	Reset monitor. For the target signal, refer to **Table 4.4-26** to **Table 4.4-28**. 0b: The target unit is released from the reset state. 1b: The target unit is in the reset state.
4	RST4_MON	x	R	Reset monitor. For the target signal, refer to **Table 4.4-26** to **Table 4.4-28**. 0b: The target unit is released from the reset state. 1b: The target unit is in the reset state.
3	RST3_MON	x	R	Reset monitor. For the target signal, refer to **Table 4.4-26** to **Table 4.4-28**. 0b: The target unit is released from the reset state. 1b: The target unit is in the reset state.
2	RST2_MON	x	R	Reset monitor. For the target signal, refer to **Table 4.4-26** to **Table 4.4-28**. 0b: The target unit is released from the reset state. 1b: The target unit is in the reset state.
1	RST1_MON	x	R	Reset monitor. For the target signal, refer to **Table 4.4-26** to **Table 4.4-28**. 0b: The target unit is released from the reset state. 1b: The target unit is in the reset state.
0	RST0_MON	x	R	Reset monitor. For the target signal, refer to **Table 4.4-26** to **Table 4.4-28**. 0b: The target unit is released from the reset state. 1b: The target unit is in the reset state.

x: Undefined value

4.4.4.13 Error Reset Select Register 1 (CPG_ERRORRST_SEL1)

This register selects whether a cold reset is or is not applied and whether an external pin is or is not asserted in response to a reset request generated by the WDT.

Access Size : 32 bits
Address : <CPG_base> + 0B00h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	ERRRSTSEL3_WEN	ERRRSTSEL2_WEN	ERRRSTSEL1_WEN	ERRRSTSEL0_WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	W	W	W	W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	ERRRSTSEL3	ERRRSTSEL2	ERRRSTSEL1	ERRRSTSEL0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 20	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
19	ERRRSTSEL3_WEN	0h	W	Write enable for ERRRSTSEL3
18	ERRRSTSEL2_WEN	0h	W	Write enable for ERRRSTSEL2
17	ERRRSTSEL1_WEN	0h	W	Write enable for ERRRSTSEL1
16	ERRRSTSEL0_WEN	0h	W	Write enable for ERRRSTSEL0
15 to 4	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
3	ERRRSTSEL3	0h	RW	When the WDT generates a CA55 cold reset request 0b: A CA55 cold reset is masked. 1b: A CA55 cold reset is applied.
2	ERRRSTSEL2	0h	RW	When the WDT generates a CM33 cold reset request 0b: A CM33 cold reset is masked. 1b: A CM33 cold reset is applied.
1	ERRRSTSEL1	0h	RW	When the WDT generates a CA55 cold reset request 0b: Assertion of the WDTUDFCA signal is masked. 1b: The WDTUDFCA signal is asserted.
0	ERRRSTSEL0	0h	RW	When the WDT generates a CM33 cold reset request 0b: Assertion of the WDTUDFCM signal is masked. 1b: The WDTUDFCM signal is asserted.

4.4.4.14 Error Reset Select Registers (CPG_ERRORRST_SELm) (m = 2 to 9)

These registers select whether a system reset is or is not applied in response to generation of an error. For the target error interrupt signals of the individual bits, refer to **Table 4.4-29** and **Table 4.4-30**. For details on interrupt signals, refer to **4.6 Interrupt Controller**.

Access Size : 32 bits

Address : <CPG_base> + 0B04h + (m-2) x 0004h

Initial Value : 0000_0000h

4.4.4.15 Error Reset Registers (CPG_ERROR_RSTm) (m = 2 to 9)

Applying a reset in response to an error interrupt factor sets the corresponding bit of these registers to 1. The state flag is cleared by writing 1 to it. For the target error interrupt signals of the individual bits, refer to **Table 4.4-31** and **Table 4.4-32**. For details on interrupt signals, refer to **4.6 Interrupt Controller**.

Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	R	R	RW	RW	RW	RW	RW	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
28	CM33SLEEP_ACK	0h	RW	Response for transition of Cortex-M33 to sleep mode 0b: There was no response for the transition. 1b: There was a response for the transition.
27 to 24	CA55SLEEP_ACK[3:0]	0h	RW	Response to transition of Cortex-A55 cores to sleep mode 0b: There was no response to the transition. 1b: There was a response to the transition. bit[24]: For core 0 bit[25]: For core 1 bit[26]: For core 2 bit[27]: For core 3
23 to 16	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
15	CM33WRESET_REQ	0h	RW	Request for a Cortex-M33 warm reset 0b: There was no request for Cortex-M33 warm reset. 1b: There was a request for Cortex-M33 warm reset.
14 to 13	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
12	CM33SLEEP_REQ	0h	RW	Request for transition of Cortex-M33 to sleep mode 0b: There was no request for the transition. 1b: There was a request for the transition.
11 to 8	CA55SLEEP_REQ[3:0]	0h	RW	Request for transition of Cortex-A55 cores to sleep mode 0b: There was no request for the transition. 1b: There was a request for the transition. bit[8]: For core 0 bit[9]: For core 1 bit[10]: For core 2 bit[11]: For core 3
7 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	STBY	0h	RW	Request for transition to software standby mode 0b: There was no request for the transition. 1b: There was a request for the transition.

4.4.4.17 Low-Power-Consumption Sequence Control Register 2 (CPG_LP_CTL2)

This register controls the masking of interrupts to the CPU (CM33).

Access Size : 32 bits
Address : <CPG_base> + 0C04h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	INTMASK_CM33_I
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	INTMASK_CM33_I	0h	RW	Setting of the signal to mask interrupts to Cortex-M33 from the ICU 0b: Interrupts are not masked. 1b: Interrupts are masked. This signal is asserted before transitions of Cortex-M33 to sleep mode (deep standby), software standby mode (WIC standby), or warm reset state. The signal is automatically negated by hardware.

4.4.4.18 GE3D Low-Power-Consumption Sequence Control Register (CPG_LP_GPU_CTL)

This register controls lower power consumption for the GE3D unit.

Access Size : 32 bits

Address : <CPG_base> + 0C08h

Initial Value : xxxx_1Fxxh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	QDENY_ACE_MST	QDENY_ACE_SLV	QDENY_AXI_MST	QDENY_AXI_SLV	QDENY_GPU	-	-	-	QACCEPTn_ACE_MST	QACCEPTn_ACE_SLV	QACCEPTn_AXI_MST	QACCEPTn_AXI_SLV	QACCEPTn_GPU

R/W	R	R	R	RW	RW	RW	RW	RW	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
28	QDENY_ACE_MST	x	R	ACE-lite MST Q-Channel request denial status This bit indicates the state of the QDENY signal from the ACE-lite asynchronous bridge master interface of the GPU. The bit indicates the Q-channel state in combination with the QREQn_ACE_MST and QACCEPTn_ACE_MST bits. For details on the combinations, refer to the AMBA® Low Power Interface Specification ARM® Q-Channel and P-Channel Interfaces.
27	QDENY_ACE_SLV	x	R	ACE-lite SLV Q-Channel request denial status This bit indicates the state of the QDENY signal from the ACE-lite asynchronous bridge slave interface of the GPU. The bit indicates the Q-channel state in combination with the QREQn_ACE_SLV and QACCEPTn_ACE_SLV bits. For details on the combinations, refer to the AMBA® Low Power Interface Specification ARM® Q-Channel and P-Channel Interfaces.
26	QDENY_AXI_MST	x	R	AXI4 MST Q-Channel request denial status This bit indicates the state of the QDENY signal from the AXI4 asynchronous bridge master interface of the GPU. The bit indicates the Q-channel state in combination with the QREQn_AXI_MST and QACCEPTn_AXI_MST bits. For details on the combinations, refer to the AMBA® Low Power Interface Specification ARM® Q-Channel and P-Channel Interfaces.
25	QDENY_AXI_SLV	x	R	AXI4 SLV Q-Channel request denial status This bit indicates the state of the QDENY signal from the AXI4 asynchronous bridge slave interface of the GPU. The bit indicates the Q-channel state in combination with the QREQn_AXI_SLV and QACCEPTn_AXI_SLV bits. For details on the combinations, refer to the AMBA® Low Power Interface Specification ARM® Q-Channel and P-Channel Interfaces.
24	QDENY_GPU	x	R	GPU Q-Channel request denial status This bit indicates the state of the QDENY signal from the GPU. The bit indicates the Q-channel state in combination with the QREQn_GPU and QACCEPTn_GPU bits. For details on the combinations, refer to the AMBA® Low Power Interface Specification ARM® Q-Channel and P-Channel Interfaces.
23 to 21	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
20	QACCEPTn_ACE_MST	x	R	ACE-lite MST Q-Channel request accept status This bit indicates the state of the QACCEPTn signal from the ACE-lite asynchronous bridge master interface of the GPU. The bit indicates the Q-channel state in combination with the QREQn_ACE_MST and QDENY_ACE_MST bits. For details on the combinations, refer to the AMBA® Low Power Interface Specification ARM® Q-Channel and P-Channel Interfaces.

Bit	Bit Name	Initial Value	R/W	Description
19	QACCEPTn_ACE_SLV	x	R	ACE-lite SLV Q-Channel request accept status This bit indicates the state of the QACCEPTn signal from the ACE-lite asynchronous bridge slave interface of the GPU. The bit indicates the Q-channel state in combination with the QREQn_ACE_SLV and QDENY_ACE_SLV bits. For details on the combinations, refer to the AMBA® Low Power Interface Specification ARM® Q-Channel and P-Channel Interfaces.
18	QACCEPTn_AXI_MST	x	R	AXI4 MST Q-Channel request accept status This bit indicates the state of the QACCEPTn signal from the AXI4 asynchronous bridge master interface of the GPU. The bit indicates the Q-channel state in combination with the QREQn_AXI_MST and QDENY_AXI_MST bits. For details on the combinations, refer to the AMBA® Low Power Interface Specification ARM® Q-Channel and P-Channel Interfaces.
17	QACCEPTn_AXI_SLV	x	R	AXI4 SLV Q-Channel request accept status This bit indicates the state of the QACCEPTn signal from the AXI4 asynchronous bridge slave interface of the GPU. The bit indicates the Q-channel state in combination with the QREQn_AXI_SLV and QDENY_AXI_SLV bits. For details on the combinations, refer to the AMBA® Low Power Interface Specification ARM® Q-Channel and P-Channel Interfaces.
16	QACCEPTn_GPU	x	R	GPU Q-Channel request accept status This bit indicates the state of the QACCEPTn signal from the GPU. The bit indicates the Q-channel state in combination with the QREQn_GPU and QDENY_GPU bits. For details on the combinations, refer to the AMBA® Low Power Interface Specification ARM® Q-Channel and P-Channel Interfaces.
15 to 13	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
12	QREQn_ACE_MST	1h	RW	ACE-lite MST Q-Channel request status This bit sets the level of the QREQn signal to the ACE-lite asynchronous bridge master interface of the GPU. When the bit is read, the value written will be read. The bit indicates the Q-channel state in combination with the QACCEPTn_ACE_MST and QDENY_ACE_MST bits. For details on the combinations, refer to the AMBA® Low Power Interface Specification ARM® Q-Channel and P-Channel Interfaces.
11	QREQn_ACE_SLV	1h	RW	ACE-lite SLV Q-Channel request status This bit sets the level of the QREQn signal to the ACE-lite asynchronous bridge slave interface of the GPU. When the bit is read, the value written will be read. The bit indicates the Q-channel state in combination with the QACCEPTn_ACE_SLV and QDENY_ACE_SLV bits. For details on the combinations, refer to the AMBA® Low Power Interface Specification ARM® Q-Channel and P-Channel Interfaces.
10	QREQn_AXI_MST	1h	RW	AXI4 MST Q-Channel request status This bit sets the level of the QREQn signal to the AXI4 asynchronous bridge master interface of the GPU. When the bit is read, the value written will be read. The bit indicates the Q-channel state in combination with the QACCEPTn_AXI_MST and QDENY_AXI_MST bits. For details on the combinations, refer to the AMBA® Low Power Interface Specification ARM® Q-Channel and P-Channel Interfaces.
9	QREQn_AXI_SLV	1h	RW	AXI4 SLV Q-Channel request status This bit sets the level of the QREQn signal to the AXI4 asynchronous bridge slave interface of the GPU. When the bit is read, the value written will be read. The bit indicates the Q-channel state in combination with the QACCEPTn_AXI_SLV and QDENY_AXI_SLV bits. For details on the combinations, refer to the AMBA® Low Power Interface Specification ARM® Q-Channel and P-Channel Interfaces.
8	QREQn_GPU	1h	RW	GPU Q-Channel request status This bit sets the level of the QREQn signal to the GPU. When the bit is read, the value written will be read. The bit indicates the Q-channel state in combination with the QACCEPTn_GPU and QDENY_GPU bits. For details on the combinations, refer to the AMBA® Low Power Interface Specification ARM® Q-Channel and P-Channel Interfaces.
7 to 5	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
4	QACTIVE_ACE_MST	x	R	ACE-lite MST Q-Channel active status This bit indicates the state of the QACTIVE signal from the ACE-lite asynchronous bridge master interface of the GPU. The state indicated by the bit is used to determine whether to start the stopped clock operation under control of the Q-channel. For details on the specifications of the QACTIVE signal, refer to the AMBA® Low Power Interface Specification ARM® Q-Channel and P-Channel Interfaces.

Bit	Bit Name	Initial Value	R/W	Description
3	QACTIVE_ACE_SLV	x	R	ACE-lite SLV Q-Channel active status This bit indicates the state of the QACTIVE signal from the ACE-lite asynchronous bridge slave interface of the GPU. The state indicated by the bit is used to determine whether to start the stopped clock operation under control of the Q-channel. For details on the specifications of the QACTIVE signal, refer to the AMBA® Low Power Interface Specification ARM® Q-Channel and P-Channel Interfaces.
2	QACTIVE_AXI_MST	x	R	AXI4 MST Q-Channel active status This bit indicates the state of the QACTIVE signal from the AXI4 asynchronous bridge master interface of the GPU. The state indicated by the bit is used to determine whether to start the stopped clock operation under control of the Q-channel. For details on the specifications of the QACTIVE signal, refer to the AMBA® Low Power Interface Specification ARM® Q-Channel and P-Channel Interfaces.
1	QACTIVE_AXI_SLV	x	R	AXI4 SLV Q-Channel active status This bit indicates the state of the QACTIVE signal from the AXI4 asynchronous bridge slave interface of the GPU. The state indicated by the bit is used to determine whether to start the stopped clock operation under control of the Q-channel. For details on the specifications of the QACTIVE signal, refer to the AMBA® Low Power Interface Specification ARM® Q-Channel and P-Channel Interfaces.
0	QACTIVE_GPU	x	R	GPU Q-Channel active status This bit indicates the state of the QACTIVE signal from the GPU. The state indicated by the bit is used to determine whether to start the stopped clock operation under control of the Q-channel. For details on the specifications of the QACTIVE signal, refer to the AMBA® Low Power Interface Specification ARM® Q-Channel and P-Channel Interfaces.

4.4.4.19 CM33 Control Register (CPG_CM33_CTL)

This register controls the program fetch when releasing the CM33 cold reset.

Access Size : 32 bits

Address : <CPG_base> + 0C0Ch

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CM33_BOOTCTL
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	CM33_BOOTCTL	0h	RW	This bit controls the program fetch when releasing the CM33 cold reset. 0b: Fetch enable 1b: Fetch disable This bit is used in the debug mode.

4.4.4.20 Low-Power Sequence Cortex-M33 Control Register 0 (CPG_LP_CM33_CTL0)

This register controls lower power consumption for the CM33.

Access Size : 32 bits
Address : <CPG_base> + 0C18h
Initial Value : 0x0x_0xxxh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	CM33_LP_CTL25	CM33_LP_CTL24	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	x	0	0	0	0	0	0	0	x	1
R/W	R	R	R	R	R	R	R	RW	R	R	R	R	R	R	R	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	CM33_WARMRESETREQ	-	-	-	-	CM33_LP_CTL4	-	-	-	CM33_LP_CTL0
Initial Value	0	0	0	0	0	0	x	x	0	0	0	x	0	0	0	x
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
25	CM33_LP_CTL25	x	R	WIC startup request response from the Cortex-M33 0: No request response 1: Request response received
24	CM33_LP_CTL24	0h	RW	WIC startup request status to the Cortex-M33 0: No request 1: Requested
23 to 18	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
17	-	x	R	Reserved. The read value is undefined. The written value should always be the read value.
16	-	1h	RW	Reserved Whenever it is read, 1b is read. The written value should always be 1b.
15 to 10	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
9	CM33_WARMRESETREQ	x	R	Warm reset request from the CM33 0b: No request 1b: Requested
8	-	x	R	Reserved. The read value is undefined. The written value should always be the read value.
7 to 5	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
4	CM33_LP_CTL4	x	R	CM33 deep standby status 0b: Neither the Cortex-M33 sleep mode nor software standby mode has been entered. 1b: Either the Cortex-M33 sleep mode or software standby mode has been entered.
3 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	CM33_LP_CTL0	x	R	CM33 sleep mode status 0b: Not in sleep mode 1b: In sleep mode Asserted in multiple modes.

x: Undefined value

4.4.4.21 Low-Power Sequence Cortex-M33 Control Register 1 (CPG_LP_CM33_CTL1)

This register controls lower power consumption for the CM33.

Access Size : 32 bits

Address : <CPG_base> + 0C1Ch

Initial Value : xxxx_31xxh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	CM33_LP_QCH29	CM33_LP_QCH28	-	-	-	-	-	-	CM33_LP_QCH21	CM33_LP_QCH20	-	-	-	-
Initial Value	0	0	x	x	0	0	0	x	0	0	x	x	0	0	0	x
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	CM33_LP_QCH13	CM33_LP_QCH12	-	-	-	-	-	-	-	CM33_LP_QCH4	CM33_LP_QCH3	-	-	-
Initial Value	0	0	1	1	0	0	0	1	0	0	0	x	x	0	0	x
R/W	R	R	RW	RW	R	R	R	RW	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31, 30	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
29	CM33_LP_QCH29	x	R	This bit indicates the state of the QDEBY signal from CM33. For details, refer to **2.2 CPU**.
28	CM33_LP_QCH28	x	R	This bit is used for CM33 software standby mode operation. For details, refer to **4.4.8.9 Software Standby Mode (only for the CM33 Cold Boot)**.
27 to 25	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
24	-	x	R	Reserved. The read value is undefined. The written value should always be the read value.
23, 22	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
21	CM33_LP_QCH21	x	R	This bit indicates the state of the QACCEPTn signal from CM33. For details, refer to **2.2 CPU**.
20	CM33_LP_QCH20	x	R	This bit is used for CM33 software standby mode operation. For details, refer to **4.4.8.9 Software Standby Mode (only for the CM33 Cold Boot)**.
19 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
16	-	x	R	Reserved. The read value is undefined. The written value should always be the read value.
15, 14	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
13	CM33_LP_QCH13	1h	RW	This bit sets the level of the QREQn signal to the CM33 debug domain. For details, refer to **2.2 CPU**.
12	CM33_LP_QCH12	1h	RW	This bit is used for CM33 software standby mode operation. For details, refer to **4.4.8.9 Software Standby Mode (only for the CM33 Cold Boot)**.
11 to 9	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
8	-	1h	RW	Reserved Whenever it is read, 1b is read. The written value should always be 1b.
7 to 5	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
4	CM33_LP_QCH4	x	R	QACTIVE signal state from CM33 For details, refer to **2.2 CPU**.
3	CM33_LP_QCH3	x	R	FPU domain activation request 0b: No request 1b: Requested
2, 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.

Bit	Bit Name	Initial Value	R/W	Description
0	-	x	R	Reserved. The read value is undefined. The written value should always be the read value.

x: Undefined value

4.4.4.22 Cortex-A55 Clock Control Register 1 (CPG_LP_CA55_CTL1)

This register controls the power modes for the CA55 cluster.

Access Size : 32 bits
Address : <CPG_base> + 0C20h
Initial Value : 0000_0x90h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Initial Value	0	0	0	x	x	x	x	x	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
20	CSYSREQ_TS	0h	RW	Clock powerdown request.
19	CSYSREQ_AT3	0h	RW	System exit low-power state request.
18	CSYSREQ_AT2	0h	RW	System exit low-power state request.
17	CSYSREQ_AT1	0h	RW	System exit low-power state request.
16	CSYSREQ_AT0	0h	RW	System exit low-power state request.
15 to 13	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
12	CSYSACK_TS	x	R	Clock powerdown acknowledge.
11	CSYSACK_AT3	x	R	Exit low-power state acknowledgement.
10	CSYSACK_AT2	x	R	Exit low-power state acknowledgement.
9	CSYSACK_AT1	x	R	Exit low-power state acknowledgement.
8	CSYSACK_AT0	x	R	Exit low-power state acknowledgement.
7 to 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.

x: Undefined value

4.4.4.27 Low-Power Sequence Control Register (CPG_LP_PMU_CTL1)

This register controls the PMU.

Access Size : 32 bits
Address : <CPG_base> + 0C4Ch
Initial Value : 0000_00xxh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	PD_OTHERS_ACK	CTRLACK	PD_OTHERS_REQ	CTRLREQ
Initial Value	0	0	0	0	0	0	0	0	0	0	0	x	x	x	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
4	-	x	R	Reserved. The read value is undefined. The written value should always be the read value.
3	PD_OTHERS_ACK	x	R	PMU control (power domain control status notification) 0b: Off control completed 1b: On control completed
2	CTRLACK	x	R	PMU control (power domain control completion response) 0b: Control completed 1b: Control in progress
1	PD_OTHERS_REQ	0h	RW	PMU control (power domain on/off request) 0b: Off request 1b: On request
0	CTRLREQ	0h	RW	PMU control (power domain control request) 0b: Request stopped 1b: Request output

x: Undefined value

4.4.4.28 SRAM Standby Control Registers (CPG_LP_SRAM_STBY_CTLm) (m = 1 to 3)

These registers control the SRAM standby mode for each unit. For details, refer to **Table 4.4-33** to **Table 4.4-35** and **4.4.8.5 SRAM Power-Saving Mode**.

Access Size : 32 bits
Address : <CPG_base> + 0C50h + (m-1) x 0004h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SRAM_STBY_CTL[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	*	*	*	*	*	*	*	*	*	*	*	*	*	*	*	*

4.4.4.29 CST Control Register 2 (CPG_LP_CST_CTL2)

This register controls shutting off communications between the CA55 and CST.

Access Size : 32 bits

Address : <CPG_base> + 0C70h

Initial Value : 0x0x_0x0xh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	LPI_ATB_ACK_CA553	LPI_ATB_REQ_CA553	-	-	-	-	-	-	LPI_ATB_ACK_CA552	LPI_ATB_REQ_CA552
Initial Value	0	0	0	0	0	x	x	1	0	0	0	0	0	x	x	1
R/W	R	R	R	R	R	R	R	RW	R	R	R	R	R	R	R	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	LPI_ATB_ACK_CA551	LPI_ATB_REQ_CA551	-	-	-	-	-	-	LPI_ATB_ACK_CA550	LPI_ATB_REQ_CA550
Initial Value	0	0	0	0	0	x	x	1	0	0	0	0	0	x	x	1
R/W	R	R	R	R	R	R	R	RW	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
26	-	x	R	Reserved. The read value is undefined. The written value should always be the read value.
25	LPI_ATB_ACK_CA553	x	R	LPI Control ATB for CA55. Clock is required when driven HIGH.
24	LPI_ATB_REQ_CA553	1h	RW	LPI Control ATB for CA55. Clock powerdown request. (Low(0b) active)
23 to 19	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
18	-	x	R	Reserved. The read value is undefined. The written value should always be the read value.
17	LPI_ATB_ACK_CA552	x	R	LPI Control ATB for CA55. Clock is required when driven HIGH.
16	LPI_ATB_REQ_CA552	1h	RW	LPI Control ATB for CA55. Clock powerdown request. (Low(0b) active)
15 to 11	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
10	-	x	R	Reserved. The read value is undefined. The written value should always be the read value.
9	LPI_ATB_ACK_CA551	x	R	LPI Control ATB for CA55. Clock is required when driven HIGH.
8	LPI_ATB_REQ_CA551	1h	RW	LPI Control ATB for CA55. Clock powerdown request. (Low(0b) active)
7 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
2	-	x	R	Reserved. The read value is undefined. The written value should always be the read value.
1	LPI_ATB_ACK_CA550	x	R	LPI Control ATB for CA55. Clock is required when driven HIGH.
0	LPI_ATB_REQ_CA550	1h	RW	LPI Control ATB for CA55. Clock powerdown request. (Low(0b) active)

x: Undefined value

4.4.4.30 PMU Control Register 1 (CPG_LP_PWC_CTL1)

This register controls the PWC of the PMU. Valid only when PWC is enabled (QRESNSEL = 0)

Access Size : 32 bits
Address : <CPG_base> + 0C78h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	ALL_OFF_TRG	AWO_OFF_TRG	OTHERS_OFF_TRG	OTHERS_ON_TRG
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
3	ALL_OFF_TRG	0h	RW	PWC control (ALL power OFF trigger signal) 0b: ALL power OFF sequence stopped 1b: ALL power OFF sequence started
2	AWO_OFF_TRG	0h	RW	PWC control (AWO power OFF trigger signal) 0b: AWO power OFF sequence stopped 1b: AWO power OFF sequence started
1	OTHERS_OFF_TRG	0h	RW	PWC control (OTHERS power OFF trigger signal) 0b: OTHERS power OFF sequence stopped 1b: OTHERS power OFF sequence started
0	OTHERS_ON_TRG	0h	RW	PWC control (OTHERS power ON trigger signal) 0b: OTHERS power ON sequence stopped 1b: OTHERS power ON sequence started

4.4.4.31 PMU Control Register 2 (CPG_LP_PWC_CTL2)

This register controls the PWC of the PMU. Valid only when PWC is enabled (QRESNSEL = 0)

Access Size : 32 bits
Address : <CPG_base> + 0C7Ch
Initial Value : 0000_00xxh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	QRESN_OUT	-	PWEN[2:0]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	x	0	x	x	x
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
4	QRESN_OUT	x	R	PWC control (QRESN_OUT output monitor signal) When this bit is 0b, a system reset is executed. Therefore, this bit is normally read as 1b.
3	-	0h	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
2 to 0	PWEN[2:0]	x	R	PWC control (PWEN output monitor signal) 0b: The PWEN pin is low 1b: The PWEN pin is high PWEN[0]: PWEN0 pin PWEN[1]: PWEN1 pin PWEN[2]: PWEN2 pin

x: Undefined value

4.4.4.32 OTP Handshaking Monitor Register (CPG_OTP_HANDSHAKE_MON)

This register monitors the flag for completion of transferring the SRAM recovery information.

Access Size : 32 bits
Address : <CPG_base> + 0C88h
Initial Value : 0000_000xh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	DFT_DONE
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	x
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	DFT_DONE	x	R	Flag for completion of transferring the SRAM recovery information 0b: The information has not been transferred. 1b: The information has been transferred.

x: Undefined value

4.4.4.33 Reset Control for the PD_OTHERS Domain (CPG_OTHERS_INI)

This register controls resets for the PD_OTHERS domain in the CPG.

Access Size : 32 bits

Address : <CPG_base> + 0C8Ch

Initial Value : 0000_000xh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	OTHERS_RST
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	x
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	OTHERS_RST	x	RW	Reset control for the PD_OTHERS domain in the CPG 0b: Normal operation 1b: A reset is applied.

x: Undefined value

4.4.4.34 MSTOP Registers (CPG_BUS_m_MSTOP) (m = 1 to 12)

These registers control buses for the individual units. For details on the registers, refer to **Table 4.4-36** to **Table 4.4-38**.

Access Size : 32 bits

Address : <CPG_base> + 0D00h + (m-1) x 0004h

Initial Value : 0000_xxxxh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

4.4.5 Functions for the Generation and Control of Clock Signals

4.4.5.1 Block Diagram of the Clock System

For more information, refer to the User's Manual Additional Document.

4.4.5.2 Control of Turning Unit Clock Signals On and Off

Control over turning unit clock signals on and off is realized by switching clock gating cells (CGCs) on and off under various conditions for enabling. The factors of control over turning clocks on and off are listed below.

- Control over turning clocks on and off by register settings
- Control over turning clocks on at the time of forcibly supplying them in the boot sequence.
- Control over turning clocks off at the time of release from the reset state
- Control over turning debug circuits (CSTs) off in normal mode (other than debug mode)

In addition, whether the CGCs are on or off can be confirmed by monitoring the clock signals output from the CGC control circuits with the *_CLK_MON registers.

4.4.5.3 Functions for Controlling, Setting, and Monitoring PLLs

This section describes functions for controlling, setting, and monitoring PLLs. The PLLs are controlled by internal registers of the CPG. The PLL states can be monitored by the internal registers of the CPG.

The functions for controlling, setting, and monitoring PLLs are listed below. Details of each of the functions are given in the following sections.

- PLL operating mode control
- Setting output clock signals
- Monitoring the PLL states (reset, locked)

Table 4.4-39 shows the implemented PLLs with or without SSCG.

Table 4.4-39 List of PLLs with or without SSCG

PLL Name	With or Without SSCG
PLLCM33	Without SSCG (fixed to off)
PLLCLN	Without SSCG (fixed to off)
PLLDTY	With SSCG (switched by a register setting)*1
PLLCA55	With SSCG (switched by a register setting)*1
PLLVDO	With SSCG (switched by a register setting)*1
PLLETH	Without SSCG (fixed to off)
PLLDSI	Without SSCG (fixed to off)
PLLDDR0	Without SSCG (default: fixed to off and switched by a register setting)
PLLGPU	With SSCG (default: fixed to on and switched by a register setting)
PLLDRP	With SSCG (switched by a register setting)*1

Note 1. The default settings are defined by the state of MD_CLKS pins.

Figure 4.4-3 is a block diagram for controlling a PLL for which the SSCG function is available.

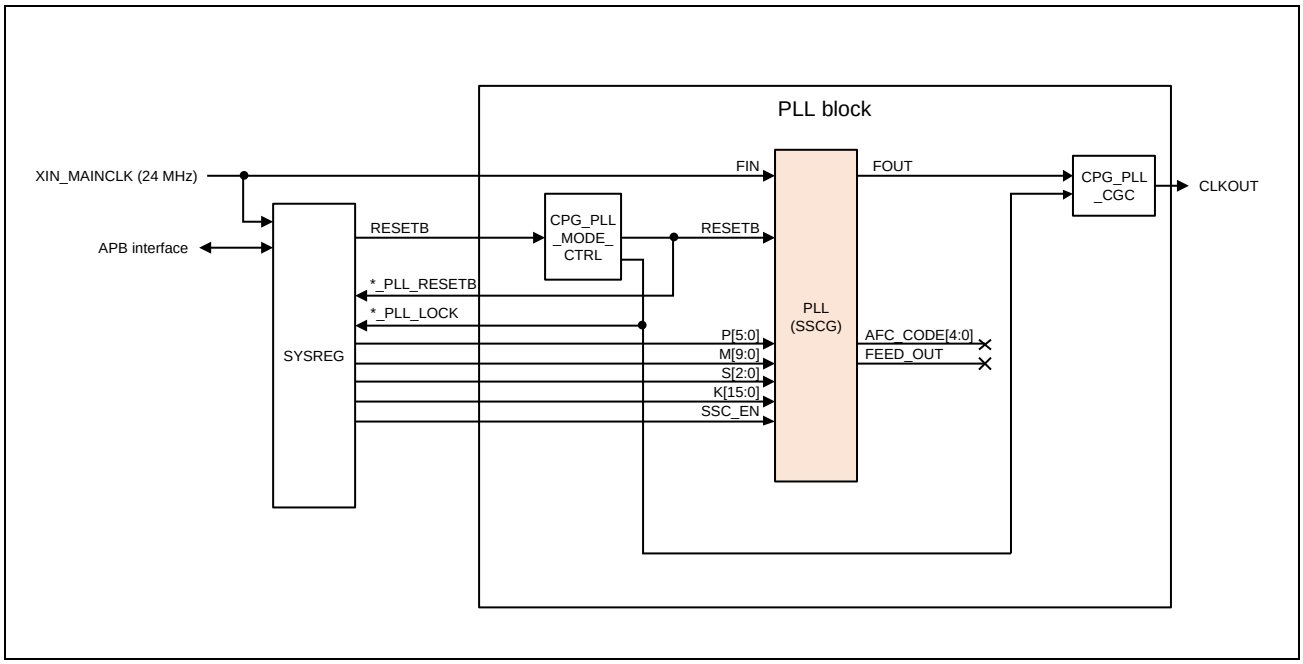

Figure 4.4-3 Block Diagram for Controlling a PLL for which the SSCG Function is Available

4.4.5.3.1 PLL operating mode control

The internal registers of the CPG are used to set the PLL operating mode and turn the SSCG on or off per PLL.

Either of the normal and standby modes is selectable as the operating mode.

The following items can be set with the internal registers of the CPG.

- Setting the operating mode (normal or standby mode)
- Turning the SSCG on or off (the setting is enabled in normal mode)

The related registers are listed in **Table 4.4-40**. For details on the settings, refer to the description of the given register.

For PLLCM33, PLLCLN, PLLETH, and PLLDSI, the SSCG setting is fixed to off so making a setting to turn the SSCG on is prohibited.

Table 4.4-40 List of PLL Standby Control Registers

Register Name	Abbreviation	Function
PLLDTY standby control register	CPG_PLLDTY_STBY	Setting the standby mode (reset state) Turning the SSCG on or off
PLLCA55 standby control register	CPG_PLLCA55_STBY	Setting the standby mode (reset state) Turning the SSCG on or off
PLLVDO standby control register	CPG_PLLVDO_STBY	Setting the standby mode (reset state) Turning the SSCG on or off
PLLDRP standby control register	CPG_PLLDRP_STBY	Setting the standby mode (reset state) Turning the SSCG on or off

4.4.5.3.2 Setting output clock signals

The internal registers of the CPG can be used to set the PLL output clock signal per PLL. The following item can be set.

- Setting the frequency of the output clock signal

The related registers are listed in **Table 4.4-41**.

Table 4.4-41 List of PLL Output Clock Setting Registers

Register Name	Abbreviation	Function
PLLCA55 output clock setting register 1	CPG_PLLCA55_CLK1	Setting the frequency
PLLCA55 output clock setting register 2	CPG_PLLCA55_CLK2	Setting the frequency
PLLDSI output clock setting register 1	CPG_PLLDSI_CLK1	Setting the frequency
PLLDSI output clock setting register 2	CPG_PLLDSI_CLK2	Setting the frequency
PLLGPU output clock setting register 1	CPG_PLLGPU_CLK1	Setting the frequency
PLLGPU output clock setting register 2	CPG_PLLGPU_CLK2	Setting the frequency
PLLDRP output clock setting register 1	CPG_PLLDRP_CLK1	Setting the frequency
PLLDRP output clock setting register 2	CPG_PLLDRP_CLK2	Setting the frequency

4.4.5.3.3 Monitoring the PLL states

The internal registers of the CPG can be used to monitor the PLL state (reset or locked) per PLL.

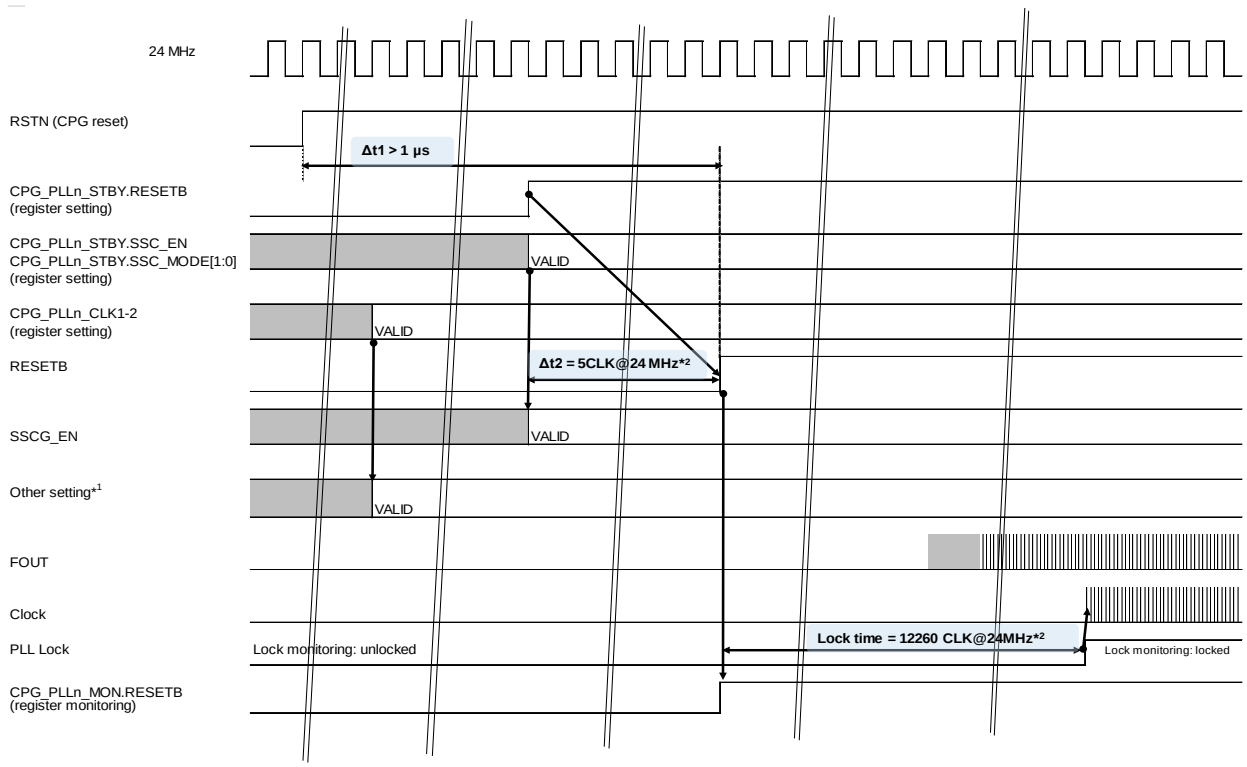
The related registers are listed in **Table 4.4-42**.

Table 4.4-42 List of PLL Monitor Registers

Register Name	Abbreviation	Function
PLLCM33 monitor register	CPG_PLLCM33_MON	Monitoring the PLL state
PLLCLN monitor register	CPG_PLLCLN_MON	Monitoring the PLL state
PLLDTY monitor register	CPG_PLLDTY_MON	Monitoring the PLL state
PLLCA55 monitor register	CPG_PLLCA55_MON	Monitoring the PLL state
PLLVDO monitor register	CPG_PLLVDO_MON	Monitoring the PLL state
PLLETH monitor register	CPG_PLLETH_MON	Monitoring the PLL state
PLLDSI monitor register	CPG_PLLDSI_MON	Monitoring the PLL state
PLLDDR0 monitor register	CPG_PLLDDR0_MON	Monitoring the PLL state
PLLGPU monitor register	CPG_PLLGPU_MON	Monitoring the PLL state
PLLDRP monitor register	CPG_PLLDRP_MON	Monitoring the PLL state

4.4.5.3.4 Timing setting

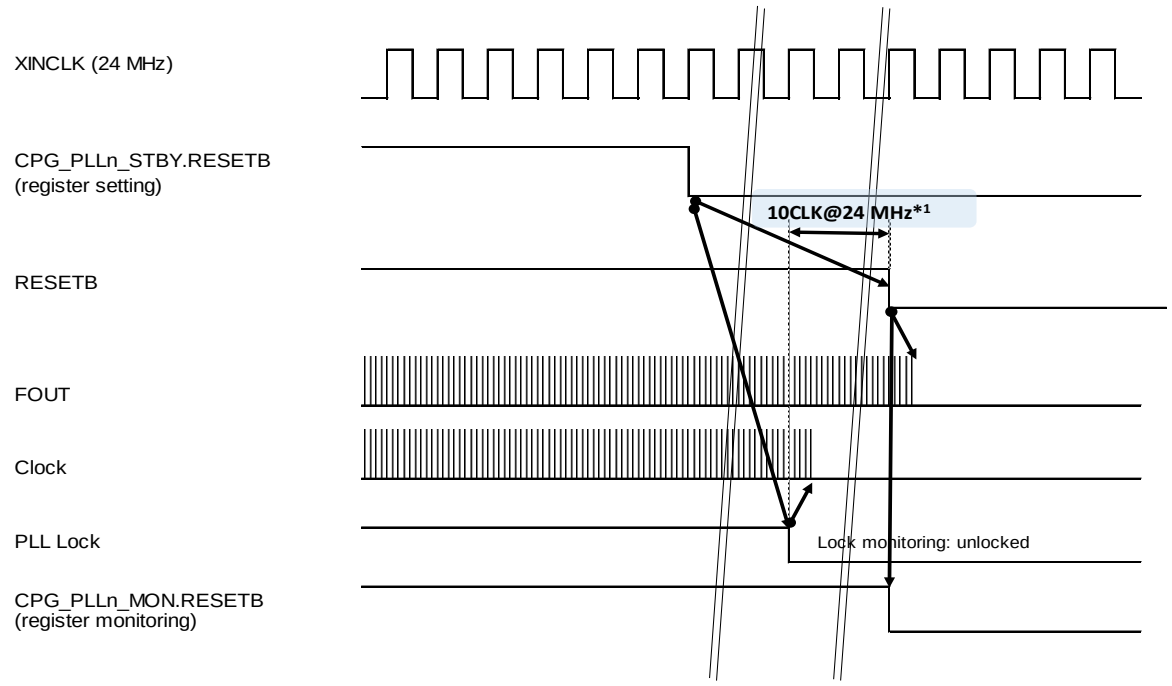
Figure 4.4-4 and **Figure 4.4-5** are timing charts in state transitions.



Note 1. Other setting: P, M, S, K

Note 2. As latency is incurred in processing by the synchronizer and sequencer in the actual circuit, the value is larger by one to five clock cycles.

Figure 4.4-4 Timing Chart in Transitions from Standby Mode to Normal Operating Mode of PLLs



Note 1. As latency is incurred in processing by the synchronizer and sequencer in the actual circuit, the value is larger by one to five clock cycles.

Figure 4.4-5 Timing Chart in Transitions from Normal Operating Mode to Standby Mode of PLLs

4.4.5.3.5 PLL settings

The initial settings of the individual PLLs are listed in the table below.

Table 4.4-43 PLL Initial Settings

PLL Name	k	m	p	s	Frequency (F_{Fout}) [MHz]	SSCG
PLLCM33	0	200	3	0	1600	Off*7
PLLCLN	0	200	3	0	1600	Off*7
PLLDTY	0	200	3	0	1600	On (off)*8
PLLCA55*1,*2	0	150	2	0	1800	On (off)*8
PLLCA55*1,*3	0	200	3	0	1600	On (off)*8
PLLCA55*1,*4	0	275	3	1	1100	On (off)*8
PLLCA55*1,*5 (These settings are the same as SYSREG initial values.)	0	250	2	1	1500	On (off)*8
PLLCA55*1,*6	−32768	213	3	0	1700	On (off)*8
PLLVDO	0	210	2	1	1260	On (off)*8
PLLETH	0	250	3	1	1000	Off*7
PLLDSI*9	0	198	2	3	297	Off*7
PLLDDR0	0	200	3	1	800	Off
PLLGPU	0	210	2	1	1260	On
PLLDRP	0	210	2	1	1260	On (off)*8

Note 1. The frequency setting for the PLLCA55 depends on the type of booting. For CM33 boot, the setting is not modified and the SYSREG initial value is retained.

Note 2. These settings are those when the PLLCA55 operates at 1.8 GHz after CM33 boot.

Note 3. When CA55 boot is selected and the levels of the BOOTPLLCA_1 and BOOTPLLCA_0 pins are high (1) and low (0), respectively,
or when CM33 boot is selected (the SYSREG initial value)

Note 4. When CA55 boot is selected and the levels of both BOOTPLLCA_1 and BOOTPLLCA_0 pins are low

Note 5. When CA55 boot is selected and the levels of the BOOTPLLCA_1 and BOOTPLLCA_0 pins are low and high, respectively

Note 6. When CA55 boot is selected and the levels of both BOOTPLLCA_1 and BOOTPLLCA_0 pins are high

Note 7. For PLLCM33, PLLCLN, PLLETH, PLLDSI, SSCGs are fixed to off.

Note 8. The level on the external MD_CLKS pin in booting up determines the SSCG on/off settings for PLLDTY, PLLCA55, PLLVDO, and PLLDRP. In normal situations, the SSCGs are on.
— The level on MD_CLKS is high: SSCG is on.
— The level on MD_CLKS is low: SSCG is off.

Note 9. These are the SYSREG initial values for the PLLDSI.

The table below lists the specifiable ranges of frequencies of the individual PLLs.

Table 4.4-44 Allowed range of PLL frequencies

PLL Name	Minimum Frequency (F_{Fout}) [MHz]	Maximum Frequency (F_{Fout}) [MHz]
PLLCM33 (fixed)	1600	1600
PLLCLN (fixed)	1600	1600
PLLDTY (fixed)	1600	1600
PLLCA55 (variable)	1100	1800
PLLVDO (fixed)	1260	1260
PLLETH (fixed)	1000	1000
PLLDSI (variable)	25	375
PLLDDR0 (fixed)	800	800
PLLGPU (variable)	1000	1260
PLLDRP (fixed*1)	1260	1260

Note 1. When this clock is to be used as the source clock for CA55 SCLK, the frequency is fixed to 1260 MHz so making the setting is prohibited. When the clock is not to be used as the source clock, making the setting is possible (for up to 1260 MHz).

The PLL oscillation frequency (F_{FVCO}) and output frequency (F_{FOUT}) can be calculated by using the expressions below.

[Expressions]

$$F_{FVCO} = \frac{((m + k/65536) \times F_{Fin})}{p}$$

$$F_{Fout} = \frac{((m + k/65536) \times F_{Fin})}{(p \times 2^{s})}$$

[Limitations]

F_{Fin}: 24 MHz

6 MHz ≤ F_{FREF} = F_{FIN}/p ≤ 25 MHz

1,600 MHz ≤ F_{FVCO} ≤ 3,200 MHz

4.4.5.4 Control Over Frequencies for the CA55

The CA55 initial states and how to control CORECLK, PERIPHCLK, and SCLK in each boot mode are described in **Table 4.4-45**.

In addition, the registers for use in control over frequencies for the CA55 are described in **Table 4.4-46**.

Table 4.4-45 Control over Frequencies for the CA55

Clock	Mode	PLL Output Frequency	Setting for Gearing in Stages after PLL
CORECLK	Initial state	In CA55 cold boot mode, the value set by hard coding according to the values of the BOOTPLLCA pins. In CM33 cold boot mode, the value following a reset.	In CA55 cold boot mode, the value determined by a setting in OTP memory. In CM33 cold boot mode, the value following a reset.
	CA55 cold boot	Can be set from CM33 if CA55 is in reset state. See **4.5.3.1.3 PD_CA55 area voltage change** for the procedure.	The setting is dynamically switchable.
	CM33 cold boot		The setting is dynamically switchable.
PERIPHCLK	Initial state	Same as the frequency of CORECLK (because the sources for the both clocks are the same PLL).	In CA55 cold boot mode, the value determined by a setting in OTP memory. In CM33 cold boot mode, the value following a reset.
	CA55 cold boot	Same as the frequency of CORECLK	The setting is dynamically switchable.
	CM33 cold boot	Same as the frequency of CORECLK	The setting is dynamically switchable.
SCLK	Initial state	In CA55 cold boot mode, any of the PLLCA55, PLLDTY, and PLLDRP is set as the clock source by using a setting in OTP memory. In CM33 cold boot mode, the value following a reset.	In CA55 cold boot mode, the value determined by a setting in OTP memory. In CM33 cold boot mode, the value following a reset.
	CA55 cold boot	The frequency can be modified under CM33 software control after the CM33 is booted up. In this case, if the PLLDRP is booted up under software control, changing the source to the PLLDRP is also possible. Note that doing so after booting the CA55 requires entry to the WFI state and Q-channel control.	The setting is dynamically switchable.
	CM33 cold boot	The frequency can be modified under CM33 software control both before and after the CA55 is booted up. In this case, if the PLLDRP is booted up under software control, changing the source to the PLLDRP is also possible. Note that doing so after booting the CA55 requires entry to the WFI state and Q-channel control.	The setting is dynamically switchable.

Table 4.4-46 Registers for Use in Control over Frequencies for the CA55

Register	Description	Initial Value in CA55 Cold Boot Mode	Initial Value in CM33 Cold Boot Mode
PLLCA55 setting register 1	This register sets the parameters for the PLLCA55. 1500 MHz is set by the initial setting.	In CA55 cold boot mode, the PLL frequency setting corresponding to the levels on the BOOTPLLCA pins is captured as the initial value in the boot sequence.	In CM33 cold boot mode, the initial value following a reset is retained without updating it in the boot sequence.
PLLDRP setting register	This register sets the parameters for the PLLDRP. 1260 MHz is set by the initial setting.	The initial setting for 1260 MHz is retained.	The initial setting for 1260 MHz is retained.
SCLK source selection register • CPG_SSEL0[0] • CPG_SSEL0[4]	This register selects a source PLL for SCLK. The PLLCA55 (01b), PLLDTY(10b), or PLLDRP(00b) is selected. The value following a reset is for the PLLDRP (00b). This initial value is retained.	In CA55 cold boot mode, a setting in OTP memory is captured as the initial value in the boot sequence.*1	In CM33 cold boot mode, the initial value following a reset is retained without updating it in the boot sequence.
CORECLK gear control register • CPG_CDDIV1[1:0] (CORE0CLK) • CPG_CDDIV1[5:4] (CORE1CLK) • CPG_CDDIV1[9:8] (CORE2CLK) • CPG_CDDIV1[13:12] (CORE3CLK)	This register sets the gear division ratio of CORECLK. DIV1 (00b), DIV2 (01b), DIV4 (10b), or DIV8 (11b) is selected. The value following a reset is for DIV1 (00b).	In CA55 cold boot mode, a setting in OTP memory is captured as the initial value in the boot sequence.	In CM33 cold boot mode, the initial value following a reset is retained without updating it in the boot sequence.
PERIPHCLK gear control register • CPG_CDDIV2[1:0]	This register sets the gear division ratio of PERIPHCLK. DIV2 (00b), DIV4 (01b), DIV8 (10b), or DIV16 (11b) is selected. The value following a reset is for DIV2 (00b).	In CA55 cold boot mode, a setting in OTP memory is captured as the initial value in the boot sequence.	In CM33 cold boot mode, the initial value following a reset is retained without updating it in the boot sequence.
SCLK gear control register • CPG_CDDIV0[13:12]	This register sets the gear division ratio of SCLK. DIV1 (00b), DIV2 (01b), DIV4 (10b), or DIV8 (11b) is selected. The value following a reset is for DIV1 (00b).	In CA55 cold boot mode, a setting in OTP memory is captured as the initial value in the boot sequence.	In CM33 cold boot mode, the initial value following a reset is retained without updating it in the boot sequence.

Note 1. If no data are written to the OTP memory, the value corresponding to the state of the BOOTPLLCA pin is set. For details, see the section below.

4.4.5.4.1 Setting PLLCA55 by BOOTPLLCA pins

For details on the relationship between the BOOTPLLCA pins and PLLCA55 frequency settings, refer to **Table 4.4-47**.

Table 4.4-47 Relationship between the BOOTPLLCA Pins and PLLCA55 Frequency Settings

BOOTPLLCA_1	BOOTPLLCA_0	CA55 CORECLK Frequency	CA55 SCLK Frequency
0	0	PLLCA55 1.1 GHz	PLLCA55 1.1 GHz
0	1	PLLCA55 1.5 GHz	PLLDRP 1.26 GHz
1	0	PLLCA55 1.6 GHz	PLLDRP 1.26 GHz
1	1	PLLCA55 1.7 GHz	PLLDRP 1.26 GHz

4.4.5.5 Clock Dividers and Selectors

The CPG uses several types of divider and selector to supply clock signals to suit the specifications of the individual units. The dividers and selectors are classified into two types in terms of the switching method: dynamic and static switching dividers and selectors. Clock switching by the former is glitch-free so dynamic switching is possible. On the other hand, as clock switching by the latter may lead to the generation of glitches, it proceeds after halting the clock supply to modules (static switching).

The types of divider and selector are described below.

- Fixed divider
- Dynamic switching selector
- Dynamic switching variable divider (output with 50% duty cycle at the time of frequency division by an even number)
- Static switching selector
- Static switching variable divider (output with 50% duty cycle at the time of frequency division by an even number)

For details on the specifications for connections between the dividers, selectors, and PLLs, refer to **4.4.5.1 Block Diagram of the Clock System**.

There are procedures for clock switching by dividers and selectors. Refer to **4.4.9.5 Procedure for Setting Frequency Division Ratios of Dynamic Switching Dividers** and **4.4.9.6 Procedure for Setting Static Switching Dividers and Selectors**.

4.4.5.5.1 Dynamic switching variable divider

Dynamic switching variable dividers can switch clock signals without the generation of glitches when the frequency division ratio settings are changed.

They can switch clock signals without halting the clock supply to units.

To avoid the generation of glitches in switching clock signals, clock switching takes certain time.

Figure 4.4-6 shows timing of clock switching by a dynamic switching variable divider.

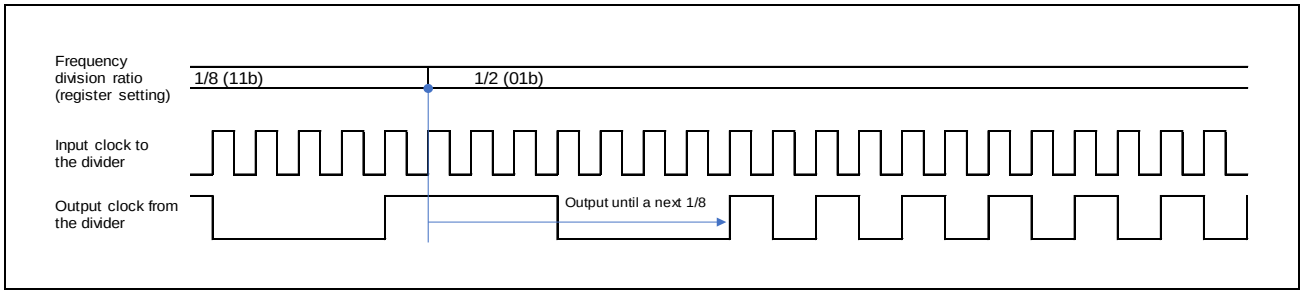


Figure 4.4-6 Timing of Clock Switching by the Dynamic Switching Variable Divider

4.4.5.5.2 Static switching selector

Clock output immediately reflecting the changed clock selection setting leads to the generation of glitches.

Therefore, to change the setting, halt the clock supply to units before doing so.

Figure 4.4-7 shows timing of clock switching by the selector.

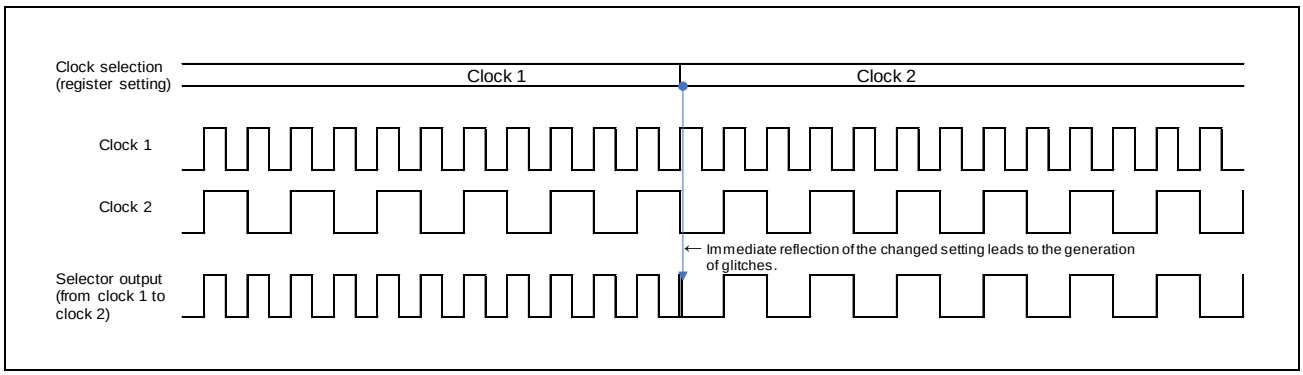

Figure 4.4-7 Timing of Clock Switching by the Static Switching Selector

4.4.5.5.3 Static switching variable divider

Static switching variable dividers immediately switch clock output in response to changing the frequency division ratio setting. This leads to the generation of a clock with the unintended pulse width (for frequency division by an odd number, the high-level pulse width is shorter by one cycle of the source clock than the low-level pulse width).

Therefore, to change the frequency division ratio setting, halt the units to which the given clock is being supplied before doing so.

Figure 4.4-8 shows timing of clock switching by the divider.

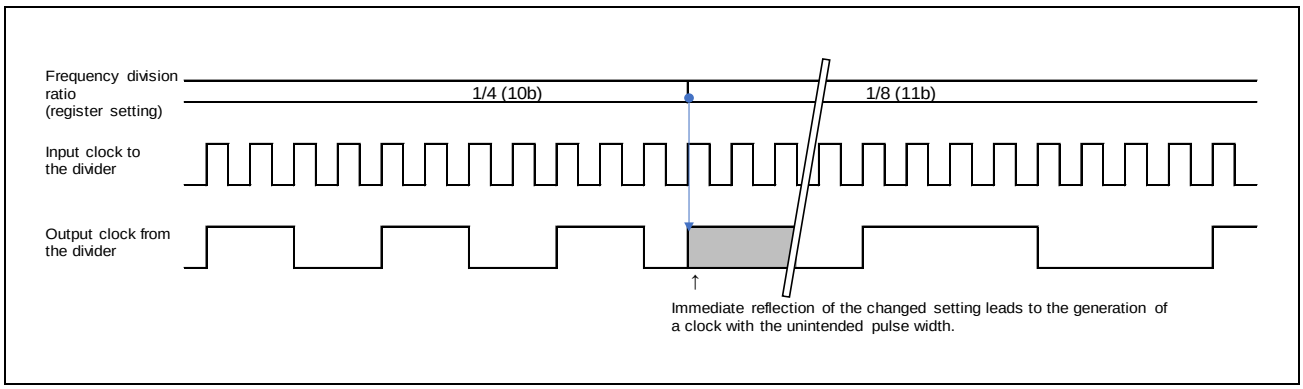

Figure 4.4-8 Timing of Clock Switching by the Static Switching Variable Divider

4.4.5.6 Temporarily Halting Clock Signals After Reset Signals are De-asserted

The CPG has a function for temporarily halting signals on the corresponding clock output pins after de-assertion of signals on the reset output pins.

For details on the correspondence between reset and clock pins, refer to **4.4.3 List of Reset Signals**.

The period over which the clock signals are temporarily halted is 64 clock cycles at 24 MHz in all (32 clock cycles at 24 MHz before and after the de-assertion of the reset signals).

4.4.6 Functions for the Generation and Control of Resets

4.4.6.1 Block Diagram of the Reset System

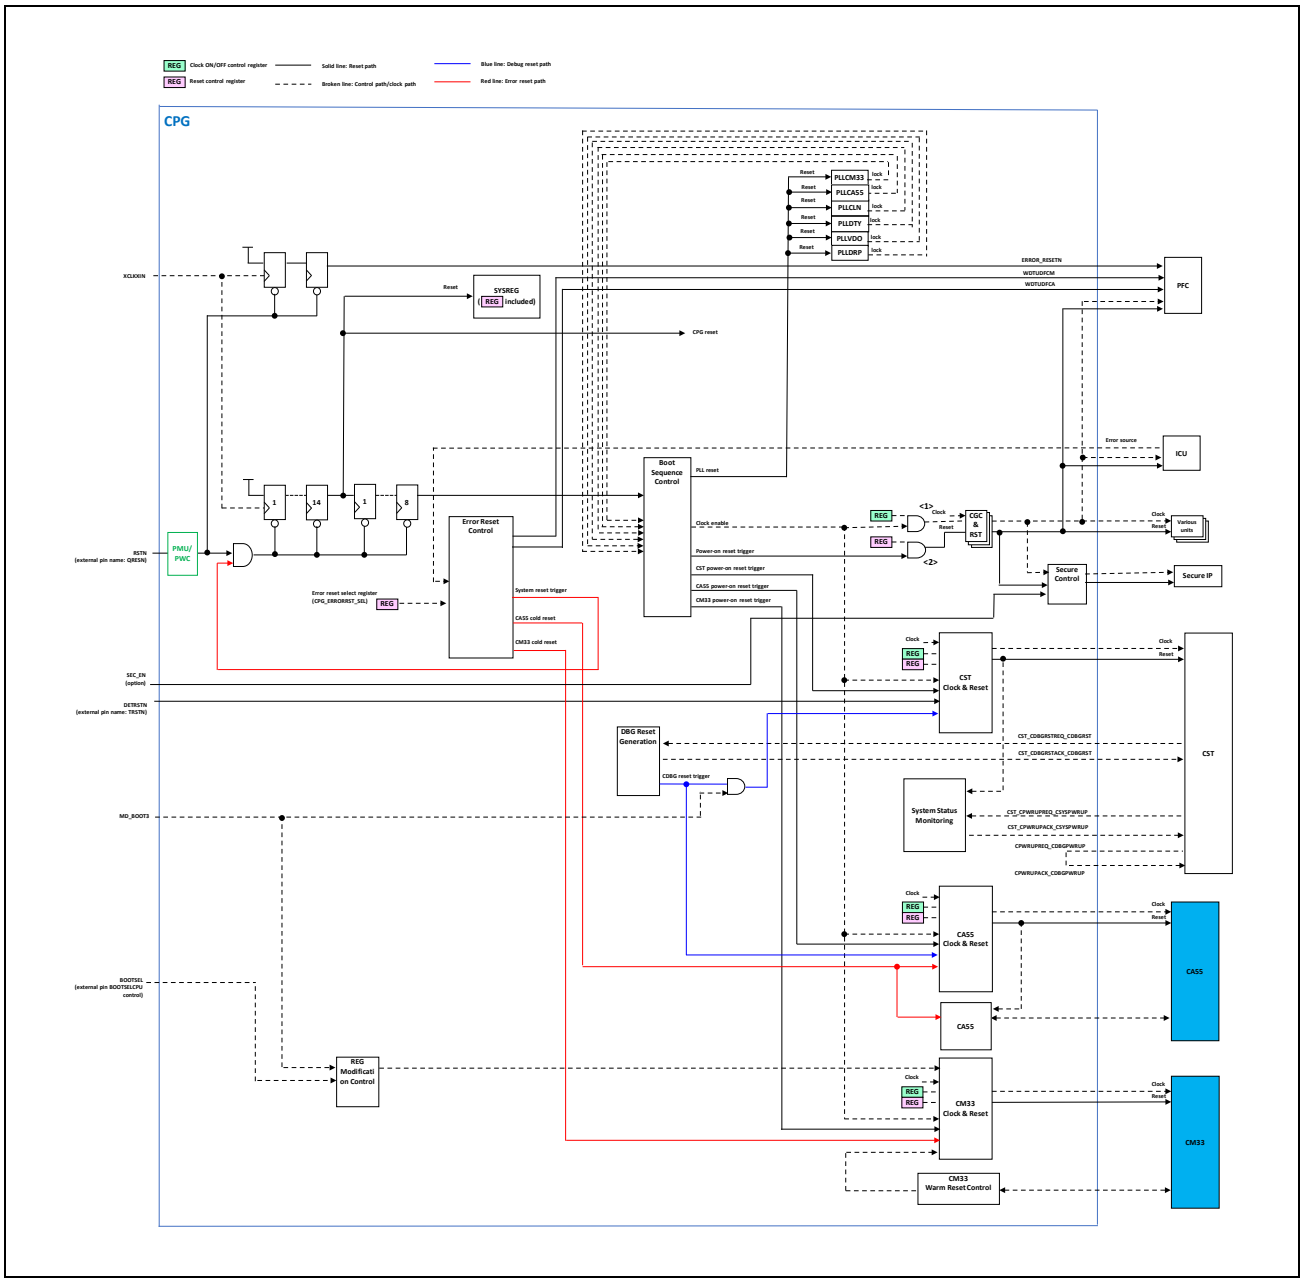

Figure 4.4-9 Block Diagram of the Reset System

4.4.6.2 Reset Application List

The scopes of application (targets) of generated resets according to the reset sources are listed below.

1) Hardware sources (QRESN, TRSTN, and MD_BOOT3)
2) Error reset sources
3) Debugger reset sources by the CST

Table 4.4-48 Reset Application List

No.	Operating Mode: MD_BOOT3 pin	Reset Initiation Source: Debug Reset: Hard-ware: TRSTN pin	Reset Initiation Source: Debug Reset: Soft-ware: DBGRST_N*5	Reset Initiation Source: System Reset: Hard-ware: QRESN pin	Reset Initiation Source: System Reset: Soft-ware: Various error sources	Reset Applicability: CA55 (debugging related)	Reset Applicability: CM33	Reset Applicability: CST	Reset Applicability: Error Register*1	Reset Applicability: All Other Units (system reset)	Reset Content

5	1	1	1	1	0	Reset*3	Reset*4	Reset*2	Outside the scope of reset	Reset*2	System reset triggered by various errors
6	1	0	1	1	1	Control by the corresponding register*6	Control by the corresponding register*7	Control by the corresponding register*8	Outside the scope of reset	Reset	DAP reset in debug operating mode
7	1	1	0	1	1	Reset*9	Control by the corresponding register*7	Reset	Outside the scope of reset	Reset	Software debugger reset
8	1	1	1	1	1	Control by the corresponding register*6	Control by the corresponding register*7	Control by the corresponding register*8	Outside the scope of reset	Reset	Debug operating mode

Note: X: Don't care

Note: Setting reset combinations not listed in the table is prohibited.

Note 1. For details, see **4.4.4.15 Error Reset Registers (CPG_ERROR_RSTm) (m = 2 to 9)**.

Note 2. Applied when a system reset is enabled by the ERRORRST_SELm register. When it is disabled, "Control by the corresponding register" applies.

Note 3. Applied when a CA55 reset or system reset is enabled by the ERRORRST_SELm register. When it is disabled, "Control by the corresponding register*6" applies.

Note 4. Applied when a CM33 reset or system reset is enabled by the ERRORRST_SELm register. When it is disabled, "Control by the corresponding register*7" applies.

Note 5. For the CST software reset (DBGRST_N), see **4.4.6.6 Debug Reset (Software Reset by CoreSight)**.

Note 6. The reset is controlled by the CPG_RST_m register setting. Initial setting: CM33 = OFF, CA55 = ON

Note 7. The reset is controlled by the CPG_RST_m register setting. Initial setting: CM33 = ON, CA55 = OFF

Note 8. The reset is controlled by the CPG_RST_m register setting. Initial setting: OFF

Note 9. Except for debug circuits, “control by the corresponding register” is applied.
The initial setting of the register is OFF for CA55 boot and ON for CM33 boot.

4.4.6.3 System Reset (External Pin)

Asserting the reset signal on the external QRESN pin initializes the whole LSI.

The timing of release of the reset following de-assertion of the reset signal on the external QRESN pin differs according to the state of the QRESNSEL pin.

- QRESNSEL = High:
  Release is immediate.
- QRESNSEL = Low:
  The timing of release of the CPG internal reset is controlled by the PWC function implemented in the PMU. For details, see **4.5 Power Management Unit (PMU)**.

4.4.6.4 Switching Unit Reset On and Off

Switching reset signals for individual units on and off can be realized by switching a reset pin for the unit on and off according to enable conditions.

Sources of control for switching reset sources on and off are listed below.

- On and off control by a register setting
- Reset control in a boot sequence
- Debug reset control
- CA55 cold reset control
- CM33 cold reset control

4.4.6.5 Error Reset

This LSI has four channels of WDT. In the CPG, a reset request is issued in response to WDT sources as well as several error sources.

For the error sources and the hardware sequences which are initiated in response to the corresponding error source, see **Table 4.4-49**.

For details on the error sources, see **4.6 Interrupt Controller**.

Table 4.4-49 Error Sources and Hardware Sequences

Error Source and Hardware Sequence	CM33 Cold Reset*1	CA55 Cold Reset*1	Error System Reset*2	WDTUDFCM Assertion	WDTUDFCA Assertion
WDT source for CM33	✓		✓	✓	
WDT source for CA55 (all cores)*3		✓	✓		✓
WDT source for Other 0			✓		
WDT source for Other 1			✓		
Error source other than WDT			✓		

Note: Items containing the symbol "✓" can be masked individually.

Note 1. When an error system reset is executed, a cold reset is also applied to the CM33 and CA55.

Note 2. The CPG_ERROR_RSTm register is outside the scope of reset.

Note 3. For CA55, the whole CA55 is reset (resetting of individual cores is not possible).

4.4.6.5.1 Error reset circuit

A reset request from various error sources including those from the WDT can be arbitrarily assigned by the mask function through the CPG_ERRORRST_SELm register setting.

Setting the corresponding bit of CPG_ERRORRST_SEL to 1 asserts a reset request from various error sources including those from the WDT.

For details on the CPG_ERRORRST_SEL register, see **4.4.4.13 Error Reset Select Register 1 (CPG_ERRORRST_SEL1)** and **4.4.4.14 Error Reset Select Registers (CPG_ERRORRST_SELm) (m = 2 to 9)**.

4.4.6.5.2 WDTUDFCM pin

This pin provides external notification of the occurrence of an underflow or refresh error by the WDT (CM33).

Whether or not to provide this notification can be selected by using bit 0 of the ERRORRST_SEL1 register.

The initial level on this pin is high and the active level is low.

Assertion of the signal from another error system reset source is ignored until completion of the output of this pulse signal.

The reset sequence by the WDT (CM33) is as follows.

1. A reset request from the WDT corresponding to bit 0 of ERRORRST_SEL1 is generated.
2. The CPG issues an error system reset.
3. Wait for 64 cycles of the 24-MHz clock.
4. A low-level pulse waveform equivalent to 64 cycles of the 24-MHz clock is output from WDTUDFCM.
5. Wait for 64 cycles of the 24-MHz clock.
6. De-assert the error system reset signal and execute a boot sequence.

For the error system reset timing, see **Figure 4.4-10**.

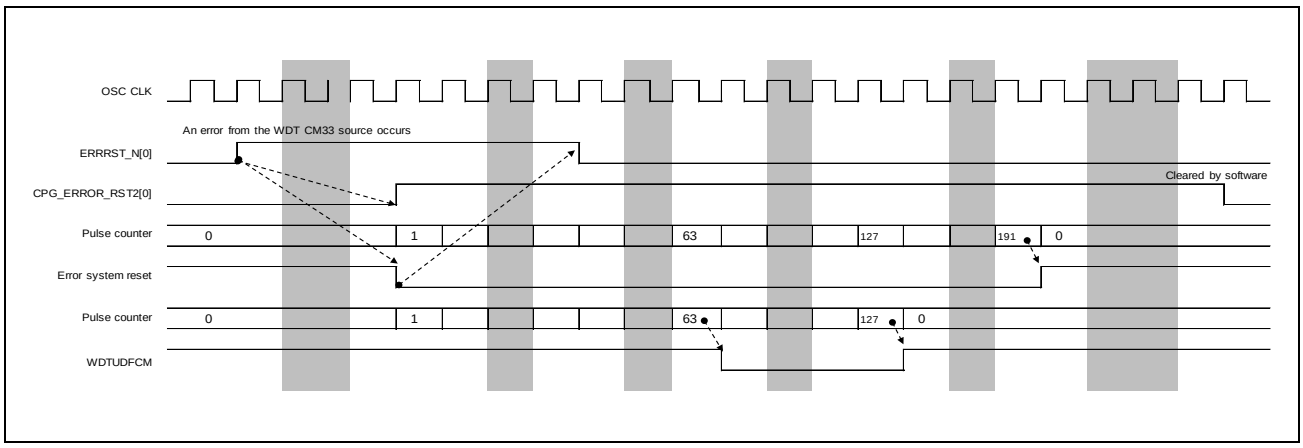

Figure 4.4-10 WDT CM33 Source Error System Reset Timing

4.4.6.5.3 WDTUDFCA pin

This pin provides external notification of the occurrence of an underflow or refresh error by the WDT (CA55).

Whether or not to provide this notification can be selected by using bit 1 of the ERRORRST_SEL1 register.

The initial level on this pin is high and the active level is low.

Assertion of the signal from another error system reset source is ignored until completion of the output of this pulse signal.

The reset sequence by the WDT (CA55) is as follows.

1. A reset request from the WDT corresponding to bit 1 of ERRORRST_SEL1 is generated.
2. The CPG issues an error system reset.
3. Wait for 64 cycles of the 24-MHz clock.
4. A low-level pulse waveform equivalent to 64 cycles of the 24-MHz clock is output from WDTUDFCA.
5. Wait for 64 cycles of the 24-MHz clock.
6. De-assert the error system reset and execute a boot sequence.

For the error system reset timing, see **Figure 4.4-11**.

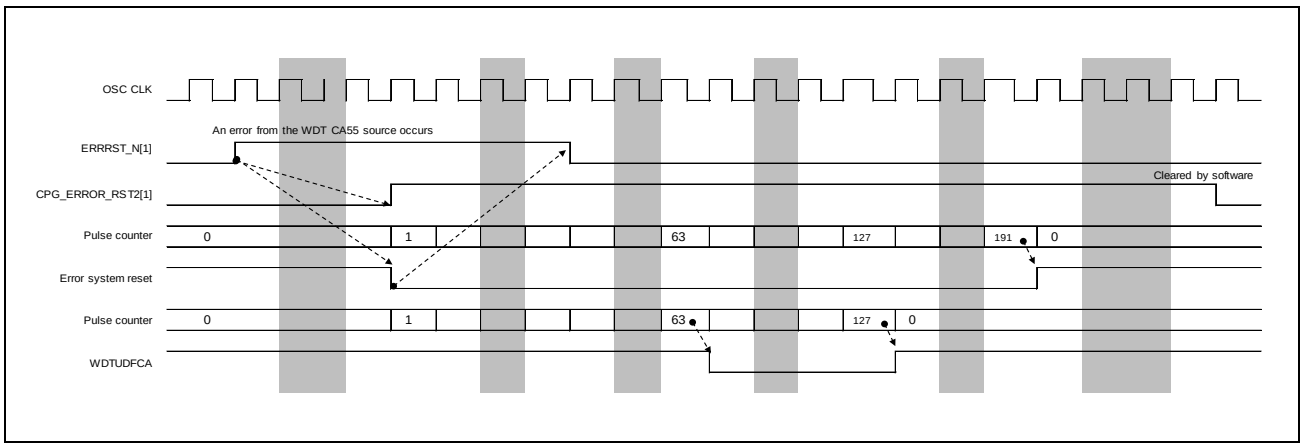

Figure 4.4-11 WDT CA55 Source Error System Reset Timing

4.4.6.5.4 Error reset registers (CPG_ERROR_RSTm)

These registers are for checking the type of error reset request which was a reset source after return from the reset, in the case of an error system reset having been applied by the error reset circuit in response to an error reset request, including that from the WDT.

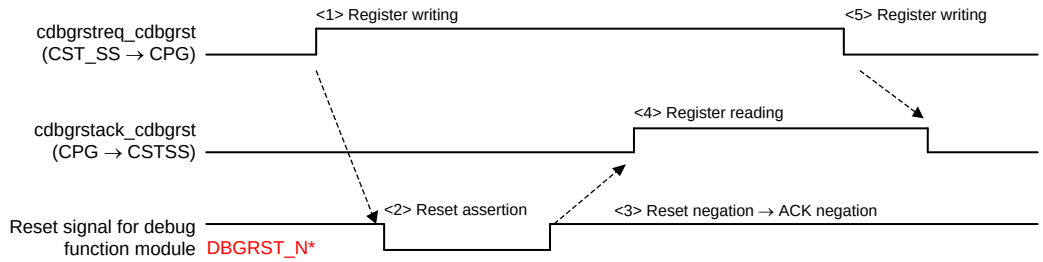
These registers are not reset by an error system reset generated by the error reset circuit.

Furthermore, the error source is not reset if the ERRRST_SELm register does not select application of a system reset, so the source can be checked by the interrupt from the corresponding error source (and the status register in each unit).

For details on these registers, see **4.4.4.15 Error Reset Registers (CPG_ERROR_RSTm) (m = 2 to 9)**.

4.4.6.6 Debug Reset (Software Reset by CoreSight)

An interface circuit with CoreSight (CST) is implemented in the CPG and a software reset of the debugging circuit of this LSI is applied from the debugger by executing the following handshake. This is only valid while QRESN = high, TRSTN = high, and MD_BOOT3 = high. The reset targets are the circuits for a debugger reset of the CST and CA55 (CM33 is outside the scope).



<1> Control the register in the CoreSight DAP from the debugger to assert the REQ signal (cdbgrstreq_cdbgrst).

<2> The CPG asserts the reset of the debug function module.

<3> The CPG negates the reset of the debug function module and asserts the ACK signal (cdbgrstack_cdbgrst). The CoreSight DAP captures the ACK assertion in the register.

<4> The debugger reads the register in the CoreSight DAP to detect the assertion of the ACK signal (that is, detect the completion of reset execution).

<5> The debugger controls the register in the CoreSight DAP to negate REQ.

<6> The CPG negates ACK and the CoreSight DAP captures the ACK negation in the register.

Figure 4.4-12 CoreSight Register Controlled Reset

4.4.6.7 CA55 Reset

The CA55 has several types of reset, differing in terms of hardware or software control and the procedure, and the CA55 reset signal through which control is applied.

Table 4.4-50 Reset Types of CA55

Reset Type		Trigger Source	Control Entity	Operation
(1a)	System Cold Reset (normal mode)	System reset Error system reset	CPG hardware	The CPG hardware asserts the reset signal. After that, the CPG hardware releases the reset through the procedure below. (1) The CPG hardware executes req and ack with P-channels. Though the req/ack handshake occurs in all channels, set PSTATE = ON only for the cluster and core 0 and set PSTATE = OFF for the other items (cores 1 to 3). (2) The CPG hardware releases the reset with the prescribed order and timing. Release the cores from the reset regardless of whether PSTATE = ON or OFF. (3) To start up the items other than core 0, set PSATE = ON by software.
(1b)	System Cold Reset (debug mode)	System reset Error system reset	CPG hardware	Same as (1a) with the exception of the following.
(1c)	Error Cold Reset	CA55 cold reset by WDT	CPG hardware	Same as (1a) with the exception of the following. PSTATE of cores 1 to 3 is in accord with the register setting.
(2a)	Software Cold Reset (at a CM33 cold boot)	Software	Software control by CM33	Assert or de-assert the reset signal by setting the PSTATE register and reset ON/OFF register in the CPG by software. The CPU hardware executes req and ack with P-channels. The req/ack handshake occurs in all channels.
(2b)	Software Cold Reset (after startup of CA55 at a CM33 boot (2a))	Software	Software control by CM33	Assert or de-assert the reset signal by setting the P-channel related register and reset ON/OFF register in the CPG by software.
(3)	Cluster Warm Reset	Software	Software control by CM33	Assert or de-assert the reset signal by setting the P-channel related register and reset ON/OFF register in the CPG by software.
(4)	Core-0 Warm Reset	Software	Software control by CM33	
(5)	Core-1 Warm Reset	Software	Software control by CM33	
(6)	Core-2 Warm Reset	Software	Software control by CM33	
(7)	Core-3 Warm Reset	Software	Software control by CM33	

Note: At the time of a CA55 boot, the CA55 is initialized by (1a) or (1b) before startup.
At the time of a CM33 boot, the CA55 is initialized by (2a) before startup. PD_CA55 to which the CA55 belongs is switched off in the initial state and initialization by (1a) or (1b) is not applied.

[Conditions for reset control by hardware]
- CA55 reset: (1a), (1b), (1c)
- Reset by CA55 P-channel control: (1a), (1b), (1c), (2a)

4.4.6.7.1 CA55 system cold reset (normal mode)

At the time of a system reset from the external pin or an error system reset, the CPG hardware asserts the reset signal. After that, the CPG hardware releases the reset through the procedure below.

1. The CPG hardware executes req and ack with P-channels. Though the req/ack handshake occurs in all channels, set PSTATE = ON only for the cluster and core 0 and set PSTATE = OFF for the other items (cores 1 to 3).
2. The CPG hardware releases the reset with the prescribed order and timing. Release the cores from the reset regardless of whether PSTATE = ON or OFF.
3. To start up the items other than core 0, set PSATE = ON by software, assert PREQ, check PACCEPT, and negate PREQ (handshaking by software).

4.4.6.7.2 CA55 system cold reset (debug mode)

Startup in debug mode is the same as a cold reset of the CA55 system (normal mode).

4.4.6.7.3 CA55 error cold reset

In this mode, the CPG applies a cold reset to a single CA55 by hardware control in response to the WDT CA55 source.

4.4.6.7.4 CA55 software cold reset

A cold reset is applied to a single CA55 by setting the P-channel related register and reset ON/OFF register in the CPG through software control by the CM33. For the resetting procedure, see **2.2 CPU**.

4.4.6.7.5 CA55 software warm reset

A warm reset is applied to a single CA55 by setting the P-channel related register and reset ON/OFF register in the CPG through software control by the CM33. For the resetting procedure, see **2.2 CPU**.

4.4.6.7.6 CA55 reset timing constraints

A CA55 reset is subject to the timing constraint related to the order of release of the reset and the constraint on the minimum reset pulse width.

(1) CA55 reset release timing

The interval between the reset (A) and (B) groups requires at least 64 clock cycles at 24 MHz. At the time of software control, software must satisfy the constraint.

(A) group: CA55_RESET14, CA55_RESET15, CA55_RESET16

(B) group: CA55 reset signals other than the above

(2) CA55 reset pulse width

The reset pulse width for the CA55 requires at least 128 clock cycles at 24 MHz. At the time of software control, software must satisfy the constraint.

4.4.6.8 CM33 Reset

The CM33 has several types of reset, differing in terms of hardware or software control and the procedure, and the CM33 reset signal through which control is applied.

Table 4.4-51 Reset Types of CM33

Reset Type		Trigger Source	Control Entity	Operation
(1a)	System Cold Reset	System reset Error system reset	CPG hardware	The CPG hardware handles the following. (1) Assert CM33_RESET0, CM33_RESET1, and CM33_RESET2. (2) De-assert CM33_RESET2 after 64 cycles (24 MHz) following the assertion of CM33_RESET2. (3) De-assert CM33_RESET0 after 64 cycles (24 MHz) following the de-assertion of CM33_RESET2.
(1b)	Error Cold Reset	CM33 cold reset by WDT	CPG hardware	Same as (1a)
(2)	SW Cold Reset	Software	Software control by CA55	Assert or de-assert the reset signal by setting the reset ON/OFF register in the CPG by software.
(3)	Warm Reset	Software	Software control by CM33 and CPG hardware	The software of CM33 handles the following. (S1) Setting to mask interrupts to the CM33. (S2) Instruction for the CM33 to enter WFI. The CM33 enters WFI, so control is transferred to the CPG hardware after that. (H1) REQ/ACK with the CM33 (H2) Assert the reset of the CM33. (H3) Release masking of interrupts to the CM33. (H4) De-assert the reset of the CM33 after the prescribed period for assertion of the reset is satisfied regardless of the generation of an interrupt.

Note: At the time of a CA55 boot, the CM33 is not started up in the initial state. The CM33 is initialized by (2) before startup.
At the time of a CM33 boot, the CM33 is initialized by (1a) or (1b) before startup.

[Conditions for reset control by hardware]
• (1a), (1b)

4.4.6.8.1 CM33 system cold reset

At the time of a system reset from the external pin or an error system reset, the CPG hardware asserts the reset signal. After that, the CPG hardware releases the reset through the procedure below. Normal mode and debug mode are the same procedure.

1. The CPG hardware releases the reset in the prescribed order.

4.4.6.8.2 CM33 error cold reset

In this mode, the CPG applies a cold reset to a single CM33 by hardware control in response to the WDT CM33 source.

4.4.6.8.3 CM33 software cold reset

A cold reset is applied to a single CM33 by setting the reset ON/OFF register in the CPG through software control by the CA55. For the resetting procedure, see **2.2 CPU**.

4.4.6.8.4 CM33 warm reset

When the CA55 applies a warm reset to the CM33, a handshake is executed between the CPG and the CM33. The reset request signal CM33_RESET1 which is issued following the handshake generates 128 cycles of the pulse at 24 MHz.

The conditions for asserting CM33_RESET1 are CM33_WARMRESETREQ = 1b and CM33_LP_CTL0 = 1b.

The INTMASK_CM33_I bit in the CPG_LP_CTL2 register is for masking interrupts from the ICU to the CM33. The CPG_LP_CTL2 register is set by software before the CM33 enters the warm reset state. It is cleared automatically by hardware.

4.4.6.8.5 CM33 reset timing constraints

A CM33 reset is subject to the timing constraint related to the order of release of the reset and the constraint on the minimum reset pulse width.

(1) CM33 reset release timing

The interval between the reset (A) and (B) groups requires at least 64 clock cycles at 24 MHz. At the time of software control, software must satisfy the constraint.

(A) group: CM33_RESET2

(B) group: CM33_RESET0, CM33_RESET1

(2) CM33 reset pulse width

The reset pulse width for the CM33 requires at least 64 clock cycles at 24 MHz. At the time of software control, software must satisfy the constraint.

4.4.7 Control of Booting

The CPG has the following four types of boot mode. For details, see **1.9 Boot Operation**.

1) CM33 normal boot

The LSI starts up in normal mode. The CPU that starts up at the time of booting is the CM33.

The power domain of PD_AWO is only switched on, and PD_OTHERS and PD_CA55 are switched off.

The SRAM rescue bit is automatically transferred to the PD_AWO domain, but transfer to the PD_OTHERS and PD_CA55 domains requires performing the steps of case 2 in **4.4.7.1 SRAM Rescue Circuit Control** by software after switching the power of the PD_OTHERS and PD_CA55 domains on.

2) CM33 debug boot

The LSI starts up in debug mode. The CPU that starts up at the time of booting is the CM33.

The power domain of PD_AWO is only switched on, and PD_OTHERS and PD_CA55 are switched off.

The SRAM rescue bit is automatically transferred to the PD_AWO domain, but transfer to the PD_OTHERS and PD_CA55 domains requires performing the steps of case 2 in **4.4.7.1 SRAM Rescue Circuit Control** by software after switching the power of the PD_OTHERS and PD_CA55 domains on.

3) CA55 normal boot

The LSI starts up in normal mode. The CPU that starts up at the time of booting is CA55 core 0.

All of the power domains (PD_AWO, PD_OTHERS, and PD_CA55) are switched on.

The SRAM rescue bit is automatically transferred.

4) CA55 debug boot

The LSI starts up in debug mode. The CPU that starts up at the time of booting is CA55 core 0.

All of the power domains (PD_AWO, PD_OTHERS, and PD_CA55) are switched on.

The SRAM rescue bit is automatically transferred.

Remark 1. The CA55 is started up at the time of a CM33 boot by software.

Remark 2. The CM33 is started up at the time of a CA55 boot by software.

4.4.7.1 SRAM Rescue Circuit Control

This LSI has functionality to read the SRAM rescue bit information from the OTP memory and transfer it to the SRAM in the set power domain.

This function is used when switching PD_OTHERS on. For the operating procedure, see **4.5.3.1 Power Domain Control** in **4.5 PMU**.

4.4.7.2 CM33 Boot (Normal Mode)

The CM33 boot (normal mode) is described.

In either case of a CA55 or CM33 boot, the boot sequencer starts up when the external QRESN pin or the error system reset is released. After startup, the CA55/CM33 boot sequence is applied in accord with the value from the external BOOTSELCPU pin. In this LSI, a CM33 boot is initiated when BOOTSELCPU = low.

When MD_BOOT3 = low, a boot is initiated in normal mode.

In a CM33 boot, only the PD_AWO power domain is powered on before the boot sequence starts up.

The units which start up after booting are as follows:

- SRAM0, SRAM1
- SYSTEM BUS (PD_AWO)
- CM33
- DMAC0
- WDT0
- PFC
- SYS
- ICU
- ROM

4.4.7.3 CM33 Boot (Debug Mode)

The CM33 boot (debug mode) is described.

In either case of a CA55 or CM33 boot, the boot sequencer starts up when the external QRESN pin or the error system reset is released. After startup, the CA55/CM33 boot sequence is applied in accord with the value from the external BOOTSELCPU pin. In this LSI, a CM33 boot is initiated when BOOTSELCPU = low.

When MD_BOOT3 = high, a boot is initiated in debug mode.

In a CM33 boot, only the PD_AWO power domain is powered on before the boot sequence starts up.

The units which start up after booting are as follows:

- SRAM0, SRAM1
- SYSTEM BUS (PD_AWO)
- CM33
- DMAC0
- WDT0
- PFC
- SYS
- ICU
- ROM
- CST

4.4.7.4 CA55 Boot (Normal Mode)

The CA55 boot (normal mode) is described.

In either case of a CA55 or CM33 boot, the boot sequencer starts up when the external QRESN pin or the error system reset is released. After startup, the CA55/CM33 boot sequence is applied in accord with the value from the external BOOTSELCPU pin. In this LSI, a CA55 boot is initiated when BOOTSELCPU = high.

Similarly, the normal mode/debug mode boot sequence is applied in accord with the value from MD_BOOT3. When MD_BOOT3 = low, a boot is initiated in normal mode.

In a CA55 boot, all of the power domains (PD_AWO, PD_OTHERS, and PD_CA55 power domains) are powered on before the boot sequence starts up.

The debugging system unit (CST) is not released from the reset and no clock signal is supplied to this unit.

The units which start up after booting are as follows:

- SRAM0 to SRAM2
- GIC
- SYC
- SYSTEM BUS
- CA55
- PFC
- SYS
- ICU
- ROM

4.4.7.5 CA55 Boot (Debug Mode)

The CA55 boot (debug mode) is described.

In either case of a CA55 or CM33 boot, the boot sequencer starts up when the external QRESN pin or the error system reset is released. After startup, the CA55/CM33 boot sequence is applied in accord with the value from the external BOOTSELCPU pin. In this LSI, a CA55 boot is initiated when BOOTSELCPU = high.

Similarly, the normal mode/debug mode boot sequence is applied in accord with the value from MD_BOOT3. When MD_BOOT3 = high, a boot is initiated in debug mode.

In a CA55 boot, all of the power domains (PD_AWO, PD_OTHERS, and PD_CA55 power domains) are powered on before the boot sequence starts up.

The debugging system units (CST and CA55 debug) are released from the reset and clock signals are supplied to these units.

The units which start up after booting are as follows:

- SRAM0 to SRAM2
- GIC
- SYC
- SYSTEM BUS
- CA55
- PFC
- SYS
- ICU
- ROM
- CST

4.4.8 Control over Lower Power Consumption

Table 4.4-52 lists the low-power consumption modes of this LSI. In CM33 cold boot, there are two low-power modes, with or without power shutdown, whereas in CA55 cold boot, power shutdown is not performed.

Table 4.4-52 Low-Power Consumption Mode and State of Respective CPUs

Cold Boot	Power Mode	Low-Power Consumption Mode	State			Overview of Functions	Recovery Method
			CM33	CA55	Peripheral Unit		
CM33 cold boot	ALL_ON	Sleep_mode (CM33)	WFI (deep standby)/WFE	—	—	CM33 stopped by WFI (deep standby)/WFE	Interrupt*1/ SysTick timer
		Sleep_mode (CA55)	—	WFI/WFE	—	Stop CA55 by WFI/WFE	Interrupt*2
		Module_standby	—	—	Register control by CPG	Stop the function (clock) of the specified peripheral unit by CPG	Register control by CPG
		Low_frequency	Register control by CPG			Reduce the clock supplied to the CPU and peripheral units	Register control by CPG
	AWO	Sleep_mode (CM33)	WFI (deep standby)/WFE	(Power off)	—	Stop CM33 by WFI (deep standby)/WFE	Interrupt*1/ SysTick Timer
		Module_standby	—	(Power off)	Register control by CPG	Stop the function (clock) of the specified peripheral unit by CPG	Register control by CPG
		Low_frequency	Register control by CPG			Reduce the clock supplied to the CPU and peripheral units	Register control by CPG
		Software_standby	WIC standby	(Power off)	Clock control + MSTOP	CM33 performs Q-channel control and further power reduction.	Interrupt*1
CA55 cold boot	ALL_ON (without power shutdown)	Sleep_mode (CM33)	WFI (deep standby)/WFE	—	—	Stop CM33 by WFI (deep standby)/WFE	Interrupt*1/ SysTick timer
		Sleep_mode (CA55)	—	WFI/WFE	—	Stop CA55 by WFI/WFE	Interrupt*2
		Module_standby	—	—	Register control by CPG	Stop the function (clock) of the specified peripheral unit by CPG	Register control by CPG
		Low_frequency	Register control by CPG			Reduce the clock supplied to the CPU and peripheral units	Register control by CPG

Note 1. To return from an interrupt, use the NVIC in the CM33. Only interrupts for recovery must be enabled.

Note 2. The recovery from an interrupt is done via an interrupt input to the ICU. Only interrupts for recovery must be enabled.

4.4.8.1 State Transition for Each Mode

Table 4.4-16 shows the LP mode state transition when the CA55 is booted, and **Figure 4.4-14** shows the LP mode state transition when the CM33 is booted.

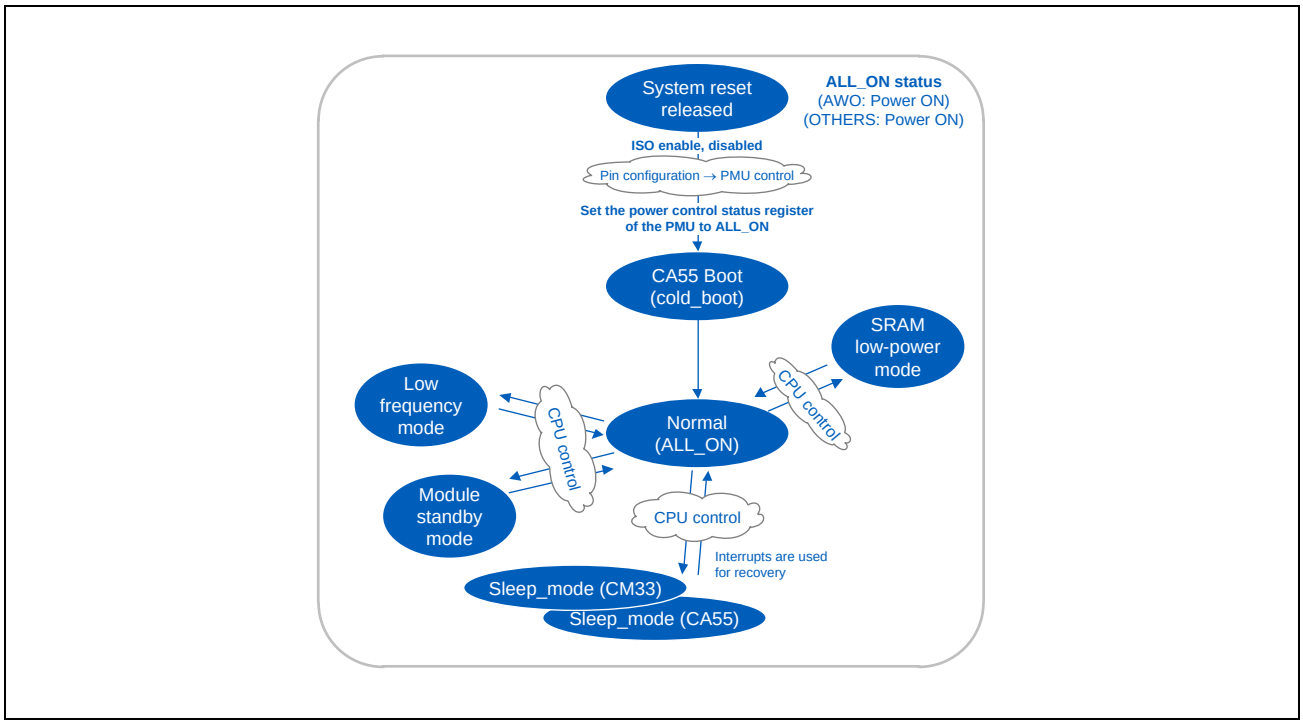


Figure 4.4-13 LP Mode Transition Diagram (CA55 Boot)

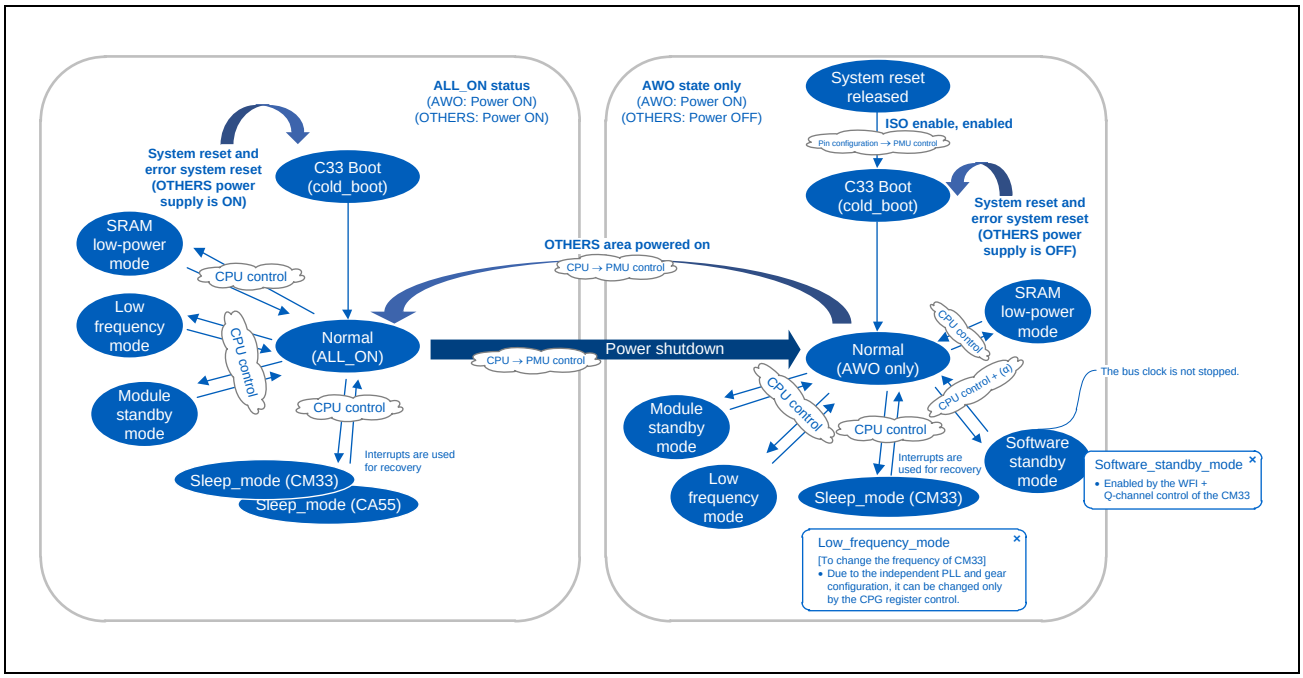

Figure 4.4-14 LP Mode Transition Diagram (CM33 Boot)

4.4.8.2 Power Mode Control

There are two power modes for CM33 cold boot: AWO mode and ALL_ON mode.

The CM33 is in AWO mode immediately after startup, and can be switched between AWO mode and ALL_ON mode after the CM33 has been started. For details on controlling, refer to **4.5 Power Management Unit (PMU)**.

4.4.8.3 Low-Frequency Mode

4.4.8.3.1 Overview

In this mode, the frequency of the clock signals supplied to specified peripheral units is lowered to obtain lower power consumption.

This is achieved by having software control registers of the CPG to switch the frequency divisors for the various domains.

See **4.4.2 List of Clock Signals**, to see which units belong to which domains and have which gears.

4.4.8.3.2 Procedure for transition to the mode

1. **Software control:** Stop units that must not have dynamic changes to the clock frequency*[1].
2. **Software control:** Control the dynamic and static gear control registers (CPG_CDDIVm) and (CPG_CSDIVm) to change the clock signals to lower frequencies.
3. **Software control:** Check the following bit in the dynamic gear status monitor register (CPG_CLKSTATUS0).

Note 1. Refer to the gearing type in **Table 4.4-2**.

4.4.8.3.3 Procedure for return from the mode

1. **Software control:** Control the dynamic and static gear control registers (CPG_CDDIVm) and (CPG_CSDIVm) to change the clock signals to normal frequencies.
2. **Software control:** Check the following bit in the dynamic gear status monitor register (CPG_CLKSTATUS0).
3. **Software control:** Resume units that must not have dynamic changes to the clock frequency.

4.4.8.4 Module Standby Mode

4.4.8.4.1 Overview

In this mode, the frequency of the clock signals supplied to specified peripheral units is stopped to obtain lower power consumption.

This is achieved by stopping supply of the clock signals by the CPG and, through the given CPG registers, switching the bus MSTOP ports. Error interrupts notify the system of attempted access to units in the MSTOP state.

The CM33 and CA55 are outside the scope of this mode. The sleep mode is used to lower power consumption by the various CPUs and is described in a later section.

4.4.8.4.2 Procedure for transition to the mode

1. **Software control:** In cases where processing must be constant so cannot be stopped until its completion, confirm that processing has definitely been completed.
2. **Software control:** For a unit that requires a procedure for stopping the clock, proceed with the sequence for stopping the clock.
3. **Software control:** Make the MSTOP settings for the target units by controlling the MSTOP control registers (CPG_BUS_m_MSTOP) of the CPG.
4. **Software control:** Stop the clocks for the target units by controlling the clock control registers (CPG_CLKON_m) of the CPG.

4.4.8.4.3 Procedure for return from the mode

1. **Software control:** Supply the clocks for the target units by controlling the clock control registers (CPG_CLKON_m) of the CPG.
2. **Software control:** Clear the MSTOP settings for the target units by controlling the MSTOP control registers (CPG_BUS_m_MSTOP) of the CPG.

4.4.8.4.4 Points to note

Depending on the unit, suddenly stopping the clock may not be possible. For example, the CM33 incorporates an interrupt controller, so abruptly stopping the clock may lead to interrupts becoming non-acceptable.

Particularly, confirmation is essential for units that have a strong possibility of restrictions applying because they can serve as masters, have an AXI bus, and in some other cases.

The items listed in the table below can be given as examples.

Table 4.4-53 Units with Restrictions Applying at the Time of Stopping

Unit Name	Stopping the Clock
CM33	It cannot be stopped.
CA55	It cannot be stopped. If power is to be reduced, cut off the power supply or if faster recovery to operation is a priority, place the core in the WFI state. (The registers for Q-channel control are in the CPG.)
GE3D	Use software control of the Q-channel control register.
CRU	Use software control of the unit's registers.
SYS	It cannot be stopped.
Internal bus	It cannot be stopped.
TZC	It cannot be stopped.

4.4.8.5 SRAM Power-Saving Mode

4.4.8.5.1 Overview

These modes consist of selective precharge mode, power down mode, and retention 2 mode, and are for reducing power consumption by placing the SRAM in the given mode. At these times, stopping and starting of the clock signals for each SRAM are controlled at the same time.

Software control of transitions to and from the SRAM low-power modes is applied through the CPG_LP_SRAM_STBY_CTLm registers of the CPG.

The modes are applicable to the 3 shared SRAM areas and to the unit-internal SRAM areas. All SRAM areas are listed on the following lines.

- (Shared SRAM area) SRAM2
- (Shared SRAM area) SRAM0, SRAM1
- (Unit-internal SRAM area) DRP-AI-internal SRAM area (with two ports)
- (Unit-internal SRAM area) ISP-internal SRAM area
- (Unit-internal SRAM area) CANFD-internal SRAM area
- (Unit-internal SRAM area) VCD-internal SRAM area

Control of both the shared and unit-internal SRAM areas is applied per SRAM area.

The standby control signal for the unit-internal SRAM areas is chain-connected between the areas. The standby state can be confirmed by monitoring the standby state signal (RSO) of the last SRAM area in the chain through the CPG register.

Control for the unit-internal SRAM areas can be applied by manipulating the signals on the SDM and RS pins and monitoring the signals on the RSO pins.

Control for the shared SRAM areas can be applied by manipulating the signals on the CENMASK, SDM, and RS pins and monitoring the signals on the RSO pins.

4.4.8.5.2 Procedure for transition to the mode

1. **Software control:** Confirm that operation of the unit that has or units that have access to the target SRAM area has been completed.
2. **Software control:** The CM33 controls the CPG registers (CPG_CLKON_m) and stops the target SRAM clocks.
3. **Software control:**
   (For shared SRAM areas) The CM33 controls the CPG registers (CPG_LP_SRAM_STBY_CTLm) and sets the CENMASK bit to 1b.
4. **Software control:**
   (For shared SRAM areas) The SDM bit is set to 1b in the case of power down and 0b in the case of retention 2.
   (For unit-internal SRAM areas) The SDM bit is set to 1b.
5. **Software control:** The CM33 controls the CPG registers and sets the RS bit of the target SRAM area to 1b.
6. **Software control:** The CM33 controls the CPG registers and confirms that the RSO bit of the target SRAM area is set to 1b.

4.4.8.5.3 Procedure for return from the mode

1. **Software control:** The CM33 controls the CPG registers (CPG_LP_SRAM_STBY_CTLm) and sets the RS bit of the target SRAM area to 0b.
2. **Software control:** The CM33 controls the CPG registers and sets the SDM bit of the target SRAM area to 0b.
3. **Software control:** (For shared SRAM areas) The CM33 controls the CPG registers and sets the CENMASK bit to 0b.
4. **Software control:** The CM33 controls the CPG registers and confirms that the RSO bit of the target SRAM area has been 0b.
5. **Software control:** The CM33 controls the CPG registers (CPG_CLKON_m) and supplies the target SRAM clocks.

4.4.8.6 CM33 Sleep Mode

4.4.8.6.1 Overview

This mode is for stopping the CM33. The transition to this mode proceeds in response to a WFI or WFE instruction having been issued for the CM33. The deep standby mode of the CM33 is used for this transition. Although most clock supply stops in this mode because the clock within the CM33 core is stopped, a clock at low speed is supplied for the 24-bit counter of the SysTick timer and as the NVIC clock for use in release.

4.4.8.6.2 Procedure for transition to the mode

1. **Software control:** The CM33 controls the CPG register (CPG_LP_CTL1) and sets the CM33SLEEP_REQ bit to 1b.
2. **Software control:** The CPG register (CPG_LP_CTL2) of the CM33 is controlled and the interrupt mask flag of the ICU is set so that interrupts cannot enter during the transition.
3. **Software control:** Registers of the NVIC within the CM33 are controlled and the interrupt mask of the source for return from the mode is removed. If the SysTick timer is to cause return of the CM33 from the mode, set the value for counting.
4. **Software control:** The CM33 itself controls the CM33 internal register (SCR) and sets the SCR.SLEEPDEEP bit to 1b.
5. **Software control:** The CM33 controls the CPG registers and decrease the speed of the CM33_CLK0 frequency of the CM33 as required.
6. **Software control:** Execute a WFI or WFE instruction as a CM33 instruction.

4.4.8.6.3 Procedure for return from the mode

1. **Software control:** After interrupt processing is completed, all interrupt factors from sources external to the LSI chip for the various units and within the ICU are cleared.
2. **Software control:** (When the CM33_CLK0 frequency is decreased at the time of a transition) Increase the speed of the CM33_CLK0 frequency of the CM33 by controlling the registers of the CPG.
3. **Software control:** The CM33 controls the CPG register (CPG_LP_CTL1) and clear a CM33SLEEP_REQ or CM33SLEEP_ACK flag.

4.4.8.7 CA55 Sleep Mode

4.4.8.7.1 Overview

This mode is for stopping operations of the CA55 cores. The transition to this mode proceeds in response to a WFI or WFE instruction having been issued for the CA55.

4.4.8.7.2 Procedure for transition to the mode

1. **Software control:** The CA55 controls the CPG register (CPG_LP_CTL1) and set the CA55SLEEP_REQ bit to 1.
2. **Software control:** The CA55 controls the GIC registers and the interrupt mask of the source for return from the mode is removed.
3. **Software control:** Execute the WFI or WFE instruction as a CA55 instruction.

4.4.8.7.3 Procedure for return from the mode

1. **Software control:** After interrupt processing is completed, all interrupt factors from sources external to the LSI chip for the various units and within the ICU are cleared.
2. **Software control:** The CA55 controls the CPG register (CPG_LP_CTL1) and clear a CA55SLEEP_REQ or CA55SLEEP_ACK flag.

4.4.8.8 Software Standby Mode (only for the CM33 Cold Boot)

4.4.8.8.1 Overview

This mode uses the CM33's WIC standby function (for WIC standby function, see the Arm® Cortex®-M33 Processor Technical Reference Manual), and enables lower power consumption than that for the sleep mode.

This mode is valid only when the CM33 is cold booted and the power mode is the AWO mode (AWO power area = ON, OTHERS power area = OFF, and CA55 OD power area = OFF).

In this mode, the unit clock is not stopped by hardware. To stop the unit clock, it should be stopped by software before shifting to this mode.

4.4.8.8.2 Procedure for transition to the mode

1. **Software control:** The CM33 controls the CPG register (CPG_LP_CTL1) and sets STBY to 1.
2. **Software control:** The CPG register (CPG_LP_CTL2) of the CM33 is controlled and the interrupt mask flag of the ICU is set so that interrupts cannot enter during the transition.
3. **Software control:** Registers of the NVIC within the CM33 are controlled and the interrupt mask of the source for return from the mode is removed.
4. **Software control:** The CM33 itself controls the CM33 internal register (SCR) and sets the SCR.SLEEPDEEP bit to 1.
5. **Software control:** The CM33 controls the CPG register (CPG_LP_CM33CTL0) and sets CM33_LP_CTL24 to 1.
6. **Software control:** The CM33 reads the CPG register (CPG_LP_CM33CTL0) and polls it until CM33_LP_CTL25 = 1.

<Steps 7 to 10 are executed only when the FPU is used>

7. **Software control:** The CM33 itself controls internal registers and switches FPU component disable.
8. **Software control:** The CM33 reads the CPG register (CPG_LP_CM33CTL1) and polls it until CM33_LP_QCH3 = 0.
9. **Software control:** The CM33 controls the CPG register (CPG_LP_CM33CTL1) and sets CM33_LP_QCH12 to 0.
10. **Software control:** The CM33 reads the CPG register (CPG_LP_CM33CTL1) and polls it until CM33_LP_QCH20 = 0.
11. **Software control:** Execute a WFI instruction as a CM33 instruction.

4.4.8.8.3 Procedure for return from the mode

<Steps 1 to 4 are executed only when the FPU is used>

1. **Software control:** The CM33 controls the CPG register (CPG_LP_CM33CTL1) and sets CM33_LP_QCH12 to 1.
2. **Software control:** The CM33 reads the CPG register (CPG_LP_CM33CTL1) and polls it until CM33_LP_QCH20 = 0.

3. **Software control:** After completion of interrupt processing, clear all interrupt factors from the external chip in each IP or ICU_TOP.
4. **Software control:** The CM33 itself controls internal registers and switches FPU component enable.
5. **Software control:** Th CM33 controls the CPG register (CPG_LP_CM33CTL0) and sets CM33_LP_CTL24 to 0.
6. **Software control:** The CM33 controls the CPG register (CPG_LP_CTL1) and clears STBY to 0.

4.4.9 Operation

4.4.9.1 Procedure for Switching Unit Clock Signals On and Off

The clock on/off should be handled in the following steps.

Note: The procedure is described using the SRAM0 clock (SRAM_0_ACLK) as an example.

[Clock on setting]

1. Set the SRAM0 clock (SRAM_0_ACLK) to on.

Set the following bits in the CGC control register (CPG_CLKON_1).
Clock on setting: Bit 5 (CLK5_ON) = 1b, bit 21 (CLK5_ONWEN) = 1b

2. Check that the SRAM0 clock (SRAM_0_ACLK) is on.

To check that the clock has been output, read the following bit in the CGC monitor register (CPG_CLKMON_0).
Clock state: Bit 21 (CLK21_MON) 1b: Clock on (0b: Clock off)

[Clock off setting]

1. Set the SRAM0 clock (SRAM_0_ACLK) to off.

Set the following bits in the CGC control register (CPG_CLKON_1).
Clock off setting: Bit 5 (CLK5_ON) = 0b, bit 21 (CLK5_ONWEN) = 1b

2. Check that the SRAM0 clock (SRAM_0_ACLK) is off.

To check that the clock has stopped, read the following bit in the CGC monitor register (CPG_CLKMON_0).
Clock state: Bit 21 (CLK21_MON) 0b: Clock off (1b: Clock on)

The above procedure is applied to the following registers.

- CGC control register (CPG_CLKON_*)
- CGC monitor register (CPG_CLKMON_*)

For clock on/off settings, refer to the section for each unit and follow the procedures described in the section for that unit.

4.4.9.2 Procedure for Switching Unit Resets On and Off

The unit reset on (reset state)/off (reset release) should be performed according to the following procedure.

Note: The procedure is described using the SRAM0 reset (SRAM_0_ARESETN) as an example.

[Reset on setting]

1. Set the SRAM0 reset (SRAM_0_ARESETN) to on.

Set the following bits in the RESET ON/OFF control register (CPG_RST_3).
Reset on setting: Bit 11 (RSTB11) = 0b, bit 27 (RSTB11_WEN) = 1b

[Reset off setting]

1. Set the SRAM0 reset (SRAM_0_ARESETN) to off.

Set the following bits in the RESET ON/OFF control register (CPG_RST_3).
Reset off setting: Bit 11(RSTB11) = 1b, bit 27 (RSTB11_WEN) = 1b

2. Check the SRAM0 reset (SRAM_0_ARESETN) is off.

To check that the reset has been released, read the following bit in the RESET monitor register (CPG_RSTMON_1).
Reset state: Bit 12 (RST12_MON) 0b: Reset off (reset canceled) 1b: Reset on

The above procedure is applied to the following registers.

- RESET on/off control register (CPG_RST_*)
- RESET monitor register (CPG_RSTMON_*)

For reset on/off settings, refer to the section for each unit and follow the procedures described in the section for that unit.

4.4.9.3 Procedure for Starting up Units

The procedures below must be followed to start up inactive units after a system reset.

Note: For unit-specific startup procedures, see the section for each unit.

1. Set the clock connected to the IP to on by the CGC control register; if the PLL of the clock domain to be turned on is stopped, start the PLL first.
2. Poll the CGC monitor register to check that supply of the relevant clock has started.
3. Set the reset connected to the unit to reset release by the RESET on/off control register.
4. Poll the RESET monitor register to check that the corresponding reset has been released.
5. Set the MSTOP register as required.

4.4.9.4 Procedure for Setting PLLs

4.4.9.4.1 Procedure for setting the PLL normal mode (changing the output frequency and SSC mode)

Follow the procedure below to make a setting of PLL from the standby to normal mode (output frequency and SSC mode change).

[n = CLN, DTY, CA55, VDO, ETH, DSI, DDR0, GPU, DRP]

This operation is not performed for PLLCM33.

1. Checking the operating mode of the PLL (checking that it is in the standby mode)

Check the following bit of the given PLLn monitoring register (CPG_PLLn_MON).
Checking the transition to the standby mode: Bit 0 (PLLn_RESETB) must be 0b (standby mode).

Check the following bit of the given PLLn monitoring register (CPG_PLLn_MON).
Checking that the PLL is not locked: Bit 4 (PLLn_LOCK) must be 0b (PLL unlocked).

*Wait until the above conditions are satisfied.

2. Output clock settings 1

Change the following bits of the given PLLn output clock setting register 1 (CPG_PLLn_CLK1).
For details of the values to set, see **4.4.5.3.5 PLL** and **4.4.4.2 pllname Output Clock Setting Registers 1 (CPG_pllname_CLK1)**.
Setting output frequency (as desired):
Bits 5 to 0 (DIV_P_5-0), bits 15 to 6 (DIV_M_9-0), bits 31 to 16 (DIV_K_15-0)

3. Setting the output clock and SSC modulation value 2

Change the following bits of the given PLLn output clock setting register 2 (CPG_PLLn_CLK2).
For details of the values to set, see **4.4.4.3 pllname Output Clock Setting Registers 2 (CPG_pllname_CLK2)**.
Setting output frequency (as desired): Bits 2 to 0 (DIV_S_2-0)

4. Setting the PLL for normal mode

Set the following bits of the given PLLn standby control register (CPG_PLLn_STBY).

Setting the operating mode: Bit 0 (RESETB) = 1b (normal mode)
Setting the SSC mode: Bit 2 (SSC_EN) is set as desired.

5. Switching the PLL to normal mode and checking that the output clock is stable

Check the following bit of the given PLLn monitoring register (CPG_PLLn_MON).
Checking the transition to the normal mode: Bit 0 (PLLn_RESETB) must be 1b (normal mode).

Check the following bit of the given PLLn monitoring register (CPG_PLLn_MON).
Checking that the PLL is locked: Bit 4 (PLL_LOCK) must be 1b (PLL locked).

*Wait until the above conditions are satisfied.

Note: Register settings for parameters that are not to be changed are not required in steps 2 and 3.

4.4.9.4.2 Procedure for setting the PLL for standby mode

Follow the procedure below to make a setting of PLL from the normal to standby mode.

[n = CLN, DTY, CA55, VDO, ETH, DSI, DDR0, GPU, DRP]

This operation is not performed for PLLCM33.

1. Setting the PLL for normal mode

Set the following bit of the given PLLn standby control register (CPG_PLLn_STBY).
Setting the operating mode: Bit 0 (RESETB) = 0b (standby mode) (the other bits are 0b)

2. Checking the transition of the PLL to the standby mode

Check the following bit of the given PLLn monitoring register (CPG_PLLn_MON).
Checking the transition to the standby mode: Bit 0 (PLLn_RESETB) must be 0b (standby mode).

Check the following bit of the given PLLn monitoring register (CPG_PLLn_MON).
Checking that the PLL is not locked: Bit 4 (PLLn_LOCK) must be 0b (PLL unlocked).

*Wait until the above conditions are satisfied.

4.4.9.5 Procedure for Setting Frequency Division Ratios of Dynamic Switching Dividers

To set the frequency divider ratio of a dynamic switching divider, follow the procedure below.

Note: The procedure is described using the example of switching PLLCM33_CST400_GEAR (instance name: CDDIV_2to64_PLLCM33_CST400).

1. Check the status of PLLCM33_CST400_GEAR (make sure that it is not busy)

Check the following bit in the dynamic gear status monitor register (CPG_CLKSTATUS0).
Check the status of PLLCM33_CST400_GEAR: Bit 0 (CLK0_MON) = 0b (switching completion status).

*Wait until the above conditions are satisfied.

2. Set the frequency divider ratio of PLLCM33_CST400_GEAR

Set the following bit in the dynamic gear control register (CPG_CDDIV0).
Frequency division ratio setting: Bits 2 to 0 (DIVCTL0) = any, bit 16 (DIVCTL0WEN) = 1b

3. Check the status of PLLCM33_CST400_GEAR (make sure that it is not busy)

Check the following bit in the dynamic gear status monitor register (CPG_CLKSTATUS0).
Check the status of PLLCM33_CST400_GEAR: Bit 0 (CLK0_MON) = 0b (switching completion status).

*Wait until the above conditions are satisfied.

The above procedure is applied to the following registers.

- CPG_CDDIV0.DIVCTL0: PLLCM33_CST400_GEAR (CDDIV_2to64_PLLCM33_CST400)
- CPG_CDDIV0.DIVCTL1: PLLCM33_GEAR (CDDIV_2to64_PLLCM33)
- CPG_CDDIV0.DIVCTL2: PLLDTY_ACPU_GEAR (CDDIV_2to64_PLLDTY_ACPU)
- CPG_CDDIV0.DIVCTL3: PLLCA55_SCLK_GEAR (CDDIV_1to8_PLLCA55_SCLK)
- CPG_CDDIV1.DIVCTL0: PLLCA55_0_GEAR (CDDIV_1to8_CLK1800_PLLCA55_CA55_0)
- CPG_CDDIV1.DIVCTL1:PLLCA55_1_GEAR (CDDIV_1to8_CLK1800_PLLCA55_CA55_1)
- CPG_CDDIV1.DIVCTL2: PLLCA55_2_GEAR (CDDIV_1to8_CLK1800_PLLCA55_CA55_2)
- CPG_CDDIV1.DIVCTL3: PLLCA55_3_GEAR (CDDIV_1to8_CLK1800_PLLCA55_CA55_3)
- CPG_CDDIV2.DIVCTL0: PLLCA55_PERIPHCLK_GEAR (CDDIV_2to16_CA55PERI)
- CPG_CDDIV2.DIVCTL2: PLLDTY_DRP_GEAR (CDDIV_2to64_PLLDTY_DRP)
- CPG_CDDIV2.DIVCTL3: PLLVDO_ISU_GEAR (CDDIV_2to64_PLLVDO_ISP)
- CPG_CDDIV3.DIVCTL0: PLLVDO_ISU_GEAR (CDDIV_2to64_PLLVDO_ISU)
- CPG_CDDIV3.DIVCTL1: PLLGPU_GEAR (CDDIV_2to64_PLLGPU)
- CPG_CDDIV3.DIVCTL2: PLLDTY_RCPU_GEAR (CDDIV_2to64_PLLDTY_RCPU)
- CPG_CDDIV3.DIVCTL3: PLLVDO_CRU0_GEAR (CDDIV_2to4_PLLVDO_CRU0)
- CPG_CDDIV4.DIVCTL0: PLLVDO_CRU0_GEAR (CDDIV_2to4_PLLVDO_CRU1)

The status monitor registers is shown below.

- Dynamic gear status monitor registers (CPG_CLKSTATUS0)

Even if there is no change in the setting value, writing 1 to “xx_WEN” allocated in the upper 16 bits of the register will start clock switching control. Therefore, wait until the status monitor (CPG_CLKSTATUS0) indicates that the switching has been completed.

4.4.9.6 Procedure for Setting Static Switching Dividers and Selectors

The division ratio setting of the static-switching frequency divider and the clock selection of the selector should be performed according to the following procedure.

- When the source clock is running

  Applicable unit clock OFF → Switching setting → Unit clock ON
  If any unit clocks cannot be stopped, switch over during reset of the respective units.

- When the source clock is stopped

  Switching setting only

The above procedure is applied to the following registers.

- CPG_CSDIV0.DIVCTL0: PLLETH_GBE0_GEAR (CSDIV_2to100_PLLETH_GBE0)
- CPG_CSDIV0.DIVCTL1: PLLETH_GBE1_GEAR (CSDIV_2to100_PLLETH_GBE1)
- CPG_CSDIV0.DIVCTL2: PLLETH_LPCLK_GEAR (CSDIV_16to128_PLLETH_LPCLK)
- CPG_CSDIV0.DIVCTL3: PLLCM33_XSPI_GEAR (CSDIV_2to16_PLLCM33_XSPI)
- CPG_CSDIV1.DIVCTL0: PLLCM33_ADC_PCLK_GEAR (CSDIV_8to10_PLLCM33_ADC_PCLK)
- CPG_CSDIV1.DIVCTL1: PLLCM33_ADC_ADCLK_GEAR (CSDIV_2to16_PLLCM33_ADC_ADCLK)
- CPG_CSDIV1.DIVCTL2: PLLDSI_GEAR (CSDIV_2to32_PLLDSI)
- CPG_SSEL0.SELCTL0: SMUX2_CA55_SCLK1
- CPG_SSEL0.SELCTL1: SMUX2_CA55_SCLK0
- CPG_SSEL0.SELCTL2: SMUX2_GBE0_TXCLK
- CPG_SSEL0.SELCTL3: SMUX2_GBE0_RXCLK
- CPG_SSEL1.SELCTL0: SMUX2_GBE1_TXCLK
- CPG_SSEL1.SELCTL1: SMUX2_GBE1_RXCLK
- CPG_SSEL1.SELCTL2: SMUX2_XSPI_CLK0
- CPG_SSEL1.SELCTL3: SMUX2_XSPI_CLK1

4.4.9.7 Boot Sequence (Normal Mode)

For a CA55 boot, after the completion of **4.4.7.2 CM33 Boot (Normal Mode)**, perform the following settings, as required.

- Startup of individual PLLs: See **4.4.9.4.1 Procedure for setting the PLL normal mode (changing the output frequency and SSC mode)**.
- Clock selector settings: See **4.4.9.6 Procedure for Setting Static Switching Dividers and Selectors**.
- Clock divider ratio setting: See **4.4.9.5 Procedure for Setting Frequency Division Ratios of Dynamic Switching Dividers**.
- Setting individual unit clocks to ON: See **4.4.9.1 Procedure for Switching Unit Clock Signals On and Off**.
- Releasing individual unit resets: See **4.4.9.2 Procedure for Switching Unit Resets On and Off**.

For a CM33 boot, after the completion of **4.4.7.2 CM33 Boot (Normal Mode)**, perform the following settings, as required.

- Startup of individual PLLs: See **4.4.9.4.1 Procedure for setting the PLL normal mode (changing the output frequency and SSC mode)**.
- Clock selector settings: See **4.4.9.6 Procedure for Setting Static Switching Dividers and Selectors**.
- Clock divider ratio setting: See **4.4.9.5 Procedure for Setting Frequency Division Ratios of Dynamic Switching Dividers**.
- Setting individual unit clocks to ON: See **4.4.9.1 Procedure for Switching Unit Clock Signals On and Off**.
- Releasing individual unit resets: See **4.4.9.2 Procedure for Switching Unit Resets On and Off**.

Moreover, when the PD_OTHERS power area is to be activated, the following settings should be made.

- Turn on the PD_OTHERS area according to the procedure described in “Initializing the PD_OTHERS Area”. (See **4.5 Power Management Unit (PMU)**)
- Apply the SRAM recovery bit according to the procedure “Case 2: When the PD_OTHERS domain is powered on (CM33 boot)” in **4.4.7.1 SRAM Rescue Circuit Control**.
- Change the source clock of CA55_0_SCLK as required. See **4.4.9.6 Procedure for Setting Static Switching Dividers and Selectors**.
- Change the frequency of CA55_0_SCLK, CA55_0_PERIPHCLK, CA55_0_SCLK, and CA55_0_CORECLK[3:0] as required.
- Start up the CA55.

Release the reset of CA55 and turn on the P-channel by software. (See **2.2 CPU**.)

After that, perform the following settings, as required.

- Startup of individual PLLs: See **4.4.9.4.1 Procedure for setting the PLL normal mode (changing the output frequency and SSC mode)**.
- Clock selector settings: See **4.4.9.6 Procedure for Setting Static Switching Dividers and Selectors**.
- Clock divider ratio setting: See **4.4.9.5 Procedure for Setting Frequency Division Ratios of Dynamic Switching Dividers**.
- Setting individual unit clocks to ON: See **4.4.9.1 Procedure for Switching Unit Clock Signals On and Off**.
- Releasing individual unit resets: See **4.4.9.2 Procedure for Switching Unit Resets On and Off**.

NOTE

If an error system reset occurs after turning on the PD_OTHERS and PD_CA55 power supply areas according to the PD_OTHERS area power control procedure after the CM33 boot, the PD_OTHERS and PD_CA55 power supply areas will remain ON, but the PMU will be in the initial state (PD_OTHERS and PD_CA55 power supply areas are set OFF) and this resulted in an inconsistent state. To resolve this inconsistency, check **4.4.4.15 Error Reset Registers (CPG_ERROR_RSTm) (m = 2 to 9**) after the CPU is booted, and if an error occurs, operate the LSI external power supply control unit (PMIC) to switch AWO = ON and OTHERS = OFF state to match the internal power supply status with the actual power supply status.

4.4.9.8 Boot Sequence (Debug Mode)

The procedure is similar to **4.4.9.7 Boot Sequence (Normal Mode)**.

After the completion of **4.4.7.5 CA55 Boot (Debug Mode)**, perform the following settings, as required.

- Startup of individual PLLs: See **4.4.9.4.1 Procedure for setting the PLL normal mode (changing the output frequency and SSC mode)**.
- Clock selector settings: See **4.4.9.6 Procedure for Setting Static Switching Dividers and Selectors**.
- Clock divider ratio setting: See **4.4.9.5 Procedure for Setting Frequency Division Ratios of Dynamic Switching Dividers**.
- Setting individual unit clocks to ON: See **4.4.9.1 Procedure for Switching Unit Clock Signals On and Off**.
- Releasing individual unit resets: See **4.4.9.2 Procedure for Switching Unit Resets On and Off**.

Moreover, when the PD_OTHERS power area is to be activated, the following settings should be made.

- Turn on the PD_OTHERS area according to the procedure described in “Initializing the PD_OTHERS Area”. (See **4.5 Power Management Unit (PMU)**)
- Apply the SRAM recovery bit according to the procedure “Case 2: When the PD_OTHERS domain is powered on (CM33 boot)” in **4.4.7.1 SRAM Rescue Circuit Control**.
- Change the source clock of CA55_0_SCLK as required. See **4.4.9.6 Procedure for Setting Static Switching Dividers and Selectors**.
- Change the frequency of CA55_0_SCLK, CA55_0_PERIPHCLK, CA55_0_SCLK, and CA55_0_CORECLK[3:0] as required.
- Start up the CA55.

Release the reset of CA55 and turn on the P-channel by software. (See **2.2 CPU**.)

After that, perform the following settings, as required.

- Startup of individual PLLs: See **4.4.9.4.1 Procedure for setting the PLL normal mode (changing the output frequency and SSC mode)**.
- Clock selector settings: See **4.4.9.6 Procedure for Setting Static Switching Dividers and Selectors**.
- Clock divider ratio setting: See **4.4.9.5 Procedure for Setting Frequency Division Ratios of Dynamic Switching Dividers**.
- Setting individual unit clocks to ON: See **4.4.9.1 Procedure for Switching Unit Clock Signals On and Off**.
- Releasing individual unit resets: See **4.4.9.2 Procedure for Switching Unit Resets On and Off**.

NOTE

If an error system reset occurs after turning on the PD_OTHERS and PD_CA55 power supply areas according to the PD_OTHERS area power control procedure after the CM33 boot, the PD_OTHERS and PD_CA55 power supply areas will remain ON, but the PMU will be in the initial state (PD_OTHERS and PD_CA55 power supply areas are set OFF) and this resulted in an inconsistent state. To resolve this inconsistency, check **4.4.4.15 Error Reset Registers (CPG_ERROR_RSTm) (m = 2 to 9)** after the CPU is booted, and if an error occurs, operate the LSI external power supply control unit (PMIC) to switch AWO = ON and OTHERS = OFF state to match the internal power supply status with the actual power supply status.

4.4.9.9 Procedure for Writing to Registers

There are two types of writable registers: those with write enable bits and those without write enable bits.

In the registers with write enable bits, the upper 16 bits are write-enabled and the lower 16 bits are normal data bits, allowing the value of only specific bits to be changed without read-modify-write.

To change the bit value, set the +16 of the bit number to be changed to 1b before writing.

(e.g., to set bit[0] to 1b, write 0001_0001h; to set bit[0] to 0b, write 0001_0000h; for 0000_xxxxh, the value of bit[15:0] does not change.)

Remark Some data registers support multiple bits of data for a single write enable bit. Refer to the functional description of each register.

4.4.9.10 Procedure for CM33 Warm Reset

When applying a CM33 warm reset, follow the procedure below.

1. Set the CPG_LP_CTL1.CM33WRESET_REQ register to 1b (requesting a CM33 warm reset) with the CM33.
2. Set the CPG_LP_CTL2.INTMASK_CM33_I register to 1b (masking interrupts for the Cortex-M33 from the ICU) with the CM33. When this register is set to 1b, the CPG outputs 1 to CM33_INTMASK of the ICU.
3. Set the SYSRESETREQ register in the CM33 to 1b with the CM33. After that, the CPG_LP_CM33CTL0.CM33_WARMRESETREQ register of the CPG is set to 1b.
4. Execute a WFI with the CM33.

4.4.10 Restrictions

4.4.10.1 CM33 Systick Timer

When the CM33_CLK0 clock frequency is switched, the period of the CM33_CLK0EN signal for Systick timer counting is not guaranteed only for the first pulse after the clock frequency switch. Therefore, the Systick timer count register must be reset.

4.4.10.2 Restrictions on Using the Individual PLLs

Since PLLCM33 is the system clock that is constantly running, the user cannot switch it arbitrarily.

Since PLLCA55 is the operating clock for the CA55, any changes to the settings after the PD_OTHERS area is activated must be performed in CM33.

Because PLLCLN/PLLDTY is the system clock used for the bus, the setting cannot be switched after the PD_OTHERS area is activated.

PLLVDO/PLLDRP/PLLGPU/PLLETH/PLLDSI/PLLDDR0 can be set, oscillated, and stopped at any timing by the user as long as it does not violate the usage conditions of the corresponding units.

4.4.10.3 Low Power Mode Transition Conditions

The following conditions apply when combining low power (LP) mode transitions.

Table 4.4-54 LP Mode Transition Conditions (CA55 Boot)

Current LP Mode	Next LP Mode				
	Module Standby	Low-Frequency	SRAM Power-Saving	CM33 Sleep	CA55 Sleep
Module standby	—	○	△*4	△*1	△*1
Low-frequency	○	—	△*4	△*2	△*2
SRAM power-saving	○	○	—	△*4	△*4
CM33 sleep	△*1	△*1	△*5	—	○
CA55 sleep	×	×	×	×	—

Table 4.4-55 LP Mode Transition Conditions (CM33 Boot, AWO Mode)

Current LP Mode	Next LP Mode					
	Module Standby	Low-Frequency	SRAM Power-Saving	CM33 Sleep	Software Standby (CM33)	ALL_ON Transition
Module standby	—	○	△*4	△*1	△*1	△*2
Low-frequency	○	—	△*4	△*1	△*1	△*3
SRAM power-saving	○	○	—	△*5	△*5	△*2
CM33 sleep	×	×	×	—	×	×
Software standby (CM33)	×	×	×	×	—	×

Table 4.4-56 LP Mode Transition Conditions (CM33 Boot, ALL_ON Mode)

Current LP Mode	Next LP Mode					
	Module Standby	Low-Frequency	SRAM Power-Saving	CM33 Sleep	CA55 Sleep	AWO Transition
Module standby	—	○	△*1	△*1	△*1	○
Low-frequency	○	—	△*1	△*1	△*1	○
SRAM power-saving	○	○	—	△*5	△*5	○
CM33 sleep	×	×	×	—	×	×
CA55 sleep	△*1	△*1	△*5	○	—	○

Remarks: ○: Transition is possible.
△: Transition is conditionally possible.
×: Transition is not possible.

Note 1. The return source function must be ready for use (clocked and released from the reset).

Note 2. The units that are required for booting the PD_OTHERS area (such as CA55) must be ready for use.

Note 3. The frequency setting of the PD_OTHERS area is initialized.
Accordingly, low-frequency mode for the PD_OTHERS area is released forcibly.

Note 4. The SRAM for the main CPU (when booting the CM33: CM33; when booting the CA55: CA55) must be ready for use.

Note 5. The SRAM used by the return source function must be ready for use.

SECTION 4 SYSTEM

4.5 Power Management Unit (PMU)

This section describes the PMU functions of this LSI.

4.5.1 Overview

The power management unit (PMU) is a unit in the CPG, and includes the power control unit (PCU) and the power sequence controller (PWC).

The PCU shuts down the undefined signals from PD_OTHERS to PD_AWO and PD_CA55 to PD_AWO (power supply isolation), which is required to control the power supply On/Off of PD_OTHERS and PD_CA55.

The PWC is a unit to sequentially set enable signals for external power switches.

The following is a block diagram of the PMU.

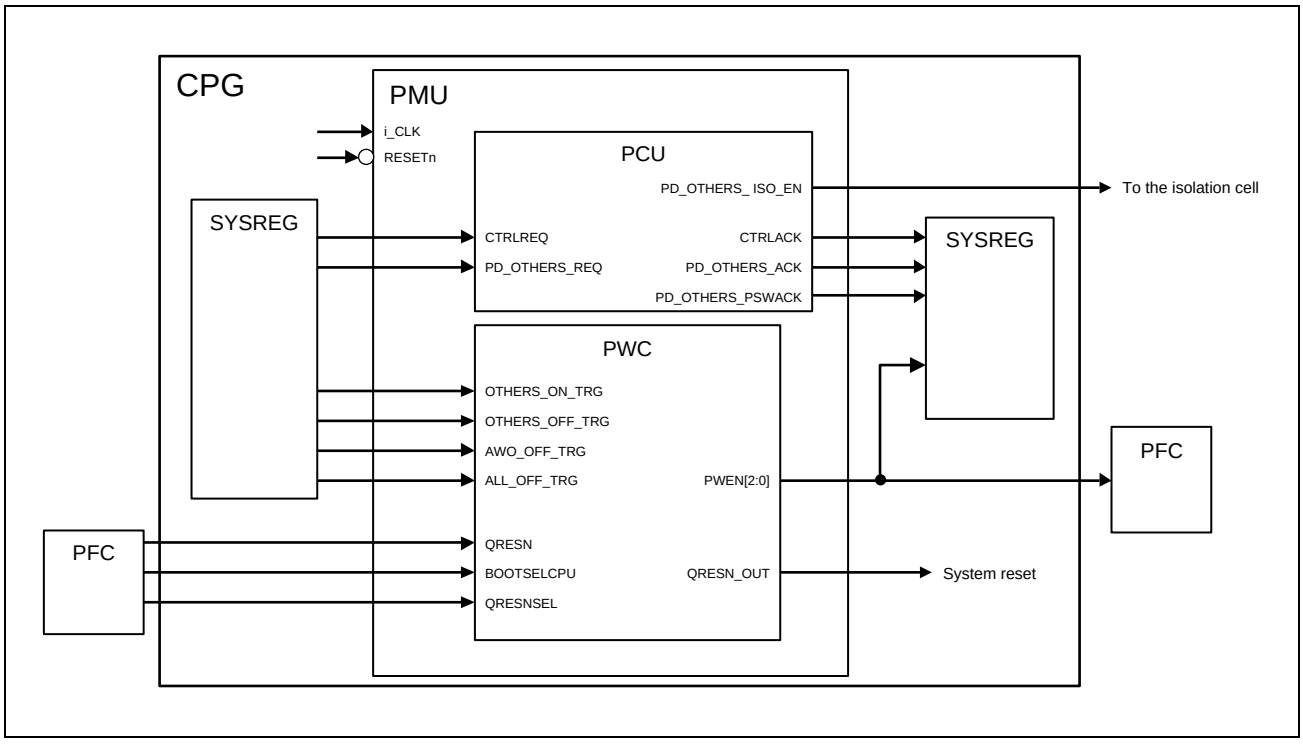

Figure 4.5-1 Block Diagram of PMU

4.5.2 Pin Description

This section describes the pins of the PMU (PWC).

Table 4.5-1 List of PWC Pins

Pin Name	Input/Output	Description
QRESNSEL	Input	PWC enable/disable selection signal Low: PWC enabled High: PWC disabled (QRESN performs a system reset)
PWEN0	Output	Enable pin [0] for the external power switch
PWEN1	Output	Enable pin [1] for the external power switch
PWEN2	Output	Enable pin [2] for the external power switch

4.5.3 Power Domains

This LSI has multiple power supply domains and performs power ON/OFF control in block units. The power domains are classified into four types: PD_AWO, PD_OTHERS, PD_CA55, and PD_DDR0. See **Table 4.5-2** for available combinations.

The PMU controls the isolation cell (hereafter referred to as ISO cell) that is placed between power domains. See **Figure 4.5-2** for the outline of the configuration.

Table 4.5-3 shows the power domain to which the respective unit is assigned.

Table 4.5-2 Operating Combinations of Power Domains

Note 1. Use this channel, when controlling by RIIC is required while PMIC is in use.

4.5.3.1 Power Domain Control

There are two power modes: AWO mode and ALL_ON mode.

(1) In AWO mode, power is supplied to the PD_AWO area only.
(2) In ALL_ON mode, power is supplied to all power supply areas.

In the case of CM33 booting, the CM33 is in AWO mode immediately after the booting. After the CM33 is booted, the mode can be switched between AWO mode and ALL_ON mode as desired.

For CA55 booting, only the ALL_ON mode is available, and switching to the AWO mode is not supported.

The following describes the procedure for switching modes and for changing the PD_CA55 voltage.

4.5.3.1.1 Power mode (AWO → ALL_ON)

Table 4.5-4 Switching Procedure from AWO to ALL_ON

Step	CPU	Processing	Remarks
Pre-process			
1	CM33	Assert the reset of units in the PD_OTHERS area / PD_CA55 area / PD_DDR0 area	CPG_RST_n register (n= 0 to 17)
2	CM33	Assert the reset of the CPG circuit in the OTHERS area	CPG_OTHERS_INI.OTHERS_RST = 1b
3	CM33	Power on for the PD_OTHERS area / PD_CA55 area / PD_DDR0 area	RIIC and PFC control
4	CM33	Waiting for stabilization of power supply for the PD_OTHERS area / PD_CA55 area / PD_DDR0 area	Timer-system unit control
Entry			
1*1	CM33	Control the PMU to supply power to the OTHERS area *Note*: The PWEN1 and PWEN2 pins are driven high by the operation described above.	CPG_LP_PWC_CTL1.OTHERS_ON_TRG = 1b
2*1	CM33	Check that PWEN1 and PWEN2 are valid	CPG_LP_PWC_CTL2.PWEN[2:1] = 11b
3*1	CM33	Deassert OTHERS_ON_TRG	CPG_LP_PWC_CTL1.OTHERS_ON_TRG = 0b
4	CM33	Check that MSTOP between ACPU bus and MCPU bus is set (1b). If not, set it to 1.	CPG_BUS_12_MSTOP.MSTOP9_ON = 1b CPG_BUS_12_MSTOP.MSTOP10_ON = 1b
5	CM33	Deassert the reset of the CPG circuit in the OTHERS area	CPG_OTHERS_INI.OTHERS_RST = 0b
6	CM33	PLL startup: Change the operation mode (reset release)	CPG_*_STBY.RESETB = 1b
7	CM33	PLL startup: Check the Lock (polling)	CPG_PLL*_MON.PLLn__LOCK = 0b to 1b
8	CM33	Supply clock for units in the PD_OTHERS area / PD_CA55 area	See **4.4 Clock Pulse Generator (CPG)**.
9	CM33	Request the PMU to set PD_OTHERS to ON	CPG_LP_PMU_CTL1.PD_OTHERS_REQ = 1b
10	CM33	Request the PMU to control the power supply domain (can be controlled simultaneously with Step 9 above)	CPG_LP_PMU_CTL1.CTRLREQ = 1b
11	CM33	Check (polling) the completion of power domain control and the state (ON state) of PD_OTHERS	CPG_LP_PMU_CTL1.CTRLACK = 0b CPG_LP_PMU_CTL1. PD_OTHRES_ACK = 1b
12	CM33	Clear the request for control of the power domain	CPG_LP_PMU_CTL1.CTRLREQ = 0b
13	CM33	Check (polling) the status of the completion flag for SRAM rescue information transfer	OTP_HANDSHAKE_MON.DFT_DONE=1b
Post-process			
1	CM33	Deassert the reset of units in the PD_OTHERS area	See **4.4 Clock Pulse Generator (CPG)**.
2	CM33	Clear MSTOP between ACPU bus and MCPU bus (0b)	CPG_BUS_12_MSTOP.MSTOP9_ON = 0b CPG_BUS_12_MSTOP.MSTOP10_ON = 0b
3	CM33	Cluster warm reset (Normal reset release and CA55 core 0 startup) procedure	See **2.2 CPU**.

Note 1. When PWC is disabled, control the external power according to the power-on sequence procedure.

4.5.3.1.2 Power mode (ALL_ON → AWO)

Table 4.5-5 Switching Procedure from ALL_ON to AWO

Step	CPU	Processing	Remarks
Pre-process			
1	CM33	Stop DMA for units with DMA	—
2	CM33	Set the multiplexed pins of the PFC to port mode (PMC_mn = 0) *Note*: If the port is connected to a device that is powered off, set it to Hi-Z.	See **4.2 Pin Function Controller (PFC)**.
Entry			
1	CM33	Set MSTOP between ACPU bus and MCPU bus (1b)	CPG_BUS_12_MSTOP.MSTOP9_ON = 1b CPG_BUS_12_MSTOP.MSTOP10_ON = 1b
2	CM33	Request the PMU to set PD_OTHERS to OFF	CPG_LP_PMU_CTL1.PD_OTHERS_REQ = 0b
3	CM33	Request the PMU to control the power supply domain (can be controlled simultaneously with Step 2 above)	CPG_LP_PMU_CTL1.CTRLREQ = 1b
4	CM33	Check (polling) the completion of power domain control and the state (OFF state) of PD_OTHERS	CPG_LP_PMU_CTL1.CTRLACK = 0b CPG_LP_PMU_CTL1.PD_OTHRES_ACK = 0b
5	CM33	Clear the request for control of the power domain	CPG_LP_PMU_CTL1.CTRLREQ = 0b
6	CM33	Set PLLs in the PD_OTHERS area/PD_CA55 area/PD_DDR0 area to the reset state Change the operation mode (Active → Reset state)	CPG_*_STBY.RESETB = 0b
7*1	CM33	Control the PMU to power off the OTHERS area *Note*: The PWEN1 and PWEN2 pins are driven low by the operation described above.	CPG_LP_PWC_CTL1.OTHERS_OFF_TRG = 1b
8*1	CM33	Check that PWEN1 and PWEN2 are invalid	CPG_LP_PWC_CTL2.PWEN[2:1] = 00b
9*1	CM33	Deassert OTHERS_OFF_TRG	CPG_LP_PWC_CTL1.OTHERS_OFF_TRG = 0b
Post-process			
1	CM33	Shut down power to the PD_OTHERS area / PD_CA55 area / PD_DDR0 area	RIIC and PFC control

Note 1. When PWC is disabled, control the external power according to the power-off sequence procedure.

4.5.3.1.3 PD_CA55 area voltage change

(1) When the power is not shut off (CA55 clock switching procedure is similar)

Table 4.5-6 PD_CA55 Area Voltage Change Procedure

Step	CPU	Processing	Remarks
1	CM33	Execute the shutdown procedure for the CA55	See **2.2 CPU**.
2	CM33	Wait for 128 CLK@24 MHz or longer	Timer-system unit control
3	CM33	Stop all CA55 clocks (CA55_0_PCLK, CA55_0_ATCLK, CA55_0_ACLK, CA55_0_GICCLK, and CA55_0_TSCLK) by controlling the CGC *Note*: CA55_0_CORECLK[3:0] and CA55_0_PERIPHCLK cannot be stopped because they have no CGC.	See **4.4 Clock Pulse Generator (CPG)**.
4	CM33	Assert the reset of PLLCA55	CPG_PLL3_STBY.RESETB = 0b
5	CM33	Changes the voltage in the PD_CA55 area *Note*: Step 5 is skipped if clock switching is only performed without changing the voltage.	RIIC and PFC control
6	CM33	Switch the Frequency of the PLL	See **4.4 Clock Pulse Generator (CPG)**.
7	CM33	Select the PLL which is used as source of CA55_0_SCLK	See **4.4 Clock Pulse Generator (CPG)**.
8	CM33	Supply all CA55 clocks (CA55_0_PCLK, CA55_0_ATCLK, CA55_0_ACLK, CA55_0_GICCLK, and CA55_0_TSCLK) by controlling the CGC	See **4.4 Clock Pulse Generator (CPG)**.
9	CM33	Wait for 128 CLK@24 MHz or longer	Timer-system unit control
10	CM33	Execute the procedure to release a cold reset on the CA55. *Note*: After releasing the reset of group A, release the reset of group B after a lapse of 64 CLK@24 MHz or longer.	See **2.2 CPU**.

(2) When the power is shut off

Set the power mode to AWO, set (change) the voltage in the PD_CA55 area, and then shift the power mode to ALL_ON again.

4.5.4 PWC Functional Description

The operation of the PWC depends on the state of the BOOTSELCPU pin (CA55 boot mode or CM33 boot mode) of this LSI. For the PWC sequences, refer to **10.1 Electrical Characteristics**.

When PWC is disabled, control the external power according to the power-on/power-off sequence procedure.

Remark To enable the PWC function, the QRESNSEL pin must be driven low, as described in **Table 4.5-2**.

4.5.4.1 CA55 Boot Mode

At startup:

HW control: Starting from the rising edge of QRESN, the PWEN[0] → [1] →[2] → QRESN_OUT signals are sequentially activated.

At shutdown:

SW control: Set CPG_LP_PWC_CTL1.ALL_OFF_TRG to 1b.

HW control: After the above setting, the opposite operation from startup is performed.

4.5.4.2 CM33 Boot Mode

AWO is on at startup:

HW control: Starting from the rising edge of QRESN, the PWEN[0] and QRESN_OUT signals are sequentially activated.

OTHERS is on:

SW control: Set CPG_LP_PWC_CTL1.OTHERS_ON_TRG to 1b.

HW control: After the above setting, the PWEN[1] → [2] signals are sequentially activated.

OTHERS is off:

SW control: Set CPG_LP_PWC_CTL1.OTHERS_OFF_TRG to 1b.*[1]

HW control: After the above setting, the PWEN[2] → [1] signals are sequentially activated.

AWO is off:

SW control: Set CPG_LP_PWC_CTL1.AWO_OFF_TRG to 1b.*[1]

HW control: After the above setting, the QRESN_OUT → PWEN[0] signals are sequentially activated.

Note 1. By setting CPG_LP_PWC_CTL1.ALL_OFF_TRG to 1b, OTHERS then AWO can be turned off sequentially.

4.5.5 Usage Note

4.5.5.1 Initialization of PD_OTHERS

Turning the PD_OTHERS area on after the CM33 boot requires initialization of this area. Initialization is done by the CPG register control.

Initialization proceeds by turning the reset on and providing a clock supply period for the units in the PD_OTHERS area. To supply clocks, the PLL oscillation for the PD_OTHERS area is required.

For the list of the units in the PD_OTHERS area that requires initialization, see **Table 4.5-3**.

NOTE

Individual ON/OFF settings for SYSTEM BUS in the PD_OTHERS area are not recommended.

SECTION 4 SYSTEM

4.6 Interrupt Controller

This section describes the interrupt control systems of this LSI chip, specifically the interrupt control unit (ICU), generic interrupt controller (GIC), and message handling unit (MHU).

This manual is a simplified version. For more information, refer to the User's Manual Additional Document.

4.6.1 Interrupt Control Unit (ICU)

The ICU uses internal registers to proceed with the interrupt event processing such as masking, logical inversion, retention of source factors, output of interrupt and event signals, and the generation of error reset triggers.

4.6.1.1 Functional Block Diagram

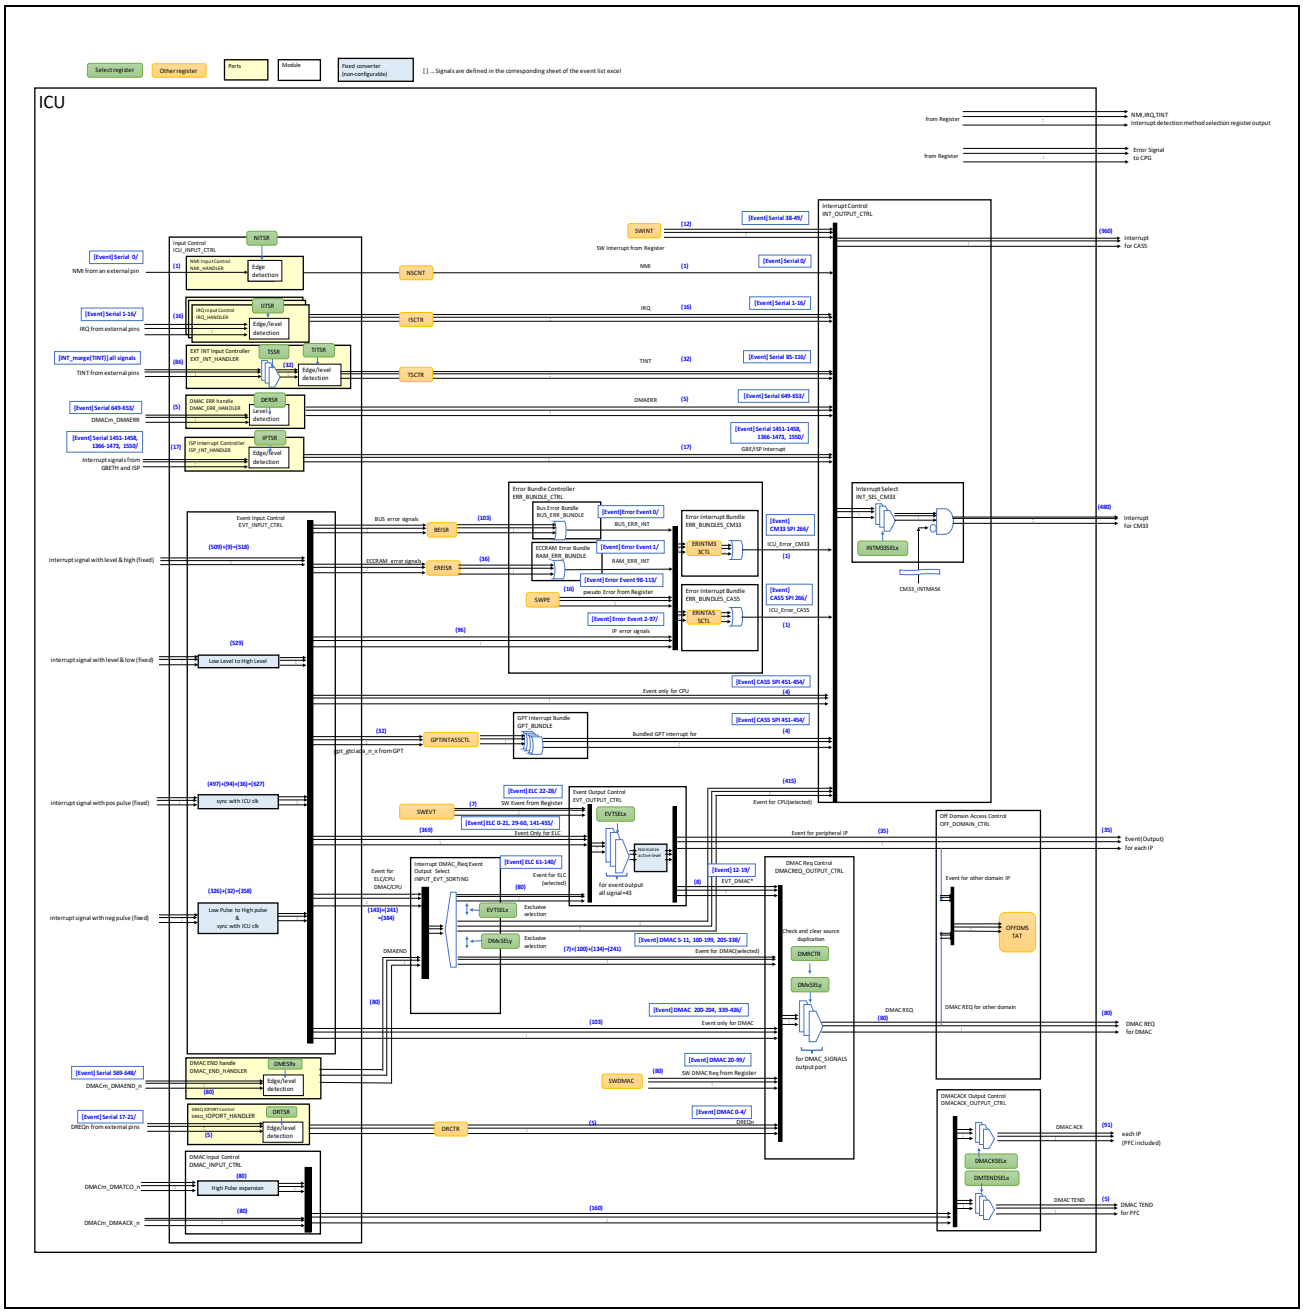

Figure 4.6-1 Block Diagram of the ICU

4.6.1.2 Registers

The base addresses for the ICU registers are given below.

Table 4.6-1 Register Base Addresses

Base Address Name	Base Address
<ICU_base>	0_1040_0000h (5040_0000h*1, 4040_0000h*2)

Note 1. CM33 address space (non-secure)

Note 2. CM33 address space (secure)

4.6.1.2.1 List of Registers

The registers are listed below.

Register Name	Abbreviation	Initial Value	Offset Address	Access Size [bits]
NMI status register	ICU_NSCNT	0000_0000h	0000h	32
NMI status clear register	ICU_NSCLR	0000_0000h	0004h	32
NMI detection method selection register	ICU_NITSR	0000_0000h	0008h	32

4.6.1.2.2 Register Description

The ICU has two reset signals.

- **PRESETn_I:**
  - Asserted on various resets.
- **ERROR_RESETn:**
  - Asserted at the reset by the QRESN pin.
  - Not asserted on a system software reset or error reset.

Remark Some registers are initialized with ERROR_RESETn. Refer to each register description for details.

The prefix (ICU_) of the register names is omitted in this and subsequent sections.

(1) NMI Status Register (ICU_NSCNT)

[Secure group: Gr1]

This register indicates the state of the NMI.

Access Size : 32 bits
Address : <ICU_base> + 0000h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	NSMON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	NSTAT
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
16	NSMON	0h	R	Indicates the NMI pin level. 0b: The NMI pin is at the low level. 1b: The NMI pin is at the high level.
15 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
0	NSTAT	0h	R	Indicates the detection of an NMI interrupt. 0b: No NMI detected 1b: NMI detected

(2) NMI Status Clear Register (ICU_NSCLR)

[Secure group: Gr1]

This register clears the NMI state flag.

Remark When the NMI is to be used, use this register to clear the NMI state flag and enable acceptance of interrupts on the CPU side before doing so.
Clear the status flag after setting the ICU_NITSR register.

Access Size : 32 bits
Address : <ICU_base> + 0004h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	NCLR
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
0	NCLR	0h	W	The read value is undefined Clears the error factor of the event allocated in the corresponding bit by writing 1b.

(3) NMI Detection Method Selection Register (ICU_NITSR)

[Secure group: Gr1]

This register controls the method of detecting the NMI.

Remark When the NMI is to be used, set up this register and enable acceptance of interrupts on the CPU side before doing so.

Access Size : 32 bits
Address : <ICU_base> + 0008h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	NTSEL
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
0	NTSEL	0h	RW	The interrupt detection method for NMI is selected. 0b: Falling edge detection 1b: Rising edge detection

(4) IRQ Status Register (ICU_ISCTR)

[Secure group: Gr1]

This register indicates the states of the IRQn interrupts.

Access Size : 32 bits

Address : <ICU_base> + 0010h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ISTAT15	ISTAT14	ISTAT13	ISTAT12	ISTAT11	ISTAT10	ISTAT9	ISTAT8	ISTAT7	ISTAT6	ISTAT5	ISTAT4	ISTAT3	ISTAT2	ISTAT1	ISTAT0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
15 to 0	ISTATn	0h	R	Indicates the detection of an IRQn interrupt. 0b: No IRQn detected 1b: IRQn detected

(5) IRQ Status Clear Register (ICU_ISCLR)

[Secure group: Gr1]

This register clears the state flags for the IRQn interrupts.

Remark When the IRQ interrupts are to be used, use this register to clear the IRQ state flags and enable acceptance of interrupts on the CPU side before doing so.
Clear the status flag after setting the ICU_IITSR register.

Access Size : 32 bits
Address : <ICU_base> + 0014h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ICLR15	ICLR14	ICLR13	ICLR12	ICLR11	ICLR10	ICLR9	ICLR8	ICLR7	ICLR6	ICLR5	ICLR4	ICLR3	ICLR2	ICLR1	ICLR0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
15 to 0	ICLRn	0h	W	The read value is undefined Clears the error factor of the event allocated in the corresponding bit by writing 1b.

(6) IRQ Interrupt Detection Method Selection Register (ICU_IITSR)

[Secure group: Gr1]

This register controls the method of detecting the IRQ interrupts.

Remark 1. When the IRQ interrupts are to be used, set up this register and enable acceptance of interrupts on the CPU side before doing so.

Remark 2. This register can be set in a one-word unit, so making the settings for multiple interrupts at the same time is possible. Take care with the settings so that only the target bits are changed (for example, use a read-modify-write operation).

Access Size : 32 bits
Address : <ICU_base> + 0018h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	IITSEL15[1:0]		IITSEL14[1:0]		IITSEL13[1:0]		IITSEL12[1:0]		IITSEL11[1:0]		IITSEL10[1:0]		IITSEL9[1:0]		IITSEL8[1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	IITSEL7[1:0]		IITSEL6[1:0]		IITSEL5[1:0]		IITSEL4[1:0]		IITSEL3[1:0]		IITSEL2[1:0]		IITSEL1[1:0]		IITSEL0[1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31, 30	IITSEL15[1:0]	0h	RW	The interrupt detection method for IRQ15 is selected. 00b: Low-level detection 01b: Falling edge detection 10b: Rising edge detection 11b: Falling edge/rising edge detection
29, 28	IITSEL14[1:0]	0h	RW	The interrupt detection method for IRQ14 is selected. 00b: Low-level detection 01b: Falling edge detection 10b: Rising edge detection 11b: Falling edge/rising edge detection
27, 26	IITSEL13[1:0]	0h	RW	The interrupt detection method for IRQ13 is selected. 00b: Low-level detection 01b: Falling edge detection 10b: Rising edge detection 11b: Falling edge/rising edge detection
25, 24	IITSEL12[1:0]	0h	RW	The interrupt detection method for IRQ12 is selected. 00b: Low-level detection 01b: Falling edge detection 10b: Rising edge detection 11b: Falling edge/rising edge detection
23, 22	IITSEL11[1:0]	0h	RW	The interrupt detection method for IRQ11 is selected. 00b: Low-level detection 01b: Falling edge detection 10b: Rising edge detection 11b: Falling edge/rising edge detection
21, 20	IITSEL10[1:0]	0h	RW	The interrupt detection method for IRQ10 is selected. 00b: Low-level detection 01b: Falling edge detection 10b: Rising edge detection 11b: Falling edge/rising edge detection

Bit	Bit Name	Initial Value	R/W	Description
19, 18	IITSEL9[1:0]	0h	RW	The interrupt detection method for IRQ9 is selected. 00b: Low-level detection 01b: Falling edge detection 10b: Rising edge detection 11b: Falling edge/rising edge detection
17, 16	IITSEL8[1:0]	0h	RW	The interrupt detection method for IRQ8 is selected. 00b: Low-level detection 01b: Falling edge detection 10b: Rising edge detection 11b: Falling edge/rising edge detection
15, 14	IITSEL7[1:0]	0h	RW	The interrupt detection method for IRQ7 is selected. 00b: Low-level detection 01b: Falling edge detection 10b: Rising edge detection 11b: Falling edge/rising edge detection
13, 12	IITSEL6[1:0]	0h	RW	The interrupt detection method for IRQ6 is selected. 00b: Low-level detection 01b: Falling edge detection 10b: Rising edge detection 11b: Falling edge/rising edge detection
11, 10	IITSEL5[1:0]	0h	RW	The interrupt detection method for IRQ5 is selected. 00b: Low-level detection 01b: Falling edge detection 10b: Rising edge detection 11b: Falling edge/rising edge detection
9, 8	IITSEL4[1:0]	0h	RW	The interrupt detection method for IRQ4 is selected. 00b: Low-level detection 01b: Falling edge detection 10b: Rising edge detection 11b: Falling edge/rising edge detection
7, 6	IITSEL3[1:0]	0h	RW	The interrupt detection method for IRQ3 is selected. 00b: Low-level detection 01b: Falling edge detection 10b: Rising edge detection 11b: Falling edge/rising edge detection
5, 4	IITSEL2[1:0]	0h	RW	The interrupt detection method for IRQ2 is selected. 00b: Low-level detection 01b: Falling edge detection 10b: Rising edge detection 11b: Falling edge/rising edge detection
3, 2	IITSEL1[1:0]	0h	RW	The interrupt detection method for IRQ1 is selected. 00b: Low-level detection 01b: Falling edge detection 10b: Rising edge detection 11b: Falling edge/rising edge detection
1, 0	IITSEL0[1:0]	0h	RW	The interrupt detection method for IRQ0 is selected. 00b: Low-level detection 01b: Falling edge detection 10b: Rising edge detection 11b: Falling edge/rising edge detection

(7) TINT Status Register (ICU_TSCTR)

[Secure group: Gr1]

This register indicates the states of the TINTn interrupts.

Access Size : 32 bits

Address : <ICU_base> + 0020h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	TSTATn	0h	R	Indicates the detection of a TINTn interrupt. 0b: No TINTn detected 1b: TINTn detected

(8) TINT Status Clear Register (ICU_TSCLR)

[Secure group: Gr1]

This register clears the state flags for the TINTn interrupts.

Remark When the TINT interrupts are to be used, use this register to clear the TINT state flags and enable acceptance of interrupts on the CPU side before doing so.
Clear the status flag after setting the ICU_TITSRk and ICU_TSSRk registers.

Access Size : 32 bits
Address : <ICU_base> + 0024h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	TCLRn	0h	W	The read value is undefined When the type of TINTn interrupt detection is set for falling edge detection or rising edge detection with the TINT interrupt detection method selection register (TITSR) When TSTATn = 1b 1b: The TINTn interrupt detection is cleared (the status changes from "detected" to "not detected"). 0b: Writing has no effect. When TSTATn = 0b Writing has no effect. When high-level detection or low-level detection is selected in ITSRx, writing to these bits has no effect.

(9) TINT Detection Method Selection Register k (ICU_TITSRk) (k = 0, 1)

[Secure group: Gr1]

These registers control the method of detecting the TINT interrupts.

Remark 1. When the TINT interrupts are to be used, set up these registers and enable acceptance of interrupts on the CPU side before doing so.

Remark 2. This register can be set in a one-word unit, so making the settings for multiple interrupts at the same time is possible. Take care with the settings so that only the target bits are changed (for example, use a read-modify-write operation).

Access Size : 32 bits

Address : <ICU_base> + 0028h + k x 0004h

Initial Value : 0000_0000h

(10) TINT Source Selection Register k (ICU_TSSRk) (k = 0 to 7)

[Secure group: Gr1]

These registers control the input sources of TINTn interrupts.

Remark 1. When the TINT interrupts are to be used, set up these registers and enable acceptance of interrupts on the CPU side before doing so.

Remark 2. This register can be set in a one-word unit, so making the settings for multiple interrupts at the same time is possible. Take care with the settings so that only the target bits are changed (for example, use a read-modify-write operation).

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
4	DRSTAT4	0h	R	Indicates the detection of a DREQ4 interrupt. 0b: No DREQn detected 1b: DREQn detected
3	DRSTAT3	0h	R	Indicates the detection of a DREQ3 interrupt. 0b: No DREQn detected 1b: DREQn detected
2	DRSTAT2	0h	R	Indicates the detection of a DREQ2 interrupt. 0b: No DREQn detected 1b: DREQn detected
1	DRSTAT1	0h	R	Indicates the detection of a DREQ1 interrupt. 0b: No DREQn detected 1b: DREQn detected
0	DRSTAT0	0h	R	Indicates the detection of a DREQ0 interrupt. 0b: No DREQn detected 1b: DREQn detected

(12) DREQ Status Clear Register (ICU_DRCLR)

[Secure group: Gr1]

This register clears the state flags for the DREQn interrupts.

Remark When the DREQ interrupts are to be used, use this register to clear the DREQ state flags before doing so. Clear the status flag after setting the ICU_DRTSR register.

Access Size : 32 bits

Address : <ICU_base> + 0054h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	W	W	W	W	W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	-	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
4	DRCLR4	0h	W	The read value is undefined Clears the error factor of the event allocated in the corresponding bit by writing 1.
3	DRCLR3	0h	W	The read value is undefined Clears the error factor of the event allocated in the corresponding bit by writing 1.
2	DRCLR2	0h	W	The read value is undefined Clears the error factor of the event allocated in the corresponding bit by writing 1.
1	DRCLR1	0h	W	The read value is undefined Clears the error factor of the event allocated in the corresponding bit by writing 1.
0	DRCLR0	0h	W	The read value is undefined Clears the error factor of the event allocated in the corresponding bit by writing 1.

(13) DREQ Detection Method Selection Register (ICU_DRTSR)

[Secure group: Gr1]

This register controls the method of detecting the DREQ interrupts.

Remark 1. When the DREQ interrupts are to be used, set up this register and make the setting for starting the acceptance of DMAC requests before doing so.

Remark 2. This register can be set in a one-word unit, so making the settings for multiple interrupts at the same time is possible. Take care with the settings so that only the target bits are changed (for example, use a read-modify-write operation).

Access Size : 32 bits
Address : <ICU_base> + 0058h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-

Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
9, 8	DRITSEL4[1:0]	0h	RW	The interrupt detection method for DREQ4 is selected. 00b: Low-level detection 01b: Falling edge detection 10b: Rising edge detection 11b: Falling edge/rising edge detection
7, 6	DRITSEL3[1:0]	0h	RW	The interrupt detection method for DREQ3 is selected. 00b: Low-level detection 01b: Falling edge detection 10b: Rising edge detection 11b: Falling edge/rising edge detection
5, 4	DRITSEL2[1:0]	0h	RW	The interrupt detection method for DREQ2 is selected. 00b: Low-level detection 01b: Falling edge detection 10b: Rising edge detection 11b: Falling edge/rising edge detection
3, 2	DRITSEL1[1:0]	0h	RW	The interrupt detection method for DREQ1 is selected. 00b: Low-level detection 01b: Falling edge detection 10b: Rising edge detection 11b: Falling edge/rising edge detection
1, 0	DRITSEL0[1:0]	0h	RW	The interrupt detection method for DREQ0 is selected. 00b: Low-level detection 01b: Falling edge detection 10b: Rising edge detection 11b: Falling edge/rising edge detection

(14) IP Detection Method Selection Register (ICU_IPTSR)

[Secure group: Gr1]

This register controls the method of detecting interrupt signals from GBETH0, GBETH1, and the ISP.

Remark 1. This register can be set in a one-word unit, so making the settings for multiple interrupts at the same time is possible. Take care with the settings so that only the target bits are changed (for example, use a read-modify-write operation).

Remark 2. The ISP is only present in the RZ/V2NP products.

For more information, refer to the User's Manual Additional Document.

(15) Bus Error Interrupt Status Register k (ICU_BEISRk) (k =0 to 3)

[Secure group: Gr0]

These registers indicate the state of the bus error factors. Even one factor having been detected keeps the bus error interrupt signal (BUS_ERR_INT) of the ICU at the active level.

These registers are reset by the ERROR_RESETn signal. They are not reset by the PRESETn_I signal.

Access Size : 32 bits

Address : <ICU_base> + 0070h + k x 0004h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

(17) ECCRAM Error Interrupt Status Register k (ICU_EREISRk) (k = 0 to 2)

[Secure group: Gr0]

These registers control SRAM errors. Even one factor having been detected keeps the RAM error interrupt signal (RAM_ERR_INT) of the ICU at the active level.

These registers are reset by the ERROR_RESETn signal. They are not reset by the PRESETn_I signal.

Access Size : 32 bits

Address : <ICU_base> + 0090h + k x 0004h

Initial Value : 0000_0000h

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
23 to 16	OFCLRk_[7:0]	0h	W	The read value is undefined When an SRAM error has occurred 1b: The interrupt detection is cleared (the status changes from "detected" to "not detected"). 0b: Writing has no effect. When an SRAM error has not occurred, writing has no effect.
15 to 8	2ECLRk_[7:0]	0h	W	The read value is undefined When an SRAM error has occurred 1b: The interrupt detection is cleared (the status changes from "detected" to "not detected"). 0b: Writing has no effect. When an SRAM error has not occurred, writing has no effect.
7 to 0	1ECLRk_[7:0]	0h	W	The read value is undefined When an SRAM error has occurred 1b: The interrupt detection is cleared (the status changes from "detected" to "not detected"). 0b: Writing has no effect. When an SRAM error has not occurred, writing has no effect.

(19) SW Interrupt Generation Register (ICU_SWINT)

[Secure group: Gr1]

This register generates software interrupts. Writing 1b to the bit corresponding to a given event generates the corresponding software interrupt from the ICU to the CPU.

Access Size : 32 bits
Address : <ICU_base> + 0130h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	IM333	IM332	IM331	IM330
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	W	W	W	W

Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	W	W	W	W

Bit	Bit Name	Initial Value	R/W	Description
31 to 20	-	All 0	R	Reserved Whenever it is read, 0 is read. The written value should always be 0b.
19	IM333	0h	W	The read value is undefined Software interrupt INTM33_3 to CM33 is generated by writing 1b.
18	IM332	0h	W	The read value is undefined Software interrupt INTM33_2 to CM33 is generated by writing 1b.
17	IM331	0h	W	The read value is undefined Software interrupt INTM33_1 to CM33 is generated by writing 1b.
16	IM330	0h	W	The read value is undefined Software interrupt INTM33_0 to CM33 is generated by writing 1b.
15 to 4	-	All 0	R	Reserved Whenever it is read, 0 is read. The written value should always be 0b.
3	IA553	0h	W	The read value is undefined Software interrupt INTA55_3 to CA55 is generated by writing 1b.
2	IA552	0h	W	The read value is undefined Software interrupt INTA55_2 to CA55 is generated by writing 1b.
1	IA551	0h	W	The read value is undefined Software interrupt INTA55_1 to CA55 is generated by writing 1b.
0	IA550	0h	W	The read value is undefined Software interrupt INTA55_0 to CA55 is generated by writing 1b.

(20) SELECT Interrupt CM33 Selection Register k (ICU_INTM33SELk) (k = 0 to 42)

[Secure group: Gr0]

These registers select the sources of interrupts to the CM33 which belong to “SELECT”. The input sources can be selected per CM33 SPI from among those allocated to “SELECT” under the “CM33” column in **Table 4.6-23**. Writing the value equivalent to the number obtained by “SEL + number” under the “CM33 SPI” column in **Table 4.6-23** to the register selects the corresponding event. The inactive value 0 is input to the CM33 SPI in response to any sources that are not selected.

Values in **Table 4.6-23** are decimal numbers.

127 interrupt signals are specifiable. No register bits are allocated to the M33SPIk_SEL1 and M33SPIk_SEL2 signals of the INTM33SEL42 register.

Remark This register can be set in a one-word unit, so making the settings for multiple interrupts at the same time is possible. Take care with the settings so that only the target bits are changed (for example, use a read–modify–write operation).

Access Size : 32 bits
Address : <ICU_base> + 0200h + k x 0004h
Initial Value : 3FFF_FFFFh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31, 30	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
29 to 20	M33SPIk_SEL2 [9:0]	3FFh	RW	The source of the event signal input to CM33 SPI No:y+2 is selected. 0h to 241h: A signal which corresponds to the number listed in "SEL + number" is output. 242 to 3FFh: Not available
19 to 10	M33SPIk_SEL1 [9:0]	3FFh	RW	The source of the event signal input to CM33 SPI No:y+1 is selected. 0h to 241h: A signal which corresponds to the number listed in "SEL + number" is output. 242 to 3FFh: Not available
9 to 0	M33SPIk_SEL0 [9:0]	3FFh	RW	The source of the event signal input to CM33 SPI No:y is selected. 0h to 241h: A signal which corresponds to the number listed in "SEL + number" is output. 242 to 3FFh: Not available

$y = 3 \times k + 353$

(21) Error Interrupt CM33 Status Register k (ICU_ERINTM33CTLk) (k = 0 to 3)

[Secure group: Gr0]

These registers hold the source flags for error interrupts to the CM33 when they have occurred. Even one factor having been detected keeps the error interrupt signal (ICU_Error_CM33) to the CM33 at the active level.

The registers do not hold the source flags for interrupt signals that have been masked by the settings of the ERINTM33MSKk registers.

The individual sources prior to their bundling for BUS_ERR_INT and RAM_ERR_INT are indicated in the BEISRk and BEISRk registers, respectively. Therefore, these registers do not hold the source flags for BUS_ERR_INT and RAM_ERR_INT. The values for BUS_ERR_INT and RAM_ERR_INT are readable.

These registers are reset by the ERROR_RESETn signal. They are not reset by the PRESETn_I signal.

Access Size : 32 bits

Address : <ICU_base> + 0304h + k x 0004h

Initial Value : 0000_0000h

(23) Error Interrupt CM33 Mask Control Register k (ICU_ERINTM33MSKk) (k = 0 to 3)

[Secure group: Gr0]

These registers control whether or not to retain factors of error interrupts to the CM33.

Register bits are allocated to the individual error interrupts. Writing 1b to a bit masks the corresponding error interrupt by preventing retention of the factor.

The interrupt signals are allocated to the register bits in the same way as in **Table 4.6-6**.

Remark 1. The ERINTM33CTLk registers do not cover BUS_ERR_INT and RAM_ERR_INT so these registers do not clear them.

Remark 2. This register can be set in a one-word unit, so making the settings for multiple interrupts at the same time is possible. Take care with the settings so that only the target bits are changed (for example, use a read-modify-write operation).

Access Size : 32 bits

(24) Error Interrupt CA55 Status Register k (ICU_ERINTA55CTLk) (k = 0 to 3)

[Secure group: Gr0]

These registers hold the source flags for error interrupts to the CA55 when they have occurred.

Even one factor having been detected keeps the error interrupt signal to the CA55 at the active level.

The registers do not hold the source flags for interrupt signals that have been masked by the settings of the ERINTA55MSKk registers.

The individual sources prior to their bundling for BUS_ERR_INT and RAM_ERR_INT are indicated in the BEISRk and BEISRk registers, respectively. Therefore, these registers do not hold the source flags for BUS_ERR_INT and RAM_ERR_INT. The values for BUS_ERR_INT and RAM_ERR_INT are readable.

These registers are reset by the ERROR_RESETn signal. They are not reset by the PRESETn_I signal.

The interrupt signals are allocated to the register bits in the same way as in **Table 4.6-6**.

(25) Error Interrupt CA55 Status Clear Register k (ICU_ERINTA55CLRk) (k = 0 to 3)

[Secure group: Gr0]

These registers clear the state flags for factors of error interrupts to the CA55.

The interrupt signals are allocated to the register bits in the same way as in **Table 4.6-7**.

Remark The ERINTA55CTLx registers do not cover BUS_ERR_INT and RAM_ERR_INT so these registers do not clear them.

Access Size : 32 bits

Address : <ICU_base> + 0348h + k x 0004h

Initial Value : 0000_0000h

31 to 0	ERRA5kCLRn	0h	W	Clears the error interrupt detection factor allocated in the corresponding bit by writing 1b. If the value is 0b, it does not change (when read, 0b is always read).

(26) Error Interrupt CA55 Mask Control Register k (ICU_ERINTA55MSKk) (k = 0 to 3)

[Secure group: Gr0]

These registers control whether or not to retain factors of error interrupts to the CA55.

Register bits are allocated to the individual error interrupts. Writing 1 to a bit masks the corresponding error interrupt by preventing retention of the factor.

The interrupt signals are allocated to the register bits in the same way as in **Table 4.6-6**.

Remark 1. The ERINTA55CTLk registers do not cover BUS_ERR_INT and RAM_ERR_INT so these registers do not clear them.

Remark 2. This register can be set in a one-word unit, so making the settings for multiple interrupts at the same time is possible. Take care with the settings so that only the target bits are changed (for example, use a read-modify-write operation).

Access Size : 32 bits

Address : <ICU_base> + 0358h + k x 0004h

Initial Value : 0000_0000h

(27) GPT Interrupt CA55 Status Register (ICU_GPTINTA55CTL)

[Secure group: Gr0]

This register holds the source flags for GPT interrupts (gpt_gtciada_n_0 to gpt_gtciada_n_7 and gpt_gtciadb_n_0 to gpt_gtciadb_n_7) when they have occurred.

Even one factor having been detected keeps the error interrupt signal to the CA55 at the active level.

Bit[7:0] are assigned to the interrupt signals (x = 7 to 0).

Access Size : 32 bits
Address : <ICU_base> + 0368h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

31 to 24	G1IADAk[7:0]	0h	R	State of interrupt gpt_gtciada_n_x of GPT1 0b: No error interrupt detected 1b: Error interrupt detected Writing has no effect.
23 to 16	G1IADBk[7:0]	0h	R	State of interrupt gpt_gtciadb_n_x of GPT1 0b: No error interrupt detected 1b: Error interrupt detected Writing has no effect.
15 to 8	G0IADAk[7:0]	0h	R	State of interrupt gpt_gtciada_n_x of GPT0 0b: No error interrupt detected 1b: Error interrupt detected Writing has no effect.
7 to 0	G0IADBk[7:0]	0h	R	State of interrupt gpt_gtciadb_n_x of GPT0 0b: No error interrupt detected 1b: Error interrupt detected Writing has no effect.

(28) GPT Interrupt CA55 Status Clear Register (ICU_GPTINTA55CLR)

[Secure group: Gr0]

This register clears the state flags for factors of GPT interrupts (gpt_gtciada_n_0 to gpt_gtciada_n_7 and gpt_gtciadb_n_0 to gpt_gtciadb_n_7).

Access Size : 32 bits
Address : <ICU_base> + 036Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	G1IADAkCLR [7:0]	0h	W	The read value is undefined Clears the error interrupt detection factor allocated in the corresponding bit by writing 1b. If the value is 0b, it does not change (when read, 0b is always read).
23 to 16	G1IADBkCLR [7:0]	0h	W	The read value is undefined Clears the error interrupt detection factor allocated in the corresponding bit by writing 1b. If the value is 0b, it does not change (when read, 0b is always read).
15 to 8	G0IADAkCLR [7:0]	0h	W	The read value is undefined Clears the error interrupt detection factor allocated in the corresponding bit by writing 1b. If the value is 0b, it does not change (when read, 0b is always read).
7 to 0	G0IADBkCLR [7:0]	0h	W	The read value is undefined Clears the error interrupt detection factor allocated in the corresponding bit by writing 1b. If the value is 0b, it does not change (when read, 0b is always read).

(29) SW Enhancing Pseudo Error Generation Register (ICU_SWPE)

[Secure group: Gr1]

This register generates software enhancing pseudo error interrupts. A software enhancing pseudo error interrupt is generated in the ICU by writing 1 to a bit corresponding to an event. A pulse lasting for one cycle of PCLK is generated.

Access Size : 32 bits
Address : <ICU_base> + 0370h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-

Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
15 to 0	PEn	0h	W	The read value is undefined A software enhancing pseudo error interrupt is generated by writing 1.

(30) SW DMAC Request Generation Register k (ICU_SWDMACk) (k = 0 to 4)

[Secure group: Gr1]

These registers generate software DMA requests. A software DMA request for transfer by a DMAC channel is generated in the ICU by writing 1 to the bit corresponding to a channel. A pulse lasting for one cycle of PCLK is generated as the DMAC REQ signal.

Remark To use this function, specify the desired type of event in DMAC Factor k Selection Register y (DMkSELy).

Access Size : 32 bits
Address : <ICU_base> + 0400h + k x 0004h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
15 to 0	DkCn	0h	W	The read value is undefined A software DMAC request for ch. n of the DMAC is generated by writing 1.

(31) DMAC Factor k Selection Register y (ICU_DMkSELy) (k = 0 to 4, y = 0 to 7)

[Secure group: Gr1]

These registers select source events for the DMAREQ signals to the DMACs. The events can be set for each DMAREQ signal to the DMACs (for DMAC0 to DMAC4). Writing the value under “DMAC No.” in **Table 4.6-23** to a register selects the corresponding event. Note that all bits of the registers following a reset have the value 1, so no sources are selected at that time and a fixed value is input to the DMAC.

The DkRQ_SEL(y × 2 + 1) and DkRQ_SEL(y × 2) bits can be automatically set for no sources (set to the default value, 3FFh) in response to the DMAC end interrupt. This function is enabled or disabled with the DkSEL_CLRON(y × 2 + 1) and DkSEL_CLRON(y × 2) bits. See **(3) Automatic clearing DMAC factor selection registers**.

Values in **Table 4.6-23** are decimal numbers.

Remark 1. This register can be set in a one-word unit, so making the settings for multiple interrupts at the same time is possible. Take care with the settings so that only the target bits are changed (for example, use a read-modify-write operation).

Remark 2. Duplication of settings between registers is prohibited, so do not set the same value. Writing the same value to the DkRQ_SEL(y × 2 + 1) and DkRQ_SEL(y × 2) bits is also prohibited.

Remark 3. When the DkRQ_SEL(y × 2 + 1) and DkRQ_SEL(y × 2) bits are not to be used, write the default value 3FFh to them.

Access Size : 32 bits

Address : <ICU_base> + 0420h + k x 0020h + y x 0004h

Initial Value : 03FF_03FFh

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DMADUPCLRk_n	0h	W	The read value is undefined Clears the factor allocated in the corresponding bit by writing 1b. If the value is 0b, it does not change.

(34) DMAC ACK Selection Register k (ICU_DMACKSELk) (k = 0 to 22)

[Secure group: Gr1]

These registers select source events for the DMA ACK signals from the DMACs. The events can be set for each DMA ACK signal from the DMACs. Each signal can be connected to any DMAC channel by setting DMAC ACK No.0 to 79 in **Table 4.6-10** for the DACK_SEL bit corresponding to "ACK No." in **Table 4.6-27**.

Note that all bits of the registers following a reset have the value 1, so no sources are selected at that time and a fixed level is input as the ACK signal of each unit.

Values in **Table 4.6-27** are decimal numbers.

Remark 1. In this LSI chip, operation of the DMAC ACK signals is assumed to be based on level detection. Set level detection for the ACK settings on the DMAC side. Use the signals in ways that suit the factors selected in the DMACk factor selection registers y (DMkSELy).

Remark 2. This register can be set in a one-word unit, so making the settings for multiple interrupts at the same time is possible. Take care with the settings so that only the target bits are changed (for example, use a read-modify-write operation).

(35) DMAC TEND Selection Register k (ICU_DMTENDSELk) (k = 0, 1)

[Secure group: Gr1]

These registers select source events for the DMA TEND signals from the DMACs. The events can be set for each DMA TEND signal from the DMACs. Each signal can be connected to any DMAC channel by setting the DMAC TEND No. 0 to 79 in **Table 4.6-11** to the DTEND_SEL bit corresponding to the "TEND No." in **Table 4.6-27**.

Note that all bits of the registers following a reset have the value 1, so no sources are selected at that time and a fixed level is input as the TEND signal of each unit.

Values in **Table 4.6-27** are decimal numbers.

Remark 1. The DMATCO signal of the DMAC is extended by 16 cycles of PCLK and output as the DMA TEND signal. Use the signals in ways that suit the factors selected in the DMACk factor selection registers y (DMkSELy).

Remark 2. Five DMA TEND signals are specifiable. No register bits are allocated to the DTEND_SEL7, DTEND_SEL6, and DTEND_SEL5 signals of the DMTENDSEL1 register.

Remark 3. This register can be set in a one-word unit, so making the settings for multiple interrupts at the same time is possible. Take care with the settings so that only the target bits are changed (for example, use a read-modify-write operation).

(37) DMA ERR Interrupt Detection Method Selection Register (ICU_DERSR)

[Secure group: Gr1]

This register controls the method of detecting DMAC ERR signals.

The DMAERR signals of the DMACs are used as interrupts. Make the settings in ways that suit the settings (level or pulse) on the DMAC side.

Remark This register can be set in a one-word unit, so making the settings for multiple interrupts at the same time is possible. Take care with the settings so that only the target bits are changed (for example, use a read–modify–write operation).

Access Size : 32 bits
Address : <ICU_base> + 057Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
4	DERSEL_4	0h	RW	The interrupt detection method for DMAC ERR is selected. 0b: Level detection 1b: Pulse detection
3	DERSEL_3	0h	RW	The interrupt detection method for DMAC ERR is selected. 0b: Level detection 1b: Pulse detection
2	DERSEL_2	0h	RW	The interrupt detection method for DMAC ERR is selected. 0b: Level detection 1b: Pulse detection
1	DERSEL_1	0h	RW	The interrupt detection method for DMAC ERR is selected. 0b: Level detection 1b: Pulse detection
0	DERSEL_0	0h	RW	The interrupt detection method for DMAC ERR is selected. 0b: Level detection 1b: Pulse detection

Table 4.6-13 Relationship between DMAC ERR Signals and DMESRk

DMAC ERR Signal	DERSEL_n
DMAC1_DMAERR	n = 0
DMAC2_DMAERR	n = 1
DMAC3_DMAERR	n = 2

DMAC ERR Signal	DERSEL_n
DMAC4_DMAERR	n = 3
DMAC0_DMAERR	n = 4

(38) SW Event Output Generation Register (ICU_SWEVT)

[Secure group: Gr1]

This register generates software event output. Software event output is generated in the ICU by writing 1 and then 0 successively to a bit corresponding to the event.

Be sure to write 1b and then 0b successively to a bit.

Remark This register can be set in a one-word unit, so making the settings for multiple interrupts at the same time is possible. Take care with the settings so that only the target bits are changed (for example, use a read–modify–write operation).

Access Size : 32 bits
Address : <ICU_base> + 0600h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-

	-	-	-	-	-	-	-	-	-	SWE6	SWE5	SWE4	SWE3	SWE2	SWE1	SWE0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 7	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
6	SWE6	0h	RW	The software event output is generated by writing 1b. When read, 0b is always read.
5	SWE5	0h	RW	The software event output is generated by writing 1b. When read, 0b is always read.
4	SWE4	0h	RW	The software event output is generated by writing 1b. When read, 0b is always read.
3	SWE3	0h	RW	The software event output is generated by writing 1b. When read, 0b is always read.
2	SWE2	0h	RW	The software event output is generated by writing 1b. When read, 0b is always read.
1	SWE1	0h	RW	The software event output is generated by writing 1b. When read, 0b is always read.
0	SWE0	0h	RW	The software event output is generated by writing 1b. When read, 0b is always read.

(39) Event Output Factor Selection Register k (ICU_EVTSELk) (k = 0 to 14)

[Secure group: Gr1]

These registers select source events for event signal outputs from the ELC. The events can be set for each destination of output from the ELC. Writing the value listed in the ELC column of **Table 4.6-23** to the register corresponding to the value of "Event Output No." in **Table 4.6-24** will select the desired event for the specified output destination.

Note that all bits of the registers following a reset have the value 1b, so no sources are selected at that time and a fixed value, which depends on the destination of output from the ELC, is output.

Values in **Table 4.6-24** are decimal numbers.

Remark 1. Using a DMAC REQ signal generated by an ICU_SW_DMAC register k (SWDMACk) as an event output is not allowed.

Remark 2. This register can be set in a one-word unit, so making the settings for multiple interrupts at the same time is possible. Take care with the settings so that only the target bits are changed (for example, use a read-modify-write operation).

Access Size : 32 bits
Address : <ICU_base> + 0604h + k x 0004h
Initial Value : 3FFF_FFFFh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	EC_SEL(kx3+2)[9:0]										EC_SEL(kx3+1)[9:6]

R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31, 30	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
29 to 20	EC_SEL(kx3+2)[9:0]	3FFh	RW	The source of the event signal output to EventOutNo(k x 3 + 2) is selected. 0 to 1C7h: The signal of the corresponding event number is output. 1C8 to 3FF: A fixed value is output
19 to 10	EC_SEL(kx3+1)[9:0]	3FFh	RW	The source of the event signal output to EventOutNo(k x 3 + 1) is selected. 0 to 1C7h: The signal of the corresponding event number is output. 1C8 to 3FF: A fixed value is output.
9 to 0	EC_SEL(kx3)[9:0]	3FFh	RW	The source of the event signal output to EventOutNo(k x 3) is selected. 0 to 1C7h: The signal of the corresponding event number is output. 1C8 to 3FF: A fixed value is output

(40) Off Domain Access Factor Maintenance Register k (ICU_OFFDMSTATk) (k = 0 to 2)

[Secure group: Gr1]

These registers retain the factors on generation of DMAC requests or event outputs to an off-domain area. They retain the factors when an event output to another area is generated while the area is disabled. Clear the retained factors with the off domain access factor clear registers k (OFFDMCLRk) as required.

Access Size : 32 bits
Address : <ICU_base> + 0780h + k x 0004h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

(41) Off Domain Access Factor Clear Register k (ICU_OFFDMCLRk) (k = 0 to 2)

[Secure group: Gr1]

These registers clear the factors of off-domain access. The registers are used to clear the factors retained in **(40) Off Domain Access Factor Maintenance Register k (ICU_OFFDMSTATk)**.

The relationship between the off-domain access signal and the bit to be cleared is the same as that shown in **Table 4.6-14** in **(40) Off Domain Access Factor Maintenance Register k (ICU_OFFDMSTATk).**

Access Size : 32 bits

Address : <ICU_base> + 0798h + k x 0004h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ODCLR31	ODCLR30	ODCLR29	ODCLR28	ODCLR27	ODCLR26	ODCLR25	ODCLR24	ODCLR23	ODCLR22	ODCLR21	ODCLR20	ODCLR19	ODCLR18	ODCLR17	ODCLR16
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ODCLR15	ODCLR14	ODCLR13	ODCLR12	ODCLR11	ODCLR10	ODCLR9	ODCLR8	ODCLR7	ODCLR6	ODCLR5	ODCLR4	ODCLR3	ODCLR2	ODCLR1	ODCLR0

R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	ODCLRn	0h	W	Clears the access generation detection factor for the off domain area allocated in the corresponding bit by writing 1b. If the value is 0b, it does not change (when read, 0b is always read).

4.6.1.3 Detailed Specifications

4.6.1.3.1 Control over input events

(1) Input event normalization/synchronization and event output

The table below shows the methods of detecting interrupts.

Table 4.6-15 Interrupt Detection Methods

Type	Detection Method	Selecting Method
NMI	Positive, negative	Register setting
IRQ	Positive, negative, positive/negative, low level	Register setting
TINT	Positive, negative, high level, low level	Register setting

Outputting interrupts

NMI, IRQ, and TINT signals are output at the high level regardless of their input type. The factors are retained in the ICU and the signals continue to be output while the factors are being held. Clearing all factors stops their output.

Similarly, the bus error, RAM error, and error interrupt signals, for which the ICU has bundling functions and factor-retention functions, continue to be output while their factors are being held.

Table 4.6-16 Output by Input Type: Part 1

Input Type	Output
NMI	High level while the factors are being held
IRQ	High level while the factors are being held
TINT	High level while the factors are being held
Error interrupt	High level while the factors are being held

For interrupts other than those in the table above, the input type determines the output type.

Outputting CPU interrupt signals

Table 4.6-17 Output by Input Type: Part 2

Input Type	Output
Low pulse	High pulse
High pulse	High pulse
Low level	High level
High level	High level

Outputting DMAC requests

In the case of level input, high-level signals are output.

In the case of pulse input, high-level pulses are output.

Outputting events

In the case of level input, high-level signals are output.

In the case of pulse input, high-level pulses are output.

Register access security control

Each register is classified into two groups (Gr0, Gr1).

Security control is possible for each group.

(2) Exclusive output control of interrupts and event output requests

Exclusive output control applies to events with ✓ under the “ELC” column and an entry under the interrupt column (“CA55” or “CM33”) in **Table 4.6-23**. For input events specified in an event output factor selection register k (EVTSELk), an event is output but an interrupt is not. On the other hand, for input events not specified in an event output factor selection register k (EVTSELk), an interrupt is output.

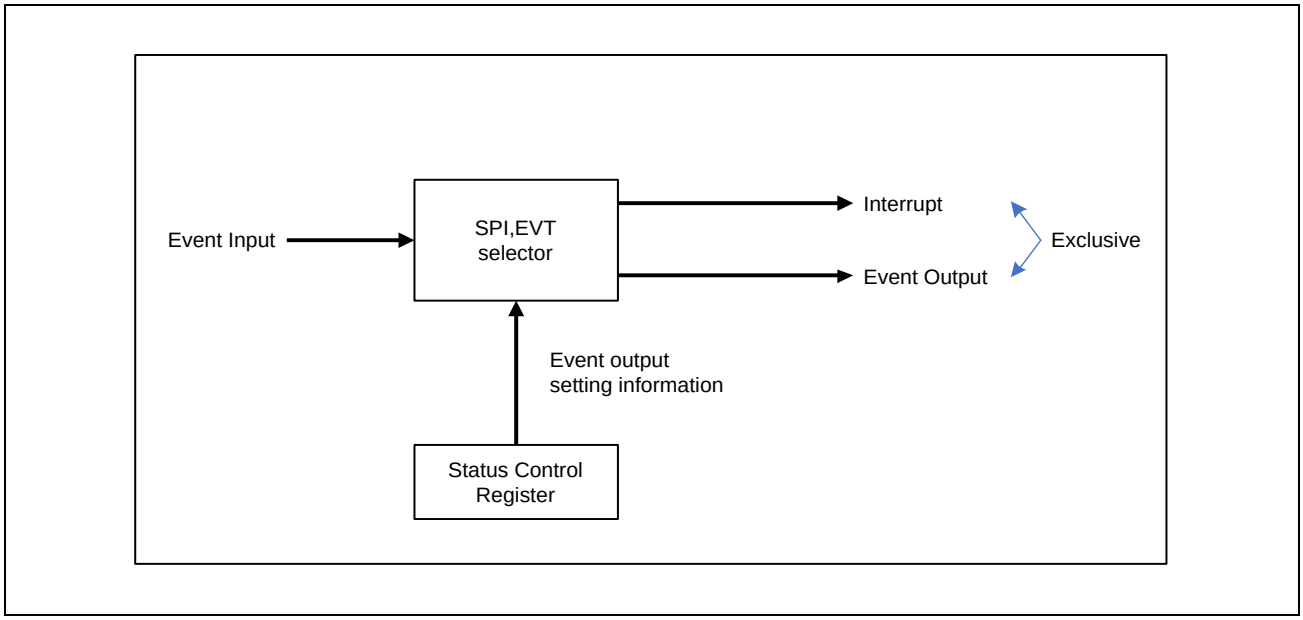

Figure 4.6-2 Exclusive Output Control of Interrupt and Event Output

(3) Exclusive output control of interrupts and DMAC requests

Exclusive output control applies to events with ✓ under the “DMAC” column and an entry under the interrupt column (“CA55” or “CM33”) in **Table 4.6-23**. For input events specified in an DMAC Factor k Selection Register y (DMkSELy), a DMA request is output but an interrupt is not. On the other hand, for input events not specified in a DMAC Factor k Selection Register y (DMkSELy), an interrupt is output.

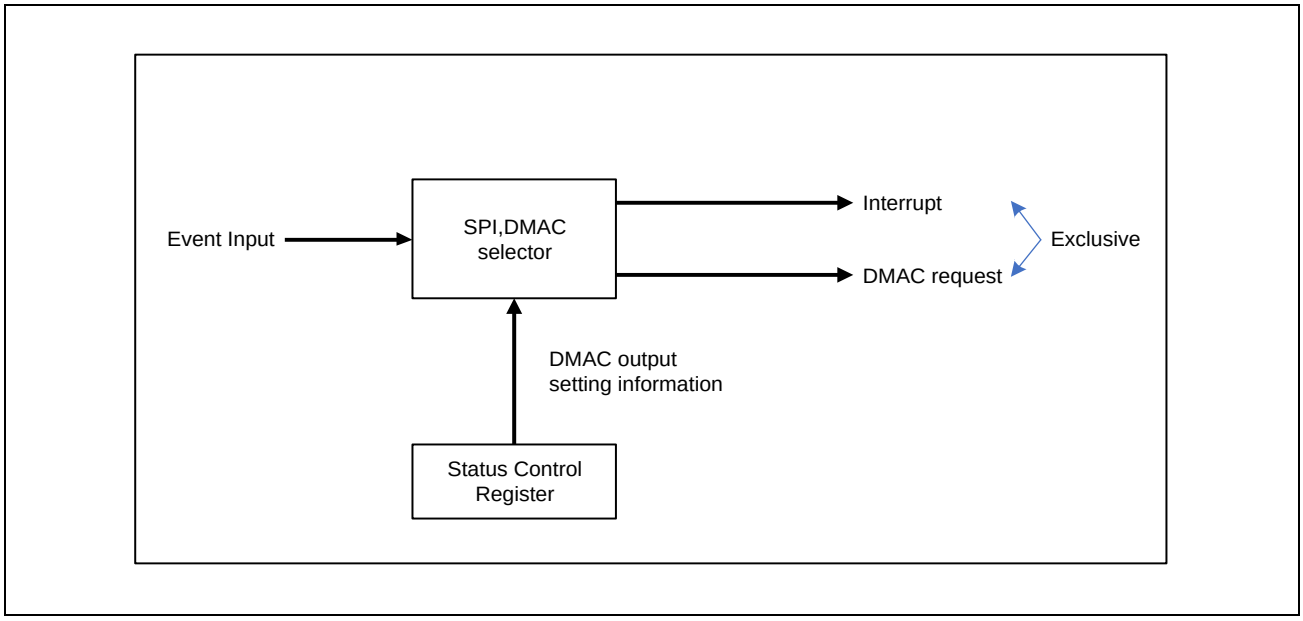

Figure 4.6-3 Exclusive Output Control of Interrupt and DMAC Request

Detecting an interrupt from the DMAC clears the setting of a DMAC Factor k Selection Register y (DMkSELy) for the corresponding DMAC channel. Change the setting to the value with all 1s (1_1111_1111b).

This clearing function can be enabled or disabled with the DMAC Factor k Selection Register y (DMkSELy).

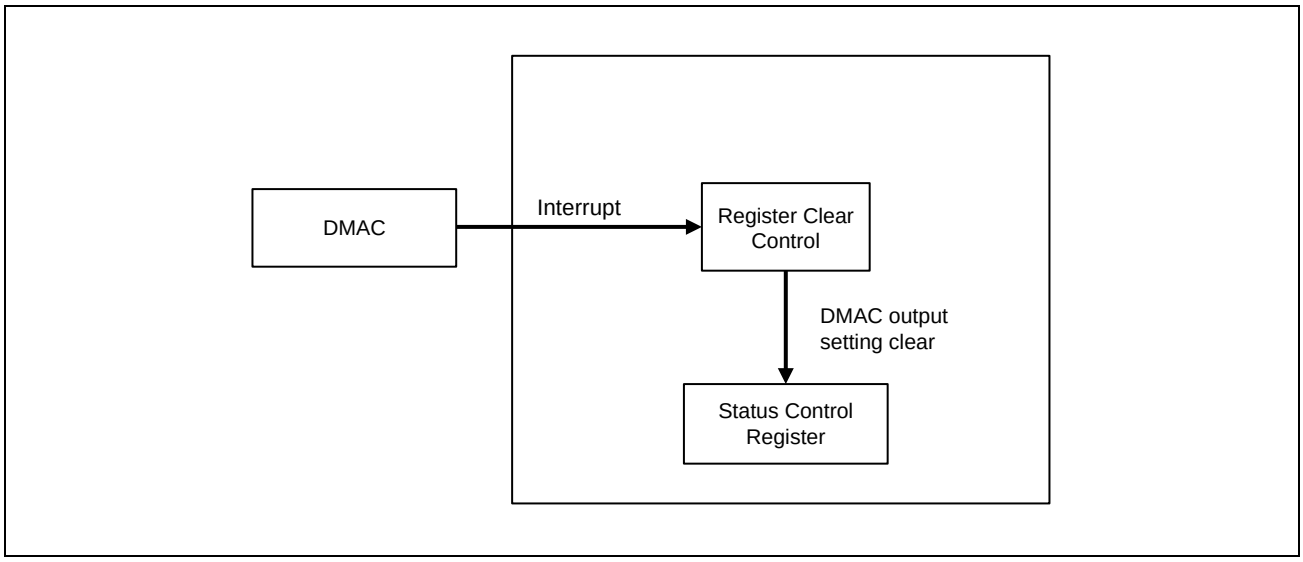

Figure 4.6-4 DMAC Request Setting Clearing

(4) Control over NMI

The configuration for control over NMI is shown in **Figure 4.6-5**. The NMI signal that is input from an external source to the LSI chip is input to the ICU through the GPIO noise filter. The ICU handles NMI synchronization, control over the interrupt state, and interrupt masking control.

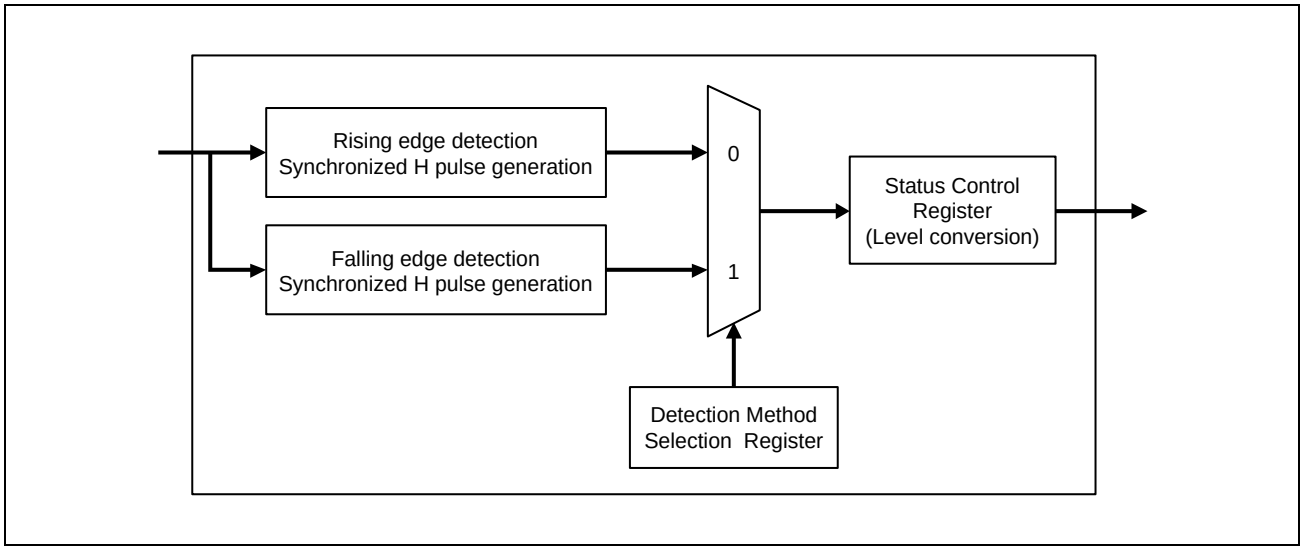

Figure 4.6-5 NMI Control Configuration

Selecting the method of interrupt detection

Two methods of detection are available for the NMI: falling edge detection and rising edge detection. The NMI detection method selection register (NITSR) is used to select either of them.

The setting of the NITSR can also be used for system control by referring to it from outside the ICU.

Retaining the interrupt detected state

When the NMI signal is asserted, the NMI status register (NSCNT) retains the detection of the interrupt.

Clearing the interrupt detected state

The interrupt detected state is cleared when 1 is written to the corresponding bit in the NMI status clear register (NSCLR).

(5) Control over IRQ

The configuration for control over IRQ is shown in the figure below. The IRQ0 to IRQ15 signals that are input from external sources to the LSI chip are input to the IM33 through the GPIO noise filters. The ICU handles IRQ synchronization, control over the interrupt state, and interrupt masking control.

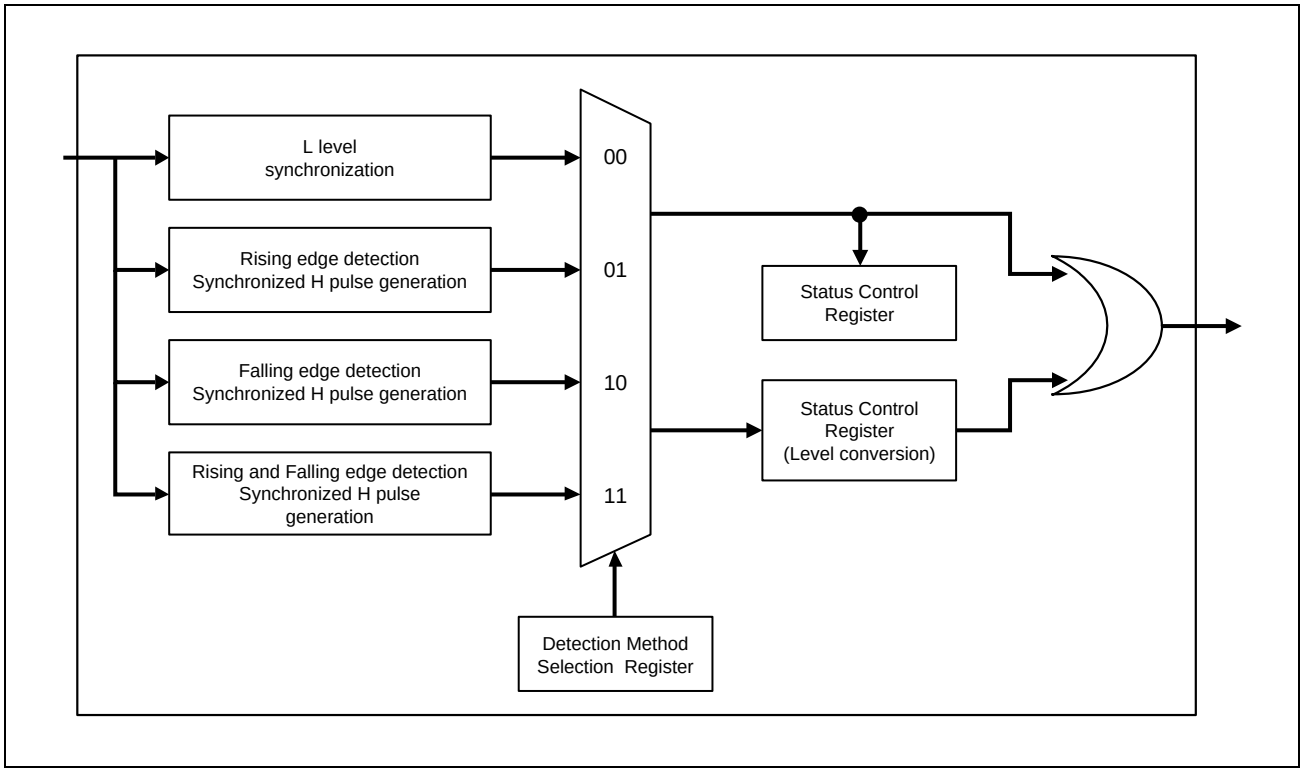

Figure 4.6-6 IRQ Control Configuration

Selecting the method of interrupt detection

Four methods of detection are available for the IRQ interrupts: low-level detection, falling edge detection, rising edge detection, and rising and falling edge detection. The IRQ interrupt detection method selection registers (IITSR) are used to select one of them.

The setting of IITSR can also be used for system control by referring to it from outside the ICU.

Retaining the interrupt detected state

When an IRQ signal is asserted, the IRQ status register (ISCTR) retains the detection of the interrupt.

Clearing the interrupt detected state

If level-sensing of an interrupt is selected in the IITSR register, the interrupt detected state is cleared when the interrupt signal is de-asserted by the source of the interrupt request.

If edge-sensing of an interrupt is selected in the IITSR register, the interrupt detected state is cleared when 1 is written to the corresponding ISCLR bit.

(6) Control over TINT

The configuration for control over TINT is shown in the figure below. The TNT0 to TNT31 signals that are input from external sources to the LSI chip are input as 86 IO_TOP_TINT signals to the ICU through the GPIO noise filters. The ICU handles TINT allocation, TINT synchronization, control over the interrupt state, and interrupt masking control.

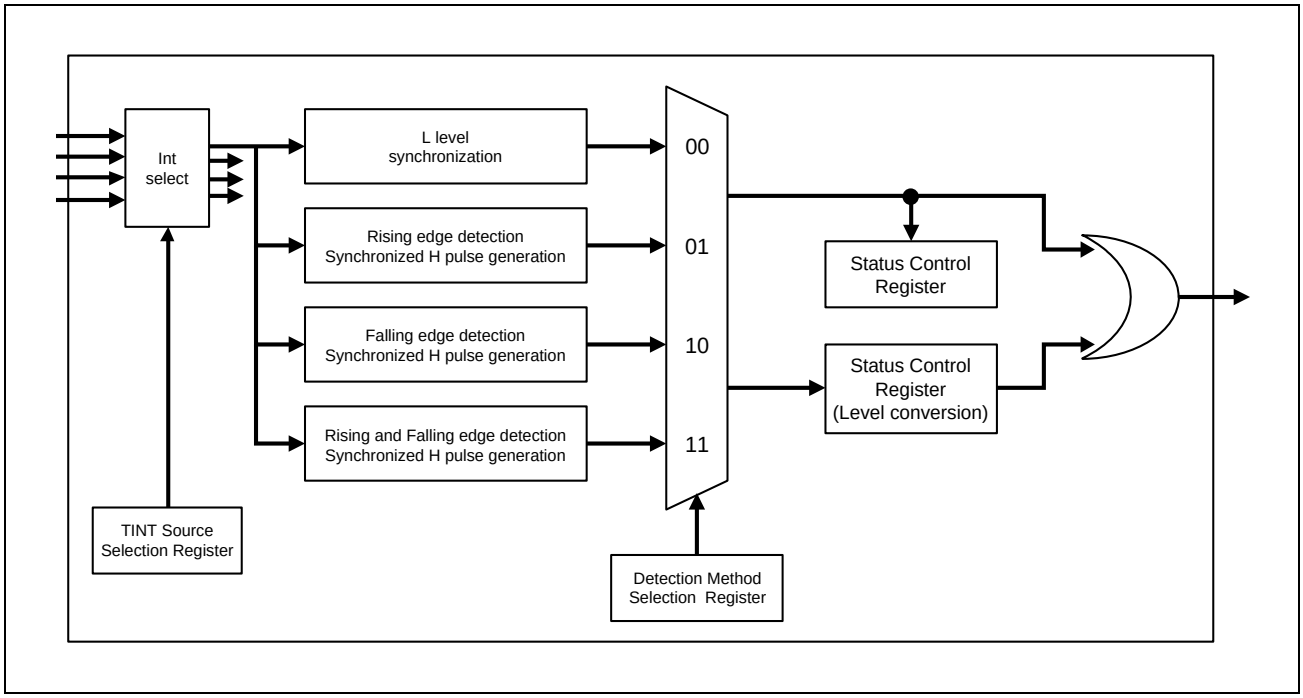

Figure 4.6-7 TINT Control Configuration

Allocating interrupts

32 desired signals from among the 86 IO_TOP_TINT signals are allocated to TINT0 to TINT31 according to the settings of the TINT source selection registers (TSSR0 to TSSR7).

Selecting the method of interrupt detection

Four methods of detection are available for the TINT interrupts: rising edge detection, falling edge detection, high-level detection, and low-level detection. The TINT detection method selection registers (TITSR0 and TITSR1) are used to select one of them.

The setting of TITSR can also be used for system control by referring to it from outside the ICU.

Retaining the interrupt detected state

When a TINT signal is asserted, the TINT status register (TSCTR) retains the detection of the interrupt.

Clearing the interrupt detected state

If level-sensing of an interrupt is selected in the TITSR0 or TITSR1 register, the interrupt detected state is cleared when the interrupt signal is de-asserted by the source of the interrupt request.

If level-sensing of an interrupt is selected in the TITSR0 or TITSR1 register, the interrupt detected state is cleared when 0 is written to the corresponding TSCR bit.

(7) Control over internal interrupts

The configuration for control over internal interrupts is shown in the figure below. The ICU handles synchronization of interrupt signals from the units and interrupt masking control.

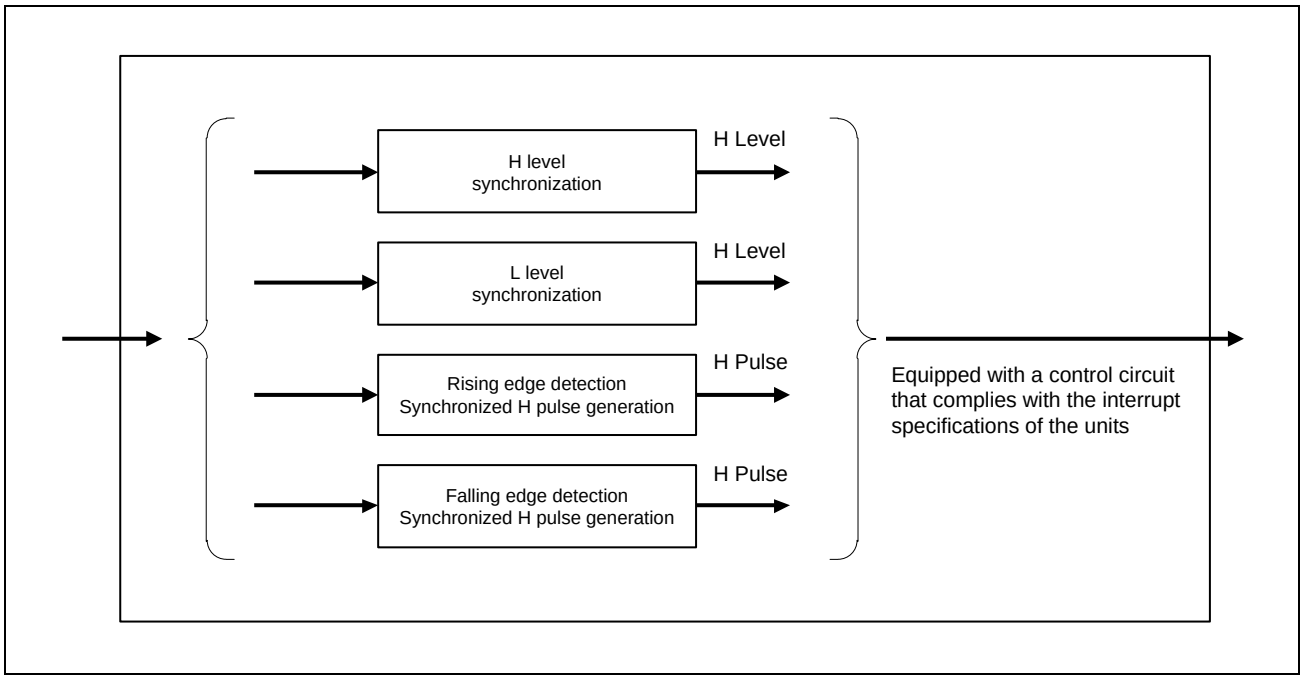

Figure 4.6-8 Internal Interrupt Control Configuration

Selecting the method of interrupt detection

Four methods of detection are available for the internal interrupts: low-level detection, high-level detection, falling edge detection, and rising edge detection. Synchronization proceeds in ways that suit the specifications of the units as interrupt request sources. The available methods are listed under “Level/Edge” and “Active” columns in **Table 4.6-23**.

4.6.1.3.2 CPU interrupt output

(1) Overview of CPU interrupt output

The ICU outputs event signals as outputs for the CA55 and CM33. The applicable events are those with “SYSTEM”, “COMMON”, “SINGLE” or “SELECT” under the “CA55” and “CM33” columns in **Table 4.6-23**. The CA55 and CM33 each output these signals.

To use interrupts classified as “SELECT”, use **(20) SELECT Interrupt CM33 Selection Register k (ICU_INTM33SELk)** to specify the interrupts.

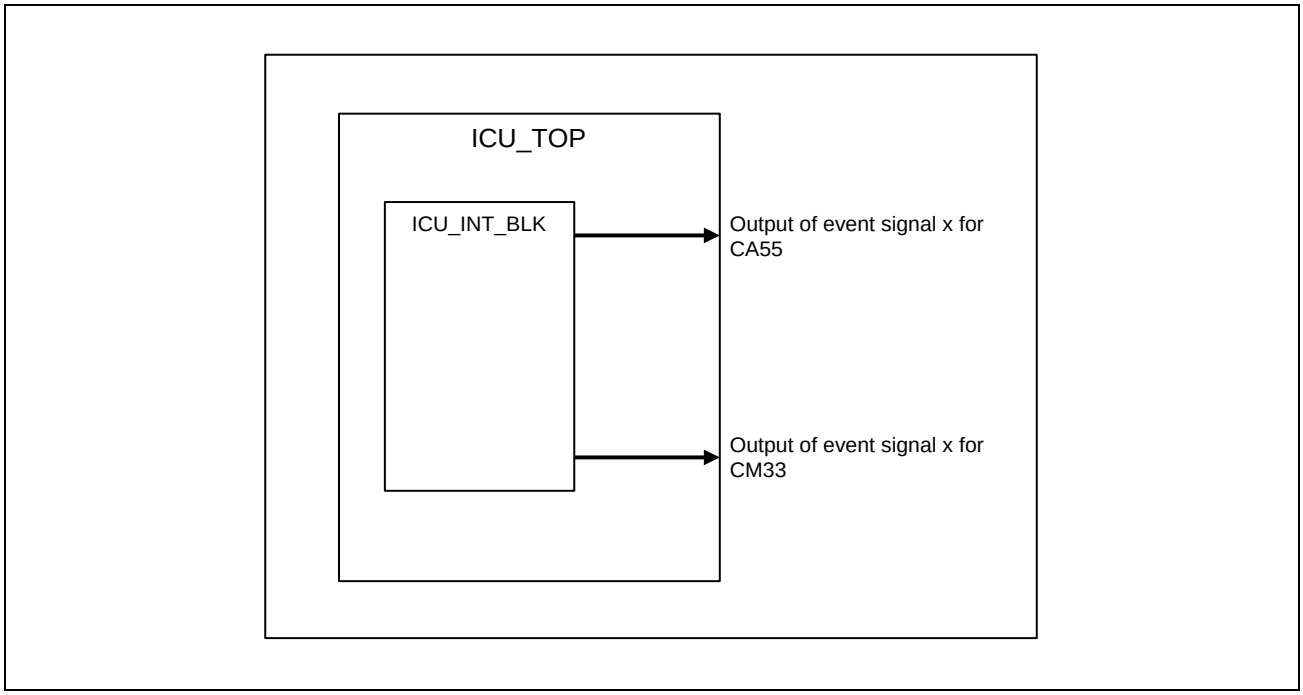

Figure 4.6-9 Interrupt Output

(2) Control over the bundling of bus error interrupts

The configuration for control over the bundling of bus error interrupts is shown in **Figure 4.6-10**. The ICU handles synchronization of bus error interrupts generated by the system bus, control over the interrupt state, and interrupt bundling control. Furthermore, it handles interrupt masking control.

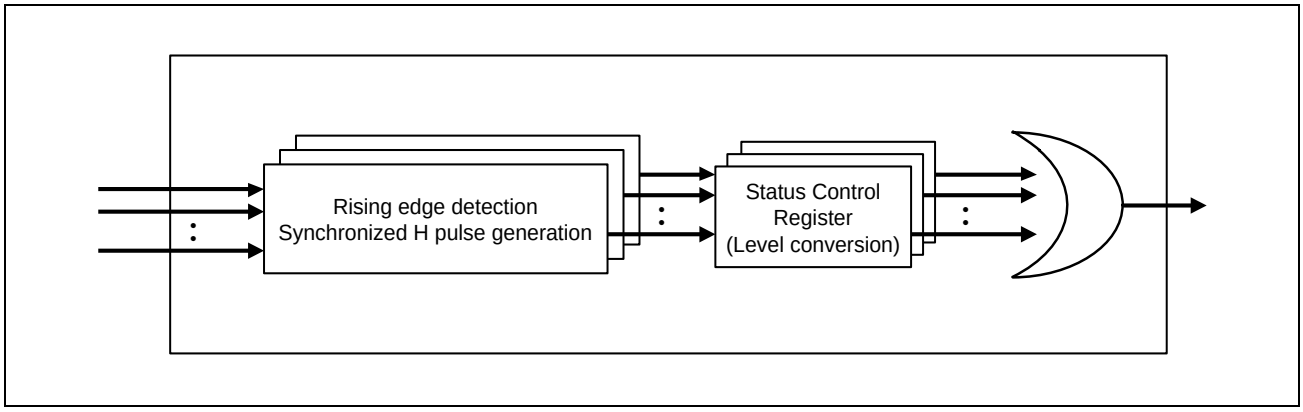

Figure 4.6-10 Bus Error Bundle Control

Retaining the interrupt detected state

When a system bus error signal is asserted, a bus error interrupt status register k (BEISRk) retains the detection of the interrupt.

Clearing the interrupt detected state

The interrupt detected state is cleared when 1b is written to the corresponding bus error interrupt status clear register k (BECLRk) bit.

Bundling of interrupts

The 42 bus error signals output by the system bus are bundled into a single bus error interrupt signal.

For the list of events, see **Table 4.6-25**.

(3) Control over the bundling of SRAM error interrupts

The configuration for control over the bundling of SRAM error interrupts is shown in **Figure 4.6-11**. The ICU handles synchronization of SRAM error interrupts, control over the interrupt state, interrupt bundling control, and interrupt masking control.

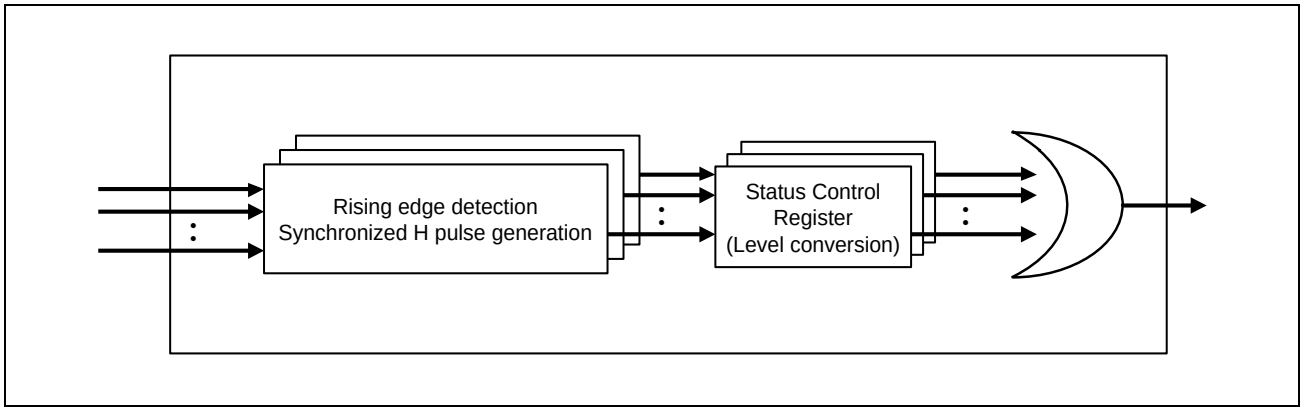

Figure 4.6-11 SRAM Error Bundle Control

Retaining the interrupt detected state

When an SRAM error signal is asserted, an SRAM error interrupt status register k (EREISRk) retains the detection of the interrupt.

Clearing the interrupt detected state

The interrupt detected state is cleared when 1b is written to the corresponding SRAM error interrupt status clear register k (ERCLRk) bit.

Bundling of interrupts

Error interrupts output by the SRAM are bundled into a single interrupt signal.

For the list of events, see **Table 4.6-26**.

(4) Control over the bundling of error interrupts

Error interrupt signals are output individually for the CA55 and CM33. When an error interrupt is generated, each factor is retained in **(21) Error Interrupt CM33 Status Register k (ICU_ERINTM33CTLk)** or **(24) Error Interrupt CA55 Status Register k (ICU_ERINTA55CTLk)**.

For the bundled bus error signal (BUS_ERR_INT) and SRAM error interrupt signal (RAM_ERR_INT), the factors before bundling of the respective signals are retained, so the bundled error signals themselves are not covered.

The factors are retained until they are cleared. The interrupt signals for the CM33 and CA55 (ICU_Error_CM33 and ICU_Error_CM55 in **Table 4.6-23**) are output according to the results of the logical OR of the source factors. (The interrupt signals continue to be output until all factors are cleared.) In addition, the masking function that determines whether or not to retain the factor can be used for each factor.

The target events for error interrupts are those with ✓ under the “Error Event” column in **Table 4.6-23**.

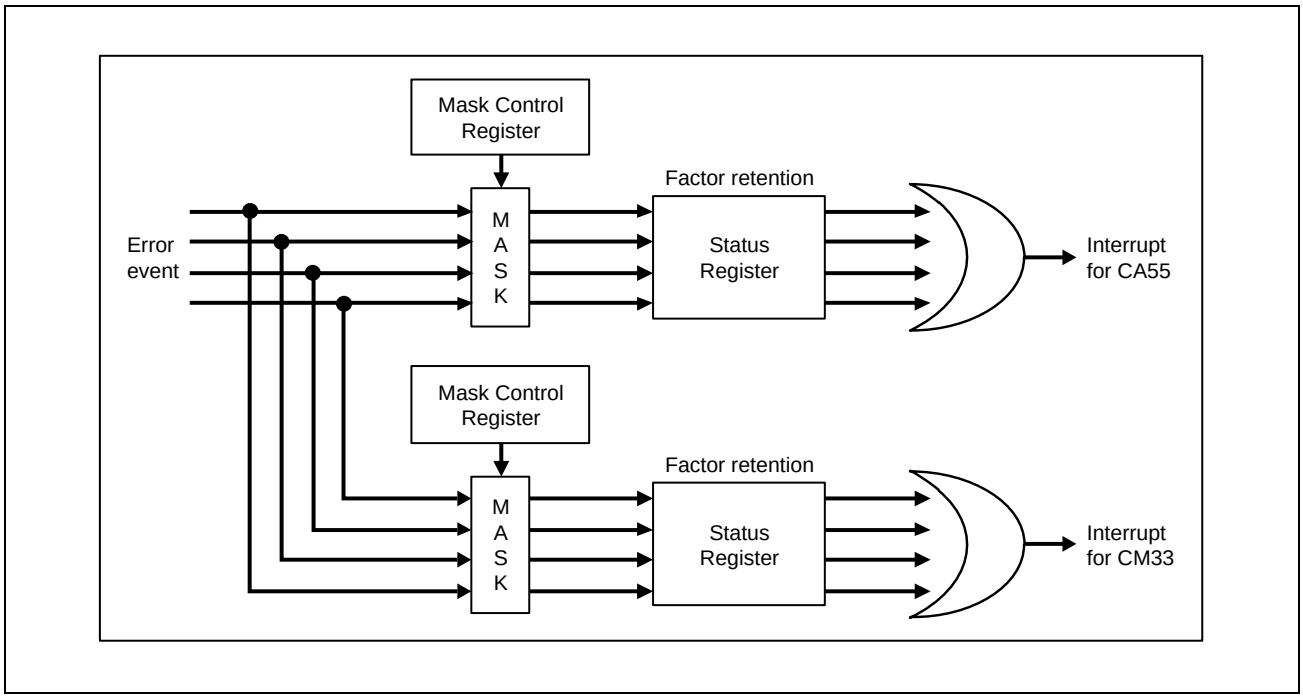

Figure 4.6-12 Error Interrupt Bundle Control

Retaining the interrupt detected state

When an error interrupt signal is asserted, an error interrupt CM33 status register k (ERINTM33CTLk) or error interrupt CA55 status register k (ERINTA55CTLk) retains the detection of the interrupt.

Clearing the interrupt detected state

The interrupt detected state is cleared when 1 is written to the corresponding interrupt status clear register bit.

Bundling of interrupts

Error interrupts are bundled per interrupt source for CPU (CM33 or CA55) into a single interrupt signal.

Points to note in processing per CPU

Registers for masking, retaining, and clearing source factors are provided individually for the CM33 and CA55. Even if the factor on one CPU side is cleared on generation of an error interrupt, the error interrupt on the other CPU may continue to be output.

Apply countermeasures such as masking error interrupts for CPUs that do not require them or clearing the factors on both CPU sides as required.

Operations involved in LSI error reset generation

The registers listed below can only be reset by ERROR_RESETn that is generated following a system reset of the LSI.

Accordingly, the settings of the registers listed below are retained when an LSI error reset is generated.

- **(15) Bus Error Interrupt Status Register k (ICU_BEISRk)**
- **(17) ECCRAM Error Interrupt Status Register k (ICU_EREISRk)**
- **(21) Error Interrupt CM33 Status Register k (ICU_ERINTM33CTLk)**
- **(24) Error Interrupt CA55 Status Register k (ICU_ERINTA55CTLk)**

If it returns to normal operation after error reset, it is necessary to confirm error status and clear error factors after restarting.

(5) Control over the bundling of GPT interrupts for the CA55

The configuration for control over the bundling of GPT interrupts (gpt_gtciada_n_0 to gpt_gtciada_n_7 and gpt_gtciadb_n_0 to gpt_gtciadb_n_7) is shown in **Figure 4.6-13**. The ICU handles synchronization of GPT interrupts, control over the interrupt state, and interrupt bundling control.

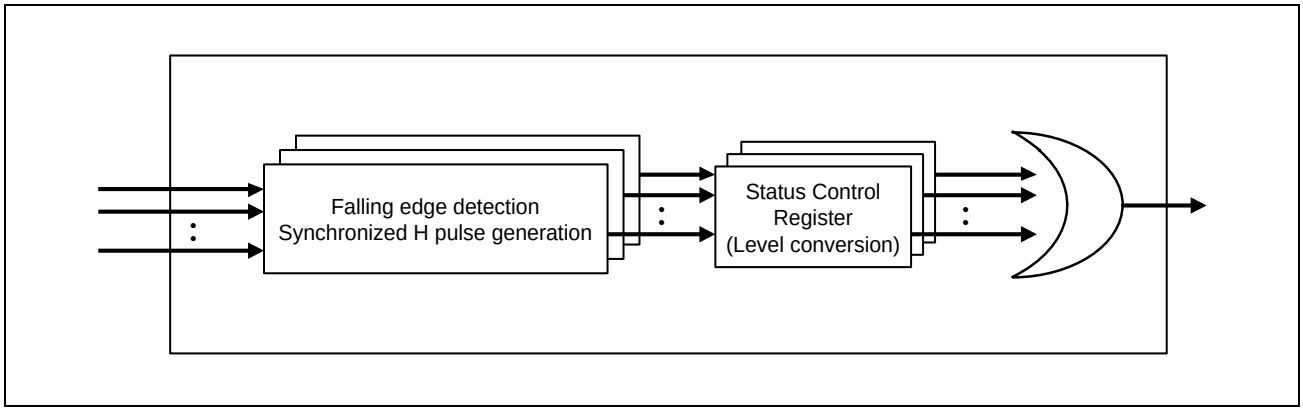

Figure 4.6-13 GPT Interrupt Bundle Control

Retaining the interrupt detected state

When any of the GPT interrupt signals (gpt_gtciada_n_0 to gpt_gtciada_n_7 and gpt_gtciadb_n_0 to gpt_gtciadb_n_7) is asserted, the GPT interrupt CA55 status register (GPTINTA55CTL) retains the detection of the interrupt.

Clearing the interrupt detected state

The interrupt detected state is cleared when 1 is written to the corresponding GPT interrupt CA55 status clear register (GPTINTA55CLR) bit.

Bundling of interrupts

The GPT interrupts (gpt_gtciada_n_0 to gpt_gtciada_n_7 and gpt_gtciadb_n_0 to gpt_gtciadb_n_7) are bundled per interrupt factor into a single interrupt signal. The interrupt factors are gpt_gtciada_n_0 to gpt_gtciada_n_7 for channel 0, gpt_gtciadb_n_0 to gpt_gtciadb_n_7 for channel 0, gpt_gtciada_n_0 to gpt_gtciada_n_7 for channel 1, and gpt_gtciadb_n_0 to gpt_gtciadb_n_7 for channel 1. The respective eight interrupt factors are bundled into a single interrupt signal (gpt_gtciada_n or gpt_gtciadb_n).

(6) Generating enhancing pseudo error interrupts

The generation of pseudo error factors is possible. A software-enhancing pseudo error is generated by writing 1 to the corresponding bit in the SW enhancing pseudo error generation register (SWPE) and behaves like an actual error interrupt. The target interrupts are SW_PSEUDO_ERR_0 to SW_PSEUDO_ERR_15 in **Table 4.6-23**.

(7) Assignment of CPU interrupts

The numbers of specifiable interrupt signals for the CA55 and CM33 are 960, 480, and 480, respectively.

The interrupts signals are assigned as shown in the table below. Details on the assignment are shown under the “CA55” and “CM33” columns in **Table 4.6-23**.

Table 4.6-18 Interrupt Assignment

SPI No.	CA55	CM33
0 to 251	COMMON	
252 to 352	SYSTEM (CA55)	SYSTEM (CM33)
353 to 479	SINGLE (CA55)	SELECT (CM33)
480 to 959		Reserved

Table 4.6-19 Outline of Each Item

Class	Description
SYSTEM (CA55)	System-related interrupt signals for the CA55 (allocated as independent interrupts with the SPI numbers)
SYSTEM (CM33)	System-related interrupt signals for the CM33 (allocated as independent interrupts with the SPI numbers)
COMMON	Interrupt signal common to the CA55 and CM33 (allocated as an interrupt with a common SPI number)
SINGLE (CA55)	Interrupt signals for the CA55 (allocated as independent interrupts with the SPI numbers)
SELECT (CM33)	Interrupt signals for the CM33 (selectable from among 538 interrupt signals)

Note: The SPI numbers per CPU for SYSTEM (CA55), SYSTEM (CM33), COMMON, and SINGLE (CA55) are shown under the "CA55 SPI No." and "CM33 SPI No." columns in **Table 4.6-23**.

Note: For SELECT (CM33), signals are selectable so the fixed SPI numbers are not allocated. These signals are described as "SELECT" under the "CA55" and "CM33" columns in **Table 4.6-23**.

Selecting SELECT (CM33)

If the value set for the selsig[8:0] select signal from among event input signals for SELECT is x, the insel[x] signal is selected and output. Note that if the value is all 1s (3FFh), the fixed value 0 is output.

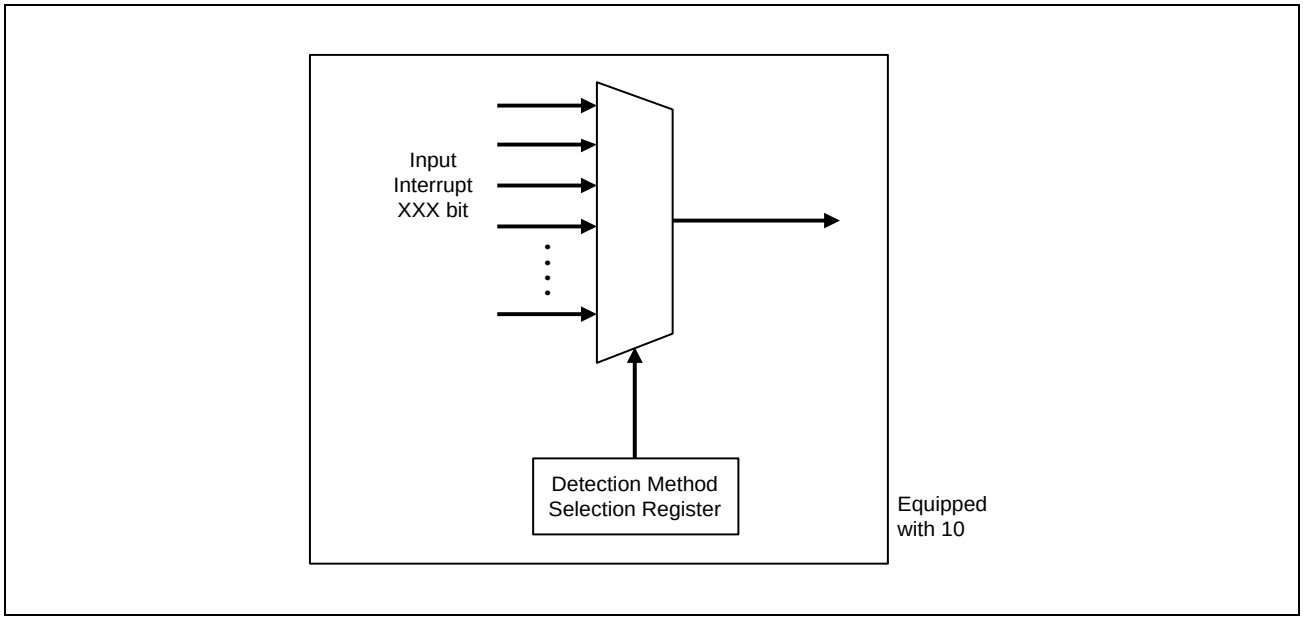

Figure 4.6-14 SELECT (CM33) Control

(8) Pulse or level for CPU interrupts

The active level and pulse or level operation for interrupt signals output to the CPUs are listed below.

The output signals are active high regardless of the input active level. For pulse or level, whichever of the two selected on the input side is output.

Table 4.6-20 Interrupt Sense

Input		Output	
Active	Pulse/Level	Active	Pulse/Level
High	Pulse	High	Pulse
Low	Pulse	High	Pulse
High	Level	High	Level
Low	Level	High	Level

4.6.1.3.3 Control over the event link controller (ELC)

The ICU has a function of the event link controller (ELC). The ELC selects the destinations for output of the event signals input from the units in the ICU and then outputs the signals to the selected destinations.

The figure below is a schematic view of the data flow by the ELC.

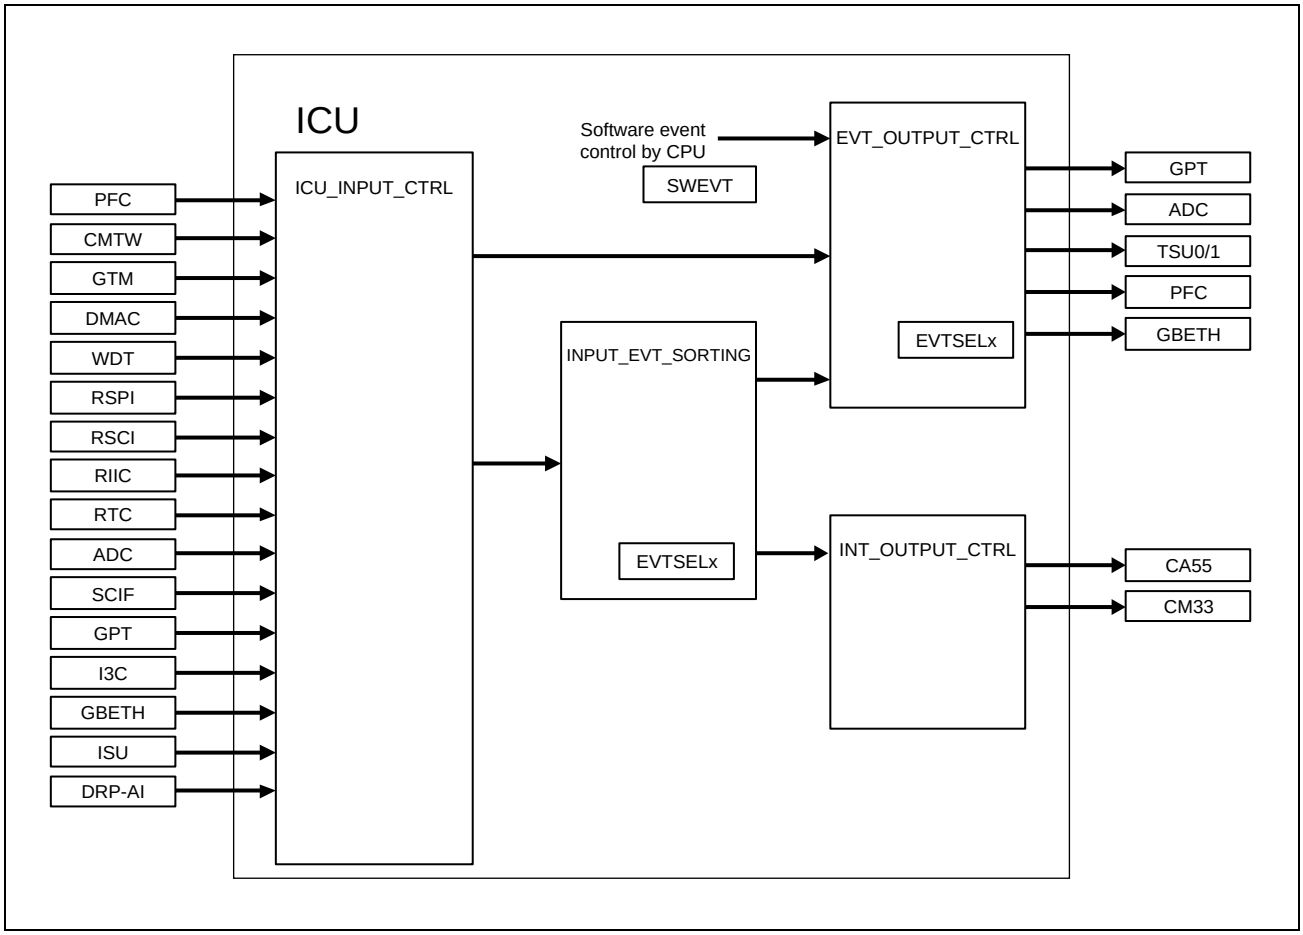

Figure 4.6-15 ELC Flow Diagram

The following three types of input are available.

- ELC-dedicated input (inputs from ICU_INPUT_CTRL)
- Input for use as both interrupts and ELC events (inputs from INPUT_EVT_SORTING)
- Input of an event generated under control of the ICU registers

(1) Event input

The signals with ✓ under the “ELC” column in **Table 4.6-23** are used as the input signals for the ELC.

(2) Generating a software event

Software events can be generated. A software event is generated by writing 1 to the corresponding bit in the ICU_SW_EVT register (SWEVT) and behaves in the same way as an event signal input by another unit. The target events are SW_EVENT_0 to SW_EVENT_6 in **Table 4.6-23**.

(3) Event output

The ELC outputs the event signals to the units. The destination units and port names for output are listed in **Table 4.6-24**. The input source can be selected per output event signal. Specifying the value of the corresponding event number in the event output factor selection register (EVTSELk) allows the selection of a desired event.

CAUTION

Using a DMAC REQ signal generated by an ICU_SW_DMAC register k (SWDMACk) as an event output is not allowed.

4.6.1.3.4 Control over the DMAC

The figure below is a schematic view of the data flow of the DMAC REQ signal.

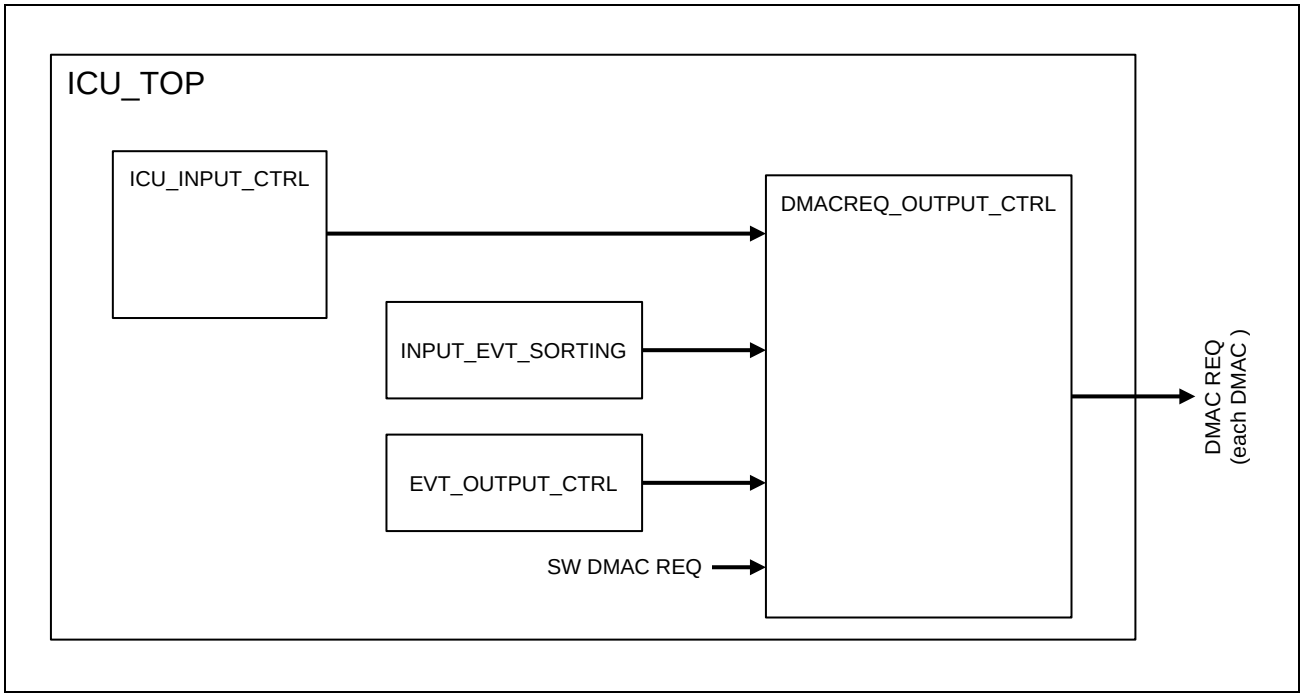

Figure 4.6-16 DMAC REQ Flow Diagram

The following four types of input are available.

- DMAC REQ-dedicated input (inputs from ICU_INPUT_CTRL)
- Input for use as both interrupts and DMAC REQ signals (inputs from INPUT_EVT_SORTING)
- Input when event output is used as a DMAC REQ signal (inputs from EVT_OUTPUT_CTRL)
- Input of an event generated under control of the ICU registers

(1) DMAC request output control module

This module selects the sources for signals (active high) processed in the input section (ICU_INPUT_CONT) for each of the event signals for the modules and outputs the signals to the DMAC as DMAREQ signals for the DMAC.

(2) Processing when DMAC request selections overlap

When the DMAC factor selection register (DMkSELy) is set, the ICU checks for duplication of the register bit setting with those of another DMAC factor selection register (DMkSELy) or the other bit field in the same register.

When duplication of the register bit setting with those of another register or the other bit field in the same register is detected, the ICU proceeds with the following processing.

- "Clears" the setting of the DMAC factor selection register bits (DkRQ_SEL(y × 2+1) or DkRQ_SEL(y × 2)) that caused the duplication of the setting of the bits in another register or the other field in the same register; that is, the bits are set to 3FFh (all effective bits are 1).
- Sets 1 in the bit of a DMAC request repetition control register k (DMRCTRk) corresponding to the DMAC channel for which the DMAC request setting caused the duplication of the setting of the bits in another register or the other field in the same register.
- The value set in the DMAC request repetition control register k (DMRCTRk) can be cleared by writing 1b to the corresponding bit of a DMAC request repetition clear register k (DMRCLRk).

CAUTION

In writing to the DMAC Factor k Selection Register y (DMkSELy), setting the same value in the higher-order (DkRQ_SEL(y × 2 + 1)) and lower-order (DkRQ_SEL(y × 2)) bits is prohibited.

If the same value has been set, the state information (DMADUP*_n) of the DMRCTRk registers, the factor settings (D*RQ_SEL*) of the DMkSELy registers, and the behavior of the overlap interrupt signal are not guaranteed.

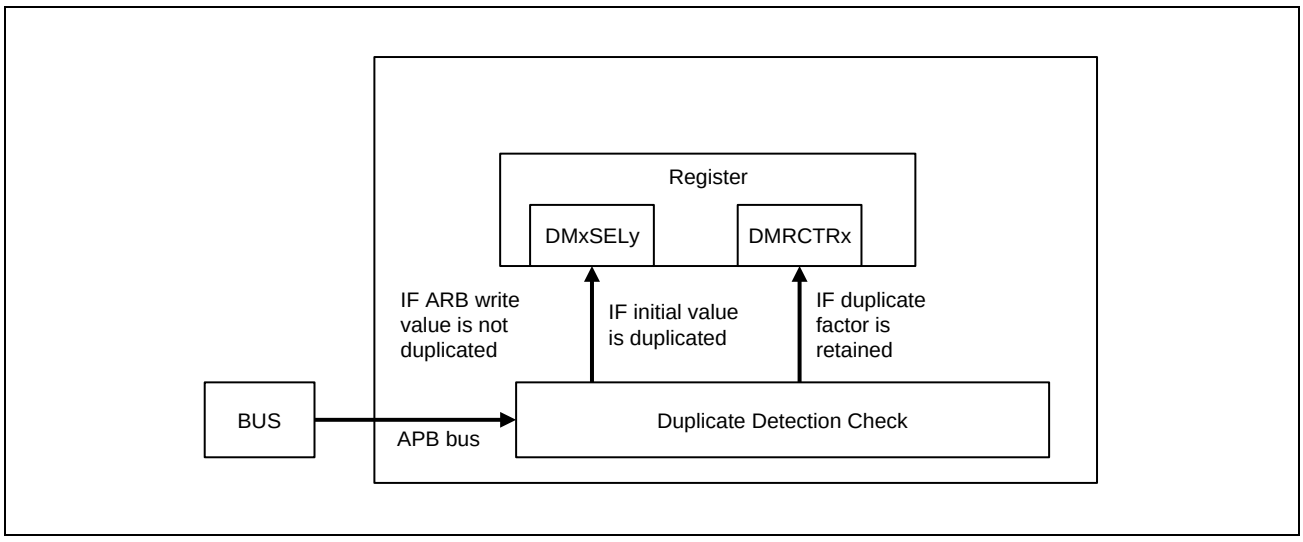

Figure 4.6-17 DMAC Selection Duplication Control

(3) Automatic clearing DMAC factor selection registers

k = 0 to 4, y = 0 to 7, z = 0 to 15

The ICU has a function for automatically clearing the settings (all effective bits are 1) of the DkRQ_SEL(y × 2) and DkRQ_SEL(y × 2 + 1) bits in the DMAC Factor k Selection Register y (DMkSELy) in response to receiving a DMAC end interrupt.

This function is triggered by the DMAC end interrupts (DMACk_INTz: k = 0 to 4, z = 0 to 15). Receiving an interrupt clears the settings (all effective bits are 1) of the DkRQ_SEL(y × 2) and DkRQ_SEL(y × 2 + 1) bits.

The DkSEL_CLRON(y × 2) and DkSEL_CLRON(y × 2 + 1) bits can be used to enable or disable this function.

- When the values of the DkSEL_CLRON(y × 2) and DkSEL_CLRON(y × 2 + 1) bits are 1b: Automatic clearing proceeds.
- When the values of the DkSEL_CLRON(y × 2) and DkSEL_CLRON(y × 2 + 1) bits are 0b: Automatic clearing does not proceed.

(4) Pulse or level for DMAC request output

The active level and pulse or level operation for REQ signals output to the DMACs are listed below.

The output signals are active high regardless of the input active level. For pulse or level, whichever of the two selected on the input side is output.

Table 4.6-21 DMAC REQ Sense

Input		Output	
Active	Pulse/Level	Active	Pulse/Level
High	Pulse	High	Pulse
Low	Pulse	High	Pulse
High	Level	High	Level
Low	Level	High	Level

(5) Control over response to the DMAC ACK and DMAC TEND signals

The DMAC ACK signals (80 in all) are input from the DMAC channels. The ICU selects the DMAC ACK signals output in response to the DMAC ACK signals of the units according to the settings of the DMAC ACK selection registers x (DMACKSELk).

For a DMAC ACK signal as an input, set it for active-high level detection. When it is an output, set it for active-high or active-low level detection. Details on the active level (high or low) are described under the “Active” column in **Table 4.6-27**.

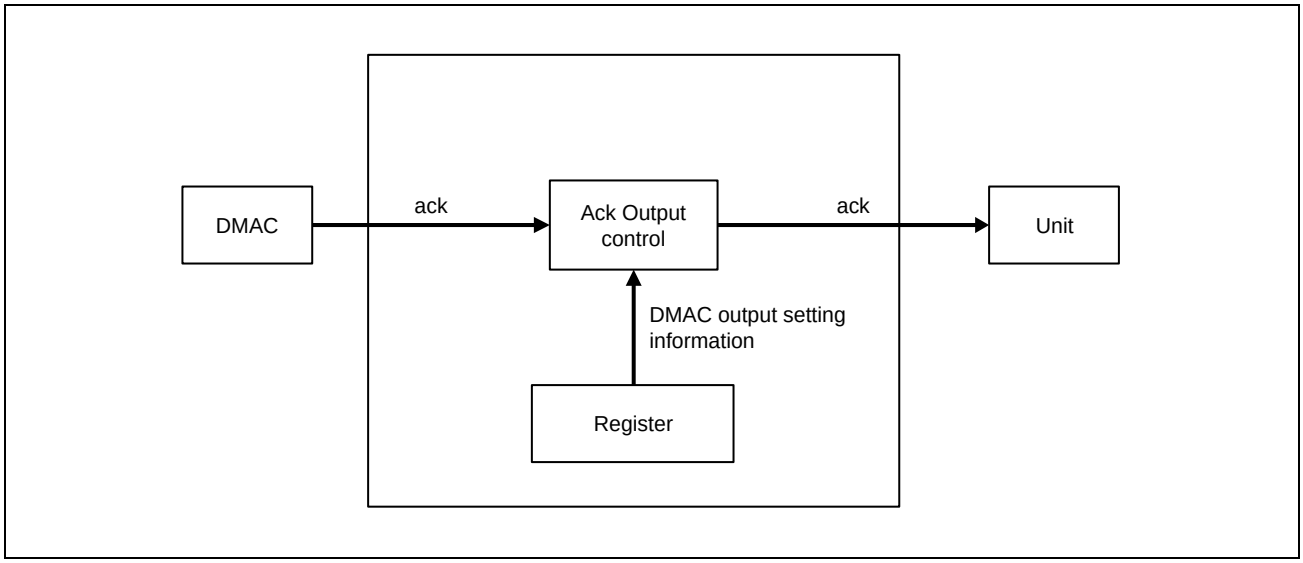

Figure 4.6-18 DMAC ACK Control

The DMAC TCO signals (80 in all) are input from the DMAC channels. Select the DMAC TCO signals to be output for the DTEND0 to DTEND4 signals of the PFC (IOTOP) according to the settings of the DMAC TEND selection registers k (DMTENDSELk).

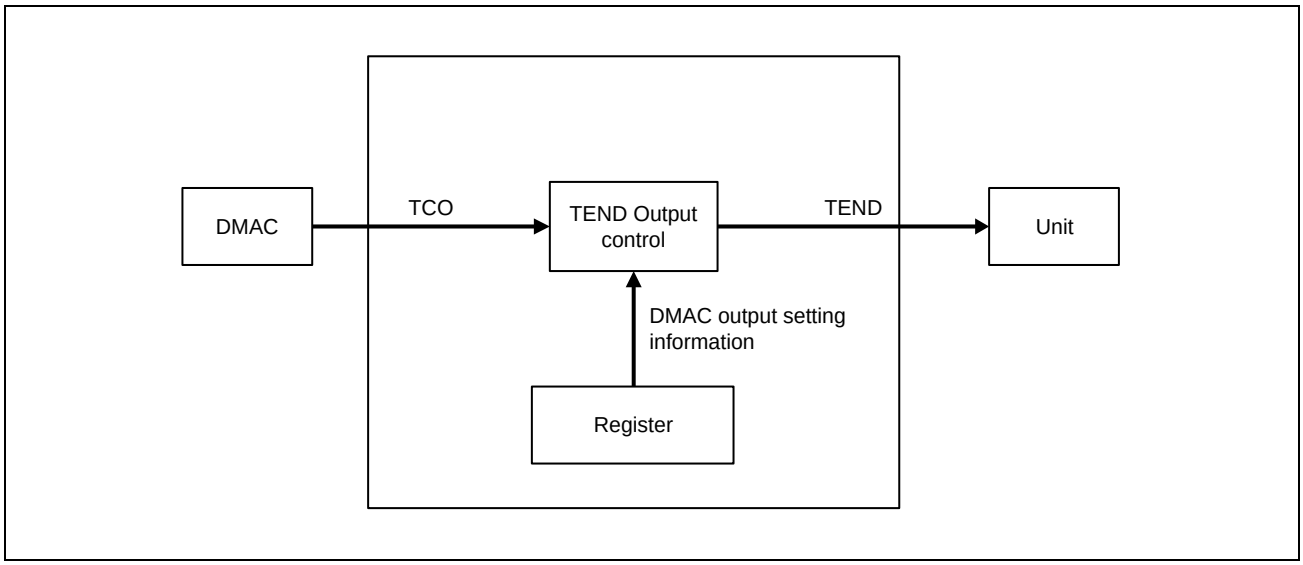

Figure 4.6-19 DMAC TEND Control

(6) DMAC request output with the use of event output

The ICU has a function for using event outputs as DMAC request outputs.

Eight event outputs, EVT_DMAC_0 to EVT_DMAC_7 in **Table 4.6-24** can be used as DMAC request outputs.

4.6.1.3.5 Other control

(1) CM33 interrupt output masking control

The figure below shows the configuration for outputting interrupt signals to the CPUs. All interrupt signals for the CM33 can be masked with the CM33_INTMASK signal (CM33_INTMASK signal can be controlled by the INTMASK_CM33_I bit of the CPG_LP_CTL2 register in the CPG). The interrupt signals for the CA55 cannot be masked.

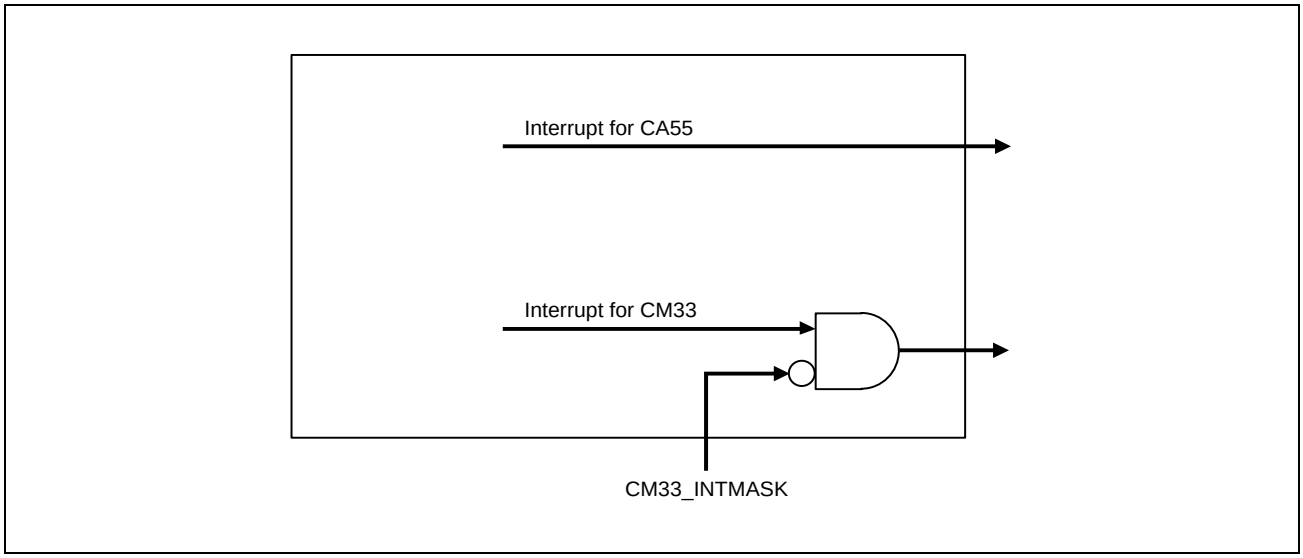

Figure 4.6-20 CM33 Interrupt Masking Control

(2) Retaining factors in access to the off domain

The ICU has a function for retaining the factor on generation of a DMAC request for a DMAC in the other area or an event output to a unit when the other area of this LSI chip is disabled. When the on/off information signal in the other area that is input to the ICU is active, this function monitors generation of DMAC requests for the other area or event output. When such access is attempted, the ICU retains the factor in the corresponding register.

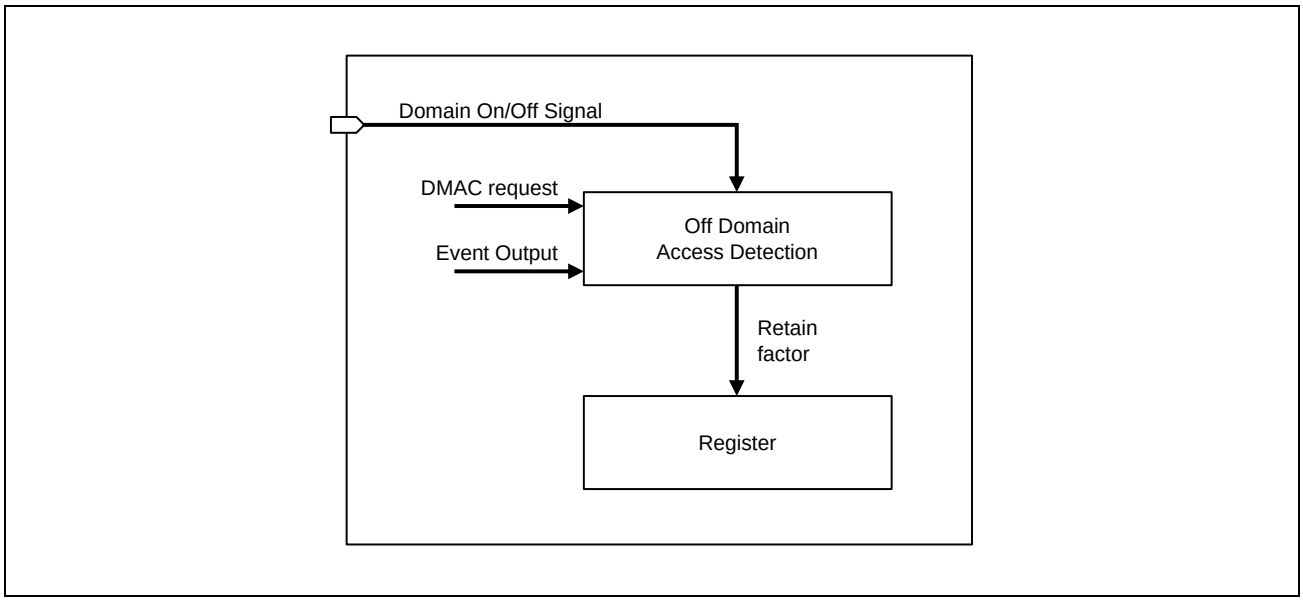

Figure 4.6-21 Off Domain Access Control

(3) Error signal output for the CPG

The ICU has a function for outputting error signals to the CPG. The ICU outputs the values of the error interrupt CM33 status registers k (ERINTM33CTLk) to pass the values retaining the error factors to the CPG. These retained signals can be cleared by writing to the error interrupt CM33 status clear registers k (ERINTM33CLRk).

(4) Register access security control

Each register of the ICU has a security control function. This function is controlled with the use of two pairs of SLEVEL[1:0] input signals from the SYS registers (MPICU0_SL and MPICU1_SL), which respectively control the registers of group 0 and group 1. For the assignment of the registers to groups 0 and 1, see **4.6.1.2.2 Register Description**. Details on control with the use of the SLEVL[1:0] signals are given in the table below.

Table 4.6-22 Secure Control Table

	Non-secure		Secure	
SLEVEL[1:0]	User	Privileged	User	Privileged
00b	RD + WR	RD + WR	RD + WR	RD + WR
01b	None	RD + WR	RD + WR	RD + WR
10b	None	None	RD + WR	RD + WR
11b	None	None	None	RD + WR

(5) Masking control

This unit has the following functions for masking output signals. For details on the respective functions, see the sections listed below.

- Masking all interrupts for the CM33
  - **(1) CM33 interrupt output masking control**
- Individually masking the error interrupts for the CM33
  - **(4) Control over the bundling of error interrupts**
- Individually masking the error interrupts for the CA55
  - **(4) Control over the bundling of error interrupts**

4.6.1.4 Restrictions

- Restriction on operation with the emergency clock

  This unit handles output based on the clock frequency ratio during normal operation with the width which can be received by the output destination unit. The unit, however, does not support the frequency ratio during operation with the emergency clock. Therefore, operation with the emergency clock of the unit is not guaranteed.

- Restriction on the interval for the input of events and interrupts

  Signals to the ICU from the other units must be input with an interval of at least 34 cycles at 100 MHz between them. If an interval is shorter than this, input signals may be lost.

- Using a DMAC REQ signal generated by an ICU_SW_DMAC register k (SWDMACk) as an event output is not allowed.

- Writing to registers is in 32 bits. When writing to them, other bits of the same register should not be affected (for example, use a read‐modify‐write operation).

- The inputs from the PFC (PORT_IRQ0 to PORT_IRQ15) following a reset are at the low level, so they are asserted by SPI nos. 1 to 16 for the CPU. De-assert them before using them.

- Error interrupt signals are asserted after release from the error reset state. De-assert them before using them.

- The DMAC REQ signals output from the ICU are active high.

- Use of the DMAC DTEND signals outside the LSI chip
- These signals are output with a pulse width of 16T at 100 MHz as stated in this manual.

4.6.1.5 Event List

The interrupt events related to the ICU are listed below and on the following pages.

4.6.1.5.1 List of input events

Table 4.6-23 List of Input Events (1/58)

CA55 SPI No.	CM33 SPI No.	DMAC No.	ELC No.	Error Event	Unit	CH	Name	Interrupt Source	Level/Edge	CA55	CM33	DMAC	ELC	Error Event
0	0				PFC	—	NMI	Non-maskable interrupt	Edge	COMMON	COMMON	×	×	×
1	1		0		PFC	—	PORT_IRQ0	External pin interrupt 0	Low-level detection/rising edge/falling edge/both edges	COMMON	COMMON	×	✓	×
2	2		1		PFC	—	PORT_IRQ1	External pin interrupt 1	Low-level detection/rising edge/falling edge/both edges	COMMON	COMMON	×	✓	×
3	3		2		PFC	—	PORT_IRQ2	External pin interrupt 2	Low-level detection/rising edge/falling edge/both edges	COMMON	COMMON	×	✓	×
4	4		3		PFC	—	PORT_IRQ3	External pin interrupt 3	Low-level detection/rising edge/falling edge/both edges	COMMON	COMMON	×	✓	×
5	5		4		PFC	—	PORT_IRQ4	External pin interrupt 4	Low-level detection/rising edge/falling edge/both edges	COMMON	COMMON	×	✓	×
6	6		5		PFC	—	PORT_IRQ5	External pin interrupt 5	Low-level detection/rising edge/falling edge/both edges	COMMON	COMMON	×	✓	×
7	7		6		PFC	—	PORT_IRQ6	External pin interrupt 6	Low-level detection/rising edge/falling edge/both edges	COMMON	COMMON	×	✓	×

4.6.1.5.3 List of bus error events

The bus error events are listed below and on the following pages. The ICU bundles these interrupts into the BUS_ERR_INT signal.

Table 4.6-25 List of Bus Error Events (1/2)

Unit	CH	Signal	Level/ Edge	Active Level	Description
CM33	—	ERRINT_BRG_CM33_C	Edge	High	Interrupt when a C-AHB bridge error occurs
CM33	—	ERRINT_BRG_CM33_S	Edge	High	Interrupt when a C-AHB bridge error occurs
BUS	—	BUS_ERR_INTR_W_SXA55M	Edge	High	Bus write error interrupt for CA55
BUS	—	BUS_ERR_INTR_R_SXA55M	Edge	High	Bus read error interrupt for CA55
BUS	—	BUS_ERR_INTR_W_SXA55P	Edge	High	Bus write error interrupt for CA55 peripherals
BUS	—	BUS_ERR_INTR_R_SXA55P	Edge	High	Bus read error interrupt for CA55 peripherals
BUS	—	BUS_ERR_INTR_W_SXGPU	Edge	High	Bus write error interrupt for GE3D
BUS	—	BUS_ERR_INTR_R_SXGPU	Edge	High	Bus read error interrupt for GE3D
BUS	—	BUS_ERR_INTR_W_SXADMC0	Edge	High	Bus write error interrupt for DMAC1
BUS	—	BUS_ERR_INTR_R_SXADMC0	Edge	High	Bus read error interrupt for DMAC1
BUS	—	BUS_ERR_INTR_W_SXADMC1	Edge	High	Bus write error interrupt for DMAC2
BUS	—	BUS_ERR_INTR_R_SXADMC1	Edge	High	Bus read error interrupt for DMAC2
BUS	—	BUS_ERR_INTR_W_SXCSTE	Edge	High	Bus write error interrupt for CST_ETR
BUS	—	BUS_ERR_INTR_R_SXCSTE	Edge	High	Bus read error interrupt for CST_ETR
BUS	—	BUS_ERR_INTR_W_SXCSTA	Edge	High	Bus write error interrupt for CST_AP
BUS	—	BUS_ERR_INTR_R_SXCSTA	Edge	High	Bus read error interrupt for CST_AP
BUS	—	BUS_ERR_INTR_W_SXM33S	Edge	High	Bus write error interrupt for CM33_S
BUS	—	BUS_ERR_INTR_R_SXM33S	Edge	High	Bus read error interrupt for CM33_S
BUS	—	BUS_ERR_INTR_W_SXM33C	Edge	High	Bus write error interrupt for CM33_C
BUS	—	BUS_ERR_INTR_R_SXM33C	Edge	High	Bus read error interrupt for CM33_C
BUS	—	BUS_ERR_INTR_W_SXMDMC	Edge	High	Bus write error interrupt for DMAC0
BUS	—	BUS_ERR_INTR_R_SXMDMC	Edge	High	Bus read error interrupt for DMAC0
BUS	—	BUS_ERR_INTR_W_SXRDMC0	Edge	High	Bus write error interrupt for DMAC3
BUS	—	BUS_ERR_INTR_R_SXRDMC0	Edge	High	Bus read error interrupt for DMAC3
BUS	—	BUS_ERR_INTR_W_SXRDMC1	Edge	High	Bus write error interrupt for DMAC4
BUS	—	BUS_ERR_INTR_R_SXRDMC1	Edge	High	Bus read error interrupt for DMAC4
BUS	—	BUS_ERR_INTR_W_SXSD0	Edge	High	Bus write error interrupt for SD channel 0
BUS	—	BUS_ERR_INTR_R_SXSD0	Edge	High	Bus read error interrupt for SD channel 0
BUS	—	BUS_ERR_INTR_W_SXSD1	Edge	High	Bus write error interrupt for SD channel 1
BUS	—	BUS_ERR_INTR_R_SXSD1	Edge	High	Bus read error interrupt for SD channel 1
BUS	—	BUS_ERR_INTR_W_SXSD2	Edge	High	Bus write error interrupt for SD channel 2
BUS	—	BUS_ERR_INTR_R_SXSD2	Edge	High	Bus read error interrupt for SD channel 2
BUS	—	BUS_ERR_INTR_W_SXGBE0	Edge	High	Bus write error interrupt for GBETH channel 0
BUS	—	BUS_ERR_INTR_R_SXGBE0	Edge	High	Bus read error interrupt for GBETH channel 0
BUS	—	BUS_ERR_INTR_W_SXGBE1	Edge	High	Bus write error interrupt for GBETH channel 1
BUS	—	BUS_ERR_INTR_R_SXGBE1	Edge	High	Bus read error interrupt for GBETH channel 1
BUS	—	BUS_ERR_INTR_W_SHU2H0	Edge	High	Bus write error interrupt for USB2 channel 0 host
BUS	—	BUS_ERR_INTR_R_SHU2H0	Edge	High	Bus read error interrupt for USB2 channel 0 host
BUS	—	BUS_ERR_INTR_W_SHU2F	Edge	High	Bus write error interrupt for USB2 channel 0 function
BUS	—	BUS_ERR_INTR_R_SHU2F	Edge	High	Bus read error interrupt for USB2 channel 0 function

Table 4.6-25 List of Bus Error Events (2/2)

Unit	CH	Signal	Level/ Edge	Active Level	Description
BUS	—	BUS_ERR_INTR_W_SXU3H0	Edge	High	Bus write error interrupt for USB3 channel 0 host
BUS	—	BUS_ERR_INTR_R_SXU3H0	Edge	High	Bus read error interrupt for USB3 channel 0 host
BUS	—	BUS_ERR_INTR_W_SXPCIE0	Edge	High	Bus write error interrupt for PCIE0
BUS	—	BUS_ERR_INTR_R_SXPCIE0	Edge	High	Bus read error interrupt for PCIE0
BUS	—	BUS_ERR_INTR_W_SXCRV0	Edge	High	Bus write error interrupt for CRU channel 0 video
BUS	—	BUS_ERR_INTR_W_SXCRS0	Edge	High	Bus write error interrupt for CRU channel 0 statistics
BUS	—	BUS_ERR_INTR_W_SXCRV1	Edge	High	Bus write error interrupt for CRU channel 1 video
BUS	—	BUS_ERR_INTR_W_SXCRS1	Edge	High	Bus write error interrupt for CRU channel 1 statistics
BUS	—	BUS_ERR_INTR_W_SXISF	Edge	High	Bus write error interrupt for ISP full video output
BUS	—	BUS_ERR_INTR_W_SXIST	Edge	High	Bus write error interrupt for ISP temper
BUS	—	BUS_ERR_INTR_R_SXIST	Edge	High	Bus read error interrupt for ISP temper
BUS	—	BUS_ERR_INTR_R_SXISV	Edge	High	Bus read error interrupt for ISP video in
BUS	—	BUS_ERR_INTR_W_SXLCD	Edge	High	Bus write error interrupt for LCDC
BUS	—	BUS_ERR_INTR_R_SXLCD	Edge	High	Bus read error interrupt for LCDC
BUS	—	BUS_ERR_INTR_W_SXDSI	Edge	High	Bus write error interrupt for MIPI DSI link
BUS	—	BUS_ERR_INTR_R_SXDSI	Edge	High	Bus read error interrupt for MIPI DSI link
BUS	—	BUS_ERR_INTR_W_SXISU	Edge	High	Bus write error interrupt for ISU
BUS	—	BUS_ERR_INTR_R_SXISU	Edge	High	Bus read error interrupt for ISU
BUS	—	BUS_ERR_INTR_W_SXVCP	Edge	High	Bus write error interrupt for VCD
BUS	—	BUS_ERR_INTR_R_SXVCP	Edge	High	Bus read error interrupt for VCD
BUS	—	BUS_ERR_INTR_W_SXDRA	Edge	High	Bus write error interrupt for DRP-AI DRP0
BUS	—	BUS_ERR_INTR_R_SXDRA	Edge	High	Bus read error interrupt for DRP-AI DRP0
BUS	—	BUS_ERR_INTR_W_SXDRM0	Edge	High	Bus write error interrupt for DRP-AI AI-MAC feature data 0 master
BUS	—	BUS_ERR_INTR_R_SXDRM0	Edge	High	Bus write error interrupt for DRP-AI AI-MAC feature data 0 master
BUS	—	BUS_ERR_INTR_W_SXDRM1	Edge	High	Bus write error interrupt for DRP-AI AI-MAC feature data 1 master
BUS	—	BUS_ERR_INTR_R_SXDRM1	Edge	High	Bus write error interrupt for DRP-AI AI-MAC feature data 1 master
BUS	—	BUS_ERR_INTR_R_SXDRW0	Edge	High	Bus write error interrupt for DRP-AI AI-MAC weight data 0 master
BUS	—	BUS_ERR_INTR_R_SXDRW1	Edge	High	Bus write error interrupt for DRP-AI AI-MAC weight data 1 master
BUS	—	BUS_TZC0INT_DDR_TZCDDR0	Level	High	Conveys access security violations or region overlap errors.
BUS	—	BUS_TZC1INT_DDR_TZCDDR0	Level	High	Conveys access security violations or region overlap errors.
BUS	—	BUS_TZCINT_ASRM	Level	High	Conveys access security violations or region overlap errors.
BUS	—	BUS_TZCINT_PCI	Level	High	Conveys access security violations or region overlap errors.
BUS	—	BUS_TZCINT_MSRM	Level	High	Conveys access security violations or region overlap errors.
BUS	—	BUS_TZCINT_XSP	Level	High	Conveys access security violations or region overlap errors.
BUS	—	BUS_TZCINT_ACRCB	Level	High	Conveys access security violations or region overlap errors.

4.6.1.5.4 List of SRAM error events

The SRAM error events are listed below. The ICU bundles these interrupts into the RAM_ERR_INT signal.

Table 4.6-26 List of SRAM Error Events

Unit	Signal	Level/ Edge	Active Level	Description
SRAM2	SRAM2_EC7TIE1[3:0]	Edge	High	ECC 1-bit error interrupt
SRAM2	SRAM2_EC7TIE2[3:0]	Edge	High	ECC 2-bit error interrupt
SRAM2	SRAM2_EC7TIOVF[3:0]	Edge	High	Interrupt on overflow of capturing ECC error addresses
SRAM0	SRAM0_EC7TIE1[1:0]	Edge	High	ECC 1-bit error interrupt
SRAM0	SRAM0_EC7TIE2[1:0]	Edge	High	ECC 2-bit error interrupt
SRAM0	SRAM0_EC7TIOVF[1:0]	Edge	High	Interrupt on overflow of capturing ECC error addresses
SRAM1	SRAM1_EC7TIE1[1:0]	Edge	High	ECC 1-bit error interrupt
SRAM1	SRAM1_EC7TIE2[1:0]	Edge	High	ECC 2-bit error interrupt
SRAM1	SRAM1_EC7TIOVF[1:0]	Edge	High	Interrupt on overflow of capturing ECC error addresses

4.6.1.5.5 List of the DMA ACK signals

The DMA ACK signals output from the ICU are listed below and on the following pages.

Table 4.6-27 List of the DMA ACK Output Signals (1/3)

Ack No.	TEND No.	Unit	CH	Signal	Description	Level/Edge	Active Level	Corresponding Req Signal
0		SPDIF	CH0	dmaack_tx_n	DMA ACK	Level	Low	rbdmareqn_tx
1		SPDIF	CH0	dmaack_rx_n	DMA ACK	Level	Low	rbdmareqn_rx
2		SPDIF	CH1	dmaack_tx_n	DMA ACK	Level	Low	rbdmareqn_tx
3		SPDIF	CH1	dmaack_rx_n	DMA ACK	Level	Low	rbdmareqn_rx
4		SPDIF	CH2	dmaack_tx_n	DMA ACK	Level	Low	rbdmareqn_tx
5		SPDIF	CH2	dmaack_rx_n	DMA ACK	Level	Low	rbdmareqn_rx
6		SCU	—	pdrack_sr0_in	DMA ACK	Level	High	pdreq_sr0_in
7		SCU	—	pdrack_sr1_in	DMA ACK	Level	High	pdreq_sr1_in
8		SCU	—	pdrack_sr2_in	DMA ACK	Level	High	pdreq_sr2_in
9		SCU	—	pdrack_sr3_in	DMA ACK	Level	High	pdreq_sr3_in
10		SCU	—	pdrack_sr4_in	DMA ACK	Level	High	pdreq_sr4_in
11		SCU	—	pdrack_sr5_in	DMA ACK	Level	High	pdreq_sr5_in
12		SCU	—	pdrack_sr6_in	DMA ACK	Level	High	pdreq_sr6_in
13		SCU	—	pdrack_sr7_in	DMA ACK	Level	High	pdreq_sr7_in
14		SCU	—	pdrack_sr8_in	DMA ACK	Level	High	pdreq_sr8_in
15		SCU	—	pdrack_sr9_in	DMA ACK	Level	High	pdreq_sr9_in
16		SCU	—	pdrack_sr0_out	DMA ACK	Level	High	pdreq_sr0_out
17		SCU	—	pdrack_sr1_out	DMA ACK	Level	High	pdreq_sr1_out
18		SCU	—	pdrack_sr2_out	DMA ACK	Level	High	pdreq_sr2_out
19		SCU	—	pdrack_sr3_out	DMA ACK	Level	High	pdreq_sr3_out

4.6.2 Generic Interrupt Controller (GIC)

GIC is equipped with Arm® CoreLink™ GIC-600 Generic Interrupt Controller for Cortex-A55.

4.6.2.1 Features

■ **Equipped with Arm® CoreLink™ GIC-600 Generic Interrupt Controller*1 for Arm Cortex-A55.**

- 32 levels of priority.
- SGI (Software Generated Interrupt): 16 interrupts
- PPI (Private Peripheral Interrupt): 16 interrupts
- SPI (Shared Peripheral Interrupt): 960 interrupts
- LPI (Locality-specific Peripheral Interrupt): Not supported

Note 1. Refer to Arm® CoreLink™ GIC-600 Generic Interrupt Controller Revision: r1p6 Technical Reference Manual.

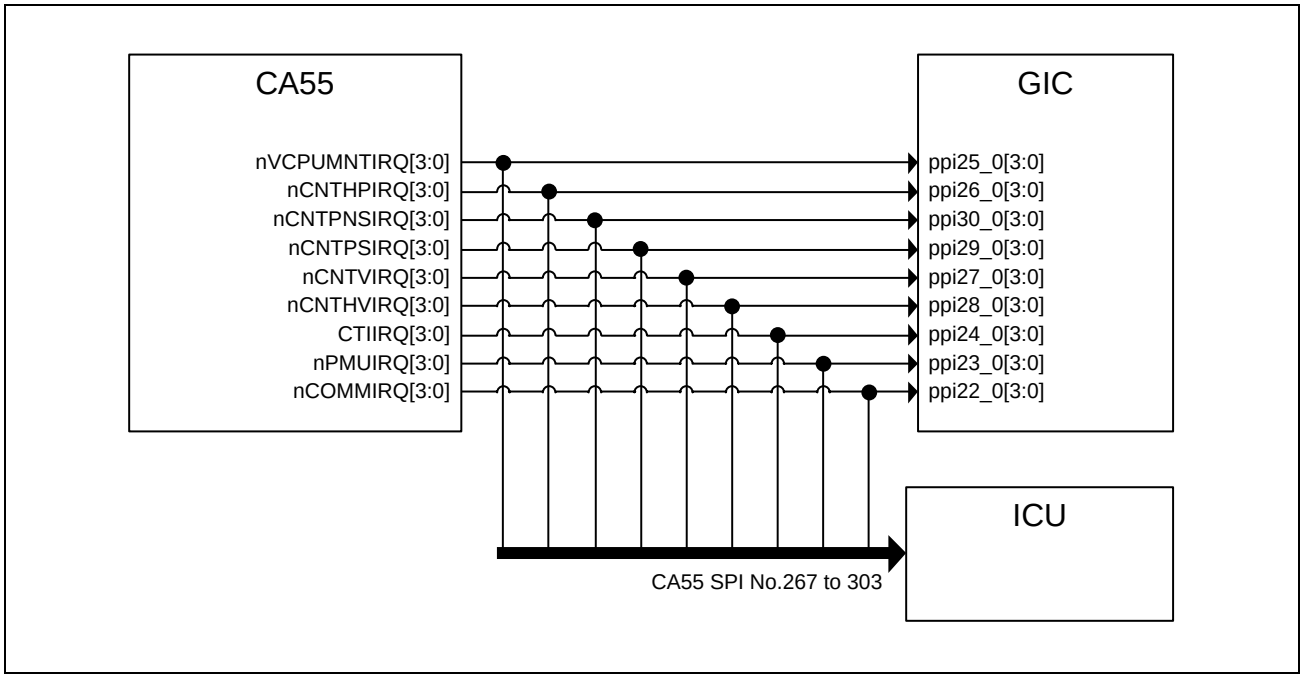

Figure 4.6-22 Diagram of SPI Signals

4.6.2.2 GIC-600 and NVIC Register Configuration

■ **GIC-600 Register**

Refer to Arm® CoreLink™ GIC-600 Generic Interrupt Controller Revision: r1p6 Technical Reference Manual.

ITS and LPI are not supported.

Base Address: 0_1490_0000h (Cortex-A55 Address Space)

Base Address: 0_4490_0000h (Cortex-M33 Address Space Secure)
Base Address: 0_5490_0000h (Cortex-M33 Address Space Non-secure)

4.6.2.3 GIC-600 and NVIC Register Descriptions

■ **GIC-600 Register**

Refer to Arm® CoreLink™ GIC-600 Generic Interrupt Controller Revision: r1p6 Technical Reference Manual for detail.

4.6.3 Message Handling Unit (MHU)

MHU is a function for message communication between each core of Cortex-A55(CA55) and Cortex-M33(CM33). Message communication is done by shared RAM (on-chip RAM and external memory) for passing messages and responses between CPUs and the function (MHU) for notifying when messages and responses are stored in the memory.

4.6.3.1 Features

Table 4.6-28 shows the MHU feature summary.

Table 4.6-28 Feature summary

Feature	Description
Interrupt by message and response	Generate interrupt to notify each core of CA55 and CM33 when the message/response is stored in shared RAM.
Software interrupt control	Control registers for interrupt setting, clearing, and status confirmation

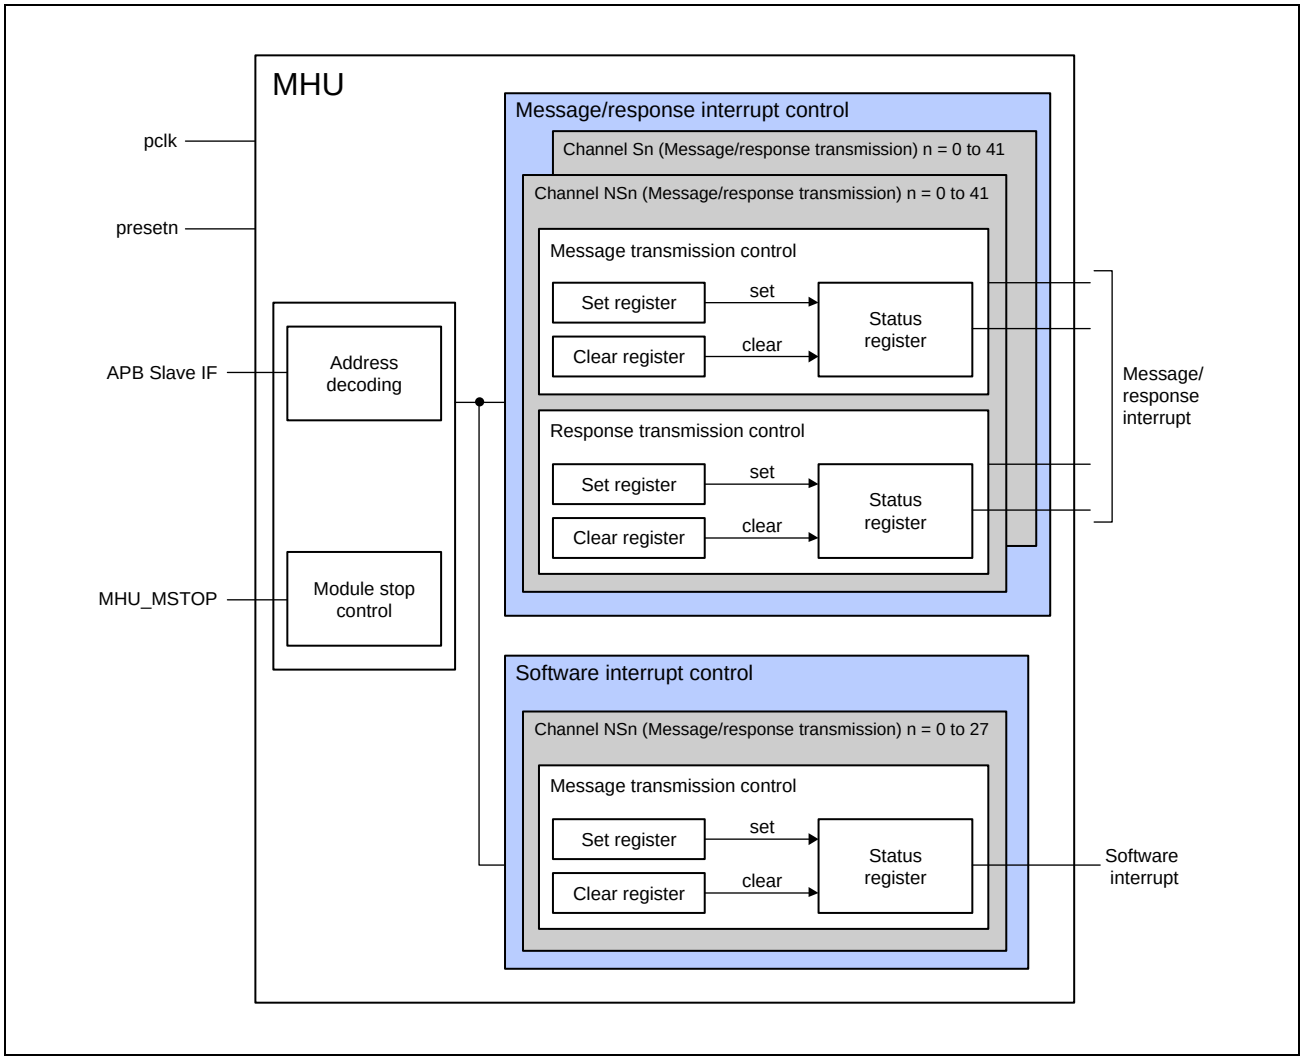

Figure 4.6-23 MHU Block Diagram

Message/response interrupt control registers

Registers that control message/response interrupts.

The message/response interrupt control register controls interrupts with the set register, clear register, and status register. An interrupt is asserted by writing “1” to the set register. The interrupt is negated by writing “1” to the clear register. The status can be checked by reading the status register. With these registers as one set, one channel is composed of a pair of the message transmission processing register and the response transmission processing register, and a total of 42 channels are mounted.

Software interrupt control register

Registers that control software interrupts.

The software interrupt control register controls interrupts using the set register, clear register, and status register. An interrupt is asserted by writing “1” to the set register. The interrupt is negated by writing “1” to the clear register. You can also check the interrupt status by reading the status register. With these registers as one set, one channel is composed of a pair of the message transmission processing register and the response transmission processing register, and a total of 28 channels are mounted.

Module stop control

This circuit refers to the module stop control (MHU_MSTOP) in CPG_MHU_MSTOP register on Clock Pulse Generator (CPG) and returns an error response if an access occurs while the module is stopped.

4.6.3.2 Interrupt

Table 4.6-29 shows the interrupt outputs.

Table 4.6-29 Interrupt type (1/5)

Output	Description	Pulse/Level	Active Level
msg_ch0_ns	Non secure message transmission interrupt (CA55 Core0 -> CA55 Core1)	Level	High
rsp_ch0_ns	Non secure response transmission interrupt (CA55 Core1 -> CA55 Core0)	Level	High

swint_ch26_ns	Not used	—	—
swint_ch27_ns	Not used	—	—

4.6.3.3 Registers

Table 4.6-30 Register Base Address

Base Register Name	The Base Address
<MHU_base>	0_1048_0000h (5048_0000h*1, 4048_0000h*2)

Note 1. CM33 address space (non-secure)

Note 2. CM33 address space (secure)

Table 4.6-31 shows offset address mapping for MHU.

Table 4.6-31 MHU Address map

Offset Address	Description
0000h to 07FFh	Non-secure message/response interrupt control register
0800h to 0FFFh	Non-secure software interrupt control register
1000h to 17FFh	Secure message/response interrupt control register
1800h to FFFFh	Reserved

Note: Access to the reserved area is prohibited.

4.6.3.3.1 List of Registers

The registers are listed below.

Register Name	Abbreviation	Initial Value	Offset Address	Access Size [bits]
Non secure message transmission interrupt Status register	MHU_MSG_INT_STSn_NS <n=0-41>	0000_0000h	0000h + n x 0020h	32
Non secure message transmission interrupt Set register	MHU_MSG_INT_SETn_NS <n=0-41>	0000_0000h	0004h + n x 0020h	32
Non secure message transmission interrupt Clear register	MHU_MSG_INT_CLRn_NS <n=0-41>	0000_0000h	0008h + n x 0020h	32
Non secure response transmission interrupt Status register	MHU_RSP_INT_STSn_NS <n=0-41>	0000_0000h	0010h + n x 0020h	32
Non secure response transmission interrupt Set register	MHU_RSP_INT_SETn_NS <n=0-41>	0000_0000h	0014h + n x 0020h	32
Non secure response transmission interrupt Clear register	MHU_RSP_INT_CLRn_NS <n=0-41>	0000_0000h	0018h + n x 0020h	32
Reserve	-	-	0540h to 07FFh	-
Non secure software interrupt Status register	MHU_SW_INT_STSn_NS <n=0-27>	0000_0000h	0800h + n x 0010h	32
Non secure software interrupt Set register	MHU_SW_INT_SETn_NS <n=0-27>	0000_0000h	0804h + n x 0010h	32
Non secure software interrupt Clear register	MHU_SW_INT_CLRn_NS <n=0-27>	0000_0000h	0808h + n x 0010h	32
Reserve	-	-	09C0h to 0FFFh	-
Secure message transmission interrupt Status register	MHU_MSG_INT_STSn_S <n=0-41>	0000_0000h	1000h + n x 0020h	32
Secure message transmission interrupt Set register	MHU_MSG_INT_SETn_S <n=0-41>	0000_0000h	1004h + n x 0020h	32
Secure message transmission interrupt Clear register	MHU_MSG_INT_CLRn_S <n=0-41>	0000_0000h	1008h + n x 0020h	32
Secure response transmission interrupt Status register	MHU_RSP_INT_STSn_S <n=0-41>	0000_0000h	1010h + n x 0020h	32
Secure response transmission interrupt Set register	MHU_RSP_INT_SETn_S <n=0-41>	0000_0000h	1014h + n x 0020h	32
Secure response transmission interrupt Clear register	MHU_RSP_INT_CLRn_S <n=0-41>	0000_0000h	1018h + n x 0020h	32

4.6.3.3.2 Register Description

The prefix (MHU_) of the register names is omitted in this and subsequent sections.

(1) Non-Secure Message Transmission Interrupt Status Register (MHU_MSG_INT_STSn_NS) (n = 0 to 41)

- n=0: CA55 Core0 -> CA55 Core1
- n=1: CA55 Core0 -> CA55 Core2
- n=2: CA55 Core0 -> CA55 Core3

Status register for non-secure message transmission interrupt

Access Size : 32 bits
Address : <MHU_base> + 0000h + n x 0020h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	STAT
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
0	STAT	0h	R	Indicates the status of the message transmission interrupt. This bit is read-only. Writing to it has no effect. 0b: No message transmission interrupt (no interrupt is notified to the interrupt controller of the message destination). 1b: Assert the message transmission interrupt (the interrupt is notified to the interrupt controller of the message destination).

(2) Non-Secure Message Transmission Interrupt Set Register (MHU_MSG_INT_SETn_NS) (n = 0 to 41)

- n=0: CA55 Core0 -> CA55 Core1
- n=1: CA55 Core0 -> CA55 Core2
- n=2: CA55 Core0 -> CA55 Core3

Set register for non-secure message transmission interrupt

Access Size : 32 bits
Address : <MHU_base> + 0004h + n x 0020h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	SET
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
0	SET	0h	R0W1	Sets the message transmission interrupt. Only 1b can be written to this bit. It is always read as 0b. 0b: Invalid 1b: Issue the interrupt to the interrupt controller of the message destination.

(3) Non-Secure Message Transmission Interrupt Clear Register (MHU_MSG_INT_CLRn_NS) (n = 0 to 41)

- n=0: CA55 Core0 -> CA55 Core1
- n=1: CA55 Core0 -> CA55 Core2

Clear register for non-secure message transmission interrupt

Access Size : 32 bits
Address : <MHU_base> + 0008h + n x 0020h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CLEAR
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
0	CLEAR	0h	R0W1	Clears the message transmission interrupt. Only 1b can be written to this bit. It is always read as 0b. 0b: Invalid 1b: Clear the interrupt to the interrupt controller of the message destination.

(4) Non-Secure Response Transmission Interrupt Status Register (MHU_RSP_INT_STSn_NS) (n = 0 to 41)

Status register for non-secure response transmission interrupt

Access Size : 32 bits
Address : <MHU_base> + 0010h + n x 0020h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	STAT
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
0	STAT	0h	R	Indicates the status of the message transmission interrupt. This bit is read-only. Writing to it has no effect. 0b: No message transmission interrupt (no interrupt is notified to the interrupt controller of the message destination). 1b: Assert the message transmission interrupt (the interrupt is notified to the interrupt controller of the message destination).

(5) Non-Secure Response Transmission Interrupt Set Register (MHU_RSP_INT_SETn_NS) (n = 0 to 41)

Status register for non-secure software interrupt status register

Access Size : 32 bits
Address : <MHU_base> + 0800h + n x 0010h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	STAT
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
0	STAT	0h	R	Indicates the status of the non-secure software interrupt. Writing to this bit has no effect. 0b: No interrupt (no interrupt is notified to the interrupt controller). 1b: Software interrupt is asserted (the interrupt is notified to the interrupt controller).

(8) Non-Secure Software Interrupt Set Register (Ch0 to Ch27) (MHU_SW_INT_SETn_NS) (n = 0 to 27)

Clear register for secure response transmission interrupt

Access Size : 32 bits
Address : <MHU_base> + 1018h + n x 0020h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CLEAR
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
0	CLEAR	0h	R0W1	Clears the message transmission interrupt. Only 1b can be written to this bit. It is always read as 0b. 0b: Invalid 1b: Clear the interrupt to the interrupt controller of the message destination.

4.6.3.4 Function Description

4.6.3.4.1 Inter-CPU communication

The hardware configuration is shown in **Figure 4.6-24**. Inter-CPU communication is established by sending a message from the message source to the message destination and sending a response from the message destination to the message source. The MHU uses an interrupt to notify that the message or response to the CPU has been written to the shared RAM. Interrupts are controlled by the Set register, Clear register, and Status register. Interrupt can be asserted by writing “1” to the Set register. Interrupt is negated by writing “1” to the Clear register, and check the interrupt status by reading the Status register. With these registers as one set, one channel is composed of a pair of the message transmission processing register and the response transmission processing register. A total of 84 channels (non-secure: 42 channels; secure: 42 channels) are installed so that bidirectional communication can be performed between CA55 Core0/Core1/Core2/Core3 and CM33. **Table 4.6-32** shows the message source/destination correspondence.

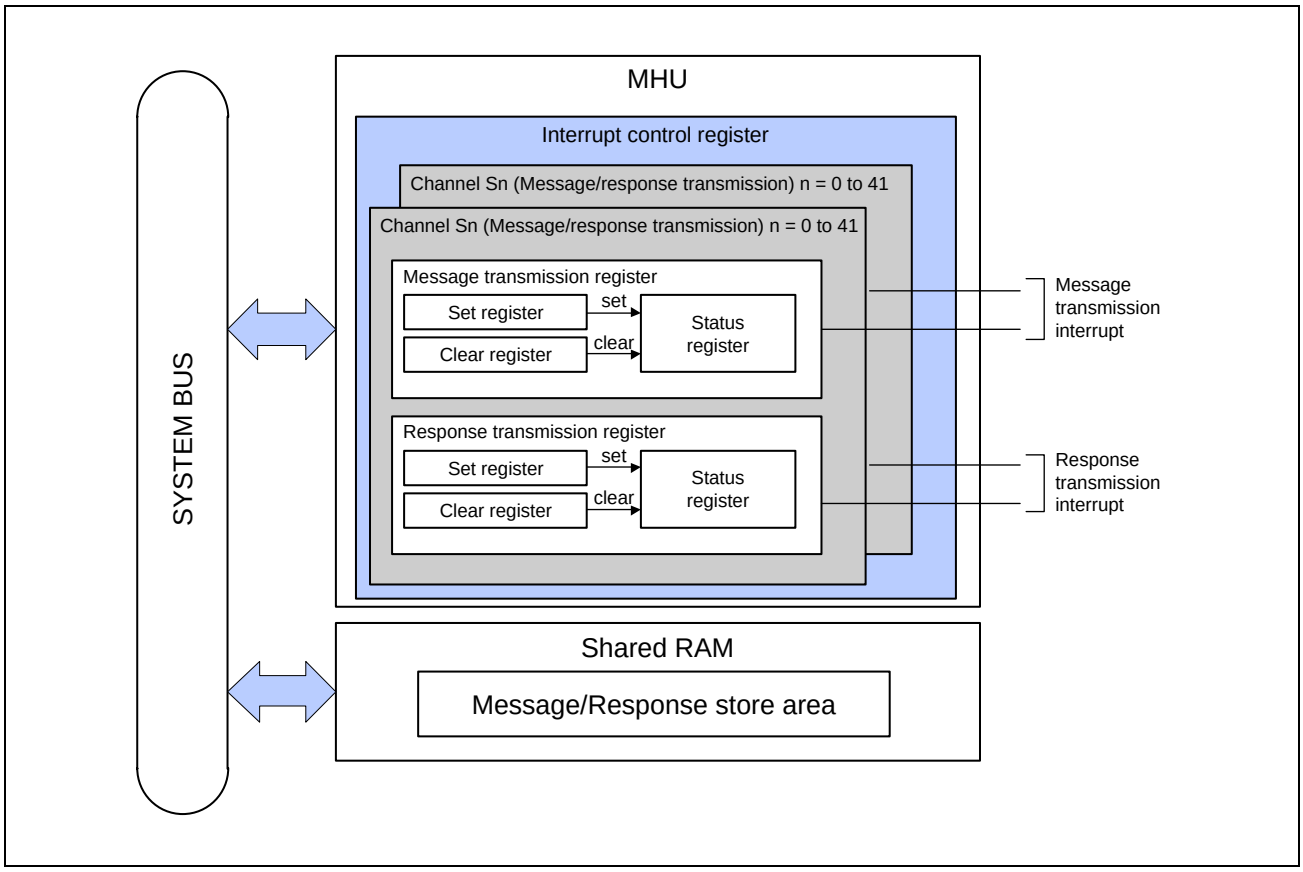

Figure 4.6-24 Hardware Configuration

Table 4.6-32 Message destination/source reference

Source	Destination	Message transmission register	Response transmission register
CA55 Core0	CA55 Core1	MSG_INT_(SEL/CLR/STS)0_NS	RSP_INT_(SET/CLR/STS)0_NS

CA55 Core3	CM33	MSG_INT_(SEL/CLR/STS)23_S	RSP_INT_(SET/CLR/STS)39_S
CM33	CA55 Core0	MSG_INT_(SEL/CLR/STS)36_S	RSP_INT_(SET/CLR/STS)5_S
CM33	CA55 Core1	MSG_INT_(SEL/CLR/STS)37_S	RSP_INT_(SET/CLR/STS)11_S
CM33	CA55 Core2	MSG_INT_(SEL/CLR/STS)38_S	RSP_INT_(SET/CLR/STS)17_S
CM33	CA55 Core3	MSG_INT_(SEL/CLR/STS)39_S	RSP_INT_(SET/CLR/STS)23_S

4.6.3.4.2 Software interrupt

Software interrupts are controlled by the set register, clear register, and status registers. An interrupt can be asserted by writing “1” to the set register. The interrupt is negated by writing “1” to the clear register, and the interrupt status can be checked by reading the status register. With these registers as one set, one channel is composed of a pair of message transmission processing / response transmission processing, and a total of 28 channels are mounted. **Table 4.6-33** lists the interrupt source/destination correspondence.

Table 4.6-33 Interrupt Destination/Source Reference

Source	Destination	Message Transmission Register
CA55 Core0	CR8 Core0	SW_INT_(SET/CLR/STS)0_NS
CA55 Core0	CR8 Core1	SW_INT_(SET/CLR/STS)1_NS
CA55 Core0	CM33	SW_INT_(SET/CLR/STS)2_NS
CA55 Core1	CR8 Core0	SW_INT_(SET/CLR/STS)3_NS
CA55 Core1	CR8 Core1	SW_INT_(SET/CLR/STS)4_NS
CA55 Core1	CM33	SW_INT_(SET/CLR/STS)5_NS

4.6.3.5 Operation Sequence

4.6.3.5.1 Message transmission sequence

The message transmission sequence from CM33 to CA55 Core0 is described below and shown in **Figure 4.6-25**.

(1) CM33: Check “0” for bit 0 in register: MSG_INT_STS36.
(Confirm cleared status and move to (2))

(2) CM33: Write message to shared RAM

(3) CM33: Write “1” to bit 0 in register: MSG_INT_SET36

(4) MHU channel 36: Assert interrupt: msg_ch36 for CA55

(5) CA55 Core0: Check interrupt source (Detect message transmission)

(6) CA55 Core0: Check “1” for bit 0 in register: MSG_INT_STS36

(7) CA55 Core0: Read message from shared RAM

(8) CA55 Core0: Write “1” to bit 0 in register: MSG_INT_CLR36

(9) MHU channel 36: Negate interrupt: msg_ch36 to CA55

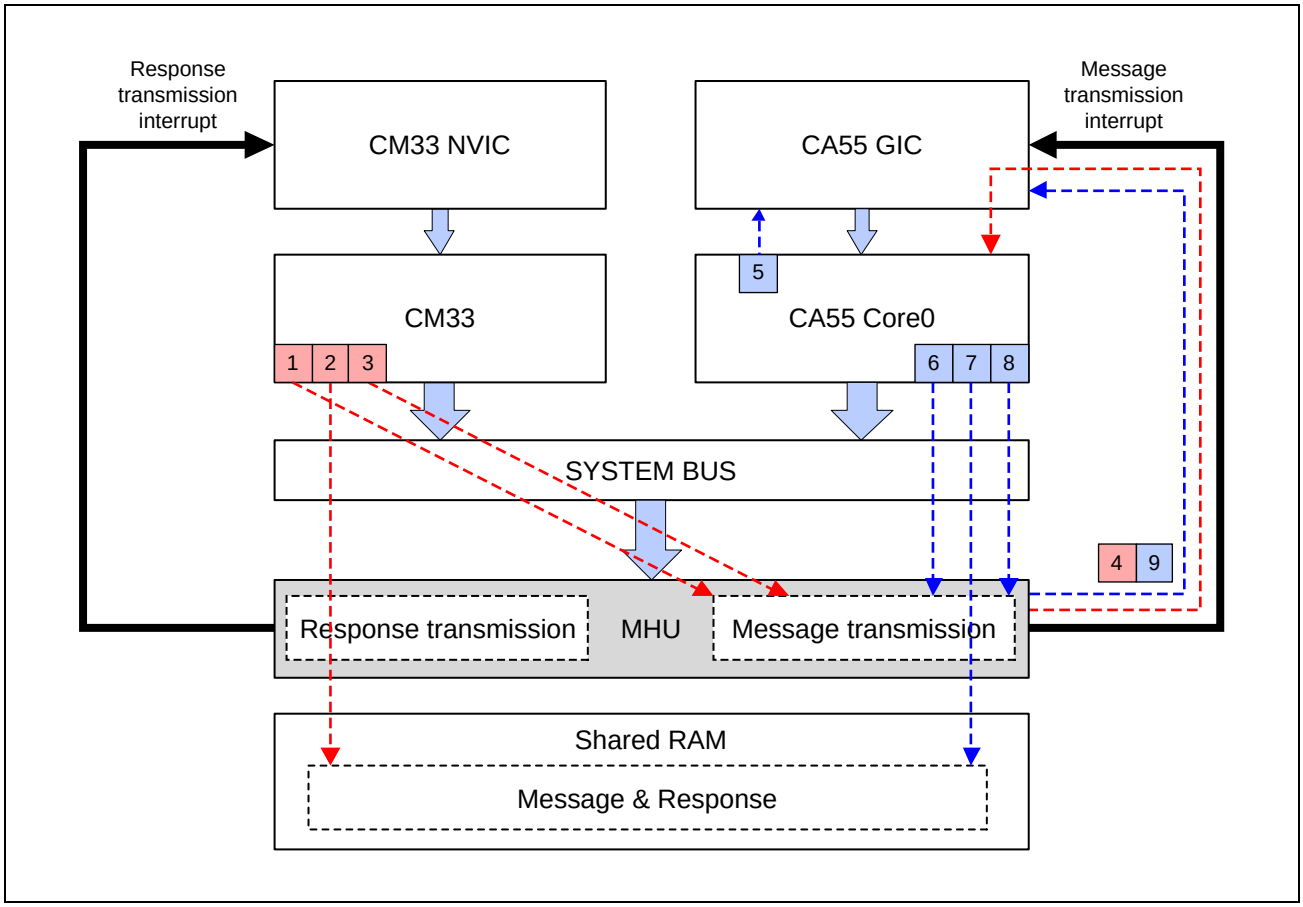

Figure 4.6-25 Message Transmission Sequence (CM33 -> CA55 Core0)

4.6.3.5.2 Response transmission sequence

The response transmission sequence from CA55 Core0 to CM33 is described below and shown in **Figure 4.6-26**.

(1) CA55 Core0: Check “0” for bit 0 in register: RSP_INT_STS5.
(Confirm cleared status and move to (2))

(2) CA55 Core0: Write response to shared RAM

(3) CA55 Core0: Write “1” to bit 0 in register: RSP_INT_SET5

(4) MHU channel 5: Assert interrupt: rsp_ch5 for CM33

(5) CM33: Check interrupt source (Detect response transmission)

(6) CM33: Check “1” for bit 0 in register: RSP_INT_STS5

(7) CM33: Read response from shared RAM

(8) CM33: Write “1” to bit 0 in register: RSP_INT_CLR5

(9) MHU channel 5: Negate interrupt:rsp_ch5 to CM33

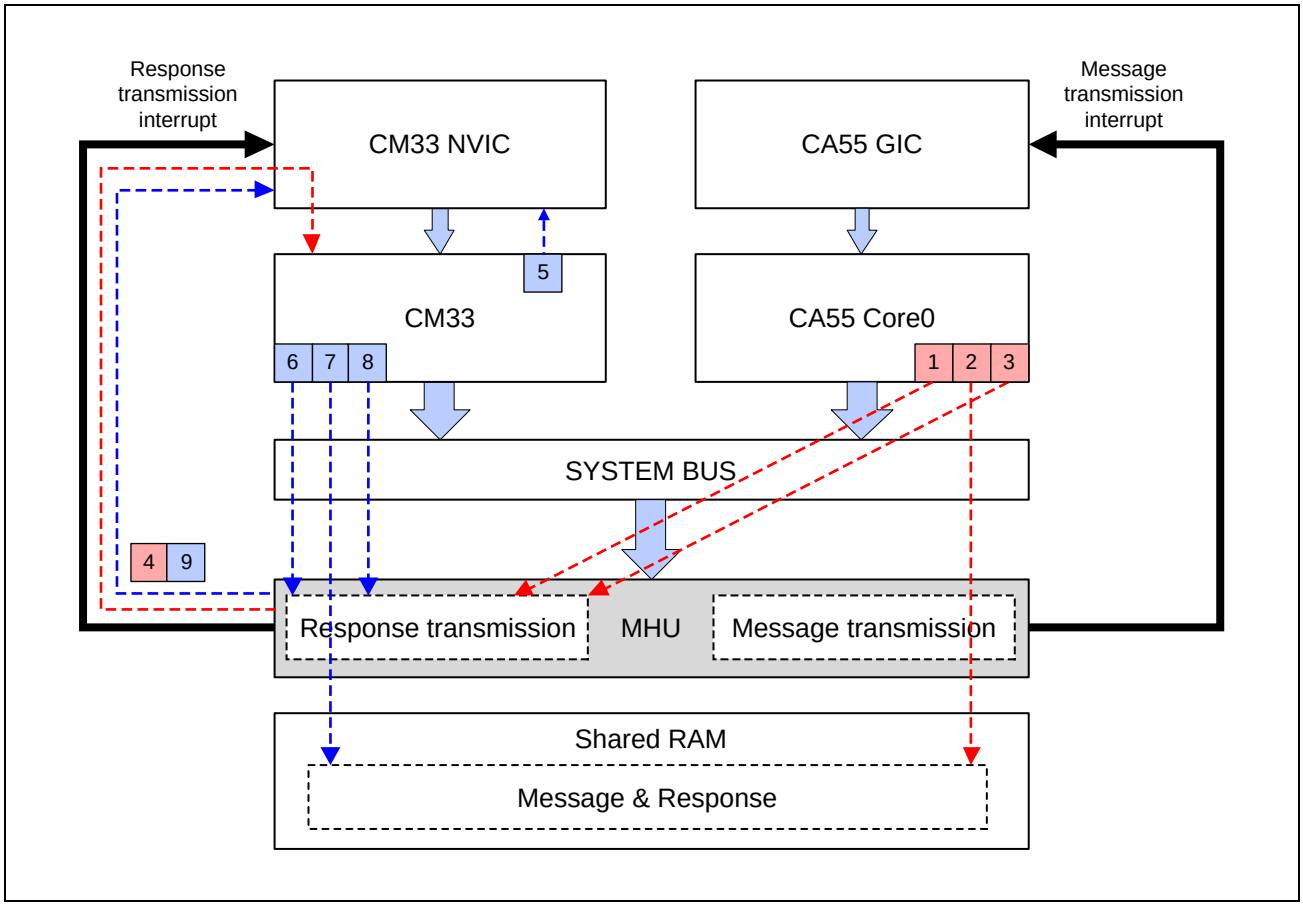

Figure 4.6-26 Response Transmission Sequence (CA55 Core0 -> CM33)

4.6.3.5.3 Software interrupt sequence

Show Software interrupt sequence from CA55 Core0 to CM33 in below.

(1) CA55 Core0: Check “0” for bit0 in register: SWI_INT_STS2_NS.
(Confirm cleared status and move to (2))

(2) CA55 Core0: Write “1” to bit 0 in register: SWI_INT_SET2_NS

(3) Software channel 2: Assert interrupt: swint_ch2_ns for CM33

(4) CM33: Check interrupt reason (Detect software interrupt)

(5) CM33: Check “1” for bit 0 in register: SWI_INT_STS2_NS

(6) CA55 Core0: Write “1” to bit0 in register: SWI_INT_CLR2_NS

(7) Software channel 2: Negate interrupt: swint_ch2_ns to CM33

SECTION 4 SYSTEM

4.7 DMA Controller (DMAC)

This section describes the functions of the DMA controller (DMAC).

4.7.1 Functional Overview

The DMAC controller (DMAC) is made up of DMACA and DMACB (each having eight channels).This LSI has 5 DMAC modules. Each module has 16 channels, so there are 80 channels in this LSI.

It supports hardware activation, software activation, and link transfer with the use of descriptors.

4.7.1.1 Features

- The AOF register setting in SYS allows access to the address space over 4 Gbytes.

- DMA transaction setting modes

  Register mode and link mode are supported.

  - Register mode
    In this mode, DMA transfer proceeds with the use of settings from the CPU. Up to two register sets (Next0 and Next1 register sets) can be set and alternating consecutive transfer according to the respective settings can proceed.
  - Link mode
    In this mode, the settings (descriptors) are allocated to the external memory and captured by the DMAC, after which DMA transfer proceeds in accord with the values. By preparing multiple settings which specify the addresses of the descriptors to control next transfers, sequential execution of transfers is possible.
    Additionally, suspension and resumption of the next DMA transfer can be specified by the header of the descriptor.

- Triggering modes

  The following two types are supported to start DMA transfer.

  - Software activation
    DMA transfer is started by writing to an internal register.
  - Hardware activation
    DMA transfer is started according to the state of the DMAREQ input. The detection mode is selectable from those listed below. Masking is also possible.

    — Rising-edge detection
    — Falling-edge detection
    — Change-point detection
    — High-level detection
    — Low-level detection

- Interrupt

  When a transfer is completed, the transfer completion interrupt DMAEND[7:0] pins are asserted (can also be masked).
  In the event of a bus error, the error interrupt DMAERR pin is asserted.

- Method of transfer

  Transfer sizes for the source and the destination are individually selectable as values from among 1 to 128 bytes.
  For transfer addresses, increment mode and fixed mode are supported.

- Buffer flushing

  Data already captured in the buffer can be forcibly flushed.

- Suspension

  DMA transfer in progress can be suspended.

- Interval function

  The interval between DMA transfers is specifiable to adjust the bus occupancy ratio.

4.7.1.2 DMA Transfer Specifications

- Maximum number of bytes for DMA transfer

  Byte counting is specifiable per channel. The maximum number is $(2^{32} - 1)$ bytes = (4G − 1) bytes.

4.7.1.3 Restrictions

If transfer proceeds with the use of this unit in such a way that the data source and destination areas are the same or parts of these areas overlap, data consistency cannot be guaranteed. Accordingly, make settings such that the data source and destination address areas do not overlap.

4.7.2 Connection Configuration

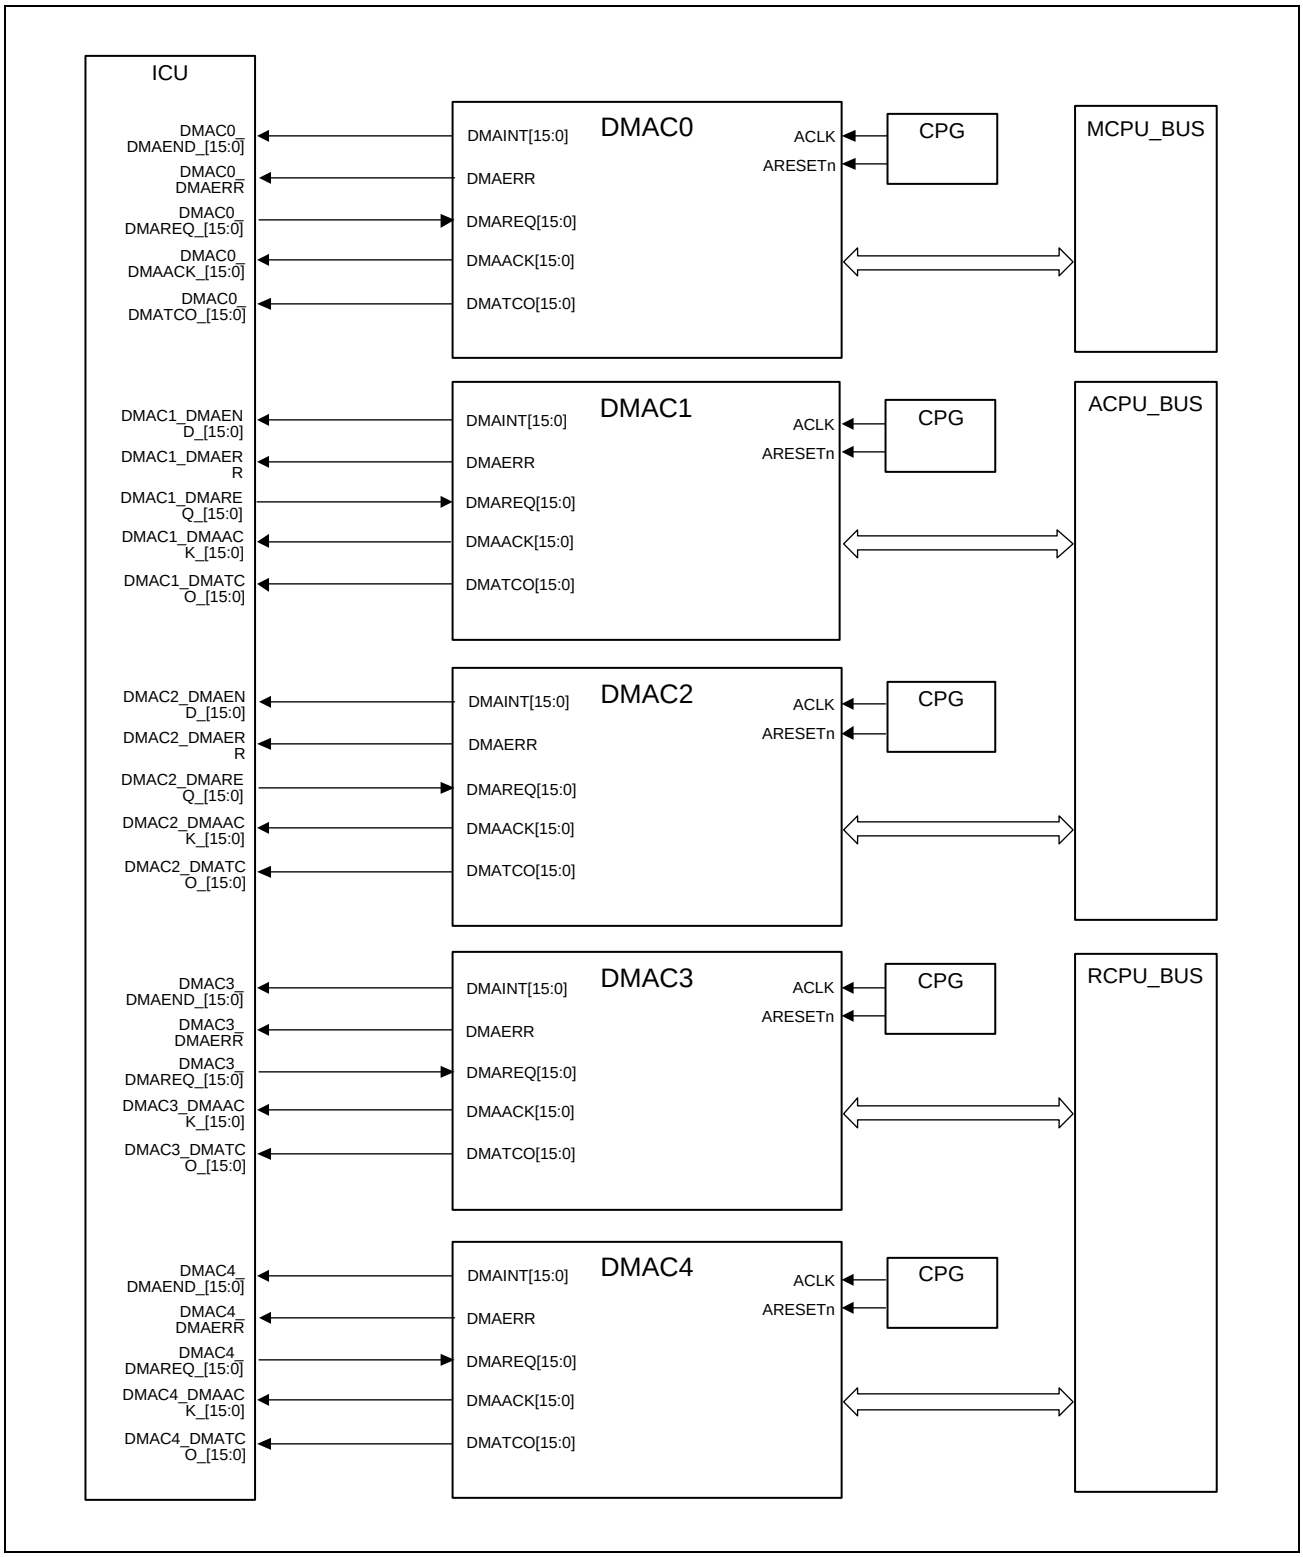

Figure 4.7-1 Connection Configuration

4.7.3 Pin Functions

4.7.3.1 List of External Pins

Table 4.7-1 List of External Pins

Pin Name	Input/Output	Functions
DREQ[4:0]	Input	DMA transfer request input from an external device to DMAC
DACK[4:0]	Output	Output of DMAC transfer request acceptance from DMAC to an external device
TEND[4:0]	Output	Output of transfer completion from DMAC to an external device

Note: The DMAC external pins are multiplexed pins. For the settings of each pin, see **1.2 Pin** and **4.2 Pin Function Controller (PFC)**.
When these pins are used, set the resource to PFC (external pin) by the ICU registers (ICU_DMkSELy, ICU_DMTENDSELk, and ICU_DMACKSELk).

4.7.3.2 List of Internal Pins

Table 4.7-2 lists the internal pins of the DMAC.

Table 4.7-2 List of Internal Pins

Pin Name	Input/Output	Functions
DMA interfaces		
DMAREQ[15:0]	Input	DMA transfer request input *Note*: If DMAREQ is generated with the clock which is not synchronized with ACLK, use level-detection mode.
DMAACK[15:0]	Output	DMA acknowledge output *Note*: If the DMAACK signal is to be fetched with the clock which is not synchronized with ACLK, use level-output mode.
DMATCO[15:0]	Output	DMA terminal count output (pulse)
Interrupt interfaces		
DMAINT[15:0]	Output	DMA transaction completed interrupt
DMAERR	Output	Error response (ERROR) interrupt

4.7.3.2.1 DMA Interfaces

Each DMAC can be set to select one request from among eight transfer requests by software.

The DMAREQ, DMAACK, and DMATCO signals are referred to as the DMA signals and are on pins for use in hardware activation.

Eight DMAREQ, DMAACK, and DMATCO signals are assigned to each DMAC unit. The bit positions to be used are switchable by using the SEL field of the DMACm_CHCFG_n register.

DMAREQ (Input)

This is a request input signal for DMA transfer.

Edge detection (rising-edge detection, falling-edge detection, and change-point detection) and level detection (high-level detection and low-level detection) are supported (masking requests is also possible).

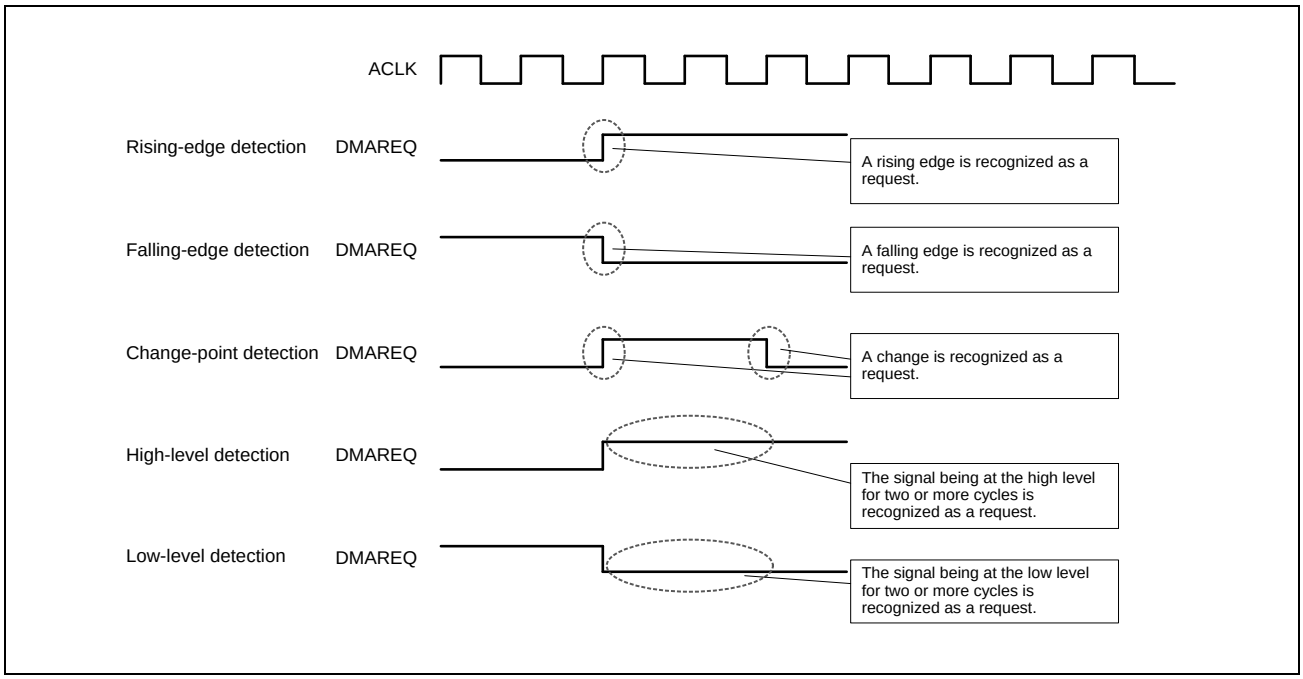

Figure 4.7-2 DMAREQ Detection Mode

DMAACK (Output)

This is an acknowledge output signal for the DMAREQ signal.

This signal is activated in response to the start of transfer corresponding to the DMAREQ signal.

It supports pulse mode, level mode, and bus cycle mode (masking the output is also possible).

If the DMAACK signal is in level mode, it remains at the high level until the DMAREQ signal is deactivated.

A next DMA request is not accepted while the DMAACK signal is at the high level. Use this signal for handshaking with the DMAREQ signal.

The figure below shows the output modes of the respective DMAACK signals and the example timing charts.

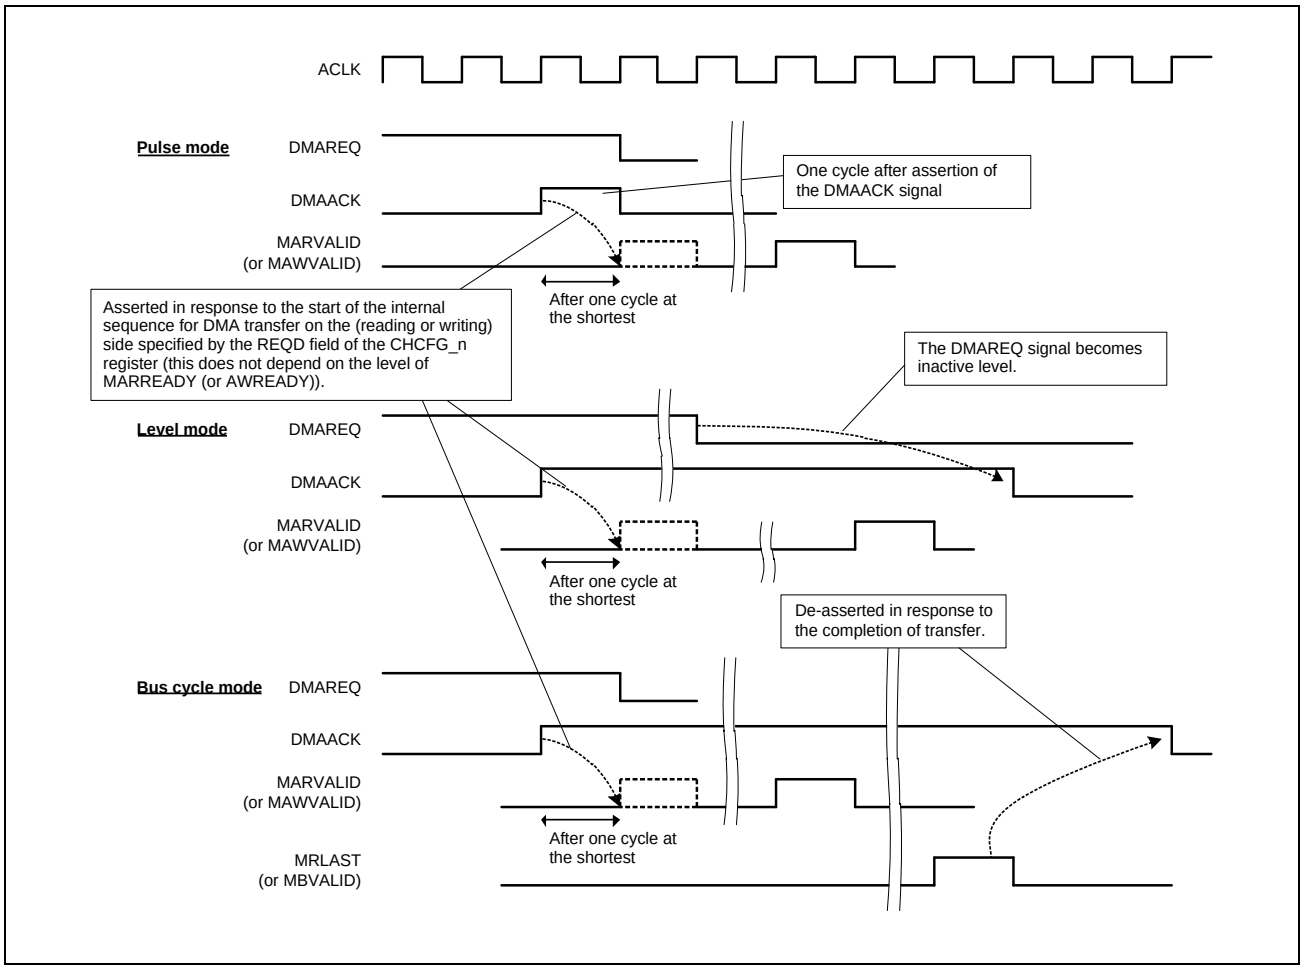

Figure 4.7-3 DMAACK Signal Output

DMATCO (Output)

This is an output signal that indicates the end of a DMA transaction.

4.7.3.2.2 Interrupt Interfaces

DMAINT (Output)

This is a DMA transaction completed interrupt signal. This signal is asserted on the completion of the DMA transaction. It is also asserted when an invalid descriptor is read in link mode.

The DMAINT pins correspond to the DMAEND pins of the internal DMAC. **Table 4.7-3** shows the assignment of the channels of the DMAC units to the DMAINT pins.

Table 4.7-3 DMAINT Pin Assignment

DMAINT pin	[15]	[14]	[13]	[12]	[11]	[10]	[9]	[8]	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
DMAC unit	DMACB								DMACA							
Channel	7	6	5	4	3	2	1	0	7	6	5	4	3	2	1	0

DMAERR (Output)

This is an error response (ERROR) interrupt signal. This signal is asserted when an error response is returned to the transfer request issued by the master interface. This pin is one bit and is common to all channels.

The format of this interrupt output is switchable between pulse output and level output through the setting of the register. After a reset, pulse output is selected.

4.7.4 Address Space

Table 4.7-4 lists the allocation of the registers for DMACm (m = 0 to 4).

Table 4.7-4 Address Space

Base Address Name	Group	Channel n	Base Address
DMAC0_base	Registers for DMAC0 (m = 0)	n = 0 to 7	0_1140_0000h (5140_0000h*1, 4140_0000h*2)
		n = 8 to 15	0_1140_0400h (5140_0400h*1, 4140_0400h*2)
DMAC1_base	Registers for DMAC1 (m = 1)	n = 0 to 7	0_1483_0000h (5483_0000h*1, 4483_0000h*2)
		n = 8 to 15	0_1483_0400h (5483_0400h*1, 4483_0400h*2)
DMAC2_base	Registers for DMAC2 (m = 2)	n = 0 to 7	0_1484_0000h (5484_0000h*1, 4484_0000h*2)
		n = 8 to 15	0_1484_0400h (5484_0400h*1, 4484_0400h*2)
DMAC3_base	Registers for DMAC3 (m = 3)	n = 0 to 7	0_1200_0000h (5200_0000h*1, 4200_0000h*2)
		n = 8 to 15	0_1200_0400h (5200_0400h*1, 4200_0400h*2)
DMAC4_base	Registers for DMAC4 (m = 4)	n = 0 to 7	0_1201_0000h (5201_0000h*1, 4201_0000h*2)
		n = 8 to 15	0_1201_0400h (5201_0400h*1, 4201_0400h*2)

Note 1. CM33 Address Space Non-Secure

Note 2. CM33 Address Space Secure

4.7.5 Register Descriptions

The following lists the registers of one DMAC unit.

4.7.5.1 List of Registers

The following table lists the registers of the DMAC unit.

Register Name	Abbreviation	Initial Value	Offset Address	Access Size [bits]
Next0 Source Address Register n	DMACm_N0SA_n	0000_0000h	0000h + k x 0040h	32
Next0 Destination Address Register n	DMACm_N0DA_n	0000_0000h	0004h + k x 0040h	32
Next0 Transaction Byte Register n	DMACm_N0TB_n	0000_0000h	0008h + k x 0040h	32
Next1 Source Address Register n	DMACm_N1SA_n	0000_0000h	000Ch + k x 0040h	32
Next1 Destination Address Register n	DMACm_N1DA_n	0000_0000h	0010h + k x 0040h	32
Next1 Transaction Byte Register n	DMACm_N1TB_n	0000_0000h	0014h + k x 0040h	32
Current Source Address Register n	DMACm_CRSA_n	0000_0000h	0018h + k x 0040h	32
Current Destination Address Register n	DMACm_CRDA_n	0000_0000h	001Ch + k x 0040h	32
Current Transaction Byte Register n	DMACm_CRTB_n	0000_0000h	0020h + k x 0040h	32
Channel Status Register n	DMACm_CHSTAT_n	0000_0000h	0024h + k x 0040h	32
Channel Control Register n	DMACm_CHCTRL_n	0000_0000h	0028h + k x 0040h	32
Channel Configuration Register n	DMACm_CHCFG_n	0000_0000h	002Ch + k x 0040h	32
Channel Interval Register n	DMACm_CHITVL_n	0000_0000h	0030h + k x 0040h	32
Channel Extension Register n	DMACm_CHEXT_n	0000_0000h	0034h + k x 0040h	32
Next Link Address Register n	DMACm_NXLA_n	0000_0000h	0038h + k x 0040h	32
Current Link Address Register n	DMACm_CRLA_n	0000_0000h	003Ch + k x 0040h	32
Reserve	-	-	0200h to 02FFh	-
DMA Control Register	DMACm_DCTRL	0000_0000h	0300h	32
Reserve	-	-	0304h to 030Fh	-
DMA Status EN Register	DMACm_DST_EN	0000_0000h	0310h	32
DMA Status ER Register	DMACm_DST_ER	0000_0000h	0314h	32
DMA Status END Register	DMACm_DST_END	0000_0000h	0318h	32
DMA Status TC Register	DMACm_DST_TC	0000_0000h	031Ch	32
DMA Status SUS Register	DMACm_DST_SUS	0000_0000h	0320h	32

Note: k = 0 to 7

CAUTIONS

1. If the reserved area is accessed, an OK response is returned. The initial value and the read/write attribute of this area may be changed by the functional extension. Do not write the code which expects that the value read from this area is 0b by software. When writing to it, write 0b.
2. If the undefined area is accessed, an error response is returned. The control registers will not be changed.
3. Do not modify the registers by software while DMA transfer is in progress (EN = 1b), with the exception of the following registers.
   - Register set on the side that has not transferred data in register mode
   - DMACm_CHCTRL_n

4.7.5.2 Register Descriptions

The functional description of each register is given below.

The prefix (DMACm_) of the register names is omitted in the register descriptions and the field descriptions in this section.

The figure below shows the register configuration.

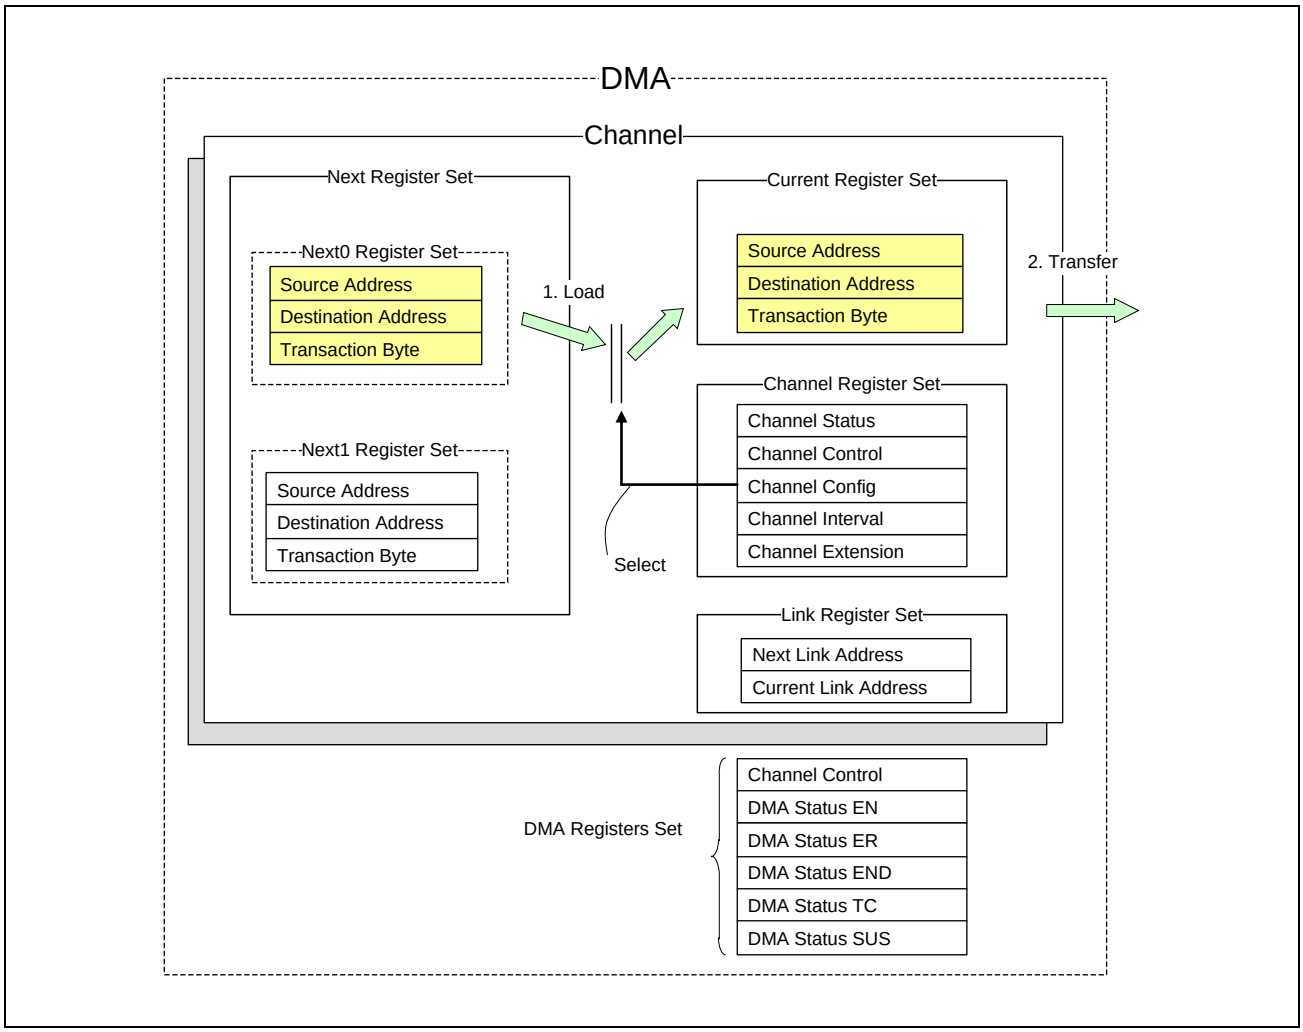

Figure 4.7-4 Register Configuration

■ Next Register Set

This register set sets the transfer source address, transfer destination address, and number of bytes to be transferred in the next DMA transaction to be executed.

It is composed of the Next0 and Next1 register sets.
In register mode, it is set by software. In link mode, the descriptor read data are automatically set in the Next0 register set.

The values of these register sets are loaded to the current register set and used for DMA transfer.

■ Current Register Set

This register set indicates the transfer source address, transfer destination address, and number of bytes being transferred in the DMA transaction that is currently in progress.

It is loaded from the Next0/1 register set (in register mode) or the descriptor read data (in link mode). It cannot be directly written by the user.

It is automatically updated every time the DMA transaction is executed.

■ Channel Register Set

This register set is used to make settings for DMA transfer.

It indicates the channel state, controls the channels, sets up DMA transactions, sets the interval between DMA transactions, and so on.

■ Link Register Set

This register set is composed of a register for setting the next descriptor address to be loaded (Next Link Address Register) and a register that indicates the descriptor address currently being executed (Current Link Address Register).

The Current Link Address Register is automatically updated by reading the descriptor and cannot be directly written by the user.

■ DMA Register Set

This register set is composed of a register that controls the entire DMAC and a register that indicates the state of the given channel. It is used to control the priority of channels, check the state of EN, ER, END, TCO, and SUS of the given channel, and so on.

4.7.5.2.1 Next0 Source Address Register n (DMACm_N0SA_n) (m = 0 to 4, n = 0 to 15)

This register sets the DMA transfer source address (32 bits) of the DMAC channel n.

Access Size : 32 bits
Address : <DMACm_base> + 0000h + k x 0040h (k = 0 to 7)
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SA[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SA[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SA[31:0]	0h	RW	Source Address Sets the start address of the DMA transfer source.

Note: k = 0: n = 0, n = 8
k = 1: n = 1, n = 9
k = 2: n = 2, n = 10
k = 3: n = 3, n = 11
k = 4: n = 4, n = 12
k = 5: n = 5, n = 13
k = 6: n = 6, n = 14
k = 7: n = 7, n = 15

4.7.5.2.2 Next0 Destination Address Register n (DMACm_N0DA_n) (m = 0 to 4, n = 0 to 15)

This register sets the DMA transfer destination address (32 bits) of the DMAC channel n.

Access Size : 32 bits
Address : <DMACm_base> + 0004h + k x 0040h (k = 0 to 7)
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DA[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DA[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DA[31:0]	0h	RW	Destination Address Sets the start address of the DMA transfer destination.

Note: k = 0: n = 0, n = 8
k = 1: n = 1, n = 9
k = 2: n = 2, n = 10
k = 3: n = 3, n = 11
k = 4: n = 4, n = 12
k = 5: n = 5, n = 13
k = 6: n = 6, n = 14
k = 7: n = 7, n = 15

4.7.5.2.3 Next0 Transaction Byte Register n (DMACm_N0TB_n) (m = 0 to 4, n = 0 to 15)

This register sets the total number of bytes transferred to the DMA channel n.

Access Size : 32 bits

Address : <DMACm_base> + 0008h + k x 0040h (k = 0 to 7)

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TB[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TB[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	TB[31:0]	0h	RW	Transaction Byte Sets the total number of transfer bytes. Note: Sets a non-zero value when starting a DMA transaction.

Note: k = 0: n = 0, n = 8
k = 1: n = 1, n = 9
k = 2: n = 2, n = 10
k = 3: n = 3, n = 11
k = 4: n = 4, n = 12
k = 5: n = 5, n = 13
k = 6: n = 6, n = 14
k = 7: n = 7, n = 15

4.7.5.2.4 Next1 Source Address Register n (DMACm_N1SA_n) (m = 0 to 4, n = 0 to 15)

This register sets the DMA transfer source address (32 bits) of the DMAC channel n.

Access Size : 32 bits
Address : <DMACm_base> + 000Ch + k x 0040h (k = 0 to 7)
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SA[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SA[31:0]	0h	RW	Source Address Sets the start address of the DMA transfer source.

Note: k = 0: n = 0, n = 8
k = 1: n = 1, n = 9
k = 2: n = 2, n = 10
k = 3: n = 3, n = 11
k = 4: n = 4, n = 12
k = 5: n = 5, n = 13
k = 6: n = 6, n = 14
k = 7: n = 7, n = 15

4.7.5.2.5 Next1 Destination Address Register n (DMACm_N1DA_n) (m = 0 to 4, n = 0 to 15)

This register sets the DMA transfer destination address (32 bits) of the DMA channel n.

Access Size : 32 bits
Address : <DMACm_base> + 0010h + k x 0040h (k = 0 to 7)
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DA[31:0]	0h	RW	Destination Address Sets the start address of the DMA transfer destination.

Note: k = 0: n = 0, n = 8
k = 1: n = 1, n = 9
k = 2: n = 2, n = 10
k = 3: n = 3, n = 11
k = 4: n = 4, n = 12
k = 5: n = 5, n = 13
k = 6: n = 6, n = 14
k = 7: n = 7, n = 15

4.7.5.2.6 Next1 Transaction Byte Register n (DMACm_N1TB_n) (m = 0 to 4, n = 0 to 15)

This register sets the total number of bytes transferred to the DMA channel n.

Access Size : 32 bits

Address : <DMACm_base> + 0014h + k x 0040h (k = 0 to 7)

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TB[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TB[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	TB[31:0]	0h	RW	Transaction Byte Sets the total number of transfer bytes. Note: Set a non-zero value when starting a DMA transaction.

Note: k = 0: n = 0, n = 8
k = 1: n = 1, n = 9
k = 2: n = 2, n = 10
k = 3: n = 3, n = 11
k = 4: n = 4, n = 12
k = 5: n = 5, n = 13
k = 6: n = 6, n = 14
k = 7: n = 7, n = 15

4.7.5.2.7 Current Source Address Register n (DMACm_CRSA_n) (m = 0 to 4, n = 0 to 15)

This register displays the DMA transfer source address of DMAC channel n.

Note: Indicates the Next 0/1 register value in register mode and the descriptor value in link mode. Cannot be written by software.

Access Size : 32 bits
Address : <DMACm_base> + 0018h + k x 0040h (k = 0 to 7)
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CRSA[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CRSA[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CRSA[31:0]	0h	R	Current Source Address Register Indicates the read address of the next DMA transaction. During a DMA transaction, increment is performed automatically. (Fixed when CHCFG_n.SAD = 1b.) The initial value is loaded from the following register. Register mode: Load source address from Next 0/1. Link mode: Load source address from the descriptor. Increment is performed at the start of read transfer. Read this register after the DMAC stops (CHSTAT_n.EN = 0b). (Treat the value during DMA operation as a reference value.)

Note: k = 0: n = 0, n = 8
k = 1: n = 1, n = 9
k = 2: n = 2, n = 10
k = 3: n = 3, n = 11
k = 4: n = 4, n = 12
k = 5: n = 5, n = 13
k = 6: n = 6, n = 14
k = 7: n = 7, n = 15

4.7.5.2.8 Current Destination Address Register n (DMACm_CRDA_n) (m = 0 to 4, n = 0 to 15)

This register displays the DMA transfer destination address of DMAC channel n.

Note: Indicates the Next 0/1 register value in register mode and the descriptor value in link mode. Cannot be written by software.

Access Size : 32 bits
Address : <DMACm_base> + 001Ch + k x 0040h (k = 0 to 7)
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CRDA[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CRDA[31:0]	0h	R	Current Destination Address Register Indicates the write address of the next DMA transaction. During a DMA transaction, increment performed automatically.(Fixed when CHCFG_n.DAD = 1b.) The initial value is loaded from the following register. Register mode: Load forwarding destination address from Next 0/1. Link mode: Load forwarding destination address from the descriptor. Increment is performed at the start of write transfer. Read this register after the DMAC stops (CHSTAT_n.EN = 0b). (Teat the value during DMA operation as a reference value.)

Note: k = 0: n = 0, n = 8
k = 1: n = 1, n = 9
k = 2: n = 2, n = 10
k = 3: n = 3, n = 11
k = 4: n = 4, n = 12
k = 5: n = 5, n = 13
k = 6: n = 6, n = 14
k = 7: n = 7, n = 15

4.7.5.2.9 Current Transaction Byte Register n (DMACm_CRTB_n) (m = 0 to 4, n = 0 to 15)

This register displays the total number of bytes transferred for DMAC channel n.

Note: Indicates the Next 0/1 register value in register mode and the descriptor value in link mode. Cannot be written by software.

Access Size : 32 bits
Address : <DMACm_base> + 0020h + k x 0040h (k = 0 to 7)
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CRTB[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CRTB[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CRTB[31:0]	0h	R	Current Transaction Byte Register Indicates the number of bytes remaining in the current DMA transaction. During a DMA transaction, it is automatically decremented. The initial value is loaded from the following register. Register mode: Load transfer byte count from Next 0/1 Link mode: Loads transfer byte from the descriptor. Decrements when write transfer is completed. Read this register after the DMAC stops (CHSTAT_n.EN = 0b). (Treat the value during DMA operation as a reference value.)

Note: k = 0: n = 0, n = 8
k = 1: n = 1, n = 9
k = 2: n = 2, n = 10
k = 3: n = 3, n = 11
k = 4: n = 4, n = 12
k = 5: n = 5, n = 13
k = 6: n = 6, n = 14
k = 7: n = 7, n = 15

4.7.5.2.10 Channel Status Register n (DMACm_CHSTAT_n) (m = 0 to 4, n = 0 to 15)

This register indicates the status of DMAC channel n.

Access Size : 32 bits

Address : <DMACm_base> + 0024h + k x 0040h (k = 0 to 7)

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	INTMSK
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	MODE	DER	DW	DL	SR	TC	END	ER	SUS	TACT	RQST	EN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	-	All 0	R	Reserved These bits are read as 0b.
16	INTMSK	0h	R	Displays the temporary mask status of DMAENDn interrupt pin output. 1b: Temporary mask state 0b: Temporary mask release state Setting condition: When SETINTMSK is set to 1b. Clearing condition: When CLRINTMSK or SWRST is set to 1b.
15 to 12	-	All 0	R	Reserved These bits are read as 0b.
11	MODE	0h	R	DMA Mode Indicates the DMA mode. Displays the setting value of the DMS bit in the CHCFG_n register. 0b: Register mode 1b: Link mode
10	DER	0h	R	Descriptor Error Indicates that the read register was invalid (LV = 0b). (It does not depend on the DIM level of the CHCFG_n register.) 0b: Descriptor Error has not occurred 1b: Descriptor Error has occurred Setting condition: Link mode descriptor load LV is 0b. Clearing condition: When SWRST is set to 1b.
9	DW	0h	R	Descriptor Write-back Indicates the descriptor write-back status. If a bus error is received during descriptor write-back, 1b is retained. 0b: Header in link mode is not written back. 1b: (ER = 0b) Header in link mode is being written back. (ER = 1b) A bus error occurred while writing back the header in link mode. Setting condition: At the start of write-back of the header in link mode. Clearing condition: Header write-back in link mode ends with an OK response, or SWRST (CHCTRLn) is set to 1b.

Bit	Bit Name	Initial Value	R/W	Description
8	DL	0h	R	Descriptor Load Indicates that the descriptor is loaded. If a bus error is received during descriptor loading, 1b is held. 0b: No descriptor is loaded. 1b: (ER = 0b) Descriptor in link mode is being loaded. (ER = 1b) Bus error occurred during descriptor loading in link mode. Setting condition: At the start of descriptor loading in link mode. Clearing condition: Descriptor loading in link mode ends with an OK response, or SWRST (CHCTRLn) is set to 1b.
7	SR	0h	R	Selected Register Set Indicates the selected register set in register mode. 0b: Next0 Register Set 1b: Next1 Register Set Setting condition: When RSEL is set to 1b. Clearing condition: When RSEL is set to 0b.
6	TC	0h	R	Terminal Count This status bit indicates that the DMAC transaction is completed. It is set only when TCM = 0b in the CHCFG_n register. 0b: DMA transfer is incomplete 1b: DMA transfer is complete Setting conditions: – When transfer for the total number of transfer bytes set in the CRTB register is completed in register mode. – When transfer of the total number of transfer bytes set in the CRTB register is completed with WBD = 1b in the header of the descriptor in link mode. – Descriptor write-back ends with WBD = 0b in the header of the descriptor in link mode. Clearing conditions: – CLRTC (CHCTRL_n) is set to 1b. – SWRST (CHCTRL_n) is set to 1b.
5	END	0h	R	DMAEND Interrupt This bit indicates that a DMA transaction has been completed and a DMAEND interrupt has occurred. 0b: DMA transfer is incomplete 1b: DMA transfer is complete Setting conditions: – When the TC bit is set and DEM = 0b in the CHCFG_n register. – When LV = 0b in the header and DIM = 0b when a descriptor is read in link mode. Clearing conditions: – CLREND (CHCTRL_n) is set to 1b. – SWRST (CHCTRL_n) is set to 1b.
4	ER	0h	R	Error Bit Indicates that a DMAERR interrupt has been generated in response to an ERROR response during DMA transfer. 0b: ERROR response not received 1b: ERROR response received Setting condition: When an error response is received in the bus cycle. Clearing condition: SWRST (CHCTRL_n) is set to 1b.
3	SUS	0h	R	Suspend This bit indicates that the channel is paused. 0b: Channel_n is not paused 1b: Channel_n is paused Setting condition: SETSUS is set to 1b during DMA transfer of Channel_n, and the internal status becomes SUSPEND. Clearing conditions: CLRSUS is set to 1b. CLREN is set to 1b.

Bit	Bit Name	Initial Value	R/W	Description
2	TACT	0h	R	Transaction Active This bit indicates that the DMAC is operating. This bit is used to confirm that the channel is completely stopped. 0b: Channel_n DMAC is stopped 1b: Channel_n DMAC is operating Setting condition: At the start of DMA transaction by Channel_n. Clearing condition: When DMA transaction is completed.
1	RQST	0h	R	Request This bit indicates that a transfer request is accepted. 0b: DMA transfer request is not received. 1b: DMA transfer request is received. Setting conditions: – The STG-bit is set to 1b. – When a transfer request is accepted from the DMAREQ pin set by the CHCFG_n register. Clearing conditions: – SWRST (CHCTRL_n) is set to 1b. – CLRRQ (CHCTRL_n) is set to 1b. – When executing transfer on the side specified by REQD in single transfer (TM = 0b) mode. – When all DMA transactions are completed in register mode (Transaction completed with REN = 0b). – When DMA transfer of the last descriptor (LE = 1b) is completed in link mode. – When transfer is stopped in descriptor mode (LV = 0b) in link mode. – When the DMA transaction is terminated with DEM = 0b in link mode. – When the master interface receives a bus error.
0	EN	0h	R	Enable Displays whether DMAC channel n is enabled or stopped. 0b: Operation stopped state 1b: Operation enabled state Setting condition: SETEN (CHCTRL_n) is set to 1b. Clearing conditions: – SWRST (CHCTRL_n) is set to 1b. – CLREN(CHCTRL_n) is set to 1b. – When an error response is received during transfer. – When all DMA transactions are completed in register mode (transaction complete when REN = 0b). – When DMA transfer (writeback if WBD = 0b) of the last descriptor (LE = 1b) is completed in link mode. – When transfer is stopped (LV = 0b) when a descriptor is read in link mode

Note: k = 0: n = 0, n = 8
k = 1: n = 1, n = 9
k = 2: n = 2, n = 10
k = 3: n = 3, n = 11
k = 4: n = 4, n = 12
k = 5: n = 5, n = 13
k = 6: n = 6, n = 14
k = 7: n = 7, n = 15

CAUTION

Treat transfers with the ER bit set as if the series of transfers is invalid. To interrupt a DMA transaction, mask and clear the transfer request or clear the enable. If a transfer request by DMA transfer request pin (DMAREQm) input and a transfer request by software (Set the STG bit) are used together for the same channel, the activated activation factor cannot be specified. Use only one of the transfer requests in the system. When performing a transfer request by software, perform the next STG bit operation after completion (Check with Current Register etc.) of the previously requested DMA transfer operation.

4.7.5.2.11 Channel Control Register n (DMACm_CHCTRL_n) (m = 0 to 4, n = 0 to 15)

This register controls the DMA transfer operation of DMA channel n.

Access Size : 32 bits

Address : <DMACm_base> + 0028h + k x 0040h (k = 0 to 7)

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CLRINTMSK	SETINTMSK
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	CLRSUS	SETSUS	-	CLRTC	CLRENDD	CLRRQ	SWRST	STG	CLREN	SETEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	RW	RW	R	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	-	All 0	R	Reserved These bits are read as 0b. The write value should always be 0b.
17	CLRINTMSK	0h	RW	Setting this bit cancels the state of masking the DMAENDn pin output. Also, the INTMSK bit of the CHSTAT_n register is 0b. If the mask is released while LVINT = 1b in the DCTRL register and END = 1b in the CHSTAT_n register, the DMAENDn pin output becomes active. (It is not active when LVINT = 0b.) When reading, 0b can be read. 1b: Cancels the mask set with SETINTMSK. 0b: Does not affect the operation.
16	SETINTMSK	0h	RW	Setting this bit temporarily masks the DMAENDn pin output. Also, the INTMSK bit of the CHSTATm register is set to 1b. When reading, 0b can be read. 1b: Masks DMAENDn. 0b: Does not affect the operation.
15 to 10	-	All 0	R	Reserved These bits are read as 0b. The write value should always be 0b.
9	CLRSUS	0h	RW	Clear suspend Releases the pause state. When this bit is set to 1b when SUS of the CHSTAT_n register is 1b, the suspended state can be released. When this bit is read, 0b can be read. 1b: Cancel suspension of DMA transfer in progress. 0b: Does not affect operation.
8	SETSUS	0h	RW	Set Suspend Suspends the ongoing DMA transfer. When this bit is set to 1b when EN of the CHSTAT_n register is 1b, DMA transfer in progress can be paused. When this bit is read, 0b can be read. 1b: Suspend DMA transfer in progress. 0b: Does not affect operation.
7	-	0h	R	Reserved These bits are read as 0b. The write value should always be 0b.
6	CLRTC	0h	RW	Clear TC Bit By setting this bit, the TC bit of the CHSTAT_n register can be cleared. When this bit is read, 0b can be read. 1b: Clear TC bit. 0b: Does not affect operation.
5	CLREND	0h	RW	Clear End Bit By setting this bit, the END bit of the CHSTAT_n register can be cleared. It also clears the DMAEND interrupt pin to low level. When this bit is read, 0b can be read. 1b: Clear END bit. 0b: Does not affect operation.
4	CLRRQ	0h	RW	Clear Request Bit By setting this bit, the RQST bit of the CHSTAT_n register can be cleared. When this bit is read, 0b can be read. 1b: Clear RQST bit. 0b: Does not affect operation.

Bit	Bit Name	Initial Value	R/W	Description
3	SWRST	0h	RW	Software Reset The status register can be cleared by setting this bit. Set this bit when the EN bit is 0b and the TACT bit is 0b. When this bit is read, 0b can be read. 1b: Channel status register reset. 0b: Does not affect operation.
2	STG	0h	RW	Software Trigger Setting this bit sets an internal transfer request (software activation). If it is set at the same time as the SWRST bit, clearing by the SWRST bit has priority. When this bit is read, 0b can be read. 1b: Set transfer request by software (set RQST bit). 0b: Does not affect operation.
1	CLREN	0h	RW	Clear Enable The EN bit can be cleared by setting this bit. When this bit is read, 0b can be read. 1b: DMA transfer stopped (EN bit cleared). 0b: Does not affect operation.
0	SETEN	0h	RW	Set Enable Sets DMA transfer permission for DMAC channel n. If it is set at the same time as the SWRST bit, clearing by the SWRST bit has priority and transfer does not start. When this bit is read, 0b can be read. 1b: DMA transfer enabled (EN bit set). 0b: Does not affect operation.

Note: k = 0: n = 0, n = 8
k = 1: n = 1, n = 9
k = 2: n = 2, n = 10
k = 3: n = 3, n = 11
k = 4: n = 4, n = 12

	SDS[3:0]				-	AM[2:0]			-	LVL	HIEN	LOEN	REQD	SEL[2:0]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	R	RW	RW	RW	R	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31	DMS	0h	RW	DMA Mode Select Sets the DMA mode. 0b: Register mode (initial value) 1b: Link mode
30	REN	0h	RW	Register Set Enable After the completion of the DMA transaction, DMA transfer is performed using the Next register set selected by RSEL. This bit is valid only in register mode. 0b: Does not perform DMA transfer accordingly. 1b: Performs DMA transfer accordingly. Setting condition: 1b is written to this bit. Clearing condition: 0b is written to this bit, or DMA transaction is completed with REN = 1b.
29	RSW	0h	RW	Register Select Switch After the DMA transaction ends, RSEL is automatically inverted. This bit is valid only in register mode. 0b: Do not reverse RSEL after completion of DMA transaction. 1b: Reverse RSEL after completion of DMA transaction.
28	RSEL	0h	RW	Register Set Select Select the next register set to be executed next. This bit is valid only in register mode. When RSW = 1b, it is automatically reversed when the DMA transaction is completed. 0b: Execute Next0 Register Set. 1b: Execute Next1 Register Set. Transition condition: When RSW = 1b and DMA transaction completes.
27	SBE	0h	RW	Sweep Buffer Enable If the enable is cleared to 0b during a DMA transaction, select whether to sweep (by writing) the data that has already been read and captured in the buffer and stop it, or stop without sweeping. The sweep mode can be used only when REQD = 0b. 0b: Cancels transfer without sweeping buffer. 1b: Transfer is canceled by sweeping out the buffer.
26	-	0h	R	Reserved These bits are read as 0b. The write value should always be 0b.
25	TCM	0h	RW	DMATCO Mask Masks DMATCOn interrupt pin output. If this bit is 1b at the DMATCO interrupt output timing, DMATCOn is not asserted. At this time, TCM is automatically cleared to 0b. This bit should be set when DMA transaction is controlled by software. 0b: Do not mask. 1b: Mask. Clearing condition: When TCM = 1b and DMA transaction completes

Bit	Bit Name	Initial Value	R/W	Description
24	DEM	0h	RW	DMAEND Mask Masks DMAEND [s] (s: pin selected by SEL) interrupt pin output during register mode transfer. If this bit is 1b at the DMAEND interrupt output timing, DMAEND [s] is not asserted. At this time, DEM is automatically cleared to 0b. 0b: Do not mask. 1b: Mask. Clearing condition: When DEM = 1b and DMA transaction completes
23	-	0h	R	Reserved These bits are read as 0b. The write value should always be 0b.
22	TM	0h	RW	Transfer Mode Sets the DMA transfer mode. 0b: Single transfer mode 1b: Block transfer mode
21	DAD	0h	RW	Sets the count direction of the transfer destination address of DMAC channel n. 0b: Increment 1b: Fixed If the destination address is beat unaligned, specify DAD = 0b (increment). If the destination address is beat aligned, both DAD = 0b and 1b can be set.
20	SAD	0h	RW	Sets the count direction of the transfer source address of DMAC channel n. 0b: Increment 1b: Fixed If the source address is beat unaligned, specify SAD = 0b (increment). If the source address is beat aligned, both SAD = 0b and 1b can be set.
19 to 16	DDS[3:0]	0h	RW	Destination Data Size Set the destination transfer size. Set Transfer Size Remarks 0000b 8 bits Initial value 0001b 16 bits 0010b 32 bits 0011b 64 bits 0100b 128 bits 0101b 256 bits 0110b 512 bits This can be set only when the number of buffer stages is 8 or 16. Setting is prohibited when the number of buffer stages is 4. 0111b 1024 bits This can be set only when the number of buffer stages is 16. Setting is prohibited when the number of buffer stages is 4 or 8. Others — Setting prohibited
15 to 12	SDS[3:0]	0h	RW	Source Data Size Set the source transfer size. Set Transfer Size Remarks 0000b 8 bits Initial value 0001b 16 bits 0010b 32 bits 0011b 64 bits 0100b 128 bits 0101b 256 bits 0110b 512 bits This can be set only when the number of buffer stages is 8 or 16. Setting is prohibited when the number of buffer stages is 4. 0111b 1024 bits This can be set only when the number of buffer stages is 16. Setting is prohibited when the number of buffer stages is 4 or 8. Others — Setting prohibited
11	-	0h	R	Reserved These bits are read as 0b. The write value should always be 0b.
10 to 8	AM[2:0]	0h	RW	ACK Mode Sets the DMAACKn output mode. 000b: Pulse mode (active for 1 clock) 001b: Level mode (active until the selected DMAREQ input becomes inactive) 01xb: Bus cycle mode (DMA transfer is active during bus cycle) 1xxb: Do not output DMAACKn
7	-	0h	R	Reserved These bits are read as 0b. The write value should always be 0b.
6	LVL	0h	RW	Level Select whether to detect the DMA request at the signal level or at the edge. 0b: Detect at edge (Initial value) 1b: Detect by level

Bit	Bit Name	Initial Value	R/W	Description
5	HIEN	0h	RW	High Enable Select to detect the DMA request at the high level or rising edge of the signal. If LVL = 0b: HIEN = 1b: Recognizes that there was a request when the signal rises HIEN = 0b: Does not recognize the request even when the signal rises If LVL = 1b: HIEN = 1b: Recognizes that there was a request when the signal is high HIEN = 0b: Does not recognize the request even if the signal is high
4	LOEN	0h	RW	Low Enable Select to detect the DMA request at the low level or falling edge of the signal. If LVL = 0b: LOEN = 1b: Recognizes that there was a request when the signal falls LOEN = 0b: Does not recognize the request even if the signal falls If LVL = 1b: LOEN = 1b: Recognizes that there was a request when the signal is low LOEN = 0b: Does not recognize the request even if the signal is low
3	REQD	0h	RW	Request Direction Selects whether the DMAREQ selected by the SEL bit is on the source side or the destination side. This bit also selects the timing at which DMAACK becomes active. 0b: Source side. DMAACK is active when reading 1b: Destination side, DMAACK is active when writing
2 to 0	SEL[2:0]	0h	RW	Terminal Select Select one from eight DMAREQ / DMAACK / DMATCO signals. SEL[2:0] Select Signal Remarks 000b DMAREQ[0], DMAACK[0], DMATCO[0] 001b DMAREQ[1], DMAACK[1], DMATCO[1] 010b DMAREQ[2], DMAACK[2], DMATCO[2] 011b DMAREQ[3], DMAACK[3], DMATCO[3] 100b DMAREQ[4], DMAACK[4], DMATCO[4] 101b DMAREQ[5], DMAACK[5], DMATCO[5] 110b DMAREQ[6], DMAACK[6], DMATCO[6] 111b DMAREQ[7], DMAACK[7], DMATCO[7]

Note: k = 0: n = 0, n = 8
k = 1: n = 1, n = 9
k = 2: n = 2, n = 10
k = 3: n = 3, n = 11
k = 4: n = 4, n = 12
k = 5: n = 5, n = 13
k = 6: n = 6, n = 14
k = 7: n = 7, n = 15

NOTE

If units with different clocks are DMA transfer targets and require DMAACK, the DMAACK signal may not be received successfully due to the synchronization clock. In such a case, set AM[2:0] to 001b or 010b so that DMAACK becomes active for a long time.

4.7.5.2.13 Channel Interval Register n (DMACm_CHITVL_n) (m = 0 to 4, n = 0 to 15)

This register sets the transfer interval for DMAC channel n.

Access Size : 32 bits

Address : <DMACm_base> + 0030h + k x 0040h (k = 0 to 7)

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	LWCA[3:0]	0h	RW	Link Writeback CACHE Sets the value to be output to CACHE[3:0] during descriptor write back in link mode.
27	-	0h	RW	Reserved These bits are read as 0b. The write value should always be 0b.
26 to 24	LWPR[2:0]	0h	RW	Link Writeback PROT Sets the value to be output to MHPROT[2:0] during descriptor write-back in link mode.
23 to 20	LDCA[3:0]	0h	RW	Link Descriptor CACHE Sets the value to be output to CACHE[3:0] when loading a descriptor in link mode.
19	-	0h	RW	Reserved These bits are read as 0b. The write value should always be 0b.
18 to 16	LDPR[2:0]	0h	RW	Link Descriptor PROT Sets the value to be output to MHPROT[2:0] when loading a descriptor in link mode.
15 to 2	-	All 0	R	Reserved These bits are read as 0b. The write value should always be 0b.
1	LVINT	0h	RW	Sets whether to output DMAEND[7:0], DMAERR as a pulse or level. 0b: Pulse output (initial value) 1b: Level output
0	PR	0h	RW	Sets the transfer priority control mode between channels 0b: Fixed priority mode (initial value) 1b: Round robin mode

4.7.5.2.18 DMA Status EN Register (DMACm_DST_EN) (m = 0 to 4)

This register displays the EN bit status of all channels.

Writing to this register does not change the value of each bit.

Access Size : 32 bits

Address : <DMACm_base> + 0310h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	EN7	EN6	EN5	EN4	EN3	EN2	EN1	EN0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	-	All 0	R	Reserved These bits are read as 0b.
7	EN7	0h	R	Displays the state of the DMAC channel 7 EN bit.
6	EN6	0h	R	Displays the state of the DMAC channel 6 EN bit.
5	EN5	0h	R	Displays the state of the DMAC channel 5 EN bit.
4	EN4	0h	R	Displays the state of the DMAC channel 4 EN bit.
3	EN3	0h	R	Displays the state of the DMAC channel 3 EN bit.
2	EN2	0h	R	Displays the state of the DMAC channel 2 EN bit.
1	EN1	0h	R	Displays the state of the DMAC channel 1 EN bit.
0	EN0	0h	R	Displays the state of the DMAC channel 0 EN bit.

NOTE

Channels that do not exist in the channel configuration are set to 0b.

4.7.5.2.19 DMA Status ER Register (DMACm_DST_ER) (m = 0 to 4)

This register displays the ER bit status of all channels.

Writing to this register does not change the value of each bit.

Access Size : 32 bits

Address : <DMACm_base> + 0314h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	ER7	ER6	ER5	ER4	ER3	ER2	ER1	ER0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	-	All 0	R	Reserved These bits are read as 0b.
7	ER7	0h	R	Displays the state of the DMAC channel 7 ER bit.
6	ER6	0h	R	Displays the state of the DMAC channel 6 ER bit.
5	ER5	0h	R	Displays the state of the DMAC channel 5 ER bit.
4	ER4	0h	R	Displays the state of the DMAC channel 4 ER bit.
3	ER3	0h	R	Displays the state of the DMAC channel 3 ER bit.
2	ER2	0h	R	Displays the state of the DMAC channel 2 ER bit.
1	ER1	0h	R	Displays the state of the DMAC channel 1 ER bit.
0	ER0	0h	R	Displays the state of the DMAC channel 0 ER bit.

NOTE

Channels that do not exist in the channel configuration are set to 0b.

4.7.5.2.20 DMA Status END Register (DMACm_DST_END) (m = 0 to 4)

This register displays the END bit status of all channels.

Writing to this register does not change the value of each bit.

Access Size : 32 bits

Address : <DMACm_base> + 0318h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	-	All 0	R	Reserved These bits are read as 0b.
7	END7	0h	R	Displays the state of the DMAC channel 7 END bit.
6	END6	0h	R	Displays the state of the DMAC channel 6 END bit.
5	END5	0h	R	Displays the state of the DMAC channel 5 END bit.
4	END4	0h	R	Displays the state of the DMAC channel 4 END bit.
3	END3	0h	R	Displays the state of the DMAC channel 3 END bit.
2	END2	0h	R	Displays the state of the DMAC channel 2 END bit.
1	END1	0h	R	Displays the state of the DMAC channel 1 END bit.
0	END0	0h	R	Displays the state of the DMAC channel 0 END bit.

NOTE

Channels that do not exist in the channel configuration are set to 0b.

4.7.5.2.21 DMA Status TC Register (DMACm_DST_TC) (m = 0 to 4)

This register displays the TC bit status of all channels.

Writing to this register does not change the value of each bit.

Access Size : 32 bits

Address : <DMACm_base> + 031Ch

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	-	-	-	-	-	-	-	-	TC7	TC6	TC5	TC4	TC3	TC2	TC1	TC0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	-	All 0	R	Reserved These bits are read as 0b.
7	TC7	0h	R	Displays the state of the DMAC channel 7 TC bit.
6	TC6	0h	R	Displays the state of the DMAC channel 6 TC bit.
5	TC5	0h	R	Displays the state of the DMAC channel 5 TC bit.
4	TC4	0h	R	Displays the state of the DMAC channel 4 TC bit.
3	TC3	0h	R	Displays the state of the DMAC channel 3 TC bit.
2	TC2	0h	R	Displays the state of the DMAC channel 2 TC bit.
1	TC1	0h	R	Displays the state of the DMAC channel 1 TC bit.
0	TC0	0h	R	Displays the state of the DMAC channel 0 TC bit.

NOTE

Channels that do not exist in the channel configuration are set to 0b.

4.7.5.2.22 DMA Status SUS Register (DMACm_DST_SUS) (m = 0 to 4)

This register displays the SUS bit status of all channels.

Writing to this register does not change the value of each bit.

Access Size : 32 bits

Address : <DMACm_base> + 0320h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	SUS7	SUS6	SUS5	SUS4	SUS3	SUS2	SUS1	SUS0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	-	All 0	R	Reserved These bits are read as 0b.
7	SUS7	0h	R	Displays the state of the DMAC channel 7 SUS bit.
6	SUS6	0h	R	Displays the state of the DMAC channel 6 SUS bit.
5	SUS5	0h	R	Displays the state of the DMAC channel 5 SUS bit.
4	SUS4	0h	R	Displays the state of the DMAC channel 4 SUS bit.
3	SUS3	0h	R	Displays the state of the DMAC channel 3 SUS bit.
2	SUS2	0h	R	Displays the state of the DMAC channel 2 SUS bit.
1	SUS1	0h	R	Displays the state of the DMAC channel 1 SUS bit.
0	SUS0	0h	R	Displays the state of the DMAC channel 0 SUS bit.

NOTE

Channels that do not exist in the channel configuration are set to 0b.

4.7.6 Functional Description

The prefix (DMACm_) of the register names is omitted in this and subsequent sections.

4.7.6.1 DMA Mode

This section describes the DMAC mode specifications of the DMAC unit.

4.7.6.1.1 Mode setting

The DMA mode can be switched between register mode and link mode according to the value of the DMS field in the CHCFG_n register.

Table 4.7-5 DMA Mode Setting

DMS (CHCFG_n)	Mode	Description
0b	Register mode	The values set in the next register set are used to proceed with DMA transfer.
1b	Link mode	The descriptor is set in the current register to proceed with DMA transfer. Loading of the descriptor and DMA transfer are repeated unless these are stopped with the setting by the descriptor or by the control register.

4.7.6.1.2 Register mode

In register mode, the values set in the internal registers are used for DMA transfer.

Two types (Next0 Register Set and Next1 Register Set) of transfer source address, transfer destination address, and number of transfer bytes can be set. The Next register set to be used can be selected and transferred, or two Next register sets can be transferred consecutively.

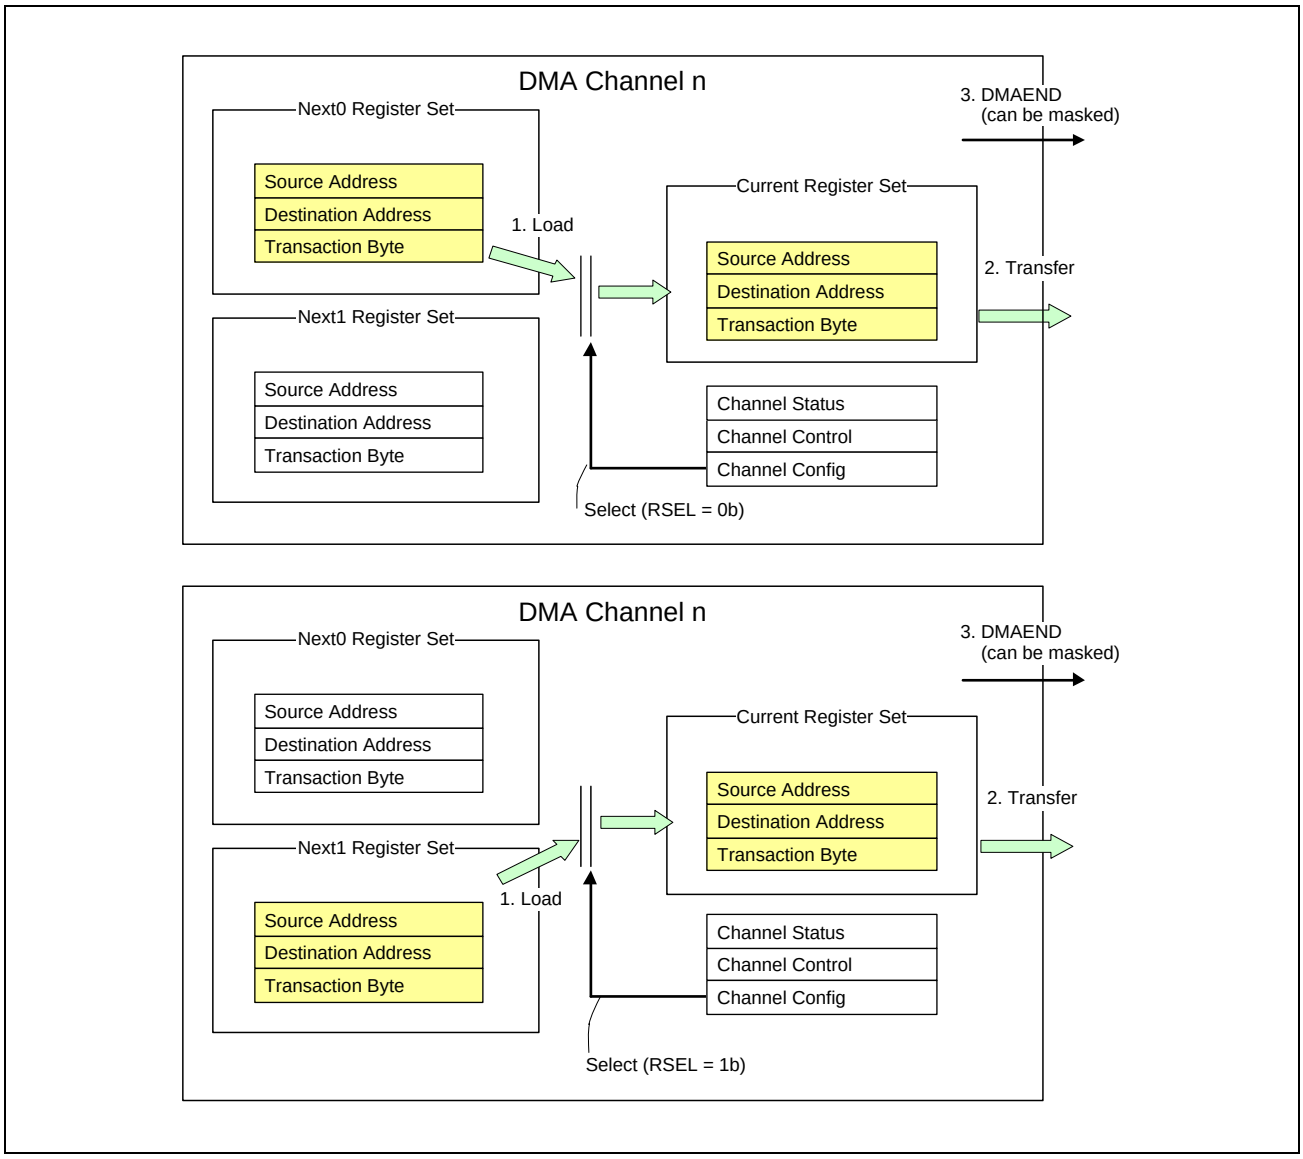

Figure 4.7-5 Overview of Register Normal Mode

The above figure illustrates operations when Next0 is executed (upper part of the figure) and when Next1 is executed (lower part of the figure).

(1) Flow of operations

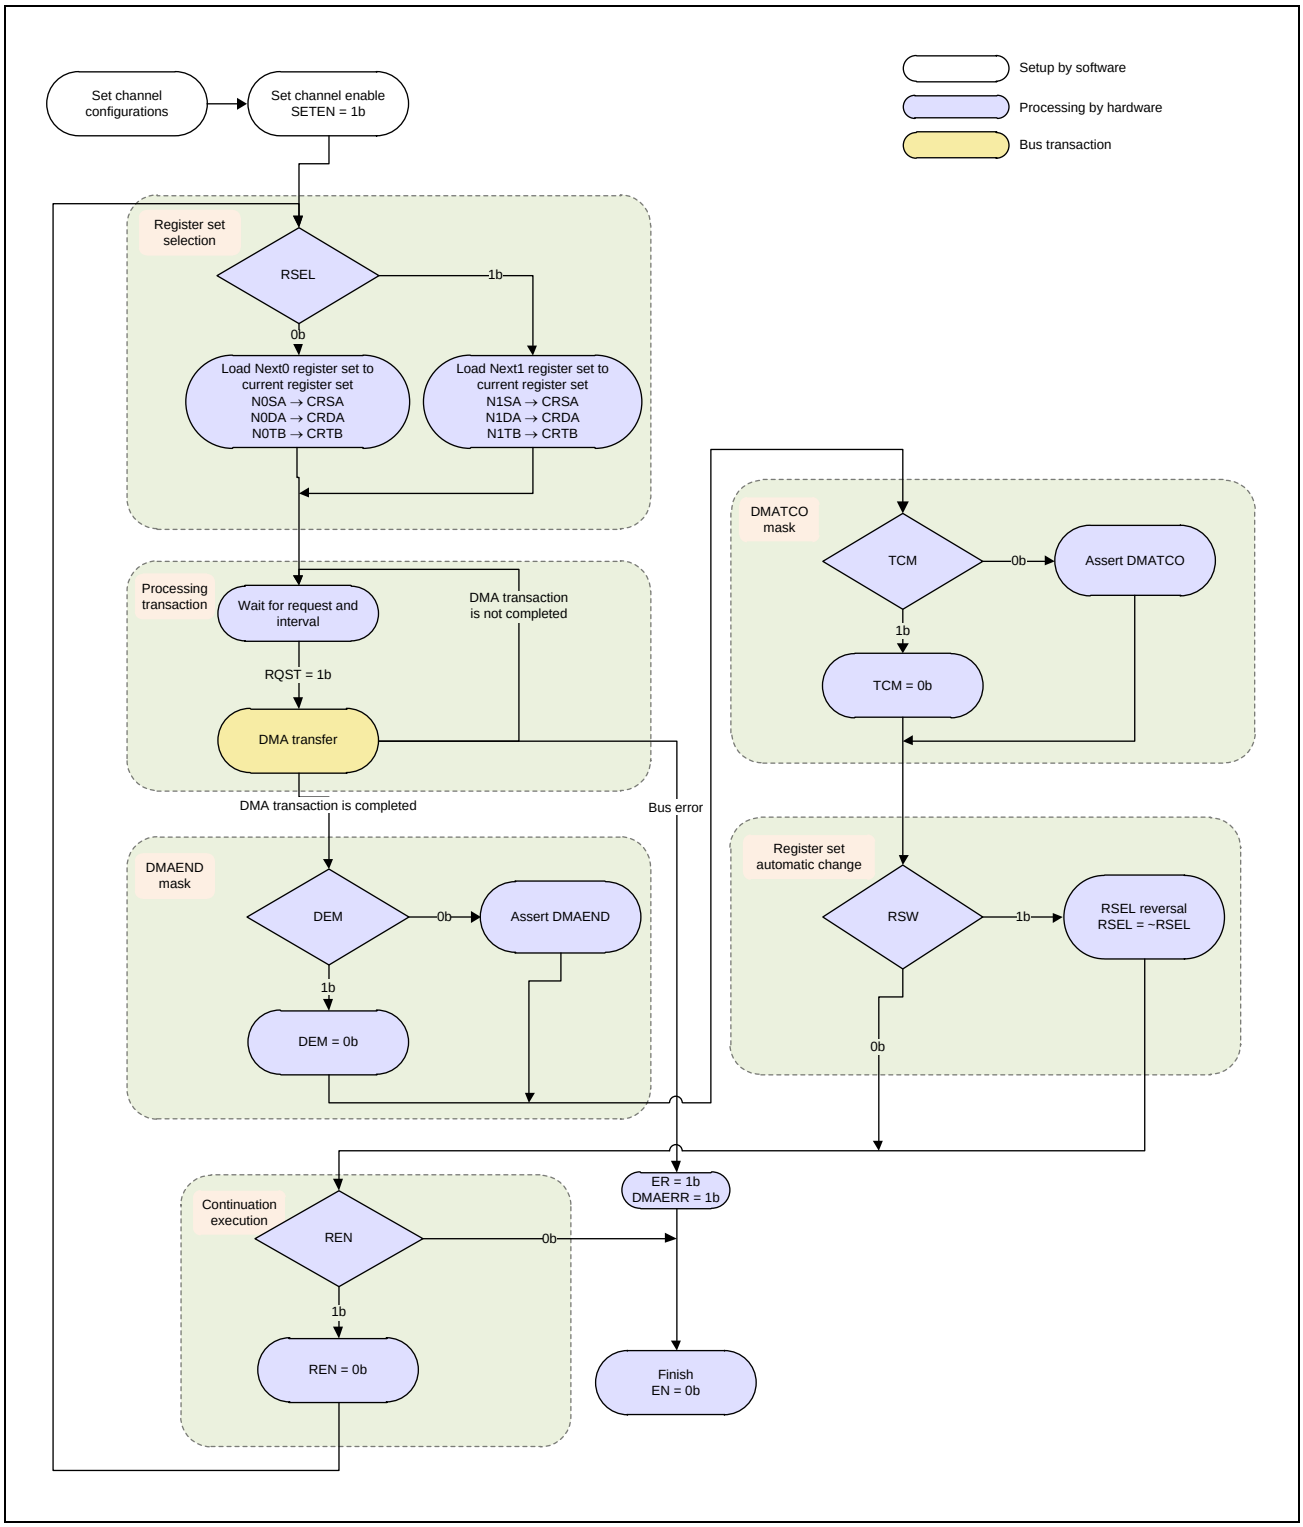

Figure 4.7-6 Register Mode Flow

<Description of the Register Mode Flow>

1. Set channel configuration

   In addition, set the DMA register set (REQ, DMAACK, the amount of data for transfer, etc.) in the channel register set (See **4.7.6.2 DMA Transfer**).

2. Register set selection

   When the EN bit is set to 1b, the setting of the next register set selected by RSEL is loaded to the current register set.

3. Processing DMA transaction

   DMA transfer proceeds in accord with the set value. For details of transfer, see **4.7.6.2 DMA Transfer**.

4. Masking DMAEND

   DMAEND is masked in accord with the value set in the DEM bit of CHCFG_n. DMAEND is not output if DEM = 1b. After that, DEM is automatically cleared to 0b.

5. Masking DMATCO

   DMATCO is masked in accord with the value set in the TCM bit of CHCFG_n. DMATCO is not output if TCM = 1b. After that, TCM is automatically cleared to 0b.

6. Register set automatic change

   Whether or not the other next register set is to be used is determined by the value set in the RSW bit of CHCFG_n.

7. Continuous execution

   Whether or not DMA transfer is to be consecutively executed is determined by the value set in the REN bit of CHCFG_n. Transfer is executed consecutively if REN = 1b. After that, REN is automatically cleared to 0b.

(2) Register settings

(a) Register mode setting

Select the register set to be executed.

Table 4.7-6 Register Mode Setting

DMS (CHCFG_n)	RSEL (CHCFG_n)	Description
0b	0b	Execute the Next0 register set.
	1b	Execute the Next1 register set.

(b) DMAEND mask setting

DMAEND can be masked for each register set.

Table 4.7-7 DMAEND Mask Setting

DEM (CHCFG_n)	Operation	Remarks
0b	DMAEND is issued on completion of the DMA transaction.	
1b	DMAEND is not issued even if the DMA transaction has completed. DEM is cleared to 0b by hardware following the completion of the DMA transaction.	

(c) DMATCO mask setting

DMATCO can be masked for each register set.

Table 4.7-8 DMATCO Mask Setting

TCM (CHCFG_n)	Operation	Remarks
0b	DMATCO is issued on completion of the DMA transaction.	
1b	DMATCO is not issued even if the DMA transaction has completed. TCM is cleared to 0b by hardware following the completion of the DMA transaction.	

(d) Automatic register set execution setting

After DMA transfer, a DMA transaction of the selected register set is automatically executed.

Table 4.7-9 Automatic Register Set Execution Setting

REN (CHCFG_n)	Operation	Remarks
0b	When the DMA transaction of the register set that is set in the RSEL bit is completed, the EN bit is cleared to end DMA operation.	Set this to execute the DMA transaction once.
1b	After the completion of the DMA transaction, DMA transfer of the contents of the selected register set follows. When continuous transfer is established, REN is cleared to 0b.	Set this to execute the contents of the register set consecutively.

(e) Automatic register set execution setting

When REN = 1b, the next register set to be automatically executed can be switched following the completion of the DMA transaction.

Table 4.7-10 Automatic Register Set Execution Setting

RSW (CHCFG_n)	Operation	Remarks
0b	When REN = 1b and the DMA transaction is completed, the register set is not switched.	Set this when using one register set only.
1b	When REN = 1b and the DMA transaction is completed, RSEL is automatically inverted and the other register set is selected.	Set this when switching the register set.

(3) Example settings

(a) When using the next0 register set only

Table 4.7-11 Example Register Mode Setting 1

DMS (CHCFG_n)	RSEL (CHCFG_n)	DEM (CHCFG_n)	TCM (CHCFG_n)	RSW (CHCFG_n)	REN (CHCFG_n)
0b (Register mode)	0b (Next0)	0b (No masking)	0b (No masking)	0b (No switching)	0b (No continuous execution)

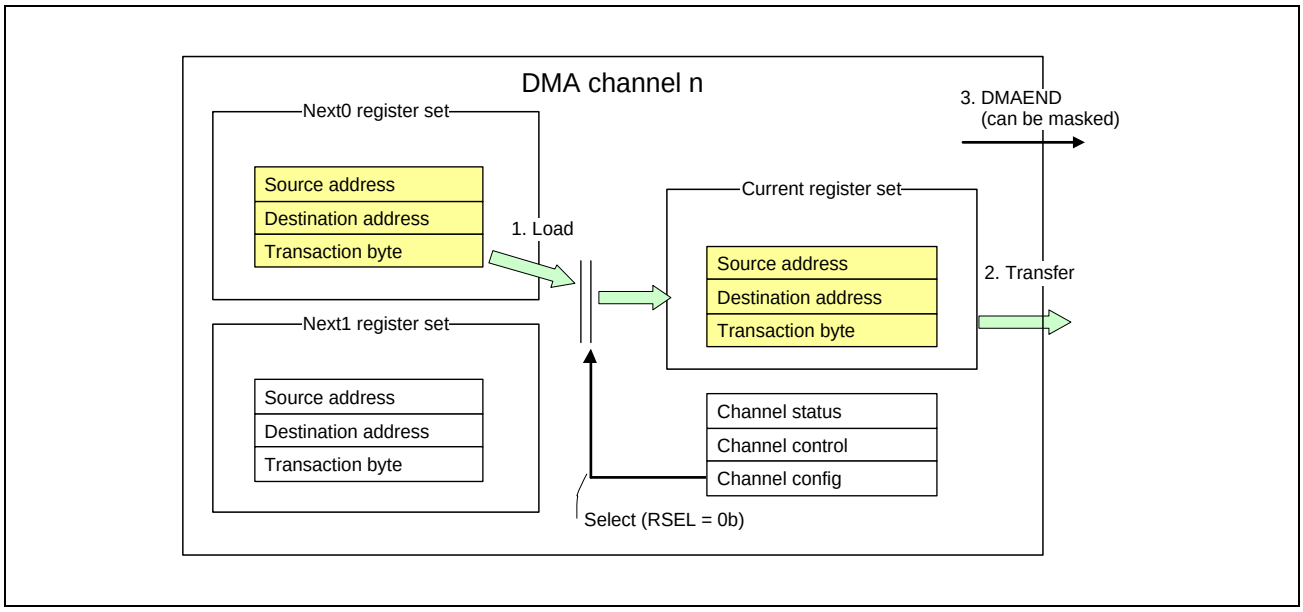

Figure 4.7-7 Example Register Mode Setting 1

1. Set EN = 1b (SETEN = 1b) to load the Next0 register set to the current register set.
2. Execute a DMA transaction according to the values of the current register set and channel register set.
3. DMAEND is issued following the completion of the DMA transaction.
4. DMATCO is issued following the completion of the DMA transaction.
5. Since REN is 0b, clear EN to 0b to end the operation.

(b) When using two register sets consecutively

Table 4.7-12 Automatic Register Set Execution Setting

DMS (CHCFG_n)	RSEL (CHCFG_n)	DEM (CHCFG_n)	TCM (CHCFG_n)	RSW (CHCFG_n)	REN (CHCFG_n)
0b (Register mode)	0b (Next0)	1b (Masking)	0b (No masking)	1b (Switching)	1b (Continuous execution)

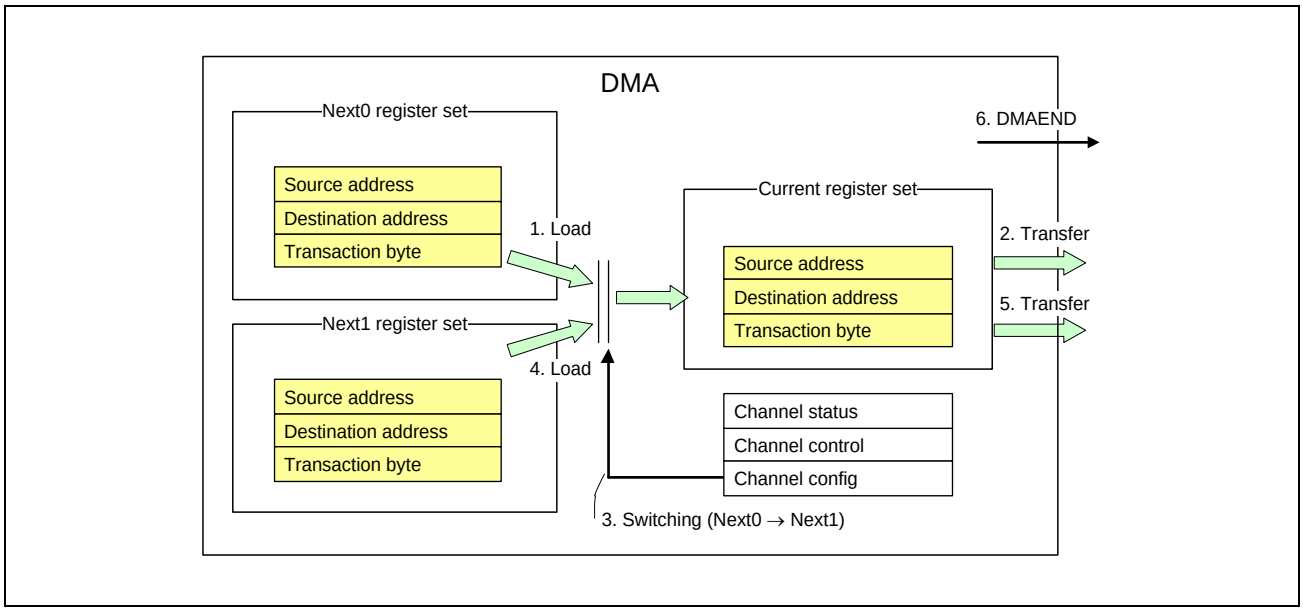

Figure 4.7-8 Example Register Mode Setting 2

1. Set EN = 1b (SETEN = 1b) to load the Next0 register set to the current register set.
2. Execute a DMA transaction according to the values of the current register set and channel register set.
3. Since DEM is 1b, DMAEND is not output following the completion of the DMA transaction. DEM is automatically cleared to 0b.
4. Since REN is 1b, the operation is executed continuously. REN is automatically cleared to 0b.
5. Since RSW is 1b, the next register set to be executed is switched (RSEL = 0b → 1b).
6. Load the Next1 register set to the current register set.
7. Execute a DMA transaction according to the values of the current register set and channel register set.
8. Since DEM is 0b, DMAEND is issued following the completion of the DMA transaction.
9. Since TCM is 0b, DMATCO is issued following the completion of the DMA transaction.
10. Since REN is 0b, clear EN to 0b to end the operation.

4.7.6.1.3 Link mode

In link mode, a DMA transaction is executed by loading descriptors in the external memory area as the settings. The DMAC has a next link address and current link address per channel and these are used to set the address of a next descriptor to be executed and to indicate the address of a descriptor for the DMA transaction that is currently in progress, respectively.

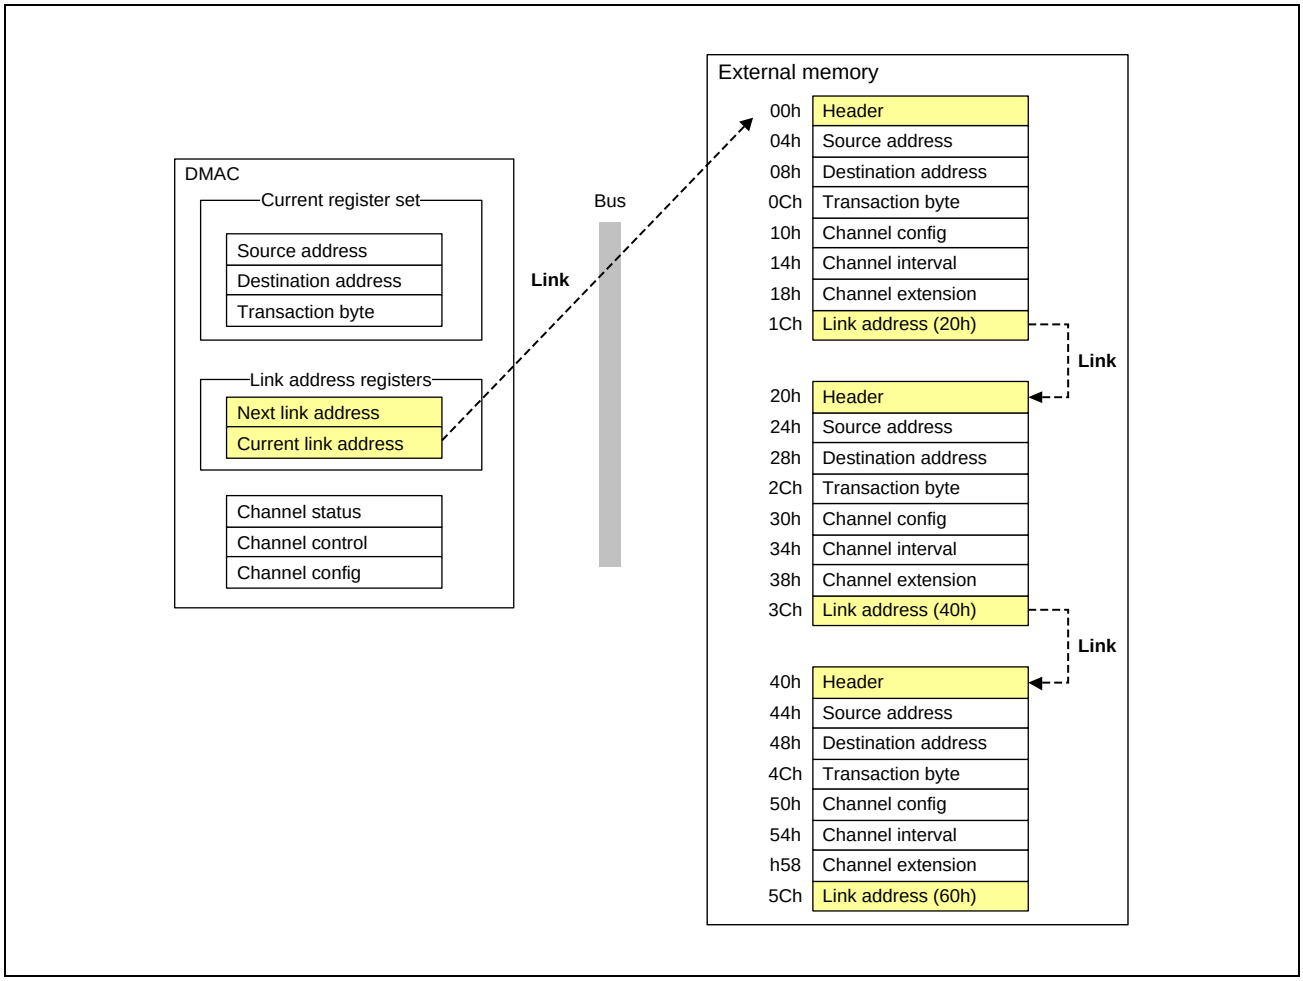

Figure 4.7-9 Overview of Link Mode

(1) Flow of operations

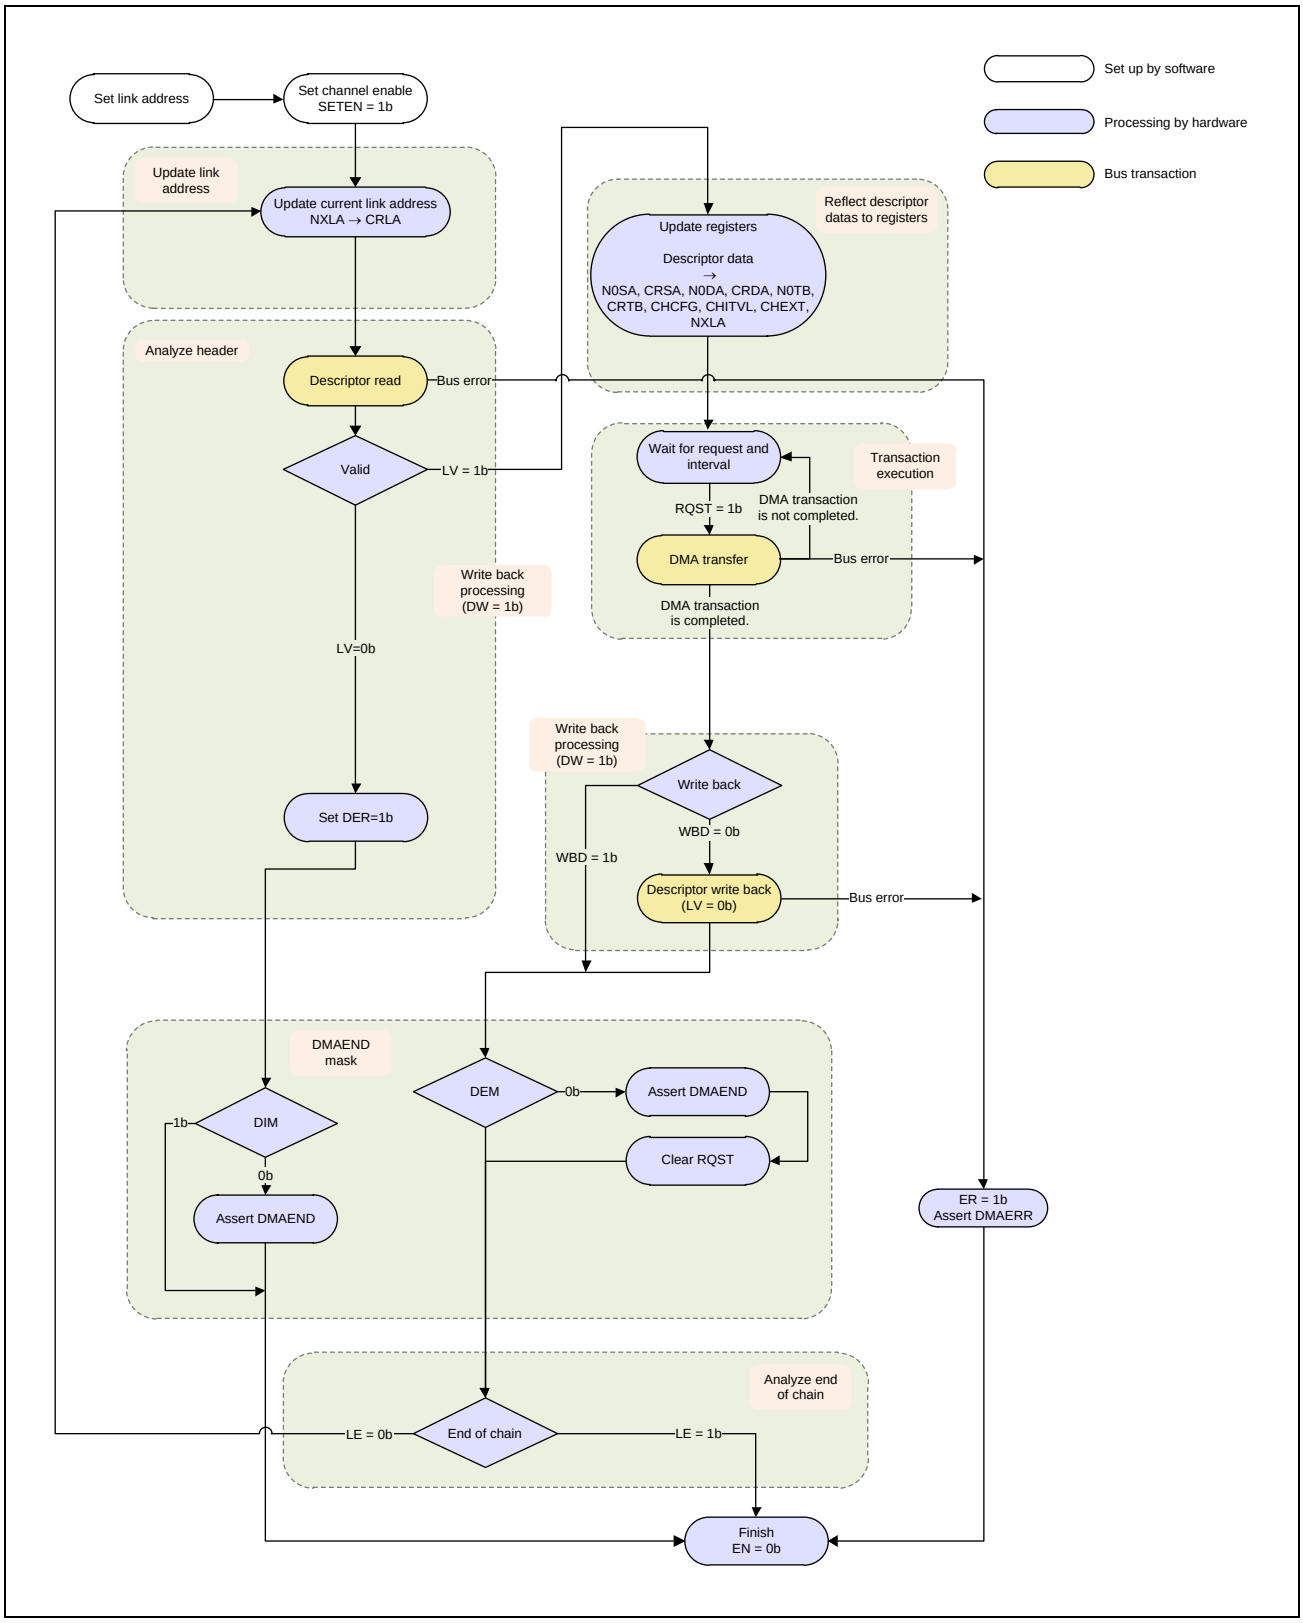

Figure 4.7-10 Flow of Link Mode

<Description of the Link Mode Flow>

1. Set channel configuration

   Set the address where the link destination is to start in NXLA_n.

2. Link address update

   Setting EN = 1b (setting SETEN to 1b) loads the link address set in NXLA_n to CRLA_n.

3. Reading the descriptor and judging the header

   The DMAC starts to load the descriptor and checks the header contents. If LV = 0b, the descriptor is discarded and DER is set to 1b indicating the end state (EN = 0b). If DIM within the header is 0b at this time, DMAEND is issued.

4. Descriptor setting

   Set the loaded descriptor in the current register set and channel register set. Also, set the next link destination in NXLA_n.

5. Processing DMA transaction

   Execute a DMA transaction according to the set values.

6. Header write-back

   If WBD in the header = 0b, the DMAC writes back 0b to the LV bit in the header.

7. Masking DMAEND

   If the DEM bit in CHCFG_n is 0b, DMAEND is issued.

8. Masking DMATCO

   If the TCM bit in CHCFG_n is 0b, DMATCO is issued.

9. Judging the end of the link

   If LE in the header = 1b, after the transfer according to the descriptor settings, TCO is issued (enabling masking by CHCFG_n) and EN is cleared to 0b to stop the operation. If LE = 0b, the current register set is updated and the DMAC starts to load the next descriptor.

(2) Register settings

(a) Link mode setting

To use link mode, set the DMS bit in the CHCFG_n register to 1b.

Table 4.7-13 Link Mode Setting

DMS (CHCFG_n)	Description
1b	Operation is in link mode. The value of this bit cannot be changed by the descriptor.

(b) LINk address setting

There are the next link address register and the current link address register as registers which indicate the link destination.

When starting link mode, set the link destination in the next link address register.

The next link address indicates the next link destination after loading of the descriptor. The current link address indicates the address of the link currently being executed.

Table 4.7-14 Link Address Register Set

Register	Description
Next Link Address Register (NXLA_n)	Sets and indicates the next link destination. Before starting link mode, set the address of the link destination in this register.
Current Link Address Register (CRLA_n)	Indicates the link destination currently being executed. This register is only readable.

CAUTION

In link mode, the setting can be changed by reading the descriptor; however the timing of the change to the setting and a hardware request cannot be synchronized. Therefore, when using hardware requests, set AM, LVL, HIEN, LOEN, and SEL of the CHCFG_n register before enabling hardware requests and also make sure that these setting bits have the same values in the descriptor.

(3) Descriptor settings

From the link destination address, prepare the parts of each descriptor in the following order.

The DMAC reads the descriptors in bursts.

(a) Descriptor arrangement

Table 4.7-15 Descriptor Setting Arrangement

Address	Data	Remark
LinkAddress + 00h	Header	
LinkAddress + 04h	Source address	
LinkAddress + 08h	Destination address	
LinkAddress + 0Ch	Transaction byte	
LinkAddress + 10h	Config	Register mode cannot be set.
LinkAddress + 14h	Interval	
LinkAddress + 18h	Extension	
LinkAddress + 1Ch	Next link address	

Note: For the link destination, set the addresses aligned in 32-bit boundaries.

(b) Header

The header indicates the descriptor state as shown below.

This area is automatically read by the DMAC before starting DMA transfer in link mode. After the completion of the DMA transaction, the DMAC writes back the header and sets the LV bit to 0b to indicate the state of transfer.

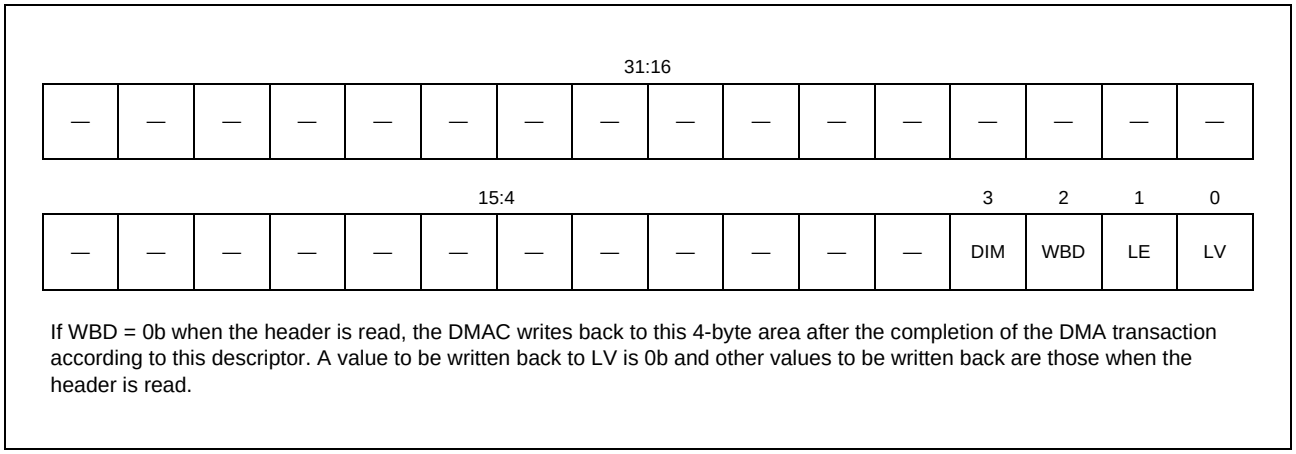

Figure 4.7-11 Header Area

Table 4.7-16 Header Area

Bit Position	Bit Name	Function
31:4	—	—
3	DIM	Descriptor Interrupt Mask If LV = 0b when the header is loaded, this bit sets whether or not to mask DMAEND. 0b: DMAEND is issued. 1b: DMAEND is not issued.
2	WBD	Write Back Disable This bit masks execution of write-back to the LV bit. When the setting of this bit is 1b, the DMAC does not proceed with write-back operation. 0b: The LV bit is written back to 0b. 1b: The LV bit is not written back.
1	LE	Link End This bit indicates that the link ends in the DMA transaction of this descriptor. Set this bit to 1b to indicate the end of the link. 0b: The link continues. 1b: The link ends.
0	LV	Link Valid This bit indicates that this descriptor is enabled. When WBD = 0b, the DMAC writes 0b to this bit following the execution of the DMA transaction written in the descriptor. When setting the header, set this bit to 1b. 0b: The descriptor is disabled. 1b: The descriptor is enabled

(c) Setting the descriptors other than the header

The values in the descriptors other than the header have the same specifications as those of the internal registers (however, the DMS bit of the CHCFG_n register cannot be modified by the descriptor). For the specifications of the internal registers, see **4.7.5 Register Descriptions**.

For example settings of the descriptors, see **4.7.7.1.4 Example setting 4 (link mode)**.

(d) PROT and CACHE settings at the time of access to the descriptors

The PROT and CACHE settings at the time of access to the descriptors can be set in LWCA, LWPR, LDCA, and LDPR described in **4.7.5.2.17 DMA Control Register (DMACm_DCTRL) (m = 0 to 4)**. Make the settings according to the destination for access in which the descriptors are prepared.

(e) Descriptor areas and DMA transfer areas

The figure below shows an overview of the descriptor areas and DMA transfer areas, which are accessed by the DMAC.

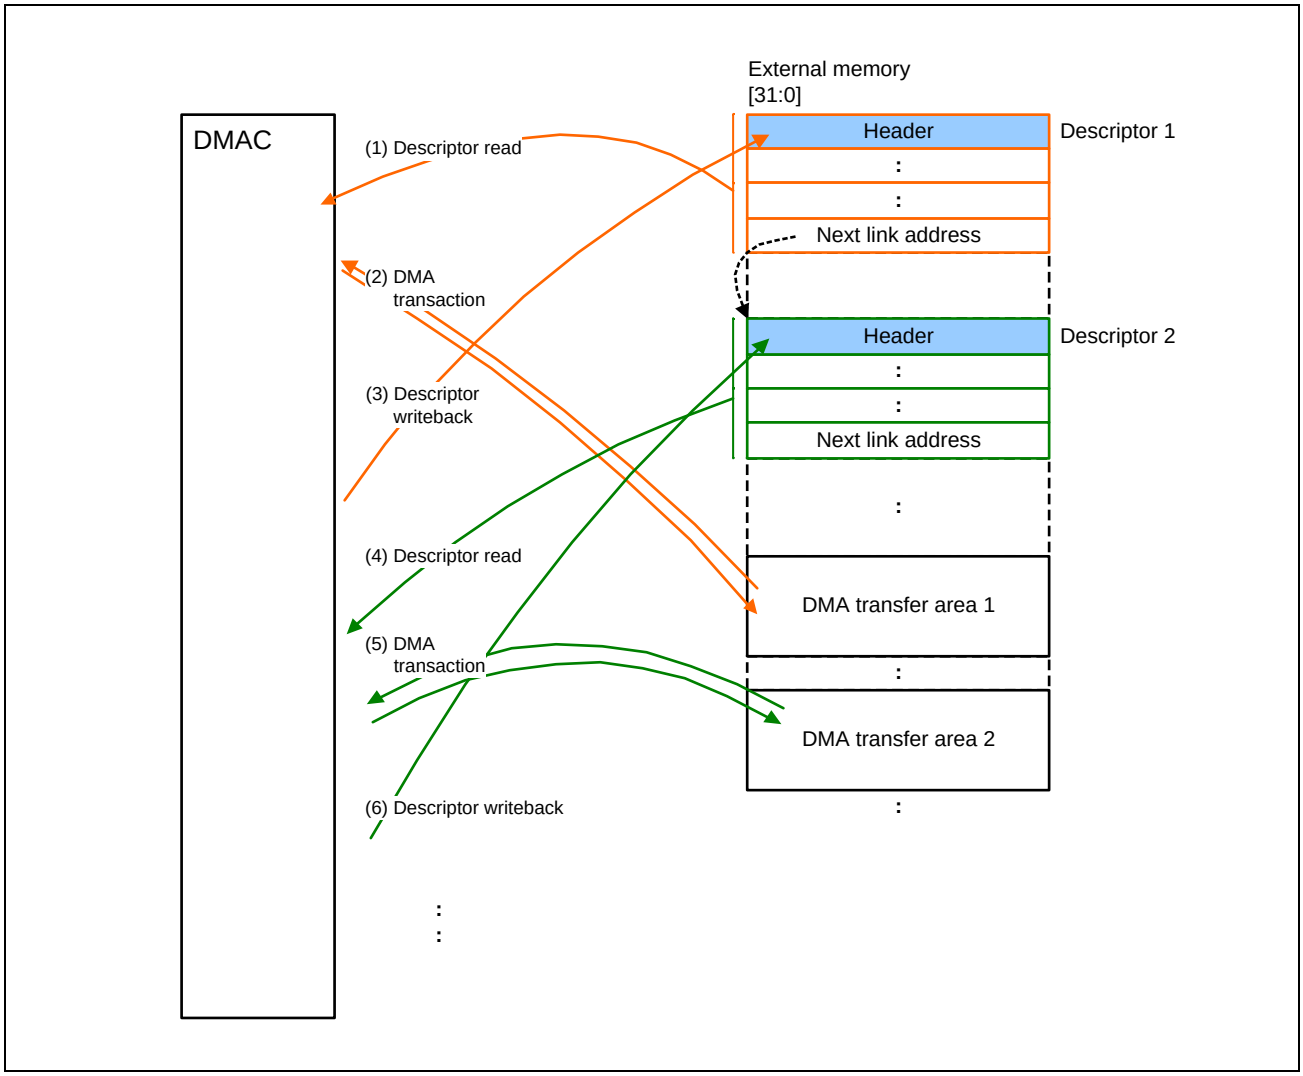

Figure 4.7-12 Overview of the Descriptor Areas and DMA Transfer Areas

(1) Descriptor read

Load the value set in the internal next link address register to the current link address register, and then read the descriptor from the external memory space (descriptor 1) indicated by the current link address register.

(2) DMA transfer

If LV in the header of the descriptor = 1b, execute DMA transfer according to the descriptor information.

(3) Descriptor write-back

After the DMA transfer for the specified number of bytes, if WBD in the header = 0b, write-back is executed on the header of descriptor 1 in the burst size of 32 bits with 0b for LV and the value read in step 1 for the other fields as data.

(4) Descriptor read

If LE in the header of the descriptor which has been previously read (in step 1) = 0b, read the next descriptor from the address (descriptor 2) indicated by the next link address in the descriptor.

(5) DMA transfer

If LV in the header of the descriptor = 1b, execute DMA transfer according to the descriptor information.

(6) Descriptor write-back

After the DMA transfer for the specified number of bytes, if WBD in the header = 0b, write-back is executed on the header of descriptor 2 in the burst size of 32 bits with 0 for LV and the value read in step 4 for the other fields as data.

After that, repeat steps (4) to (6).

If LE in the header = 1b and WBD = 0b, DMA transfer proceeds in accord with the descriptor settings, and 0 is written back to the LV bit of the header, after which the operation ends.

If LE in the header = 1b and WBD = 1b, DMA transfer proceeds in accord with the descriptor settings, after which the operation ends (write-back does not proceed).

If LV in the header = 0b, the operation stops (DMA transfer does not proceed).

(4) Example descriptor configuration

In link mode, descriptors can be configured as shown in the figure below.

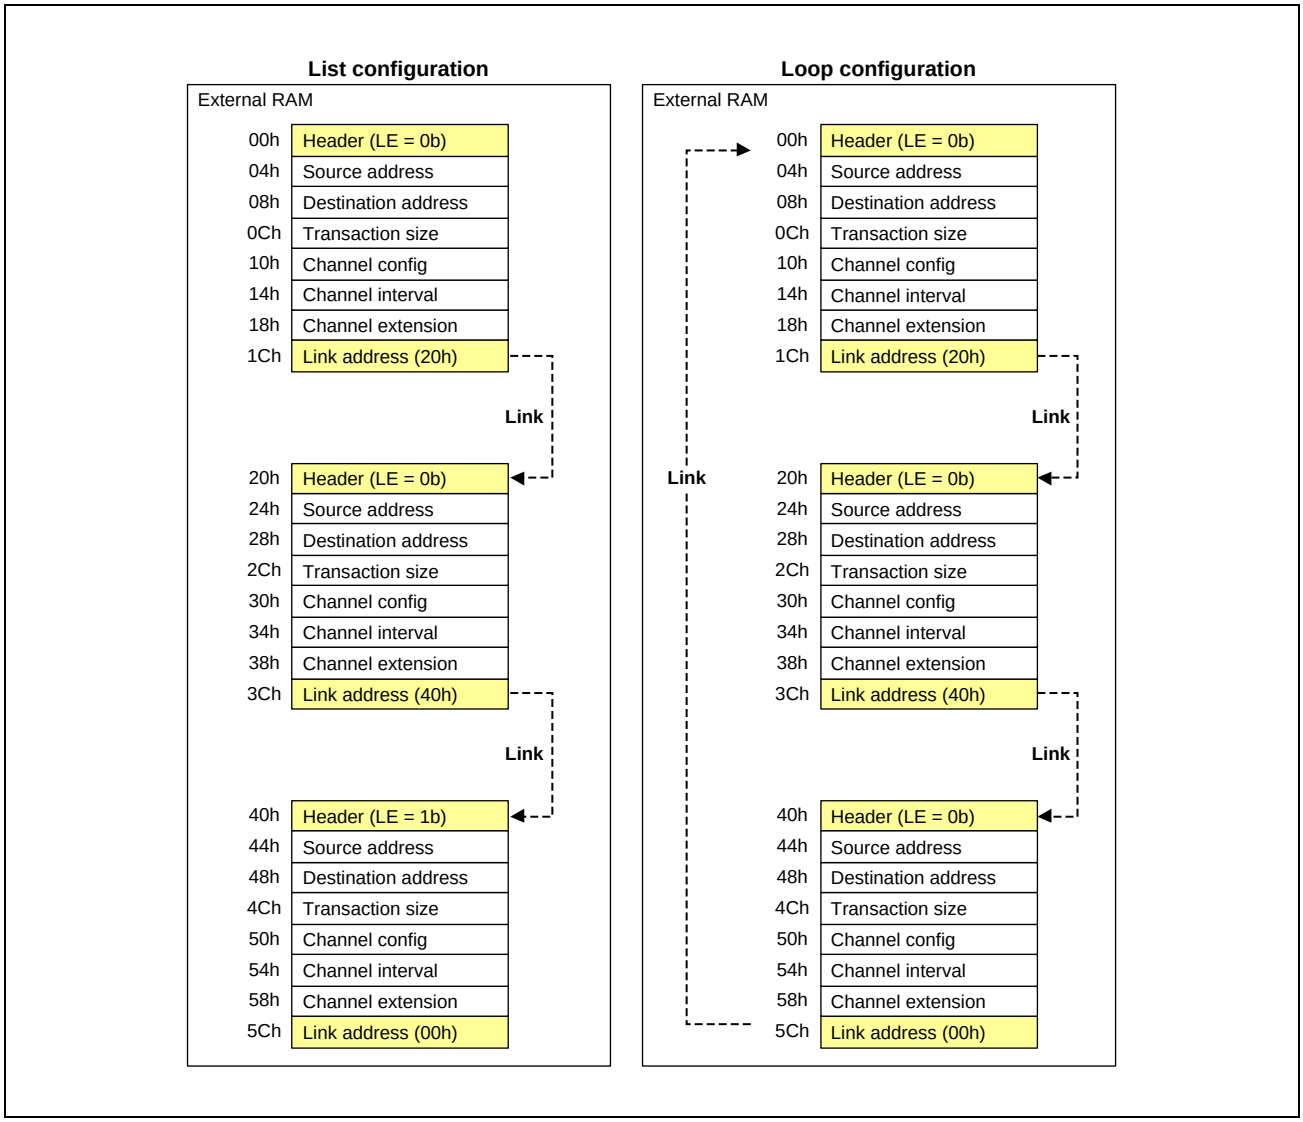

Figure 4.7-13 Example Descriptor Configuration

- List configuration

  Setting the LE bit in the header of the last descriptor to 1b ends the link.

- Loop configuration

  Setting the address of the first descriptor as the link address for the last descriptor configures the descriptors in a loop. To end the loop, either overwrite the LE bit of the header with 1b before the DMAC reads the descriptor or stop the DMAC according to the transfer suspension procedure.

4.7.6.2 DMA Transfer

This section describes basic operations of DMA transfer by the DMAC unit.

4.7.6.2.1 Transfer mode

As the transfer mode, single-transfer mode and block-transfer mode are supported.

Select the mode by using the TM bit of CHCFG_n per channel.

Use single-transfer mode for normal DMA transfer with the use of the DMAREQm input and block-transfer mode for memory-to-memory transfer, etc., with the use of software activation.

Table 4.7-17 Basic Transfer Setting

Transfer Mode	TM (CHCFG_n)	Function	Usage
Single transfer	0b	A single round of DMA transfer proceeds in response to a single DMAREQ.	Use this mode for DMA transfer with the use of the DMAREQ input.
Block transfer	1b	Transfer proceeds in response to a single software activation until the completion of the DMA transaction.	Use this mode for memory-to-memory transfer with the use of software activation.

(1) Single-transfer mode

When a DMA transfer request is received, DMA transfer is executed once in the direction (source or destination) indicated by REQD and DMAACK is asserted. A single round of transfer proceeds every time a transfer request is received and this operation is repeated for the number of bytes loaded to CRTB_n (arbitration between channels proceeds per DMA transfer).

The timing of DMAACK and the timing of counting CRTB vary with the setting of REQD and the transfer size (DDS, SDS). For details, see **4.7.6.2.9 Differences in operation with the transfer size**.

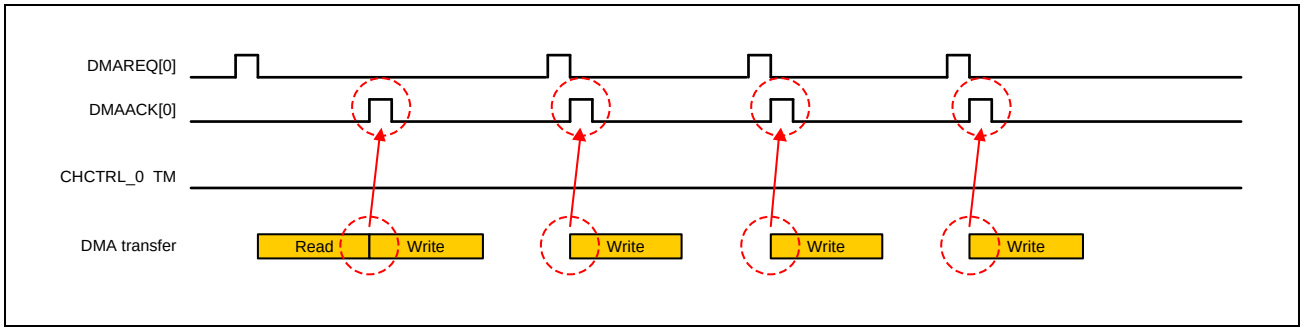

Figure 4.7-14 Single-Transfer Mode (REQD = 1b, SDS > DDS)

(2) Block-transfer mode

Once a DMA transfer request is received, transfer continues until a transfer for the number of bytes loaded to the DMA transfer byte register (CRTB_n register) is completed (the completion of the DMA transaction) (arbitration between channels proceeds per DMA transfer).

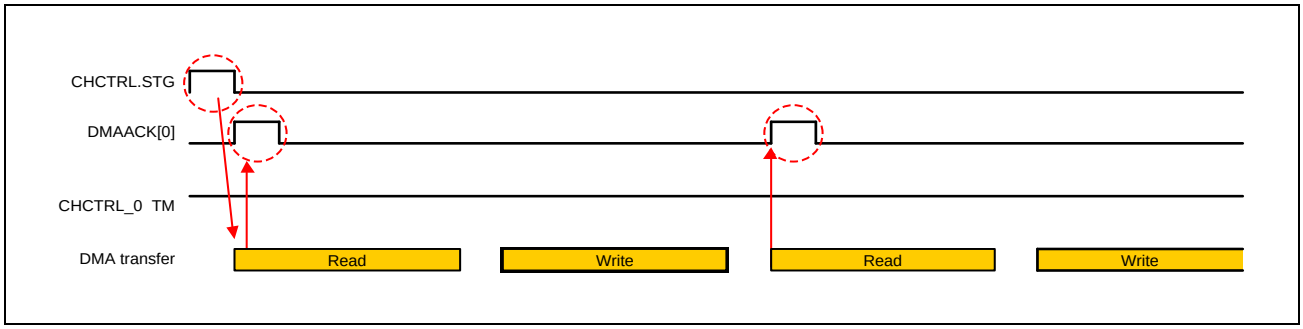

Figure 4.7-15 Block-Transfer Mode (REQD = 0b, SDS < DDS)

4.7.6.2.2 Control over the priority of DMAC channels

Fixed priority mode and round-robin mode are supported as the order of priority among channels 0 to 7 of DMACA and among channels 0 to 7 of DMACB. The mode is selected by using the PR bit of the DMA control register (DCTRL). When the setting of the PR bit is 0b, operation is in fixed priority mode; when it is 1b, operation is in round-robin mode.

Table 4.7-18 Priority Control Setting

Mode	PR (DCTRL)	Function	Usage
Fixed priority	0b	Controls requests in the fixed priority order (high: CH0 > CH1.> CH2 > CH3 > CH4 > CH5 > CH6 > CH7: low).	Use this mode when channels have the priority order.
Round-robin	1b	Controls requests in round-robin fashion.	Use this mode to execute each request evenly.

Round-robin mode is only supported as the order of priority between DMACA and DMACB. In round-robin mode, the DMAC of DMAC No. (which is currently executing transfer) + 1 has the highest priority. After a reset, DMACA is given the highest priority.

Table 4.7-19 Priority of Transfer Requests for DMAC during Transfer

Current DMAC \ Next DMAC	DMACA	DMACB
DMACA	2	1
DMACB	1	2

Note: Priority: 1 (high) ⇔ 2 (low)

The priority of reading and that of writing are controlled independently.

The DMAC issues transfer requests to the individual channels concurrently without waiting for the completion of transfer and handles them in the order the responses are returned. Therefore, the orders in which transactions start and end do not necessarily match.

(1) Fixed priority mode

In fixed priority mode, the order of priority among channels 0 to 7 of DMACA and among channels 0 to 7 of DMACB is fixed. The order of priority between DMACA and DMACB is round-robin. The order of priority after a reset is as follows.

High D0_CH0 > D1_CH0 > D0_CH1 > D1_CH1 > D0_CH2 > D1_CH2 > D0_CH3 > D1_CH3 > D0_CH4 > D1_CH4 > D0_CH5 > D1_CH5 > D0_CH6 > D1_CH6 > D0_CH7 > D1_CH7 Low

Note: D0 and D1 refer to DMACA and DMACB, respectively.

If a transfer request for channel 0 of DMACA is output in this state, transfer by channel 0 of DMACA proceeds. The order of priority after the end of transfer is as follows.

High D1_CH1 > D0_CH0 > D1_CH1 > D0_CH1 > D1_CH2 > D0_CH2 > D1_CH3 > D0_CH3 > D1_CH4 > D0_CH4 > D1_CH5 > D0_CH5 > D1_CH6 >D0_CH6 > D1_CH7 > D0_CH7 Low

Note: D0 and D1 refer to DMACA and DMACB, respectively.

If DMA transfer requests are generated on multiple channels simultaneously, the request for a smaller number channel is given priority. The figure below shows an example when another DMA transfer request with higher priority is generated while DMA transfer proceeds in fixed priority mode.

(2) Round-robin mode

In round-robin mode, the order of priority is changed so that the channel which has proceeded with the immediately preceding transfer is given the lowest priority every time a transfer among channels 0 to 7 of DMACA and among channels 0 to 7 of DMACB is accepted.

The order of priority between DMACA and DMACB is also determined in round-robin.

As with fixed priority mode, the order or priority after a reset is as follows.

High D0_CH0 > D1_CH0 > D0_CH1 > D1_CH1 > D0_CH2 > D1_CH2 > D0_CH3 > D1_CH3 > D0_CH4 > D1_CH4 > D0_CH5 > D1_CH5 > D0_CH6 > D1_CH6 > D0_CH7 > D1_CH7 Low

Note: D0 and D1 refer to DMACA and DMACB, respectively.

If a transfer request for channel 2 of DMACA is output in this state, transfer by channel 2 of DMACA proceeds. The order of priority after the end of transfer is as follows.

High D1_CH0 > D0_CH3 > D1_CH1 > D0_CH4 > D1_CH2 > D0_CH5 > D1_CH3 > D0_CH6 > D1_CH4 > D0_CH7 > D1_CH5 > D0_CH0 > D1_CH6 > D0_CH1 > D1_CH7 > D0_CH2 Low

Note: D0 and D1 refer to DMACA and DMACB, respectively.

4.7.6.2.3 DMA transfer request

Edge detection or level detection is selectable by using the LVL bit of the CHCFG_n register.

The HIEN and LOEN bits of the CHCFG_n register are used to select rising or falling edge for edge detection and the high or low level for level detection.

Table 4.7-20 DMAREQ Pin Selection Setting

SEL[2:0] (CHCFG_n)	Request Pin	Acknowledge Pin	Terminal Count Pin	Usage
000b	DMAREQ[0]	DMAACK[0]	DMATCO[0]	Set the DMAC pin to be used for channel n.
001b	DMAREQ[1]	DMAACK[1]	DMATCO[1]	
010b	DMAREQ[2]	DMAACK[2]	DMATCO[2]	
011b	DMAREQ[3]	DMAACK[3]	DMATCO[3]	
100b	DMAREQ[4]	DMAACK[4]	DMATCO[4]	
101b	DMAREQ[5]	DMAACK[5]	DMATCO[5]	
110b	DMAREQ[6]	DMAACK[6]	DMATCO[6]	
111b	DMAREQ[7]	DMAACK[7]	DMATCO[7]	

Table 4.7-21 DMAREQ Detection Setting

Mode	LVL (CHCFG_n)	HIEN (CHCFG_n)	LOEN (CHCFG_n)	Function	Usage
Edge detection	0b	0b	0b	Edge detection cannot be performed in this setting. Select this setting when not using a hardware request.	Set the mode of DMAREQ and the method for detecting rising and falling edges.
			1b	Detection of falling edges of DMAREQm.	
		1b	0b	Detection of rising edges of DMAREQm.	
			1b	Detection of rising and falling edges of DMAREQm.	
Level detection	1b	0b	0b	Level detection cannot be performed in this setting.	
			1b	DMAREQm is detected in the low-level mode.	
		1b	0b	DMAREQm is detected in high-level mode.	
			1b	Transfer starts in response to the SETEN bit of the CHCTRL_n register being set to 1b regardless of the input level of DMAREQm. In this setting, set DMAACK to the mode other than level mode. If level mode is set, the operation will be deadlocked.	

DMA activation requests have three types: software request, external request, and on-chip peripheral module request. Select the transfer request source for an external request, on-chip peripheral module request, and software request with the ICU_DMkSELy.DkRQ_SELn register (k = 0 to 4, y = 0 to 7, n = 0 to 15).

For software requests, see the description of the ICU_SWDMACk register (k = 0 to 4).

For each DMA transfer source, set the CHCFG_n register according to **Table 4.7-22**. Regarding external requests, make the setting to suit the system.

Remark: CHCFG_n register setting values

TM bit
- 0: Single transfer
- 1: Block transfer

AM[2:0] bits
- 000: ACK pulse output
- 001: ACK level output
- 010: ACK bus cycle output
- 100: No ACK

LVL bit
- 0: Detects the edge of a DMA request
- 1: Detects the level of a DMA request

REQD bit
- 0: DACK output during read operation
- 1: DACK output during write operation

(1) Edge detection

Edge detection is selected by setting the LVL bit in the CHCFG_n register.

Setting the HIEN bit of the CHCFG_n register to 1b selects rising-edge detection and setting the LOEN bit to 1b selects falling-edge detection.

Make sure that the unit to be connected issues a next DMA transfer request after waiting for detection of DMAACK.

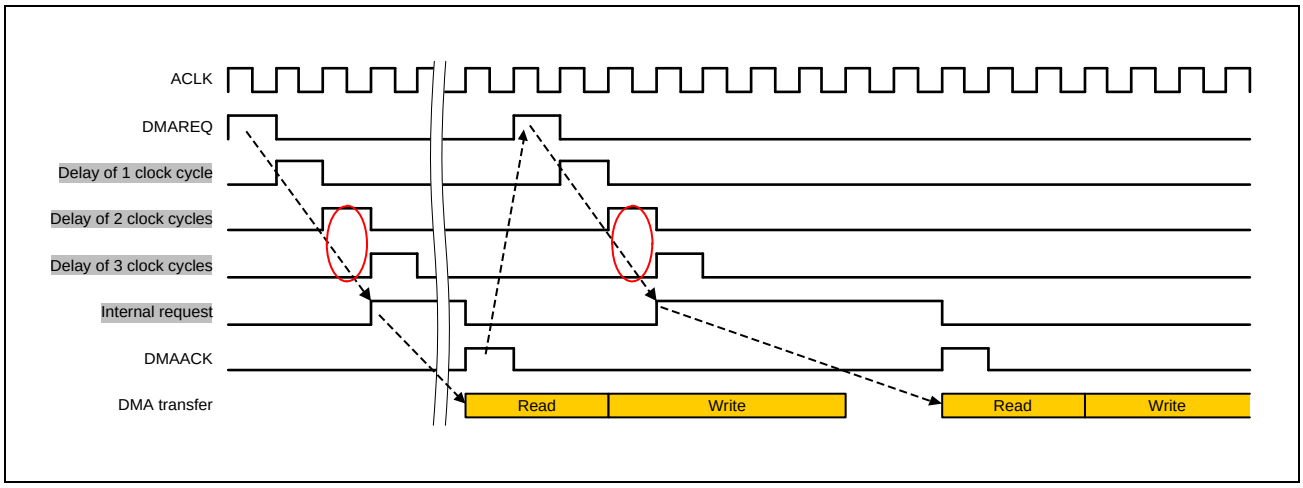

Figure 4.7-16 Edge Detection Timing (HIEN = 1b, REQD = 0b)

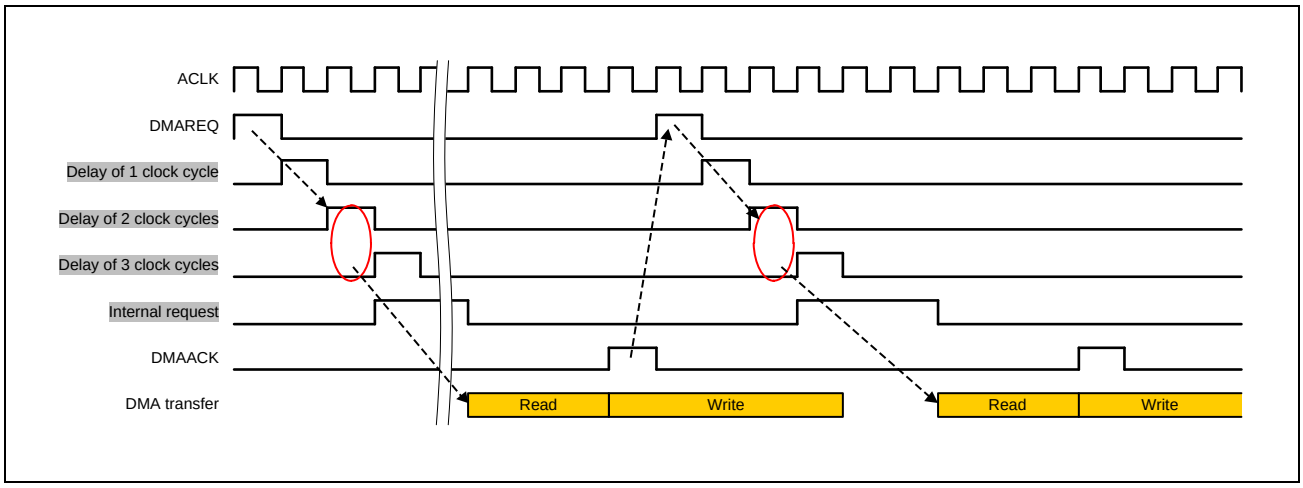

Figure 4.7-17 Edge Detection Timing (HIEN = 1b, REQD = 1b)

(2) Level detection

Setting the LVL bit of the CHCFG_n register to 1b selects level detection.

If DMAREQ is at the active level (by the setting of HIEN or LOEN) for at least two consecutive clock cycles, it is recognized as a correct DMAREQ.

If DMAACK is set to level mode, DMAACK is at the high level until DMAREQ is de-asserted, so when a next DMA transfer request is to be output, assert DMAREQ after waiting for DMAACK to be de-asserted.

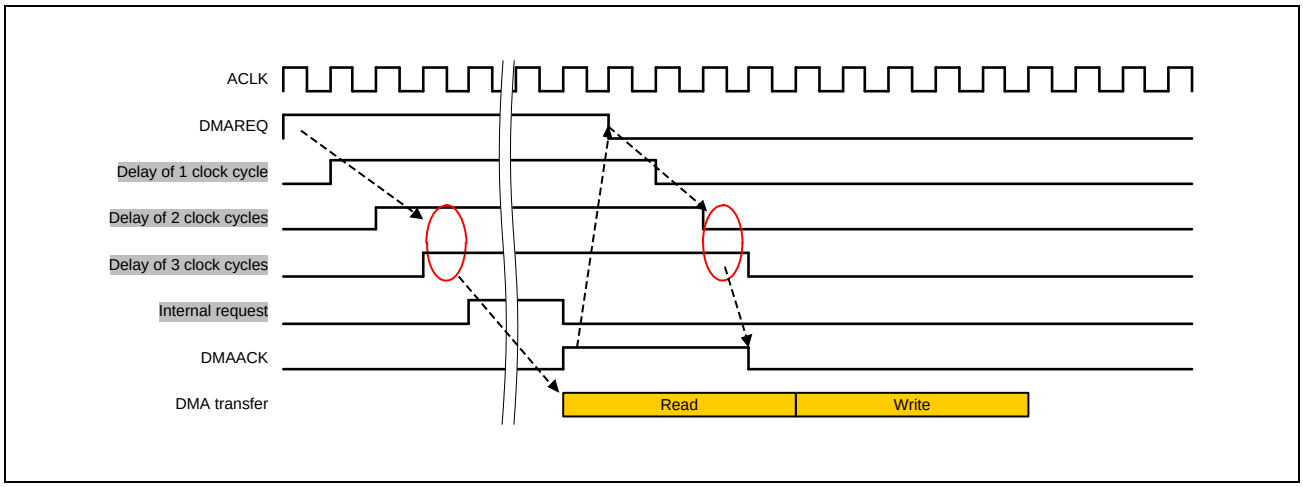

Figure 4.7-18 Level Detection Timing (HIEN = 1b, REQD = 0b, AM[2:0] = 001b)

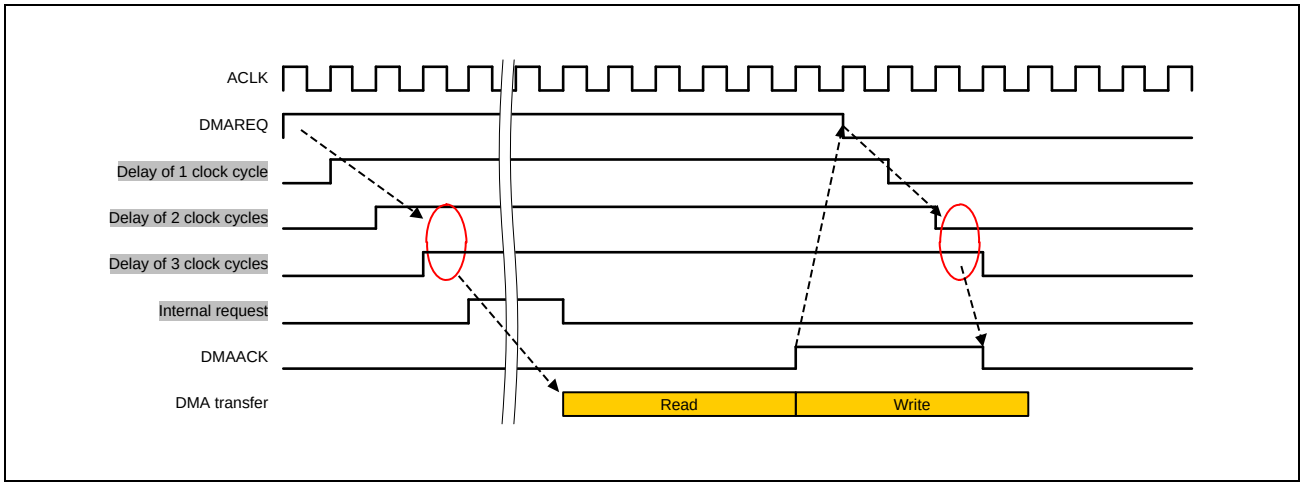

Figure 4.7-19 Level Detection Timing (HIEN = 1b, REQD = 1b, AM[2:0] = 001b)

4.7.6.2.4 DMA acknowledge output

DMAACK[7:0] is an acknowledge signal for the request source that outputs a DMA transfer request. This unit supports pulse output, level output, and bus cycle output to output DMAACK. For handshaking between REQ and ACK, use level output in this LSI.

The SEL bit of the CHCFG_n register is used to select one from among the eight DMAACK[7:0] outputs per channel (See **Table 4.7-20**).

(1) DMA acknowledge signal output timing setting

When the DMA transfer request is accepted, the acknowledge signal becomes active level (high level output). The REQD and AM[2:0] bits of the CHCFG_n register can be used to make the settings as follows.

Table 4.7-23 DMAACK Output Timing Setting

Mode	AM[2] (CHCFG_n)	AM[1:0] (CHCFG_n)	REQD (CHCFG_n)	Usage
Pulse	0b	00b	0b (Active at the time of reading)	DMAACK is output with a pulse. Use this mode when the unit to which DMAACK is connected can receive DMAACK with a pulse.
			1b (Active at the time of writing)	
Level	0b	01b	0b (Active at the time of reading)	DMAACK is output with a level. DMAACK continues to be asserted until DMAREQ is de-asserted. Use this mode when this output is asynchronous with the destination to which DMAACK is connected.
			1b (Active at the time of writing)	
Bus cycle	0b	10b 11b	0b (Active at the time of reading)	DMAACK is output during the bus cycle period. Use this mode when DMAACK is to be asserted until the completion of a bus cycle.
			1b (Active at the time of writing)	
Masking	1b	—	—	DMAACK is fixed at the low level. Use this mode when DMAACK is not to be issued to the destination for connection.

(2) Pulse Output

Setting the AM bits of the CHCFG_m register to 000 selects pulse output.

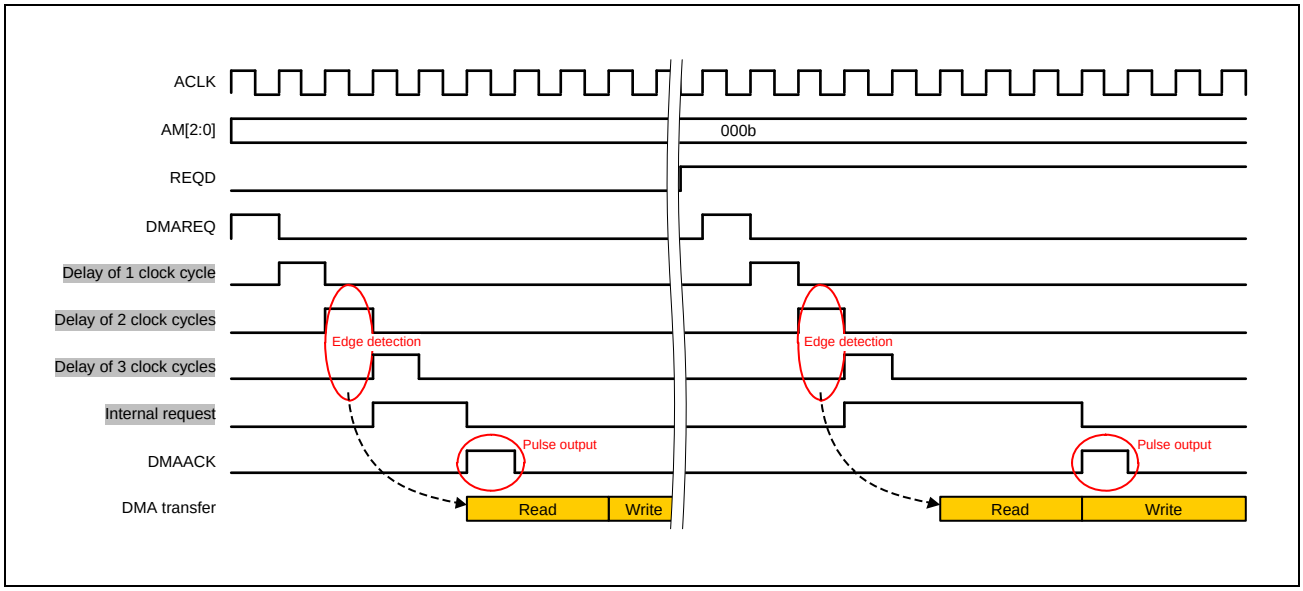

Figure 4.7-20 DMAACK Output Timing (AM[2:0] = 000b, LVL = 0b)

When REQD = 0b, DMAACK is asserted when a bus cycle for reading starts.

When REQD = 1b, DMAACK is asserted when a bus cycle for writing starts.

(3) Level output

Setting the AM bits of the CHCFG_n register to 001b selects level output. DMAACK continues to be asserted until DMAREQ is de-asserted.

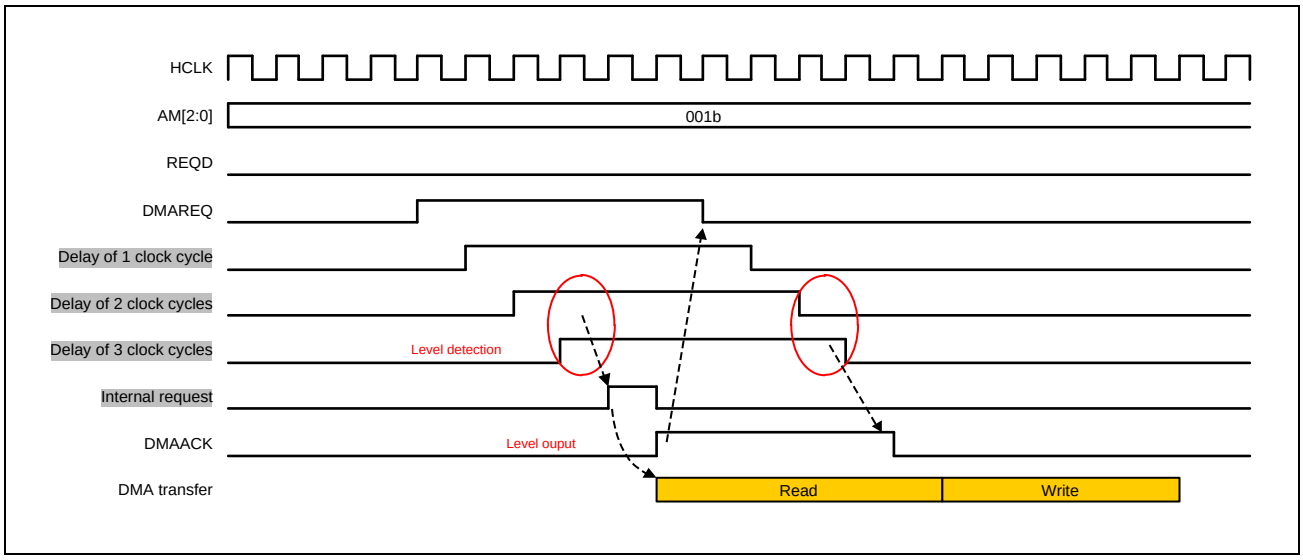

Figure 4.7-21 DMAACK Output Timing (AM[2:0] = 001b, LVL = 1b, REQD = 0b)

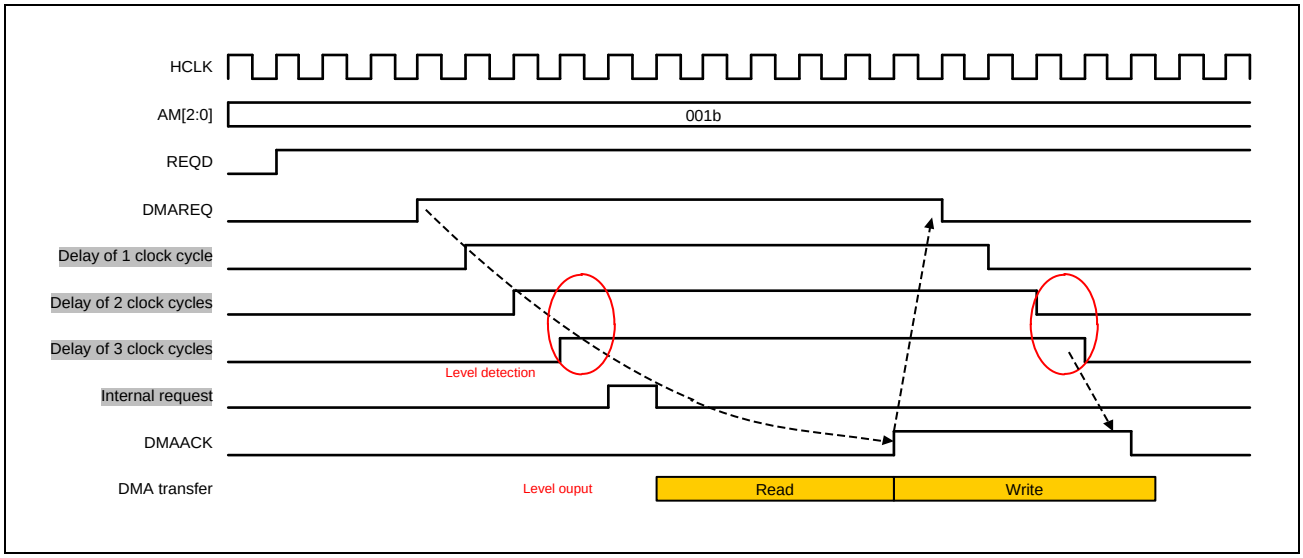

Figure 4.7-22 DMAACK Output Timing (AM[2:0] = 001b, LVL = 1b, REQD = 1b)

(4) Bus Cycle Output

Setting the AM bits of the CHCTRL_m register to 010 selects bus cycle output. DMAACK is at the active level during the bus cycle period.

DMAREQ is masked within this unit while DMAACK is at the active level. Accordingly, even if DMAREQ is set for level detection, the output side does not need to de-assert it once.

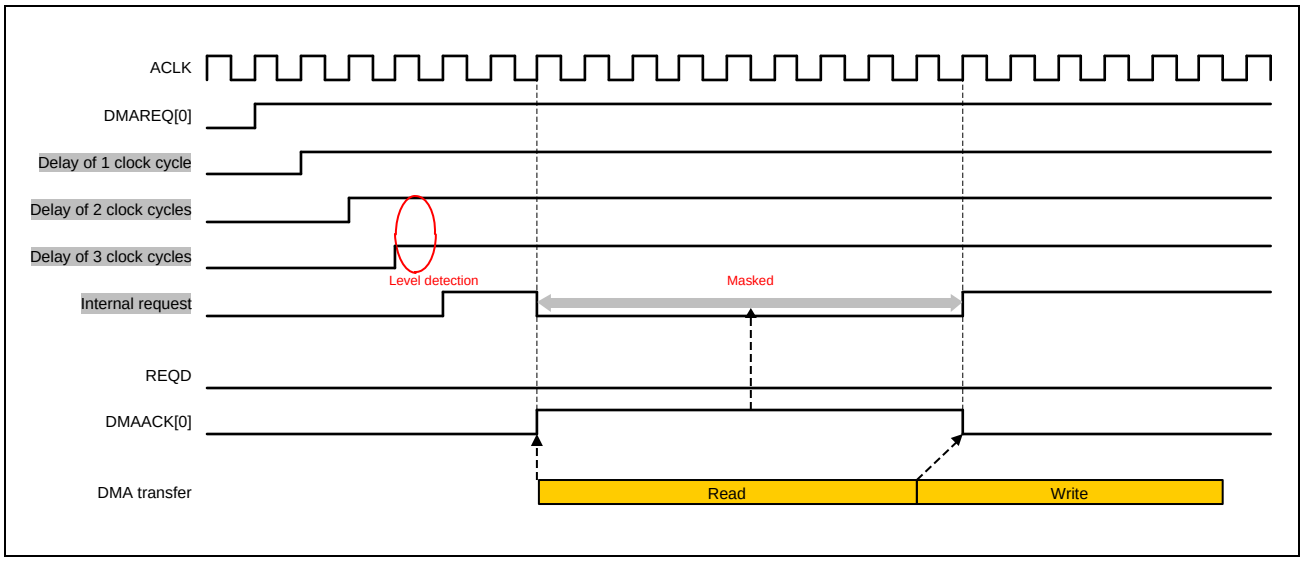

Figure 4.7-23 Bus Cycle Output Timing (AM[2:1] = 01b, LVL = 1b, REQD = 0b)

- When DMAACK is at the active level at the time of reading (REQD = 0b), it is active during the period from the start of the read cycle to one cycle after the end of the read cycle.
  - Start of the read cycle: MARVALID = 1b
  - End of the read cycle: MRVALID & MRLAST & MRREADY = 1b

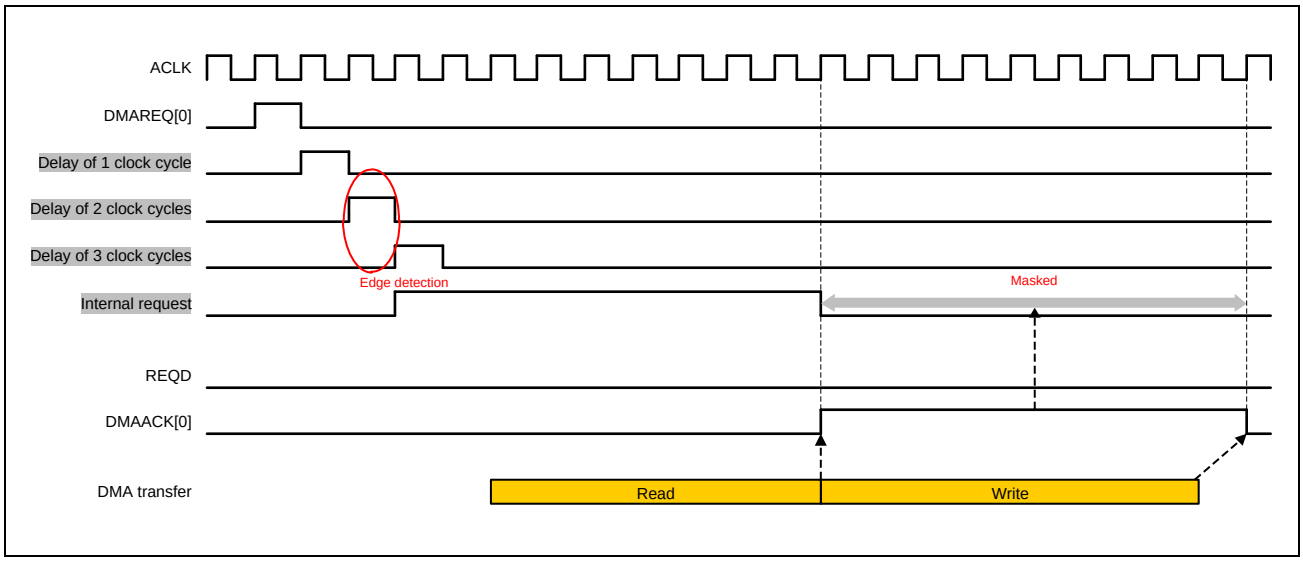

Figure 4.7-24 Bus Cycle Output Timing (AM[2:1] = 01b, LVL = 0b, REQD = 1b)

- When DMAACK is at the active level at the time of writing (REQD = 1b), it is active during the period from the start of the write cycle to one cycle after the end of the write cycle.
  - Start of the write cycle: MAWVALID = 1b
  - End of the write cycle: MBVALID & MBREADY = 1b

4.7.6.2.5 DMA transfer completed interrupt

DMAEND[7:0] are interrupt request signals that indicate the completion of a DMA transaction.

Each bit of DMAEND[7:0] corresponds to a respective channel.

If a transfer for the total number of transfer bytes loaded to CRTB (Current Transaction Byte) is completed with an OKAY response, END of the CHSTAT_n register is set to 1b. If DEM of the CHCFG_n register = 0b at this time, the high level is output from the DMAEND[n] pin (n = 7 to 0) (when write-back proceeds in link mode, the high level is output after the completion of write-back).

In link mode, if LV = 0b in the header of the descriptor that has been read, DER of the CHSTAT_n register is set to 1b. If DIM of the header = 0b at this time, the high level is output from the DMAEND[n] pin.

Use this signal for detection of a transfer completed interrupt by the interrupt controller.

Table 4.7-24 DMAEND Assertion Conditions

Source	Condition	DMAEND[n] Mask Signal
Completion of the DMAC transaction	A transfer for the total number of transfer bytes loaded to CRTB (current transaction byte) being completed with an OKAY response (after the completion of write-back if write-back proceeds in link mode).	DEM bit of the CHCFG_n register
Descriptor invalid	In link mode, LV = 0b in the header of the descriptor that has been read while DIM of the header = 0b.	DIM bit of the header

4.7.6.2.6 DMA terminal count signal output function

DMATCO[7:0] are transaction completion signals to the request source that has issued the DMA transfer request.

One of the eight outputs of DMATCO[7:0] can be selected per channel, which is set by the SEL bit in the CHCFG_n register. (See **Table 4.7-20**).

When a transaction is completed with an OKAY response for the total number of transferred bytes that have been loaded into CRTB_n (Current Transaction Byte), set TC in the CHSTAT_n register to 1b and activate the DMA terminal count signal (DMATCO) for one cycle period (n = 7 to 0).

The DMATCO output signal can be masked by the TCM bit in the CHCFG_n register. When using software startup (setting the STG bit in the CHCTRL_n register), it should be masked.

Table 4.7-25 DMATCO Settings

TCM (CHCFG_n)	Function	Usage
0	Output DMATCO	Used when transfer, count end, or end of link mode is detected by the hardware.
1	Mask DMATCO	Used when DMA transfer is controlled by software; TCM is cleared to 0 after a DMA transaction.

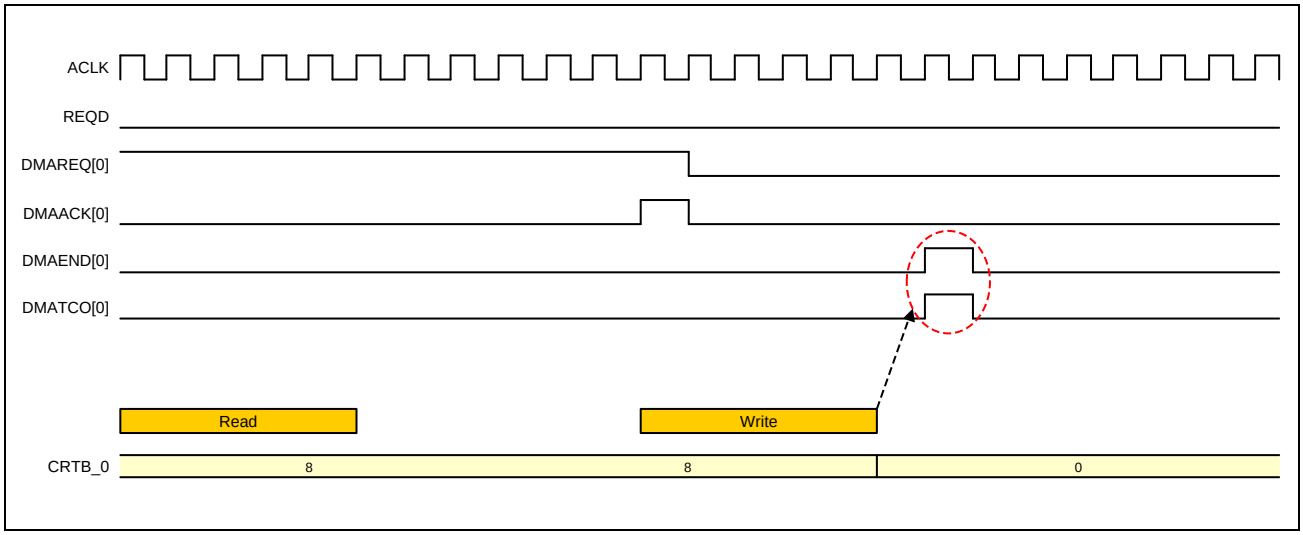

Figure 4.7-25 DMAEND and DMATCO Timing 2 (REQD = 1)

4.7.6.2.7 DMA error interrupt (DMAERR)

If an error response is received in DMA transfer and descriptor access, this unit judges this to be an error and stops transfer. If an error response is received, the EN bit of the CHSTAT_n register for channel n during transfer is cleared to 0b and the ER bit is set to 1b (n = 0 to 7). Also, the high level is output from the DMAERR pin (on the other hand, DMAERR is not output if an error occurs in access to a slave of this unit).

The DMAERR signal cannot be masked.

The series of transfers which causes the error does not guarantee that data. Be sure to start transfer over again from the beginning by following the procedure below.

1. Set the SWRST bit of the CHCTRL_n register to 1b.
2. Re-set each register.

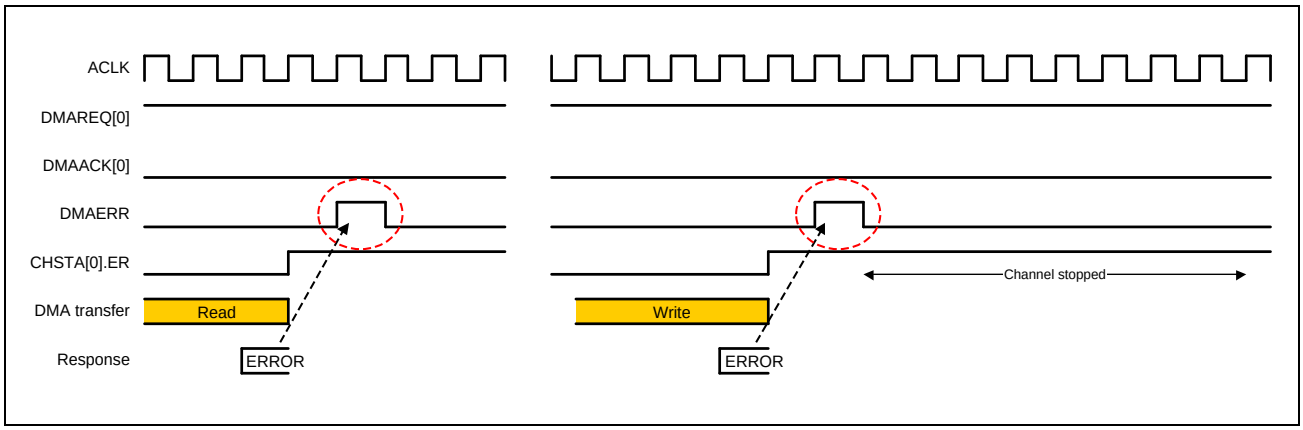

Figure 4.7-26 Timing of Stopping Transfer by an Error Response (ERROR)

4.7.6.2.8 Interval counting

The interval between the execution of DMA transfers can be adjusted by the setting of the ITVL bit of the channel interval register (CHITVL_n). This functionality is intended to make sure that the DMA controller does not occupy the bus.

When one round of reading or writing is completed, counting down starts from the value set in CHITVL_n. A next internal request is not executed until the value counted reaches to 0.

The figure below shows an example of operations.

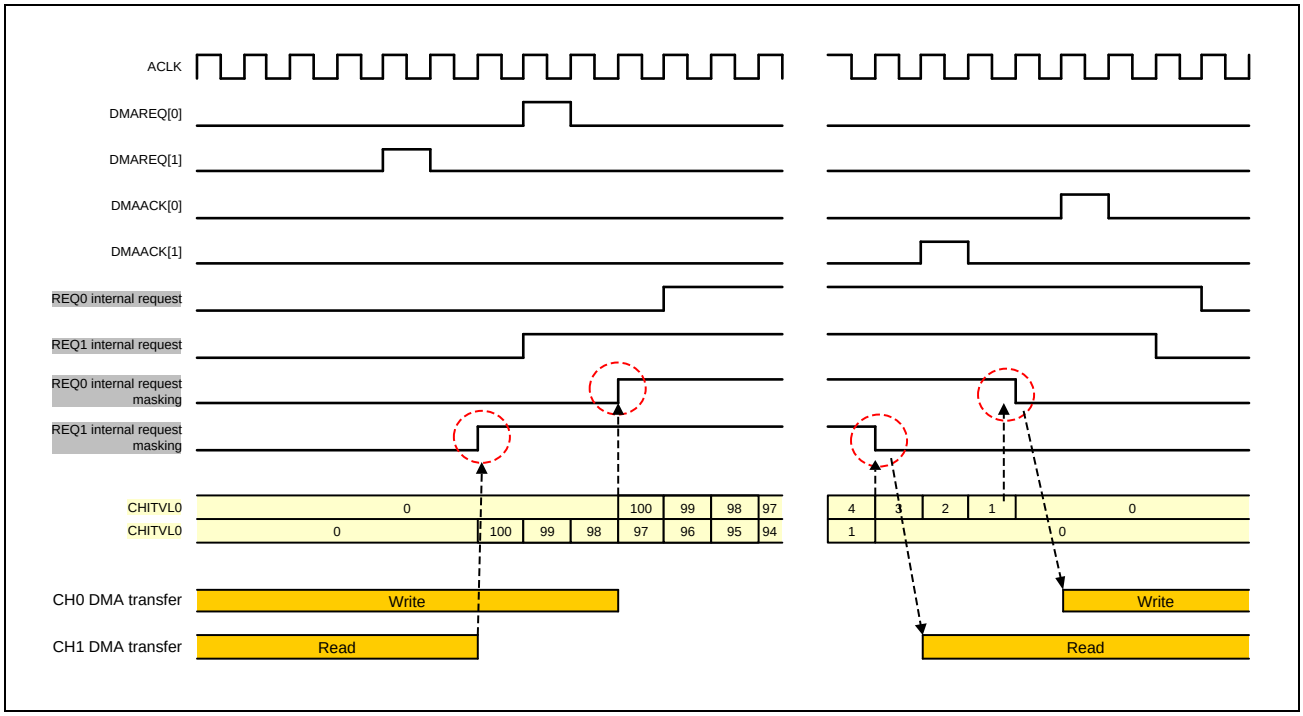

Figure 4.7-27 Interval Counting

4.7.6.2.9 Differences in operation with the transfer size

(1) When the transfer size of the source is small

When reading of data corresponding to the destination transfer size is completed, writing to the destination proceeds.

The figure below is a timing chart when the transfer size of the source is 8 bits and that of the destination is 32 bits (in the case of rising-edge detection).

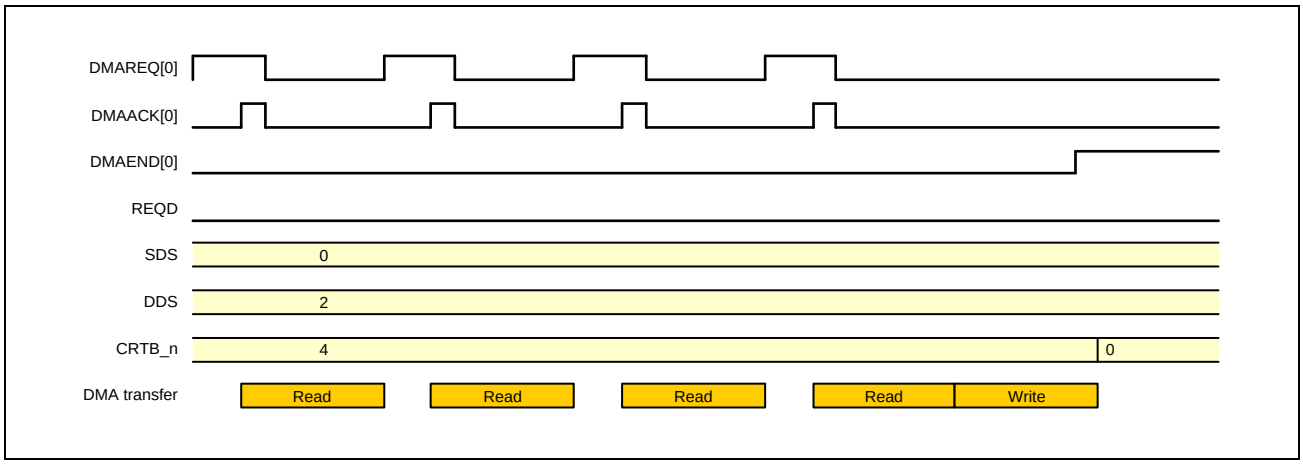

Figure 4.7-28 When the Transfer Size of the Source is Small (LVL of CHCFG_n = 0b, HIEN = 1b, REQD = 0b, SDS < DDS)

(2) When the transfer size of the destination is small

Since the transfer size of the source is larger than that of the destination, after reading from the source once, writing to the destination proceeds several times. The figure below is a timing chart when the transfer size of the source is 64 bits and that of the destination is 16 bits (in the case of rising-edge detection and (REQD of the CHCFG_n register is set to 1).

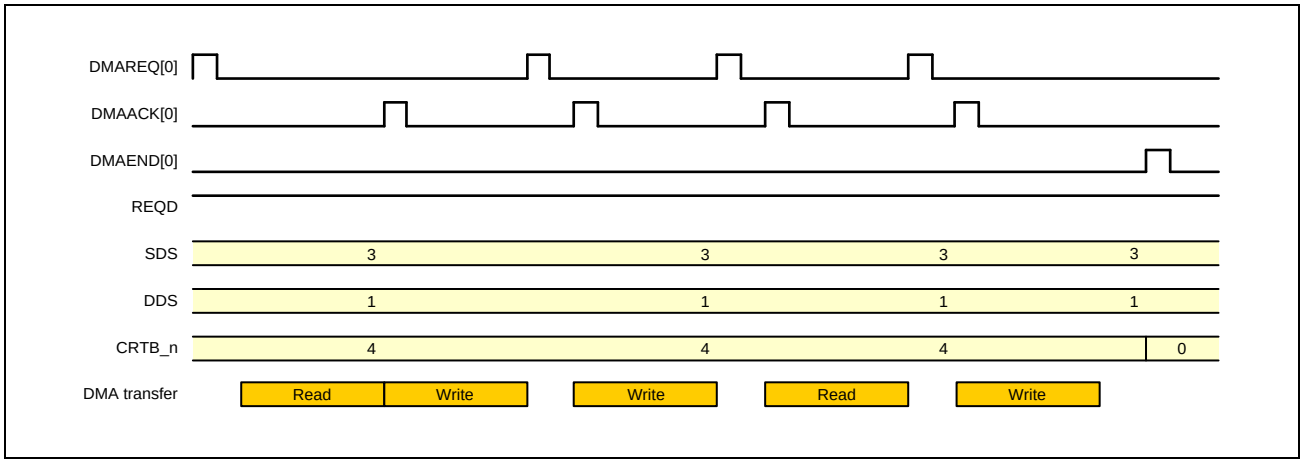

Figure 4.7-29 When the Transfer Size of the Destination is Small (LVL of CHCFG_n = 0b, HIEN = 1b, REQD = 1b, SDS > DDS)

(3) When the transfer sizes of the source and destination are the same

Reading from the source and writing to the source proceed every time a DMA transfer request is detected.

The figure below is a timing chart when the transfer sizes of the source and destination are 8 bits (in the case of rising-edge detection and when REQD of the CHCFG_n register is set to 1b).

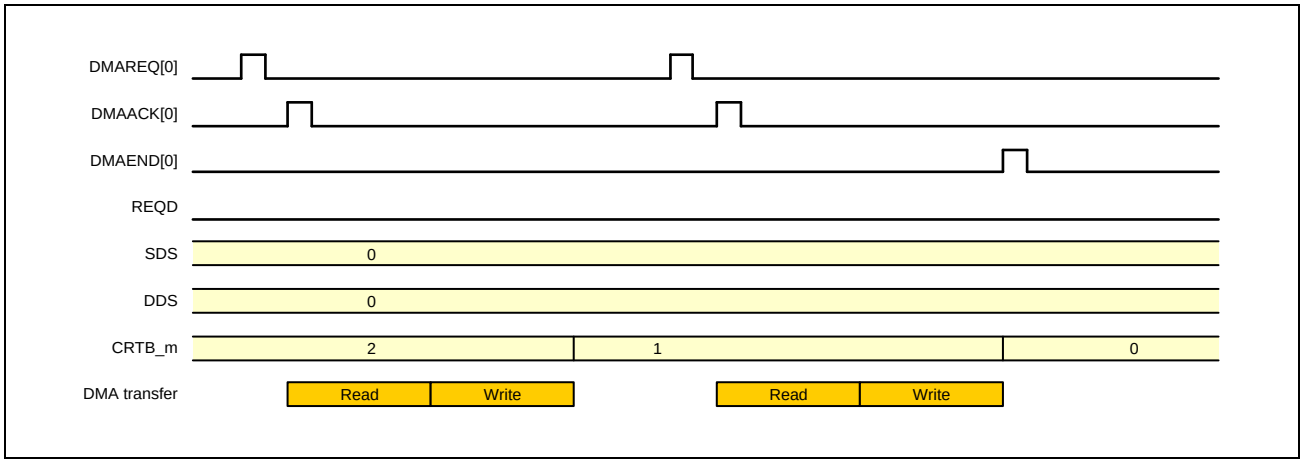

Figure 4.7-30 When the Transfer Sizes of the Source and Destination are the Same (LVL of CHCFG_n = 0b, HIEN = 1b, REQD = 0b, SDS = DDS)

4.7.6.2.10 Transfer state

The channel status register indicates the DMA transfer state of the channel.

(1) Transfer state

The transfer state is indicated by TACT as shown below.

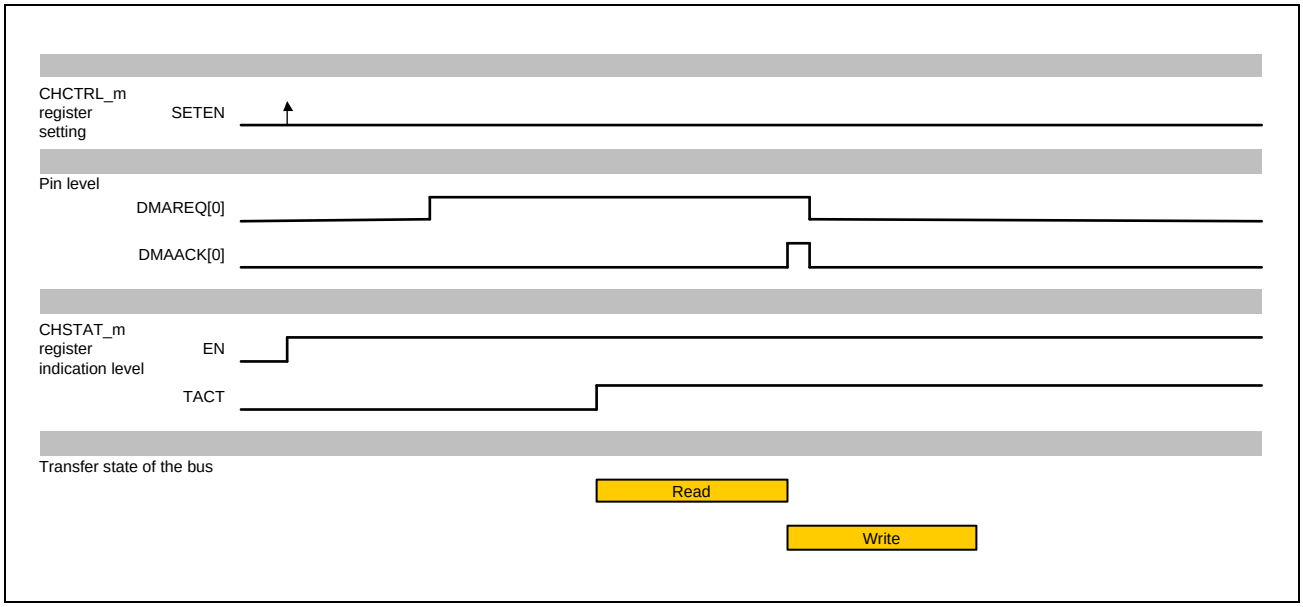

Figure 4.7-31 DMAC State Example 1 (Hardware Request)

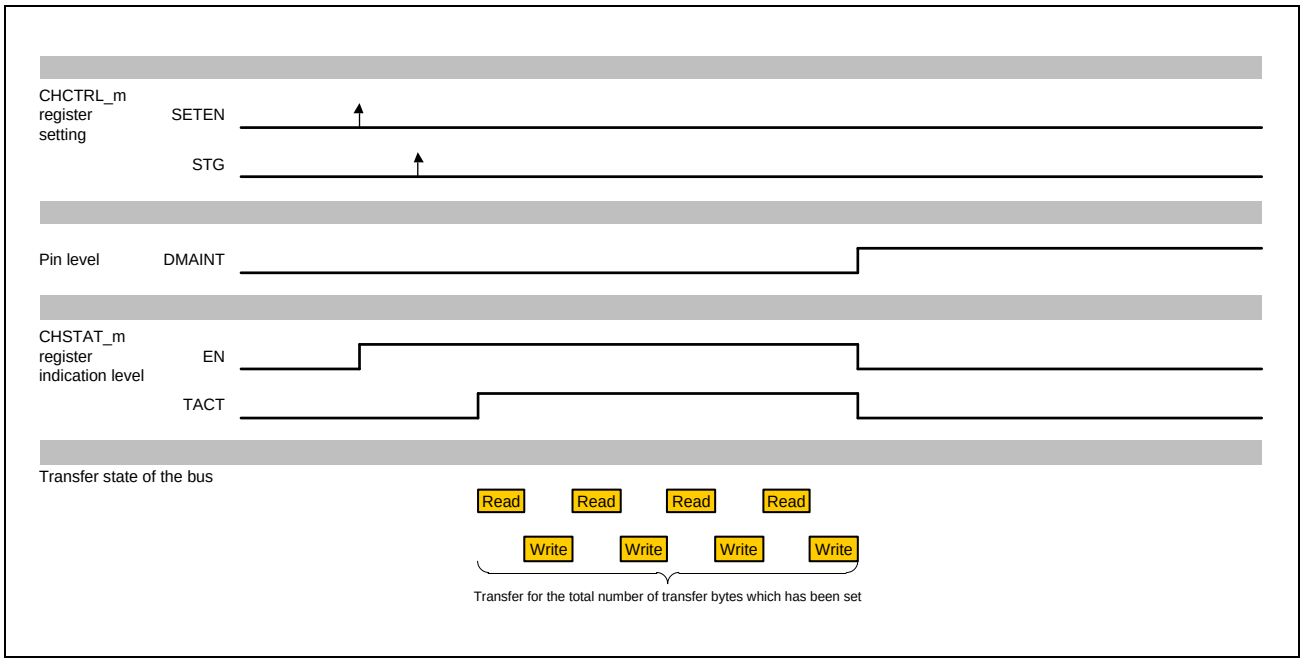

Figure 4.7-32 DMAC State Example 2 (Software Request)

(2) Suspension

The SETSUS bit of CHCTRL_n can be used to suspend DMA transfer. At that time, if the bus cycle is already is in progress, the DMAC is suspended after waiting for the completion of the cycle. It can be resumed from the suspended state by writing 1b to the CLRSUS bit.

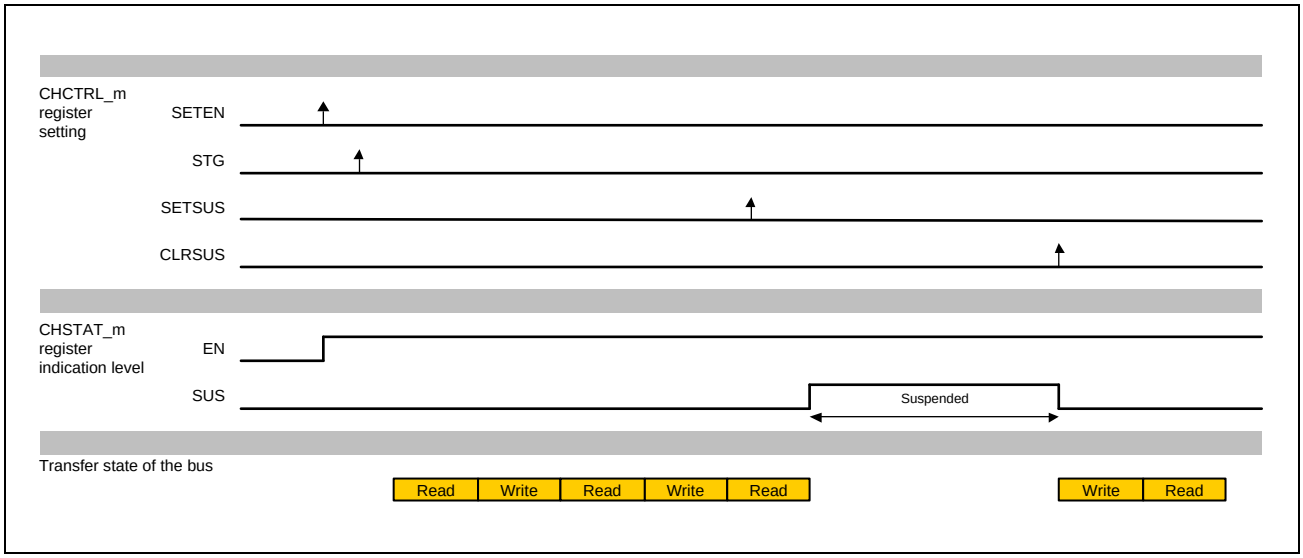

Figure 4.7-33 DMAC Suspended State (Block Transfer by Software Request)

In the above case, the DMAC is suspended at the time read transfer is completed.

If the DMAC has already executed transfer, it is suspended at the time that transfer is completed. To confirm that the transfer is suspended, set SETSUS and then check that the SUS bit for the corresponding channel is 1b by reading the CHSTAT or DST_SUS register.

(3) Aborting transfer

Writing 1 to CLREN during the DMA transaction aborts the DMA transaction by the corresponding channel. As processing after the transaction has been aborted, select either of the following modes by using the SBE bit in the CHCFG_n register: the mode where the data remaining in the buffer are flushed at the time the transaction is aborted (SBE = 1b) and the mode where the data are not flushed (SBE = 0b). By default, SBE = 0b.

When the transfer in progress is aborted by setting CLREN to 1b while this flushing mode is enabled, if data remain in the buffer of the DMAC, that data are flushed before the transaction is completed.

(a) Aborting transfer (no buffer flushing: SBE = 0b)

When CLREN is set during DMA transfer, the DMA transfer is aborted and then stopped. The timing of stopping the transfer depends on the value set in REQD. After the transfer has been stopped, be sure to clear the internal state of the DMAC before making the settings for next transfer.

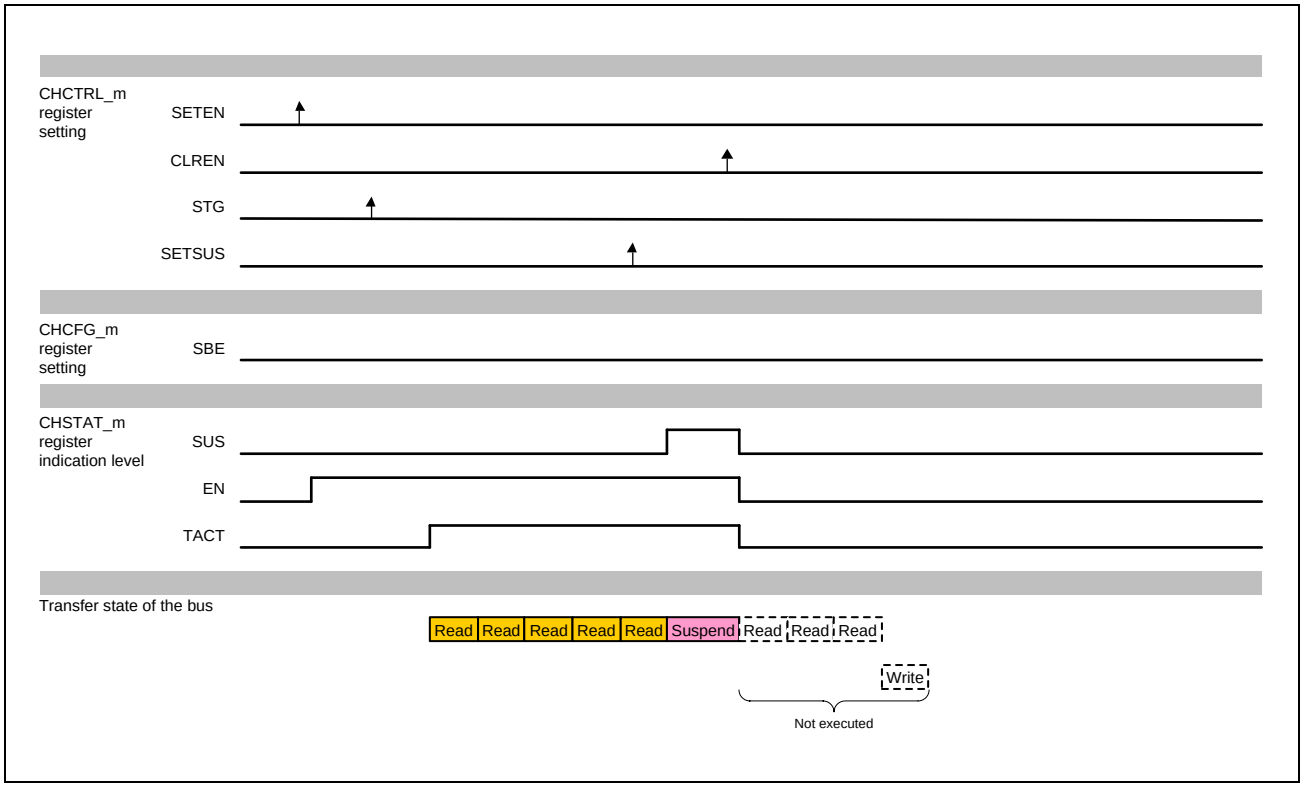

Figure 4.7-34 Aborting DMA Transfer

- Complete stopping of the channel can be confirmed at the time the TACT bit is cleared.
- If the DMA transfer in progress is aborted, the DMAEND pin is not asserted.
- If REQD = 0b, the transfer is stopped at the time next reading is completed. Note that if the buffer contains data that can be written, the transfer is stopped after the data are written.
- If REQD = 1b, the transfer is stopped at the time next writing is completed.

(b) Aborting transfer (with buffer flushing: SBE = 1b)

Setting CLREN during DMA transfer aborts the DMA transfer. If REQD = 0b, data that have already been read are flushed (written) and then the DMA transfer is stopped. After the transfer has been stopped, set SWRST and clear the internal state of the DMAC before making the settings for next transfer.

If flushing mode is used when a hardware request is in use while REQD = 1b, data that have been read in advance may be written, so only use this mode while REQD = 0b.

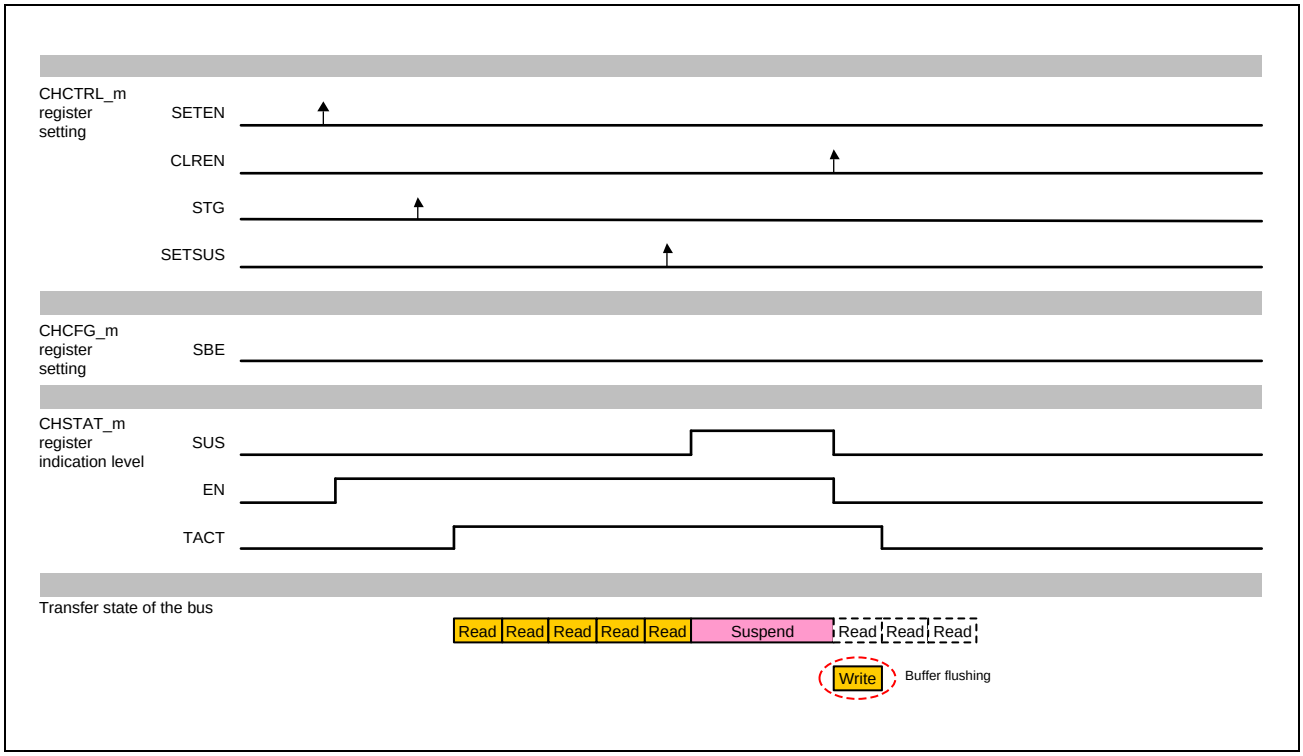

Figure 4.7-35 Aborting DMA Transfer (Buffer Flushing Mode)

- Complete stopping of the channel can be confirmed at the time the TACT bit is cleared.
- If the transfer is aborted during the fifth read transfer in flushing mode (SBE = 1b), the DMAC is stopped after writing the data that have been read.

(c) Checking stopping of the channel

Even if the EN bit is cleared to 0b, the DMAC cannot be stopped immediately if transfer has already been executed on the bus. Accordingly, to confirm that the DMAC has been stopped completely, check that both the EN and TACT bits are 0b.

(d) Procedure for aborting transfer

The following describes the procedure for stopping transfer.

1. Set SETSUS of CHCTRL_n.

2. Poll the SUS bit of CHSTAT_n until it becomes 1b (if EN is already 0b at this time, proceed to step 6 because the DMAC has been stopped).

3. Set CLREN of CHCTRL_n.

4. If SBE = 0b, the DMAC is stopped according to the value of REQD, and if SBE = 1b, the data are flushed. If the setting of SBE = 1b, set REQD = 0b beforehand.

5. Read CHSTAT_n to check that the TACT bit is 0b. TACT = 0b means that the DMAC has been stopped completely. If TACT = 1b, poll this bit until it becomes 0b.

6. To proceed with a next DMA transfer after aborting the transfer, be sure to set the SWRST (software reset) bit of CHCTRLn before the next transfer starts.

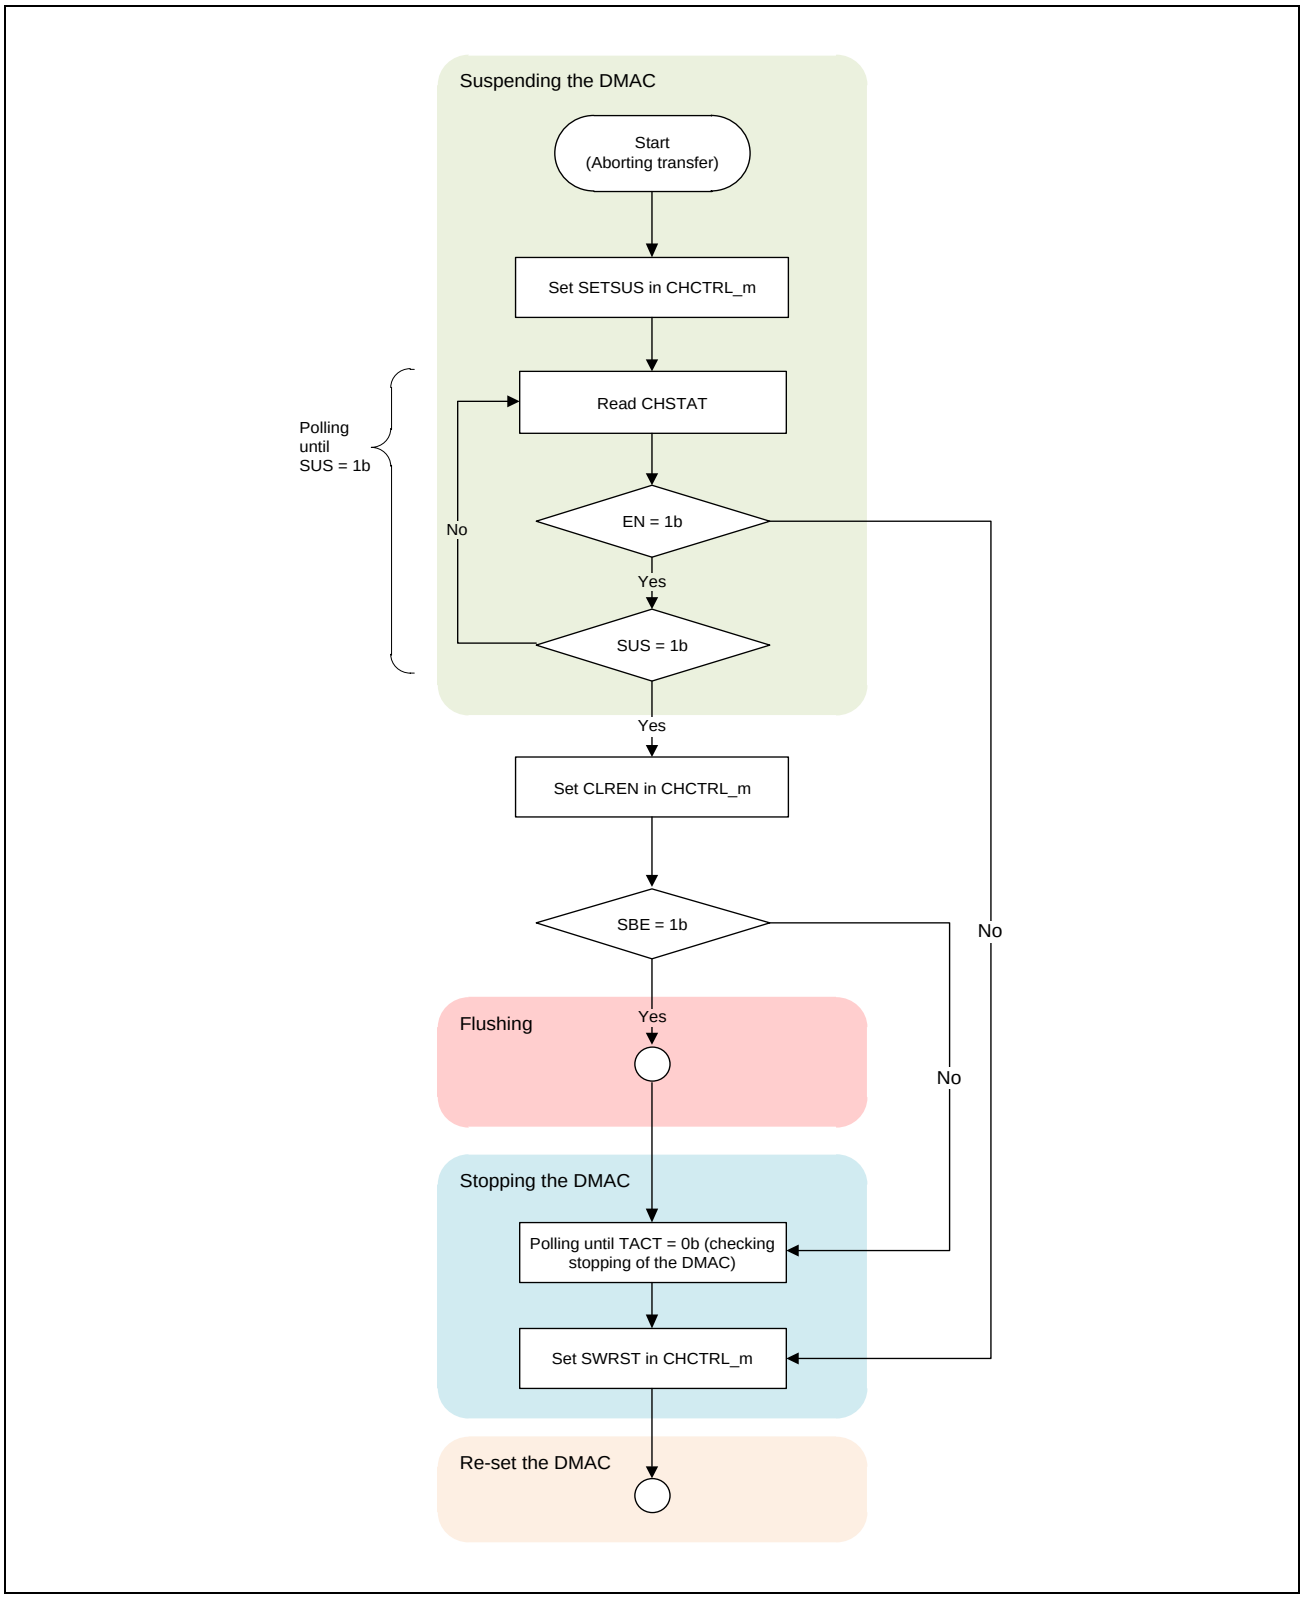

Figure 4.7-36 Flow of Aborting Transfer

4.7.6.3 AXI Address Conversion

Two bank switching address bits input by SYS are appended to the higher-order bits of the AXI master addresses to extend them to 34-bit master addresses, which makes a 16-GB address space accessible.

Since three bank switching addresses for the source, destination, and descriptor are input per DMAC number and channel number, the source, destination, and descriptor areas can be set in separate 4-GB address spaces.

Bank switching addresses are set by using the registers of the SYS unit.

The figure below shows an example of access to the 16-GB address space.

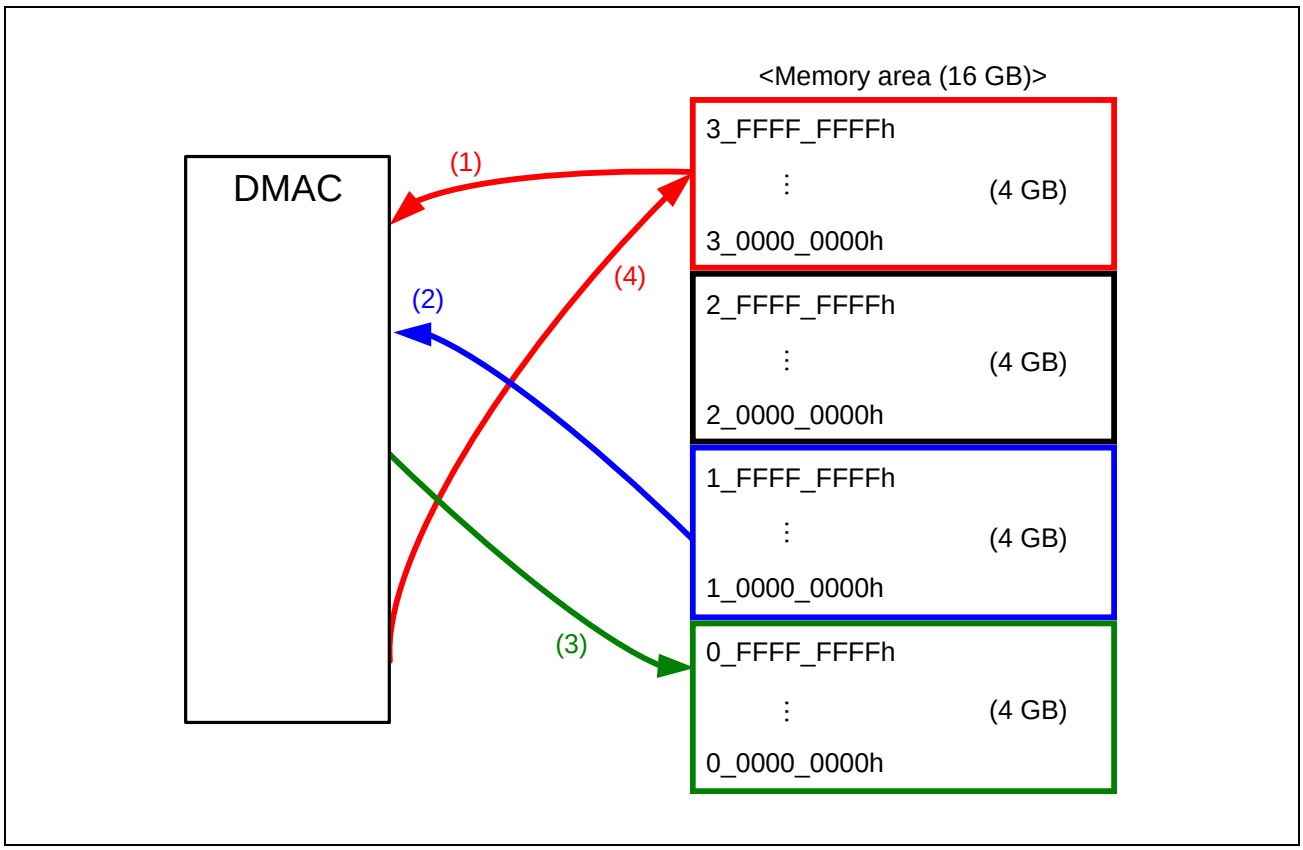

Figure 4.7-37 Example of Access to the 16-GB Address Space

(1) Descriptor read

- Access to a desired 4-GB address space is possible by setting the bank switching address (for the descriptor) for the corresponding DMAC number and channel.
- In the example of the above figure, the setting is 3.
- Setting is only required when link mode is in use.

(2) DMA transfer (source data read)

- Access to a desired 4-GB address space is possible by setting the bank switching address (for the source) for the corresponding DMAC number and channel.
- In the example of the above figure, the setting is 1.

(3) DMA transfer (destination data write)

- Access to a desired 4-GB address space is possible by setting the bank switching address (for the destination) for the corresponding DMAC number and channel.
- In the example of the above figure, the setting is 0.

(4) Descriptor write-back

- The same area as that in step 1.

4.7.6.3.1 Prohibited items

This function has the following prohibited items.

- Changing a bank switching address value for a DMAC number and channel that is currently operating is prohibited.
- Usage that spans the 4-GB boundaries is prohibited.

4.7.7 Operating Procedure

For the individual setting procedures, see the following. The following gives supplementary information.

4.7.7.1 Example DMAC Settings

This section describes example settings when DMA transfer is to proceed with the use of the DMAC unit.

The conditions for transfer with the individual example settings are listed below.

Table 4.7-26 List of the Conditions for Transfer with Example DMA Transfer Settings

	DMA Mode	Transfer Mode	Transfer Request
Example setting 1	Register	Single	Hardware
Example setting 2	Register	Block	Software
Example setting 3	Register (continuous execution)	Block	Software
Example setting 4	Link	Block	Software

For details of the settings, see the individual example settings.

4.7.7.1.1 Example setting 1 (hardware request in register mode)

The table below lists the settings when DMA transfer is to proceed with example setting 1.

Table 4.7-27 Example Setting 1 for DMA Transfer

Item		Description	
Channel to be used		3	
DMA mode		Register	
Transfer mode		Single transfer	
Register set to be used		Next0	
Transfer source/destination		Transfer source	Transfer destination
	Start address	1111_0000h	2222_0000h
	Address direction	Incremental	Incremental
	Transfer size	32 bits	32 bits
Number of bytes for DMA transfer		64 bytes	
DMAREQ/ACK/TCO		Select DMAREQ[3], DMAACK[3], and DMATCO[3].	
DMA transfer request		Rising-edge detection by hardware (the DMAREQ[3] pin)	
DMAACK signal		Pulse output at the time of reading	
DMAEND masking		No	
AXI setting (PROT, CACHE)		Initial value	

Example setting 1

N0SA = 1111_0000h (Transfer source address)

N0DA = 2222_0000h (Transfer destination address)

N0TB = 0000_0040h (Number of transfer bytes)

CHCFG = 0002_2023h (Configuration)

CHITVL = 0000_0000h (Interval)

CHEXT = 0000_0000h (AXI setting)

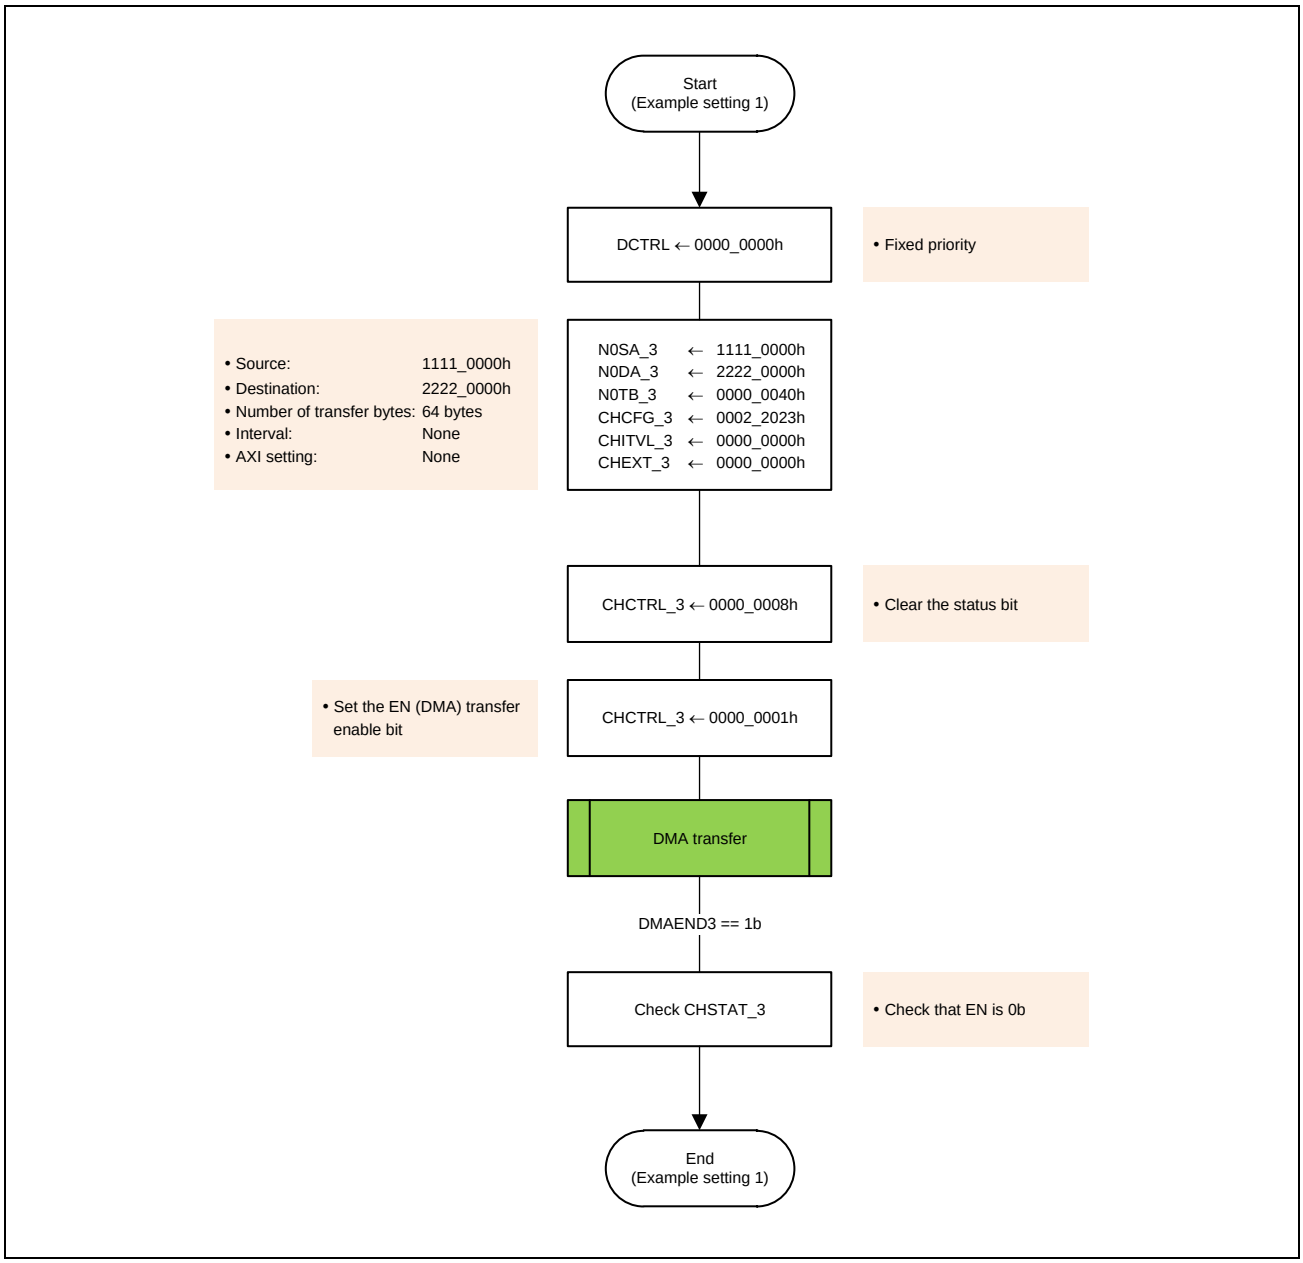

Figure 4.7-38 Example Setting 1

4.7.7.1.2 Example setting 2 (software request in register mode)

The table below lists the settings when DMA transfer is to proceed with example setting 2.

Table 4.7-28 Example Setting 2 for DMA Transfer

Item		Description	
Channel to be used		2	
Priority control		Round-robin	
DMA mode		Register	
Transfer mode		Block transfer	
Register set to be used		Next1	
Transfer source/destination		Transfer source	Transfer destination
	Start address	0FFF_E000h	3333_0000h
	Address direction	Incremental	Incremental
	Transfer size	8 bits	256 bits
Number of bytes for DMA transfer		128 bytes	
DMAREQ/ACK/TCO		Select DMAREQ[7], DMAACK[7], and DMATCO[7].	
DMA transfer request		Software request	
DMAACK signal		Masking	
DMAEND masking		No	
AXI setting (PROT, CACHE)		Initial value	

Example setting 2

DCTRL = 0000_0001h (DMAC setting)

N1SA = 0FFF_E000h (Transfer source address)

N1DA = 3333_0000h (Transfer destination address)

N1TB = 0000_0080h (Number of transfer bytes)

CHCFG = 1045_0407h (Configuration)

CHITVL = 0000_0000h (Interval)

CHEXT = 0000_0000h (AXI setting)

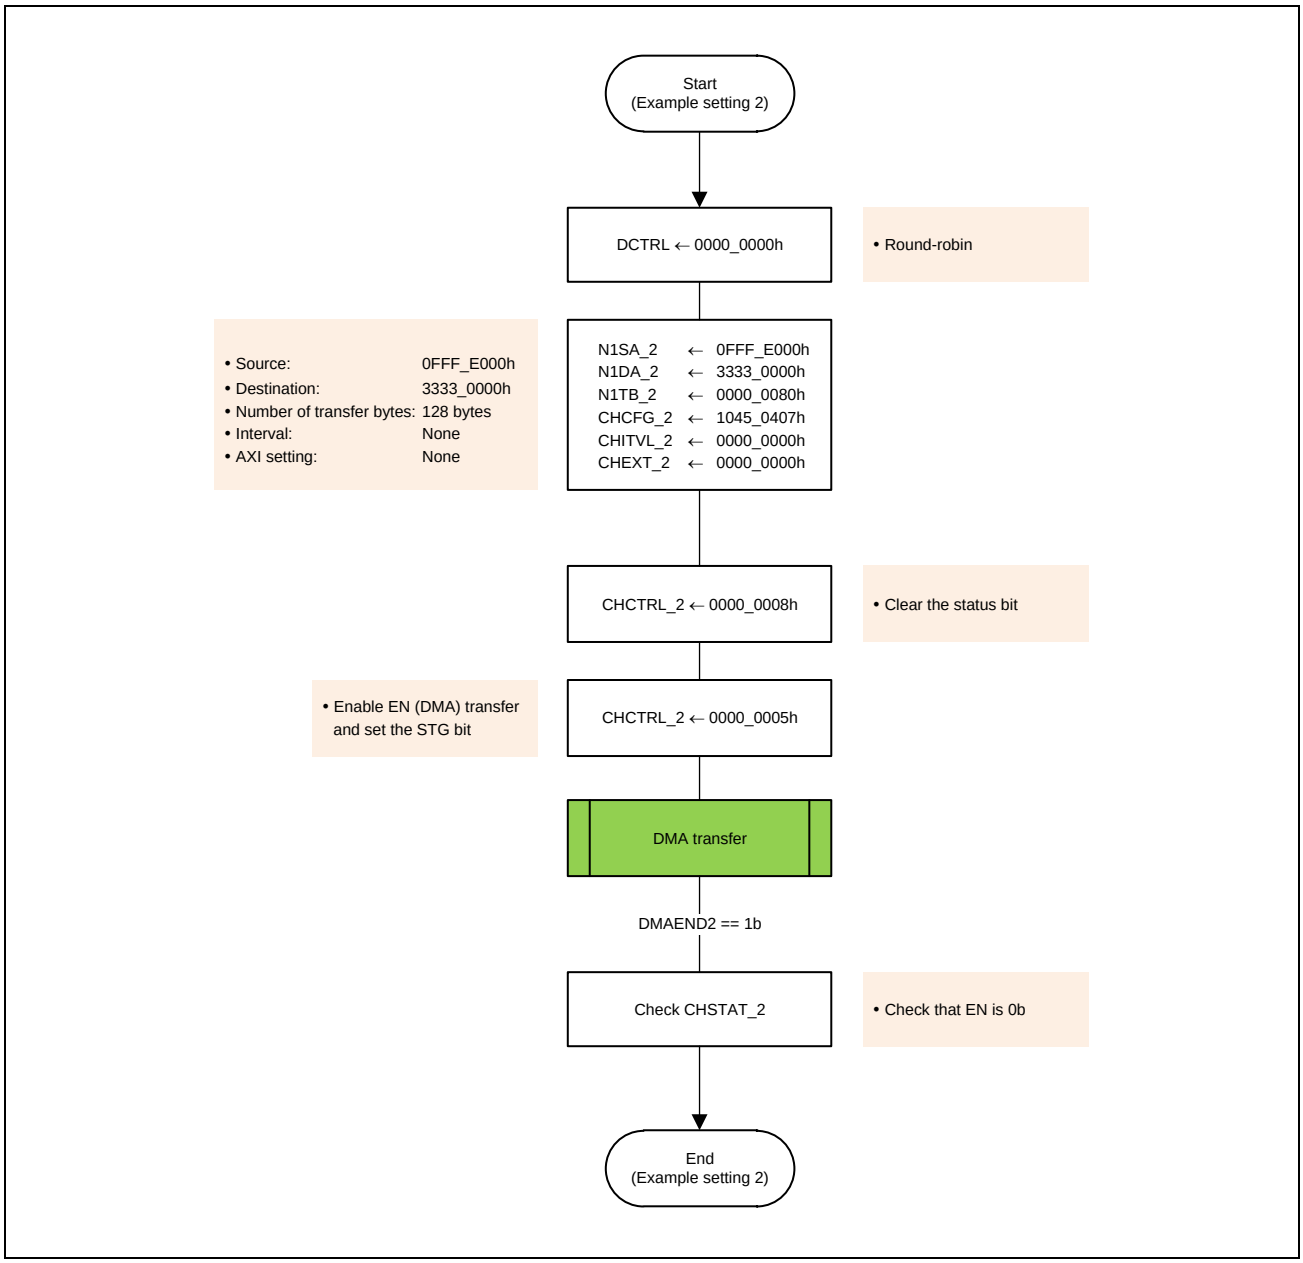

Figure 4.7-39 Example Setting 2

4.7.7.1.3 Example setting 3 (continuous execution in register mode)

The table below lists the settings when DMA transfer is to proceed with example setting 3.

Table 4.7-29 Example Setting 3 for DMA Transfer

Item		Description	
Channel to be used		1	
Priority control		Round-robin	
DMA mode		Register	
Transfer mode		Block transfer	
Register set to be used		Continuous from Next0 to Next1	
Next0		Transfer source	Transfer destination
	Start address	1111_0000h	3333_0000h
	Address direction	Fixed	Fixed
	Transfer size	32 bits	512 bits
	Number of bytes for DMA transfer	512 bytes	
Next1		Transfer source	Transfer destination
	Start address	2222_0000h	4444_0000h
	Address direction	Fixed	Fixed
	Transfer size	32 bits	512 bits
	Number of bytes for DMA transfer	2048 bytes	
DMAREQ/ACK/TCO		Select DMAREQ[7], DMAACK[7], and DMATCO[7].	
DMA transfer request		Software request	
DMAACK signal		Not output	
DMAEND masking		Masking DMAEND on completion of Next0	
AXI setting (PROT, CACHE)		Initial value	

Example setting 3

DCTRL = 0000_0001h (DMAC setting)

N0SA = 1111_0000h (Transfer source address)

N0DA = 3333_0000h (Transfer destination address)

N0TB = 0000_0200h (Number of transfer bytes)

N1SA = 2222_0000h (Transfer source address)

N1DA = 4444_0000h (Transfer destination address)

N1TB = 0000_0800h (Number of transfer bytes)

CHCFG = 6176_2007h (Configuration)

CHITVL = 0000_0000h (Interval)

CHEXT = 0000_0000h (AXI setting)

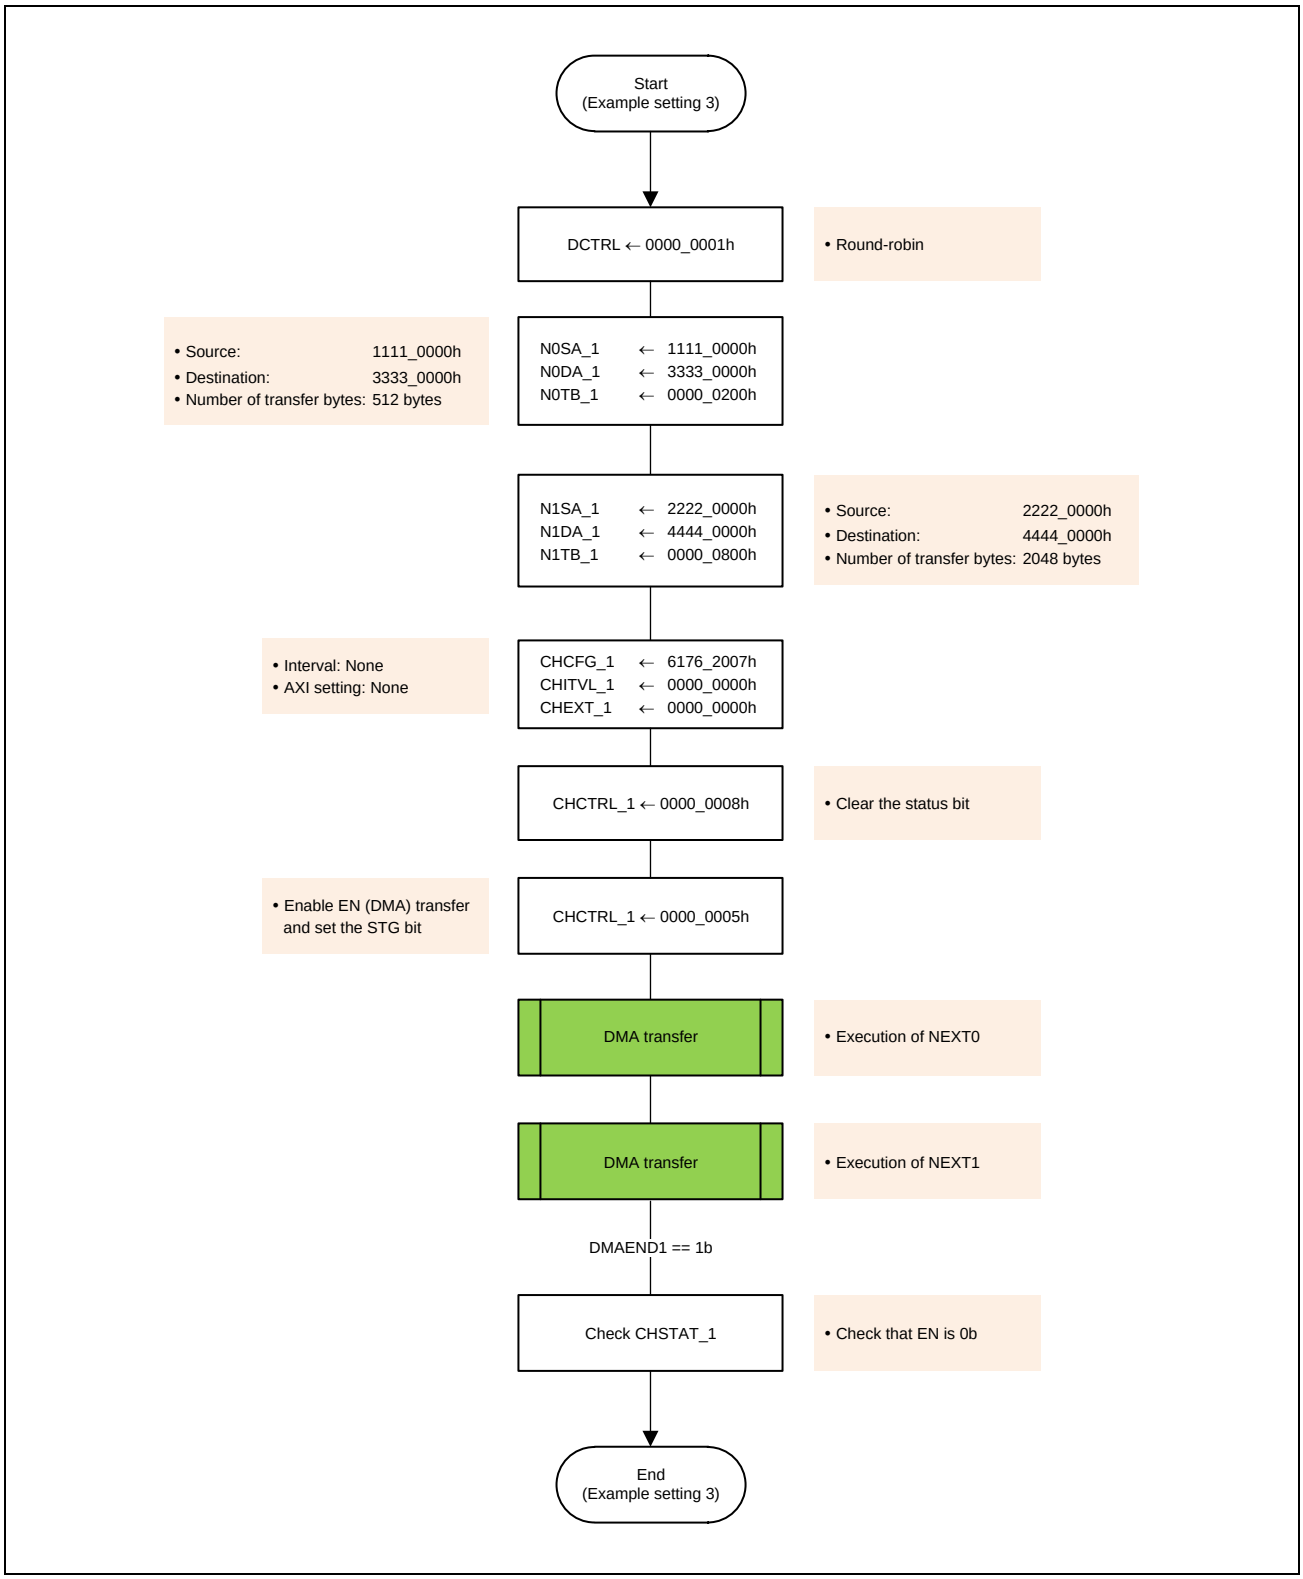

Figure 4.7-40 Example Setting 3

4.7.7.1.4 Example setting 4 (link mode)

The table below lists the settings when DMA transfer is to proceed with example setting 4.

Table 4.7-30 Example Setting 4 for DMA Transfer

Item	Description
Channel to be used	0
Priority control	Round-robin
DMA mode	Link
Transfer mode	Block transfer
Register set to be used	—
Descriptor start address	0000_1000h

Table 4.7-31 Example Setting 4 for DMA Transfer (Descriptor 1)

Item		Description	
Descriptor start address		0000_1000h	
Next descriptor start address		0000_2000h	
Transfer mode		Block transfer	
Next0		Transfer source	Transfer destination
	Start address	1111_0000h	3333_0000h
	Address direction	Incremental	Incremental
	Transfer size	32 bits	32 bits
	Number of bytes for DMA transfer	2048 bytes	
DMAREQ/ACK/TCO		Select DMAREQ[0], DMAACK[0], and DMATCO[0].

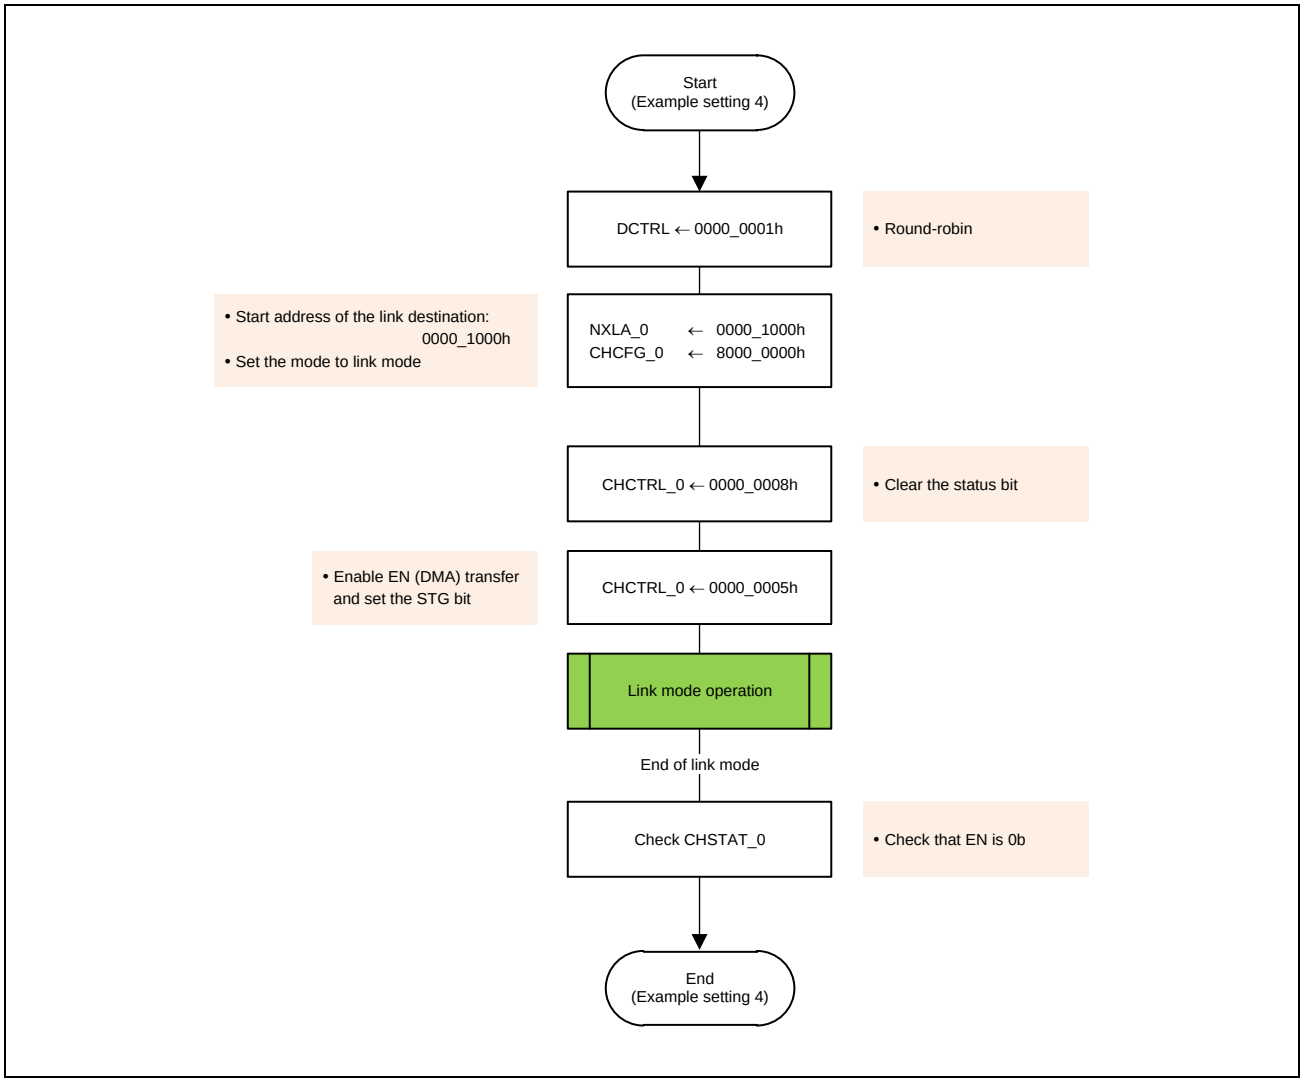

Figure 4.7-41 Example Setting 4

4.7.7.1.5 Setting for next register continuous execution

The figure below is a flowchart when DMA transfer continues with the use of two Next register sets in register mode. While the DMA transaction of one Next register is in progress, the other Next register is set to continue with DMA transfer.

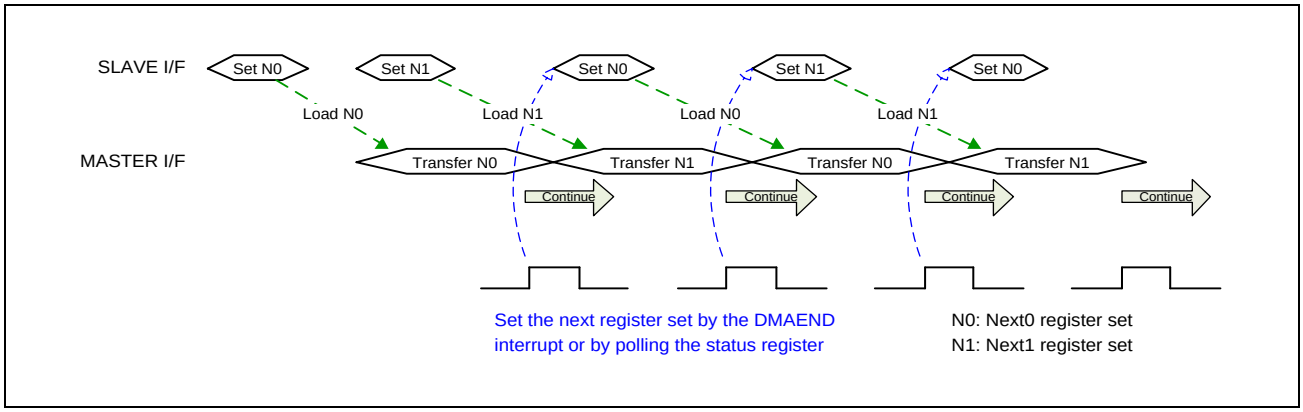

Figure 4.7-42 Schematic View of Next Register Continuous Execution

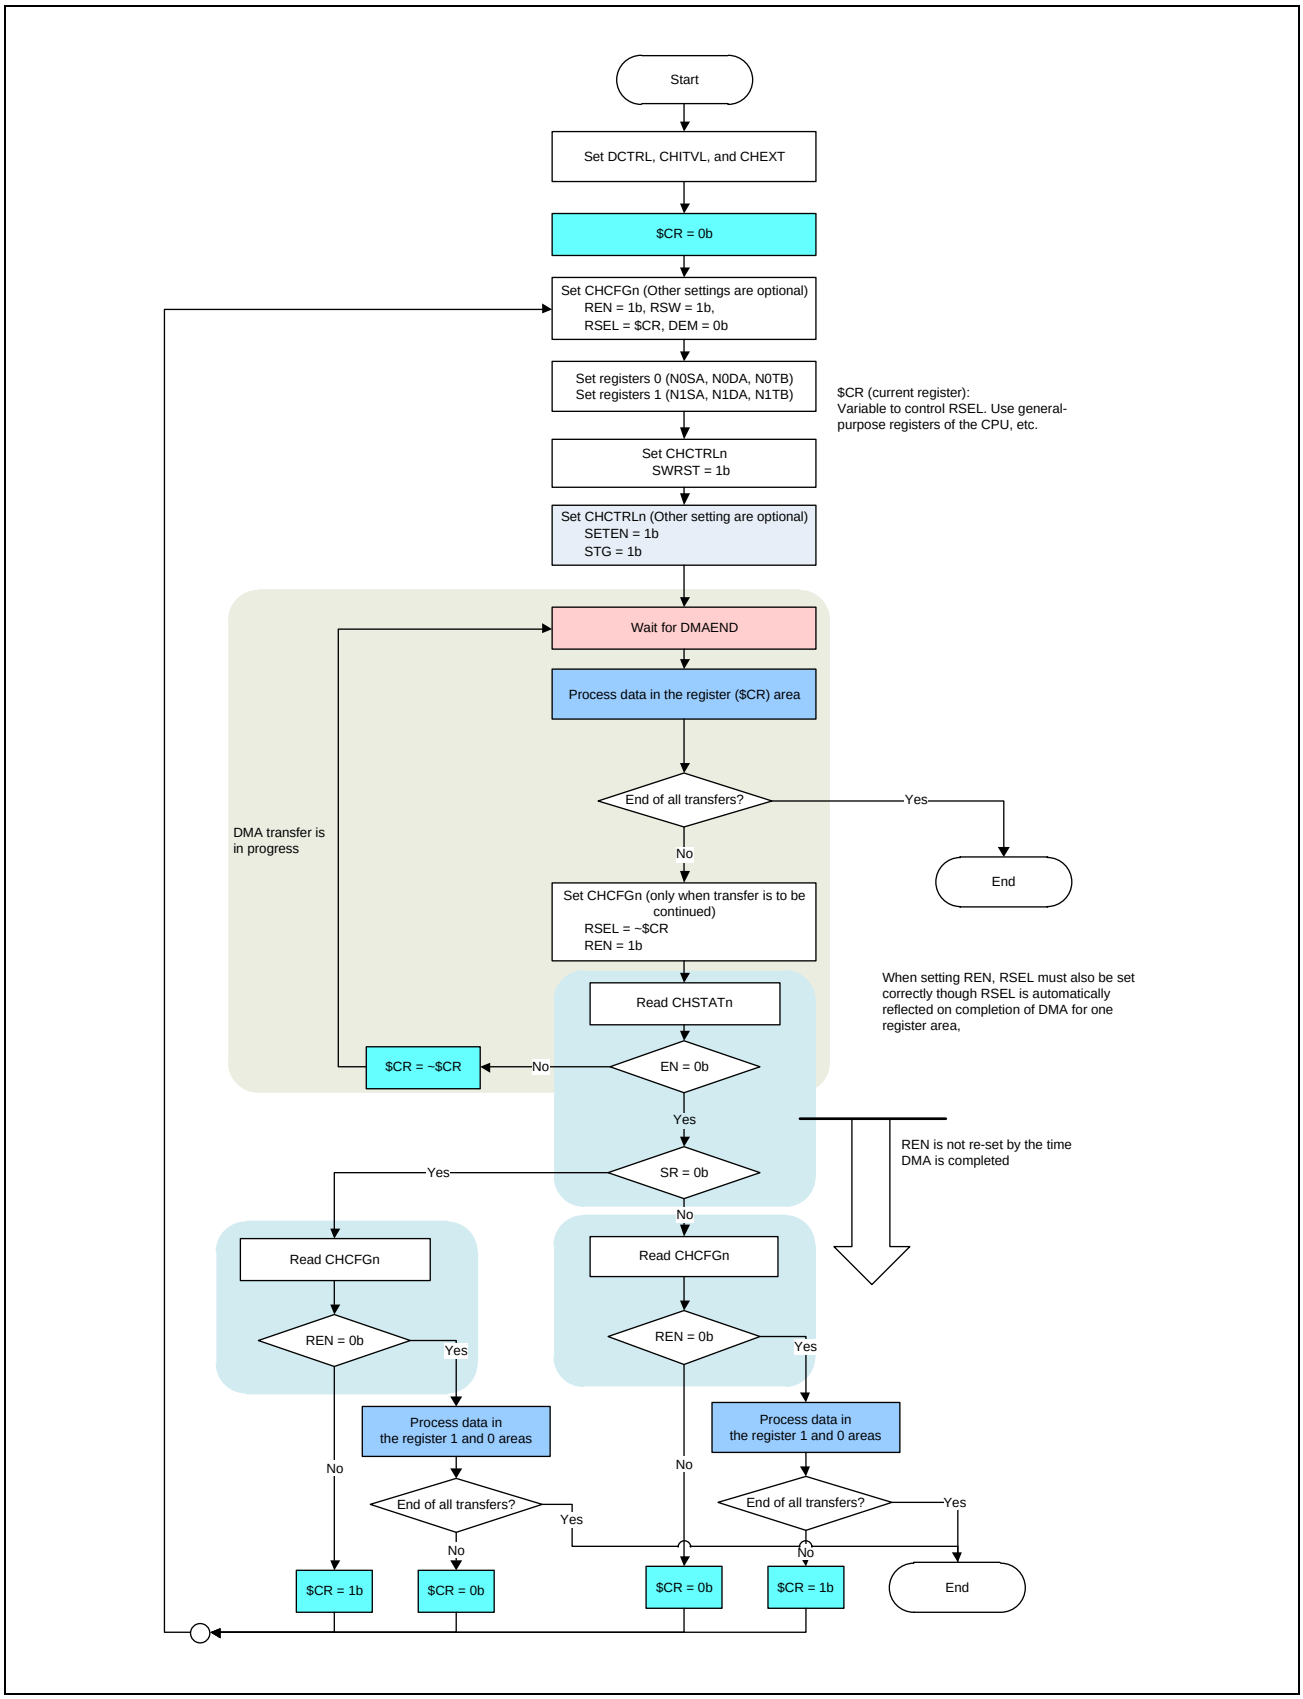

Figure 4.7-43 Example Setting 5

Supplementary Information

Store the first register sets (0 (N0SA, N0DA, N0TB) , 1 (N1SA, N1DA, N1TB)) to be transferred in general-purpose registers of the CPU (this register value called $CR for convenience).

Every time DMA transfer of one register set is completed (DMAEND is asserted), REN is automatically cleared to 0b. To continue transfer, REN of the CHCFG_n register must be set every time DMAEND is asserted. The same register also has the setting bit of RSEL, so this value must also be set correctly. To do this, use $CR.

In this mode, two Next registers are executed consecutively. However, if CLREN is not set by the time the DMA transaction is completed (next DMAEND is asserted), continuous execution stops. In such cases, check how far the transfer has proceeded by reading the SR and EN bits of the CHSTATn register and REN of the CHCFG_n register. To resume the transfer, follow the procedure in the above flowchart.

4.7.8 Points for Caution

4.7.8.1 DMA Transfer Requests by External Devices

When connecting the DREQ and DACK pins to external devices and requesting DMA transfers, use the ACK and REQ signals as level outputs.

4.7.8.2 Problem of the Interrupt Signal Overtaking DMA Transfer

4.7.8.2.1 Overview

This unit asserts the DMAINT interrupt signal on completion of transfer and this serves as a trigger for the CPU to start processing the data.

However, in cases such as where the device for writing is on another bus, the final data to be written may not yet have reached the device for writing at the time the DMAINT interrupt signal is asserted.

If the CPU accesses a device that has detected the DMAINT interrupt signal before the final data of the DMA transaction have been written to the device, it may be using some old data from before the writing.

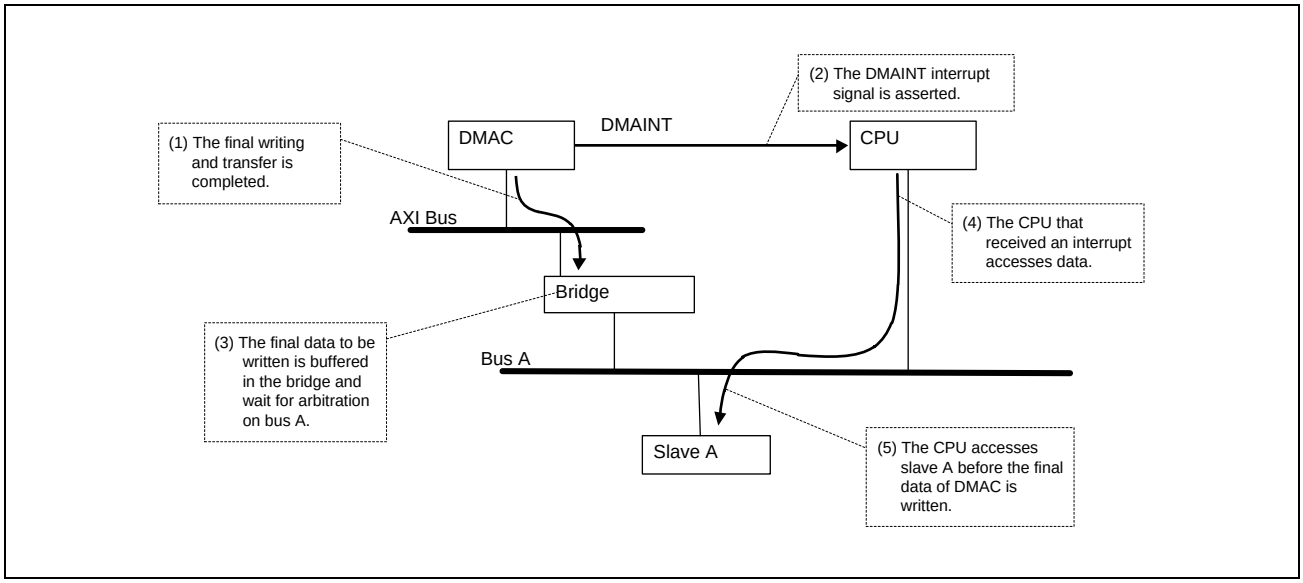

Figure 4.7-44 Example when Access by the CPU Overtakes Writing of the Final Data by the DMAC

4.7.8.2.2 Workarounds

The following describes workarounds for the above problems.

Setting AWCACHE as non-bufferable

Set the AWCACHE signal as non-bufferable for DMA transactions. By doing this, the above problems can be avoided because the DMAINT interrupt signal will only be asserted after the completion of writing to the device for access.

Setting all transfers to non-bufferable may reduce the efficiency of transfer. In such cases, divide up the register sets or descriptors by setting most of the transactions to bufferable for transfer, and then set only the last transfer to non-bufferable.

Exception)

The effect is not obtained if the device in the access path does not refer to AWCACHE.

SECTION 4 SYSTEM

4.8 Trusted Secure IP

This LSI incorporates a Trusted Secure IP module to provide security functions. The module consists of an access management circuit, encryption engine, and random number generator. In combination with the Trusted Secure IP driver, the Trusted Secure IP can prevent eavesdropping (confidentiality), falsification of information (integrity), and impersonation (authenticity).

Key information to be used in encrypting and decrypting data is only stored within the Trusted Secure IP, and any external access can be shut out to obtain a system with strong security.

4.8.1 Overview

Table 4.8-1 summarizes the specifications of the Trusted Secure IP. **Figure 4.8-1** shows a block diagram of the Trusted Secure IP.

Table 4.8-1 Specifications of Trusted Secure IP (1/2)

Item	Description
Access control	Access management circuit • In case of irregular access to the Trusted Secure IP due to a falsified program or runaway execution of a program, this circuit blocks all subsequent access and stops the output of data from the Trusted Secure IP.
Encryption engine	AES: Compliant with NIST FIPS PUB 197 algorithm • Key sizes: 128, 192, or 256 bits • Block sizes: 128 bits • Block cipher mode of operation – ECB, CBC, CTR: Compliant with NIST SP 800-38A – CMAC: Compliant with NIST SP 800-38B – CCM: Compliant with NIST SP 800-38C – GCM: Compliant with NIST SP 800-38D – XTS: Compliant with NIST SP 800-38E – GCTR AES-GCM is realized by combining AES-GCTR and GHASH.
Encryption engine	RSA • Key sizes: Up to 4096 bits • Block sizes: Up to 4096 bits HASH • Support for SHA1, SHA224/SHA256, GHASH • Block sizes: 512 bits ECC • Compatible with ECDSA and ECDH • Data block length: 256 bits

Table 4.8-1 Specifications of Trusted Secure IP (2/2)

Item	Description
Encryption engine	Key management • Keys are only valid within the Trusted Secure IP. • Only key generation information is output from the Trusted Secure IP. • Keys can be regenerated by the input of key generation information to the Trusted Secure IP. Endian • Big or little
Generation of random numbers	32-bit true random number generator • The Trusted Secure IP driver can assemble 32-bit true random numbers to generate 128- or 256-bit true random numbers. • The generated 128-bit and 256-bit true random numbers are used as keys in encrypting and decrypting data.
Unique ID	• An ID unique to the LSI (unique ID) is accessible from the access management circuit through the dedicated bus. • Combining the unique ID with the key generation information prevents the illicit copying of data to another LSI.
Interrupt sources	10
Low power consumption	Setting of the module stop state is possible.

Note 1. This does not include the overhead for calling functions of the Trusted Secure IP driver.

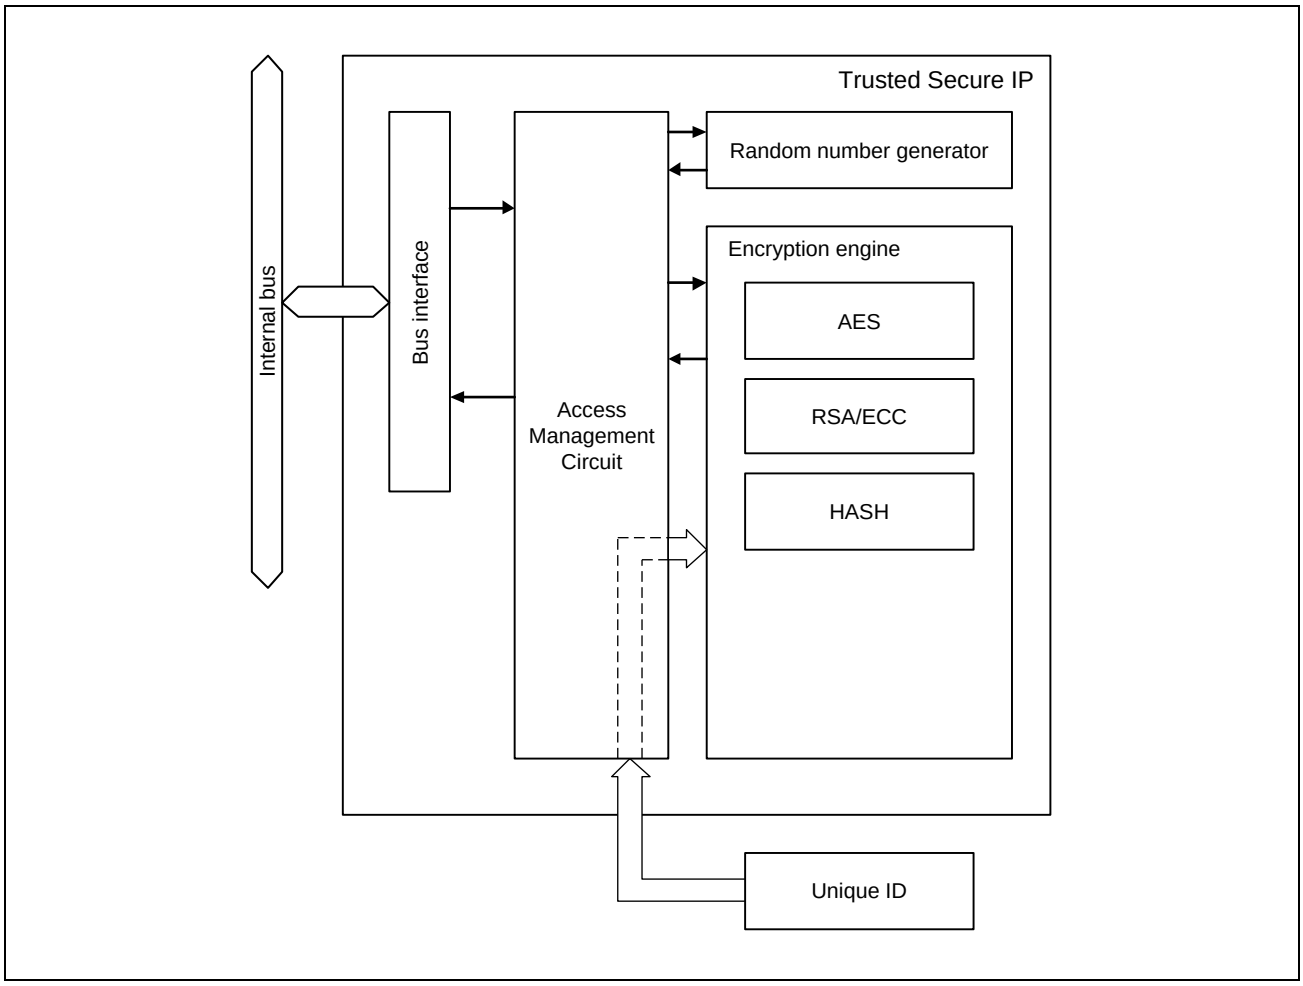

Figure 4.8-1 Trusted Secure IP Block Diagram

4.8.2 Operation

4.8.2.1 Operating Modes and State Transitions

Figure 4.8-2 shows the state transitions of the Trusted Secure IP.

Use of the Trusted Secure IP security functions is only possible through use of the Trusted Secure IP driver provided by Renesas Electronics, in accordance with the state transitions as shown in the figure below.

When irregular access to the Trusted Secure IP (access that violates the defined procedure) due to a falsified program or a program entering runaway execution, etc. is attempted, the access management circuit does not accept any subsequent access and stops the output of any data from the Trusted Secure IP.

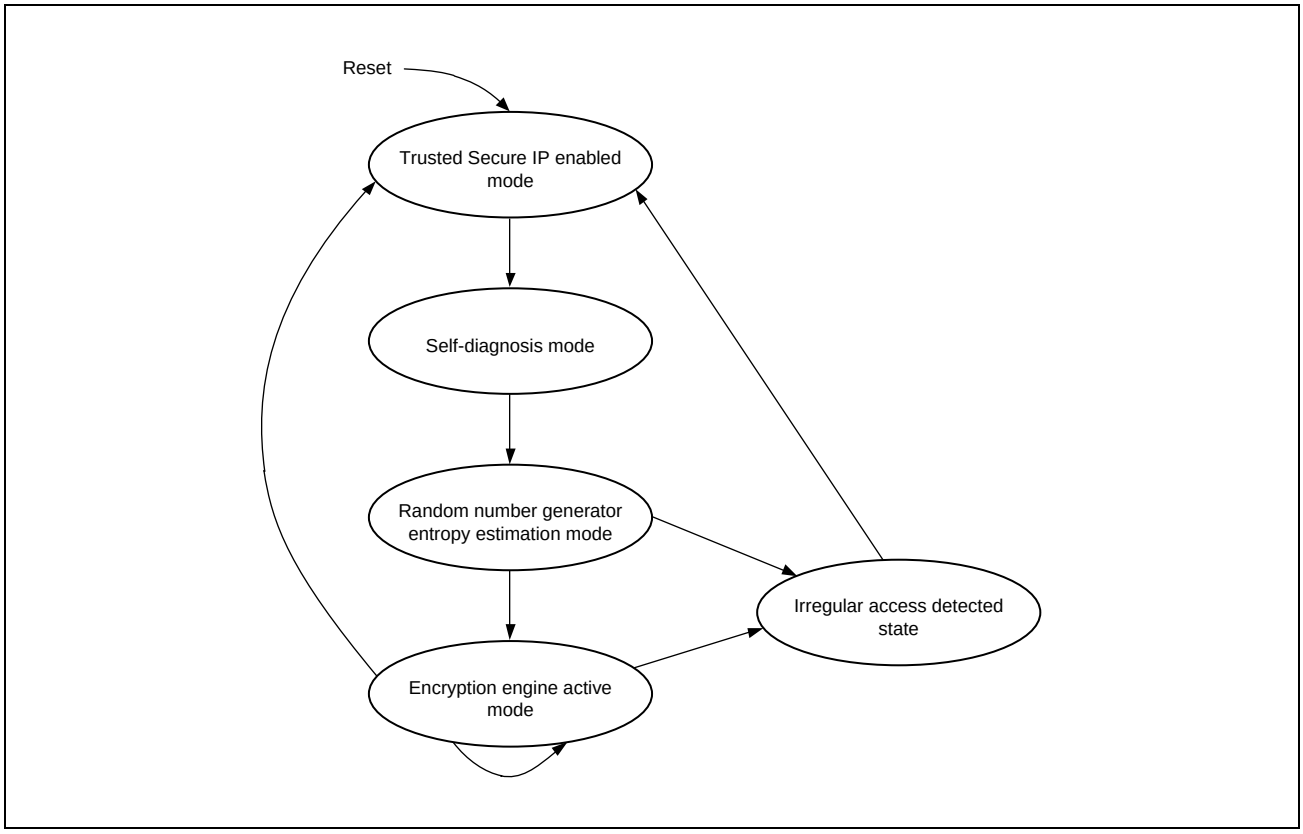

Figure 4.8-2 Trusted Secure IP Operating Modes and State Transitions

Many of the security functions that the Trusted Secure IP offers are applicable only in the encryption engine active mode. The operations that can be performed in this mode are given below.

(1) Key installation

(2) Encryption and decryption

(3) Key generation

(4) Random number generation

4.8.2.2 Encryption Engine

Figure 4.8-3 shows processing by the encryption engine integrated in the Trusted Secure IP.

The encryption engine performs plaintext-to-ciphertext encryption and ciphertext-to-plaintext decryption using the key generation information by hardware.

In any part of encryption and decryption processing, key and intermediate data are never exposed outside the Trusted Secure IP.

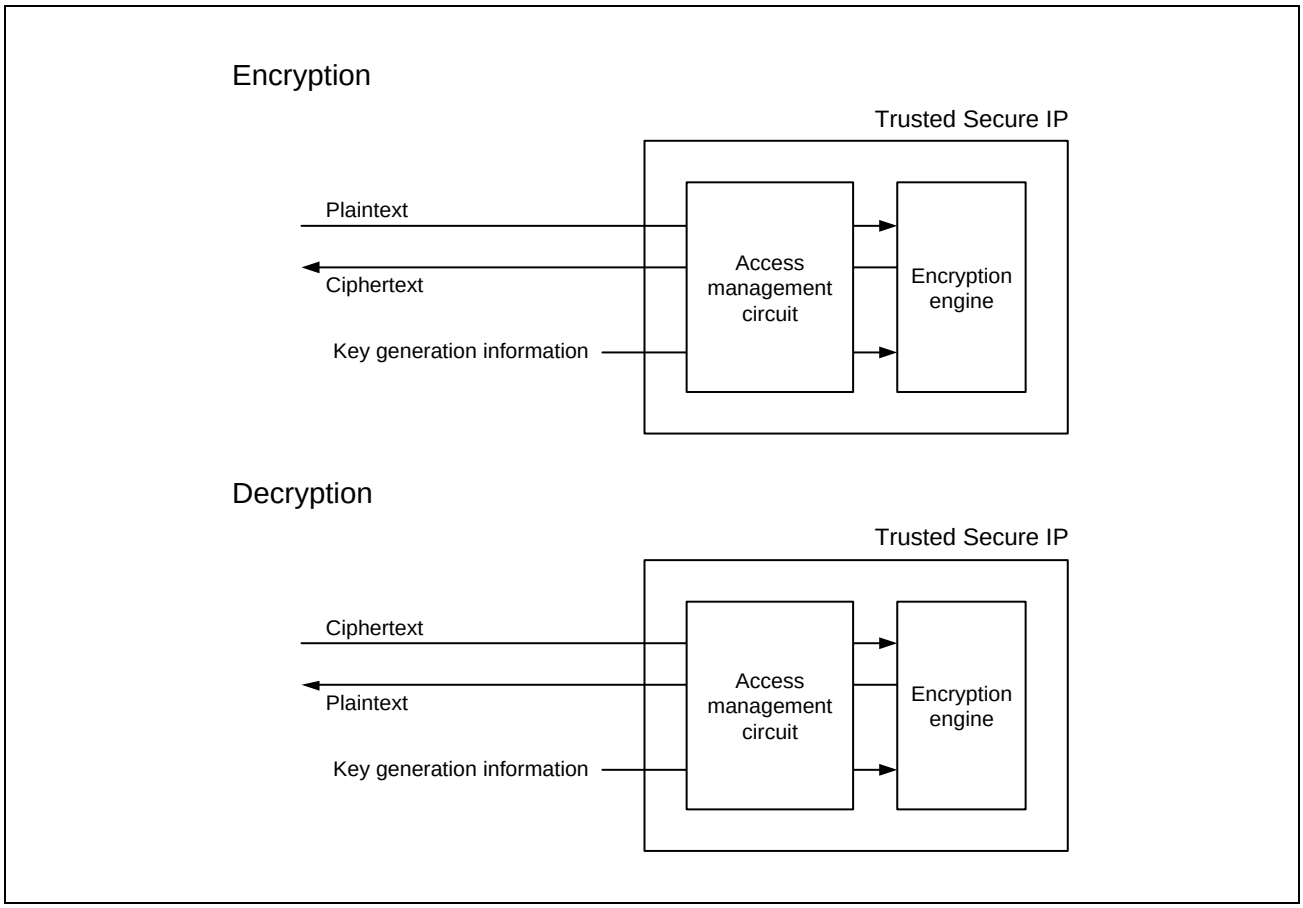

Figure 4.8-3 Encryption and Decryption Processing by Encryption Engine

4.8.2.3 Key Installation

The key installation is the operation that safely converts the user key to the key generation information and stores it in flash memory. The procedure for installing the key data are given below.

(1) The user uses the key (Key-2) used for encrypting the user key to encrypt the user key (Key-1) producing eKey-1.

(2) The user sends the encrypted user key (eKey-1) to the Trusted Secure IP.

(3) The key generation information of the Key-2 (Index-2) contained in the Trusted Secure IP driver is used to recover the Key-2, which is then used to decrypt the user key.

(4) The user key is converted to user key generation information (Index-1) using the unique ID and a random number, and stored in flash memory.

The installation process and flow chart are given in **Figure 4.8-4** and **Figure 4.8-5**, respectively.

Once the key data is installed, the user key generation information (Index-1) can then be used to perform encryption or decryption.

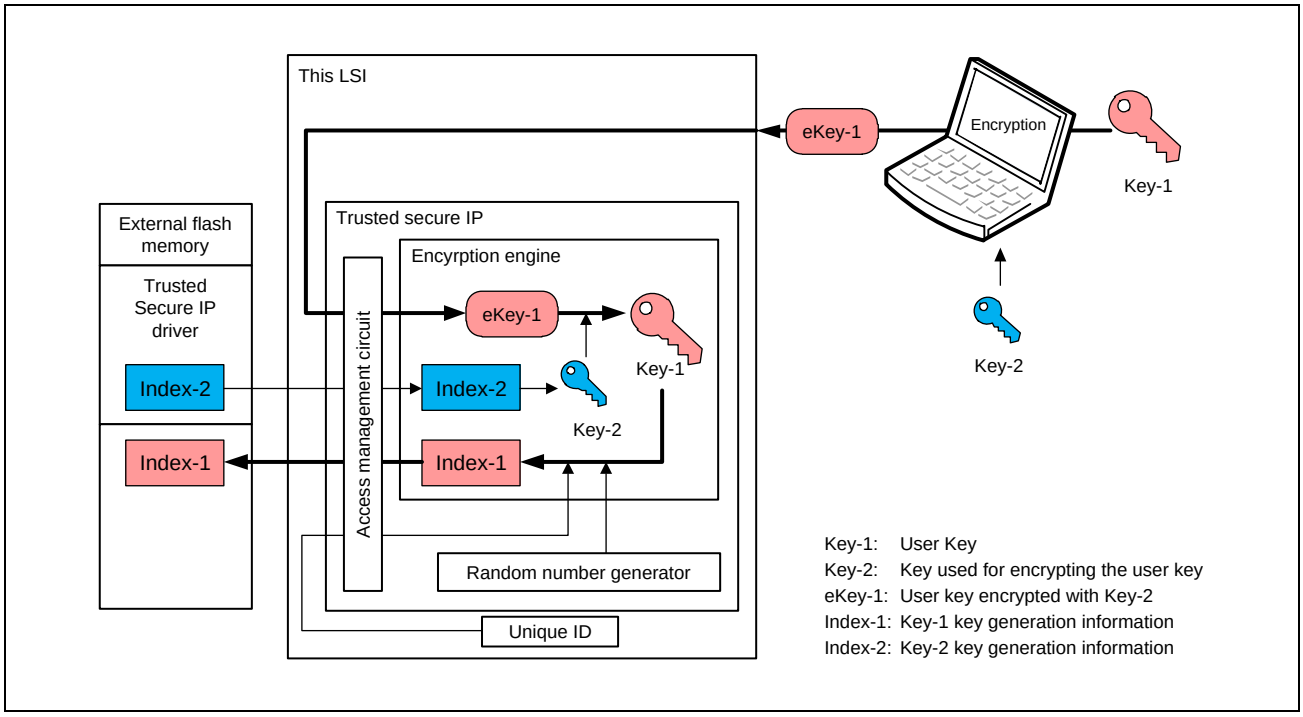

Figure 4.8-4 Key Installation Process

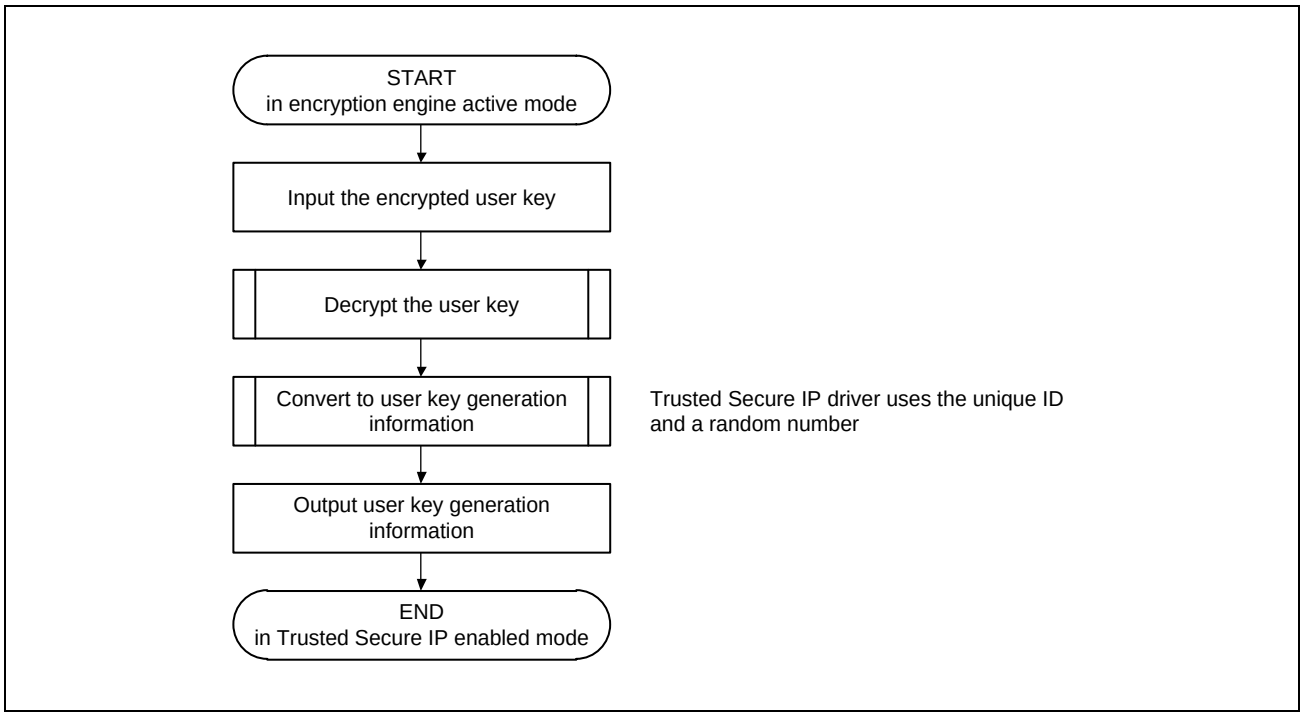

Figure 4.8-5 Key Installation Flow Chart

4.8.2.4 Encryption and Decryption

The procedures for encrypting and decrypting data are given below.

(1) Input the key generation information into the Trusted Secure IP, and recover the key data.

(2) Input the data to encrypt or decrypt into the Trusted Secure IP. This converts plaintext into ciphertext, and ciphertext into plaintext.

(3) Read the converted data.

The encryption engine has an input buffer and an output buffer, enabling encryption/decryption to proceed in parallel with data input/output.

Figure 4.8-6, **Figure 4.8-7**, and **Figure 4.8-8** show the timing diagram, encryption flow, and decryption flow, respectively.

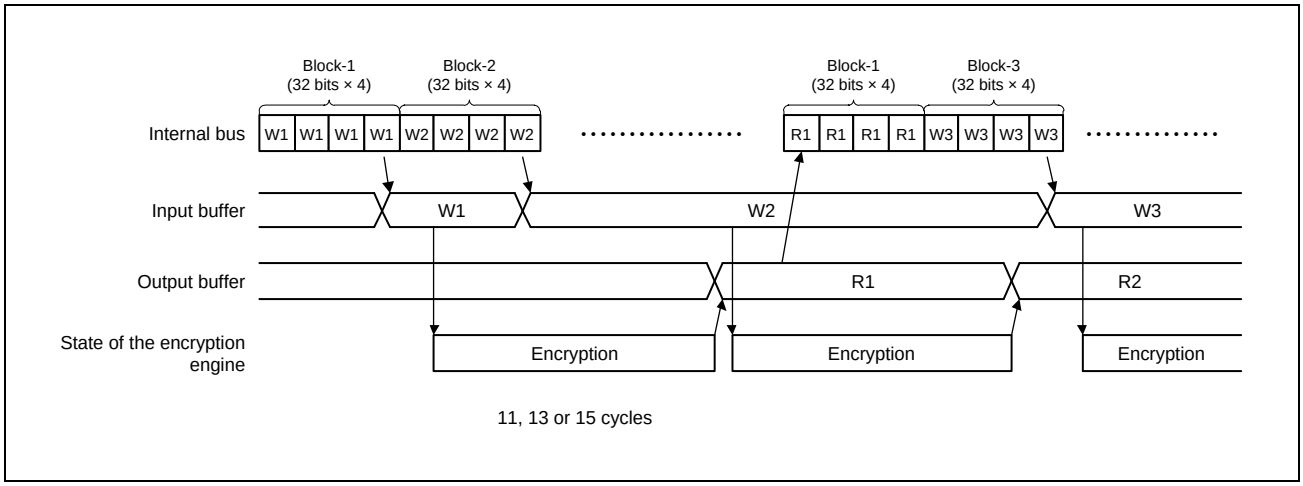

Figure 4.8-6 Encryption and Decryption Timing Diagram

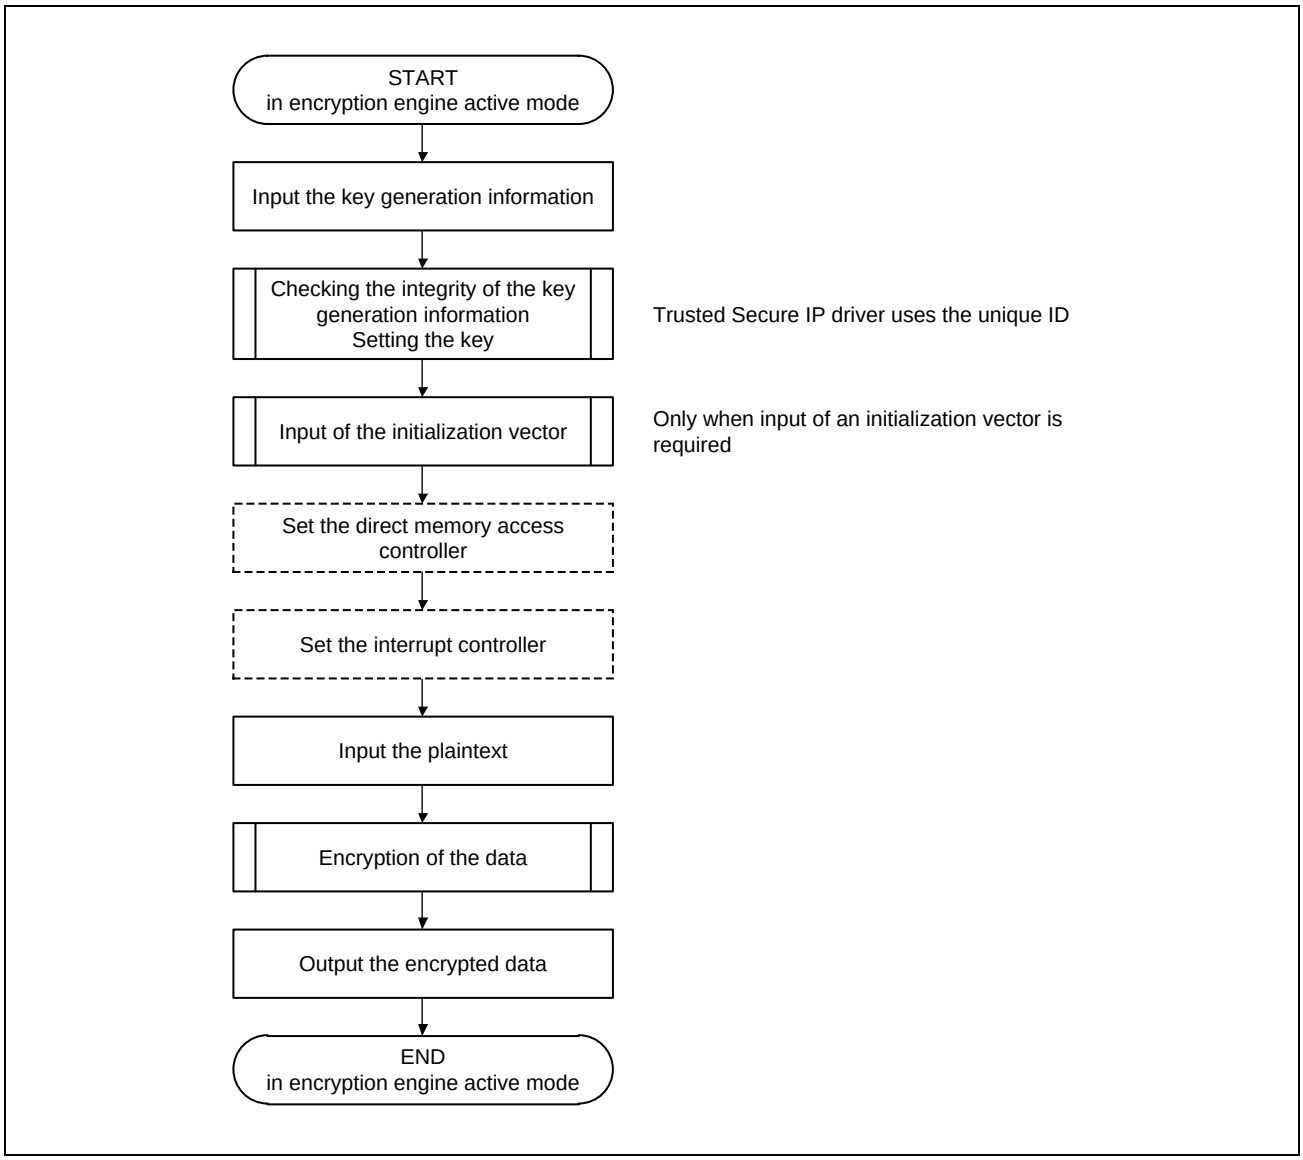

Figure 4.8-7 Encryption Flow Chart

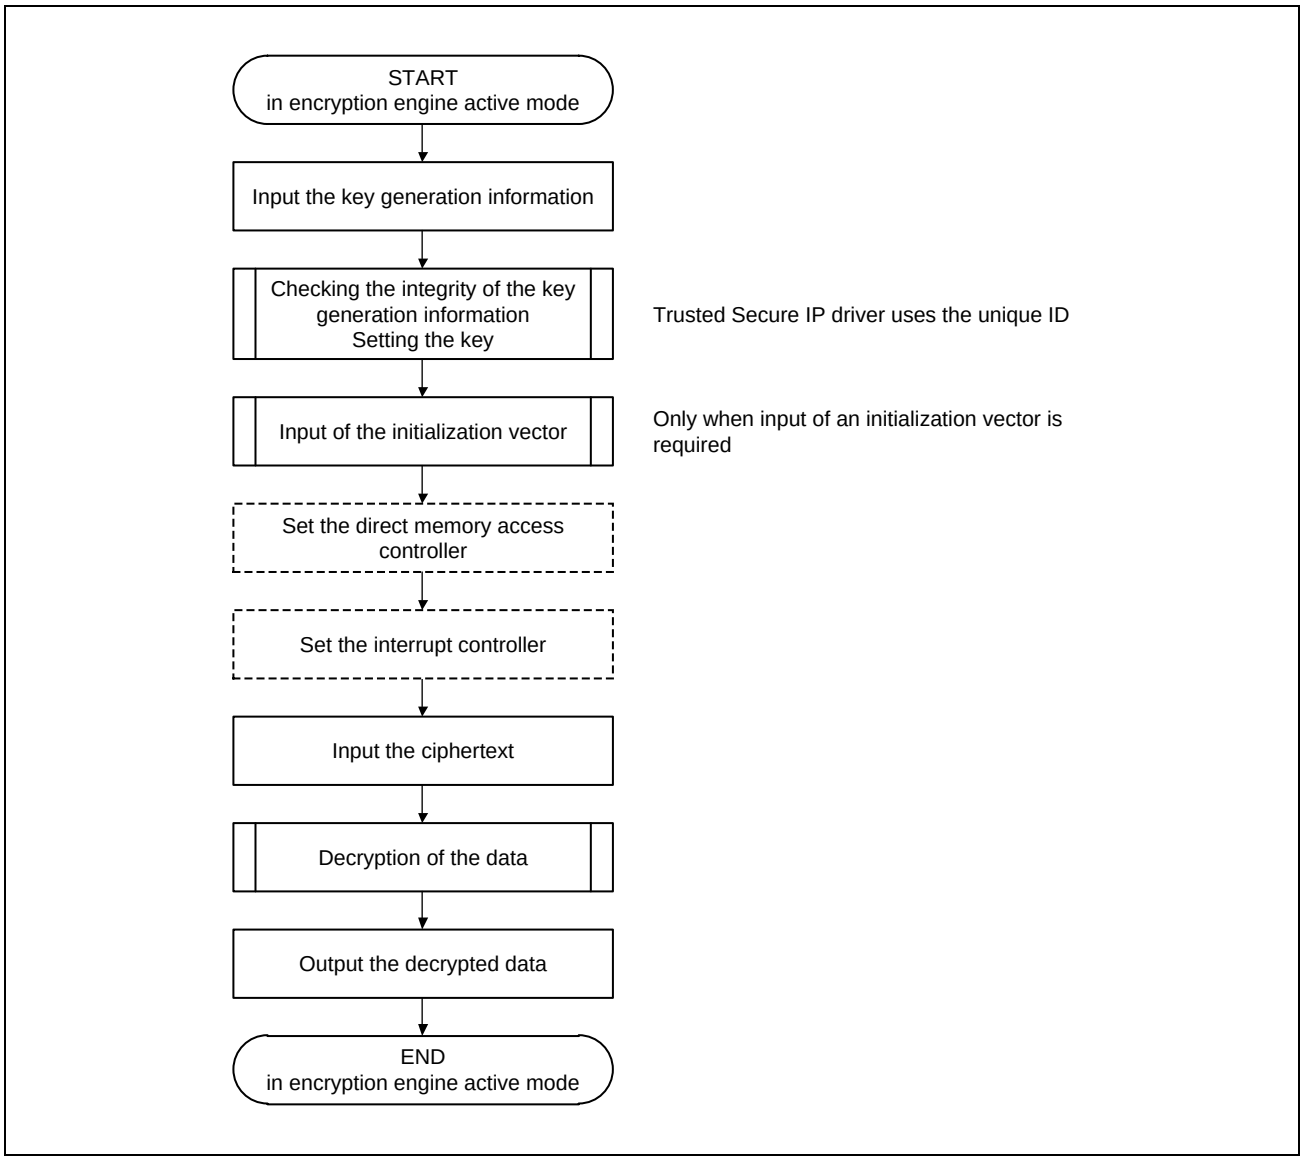

Figure 4.8-8 Decryption Flow Chart

4.8.2.5 Generating Key Generation Information (by Using Random Numbers)

Figure 4.8-9 shows the generating flow for the key generation information by using random numbers.

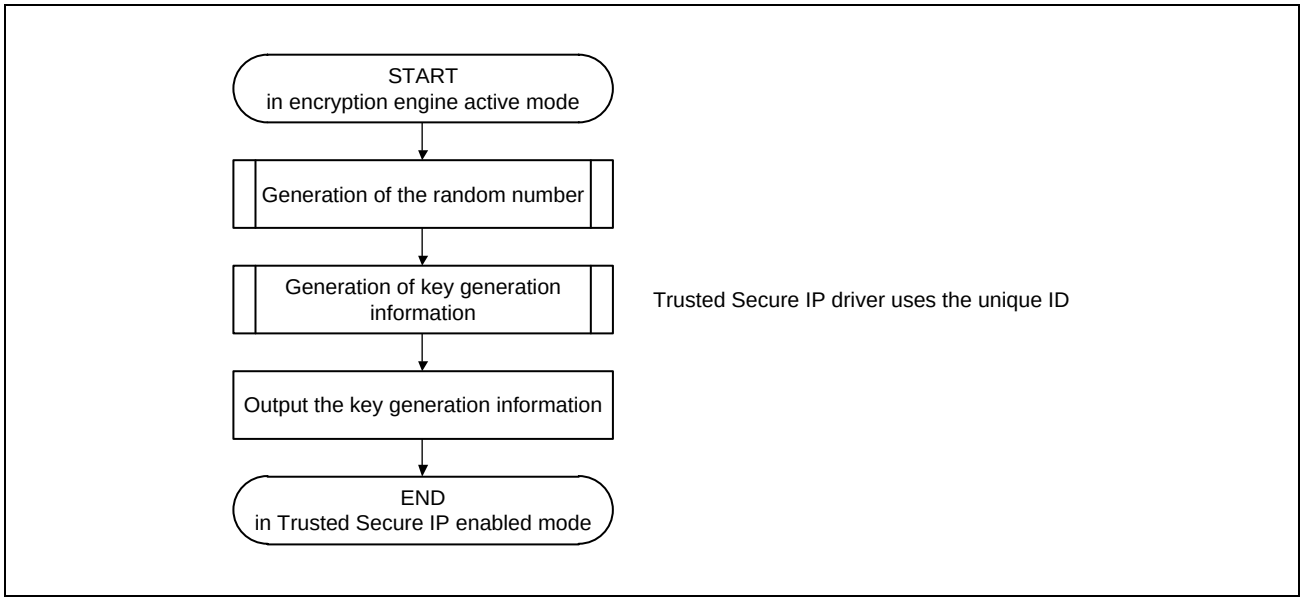

Figure 4.8-9 Key Generation Information Generation Flow Chart (Using Random Numbers)

4.8.2.6 Random Number Generation

Figure 4.8-10 shows the random number generation flow.

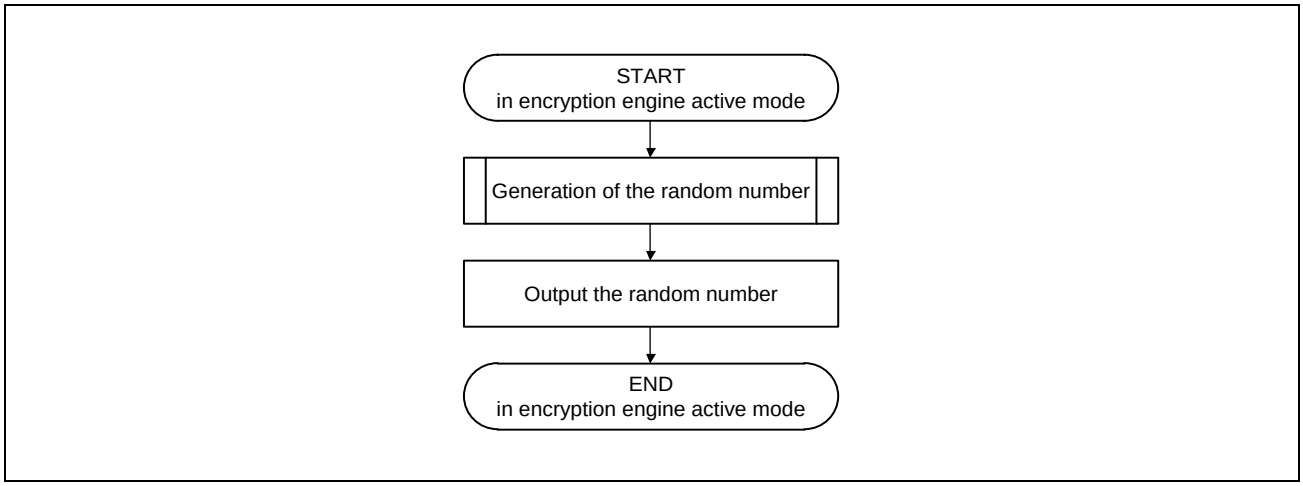

Figure 4.8-10 Random Number Generation Flow Chart

4.8.3 Interrupt

Table 4.8-2 lists the interrupt sources.

The Trusted Secure IP driver uses interrupts caused by these interrupt sources. Do not change the settings of the interrupt controller corresponding to these interrupt sources.

Table 4.8-2 Trusted Secure IP Interrupt Sources

Name	Interrupt Source
PROC_BUSY	Procedure completion interrupt
ROMOK	Falsification detection interrupt
LONG_PLG	Calculation completion interrupt
WRRDY0	Write ready 0
WRRDY1	Write ready 1
WRRDY4	Write ready 4
RDRDY0	Read ready 0
RDRDY1	Read ready 1
IWRRDY	Integration write ready
IRDRDY	Integration read ready

4.8.4 Usage Notes

4.8.4.1 Trusted Secure IP Driver

Use of the Trusted Secure IP requires the Trusted Secure IP driver provided by Renesas Electronics. Please contact our sales office for information regarding the Trusted Secure IP driver.

SECTION 4 SYSTEM

4.9 Debug Interface

4.9.1 Overview

This LSI has a debug interface for boundary scan function and debug support for CA55 and CM33.

4.9.1.1 Features

The functions of the debug interface of this LSI are shown below.

- Debug Interface
  - Support JTAG and SWD
- Debugger control function (DAP function)
  - Direct control of IP without going through CPU by switching Access Port (AP)
- Trace data support
  - CA55 trace output
  - CM33 trace output
  - Buffer function of trace data by ETF
  - Trace data output to the system bus by using ETR
- Boundary Scan
  - Connection test between this LSI and other LSIs on the user board
- Other functions
  - Interlocking operation of CA55, CM33, system counter (SYC), watchdog timer (WDT), general timer (GTM), and debug component by cross trigger
  - Support WDT counter stop control function
  - Add time information to trace data by Time Stamp (24MHz operation)

4.9.1.2 Block Diagram

Figure 4.9-1 shows the block diagram of the debug interface, and **Figure 4.9-2** shows the block diagram of the Core Sight System (CST).

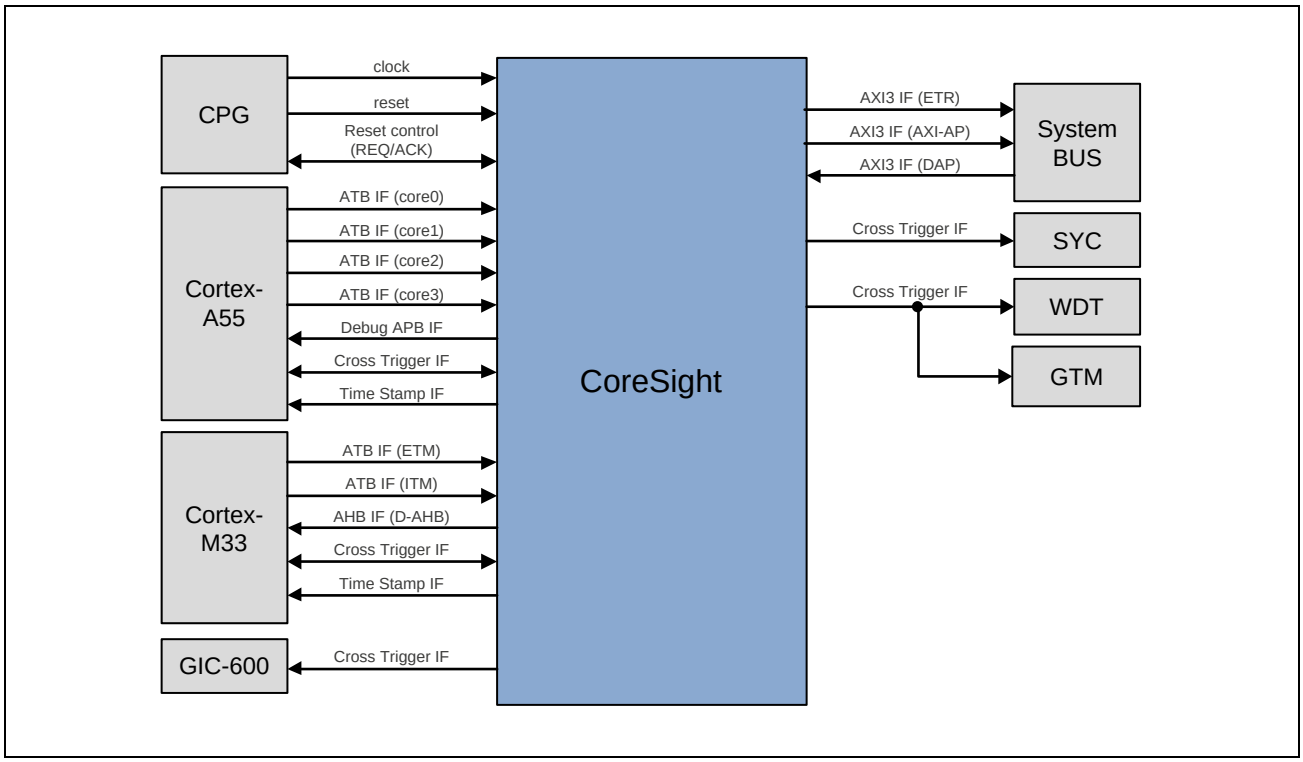

Figure 4.9-1 Debug System Block Diagram

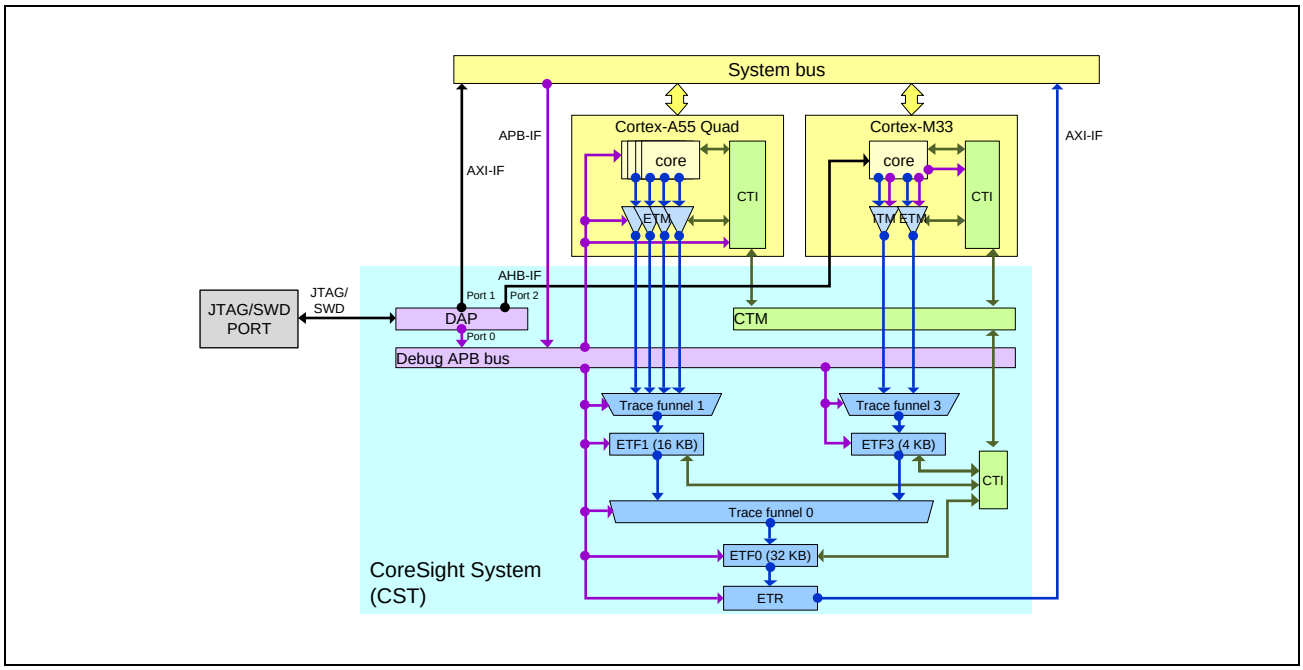

Figure 4.9-2 Core Sight System Block Diagram

- Debug Bus (APB)

  Bus used for controlling debug functions and acquiring debug data (register values and trace data in On-Chip Buffer)

  - DAP: Debug Access Port

- Cross Trigger Matrix (CTM)

  Functions required for co-debugging triggered by mutual events between CPU and Component

  - CTI: Cross Trigger Interface

- Trace Bus (ATB)

  A data bus which the trace data output by ETM flows

  - ETM: Embedded Trace Macrocell
  - ETR: Embedded Trace Router
  - ETF: Embedded Trace FIFO
  - Funnel: Trace data merge function

For details on ETM, ETR, and ETF, refer to “CoreSight Trace Memory Controller Technical Reference Manual”.

4.9.1.3 External Pins

■ **JTAG pins**

The debug interface supports JTAG IF and SWD IF. **Table 4.9-1** shows the JTAG pins and their functions.

Table 4.9-1 JTAG Pins

Pin Name	Input/Output	Function		Name
		JTAG IF	SWD IF	
TCK_SWCLK	Input	TCK	SWCLK	Test clock, Serial wire clock
TMS_SWDIO	Input, I/O	TMS	SWDIO	Test mode select, Serial wire data input/output
TDI	Input	TDI	—	Test data input
TDO	Output	TDO	—	Test data output
TRSTN	Input	TRST	—	Test reset

■ **MD_BOOT3 pins**

Table 4.9-2 shows the functions of the MD_BOOT3 pin.

Table 4.9-2 MD_BOOT3 Pins

Pin Name	Input/Output	Function
MD_BOOT3	Input	Switches between normal operation and debug operation. 0: Normal operation 1: Debug operation

The MD_BOOT3 value must be fixed before releasing the power-on reset (PRST#). **Table 4.9-3** shows the difference in operation between normal operation and debug operation.

Table 4.9-3 Difference in Operation by MD_BOOT3

	Normal Operation (MD_BOOT3 = 0)	Debug Operation (MD_BOOT3 = 1)	Related Module
Debug function module (CoreSight (other than DAP))	Boot impossible (Reset state)	Boot (Refer **4.9.5.1 Debug Related Reset** for reset condition and range)	CPG (Reset control)

■ BSCANP pins

Table 4.9-4 shows the functions of the BSCANP pin.

Contact a Renesas Electronics sales office for information regarding the boundary scan.

Table 4.9-4 BSCANP Pins

Pin Name	Input/Output	Function
BSCANP	Input	Switches between normal operation and boundary scan test mode. 0: Normal operation 1: Boundary scan test mode

Boundary scan test mode is a mode in which a connection test is performed between the terminals of this LSI and other ICs connected on the customer's board and is performed when BSCANP = 1.

The actual access is controlled by the 5 terminals of JTAG when BSCANP = 1.

Table 4.9-5 shows the operation modes of this LSI according to the values of the MD_BOOT3 pin and BSCANP pin.

Table 4.9-5 Operating Mode

Pin Name		
BSCANP	MD_BOOT3	Operating Mode
0	0	Normal operation
0	1	Debug operation
1	*	Boundary scan test mode

4.9.2 CST Registers

The CoreSight of this LSI has a 4 MB debug system address space. The base addresses for the respective channels are as follows.

Table 4.9-6 Address Space of the Debug System (1/2)

Address	Component*1
CoreSight Debug Components (Overall Address Space of this LSI)	
0_1F00_0000h to 0_1F00_FFFFh	CoreSight: ROM table
0_1F01_0000h to 0_1F01_FFFFh	CoreSight: Timestamp generator
0_1F02_0000h to 0_1F02_FFFFh	CoreSight: ETF0
0_1F03_0000h to 0_1F03_FFFFh	CoreSight: ETF1
0_1F04_0000h to 0_1F04_FFFFh	CoreSight: ETF2
0_1F05_0000h to 0_1F05_FFFFh	CoreSight: ETF3
0_1F06_0000h to 0_1F06_FFFFh	CoreSight: ETR
0_1F07_0000h to 0_1F07_FFFFh	CoreSight: Trace Funnel 0
0_1F08_0000h to 0_1F08_FFFFh	CoreSight: Trace Funnel 1
0_1F09_0000h to 0_1F09_FFFFh	CoreSight: Trace Funnel 2
0_1F0A_0000h to 0_1F0A_FFFFh	CoreSight: Trace Funnel 3
0_1F0B_0000h to 0_1F0B_FFFFh	CoreSight: CTI0
0_1F0C_0000h to 0_1F0C_FFFFh	CoreSight: CTI1
0_1F0D_0000h to 0_1F0F_FFFFh	CoreSight: Reserved
0_1F100000h to 0_1F3FFFFFh	Reserved
CA55 Debug Components (Overall Address Space of this LSI)	
0_1F40_0000h to 0_1F40_FFFFh	CA55: ROM table
0_1F41_0000h to 0_1F41_FFFFh	CA55: Core0 Debug
0_1F42_0000h to 0_1F42_FFFFh	CA55: Core0 CTI
0_1F43_0000h to 0_1F43_FFFFh	CA55: Core0 PMU
0_1F44_0000h to 0_1F44_FFFFh	CA55: Core0 ETM
0_1F45_0000h to 0_1F50_FFFFh	Reserved
0_1F51_0000h to 0_1F51_FFFFh	CA55: Core1 Debug
0_1F52_0000h to 0_1F52_FFFFh	CA55: Core1 CTI
0_1F53_0000h to 0_1F53_FFFFh	CA55: Core1 PMU
0_1F54_0000h to 0_1F54_FFFFh	CA55: Core1 ETM
0_1F55_0000h to 0_1F60_FFFFh	Reserved
0_1F61_0000h to 0_1F61_FFFFh	CA55: Core2 Debug
0_1F62_0000h to 0_1F62_FFFFh	CA55: Core2 CTI
0_1F63_0000h to 0_1F63_FFFFh	CA55: Core2 PMU
0_1F64_0000h to 0_1F64_FFFFh	CA55: Core2 ETM
0_1F65_0000h to 0_1F70_FFFFh	Reserved
0_1F71_0000h to 0_1F71_FFFFh	CA55: Core3 Debug
0_1F72_0000h to 0_1F72_FFFFh	CA55: Core3 CTI
0_1F73_0000h to 0_1F73_FFFFh	CA55: Core3 PMU
0_1F74_0000h to 0_1F74_FFFFh	CA55: Core3 ETM
0_1F75_0000h to 0_1F7F_FFFFh	CA55: Reserved

Table 4.9-6 Address Space of the Debug System (2/2)

Address	Component*1
CM33 Debug Components (CM33 Address Space)	
0_E000_0000h to 0_E000_0FFFh	CM33: ITM
0_E000_1000h to 0_E000_1FFFh	CM33: DWT
0_E000_2000h to 0_E000_2FFFh	CM33: FPB
0_E000_3000h to 0_E000_DFFFh	CM33: Reserved
0_E000_E000h to 0_E000_EFFFh	CM33: Secure SCS
0_E000_F000h to 0_E002_DFFFh	CM33: Reserved
0_E002_E000h to 0_E002_EFFFh	CM33: Non-secure SCS
0_E002_F000h to 0_E004_0FFFh	CM33: Reserved
0_E004_1000h to 0_E004_1FFFh	CM33: ETM
0_E004_2000h to 0_E004_2FFFh	CM33: CTI
0_E004_3000h to 0_E00F_EFFFh	CM33: Reserved
0_E00F_F000h to 0_E00F_FFFFh	CM33: ROM table

Note 1. Access to the reserved area is prohibited. Operation is not guaranteed when accessed.

NOTE

- The CoreSight Debug Components area and CA55 Debug Components area can be accessed via the system bus and APB-AP.
  APB-AP is connected to port-0 of DAP. For the port configuration of DAP, refer to **4.9.5.2 DAP**.
- The CM33 Debug Components area is accessible via AHB-AP.
  The AHB-AP for the area access is connected to port-2 of the DAP. For the port configuration of DAP, refer to **4.9.5.2 DAP**.
- Each component is placed on a 64-KB address boundary according to the ARMv8 Debug memory map. As an entity, the first 4 KB is valid.

4.9.2.1 List of Registers

The register is listed below.

Register Name	Abbreviation	Initial Value	Offset Address	Access Size [bits]
ID Register	CST_BSID	x867_D447h	-	32

4.9.2.2 CST Register Descriptions

4.9.2.2.1 ID Register (CST_BSID)

The BSID register is a 32-bit register that cannot be accessed from the CPU. When the BSCANP pin is 1b, it can be read from the TDO pin by setting the IDCODE command on the TAP controller. It cannot be written.

Access Size : 32 bits
Address : -
Initial Value : x867_D447h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	BSID[31:16]															
Initial Value	x	x	x	x	1	0	0	0	0	1	1	0	0	1	1	1
R/W	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	BSID[15:0]															
Initial Value	1	1	0	1	0	1	0	0	0	1	0	0	0	1	1	1
R/W	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	BSID[31:0]	x867_D447h	-	This is the ID register specified in JTAG. The upper 4 bits (bit31-28) indicate the produect revision.

4.9.2.2.2 Other Registers

For details on each register other than the BSID register, refer to “ARM CoreSight SoC-400 Technical Reference Manual” and “CoreSight Trace Memory Controller Technical Reference Manual”.

4.9.3 Debug Connection

4.9.3.1 Debug Connection Mode

There are the following three modes for the debug connection method of this LSI.

Authentication Mode	Method
No authentication	Allow access from the debugger without authentication (initial setting)
SEC authentication*1	Allow access from the debugger after authentication is OK. (authentication method is security authentication by security IP)
Authentication refusal*1	Block access from the debugger

Note 1. SEC authentication and Authentication refusal can only be authenticated with secure products.

For SEC authentication modes, enter the authentication code from the debugger is needed.

For information on the authentication function of secure products, contact a Renesas Electronics sales office.

4.9.4 Debug Access Range

The debug access range by CoreSight is for all slaves as well as CA55. For details, refer to **1.7 Internal Bus**.

4.9.5 Operation

4.9.5.1 Debug Related Reset

Refer to **4.4 Clock Pulse Generator (CPG)** for the debug-related resets and reset range.

4.9.5.2 DAP

DAP is equipped with SWJ-DP as Debug Port (DP) and APB-AP, AXI-AP, AHB-AP as Access Port (AP).

The DAP port numbers are shown in **Table 4.9-7** that describes the correspondence between the port number specified in the DP SELECT register and the AP, and its usage.

Table 4.9-7 DAP Port Number

Port number	AP	Usage
Port-0	APB-AP	Debug Component recognition and settings
Port-1	AXI-AP	System IP control (access to system bus)
Port-2	AHB-AP	CM33 settings

4.9.5.3 Trace

4.9.5.3.1 Data flow

In CoreSight, all trace data is aggregated once by Trace Funnel, and stored in ETF, or output to the system bus via ETR in the subsequent stage. Setting this port number to the Trace Funnel according to the route of the trace data is needed. The Trace Funnel port numbers are shown in **Table 4.9-8**.

Table 4.9-8 Trace Funnel Port Number

Trace Funnel Number	Port Number	Source Components
Funnel 0	Port-0	CA55 cluster
	Port-2	CM33 cluster
Funnel 1	Port-0	CA55: Core0 ETM
	Port-1	CA55: Core1 ETM
	Port-2	CA55: Core2 ETM
	Port-3	CA55: Core3 ETM
Funnel 3	Port-0	CM33: ITM
	Port-1	CM33: ETM

4.9.5.3.2 Timestamp

If time information want to be included in the trace data, the Timestamp Generator can be used. The timestamp replicator port numbers are shown in **Table 4.9-9**. The Timestamp Generator runs on a 24-MHz clock.

Table 4.9-9 Timestamp Replicator Port Number

Port Number	Target Components
Port-0	CA55: Core0/1/2/3 ETM
Port-2	CM33

4.9.5.4 Cross Trigger

The CTI (Cross Trigger Interface) implemented in CoreSight, CA55, and CM33 is used to communicate debug events.

4.9.5.4.1 CoreSight cross trigger connection

CoreSight has two CTIs. The connection specifications are shown in **Table 4.9-10** to **Table 4.9-13**.

Table 4.9-10 CoreSight CTI0 Trigger Input

[2]	CM33: System	Interrupt request 0
[1]	CM33: Processor	Processor Restart
[0]	CM33: Processor	Processor debug request

4.9.5.5 WDT Counter Stop Control

This LSI has a WDT counter stop control function linked with a debug event to prevent an unintended reset by WDT during debug operation. When a debug event occurs, CoreSight asserts the WDT counter stop request signal, controls the WDT counter stop signal (CNTSTOP), and stops counting. The target WDT is all WDT. For details on the WDT count stop function, refer to **4.3 System Controller (SYS)**.

4.9.5.6 SYC Counter Stop Control

This LSI has a SYC counter stop control function linked with debug events to prevent unintended SYC counts during debug operation. When a debug event occurs, CoreSight asserts a SYC counter stop request signal to stop the SYC count.

SECTION 5 TIMER

5.1 Timer Overview

This sections describes the timer unit of this LSI. For details, refer to the section of each unit.

■ System Counter (SYC) (See 5.2)

SYC provides count values for CA55 and GE3D.

■ Realtime Clock (RTC) (See 5.3)

■ Watchdog Timer (WDT) (See 5.4)

This LSI equips 4ch of WDT. Available for CA55 (All core) and CM33 respectively.

■ General Timer (GTM) (See 5.5)

This LSI equips 8ch of GTM.

■ Compare Match Timer W (CMTW) (See 5.6)

This LSI equips 8ch of CMTW.

This unit can input/ouput interrupt signals to/from external devices using external pins.

■ General Purpose Timer (GPT) (See 5.7)

This LSI equips 16ch of GPT. This unit can output PWM waveform in PWM mode.

Enabling control of each GPT external pin is possible by using POEG. For details on POEG, see **5.8 Port Output Enable for GPT (POEG)**.

SECTION 5 TIMER

5.2 System Counter (SYC)

The SYC generates the count value that is used by the GE3D and the generic timer built into the Cortex-A55.

It uses the timestamp generator, which is part of the Arm CoreSight SoC-400, to generate a 64-bit count value. For more information on the timestamp generator, refer to *the ARM CoreSight SoC-400 Technical Reference Manual*.

5.2.1 Overview

5.2.1.1 Features

- Count by 24 MHz clock (SYC_0_CNT_CLK)
- 64-bit gray code counter value generation
  - Convert the value generated by timestamp generator to Gray code and output it.
- Access control
  - Access control for the two interfaces of the timestamp generator
  - Control secure access/non-secure access
- Halt on debug function
  - Counting can be stopped/restarted during debugging as requested by CoreSight

5.2.1.2 Block Diagram of SYC

The SYC connection diagram is shown in **Figure 5.2-1** and the SYC block diagram is shown in **Figure 5.2-2**.

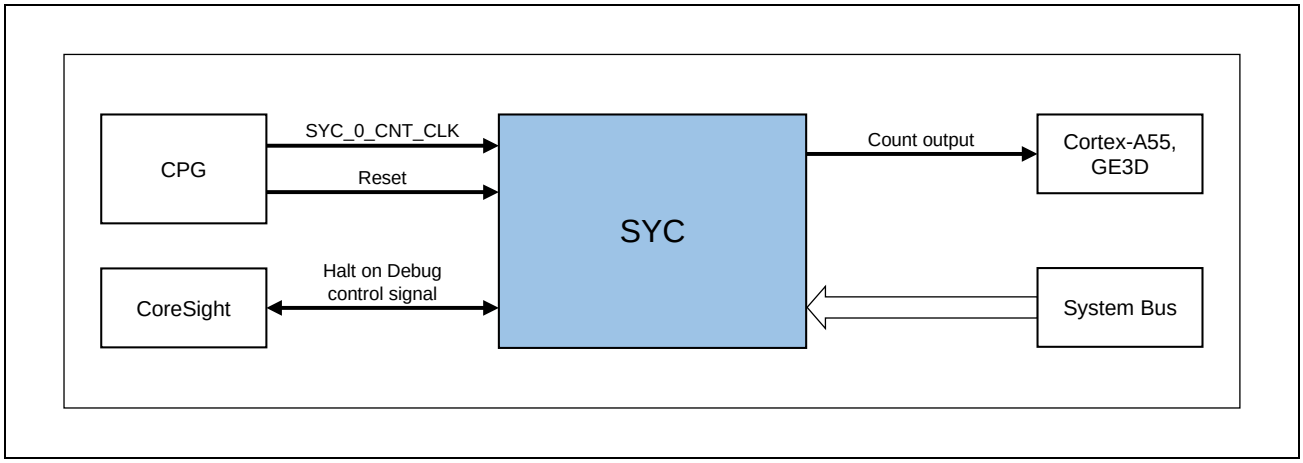

Figure 5.2-1 SYC Connection Diagram

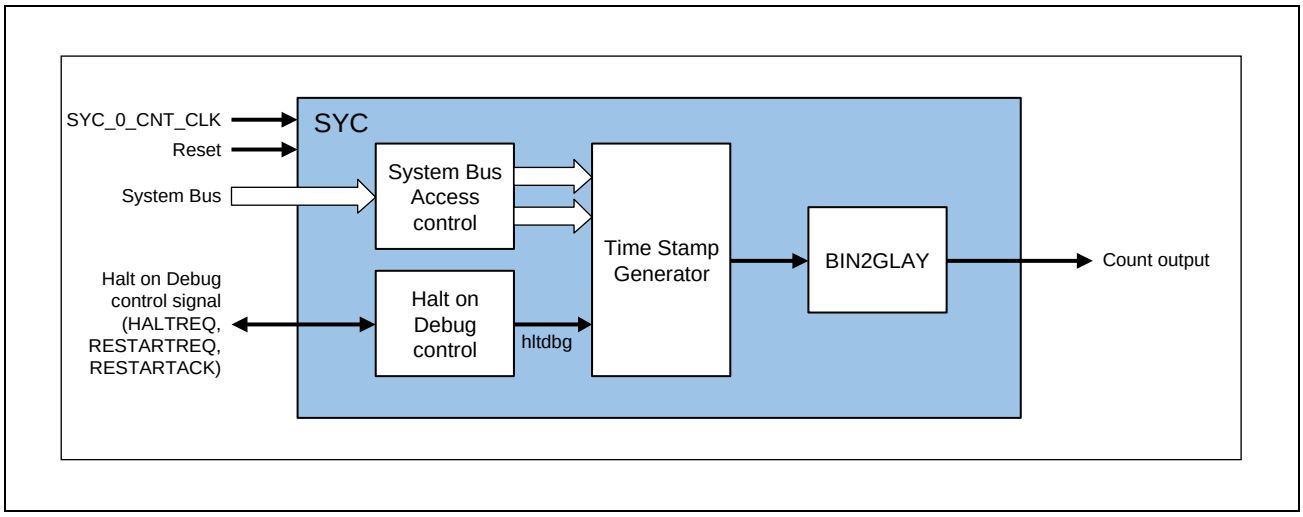

Figure 5.2-2 SYC Block Diagram

5.2.2 Registers

Table 5.2-2 shows the SYC address space. SYC has an address space of 8 KB. The SYC address space is offset from the base address. The base address of SYC is as follows.

Table 5.2-1 Register Base Addresses

Base Address Name	Base Address
<SYC0_base>	0_1401_0000h (5401_0000h*1, 4401_0C00h*2)

Note 1. CM33 address space (non-secure)

Note 2. CM33 address space (secure)

Table 5.2-2 SYC Address Space

Offset Address	Region Name	Access Target
0000h to 0FFFh	PSELCTRL region	PSELCTRL region & PSELCTRL region Management registers
1000h to 1FFFh	PSELREAD region	PSELREAD region & PSELREAD region Management registers

Note: Secure access and non-secure access are possible for the PSELCTRL region and PSELREAD region.

For more information on SYC registers, refer ARM CoreSight SoC-400 Technical Reference Manual 3.10 Timestamp generator.

5.2.3 Operation

5.2.3.1 System Bus Access Control

Access control is performed from a system bus interface of the SYC to two APB interfaces of the timestamp generator.

The PSELCTRL area can be accessed when accessing the first half 4 KB of the 8 KB address area of SYC, and the PSELREAD area can be accessed when accessing the last 4 KB.

The PSELCTRL area and PSELREAD area accept secure access and non-secure access.

5.2.3.2 Halt on Debug Function

SYC supports the Halt on Debug function included in timestamp generator. When HALTREQ is asserted from CoreSight, the counting operation of timestamp generator is stopped.

When RESTARTREQ is asserted from CoreSight, the counting operation of timestamp generator is restarted.

HALTREQ and RESTARTREQ are controlled by CoreSight's CTI (Cross Trigger Interface).

NOTE

This LSI provides the common count value generated by SYC to Cortex-A55 and GE3D. The stop/restart control of the counter by the Halt on Debug function is also performed simultaneously for Cortex-A55 and GE3D.

SECTION 5 TIMER

5.3 Realtime Clock (RTC)

In this section, “PCLK” is used to refer to RTC_0_clk_rtc (clk_rtc).

5.3.1 Overview

The RTC (Real time Clock) has two types of counting mode: calendar count mode and binary count mode. They are used by switching the register settings.

In calendar count mode, the RTC uses a 100-year calendar from 2000 to 2099 and automatically adjusts dates for leap years.

In binary count mode, the RTC does not count in terms of years, months, dates, day-of-week, hours, or minutes; it counts seconds, and retains the information as a serial value. This mode can be used for calendars other than the Gregorian calendar.

The RTC uses the 128-Hz clock which is acquired by the count source divided by the prescaler as the reference clock.

Year, month, date, day-of-week, a.m./p.m. (in 12-hour mode), hour, minute, second, or 32-bit binary is counted in 1/128 second units.

Table 5.3-1 lists the specifications of the RTC, **Figure 5.3-1** shows a block diagram of the RTC, and **Table 5.3-2** shows the pin configuration of the RTC.

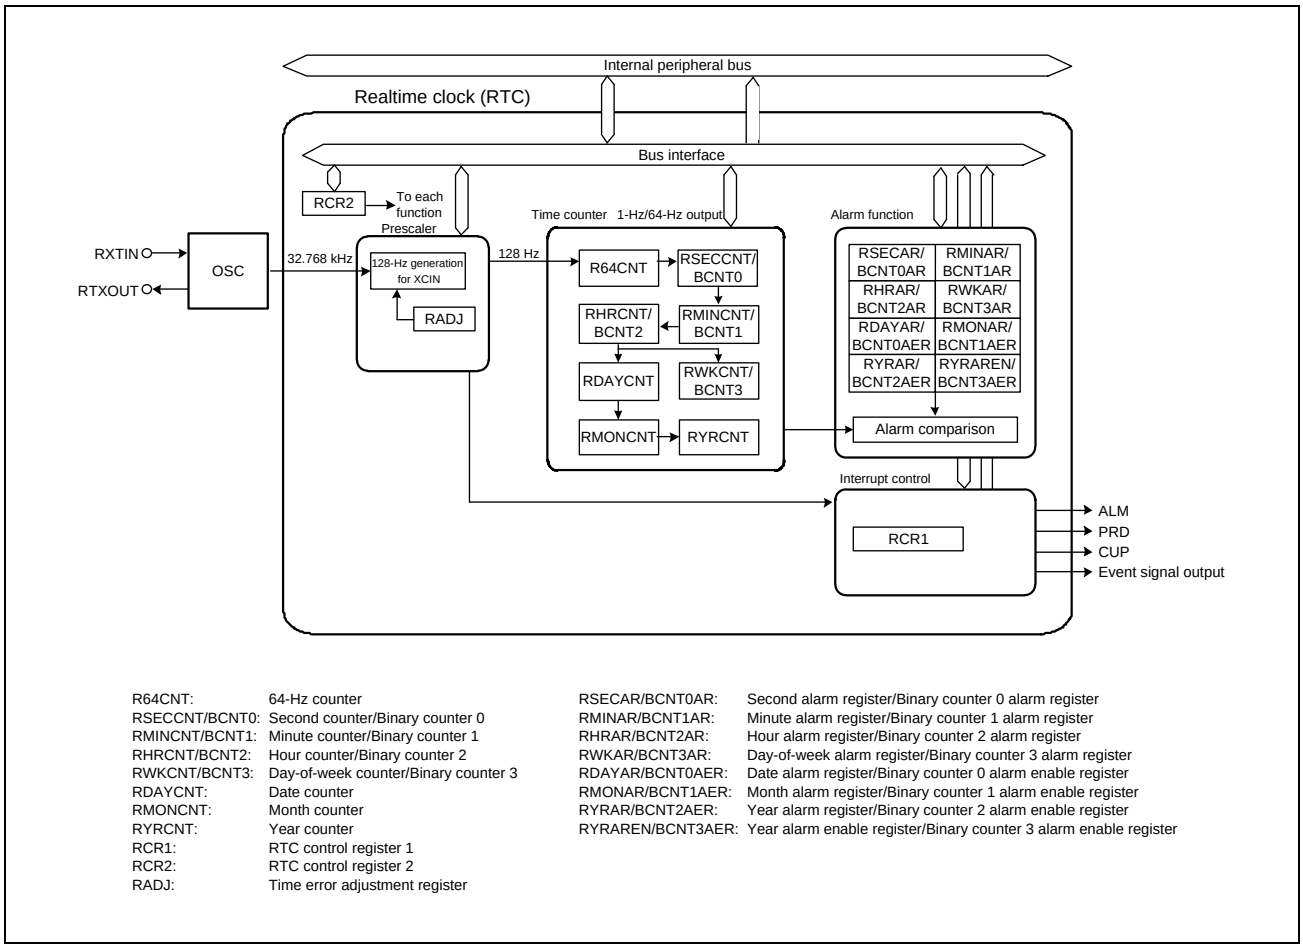
Table 5.3-1 RTC Specifications (1/2)

Item	Description
Count mode	Calendar count mode/binary count mode
Count source*1	Real time Clock (RXTIN)
Clock and calendar functions	• Calendar count mode – Year, month, date, day-of-week, hour, minute, second are counted, BCD display – 12 hours/24 hours mode switching function – 30 seconds adjustment function (a number less than 30 is rounded down to 00 seconds, and 30 seconds or more are rounded up to one minute) – Automatic adjustment function for leap years • Binary count mode – Count seconds in 32 bits, binary display • Common to both modes – Start/stop function – The sub-second digit is displayed in binary units (1 Hz, 2 Hz, 4 Hz, 8 Hz, 16 Hz, 32 Hz, or 64 Hz). – Clock error correction function

Table 5.3-1 RTC Specifications (2/2)

Item	Description
Interrupts	• Alarm interrupt (ALM) As an alarm interrupt condition, selectable which of the below is compared with: – Calendar count mode: Year, month, date, day-of-week, hour, minute, or second can be selected – Binary count mode: Each bit of the 32-bit binary counter • Periodic interrupt (PRD) – 2 seconds, 1 second, 1/2 seconds, 1/4 seconds, 1/8 seconds, 1/16 seconds, 1/32 seconds, 1/64 seconds, or 1/128 seconds can be selected as an interrupt period. • Carry interrupt (CUP) An interrupt is generated at either of the following timings: – When a carry from the 64-Hz counter to the second counter is generated. – When the 64-Hz counter is changed and the R64CNT register is read at the same time.
Event link function	• Alarm event output • Periodic event output • Carry event output

Note 1. Satisfy the frequency of the peripheral module clock (PCLK) ≥ the frequency of the count source.



R64CNT: 64-Hz counter
RSECCNT/BCNT0: Second counter/Binary counter 0
RMINCNT/BCNT1: Minute counter/Binary counter 1
RHRCNT/BCNT2: Hour counter/Binary counter 2
RWKCNT/BCNT3: Day-of-week counter/Binary counter 3
RDAYCNT: Date counter
RMONCNT: Month counter
RYRCNT: Year counter
RCR1: RTC control register 1
RCR2: RTC control register 2
RADJ: Time error adjustment register

RSECAR/BCNT0AR: Second alarm register/Binary counter 0 alarm register
RMINAR/BCNT1AR: Minute alarm register/Binary counter 1 alarm register

Table 5.3-2 Pin Configuration of RTC

Pin Name	Input/Output	Function
RTXIN	Input	Connect a 32.768-kHz crystal to these pins.
RTXOUT	Output	

5.3.2 Registers

When writing to or reading from RTC registers, do so in accordance with **5.3.6.4 Notes on Writing to and Reading from Registers**.

If the value in an RTC register after a reset is given as x (undefined bits) in the list, it is not initialized by a reset. When RTC enters the reset state or a low power consumption state during counting operations (i.e. while the RCR2.START bit is 1), the year, month, day of the week, date, hours, minutes, seconds, and 64-Hz counters continue to operate. Note that a reset generated during writing to or updating of a register might destroy the register value. In addition, do not allow the chip to enter software standby mode immediately after setting any of these registers. For details, refer to **5.3.6.3 Transitions to Low Power Consumption Modes after Setting Registers**.

The register addresses of RTC are given as offsets from the individual base addresses <RTC_base> and <RTC_Read_Only_base>. The register base addresses of each RTC are listed in the following table.

Table 5.3-3 Register Base Addresses

Base Address Name	Base Address
<RTC_base>	0_11C0_0800 (51C0_0800*1, 41C0_0800*2)
<RTC_Read_Only_base>*3	0_11C0_0C00 (51C0_0C00*1, 41C0_0C00*2)

Note 1. CM33 address space (non-secure)

Note 2. CM33 address space (secure)

Note 3. The following registers are only readable.
R64CNT, RSECCNT/BCNT0, RMINCNT/BCNT1, RHRCNT/BCNT2, RWKCNT/BCNT3, RDAYCNT, RMONCNT,RYRCNT

5.3.2.1 List of Registers

The RTC registers and the memory addresses are listed in the following table.

For the actual addresses, the offset values indicated in this table are added to the base addresses.

Register Name	Abbreviation	Initial Value	Offset Address	Access Size [bits]
64-Hz Counter	RTC_R64CNT	xxh	00h	8
Reserve	-	-	01h	-
Second Counter/Binary Counter 0	RTC_RSECCNT/RTC_BCNT0	xxh	02h	8

Time Error Adjustment Register	RTC_RADJ	xxh	2Eh	8

5.3.2.2 Register Description

The prefix (RTC_) of the register names is omitted in this and subsequent sections.

5.3.2.2.1 64-Hz Counter (RTC_R64CNT)

The R64CNT counter is used in both calendar count mode and in binary count mode.

The 64-Hz counter (R64CNT) generates a period of one second by counting the 128-Hz reference clock.

The state in the sub-second range can be confirmed by reading this counter.

This counter is set to 00h by an RTC software reset or executing 30-second adjustment.

To read this counter, follow the procedure in **5.3.3.5 Reading 64-Hz Counter and Time**.

Access Size : 8 bits

Address : <RTC_base> + 00h
<RTC_Read_Only_base> + 00h

Initial Value : xxh

Bit	7	6	5	4	3	2	1	0
	-	F1HZ	F2HZ	F4HZ	F8HZ	F16HZ	F32HZ	F64HZ
Initial Value	0	x	x	x	x	x	x	x
RW	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	RW	Description
7	-	0h	R	Reserved This bit is always read as 0b. The written value will be ignored.
6	F1HZ	x	R	Indicate the state between 1 Hz and 64 Hz of the sub-second digit.
5	F2HZ	x	R	Indicate the state between 1 Hz and 64 Hz of the sub-second digit.
4	F4HZ	x	R	Indicate the state between 1 Hz and 64 Hz of the sub-second digit.
3	F8HZ	x	R	Indicate the state between 1 Hz and 64 Hz of the sub-second digit.
2	F16HZ	x	R	Indicate the state between 1 Hz and 64 Hz of the sub-second digit.
1	F32HZ	x	R	Indicate the state between 1 Hz and 64 Hz of the sub-second digit.
0	F64HZ	x	R	Indicate the state between 1 Hz and 64 Hz of the sub-second digit.

x: Undefined value

5.3.2.2.2 Second Counter (RTC_RSECCNT)/Binary Counter 0 (RTC_BCNT0)

a. In calendar count mode

The RSECCNT counter is used for setting and counting the BCD-coded second value. It counts carries generated once per second in the 64-Hz counter.

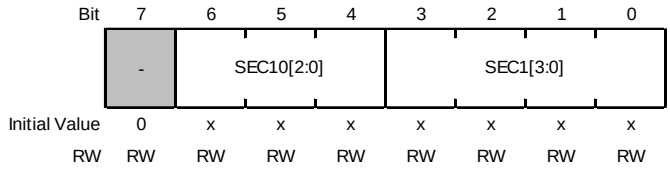
The setting range is decimal 00 to 59. The RTC will not operate normally if any other value is set. Before writing to this register, be sure to stop the count operation through the setting of the START bit in RCR2.

After writing to the RSECCNT register, confirm that its value has actually changed before proceeding with further processing. Refer to **5.3.6.4 Notes on Writing to and Reading from Registers** for notes on accessing registers.

Access Size : 8 bits

Address : <RTC_base> + 02h
<RTC_Read_Only_base> + 02h

Initial Value : xxh



Bit	Bit Name	Initial Value	RW	Description
7	-	0h	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
6 to 4	SEC10[2:0]	x	RW	Counts from 0 to 5 for 60-second counting.
3 to 0	SEC1[3:0]	x	RW	Counts from 0 to 9 every second. When a carry is generated, 1 is added to the tens place.

x: Undefined value

b. In binary count mode

The BCNT0 counter is a readable/writable 32-bit binary counter b7 to b0.

The 32-bit binary counter performs count operation by a carry generating for each second of the 64-Hz counter.

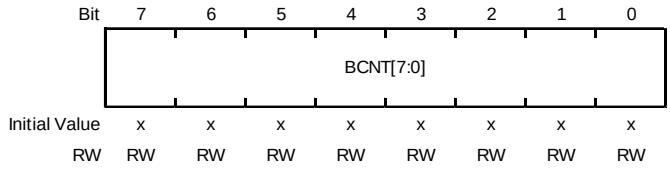
Before writing to this register, be sure to stop the count operation through the setting of the START bit in RCR2.

To read this counter, follow the procedure in **5.3.3.5 Reading 64-Hz Counter and Time**.

Access Size : 8 bits

Offset Address : <RTC_base> + 02h
<RTC_Read_Only_base> + 02h

Initial Value : xxh



5.3.2.2.3 Minute Counter (RTC_RMINCNT)/Binary Counter 1 (RTC_BCNT1)

a. In calendar count mode

The RMINCNT counter is used for setting and counting the BCD-coded minute value. It counts carries generated once per minute in the second counter.

A value from 00 through 59 (in BCD) can be specified; if a value outside of this range is specified, the RTC does not operate correctly. Before writing to this register, be sure to stop the count operation through the setting of the START bit in RCR2.

After writing to the RMINCNT counter, confirm that its value has actually changed before proceeding with further processing. Refer to **5.3.6.4 Notes on Writing to and Reading from Registers** for notes on accessing registers.

Access Size : 8 bits

Address : <RTC_base> + 04h
<RTC_Read_Only_base> + 04h

Initial Value : xxh

Bit	7	6	5	4	3	2	1	0
	-	MIN10[2:0]			MIN1[3:0]			
Initial Value	0	x	x	x	x	x	x	x
RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	RW	Description
7	-	0h	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
6 to 4	MIN10[2:0]	x	RW	Counts from 0 to 5 for 60-minute counting.
3 to 0	MIN1[3:0]	x	RW	Counts from 0 to 9 every minute. When a carry is generated, 1 is added to the tens place.

x: Undefined value

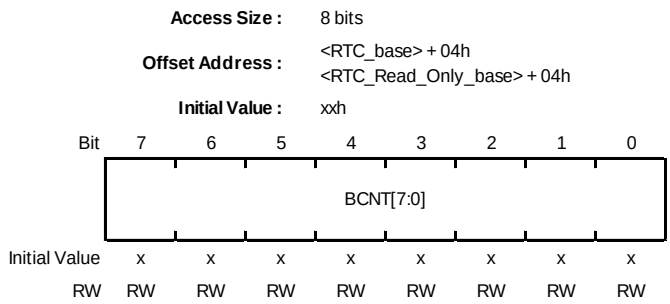
b. In binary count mode

The BCNT1 counter is a readable/writable 32-bit binary counter b15 to b8.

The 32-bit binary counter performs count operation by a carry generating for each second of the 64-Hz counter.

Before writing to this register, be sure to stop the count operation through the setting of the START bit in RCR2.

To read this counter, follow the procedure in **5.3.3.5 Reading 64-Hz Counter and Time**.



5.3.2.2.4 Hour Counter (RTC_RHRCNT)/Binary Counter 2 (RTC_BCNT2)

a. In calendar count mode

The RHRCNT counter is used for setting and counting the BCD-coded hour value. It counts carries generated once per hour in the minute counter.

The specifiable time differs according to the setting in the hours mode bit (RCR2.HR24).

When the RCR2.HR24 bit is 0: From 00 to 11 (in BCD)

When the RCR2.HR24 bit is 1: From 00 to 23 (in BCD)

If a value outside of this range is specified, the RTC does not operate correctly. Before writing to this register, be sure to stop the count operation through the setting of the START bit in RCR2.

The PM bit is only enabled when the RCR2.HR24 bit is 0. Otherwise, the setting in the PM bit has no effect.

After writing to the RHRCNT counter, confirm that its value has actually changed before proceeding with further processing. Refer to **5.3.6.4 Notes on Writing to and Reading from Registers** for notes on accessing registers.

Access Size : 8 bits

Address : <RTC_base> + 06h
<RTC_Read_Only_base> + 06h

Initial Value : xxh

Bit	7	6	5	4	3	2	1	0
	-	PM	HR10[1:0]		HR1[3:0]			
Initial Value	0	x	x	x	x	x	x	x
RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	RW	Description
7	-	0h	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
6	PM	x	RW	Time Counter Setting for a.m./p.m. 0b: a.m. 1b: p.m.
5 to 4	HR10[1:0]	x	RW	Counts from 0 to 2 once per carry from the ones place.
3 to 0	HR1[3:0]	x	RW	Counts from 0 to 9 once per hour. When a carry is generated, 1 is added to the tens place.

x: Undefined value

b. In binary count mode

The BCNT2 counter is a readable/writable 32-bit binary counter b23 to b16.

The 32-bit binary counter performs count operation by a carry generating for each second of the 64-Hz counter.

Before writing to this register, be sure to stop the count operation through the setting of the START bit in RCR2.

To read this counter, follow the procedure in **5.3.3.5 Reading 64-Hz Counter and Time**.

Access Size : 8 bits

Offset Address : <RTC_base> + 06h
<RTC_Read_Only_base> + 06h

Initial Value : xxh

Bit	7	6	5	4	3	2	1	0
	BCNT[7:0]							
Initial Value	x	x	x	x	x	x	x	x
	RW	RW	RW	RW	RW	RW	RW	RW

5.3.2.2.5 Day-of-Week Counter (RTC_RWKCNT)/Binary Counter 3 (RTC_BCNT3)

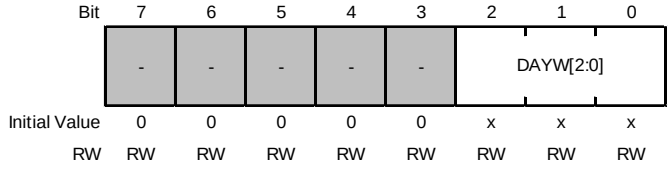
a. In calendar count mode

The RWKCNT counter is used for setting and counting in the coded day-of-week value. It counts carries generated once per day in the hour counter.

A value from 0 through 6 can be specified; if a value outside of this range is specified, the RTC does not operate correctly. Before writing to this register, be sure to stop the count operation through the setting of the START bit in RCR2.

Refer to **5.3.6.4 Notes on Writing to and Reading from Registers** for notes on accessing registers.

Access Size : 8 bits
Address : <RTC_base> + 08h
<RTC_Read_Only_base> + 08h
Initial Value : 0xh



Bit	Bit Name	Initial Value	RW	Description
7 to 3	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
2 to 0	DAYW[2:0]	x	RW	000b: Sunday 001b: Monday 010b: Tuesday 011b: Wednesday 100b: Thursday 101b: Friday 110b: Saturday 111b: Setting prohibited

x: Undefined value

b. In binary count mode

The BCNT3 counter is a readable/writable 32-bit binary counter b31 to b24.

The 32-bit binary counter performs count operation by a carry generating for each second of the 64-Hz counter.

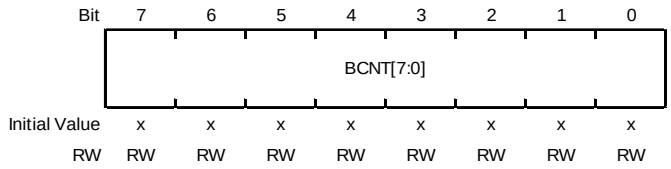
Before writing to this register, be sure to stop the count operation through the setting of the START bit in RCR2.

To read this counter, follow the procedure in **5.3.3.5 Reading 64-Hz Counter and Time**.

Access Size : 8 bits

Offset Address : <RTC_base> + 08h
<RTC_Read_Only_base> + 08h

Initial Value : xxh



5.3.2.2.6 Date Counter (RTC_RDAYCNT)

The RDAYCNT counter is used in calendar count mode.

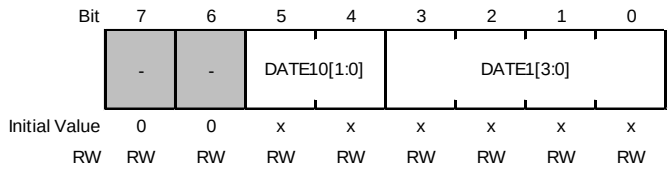
The RDAYCNT counter is used for setting and counting the BCD-coded date value. It counts carries generated once per day in the hour counter. The count operation depends on the month and whether the year is a leap year.

Leap years are determined according to whether the year counter (RYRCNT) value is divisible by 400, 100, and 4.

A value from 01 through 31 (in BCD) can be specified; if a value outside of this range is specified, the RTC does not operate correctly. (When specifying a value, note that the range of specifiable days depends on the month and whether the year is a leap year.) Before writing to this register, be sure to stop the count operation through the setting of the START bit in RCR2.

After writing to the RDAYCNT counter, confirm that its value has actually changed before proceeding with further processing. Refer to **5.3.6.4 Notes on Writing to and Reading from Registers** for notes on accessing registers.

Access Size : 8 bits
Address : <RTC_base> + 0Ah
<RTC_Read_Only_base> + 0Ah
Initial Value : xxh



Bit	Bit Name	Initial Value	RW	Description
7, 6	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
5, 4	DATE10[1:0]	x	RW	Counts from 0 to 3 once per carry from the ones place.
3 to 0	DATE1[3:0]	x	RW	Counts from 0 to 9 once per day. When a carry is generated, 1 is added to the tens place.

x: Undefined value

5.3.2.2.7 Month Counter (RTC_RMONCNT)

The RMONCNT counter is used in calendar count mode.

The RMONCNT counter is used for setting and counting the BCD-coded month value. It counts carries generated once per month in the date counter.

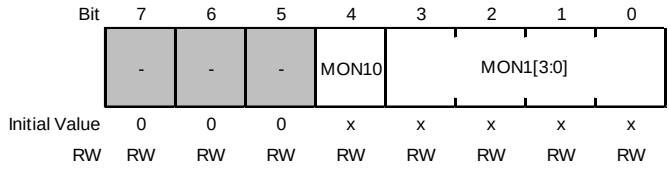
A value from 01 through 12 (in BCD) can be specified; if a value outside of this range is specified, the RTC does not operate correctly. Before writing to this register, be sure to stop the count operation through the setting of the START bit in RCR2.

After writing to the RMONCNT counter, confirm that its value has actually changed before proceeding with further processing. Refer to **5.3.6.4 Notes on Writing to and Reading from Registers** for notes on accessing registers.

Access Size : 8 bits

Address : <RTC_base> + 0Ch
<RTC_Read_Only_base> + 0Ch

Initial Value : xxh



Bit	Bit Name	Initial Value	RW	Description
7 to 5	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
4	MON10	x	RW	Counts from 0 to 1 once per carry from the ones place.
3 to 0	MON1[3:0]	x	RW	Counts from 0 to 9 once per month. When a carry is generated, 1 is added to the tens place.

x: Undefined value

5.3.2.2.8 Year Counter (RTC_RYRCNT)

The RYRCNT counter is used in calendar count mode.

The RYRCNT counter is used for setting and counting the BCD-coded year value. It counts carries generated once per year in the month counter.

A value from 00 through 99 (in BCD) can be specified; if a value outside of this range is specified, the RTC does not operate correctly. Before writing to this register, be sure to stop the count operation through the setting of the START bit in RCR2.

After writing to the RYRCNT counter, confirm that its value has actually changed before proceeding with further processing. Refer to **5.3.6.4 Notes on Writing to and Reading from Registers** for notes on accessing registers.

Access Size : 16 bits

Address : <RTC_base> + 0Eh
<RTC_Read_Only_base> + 0Eh

Initial Value : 00xxh

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	YR10[3:0]				YR1[3:0]			
Initial Value	0	0	0	0	0	0	0	0	x	x	x	x	x	x	x	x
RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	RW	Description
15 to 8	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
7 to 4	YR10[3:0]	x	RW	Counts from 0 to 9 once per carry from the ones place. When a carry is generated in the tens place, 1 is added to the hundreds place.
3 to 0	YR1[3:0]	x	RW	Counts from 0 to 9 once per year. When a carry is generated, 1 is added to the tens place.

x: Undefined value

5.3.2.2.9 Second Alarm Register (RTC_RSECAR)/Binary Counter 0 Alarm Register (RTC_BCNT0AR)

a. In calendar count mode

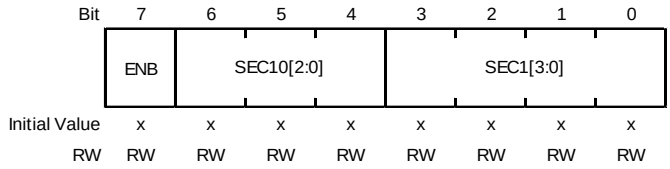
The RSECAR register is an alarm register corresponding to the BCD-coded second counter RSECCNT. When the ENB bit is set to 1, the RSECAR value is compared with the RSECCNT value. From among the alarm registers (RSECAR, RMINAR, RHRAR, RWKAR, RDAYAR, RMONAR, and RYRAREN), only those selected with the ENB bits set to 1 are compared with the corresponding counters. When the respective values all match, the alarm flag of RSR corresponding to the ALM interrupt is set to 1.

RSECAR values from 00 through 59 (in BCD) can be specified; if a value outside of this range is specified, the RTC does not operate correctly.

After writing to the RSECAR register, confirm that its value has actually changed before proceeding with further processing. Refer to **5.3.6.4 Notes on Writing to and Reading from Registers** for notes on accessing registers.

This register is set to 00h by an RTC software reset.

Access Size : 8 bits
Address : <RTC_base> + 10h
Initial Value : xxh



Bit	Bit Name	Initial Value	RW	Description
7	ENB	x	RW	0b: The register value is not compared with the RSECCNT counter value. 1b: The register value is compared with the RSECCNT counter value.
6 to 4	SEC10[2:0]	x	RW	Value for the tens place of seconds
3 to 0	SEC1[3:0]	x	RW	Value for the ones place of seconds

x: Undefined value

b. In binary count mode

The BCNT0AR counter is a readable/writable alarm register corresponding to 32-bit binary counter b7 to b0.

This register is set to 00h by an RTC software reset.

Access Size : 8 bits
Offset Address : <RTC_base> + 10h
Initial Value : xxh

Bit	7	6	5	4	3	2	1	0
	BCNTAR[7:0]							
Initial Value	x	x	x	x	x	x	x	x
RW	RW	RW	RW	RW	RW	RW	RW	RW

5.3.2.2.10 Minute Alarm Register (RTC_RMINAR)/Binary Counter 1 Alarm Register (RTC_BCNT1AR)

a. In calendar count mode

The RMINAR register is an alarm register corresponding to the BCD-coded minute counter RMINCNT. When the ENB bit is set to 1, the RMINAR value is compared with the RMINCNT value. From among the alarm registers (RSECAR, RMINAR, RHRAR, RWKAR, RDAYAR, RMONAR, and RYRAREN), only those selected with the ENB bits set to 1 are compared with the corresponding counters. When the respective values all match, the alarm flag of RSR corresponding to the ALM interrupt is set to 1.

RMINAR values from 00 through 59 (in BCD) can be specified; if a value outside of this range is specified, the RTC does not operate correctly.

After writing to the RMINAR register, confirm that its value has actually changed before proceeding with further processing. Refer to **5.3.6.4 Notes on Writing to and Reading from Registers** for notes on accessing registers.

This register is set to 00h by an RTC software reset.

Access Size : 8 bits
Address : <RTC_base> + 12h
Initial Value : xxh

Bit	7	6	5	4	3	2	1	0
	ENB	MIN10[2:0]			MIN1[3:0]			
Initial Value	x	x	x	x	x	x	x	x
RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	RW	Description
7	ENB	x	RW	0b: The register value is not compared with the RMINCNT counter value. 1b: The register value is compared with the RMINCNT counter value.
6 to 4	MIN10[2:0]	x	RW	Value for the tens place of minutes
3 to 0	MIN1[3:0]	x	RW	Value for the ones place of minutes

x: Undefined value

b. In binary count mode

The BCNT1AR counter is a readable/writable alarm register corresponding to 32-bit binary counter b15 to b8.

This register is set to 00h by an RTC software reset.

Access Size : 8 bits
Offset Address : <RTC_base> + 12h
Initial Value : xxh

Bit	7	6	5	4	3	2	1	0
	BCNTAR[7:0]							
Initial Value	x	x	x	x	x	x	x	x
RW	RW	RW	RW	RW	RW	RW	RW	RW

5.3.2.2.11 Hour Alarm Register (RTC_RHRAR)/Binary Counter 2 Alarm Register (RTC_BCNT2AR)

a. In calendar count mode

The RHRAR register is an alarm register corresponding to the BCD-coded hour counter RHRCNT. When the ENB bit is set to 1, the RHRAR value is compared with the RHRCNT value. From among the alarm registers (RSECAR, RMINAR, RHRAR, RWKAR, RDAYAR, RMONAR, and RYRAREN), only those selected with the ENB bits set to 1 are compared with the corresponding counters. When the respective values all match, the alarm flag of RSR corresponding to the ALM interrupt is set to 1.

The specifiable time differs according to the setting in the hours mode bit (RCR2.HR24).

- When the RCR2.HR24 bit is 0: From 00 to 11 (in BCD)
- When the RCR2.HR24 bit is 1: From 00 to 23 (in BCD)

If a value outside of this range is specified, the RTC does not operate correctly.

- When the RCR2.HR24 bit is 0, be sure to set the PM bit.
- When the RCR2.HR24 bit is 1, the setting in the PM bit has no effect.

After writing to the RHRAR register, confirm that its value has actually changed before proceeding with further processing. Refer to **5.3.6.4 Notes on Writing to and Reading from Registers** for notes on accessing registers.

This register is set to 00h by an RTC software reset.

Access Size : 8 bits
Address : <RTC_base> + 14h
Initial Value : xxh

Bit	7	6	5	4	3	2	1	0
	ENB	PM	HR10[1:0]		HR1[3:0]			
Initial Value	x	x	x	x	x	x	x	x
RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	RW	Description
7	ENB	x	RW	0b: The register value is not compared with the RHRCNT counter value. 1b: The register value is compared with the RHRCNT counter value.
6	PM	x	RW	Time Alarm Setting for a.m./p.m. 0b: a.m. 1b: p.m.
5, 4	HR10[1:0]	x	RW	Value for the tens place of hours
3 to 0	HR1[3:0]	x	RW	Value for the ones place of hours

x: Undefined value

b. In binary count mode

The BCNT2AR counter is a readable/writable alarm register corresponding to 32-bit binary counter b23 to b16.

This register is set to 00h by an RTC software reset.

Access Size : 8 bits
Offset Address : <RTC_base> + 14h
Initial Value : xxh

Bit	7	6	5	4	3	2	1	0
	BCNTAR[7:0]							
Initial Value	x	x	x	x	x	x	x	x
RW	RW	RW	RW	RW	RW	RW	RW	RW

5.3.2.2.12 Day-of-Week Alarm Register (RTC_RWKAR)/Binary Counter 3 Alarm Register (RTC_BCNT3AR)

a. In calendar count mode

The RWKAR register is an alarm register corresponding to the coded day-of-week counter RWKCNT. When the ENB bit is set to 1, the RWKAR value is compared with the RWKCNT value. From among the alarm registers (RSECAR, RMINAR, RHRAR, RWKAR, RDAYAR, RMONAR, and RYRAREN), only those selected with the ENB bits set to 1 are compared with the corresponding counters. When the respective values all match, the alarm flag of RSR corresponding to the ALM interrupt is set to 1.

RWKAR values from 0 through 6 (in BCD) can be specified; if a value outside of this range is specified, the RTC does not operate correctly.

After writing to the RWKAR register, confirm that its value has actually changed before proceeding with further processing. Refer to **5.3.6.4 Notes on Writing to and Reading from Registers** for notes on accessing registers.

This register is set to 00h by an RTC software reset.

Access Size : 8 bits
Address : <RTC_base> + 16h
Initial Value : xxh

Bit	7	6	5	4	3	2	1	0
	ENB	-	-	-	-	DAYW[2:0]		
Initial Value	x	0	0	0	0	x	x	x
RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	RW	Description
7	ENB	x	RW	0b: The register value is not compared with the RWKCNT counter value. 1b: The register value is compared with the RWKCNT counter value.
6 to 3	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
2 to 0	DAYW[2:0]	x	RW	000b: Sunday 001b: Monday 010b: Tuesday 011b: Wednesday 100b: Thursday 101b: Friday 110b: Saturday 111b: Setting prohibited

x: Undefined value

b. In binary count mode

The BCNT3AR counter is a readable/writable alarm register corresponding to 32-bit binary counter b31 to b24.

This register is set to 00h by an RTC software reset.

Access Size : 8 bits
Offset Address : <RTC_base> + 16h
Initial Value : xxh

Bit	7	6	5	4	3	2	1	0
	BCNTAR[7:0]							
Initial Value	x	x	x	x	x	x	x	x
RW	RW	RW	RW	RW	RW	RW	RW	RW

5.3.2.2.13 Date Alarm Register (RTC_RDAYAR)/Binary Counter 0 Alarm Enable Register (RTC_BCNT0AER)

a. In calendar count mode

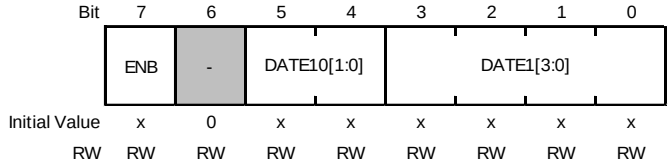
The RDAYAR register is an alarm register corresponding to the BCD-coded date counter RDAYCNT. When the ENB bit is set to 1, the RDAYAR value is compared with the RDAYCNT value. From among the alarm registers (RSECAR, RMINAR, RHRAR, RWKAR, RDAYAR, RMONAR, and RYRAREN), only those selected with the ENB bits set to 1 are compared with the corresponding counters. When the respective values all match, the alarm flag of RSR corresponding to the ALM interrupt is set to 1.

RDAYAR values from 01 through 31 (in BCD) can be specified; if a value outside of this range is specified, the RTC does not operate correctly.

After writing to the RDAYAR register, confirm that its value has actually changed before proceeding with further processing. Refer to **5.3.6.4 Notes on Writing to and Reading from Registers** for notes on accessing registers.

This register is set to 00h by an RTC software reset.

Access Size : 8 bits
Address : <RTC_base> + 18h
Initial Value : xxh



Bit	Bit Name	Initial Value	RW	Description
7	ENB	x	RW	0b: The register value is not compared with the RDAYCNT counter value. 1b: The register value is compared with the RDAYCNT counter value.
6	-	0h	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
5, 4	DATE10[1:0]	x	RW	Value for the tens place of days
3 to 0	DATE1[3:0]	x	RW	Value for the ones place of days

x: Undefined value

b. In binary count mode

The BCNT0AER register is a readable/writable register for setting the alarm enable corresponding to 32-bit binary counter b7 to b0. Among the ENB[31:0] bits, the binary counter (BCNT[31:0]) corresponding to the bits which are set to 1 and the binary alarm register (BCNTAR[31:0]) are compared, and when all match, the IR (alarm of RSR) flag corresponding to the ALM interrupt becomes 1.

This register is set to 00h by an RTC software reset.

Access Size : 8 bits
Offset Address : <RTC_base> + 18h
Initial Value : xxh

Bit	7	6	5	4	3	2	1	0
	ENB[7:0]							
Initial Value	x	x	x	x	x	x	x	x
RW	RW	RW	RW	RW	RW	RW	RW	RW

5.3.2.2.14 Month Alarm Register (RTC_RMONAR)/Binary Counter 1 Alarm Enable Register (RTC_BCNT1AER)

a. In calendar count mode

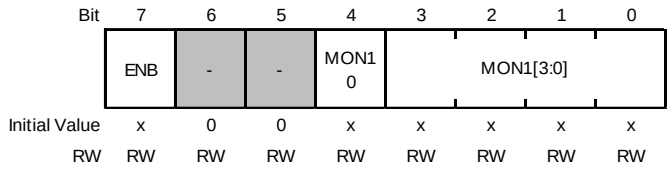
The RMONAR register is an alarm register corresponding to the BCD-coded month counter RMONCNT. When the ENB bit is set to 1, the RMONAR value is compared with the RMONCNT value. From among the alarm registers (RSECAR, RMINAR, RHRAR, RWKAR, RDAYAR, RMONAR, and RYRAREN), only those selected with the ENB bits set to 1 are compared with the corresponding counters. When the respective values all match, the alarm flag of RSR corresponding to the ALM interrupt is set to 1.

RMONAR values from 01 through 12 (in BCD) can be specified; if a value outside of this range is specified, the RTC does not operate correctly.

After writing to the RMONAR register, confirm that its value has actually changed before proceeding with further processing. Refer to **5.3.6.4 Notes on Writing to and Reading from Registers** for notes on accessing registers.

This register is set to 00h by an RTC software reset.

Access Size : 8 bits
Address : <RTC_base> + 1Ah
Initial Value : xxh



Bit	Bit Name	Initial Value	RW	Description
7	ENB	x	RW	0b: The register value is not compared with the RMONCNT counter value. 1b: The register value is compared with the RMONCNT counter value.
6, 5	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
4	MON10	x	RW	Value for the tens place of months
3 to 0	MON1[3:0]	x	RW	Value for the ones place of months

x: Undefined value

b. In binary count mode

The BCNT1AER register is a readable/writable register for setting the alarm enable corresponding to 32-bit binary counter b15 to b8. Among the ENB[31:0] bits, the binary counter (BCNT[31:0]) corresponding to the bits which are set to 1 and the binary alarm register (BCNTAR[31:0]) are compared, and when all match, the IR (alarm of RSR) flag corresponding to the ALM interrupt becomes 1.

This register is set to 00h by an RTC software reset.

Access Size : 8 bits
Offset Address : <RTC_base> + 1Ah
Initial Value : xxh

Bit	7	6	5	4	3	2	1	0
	ENB[7:0]							
Initial Value	x	x	x	x	x	x	x	x
RW	RW	RW	RW	RW	RW	RW	RW	RW

5.3.2.2.15 Year Alarm Register (RTC_RYRAR)/Binary Counter 2 Alarm Enable Register (RTC_BCNT2AER)

a. In calendar count mode

The RYRAR register is an alarm register corresponding to the BCD-coded year counter RYRCNT.

RYRAR values from 00 through 99 (in BCD) can be specified; if a value outside of this range is specified, the RTC does not operate correctly.

After writing to the RYRAR register, confirm that its value has actually changed before proceeding with further processing. Refer to **5.3.6.4 Notes on Writing to and Reading from Registers** for notes on accessing registers.

This register is set to 0000h by an RTC software reset.

Access Size : 16 bits
Address : <RTC_base> + 1Ch
Initial Value : 00xxh

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	YR10[3:0]				YR1[3:0]			
Initial Value	0	0	0	0	0	0	0	0	x	x	x	x	x	x	x	x
RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	RW	Description
15 to 8	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
7 to 4	YR10[3:0]	x	RW	Value for the tens place of years
3 to 0	YR1[3:0]	x	RW	Value for the ones place of years

x: Undefined value

b. In binary count mode

The BCNT2AER register is a readable/writable register for setting the alarm enable corresponding to 32-bit binary counter b23 to b16. Among the ENB[31:0] bits, the binary counter (BCNT[31:0]) corresponding to the bits which are set to 1 and the binary alarm register (BCNTAR[31:0]) are compared, and when all match, the IR (alarm of RSR) flag corresponding to the ALM interrupt becomes 1.

This register is set to 0000h by an RTC software reset.

Access Size : 16 bits
Offset Address : <RTC_base> + 1Ch
Initial Value : 00xxh

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	ENB[7:0]							
Initial Value	0	0	0	0	0	0	0	0	x	x	x	x	x	x	x	x
RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

5.3.2.2.16 Year Alarm Enable Register (RTC_RYRAREN)/Binary Counter 3 Alarm Enable Register (RTC_BCNT3AER)

a. In calendar count mode

When the ENB bit in the RYRAREN register is set to 1, the RYRAR value is compared with the RYRCNT value. From among the alarm registers (RSECAR, RMINAR, RHRAR, RWKAR, RDAYAR, RMONAR, and RYRAREN), only those selected with the ENB bits set to 1 are compared with the corresponding counters. When the respective values all match, the IR (alarm of RSR) flag corresponding to the ALM interrupt is set to 1.

This register is set to 00h by an RTC software reset.

Access Size : 8 bits
Address : <RTC_base> + 1Eh
Initial Value : x0h

Bit	7	6	5	4	3	2	1	0
	ENB	-	-	-	-	-	-	-
Initial Value	x	0	0	0	0	0	0	0
RW	RW	RW	RW	RW	RW	RW	RW	RW

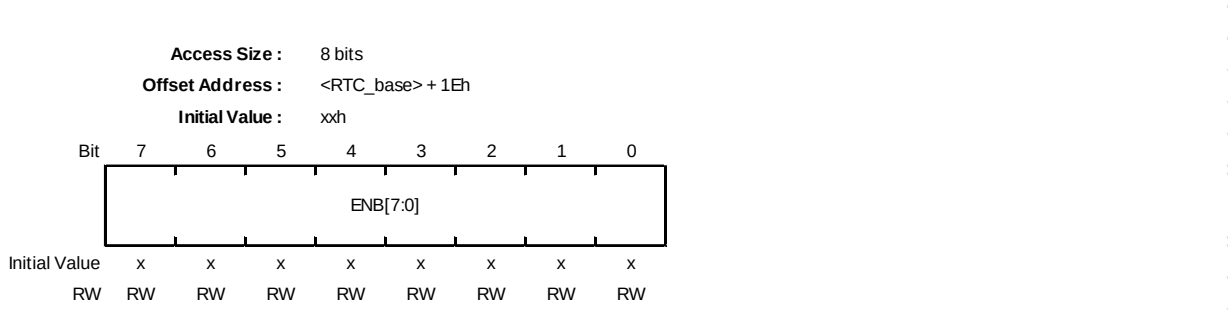
Bit	Bit Name	Initial Value	RW	Description
7	ENB	x	RW	0b: The register value is not compared with the RYRCNT counter value. 1b: The register value is compared with the RYRCNT counter value.
6 to 0	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.

x: Undefined value

b. In binary count mode

The BCNT3AER register is a readable/writable register for setting the alarm enable corresponding to 32-bit binary counter b31 to b24. Among the ENB[31:0] bits, the binary counter (BCNT[31:0]) corresponding to the bits which are set to 1 and the binary alarm register (BCNTAR[31:0]) are compared, and when all match, the alarm flag of RSR corresponding to the ALM interrupt becomes 1.

This register is set to 00h by an RTC software reset.



5.3.2.2.17 RTC Status Register (RTC_RSR)

RSR is a flag register for a periodic interrupt, carry, and alarm. This register is common to calendar count mode and binary count mode.

Each flag is set to 1 when the prescaler or clock counter matches the given interrupt setting condition. Since the prescaler, clock counter, and the setting register for each interrupt are not reset, the flag may remain set until it is read.

This register is cleared to 00h by an RTC software reset.

Access Size : 8 bits
Address : <RTC_base> + 20h
Initial Value : 0xh

Bit	7	6	5	4	3	2	1	0
	-	-	-	-	-	PF	CF	AF
Initial Value	0	0	0	0	0	x	x	x
RW	R	R	R	R	R	RW	RW	RW

Bit	Bit Name	Initial Value	RW	Description
7 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
2	PF	x*1	RW	This flag indicates the generation of an interrupt at the interval set by the RCR1.PES[3:0] bits. A periodic interrupt is generated when this flag is set to 1. Clearing condition: 0 is written to the PF flag. Setting condition: An interrupt is generated at the interval set by the RCR1.PES[3:0] bits. 0b: No interrupt is generated at the interval set by the RCR1.PES[3:0] bits. 1b: An interrupt is generated at the interval set by the RCR1.PES[3:0] bits.*1
1	CF	x*1	RW	The setting of this flag being 1 indicates the generation of a carry to the second counter/binary counter 0 or a carry to the 64-Hz counter during reading of the 64-Hz counter. A value of the counter read at this point is not guaranteed. Be sure to read the counter again in such cases. Clearing condition: 0 is written to the CF flag. Setting conditions: • A carry to the second counter/binary counter 0 or a carry to the 64-Hz counter during reading of the 64-Hz counter is generated. • 1 is written to the CF flag. 0b: A carry to the second counter/binary counter 0 or a carry to the 64-Hz counter while reading the 64-Hz counter has not occurred. 1b: A carry to the second counter/binary counter 0 or a carry to the 64-Hz counter while reading the 64-Hz counter has occurred.
0	AF	x*1	RW	This flag is set to 1 when the counter matches the alarm time set by the alarm registers (RSECAR, RMINAR, RHRAR, RWKAR. RDAYAR, RMONAR, and RYRAR in calendar count mode, and BCNT0AR, BCNT1AR, BCNT2AR, and BCNT3AR in binary count mode: only those in which the ENB bit is set to 1). Clearing condition: 0 is written to the AF flag. Setting condition: The counter matches the alarm registers (only those in which the ENB bit is set to 1). 0b: The alarm register and the counter do not match. 1b: The alarm register and the counter match.*1

x: Undefined value

Note 1. Writing 1 has no effect.

5.3.2.2.18 RTC Control Register 1 (RTC_RCR1)

The RCR1 register is used in both calendar count mode and in binary count mode.

Bits AIE, PIE, and PES[3:0] are updated synchronously with the count source. When the RCR1 register is modified, check that all the bits have been updated before proceeding to the next processing.

Access Size : 8 bits
Address : <RTC_base> + 22h
Initial Value : xxh

Bit	7	6	5	4	3	2	1	0
	PES[3:0]				-	PIE	CIE	AIE
Initial Value	x	x	x	x	0	x	0	x
RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	RW	Description
7 to 4	PES[3:0]	x	RW	0111b: A periodic interrupt is generated every 1/128 seconds. 1000b: A periodic interrupt is generated every 1/64 seconds. 1001b: A periodic interrupt is generated every 1/32 seconds. 1010b: A periodic interrupt is generated every 1/16 seconds. 1011b: A periodic interrupt is generated every 1/8 seconds. 1100b: A periodic interrupt is generated every 1/4 seconds. 1101b: A periodic interrupt is generated every 1/2 seconds. 1110b: A periodic interrupt is generated every 1 second. 1111b: A periodic interrupt is generated every 2 seconds. Other than above: No periodic interrupts are generated.
3	-	0h	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
2	PIE	x	RW	0b: A periodic interrupt request is disabled. 1b: A periodic interrupt request is enabled.
1	CIE	0h	RW	0b: A carry interrupt request is disabled. 1b: A carry interrupt request is enabled.
0	AIE	x	RW	0b: An alarm interrupt request is disabled. 1b: An alarm interrupt request is enabled.

x: Undefined value

AIE Bit (Alarm Interrupt Enable)

This bit enables or disables alarm interrupt requests.

CIE Bit (Carry Interrupt Enable)

This bit enables and disables interrupt requests when a carry to the RSECCNT/BCNT0 register occurs, or when a carry to the 64-Hz counter (R64CNT) occurs while reading the 64-Hz counter.

PIE Bit (Periodic Interrupt Enable)

This bit enables or disabled a periodic interrupt.

PES[3:0] Bits (Periodic Interrupt Select)

These bits specify the period for the periodic interrupt. A periodic interrupt is generated with the period specified by these bits.

5.3.2.2.19 RTC Control Register 2 (RTC_RCR2)

The RCR2 register is related to hours mode, automatic adjustment function, 30-second adjustment, RTC software reset, and controlling count operation.

Access Size : 8 bits
Address : <RTC_base> + 24h
Initial Value : xxh

Bit	7	6	5	4	3	2	1	0
	CNTMD	HR24	AADJP	AADJE	-	ADJ30	RESET	START
Initial Value	x	x	x	x	0	0	0	x
RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	RW	Description
7	CNTMD*3	x	RW	0b: Calendar count mode 1b: Binary count mode
6	HR24*2,*3	x	RW	0b: The RTC operates in 12-hour mode. 1b: The RTC operates in 24-hour mode.
5	AADJP*3	x	RW	0b: The RADJ.ADJ[5:0] setting value is adjusted from the count value of the prescaler every minute (every 32 seconds in binary counter mode). 1b: The RADJ.ADJ[5:0] setting value is adjusted from the count value of the prescaler every 10 seconds (every 8 seconds in binary counter mode).
4	AADJE*3	x	RW	0b: Automatic adjustment is disabled. 1b: Automatic adjustment is enabled.
3	-	0h	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
2	ADJ30*2	0h	RW	Writing 0b: Writing is invalid. 1b: 30-second adjustment is executed. Reading 0b: In normal time operation, or 30-second adjustment has completed. 1b: During 30-second adjustment
1	RESET	0h	RW	Writing 0b: Writing is invalid. 1b: The prescaler and the target registers for RTC software reset*1 are initialized. Reading 0b: In normal time operation, or an RTC software reset has completed. 1b: During an RTC software reset
0	START*3	x	RW	0b: The prescaler and counter are stopped. 1b: The prescaler and counter operate normally.

x: Undefined value

Note 1. R64CNT, RSECAR/BCNT0AR, RMINAR/BCNT1AR, RHRAR/BCNT2AR, RWKAR/BCNT3AR, RDAYAR/BCNT0AER, RMONAR/BCNT1AER, RYRAR/BCNT2AER, RYRAREN/BCNT3AER, RADJ, RTCCRn, RSECCPn/BCNT0CPn, RMINCPn/BCNT1CPn, RHRCPn/BCNT2CPn, RDAYCPn/BCNT3CPn, RMONCPn, RSR, RCR2.ADJ30, RCR2.AADJE, RCR2.AADJP

Note 2. This bit is reserved in binary counter mode. When writing to this bit, write 0.

Note 3. After writing to this bit, confirm that its value has actually changed before proceeding with further processing. Refer to **5.3.6.4 Notes on Writing to and Reading from Registers** regarding changes to the values of the AADJE, AADJP, and HR24 bits.

START Bit (Start)

This bit stops or restarts the prescaler or counter (clock) operation.

The START bit is updated in synchronization with the count source. When the START bit is modified, check that the bit is updated before proceeding to the next processing.

RESET Bit (RTC Software Reset)

This bit initializes the prescaler and registers to be reset by RTC software reset.

When 1 is written to the RESET bit, the initialization starts in synchronization with the count source. When the initialization is completed, the RESET bit is automatically set to 0.

When 1 is written to the RESET bit, check that the bit is set to 0, and then make next settings.

ADJ30 Bit (30-Second Adjustment)

This bit is for 30-second adjustment.

When 1 is written to the ADJ30 bit, the RSECCNT value of 30 seconds or less is rounded down to 00 second and the value of 30 seconds or more is rounded up to 1 minute.

The 30-second adjustment is performed in synchronization with the count source. When 1 is written to this bit, the ADJ30 bit is automatically set to 0 after the 30-second adjustment is completed. In case when 1 is written to the ADJ30 bit, check that the bit is set to 0, and then make next settings.

When the 30-second adjustment is performed, the prescaler and R64CNT are also reset.

The ADJ30 bit is set to 0 by an RTC software reset.

This bit is reserved in binary counter mode. The write value should be 0.

AADJE Bit (Automatic Adjustment Enable)

This bit controls (enables or disables) automatic adjustment.

Set the plus–minus bits (RADJ.PMADJ[1:0]) to 00b (adjustment is not performed) before changing the value of the AADJE bit.

The AADJE bit is set to 0 by an RTC software reset.

AADJP Bit (Automatic Adjustment Period Select)

This bit selects the automatic-adjustment period.

Set the plus–minus bits (RADJ.PMADJ[1:0]) to 00b (adjustment is not performed) before changing the value of the AADJP bit.

The AADJP bit is set to 0 by an RTC software reset.

HR24 Bit (Hours Mode)

This bit specifies whether the RTC will operate in 12- or 24-hour mode.

Use the START bit to stop counting by the counters before changing the value of the HR24 bit. Do not stop counting (write 0 to the START bit) and change the value of the HR24 bit at the same time.

This bit is reserved in binary counter mode. The write value should be 0.

CNTMD Bit (Count Mode Select)

This bit specifies whether the RTC count mode is operated in calendar count mode or in binary count mode.

After setting the count mode, execute an RTC software reset and start again from the initial settings.

The CNTMD bit is updated in synchronization with the count source, so when the value of the CNTMD bit has been changed, check that the value of the bit has actually been updated before applying the RTC software reset. The count mode changes to that which was specified beforehand in the CNTMD bit after the RTC software reset is applied.

For details on initial settings, refer to **5.3.3.1 Outline of Initial Settings of Registers after Power On**.

5.3.2.2.20 Time Error Adjustment Register (RTC_RADJ)

Adjustment is performed by the addition to or subtraction from the prescaler.

In case when the automatic adjustment enable (RCR2.AADJE) bit is 0, adjustment is performed when writing to the RADJ.

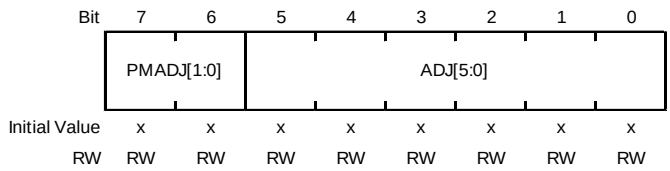
In case when the RCR2.AADJE bit is 1, adjustment is performed in the interval specified by the automatic adjustment period select (RCR2.AADJP) bit.

The current adjustment by software (disabling automatic adjustment) may be invalid if the following adjustment value is specified within 320 cycles of the count source after the register setting. To perform adjustment consecutively, wait for 320 cycles or more of the count source after the register setting and then specify the next adjustment value.

RADJ is updated in synchronization with the count source. When RADJ is modified, check that all the bits have been updated before continuing with further processing.

This register is set to 00h by an RTC software reset.

Access Size : 8 bits
Address : <RTC_base> + 2Eh
Initial Value : xxh



Bit	Bit Name	Initial Value	RW	Description
7, 6	PMADJ[1:0]	x	RW	00b: Adjustment is not performed. 01b: Adjustment is performed by addition to the prescaler. 10b: Adjustment is performed by subtraction from the prescaler. 11b: Setting prohibited
5 to 0	ADJ[5:0]	x	RW	These bits specify the adjustment value from the prescaler.

x: Undefined value

ADJ[5:0] Bits (Adjustment Value)

These bits specify the adjustment value (the number of sub-clock cycles) from the prescaler.

PMADJ[1:0] Bits (Plus–Minus)

These bits select whether the clock is set ahead or back depending on the error-adjustment value set in the ADJ[5:0] bits.

5.3.3 Operation

5.3.3.1 Outline of Initial Settings of Registers after Power On

After the power is turned on, the initial settings for the clock setting, count mode setting, time error adjustment, time setting, alarm, interrupt, and time capture control register should be performed.

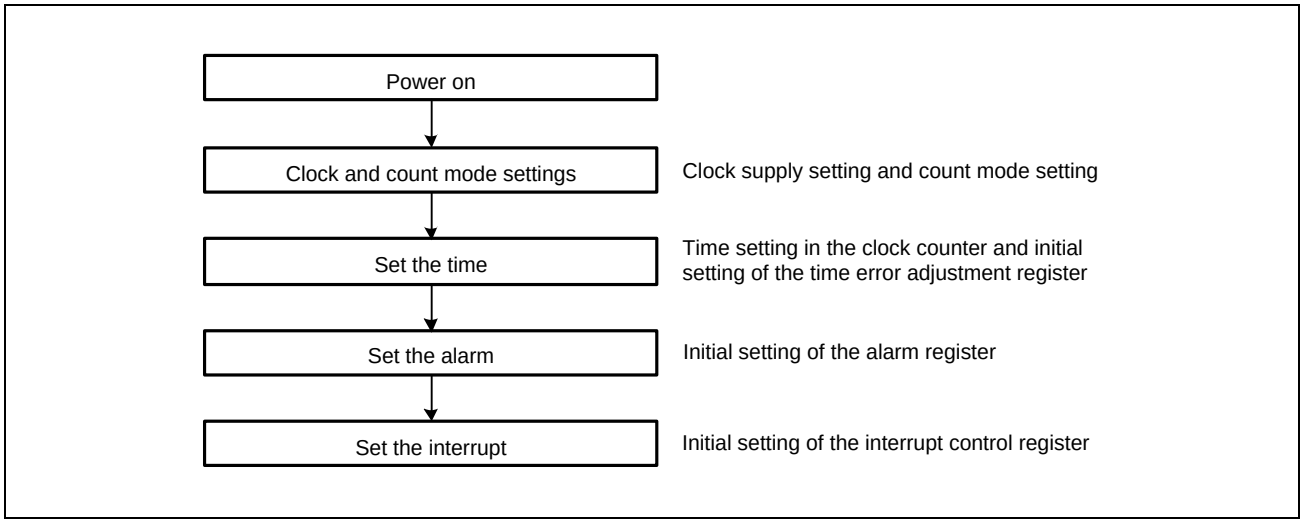


Figure 5.3-2 Outline of Initial Settings after Power On

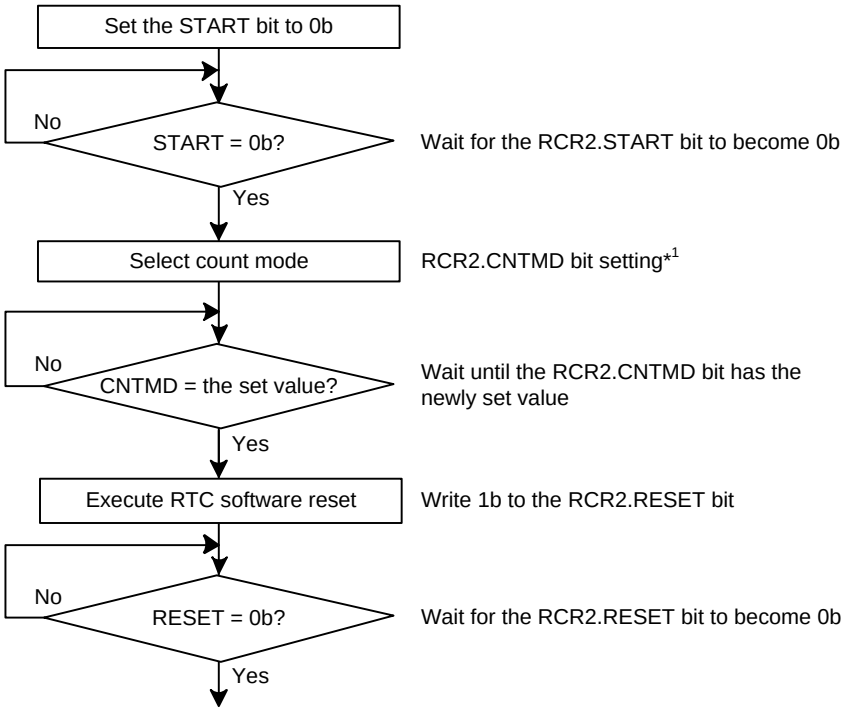
5.3.3.2 Clock and Count Mode Setting Procedure

Figure 5.3-3 shows how to set the clock and the count mode.

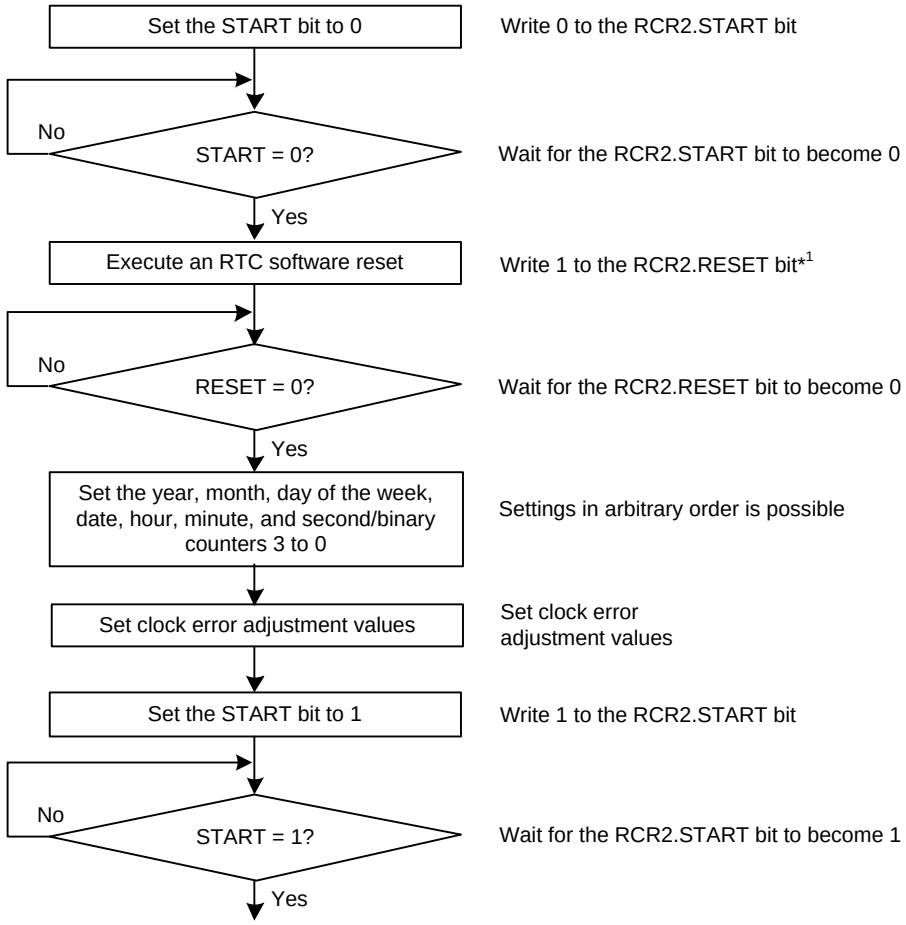


Note 1. This step is not necessary if the count mode has been set concurrently with setting the START bit to 0. A value corresponding to the count mode setting must be written to the RCR2.CNTMD bit.

Figure 5.3-3 Clock and Count Mode Setting Procedure

5.3.3.3 Setting the Time

Figure 5.3-4 shows how to set the time.



Note 1. This step is not necessary for the time-setting procedure because an RTC software reset is executed in the clock setting procedure of the initial settings for the power supply.

Figure 5.3-4 Setting the Time

5.3.3.4 30-Second Adjustment

Figure 5.3-5 shows how to execute 30-second adjustment.

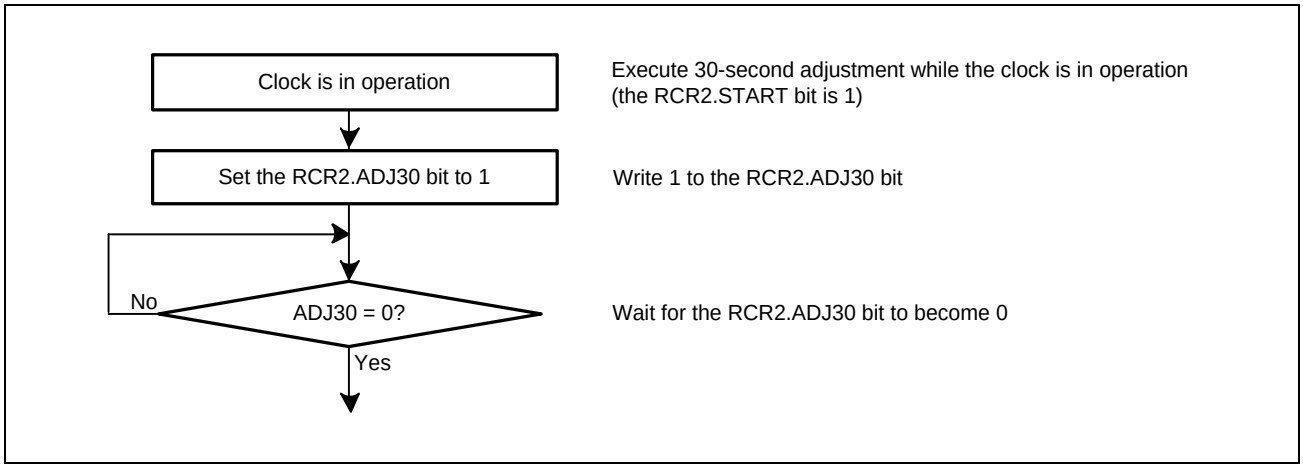


Figure 5.3-5 30-Second Adjustment

5.3.3.5 Reading 64-Hz Counter and Time

Figure 5.3-6 shows how to read the 64-Hz counter and time.

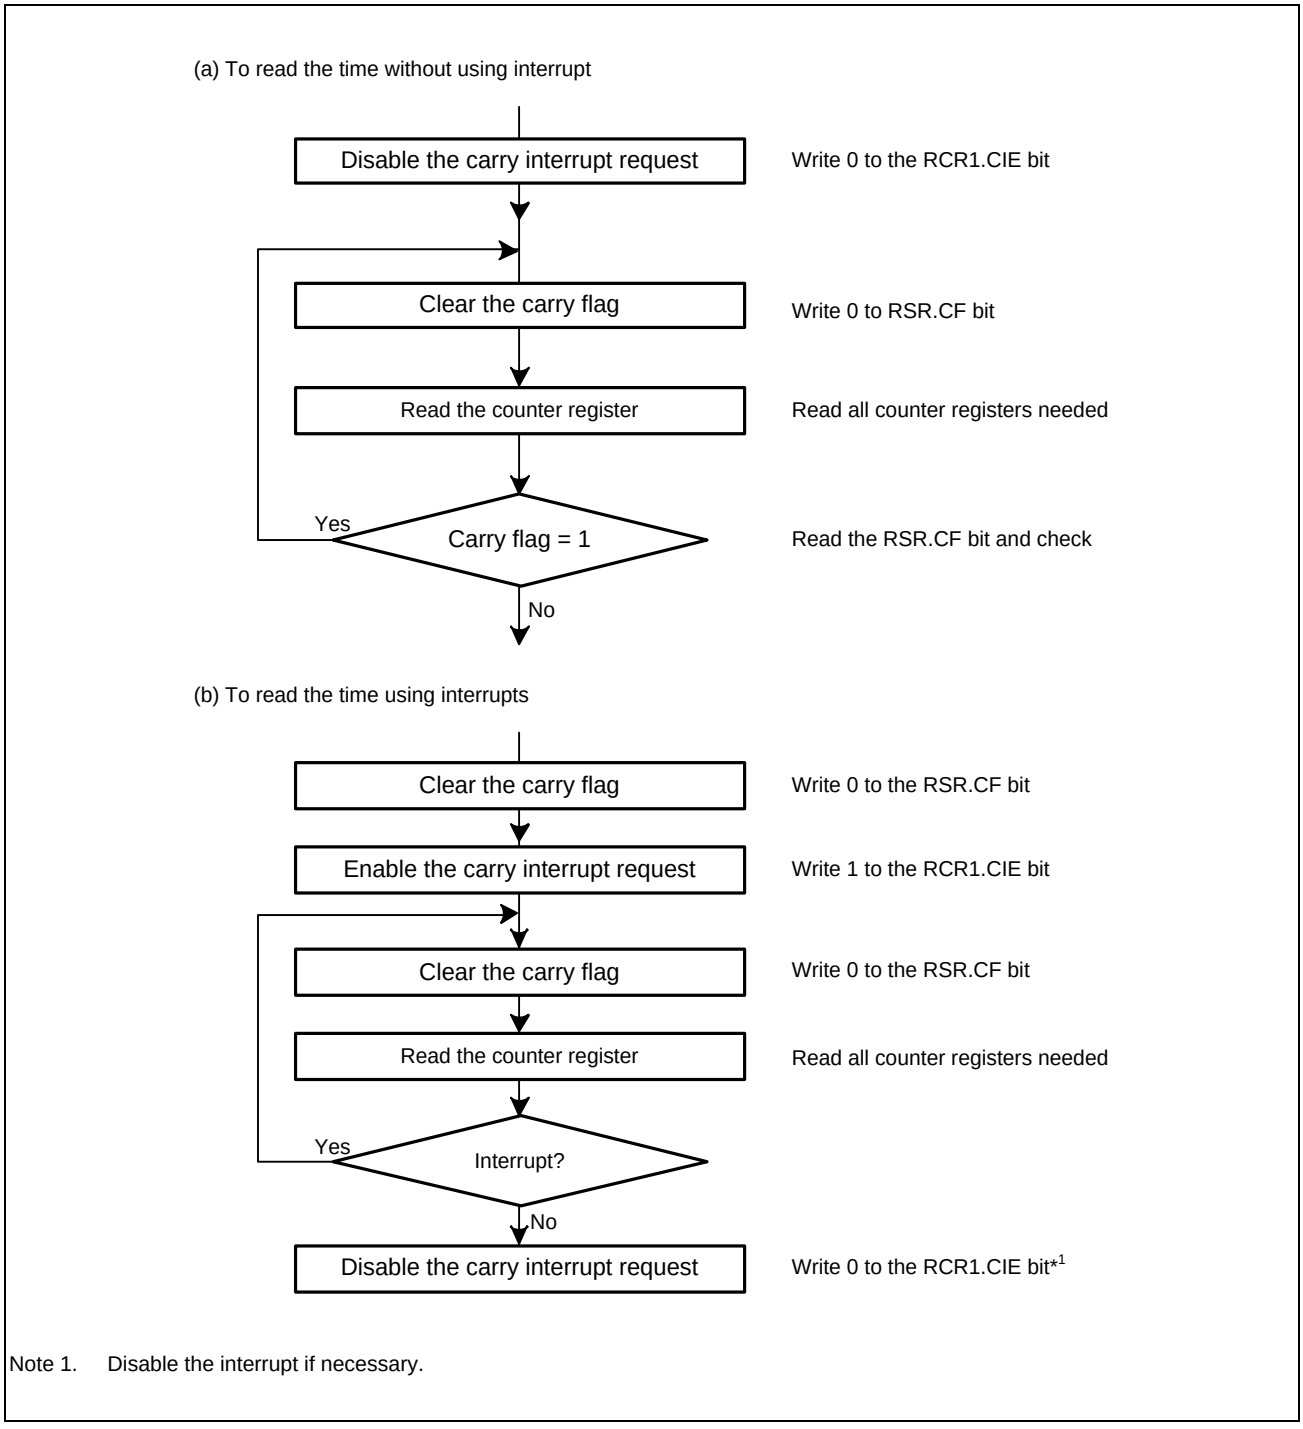

Figure 5.3-6 Reading Time

If a carry occurs while the 64-Hz counter and time are being read, the correct time will not be obtained, so they must be read again. The procedure for reading the time without using interrupts is shown in (a) in **Figure 5.3-6**, and the procedure using carry interrupts in (b). To keep the program simple, method (a) should be used in most cases.

5.3.3.6 Alarm Function

Figure 5.3-7 shows how to use the alarm function.

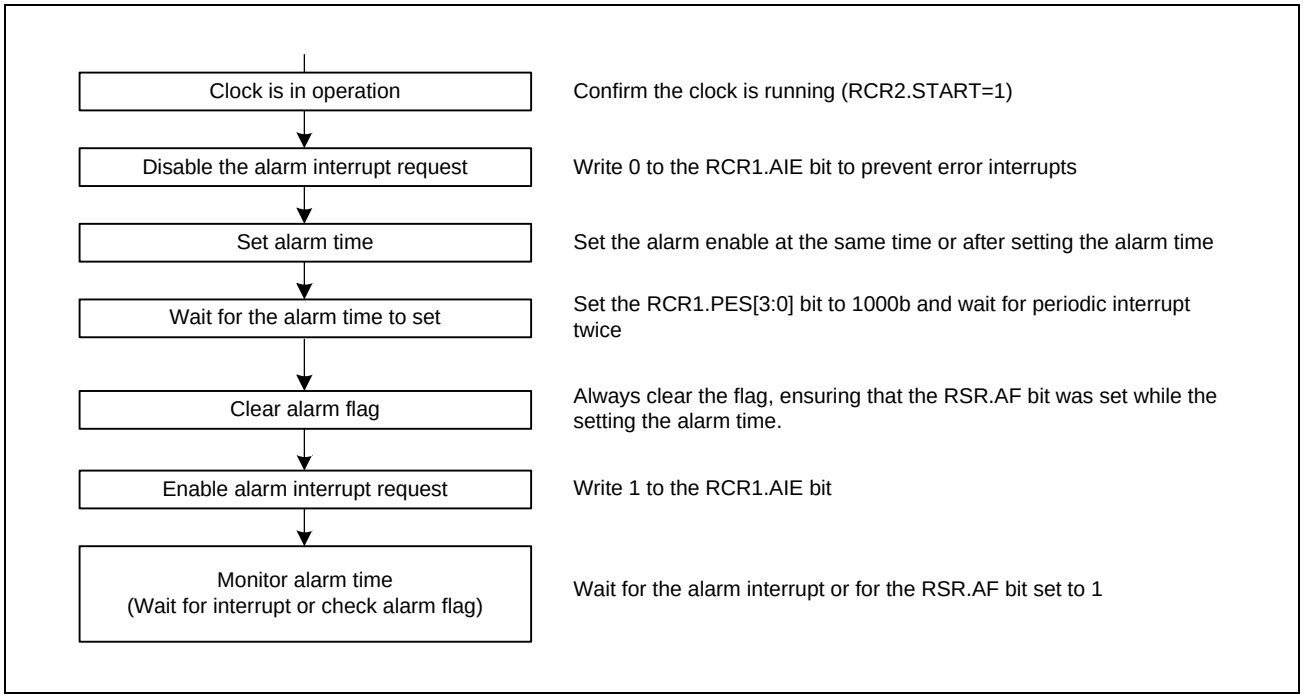

Figure 5.3-7 Using Alarm Function

In calendar count mode, an alarm can be generated by any one of year, month, date, day-of-week, hour, minute or second, or any combination of those. Write 1 to the ENB bit in the alarm registers involved in the alarm setting, and set the alarm time in the lower bits. Write 0b to the ENB bit in registers not involved in the alarm setting.

In binary count mode, an alarm can be generated in any bit combination of 32 bits. Write 1b to the ENB bit of the alarm enable register corresponding to the target bit of the alarm, and set the alarm time to the alarm register. For bits that are not target of the alarm, write 0b to the ENB bit of the alarm enable register.

When the counter and the alarm time match, the alarm flag of RSR is set to 1. Alarm detection can be confirmed by reading this flag, but an interrupt should be used in most cases. If 1 has been written to the RCR1.AIE bit, an alarm interrupt is generated in the event of alarm, enabling the alarm to be detected.

Writing 0b to the alarm flag of RSR clears it to 0b.

5.3.3.7 Time Error Adjustment Function

The time error adjustment function is used to correct errors (running fast or slow) in the time due to the precision of oscillation by the RTC.

Since 32,768 cycles of the RTC constitute 1 second of operation, the clock runs fast if the RTC frequency is high and slow if the RTC frequency is low. This function can be used to correct errors by advancing or delaying the clock.

Two types of time error adjustment functions are provided: automatic adjustment and adjustment by software.

Use the RCR2.AADJE bit to select automatic adjustment or adjustment by software.

5.3.3.7.1 Automatic adjustment

Enable automatic adjustment by setting the RCR2.AADJE bit to 1.

Automatic adjustment is the addition or subtraction of the value counted by the prescaler to or from the value in the RADJ register every time the adjustment period selected by the RCR2.AADJE bit elapses.

Examples are shown below.

[*Example 1*] RTC running at 32.769 kHz

Adjustment procedure:
When the RTC is running at 32.769 kHz, 1 second elapses every 32,769 clock cycles. The RTC is meant to run at 32,768 clock cycles, so the clock runs fast by one clock cycle every second. The time on the clock is fast by 60 clock cycles per minute, so adjustment can take the form of setting the clock back by 60 cycles every minute.

Register settings: (when RCR2.CNTMD = 0)

- RCR2.AADJP = 0b (adjustment every minute)
- RADJ.PMADJ[1:0] = 10b (adjustment is performed by the subtraction from the prescaler.)
- RADJ.ADJ[5:0] = 60 (3Ch)

[*Example 2*] RTC running at 32.766 kHz

Adjustment procedure:
When the RTC is running at 32.766 kHz, 1 second elapses every 32,766 clock cycles. The RTC is meant to run at 32,768 clock cycles, so the clock runs slow by two clock cycles every second. The time on the clock is slow by 20 clock cycles every 10 seconds, so adjustment can take the form of setting the clock forward by 20 cycles every 10 seconds.

Register settings: (when RCR2.CNTMD = 0)

- RCR2.AADJP = 1b (adjustment every 10 seconds)
- RADJ.PMADJ[1:0] = 01b (adjustment is performed by the addition to the prescaler.)
- RADJ.ADJ[5:0] = 20 (14h)

[*Example 3*] RTC running at 32.764 kHz

Adjustment procedure:
When the RTC is running at 32.764 kHz, 1 second elapses on 32,764 clock cycles. Since the RTC operates for 32,768 clock cycles as 1 second, the clock is delayed for four clock cycles per second. In 8 seconds, the delay is 32 clock cycles, so correction can be made by proceeding the clock for 32 clock cycles every 8 seconds.

Register settings when the RCR2.CNTMD bit is 1

- RCR2.AADJP = 1b (adjustment every 8 seconds)
- RADJ.PMADJ[1:0] = 01b (adjustment is performed by the addition to the prescaler.)
- RADJ.ADJ[5:0] = 32 (20h)

5.3.3.7.2 Adjustment by software

Enable adjustment by software by setting the RCR2.AADJE bit to 0b.

Adjustment by software is the addition or subtraction of the value counted by the prescaler to or from the value in the RADJ register at the time of execution of an instruction for writing to the RADJ register.

An example is shown below.

[*Example 1*] RTC running at 32.769 kHz

Adjustment procedure:
When the RTC is running at 32.769 kHz, 1 second elapses every 32,769 clock cycles. The RTC is meant to run at 32,768 clock cycles, so the clock runs fast by one clock cycle every second. The time on the clock is fast by one clock cycle per second, so adjustment can take the form of setting the clock back by one cycle every second.

Register settings:

- RADJ.PMADJ[1:0] = 10b (adjustment is performed by the subtraction from the prescaler.)
- RADJ.ADJ[5:0] = 1 (01h)
  This is written to the RADJ register once per 1-second interrupt.

5.3.3.7.3 Procedure for changing the mode of adjustment

When changing the mode of adjustment, change the value of the AADJE bit in RCR2 after setting the RADJ.PMADJ[1:0] bits to 00b (adjustment is not performed).

Changing from adjustment by software to automatic adjustment:

(1) Set the RADJ.PMADJ[1:0] bits to 00b (adjustment is not performed).

(2) Set the RCR2.AADJE bit to 1b (automatic adjustment is enabled).

(3) Use the RCR2.AADJP bit to select the period of adjustment.

(4) In RADJ, set the PMADJ[1:0] bits for addition or subtraction and the ADJ[5:0] bits to the value for use in time error adjustment.

Changing from adjustment by software to automatic adjustment:

(1) Set the RADJ.PMADJ[1:0] bits to 00b (adjustment is not performed).

(2) Set the RCR2.AADJE bit to 0b (adjustment by software is enabled).

(3) Proceed with adjustment by setting the RADJ.PMADJ[1:0] bits for addition or subtraction and the RADJ.ADJ[5:0] bits to the value for use in time error adjustment at the desired time. After that, the time is adjusted every time a value is written to the RADJ register.

5.3.3.7.4 Procedure for stopping adjustment

To stop adjustment, set the RADJ.PMADJ[1:0] bits to 00b (adjustment is not performed).

5.3.4 Interrupt Sources

There are three interrupt sources in the RTC. **Table 5.3-4** lists interrupt sources for the RTC.

Table 5.3-4 RTC Interrupt Sources

Name	Interrupt Sources
ALM	Alarm interrupt
PRD	Periodic interrupt
CUP	Carry interrupt

5.3.4.1 Alarm Interrupt (ALM)

This interrupt is generated according to the result of comparison between the alarm registers and RTC counters (for details, refer to **5.3.3.6 Alarm Function**).

Since the interrupt flag may be set to 1 when the settings of the alarm registers match the clock counters, wait for the alarm time settings to be confirmed and set the alarm flag of RSR to 0 again after changing the values of the alarm registers. Once the interrupt flag for the alarm interrupt has been set to 1 and the state has returned to non-matching of the alarm registers and clock counters, the flag will not be set again until there is a further match or the values of the alarm registers are modified again.

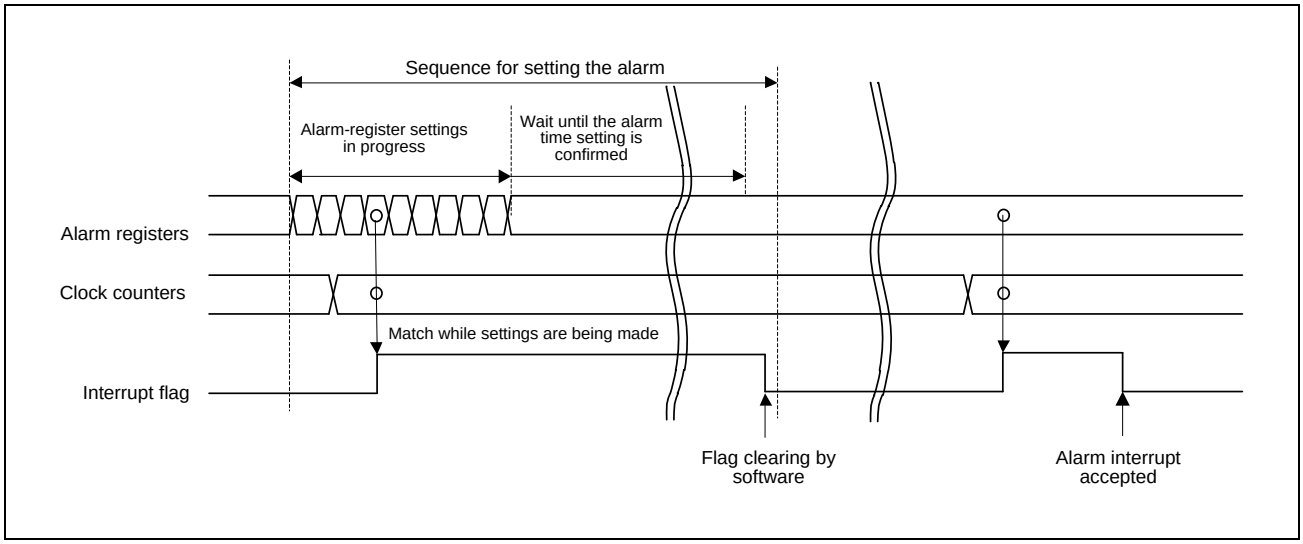

Figure 5.3-8 Timing Chart for the Alarm Interrupt (ALM)

5.3.4.2 Periodic Interrupt (PRD)

This interrupt is generated at intervals of 2 seconds, 1 second, 1/2 seconds, 1/4 seconds, 1/8 seconds, 1/16 seconds, 1/32 seconds, 1/64 seconds, or 1/128 seconds. The interrupt interval can be selected through the RCR1.PES[3:0] bits.

5.3.4.3 Carry Interrupt (CUP)

This interrupt is generated when a carry to the second counter/binary counter 0 occurred or a carry to the R64CNT counter occurred during read access to the 64-Hz counter.

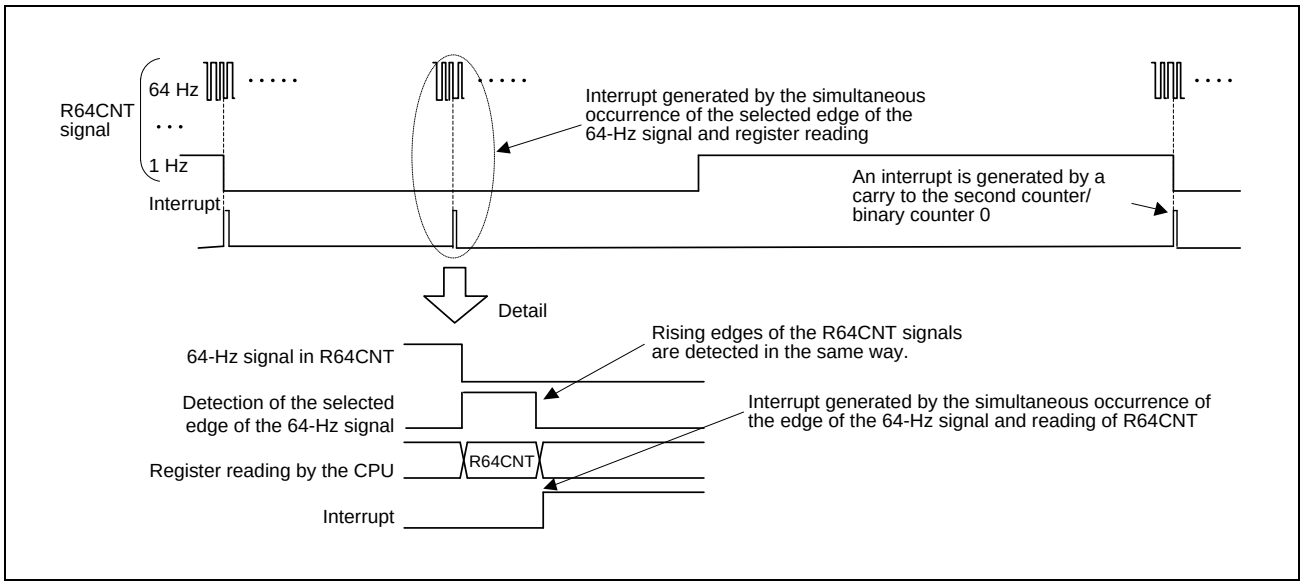

Figure 5.3-9 Carry Interrupt (CUP) Timing Chart

5.3.5 Event Link Output

This module is able to output interrupt source signals as event signals to the event link controller (ELC) to operate modules selected in advance.

(1) Alarm event output

The alarm registers (the year, month, day of the week, date, hour, minute, second/binary counters 3 to 0) selected with the ENB bits set to 1 are compared with the corresponding clock counters. When all values match, an alarm event is output.

Since unintended events as well as interrupts may be generated while the alarm registers are being set, wait for the alarm time settings to be confirmed before making the ELC settings.

(2) Periodic event output

The periodic event signal is output at the interval selected by the setting of the RCR1.PES[3:0] bits (2, 1, 1/2, 1/4, 1/8, 1/16, 1/32, 1/64, or 1/128 seconds).

Since unintended events as well as interrupts may be generated while the event generation interval is selected, select the interval before making the ELC settings. The event generation interval immediately after it has been selected is not guaranteed.

(3) Carry event output

A carry event is output when a carry to the second counter/binary counter 0 has occurred or reading of the 64-Hz counter has coincided with a carry to the R64CNT counter.

NOTE

If event linking from the RTC is to be used, only make the ELC settings after making the RTC settings (initialization, time settings, etc.). Making the RTC settings after the ELC settings can lead to the output of unexpected event signals.

5.3.5.1 Interrupt Handling and Event Linking

Each of the alarm, periodic, and carry interrupts of the RTC has an enable bit to control enabling or disabling of the interrupt signal. An interrupt request signal is output for the CPU when an interrupt source condition is satisfied while the setting of the corresponding enable bit is enabled.

In contrast, an event link output signal is sent to other modules as an event signal via the ELC when an interrupt source is generated, regardless of the setting of the corresponding interrupt enable bit.

NOTE

Although alarm and periodic interrupts can still be output during software standby, the periodic event signals for the ELC are not output.

5.3.6 Usage Notes

5.3.6.1 Register Writing during Counting

The following registers should not be written to during counting (while the RCR2.START bit = 1).

RSECCNT/BCNT0, RMINCNT/BCNT1, RHRCNT/BCNT2, RDAYCNT, RWKCNT/BCNT3, RMONCNT, RYRCNT, RCR1.RTCOS, RCR2.RTCOE, RCR2.HR24

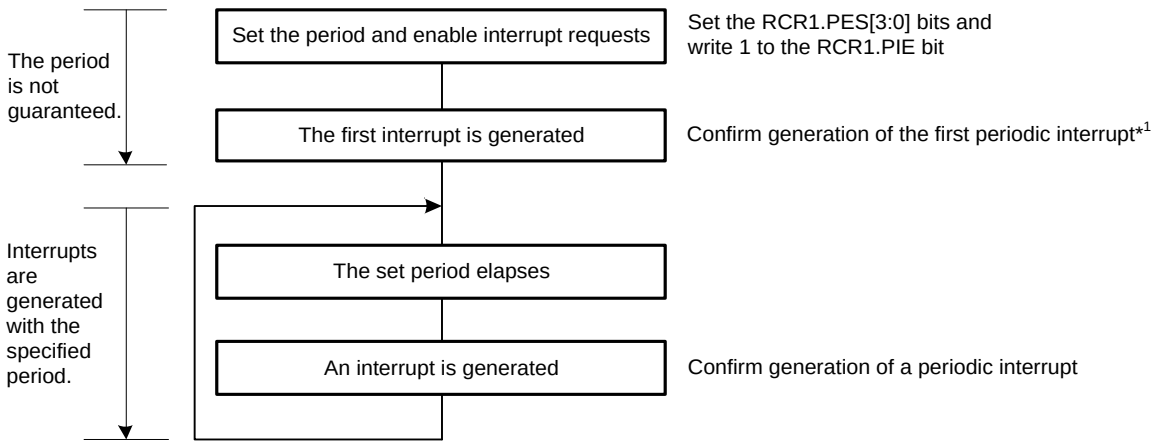
The counter must be stopped before writing to any of the above registers.

5.3.6.2 Use of Periodic Interrupts

The procedure for using periodic interrupts is shown in **Figure 5.3-10**.

The generation and period of the periodic interrupt can be changed by the setting of the RCR1.PES[3:0] bits. However, since the prescaler, R64CNT, and RSECCNT/BCNT0 are used to generate interrupts, the interrupt period is not guaranteed immediately after setting of the RCR1.PES[3:0] bits.

Furthermore, stopping/restarting or resetting counter operation, reset by RTC software, and the 30-second adjustment by changing the RCR2 value affects the interrupt period. When the time error adjustment function is used, the interrupt generation period after adjustment is added or subtracted according to the adjustment value.



Note 1. When an interrupt generation period is changed while the periodic interrupt is used, an interrupt may be generated at the completion of the setting. If the interrupt is generated immediately after the setting, the period is not guaranteed for two interrupts including the current interrupt.

Figure 5.3-10 Using Periodic Interrupt Function

5.3.6.3 Transitions to Low Power Consumption Modes after Setting Registers

A transition to a low power consumption state (software standby mode) during writing to or updating of an RTC register might destroy the register's value. After setting a register, confirm that the setting is in place before initiating a transition to a low power consumption state.

5.3.6.4 Notes on Writing to and Reading from Registers

- When reading a counter register such as the second counter after having written to the counter register, follow the procedure in **5.3.3.5 Reading 64-Hz Counter and Time**.
- The value written to the count registers, alarm registers, year alarm enable register, bits RCR2.AADJE, AADJP, and HR24, r is reflected when four read operations are performed after writing.
- The values written to the RTC Statas Register and RTC Control Register 1.CIE bits can be read immediately after writing.
- To read the value from the timer counter after return from a reset, or software standby mode, wait for 1/128 second while the clock is operating (RCR2.START bit = 1b).
- After a reset is generated, write to the RTC register when six cycles of the count source have elapsed.

5.3.6.5 Changing the Count Mode

When changing the count mode (calendar/binary), set the RCR2.START bit to 0b, stop counting operation, then start again from the initial settings. For details on the initial settings, refer to **5.3.3.1 Outline of Initial Settings of Registers after Power On**.

5.3.6.6 Initialization Procedure When the RTC is Not to be Used

Registers in the RTC are not initialized by a reset. Accordingly, depending on the initial state, the generation of an unintentional interrupt request or operation of the counter may lead to increased power consumption.

For products that do not require a RTC, initialize the registers by following the initialization procedure shown in **Figure 5.3-11**.

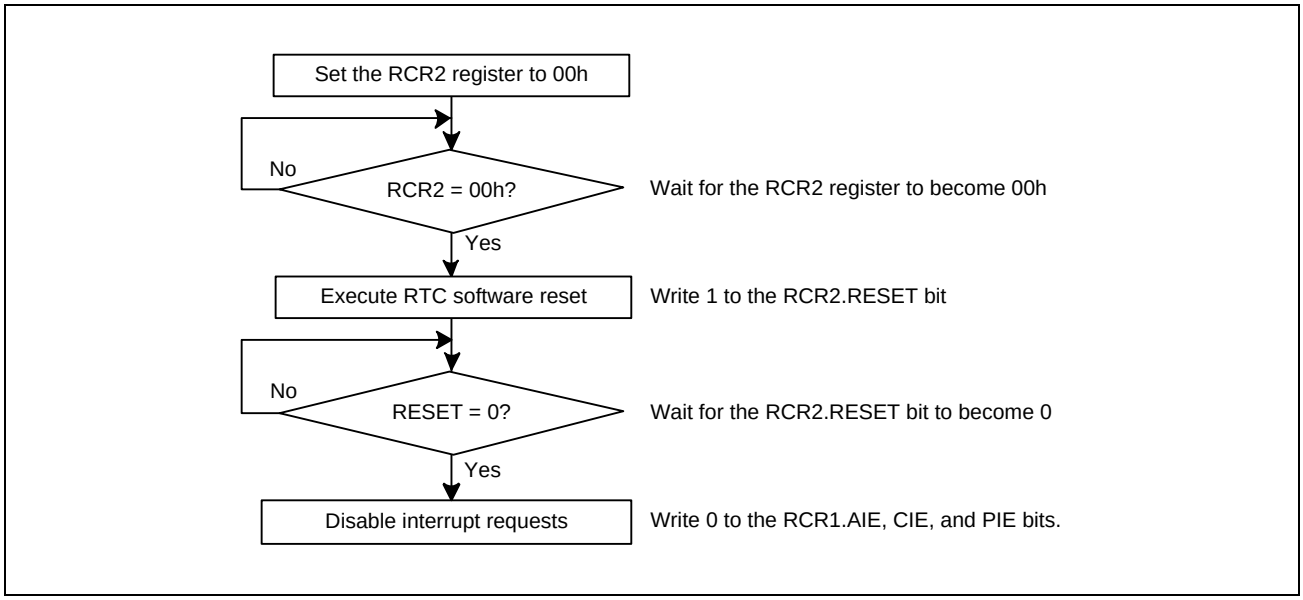


Figure 5.3-11 Initialization Procedure

SECTION 5 TIMER

5.4 Watchdog Timer (WDT)

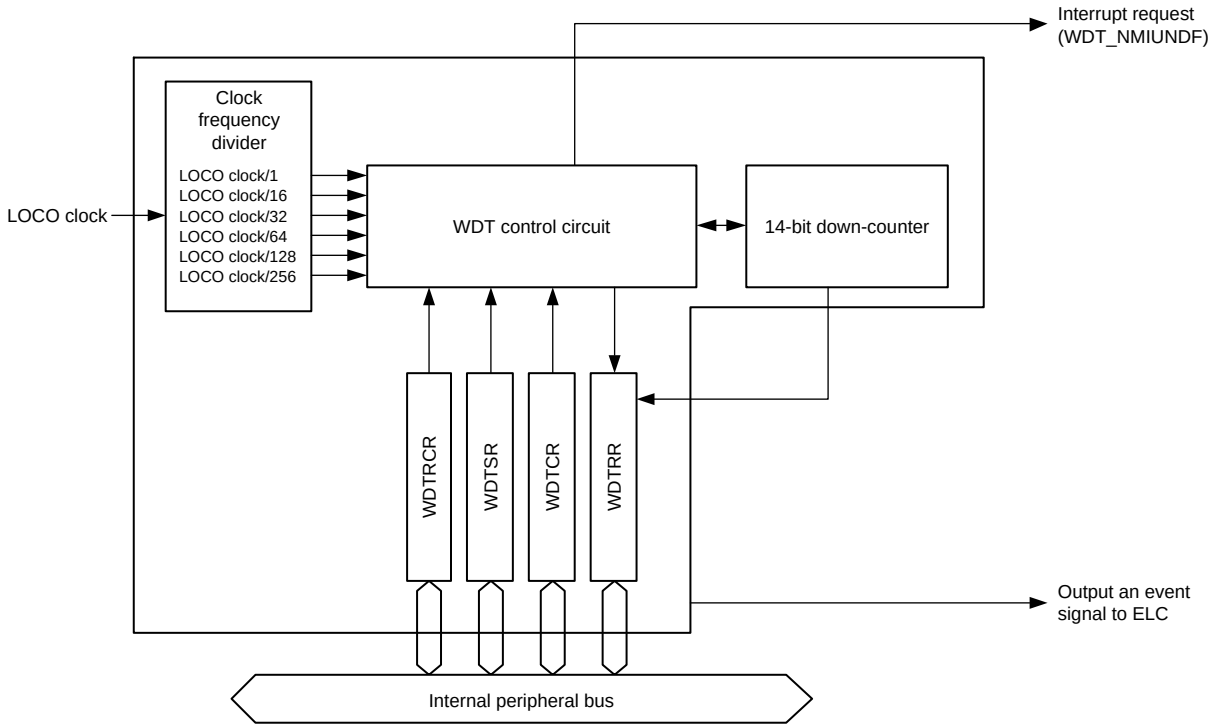
5.4.1 Overview

The Watchdog Timer (WDT) is a 14-bit down counter that can be used to reset this LSI when the counter underflows because the system has run out of control and is unable to refresh the WDT. In addition, the WDT can be used to generate a non-maskable interrupt or an underflow interrupt.

Table 5.4-1 lists the WDT specifications and **Figure 5.4-1** shows a block diagram.

Table 5.4-1 WDT Specifications

Parameter	Specifications
Number of channels	4 channels
Count source	LOCO clock (WDT_0_clk_loco, WDT_1_clk_loco, WDT_2_clk_loco, WDT_3_clk_loco)
Clock division ratio	Division by 1, 16, 32, 64, 128, or 256
Counter operation	Counting down using a 14-bit down-counter
Condition for starting the counter	Counting is started with a refresh by writing to the WDTRR register
Conditions for stopping the counter	• Reset (the down-counter and other registers return to their initial values) • A counter underflows or a refresh error is generated • CA55, CM33 debug state
Window function	Window start and end positions can be specified (refresh-permitted and refresh-prohibited periods)
Interrupt sources	• Down-counter underflows • Refreshing outside the refresh-permitted period (refresh error)
Reading of the counter value	The down-counter value can be read by the WDTSR register
Event link function (output)	• Down-counter underflow event output • Refresh error event output
Output signal (internal signal)	• Interrupt request output



Note: WDTRR: WDT Refresh Register
WDTCR: WDT Control Register
WDTSR: WDT Status Register
WDTRCR: WDT Reset Control Register

Figure 5.4-1 WDT Block Diagram

5.4.2 Registers

The register addresses of WDT are given as offsets from the individual base addresses <WDTn_base>. The register base addresses of each WDT are listed in the following table.

Table 5.4-2 Register Base Addresses

Base Address Name	Base Address	Function
<WDT0_base>	0_11C0_0400 (51C0_0400*1, 41C0_0400*2)	WDT for CM33
<WDT1_base>	0_1440_0000 (5440_0000*1, 4440_0000*2)	WDT for CA55
<WDT2_base>	0_1300_0000 (5300_0000*1, 4300_0000*2)	WDT for Other 0
<WDT3_base>	0_1300_0400 (5300_0400*1, 4300_0400*2)	WDT for Other 1

Note 1. CM33 address space (non-secure)

Note 2. CM33 address space (secure)

5.4.2.1 List of Registers (m = 0 to 3)

The WDT registers and the memory addresses are listed in the following table.

For the actual addresses, the offset values indicated in this table are added to the base addresses.

Register Name	Abbreviation	Initial Value	Offset Address	Access Size [bits]
WDT Refresh Register	WDTm_WDTRR	FFh	0000h	8
WDT Control Register	WDTm_WDTCR	33F3h	0002h	16
WDT Status Register	WDTm_WDTSR	0000h	0004h	16
WDT Reset Control Register	WDTm_WDTRCR	80h	0006h	8

5.4.2.2 Register Description

The prefix (WDTm_) of the register names is omitted in this and subsequent sections.

5.4.2.2.1 WDT Refresh Register (WDTm_WDTRR)

The WDTRR register refreshes the down-counter of the WDT.

The down-counter of the WDT is refreshed by writing 00h and then writing FFh to WDTRR register (refresh operation) within the refresh-permitted period.

Counting down starts from the value selected by setting the Timeout Period Select bits (WDTCR.TOPS[1:0]) in the WDT Control Register.

When 00h is written, the read value is 00h. When a value other than 00h is written, the read value is FFh. For details of the refresh operation, see **5.4.3.3 Refresh Operation**.

Access Size : 8 bits
Address : <WDTm_base> + 00h
Initial Value : FFh

Bit	7	6	5	4	3	2	1	0
	REFRESH[7:0]							
Initial Value	1	1	1	1	1	1	1	1
R/W	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	REFRESH[7:0]	FFh	RW	The down-counter is refreshed by writing 00h and then writing FFh to this register.

5.4.2.2.2 WDT Control Register (WDTm_WDTCR)

The WDTCR register is used to set the clock division ratio, and window start and end positions for refresh, and the timeout period until the down-counter underflows in register start mode.

Some constraints apply to writes to the WDTCR register. For details, see **5.4.3.2 Controlling Writes to the WDTCR and WDTRCR Registers**.

Access Size : 16 bits
Address : <WDTm_base> + 02h
Initial Value : 33F3h

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	RPSS[1:0]		-	-	RPES[1:0]		CKS[3:0]				-	-	TOPS[1:0]	
Initial Value	0	0	1	1	0	0	1	1	1	1	1	1	0	0	1	1
R/W	R	R	RW	RW	R	R	RW	RW	RW	RW	RW	RW	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
15, 14	-	All 0	R	Reserved These bits are always read as 0b. The written value will be ignored.
13, 12	RPSS[1:0]	3h	RW	Window Start Position Select 00b: 25% 01b: 50% 10b: 75% 11b: 100% (the window start position is not specified)
11, 10	-	All 0	R	Reserved These bits are always read as 0b. The written value will be ignored.
9, 8	RPES[1:0]	3h	RW	Window End Position Select 00b: 75% 01b: 50% 10b: 25% 11b: 0% (the window end position is not specified)
7 to 4	CKS[3:0]	Fh	RW	Clock Division Ratio Select 0000b: LOCO clock 0010b: LOCO clock/16 0011b: LOCO clock/32 0100b: LOCO clock/64 1111b: LOCO clock/128 0101b: LOCO clock/256 Others: Setting prohibited
3, 2	-	All 0	R	Reserved These bits are always read as 0b. The written value will be ignored.
1, 0	TOPS[1:0]	3h	RW	Timeout Period Select 00b: 1024 cycles (03FFh) 01b: 4096 cycles (0FFFh) 10b: 8192 cycles (1FFFh) 11b: 16384 cycles (3FFFh)

TOPS[1:0] bits (Timeout Period Select)

The TOPS[1:0] bits select the timeout period, the period until the down-counter underflows, from 1024, 4096, 8192, and 16384 cycles, taking the divided clock specified in the CKS[3:0] bits as 1 cycle. After the down-counter is refreshed, the combination of the CKS[3:0] and TOPS[1:0] bits determines the number of LOCO clock cycles until the counter underflows.

Table 5.4-3 lists the relationship between the CKS[3:0] and TOPS[1:0] bit settings, the timeout period, and the number of LOCO clock cycles.

Table 5.4-3 Timeout Period Settings

CKS[3:0] Bits	TOPS[1:0] Bits	Clock Division Ratio	Timeout Period (Number of Cycles)	LOCO Clock Cycles
0000b	00b	LOCO clock	1024	1024
	01b		4096	4096
	10b		8192	8192
	11b		16384	16384
0010b	00b	LOCO clock/16	1024	16384
	01b		4096	65536
	10b		8192	131072
	11b		16384	262144
0011b	00b	LOCO clock/32	1024	32768

	11b		16384	1048576
1111b	00b	LOCO clock/128	1024	131072
	01b		4096	524288
	10b		8192	1048576
	11b		16384	2097152
0101b	00b	LOCO clock/256	1024	262144
	01b		4096	1048576
	10b		8192	2097152
	11b		16384	4194304

CKS[3:0] bits (Clock Division Ratio Select)

The CKS[3:0] bits specify the division ratio of the clock used for the down-counter. The division ratio can be selected from the LOCO clock divided by 1, 16, 32, 64, 128, and 256. Combined with the TOPS[1:0] bit setting, this allows the WDT to be configured to a count period between 1024 and 4194304 LOCO clock cycles.

RPES[1:0] bits (Window End Position Select)

The RPES[1:0] bits specify the window end position that indicates the refresh-permitted period. 75%, 50%, 25%, or 0% of the timeout period can be selected for the window end position. Set the window end position to a value less than the value for the window start position (window start position > window end position). If the window end position is greater than the window start position, only the window start position setting is enabled and the window end position is set to 0%.

RPSS[1:0] bits (Window Start Position Select)

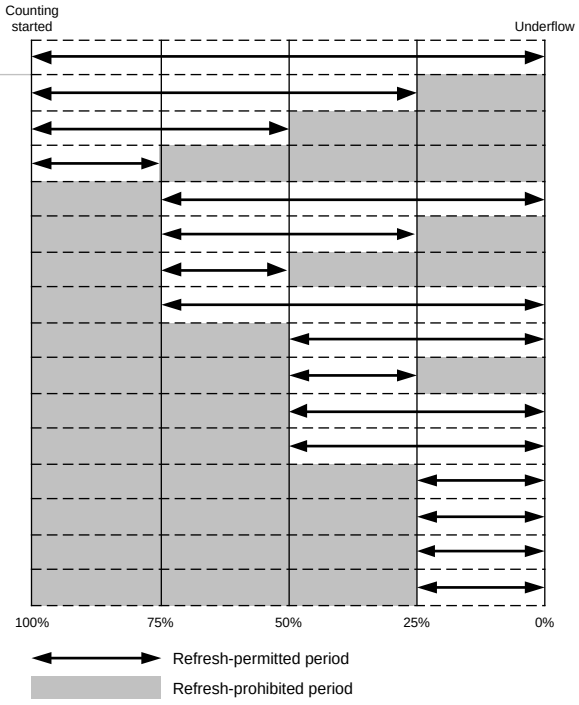
The RPSS[1:0] bits specify the window start position that indicates the refresh-permitted period. 100%, 75%, 50%, or 25% of the timeout period can be selected for the window start position. Set the window start position to a value greater than the value for the window end position. If the window start position is set to a value less than or equal to the window end position, the window start position setting is enabled and the window end position is set to 0%.

Table 5.4-4 lists the counter values for the window start and end positions, and **Figure 5.4-2** shows the refresh-permitted period set in the RPSS[1:0], RPES[1:0], and TOPS[1:0] bits.

Table 5.4-4 Relationship between the Timeout Period and Window Start and End Counter Values

	Timeout Period		Window Start and End Counter Value			
TOPS[1:0]	Cycles	Counter Value	100%	75%	50%	25%
00b	1024	03FFh	03FFh	02FFh	01FFh	00FFh
01b	4096	0FFFh	0FFFh	0BFFh	07FFh	03FFh
10b	8192	1FFFh	1FFFh	17FFh	0FFFh	07FFh
11b	16384	3FFFh	3FFFh	2FFFh	1FFFh	0FFFh

RPSS[1:0] bits		RPES[1:0] bits		Window	
b13	b12	b9	b8	Start (%)	End (%)
1	1	1	1	100	0
		1	0		25
		0	1		50
		0	0		75
1	0	1	1	75	0
		1	0		25
		0	1		50
		0	0		75
0	1	1	1	50	0
		1	0		25
		0	1		50
		0	0		75
0	0	1	1	25	0
		1	0		25
		0	1		50
		0	0		75



Note: If window end setting ≥ window start setting, the window end setting is set to 0%.

Figure 5.4-2 RPSS[1:0] and RPES[1:0] Bits Settings and Refresh-permitted Period

5.4.2.2.3 WDT Status Register (WDTm_WDTSR)

The WDTSR register indicates the counter value of the down-counter and the status of whether an underflow or refresh error occurred in the down-counter.

Access Size : 16 bits
Address : <WDTm_base> + 04h
Initial Value : 0000h

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	REFEF	UNDFF	CNTVAL[13:0]													
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15	REFEF	0h	RW	Refresh Error Flag 0b: No refresh error occurred 1b: Refresh error occurred
14	UNDFF	0h	RW	Underflow Flag 0b: No underflow occurred 1b: Underflow occurred
13 to 0	CNTVAL[13:0]	00h	R	Down-Counter Value Value counted by the down-counter

CNTVAL[13:0] bits (Down-Counter Value)

Read the CNTVAL[13:0] bits to confirm the value of the down-counter. The read value might differ from the actual count by 1.

UNDFF flag (Underflow Flag)

Read the UNDFF flag to confirm whether an underflow occurred in the counter. A value of 1 indicates that the down counter underflowed. Write 0 to the flag to set the value to 0. Writing 1 has no effect.

Clearing the UNDFF flag requires (N + 2) LOCO clock cycles and two WDT_n_clkp (n = 0 to 3) cycles. Furthermore, the clearing of this flag is ignored for (N + 2) LOCO clock cycles from an underflow. N is specified in the WDTCR.CKS[3:0] bits as follows:

- When WDTCR.CKS[3:0] = 0h, N = 1
- When WDTCR.CKS[3:0] = 2h, N = 16
- When WDTCR.CKS[3:0] = 3h, N = 32
- When WDTCR.CKS[3:0] = 4h, N = 64
- When WDTCR.CKS[3:0] = Fh, N = 128
- When WDTCR.CKS[3:0] = 5h, N = 256

REFEF flag (Refresh Error Flag)

Read the REFEF flag to confirm whether a refresh error occurred, indicating that a refresh operation was performed during a prohibited period. A value of 1 indicates that a refresh error occurred. Write 0 to the flag to set the value to 0. Writing 1 has no effect.

Clearing the REFEF flag requires (N + 2) LOCO clock cycles and two WDT_n_clkp (n = 0 to 3) cycles. Furthermore, the clearing of this flag is ignored for (N + 2) LOCO clock cycles from a refresh error. N is specified in the WDTCR.CKS[3:0] bits as follows:

- When WDTCR.CKS[3:0] = 0h, N = 1

- When WDTCR.CKS[3:0] = 2h, N = 16
- When WDTCR.CKS[3:0] = 3h, N = 32
- When WDTCR.CKS[3:0] = 4h, N = 64
- When WDTCR.CKS[3:0] = Fh, N = 128
- When WDTCR.CKS[3:0] = 5h, N = 256

5.4.2.2.4 WDT Reset Control Register (WDTm_WDTRCR)

The WDTRCR register controls interrupt request output by a WDT down-counter underflow.

Some constraints apply to writes to the WDTRCR register. For details, see **5.4.3.2 Controlling Writes to the WDTCR and WDTRCR Registers**.

Access Size : 8 bits
Address : <WDTm_base> + 06h
Initial Value : 80h

Bit	7	6	5	4	3	2	1	0
	RSTIRQS	-	-	-	-	-	-	-
Initial Value	1	0	0	0	0	0	0	0
R/W	RW	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7	RSTIRQS	1h	RW	Reset Interrupt Request Select 0b: Enable non-maskable interrupt request or interrupt request output. 1b: Enable reset output.
6 to 0	-	All 0	R	Reserved These bits are always read as 0b. The written value will be ignored.

CAUTION

In this LSI, always set RSTIRQS = 0 when using the WDT.

5.4.3 Operation

5.4.3.1 Register Start Mode

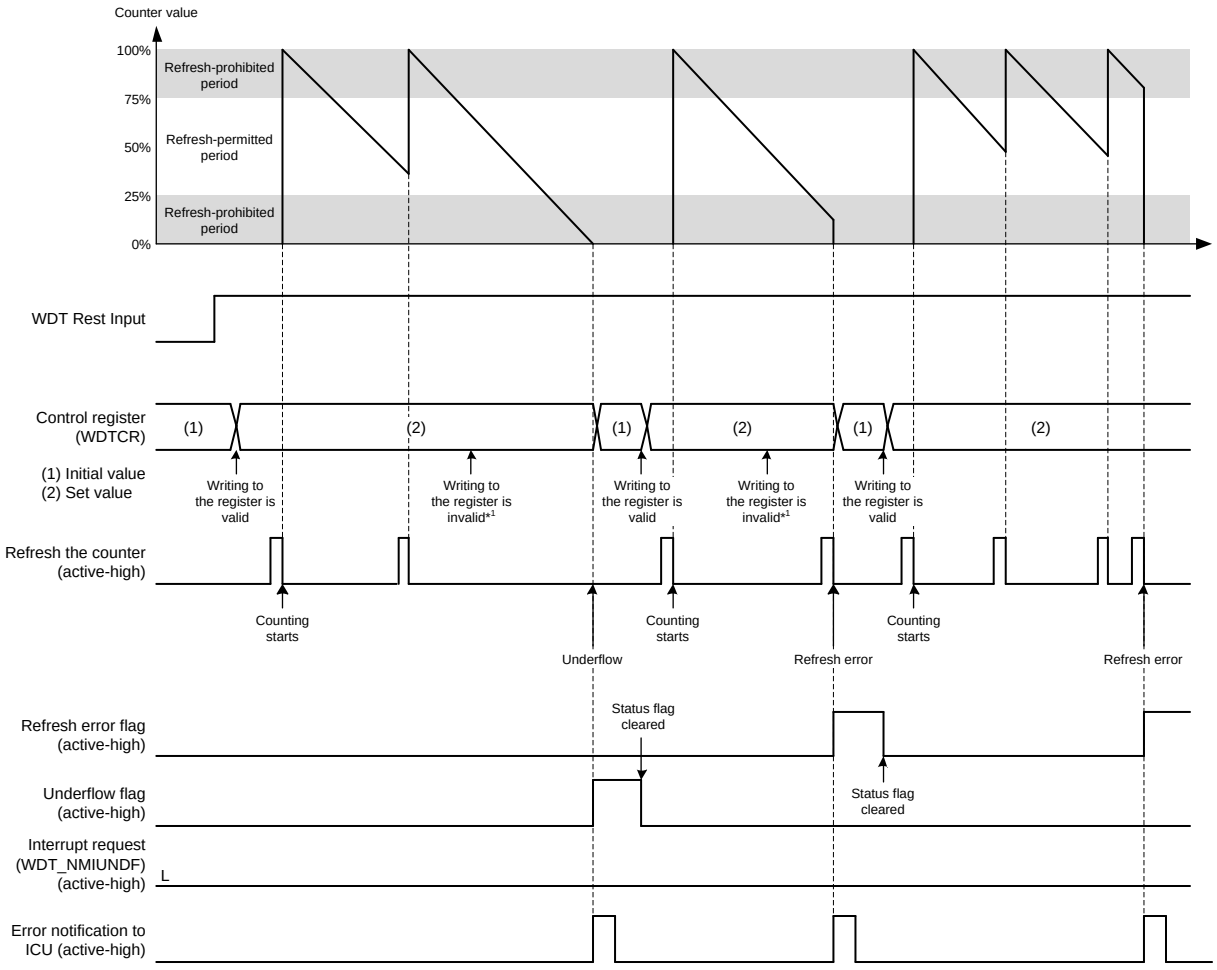
- Clock division ratio
- Window start and end positions
- Timeout period in the WDTCR register
- Interrupt request output in the WDTRCR register

The WDT refresh register (WDTRR) refreshes the down counter. As a result, the down count starts at the value set by the timeout period selection bit (WDTCR.TOPS[1:0]).

As long as the counter is refreshed in the refresh-permitted period, the value in the counter is reset each time the counter is refreshed, and the counter continues to count down. The WDT does not output the non-maskable interrupt request/interrupt request as long as the down-counter continues to count. However, if the down-counter underflows because the down-counter cannot be refreshed due to a program runaway, or if a refresh error occurs because the counter was refreshed outside the refresh-permitted period, the WDT outputs a non-maskable interrupt request/interrupt request (WDT_NMIUNDF). The interrupt request output can be enabled in the WDT Reset Interrupt Request Select bit (WDTRCR.RSTIRQS).

Figure 5.4-3 shows an example of operation under the following conditions:

- Reset Interrupt Request bit (RSTIRQS): 0b
- The window start position is 75% (WDTCR.RPSS[1:0] = 10b)
- The window end position is 25% (WDTCR.RPES[1:0] = 10b)



Note: See **5.4.3.2 Controlling Writes to the WDTCR and WDTRCR Registers**.
Reset pin = QRESN

Figure 5.4-3 Operation Example in Register Start Mode

5.4.3.2 Controlling Writes to the WDTCR and WDTRCR Registers

Writing to the WDT Control Register (WDTCR) or WDT Reset Control Register (WDTRCR) is possible once between the release from the reset state and the first refresh operation.

After a refresh (counting starts) or a write to the WDTCR or WDTRCR register, the protection signal in the WDT becomes 1 to protect the WDTCR and WDTRCR registers against subsequent write attempts. This protection is released by the reset source of the WDT. With other reset sources, the protection is not released.

Figure 5.4-4 shows control waveforms produced in response to writing to the WDTCR.

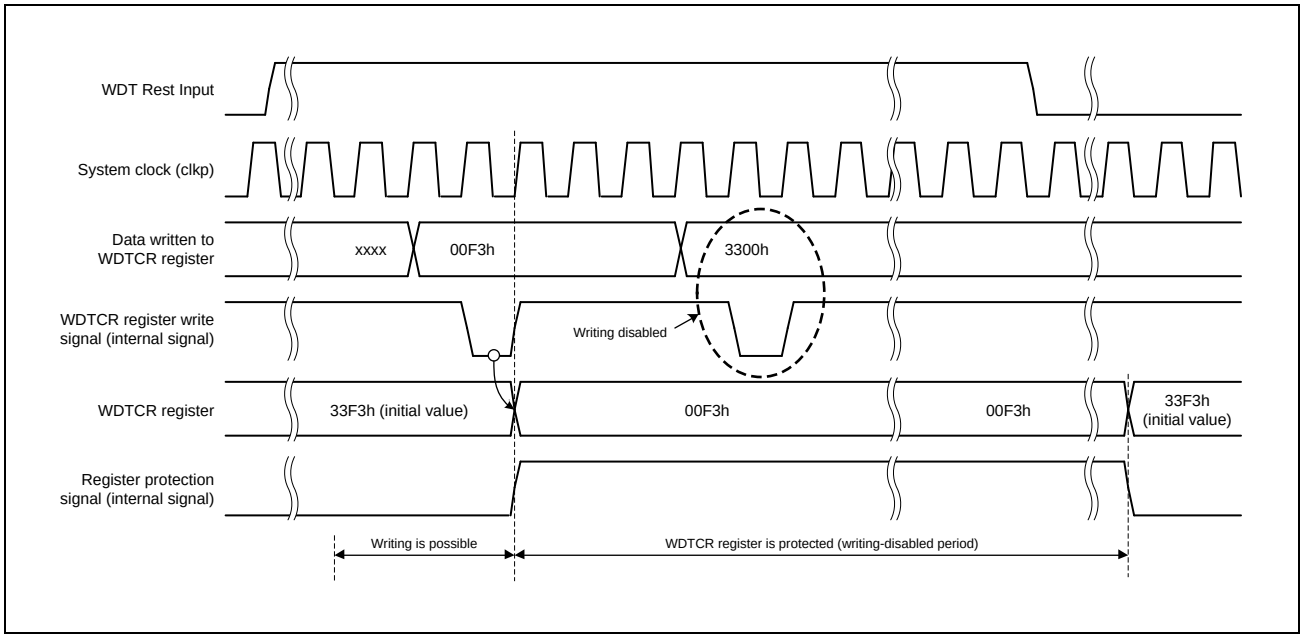


Figure 5.4-4 Control Waveforms Produced in Response to Writes to the WDTCR Register

5.4.3.3 Refresh Operation

To refresh the down counter and start the counting operation, write to the WDT Refresh Register (WDTRR) in the order of values from 00h to FFh. If a value other than FFh is written after 00h, the down-counter is not refreshed. If an invalid value is written, refreshing is performed normally by writing to the WDTRR register in the order of values from 00h to FFh.

Correct refreshing is also performed when a register other than WDTRR is accessed or WDTRR is read between writing 00h and writing FFh to WDTRR. Writes to refresh the counter must be made within the refresh-permitted period, and this is determined by the FFh write. For this reason, correct refreshing is performed even when 00h is written outside the refresh-permitted period.

[Example write sequences that are valid for refreshing the counter]

00h → FFh

00h ((n − 1)th time) → 00h (nth time) → FFh

00h → access to another register or read from WDTRR → FFh

[Example write sequences that are invalid for refreshing the counter]

23h (a value other than 00h) → FFh

00h → 54h (a value other than FFh)

00h → AAh (00h and a value other than FFh) → FFh

After FFh is written to the WDT Refresh Register (WDTRR), refreshing the down-counter requires up to 4 cycles of the signal for counting. To meet this requirement, complete writing FFh to WDTRR 4 count cycles before the ms.

Figure 5.4-5 shows the WDT refresh-operation waveforms when the clock division ratio is LOCO clock/1.

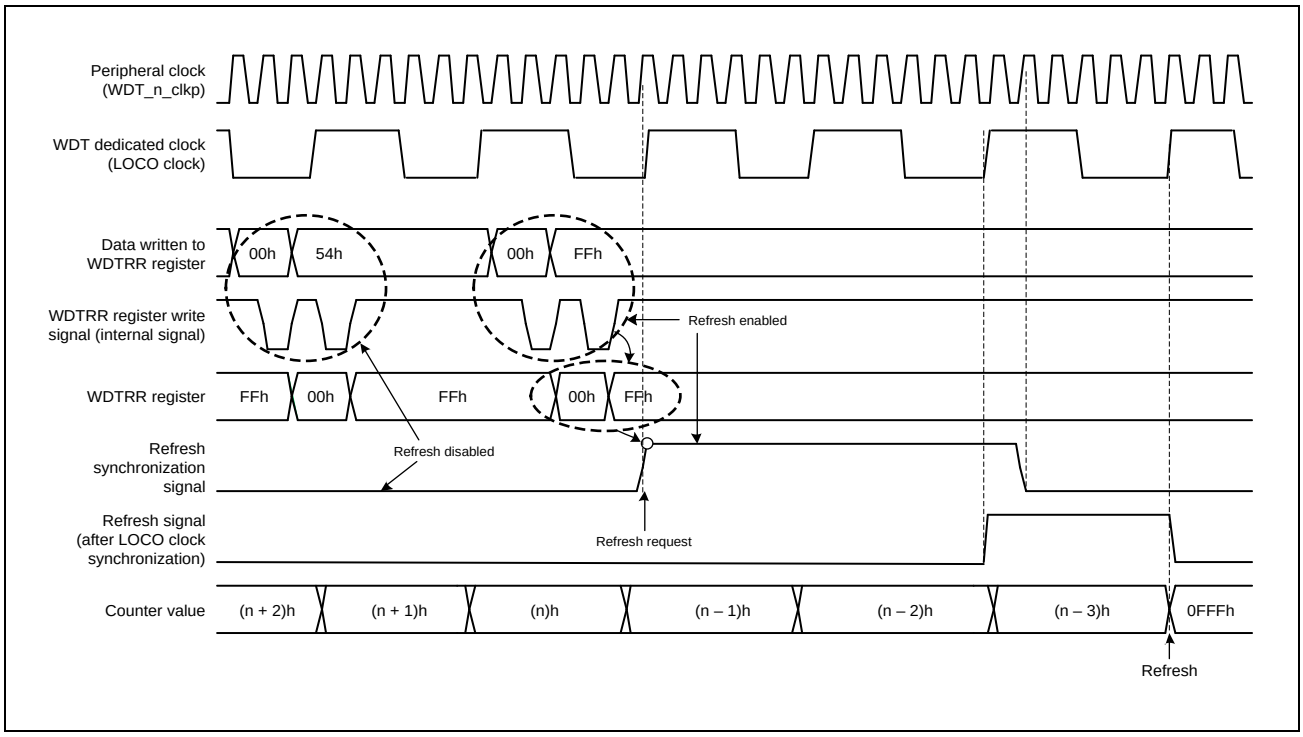

Figure 5.4-5 WDT Refresh Operation Waveforms when WDTCR.CKS[3:0] = 4h and WDTCR.TOPS[1:0] = 01b

5.4.3.4 Status Flags

The refresh error (WDTSR.REFEF) and underflow (WDTSR.UNDFF) flags retain the source of the interrupt request from the WDT. After a release from the interrupt request generation, read the WDTSR.REFEF and WDTSR.UNDFF flags to check for the interrupt source. For each flag, writing 0 clears the bit. Writing 1 has no effect. Leaving the status flags unchanged does not affect operation. If the flags are not cleared at the next interrupt request from the WDT, the earlier interrupt source is cleared and the new interrupt source is written. For the time period between when 0 is written in each flag and when its value is reflected, see **5.4.2.2.3 WDT Status Register (WDTm_WDTSR)**.

5.4.3.5 Interrupt Sources

When the Reset Interrupt Request Select bit (WDTRCR.RSTIRQS) is set to 0, an interrupt signal (WDT_NMIUNDF) is generated upon a counter underflow or generation of a refresh error. For details, see **4.6.1 Interrupt Controller Unit (ICU)**.

Table 5.4-5 WDT Interrupts

Interrupt name	Signal (WDTn)	Function	Interrupt to CPU	Error Interrupt
WDT_NMIUNDF	WDT_CM33_iwdt_nmiundf_n (WDT0)	WDT0 interrupt	Not possible	Possible
	WDT_CA55_iwdt_nmiundf_n (WDT1)	WDT1 interrupt	Not possible	Possible
	WDT_Other_0_iwdt_nmiundf_n (WDT2)	WDT2 interrupt	Possible	Possible
	WDT_Other_1_iwdt_nmiundf_n (WDT3)	WDT3 interrupt	Possible	Possible

5.4.3.6 Reading the Down-Counter Value

The WDT stores the counter value in the down-counter value bits (WDTSR.CNTVAL[13:0]) of the WDT Status Register. Check these bits to obtain the counter value. The read value of the down-counter might differ from the actual count by one.

Figure 5.4-6 shows the processing for reading the WDT down-counter value when the clock division ratio is LOCO clock/1.

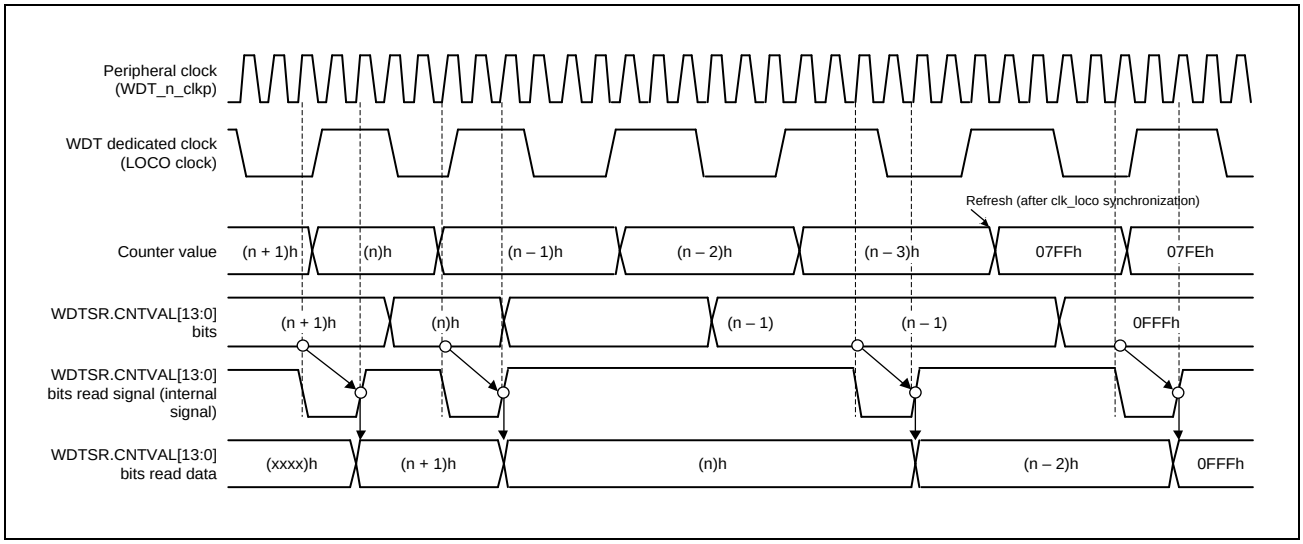

Figure 5.4-6 Processing for Reading WDT Down-Counter Value when WDTCR.CKS[3:0] = 4h and WDTCR.TOPS[1:0] = 01b

5.4.4 Output to the Event Link Controller (ELC)

The WDT is capable of a link operation for the previously specified module when the interrupt request signal is used as an event signal by the ELC. An event signal is output by a counter underflow or refresh error.

An event signal is output regardless of the setting of the WDTRCR.RSTIRQS bit.

An event signal can also be output when the next interrupt source is generated while the Refresh Error flag (WDTSR.REFEF) or Underflow flag (WDTSR.UNDFF) is 1.

5.4.5 Example WDT1 Setting for Error System Reset

A setting example for WDT1 is shown below.

Table 5.4-6 WDT1 Setting Procedure for Error System Reset

Step	Description	Register	Setting Value
0	Confirm the error status, and if an error factor is applied, perform the appropriate processing to suit the system.	—	—
1	Clear the error factor.*1	ICU_ERINTA55CLR0	1000_0000h
2	Set the reset vector address.	SYS_ACPU_CFG_RVAL0	8000_0000h
3	When the WDT generates a CA55 cold reset request • A CA55 cold reset is applied. • The WDTUDFCA signal is asserted.	CPG_ERRORRST_SEL1	***A_***Ah
4	The error system reset is executed when WDT_CA55_iwdt_nmiundf_n is asserted.	CPG_ERRORRST_SEL2	0002_0002h
5	Clear the error flag of WDT_CA55_iwdt_nmiundf_n.	CPG_ERROR_RST2	0002_0002h
6	• Timeout period: 16384 cycles • Clock division ratio: LOCO clock/128 • Window end position: 0% • Window start position: 100%	WDT1_WDTCR*2	33F3h
7	Enable WDT1 interrupt output to the ICU.	WDT1_WDTRCR*2	00h
8	Clear an underflow flag and a refresh error flag.	WDT1_WDTSR	0000h

Remarks: Writing to bits with * is prohibited (read-modify-write operations are required).

Note 1. The error factors are retained by default. Be sure to clear the factors before setting WDT1. Interrupts should be set after clearing the factors. See **4.6 Interrupt Controller** for details.

Note 2. These registers have write restrictions. For details, see **5.4.3.2 Controlling Writes to the WDTCR and WDTRCR Registers**.

SECTION 5 TIMER

5.5 General Timer (GTM)

5.5.1 Functional Overview

The general timer has the following features.

- Two operating modes
  - Interval timer mode
  - Free-running comparison mode
- Choice between startup of the ELC by a compare match and generation of an interrupt

5.5.1.1 Features of GTM

■ **Channels**

This product has the following number of channels of the General timer.

Table 5.5-1 Channels of General Timer

General Timer	
Number of channels	8
Name	OSTMn

Note: n = 0 to 7

■ **Meaning of n**

Throughout this section, the individual channels of the General timer are identified by the index “n” (n = 0 to 7), for example OSTMnCMP for the General timer n output register.

■ **Register address**

The register addresses of the General timer are given as offsets from the individual base addresses <GTMn_base>. The register base addresses of each GTM are listed in the following table.

■ Interrupts

The General timers can generate the following interrupt requests (GTMTINT).

Table 5.5-2 GTM Interrupt Requests

GTM Interrupt Signal	Function	Startup of Direct Memory Access Controller	Function Startup of Event Link Controller
GTM0_GTMTINT	GTM0 interrupt	Not possible	Possible
GTM1_GTMTINT	GTM1 interrupt	Not possible	Possible
GTM2_GTMTINT	GTM2 interrupt	Not possible	Possible
GTM3_GTMTINT	GTM3 interrupt	Not possible	Possible
GTM4_GTMTINT	GTM4 interrupt	Not possible	Possible
GTM5_GTMTINT	GTM5 interrupt	Not possible	Possible
GTM6_GTMTINT	GTM6 interrupt	Not possible	Possible
GTM7_GTMTINT	GTM7 interrupt	Not possible	Possible

5.5.2 Registers

The General timer is controlled by the following registers.

Table 5.5-3 Register Base Addresses

Base Address Name	Base Address
<GTM0_base>	0_1180_0000h (5180_0000h*1, 4180_0000h*2)
<GTM1_base>	0_1180_1000h (5180_1000h*1, 4180_1000h*2)
<GTM2_base>	0_1400_0000h (5400_0000h*1, 4400_0000h*2)
<GTM3_base>	0_1400_1000h (5400_1000h*1, 4400_1000h*2)
<GTM4_base>	0_12C0_0000h (52C0_0000h*1, 42C0_0000h*2)
<GTM5_base>	0_12C0_1000h (52C0_1000h*1, 42C0_1000h*2)
<GTM6_base>	0_12C0_2000h (52C0_2000h*1, 42C0_2000h*2)
<GTM7_base>	0_12C0_3000h (52C0_3000h*1, 42C0_3000h*2)

Note 1. CM33 Address Space Non-Secure

Note 2. CM33 Address Space Secure

5.5.2.1 List of Registers

The registers are listed below.

Register Name	Abbreviation	Initial Value	Offset Address	Access Size [bits]
OSTM Compare register	OSTMnCMP	0000_0000h	0000h	32
OSTM Counter Register	OSTMnCNT	FFFF_FFFFh	0004h	32
Reserve	-	-	0008h to 000Fh	-
OSTM Count Enable Status Register	OSTMnTE	00h	0010h	8
Reserve	-	-	0011h to 0013h	-
OSTM Count Start Trigger Register	OSTMnTS	00h	0014h	8
Reserve	-	-	0015h to 0017h	-
OSTM Count Stop Trigger Register	OSTMnTT	00h	0018h	8
Reserve	-	-	0019h to 001Fh	-
OSTM Control Register	OSTMnCTL	00h	0020h	8

5.5.2.2 Register Description

5.5.2.2.1 OSTM Compare Register (OSTMnCMP)

Depending on the mode of operation, this register holds the start value of the down-counter or the value for comparison with that of the counter.

Access Size : 32 bits
Address : <GTMm_base> + 00h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CMP[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CMP[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CMP[31:0]	0h	RW	In interval timer mode: the start value of the down-counter In free-running comparison mode: the value for comparison

5.5.2.2.2 OSTM Counter Register (OSTMnCNT)

This register indicates the counter value of the timer.

Access Size : 32 bits
Address : <GTMm_base> + 04h
Initial Value : FFFF_FFFFh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CNT[31:16]															
Initial Value	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CNT[15:0]															
Initial Value	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CNT[31:0]	FFFF_FFFFh*1	R	32-bit counter value

Note 1. The initial value depends on the operating mode of the General timer. Refer to **Table 5.5-4**.

The following table shows the correspondence between operating mode, counting direction and initial value. The initial value is the value read from the counter after a change to the operating mode.

Table 5.5-4 Correspondence between Operating Mode, Counting Direction and Initial Value

Timer Operating Mode	OSTMnCTL.OSTMnMD1	Counting Direction	Initial value
Interval timer mode	0*1	Down	FFFF_FFFFh
Free-running comparison mode	1	Up	0000_0000h

Note 1. Value after reset

5.5.2.2.3 OSTM Count Enable Status Register (OSTMnTE)

This register indicates whether the counter is enabled or disabled.

Access Size : 8 bits
Address : <GTMm_base> + 10h
Initial Value : 00h

Bit	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	TE
Initial Value	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 1	-	All 0	R	Reserved These bits are always read as 0b. The write value should always be 0b.
0	TE	0h	R	This bit indicates whether the counter is enabled or disabled. 0b: Counter disabled 1b: Counter enabled This bit is set to 1b in response to OSTMnTS.OSTMnTS being set to 1b. This bit is reset to 0b in response to OSTMnTT.OSTMnTT being set to 1b.

Note: When OSTMnTE = 0, the counter retains its value.
If the counter is restarted, it restarts counting down from the value in the OSTMnCMP register if it is in interval timer mode, or restarts counting up from the counter value 0000_0000h if it is in free-running comparison mode.

Note: For debugging, the GTM counter can be paused by the counter stop request.

5.5.2.2.4 OSTM Count Start Trigger Register (OSTMnTS)

This register starts the counter.

Access Size : 8 bits
Address : <GTMm_base> + 14h
Initial Value : 00h

Bit	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	TS
Initial Value	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Bit	Bit Name	Initial Value	R/W	Description
7 to 1	-	All 0	R	Reserved These bits are always read as 0b. The write value should always be 0b.
0	TS	0h	W	The read value is undefined This bit starts the counter. 0b: This setting has no effect. 1b: Starts the counter and sets OSTMnTE.OSTMnTE = 1b. In interval timer mode, a forced restart is executed if this bit is set while OSTMnTE.OSTMnTE = 1b. In free-running comparison mode, setting this bit is ignored as long as OSTMnTE.OSTMnTE = 1b.

5.5.2.2.5 OSTM Count Stop Trigger Register (OSTMnTT)

This register stops the counter.

Access Size : 8 bits
Address : <GTMm_base> + 18h
Initial Value : 00h

Bit	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	TT
Initial Value	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Bit	Bit Name	Initial Value	R/W	Description
7 to 1	-	All 0	R	Reserved These bits are always read as 0b. The write value should always be 0b.
0	TT	0h	W	The read value is undefined Stops the counter. 0b: This setting has no effect. 1b: Stops the counter and clears the OSTMnTE.OSTMnTE bit.

5.5.2.2.6 OSTM Control Register (OSTMnCTL)

This register specifies the operating mode for the counter and controls enabling/disabling of GTMTINT interrupt requests when counting starts.

Access Size : 8 bits
Address : <GTMm_base> + 20h
Initial Value : 00h

Bit	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	MD1	MD0
Initial Value	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
7 to 2	-	All 0	R	Reserved These bits are always read as 0b. The write value should always be 0b.
1	MD1	0h	RW	Specifies the operating mode for the counter. 0b: Interval timer mode 1b: Free-running comparison mode
0	MD0	0h	RW	Controls enabling/disabling of OSTMnTINT interrupt requests when counting starts. 0b: Disables the interrupts when counting starts. 1b: Enables the interrupts when counting starts.

5.5.3 Functional Description

Each General timer is a 32-bit timer/counter.

The settings for operating mode specify the direction of counting (up or down) and the generation of interrupt requests.

5.5.3.1 Block Diagram

The following block diagram shows the main components of GTM.

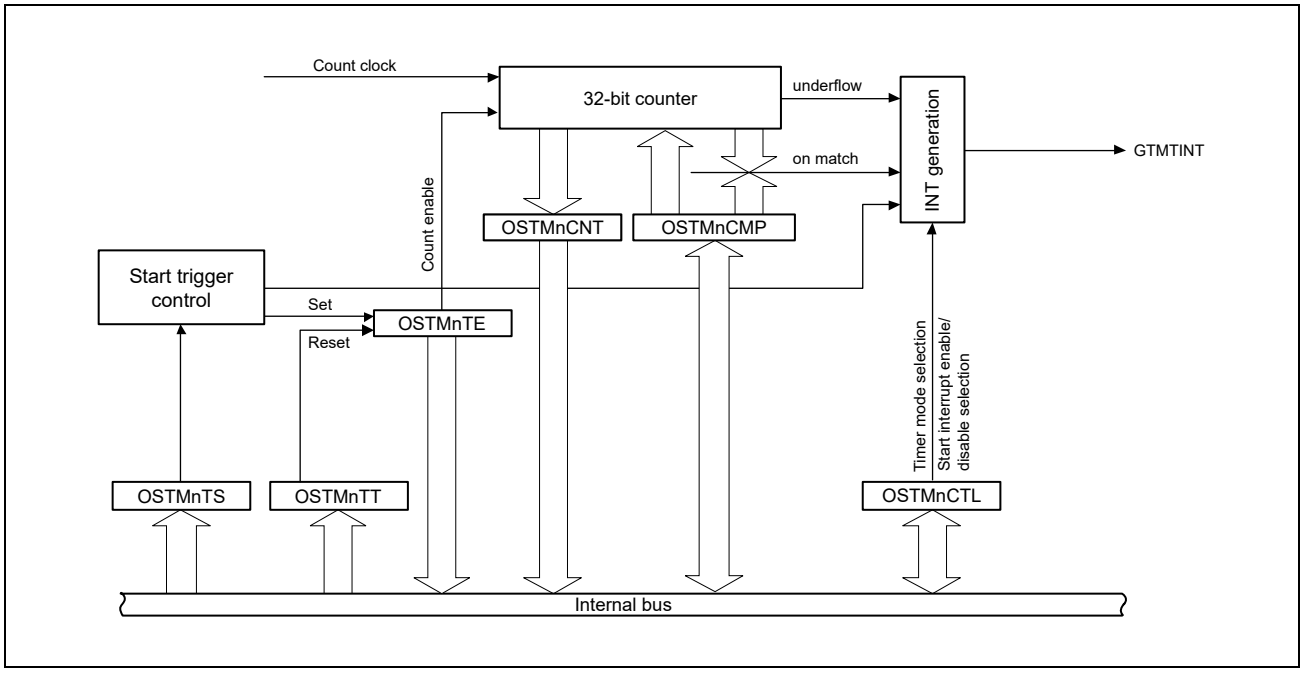

Figure 5.5-1 Block Diagram of GTM

5.5.3.2 Count Clock

The count clocks of GTMn (n = 0 to 7) are listed below.

Table 5.5-5 GTM Clock Signals

GTM Clock Signal	Function
GTM_0_PCLK	GTM0 PCLK
GTM_1_PCLK	GTM1 PCLK
GTM_2_PCLK	GTM2 PCLK
GTM_3_PCLK	GTM3 PCLK
GTM_4_PCLK	GTM4 PCLK
GTM_5_PCLK	GTM5 PCLK
GTM_6_PCLK	GTM6 PCLK
GTM_7_PCLK	GTM7 PCLK

5.5.3.3 Generation of Interrupt Request

A GTMTINT interrupt request is generated whenever the counter reaches 0000_0000h (in interval timer mode) or matches the comparison value (in free-running comparison mode).

An interrupt request can also be generated on starting and restarting of the counter. This is controlled by the OSTMnCTL.OSTMnMD0 bit.

This operation is shown in the following figure.

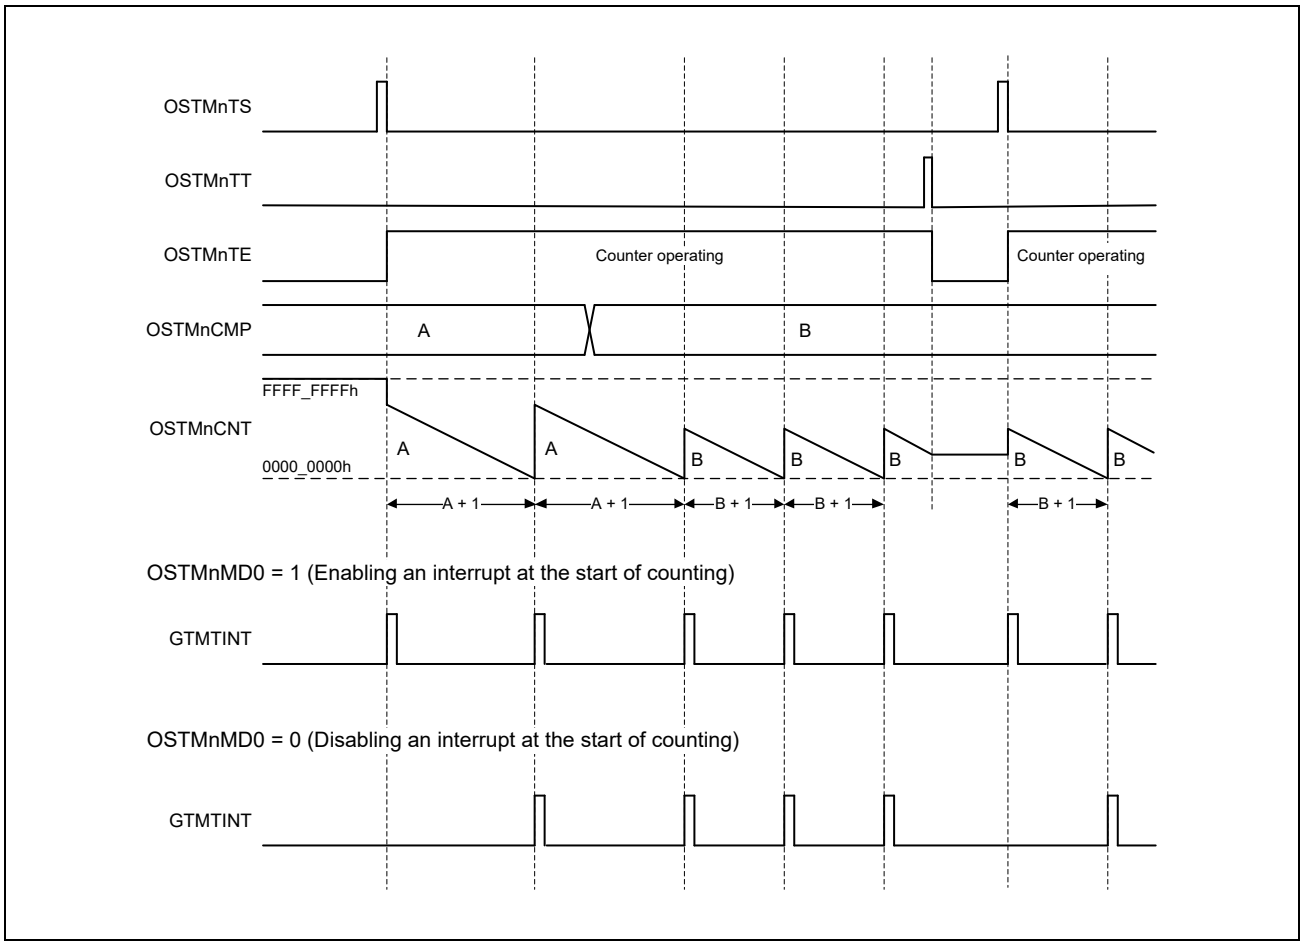

Figure 5.5-2 Generating an Interrupt when Counting Starts (in Interval Timer Mode)

5.5.3.4 Starting and Stopping the Timer

The General timer is started and stopped as follows.

Starting the timer

The timer is started in either of the following way:

- Setting the OSTMnTS.OSTMnTSF bit to 1.
- Status bit OSTMnTE.OSTMnTE is set to 1.

The counter starts to count up or down in accord with the settings for operating mode.

Stopping the timer

Setting the OSTMnTT.OSTMnTT bit to 1 stops the timer.

This also clears the OSTMnTE.OSTMnTE status flag.

5.5.3.5 Interval Timer Mode

Select the interval timer mode when a General timer is to be used as a reference timer for generating interrupt requests at a fixed interval.

5.5.3.5.1 Basic Operation in Interval Timer Mode

In interval timer mode, the timer counts down from the value specified in the OSTMnCMP register. An GTMTINT interrupt request is generated when the counter reaches 0000_0000h.

Select interval timer mode by setting OSTMnCTL.OSTMnMD1 = 0.

New values can be written to the OSTMnCMP register at any time. If it is rewritten during count operation, the counter loads the new OSTMnCMP value when the next 0000_0000h is reached.

Cycles of GTMTINT output

The cycle of GTMTINT output is as follows.

- GTMTINT generation cycle = counter-clock cycle × (OSTMnCMP + 1)

The following figure shows the basic operation of GTM when counter-start interrupts is enabled in interval timer mode.

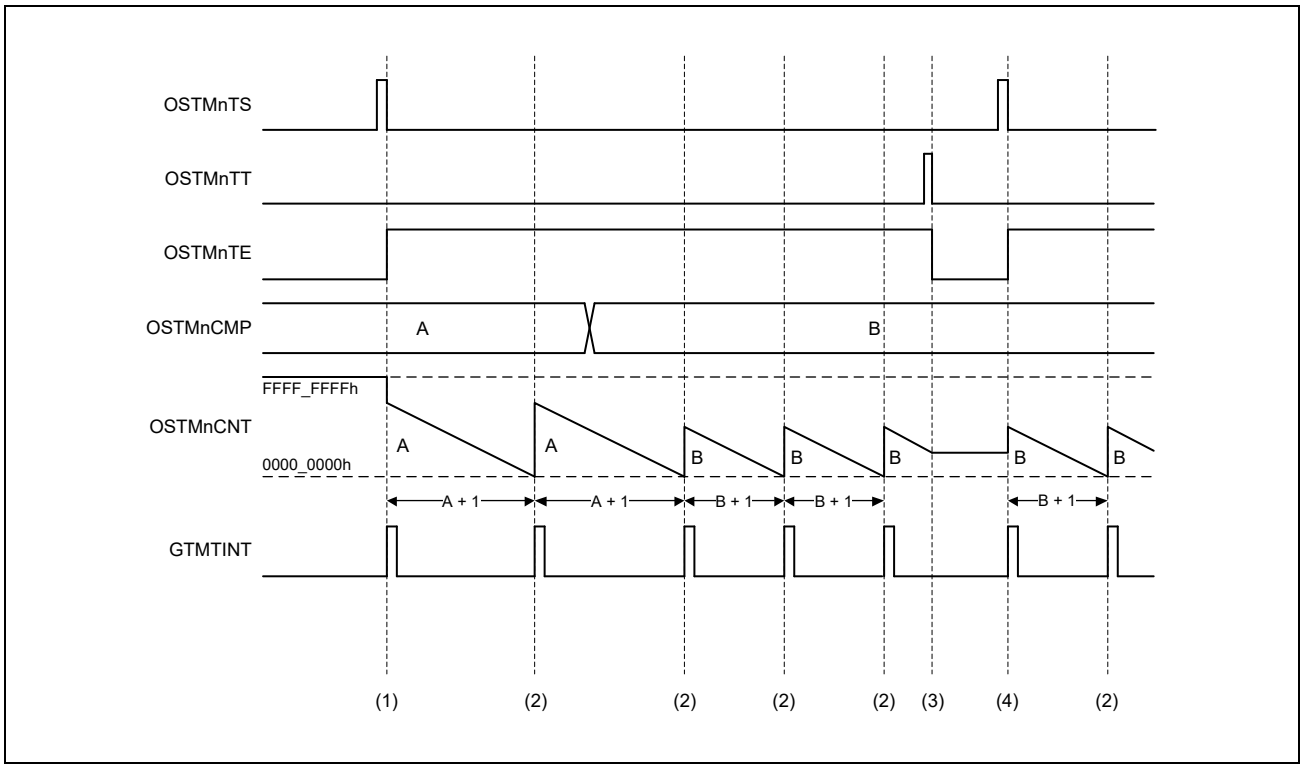

Figure 5.5-3 Timing Diagram of GTM in Interval Timer Mode

The timing diagram above shows the following:

(1) The counter starts counting when OSTMnTS.OSTMnTS = 1. The OSTMnTE.OSTMnTE bit is set to indicate enabling of the counter.
The counter starts counting down from the value of OSTMnCMP.

If OSTMnCTL.OSTMnMD0 is 1, GTMTINT interrupt requests are generated at the start of counting. The OSTMnCNT register contains the current value as the counter.

(2) When the counter reaches 0000_0000h, an GTMTINT interrupt request is generated. The counter loads the new start value from OSTMnCMP and continues counting down.

(3) When the counter is stopped (OSTMnTT.OSTMnTT = 1), the OSTMnTE.OSTMnTE bit is cleared to indicate disabling of the counter. The counter retains its current value until it is restarted.

(4) When counting is restarted (OSTMnTS.OSTMnTS = 1), the counter loads the new start value from OSTMnCMP and starts counting down.

Forced restart

The counter is forcibly restarted by setting OSTMnTS.OSTMnTS = 1 during counting.

The counter loads the start value from the OSTMnCMP register and continues to count down.

The following figure shows the forced restart of the General timer in interval timer mode, with counter-start interrupts enabled (OSTMnCTL.OSTMnMD0 = 1).

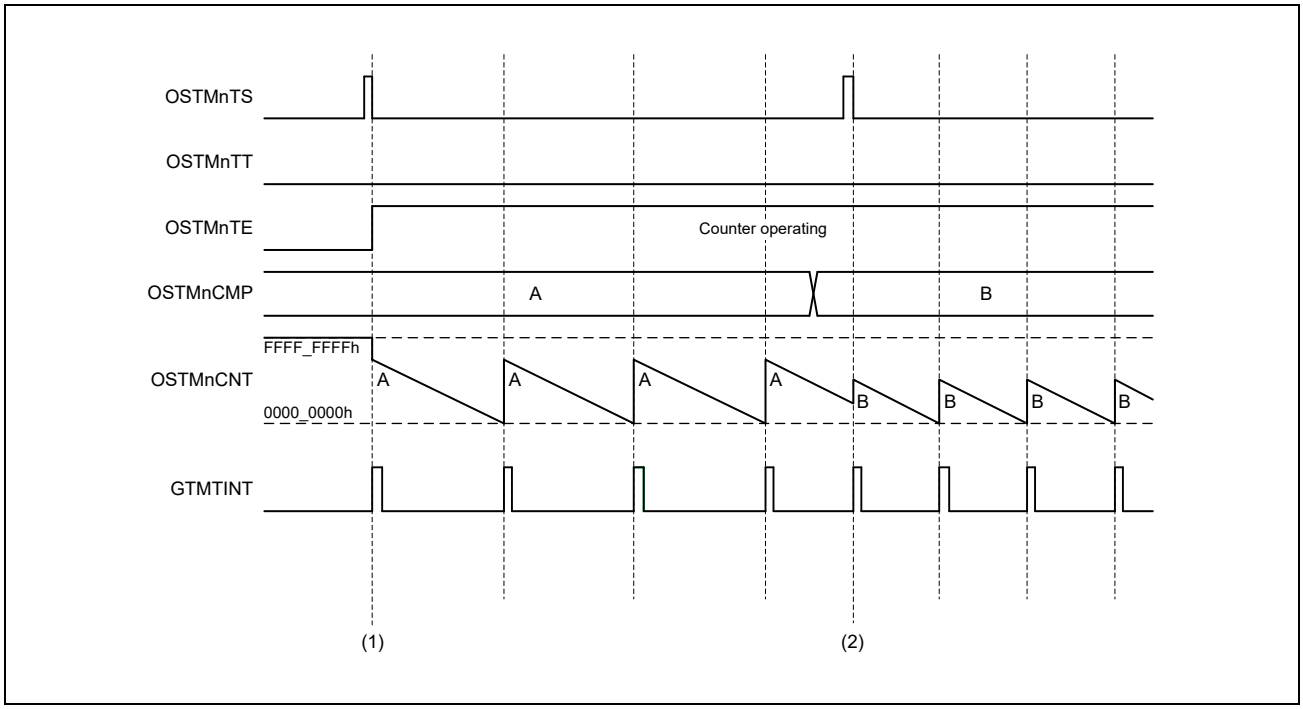

Figure 5.5-4 Timing Diagram of Forced Restart in Interval Timer Mode

Operations shown in the above timing diagram are as follows.

(1) The counter is started and stopped as described under **Figure 5.5-3**.

(2) Setting OSTMnTS.OSTMnTS = 1 restarts the counter while counting is in progress (i.e. while OSTMnTE.OSTMnTE = 1).

The counter immediately restarts counting down, starting with the current value of OSTMnCMP.

When OSTMnCTL.OSTMnMD0 = 1, an GTMTINT interrupt request is generated when counting starts.

5.5.3.5.2 Operation when OSTMnCMP = 0000_0000h

When OSTMnCMP = 0000_0000h, GTM behaves as follows.

- When the counter is enabled, the GTMTINT interrupt request is always set to 1.

The following figure shows operations of GTM when OSTMnCMP = 0000_0000h, and counter-start interrupts are enabled.

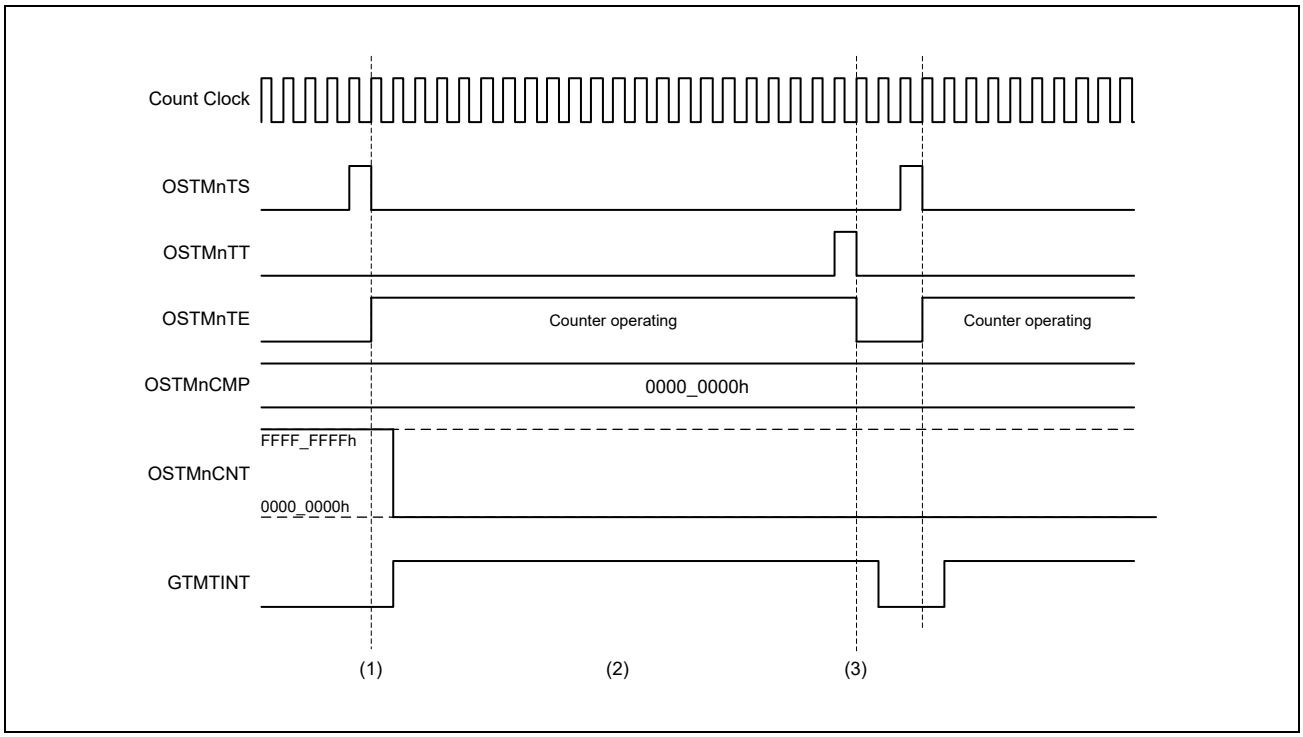

Figure 5.5-5 Timing Diagram when OSTMnCMP = 0000_0000h in Interval Timer Mode

The timing diagram above shows the following operations:

(1) The counter is reloaded with the value in OSTMnCMP as soon as it starts counting, so the value 0000_0000h is retained in OSTMnCMP.

(2) The GTMTINT interrupt request is continuously asserted.

(3) After the counter stops, the GTMTINT interrupt request signal is deasserted.

(4) When interrupts on starting of the counter are disabled, no interrupt is generated when counting starts.

5.5.3.6 Free-Running Comparison Mode

5.5.3.6.1 Basic Operation in Free-Running Comparison Mode

In free-running comparison mode, the counter counts up from 0000_0000h to FFFF_FFFFh. An GTMTINT interrupt request is output when the current value of the counter matches the value of the OSTMnCMP register. The free-running comparison mode is selected by setting the OSTMnCTL.OSTMnMD1 bit to 1.

New values can be written to the OSTMnCMP register at any time.

The following figure shows the basic operation of GTM in free-run compare mode with the start of counting enabled (OSTMnCTL.OSTMnMD0 = 1).

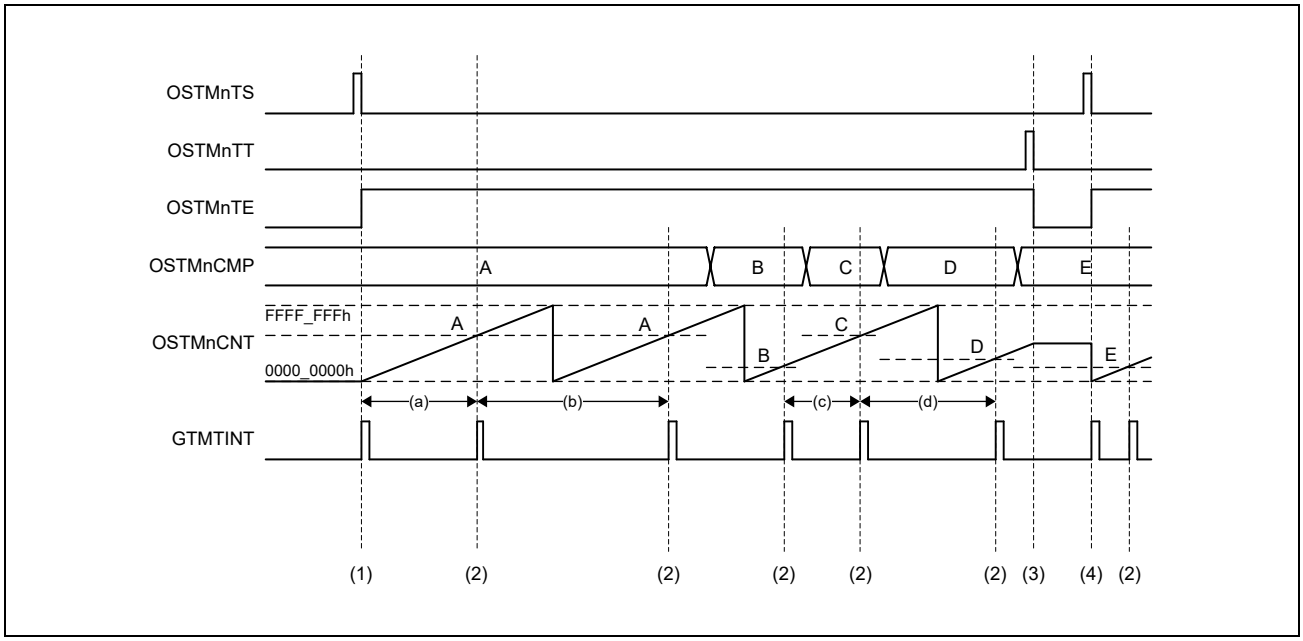

Figure 5.5-6 Timing Diagram of GTM in Free-Run Compare Mode

The timing diagram above shows the following:

(1) The counter starts counting when OSTMnTS.OSTMnTS = 1.
The OSTMnTE.OSTMnTE bit is set to indicate enabling of the counter. The counter counts up from 0000_0000h to FFFF_FFFFh. The OSTMnCNT register is the counter, so it contains the current value.
When OSTMnCTL.OSTMnMD0 = 1, an GTMTINT interrupt request is generated at the start of counting.

(2) When the current counter value matches the value in the OSTMnCMP register, an GTMTINT interrupt request is generated.

(3) When the counter is stopped (OSTMnTT.OSTMnTT = 1), the OSTMnTE.OSTMnTE bit is cleared to indicate disabling of the counter.
The counter retains its current value until it is restarted.

(4) Counting by the counter restarts from 0000_0000h when OSTMnTS.OSTMnTS = 1.

GTMTINT period

The GTMTINT generation period is different at the start of counting and depends on the old and new compare values if OSTMnCMP is rewritten during operation.

Table 5.5-6 GTMTINT Generation Timing

Old Value for Comparison	New Value for Comparison	Counter Value at Time of Rewriting	Period of GTMTINT Generation	Label in Timing Diagram
Counter starts			(A + 1) × counter clock period	(a)
A	A	No rewriting	(FFFF_FFFFh + 1) x counter clock period	(b)
B	C > B	B < counter value < C	(C – B) × counter clock period	(c)
C	D < C	Counter value > D,C	(FFFF_FFFFh – C + D + 1) x counter clock period	(d)

Forced restart

Forced restarting does not proceed during counting even if the OSTMnTS.OSTMnTS bit is set. The counter ignores the attempted setting and continues counting.

5.5.3.6.2 Operation when OSTMnCMP = 0000_0000h

The following figure shows the operation of GTM when OSTMnCMP = 0000_0000h, and counter-start interrupts are enabled (OSTMnCTL.OSTMnMD0 = 1).

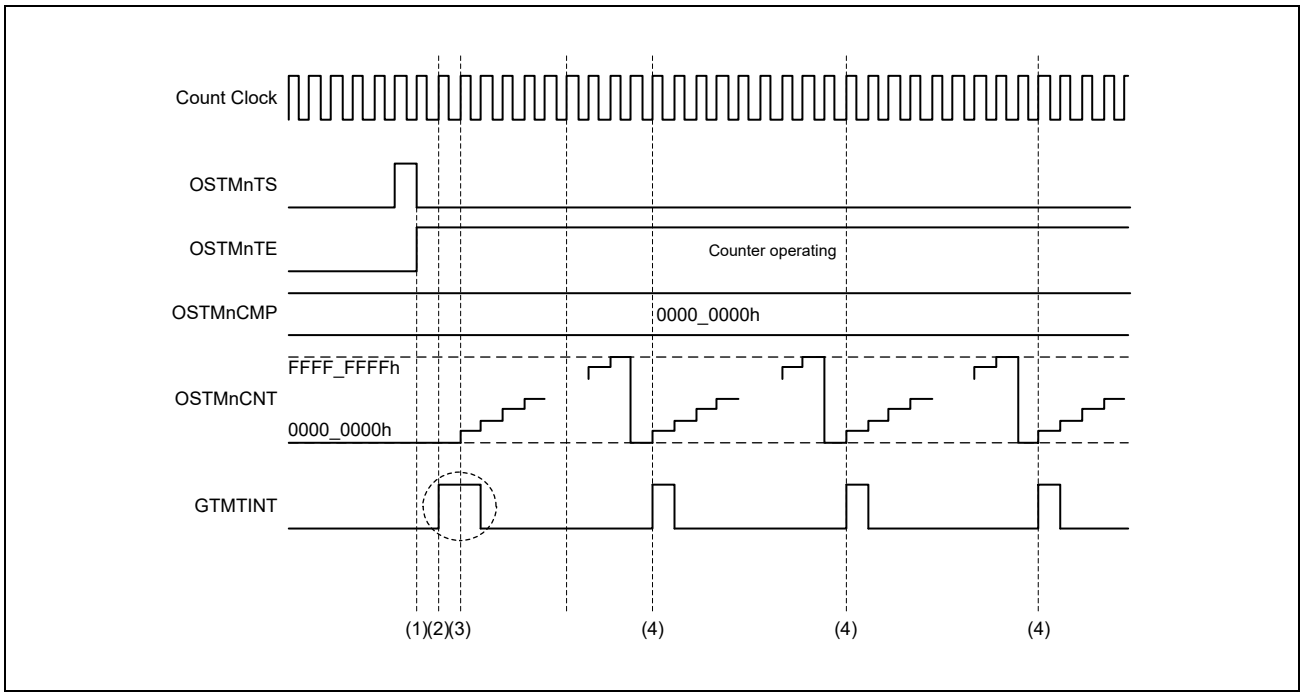

Figure 5.5-7 Timing Diagram when OSTMnCMP = 0000_0000h in Free-Run Compare Mode

The timing diagram above shows the following operations.

(1) Once the counter starts, it counts up from 0000_0000h to FFFF_FFFFh.

(2) An GTMTINT interrupt request is generated when counting starts.

(3) If the current counter value matches OSTMnCMP, an GTMTINT interrupt request is generated. If OSTMnCMP = 0000_0000h in the above case, GTMTINT is generated over two clock cycles.

(4) Every (FFFF_FFFFh + 1) clock cycles the GTMTINT interrupt request is asserted.

When interrupts on starting of the counter are disabled, no interrupt is generated when counting starts.

SECTION 5 TIMER

5.6 Compare Match Timer W (CMTW)

5.6.1 Overview

The LSI has eight channels (4 channels × 2 units) of the 32-bit compare match timer W (CMTW). The CMTW has a 32-bit counter and can generate interrupts each time a set period elapses.

Table 5.6-1 shows the specifications of the CMTW and **Figure 5.6-1** shows a block diagram of the CMTW.

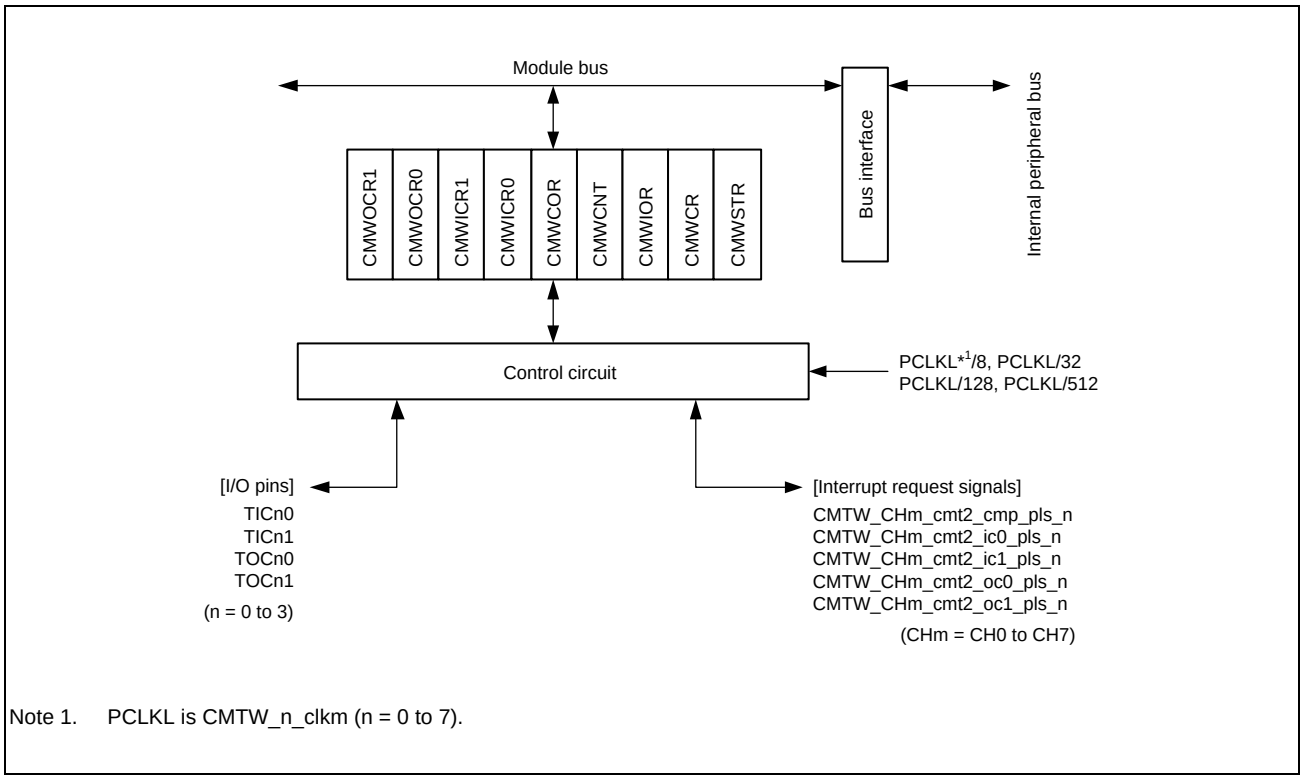
Table 5.6-1 CMTW Specifications

Item	Description
Number of channels	8 channels (4 channels x 2 units)
Timer counter	• 16-bit/32-bit selectable up-counter. • The counter returns to 0000_0000h after a compare match.
Prescaler	• Four dividing clocks are output. • Selectable from any of PCLKL*1/8, PCLKL/32, PCLKL/128, or PCLKL/512.
Input capture	Up to two input capture input signals available per channel
Output compare	Up to two output compare output signals available per channel
Compare match	One compare match available (no output compare output pin used)
Interrupt	• Compare match interrupt • Input capture 0 and 1 interrupts per channel • Output compare 0 and 1 interrupts per channel
Three event outputs available	• Compare match event • Output compare 0 and 1 event

Note 1. PCLKL is CMTW_n_clkm (n = 0 to 7).

Table 5.6-2 CMTW Clock Signals

Clock Signal Name	Description
CMTW_0_clkm	CMTW0 unit clock
CMTW_1_clkm	CMTW1 unit clock
CMTW_2_clkm	CMTW2 unit clock
CMTW_3_clkm	CMTW3 unit clock
CMTW_4_clkm	CMTW4 unit clock
CMTW_5_clkm	CMTW5 unit clock
CMTW_6_clkm	CMTW6 unit clock
CMTW_7_clkm	CMTW7 unit clock



Note 1. PCLKL is CMTW_n_clkm (n = 0 to 7).

Figure 5.6-1 Block Diagram of CMTW

Table 5.6-3 shows the CMTW pin configuration.

Table 5.6-3 Input/Output pins of CMTW

Unit	Pin Name	Input/Output	Description
CMTWn (n = 0 to 3)	TICn0	Input	CMTWn input capture input 0
	TICn1	Input	CMTWn input capture input 1
	TOCn0	Output	CMTWn output compare output 0
	TOCn1	Output	CMTWn output compare output 1

Note: CMTW4 to CMTW7 do not have any I/O pins.

5.6.2 Registers

The register addresses of CMTW are given as offsets from the individual base addresses <CMTWn_base>. The register base addresses of each CMTW are listed in the following table.

Table 5.6-4 Register Base Addresses

Base Address Name	Base Address
<CMTW0_base>	0_11C0_1800h (51C0_1800h*1, 41C0_1800h*2)
<CMTW1_base>	0_11C0_1C00h (51C0_1C00h*1, 41C0_1C00h*2)
<CMTW2_base>	0_11C0_2000h (51C0_2000h*1, 41C0_2000h*2)
<CMTW3_base>	0_11C0_2400h (51C0_2400h*1, 41C0_2400h*2)
<CMTW4_base>	0_1300_0C00h (5300_0C00h*1, 4300_0C00h*2)
<CMTW5_base>	0_1300_1000h (5300_1000h*1, 4300_1000h*2)
<CMTW6_base>	0_1300_1400h (5300_1400h*1, 4300_1400h*2)
<CMTW7_base>	0_1300_1800h (5300_1800h*1, 4300_1800h*2)

Note 1. CM33 address space (non-secure)

Note 2. CM33 address space (secure)

5.6.2.1 List of Registers

The CMTW registers and the memory addresses are listed in the following table. For the actual addresses, the offset values indicated in this table are added to the base addresses.

Register Name	Abbreviation	Initial Value	Offset Address	Access Size [bits]
Timer Start Register	CMTWm_CMWSTR	0000h	00h	16, 32
Timer Control Register	CMTWm_CMWCR	0000h	04h	16, 32
Timer I/O Control Register	CMTWm_CMWIOR	0000h	08h	16, 32
Reserve	-	-	0Ch to 0Fh	-
Timer Counter	CMTWm_CMWCNT	0000_0000h	10h	32
Compare Match Constant Register	CMTWm_CMWCOR	FFFF_FFFFh	14h	32
Input Capture Registers 0	CMTWm_CMWICR0	0000_0000h	18h	32
Input Capture Registers 1	CMTWm_CMWICR1	0000_0000h	1Ch	32
Output Compare Registers 0	CMTWm_CMWOCR0	FFFF_FFFFh	20h	32
Output Compare Registers 1	CMTWn_CMWOCR1	FFFF_FFFFh	24h	32

5.6.2.2 Register Description

The prefix (CMTWm_) of the register names is omitted in this and subsequent sections.

5.6.2.2.1 Timer Start Register (CMTWm_CMWSTR)

The CMWSTR register is used to start or stop the CMWCNT counter.

Access Size : 16, 32 bits
Address : <CMTWm_base> + 00h
Initial Value : 0000h

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	STR
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
15 to 1	-	All 0	R	Reserved These bits are read as 0b. The write value should be 0b.
0	STR	0h	RW	Counter Start 0b: The CMWCNT counter stops counting. The value immediately before the end of counting is retained and counting is stopped. 1b: The CMWCNT counter starts counting.

STR bit (Counter Start)

Specifies whether the timer counter operates or is stopped. The relevant prescaler operates or is stopped according to the setting of the STR bit.

5.6.2.2.2 Timer Control Register (CMTWm_CMWCR)

The CMWCR register selects the counter clearing source and the counter input clock, and enables or disables interrupts. The CMWCR register should be set while the timer counter (CMWCNT) operation is stopped.

Access Size : 16, 32 bits
Address : <CMTWm_base> + 04h
Initial Value : 0000h

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CCLR[2:0]			-	-	-	CMS	-	OC1IE	OC0IE	IC1IE	IC0IE	CMWIE	-	CKS[1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	R	R	R	RW	R	RW	RW	RW	RW	RW	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
15 to 13	CCLR[2:0]	0h	RW	Counter Clear 000b: The CMWCNT counter is cleared by CMWCOR register compare match. 001b: The CMWCNT counter is not cleared. 010b: The CMWCNT counter is not cleared. 011b: The CMWCNT counter is not cleared. 100b: The CMWCNT counter is cleared by CMWICR0 register input capture. 101b: The CMWCNT counter is cleared by CMWICR1 register input capture. 110b: The CMWCNT counter is cleared by CMWOCR0 register compare match. 111b: The CMWCNT counter is cleared by CMWOCR1 register compare match.
12 to 10	-	All 0	R	Reserved These bits are read as 0b. The write value should be 0b.
9	CMS	0h	RW	Timer Counter Size 0b: 32 bits 1b: 16 bits
8	-	0h	R	Reserved This bit is read as 0b. The write value should be 0b.
7	OC1IE*2	0h	RW	Output Compare 1 Interrupt Enable 0b: Disables an interrupt request by the output compare 1 (CMTWm_OC1I). 1b: Enables an interrupt request by the output compare 1 (CMTWm_OC1I).
6	OC0IE*2	0h	RW	Output Compare 0 Interrupt Enable 0b: Disables an interrupt request by the output compare 0 (CMTWm_OC0I). 1b: Enables an interrupt request by the output compare 0 (CMTWm_OC0I).
5	IC1IE*2	0h	RW	Input Capture 1 Interrupt Enable 0b: Disables an interrupt request by the input capture 1 (CMTWm_IC1I). 1b: Enables an interrupt request by the input capture 1 (CMTWm_IC1I).
4	IC0IE*2	0h	RW	Input Capture 0 Interrupt Enable 0b: Disables an interrupt request by the input capture 0 (CMTWm_IC0I). 1b: Enables an interrupt request by the input capture 0 (CMTWm_IC0I).
3	CMWIE	0h	RW	Compare Match Interrupt Enable 0b: Disables a compare match interrupt request (CMTWm_CMWI). 1b: Enables a compare match interrupt request (CMTWm_CMWI).
2	-	0h	R	Reserved This bit is read as 0b. The write value should be 0b.
1, 0	CKS[1:0]	0h	RW	Clock Select*1 00b: PCLKL/8 01b: PCLKL/32 10b: PCLKL/128 11b: PCLKL/512

Note 1. PCLKL is CMTW_n_clkm (n = 0 to 7).

Note 2. CMTW4 to 7 are invalid because they do not use input capture and output compare.

CKS[1:0] bits (Clock Select)

Select the clock to be input to the CMWCNT counter from among four internal clocks obtained by dividing the peripheral clock (PCLKL). When the CMWSTR.STR bit is set to 1, the CMWCNT counter starts counting up based on the clock selected with the CMWCR.CKS[1:0] bits.

CMWIE bit (Compare Match Interrupt Enable)

Enables or disables compare match interrupt (CMTWm_CMWI) request generation when the CMWCNT counter and CMWCOR register values match.

IC0IE bit (Input Capture 0 Interrupt Enable)

Enables or disables input capture interrupt 0 (CMWm_IC0I) request generation when input capture is generated in the CMWICR0 register.

IC1IE bit (Input Capture 1 Interrupt Enable)

Enables or disables input capture interrupt 1 (CMWm_IC1I) request generation when input capture is generated in the CMWICR1 register.

OC0IE bit (Output Compare 0 Interrupt Enable)

Enables or disables compare match interrupt 0 (CMWm_OC0I) request generation when the CMWCNT counter and CMWOCR0 register values match.

OC1IE bit (Output Compare 1 Interrupt Enable)

Enables or disables compare match interrupt 1 (CMWm_OC1I) request generation when the CMWCNT counter and CMWOCR1 register values match.

CMS bit (Timer Counter Size)

Selects either 16 or 32 bits as the size of the timer counter (CMWCNT). The size selected with the CMS bit is valid in the compare match constant register (CMWCOR), input capture registers (CMWICR0 and CMWICR1), and output compare registers (CMWOCR0 and CMWOCR1).

CCLR[2:0] bits (Counter Clear)

Selects the CMWCNT counter clearing source.

5.6.2.2.3 Timer I/O Control Register (CMTWm_CMWIOR)

The CMWIOR register controls the CMWCOR, CMWICR0, CMWICR1, CMWOCR0, and CMWOCR1 registers. CMWIOR should be set while the timer counter (CMWCNT) operation is stopped.

External pins can only be used by CMTW0 to CMTW3.

Access Size : 16, 32 bits
Address : <CMTWm_base> + 08h
Initial Value : 0000h

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CMWE	-	OC1E	OC0E	OC1[1:0]		OC0[1:0]		-	-	IC1E	IC0E	IC1[1:0]		IC0[1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	R	RW	RW	RW	RW	RW	RW	R	R	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
15	CMWE	0h	RW	Compare Match Enable 0b: Disables the compare match operation using the CMWCOR register. 1b: Enables the compare match operation using the CMWCOR register.
14	-	0h	R	Reserved These bits are read as 0b. The write value should be 0b.
13	OC1E	0h	RW	Compare Match Enable 1 0b: Disables the compare match operation using the CMWOCR1 register. 1b: Enables the compare match operation using the CMWOCR1 register.
12	OC0E	0h	RW	Compare Match Enable 0 0b: Disables the compare match operation using the CMWOCR0 register. 1b: Enables the compare match operation using the CMWOCR0 register.
11, 10	OC1[1:0]	0h	RW	Output Compare Control 1 00b: Retains the output value.*1 01b: Initially outputs 0 and toggles the output value upon compare match. 10b: Initially outputs 1 and toggles the output value upon compare match. 11b: Setting prohibited
9, 8	OC0[1:0]	0h	RW	Output Compare Control 0 00b: Retains the output value.*1 01b: Initially outputs 0 and toggles the output value upon compare match. 10b: Initially outputs 1 and toggles the output value upon compare match. 11b: Setting prohibited
7, 6	-	All 0	R	Reserved These bits are read as 0b. The write value should be 0b.
5	IC1E	0h	RW	Input Capture Enable 1 0b: Disables the input capture operation of the CMWICR1 register. 1b: Enables the input capture operation of the CMWICR1 register.
4	IC0E	0h	RW	Input Capture Enable 0 0b: Disables the input capture operation of the CMWICR0 register. 1b: Enables the input capture operation of the CMWICR0 register.
3, 2	IC1[1:0]	0h	RW	Input Capture Control 1 00b: Input capture at the rising edge on the TICn1 pin. 01b: Input capture at the falling edge on the TICn1 pin. 10b: Input capture at both edges on the TICn1 pin. 11b: Setting prohibited
1, 0	IC0[1:0]	0h	RW	Input Capture Control 0 00b: Input capture at the rising edge on the TICn0 pin. 01b: Input capture at the falling edge on the TICn0 pin. 10b: Input capture at both edges on the TICn0 pin. 11b: Setting prohibited

Note 1. After reset, 0 is output until the CMWIOR register is set.

IC0[1:0] bits (Input Capture Control 0)

Selects the input capture operation of the CMWICR0 register.

IC1[1:0] bits (Input Capture Control 1)

Selects the input capture operation of the CMWICR1 register.

IC0E bit (Input Capture Enable 0)

Enables or disables the input capture operation of the CMWICR0 register.

IC1E bit (Input Capture Enable 1)

Enables or disables the input capture operation of the CMWICR1 register.

OC0[1:0] bits (Output Compare Control 0)

Sets the output compare operation using the CMWOCR0 register.

OC1[1:0] bits (Output Compare Control 1)

Sets the output compare operation using the CMWOCR1 register.

OC0E bit (Compare Match Enable 0)

Enables or disables the compare match operation using the CMWOCR0 register.

OC1E bit (Compare Match Enable 1)

Enables or disables the compare match operation using the CMWOCR1 register.

CMWE bit (Compare Match Enable)

Enables or disables the compare match operation using the CMWCOR register.

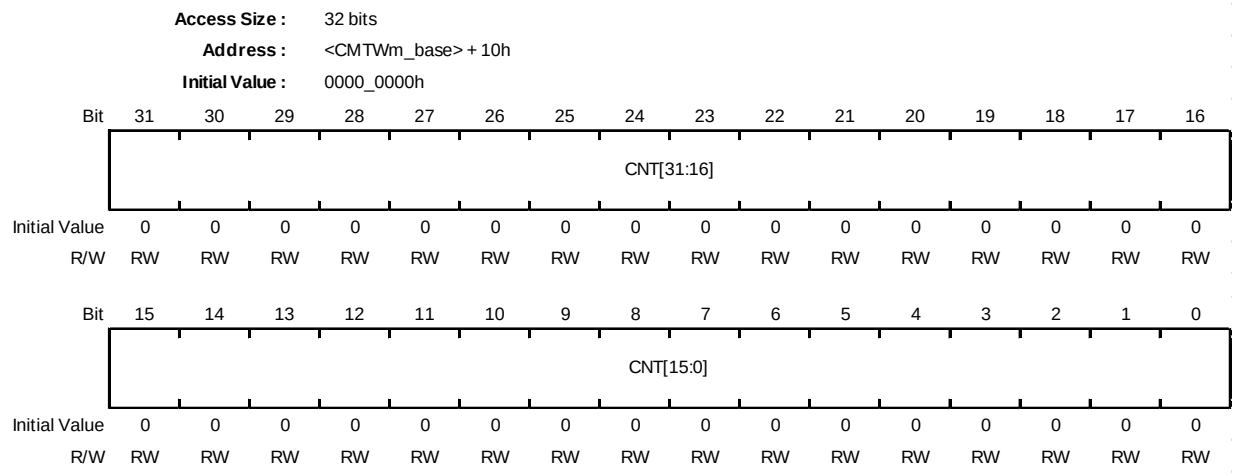
5.6.2.2.4 Timer Counter (CMTWm_CMWCNT)

The CMWCNT counter is used as a readable/writable up-counter.

Before starting counter operation, the timer control register (CMWCR) should be set. When the 16-bit counter size is selected with the CMS bit in the timer control register (CMWCR), bits 15 to 0 in the CMWCNT counter are valid. Since access to this register is in 32-bit units, when writing, write 32-bit values to it with 0000 in the higher-order bits. If a value other than 0000h is set in the higher-order bits, a value greater than 0000_FFFFh may be read when this register is read.

When the STR bit is set to 1, the CMWCNT counter starts counting. When the STR bit is set to 0, the CMWCNT counter retains the value immediately before the end of counting and stops counting.

Access Size : 32 bits
Address : <CMTWm_base> + 10h
Initial Value : 0000_0000h



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CNT[31:0]	0h	RW	Timer Counter

5.6.2.2.5 Compare Match Constant Register (CMTWm_CMWCOR)

The CMWCOR register is a readable/writable register that specifies the time up to a compare match between the timer counter (CMWCNT) value and CMWCOR value.

When the 16-bit counter size is selected with the CMS bit in the timer control register (CMWCR), bits 15 to 0 in this register are valid. Since access to this register is in 32-bit units, when writing, write a 32-bit value to it with 0000h in the higher-order bits.

The cycle for compare matches is as follows:

Compare-match cycle = (setting of the CMWCOR register + 1) × counter-clock cycle*1

Note 1. This is a clock cycle set by the CMWCR.CKS[1:0] bits.

Access Size : 32 bits
Address : <CMTWm_base> + 14h
Initial Value : FFFF_FFFFh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	COR[31:16]

5.6.2.2.6 Input Capture Registers n (CMTWm_CMWICRn) (n = 0, 1)

The CMWICR0 and CMWICR1 registers are read-only registers in which the CMWCNT counter value is stored when an input capture is generated.
When the 16-bit counter size is selected with the CMS bit in the timer control register (CMWCR), bits 15 to 0 in these registers are valid. Writing to these registers is invalid.

Access Size : 32 bits

Address : <CMTWm_base> + 18h (n=0)
<CMTWm_base> + 1Ch (n=1)

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

5.6.2.2.7 Output Compare Registers n (CMTWm_CMWOCRn) (n = 0, 1)

The CMWOCR0 and CMWOCR1 registers are readable/writable registers that set the value to be compared when an output compare is generated.
When the 16-bit counter size is selected with the CMS bit in the timer control register (CMWCR), bits 15 to 0 in these registers are valid. Since access to these registers is in 32-bit units, when writing, write a 32-bit value to them with 0000_0000h in the higher-order bits.

Access Size : 32 bits

Address : <CMTWm_base> + 20h (n=0)
<CMTWm_base> + 24h (n=1)

Initial Value : FFFF_FFFFh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

5.6.3 Operation

When the CMWCR register is set and then the STR bit in CMWCR is set to 1, the CMTW starts counter operation.

Setting the CMWSTR.STR bit to 0 enables the CMWCNT counter to retain the value immediately before the end of counting and stop counting. Setting CMWIOR register enables using the compare match function, input capture input function, and output compare output function.

5.6.3.1 Period Counting Operation

When the internal clock is selected by using the CMWCNT.CKS[1:0] bits and the CMWSTR.STR bit is set to 1, the CMWCNT counter starts counting up cycles of the selected clock. When the CCLR[2:0] bits in CMWCR are set so that CMWCNT should be cleared by a specific counter clearing source and the counter clearing source is generated, the CMWCNT counter is cleared to 0000_0000h and continues incrementing. When the CCLR[2:0] bits are set so that CMWCNT should not be cleared by any specific counter clearing source, the CMWCNT counter is cleared to 0000_0000h only when an overflow is generated (FFFF_FFFFh → 0000_0000h (when the counter size is 32 bits) or 0000_FFFFh → 0000_0000h (when the counter size is 16 bits)) and continues incrementing.

5.6.3.2 Compare Match Function

When the values of the CMWCNT counter and CMWCOR register match, a compare match interrupt (CMTWm_CMWI) is generated. The CMWCNT counter operates as follows according to the setting of CMWCR.CCLR[1:0].

1. When CMWCR.CCLR[2:0] = 000b
   When the values of the CMWCNT counter and CMWCOR register match, the CMWCNT counter is cleared to 0000_0000h. The CMWCNT counter then restarts counting up from 0000_0000h.
2. When CMWCR.CCLR[2:0] = a value other than 000b
   Even when the values of the CMWCNT counter and CMWCOR register match, the CMWCNT counter is not cleared to 0000_0000h but continues counting up until the clearing condition set in CMWCR.CCLR[1:0] is satisfied or the value of the counter reaches FFFF_FFFFh (when the size of the counter is 32 bits) or 0000_FFFFh (when the size of the counter is 16 bits).
   The CMWCNT counter is then cleared to 0000_0000h and restarts counting up from 0000_0000h.

Figure 5.6-2 shows an example of procedure for setting compare match operation.

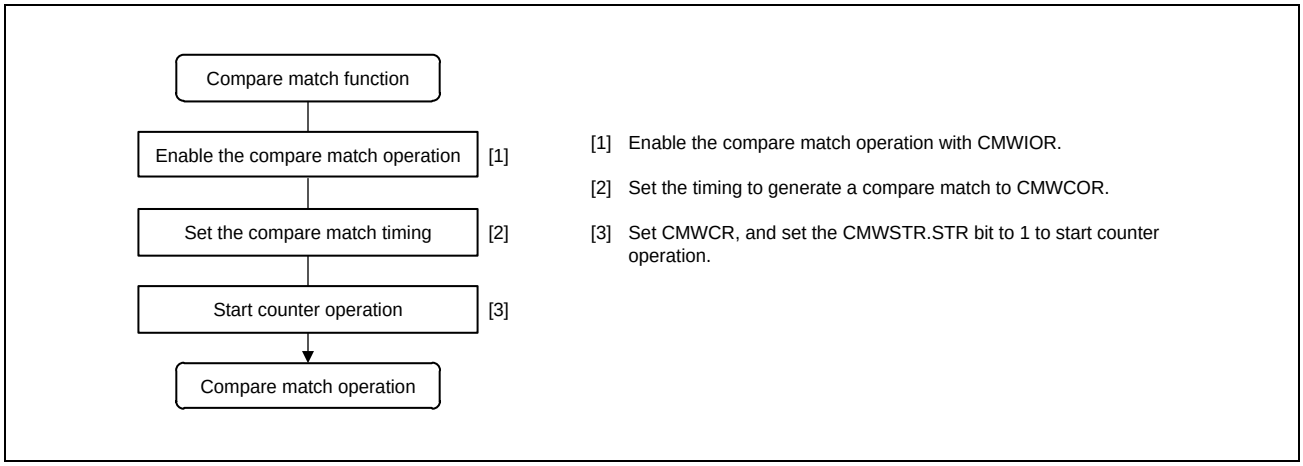

Figure 5.6-2 Procedure for Setting Compare Match Operation

Figure 5.6-3 shows an example when compare match with CMWCOR is set as a counter clearing source.

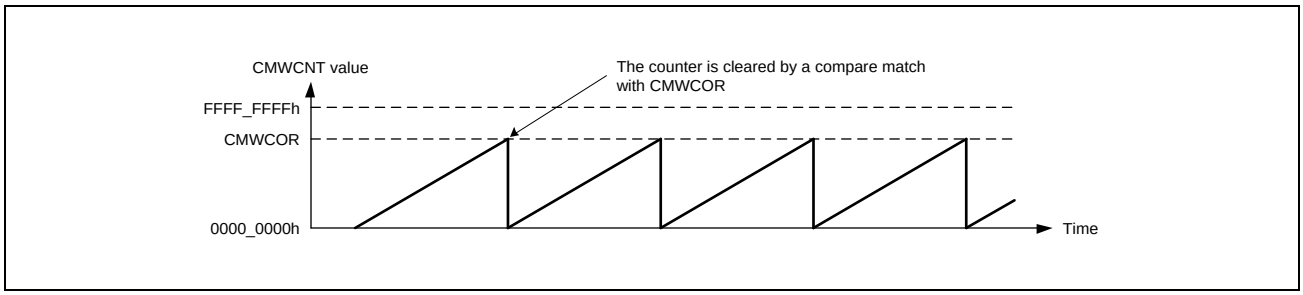

Figure 5.6-3 Example of Compare Match Operation

Figure 5.6-4 shows an example when CMWCOR is set to FFFF_FFFFh and an overflow is detected.

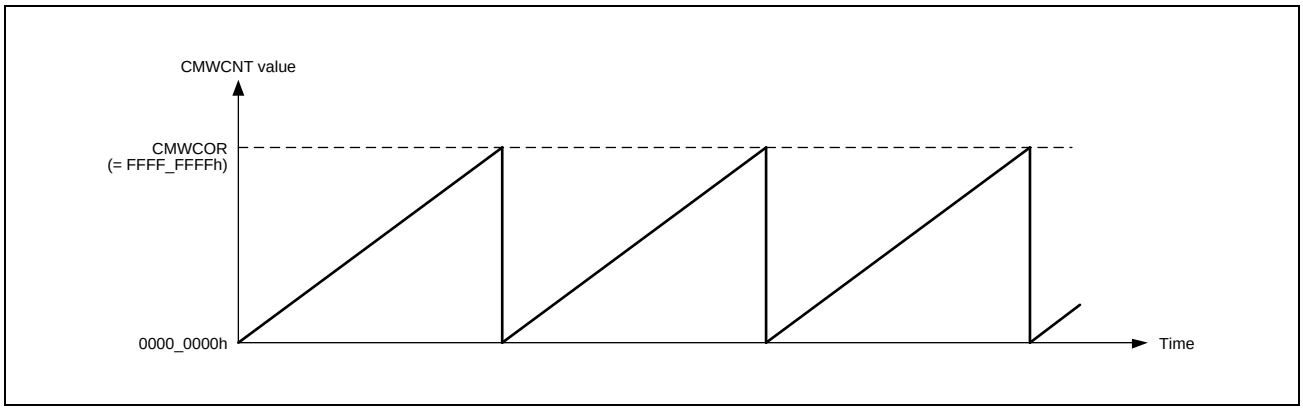

Figure 5.6-4 Example of Compare Match Operation (Overflow Detected)

5.6.3.3 Output Compare Function

Using the output compare function, toggle output from the relevant output pins can be provided. When the CMWCNT counter value matches the value of the CMWOCR0 or CMWOCR1 register, the output compare interrupt (CMTWm_OC0I or CMTWm_OC1I) is generated. The CMWCNT counter operates as follows according to the setting of CMWCR.CCLR[2:0].

1. When CMWCR.CCLR[2:0] = 110b
   When the values of the CMWCNT counter and CMWOCR0 register match, the CMWCNT counter is cleared to 0000_0000h. The CMWCNT counter then restarts counting up from 0000_0000h.
2. When CMWCR.CCLR[2:0] = 111b
   When the values of the CMWCNT counter and CMWOCR1 register match, the CMWCNT counter is cleared to 0000_0000h. The CMWCNT counter then restarts counting up from 0000_0000h.
3. When CMWCR.CCLR[2:0] = a value other than 110b and 111b
   Even when the values of the CMWCNT counter and CMWOCR0 or CMWOCR1 register match, the CMWCNT counter is not cleared to 0000_0000h but continues counting up until the clearing condition set in CMWCR.CCLR[2:0] is satisfied or the value of the counter reaches FFFF_FFFFh (when the size of the counter is 32 bits) or 0000_FFFFh (when the size of the counter is 16 bits). The CMWCNT counter is then cleared to 0000_0000h and restarts counting up from 0000_0000h.

Figure 5.6-5 shows an example of procedure for setting output compare operation.

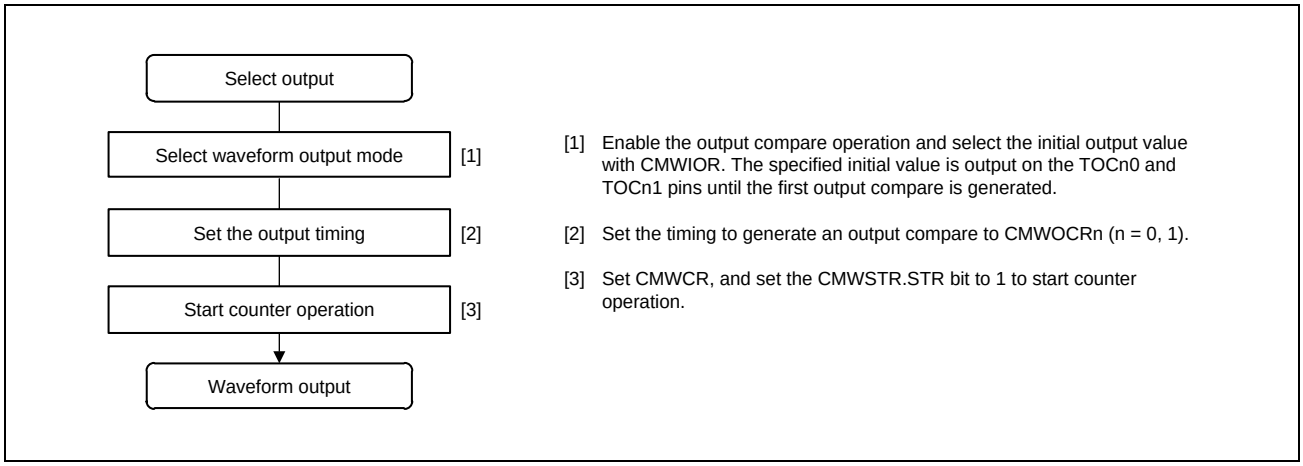

Figure 5.6-5 Procedure for Setting Output Compare Operation

Figure 5.6-6 shows an example when the counter is cleared upon compare match with the CMWOCR1 register and toggle outputs are provided from the TOCn0 and TOCn1 pins.

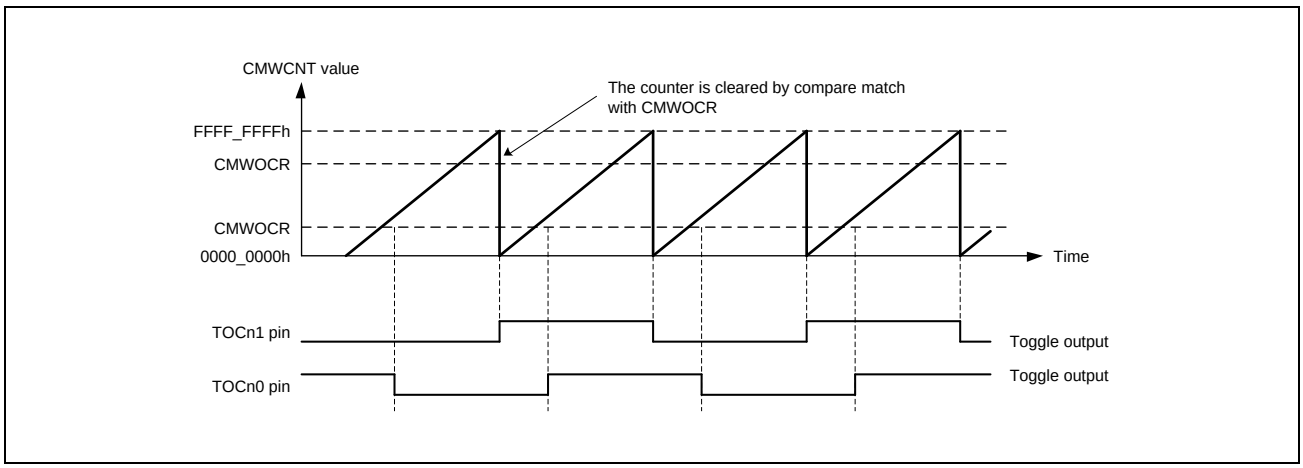

Figure 5.6-6 Example of Output Compare Operation

5.6.3.4 Input Capture Function

Through detecting the edge on the TICn0 and TICn1 pin input, the CMWCNT counter value can be transferred to the CMWICR0 and CMWICR1 registers, respectively. The edges to be detected can be selected from among the rising edge alone, falling edge alone, and both the rising and falling edges. When the CMWCNT counter value is transferred to the CMWICR0 or CMWICR1 register using the input capture function, an input capture interrupt (CMTWm_IC0I or CMTWm_IC1I) is generated. The CMWCNT counter operates as follows according to the setting of CMWCR.CCLR[2:0].

1. When CMWCR.CCLR[2:0] = 100b
   When the CMWCNT counter value is transferred to CMWICR using the input capture operation, the CMWCNT counter is cleared to 0000_0000h.
   The CMWCNT counter then restarts counting up from 0000_0000h.
2. When CMWCR.CCLR[2:0] = 101b
   When the CMWCNT counter value is transferred to CMWICR using the input capture operation, the CMWCNT counter is cleared to 0000_0000h.
   The CMWCNT counter then restarts counting up from 0000_0000h.
3. When CMWCR.CCLR[2:0] = a value other than 100b and 101b
   Even when the CMWCNT counter value is transferred to CMWICR0 or CMWICR1 using the input capture operation, the CMWCNT counter is not cleared to 0000_0000h but continues counting up until the clearing condition set in CMWCR.CCLR[2:0] is satisfied or the value of the counter reaches FFFF_FFFFh (when the size of the counter is 32 bits) or 0000_FFFFh (when the size of the counter is 16 bits). The CMWCNT counter is then cleared to 0000_0000h and restarts counting up from 0000_0000h.

Figure 5.6-7 shows an example of procedure for setting input capture operation.

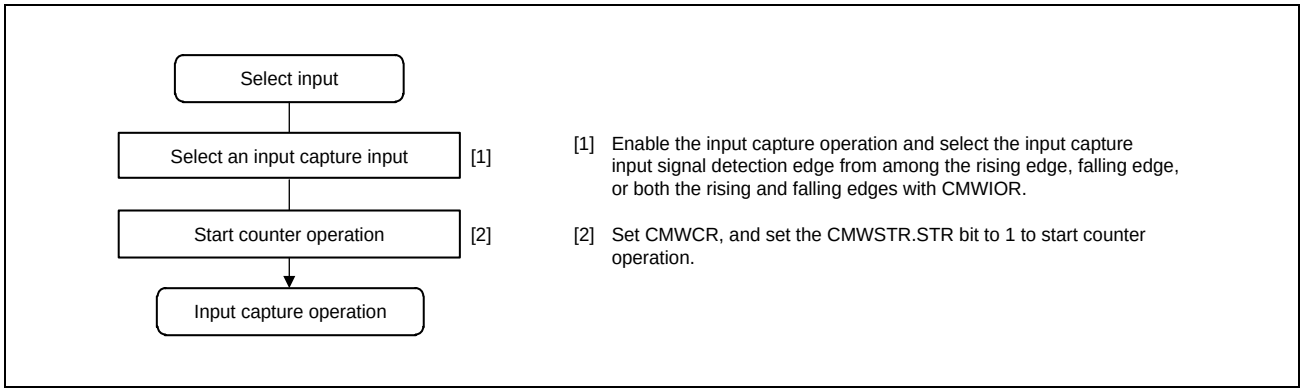

Figure 5.6-7 Procedure for Setting Input Capture Operation

Figure 5.6-8 shows an example in which both the rising and falling edges are selected for the TICn0 pin input capture input edge and the falling edge for the TICn1 pin, and the CMWCNT counter is cleared by a CMWICR1 register input capture.

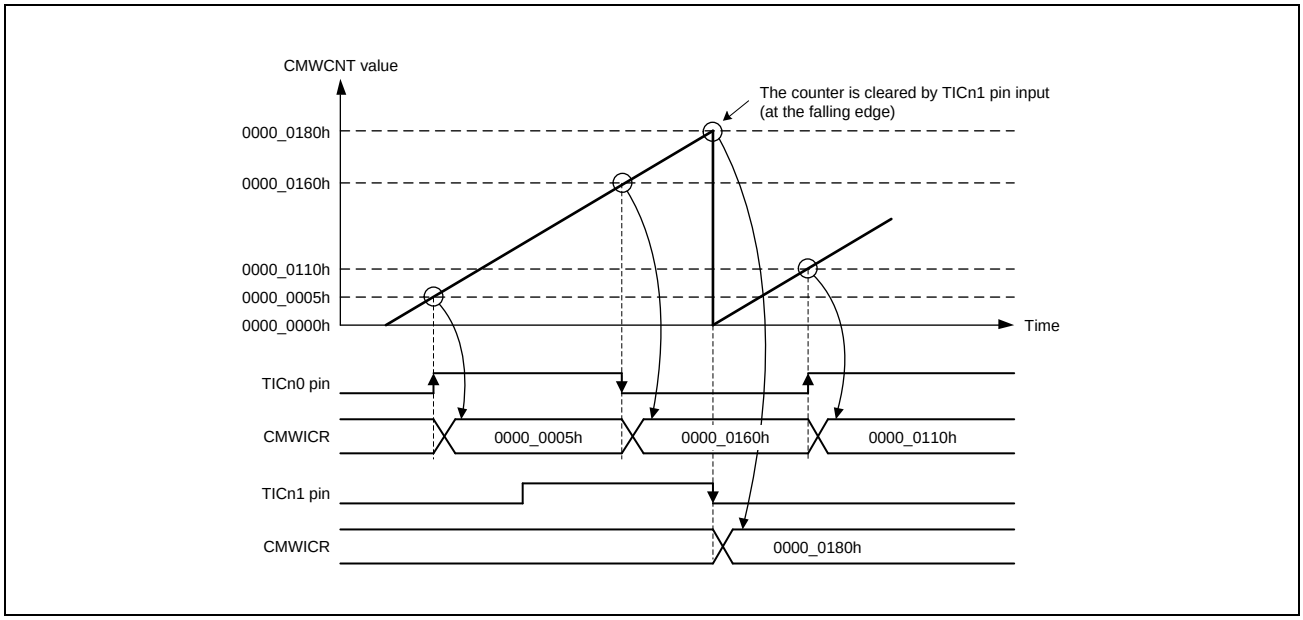

Figure 5.6-8 Example of Input Capture Operation

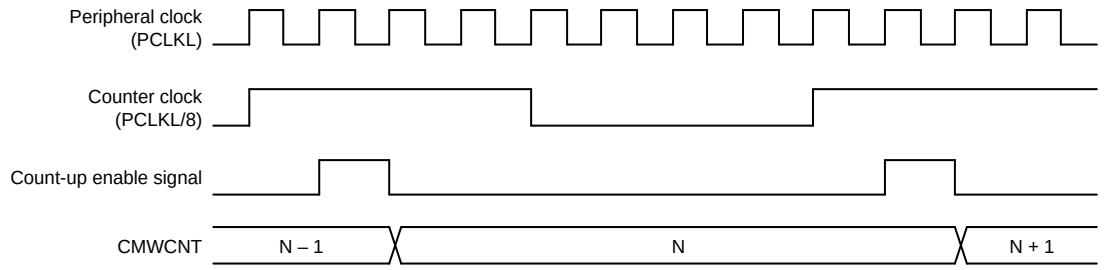
5.6.3.5 Counter Size

With the CMTW, either 16 or 32 bits can be selected as the counter size by using the CMWCR.CMS bit. When the counter is used as a 32-bit counter, set the CMWCOR, CMWOCR0, or CMWOCR1 register to the desired values in 32-bit units. In reading, all 32 bits of CMWICR0 and CMWICR1 are valid. When the counter is used as a 16-bit counter, a 32-bit value should be set to the CMWCOR register with 0000h in the higher-order bits. Similarly, a 32-bit value should be set to the CMWOCR0 and CMWOCR1 registers with 0000h in the higher-order bits.

A 32-bit value with 0000h in the higher-order bits is read from the CMWICR0 and CMWICR1 registers.

5.6.3.6 Count Timing Based on CMWCNT

One of four clocks (PCLKL/8, PCLKL/32, PCLKL/128, and PCLKL/512) obtained by dividing the peripheral clock (PCLKL) can be selected with the CMWCR.CKS[1:0] bits. **Figure 5.6-9** shows the timing.



Note: PCLKL is CMTW_n_clkm (n = 0 to 7).

Figure 5.6-9 Count Timing (PCLKL/8)

5.6.3.7 Output Compare Output Timing

A compare match signal is generated in the last state in which the CMWOCRn (n = 0, 1) register and CMWCNT counter values match (the CMWCNT counter value is updated immediately after the state). That is, the compare match signal is not generated if the CMWCNT counter clock is not input after a match between the CMWOCR register and CMWCNT counter values. When a compare match signal is generated, the output compare output pin (TOC) changes in accord with the setting of the OC0[1:0] or OC1[1:0] bits in the CMWIOR register. **Figure 5.6-10** shows the output compare output timing.

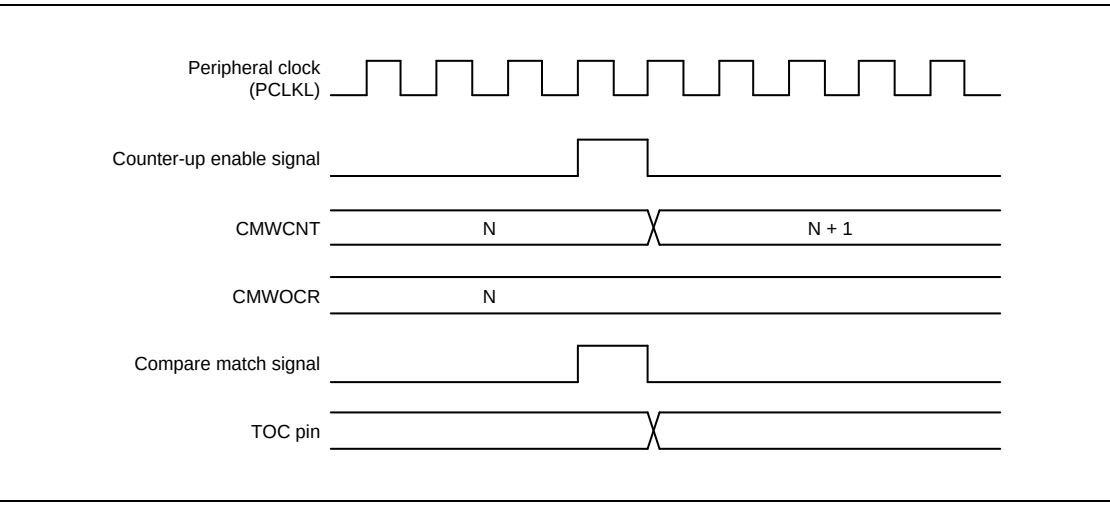


Figure 5.6-10 Output Compare Output Timing

5.6.3.8 Input Capture Timing

Figure 5.6-11 shows the input capture timing.

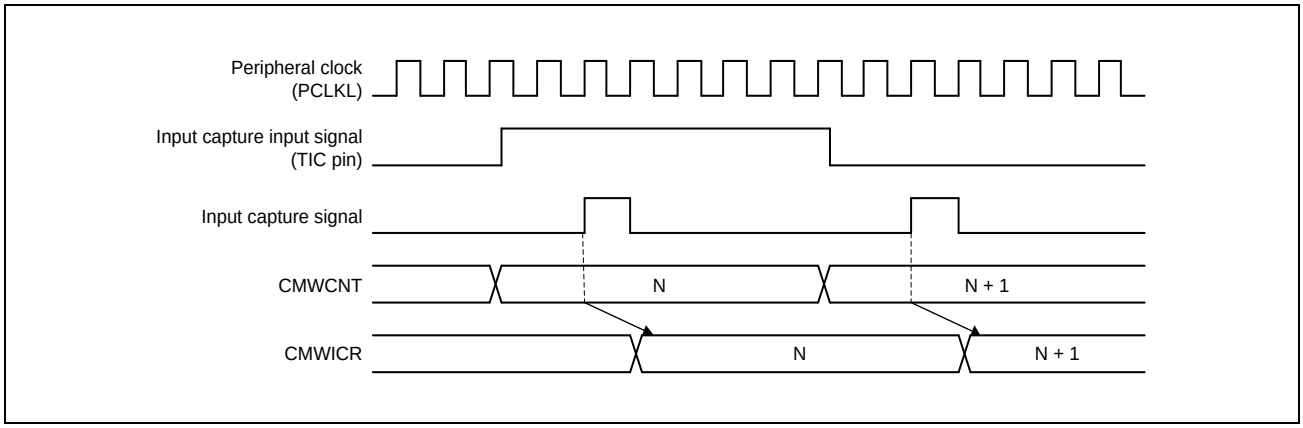

Figure 5.6-11 Input Capture Timing

5.6.4 Interrupts

5.6.4.1 CMTW Interrupt Sources and DMAC Transfer Requests

The CMTW has five interrupt sources: two input capture interrupt requests (CMTWm_IC0I and CMTWm_IC1I), two output compare interrupt requests (CMTWm_OC0I and CMTWm_OC1I), and a compare match interrupt request (CMTWm_CMWI).

Table 5.6-5 shows the interrupt sources and priority. The interrupt sources can be enabled or disabled using the IC0IE, IC1IE, OC0IE, OC1IE, and CMWIE bits in CMWCR and are separately issued to the interrupt controller.

Table 5.6-5 CMTW Interrupt Sources

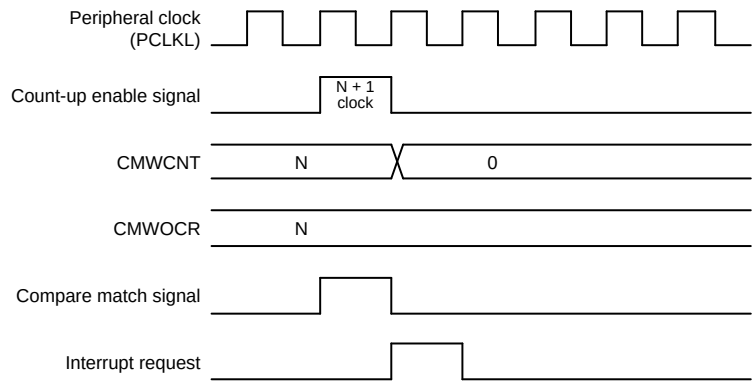
Interrupt source	Interrupt signal name	Interrupt	Interrupt enable bit	DMAC activation	Priority
CMTWm_CMWI	CMTW_CHm_cmt2_cmp_pls_n (“CHm” = CH0 to CH7)	Interrupt caused by compare match	CMWIE	Possible	High
CMTWm_IC0I*1	CMTW_CHm_cmt2_ic0_pls_n (“CHm” = CH0 to CH7)	Interrupt caused by input capture 0	IC0IE	Possible	
CMTWm_IC1I*1	CMTW_CHm_cmt2_ic1_pls_n (“CHm” = CH0 to CH7)	Interrupt caused by input capture 1	IC1IE	Possible	
CMTWm_OC0I*1	CMTW_CHm_cmt2_oc0_pls_n (“CHm” = CH0 to CH7)	Interrupt caused by output compare 0	OC0IE	Possible	
CMTWm_OC1I*1	CMTW_CHm_cmt2_oc1_pls_n (“CHm” = CH0 to CH7)	Interrupt caused by output compare 1	OC1IE	Possible	Low

Note: m = 0 to 7

Note 1. CMTW4 to 7 cannot be used because they do not have external pins.

5.6.4.2 Timing of Compare Match Interrupt Generation

When the values of the CMWCNT counter and CMWCOR register match, a compare match interrupt (CMTWm_CMWI) is generated. The compare match signal is generated at the end of the cycle where the values matched (i.e. when the CMWCNT counter is updated from the matching counter value). The compare match signal, therefore, is not generated until a further cycle of the input clock (PCLKL/8, PCLKL/32, PCLKL/128, or PCLKL/512) for the CMWCNT counter arrives after the values of the CMWCNT counter and CMWCOR register have matched.
Figure 5.6-12 shows the timing of compare match interrupt generation.



Note: PCLKL is CMTW_n_clkm (n = 0 to 7).

Figure 5.6-12 Timing of Compare Match Interrupt Generation

5.6.4.3 Timing of Output Compare Interrupt Generation

Figure 5.6-13 shows the timing of output compare interrupt generation.

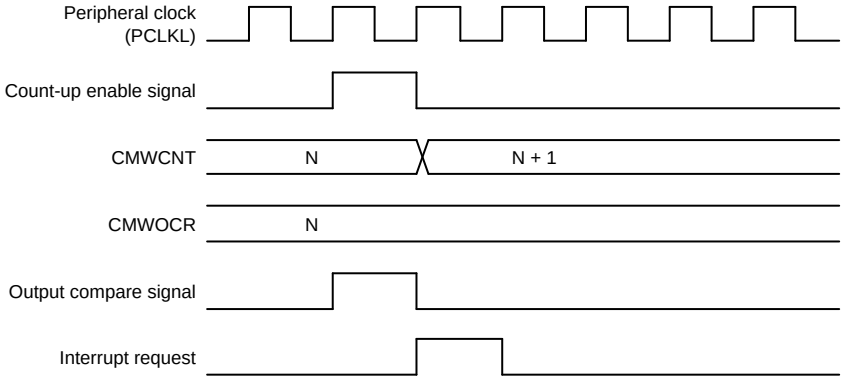


Figure 5.6-13 Timing of Output Compare Interrupt Generation

5.6.4.4 Timing of Input Capture Interrupt Generation

Figure 5.6-14 shows the timing of input capture interrupt generation.

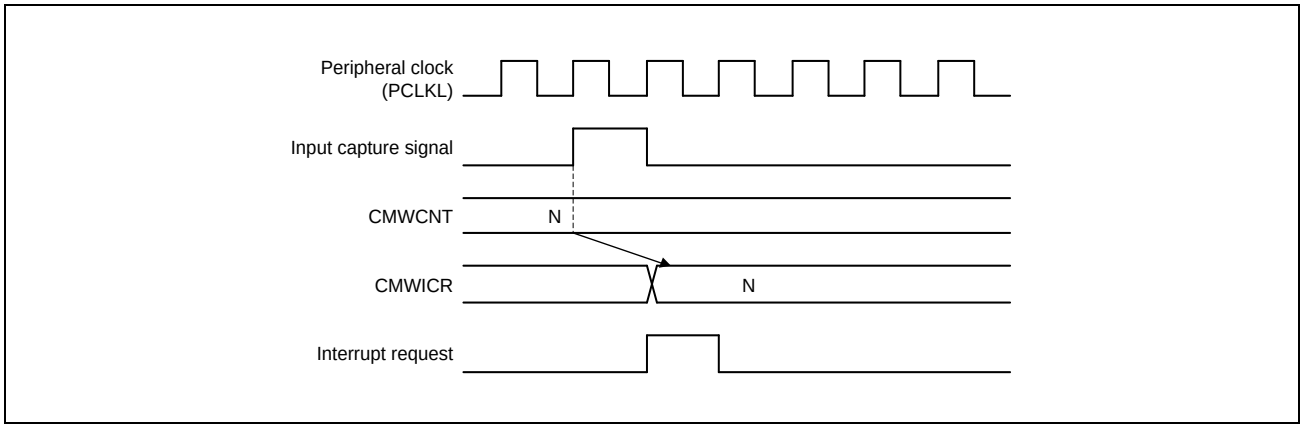

Figure 5.6-14 Timing of Input Capture Interrupt Generation

5.6.5 Event Link Operation

5.6.5.1 Issuing Event Signals to the ELC

The CMTW can issue the following event signals to the event link controller (ELC).

5.6.5.1.1 Compare match event

Upon generation of a compare match signal, the CMTW simultaneously issues an interrupt request and a compare match event signal to the ELC. The event signal is issued regardless of the setting of the corresponding interrupt request enable bit (CMWCR.CMWIE bit).

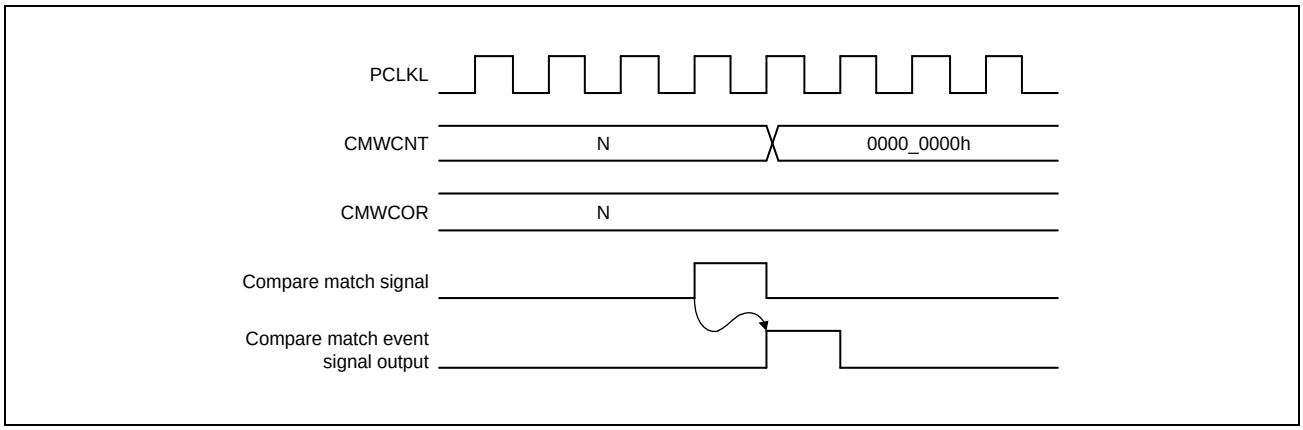

Figure 5.6-15 Timing of Issuing Compare Match Event

5.6.5.1.2 Output compare event

Upon generation of an output compare signal, the CMTW simultaneously issues an interrupt request and an output compare event signal to the ELC. The event signal is issued regardless of the setting of the corresponding interrupt request enable bit (CMWCR. OC0IE or CMWCR. OC1IE bit).

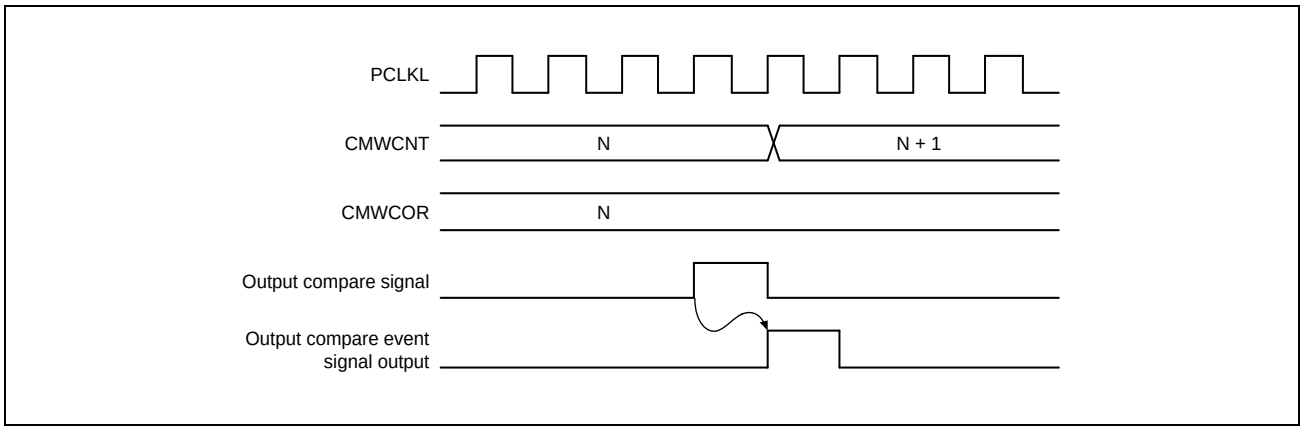

Figure 5.6-16 Timing of Issuing Output Compare Event

5.6.6 Usage Notes

5.6.6.1 Contention between CMWCNT Counter Writing and Compare Match

If the compare match signal is generated during CPU writing to the CMWCNT counter, the compare match interrupt request is output but the counter is not cleared since the CPU writing to the counter is given priority.

Figure 5.6-17 shows the timing of contention between CMWCNT counter writing and compare match.

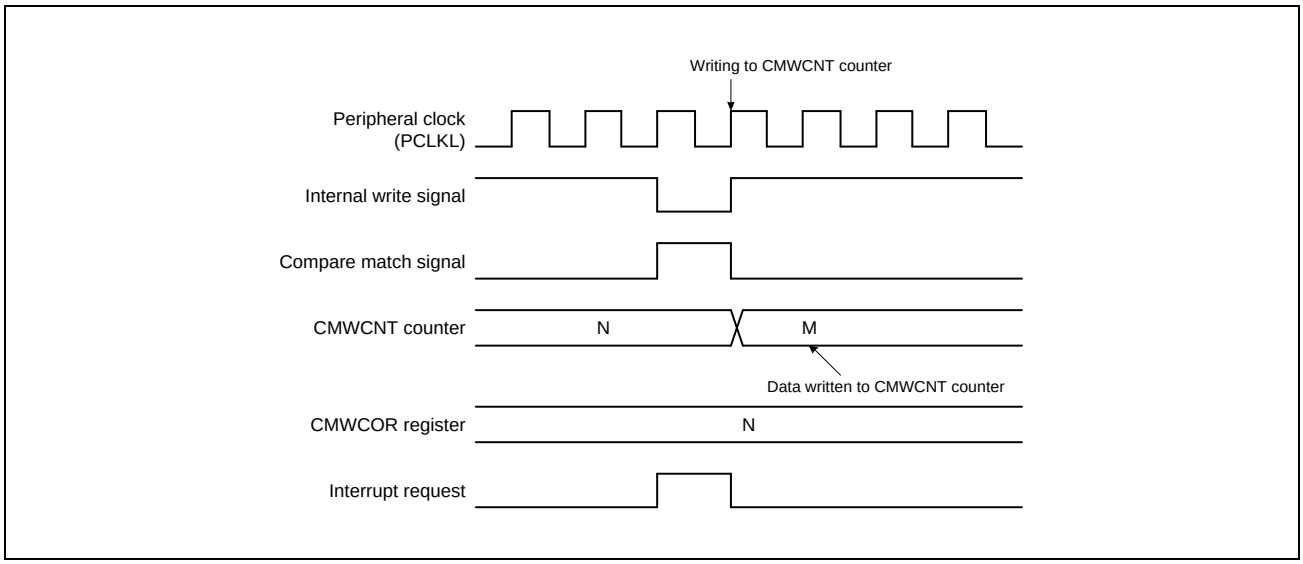

Figure 5.6-17 Contention between CMWCNT Counter Writing and Compare Match

5.6.6.2 Contention between CMWCNT Counter Writing and Incrementing or Clearing

In case of contention between incrementation or clearing of the CMWCNT counter and CPU writing to the counter, the counter is not actually incremented or cleared since the CPU writing to the CMWCNT counter is given priority.

Figure 5.6-18 shows the timing in the case of contention between writing to the CMWCNT counter and incrementation or clearing.

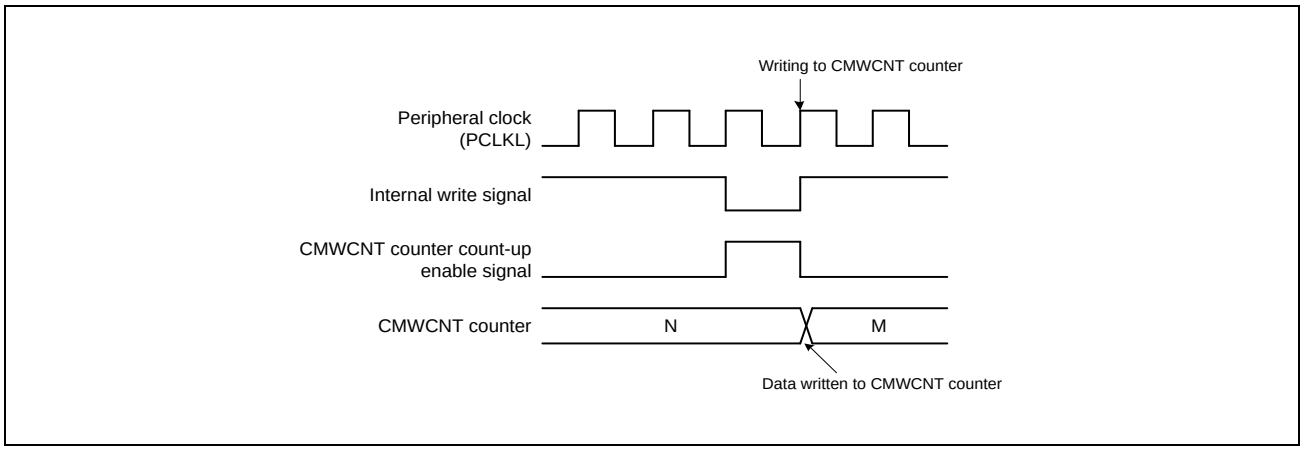

Figure 5.6-18 Contention between CMWCNT Counter Writing and Incrementing

5.6.6.3 Contention between CMWCOR Register Writing and Compare Match

If the compare match is generated during CPU writing to the CMWCOR register, the CPU writing to the CMWCOR register proceeds and also the compare match signal is output.

Figure 5.6-19 shows the timing of contention between CMWCOR register writing and compare match.

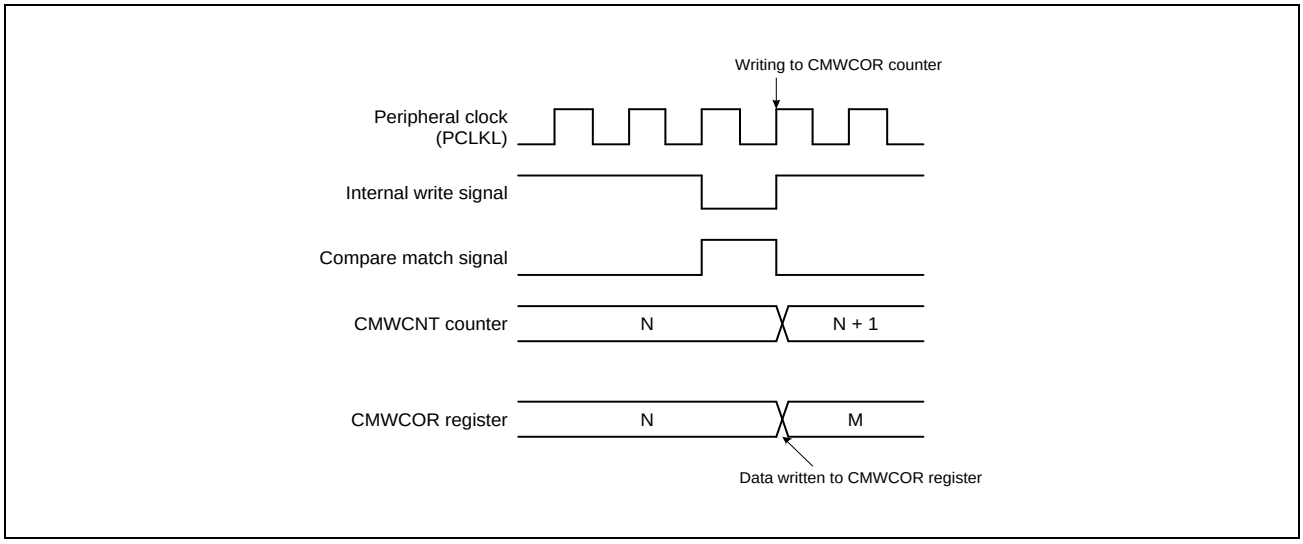

Figure 5.6-19 Contention between CMWCOR Register Writing and Compare Match

5.6.6.4 Contention between CMWOCRn Register Writing and Compare Match

If the compare match is generated during CPU writing to the CMWOCRn register, the CPU writing to the CMWOCRn register proceeds and also the compare match signal is output (n = 0, 1).

Figure 5.6-20 shows the timing of contention between CMWOCRn register writing and compare match.

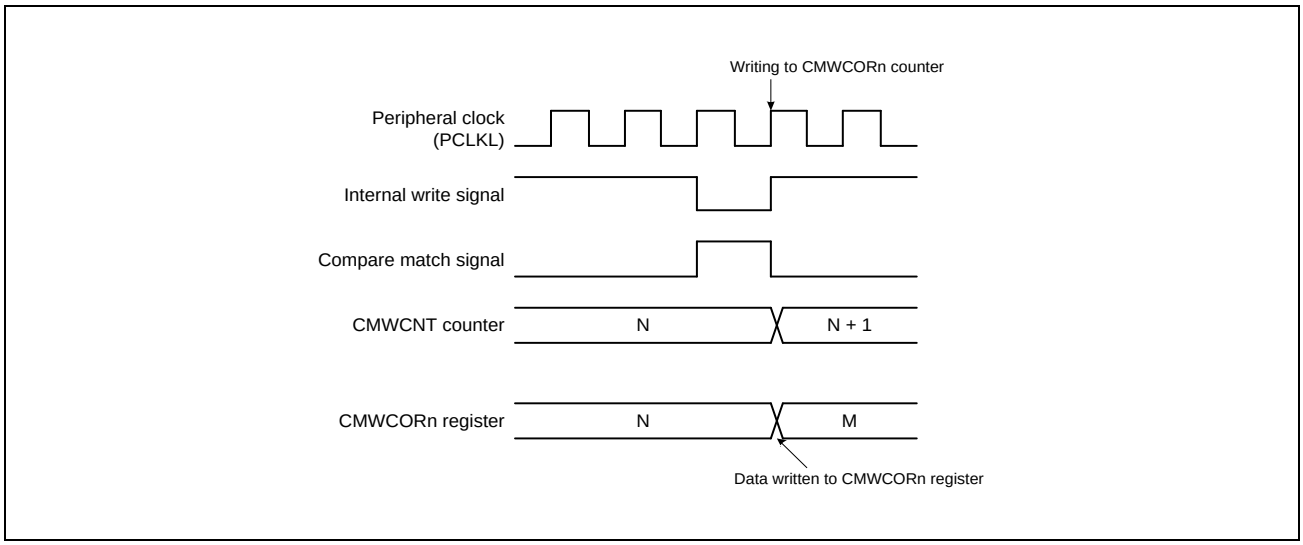

Figure 5.6-20 Contention between CMWOCRn Register Writing and Compare Match

5.6.6.5 Contention between CMWCNT Counter Reading and Incrementing or Clearing

If the CMWCNT counter incrementing or clearing process occurs at the same time that the data of the CMWCNT counter is read, the value having been in the CMWCNT counter before incremented or cleared is read.

Figure 5.6-21 shows the timing of contention between the CMWCNT counter reading and incrementing.

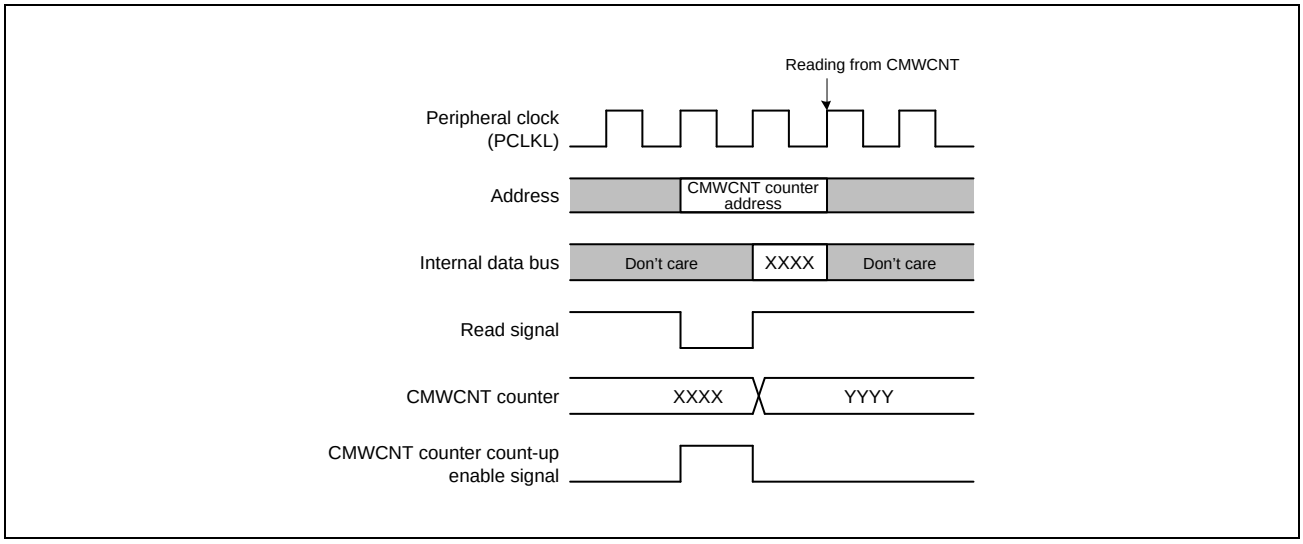

Figure 5.6-21 Contention between CMWCNT Counter Reading and Incrementing (When the Data Reading and Incrementing Process Occur Simultaneously)

5.6.6.6 Contention Between CMWICRn Register Reading and Input Capture

If the input capture signal is generated at the same time that the data of CMWICRn register is read, the value having been in CMWICRn register before updated by input capture transfer is read (n = 0, 1).

Figure 5.6-22 shows the timing of contention between the CMWICRn register reading and input capture.

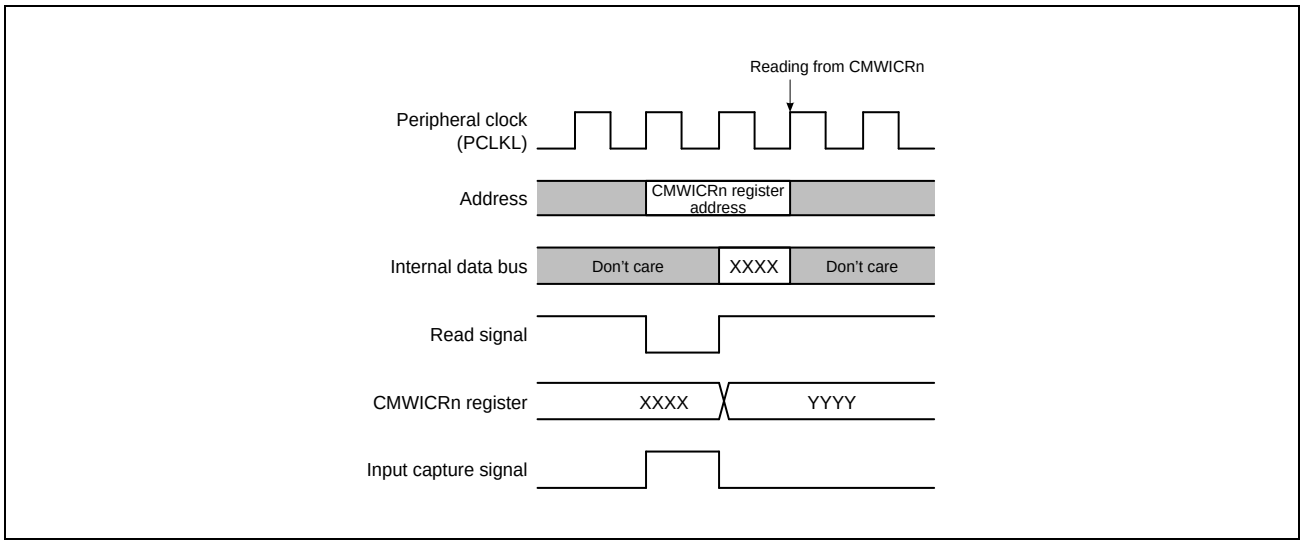

Figure 5.6-22 Contention between CMWICRn Register Reading and Input Capture (When the Input Capture Signal and Read Signal are Generated Simultaneously)

Table 5.6-6 Summary of Contention between Operations Due to the Access to Registers and Changes to the Counter's State

Register Access	CMWCNT State	CMWICR0/1 State	Operation to be Performed
Writing to CMWCNT	Compare match	—	Output of compare match interrupt request/writing to CMWCNT
	Counting up	—	Writing to CMWCNT
Writing to CMWCOR	Compare match	—	Compare match
Writing to CMWOCR0	Output compare 0	—	Output compare 0
Writing to CMWOCR1	Output compare 1	—	Output compare 1
Reading from CMWCNT	Counting up	—	Counting up and reading of the previous value
Reading from CMWICR0	—	Input capture 0	Input capture 0 and reading of the value before transfer
Reading from CMWICR1	—	Input capture 1	Input capture 1 and reading of the value before transfer

SECTION 5 TIMER

5.7 General-Purpose Timer (GPT)

5.7.1 Overview

The GPT is a 32-bit timer with 16 channels. PWM waveforms can be generated by controlling the up-counter, down-counter, or up- and down-counter.

Table 5.7-1 lists the GPT specifications, **Table 5.7-2** shows the GPT functions, and **Figure 5.7-1** shows a block diagram.

Table 5.7-1 GPT Specifications

Parameter	Description
Functions	• 32 bits × 16 channels • Up-counting or down-counting (saw waves) or up/down-counting (triangle waves) for each counter • Clock sources independently selectable for each channel • Four input/output pins per channel • Two output compare / input capture registers per channel • For the two output compare/input capture registers of each channel, four registers are provided as buffer registers and are capable of operating as comparison registers when buffering is not in use • In output compare operation, buffer switching can be at crests or troughs, enabling the generation of laterally asymmetric PWM waveforms • Registers for setting up frame cycles in each channel with capability for generating interrupts at overflow or underflow • Generation of dead times in PWM operation • Synchronous starting, stopping and clearing counters for arbitrary channels • Count start, count stop, count clear, up-count, down-count, or input capture operation in response to a maximum of 8 ELC events • Count start, count stop, count clear, up-count, down-count, or input capture operation in response to the status of two input pins • Count start, count stop, count clear, up-count, down-count, or input capture operation in response to a maximum of 4 external triggers • Output pin disable function by detected short-circuits between output pins • A/D converter start triggers can be generated • Compare match A to F event and overflow/underflow event can be output to the ELC • Enables the noise filter for input capture • Logical operation between the channel output • Bus clock: GPT_0_pclk_sfr, GPT_1_pclk_sfr Core clock: GPT_0_clks_gpt, GPT_1_clks_gpt

5.7.2.2 Register Description

The prefix (GPTm_n_) of the register names is omitted in this and subsequent sections.

5.7.2.2.1 General-Purpose Timer Write-Protection Register (GPTm_n_GTWP)

GTWP enables or disables writing to registers to prevent accidental modification. Protection by the GTWP register is only for the writes by the CPU. GTWP does not protect registers from updates that occur in association with CPU writes.

Access Size : 32 bits
Address : <GPTm_base> + 0000h + n x 0100h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
15 to 8	PRKEY[7:0]	-	W	GTWP Key Code When A5h is written to these bits, writing to the WP, STRWP, STPWP, CLRWP, and CMNWP bits is permitted. These bits are read as 0b.
7 to 5	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
4	CMNWP	0h	RW	Common Register Write Disable 0b: Writing to the registers is enabled 1b: Writing to the registers is disabled
3	CLRWP	0h	RW	GTCLR.CCLR Bit Write Disable 0b: Writing to the bit is enabled 1b: Writing to the bit is disabled
2	STPWP	0h	RW	GTSTP.CSTOP Bit Write Disable 0b: Writing to the bit is enabled 1b: Writing to the bit is disabled
1	STRWP	0h	RW	GTSTR.CSTRT Bit Write Disable 0b: Writing to the bit is enabled 1b: Writing to the bit is disabled
0	WP	0h	RW	Register Write Disable 0b: Writing to the register enabled 1b: Writing to the register disabled

WP bit (Register Write Disable)

The following is a list of write enabled or disabled registers:

GTSSR, GTPSR, GTCSR, GTUPSR, GTDNSR, GTICASR, GTICBSR, GTCR, GTUDDTYC, GTIOR, GTINTAD, GTST, GTBER, GTITC, GTCNT, GTCCRA, GTCCRB, GTCCRC, GTCCRD, GTCCRE, GTCCRF, GTPR, GTPBR, GTPDBR, GTADTRA, GTADTBRA, GTADTDBRA, GTADTRB, GTADTBRB, GTADTDBRB, GTDTCR, GTDVU, GTDVD, GTDBU, GTDBD, GTSOS, GTSOTR, GTEITC, GTEITLI1, GTEITLI2, GTEITLB, GTICLF.

STRWP bit (GTSTR.CSTRT Bit Write Disable)

The STRWP bit enables or disables starting the updating of counter values by writing to the CSTRTn bit (n = 0 to 15) corresponding to a channel number in the GTSTR register.

The bit position of each CSTRTn bit in the GTSTR register is allocated to the channel with the corresponding number, and writing to the GTSTR register for any channel results in writing to the registers of all channels. The STRWP bit for each channel does not control writing but only controls updating of the CSTRT bit for the corresponding channel when simultaneously writing to all channels.

Therefore, when writing to the CSTRT bits of a channel for which the setting of the STRWP bit is 1b (disabling writing), the CSTRT bit for the given channel is not updated, but the CSTRT bits corresponding to channel for which the setting of the STRWP bit is 0b (enabling writing) are updated. For example, when the setting of the GPT00.GTWP.STRWP bit is 0b (enabling writing), writing 1b to the GPT01.GTSTR.CSTRT0 bit when its current setting is 0b causes the value to be updated, and the GPT00.GTCNT counter starts to run. When the setting of the GPT00.GTWP.STRWP bit is 1b (disabling writing), writing 1b to the GPT01.GTSTR.CSTRT0 bit when its current setting is 0b leaves the bit with the value 0b, and the GPT00.GTCNT counter does not run.

If you want to protect all bits in the GTSTR register from being updated, set the STRWP bits of all channels to 1b.

STPWP bit (GTSTP.CSTOP Bit Write Disable)

The STPWP bit enables or disables starting the updating of counter values by writing to the CSTOPn bit (n = 0 to 15) corresponding to a channel number in the GTSTP register.

The bit position of each CSTOPn bit in the GTSTP registers is allocated to the channel with the corresponding number, and the writing to the GTSTP register for any channel results in writing to the registers of all channels. The STPWP bit for each channel does not control writing but only controls updating of the CSTOP bit for the corresponding channel when simultaneously writing to all channels.

Therefore, when writing to the CSTOP bits of a channel for which the setting of the STPWP bit is 1b(disabling writing), the CSTOP bit for the given channel is not updated, but the CSTOP bits corresponding to channel for which the setting of the STPWP bit is 0b (enabling writing) are updated. For example, when the setting of the GPT00.GTWP.STPWP bit is 0b (enabling writing), writing 1b to the GPT01.GTSTP.CSTOP0 bit when its current setting is 0b causes the value to be updated, and the GPT00.GTCNT counter is stopped. When the setting of the GPT00.GTWP.STPWP bit is 1b (disabling writing), writing 1b to the GPT01.GTSTP.CSTOP0 bit when its current setting is 0b leaves the bit with the value 0b, and the GPT00.GTCNT counter is not stopped.

If you want to protect all bits in the GTSTP register from being updated, set the STPWP bits of all channels to 1b.

CLRWP bit (GTCLR.CCLR Bit Write Disable)

CLRWP bit enables or disables starting the updating of counter values by writing to the CCLRn bit (n = 0 to 7) corresponding to a channel number in the GTCLR register.

The bit position of each CCLRn bit in the GTCLR registers is allocated to the channel with the corresponding number, and the writing to the GTCLR register for any channel results in writing to the registers of all channels. The CLRWP bit for each channel does not control writing but only controls updating of the CCLR bit for the corresponding channel when simultaneously writing to all channels.

Therefore, when writing to the CCLR bits of a channel for which the setting of the CLRWP bit is 1b (disabling writing), the CCLR bit for the given channel is not updated, but the CCLR bits corresponding to channel for which the setting of the CLRWP bit is 0b (enabling writing) are updated. For example, when the setting of the GPT00.GTWP.CLRWP bit is 0b (enabling writing), writing 1b to the GPT01.GTCLR.CCLR0 bit when its current setting is 0b causes the value to be updated, and the GPT00.GTCNT counter is cleared. When the setting of the GPT00.GTWP.CLRWP bit is 1b (disabling writing), writing 1b to the GPT01.GTCLR.CCLR0 bit when its current setting is 0b leaves the bit with the value 0b, and the GPT00.GTCNT counter is not cleared.

If you want to protect all bits in the GTCLR register from being updated, set the CLRWP bits of all channels to 1b.

CMNWP bit (Common Register Write Disable)

CMNWP bit enables or disables starting the updating of counter values by writing to the SECSELn bit (n = 0 to 15) corresponding to a channel number in the GTSECSR register or to the GTSECR register.

The bit position of each SECSEL bit in the GTSECSR registers is allocated to the channel with the corresponding number, and the writing to the GTSECSR register for any channel results in writing to the registers of all channels. Writing to the GTSECR register of any channel leads to writing to the registers of all channels. The CMNWP bit for each channel does not control writing but only controls updating of the SECSEL bit and the GTSECR register value for the corresponding channel when simultaneously writing to all channels.

Therefore, when writing to the SECSEL bit and the GTSECR register value of a channel for which the setting of the CMNWP bit is 1b(disabling writing), the SECSEL bit and the GTSECR register value for the given channel is not updated, but the SECSEL bit and the GTSECR register value corresponding to channel for which the setting of the CMNWP bit is 0 (enabling writing) are updated.

For example, when the setting of the GPT00.GTWP.CMNWP bit is 0 (enabling writing), writing to the GPT01.GTSECSR.SECSEL0 bit causes the value of the GPT00.GTSECSR.SECSEL0 bit to be updated. In the same way, writing to the GPT01.GTSECR register updates the value of the GPT00.GTSECR register. When the setting of the GPT00.GTWP.CMNWP bit is 1b (disabling writing), writing to the GPT01.GTSECSR.SECSEL0 bit does not cause the value of the GPT00.GTSECSR.SECSEL0 bit to be updated. In the same way, writing to the GPT01.GTSECR register does not update the value of the GPT00.GTSECR register.

If you want to protect all bits in the GTSECSR and GTSECR registers from being updated, set the CMNWP bits of all channels to 1b.

PRKEY[7:0] bits (GTWP Key Code)

These bits control whether the WP, STRWP, STPWP, CLRWP, and CMNWP bits can be overwritten.

5.7.2.2.2 General-Purpose Timer Software Start Register (GPTm_n_GTSTR)

The GTSTR starts operation of the GTCNT counter of channel n (n = 0 to 15).

The GTSTR bit number represents the channel number. The GTSTR register of each channel is shared by all of the channels. The GTCNT counter starts for the channel corresponding to the GTSTR bit number where 1b is written. Writing 0b has no effect on the status of GTCNT counter and the value of GTSTR register.

Access Size : 32 bits
Address : <GPTm_base> + 0004h + n x 0100h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
15 to 0	CSTRT[15:0]	0h	RW (R)	GPTmn GTCNT Count Start 0b: GTCNT counter is not started 1b: GTCNT counter is started

CSTRTn bits (Channel n GTCNT Count Start (n = 0 to 15))

The CSTRTn bits start operation of the GTCNT counter of channel n. Writing to the GTSTR.CSTRTn bit (n = 0 to 15) has no effect unless the GTSSR.CSTRT bit is set to 1b.

The read data shows the counter status of each channel (GTCR.CST bit). A value of 0 means the counter is stopped and 1 means the counter is running.

Note that the definitions of the bits differ between GPT0 and GPT1. For details, see the table below.

Table 5.7-5 Definitions of Count Start Bits

	GPT0		GPT1	
Bit	Bit Description	Bit Attribute	Bit Description	Bit Attribute

31 - 16	Reserved	RW	Reserved	RW

5.7.2.2.3 General-Purpose Timer Software Stop Register (GPTm_n_GTSTP)

The GTSTP stops operation of the GTCNT counter of channel n (n = 0 to 15).

The GTSTP bit number represents the channel number. The GTSTP register of each channel is shared by all the channels. The GTCNT counter stops for the channel corresponding to the GTSTP bit number where 1b is written. Writing 0b has no effect on the status of the GTCNT counter and the value of GTSTP register.

Access Size : 32 bits
Address : <GPTm_base> + 0008h + n x 0100h
Initial Value : FFFF_FFFFh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

15 to 0	CSTOP[15:0]	FFFFh	RW (R)	GPTmn GTCNT Count Stop 0b: GTCNT counter is not stopped 1b: GTCNT counter is stopped

CSTOPn bits (Channel n GTCNT Count Stop (n = 0 to 15))

The CSTOPn bits stop operation of the GTCNT counter of channel n. Writing to the GTSTP.CSTOPn bit (n = 0 to 15) has no effect unless the GTPSR.CSTOP bit is set to 1b. The read data shows the counter status of each channel (invert of GTCR.CST bit). A value of 0b means the counter is running and 1b means the counter is stopped.

Note that the definitions of the bits differ between GPT0 and GPT1. For details, see the table below.

Table 5.7-6 Definitions of Count Stop Bits

	GPT0		GPT1	
Bit	Bit Description	Bit Attribute	Bit Description	Bit Attribute

31 - 16	Reserved	RW	Reserved	RW

5.7.2.2.4 General-Purpose Timer Software Clear Register (GPTm_n_GTCLR)

The GTCLR is a write-only register that clears operation of the GTCNT counter of channel n (n = 0 to 15).

The GTCLR bit number represents the channel number. The GTCLR register of each channel is shared by all the channels. The GTCNT counter is cleared for the channel corresponding to the GTCLR bit number where 1b is written. Writing 0b has no effect on the status of GTCNT counter.

Access Size : 32 bits
Address : <GPTm_base> + 000Ch + n x 0100h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-

7 to 0	CCLR[7:0]	0h	W	GPTmn GTCNT Count Clear 0b: GTCNT counter is not cleared 1b: GTCNT counter is cleared

CCLRn bits (Channel n GTCNT Count Clear (n = 0 to 15))

Writing 1 to these bits clears the value of the GTCNT counter of channel 0. These bits are read as 0.

Note that the definitions of the bits differ between GPT0 and GPT1. For details, see the table below.

Table 5.7-7 Definitions of Count Clear Bits

	GPT0		GPT1	
Bit	Bit Description	Bit Attribute	Bit Description	Bit Attribute
0	GPT00 GTCNT Count Clear	W	GPT10 GTCNT Count Clear	W

31 - 8	Reserved	W	Reserved	W

5.7.2.2.5 General-Purpose Timer Start Source Select Register (GPTm_n_GTSSR)

The GTSSR sets the source to start the GTCNT counter.

Input from GTETRGn (n = A to H) pins are input to the GPT via the POEG. Set the polarity of these signals with the POEG.

Access Size : 32 bits

Address : <GPTm_base> + 0010h + n x 0100h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

SSGTRGAR bit (GTETRGA/GTETRGE Pin Rise Input Source Counter Start Enable)

The SSGTRGAR bit enables or disables starting of the GTCNT counter on the rising edge of the GTETRGA/GTETRGE pin input.

SSGTRGAF bit (GTETRGA/GTETRGE Pin Fall Input Source Counter Start Enable)

The SSGTRGAF bit enables or disables starting of the GTCNT counter on the falling edge of the GTETRGA/GTETRGE pin input.

SSGTRGBR bit (GTETRGB/GTETRGF Pin Rise Input Source Counter Start Enable)

The SSGTRGBR bit enables or disables starting of the GTCNT counter on the rising edge of the GTETRGB/GTETRGF pin input.

SSGTRGBF bit (GTETRGB/GTETRGF Pin Fall Input Source Counter Start Enable)

The SSGTRGBF bit enables or disables starting of the GTCNT counter on the falling edge of the GTETRGB/GTETRGF pin input.

SSGTRGCR bit (GTETRGC/GTETRGG Pin Rise Input Source Counter Start Enable)

The SSGTRGCR bit enables or disables starting of the GTCNT counter on the rising edge of the GTETRGC/GTETRGG pin input.

SSGTRGCF bit (GTETRGC/GTETRGG Pin Fall Input Source Counter Start Enable)

The SSGTRGCF bit enables or disables starting of the GTCNT counter on the falling edge of the GTETRGC/GTETRGG pin input.

SSGTRGDR bit (GTETRGD/GTETRGH Pin Rise Input Source Counter Start Enable)

The SSGTRGDR bit enables or disables starting of the GTCNT counter on the rising edge of the GTETRGD/GTETRGH pin input.

SSGTRGDF bit (GTETRGD/GTETRGH Pin Fall Input Source Counter Start Enable)

The SSGTRGDF bit enables or disables starting of the GTCNT counter on the falling edge of the GTETRGD/GTETRGH pin input.

SSCARBL bit (GTIOCnA Pin Rise Input Source Counter Start Enable when GTIOCnB Value is Low)

The SSCARBL bit enables or disables starting of the GTCNT counter on the rising edge of the GTIOCnA pin input, when GTIOCnB input is 0.

SSCARBH bit (GTIOCnA Pin Rise Input Source Counter Start Enable when GTIOCnB Value is High)

The SSCARBH bit enables or disables starting of the GTCNT counter on the rising edge of the GTIOCnA pin input, when GTIOCnB input is 1.

SSCAFBL bit (GTIOCnA Pin Fall Input Source Counter Start Enable when GTIOCnB Value is Low)

The SSCAFBL bit enables or disables starting of the GTCNT counter on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 0.

SSCAFBH bit (GTIOCnA Pin Fall Input Source Counter Start Enable when GTIOCnB Value is High)

The SSCAFBH bit enables or disables starting of the GTCNT counter on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 1.

SSCBRAL bit (GTIOCnB Pin Rise Input Source Counter Start Enable when GTIOCnA Value is Low)

The SSCBRAL bit enables or disables starting of the GTCNT counter on the rising edge of the GTIOCnB pin input, when GTIOCnA input is 0.

SSCBRAH bit (GTIOCnB Pin Rise Input Source Counter Start Enable when GTIOCnA Value is High)

The SSCBRAH bit enables or disables starting of the GTCNT counter on the rising edge of the GTIOCnB pin input, when GTIOCnA input is 1.

SSCBFAL bit (GTIOCnB Pin Fall Input Source Counter Start Enable when GTIOCnA Value is Low)

The SSCBFAL bit enables or disables starting of the GTCNT counter on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 0.

SSCBFAH bit (GTIOCnB Pin Fall Input Source Counter Start Enable when GTIOCnA Value is High)

The SSCBFAH bit enables or disables starting of the GTCNT counter on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 1.

SSELCm bit (ELC_GPTm Event Source Counter Start Enable) (m = A to H)

The SSELCm bit enables or disables starting of the GTCNT counter at the ELC_GPTm event input.

CSTRT bit (Software Source Counter Start Enable)

The CSTRT bit enables or disables starting of the GTCNT counter by the GTSTR register.

5.7.2.2.6 General-Purpose Timer Stop Source Select Register (GPTm_n_GTPSR)

The GTPSR sets the source to stop the GTCNT counter.

Inputs from GTETRGn (n = A to H) pins are input to the GPT via the POEG. Set the polarity of these signals with the POEG.

PSGTRGAR bit (GTETRGA/GTETRGE Pin Rise Input Source Counter Stop Enable)

The PSGTRGAR bit enables or disables stopping of the GTCNT counter on the rising edge of the GTETRGA/GTETRGE pin input.

PSGTRGAF bit (GTETRGA/GTETRGE Pin Fall Input Source Counter Stop Enable)

The PSGTRGAF bit enables or disables stopping of the GTCNT counter on the falling edge of the GTETRGA/GTETRGE pin input.

PSGTRGBR bit (GTETRGB/GTETRGF Pin Rise Input Source Counter Stop Enable)

PSGTRGBR bit enables or disables stopping of the GTCNT counter on the rising edge of the GTETRGB/GTETRGF pin input.

PSGTRGBF bit (GTETRGB/GTETRGF Pin Fall Input Source Counter Stop Enable)

The PSGTRGBF bit enables or disables stopping of the GTCNT counter on the falling edge of the GTETRGB/GTETRGF pin input.

PSGTRGCR bit (GTETRGC/GTETRGG Pin Rise Input Source Counter Stop Enable)

PSGTRGCR bit enables or disables stopping of the GTCNT counter on the rising edge of the GTETRGC/GTETRGG pin input.

PSGTRGCF bit (GTETRGC/GTETRGG Pin Fall Input Source Counter Stop Enable)

The PSGTRGCF bit enables or disables stopping of the GTCNT counter on the falling edge of the GTETRGC/GTETRGG pin input.

PSGTRGDR bit (GTETRGD/GTETRGH Pin Rise Input Source Counter Stop Enable)

PSGTRGDR bit enables or disables stopping of the GTCNT counter on the rising edge of the GTETRGD/GTETRGH pin input.

PSGTRGDF bit (GTETRGD/GTETRGH Pin Fall Input Source Counter Stop Enable)

The PSGTRGDF bit enables or disables stopping of the GTCNT counter on the falling edge of the GTETRGD/GTETRGH pin input.

PSCARBL bit (GTIOCnA Pin Rise Input Source Counter Stop Enable when GTIOCnB Value is Low)

The PSCARBL bit enables or disables stopping of the GTCNT counter on the rising edge of the GTIOCnA pin input, when GTIOCnB input is 0.

PSCARBH bit (GTIOCnA Pin Rise Input Source Counter Stop Enable when GTIOCnB Value is High)

The PSCARBH bit enables or disables stopping of the GTCNT counter on the rising edge of the GTIOCnA pin input, when GTIOCnB input is 1.

PSCAFBL bit (GTIOCnA Pin Fall Input Source Counter Stop Enable when GTIOCnB Value is Low)

The PSCAFBL bit enables or disables stopping of the GTCNT counter on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 0.

PSCAFBH bit (GTIOCnA Pin Fall Input Source Counter Stop Enable when GTIOCnB Value is High)

The PSCAFBH bit enables or disables stopping of the GTCNT counter on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 1.

PSCBRAL bit (GTIOCnB Pin Rise Input Source Counter Stop Enable when GTIOCnA Value is Low)

The PSCBRAL bit enables or disables stopping of the GTCNT counter on the rising edge of the GTIOCnB pin input, when GTIOCnA input is 0.

PSCBRAH bit (GTIOCnB Pin Rise Input Source Counter Stop Enable when GTIOCnA Value is High)

The PSCBRAH bit enables or disables stopping of the GTCNT counter on the rising edge of the GTIOCnB pin input, when GTIOCnA input is 1.

PSCBFAL bit (GTIOCnB Pin Fall Input Source Counter Stop Enable when GTIOCnA Value is Low)

The PSCBFAL bit enables or disables stopping of the GTCNT counter on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 0.

PSCBFAH bit (GTIOCnB Pin Fall Input Source Counter Stop Enable when GTIOCnA Value is High)

The PSCBFAH bit enables or disables stopping of the GTCNT counter on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 1.

PSELCm bit (ELCm Event Source Counter Stop Enable) (m = A to H)

The PSELCm bit enables or disables stopping of the GTCNT counter at the ELC_GPTm event input.

CSTOP bit (Software Source Counter Stop Enable)

The CSTOP bit enables or disables stopping of the GTCNT counter by the GTSTP register.

5.7.2.2.7 General-Purpose Timer Clear Source Select Register (GPTm_n_GTCSR)

The GTCSR sets the source to clear the GTCNT counter.

Counter clearing can be executed whether the counter is running (GTCR.CST=1) or stopped (GTCR.CST=0).

Inputs from GTETRGn (n = A to H) pins are input to the GPT via the POEG. Set the polarity of these signals with the POEG.

CSGTRGAR bit (GTETRGA/GTETRGE Pin Rising Input Source Counter Clear Enable)

The CSGTRGAR bit enables or disables clearing of the GTCNT counter on the rising edge of the GTETRGA/GTETRGE pin input.

CSGTRGAF bit (GTETRGA/GTETRGE Pin Fall Input Source Counter Clear Enable)

The CSGTRGAF bit enables or disables clearing of the GTCNT counter on the falling edge of the GTETRGA/GTETRGE pin input.

CSGTRGBR bit (GTETRGB/GTETRGF Pin Rise Input Source Counter Clear Enable)

The CSGTRGBR bit enables or disables clearing of the GTCNT counter on the rising edge of the GTETRGB/GTETRGF pin input.

CSGTRGBF bit (GTETRGB/GTETRGF Pin Fall Input Source Counter Clear Enable)

The CSGTRGBF bit enables or disables clearing of the GTCNT counter on the falling edge of the GTETRGB/GTETRGF pin input.

CSGTRGCR bit (GTETRGC/GTETRGG Pin Rise Input Source Counter Clear Enable)

The CSGTRGCR bit enables or disables clearing of the GTCNT counter on the rising edge of the GTETRGC/GTETRGG pin input.

CSGTRGCF bit (GTETRGC/GTETRGG Pin Fall Input Source Counter Clear Enable)

The CSGTRGCF bit enables or disables clearing of the GTCNT counter on the falling edge of the GTETRGC/GTETRGG pin input.

CSGTRGDR bit (GTETRGD/GTETRGH Pin Rise Input Source Counter Clear Enable)

The CSGTRGDR bit enables or disables clearing of the GTCNT counter on the rising edge of the GTETRGD/GTETRGH pin input.

CSGTRGDF bit (GTETRGD/GTETRGH Pin Fall Input Source Counter Clear Enable)

The CSGTRGDF bit enables or disables clearing of the GTCNT counter on the falling edge of the GTETRGD/GTETRGH pin input.

CSCARBL bit (GTIOCnA Pin Rise Input Source Counter Clear Enable when GTIOCnB Value is Low)

The CSCARBL bit enables or disables clearing of the GTCNT counter on the rising edge of the GTIOCnA pin input, when GTIOCnB input is 0.

CSCARBH bit (GTIOCnA Pin Rise Input Source Counter Clear Enable when GTIOCnB Value is High)

The CSCARBH bit enables or disables clearing of the GTCNT counter on the rising edge of the GTIOCnA pin input, when GTIOCnB input is 1.

CSCAFBL bit (GTIOCnA Pin Fall Input Source Counter Clear Enable when GTIOCnB Value is Low)

The CSCAFBL bit enables or disables clearing of the GTCNT counter on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 0.

CSCAFBH bit (GTIOCnA Pin Fall Input Source Counter Clear Enable when GTIOCnB Value is High)

The CSCAFBH bit enables or disables clearing of the GTCNT counter on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 1.

CSCBRAL bit (GTIOCnB Pin Rise Input Source Counter Clear Enable when GTIOCnA Value is Low)

The CSCBRAL bit enables or disables clearing of the GTCNT counter on the rising edge of the GTIOCnB pin input, when GTIOCnA input is 0.

CSCBRAH bit (GTIOCnB Pin Rise Input Source Counter Clear Enable when GTIOCnA Value is High)

The CSCBRAH bit enables or disables clearing of the GTCNT counter on the rising edge of the GTIOCnB pin input, when GTIOCnA input is 1.

CSCBFAL bit (GTIOCnB Pin Fall Input Source Counter Clear Enable when GTIOCnA Value is Low)

The CSCBFAL bit enables or disables clearing of the GTCNT counter on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 0.

CSCBFAH bit (GTIOCnB Pin Fall Input Source Counter Clear Enable when GTIOCnA Value is High)

The CSCBFAH bit enables or disables clearing of the GTCNT counter on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 1.

CSELCm bit (ELCm Event Source Counter Clear Enable) (m = A to H)

The CSELCm bit enables or disables clearing of the GTCNT counter at the ELC_GPTm event input.

CCLR bit (Software Source Counter Clear Enable)

The CCLR bit enables or disables clearing of the GTCNT counter by the GTCLR register.

5.7.2.2.8 General-Purpose Timer Up Count Source Select Register (GPTm_n_GTUPSR)

The GTUPSR sets the source to count up the GTCNT counter.

When at least one bit in the GTUPSR register is set to 1b, the GTCNT counter is counted up by the source that is set to 1 in this register. In this case, GTCR.TPCS has no effect.

Number of increments in counting is one even when multiple sources are generated simultaneously.

Inputs from GTETRGn (n = A to H) pins are input to the GPT via the POEG. Set the polarity of these signals with the POEG.

USGTRGAR bit (GTETRGA/GTETRGE Pin Rise Input Source Counter Count Up Enable)

The USGTRGAR bit enables or disables counting up of the GTCNT counter on the rising edge of the GTETRGA/GTETRGE pin input.

USGTRGAF bit (GTETRGA/GTETRGE Pin Fall Input Source Counter Count Up Enable)

The USGTRGAF bit enables or disables counting up of the GTCNT counter on the falling edge of the GTETRGA/GTETRGE pin input.

USGTRGBR bit (GTETRGB/GTETRGF Pin Rise Input Source Counter Count Up Enable)

The USGTRGBR bit enables or disables counting up of the GTCNT counter on the rising edge of the GTETRGB/GTETRGF pin input.

USGTRGBF bit (GTETRGB/GTETRGF Pin Fall Input Source Counter Count Up Enable)

The USGTRGBF bit enables or disables counting up of the GTCNT counter on the falling edge of the GTETRGB/GTETRGF pin input.

USGTRGCR bit (GTETRGC/GTETRGG Pin Rise Input Source Counter Count Up Enable)

The USGTRGCR bit enables or disables counting up of the GTCNT counter on the rising edge of the GTETRGC/GTETRGG pin input.

USGTRGCF bit (GTETRGC/GTETRGG Pin Fall Input Source Counter Count Up Enable)

The USGTRGCF bit enables or disables counting up of the GTCNT counter on the falling edge of the GTETRGC/GTETRGG pin input.

USGTRGDR bit (GTETRGD/GTETRGH Pin Rise Input Source Counter Count Up Enable)

The USGTRGDR bit enables or disables counting up of the GTCNT counter on the rising edge of the GTETRGD/GTETRGH pin input.

USGTRGDF bit (GTETRGD/GTETRGH Pin Fall Input Source Counter Count Up Enable)

The USGTRGDF bit enables or disables counting up of the GTCNT counter on the falling edge of the GTETRGD/GTETRGH pin input.

USCARBL bit (GTIOCnA Pin Rise Input Source Counter Count Up Enable when GTIOCnB Value is Low)

The USCARBL bit enables or disables GTCNT counter count up on the rising edge of GTIOCnA pin input, when GTIOCnB input is 0.

USCARBH bit (GTIOCnA Pin Rise Input Source Counter Count Up Enable when GTIOCnB Value is High)

The USCARBH bit enables or disables counting up of the GTCNT counter on the rising edge of the GTIOCnA pin input, when GTIOCnB input is 1.

USCAFBL bit (GTIOCnA Pin Fall Input Source Counter Count Up Enable when GTIOCnB Value is Low)

The USCAFBL bit enables or disables counting up of the GTCNT counter on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 0.

USCAFBH bit (GTIOCnA Pin Fall Input Source Counter Count Up Enable when GTIOCnB Value is High)

The USCAFBH bit enables or disables counting up of the GTCNT counter on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 1.

USCBRAL bit (GTIOCnB Pin Rise Input Source Counter Count Up Enable when GTIOCnA Value is Low)

The USCBRAL bit enables or disables counting up of the GTCNT counter on the rising edge of the GTIOCnB pin input, when GTIOCnA input is 0.

USCBRAH bit (GTIOCnB Pin Rise Input Source Counter Count Up Enable when GTIOCnA Value is High)

The USCBRAH bit enables or disables counting up of the GTCNT counter on the rising edge of the GTIOCnB pin input, when the GTIOCnA input is 1.

USCBFAL bit (GTIOCnB Pin Fall Input Source Counter Count Up Enable when GTIOCnA Value is Low)

The USCBFAL bit enables or disables counting up of the GTCNT counter on the falling edge of the GTIOCnB pin input, when the GTIOCnA input is 0.

USCBFAH bit (GTIOCnB Pin Fall Input Source Counter Count Up Enable when GTIOCnA Value is High)

The USCBFAH bit enables or disables counting up of the GTCNT counter on the falling edge of the GTIOCnB pin input, when the GTIOCnA input is 1.

USELCm bit (ELC_GPTm Event Source Counter Count Up Enable) (m = A to H)

The USELCm bit enables or disables counting up of the GTCNT counter at the ELC_GPTm event input.

5.7.2.2.9 General-Purpose Timer Down Count Source Select Register (GPTm_n_GTDNSR)

The GTDNSR sets the source to count down the GTCNT counter.

When at least one bit in the GTDNSR register is set to 1b, the GTCNT counter is counted down by the source that is set to 1b in this register. In this case, GTCR.TPCS has no effect.

Number of decrements in counting is one even when multiple sources are generated simultaneously.

Inputs from GTETRGn (n = A to H) pins are input to the GPT via the POEG. Set the polarity of these signals with the POEG.

DSGTRGAR bit (GTETRGA/GTETRGE Pin Rise Input Source Counter Count Down Enable)

The DSGTRGAR bit enables or disables counting down of the GTCNT counter on the rising edge of the GTETRGA/GTETRGE pin input.

DSGTRGAF bit (GTETRGA/GTETRGE Pin Fall Input Source Counter Count Down Enable)

The DSGTRGAF bit enables or disables counting down of the GTCNT counter on the falling edge of the GTETRGA/GTETRGE pin input.

DSGTRGBR bit (GTETRGB/GTETRGF Pin Rise Input Source Counter Count Down Enable)

The DSGTRGBR bit enables or disables counting down of the GTCNT counter on the rising edge of the GTETRGB/GTETRGF pin input.

DSGTRGBF bit (GTETRGB/GTETRGF Pin Fall Input Source Counter Count Down Enable)

The DSGTRGBF bit enables or disables counting down of the GTCNT counter on the falling edge of the GTETRGB/GTETRGF pin input.

DSGTRGCR bit (GTETRGC/GTETRGG Pin Rise Input Source Counter Count Down Enable)

The DSGTRGCR bit enables or disables counting down of the GTCNT counter on the rising edge of the GTETRGC/GTETRGG pin input.

DSGTRGCF bit (GTETRGC/GTETRGG Pin Fall Input Source Counter Count Down Enable)

The DSGTRGCF bit enables or disables counting down of the GTCNT counter on the falling edge of the GTETRGC/GTETRGG pin input.

DSGTRGDR bit (GTETRGD/GTETRGH Pin Rise Input Source Counter Count Down Enable)

The DSGTRGDR bit enables or disables counting down of the GTCNT counter on the rising edge of the GTETRGD/GTETRGH pin input.

DSGTRGDF bit (GTETRGD/GTETRGH Pin Fall Input Source Counter Count Down Enable)

The DSGTRGDF bit enables or disables counting down of the GTCNT counter on the falling edge of the GTETRGD/GTETRGH pin input.

DSCARBL bit (GTIOCnA Pin Rise Input Source Counter Count Down Enable when GTIOCnB Value is Low)

The DSCARBL bit enables or disables counting down of the GTCNT counter on the rising edge of the GTIOCnA pin input, when the GTIOCnB input is 0.

DSCARBH bit (GTIOCnA Pin Rise Input Source Counter Count Down Enable when GTIOCnB Value is High)

The DSCARBH bit enables or disables counting down of the GTCNT counter on the rising edge of the GTIOCnA pin input, when GTIOCnB input is 1.

DSCAFBL bit (GTIOCnA Pin Fall Input Source Counter Count Down Enable when GTIOCnB Value is Low)

The DSCAFBL bit enables or disables counting down of the GTCNT counter on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 0.

DSCAFBH bit (GTIOCnA Pin Fall Input Source Counter Count Down Enable when GTIOCnB Value is High)

The DSCAFBH bit enables or disables counting down of the GTCNT counter on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 1.

DSCBRAL bit (GTIOCnB Pin Rise Input Source Counter Count Down Enable when GTIOCnA Value is Low)

The DSCBRAL bit enables or disables counting down of the GTCNT counter on the rising edge of the GTIOCnB pin input, when GTIOCnA input is 0.

DSCBRAH bit (GTIOCnB Pin Rise Input Source Counter Count Down Enable when GTIOCnA Value is High)

The DSCBRAH bit enables or disables counting down of the GTCNT counter on the rising edge of GTIOCnB pin input, when GTIOCnA input is 1.

DSCBFAL bit (GTIOCnB Pin Fall Input Source Counter Count Down Enable when GTIOCnA Value is Low)

The DSCBFAL bit enables or disables counting down of the GTCNT counter on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 0.

DSCBFAH bit (GTIOCnB Pin Fall Input Source Counter Count Down Enable when GTIOCnA Value is High)

The DSCBFAH bit enables or disables counting down of the GTCNT counter on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 1.

DSELCm bit (ELC_GPTm Event Source Counter Count Down Enable) (m = A to H)

The DSELCm bit enables or disables counting down of the GTCNT counter at the ELC_GPTm event input.

5.7.2.2.10 General-Purpose Timer Input Capture Source Select Register A (GPTm_n_GTICASR)

The GTICASR sets the source of input capture for GTCCRA.

When at least one bit among bits in the GTICASR register is set to 1b, input capture operation making the GTCCRA register as an input capture register is performed.

Inputs from GTETRGn (n = A to H) pins are input to the GPT via the POEG. Set the polarity of these signals with the POEG.

ASGTRGAR bit (GTETRGA/GTETRGE Pin Rise Input Source GTCCRA Input Capture Enable)

The ASGTRGAR bit enables or disables input capture for GTCCRA on the rising edge of the GTETRGA/GTETRGE pin input.

ASGTRGAF bit (GTETRGA/GTETRGE Pin Fall Input Source GTCCRA Input Capture Enable)

The ASGTRGAF bit enables or disables input capture for GTCCRA on the falling edge of the GTETRGA/GTETRGE pin input.

ASGTRGBR bit (GTETRGB/GTETRGF Pin Rise Input Source GTCCRA Input Capture Enable)

The ASGTRGBR bit enables or disables input capture for GTCCRA on the rising edge of the GTETRGB/GTETRGF pin input.

ASGTRGBF bit (GTETRGB/GTETRGF Pin Fall Input Source GTCCRA Input Capture Enable)

The ASGTRGBF bit enables or disables input capture for GTCCRA on the falling edge of the GTETRGB/GTETRGF pin input.

ASGTRGCR bit (GTETRGC/GTETRGG Pin Rise Input Source GTCCRA Input Capture Enable)

The ASGTRGCR bit enables or disables input capture for GTCCRA on the rising edge of the GTETRGC/GTETRGG pin input.

ASGTRGCF bit (GTETRGC/GTETRGG Pin Fall Input Source GTCCRA Input Capture Enable)

The ASGTRGCF bit enables or disables input capture for GTCCRA on the falling edge of the GTETRGC/GTETRGG pin input.

ASGTRGDR bit (GTETRGD/GTETRGH Pin Rise Input Source GTCCRA Input Capture Enable)

The ASGTRGDR bit enables or disables input capture for GTCCRA on the rising edge of the GTETRGD/GTETRGH pin input.

ASGTRGDF bit (GTETRGD/GTETRGH Pin Fall Input Source GTCCRA Input Capture Enable)

The ASGTRGDF bit enables or disables input capture for GTCCRA on the falling edge of the GTETRGD/GTETRGH pin input.

ASCARBL bit (GTIOCnA Pin Rise Input Source GTCCRA Input Capture Enable when GTIOCnB Value is Low)

The ASCARBL bit enables or disables input capture for GTCCRA on the rising edge of the GTIOCnA pin input, when GTIOCnB input is 0b.

ASCARBH bit (GTIOCnA Pin Rise Input Source GTCCRA Input Capture Enable when GTIOCnB Value is High)

The ASCARBH bit enables or disables input capture for GTCCRA on the rising edge of the GTIOCnA pin input, when GTIOCnB input is 1b.

ASCAFBL bit (GTIOCnA Pin Fall Input Source GTCCRA Input Capture Enable when GTIOCnB Value is Low)

The ASCAFBL bit enables or disables input capture for GTCCRA on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 0b.

ASCAFBH bit (GTIOCnA Pin Fall Input Source GTCCRA Input Capture Enable when GTIOCnB Value is High)

The ASCAFBH bit enables or disables input capture for GTCCRA on the falling edge of the GTIOCnA pin input, when the GTIOCnB input is 1b.

ASCBRAL bit (GTIOCnB Pin Rise Input Source GTCCRA Input Capture Enable when GTIOCnA Value is Low)

The ASCBRAL bit enables or disables input capture for GTCCRA on the rising edge of the GTIOCnB pin input, when the GTIOCnA input is 0b.

ASCBRAH bit (GTIOCnB Pin Rise Input Source GTCCRA Input Capture Enable when GTIOCnA Value is High)

The ASCBRAH bit enables or disables input capture for GTCCRA on the rising edge of the GTIOCnB pin input, when GTIOCnA input is 1b.

ASCBFAL bit (GTIOCnB Pin Fall Input Source GTCCRA Input Capture Enable when GTIOCnA Value is Low)

The ASCBFAL bit enables or disables input capture for GTCCRA on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 0b.

ASCBFAH bit (GTIOCnB Pin Fall Input Source GTCCRA Input Capture Enable when GTIOCnA Value is High)

The ASCBFAH bit enables or disables input capture for GTCCRA on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 1b.

ASELCm bit (ELC_GPTm Event Source Counter GTCCRA Input Capture Enable) (m = A to H)

The ASELCm bit enables or disables input capture for GTCCRA at the ELC_GPTm event input.

5.7.2.2.11 General-Purpose Timer Input Capture Source Select Register B (GPTm_n_GTICBSR)

The GTICBSR sets the source of input capture for GTCCRB.

When at least one bit among bits in the GTICBSR register is set to 1b, input capture operation making the GTCCRB register as an input capture register is performed.

Inputs from GTETRGn (n = A to H) pins are input to the GPT via the POEG. Set the polarity of these signals with the POEG.

BSGTRGAR bit (GTETRGA/GTETRGE Pin Rise Input Source GTCCRB Input Capture Enable)

The BSGTRGAR bit enables or disables input capture for GTCCRB on the rising edge of the GTETRGA/GTETRGE pin input.

BSGTRGAF bit (GTETRGA/GTETRGE Pin Fall Input Source GTCCRB Input Capture Enable)

The BSGTRGAF bit enables or disables input capture for GTCCRB on the falling edge of the GTETRGA/GTETRGE pin input.

BSGTRGBR bit (GTETRGB/GTETRGF Pin Rise Input Source GTCCRB Input Capture Enable)

The BSGTRGBR bit enables or disables input capture for GTCCRB on the rising edge of GTETRGB/GTETRGF pin input.

BSGTRGBF bit (GTETRGB/GTETRGF Pin Fall Input Source GTCCRB Input Capture Enable)

The BSGTRGBF bit enables or disables input capture for GTCCRB on the falling edge of the GTETRGB/GTETRGF pin input.

BSGTRGCR bit (GTETRGC/GTETRGG Pin Rise Input Source GTCCRB Input Capture Enable)

The BSGTRGCR bit enables or disables input capture for GTCCRB on the rising edge of GTETRGC/GTETRGG pin input.

BSGTRGCF bit (GTETRGC/GTETRGG Pin Fall Input Source GTCCRB Input Capture Enable)

The BSGTRGCF bit enables or disables input capture for GTCCRB on the falling edge of the GTETRGC/GTETRGG pin input.

BSGTRGDR bit (GTETRGD/GTETRGH Pin Rise Input Source GTCCRB Input Capture Enable)

The BSGTRGDR bit enables or disables input capture for GTCCRB on the rising edge of GTETRGD/GTETRGH pin input.

BSGTRGDF bit (GTETRGD/GTETRGH Pin Fall Input Source GTCCRB Input Capture Enable)

The BSGTRGDF bit enables or disables input capture for GTCCRB on the falling edge of the GTETRGD/GTETRGH pin input.

BSCARBL bit (GTIOCnA Pin Rise Input Source GTCCRB Input Capture Enable when GTIOCnB Value is Low)

The BSCARBL bit enables or disables input capture for GTCCRB on the rising edge of the GTIOCnA pin input, when the GTIOCnB input is 0b.

BSCARBH bit (GTIOCnA Pin Rise Input Source GTCCRB Input Capture Enable when GTIOCnB Value is High)

The BSCARBH bit enables or disables input capture for GTCCRB on the rising edge of the GTIOCnA pin input, when GTIOCnB input is 1b.

BSCAFBL bit (GTIOCnA Pin Fall Input Source GTCCRB Input Capture Enable when GTIOCnB Value is Low)

The BSCAFBL bit enables or disables input capture for GTCCRB on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 0b.

BSCAFBH bit (GTIOCnA Pin Fall Input Source GTCCRB Input Capture Enable when GTIOCnB Value is High)

The BSCAFBH bit enables or disables input capture for GTCCRB on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 1b.

BSCBRAL bit (GTIOCnB Pin Rise Input Source GTCCRB Input Capture Enable when GTIOCnA Value is Low)

The BSCBRAL bit enables or disables input capture for GTCCRB on the rising edge of the GTIOCnB pin input, when GTIOCnA input is 0b.

BSCBRAH bit (GTIOCnB Pin Rise Input Source GTCCRB Input Capture Enable when GTIOCnA Value is High)

The BSCBRAH bit enables or disables input capture for GTCCRB on the rising edge of the GTIOCnB pin input, when GTIOCnA input is 1b.

BSCBFAL bit (GTIOCnB Pin Fall Input Source GTCCRB Input Capture Enable when GTIOCnA Value is Low)

The BSCBFAL bit enables or disables input capture for GTCCRB on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 0b.

BSCBFAH bit (GTIOCnB Pin Fall Input Source GTCCRB Input Capture Enable when GTIOCnA Value is High)

The BSCBFAH bit enables or disables input capture for GTCCRB on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 1b.

BSELCm bit (ELC_GPTm Event Source Counter GTCCRB Input Capture Enable) (m = A to H)

The BSELCm bit enables or disables input capture for GTCCRB at the ELC_GPTm event input.

5.7.2.2.12 General-Purpose Timer Control Register (GPTm_n_GTCR)

The GTCR controls GTCNT.

15 to 1	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
0	CST	0h	RW	Count Start 0b: Count operation is stopped 1b: Count operation is performed

CST bit (Count Start)

The CST bit controls starting and stopping of the GTCNT counter.

[Setting conditions]

- The GTSTR value where the channel number corresponding to the bit number is set to 1b with the GTSSR.CSTRT bit at 1b.
- Occurrence of the ELC event input, the external trigger, or the GTIOCnA/GTIOCnB input that are enabled by GTSSR for the starting counter source (n = 0 to 15)
- 1b is written by software directly.

[Clearing conditions]

- The GTSTP value where the channel number corresponding to the bit number is set to 1b with the GTPSR.CSTOP bit at 1b.
- Occurrence of the ELC event input, the external trigger, or the GTIOCnA/GTIOCnB input enabled by GTSSR as the counter stop source (n = 0 to 15)
- 0b is written by software directly.

MD[2:0] bits (Mode Select)

The MD[2:0] bits select the GPT operating mode. The MD[2:0] bits must be set while the GTCNT operation is stopped.

TPCS[3:0] bits (Timer Prescaler Select)

The TPCS[3:0] bits select the clock for GTCNT. A clock prescaler can be selected independently for each channel. The TPCS[3:0] bits must be set while the GTCNT operation is stopped.

5.7.2.2.13 General-Purpose Timer Count Direction and Duty Setting Register (GPTm_n_GTUDDTYC)

The GTUDDTYC sets the direction in which the GTCNT counts (up-counting or down-counting), and sets the duty cycle of the GTIOCnA/GTIOCnB pin output.

Access Size : 32 bits

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
27	OBDTYR	0h	RW	GTIOCnB Output Value Selection after Release of 0%/100% Duty Setting 0b: The function selected by the GTIOB[3:2] bits is applied to the output value set for a duty cycle of 0% or 100% after release from the 0% or 100% duty-cycle setting. 1b: The function selected by the GTIOB[3:2] bits is applied to the masked compare match output value after release from the 0% or 100% duty-cycle setting.
26	OBDTYF	0h	RW	Forcible GTIOCnB Output Duty Setting 0b: Not forcibly set 1b: Forcibly set
25, 24	OBDTY[1:0]	0h	RW	GTIOCnB Output Duty Setting 00b: The duty cycle of the GTIOCnB pin depends on the compare match 01b: The duty cycle of the GTIOCnB pin depends on the compare match 10b: The duty cycle of the GTIOCnB pin is 0% 11b: The duty cycle of the GTIOCnB pin is 100%
23 to 20	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
19	OADTYR	0h	RW	GTIOCnA Output Value Selecting after Releasing 0%/100% Duty Setting 0b: The function selected by the GTIOA[3:2] bits is applied to the output value when the duty cycle is set after release from the 0 or 100% duty-cycle setting. 1b: The function selected by the GTIOA[3:2] bits is applied to the compare match output value which is masked after release from the 0 or 100% duty-cycle setting.
18	OADTYF	0h	RW	Forcible GTIOCnA Output Duty Setting 0b: Not forcibly set 1b: Forcibly set
17, 16	OADTY[1:0]	0h	RW	GTIOCnA Output Duty Setting 00b: The duty cycle of the GTIOCnA pin depends on the compare match 01b: The duty cycle of the GTIOCnA pin depends on the compare match 10b: The duty cycle of the GTIOCnA pin is 0% 11b: The duty cycle of the GTIOCnA pin is 100%
15 to 2	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
1	UDF	0h	RW	Forcible Count Direction Setting 0b: Not forcibly set 1b: Forcibly set
0	UD	1h	RW	Count Direction Setting 0b: GTCNT counts down 1b: GTCNT counts up

The setting is invalid during the event count operation.

[Count Direction]

- In saw-wave mode

  When the UD value is set to 0b during up-counting, the count direction changes on overflow (the timing synchronous with count clock after the GTCNT value becomes the GTPR value). When the UD value is set to 1b during down-counting, the count direction changes on underflow (the timing synchronous with count clock after the GTCNT value becomes 0b).

  When the UD value changes from 1b to 0b with the UDF bit being 0b and while counting stops, the counter starts up-counting and the count direction changes on overflow (the timing synchronous with count clock after the GTCNT value becomes the GTPR value). When the UD value changes from 0b to 1b with the UDF bit being 0b and while counting stops, the counter starts down-counting and the count direction changes on underflow (the timing synchronous with count clock after the GTCNT value becomes 0b).

  When the UDF bit is set to 1b while counting stops, the UD bit value is reflected in the count direction when counting starts.

- In triangle-wave mode

  When the UD value changes during counting, the count direction does not change. When the UD value changes while the UDF bit is 0b and counting stops, the change is not reflected in the count direction when counting starts.

  When the UDF bit is set to 1b while counting is stopped, the UD value is reflected in the count direction when counting starts.

UD bit (Count Direction Setting)

The UD bit sets the count direction (up-counting or down-counting) for GTCNT.

UDF bit (Forcible Count Direction Setting)

The UDF bit forcibly sets the count direction when GTCNT starts operation as the UD value. Only 0b should be written to this bit during counter operation. When 1b is written to this bit while counting stops, return this bit to 0 before counting starts.

[Output duty cycle]

- In saw-wave mode

  When the OADTY/OBDTY value changes during up-counting, the duty cycle is reflected on overflow (GTCNT = GTPR). When the OADTY/OBDTY value is changed during down-counting, the duty cycle is reflected on underflow (GTCNT = 0b).

  When the OADTY/OBDTY value is changed with the OADTYF/OBDTYF bit being 0b and while counting stops the output duty cycle is not reflected at the starting counter operation. When the count direction is up, the output duty cycle is reflected on overflow (GTCNT = GTPR). When the count direction is down, the output duty cycle is reflected on underflow (GTCNT = 0b).

  When the OADTY/OBDTY value is changed with the OADTYF/OBDTYF bit being 1b and while counting stops, the output duty cycle is reflected at the start of counter operation.

- In triangle-wave mode

  When the OADTY/OBDTY value changes during counting, the duty cycle is reflected on underflow.

  When the OADTY/OBDTY value is changed with the OADTYF/OBDTYF bit being 0b and while counting stops, the output duty cycle is not reflected at the start of counter operation. The output duty cycle is reflected on underflow.

When the OADTY/OBDTY value is changed with the OADTYF/OBDTYF bit being 1b and while counting stops, the output duty cycle is reflected at the start of counter operation.

In both saw-wave mode and triangle-wave mode, when the OADTYF/OBDTYF bit is set back to 0b and the OADTY[1:0]/ OBDTY[1:0] bits are set after setting the OADTYF/OBDTYF bit to 1b and setting the OADTY[1:0]/OBDTY[1:0] bits for the duty cycle of the first cycle while counting is stopped, these duty-cycle settings during stopping count operation are reflected in the first cycle and the second cycle after starting count operation.

OmDTY[1:0] bits (GTIOCnm Output Duty Setting) (m = A, B)

The OmDTY[1:0] bits set the output duty cycle (0%, 100% or compare match control) of the GTIOCm pin.

OmDTYF bit (Forcible GTIOCnm Output Duty Setting) (m = A, B)

The OmDTYF bit forcibly sets the output duty cycle to the OmDTY setting. Set this bit to 0b during counter operation.

OmDTYR bit (GTIOCnm Output Value Selection after Release from 0%/100% Duty Setting) (m = A, B)

The OmDTYR bit selects the target value for output retained or toggled at the cycle end, when the control changes from 0% or 100% duty-cycle setting to compare match for the GTIOCm pin and GTIOR.GTIOm[3:2] bits are set to 00b (output retained at the cycle end) or the GTIOR.GTIOm[3:2] bits are set to 11b (output toggled at the cycle end).

The GPT internally continues to perform compare match operation during duty-cycle 0% or 100% operation. When the OmDTYR bit is 1b, the value after the period has elapsed from this compare match operation is a target for the GTIOm[3:2] bits.

5.7.2.2.14 General-Purpose Timer I/O Control Register (GPTm_n_GTIOR)

The GTIOR sets the functions of the GTIOCnA and GTIOCnB pins.

4 to 0	GTIOA[4:0]	0h	RW	GTIOCnA Pin Function Select See **Table 5.7-8**.

GTIOA[4:0] bits (GTIOCnA Pin Function Select)

The GTIOA[4:0] bits select the GTIOCnA pin function. For details, see **Table 5.7-8**.

OADFLT bit (GTIOCnA Pin Output Value Setting at Count Stop)

The OADFLT bit sets whether the GTIOCnA pin outputs the high or low level when counting stops.

OAHLD bit (GTIOCnA Pin Output Setting at Count Start/Stop)

The OAHLD bit specifies whether the GTIOCnA pin output level is retained or it is in accord with the register setting at the start or stop of counting.

When the OAHLD bit is set to 0b:

- The value specified in bit [4] of the GTIOA[4:0] bits is output when counting starts
- The value specified in the OADFLT bit is output when counting stops
- If the OADFLT bit is modified while counting stops, the new value is immediately reflected in the output.

When the OAHLD bit is set to 1b:

- The output is retained when counting starts or stops.

OAE bit (GTIOCnA Pin Output Enable)

The OAE bit disables or enables the GTIOCnA pin output.

When GTCCRA register is used as the input capture register (at least one bit in the GTICASR register is set to 1b), the GTIOCnA pin does not output regardless of the OAE bit value.

OADF[1:0] bits (GTIOCnA Pin Disable Value Setting)

The OADF[1:0] bits select the output value of the GTIOCnA pin in response to a request to disable output from the POEG.

NFAEN bit (Noise Filter A Enable)

The NFAEN bit disables or enables the noise filter for input from the GTIOCnA pin. Because changing the value of the bit might lead to the internal generation of an unexpected edge, select the output compare function for the relevant pin in the GTIOR register before doing so.

NFCSA[1:0] bits (Noise Filter A Sampling Clock Select)

The NFCSA[1:0] bits set the sampling interval for the noise filter of the GTIOCnA pin. When setting these bits, wait for 2 cycles of the selected sampling interval before setting the input capture function.

GTIOB[4:0] bits (GTIOCnB Pin Function Select)

The GTIOB[4:0] bits select the GTIOCnB pin function. For details, see **Table 5.7-8**.

OBDFLT bit (GTIOCnB Pin Output Value Setting at Count Stop)

The OBDFLT bit sets whether the GTIOCnB pin outputs the high or low level when counting stops.

OBHLD bit (GTIOCnB Pin Output Setting at Count Start/Stop)

The OBHLD bit specifies whether the GTIOCnB pin output level is retained or it is in accord with the register setting at the start or stop of counting.

When the OBHLD bit is set to 0b:

- The value specified in bit [4] of the GTIOB[4:0] bits is output when counting starts
- The value specified in the OBDFLT bit is output when counting stops
- If the OBDFLT bit is modified while counting stops, the new value is immediately reflected in the output.

When the OBHLD bit is set to 1b:

- The output is retained when counting starts or stops.

OBE bit (GTIOCnB Pin Output Enable)

The OBE bit disables or enables the GTIOCnB pin output.

When GTCCRB register is used as the input capture register (at least one bit in the GTICBSR register is set to 1b), the GTIOCnB pin does not output regardless of the OBE bit value.

OBDF[1:0] bits (GTIOCnB Pin Disable Value Setting)

The OBDF[1:0] bits select the output value of the GTIOCnB pin in response to a request to disable output from the POEG.

NFBEN bit (Noise Filter B Enable)

The NFBEN bit disables or enables the noise filter for input from the GTIOCnB pin. Because changing the value of the bit might lead to the internal generation of an unexpected edge, select the output compare function for the relevant pin in the GTIOR register before doing so.

NFCSB[1:0] bits (Noise Filter B Sampling Clock Select)

The NFCSB[1:0] bits set the sampling interval for the noise filter of the GTIOCnB pin. When setting these bits, wait for 2 cycles of the selected sampling interval before setting the input capture function.

Table 5.7-8 Settings of GTIOA[4:0] and GTIOB[4:0] Bits

GTIOA/GTIOB[4:0] Bits					Function		
b4	b3	b2	b1	b0	b4	b3, b2*1,*2,*3	b1, b0*2
0	0	0	0	0	Initial output is low	Output retained at cycle end	Output retained at GTCCRA/GTCCRB compare match
0	0	0	0	1			Low-level output at GTCCRA/GTCCRB compare match
0	0	0	1	0			High-level output at GTCCRA/GTCCRB compare match
0	0	0	1	1			Output toggled at GTCCRA/GTCCRB compare match
0	0	1	0	0		Low-level output at cycle end	Output retained at GTCCRA/GTCCRB compare match
0	0	1	0	1			Low-level output at GTCCRA/GTCCRB compare match
0	0	1	1	0			High-level output at GTCCRA/GTCCRB compare match
0	0	1	1	1			Output toggled at GTCCRA/GTCCRB compare match
0	1	0	0	0		High-level output at cycle end	Output retained at GTCCRA/GTCCRB compare match
0	1	0	0	1			Low-level output at GTCCRA/GTCCRB compare match
0	1	0	1	0			High-level output at GTCCRA/GTCCRB compare match
0	1	0	1	1			Output toggled at GTCCRA/GTCCRB compare match
0	1	1	0	0		Output toggled at cycle end	Output retained at GTCCRA/GTCCRB compare match
0	1	1	0	1			Low-level output at GTCCRA/GTCCRB compare match
0	1	1	1	0			High-level output at GTCCRA/GTCCRB compare match
0	1	1	1	1			Output toggled at GTCCRA/GTCCRB compare match
1	0	0	0	0	Initial output is high	Output retained at cycle end	Output retained at GTCCRA/GTCCRB compare match
1	0	0	0	1			Low-level output at GTCCRA/GTCCRB compare match
1	0	0	1	0			High-level output at GTCCRA/GTCCRB compare match
1	0	0	1	1			Output toggled at GTCCRA/GTCCRB compare match
1	0	1	0	0		Low-level output at cycle end	Output retained at GTCCRA/GTCCRB compare match
1	0	1	0	1			Low-level output at GTCCRA/GTCCRB compare match
1	0	1	1	0			High-level output at GTCCRA/GTCCRB compare match
1	0	1	1	1			Output toggled at GTCCRA/GTCCRB compare match
1	1	0	0	0		High-level output at cycle end	Output retained at GTCCRA/GTCCRB compare match
1	1	0	0	1			Low-level output at GTCCRA/GTCCRB compare match
1	1	0	1	0			High-level output at GTCCRA/GTCCRB compare match
1	1	0	1	1			Output toggled at GTCCRA/GTCCRB compare match
1	1	1	0	0		Output toggled at cycle end	Output retained at GTCCRA/GTCCRB compare match
1	1	1	0	1			Low-level output at GTCCRA/GTCCRB compare match
1	1	1	1	0			High-level output at GTCCRA/GTCCRB compare match
1	1	1	1	1			Output toggled at GTCCRA/GTCCRB compare match

Note 1. The cycle end means an overflow (GTCNT changes from GTPR to 0 in up-counting), an underflow (GTCNT changes from 0 to GTPR in down-counting), or counter clearing for saw-wave mode, and a trough (GTCNT changes from 0b to 1b) for triangle-wave mode.

Note 2. When the timing of a cycle end and the timing of a GTCCRA/GTCCRB compare match are the same in a compare-match operation, the b3 and b2 settings are given priority in saw-wave PWM mode, and the b1 and b0 settings are given priority in any other mode.

Note 3. In event count operation where at least one bit in GTUPSR or GTDNSR is set to 1b, the setting of b3 and b2 is ignored.

5.7.2.2.15 General-Purpose Timer Interrupt Output Setting Register (GPTm_n_GTINTAD)

The GTINTAD enables or disables interrupt requests, A/D converter start requests and output disable requests.

0	GTINTA	0h	RW	GTCCRA Compare Match/Input Capture Interrupt Enable 0b: Disable interrupt requests 1b: Enable interrupt requests

GTINTA bit (GTCCRA Compare Match/Input Capture Interrupt Enable)

The GTINTA bit enables and disables the interrupt request (GPT_Ux_gpt_gtcia_n_m) in response to compare matches with or input capture by the GTCCRA register.

GTINTB bit (GTCCRB Compare Match/Input Capture Interrupt Enable)

The GTINTB bit enables and disables the interrupt request (GPT_Ux_gpt_gtcib_n_m) in response to compare matches with or input capture by the GTCCRB register.

GTINTC bit (GTCCRC Compare Match Interrupt Enable)

The GTINTC bit enables and disables the interrupt request (GPT_Ux_gpt_gtcic_n_m) in response to compare matches with the GTCCRC register.

GTINTD bit (GTCCRD Compare Match Interrupt Enable)

The GTINTD bit enables and disables the interrupt request (GPT_Ux_gpt_gtcid_n_m) in response to compare matches with the GTCCRD register.

GTINTE bit (GTCCRE Compare Match Interrupt Enable)

The GTINTE bit enables and disables the interrupt request (GPT_Ux_gpt_gtcie_n_m) in response to compare matches with the GTCCRE register.

GTINTF bit (GTCCRF Compare Match Interrupt Enable)

The GTINTF bit enables and disables the interrupt request (GPT_Ux_gpt_gtcif_n_m) in response to compare matches with the GTCCRF register.

GTINTPR[1:0] bits (GTPR Compare Match Interrupt Enable)

The GTINTPR[1:0] bits enable and disable the interrupt requests (GPT_Ux_gpt_gtciv_n_m and GPT_Ux_gpt_gciu_n_m) in response to compare matches with the GTPR register (and overflows of the GTCNT counter) and underflows of the GTCNT counter.

ADTRAUEN bit (GTADTRA Compare Match (Up-Counting) A/D Converter Start Request Enable)

The ADTRAUEN bit enables or disables A/D converter start requests generated by GTADTRA compare matches during GTCNT up-counting. The setting of this bit has no effect during event counting and A/D converter start requests are not generated.

ADTRADEN bit (GTADTRA Compare Match (Down-Counting) A/D Converter Start Request Enable)

The ADTRADEN bit enables or disables A/D converter start requests generated by GTADTRA compare matches during GTCNT down-counting. The setting of this bit has no effect during event counting and A/D converter start requests are not generated.

ADTRBUEN bit (GTADTRB Compare Match (Up-Counting) A/D Converter Start Request Enable)

The ADTRBUEN bit enables or disables A/D converter start requests generated by GTADTRB compare matches during GTCNT up-counting. The setting of this bit has no effect during event counting and A/D converter start requests are not generated.

ADTRBDEN bit (GTADTRB Compare Match (Down-Counting) A/D Converter Start Request Enable)

The ADTRBDEN bit enables or disables A/D converter start requests generated by GTADTRB compare matches during GTCNT down-counting. The setting of this bit has no effect during event counting and A/D converter start requests are not generated.

GRP[1:0] bits (Output Disable Source Select)

These bits select the group of output disable requests from GPT to POEG and the group of output disable sources for the GTIOCnA and GTIOCnB pins from POEG to GPT.

The output disable request to POEG is output to the group selected in the GRP[1:0] bits, with dead-time errors, simultaneous high-level output, and simultaneous low-level output sources following their respective disable request enable bits.

GTST.ODF shows the request of the output disable source group that is selected with the GRP[1:0] bits. Set the GRP[1:0] bits when both GTIOR.OAE and GTIOR.OBE bits are 0b.

GRPDTE bit (Dead Time Error Output Disable Request Enable)

The GRPDTE bit enables or disables dead time error output disable requests. The setting of this bit has no effect during event counting.

GRPABH bit (Simultaneous Output Level High Disable Request Enable)

The GRPABH bit enables or disables the output disable request when the GTIOCnA and GTIOCnB pins output 1 at the same time.

GRPABL bit (Simultaneous Output Level Low Disable Request Enable)

The GRPABL bit enables or disables the output disable request when the GTIOCnA and GTIOCnB pins output 0 at the same time.

5.7.2.2.16 General-Purpose Timer Status Register (GPTm_n_GTST)

The GTST indicates the status of the GPT.

0	TCFA	0h	RW	Input Capture/Compare Match Flag A 0b: No input capture/compare match of GTCCRA is generated 1b: An input capture/compare match of GTCCRA is generated Only "0" can be written to clear the flag. When clearing the ADTRAUF, ADTRADF, ADTRBUF, or ADTRBDF flag, write "0" to clear and write "1" to keep the flag.

TCFA flag (Input Capture/Compare Match Flag A)

The TCFA flag indicates the status of the input capture or compare match with GTCCRA.

[Setting conditions]

- GTCNT = GTCCRA, when the GTCCRA register functions as a compare match register
- The GTCNT counter value is transferred to GTCCRA by the input capture signal when the GTCCRA register functions as an input capture register.

[Clearing condition]

- 0b is written to this flag.

TCFB flag (Input Capture/Compare Match Flag B)

The TCFB flag indicates the status of the input capture or compare match with GTCCRB.

[Setting conditions]

- GTCNT = GTCCRB, when the GTCCRB register functions as a compare match register
- The GTCNT counter value is transferred to GTCCRB by the input capture signal when the GTCCRB register functions as an input capture register.

[Clearing condition]

- 0b is written to this flag.

TCFC flag (Input Compare Match Flag C)

The TCFC flag indicates the status of the compare match with GTCCRC.

When GTCCRC performs buffer operation, it does not perform compare match.

[Setting condition]

- GTCNT = GTCCRC.

[Clearing condition]

- 0b is written to this flag.

[Conditions for no comparison]

- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (triangle-wave PWM mode 3)
- GTBER.CCRA[1:0] = 01b, 10b, 11b (GTCCRC performs buffer operation).

TCFD flag (Input Compare Match Flag D)

The TCFD flag indicates the status of the compare match with GTCCRD.

When GTCCRD performs buffer operation, it does not perform compare match.

[Setting condition]

- GTCNT = GTCCRD.

[Clearing condition]

- 0b is written to this flag.

[Conditions for no comparison]

- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (triangle-wave PWM mode 3)
- GTBER.CCRA[1:0] = 10b, 11b (GTCCRD performs buffer operation).

TCFE flag (Input Compare Match Flag E)

The TCFE flag indicates the status of the compare match with GTCCRE.

When GTCCRE performs buffer operation, it does not perform compare match.

[Setting condition]

- GTCNT = GTCCRE.

[Clearing condition]

- 0b is written to this flag.

[Conditions for no comparison]

- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (triangle-wave PWM mode 3)
- GTBER.CCRB[1:0] = 01b, 10b, 11b (GTCCRE performs buffer operation).

TCFF flag (Input Compare Match Flag F)

The TCFF flag indicates the status of the compare match with GTCCRF.

When GTCCRF performs buffer operation, it does not perform compare match.

[Setting condition]

- GTCNT = GTCCRF.

[Clearing condition]

- 0b is written to this flag.

[Conditions for no comparison]

- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (triangle-wave PWM mode 3)
- GTBER.CCRB[1:0] = 10b, 11b (GTCCRF performs buffer operation).

TCFPO flag (Overflow Flag)

The TCFPO flag indicates when an overflow or crest has occurred.

[Setting conditions]

- In saw-wave mode, an overflow (GTCNT changes from GTPR to 0b in up-counting) has occurred
- In triangle-wave mode, a crest (GTCNT changes from GTPR to GTPR - 1) has occurred
- In counting by hardware sources, an overflow (GTCNT changes from GTPR to 0b in up-counting) has occurred.

[Clearing condition]

- 0b is written to this flag.

TCFPU flag (Underflow Flag)

The TCFPU flag indicates when an underflow or trough has occurred.

[Setting conditions]

- In saw-wave mode, an underflow (GTCNT changes from 0 to GTPR in down-counting) has occurred
- In triangle-wave mode, a trough (GTCNT changes from 0 to 1) has occurred
- In counting by hardware sources, an underflow (GTCNT changes from 0 to GTPR in down-counting) has occurred.

[Clearing condition]

- 0b is written to this bit.

ITCNT[2:0] bits (GPT_Ux_gpt_gtciv_n_m/GPT_Ux_gpt_gciu_n_m Interrupt Skipping Count Counter)

When the GPT_Ux_gpt_gtciv_n_m/GPT_Ux_gpt_gciu_n_m (x = 0 or 1, m = 0 to 7) interrupt skipping function is used (the GTITC.IVTC[1:0] bits are set to a value other than 00b), the counter in the ITCNT[2:0] bits is incremented by 1 every time the GPT_Ux_gpt_gtciv_n_m/GPT_Ux_gpt_gciu_n_m interrupt source that is selected in GTITC.IVTC[1:0] is generated.

[Clearing conditions]

- The GPT_Ux_gpt_gtciv_n_m/GPT_Ux_gpt_gciu_n_m interrupt skipping function is not used (GTITC.IVTT[2:0] is 000b when GTITC.IVTC[1:0] is 00b)
- The GPT_Ux_gpt_gtciv_n_m/GPT_Ux_gpt_gciu_n_m interrupt skipping count matches the specified count (ITCNT[2:0] matches the skipping count specified in GTITC.IVTT[2:0]).

TUCF flag (Count Direction Flag)

The TUCF flag indicates the count direction of GTCNT. In event count operation, this flag is set to 1b in up-counting and to 0b in down-counting.

ADTRAUF flag (GTADTRA Compare Match (Up-Counting) A/D Converter Start Request Flag)

The ADTRAUF flag indicates whether or not a compare match with the GTADTRA register has occurred during counting up.

[Setting condition]

- GTCNT = GTADTRA during counting up

[Clearing condition]

- 0b is written to this flag.

ADTRADF flag (GTADTRA Compare Match (Down-Counting) A/D Converter Start Request Flag)

The ADTRADF flag indicates whether or not a compare match with the GTADTRA register has occurred during counting down.

[Setting condition]

- GTCNT = GTADTRA during counting down

[Clearing condition]

- 0b is written to this flag.

ADTRBUF flag (GTADTRB Compare Match (Up-Counting) A/D Converter Start Request Flag)

The ADTRBUF flag indicates whether or not a compare match with the GTADTRB register has occurred during counting up.

[Setting condition]

- GTCNT = GTADTRB during counting up

[Clearing condition]

- 0b is written to this flag.

ADTRBDF flag (GTADTRB Compare Match (Down-Counting) A/D Converter Start Request Flag)

The ADTRBDF flag indicates whether or not a compare match with the GTADTRB register has occurred during counting down.

[Setting condition]

- GTCNT = GTADTRB during counting down

[Clearing condition]

- 0b is written to this flag.

ODF flag (Output Disable Flag)

The ODF flag shows the request of the output disable source group selected in the GRP[1:0] bits.

When output is disabled, an output disable control is not released within the same cycle in which an output disable request is negated. It is released in the next cycle.

DTEF flag (Dead Time Error Flag)

The DTEF flag indicates that the timer output toggle point after the automatic addition of dead time has exceeded the timer cycle. This flag returns to 0b when the timer output toggle point after the automatic addition of dead time is returned to the cycle. This flag is read only. Writing 0b to clear the flag is not allowed.

When an interrupt by the DTEF flag is enabled (GTINTAD.GRPDTE = 1b), the DTEF flag is output to POEG as an output disable request each time the DTEF flag changes from 0b to 1b.

[Setting condition]

- The timer output toggle point after the automatic addition of dead time has exceeded the timer cycle.

  For triangle wave in up-counting: GTCCRA – GTDVU ≤ 0

  For triangle wave in down-counting: GTCCRA – GTDVD < 0

  For saw wave 1 shot pulse mode in up-counting: GTCCRA – GTDVU < 0 or GTCCRA + GTDVD > GTPR

  For saw wave 1 shot pulse mode in down-counting: GTCCRA + GTDVU > GTPR or GTCCRA - GTDVD < 0

[Clearing condition]

- The timer output toggle point after the automatic addition of dead time is within the timer cycle.

OABHF flag (Simultaneous Output Level High Flag)

The OABHF flag indicates that the GTIOCnA and GTIOCnB pins output 1 at the same time.

When the GTIOCnA or GTIOCnB pin outputs 0, this flag returns to 0b. This flag is read only. Writing 0 to clear the flag is prohibited.

When the output disable request by the OABHF flag is enabled (GTINTAD.GRPABH = 1b), the OABHF flag is output to POEG as an output disable request. The GPT does not have an interrupt to indicate that outputs have been simultaneous driven to the high level. Use the interrupt function in the POEG if this is necessary.

[Setting condition]

- The GTIOCnA and GTIOCnB pins output 1 at the same time when both OAE and OBE bits are set to 1b.

[Clearing conditions]

- The GTIOCnA pin output value is different from the GTIOCnB pin output value when both OAE and OBE bits are set to 1b
- The GTIOCnA and GTIOCnB pins output 0 at the same time when both OAE and OBE bits are set to 1b
- Either the OAE bit or OBE bit is set to 0b.

OABLF flag (Simultaneous Output Level Low Flag)

The OABLF flag indicates that the GTIOCnA and GTIOCnB pins output 0 at the same time.

When the GTIOCnA pin or GTIOCnB pin outputs 1, this flag returns to 0b. This flag is read only. Writing 0b to clear the flag is prohibited.

When the output disable request by the OABLF flag is enabled (GTINTAD.GRPABL = 1b), the OABLF flag is output to POEG as an output disable request. The GPT does not have an interrupt to indicate that outputs have been simultaneous driven to the low level. Use the interrupt function in the POEG if this is necessary.

[Setting condition]

- The GTIOCnA and GTIOCnB pins output 0 at the same time when both OAE and OBE bits are set to 1b.

[Clearing conditions]

- The GTIOCnA pin output value is different from the GTIOCnB pin output value when both OAE and OBE bits are set to 1b
- The GTIOCnA and GTIOCnB pins output 1 at the same time when both OAE and OBE bits are set to 1b
- Either the OAE bit or the OBE bit is set to 0b.

The compare-target signals to generate the OABHF/OABLF flag are the compare match outputs (PWM outputs) signals before they are masked by the output disable function. Even during the output disable condition, compare match operation continues internally, where the OABHF or OABLF flag is updated based on the operation results.

5.7.2.2.17 General-Purpose Timer Buffer Enable Register (GPTm_n_GTBER)

The GTBER register provides settings for buffer operation. Set the GTBER register while the GTCNT counter is stopped.

0	BD0	0h	RW	GTCCR Buffer Operation Disable 0b: Buffer operation is enabled 1b: Buffer operation is disabled

BD[0] bit (GTCCR Buffer Operation Disable)

The BD[0] bit disables buffer operation in combination with GTCCRA, GTCCRB, GTCCRC, GTCCRD, GTCCRE, and GTCCRF.

When GTDTCR.TDE is 1b and when BD0 is set to 0b, GTCCRB does not perform buffer operation. The GTCCRB register is automatically set to a compare match value for negative-phase waveform with dead time.

A value for the BD0 bit in the channel related to the position of the bit written with 1b by the GTSECSR register can be set when 1b is written to the GTSECR.SBDCE or GTSECR.SBDCD.

If the DBRTECm (m = A, B) bit is 1b, when a double buffer is used in saw-wave one-shot pulse mode, triangle-wave PWM mode 3, or triangle-wave PWM mode 2, buffer operation from an intermediate buffer to the GTCCRm register is performed even if the BD[0] bit is set to 1b.

BD[1] bit (GTPR Buffer Operation Disable)

The BD[1] bit disables buffer operation in combination with GTPR and GTPBR.

A value of the BD1 bit in the channel related to the position of the bit written with 1b by the GTSECSR register can be set when 1b is written to the GTSECR.SBDPE or GTSECR.SBDPD.

BD[2] bit (GTADTR Buffer Operation Disable)

The BD[2] bit disables buffer operation in combination with GTADTRA, GTADTRB, GTADTBRA, GTADTBRB, GTADTDBRA, and GTADTDBRB of GPT. In event count operation, this bit is not available and the GTADTR buffer operation is not performed. The setting of this bit has no effect during event counting and the GTADTRA and GTADTRB registers do not perform buffer operation.

By writing 1b to the SBDAE or SBDAD bit of the GTSECR register, a value can be set in the BD[2] bit of the corresponding channel at the bit position which is set to 1b in the GTSECSR register.

If the DBRTEADm (m = A, B) bit is 1b, when the GTADTRm register is made to operate as a double buffer with triangle waves and the timing of buffer transfer is set for both troughs and crests (the GTBER.ADTTm[1:0] bits are set to 11b), buffer operation from an intermediate buffer to the GTADTRm register is performed even if the BD[2] bit is set to 1b.

BD[3] bit (GTDV Buffer Operation Disable)

The BD[3] bit disables buffer operation in combination with GTDVU, GTDVD, GTDBD, and GTDBU of GPT. When the GTDTCR.TDFER bit is set to 1b and when BD[3] is set to 0b, buffer operation is not performed and the GTDVD value is set as a value of GTDVU automatically. In event count operation, this bit is not available and the GTDV buffer operation is not performed. The setting of this bit has no effect during event counting and the GTDVU and GTDVD registers do not perform buffer operation.

By writing 1b to the SBDDE or SBDDD bit of the GTSECR register, a value can be set in the BD[3] bit of the channels in the bit position which is set to 1b in the GTSECSR register.

DBRTECm bit (GTCCRm Register Double Buffer Repeat Operation Enable) (m = A, B)

To make the GTCCRm register operate as a double buffer, this bit enables operation to repeat transfer from an intermediate buffer to the GTCCRm register on a cyclic basis over the period where buffer transfer is disabled.

This bit is valid in saw-wave one-shot pulse mode, triangle-wave PWM mode 3, and triangle-wave PWM mode 2 that makes the GTCCRm register operate as a double buffer.

In the period where buffer transfer is disabled, setting the BD[0] bit (CPU writing or simultaneous buffer operation control by the GTSECSR register) and buffer transfer extended skipping (except for skipping by counting both crests and troughs with triangle waves) by the GTEITLB register are both possible.

When the DBRTECm bit is 1b, writing by the CPU to the GTCCRm register sets the same value in temporary register x (x = C, E). Also, the value of the GTCCRx (x = C, E) register is transferred to temporary register x (x = C, E) by forcible buffer transfer.

DBRTSCm bit (GTCCRm Register Double Buffer Repeat Operation Period Select) (m = A, B)

This bit selects the target period for repeated operation when GTCCRm double buffer repeat operation is enabled. This bit is valid in triangle-wave PWM mode 2.

When disabling or enabling of buffer transfer is to be changed during counting by GTCNT, change it with the period on the basis of the same cyclic period as that set by the DBRTSCm bit.

DBRTEADm bit (GTADTRm Register Double Buffer Repeat Operation Enable) (m = A, B)

To make the GTADTRm register operate as a double buffer, this bit enables operation to repeat transfer from an intermediate buffer to the GTADTRm register on a cyclic basis over the period where buffer transfer is disabled.

This bit is valid when the GTADTRm register is made to operate as a double buffer (the GTBER.ADTDm is 1b) with triangle waves and the timing of buffer transfer is set for both troughs and crests (the GTBER.ADTTm[1:0] bits are 11b).

In the period where buffer transfer is disabled, setting the BD[2] bit (CPU writing or simultaneous buffer operation control by the GTSECSR register) and buffer transfer extended skipping (except for skipping by counting both crests and troughs with triangle waves) by the GTEITLB register are both possible.

When the ADTDm bit is 1b and the DBRTEADm bit is 1b, writing by the CPU to the GTADTRm register sets the same value in temporary register ADm (m = A, B).

DBRTSADm bit (GTADTRm Register Double Buffer Repeat Operation Period Select) (m = A, B)

This bit selects the target period for repeated operation when GTADTRm double buffer repeat operation is enabled.

When disabling or enabling of buffer transfer is to be changed during counting by GTCNT, change it with the period on the basis of the same cyclic period set by the DBRTSADm bit.

CCRA[1:0] bits (GTCCRA Buffer Operation)

The CCRA[1:0] bits set buffer operation in combination with GTCCRA, GTCCRC, and GTCCRD. When the buffer operation is restricted by the operating mode set in GTCR, the GTCR setting is given priority.

The buffer operation mode is fixed in saw-wave one-shot pulse mode or triangle-wave PWM mode 3 (64-bit transfer at trough).

CCRB[1:0] bits (GTCCRB Buffer Operation)

The CCRB[1:0] bits set buffer operation in combination with GTCCRB, GTCCRE, and GTCCRF. When the buffer operation is restricted by the operating mode set in GTCR, the GTCR setting is given priority.

The buffer operation mode is fixed in saw-wave one-shot pulse mode or triangle-wave PWM mode 3 (64-bit transfer at trough).

PR[1:0] bits (GTPR Buffer Operation)

The PR[1:0] bits set buffer operation in combination with GTPR, GTPBR and GTPDBR.

CCRSWT bit (GTCCRA and GTCCRB Forcible Buffer Operation)

Writing 1b to the CCRSWT bit forces a buffer transfer of GTCCRA and GTCCRB. This bit automatically returns to 0b after 1b has been written. This bit is read as 0b, and is valid only when counting is stopped with a compare match operation specified.

ADTTA[1:0] bits (GTADTRA Buffer Transfer Timing Select)

The ADTTA[1:0] bits set the transfer timing for buffer operation of GTADTRA, GTADTBRA, and GTADTDBRA.

These bits are not available in event count operation.

ADTDA bit (GTADTRA Double Buffer Operation)

The ADTDA bit sets buffer operation in combination with GTADTRA, GTADTBRA, and GTADTDBRA. This bit is not available in event count operation.

ADTTB[1:0] bits (GTADTRB Buffer Transfer Timing Select)

The ADTTB[1:0] bits set the transfer timing for buffer operation of GTADTRB, GTADTBRB, and GTADTDBRB. This bit is not available in event count operation.

ADTDB bit (GTADTRB Double Buffer Operation)

The ADTDB bit sets buffer operation in combination with GTADTRB, GTADTBRB, and GTADTDBRB of GPT. This bit is not available in event count operation.

5.7.2.2.18 General-Purpose Timer Interrupt and A/D Converter Start Request Setting Register (GPTm_n_GTITC)

GTITC sets the skipping function for the GTCNT counter overflow (GTPR compare match) interrupt (OVFn) and underflow interrupt (UNFn). It also specifies whether to link other interrupts and A/D converter start requests with the OVFn/UNFn interrupt skipping function. An output disable request to the POEG cannot be linked with the OVFn/UNFn interrupt skipping function. This bit is not available in event count operation.

Access Size : 32 bits

Address : <GPTm_base> + 0044h + n x 0100h

ITLA bit (GTCCRA Compare Match/Input Capture Interrupt Link)

The ITLA bit specifies whether to link the GTCCRA compare match/input capture interrupt (GTCIA) with the OVFn/UNFn interrupt skipping function.

ITLB bit (GTCCRB Compare Match/Input Capture Interrupt Link)

The ITLB bit specifies whether to link the GTCCRB compare match/input capture interrupt (GTCIB) with the OVFn/UNFn interrupt skipping function.

ITLC bit (GTCCRC Compare Match Interrupt Link)

The ITLC bit specifies whether to link the GTCCRC compare match interrupt (GTCIC) with the OVFn/UNFn interrupt skipping function.

ITLD bit (GTCCRD Compare Match Interrupt Link)

The ITLD bit specifies whether to link the GTCCRD compare match interrupt (GTCID) with the OVFn/UNFn interrupt skipping function.

ITLE bit (GTCCRE Compare Match Interrupt Link)

The ITLE bit specifies whether to link the GTCCRE compare match interrupt (GTCIE) with the OVFn/UNFn interrupt skipping function.

ITLF bit (GTCCRF Compare Match Interrupt Link)

The ITLF bit specifies whether to link the GTCCRF compare match interrupt (GTCIF) with the OVFn/UNFn interrupt skipping function.

IVTC[1:0] bits (OVFn/UNFn Interrupt Skipping Function Select)

The IVTC[1:0] bits set the skipping function for the GTPR compare match (GTCNT overflow) interrupt (OVFn) and GTCNT counter underflow interrupt (UNFn).

IVTT[2:0] bits (OVFn/UNFn Interrupt Skipping Count Select)

The IVTT[2:0] bits set the skipping count for the GTPR compare match (GTCNT overflow) interrupt (OVFn) and GTCNT counter underflow interrupt (UNFn). When modifying the IVTT[2:0] bits, first set the IVTC[1:0] bits to 00b.

ADTAL bit (GTADTRA A/D Converter Start Request Link)

The ADTAL bit specifies whether to link the GTADTRA A/D converter start request with OVFn/UNFn interrupt skipping function.

ADTBL bit (GTADTRB A/D Converter Start Request Link)

The ADTBL bit specifies whether to link the GTADTRB A/D converter start request with OVFn/UNFn interrupt skipping function.

5.7.2.2.19 General-Purpose Timer Counter (GPTm_n_GTCNT)

Access Size : 32 bits

Address : <GPTm_base> + 0048h + n x 0100h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	GTCNT[31:0]	0h	RW	GTCNT is a 32-bit readable/writable counter. GTCNT can only be written to after counting stops. GTCNT must be set within the range of 0 ≤ GTCNT ≤ GTPR.

5.7.2.2.20 General-Purpose Timer Compare Capture Register k (GPTm_n_GTCCRk) (k = A to F)

The notations of the addresses are as follows.

p = 0 when k = A
p = 1 when k = B
p = 2 when k = C
p = 3 when k = E
p = 4 when k = D
p = 5 when k = F

Access Size : 32 bits
Address : <GPTm_base> + 004Ch + n x 0100h + 04h x p
Initial Value : FFFF_FFFFh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GTCCR[31:16]

R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	GTCCR[31:0]	FFFF_FFFFh	RW	GTCCRk registers are readable/writable registers. GTCCRA and GTCCRB are registers used for both output compare and input capture. GTCCRC and GTCCRE are compare match registers, and can also function as buffer registers for GTCCRA and GTCCRB. GTCCRD and GTCCRF are compare match registers, and can also function as buffer registers for GTCCRC and GTCCRE (double-buffer registers for GTCCRA and GTCCRB).

5.7.2.2.21 General-Purpose Timer Cycle Setting Register (GPTm_n_GTPR)

Access Size : 32 bits

Address : <GPTm_base> + 0064h + n x 0100h

Initial Value : FFFF_FFFFh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GTPR[31:16]

R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
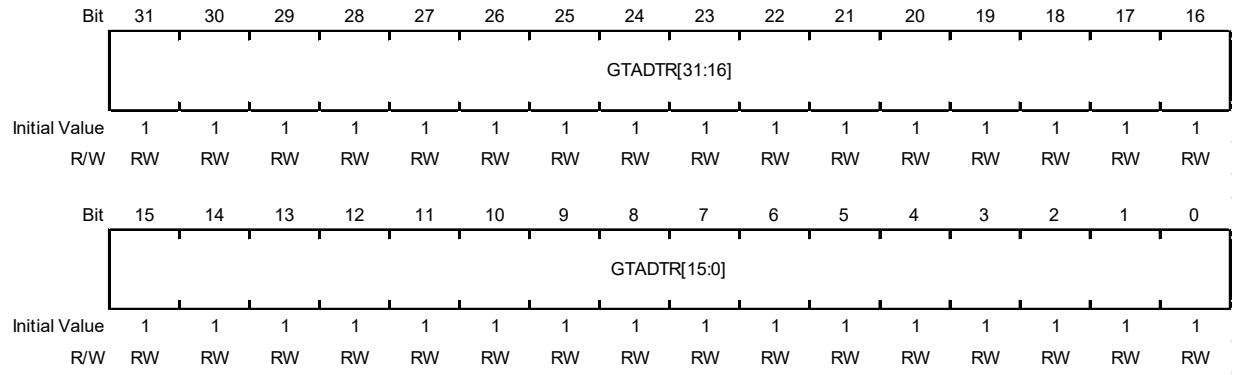
31 to 0	GTPDBR[31:0]	FFFF_FFFFh	RW	The GTPDBR register is a readable/writable register and operates as a buffer register for the GTPBR register (GTPR double buffer register).

5.7.2.2.24 A/D Converter Start Request Timing Register k (GPTm_n_GTADTRk) (k = A, B)

Access Size : 32 bits

Address : <GPTm_base> + 0070h + n x 0100h (k = A)
<GPTm_base> + 007Ch + n x 0100h (k = B)

Initial Value : FFFF_FFFFh



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	GTADTR[31:0]	FFFF_FFFFh	RW	The GTADTRk register is a readable/writable register that sets the timing of the A/D conversion start request. When the GTADTRk register value matches the GTCNT counter value, an A/D converter start request is generated.

5.7.2.2.25 A/D Converter Start Request Timing Buffer Register k (GPTm_n_GTADTBRk) (k = A, B)

Access Size : 32 bits

Address : <GPTm_base> + 0074h + n x 0100h (k = A)
<GPTm_base> + 0080h + n x 0100h (k = B)

Initial Value : FFFF_FFFFh

R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	GTADTDBR [31:0]	FFFF_FFFFh	RW	The GTADTDBRk register is a readable/writable register that operates as a buffer register for the GTADTBRk register (double buffer register for GTADTRk).

5.7.2.2.27 General-Purpose Timer Dead Time Control Register (GPTm_n_GTDTCR)

GTDTCR enables automatic setting of the compare match value for a negative-phase waveform with dead time. GPT has a dead time control function and the GTDVU register is used for setting the dead time value.

Access Size : 32 bits
Address : <GPTm_base> + 0088h + n x 0100h
Initial Value : 0000_0000h

31 to 9	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
8	TDFER	0h	RW	GTDVD Register Setting 0b: Sets GTDVU and GTDVD registers individually 1b: The value written to the GTDVU register is automatically set in the GTDVD register
7, 6	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
5	TDBDE	0h	RW	GTDVD Register Buffer Operation Enable 0b: Disable GTDVD register buffer operation 1b: Enable GTDVD register buffer operation
4	TDBUE	0h	RW	GTDVU Register Buffer Operation Enable 0b: Disable GTDVU register buffer operation 1b: Enable GTDVU register buffer operation
3 to 1	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
0	TDE	0h	RW	Negative-Phase Waveform Setting 0b: GTCCRB is set without using GTDVU/GTDVD 1b: GTDVU/GTDVD is used to automatically set the compare match value for negative-phase waveform with dead time in GTCCRB

TDE bit (Negative-Phase Waveform Setting)

The TDE bit specifies whether to use GTDVU/GTDVD. When GTDVU is used, the compare match value for a negative-phase waveform with dead time obtained by the compare match value of a positive-phase waveform (GTCCRA) and the dead time value (GTDVU/GTDVD) is automatically set in GTCCRB.

The TDE bit setting is ignored in saw-wave PWM mode, and the GTCCRB is not automatically set.

The GTCCRB value is automatically set and has the following upper and lower limit values. If the obtained GTCCRB value is not within the upper or lower limit, the following limit value is set in GTCCRB.

- Triangle waves:
  Upper limit value: GTPR – 1
  Lower limit value: 1 in up-counting, 0 in down-counting
- Saw-wave one-shot pulse mode:
  Upper limit value:
  GTPR Lower limit value: 0.

TDBUE bit (GTDVU Buffer Operation Enable)

The TDBUE bit enables buffer operation in combination with GTDVU and GTDBU. The buffer transfer timing is the trough for triangle waves, and an overflow or underflow for saw waves.

TDBDE bit (GTDVD Buffer Operation Enable)

The TDBDE bit enables buffer operation in combination with GTDVD and GTDBD. The buffer transfer timing is the trough for triangle waves, and an overflow or underflow for saw waves. When this bit and the TDFER bit are set to 1 simultaneously, the TDFER bit setting is given priority.

TDFER bit (GTDVD Setting)

The TDFER bits sets whether or not the value written to GTDVU is also set to GTDVD automatically.

5.7.2.2.28 General-Purpose Timer Dead Time Value Register k (GPTm_n_GTDVk) (k = U, D)

Access Size : 32 bits

Address : <GPTm_base> + 008Ch + n x 0100h (k = U)
<GPTm_base> + 0090h + n x 0100h (k = D)

Initial Value : FFFF_FFFFh

R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	GTDV[31:0]	FFFF_FFFFh	RW	GTDVk is a 32-bit read/write register that sets the dead time for generating PWM waveforms with dead time. GTDVU is used for up-counting and GTDVD is used for down-counting. It is prohibited to set the GTDVk register with a value larger than or equal to that of the GTPR register. Do not set the change point of waveform beyond the count cycle period, when the automatic dead time setting function is used. By reading the GTCCRB register, the change point for the reverse-phase waveform after the dead time added, which is set in the automatic dead time setting function. When GTDVk is used, writing to GTCCRB is not allowed. When this register is set to 0, waveforms without dead time are output. GTDVn must be accessed in 32-bit units. Access in 8-bit/16-bit units is prohibited. When GTDVk buffer operation is enabled, GTDBk can be written anytime. The value of GTDBk is transferred to GTDVk at the end of the count cycle period. When the GTDVn buffer operation is disabled, set the CST bit in the GTCR register to stop the GPT with before changing GTDVn to a new value. When GTDVk buffer operation is disabled, to change GTDVk to a new value, stop the GPT with the CST bit in the GTCR register.

5.7.2.2.29 General-Purpose Timer Dead Time Buffer Register k (GPTm_n_GTDBk) (k = U, D)

Access Size : 32 bits

Address : <GPTm_base> + 0094h + n x 0100h (k = U)
<GPTm_base> + 0098h + n x 0100h (k = D)

Initial Value : FFFF_FFFFh

5.7.2.2.30 General-Purpose Timer Output Protection Function Status Register (GPTm_n_GTSOS)

GTSOS is a status register that indicates the status of the output protection function. The output protection function is enabled only when the dead time is automatically set (GTDTCR.TDE bit = 1) in triangle-wave mode.

Access Size : 32 bits

Address : <GPTm_base> + 009Ch + n x 0100h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

9	OBMON	0h	R	GTIOCnB Pin Monitoring
8	OAMON	0h	R	GTIOCnA Pin Monitoring
7 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
1, 0	SOS[1:0]	0h	R	Output Protection Function Status 00b: Normal operation 01b: Protected state (GTCCRA register = 0b is set in transfer at troughs or crests) 10b: Protected state (GTCCRA register ≥ GTPR register is set in transfer at troughs) 11b: Protected state (GTCCRA register ≥ GTPR register is set in transfer at crests)

SOS bits (Output Protection Function Status)

The SOS[1:0] bits indicate the status of the output protection function in triangle-wave PWM mode. For details of the output protection function, see **5.7.8.4 GTIOCnm Protection Function for GTIOCnm Pin Output (n = 0 to 15; m = A, B)**.

OAMON bit (GTIOCnA Pin Monitoring)

In input capture operation, the state of input capture input on the GTIOCnA pin via the synchronization circuit is monitored. When the noise filter is enabled, the state of input capture input on the GTIOCnA pin via the noise filter is monitored. In output compare/PWM operation, the state of output compare output on the GTIOCnA pin to which output disable control has not been applied is monitored.

OBMON bit (GTIOCnB Pin Monitoring)

In input capture operation, the state of input capture input on the GTIOCnB pin via the synchronization circuit is monitored. When the noise filter is enabled, the state of input capture input on the GTIOCnB pin via the noise filter is monitored. In output compare/PWM operation, the state of output compare output on the GTIOCnB pin to which output disable control has not been applied is monitored.

5.7.2.2.31 General-Purpose Timer Output Protection Function Temporary Release Register (GPTm_n_GTSOTR)

GTSOTR temporarily releases the protected state of GTIOCnB pin output when output protection is set. The protected state can be released only when GTSOS.SOS[1:0] bits = 10b (protected state in which GTCCRA ≥ GTPR has occurred during transfer at trough). The protected state cannot be released in any other case.

Access Size : 32 bits
Address : <GPTm_base> + 00A0h + n x 0100h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
0	SOTR	0h	RW	Output Protection Function Temporary Release 0b: The protected state is not released 1b: The protected state is released

SOTR bit (Output Protection Function Temporary Release)

The SOTR bit specifies whether to temporarily release the protected state of the GTIOCnB pin output in an output protected state. When the SOTR bit is set to 1b, the output protection function is canceled from the first trough. When the SOTR bit is set to 0b, output protection resumes from the first trough.

5.7.2.2.32 General-Purpose Timer Extended Interrupt Skipping Counter Control Register (GPTm_n_GTEITC)

The GTEITC register controls the skipping counter for the extended interrupt skipping function to skip interrupts, A/D converter start requests, and buffer transfers independently by counting the overflow and underflow of the GTCNT counter.

It operates independently of interrupt skipping by the GTITC register. The setting of this register has no effect during event counting.

Access Size : 32 bits
Address : <GPTm_base> + 00A8h + n x 0100h
Initial Value : 0000_0000h

3, 2	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
1, 0	EIVTC1[1:0]	0h	RW	Extended Interrupt Skipping Counter 1 Count Source Select 00b: Do not count (no skipping) 01b: Count both overflow/underflow in saw-wave mode and (crests) in triangle-wave mode 10b: Count both overflow/underflow in saw-wave mode and (troughs) in triangle-wave mode 11b: Counts both overflows/underflows in saw-wave mode and both (troughs/crests) in triangle-wave mode

EIVTCk[1:0] bits (Extended Interrupt Skipping Counter k Count Source Select) (k = 1, 2)

These bits select the way of counting by extended interrupt skipping counter k.

Only setting these bits does not skip the interrupts, A/D converter start requests, and buffer transfers. Use the GTEITLI1, GTEITLI2, and GTEITLB registers to set the skipping function for the interrupt, A/D converter start request, and buffer transfer individually as targets for skipping.

EIVTTk[3:0] bits (Extended Interrupt Skipping k Skipping Count Setting) (k = 1, 2)

These bits set the count for the period for continuous skipping as the skipping count with generation of the count source selected by the EIVTCk[1:0] bits as an interval.

When the count source is generated while the value of the EIVTTk[3:0] bits matches the EITCNTk[3:0] value, the EITCNTk[3:0] bits return to 0b.

When these bits are 0000b, skipping is not performed.

EITCNT1[3:0] bits (Extended Interrupt Skipping Counter 1)

This counter counts up by 1 every time the count source (overflow/underflow/crest/trough) selected by the EIVTC1[1:0] bits is generated.

Counting is performed periodically within the range between 0 and the EIVTT1[3:0] bits.

The value is not cleared even when the GTCNT counter is stopped, and the value when the GTCNT counter is stopped is retained.

[Clearing conditions]

- 00b is written to the EIVTC1[1:0] bits.
- 0000b is written to the EIVTT1[3:0] bits.
- The count source (overflow/underflow/crest/trough) selected by the EIVTC1[1:0] bits is generated while the extended interrupt skipping 1 skipping count set by the EIVTT1[3:0] bits matches the value of the EITCNT1[3:0].

EITCNT2IV[3:0] bits (Extended Interrupt Skipping Counter 2 Initial Value)

The value of these bits is the initial value of extended interrupt skipping counter 2.

Writing to the EITCNT2[3:0] bits only proceeds when the GTEITC register is written by access in 32-bit units and the value written to the EIVTC2[1:0] bits is other than 00b while the setting of the EITCNT2[3:0] bits is for no counting (EIVTC2[1:0] bits are 00b). When the EITCNT2IV[3:0] bits are written, the value written to the EITCNT2IV[3:0] bits is also written to the EITCNT2[3:0] bits simultaneously.

While the setting of the EITCNT2[3:0] bits is for counting (the EIVTC2[1:0] bits are other than 00b) or when these bits are set for no counting (00b is written to the EIVTC2[1:0] bits), writing to the EITCNT2IV[3:0] bits is ignored.

The EITCNT2IV[3:0] bits are not reset by writing 00b to the EIVTC2[1:0] bits.

EITCNT2[3:0] bits (Extended Interrupt Skipping Counter 2)

This counter counts up by 1 every time the count source (overflow/underflow/crest/trough) selected by the EIVTC2[1:0] bits is generated.

Counting is performed periodically within the range between 0 and the EIVTT2[3:0] bits.

The value is not cleared even when the GTCNT counter is stopped, and the value when the GTCNT counter is stopped is retained.

The initial value of the EITCNT2[3:0] bits is only set when the GTEITC register is written by access to the higher-order 16 or 32 bits and the value written to the EIVTC2[1:0] bits is other than 00b while the setting of extended interrupt skipping counter 2 is for no counting (the EIVTC2[1:0] bits are 00b).

When the initial value is written, the value written to the EITCNT2IV[3:0] bits is written to the EITCNT2[3:0] bits as the initial value.

[Clearing conditions]

- 00b is written to the EIVTC2[1:0] bits.

- 0000b is written to the EIVTT2[3:0] bits.
- The value other than 00b is written to the EIVTC2[1:0] bits and 0000b is written to the EITCNT2IV[3:0] bits simultaneously while the setting of the EIVTC2[1:0] bits is 00b.
- The count source (overflow/underflow/crest/trough) selected by the EIVTC2[1:0] bits is generated when the extended interrupt skipping 2 skipping count set by the EIVTT2[3:0] bits matches the value of the EITCNT2[3:0] bits.

5.7.2.2.33 General-Purpose Timer Extended Interrupt Skipping Setting Register 1 (GPTm_n_GTEITLI1)

The GTEITLI1 register sets the extended skipping function for the interrupt by compare match/input capture, overflow, and underflow. When the extended interrupt skipping function is set, a change in the status flag is also skipped.

Only the setting of this register does not lead to skipping. Set the GTEITC register such that the corresponding extended interrupt skipping counter operates counting.

It operates independently of interrupt skipping by the GTITC register. The setting of this register has no effect during event counting.

EITLm[2:0] bits (GTCCRm Register Compare Match/Input Capture Interrupt Extended Skipping Function Select) (m = A, B)

These bits select the extended interrupt skipping function to skip the compare match/input capture interrupt (GTCIm) from the GTCCRm register. For details, see **Table 5.7-9**.

EITLPm bit (GTCCRm Register Compare Match/Input Capture Interrupt Extended Skipping Period Select) (m = A, B)

This bit selects the skipping period when skipping by the GTITC.ITLm bit and skipping by the EITLm[2:0] bits are performed simultaneously in response to the compare match/input capture interrupt (GTCIm) from the GTCCRm register.

EITLx[2:0] bits (GTCCRx Register Compare Match Interrupt Extended Skipping Function Select) (x = C, D, E, F)

These bits select the extended interrupt skipping function to skip compare match interrupts (GTCIx) from the GTCCRx register. For details, see **Table 5.7-9**.

EITLPx bit (GTCCRx Register Compare Match Interrupt Extended Skipping Period Select) (x= C, D, E, F)

This bit selects the skipping period when skipping by the GTITC.ITLx bit and skipping by the EITLx[2:0] bits are performed simultaneously in response to the compare match interrupt (GTCIx) from the GTCCRx register.

EITLV[2:0] bits (Overflow Interrupt Extended Skipping Function Select)

These bits select the extended interrupt skipping function to skip overflow interrupts. For details, see **Table 5.7-9**.

EITLPV bit (Overflow Interrupt Extended Skipping Period Select)

This bit selects the skipping period when overflow interrupt skipping by the GTITC.IVTC[1:0] bits and skipping by the EITLV[2:0] bits are performed simultaneously in response to the overflow interrupt (GTCIV).

EITLU[2:0] bits (Underflow Interrupt Extended Skipping Function Select)

These bits select the extended interrupt skipping function to skip underflow interrupts. For details, see **Table 5.7-9**.

EITLPU bit (Underflow Interrupt Extended Skipping Period Select)

This bit selects the skipping period when underflow interrupt skipping by the GTITC.IVTC[1:0] bits and skipping by the EITLV[2:0] bits are performed simultaneously in response to the underflow interrupt (GTCIU).

Table 5.7-9 Settings of GTEITLI1 Register Function Select Bits

EITLy[2:0]	Function
000b	Extended interrupt skipping is not performed.
001b	Interrupts are skipped for the period in which the value of extended interrupt skipping counter 1 is other than 0 (interrupts are output for the period in which EITCNT1[3:0] bits = 0).
010b	Interrupts are skipped for the period in which the value of extended interrupt skipping counter 2 is other than 0 (interrupts are output for the period in which EITCNT2[3:0] bits = 0).
011b	Interrupts are skipped for the period in which the value of extended interrupt skipping counter 1 or 2 is other than 0 (interrupts are output for the period in which EITCNT1[3:0] bits = EITCNT2[3:0] bits = 0).
100b	Reserved
101b	Interrupts are skipped for the period in which the value of extended interrupt skipping counter 1 is other than the skipping count (interrupts are output for the period in which EITCNT1[3:0] bits = EIVTT1[3:0] bits).
110b	Interrupts are skipped for the period in which the value of extended interrupt skipping counter 2 is other than the skipping count (interrupts are output for the period in which EITCNT2[3:0] bits = EIVTT2[3:0] bits).
111b	Interrupts are skipped for the period in which the value of extended interrupt skipping counter 1 or 2 is other than the skipping count (interrupts are output for the period in which EITCNT1[3:0] bits = EIVTT1[3:0] bits and EITCNT2[3:0] bits = EIVTT2[3:0] bits).

Remarks: y = A, B, C, D, E, F, V, U

Note: Skipping is not performed if the skipping counter to be used is set for no counting (EIVTCk[1:0] bits = 00b or EIVTTk[3:0] bits = 0000b: k = 1, 2).

Note: Skipping is not performed when the EITLy[2:0] bits are set to 011b or 111b, or when either of the skipping counters is set for no counting.

5.7.2.2.34 General-Purpose Timer Extended Interrupt Skipping Setting Register 2 (GPTm_n_GTEITLI2)

The GTEITLI2 register selects the extended skipping function for A/D converter start requests. When the extended interrupt skipping function is set, a change in the status flag is also skipped.

Only the setting of this register does not lead to skipping. Set the GTEITC register such that the corresponding extended interrupt skipping counter operates counting.

It operates independently of interrupt skipping by the GTITC register. The setting of this register has no effect during event counting.

Access Size : 32 bits

EADTmL[2:0] bits (GTADTRm Register A/D Converter Start Request Extended Skipping Function Select) (m = A, B)

These bits select the extended interrupt skipping function to skip A/D converter start requests on compare match with the GTADTRm register. For details, see **Table 5.7-10**.

EADTPmL bit (GTADTRm Register A/D Converter Start Request Extended Skipping Period Select) (m = A, B)

This bit selects the skipping period when skipping by the GTITC.ADTmL bit and skipping by the EADTmL[2:0] bits are performed simultaneously in response to the A/D converter start request on compare match with the GTADTRm register.

Table 5.7-10 Settings of GTEITLI2 Register Function Select Bits

EADTmL[2:0]	Function
000b	Extended interrupt skipping is not performed.
001b	A/D converter start requests are skipped for the period in which the value of extended interrupt skipping counter 1 is other than 0 (A/D converter start requests are output for the period in which EITCNT1[3:0] bits = 0).
010b	A/D converter start requests are skipped for the period in which the value of extended interrupt skipping counter 2 is other than 0 (A/D converter start requests are output for the period in which EITCNT2[3:0] bits = 0).
011b	A/D converter start requests are skipped for the period in which the value of extended interrupt skipping counter 1 or 2 is other than 0 (A/D converter start requests are output for the period in which EITCNT1[3:0] bits = 0 and EITCNT2[3:0] bits = 0).
100b	Reserved
101b	A/D converter start requests are skipped for the period in which the value of extended interrupt skipping counter 1 is other than the skipping count (A/D converter start requests are output for the period in which EITCNT1[3:0] bits = EIVTT1[3:0] bits).
110b	A/D converter start requests are skipped for the period in which the value of extended interrupt skipping counter 2 is other than the skipping count (A/D converter start requests are output for the period in which EITCNT2[3:0] bits = EIVTT2[3:0] bits).
111b	A/D converter start requests are skipped for the period in which the value of extended interrupt skipping counter 1 or 2 is other than the skipping count (A/D converter start requests are output for the period in which EITCNT1[3:0] bits = EIVTT1[3:0] bits and EITCNT2[3:0] bits = EIVTT2[3:0] bits).

Remarks: m = A, B

Note: Skipping is not performed if the skipping counter to be used is set for no counting (EIVTCk[1:0] bits = 00b or EIVTTk[3:0] bits = 0000b: k = 1, 2).

Note: Skipping is not performed when the EADTmL[2:0] bits are set to 011b or 111b, or when either of the skipping counters is set for no counting.

5.7.2.2.35 General-Purpose Timer Extended Buffer Transfer Skipping Setting Register (GPTm_n_GTEITLB)

The GTEITLB register selects the extended skipping function for buffer transfer.

Only the setting of this register does not lead to skipping. Set the GTEITC register such that the corresponding extended interrupt skipping counter operates counting.

It operates independently of interrupt skipping by the GTITC register. The setting of this register has no effect during event counting.

3	-	0h	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
2 to 0	EBTLCA[2:0]	0h	RW	GTCCRA Register Buffer Transfer Extended Skipping Function Select See **Table 5.7-11 Settings of GTEITLB Register Function Select Bits**

EBTLCA[2:0] bits (GTCCRA Register Buffer Transfer Extended Skipping Function Select)

These bits select the extended buffer transfer skipping function to skip buffer transfer from the GTCCRA register (transfer from the GTCCRA, GTCCRC, or GTCCRD register to temporary register A). For details, see **Table 5.7-11**.

Extended skipping of buffer transfer from the GTCCRA register is also valid for forcible buffer transfer by the GTBER.CCRSWT bit while counting is stopped. When forcible buffer transfer from the GTCCRA register is to be performed, buffer transfer should be performed with no extended skipping of buffer transfer.

EBTLCB[2:0] bits (GTCCRB Register Buffer Transfer Extended Skipping Function Select)

These bits select the extended buffer transfer skipping function to skip buffer transfer from the GTCCRB register (transfer from the GTCCRB, GTCCRE, or GTCCRF register to temporary register B). For details, see **Table 5.7-11**.

Extended skipping of buffer transfer from the GTCCRB register is also valid for forcible buffer transfer by the GTBER.CCRSWT bit while counting is stopped. When forcible buffer transfer from the GTCCRB register is to be performed, buffer transfer should be performed with no extended skipping of buffer transfer.

EBTLPR[2:0] bits (GTPR Register Buffer Transfer Extended Skipping Function Select)

These bits select the extended buffer transfer skipping function to skip buffer transfer from the GTPR register (transfer from the GTPR register to the GTPBR or GTPDBR register). For details, see **Table 5.7-11**.

EBTLADm[2:0] bits (GTADTRm Register Buffer Transfer Extended Skipping Function Select) (m = A, B)

These bits select the extended buffer transfer skipping function to skip buffer transfer from the GTADTRm register (transfer from the GTADTRm register to the GTADTBRm or GTADTDBRm register). For details, see **Table 5.7-11**.

EBTLDVm[2:0] bits (GTDVm Register Buffer Transfer Extended Skipping Function Select) (m = U, D)

These bits select the extended buffer transfer skipping function to skip buffer transfer from the GTDVm register (transfer from the GTDVm register to the GTDBm register). For details, see **Table 5.7-11**.

Table 5.7-11 Settings of GTEITLB Register Function Select Bits

EBTLx[2:0]	Function
000b	Extended buffer transfer skipping is not performed.
001b	Buffer transfer is skipped for the period in which the value of extended interrupt skipping counter 1 is other than 0 (buffer transfer is performed for the period in which EITCNT1[3:0] bits = 0).
010b	Buffer transfer is skipped for the period in which the value of extended interrupt skipping counter 2 is other than 0 (buffer transfer is performed for the period in which EITCNT2[3:0] bits = 0).
011b	Buffer transfer is skipped for the period in which the value of extended interrupt skipping counter 1 or 2 is other than 0 (buffer transfer is performed for the period in which EITCNT1[3:0] bits = EITCNT2[3:0] bits = 0).
100b	Reserved
101b	Buffer transfer is skipped for the period in which the value of extended interrupt skipping counter 1 is other than the skipping count (buffer transfer is performed for the period in which EITCNT1[3:0] bits = EIVTT1[3:0] bits).
110b	Buffer transfer is skipped for the period in which the value of extended interrupt skipping counter 2 is other than the skipping count (buffer transfer is performed for the period in which EITCNT2[3:0] bits = EIVTT2[3:0] bits).
111b	Buffer transfer is skipped for the period in which the value of extended interrupt skipping counter 1 or 2 is other than the skipping count (buffer transfer is performed for the period in which EITCNT1[3:0] bits = EIVTT1[3:0] bits and EITCNT2[3:0] bits = EIVTT2[3:0] bits).

Remarks: x = CA, CB, PR, ADA, ADB, DVU, DVD

Note: Skipping is not performed if the skipping counter to be used is set for no counting (EIVTCk[1:0] bits = 00b or EIVTTk[3:0] bits = 0000b: k = 1, 2).

Note: Skipping is not performed when the EBTLx[2:0] bits are set to 011b or 111b, or when either of the skipping counters is set for no counting.

5.7.2.2.36 General-Purpose Timer Inter Channel Logical Operation Function Setting Register (GPTm_n_GTICLF)

The GTICLF register sets the logical operation function between compare match outputs. The logical operation is performed with the signals that the duty cycle 0%/100% control is performed after compare match control. (The output disable control is performed with the signal after logical operation.)

Access in 8-bit units to GTICLF is prohibited.

Access Size : 32 bits

Address : <GPTm_base> + 00B8h + n x 0100h

Initial Value : 0000_0000h

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
25 to 20	ICLFSELD [5:0]	0h	RW	Inter Channel Signal D Select*1,*3 Refer to **Table 5.7-12**.
19	-	0h	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
18 to 16	ICLFB[2:0]	0h	RW	GTIOCnB Output Logical Operation Function Select 000b: B (no delay) 001b: NOT B (no delay) 010b: D (1 PCLKD delay) 011b: NOT D (1 PCLKD delay) 100b: B AND D (1 PCLKD delay)*3 101b: B OR D (1 PCLKD delay)*3 110b: B EXOR D (1 PCLKD delay)*3 111b: B NOR D (1 PCLKD delay)*3
15 to 10	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
9 to 4	ICLFSELC [5:0]	0h	RW	Inter Channel Signal C Select*1,*2 Refer to **Table 5.7-12**.
3	-	0h	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
2 to 0	ICLFA[2:0]	0h	RW	GTIOCnA Output Logical Operation Function Select 000b: A (no delay) 001b: NOT A (no delay) 010b: C (1 PCLKD delay) 011b: NOT C (1 PCLKD delay) 100b: A AND C (1 PCLKD delay)*2 101b: A OR C (1 PCLKD delay)*2 110b: A EXOR C (1 PCLKD delay)*2 111b: A NOR C (1 PCLKD delay)*2

Note 1. The signal before performing output disable control is selected.

Note 2. When channel's own GTIOCnA is selected, C is treated as "1".

Note 3. When channel's own GTIOCnB is selected, D is treated as "1".

ICLFm[2:0] bits (GTIOCnm Output Logical Operation Function Select) (m = A, B)

These bits select the logical operation function between signals before performing output disable control for GTIOCnm. To prevent hazard to the GPT output, the signal after logical operation is latched with PCLKD. After latching, the output disable control is performed. When the logical operation function which causes the delay of 1 PCLKD is selected, the output enable signal is also delayed with 1 PCLKD and input to the output disable control.

When the same signal to operate logical function AND, OR, EXOR and NOR is selected, one signal is treated as “1”.

ICLFSELk[5:0] bits (Inter Channel Signal k Select) (k = C, D)

These bits select the signal k to which the logical operation is performed with the signal before performing output disable control for GTIOCnm.

The pins to be selected differ between GPT0n and GPT1n. For details, see the table below.

5.7.2.2.37 General-Purpose Timer Operation Enable Bit Simultaneous Control Channel Select Register (GPTm_n_GTSECSR)

The GTSECSR register selects desired channel n (n = 0 to 15) for updating an operation enable bit by the GTSECR register. A bit position for the GTSECSR register indicates a channel number. The GTSECSR register of each channel is a common register, and writing 1b to a bit in the GTSECSR register in any channel and updating it changes a channel, related to the position of the bit written with 1 by the GTSECSR register, to be simultaneously controlled of the operation enable bit by the GTSECR register.

SECSELn bit (Operation Enable Bit Simultaneous Control Channel Select) (n = 0 to 15)

This bit enables or disables simultaneous control of operation enable in channel n.

Simultaneous control is enabled when the bit is set to 1b and disabled when the bit is 0b.

Note that the definitions of the bits differ between GPT0n and GPT1n. For details, see the table below.

Table 5.7-13 Definitions of Timer Operation Enable Bit Simultaneous Control Channel Select Bits

	GPT0		GPT1	
Bit	Bit Description	Bit Attribute	Bit Description	Bit Attribute

5.7.2.2.38 General-Purpose Timer Operation Enable Bit Simultaneous Control Register (GPTm_n_GTSECR)

The GTSECR register simultaneously updates the value for operation enable bits of a channel set by the GTSECSR register.

Writing 1b to a bit in the GTSECR register in any channel and updating it updates an operation enable bit for all channels, related to the position of the bit written with 1b by the all GTSECSR registers.

Setting enable and disable bits for the same operation enable bit to 1b in the GTSECR is prohibited.

A bit to which 1b has been written is automatically cleared. When the GTSECR is read, 0b is read.

Access Size : 32 bits

Address : <GPTm_base> + 00D4h + n x 0100h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	SBDPD	SBDCD	-	-	-	-	-	-	SBDPE	SBDCE

R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
9	SBDPD	0h	RW	GTPR Register Buffer Operation Simultaneous Disable 0b: Disable simultaneous disabling of GTPR buffer operations 1b: Disable GTPR register buffer operations simultaneously
8	SBDCD	0h	RW	GTCCR Register Buffer Operation Simultaneous Disable 0b: Disable simultaneous disabling of GTCCR buffer operations 1b: Disable GTCCR register buffer operations simultaneously
7 to 2	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
1	SBDPE	0h	RW	GTPR Register Buffer Operation Simultaneous Enable 0b: Disable simultaneous enabling of GTPR buffer operations 1b: Enable GTPR register buffer operations simultaneously
0	SBDCE	0h	RW	GTCCR Register Buffer Operation Simultaneous Enable 0b: Disable simultaneous enabling of GTCCR buffer operations 1b: Enable GTCCR register buffer operations simultaneously

SBDCE bit (GTCCR Register Buffer Operation Simultaneous Enable)

When 1b is written to this bit, 0b is simultaneously set to a GTBER.BD[0] bit in the channels, which has been set to 1b by the GTSECSR register, and buffer operations using the GTCCRA, GTCCRC, and GTCCRD registers and using the GTCCRB, GTCCRE, and GTCCRF registers are enabled.

Simultaneous setting of the SBDCE and SBDCD bits to 1b is prohibited.

SBDPE bit (GTPR Register Buffer Operation Simultaneous Enable)

When 1b is written to this bit, 0b is simultaneously set to a GTBER.BD[1] bit in the channels, which has been set to 1b by the GTSECSR register, and buffer operations using the GTPR and GTPBR registers are enabled.

Simultaneous setting of the SBDPE and SBDPD bits to 1b is prohibited.

SBDCD bit (GTCCR Register Buffer Operation Simultaneous Disable)

When 1b is written to this bit, 1b is simultaneously set to a GTBER.BD[0] bit in the channels, which has been set to 1b by the GTSECSR register, and buffer operations using the GTCCRA, GTCCRC, and GTCCRD registers and using the GTCCRB, GTCCRE, and GTCCRF registers are disabled.

Simultaneous setting of the SBDCE and SBDCD bits to 1b is prohibited.

SBDPD bit (GTPR Register Buffer Operation Simultaneous Disable)

When 1b is written to this bit, 1b is simultaneously set to a GTBER.BD[1] bit in the channels, which has been set to 1b by the GTSECSR register, and buffer operations using the GTPR and GTPBR registers are disabled.

Simultaneous setting of the SBDPE and SBDPD bits to 1b is prohibited.

5.7.3 Operation

5.7.3.1 Basic Operation

A timer in each channel performs periodic count operation using the count clock and hardware sources. The counting function provides both up-counting and down-counting. The GTPR controls the counting cycle.

When the GTCNT counter value matches the value in GTCCRA or GTCCRB, the output from the corresponding GTIOCnA or GTIOCnB can be changed (n = 0 to 15). GTCCRA or GTCCRB can be used as an input capture register with hardware sources.

GTCCRC and GTCCRD can function as buffer registers for GTCCRA. GTCCRE and GTCCRF can function as buffer registers for GTCCRB.

5.7.3.1.1 Counter Operation

(1) Counter Starting and Stopping

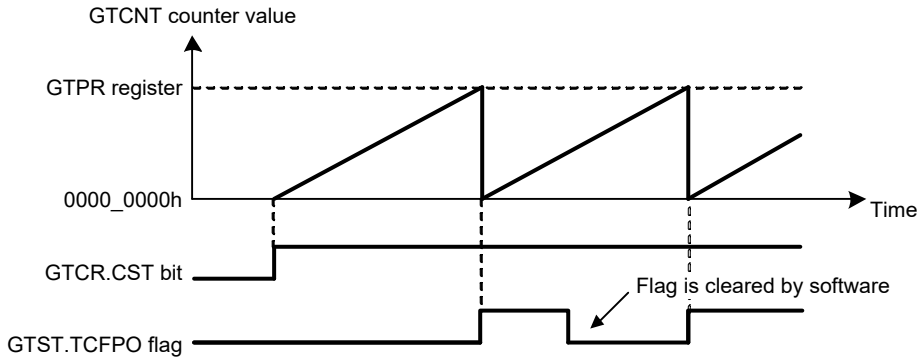
The counter of each channel starts counting when the GTCR.CST bit is set to 1b, and stops counting when the bit is set to 0b. The GTCR.CST bit value is changed by any of the following sources:

- Writing to the GTCR register
- Writing 1b to the bit in GTSTR corresponding to the GPT channel number when the GTSSR.CSTRT bit is 1b
- Writing 1b to the bit in GTSTP corresponding to the GPT channel number when the GTPSR.CSTOP bit is 1b
- The hardware source selected in the GTSSR register
- The hardware source selected in the GTPSR register.

(2) Periodic Count Operation in Up-counting by Count Clock

The GTCNT counter of each channel starts up-counting when the corresponding GTCR.CST bit is set to 1b with GTUPSR and GTDNSR registers set to 0000_0000h. When the GTCNT value changes from the GTPR value to 0 (overflow), the GTST.TCFPO flag is set to 1b, and the overflow interrupt (GPT_Ux_gpt_gtciv_n_m) is also generated. After GTCNT overflows, up-counting resumes from 0000_0000h.

Figure 5.7-3 shows an example of periodic count operation in up-counting by the count clock.



Note: The base addresses of the registers are the same.

Figure 5.7-3 Example of Periodic Count Operation in Up-Counting by the Count Clock

Table 5.7-14 shows an example for setting periodic count operation in up-counting by the count clock.

Table 5.7-14 Example for Setting Periodic Count Operation in Up-Counting by the Count Clock

No.	Step Name	Description
1	Set operating mode	Set the operating mode with the GTCR.MD[2:0] bits. In **Figure 5.7-3**, 000b (saw-wave PWM mode) is set.
2	Set count direction	Select the count direction (up or down) with the GTUDDTYC register. In **Figure 5.7-3**, after 11b is set in the GTUDDTYC[1:0] bits, 01b is set in the GTUDDTYC[1:0] bits (up-counting).
3	Select count clock	Select the count clock with the GTCR.TPCS[3:0] bits.
4	Set cycle	Set the cycle in the GTPR register.
5	Set initial value for counter	Set the initial value in the GTCNT counter. In **Figure 5.7-3**, 0000_0000h is set.
6	Start count operation	Set the GTCR.CST bit to 1b to start count operation.

(3) Periodic Count Operation in Down-counting by Count Clock

The GTCNT counter of each channel can perform down-counting by setting GTUDDTYC.UD with GTUPSR and GTDNSR registers set to 0000_0000h. When GTCNT changes from 0 to the GTPR value (underflow), GTST.TCFPU is set to 1b, and the underflow interrupt (GPT_Ux_gpt_gtciu_n_m) is also generated. After the GTCNT counter underflows, down-counting resumes from the GTPR value.

Figure 5.7-4 shows an example of periodic count operation in down-counting by the count clock.

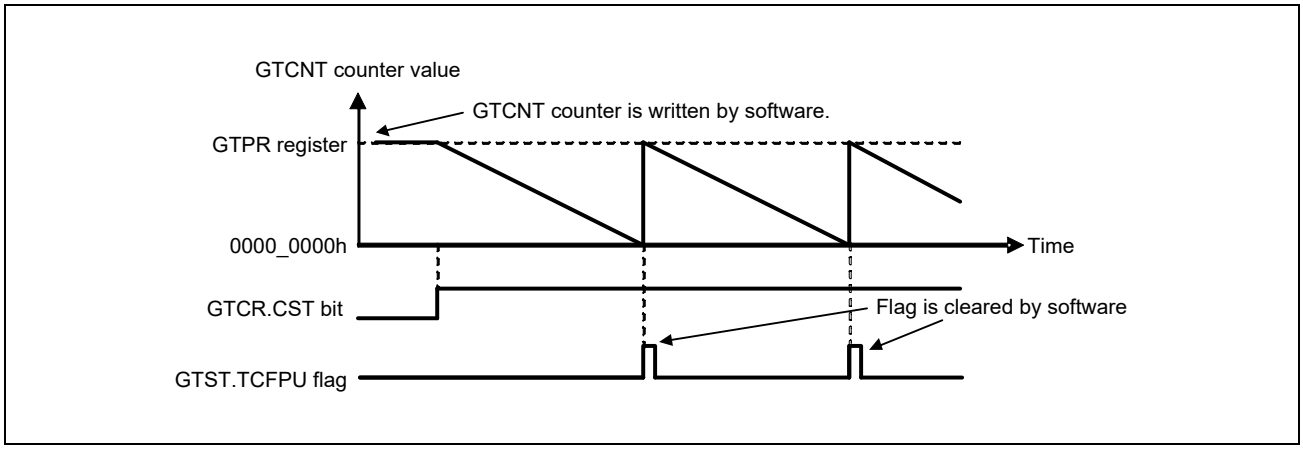


Figure 5.7-4 Example of Periodic Count Operation in Down-Counting by the Count Clock

Table 5.7-15 shows an example for setting periodic count operation in down-counting by the count clock.

Table 5.7-15 Example for Setting Periodic Count Operation in Down-Counting by Count Clock

No.	Step Name	Description
1	Set operating mode	Set the operating mode with the GTCR.MD[2:0] bits. In **Figure 5.7-4**, 000b (saw-wave PWM mode) is set.
2	Set count direction	Select the count direction with the GTUDDTYC register. In **Figure 5.7-4**, after 10b is set in the GTUDDTYC[1:0] bits, 00b is set in the GTUDDTYC[1:0] bits (down-counting).
3	Select count clock	Select the count clock with the GTCR.TPCS[3:0] bits.
4	Set cycle	Set the cycle in the GTPR register.
5	Set initial value for counter	Set the initial value in the GTCNT counter. In **Figure 5.7-4**, the GTPR register value is set.
6	Start count operation	Set the GTCR.CST bit to 1 to start count operation. In **Figure 5.7-4**, 1 is set in the CST bit.

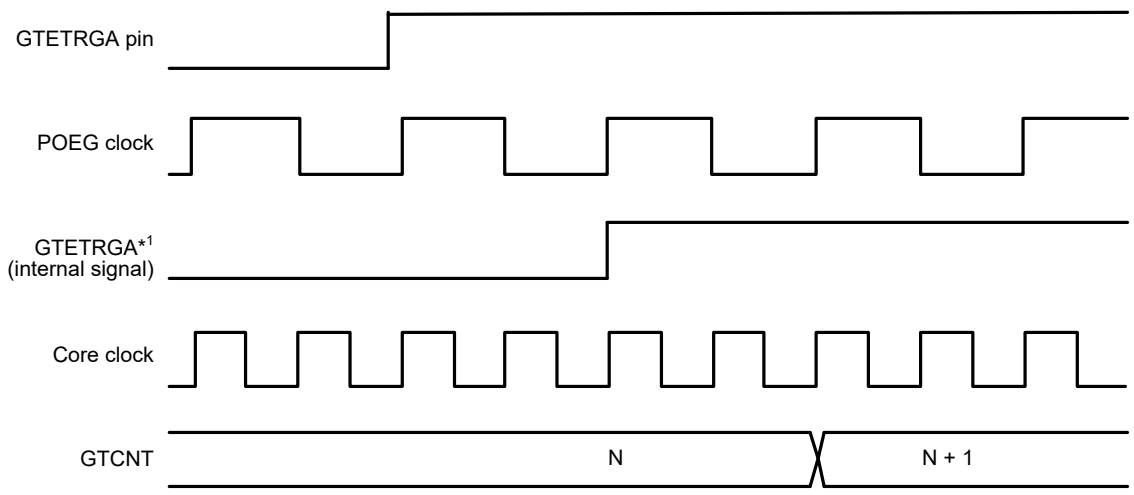
(4) Event Count Operation in Up-counting Using Hardware Sources

The GTCNT counter of each channel can perform up-counting using hardware sources set in GTUPSR.

When GTUPSR is set to enable, the count clock selected in GTCR.TPCS[3:0] and the count direction selected in GTUDDTYC.UD are ignored. If up-counting and down-counting using hardware sources occur at the same time, the GTCNT counter value does not change. The overflow behavior when up-counting using hardware sources is the same as when up-counting by the count clock.

When GTCR.CST bit is set to 1b to count up using hardware sources, counting operation is enabled. After GTCR.CST is set to 1b, the counter cannot count up for 1 clock cycle as specified in GTCR.TPCS[3:0] because counting operation is synchronized by the count clock selected in GTCR.TPCS[3:0]. Set GTCR.TPCS[3:0] to 000b to count up with a 1 PCLKD delay after GTCR.CST is set to 1b.

Figure 5.7-5 shows an example of event count operation in up-counting by a hardware source (the rising edge of the GTETRGA pin input).



Note: POEG clock: GPT_0_pclk_sfr, GPT_1_pclk_sfr
Core clock: GPT_0_clks_gpt, GPT_1_clks_gpt

Note 1. The GTETRGA internal signal reflects the signal being input to the GPT when the digital noise filter for the GTETRGA pin in the POEG is not in use.

Figure 5.7-5 Example of Event Count Operation in Up-Counting Using Hardware Sources

Table 5.7-16 shows an example for setting event count operation in up-counting by a hardware source.

Table 5.7-16 Example for Setting Event Count Operation in Up-Counting Using Hardware Sources

No.	Step Name	Description
1	Set count source	Select the counting-up source with the GTUPSR register.
2	Set cycle	Set the cycle in the GTPR register.
3	Set initial value for counter	Set the initial value in the GTCNT counter.
4	Start count operation	Set the GTCR.CST bit to 1b to start count operation.

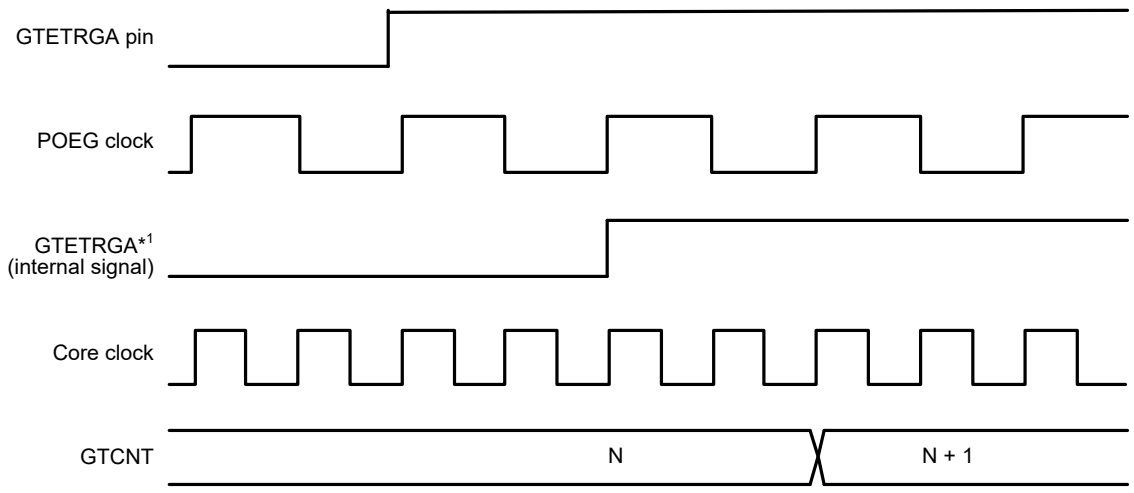
(5) Event Count Operation in Down-counting Using Hardware Sources

The GTCNT counter of each channel can perform down-counting using hardware sources set in GTDNSR.

When GTDNSR is set to enable, the count clock selected in GTCR.TPCS[3:0] and the count direction selected in GTUDDTYC.UD are ignored. If up-counting and down-counting using hardware sources occur at the same time, the GTCNT counter value does not change. The underflow behavior when down-counting using hardware sources is the same as when down-counting by the count clock.

When GTCR.CST bit is set to 1b to count down using hardware sources, counting operation is enabled. After GTCR.CST is set to 1b, the counter cannot count down for 1 clock cycle as specified in GTCR.TPCS[3:0] because counting operation is synchronized with the count clock selected in GTCR.TPCS[3:0]. Set GTCR.TPCS[3:0] to 000b to count down with a 1 PCLKD delay after GTCR.CST is set to 1b.

Figure 5.7-6 shows an example of event count operation in down-counting by a hardware source (the rising edge of the GTETRGA pin input).



Note: POEG clock: GPT_0_pclk_sfr, GPT_1_pclk_sfr
Core clock: GPT_0_clks_gpt, GPT_1_clks_gpt

Note 1. The GTETRGA internal signal reflects the signal being input to the GPT when the digital noise filter for the GTETRGA pin in the POEG is not in use.

Figure 5.7-6 Example of Event Count Operation in Down-Counting Using Hardware Sources

Table 5.7-17 shows an example for setting event count operation in down-counting by a hardware source.

Table 5.7-17 Example for Setting an Event Count Operation in Down-Counting Using Hardware Sources

No.	Step Name	Description
1	Set count source	Select the counting-down source with the GTDNSR register.
2	Set cycle	Set the cycle in the GTPR register.
3	Set initial value for counter	Set the initial value in the GTCNT counter.
4	Start count operation	Set the GTCR.CST bit to 1b to start count operation.

(6) Counter Clearing Operation

The counter of each channel is cleared by any of the following sources:

- Writing 0b to GTCNT register
- Writing 1b to the bit in GTCLR corresponding to the GPT channel number when the GTCSR.CCLR bit is 1b
- The hardware source selected in GTCSR register.

Writing to the GTCNT register is prohibited during counting. The GTCNT counter can be cleared by both writing 1b to the GTCLR and requesting clearing by hardware sources, even when GTCNT is counting (GTCR.CST is 1b) or not counting (GTCR.CST is 0).

When the count direction flag is set as decrement (GTST.TCUF flag = 0b) in saw-wave mode selected with GTCR.MD[2:0] bits, the GTCNT register is set to the value of the GTPR register when writing 1b to the GTCLR register or clearing by hardware sources.

When operation is neither in saw-waves mode nor down-counting, the GTCNT register is set to 0b when writing 1b to the GTCLR register or clearing by hardware sources.

In event count operation when at least 1 bit in the GTUPSR or GTDNSR register is set to 1b, after the generation of clear sources, both writing to GTCLR register and clearing by hardware sources are performed immediately for synchronization with PCLKD. If other settings are used, clearing is synchronized with the counter clock selected in GTCR.TPCS[3:0].

5.7.3.1.2 Waveform Output by Compare Match

Compare match means that the GTCNT counter value matches the value of GTCCRA or GTCCRB. When a compare match occurs, the compare match flag is generated synchronously with the count clock, including the event count. At the same time, the GPT can perform low-level, high-level, or toggled output from the corresponding GTIOCnA or GTIOCnB output pin (n = 0 to 15). In addition, the GTIOCnA or GTIOCnB pin output can be low-level, high-level, or toggled output at the cycle end which is determined by GTPR.

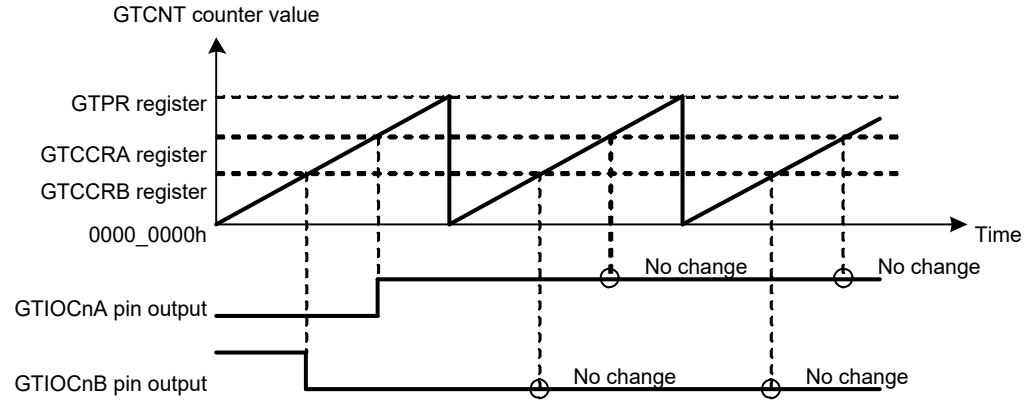
The cycle end is:

- For saw waves in up-counting: When GTCNT changes from the GTPR value to 0b (overflow)
- For saw waves in down-counting: When GTCNT changes from 0b to GTPR value (underflow)
- For saw waves: When the GTCNT counter is cleared
- For triangle waves: When the GTCNT counter changes from 0b to 1b (trough).

(1) Low-level/High-level Output

Figure 5.7-7 shows an example of low-level and high-level output operation by a compare match with GTCCRA and GTCCRB.

In this example, the GTCNT counter performs up-counting, and settings are made so that the high level is output from the GTIOCnA pin by a compare match with GTCCRA, and the low level is output from the GTIOCnB pin by a compare match with GTCCRB. The pin level does not change when the specified level and pin level match.



[Setting examples]
GTIOR.GTIOA[4:0] bits: Initial output is low, high output at compare match, output retained at cycle end
GTIOR.GTIOB[4:0] bits: Initial output is high, low output at compare match, output retained at cycle end

Note: The base addresses of the registers are the same.

Figure 5.7-7 Example of Low-level and High-level Output Operation

Table 5.7-18 shows an example for setting low-level and high-level output operation.

Table 5.7-18 Example for Setting Low-level and High-level Output Operation

No.	Step Name	Description
1	Set operating mode	Set the operating mode with the GTCR.MD[2:0] bits. In **Figure 5.7-7**, 000b (saw-wave PWM mode) is set.
2	Set count direction	Select the count direction (up or down) with the GTUDDTYC register. In **Figure 5.7-7**, after 11b is set in the GTUDDTYC[1:0] bits, 01b is set in the GTUDDTYC[1:0] bits (up-counting).
3	Select count clock	Select the count clock with the GTCR.TPCS[3:0] bits.
4	Set cycle	Set the cycle in the GTPR register.
5	Set initial value for counter	Set the initial value in the GTCNT counter.
6	Set GTIOCnm pin function	Set the GTIOCnm pin function with the GTIOA[4:0] and GTIOB[4:0] bits in the GTIOR register. In **Figure 5.7-7**, GTIOA[4:0] = 0_0010b, GTIOB[4:0] = 1_0001b.
7	Enable GTIOCnm pin output	Set to enable the GTIOCnm pin output with the OAE and OBE bits in the GTIOR register.
8	Set compare match value	Set compare match values in the GTCCRA and GTCCRB registers.
9	Start count operation	Set the GTCR.CST bit to 1b to start count operation.

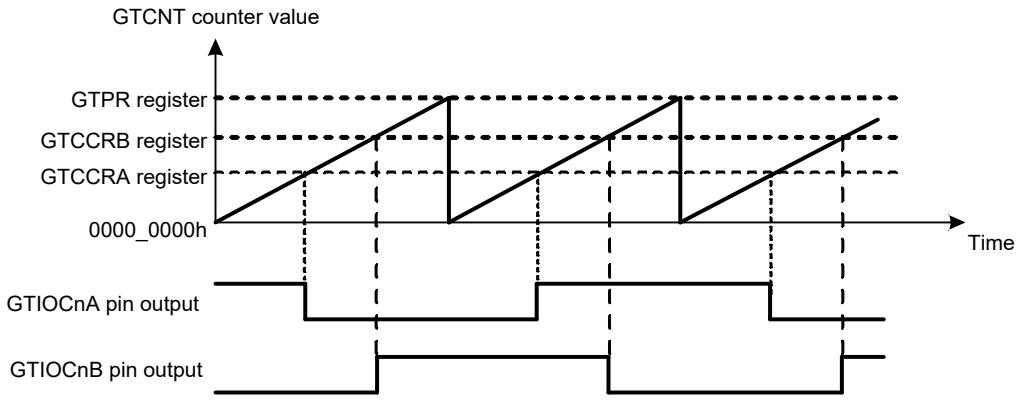
Note: n: 0 to 15
m: A, B

(2) Toggled Output

Figure 5.7-8 and **Figure 5.7-9** show examples of toggled output operation by compare matches with GTCCRA and GTCCRB.

In **Figure 5.7-8**, the GTCNT counter performs up-counting, and settings are made so that the GTIOCnA pin output by a compare match with GTCCRA and GTIOCnB pin output by a compare match with GTCCRB are toggled.

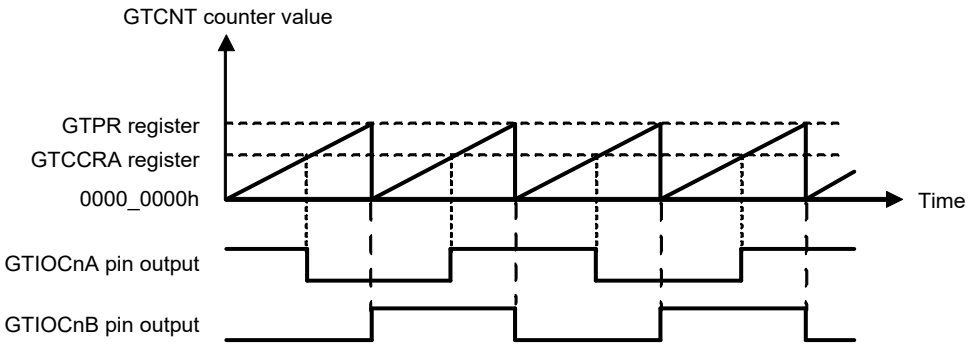
In **Figure 5.7-9**, the GTCNT counter performs up-counting, and settings are made so that a compare match with GTCCRA toggles the GTIOCnA pin output and toggles the GTIOCnB pin output at the cycle end.



[Setting examples]
GTIOR.GTIOA[4:0] bits: Initial output is high, output toggled at compare match, output retained at cycle end
GTIOR.GTIOB[4:0] bits: Initial output is low, output toggled at compare match, output retained at cycle end

Note: The base addresses of the registers are the same.

Figure 5.7-8 Example of Toggled Output Operation (1)



[Setting examples]
GTIOR.GTIOA[4:0] bits: Initial output is high, output toggled at compare match, output retained at cycle end
GTIOR.GTIOB[4:0] bits: Initial output is low, output retained at compare match, output toggled at cycle end

Note: The base addresses of the registers are the same.

Figure 5.7-9 Example of Toggled Output Operation (2)

Table 5.7-19 shows an example for setting toggled output operation.

Table 5.7-19 Example for Setting Toggled Output Operation

No.	Step Name	Description
1	Set operating mode	Set the operating mode with the GTCR.MD[2:0] bits. In **Figure 5.7-8** and **Figure 5.7-9**, 000b (saw-wave PWM mode) is set.
2	Set count direction	Select the count direction (up or down) with the GTUDDTYC register. In **Figure 5.7-8** and **Figure 5.7-9**, after 11b is set in the GTUDDTYC[1:0] bits, 01b is set in the GTUDDTYC[1:0] bits (up-counting).
3	Select count clock	Select the count clock with the GTCR.TPCS[3:0] bits.
4	Set cycle	Set the cycle in the GTPR register.
5	Set initial value for counter	Set the initial value in the GTCNT counter.
6	Set GTIOCnm pin function	Set the GTIOCnm pin function with the GTIOA[4:0] and GTIOB[4:0] bits in the GTIOR register. In **Figure 5.7-8**, GTIOA[4:0] = 1_0011b, GTIOB[4:0] = 0_0011b, and in **Figure 5.7-9**, GTIOA[4:0] = 1_0011b, GTIOB[4:0] = 0_1100b.
7	Enable GTIOCnm pin output	Set to enable the GTIOCnm pin output with the OAE and OBE bits in the GTIOR register.
8	Set compare match value	Set compare match values in the GTCCRA and GTCCRB registers.
9	Start count operation	Set the GTCR.CST bit to 1b to start count operation.

Note: n: 0 to 15
m: A, B

5.7.3.1.3 Input Capture Function
