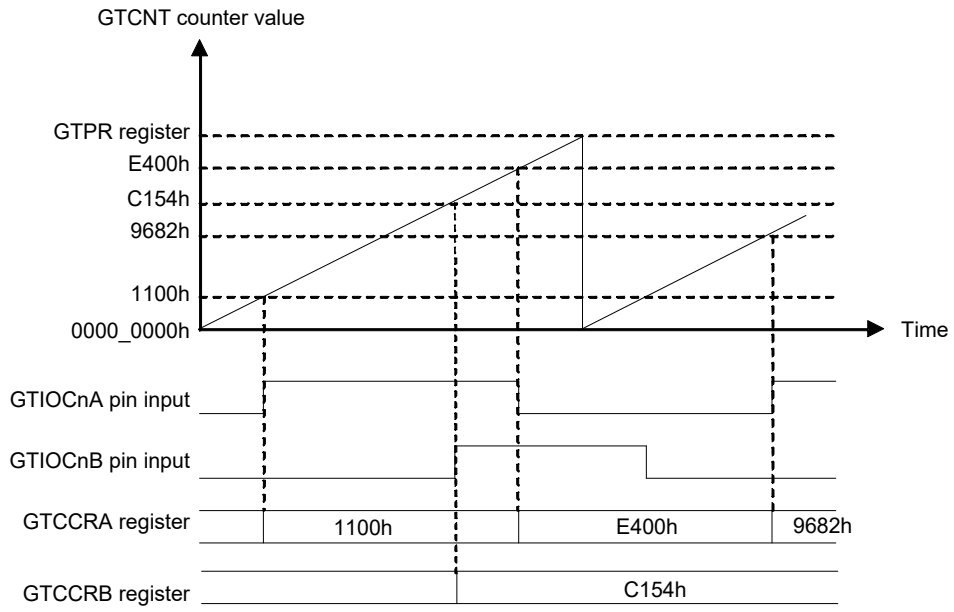
The GTCNT counter value can be transferred to either GTCCRA or GTCCRB on detection of the hardware source that is set in GTICASR and GTICBSR.

Figure 5.7-10 shows an example of the input capture function.

In this example, the GTCNT counter performs up-counting by the count clock, and settings are made so that input capture is performed to GTCCRA at both edges of the GTIOCnA input pin and to GTCCRB on the rising edge of the GTIOCnB input pin.



[Setting examples]
GTICASR setting: Input capture at both edges
GTICBSR setting: Input capture at the rising edge

Note: The base addresses of the registers are the same.

Figure 5.7-10 Example of Input Capture Operation

Table 5.7-20 and **Table 5.7-23** show the example for setting input capture operation with count operation by the count clock.

Table 5.7-20 Example for Setting Input Capture Operation

No.	Step Name	Description
1	Set operating mode	Set the operating mode with the GTCR.MD[2:0] bits. In **Figure 5.7-10**, 000b (saw-wave PWM mode) is set.
2	Set count direction	Select the count direction (up or down) with the GTUDDTYC register. In **Figure 5.7-10**, after 11b is set in the GTUDDTYC[1:0] bits, 01b is set in the GTUDDTYC[1:0] bits (up-counting).
3	Select count clock	Select the count clock with the GTCR.TPCS[3:0] bits.
4	Set cycle	Set the cycle in the GTPR register.
5	Set initial value for counter	Set the initial value in the GTCNT counter.
6	Select input capture source	Select the input capture source in the GTICASR and GTICBSR registers. In **Figure 5.7-10**, GTICASR = 0000_0F00h, GTICBSR = 0000_3000h.
7	Start count operation	Set the GTCR.CST bit to 1b to start count operation.

5.7.3.2 Buffer Operation

The following buffer operations can be set with GTBER:

- GTPR, GTPBR, and GTPDBR
- GTCCRA, GTCCRC, and GTCCRD
- GTCCRB, GTCCRE, and GTCCRF
- GTADTRA, GTADTBRA, and GTADTDBRA
- GTADTRB, GTADTBRB, and GTADTDBRB
- GTDVU and GTDBU
- GTDVD and GTDBD

5.7.3.2.1 GTPR Register Buffer Operation

GTPBR can function as a buffer register for GTPR, and GTPDBR can function as a buffer register for GTPBR (double buffer register for GTPR). Buffer transfer is performed on overflow (during up-counting) or underflow (during down-counting) in saw-wave mode or in event counting, and at troughs in triangle-wave mode.

In saw-wave mode or in event counting, buffer transfer is performed when any of the following counter clearing operations occurs during counting:

- Clearing by hardware sources (the clear source is selected in GTCSR register)
- Clearing by software (when GTCSR.CCLR bit is 1b and GTCLR.CCLRn bit is set to 1, n = 0 to 15).

To set GTPR to function as a buffer, set the GTBER.PR bit to 1b. To set GTPR not to function as a buffer, set the GTBER.PR bit to 0b.

Figure 5.7-11 to **Figure 5.7-13** show examples of GTPR buffer operation and **Table 5.7-21** shows an example for setting GTPR buffer operation.

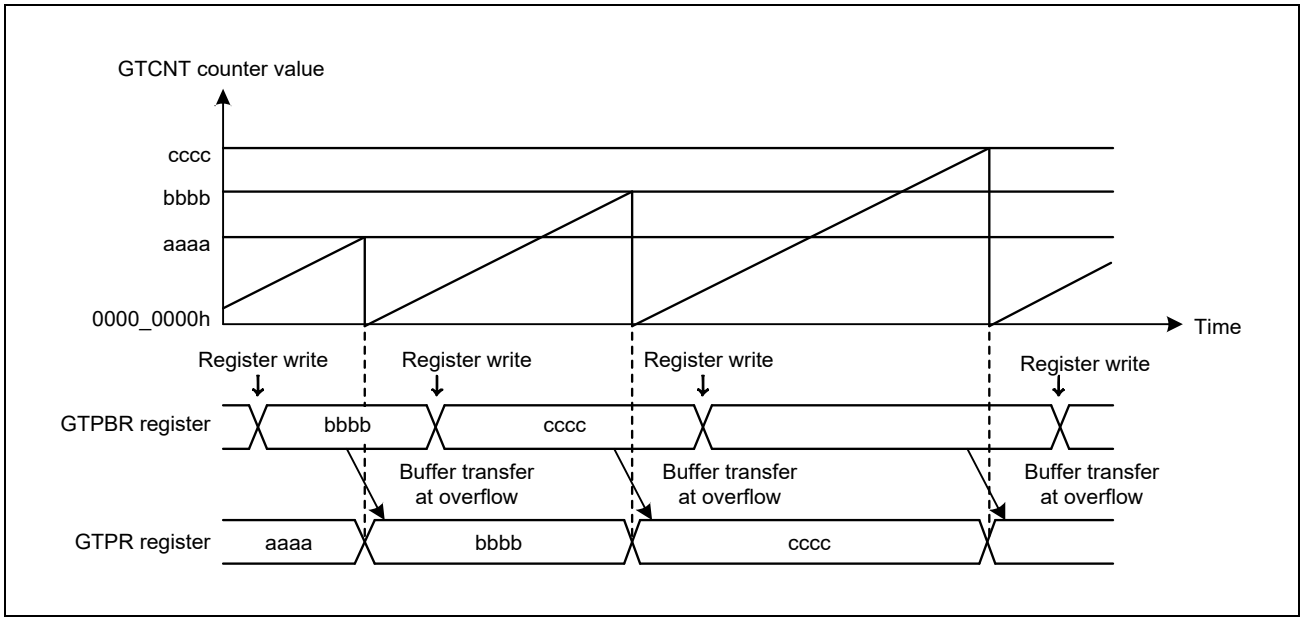


Figure 5.7-11 Example of GTPR Buffer Operation with Saw Waves in Up-Counting

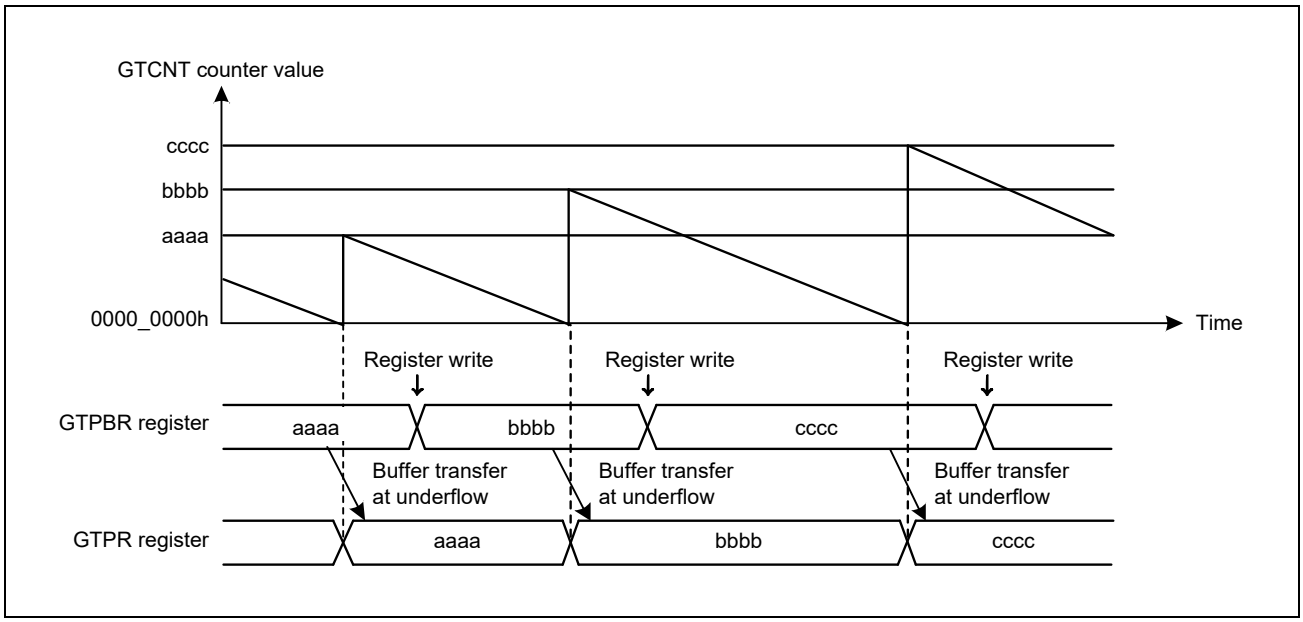

Figure 5.7-12 Example of GTPR Buffer Operation with Saw Waves in Down-Counting

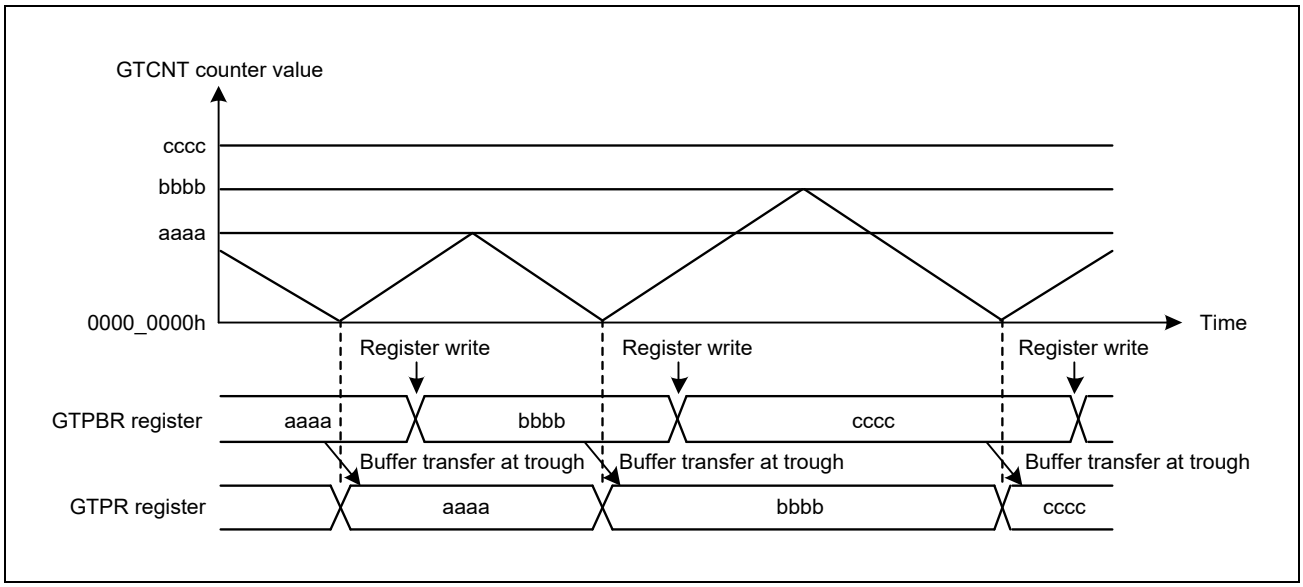

Figure 5.7-13 Example of GTPR Buffer Operation with Triangle Waves

Table 5.7-21 Example for Setting GTPR Register Buffer Operation

No.	Step Name	Description
1	Set operating mode	Set the operating mode with the GTCR.MD[2:0] bits. In **Figure 5.7-11** and **Figure 5.7-12**, 000b (saw-wave PWM mode) is set, and in **Figure 5.7-13**, 100b (triangle-wave PWM mode 1) is set.
2	Set count direction	Select the count direction (up or down) with the GTUDDTYC register. In **Figure 5.7-11**, after 11b is set in the GTUDDTYC[1:0] bits, 01b is set in the GTUDDTYC[1:0] bits (up-counting). In **Figure 5.7-12**, after 10b is set in the GTUDDTYC[1:0] bits, 00b is set in the GTUDDTYC[1:0] bits (down-counting).
3	Select count clock	Select the count clock with the GTCR.TPCS[3:0] bits.
4	Set cycle	Set the cycle in the GTPR register.
5	Set initial value for counter	Set the initial value in the GTCNT counter.
6	Set buffer operation	Set buffer operation with the GTBER.PR[1:0] bits. In **Figure 5.7-11**, **Figure 5.7-12**, and **Figure 5.7-13**, PR[1:0] = 01b.
7	Set buffer value	For buffer operation, set a value of one cycle after the current cycle in GTPBR. For double buffer operation, also set a value in two cycles after the current cycle in GTPDBR.
8	Start count operation	Set the GTCR.CST bit to 1b to start count operation.
9	Set buffer value for each cycle	For buffer operation, set a value of one cycle after the current cycle in GTPBR. For double buffer operation, also set a value in two cycles after the current cycle in GTPDBR.

5.7.3.2.2 Buffer Operation for GTCCRA and GTCCRB Registers

GTCCRC can function as a buffer register for GTCCRA and GTCCRD can function as a buffer register for GTCCRC (double-buffer register for GTCCRA). Similarly, GTCCRE can function as a buffer register for GTCCRB and GTCCRF can function as a buffer register for GTCCRE (double-buffer register for GTCCRB).

To set GTCCRA or GTCCRB to function as a double buffer, set GTBER.CCRA[1:0] or GTBER.CCRB[1:0] to 10b or 11b. For single buffer operation, set 01b. To set GTCCRA or GTCCRB to not function as a buffer, set 00b.

(1) When GTCCRA or GTCCRB Functions as Output Compare Register

Buffer transfer occurs in the following situations:

- Buffer transfer by overflow or underflow

  Buffer transfer is performed on overflow (during up-counting) or underflow (during down-counting) in saw-wave mode or in event count operation. In triangle-wave mode, buffer transfer is performed at troughs (triangle-wave PWM mode 1) or at crests and troughs (triangle-wave PWM mode 2).

- Buffer transfer by counter clearing

  In saw-wave mode or in event count operation, during counting, buffer transfer (which is the same as an overflow during up-counting or an underflow during down-counting) is performed by the counter clear sources similar to the case shown in **5.7.3.2.1 GTPR Register Buffer Operation**.

  In triangle-wave mode, buffer transfer is not performed by counter clearing.

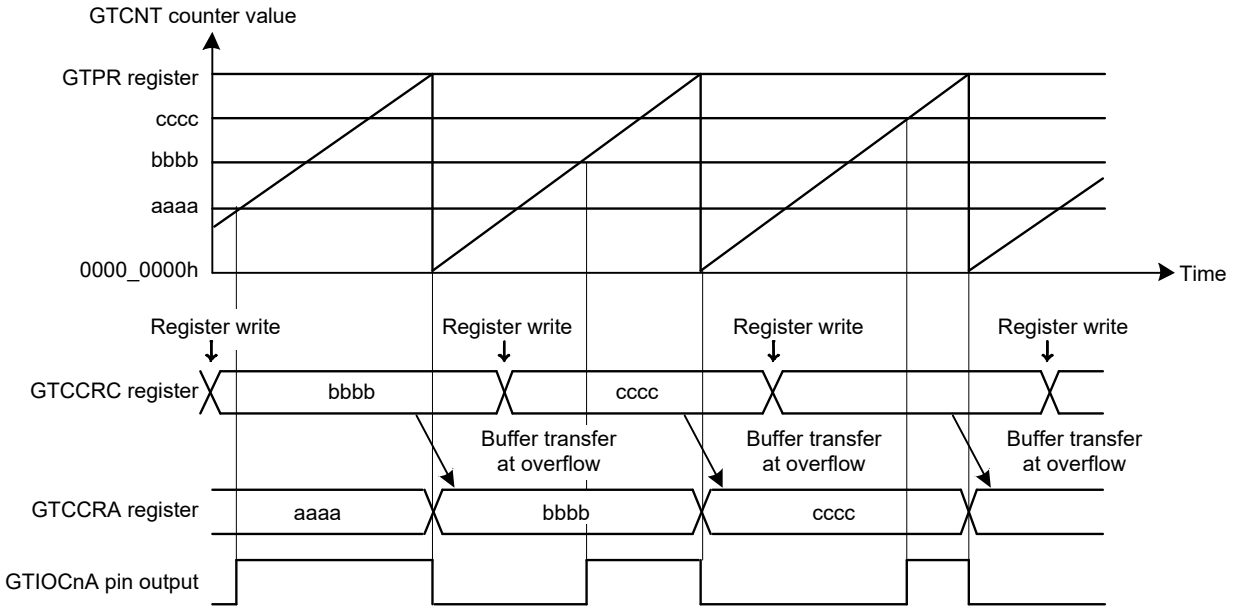
- Forcible buffer transfer

  When GTBER.CCRSWT bit is set to 1 while counting is stopped, buffer transfer of the GTCCRA and GTCCRB registers is performed forcibly in saw-wave mode, in event count operation and in triangle-wave mode.

  Additionally buffer transfer from the GTCCRD register to temporary register A and from the GTCCRF register to temporary register B is performed in saw-wave one-shot pulse mode or in triangle-wave PWM mode 3.

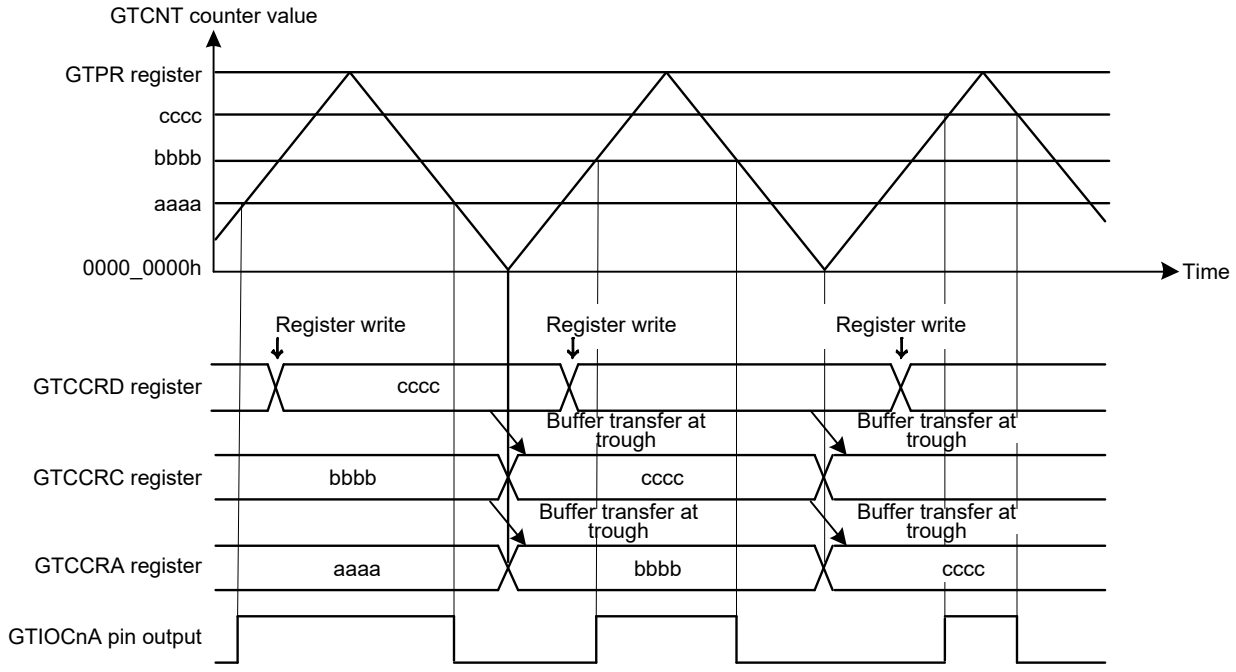
If a double buffer is used in saw-wave one-shot pulse mode, triangle-wave PWM mode 3, or triangle-wave PWM mode 2 by setting the GTBER.DBRTECm (m = A, B) bit to 1, even while buffer transfer is inhibited by the setting of the GTBER.BD[0] bit or buffer transfer extended skipping function, transfer from the intermediate buffer to the GTCCRm (m = A, B) register is repeated on a cyclic basis (the function for repeated double-buffered operation when buffer transfer is inhibited). For details, see **5.7.8.2.2 Repeated Double-Buffered Operation when GTCCR Buffer Transfer is Inhibited**.

Figure 5.7-14 to **Figure 5.7-16** show examples of GTCCRA and GTCCRB buffer operation and **Table 5.7-22** shows an example for setting GTCCRA and GTCCRB buffer operation.



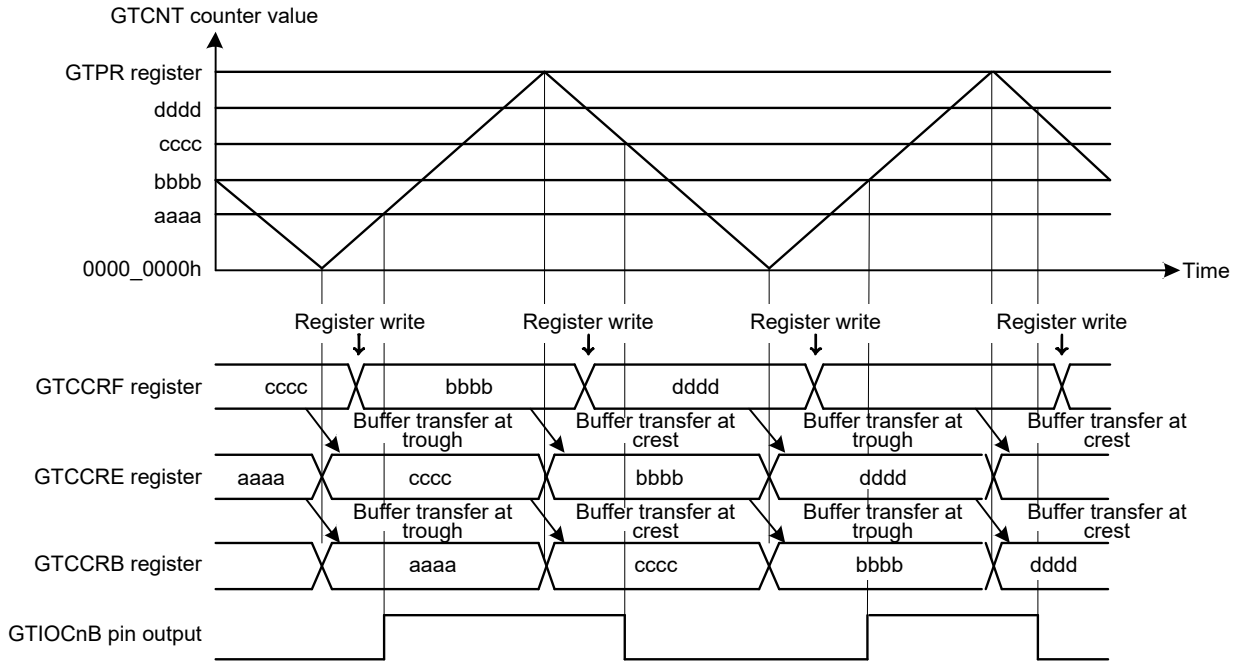
Note: The base addresses of the registers are the same.

Figure 5.7-14 Example of GTCCRA and GTCCRB Buffer Operation with Output Compare, Saw Waves in Up-Counting, High-level Output at GTCCRA Compare Match, and Low-level Output at Cycle End



Note: The base addresses of the registers are the same.

Figure 5.7-15 Example of GTCCRA and GTCCRB Double Buffer Operation with Output Compare, Triangle Waves, Buffer Operation at Trough, Output Toggled at GTCCRA Compare Match, and Output Retained at Cycle End



Note: The base addresses of the registers are the same.

Figure 5.7-16 Example of GTCCRA and GTCCRB Double Buffer Operation with Output Compare, Triangle Waves, Buffer Operation at Both Troughs and Crests, Output Toggled at GTCCRB Compare Match, and Output Retained at Cycle End

Table 5.7-22 Example for Setting GTCCRA and GTCCRB Buffer Operation for Output Compare

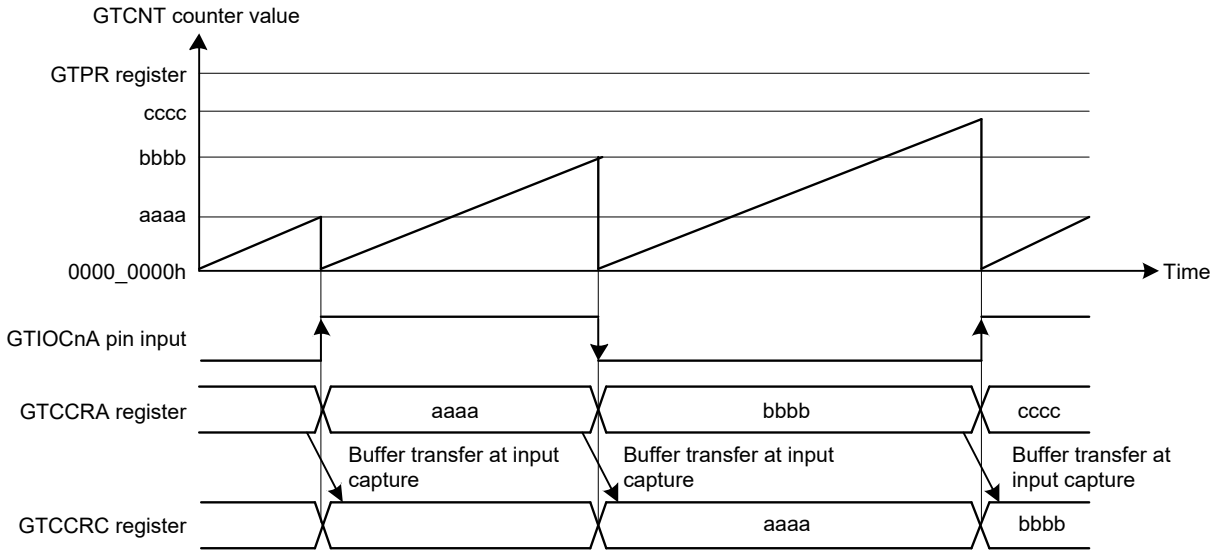
No.	Step Name	Description
1	Set operating mode	Set the operating mode with the GTCR.MD[2:0] bits. In **Figure 5.7-14**, 000b (saw-wave PWM mode) is set, in **Figure 5.7-15**, 100b (triangle-wave PWM mode 1) is set, and in **Figure 5.7-16**, 101b (triangle-wave PWM mode 2) is set.
2	Set count direction	Select the count direction (up or down) with the GTUDDTYC register. In **Figure 5.7-14**, after 11b is set in the GTUDDTYC[1:0] bits, 01b is set in the GTUDDTYC[1:0] bits (up-counting).
3	Select count clock	Select the count clock with the GTCR.TPCS[3:0] bits.
4	Set cycle	Set the cycle in the GTPR register.
5	Set initial value for counter	Set the initial value in the GTCNT counter.
6	Set GTIOCnm pin function	Set the GTIOCnm pin function with the GTIOA[4:0] and GTIOB[4:0] bits in the GTIOR register. In **Figure 5.7-14**, GTIOA[4:0] = 0_0110b, in **Figure 5.7-15**, GTIOA[4:0] = 0_0011b, and in **Figure 5.7-16**, GTIOB[4:0] = 0_0011b.
7	Enable GTIOCnm pin output	Set to enable the GTIOCnm pin output with the OAE and OBE bits in the GTIOR register.
8	Set buffer operation	Set buffer operation with the CCRA[1:0] and CCRB[1:0] bits in the GTBER register. In **Figure 5.7-14**, CCRA[1:0] = 01b, in **Figure 5.7-15**, CCRA[1:0] = 1xb, and in **Figure 5.7-16**, CCRB[1:0] = 1xb.
9	Set compare match value	Set the GTIOCnA pin transition in the GTCCRA register and the GTIOCnB pin transition in the GTCCRB register.
10	Set buffer value	For buffer operation, set the GTIOCnA and GTIOCnB pins transitions in 1 cycle after the current cycle (in saw-wave mode or triangle-wave mode with buffer transfer at trough or crest) or half cycle after the current cycle (in triangle-wave mode with buffer transfer at both trough and crest) in the GTCCRC and GTCCRE registers, respectively. For double buffer operation, also set the GTIOCnA and GTIOCnB pins transitions in 2 cycles after the current cycle (in saw-wave mode or triangle-wave mode with buffer transfer at trough or crest) or 1 cycle after the current cycle (in triangle-wave mode with buffer transfer at both trough and crest) in the GTCCRD and GTCCRF registers, respectively.
11	Start count operation	Set the GTCR.CST bit to 1b to start count operation.
12	Set buffer value for each cycle	For buffer operation, set the GTIOCnA and GTIOCnB pins transitions in 1 cycle after the current cycle (in saw-wave mode or triangle-wave mode with buffer transfer at trough or crest) or half cycle after the current cycle (in triangle-wave mode with buffer transfer at both trough and crest) in the GTCCRC and GTCCRE registers, respectively. For double buffer operation, also set the GTIOCnA and GTIOCnB pins transitions in 2 cycles after the current cycle (in saw-wave mode or triangle-wave mode with buffer transfer at trough or crest) or 1 cycle after the current cycle (in triangle-wave mode with buffer transfer at both trough and crest) in the GTCCRD and GTCCRF registers, respectively.

Note: n: 0 to 15
m: A, B

(2) When GTCCRA or GTCCRB Functions as Input Capture Register

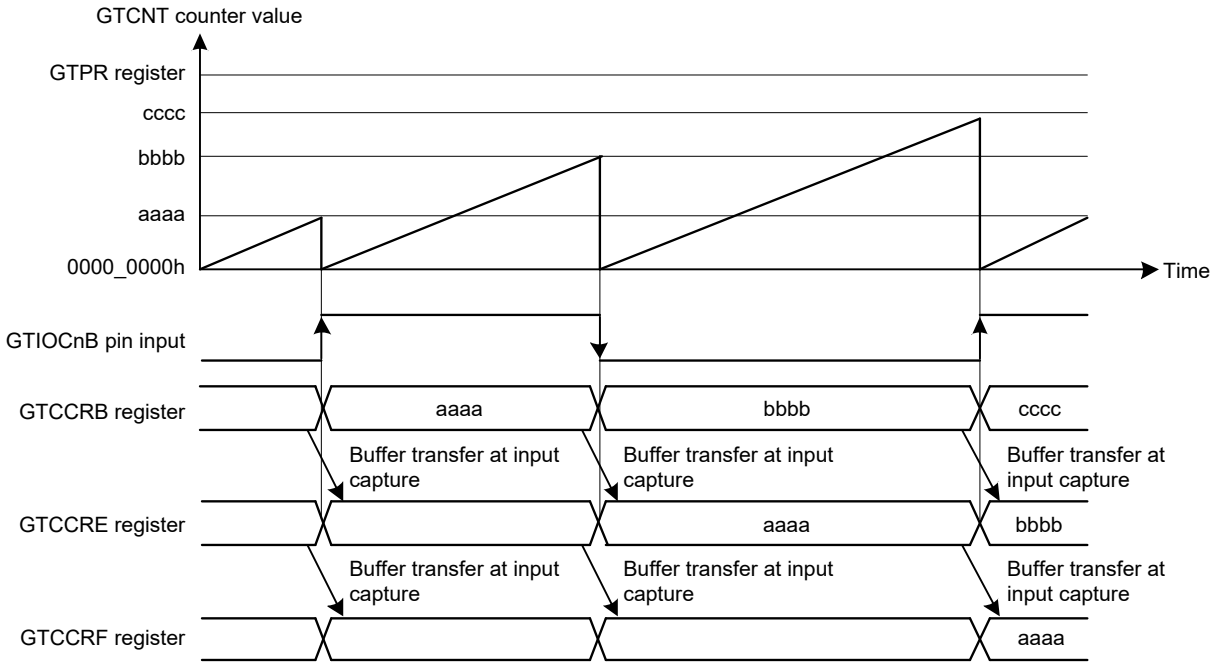
When input capture occurs, the GTCNT counter value is transferred to GTCCRA and GTCCRB and the stored GTCCRA and GTCCRB register values are transferred to the buffer registers. In input capture operation, buffer transfer is not performed by counter clearing.

Figure 5.7-17 and **Figure 5.7-18** show examples of GTCCRA and GTCCRB buffer operation and **Table 5.7-23** shows an example for setting GTCCRA and GTCCRB buffer operation.



Note: The base addresses of the registers are the same.

Figure 5.7-17 Example of GTCCRA and GTCCRB Buffer Operation with Input Capture at Both Edges of GTIOCnA Input, Saw Waves in Up-counting, and GTCNT Counter Cleared at Both Edges of GTIOCnA Input



Note: The base addresses of the registers are the same.

Figure 5.7-18 Example of GTCCRA and GTCCRB Double Buffer Operation with Input Capture at Both Edges of GTIOCnB Input, Saw Waves in Up-counting, and GTCNT Counter Cleared at Both Edges of GTIOCnB Input

Table 5.7-23 Example for Setting GTCCRA and GTCCRB Buffer Operation for Input Capture

No.	Step Name	Description
1	Set operating mode and counter clear sources	Set the operating mode with the GTCR.MD[2:0] bits and count clear source with the GTCSR register. In **Figure 5.7-17**, MD[2:0] = 000b (saw-wave PWM mode) and GTCSR = 0000_0F00h, and in **Figure 5.7-18**, MD[2:0] = 000b (saw-wave PWM mode) and GTCSR = 0000_F000h.
2	Set count direction	Select the count direction (up or down) with the GTUDDTYC register. In **Figure 5.7-17**, after 11b is set in the GTUDDTYC[1:0] bits, 01b is set in the GTUDDTYC[1:0] bits (up-counting).
3	Select count clock	Select the count clock with the GTCR.TPCS[3:0] bits.
4	Set cycle	Set the cycle in the GTPR register.
5	Set initial value for counter	Set the initial value in the GTCNT counter.
6	Select input capture source	Select input capture source in the GTICASR register and GTICBSR register. In **Figure 5.7-17**, GTICASR = 0000_0F00h, and in **Figure 5.7-18**, GTICBSR = 0000_F000h.
7	Set buffer operation	Set buffer operation with the CCRA and CCRB bits in the GTBER register. In **Figure 5.7-17**, CCRA[1:0] = 01b, and in **Figure 5.7-18**, CCRB[1:0] = 1xb.
8	Start count operation	Set the GTCR.CST bit to 1b to start count operation.

5.7.3.2.3 Buffer Operation for GTADTRA and GTADTRB

The GTADTBRA register operates as a buffer register for the GTADTRA register and the GTADTDBRA register operates as a buffer register for the GTADTBRA register (a double-buffer register for the GTADTRA register). Similarly, the GTADTBRB register operates as a buffer register for the GTADTRB register and the GTADTDBRB register operates as a buffer register for the GTADTBRB register (a double-buffer register for the GTADTRB register).

To make the GTADTRA and GTADTRB registers operate as double buffers, set the GTBER.ADTDA and ADTDB bits to 1b, respectively. For single buffer operation, set these bits to 0b. To make the GTADTRA and GTADTRB buffers not operate as buffers, set the GTBER.ADTTA[1:0] and ADTTB[1:0] bits to 00b, respectively.

The timing of buffer transfer can be set by using the GTBER.ADTTm[1:0] (m = A, B) bits. Buffer transfer proceeds on overflow (in up-counting) or underflow (in down-counting) in saw-wave mode. In triangle-wave mode, it proceeds at crests when the setting of the GTBER.ADTTm[1:0] (m = A, B) bits is 01b, at troughs when the setting is 10b, and at crests and troughs when the setting is 11b.

In saw-wave mode, when counting is in progress and the setting of the GTBER.ADTTm[1:0] (m = A, B) bits is other than 00b, buffer transfer proceeds in the same way as that on overflow (in up-counting) or underflow (in down-counting) by the same counter clearing source in **5.7.3.2.1 GTPR Register Buffer Operation**.

If the GTADTRm (m = A, B) register is made to operate as a double buffer and triangle-wave mode is used by setting the GTBER.DBRTEADm (m = A, B) bit to 1b, even while buffer transfer is inhibited by the setting of the GTBER.BD[2] bit or buffer transfer extended skipping function, transfer to the GTADTRm (m = A, B) register is repeated on a cyclic basis (the function for repeated double-buffered operation when buffer transfer is inhibited). For details, see **5.7.8.2.3 Repeated Double-Buffered Operation when GTADTR Buffer Transfer is Inhibited**.

Figure 5.7-19 to **Figure 5.7-21** show examples of buffer operation of the GTADTRA and GTADTRB registers, and **Figure 5.7-22** shows an example for setting buffer operation for the GTADTRA and GTADTRB registers.

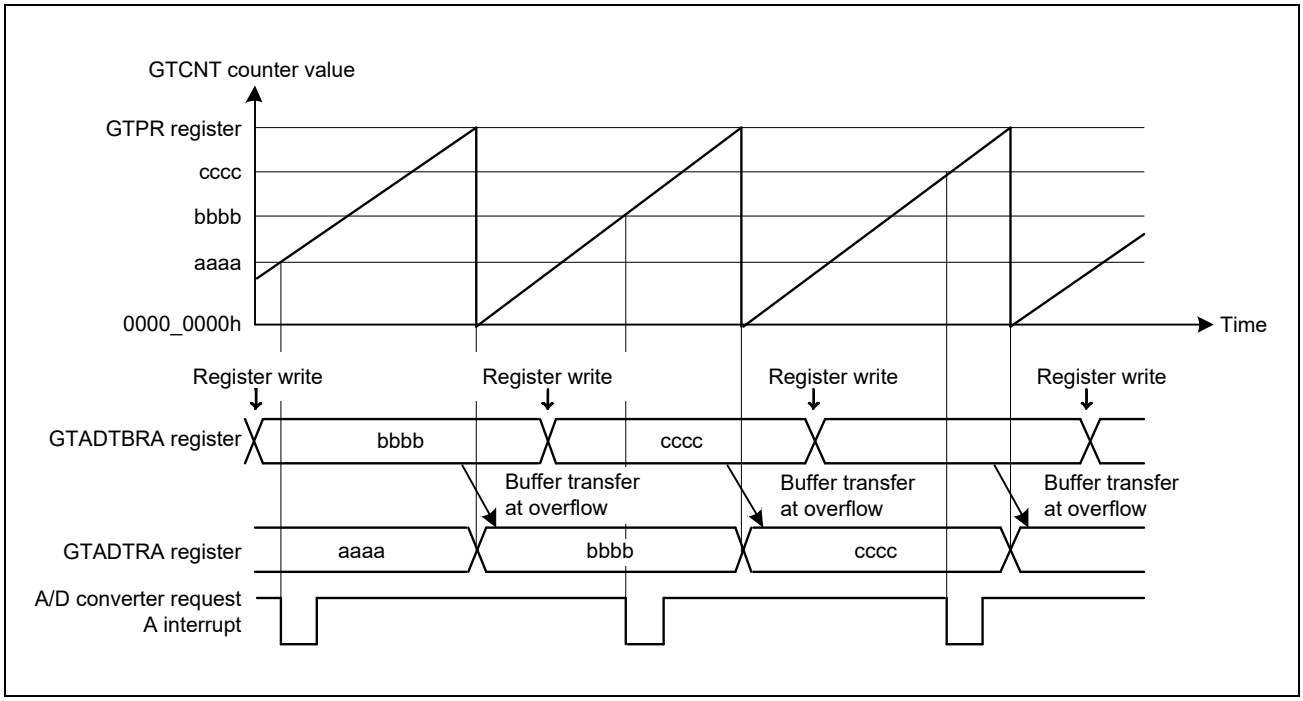


Figure 5.7-19 Example of Buffer Operation of GTADTRA and GTADTRB Registers (Saw-Wave Up-Counting, A/D Converter Start Request Interrupt Generated in Up-Counting)

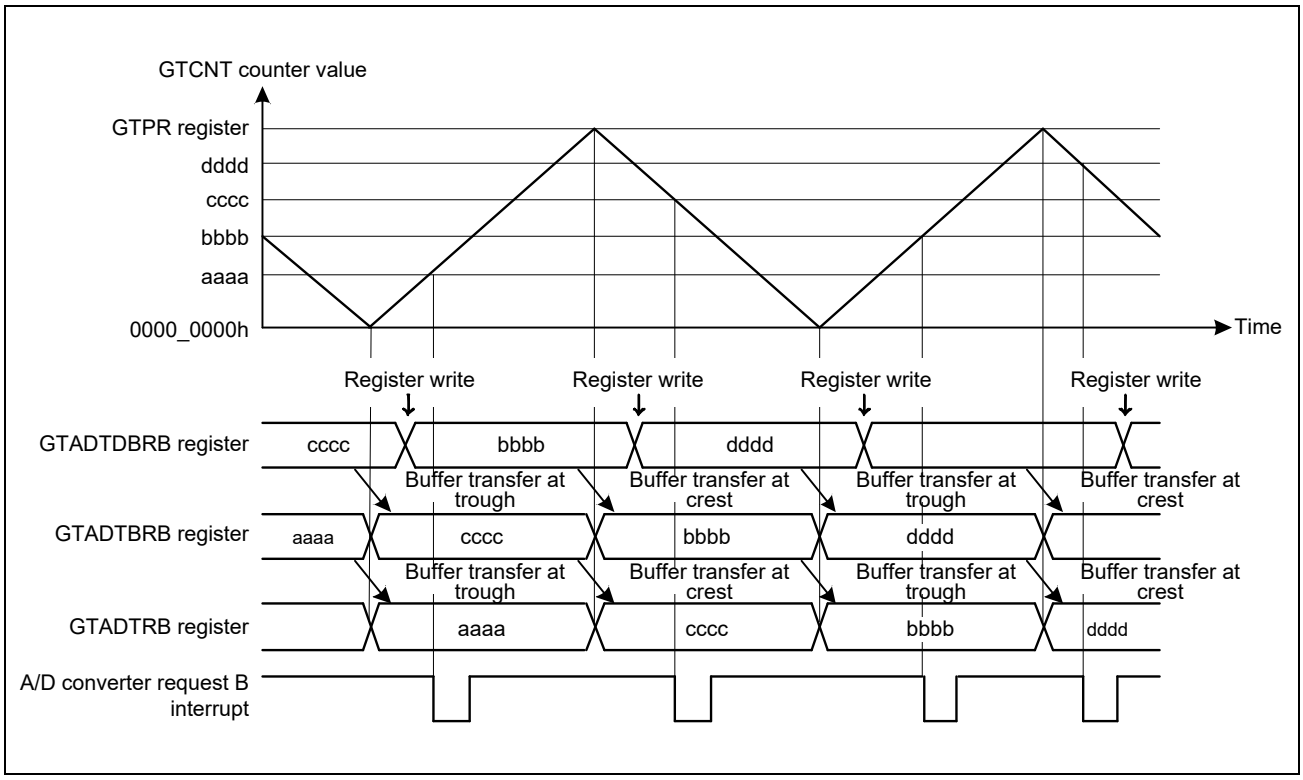

Figure 5.7-21 Example of Double-Buffered Operation of GTADTRA and GTADTRB Registers (Triangle Waves, Buffer Transfer at Both Troughs and Crests, A/D Converter Start Request Interrupt Generated in Both Up-Counting and Down-Counting)

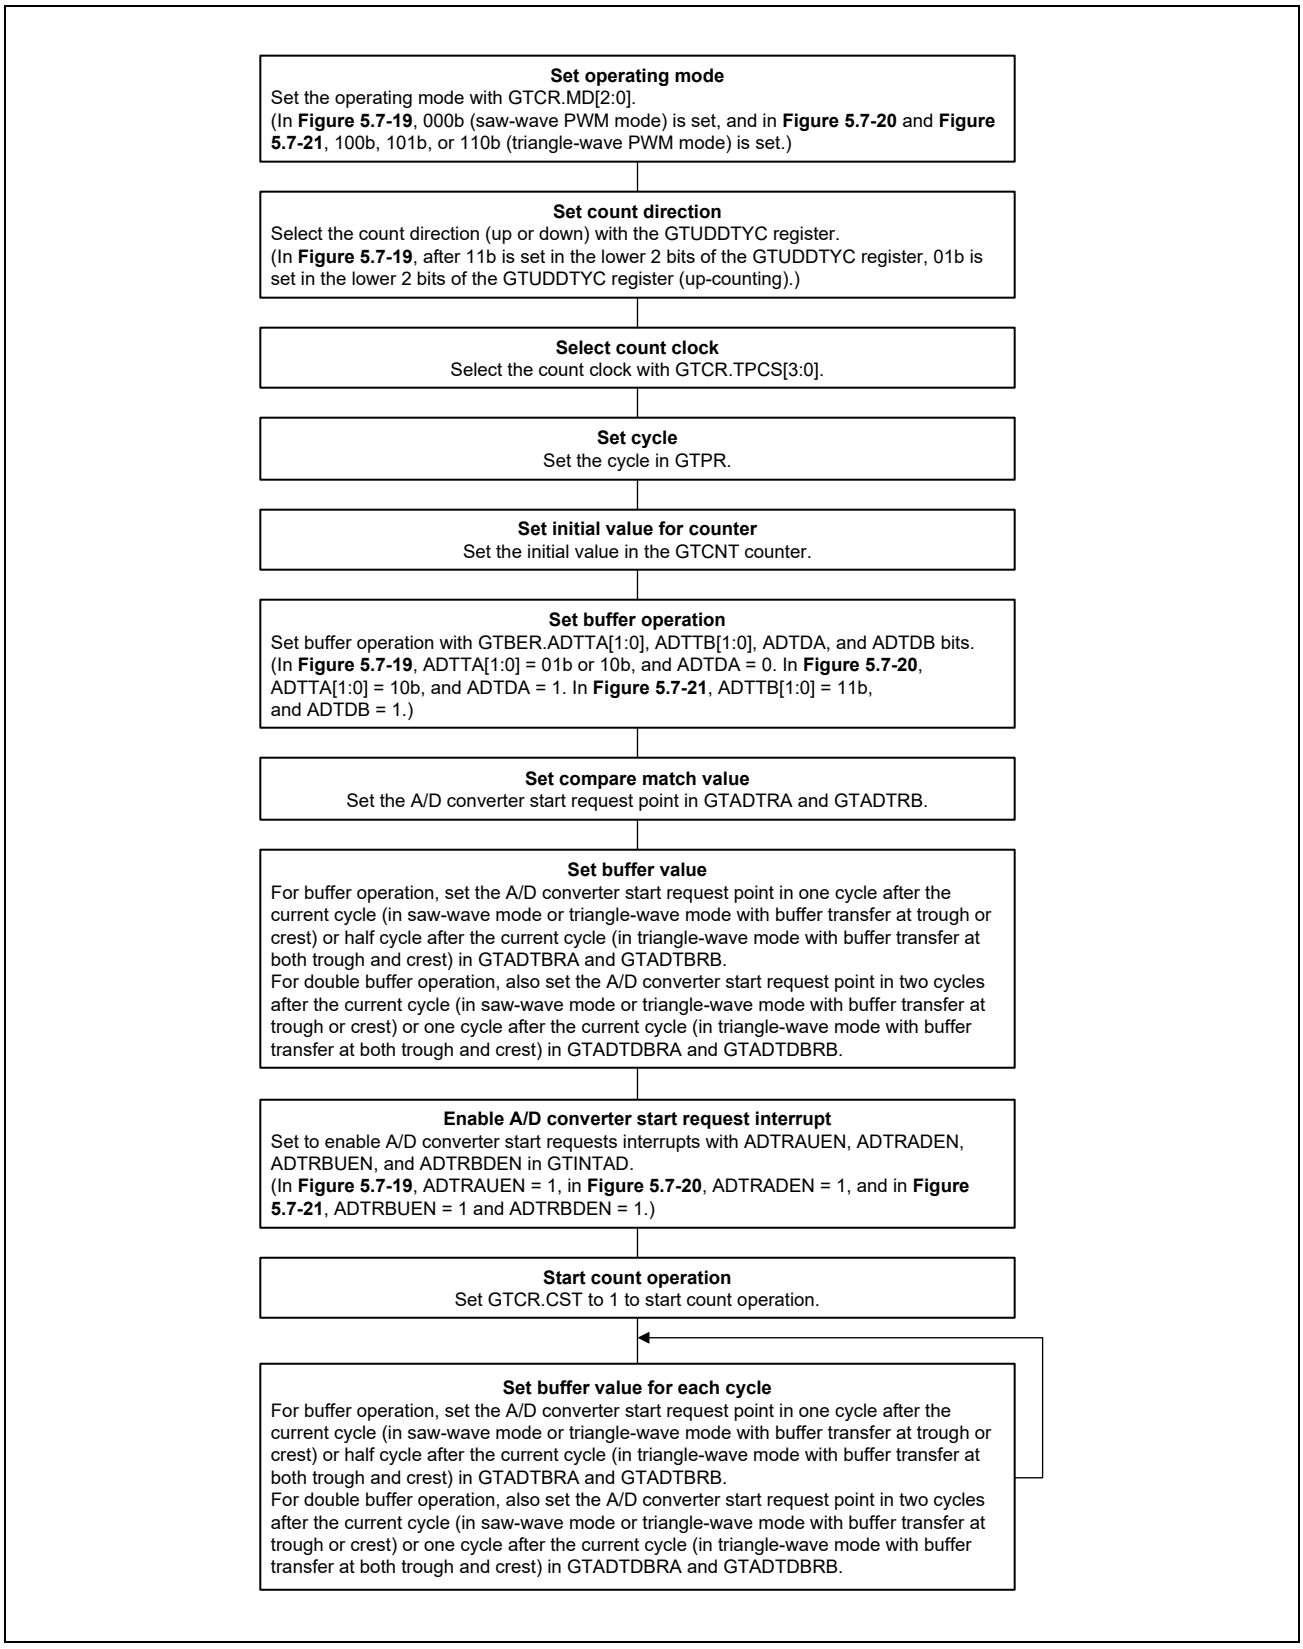

Figure 5.7-22 Example of Setting Buffer Operation for GTADTRA and GTADTRB Registers

5.7.3.3 PWM Output Operating Mode

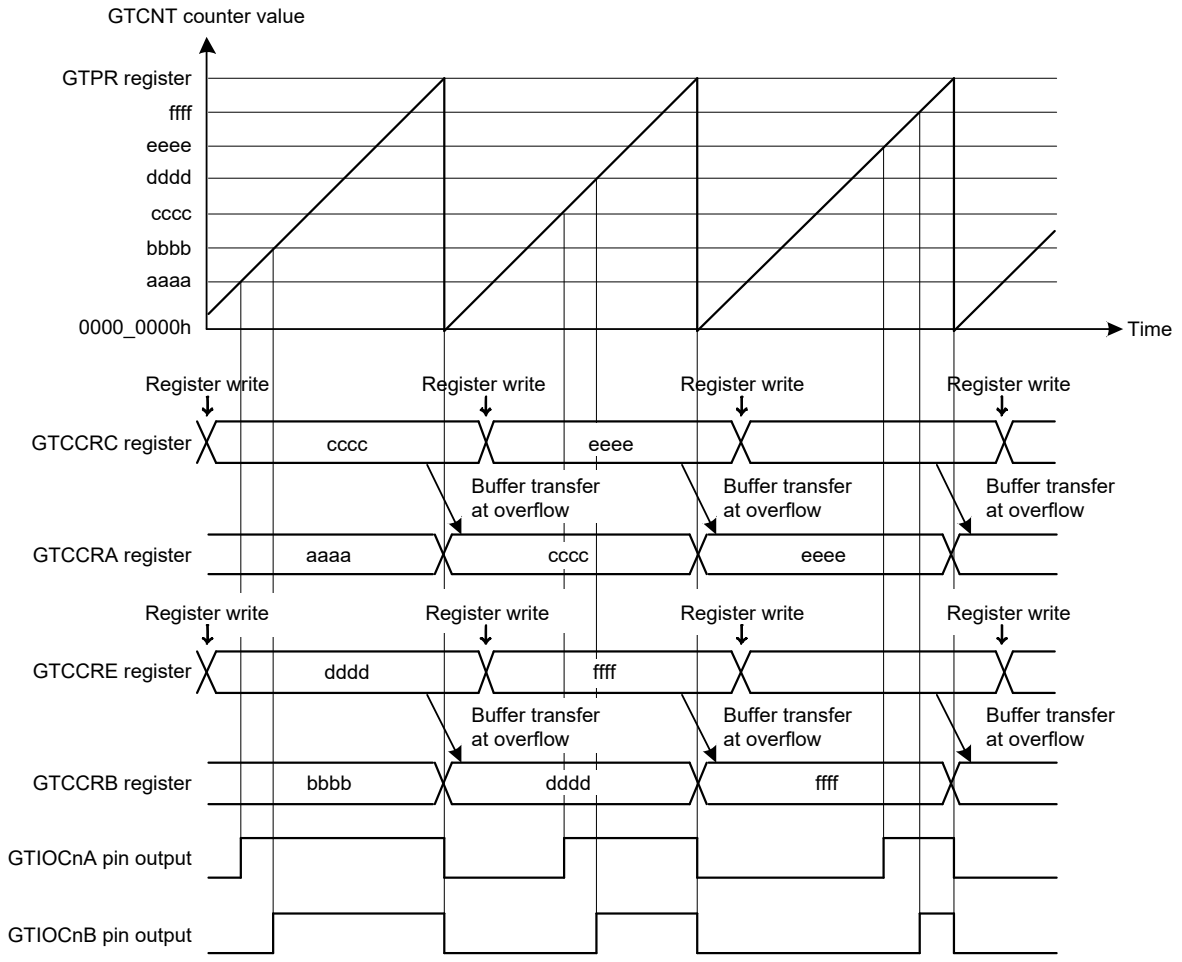
The GPT can output PWM waveforms to the GTIOCnA or GTIOCnB pin (n = 0 to 15) by a compare match between the GTCNT counter and GTCCRA or GTCCRB.

By setting GTDTCR, GTDVU, and GTDVD, the compare match value for a negative-phase waveform with dead time can be automatically set in GTCCRB.

5.7.3.3.1 Saw-wave PWM Mode

In saw-wave PWM mode, GTCNT performs saw-wave (half-wave) operation by setting the cycle in GTPR and a PWM waveform is output to the GTIOCnA or GTIOCnB pin (n = 0 to 15) when a GTCCRA or GTCCRB compare match occurs. The pin output value can be selected from low-level output, high-level output, or toggle output separately for a compare match and for the cycle end according to the GTIOR setting.

Figure 5.7-23 shows an example of saw-wave PWM mode operation, and **Table 5.7-24** shows an example for setting saw-wave PWM mode.



Note: The base addresses of the registers are the same.

Figure 5.7-23 Example of Saw-Wave PWM Mode Operation with Up-Counting, Buffer Operation, High-level Output at GTCCRA/GTCCRB Compare Match, and Low-level Output at Cycle End

Table 5.7-24 Example for Setting Saw-Wave PWM Mode

No.	Step Name	Description
1	Set operating mode	Set the operating mode with the GTCR.MD[2:0] bits. In **Figure 5.7-23**, 000b (saw-wave PWM mode) is set.
2	Set count direction	Select the count direction (up or down) with the GTUDDTYC register. In **Figure 5.7-23**, after 11b is set in the GTUDDTYC[1:0] bits, 01b is set in the GTUDDTYC[1:0] bits (up-counting).
3	Select count clock	Select the count clock with the GTCR.TPCS[3:0] bits.
4	Set cycle	Set the cycle in the GTPR register.
5	Set initial value for counter	Set the initial value in the GTCNT counter.
6	Set GTIOCnm pin function	Set the GTIOCnm pin function with the GTIOA[4:0] and GTIOB[4:0] bits in the GTIOR register. In **Figure 5.7-23**, GTIOA[4:0] = 0_0110b and GTIOB[4:0] = 0_0110b.
7	Enable GTIOCnm pin output	Set to enable the GTIOCnm pin output with the OAE and OBE bits in the GTIOR register.
8	Set buffer operation	Set buffer operation with the CCRA[1:0] and CCRB[1:0] bits in the GTBER register. In **Figure 5.7-23**, CCRA[1:0] = 01b and CCRB[1:0] = 01b.
9	Set compare match value	Set the GTIOCnA pin transition in the GTCCRA register and the GTIOCnB pin transition in the GTCCRB register.
10	Set buffer value	For buffer operation, set the GTIOCnA and GTIOCnB pins transitions in 1 cycle after the current cycle in the GTCCRC and GTCCRE registers, respectively. For double buffer operation, also set the GTIOCnA and GTIOCnB pins transitions in 2 cycles after the current cycle in the GTCCRD and GTCCRF registers, respectively.
11	Start count operation	Set the GTCR.CST bit to 1b to start count operation.
12	Set buffer value for each cycle	For buffer operation, set the GTIOCnA and GTIOCnB pins transitions in 1 cycle after the current cycle in the GTCCRC and GTCCRE registers, respectively. For double buffer operation, also set the GTIOCnA and GTIOCnB pins transitions in 2 cycles after the current cycle in the GTCCRD and GTCCRF registers, respectively.

Note: n: 0 to 15
m: A, B

5.7.3.3.2 Saw-Wave One-Shot Pulse Mode

The saw-wave one-shot pulse mode is a mode in which the cycle is set in GTPR, the GTCNT counter performs saw-wave (half-wave) operation and a PWM waveform is output to the GTIOCnA or GTIOCnB pin (n = 0 to 15) on a compare match with GTCCRA or GTCCRB with buffer operation fixed.

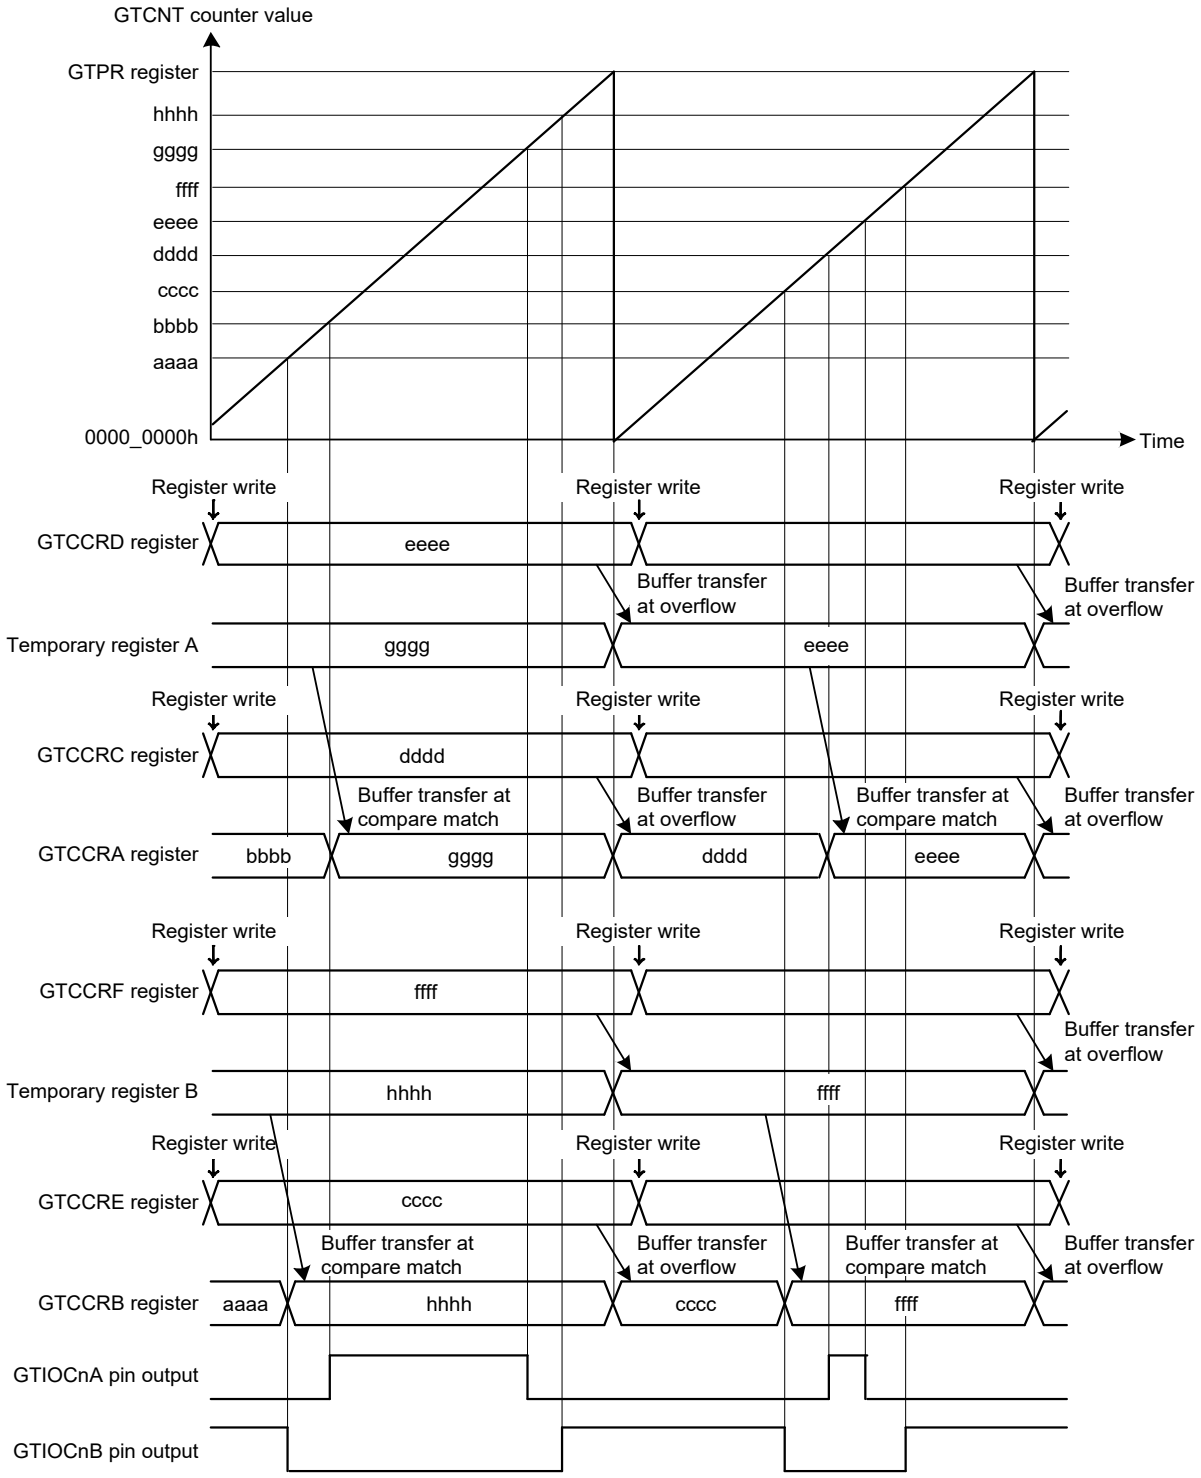
Buffer operation in saw-wave one-shot pulse mode is different from the usual buffer operation. Buffer transfer is performed as follows:

- From GTCCRC to GTCCRA at the cycle end
- From GTCCRE to GTCCRB at the cycle end
- From GTCCRD to temporary register A at the cycle end
- From GTCCRF to temporary register B at the cycle end
- From temporary register A to GTCCRA on a compare match with GTCCRA
- From temporary register B to GTCCRB on a compare match with GTCCRB

The pin output value can be selected from low-level output, high-level output, or toggled output separately for a compare match and the cycle end according to the GTIOR setting. When the GTBER.CCRSWT bit is set to 1 while counting is stopped, buffer transfer from the GTCCRD register to temporary register A and from the GTCCRF register to temporary register B is forcibly performed. By setting GTDTCR, GTDVU, and GTDVD, a compare match value for a negative-phase waveform with dead time is automatically set in GTCCRB.

If the GTBER.DBRTECm (m = A, B) bit is set to 1b, transfer from an intermediate buffer to the GTCCRm (m = A, B) register is repeated on a cyclic basis by using temporary register x (x = C, E) and temporary register m (m = A, B) which serve as intermediate buffers for the GTCCRx (x = C, E) and GTCCRm (m = A, B) registers, respectively, even while buffer transfer is inhibited (the function for repeated double-buffered operation when buffer transfer is inhibited). For details, see **5.7.8.2.2 Repeated Double-Buffered Operation when GTCCR Buffer Transfer is Inhibited**.

Figure 5.7-24 shows an example of saw-wave one-shot pulse mode operation, and **Table 5.7-25** shows an example for setting saw-wave one-shot pulse mode.



Note: The base addresses of the registers are the same.

Figure 5.7-24 Example of Saw-Wave One-Shot Pulse Mode Operation with Up-Counting, Low-level Output from the GTIOCnA Pin and High-level Output from the GTIOCnB Pin at Count Start, Output Toggled at GTCCRA/ GTCCRB Compare Match, and Output Retained at Cycle End

Table 5.7-25 Example Setting for Saw-Wave One-Shot Pulse Mode

No.	Step Name	Description
1	Set operating mode	Set the operating mode with the GTCR.MD[2:0] bits. In **Figure 5.7-24**, 001b (saw-wave one-shot pulse mode) is set.
2	Set count direction	Select the count direction (up or down) with the GTUDDTYC register. In **Figure 5.7-24**, after 11b is set in the GTUDDTYC[1:0] bits, 01b is set in the GTUDDTYC[1:0] bits (up-counting).
3	Select count clock	Select the count clock with the GTCR.TPCS[3:0] bits.
4	Set cycle	Set the cycle in the GTPR register.
5	Set initial value for counter	Set the initial value in the GTCNT counter.
6	Set GTIOCnm pin function	Set the GTIOCnm pin function with the GTIOA[4:0] and GTIOB[4:0] bits in the GTIOR register. In **Figure 5.7-24**, GTIOA[4:0] = 0_0011b and GTIOB[4:0] = 1_0011b.
7	Enable GTIOCnm pin output	Set to enable the GTIOCnm pin output with the OAE and OBE bits in the GTIOR register.
8	Set compare match value	Set the GTIOCnA pin transition immediately after the count start in the GTCCRC and GTCCRD registers and the GTIOCnB pin transition in the GTCCRE and GTCCRF registers.
9	Set forcible buffer transfer	Set the GTBER.CCRSWT bit to 1b to transfer buffer register data forcibly.
10	Set buffer value	For buffer operation, set the GTIOCnA pin transition in one cycle after the current cycle in the GTCCRC and GTCCRD registers and the GTIOCnB pin transition in the GTCCRE and GTCCRF registers.
11	Start count operation	Set the GTCR.CST bit to 1b to start count operation.
12	Set buffer value for each cycle	For buffer operation, set the GTIOCnA pin transition in one cycle after the current cycle in the GTCCRC and GTCCRD registers and the GTIOCnB pin transition in the GTCCRE and GTCCRF registers.

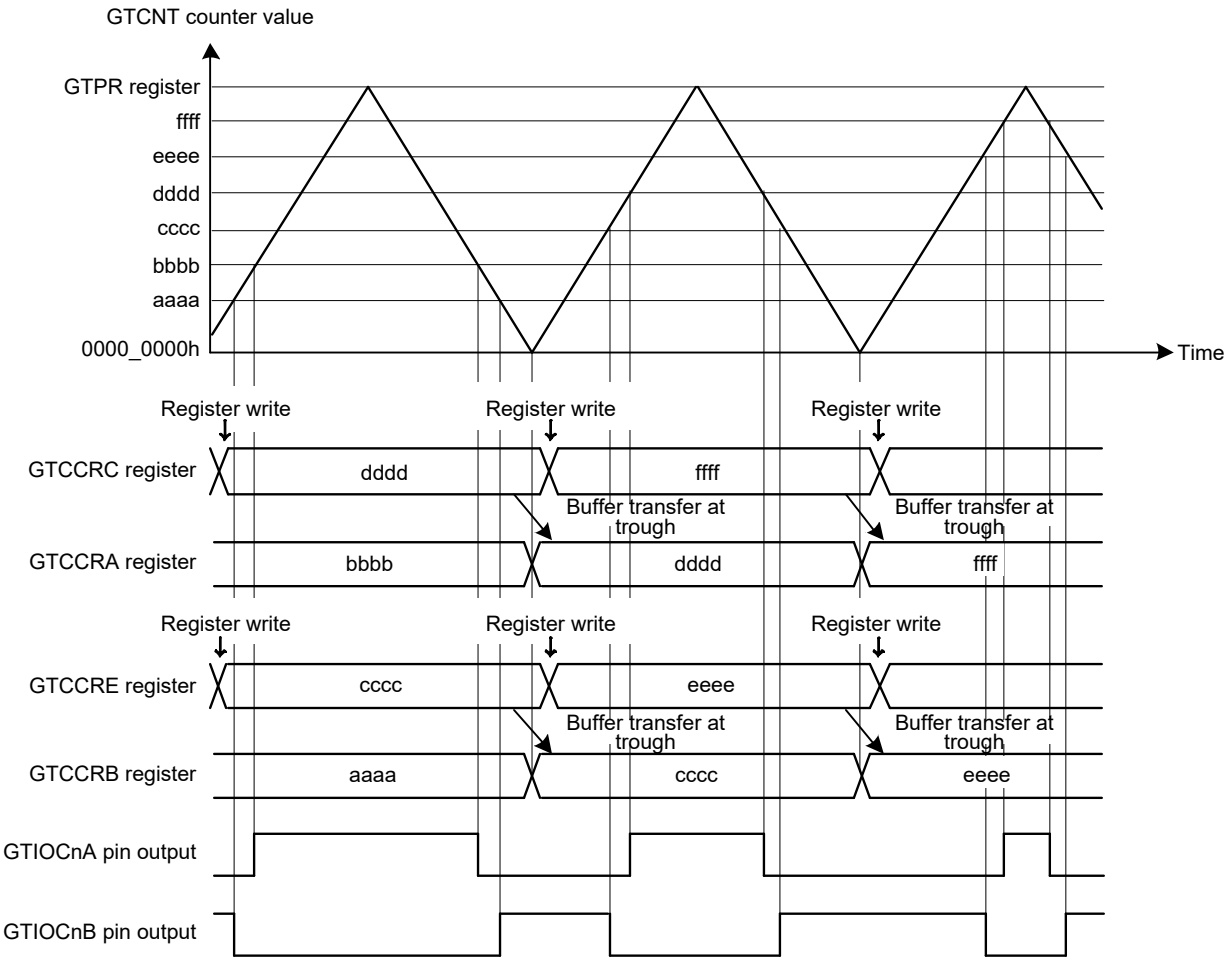
Note: n: 0 to 15
m: A, B

5.7.3.3.3 Triangle-Wave PWM Mode 1 (32-Bit Transfer at Trough)

The triangle-wave PWM mode 1 is a mode in which the cycle is set in GTPR. The GTCNT counter performs triangle-wave (full-wave) operation, and a PWM waveform is output to the GTIOCnA or GTIOCnB pin (n = 0 to 15) when a GTCCRA or GTCCRB compare match occurs. Buffer transfer is performed at troughs. The pin output value can be selected from low-level output, high-level output, or toggled output separately for a compare match and for the cycle end according to the GTIOR setting.

By setting GTDTCR, GTDVU, and GTDVD, a compare match value for a negative-phase waveform with dead time can be automatically set in GTCCRB.

Figure 5.7-25 shows an example of a triangle-wave PWM mode 1 operation, and **Table 5.7-26** shows an example for setting a triangle-wave PWM mode 1.



Note: The base addresses of the registers are the same.

Figure 5.7-25 Example of Triangle-Wave PWM Mode 1 Operation with Buffer Operation, Low-level Output from the GTIOCnA Pin and High-level Output from the GTIOCnB Pin at Count Start, Output Toggled at GTCCRA/GTCCRB Register Compare Match, and Output Retained at Cycle End

Table 5.7-26 Example Setting for Triangle-Wave PWM Mode 1

No.	Step Name	Description
1	Set operating mode	Set the operating mode with the GTCR.MD[2:0] bits. In **Figure 5.7-25**, 100b (triangle-wave PWM mode 1) is set.
2	Select count clock	Select the count clock with the GTCR.TPCS[3:0] bits.
3	Set cycle	Set the cycle in the GTPR register.
4	Set initial value for counter	Set the initial value in the GTCNT counter.
5	Set GTIOCnm pin function	Set the GTIOCnm pin function with the GTIOA[4:0] and GTIOB[4:0] bits in the GTIOR register. In **Figure 5.7-25**, GTIOA[4:0] = 0_0011b and GTIOB[4:0] = 1_0011b.
6	Enable GTIOCnm pin output	Set to enable the GTIOCnm pin output with the OAE and OBE bits in the GTIOR register.
7	Set buffer operation	Set buffer operation with the CCRA[1:0] and CCRB[1:0] bits in the GTBER register. In **Figure 5.7-25**, CCRA[1:0] = 01b and CCRB[1:0] = 01b.
8	Set compare match value	Set the GTIOCnA and GTIOCnB pins transitions in the GTCCRA and GTCCRB registers, respectively.
9	Set buffer value	For buffer operation, set the GTIOCnA and GTIOCnB pins transitions in 1 cycle after the current cycle in the GTCCRC and GTCCRE registers, respectively. For double buffer operation, also set the GTIOCnA and GTIOCnB pins transitions in 2 cycles after the current cycle in the GTCCRD and GTCCRF registers, respectively.
10	Start count operation	Set the GTCR.CST bit to 1b to start count operation.
11	Set buffer value for each cycle	For buffer operation, set the GTIOCnA and GTIOCnB pins transitions in 1 cycle after the current cycle in the GTCCRC and GTCCRE registers, respectively. For double buffer operation, also set the GTIOCnA and GTIOCnB pins transitions in 2 cycles after the current cycle in the GTCCRD and GTCCRF registers, respectively.

Note: n: 0 to 15
m: A, B

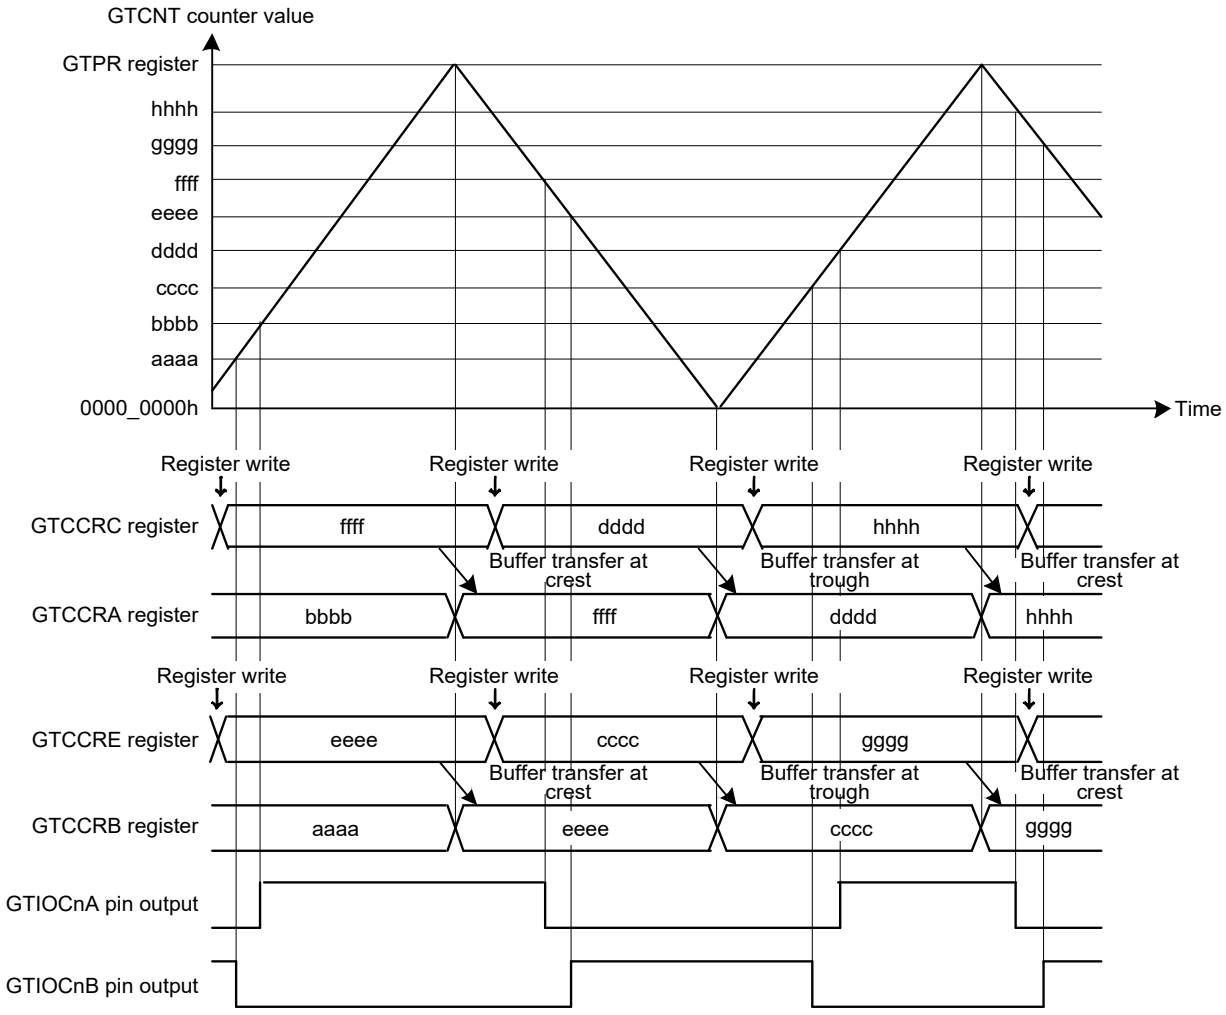
5.7.3.3.4 Triangle-Wave PWM Mode 2 (32-Bit Transfer at Crest and Trough)

Similar to triangle-wave PWM mode 1, in triangle-wave PWM mode 2 the cycle is set in GTPR. The GTCNT counter performs triangle-wave (full-wave) operation, and a PWM waveform is output to the GTIOCnA or GTIOCnB pin (n = 0 to 15) when a GTCCRA or GTCCRB compare match occurs. The buffer transfer is performed at both crests and troughs. The pin output value can be selected from low-level output, high-level output, or toggle output separately for a compare match and for the cycle end according to the GTIOR setting.

By setting GTDTCR, GTDVU, and GTDVD, a compare match value for a negative-phase waveform with dead time can be automatically set in GTCCRB.

If the GTCCRm (m = A, B) register is made to operate as a double buffer, when the GTBER.DBRTECm (m = A, B) bit is set to 1b, transfer from an intermediate buffer to the GTCCRm (m = A, B) register is repeated on a cyclic basis by using temporary register x (x = C, E) and the GTCCRx (x = C, E) register which serve as intermediate buffers for the GTCCRx (x = C, E) and GTCCRm (m = A, B) registers, respectively, even while buffer transfer is inhibited (the function for repeated double-buffered operation when buffer transfer is inhibited). For details, see **5.7.8.2.2 Repeated Double-Buffered Operation when GTCCR Buffer Transfer is Inhibited**.

Figure 5.7-26 shows an example of triangle-wave PWM mode 2 operation, and **Table 5.7-27** shows an example for setting triangle-wave PWM mode 2.



Note: The base addresses of the registers are the same.

Figure 5.7-26 Example of Triangle-Wave PWM Mode 2 Operation with Buffer Operation, Low-level Output from the GTIOCnA Pin and High-level Output from the GTIOCnB Pin at Count Start, Output Toggled at GTCCRA/GTCCRB Compare Match, and Output Retained at Cycle End

Table 5.7-27 Example for Setting Triangle-Wave PWM Mode 2

No.	Step Name	Description
1	Set operating mode	Set the operating mode with the GTCR.MD[2:0] bits. In **Figure 5.7-26**, 101b (triangle-wave PWM mode 2) is set.
2	Select count clock	Select the count clock with the GTCR.TPCS[3:0] bits.
3	Set cycle	Set the cycle in the GTPR register.
4	Set initial value for counter	Set the initial value in the GTCNT counter.
5	Set GTIOCnm pin function	Set the GTIOCnm pin function with the GTIOA[4:0] and GTIOB[4:0] bits in the GTIOR register. In **Figure 5.7-26**, GTIOA[4:0] = 0_0011b and GTIOB[4:0] = 1_0011b.
6	Enable GTIOCnm pin output	Set to enable the GTIOCnm pin output with the OAE and OBE bits in the GTIOR register.
7	Set buffer operation	Set buffer operation with the CCRA[1:0] and CCRB[1:0] bits in the GTBER register. In **Figure 5.7-26**, CCRA[1:0] = 01b and CCRB[1:0] = 01b.
8	Set compare match value	Set the GTIOCnA and GTIOCnB pins transitions in the GTCCRA and GTCCRB registers, respectively.
9	Set buffer value	For buffer operation, set the GTIOCnA and GTIOCnB pins transitions in half cycle after the current cycle in the GTCCRC and GTCCRE registers, respectively. For double buffer operation, also set the GTIOCnA and GTIOCnB pins transitions in 1 cycle after the current cycle in the GTCCRD and GTCCRF registers, respectively.
10	Start count operation	Set the GTCR.CST bit to 1b to start count operation.
11	Set buffer value for each half cycle	For buffer operation, set the GTIOCnA and GTIOCnB pins transitions in half cycle after the current cycle in the GTCCRC and GTCCRE registers, respectively. For double buffer operation, also set the GTIOCnA and GTIOCnB pins transitions in 1 cycle after the current cycle in GTCCRD and GTCCRF registers, respectively.

Note: n: 0 to 15
m: A, B

5.7.3.3.5 Triangle-Wave PWM Mode 3 (64-Bit Transfer at Trough)

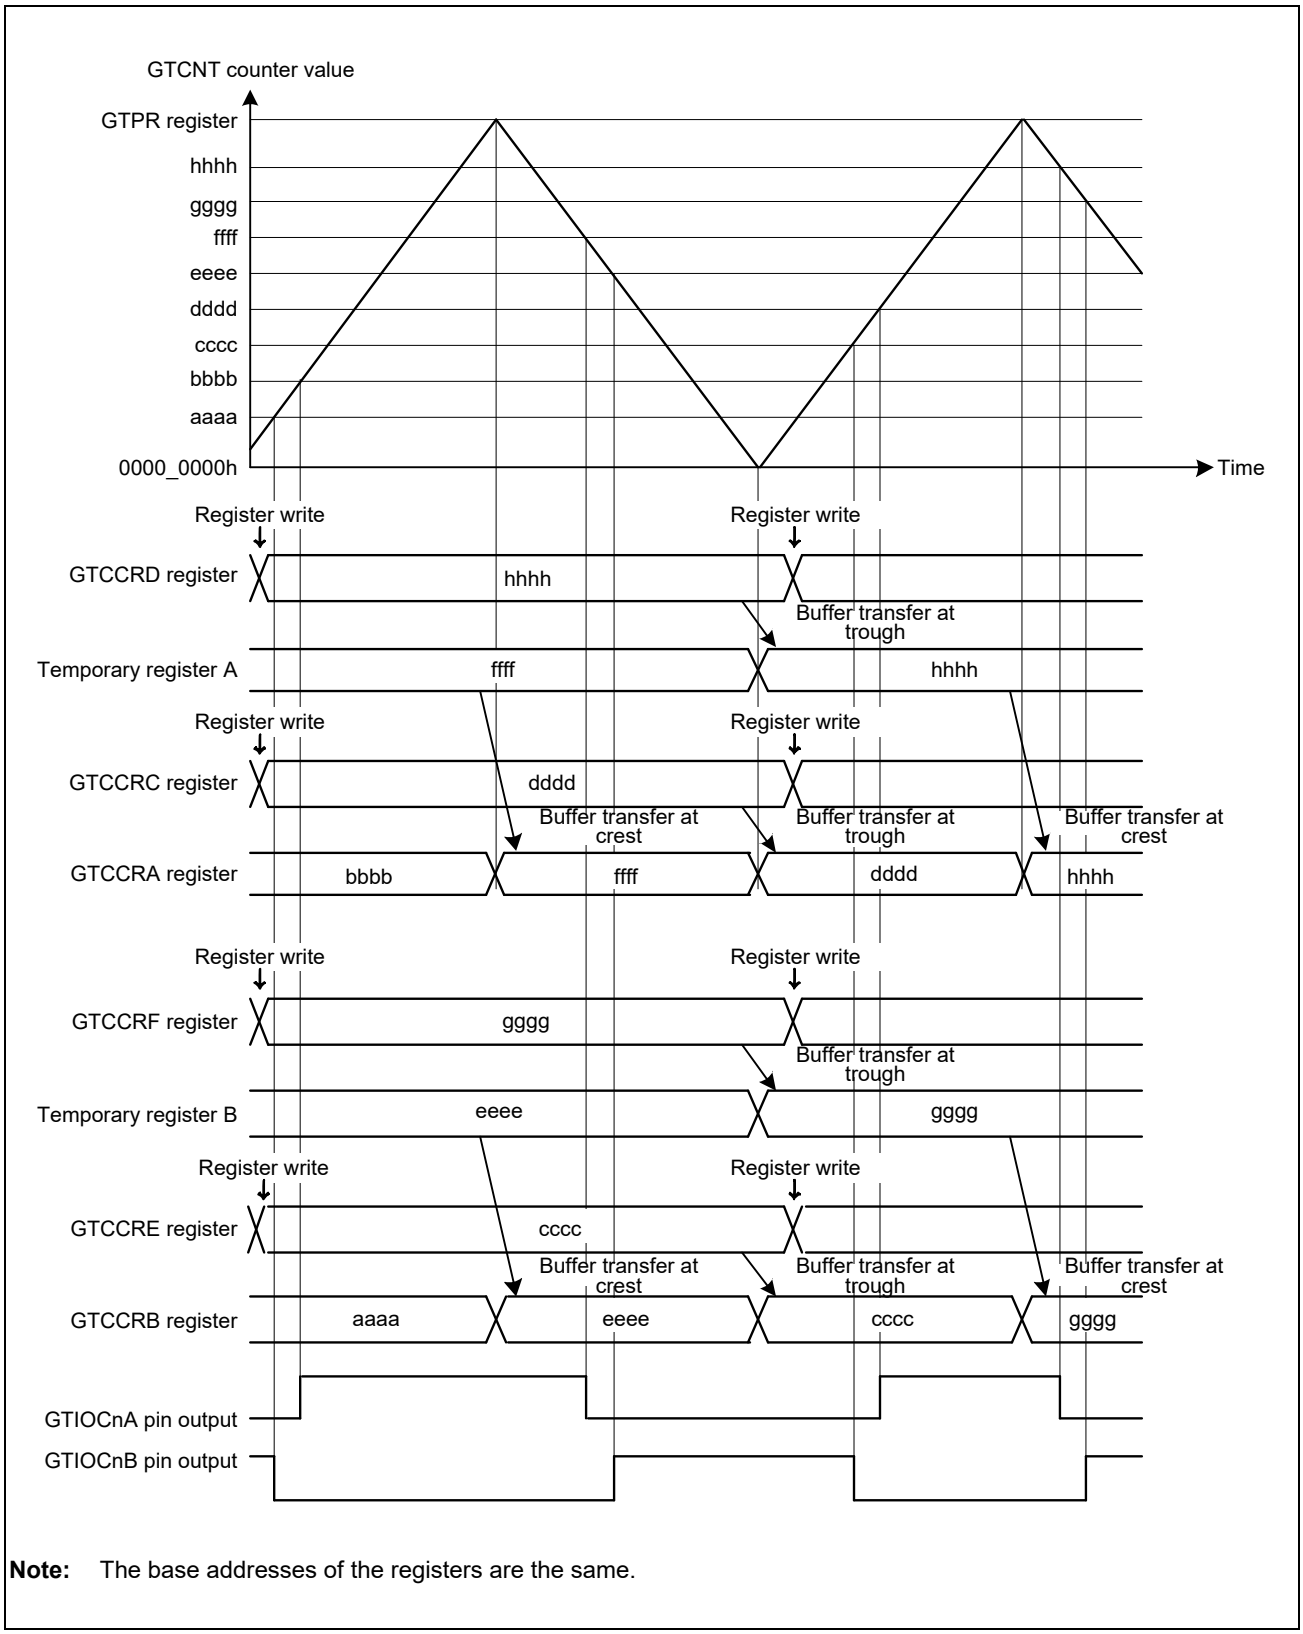
The triangle-wave PWM mode 3 is a mode in which the cycle is set in GTPR. The GTCNT counter performs triangle-wave (full-wave) operation and a PWM waveform is output to the GTIOCnA or GTIOCnB pin (n = 0 to 15) on a compare match with GTCCRA or GTCCRB with buffer operation fixed. Buffer operation in triangle-wave PWM mode 3 is different from usual buffer operation. Buffer transfer is performed as follows:

- From GTCCRC to GTCCRA at troughs
- From GTCCRE to GTCCRB at troughs
- From GTCCRD to temporary register A at troughs
- From GTCCRF to temporary register B at troughs
- From temporary register A to GTCCRA at crests
- From temporary register B to GTCCRB at crests

The pin output value can be selected from low-level output, high-level output, or toggled output separately for a compare match and for the cycle end according to the GTIOR setting.

By setting GTDTCR, GTDVU, and GTDVD, a compare match value for a negative-phase waveform with dead time can be automatically set in GTCCRB.

Figure 5.7-27 shows an example of triangle-wave PWM mode 3 operation, and **Table 5.7-28** shows an example for setting triangle-wave PWM mode 3.



Note: The base addresses of the registers are the same.

Figure 5.7-27 Example of Triangle-Wave PWM Mode 3 Operation with Low-level Output from the GTIOCnA Pin and High-level Output from the GTIOCnB Pin at Count Start, Output Toggled at GTCCRA/GTCCRB Compare Match, and Output Retained at Cycle End

Table 5.7-28 Example Setting for Triangle-Wave PWM Mode 3

No.	Step Name	Description
1	Set operating mode	Set the operating mode with the GTCR.MD[2:0] bits. In **Figure 5.7-27**, 110b (triangle-wave PWM mode 3) is set.
2	Select count clock	Select the count clock with the GTCR.TPCS[3:0] bits.
3	Set cycle	Set the cycle in the GTPR register.
4	Set initial value for counter	Set the initial value in the GTCNT counter.
5	Set GTIOCnm pin function	Set the GTIOCnm pin function with the GTIOA[4:0] and GTIOB[4:0] bits in the GTIOR register. In **Figure 5.7-27**, GTIOA[4:0] = 0_0011b and GTIOB[4:0] = 1_0011b.
6	Enable GTIOCnm pin output	Set to enable the GTIOCnm pin output with the OAE and OBE bits in the GTIOR register.
7	Set compare match value	Set the GTIOCnA pin transition immediately after the count start in the GTCCRC and GTCCRD registers and the GTIOCnB pin transition in the GTCCRE and GTCCRF registers.
8	Set forcible buffer transfer	Set the GTBER.CCRSWT bit to 1b to transfer buffer register data forcibly.
9	Set buffer value	Set the GTIOCnA pin transition in 1 cycle after the current cycle in the GTCCRC and GTCCRD registers and the GTIOCnB pin transition in the GTCCRE and GTCCRF registers.
10	Start count operation	Set the GTCR.CST bit to 1b to start count operation.
11	Set buffer value for each cycle	Set the GTIOCnA pin transition in 1 cycle after the current cycle in the GTCCRC and GTCCRD registers and the GTIOCnB pin transition in the GTCCRE and GTCCRF registers.

Note: n: 0 to 15
m: A, B

5.7.3.4 Automatic Dead Time Setting Function

By setting the GTDTCR register, a compare match value for a negative waveform with dead time obtained by a compare match value for a positive waveform (the GTCCRA register value) and specified dead time values (the GTDVU and GTDVD registers values) can be automatically set in the GTCCRB register.

The automatic dead time setting function can be used in saw-wave one-shot pulse mode and all the triangle PWM modes.

Dead time can be separately set for the first half and second half of a waveform. Dead time for the changing point in the first half of a negative waveform is set in the GTDVU register and that in the second half is set in the GTDVD register. The same dead time can also be set for the first and second halves by setting the GTDTCR.TDFER bit to 1b.

The GTDBU register can be used as a buffer register for the GTDVU register, and the GTDBD register can be used as a buffer register for the GTDVD register. Buffer transfer is performed at the end of the cycle (in saw-wave mode: either of an overflow of the GTCNT counter (up-counting), an underflow (down-counting), or the GTCNT counter clearing in triangle-wave mode: a trough).

The change point of the negative-phase waveform, which is automatically calculated, is obtained by reading the GTCCRB register. Writing to the GTCCRB register is prohibited when the automatic dead time setting function is used.

Do not set the dead-time that makes the change point of the waveform exceeding the count period. When a dead-time setting which would generate a dead-time error is made, adjust the change points of the positive- and negative-phase waveforms to generate waveforms with secured dead-time as shown in **Table 5.7-29**. The adjusted change point of the negative-phase waveform is automatically set in the GTCCRB register. An internal signal is used to determine the change point of the positive-phase waveform, thus the value of the GTCCRA register is not updated by the adjusted value.

In saw-wave one-shot pulse mode, if the order of the change point becomes inconsistent by adjustment of the waveform change point due to occurrence of dead time errors, or if the change point exceeds the count period even after the adjustment, the complementary relation between the positive- and negative-phases cannot be guaranteed.

In triangle-wave PWM mode, if dead-time exceeds the count period by setting 0000_0000h or a value greater than or equal to the setting value of the GTPR register is set in the GTCCRA register, output change is controlled by the output protection function (see **5.7.8.4 GTIOCnm Protection Function for GTIOCnm Pin Output (n = 0 to 15; m = A, B)**). When GTCCRA register is greater than or equal to [GTPR register + GTDVm (m = U, D) register], [GTPR register − 1] is set in the GTCCRB register as the upper limit.

Automatic setting for a dead time value to the GTCCRB register is performed at the next count clock after the register value for calculating the automatic setting value is updated. In triangle-wave mode, it can also be done at the next count clock from the current crest.

Table 5.7-29 Adjustment of the waveform change point when a dead-time error occurs

Mode	Count direction	Period	Condition for dead-time error	Change point of the positive-phase waveform after adjustment	Change point of the negative-phase waveform after adjustment
Saw-wave one-shot pulse mode	Up-counting	First half	GTCCRA − GTDVU < 0	GTDVU	0
		Second half	GTCCRA + GTDVD > GTPR	GTPR − GTDVD	GTPR
	Down-counting	First half	GTCCRA + GTDVU > GTPR	GTPR − GTDVU	GTPR
		Second half	GTCCRA − GTDVD < 0	GTDVD	0
Triangle-wave PWM mode 1/2/3	Up-counting	(First half)	GTCCRA − GTDVU ≤ 0	GTDVU + 1	1
	Down-counting	(Second half)	GTCCRA − GTDVD < 0	GTDVD	0

Figure 5.7-28 to **Figure 5.7-30** show examples of automatic dead time setting function operation.

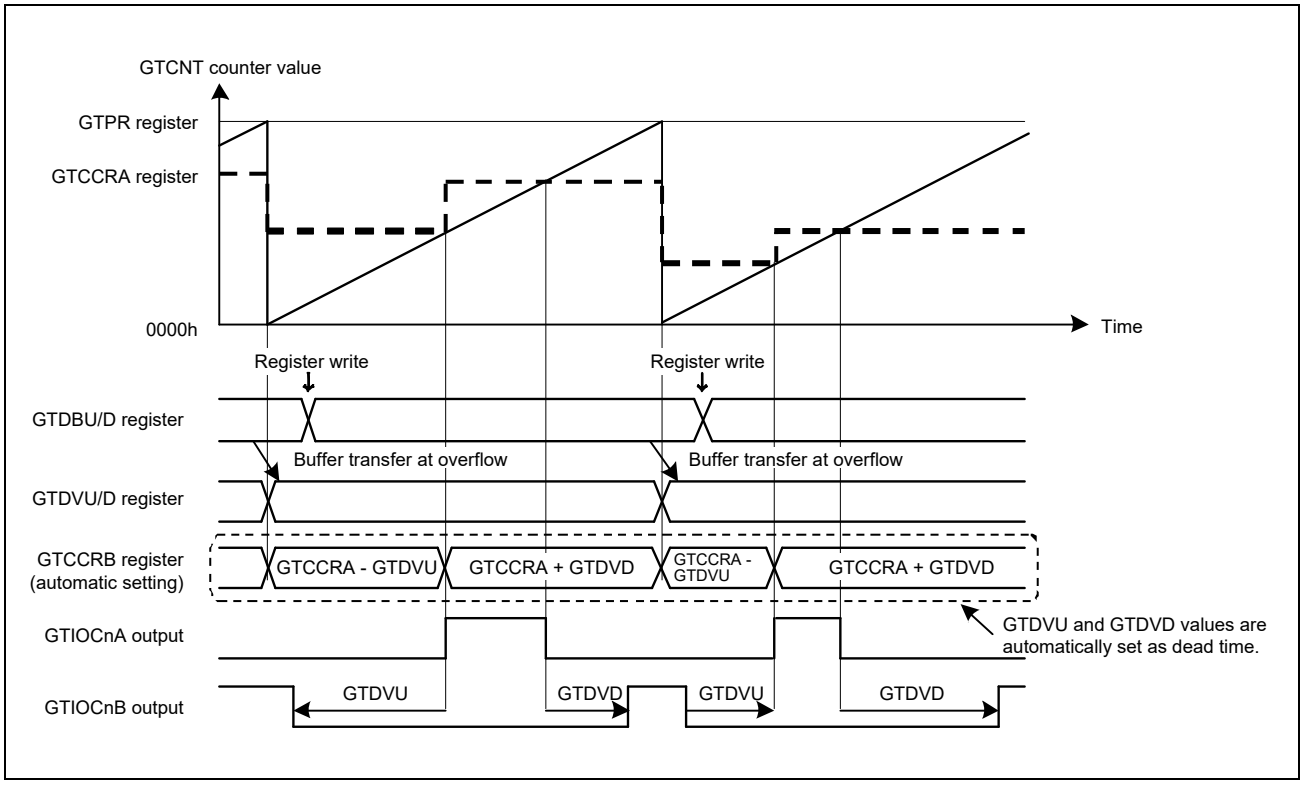


Figure 5.7-28 Example of automatic dead time setting function operation (saw-wave one-shot pulse mode, up-counting, GTDVU and GTDVD registers set to buffer operation, active-level: high) (n = 0 to 15)

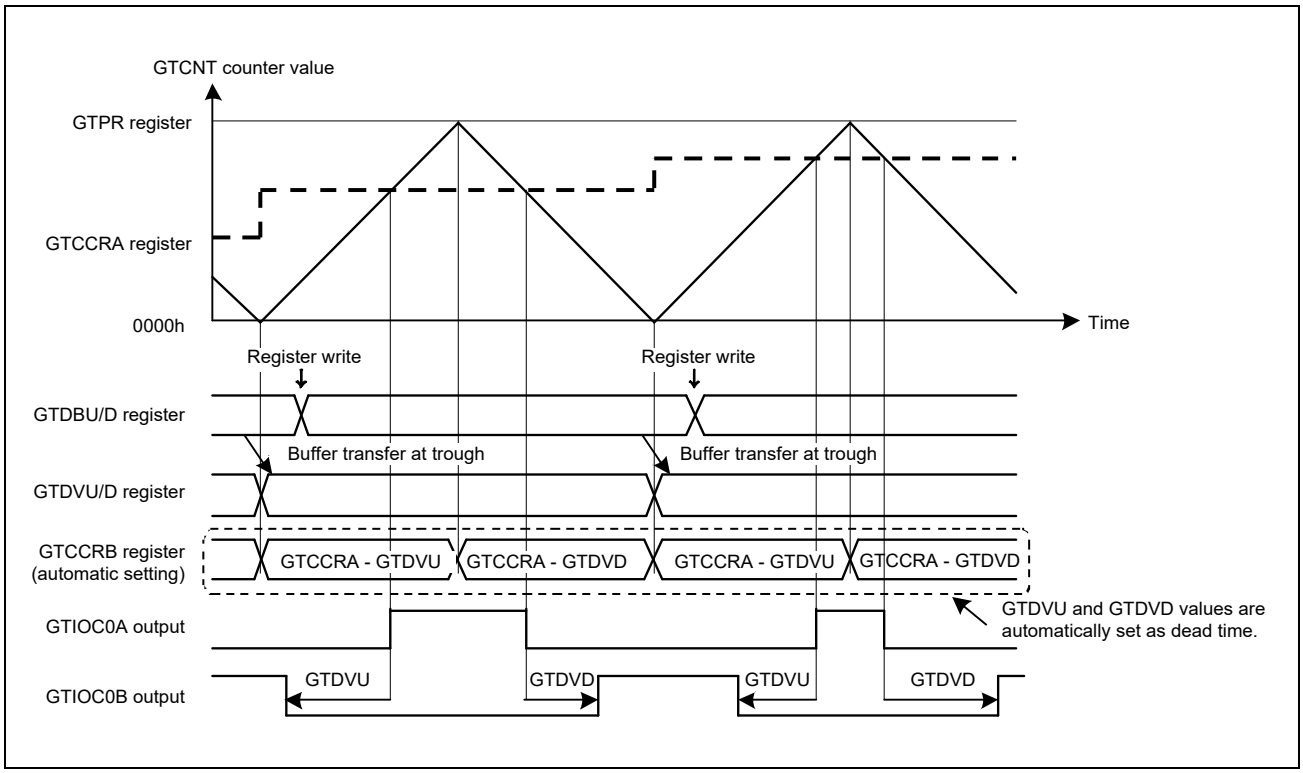

Figure 5.7-29 Example of automatic compare-match value setting function with dead time (triangle-wave PWM mode 1, GTDVU and GTDVD registers set to buffer operation, active-level: high)

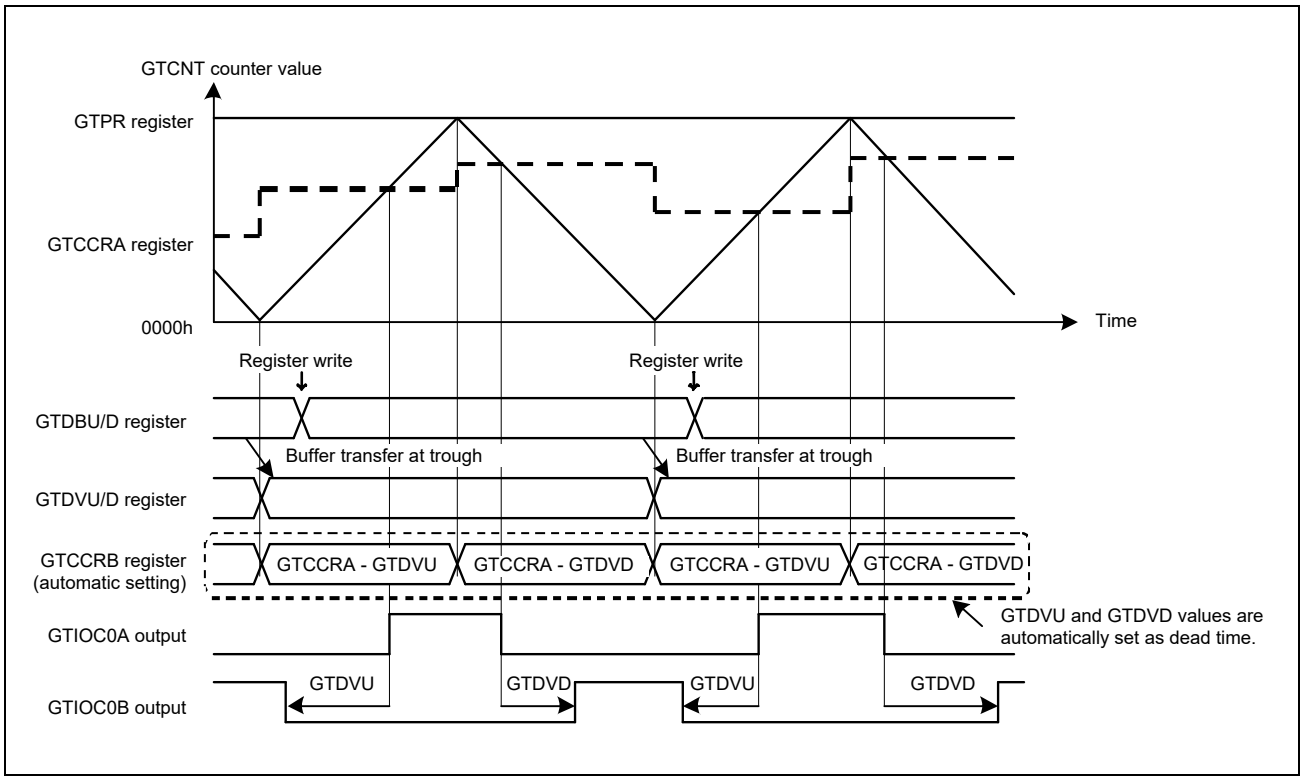

Figure 5.7-30 Example of automatic compare-match value setting function with dead time (triangle-wave PWM mode 2 or 3, GTDVU and GTDVD registers set to buffer operation, active-level: high)

The following example shows the settings for the automatic dead time setting function (saw-wave one-shot pulse mode, triangle-wave PWM mode 3). Note that n = 0 to 15 and m = A, B for the signals below.

1. Set operating mode
   Set the operating mode with the GTCR.MD[2:0] bits.
   In **Figure 5.7-28**, 001b (saw-wave one-shot pulse mode) is set. In **Figure 5.7-30**, 110b (triangle-wave PWM mode 3) is set.
2. Select count direction
   Select the count direction (up or down) with the GTUDDTYC register. In **Figure 5.7-28**, the lower 2 bits of the GTUDDTYC register is set to 11b and then to 01b for up counting.
3. Select count clock
   Select the count clock with GTCR.TPCS[3:0] bits.
4. Period setting
   Set a period in the GTPR register.
5. Set initial value for counter
   Set the initial value in the GTCNT counter.
6. Set GTIOCnm pin function
   Set the GTIOCnm pin function with the GTIOA[4:0] and GTIOB[4:0] bits in the GTIOR register. In **Figure 5.7-28** and **Figure 5.7-30**, GTIOA[4:0] bits = 0_0011b and GTIOB[4:0] bits = 1_0011b.
7. Enable GTIOCnm pin output
   Set to enable the GTIOCnm pin output with the OAE and OBE bits in the GTIOR register.
8. Set buffer value for compare match
   Set the GTIOCnA pin changing point immediately after the count start in the GTCCRC and GTCCRD registers.
9. Set forcible buffer transfer for compare match
   Set the GTBER.CCRSWT bit to 1b to transfer buffer register data forcibly to the GTCCRA register.
10. Set buffer value for compare match
    Set the GTIOCnA pin changing point in one cycle after the count start in the GTCCRC and GTCCRD registers.
11. Set automatic dead time setting function
    Set GTDTCR.TDE to 1b to enable the automatic dead time setting function.
12. Set buffer operation for dead time setting
    Set buffer operation with the TDBUE and TDBDE bits in the GTDTCR register.
13. Set dead time value
    Set the first half dead time value in the GTDVU register and the second half dead time in the GTDVD register. When the GTDVU register is set with the GTDTCR.TDFER bit set to 1b, the same value is also set to the GTDVD register, the same dead time value can be set for the first and second halves.
14. Set buffer value for dead time
    For buffer operation, set the first half dead time in one cycle after the current cycle in the GTDBU register and the second half dead time in the GTDBD register.
15. Set count operation
    Set the GTCR.CST bit to 1b to start count operation.

16. Set buffer value by cycle
    Set the GTIOCnA pin changing point for the next cycle from the current cycle to the GTCCRC and GTCCRD registers. When the dead time register is used for buffer operation, set the dead time value in the first half of the next cycle from the current cycle to the GTDBU register and the dead time value in the second half to the GTDBD register.

The following example shows the settings for the automatic dead time setting function (triangle-wave PWM mode 1 or 2). Note that n = 0 to 15 and m = A, B for the signals below.

1. Set operating mode
   Set the operating mode with the GTCR.MD[2:0] bits.
   In **Figure 5.7-29**, 100b (triangle-wave PWM mode 1) is set.
   In **Figure 5.7-30**, 101b (triangle-wave PWM mode 2) is set.
2. Select count clock
   Select the count clock with GTCR.TPCS[3:0] bits.
3. Period setting
   Set a period in the GTPR register.
4. Set initial value for counter
   Set the initial value in the GTCNT counter.
5. Set GTIOCnm pin function
   Set the GTIOCnm pin function with the GTIOA[4:0] and GTIOB[4:0] bits in the GTIOR register.
   In **Figure 5.7-29** and **Figure 5.7-30**, GTIOA[4:0] bits = 0_0011b and GTIOB[4:0] bits = 1_0011b.
6. Enable GTIOCnm pin output
   Set to enable the GTIOCnm pin output with the OAE and OBE bits in the GTIOR register.
7. Set buffer operation for compare match
   Set buffer operation with the GTBER.CCRA[1:0] bits.
8. Set the value for compare match
   Set the GTIOCnA pin changing point to the GTCCRA register.
9. Set buffer value for compare match
   For buffer operation, set the GTIOCnA pin changing point in one cycle after the current cycle (in triangle-wave PWM mode 1) or half cycle after the current cycle (in triangle-wave PWM mode 2) in the GTCCRC register. For double buffer operation, also set the GTIOCnA pin changing point in two cycles after the current cycle (in triangle-wave PWM mode 1) or one cycle after the current cycle (in triangle-wave PWM mode 2) in the GTCCRD register.
10. Set automatic dead time setting function
    Set GTDTCR.TDE to 1b to enable the automatic dead time setting function.
11. Set buffer operation for dead time setting
    Set buffer operation with the TDBUE and TDBDE bits in the GTDTCR register.
12. Set dead time value
    Set the first half dead time value in the GTDVU register and the second half dead time in the GTDVD register. When the GTDVU register is set with the GTDTCR.TDFER bit set to 1b, the same value is also set to the GTDVD register, and the same dead time value can be set for the first and second halves.

13. Set buffer value for dead time
    For buffer operation, set the first half dead time in one cycle after the current cycle in the GTDBU register and the second half dead time in the GTDBD register.
14. Set count operation
    Set the GTCR.CST bit to 1b to start count operation.
15. Set buffer value by cycle
    For buffer operation of compare match registers, set the GTIOCnA pin changing point in one cycle after the current cycle (in triangle-wave PWM mode 1) or half cycle after the current cycle (in triangle-wave PWM mode 2) in the GTCCRC register. For double buffered operation of compare match registers, set the GTICCnA pin changing point in two cycles after the current cycle (in triangle-wave PWM mode 1) or one cycle after the current cycle (in triangle-wave PWM mode 2) in the GTCCRD register.
    In the same way, set the dead time value in the first half of the cycle after the current cycle in the GTDBU register and the dead time in the second half in the GTDBD register.

5.7.3.5 Count Direction Changing Function

The count direction of the GTCNT counter can be changed by modifying the UD bit in GTUDDTYC.

In saw-wave mode, if the UD bit in GTUDDTYC is modified during counting, the count direction is changed on overflow (when modified during up-counting) or underflow (when modified during down-counting). If the GTUDDTYC.UD bit is modified while counting is stopped and the GTUDDTYC.UDF bit is 0b, the GTUDDTYC.UD bit modification is not reflected at the start of counting and the count direction is changed on overflow or underflow. If the UDF bit is set to 1b while counting is stopped, the GTUDDTYC.UD bit value at that time is reflected at the start of counting.

In triangle-wave mode, the count direction is not changed even though the UD bit in GTUDDTYC is modified during counting. Similarly, even though the GTUDDTYC.UD bit is modified while counting is stopped and GTUDDTYC.UDF bit is 0b, the GTUDDTYC.UD bit value is not reflected in counting operation. If the GTUDDTYC.UDF bit is set to 1b while counting is stopped, the GTUDDTYC.UD bit value at that time is reflected at the start of counting.

If the count direction is changed during a saw-wave count operation, the GTPR value after the start of up-counting is reflected in the counting cycle during up-counting and the GTPR value after the start of down-counting is reflected in the counting cycle during down-counting.

Figure 5.7-31 shows an example of count direction changing function operation.

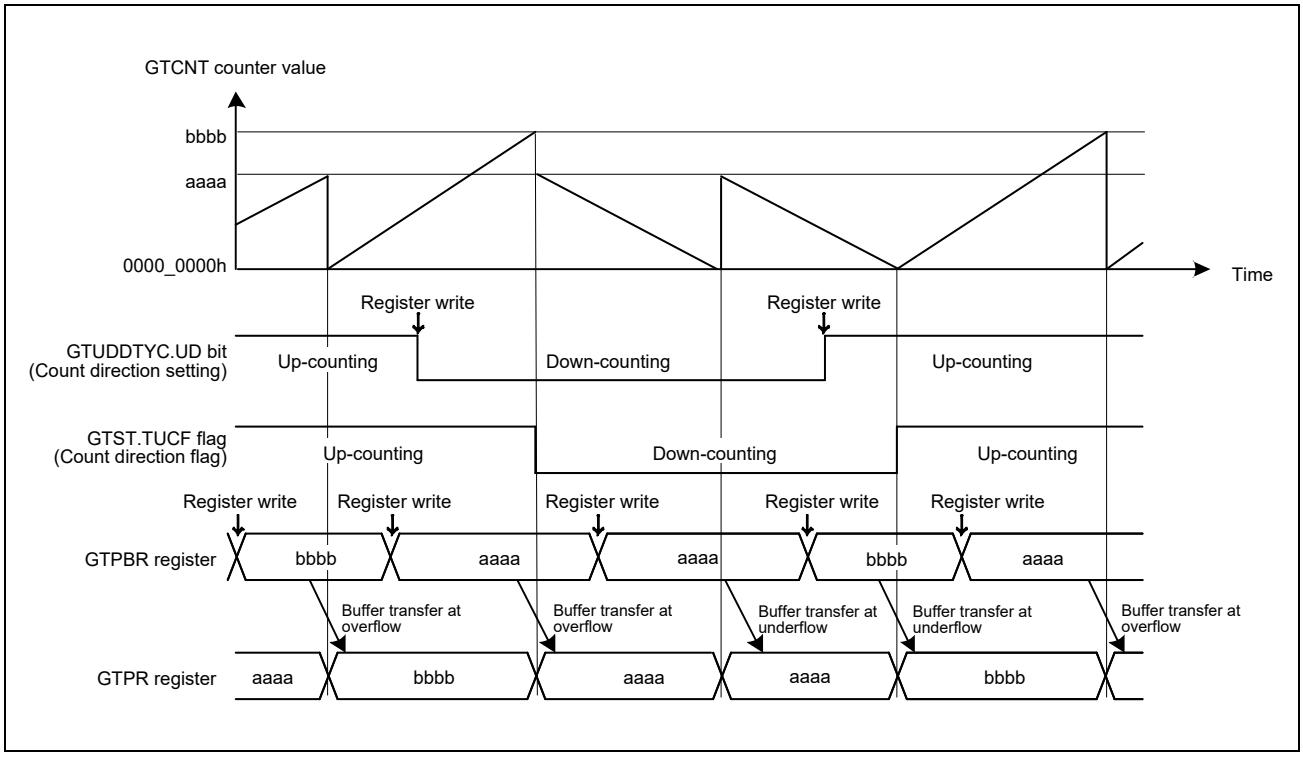

Figure 5.7-31 Example of a Count Direction Changing Function Operation during Buffer Operation

5.7.3.6 Function of Output Duty 0% and 100%

The output duty cycle of the GTIOCnA and GTIOCnB pins (n = 0 to 15) is set to 0% or 100% by changing the GTUDDTYC.OADTY or GTUDDTYC.OBDTY bit.

In saw-wave mode, if the GTUDDTYC.OADTY or GTUDDTYC.OBDTY bit is modified during counting, the output duty-cycle setting is reflected on overflow (when modified during up-counting) or underflow (when modified during down-counting). If the GTUDDTYC.OADTY or GTUDDTYC.OBDTY bit is modified while counting is stopped and the GTUDDTYC.OADTYF or the GTUDDTYC.OBDTYF bit is 0b, the output duty-cycle modification is not reflected at the start of counting. The output duty cycle changes on overflow or underflow. If the GTUDDTYC.OADTY or GTUDDTYC.OBDTY bit is modified while counting is stopped and the GTUDDTYC.OADTYF or GTUDDTYC.OBDTYF bit is 1b, the GTUDDTYC.OADTY or GTUDDTYC.OBDTY bit value at that time is reflected at the start of counting.

In triangle-wave mode, if the GTUDDTYC.OADTY or GTUDDTYC.OBDTY bit is modified during counting, the output duty-cycle setting is reflected on underflow.

If the GTUDDTYC.OADTY or GTUDDTYC.OBDTY bit is modified while counting is stopped and the GTUDDTYC.OADTYF or GTUDDTYC.OBDTYF bit is 0, the output duty-cycle modification is not reflected at the start of counting. The output duty cycle changes on underflow. If the GTUDDTYC.OADTY or GTUDDTYC.OBDTY bit is modified while counting is stopped and the GTUDDTYC.OADTYF or GTUDDTYC.OBDTYF bit is 1b, the output duty-cycle modification is reflected at the start of counting.

In performing 0% or 100% duty-cycle operation, GPT internally continues the following operations:

- Perform compare match operation
- Set compare match flag
- Output interrupts
- Perform buffer operation.

When control is changed from the 0% or 100% duty-cycle setting to the compare match, the output value of GTIOCnA pin at the cycle end is decided by GTIOR.GTIOA[3:2] and GTUDDTYC.OADTYR. The output value of GTIOCnB pin at the cycle end is decided by GTIOR.GTIOB[3:2] and GTUDDTYC.OBDTYR.

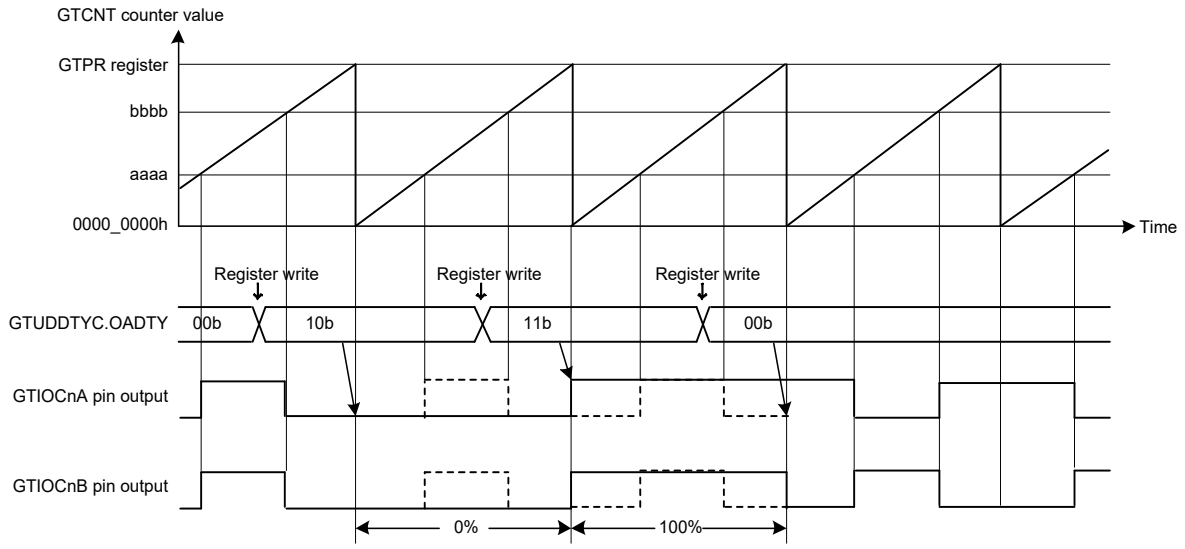
When GTIOR.GTIOA[3:2] and GTIOR.GTIOB[3:2] are set to 01b, the output pins output the low level at the cycle end. When GTIOR.GTIOA[3:2] and GTIOR.GTIOB[3:2] are set to 10b, the output pins output the high level at the cycle end.

GTUDDTYC.OADTYR selects the target value for output retained/toggled at the cycle end, when GTIOR.GTIOm[3:2] are set to 00b (output retained at the cycle end) or when GTIOR.GTIOm[3:2] are set to 11b (output toggled at the cycle end). **Table 5.7-30** shows the output values of the GTIOCnA and GTIOCnB pins at the cycle end.

Table 5.7-30 Output Values after Release from 0% or 100% Duty-Cycle Setting (m = A, B)

GTIOR.GTIOm[3:2]	Compare Match Value at Cycle End Masked by 0% or 100% Duty-Cycle Setting	GTUDDTYC.OmDTYR in Duty 0% Setting		GTUDDTYC.OmDTYR in Duty 100% Setting	
		0	1	0	1
00b (output retained at cycle end)	0	0	0	1	0
	1	0	1	1	1
01b (low-level output at cycle end)	—	0	0	0	0
10b (high-level output at cycle end)	—	1	1	1	1
11b (output toggled at cycle end)	0	1	1	0	1
	1	1	0	0	0

Figure 5.7-32 shows an example of output duty-cycle 0% and 100% function.



[Setting examples]

GTIOR.GTIOA[4:0] bits: 0_0011b
Initial low-level output, output toggled at compare match, output retained at cycle end

GTUDDTYC.OADTYR bit: 0b
The function selected by GTIOA[3:2] is applied to the output value when the duty cycle is set after release from 0% or 100% duty-cycle setting.

GTIOR.GTIOB[4:0] bits: 0_0011b
Initial low-level output, output toggled at compare match, output retained at cycle end

GTUDDTYC.OBDTYR bit: 1
The function of GTIOB[3:2] is applied to the compare match output value which is masked after 0% or 100% duty-cycle setting release.

Note: The base addresses of the registers are the same.

Figure 5.7-32 Example of Output Duty 0% and 100% Function

5.7.3.7 Hardware Count Start/Count Stop and Clear Operation

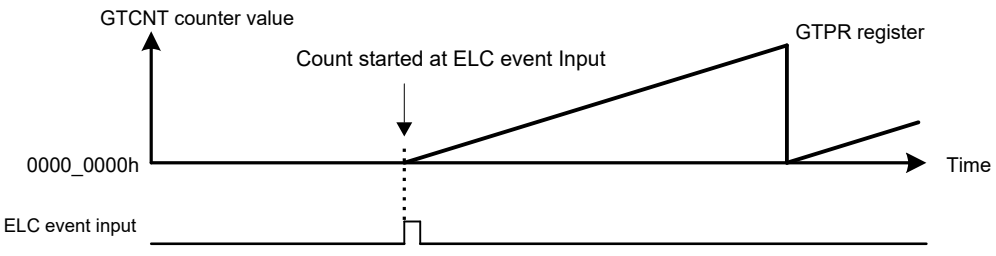
The GTCNT counter can be started, stopped, or cleared by the following hardware sources:

- External trigger input
- ELC event input
- GTIOCnA and GTIOCnB pin input (n = 0 to 15)

5.7.3.7.1 Hardware Start Operation

The GTCNT counter can be started by selecting a hardware source using GTSSR.

Figure 5.7-33 shows an example of count start operation by a hardware source. **Table 5.7-31** shows the setting example.



Note: ELC event input: ELC_GPTA event input

Figure 5.7-33 Example of Count Start Operation by Hardware Source (Starting at the Input of the Signal from the ELC_GPTA Event)

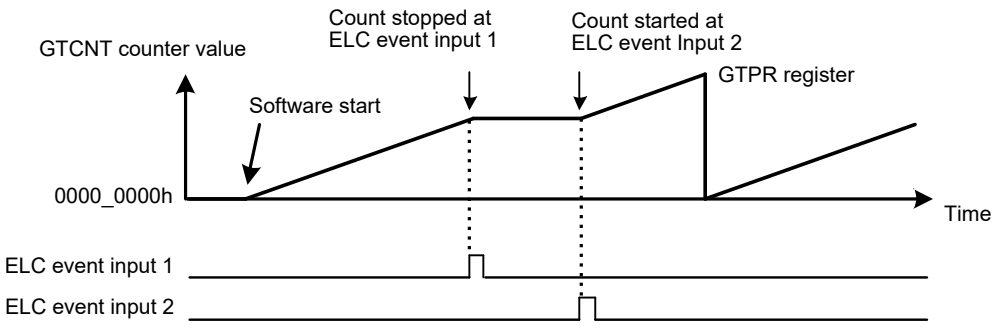
Table 5.7-31 Example Setting for Count Start Operation by Hardware Source

No.	Step Name	Description
1	Set operating mode	Set the operating mode with the GTCR.MD[2:0] bits. In **Figure 5.7-33**, 000b (saw-wave PWM mode) is set.
2	Set count direction	Select the count direction (up or down) with the GTUDDTYC register. In **Figure 5.7-33**, after 11b is set in the GTUDDTYC[1:0] bits, 01b is set in the GTUDDTYC[1:0] bits (up-counting).
3	Select count clock	Select the count clock with the GTCR.TPCS[3:0] bits.
4	Set cycle	Set the cycle in the GTPR register.
5	Set initial value for counter	Set the initial value in the GTCNT counter. In **Figure 5.7-33**, 0000_0000h is set.
6	Set hardware count start	Select a hardware source for starting count operation in the GTSSR register. In **Figure 5.7-33**, GTSSR.SSELCA = 1
7	Set hardware source operation	Set operation of the hardware source selected by the GTSSR register and start counting. In **Figure 5.7-33**, the ELC_GPTA event input operation is set.

5.7.3.7.2 Hardware Stop Operation

The GTCNT counter can be stopped by selecting a hardware source using GTPSR.

Figure 5.7-34 shows an example of count stop operation by a hardware source. **Table 5.7-32** shows the setting example. In this example, counting stops at the ELC_GPTA event input and restarts at the ELC_GPTB event input.



Note: ELC event input 1: ELC_GPTA event input
ELC event input 2: ELC_GPTB event input

Figure 5.7-34 Example of Count Stop Operation by Hardware Source (Starting by Software, Stopping at ELC_GPTA Input, and Restarting at ELC_GPTB Input)

Table 5.7-32 Example Setting for Count Stop Operation by Hardware Source

No.	Step Name	Description
1	Set operating mode	Set the operating mode with GTCR.MD[2:0]. In **Figure 5.7-34**, 000b (saw-wave PWM mode) is set.
2	Set count direction	Select the count direction (up or down) with the GTUDDTYC register. In **Figure 5.7-34**, after 11b is set in GTUDDTYC[1:0], 01b is set in GTUDDTYC[1:0] (up-counting).
3	Select count clock	Select the count clock with GTCR.TPCS[3:0].
4	Set cycle	Set the cycle in GTPR.
5	Set initial value for counter	Set the initial value in the GTCNT counter. In **Figure 5.7-34**, 0000_0000h is set.
6	Set hardware count start	Select a hardware source for starting count operation in GTSSR register, and wait for count start by the hardware source. In **Figure 5.7-34**, GTSSR.SSELCB = 1b.
7	Set hardware count stop	Select a hardware source for stopping count operation in GTPSR register and wait for count stop by the hardware source. In **Figure 5.7-34**, GTPSR.PSELCA = 1b.
8	Set hardware source operation	Set operation of the hardware source selected in GTSSR register or GTPSR register, and start or stop counting. In **Figure 5.7-34**, ELC_GPTA input operation and ELC_GPTB input operation are set.

Figure 5.7-35 shows an example of count start/stop operation by a hardware source. **Table 5.7-33** shows the setting example. In this example, the counter operates during the high-level periods of the external trigger input GTETRGA.

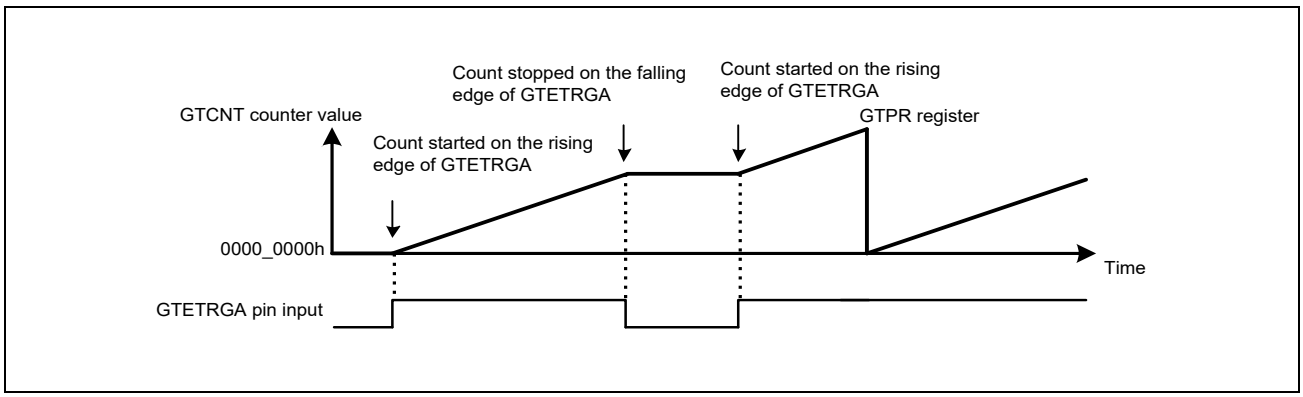


Figure 5.7-35 Example of Count Start/Stop Operation by Hardware Source (Starting on the Rising Edge of GTETRGA Pin Input, and Stopping on the Falling Edge of GTETRGA Pin Input)

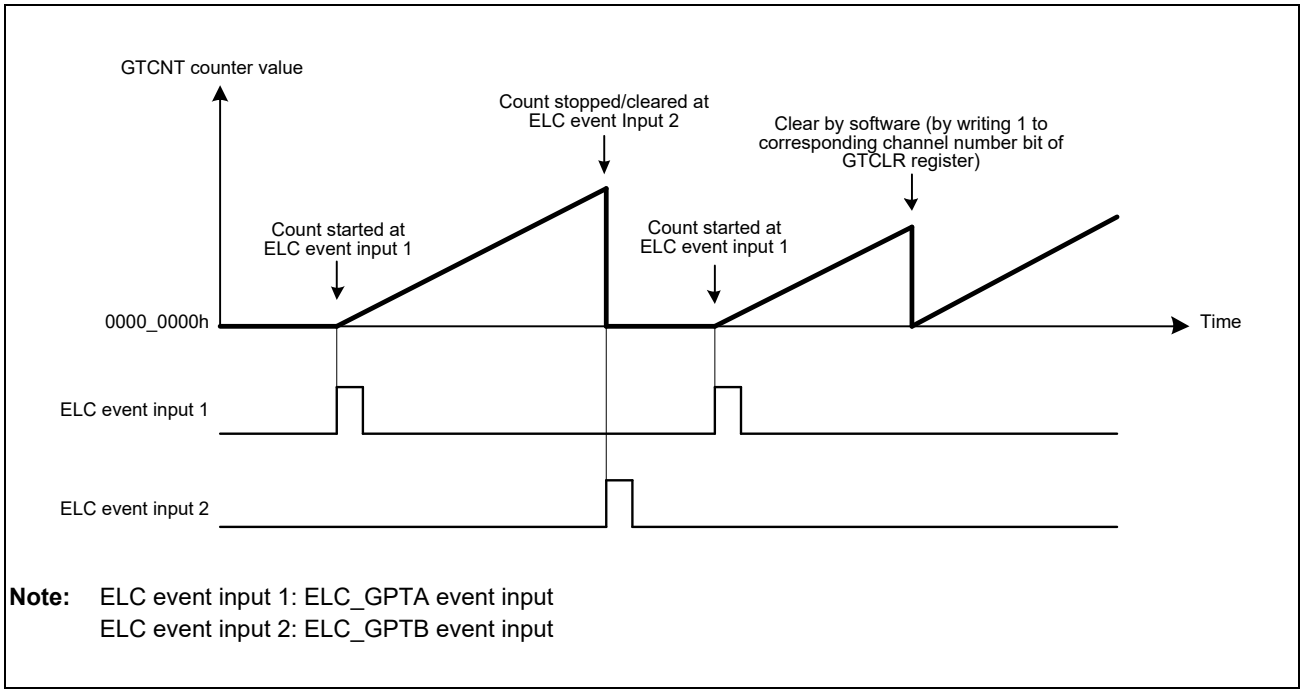
Table 5.7-33 Example Setting for Count Start/Stop Operation by Hardware Source

No.	Step Name	Description
1	Set operating mode	Set the operating mode with the GTCR.MD[2:0] bits. In **Figure 5.7-35**, 000b (saw-wave PWM mode) is set.
2	Set count direction	Select the count direction (up or down) with the GTUDDTYC register. In **Figure 5.7-35**, after 11b is set in the GTUDDTYC[1:0] bits, 01b is set in the GTUDDTYC[1:0] bits (up-counting).
3	Select count clock	Select the count clock with the GTCR.TPCS[3:0] bits.
4	Set cycle	Set the cycle in the GTPR register.
5	Set initial value for counter	Set the initial value in the GTCNT counter. In **Figure 5.7-35**, 0000_0000h is set.
6	Set hardware count start	Select a hardware source for starting count operation with the GTSSR register, and wait for count start by the hardware source. In **Figure 5.7-35**, GTSSR.SSGTRGAR = 1b.
7	Set hardware count stop	Select a hardware source for stopping count operation with the GTPSR register, and wait for count stop by the hardware source. In **Figure 5.7-35**, GTPSR.PSGTRGAF = 1b.
8	Set hardware source operation	Set operation of the hardware source selected in the GTSSR register or GTPSR register and start or stop counting. In **Figure 5.7-35**, the GTETRGA pin operation is set.

5.7.3.7.3 Hardware Clear Operation

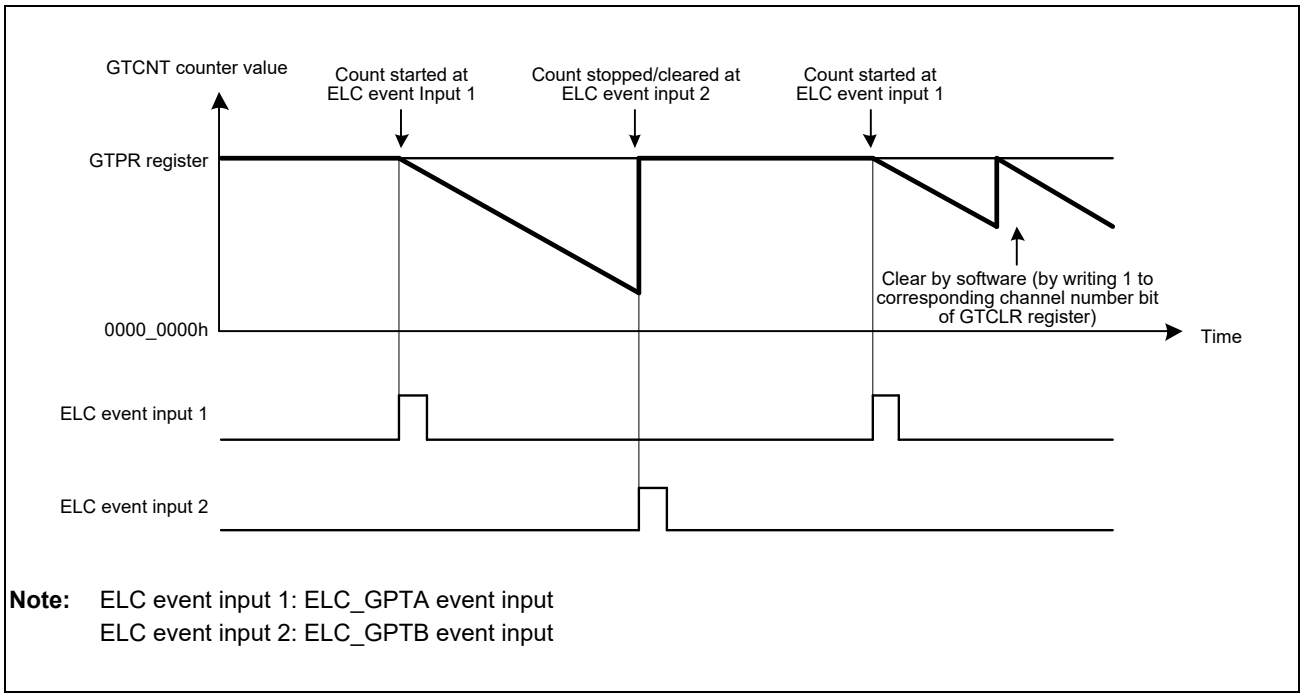
The GTCNT counter can be cleared by selecting a hardware source using GTCSR. The GPT_Ux_gpt_gtciv_n_m/GPT_Ux_gpt_gtciu_n_m (m = 0 to 7) interrupt (overflow/underflow interrupt) is not generated when the GTCNT counter is cleared by a hardware source or by software.

Figure 5.7-36 and **Figure 5.7-37** show examples of clearing the GTCNT counter by a hardware source. **Table 5.7-34** shows the setting example. In this example, the GTCNT counter starts at the ELC_GPTA input, and the counter is stopped and cleared at the ELC_GPTB input.



Note: ELC event input 1: ELC_GPTA event input
ELC event input 2: ELC_GPTB event input

Figure 5.7-36 Examples of Count Clearing Operation by Hardware Source in Saw Wave Up-Counting (Starting at ELC_GPTA Input, and Stopping/Clearing at ELC_GPTB Input)



Note: ELC event input 1: ELC_GPTA event input
ELC event input 2: ELC_GPTB event input

Figure 5.7-37 Examples of Count Clearing Operation by Hardware Source in Saw Wave Down-Counting (Starting at ELC_GPTA Input, and Stopping/Clearing at ELC_GPTB Input)

Table 5.7-34 Example Setting for Count Clearing Operation by Hardware Source

No.	Step Name	Description
1	Set operating mode	Set the operating mode with the GTCR.MD[2:0] bits. In **Figure 5.7-36** and **Figure 5.7-37**, 000b (saw-wave PWM mode) is set.
2	Set count direction	Select the count direction (up or down) with the GTUDDTYC register. In **Figure 5.7-36**, after 11b is set in the GTUDDTYC[1:0] bits, 01b is set in the GTUDDTYC[1:0] bits (up-counting). In **Figure 5.7-37**, after 10b is set in the GTUDDTYC[1:0] bits, 00b is set in the GTUDDTYC[1:0] bits (down-counting).
3	Select count clock	Select the count clock with the GTCR.TPCS[3:0] bits.
4	Set cycle	Set the cycle in the GTPR register.
5	Set initial value for counter	Set the initial value in the GTCNT counter. In **Figure 5.7-36**, 0000_0000h is set. In **Figure 5.7-37**, the GTPR register value is set.
6	Set hardware count start	Select a hardware source for starting count operation in the GTSSR register, and wait for count start by the hardware source. In **Figure 5.7-36** and **Figure 5.7-37**, GTSSR.SSELCA = 1b.
7	Set hardware count stop	Select a hardware source for stopping count operation in the GTPSR register, and wait for count stop by the hardware source. In **Figure 5.7-36** and **Figure 5.7-37**, GTPSR.PSELCB = 1b.
8	Set hardware count clear	Select a hardware source for clearing count operation in the GTCSR register, and wait for count clear by the hardware source. In **Figure 5.7-36** and **Figure 5.7-37**, GTCSR.CSELCB = 1b.
9	Set hardware source operation	Set operation of the hardware source selected in the GTSSR register, GTPSR register or GTCSR register and start, stop or clear counting. In **Figure 5.7-36** and **Figure 5.7-37**, the ELC_GPTA input and ELC_GPTB input are set.

The GPT_Ux_gpt_gtciv_n_m/GPT_Ux_gpt_gtciu_n_m (m = 0 to 7) interrupt (overflow/underflow interrupt) is not generated when the counter is cleared by a hardware source or by software.

Figure 5.7-38 shows the relationship between counter clearing by a hardware source and the GPT_Ux_gpt_gtciv_n_m interrupt.

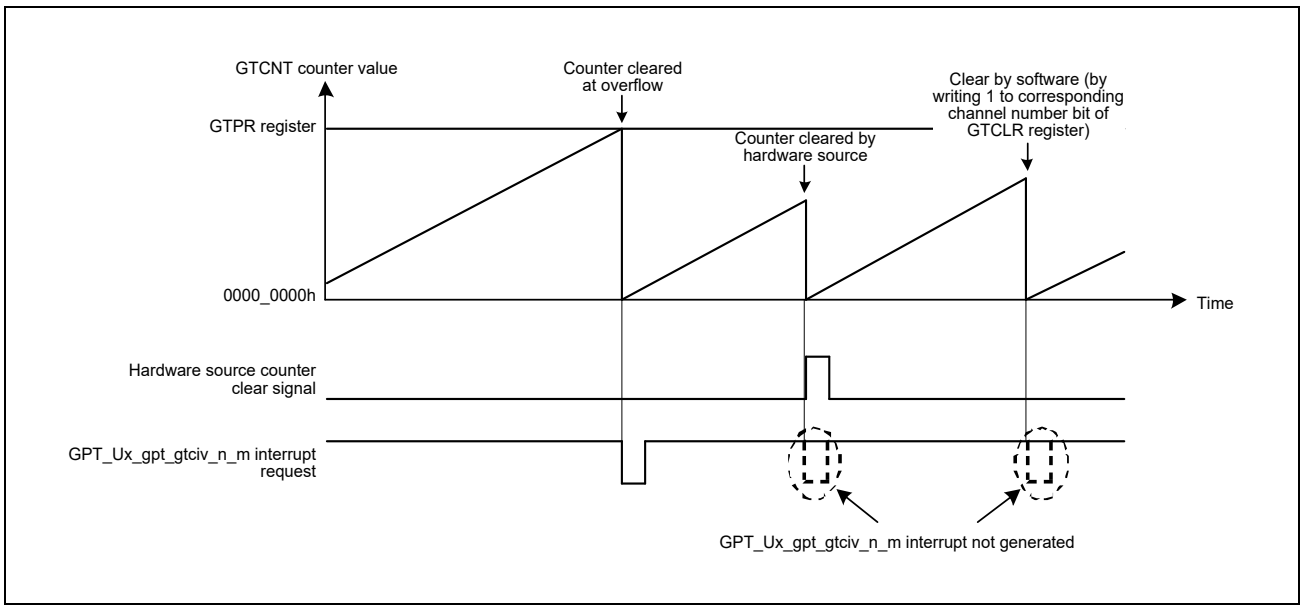


Figure 5.7-38 Relationship between Counter Clearing by Hardware Source and GPT_Ux_gpt_gtciv_n_m Interrupt

5.7.3.8 Synchronized Operation

Synchronized operation on channels such as synchronized starting, stopping, and clearing can be performed.

5.7.3.8.1 Synchronized Operation by Software

The GTCNT counters can be started, stopped, and cleared on multiple channels by setting the corresponding GTSTR, GTSTP, or GTCLR bits simultaneously to 1b.

Count start with a phase difference is possible by setting the initial value in the GTCNT counter and setting the corresponding GTSTR bits simultaneously to 1b.

Figure 5.7-39 shows an example of simultaneous starting, stopping, and clearing by software. **Figure 5.7-40** shows an example of phase start operation by software.

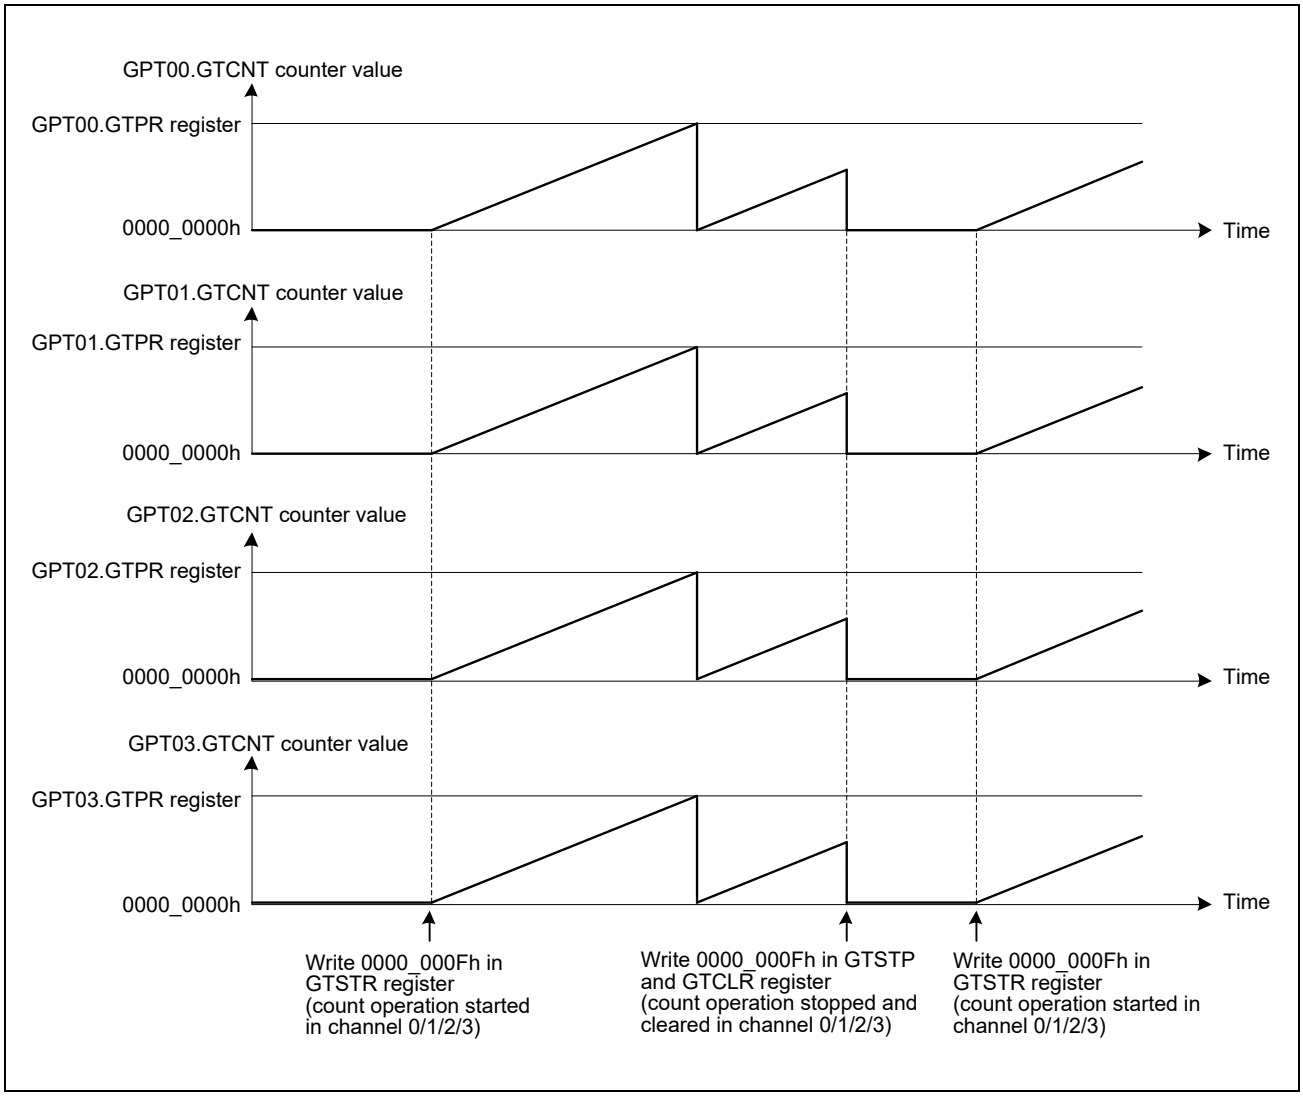

Figure 5.7-39 Example of Simultaneous Starting, Stopping, and Clearing by Software with the Same Counting Cycle (GTPR Register Value)

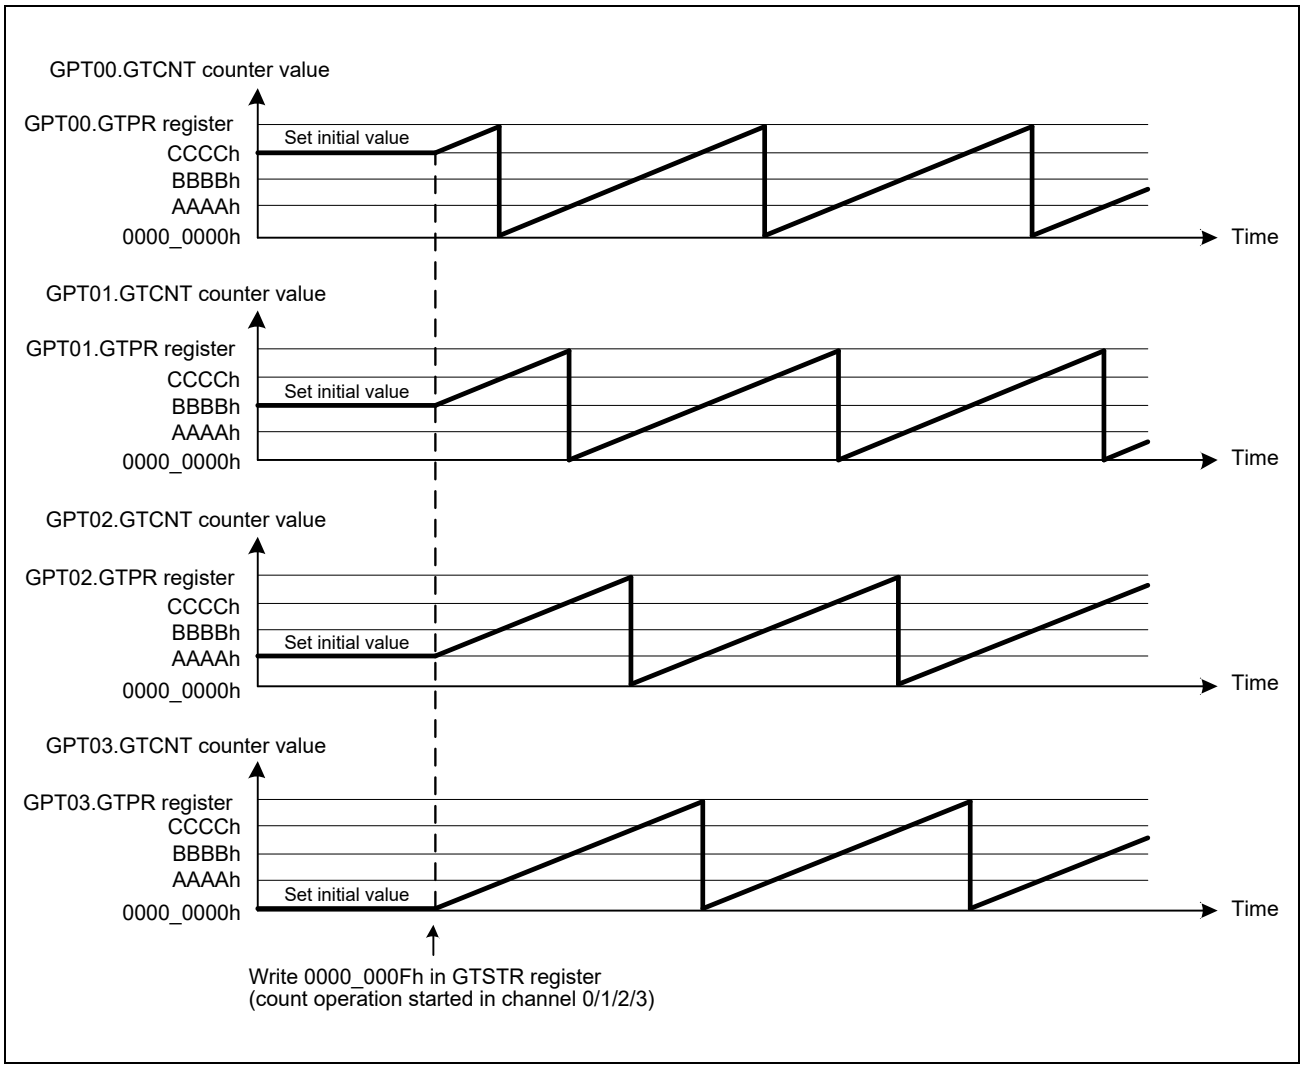

Figure 5.7-40 Example of Phase Start by Software with the Same Counting Cycle (GTPR Register Value)

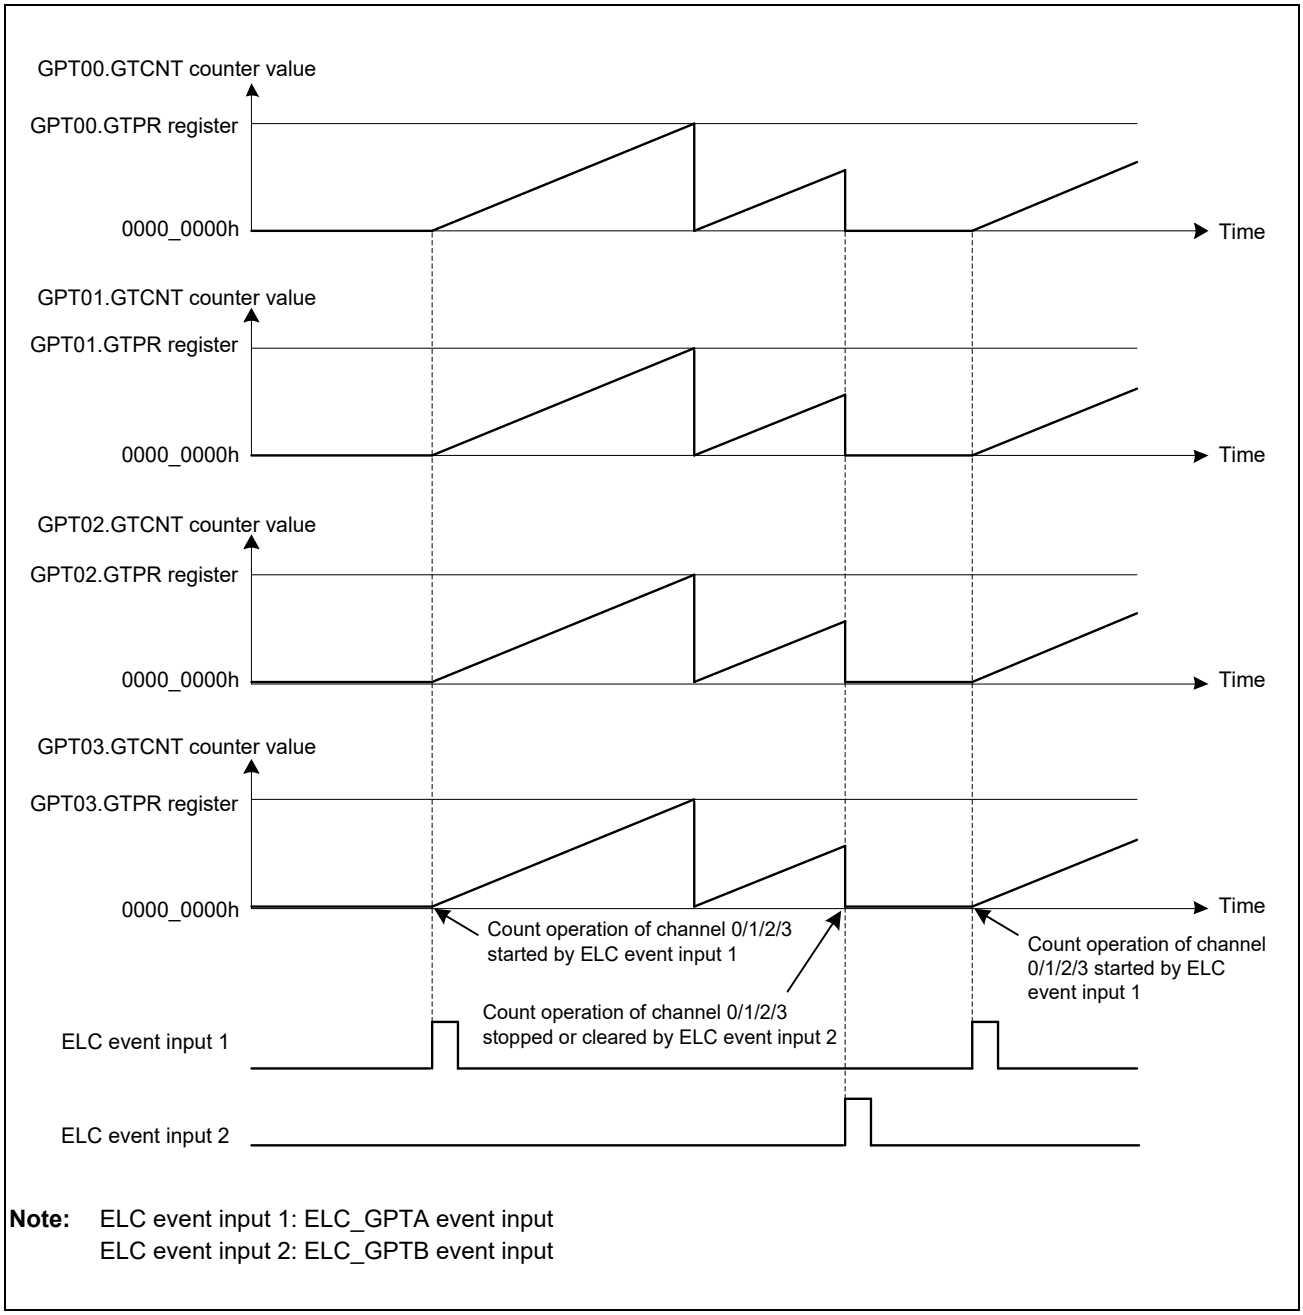
5.7.3.8.2 Synchronized Operation by Hardware

The counters for multiple channels can be started, stopped, and cleared simultaneously by the following hardware sources. Hardware sources that can cause a synchronized operation are external trigger input and ELC event input. Synchronized operation through the GTIOCnA and GTIOCnB pin inputs is possible by setting an ELC event due to input capture as a hardware source (n = 0 to 15).

Figure 5.7-41 shows an example of simultaneous starting, stopping, and clearing by a hardware source. **Table 5.7-35** shows the setting example.



Note: ELC event input 1: ELC_GPTA event input
ELC event input 2: ELC_GPTB event input

Figure 5.7-41 Example of Simultaneous Starting, Stopping, and Clearing by Hardware Source with the Same Counting Cycle (GTPR Register Value)

Table 5.7-35 Example Setting for Simultaneous Start by Hardware Source

No.	Step Name	Description
1	Set operating mode	Set the operating mode with the GTCR.MD[2:0] bits. In **Figure 5.7-41**, 000b (saw-wave PWM mode) is set.
2	Set count direction	Select the count direction (up or down) with the GTUDDTYC register. In **Figure 5.7-41**, after 11b is set in the GTUDDTYC[1:0] bits, 01b is set in the GTUDDTYC[1:0] bits (up-counting).
3	Select count clock	Select the count clock with the GTCR.TPCS[3:0] bits.
4	Set cycle	Set the cycle in the GTPR register.
5	Set initial value for counter	Set the initial value in the GTCNT counter. In **Figure 5.7-41**, 0000_0000h is set.
6	Set hardware count start	Select a hardware source for starting count operation with the GTSSR register, and wait for count start by the hardware source. In **Figure 5.7-41**, GTSSR.SSELCA = 1b.
7	Set hardware count stop	Select a hardware source for stopping count operation with the GTPSR register, and wait for count stop by the hardware source. In **Figure 5.7-41**, GTPSR.PSELCB = 1b.
8	Set hardware count clear	Select a hardware source for clearing count operation with the GTCSR register, and wait for count clear by the hardware source. In **Figure 5.7-41**, GTCSR.CSELCB = 1b.
9	Set hardware source operation	Set operation of the hardware source selected in the GTSSR, GTPSR, or GTCSR registers, and start, stop, or clear counting. In **Figure 5.7-41**, ELC_GPTA input and ELC_GPTB input are set.

5.7.3.9 PWM Output Operation Examples

5.7.3.9.1 Synchronized PWM Output

The GPT outputs 16 × 2 phases of linked PWM waveforms for a maximum of GPT × 16 channels.

Figure 5.7-42 shows an example in which four channels perform synchronized operation in saw-wave PWM mode and eight phases of PWM waveforms are output. The GTIOCnA is set so that it outputs the low level as the initial value, high level on a compare match with GTCCRA, and low level at the cycle end. The GTIOCnB is set so that it outputs the low level as the initial value, high level on a compare match with GTCCRB, and low level at the cycle end.

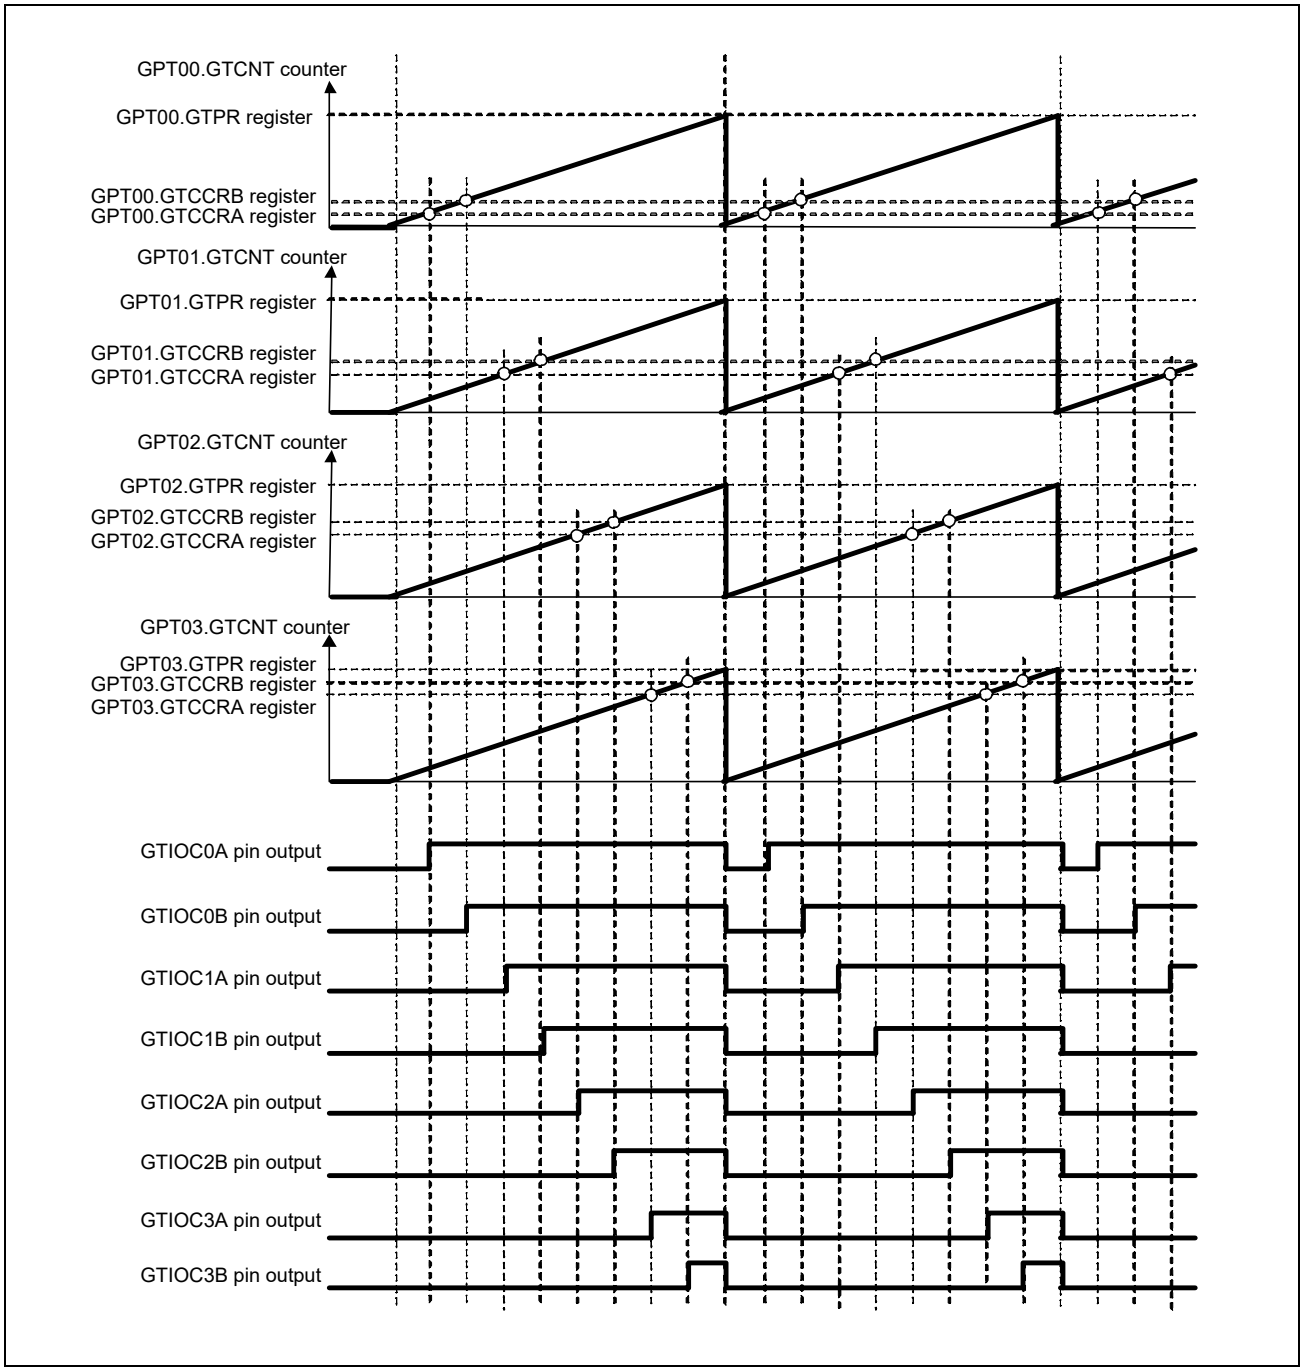


Figure 5.7-42 Example of Synchronized PWM Output

5.7.3.9.2 3-Phase Saw-Wave Complementary PWM Output

Figure 5.7-43 shows an example in which three channels perform synchronized operation in saw-wave PWM mode and 3- phase complementary PWM waveforms are output. The GTIOCnA pin is set so that it outputs the low level as the initial value, high level on a compare match with GTCCRA, and low level at the cycle end. The GTIOCnB pin is set so that it outputs the high level as the initial value, low level on a compare match with GTCCRB, and high level at the cycle end.

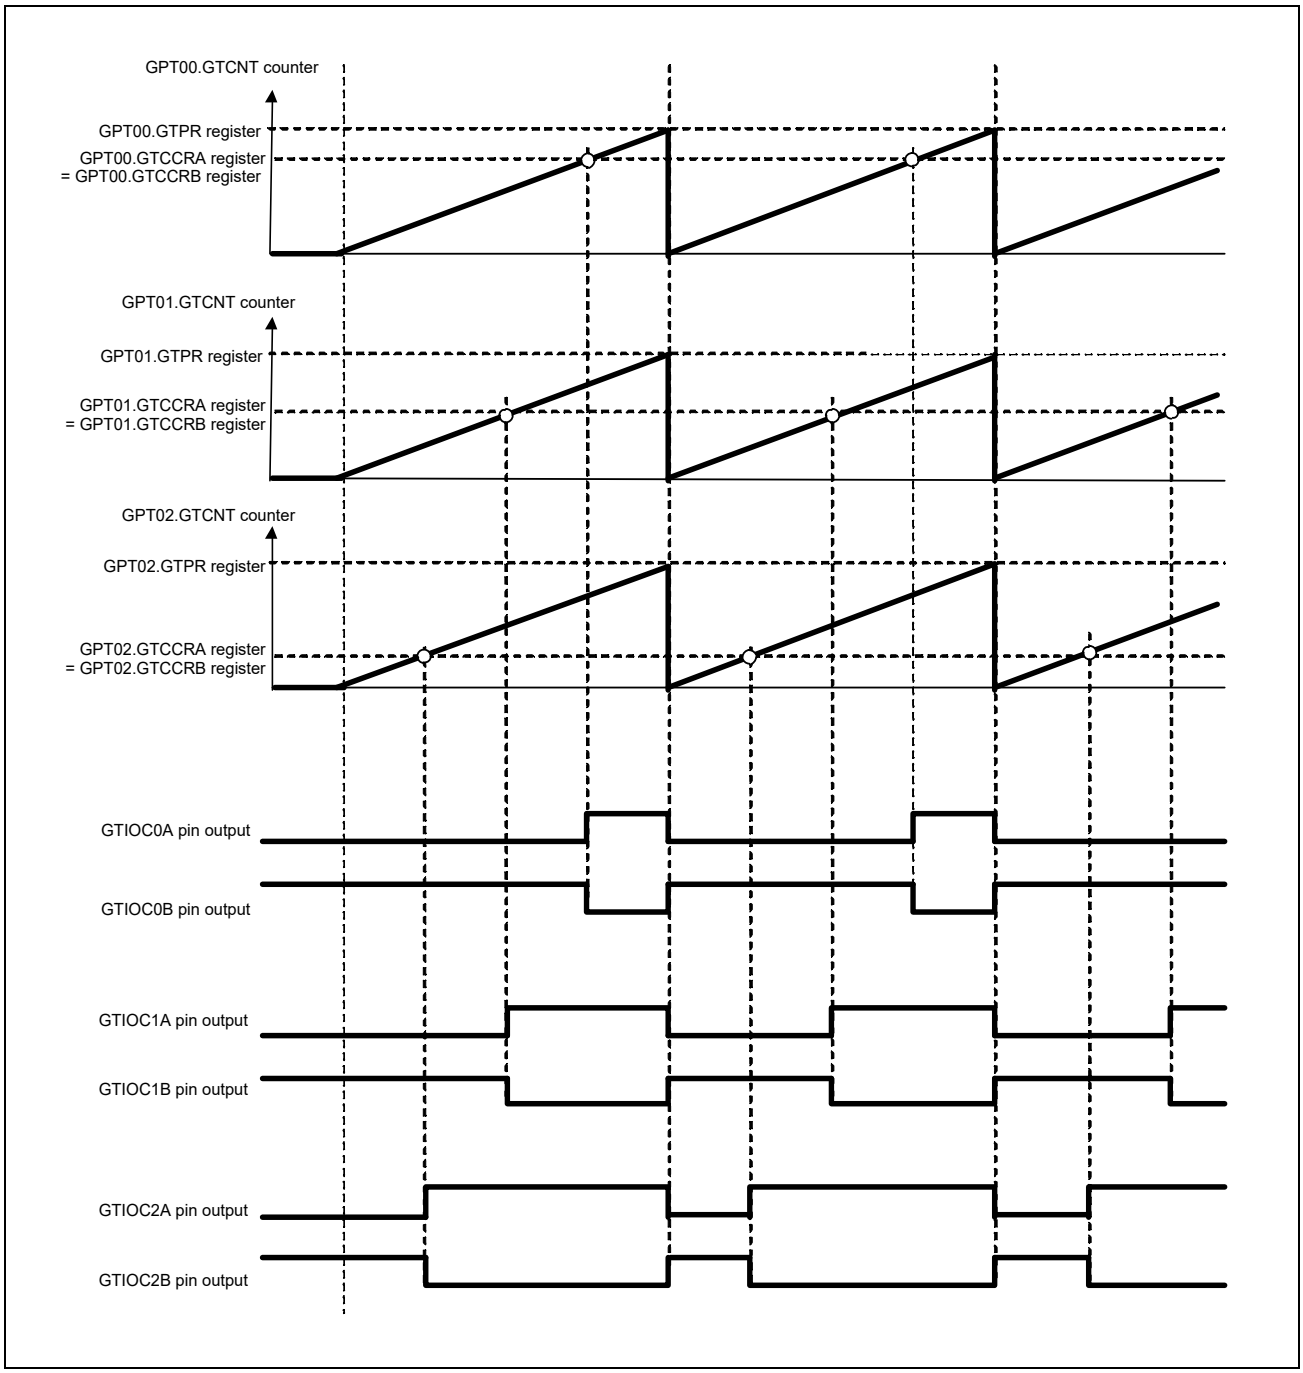

Figure 5.7-43 Example of 3-Phase Saw-Wave Complementary PWM Output

5.7.3.9.3 3-Phase Saw-Wave Complementary PWM Output with Automatic Dead Time Setting

Figure 5.7-44 shows an example in which three channels perform synchronized operation in saw-wave one-shot pulse mode with automatic dead time setting and 3-phase complementary PWM waveforms are output. The GTIOCnA pin is set so that it outputs the low level as the initial value, toggles the output on a compare match with GTCCRA, and retains the output at the cycle end. The GTIOCnB pin is set so that it outputs the high level as the initial value, toggles the output on a compare match with GTIOCnB, and retains the output at the cycle end.

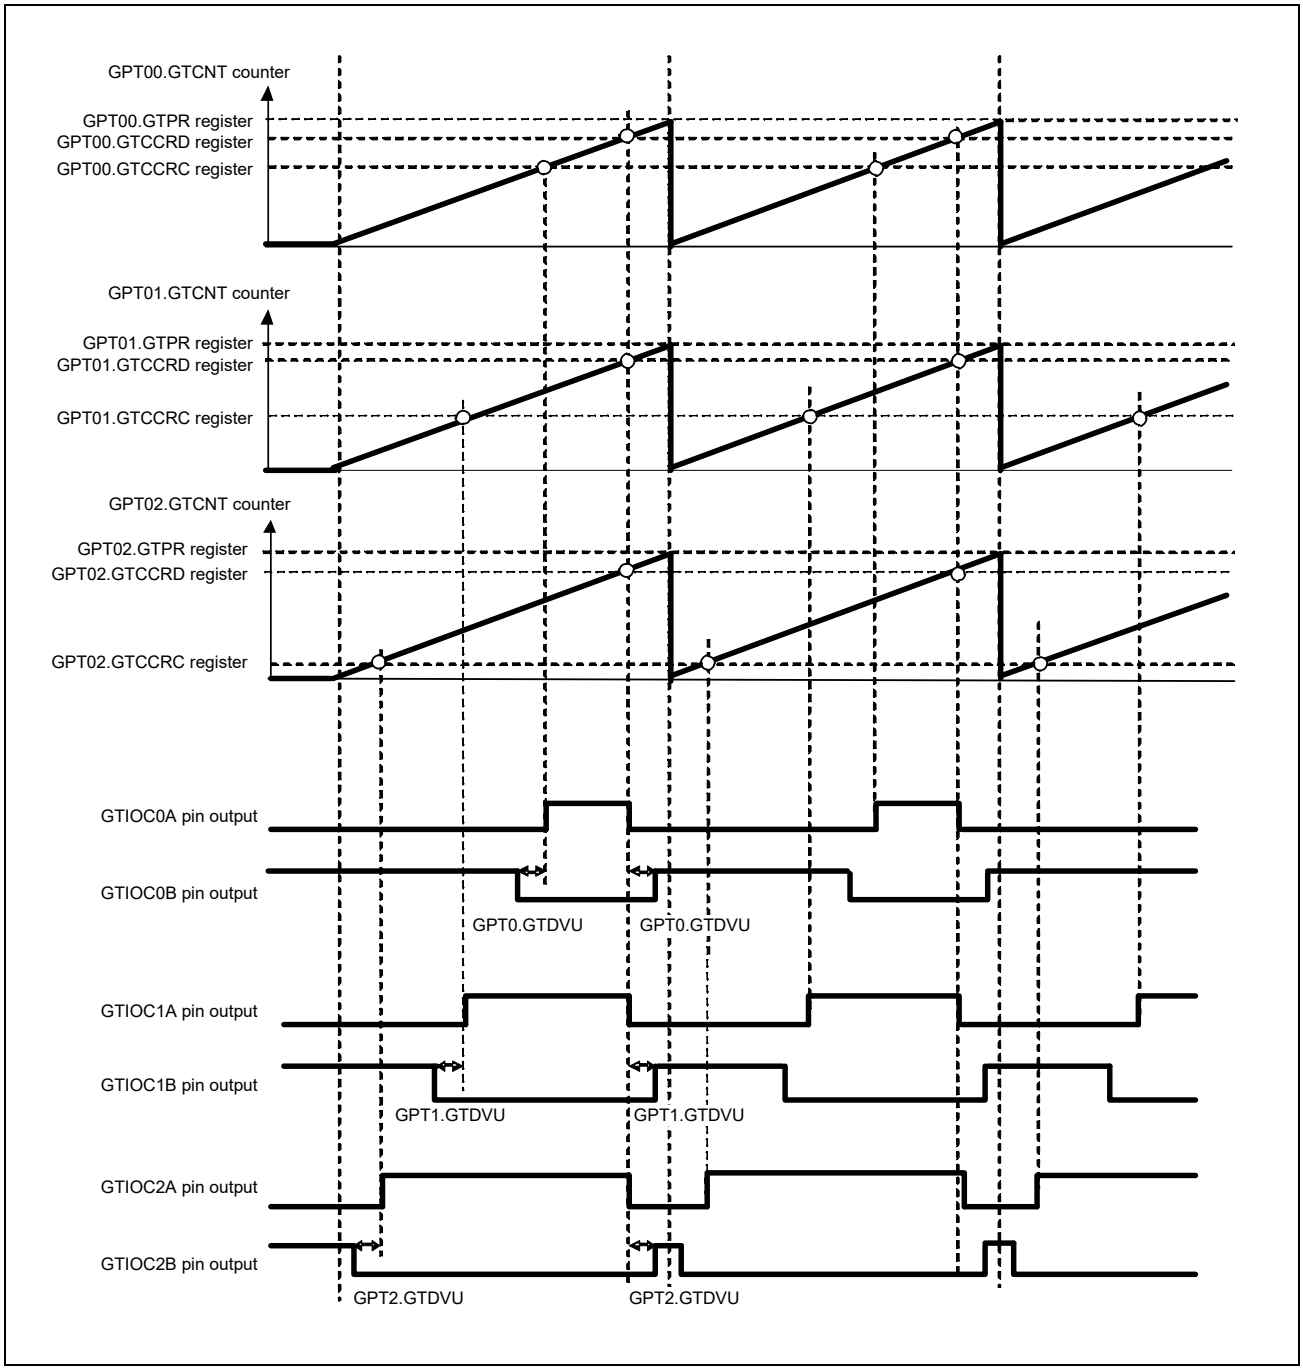

Figure 5.7-44 Example of 3-Phase Saw-Wave Complementary PWM Output with Automatic Dead Time Setting

5.7.3.9.4 3-Phase Triangle-Wave Complementary PWM Output

Figure 5.7-45 shows an example in which three channels perform synchronized operation in triangle-wave PWM mode 1 and 3-phase complementary PWM waveforms are output. The GTIOCnA pin is set so that it outputs the low level as the initial value, toggles the output on a compare match with GTCCRA, and retains the output at the cycle end. The GTIOCnB pin is set so that it outputs the high level as the initial value, toggles the output on a compare match with GTCCRB, and retains the output at the cycle end.

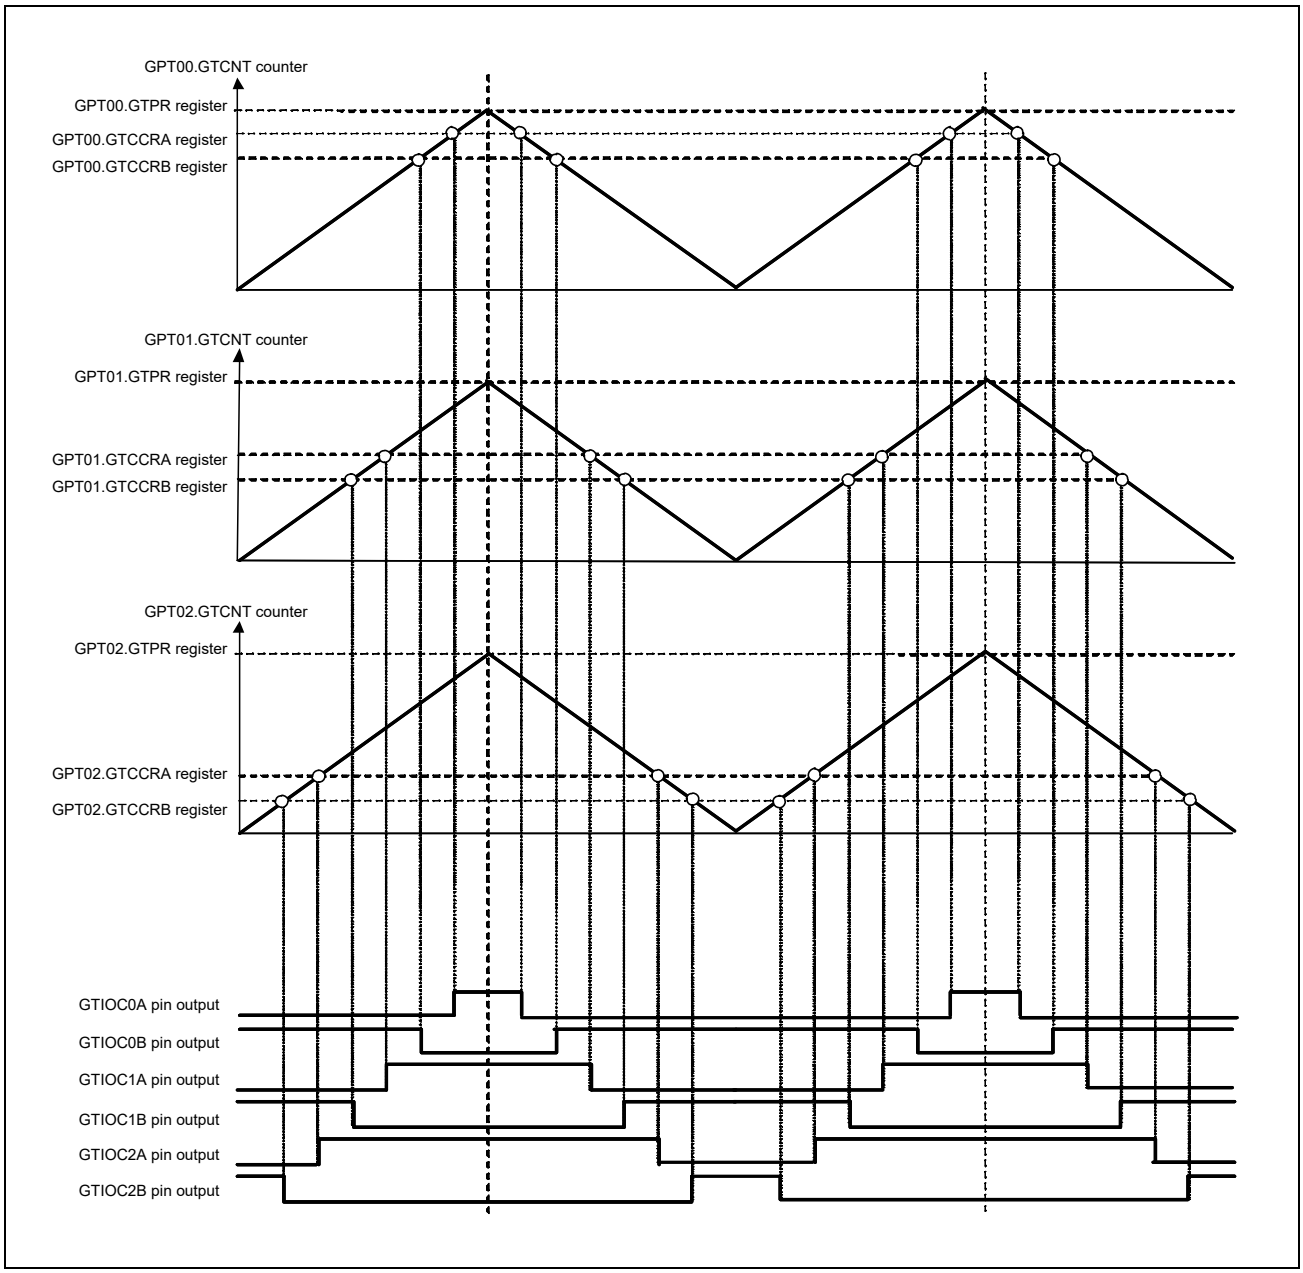

Figure 5.7-45 Example of 3-Phase Triangle-Wave Complementary PWM Output

5.7.3.9.5 3-Phase Triangle-Wave Complementary PWM Output with Automatic Dead Time Setting

Figure 5.7-46 shows an example in which three channels perform synchronized operation in triangle-wave PWM mode 1 with automatic dead time setting and 3-phase complementary PWM waveforms are output. The GTIOCnA pin is set so that it outputs the low level as the initial value, toggles the output on a compare match with GTCCRA, and retains the output at the cycle end.

The GTIOCnB pin is set so that it outputs the high level as the initial value, toggles the output on a compare match with GTCCRB, and retains the output at the cycle end.

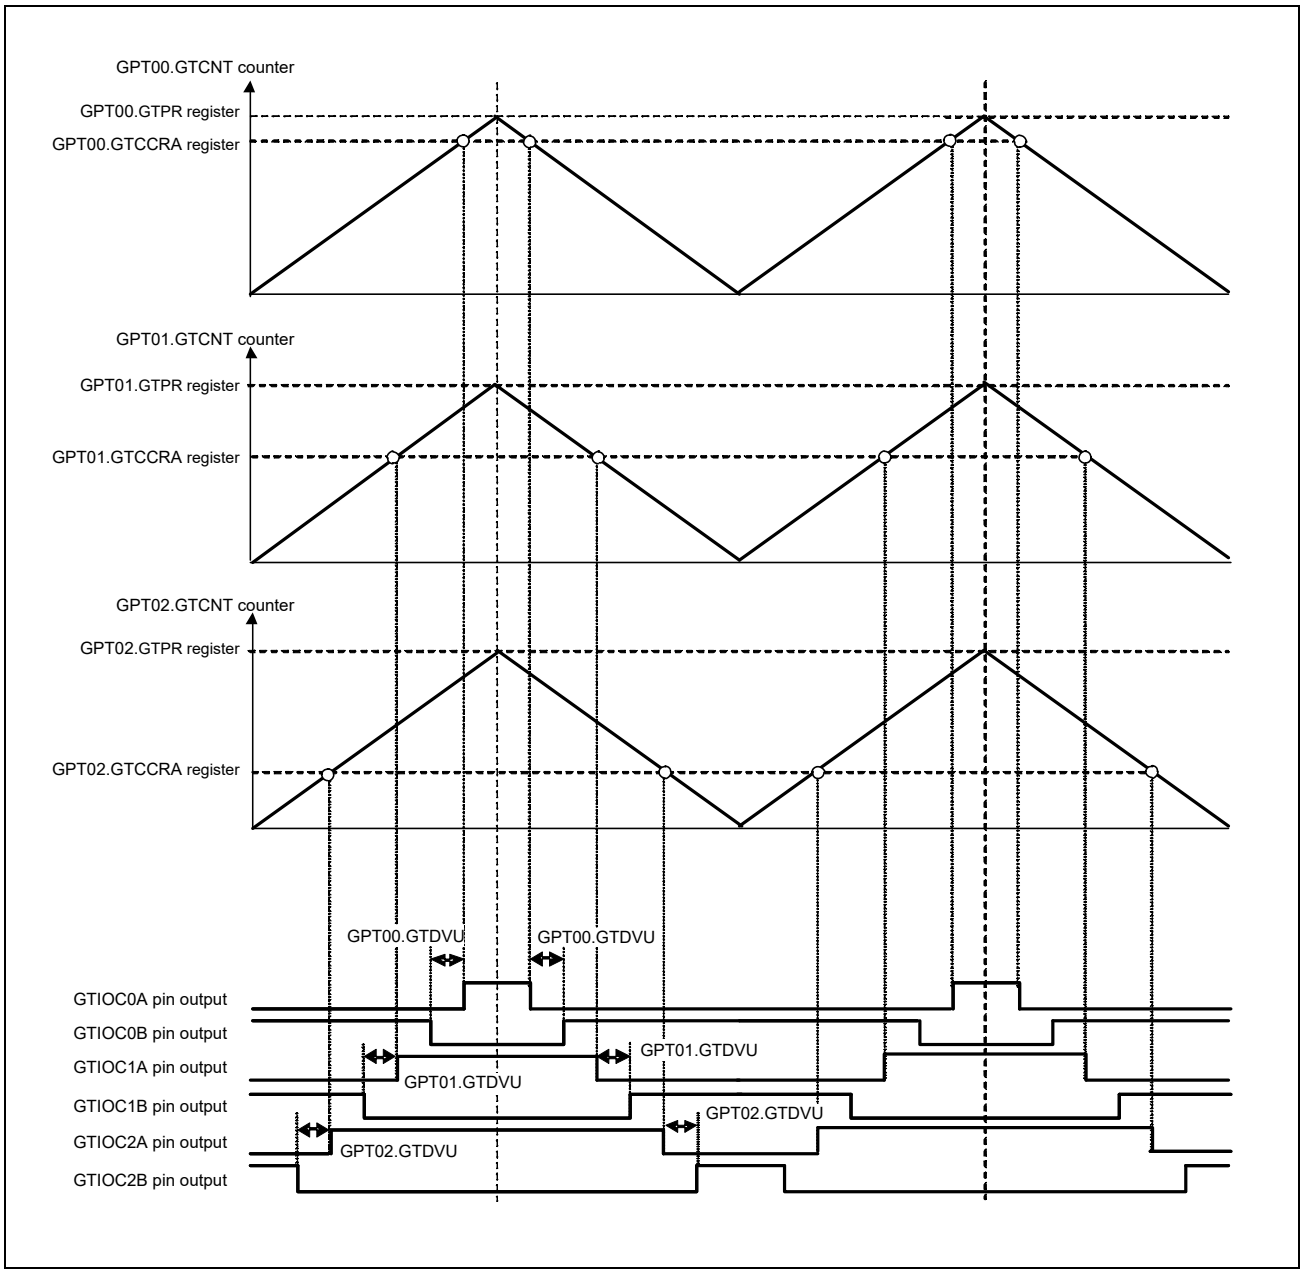

Figure 5.7-46 Example of 3-Phase Triangle-Wave Complementary PWM Output with Automatic Dead Time Setting

5.7.3.9.6 3-Phase Asymmetric Triangle-Wave Complementary PWM Output with Automatic Dead Time Setting

Figure 5.7-47 shows an example in which three channels perform synchronized operation in triangle-wave PWM mode 3 with automatic dead time setting and 3-phase complementary PWM waveforms are output. The GTIOCnA is set so that it outputs the low level as the initial value, toggles the output on a compare match with GTCCRA, and retains the output at the cycle end.

The GTIOCnB is set so that it outputs the high level as the initial value, toggles the output on a compare match with GTCCRB, and retains the output at the cycle end.

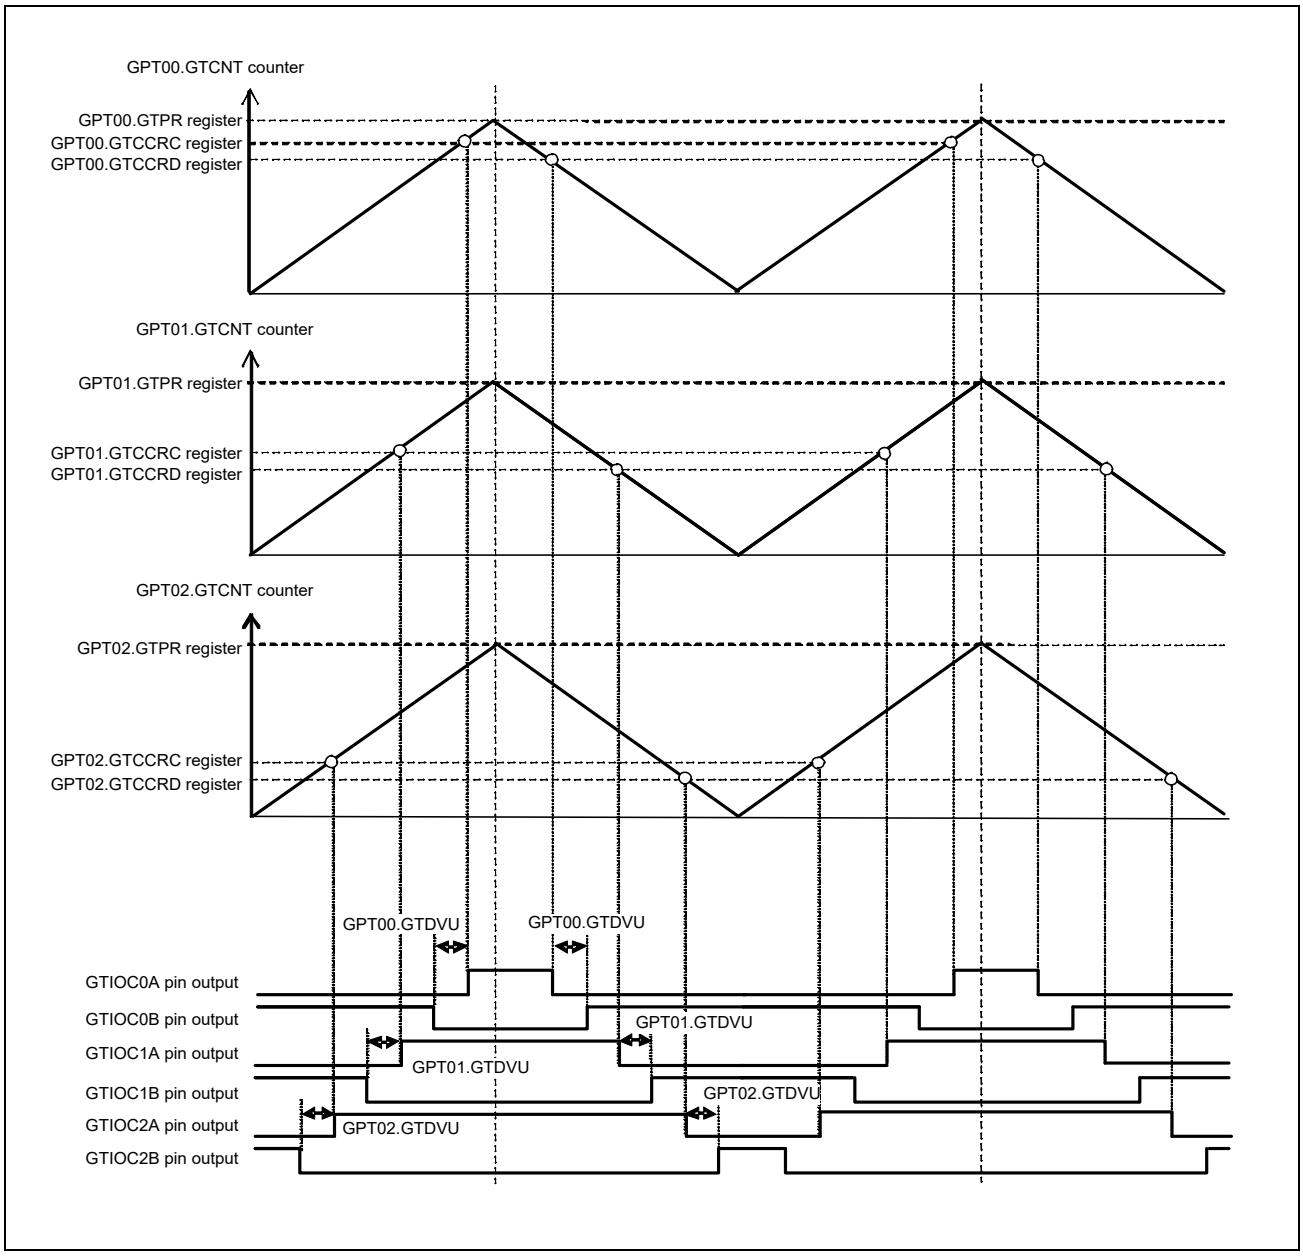

Figure 5.7-47 Example of 3-Phase Asymmetric Triangle-Wave Complementary PWM Output with Automatic Dead Time Setting

5.7.3.10 Phase Counting Function

A phase difference between the GTIOCnA and GTIOCnB pin (n = 0 to 15) inputs is detected and the corresponding GTCNT counts up or counts down. A phase difference is detectable in any combination of the relationship between the edge and the level of GTIOCnA and GTIOCnB pin inputs that are set in the GTUPSR and GTDNSR registers. For details on count operation, see **5.7.3.1.1 Counter Operation**.

Figure 5.7-48 to **Figure 5.7-57** show an example of operation of phase counting modes 1 to 5 when the GTIOCnA, GTIOCnB pins are used. **Table 5.7-36** to **Table 5.7-45** show conditions for up-counting or down-counting and list the settings of the GTUPSR and GTDNSR registers which are corresponding to **Figure 5.7-48** to **Figure 5.7-57**.

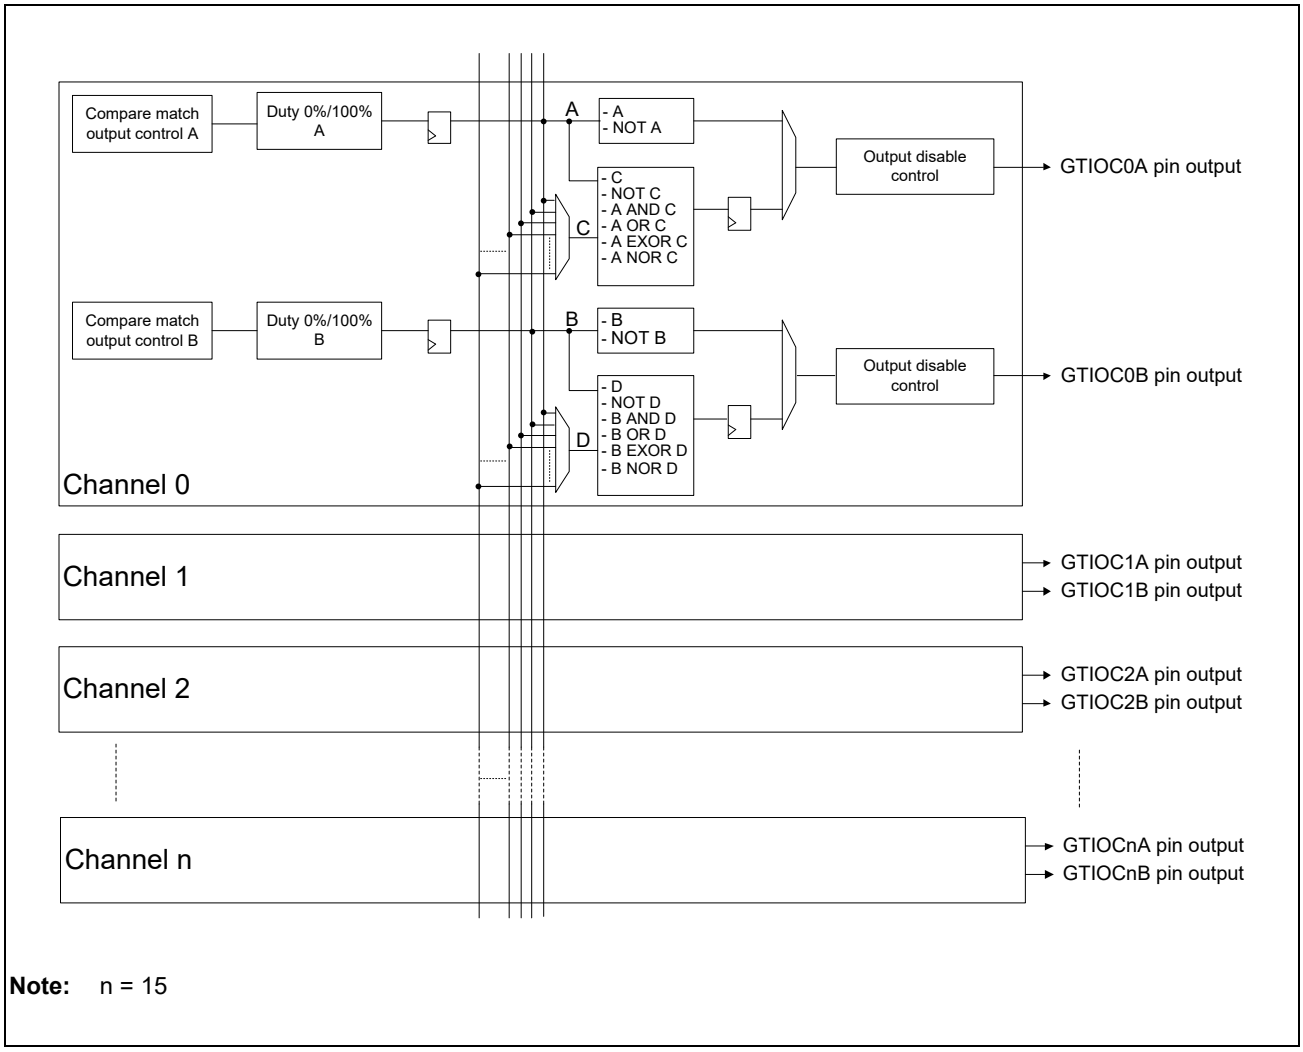
5.7.3.11 Inter Channel Logical Operation Function

The logical operation function between compare match outputs can be performed. **Figure 5.7-58** shows the block diagram of inter channel logical operation.

To prevent hazard to the GPT output, the signal after logical operation is latched with PCLKD. After latching, output disable control is performed.

When the logical operation function which causes the delay of 1 PCLKD is selected, the output enable signal is also delayed with 1 PCLKD and input to the output disable control.

When the same signal (C = A or D = B) to operate logical function AND, OR, EXOR and NOR is selected, C or D is treated as 1. In the case of GTIOCnA pin output, when A of same channel is selected for C, the result of AND is A, the result of OR is 1, the result of EXOR is NOT A, and the result of NOR is 0.



Note: n = 15

Figure 5.7-58 Block Diagram of Inter Channel Logical Operation

Figure 5.7-59 shows an example of inter channel logical operation.

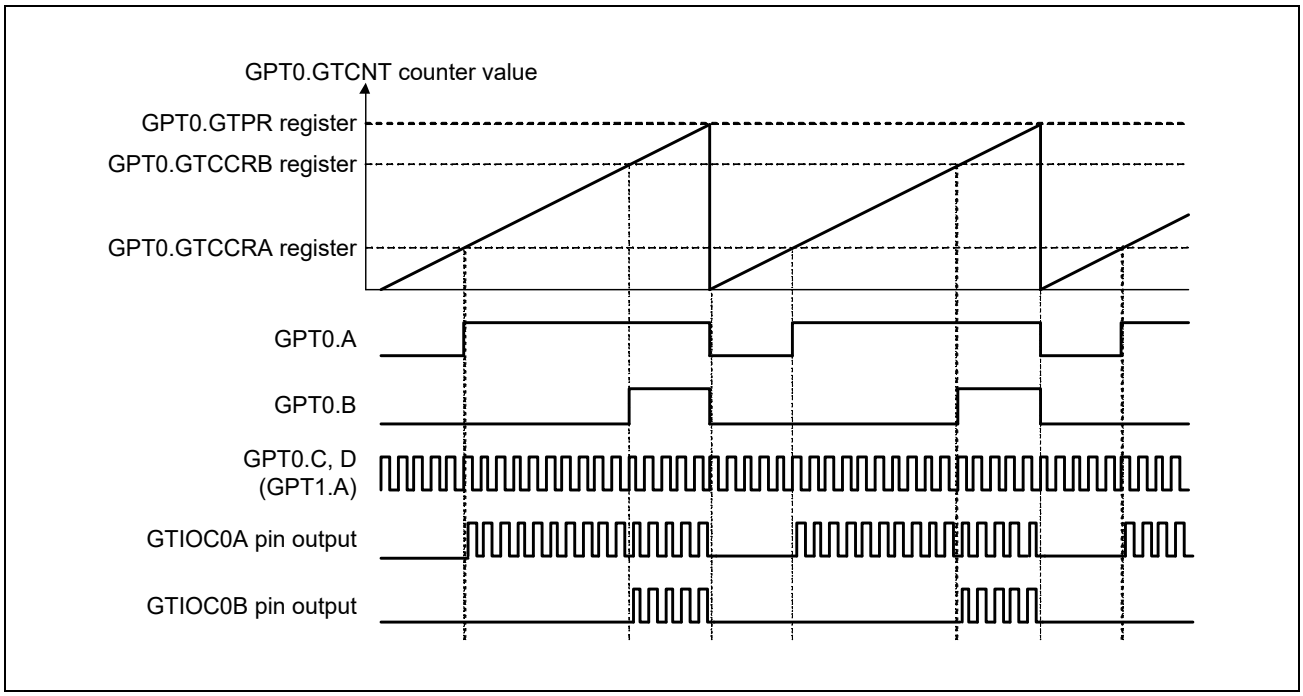


Figure 5.7-59 Example of Inter Channel Logical Operation

5.7.4 Interrupt Sources

5.7.4.1 Interrupt Sources

The GPT provides the following interrupt sources:

- GTCCR input capture/compare match
- GTCNT counter overflow (GTPR compare match)/underflow.
- GTADTR compare match
- Dead time error
- Short-circuited output

Each interrupt source has its own status flag. When an interrupt source signal is generated, the corresponding status flag in GTST is set to 1b. The corresponding status flag in GTST can be cleared by writing 0b to it. If flag setting and flag clearing occur at the same time, flag clearing takes priority over flag setting. These flags are automatically updated according to the internal state. The Interrupt Controller Unit can change the priority between the channels. However, the priority within a channel is fixed. For details, see **4.6.1 Interrupt Control Unit (ICU)**.

Table 5.7-46 lists the GPT interrupt sources.

Table 5.7-46 Interrupt sources

Name	Interrupt Source	Interrupt Flag	DMAC Activation
GPT_Ux_gpt_gtcia_n_m	GTCCRA input capture/compare match	GTST[0] (TCFA)	Possible
GPT_Ux_gpt_gtcib_n_m	GTCCRB input capture/compare match	GTST[1] (TCFB)	Possible
GPT_Ux_gpt_gtcic_n_m	GTCCRC compare match	GTST[2] (TCFC)	Possible
GPT_Ux_gpt_gtcid_n_m	GTCCRD compare match	GTST[3] (TCFD)	Possible
GPT_Ux_gpt_gtcie_n_m	GTCCRE compare match	GTST[4] (TCFE)	Possible
GPT_Ux_gpt_gtcif_n_m	GTCCRF compare match	GTST[5] (TCFF)	Possible
GPT_Ux_gpt_gtciv_n_m	GTCNT overflow (GPTn.GTPR compare match)	GTST[6] (TCFPO)	Possible
GPT_Ux_gpt_gtciu_n_m	GTCNT underflow	GTST[7] (TCFPU)	Possible
GPT_Ux_gpt_gtdei_n_m	Dead time error	GTST[28] (DTEF)	Possible
GPT_Ux_gpt_gtcih_n_m	A and B both high interrupt	GTST[29] (OABHF)	Possible
GPT_Ux_gpt_gtcil_n_m	A and B both low interrupt	GTST[30] (OABLF)	Possible
GPT_Ux_gpt_gtciada_n_m	Compare match with the GTADTRA register	GTST[16] (ADTRAUF) GTST[17] (ADTRADF)	Possible
GPT_Ux_gpt_gtciadb_n_m	Compare match with the GTADTRB register	GTST[18] (ADTRBUF) GTST[19] (ADTRBDF)	Possible

Note: x: 0, 1
m: 0 to 7

5.7.4.1.1 GPT_Ux_gpt_gtcia_n_m

An interrupt request is generated under the following conditions:

- When the GTCCRA register functions as a compare match register, the GTCNT counter value matches with the GTCCRA register
- When the GTCCRA register functions as an input capture register, the input-capture signal causes transfer of the GTCNT counter value to the GTCCRA register.

5.7.4.1.2 GPT_Ux_gpt_gtcib_n_m

An interrupt request is generated under the following conditions:

- When the GTCCRB register functions as a compare match register, the GTCNT counter value matches with the GTCCRB register
- When the GTCCRB register functions as an input capture register, the input-capture signal causes transfer of the GTCNT counter value to the GTCCRB register.

5.7.4.1.3 GPT_Ux_gpt_gtcic_n_m

An interrupt request is generated under the following condition:

- When the GTCCRC register functions as a compare match register, the GTCNT counter value matches with the GTCCRC register.

A compare match is not performed and therefore, an interrupt is not requested in the following conditions:

- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (triangle-wave PWM mode 3)
- GTBER.CCRA[1:0] = 01b, 10b, 11b (the GTCCRC register performs buffer operation).

5.7.4.1.4 GPT_Ux_gpt_gtcid_n_m

An interrupt request is generated under the following condition:

- When the GTCCRD register functions as a compare match register, the GTCNT counter value matches with the GTCCRD register.

A compare match is not performed and therefore, an interrupt is not requested in the following conditions:

- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (triangle-wave PWM mode 3)
- GTBER.CCRA[1:0] = 10b, 11b (the GTCCRD register performs buffer operation).

5.7.4.1.5 GPT_Ux_gpt_gtcie_n_m

An interrupt request is generated under the following condition:

- When the GTCCRE register functions as a compare match register, the GTCNT counter value matches with the GTCCRE register.

A compare match is not performed and therefore, an interrupt is not requested in the following conditions:

- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (triangle-wave PWM mode 3)
- GTBER.CCRB[1:0] = 01b, 10b, 11b (the GTCCRE register performs buffer operation).

5.7.4.1.6 GPT_Ux_gpt_gtcif_n_m

An interrupt request is generated under the following condition:

- When the GTCCRF register functions as a compare match register, the GTCNT counter value matches with the GTCCRF register.

A compare match is not performed and therefore, an interrupt is not requested in the following conditions:

- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (triangle-wave PWM mode 3)
- GTBER.CCRB[1:0] = 10b, 11b (the GTCCRF register performs buffer operation).

5.7.4.1.7 GPT_Ux_gpt_gtciv_n_m

An interrupt request is generated in the following conditions:

- In saw-wave mode, interrupt requests are enabled on overflow (when the GTCNT counter value changes from GTPR to 0b during up-counting)
- In triangle-wave mode, interrupt requests are enabled at crests (the GTCNT changes from GTPR to GTPR-1)
- In counting by hardware sources, an overflow (GTCNT changes from GTPR to 0b in up-counting) has occurred.

5.7.4.1.8 GPT_Ux_gpt_gtciu_n_m

An interrupt request is generated in the following conditions.

- In saw-wave mode, interrupt requests are enabled on underflow (when the GTCNT counter value changes from 0b to GTPR during down-counting)
- In triangle-wave mode, interrupt requests are enabled at troughs (the GTCNT changes from 0b to 1b)
- In counting by hardware sources, underflow (GTCNT changes from 0b to GTPR in down-counting) has occurred.

About Interrupt signals and interrupt status flags, see **5.7.2.2.16 General-Purpose Timer Status Register (GPTm_n_GTST)**.

5.7.4.1.9 GPT_Ux_gpt_gtdei_n_m

When the automatic dead time setting has been made, the GTST.DTEF flag becomes 1b when the change point of the waveform after the automatic setting exceeds the counting cycle. If the GTINTAD.GRPDTE bit is 1 at this time, a dead time error interrupt (GDTE) request is generated.

Note that the GTST.DTEF flag changes from 1b to 0b when the change point of the waveform after the automatic dead time setting has fallen back within the counting cycle.

5.7.4.1.10 GPT_Ux_gpt_gtcih_n_m

If the values on the GTIOCnA and GTIOCnB pins become 1 simultaneously, the GTST.OABHF flag becomes 1b. If the setting of the GTINTAD.GRPABH bit is 1b at this time, a simultaneous high-level output interrupt (GTCIH) is generated.

Note that the GTST.OABHF flag changes from 1b to 0b if the value on either of the GTIOCnA and GTIOCnB pins becomes 0.

5.7.4.1.11 GPT_Ux_gpt_gtcil_n_m

If the values on the GTIOCnA and GTIOCnB pins become 0 simultaneously, the GTST.OABLF flag becomes 1b. If the setting of the GTINTAD.GRPABL bit is 1b at this time, a simultaneous low-level output interrupt (GTCIL) is generated.

Note that the GTST.OABLF flag changes from 1b to 0b if the value on either of the GTIOCnA and GTIOCnB pins becomes 1.

5.7.4.1.12 GPT_Ux_gpt_gtciada_n_m

When the GTCNT counter value matches the value of the GTADTRA register, an interrupt request is generated if any of the following condition is met:

- The GTINTAD.ADTRAUEN bit is 1b in up-counting.
- The GTINTAD.ADTRADEN bit is 1b in down-counting.

An interrupt request is not generated during event counting.

5.7.4.1.13 GPT_Ux_gpt_gtciadb_n_m

When the GTCNT counter value matches the value of the GTADTRB register, an interrupt request is generated if any of the following condition is met:

- The GTINTAD.ADTRBUEN bit is 1b in up-counting.
- The GTINTAD.ADTRBDEN bit is 1b in down-counting.

An interrupt request is not generated during event counting.

5.7.4.2 DMAC Activation

The DMAC can be activated by the interrupt in each channel. For details, see **4.6.1 Interrupt Control Unit (ICU)** and **4.7 DMA Controller (DMAC)**.

5.7.4.3 Interrupt and A/D Converter Start Request Skipping Function

5.7.4.3.1 Interrupt Skipping Function by GTITC Register

By setting the GTITC register, the GTCNT counter overflow (GTPR register compare match)/underflow interrupt (GTCIV/GTCIU) can be skipped. Other interrupts and A/D converter start request signals can be skipped by interlinking with the GTCIV/GTCIU interrupt skipping function. However, the dead time error interrupts cannot be interlinked with the GTCIV/GTCIU skipping function. Simultaneous high-level output and low-level output interrupts cannot be interlinked with the GTCIV/GTCIU interrupt skipping function. When interrupts are skipped, a change in the corresponding status flag is also skipped and the skipping function continues to operate even while the status flag is 1b.

The interrupt skipping function is only dependent on the setting of the GTITC register and is not dependent on the setting of the GTINTAD register interrupt enable bit.

When both troughs and crests are counted and skipped in triangle-wave mode, if the skipping count is an odd number, GTCIV/GTCIU interrupt requests on troughs only or crests only are not generated depending on the timing with which the skipping counter is started. When both troughs and crests are to be counted and skipped in triangle-wave mode and the GTCIV/GTCIU interrupts on troughs only or crests only are to be used, the skipping count setting should be an even number.

Similarly, when both overflows and underflows are counted and skipped with the counting direction changed in saw-wave mode, GTCIV/GTCIU interrupt requests on overflow only or underflow only may not be generated. When both overflows and underflows are to be counted and skipped with the counting direction changed in saw-wave mode and the GTCIV/GTCIU interrupts on overflow only or underflow only, the skipped state should be checked thoroughly before use.

Before changing the skipping count, be sure to release the skipping function (GTITC.IVTC[1:0] bits = 00b).

Figure 5.7-60 to **Figure 5.7-65** show examples of skipping function operation.

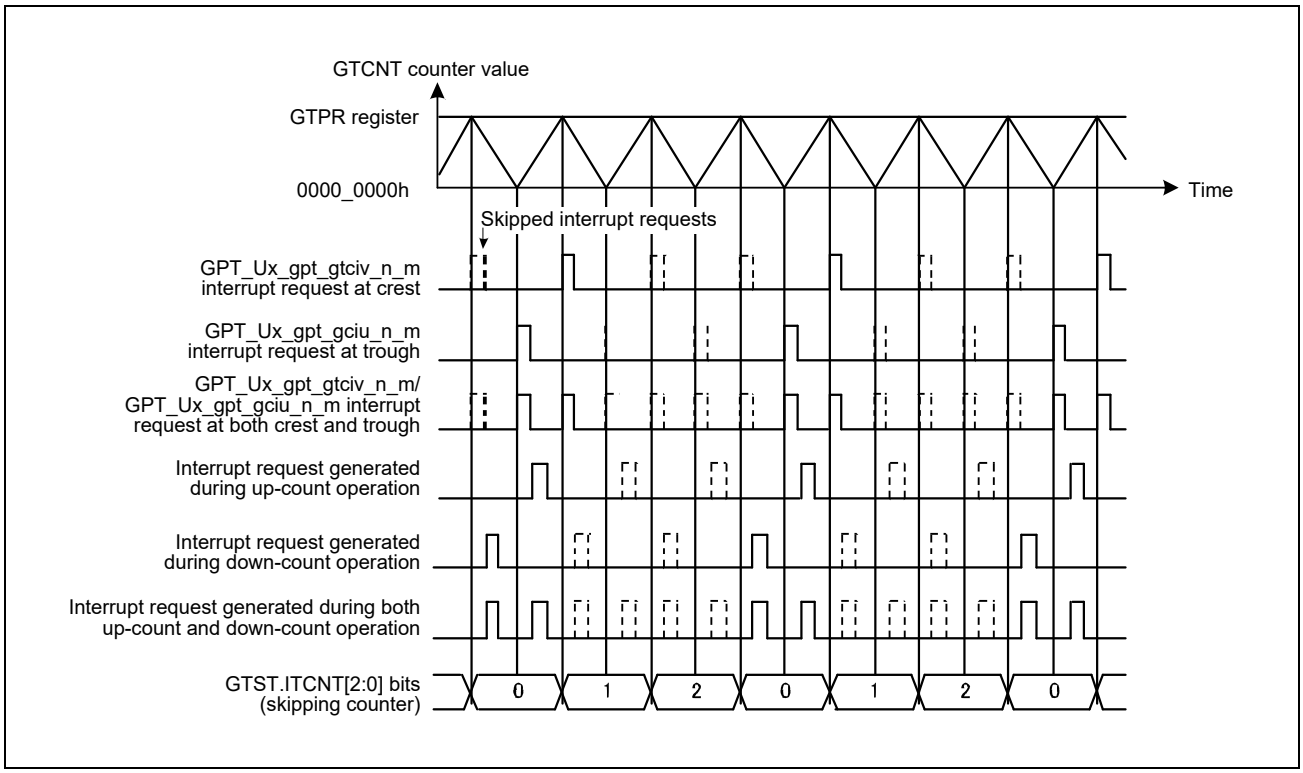

Figure 5.7-60 Example of Interrupt Skipping Function Operation (Triangle Waves, Counting and Skipping Crests, Skipping Count: 2)

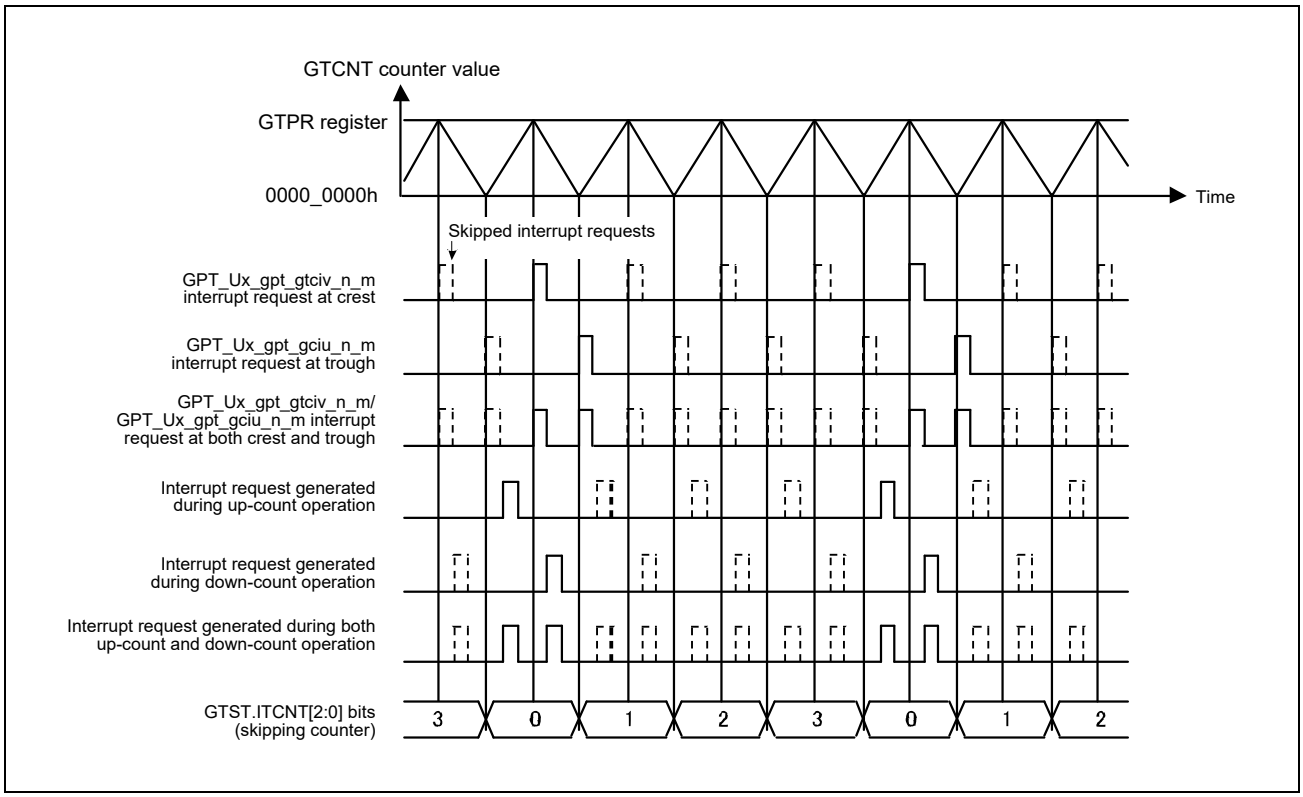

Figure 5.7-61 Example of Interrupt Skipping Function Operation (Triangle Waves, Counting and Skipping Troughs, Skipping Count: 3)

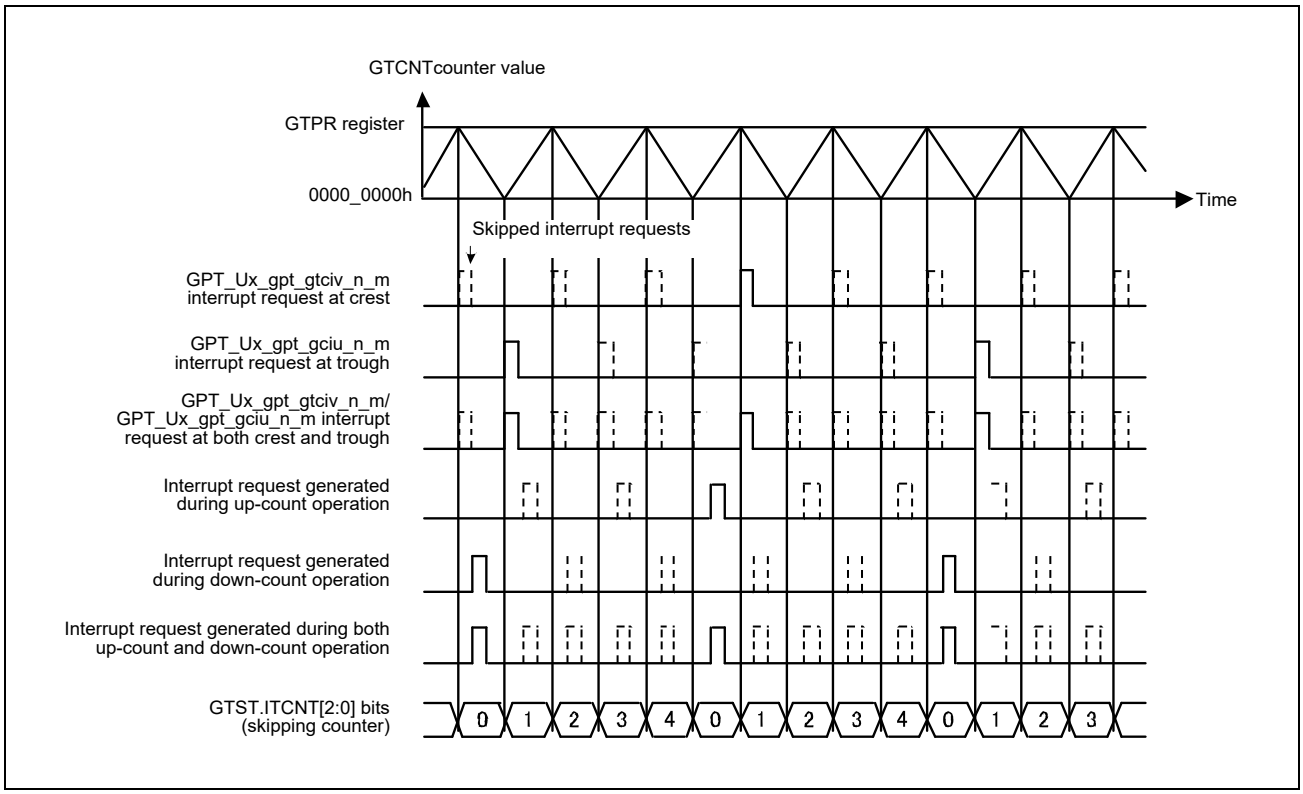

Figure 5.7-62 Example of Interrupt Skipping Function Operation (Triangle Waves, Counting and Skipping Both Troughs and Crests, Skipping Count: 4)

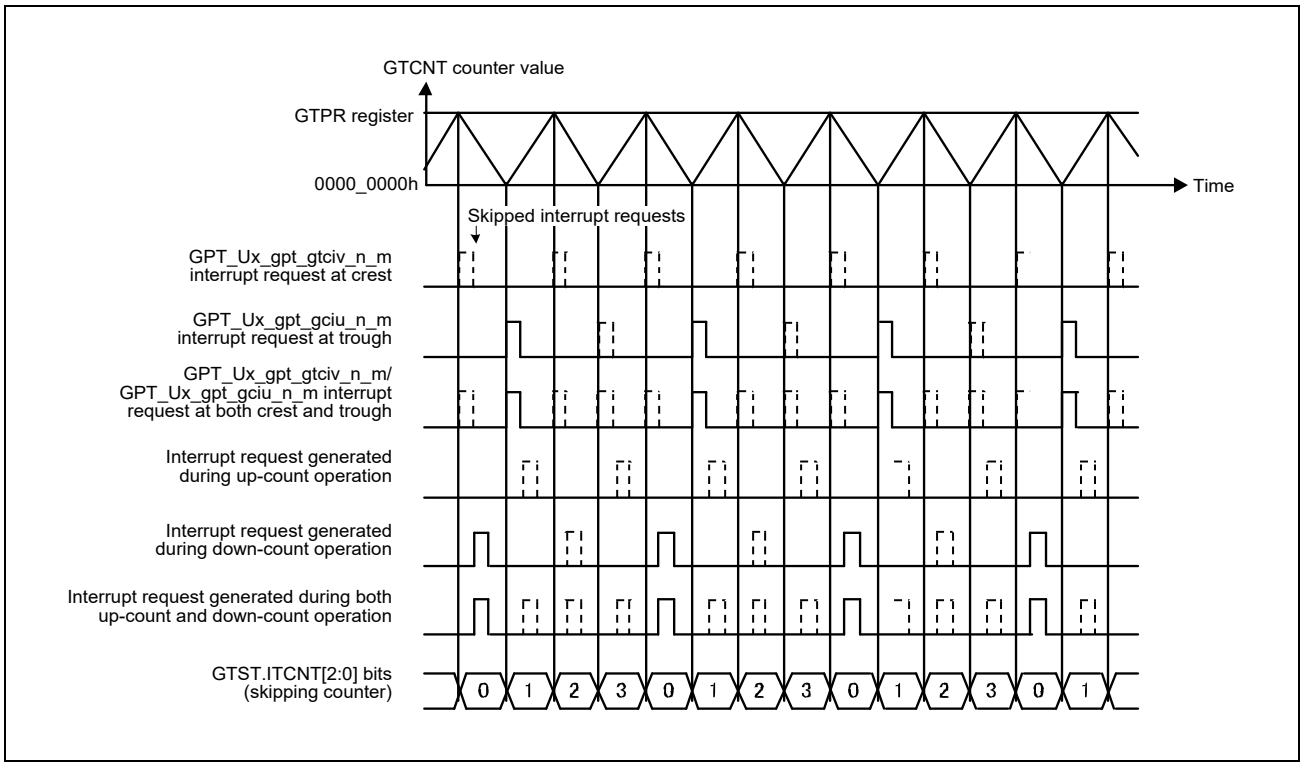

Figure 5.7-63 Example of Interrupt Skipping Function Operation (Triangle Waves, Counting and Skipping Both Troughs and Crests, Skipping Count: 3, Skipping Started at Up-Counting)

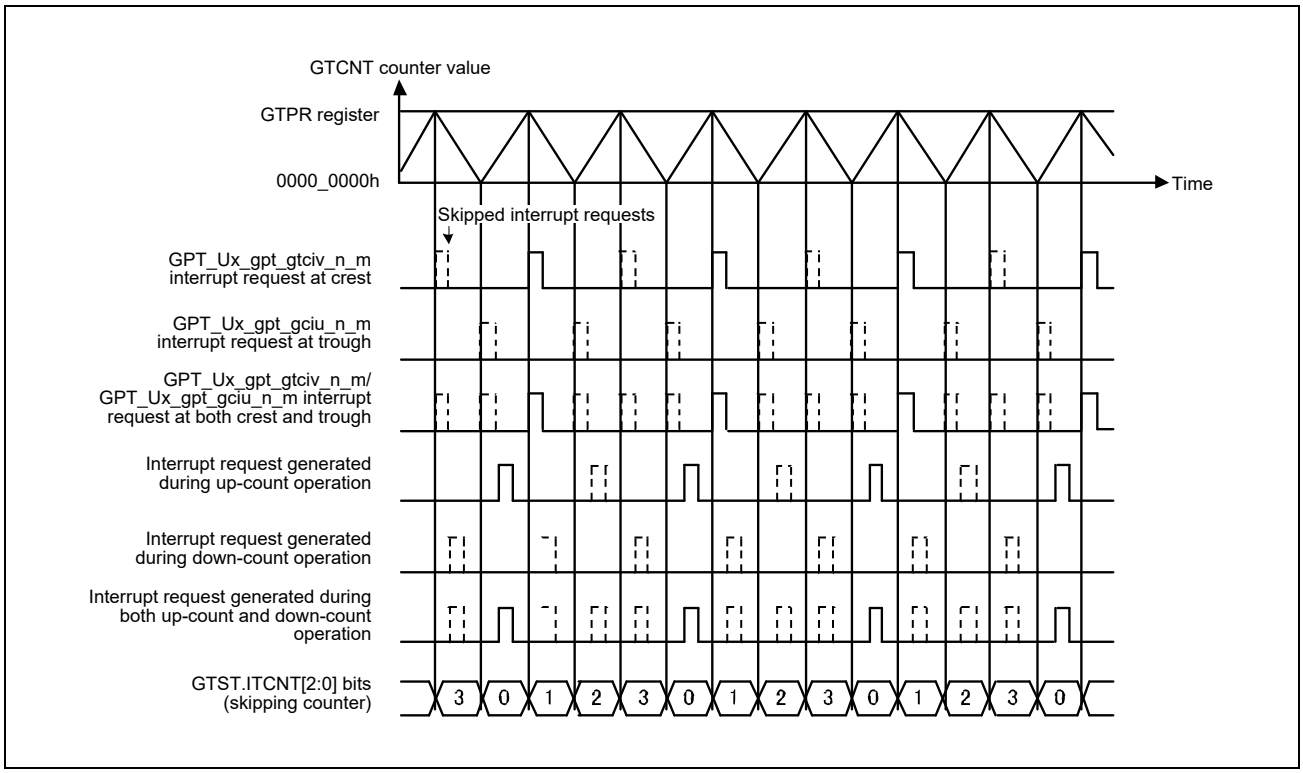

Figure 5.7-64 Example of Interrupt Skipping Function Operation (Triangle Waves, Counting and Skipping Both Troughs and Crests, Skipping Count: 3, Skipping Started at Down-Counting)

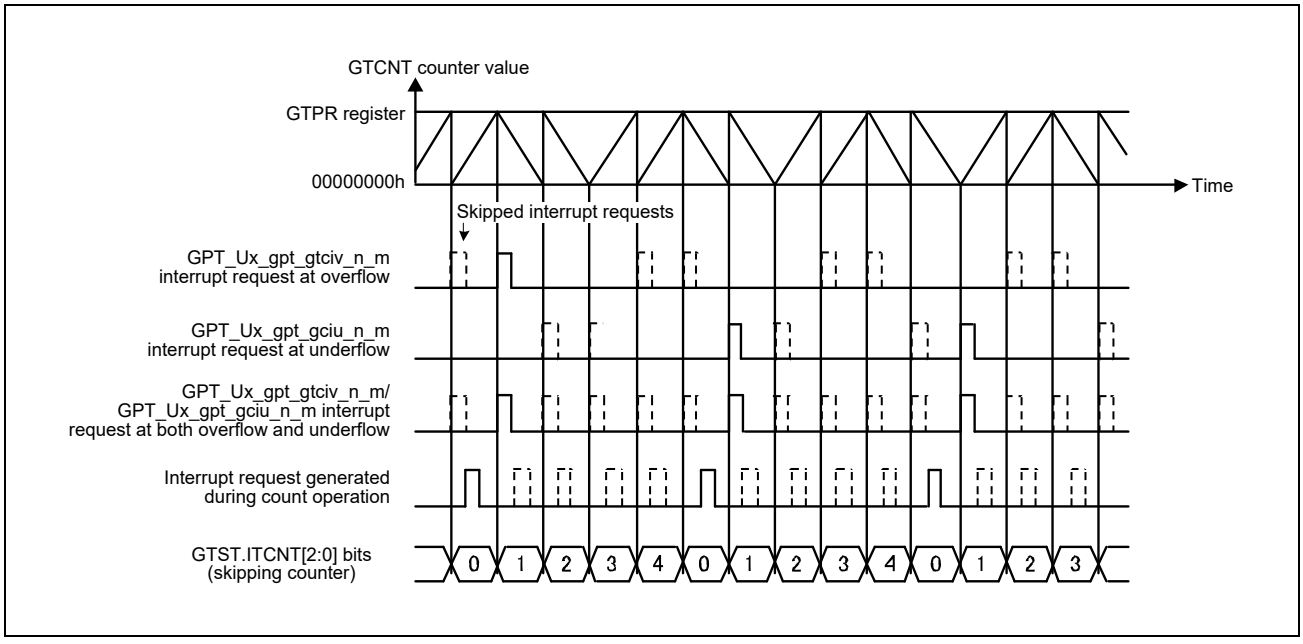

Figure 5.7-65 Example of Interrupt Skipping Function Operation (Saw Waves, Operation with Count Direction Changed, Counting and Skipping Both Overflows and Underflows, Skipping Count: 4)

5.7.4.3.2 Extended Interrupt Skipping Function

An overflow/underflow interrupt, compare match/input capture interrupt, A/D converter start request, and buffer transfer can be skipped by counting the GTCNT counter overflows or underflows through the settings of the GTEITC, GTEITLI1, GTEITLI2, and GTEITLB registers. A dead time error interrupt cannot be skipped. Simultaneous high-level output and low-level output interrupts cannot be skipped.

For ELC event outputs corresponding to interrupts and A/D converter start requests, two signals for skipping and no skipping are output.

Whether or not to perform skipping and the skipping period can be set individually for the overflow/underflow interrupt, compare match/input capture interrupt, A/D converter start request, and buffer transfer by using the GTEITLI1, GTEITLI2, and GTEITLB registers.

The skipping period is set as a period in which the counter value is other than 0 or other than the skipping count, in conjunction with the operation of the two independent extended interrupt skipping counters (GTEITC.EITCNT1[3:0] and EITCNT2[3:0] bits). It can also be selected when not only one skipping counter but two counters are both other than 0 or other than the skipping count.

Figure 5.7-66 shows an example of operation of the counter for interrupt skipping by the GTITC register and the counter for extended interrupt skipping.

The counter operation for extended interrupt skipping is set by the GTEITC register.

The EITCNT1[3:0] bits count the count source (a crest in **Figure 5.7-66**) selected by the extended interrupt skipping counter 1 count source select bits (EIVTC1[1:0] bits) when the initial value is 0b, and repeat counting which returns to 0 when the skipping count (2 in **Figure 5.7-66**) set by the extended interrupt skipping 1 skipping count setting bits (EIVTT1[3:0] bits) is reached.

The EITCNT2[3:0] bits can set the initial value, count the count source (a trough in **Figure 5.7-66**) selected by the extended interrupt skipping counter 2 count source select bits (EIVTC2[1:0] bits), and repeat counting which returns to 0 when the skipping count (2 in **Figure 5.7-66**) set by the EIVTT2[3:0] bits is reached. The initial value is set when the GTEITC register is written by access to the higher-order 16 or 32 bits and only when the value written to the EIVTC2[1:0] bits is other than 00b, while the setting of extended interrupt skipping counter 2 is for no counting (EIVTC2[1:0] bits are 00b). When the initial value is written, the value written to the extended interrupt skipping counter 2 initial value bits (EITCNT2IV[3:0] bits) is set in the EITCNT2[3:0] bits as the initial value.

The extended interrupt skipping counter counts up in the first cycle of the counter clock after the setting has been modified from no counting to counting.

The interrupt skipping count counter (GTST.ITCNT[2:0] bits) for interrupt skipping by the GTITC register is reset to 000b when the GTCNT counter operation is stopped; however, the EITCNT1[3:0] and EITCNT2[3:0] bits for extended interrupt skipping retain their values even after the GTCNT counter operation has been stopped, and counting can be resumed from the value before the counter is stopped. To reset the values of the EITCNT1[3:0] and EITCNT2[3:0] bits (to 0000b), set the EIVTC1[1:0] and EIVTC2[1:0] bits for no counting (no skipping) (00b).

When the skipping count is to be changed, only do so after stopping the skipping counter operation (set the EIVTC1[1:0] bits or EIVTC2[1:0] bits to 00b).

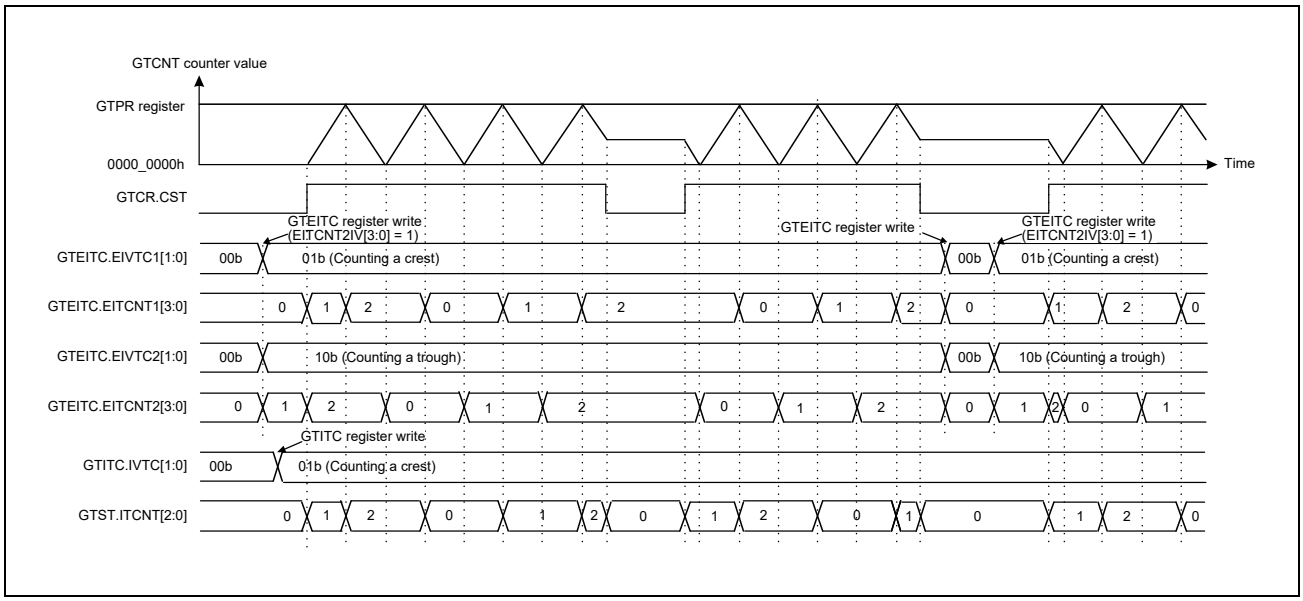

Figure 5.7-66 Example of Counter Operation for Interrupt Skipping

Interrupt skipping by the GTEITLI1 register and A/D converter start request skipping by the GTEITLI2 register can be performed simultaneously with interrupt skipping by the GTITC register. A skipping period at this time is represented by ORed skipping periods of respective registers. When the skipping period select bit is set to 1b, a skipping period is the logical AND of the respective skipping periods. **Figure 5.7-67** shows an example of operation when interrupt skipping operations by different registers are performed simultaneously.

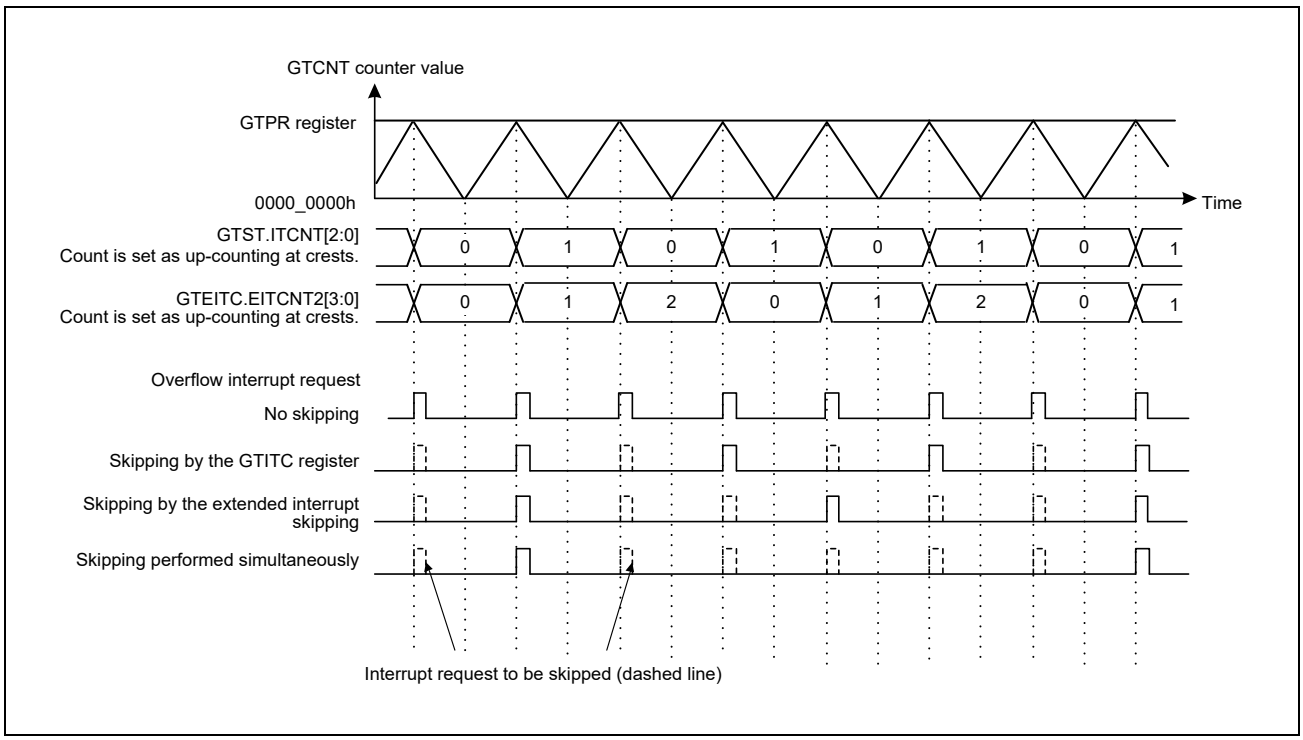

Figure 5.7-67 Example of Interrupt Skipping Operation (Skipping by the GTITC Register: Counting Crests, Extended Interrupt Skipping: EIVTC1[1:0] = 00b, EIVTC2[1:0] = 01b, EITLV[2:0] = 010b)

If interrupt skipping which can be set by the GTEITLI1 register is performed, a change in the corresponding status flag is also skipped and the skipping function continues to operate even while the status flag is 1b. Updating of the status flag corresponding to interrupts for which skipping can be set up in the GTEITLI1 register and skipping of ELC event outputs are only based on the settings of the GTITC register and the extended interrupt skipping register, and has no connection with the setting of the interrupt enable bit in the GTINTAD register. The interrupt enable bit is used only for the interrupt signal output after skipping.

If A/D converter start request skipping which can be set by the GTEITLI2 register is performed, updating of the corresponding status flag and ELC event outputs only depend on the setting the A/D converter start request enable bit in the GTINTAD register. Operations by A/D converter start requests which are set to “disabled” in the GTINTAD register are not all performed.

Buffer transfer skipping by the GTEITLB register is performed for buffer operation which is enabled in the GTBER and GTDTCR registers and for all buffer operations which are performed in saw-wave one-shot pulse mode or triangle-wave PWM mode 3.

Interrupt skipping and buffer transfer skipping operate independently. For buffer transfer which involves output of interrupts, interrupt output without buffer transfer and buffer transfer without interrupt output are both possible.

The extended interrupt skipping counter 2 initial value is set by the value written to the ETICNT2IV[3:0] bits which is applied to change the setting from no counting of the extended interrupt skipping counter 2 count source (GTEITC.EIVTC2[1:0] = 00b) to counting (EIVTC2[1:0] = other than 00b). Writing to the extended interrupt skipping counter 2 initial value bits (ETICNT2IV[3:0]) is performed only when the setting of the above-mentioned extended interrupt skipping counter 2 initial value is written.

1. Set GTCNT counter operation, set buffer operation, and set compare match value
2. Set the extended interrupt skipping function
   Select the skipping counter used for skipping and the skipping period with the skipping function select bit for the interrupt, for the A/D converter start request, and for a buffer transfer, all of which are to be skipped, in the GTEITLI1, GTEITLI2, and GTEITLB registers, respectively.
3. Set the extended skipping counter
   With the GTEITC register, set a count source of the skipping counter used for skipping, skipping count, and the skipping counter 2 initial value in the following order.
   Set the EIVTCk[1:0] bits (k = 1, 2) to a value other than 00b, and set the EIVTTk[3:0] bits to a value other than 0000b. When the skipping counter 2 is used, change the EIVTC2[1:0] bits from 00b to a value other than 00b as well as set the EITCNT2IV[3:0] bits to the skipping counter 2 initial value.
4. Start count operation
   Set the GTCR.CST bit to 1b to start count operation.
5. Set buffer value by cycle

5.7.5 A/D Converter Start Request

An A/D converter start request can be generated by a compare match between the GTCNT counter and the GTADTRA or GTADTRB register. It can be generated in up-counting only, down-counting only, or both up-counting and down-counting by the setting of the GTINTAD register.

An A/D converter start request cannot be generated during event counting.

The A/D converter start request is not output directly to the A/D converter but the interrupt and event signals to the ELC are output.

The GTADTRA and GTADTRB registers each have two buffer registers. Buffer operation of the GTADTRA register in combination with the GTADTBRA and GTADTDBRA registers and buffer operation of the GTADTRB register in combination with the GTADTBRB and GTADTDBRB registers are possible.

The timing of the generation of A/D converter start requests can be monitored by an external pin. When the A/D converter start request signal to be monitored is selected in the GTADSMR.ADSMSk bit (k = 0, 1) and when the output is enabled in the ADSMENk bit, a signal is output synchronized with a cycle frame of the timer used to generate the A/D converter start request signal, of which the output is driven high at the generation of the A/D converter start request signal by the GTADSMk pin, or at the end of the cycle of which the output is driven low. When a signal to request the start of A/D conversion is generated at the end of the cycle, the generation of this signal has priority in terms of monitoring output and the output remains at the high level till the end of the next cycle. The registers (GTADTRA and GTADTRB) that are sources of generating the A/D converter start request signals and their counting directions can be checked by the A/D converter start request flags (ADTRAUF, ADTRADF, ADTRBUF, and ADTRBDF) in the GTST register. When the output of the same A/D converter start request signal monitoring output is enabled for multiple channels, ORed signals will be output from the GPTW.

Figure 5.7-68 shows an example of A/D converter start request operation and **Figure 5.7-69** shows an example of the settings for A/D converter start request operation.

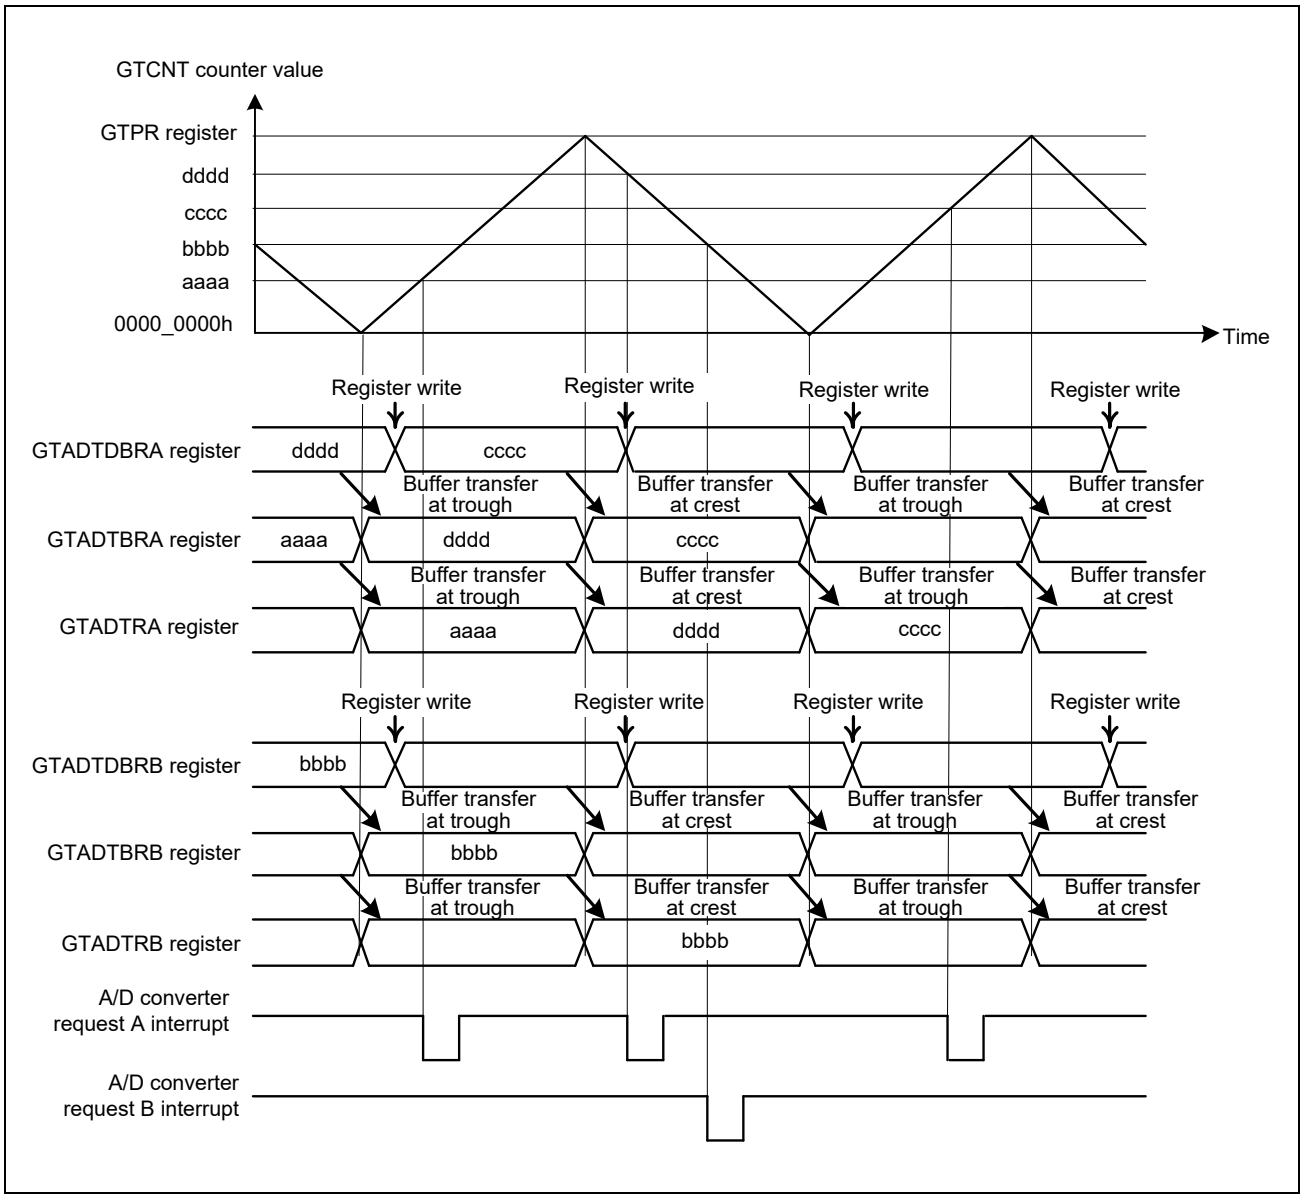

Figure 5.7-68 Example of A/D Converter Start Request Operation (Triangle Waves, Double Buffer Operation, Buffer Transfer at Both Troughs and Crests, A/D Converter Start Request Interrupt Generation by GTADTRA at Both Up-Counting and Down-Counting, A/D Converter Start Request Interrupt Generation by GTADTRB at Down-Counting, Monitoring of GTADTRA Up-Counting by GTADSM0, Monitoring of GTADTRB Down-Counting by GTADSM1)

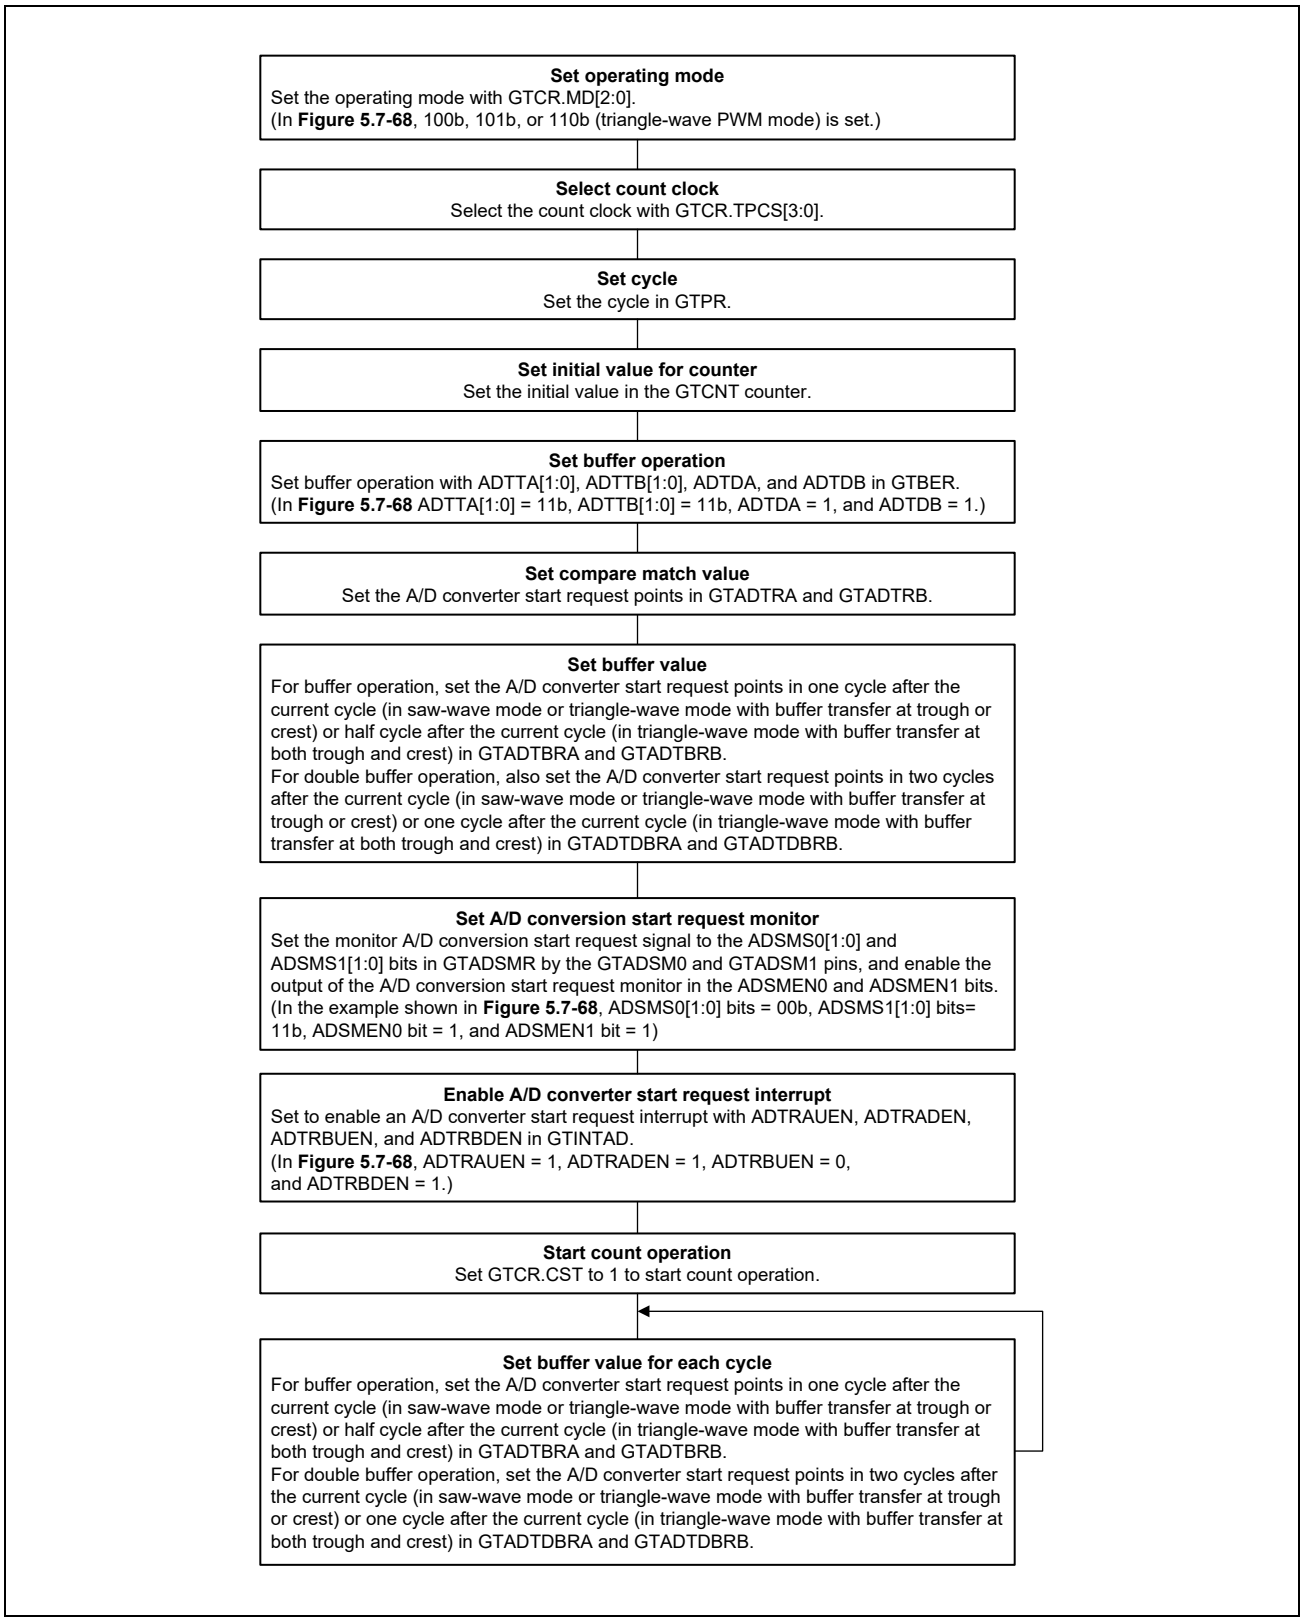

Figure 5.7-69 Example of Settings for A/D Converter Start Request Operation

5.7.6 Operations Linked by ELC

5.7.6.1 Event Signal Output to ELC

The GPT can perform operation linked with another module set in advance when its interrupt request signal is used as an event signal by the Event Link Controller (ELC).

The GPT has the following ELC event signals (“GPT_Ux_” (x = 0, 1) is omitted.):

- Generation of compare match and input capture A interrupt (gpt_elccmpa_m)
- Generation of compare match and input capture B interrupt (gpt_elccmpb_m)
- Generation of compare match C interrupt (gpt_elccmpc_m)
- Generation of compare match D interrupt (gpt_elccmpd_m)
- Generation of compare match E interrupt (gpt_elccmpe_m)
- Generation of compare match F interrupt (gpt_elccmpf_m)
- Generation of overflow interrupt (gpt_elcovf_m)
- Generation of underflow interrupt (gpt_elcudf_m)

Note: m = 0 to 7

5.7.6.2 Event Signal Inputs from ELC

The GPT can perform the following operations in response to a maximum of 8 events from the ELC:

- Start counting, stop counting, clear counting
- Up-counting, down-counting
- Input capture.

See **4.2.1.6 Event Link Controller (ELC)** for the connection between the ELC and the event signal input.

5.7.7 Noise Filter Function

The pin for use in input capture to the GPT is equipped with a noise filter. The noise filter samples input signals at the sampling clock and removes the pulses whose length is less than 3 sampling cycles.

The noise filter functionality includes enabling and disabling the noise filter for each pin and setting of the sampling clock for each channel.

Figure 5.7-70 shows the timing of noise filtering.

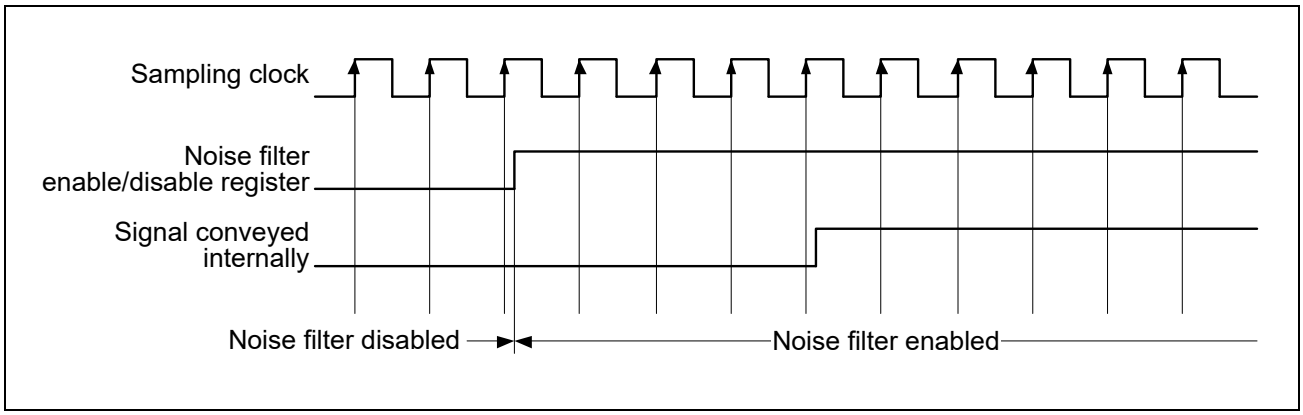

Figure 5.7-70 Timing of Noise Filtering

If noise filtering is enabled, the input capture operation or output phase switching operation is performed on the edges of the noise filtered signal after a delay of (sampling interval × 2 + PCLKD) at the shortest. This is due to the noise filtering for the input capture input or hall sensor input.

5.7.8 Protection Function

5.7.8.1 Write-Protection for Registers

To prevent registers from being accidentally modified, registers can be write-protected in channel units by setting GTWP.WP. Write-protection can be set for the following registers:

GTSSR, GTPSR, GTCSR, GTUPSR, GTDNSR, GTICASR, GTICBSR, GTCR, GTUDDTYC, GTIOR, GTINTAD, GTST, GTBER, GTITC, GTCNT, GTCCRA, GTCCRB, GTCCRC, GTCCRD, GTCCRE, GTCCRF, GTPR, GTPBR, GTPDBR, GTADTRA, GTADTBRA, GTADTDBRA, GTADTRB, GTADTBRB, GTADTDBRB, GTDTCR, GTDVU, GTDVD, GTDBU, GTDBD, GTSOS, GTSOTR, GTEITC, GTEITLI1, GTEITLI2, GTEITLB, GTICLF.

Every bit in registers GTSTR, GTSTP and GTCLR which can update the corresponding registers in other channels and can be updated by any of the corresponding registers in other channels conversely, can be protected by setting the GTWP.STRWP, STPWP, and CLRWP bits, respectively, per channel.

Likewise, writing to the GTSECSR and GTSECR registers, which can control all channels by writing to the GTSECSR and GTSECR registers of a given channel, can be enabled or disabled by the setting of the GTWP.CMNWP bit.

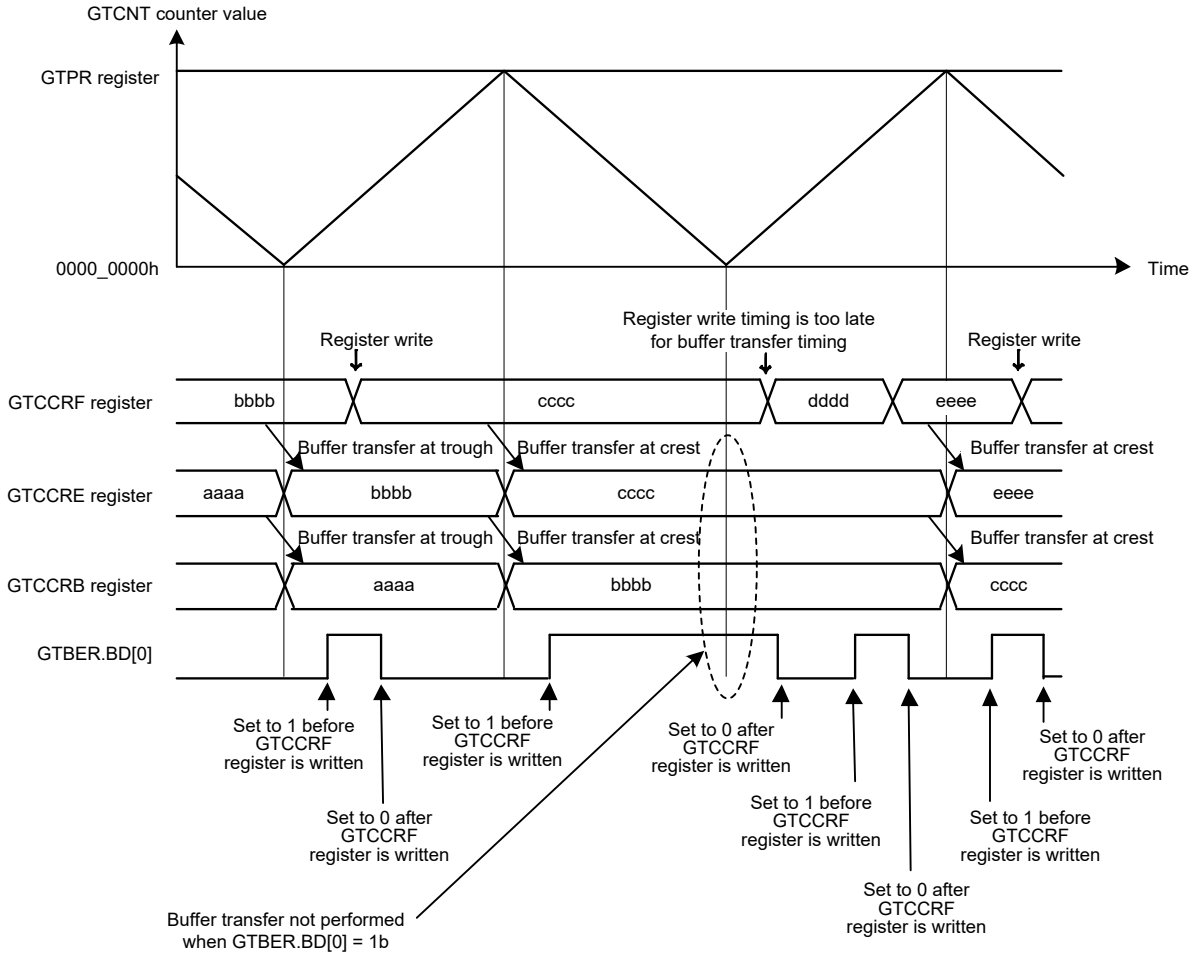
Protection using the GTWP register is only for write operations by the CPU. This protection does not cover updates to registers that occur in association with CPU writes.

5.7.8.2 Disabling of Buffer Operation

If the timing of the buffer register write is delayed relative to the timing for the buffer transfer, buffer operation can be suspended with the GTBER.BD[1] and BD[0] bits settings. Specifically, buffer transfer can be temporarily disabled even though a buffer transfer condition is generated during buffer register write, by setting the BD[1] and BD[0] bits to 1b (buffer operation disabled) before buffer register write, and setting the bits to 0b (buffer operation enabled) after completion of writing to all the buffer registers.

The BD[1] and BD[0] bits can be set on channel basis by writing directly to the GTBER register or it can be set to 0b simultaneously by setting the GTSECR register for multiple channels which were set by the GTSECSR register.

Figure 5.7-71 shows an example of operation for disabling buffer operation by writing to the GTBER register.



Note: The base addresses of the registers are the same.

Figure 5.7-71 Example of Operation for Disabling Buffer Operation with Triangle Waves, Double Buffer Operation, and Buffer Transfer at Both Troughs and Crests

5.7.8.2.1 Simultaneous Control of Buffer Operations of Multiple Channels

The GTBER.BD bit can be set by writing directly to the GTBER register per channel or by making settings in the GTSECR register for multiple channels that have already set in the GTSECSR register.

Follow the procedure below to simultaneously set the GTBER.BD bits of multiple channels.

1. Select the channels for simultaneously setting by the GTSECSR register
   Set the GTSECSR register so that the values at the bit positions for the corresponding channels for simultaneously setting of the GTBER.BD bits become 1b. All GTSECSR registers can be updated by writing to the GTSECSR register of any channel.
2. Simultaneously set the GTBER.BD bits by updating the GTSECR register
   In the GTSECR register, set the operation of the GTBER.BD bits (enabling or disabling of buffer operation) which are to be simultaneously set. Writing to a GTSECR register from any channel updates the GTBER.BD bits in all channels corresponding to the bits set as 1b in the GTSECSR register, in accordance with the value of the GTSECR register.

Figure 5.7-72 shows examples of simultaneously controlling the enabling or disabling of buffer operation for multiple channels.

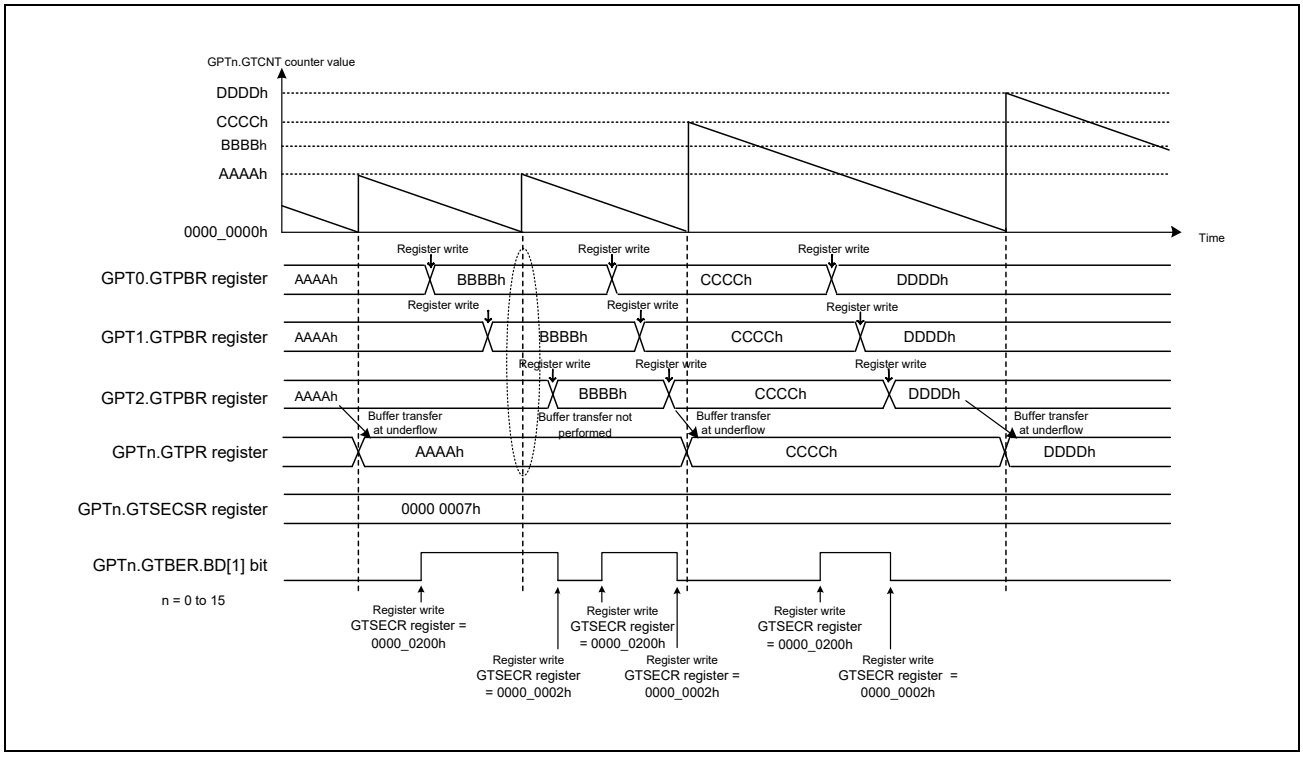


Figure 5.7-72 Example of Multiple Channel Operation for Disabling Buffer Operation (Saw Waves, Single Buffer Operation)

5.7.8.2.2 Repeated Double-Buffered Operation when GTCCR Buffer Transfer is Inhibited

If saw-wave one-shot pulse mode, triangle-wave PWM mode 3, or triangle-wave PWM mode 2 that operates the GTCCRm (m =A, B) register as a double buffer is used, setting the GTBER.DBRTECm (m = A, B) bit to 1b repeats transfer from the intermediate buffer to the GTCCRm (m = A, B) register on a cyclic basis even while buffer transfer is inhibited by the setting of the GTBER.BD[0] bit or by the buffer transfer extended skipping function.

(1) In saw-wave one-shot pulse mode

In saw-wave one-shot pulse mode, the compare match value for the first half of the cycle is stored in temporary register x (x = C, E) as the intermediate buffer for the GTCCRx (x = C, E) register and the compare match value for the second half of the cycle is stored in temporary register m (m = A, B) as the intermediate buffer for the GTCCRy (y = D, F) register, respectively, for compare match values during repeated operation, and the given values are alternately transferred to the GTCCRm (m = A, B) registers. **Table 5.7-47** lists the types of buffer transfer of the GTCCR register during counting in saw-wave one-shot pulse mode.

While counting is stopped, the setting of the value in the temporary register is transferred through forcible buffer transfer. In forcible buffer transfer, the values of the GTCCRy (y = D, F) registers are transferred to temporary registers m (m = A, B), and the values of the GTCCRx (x = C, E) registers are transferred to temporary registers x (x = C, E), when the setting of the corresponding GTBER.DBRTECm (m = A, B) bit is 1b, respectively.

When the setting of the GTBER.DBRTECm (m = A, B) bit is 1b, values written by the CPU to the GTCCRm (m = A, B) registers are reflected as the values of temporary registers x (x = C, E).

Table 5.7-47 GTCCR Buffer Operation in Saw-Wave One-Shot Pulse Mode (during Counting)

GTBER.DBRTECm Bit	Buffer Transfer	Transfer Timing				
		GTCCRx register ↓ GTCCRm register	GTCCRx register ↓ Temporary register x	Temporary register x ↓ GTCCRm register	GTCCRy register ↓ Temporary register m	Temporary register m ↓ GTCCRm register
0b	Transfer-enabled period	Overflow or underflow	No transfer	No transfer	Overflow or underflow	GTCCRm compare match
	Transfer-inhibited period	No transfer	No transfer	No transfer	No transfer	No transfer
1b	Transfer-enabled period	Overflow or underflow	Overflow or underflow	No transfer	Overflow or underflow	GTCCRm compare match
	Transfer-inhibited period	No transfer	No transfer	Overflow or underflow	No transfer	GTCCRm compare match

Note: m: A, B
x: C, E
y: D, F

Figure 5.7-73 shows the case when a transfer-inhibited period is generated by extended buffer transfer skipping, as an example of repeated double-buffered operation when the GTCCR buffer transfer is inhibited in saw-wave one-shot pulse mode. **Figure 5.7-74** shows the case when a transfer-inhibited period is generated by updating the GTBER.BD[0] bit, as an example of repeated double-buffered operation when the GTCCR buffer transfer is inhibited in saw-wave one-shot pulse mode.

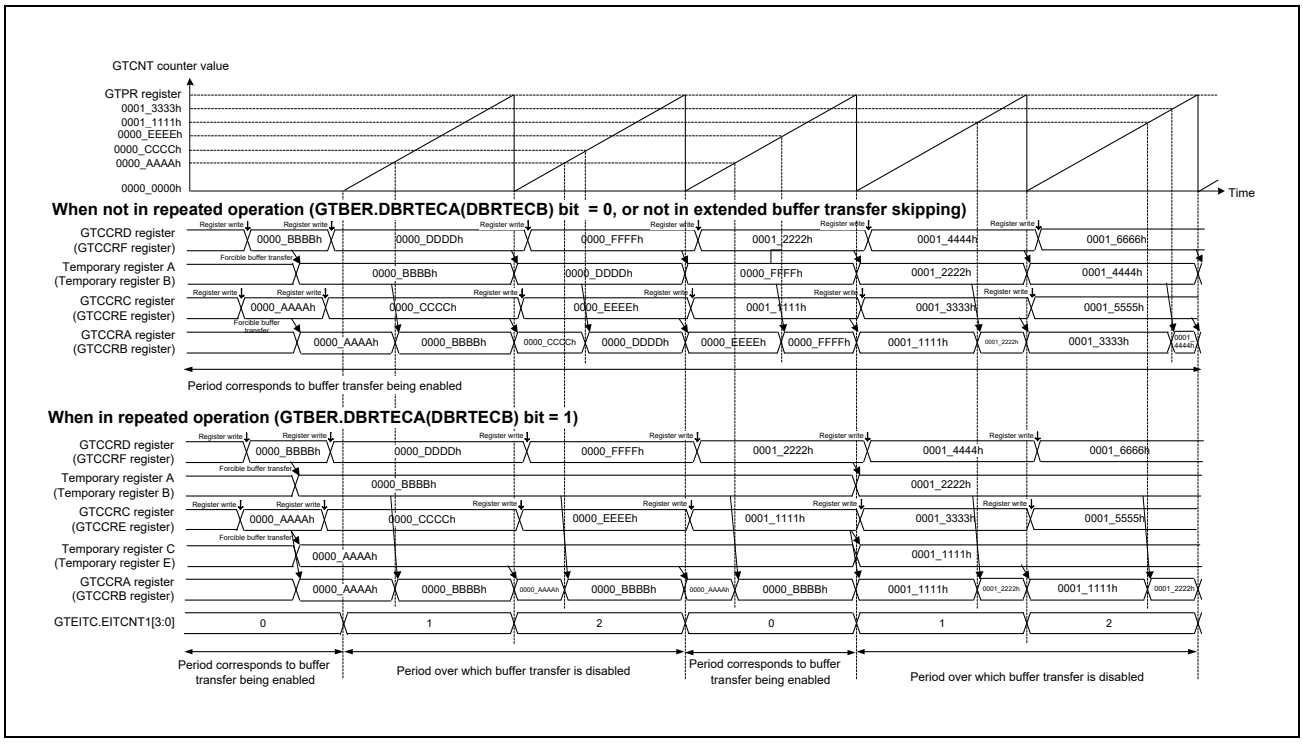

Figure 5.7-73 Example of Repeated Double-Buffered Operation when GTCCR Buffer Transfer is Inhibited (in Saw-Wave One-Shot Pulse Mode, Extended Buffer Transfer Skipping is Used, the GTBER.BD[0] Bit is Always 0)

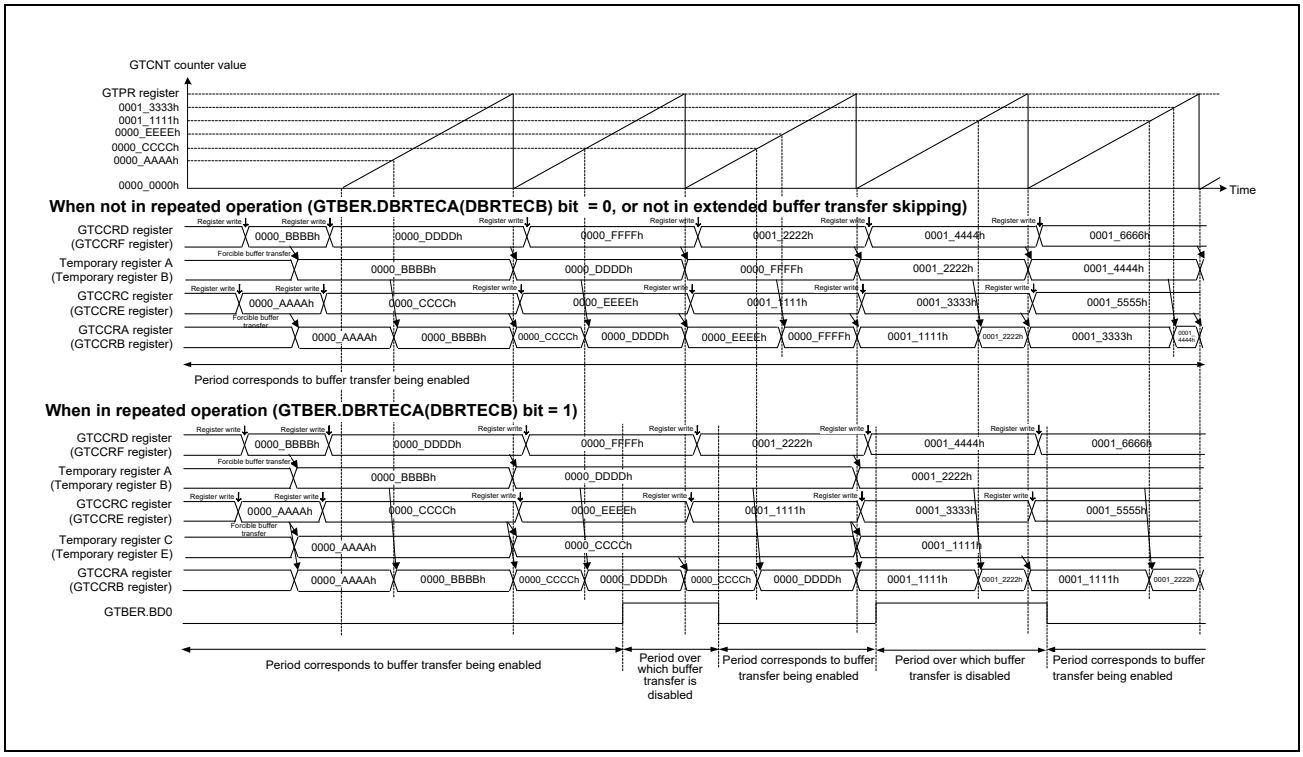

Figure 5.7-74 Example of Repeated Double-Buffered Operation when GTCCR Buffer Transfer is Inhibited (in Saw-Wave One-Shot Pulse Mode, the GTBER.BD[0] Bit is Updated)

(2) In triangle-wave PWM mode 3

In triangle-wave PWM mode 3, the compare match value for the first half of the cycle is stored in temporary register x (x = C, E) as the intermediate buffer for the GTCCRx (x = C, E) register and the compare match value for the second half of the cycle is stored in temporary register m (m = A, B) as the intermediate buffer for the GTCCRy (y = D, F) register, respectively, for compare match values during repeated operation, and the given values are alternately transferred to the GTCCRm (m = A, B) register. **Table 5.7-48** lists the types of buffer transfer of the GTCCR register during counting in triangle-wave PWM mode 3.

While counting is stopped, the setting of the value in the temporary register is transferred through forcible buffer transfer. In forcible buffer transfer, the values of the GTCCRy (y = D, F) registers are transferred to temporary registers m (m = A, B), and the values of the GTCCRx (x = C, E) registers are transferred to temporary registers x (x = C, E), when the setting of the corresponding GTBER.DBRTECm (m = A, B) bit is 1b, respectively.

When the setting of the GTBER.DBRTECm (m = A, B) bit 1b, values written by the CPU to the GTCCRm (m = A, B) registers are reflected as the values of temporary registers x (x = C, E).

Table 5.7-48 GTCCR Buffer Operation in Triangle-Wave PWM Mode 3 (during Counting)

GTBER.DBRTECm Bit	Buffer Transfer	Transfer Timing				
		GTCCRx register ↓ GTCCRm register	GTCCRx register ↓ Temporary register x	Temporary register x ↓ GTCCRm register	GTCCRy register ↓ Temporary register m	Temporary register m ↓ GTCCRm register
0b	Transfer-enabled period	Trough	No transfer	No transfer	Trough	Crest
	Transfer-inhibited period	No transfer	No transfer	No transfer	No transfer	No transfer
1b	Transfer-enabled period	Trough	Trough	No transfer	Trough	Crest
	Transfer-inhibited period	No transfer	No transfer	Trough	No transfer	Crest

Note: m: A, B
x: C, E
y: D, F

Figure 5.7-75 shows the case when a transfer-inhibited period is generated by extended buffer transfer skipping, as an example of repeated double-buffered operation when the GTCCR buffer transfer is inhibited in triangle-wave PWM mode 3. **Figure 5.7-76** shows the case when a transfer-inhibited period is generated by updating the GTBER.BD[0] bit, as an example of repeated double-buffered operation when the GTCCR buffer transfer is inhibited in triangle-wave PWM mode 3.

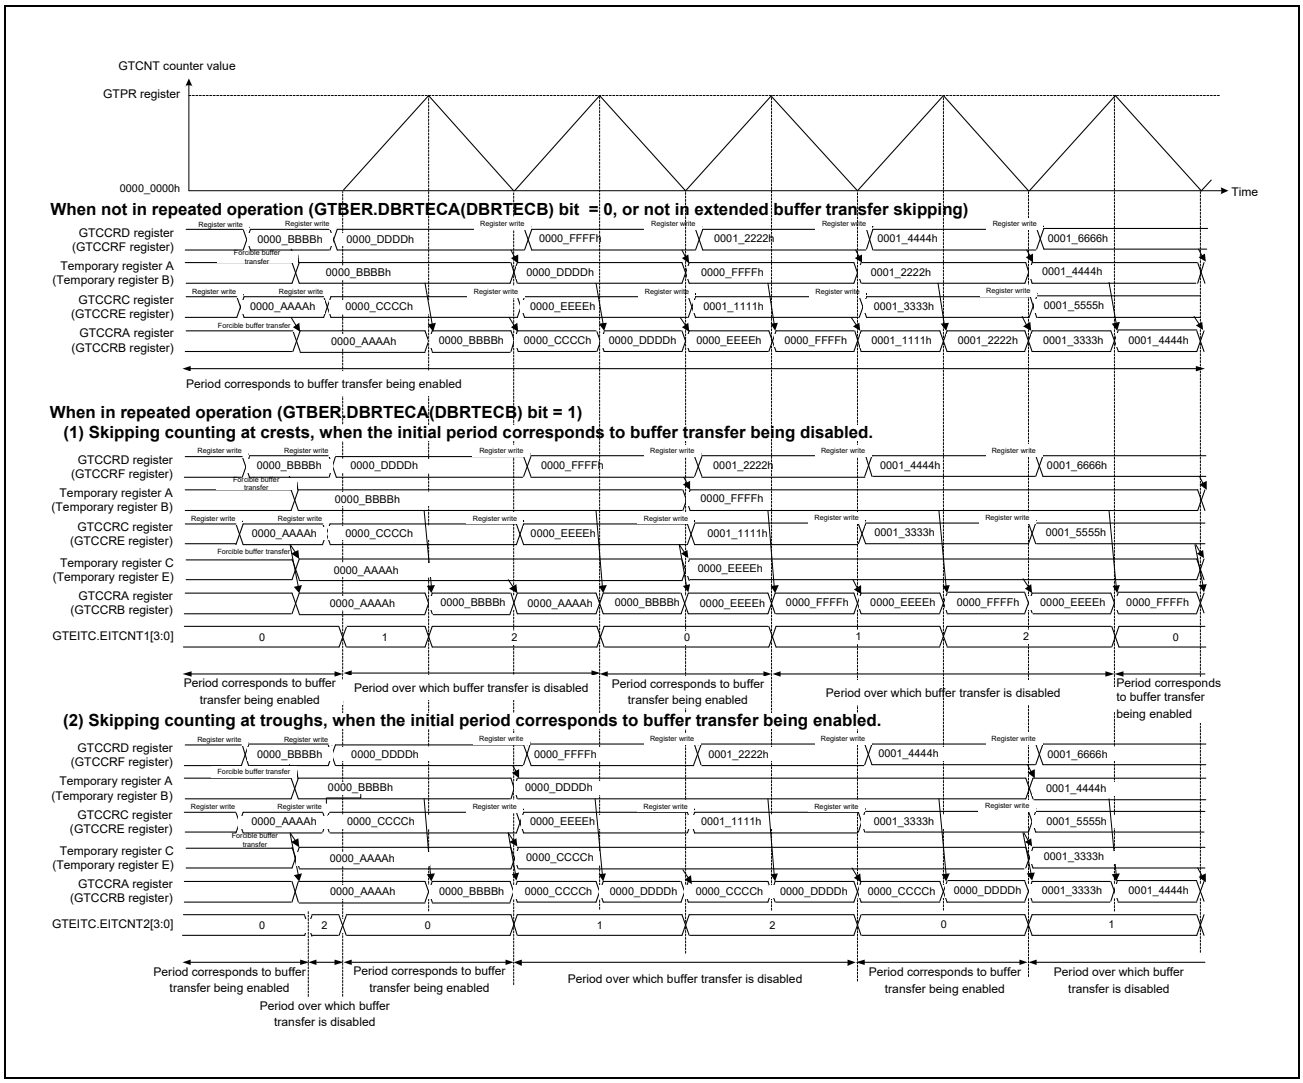

Figure 5.7-75 Example of Repeated Double-Buffered Operation when GTCCR Buffer Transfer is Inhibited (in Triangle-Wave PWM Mode 3, Extended Buffer Transfer Skipping is Used, the GTBER.BD[0] Bit is Always 0)

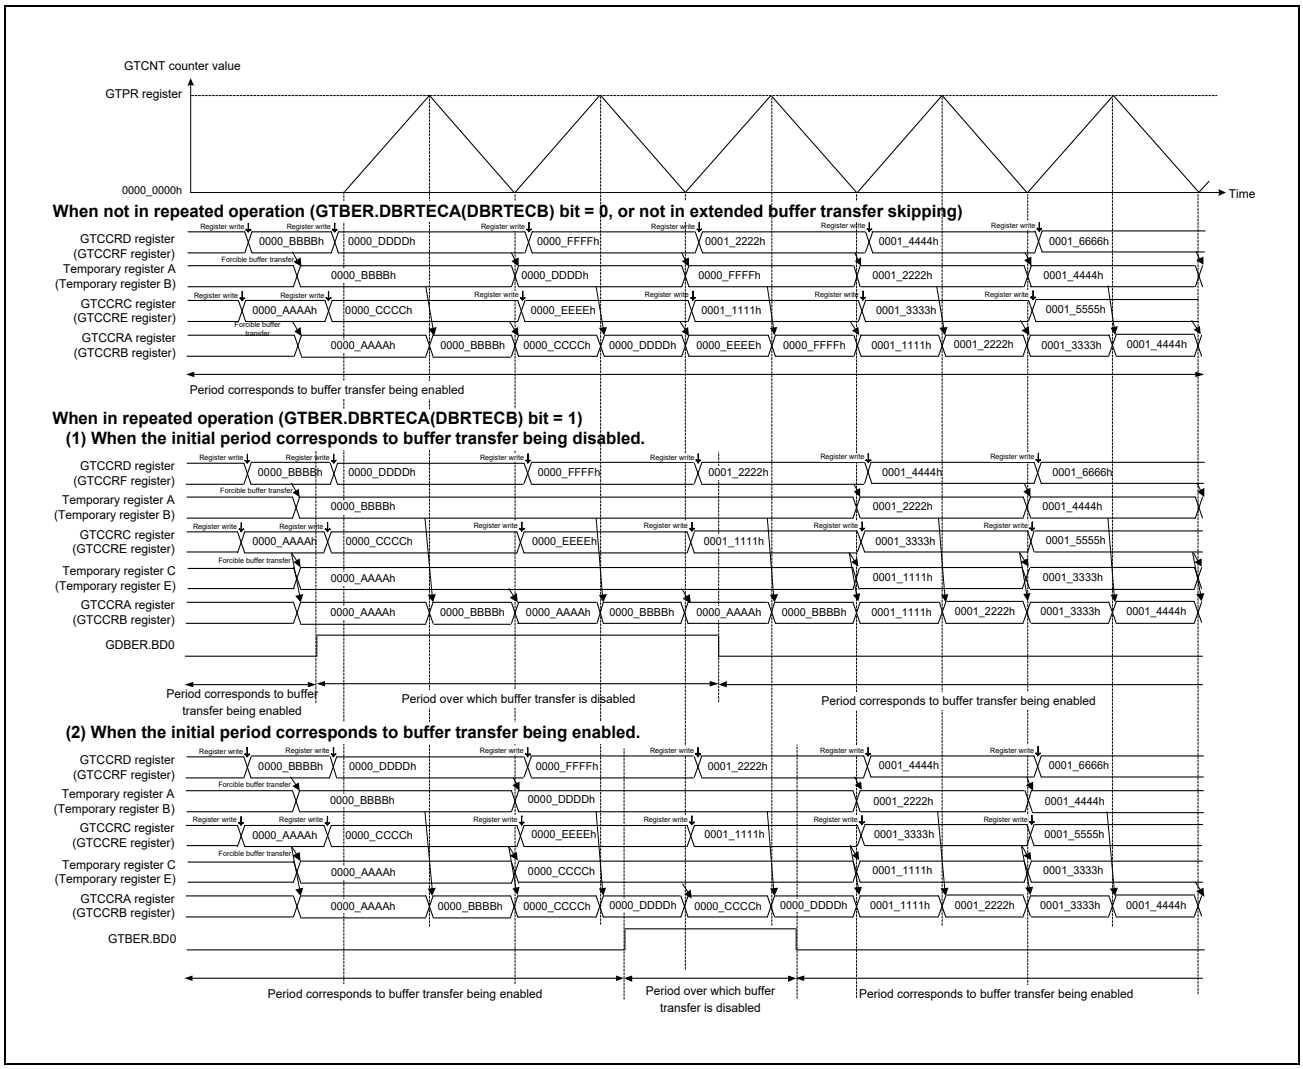

Figure 5.7-76 Example of Repeated Double-Buffered Operation when GTCCR Buffer Transfer is Inhibited (in Triangle-Wave PWM Mode 3, the GTBER.BD[0] Bit is Updated)

(3) In triangle-wave PWM mode 2

In triangle-wave PWM mode 2, the compare match value for the first half of the cycle is stored in temporary register x (x = C, E) as the intermediate buffer for the GTCCRx (x = C, E) register and the compare match value for the second half of the cycle is stored in the GTCCRx (x = C, E) register, respectively, for compare match values during repeated operation, and the given values are alternately transferred to the GTCCRm (m = A, B) register. The first and second halves of a waveform is determined by the setting of the GTCCRm double-buffer repeat operation period select bit GTBER.DBRTSCm (m = A, B). **Table 5.7-49** lists the types of buffer transfer of the GTCCR register during counting in triangle-wave PWM mode 2.

While counting is stopped, set the compare match value for the first half of the cycle following the start of counting in temporary register x (x = C, E) beforehand. When the setting of the GTBER.DBRTECm (m = A, B) bit is 1b, values written by the CPU to the GTCCRm (m = A, B) registers are reflected as the values of temporary registers x (x = C, E).

If the start of counting is at the second half of the cycle, set the value for the second half of the cycle in the GTCCRm (m = A, B) register beforehand when counting is stopped. If the start of counting is at the second half of the cycle and in the buffer transfer inhibited period, set the same value as the GTCCRx (x = C, E) register in the GTCCRm (m = A, B) register. When setting the value for the second half of the cycle in the GTCCRm (m = A, B) register when counting is stopped, set the value for the first half of the cycle in temporary register x (x = C, E), and then return the value of the GTBER.DBRTECm (m = A, B) bit to 0 once before writing by the CPU. After writing, set the GTBER.DBRTECm (m = A, B) bit to 1b before counting starts.

Table 5.7-49 GTCCR Buffer Operation in Triangle-Wave PWM Mode 2 (during Counting)

GTBER.DBRTECm Bit	GTBER.DBRTSCm Bit	Buffer Transfer	Transfer Timing			
			GTCCRy register ↓ GTCCRx register	GTCCRx register ↓ GTCCRm register	GTCCRy register ↓ Temporary register x	Temporary register x ↓ GTCCRm register
0b	—	Transfer-enabled period	Both trough and crest	Both trough and crest	No transfer	No transfer
		Transfer-inhibited period	No transfer	No transfer	No transfer	No transfer
1b	0b (trough cycle)	Transfer-enabled period	Both trough and crest	Both trough and crest	Crest	No transfer
		Transfer-inhibited period	No transfer	Crest	No transfer	Trough
	1b (crest cycle)	Transfer-enabled period	Both trough and crest	Both trough and crest	Trough	No transfer
		Transfer-inhibited period	No transfer	Trough	No transfer	Crest

Note: m: A, B
x: C, E
y: D, F

5.7.8.2.3 Repeated Double-Buffered Operation when GTADTR Buffer Transfer is Inhibited

If the GTADTRm (m = A, B) register is made to operate as a double buffer in triangle-wave mode (the GTBER.ADTDm (m = A, B) bit is 1) and the timing of buffer transfer is set for both troughs and crests (the GTBER.ADTTm (m= A, B)[1:0] bits are 11b), setting the GTBER.DBRTEADm (m = A, B) bit to 1 repeats transfer from the intermediate buffer to the GTADTRm (m = A, B) register on a cyclic basis even while buffer transfer is inhibited by the setting of the GTBER.BD[2] bit or by the buffer transfer extended skipping function.

The A/D converter start request timing value for the first half of the cycle is stored in temporary register ADm (m=A, B) as the intermediate buffer for the GTADTBRm (m = A, B) register and the A/D converter start request timing value for the second half of the cycle is stored in the GTADTBRm (m = A, B) register, respectively, for A/D converter start request timing values during repeated operation, and the given values are alternately transferred to the GTADTRm (m = A, B) register. The first and second halves of the cycle is determined by the setting of the GTADTRm double-buffer repeat operation period select bit GTBER.DBRTSADm (m = A, B). **Table 5.7-50** lists the types of buffer transfer of the GTADTR register during counting in triangle-wave mode.

While counting is stopped, set the A/D converter start request timing value for the first half of the cycle following the start of counting in temporary register ADm (m = A, B) beforehand. When the setting of the GTBER.DBRTEADm (m = A, B) bit is 1b, values written by the CPU to the GTADTRm (m = A, B) registers are reflected as the values of temporary registers ADm (m = A, B).

If the start of counting is at the second half of the cycle, set the value for the second half of the cycle in the GTADTRm (m = A, B) register beforehand when counting is stopped. If the start of counting is at the second half of the cycle and in the buffer transfer inhibited period, set the same value as the GTADTBRm (m = A, B) register in the GTADTRm (m = A, B) register. When setting the value for the second half of the cycle in the GTADTRm (m = A, B) register when counting is stopped, set the value for the first half of the cycle in temporary register ADm (m = A, B), and then return the value of the GTBER.DBRTEADm (m = A, B) bit to 0b once before writing by the CPU. After writing, set the GTBER.DBRTEADm (m = A, B) bit to 1b before counting starts.

Table 5.7-50 GTADTR Buffer Operation in Triangle-Wave Mode (during Counting)

GTBER. DBRTECm Bit	GTBER. DBRTSCm Bit	Buffer Transfer	Transfer Timing			
			GTCCRy register ↓ GTCCRx register	GTCCRx register ↓ GTCCRm register	GTCCRy register ↓ Temporary register x	Temporary register x ↓ GTCCRm register
0b	—	Transfer-enabled period	Both trough and crest	Both trough and crest	No transfer	No transfer
		Transfer-inhibited period	No transfer	No transfer	No transfer	No transfer
1b	0b (trough cycle)	Transfer-enabled period	Both trough and crest	Both trough and crest	Crest	No transfer
		Transfer-inhibited period	No transfer	Crest	No transfer	Trough
	1b (crest cycle)	Transfer-enabled period	Both trough and crest	Both trough and crest	Trough	No transfer
		Transfer-inhibited period	No transfer	Trough	No transfer	Crest

Note: m: A, B

5.7.8.3 GTIOCnm Pin Output Negate Control (n = 0 to 15, m = A, B)

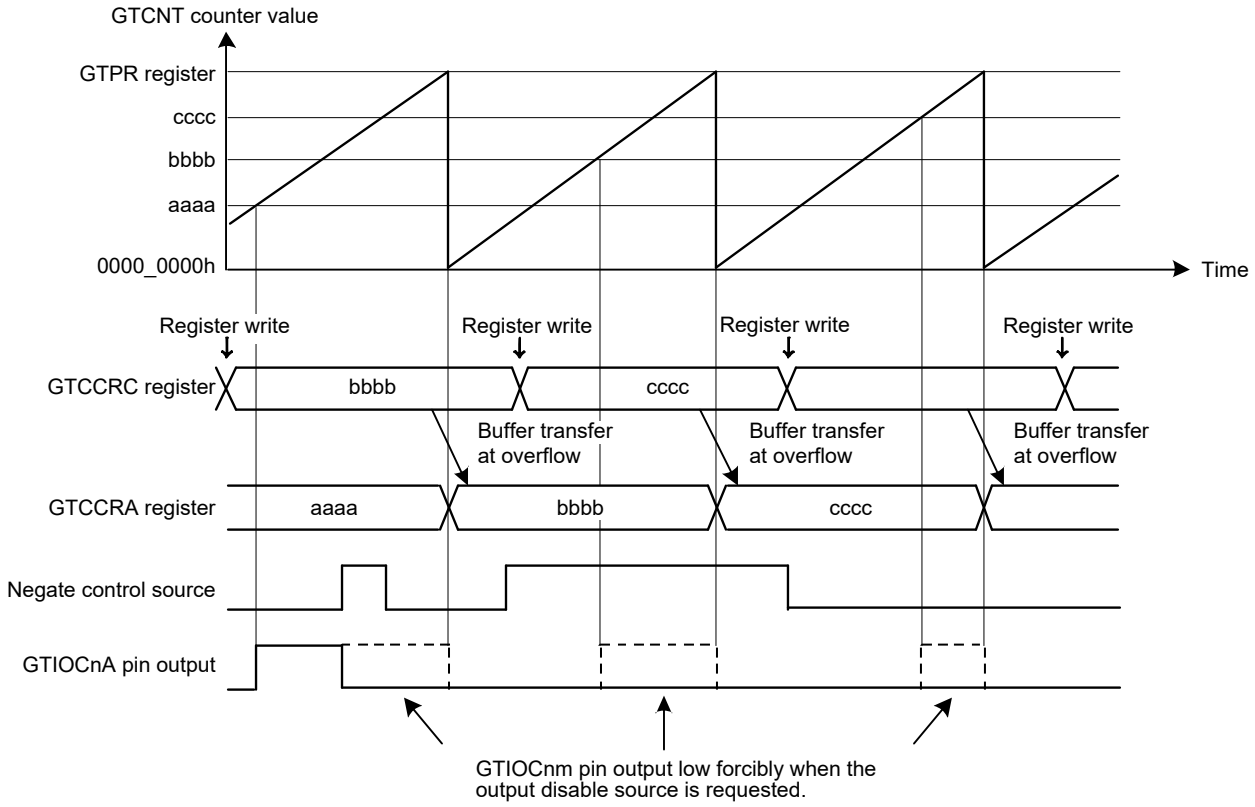
For protection from system failure, the output disable control that changes the GTIOCnm pin output value forcibly is provided for GTIOCnm pin output by the request of output disable from POEG. Output protection is required when the same output level being on the GTIOCnA and GTIOCnB pins is detected. GPT detects this condition and generates output disable requests to POEG according to the setting of the output disable request permission bits, such as GTINTAD.GRPABH, GTINTAD.GRPABL. After the POEG performs the logical OR of the output disable request from each channel and the output disable request from the external input, the POEG generates output disable requests to GPT.

One output disable signal (representing the shared output disable request signal of the GTIOCnA pin and the GTIOCnB pin) out of 4 output disable requests generated by the POEG is selected by setting GTINTAD.GRP[1:0]. The status of the selected output disable request is monitored by reading the GTST.ODF bit. The output level during output disable is set based on the GTIOR.OADF[1:0] bits for the GTIOCnA pin and the GTIOR.OBDF[1:0] setting for the GTIOCnB pin.

The change to the output disable state is performed asynchronously by generating the output disable request from the POEG. The release of the output disable state is performed at end of cycle by terminating the output disable request. It is after 3 PCLKD at shortest when the output disable condition is released after the output disable request becomes no longer satisfied. To reliably control output disabling, clear the flag of POEG for which the condition for the request to disable the output is no longer satisfied after 4 cycles of PCLKD.

When event count is performed or when the output disable state should be released immediately without waiting for end of cycle, GTIOR.OADF[1:0] should be set to 00b (for GTIOCnA pin) or GTIOR.OBDF[1:0] should be set to 00b (for the GTIOCnB pin).

Figure 5.7-77 shows an example of the GTIOCnm pin output disable control operation. (n = 0 to 15, m = A, B)



Note: The base addresses of the registers are the same.

Figure 5.7-77 Example of GTIOCnm Pin Output Disable Control Operation in Saw-Wave Up-Counting, Buffer Operation, Active Level 1, High-level Output at GTCCRA Compare Match, Low-level Output at Cycle End, and Low-level Output at Output Disable (n = 0 to 15, m = A, B)

5.7.8.4 GTIOCnm Protection Function for GTIOCnm Pin Output (n = 0 to 15; m = A, B)

In case an incorrect value (0000_0000h or a value greater than or equal to the GTPR register value) is set in the GTCCRA register, the output protection function (inhibition) for the GTIOCnm pin output operates when the automatic dead time setting is made (the GTDTCR.TDE bit = 1) in triangle-wave PWM mode.

The operating state of the output protection function can be checked by reading the GTSOS.SOS[1:0] bits.

Figure 5.7-78 shows the state transitions of the output protection function.

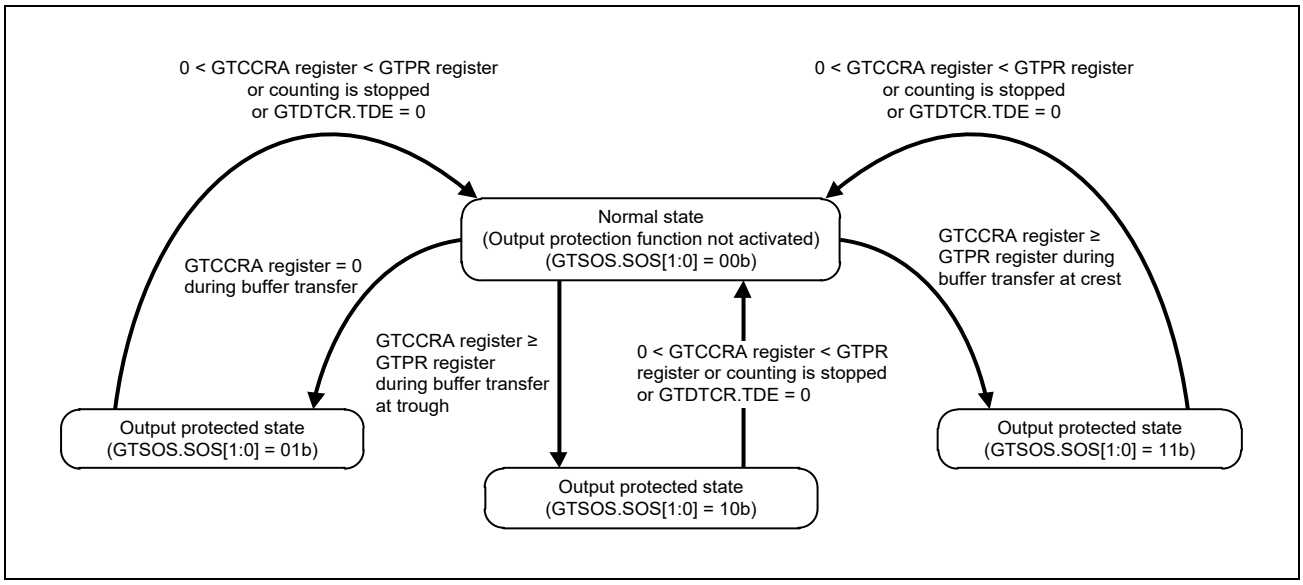


Figure 5.7-78 Output Protection Function

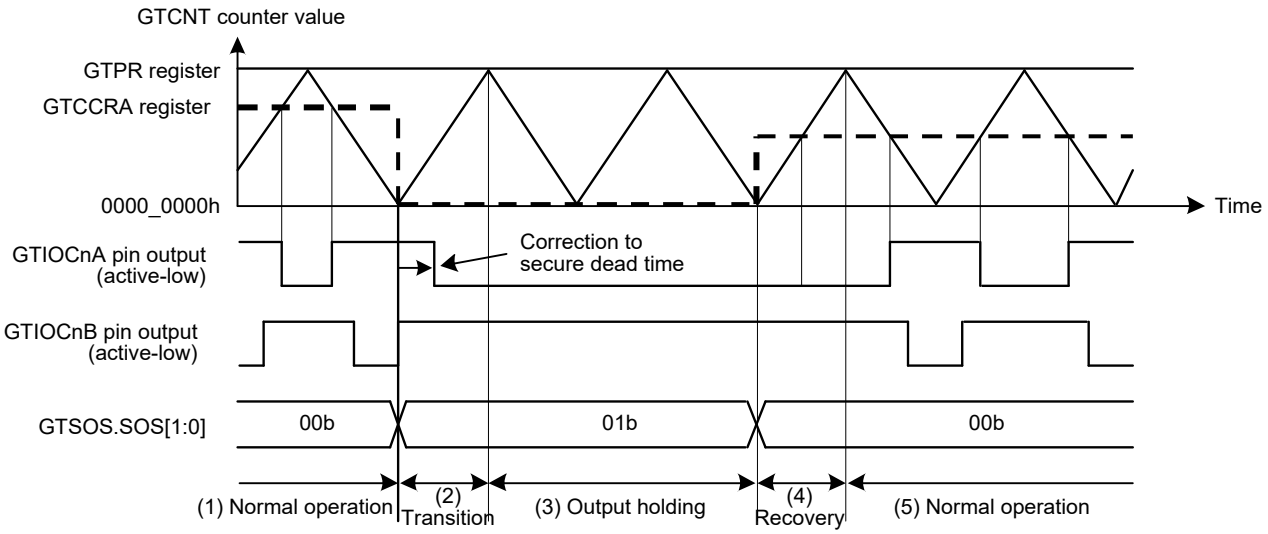
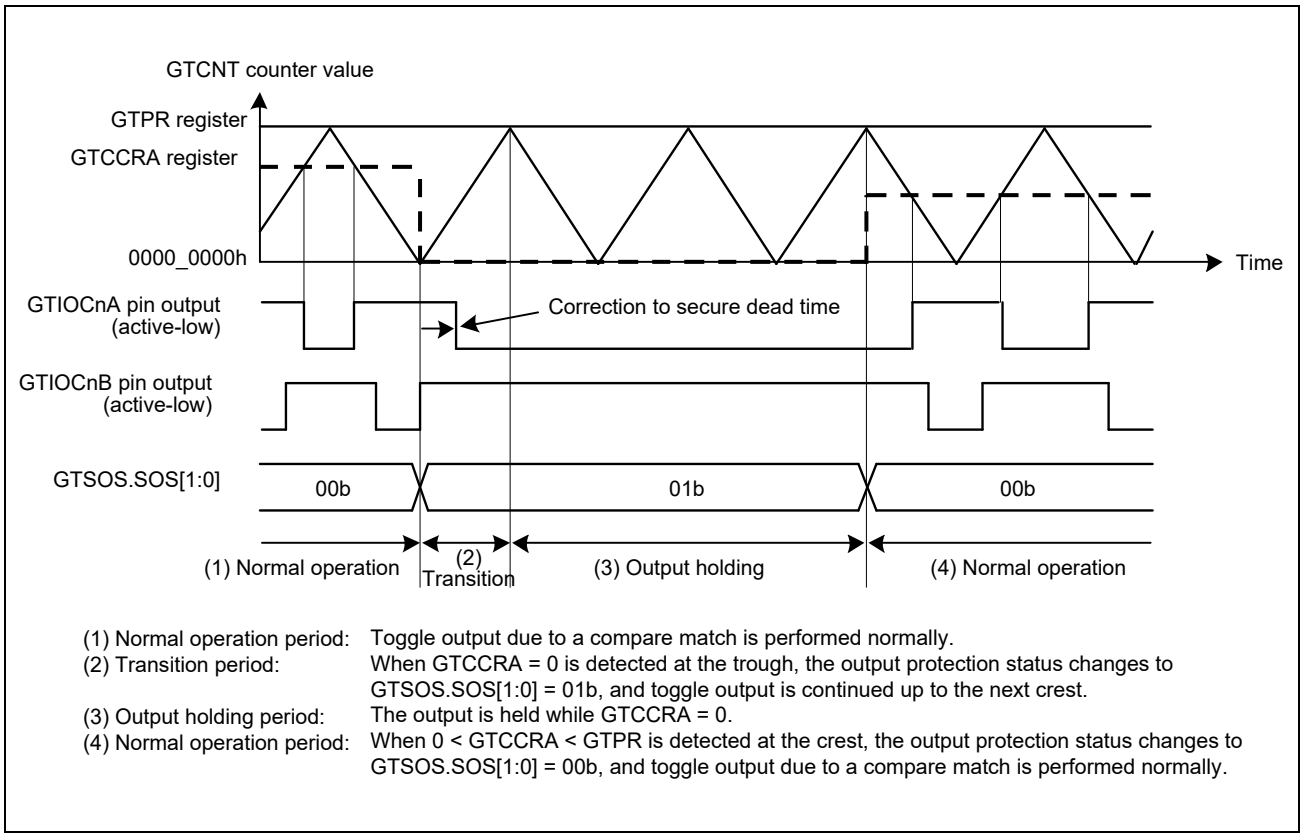
(1) Output Protection Function when the GTCCRA Register Value is 0000_0000h during Buffer Transfer

Figure 5.7-79 and **Figure 5.7-81** show examples of output protection function operation when the GTCCRA register value is 0000_0000h during buffer transfer at troughs, and **Figure 5.7-82** and **Figure 5.7-83** show examples when the GTCCRA register value is 0000_0000h during buffer transfer at crests.



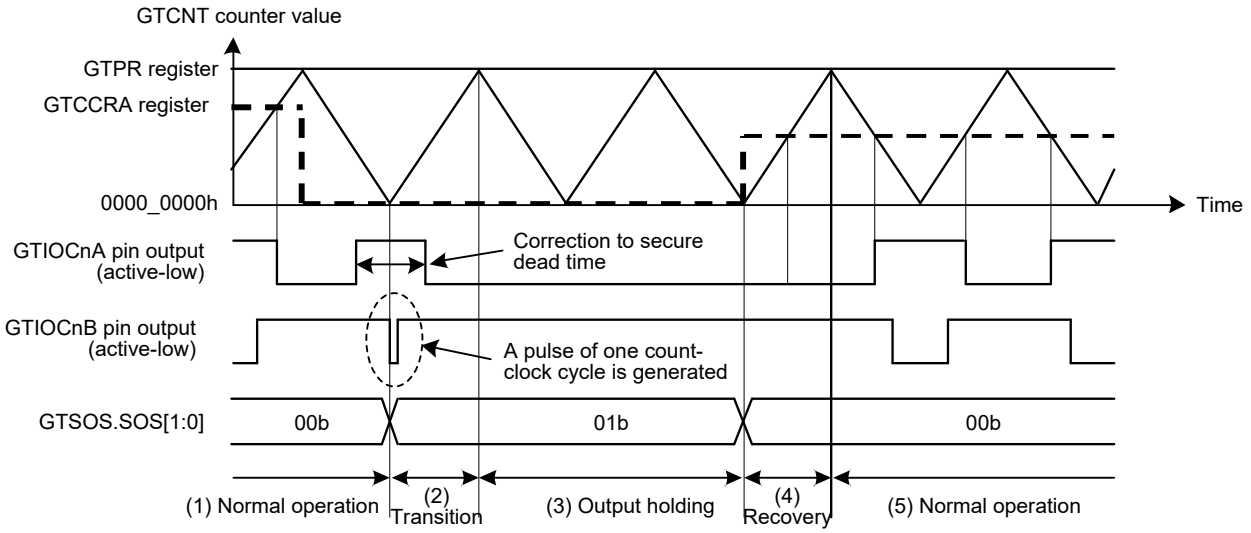
(1) Normal operation period: Toggle output due to a compare match is performed normally.
(2) Transition period: When GTCCRA = 0 is detected at the trough, the output protection status changes to GTSOS.SOS[1:0] = 01b, and toggle output is continued up to the next crest.
(3) Output holding period: The output is held while GTCCRA = 0.
(4) Recovery period: When 0 < GTCCRA < GTPR is detected at the trough, the output protection status changes to GTSOS.SOS[1:0] = 00b, and holding output is maintained up to the next crest.
(5) Normal operation period: Toggle output due to a compare match is performed normally.

Figure 5.7-79 Example of Output Protection Function Operation when the GTCCRA Register Value is 0000_0000h during Buffer Transfer at Troughs (Restored to 0 < GTCCRA Register < GTPR Register during Buffer Transfer at Troughs, Active Level: Low) (n = 0 to 15)



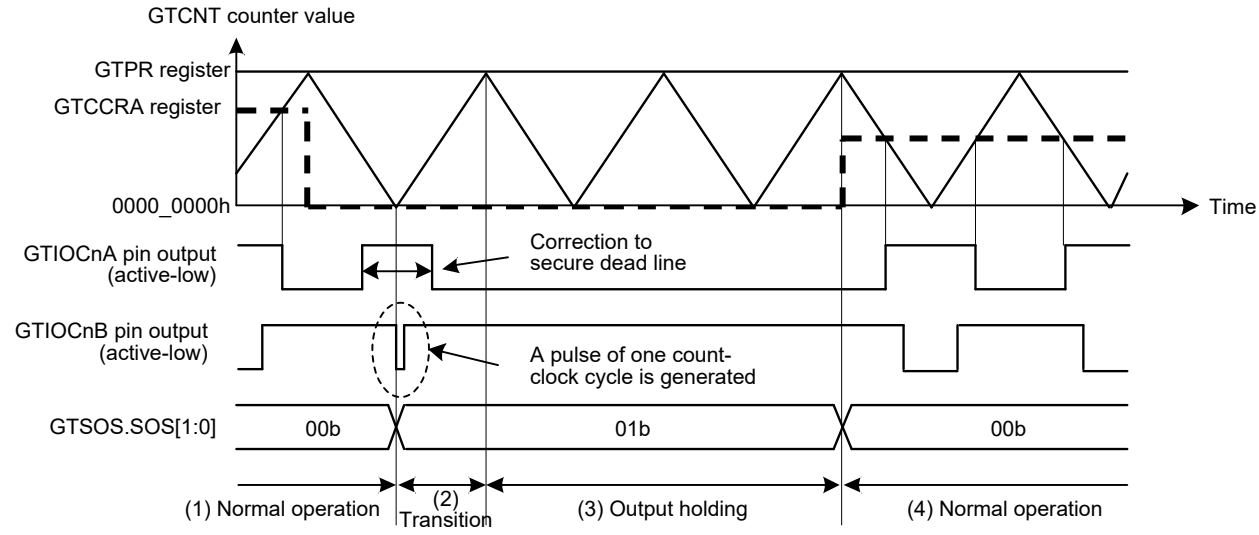
(1) Normal operation period: Toggle output due to a compare match is performed normally.
(2) Transition period: When GTCCRA = 0 is detected at the trough, the output protection status changes to GTSOS.SOS[1:0] = 01b, and toggle output is continued up to the next crest.
(3) Output holding period: The output is held while GTCCRA = 0.
(4) Normal operation period: When 0 < GTCCRA < GTPR is detected at the crest, the output protection status changes to GTSOS.SOS[1:0] = 00b, and toggle output due to a compare match is performed normally.

Figure 5.7-80 Example of Output Protection Function Operation when the GTCCRA Register Value is 0000_0000h during Buffer Transfer at Troughs (Restored to 0 < GTCCRA Register < GTPR Register during Buffer Transfer at Crests, Active Level: Low) (n = 0 to 15)



(1) Normal operation period:	Toggle output due to a compare match is performed normally.
(2) Transition period:	When GTCCRA = 0 is detected at the trough, the output protection status changes to GTSOS.SOS[1:0] = 01b, and toggle output is continued up to the next crest.
(3) Output holding period:	The output is held while GTCCRA = 0.
(4) Recovery period:	When 0 < GTCCRA < GTPR is detected at the trough, the output protection status changes to GTSOS.SOS[1:0] = 00b, and holding output is maintained up to the next crest.
(5) Normal operation period:	Toggle output due to a compare match is performed normally.

Figure 5.7-81 Example of Output Protection Function Operation when the GTCCRA Register Value is 0000_0000h during Buffer Transfer at Crests (Restored to 0 < GTCCRA Register < GTPR Register during Buffer Transfer at Troughs, Active Level: Low) (n = 0 to 15)



(1) Normal operation period: Toggle output due to a compare match is performed normally.
(2) Transition period: When GTCCRA = 0 is detected at the trough, the output protection status changes to GTSOS.SOS[1:0] = 01b, and toggle output is continued up to the next crest.
(3) Output holding period: The output is held while GTCCRA = 0.
(4) Recovery period: When 0 < GTCCRA < GTPR is detected at the crest, the output protection status changes to GTSOS.SOS[1:0] = 00b, and toggle output due to a compare match is performed normally.

Figure 5.7-82 Example of Output Protection Function Operation when the GTCCRA Register Value is 0000_0000h during Buffer Transfer at Crests (Restored to 0 < GTCCRA Register < GTPR Register during Buffer Transfer at Crests, Active Level: Low) (n = 0 to 15)

(2) Output Protection Function when GTCCRA Register ≥ GTPR Register is Set during Buffer Transfer at Troughs

Figure 5.7-83 and **Figure 5.7-84** show examples of output protection function operation when GTCCRA register ≥ GTPR register is set during buffer transfer at troughs.

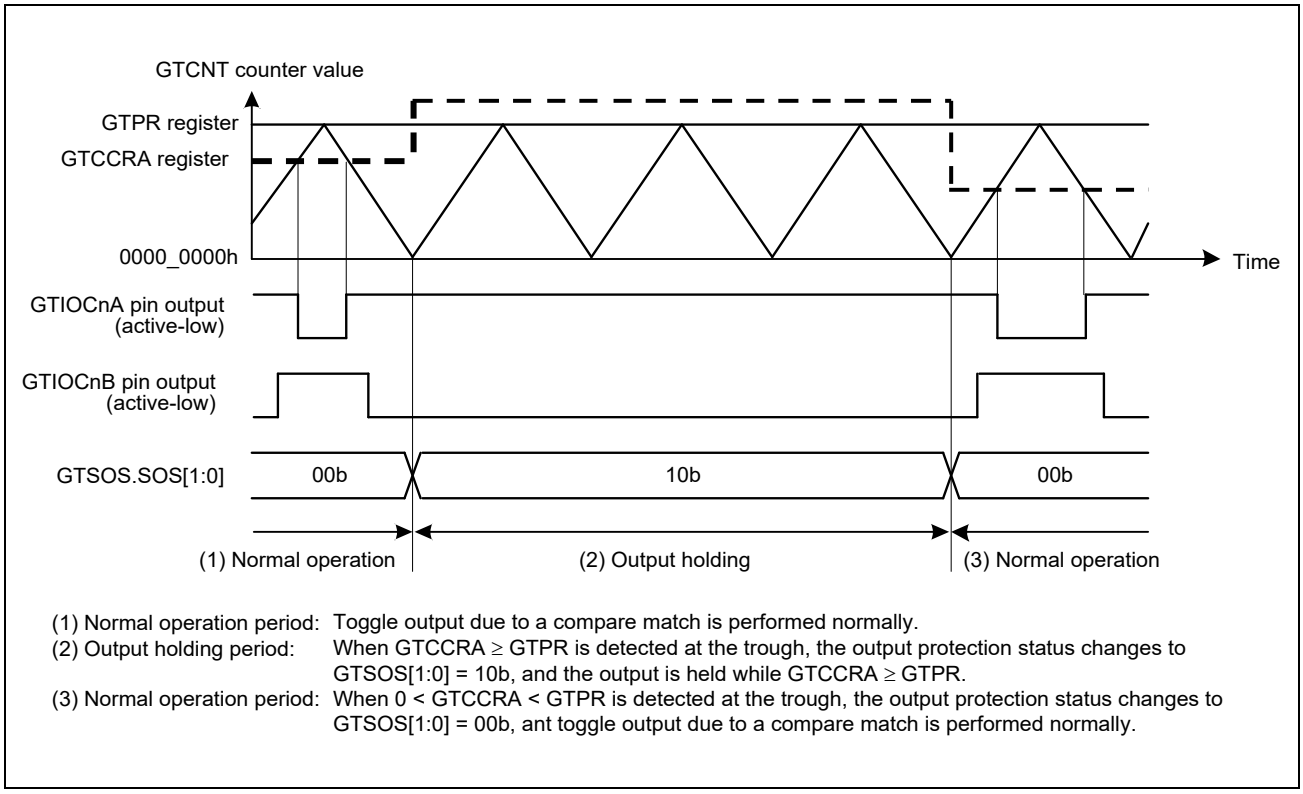


Figure 5.7-83 Example of Output Protection Function Operation when GTCCRA Register ≥ GTPR Register is Set during Buffer Transfer at Troughs (Restored to 0 < GTCCRA Register < GTPR Register during Buffer Transfer at Troughs, Active Level: Low) (n = 0 to 15)

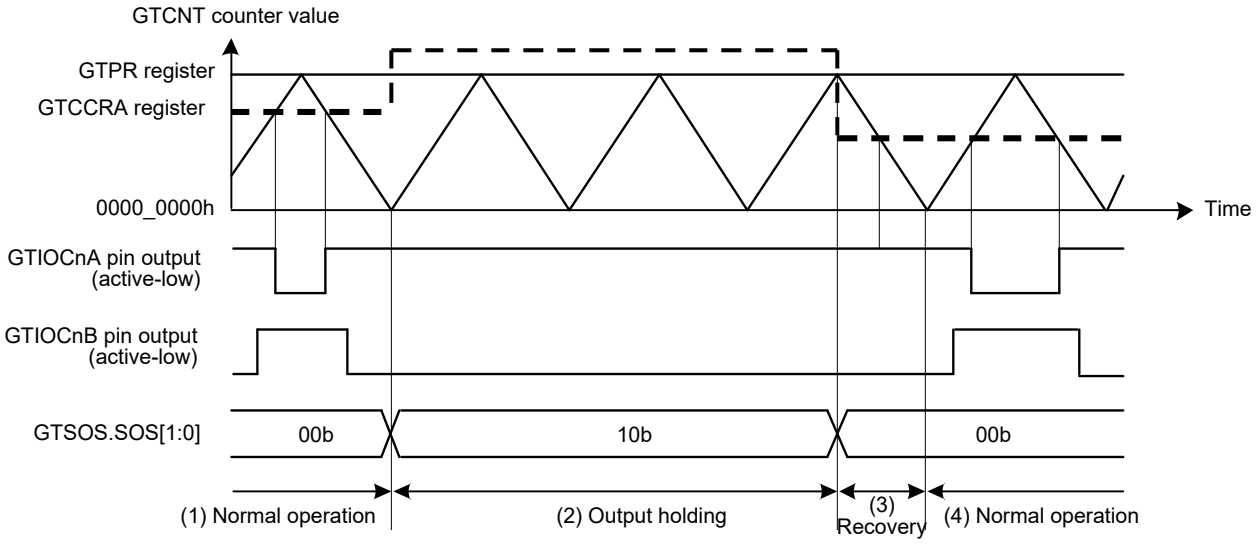
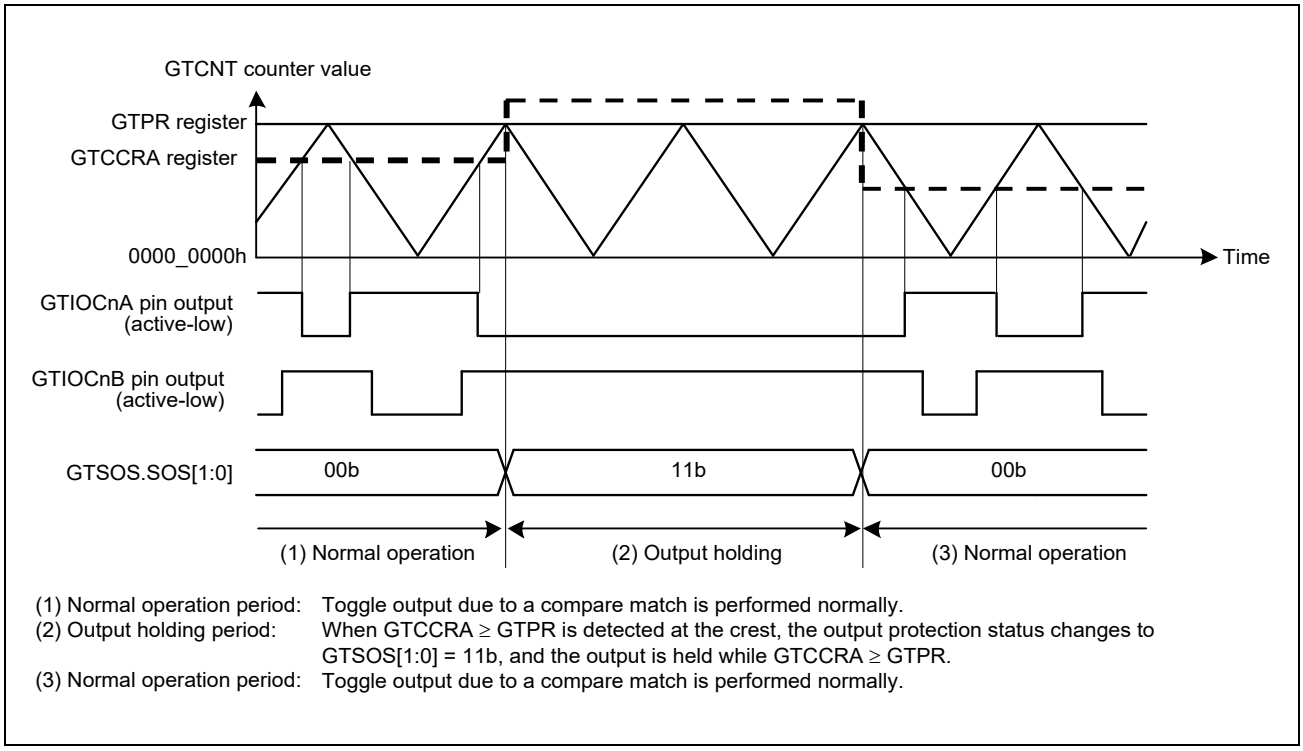


(1) Normal operation period: Toggle output due to a compare match is performed normally.
(2) Output holding period: When GTCCRA ≥ GTPR is detected at the trough, the output protection status changes to GTSOS[1:0] = 10b, and the output is held while GTCCRA ≥ GTPR.
(3) Recovery period: When 0 < GTCCRA < GTPR is detected at the crest, the output protection status changes to GTSOS.SOS[1:0] = 00b, and holding output is maintained up to the next trough.
(4) Normal operation period: When 0 < GTCCRA register < GTPR register is detected in the crest, the output protection status changes to GTSOS[1:0] = 00b, and toggle output due to a compare match is performed normally.

Figure 5.7-84 Example of Output Protection Function Operation when GTCCRA Register ≥ GTPR Register is Set during Buffer Transfer at Troughs (Restored to 0 < GTCCRA Register < GTPR Register during Buffer Transfer at Crests, Active Level: Low) (n = 0 to 15)

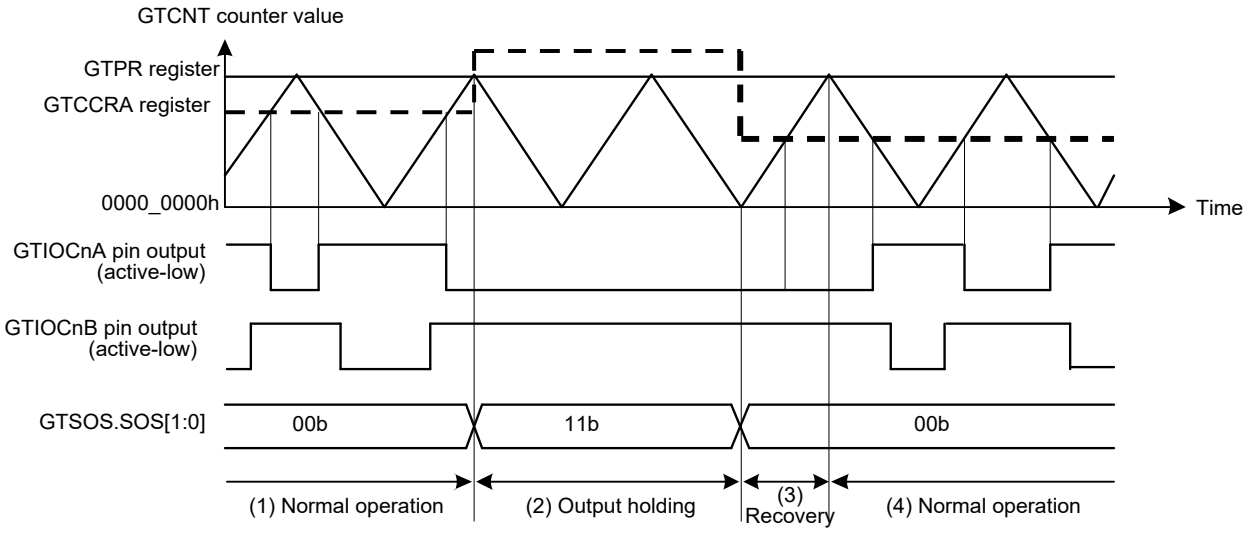
(3) Output Protection Function when GTCCRA Register ≥ GTPR Register is Set during Buffer Transfer at Crests

Figure 5.7-85 and **Figure 5.7-86** show examples of output protection function operation when GTCCRA register ≥ GTPR register is set during buffer transfer at crests.



(1) Normal operation period: Toggle output due to a compare match is performed normally.
(2) Output holding period: When GTCCRA ≥ GTPR is detected at the crest, the output protection status changes to GTSOS[1:0] = 11b, and the output is held while GTCCRA ≥ GTPR.
(3) Normal operation period: Toggle output due to a compare match is performed normally.

Figure 5.7-85 Example of Output Protection Function Operation when GTCCRA Register ≥ GTPR Register is Set during Buffer Transfer at Crests (Restored to 0 < GTCCRA Register < GTPR Register during Buffer Transfer at Crests, Active Level: Low) (n = 0 to 15)



(1) Normal operation period: Toggle output due to a compare match is performed normally.
(2) Output holding period: When GTCCRA ≥ GTPR Is detected at the crest, the output protection status changes to GTSOS[1:0] = 11b, and the output is held while GTCCRA ≥ GTPR.
(3) Recovery period: When 0 < GTCCRA < GTPR is detected at the trough, the output protection status changes to GTSOS.SOS[1:0] = 00b, and holding output is maintained up to the next crest.
(4) Normal operation period: Toggle output due to a compare match is performed normally.

Figure 5.7-86 Example of Output Protection Function Operation when GTCCRA Register ≥ GTPR Register is Set during Buffer Transfer at Crests (Restored to 0 < GTCCRA Register < GTPR Register during Buffer Transfer at Troughs, Active Level: Low) (n = 0 to 15)

(4) Note on Output Protection Function

The output protection function operates in such a way that either of the positive- and negative-phase outputs becomes non-active even if an incorrect value (0000_0000h or a value greater than or equal to the GTPR register value) is set in the GTCCRA register during counting. However, the output protection function does not operate normally if the following condition is not satisfied.

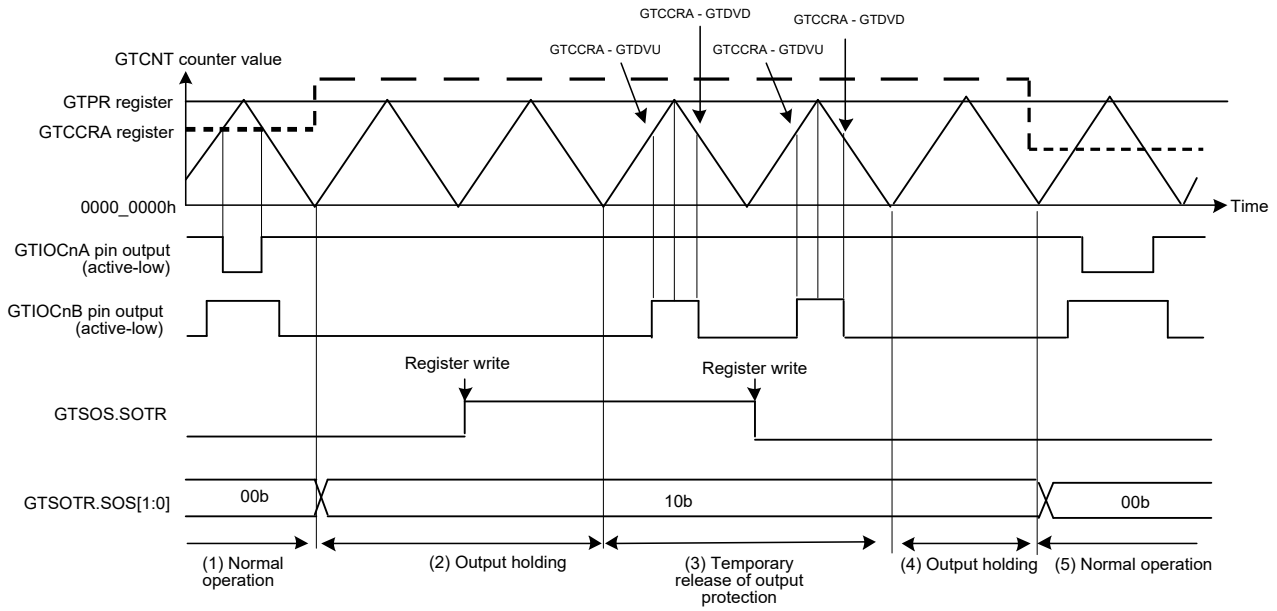
- When the GTCCRA register value at the start of counting is greater than or equal to 0000_0001h and less than the GTPR register value

(5) Temporary Release of Output Protection Function

When the GTSOS.SOS[1:0] bits = 10b (in the protected state indicating GTCCRA register ≥ GTPR register during transfer at troughs), the protected state of the GTIOCnB pin output can be temporarily released by setting the GTSOTR.SOTR bit to 1b. The GTSOS.SOS[1:0] bits retain 10b even if the output protection function has been released.

When the SOTR bit is set to 0b, the GTIOCnB pin output protection can be resumed.

Figure 5.7-87 shows an operation example of temporary release of the output protection function when the setting of the GTCCRA register ≥ GTPR register during buffer transfer at troughs.



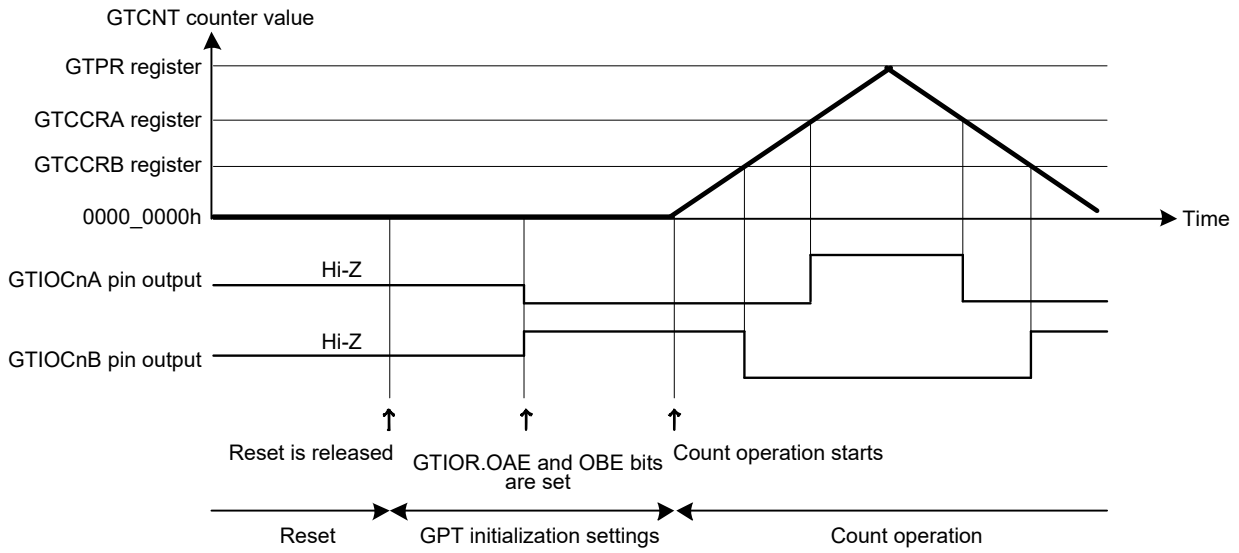
(1) Normal operation period:	Toggle output due to compare match is performed normally.
(2) Output holding period:	When GTCCRA register ≥ GTPR register is detected in the trough, the output protection status changes to GTSOS[1:0] = 10b, and the output is held while GTCCRA register ≥ GTPR register. Even when the GTSOTR.SOTR bit is set to 1 during the output holding period, the GTIOCnB pin output is held until the first trough after the setting.
(3) Temporary release of output protection period	After GTSOTR.SOTR bit is set to 1, the GTIOCnB pin is performed normally from the first trough after the setting. Even when the GTSOTR.SOTR bit is set to 0 during the output protection releasing period, the GTIOCnB pin output is held until the first trough after the setting.
(4) Output holding period:	The output is held until 0 < GTCCRA register < GTPR register is detected in the trough.
(5) Normal operation period:	When 0 < GTCCRA register < GTPR register is detected in the trough, the output protection status changes to GTSOS[1:0] = 00b, and toggle output due to a compare match is performed normally.

Figure 5.7-87 Operation Example of Temporary Release of Output Protection Function when GTCCRA Register ≥ GTPR Register is Set during Buffer Transfer at Troughs (Restored to 0 < GTCCRA Register < GTPR Register during Buffer Transfer at Troughs, Active Level: Low) (n = 0 to 15)

5.7.9 Initialization Method of Output Pins

5.7.9.1 Pin Settings after Reset

The GPT registers are initialized at a reset. Start counting after selecting the port pin function with the PmnPFS register, setting GTIOR.OAE and GTIOR.OBE bits, and output of the GPT function to external pins.



[Setting examples]
GTIOR.GTIOA[4:0] bits: Initial low output, output retained at cycle end, output toggled at compare match
GTIOR.GTIOB[4:0] bits: Initial high output, output retained at cycle end, output toggled at compare match

Note: The base addresses of the registers are the same.

Figure 5.7-88 Example of Pin Settings after Reset

5.7.9.2 Pin Initialization Due to Error during Operation

If an error occurs during GPT operation, the following four types of pin control can be performed before pin initialization:

- Set the OAHLD and OBHLD bits in GTIOR to 1b and retain the outputs at count stop
- Set the OAHLD and OBHLD bits in GTIOR to 0b, specify arbitrary output values at OADFLT and OBDFLT in GTIOR, and output the arbitrary values at count stop
- Set the pin to output an arbitrary value as a general output port by setting the PDR, PODR registers and PmnPFS.PMR bit of the I/O port in advance. Set the OAE and OBE bits in GTIOR to 0b, and the control bit corresponding to the pin in the PMR to 0 to allow arbitrary values to be output from the pin set as a general output port when an error occurs.
- Drive the output to a high impedance state using the POEG function.

If the automatic dead time setting is made, clear the GTDTCR.TDE bit to 0b after counting stops. When counting stops, only the values of registers that are changed by a GPT external source change. If counting is resumed, operation continues from where it stopped. If counting is stopped, the registers must be initialized before counting starts.

5.7.10 Usage Notes

5.7.10.1 Settings of the GTCCRn Register during Compare Match Operation (n = A to F)

(1) When Automatic Dead Time Setting is Made in Triangle-Wave PWM Mode

The GTCCRA register must satisfy the following conditions:

- GTCCRA register > GTDVU register
- GTCCRA register > GTDVD register
- GTCCRA register < GTPR register

When the GTCCRA register is set to 0000_0000h or a value greater than or equal to the GTPR register value during counting, the output protection function is activated.

However, if the following conditions are not satisfied, the output protection does not operate normally.

- When the GTCCRA register value at the start of counting operation is 0000_0001h or greater, and less than the setting value of the GTPR register

For details, see **5.7.8.4 GTIOCnm Protection Function for GTIOCnm Pin Output (n = 0 to 15; m = A, B)**.

(2) When Automatic Dead Time Setting is not Made in Triangle-Wave PWM Mode

Set a value greater than 0000_0000h and less than the setting value of the GTPR register in the GTCCRA register. When 0000_0000h or the same value as that of the GTPR register is set in the GTCCRA register, compare match is generated in one cycle only when [GTCCRA register = 0000_0000h] or [GTCCRA register = GTPR register] is met. Furthermore, a value exceeding the setting value of the GTPR register is set in the GTCCRA register, compare match does not occur.

Similarly, set a value greater than 0000_0000h, and less than the setting value of the GTPR register in the GTCCRB register. When 0000_0000h or the same value as that of the GTPR register is set in the GTCCRB register, compare match is generated in one cycle only when [GTCCRB register = 0000_0000h] or [GTCCRB register = GTPR register] is met.

Furthermore, a value exceeding the setting value of the GTPR register is set in the GTCCRB register, compare match does not occur.

(3) When Automatic Dead Time Setting is Made in Saw-Wave One-Shot Pulse Mode

The GTCCRC and GTCCRD registers must be set to satisfy the following restrictions. If the restrictions are not satisfied, correct output waveforms with secured dead time may not be obtained.

- In up-counting:
  GTCCRC register < GTCCRD register
  GTCCRC register > GTDVU register
  GTCCRD register < GTPR register − GTDVD register
- In down-counting:
  GTCCRC register > GTCCRD register
  GTCCRC register < GTPR register − GTDVU register
  GTCCRD register > GTDVD register

(4) When Automatic Dead Time Setting is not Made in Saw-Wave One-Shot Pulse Mode

The GTCCRC and GTCCRD registers must be set to satisfy the following restrictions. If the restrictions are not satisfied, two compare matches do not occur and pulse output cannot be performed.

- In up-counting: 0 < GTCCRC register < GTCCRD register < GTPR register
- In down-counting: GTPR register > GTCCRC register > GTCCRD register > 0

Similarly, GTCCRE and GTCCRF registers must be set to satisfy the following restrictions. If the restrictions are not satisfied, two compare matches do not occur and pulse output cannot be performed.

- In up-counting: 0 < GTCCRE register < GTCCRF register < GTPR register
- In down-counting: GTPR register > GTCCRE register > GTCCRF register > 0

(5) In Saw-Wave PWM Mode

The GTCCRA register must be set with the range of 0000_0000h < GTCCRA register < GTPR register. If GTCCRA register = 0000_0000h or GTCCRA register = GTPR register is set, a compare match occurs within the cycle only when GTCCRA register = 0000_0000h or GTCCRA register = GTPR register is satisfied. If GTCCRA register > GTPR register is set, no compare match occurs.

5.7.10.2 Setting Range for GTCNT Counter

The GTCNT counter register must be set with the range of 0 ≤ GTCNT ≤ GTPR.

5.7.10.3 Starting and Stopping the GTCNT Counter

The control timing of starting and stopping the GTCNT counter by the GTCR.CST bit synchronizes the count clock that is selected in GTCR.TPCS[3:0]. When GTCR.CST is updated, the GTCNT counter starts/stops after a count clock that is selected in GTCR.TPCS[3:0]. Therefore, an event generated before the GTCNT counter actually starts is ignored, resulting in situations in which an event is accepted or an interrupt occurs after GTCR.CST is set to 0b.

5.7.10.4 Priority Order of Each Event

(1) GTCNT Register

Table 5.7-51 shows a priority order of events updating the GTCNT register.

Table 5.7-51 Priority Order of Sources Updating GTCNT

Source Updating GTCNT	Priority Order
Writing by CPU (writing to GTCNT/GTCLR)	High
Clear by hardware sources set in GTCSR	↑
Count up or down by hardware sources set in GTUPSR/GTDNSR	↑
Count operation	Low

If up-counting and down-counting by hardware sources occur at the same time, the GTCNT counter value does not change. When there is a conflict between updating the GTCNT register and reading by the CPU, pre-update data is read.

(2) GTCR.CST Bit

When there is a conflict between starting/stopping by hardware sources set in the GTSSR/GTPSR registers and writing by the CPU (writing to GTCR/GTSTR/GTSTP registers), the writing by CPU has priority over the starting/stopping by hardware sources.

When there is a conflict between starting by hardware sources set in the GTSSR register and stopping by hardware sources set in GTPSR register, the GTCR.CST bit value does not change. When there is a conflict between updating the GTCR.CST bit and reading by the CPU (reading from GTCR/GTSTR/GTSTP registers), pre-update data is read.

(3) GTCCRm Registers (m = A to F)

When there is a conflict between input capture/buffer transfer operation and writing to the GTCCRm registers, the writing to GTCCRm registers has priority over input capture/buffer transfer operation. When there is a conflict between input capture and writing to the counter register by the CPU or updating the counter register by hardware sources, the pre-update counter value is captured. When there is a conflict between updating the GTCCRm registers and reading by the CPU, pre-update data is read.

(4) GTPR Register

When there is a conflict between buffer transfer operation and writing to the GTPR register, writing to GTPR register has priority over buffer transfer operation. When there is a conflict between updating GTPR register and reading by the CPU, pre-update data is read.

(5) GTADTRm Register (m = A, B)

In case of contention between a buffer transfer and the GTADTRm register writing, the GTADTRm register writing takes priority over a buffer transfer.

In case of contention between the GTADTRm register updating and the CPU reading, data before updating is read.

(6) GTDVm Register (m = U, D)

In case of contention between a buffer transfer and the GTDVm register writing, the GTDVm register writing takes priority over a buffer transfer.

In case of contention between the GTDVm register updating and the CPU reading, data before updating is read.

SECTION 5 TIMER

5.8 Port Output Enable for GPT (POEG)

5.8.1 Overview

The Port Output Enable (POEG) function can place the General Purpose Timer (GPT) output pins in the output disable state in one of the following ways:

- Input level detection of the GTETRGn (n = A to H) pins
- Output-disable request from the GPT
- Register settings

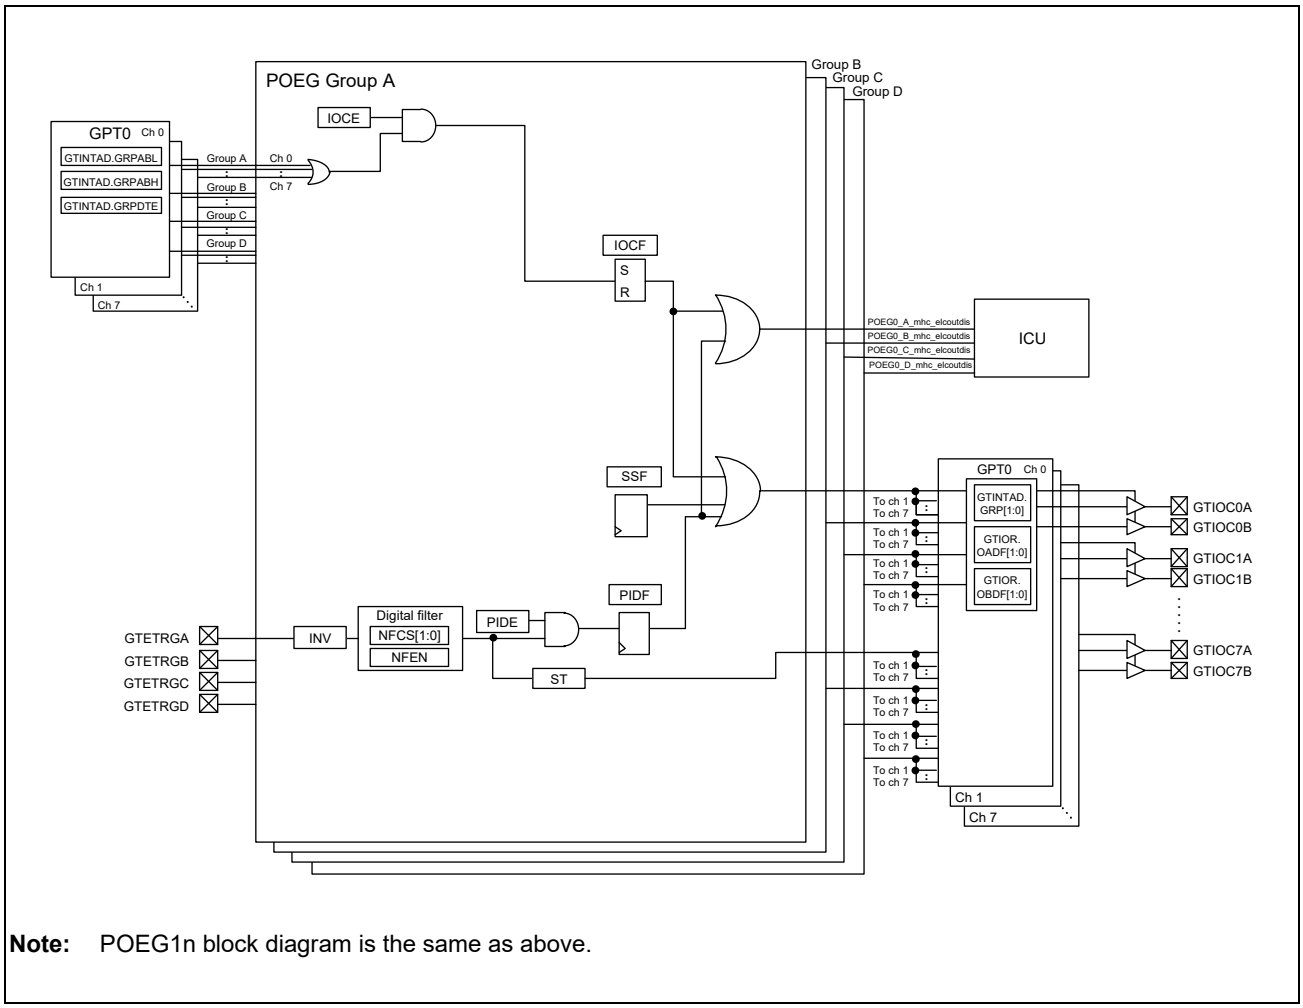
The GTETRGn (n = A to H) pins can be used as GPT external trigger input pins.

Table 5.8-1 lists the POEG specifications, **Figure 5.8-1** shows a block diagram, and **Table 5.8-2** lists the input pins.

Table 5.8-1 POEG Specifications

Parameter	Specifications
Output-disable control through input level detection	• The GPT output pins can be disabled when a GTETRGn rising edge or high level is sampled after polarity and filter selection.
Output-disable request from the GPT	• When the GTIOCmA and GTIOCmB pins are driven to an active level simultaneously, the GPT generates an output-disable request to the POEG. Through reception of these requests, the POEG can control whether the GTIOCmA and GTIOCmB pins are output-disabled.
Output-disable control by software (registers)	• The GPT output pins can be disabled by modifying the register settings.
Interrupt	• Interrupts can be generated by detecting the input level of external trigger input pins (GTETRGn pins). • Interrupts can be generated when all GPT output pins are driven to an active level simultaneously.
External trigger output to the GPT	• The GTETRGn signals can be output to the GPT after polarity and filter selection. (count start, count stop, count clear, up-count, down-count, or input capture function)
Noise filtering	• For input from the GTETRGn pins, PCLKB/1, PCLKB/8, PCLKB/32, or PCLKB/128 can be selected as the noise filtering clock. (Filtering is performed by sampling the input signals three times using the selected clock.)*1 • Positive or negative polarity can be selected for any of the GTETRGn input pins. • Signal state after polarity and filter selection can be monitored.

Note 1. n = A to H
m = 0 to 15
PCLKB is equivalent to POEGk_0_PCLK or POEGk_1_PCLK. (k = A to D)



Note: POEG1n block diagram is the same as above.

Figure 5.8-1 POEG0n Block Diagram (n = A to D)

Table 5.8-2 POEG Input Pins

Pin Name	Input/Output	Description
GTETRGA	Input	GPT0 output pin output-disable request signal or GPT0 external trigger input pin A
GTETRGB	Input	GPT0 output pin output-disable request signal or GPT0 external trigger input pin B
GTETRGC	Input	GPT0 output pin output-disable request signal or GPT0 external trigger input pin C
GTETRGD	Input	GPT0 output pin output-disable request signal or GPT0 external trigger input pin D
GTETRGE	Input	GPT1 output pin output-disable request signal or GPT1 external trigger input pin A
GTETRGF	Input	GPT1 output pin output-disable request signal or GPT1 external trigger input pin B
GTETRGG	Input	GPT1 output pin output-disable request signal or GPT1 external trigger input pin C
GTETRGH	Input	GPT1 output pin output-disable request signal or GPT1 external trigger input pin D

5.8.2.1 List of Registers

The registers are listed below.

Register Name	Abbreviation	Initial Value	Offset Address	Access Size [bits]
POEG Group n Setting Register	POEG_POEGGn	0000_0000h	0000h	32

5.8.2.2 Register Description

The prefix (POEG_) of the register names is omitted in this and subsequent sections.

5.8.2.2.1 POEG Group n Setting Register (POEG_POEGGn) (n = A to H)

The POEGGn (n = A to H) registers control the output-disabled state of the GPT pins, interrupts, and the external trigger input to the GPT.

Access Size : 32 bits

Address : <POEGk_base> + 0000h (k = 0A to 0D, 1A to 1D)

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	NFCS[1:0]		NFEN	INV	-	-	-	-	-	-	-	-	-	-	-	ST
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	IOCE	PIDE	SSF	-	IOCF	PIDF
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31, 30	NFCS[1:0]	0h	RW	Noise Filter Clock Select 00b: Sample GTETRGn pin input level three times every PCLKB 01b: Sample GTETRGn pin input level three times every PCLKB/8 10b: Sample GTETRGn pin input level three times every PCLKB/32 11b: Sample GTETRGn pin input level three times every PCLKB/128
29	NFEN	0h	RW	Noise Filter Enable 0b: Disable noise filtering 1b: Enable noise filtering
28	INV	0h	RW	GTETRGn Input Reverse 0b: Input GTETRGn as-is 1b: Input GTETRGn in reverse
27 to 17	-	All 0	R	Reserved These bits are always read as 0b. The written value will be ignored.
16	ST	0h	R	GTETRGn Input Status Flag 0b: GTETRGn input after filtering was 0 1b: GTETRGn input after filtering was 1
15 to 7	-	All 0	R	Reserved These bits are always read as 0b. The written value will be ignored.
6	-	0h	RW*2	Reserved These bits are read as 0b. The write value should be 0b.
5	IOCE	0h	RW*2	Enable for GPT Output-Disable Request 0b: Disable output-disable requests from GPT 1b: Enable output-disable requests from GPT
4	PIDE	0h	RW*2	Port Input Detection Enable 0b: Disable output-disable requests from the GTETRGn pins 1b: Enable output-disable requests from the GTETRGn pins
3	SSF	0h	RW	Software Stop Flag 0b: No output-disable request from software occurred 1b: Output-disable request from software occurred
2	-	0h	RW*1	Reserved These bits are read as 0b. The write value should be 0b.

Bit	Bit Name	Initial Value	R/W	Description
1	IOCF	0h	RW*1	Detection Flag for GPT Output-Disable Request 0b: No output-disable request from GPT occurred 1b: Output-disable request from GPT occurred
0	PIDF	0h	RW*1	Port Input Detection Flag 0b: No output-disable request from the GTETRGn pin occurred 1b: Output-disable request from the GTETRGn pin occurred

Note 1. Only 0 can be written to clear the flag.

Note 2. This bit can be written only once after a reset.

5.8.3 Output-Disable Control Operation

If any of the following conditions is satisfied, the GTIOCmA and GTIOCmB (m = 0 to 15) pins can be set to output-disabled:

- Input level or edge detection of the GTETRGn pins
  When POEGGn.PIDE is 1, the POEGGn.PIDF flag is set to 1b. (n = A to H)
- Output-disable request from the GPT
  When POEGGn.IOCE is 1, the POEGGn.IOCF flag is set to 1 if the disabled request is enabled by the General Purpose Timer Interrupt Output Setting Register (GTINTAD). The GTINTAD.GRPABH and GTINTAD.GRPABL settings apply to the group selected by the GPT register GTINTAD.GRP[1:0].
- SSF bit setting
  When POEGGn.SSF is set to 1, the PWM output is disabled.

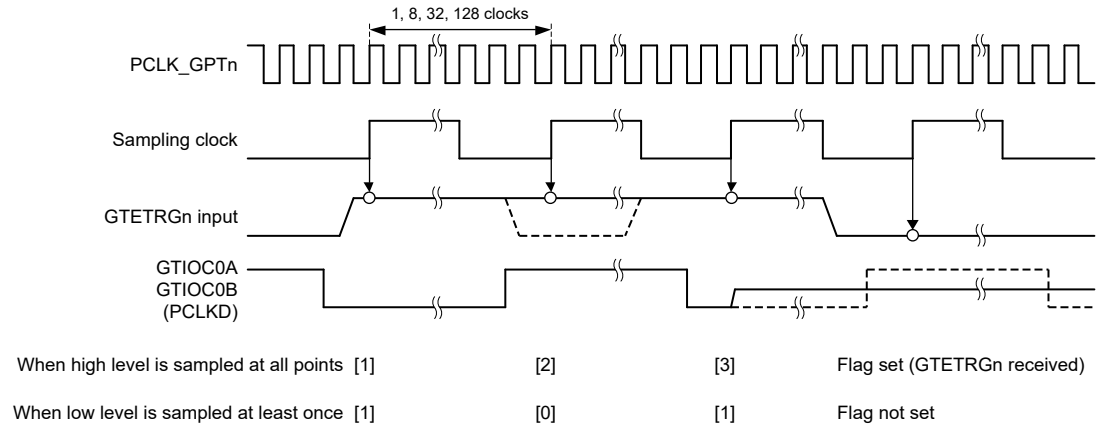
The output-disabled state is controlled in the GPT module. The output-disable for the GTIOCmA and GTIOCmB (m = 0 to 15) pins is set in the GTINTAD.GRP[1:0], General Purpose Timer I/O Control Register (GTIOR).OADF[1:0], and GTIOR.OBDF[1:0] bits in GPTm (m = 0, 1).

5.8.3.1 Pin Input Level Detection Operation

If the input conditions set in POEGGn.PIDE, POEGGn.NFCS[1:0], POEGGn.NFEN, and POEGGn.INV occur on GTETRGn, the GPT output pins are output-disabled.

5.8.3.1.1 Digital Filter

Figure 5.8-2 shows high-level detection by the digital filter. When a high level associated with the POEGGn.INV polarity setting is detected three times consecutively with the sampling clock selected in POEGGn.NFCS[1:0] and POEGGn.NFEN, the detected level is recognized as high, and the GPT output pins are output-disabled. If even one low level is detected during this interval, the detected level is not recognized as high. In addition, in an interval where the sampling clock is not output, changes of the levels on the GTETRGn pins are ignored.



Note: PCLKB is equivalent to POEGk_0_PCLK or POEGk_1_PCLK. (k = A toD)

Note: Each channel output can be set in the GPT setting. Low level sampling can be set in the POEGGn.INV setting.

Figure 5.8-2 Example of Digital Filter Operation

5.8.3.2 Output-Disable Requests from the GPT

For details on the operation, see the description for GTIOCmA and GTIOCmB Pin Output Negate Control in **5.7 General Purpose Timer (GPT)**.

5.8.3.3 Output-Disable Control Using Registers

The GPT output pins can be directly controlled by writing 1 to the Software Stop flag, POEGGn.SSF.

5.8.3.4 Release from Output-Disable

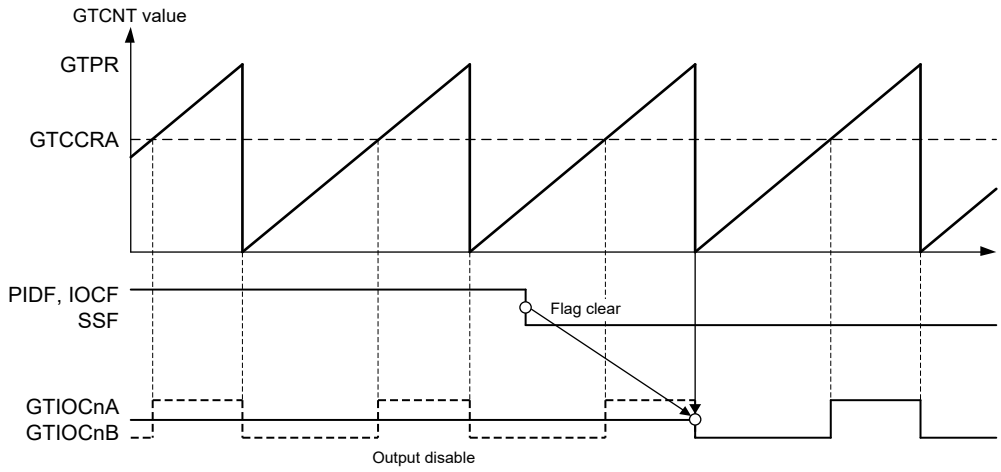
To release the GPT output pins placed in the output-disabled state, either return them to their initial state with a reset or clear all of the following flags:

- POEGGn.PIDF
- POEGGn.IOCF
- POEGGn.SSF

Writing 0 to the POEGGn.PIDF flag is ignored (the flag is not cleared) if the external input pins, GTETRGn are not disabled and the POEGGn.ST bit is not set to 0.

Writing 0 to the POEGGn.IOCF flag is valid (the flag is cleared) only if all of the General Purpose Timer Status Register (GTST).OABHF, GTST.OABLF, and GTST.DTEF flags in the GPT are set to 0.

Figure 5.8-3 shows the release timing for output-disable. The output-disable is released at the beginning of the next count cycle of the GPT after the flag is cleared.



Note: The base addresses of the registers are the same.

Note: n = 0 to 15

Figure 5.8-3 Output-Disable Release Timing for GPT Pin Outputs

5.8.4 Interrupt Sources

The POEG generates an interrupt request when triggered by these sources:

- Output-disable control by the input level detection
- Output-disable request from the GPT

Table 5.8-4 lists the conditions for interrupt requests.

Table 5.8-4 Interrupt Sources and Conditions

Name	Interrupt Sources	CA55 GIC Request	CM33 GIC Request	CR8 GIC Request	DMAC Activation
POEG_CH0_mhc_elcoutdis	POEG0 group A interrupt for channels in GPT0	Possible	Possible	Possible	Not possible
POEG_CH1_mhc_elcoutdis	POEG0 group B interrupt for channels in GPT0	Possible	Possible	Possible	Not possible
POEG_CH2_mhc_elcoutdis	POEG0 group C interrupt for channels in GPT0	Possible	Possible	Possible	Not possible
POEG_CH3_mhc_elcoutdis	POEG0 group D interrupt for channels in GPT0	Possible	Possible	Possible	Not possible
POEG_CH4_mhc_elcoutdis	POEG1 group A interrupt for channels in GPT1	Possible	Possible	Possible	Not possible
POEG_CH5_mhc_elcoutdis	POEG1 group B interrupt for channels in GPT1	Possible	Possible	Possible	Not possible
POEG_CH6_mhc_elcoutdis	POEG1 group C interrupt for channels in GPT1	Possible	Possible	Possible	Not possible
POEG_CH7_mhc_elcoutdis	POEG1 group D interrupt for channels in GPT1	Possible	Possible	Possible	Not possible

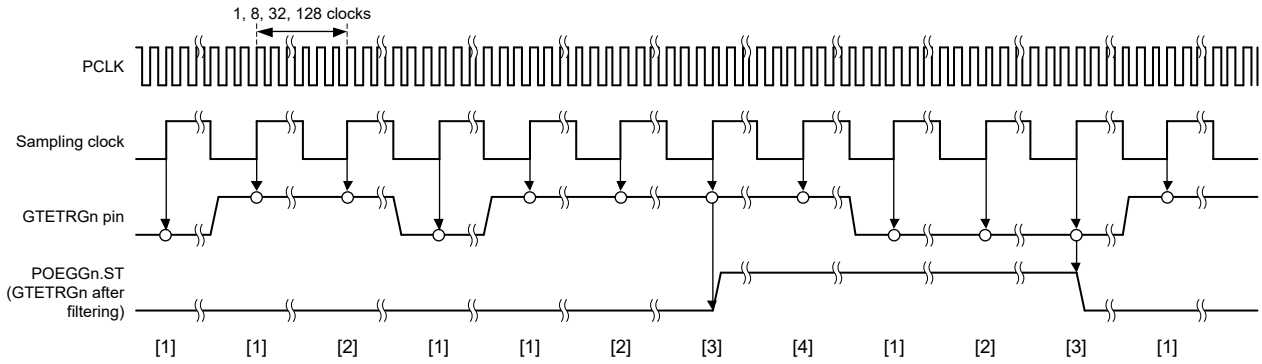
5.8.5 External Trigger Output to the GPT

The POEG outputs signals generated by filtering and level detection of GTETRGn pins input signals as the GPT operation trigger signal for the following:

- Count start
- Count stop
- Count clear
- Up-count
- Down-count
- Input capture

For the POEGGn.INV polarity setting signal, when the same level is input three times continuously with the sampling clock selected in POEGGn.NFCS[1:0] and POEGGn.NFEN, that value is output. Set the control registers the same as for the input level detection operation described in **5.8.3.1 Pin Input Level Detection Operation**. The state after filtering can be monitored in POEGGn.ST.

Figure 5.8-4 shows the output timing of an external trigger to the GPT.



Note: PCLKB is equivalent to POEGk_0_PCLK or POEGk_1_PCLK. (k = A to D)

Note: Each channel output can be set in the GPT settings. Polarity can be reversed in POEGGn.INV.

Figure 5.8-4 Output Timing of External Trigger to the GPT

5.8.6 Usage Notes

5.8.6.1 Transition to Software Standby Mode

When using the POEG, do not invoke Software Standby mode. In this mode, the POEG stops and therefore output disable of the pins cannot be controlled.

5.8.6.2 Specifying Pins Associated with the GPT

The POEG controls output-disable only when a pin is associated with the GPT in the PMC_mn and PFC_mn register settings of the PFC. When the pin is specified as a general I/O pin, the POEG does not perform output-disable control.

SECTION 6 HIGH-SPEED INTERFACE

6.1 High-Speed Interface Overview

This sections describes the High-Speed Interface unit of this LSI. For details, refer to the sections of each unit.

■ SD/MMC Host Interface (SD) (See 6.2)

This LSI equips 3ch of SD.

SD0 supports 8-bit bus and SD1/SD2 supports 4-bit bus MMC Interface.

■ Gigabit Ethernet Interface (GBETH) (See 6.3)

This LSI equips 2ch of GBETH. Conforms to the following standards.

- IEEE 802.3-2008 for Ethernet MAC, Gigabit Media Independent Interface (GMII), and Media Independent Interface (MII)

■ USB3.2 Gen2x1 Interface (USB3) (See 6.4)

This LSI equips 1ch of USB3. Conforms to the following standards (Host mode only).

- Universal Serial Bus 3.2 Specification Revision 1.0 and ECNs approved in Jan 25, 2021.

■ USB2.0 Interface (USB2) (See 6.5)

This LSI equips 1ch of USB2. Conforms to the following standards.

- Universal Serial Bus Specification Revision 2.0

■ PCI Express 3.0 Interface (PCIe) (See 6.6)

This LSI equips 1ch of PCIe. 1 unit × 2 lanes usage is available.

Conforms to the following standards.

- PCI Express Base Specification 4.0 for Gen1 / Gen2 / Gen3

SECTION 6 HIGH-SPEED INTERFACE

6.2 SD/MMC Host Interface (SD)

This section describes the functions of the SD/MMC host interface (SD).

CAUTION

Development of the SD host-related products needs the conclusion of the following agreement.

- "SD Host/Ancillary Product License Agreement (SD HALA)"

6.2.1 Overview

6.2.1.1 Features

- 3 channels
- Channel 0 supports SD and e-MMC.
- Channel 1 supports SD.
- Channel 2 supports SD.
- SD memory/IO card interface (1-bit/4-bit SD bus)
- SD, SDHC, and SDXC SD memory card access supported
- Default, high-speed, UHS-I/SDR50, SDR104, and DDR50 transfer modes supported
- SD clock (SD_CLK) frequency = SDHI_x_IMCLK frequency/2^n (n = 0 to 9) (x = 0 to 2)
- Error check function: CRC7 (for command/response), CRC16 (for data)
- Interrupt request: 2
- Card detect function
- Write protect supported
- MMC interface (1-/4-/8-bit MMC bus)
- e-MMC device access supported
- Backward-compatible, high-speed, HS-DDR, and HS200 transfer modes supported
- High-priority interrupt (HPI) supported

6.2.1.2 Block Diagram

Figure 6.2-1 shows a block diagram of the SD/MMC host interface.

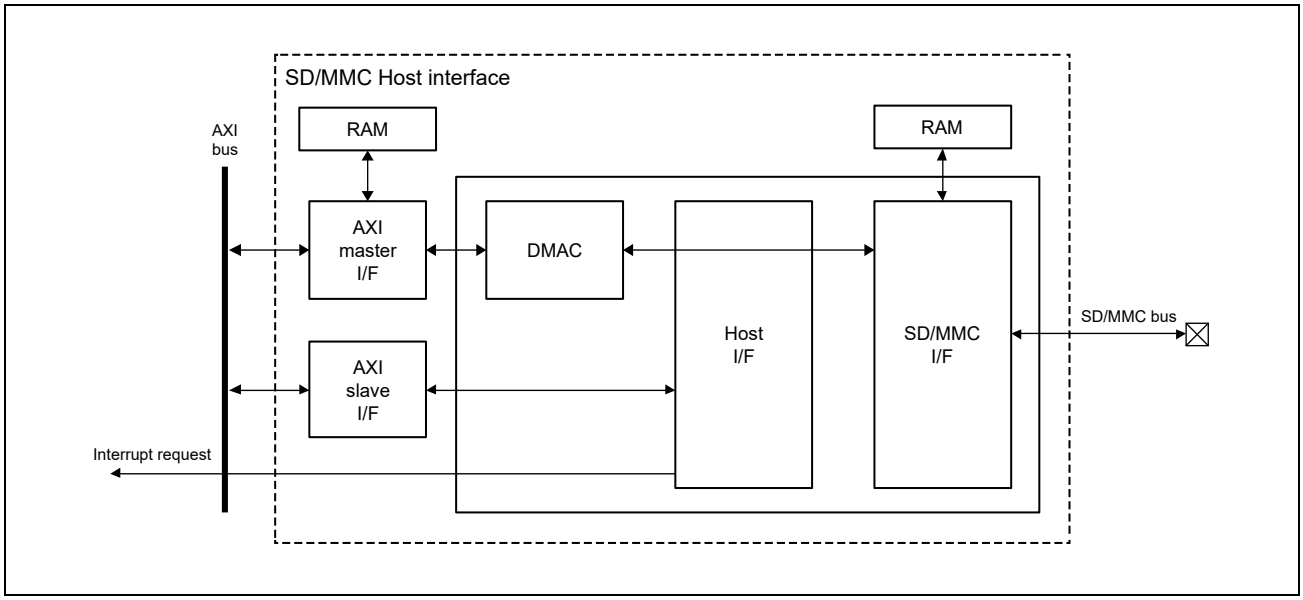


Figure 6.2-1 Block Diagram of SD/MMC Host Interface

6.2.1.3 External Pins

Figure 6.2-1 lists the input and output pins used by the interface. The operating voltage on the pins of the SD/MMC host interface is 3.3 V or 1.8 V.

Table 6.2-1 Pin Configuration

Pin Name	Input/Output	Function
SDxCLK*1	Output	SD/MMC clock output
SDxCMD*1	I/O	SD/MMC command output, response input
SDxDAT0*1	I/O	SD/MMC Data 0 [bit 0]
SDxDAT1*1	I/O	SD/MMC Data 1 [bit 1], SDIO interrupt
SDxDAT2*1	I/O	SD/MMC Data 2 [bit 2], read wait
SDxDAT3*1	I/O	SD/MMC Data 3 [bit 3], card detection
SD0DAT4*1	I/O	SD/MMC Data 4 [bit 4] (SD0 only)
SD0DAT5*1	I/O	SD/MMC Data 5 [bit 5] (SD0 only)
SD0DAT6*1	I/O	SD/MMC Data 6 [bit 6] (SD0 only)
SD0DAT7*1	I/O	SD/MMC Data 7 [bit 7] (SD0 only)
SDxCD*1	Input	SD/MMC card detection*2
SDxWP*1	Input	SD/MMC write protection*2
SD0RSTN	Output	SD/MMC reset (SD0 only)
SDxPWEN	Output	SD power-enable signals for the power supply IC
SDxIOVS	Output	SD IO voltage level signals for the SD device

Note 1. x (= 0, 1, 2) is the channel number of the SD/MMC host interface. In this manual, those pins are referred to as SDDAT0, SDDAT1, …, SDDAT7.

6.2.2 SD Registers

The base addresses for each channel are as follows. The SD interface and MMC interface are switched by setting the command type register (SDm_SD_CMD).

Table 6.2-2 Register Base Address

Base Register Name	Unit Name	Base Address
<SD0_base>	SD0	0_15C0_0000h (55C0_0000h*1, 45C0_0000h*2)
<SD1_base>	SD1	0_15C1_0000h (55C1_0000h*1, 45C1_0000h*2)
<SD2_base>	SD2	0_15C2_0000h (55C2_0000h*1, 45C2_0000h*2)

Note 1. CM33 address space (non-secure)

Note 2. CM33 address space (secure)

6.2.2.1 List of Registers

The registers are listed below.

Register Name	Abbreviation	Initial Value	Offset Address	Access Size [bits]
Command Type Register	SDm_SD_CMD	0000_0000_0000_0000h	0000h	16, 32, 64
Reserve	-	-	0008h to 000Fh	-
Command Argument Register	SDm_SD_ARG	0000_0000_0000_0000h	0010h	16, 32, 64
Command Argument Register 1	SDm_SD_ARG1	0000_0000_0000_0000h	0018h	16, 32, 64
Data Stop Register	SDm_SD_STOP	0000_0000_0000_0000h	0020h	16, 32, 64
Block Count Register	SDm_SD_SECCNT	0000_0000_0000_0000h	0028h	16, 32, 64
SD Card Response Registers 10	SDm_SD_RSP10	0000_0000_0000_0000h	0030h	16, 32, 64
SD Card Response Registers 1	SDm_SD_RSP1	0000_0000_0000_0000h	0038h	16, 32, 64
SD Card Response Registers 32	SDm_SD_RSP32	0000_0000_0000_0000h	0040h	16, 32, 64
SD Card Response Registers 3	SDm_SD_RSP3	0000_0000_0000_0000h	0048h	16, 32, 64
SD Card Response Registers 54	SDm_SD_RSP54	0000_0000_0000_0000h	0050h	16, 32, 64
SD Card Response Registers 5	SDm_SD_RSP5	0000_0000_0000_0000h	0058h	16, 32, 64
SD Card Response Registers 76	SDm_SD_RSP76	0000_0000_0000_0000h	0060h	16, 32, 64
SD Card Response Registers 7	SDm_SD_RSP7	0000_0000_0000_0000h	0068h	16, 32, 64
SD Card Interrupt Flag Register 1	SDm_SD_INFO1	0000_0000_0000_0xx0h	0070h	16, 32, 64
SD Card Interrupt Flag Register 2	SDm_SD_INFO2	0000_0000_0000_20x0h	0078h	16, 32, 64
SD_INFO1 Interrupt Mask Register	SDm_SD_INFO1_MASK	0000_0000_0001_031Dh	0080h	16, 32, 64
SD_INFO2 Interrupt Mask Register	SDm_SD_INFO2_MASK	0000_0000_0000_8B7Fh	0088h	16, 32, 64
SD Clock Control Register	SDm_SD_CLK_CTRL	0000_0000_0000_0020h	0090h	16, 32, 64
Transfer Data Length Register	SDm_SD_SIZE	0000_0000_0000_0200h	0098h	16, 32, 64
SD Card Access Control Option Register	SDm_SD_OPTION	0000_0000_0000_40EEh	00A0h	16, 32, 64
Reserve	-	-	00A8h to 00AFh	-
Error Status Register 1	SDm_SD_ERR_STS1	0000_0000_xxxx_x000h	00B0h	16, 32, 64
SD Error Status Register 2	SDm_SD_ERR_STS2	0000_0000_0000_0000h	00B8h	16, 32, 64
SD Buffer Read/Write Register	SDm_SD_BUF0	xxxx_xxxx_xxxx_xxxxh	00C0h	16, 32, 64
Reserve	-	-	00C8h to 00CFh	-
SDIO Mode Control Register	SDm_SDIO_MODE	0000_0000_0000_0000h	00D0h	16, 32, 64
SDIO Interrupt Flag Register	SDm_SDIO_INFO1	0000_0000_0000_0000h	00D8h	16, 32, 64
SDIO_INFO1 Interrupt Mask Register	SDm_SDIO_INFO1_MASK	0000_0000_0000_C007h	00E0h	16, 32, 64
Reserve	-	-	00E8h to 035Fh	-

Register Name	Abbreviation	Initial Value	Offset Address	Access Size [bits]
DMA Mode Enable Register	SDm_CC_EXT_MODE	0000_0000_0000_1010h	0360h	16, 32, 64
Reserve	-	-	0368h to 037Fh	-
Software Reset Register	SDm_SOFT_RST	0000_0000_0000_0007h	0380h	16, 32, 64
Version Register	SDm_VERSION	0000_0000_0000_CC10h	0388h	16, 32, 64
Host Interface Mode Setting Register	SDm_HOST_MODE	0000_0000_0000_0000h	0390h	16, 32, 64
SD Interface Mode Setting Register	SDm_SDIF_MODE	0000_0000_0000_0000h	0398h	16, 32, 64
Reserve	-	-	03A0h to 03C7h	-
SD Status Register	SDm_SD_STATUS	0000_0000_0000_0001h	03C8h	16, 32, 64
Reserve	-	-	03D0h to 081Fh	-
DMAC Transfer Mode Register	SDm_DM_CM_DTRAN_MODE	0000_0000_0000_0030h	0820h	16, 32, 64
DMAC Transfer Control Register	SDm_DM_CM_DTRAN_CTRL	0000_0000_0000_0000h	0828h	16, 32, 64
DMAC Reset Register	SDm_DM_CM_RST	0000_0000_FFFF_FFFFh	0830h	16, 32, 64
Reserve	-	-	0838h to 083Fh	-
DMAC Interrupt Register 1	SDm_DM_CM_INFO1	0000_0000_0000_0000h	0840h	16, 32, 64
DM_CM_INFO1 Interrupt Mask Register	SDm_DM_CM_INFO1_MASK	0000_0000_FFFF_FFFFh	0848h	16, 32, 64
DMAC Interrupt Register 2	SDm_DM_CM_INFO2	0000_0000_0000_0000h	0850h	16, 32, 64
DM_CM_INFO2 Interrupt Mask Register	SDm_DM_CM_INFO2_MASK	0000_0000_FFFF_FFFFh	0858h	16, 32, 64
Reserve	-	-	0860h to 087Fh	-
DMAC Transfer Address Register	SDm_DM_DTRAN_ADDR	0000_0000_0000_0000h	0880h	16, 32, 64
Reserve	-	-	0888h to 0FFFh	-

6.2.2.2 SD Register Description

The prefix (SDm_) of the register names is omitted in this and subsequent sections.

6.2.2.2.1 Command Type Register (SDm_SD_CMD)

The command type register (SD_CMD) is used to select the command type and response type. The command sequence is started by writing to SD_CMD.

For details on the SD_CMD setting, refer to **6.2.4.14 Example of SD_CMD Register Setting**.

Access Size : 16, 32, 64 bits
Offset Address : <SDm_base> + 0000h
Initial Value : 0000_0000_0000_0000h

Bit	63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48

	MD7, MD6[1:0]		MD5	MD4	MD3	MD2 to MD0[2:0]			C1, C0[1:0]		CF45 to CF40[5:0]					
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
63 to 16	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
15, 14	MD7, MD6[1:0]	0h	RW	Multiple Block Transfer Mode (enabled at multiple block transfer) 00b: CMD12 is automatically issued at multiple block transfer. 01b: CMD12 is not automatically issued at multiple block transfer. 10b: Setting prohibited 11b: Setting prohibited
13	MD5	0h	RW	Single/Multiple Block Transfer (enabled when the command with data is handled) 0b: Single block transfer 1b: multi-block transfer
12	MD4	0h	RW	Write/Read Mode (enabled when the command with data is handled) 0b: Write (SD/MMC host interface -> SD card) 1b: Read (SD/MMC host interface <- SD card)
11	MD3	0h	RW	Data Mode (Command Type) 0b: Command without data transfer (bc, bcr, ac) 1b: Command with data transfer (adtc)

Bit	Bit Name	Initial Value	R/W	Description
10 to 8	MD2 to MD0[2:0]	0h	RW	Mode/Response Type 000: Normal mode The response type and the transfer mode are selected by SD_CMD[7:0], and the SD_CMD[15:11] setting is disabled. 001b: Setting prohibited 010b: Setting prohibited 011b: Extended mode/No response 100b: Extended mode/R1, R5, R6, or R7 response from the SD card 101b: Extended mode/R1b response from the SD card 110b: Extended mode/R2 response from the SD card 111b: Extended mode/R3 or R4 response from the SD card Some commands cannot be used in normal mode. For details, see **6.2.4.14 Example of SD_CMD Register Setting** to select mode/response type.
7, 6	C1, C0[1:0]	0h	RW	00b: CMD 01b: ACMD 10b: Setting prohibited 11b: Setting prohibited
5 to 0	CF45 to CF40[5:0]	0h	RW	Command Index These bits specify command format[45:40] (command index). [Examples] CMD6: SD_CMD[7:0] = 0000 0110b CMD18: SD_CMD[7:0] = 0001 0010b ACMD13: SD_CMD[7:0] = 0100 1101b

6.2.2.2.2 Command Argument Registers

Command arguments for SD cards are set in the SD command argument registers (SD_ARG). Set the command arguments before writing to SD_CMD.

Note that the argument of CMD12 within command sequences is 0000 0000h regardless of the setting of SD_ARG.

(1) Command Argument Register (SDm_SD_ARG)

Access Size : 16, 32, 64 bits
Offset Address : <SDm_base> + 0010h
Initial Value : 0000_0000_0000_0000h

Bit	63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CF39 to CF8[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CF39 to CF8[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
63 to 32	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
31 to 0	CF39 to CF8[31:0]	0h	RW	Set command format[39:8] (argument).

(2) Command Argument Register 1 (SDm_SD_ARG1) (Mirror of SDm_SD_ARG[31:16])

Access Size : 16, 32, 64 bits
Offset Address : <SDm_base> + 0018h
Initial Value : 0000_0000_0000_0000h

Bit	63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CF39 to CF24[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
63 to 16	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
15 to 0	CF39 to CF24[15:0]	0h	RW	Set command format[39:24] (argument).

6.2.2.2.3 Data Stop Register (SDm_SD_STOP)

The data stop register (SD_STOP) is used to enable or disable block counting at multiple block transfer, and to control the issuing of CMD12 within command sequences.

Access Size : 16, 32, 64 bits
Offset Address : <SDm_base> + 0020h
Initial Value : 0000_0000_0000_0000h

Bit	63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	HPIMODE	HPICMD
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	SEC	-	-	-	-	-	-	-	STP
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	RW	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
63 to 19	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
18	-	0h*1	RW	Reserved The written value should always be 0b.
17	HPIMODE	0h*1	RW	HPI Mode Enable 0b: Disables HPI mode. 1b: Enables HPI mode.
16	HPICMD	0h*1	RW*3	HPI Command Issue When HPICMD is set to 1b while HPIMODE is 1b, the HPI command (CMD12) is issued. This bit is cleared to 0 when reception of the response to CMD12 is completed. The timing with which this bit is set to 1b is as follows. - After reception of the response to CMD12 that was issued by setting the STP bit to 1b has been completed during the CMD6/CMD38 or CMD25 sequence. - After reception of the response to CMD24/CMD25 has been completed After HPICMD is set to 1b, do not write 0b to this bit while the CBSY bit in SD_INFO2 is 1b. Do not set this bit to 1b when the CBSY bit in SD_INFO2 is 0b.
15 to 9	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.

Bit	Bit Name	Initial Value	R/W	Description
8	SEC	0h*1	RW	Block Count Enable*2 0: Disables SD_SECCNT setting value. 1: Enables SD_SECCNT setting value. Set SEC to 1 at multiple block transfer. When SD_CMD is set as follows to start the command sequence while SEC is set to 1, CMD12 is automatically issued to stop multiple block transfer with the number of blocks which is set to SD_SECCNT. 1. CMD18 or CMD25 in normal mode (SD_CMD[10:8] = 000) 2. SD_CMD[15:13] = 001 in extended mode (CMD12 is automatically issued, multiple block transfer) When the command sequence is halted because of a communications error or timeout, CMD12 is not automatically issued.
7 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
0	STP	0h*1	RW	Stop - When STP is set to 1 during multiple block transfer, CMD12 is issued to halt the transfer through the SD/MMC host interface. However, if a command sequence is halted because of a communications error or timeout, CMD12 is not issued. Although continued buffer access is possible even after STP has been set to 1, the buffer access error bit (ERR5 or ERR4) in SD_INFO2 will be set accordingly. - When STP has been set to 1 during transfer for single block write, the access end flag is set when SD_BUF becomes empty, and CMD12 is not issued. If SD_BUF does contain data, the access end flag is set on completion of reception of the busy state without CMD12 having been issued. - When STP has been set to 1 during transfer for single block read, the access end flag is set immediately after setting of the STP bit and CMD12 is not issued. - When STP is set to 1 during reception of the busy state after an R1b response, the access end flag is set on completion of reception of the busy state without CMD12 having been issued. - When STP is set to 1 after a command sequence has been completed, CMD12 is not issued and the access end flag is not set. - Set STP to 1 after the response end flag has been set. - Set STP to 0 after the response end flag has been set.

Note 1. The initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0.

Note 2. Do not change the value of this bit when the CBSY bit in SD_INFO2 is set to 1.

Note 3. Only effective when 1 is written.

6.2.2.2.4 Block Count Register (SDm_SD_SECCNT)

The block count register (SD_SECCNT) is used to specify the number of transfer blocks at multiple block transfer.

Access Size : 16, 32, 64 bits
Offset Address : <SDm_base> + 0028h
Initial Value : 0000_0000_0000_0000h

Bit	63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CNT31 to CNT0[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CNT31 to CNT0[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
63 to 32	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
31 to 0	CNT31 to CNT0[31:0]	0h	RW	Number of Transfer Blocks*1 When 0000 0001h is set, the number of transfer blocks is 1. : When 0000 FFFFh is set, the number of transfer blocks is 65535. : When FFFF FFFFh is set, the number of transfer blocks is 4294967295. Do not set this register to 0000 0000h if multiple blocks are to be transferred.

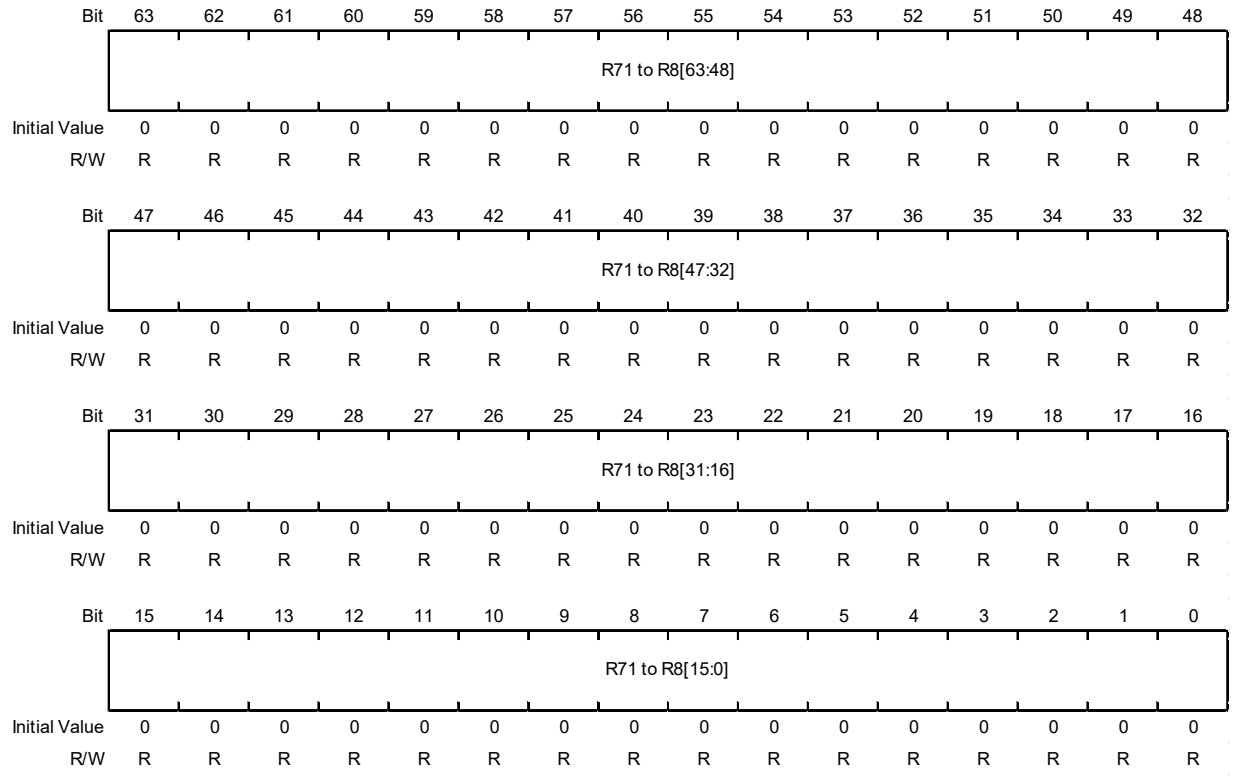
Note 1. Do not change the value of these bits when the CBSY bit in SD_INFO2 is set to 1.

6.2.2.2.5 SD Card Response Registers

The SD card response registers (SD_RSP) hold the response from the SD card.

(1) SD Card Response Registers 10 (SDm_SD_RSP10)

Access Size : 16, 32, 64 bits
Offset Address : <SDm_base> + 0030h
Initial Value : 0000_0000_0000_0000h



Bit	Bit Name	Initial Value	R/W	Description
63 to 0	R71 to R8[63:0]	0h	R	Hold the response from the SD card

(2) SD Card Response Registers 1 (SDm_SD_RSP1) (Mirror of SD_RSP10[31:16])

Access Size : 16, 32, 64 bits
Offset Address : <SDm_base> + 0038h
Initial Value : 0000_0000_0000_0000h

Bit	63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	R39 to R24[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
63 to 16	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
15 to 0	R39 to R24[15:0]	0h	R	Hold the response from the SD card

(3) SD Card Response Registers 32 (SDm_SD_RSP32) (Mirror of SD_RSP10[63:32])

Access Size : 16, 32, 64 bits
Offset Address : <SDm_base> + 0040h
Initial Value : 0000_0000_0000_0000h

Bit	63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
63 to 8	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
7 to 0	R127 to R120[7:0]	0h	R	Hold the response from the SD card

Table 6.2-3 lists the response types and corresponding SD_RSP registers.

Table 6.2-3 Response Types and Corresponding SD_RSP Registers

Response Types	SD_RSP Registers
R1, R1b[39:8]	SD_RSP10 SD_RSP54*1
R2[127:8]	SD_RSP54 and SD_RSP10
R3[39:8]	SD_RSP10
R4[39:8]	SD_RSP10
R5[39:8]	SD_RSP10
R6[39:8]	SD_RSP10
R7[39:8]	SD_RSP10

Note 1. The response to CMD18 and to CMD25 is stored in both R[39:8] and R[103:72].
This makes it possible to confirm the response to CMD18 and CMD25 by reading R[103:72] even if the response to automatic CMD12 is stored in R[39:8].

6.2.2.2.6 SD Card Interrupt Flag Register 1 (SDm_SD_INFO1)

The SD card interrupt flag register 1 (SD_INFO1) indicates the response end and access end in the command sequence. This register also indicates the card detect/write protect state.

For CMD12 and CMD52 (SDIO abort) at multiple block transfer, INFO0 is not set but only INFO2 is set.

Even if the command sequence is halted because of a communications error or timeout, INFO0 or INFO2 is set.

INFO10, INFO9, and INFO8 change depending on the SDDAT3 state after a reset is released and continue to change in 4-bit transfer mode.

To clear a flag, write 0b to the bit to be cleared and 1 to the other bits.

Access Size : 16, 32, 64 bits

Offset Address : <SDm_base> + 0070h

Initial Value : 0000_0000_0000_0xx0h

R/W	R	R	R	R	R	R	RW	RW	R	R	R	RW	RW	RW	R	RW

Bit	Bit Name	Initial Value	R/W	Description
63 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
16	HPIRES	0h*2	RW*1	Response Reception Completion [Setting condition] When reception of the response to CMD12 that was issued by setting the STP bit to 1b is completed during the CMD6/CMD38 or CMD25 sequence in HPI mode. [Clearing condition] When 0b is written to HPIRES
15 to 11	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
10	INFO10	x	R	Indicates the SDDAT3 state. 0b: SDDAT3 is set to 0. 1b: SDDAT3 is set to 1.

Bit	Bit Name	Initial Value	R/W	Description
9	INFO9	0h	RW*1	SDDAT3 Card Insertion [Setting condition] After a change in SDDAT3 from 0 to 1, two cycles of 2 P1ϕ have elapsed with SDDAT3 held at 1. [Clearing condition] When 0b is written to INFO9
8	INFO8	0h	RW*1	SDDAT3 Card Removal [Setting condition] After a change in SDDAT3 from 1 to 0, two cycles of 2 P1ϕ have elapsed with SDDAT3 held at 0. [Clearing condition] When 0b is written to INFO8
7	INFO7	x	R	Write Protect Indicates the ISDWP state. 0b: ISDWP is set to 1. 1b: ISDWP is set to 0.
6	-	0h	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
5	INFO5	x	R	Indicates the ISDCD state. 0b: Indicates that Mcycle has elapsed with ISDCD held at 1. 1b: Indicates that Mcycle has elapsed with ISDCD held at 0. Mcycle is set by bits 3 to 0 in SD_OPTION.
4	INFO4	0h	RW*1	ISDCD Card Insertion [Setting condition] After a change in ISDCD from 1 to 0, Mcycle has elapsed with ISDCD held at 0. [Clearing condition] When 0b is written to INFO4 Mcycle is set by bits 3 to 0 in SD_OPTION.
3	INFO3	0h	RW*1	ISDCD Card Removal [Setting condition] After a change in ISDCD from 0 to 1, Mcycle has elapsed with ISDCD held at 1. [Clearing condition] When 0 is written to INFO3 Mcycle is set by bits 3 to 0 in SD_OPTION.
2	INFO2	0h*2	RW*1	Access End [Setting conditions] 1. When read access to the buffer is completed in the case of transfer for single block read 2. When read access to the buffer for the last block of data is completed in the case of transfer for multiple block read 3. When read access to the buffer and reception of the response to CMD12 are completed in the case of transfer for multiple block read with automatic issuing of CMD12 4. When reception of the busy state after reception of the CRC status is completed in the case of transfer for single block write 5. When reception of the busy state after reception of the CRC status of the last block of data is completed in the case of transfer for multiple block write 6. When reception of the response busy state for CMD12 is completed in the case of transfer for multiple block write with automatic issuing of CMD12 7. When reception of the response to CMD12 that was issued by setting the STP bit to 1 is completed in the case of transfer for multiple block read 8. When reception of the response busy state for CMD12 that was issued by setting the STP bit to 1 is completed in the case of transfer for multiple block write 9. When reception of the response to CMD52 that was issued by setting the IOABT bit to 1 is completed in the case of transfer for multiple block read 10. When reception of the response to CMD52 that was issued by setting the IOABT bit to 1 is completed in the case of transfer for multiple block write. In addition to the above conditions, this bit is set when a command sequence is halted because of a communications error or timeout. [Clearing condition] When 0 is written to INFO2 When the access end bit is set to 1, the command sequence is terminated.
1	-	0h	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.

Bit	Bit Name	Initial Value	R/W	Description
0	INFO0	0h*2	RW*1	Response End [Setting conditions] 1. When the reception of the response is completed 2. When the transmission of the command not requiring a response is completed, 3. When receiving busy reception after R1b response 4. When reception of the response to CMD52 that was issued by setting the C52PUB bit to1 is completed in the case of transfer for multiple block read 5. When reception of the response to CMD52 that was issued by setting the C52PUB bit to1 is completed in the case of transfer for multiple block write, In addition to the above conditions, this bit is set when a command sequence is halted because of a communications error or timeout. [Clearing condition] When 0 is written to INFO0 When issuing a command without data, the command sequence ends when the response end is set to 1.

x: Undefined value

Note 1. Only effective when 0b is written.

Note 2. The value is initialized by a reset and also in the case of a reset by the SDRST bit in SOFT_RST.

6.2.2.2.7 SD Card Interrupt Flag Register 2 (SDm_SD_INFO2)

The SD card interrupt flag register 2 (SD_INFO2) indicates the access status of the SD buffer (SD_BUF) and SD card. To clear a flag, write 0b to the bit to be cleared and 1 to the other bits.

Access Size : 16, 32, 64 bits
Offset Address : <SDm_base> + 0078h
Initial Value : 0000_0000_0000_20x0h

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ILA	CBSY	SCLKDIVEN	-	-	-	BWE	BRE	DAT0	ERR6	ERR5	ERR4	ERR3	ERR2	ERR1	ERR0
Initial Value	0	0	1	0	0	0	0	0	x	0	0	0	0	0	0	0
R/W	RW	R	R	R	RW	R	RW	RW	R	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
63 to 16	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
15	ILA	0h*2	RW*1	Illegal Access Error [Setting conditions] 1. Writing of data to SD_CMD within a command sequence (CBSY=1) 2. When SD_CMD[11] = 1 (command with data transfer) and SD_CMD[7:0] = 0000 1100b (CMD12) are set in SD_CMD [Clearing condition] When 0 is written to ILA
14	CBSY	0h*2	R	Command Type Register Busy 0: A command sequence has been completed. 1: A command sequence is being executed.
13	SCLKDIVEN	1h*2	R	0: The SD bus (CMD, DAT) is busy. Do not attempt to write to the SD_CLK_CTRL register. 1: The SD bus (CMD, DAT) is not busy. When a command sequence is started by writing to SD_CMD, the CBSY bit is set to 1 and, at the same time, the SCLKDIVEN bit is set to 0. The SCLKDIVEN bit is set to 1 after 8 cycles of SDCLK have elapsed after setting of the CBSY bit to 0 due to completion of the command sequence.
12	-	0h	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
11	-	0h	RW	Reserved The written value should always be 1b.
10	-	0h	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.

Bit	Bit Name	Initial Value	R/W	Description
9	BWE	0h*2	RW*1	SD_BUF Write Enable 0b: Data cannot be written in SD_BUF0. 1b: Data can be written in SD_BUF0. [Setting conditions] 1. When SD_BUF is empty at single block transfer 2. When either bank 1 or bank 2 of SD_BUF is empty at multiple block transfer [Clearing conditions] 1. When 0b is written to BWE 2. Writing of a block of data to SD_BUF by DMA transfer When data is written to SD_BUF0 by the CPU, clear BWE and then write the amount of data specified by SD_SIZE*3
8	BRE	0h*2	RW*1	SD_BUF Read Enable 0b: Data cannot be read from SD_BUF0. 1b: Data can be read from SD_BUF0. [Setting conditions] 1. When data set in SD_SIZE is stored in SD_BUF at single block transfer 2. When data set in SD_SIZE is stored in either bank 1 or bank 2 of SD_BUF at multiple block transfer [Clearing conditions] 1. When 0b is written to BRE 2. Reading of a block of data from SD_BUF by DMA transfer When data is read from SD_BUF0 by the CPU, clear BRE and then read the amount of data specified by SD_SIZE*3. Even if a CRC error or an END error occurs while block data is read, data is stored in SD_BUF and BRE is set.
7	DAT0	x	R	SDDAT0 Indicates the SDDAT0 state. 0b: SDDAT0 is set to 0. 1b: SDDAT0 is set to 1. If the data timeout (ERR3) is set but the response timeout (ERR6) is not set after the Erase command has been issued, the end of the Erase sequence (DAT0 = 1) is confirmed by polling DAT0. If a communications error or timeout occurs during a write sequence, the DAT0 bit may retain the value 0. While the SD clock (SDCLK) is stopped, the DAT0 bit retains the value before the clock is stopped.
6	ERR6	0h*2	RW*1	Response Timeout [Setting condition] When a response is not received even after 640 cycles of SDCLK have elapsed (including a response to a command issued within a command sequence*5) [Clearing condition] When 0b is written to ERR6 The command sequence is halted by a response timeout.*4
5	ERR5	0h*2	RW*1	SD_BUF Illegal Read Access [Setting conditions] 1. When SD_BUF is empty while SD_BUF0 is read 2. When data with a CRC error or END error is read from SD_BUF0 [Clearing condition] When 0b is written to ERR5
4	ERR4	0h*2	RW*1	SD_BUF Illegal Write Access [Setting conditions] 1. When data is written to SD_BUF0 while it is not in the data read/write command state 2. When data is written to SD_BUF0 while SD_BUF is full 3. When data is written to SD_BUF0 while an error occurs in the CRC status or CRC status length 4. When data is written to SD_BUF0 while the interface remains in a busy state for at least Ncycle after the CRC status [Clearing condition] When 0b is written to ERR4 Ncycle is set by bits 7 to 4 in SD_OPTION.

Bit	Bit Name	Initial Value	R/W	Description
3	ERR3	0h*2	RW*1	Data Timeout (except response timeout) [Setting conditions] 1. After the reception of the R1b response, the interface remains in a busy state (SDDAT0 = 0) for at least Ncycle. 2. After the reception of the CRC status, the interface remains in a busy state (SDDAT0 = 0) for at least Ncycle. 3. After write data, the CRC status is not received even after Ncycle has elapsed. 4. After the read command, read data is not received even after Ncycle has elapsed. 5. After CMD12 has been issued within a command sequence, the interface remains in a busy state (SDDAT0 = 0) for at least Ncycle. 6. After the reception of read data, read data for the next block are not received even after Ncycle has elapsed. 7. After release of the read wait state, read data for the next block are not received even after Ncycle has elapsed. [Clearing condition] When 0b is written to ERR3 Ncycle is set by bits 7 to 4 in SD_OPTION. The command sequence is halted by the data timeout.
2	ERR2	0h*2	RW*1	END Error [Setting conditions] 1. When an error occurs in the response length (and the end bit has not been detected) 2. When an error occurs in the read data length (and the end bit has not been detected among the valid bits) 3. When an error occurs in the CRC status length (and the end bit has not been detected) 4. An error in the length of a response to a command issued within a command sequence*5 (i.e. the end bit has not been detected) [Clearing condition] When 0b is written to ERR2 The command sequence is halted by the End error.*4
1	ERR1	0h*2	RW*1	CRC Error [Setting conditions] 1. When an error occurs in the CRC status (i.e. the received CRC status was not 010') 2. When a CRC error occurs in the read data 3. When a CRC error occurs in the response 4. A CRC error in the response to a command issued within a command sequence*5 [Clearing condition] When 0b is written to ERR1 The command sequence is halted by the CRC error.*4
0	ERR0	0h*2	RW*1	CMD Error [Setting conditions] 1. The command index of the transmitted command differing from the command index of the received response 2. The command index of a command issued within a command sequence*5 differing from the command index of the received response [Clearing condition] When 0b is written to ERR0 The command sequence is halted by the CMD error.*4

x: Undefined value

Note 1. Only effective when 0b is written.

Note 2. The initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0.

Note 3. When the WMODE bit in HOST_MODE is 0, the single byte from the fraction of a full 16-bit unit is regarded as excess data due to an odd value for the number of bytes setting in SD_SIZE. When the WMODE bit in HOST_MODE is 1, the single byte or three bytes from the fraction of a full 64-bit unit are regarded as excess data due to an odd value for the number of bytes setting in SD_SIZE, or the two bytes from the fraction of a full 64-bit unit are regarded as excess data due if the value for the number of bytes setting in SD_SIZE is even but is not on a four-byte boundary.

Note 4. After the C52PUB bit in SDIO_MODE has been set to 1b, if a communications error or timeout for response occurs in response to the CMD52 that is issued, since the command sequence has not been completed, complete the sequence with error processing as in usage examples in **Figure 6.2-18** under **6.2.4.8 IO_RW_EXTENDED (CMD53/Multiple Block Read)** or in **Figure 6.2-21** under **6.2.4.9 IO_RW_EXTENDED (CMD53/Multiple Block Write)**.

Note 5. "Command issued within a command sequence" refers to CMD12 when automatic issuing is enabled for multiple block transfer by the setting in SD_CMD, CMD12 when the STP bit in SD_STOP is set to 1b, or CMD52 when the C52PUB or IOABT bit in SDIO_MODE is set to 1b.

6.2.2.2.8 SD_INFO1 Interrupt Mask Register (SDm_SD_INFO1_MASK)

The SD_INFO1 interrupt mask register (SD_INFO1_MASK) is used to enable or disable the SD_INFO1 interrupt.

When 0b is set in SD_INFO1_MASK while the corresponding flag in SD_INFO1 is set, an interrupt occurs.

6.2.2.2.9 SD_INFO2 Interrupt Mask Register (SDm_SD_INFO2_MASK)

The SD_INFO2 interrupt mask register (SD_INFO2_MASK) is used to enable or disable the SD_INFO2 interrupt.

When 0b is set in SD_INFO2_MASK while the corresponding flag in SD_INFO2 is set, an interrupt occurs.

Access Size : 16, 32, 64 bits
Offset Address : <SDm_base> + 0088h
Initial Value : 0000_0000_0000_8B7Fh

6.2.2.2.10 SD Clock Control Register (SDm_SD_CLK_CTRL)

The SD clock control register (SD_CLK_CTRL) is used to control the SD clock (SDCLK) output and to set the frequency. Set SCLKEN to 1 before writing to SD_CMD to issue a command. Do not write to SD_CLK_CTRL while the SCLKDIVEN bit in SD_INFO2 is set to 0.

Access Size : 16, 32, 64 bits
Offset Address : <SDm_base> + 0090h
Initial Value : 0000_0000_0000_0020h

Bit	63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48

R/W	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
63 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
16	-	0h	RW	Reserved The written value should always be 0b.
15 to 11	-	0h	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
10	-	0h*1	RW	Reserved The written value should always be 0b.
9	SDCLKOFFEN	0h	RW	SD Clock (SDCLK) Output Automatic Control Enable 0b: Automatic control for SD clock (SDCLK) output is disabled. 1b: Automatic control for SD clock (SDCLK) output is enabled. This function of automatic control for SD clock (SDCLK) output causes SDCLK output only within a command sequence. The timing with which SDCLK output starts and stops is as follows. SDCLK output starts after writing to SD_CMD. SDCLK output stops when 8 cycles of SDCLK have elapsed after the end of the command sequence. In addition, SDCLK is fixed to 0 while SCLKEN of SD_CLK_CTRL is 0, regardless of the value of this bit.
8	SCLKEN	0h*1	RW	SD Clock (SDCLK) Output Control Enable 0b: SD clock (SDCLK) output is disabled. The SDCLK signal is fixed 0. 1b: SD clock (SDCLK) output is enabled.

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	DIV7 to DIV0[7:0]	20h	RW*2	SD Clock (SDCLK) 1000 0000b: (SDxϕ/4)/512 0100 0000b: (SDxϕ/4)/256 0010 0000b: (SDxϕ/4)/128 0001 0000b: (SDxϕ/4)/64 0000 1000b: (SDxϕ/4)/32 0000 0100b: (SDxϕ/4)/16 0000 0010b: (SDxϕ/4)/8 0000 0001b: (SDxϕ/4)/4 0000 0000b: (SDxϕ/4)/2 1111 1111b: SDxϕ/4 (x = 0, 1) Other settings are prohibited. In addition, in the case of data transfer in DDR mode (DDR bit in SDIF_MODE = 1), do not set DIV[7:0] to 1111 1111b.

Note 1. This initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0b.

Note 2. Writing to SD_CLK_CTRL is impossible when the CBSY bit in SD_INFO2 is 1b.

CAUTION

Notes on when setting the SD clock (SDCLK) to P1ϕ (DIV[7:0] = 1111 1111b)

When changing the setting of bits DIV[7:0] to 1111 1111b, or from 1111 1111b to other setting, perform the following processing before writing to SD_CMD.

1. Set the SCLKEN bit to 0 by writing to SD_CLK_CTRL. (Do not change the setting of bits other than SCLKEN at this time.)
2. Change the setting of bits DIV[7:0] by writing to SD_CLK_CTRL. (Do not change the setting of bits other than DIV[7:0] at this time. The SCLKEN bit should retain the value 0.)
3. Set the SCLKEN bit to 1b by writing to SD_CLK_CTRL. (Do not change the setting of bits other than SCLKEN at this time.)

Also, when changing the setting of bits DIV[7:0] to 1111 1111b after having set the SDRST bit in SOFT_RST to 0 and then changed it to 1b, perform this processing before writing to SD_CMD.

6.2.2.2.11 Transfer Data Length Register (SDm_SD_SIZE)

The transfer data length register (SD_SIZE) is used to specify the transfer data size.

Access Size : 16, 32, 64 bits
Offset Address : <SDm_base> + 0098h
Initial Value : 0000_0000_0000_0200h

Bit	63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	LEN9 to LEN0[9:0]									
Initial Value	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
63 to 12	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
11 to 10	-	All 0	R	Reserved
9 to 0	LEN9 to LEN0[9:0]	200h	RW	Transfer Data Size*1 These bits specify a size between 1 and 512 bytes for single block transfer. In cases of multiple block transfer with automatic issuing of CMD12 (CMD18 and CMD25), the only specifiable transfer data size is 512 bytes. Furthermore, in cases of multiple block transfer without automatic issuing of CMD12, as well as 512 bytes, 32, 64, 128, and 256 bytes are specifiable. However, in the reading of 32, 64, 128, and 256 bytes for the transfer of multiple blocks, this is restricted to multiple block transfer by CMD53. Additionally, if a command accompanies data transfer, do not set these bits to 0. Do not specify a data size larger than 512 bytes.

Note 1. Do not change the values of these bits when the CBSY bit in SD_INFO2 is 1b.

6.2.2.2.12 SD Card Access Control Option Register (SDm_SD_OPTION)

The SD card access control option register (SD_OPTION) is used to set the bus width and timeout counter.

Access Size : 16, 32, 64 bits
Offset Address : <SDm_base> + 00A0h
Initial Value : 0000_0000_0000_40EEh

Bit	63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48

R/W	RW	R	RW	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
63 to 16	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
15	WIDTH	0h*1	RW	Bus width*2 {WIDTH,WIDTH8} = 01b: 8-bit width {WIDTH,WIDTH8} = 00b: 4-bit width {WIDTH,WIDTH8} = 10b or 11b: 1-bit width In the case of data transfer in DDR mode (DDR bit in SDIF_MODE = 1), do not set this bit to 1b. In the case of writing of one-byte block, 8-bit width cannot be specified for the bus width. Change the bus width to 4 bits or 1 bit before writing one-byte block.
14	-	1h	R	Reserved Whenever it is read, 1b is read. The written value should always be 1b.
13	WIDTH8	0h*1	RW	Bus width*2 See the description of the WIDTH bit.
12 to 10	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
9	EXTOP	0h*1	RW	Timeout Mode Select 0b: Bits TOP27 to TOP24 specify the timeout count from SDCLK x 2^{13} to SDCLK x 2^{27}. 1b: Bits TOP27 to TOP24 specify the timeout count from SDCLK x 2^{14} to SDCLK x 2^{28}.
8	TOUTMASK	0h*1	RW	Timeout Mask 0b: Enables timeout. 1b: Disables timeout. (The ERR6 and ERR3 bits in SD_INFO2 and the E6 to E0 bits in SD_ERR_STS2 are not set.) If a timeout occurs while it is disabled, perform a software reset to terminate a command sequence.

Bit	Bit Name	Initial Value	R/W	Description
7 to 4	TOP27 to TOP24[3:0]	Eh*1	RW	Timeout Counter*2 0000b: SDCLK x 2^{13} 0001b: SDCLK x 2^{14} : 1101b: SDCLK x 2^{26} 1110b: SDCLK x 2^{27} 1111b: Setting prohibited
3 to 0	CTOP24 to CTOP21[3:0]	Eh*1	RW	Card Detect Time Counter 0000b: SDCLK x 2^{10} 0001b: SDCLK x 2^{11} : 1101b: SDCLK x 2^{23} 1110b: SDCLK x 2^{24} 1111b: Setting prohibited

Note 1. The initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0b.

Note 2. Do not change the values of these bits when the CBSY bit in SD_INFO2 is 1b.

6.2.2.2.13 SD Error Status Register 1 (SDm_SD_ERR_STS1)

The SD error status register 1 (SD_ERR_STS1) indicates the CRC status, CRC error, End error, and CMD error.

Access Size : 16, 32, 64 bits

Offset Address : <SDm_base> + 00B0h

Initial Value : 0000_0000_xxxx_x000h

Bit	63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
63 to 32	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
31 to 15	-	X	R	Reserved The read value is undefined. The written value should always be 0b.
14 to 12	E14 to E12[2:0]	2h*1	R	These bits hold the CRC status. (normal: 010)
11	E11	0h*1	R	Set to 1 when an error occurs in the CRC status.
10	E10	0h*1	R	Set to 1 when a CRC error occurs in the read data.
9	E9	0h*1	R	Set to 1 when a CRC error occurs in the response to a command issued within a command sequence*2. In cases where CMD12 is issued by setting a command index in SD_CMD, this is indicated in E8.
8	E8	0h*1	R	Set to 1 when a CRC error occurs in a response (other than a response to a command issued within a command sequence*2).
7, 6	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
5	E5	0h*1	R	Set to 1 when an error occurs in the CRC status length (and the end bit has not been detected).
4	E4	0h*1	R	Set to 1 when an error occurs in the read data length (and the end bit has not been detected among the valid bits).
3	E3	0h*1	R	Set to 1 when an error occurs in the response length to a command issued within a command sequence*2. In cases where CMD12 is issued by setting a command index in SD_CMD, this is indicated in E2.
2	E2	0h*1	R	Set to 1 when an error occurs in the response length (other than a response to a command issued within a command sequence*2).

Bit	Bit Name	Initial Value	R/W	Description
1	E1	0h*1	R	Set to 1 when an error occurs in the command index of the response to a command issued within a command sequence*2. In cases where CMD12 is issued by setting a command index in SD_CMD, this is Indicated in E0.
0	E0	0h*1	R	Set to 1 when an error occurs in the command index of a response (other than a response to a command issued within a command sequence*2).

x: Undefined value

Note 1. The initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0b.

Note 2. “Command issued within a command sequence” refers to CMD12 when automatic issuing is enabled for multiple block transfer by the setting in SD_CMD, CMD12 when the STP bit in SD_STOP is set to 1b, or CMD52 when the C52PUB or IOABT bit in SDIO_MODE is set to 1b.

6.2.2.2.14 SD Error Status Register 2 (SDm_SD_ERR_STS2)

The SD error status register 2 (SD_ERR_STS2) indicates the timeout state. Ncycle is set by bits 7 to 4 in SD_OPTION.

Access Size : 16, 32, 64 bits
Offset Address : <SDm_base> + 00B8h
Initial Value : 0000_0000_0000_0000h

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	E6	E5	E4	E3	E2	E1	E0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

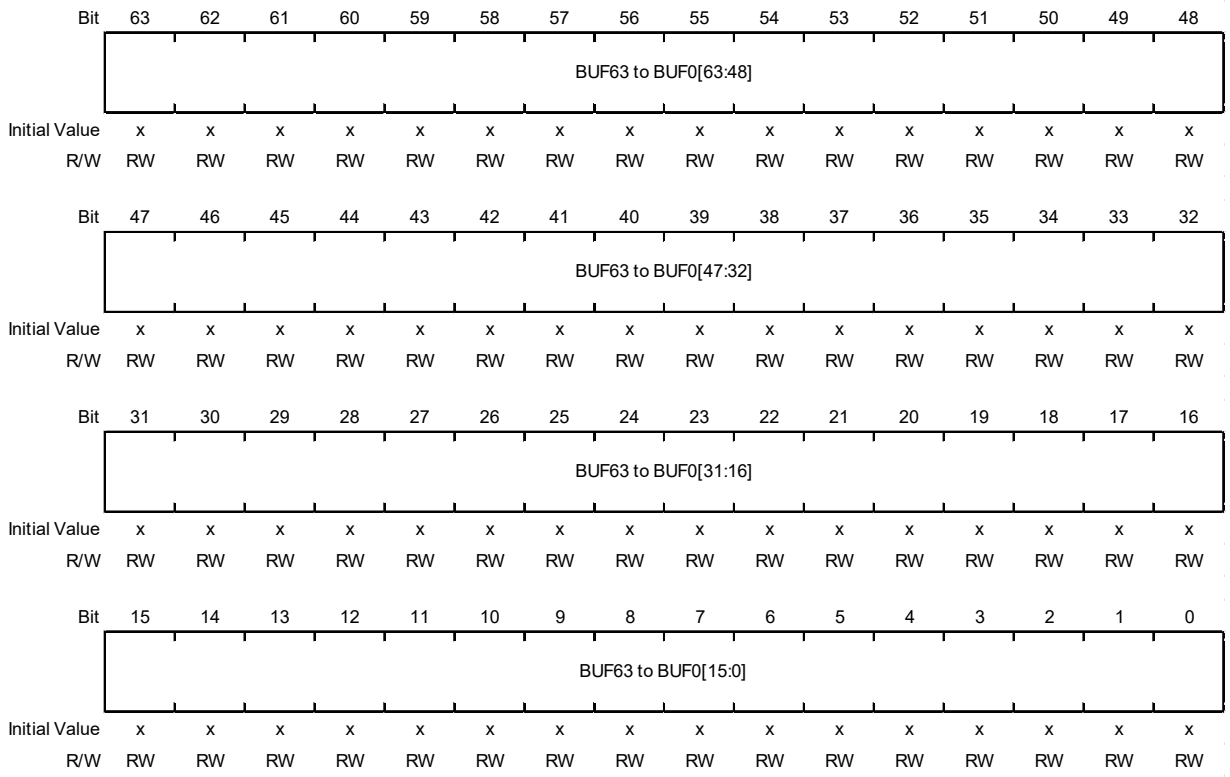
Bit	Bit Name	Initial Value	R/W	Description
63 to 7	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
6	E6	0h*1	R	Set to 1b when the interface remains in a busy state for at least Ncycle after the CRC status.
5	E5	0h*1	R	Set to 1b when the CRC status is not received even after Ncycle has elapsed after data writing.
4	E4	0h*1	R	Set to 1b when read data is not received even after Ncycle has elapsed after the command has been read. Set to 1b when read data for the next block are not received even after Ncycle has elapsed after the reception of read data. Set to 1b when read data for the next block are not received even after Ncycle has elapsed after release of the read wait state.
3	E3	0h*1	R	Set to 1b when the interface remains in a busy state for at least Ncycle after CMD12 has been issued within a command sequence. In cases where CMD12 is issued by setting a command index in SD_CMD, this is indicated in E2.
2	E2	0h*1	R	Set to 1b when the interface remains in a busy state for at least Ncycle after R1b response.
1	E1	0h*1	R	Set to 1b when the response to a command issued within a command sequence*2 is not received even after 640 cycles of SDCLK have elapsed. In cases where CMD12 is issued by setting a command index in SD_CMD, this is indicated in E0.
0	E0	0h*1	R	Set to 1b when the response (other than a response to a command issued within a command sequence*2) is not received even after 640 cycles of SDCLK have elapsed.

Note 1. The initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0b.

Note 2. “Command issued within a command sequence” refers to CMD12 when automatic issuing is enabled for multiple block transfer by the setting in SD_CMD, CMD12 when the STP bit in SD_STOP is set to 1b, or CMD52 when the C52PUB or IOABT bit in SDIO_MODE is set to 1b.

6.2.2.2.15 SD Buffer Read/Write Register (SDm_SD_BUF0)

Access Size : 16, 32, 64 bits
Offset Address : <SDm_base> + 00C0h
Initial Value : xxxx_xxxx_xxxx_xxxxh



Bit	Bit Name	Initial Value	R/W	Description
63 to 0	BUF63 to BUF0[63:0]	x	RW	When writing to the SD card, the write data is written to this register. When reading from the SD card, the read data is read from this register. This register is internally connected to two 512-byte buffers (SD_BUF). When both buffers are not empty at multiple block read, suspend data reception by stopping the SD clock. When either buffer becomes empty, restart data reception by starting supply of the SD clock.

x: Undefined value

Note: When using the DMAC, the bus width should be fixed at 64 bits.

6.2.2.2.16 SDIO Mode Control Register (SDm_SDIO_MODE)

The SDIO mode control register (SDIO_MODE) controls the CMD52 issuance and the read wait state at multiple block transfer, and the reception of SDIO interrupt. C52PUB and IOABT should not be set to 1b simultaneously.

Access Size : 16, 32, 64 bits
Offset Address : <SDm_base> + 00D0h
Initial Value : 0000_0000_0000_0000h

Bit	63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	C52PUB	IOABT	-	-	-	-	-	RWREQ	-	IOMOD
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	RW	RW	R	R	R	R	R	RW	R	RW

Bit	Bit Name	Initial Value	R/W	Description
63 to 10	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
9	C52PUB	0h	RW	SDIO None Abort - When C52PUB is set to 1b in the CMD53 (multiple block) write sequence, CMD52 is automatically issued between blocks if SD_BUF becomes empty. C52PUB is automatically cleared to 0 after reception of the response to CMD52 is completed. Additionally, if C52PUB is set to 1b while the last block is being transferred, CMD52 is not issued. In this case, C52PUB is automatically cleared to 0 after the access end flag has been set to 1b. - When C52PUB and RWREQ are set to 1b in the CMD53 (multiple block) read sequence, the block transfer enters the read wait state between blocks and CMD52 is automatically issued. C52PUB is automatically cleared to 0 after reception of the response to CMD52 is completed. Additionally, if C52PUB is set to 1b while the last block is being transferred, CMD52 is not issued. In this case, C52PUB is automatically cleared to 0 after the access end flag has been set to 1b. - If C52PUB is set to 1b in the CMD53 (multiple block) read sequence, be sure to set RWREQ to 1 as well as C52PUB. - Set SD_ARG before setting C52PUB to 1. - Set C52PUB to 1 after the response end flag has been set.

Bit	Bit Name	Initial Value	R/W	Description
8	IOABT	0h	RW	SDIO Abort - When IOABT is set to 1b in the CMD53 (multiple block) sequence, the CMD53 sequence is halted and CMD52 is issued. However, if a command sequence is halted because of a communications error or timeout, CMD52 is not issued. Although continued buffer access is possible even after IOABT has been set to 1b, the buffer access error bit (ERR5 or ERR4) in SD_INFO2 will be set accordingly. Set SD_ARG before setting IOABT to 1. - When IOABT has been set to 1b during transfer for single block write, the access end flag is set when SD_BUF becomes empty, and CMD52 is not issued. If SD_BUF does contain data, the access end flag is set on completion of reception of the busy state without CMD52 having been issued. - When IOABT has been set to 1b during transfer for single block read, the access end flag is set immediately after setting of IOABT and CMD52 is not issued. - When IOABT is set to 1b during reception of the busy state after an R1b response, the access end flag is set on completion of reception of the busy state without CMD52 having been issued. - When IOABT is set to 1b after a command sequence has been completed, CMD52 is not issued and the access end flag is not set. - Set IOABT to 1 after the response end flag has been set. Set IOABT to 0 after the access end flag has been set.
7 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
2	RWREQ	0h	RW	Read Wait Request When RWREQ is set to 1 in the CMD53 (multiple block) read sequence, the block transfer enters the read wait state between blocks. [Releasing the read wait state] (1) The read wait state is released when RWREQ is cleared to 0 in the read wait state. (2) When IOABT is set to 1 in the read wait state, RWREQ is automatically cleared to 0 after CMD52 has been issued, and then the read wait state is released. (3) When C52PUB and RWREQ are set to 1 simultaneously in the CMD53 (multiple block) read sequence, the read wait state is not automatically released. Therefore, after the CMD52 response is received, clear RWREQ. (Be sure to set RWREQ and C52PUB simultaneously.) When RWREQ is set to 1 while the last block in the CMD53 (multiple block) read sequence is transferred, the read wait state is not entered and RWREQ is automatically cleared to 0 by setting access end. Set RWREQ to 1 after the response end flag has been set.
1	-	0h	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
0	IOMOD	0h	RW	SDIO Mode*1 0b: Disables the SD/MMC host interface to receive SDIO interrupts from the SDIO card 1b: Enables the SD/MMC host interface to receive SDIO interrupts from the SDIO card

Note 1. Do not change the value of this bit when the CBSY bit in SD_INFO2 is set to 1b.

6.2.2.2.17 SDIO Interrupt Flag Register (SDm_SDIO_INFO1)

The SDIO interrupt flag register (SDIO_INFO1) indicates the status regarding to the SDIO card access. To clear a flag, write 0b to the bit to be cleared and 1b to the other bits.

Access Size : 16, 32, 64 bits
Offset Address : <SDm_base> + 00D8h
Initial Value : 0000_0000_0000_0000h

R/W	RW	RW	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
63 to 16	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
15	EXWT	0h*2	RW*1	[Setting condition] While the last block in the CMD53 (multiple block) read sequence is transferred, RWREQ in SDIO_MODE is set to 1. [Clearing condition] When 0 is written to EXWT
14	EXPUB52	0h*2	RW*1	[Setting conditions] 1. While the last block in the CMD53 (multiple block) sequence is transferred, C52PUB in SDIO_MODE is set to 1b. 2. While C52PUB is set to 1b in the CMD53 (multiple block) write sequence, the last block is transferred. [Clearing condition] When 0b is written to EXPUB52
13 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
2, 1	-	All 0*2	RW	Reserved The read value is undefined. The written value should always be 1b.
0	IOIRQ	0h*2	RW*1	[Setting condition] When an SDIO interrupt from the SDIO card is received while IOMOD in SDIO_MODE is set to 1b. [Clearing condition] When 0b is written to IOIRQ*3

Note 1. Only effective when 0b is written.

Note 2. The initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0b.

Note 3. Before clearing this bit, access the SDIO card to negate the SDIO interrupt signal from the SDIO card. If the interrupt signal is not negated, this bit may be set again.

6.2.2.2.18 SDIO_INFO1 Interrupt Mask Register (SDm_SDIO_INFO1_MASK)

The SDIO_INFO1 interrupt mask register (SDIO_INFO1_MASK) enables or disables the SD_INFO1 interrupt. When 0b is set in SDIO_INFO1_MASK while the corresponding flag in SD_INFO1 is set, an interrupt occurs.

6.2.2.2.22 Host Interface Mode Setting Register (SDm_HOST_MODE)

The host interface mode setting register (HOST_MODE) selects the width for access to the data bus.

Access Size : 16, 32, 64 bits
Offset Address : <SDm_base> + 0390h
Initial Value : 0000_0000_0000_0000h

Bit	63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	BUSWIDTH	-	-	-	-	-	-	ENDIAN	WMODE
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	RW	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
63 to 9	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
8	BUSWIDTH	0h	RW	Width for Access to SD_BUF*1*2 Read or write access to SD_BUF0 can be performed with the specified width for access. 0b: 16-bit access 1b: 32-bit access This bit is enabled while the WMODE bit is set to 1b.
7 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
1	ENDIAN	0h	RW	SD_BUF0 data swap
0	WMODE	0h	RW	Width for Access to SD_BUF*1*2 Read or write access to SD_BUF0 can be performed with the specified width for access. 0b: 64-bit access 1b: 16-bit or 32-bit access

Note 1. Do not change the value of this bit when the CBSY bit in SD_INFO2 is set to 1b.

Note 2. When using the built-in DMAC of this module, fix the bus width to 64 bits.

6.2.2.2.23 SD Interface Mode Setting Register (SDm_SDIF_MODE)

The SD interface mode setting register specifies DDR mode.

Access Size : 16, 32, 64 bits
Offset Address : <SDm_base> + 0398h
Initial Value : 0000_0000_0000_0000h

Bit	63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	NOCHKCR	-	-	-	-	-	-	-	DDR
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	RW	RW	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
63 to 10	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
9	-	0h*1	RW	Reserved The written value should always be 0b.
8	NOCHKCR	0h*1	RW	CRC Check Mask (test command for MMC supported) Enables or disables checking of the CRC16 and CRC status. 0b: Enables the CRC check. 1b: Disables the CRC check (the CRC16 value is ignored at read, and the CRC status is not detected at write)
7 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
0	DDR	0h*1	RW	DDR Mode Select*2 0b: Normal mode (default, high speed, or SDR) 1b: DDR mode Set this bit to 0b when the SD clock division ratio is specified as 1:1 (bits DIV[7:0] in SD_CLK_CTRL are set to 1111_1111b).

Note 1. The initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0b.

Note 2. Do not change the value of this bit when the CBSY bit in SD_INFO2 is set to 1b.

6.2.2.2.24 SD Status Register (SDm_SD_STATUS)

The effective bit of the SD status register controls the output value on the SDmPWEN, SDmIOVS and SD0RSTN pins.

Access Size : 16, 32, 64 bits
Offset Address : <SDm_base> + 03C8h
Initial Value : 0000_0000_0000_0001h

Bit	63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	SD_IOVS
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	SD_RST	SD_PWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
63 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
16	SD_IOVS	0h	RW	Controls the output value on SDmIOVS pin. 0b: The output value on the SDmIOVS pin is 0 (3.3 V). 1b: The output value on the SDmIOVS pin is 1 (1.8 V).
15 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
1	SD_RST	0h	RW	Controls the output value on the SD0RSTN pin. (SD0 only) 0b: The output value on the SD0RSTN pin is 0. 1b: The output value on the SD0RSTN pin is 1.
0	SD_PWEN	1h	RW	Controls the output value on the SDmPWEN pin. 0b: The ouptut value on the SDmPWEN pin is 0. 1b: The ouput value on the SDmPWEN pin is 1.

6.2.2.2.25 DMAC Transfer Mode Register (SDm_DM_CM_DTRAN_MODE)

The DMAC transfer mode register (DM_CM_DTRAN_MODE) sets the operation mode of the DMAC of this module.

Higher-order 32 bits (bit 63 to 32) are read-only and read as 0.

Access Size : 16, 32, 64 bits
Offset Address : <SDm_base> + 0820h
Initial Value : 0000_0000_0000_0030h

Bit	63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CH_NUM[1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	BUS_WIDTH [1:0]		-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	1	1	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	RW	RW	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
63 to 18	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
17, 16	CH_NUM[1:0]	0h	RW	DMAC channel selector 00b : SD downstream 01b : SD upstream Other settings are prohibited.
15 to 6	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
5, 4	BUS_WIDTH [1:0]	3h	RW	Bus width selector 11b: 64 bits Other settings are prohibited.
3 to 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.

6.2.2.2.26 DMAC Transfer Control Register (SDm_DM_CM_DTRAN_CTRL)

The DMAC transfer control register (DM_CM_DTRAN_CTRL) controls DMAC operation of the module. Higher-order 32 bits (bit 63 to 32) are read-only and read as 0.

Access Size : 16, 32, 64 bits
Offset Address : <SDm_base> + 0828h
Initial Value : 0000_0000_0000_0000h

Bit	63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	RW	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
63 to 9	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
8	-	0h	RW	Reserved The written value should always be 0b.
7 to 1	-	All 0	R	Reserved
0	DM_START	0h	RW	DMAC Start Writing 1b to this bit starts DMAC operation. This bit is automatically cleared when DMA transfer is started.

6.2.2.2.27 DMAC Reset Register (SDm_DM_CM_RST)

Higher-order 32 bits (bit 63 to 32) are read-only and read as 0b.

Access Size : 16, 32, 64 bits
Offset Address : <SDm_base> + 0830h
Initial Value : 0000_0000_FFFF_FFFFh

Bit	63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	-	-	-	-	-	-	DTRANRST1	DTRANRST0	-	-	-	-	-	-	-	SEQRST
Initial Value	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R	R	R	R	R	R	RW	RW	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
63 to 32	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
31 to 10	-	All 1	R	Reserved Whenever it is read, 1b is read. The written value should always be 1b.
9	DTRANRST1	1h	RW	Software reset of DMAC channel 1 of the module 0b: Reset 1b: Reset released
8	DTRANRST0	1h	RW	Software reset of DMAC channel 0 of the module 0b: Reset 1b: Reset released
7 to 1	-	All 1	R	Reserved Whenever it is read, 1b is read. The written value should always be 1b.
0	SEQRST	1h	RW	Software reset of the sequencer 0b: Reset 1b: Reset released

NOTE

Make sure there is no communication to the SD/MMC device before applying a software reset using this register.

6.2.2.2.28 DMAC Interrupt Register 1 (SDm_DM_CM_INFO1)

The DMAC interrupt register 1 (DM_CM_INFO1) indicates the status of the DMAC of the module and the sequencer. To clear a flag, write 0b to the bit to be cleared and 1b to the other bits.

Access Size : 16, 32, 64 bits
Offset Address : <SDm_base> + 0840h
Initial Value : 0000_0000_0000_0000h

Bit	63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	DTRANEND1	-	-	-	DTRANEND0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	RW	R	R	R	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	SEQEND
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
63 to 21	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
20	DTRANEND1	0h*1	RW	DMAC Channel 1 Transfer End [Setting conditions] 1. When transfer of DMAC channel 1 is completed 2. When an error occurs on DMAC channel 1 [Clearing condition] When 0b is written to DTRANEND1
19 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
16	DTRANEND0	0h*2	RW	DMAC Channel 0 Transfer End [Setting conditions] 1. When transfer of DMAC channel 0 is completed 2. When an error occurs on DMAC channel 0 [Clearing condition] When 0b is written to DTRANEND0
15 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
0	SEQEND	0h*3	RW	Sequencer Operation End [Setting conditions] 1. When operation of the sequencer is completed 2. When a sequencer error occurs [Clearing condition] When 0b is written to SEQEND

Note 1. The initial value is applied at a reset and when the DTRANRST1 bit in DM_CM_RST is 0b.

Note 2. The initial value is applied at a reset and when the DTRANRST0 bit in DM_CM_RST is 0b.

Note 3. The initial value is applied at a reset and when the SEQRST bit in DM_CM_RST is 0b.

6.2.2.2.29 DM_CM_INFO1 Interrupt Mask Register (SDm_DM_CM_INFO1_MASK)

The DM_CM_INFO1 interrupt mask register (DM_CM_INFO1_MASK) enables or disables the DM_CM_INFO1 interrupt. When 0 is set in DM_CM_INFO1_MASK while the corresponding flag in DM_CM_INFO1 is set, an interrupt occurs.

Access Size : 16, 32, 64 bits
Offset Address : <SDm_base> + 0848h
Initial Value : 0000_0000_FFFF_FFFFh

Bit	63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
63 to 32	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
31 to 21	-	All 1	R	Reserved Whenever it is read, 1b is read. The written value should always be 1b.
20	DTRANEND1_MASK	1h	RW	DTRANEND1 interrupt masked
19 to 17	-	All 1	RW	Reserved The written value should always be 1b.
16	DTRANEND0_MASK	1h	RW	DTRANEND0 interrupt masked
15 to 1	-	All 1	R	Reserved Whenever it is read, 1b is read. The written value should always be 1b.
0	SEQEND_MASK	1h	RW	SEQEND interrupt masked

6.2.2.2.30 DMAC Interrupt Register 2 (SDm_DM_CM_INFO2)

The DMAC interrupt register 2 (DM_CM_INFO2) indicates the status of the DMAC of the module and the sequencer. To clear a flag, write 0b to the bit to be cleared and 1b to the other bits.

Access Size : 16, 32, 64 bits
Offset Address : <SDm_base> + 0850h
Initial Value : 0000_0000_0000_0000h

Bit	63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	DTRANERR1	DTRANERR0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	SEQERR
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
63 to 20	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
19, 18	-	All 0	R	Reserved The written value should always be 0b.
17	DTRANERR1	0h*1	RW	DMAC Channel 1 Error [Setting condition] When an error occurs on DMAC channel 1 [Clearing condition] When 0b is written to DTRANERR1
16	DTRANERR0	0h*2	RW	DMAC Channel 0 Error [Setting condition] When an error occurs on DMAC channel 0 [Clearing condition] When 0b is written to DTRANERR0
15 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
0	SEQERR	0h*3	RW	Sequencer error [Setting condition] When a sequencer error occurs [Clearing condition] When 0b is written to SEQERR

Note 1. The initial value is applied at a reset and when the DTRANRST1 bit in DM_CM_RST is 0b.

Note 2. The initial value is applied at a reset and when the DTRANRST0 bit in DM_CM_RST is 0b.

Note 3. The initial value is applied at a reset and when the SEQRST bit in DM_CM_RST is 0b.

6.2.2.2.31 DM_CM_INFO2 Interrupt Mask Register (SDm_DM_CM_INFO2_MASK)

The DM_CM_INFO2 interrupt mask register (DM_CM_INFO2_MASK) enables or disables the DM_CM_INFO2 interrupt. When 0b is set in DM_CM_INFO2_MASK while the corresponding flag in DM_CM_INFO2 is set, an interrupt occurs.

Access Size : 16, 32, 64 bits
Offset Address : <SDm_base> + 0858h
Initial Value : 0000_0000_FFFF_FFFFh

Bit	63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
63 to 32	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
31 to 20	-	All 1	R	Reserved Whenever it is read, 1b is read. The written value should always be 1b.
19, 18	-	All 1	R	Reserved The written value should always be 1b.
17	DTRANERR1_MASK	1h	RW	DTRANERR1 interrupt masked
16	DTRANERR0_MASK	1h	RW	DTRANERR0 interrupt masked
15 to 1	-	All 1	R	Reserved Whenever it is read, 1b is read. The written value should always be 1b.
0	SEQERR_MASK	1h	RW	SEQERR interrupt masked

6.2.2.2.32 DMAC Transfer Address Register (SDm_DM_DTRAN_ADDR)

The DMAC transfer address register (DM_DTRAN_ADDR) sets the transfer destination and source addresses for the DMAC of the module.

Higher-order 32 bits (bit 63 to 32) are read-only and read as 0b.

Access Size : 16, 32, 64 bits
Offset Address : <SDm_base> + 0880h
Initial Value : 0000_0000_0000_0000h

Bit	63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DADDR[28:13]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DADDR[12:0]													-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
63 to 32	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
31 to 3	DADDR[28:0]	0h	RW	Destination address/Source address (8 byte unit) Note that the value of DM_DTRAN_ADDR + transfer data length is less than or equal to 2^{32}.
2 to 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.

6.2.3 Operation

6.2.3.1 SD Interface

6.2.3.1.1 SD data format

When data is read from the SD card, the procedure is as follows.

1. The SD/MMC host interface receives data from the SD card via the SDDAT signal. (SDDAT signal: see **Figure 6.2-2**, **Figure 6.2-3** and **Figure 6.2-5**.)
2. The receive data is stored in SD_BUF of the SD/MMC host interface. (SD_BUF store data: see **Figure 6.2-7**)
3. The data stored in SD_BUF is read from SD_BUF0. (Reading from SD_BUF0: see **Table 6.2-4**)

When data is written to the SD card, the above procedure will be reversed.

When accessing SD_BUF0, caution should be taken for the transfer order in SDDAT and the store order in SD_BUF. In addition, data stored in SD_BUF0 can be replaced in bytes with the EXT_SWAP. (See **Figure 6.2-7**)

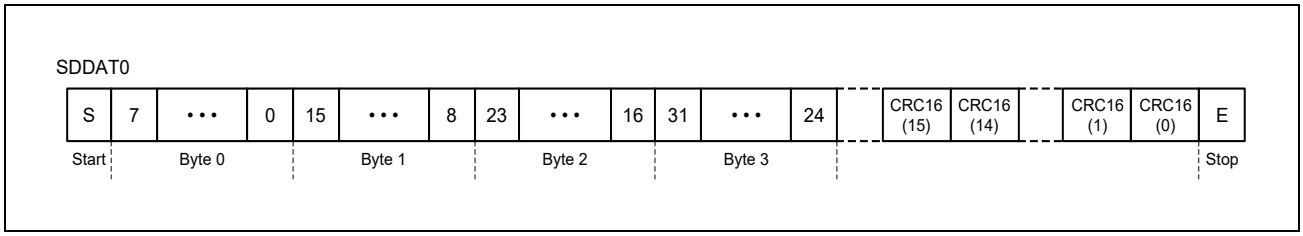

Figure 6.2-2 SDDAT in 1-Bit Width Mode

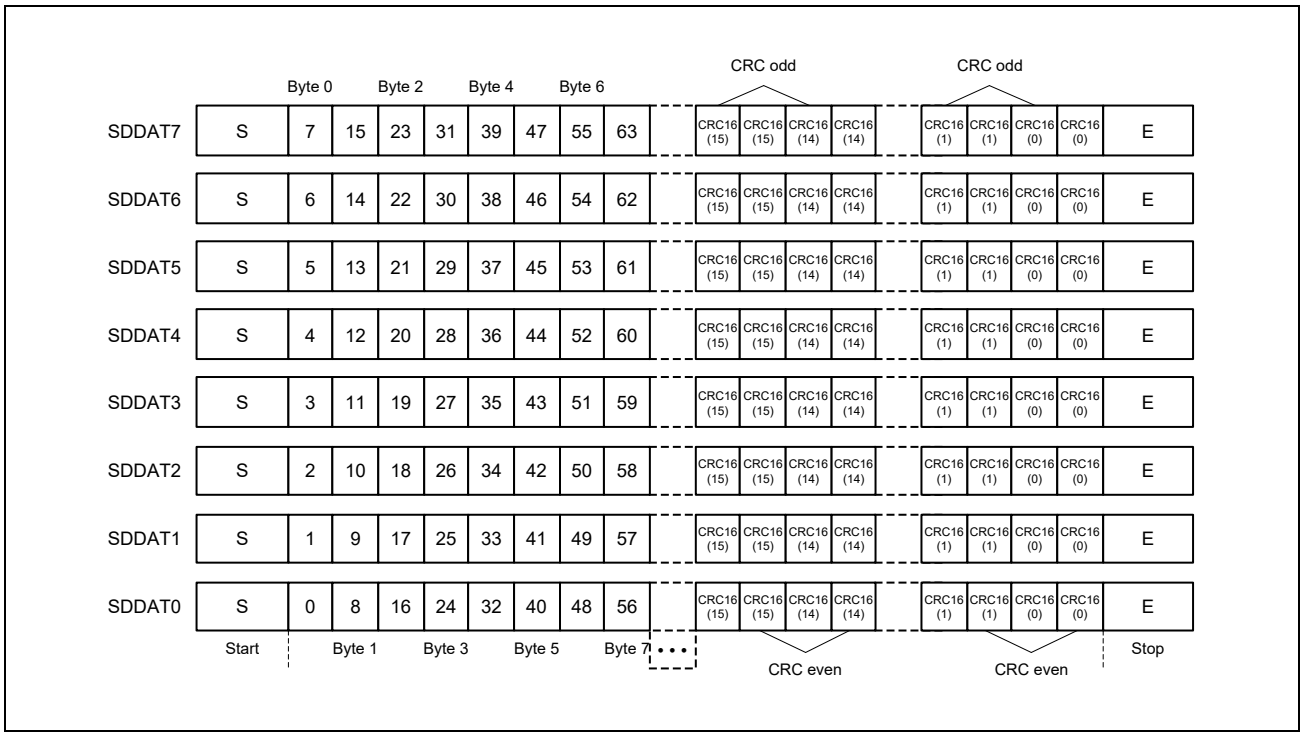

Figure 6.2-6 SDDAT in 8-Bit Width DDR Mode

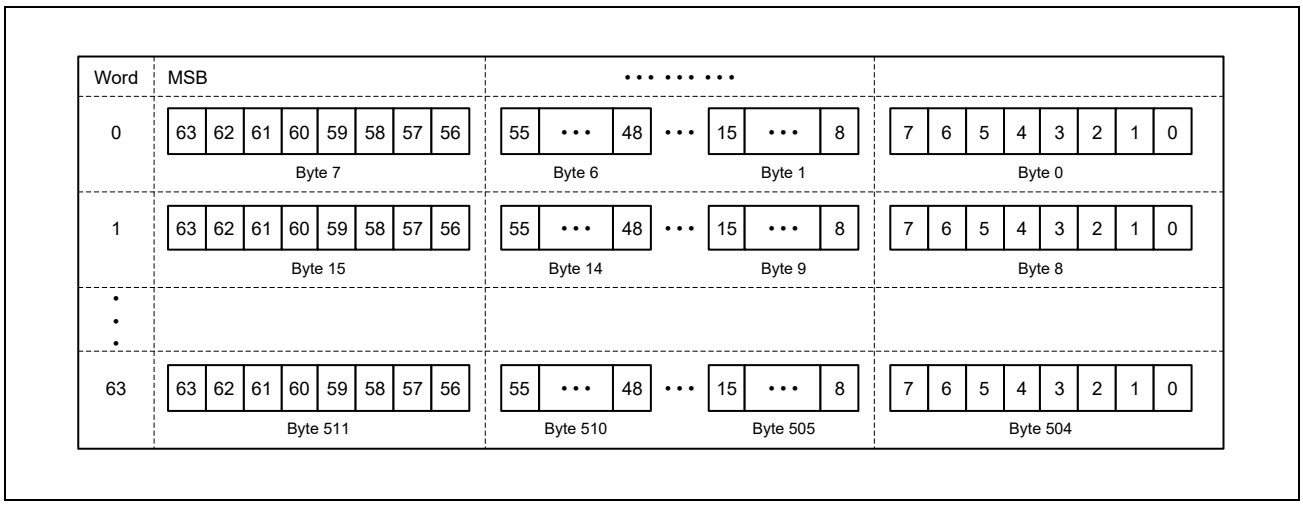

Figure 6.2-7 SD_BUF Store Data

Table 6.2-4 Reading from SD_BUF0

WMODE*1	BUSWIDTH*1	ENDIAN*1	Read Data*2
0	0	0	0123_4567_89AB_CDEFh
0	0	1	EFC_DAB8_9674_52301h
1	1	0	89AB_CDEFh (1st) 0123_4567h (2nd)
1	1	1	EFCD_AB89h (1st) 6745_2301h (2nd)
1	0	0	CDEFh (1st) 89ABh (2nd) 4567h (3rd) 0123h (4th)
1	0	1	EFCDh (1st) AB89h (2nd) 6745h (3rd) 2301h (4th)

Note 1. The name of a bit in HOST_MODE.

Note 2. When the data stored in SD_BUF is 0123_4567_89AB_CDEFh

6.2.3.1.2 Bus signal voltage switch

Change the electric potential of the bus signal in the following procedure after checking that the SD card supports 1.8 V.

1. Issuing CMD11
   Perform command sequence processing of CMD11.

2. Stopping the SD clock (a)
   Set the SCLKEN bit in the SD_CLK_CTRL to 0 to stop*1 the output of the SD clock. When the SDCLKOFFEN bit in the SD_CLK_CTRL register is 1, the SDCLKOFFEN bit is also set to 0b.

Note 1. When the SDCLKOFFEN bit in the SD_CLK_CTRL register is 1, the SD clock has automatically been stopped.

3. Checking the value of SDDAT
   Check that the DAT0 bit in the SD_INFO2 register is 0.

4. Changing the supply voltage of the host device
   Change the voltage which is supplied through the power supply pin of the given channel (VDD1833_SD0 for channel 0, VDD1833_SD1 for channel 1 or VDD1833_SD2 for channel 2) from 3.3 V to 1.8 V.

   For details, see the following sections:

   4.2.2.5 Port Function Control Registers (PFC_mn)
   6.2.2.2.24 SD Status Register (SDm_SD_STATUS)

5. Starting supply of the SD clock (b)
   After the SD clock has been stopped ((a) above) and 5 ms or more has elapsed, set the SCLKEN bit in the SD_CLK_CTRL register to 1 and allow the output of the SD clock. The SDCLKOFFEN bit must be 0.

6. Checking the value of SDDAT
   After supplying the SD clock has been started ((b) above) and 1 ms or more has elapsed, check that the DAT0 bit in the SD_INFO2 register is 1. It is possible to set the SDCLKOFFEN bit in the SD_CLK_CTRL register to 1 and allow SD Clock (SDCLK) Output Automatic Control Enable.

6.2.3.2 Card Detect/Write Protect

6.2.3.2.1 Card detect

The SD/MMC host interface has two types of card detect functions as described in the following.

(1) Card detect with ISDCD

Figure 6.2-8 shows the timing chart of card detect using ISDCD. ISDCD is connected to the card socket and pulled up on the host device. The resistance of the pull-up resistor is decided by the specification of the SD host device.

[Card insertion]

ISDCD is pulled down when a card is inserted. At this time, if ISDCD has been pulled down for the Mcycle period (set in SD_OPTION), INFO4 in SD_INFO1 is set to 1. (It is cleared to by writing 0.)

[Card removal]

ISDCD is pulled up when a card is removed. At this time, if ISDCD has been pulled up for the Mcycle period (set in SD_OPTION), INFO3 in SD_INFO1 is set to 1. (It is cleared to by writing 0.)

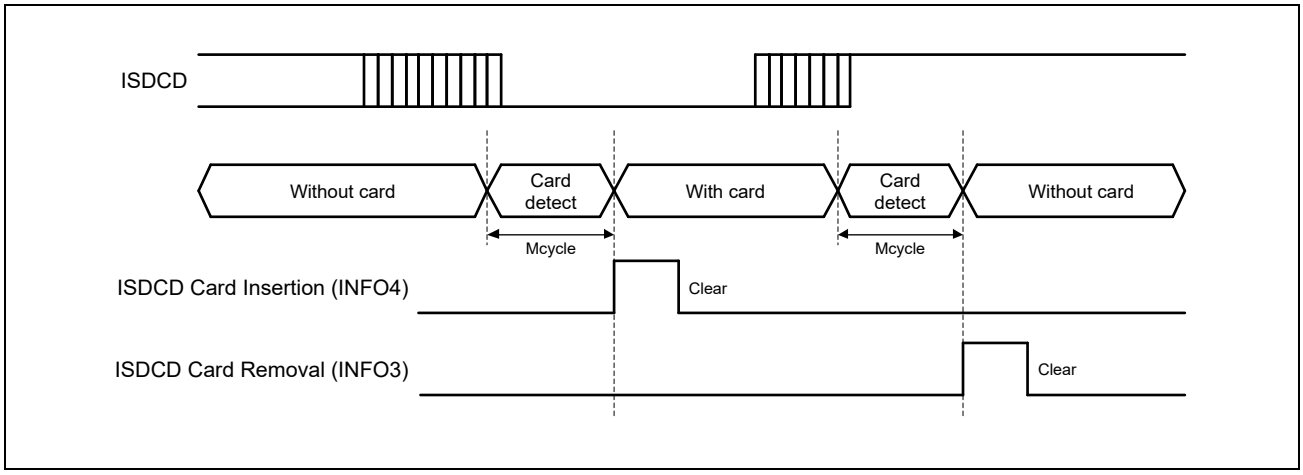

Figure 6.2-8 Example of Card Detect with ISDCD

(2) SD card detect with SDDAT3

Figure 6.2-9 shows the timing chart when the SD card is detected using SDDAT3. In addition, SDDAT3 is pulled down on the host device. The resistance of the pull-down resistor is decided by the specification of the SD host device.

[Card insertion]

When an SD card is inserted, SDDAT3 is pulled up. Accordingly, INFO9 in SD_INFO1 is set to 1. (It is cleared to by writing 0.)

[Card removal]

When an SD card is removed, SDDAT3 is pulled down. Accordingly, INFO8 in SD_INFO1 is set to 1. (It is cleared to by writing 0.)

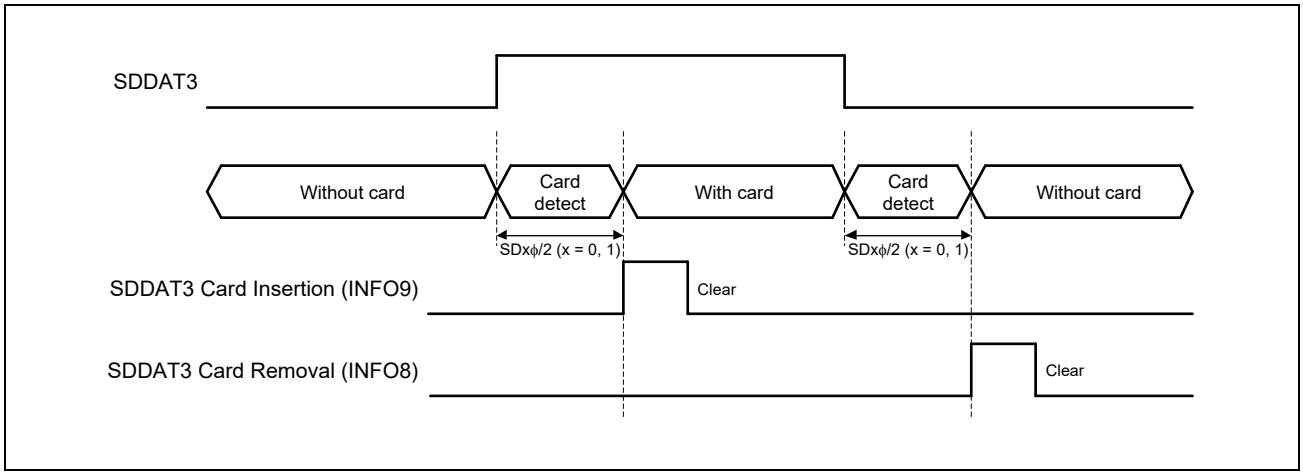

Figure 6.2-9 SD Card Detect with SDDAT3

6.2.3.2.2 Write protect

The SD/MMC host interface has two types of write protect functions.

(1) Write protect with ISDWP

ISDWP is connected to the card socket, and pulled up or pulled down by the card insertion. The selection of pulling up or pulling down and the resistance value is decided by the specifications of the SD host device. As the ISDWP state is reflected to INFO7 in SD_INFO1, the write protect is decided after the SD card is inserted.

(2) Write protect with command

The card's internal write protection and the card lock/unlock operation are realized by the command.

6.2.3.3 Interrupt Request

6.2.3.3.1 Interrupt request

The SD/MMC host interface has the interrupt requests shown in **Table 6.2-5** shows the relationship between the interrupt flag registers and the interrupt mask registers. When a bit in an interrupt mask register is set to 0, an interrupt occurs by setting the corresponding bit in the interrupt flag register to 1.

To clear a flag, write 0b to the bit to be cleared and 1b to the other bits.

Table 6.2-5 Interrupt Request

Interrupt Request	Interrupt Flag Register		Interrupt Mask Register	
	Register Name	Bit Name	Register Name	Bit Name
Card access interrupt*1	SD_INFO1	INFO2	SD_INFO1_MASK	IMASK2
		INFO0		IMASK0
	SD_INFO2	ILA	SD_INFO2_MASK	IMASK
		BWE		BMASK1
		BRE		BMASK0
		ERR6		EMASK6
		ERR5		EMASK5
		ERR4		EMASK4
		ERR3		EMASK3
		ERR2		EMASK2
		ERR1		EMASK1
		ERR0		EMASK0
SDIO access interrupt*2	SDIO_INFO1	EXWT	SDIO_INFO1_MASK	MEXWT
		EXPUB52		MEXPUB52
		IOIRQ		IOMSK
Card detect interrupt*1	SD_INFO1	INFO9	SD_INFO1_MASK	IMASK9
		INFO8		IMASK8
		INFO4		IMASK4
		INFO3		IMASK3
DMAC interrupt*1	DM_CM_INFO1	DTRANEND1	DM_CM_INFO1_MASK	DTRANEND1_MASK
		DTRANEND0		DTRANEND0_MASK
		SEQEND		SEQEND_MASK
	DM_CM_INFO2	DTRANERR1	DM_CM_INFO2_MASK	DTARERR1_MASK
		DTRANERR0		DTARERR0_MASK
		SEQERR		SEQERR_MASK

Note 1. Interrupt signal “OXMNIRQ” is asserted.

Note 2. Interrupt signal both “OXMNIRQ” and “OXASIOIRQ” are asserted.

6.2.3.4 Communications Errors and Timeouts

1) Communications errors and timeouts

Table 6.2-6 and **Table 6.2-7** show the relationships between the SD card interrupt flag register and SD error status register for communications errors and timeouts, respectively. When a bit in the SD card interrupt flag register is set to 1, the corresponding bit in the SD error status register is set to 1. The values of the SD error status register are cleared by writing to SD_CMD or writing 0 to the SDRST bit in SOFT_RST.

Table 6.2-6 Communications Errors

Communication Error	SD Interrupt Flag Register		SD Error Status Register		Description
	Register Name	Bit Name	Register Name	Bit Name	
END error	SD_INFO2	ERR2	SD_ERR_STS1	E5	When an error occurs in the CRC status length
				E4	When an error occurs in read data length
				E3	When an error occurs in the response length to a command issued within a command sequence
				E2	When an error occurs in the response length (other than a response to a command issued within a command sequence)
CRC error		ERR1		E11	When an error occurs in the CRC status
				E10	When a CRC error occurs in the read data
				E9	When a CRC error occurs in the response to a command issued within a command sequence
				E8	When a CRC error occurs in the response (other than a response to a command issued within a command sequence)
CMD error		ERR0		E1	The command index of the transmitted command differed from the command index of the received response (for a command issued within a command sequence)
				E0	The command index of the transmitted command differed from the command index of the received response (for a command issued other than within a command sequence)

Table 6.2-7 Timeouts

Timeout	SD Interrupt Flag Register		SD Error Status Register		Description
	Register Name	Bit Name	Register Name	Bit Name	
Response timeout	SD_INFO2	ERR6	SD_ERR_STS2	E1	When the response to a command issued within a command sequence is not received even after 640 cycles of SDCLK have elapsed
				E0	When the response (other than a response to a command issued within a command sequence) is not received even after 640 cycles of SDCLK have elapsed
Data timeout (other than response timeout)		ERR3		E6	When the interface remains in a busy state (SDDAT0 = 0) for at least Ncycle*1 after the CRC status
				E5	When the CRC status is not received even after Ncycle*1 has elapsed after data writing
				E4	When read data are not received even after Ncycle*1 has elapsed after read command
					When read data for the next block are not received even after Ncycle*1 has elapsed after the reception of read data
					When read data for the next block are not received even after Ncycle*1 has elapsed after release of the read wait state
				E3	When the interface remains in a busy state (SDDAT0 = 0) for at least Ncycle*1 after CMD12 has been issued within a command sequence
				E2	When the interface remains in a busy state (SDDAT0 = 0) for at least Ncycle*1 after R1b response

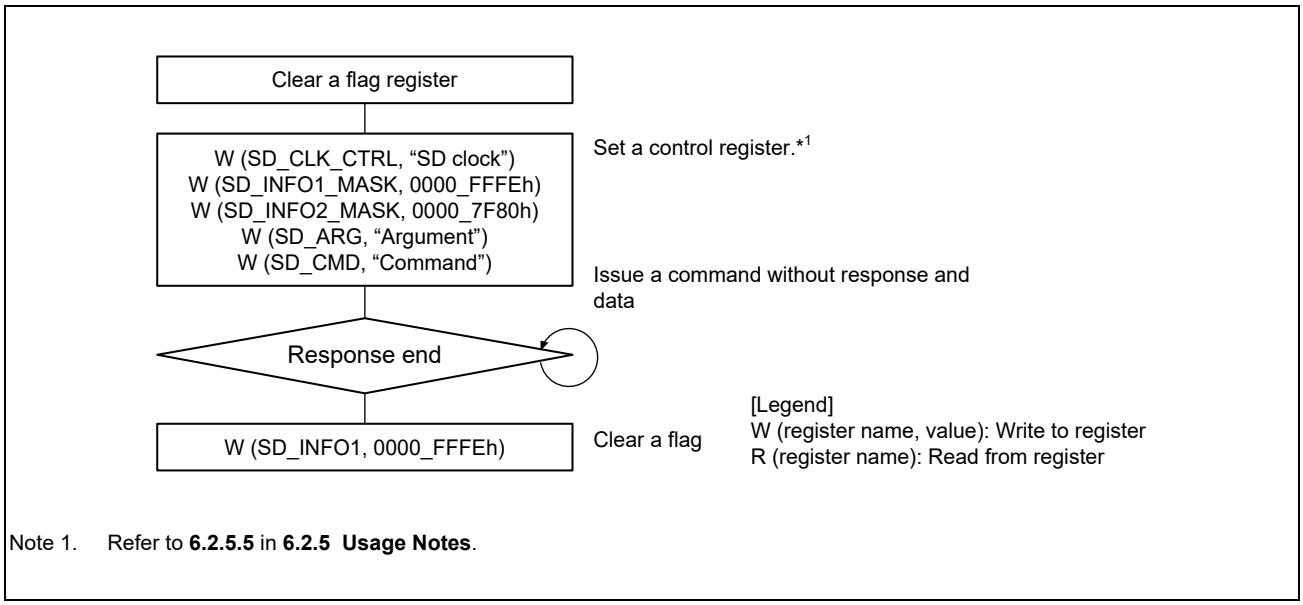
Note 1. Ncycle is set by bit 7 to bit 4 in SD_OPTION.

6.2.4 Usage Example

6.2.4.1 Command without Data Transfer

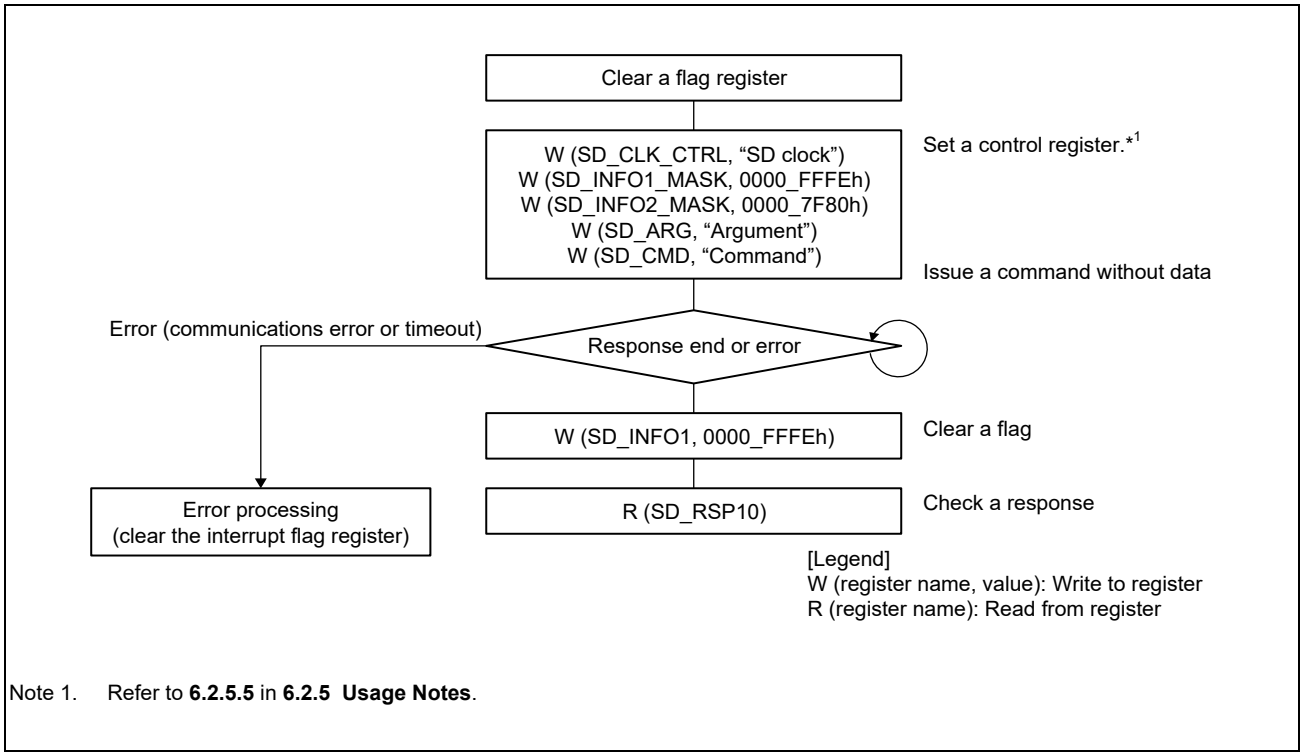
6.2.4.1.1 Flowchart

Figure 6.2-10 and **Figure 6.2-11** show flowchart examples.



Note 1. Refer to **6.2.5.5** in **6.2.5 Usage Notes**.

Figure 6.2-10 Flow Example of Command without Response and Data



Note 1. Refer to **6.2.5.5** in **6.2.5 Usage Notes**.

Figure 6.2-11 Flow Example of Command without Data

6.2.4.1.2 Operation for command without data transfer

The legend below is used for description of register read/write.

— W (register name, value): Write to register

— R (register name): Read from register

The operation is described as below.

(1) Command without response and data

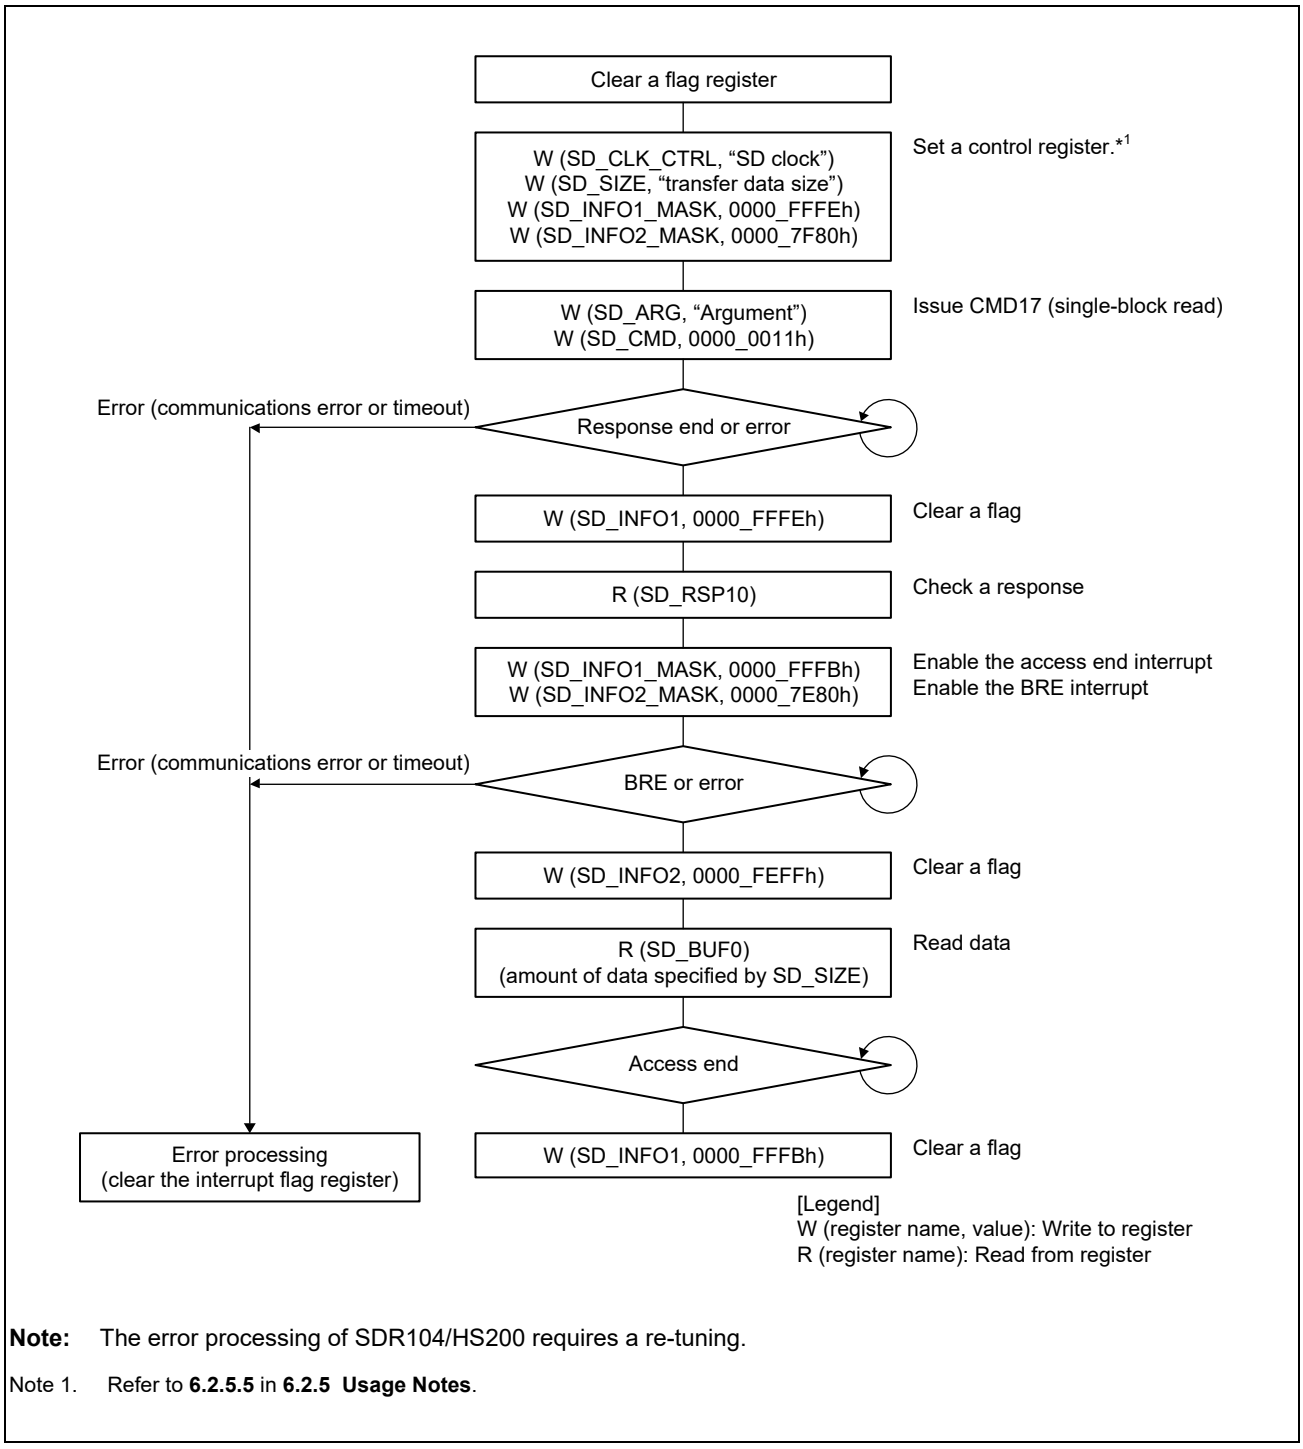
1. Flag register clear
   First, clear the bits in the flag registers. (SD_INFO1 and SD_INFO2)
2. Control register set
   Set the SD clock (SDCLK), interrupt mask, and so on. (SD_CLK_CTRL, SD_INFO1_MASK, and SD_INFO2_MASK)
3. Command issue
   Set CMD Argument in SD_ARG and write to SD_CMD.
   Accordingly, CMD is issued, and the operation is started.
4. Flag clear
   When transmission of a command is completed, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0.

(2) Command without data

1. Flag register clear
   First, clear the bits in the flag registers. (SD_INFO1 and SD_INFO2)
2. Control register set
   Set the SD clock (SDCLK), interrupt mask, and so on. (SD_CLK_CTRL, SD_INFO1_MASK, and SD_INFO2_MASK)
3. Command issue
   Set CMD Argument in SD_ARG and write to SD_CMD.
   Accordingly, CMD is issued, and the operation is started.
4. Flag clear
   When a response is received, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0.
5. Read a response from SD_RSP10.
   Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

6.2.4.2 Single Block Read

6.2.4.2.1 Flowchart



Note: The error processing of SDR104/HS200 requires a re-tuning.

Note 1. Refer to **6.2.5.5** in **6.2.5 Usage Notes**.

Figure 6.2-12 Single Block Read Flowchart Example

6.2.4.2.2 Operation for single block read

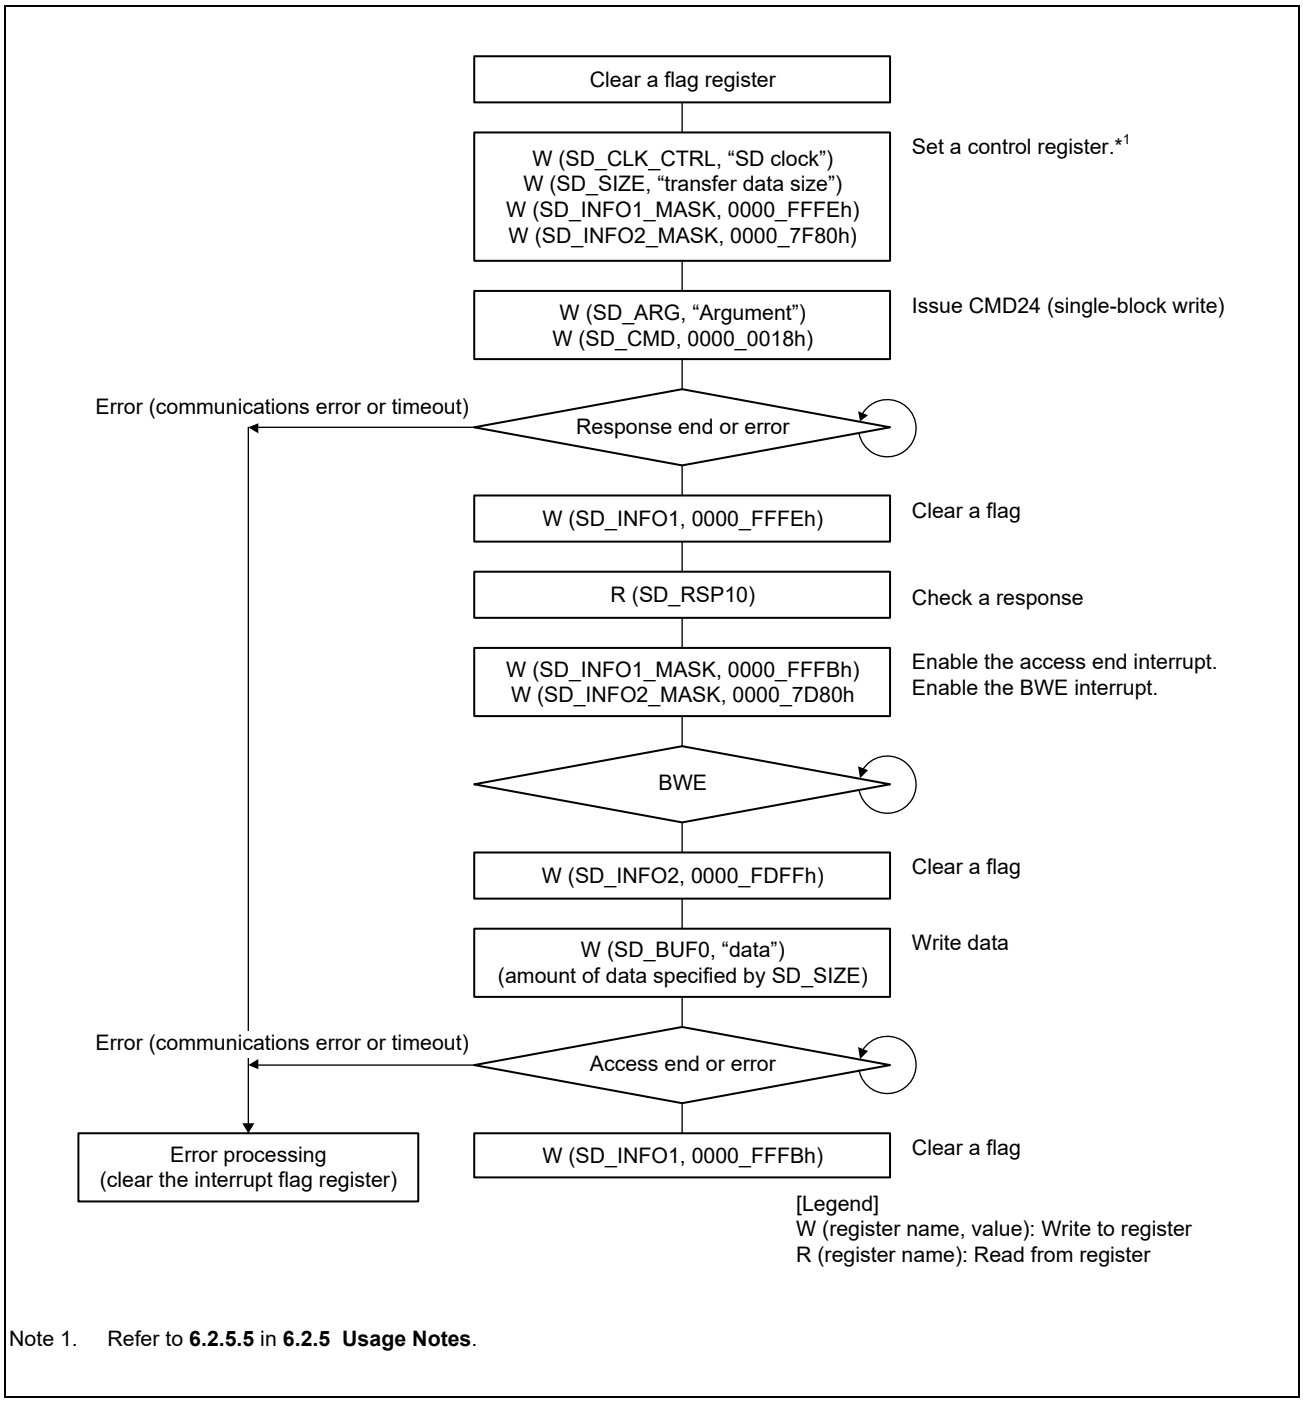
The operation of single block read is described below.

1. Flag register clear
   First, clear the bits in the flag registers. (SD_INFO1 and SD_INFO2)
2. Control register set
   Set the SD clock (SDCLK), transfer data size, interrupt mask, and so on. (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK)
3. Command issue (CMD17)
   Set CMD17 Argument in SD_ARG and write 0000_0011h to SD_CMD.
   Accordingly, CMD17 is issued, and the single block read operation is started.
4. Response check
   On receiving the response, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0 and read the response from SD_RSP10.
   If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STP or the IOABT bit in SDIO_MODE to 1. Furthermore, this causes CMD12 and CMD52 to not be issued.
   If the command sequence is halted, the INFO2 bit (access end) in SD_INFO1 is set to 1 to generate an interrupt.
5. Data receive from SD card and data read
   Write 0000_FFFBh to SD_INFO1_MASK to enable the access end interrupt. In addition, write 0000_7E80h to SD_INFO2_MASK to enable the BRE interrupt. When the data receive from the SD card is completed, the BRE bit in SD_INFO2 is set to 1 to generate an interrupt. Clear the BRE bit to 0 and read the amount of data specified by SD_SIZE from SD_BUF0.
   However, a communications error or timeout may be generated if data are being received while reading of SD_BUF0 is in progress.
6. Operation complete
   When the data read from SD_BUF0 is completed, INFO2 (access end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO2 to 0 to end the single block read operation.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

6.2.4.3 Single Block Write

6.2.4.3.1 Flowchart



Note 1. Refer to **6.2.5.5** in **6.2.5 Usage Notes**.

Figure 6.2-13 Single Block Write Flowchart Example

6.2.4.3.2 Operation for single block write

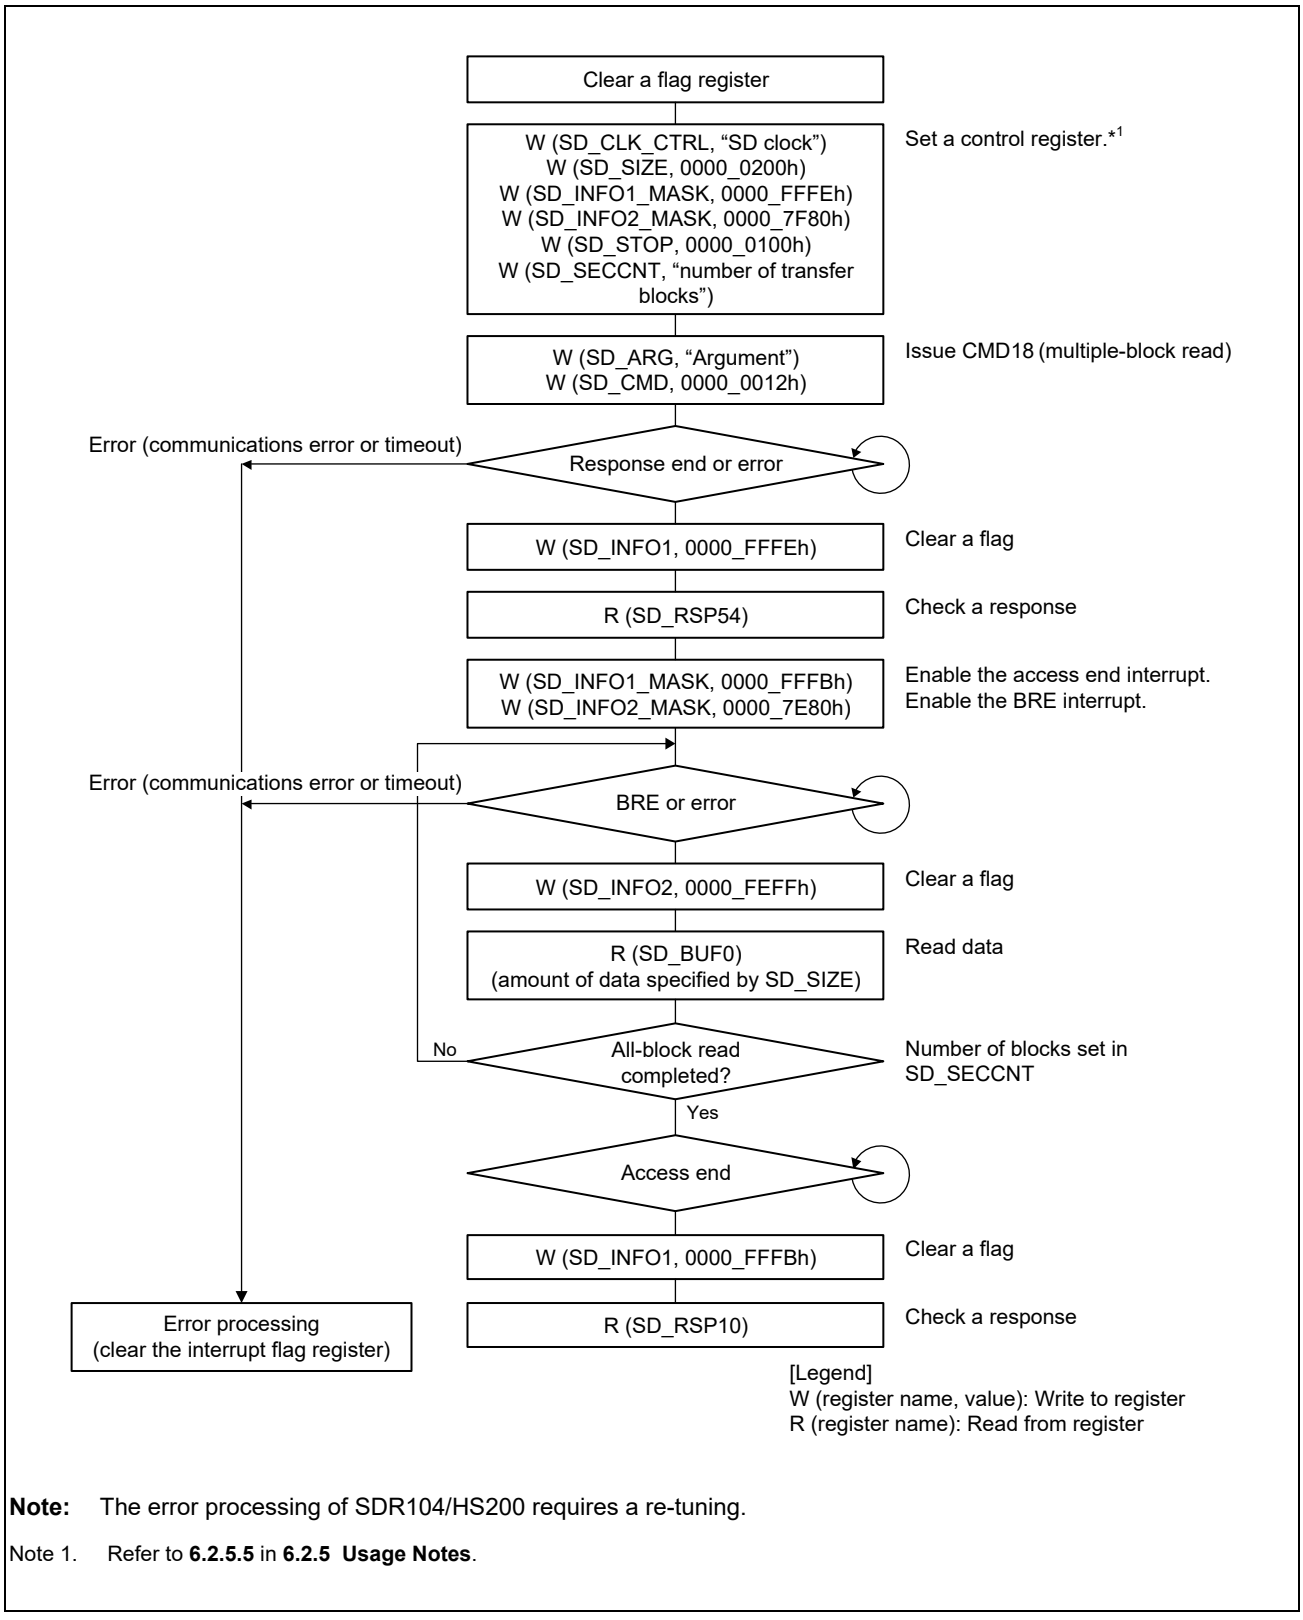
The operation of single block write is described below.

1. Flag register clear
   First, clear the bits in the flag registers. (SD_INFO1 and SD_INFO2)
2. Control register set
   Set the SD clock (SDCLK), transfer data size, interrupt mask, and so on. (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK)
3. Command issue (CMD24)
   Set CMD24 Argument in SD_ARG and write 0000_0018h to SD_CMD.
   Accordingly, CMD24 is issued, and the single block write operation is started.
4. Response check
   On receiving the response, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0 and read the response from SD_RSP10.
   If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STP or the IOABT bit in SDIO_MODE to 1. Furthermore, this causes CMD12 and CMD52 to not be issued.
   If the command sequence is halted, the INFO2 bit (access end) in SD_INFO1 is set to 1 to generate an interrupt.
5. Data write and data transmit to SD card
   Write 0000_FFFBh to SD_INFO1_MASK to enable the access end interrupt. In addition, write 0000_7D80h to SD_INFO2_MASK to enable the BWE interrupt. When SD_BUF0 is ready for the data to be written, the BWE bit in SD_INFO2 is set to 1 to generate an interrupt. Clear the BWE bit to 0 and write the amount of data specified by SD_SIZE to SD_BUF0. When the data write to SD_BUF0 is completed, data is transmitted to the SD card. Then, the CRC status and busy state are received from the SD card.
   However, a communications error or timeout may be generated if data are being transmitted after writing to SD_BUF0.
6. Operation complete
   When the CRC status and busy state are received from the SD card, INFO2 (access end) in SD_INFO1 is set to 1 to generate an interrupt. Clear the INFO2 bit to 0 to end the single block write operation.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

6.2.4.4 Multiple Block Read

6.2.4.4.1 Flowchart



Note: The error processing of SDR104/HS200 requires a re-tuning.

Note 1. Refer to **6.2.5.5** in **6.2.5 Usage Notes**.

Figure 6.2-14 Multiple Block Read Flowchart Example

6.2.4.4.2 Operation for multiple block read

The operation of multiple block read is described below.

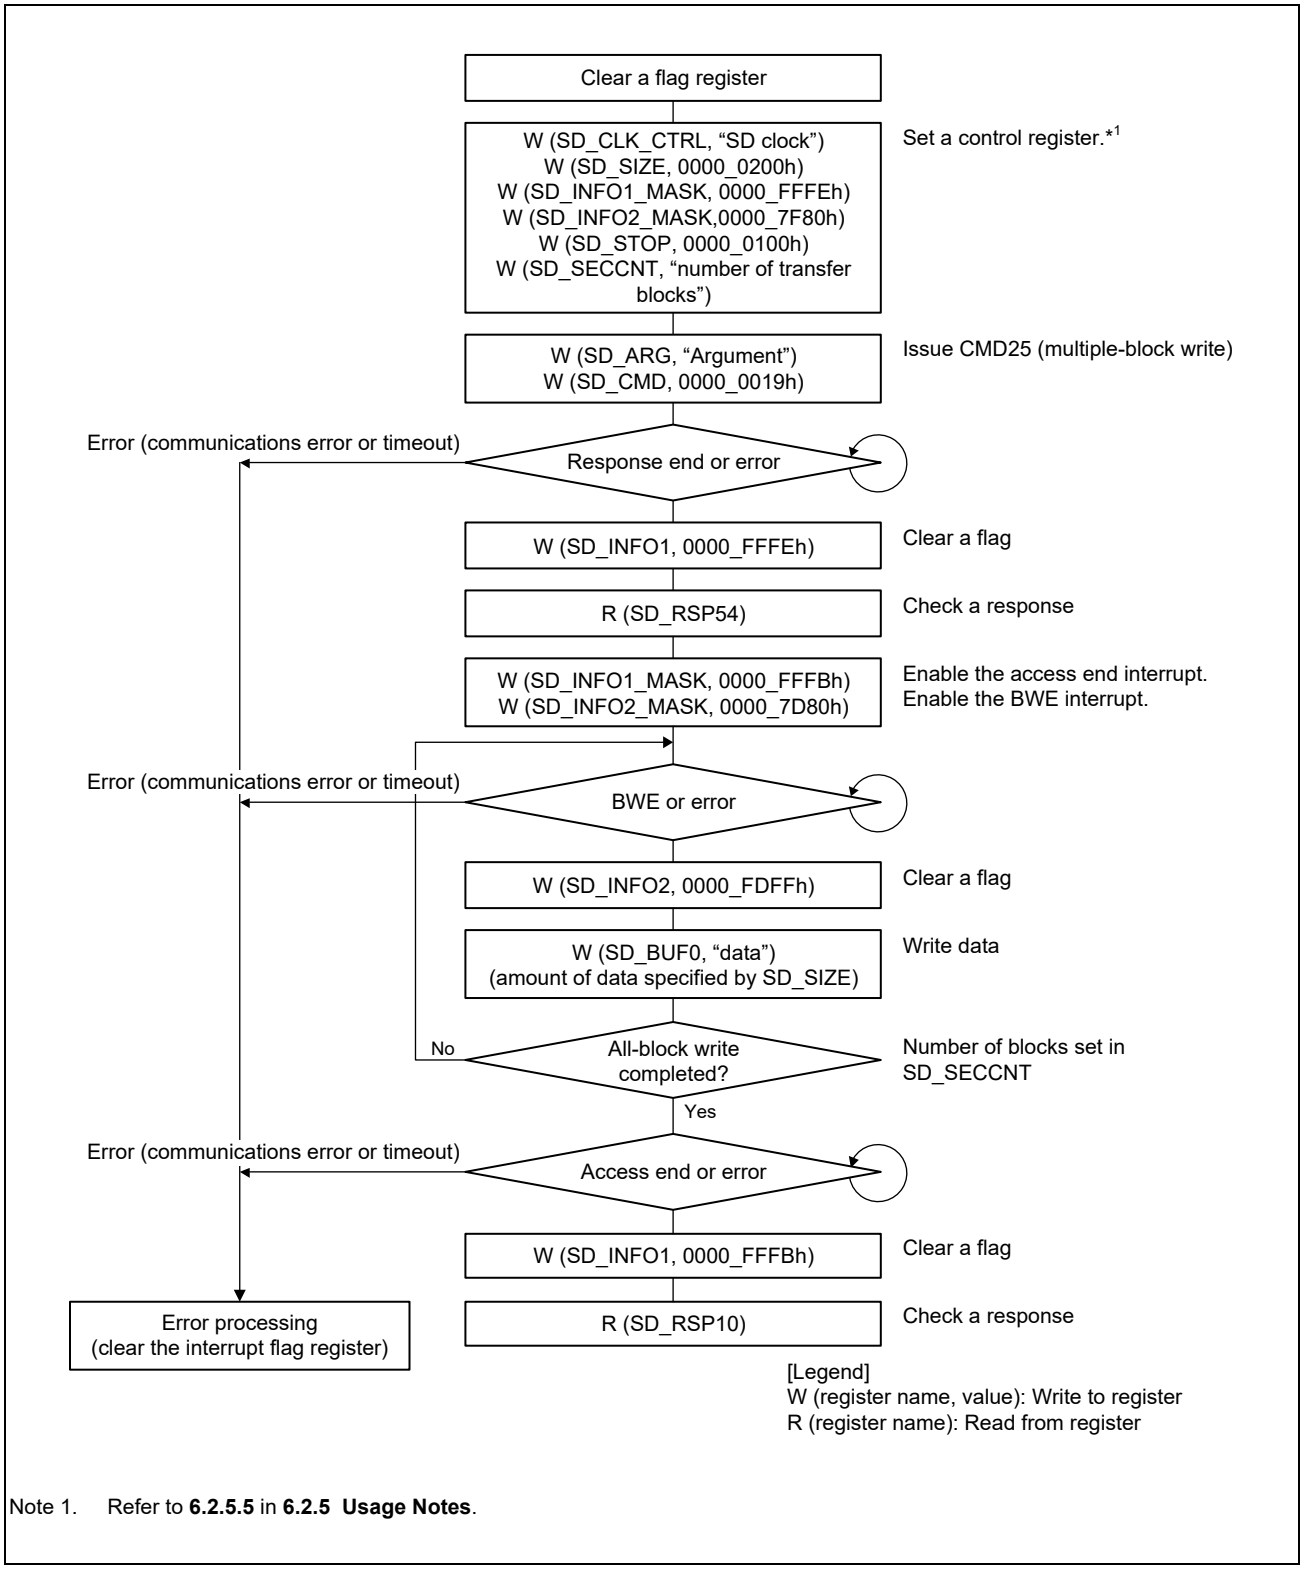
1. Flag register clear
   First, clear the bits in the flag registers. (SD_INFO1 and SD_INFO2)
2. Control register set
   Set the SD clock (SDCLK), transfer data size, interrupt mask, and so on. (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK)
   Set the SEC bit in SD_STOP to 1, and set the number of transfer blocks in SD_SECCNT.
3. Command issue (CMD18)
   Set CMD18 Argument in SD_ARG and write 0000_0012h to SD_CMD.
   Accordingly, CMD18 is issued, and the multiple block read operation is started.
4. Response check
   On receiving the response, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0 and read the response from SD_RSP54.
   If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STP to 1. Setting the STP bit to 1 also causes CMD12 to be issued and the response received. If the command sequence is halted because the access end interrupt has been enabled, an interrupt will be generated by setting the INFO2 bit (access end) in SD_INFO1 to 1 when reception of the response has been completed. Clear the INFO2 bit to 0 and read the response.
5. Data receive from SD card and data read
   Write 0000_FFFBh to SD_INFO1_MASK to enable the access end interrupt. In addition, write 0000_7E80h to SD_INFO2_MASK to enable the BRE interrupt. When one-block data receive from the SD card is completed, the BRE bit in SD_INFO2 is set to 1 to generate an interrupt. Clear the BRE bit to 0 and read the amount of data specified by SD_SIZE from SD_BUF0. Doing this repeats transfer of the number of blocks set in SD_SECCNT. However, a communications error or timeout may be generated if data are being received while reading of SD_BUF0 is in progress. CMD12 is automatically issued to stop multi-block transfer with the number of blocks which is set to SD_SECCNT and the response is received. At this point, CMD12 Argument is automatically set to 000_0000h.
6. Operation complete
   When all-block data read and the CMD12 response receive are completed, INFO2 (access end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO2 to 0 to read the response. This is the end of multiple block read operation.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

6.2.4.5 Multiple Block Write (when Using Internal Timer)

6.2.4.5.1 Flowchart

Figure 6.2-15 shows the flowchart when using an internal timer.



Note 1. Refer to **6.2.5.5** in **6.2.5 Usage Notes**.

Figure 6.2-15 Multiple Block Write Flowchart Example (when Using Internal Timer)

6.2.4.5.2 Operation for multiple block write

The operation of multiple block write is described below.

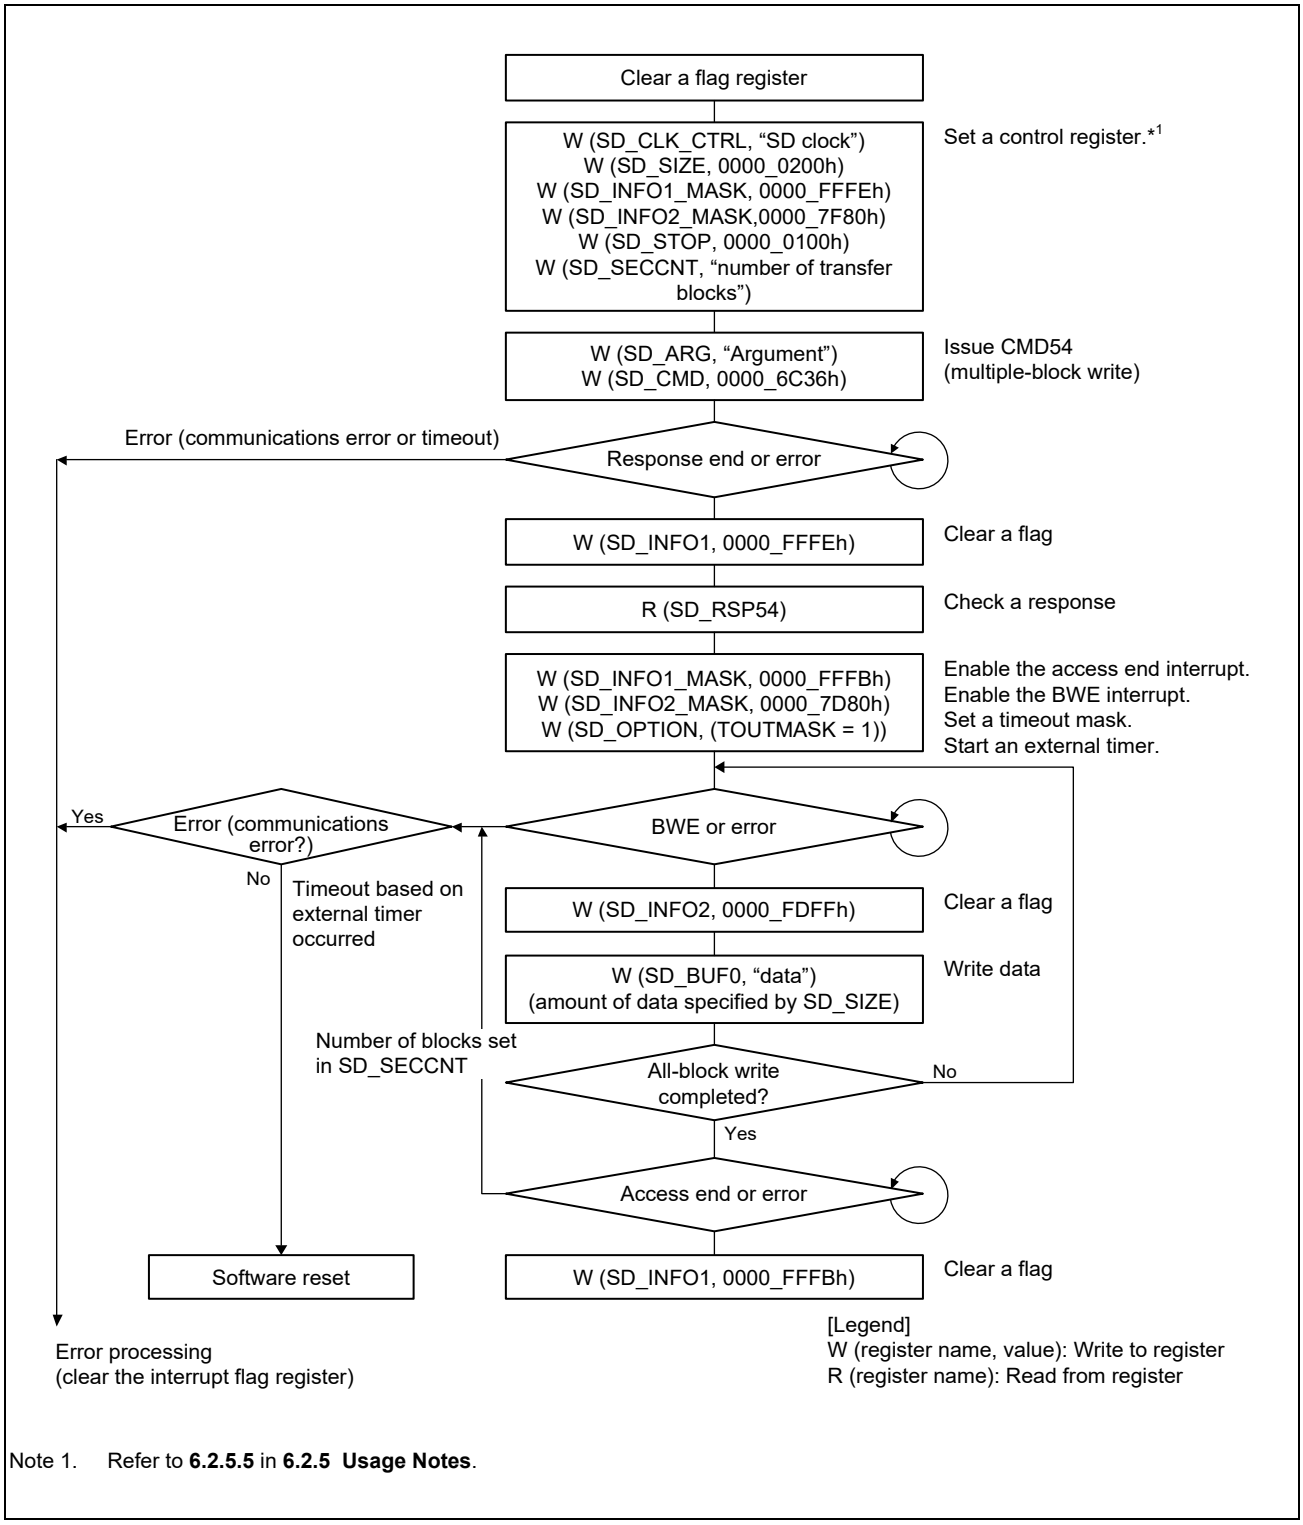
1. Flag register clear
   First, clear the bits in the flag registers. (SD_INFO1 and SD_INFO2)
2. Control register set
   Set the SD clock (SDCLK), transfer data size, interrupt mask, and so on. (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK)
   Set the SEC bit in SD_STOP to 1, and set the number of transfer blocks in SD_SECCNT.
3. Command issue (CMD25)
   Set CMD25 Argument in SD_ARG and write 0000_0019h to SD_CMD.
   Accordingly, CMD25 is issued, and the multiple block write operation is started.
4. Response check
   On receiving the response, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0 and read the response from SD_RSP54.
   If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STP to 1. Setting the STP bit to 1 also causes CMD12 to be issued and the response received. If the command sequence is halted because the access end interrupt has been enabled, an interrupt will be generated by setting the INFO2 bit (access end) in SD_INFO1 to 1 when reception of the response has been completed. Clear the INFO2 bit to 0 and read the response.
5. Data write and data transmit to SD card
   Write 0000_FFFBh to SD_INFO1_MASK to enable the access end interrupt. In addition, write 0000_7D80h to SD_INFO2_MASK to enable the BWE interrupt. When SD_BUF0 is ready for the data to be written, the BWE bit in SD_INFO2 is set to 1 to generate an interrupt. Clear the BWE bit to 0 and write the amount of data specified by SD_SIZE to SD_BUF0. When the data write to SD_BUF0 is completed, data is transmitted to the SD card. Then, the CRC status and busy state are received from the SD card. Doing this repeats transfer of the number of blocks set in SD_SECCNT.
   However, a communications error or timeout may be generated if data are being transmitted while writing to SD_BUF0 is in progress. CMD12 is automatically issued to stop multi-block transfer with the number of blocks which is set to SD_SECCNT and the response is received. At this point, CMD12 Argument is automatically set to 0000_0000h.
6. Operation complete
   When all-block data transmit and the CRC status receive are completed, the INFO2 bit (access end) in SD_INFO1 is set to 1 to generate an interrupt. Clear the INFO2 bit to 0 to read the response. This is the end of multiple block write operation.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

6.2.4.6 Multiple Block Write (when Using External Timer)

6.2.4.6.1 Flowchart

The flowchart when using an external timer instead of an internal timer of this module is shown below.



Note 1. Refer to **6.2.5.5** in **6.2.5 Usage Notes**.

Figure 6.2-16 Multiple Block Write Flowchart Example (when Using External Timer)

6.2.4.6.2 Operation for multiple block write

The operation of multiple block write is described below.

1. Flag register clear
   First, clear the bits in the flag registers. (SD_INFO1 and SD_INFO2)
2. Control register set
   Set the SD clock (SDCLK), transfer data size, interrupt mask, and so on. (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK)
   Set the SEC bit in SD_STOP to 1, and set the number of transfer blocks in SD_SECCNT.
3. Command issue (CMD54)
   Set CMD54 Argument in SD_ARG and write 0000_6C36h to SD_CMD.
   Accordingly, CMD54 is issued, and the multiple block write operation is started.
4. Response check
   On receiving the response, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0 and read the response from SD_RSP54.
   If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STP to 1. Setting the STP bit to 1 also causes CMD12 to be issued and the response received. If the command sequence is halted because the access end interrupt has been enabled, an interrupt will be generated by setting the INFO2 bit (access end) in SD_INFO1 to 1 when reception of the response has been completed. Clear the INFO2 bit to 0 and read the response.
5. Data write and data transmit to SD card
   Write 0000_FFFBh to SD_INFO1_MASK to enable the access end interrupt. In addition, write 0000_7D80h to SD_INFO2_MASK to enable the BWE interrupt. Set the TOUTMASK bit in SD_OPTION to disable timeout and start an external timer.
   When SD_BUF0 is ready for the data to be written, the BWE bit in the SD_INFO2 register is set to 1 to generate an interrupt. Clear the BWE bit to 0 and write the amount of data specified by SD_SIZE to SD_BUF0. When the data write to SD_BUF0 is completed, data is transmitted to the SD card. Then, the CRC status and busy state are received from the SD card. Doing this repeats transfer of the number of blocks set in SD_SECCNT. However, a communications error may be generated if data are being transmitted while writing to SD_BUF0 is in progress.
6. Operation complete
   When all-block data transmit and the CRC status receive are completed, the INFO2 bit (access end) in SD_INFO1 is set to 1 to generate an interrupt. Clear the INFO2 bit to 0 to read the response. This is the end of multiple block write operation.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs at response reception (a communications error or timeout) or at data transmission. Perform a software reset if a timeout occurs at data transmission based on an external timer.

6.2.4.7 IO_RW_DIRECT Command (CMD52)

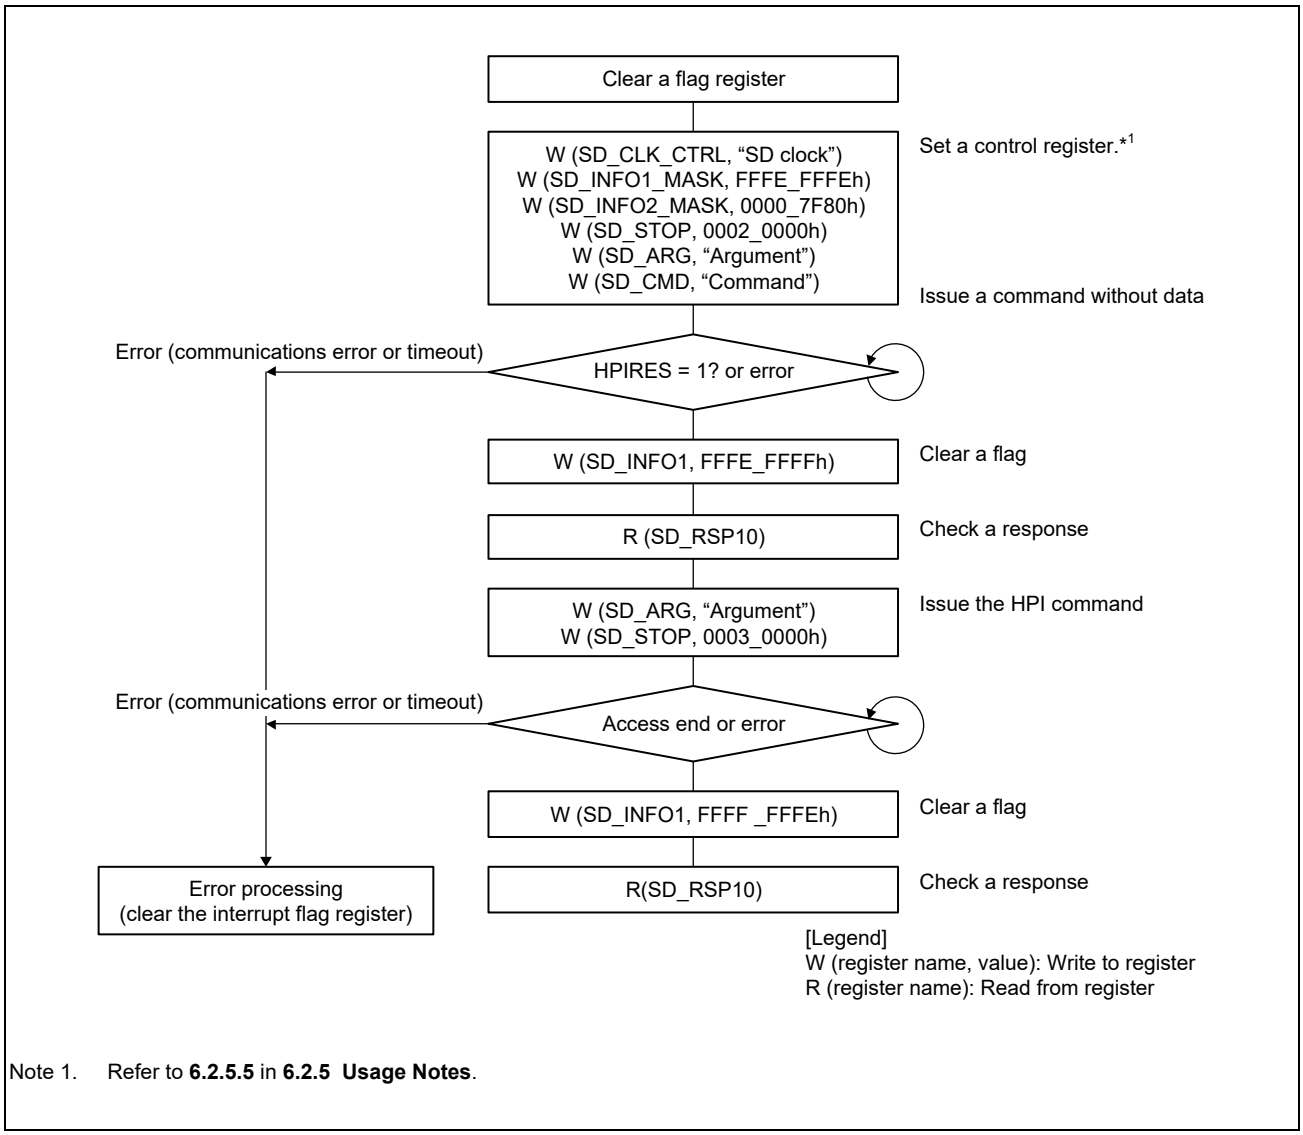
6.2.4.11 High-Priority Interrupt (without Data Transfer)

6.2.4.11.1 Flowchart



Note 1. Refer to **6.2.5.5** in **6.2.5 Usage Notes**.

Figure 6.2-26 Example of the High-Priority Interrupt (without Data Transfer) Flowchart

6.2.4.11.2 Operation for high-priority interrupt without data transfer

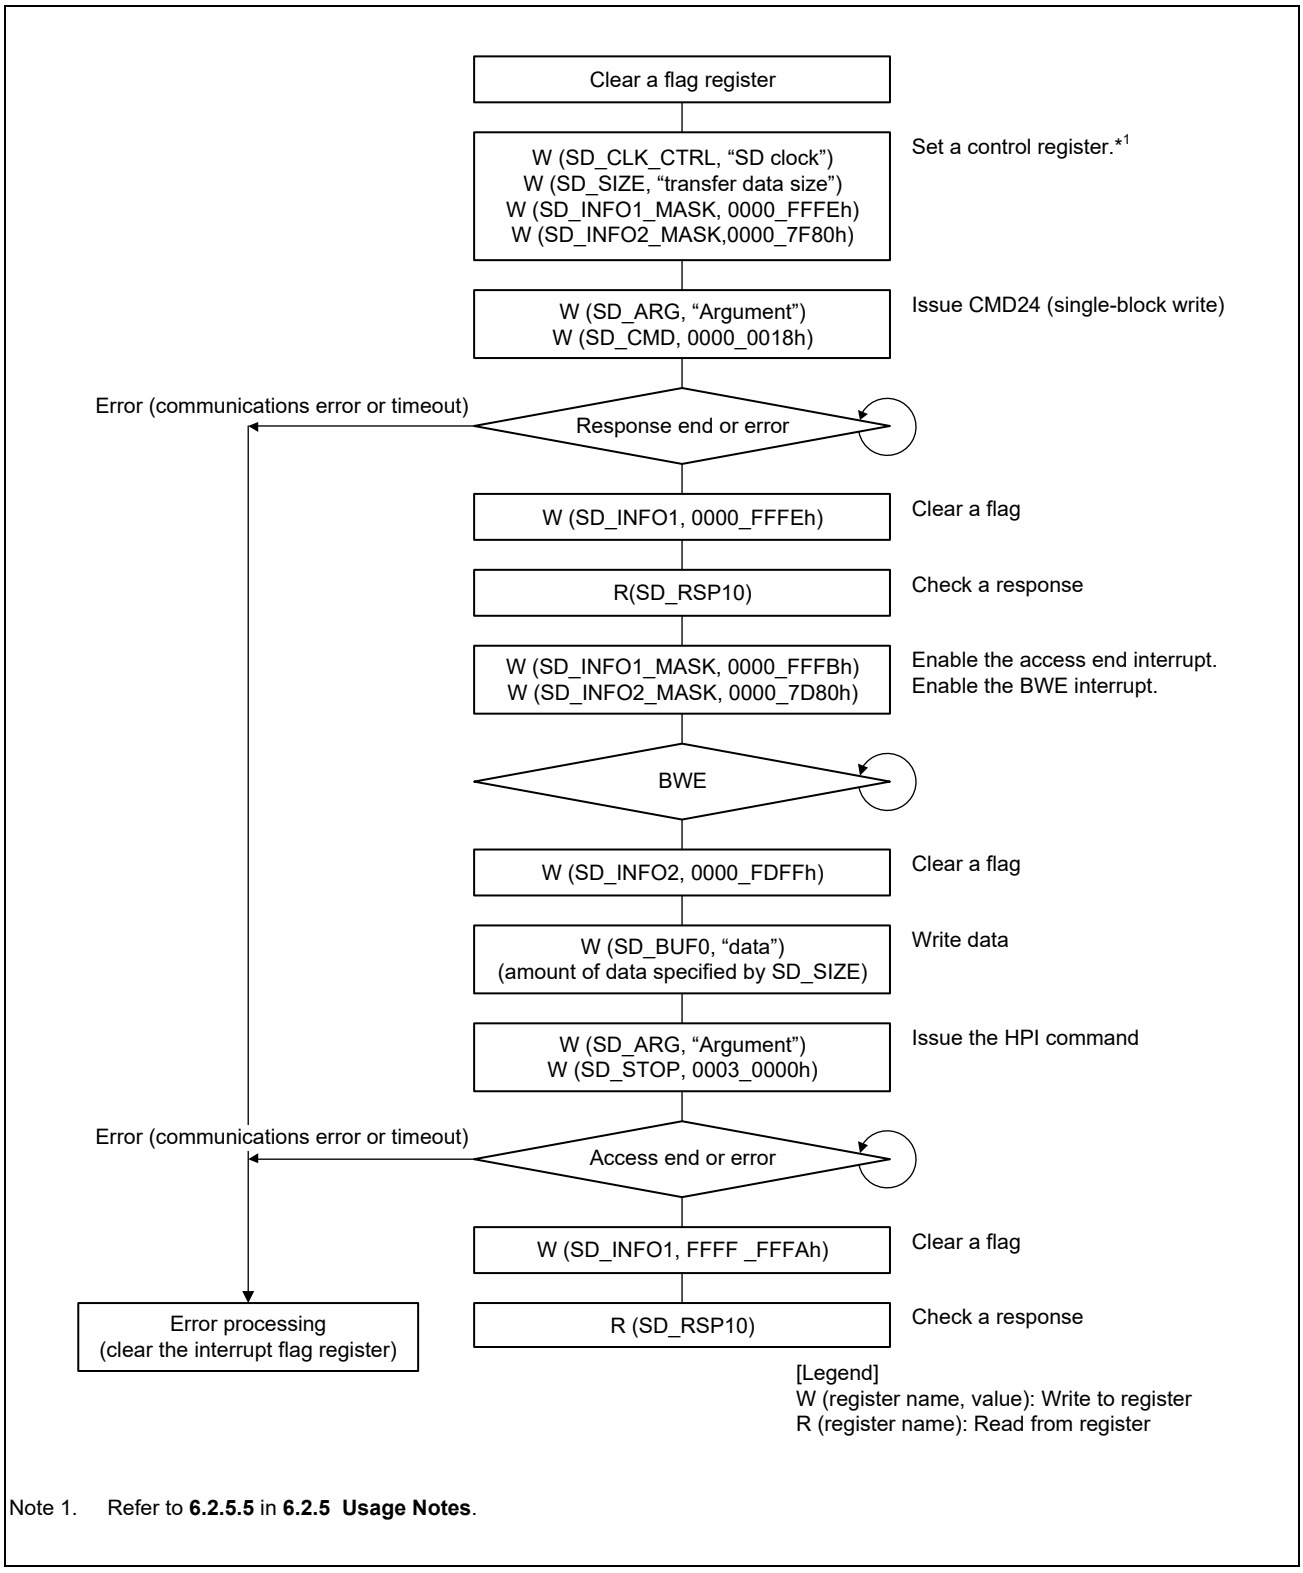
The operation of the high-priority interrupt (HPI) without data transfer is described below.

1. Flag register clear
   First, clear the bits in the flag registers. (SD_INFO1 and SD_INFO2)
2. Control register set
   Set the SD clock (SDCLK), HPI enable, interrupt mask, and so on. (SD_CLK_CTRL, SD_INFO1_MASK, and SD_INFO2_MASK)
3. Command issue
   Set the CMD Argument in SD_ARG and write to SD_CMD.
   Accordingly, CMD is issued, and the operation is started.
4. Flag clear
   On receiving the response, the HPIRES bit in SD_INFO1 is set to 1 to generate an interrupt. Clear the HPIRES bit to 0.
5. Read the response from SD_RSP10.
6. HPI command issue
   Set the HPI command argument in SD_ARG and set the HPIMODE and HPICMD bits in SD_STOP to 1.
7. Operation complete
   When reception of the response to the HPI command is completed and the busy state is released, the INFO0 bit in SD_INFO1 is set to 1 to generate an interrupt. Clear the INFO0 bit to 0 to read the response from SD_RSP10. This is the end of HPI operation.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

6.2.4.12 High-Priority Interrupt (at Single Block Write)

6.2.4.12.1 Flowchart



Note 1. Refer to **6.2.5.5** in **6.2.5 Usage Notes**.

Figure 6.2-27 Example of the High-Priority Interrupt (at Single Block Write) Flowchart

6.2.4.12.2 Operation for HPI at single block write

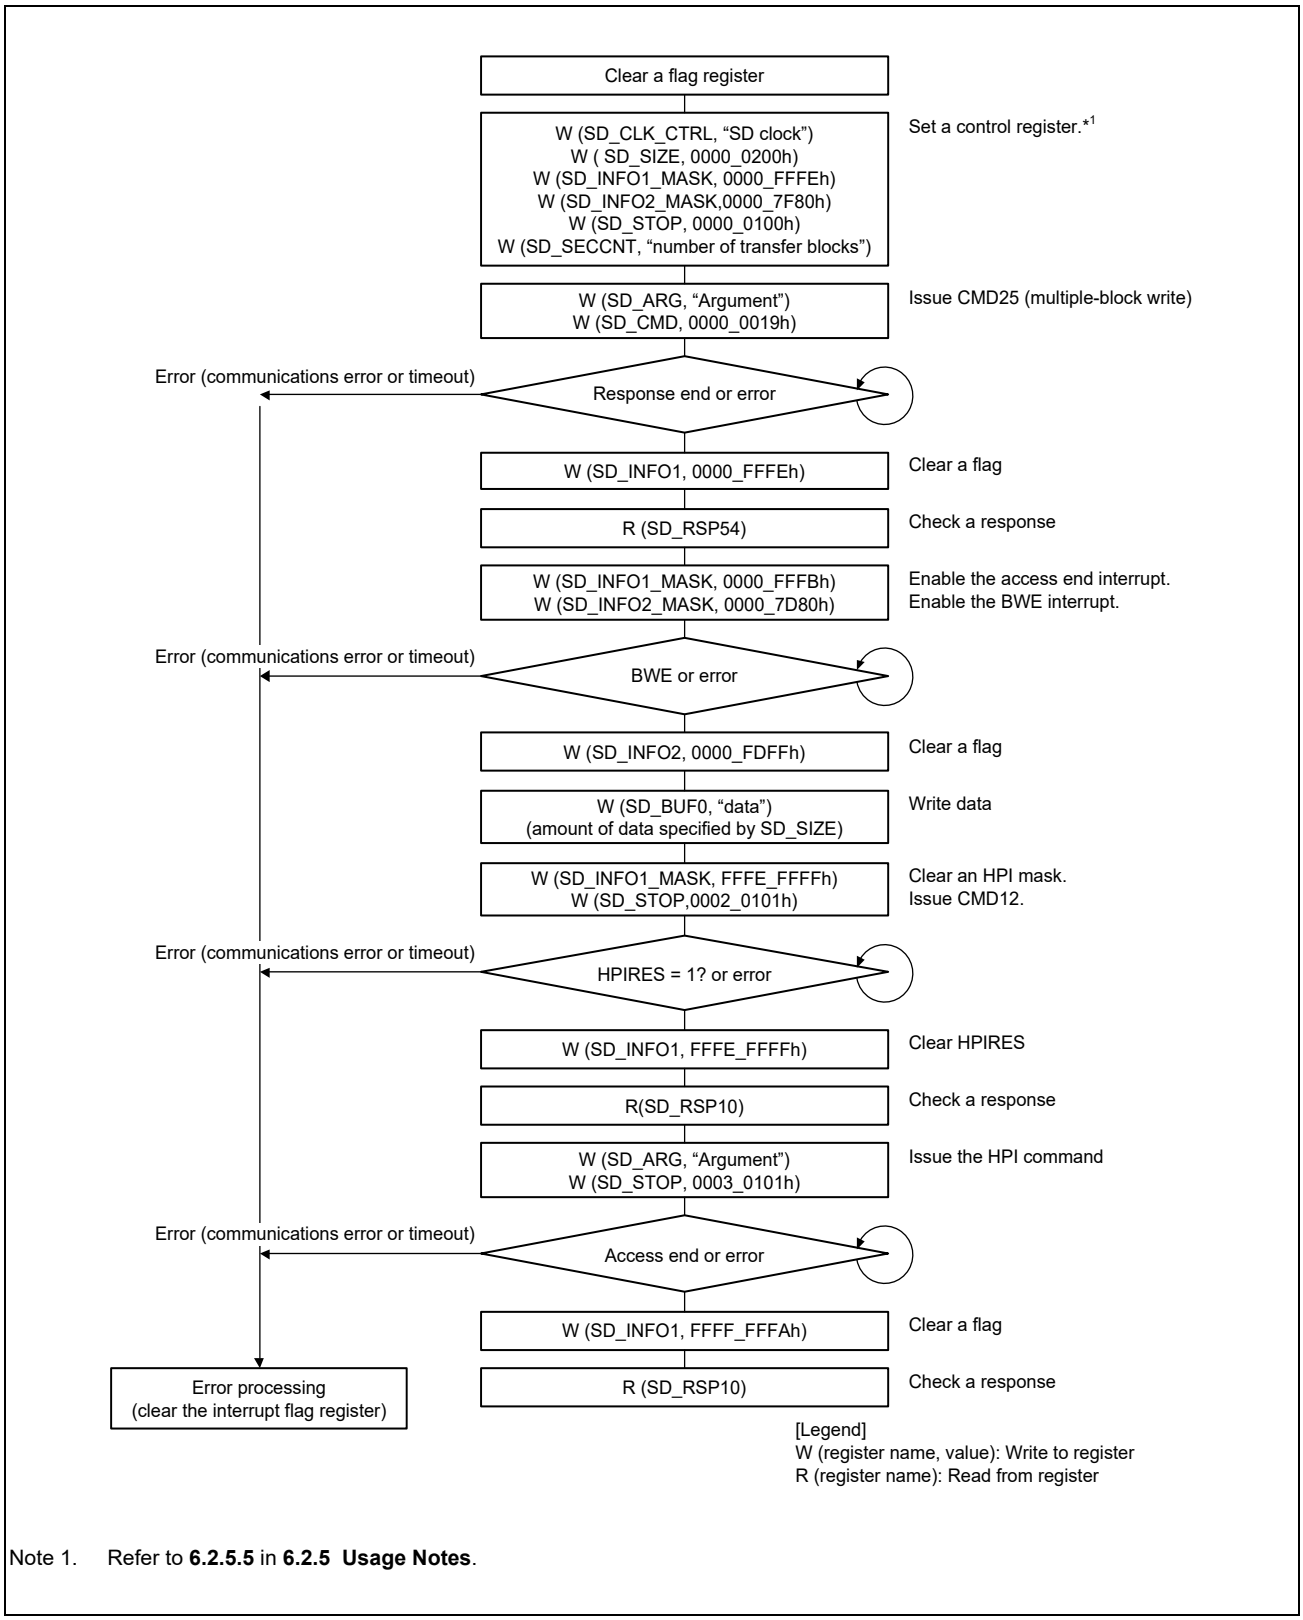
The operation of HPI at single block write is described below.

1. Flag register clear
   First, clear the bits in the flag registers. (SD_INFO1 and SD_INFO2)
2. Control register set
   Set the SD clock (SDCLK), transfer data size, interrupt mask, and so on. (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK)
3. Command issue (CMD24)
   Set CMD24 Argument in SD_ARG and write 0000_0018h to SD_CMD.
   Accordingly, CMD24 is issued, and the single block write operation is started.
4. Response check
   On receiving the response, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0 and read the response from SD_RSP10.
   If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STP or the IOABT bit in SDIO_MODE to 1. Furthermore, this causes CMD12 and CMD52 to not be issued.
   If the command sequence is halted, the INFO2 bit (access end) in SD_INFO1 is set to 1 to generate an interrupt.
5. Data write and data transmit to SD card
   Write 0000_FFFBh to SD_INFO1_MASK to enable the access end interrupt. In addition, write 0000_7D80h to SD_INFO2_MASK to enable the BWE interrupt. When SD_BUF0 is ready for the data to be written, the BWE bit in SD_INFO2 is set to 1 to generate an interrupt. Clear the BWE bit to 0 and write the amount of data specified by SD_SIZE to SD_BUF0. When the data write to SD_BUF0 is completed, data is transmitted to the SD card.
6. HPI command issue
   Set the HPI command argument in SD_ARG and set the HPIMODE and HPICMD bits in SD_STOP to 1.
7. Operation complete
   When reception of the response to the HPI command is completed and the busy state is released, the INFO2 and INFO0 bits in SD_INFO1 are set to 1 to generate an interrupt. Clear the INFO2 and INFO0 bits to 0 to read the response from SD_RSP10. This is the end of HPI operation.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

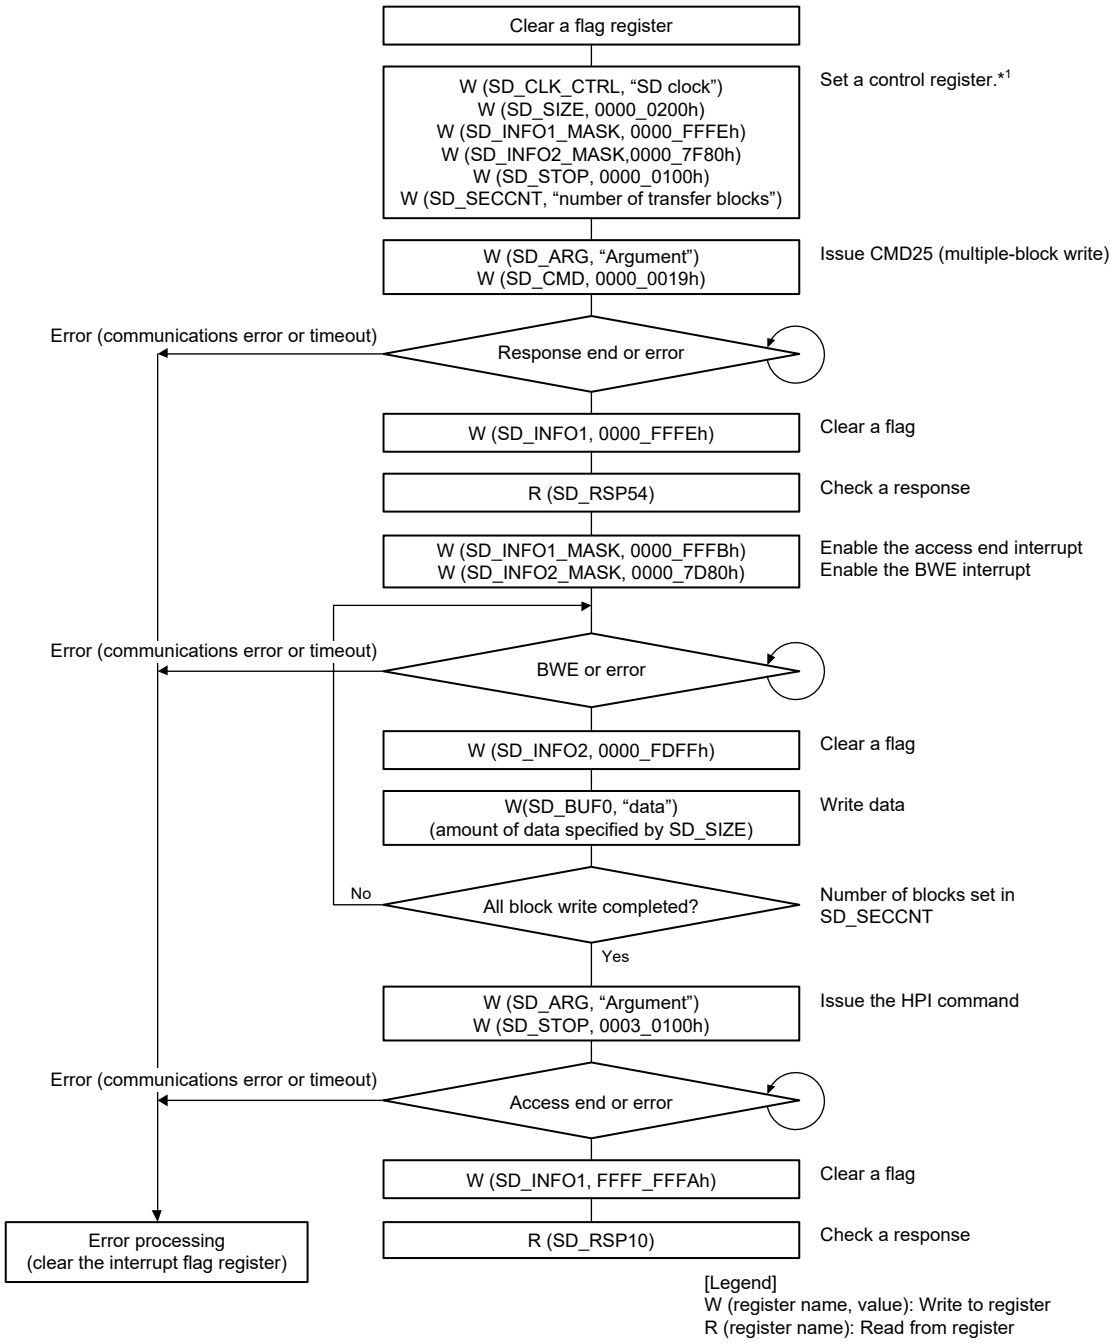
6.2.4.13 High-Priority Interrupt (at Multiple Block Write)

6.2.4.13.1 Flowchart



Note 1. Refer to **6.2.5.5** in **6.2.5 Usage Notes**.

Figure 6.2-28 Example of the High-Priority Interrupt (at Multiple Block Write) Flowchart (a)



Note 1. Refer to **6.2.5.5** in **6.2.5 Usage Notes**.

Figure 6.2-29 Example of the High-Priority Interrupt (at Multiple Block Write) Flowchart (b)

6.2.4.13.2 Operation for HPI at multiple block transfer

The operation of HPI at multiple block write is described below.

(1) When not all the data has been written to SD_BUF

1. Flag register clear
   First, clear the bits in the flag registers. (SD_INFO1 and SD_INFO2)
2. Control register set
   Set the SD clock (SDCLK), transfer data size, interrupt mask, and so on. (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK)
   Set the SEC bit in SD_STOP to 1, and set the number of transfer blocks in SD_SECCNT.
3. Command issue (CMD25)
   Set CMD25 Argument in SD_ARG and write 0000_0019h to SD_CMD.
   Accordingly, CMD25 is issued, and the multiple block write operation is started.
4. Response check
   On receiving the response, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0 and read the response from SD_RSP54.
   If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STP to 1. Setting the STP bit to 1 also causes CMD12 to be issued and the response received. If the command sequence is halted because the access end interrupt has been enabled, an interrupt will be generated by setting the INFO2 bit (access end) in SD_INFO1 to 1 when reception of the response has been completed. Clear the INFO2 bit to 0 and read the response.
5. Data write and data transmit to SD card
   Write 0000_FFFBh to SD_INFO1_MASK to enable the access end interrupt. In addition, write 0000_7D80h to SD_INFO2_MASK to enable the BWE interrupt. When SD_BUF0 is ready for the data to be written, the BWE bit in SD_INFO2 is set to 1 to generate an interrupt. Clear the BWE bit to 0 and write the amount of data specified by SD_SIZE to SD_BUF0. When the data write to SD_BUF0 is completed, data is transmitted to the SD card. Then, the CRC status and busy state are received from the SD card.
   However, a communications error or timeout may be generated if data are being transmitted while writing to SD_BUF0 is in progress.
6. Command issue (CMD12)
   Write FFFE_FFFFh to SD_INFO1_MASK to enable the HPIRES interrupt. Write 0002_0101h to SD_STOP, which causes CMD12 to be issued.
7. Response check
   When the response is received, the HPIRES bit in SD_INFO1 is set to 1 to generate an interrupt. Clear the HPIRES bit to 0 to read the response from SD_RSP10.
8. HPI command issue (CMD25)
   Set the HPI command argument in SD_ARG and set the HPIMODE and HPICMD bits in SD_STOP to 1.
9. Operation complete
   When reception of the response to the HPI command is completed and the busy state is released, the INFO2 and INFO0 bits in SD_INFO1 are set to 1 to generate an interrupt. Clear the INFO2 and INFO0 bits to 0 to read the response from SD_RSP10. This is the end of HPI operation.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

(2) When all the data has been written to SD_BUF

1. Flag register clear
   First, clear the bits in the flag registers. (SD_INFO1 and SD_INFO2)
2. Control register set
   Set the SD clock (SDCLK), transfer data size, interrupt mask, and so on. (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK)
   Set the SEC bit in SD_STOP to 1, and set the number of transfer blocks in SD_SECCNT.
3. Command issue (CMD25)
   Set CMD25 Argument in SD_ARG and write 0000_0019h to SD_CMD.
   Accordingly, CMD25 is issued, and the multiple block write operation is started.
4. Response check
   On receiving the response, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0 and read the response from SD_RSP54.
   If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STP to 1. Setting the STP bit to 1 also causes CMD12 to be issued and the response received. If the command sequence is halted because the access end interrupt has been enabled, an interrupt will be generated by setting the INFO2 bit (access end) in SD_INFO1 to 1 when reception of the response has been completed. Clear the INFO2 bit to 0 and read the response.
5. Data write and data transmit to SD card
   Write 0000_FFFBh to SD_INFO1_MASK to enable the access end interrupt. In addition, write 0000_7D80h to SD_INFO2_MASK to enable the BWE interrupt. When SD_BUF0 is ready for the data to be written, the BWE bit in SD_INFO2 is set to 1 to generate an interrupt. Clear the BWE bit to 0 and write the amount of data specified by SD_SIZE to SD_BUF0. When the data write to SD_BUF0 is completed, data is transmitted to the SD card.
   Then, the CRC status and busy state are received from the SD card. Doing this repeats transfer of the number of blocks set in SD_SECCNT.
   However, a communications error or timeout may be generated if data are being transmitted while writing to SD_BUF0 is in progress.
6. HPI command issue
   Set the HPI command argument in SD_ARG and set the HPIMODE and HPICMD bits in SD_STOP to 1.
7. Operation complete
   When reception of the response to the HPI command is completed and the busy state is released, the INFO2 and INFO0 bits in SD_INFO1 are set to 1 to generate an interrupt. Clear the INFO2 and INFO0 bits to 0 to read the response from SD_RSP10. This is the end of HPI operation.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

6.2.4.14 Example of SD_CMD Register Setting

Table 6.2-8 lists the example of SD_CMD (SD interface) register setting.

Table 6.2-8 Example of SD_CMD Register Setting (SD) (1/2)

Type	Command	Example of SD_CMD Register Setting	Remark
CMD	CMD0	0000_0000h	
	CMD2	0000_0002h	
	CMD3	0000_0003h	
	CMD4	0000_0004h	
	CMD5	0000_0705h or 0000_0005h	
	CMD6	0000_1C06h or 0000_0006h	
	CMD7	0000_0007h	When the card is placed in the deselected state, the response timeout flag will be set since there is no response.
	CMD8	0000_0408h or 0000_0008h

6.2.5 Usage Notes

6.2.5.1 SD_BUF Illegal Write Access

When writing data to SD_BUF0 after the single block write or multi block write command is issued, the data of the size specified by SD_SIZE must be written to.

If the data of the size which exceeds the size specified by SD_SIZE is written to, the ERR4 bit in SD_INFO2 is set to 1. In addition, the data written to SD_BUF0 may not be transmitted and it causes the SCLKDIVEN bit in SD_INFO2 to hold the value of 0. In such cases, clearing the SDRST bit in SOFT_RST to 0 and then restoring its value to 1 clears the SCLKDIVEN bit to 1.

However, for the single byte (in the case of 16- or 32-bit access) or three bytes (in the case of 32-bit access) when the number of bytes setting in SD_SIZE is odd, or the fraction of bytes when the number of bytes setting in SD_SIZE is even (in the case of 32-bit access), since the portion of dummy data writing is regarded as excess data and ignored, it is not within the scope of the above description (the fraction of bytes: the two bytes that are not in a four-byte unit).

6.2.5.2 Block Number Limitation for Multiple Block Read

When performing a multiple block read of one or two blocks, depending on the timing with which the response register is read, the response value may not be read properly. This must be avoided by either of the following countermeasures.

1) When receiving one or two blocks of data, use single block reading.
2) Read the response to CMD18 from SD_RSP54.

[Mechanism of incorrect reading]

Figure 6.2-30 shows the processing flows of SD/MMC host interface (hardware) operation and software operation when a multiple block read is performed on two blocks. As shown in the incorrect operation of **Figure 6.2-30**, when an interrupt is generated on reception of the CMD18 response and the timing with which the SD card response register (SD_RSP10) is read by the interrupt is delayed, the data during the CMD12 response reception or the CMD12 response may be read. In the case of a multiple block read of three or more blocks, CMD12 is not issued until the block of data has been read, so this problem does not arise. Furthermore, in the case of a multiple block write, since the CMD25 response is read before the block of data is sent, the problem does not arise.

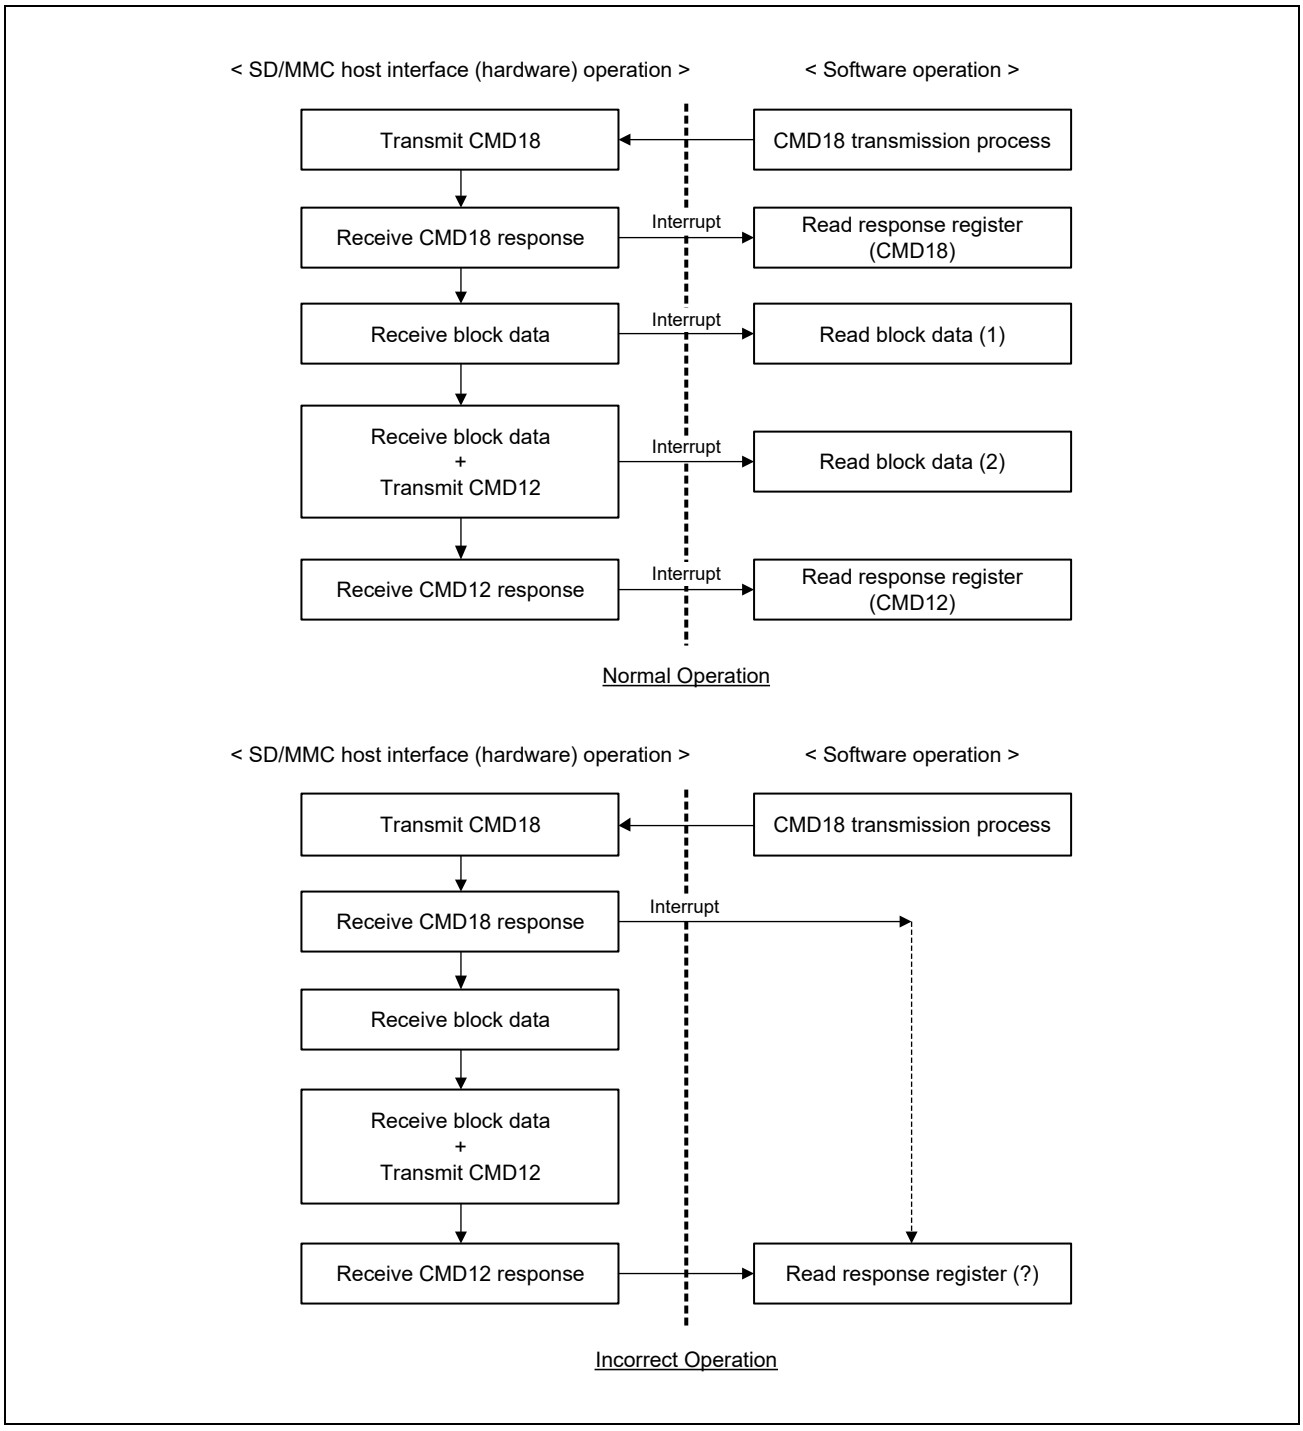

Figure 6.2-30 Flowcharts for Multiple Block Read Operation (Two Blocks)

6.2.5.3 Automatic Control of SDCLK Output

In the SD Card standard, 74 cycles of SDCLK must be output before initialization of the card. For this reason, use automatic control of SDCLK output after 74 cycles of SDCLK have been output. Furthermore, if automatic control of SDCLK output was in use, SDCLK output is stopped on completion of the sequence for a communications error or timeout. Thus, in cases where state transitions within the SD card are necessary and so on after completion of the sequence, release automatic control of SDCLK output and restart supply of SDCLK to the SD card.

6.2.5.4 Control of the C52PUB Setting for Multiple Block Write

If the C52PUB bit in SDIO_MODE is set to 1 during a sequence of multiple block write due to CMD53, CMD52 is not issued until SD_BUF becomes empty. For this reason, set the C52PUB bit after suspending writing to SD_BUF by following the appropriate procedure below.

- When DMA transfer is not in use

1. Before setting the C52PUB bit, suspend writing to SD_BUF by making the setting in SD_INFO2 to disable BWE interrupts.
2. Set the C52PUB bit in SDIO_MODE to 1 (so that CMD52 is issued when SD_BUF becomes empty).
3. After the INFO0 interrupt processing in SD_INFO1 due to the issuing of CMD52 has been completed, restart writing to SD_BUF by making the setting in SD_INFO2 to enable BWE interrupts.

- When DMA transfer is in use

1. Every time DMA transfer of the value set in SD_SIZE × n blocks (where n = 1, 2, ...) proceeds, suspend writing to SD_BUF by DMA transfer before the C52PUB bit is set.
2. Set the C52PUB bit in SDIO_MODE to 1 (so that CMD52 is issued when SD_BUF becomes empty).
3. After the INFO0 interrupt processing in SD_INFO1 due to the issuing of CMD52 has been completed, restart writing to SD_BUF by DMA transfer.

6.2.5.5 Notes on SD_CLK_CTRL Register Settings

When the SCLKDIVEN bit in SD_INFO2 is 0, SD_CLK_CTRL cannot be written to. Before writing to SD_CLK_CTRL, be sure to check that the SCLKDIVEN bit in SD_INFO2 is 1.

6.2.5.6 Restrictions on specifications

1. The SDIO suspend/resume is not supported.
2. The SPI bus is not supported.
3. The shared bus and 8-bit SD bus for embedded SDIO are not supported.
4. The stream transfer for MMC cards is not supported.
5. MMC open ended multiple block read is not supported.

6.2.5.7 STP bit setting during multiple block read

During execution of multiple block read with automatic CMD12 execution by setting the SEC bit in SD_STOP to 1, even if the STP bit in SD_STOP is set to 1 to forcibly stop the execution, the command sequence may not stop depending on the timing of setting the STP bit.

To avoid this, when setting the STP bit in SD_STOP to 1 during multiple block transfer, clear the SEC bit in SD_STOP to 0 at the same time. (Even when the SCLKDIVEN bit in SD_INFO2 is 0, change the SEC bit from 1 to 0.)

When the command sequence has not stopped because the SEC bit was not cleared to 0, the command sequence can be stopped by clearing the SDRST bit in SOFT_RST to 0.

When forcibly terminating the CMD53 multiple block transfer through the IOABT bit in SDIO_MODE, be sure to leave the SEC bit in SD_STOP as 1.

6.2.6 Sampling Clock Controller (SCC)

6.2.6.1 Features

This module controls a sampling clock (hereafter referred to as the SCC sampling clock) that is used for SD UHS-I/ SDR104 and MMC HS200. When this module is used with the LSI, SD UHS-I/SDR104 and MMC HS200 can be supported.

6.2.6.2 SCC Block Diagram

Figure 6.2-31 shows a block diagram of the sampling clock controller.

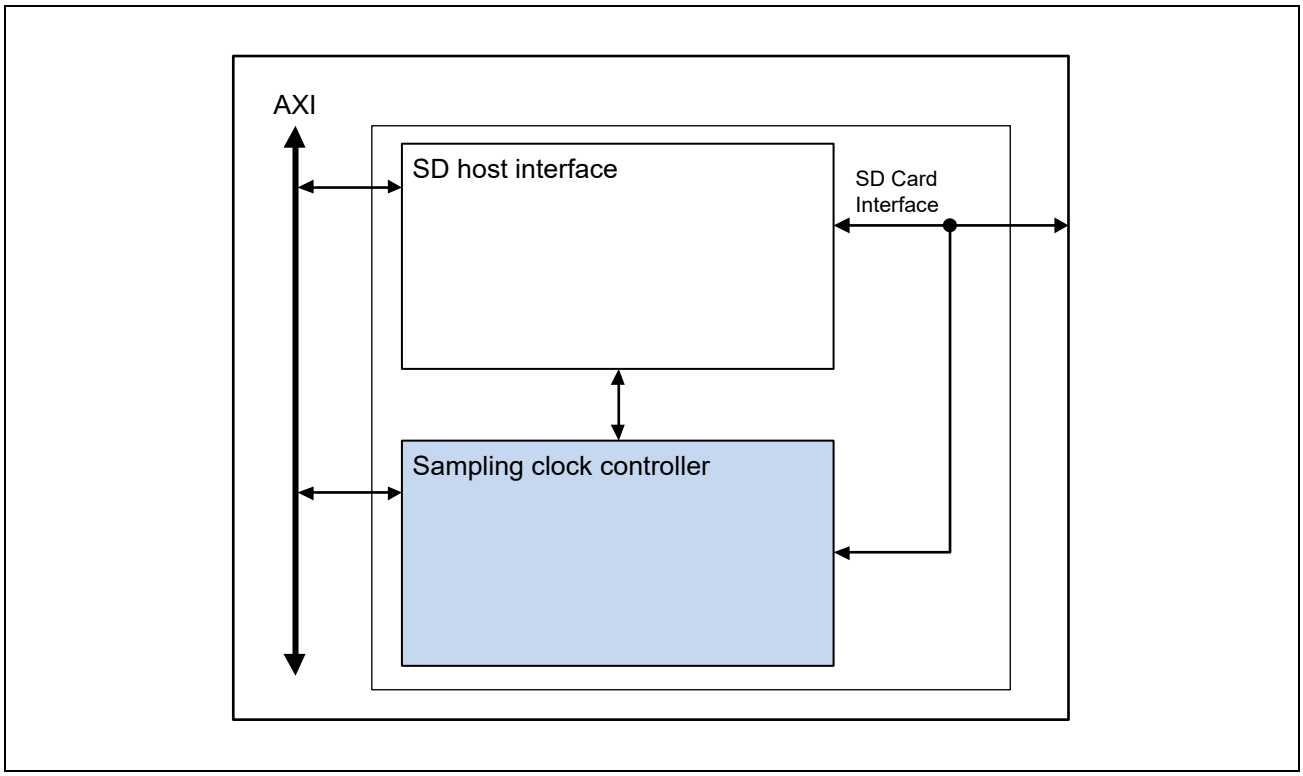

Figure 6.2-31 Block Diagram of the Sampling Clock Controller

6.2.7 SCC Registers

6.2.7.1 List of Registers

The registers are listed below.

The SCC registers are listed below. Regarding the base addresses of the following registers, refer to **6.2.2 SD Registers**.

Register Name	Abbreviation	Initial Value	Offset Address	Access Size [bits]
Initial Setting Register	SDm_SCC_DTCNTL	0000_0000_0008_0000h	1000h	32, 64
Sampling Clock Position Setting Register	SDm_SCC_TAPSET	0000_0000_0000_0000h	1008h	32, 64
Hardware Adjustment Register 1	SDm_SCC_DT2FF	0000_0000_0000_0300h	1010h	32, 64
Sampling Clock Selection Register	SDm_SCC_CKSEL	0000_0000_0000_0000h	1018h	32, 64
Sampling Clock Position Correction Register	SDm_SCC_RVSCNTL	0000_0000_0000_0000h	1020h	32, 64
Sampling Clock Position Correction Request Register	SDm_SCC_RVSREQ	0000_0000_0000_0000h	1028h	32, 64
Sampling data comparison register	SDm_SCC_SMPCMP	0000_0000_0000_0000h	1030h	32, 64
Hardware adjustment register 2	SDm_SCC_TMPPORT	0000_0000_0000_0000h	1038h	32, 64

6.2.7.2 SCC Register Descriptions

6.2.7.2.1 Initial Setting Register (SDm_SCC_DTCNTL)

Access Size : 32, 64 bits
Offset Address : <SDm_base> + 1000h
Initial Value : 0000_0000_0008_0000h

Bit	63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48

Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAPSEL7 to TAPSEL0[7:0]								-	-	-	-	-	-	RVSW	RVSEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
63 to 16	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
15 to 8	TAPSEL7 to TAPSEL0[7:0]	0h	R	SCC Sampling Clock Position Display Displays the SCC sampling clock position selected by hardware. After RVSEN has been set to 1b, the value may differ from that of TAPSET.
7 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
1	RVSW	0h	RW	This bit is read as 0b. The write value should be 1b.
0	RVSEN	0h	RW	SCC Sampling Clock Position Correction Enable 0b: SCC sampling clock position correction is disabled. 1b: SCC sampling clock position correction is enabled. When RVSEN is set to 1b after tuning has been performed, this module corrects the SCC sampling clock position each time of a command sequence of the SD/MMC host interface. However, when RVSERR is 1b, this module does not correct the SCC sampling clock position. While tuning is being performed, set RVSEN to 0. When this controller is used with an SDIO device which asserts SDIO interrupt, set RVSEN to 0.

6.2.7.2.5 Sampling Clock Position Correction Request Register (SDm_SCC_RVSREQ)

Access Size : 32, 64 bits

Offset Address : <SDm_base> + 1028h

Initial Value : 0000_0000_0000_0000h

Bit	63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48

Bit	Bit Name	Initial Value	R/W	Description
63 to 16	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
15 to 8	DT2NE[7:0]	3h	RW	Hardware Adjustment 2 This is a setting register for adjusting the timing inside the IP when using Tuning. When using Tuning, set 8'h02 to this bit, make the setting before setting 1 in SCC_CKSEL [0] .DTSEL.
7 to 0	DT2NS[7:0]	0h	RW	Hardware Adjustment 1 This is a setting register for adjusting the timing inside the IP when using Tuning. When using Tuning, set 8'h07 to this bit., make the setting before setting 1 in SCC_CKSEL [0] .DTSEL.

6.2.7.2.7 Sampling Data Comparison Register (SDm_SCC_SMPCMP)

Data comparison register indicates the result of the comparison of the sampling data. The subject of the comparison is the previous TAP and the subsequent TAP.

Access Size : 32, 64 bits
Offset Address : <SDm_base> + 1030h
Initial Value : 0000_0000_0000_0000h

Bit	63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	CMPNGU[8:0]								
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	CMPNGD[8:0]								
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
63 to 25	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
24 to 16	CMPNGU[8:0]	0h	RW	Comparison of sampling data with the previous TAP Clock. Bits 16-23 are the comparison result of data 0-7. Bit 24 is the comparison result of CMD. 0b: Match 1b: Mismatch < Clear conditions.> The start of the command sequence Write to SCC_TAPSET register
15 to 9	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
8 to 0	CMPNGD[8:0]	0h	RW	Comparison of sampling data with the subsequent TAP Clock. Bits 0-7 are the comparison result of data 0-7. Bit 8 is the comparison result of CMD. 0b: Match 1b: Mismatch < Clear conditions.> The start of the command sequence Write to SCC_TAPSET register

6.2.7.2.8 Hardware Adjustment Register 2 (SDm_SCC_TMPPORT)

This register makes a setting that SD_DATA, which has been fetched by the sampling clock at each TAP position, is used in the appropriate timing.

Access Size : 32, 64 bits
Offset Address : <SDm_base> + 1038h
Initial Value : 0000_0000_0000_0000h

Bit	63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TMPOUT[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
63 to 16	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
15 to 0	TMPOUT[15:0]	0h	RW	Hardware adjustment 3 When using the delay tuning mechanism, set the following values. When TAPNUM = 8, set 0000h to these bits. When operating with other than SDR104 / HS200, this register adjusts the clock delay of the Flip Flop that latches the received data from the outside of the chip. For this LSI, set 0000h when transferring at 3.3 V, and set 0001h when transferring at 1.8 V.

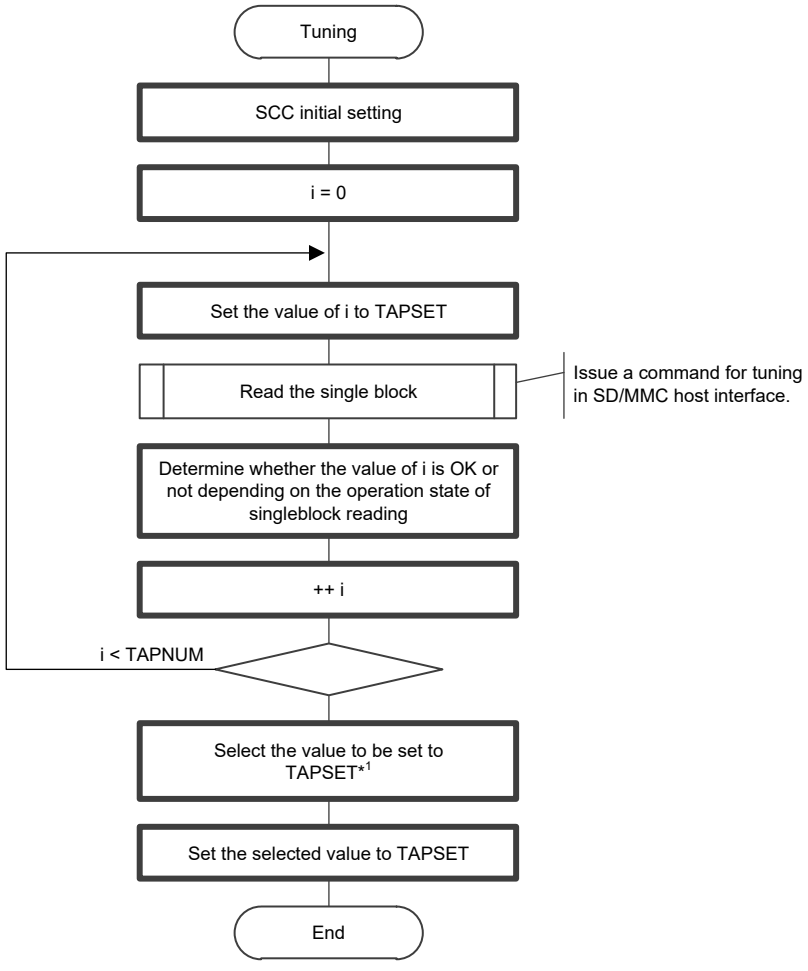
6.2.8 Usage Example of SCC

6.2.8.1 Tuning

SCC is tuned by using operation of single-block reading.

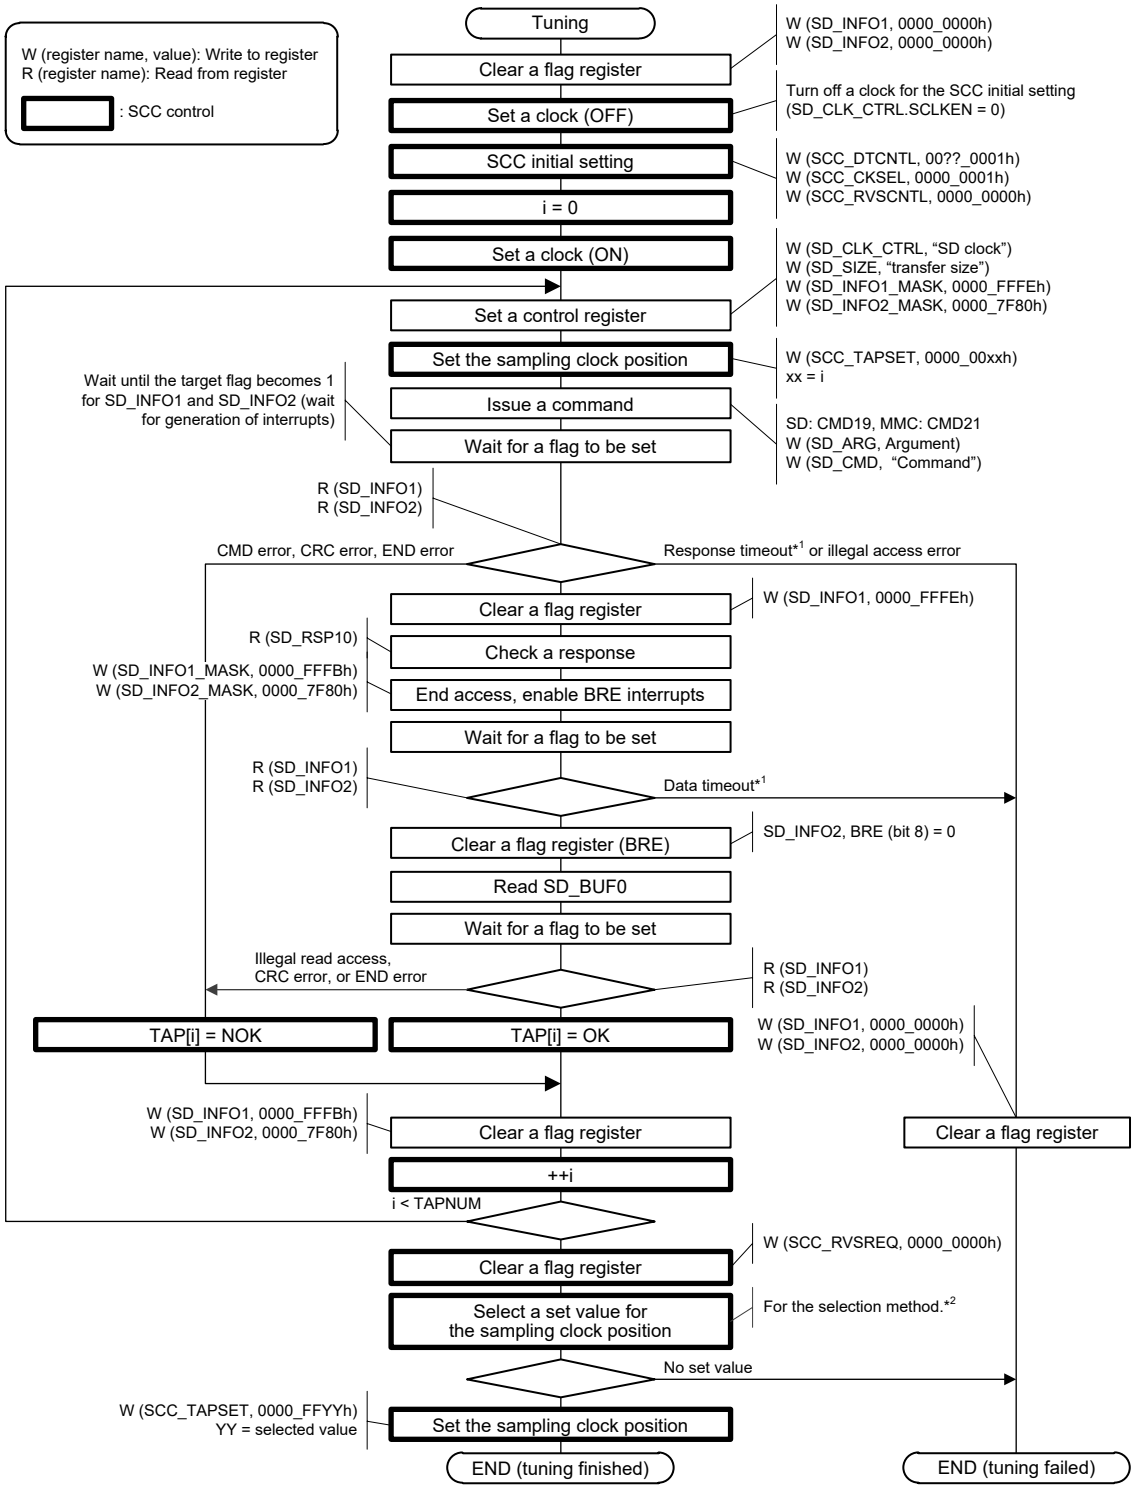
As shown in **Figure 6.2-32**, check whether the single-block read command normally ends when the sampling clock position is changed from 0 to TAPNUM-1 and save the result. After checking, confirm that there exists the range which has three or more continuous normal ends (OK). Then, the median value within the continuous range is determined as the final adjustment value.

Figure 6.2-33 and **Table 6.2-10** show the detailed tuning flow and how to select the sampling clock position (example when TAPNUM = 8).



Note 1. See the example shown in **Table 6.2-10**.

Figure 6.2-32 Example of Tuning Flow (Outline)



Note 1. When all of TAP[i] are "NOK".

Note 2. See **Table 6.2-10**.

Figure 6.2-33 Example of Tuning Flow (Detailed)

Table 6.2-10 Example of How to Select the Sampling Clock Position (when TAPNUM = 8)

Item	i	Case 1	Case 2	Case 3	Case 4	Case 5*1
TAP[i]	0	NOK	OK	NOK	OK	OK
	1	OK	OK	NOK	NOK	OK
	2	OK	NOK	OK	NOK	OK
	3	OK(←)	NOK	OK	NOK	OK
	4	OK	NOK	NOK	NOK	OK
	5	OK	OK	NOK	OK	OK
	6	NOK	OK	NOK	OK(←)	OK
Max. value→	7	NOK	OK(←)	NOK	OK	OK
	(0)	NOK	OK	NOK	OK	OK
	(1)	OK	OK	NOK	NOK	OK
	(2)	OK	NOK	OK	NOK	OK
	(3)	OK	NOK	OK	NOK	OK
	(4)	OK	NOK	NOK	NOK	OK
	(5)	OK	OK	NOK	OK	OK
	(6)	NOK	OK	NOK	OK	OK
	(7)	NOK	OK	NOK	OK	OK
Selected value		i = 3	i = 7	Fail	i = 6 or 7	i = 0 to 7

Remarks: (←): Example of selection, (x): repeated display of index x of TAP[x]

(a) The sampling clock position is selected by considering a margin in the range which has three or more continuous 'TAP[i] = OK'.

(b) The sampling clock position is repeated from 0 after the maximum value (TAPNUM-1). In case 2 above, that position is continued in the order of 5 → 6 → 7 → 0 → 1.

Note 1. If all of the TAP [i] is OK, the sampling clock position is selected by identifying the change point of data. Change point of the data can be found in the value of SCC_SMPCMP register. Usage example is **6.2.8.3 Change point of the input data**.

6.2.8.2 Sampling Clock Position Correction after Tuning

After tuning, correction of the sampling clock position may be required when a command is issued.

There are manual and automatic correction methods. After a command sequence, if the CMD, CRC, END error or time out occurs or the correction error occurs, tuning will be performed again. The following shows examples of manual and automatic correction methods.

6.2.8.2.1 Manual correction of the sampling clock position

Figure 6.2-34 shows the flow of manual correction of the sampling clock position. **Table 6.2-11** shows set values determined when correction is required (when TAPNUM = 8).

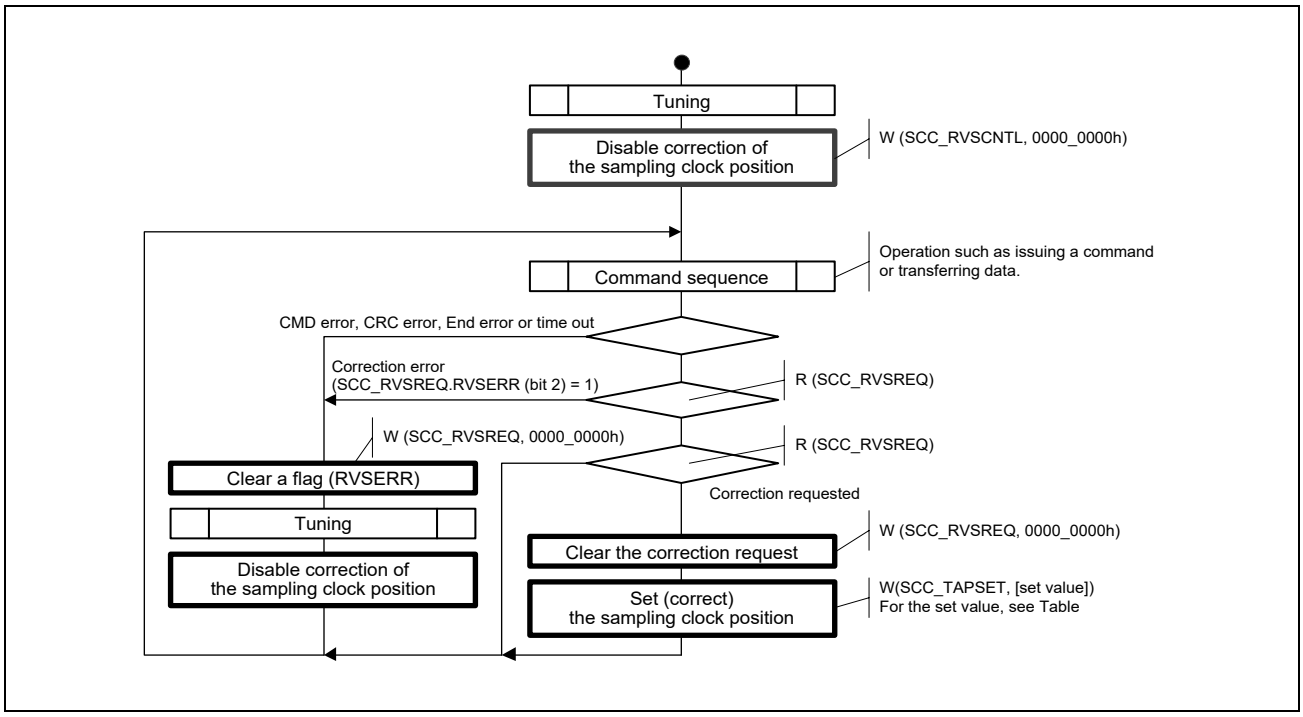


Figure 6.2-34 Flow of Manual Correction of the Sampling Clock Position (Example)

Table 6.2-11 Set Values for TAPSET when Correction is Required (when TAPNUM = 8)

No.	Current value of TAPSET	Value set to TAPSET when REQTAPUP = 1	Value set to TAPSET when REQTAPDWN = 1
1	0	1	7
2	1	2	0
3	2	3	1
4	3	4	2
5	4	5	3
6	5	6	4
7	6	7	5
8	7	0	6

Note: As is the case in the tuning selection method, the sampling clock position is 0 after the maximum value (TAPNUM-1).

6.2.8.2.2 Automatic correction of the sampling clock position

Figure 6.2-35 shows the flow of automatic correction of the sampling clock position.

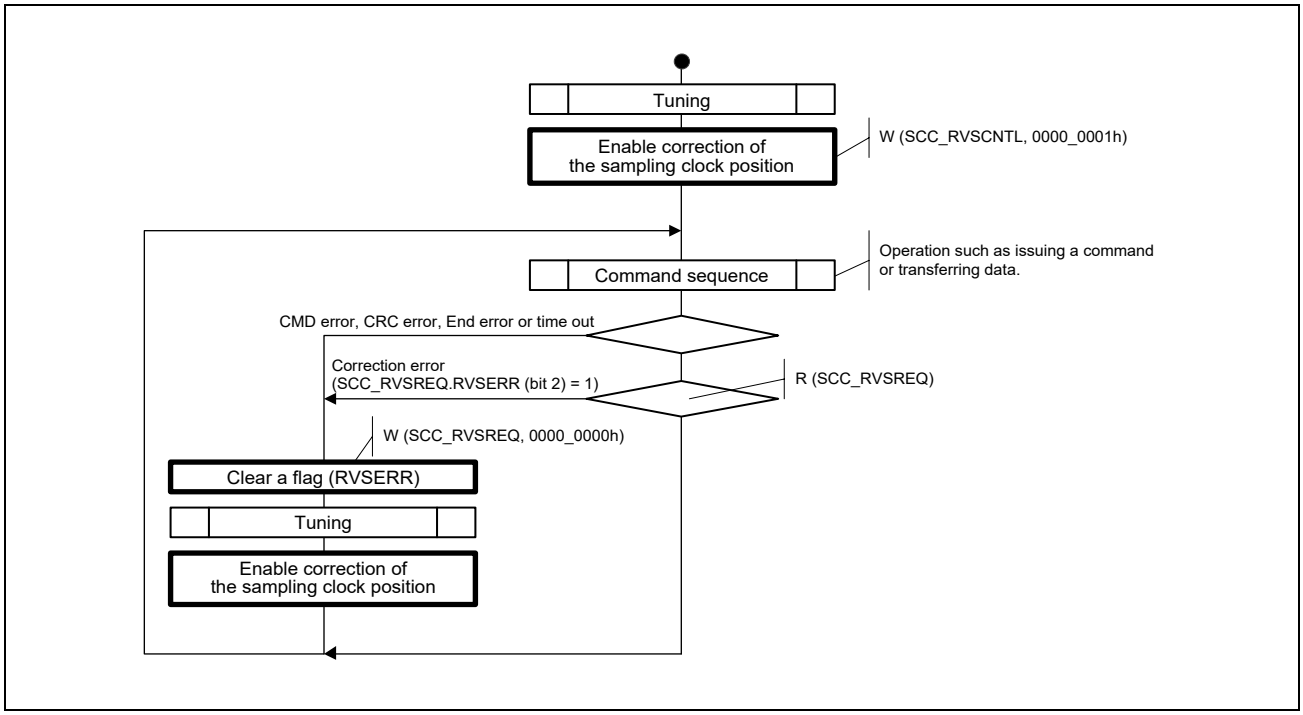

Figure 6.2-35 Flow of Automatic Correction of the Sampling Clock Position (Example)

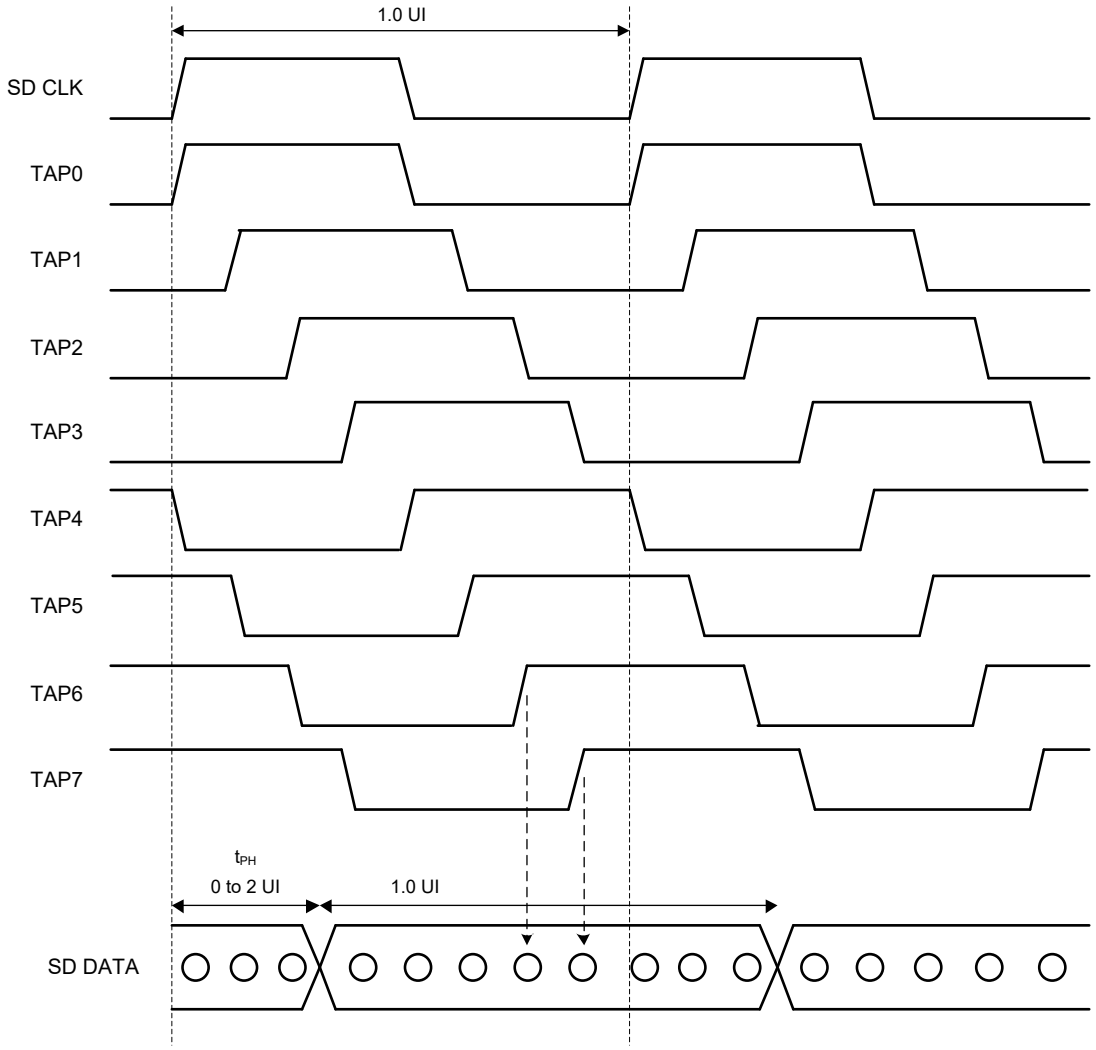
6.2.8.3 Change point of the input data

Tuning is capture the data by the TAP clock selected. However, also captures the data by the previous TAP clock and the subsequent TAP clock at the same time. This result is reflected in the sampling data comparison register (SCC_SMPCMP). Point of mismatch before and after the selected TAP clock is the changing point of the data. In this example, it is desirable to set the TAP clock as TAP6 or TAP7.



Note: After recognizing the changing point of the input data, need to set the TAP clock.

Figure 6.2-36 Example: All Taps are OK

Figure 6.2-36 shows the change point of data between TAP2 and TAP3. Change point of the data can be confirmed by sampling data comparison register (SCC_SMPCMP). For the tuning of TAP2 or TAP3, the CMPNGU bit of sampling data comparison register indicates a mismatch. As the width of the input data is 1 (UI), select TAP6 or TAP7 which is the median of next TAP3 from TAP3.

SECTION 6 HIGH-SPEED INTERFACE

6.3 Gigabit Ethernet Interface (GBETH)

This section describes the GBETH functions of this LSI.

This manual is a simplified version. For more information, refer to the User's Manual Additional Document.

6.3.1 Overview

6.3.1.1 Features

The LSI includes an Ethernet MAC that:

- Is compliant with the following standards:
  - IEEE 802.3-2008 for Ethernet MAC, Gigabit Media Independent Interface (RGMII), and Media Independent Interface (MII)
  - IEEE 1588-2008 v2 standard for precision networked clock synchronization, IEEE 1588-2008 v2 is compliant with Power IEEE-C37.238 profile
  - IEEE 802.3-az, version D2.0 for Energy Efficient Ethernet (EEE).
  - IEEE 802.1Qav-2009, IEEE 802.1Qat-2009, IEEE 802.1AS-2011
- Supports 10/100/1000 Mbps data transfer rates
- Supports both half-duplex and full-duplex operation
- Has programmable frame length to support both standard and jumbo ethernet frames of size up to 16 KB (16 KB - 1):
  - Jumbo mode support in cut-through mode only (not implemented in store and forward due to TX and RX FIFO size).
- Contains 31 MAC address registers for the address filter block
- Supports variety of flexible addresses filtering modes:
  - Perfect (DA) address filters with masks for each byte
  - SA address comparison check with masks for each byte
  - 256-bit Hash filter for multicast and unicast (DA) addresses
  - Option to pass all multicast addressed frames
  - Promiscuous mode support to pass all frames without any filtering for network monitoring
  - Passes all incoming packets (as per filter) with a status report.
- Supports native DMA with simple independent channels transmit and receive engines:
  - 4 RX channels of 8 KB FIFO size for receive channel
  - 4 TX channels of 8 KB FIFO size for transmit channel
  - DMA implements dual buffer (ring) or linked list (chained) descriptor chaining.
- Supports advanced IEEE 1588-2002 & 2008 ethernet frame time stamping:

- IEEE1588 time base information, with reference clock of 125 MHz
- IEEE1588 external snapshot.

- Supports programmable CRC generation and checking
- Supports RMON statistics (L2 layer only)
- Supports Station Management Block and MDIO interface
- Is Ethernet Energy Efficiency compliant with IEEE 802.3az-2010:
  - Supports wakeup on LAN on magic packet and packet filtering
  - Supports energy efficiency feature (LPI mode)
  - Wakeup capability.
- Has interface for:
  - RGMII and MII (GMII is not supported.)

6.3.1.2 Block Diagram

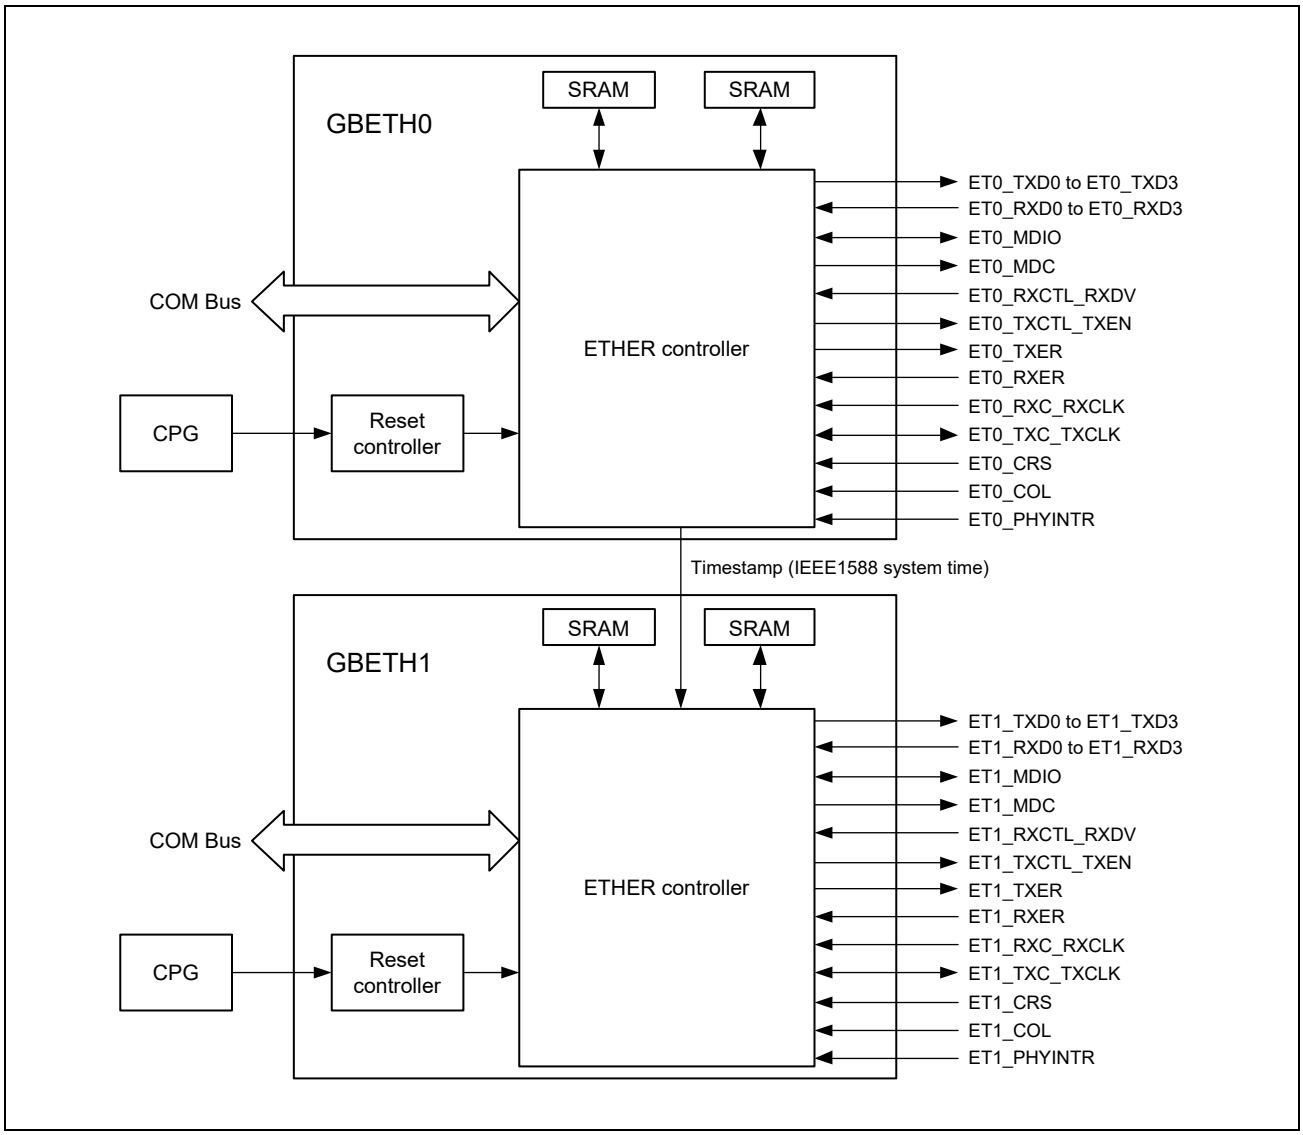


Figure 6.3-1 Block Diagram of the Ethernet Interface

6.3.1.3 External Pins

Table 6.3-1 Input/Output Pins of the GBETHm (m = 0, 1)

Pin Name	Input/Output	Description
ETm_MDC	Output	Management data clock output
ETm_MDIO	I/O	Management data I/O
ETm_RXCTL_RXDV	Input	RX control / data valid
ETm_TXCTL_TXEN	Output	TX control / data enable
ETm_TXER	Output	TX data error (MII mode)
ETm_RXER	Input	RX data error
ETm_RXC_RXCLK	Input	RX clocks
ETm_TXC_TXCLK	I/O	Tx clocks (MII mode)
ETm_CRS	Input	Carrier sense (MII mode)
ETm_COL	Input	Collision detection (MII mode)
ETm_TXD0 to ETm_TXD3	Output	TX data 0 to 3
ETm_RXD0 to ETm_RXD3	Input	RX data 0 to 3
ETm_PHYINTR	Input	PHY interrupt signals

SECTION 6 HIGH-SPEED INTERFACE

6.4 USB3.2 Gen2x1 Interface (USB3)

This section describes the functions of the USB3.2 Gen2x1 interface (USB3).

This manual is a simplified version. For more information, refer to the User's Manual Additional Document.

6.4.1 Functional Overview

In this product, one USB3 module is implemented (ch0). USB3 module is composed of a USB3.2 Gen2 Host controller (USB3HOST), and a USB test module (USB3TEST and USB2TEST). **Table 6.4-1** and **Table 6.4-2** list the functions in outline.

Table 6.4-1 Functions in Outline

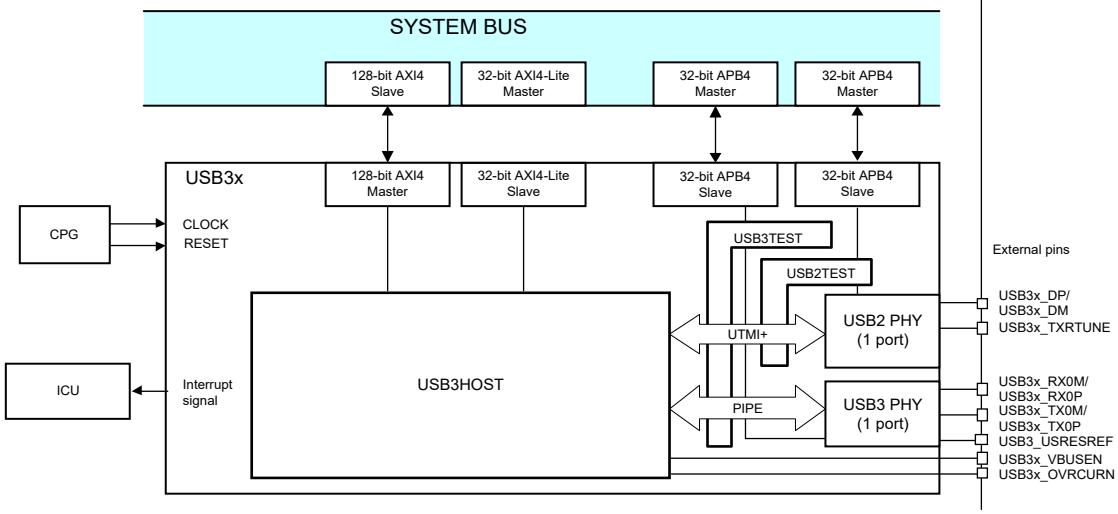
Item	Description
USB3HOST function	• Support for super-speed plus (10 Gbps), super-speed (5 Gbps), high-speed (480 Mbps), full-speed (12 Mbps), and low-speed (1.5 Mbps) transfer • Support for all transfer types: isochronous, interrupt, control, and bulk • Support for isochronous and interrupt high-band transfer • Compliant with the eXtensible Host Controller Interface(xHCI) Specification for USB
USB3TEST function	• Reset control • Control of PHY input pins • Monitor of PHY output pins

Table 6.4-2 Supported Speed Types

	Speed Type				
Function	Super Speed Plus (10 Gbps)	Super Speed (5 Gbps)	High Speed (480 Mbps)	Full Speed (12 Mbps)	Low Speed (1.5 Mbps)
Host Controller	✓	✓	✓	✓	✓

6.4.2 Connection Configuration

Figure 6.4-1 shows the connection configuration of this unit.



Note: PIPE: The PHY Interface for the PCI Express, SATA, and USB3.2
UTMI+: The USB2.0 Transceiver Macrocell Interface Plus
External Pins: USB3x_* means USB30_* for ch0.

Figure 6.4-1 USB Connection Configuration

6.4.3 Pin Functions

Table 6.4-3 lists the external pins of the USB3.

Table 6.4-3 List of External Pins

Pin Name*1	Input/Output	Function
USB3x_DP	I/O	USB2.0 USB D+ signal (positive)
USB3x_DM	I/O	USB2.0 USB D− signal (negative)
USB3x_TXRTUNE	—	Transmitter Resistor Tune Pin (for USB2PHY).
USB3x_RX0M	Input	USB3.2 super-speed plus differential reception pair (negative)
USB3x_RX0P	Input	USB3.2 super-speed plus differential reception pair (positive)
USB3x_TX0M	Output	USB3.2 super-speed plus differential transmission pair (negative)
USB3x_TX0P	Output	USB3.2 super-speed plus differential transmission pair (positive)
USB3_USRESREF	—	Reference resistor connection
USB3x_VBUSEN	Output	VBUS control signal (active high)
USB3x_OVRCURN	Input	Overcurrent detection (active low)

Note 1. For the details, see **4.2 Pin Function Controller (PFC)**.

6.4.4 USB3.2 Gen1 Host Controller (USB3HOST)

6.4.4.1 Introduction

The USB3.2 Gen1 Host Controller (USB3HOST) complies with the Universal Serial Bus (USB) 3.2 Specification.

6.4.4.1.1 Features

The functions of the USB3HOST are outlined below.

■ USB functions

The USB3HOST is compliant with the Universal Serial Bus 3.2 Specification Revision 1.0 and ECNs approved in Jan 25, 2021.

- Supports 1 downstream USB receptacles
  - Number of SSP Gen2 or SS ports: 1
  - Number of HS or FS or LS ports: 1
- Supports Super Speed Plus Gen2x1 (10 Gbps), Super Speed (5 Gbps), High Speed (480 Mbps), Full Speed (12 Mbps), and Low Speed (1.5 Mbps).
- Supports all transfer-types: Control, Bulk, Interrupt, Isochronous, and these split-transactions.
- Supports Power Control and Over Current Detection.
- Implements the following USB2.0 ECNs USB 2.0 Link Power Management Addendum and LPM functions that are compliant with the xHCI specification.
  - USB 2.0 Link Power Management Addendum Engineering Change Notice to the USB 2.0 specification as of July 16, 2007
  - Errata for USB 2.0 ECN: Link Power Management (LPM) — 7/2007 as of October 11, 2011

■ Battery charging functions

The USB3HOST supports the following functions that are compliant with the Battery Charging Specification Revision 1.2.

- The USB3HOST supports the following modes of chargeable port devices.
  - Standard Downstream Port (SDP) Mode
  - Charging Downstream Port (CDP) Mode
  - Dedicated Charging Port (DCP) Mode

■ xHCI capabilities

The USB3HOST has the following capabilities that are compliant with the eXtensible Host Controller Interface for the Universal Serial Bus Specification Revision 1.2.

- Supports 64-bit address capability
- xHCI Host Capability
  - Number of Device Slots (MaxSlots): 32
  - Number of Total Endpoints: 64
  - Number of Event Ring Segment Tables (ERST Max): 2 (1)
  - Supported Page Size: 4 Kbytes
  - Context Size (CSZ): 64 bytes (1)
  - Number of Interrupter (MaxIntrs): 1
  - Number of Stream IDs (MaxPSASize): 65536 (15)
  - Supports Primary Stream Array
  - Supports the USB Legacy Support.
  - Supports the Hardware LPM Capability.
  - Supports Best Effort Service Latency (BESL) LPM Capability.

■ Clock Control

The USB3HOST has the following clock and PLL control functions.

- Clock gating
  - Enables/disables clock gating to applicable functional sub-blocks depending on the USB state.
- Clock dividing:
  - Controls an internal clock frequency of USB3.2 PHY’s clock-domain by USB3.2
  - PHY’s rate-signal.
- PLL control
  - Enables/disables PLLs for USB2.0 and USB3.2 depending on their USB states.

6.4.4.2 Interrupts

6.4.4.2.1 Interrupt diagram

In the USB3HOST, the elements of interrupt are notified by the following layered structure.

- INTSTS register is not implemented in any FFs.
- This register is a read-only register (monitor register).

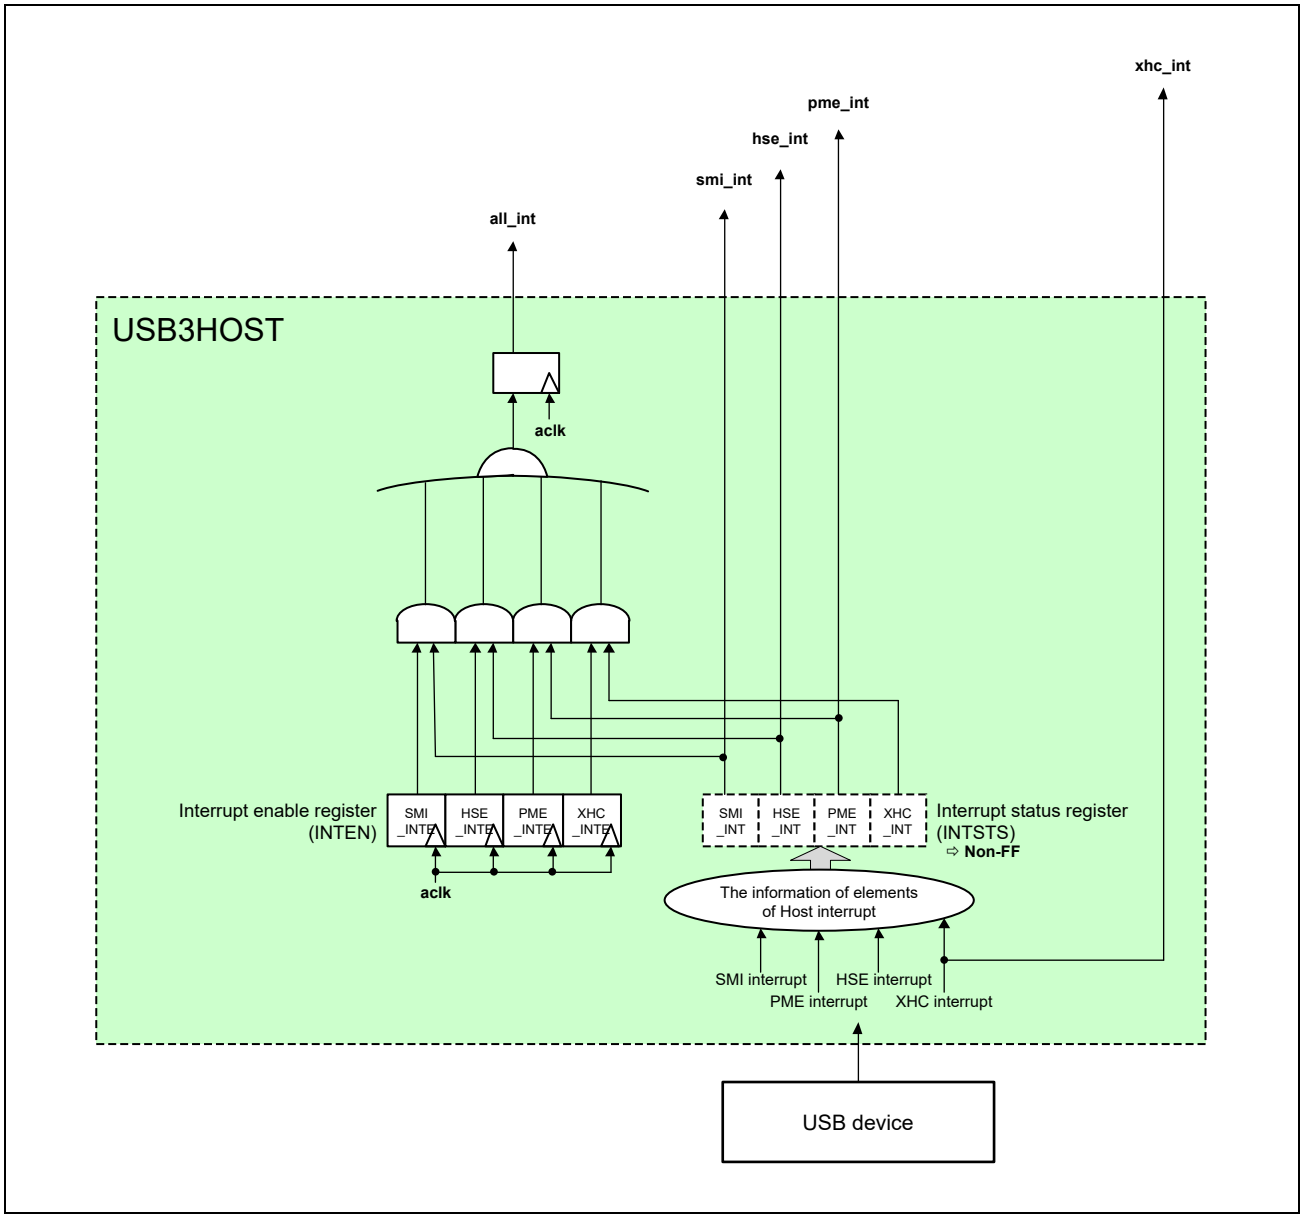


Figure 6.4-2 USB3HOST Interrupts Structure

6.4.4.2.2 Interrupt sources

The USB3HOST has the following interrupt sources.

Table 6.4-4 USB3HOST Interrupt Source Information

Interrupt Name	Type of Notification	Description
xhc_int	Level Pulse	xHC interrupt This signal notifies that Event Data TRB is set in Event Ring of a system memory. In this LSI, “level mode” is selected for the interrupt. Refer to section 4.17 of the xHCI specification for details.
pme_int	Level	Power management event interrupt. When PMCSR.PME Enable is set to 1b and PMCSR.PME Status is set to 1b, this signal is asserted. PMCSR.PME Status is set to 1b by one of the following conditions. • PORTSC.WCE = 1b, and Connected condition • PORTSC.WDE = 1b, and Disconnected condition • PORTSC.WOE = 1b, and Overcurrent condition • PORTSC.PLS = U3, and Remote Wakeup condition
hse_int	Level	Host system error interrupt When the USBCMD.HSEE is set to 1b and the USBSTS.HSE is set to 1b, this signal is asserted. The USBSTS.HSE is set to 1b by one of the following conditions. • Either SLVERR or DECERR is received as the Response in the transaction of AXI master write. • Either SLVERR or DECERR is received as the Response in the transaction of AXI master read.
smi_int	Level	System management interrupt This signal is asserted by one of the following conditions. • USBLEGCTLSTS.SEI = 1b and USBLEGCTLSTS.USE = 1b • USBLEGCTLSTS.SHSE = 1b and USBLEGCTLSTS.SHSEE = 1b • USBLEGCTLSTS.SOOC = 1b and USBLEGCTLSTS.SOOE = 1b • USBLEGCTLSTS.SPC = 1b and USBLEGCTLSTS.SPCE = 1b • USBLEGCTLSTS.SBA = 1b and USBLEGCTLSTS.SBAE = 1b
all_int	Level	Logical OR of all interrupt signals. This signal is asserted by one of the following conditions. • INTEN.XHC_INTE = 1b and INTSTS.XHC_INT = 1b • INTEN.PME_INTE = 1b and INTSTS.PME_INT = 1b • INTEN.HSE_INTE = 1b and INTSTS.HSE_INT = 1b • INTEN.SMI_INTE = 1b and INTSTS.SMI_INT = 1b

6.4.4.3 Register Specification

Registers in the USB3HOST are composed of the following register groups.

- xHCI compliant registers
  - Host Controller Capability Registers
  - Host Controller Operational Registers
  - Port Register Sets in Host Controller Registers
  - xHCI Extended Capabilities
  - Host Controller Runtime Registers
  - Doorbell Registers

- USB3HOST's specific registers
  - Core Control and Status Registers
  - Battery Charging Register

aclk is supplied to the USB3HOST from CPG, when the user reads or writes a valid value from/to these registers.

When the situations below occurred, the USB3HOST replies "SLVERR" to the AXI interconnect.

[Conditions in which the USB3HOST replies "SLVERR"]

- The case of access to the Renesas private registers in the register group "Renesas Private Registers".
- The case of access to the related CPC's registers (CRCRL, and CRCRH) or the related HEP's registers (IMAN, IMOD, ERSTSZ, ERSTBAL, ERSTBAH, ERDPL, and ERDPH) in the "Suspend" state of the USB Power State.

For the register base address (<USB3m_host_base>), see **Table 6.4-5**.

Table 6.4-5 Register Base Addresses

Unit Name	Base Address Name	Base Address
USB30 (Host)	<USB30_host_base>	0_1585_0000h (5585_0000h*1, 4585_0000h*2)

Note 1. CM33 address space (non-secure)

Note 2. CM33 address space (secure)

6.4.4.3.1 Register Overview

- Operational Base = CAPLENGTH: 0020h
- U3 Port Register Offset: 0420h
- U2 Port Register Offset: 0420h + (CFGSTS1.U3NUM) × 10h
- Extended Capability Base = HCCPARAMS1.xECP << 2: 0500h
- USB Legacy Support Capability: 0500h
- xHCI Supported Protocol Capability for USB3.2: 0510h
- xHCI Supported Protocol Capability for USB2.0: 0530h
- xHCI Extended Power Management Capability: 0550h
- Runtime Base = RTSOFF: 0600h
- Doorbell Base= DBOFF: 0700h

6.4.4.3.2 Register List

Register Name	Abbreviation	Initial Value	Offset Address	Access Size [bits]
Capability Register Length and Interface Version Number Register	USB3m_HOST_CAPLENGTH_HCIVERSION	0120_0020h	0000h	32

6.4.4.4 Register Descriptions

The function description of each register is given below.

The prefix (USB3m_HOST_) of the register names is omitted in the register descriptions and the field descriptions in this section.

The prefix (USB3m_HOST_) means below (m = 0):

- USB30_HOST_*: USB30 registers

6.4.4.4.1 Host Controller Capability Registers

(1) Capability Register Length and Interface Version Number Register (USB3m_HOST_CAPLENGTH_HCIVERSION)

This register indicates the capability register length and the interface version number.

Access Size : 32 bits
Address : <USB3m_host_base> + 0000h
Initial Value : 0120_0020h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	HCIVERSION[15:0]															
Initial Value	0	0	0	0	0	0	0	1	0	0	1	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	CAPLENGTH[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	HCIVERSION [15:0]	120h	R	This is a two-byte register containing a BCD encoding of the xHCI specification revision number supported by this host controller. The most significant byte of this register represents a major revision and the least significant byte is the minor revision. (Ex) 0120h corresponds to xHCI version 1.2.
15 to 8	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
7 to 0	CAPLENGTH [7:0]	20h	R	This register is used as an offset to add to register base to find the beginning of the Operational Register Space.

(2) Structural Parameters 1 Register (USB3m_HOST_HCSPARAMS1)

This register is the structural parameter register.

Access Size : 32 bits
Address : <USB3m_host_base> + 0004h
Initial Value : 0200_0120h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Number of Ports[7:0]								-	-	-	-	-	Number of Interrupters[10:8]		
Initial Value	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Number of Interrupters[7:0]								Number of Device Slots[7:0]							
Initial Value	0	0	0	0	0	0	0	1	0	0	1	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	Number of Ports[7:0]	2h	R	This field specifies the maximum Port Number value, i.e. the highest numbered Port Register Sets that are addressable in the Operational Register Space. Valid values are in the range of 1h to FFh. The value in this field shall reflect the maximum Port Number value assigned by an xHCI Supported Protocol Capability, described in section 7.2 of xHCI Specification. Software shall refer to these capabilities to identify whether a specific Port Number is valid, and the protocol supported by the associated Port Register Set.
23 to 19	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
18 to 8	Number of Interrupters [10:0]	1h	R	This field specifies the number of Interrupters implemented on this host controller. Each Interrupter may be allocated to MSI or MSI-X vector and controls its generation and moderation. The value of this field determines how many Interrupter Register Sets are addressable in the Runtime Register Space. Valid values are in the range of 1h to 400h. A 0h in this field is undefined
7 to 0	Number of Device Slots[7:0]	20h	R	This field specifies the maximum number of Device Context Structures and Doorbell Array entries this host controller can support. Valid values are in the range of 1 to 255. The value of 0b is reserved.

(3) Structural Parameters 2 Register (USB3m_HOST_HCSPARAMS2)

This register is the structural parameter register 2.

Access Size : 32 bits
Address : <USB3m_host_base> + 0008h
Initial Value : 0000_0011h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Max Scratchpad Buffers (Max Scratchpad Bufs Lo)[4:0]					Scratchpad Restore(SPR)	Max Scratchpad Buffers (Max Scratchpad Bufs Hi)[4:0]					-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	Event Ring Segment Table Max (ERST Max)[3:0]				Isochronous Scheduling Threshold (IST)[3:0]			
Initial Value	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	Max Scratchpad Buffers (Max Scratchpad Bufs Lo)[4:0]	0h	R	Default = implementation dependent. Valid values for Max Scratchpad Buffers (Hi and Lo) are 0 to 1023. This field indicates the lower-order 5 bits of the number of Scratchpad Buffers system software reserves for the xHC.
26	Scratchpad Restore(SPR)	0h	R	Default = implementation dependent. If Max Scratchpad Buffers is greater than 0 then this flag indicates whether the xHC uses the Scratchpad Buffers for saving state when executing Save and Restore State operations. If Max Scratchpad Buffers is = 0b, then this flag is 0b. The value 1 indicates that the xHC requires the integrity of the space for the Scratchpad Buffer to be maintained across power events. The value 0 indicates that the space for the Scratchpad Buffer can freed and reallocated between power events.
25 to 21	Max Scratchpad Buffers (Max Scratchpad Bufs Hi)[4:0]	0h	R	Default = implementation dependent. This field indicates the higher-order 5 bits of the number of Scratchpad Buffers system software reserves for the xHC.
20 to 8	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
7 to 4	Event Ring Segment Table Max (ERST Max)[3:0]	1h	R	Default = implementation dependent. Valid values are 0 to 15. This field determines the maximum value supported the Event Ring Segment Table Base Size registers, where: The maximum number of Event Ring Segment Table entries = 2 ERST Max. e.g. if the ERST Max = 7, then the xHC Event Ring Segment Table(s) supports up to 128 entries, 15 then 32K entries, etc.
3 to 0	Isochronous Scheduling Threshold (IST)[3:0]	1h	R	Default = implementation dependent. The value in this field indicates to system software the minimum distance (in time) that it is required to stay ahead of the host controller while adding TRBs, in order to have the host controller process them at the correct time. The value shall be specified in terms of number of frames/microframes. If bit [3] of the IST is cleared to 0, software can add a TRB no later than IST[2:0] Microframes before that TRB is scheduled to be executed. If bit [3] of the IST is set to 1, a TRB is added by software no later than IST[2:0] Frames before that TRB is scheduled to be executed.

(4) Structural Parameters 3 Register (USB3m_HOST_HCSPARAMS3)

This register is structural parameter register 3.

Access Size : 32 bits
Address : <USB3m_host_base> + 000Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	U2 Device Exit Latency[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	U1 Device Exit Latency[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	U2 Device Exit Latency[15:0]	0h	R	Worst case latency to transition from U2 to U0. Applies to all root hub ports. The following are permissible values: 0000h: Zero 0001h: Less than 1 µs 0002h: Less than 2 µs ⋮ 07FFh: Less than 2047 µs 0800h to FFFFh: Reserved
15 to 8	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
7 to 0	U1 Device Exit Latency[7:0]	0h	R	Worst case latency to transition a root hub Port Link State (PLS) from U1 to U0. Applies to all root hub ports. The following are permissible values: 00h: Zero 01h: Less than 1 µs 02h: Less than 2 µs ⋮ 0Ah: Less than 10 µs 0Bh to FFh: Reserved

(5) Capability Parameter 1 Register (USB3m_HOST_HCCPARAMS1)

This register is the capability parameter register.

Access Size : 32 bits
Address : <USB3m_host_base> + 0010h
Initial Value : 0140_FE8Ch

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	xHCI Extended Capabilities Pointer (xECP)[15:0]															
Initial Value	0	0	0	0	0	0	0	1	0	1	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Maximum Primary Stream Array Size (MaxPSASize)[3:0]				Contiguous Frame ID Capability (CFC)	Stopped EDTLA Capability (SEC)	Stopped Short Packet Capability (SPC)	Parse All Event Data (PAE)	No Secondary SID Support (NSS)	Latency Tolerance Messaging Capability (LTC)	Light HC Reset Capability (LHRC)	Port Indicators (PIND)	Port Power Control (PPC)	Context Size (CSZ)	BW Negotiation Capability (BNC)	64-bit Addressing Capability (AC64)
Initial Value	1	1	1	1	1	1	1	0	1	0	0	0	1	1	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	xHCI Extended Capabilities Pointer (xECP)[15:0]	140h	R	This field indicates the existence of a capabilities list. The value of this field indicates a relative offset, in 32-bit words, from Base to the beginning of the first extended capability. For example, using the offset of Base is 1000h and the xECP value of 0068h, we can calculate the following effective address of the first extended capability: 1000h + (0068h << 2) -> 1000h + 01A0h -> 11A0h
15 to 12	Maximum Primary Stream Array Size (MaxPSASize)[3:0]	Fh	R	This field identifies the maximum size Primary Stream Array that the xHC supports. The Primary Stream Array size = 2MaxPSASize+1. Valid MaxPSASize values are 0 to 15, where 0 indicates that streams are not supported
11	Contiguous Frame ID Capability (CFC)	1h	R	This flag indicates that the host controller implementation is capable of matching the Frame ID of consecutive Isoch TDs.
10	Stopped EDTLA Capability (SEC)	1h	R	This flag indicates that the host controller implementation Stream Context supports a Stopped EDTLA field. Stopped EDTLA Capability support (i.e. SEC = '1') shall be mandatory for all xHCI 1.2 compliant xHCs.
9	Stopped Short Packet Capability (SPC)	1h	R	This flag indicates that the host controller implementation is capable of generating a Stopped Short Packet Completion Code.
8	Parse All Event Data (PAE)	0h	R	This flag indicates whether the host controller implementation Parses all Event Data TRBs while advancing to the next TD after a Short Packet, or it skips all but the first Event Data TRB. A 1 in this bit indicates that all Event Data TRBs are parsed. A 0 in this bit indicates that only the first Event Data TRB is parsed.
7	No Secondary SID Support (NSS)	1h	R	This flag indicates whether the host controller implementation supports Secondary Stream IDs. A 1 in this bit indicates that Secondary Stream ID decoding is not supported. A 0 in this bit indicates that Secondary Stream ID decoding is supported.
6	Latency Tolerance Messaging Capability (LTC)	0h	R	This flag indicates whether the host controller implementation supports Latency Tolerance Messaging (LTM). A 1 in this bit indicates that LTM is supported. A 0 in this bit indicates that LTM is not supported.
5	Light HC Reset Capability (LHRC)	0h	R	This flag indicates whether the host controller implementation supports a Light Host Controller Reset. A 1 in this bit indicates that Light Host Controller Reset is supported. A 0 in this bit indicates that Light Host Controller Reset is not supported. The value of this flag affects the functionality of the Light Host Controller Reset (LHCRST) flag in the USBCMD register.

Bit	Bit Name	Initial Value	R/W	Description
4	Port Indicators (PIND)	0h	R	This bit indicates whether the xHC root hub ports support port indicator control. When this bit is 1, the port status and control registers include a readable/writeable field for controlling the state of the port indicator.
3	Port Power Control (PPC)	1h	R	This flag indicates whether the host controller implementation includes port power control. A 1 in this bit indicates the ports have port power switches. A 0 in this bit indicates the port do not have port power switches. The value of this flag affects the functionality of the PP flag in each port status and control register.
2	Context Size (CSZ)	1h	R	If this bit is set to 1b, then the xHC uses 64 byte Context data structures. If this bit is cleared to 0b, then the xHC uses 32 byte Context data structures. Note: This flag does not apply to Stream Contexts
1	BW Negotiation Capability (BNC)	0h	R	This flag identifies whether the xHC has implemented the Bandwidth Negotiation. Values for this flag have the following interpretation: 0b: BW Negotiation is not implemented. 1b: BW Negotiation is implemented.
0	64-bit Addressing Capability (AC64)	0h	R	This flag documents the addressing range capability of this implementation. The value of this flag determines whether the xHC has implemented the higher-order 32 bits of a 64-bit register and data structure pointer fields. Values for this flag have the following interpretation: 0b: 32-bit address memory pointers are implemented 1b: 64-bit address memory pointers are implemented If 32-bit address memory pointers are implemented, the xHC ignores the higher-order 32 bits of a 64-bit data structure pointer fields, and system software ignores the higher-order 32 bits of a 64-bit xHC registers.

(6) Doorbell Offset Register (USB3m_HOST_DBOFF)

This register indicates the doorbell array offset.

Access Size : 32 bits
Address : <USB3m_host_base> + 0014h
Initial Value : 0000_0700h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Doorbell Array Offset[29:14]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Doorbell Array Offset[13:0]														-	-
Initial Value	0	0	0	0	0	1	1	1	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	Doorbell Array Offset[29:0]	1C0h	R	Default = implementation dependent. This field defines the offset in Dwords of the base address of the Doorbell Array from main base address (i.e. the base address of the xHCI Capability register address space).
1, 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

(7) Runtime Register Space Offset Register (USB3m_HOST_RSTOFF)

This register indicates the 32-byte offset of the xHCI Runtime Registers from the Base.

Access Size : 32 bits
Address : <USB3m_host_base> + 0018h
Initial Value : 0000_0600h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Runtime Register Space Offset[26:11]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Runtime Register Space Offset[10:0]											-	-	-	-	-
Initial Value	0	0	0	0	0	1	1	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	Runtime Register Space Offset[26:0]	30h	R	Default = implementation dependent. This field defines the 32-byte offset of the xHCI Runtime Registers from the Base. i.e. Runtime Register Base Address = Base + Runtime Register Set Offset.
4 to 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

(8) Capability Parameter 2 Register (USB3m_HOST_HCCPARAMS2)

This register is capability parameter register 2.

Access Size : 32 bits
Address : <USB3m_host_base> + 001Ch
Initial Value : 0000_002Dh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	Configuration Information Capability (CIC)	Large ESIT Payload Capability (LEC)	Compliance Transition Capability (CTC)	Force Save Context Capability (FSC)	Configure Endpoint Command Max Exit Latency Too Large Capability (CMC)	U3 Entry Capability (U3C)
Initial Value	0	0	0	0	0	0	0	0	0	0	1	0	1	1	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
5	Configuration Information Capability (CIC)	1h	R	This bit indicates if the xHC supports extended Configuration Information. When this bit is 1b, the Configuration Value, Interface Number, and Alternate Setting fields in the Input Control Context are supported. When this bit is 0b, the extended Input Control Context fields are not supported.
4	Large ESIT Payload Capability (LEC)	0h	R	This bit indicates whether the xHC supports ESIT Payloads greater than 48K bytes. When this bit is 1b, ESIT Payloads greater than 48K bytes are supported. When this bit is 0b, ESIT Payloads greater than 48K bytes are not supported.
3	Compliance Transition Capability (CTC)	1h	R	This bit indicates whether the xHC USB3 Root Hub ports support the Compliance Transition Enabled (CTE) flag. When this bit is 1b, transition of the port state machine of a USB3 Root Hub to the Compliance substate shall be explicitly enabled by software. When this bit is 0b, transition of the port state machine of a USB3 Root Hub to the Compliance substate are automatically enabled.
2	Force Save Context Capability (FSC)	1h	R	This bit indicates whether the xHC supports the Force Save Context Capability. When this bit is 1b, the Save State operation shall save any cached Slot, Endpoint, Stream or other Context information to memory.
1	Configure Endpoint Command Max Exit Latency Too Large Capability (CMC)	0h	R	This bit indicates whether a Configure Endpoint Command is capable of generating a Max Exit Latency Too Large Capability Error. When this bit is 1b, a Max Exit Latency Too Large Capability Error can be returned by a Configure Endpoint Command. When this bit is 0b, a Max Exit Latency Too Large Capability Error shall not be returned by a Configure Endpoint Command. This capability is enabled by the CME flag in the USBCMD register.
0	U3 Entry Capability (U3C)	1h	R	This bit indicates whether the xHC Root Hub ports support port Suspend Complete notification. When this bit is 1b, PLC shall be asserted on any transition of PLS to the U3 State.

6.4.4.4.2 Host Controller Operational Registers

(1) USB Command Register (USB3m_HOST_USBCMD)

This register issues USB commands.

Access Size : 32 bits
Address : <USB3m_host_base> + 0020h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	CEM Enable (CME)	Stopped – Short Packet Enable (SPE)	Enable U3 MFINDEX Stop (EU3S)	Enable Wrap Event (EWE)	Controller Restore State (CRS)	Controller Save State (CSS)	Light Host Controller Reset (LHCRST)	-	-	-	Host System Error Enable (HSEE)	Interrupter Enable (INTE)	Host Controller Reset (HCRST)	Run/Stop (R/S)
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	RW	RW	RW	RW	RW	RW	R	R	R	R	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 14	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
13	CEM Enable (CME)	0h	RW	When set to 1b, a Max Exit Latency Too Large Capability Error can be returned by a Configure Endpoint Command. When cleared to 0b, a Max Exit Latency Too Large Capability Error shall not be returned by a Configure Endpoint Command. This bit is Reserved if CMC = '0b'.
12	Stopped – Short Packet Enable (SPE)	0h	RW	When set to 1b, the xHC can generate a Stopped Short Packet Completion Code. This bit is Reserved if SPC = '0b'.
11	Enable U3 MFINDEX Stop (EU3S)	0h	RW	Default = 0b. When set to 1b, the xHC can stop the MFINDEX counting action if all Root Hub ports are in the U3, Disconnected, Disabled, or Powered-off state. When cleared to 0b, the xHC can stop the MFINDEX counting action if all Root Hub ports are in the Disconnected, Disabled, Training, or Powered-off state. The USB3HOST does not implement this function.
10	Enable Wrap Event (EWE)	0h	RW	Default = 0b. When set to 1b, the xHC generates a MFINDEX Wrap Event every time the MFINDEX register transitions from 0_3FFFh to 0_0000h. When cleared to 0b, no MFINDEX Wrap Events are generated
9	Controller Restore State (CRS)	0h	RW	Default = 0b. When set to 1b, and HCHalted (HCH) = 1b, then the xHC performs a Restore State operation and restores its internal state. When set to 1b and Run/Stop (R/S) = 1b or HCHalted (HCH) = 0b, or when cleared to 0b, no Restore State operation is performed. This flag always returns 0b when read. Refer to the Restore State Status (RSS) flag in the USBSTS register for information on Restore State completion. Note that undefined behavior can occur if a Restore State operation is initiated while Save State Status (SSS) = 1b.
8	Controller Save State (CSS)	0h	RW	Default = 0b. When 1b is written by software and HCHalted (HCH) = 1b, then the xHC saves any internal state that can be restored by a subsequent Restore State operation. When 1b is written by software and HCHalted (HCH) = 0b, or 0b is written, no Save State operation is performed. This flag always returns 0b when read. Refer to the Save State Status (SSS) flag in the USBSTS register for information on Save State completion. Note that undefined behavior can occur if a Save State operation is initiated while Restore State Status (RSS) = 1b.
7	Light Host Controller Reset (LHCRST)	0h	R	The Default = Controller Light HC Reset Capability (LHRC) bit in the HCCPARAMS1 register is formed on completion of the save state. Note that the xHC does not affect the state of the ports. When system software reads this bit, the value 0 indicates that the Light Host Controller Reset has been completed and it is safe for software to re-initialize the xHC. The value 1 indicates that the Light Host Controller Reset has not yet been completed. If not implemented, reading of this flag always returns a "0b".

Bit	Bit Name	Initial Value	R/W	Description
6 to 4	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
3	Host System Error Enable (HSEE)	0h	RW	Default = 0b. When this bit is 1b, and the HSE bit in the USBSTS register is 1b, the xHC asserts the out-of-band error signal for the host. The signal is acknowledged by software clearing the HSE bit.
2	Interrupter Enable (INTE)	0h	RW	Default = 0b. This bit provides system software with a means of enabling or disabling the host system interrupts generated by Interrupters. When this bit is 1b, then Interrupter host system interrupt generation is allowed, e.g. the xHC issues an interrupt at the next interrupt threshold if the host system interrupt mechanism (e.g. MSI, MSI-X, etc.) is enabled. The interrupt is acknowledged by a host system interrupt specific mechanism.
1	Host Controller Reset (HCRST)	0h	RW	Default = 0b. This control bit is used by software to reset the host controller. The effects of this bit on the xHC and the Root Hub registers are similar to those of a Chip Hardware Reset. When 1b is written to this bit by software, the Host Controller resets its internal pipelines, timers, counters, state machines, etc. to their initial values. Any transaction currently in progress on the USB is immediately terminated. A USB reset is not driven on USB2 downstream ports, however a Hot or Warm Reset is initiated on USB3 Root Hub downstream ports. PCI Configuration registers are not affected by this reset. All operational registers, including port registers and port state machines are set to their initial values. Software reinitializes the host controller in order to return the host controller to an operational state. This bit is cleared to 0b by the Host Controller when the reset process is complete. Software cannot terminate the reset process early by writing 0b to this bit and does not write any xHC Operational or Runtime registers until while HCRST is 1b. Note that the completion of the xHC reset process is not gated by the Root Hub port reset process. This bit is not set to 1b by software when the HCHalted (HCH) bit in the USBSTS register is 0b. Attempting to reset an actively running host controller can result in undefined behavior.
0	Run/Stop (R/S)	0h	RW	Default = 0b. 1b = Run. 0b = Stop. When set to 1b, the xHC proceeds with execution of the schedule. The xHC continues execution as long as this bit is set to 1b. When this bit is cleared to 0b, the xHC completes any current or queued commands or TDs, and any USB transactions associated with them, then halt. The xHC halts within 16 ms. After the Run/Stop bit is cleared by software if the above conditions have been met. The HCHalted (HCH) bit in the USBSTS register indicates when the xHC has finished its pending pipelined transactions and has entered the stopped state. 1b is not written by software to this flag unless the xHC is in the Halted state (i.e. HCH in the USBSTS register is 1b). Doing so can yield undefined results. Writing 0b to this flag when the xHC is in the Running state (i.e. HCH = 0b) and any Event Rings are in the Event Ring Full state can result in lost events.

(2) USB Status Register (USB3m_HOST_USBSTS)

This register is the USB status register.

Access Size : 32 bits
Address : <USB3m_host_base> + 0024h
Initial Value : 0000_0001h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	Host Controller Error (HCE)	Controller Not Ready (CNR)	Save/Restore Error (SRE)	Restore State Status (RSS)	Save State Status (SSS)	-	-	-	Port Change Detect (PCD)	Event Interrupt (EINT)	Host System Error (HSE)	-	HCHalted (HCH)
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	RW1	R	R	R	R	R	RW1	RW1	RW1	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 13	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
12	Host Controller Error (HCE)	0h	R	Default = 0b. 0b = No internal xHC error conditions exist and 1b = Internal xHC error condition. This flag shall be set to indicate detection of an internal error condition, which requires a reset and reinitialization of the xHC by software.
11	Controller Not Ready (CNR)	0h	R	Default = 0b. 0b = Ready and 1b = Not Ready. Doorbell or Operational register of the xHC, other than the USBSTS register, are not written by software while CNR = 0b. This flag is set by the xHC after a Chip Hardware Reset and cleared when the xHC is ready to begin accepting register writes. This flag remains cleared (0) until the next Chip Hardware Reset.
10	Save/Restore Error (SRE)	0h	RW1	Default = 0b. If an error occurs during a Save or Restore operation, this bit is set to 1b. This bit is cleared to 0b when a Save or Restore operation is initiated or when written with 1b.
9	Restore State Status (RSS)	0h	R	Default = 0b. When the Controller Restore State (CRS) flag in the USBCMD register is written with 1b, this bit is set to 1b and remains 1b while the xHC restores its internal state. When the Restore State operation is complete, this bit is cleared to 0b.
8	Save State Status (SSS)	0h	R	Default = 0b. When the Controller Save State (CSS) flag in the USBCMD register is written with 1b, this bit is set to 1b and remains 1b while the xHC saves its internal state. When the Save State operation is complete, this bit is cleared to 0b.
7 to 5	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
4	Port Change Detect (PCD)	0h	RW1	Default = 0b. The xHC sets this bit to 1b when a bit of any port has a state transition from 0b to 1b. This bit can be maintained in the Aux Power as well. Alternatively, loading this bit with the OR of all of the PORTSC change bits on a D3 to D0 transition of the xHC is also acceptable. This bit provides system software an efficient means of determining if there has been Root Hub port activity. It is cleared by writing 1b. Writing 0b has no effect.
3	Event Interrupt (EINT)	0h	RW1	Default = 0b. The xHC sets this bit to 1b in response to a transition of the Interrupt Pending (IP) bit from any interrupt source from 0b to 1b. Software that uses EINT clears it prior to clearing any IP flags. A race condition can occur if software clears the IP flags then clears the EINT flag, and another IP 0 to 1 transition occurs between these operations. In this case the new transition of the IP bit shall be lost. It is cleared by writing 1b. Writing 0b has no effect.
2	Host System Error (HSE)	0h	RW1	Default = 0b. The xHC sets this bit to 1b when a serious error is detected, either internal to the xHC or during a host system access involving the xHC module. In a PCI system, conditions that lead to this bit being set to 1b include a PCI Parity error, PCI Master Abort, and PCI Target Abort. When this error occurs, the xHC clears the Run/Stop (R/S) bit in the USBCMD register to prevent further execution of the scheduled TDs. If the HSEE bit in the USBCMD register is 1, the xHC also asserts the out-of-band error signal to the host. It is cleared by writing 1b. Writing 0b has no effect.

Bit	Bit Name	Initial Value	R/W	Description
1	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
0	HCHalted (HCH)	1h	R	Default = 1b. This bit is 0b whenever the Run/Stop (R/S) bit is set to 1b. The xHC sets this bit to 1b after it has stopped executing as a result of the Run/Stop (R/S) bit being cleared to 0b, either by software or by the xHC hardware (e.g. internal error). If this bit is 1b, then SOFs, microSOFs, or Isochronous Timestamp Packets (ITP) is not generated by the xHC, and any received Transaction Packet is dropped.

(3) Page Size Register (USB3m_HOST_PAGESIZE)

This register indicates the page size supported by the xHC implementation.

Access Size : 32 bits
Address : <USB3m_host_base> + 0028h
Initial Value : 0000_0001h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Page Size[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
15 to 0	Page Size[15:0]	1h	R	Default = Implementation defined. This field defines the page size supported by the xHC implementation. This xHC supports a page size of 2^(n+12) if bit n is set. For example, if bit 0b is set, the xHC supports 4-Kbyte page sizes. For a Virtual Function, this register reflects the page size selected in the System Page Size field of the SR-IOV Extended Capability structure. For the Physical Function 0, this register reflects the implementation dependent default xHC page size. Various xHC resources reference PAGESIZE to describe their minimum alignment requirements. The maximum possible page size is 128M.

(4) Device Notification Control Register (USB3m_HOST_DNCTRL)

This register controls the device notification.

Access Size : 32 bits
Address : <USB3m_host_base> + 0034h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Notification Enable[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
15 to 0	Notification Enable[15:0]	0h	RW	When a Notification Enable bit is set, a Device Notification Event is generated when a Device Notification Transaction Packet is received with the matching value in the Notification Type field. For example, setting N1 to 1 enables Device Notification Event generation if a Device Notification TP is received with its Notification Type field set to 1 (FUNCTION_WAKE), etc.

(5) Command Ring Control Low Register (USB3m_HOST_CRCRL)

This register contains the lower-order bits of the initial value of the 64-bit command ring dequeue pointer and the command ring control bits.

Access Size : 32 bits
Address : <USB3m_host_base> + 0038h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Command Ring Pointer Low[25:10]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Command Ring Pointer Low[9:0]										-	-	Command Ring Running (CRR)	Command Abort (CA)	Command Stop (CS)	Ring Cycle State (RCS)
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	R	R	R	RW1	RW1	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	Command Ring Pointer Low[25:0]	0h	RW	Default = 0b. This field defines lower-order bits of the initial value of the 64-bit Command Ring Dequeue Pointer. Writing to this field is ignored when Command Ring Running (CRR) = 1b. In writing to the CRCR (combination of CRCRL and CRCRH) while the Command Ring is stopped (CRR = 0b), the value of this field is used to fetch the first Command TRB the next time writing to the Host Controller Doorbell register proceeds with the DB Reason field set to Host Controller Command. If the CRCR is not written while the Command Ring is stopped (CRR = 0b), then the Command Ring begins fetching Command TRBs at the current value of the internal xHC Command Ring Dequeue Pointer. Reading this field always returns 0b.
5, 4	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
3	Command Ring Running (CRR)	0h	R	Default = 0b. This flag is set to 1b if the Run/Stop (R/S) bit is 1 and the Host Controller Doorbell register is written with the DB Reason field set to Host Controller Command. It is cleared to 0b when the Command Ring is “stopped” after writing 1b to the Command Stop (CS) or Command Abort (CA) flags, or if the R/S bit is cleared to 0b.
2	Command Abort (CA)	0h	RW1	Default = 0b. Writing a 1b to this bit immediately terminates the command currently being executed, stops the Command Ring, and generates a Command Completion Event with the Completion Code set to Command Ring Stopped. The next write to the Host Controller Doorbell with DB Reason field set to Host Controller Command shall restart the Command Ring operation. Writing to this flag is ignored by the xHC if Command Ring Running (CRR) = 0b. Reading this bit always returns 0b.
1	Command Stop (CS)	0h	RW1	Default = 0b. Writing a 1b to this bit stops the operation of the Command Ring after completion of the command currently being executed, and generates a Command Completion Event with the Completion Code set to Command Ring Stopped and the Command TRB Pointer set to the current value of the Command Ring Dequeue Pointer. The next write to the Host Controller Doorbell with DB Reason field set to Host Controller Command shall restart the Command Ring operation. Writing to this flag is ignored by the xHC if Command Ring Running (CRR) = 0b. Reading this bit always returns 0b.
0	Ring Cycle State (RCS)	0h	RW	This bit identifies the value of the xHC Consumer Cycle State (CCS) flag for the TRB referenced by the Command Ring Pointer. Writing to this flag is ignored if Command Ring Running (CRR) is 1b. In case of writing to the CRCR while the Command Ring is stopped (CRR = 0b), the value of this flag is used to fetch the first Command TRB the next time writing to the Host Controller Doorbell register proceeds with the DB Reason field set to Host Controller Command. If the CRCR is not written while the Command Ring is stopped (CRR = 0b), then the Command Ring begins fetching Command TRBs using the current value of the internal Command Ring CCS flag. Reading this flag always returns 0b.

(6) Command Ring Control High Register (USB3m_HOST_CRCRH)

This register defines higher-order bits of the initial value of the 64-bit Command Ring Dequeue Pointer.

Access Size : 32 bits
Address : <USB3m_host_base> + 003Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Command Ring Pointer High[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Command Ring Pointer High[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	Command Ring Pointer High[31:0]	0h	RW	Default = 0b. This field defines higher-order bits of the initial value of the 64-bit Command Ring Dequeue Pointer. Writing to this field is ignored when Command Ring Running (CRR) = 1b. In case of writing to the CRCR while the Command Ring is stopped (CRR = 0b), the value of this field is used to fetch the first Command TRB the next time writing to the Host Controller Doorbell register proceeds with the DB Reason field set to Host Controller Command. If the CRCR is not written while the Command Ring is stopped (CRR = 0b) then the Command Ring begins fetching Command TRBs at the current value of the internal xHC Command Ring Dequeue Pointer. Reading this field always returns 0b.

(7) Device Context Base Address Array Pointer Low Register (USB3m_HOST_DCBAAPL)

This register defines lower-order bits of the 64-bit base address of the Device Context Pointer Array.

Access Size : 32 bits
Address : <USB3m_host_base> + 0050h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Device Context Base Address Array Pointer Low[25:10]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Device Context Base Address Array Pointer Low[9:0]										-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	Device Context Base Address Array Pointer Low[25:0]	0h	RW	This field defines lower-order bits of the 64-bit base address of the Device Context Pointer Array. A table of address pointers that reference Device Context structures for the devices is attached to the host.
5 to 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

(8) Device Context Base Address Array Pointer High Register (USB3m_HOST_DCBAAPH)

This register defines higher-order bits of the 64-bit base address of the Device Context Pointer Array.

Access Size : 32 bits
Address : <USB3m_host_base> + 0054h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Device Context Base Address Array Pointer High[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Device Context Base Address Array Pointer High[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	Device Context Base Address Array Pointer High[31:0]	0h	RW	This field defines higher-order bits of the 64-bit base address of the Device Context Pointer Array. A table of address pointers that reference Device Context structures for the devices is attached to the host.

(9) Configure Register (USB3m_HOST_CONFIG)

This register configures USB3HOST.

Access Size : 32 bits
Address : <USB3m_host_base> + 0058h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	Configuration Information Enable (CIE)	U3 Entry Enable (U3E)	Max Device Slots Enabled (MaxSlotsEn)[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
9	Configuration Information Enable (CIE)	0h	RW	When set to 1b, the software shall initialize the Configuration Value, Interface Number, and Alternate Setting fields in the Input Control Context when it is associated with a Configure Endpoint Command. When this bit is 0b, the extended Input Control Context fields are not supported.
8	U3 Entry Enable (U3E)	0h	RW	When set to 1b, the xHC shall assert the PLC flag (1b) when a Root Hub port transitions to the U3 State.
7 to 0	Max Device Slots Enabled (MaxSlotsEn) [7:0]	0h	RW	Default = 0b. This field specifies the maximum number of enabled Device Slots. Valid values are in the range of 0 to MaxSlots. Enabled Devices Slots are allocated contiguously. E.g.) A value of 16 specifies that Device Slots 1 to 16 are active. A value of 0 disables all Device Slots. A disabled Device Slot shall not respond to Doorbell Register references. This field shall not be modified by software if the xHC is running (Run/Stop (R/S) = '1b').

6.4.4.4.3 Port Register Sets in Host Controller Operational Registers

(1) U3P1 Port Status and Control Register (USB3m_HOST_U3P1PORTSC)

This register contains the USB 3.2 port status and control bits.

Access Size : 32 bits

Address : <USB3m_HOST_base> + 0420h

Initial Value : 0000_02A0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Warm Port Reset (WPR)	Device Removable (DR)	-	-	Wake on Overcurrent Enable (WOE)	Wake on Disconnect Enable (WDE)	Wake on Connect Enable (WCE)	Cold Attach Status (CAS)	Port Config Error Change (CEC)	Port Link State Change (PLC)	Port Reset Change (PRC)	Over-current Change (OCC)	Warm Port Reset Change (WRC)	Port Enable/Disable Change (PEC)	Connect Status Change (CSC)	Port Link State Write Strobe (LWS)
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW1	R	R	R	RW	RW	RW	R	RW1	RW1	RW1	RW1	RW1	RW1	RW1	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Port Indicator Control (PIC)[1:0]		Port Speed[3:0]				Port Power (PP)	Port Link State (PLS)[3:0]				Port Reset (PR)	Over-current Active (OCA)	-	Port Enable/ Disable (PED)	Current Connect Status (CCS)
Initial Value	0	0	0	0	0	0	1	0	1	0	1	0	0	0	0	0
R/W	RW	RW	R	R	R	R	RW	RW	RW	RW	RW	RW1	R	R	RW1	R

Bit	Bit Name	Initial Value	R/W	Description
31	Warm Port Reset (WPR)	0h	RW1	1b: Starts Warm Reset sequence, and sets the PR bit to 1b.
30	Device Removable (DR)	0h	R	1b: A device connected to this Port is non-removable. 0b: A device connected to this Port is removable.
29, 28	-	All 0	R	Reserved These bits are read as 0b. The write value should always be 0b.
27	Wake on Overcurrent Enable (WOE)	0h	RW	1b: Enables over-current condition as System Wake-up Event The USB3HOST can write this bit in the case of both “PED = 1b” and “PED = 0b”
26	Wake on Disconnect Enable (WDE)	0h	RW	1b: Enables device disconnection as System Wake-up Event The USB3HOST can write this bit in the case of both “PED = 1b” and “PED = 0b”.
25	Wake on Connect Enable (WCE)	0h	RW	1b: Enables device connection as System Wake-up Event The USB3HOST can write this bit in the case of both “PED = 1b” and “PED = 0b”.
24	Cold Attach Status (CAS)	0h	R	1b: Far-end Receiver Termination is detected but Port Status cannot transition to Enabled State. This bit is fixed to “0b” in the USB3HOST.
23	Port Config Error Change (CEC)	0h	RW1	This bit is set when configuration with Link Partner fails.
22	Port Link State Change (PLC)	0h	RW1	0b: No Change 1b: Link state is changed. This bit is set in the case of below Link transitions. U3 -> Resume Resume -> Recovery -> U0 U3 -> Recovery ->U0 Any state -> Inactive (In the case of U3E = 1b) Any state -> U3 When 1b is written by software, the bit is cleared.

Bit	Bit Name	Initial Value	R/W	Description
21	Port Reset Change (PRC)	0h	RW1	This bit is set when Port reset process completes. (Port Reset changes from 1b to 0b) But if Port reset process is finished in below cases, this bit is not set to "1b". When SW sets PP bit to "0b" When SW sets PED bit to "1b" When the Over Current is occurred 0b: No Change 1b: Reset is complete. Writing 1b by software clears this bit. When 1b is written by software, this bit is cleared.
20	Over-current Change (OCC)	0h	RW1	When Over-current Active changes from "0b" to "1b", this bit is set to 1b. When 1b is written by software, this bit is cleared.
19	Warm Port Reset Change (WRC)	0h	RW1	This bit is set to 1b when a Warm Reset is completed
18	Port Enable/Disable Change (PEC)	0h	RW1	0b: No Change 1b: Port enabled/disabled status has changed. This bit for a port is set when the port is a USB2 protocol port and is disabled due to exit under the appropriate conditions at the EOF2 point. When 1b is written by software, this bit is cleared. If Port Power is 0b, this bit is set to 0b. U3P[m]PORTSC.PEC is fixed to "0b".
17	Connect Status Change (CSC)	0h	RW1	0b: No Change 1b: Change in Current Connect Status The xHC sets this bit to 1b at change of port device connection status. When 1b is written by software, this bit is cleared. If Port Power is 0b, this bit is set to 0b.
16	Port Link State Write Strobe (LWS)	0h	RW	1b: Writing to PLS field is enabled. 0b: Writing to PLS field is ignored. The read value is 0
15, 14	Port Indicator Control (PIC)[1:0]	0h	RW	If Port Indicator (PIND) bit in HCCPRAMS1 Register is 0, writing to this field has no effect. If the Port Indicator (PIND) bit is 1b: 00b: Port indicators are off 01b: Amber 10b: Green 11b: Undefined If Port Power is 0b, this field is set to 0b.
13 to 10	Port Speed[3:0]	0h	R	Speed type of USB device connected to the port. This is enabled only when a device is connected to the port. (Current Connect Status is 1b) After a port reset, this field indicates the speed of the device connected to the port. If the reset or speed detection fails, this field indicates an unknown speed. When the Current Connect Status changes from 0b to 1b, this field indicates an undefined speed. 0000b: Undefined speed (before speed detection) 0001b to 0011b: Reserved 0100b: SuperSpeed Gen1x1 device is attached. 0101b: SuperSpeed Plus Gen2x1 device is attached. 0110b: SuperSpeed Plus Gen1x2 device is attached (not supported). 0111b: SuperSpeed Plus Gen2x2 device is attached (not supported). 1000b to 1111b: Reserved
9	Port Power (PP)	1h	RW	This field reflects a port's logical power state. 0b: This port is in the Powered-off state. (USB3m_VBUSEN is low.) 1b: This port is not in the Powered-off state. (USB3m_VBUSEN is high.) When the Port Power Control (PPC) bit in the HCCPARAMS1 Register is 1b, the xHC has a port power control switch and this bit shows the current state of the switch. (0b: off, 1b: on) When the Port Power Control (PPC) bit in the HCCPARAMS1 Register is set to "0b", the xHC has no port power control switch and each port is hard wired to power and not affected by this bit. When the USB3m_OVRCURN pin detects low within a fixed interval, the PP bit is changed from 1 to 0. After modifying PP, software shall read PP and confirm that it is reached its target state before modifying it again (page 312 of the xHCI specification). PP flag can be delayed in reflecting this change, (Ex) due to waiting for a port related state machine to complete reset signaling or other operation. (page 315 of the xHCI specification)

Bit	Bit Name	Initial Value	R/W	Description
8 to 5	Port Link State (PLS)[3:0]	5h	RW	This field is used for port power management and shows the Current Link state. When the PED is 1b, System software sets this bit then sets Link U state. Port Link State is not set to Disabled, RxDetect, or Inactive State. 0000b: The link makes a transition to the U0 state from any U state. 0001b: Ignored. 0010b: Ignored. 0011b: The link makes a transition to the U3 state from any U state. 0100b: Ignored. 0101b: When PLS is set to the Disabled and PP is set to "1", the link makes a transition to the Disconnected. 0110b to 1001b: Ignored. 1010b: The link makes a transition to the Compliance mode. 1011b to 1111b: Ignored. To write to this field, the Port Link State Write strobe should be 1. Software reads this field to determine the success or failure of a transition to the U2 state. Write 0: Deasserts L1 signal. Write 1: No influence 0000b: Link is in the U0 State 0001b: Link is in the U1 State 0010b: Link is in the U2 State 0011b: Link is in the U3 State (Device Suspended) 0100b: Link is in the Disabled State 0101b: Link is in the RxDetect State 0110b: Link is in the Inactive State 0111b: Link is in the Polling State 1000b: Link is in the Recovery State 1001b: Link is in the Hot Reset State 1010b: Link is in the Compliance Mode State 1011b: Link is in the Test State 1100 to 1110b: Reserved 1111b: Link is in the Resume State If Port Power is 0, this field is undefined. Transitions between different states are not reflected until the transition is complete. (page 311 of the xHCI specification)
4	Port Reset (PR)	0h	RW1	0b: Port is not being reset. 1b: Port reset signal is being asserted. When software sets this bit from 0b to 1b, the bus reset sequence is started. This bit remains set to 1b until a reset by root hub is completed. When an error is detected during resetting, Port Speed field indicates an undefined speed. If Port Power is 0b, this field is set to 0b.
3	Over-current Active (OCA)	0h	R	0b: Not over-current condition 1b: Over-current condition When an over-current condition is removed, this bit changes from 1b to 0b automatically
2	-	0h	R	Reserved These bits are read as 0b. The write value should always be 0b.
1	Port Enable/Disable (PED)	0h	RW1	0b: Disabled 1b: Enabled After detecting a connection at a port, if SS port initialization or reset by the system software is successful, this bit is automatically enabled by the xHC. The Port is disabled by fault condition (disconnection event or other fault condition), or USB System Software. The bit status does not change until port status changes. If Port Power is 0b, this field is set to 0b.
0	Current Connect Status (CCS)	0h	R	0b: No device is present 1b: A device is present on port. Reflects current port status. If Port Power is 0b, this field is set to 0b.

(2) U3P1 Port Power Management Status and Control Register (USB3m_HOST_U3P1PORTPMSC)

This register contains the USB 3.2 port power management status and control bits.

Access Size : 32 bits
Address : <USB3m_host_base> + 0424h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	Force Link PM Accept (FLA)
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	U2 Timeout[7:0]								U1 Timeout[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
16	Force Link PM Accept (FLA)	0h	RW	0b -> 1b: St Link Function LMP with FLA = 1b is generated. 1b -> 0b: Set Link Function LMP with FLA = 0b is generated. This bit is set to 0 when PR changes from “0b” to “1b” or CCS changes from “0b” to “1b”. While PP is set to “0”, writing action to this bit is ignored.
15 to 8	U2 Timeout[7:0]	0h	RW	U2 inactivity timer Timeout value If FFh, a port is in the U2 entry disabled state. When PR bit is changed from “0b” to “1b”, this bit is initialized. 00h: Zero (default) 01h: 256 µs 02h: 512 µs ⋮ FEh: 65.024 ms FFh: Infinite
7 to 0	U1 Timeout[7:0]	0h	RW	U1 inactivity timer Timeout value If FFh, port is in the U1 entry disabled state. When PR bit is changed from “0b” to “1b”, this bit is initialized. 00h: Zero (default) 01h: 1 µs 02h: 2 µs ⋮ 7Fh: 127 µs 80h to FEh: Reserved FFh: Infinite

(3) U3P1 Port Link Info Register (USB3m_HOST_U3P1PORTLI)

This register indicates the USB 3.2 port link information.

Access Size : 32 bits
Address : <USB3m_host_base> + 0428h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	Tx Lane Count (TLC)[3:0]				Rx Lane Count (RLC)[3:0]			
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Link Error Count[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
23 to 20	Tx Lane Count (TLC)[3:0]	0h	R	This field that identifies the number of Transmit Lanes negotiated by the port. This is a “zerobased” value, where 0 to 15 represents Lane Counts of 1 to 16, respectively. This value is valid only when CCS = ‘1b’. TLC shall equal ‘0b’ for a simplex Sublink. This core’s value is fixed to “0h”.
19 to 16	Rx Lane Count (RLC)[3:0]	0h	R	This field that identifies the number of Receive Lanes negotiated by the port. This is a “zerobased” value, where 0 to 15 represents Lane Counts of 1 to 16, respectively. This value is valid only when CCS = ‘1b’. RLC shall equal ‘0b’ for a simplex Sublink. This core’s value is fixed to “0h”.
15 to 0	Link Error Count[15:0]	0h	RW	This field returns the number of link errors detected by the port. This value shall be reset to ‘0b’ by the assertion of a Chip Hardware Reset, HCRST, when PR transitions from ‘1b’ to ‘0b’, or when reset by software by writing 0 to it. This register will saturate at max and will increment by one each time a port transitions from U0 to Recovery to recover an error event.

(4) U3P1 Port Hardware LPM Control Register (USB3m_HOST_U3P1PORTHLPMC)

This register is reserved for USB 3.2. The Hardware LPM Control Register is used for USB 2.0 (**(8) U2P1 Port Hardware LPM Power Control Register (USB3m_HOST_U2P1PORTHLPMC)**).

Access Size : 32 bits
Address : <USB3m_host_base> + 042Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	—[31:0]	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

(5) U2P1 Port Status and Control Register (USB3m_HOST_U2P1PORTSC)

This register contains the USB 2.0 port status and control bits.

Access Size : 32 bits
Address : <USB3m_host_base> + 0430h
Initial Value : 0000_02A0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	Device Removable (DR)	-	-	Wake on Overcurrent Enable (WOE)	Wake on Disconnect Enable (WDE)	Wake on Connect Enable (WCE)	Cold Attach Status (CAS)	-	Port Link State Change (PLC)	Port Reset Change (PRC)	Over-current Change (OCC)	-	Port Enable/Disable Change (PEC)	Connect Status Change (CSC)	Port Link State Write Strobe (LWS)
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	RW	RW	RW	R	R	RW1	RW1	RW1	R	RW1	RW1	RW1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Port Indicator Control (PIC)[1:0]		Port Speed[3:0]				Port Power (PP)	Port Link State (PLS)[3:0]				Port Reset (PR)	Over-current Active (OCA)	-	Port Enable/ Disable (PED)	Current Connect Status (CCS)
Initial Value	0	0	0	0	0	0	1	0	1	0	1	0	0	0	0	0
R/W	RW	RW	R	R	R	R	RW	RW	RW	RW	RW	RW1	R	R	RW1	R

Bit	Bit Name	Initial Value	R/W	Description
31	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
30	Device Removable (DR)	0h	R	1b: A device connected to this Port is non-removable. 0b: A device connected to this Port is removable. In the USB3HOST, this bit is fixed to 0b to indicate that all USB2.0 ports are removable.
29, 28	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
27	Wake on Overcurrent Enable (WOE)	0h	RW	Write 1b: Enables over-current condition as System Wake-up Event The USB3HOST can write this bit in the case of both “PED = 1b” and “PED = 0b”.
26	Wake on Disconnect Enable (WDE)	0h	RW	Write 1b: Enables device disconnection as System Wake-up Event The USB3HOST can write this bit in the case of both “PED = 1b” and “PED = 0b”.
25	Wake on Connect Enable (WCE)	0h	RW	Write 1b: Enables device connection as System Wake-up Event The USB3HOST can write this bit in the case of both “PED = 1b” and “PED = 0b”.
24	Cold Attach Status (CAS)	0h	R	This bit is fixed to 0b for USB2 protocol ports.
23	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
22	Port Link State Change (PLC)	0h	RW1	0b: No Change 1b: Port Link State has changed. This flag is set to 1b due to the following PLS transitions: Refer to **Table 6.4-6**. When 1b is written by software, the bit is cleared
21	Port Reset Change (PRC)	0h	RW1	This bit is set when Port reset process completes. (Port Reset changes from 1 to 0) 0b: No Change 1b: Reset is complete. When 1b is written by software, the bit is cleared
20	Over-current Change (OCC)	0h	RW1	When Over-current Active changes, this bit is set to 1b. When 1b is written by software, the bit is cleared.
19	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

Bit	Bit Name	Initial Value	R/W	Description
18	Port Enable/Disable Change (PEC)	0h	RW1	0b: No Change 1b: Port enabled/disabled has changed. This bit for a port is set when the port is a USB2 protocol port and is disabled due to exit under the appropriate conditions at the EOF2 point. When 1b is written by software, the bit is cleared. Note: This flag is not set if the PED transition was due to software setting PP to “0b”.
17	Connect Status Change (CSC)	0h	RW1	0b: No Change 1b: Change in Current Connect Status The xHC sets this bit to 1b at change of CCS-bit’s status. When 1b is written by software, the bit is cleared. Note: This flag shall not be set if the CCS transition was due to software setting PP to ‘0b’.
16	Port Link State Write Strobe (LWS)	0h	RW1	1b: Writing to PLS field is enabled. 0b: Writing to PLS field is ignored. The read value is 0
15, 14	Port Indicator Control (PIC)[1:0]	0h	RW	If Port Indicator (PIND) bit in HCCPRAMS1 Register is 0b, writing to this field has no effect. If the Port Indicator (PIND) bit is 1b: 00b: Port indicators are off 01b: Amber 10b: Green 11b: Undefined In the USB3HOST, this bit is fixed to 0b.
13 to 10	Port Speed[3:0]	0h	R	Speed type of USB device connected to the port. This is enabled only when a device is connected to the port (Current Connect Status is 1b). After a port reset, this field indicates the speed of the device connected to the port. If the reset or speed detection fails, this field indicates an unknown speed. When the Current Connect Status changes from 0b to 1b, this field indicates an undefined speed. 0000b: Undefined speed (before speed detection) 0001b: Full-speed device attached 0010b: Low-speed device attached 0011b: High-speed device attached 0100b to 1111b: Reserved
9	Port Power (PP)	1h	RW	This field reflects a port’s logical power state. 0b : This port is in the Powered-off state. (USB3m_VBUSEN is low.) 1b : This port is not in the Powered-off state. (USB3m_VBUSEN is high.) When the Port Power Control (PPC) bit in the HCCPARAMS1 Register is 1b, the xHC has a port power control switch and this bit shows the current state of the switch. (0b: off, 1b: on) When the Port Power Control (PPC) bit in the HCCPARAMS1 Register is set to “0b”, the xHC has no port power control switch and each port is hard wired to power and not affected by this bit. When the USB3m_OVRCURN pin detects low within a fixed interval, the PP bit of each port is changed from 1b to 0b. After the HC reset releases, this bit is set from 0b to 1b automatically. This bit is set to 1b when in the Compliance Test Mode.

Bit	Bit Name	Initial Value	R/W	Description
8 to 5	Port Link State (PLS)[3:0]	5h	RW	This field is used for port power management and shows the Current Link state. When the PED is 1b, System software sets this bit then sets Link U state. Port Link State is not set to Disabled, RxDetect, or Inactive State. Write 0000b: The link makes a transition to the U0 state from any U state. Write 0001b: Ignored. Write 0010b: Requests LPM and asserting L1 signal on the USB2 bus. The link should enter U2 state if device response ACK. Write 0011b: The link makes a transition to the U3 state from any U state. Write 0100b to 1110b: Ignored. Write 1111b: xHC initial resume when port in U3 state. Writing to this field sets the Port Link State Write strobe 1. For USB2 Protocol port, writing 2 requests LPM. Software reads this field to determine success/failure of transition to U2 state. Write 0b: Deasserts L1 signal Write 1b: No influence Read 0000b: Link is in the Enabled / WLPM State Read 0001b: Reserved Read 0010b: Link is in the L1Suspend State Read 0011b: Link is in the Suspended State Read 0100b: Link is in the Powered-off State Read 0101b: Link is in the Disconnected State Read 0110b: Reserved Read 0111b: Link is in the Disabled State Read 1000b: Reserved Read 1001b: Link is in the Hot Reset State Read 1010b: Reserved Read 1011b: Link is in the Test Mode State Read 1100b to 1110b: Reserved Read 1111b: Link is in the Resuming / L1Resuming / SendEOR State If Port Power is set to “0b”, this field is undefined.
4	Port Reset (PR)	0h	RW1	0b: port is not in reset 1b: port reset assertion When this bit is set from 0b to 1b by software, the bus reset sequence is started. This bit remains to be set to 1b until a reset by root hub is completed. When an error is detected during resetting, Port Speed field indicates an undefined speed. If Port Power is 0b, this field is set to 0b.
3	Over-current Active (OCA)	0h	R	0b: Over-current condition 1b: Not over-current condition When an over-current condition is removed, this bit changes from 1b to 0b automatically.
2	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
1	Port Enable/ Disable (PED)	0h	RW1	0b: Disable 1b: Enable This bit is set to 1b when the USB2.0 port enters U0 state. If Port Power is 0b, this field is set to 0b.
0	Current Connect Status (CCS)	0h	R	0b: No device is present. 1b: A device is present on port. Reflects current port status. If Port Power is 0b, this field is set to 0b.

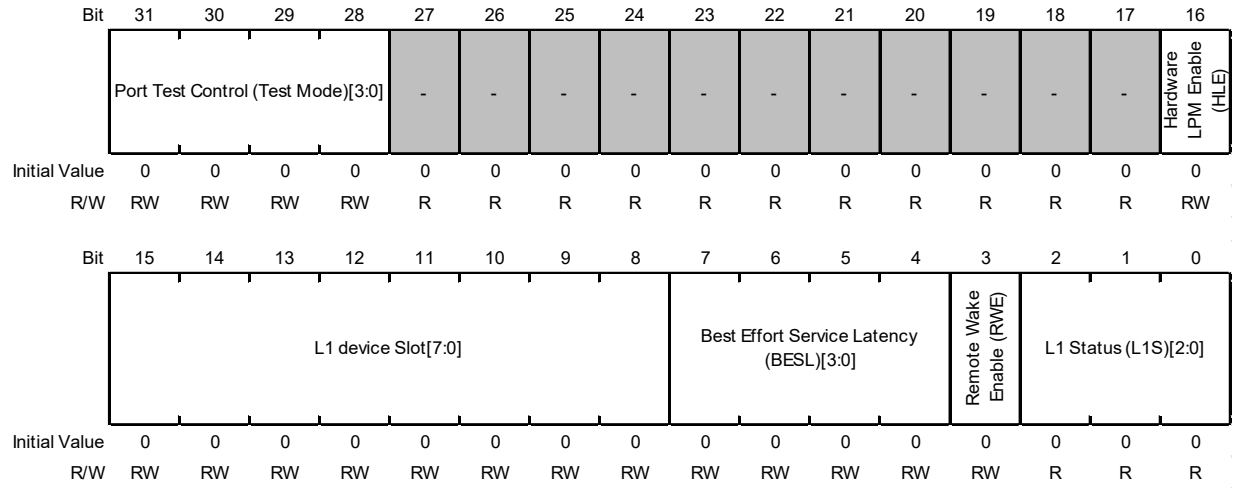
Table 6.4-6 PLS Transition

Transition	Condition
U3 -> Resume	Wakeup signal from a device
Resume -> U0	Host/Device Remote Resume complete
U2 -> U0	L1 Resume complete
U0 -> U0	L1 Entry Reject

(6) U2P1 Port Power Management Status and Control Register (USB3m_HOST_U2P1PORTPMSC)

This register contains the USB 2.0 port power management status and control bits.

Access Size : 32 bits
Address : <USB3m_host_base> + 0434h
Initial Value : 0000_0000h



Bit	Bit Name	Initial Value	R/W	Description
31 to 28	Port Test Control (Test Mode)[3:0]	0h	RW	When this field is '0b', the port is NOT operating in a test mode. A non-zero value indicates that it is operating in test mode and the specific test mode is indicated by the specific value. A nonzero Port Test Control value is only valid to a port that is in the Powered-Off state (PLS = Disabled). If the port is not in this state, the xHC shall respond with the Port Test Control field set to Port Test Control Error. Refer to section 4.19.6 of xHCI 1.2 specification for the operational model for using these test modes. The encoding of the Test Mode bits for a USB2 protocol port are : 0000b: Test mode not enabled 0001b: Test J_STATE 0010b: Test K_STATE 0011b: Test SE0_NAK 0100b: Test Packet 0101b: Test FORCE_ENABLE 0110b to 1110b: Reserved 1111b: Port Test Control Error Refer to sections 7.1.20 and 11.24.2.13 of the USB2 spec for more information on Test Modes.
27 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
16	Hardware LPM Enable (HLE)	0h	RW	If this bit is set to '1b', then hardware controlled LPM shall be enabled for this port. Refer to section 4.23.5.1.1.1 of xHCI 1.2 specification. If the USB2 Hardware LPM Capability is not supported (HLC = '0b') this field shall be RsvdZ. Note the BESL LMP Capability support (i.e. HLE = '1b' and BLC = '1b') shall be mandatory for all xHCI 1.2 compliant xHCs.
15 to 8	L1 device Slot[7:0]	0h	RW	System software sets this field to indicate the ID of the Device Slot associated with the device directly attached to the Root Hub port. A value of '0' indicates no device is present. The xHC uses this field to lookup information necessary to generate the LPM Token packet.
7 to 4	Best Effort Service Latency (BESL)[3:0]	0h	RW	System software sets this field to indicate to the recipient device how long the xHC will drive resume if it (the xHC) initiates an exit from L1. The BESL value encoding is defined in Table 13 of xHCI 1.2 specification. Note: The BESL field is used by both software and hardware controlled LPM. Refer to section 4.23.5.1.1 of xHCI 1.2 for more information on BESL use. Refer to section 5.2.5 of xHCI 1.2 for information on how DBESL can be used to establish an initial value for BESL.
3	Remote Wake Enable (RWE)	0h	RW	System software sets this flag to enable or disable the device for remote wake from L1. The value of this flag shall temporarily (while in L1) override the current setting of the Remote Wake feature set by the standard Set/ClearFeature() commands defined in *Universal Serial Bus Specification, revision 2.0, Chapter 9*.

Bit	Bit Name	Initial Value	R/W	Description
2 to 0	L1 Status (L1S)[2:0]	0h	R	This field is used by software to determine whether an L1-based suspend request (LPM transaction) was successful, specifically: 000b: Invalid – This field shall be ignored by software. 001b: Success – Port successfully transitioned to L1 (ACK) 010b: Not Yet – Device is unable to enter L1 at this time (NYET) 011b: Not Supported – Device does not support L1 transitions (STALL) 100b: Timeout/Error – Device failed to respond to the LPM Transaction or an error occurred 101b to 111b: Reserved The value of this field is only valid when the port resides in the L0 or L1 state (PLS = '0' or '2'). Refer to section 4.23.5.1.1 of xHCI 1.2 for more information.

(7) U2P1 Port Link Info Register (USB3m_HOST_U2P1PORTLI)

This register is reserved for USB 2.0. the Port Link Info Register is used for USB 3.2 (**(3) U3P1 Port Link Info Register (USB3m_HOST_U3P1PORTLI)**).

Access Size : 32 bits
Address : <USB3m_host_base> + 0438h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	—[31:0]	0h	R	Reserved These bits are read as 0b. The write value should always be 0b.

(8) U2P1 Port Hardware LPM Power Control Register (USB3m_HOST_U2P1PORTHLPMC)

This register control USB 2.0 port Hardware LPM Power.

Access Size : 32 bits
Address : <USB3m_host_base> + 043Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	Best Effort Service Latency Deep (BESLD)[3:0]				L1 Timeout[7:0]								Host Initiated Resume Duration Mode (HIRDM)[1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 14	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
13 to 10	Best Effort Service Latency Deep (BESLD)[3:0]	0h	RW	System software sets this field to indicate to the recipient device how long the xHC will drive resume on an exit from U2. Refer to section 4.23.5.1.1.1 of xHCI 1.2 for more information on BESLD use. The BESLD value encoding is defined in Table 13 of xHCI 1.2. Refer to section 5.2.6 of xHCI 1.2 for information on how DBESLD can be used to establish an initial value for BESLD.
9 to 2	L1 Timeout[7:0]	0h	RW	Timeout value for the L1 inactivity timer (LPM Timer). This field shall be set to 00h by the assertion of PR to '1'. Refer to section 4.23.5.1.1.1 of xHCI 1.2 for more information on L1 Timeout operation. The following are permissible values: 00h: 128 µs (default) 01h: 256 µs 02h: 512 µs 03h: 768 µs ⋮ FFh: 65.280 ms
1, 0	Host Initiated Resume Duration Mode (HIRDM)[1:0]	0h	RW	Indicates which HIRD value should be used. The following are permissible values: 00b: Initiate L1 using BESL only on timeout. (default) 01b: Initiate L1 using BESLD on timeout. If rejected by device, initiate L1 using BESL. 10b, 11b: Reserved

6.4.4.4.4 xHCI Extended Capabilities

(1) USB Legacy Supported Protocol Capability

(a) USB Legacy Support Capability Register (USB3m_HOST_USBLEGSUP)

USB legacy support capability register.

Access Size : 32 bits
Address : <USB3m_host_base> + 0500h
Initial Value : 0000_0401h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	HC OS Owned Semaphore (HOOS)	-	-	-	-	-	-	-	HC BIOS Owned Semaphore (HBOS)
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	RW	R	R	R	R	R	R	R	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Next Capability Pointer[7:0]								Capability ID[7:0]							
Initial Value	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
24	HC OS Owned Semaphore (HOOS)	0h	RW	System software sets this bit to request ownership of the xHC. Ownership is obtained when this bit is read as 1b and the HC BIOS Owned Semaphore bit is read as 0b.
23 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
16	HC BIOS Owned Semaphore (HBOS)	0h	RW	The BIOS sets this bit to establish ownership of the xHC. System BIOS will set this bit to a 0b in response to a request for ownership of the xHC by system software.
15 to 8	Next Capability Pointer[7:0]	4h	R	This field indicates the location of the next capability relative to the effective address of the current capability.
7 to 0	Capability ID[7:0]	1h	R	Legacy Support

(b) USB Legacy Support Control and Status Register (USB3m_HOST_USBLEGCTLSTS)

USB legacy support control and status register.

Access Size : 32 bits
Address : <USB3m_host_base> + 0504h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SMI on BAR (SBA)	SMI on PCI Comm and (SPC)	SMI on OS Ownership Change (SOOC)	-	-	-	-	-	-	-	-	SMI on Host System Error (SHSE)	-	-	-	SMI on Event Interrupt (SEI)
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW1	RW1	RW1	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SMI on BAR Enable (SBAE)	SMI on PCI Command Enable (SPCE)	SMI on OS Ownership Enable (SOOE)	-	-	-	-	-	-	-	-	SMI on Host System Error Enable (SHSEE)	-	-	-	USB SMI Enable (USE)
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	R	R	R	R	R	R	R	R	RW	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31	SMI on BAR (SBA)	0h	RW1	This bit is set to 1b whenever the Base Address Register (BAR) is written. This bit is fixed to 0b, because the USB3HOST does not have the Base Address Register.
30	SMI on PCI Command (SPC)	0h	RW1	This bit is set to 1b whenever the PCI Command Register is written. This bit is fixed to 0b, because the USB3HOST does not have the PCI Command Register.
29	SMI on OS Ownership Change (SOOC)	0h	RW1	This bit is set to 1b whenever the HC OS Owned Semaphore bit in the USBLEGSUP register transitions from 1b to 0b or 0b to 1b.
28 to 21	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
20	SMI on Host System Error (SHSE)	0h	R	Shadow bit of the Host System Error (HSE) bit in the USBSTS register.
19 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
16	SMI on Event Interrupt (SEI)	0h	R	Shadow bit of Event Interrupt (EINT) bit in the USBSTS register.
15	SMI on BAR Enable (SBAE)	0h	RW	When this bit is 1b and SMI on BAR is 1b, then the host controller will issue an SMI.
14	SMI on PCI Command Enable (SPCE)	0h	RW	When this bit is 1b and SMI on PCI Command is 1b, then the host controller will issue an SMI.
13	SMI on OS Ownership Enable (SOOE)	0h	RW	When this bit is 1b and the OS Ownership Change bit is 1b, the host controller will issue an SMI
12 to 5	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
4	SMI on Host System Error Enable (SHSEE)	0h	RW	When this bit is 1b and the SMI on Host System Error bit (below) in this register is 1b, the host controller will issue an SMI immediately.
3 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
0	USB SMI Enable (USE)	0h	RW	When this bit is 1b and the SMI on Event Interrupt bit in this register is 1b, the host controller will issue an SMI immediately.

(2) xHCI Supported Protocol Capability for USB3.2

(a) Offset 00h - xHCI Supported Protocol Capability Field Definitions (USB3.2) Register (USB3m_HOST_U3HCSPC1)

xHCI supported protocol capability field definitions (USB3.2) register.

Access Size : 32 bits
Address : <USB3m_host_base> + 0510h
Initial Value : 0320_0802h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Major Revision[7:0]								Minor Revision[7:0]							
Initial Value	0	0	0	0	0	0	1	1	0	0	1	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Next Capability Pointer[7:0]								Capability ID[7:0]							
Initial Value	0	0	0	0	1	0	0	0	0	0	0	0	0	0	1	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	Major Revision[7:0]	3h	R	Major Specification Release Number in Binary-Coded Decimal (i.e., version 3.x is 03h). This field identifies the major release number component of the specification with which the xHC is compliant.
23 to 16	Minor Revision[7:0]	20h	R	Minor Specification Release Number in Binary-Coded Decimal (i.e., version x.10 is 10h). This field identifies the minor release number component of the specification with which the xHC is compliant.
15 to 8	Next Capability Pointer[7:0]	8h	R	This field indicates the location of the next capability with relative to the effective address of the current capability.
7 to 0	Capability ID[7:0]	2h	R	xHCI Supported Protocol

(b) Offset 04h - xHCI Supported Protocol Capability Field Definitions (USB3.2) Register (USB3m_HOST_U3HCSPC2)

xHCI supported protocol capability field definitions (USB3.2) register.

Access Size : 32 bits
Address : <USB3m_host_base> + 0514h
Initial Value : 2042_5355h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Name String[31:16]															
Initial Value	0	0	1	0	0	0	0	0	0	1	0	0	0	0	1	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Name String[15:0]															
Initial Value	0	1	0	1	0	0	1	1	0	1	0	1	0	1	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	Name String[31:0]	20425355h	R	This field is a mnemonic name string that references the specification with which the xHC is compliant. Four ASCII characters can be defined. Allowed characters are: alphanumeric, space, and underscore. Alpha characters are case sensitive

(c) Offset 08h - xHCI Supported Protocol Capability Field Definitions (USB3.2) Register (USB3m_HOST_U3HCSPC3)

xHCI supported protocol capability field definitions (USB3.2) register.

Access Size : 32 bits
Address : <USB3m_host_base> + 0518h
Initial Value : 0000_0101h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Protocol Speed ID Count (PSIC)[3:0]				Hub Depth (MHD)[2:0]			-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Compatible Port Count[7:0]								Compatible Port Offset[7:0]							
Initial Value	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	Protocol Speed ID Count (PSIC)[3:0]	0h	R	This field indicates the number of Protocol Speed ID (PSI) Dwords that the xHCI Supported Protocol Capability data structure contains. If this field is non-zero, then all speeds supported by the protocol shall be defined using PSI Dwords, i.e. no implied Speed ID mappings apply. PSIC value of 0 implies that only the default SuperSpeed Gen1x1 and SuperSpeed Plus Gen2x1 bit rate are supported
27 to 25	Hub Depth (MHD)[2:0]	0h	R	If this field is '0h', then the standard USB3 hub depth constraints apply, if this field is > '0h', then it indicates the maximum hub depth supported by the USB3 ports. This bit is fixed to 0h in the USB3HOST.
24 to 16	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
15 to 8	Compatible Port Count[7:0]	1h	R	This field identifies the number of consecutive Root Hub Ports (starting at the Compatible Port Offset) that support this protocol. Valid values are 1 to MaxPorts
7 to 0	Compatible Port Offset[7:0]	1h	R	This field specifies the starting Port Number of Root Hub Ports that support this protocol. Valid values are 1 to MaxPorts.

(d) Offset 0Ch - xHCI Supported Protocol Capability Field Definitions (USB3.2) Register (USB3m_HOST_U3HCSPC4)

xHCI supported protocol capability field definitions (USB3.2) register.

Access Size : 32 bits
Address : <USB3m_host_base> + 051Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	Protocol Slot Type[4:0]				
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
4 to 0	Protocol Slot Type[4:0]	0h	R	This field specifies the Slot Type value which can specified when allocating Device Slots that support this protocol. Valid values are 0 to 31.

(e) Protocol Speed ID for SS Register (USB3m_HOST_PSISS)

Protocol speed ID for ss register.

Access Size : 32 bits
Address : <USB3m_host_base> + 0520h
Initial Value : 0005_0134h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Protocol Speed ID Mantissa (PSIM)[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	PSI Full-duplex (PFD)	PSI Type (PLT)[1:0]		Protocol Speed ID Exponent (PSIE)[1:0]		Protocol Speed ID Value (PSIV)[3:0]			
Initial Value	0	0	0	0	0	0	0	1	0	0	1	1	0	1	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	Protocol Speed ID Mantissa (PSIM)[15:0]	5h	R	This field defines the mantissa that is applied to the PSIE when calculating the maximum bit rate represented by this PSI Dword.
15 to 9	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
8	PSI Full-duplex (PFD)	1h	R	If this bit is 1b, the link is full-duplex, and if 0b, the link is half-duplex.
7, 6	PSI Type (PLT)[1:0]	0h	R	This field identifies whether the PSI Dword defines a symmetric or asymmetric bit rate, and if asymmetric, then this field also indicates if this Dword defines the receive or transmit bit rate. Note that the Asymmetric PSI Dwords shall be paired, i.e. an Rx immediately followed by a Tx, and both Dwords shall define the same value for the PSIV. Refer to **Table 6.4-7**.
5, 4	Protocol Speed ID Exponent (PSIE)[1:0]	3h	R	This field defines the base 10 exponent to be applied with the Protocol Speed ID Mantissa is used in calculating the maximum bit rate represented by this PSI Dword. The power is three times the value of the field. Refer to **Table 6.4-8**.
3 to 0	Protocol Speed ID Value (PSIV)[3:0]	4h	R	If a device is attached that operates at the bit rate defined by this PSI Dword, then the value of this field is reported in the Port Speed field of PORTSC register of a compatible port. Note that the PSIV value of 0 is reserved and shall not be defined by a PSI.

Table 6.4-7 PLT

RLT Value	Bit Rate	Note
0	Symmetric	Single PSI Dword
1	Reserved	
2	Asymmetric Rx	Paired with Asymmetric Tx PSI Dword
3	Asymmetric Tx	Immediately follows Rx Asymmetric PSI Dword

Table 6.4-8 PSIE

PSIE Value	Bit Rate
0	Bits per second
1	Kb/s
2	Mb/s
3	Gb/s

(f) Protocol Speed ID for SSP (USB3m_HOST_RP)

Protocol speed ID for SSP.

Access Size : 32 bits
Address : <USB3m_host_base> + 0524h
Initial Value : 000A_0135h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Protocol Speed ID Mantissa (PSIM)[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	1	0	1	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	PSI Full-duplex (PFD)	PSI Type (PLT)[1:0]		Protocol Speed ID Exponent (PSIE)[1:0]		Protocol Speed ID Value (PSIV)[3:0]			
Initial Value	0	0	0	0	0	0	0	1	0	0	1	1	0	1	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	Protocol Speed ID Mantissa (PSIM)[15:0]	Ah	R	This field defines the mantissa that is applied to the PSIE when calculating the maximum bit rate represented by this PSI Dword.
15 to 9	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
8	PSI Full-duplex (PFD)	1h	R	If this bit is 1b, the link is full-duplex, and if 0b, the link is halfduplex.
7, 6	PSI Type (PLT)[1:0]	0h	R	This field identifies whether the PSI Dword defines a symmetric or asymmetric bit rate, and if asymmetric, then this field also indicates if this Dword defines the receive or transmit bit rate. Note that the Asymmetric PSI Dwords shall be paired, i.e. an Rx immediately followed by a Tx, and both Dwords shall define the same value for the PSIV. PLT Value: Bit Rate: Note 0h: Symmetric Single: PSI Dword 1h: Reserved 2h: Asymmetric Rx: Paired with Asymmetric Tx PSI Dword 3h: Asymmetric Tx : Immediately follows Rx Asymmetric PSI Dw
5, 4	Protocol Speed ID Exponent (PSIE)[1:0]	3h	R	This field defines the base 10 exponent to be applied with the Protocol Speed ID Mantissa is used in calculating the maximum bit rate represented by this PSI Dword. The power is three times the value of the field. PSIE Value: Bit Rate 0h: Bits per second 1h: Kb/s 2h: Mb/s 3h: Gb/s
3 to 0	Protocol Speed ID Value (PSIV)[3:0]	5h	R	If a device is attached that operates at the bit rate defined by this PSI Dword, then the value of this field is reported in the Port Speed field of PORTSC register of a compatible port. Note that the PSIV value of 0 is reserved and shall not be defined by a PSI.

(3) xHCI Supported Protocol Capability for USB2.0

(a) Offset 00h - xHCI Supported Protocol Capability Field Definitions (USB2.0) Register (USB3m_HOST_U2HCSPC1)

xHCI supported protocol capability field definitions (USB2.0) register.

Access Size : 32 bits
Address : <USB3m_host_base> + 0530h
Initial Value : 0200_0802h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Major Revision[7:0]								Minor Revision[7:0]							
Initial Value	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Next Capability Pointer[7:0]								Capability ID[7:0]							
Initial Value	0	0	0	0	1	0	0	0	0	0	0	0	0	0	1	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	Major Revision[7:0]	2h	R	Major Specification Release Number in Binary-Coded Decimal (i.e., version 3.x is 03d). This field identifies the major release number component of the specification with which the xHC is compliant.
23 to 16	Minor Revision[7:0]	0h	R	Minor Specification Release Number in Binary-Coded Decimal (i.e., version x.10 is 10d). This field identifies the minor release number component of the specification with which the xHC is compliant.
15 to 8	Next Capability Pointer[7:0]	8h	R	This field indicates the location of the next capability with relative to the effective address of the current capability.
7 to 0	Capability ID[7:0]	2h	R	xHCI Supported Protocol

(b) Offset 04h - xHCI Supported Protocol Capability Field Definitions (USB2.0) Register (USB3m_HOST_U2HCSPC2)

xHCI supported protocol capability field definitions (USB2.0) register.

Access Size : 32 bits
Address : <USB3m_host_base> + 0534h
Initial Value : 2042_5355h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Name String[31:16]															
Initial Value	0	0	1	0	0	0	0	0	0	1	0	0	0	0	1	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Name String[15:0]															
Initial Value	0	1	0	1	0	0	1	1	0	1	0	1	0	1	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	Name String[31:0]	20425355h	R	This field is a mnemonic name string that references the specification with which the xHC is compliant. Four ASCII characters can be defined. Allowed characters are: alphanumeric, space, and underscore. Alpha characters are case sensitive.

(c) Offset 08h - xHCI Supported Protocol Capability Field Definitions (USB2.0) Register (USB3m_HOST_U2HCSPC3)

xHCI supported protocol capability field definitions (USB2.0) register.

Access Size : 32 bits
Address : <USB3m_host_base> + 0538h
Initial Value : 0018_0102h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Protocol Speed ID Count (PSIC)[3:0]				Hub Depth (MHD)[2:0]			-	-	-	-	BESL LPM Capability (BLC)	Hardware LPM Capability (HLC)	Integrated Hub Implemented (IHI)	High-speed Only (HSO)	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	1	1	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Compatible Port Count[7:0]								Compatible Port Offset[7:0]							
Initial Value	0	0	0	0	0	0	0	1	0	0	0	0	0	0	1	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	Protocol Speed ID Count (PSIC)[3:0]	0h	R	This field indicates the number of Protocol Speed ID (PSI) Dwords that the xHCI Supported Protocol Capability data structure contains. If this field is non-zero, then all speeds supported by the protocol shall be defined using PSI Dwords, i.e. no implied Speed ID mappings apply. PSIC value of 0 implies that the default Full-speed, Low-speed, and High-speed bit rates are supported.
27 to 25	Hub Depth (MHD)[2:0]	0h	R	If this field is '0h', then the standard USB2 hub depth constraints apply, if this field is > '0h', then it indicates the maximum hub depth supported by the USB2 ports. This bit is fixed to 0h in the USB3HOST.
24 to 21	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
20	BESL LPM Capability (BLC)	1h	R	If this bit is set to 1b, the ports described by this xHCI Supported Protocol Capability shall apply BESL timing to BESL and BESLD fields of the PORTPMSC and PORTHLPMC registers. If this bit is cleared to 0b, the ports described by this xHCI Supported Protocol Capability shall apply HIRD timing to BESL and BESLD fields of the PORTPMSC and PORTHLPMC registers. Note the BESL LMP Capability support (i.e. HLE = '1b' and BLC = '1b') shall be mandatory for all xHCI 1.2 compliant xHCs. This bit is fixed to 1b in the USB3HOST.
19	Hardware LPM Capability (HLC)	1h	R	If this bit is set to 1b, the ports described by this xHCI Supported Protocol Capability support hardware controlled USB2 Link Power Management. This bit is fixed to 1b in the USB3HOST.
18	Integrated Hub Implemented (IHI)	0h	R	If this bit is cleared to 0b, the Root hub to External xHC port mapping adheres to the default mapping. If this bit is set to 1b, the Root Hub to External xHC port mapping does not adhere to the default mapping, and ACPI or other mechanism is required to define the mapping. This bit is fixed to 0b in the USB3HOST.
17	High-speed Only (HSO)	0h	R	If this bit is cleared to 0b, the USB2 ports described by this capability are High-speed only, e.g. the ports do not support Low- or Full-speed operation. High-speed only implementations can introduce a "Tier mismatch".
16	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
15 to 8	Compatible Port Count[7:0]	1h	R	This field identifies the number of consecutive Root Hub Ports (starting at the Compatible Port Offset) that support this protocol. Valid values are 1 to MaxPorts.
7 to 0	Compatible Port Offset[7:0]	2h	R	This field specifies the starting Port Number of Root Hub Ports that support this protocol. Valid values are 1 to MaxPorts.

(d) Offset 0Ch - xHCI Supported Protocol Capability Field Definitions (USB2.0) Register (USB3m_HOST_U2HCSPC4)

xHCI supported protocol capability field definitions (USB2.0) register.

Access Size : 32 bits
Address : <USB3m_host_base> + 053Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	Protocol Slot Type[4:0]				
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
4 to 0	Protocol Slot Type[4:0]	0h	R	This field specifies the Slot Type value which can specified when allocating Device Slots that support this protocol. Valid values are 0 to 31.

(e) Protocol Speed ID for FS Register (USB3m_HOST_PSIFS)

Protocol speed ID for FS register.

Access Size : 32 bits
Address : <USB3m_host_base> + 0540h
Initial Value : 000C_0021h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Protocol Speed ID Mantissa (PSIM)[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	1	1	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	PSI Full-duplex (PFD)	PSI Type (PLT)[1:0]		Protocol Speed ID Exponent (PSIE)[1:0]		Protocol Speed ID Value (PSIV)[3:0]			
Initial Value	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	Protocol Speed ID Mantissa (PSIM)[15:0]	Ch	R	This field defines the mantissa that is applied to the PSIE when calculating the maximum bit rate represented by this PSI Dword.
15 to 9	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
8	PSI Full-duplex (PFD)	0h	R	If this bit is 1b, the link is full-duplex, and if 0b, the link is half-duplex.
7, 6	PSI Type (PLT)[1:0]	0h	R	This field identifies whether the PSI Dword defines a symmetric or asymmetric bit rate, and if asymmetric, then this field also indicates if this Dword defines the receive or transmit bit rate. Note that the Asymmetric PSI Dwords shall be paired, i.e. an Rx immediately followed by a Tx, and both Dwords shall define the same value for the PSIV. Refer to **Table 6.4-9**.
5, 4	Protocol Speed ID Exponent (PSIE)[1:0]	2h	R	This field defines the base 10 exponent to be applied with the Protocol Speed ID Mantissa is used in calculating the maximum bit rate represented by this PSI Dword. The power is three times the value of the field. Refer to **Table 6.4-10**.
3 to 0	Protocol Speed ID Value (PSIV)[3:0]	1h	R	If a device is attached that operates at the bit rate defined by this PSI Dword, then the value of this field is reported in the Port Speed field of PORTSC register of a compatible port. Note that the PSIV value of 0 is reserved and shall not be defined by a PSI.

Table 6.4-9 PLT

RLT Value	Bit Rate	Note
0	Symmetric	Single PSI Dword
1	Reserved	
2	Asymmetric Rx	Paired with Asymmetric Tx PSI Dword
3	Asymmetric Tx	Immediately follows Rx Asymmetric PSI Dword

(4) xHCI Extended Power Management Capability

(a) Power Management Capabilities Register (USB3m_HOST_PMC)

Power management capabilities register.

Access Size : 32 bits
Address : <USB3m_host_base> + 0550h
Initial Value : 4803_0003h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PME Support[4:0]					D2 Support	D1 Support	Aux Current[2:0]			DSI	-	PME Clock	Version[2:0]		
Initial Value	0	1	0	0	1	0	0	0	0	0	0	0	0	0	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Next Capability Pointer[7:0]								Capability ID[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	PME Support[4:0]	9h	R	This 5-bit field indicates the power states in which the function can assert PME#. A value of 0b for any bit indicates that the function is not capable of asserting the PME# signal in that power state. Bit[27] XXXX1b – PME# can be asserted from D0 Bit[28] XXX1Xb – PME# can be asserted from D1 Bit[29] XX1XXb – PME# can be asserted from D2 Bit[30] X1XXXb – PME# can be asserted from D3hot Bit[31] 1XXXXb – PME# can be asserted from D3cold
26	D2 Support	0h	R	If this bit is 1b, this function supports the D2 Power Management State. Functions that do not support D2 shall always return a value of 0 for this bit.
25	D1 Support	0h	R	If this bit is 1b, this function supports the D1 Power Management State. Functions that do not support D1 shall always return a value of 0 for this bit.
24 to 22	Aux Current[2:0]	0h	R	This 3 bit field reports the 3.3 Vaux auxiliary current requirements for the PCI function. If the Data Register has been implemented by this function: Reading this field returns a value of 000b. The Data Register takes precedence over this field for 3.3 Vaux current requirement reporting. If PME# generation from D3cold is not supported by the function (PMC (15) = 0), this field returns a value of 000b, when read.
21	DSI	0h	R	The Device Specific Initialization bit indicates whether special initialization of this function is required (beyond the standard PCI configuration header) before the generic class device driver is able to use it. Note that this bit is not used by some operating systems. Microsoft Windows and Windows NT, for instance, do not use this bit to determine whether to use D3. Instead, they use the driver's capabilities to determine this. A 1 indicates that the function requires a device specific initialization sequence following transition to the D0 uninitialized state.
20	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
19	PME Clock	0h	R	When this bit is 1b, it indicates that the function relies on the presence of the PCI clock for PME# operation. When this bit is 0b, it indicates that no PCI clock is required for the function to generate PME#. Functions that do not support PME# generation in any state returns 0 for this field.
18 to 16	Version[2:0]	3h	R	A value of 011b indicates that this function complies with revision 1.2 of the PCI Power Management Interface Specification.
15 to 8	Next Capability Pointer[7:0]	0h	R	This field provides an offset into the function's PCI Configuration Space pointing to the location of next item in the function's capability list. If there are no additional items in the Capabilities List, this register is set to 0h.
7 to 0	Capability ID[7:0]	3h	R	Extended Power Management

(b) Power Management Control/Status Register (USB3m_HOST_PMCSR)

Power management control/status register.

Access Size : 32 bits
Address : <USB3m_host_base> + 0554h
Initial Value : 0000_0008h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PME Status	Data Scale[1:0]		Data Select[3:0]				PME En	-	-	-	-	No Soft Reset	-	PowerState [1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0
R/W	RW1	R	R	R	R	R	R	RW	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
15	PME Status	0h	RW1	This bit is set when the function would normally assert the PME# signal independent of the state of the PME_En bit. Writing 1b clears this bit and causes the function to stop asserting a PME# (if enabled). Writing 0b has no effect. This bit defaults to 0b if the function does not support PME# generation from D3cold. If the function supports PME# from D3cold, then this bit is sticky and shall be explicitly cleared by the operating system each time the operating system is initially loaded.
14, 13	Data Scale[1:0]	0h	R	This 2-bit read-only field indicates the scaling factor to be used when interpreting the value of the Data register. The value and meaning of this field will vary depending on which data value has been selected by the Data_Select field. This field is a required component of the Data register (offset 7) and shall be implemented if the Data register is implemented. If the Data register has not been implemented, this field shall return 00b when the PMCSR is read.
12 to 9	Data Select[3:0]	0h	R	This 4-bit field is used to select which data is to be reported through the Data register and Data_Scale field. This field is a required component of the Data register (offset 7) and shall be implemented if the Data register is implemented. If the Data register is not implemented, this field should be read only and return 0000b when the PMCSR is read.
8	PME En	0h	RW	Writing 1b to this bit enables the function to assert PME#. When 0b, PME# assertion is disabled. This bit defaults to 0b if the function does not support PME# generation from D3cold. If the function supports PME# from D3cold, then this bit is sticky and shall be explicitly cleared by the operating system each time it is initially loaded. Functions that do not support PME# generation from any D-state (i.e., PMC (15:11) = 0_0000b), can hardwire this bit to be read-only always returning 0 when read by system software.
7 to 4	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
3	No Soft Reset	1h	R	When set (1), this bit indicates that devices are transitioning from D3hot to D0 because of PowerState commands do not perform an internal reset. Configuration Context is preserved. Upon transition from the D3hot to the D0 Initialized state, no additional operating system intervention is required to preserve Configuration Context beyond writing the PowerState bits. When clear (0), devices do perform an internal reset upon transitioning from D3hot to D0 via software control of the PowerState bits. Configuration Context is lost when performing the soft reset. Upon transition from the D3hot to the D0 state, full reinitialization sequence is needed to return the device to D0 Initialized. Regardless of this bit, devices that transition from D3hot to D0 by a system or bus segment reset will return to the device state D0 Uninitialized with only PME context preserved if PME is supported and enabled.
2	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

Bit	Bit Name	Initial Value	R/W	Description
1, 0	PowerState [1:0]	0h	RW	This 2-bit field is used both to determine the current power state of a function and to set the function into a new power state. The definition of the field values is given below. 00b: D0 01b: D1 10b: D2 11b: D3hot If an unsupported or optional state is written to this field by software, the write operation shall complete normally on the bus. However, the data is discarded and no state change occurs.

6.4.4.4.5 Host Controller Runtime Registers

(1) Microframe Index Register (USB3m_HOST_MFINDEX)

Microframe index register.

Access Size : 32 bits
Address : <USB3m_host_base> + 0600h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	Microframe Index[13:0]													
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 14	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
13 to 0	Microframe Index[13:0]	0h	R	The value in this register increments at the end of each microframe (e.g. 125 µs.). Bits [13:3] can be used to determine the current 1ms Frame Index.

(2) Interrupter Register Set 0

(a) Interrupter Management Register (USB3m_HOST_IMAN)

Interrupter management register.

Access Size : 32 bits
Address : <USB3m_host_base> + 0620h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	Interrupt Enable (IE)	Interrupt Pending (IP)
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW1

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
1	Interrupt Enable (IE)	0h	RW	Default = 0b. This flag specifies whether the Interrupter is capable of generating interrupts. When this bit and the IP bit are set to (1b), the Interrupter generates an interrupt when the Interrupter Moderation Counter reaches 0. If this bit is 0b, then the Interrupter is prohibited from generating interrupts.
0	Interrupt Pending (IP)	0h	RW1	Default = 0b. This flag represents the current state of the Interrupter. If IP = 1b, an interrupt is pending for this Interrupter. A 0 value indicates that no interrupt is pending for the Interrupter.

(b) Interrupter Moderation Register (USB3m_HOST_IMOD)

Interrupter moderation register.

Access Size : 32 bits
Address : <USB3m_host_base> + 0624h
Initial Value : 0000_0FA0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Interrupt Moderation Counter (IMODC)[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Interrupt Moderation Interval (IMODI)[15:0]															
Initial Value	0	0	0	0	1	1	1	1	1	0	1	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

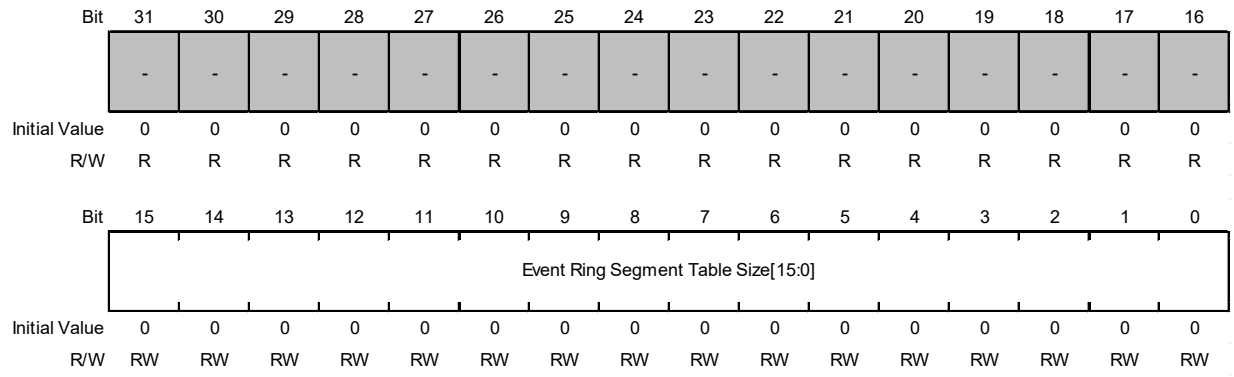
Bit	Bit Name	Initial Value	R/W	Description
31 to 16	Interrupt Moderation Counter (IMODC)[15:0]	0h	RW	Default = undefined. Down counter. Loaded with the IMODI value whenever IP is cleared to 0, counts down to 0, and stops. The associated interrupt is signaled whenever this counter is 0, the Event Ring is not empty, the IE and IP flags = 1b, and EHB = 0b. This counter can be directly written by software at any time to alter the interrupt rate.
15 to 0	Interrupt Moderation Interval (IMODI)[15:0]	FA0h	RW	Default = ‘4000’ (up to 1 ms). Minimum inter-interrupt interval. The interval is specified in 250ns increments. A value of 0 disables interrupt throttling logic and interrupts are generated immediately if IP = 0b, EHB = 0b, and the Event Ring is not empty.

(c) Event Ring Registers

(c-1) Event Ring Segment Table Size Register (USB3m_HOST_ERSTSZ)

Event ring segment table size register.

Access Size : 32 bits
Address : <USB3m_host_base> + 0628h
Initial Value : 0000_0000h



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
15 to 0	Event Ring Segment Table Size[15:0]	0h	RW	Default = 0b. This field identifies the number of valid Event Ring Segment Table entries in the Event Ring Segment Table pointed to by the Event Ring Segment Table Base Address register. The maximum value supported by an xHC implementation for this register is defined by the ERST Max field in the HCSPARAMS2 register. For the Primary Interrupter: Writing a value of 0 to this field results in undefined behavior of the Event Ring. The Primary Event Ring cannot be disabled.

(c-2) Event Ring Segment Table Base Address Low Register (USB3m_HOST_ERSTBAL)

Event ring segment table base address low register.

Access Size : 32 bits

Address : <USB3m_host_base> + 0630h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Event Ring Segment Table Base Address Low Register[25:10]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Event Ring Segment Table Base Address Low Register[9:0]										-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	Event Ring Segment Table Base Address Low Register[25:0]	0h	RW	Default = 0b. This field defines the lower-order bits of the address of where the Event Ring Segment Table starts. Writing to this register sets advancement of the event ring state machine (EREP) to the start state. This field shall not be modified if HCHalted (HCH) = 0b.
5 to 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

(c-3) Event Ring Segment Table Base Address High Register (USB3m_HOST_ERSTBAH)

Event ring segment table base address high register.

Access Size : 32 bits

Address : <USB3m_host_base> + 0634h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Event Ring Segment Table Base Address High Register[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

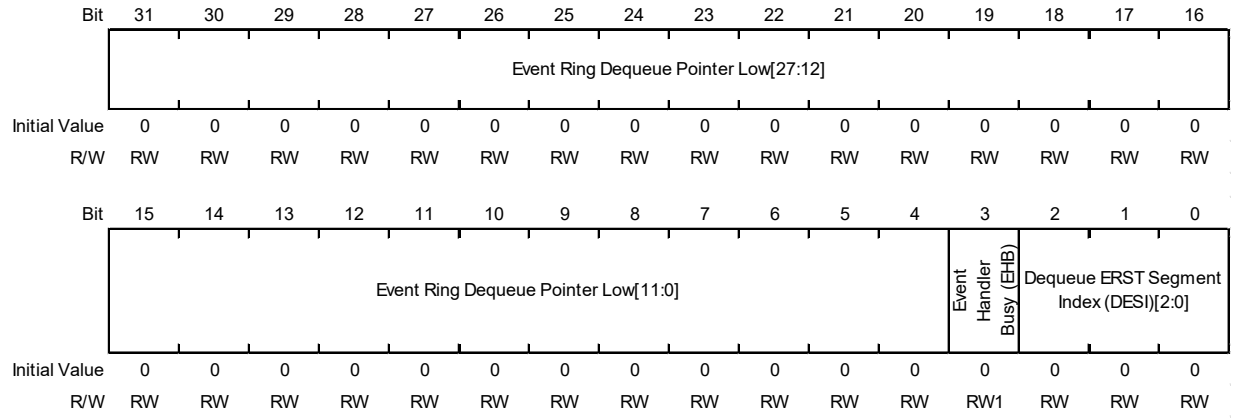
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Event Ring Segment Table Base Address High Register[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	Event Ring Segment Table Base Address High Register[31:0]	0h	RW	Default = 0b. This field defines the higher-order bits of the start address where the Event Ring Segment Table starts. Writing to this register sets advancement of the event ring state machine (EREP) to the start state. This field shall not be modified if HCHalted (HCH) = 0b.

(c-4) Event Ring Dequeue Pointer Low Register (USB3m_HOST_ERDPL)

Event ring dequeue pointer low register.

Access Size : 32 bits
Address : <USB3m_host_base> + 0638h
Initial Value : 0000_0000h

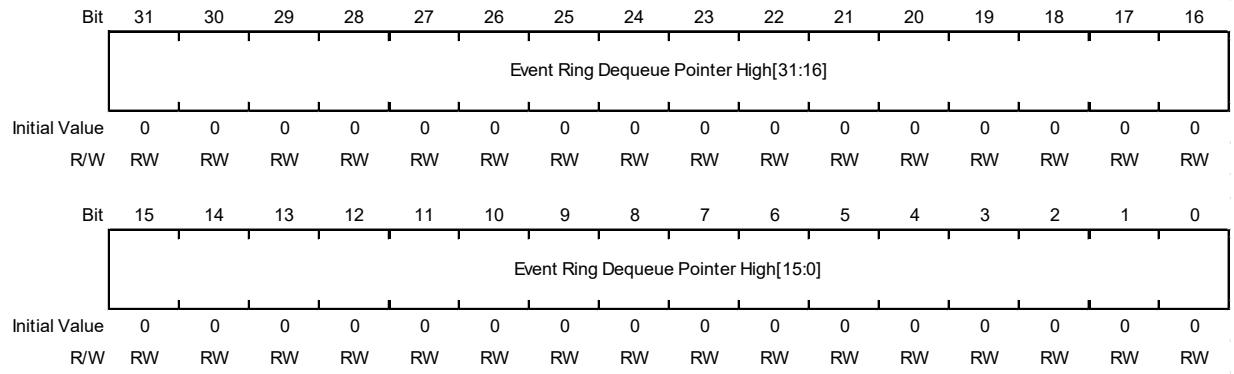


Bit	Bit Name	Initial Value	R/W	Description
31 to 4	Event Ring Dequeue Pointer Low[27:0]	0h	RW	Default = 0b. This field defines the lower-order bits of the 64-bit address of the current Event Ring Dequeue Pointer.
3	Event Handler Busy (EHB)	0h	RW1	Default = 0b. This flag is set to 1b when the IP bit is set to 1b and cleared to 0b by software when the Dequeue Pointer register is written.
2 to 0	Dequeue ERST Segment Index (DESI)[2:0]	0h	RW	Default = 0b. This field can be used by the xHC to accelerate checking the Event Ring full condition. This field is written with the lower-order 3 bits of the offset of the ERST entry which defines the Event Ring segment that the Event Ring Dequeue Pointer resides in.

(c-5) Event Ring Dequeue Pointer High Register (USB3m_HOST_ERDPH)

Event ring dequeue pointer high register.

Access Size : 32 bits
Address : <USB3m_host_base> + 063Ch
Initial Value : 0000_0000h



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	Event Ring Dequeue Pointer High[31:0]	0h	RW	Default = 0b. This field defines the higher-order bits of the 64-bit address of the current Event Ring Dequeue Pointer.

6.4.4.4.6 Doorbell Registers

(1) Host Controller Doorbell Register (USB3m_HOST_HCD)

Host controller doorbell register.

Access Size : 32 bits
Address : <USB3m_host_base> + 0700h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

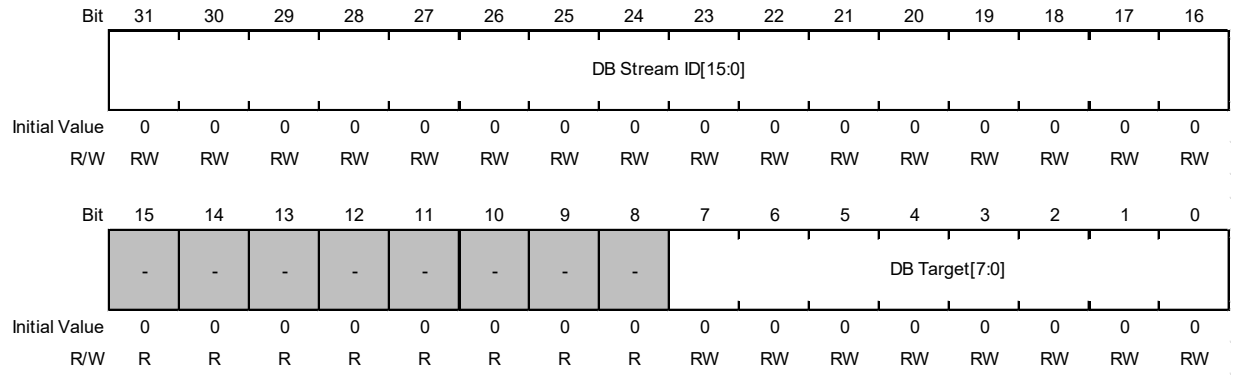
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	DB Target[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
7 to 0	DB Target[7:0]	0h	RW	Doorbell Target. This field defines the target of a doorbell reference. The table below defines the xHC notifications that are generated by ringing a doorbell. Note that Doorbell Register 0 is dedicated to the Command Ring and this field of that register is decoded differently from the field in the Doorbell Registers. Host Controller Doorbell (0) 00h: Command Doorbell 01h to F7h: Reserved F8h to FFh: Vendor Defined This field returns 0b when read and should be treated as “undefined” by software.

(2) Device Context Doorbell Register (Slot #n) (USB3m_HOST_DCDn) (n = 1 to 32)

Device context doorbell register.

Access Size : 32 bits
Address : <USB3m_host_base> + 0700h + n x 0004h
Initial Value : 0000_0000h



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	DB Stream ID[15:0]	0h	RW	Doorbell Stream ID. If the endpoint of a Device Context Doorbell defines streams, then this field can be used to identify the stream of the endpoint the doorbell reference is targeting. System software is responsible for ensuring that the value written to this field is valid. If the endpoint defines streams (MaxPStreams > 0), then 0, 65535 (no stream) and 65534 (prime) are reserved stream ID values and shall not be written to this field. If the endpoint does not define streams (MaxPStreams = 0) and a non-0 value is written to this field, the doorbell reference shall be ignored. This field only applies to Device Context Doorbells and shall be cleared to '0b' for Host Controller Command Doorbells. This field returns '0b' when read.
15 to 8	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
7 to 0	DB Target[7:0]	0h	RW	Doorbell Target. This field defines the target of a doorbell reference. The table below defines the xHC notifications that are generated by ringing a doorbell. Note that Doorbell Register 0 is dedicated to the Command Ring and this field of that register is decoded differently from the field in the Doorbell Registers. Device Context Doorbells (1-255) 00h: Reserved 01h: Control EP 0 Enqueue Pointer Update 02h: EP 1 OUT Enqueue Pointer Update 03h: EP 1 IN Enqueue Pointer Update 04h: EP 2 OUT Enqueue Pointer Update 05h: EP 2 IN Enqueue Pointer Update ⋮ 1Eh: EP 15 OUT Enqueue Pointer Update 1Fh: EP 15 IN Enqueue Pointer Update 20h to F7h: Reserved F8h to FFh: Vendor Defined This field returns 0b when read and should be treated as "undefined" by software.

6.4.4.4.7 Core Defined Registers

(1) Core Control and Status Registers

(a) Revision ID Register (USB3m_HOST_REVID)

Revision ID register.

Access Size : 32 bits
Address : <USB3m_host_base> + 1000h
Initial Value : E302_0100h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Core ID1[7:0]								Core ID2[7:0]							
Initial Value	1	1	1	0	0	0	1	1	0	0	0	0	0	0	1	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Major Version[7:0]								Minor Version[7:0]							
Initial Value	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	Core ID1[7:0]	E3h	R	Identified upper number of the core
23 to 16	Core ID2[7:0]	2h	R	Identified lower number of the core
15 to 8	Major Version[7:0]	1h	R	Major version of the core
7 to 0	Minor Version[7:0]	0h	R	Minor version of the core

(b) Configuration Status1 Register (USB3m_HOST_CFGSTS1)

Register for reading core configuration values.

Access Size : 32 bits
Address : <USB3m_host_base> + 1004h
Initial Value : 0x29_4111h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Renesas Private18	Renesas Private17	Renesas Private16	Renesas Private15	Renesas Private14	Renesas Private13	Renesas Private12	Renesas Private11	Renesas Private10	Renesas Private9	Renesas Private8	Renesas Private7	Support SSP (SUPSSP)	Renesas Private5[1:0]		Renesas Private4
Initial Value	0	0	0	0	1	1	x	x	0	0	1	0	1	0	0	1

26	Renesas Private13	1h	R	Renesas Private bit
25	Renesas Private12	x	R	Renesas Private bit
24	Renesas Private11	x	R	Renesas Private bit
23	Renesas Private10	0h	R	Renesas Private bit
22	Renesas Private9	0h	R	Renesas Private bit
21	Renesas Private8	1h	R	Renesas Private bit
20	Renesas Private7	0h	R	Renesas Private bit
19	Support SSP (SUPSSP)	1h	R	Indicates whether the “SSP” is supported or not in this core. 0b : Not supported 1b : Supported
18, 17	Renesas Private5[1:0]	0h	R	Renesas Private bit
16	Renesas Private4	1h	R	Renesas Private bit
15	Renesas Private3	0h	R	Renesas Private bit
14	Renesas Private2	1h	R	Renesas Private bit
13	Renesas Private1	0h	R	Renesas Private bit

Bit	Bit Name	Initial Value	R/W	Description
12	Renesas Private0	0h	R	Renesas Private bit
11	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
10 to 8	Number of USB Receptacle (REPNUM)[2:0]	1h	R	Indicate the number of USB receptacle
7	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
6 to 4	Number of U3 Port (U3NUM)[2:0]	1h	R	Indicate the number of U3 ports
3	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
2 to 0	Number of U2 Port (U2NUM)[2:0]	1h	R	Indicate the number of USB2.0 ports.

(c) Configuration Status2 Register (USB3m_HOST_CFGSTS2)

Register for reading core configuration values.

Access Size : 32 bits
Address : <USB3m_host_base> + 1008h
Initial Value : 0000_1388h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ACLK's period (ACLKFREQ)[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ACLK's period (ACLKFREQ)[15:0]															
Initial Value	0	0	0	1	0	0	1	1	1	0	0	0	1	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	ACLK's period (ACLKFREQ) [31:0]	1388h	R	Indicates "the aclk's Period". This value 1388h means aclk's period is 5000ps (5ns), that is 200MHz.

(d) Configuration Status3 Register (USB3m_HOST_CFGSTS3)

Register for reading core configuration values.

Access Size : 32 bits
Address : <USB3m_host_base> + 100Ch
Initial Value : 0011_0111h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	Renesas Private16	Renesas Private15	Renesas Private14	Renesas Private13	Renesas Private12	-	Renesas Private11[2:0]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Renesas Private10	Renesas Private9	Renesas Private8	Renesas Private7	Renesas Private6	Renesas Private5	Renesas Private4	Renesas Private3	-	-	Renesas Private2	Renesas Private1	Renesas Private0[3:0]			
Initial Value	0	0	0	0	0	0	0	1	0	0	0	1	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
24	Renesas Private16	0h	R	Renesas Private bit
23	Renesas Private15	0h	R	Renesas Private bit
22	Renesas Private14	0h	R	Renesas Private bit
21	Renesas Private13	0h	R	Renesas Private bit
20	Renesas Private12	1h	R	Renesas Private bit
19	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
18 to 16	Renesas Private11[2:0]	1h	R	Renesas Private bit
15	Renesas Private10	0h	R	Renesas Private bit
14	Renesas Private9	0h	R	Renesas Private bit
13	Renesas Private8	0h	R	Renesas Private bit
12	Renesas Private7	0h	R	Renesas Private bit
11	Renesas Private6	0h	R	Renesas Private bit
10	Renesas Private5	0h	R	Renesas Private bit
9	Renesas Private4	0h	R	Renesas Private bit
8	Renesas Private3	1h	R	Renesas Private bit
7, 6	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
5	Renesas Private2	0h	R	Renesas Private bit

Bit	Bit Name	Initial Value	R/W	Description
4	Renesas Private1	1h	R	Renesas Private bit
3 to 0	Renesas Private0[3:0]	1h	R	Renesas Private bit

(e) Configuration Status4 Register (USB3m_HOST_CFGSTS4)

Register for reading core configuration values.

Access Size : 32 bits
Address : <USB3m_host_base> + 1010h
Initial Value : 0000_0021h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	Renesas Private1[9:0]									
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	Renesas Private0[9:0]									
Initial Value	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
25 to 16	Renesas Private1[9:0]	0h	R	Renesas Private field.
15 to 10	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
9 to 0	Renesas Private0[9:0]	21h	R	Renesas Private field.

(f) Configuration Status5 Register (USB3m_HOST_CFGSTS5)

Register for reading core configuration values.

Access Size : 32 bits
Address : <USB3m_host_base> + 1014h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	Renesas Private1[9:0]									
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	Renesas Private0[9:0]									
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
25 to 16	Renesas Private1[9:0]	0h	R	Renesas Private field.
15 to 10	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
9 to 0	Renesas Private0[9:0]	0h	R	Renesas Private field.

(g) Configuration Status6 Register (USB3m_HOST_CFGSTS6)

Register for reading core configuration values.

Access Size : 32 bits
Address : <USB3m_host_base> + 1018h
Initial Value : 0000_0129h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	Renesas Private1[9:0]									
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	Renesas Private0[9:0]									
Initial Value	0	0	0	0	0	0	0	1	0	0	1	0	1	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
25 to 16	Renesas Private1[9:0]	0h	R	Renesas Private field.
15 to 10	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
9 to 0	Renesas Private0[9:0]	129h	R	Renesas Private field.

(h) Configuration Status7 Register (USB3m_HOST_CFGSTS7)

Register for reading core configuration values.

Access Size : 32 bits
Address : <USB3m_host_base> + 101Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	Renesas Private1[9:0]									
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	Renesas Private0[9:0]									
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
25 to 16	Renesas Private1[9:0]	0h	R	Renesas Private field.
15 to 10	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
9 to 0	Renesas Private0[9:0]	0h	R	Renesas Private field.

(i) Configuration Status8 Register (USB3m_HOST_CFGSTS8)

Register for reading core configuration values.

Access Size : 32 bits
Address : <USB3m_host_base> + 1020h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	Renesas Private1[9:0]									
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	Renesas Private0[9:0]									
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
25 to 16	Renesas Private1[9:0]	0h	R	Renesas Private field.
15 to 10	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
9 to 0	Renesas Private0[9:0]	0h	R	Renesas Private field.

(j) Configuration Status9 Register (USB3m_HOST_CFGSTS9)

Register for reading core configuration values.

Access Size : 32 bits
Address : <USB3m_host_base> + 1024h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	Renesas Private1[9:0]									
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	Renesas Private0[9:0]									
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
25 to 16	Renesas Private1[9:0]	0h	R	Renesas Private field.
15 to 10	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
9 to 0	Renesas Private0[9:0]	0h	R	Renesas Private field.

(k) Configuration Status10 Register (USB3m_HOST_CFGSTS10)

Register for reading core configuration values.

Access Size : 32 bits
Address : <USB3m_host_base> + 1028h
Initial Value : 0006_0030h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	SS Data Buffer Size[4:0]				
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	Renesas Private1[4:0]					-	U2 Data Buffer Size[2:0]			-	-	Renesas Private0[1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	1	1	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
20 to 16	SS Data Buffer Size[4:0]	6h	R	Indicate the Data buffer size for U3. 6: 6 Kbytes
15 to 13	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
12 to 8	Renesas Private1[4:0]	0h	R	Renesas Private field.
7	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
6 to 4	U2 Data Buffer Size[2:0]	3h	R	Indicate the Data buffer size for U2. 3: 1 Kbyte
3, 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
1, 0	Renesas Private0[1:0]	0h	R	Renesas Private field.

(I) Data Buffer Threshold Control Register (USB3m_HOST_DBUFTH)

Before USBCMD register's Run/Stop bit is set to 1, this register shall be written.

Access Size : 32 bits
Address : <USB3m_host_base> + 102Ch
Initial Value : 1111_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	Renesas Private7[1:0]		-	-	Renesas Private6[1:0]		-	-	Renesas Private5[1:0]		-	-	Renesas Private4[1:0]	
Initial Value	0	0	0	1	0	0	0	1	0	0	0	1	0	0	0	1
R/W	R	R	RW	RW	R	R	RW	RW	R	R	RW	RW	R	R	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	Renesas Private3[1:0]		-	-	Renesas Private2[1:0]		-	-	Renesas Private1[1:0]		-	-	Renesas Private0[1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	RW	RW	R	R	RW	RW	R	R	RW	RW	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31, 30	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
29, 28	Renesas Private7[1:0]	1h	RW	Renesas Private bit This field shall be set to 1h.
27, 26	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
25, 24	Renesas Private6[1:0]	1h	RW	Renesas Private bit This field shall be set to 1h.
23, 22	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
21, 20	Renesas Private5[1:0]	1h	RW	Renesas Private bit This field shall be set to 1h.
19, 18	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
17, 16	Renesas Private4[1:0]	1h	RW	Renesas Private bit This field shall be set to 1h.
15, 14	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
13, 12	Renesas Private3[1:0]	0h	RW	Renesas Private bit This field shall be set to 0h.
11, 10	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
9, 8	Renesas Private2[1:0]	0h	RW	Renesas Private bit This field shall be set to 0h.
7, 6	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
5, 4	Renesas Private1[1:0]	0h	RW	Renesas Private bit This field shall be set to 0h.
3, 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
1, 0	Renesas Private0[1:0]	0h	RW	Renesas Private bit This field shall be set to 0h.

(m) Core Control Register (USB3m_HOST_CORECTRL)

Core control register.

Access Size : 32 bits

Address : <USB3m_host_base> + 1030h

Initial Value : 0000_2000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Renesas Private5	-	-	-	-	-	-	-	-	-	-	-	-	-	-	Renesas Private4
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Renesas Private4[3:0]				-	Renesas Private3	Renesas Private2	Renesas Private1	-	-	-	-	-	-	-	Renesas Private0
Initial Value	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	R	RW	RW	RW	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31	Renesas Private5	0h	RW	Renesas Private bit This field shall be set to 0h.
30 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
16 to 12	Renesas Private4[4:0]	2h	RW	Renesas Private bit This field shall be set to 2h.
11	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
10	Renesas Private3	0h	RW	Renesas Private bit This field shall be set to 0h.
9	Renesas Private2	0h	RW	Renesas Private bit This field shall be set to 0h.
8	Renesas Private1	0h	RW	Renesas Private bit This field shall be set to 0h.
7 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
0	Renesas Private0	0h	RW	Renesas Private bit This field shall be set to 0h.

(n) PHY Control Register (USB3m_HOST_PHYCTRL)

Phy control register.

Access Size : 32 bits
Address : <USB3m_host_base> + 1034h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Renesas Private6	Renesas Private5	Renesas Private4	Renesas Private3	-	-	-	-	-	-	-	-	Renesas Private2	Renesas Private1	Renesas Private0	USB3.2 PHY for Port1's Reset (U3P1PHY_RST)
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	R	R	R	R	R	R	R	R	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	Force Active USB2.0 PHY PLL (FA_U2PLL)	-	-	-	-	-	-	-	USB2.0 PHY Reset (U2PHY_RST)
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	RW	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31	Renesas Private6	0h	RW	Renesas Private bit This field shall be set to 0h.
30	Renesas Private5	0h	RW	Renesas Private bit This field shall be set to 0h.
29	Renesas Private4	0h	RW	Renesas Private bit This field shall be set to 0h.
28	Renesas Private3	0h	RW	Renesas Private bit This field shall be set to 0h.
27 to 20	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
19	Renesas Private2	0h	RW	Renesas Private bit This field shall be set to 0h.
18	Renesas Private1	0h	RW	Renesas Private bit This field shall be set to 0h.
17	Renesas Private0	0h	RW	Renesas Private bit This field shall be set to 0h.
16	USB3.2 PHY for Port1's Reset (U3P1PHY_RST)	0h	RW	This is a bit to output a reset signal for USB3.2 PHY for Port1. 0b: Non-reset assertion 1b: Reset assertion
15 to 9	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
8	Force Active USB2.0 PHY PLL (FA_U2PLL)	0h	RW	Setting this bit forces the PLL for USB2.0 to the active condition. 0b: PLL for USB2.0 does not force to the active condition 1b: PLL for USB2.0 forces to the active condition
7 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
0	USB2.0 PHY Reset (U2PHY_RST)	0h	RW	This is a bit to output a reset signal for USB2.0 PHY. 0b: Non-reset assertion 1b: Reset assertion

(o) PHY Status Register (USB3m_HOST_PHYSTS)

Phy status register.

Access Size : 32 bits
Address : <USB3m_host_base> + 1038h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	Renesas Private2	Renesas Private1	Renesas Private0	USB3.2 for Port1 PLL Lock (U3P1PLL_LOCK)
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	USB2.0 PLL Lock (U2PLL_LOCK)
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 20	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
19	Renesas Private2	0h	R	Renesas Private bit
18	Renesas Private1	0h	R	Renesas Private bit
17	Renesas Private0	0h	R	Renesas Private bit
16	USB3.2 for Port1 PLL Lock (U3P1PLL_LOCK)	0h	R	Indicates that USB3.2 for Port 1 PLL is locked. 0b: USB3.2 PLL is not locked. 1b: USB3.2 PLL is locked.
15 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
0	USB2.0 PLL Lock (U2PLL_LOCK)	0h	R	Indicates that USB2.0 PLL is locked. 0b: USB2.0 PLL is not locked. 1b: USB2.0 PLL is locked

(p) Renesas Private Register (USB3m_HOST_RP2)

Renesas private register.

Access Size : 32 bits
Address : <USB3m_host_base> + 103Ch
Initial Value : 000x_xxxxh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	Renesas Private[17:16]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	x	x
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Renesas Private[15:0]															
Initial Value	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
17 to 0	Renesas Private[17:0]	x	RW	Renesas Private field. This field shall be set to this field's read value. Note: The default value depends on User-settable Keywords.

Note: X: Undefined

(q) Interrupt Status Register (USB3m_HOST_INTSTS)

This register indicates the interrupt status of the USB3HOST.

Access Size : 32 bits
Address : <USB3m_host_base> + 1040h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	SMI Interrupt (SMI_INT)	-	HSE Interrupt (HSE_INT)	PME Interrupt (PME_INT)	XHC Interrupt (XHC_INT)
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
4	SMI Interrupt (SMI_INT)	0h	R	SMI interrupt status When an SMI interrupt occurs, this bit is set to 1b. Smi_int is this interrupt output signal.
3	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
2	HSE Interrupt (HSE_INT)	0h	R	HSE interrupt status When an HSE interrupt occurs, this bit is set to 1b. Hse_int is this interrupt output signal
1	PME Interrupt (PME_INT)	0h	R	PME interrupt status When a PME interrupt occurs, this bit is set to 1b. Pme_int is this interrupt output signal.
0	XHC Interrupt (XHC_INT)	0h	R	XHC interrupt status When an XHC interrupt occurs, this bit is set to 1b. Xhc_int is this interrupt output signal.

(r) Interrupt Enable Register (USB3m_HOST_INTEN)

Interrupt enable register.

Access Size : 32 bits
Address : <USB3m_host_base> + 1044h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	SMI Interrupt Enable (SMI_INTE)	-	HSE Interrupt Enable (HSE_INTE)	PME Interrupt Enable (PME_INTE)	XHC Interrupt Enable (XHC_INTE)
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
4	SMI Interrupt Enable (SMI_INTE)	0h	RW	This bit selects whether the interrupt state of INTSTS.SMI_INT is joined all_int interrupt output or not. 0b: The interrupt state of INTSTS.SMI_INT is not joined all_int. 1b: The interrupt state of INTSTS.SMI_INT is joined all_int.
3	-	0h	RW	Reserved When writing to this bit, Read modify write should be done.
2	HSE Interrupt Enable (HSE_INTE)	0h	RW	This bit selects whether the interrupt state of INTSTS.HSE_INT is joined all_int interrupt output. 0b: The interrupt state of INTSTS.HSE_INT is not joined all_int. 1b: The interrupt state of INTSTS.HSE_INT is joined all_int.
1	PME Interrupt Enable (PME_INTE)	0h	RW	This bit selects whether the interrupt state of INTSTS.PME_INT is joined all_int interrupt output. 0b: The interrupt state of INTSTS.PME_INT is not joined all_int. 1b: The interrupt state of INTSTS.PME_INT is joined all_int.
0	XHC Interrupt Enable (XHC_INTE)	0h	RW	This bit selects whether the interrupt state of INTSTS.XHC_INT is joined all_int interrupt output. 0b: The interrupt state of INTSTS.XHC_INT is not joined all_int. 1b: The interrupt state of INTSTS.XHC_INT is joined all_int.

(s) Frame Length Adjustment Register (FLADJ) & Serial Bus Release Number Register (SBRN) (USB3m_HOST_FLADJ_SBRN)

This is Serial Bus Release Number (SBRN) & Frame Length Adjustment (FLADJ) & Default Best Effort Service Latency (DBESL) & Default Best Effort Service Latency Deep (DBESLD) Register.

Access Size : 32 bits
Address : <USB3m_host_base> + 1050h
Initial Value : 00xx_2032h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	Default Best Effort Service Latency Deep (DBESLD)[3:0]				Default Best Effort Service Latency (DBESL)[3:0]			
Initial Value	0	0	0	0	0	0	0	0	x	x	x	x	x	x	x	x
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	No Frame Length Timing Capability (NFC)	Frame Length Adjustment (FLADJ)[5:0]						Serial Bus Release Number (SBRN)[7:0]							
Initial Value	0	0	1	0	0	0	0	0	0	0	1	1	0	0	1	0
R/W	R	R	RW	RW	RW	RW	RW	RW	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
23 to 20	Default Best Effort Service Latency Deep (DBESLD)[3:0]	x	R	If the value of this field is non-zero, it defines the recommended value for programming the PORTPMSC register BESLD field.
19 to 16	Default Best Effort Service Latency (DBESL)[3:0]	x	R	If the value of this field is non-zero, it defines the recommended value for programming the PORTPMSC register BESL field.
15	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
14	No Frame Length Timing Capability (NFC)	0h	R	This flag indicates whether the host controller implementation supports a Frame Length Timing Value. A 1b in this bit indicates that the Frame Length Timing Value is not supported. A 0b in this bit indicates that the Frame Length Timing Value is supported.
13 to 8	Frame Length Adjustment (FLADJ)[5:0]	20h	RW	Each decimal value change to this register corresponds to 16 high-speed bit times. The SOF cycle time (number of SOF counter clock periods to generate an SOF microframe length) is equal to 59488 + value in this field. The default value is decimal 32 (20h), which gives an SOF cycle time of 60000. Refer to **Table 6.4-15**.
7 to 0	Serial Bus Release Number (SBRN)[7:0]	32h	R	The version of the Universal Serial Bus Specification that is compliant with Host Controller. 32h: Release 3.2

Note: X: Undefined

Table 6.4-15 FLADJ

Frame Length (# HS bit times) (decimal)	FLADJ Value (decimal)
59488	0 (00h)
59504	1 (01h)
59520	2 (02h)
…	…
59984	31 (1Fh)
60000	32 (20h)
…	…
60480	62 (3Eh)
60496	63 (3Fh)

(2) Battery Charging Register

(a) Battery Charging Control Register (USB3m_HOST_BCCTRL)

Battery charging control register.

Access Size : 32 bits
Address : <USB3m_host_base> + 1080h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	Renesas Private6	Renesas Private5	Renesas Private4	Renesas Private3	Renesas Private2[1:0]		Renesas Private1[1:0]		Renesas Private0[1:0]		BC_MODE_P1 [1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
11	Renesas Private6	0h	RW	Renesas Private bit This bit shall be set to 0b.
10	Renesas Private5	0h	RW	Renesas Private bit This bit shall be set to 0b.
9	Renesas Private4	0h	RW	Renesas Private bit This bit shall be set to 0b.
8	Renesas Private3	0h	RW	Renesas Private bit This bit shall be set to 0b.
7, 6	Renesas Private2[1:0]	0h	RW	Renesas Private bit This field shall be set to 0h.
5, 4	Renesas Private1[1:0]	0h	RW	Renesas Private bit This field shall be set to 0h.
3, 2	Renesas Private0[1:0]	0h	RW	Renesas Private bit This field shall be set to 0h.
1, 0	BC_MODE_P1 [1:0]	0h	RW	Battery Charging Mode for Port1 00b: SDP 01b: CDP 10b: DCP 11b: Reserved

6.4.4.4.8 PIPE Status and Control Registers

(1) PIPE Status and Control Register 0 (USB3m_HOST_U3P0PIPESC0)

PIPE Status and Control Register 0.

Access Size : 32 bits
Address : <USB3m_host_base> + 10C0h
Initial Value : 3013_2000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	Tx Coefficient C+1[5:0]						-	-	Tx Coefficient C0[5:0]					
Initial Value	0	0	1	1	0	0	0	0	0	0	0	1	0	0	1	1
R/W	R	R	RW	RW	RW	RW	RW	RW	R	R	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	Tx Coefficient C-1[5:0]						-	-	-	Tx Swing	-	Tx Margin[2:0]		
Initial Value	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	RW	RW	RW	RW	RW	RW	R	R	R	RW	R	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31, 30	-	All 0	R	Reserved These bits are read as 0b. The write value should always be 0b.
29 to 24	Tx Coefficient C+1[5:0]	30h	RW	Renesas Private bit Specify d'3.
23, 22	-	All 0	R	Reserved These bits are read as 0b. The write value should always be 0b.
21 to 16	Tx Coefficient C0[5:0]	13h	RW	Renesas Private bit Specify d'19.
15, 14	-	All 0	R	Reserved These bits are read as 0b. The write value should always be 0b.
13 to 8	Tx Coefficient C-1[5:0]	20h	RW	Renesas Private bit Specify d'2.
7 to 5	-	All 0	R	Reserved These bits are read as 0b. The write value should always be 0b.
4	Tx Swing	0h	RW	Renesas Private bit Keep the initial value.
3	-	0h	R	Reserved This bit is read as 0b. The write value should always be 0b.
2 to 0	Tx Margin[2:0]	0h	RW	Renesas Private bit Keep the initial value.

(2) PIPE Status and Control Register 1 (USB3m_HOST_U3P0PIPESC1)

PIPE Status and Control Register 1.

Access Size : 32 bits
Address : <USB3m_host_base> + 10C4h
Initial Value : 0016_2000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	Tx Coefficient C+1[5:0]						-	-	Tx Coefficient C0[5:0]					
Initial Value	0	0	0	0	0	0	0	0	0	0	0	1	0	1	1	0
R/W	R	R	RW	RW	RW	RW	RW	RW	R	R	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	Tx Coefficient C-1[5:0]						-	-	-	-	-	-	-	-
Initial Value	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	RW	RW	RW	RW	RW	RW	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31, 30	-	All 0	R	Reserved These bits are read as 0b. The write value should always be 0b.
29 to 24	Tx Coefficient C+1[5:0]	0h	RW	Renesas Private bit Specify d'0.
23, 22	-	All 0	R	Reserved These bits are read as 0b. The write value should always be 0b.
21 to 16	Tx Coefficient C0[5:0]	16h	RW	Renesas Private bit Specify d'22.
15, 14	-	All 0	R	Reserved These bits are read as 0b. The write value should always be 0b.
13 to 8	Tx Coefficient C-1[5:0]	20h	RW	Renesas Private bit Specify d'2.
7 to 0	-	0h	R	Reserved These bits are read as 0b. The write value should always be 0b.

(3) PIPE Status and Control Register 2 (USB3m_HOST_U3P0PIPESC2)

PIPE Status and Control Register 2.

Access Size : 32 bits
Address : <USB3m_host_base> + 10C8h
Initial Value : 3015_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	Tx Coefficient C+1[5:0]						-	-	Tx Coefficient C0[5:0]					
Initial Value	0	0	1	1	0	0	0	0	0	0	0	1	0	1	0	1
R/W	R	R	RW	RW	RW	RW	RW	RW	R	R	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	Tx Coefficient C-1[5:0]						-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	RW	RW	RW	RW	RW	RW	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31, 30	-	All 0	R	Reserved These bits are read as 0b. The write value should always be 0b.
29 to 24	Tx Coefficient C+1[5:0]	30h	RW	Renesas Private bit Specify d'3.
23, 22	-	All 0	R	Reserved These bits are read as 0b. The write value should always be 0b.
21 to 16	Tx Coefficient C0[5:0]	15h	RW	Renesas Private bit Specify d'21.
15, 14	-	All 0	R	Reserved These bits are read as 0b. The write value should always be 0b.
13 to 8	Tx Coefficient C-1[5:0]	0h	RW	Renesas Private bit Specify d'0.
7 to 0	-	0h	R	Reserved These bits are read as 0b. The write value should always be 0b.

(4) PIPE Status and Control Register 3 (USB3m_HOST_U3P0PIPESC3)

PIPE Status and Control Register 3.

Access Size : 32 bits
Address : <USB3m_host_base> + 10CCh
Initial Value : 3013_2000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	Tx Coefficient C+1[5:0]						-	-	Tx Coefficient C0[5:0]					
Initial Value	0	0	1	1	0	0	0	0	0	0	0	1	0	0	1	1
R/W	R	R	RW	RW	RW	RW	RW	RW	R	R	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	Tx Coefficient C-1[5:0]						-	-	-	-	-	-	-	-
Initial Value	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	RW	RW	RW	RW	RW	RW	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31, 30	-	All 0	R	Reserved These bits are read as 0b. The write value should always be 0b.
29 to 24	Tx Coefficient C+1[5:0]	30h	RW	Renesas Private bit Specify d'3.
23, 22	-	All 0	R	Reserved These bits are read as 0b. The write value should always be 0b.
21 to 16	Tx Coefficient C0[5:0]	13h	RW	Renesas Private bit Specify d'19.
15, 14	-	All 0	R	Reserved These bits are read as 0b. The write value should always be 0b.
13 to 8	Tx Coefficient C-1[5:0]	20h	RW	Renesas Private bit Specify d'2.
7 to 0	-	0h	R	Reserved These bits are read as 0b. The write value should always be 0b.

(5) PIPE Status and Control Register 4 (USB3m_HOST_U3P0PIPESC4)

PIPE Status and Control Register 4.

Access Size : 32 bits
Address : <USB3m_host_base> + 10D0h
Initial Value : 0018_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	Tx Coefficient C+1[5:0]						-	-	Tx Coefficient C0[5:0]					
Initial Value	0	0	0	0	0	0	0	0	0	0	0	1	1	0	0	0
R/W	R	R	RW	RW	RW	RW	RW	RW	R	R	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	Tx Coefficient C-1[5:0]						-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	RW	RW	RW	RW	RW	RW	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31, 30	-	All 0	R	Reserved These bits are read as 0b. The write value should always be 0b.
29 to 24	Tx Coefficient C+1[5:0]	0h	RW	Renesas Private bit Specify d'0.
23, 22	-	All 0	R	Reserved These bits are read as 0b. The write value should always be 0b.
21 to 16	Tx Coefficient C0[5:0]	18h	RW	Renesas Private bit Specify d'24.
15, 14	-	All 0	R	Reserved These bits are read as 0b. The write value should always be 0b.
13 to 8	Tx Coefficient C-1[5:0]	0h	RW	Renesas Private bit Specify d'0.
7 to 0	-	0h	R	Reserved These bits are read as 0b. The write value should always be 0b.

6.4.4.5 Description of Functions

The prefix (USB3m_HOST_) of the register names is omitted in this and subsequent sections.

6.4.4.5.1 Battery Charging

The USB3HOST supports the Battery Charging function of the Charging Port Device which is on the supply side.

The Battery Charging function is used to pull more current from VBUS than the current specified in the USB specification.

The following Port Modes are supported in the USB3HOST;

- Standard Downstream Port (SDP)
- Charging Downstream Port (CDP)
- Dedicated Charging Port (DCP)

Remark For detail, refer to the Battery Charging Specification Revision1.2.

(1) Setting Battery Charging Mode

The user can select one of BC modes by setting BCCTRL.BC_MODE_P[m] (m: 1)'s field in Battery Charging Control Register (BCCTRL) (refer to **(a) Battery Charging Control Register (USB3m_HOST_BCCTRL)**), when the user uses the battery charging function.

Table 6.4-16 BC_MODE_P[m]'s information of Battery Charging Control Register (BCCTRL)

Bit	Field	SW	Default Value	Function
1:0	BC_MODE_P1	RW	0h	Battery Charging Mode for Port1 0h: SDP 1h: CDP 2h: DCP 3h: Reserved

(2) How to Set Battery Charging Mode

The host driver can set the battery charging mode by executing the flow in **Figure 6.4-3**.

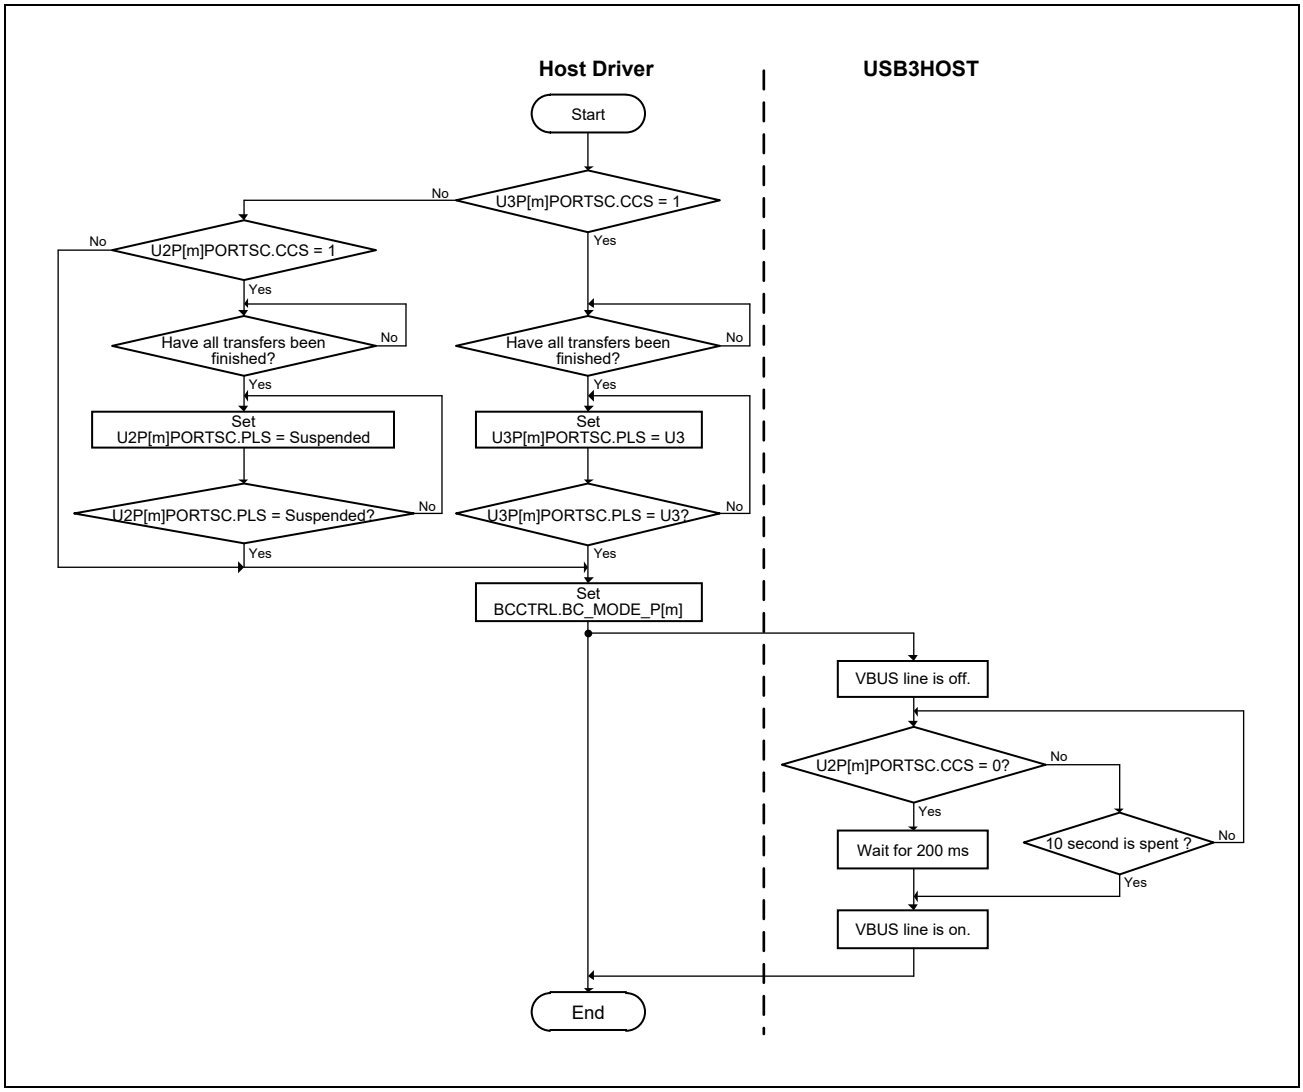

Figure 6.4-3 Host Driver's Flow to Set BC Mode (m = 1)

6.4.4.5.2 Initialization Flow

Figure 6.4-4 shows the “initialization flow” to the USB3HOST in USB system.

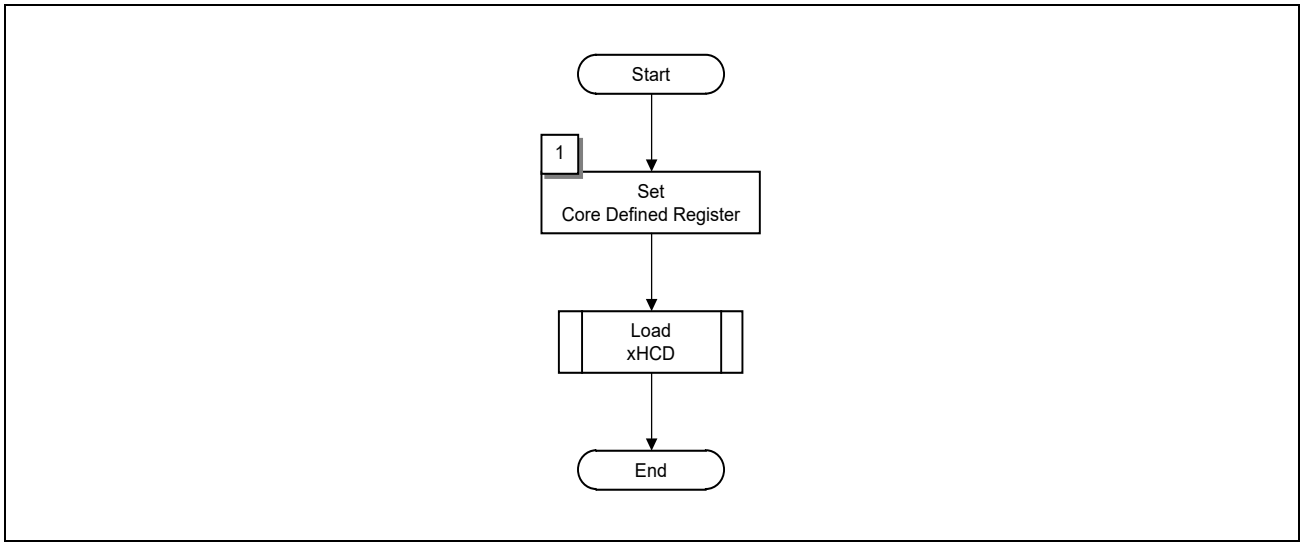

Figure 6.4-4 Initialization Flowchart

1. Set Core Defined Register
   Information of related interrupts is set in this phase.

6.4.4.5.3 xHCD Initialization Flow

Figure 6.4-5 shows the “initialization flow by xHCD (xHCI Driver)” to the USB3HOST in USB system.

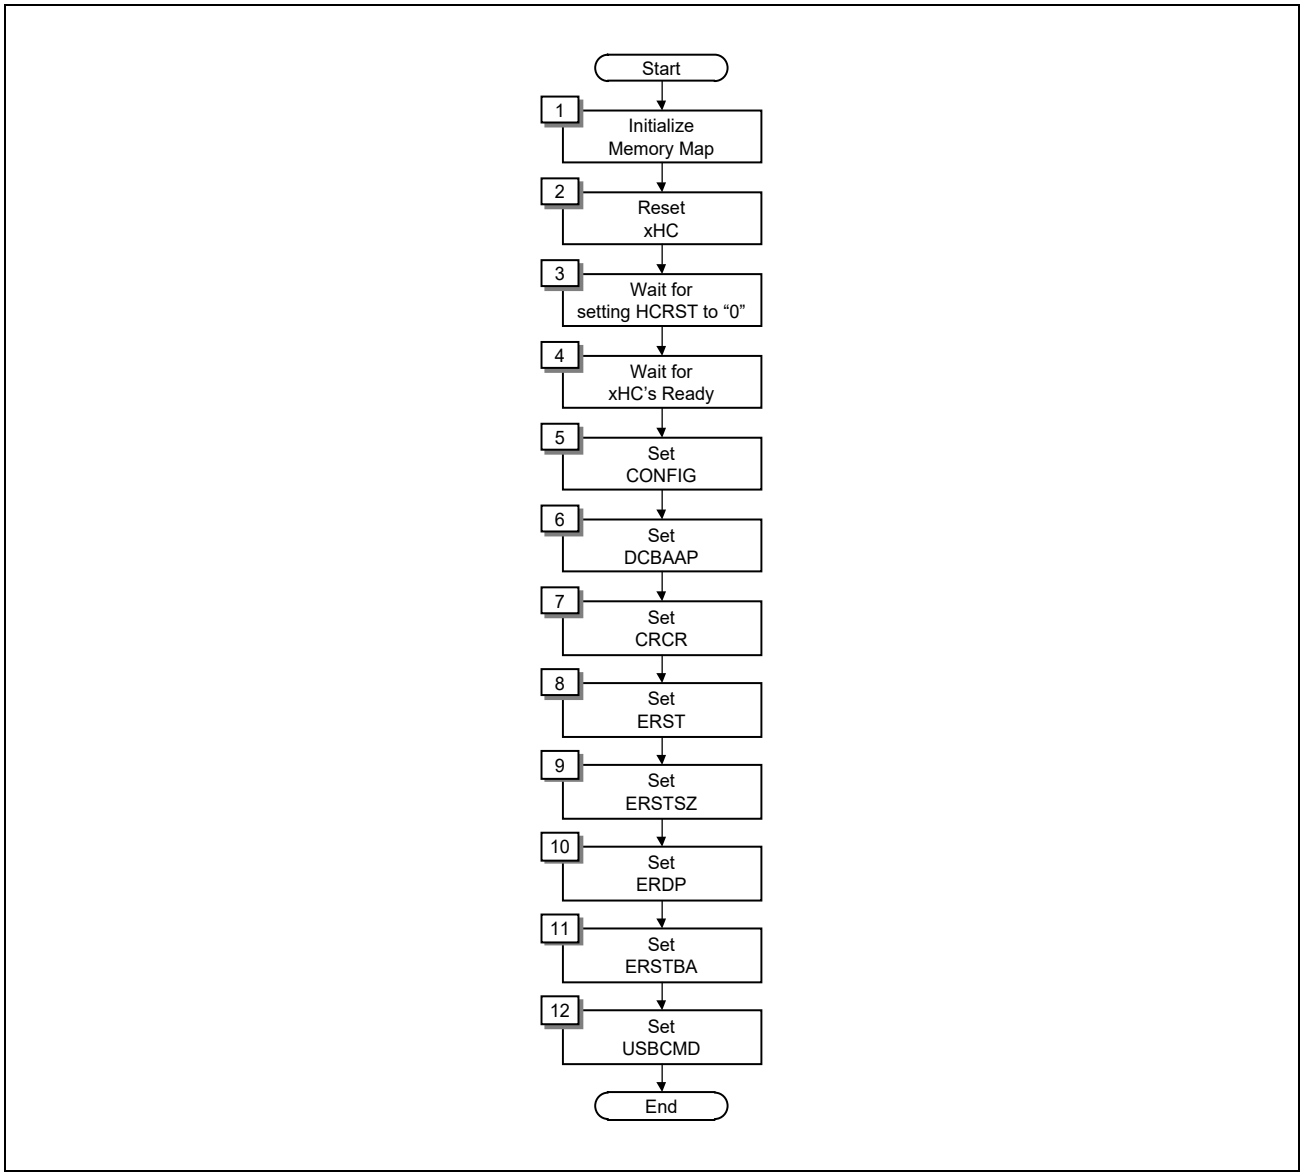

Figure 6.4-5 Initialization Flowchart by xHCD (xHCI Driver)

1. Initialize Memory Map
   xHCD initializes the memory area in the system.
2. Reset xHC
   xHCD confirms that USBSTS.HCH is set to “1b”.
   Then, xHCD resets xHC (the USB3HOST) by setting USBCMD.HCRST to “1b”.
3. Wait for setting HCRST to “0b”
   xHCD waits for setting USBCMD.HCRST to “0b”.
4. Wait for xHC’s Ready
   xHCD waits for setting USBSTS.CNR to “0b”.

5. Set CONFIG
   xHCD sets CONFIG.MaxSlotsEn to a valid value.
6. Set DCBAAP
   xHCD sets the “Device Context Base Address Array (DCBAAP)” to a valid value.
7. Set CRCR
   xHCD sets the “Command Ring Control Register (CRCR)” to the Command Ring’s address.
8. Set ERST
   xHCD sets the “Event Ring Segment Table (ERST)” to the Event Ring’s address and size in the system memory.
9. Set ERSTSZ
   xHCD sets the “Event Ring Segment Table Size (ERSTSZ)” to the Event Ring Segment Table’s size.
10. Set ERDP
    xHCD sets the “Event Ring Dequeue Pointer (ERDP) Register” to the Event Ring’s read address.
11. Set ERSTBA
    xHCD sets the “Event Ring Segment Table Base Address (ERSTBA) Register” to the Event Ring Segment Table’s address.
12. Set USBCMD
    xHCD sets USBCMD.INTE to”1b” and also sets USBCMD.R/S to “1b”.

6.4.4.5.4 Interrupt Flow

(1) “all_int” Interrupt Flow

Figure 6.4-6 shows “all_int” interrupt flow in USB system.

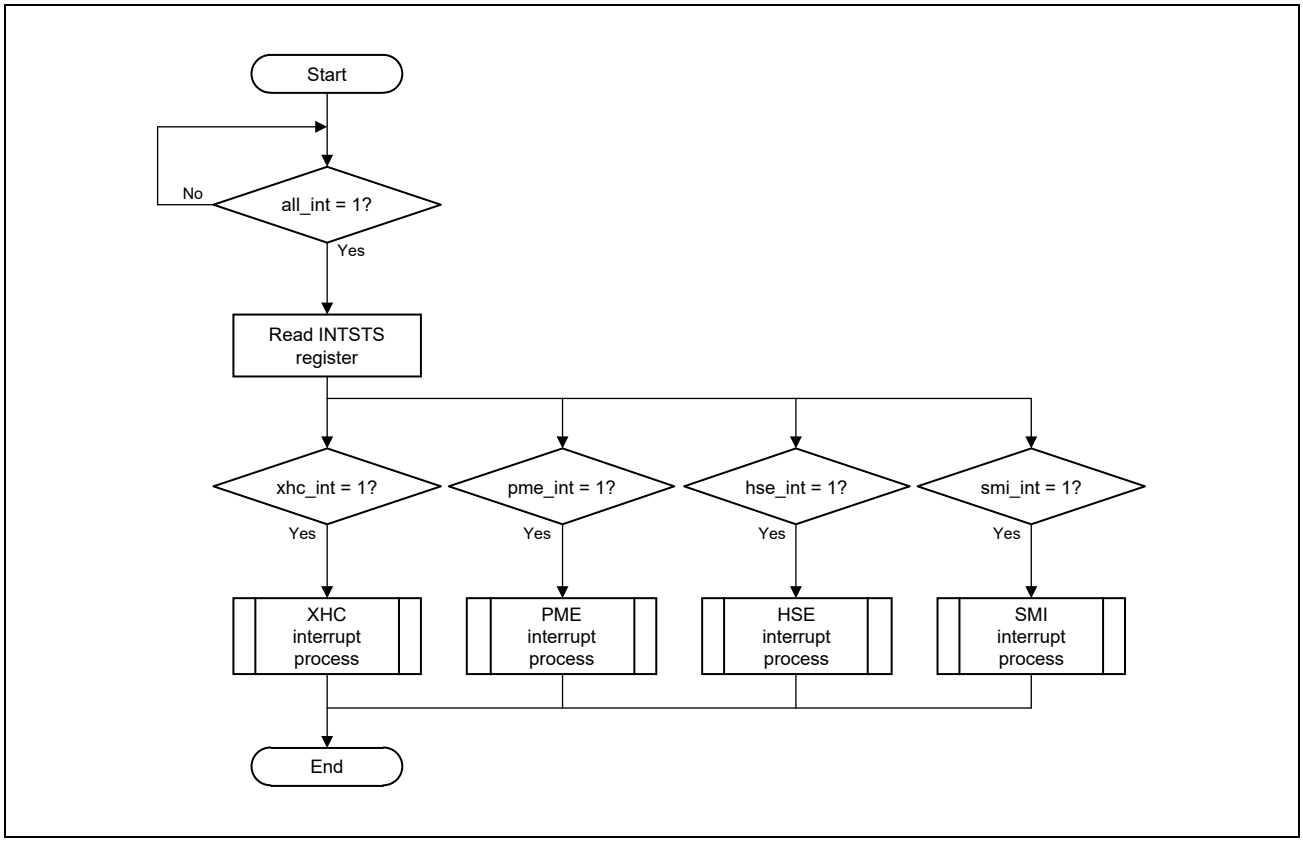

Figure 6.4-6 “all_int” Interrupt Flowchart

(2) XHC Interrupt Flow

Figure 6.4-7 shows “xhc_int” interrupt flow in USB system.

In the case of “CFGSTS1.INTEDGEN = 0b”, the notification mode of “xhc_int” is the Level mode.

(This mode is the same as INTA# in PCI System.)

In the case of “CFGSTS1.INTEDGEN = 1b”, the notification mode of “xhc_int” is the Pulse mode.

(This is the same as MSI / MSI-X in PCI System.)

In this LSI, “level mode” is selected as default interrupt mode.

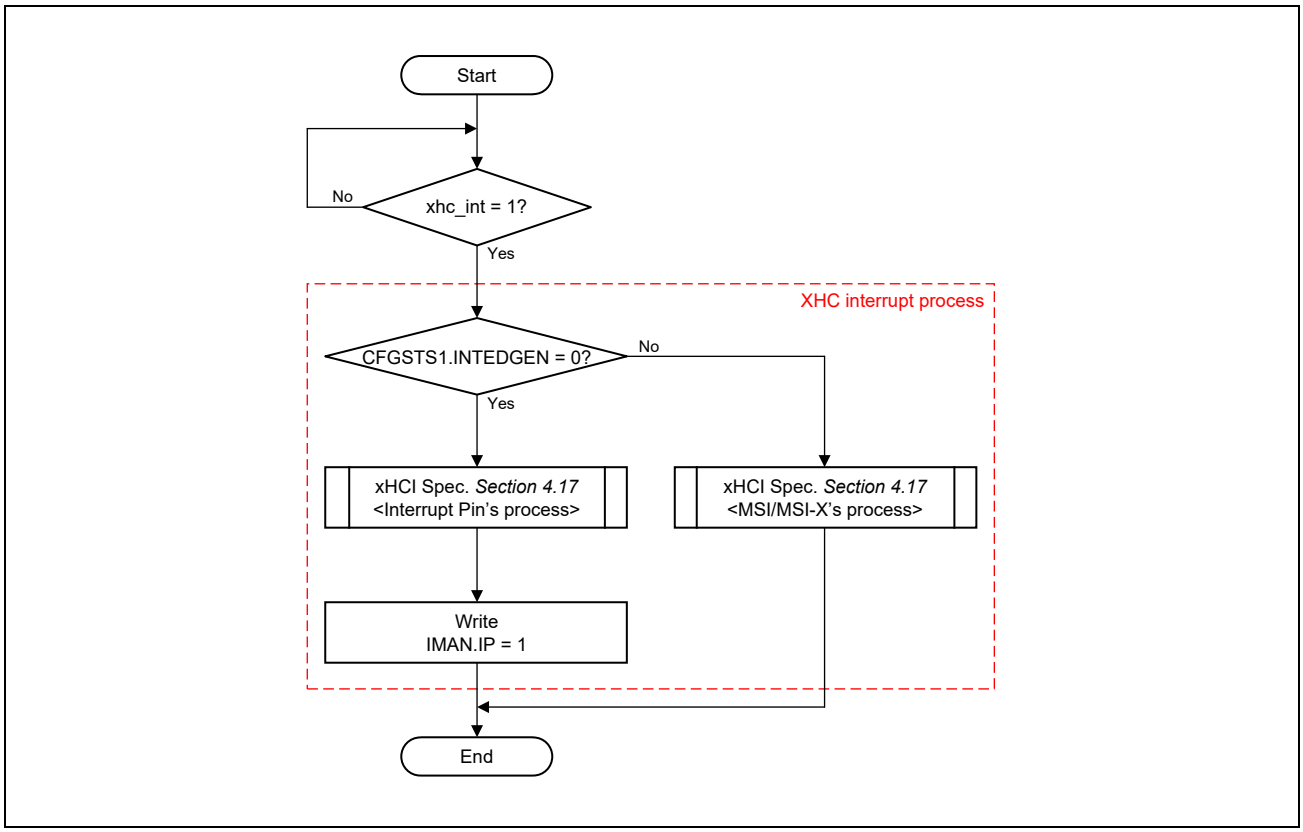

Figure 6.4-7 XHC Interrupt Flowchart

(3) PME Interrupt Flow

Figure 6.4-8 shows the “pme_int” interrupt flow in USB system.

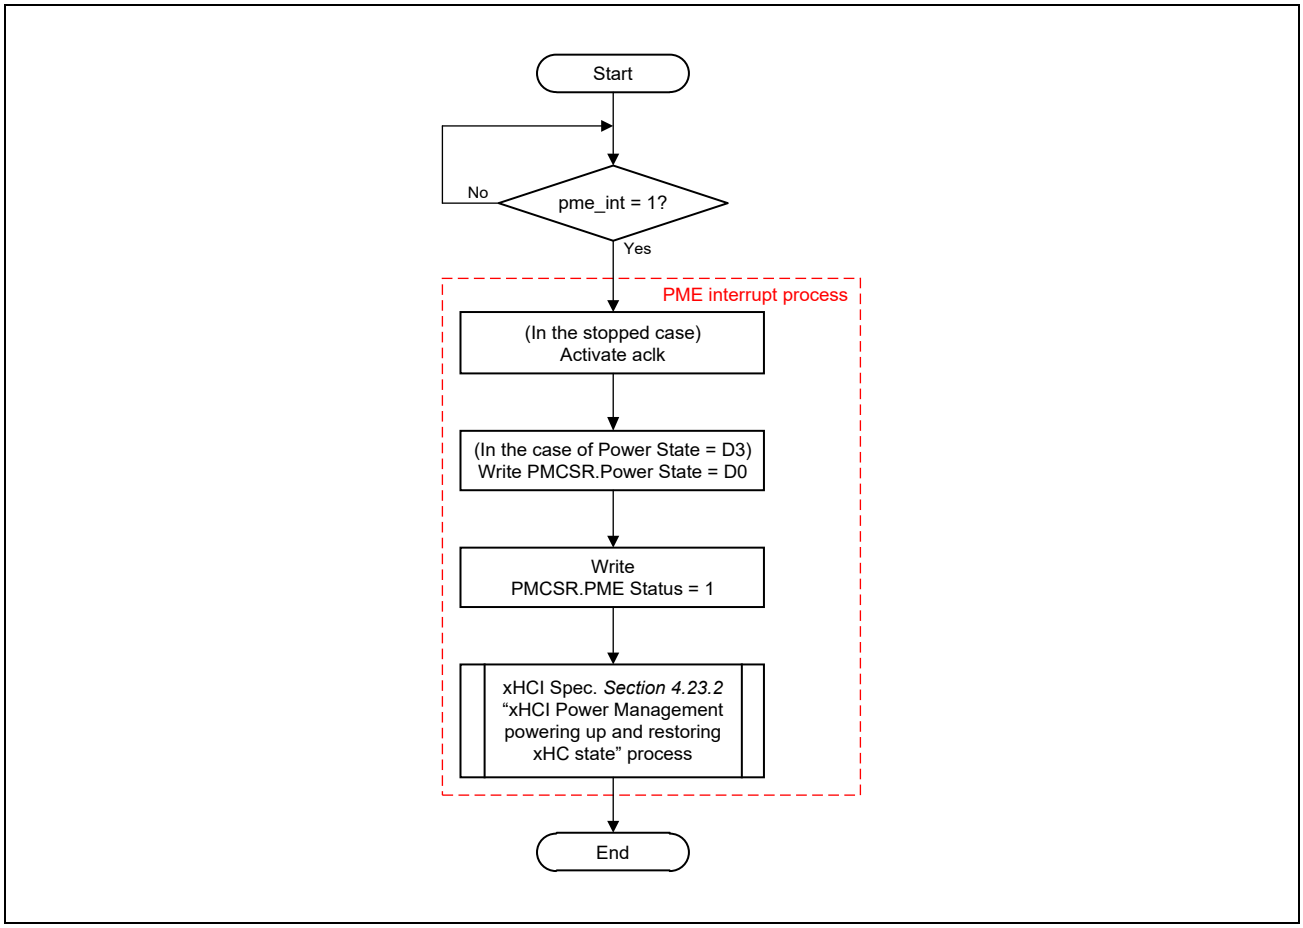

Figure 6.4-8 PME Interrupt Flowchart

(4) HSE Interrupt Flow

Figure 6.4-9 shows the “hse_int” interrupt flow in USB system.

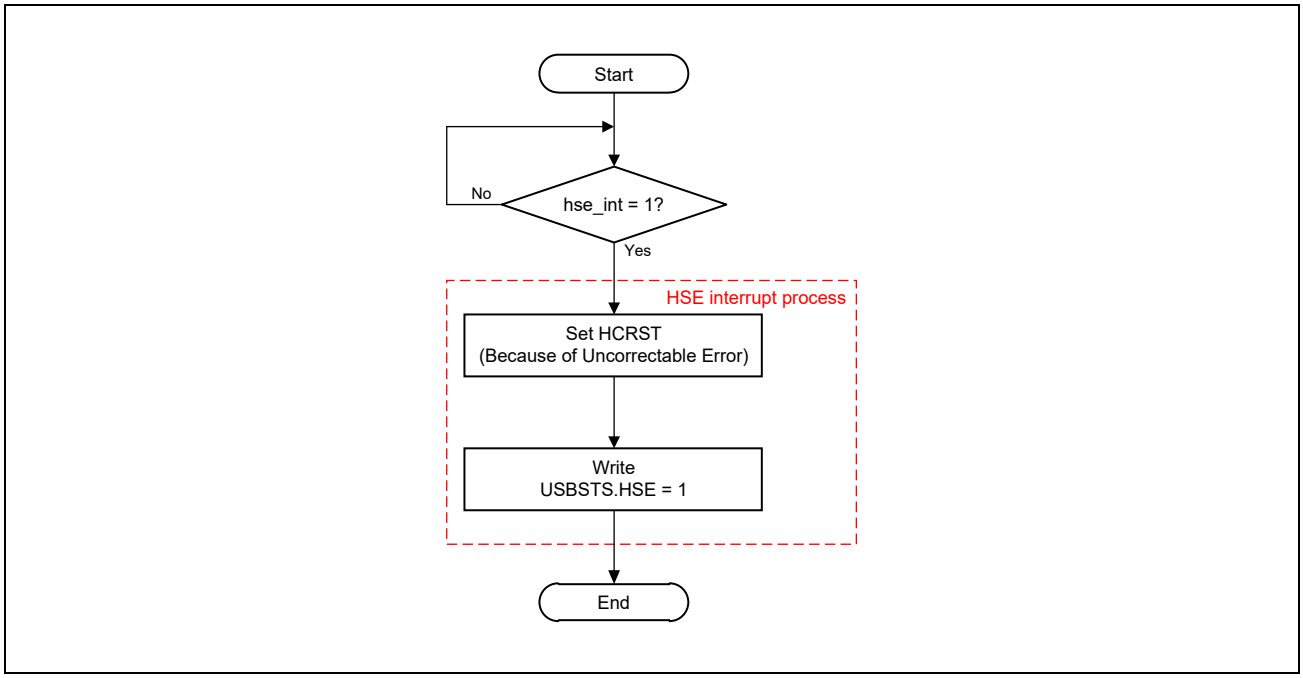

Figure 6.4-9 HSE Interrupt Flowchart

(5) SMI Interrupt Flow

Figure 6.4-10 shows the “smi_int” interrupt flow in USB system.

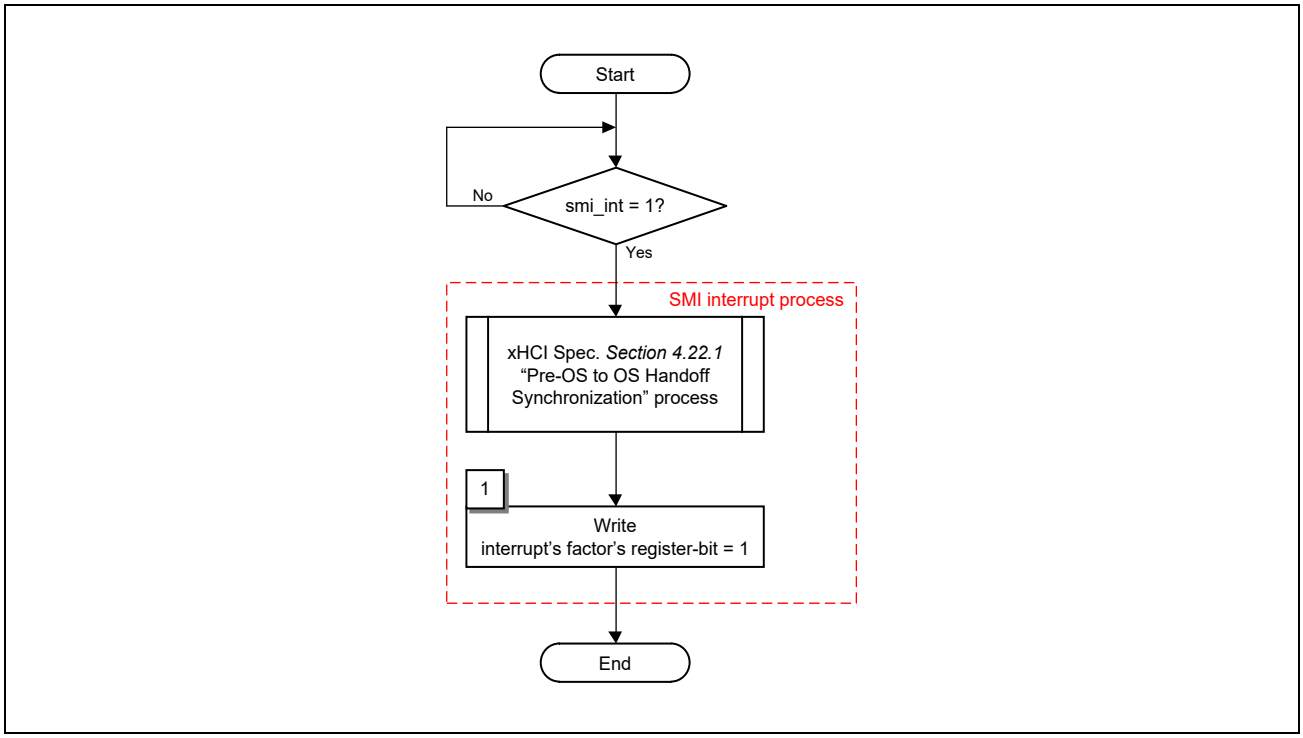

Figure 6.4-10 SMI Interrupt Flowchart

1. Write interrupt’s factor’s register-bit = 1b
   If this interrupt’s factor is USBLEGCTLSTS.SBA, write “1b” to USBLEGCTLSTS.SBA.
   If this interrupt’s factor is USBLEGCTLSTS.SPC, write “1b” to USBLEGCTLSTS.SPC.
   If this interrupt’s factor is USBLEGCTLSTS.SOOC, write “1b” to USBLEGCTLSTS.SOOC.
   If this interrupt’s factor is USBLEGCTLSTS.SHSE, write “1b” to USBSTS.HSE.
   If this interrupt’s factor is USBLEGCTLSTS.SEI, write “1b” to USBSTS.EINT.

6.4.4.5.5 xHCI Command

Figure 6.4-11 shows an abstract of xHCI Command flow by using the USB3HOST.

Refer to "*Section 4.11.3 Event TRBs*" and "*Section 4.11.4 Command TRBs*" of the *xHCI specification* for detail information.

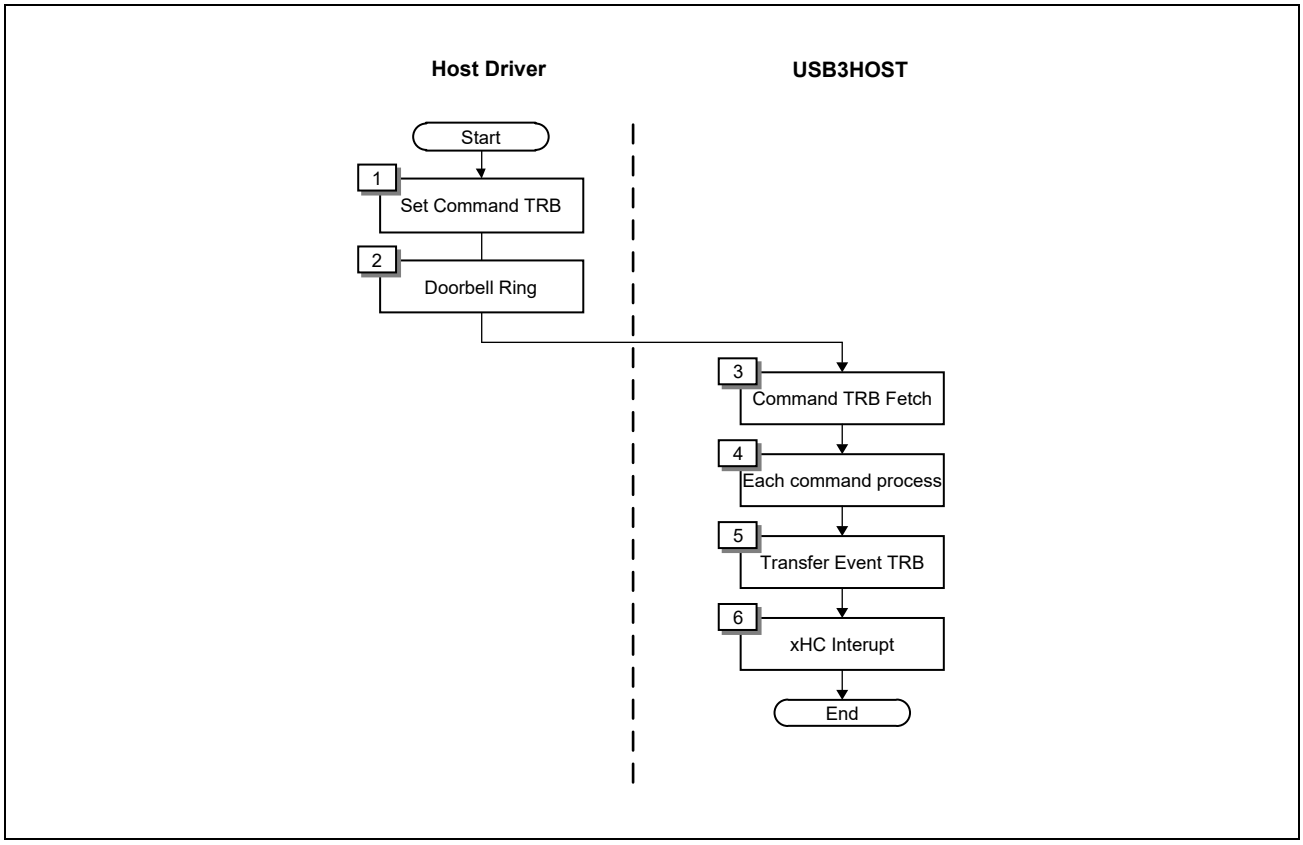

Figure 6.4-11 xHCI Command Flowchart

1. Set Command TRB
   Host driver sets the Command TRB in the Command Ring.
2. Doorbell Ring
   Host driver rings the Doorbell to prepare data for each xHCI command's process.
3. Command TRB Fetch
   The USB3HOST fetches Command TRB from Command Ring,
4. Each command process
   The USB3HOST decodes that command's content and executes each command process.
5. Transfer Event TRB
   The USB3HOST writes Event TRB to Event Ring.
6. xHC Interrupt
   The USB3HOST sends the interrupt to the system.

6.4.4.5.6 Examples of Transaction Flows

This section describes transactions when the USB3HOST is used.

As examples, Bulk OUT and Bulk IN transactions are described.

The USB3HOST complies with the xHCI Specification.

Refer to "*Section 4.11.2 Transfer TRBs*" and "*Section 4.11.3 Event TRBs*" of the *xHCI Specification* for detail information.

Bulk OUT Transaction Flow

Bulk OUT transaction flow is shown below.

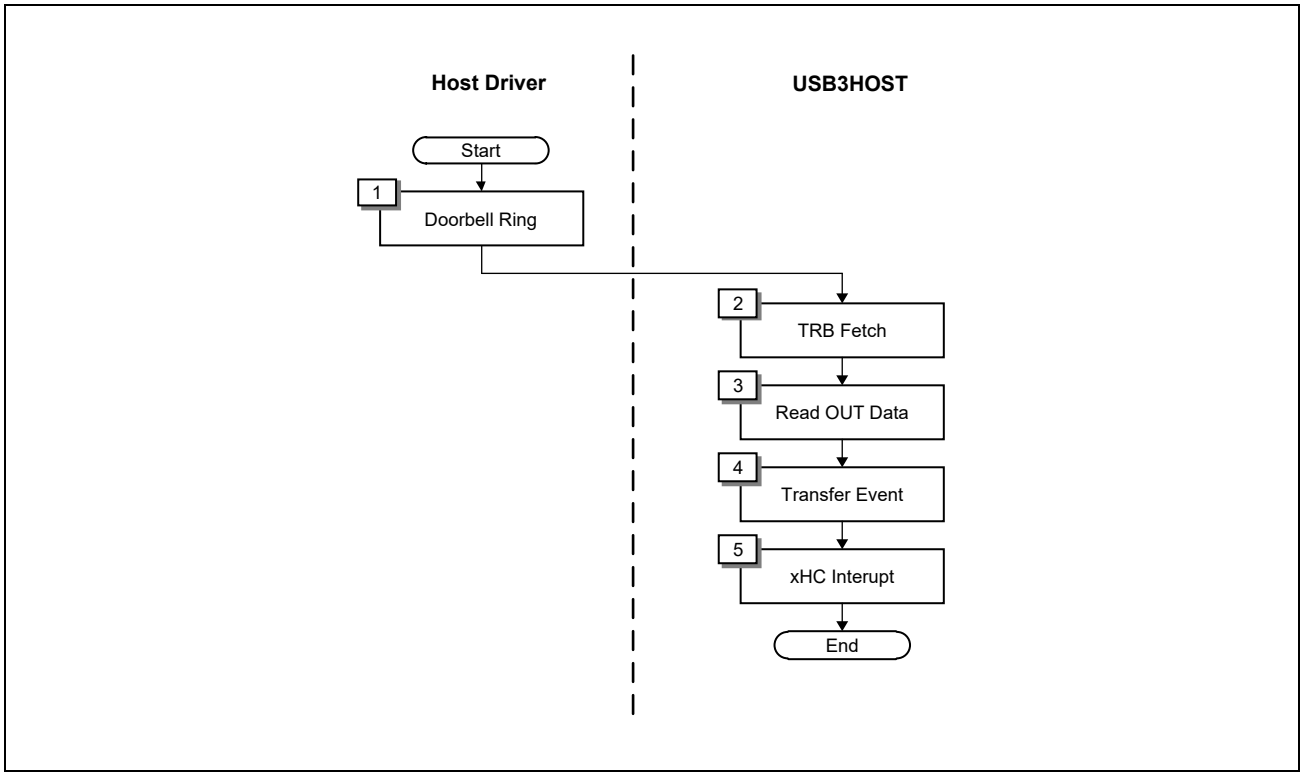

Figure 6.4-12 Example of Bulk OUT Transaction Flowchart

1. Doorbell Ring
   Host Driver rings Doorbell to prepare Transfer Data.
2. TRB Fetch
   The USB3HOST fetches TRB from OUT Transfer Ring,
3. Read OUT Data
   The USB3HOST reads OUT Data from Data Buffer Pointer.
4. Transfer Event
   The USB3HOST writes Transfer Event TRB to Event Ring.
5. xHC Interrupt
   The USB3HOST sends the interrupt to the system.

Bulk IN transaction

Bulk IN transaction flow is shown below.

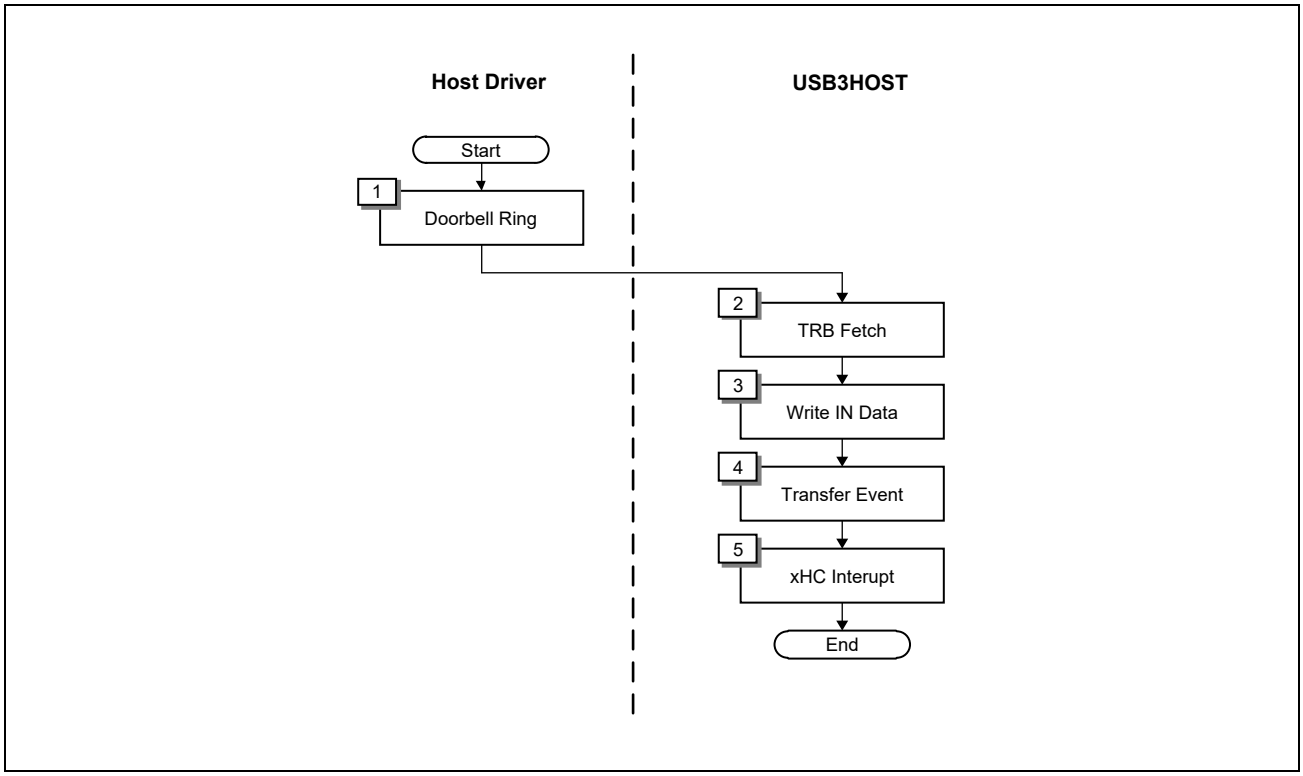

Figure 6.4-13 Example of Bulk IN Transaction Flowchart

1. Doorbell Ring
   Host driver rings Doorbell to prepare Transfer Data.
2. TRB Fetch
   The USB3HOST fetches TRB from OUT Transfer Ring.
3. Write IN Data
   The USB3HOST writes IN Data to Data Buffer Pointer.
4. Transfer Event
   The USB3HOST writes Transfer Event TRB to Event Ring.
5. xHC Interrupt
   The USB3HOST sends the interrupt to the system.

6.4.4.5.7 Functional Implementation Constraint

The USB3HOST core has functional implementation constraints.

One packet shall be composed of 8 TRBs or less.

If one packet is composed of nine or more TRBs, the USB3HOST generates a TRB Error for the higher-level system.

SW shall not set to U3 state before an event of the Force Header Command is completed.

If SW sets to U3 state before this event is completed, the USB3HOST results in undefined xHC behavior.

6.4.5 USB Test Module (USB3TEST/USB2TEST)

6.4.5.1 Features

This section mainly describes the USB test modules (USB3TEST and USB2TEST) which are connected between the USB3HOST and the PHY module. The main functions of USB3TEST/USB2TEST are as follows.

- Reset control
- Control of PHY input pins
- Monitoring of PHY output pins

For more information, refer to the User's Manual Additional Document.

SECTION 6 HIGH-SPEED INTERFACE

6.5 USB2.0 Interface

This section describes the USB2 functions of this LSI.

This LSI includes 1 channel USB2.0 OTG/DRD (Host/Function) interface.

This manual is a simplified version. For more information, refer to the User's Manual Additional Document.

6.5.1 USB2.0 PHY Controller

This section describes the overview of USB2.0 and USB2.0 PHY control.

The detail function of USB2.0 Host controller and the common function both Host module and Function module are described in **6.5.2 USB2.0 Host Controller**.

The detail function of USB2.0 Function controller is described in **6.5.3 USB2.0 Function Controller**.

6.5.1.1 Features

This interface complies the following specifications.

- Universal Serial Bus Specification Revision 2.0
- On-The-Go and Embedded Host Supplement to the USB Revision 2.0 Specification Revision 2.0 plus errata and ecn*[1]
- Enhanced Host Controller Interface (EHCI) Specification for Universal Serial Bus Revision 1.0
- EHCI v1.1 Addendum*[2]
- Open Host Controller Interface (OHCI) Specification for USB Release 1.0a
- Battery Charging Specification Revision 1.2*[3]

Note 1. Session Request Protocol(SRP) and Host Negotiation Protocol(HNP) are not supported

Note 2. Some EHCI v1.1 feature are not supported. (Refer to **6.5.2 USB2.0 Host Controller** for detail)

Note 3. DCP (Dedicated Charging Port) is not supported as downstream port.
For this LSI, IDP_SRC will flow to a maximum of 32 μA.

6.5.1.1.1 Ch0: USB2.0 OTG/DRD (host/function) interface

The following table shows features of this interface.

Table 6.5-1 Ch0: USB2.0 OTG/DRD (Host/Function) Interface Features

Function	Description
Host mode	• Support mode: – High-Speed (480 Mbps) – Full-Speed (12 Mbps) – Low-Speed (1.5 Mbps) • Support Isochronous / Interrupt/Control / Bulk transfer modes • Support Isochroous / Interrupt high bandwidth transfer
Function mode	• Support mode: – High-Speed (480 Mbps) – Full-Speed (12 Mbps) • Isochronous / Interrupt / Control / Bulk transfer • Up to 10 ch PIPE (includes default control PIPE)
Other functions	• OTG function (Rev. 2.0) • Battery Charging function • DRD (Dual-Role-Device) function (Static switch between Host and Function)

6.5.1.1.2 Block diagram

The block diagram of USB interface is as follows.

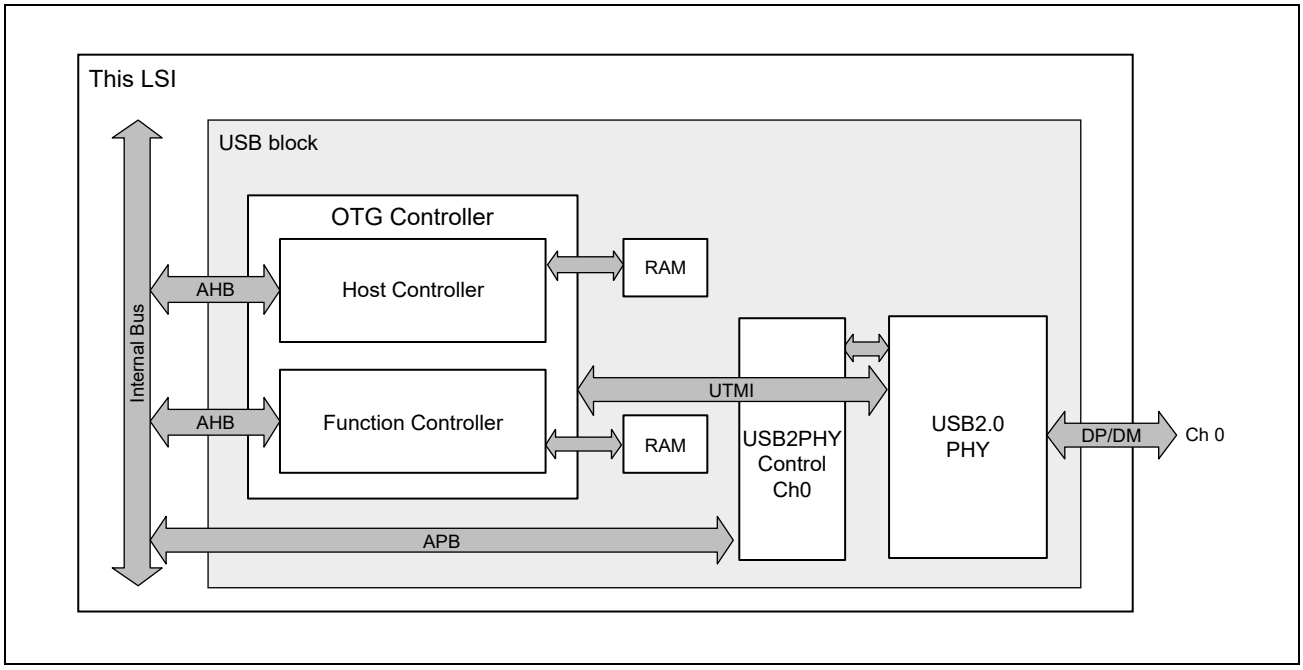

Figure 6.5-1 USB Interface Block Diagram

6.5.1.1.3 External signal pins

The following table shows external signal pins for USB block.

Table 6.5-2 External Signal Pins

Name	Input/Output	Description	Initial Value
USB20_DP	—	USB data pin Data+ (Ch0)	—
USB20_DM	—	USB data pin Data− (Ch0)	—
USB20_OVRCURN	Input	Over current detection input (Ch0)	—
USB20_VBUSEN	Output	VBUS output enable (Ch0)	0b
USB20_VUBUSIN	Input	Peripheral VBUS input (Ch0)	—
USB20_OTGEXICEN	Output	External power IC control (Ch0)	0b
USB20_OTGID	Input	OTG ID input (Ch0)	—

6.5.1.1.4 Power and GND pins

The following table shows Power and GND pins for USB block.

Table 6.5-3 Power and GND Pins

Name	Description
USB20_USDVDD	USB2PHY ch0 Core power supply
USB20_USVDD18	USB2PHY ch0 Internal Regulator Power (1.8 V), HS receiver power (1.8 V)
USB20_USVDD33	USB2PHY ch0 IO power (3.3 V)
USB20_TXRTUNE	USB2PHY ch0 Reference voltage

6.5.1.1.5 Interrupt

The following table shows interrupt list for USB block.

Table 6.5-4 USB Interrupt

Name	Description	Active Level	Type
U2H0_INT	USB2.0 Host AHB Interrupt (Ch0)	H	Level-Sensitive
U2H0_OHCI_INT	USB2.0 Host OHCI Interrupt (Ch0)	H	Level-Sensitive
U2H0_EHCI_INT	USB2.0 Host EHCI Interrupt (Ch0)	H	Level-Sensitive
U2H0_WAKEON_INT	USB2.0 Host EHCI Wakeup Interrupt (Ch0)	H	Level-Sensitive
U2H0_OBINT	USB2.0 Host OTG and Battery Charging Interrupt (Ch0)	H	Level-Sensitive
U2P_IXL_INT	USB2.0 Function controller Interrupt (Ch0)	H	Edge-Triggered
U2P_INT_DMA[1:0]	USB2.0 Function controller DMA transaction complete interrupt (Ch0)	H	Level-Sensitive
U2P_INT_DMAERR	USB2.0 Function controller DMA error response interrupt (Ch0)	H	Level-Sensitive

6.5.1.2 Interface Registers

6.5.1.2.1 USB2PHY Control Register

USB2PHY Control Register mainly controls reset and power down of the USB2PHY.

Table 6.5-5 Register Base Addresses

Unit Name	Base Address Name	Base Address
USB20	<USB20_phy_base>	0_1583_0000h (5583_0000h*1, 4583_0000h*2)
USB21	<USB21_phy_base>	0_1584_0000h (5584_0000h*1, 4584_0000h*2)

Note 1. CM33 Address Space Non-Secure

Note 2. CM33 Address Space Secure

The prefix (USB2m_PHY_) of the register names is omitted in the register descriptions and the field descriptions in this section.

The prefix (USB2m_PHY_) means below (m = 0, 1):

- USB20_PHY_*: USB20 registers
- USB21_PHY_*: USB21 registers

For more information, refer to the User's Manual Additional Document.

6.5.1.3 Operation

For more information, refer to the User's Manual Additional Document.

6.5.2 USB2.0 Host Controller

6.5.2.1 Overview

This LSI has two USB 2.0 host/function modules. For each module, you can switch between the host mode and the peripheral mode by specifying the UCOM register setting. This section describes the circuits that are common to both modes, and the host controller itself.

6.5.2.1.1 Features

This module has the following features:

Function	Description
Host function	• Supporting high-speed (480 Mbps), full-speed (12 Mbps), and low-speed (1.5 Mbps) transfers • Compliant with Open Host Controller Interface (OHCI) Specification for USB Revision 1.0a • Compliant with Enhanced Host Controller Interface (EHCI) Specification for USB Revision 1.1*1
Other functions	• Battery charging (compliant with Battery Charging Specification Revision 1.2)*2 • Dual-role-device function (static switching between the USB host and USB peripheral functions)

Note 1. Some functions (specifications) are not supported.

Note 2. The setting for battery charging is handled by the host controller even if the function controller is selected. This LSI does not support DCP (Dedicated Charging Port) as a Downstream Port.

(1) EHCI v1.1 functions

Conventional host controller modules comply with EHCI Specification Revision.1.0. Meanwhile, this module supports the additional functions listed below to comply with EHCI v1.1 Addendum.

Note, however, that this module supports only the functions marked with "✓" in the table below.

Function Name	Support
Per-Port Change Events	✓
Shorter Periodic Frame List	✓
Hardware Prefetching	—
Link Power Management (LPM)	✓

Of the three features to support, the registers associated with "Per-Port Change Events" and "Shorter Periodic Frame List" are listed below. For more information on each register, refer to the appropriate register specification in **6.5.2.2 Host Registers**.

"Link Power Management (LPM)" is described in **(1) Link power management (LPM) function**.

Table 6.5-6 Per-Port Change Events

Relevant Register	Relevant Bit		Attribute	Function
HCCPARAMS (offset: 108h)	bit 18	Per-Port Change Event Capability	R	This bit indicates support for this function. This bit is fixed to 1b.
USBCMD (offset: 120h)	bit 15	Per-Port Change Events Enable	RW	Per-Port event notification setting. Writing 1b to this bit enables the Per-Port event notification function.
USBSTS (offset: 124h)	bit 16	Port-1 Change Detect	RW(1)	If a port-1 change event is detected, 1b is written to this bit.
USBINTR (offset: 128h)	bit 16	Port-1 Change Event Enable	RW	Enable/Disable setting of the above "port-1 Change Detect" field. To reflect the port event on the above field for the port, set the corresponding bit to 1b.

Table 6.5-7 Shorter Periodic Frame List

Relevant Register	Relevant Bit		Attribute	Function
HCCPARAMS (offset: 108h)	bit 19	32-Frame Periodic List Capability	R	This bit indicates support for this function. This bit is fixed to 1b.
USBCMD (offset: 120h)	bit[3:2]	Frame List Size	RW	This bit determines the Frame List Size. To determine 32-frames, set this field to 11b.

(2) Link power management (LPM) function

This module supports the power management function conforming to “USB 2.0 Link Power Management Addendum to the Universal Serial Bus v2.0 Specification” (abbreviated as LPM).

When the peripheral device which supports the LPM function is connected to this module, the device can be moved to the suspend state faster than conventional by using the LPM function.

Remark When using the LPM function: 8 to 10 µs

The relevant registers are listed in the following. Refer to the appropriate register specification of each register detail in **6.5.2.2 Host Registers**.

Relevant Register	Relevant Bit		Attribute	Function
HCCPARAMS (offset: 108h)	bit 17	Link Power Management Capability	R	This bit indicates support for this function. This bit is fixed to 1b.
USBCMD (offset: 120h)	bit[27:24]	Host-Initiated Resume Duration	RW	The minimum duration time of K-state drive for resumption from LPM state.
PORTSC1 (offset: 164h)	bit[31:25]	Device Address [7:0]	RW	The device address of the destination of LPM Token. When using LPM function, this setting is needed. Set the address of the device connected to the corresponding port before sending LPM Token.
	bit[24:23]	Suspend Status [1:0]	R	The device response to LPM Token.
	bit 9	Suspend using L1	RW	When using LPM function, set this bit to 1b.
	bit 7	Suspend	RW	When this bit is set to 1b this module starts LPM Token transaction, in condition of “Suspend using L1 bit = 1b” and “Device address field = 000h”.
PORT_LPM_CTR1 (offset: 320h)	bit[7:4]	NYET_RETRY_CNT_P1 [3:0]	RW	The number of retries for NYET response of device in LPM transaction.
	bit 3	REMOTEWAKE_EN_P1	RW	Setting of LPM RemoteWakeup permission. 0b: permitted (default) 1b: not permitted
	bit 2	SLEEP_INT_EN_P1	RW	In LPM transaction, setting to generate an interrupt or not when a response other than ACK is received. 0b: not to generate an interrupt (default) 1b: to generate an interrupt
	bit 1	RETRY_ENABLE_NYET_P1	RW	In LPM transaction, setting to the host behavior when NYET response from the device is received. 0b: not to Retry (default) 1b: to Retry
	bit 0	HIRD_SEL_P1	RW	Setting the duration time of the K-state drive for resumption from LPM state.

(3) OTG function

Detects a change of the USB0_OTG_ID pin by U2H0_OBINT interrupt and switches the Host/Function role. Confirm the IDCHG_STA bit of **(2) OTG-BC Interrupt Status Register (USB2m_HOST_OBINTSTA)** and the IDMON bit of **(5) Line Control Port 1 Register (USB2m_HOST_LINECTRL1)**.

Host/Function role switching is performed by the OTG_PERI bit of **(1) Common Control Register (USB2m_HOST_COMMCTRL)**.

OTG_PERI bit
0: Host mode
1: Function mode

(4) Battery-charging function

The Control and monitoring of the Battery Charging I/F of the USBPHY is set in the UCOM register of this module. For the detail of the UCOM register, refer to **6.5.2.2.6 UCOM Register** Descriptions .

(5) Suspend extension function

This module implements the following two suspend extension functions to reduce power consumption by stopping PLL of USBPHY.

For the detail of the register, refer to **(6) Suspend Control Register (USB2m_HOST_SPD_CTRL)**.

[Relevant register]

Suspend Control Register (offset: 308h)

[Functional specification]

Function		Relevant Bit	
[1]	Function to assert USBPHY SUSPENDM by asserting the Suspend bit in the OHCI/EHCI Operational Register	bit 31	SUSPENDM_ENABLE
[2]	Function to forcibly assert USBPHY SUSPENDM	bit 0	GLOBAL_SUSPENDM_P1

6.5.2.1.2 Support of USB-related specifications

USB-Related Specification or Function			Support
Host function	High Speed	Bulk IN/OUT transfer	✓
		Control IN/OUT transfer	✓
		Isochronous IN/OUT transfer	✓
		Isochronous high-bandwidth transfer	✓
		Interrupt IN/OUT transfer	✓
	Full Speed	Bulk IN/OUT transfer	✓
		Control IN/OUT transfer	✓
		Isochronous IN/OUT transfer	✓

6.5.2.2.2 OHCI Operational Register Descriptions

(1) HcRevision Register (USB2m_HOST_HcRevision)

Access Size : 32 bits

Address : <USB2m_host_base> + 0000h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	Revision[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
7 to 0	Revision[7:0]	0h	R	This field indicates the version of HCI specifications implemented in this host controller module. Because this module conforms to OHCI standard 1.0a, 10h is indicated.

(2) HcControl Register (USB2m_HOST_HcControl)

Access Size : 32 bits
Address : <USB2m_host_base> + 0004h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	RWC	-	HCFS[1:0]		BLE	CLE	IE	PLE	CBSR[1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	RW	R	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
9	RWC	0h	RW	Remote Wakeup Connected This bit indicates whether the host controller supports remote wakeup signaling. Software should set this bit to 1b in the initialization sequence if it is required to support remote wakeup. Note that this bit can be initialized at hardware reset only. 0b: The remote wakeup is not supported. 1b: The remote wakeup is supported
8	-	0h	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
7, 6	HCFS[1:0]	0h	RW	Host Controller Functional State This field indicates the operating state of the host controller. 00b: USB Reset 01b: USB Resume 10b: USB Operational 11b: USB Suspend When the state is changed to USB Operational, the host controller module starts SOF transmission at 1 ms boundary. This field is basically controlled by software, but it can be controlled by the host controller in the state of USB Suspend only. If the host controller (in the state of USB Suspend) detects a Remote Wakeup signal from the connecting device, the state in this field is changed to USB Resume. Note that the reset value of this field differs between hardware reset and software reset. Hardware reset: 00b (USB Reset) Software reset: 11b (USB Suspend)
5	BLE	0h	RW	BulkList Enable This bit sets whether the bulk list processing is performed for the next frame. The setting value of this bit is enabled from the next frame. When you correct the bulk list, this bit must be 0b. 0b: The processing of the Bulk list is disabled. 1b: The processing of the Bulk list is enabled
4	CLE	0h	RW	Control List Enable This bit sets whether the control list processing is performed for the next frame. The setting value of this bit is enabled from the next frame. When you correct the control list, this bit must be 0b. 0b: The processing of the Control list is disabled. 1b: The processing of the Control list is enabled.

Bit	Bit Name	Initial Value	R/W	Description
3	IE	0h	RW	Isochronous Enable This bit sets whether the isochronous ED processing is performed. The setting value of this bit is enabled from the next frame. If the host controller module detects isochronous ED (F = 1) during the periodic list processing, it checks the bit and determines whether to perform isochronous ED processing. 1b: The processing of the isochronous ED is continued. 0b: The periodic list processing is stopped, and the bulk/control list processing is started. 0b: The processing of the isochronous ED is disabled. 1b: The processing of the isochronous ED is enabled.
2	PLE	0h	RW	Periodic List Enable This bit indicates whether the periodic list processing is performed for the next frame. The setting value of this bit is enabled from the next frame. The host controller module checks this bit before starting the periodic list processing. 0b: The processing of the periodic list is disabled. 1b: The processing of the periodic list is enabled.
1, 0	CBSR[1:0]	0h	RW	Control Bulk Service Ratio This field defines the service ratio of the control transfer and bulk transfer. When the periodic list is processed, the service ratio defined in this field is used for transfer. CBSR No. of Control EDs Over Bulk EDs Served 00b 1 : 1 01b 2 : 1 10b 3 : 1 11b 4 : 1

(3) HcCommandStatus Register (USB2m_HOST_HcCommandStatus)

Access Size : 32 bits
Address : <USB2m_host_base> + 0008h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	SOC[1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	BLF	CLF	HCR
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	W

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
17, 16	SOC[1:0]	0h	R	Scheduling Overrun Count This field counts the number of scheduling overrun. This field is initialized to 00b, and is counted up every time scheduling overrun is detected. After the field is incremented to 11b, it returns to 00b. Even if the SO (Scheduling Overrun) bit in the HcInterrupt Status register is set, this field is counted up when scheduling overrun is detected.
15 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
2	BLF	0h	RW	BulkList Filled This bit indicates whether TD exists in the bulk list. To add TD to ED in the bulk list, set this bit to 1b. The host controller checks this bit when it starts processing of the head ED in the bulk list. If this bit is set to 0b, the host controller does not start the list processing. If this bit is set to 1b, the host controller starts processing of the bulk list, and sets this bit to 0b. When the host controller finds TD in the bulk list, it sets this bit to 1b again, and continues processing of the bulk list. When the host controller finishes the list processing, this bit is set to 0b. However, if TD is not found in the bulk list, or if this bit is not set to 1b, this bit remains to be 0b, and the list processing stops. To rebuild the list and start the list processing, before you set the BLE bit of the HcControl register and start the list processing, you need to set this bit. 0b: TD does not exist in the bulk list. 1b: TD exists in the bulk list.
1	CLF	0h	RW	Control List Filled This bit indicates whether TD exists in the control list. To add TD to ED in the control list, set this bit to 1b. The host controller checks this bit when it starts processing of the head ED in the control list. If this bit is set to 0b, the host controller does not start the processing of the control list. If this bit is set to 1b, the host controller starts processing of the control list, and set this bit to 0b. When the host controller finds TD in the control list, it sets this be to 1b again, and continues the list processing. When the host controller finishes the list processing, this bit is set to 0b. However, if TD is not found in the control list, or if this bit is not set to 1b, this bit remains to be 0b, and the list processing stops. To rebuild the list and start the list processing, before you set the CLE bit of the HcControl register and start the list processing, you need to set this bit. 0b: TD does not exist in the control list. 1b: TD exists in the control list.
0	HCR	0h	W	Host Controller Reset This bit is used to start OHCI software reset for the host controller. When this bit is set to 1b, the operating status of the host controller is changed to USB Suspend regardless of the functional state of the host controller. Also, the most OHCI Operational registers and OHCI control circuits are initialized. When the software reset finishes, the host controller clears this bit to 0b.

(4) HcInterruptStatus Register (USB2m_HOST_HcInterruptStatus)

Access Size : 32 bits
Address : <USB2m_host_base> + 000Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	RHSC	FNO	UE	RD	SF	WDH	SO
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 7	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
6	RHSC	0h	RW	Root Hub Status Change Interrupt bit that indicates that the state of the HcRhStatus register or HcRhPortStatus1 register has changed. When the Root Hub status is changed, the host controller sets this bit to 1b. Writing 1b to this bit clears the interrupt. 0b: The status of root hub has not changed. 1b: The status of root hub has changed.
5	FNO	0h	RW	Frame Number Overflow Interrupt bit that indicates that the MSB in the Frame Number (FN) field of theHcFmNumber register has changed. When the MSB in the Frame Number field is changed from 0 to 1, or from 1 to 0, this bit is set after HccaFrameNumber is updated. Writing this bit to 1b clears the interrupt. 0b: The overflow of frame number has not occurred. 1b: The overflow of frame number has occurred.
4	UE	0h	RW	Unrecoverable Error Interrupt bit that indicates that a system error that is not related to the USB (for example, an error on the system bus) has been detected. Writing this bit to 1b clears the interrupt. 0b: The unrecoverable error has not occurred. 1b: The unrecoverable error has occurred.
3	RD	0h	RW	Resume Detected Interrupt bit that indicates that Resume has been detected. When the host controller detects the Resume signal (RemoteWakeup) from an USB device, it sets this bit to 1b. This bit is not set when the Resume signal is sent by setting the HCFS field to USB Resume. Writing this bit to 1b clears the interrupt. 0b: The host controller has not detected resume signaling (RemoteWakeup). 1b: The host controller has detected resume signaling (RemoteWakeup).
2	SF	0h	RW	Start of Frame Interrupt bit that indicates that Hcca Frame Number was updated when each frame started. The host controller sends an SOF packet and updates HccaFrameNumber at the same time, and sets this bit to 1b. Writing this bit to 1b clears the interrupt. 0b: The host controller has not started new frame. 1b: The host controller has started new frame.

Bit	Bit Name	Initial Value	R/W	Description
1	WDH	0h	RW	Writeback DoneHead Interrupt bit that indicates that the host controller has written the contents of HcDoneHead to HccDoneHead. The host controller sets this bit to 1b immediately after it updates HccaDoneHead. Note that HccaDoneHead is not updated until this bit is cleared. Writing this bit to 1b clears the interrupt. This bit must be cleared only after the contents of HccaDoneHead are saved. 0b: The write back to HccaDoneHead has not occurred. 1b: The write back to HccaDoneHead has occurred.
0	SO	0h	RW	Scheduling Overrun Interrupt bit that indicates that overrun of the USB schedule occurred. When USB scheduling overrun occurs, the host controller updates HccaFrameNumber, and sets this bit to 1b. When this bit is set, the SchedulingOverrunCount field of the HcCommandStatus register is also incremented. Writing this bit to 1b clears the interrupt. 0b: The scheduling overrun has not occurred. 1b: The scheduling overrun has occurred.

(5) HcInterruptEnable Register (USB2m_HOST_HcInterruptEnable)

Access Size : 32 bits
Address : <USB2m_host_base> + 0010h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	MIE	OCE	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	RHSCE	FNOE	UEE	RDE	SFE	WDHE	SOE
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31	MIE	0h	RW	Master Interrupt Enable This bit sets whether each Interrupt Enable setting (which is set in HcInterruptEnable [30:0]) is enabled. If this bit is set to 0b, all OHCI interrupts are masked. To clear this bit, set the MID bit (bit 31) of the HcInterruptDisable register to 1b. 0b: All interrupts are disabled. 1b: Interrupts that are set to 1b are enabled.
30	OCE	0h	RW	OC (Ownership Change) Interrupt Enable bit. If this bit is set to 1b, the interrupt source becomes OC (OwnershipChange). To clear this bit, set the OCD bit (bit 30) of the HcInterruptDisable register to 1b. 0b: OC (Ownership Change) interrupt is disabled. 1b: OC (Ownership Change) interrupt is enabled.
29 to 7	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
6	RHSCE	0h	RW	RHSC (Root Hub Status Change) Interrupt Enable bit. If this bit is set to 1b, the interrupt source becomes RHSC (Root Hub Status Change). To clear this bit, set the RHSCD bit (bit 6) of the HcInterruptDisable register to 1b. 0b: RHSC (Root Hub Status Change) interrupt is disabled. 1b: RHSC (Root Hub Status Change) interrupt is enabled.
5	FNOE	0h	RW	FNO (Frame Number Overflow) Interrupt Enable bit. If this bit is set to 1b, the interrupt source becomes FNO (Frame Number Overflow). To clear this bit, set the FNOD bit (bit 5) of the HcInterruptDisable register to 1b. 0b: FNO (Frame Number Overflow) interrupt is disabled. 1b: FNO (Frame Number Overflow) interrupt is enabled.
4	UEE	0h	RW	UE (Unrecoverable Error) Interrupt Enable bit. If this bit is set to 1b, the interrupt source becomes UE (Unrecoverable Error). To clear this bit, set the UED bit (bit 4) of the HcInterruptDisable register to 1b. 0b: UE (Unrecoverable Error) interrupt is disabled. 1b: UE (Unrecoverable Error) interrupt is enabled.
3	RDE	0h	RW	RD (Resume Detect) Interrupt Enable bit. If this bit is set to 1b, the interrupt source becomes RD (Resume Detect). To clear this bit, set the RDD bit (bit 3) of the HcInterruptDisable register to 1b. 0b: RD (Resume Detect) interrupt is disabled. 1b: RD (Resume Detect) interrupt is enabled.
2	SFE	0h	RW	SF (Start of Frame) Interrupt Enable bit. If this bit is set to 1b, the interrupt source becomes SF (Start of Frame). To clear this bit, set the SFD bit (bit 2) of the HcInterruptDisable register to 1b. 0b: SF (Start of Frame) interrupt is disabled. 1b: SF (Start of Frame) interrupt is enabled.
1	WDHE	0h	RW	WDH (Writeback DoneHead) Interrupt Enable bit. If this bit is set to 1b, the interrupt source becomes WDH (Writeback DoneHead). To clear this bit, set the WDHDD bit (bit 1) of the HcInterruptDisable register to 1b. 0b: WDH (Writeback DoneHead) interrupt is disabled. 1b: WDH (Writeback DoneHead) interrupt is enabled.

Bit	Bit Name	Initial Value	R/W	Description
0	SOE	0h	RW	SO (Scheduling Overrun) Interrupt Enable bit. If this bit is set to 1b, the interrupt source becomes SO (Scheduling Overrun). To clear this bit, set the SOD bit (bit 0) of the HcInterruptDisable register to 1b. 0b: SO (Scheduling Overrun) interrupt is disabled. 1b: SO (Scheduling Overrun) interrupt is enabled.

(6) HcInterruptDisable Register (USB2m_HOST_HcInterruptDisable)

Access Size : 32 bits
Address : <USB2m_host_base> + 0014h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	MID	OCD	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW1	RW1	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	RHSCD	FNOD	UED	RDD	SFD	WDHD	SOD
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	RW1	RW1	RW1	RW1	RW1	RW1	RW1

Bit	Bit Name	Initial Value	R/W	Description
31	MID	0h	RW1	Master Interrupt Disable This bit sets whether the Enable setting (for each interrupt) that is set by HcInterruptEnable[30:0] is disabled. If this bit is set to 1b, the MIE bit (bit 31) of the HcInterruptEnable register is cleared to 0b, and all OHCI interrupts are masked. Writing 0b to this bit is ignored.
30	OCD	0h	RW1	OC (Ownership Change) Interrupt Disable bit. If this bit is set to 1b, the OCE bit (bit 30) of the HcInterruptEnable register is cleared to 0b, and OC (Ownership Change) is excluded from the interrupt source. Writing 0b to this bit is ignored.
29 to 7	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
6	RHSCD	0h	RW1	RHSC (Root Hub Status Change) Interrupt Disable bit. If this bit is set to 1b, the RHSCE bit (bit 6) of the HcInterruptEnable register is cleared to 0b, and RHSC (Root Hub Status Change) is excluded from the interrupt source. Writing 0b to this bit is ignored.
5	FNOD	0h	RW1	FNO (Frame Number Overflow) Interrupt Disable bit. If this bit is set to 1b, the FNOE bit (bit 5) of the HcInterruptEnable register is cleared to 0b, and FNO (Frame Number Overflow) is excluded from the interrupt source. Writing 0b to this bit is ignored.
4	UED	0h	RW1	UE (Unrecoverable Error) Interrupt Disable bit. If this bit is set to 1b, the UEE bit (bit 4) of the HcInterruptEnable register is cleared to 0b, and UE (Unrecoverable Error) is excluded from the interrupt source. Writing 0b to this bit is ignored.
3	RDD	0h	RW1	RD (Resume Detected) Interrupt Disable bit. If this bit is set to 1b, the RDE bit (bit 3) of the HcInterruptEnable register is cleared to 0b, and RD (Resume Detected) is excluded from the interrupt source. Writing 0b to this bit is ignored.
2	SFD	0h	RW1	SF (Start of Frame) Interrupt Disable bit. If this bit is set to 1b, the SFE bit (bit 2) of the HcInterruptEnable register is cleared to 0b, and SF (Start of Frame) is excluded from the interrupt source. Writing 0b to this bit is ignored.
1	WDHD	0h	RW1	WDH (Writeback DoneHead) Interrupt Disable bit. If this bit is set to 1b, the WDHE bit (bit 1) of the HcInterruptEnable register is cleared to 0b, and WDH (Writeback DoneHead) is excluded form the interrupt source. Writing 0b to this bit is ignored.
0	SOD	0h	RW1	SO (Scheduling Overrun) Interrupt Disable bit. If this bit is set to 1b, the SOE bit (bit 1) of the HcInterruptEnable register is cleared to 0b, and SO (Scheduling Overrun) is excluded from the interrupt source. Writing 0b to this bit is ignored.

(7) HcHCCA Register (USB2m_HOST_HcHCCA)

Access Size : 32 bits
Address : <USB2m_host_base> + 0018h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	HcHCCA(31:8)[23:8]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	HcHCCA(31:8)[7:0]								-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	R	R	R	R	R	R	R	R

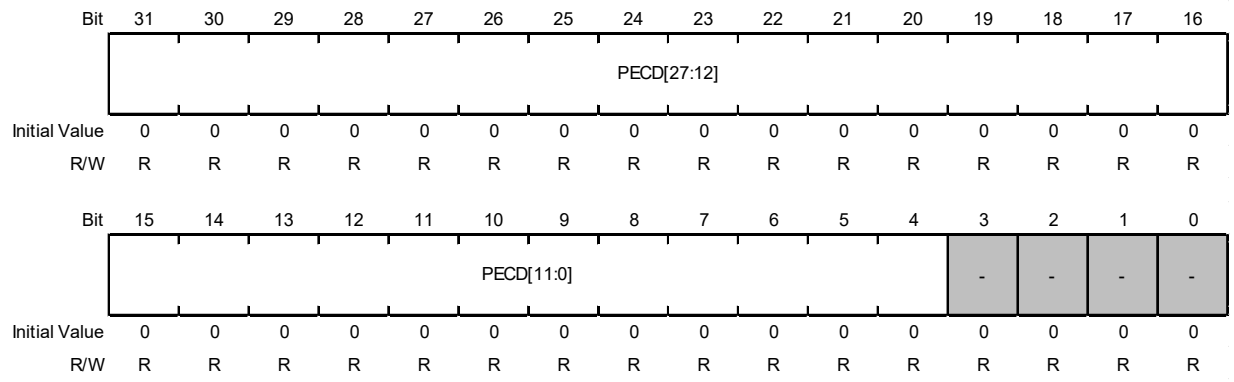
Bit	Bit Name	Initial Value	R/W	Description
31 to 8	HcHCCA(31:8)[23:0]	0h	RW	This field sets the base address (of the RAM) that is assigned as the Host Controller Communication Area. This field must be set at initialization. The host controller requests (as HCCA) 256-byte area from the base address specified in this field.
7 to 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.

(8) HcPeriodicCurrentED Register (USB2m_HOST_HcPeriodCurrentED)

Access Size : 32 bits

Address : <USB2m_host_base> + 001Ch

Initial Value : 0000_0000h



Bit	Bit Name	Initial Value	R/W	Description
31 to 4	PECD[27:0]	0h	R	Period Current ED This pointer indicates the physical address of ED in the periodic list that is currently processed. The host controller updates this pointer when the list processing of the periodic ED finishes.
3 to 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.

(9) HcControlHeadED Register (USB2m_HOST_HcControlHeadED)

Access Size : 32 bits
Address : <USB2m_host_base> + 0020h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CHED[27:12]

R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	CHED[27:0]	0h	RW	Control Head ED This field specifies the physical address of the head ED of the control list. These bits must be set for control transfer before the CLE bit of the HcControl register is set. The host controller starts processing of the control list from the HcBulkHeadED pointer.
3 to 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.

(10) HcControlCurrentED Register (USB2m_HOST_HcControlCurrentED)

Access Size : 32 bits
Address : <USB2m_host_base> + 0024h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CCED[27:12]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CCED[11:0]												-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	CCED[27:0]	0h	RW	Control Current ED This pointer indicates the physical address of the ED that is currently processed in the control list. After the current ED processing finishes, this pointer proceeds to the next ED. The host controller continues the list processing until the end of the frame. When the end of the control list is reached, the host controller checks the Control List Filled bit of the HcCommandStatus register. If the corresponding bit is set to 1b, the contents of the HcControlHeadED field are copied to the HcControlCurrentED field, and the Control List Filled bit is cleared. If the corresponding bit is set to 0b, nothing is performed. Update of this register is allowed only when the Control List Enable bit of the HcControl register is cleared. If the Control List Enable bit is set to 1b, the value of this register is only read. This register is initially set to 0h to indicate the end of the control list.
3 to 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.

(11) HcBulkHeadED Register (USB2m_HOST_HcBulkHeadED)

Access Size : 32 bits
Address : <USB2m_host_base> + 0028h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	BHED[27:12]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	BHED[11:0]												-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	BHED[27:0]	0h	RW	Bulk Head ED This field specifies the physical address of the head ED of the bulk list. This field must be set for bulk transfer before the BLE bit of the HcControl register is set. The host controller starts the processing of the control list from the HcBulkHeadED pointer.
3 to 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.

(12) HcBulkCurrentED Register (USB2m_HOST_HcBulkCurrentED)

Access Size : 32 bits

Address : <USB2m_host_base> + 002Ch

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	BCED[27:12]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	BCED[11:0]												-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	BCED[27:0]	0h	RW	Bulk Current ED This pointer indicates the physical address of the ED that is currently processed in the bulk list. After the current ED processing finishes, this pointer proceeds to the next ED. The host controller continues the list processing until the end of the frame. When the end of the bulk list is reached, the host controller checks the Control List Filled bit of the HcCommandStatus register. If the corresponding bit is set to 1b, the contents of the HcBulkHeadED field are copied to the HcBulkICurrentED field, and the ControlListFilled bit is cleared. If the corresponding bit is set to 0b, nothing is performed. Update of this register is allowed only when the ControlListEnable bit of the HcControl register is cleared. If the ControlListEnable bit is set to 1b, the value of this register is only read. This register is initially set to 0h to indicate the end of the bulk list.
3 to 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.

(13) HcDoneHead Register (USB2m_HOST_HcDoneHead)

Access Size : 32 bits
Address : <USB2m_host_base> + 0030h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DH[27:12]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DH[11:0]												-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	DH[27:0]	0h	R	Done Head This field indicates the physical address of the HcDoneHead of the host controller. The physical address of the TD that lately finished and is added to the Done queue. After the TD processing finishes, the host controller writes the contents of the HcDoneHead to the NextTD field of the TD. At the same time, the host controller overwrites the contents of HcDoneHead with the TD address. After the host controller writes the contents of this register into HCCA, it sets 0b to this register. Then, the Writeback DoneHead bit of the HcInterruptStatus register is set to 1b.
3 to 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.

(14) HcFmInterval Register (USB2m_HOST_HcFmInterval)

Access Size : 32 bits
Address : <USB2m_host_base> + 0034h
Initial Value : 0000_2EDFh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	FIT	FSMPS[14:0]														
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	FI[13:0]													
Initial Value	0	0	1	0	1	1	1	0	1	1	0	1	1	1	1	1
R/W	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31	FIT	0h	RW	Frame Interval Toggle This bit is used to synchronize the frame setting value with the hardware (host controller). When the FI field is updated, the toggle value is written to this bit. When the FI field value is applied to the FR field of the HcFmRemaining register, the value of this bit is also applied to the FRT bit of the HcFmRemaining register. By checking the toggle value in the FRT bit of the cFmRemaining register, the software can check whether the value in the FI field has been applied to the FR field of the HcFmRemaining register.
30 to 16	FSMPS[14:0]	0h	RW	FS Largest Data Packet This field sets the maximum amount of data (bits) that the host controller can send and receive without the fear of schedule overrun. The host controller compares the current frame position and the setting value in this field to determine the length (of the frame) that is ready to be transferred. This value differs depending on the capacity of the system bus and other reasons, estimate the value and set it to this field. Note: The maximum setting value for this field is 2778h. Do not set any value that is larger than 2778h.
15, 14	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
13 to 0	FI[13:0]	2EDFh	RW	Frame Interval This field is used to set the length of the frame (bit time) used for Full Speed. Set the value of this field to “2EDFh” so that 1 frame (= 1 ms) of USB standard is satisfied.

(15) HcFmRemaining Register (USB2m_HOST_HcFmRemaining)

Access Size : 32 bits
Address : <USB2m_host_base> + 0038h
Initial Value : 0000_2EDFh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	FRT	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	FR[13:0]													
Initial Value	0	0	1	0	1	1	1	0	1	1	0	1	1	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	FRT	0h	R	Frame Remaining Toggle This bit is used to synchronize the frame setting value with the hardware (host controller). When the FR (Frame Remaining) field is set to 0000h, the host controller copies the FI (Frame Interval) field value to the FR field, and copies the FIT (Frame Interval Toggle) bit value to this bit. This bit can be used to check that the FI field of the HcFmInterval register has been correctly copied to the FR field.
30 to 14	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
13 to 0	FR[13:0]	2EDFh	R	Frame Remaining This field indicates the current frame value for 14-bit down counter. The value in this field counts down as time passes. When the value becomes 0000h, the value of FI (Frame Interval) of the HcFmInterval register is loaded. When the state of the host controller is changed to the USB Operational state, the host controller reloads the value in the FI (Frame Interval) field of the HcFmInterval register, and the new value is used from the next SOF.

(16) HcFmNumber Register (USB2m_HOST_HcFmNumber)

Access Size : 32 bits

Address : <USB2m_host_base> + 003Ch

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	FN[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
15 to 0	FN[15:0]	0h	R	Frame Number This field indicates the number of passed frames. When the HcFmRemaining register is reloaded, this field is incremented. If this field is reached to FFFFh, the value is rolled over to 0000h. When the state of the host controller is changed to the USB Operational state, this field is automatically incremented. After the host controller increments the frame number at the frame boundary and sends SOF, the contents of this field are written to HCCA. This is performed before the host controller reads the first ED of the frame. After writing to HCCA, the host controller sets the SF bit of the HcInterruptStatus register.

(17) HcPeriodicStart Register (USB2m_HOST_HcPeriodicStart)

Access Size : 32 bits
Address : <USB2m_host_base> + 0040h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	PS[13:0]													
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 14	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
13 to 0	PS[13:0]	0h	RW	Periodic Start This field indicates the time the host controller starts the periodic list processing in the frame. Estimate an appropriate value, and set the value to this field at the initial setting of the host controller. OHCI standard recommends that you set this setting value to about 90% of the FI field value of the HcFmInterval register. The recommended value is 2A2Fh. When the value in the FR field of the HcFmRemaining register reaches the value set to this field, the periodic list processing is given priority over the control/bulk list processing. Therefore, after the currently running control or bulk transfer finishes, the host controller starts the Interrupt list processing.

(18) HcLSThreshold Register (USB2m_HOST_HcLSThreshold)

Access Size : 32 bits
Address : <USB2m_host_base> + 0044h
Initial Value : 0000_0628h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	LST[11:0]											
Initial Value	0	0	0	0	0	1	1	0	0	0	1	0	1	0	0	0
R/W	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
11 to 0	LST[11:0]	628h	RW	LS Threshold This field indicates the threshold value of whether transfer is available for the remaining time of the LS transfer frame. If the value of the FR field of the FmRemaining register is larger than the value set to this field, the host controller can start LS transfer.

(19) HcRhDescriptorA Register (USB2m_HOST_HcRhDescriptorA)

Access Size : 32 bits
Address : <USB2m_host_base> + 0048h
Initial Value : 0F00_0901h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	POTPGT[7:0]								-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	1	1	1	1	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	NOCP	OCPM	DT	NPS	PSM	NDP[7:0]							
Initial Value	0	0	0	0	1	0	0	1	0	0	0	0	0	0	0	1
R/W	R	R	R	RW	RW	R	RW	RW	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	POTPGT[7:0]	0Fh	RW	PowerOn To PowerGood Time This field indicates the time for waiting until software can access the root hub port after the power is supplied to the port. The unit of time is 2 ms. Therefore, the wait time is POTPGT x 2 ms.
23 to 13	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
12	NOCP	0h	RW	No OverCurrent Protection This bit sets whether the overcurrent function of the root hub is supported. If this bit is set to 0b, the overcurrent state is reported depending on the setting of the OCPM bit. 0b: The overcurrent state is supported. 1b: The overcurrent state is not supported. If you do not require the overcurrent function, set this bit to 1b once the module is released from module standby. For details, see **6.5.2.9.1 Host/Peripheral Common Setting Sequence**.
11	OCPM	1h	RW	OverCurrent Protection Mode This bit sets how to report the overcurrent state of the root hub. If this bit is reset, this bit must indicate the same mode as the PSM (Power Switching Mode) bit. This bit is valid only when the NOCP (No OverCurrent Protection) bit is cleared (0b). 0b: The overcurrent state is collectively reported for all ports. 1b: The overcurrent state is reported for each port.
10	DT	0h	R	Device Type This bit indicates that the root hub is not a composite device. This bit is always 0b because the root hub is not allowed to be a composite device.
9	NPS	0h	RW	No Power Switching This bit sets how to control the port power. If this bit is set to 0b, the PSM bit is used to set whether the power control is collectively performed for all ports or is performed for each port. 0b: The port power can be switched between on and off. 1b: The power is always on while the host controller is running.
8	PSM	1h	RW	Power Switching Mode This bit sets how to control the power switch for each port of the root hub. This bit is valid only when the NPS bit is 0b. 0b: The power of all ports is collectively controlled. 1b: The power of ports is controlled for each port. If the PPCM (Port Power Control Mask) bit of the HcRhDescriptorB register is set, each port responds only to the Set/ClearPortPower command. If the PPCM bit is cleared, each port is controlled by the Set/ClearGlobalPower command.
7 to 0	NDP[7:0]	1h	R	Number Down stream Ports This field indicates the number of downstream ports supported by the root hub.

(20) HcRhDescriptorB Register (USB2m_HOST_HcRhDescriptorB)

Access Size : 32 bits
Address : <USB2m_host_base> + 004Ch
Initial Value : 0002_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	PPCM	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	DR	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
17	PPCM	1h	RW	Port Power Control Mask This bit sets the port power control command when the PSM (Power Switching Mode) bit of the HcRhDescriptorA register is set. If this bit is 0b, the Global Power Control command (Set/ClearGlobalPower) is used for control. If this bit is 1b, the Port Power Control command (Set/ClearPortPower) is used for control. If the PSM bit is 0b, this bit is ignored.
16 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
1	DR	0h	RW	Device Removable This bit indicates whether each port of the root hub is removable. If this bit is 0b, the connected device is removable. If this bit is 1b, the connected device is not removable.
0	-	0h	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.

(21) HcRhStatus Register (USB2m_HOST_HcRhStatus)

Access Size : 32 bits
Address : <USB2m_host_base> + 0050h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CRWE	-	-	-	-	-	-	-	-	-	-	-	-	-	OCIC	LPSC
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	R	R	R	R	R	R	R	R	R	R	R	R	R	RW1	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DRWE	-	-	-	-	-	-	-	-	-	-	-	-	-	OCI	LPS
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31	CRWE	0h	W	Clear RemoteWakeup Enable This bit is used to clear the DRWE bit. If this bit is set to 1b, DRWE (Device RemoteWakeup Enable) bit can be cleared. Writing 0b to this bit has no effect.
30 to 18	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
17	OCIC	0h	RW1	OverCurrent Indicator Change This bit is used to report the change in the OCI bit. If there is any change in the OCI bit, the host controller sets this bit to 1b. If 1b is written to this bit while this bit is set to 1b, this bit can be cleared. Writing 0b to this bit has no effect. 0b: There is no change in the Overcurrent state. 1b: There is a change in the Overcurrent state.
16	LPSC	0h	RW	The meaning of this bit differs depending on whether the operation is read or write. [Read] Local Power Status Change This bit is always read as 0b because the Local Power Status is not supported. [Write] Set Global Power If this bit is set to 1b, the power to the ports is turned on. The ports whose power is turned on are determined by the settings of the PSM (Power Switching Mode) bit and the PPCM (Port Power Control Mask) bit of the HcRhDescriptorA register. Writing 0b to this bit has no effect.
15	DRWE	0h	RW	[Read] Device RemoteWakeup Enable This bit sets whether the RemoteWakeup event includes the CSC (Connect Status Change) bit. If this bit is set to 1b, the CSC bit of the HcRhPortStatus register becomes valid as the Resume event. If the CSC bit is changed to 1b, the state is changed from USB Suspend to USB Resume, and the Resume detection interrupt occurs. 0b: Connect Status Change is not the source of RemoteWakeup. 1b: Connect Status Change is the source of RemoteWakeup. [Write] Set RemoteWakeup Enable This bit is used to set the DRWE bit. Writing 0b to this bit has no effect.
14 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
1	OCI	0h	R	Over Current Indicator This bit is used to report the overcurrent state in the global overcurrent detection mode (OCPM bit = 0b). This bit always indicates 0b when overcurrent for each port is reported (when OPCM bit = 1b). 0b: The port state is normal. 1b: The port is in the overcurrent state.

Bit	Bit Name	Initial Value	R/W	Description
0	LPS	0h	RW	The meaning of this bit differs depending on whether the operation is read or write. [Read] Local Power Status This bit is always read as 0b because the Local Power Status is not supported. [Write] Clear Global Power If this bit is set to 1b, the power to the ports is turned off. The ports whose power is turned off are determined by the settings of the PSM (Power Switching Mode) bit and PPCM (Port Power Control Mask) bit of the HcRhDescriptorA register. Writing 0b to this bit has no effect.

Note: ● Supplementary note on LPSC bit

Value written to this bit	PSM	PPCM[N]	Description
0	—	—	Setting ignored
1	0	—	1b is set to the PPS bit.
	1	0	1b is set to the PPS bit.
		1	Setting ignored

● Supplementary note on LPS bit

Value written to this bit	PSM	PPCM[N]	Description
0	—	—	Setting ignored
1	0	—	The PPS bit is cleared to 0b.
	1	0	The PPS bit is cleared to 0b.
		1	Setting ignored

(22) HcRhPortStatus[1:NDP] Register (USB2m_HOST_HcRhPortStatus1)

Access Size : 32 bits
Address : <USB2m_host_base> + 0054h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	PRSC	OCIC	PSSC	PESC	CSC
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	RW1	RW1	RW1	RW1	RW1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	LSDA	PPS	-	-	-	PRS	POCI	PSS	PES	CCS
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	RW	RW	R	R	R	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
20	PRSC	0h	RW1	Port Reset Status Change This bit indicates that port reset (bus reset) has finished. The host controller sets this bit when 10 ms port reset (bus reset) finishes. 0b: Port reset has not finished, or the PRS (Port Reset Status) bit is not changed. 1b: Port reset has finished.
19	OCIC	0h	RW1	Port OverCurrent Indicator Change This bit is set when the overcurrent state of the port is detected. This bit is set when the host controller changed the POCI bit value. This bit is valid only under the setting that the overcurrent state is reported for each port (OCPM bit = 1b). If this bit is set to 1b, this bit is cleared. Writing 0b to this bit has no effect. 0b: The overcurrent state has not changed. 1b: The overcurrent state has changed (POCI bit changed).
18	PSSC	0h	RW1	Port Suspend Status Change This bit indicates that the Resume sequence finished. This sequence includes 20 ms of the Resume signal, LS EOP, and 3 ms of resynchronization delay. If this bit is set to 1b, this bit is cleared. Writing 0b to this bit has no effect. If the PRSC (Port Reset Status Change) bit is set, this bit is cleared. 0b: The Resume sequence has not finished. 1b: The Resume sequence has finished.
17	PESC	0h	RW1	Port Enable Status Change This bit indicates that the PES (Port Enable Status) bit was changed. If a hardware event clears the PES bit, this bit is set to 1b. If this bit is set to 1b, this bit is cleared. Writing 0b to this bit has no effect. 0b: The PES (Port Enable Status) bit has not changed. 1b: The PES (Port Enable Status) bit has changed.
16	CSC	0h	RW1	Connect Status Change This bit indicates that the CCS (Current Connect Status) bit was changed. If the Connect/Disconnect event occurs, this bit is set to 1b. If this bit is set to 1b, this bit is cleared. Writing 0b to this bit has no effect. If a request (Port Reset/Port Enable/Port Suspend) is received during the Disconnect status, this bit is set for reevaluation of device connection confirmation. 0b: The CCS (Current Connect Status) bit has not changed. 1b: The CCS (Current Connect Status) bit has changed.
15 to 10	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.

Bit	Bit Name	Initial Value	R/W	Description
9	LSDA	0h	RW	The meaning of this bit differs depending on whether the operation is read or write. [Read] Low Speed Device Attached This bit indicates the speed of the device connected to the port. This bit is valid only when the CCS (Current Connect Status) bit is set. 0b: Full Speed device is connected. 1b: Low Speed device is connected. [Write] Clear Port Power This bit is used to turn off the power of the port when the port is power controlled. Writing 1b to this bit turns off the port power. Writing 0b to this bit has no effect.
8	PPS	0h	RW	The meaning of this bit differs depending on whether the operation is read or write. [Read] Port Power Status This bit indicates the power status of the port. This bit is cleared when the overcurrent is detected. 0b: Port power is off. 1b: Port power is on. [Write] Set Port Power This bit is used to turn on the power of the port when the port is power controlled. Writing 1b to this bit turns on the port power. Writing 0b has no effect.
7 to 5	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
4	PRS	0h	RW	The meaning of this bit differs depending on whether the operation is read or write. [Read] Port Reset Status This bit indicates the port reset (bus reset) status. When 10 ms of port reset finishes, the PRSC (Port Reset Status Change) bit is set and this bit is cleared. When the CCS bit is cleared (when no device is connected), this bit cannot be set. 0b: Not during port reset 1b: During port reset [Write] Set Port Reset This bit is used to issue a port reset (bus reset) to the downstream port. Writing 1b to this bit starts 10 ms of port reset. Writing 0b to this bit has no effect. If CCS is cleared, this bit cannot be set. Instead, CSC is set to 1b. This is performed to report to ports to which no device is connected, that port reset was performed.
3	POCI	0h	RW	The meaning of this bit differs depending on whether the operation is read or write. [Read] Port OverCurrent Indicator This bit indicates that the downstream port is in the overcurrent status. This bit is valid only when the setting is specified that the overcurrent status is reported for each port (OCPM bit = 1b). On the other hand, if the setting is specified that the overcurrent status is reported for all ports, this bit is always read as 0b. 0b: The port is in normal status. 1b: The port is in overcurrent status. [Write] Clear Suspend Status This bit is used to finish the Suspend status and start the Resume sequence. Writing 1b to this bit starts the Resume sequence. Writing 0b has no effect. The Resume sequence starts only when PSS (Port Suspend Status) is set.
2	PSS	0h	RW	The meaning of this bit differs depending on whether the operation is read or write. [Read] Port Suspend Status This bit indicates that the port status is in Suspend or Resume sequence. 0b: The port is not in Suspend status. 1b: The port is in Suspend status. When the CCS bit is cleared (when no device is connected), this bit cannot be set. This bit is cleared under the following conditions: When the Resume sequence finished, and the PSSC (Port Suspend Status Change) bit is set When the port reset finished, and the PRSC (Port Reset Status Change) bit is set When the host controller is in the USB Resume state [Write] Set Port Suspend This bit is used to change the port status to Suspend. Writing 1b to this bit changes the status to Suspend. Writing 0b to this bit has no effect. If CCS is cleared, this bit cannot be set. Instead, CSC is set to 1b. This is performed to report to the ports to which no device is connected that the Suspend command was issued.

Bit	Bit Name	Initial Value	R/W	Description
1	PES	0h	RW	The meaning of this bit differs depending on whether the operation is read or write. [Read] Port Enable Status This bit indicates whether the port status is Enable or Disable. If the host controller detects a bus error (for example, overcurrent state, disconnect, port power off, and babble error), it clears this bit. Then, the PESC (Port Enable Status Change) bit is set. When the CCS bit is cleared (when no device is connected), this bit cannot be set. This bit is set “when port reset finished and the PRSC bit is set” or “when the port status becomes Suspend and the PRSC bit is set”. 0b: The port status is Disable. 1b: The port status is Enable. [Write] Set Port Enable This bit is used to set the PES bit. Writing 1b to this bit changes the port status to Enable. Writing 0b to this bit has no effect. If CCS is cleared, this bit cannot be set. Instead, CSC is set to 1b. This is performed to report that the status of the ports to which no device is connected was tried to be changed to Enable.
0	CCS	0h	RW	The meaning of this bit differs depending on whether the operation is read or write. [Read] Current Connect Status The current connection status of the downstream port is applied to this bit. 0b: No device is connected. 1b: A device is connected. [Write] Clear Port Enable This bit is used to clear the PES (Port Enable Status) bit. Writing 1b to this bit changes the port status to Disable. Writing 0b to this bit has no effect.

6.5.2.2.3 EHCI Controller Capability Register Descriptions

(1) HCIVERSION/CAPLENGTH Register (USB2m_HOST_CAPL_VERSION)

Access Size : 32 bits

Address : <USB2m_host_base> + 0100h

Initial Value : 0110_0020h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Interface Version Number[15:0]															
Initial Value	0	0	0	0	0	0	0	1	0	0	0	1	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	Capability Registers Length[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	Interface Version Number[15:0]	110h	R	This field indicates the EHCI version supported by the host controller. 0110h is indicated because this host controller supports EHCI Rev1.1.
15 to 8	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
7 to 0	Capability Registers Length[7:0]	20h	R	This field is used as an offset that is added to the base address to find the start address of the EHCI Operational register. 20h is indicated because the EHCI Operation register of this module starts from 20h.

(2) HCSPARAMS Register (USB2m_HOST_HCSPARAMS)

Access Size : 32 bits
Address : <USB2m_host_base> + 0104h
Initial Value : 0000_1191h

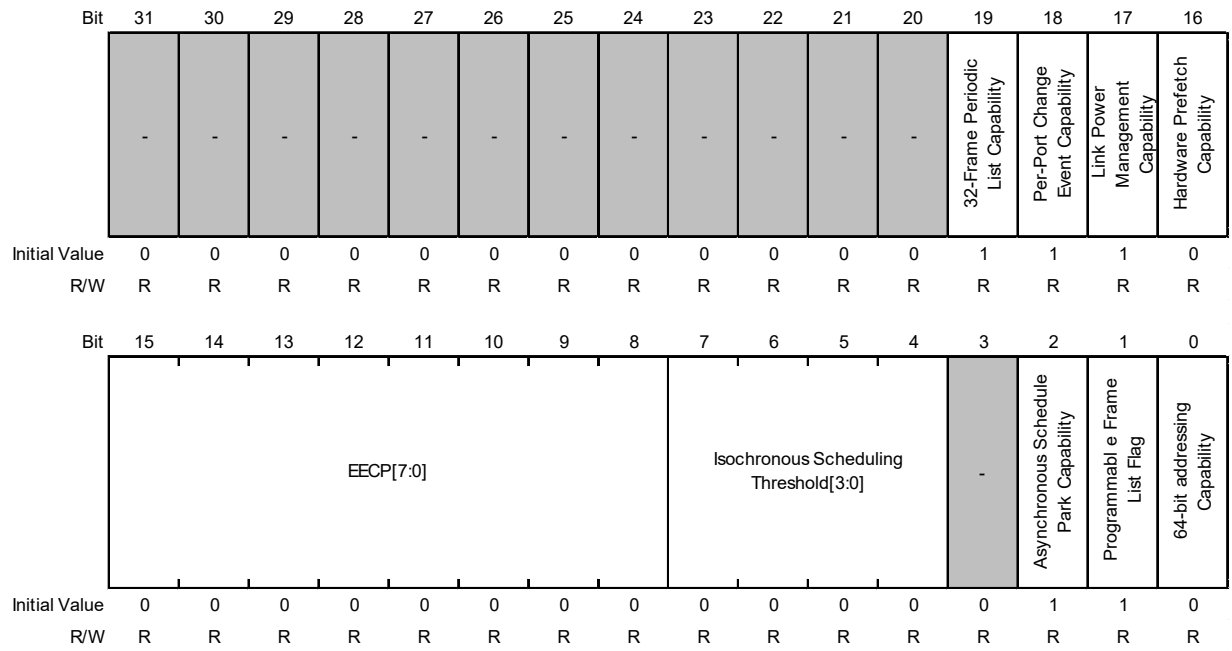
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	Debug Port Number[3:0]				-	-	-	P_INDICATOR
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	N_CC[3:0]				N_PCC[3:0]				Port Routing Rules	-	-	PPC	N_PORTS[3:0]			
Initial Value	0	0	0	1	0	0	0	1	1	0	0	1	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
23 to 20	Debug Port Number[3:0]	0h	R	This field indicates that the host controller port is a debug port. 0000b is indicated because this module does not have a debug port.
19 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
16	P_INDICATOR	0h	R	Port Indicators This bit indicates whether the host controller supports port indicator control. 0b is indicated because this module does not support port indicator control.
15 to 12	N_CC[3:0]	1h	R	Number of Companion Controller This field indicates the number of OHCI host controllers implemented in this module. 1h is indicated because this module has one OHCI host controller.
11 to 8	N_PCC[3:0]	1h	R	Number of Ports per Companion Controller This field indicates the number of ports supported by an OHCI host controller. The setting value of the Port_no field of the PCI Configuration EXT1 register is applied to this field.
7	Port Routing Rules	1h	R	This bit indicates how individual ports are mapped to the OHCI host controller. This bit indicates 1b because, in this module, the contents of the HCSP_PORTROUTE register show the mapping method.
6, 5	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
4	PPC	1h	R	Port Power Control This bit indicates how the port power of this module is controlled. 0b: The port power is always on. 1b: The PP bit of the PORTSC register controls the port power.
3 to 0	N_PORTS[3:0]	1h	R	This field indicates the number of physical downstream ports used by this module. 0001b: 1 Port

(3) HCCPARAMS Register (USB2m_HOST_HCCPARAMS)

Access Size : 32 bits
Address : <USB2m_host_base> + 0108h
Initial Value : 000E_0006h



Bit	Bit Name	Initial Value	R/W	Description
31 to 20	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
19	32-Frame Periodic List Capability	1h	R	This bit indicates 1b because this module supports 32-Frame Periodic List defined in EHCI V1.1. This means that the Frame List Size field of the USBCMD register is set to 11b, so this module supports 32-Frame Periodic List.
18	Per-Port Change Event Capability	1h	R	This bit indicates 1b because this module supports event detection function for ports that are defined in EHCI V1.1. This means that this module supports event detection function for ports, and is associated with the Pre-Port Change Event Enable field of the USBCMD register, Port-1 Change Detect field of the USBSTS register, and Port-1 Change Interrupt Enable field of the USBINT register. If this bit is 0b, the corresponding fields of the above registers are treated as Reserved.
17	Link Power Management Capability	1h	R	This bit indicates 1b because this module supports LPM (Link Power Management) defined in EHCI V1.1. This means that this module supports LPM L1 state, and is controlled by the Suspend using L1 bit, Suspend Status bit, and Device Address field of the PORTSC register. If this bit is 0b, the corresponding bits and field of the above PORTC register are treated as Reserved.
16	Hardware Prefetch Capability	0h	R	This bit indicates 0b because this module does not support the hardware prefetch function defined in EHCI V1.1.
15 to 8	EECP[7:0]	0h	R	This field indicates the offset address of the EHCI Extend Capabilities Registers. This field indicates 00h because this module does not use EHCI Extend Capabilities Registers.
7 to 4	Isochronous Scheduling Threshold[3:0]	0h	R	This field indicates 0h because this module does not support caches with isochronous data structure for the entire frame.
3	-	0h	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
2	Asynchronous Schedule Park Capability	1h	R	This bit indicates whether the Park mode is supported for High Speed QH (Queue Head) in an asynchronous schedule. This bit indicates 1b because this module supports the above function.
1	Programmabl e Frame List Flag	1h	R	This bit indicates the setting for the available frame list size. This bit indicates 1b for this module. If this bit is set to 1b, bit [3:2] (Frame List Size) of the USBCMD register can be used to set the available frame list size, and the frame list size smaller than 4 Kbyte is configurable.

Bit	Bit Name	Initial Value	R/W	Description
0	64-bit addressing Capability	0h	R	This bit indicates which type of memory pointer the data structure uses (32 bit address memory pointer or 64 bit address memory pointer). This bit indicates 0b for this module because this module has the data structure that uses 32 bit address memory pointer. 64 bit address is not supported.

(4) HCSP-PORTROUTE Register (USB2m_HOST_HCSP_PORTROUTE)

Access Size : 32 bits
Address : <USB2m_host_base> + 010Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Companion Port Route[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Companion Port Route[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	Companion Port Route[31:0]	0h	R	This field indicates the ports controlled by the OHCI host controller. This field indicates 0b for this module because this module has one OHCI host controller.

6.5.2.2.4 HCI Operational Register Descriptions

(1) USBCMD Register (USB2m_HOST_USBCMD)

Access Size : 32 bits
Address : <USB2m_host_base> + 0120h
Initial Value : 0008_0B00h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	Host-Initiated Resume Duration[3:0]				Interrupt Threshold Control[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0
R/W	R	R	R	R	RW	RW	RW	RW	R	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Per-Port Change Events Enable	-	-	-	Asynchronous Schedule Park Mode Enable	-	Asynchronous Schedule Park Mode Count[1:0]		-	Interrupt on Async Advance Doorbell	Asynchronous Schedule Enable	Periodic Schedule Enable	Frame List Size[1:0]		HCRESET	RS
Initial Value	0	0	0	0	1	0	1	1	0	0	0	0	0	0	0	0
R/W	RW	R	R	R	RW	R	RW	RW	R	RW	RW	RW	RW	RW	W	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
27 to 24	Host-Initiated Resume Duration[3:0]	0h	RW	This field indicates the minimum time of the K-state drive while the host controller resumes from the LPM (L1) state. The value in this field is sent to the connected device that has the LPM function via the HIDR field in the bmAttributes field of the LPM token. The encoded value of this field is defined as the name of the HIRD field in the LPM Token. Specifically, 0h means 50 µs, and if the value is incremented by 1, 75 µs is incremented. For example, 1h means 125 µs, and 4h means 1175 µs.
23 to 16	Interrupt Threshold Control[7:0]	8h	RW(R)	This field indicates the maximum rate until the host controller issues an interrupt. Note that the setting values other than the following values are not guaranteed. Value Maximum Interrupt Interval 00h Reserved 01h 1 micro-frame 02h 2 micro-frames 04h 4 micro-frames 08h 8 micro-frames (default, equals to 1 ms) 10h 16 micro-frames (2 ms) 20h 32 micro-frames (4 ms) 40h 64 micro-frames (8 ms) Do not set 00h to this field while the Halted bit is 0b.
15	Per-Port Change Events Enable	0h	RW	This field is used to enable the event report function of the ports defined by the Port-1 Change Detect field of the USBSTS register and the Port-1 Change Detect Enable field of the USBINTR register. 0b: The event report function of the ports is disabled. 1b: The event report function of the ports is enabled.
14 to 12	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
11	Asynchronous Schedule Park Mode Enable	1h	RW	This bit enables or disables the Asynchronous Schedule Park mode. 0b: The Park mode is disabled. 1b: The Park mode is enabled.
10	-	0h	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.

Bit	Bit Name	Initial Value	R/W	Description
9, 8	Asynchronous Schedule Park Mode Count[1:0]	3h	RW	This field sets the number of transactions that the host controller can serially execute for one QH (Queue Head) fetch in an asynchronous schedule. The valid value range is 1h to 3h. This field is valid when bit 11 (Asynchronous Schedule Park Mode Enable) is 1b. Do not set 0h to this field.
7	-	0h	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
6	Interrupt on Async Advance Doorbell	0h	RW	This bit is used as the doorbell. In an asynchronous schedule processing, if you want an interrupt to occur before proceeding to the next QH (Queue), set this bit to 1b. After a QH processing normally finishes, the host controller clears this bit to 0b, and sets bit 5 (Interrupt on Async Advance bit) of the USBSTS register to 1b. If bit 5 (Interrupt on Async Advance Enable bit) of the UBINTR register is set to 1b, an interrupt occurs at the next interrupt timing. If the asynchronous schedule is disabled, do not write 1b to this bit.
5	Asynchronous Schedule Enable	0h	RW	This bit sets whether the host controller proceeds to the asynchronous list processing or skip the processing. 0b: The asynchronous list processing is skipped. 1b: Use the ASYNCLISTADDR register to proceed the asynchronous list processing.
4	Periodic Schedule Enable	0h	RW	This bit sets whether the host controller proceeds or skips the periodic list processing. 0b: The periodic list processing is skipped. 1b: Use the PERIODICLISTBASE register to proceed the periodic list processing.
3, 2	Frame List Size[1:0]	0h	RW	This field specifies the frame list size. The setting value of this field determines the size of the Frame List Current index of the FRINDEX register. Value the number of frames in Frame List 00b 1024 frames (default) 01b 512 frames 10b 256 frames 11b 32 frames
1	HCRESET	0h	W	Host Controller Reset This bit is used to initialize the EHCI circuit of the host controller. If this bit is set to 1b, the host controller initializes the internal pipelines, counters, and state machines, and communications on the USB immediately stop. At this time, port reset is not issued to the downstream ports. Reset by this bit has no effect on the registers other than the EHCI Operational register. The EHCI Operational register is initialized, and the port owner returns to OHCI. Software must be reset to return the host controller to the operational state. When this reset processing finishes, the host controller sets this bit to 0b. Writing 0b to this bit cannot stop the reset processing. If the HCHalted bit of the USBSTS register is set to 0b, do not set 1b to this bit.
0	RS	0h	RW	Run/Stop This bit is used to run or stop the EHCI host controller. If this bit is set to 1b, the host controller starts operation. As long as this bit is set to 1b, the host controller continues running. If this bit is set to 0b, the host controller finishes the currently executing transaction and some other transactions, and then is changed to the Halt status. The HCHalted bit of the USBSTS register indicates that the host controller finished the transaction processing and entered into the stop status. If the host controller is in a status other than Halt (the HCHalted bit of the USBSTS register is 1b), do not write 1b to this bit.

(2) USBSTS Register (USB2m_HOST_USBSTS)

Access Size : 32 bits

Address : <USB2m_host_base> + 0124h

Initial Value : 0000_1000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	Port-1Change Detect
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Asynchronous Schedule Status	Periodic Schedule Status	Reclamation	HCHalted	-	-	-	-	-	-	Interrupt on Async Advance	Host System Error	Frame List Rollover	Port Change Detect	USBERRINT	USBINT
Initial Value	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	RW1	RW1	RW1	RW1	RW1	RW1

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
16	Port-1Change Detect	0h	RW1	If this bit is set to 1b, it indicates that a change in the port status was detected. This bit is used only when the Per-Port Change Events Enable bit of the USBCMD register is set to 1b.
15	Asynchronous Schedule Status	0h	R	This bit indicates the current status of the asynchronous schedule. 0b: The asynchronous schedule is disabled. 1b: The asynchronous schedule is enabled. If this bit and bit 5 (Asynchronous Schedule Enable) of the USBCMD register have the same value, the asynchronous schedule is enabled (1b) or disabled (0b).
14	Periodic Schedule Status	0h	R	This bit indicates the current status of the periodic schedule. 0b: The periodic schedule is disabled. 1b: The periodic schedule is enabled. If this bit and bit 4 (Periodic Schedule Enable) of the USBCMD register have the same value, the periodic schedule is enabled (1b) or disabled (0b).
13	Reclamation	0h	R	This bit is used to detect an empty asynchronous schedule. If this bit is 1b, the asynchronous schedule is empty. After reset or when a QH (H = 1) is fetched, the host controller clears this bit to 0b. Also, when the host controller executes an asynchronous transaction or detects a start event, it sets this bit to 1b. If this bit is 0b and a QH (H = 1) is fetched, the host controller is entered into the Async Sched Sleeping mode.
12	HCHalted	1h	R	If the Run/Stop bit of the USBCMD register is 1b, this bit indicates 0b. If the software or host controller sets the Run/Stop bit to 0b, the host controller stops operation, and sets 1b to this bit. 0b: The EHCI host controller is running. 1b: The EHCI host controller is stopped.
11 to 6	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
5	Interrupt on Async Advance	0h	RW1	This bit indicates the Async Advance Interrupt status. After the host controller fetches the QH, it checks bit 6 (Interrupt on Async Advance Doorbell [IAAD] bit) of the USBCMD Register. If the IAAD bit is set to 1b, the host controller clears the IAAD bit after the QH processing normally finishes, and sets this bit. If bit 5 (Interrupt on Async Advance Enable bit) of the UBINTR register is set to 1b, an interrupt due to this source will occur at the next interrupt timing after 1b is set to this bit. If HCD writes 1b to this bit, this bit can be cleared. Writing 0b to this bit has no effect. 0b: Async Advance Interrupt not occurred. 1b: Async Advance Interrupt status is detected.

Bit	Bit Name	Initial Value	R/W	Description
4	Host System Error	0h	RW1	This bit is set to 1b if a serious error occurs in the host controller. If this error occurs, the host controller clears the Run/Stop bit of the USBCMD register to 0b so that the subsequent schedules are not executed. Writing 1b to this bit can clear this bit. Writing 0b to this bit has no effect. 0b: No system error occurred. 1b: A system error occurred.
3	Frame List Rollover	0h	RW1	If a frame list rollover occurs, the host controller sets this bit to 1b. Specifically, when the Frame Index field of the FRINDEX register is returned to 000h from the maximum value (rollover), the host controller sets this bit to 1b. The maximum value (the value at which rollover occurs) depends on the Frame List Size field of the USBCMD register. For example, if the Frame List Size is 1024 frame, rollover occurs every time FRIMDEX [13] toggles. If the Frame List Size is 512 frame, rollover occurs every time FRINDEX [12] toggles. If the Frame List Size is 256 frame, rollover occurs every time FRINDEX [11] toggles. Writing 1b to this bit can clears this bit. Writing 0b to this bit has no effect. 0b: The frame list is not returned to 000h. 1b: The frame list is returned to 000h (rollover occurred).
2	Port Change Detect	0h	RW1	This bit indicates that the port status has changed. Among the ports for which the Port Owner bit of the PORTSC1 register is set to 0b, if any port satisfies one of the following conditions, the host controller sets this bit to 1b: Connect or Disconnect status of a device is detected, and the Connect Status Change bit of the PORTSC1 register is changed from 0b to 1b. A change of the Enable status of the port is detected, and the Port Enable/Disable Change bit of the PORTSC1 register is changed from 0b to 1b. The overcurrent state is detected, and the Over-current Change bit of the PORTSC1 register is changed from 0b to 1b. J-K transition is detected on a port in the Suspend status, and the Force Port Resume bit of the PORTSC1 register is changed from 0b to 1b. Writing 1b to this bit can clear this bit. Writing 0b to this bit has no effect.
1	USBERRINT	0h	RW1	USB Error Interrupt This bit indicates that a USB transaction finished with an error. When a USB transaction finishes with an error, the host controller sets this bit to 1b. If 1b is set to the IOC bit of qTD at which an error interrupt occurred, 1b is set to both of this bit and USBINT bit. Writing 1b to this bit can clear this bit. Writing 0b to this bit has no effect. 0b: USB transaction is normal. 1b: USB transaction finished with an error.
0	USBINT	0h	RW1	USB Interrupt This bit indicates that a USB transfer has finished. The host controller sets this bit to 1b if one of the following conditions is satisfied: A USB transfer has finished. A short packet is received. Even if a USB transfer finished with an error, if IOC (Interrupt On Complete) of the TD is set to 1b, this bit is set to 1b. Writing 1b to this bit can clear this bit. Writing 0b to this bit has no effect. 0b: A USB transfer has not finished. 1b: A USB transfer has finished.

(3) SBINTR Register (USB2m_HOST_USBINTR)

Access Size : 32 bits
Address : <USB2m_host_base> + 0128h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	Port-1 Change EventEnable
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	Interrupt on Async Advance Enable	Host System Error Enable	Frame List Rollover Enable	Port Change Detect Enable	USB Error Interrupt Enable	USB Interrupt Enable
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
16	Port-1 Change EventEnable	0h	RW	If this bit is 1b and the Port Change Detect bit of the USBSTS register is set to 1b, the host controller issues an interrupt.
15 to 6	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
5	Interrupt on Async Advance Enable	0h	RW	This bit sets whether bit 5 (Interrupt on Async Advance [IAA] bit) of the USBSTS register is enabled or disabled. If the IAA bit is set to 1b while this bit is set to 1b, the host controller issues an interrupt at the next interrupt timing. 0b: Disabled. 1b: Enabled (an interrupt occurs via the IAA bit).
4	Host System Error Enable	0h	RW	This bit sets whether bit 4 (Host System Error [HSE] bit) of the USBSTS register is enabled or disabled. If the HSE bit is set to 1b while this bit is set to 1b, the host controller issues an interrupt at the next interrupt timing. 0b: Disabled. 1b: Enabled (an interrupt occurs via the HSE bit).
3	Frame List Rollover Enable	0h	RW	This bit sets whether the bit 3 (Frame List Rollover [FLR] bit) of the USBSTS register is enabled or disabled. If the FLR bit is set to 1b while this bit is set to 1b, the host controller issues an interrupt at the next interrupt timing. 0b: Disabled. 1b: Enabled (an interrupt occurs via the FLR bit).
2	Port Change Detect Enable	0h	RW	This bit sets whether bit 2 (Port Change Detect [PCD] bit) of the USBSTS register is enabled or disabled. If the USBERRINT bit is set to 1b while this bit is set to 1b, the host controller issues an interrupt at the next interrupt timing. 0b: Disabled. 1b: Enabled (an interrupt occurs via the PCD bit).
1	USB Error Interrupt Enable	0h	RW	This bit sets whether bit 1 (USBERRINT bit) of the USBSTS register is enabled or disabled. If the USBERRINT bit is set to 1b while this bit is set to 1b, the host controller issues an interrupt at the next interrupt timing. 0b: Disabled. 1b: Enabled (an interrupt occurs via the USBERRINT bit).
0	USB Interrupt Enable	0h	RW	This bit sets whether bit 0 (IUSBINT bit) of the USBSTS register is enabled or disabled. If the USBINT bit is set to 1b while this bit is set to 1b, the host controller issues an interrupt at the next interrupt timing. 0b: Disabled. 1b: Enabled (an interrupt occurs via the USBINT bit).

(4) FRINDEX Register (USB2m_HOST_FRINDEX)

Access Size : 32 bits
Address : <USB2m_host_base> + 012Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	Frame Index[13:0]													
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 14	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
13 to 0	Frame Index[13:0]	0h	RW	This field is used by the host controller to add an index to the periodic frame list. The value in this field is incremented at the end of a micro frame. Bit [N:3] of this field is used as the Frame List Current index. This means that, before the next index arrives, the current frame list is accessed 8 times. The value for N is determined, as follows, by the setting value of bit [3:2] (Frame List Size field) of the USBCMD register. Access this register only when the host controller is in stop status (bit 12 [HCHalted] = 1b). The setting value of this field is applied to the SOF frame number of the SOF token.

Note: ■ Supplementary Note on Frame Index Bit

Frame List Size	Number of Frames
00b	1024 (N = 12)
01b	512 (N = 11)
10b	256 (N = 10)
11b	32 (N = 12)

(5) CTRLDSSEGMENT Register (USB2m_HOST_CTRLDSSEGMENT)

Access Size : 32 bits
Address : <USB2m_host_base> + 0130h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CTRLDSSEG MENT[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CTRLDSSEG MENT[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CTRLDSSEG MENT[31:0]	0h	R	This register is not used because this module does not support 64-bit address method. Therefore, HCD must not access this register.

(6) PERIODICLISTBASE Register (USB2m_HOST_PERIODICLISTBASE)

Access Size : 32 bits
Address : <USB2m_host_base> + 0134h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Base Address[19:4]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Base Address[3:0]				-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	Base Address[19:0]	0h	RW	This field indicates the head address of the periodic frame list on the system memory. The host controller loads the contents of this register before starting the list processing. The host controller determines the frame list to be processed by using this field and Frame Index of the FRINDEX register. Align the address of the periodic frame list by 4 Kbyte. Normal operation is not guaranteed if any of these bits are changed during operation.
11 to 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.

(7) ASYNCLISTADDR Register (USB2m_HOST_ASYNCLISTADDR)

Access Size : 32 bits

Address : <USB2m_host_base> + 0138h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	LPL[26:11]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	LPL[10:0]											-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	LPL[26:0]	0h	RW	Link Pointer Low This field indicates the address (on the system memory) of the Asynchronous Queue Head to be processed next time. Align the address of Asynchronous Queue Head by 32 byte.
4 to 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.

(8) CONFIGFLAG Register (USB2m_HOST_CONFIGFLAG)

Access Size : 32 bits

Address : <USB2m_host_base> + 0160h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CF
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
0	CF	0h	RW	Configuration Flag This bit controls which of OHCI or EHCI is routed by the port routing control circuit by default. At the end of the host controller configuration, this bit is set to 1b. 0b: The port routing control circuit routes each port to the OHCI host controller by default. 1b: The port routing control circuit routes each port to the EHCI host controller by default.

(9) PORTSC1Register (USB2m_HOST_PORTSC1)

Access Size : 32 bits
Address : <USB2m_host_base> + 0164h
Initial Value : 0000_2000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Device Address[6:0]							Suspend Status[1:0]		WKOC_E	WKDSCNNT_E	WKCNNT_E	Port Test Control[3:0]			
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	R	R	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	Port Owner	PP	Line Status[1:0]		Suspend using L1	Port Reset	Suspend	Force Port Resume	Over-current Change	Over-current Active	Port Enable/ Disable Change	Port Enabled/ Disabled	Connect Status Change	Current Connect Status
Initial Value	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	RW	RW	R	R	RW	RW	RW	RW	RW1	R	RW1	RW	RW1	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	Device Address[6:0]	0h	RW	This field indicates the USB device address (7 bits) of the device connected to the down port. This address is used when the LPM Token is sent. If the value of this filed is 00h, it means that no device that needs to use this field has been connected.
24, 23	Suspend Status[1:0]	0h	R	This field indicates the response from the connected device to the LPM Token (L1 transition request). 00b: The device succeeded transition to the L1 state (ACK received from the device). 01b: The device has not changed to the L1 state (NYET received from the device). 10b: The device does not support the L1 state transition (STALL received from the device). 11b: Other response (for example, Timeout error) Change this field only when the Suspend bit is 0b.
22	WKOC_E	0h	RW	Wake on Overcurrent Enable By writing 1b to this bit, the overcurrent state can be detected as an EHCI Wakeup event. If bit 12 (PP [Port Power] bit) is 0b, this bit becomes 0b.
21	WKDSCNNT_E	0h	RW	Wake on Disconnect Enable By writing 1b to this bit, device disconnection can be detected as an EHCI Wakeup event. If bit 12 (PP [Port Power] bit) is 0b, this bit becomes 0b.
20	WKCNNT_E	0h	RW	Wake on Connect Enable By writing 1b to this bit, device connection can be detected as an EHCI Wakeup event. If bit 12 (PP [Port Power] bit) is 0b, this bit becomes 0b.
19 to 16	Port Test Control[3:0]	0h	RW	This field is controlled by the test mode. If the value of this field is other than 0000b, it indicates that this module is running in the test mode.
15, 14	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
13	Port Owner	1h	RW	This bit indicates which of OHCI or EHCI has the port ownership. 0b: EHCI has the port ownership. 1b: OHCI has the port ownership. When bit 0 (Configure Flag bit) of the CONFIGFLA register is changed from 0b to 1b, this bit becomes 0b. If bit 0 (Configure Flag bit) of the CONFIGFLA register is 0b, this bit becomes 1b. If the connected device is not a High Speed device, this bit is set to 1b to transfer the port ownership to OHCI.

Bit	Bit Name	Initial Value	R/W	Description
12	PP	0h	RW	Port Power This bit controls power supply to the port. If this bit is 0b, power is not supplied to the port. Therefore, the port does not function, and does not recognize connection and disconnection. If overcurrent is detected while this bit is set to 1b, the host controller clears this bit to 0b, and the power supplied to the port is stopped. Note: As described later, if the PPC bit is 0b, this bit is fixed to 1b, so the power supplied to the port is not stopped. The function of this bit differs depending on the value of bit 4 (PPC [Port Power Control] bit) of the HCSPARAMS register.
11, 10	Line Status[1:0]	0h	R	This field indicates the logical level of D+/D- lines of the current USB bus. (bit 11: DP / bit 10: DM) This field is used to detect an LS device before starting a sequence for port reset and port enable. Therefore, this bit is valid only when bit 3 (Port Enable/Disable bit) is 0b and bit 0 (Current Connect Status bit) is 1b.
9	Suspend using L1	0h	RW	Suspend using L1 (LPM) control bit. If 1b is written to the Suspend bit (bit 7) while this bit is 1b, the state of this module is changed to the LPM state. Writing to this bit is possible only when the Suspend bit (bit 7) is 0b. 0b: Suspend using L2 1b: Suspend using L1 (LPM) If this bit is 1b and the Device Address field is other than 0000h, when the Suspend bit is set to 1b, the host controller generates an LPM Token to change the state to the L1 state. If this bit is 0b, the host controller operates as L2 Suspend.
8	Port Reset	0h	RW	This bit indicates the reset status of the port. 0b: The port is not being reset. 1b: The port is being reset. If 1b is written to this bit while this bit is 0b, the bus reset sequence defined in USB 2.0 standard starts. To finish the bus reset sequence, 0b must be written to this bit. Note that this bit must remain 1b long time enough to guarantee that the bus reset sequence defined in USB 2.0 standard will be complete. If bit 12 (HCHalted) of the USBSTS register is 1b, do not set this bit to 1b. If any of the PP (Port Power) bit, Port Owner bit, and Current Connect Status bit is in the following status, this bit becomes 0b. Note: Even if 1b is written to this bit, the bus reset sequence does not start. PP (Port Power) bit = 0b Port Owner bit = 1b Current Connect Status bit = 0b
7	Suspend	0h	RW	This bit indicates the Suspend control and status of the port. This bit and bit 2 (Port Enabled/Disabled bit) indicate the port status. (see below) To change the port state to L1 or L2 Suspend, set this bit to 1b. Whether the host controller supports L1 Suspend state or L2 Suspend state depends on the value in the Suspend Using L1 bit. In the Suspend state, data transfer to the downstream port is blocked by this port (except for port reset). If this bit is set to 1b during data transfer, blocking of transfer data does not occur until the current data transfer finishes. Writing 0b to this bit has no effect. This bit can be set to 1b only when all the following conditions are satisfied: “PP (Port Power) bit = 1b”, “Port Owner bit = 0b”, and “Current Connect Status bit = 1b”. If any of the following conditions is satisfied, the host controller clears this bit: “Resume is complete” is detected. The PR bit is set to 1b when PR (Port Reset) bit is 0b. The port owner is 1b (OHCI). The PP (Port Power) bit is set to 0b. The Port Enabled/Disabled bit is set to 0b.

Bit	Bit Name	Initial Value	R/W	Description
6	Force Port Resume	0h	RW	This bit indicates that the Resume state of the port is detected. 0b: Resume signal is not detected or output. 1b: Resume (K-state) is detected or output. When the port is in Suspend state, if the host controller detects transition of the state from J to K (if RemoteWakeup is detected from the connected device), it sets this bit to 1b. The host controller also sets the Port Change Detect bit or Port-1 Changes Detect bit of the USBSTS register to 1b. If this bit is set to 1b, the host controller does not set 1b to the Port Change Detect bit and Port-1 Changes Detect bit of the USBSTS register. While this bit is 1b, the Resume signal (FS K) is driven onto the USB bus. For L2 transition, this bit must be cleared to 0b after an appropriate time has passed. By writing 0b to this bit while this bit is 1b, the port status is recovered to be the HS Idle status. This bit remains 1b until the port is recovered. The host controller must finish transition to the HS Idle state within 2msec since this bit is cleared to 0b. On the other hand, for L1 transition, the host controller sends a Resume signal at necessary timing, and this bit is cleared to 0b at Resume recovery. Note that the software sets the length of the Resume signal driven by the host controller, by using the Host-Initiated Resume Duration field of the USBCMD register. If the Port Power (PP) bit is 0b, this bit becomes 0b.
5	Over-current Change	0h	RW1	This bit indicates that bit 4 (Over-current Active bit) has changed. Writing 1b to this bit can clear this bit. Writing 0b to this bit has no effect. 0b: Over-current Active bit has not changed. 1b: Over-current Active bit has changed.
4	Over-current Active	0h	R	This bit indicates the overcurrent status of the port. If the host controller detects overcurrent, it disables the port, and set this bit to 1b. After the overcurrent state is released, the host controller automatically clears this bit from 1b to 0b. 0b: The port is not in overcurrent state. 1b: The port is in overcurrent state.
3	Port Enable/ Disable Change	0h	RW1	This bit indicates that the host controller detected frame babble. If the Host Controller detects frame babble, it disables the port and sets this bit to 1b. Writing 1b to this bit can clear this bit. Writing 0b to this bit has no effect. If the Port Power (PP) bit is 0b, this bit becomes 0b. 0b: Frame babble has not occurred. 1b: Frame babble is detected.
2	Port Enabled/ Disabled	0h	RW1	This bit indicates the Enable/Disable status of the port. The host controller resets the port, and enables the port if the connected device is recognized as an HS device, and sets this bit to 1b. The software cannot set this bit to 1b. If the host controller detects disconnection of a device or other errors, it disables the port, and clears this bit to 0b. The port also becomes disabled when 0b is written to this bit. If the port is disabled, data transfer to the downstream port is blocked except for port reset. If Port Test Control [3:0] = 0101b (Test FORCE_ENABLE), the port becomes enabled, and this bit is set to 1b. If the Port Power (PP) bit is 0b, this bit becomes 0b. 0b: The port is disabled. 1b: The port is enabled.
1	Connect Status Change	0h	RW1	This bit indicates that bit 0 (Current Connect Status bit) has changed. Writing 1b to this bit can clear this bit. Writing 0b to this bit has no effect. If the Port Power (PP) bit is 0b, this bit becomes 0b. 0b: The Current Connect Status bit has no change. 1b: The Current Connect Status bit has changed.
0	Current Connect Status	0h	R	This bit indicates the connection status of the port. If the host controller detects connection of a device, it sets this bit to 1b. Also, if Port Test Control [3:0] = 0101b (Test FORCE_ENABLE), the Host Controller sets this bit to 1b even if no device is connected. On the other hand, if the host controller detects disconnection of a device, it sets this bit to 0b. If the Port Power (PP) bit is 0b, or the Port Owner (PO) bit is 0b, this bit becomes 0b. 0b: No device is connected to the port. 1b: A device is connected to the port.

Note: ■ Supplementary Note on Port Test Control (1/1)

Value	Test mode
0000b	Test mode not enabled
0001b	Test J_STATE
0010b	Test K_STATE
0011b	Test SE0_NAK

■ Supplementary Note on Port Test Control (2/2)

Value	Test mode
0100b	Test Packet
0101b	Test FORCE_ENABLE
Other	Reserved

■ Supplementary Note on PP

PPC	PP	Operation		
0b	1b	RO	This bit is fixed to 1b, and the power is always supplied to the port.	
1b	0b/1b	R/W	Whether or not power is supplied to the port depends on the setting of this bit.	
			0b	Power is not supplied to the port.
			1b	Power is supplied to the port.

■ Supplementary Note on Line Status Bit

Bit11	Bit10	USB bus status	Description
0b	0b	SE0	The device is not an LS device.
			EHCI port reset is executing.
1b	0b	J-state	J-state The device is not an LS device.
			EHCI port reset is executing.
0b	1b	K-state	K-state An LS device was connected.
			The port ownership is transferred from EHCI to OHCI.
1b	1b	Undefined	The device is not an LS device.
			EHCI port reset is executing.

■ Supplementary Note on Suspend Bit

Port Enabled	Suspend	Port Status
0b	—	Disable
1b	0b	Enable
	1b	Suspend

6.5.2.2.5 AHB Bridge Register Descriptions

(1) INT_ENABLE Register (USB2m_HOST_INT_ENABLE)

Access Size : 32 bits

Address : <USB2m_host_base> + 0200h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	WAKEON_INTEN	UCOM_INTEN	USBH_INTBEN	USBH_INTAEN	AHB_INTEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
4	WAKEON_INTEN	0h	RW	This bit enables or disables bit 4 (WAKEON_INT) of the INT_STATUS register. 0b: disable 1b: enable
3	UCOM_INTEN	0h	RW	This bit enables or disables bit 3 (UCOM_INT) of the INT_STATUS register. 0b: disable 1b: enable
2	USBH_INTBEN	0h	RW	This bit enables or disables bit 2 (USBH_INTB) of the INT_STATUS register. 0b: disable 1b: enable
1	USBH_INTAEN	0h	RW	This bit enables or disables bit 1 (USBH_INTA) of the INT_STATUS register. 0b: disable 1b: enable
0	AHB_INTEN	0h	RW	This bit enables or disables bit 0 (AHB_INT) of the INT_STATUS register. 0b: disable 1b: enable

(2) INT_STATUS Register (USB2m_HOST_INT_STATUS)

Access Size : 32 bits
Address : <USB2m_host_base> + 0204h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	WAKEON_INT	UCOM_INT	USBH_INTB	USBH_INTA	AHB_INT
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	RW1	RW	RW	RW	RW1

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
4	WAKEON_INT	0h	RW1	This bit indicates the state of WAKEON interrupt from the HOST module. Writing 1b to this bit can clear this bit. 0b: No WAKEON interrupt 1b: WAKEON interrupt
3	UCOM_INT	0h	RW	This bit indicates the state of interrupt from the UCOM register. To clear the interrupt, use the UCOM2 Register. 0b: No UCOM register interrupt 1b: UCOM register interrupt
2	USBH_INTB	0h	RW	This bit indicates the state of EHCI interrupt. To clear the interrupt, use the USBSTS Register (of the EHCI Operational Register). 0b: No INTB interrupt 1b: INTB interrupt
1	USBH_INTA	0h	RW	This bit indicates the state of OHCI interrupt. To clear the interrupt, use the HcInterruptStatus Register (of the OHCI Operational Register). 0b: No INTA interrupt 1b: INTA interrupt
0	AHB_INT	0h	RW1	This bit indicates that a BUS Master error occurred. Writing 1b to this bit can clear this bit. 0b: No bus error occurred. 1b: A bus error occurred.

(3) AHB_BUS_CTR Register (USB2m_HOST_AHB_BUS_CTR)

Access Size : 32 bits
Address : <USB2m_host_base> + 0208h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PROT_TYPE[3:0]				-	-	-	PROT_MODE	-	-	ALIGN_ADDRESS[1:0]		-	-	MAX_BURST_LEN[1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	R	R	R	RW	R	R	RW	RW	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
15 to 12	PROT_TYPE [3:0]	0h	RW	This field sets MHPROT [3:0] used when the BUS Master interface issues a transfer request. bit 15 0b: Cache disabled. 1b: Cache enabled. bit 14 0b: Buffer disabled. 1b: Buffer enabled. bit 13 0b: User access 1b: Privileged access bit 12 0b: Operation code 1b: Data
11 to 9	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
8	PROT_MODE	0h	RW	This bit selects the mode of MHPROT [3:0] used when the Master interface issues a transfer request. 0b: The value of PROT_TYPE is output as MHPROT [3:0]. 1b: When a DMA transfer is performed, MHPROT [3:0] is set to 0000b if the final burst is performed, or MHPROT [3:0] is set to the PROT_TYPE value if another burst transfer is performed.
7, 6	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
5, 4	ALIGN_ADDRESS[1:0]	0h	RW	This field sets the address boundary used when the BUS Master interface issues a burst transfer. 00b: A burst transfer is issued so that not to exceed 1-Kbyte boundary. 01b: A burst transfer is issued so that not to exceed 64-byte boundary. 10b: A burst transfer is issued so that not to exceed 32-byte boundary. (The maximum burst length is INCR8. This is because, if INCR16 is used, 32-byte boundary is exceeded.) 11b: A burst transfer is issued so that not to exceed16 byte boundary. (The maximum burst length is INCR4. This is because, if the length is at least INCR8, 16-byte boundary is exceeded.)
3, 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
1, 0	MAX_BURST_LEN[1:0]	0h	RW	This field selects the maximum burst length used when the BUS Master interface issues a transfer request. 00b: INCR16 01b: INCR8 10b: INCR4 11b: SINGLE

(4) USBCTR Register (USB2m_HOST_USBCTR)

Access Size : 32 bits

Address : <USB2m_host_base> + 020Ch

Initial Value : 0000_0002h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	DIRPD	PLL_RST	USBH_RST
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	W

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
2	DIRPD	0h	RW	USBPHY Standby Mode Control 0b: USBPHY normal operating mode 1b: USBPHY standby mode Note: When the USB module is not in use, setting this bit to 1 reduces power consumption by the USBPHY module. Only set it to 1b when the USB module is not in use. In transitions from USBPHY standby mode to USBPHY normal operating mode, assert the reset signal for the USBPHY module for at least 1 µs before the transition.
1	PLL_RST	1h	RW	This bit controls resetting of the USBPHY module. 0b: The USBPHY reset is released. 1b: The USBPHY module is reset.
0	USBH_RST	0h	W	The read value is undefined Software reset to this module. Setting this bit to 1b resets this module entirely. This bit is always read as 0b. Note: Set this bit only when the BUS Master interface of this module is not running. Access to this module becomes valid 10 CLK (internal bus clock [P1φ]) after this bit is written. 0b: Nothing occurs. 1b: Reset is issued to this module.

(5) Register Enable/Clock Gating Control Register (USB2m_HOST_REGEN_CG_CTRL)

Access Size : 32 bits
Address : <USB2m_host_base> + 0304h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	NONUSE_CLK_MSK	-	HOST_CLK_MSK	PERI_CLK_MSK	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	R	RW	RW	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	UPHY_WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31	NONUSE_CLK_MSK	0h	RW	This bit is used to mask the clock for the unused host or peripheral controller, depending on the setting value of the OTG_PERI bit of the COMMCTRL register. 0b: Do not mask the clock. 1b: Mask the clock. For details, see **(2) Specifications of NONUSE_CLK_MSK operation**.
30	-	0h	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
29	HOST_CLK_MSK	0h	RW	This bit is used to forcibly mask clock supply to the host controller. 0b: Do not mask the clock supply. 1b: Mask the clock supply. For details, see **(3) Specifications of PERI_CLK_MSK and HOST_CLK_MSK operations**.
28	PERI_CLK_MSK	0h	RW	This bit is used to forcibly mask the clock supply to the peripheral controller. 0b: Do not mask the clock supply. 1b: Mask the clock supply. For details, see **(3) Specifications of PERI_CLK_MSK and HOST_CLK_MSK operations**.
27 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
0	UPHY_WEN	0h	RW	This bit controls write access to the UTMI_CTRL register. 0b: Write access to the UTMI_CTRL register is disabled. 1b: Write access to the UTMI_CTRL register is enabled.

(6) Suspend Control Register (USB2m_HOST_SPD_CTRL)

Access Size : 32 bits

Address : <USB2m_host_base> + 0308h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SUSPENDM_ENABLE	SLEEPM_ENABLE	-	-	-	-	-	-	WKCNNT_ENABLE	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	R	R	R	R	R	R	RW	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	GLOBAL_SUSPENDM_P1
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31	SUSPENDM_ENABLE	0h	RW	The setting of this bit is valid only in the Host mode (when the OTG_PERI bit of the COMMCTRL register is 0b). This bit is used to place USBPHY into the suspend status (the state in which PHY built-in PLL is stopped) when this module is changed to the USB Suspend mode. If this bit is set to 1b, the Suspend related bits of the OHCI/EHCI Operational registers below are set. If this module is changed to the USB Suspend mode, USBPHY is placed into the suspend status. [This function is valid for the following OHCI/EHCI Operational registers] EHCI: bit [7] (Suspend bit) of the PORTSC1 register OHCI: bit [2] (PSS bit) of the HcRhPortStatus register OHCI: bit [7:6] (HCFS field) of the HcControl register
30	SLEEPM_ENABLE	0h	RW	The setting of this bit is valid only in the Host mode (when the OTG_PERI bit of the COMMCTRL register is 0b). This bit is used to place USBPHY into the sleep status when the LPM function is used to change to the L1 Suspend mode. (In the sleep status, the PHY built-in PLL is running, but the 60MHz clock from USBPHY is gated.) This bit is valid when "Suspend using L1" of the POTSC register is 1b. If this bit is set to 1b, an L1 transition request is issued to the device. If the request is accepted, USBPHY is placed into the sleep status after the following EHCI register bit is set to 1b. [This function is valid for the following OHCI/EHCI Operational register] EHCI: bit [7] (Suspend bit) of the PORTSC1 register
29 to 24	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
23	WKCNNT_ENABLE	0h	RW	The setting of this bit is valid only in the Host mode (the OTG_PERI bit of the COMMCTRL register is 0b). If this bit is set to 1b, when a device disconnect occurs while USBPHY is in the suspend or sleep status, the suspend or sleep status is released. This bit is valid only when the SUSPENDM_ENABLE bit (bit 31) or SLEEP_ENABLE bit (bit 30) is 1b. Note: To set 1b to the SUSPENDM_ENABLE bit (bit 31) or SLEEPM_ENABLE bit (bit 30), as the general rule, set this bit to 1b. If, in the above case, this bit is not set to 1b, the suspend or sleep status cannot be released even if a device disconnect occurs.
22 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.

Bit	Bit Name	Initial Value	R/W	Description
0	GLOBAL_SUSPENDM_P1	0h	RW	The setting of this bit is valid regardless of the value of the OTG_PERI bit of the COMMCTRL register. This bit is used to forcibly place USBPHY into the suspend status (in which the PHY built-in PLL is stopped). If this bit is set to 1b, USBPHY is placed into the suspend status, regardless of the operating status and port status of the host controller. Note: – Do not set this bit to 1b during data transfer. We recommend that you set this bit to 1b after “stopping the EHCI/OHCI list processing” and “placing the port in the Disable status”. – If the SUSPENDM_ENABLE bit (bit 31) is 1b, do not set this bit to 1b.

(7) Suspend/Resume Timer Setting Register (USB2m_HOST_SPD_RSM_TIMSET)

Access Size : 32 bits
Address : <USB2m_host_base> + 030Ch
Initial Value : 01F4_03E8h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TIMER_CONNECT[15:0]															
Initial Value	0	0	0	0	0	0	0	1	1	1	1	1	0	1	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TIMER_RESUME[15:0]															
Initial Value	0	0	0	0	0	0	1	1	1	1	1	0	1	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	TIMER_CONNECT[15:0]	1F4h	RW	This field indicates the timer value used by USBPHY to detect Device Connect/Disconnect of the device in the suspend status (in which the PHY built-in PLL is stopped) when the SUSPENDM_ENABLE bit of the SPD_CTRL register is set to 1b. When USBPHY is in suspend status, whether Connect/Disconnect occurs is judged by the internal bus clock (P1φ). According to the internal bus clock (P1φ) frequency, specify the setting so that this timer value becomes at least 2.5 µs. 1 bit = 1 cycle (µs) (Setting guideline) For 100 MHz: At least FAh
15 to 0	TIMER_RESUME[15:0]	3E8h	RW	This field indicates the timer value used by USBPHY to detect RemoteWakeup signal from the device in suspend status (in which the PHY built-in PLL is stopped) when the SUSPENDM_ENABLE bit of the SPD_CTRL register is set to 1b. When USBPHY is in suspend status, whether the RemoteWakeup signal or not is judged by the internal bus clock (P1φ). According to the internal bus clock (P1φ) frequency, specify the setting so that this timer value becomes at least 5 µs. 1 bit = 1 cycle (µs) (Setting guideline) For 100 MHz: At least 1F4h

(8) Overcurrent Detection/Sleep Timer Setting Register (USB2m_HOST_OC_SLP_TIMSET)

Access Size : 32 bits

Address : <USB2m_host_base> + 0310h

Initial Value : 0C83_0D40h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	TIMER_SLEEP[8:0]									TIMER_OC[19:16]			
Initial Value	0	0	0	0	1	1	0	0	1	0	0	0	0	0	1	1
R/W	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TIMER_OC[15:0]															
Initial Value	0	0	0	0	1	1	0	1	0	1	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

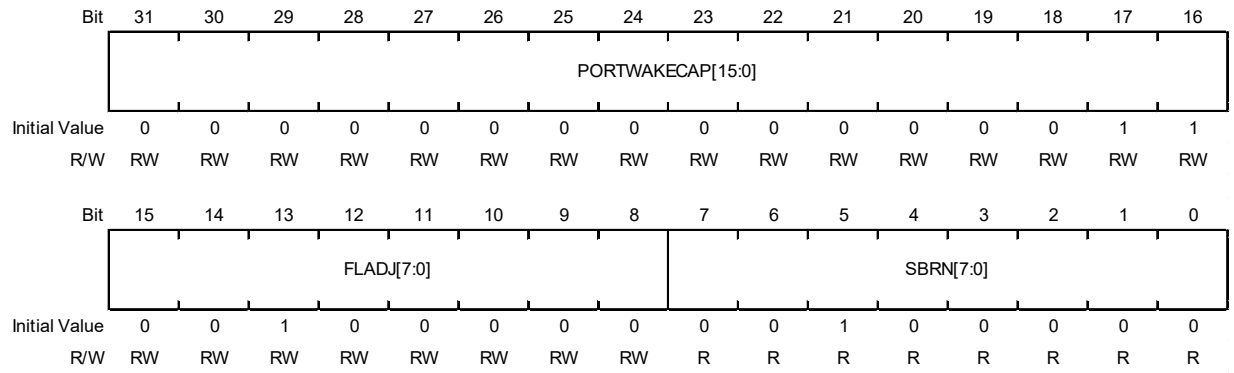
Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
28 to 20	TIMER_SLEEP [8:0]	C8h	RW	This field indicates the timer value used by USBPHY when the SLEEPM_ENABLE bit of the SPD_CTRL register is set to 1b. This timer value is used to measure the time for detecting RemoteWakeup reception and Resume-K drive time during sleep status (in which the PHY built-in PLL is running, but 60MHz clock from the USBPHY is gated). When USBPHY is in sleep status, whether the RemoteWakeup signal or not is judged by the internal bus clock (P1φ). According to the internal bus clock (P1φ) frequency, specify the setting so that this timer value becomes 1 µs. 1 bit = 1 cycle (µs) (Setting guideline) For 100 MHz: 064h
19 to 0	TIMER_OC [19:0]	30D40h	RW	This field indicates the timer value used for overcurrent detection. If the overcurrent input (OVRCUR) set in this field is continuously asserted (0b) for the duration set in this register, this module determines that overcurrent occurred. According to the internal bus clock (P1φ) frequency, specify the setting so that this timer value becomes at least 1 ms. 1 bit is 1 cycle (µs). (Setting guideline) For 100 MHz and 1 ms: At least 1_86A0h

(9) SBRN_FLADJ_PORTWAKECAP Register (USB2m_HOST_SBRN_FLADJ_PW)

Access Size : 32 bits

Address : <USB2m_host_base> + 0314h

Initial Value : 0003_2020h



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	PORTWAKECAP[15:0]	3h	RW	This field is used to mask the ports (of the connected device) that are used for Wakeup event. Operation on this field has no effect on the operation of the HOST module.
15 to 8	FLADJ[7:0]	20h	RW	This field adjusts the length of one micro frame by 16HS bit time unit. The initial value indicates 20h (60000d HS bit time).
7 to 0	SBRN[7:0]	20h	R	This field indicates the Serial Bus Release Number. The fixed value “20h” is indicated.

(10) UTMI+PHY Control Register (USB2m_HOST_UTMI_CTRL)

Abbreviated name of register: HOST_UTMI_CTRL

Access Size : 32 bits
Address : <USB2m_host_base> + 0318h
Initial Value : 8000_0004h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Renesas Private	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	Renesas Private								
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0
R/W	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31	Renesas Private	1h	RW	Reserved bit. Set the value specified in **6.5.2.9.1 Host/Peripheral Common Setting Sequence**.
30 to 9	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
8 to 0	Renesas Private	4h	RW	Reserved bit. Set the value specified in **6.5.2.9.1 Host/Peripheral Common Setting Sequence**.

(11) PORT_LPM_CTR1 Register (USB2m_HOST_PORT_LPM_CTRL1)

Access Size : 32 bits
Address : <USB2m_host_base> + 0320h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	NYET_RETRY_CNT_P1[3:0]				REMOTEWAKE_EN_P1	SLEEP_INT_EN_P1	RETRY_ENABLE_NYET_P1	HIRD_SEL_P1
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
7 to 4	NYET_RETRY_CNT_P1[3:0]	0h	RW	This field sets the number of retries that are allowed when the response from the device in the LPM transaction was NYET. The setting value of this bit is valid if the RETRY_ENABLE_NYET_P1 bit (bit 1) is 1b. 0000b: No retry. 0001b to 1111b: Retries the set number of times. (MAX: 15 retries)
3	REMOTEWAKE_EN_P1	0h	RW	This bit is used to indicate the value of the RemoteWakeup bit of the LPM Token. 0b: RemoteWakeup is supported. 1b: RemoteWakeup is not supported.
2	SLEEP_INT_EN_P1	0h	RW	This bit is used to enable an interrupt to occur when a status other than ACK is received in the LPM transaction. The Per-Port Change interrupt can occur. 0b: No interrupt occurs. 1b: An interrupt occurs.
1	RETRY_ENABLE_NYET_P1	0h	RW	This bit is used to set the behavior of the host controller when a response from the device is NYET in an LPM transaction. 0b: No retry. 1b: Retries are made.
0	HIRD_SEL_P1	0h	RW	This bit sets the time for K drive for when recovered from the Sleep state. Based on the setting values of this bit and EHCI USBCMD Register bit [27:24], the K drive time is determined as **Note**.

Note: ■ Supplementary Note on HIRD_SEL_P1 Bit

USBCMD Register	HIRD_SEL_P1 (Setting value of this bit)	
Bits [27:24]	0b	1b
0000b	75 µs	50 µs
0001b	100 µs	125 µs
0010b	150 µs	200 µs

6.5.2.2.6 UCOM Register Descriptions

(1) Common Control Register (USB2m_HOST_COMMCTRL)

Access Size : 32 bits

Address : <USB2m_host_base> + 0800h

Initial Value : 8000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	OTG_PERI	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	OTG_PERI	1h	RW	This bit specifies whether this module is set to the host mode or function mode. 0b: Host mode 1b: Function mode
30 to 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.

(2) OTG-BC Interrupt Status Register (USB2m_HOST_OBINTSTA)

Access Size : 32 bits
Address : <USB2m_host_base> + 0804h
Initial Value : 0000_0001h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	DPMONCHG_STA	DMMONCHG_STA
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW1	RW1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	CHGDETCHG1_STA	-	PDDETCHG1_STA	-	-	OCINT_STA	IDCHG_STA
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	RW1	R	RW1	R	R	RW1	RW1

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
17	DPMONCHG_STA	0h	RW1	This bit is set if the DPMON bit of the LINECTRL1 register has changed. 0b: The DPMON bit of the LINECTRL1 register has not changed. 1b: The DPMON bit of the LINECTRL1 register has changed.
16	DMMONCHG_STA	0h	RW1	This bit is set if the DMMON bit of the LINECTRL1 register has changed. 0b: The DMMON bit of the LINECTRL1 register has not changed. 1b: The DMMON bit of the LINECTRL1 register has changed.
15 to 7	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
6	CHGDETCHG1_STA	0h	RW1	This bit is set if the CHGDETSTS bit of the BCCTRL1 register has changed from 0b to 1b. 0b: The CHGDETSTS bit of the BCCTRL1 register has not changed from 0b to 1b 1b: The CHGDETSTS bit of the BCCTRL1 register has changed from 0b to 1b.
5	-	0h	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
4	PDDETCHG1_STA	0h	RW1	This bit is set if the PDDETSTS bit of the BCCTRL1 register has changed from 0b to 1b. 0b: The PDDETSTS bit of the BCCTRL1 register has not changed from 0b to 1b. 1b: The PDDETSTS bit of the BCCTRL1 register has changed from 0b to 1b.
3, 2	-	0h	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
1	OCINT_STA	0h	RW1	This bit is set if the OVRCUR pin is asserted. 0b: The OVRCUR pin is not asserted (and remains 1b). 1b: The OVRCUR pin is asserted (and became 0b).
0	IDCHG_STA	1h	RW1	This bit is set if the input value from the OTG_ID pin has changed. 0b: There is no change in the OTG_ID pin. 1b: There is a change in the OTG_ID pin. Note: The initial value is 1. Before using this bit, clear the status.

(3) OTG-BC Interrupt Enable Register (USB2m_HOST_OBINTEN)

Access Size : 32 bits
Address : <USB2m_host_base> + 0808h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	DPMONCHG_EN	DMMONCHG_EN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	CHGDETCHG1_EN	-	PDDETCHG1_EN	-	-	OCINT_EN	IDCHG_EN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	RW	R	RW	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
17	DPMONCHG_EN	0h	RW	DPMONCHG_STA bit interrupt enable 0b: Interrupt via the DPMONCHG_STA bit is disabled. 1b: Interrupt via the DPMONCHG_STA bit is enabled.
16	DMMONCHG_EN	0h	RW	DMMONCHG_STA bit interrupt enable 0b: Interrupt via the DMMONCHG_STA bit is disabled. 1b: Interrupt via the DMMONCHG_STA bit is enabled.
15 to 7	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
6	CHGDETCHG1_EN	0h	RW	CHGDETCHG1_STA bit interrupt enable 0b: Interrupt via the CHGDETCHG1_STA bit is disabled. 1b: Interrupt via the CHGDETCHG1_STA bit is enabled.
5	-	0h	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
4	PDDETCHG1_EN	0h	RW	PDDETCHG1_STA bit interrupt enable 0b: Interrupt via the PDDETCHG1_STA bit is disabled. 1b: Interrupt via the PDDETCHG1_STA bit is enabled.
3, 2	-	0h	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
1	OCINT_EN	0h	RW	OCINT_STA bit interrupt enable 0b: Interrupt via the OCINT_STA bit is disabled. 1b: Interrupt via the OCINT_STA bit is enabled.
0	IDCHG_EN	0h	RW	IDCHG_STA bit interrupt enable 0b: Interrupt via the IDCHG_STA bit is disabled. 1b: Interrupt via the IDCHG_STA bit is enabled.

(4) VBUS Control Register (USB2m_HOST_VBCTRL)

Access Size : 32 bits

Address : <USB2m_host_base> + 080Ch

Initial Value : 0001_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	VGPUO	-	-	-	VBOUT
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	RW	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
16	-	1h	R	Reserved Whenever it is read, 1b is read. The write value should always be 1b.
15 to 5	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
4	VGPUO	0h	RW	The level corresponding to the inverse of this bit (in terms of positive logic) is output from the OTG_EXICEN pin. This bit is used, for example, for control of the external power IC.
3 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
0	VBOUT	0h	RW	This bit is one of the VBUSEN control bits. This bit is used to assert VBUS by controlling the external power IC. 0b: VBUS output disable 1b: VBUS output enable If overcurrent occurs, this bit is automatically cleared to 0b.

(5) Line Control Port 1 Register (USB2m_HOST_LINECTRL1)

Access Size : 32 bits
Address : <USB2m_host_base> + 0810h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	DPRPU_EN	DP_RPU	DPRPD_EN	DP_RPD	DMRPD_EN	DM_RPD
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	DPMON	DMMON	-	IDMON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
25, 24	-	0h	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
23, 22	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
21	DPRPU_EN	0h	RW	This bit enables the DP_RPU (bit 20) setting for pullup control of D+ in port 1. 0: DP_RPU (bit 20) setting for pullup control of D+ in port 1 is disabled. 1: DP_RPU (bit 20) setting for pullup control of D+ in port 1 is enabled.
20	DP_RPU	0h	RW	This bit controls pullup of D+ in port 1b. This control is enabled only when DPRPU_EN (bit 21) = 1b. Note that if this bit is cleared to 0b when DPRPU_EN (bit 21) = 1b, D+ is in the floating state while no device drives the USB bus. Note also that setting DPRPD_EN (bit 19) and DP_RPD (bit 18) to enabled is prohibited while this bit is set to enabled - that is, enabling both pullup and pulldown of D+ together is prohibited. 0: Pullup of D+ in port 1 is disabled. 1: Pullup of D+ in port 1 is enabled.
19	DPRPD_EN	0h	RW	This bit enables DP_RPD (bit 18) to control USB bus (DP) 15 kΩ Pulldown resistor. 0b: Control of DP-side 15 kΩ Pulldown resistor by DP_RPD (bit 18) is disabled. 1b: Control of DP-side 15 kΩ Pulldown resistor by DP_RPD (bit 18) is enabled.
18	DP_RPD	0h	RW	This bit controls USB bus (DP) 15 kΩ Pulldown resistor when DPRPD_EN (bit 19) = 1b. 0b: DP-side 15 kΩ Pulldown resistor is OFF. 1b: DP-side 15 kΩ Pulldown resistor is ON.
17	DMRPD_EN	0h	RW	This bit enables DM_RPD (bit 16) to control USB bus (DM) 15 kΩ Pulldown resistor. 0b: Control of DM-side 15 kΩ Pulldown resistor by DM_RPD (bit 16) is disabled. 1b: Control of DM-side 15 kΩ Pulldown resistor by DM_RPD (bit 16) is enabled.
16	DM_RPD	0h	RW	This bit controls USB bus (DM) 15 kΩ Pulldown resistor when DMRPD_EN (bit 17) = 1b. 0b: DM-side 15 kΩ Pulldown resistor is OFF. 1b: DM-side 15 kΩ Pulldown registor is ON.
15 to 4	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
3	DPMON	0h	R	This bit indicates the value of USB bus DP.
2	DMMON	0h	R	This bit indicates the value of USB bus DM.
1	-	0h	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
0	IDMON	0h	R	This bit indicates the value of the OTG_ID pin.

(6) BC Control Port 1 Register (USB2m_HOST_BCCTRL1)

Access Size : 32 bits
Address : <USB2m_host_base> + 0820h
Initial Value : 0300_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	1	1	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	PDDETSTS	CHGDETSTS	-	-	DCPMODE	VDMSRCE	IDPSINKE	VDPSRCE	IDMSINKE	IDPSRCE
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
25, 24	-	3h	R	Reserved Whenever it is read, 1b is read. The write value should always be 1b.
23 to 10	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
9	PDDETSTS	0h	R	This bit indicates the USBPHY Portable Device Detect signal state.
8	CHGDETSTS	0h	R	This bit indicates the USBPHY Charging Downstream Port Detect signal state.
7, 6	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
5	DCPMODE	0h	RW	If USBPHY is used as DCP (Dedicated Charging Port), this bit is set to 1b.
4	VDMSRCE	0h	RW	This bit controls the USBPHY built-in VDM_SRC circuit. If this bit is set to 1b, VDM_SRC goes ON, and the DM pin is driven.
3	IDPSINKE	0h	RW	This bit controls the USBPHY built-in Portable Device Detect circuit. If this bit is set to 1b, Portable Device detection is enabled.
2	VDPSRCE	0h	RW	This bit controls the USBPHY built-in VDP_SRC circuit. If this bit is set to 1b, VDP_SRC goes ON, and the DP pin is driven.
1	IDMSINKE	0h	RW	This bit controls the USBPHY built-in Charging Downstream Port Detect circuit. If this bit is set to 1b, Charging Downstream Port detection is enabled.
0	IDPSRCE	0h	RW	This bit controls the USBPHY built-in IDP_SRC circuit. If this bit is set to 1b, IDP_SRC goes ON, and the DP pin is driven.

6.5.2.3 Clock Signals

6.5.2.3.1 Clock Gating Specifications

(1) Overview of clock gating

Because this module has a feature of switching the host controller and peripheral controller, clock supply to the unused controller might not be necessary.

Therefore, three clock gating control bits are allocated in the Register Enable/Clock Gating Control Register for the purpose of reducing power consumption by implementing clock gating for the “circuits that do not require clock supply temporarily.”

The clock gating control bits can be controlled to gate the clock that is supplied to the host controller or the peripheral controller.

[Target Register]

Register Enable/Clock Gating Control Register (offset: 304h)

[Functional specification]

Bit	Symbol	Functional Specification
31	NONUSE_CLK_MSK	Gating clocks for unused host controller or peripheral controller.
29	HOST_CLK_MSK	Gating clocks for host controller.
28	PERI_CLK_MSK	Gating clocks for peripheral controller.

(2) Specifications of NONUSE_CLK_MSK operation

This function automatically gates the clock to the unused host controller or the unused peripheral controller.

This function is enabled if the NONUSE_CLK_MSK bit (bit 31) is set to 1b.

If it is no problem whether the clock supply to the unselected function is stopped, use this function.

The following table shows the operating specifications of this function, based on the setting of the OTG_PERI bit (bit 31) of the Common Control Register (offset: 800h).

Clock Gating Register Setting			Host/Peripheral Switching Setting	Gating Target	
			Register		
NONUSE_CLK_MSK	HOST_CLK_MSK	PERI_CLK_MSK	OTG_PERI	Host Controller	Function Controller
1	0	0	0	—	✓
			1	✓	—

[Note on using the NONUSE_CLK_MSK bit]

If the NONUSE_CLK_MSK bit is used, as the general rule, set the HOST_CLK_MSK/PERI_CLK_MSK bit to 0b.

If the HOST_CLK_MSK/PERI_CLK_MSK bit is 1b, the effect of clock gating becomes logical OR of each bit.

(3) Specifications of PERI_CLK_MSK and HOST_CLK_MSK operations

This function forcibly gates the clock to the host controller and function controller.

The following table shows the operating specifications of this function.

Clock Gating Register Setting			Host/Peripheral Switching Setting	Gating Target	
			Register		
NONUSE_CLK_MSK	HOST_CLK_MSK	PERI_CLK_MSK	OTG_PERI	Host Controller	Function Controller
0	1	0	—	✓	
	0	1	—		✓
	1	1	0	✓	✓

Note: If the HOST_CLK_MSK/PERI_CLK_MSK bit is used, as the general rule, set the NONUSE_CLK_MSK bit to 0b.
If the NONUSE_CLK_MSK bit is set t0 1b, the effect of clock gating becomes logical OR of each bit.

6.5.2.4 Interrupt Sources

6.5.2.4.1 Interrupt Signals

This module has the five interrupt signals listed below.

Interrupt Source Name	Interrupt Type	Pulse/ Level	Active Level
U2H_INT	BUS Master interrupt signal. This signal is asserted when a bus error occurs in the BUS Master. Interrupt control is performed by the AHB Bridge Register.	Level	H
U2H_OHCI_INT	OHCI interrupt signal This signal is asserted during FS/LS transfer, when data transfer finishes or when the change of the USB bus state is detected. Interrupt control is performed by the OHCI Operational Register.	Level	H
U2H_EHCI_INT	EHCI interrupt signal. This signal is asserted during HS transfer, when data transfer finishes or when the change of the USB bus state is detected. Interrupt control is performed by the EHCI Operational Register.	Level	H
U2H_WAKEON_INT	EHCI Wakeup interrupt signal. This signal is asserted by an EHCI Wakeup event. Interrupt control is performed by the EHCI Operational Register.	Level	H
U2H_OBINT	OTG/Battery Charging interrupt signal. This signal is asserted by OTG or Battery Charging related event. Interrupt control is performed by the UCOM2 Register.	Level	H

6.5.2.4.2 Interrupt Sources and Control

(1) U2H_INT assertion source and control

[Interrupt enable control by register]

Assert the interrupt enable bit in the register below. The interrupt signal is asserted when an interrupt source occurs.

AHB Bridge Register INT_ENABLE Register (offset: 200h) bit[0] (AHB_INTEN)

[Interrupt source]

A bus error (MHRESP = 1b) occurs in the AHB master.

[Clearing the interrupt]

To clear the interrupt, write 1b to the relevant bit in the register below.

AHB Bridge Register INT_STATUS Register (offset: 204h) bit[0] (AHB_INT)

(2) U2H_OHCI_INT assertion source and control

[Interrupt enable control by register]

Assert the interrupt enable bit in the registers below. The interrupt signal is asserted when an interrupt source occurs.

AHB Bridge Register INT_ENABLE Register (offset: 200h) bit[1] (USBH_INTAEN)

OHCI Operational Register HcInterruptEnable Register (offset: 010h) bit[31], bit[6:0]*1

Note 1. Enable the bit required as the assertion source.

[Interrupt source]

Interrupt Source		Registers That Require Interrupt Enable Setting							
			HcInterruptEnable						
		USBH_INTAEN	bit [31] MIE	bit [6] RHSCE	bit [5] FNOE	bit [3] ROE	bit [2] SFE	bit [1] WDHE	bit [0] SOE
1	Device connection is detected.	✓	✓	✓	—	—	—	—	—
2	Device disconnection is detected.	✓	✓	✓	—	—	—	—	—
3	Port power is OFF (excluding overcurrent detection).	✓	✓	✓	—	—	—	—	—
4	Babble error is detected during a USB transfer.	✓	✓	✓	—	—	—	—	—
5	Resume is complete.	✓	✓	✓	—	—	—	—	—
6	Overcurrent is detected.	✓	✓	✓	—	—	—	—	—
7	Bus reset is complete.	✓	✓	✓	—	—	—	—	—
8	When the HcRhDescritorB Register DR bit is 1b, OHCI becomes “USB Operational” (HCFS[1:0] bit = 10b) or “USB Suspend” (HCFS[1:0] bit = 11b).	✓	✓	✓	—	—	—	—	—
9	When no device is connected (CCS bit = 0b), 1 is written to bit [0] (Clear Port Enable) of the OHCI HcRhPort Status register.	✓	✓	✓	—	—	—	—	—
10	When no device is connected (CCS bit = 0b), 1 is written to bit [1] (Set Port Enable) of the OHCI HcRhPort Status register.	✓	✓	✓	—	—	—	—	—
11	When no device is connected (CCS bit = 0b), 1 is written to bit [2] (Set Port Suspend) of the OHCI HcRhPort Status register.	✓	✓	✓	—	—	—	—	—
12	When no device is connected (CCS bit = 0b), 1 is written to bit [3] (Clear Suspend Status) of the OHCI HcRhPort Status register.	✓	✓	✓	—	—	—	—	—
13	When no device is connected (CCS bit = 0b), 1 is written to bit [4] (Set Port Reset) of the OHCI HcRhPort Status register.	✓	✓	✓	—	—	—	—	—
14	When no device is connected (CCS bit = 1b), the port power is turned off.	✓	✓	✓	—	—	—	—	—
15	The MSB of bit [15:0] (Frame Number) of the HcFmNumber register has changed.	✓	✓	—	✓	—	—	—	—
16	RemoteWakeup signal (Resume signal) is detected from a device.	✓	✓	—	—	✓	—	—	—
17	HccaFrameNumber is updated. (Almost the same meaning as SOF is sent.)	✓	✓	—	—	—	✓	—	—
18	A transfer finishes (including an error), and the host module updated HccaDoneHead.	✓	✓	—	—	—	—	✓	—
19	USB schedule overrun occurred for the frame.	✓	✓	—	—	—	—		✓

[Clearing the interrupt]

To clear the interrupt, write 1b to the bit corresponding to the interrupt source in the register below to clear the interrupt.

OHCI Operational Register HcInterruptStatus Register (offset: 00Ch) bit[6:0]

(3) U2H_EHCI_INT assertion source and control

[Interrupt enable control by register]

Assert the interrupt enable bit in the registers below. The interrupt signal is asserted when an interrupt source occurs.
AHB Bridge Register INT_ENABLE Register (offset: 200h) bit[2] (USBH_INTBEN)

EHCI Operational Register USBINTR Register (offset: 128h) bit[16], bit[5:0]*1

Note 1. Enable the bit required as the assertion source.

Also, control the relevant bit(s) in the register below as required.

EHCI Operational Register USBCMD Register (offset: 120h) bit[15], bit[6]

[Interrupt source]

		Registers That Require Interrupt Enable Setting								
			USBCMD		USBINTR					
			bit [15]	bit [6]	bit [16]	bit [5]	bit [3]	bit [2]	bit [1]	bit [0]
Interrupt Source		USBH_INTB EN	Per-Port Change Event	Doorbell	Port-1 Change Event	Async Advance	Frame List Rollover	Port Change Detect	USB ERRINT	USB INT
[1]	Device connection is detected.	✓	—	—	—	—	—	✓	—	—
[2]	Device disconnection is detected.	✓	—	—	—	—	—	✓	—	—
[3]	Overcurrent is detected.	✓	—	—	—	—	—	✓	—	—
[4]	RemoteWakeup signal (Resume Signal) is detected from a device.	✓	—	—	—	—	—	—	—	—
[5]	Babble status of the USB bus is detected.	✓	—	—	—	—	—	✓	—	—
[6]	USB transfer with “qTD IOC = 1b” normally finishes.	✓	—	—	—	—	—	—	—	✓
[7]	Short packet is received.	✓	—	—	—	—	—	—	—	✓
[8]	USB transfer finished with an error. (Retry transfer failed three times. A bubble error was detected. STALL was received.)	✓	—	—	—	—	—	—	✓	—
[9]	The QH processing normally finished while the USBCMD Register bit [6] (Interrupt on Async Advance Doorbell) is 1b.	✓	—	✓	—	✓	—	—	—	—
[10]	The FRINDEX Register Frame Index bit returned from the maximum value to 000h (rollover detected).	✓	—	—	—	—	✓	—	—	—
[11]	The Port Change Detect event (interrupt source 1 to 5) was detected.	✓	✓	—	✓	—	—	—	—	—

[Clearing the interrupt]

To clear the interrupt, write 1b to the bit corresponding to the interrupt source in the register below to clear the interrupt.

EHCI Operational Register USBSTS Register (offset: 124h) bit[17:16], bit[5:0]

(4) U2H_WAKEON_INT assertion source and control

[Interrupt enable control by register]

Assert the interrupt enable bit in the registers below. The interrupt signal is asserted when an interrupt source occurs.

AHB Bridge Register INT_ENABLE Register (offset: 200h) bit[4] (WAKEON_INTEN)

EHCI Operational Register PORTSC[1:2] Register (offset: 164h/168h) bit[22:20]*[1]

Note 1. Enable the bit required as the assertion source.

[Interrupt source]

Interrupt Source		Registers That Require Interrupt Enable Setting			
			PORTSC		
		WAKEON_INTEN	bit [22]	bit [21]	bit [20]
			WKOC_E	WKDSCNNT_E	WKCNNT_E
1	Device connection is detected.	✓	—	—	✓
2	Device disconnection is detected.	✓	—	✓	—
3	Overcurrent is detected.	✓	✓	—	—
4	RemoteWakeup signal (Resume Signal) is detected from a device.	✓	—	—	—

[Clearing the interrupt]

To clear the interrupt, write 1b to the relevant bit in the register below.

AHB Bridge Register INT_STATUS Register (offset: 204h) bit[4] (WAKEON_INT)

(5) U2H_OBINT assertion source and control

[Interrupt enable control by register]

Assert the interrupt enable bit in the registers below. The interrupt signal is asserted when an interrupt source occurs.

AHB Bridge Register INT_ENABLE Register (offset: 200h) bit[3] (UCOM_INTEN)

UCOM Register OTG-BC Interrupt Enable Register (offset: 808h) bit[17:16], bit[6], bit[4], bit[1:0]*[1]

Note 1. Enable the bit required as the assertion source.

[Interrupt source]

		Registers That Require Interrupt Enable Setting		
			OTG-BC Interrupt Enable	
			bit [17]	bit [16]
	Interrupt Source	UCOM_INTEN	DPMONCHG_EN	DMMONCHG_EN
1	The DP pin has changed.	✓	✓	—
2	The DM pin has changed.	✓	—	✓

		Registers That Require Interrupt Enable Setting		
			OTG-BC Interrupt Enable	
			bit [6]	bit [4]
	Interrupt Source	UCOM_INTEN	CHGDETCHG1_EN	PDDETCHG1_EN
1	The portable device detection signal has changed.	✓	—	✓
2	The charging port detection signal has changed.	✓	✓	—

		Registers That Require Interrupt Enable Setting		
			OTG-BC Interrupt Enable	
			bit [1]	bit [0]
	Interrupt Source	UCOM_INTEN	OCINT_EN	IDCHG_EN
1	Overcurrent is detected. (The change of the OVRCURN pin from 1 to 0b is detected.)	✓	✓	—
2	The OTG_ID pin has changed.	✓	—	✓

[Clearing the interrupt]

To clear the interrupt, write 1b to the bit corresponding to the interrupt source in the register below to clear the interrupt.

UCOM Register OTG-BC Interrupt Status Register (offset: 804h) bit[17:16], bit[6], bit[4], bit[1:0]

6.5.2.4.3 Timing of De-asserting Interrupt Signals

After the register access to clear an interrupt source, it may take time to begin clearing the interrupt triggered by the interrupt source. Therefore, take a measure to prevent the false recognition of interrupts during the period from the end of the register clear access until the next interrupt is recognized.

6.5.2.5 Power-Saving Function

This module controls power consumption by using the following two methods:

(1) Controlling the SUSPENDM/SLEEPM pin of USB2PHY

(2) Using clock gating to stop the clock to the host controller or peripheral controller.

6.5.2.5.1 Controlling the SUSPENDM and SLEEPM Pins of the USB2PHY

You can expect the following power-saving effects by asserting the SUSPENDM and SLEEPM pins of the USB2PHY:

- Reducing the power consumption by the USB2PHY
- Reducing the power consumption by the host core by stopping the clocks from the USB2PHY

As described at **(4) Suspend extension function**, by default, the SUSPENDM and SLEEPM pins of the USB2PHY are not asserted even when EHCI and OHCI are put into the Suspended state.

See **(6) Suspend Control Register (USB2m_HOST_SPD_CTRL)** and control the relevant registers appropriately.

6.5.2.5.2 Controlling the Clock-Gating Function

See **(5) Register Enable/Clock Gating Control Register (USB2m_HOST_REGEN_CG_CTRL)** and **6.5.2.3.1 Clock Gating Specifications**, then control the relevant registers appropriately.

6.5.2.6 Battery Charging

6.5.2.6.1 Support of charging port

The charging port refers to a port that supplies power in compliance with the Battery Charging Specification. The charging port is usually installed on the host controller.

Charging ports can be generally classified by function as described below.

Type	Function
CDP (Charging Downstream Port)	Downstream port that can supply power in compliance with the Battery Charging Specification. This type of charging port detects a portable device, and after the handshake (for Battery Charging) finishes, it proceeds to the usual device connect sequence (and operates as the usual host).
DCP (Dedicated Charging Port)	Port that provides only power supply function in compliance with the Battery Charging Specification. This type of charging port does not operate as the usual host.
SDP (Standard Downstream Port)	Standard Downstream Port that is not compliant with the Battery Charging Specification. This type of charging port supplies power in the range conforming to the conventional USB 2.0 standard, and operates as the usual host.

6.5.2.6.2 Support of portable device

A portable device refers to a device that is supplied power (or that requests power supply) in compliance with the Battery Charging Specification. The portable port is usually installed in the peripheral controller.

6.5.2.7 Bus Master

6.5.2.7.1 Functional specifications of the bus master

(1) Supported bus master functions

Function as the BUS MASTER	Status
Residual burst after an error response is received	The transfer is not stopped.
1 Kbyte boundary processing	The fixed length burst (INCRx) across 1 Kbyte boundary is not performed.

(2) Issuing requests for different types of bus transfer

MHTRANS[1:0]	MHSIZE[2:0]	MHWRITE	MHBURST[2:0]	Reply	Remarks
IDLE (00b)	—	—	—	—	—
BUSY (01b)	—	—	—	—	Not issued.
NONSEQ (10b)	32-bit (010b)	WRITE	SINGLE INCR4 INCR8 INCR16	OKAY/ERROR	32-bit transfer is issued. A response error is reported by an interrupt, and the transfer is not stopped.
		READ			
	8-bit (000b) 16-bit (001b)	WRITE	SINGLE	OKAY/ERROR	8-bit/16-bit transfer is issued (SINGLE only). A response error is reported by an interrupt.
	other than the above	—	—	—	Not issued.
SEQ (11b)	32-bit (010b)	WRITE	INCR4 INCR8 INCR16	OKAY/ERROR	32-bit transfer is issued. A response error is reported by an interrupt, and the transfer is not stopped.
		READ		OKAY/ERROR	
	other than the above	—	—	—	Not issued.

(3) Supported responses

Response type	Response	Remarks
OKAY	Enable	Supported.
ERROR	Enable	A response error is reported by an interrupt, and termination of transfer (Early Burst Termination) is not performed.

(4) Protection control information

The value of MHPROT[3:0] can be set in the PROT_TYPE bits (bits [15:12]) in the AHB_BUS_CTR Register (offset: 208h).

Also, when the PROT_MODE bit (bit 8) in the AHB_BUS_CTR Register is set, only the last data transfer in an EHCI/OCHI DMA transfer can be handled as a non-buffered transfer, and other transfers can be handled as buffered transfers.

(5) Maximum burst length

The maximum burst length can be selected from SINGLE, INCR4, INCR8, and INCR16 by using the MAX_BURST_LEN bits (bit[1:0]) in the AHB_BUS_CTR Register (offset: 208h). The maximum burst length is common to reading and writing.

(6) Boundary of transfer data

The value of MHADDR[31:0] bits does not exceed 1 KB boundary during a burst transfer. Also, you can change the address boundary for burst transfer to 16, 32, or 64 bytes by writing a value to the ALIGN_ADDRESS bits (bit[5:4]) in the AHB_BUS_CTR Register (offset: 208h).

(7) Start address of fixed-length INCR burst transfer

The following table lists the values of the lower bits of MHADDR to be applied when a fixed-length INCR burst transfer starts.

ALIGN_ADDRESS Setting	Fixed length Start Address of INCR Burst		
	INCR4	INCR8	INCR16
00b (Aligned at the 1-Kbyte boundary)	MHADDR[9:0] = 000h 004h 008h 00Ch 010h ⋮ 3D0h 3D4h 3D8h 3DCh 3E0h 3E4h 3E8h 3ECh 3F0h	MHADDR[9:0] = 000h 004h 008h 00Ch 010h ⋮ 3C8h 3CCh 3D0h 3D4h 3D8h 3DCh 3E0h	MHADDR[9:0] = 000h 004h 008h 00Ch 010h ⋮ 3B8h 3BCh 3C0h
01b (Aligned at the 16-byte boundary)	MHADDR[3:0] = 0h	— (Not issued)	— (Not issued)
10b (Aligned at the 32-byte boundary)	MHADDR[4:0] = 00h 04h 08h 0Ch 10h	MHADDR[4:0] = 00h	— (Not issued)
11b (Aligned at the 64-byte boundary)	MHADDR[5:0] = 00h 04h 08h 0Ch 10h 14h 18h 1Ch 20h 24h 28h 2Ch 30h	MHADDR[5:0] = 00h 04h 08h 0Ch 10h 14h 18h 1Ch 20h	MHADDR[5:0] = 00h

6.5.2.8 Overcurrent Control and VBUS Control

6.5.2.8.1 OVRCURN/VBUSEN pin

Overcurrent detection on the USB port and port power (VBUS) control are performed by the external power IC connected to this module.

This module pin	Input/Output	Level	Description
OVRCURN	Input	L	Overcurrent status was detected.
		H	Overcurrent status was not detected.
VBUSEN	Output	L	Port Power (VBUS) OFF
		H	Port Power (VBUS) ON

6.5.2.8.2 Overcurrent detection timer setting

This module detects overcurrent when the OVRCURN pin remains asserted (0b) for a set period.

The period over which assertion of the OVRCURN pin is required (“Overcurrent detection time”) can be set in the following register.

Register	Overcurrent detection/sleep timer setting register (offset: 310h)
Bits	TIMER_OC[19:0]
Initial value	3_0D40h

The overcurrent detection time can be converted from the setting value of the above register, taking that one bit equal to the internal bus clock (P1ϕ) cycle.

Therefore, set the value of the above register at initial configuration, considering “the internal bus clock (P1ϕ) frequency to be used” and “the overcurrent detection time you want to specify”.

6.5.2.8.3 Port Power (VBUS) control specifications

VBUSEN can be controlled by the Port Power bit of the EHCI/OHCI Operational register or by the VBOUT bit of the VBUS Control Register. Which of the above bit controls VBUSEN is determined by the VBUSEN control (VBENCTL) register in USBPHY Control.

When using as Function, VBUSEN should be 0.

The following table describes control examples by the Port Power bit of the EHCI/OHCI Operational register.

Situation		Register		bit
EHCI control		PORTSC1 (offset: 164h)		bit 12 (PP)
OHCI control	Global control*1	ON setting	HcRhStatus Register (offset: 050h)	bit 16 (Set Global Power)
		OFF setting		bit 0 (Clear Port Status)
	Selective control*2	ON setting	HcRhPortStatus1 Register (offset: 054h)	bit 8 (Set Port Power)
		OFF setting		bit 9 (Clear Port Power)

Note 1. Global control refers to the status in which the register settings are as follows:
HcRhDescriptorA Register (offset: 048h) bit 8 (PSM) = 0b
or
HcRhDescriptorA Register (offset: 048h) bit 8 (PSM) = 1b
and
HcRhDescriptorB Register (offset: 04Ch) bit 17 (PPCM[1]) = 0b

Note 2. Selective control refers to the status in which the register settings are as follows:
HcRhDescriptorA Register (offset: 048h) bit 8 (PSM) = 1b
and
HcRhDescriptorB Register (offset: 04Ch) bit 17 (PPCM[1]) = 1b

However, if the register settings are as follows, the VBUSEN pin is always asserted (1b), and the Port Power (VBUS) becomes ON, regardless of the OVRCURN pin's status.

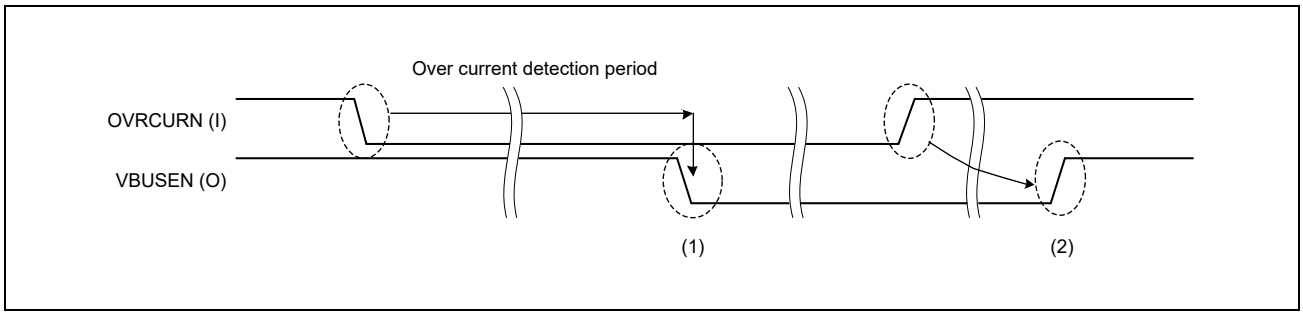
Specify the settings as necessary (for example, your system needs that VBUS is always ON).

EHCI Operational	OHCI Operational				
HCSPARAMS (offset: 104h)	HcRhDescriptorA (offset: 048h)			HcRhDescriptorB (offset: 04Ch)	Pin Operation
PPC (bit 4)	NOCP (bit 12)	NPS (bit 9)	PSM (bit 8)	PPCM[1] (bit 17)	When the OVRCURN pin is asserted (0b)
0	—	—	—	—	Fixed to 1b
—	1	—	—	—	Fixed to 1b
—	—	1	—	—	Fixed to 1b
1	0	0	0	—	0b
			1	0	
				1	

6.5.2.8.4 Timing Chart for Overcurrent Detection and Recovery

The figure below shows the assertion/de-assertion timings of the OVRCURN and VBUSEN pins signals at overcurrent detection and recovery.

Note that this timing chart is on the assumption that the changes of register settings to fix the Port Power bit to asserted state (see **6.5.2.8.3 Port Power (VBUS) control specifications**) have not been made.



1. When the OVRCURN pin is kept asserted (0b) for the overcurrent detection time, this module determines the occurrence of overcurrent, and then de-asserts the VBUSEN pin (0b).
2. After the overcurrent status has been resolved, and de-assertion of the OVRCURN pin (1b) is confirmed, 1b is written to the Port Power bit described in **6.5.2.8.3 Port Power (VBUS) control specifications** to turn on the Port Power (Vbus).

Remark Before the Port Power bit is set by firmware, be sure to check that the OVRCURN pin has been deasserted.

6.5.2.9 Procedure for Setting this Module

6.5.2.9.1 Host/Peripheral Common Setting Sequence

The following shows the necessary sequence common to both host and peripheral modes.

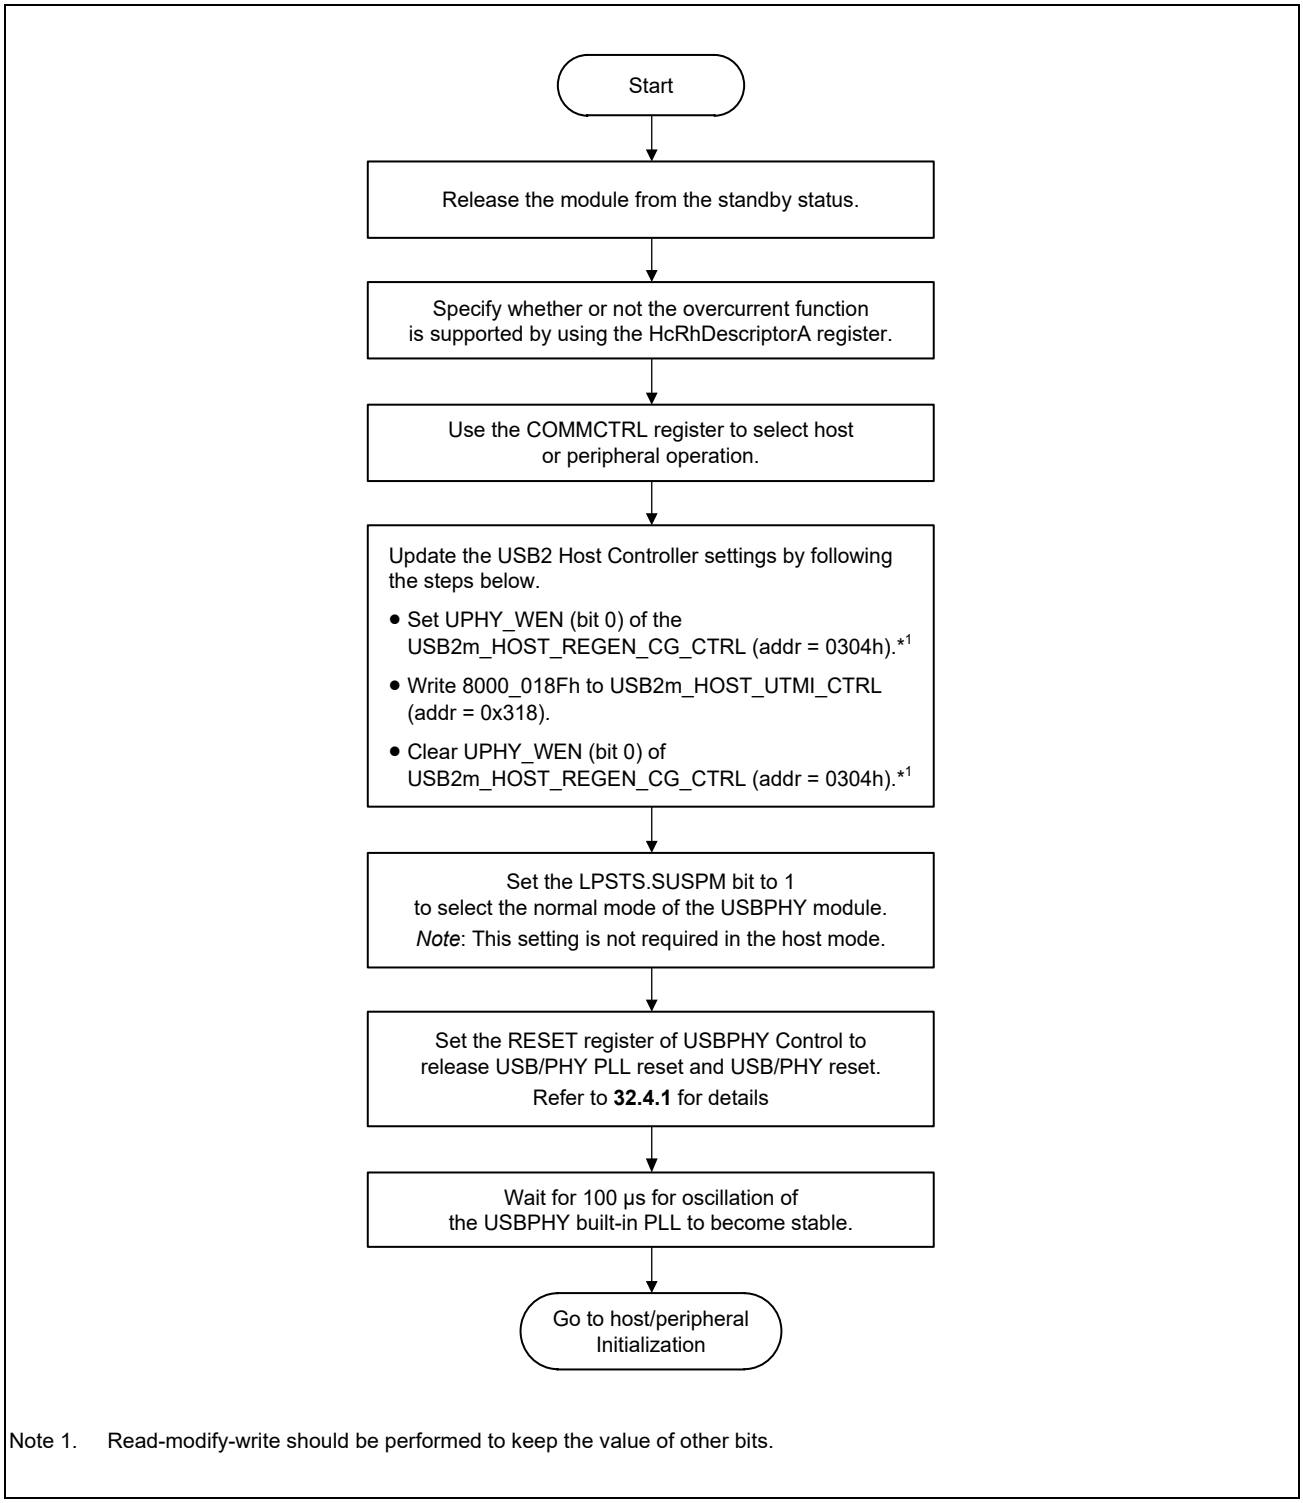


Figure 6.5-2 Sequence Common to Both Host and Peripheral Modes

6.5.2.9.2 Initialization Sequence

The following shows the initialization sequence in the Host mode

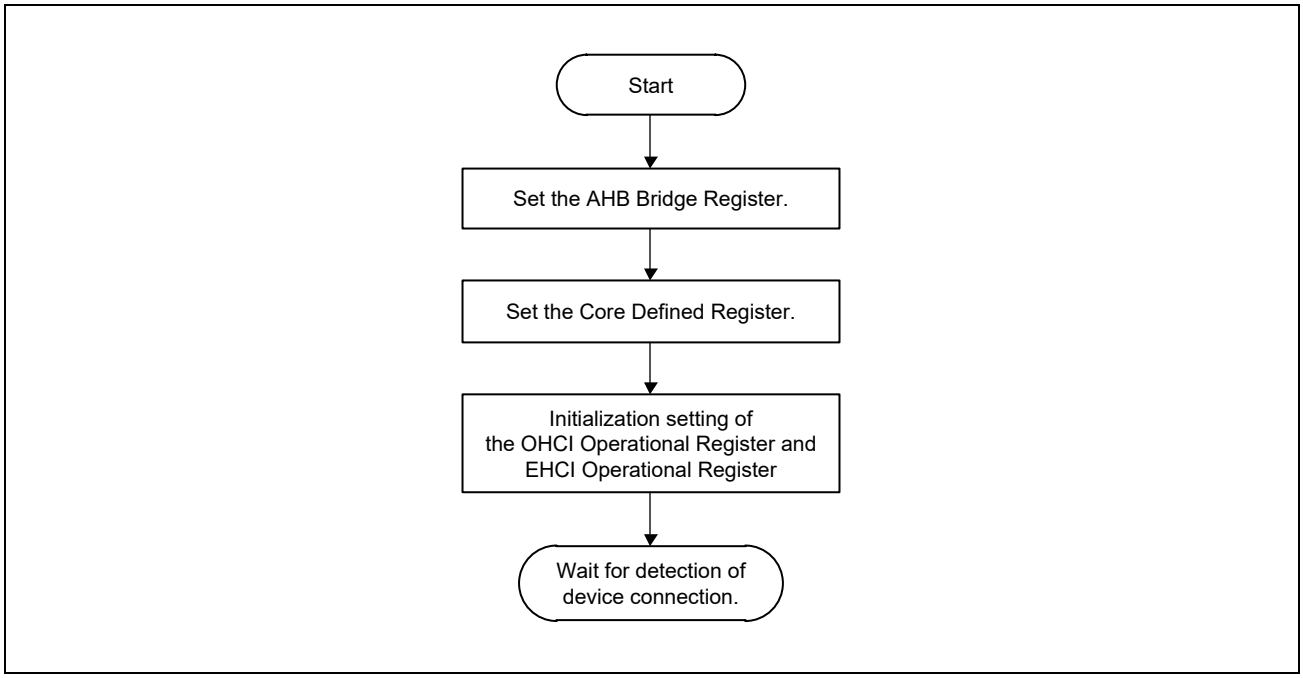

Figure 6.5-3 Initialization Sequence

6.5.2.9.3 Flow of Error Handling

While operating this module, if the operation falls into an abnormal state and recovery to the normal flow seems difficult, perform the following steps for reset.

[When an abnormality occurs while EHCI is running]

1. Write 1b to the HCRESET bit (bit 1) of the EHCI Operational Register USBCMD Register (offset: 120h) to execute EHCI software reset.
2. Re-initialize the EHCI Operational Register.

[When an abnormality occurs while OHCI is running]

1. Write 1b to the HCR bit (bit 0) of the OHCI Operational Register HcCommandStatus Register (offset: 008h) to execute OHCI software reset.
2. Re-initialize the OHCI Operational Register.

6.5.3 USB2.0 Function Controller

6.5.3.1 Overview

This LSI has two channels of USB 2.0 host/function module. Switching between the host and peripheral functions for each channel is possible by setting the UCOM register.

The setting for battery charging is handled by the host controller even if the peripheral controller is selected.

This section describes the peripheral controller. For details on the host/peripheral common circuit and battery charging, see **6.5.2 USB2.0 Host Controller**.

This module is a universal serial bus (USB) controller that has peripheral functions.

This module supports high-speed and full-speed transfer defined by the Universal Serial Bus Specification Revision 2.0.

This module supports all transfer types defined in the USB Specification. This module incorporates 8 Kbytes of buffer memory for data transfer, and can use a maximum of 10 pipes. You can assign any endpoint number to any pipe other than pipe 0 in conformity to the peripheral equipment or system to communicate with.

6.5.3.1.1 Features

Peripheral controller supporting high-speed USB

- On-chip peripheral USB controller

Support of all types of USB transfer

- Supporting all types of USB transfer, including isochronous transfer
- Control transfer
- Bulk transfer
- Interrupt transfer (high-bandwidth transfers not supported)
- Isochronous transfer (high-bandwidth transfers not supported)

Bus interface

- Includes a two-channel DMA interface

Pipe configuration

- 8 Kbytes of buffer memory for USB communications for each channel
- Up to 10 pipes (including the default control pipe) selectable for each channel
- Programmable pipe configuration
- Any endpoint number assignable to pipes other than pipe 0

Table 6.5-9 Pipe Settings

PIPE	Transfer Type	Double Buffer	Continuous Transfer Mode	Buffer Size
PIPE0	Control	—	—	Fixed to 64 bytes/ 256 bytes (CNTMD = 1)
PIPE1	Iso/Bulk	✓	✓ (Bulk only)	Up to 2 Kbytes
PIPE2	Iso/Bulk	✓	✓ (Bulk only)	Up to 2 Kbytes
PIPE3	Bulk	✓	✓	Up to 2 Kbytes
PIPE4	Bulk	✓	✓	Up to 2 Kbytes
PIPE5	Bulk	✓	✓	Up to 2 Kbytes
PIPE6	Int	—	—	Fixed to 64 bytes
PIPE7	Int	—	—	Fixed to 64 bytes
PIPE8	Int	—	—	Fixed to 64 bytes
PIPE9	Int	—	—	Fixed to 64 bytes

Features of peripheral functions

- Support of high-speed transfer (at 480 Mbps) and full-speed transfer (at 12 Mbps)
- Automatic recognition of high-speed or full-speed operation based on automatic response to the reset handshake
- Control transfer stage monitoring function
- Device state monitoring function
- Automatic response to SET_ADDRESS request
- NAK response interrupt (NRDY)
- SOF interpolation

Features of DMA transfer

- DMA transaction mode:
  Fetching in both register and link modes are supported.
- Interrupt:
  Level is supported.
- Transfer size:
  A transfer size from 1 to 128 bytes can be selected separately for the transfer source and transfer destination.
- Skip (scatter/gather) function:
  The access size and skip size can be specified separately for the transfer source and destination.
- Suspend function:
  A running DMA transaction can be suspended temporarily.
- Interval function:
  The interval of DMA transfers can be specified to control the bus occupancy.

Other functions

- Byte endian swap function to support both big endian and little endian as data formats (when using only CFIFO)
- Transfer ending function using a transaction counter
- SOF pulse output function
- BRDY interrupt event notification timing change function (BFRE)
- Function (SHTNAK) to set NAK in the response PID when transfer ends
- Support of the Link Power Management (LPM) ECN, making available a new low-power-consumption state (L1 state)

6.5.3.1.2 Overview of functions

(1) Automatic recognition of USB transfer speed

This module automatically recognizes USB transfer speed.

(a) Methods of FIFO buffer memory access

This module supports the two types of access described below to the FIFO buffer memory for USB data transfer.

a-1) Access from the CPU

Specify a FIFO port address, and then write data to or read data from the FIFO buffer memory.

a-2) Direct memory access (DMA)

Selecting a pipe window and setting the DMA control registers enables writing data to or reading data from the FIFO buffer memory.

(2) USB event

This module notifies the event in USB operation by issuing an interrupt.

You can specify whether to enable notification by interrupt for individual interrupt types and sources through software settings.

(3) USB data transfer

This module performs all types of USB data transfer: control transfer, bulk transfer, interrupt transfer, and isochronous transfer. The following pipe resources are available for individual transfer types:

a) One pipe dedicated to control transfer

b) Four pipes dedicated to interrupt transfer

c) Three pipes dedicated to bulk transfer

d) Two pipes selectively used for bulk or isochronous transfer

For each pipe, specify the settings, including transfer type, endpoint number, and maximum packet size, required for USB transfer according to the system.

This module can incorporate up to 8 Kbytes of buffer memory. For the pipes dedicated to bulk transfer and those selectively used for bulk transfer or isochronous transfer, allocate buffer memory and specify a buffer operating mode and other necessary settings according to the system. Setting the buffer operating mode enables high-speed data transfers with fewer interrupts to be performed by using double-buffering and continuous transfer of data packets.

(4) SOF pulse output function

This module has a function to output an SOF pulse to indicate the timing of SOF packet transmission. This module asserts a SOF pulse output signal when an SOF packet is received. This module outputs pulses at regular intervals based on an SOF interpolation timer even when an SOF packet is damaged.

6.5.3.1.3 Restrictions and notes

(1) Restrictions

(a) Restrictions on the USB specifications

There is no support for the following USB 2.0 specification.

- High-bandwidth transfer is not supported.

(b) Restrictions on DMA master

- DAD = 1 (destination address fixed) and skip transfer cannot be used on the destination side. When forwarding by such setting, movement is unsettled. Such transmission should not be done.
- SAD = 1 (source address fixed), and skip transfer cannot be used on the source side. When forwarding by such setting, movement is unsettled. Such transmission should not be done.
- DAD = 1 (destination address fixed), and beat-unaligned transfer cannot be used on the destination side. When forwarding by such setting, movement is unsettled. Such transmission should not be done.
- SAD = 1 (source address fixed), and beat-unaligned transfer cannot be used on the source side. When forwarding by such setting, movement is unsettled. Such transmission should not be done.
- When REQD =1, SBE = 1 (sweep mode) and compulsion discharge function cannot be used.

(2) Notes

(a) DMA transfer and avoiding problem with interrupt signal in DMA Master configuration

a-1) Overview

A USBFDMAmn interrupt (m, n = 0, 1) might occur before the last data of DMA transaction is written to the write-target device.

a-2) Workaround

A workaround for the above problem is described below.

HPROT is set as non bufferable.

According to the DMA mode, set 0 in the DPR[2] bit in the CHEXT_n register or the LDPR[2] bit in the DCTRL register, set the HPROT signal as non bufferable, and then perform the DMA transaction.

If all transfers are set to non bufferable, transfer efficiency might fall.

In such cases, set the most part of transaction as bufferable and perform a transfer, and then perform the last transfer by setting a register set or descriptor as non bufferable.

(b) Setting for battery charging when the peripheral controller is selected

The setting for battery charging is handled by the host controller even if the peripheral controller is selected.

6.5.3.2 Function Controller Registers

Table 6.5-10 Register Base Addresses

Unit Name	Base Address Name	Base Address
USB20	<USB20_func_base>	0_1582_0000h (5582_0000h*1, 4582_0000h*2)

Note 1. CM33 Address Space Non-Secure

Note 2. CM33 Address Space Secure

The prefix (USB20_FUNC_) of the register names is omitted in the register descriptions and the field descriptions in this section.

Remark USB21 does not have the function controller.

6.5.3.2.1 How to read the register table

(1) Bit number:

(2) State after reset: Initial state of the register that occurs immediately after a reset “Power on Reset” indicates the initial state at power-on reset.
The state after USB reset is the initial state of the register that occurs when this module detects a USB bus reset.
Significant points regarding reset operation are indicated in notes.
“—” indicates that a user’s setting is retained without this module operation having been performed. “X” indicates that the value is undefined.

(3) Access condition: The condition to be met when this module accesses the register for an operation.

R: Reading only
W: Writing only
RW: Reading or writing
R(0): 0-reading only
W(1): 1-writing only

(4) Name: Bit symbol and bit name

(5) Function: Description of functions.

<Example of description>

(1) Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	A bit	B bit	C bit	—	—	—	—	—	—	—	—	—	—	—	—
(2) Initial Value	X	0	0	0												
R/W	X	0	—	—												

Bit	Bit Name	Initial Value	R/W	Description
15	—			Nothing is assigned. Fix this bit to 0b.
14	A bit		RW	AAA enable 0: Disables operation 1: Enables operation
13	B bit		R	BBB operation 0: Outputs low-level signal 1: Outputs high-level signal
12	C bit		R(0)/ W(1)	CCC control 0: ..... 1: .....
	(4)		(3)	(5)

6.5.3.2.2 List of Registers

Register Name	Abbreviation	Initial Value	Offset Address	Access Size [bits]
System Configuration Control Register 0	USB20_FUNC_SYSCFG0	0020h	0000h	16

6.5.3.2.3 System Configuration Control Registers

(1) System Configuration Control Register 0 (USB20_FUNC_SYSCFG0)

Access Size : 16 bits
Address : <USB20_func_base> + 0000h
Initial Value : 0020h

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	CNEN	HSE	-	DRPD	DPRPU	-	-	-	USBE
Initial Value	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
R/W	R	R	R	R	R	R	R	RW	RW	R	RW	RW	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
15 to 9	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
8	CNEN	0h	RW	This bit prohibits or enables single-ended receiver operation. 0b: Single-ended receiver operation prohibited 1b: Single-ended receiver operation enabled
7	HSE	0h	RW	This bit prohibits or enables High-Speed operation. 0b: High-Speed operation prohibited (Full-Speed) 1b: High-Speed operation enable (The controller detects the communication speed.)
6	-	0h	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
5	DRPD	1h	RW	D+/D- line resistor control Set this bit to 0 to use this module. For details, see **Table 6.5-11 Control of USB Data Bus Resistors**.
4	DPRPU	0h	RW	D+ line resistor control This bit prohibits or enables D+ line pull-up for the peripheral controller function. For details, see **Table 6.5-11 Control of USB Data Bus Resistors**. 0b: Pull Up prohibited 1b: Pull Up enabled
3 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
0	USBE	0h	RW	USB block operation prohibited This bit prohibits or enables USB block operation. 0b: USB block operation prohibited 1b: USB block operation enabled

Note 1. Data can be written to and read from this register even while the UTMI+PHY clock is stopped. However, if a value is set while the UTMI+PHY clock is stopped, the corresponding function is enabled after the UTMI+PHY clock starts oscillating.

(a) Single-ended receiver operation enable (CNEN) bit

Setting this bit enables the single-ended receiver to operate. This bit is intended to prevent damage by inrush current that can be caused when the single-ended receiver in unattached status goes floating. This bit also allows the LNST bit to be referenced.

Set this bit when VBUS is detected as the result of a VBUS interrupt. Clear this bit when VBUS is removed.

(b) High-speed operation enable (HSE) bit

Setting this bit enables the high-speed operation. When this bit is 1, this module performs a high-speed or full-speed operation according to the result of reset handshake.

- When the HSE bit is 0, this module performs a full-speed operation.
- When the HSE bit is 1, this module executes the reset handshake protocol, and then automatically performs a high-speed or full-speed operation according to the result of reset handshake.

Rewriting the value of this bit must be done when the DPRPU bit is 0.

(c) D+/D- line resistor control (DRPD or DPRPU) bit

Table 6.5-11 shows available settings of the resistors for the USB data bus. Use the DPRPU bit to select the USB data bus resistors.

Table 6.5-11 Control of USB Data Bus Resistors

Setting		Control of USB Data Bus Resistors		
DRPD	DPRPU	D- Line	D+ Line	Remarks
0	0	Open	Open	
0	1	Open	Pull-Up	Specify the settings as shown in the left.
1	0	Pull-Down	Pull-Down	Initial state (When power on reset is canceled)
1	1	Pull-Down	Pull-Up	Setting prohibited

(d) D+ pull-up resistor control (DPRPU) bit

Setting this bit enables this module to notify the USB host of attaching by pulling up the D+ line voltage to 3.3 V. Clearing this bit enables this module to let the USB host know that the device has been detached by stopping pulling up the D+ line voltage.

(e) USB block operation enable (USBE) bit

This bit enables or disables the operation of the USB block of this module.

When this bit is changed from 1 to 0, this module initializes the bits shown in **Table 6.5-12**.

Table 6.5-12 Register Bits That Are Initialized by Writing 0 to the USBE Bit

Register Name	Bit Name
SYSSTS0	LNST
DVSTCTR0	RHST
INTSTS0	DVSQ
USBADDR	USBADDR
USBREQ	bRequest bmRequestType
USBVAL	wValue
USBINDX	wIndex
USBLENG	wLength

Note: Changing the value of this bit must be done when the SUSPENDM bit is 1 and after the oscillation of UTMI+PHY clock starts.

(2) System Configuration Control Register 1 (USB20_FUNC_SYSCFG1)

Access Size : 16 bits
Address : <USB20_func_base> + 0002h
Initial Value : 0F0Fh

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	BWAIT[5:0]					
Initial Value	0	0	0	0	1	1	1	1	0	0	0	0	1	1	1	1
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
R/W	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
15 to 12	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
11 to 8	-	Fh	R	Reserved Whenever it is read, 1b is read. The write value should always be 1b.
7, 6	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
5 to 0	BWAIT[5:0]	Fh	RW	CPU bus access wait specification These bits specify the number of wait cycles for the access to this module. 00_0000b: 0 wait cycles (2 access cycles) : 00_0010b: 2 wait cycles (4 access cycles) : 00_0100b: 4 wait cycles (6 access cycles) : 00_1111b: 15 wait cycles (17 access cycles) (default) : 11_1111b: 63 wait cycles (65 access cycles)

(a) CPU bus access wait specification (BWAIT) bits

These bits specify the wait cycles for the access to the HPB.

The following restriction is placed on the cycle of the access to the registers at address 04h or after of this module:
Restriction on wait cycle: The cycle of continuous accesses to registers of this module must be at least 67 ns.

To comply with this restriction, you must control the number of wait cycles with the internal bus clock (P1ϕ) frequency.

The default of wait cycles is 17 clock cycles (maximum limit). Select an optimum setting.

This setting is also applied to accesses to FIFO port registers. The maximum speeds of accesses to FIFO ports are as follows:

MBW = 10 (32-bit access width): Max 60 Mbytes/sec
MBW = 01 (16-bit access width): Max 30 Mbytes/sec
MBW = 00 (8-bit access width): Max 15 Mbytes/sec

6.5.3.2.4 System Configuration Status

(1) System Configuration Status Register (USB20_FUNC_SYSSTS0)

Access Size : 16 bits
Address : <USB20_func_base> + 0004h
Initial Value : 0000h

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	LNST[1:0]	
Initial Value	-	-	0	0	0	0	0	0	0	0	0	0	0	–	0	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 2	-	See above	R	Reserved Whenever it is read, 0b or "-" is read. The written value will be ignored.
1, 0	LNST[1:0]	0h	R	USB Line status monitor The USB line status is displayed. Note: See the detailed description.

(a) Line status monitor (LNST) bits

Table 6.5-13 shows the line status of the USB data bus of this module. This module monitors the line status (status of the D+ and D- lines) of the USB data bus in the LNST bits of the SYSSTS0 register.

Referencing the LNST bits must be done only after the USBE bit is set and attaching is performed (the DPRPU bit is set).

Table 6.5-13 Line Status of USB Data Bus

LNST [1]	LNST [0]	Full-Speed operation	High-Speed operation	Chirp operation
0	0	SE0	Squelch	Squelch
0	1	J State	Unsquelch	Chirp J
1	0	K State	Invalid	Chirp K
1	1	SE1	Invalid	Invalid

Note: Chirp: State in which high-speed operation is enabled (HSE = 1) and the reset handshake protocol is being executed
Squelch: SE0 or idle state
Unsquelch: High-speed J or high-speed K state
Chirp J: Chirp J State
Chirp K: Chirp K State

6.5.3.2.5 USB Signal Control Registers

(1) Device State Control Register 0 (USB20_FUNC_DVSTCTR0)

Access Size : 16 bits
Address : <USB20_func_base> + 0008h
Initial Value : 0000h

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	WKUP	-	-	-	-	-	RHST[2:0]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	-	-	-	-	-	-	-	0	-	-	-	-	-	-	-	-
R/W	RW	R	R	R	R	R	R	RW1	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15	-	0	RW	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
14 to 9	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
8	WKUP	0h	RW1	Remote wakeup output This bit prohibits or enables Remote wakeup (resume signal output). 0b: Remote wakeup signal is not output. 1b: Remote wakeup signal is output.
7 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
2 to 0	RHST[2:0]	0h	R	Reset handshake This bit indicates the reset handshake status. Note: See the detailed description.

(a) Remote wakeup (resume signal output) enable (WKUP) bit

When this bit is set, this module outputs the remote wakeup signal to the USB.

This module manages the time of remote wakeup signal output. When the WKUP bit is set, this module outputs the K state for 10 ms, and then clears the WKUP bit.

The USB Specification requires the USB idle state to be retained for at least 5 ms before the remote wakeup signal is sent. Therefore, even if the WKUP bit is set immediately after the suspended state is detected, this module waits for 2 ms, and then outputs the K state.

Writing 1 to the WKUP bit must be done only when the device is in the suspended state (DVSQ = 1xx) and remote wakeup is allowed by the USB host.

When setting the WKUP bit, do not stop the internal clock even if the device is in the suspended state. (Write 1 to the WKUP bit when the SUSPM bit is 1.)

When the WKUP bit is set at a transition to the L1 state, this module outputs the K state for 50 µs, and then clears the WKUP bit. In the L1 state, setting the WKUP bit must be done only when the DVSQ[4] bit is 1.

(b) Reset handshake status (RHST) bits

This module outputs the result of reset handshake to this bit. **Table 6.5-14** lists the results of reset handshake.

Table 6.5-14 Reset Handshake Status

Bus State	Value of RHST Bit
Powered or disconnected state	000
Reset handshake in process	100
Full-speed connection	010
High-speed connection	011

If the HSE bit is 1, the RHST bits indicate 100 when this module detects a USB bus reset. Then, after this module has output Chirp K, these bits indicate 011 when this module detects Chirp JK from the USB host three times. If the status is not fixed to High-Speed within 2.5 ms after Chirp K is output, these bits indicate 010.

If the HSE bit is 0, the RHST bits indicate 010 when this module detects a bus reset.

After this module has detected a USB reset, a DVST interrupt occurs when the value of the RHST bits is fixed to 010 or 011.

6.5.3.2.6 Test Mode Register

(1) USB Test Mode Register (USB20_FUNC_TESTMODE)

Access Size : 16 bits
Address : <USB20_func_base> + 000Ch
Initial Value : 0100h

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	UTST[3:0]			
Initial Value	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
R/W	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
15 to 4	-	10h	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
3 to 0	UTST[3:0]	0h	RW	Test mode See the detailed description.

(a) Test mode (UTST) bits

When a value is written to these bits, this module outputs a USB test signal during high-speed operation.

Table 6.5-15 lists the test modes of this module.

Table 6.5-15 List of test mode operation

Test mode	Value of UTST Bits
Normal operation	0000
Test_J	0001
Test_K	0010
Test_SE0_NAK	0011
Test_Packet	0100
Test_Force_Enable	—
Reserved	0101 to 0111

Write a value to these bits according to the SetFeature request sent from the USB host during high-speed communication. When these bits contain a value from 0001 to 0100, this module does not enter the suspended state.

To perform a normal USB communication after setting a test mode, perform power on reset.

6.5.3.2.7 FIFO Port Registers

(1) CFIFO Port Register (USB20_FUNC_CFIFO)

Access Size : 32/16/8 bits
Address : <USB20_func_base> + 0014h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	FIFOPORT[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	FIFOPORT[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	FIFOPORT [31:0]	0h	RW	FIFO port These bits are accessed to read received data from the FIFO buffer or to write send data to the FIFO buffer.

(a) FIFO port control bits (for FIFOPORT)

The send/receive buffer memory of this module has a FIFO structure (FIFO buffer). Use FIFO port registers to access the FIFO buffer. The FIFO port consists of the port register (CFIFO) to read data from and write data to the FIFO buffer, the register (CFIFOSEL) to select the pipe to be allocated to the FIFO port, and the control register (CFIFOCTR).

Individual FIFO ports have the following features:

- The CFIFO port must be used to access the FIFO buffer through the DCP.
- When functions specific to FIFO ports are used, the pipe number (selected pipe) specified in the CURPIPE bits cannot be changed.
- The registers configured for a FIFO port do not affect any other FIFO ports.
- The FIFO buffer memory can be accessed by either the CPU or SIE. Access by the CPU is not possible while the SIE has the right of access to the FIFO buffer memory.

FIFO port bits (CFIFO)

When one of these registers is accessed, this module accesses the FIFO buffer allocated to the pipe number specified in the CURPIPE bits in the corresponding pipe select register (CFIFOSEL).

These registers can be accessed only when the FRDY bit of the respective control registers (CFIFOCTR) is 1 (or when the UCL_Dx_DREQ output is asserted by this module).

The valid bits of these registers vary depending on the values of the NBW and BIGEND bits. The valid bits are shown in **Table 6.5-16** to **Table 6.5-18**.

Table 6.5-16 Endian Operation in 32-Bit Access (When MBW = 10)

BIGEND	b31 to b24	b23 to b16	b15 to b8	b7 to b0
0	N + 3 address	N + 2 address	N + 1 address	N + 0 address
1	N + 0 address	N + 1 address	N + 2 address	N + 3 address

Table 6.5-17 Endian Operation in 16-Bit Access (When MBW = 01)

BIGEND	b31 to b24	b23 to b16	b15 to b8	b7 to b0
0	Writing: invalid Reading: prohibited*1		even-numbered address	odd-numbered address
1	even-numbered address	odd-numbered address	Writing: invalid Reading: prohibited*1	

Table 6.5-18 Endian Operation in 8-Bit Access (When MBW = 00)

BIGEND	b31 to b24	b23 to b16	b15 to b8	b7 to b0
0	Writing: invalid Reading: prohibited*1			Writing: valid Reading: valid
1	Writing: valid Reading: valid	Writing: invalid Reading: prohibited*1		

Note 1. Reading words or bytes from an invalid register is prohibited.

(2) CFIFO Port Select Register (USB20_FUNC_CFIFOSEL)

Access Size : 16 bits
Address : <USB20_func_base> + 0020h
Initial Value : 0000h

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RCNT	REW	-	-	MBW[1:0]		-	BIGEND	-	-	ISEL	-	CURPIPE[3:0]			
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
R/W	RW	R0W	R	R	RW	RW	R	RW	R	R	RW	R	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
15	RCNT	0h	RW	Read count mode This bit specifies DTLN read mode for the CFIFOCTR register. 0b: Clears the DTLN bits when all received data is read. 1b: Decrements the value of the DTLN bits each time received data is read.
14	REW	0h	R0W	The read value is always 0b. Buffer pointer rewind Set this bit to 1b to rewind the buffer pointer. 0b: Does not rewind the buffer pointer. 1b: Rewinds the buffer pointer.
13, 12	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
11, 10	MBW[1:0]	0h	RW	CFIFO port access bit width This bit specifies the bit width for access to the CFIFO port. 00b: 8-bit width 01b: 16-bit width 10b: 32-bit width 11b: Setting prohibited
9	-	0h	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
8	BIGEND	0h	RW	FIFO port byte endian control This bit specifies the byte endian of the CFIFO port. 0b: Little endian 1b: Big endian
7, 6	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
5	ISEL	0h	RW	FIFO port access direction with DCP selected This bit specifies the FIFO port access direction when DCP is selected for the CURPIPE bits. 0b: Selects reading of buffer memory. 1b: Selects writing of buffer memory.
4	-	0h	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
3 to 0	CURPIPE[3:0]	0h	RW	FIFO port access pipe specification This bit specifies the pipe number used for accessing the CFIFO port. 0000b: DCP 0001b: PIPE1 0010b: PIPE2 ↓ 1000b: PIPE8 1001b: PIPE9 ↓ 1110b: PIPE14 1111b: PIPE15

(a) Read count mode (RCNT) bit

When this bit is 0, this module clears the DTLN bits in the CFIFOCTR register when all received data has been read from the FIFO buffer allocated to the pipe (selected pipe) specified in the CURPIPE bits (or, in the case of double-buffer configuration, when all relieved data has been read from one buffer).

With this bit is 1, this module decrements the value of the DTLN bits in the CFIFOCTR register each time received data is read from the FIFO buffer allocated to the specified pipe.

(b) Buffer pointer rewind (REW) bit

When this bit is set during data reading from the FIFO buffer while the selected pipe is in the receiving direction, reading can be restarted from the first data in the FIFO buffer (or, in the case of a double-buffer configuration, rereading can be started from the first data in the FIFO buffer being read).

Do not set this bit at the same time as changing the value of the CURPIPE bits. Before setting this bit, always check that the FRDY bit is 1.

If you want to redo writing to the FIFO buffer from the first data in the FIFO buffer when the selected PIPE is in the sending direction, use the BCLR bit.

(c) CFIFO port access bit width (MBW) bits

These bits are used to specify the bit width for the access to the CFIFO port.

If you start reading after setting a value in these bits when the pipe specified in the CURPIPE bits is in the receiving direction, do not change the value of these bits until data is all read.

Also, to set a value in these bits when the pipe specified in the CURPIPE bits is in the receiving direction, temporarily change the original value of the CURPIPE bits to a different value, and then set the values of the CURPIPE and MBW bits at the same time.

For how to change the value of the CURPIPE bits, see the description of the CURPIPE bits.

When the pipe specified in the CURPIPE bits is in the sending direction, you cannot change the bit width from 8 bits to 16 bits or 32 bits or from 16 bits to 32 bits while writing to the buffer memory is in process.

Even with the 16-bit width or 32-bit width setting, you can write data also to odd bytes by using byte access control.

(d) FIFO port byte endian control (BIGEND) bit

This bit is used to specify the byte endian of the CFIFO port.

For details see **(a) FIFO port control bits (for FIFOPORT)**.

(e) FIFO port access direction with DCP selected (ISEL) bit

To change the value of this bit when the specified pipe is DCP, write a value to this bit, read the bit, and then check that the written value is the same as the read value before proceeding to the next processing.

If the value of the bit is changed in the middle of an access to the FIFO buffer, the access is held. Therefore, the same access can be resumed after these bits are restored to the original value.

Set this bit simultaneously with setting of the CURPIPE bits.

(f) FIFO port access pipe specification (CURPIPE) bits

These bits are used to specify the pipe number of the pipe through which to read or write data via the CFIFO port.

If you change the value of these bits, write a desired value to these bits, read these bits, and then check that the written value is the same as the read value before proceeding to the next processing.

If the value of these bits is changed in the middle of an access to the FIFO buffer, the access is held. Therefore, the same access can be resumed after these bits are restored to the original value.

(3) DnFIFO Port Select Register (USB20_FUNC_DnFIFOSEL) (n = 0, 1)

Access Size : 16 bits
Address : <USB20_func_base> + 0028h + n x 0004h
Initial Value : 0000h

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RCNT	REW	DCLRM	DREQE	MBW[1:0]		-	-	-	-	-	-	CURPIPE[3:0]			
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
R/W	RW	R0W	RW	RW	RW	RW	R	R	R	R	R	R	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
15	RCNT	0h	RW	Read count mode This bit specifies Dx_FIFOCTR DTLN read mode. 0b: Clears the DTLN bits when all received data is read. 1b: Decrements the value of the DTLN bits each time received data is read.
14	REW	0h	R0W	The read value is always 0b. Buffer pointer rewind Set this bit to 1b to rewind the buffer pointer. 0b: Does not rewind the buffer pointer. 1b: Rewinds the buffer pointer.
13	DCLRM	0h	RW	Automatic buffer memory clear mode after reading data through the specified pipe This bit prohibits or enables automatic buffer memory clear after data is read through the specified pipe. 0b: Automatic FIFO buffer clear prohibited 1b: Automatic FIFO buffer clear enabled
12	DREQE	0h	RW	UCL_Dx_DREQ output enable This bit prohibits or enables the output of the UCL_Dx_DREQ signal. 0b: Output prohibited 1b: Output enabled
11, 10	MBW[1:0]	0h	RW	DxFIFO port access bit width This bit specifies the bit width for access to the DxFIFO port. 00b: 8-bit width 01b: 16-bit width 10b: 32-bit width 11b: Setting prohibited
9 to 4	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
3 to 0	CURPIPE[3:0]	0h	RW	FIFO port access pipe specification 0000b: No specification 0001b: PIPE1 0010b: PIPE2 ↓ 1000b: PIPE8 1001b: PIPE9

(a) Read count mode (RCNT) bit

When this bit is 0, this module clears the DTLN bits in the DxFIFOCTR register when all received data has been read from the FIFO buffer allocated to the pipe (selected pipe) specified in the CURPIPE bits (or, in the case of double-buffer configuration, when all relieved data has been read from one buffer).

With this bit is 1, this module decrements the value of the DTLN bits in the DxFIFOCTR register each time received data is read from the FIFO buffer allocated to the specified pipe.

(b) Buffer pointer rewind (REW) bit

When this bit is set during data reading from the FIFO buffer while the selected pipe is in the receiving direction, reading can be restarted from the first data in the FIFO buffer (or, in the case of a double-buffer configuration, rereading can be started from the first data in the FIFO buffer being read).

Do not set this bit at the same time as changing the value of the CURPIPE bits. Before setting this bit, always check that the FRDY bit is 1.

If you want to redo writing to the FIFO buffer from the first data in the FIFO buffer when the selected PIPE is in the sending direction, use the BCLR bit.

(c) Automatic FIFO buffer clear enable (DCLRM) bit

This bit is used to enable or disable the mode to automatically clear the FIFO buffer memory after reading data from the specified pipe. With this bit set, this module performs the “BCLR = 1” processing on the FIFO buffer, if a zero-length packet is received when the FIFO buffer allocated to the specified pipe is empty or if data reading ends because a short packet is received when the BFRE bit is 1.

Always clears this bit when you use this module with the BRDYM bit set.

(d) UCL_Dx_DREQ output enable (DREQE) bit

This bit is used to enable or disable the output of the UCL_Dx_DREQ signal.

When enabling the UCL_Dx_DREQ signal, set this bit always after setting a value in the CURPIPE bits. When changing the value of the CURPIPE bits, change the value always after clearing this bit.

(e) DxFIFO port access bit width (MBW) bits

These bits are used to specify the bit width for the access to the DxFIFO port. For details, see **(c) CFIFO port access bit width (MBW) bits**.

(f) FIFO port access pipe specification (CURPIPE) bits

These bits are used to specify the pipe number through which to read or write data via the DxFIFO port.

If you change the value of these bits, write a desired value to these bits, read these bits, and then check that the written value is the same as the read value before proceeding to the next processing.

Do not specify the same pipe number for the CURPIPE bits in the CFIFOSEL, D0FIFOSEL, and D1FIFOSEL registers. If the value of these bits is changed in the middle of an access to the FIFO buffer, the access is held. Therefore, the same access can be resumed after these bits are restored to the original value.

(4) CFIFO Port Control Register (USB20_FUNC_CFIFOCTR)
D0FIFO Port Control Register (USB20_FUNC_D0FIFOCTR)
D1FIFO Port Control Register (USB20_FUNC_D1FIFOCTR)

Access Size : 16 bits

Address : <USB20_func_base> + 0022h (CFIFO)
<USB20_func_base> + 002Ah (D0FIFO)
<USB20_func_base> + 002Eh (D1FIFO)

Initial Value : 0000h

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	BVAL	BCLR	FRDY	-	DTLN[11:0]											
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
R/W	RW1	R0W1	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15	BVAL	0h	RW1	Buffer memory valid flag Specify 1b for this bit when writing to the FIFO buffer on the CPU side through the pipe specified in CURPIPE (current pipe) ends. 0b: Invalid 1b: Writing complete
14	BCLR	0h	R0W1	The read value is always 0b. CPU buffer clear Specify 1b for this bit to clear the FIFO buffer on the CPU side of the current pipe. 0b: Invalid 1b: CPU buffer memory clear
13	FRDY	0h	R	FIFO port ready This bit indicates whether the FIFO port can be accessed. 0b: The FIFO port cannot be accessed. 1b: The FIFO port can be accessed.
12	-	0h	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
11 to 0	DTLN[11:0]	0h	R	Receive data length These bits indicate the length of receive data.

(a) Buffer memory valid flag (BVAL)

When the pipe (selected pipe) specified in the CURPIPE bits is in the sending direction, this bit must be set in the cases descried below. This module switches the FIFO buffer from the CPU side to the SIE side to enable data sending.

1. To send short packets, set this bit when data writing ends.
2. To send zero length packets, set this bit before writing data to the FIFO buffer.
3. Set this bit after writing, to the pipe in continuous transfer mode, the data of which the size is a positive integral multiple of the maximum packet size and less than the buffer size.

When the maximum packet size of data is written to the pipe in non-continuous transfer mode, this module sets this bit to switch the FIFO buffer from the CPU side to the SIE side and enable data sending.

When this bit and the BCLR bit are set at the same time when the specified pipe is in the sending direction, this module clears the data that has been written so far and enables zero-length packets to be sent.

Setting this bit must be done only when the FRDY bit in the corresponding port control register is 1. If you want to check the value of the FRDY bit after setting this bit, wait at least 80 ns after setting this bit, and then reference the FRDY bit. Do not set this bit when the specified pipe is in the receiving direction.

(b) CPU buffer clear (BCLR) bit

When this bit is set, this module clears the FIFO buffer on the CPU side among the FIFO buffers allocated to the specified pipe.

Even if the two FIFO buffers in a double-buffer configuration are allocated to the specified pipe and the both buffers can be read, this module clears only one of the two buffers.

If this bit is set when the specified pipe is the DCP, this module clears the FIFO buffer regardless of whether the FIFO buffer is on the CPU side or it is on the SIE side. To clear the buffer on the SIE side, set this bit always after setting the PID bits for DCP to “NAK”.

When the specified pipe is other than the DCP, setting this bit must be done only when the FRDY bit in the corresponding port control register is 1. If you want to check the value of the FRDY bit after setting this bit, wait at least 80 ns after setting this bit, and then reference the FRDY bit.

(c) FIFO port ready (FRDY) bit

This bit indicates whether the FIFO port can be accessed from the CPU. This bit is operated by this module.

In the cases described below, even when this module sets this bit, data cannot be read from the FIFO port because the FIFO buffer does not contain data to be read. In these cases, set the BCLR bit to clear the FIFO buffer to enable the next sending and receiving of data.

1. A zero-length packet has been received while the FIFO buffer allocated to the specified pipe is empty.
2. A short packet has been received and data reading has ended while the BFRE bit is 1.

(d) Receive data length (DTLN) bits

These bits indicate the length of receive data. These bits are operated by this module. During reading of the FIFO buffer, the value of these bits varies depending on the value of the RCNT bit as described below.

- When the RCNT bit is 0:
  This module indicates a receive data length by using these bits until the CPU ends reading all received data from one FIFO buffer.
  When the BFRE bit is 1, this module retains the receive data length until the BCLR bit is set even if reading of received data has ended.
- When the RCNT bit is 1:
  This module decrements the value of these bits each time the CPU reads data.
  (The value is decremented by 1 when the MBW bits are 00, by 2 when the MBW bits are 01 or by 4 when the MBW bits are 10.)

When the CPU ends reading from one FIFO buffer, this module clears these bits. If reading of one of the FIFO buffers in a double-buffer configuration, however, ends before reading of received data from the other FIFO buffer ends, these bits indicate the receive data length for the other FIFO buffer at the end of reading from the FIFO buffer of which reading ends earlier.

When these bits are read during reading of the FIFO buffer when the RCNT bit is 1, this module updates the value of these bits within 150 ns after a cycle of read access to the corresponding FIFO port.

6.5.3.2.8 Interrupt Enable Registers

(1) Interrupt Enable Register 0 (USB20_FUNC_INTENB0)

Access Size : 16 bits
Address : <USB20_func_base> + 0030h
Initial Value : 0000h

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	VBSE	RSME	SOFE	DVSE	CTRE	BEMPE	NRDYE	BRDYE	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
R/W	RW	RW	RW	RW	RW	RW	RW	RW	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15	VBSE	0h	RW	VBUS Interrupt Enable This bit prohibits or enables a USB interrupt when a VBINT interrupt is detected. 0b: Interrupt output prohibited 1b: Interrupt output enabled
14	RSME	0h	RW	Resume interrupt enable This bit prohibits or enables a USB interrupt when a RESM interrupt is detected. 0b: Interrupt output prohibited 1b: Interrupt output enabled
13	SOFE	0h	RW	Frame number update interrupt enable This bit prohibits or enables a USB interrupt when a SOF interrupt is detected. 0b: Interrupt output prohibited 1b: Interrupt output enabled
12	DVSE	0h	RW	Device state transition interrupt enable This bit prohibits or enables a USB interrupt when a DVST interrupt is detected. 0b: Interrupt output prohibited 1b: Interrupt output enabled
11	CTRE	0h	RW	Control transfer stage transition interrupt enable This bit prohibits or enables a USB interrupt when a CTRT interrupt is detected. 0b: Interrupt output prohibited 1b: Interrupt output enabled
10	BEMPE	0h	RW	Buffer empty interrupt enable This bit prohibits or enables a USB interrupt when a BEMP interrupt is detected. 0b: Interrupt output prohibited 1b: Interrupt output enabled
9	NRDYE	0h	RW	Buffer not ready response interrupt enable This bit prohibits or enables a USB interrupt when an NRDY interrupt is detected. 0b: Interrupt output prohibited 1b: Interrupt output enabled
8	BRDYE	0h	RW	Buffer ready interrupt enable This bit prohibits or enables a USB interrupt when a BRDY interrupt is detected. 0b: Interrupt output prohibited 1b: Interrupt output enabled
7 to 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.

(2) BRDY Interrupt Enable Register (USB20_FUNC_BRDYENB)

Access Size : 16 bits
Address : <USB20_func_base> + 0036h
Initial Value : 0000h

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	PIPEBRDYE[9:0]									
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
15 to 10	-	All 0	RW	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
9 to 0	PIPEBRDYE [9:0]	0h	RW	Pipe BRDY interrupt enable These bits prohibit or enable the BRDY bit to be set when a BRDY interrupt to a pipe is detected. 0b: Interrupt output prohibited 1b: Interrupt output enabled

(a) Pipe BRDY interrupt enable (PIPEBRDYE) bits

When this module detects a BRDY interrupt to the pipe for which is set 1 in this register, this module sets the corresponding PIPEBRDY bit in the BRDYSTS register, sets the BRDY bit in the INTSTS0 register, and asserts the interrupt.

When at least one of the PIPEBRDY bits in the BRDYSTS register is 1 and software changes the corresponding interrupts enable bit in this register changes from 0 to 1, this module asserts the interrupt.

(3) NRDY Interrupt Enable Register (USB20_FUNC_NRDYENB)

Access Size : 16 bits
Address : <USB20_func_base> + 0038h
Initial Value : 0000h

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	PIPENRDYE[9:0]									
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
15 to 10	-	All 0	RW	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
9 to 0	PIPENRDYE [9:0]	0h	RW	Pipe NRDY interrupt enable These bits prohibit or enable the NRDY bit to be set when a BRDY interrupt to a pipe is detected. 0b: Interrupt output prohibited 1b: Interrupt output enabled

(a) Pipe NRDY interrupt enable (PIPENRDYE) bits

When this module detects a BRDY interrupt to the pipe for which is set 1 in this register, this module sets the corresponding PIPENRDY bit in the NRDYSTS register, sets the NRDY bit in the INTSTS0 register, and asserts the interrupt.

When at least one of the PIPENRDY bits in the NRDYSTS register is 1 and the corresponding interrupts enable bit in this register changes from 0 to 1, this module asserts the interrupt.

(4) BEMP Interrupt Enable Register (USB20_FUNC_BEMPENB)

Access Size : 16 bits
Address : <USB20_func_base> + 003Ah
Initial Value : 0000h

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	PIPEBEMPE[9:0]									
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
15 to 10	-	All 0	RW	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
9 to 0	PIPEBEMPE [9:0]	0h	RW	Pipe BEMP interrupt enable These bits prohibit or enable the BEMP bit to be set when a BRDY interrupt to a pipe is detected 0b: Interrupt output prohibited 1b: Interrupt output enabled

Note: Bit numbers correspond to pipe numbers.

(a) Pipe BEMP interrupt enable (PIPEBEMPE) bits

When this module detects a BEMP interrupt to the pipe for which is set 1 in this register, this module sets the corresponding PIPEBEMP bit in the BEMPSTS register, sets the BEMP bit in the INTSTS0 register, and asserts the interrupt.

When at least one of the PIPEBEMP bits in the BEMPSTS register is 1 and the corresponding interrupts enable bit in this register changes from 0 to 1, this module asserts the interrupt.

6.5.3.2.9 SOF Control Register

(1) SOF Pin Configuration Register (USB20_FUNC_SOFCFG)

Access Size : 16 bits
Address : <USB20_func_base> + 003Ch
Initial Value : 0000h

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	BRDYM	-	-	SOFM[1:0]		-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
R/W	R	R	R	R	R	R	R	R	R	RW	R	R	RW	RW	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 7	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
6	BRDYM	0h	RW	PIPEBRDY interrupt status clear timing This bit specifies the timing at which the PIPEBRDY interrupt is to be cleared. 0b: Software clears the status. 1b: Hardware clears the status by reading from or writing to the FIFO buffer. This bit can be set only during initialization (before communication). The setting cannot be changed after communication.
5, 4	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
3, 2	SOFM[1:0]	0h	RW	SOF function setting These bits are used to select SOF pulse output mode. 00b: SOF output disabled 01b: SOF output in units of 1 ms 10b: µSOF output in units of 125 µs 11b: Reserved
1, 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.

6.5.3.2.10 Interrupt Status

(1) Interrupt Status Register 0 (USB20_FUNC_INTSTS0)

Access Size : 16 bits
Address : <USB20_func_base> + 0040h
Initial Value : 00x0h

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	VBINT	RESM	SOFR	DVST	CTRT	BEMP	NRDY	BRDY	VBSTS	DVSQ[2:0]			VALID	CTSQ[2:0]		
Initial Value	0	0	0	0	0	0	0	0	x	0	0	0	0	0	0	0
	-	-	-	1	-	-	-	-	-	0	0	1	-	-	-	-
R/W	RW0	RW0	RW0	RW0	RW0	R	R	R	R	R	R	R	RW0	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15	VBINT	0h	RW0	Change detection interrupt status This bit indicates the VBUS change detection interrupt status. 0b: No VBUS interrupt is generated. 1b: A VBUS interrupt is generated.
14	RESM	0h	RW0	Resume interrupt status This bit indicates the resume detection interrupt status. 0b: No resume interrupt is generated. 1b: A resume interrupt is generated.
13	SOFR	0h	RW0	Frame number update interrupt status This bit indicates the frame number update interrupt status. 0b: No SOF interrupt is generated. 1b: A SOF interrupt is generated.
12	DVST	0h/1h	RW0	Device state transition interrupt status This bit indicates the device state transition interrupt. 0b: No device state transition interrupt is generated. 1b: A device state transition interrupt is generated.
11	CTRT	0h	RW0	Control transfer stage transition interrupt status This bit indicates the status of a control transfer stage transition interrupt. 0b: No control transfer stage transition interrupt is generated. 1b: A control transfer stage transition interrupt is generated.
10	BEMP	0h	R	BEMP interrupt status This bit indicates the BEMP interrupt status. 0b: No BEMP interrupt is generated. 1b: A BEMP interrupt is generated.
9	NRDY	0h	R	NRDY interrupt status This bit indicates the NRDY interrupt status. 0b: No NRDY interrupt is generated. 1b: An NRDY interrupt is generated.
8	BRDY	0h	R	BRDY interrupt status This bit indicates the BRDY interrupt status. 0b: No BRDY interrupt is generated. 1b: A BRDY interrupt is generated.
7	VBSTS	x	R	VBUS input status This bit indicates the VBUS pin input status. 0b: The VBUS pin is at the low level. 1b: The VBUS pin is at the high level.
6 to 4	DVSQ[2:0]	0h/1h	R	Device state These bits indicate the device state. 000b: Powered state 001b: Default state 010b: Address state 011b: Configured state 1xxb: Suspended state
3	VALID	0h	RW0	USB request reception This bit indicates whether USB request reception is detected. 0b: Not detected 1b: A setup packet is received.

Bit	Bit Name	Initial Value	R/W	Description
2 to 0	CTSQ[2:0]	0h	R	Control transfer stage These bits indicate the control transfer stage. 000b: Idle or setup stage 001b: Control reading data stage 010b: Control reading status stage 011b: Control writing data stage 100b: Control writing status stage 101b: Control writing (No Data) status stage 110b: Control transfer sequence error 111b: Reserved

Note: x: Undefined value

Note: When you want to clear the status indicated by the VBINT, RESM, SOFR, DVST, or CTRT bit, write 0b to only the bit to be cleared and 1b to other bits. Do not write 0b to any status bit that is currently 0b.

Note: This module detects a status change indicated by the VBINT or RESM bit in this register even while the clock is stopped (the SUSPM bit is 0b), and reports an interrupt corresponding to the status bit if the interrupt is enabled. Clearing the interrupt status must be done after the clock enabled.

(a) VBUS change interrupt status (VBINT) bit

This module sets this bit when it detects a change of the level of the VBUS pin input (from the high level to low level, or vice versa). This module indicates the level of the VBUS pin input by the VBSTS bit. When a VBINT interrupt occurs, read the VBSTS bit several times to check for consistency and remove chattering.

(b) Resume interrupt status (RESM) bit

This module sets this bit when it is in the suspended state (DVSQ bits are 1XX) and detects a falling edge of the signal at the DP pin.

(c) Frame number update interrupt status (SOFR) bit

This module sets this bit under the following conditions:

This module sets this bit when the frame number is updated. (The frame number update interrupt is monitored at intervals of 1 ms.)

This module detects an SOFR interrupt based on SOF interpolation even when an SOF packet from the USB host is damaged.

(d) Device state transition interrupt status (DVST) bit

When this module detects a change of the device state, this module updates the value of the DVSQ bits, and sets this bit. When a device state transition interrupt occurs, clear the interrupt status before this module detects the next device state transition.

(e) Control transfer stage transition interrupt status (CTRT) bit

When this module detects a transition of control transfer stage, this module updates the value of the CTSQ bits and sets this bit.

When a control transfer stage transition interrupt occurs, clear the interrupt status before this module detects the next transition of control transfer stage.

(f) Buffer empty interrupt status (BEMP) bit

This module sets this bit when at least one of the PIPEBEMP bits in the BEMPSTS register corresponding to the pipes for which the PIPEBEMPE bit in the BEMPENB register is set (that is, when this module detects a BEMP interrupt to at least one of the pipes for which is enabled BEMP interrupt notification).

For the conditions to assert the PIPEBEMP status signal, see the description of the BEMPSTS register.

This module clears this bit when writes 0 to all the PIPEBEMP bits corresponding to the pipes for which a BEMP interrupt has been enabled by setting the PIPEBEMPE bit.

Cannot clear this bit even by writing 0.

(g) Buffer not-ready interrupt status (NRDY) bit

This module sets this bit when at least one of the PIPENRDY bits in the BNRDYSTS register corresponding to the pipes for which the PIPENRDYE bit in the NRDYENB register is set (that is, when this module detects an NRDY interrupt to at least one of the pipes for which is enabled NRDY interrupt notification).

For the conditions to assert the PIPENRDY status signal, see the description of the NRDYSTS register.

This module clears this bit when writes 0 to all the PIPENRDY bits corresponding to the pipes for which a NRDY interrupt has been enabled by setting the PIPENRDYE bit.

Software cannot clear this bit even by writing 0.

(h) Buffer ready interrupt status (BRDY) bit

This module sets this bit when at least one of the PIPEBRDY bits in the BRDYSTS register corresponding to the pipes for which the PIPEBRDYE bit in the BRDYENB register is set (that is, when this module detects an BRDY interrupt to at least one of the pipes for which is enabled BRDY interrupt notification).

For the conditions to assert the PIPEBRDY status signal, see the description of the BRDYSTS register.

This module clears this bit when writes 0 to all the PIPEBRDY bits corresponding to the pipes for which a BRDY interrupt has been enabled by setting the PIPEBRDYE bit.

Software cannot clear this bit even by writing 0.

(2) BRDY Interrupt Status Register (USB20_FUNC_BRDYSTS)

Access Size : 16 bits
Address : <USB20_func_base> + 0046h
Initial Value : 0000h

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	PIPEBRDY[9:0]									
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
R/W	RW	RW	RW	RW	RW	RW	RW0	RW0	RW0	RW0	RW0	RW0	RW0	RW0	RW0	RW0

Bit	Bit Name	Initial Value	R/W	Description
15 to 10	-	All 0	RW	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
9 to 0	PIPEBRDY [9:0]	0h	RW0	Pipe BRDY interrupt status These bits indicate the BRDY interrupt status of each pipe. 0b: No interrupt is generated. 1b: An interrupt is generated.

Note: Bit numbers correspond to pipe numbers.

Note: To clear the interrupt status indicated by a bit in this register when the BRDYM bit is 0b, write 0b to only the bit to be cleared and 1b to other bits.

Note: When the BRDYM bit is 0b, clearing the BRDY interrupt status must be done always before the next access to the FIFO.

(a) Pipe BRDY interrupt status (PIPEBRDY) bit

When this module detects a BRDY interrupt to a pipe, this module sets the corresponding PIPEBRDY bit in the BRDYSTS register. At that time, if already set the corresponding bit in the BRDYENB register, this module sets the BRDY bit in the INTSTS0 register, and asserts the interrupt.

Conditions to generate and clear a BRDY interrupt vary depending on the values of the BRDYM bit, and the BFRE bit for each pipe.

a-1) BRDYM = 0 and BFRE = 0

When the BRDYM and BFRE bits are 0, the BRDY interrupt is generated to indicate that the FIFO port has become ready for access.

Under the conditions described below, this module generates an internal BRDY interrupt request trigger, and sets the PIPEBRDY bit corresponding to the pipe for which the request trigger is generated.

1. For the pipe in the sending direction
   - When the DIR bit changes from 0 to 1
   - When this module has ended sending packets through a pipe when data writing by the CPU to the FIFO buffer allocated to that pipe is disabled (when the value read from the BSTS bit is 0)
     In continuous transfer mode, a request trigger is generated when data has all been sent from one FIFO buffer.
   - When, in a double-buffer configuration, one FIFO buffer is empty when writing to the other FIFO buffer has ended
     If sending to one FIFO buffer has ended during writing to the other FIFO buffer, no request trigger is generated until the ongoing writing to the other FIFO buffer ends.
   - When this module flushes the FIFO buffer allocated to the pipe of which the transfer type is isochronous.
   - When the state of the FIFO buffer is changed from the write-disabled state to the write-enabled state by writing 1 to the ACLRM bit

No request trigger is generated when the pipe is the DCP (in other words, when data is sent by a control transfer).

2. For the pipe in the receiving direction

- When this module has ended receiving packets through a pipe and reading from the FIFO buffer is enabled when data reading by the CPU from the FIFO buffer allocated to that pipe is disabled (when the value read from the BSTS bit is 0)
  No request trigger is generated for the transaction that involves a data PID mismatch.
  In continuous transmission/reception mode, no request trigger is generated when the data size is the maximum packet size and the FIFO buffer still has a free space.
  If a short packet is received, a request trigger is generated even when the FIFO buffer has a free space.
  When the transaction counter is used, a request trigger is generated when the specified number of packets have been received.
  In that case, the request trigger is generated even if the FIFO buffer has a free space.
- When, in a double-buffer configuration, one FIFO buffer is in the read-enabled state when reading from the other FIFO buffer has ended
  If receiving from one FIFO buffer has ended during reading from the other FIFO buffer, no request trigger is generated until the ongoing reading from the other FIFO buffer ends.

This interrupt does not occur during the communication at the status stage of a control transfer.

The PIPEBRDY interrupt status of the corresponding pipe can be cleared to "0" by writing "0" to the corresponding bit. When clearing a PIPEBRDY bit by writing 0, write 1 to all the PIPEBRDY bits corresponding to other pipes.

Clearing the pipe BRDT interrupt status must be done always before the next access to the FIFO buffer.

a-2) When BRDYM = 0 and BFRE = 1

When the BRDYM bit is 0 and the BFRE bit is 1, this module determines that a BRDY interrupt occurs when all the data for a transfer has been read through a receiving pipe, and sets the PIPEBRDY bit corresponding to the pipe.

This module determines that the last data in a transfer has been received when one of the following conditions is met:

1. A short packet or a zero-length packet has been received.
2. The transaction counter (TRNCNT bits) is used, and as many packets as the value of the TRNCNT bits have been received.

When one of the above conditions is met and reading of the relevant data has ended, this module determines that all the data in a transfer has been read.

If a zero-length packet is received when the FIFO buffer is empty, this module determines that all the data in a transfer has been read when the FRDY bit is set and the DTLN bits are cleared in the corresponding FIFO Port Control Register. To start the next transfer in that case, write 1 to the BCLR bit in the corresponding FIFOCTR.

When the BRDYM bit is 0 and the BFRE bit is 1, this module does not detect any BRDY interrupt to the pipe in the sending direction.

The PIPEBRDY interrupt status of the corresponding pipe can be cleared to “0” by writing “0” to the corresponding bit. When clearing a PIPEBRDY bit by writing 0, write 1 to the PIPEBRDY bits corresponding to other pipes.

In this mode, do not change the value of the BFRE bit until all the processing for a transfer ends.

If you need to change the value of the BFRE bit during the transfer, set the ACLRM bit to clear all the FIFO buffers for the specified pipe.

a-3) When BRDYM = 1 and BFRE = 0

When the BRDYM bit is 1 and the BFRE bit is 0, the values of individual PIPEBRDY bits interlock with the values of the BSTS bits for individual pipes. In other words, this module sets or clears the BRDY interrupt status of a pipe according to the state of the FIFO buffer allocated to the pipe.

- For the pipe in the sending direction
  This module sets the PIPEBRDY bit for the pipe when data can be written to the FIFO port or clears the PIPEBRDY bit when data cannot be written to the FIFO port.
  The BRDY interrupt signal, however, is not asserted even when the sending pipe is write-enabled if the pipe is the DCP.
- For the pipe in the receiving direction
  This module sets the PIPEBRDY bit for the pipe when data can be read from the FIFO port or clears the PIPEBRDY bit when all data has been read (that is, when data reading from the FIFO port is disabled).
  If a zero-length packet is received when the FIFO buffer is empty, the PIPEBRDY bit corresponding to the specified pipe is kept being set and the BRDY interrupt signal is kept being asserted until sets the BCLR bit.

When the BRDYM bit is 1 and the BFRE bit is 0, this module cannot clear any PIPEBRDY bit.

When the BRDYM bit is 1, all the BFRE bits (for all pipes) must be 0.

(3) NRDY Interrupt Status Register (USB20_FUNC_NRDYSTS)

Access Size : 16 bits
Address : <USB20_func_base> + 0048h
Initial Value : 0000h

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	PIPENRDY[9:0]									
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
R/W	RW	RW	RW	RW	RW	RW	RW0	RW0	RW0	RW0	RW0	RW0	RW0	RW0	RW0	RW0

Bit	Bit Name	Initial Value	R/W	Description
15 to 10	-	All 0	RW	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
9 to 0	PIPENRDY [9:0]	0h	RW0	Pipe NRDY interrupt status These bits indicate the NRDY interrupt status of each pipe. 0b: No interrupt is generated. 1b: An interrupt is generated.

Note: Bit numbers correspond to pipe numbers.

Note: To clear the interrupt status indicated by a bit in this register, write 0b only to the bit and 1b to all other bit.

(a) Pipe NRDY interrupt status (PIPENRDY) bit

When this module issues an internal NRDY interrupt request for a pipe of which the PID is set to BUF, this module sets the PIPENRDY bit corresponding to the pipe in the NRDYSTS register. At that time, if the NRDYENB register bit corresponding to the pipe is set, this module sets the NRDY bit in the INTSTS0 register, and asserts the interrupt.

This module issues an internal NRDY interrupt request for individual pipes under the conditions described below. This module does not issue any interrupt request at the status stage of a control transfer.

a-1) For the pipe in the sending direction

- When an IN token is received in a situation where the PID bits corresponding to the specified pipe are 01 (BUF) and the FIFO buffer does not contain send data
  When an IN token is received, this module issues an NRDY interrupt request, and sets the PIPENRDY bit.
  If the transfer type of the pipe for which the interrupt is generated is isochronous transfer, this module sends a zero-length packet, and sets the OVRN bit.

a-2) For the pipe in the receiving direction

- When an OUT token is received in a situation where the PID bits corresponding to the specified pipe are 01 (BUF) and the FIFO buffer is full
  If the transfer type of the pipe for which the interrupt is generated is isochronous transfer, this module issues an NRDY interrupt request, sets the PIPENRDY bit, and sets the OVRN bit.
  If the transfer type of the pipe for which the interrupt is generated is not isochronous transfer, this module issues an NRDY interrupt request when sending an NAK Handshake signal after receiving the data that follows the OUT token, and sets the PIPENRDY bit.
  Note, however, that this module does not issue an NRDY interrupt request when resending data (when a DATA-PID mismatch has occurred).
  This module does not issue an NRDY interrupt request also when an error has occurred in a data packet.
- When a PING token is received in a situation where the PID bits corresponding to the specified pipe are 01 (BUF) and the FIFO buffer is full
  When a PING token is received, this module issues an NRDY interrupt request, and sets the PIPENRDY bit.

- When the transfer type of the specified pipe is isochronous transfer, the PID bits corresponding to the specified pipe are 01 (BUF), and data has not been received normally within an interval frame
  When an SOF token is received, this module issues an NRDY interrupt request, and sets the PIPENRDY bit for the specified pipe.

(4) BEMP Interrupt Status Register (USB20_FUNC_BEMPSTS)

Access Size : 16 bits
Address : <USB20_func_base> + 004Ah
Initial Value : 0000h

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	PIPEBEMP[9:0]									
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
R/W	RW	RW	RW	RW	RW	RW	RW0	RW0	RW0	RW0	RW0	RW0	RW0	RW0	RW0	RW0

Bit	Bit Name	Initial Value	R/W	Description
15 to 10	-	All 0	RW	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
9 to 0	PIPEBEMP[9:0]	0h	RW0	Pipe BEMP interrupt status These bits indicate the BEMP interrupt status of each pipe. 0b: No interrupt is generated. 1b: An interrupt is generated.

Note: Bit numbers correspond to pipe numbers.

Note: To clear the interrupt status indicated by a bit in this register, write 0b only to the bit and 1b to all other bit.

(a) Pipe BEMP interrupt status (PIPEBEMP) bit

When this module detects a BEMP interrupt to a pipe of which the PID is set to BUF, this module sets the PIPEBEMP bit corresponding to the pipe in the BEMPSTS register. At that time, if the BEMPENB register bit corresponding to the pipe is set, this module sets the BEMP bit in the INTSTS0 register, and asserts the interrupt.

This module issues an internal BEMP interrupt request for individual pipes under the conditions described below.

1. When data sending (including sending of zero-length packets) to a pipe in the sending direction has ended and the FIFO buffer allocated to the pipe is empty
   In a single-buffer configuration, this module generates a BRDY interrupt at the same time as issuing an internal BEMP interrupt request for the pipes other than the DCP.
   Note, however, that this module does not issue the internal BEMP interrupt request in the following cases:
   - When software (DMAC) has already started writing to the CPU-side FIFO buffer, in a double-buffer configuration, when sending data for one buffer ends
   - When the buffer is cleared (to empty the buffer) by writing 1 to the ACLRM or BCLR bit
   - During an IN transfer (sending zero-length packets) at the status stage of a control transfer
2. For the pipe in the receiving direction
   When the data larger than the specified maximum packet size has been received normally
   In that case, this module issues a BEMP interrupt request, sets the PIPEBEMP bit for the specified pipe, discards the received data, and changes the value of the PID bits for the specified pipe to 11 (STALL).
   Then, this module returns a STALL packet.
   Note, however, that this module does not issue the internal BEMP interrupt request in the following cases:
   - When a CRC or bit stuff error has been detected in the received data
   - When a SETUP transaction is being executed

Writing 0 to this bit clears the interrupt status.

Writing 1 to this bit has no effect.

6.5.3.2.11 Frame Number Registers

(1) Frame Number Register (USB20_FUNC_FRMNUM)

Access Size : 16 bits
Address : <USB20_func_base> + 004Ch
Initial Value : 0000h

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	OVRN	CRCE	-	-	-	FRNM[10:0]										
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
R/W	RW0	RW0	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15	OVRN	0h	RW0	Overrun/underrun detection status This bit indicates whether an overrun or underrun is detected in the pipe being used to perform an isochronous transfer. 0b: No error 1b: An error occurred.
14	CRCE	0h	RW0	CRC error detection status This bit indicates the CRC error detection status for the pipe being used to perform an isochronous transfer. 0b: No error 1b: An error occurred.
13 to 11	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
10 to 0	FRNM[10:0]	0h	R	Frame number These bits indicate the latest frame number.

Note: The OVRN bit is intended for debugging. When designing a system, design transfer timings appropriately to prevent buffer overruns and underruns.

(a) Overrun/underrun detection status (OVRN) bit

This module sets this bit when this module detects an overrun or underrun in a pipe of which the transfer type is isochronous transfer.

When this module detects an overrun or underrun, this module issues an internal NRDY interrupt request. For details, see **(a) Pipe NRDY interrupt status (PIPENRDY) bit**.

Software can clear this bit by writing 0 to this bit. If the CRCE bit should not be cleared together when this bit is cleared, write 40h.

When the peripheral controller function is selected

This module sets this bit in the following cases:

1. When an IN token is received although writing send data to the FIFO has not ended, in the case of a pipe that is in the sending direction and performs an isochronous transfer
2. When an OUT token is received although the free space of FIFO buffer is less than the size of one FIFO buffer, in the case of a pipe that is in the sending direction and performs an isochronous transfer

(b) CRC error detection status (CRCE) bit

This module sets this bit when this module detects a CRC or bit stuff error in a pipe of which the transfer type is isochronous transfer.

Software can clear this bit by writing 0 to this bit. If the OVRN bit should not be cleared together when this bit is cleared, write 80h.

When this module detects a CRC error, this module issues an internal NRDY interrupt request. For details, see **(a) Pipe NRDY interrupt status (PIPENRDY) bit**.

(c) Frame number (FRNM) bits

This module updates the value of these bits each time an SOF packet is received (once per 1 ms), and indicates the latest frame number in these bits.

When reading these bits, read them twice and check for consistency.

(2) Micro Frame Number Register (USB20_FUNC_UFRMNUM)

Access Size : 16 bits
Address : <USB20_func_base> + 004Eh
Initial Value : 0000h

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	UFRNM[2:0]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
2 to 0	UFRNM[2:0]	0h	R	Micro frame These bits indicate the micro frame number.

(a) Micro frame number (UFRNM) bit

In high-speed transfer mode, this module writes the micro frame number to these bits. In a mode other than high-speed transfer mode, this module writes 00h to these bits.

When reading these bits, read them twice and check for consistency.

6.5.3.2.12 USB Address

(1) USB Address Register (USB20_FUNC_USBADDR)

Access Size : 16 bits
Address : <USB20_func_base> + 0050h
Initial Value : 0000h

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	USBADDR[6:0]						
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	-	-	-	-	-	-	-	-	-	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 7	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
6 to 0	USBADDR[6:0]	0h	R	USB address These bits indicate the USB address allocated by the host.

(a) USB address (USBADDR) bits

When this module has received and normally processed a SetAddress request, this module writes the received USB address to these bits.

When this module detects a USB bus reset, this module writes 00h to these bits.

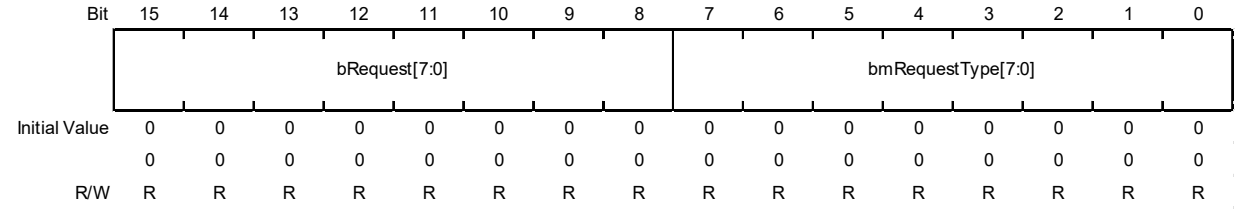
6.5.3.2.13 USB Request Registers

USB request registers are used to store control transfer setup requests.

These registers store the values set in the received USB requests.

(1) USB Request Type Register (USB20_FUNC_USBREQ)

Access Size : 16 bits
Address : <USB20_func_base> + 0054h
Initial Value : 0000h



Bit	Bit Name	Initial Value	R/W	Description
15 to 8	bRequest[7:0]	0h	R	Request Value of USBRequestbRequest
7 to 0	bmRequestTyp e[7:0]	0h	R	Request type Value of USBRequestbmRequestType

(a) USB request (bRequest) bits

These bits indicate the value of the USB request data this module has received in a SETUP transaction. Writing to these bits is ignored.

(b) USB request type (bRmRequestType) bits

These bits indicate the value of the USB request data this module has received in a SETUP transaction. Writing to these bits is ignored.

(2) USB Request Value Register (USB20_FUNC_USBVAL)

Access Size : 16 bits
Address : <USB20_func_base> + 0056h
Initial Value : 0000h

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	wValue[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	wValue[15:0]	0h	R	Value Value of the wValue field in a USB request

(a) Value (wValue) bits

These bits indicate the value of the wValue field in a USB request.

These bits indicate the value of wValue field in the USB request data this module has received in a SETUP transaction. Writing to these bits is ignored.

(3) USB Request Index Register (USB20_FUNC_USBINDX)

Access Size : 16 bits
Address : <USB20_func_base> + 0058h
Initial Value : 0000h

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	wIndex[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	wIndex[15:0]	0h	R	Index Value of the wIndex field in a USB request

(a) Index (wIndex) bits

These bits indicate the value of the wIndex field in a USB request.

These bits indicate the value of wIndex field in the USB request data this module has received in a SETUP transaction. Writing to these bits is ignored.

(4) USB Request Length Register (USB20_FUNC_USBLENG)

Access Size : 16 bits
Address : <USB20_func_base> + 005Ah
Initial Value : 0000h

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	wLength[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	wLength[31:0]	0h	R	Length Value of the wLength field in a USB request

(a) Length (wLength) bits

These bits indicate the value of the wLength field in a USB request.

These bits indicate the value of wLength field in the USB request data this module has received in a SETUP transaction. Writing to these bits is ignored.

6.5.3.2.14 DCP Configuration

When performing a data communication by a control transfer, use the default control pipe (DCP).

(1) DCP Configuration Register (USB20_FUNC_DCPCFG)

Access Size : 16 bits

Address : <USB20_func_base> + 005Ch

Initial Value : 0000h

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	CNTMD	SHTNAK	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
R/W	R	R	R	R	R	R	R	RW	RW	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 9	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
8	CNTMD	0h	RW	Continuous transfer mode This bit specifies whether to use the default control pipe to perform communication in continuous transfer mode. 0b: Non-continuous transfer mode 1b: Continuous transfer mode
7	SHTNAK	0h	RW	Pipe disable at transfer end When the default control pipe is in the receiving direction, this bit specifies whether to change the PID setting to NAK when the transfer ends. 0b: Continues the pipe when the transfer ends 1b: Disables the pipe when the transfer ends
6 to 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.

(2) DCP Max. Packet Size Register (USB20_FUNC_DCPMAXP)

Access Size : 16 bits
Address : <USB20_func_base> + 005Eh
Initial Value : 0040h

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	MXPS[6:0]						
Initial Value	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
15 to 7	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
6 to 0	MXPS[6:0]	40h	RW	Maximum packet size These bits specify the maximum data payload size (maximum packet size) for the DCP.

(a) Maximum packet size (MXPS) bits

These bits are used to specify the maximum data payload size (maximum packet size) for the DCP.

The default is 40h (64 bytes).

The value of the MXPS bits must conform to the USB Specification.

Writing a value to the MXPS bits must be done when the PID is set to NAK and no value is set in the CURPIPE bits. If you need to change the value of these bits after changing the PID setting for the specified pipe from BUF to NAK, check the PBUSY bit is 0 before changing the value of these bits. If, however, this module has changed the PID setting from BUF to NAK, the value of the PBUSY bit need not be checked.

When the MXPS bits are all 0, data must not be written to the FIFO buffer, and the PID setting must not be changed to BUF.

(3) DCP Control Register (USB20_FUNC_DCPCTR)

Access Size : 16 bits
Address : <USB20_func_base> + 0060h
Initial Value : 0040h

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	BSTS	-	-	-	-	-	-	SQCLR	SQSET	SQMON	PBUSY	-	-	CCPL	PID[1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	0	0	0
R/W	R	R	R	R	R	R	R	R0W1	R0W1	R	R	R	R	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
15	BSTS	0h	R	Buffer status This bit indicates the accessibility status of the DCP FIFO buffer. 0b: Buffer access is not possible. 1b: Buffer access is possible.
14 to 9	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
8	SQCLR	0h	R0W1	The read value is always 0b. Toggle bit clear This bit can set DATA0 as the expected value of the sequence toggle bit for the next transaction in DCP transfer. 0b: Writing disabled 1b: DATA0 specified
7	SQSET	0h	R0W1	The read value is always 0b. Toggle bit set This bit can set DATA1 as the expected value of the sequence toggle bit for the next transaction in DCP transfer. 0b: Writing disabled 1b: DATA1 specified
6	SQMON	1h	R	Sequence toggle bit monitor This bit indicates the expected value of the sequence toggle bit for the next transaction in DCP transfer. 0b: DATA0 1b: DATA1
5	PBUSY	0h	R	Pipe busy This bit indicates whether the specified pipe is being used in the USB bus. 0b: The specified pipe is not used in the USB bus. 1b: The specified pipe is being used in the USB bus.
4, 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
2	CCPL	0h	RW	Control transfer end enable Setting this bit permits the status stage of the control transfer to end. 0b: Does not permit the control transfer to end. 1b: Permits the control transfer to end.
1, 0	PID[1:0]	0h	RW	Response PID These bits control responses from this module in control transfer. 00b: NAK response 01b: BUF response (according to the buffer status) 10b: STALL response 11b: STALL response

(a) Buffer status (BSTS) bit

This bit indicates whether the CPU can access the FIFO buffer allocated to the DCP. This bit is operated by this module. The meaning of this bit varies as follows depending on the value of the ISEL bit:

- When ISEL = 0: This bit indicates whether receive data can be read from the FIFO buffer.
- When ISEL = 1: This bit indicates whether send data can be written to the FIFO buffer.

(b) Sequence toggle bit clear (SQCLR) bit

When software sets this bit, this module specifies DATA0 as the expected value of the sequence toggle bit for the specified pipe. This module always clears this bit.

Do not set the SQCLR and SQSET bits at the same time.

Setting this bit must be done when the PID is set to NAK and no value is set in the CURPIPE bits.

If you need to set this bit after changing the PID setting for the specified pipe from BUF to NAK, check, that the PBUSY bit is 0 before setting this bit. If, however, this module has changed the PID setting from BUF to NAK, the value of the PBUSY bit need not be checked.

(c) Sequence toggle bit set (SQSET) bit

When software sets this bit, this module specifies DATA1 as the expected value of the sequence toggle bit for the specified pipe. This module always clears this bit.

Do not set the SQCLR and SQSET bits at the same time.

Setting this bit must be done when the PID is set to NAK and no value is set in the CURPIPE bits.

If you need to set this bit after changing the PID setting for the specified pipe from BUF to NAK, check, that the PBUSY bit is 0 before setting this bit. If, however, this module has changed the PID setting from BUF to NAK, the value of the PBUSY bit need not be checked.

(d) Sequence toggle bit monitor (SQMON) bit

This bit indicates the expected value of the sequence toggle bit for the specified pipe. This bit is operated by this module. When a transaction ends normally, this module toggles this bit.

This module, however, does not toggle this bit if a DATA-PID mismatch occurs during a transfer in the receiving direction.

When a SETUP packet is received normally, this module sets this bit (to specify DATA1 as the expected value).

This module does not reference this bit in an IN or OUT transaction at the status stage. Also, this module does not toggle this bit even when the transaction ends normally.

(e) Pipe busy (PBUSY) bit

This module changes this bit from 0 to 1 when a USB transaction using the specified pipe starts. This module changes this bit from 1 to 0 when the transaction ends.

Reading this bit after software sets the PID to NAK enables you to check whether you can change pipe settings.

(f) Control transfer end enable (CCPL) bit

When software sets this bit when the PID of the specified pipe is BUF, this module ends the status stage of the ongoing control transfer.

In other words, in a control read transfer, this module sends an ACK handshake in response to an OUT transaction request from the USB host, and, in a control write or no-data control transfer, this module sends a zero-length packet in response to an IN transaction request from the USB host. If, however, a SetAddress request is detected, this module performs automatic response throughout the period from the setup stage to the end of the status stage regardless of the value of this bit.

When a new SETUP packet is received, this module changes this bit from 1 to 0.

When the VALID bit is 1, software cannot set this bit.

(g) Response PID (PID) bits

The setting of these bits must be changed from NAK to BUF when the data stage or status stage of a control transfer is executed.

This module changes the value of these bits in the following cases:

- This module changes the value of these bits to 00 (NAK) when it receives a SETUP packet. At that time this module sets the VALID bit. Software cannot change the value of these bits until it clears the VALID bit.
- When set these bits to 01 (BUF), this module changes the value of these bits to 11 (STALL) when it receives the data exceeding the specified maximum packet size.
- This module changes the value of these bits to 1x (STALL) when it detects a sequence error in a control transfer.
- This module changes the value of these bits to 00 (NAK) when it detects a USB reset.

This module does not reference these bits during SetAddress request processing (automatic processing).

6.5.3.2.15 Pipe Configuration Registers

To configure pipes 1 to 15, use the PIPESEL, PIPECFG, PIPEBUF, PIPEMAXP, PIPEPERI, PIPExCTR, PIPExTRE, and PIPExTRN registers.

Select the pipes to be used by using the PIPESEL register, and then configure functions of individual pipes by using the PIPECFG, PIPEBUF, PIPEMAXP, and PIPEPERI registers. Note that you can use the PIPExCTR, PIPExTRE, and PIPExTRN registers for setting regardless of the pipe selection by the PIPESEL register.

(1) Pipe Window Select Register (USB20_FUNC_PIPESEL)

Access Size : 16 bits
Address : <USB20_func_base> + 0064h
Initial Value : 0000h

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	PIPESEL[3:0]			
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
R/W	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
15 to 4	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
3 to 0	PIPESEL[3:0]	0h	RW	Pipe window select These bits specify a pipe for registers at addresses 68h to 6Eh. 0000b: No selection 0001b: PIPE1 0010b: PIPE2 0011b: PIPE3 0100b: PIPE4 0101b: PIPE5 0110b: PIPE6 0111b: PIPE7 1000b: PIPE8 1001b: PIPE9

Note: When the PIPESEL bits are 0000b, all bits of the PIPECFG, PIPEBUF, PIPEMAXP, and PIPEPERI registers are cleared. When the PIPESEL bits are 0000b, writing to the registers at addresses 68h to 6Eh is ignored.

(a) Pipe Window select (PIPESEL) bits

When software a value from 0001 to 1111 to these bits, this module indicate the pipe information and settings corresponding to the registers at addresses 68h to 6Eh. After a pipe is selected by these bits, the values set in the areas at addresses 68h to 6Eh are applied, by this module, to the transfer operation using the selected pipe.

When writes 0000 to these bits, this module writes 0 to all bits of the registers at addresses 68h to 6Eh. Then, writing to the areas at addresses 68h to 6Eh is ignored.

(2) Pipe Configuration Register (USB20_FUNC_PIPECFG)

Access Size : 16 bits
Address : <USB20_func_base> + 0068h
Initial Value : 0000h

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TYPE[1:0]		-	-	-	BFRE	DBLB	CNTMD	SHTNAK	-	-	DIR	EPNUM[3:0]			
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	R	R	R	RW	RW	RW	RW	R	R	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
15, 14	TYPE[1:0]	0h	RW	Transfer type These bits specify the transfer type of the pipe specified in the PIPESEL bit. 00b: The pipe cannot be used. 01b: Bulk transfer 10b: Interrupt transfer 11b: Isochronous transfer
13 to 11	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
10	BFRE	0h	RW	BRDY interrupt operation specification This bit specifies the timing at which this module notifies a BRDY interrupt relating to the specified pipe. 0b: A BRDY interrupt is notified when data is sent or received. 1b: A BRDY interrupt is notified when reading of data is completed.
9	DBLB	0h	RW	Double-buffer mode This bit specifies a single or double FIFO buffer to be used by the specified pipe. 0b: Single buffer 1b: Double buffer
8	CNTMD	0h	RW	Continuous transfer mode This bit specifies whether to use the specified pipe to perform communication in continuous transfer mode. 0b: Non-continuous transfer mode 1b: Continuous transfer mode
7	SHTNAK	0h	RW	Pipe disable at transfer end When the specified pipe is in the receiving direction, this bit specifies whether to change the PID setting to NAK when the transfer ends. 0b: Continues the pipe when the transfer ends. 1b: Disables the pipe when the transfer ends.
6, 5	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
4	DIR	0h	RW	Transfer direction This bit specifies the transfer direction of the specified pipe. 0b: Receiving direction 1b: Sending direction
3 to 0	EPNUM[3:0]	0h	RW	Endpoint number These bits specify the endpoint number of the specified pipe.

(a) Transfer type (TYPE) bits

These bits are used to specify the USB transfer type of the pipe (selected pipe) specified in the PIPESEL bits.

Table 6.5-19 lists pipes and the transfer types specifiable in these bits.

Table 6.5-19 Selected Pipes and the Transfer Types Specifiable in the TYPE Bits

Selected Pipe	TYPE Bits	USB Transfer Type
PIPE1 or PIPE2	01 or 11	Bulk or isochronous transfer
PIPE3 to PIPE5	01	Bulk transfer
PIPE6 to PIPE9	10	Interrupt transfer

Always specify a value other than 00 in these bits for a selected pipe before setting the PID of the selected pipe to BUF (to start USB communication using the selected pipe).

The value of these bits for a selected pipe must be done while the PID of the selected pipe is NAK. If you change the value of these bits for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that, and the PBUSY bit is 0 before changing the value of these bits. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

(b) BRDY interrupt operation specification (BFRE) bit

This bit is valid when the selected PIPE is PIPE1 to PIPE5.

When set this bit and been using the selected pipe in the receiving direction (in other words, the DIR bit is 0), this module detects the end of transfer (when it occurs) and generates a BRDY interrupt when reading of the last packet ends.

If a BRDY interrupt occurs with the above settings, software must write 1 to the BCLR bit. The FIFO buffer allocated to the selected pipe remains unready for reception until 1 is written to the BCLR bit.

When set this bit and been using the selected pipe in the sending direction (in other words, the DIR bit is 1), this module does not generate any BRDY interrupt.

For details, see the description of the PIPEBRDY interrupt status bit.

Changing the value of this bit for a selected pipe must be done while the PID of the selected pipe is NAK and the selected pipe is not specified in the CURPIPE bits.

If you change the value of this bit for a selected pipe after the USB communication using the selected pipe, not only check the values of above three kinds of register bits but also write 1 and 0 successively to the ACLRM bit to clear the FIFO buffer allocated to the selected pipe.

If you change the value of this bit for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that, and the PBUSY bit is 0 before changing the value of this bit. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

(c) Double-buffer mode (DBLB) bit

This bit is valid when the selected pipe is PIPE1 to PIPE5.

When set this bit for a selected pipe, this module allocates, to the selected pipe, two FIFO buffers, each of which has the FIFO buffer size specified in the BUFSIZE bits in the PIPEBUF register.

The size of the FIFO buffer this module allocates to the selected pipe is as follows:

$$(\text{BUFSIZE} + 1) \times 64 \times (\text{DBLB} + 1)\ [\text{bytes}]$$

Changing the value of this bit for a selected pipe must be done while the PID of the selected pipe is NAK and the selected pipe is not specified in the CURPIPE bits.

If you change the value of this bit for a selected pipe after the USB communication using the selected pipe, not only check the values of above three kinds of register bits but also write 1 and 0 successively to the ACLRM bit to clear the FIFO buffer allocated to the selected pipe.

If you change the value of this bit for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that, and the PBUSY bit is 0 before changing the value of this bit. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

(d) Continuous transfer mode (CNTMD) bit

This bit is valid when the selected pipe is PIPE1 to PIPE5, and the transfer type of the selected pipe is bulk transfer.

This module determines whether data sending from or receiving in the FIFO buffer allocated to the selected pipe has ended according to the value of this bit in the way described in **Table 6.5-20**.

Table 6.5-20 How to Determine the End of Data Sending from or Receiving in the FIFO Buffer According to the Value of the CNTMD Bit

CNTMD Bit Setting Value	How to Determine Whether Reading or Sending is Enabled
0	Condition for enabling reading from the FIFO buffer when the receiving direction is set (“DIR = 0”): This module receives one packet
	Condition for enabling sending from the FIFO buffer when the sending direction is set (“DIR = 1”): Either of the following conditions 1) and 2) is met: 1) Data for the maximum packet size is written to the FIFO buffer. 2) Data for the short packet (including the case of zero-byte data) is written to the FIFO buffer and then 1 is written in the BVAL bit.
1	Conditions for enabling reading from the FIFO buffer when the receiving direction is set (“DIR = 0”): 1) The number of bytes in data received in the FIFO buffer allocated to the selected pipe becomes equal to the number of allocated bytes ((BUFSIZE + 1) × 64). 2) This module receives a short packet other than a zero-length packet. 3) This controller receives a zero-length packet when the FIFO buffer allocated to the selected pipe already contains data. 4) Packets are received as many times as the value of the transaction counter set for the selected pipe.
	Condition for enabling sending from the FIFO buffer when the sending direction is set (“DIR = 1”): One of the following conditions 1) to 3) is met: 1) The amount of written data becomes equal to the size of one FIFO buffer allocated to the selected pipe. 2) Data for less than the size of one FIFO buffer allocated to the selected pipe (including the case of zero-byte data) is written to the FIFO buffer and then 1 is written in the BVAL bit. 3) Data for less than the size of one FIFO buffer allocated to the selected pipe (including the case of zero-byte data) is written to the FIFO buffer, and a transfer end signal is asserted at the same time of the last writing.

Changing the value of this bit for a selected pipe must be done while the PID of the selected pipe is NAK and the selected pipe is not specified in the CURPIPE bits.

If you change the value of this bit for a selected pipe after the USB communication using the selected pipe, not only check the values of above three kinds of register bits but also write 1 and 0 successively to the ACLRM bit to clear the FIFO buffer allocated to the selected pipe.

If you change the value of this bit for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that, and the PBUSY bit is 0 before changing the value of this bit. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

(e) PIPE disable at transfer end (SHTNAK) bit

This bit is valid when the selected pipe is PIPE1 to PIPE5 and is in the receiving direction.

When set this bit for a selected pipe in the receiving direction, this module changes the PID of the selected pipe to NAK when this module determines the end of data transfer to the selected pipe. This module determines the end of transfer when one of the following conditions (1) and (2) is met:

(1) This module has normally received short packet data (including zero-length packets).

(2) When using a transaction counter, this module has normally received as many packets as the value set in the transaction counter.

Changing the value of this bit for a selected pipe must be done while the PID of the selected pipe is NAK.

If you change the value of this bit for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that, and the PBUSY bit is 0 before changing the value of this bit. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

For the pipes in the sending direction, this bit must be cleared.

(f) Transfer direction (DIR) bit

When writes 0 to this bit for a selected pipe, this module uses the selected pipe in the receiving direction. When software writes 1 to this bit for the selected pipe, this module uses the selected pipe in the sending direction.

Changing the value of this bit for a selected pipe must be done while the PID of the selected pipe is NAK and the selected pipe is not specified in the CURPIPE bits.

If you change the value of this bit for a selected pipe after the USB communication using the selected pipe, not only check the values of above three kinds of register bits but also write 1 and 0 successively to the ACLRM bit to clear the FIFO buffer allocated to the selected pipe.

If you change the value of this bit for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that, and the PBUSY bit is 0 before changing the value of this bit. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

(g) Endpoint number (EPNUM) bits

These bits are used to specify the endpoint number of the endpoint of a selected pipe. Note that specifying 0000 in these bits for a pipe means that the pipe is not used.

Changing the value of these bits for a selected pipe must be done while the PID of the selected pipe is NAK and the selected pipe is not specified in the CURPIPE bits.

If you change the value of these bits for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that, and the PBUSY bit is 0 before changing the value of these bits. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

The combination of the values of the DIR bit and EPNUM bits for a pipe must be unique among those for all pipes. (The setting “EPNUM = 000” [the selected pipe is not used] can be duplicated for multiple pipes.)

(3) Pipe Buffer Setting Register (USB20_FUNC_PIPEBUF)

Access Size : 16 bits
Address : <USB20_func_base> + 006Ah
Initial Value : 0000h

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	BUFSIZE[4:0]					-	-	BUFNMB[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
R/W	R	RW	RW	RW	RW	RW	R	R	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
15	-	0h	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
14 to 10	BUFSIZE[4:0]	0h	RW	Buffer size These bits specify the size of the FIFO buffer for the pipe specified in the PIPESEL bit. 00h: 64 bytes 01h: 128 bytes ... (1Fh: 2 Kbytes)
9, 8	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
7 to 0	BUFNMB[7:0]	0h	RW	Buffer number These bits specify the FIFO buffer number of the specified pipe. (4h to 7Fh)

Note: Changing values of these register bits for a selected pipe must be done when the PID of the selected pipe is set to NAK, and no pipe is specified in the CURPIPE bits.

Note: If you change values of these register bits for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check that the PBUSY bit is 0b before changing the values of these bits. If this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

(a) Buffer size (BUFSIZE) bits

These bits are used to specify the size of the FIFO buffer to be allocated to the selected pipe. Specify the FIFO buffer size in units of blocks. One block has 64 bytes.

When set the DBLB bit for a selected pipe, this module allocates, to the selected pipe, two FIFO buffers, each of which has the FIFO buffer size specified in these bits.

The size of the FIFO buffer this module allocates to the selected pipe is as follows:

(BUFSIZE + 1) × 64 × (DBLB + 1) [bytes]

The following value can be specified in these bits:

- Any value from 00h to 1Fh when the selected pipe is PIPE1 to PIPE5.
- 0h only when the selected pipe is PIPE6 to PIPE9.

In continuous transfer mode (CNTMD = 1), specify an integral multiple of the maximum packet size in the BUFSIZE bits.

(b) Buffer number (BUFNMB) bits

These bits are used to specify the block number of the first block in the FIFO buffer to be allocated to the selected pipe. This module allocates the following blocks of FIFO buffer to the selected pipe:

Block with block number “BUFNMB” to the block with block number “BUFNMB + (BUFSIZE + 1) × (DBLB + 1) − 1”

The value of these bits must be 04h to 7Fh. Note, however, that the following rules must be observed: Value “00h” is exclusively used for DCP.

Value “04h” is exclusively used for PIPE6. When, however, PIPE6 is not used, this value can be used for another pipe. If PIPE6 is selected, writing to the BUFNMB bits is ignored. Then, this module aromatically sets 04h in the BUFNMB bits for PIPE6.

Value “05h” is exclusively used for PIPE7. When, however, PIPE7 is not used, this value can be used for another pipe. If PIPE7 is selected, writing to the BUFNMB bits is ignored. Then, this module aromatically sets 05h in the BUFNMB bits for PIPE7.

Value “06h” is exclusively used for PIPE8. When, however, PIPE8 is not used, this value can be used for another pipe. If PIPE8 is selected, writing to the BUFNMB bits is ignored. Then, this module aromatically sets 06h in the BUFNMB bits for PIPE8.

Value “07h” is exclusively used for PIPE9. When, however, PIPE9 is not used, this value can be used for another pipe. If PIPE9 is selected, writing to the BUFNMB bits is ignored. Then, this module aromatically sets 07h in the BUFNMB bits for PIPE9.

(4) Pipe Maximum Packet Size Register (USB20_FUNC_PIPEMAXP)

Access Size : 16 bits
Address : <USB20_func_base> + 006Ch
Initial Value : 0000h

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	MXPS[10:0]										
Initial Value	0	0	0	0	0	0	0	0	0	0(1)	0	0	0	0	0	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
R/W	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
15 to 11	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
10 to 0	MXPS[10:0]	0(1)*1	RW	Maximum packet size These bits specify the maximum data payload size (maximum packet size) for the specified pipe. For PIPE6 to PIPE8, a value from 1h to 40h (bytes) can be set.

Note 1. The initial value of the MXPS bits is 00h when no pipe is specified in the PIPESEL bits in the PIPESEL register or 40h when a pipe is specified in the PIPESEL bits.

(a) Maximum packet size (MXPS) bits

These bits are used to specify the maximum data payload size (maximum packet size) for the selected pipe.

The initial value of these bits is 40h (64 bytes).

- For PIPE1 and PIPE2, a value from 1h (1 byte) to 400h (1024 bytes) can be specified.
- For PIPE3 to PIPE5, 8h (8 bytes), 10h (16 bytes), 20h (32 bytes), 40h (64 bytes), or 200h (512 bytes) can be specified. (Bits [2:0] are excluded.)
- For PIPE6 to PIPE9, a value from 1h (1 byte) to 40h (64 bytes) can be specified.

The value of the MXPS bits for individual transfer type must conform to the USB Specification.

Setting a value in these bits for a selected pipe must be done while the PID of the selected pipe is NAK and the selected pipe is not specified in the CURPIPE bits.

If you change the value of these bits for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check the PBUSY bit is 0 before changing the value of these bits. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

When the MXPS bits are all 0, data must not be written to the FIFO buffer, and the PID setting must not be changed to BUF.

(5) Pipe Cycle Control Register (USB20_FUNC_PIPEPERI)

Access Size : 16 bits
Address : <USB20_func_base> + 006Eh
Initial Value : 0000h

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	IFIS	-	-	-	-	-	-	-	-	-	IITV[2:0]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
R/W	R	R	R	RW	R	R	R	R	R	R	R	R	R	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
15 to 13	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
12	IFIS	0h	RW	Isochronous IN buffer flush This bit specifies whether to perform a buffer flush when the pipe specified in the PIPESEL bit is used for isochronous IN transfer. 0b: Does not perform a buffer flush. 1b: Performs a buffer flush.
11 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
2 to 0	IITV[2:0]	0h	RW	These bits specify the transfer interval of the specified pipe. The value to be specified is the frame timing multiplied by an n-th power of 2.

(a) Isochronous IN buffer flush (IFIS) bit

When the selected pipe is used for isochronous IN transfer, this bit is used to specify this module automatically clears the FIFO buffer if this module fails to receive the IN token from the USB host in a (micro) frame sent at intervals specified in the IITV bits.

In double-buffer mode (DBLB = 1), this module clears only the data in one buffer used earlier than the other.

This module clears the FIFO buffer when it receives an SOF packet immediately after the (micro) frame in which the IN token hag to be received. Even if the SOF packet is corrupted, this module clears the FIFO buffer in the same timing to receive the SOF packet by the use of the internal interpolation function.

(b) Interval error detection interval (IITV) bits

These bits specify the interval of interval error detection for the selected pipe. The value to be specified is the frame timing multiplied by an n-th power of 2.

Setting a value in these bits for a selected pipe must be done while the PID of the selected pipe is NAK and the selected pipe is not specified in the CURPIPE bits.

If you change the value of these bits for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that, and the PBUSY bit is 0 before changing the value of these bits. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

If you change the value specified in these bits to another after a USB communication, change the PID to NAK, and then set the ACLRM bit to initialize the interval timer before changing the value.

For PIPE3 to PIPE5 these bits are ignored. Write 0 to all these bits corresponding to PIPE3 to PIPE5.

You can specify a value in these bits when the transfer type of the selected pipe is isochronous.

b-1) When the selected pipe is used for isochronous OUT transfer

If this module does not receive any data packet in the (micro) frame sent at intervals specified in the IITV bits, this module generates an NRDT interrupt.

This module generates an NRDY interrupt also if this module cannot receive data because an error, e.g., CRC error, has occurred in a data packet or because the FIFO buffer is full (such a situation might result if, for example, software [DMAC] delays in reading data from the FIFO buffer).

This module generates the NRDY interrupt when it receives an SOF packet. Even if the SOF packet is corrupted, this module generates the NRDY interrupt in the same timing to receive the SOF packet by the use of the internal interpolation function.

When, however, the value of the IITV bits is not 0, this module generates the NRDY interrupt every time an SOF packet is received at the specified intervals after interval counting starts.

If the PID of the selected pipe is changed to NAK after the interval timer starts, this module does not generate the NRDY interrupt even when it receives an SOF packet.

The condition for starting interval counting varies by the value of the IITV bits.

- When IITV = 0: Interval counting starts when the PID of the selected pipe is changed to BUF.

(Micro) frame	SOF	SOF	SOF	OUT	DATA0	SOF	OUT	DATA0
Setting of PID bits	NAK	NAK	BUF			BUF		
Whether token reception is expected (0: reception expected —: non-reception expected)	—	—	0			0		
Start of interval counting			↑					

Figure 6.5-4 Relationship between (Micro) Frames and Whether Token Reception Is Expected When IITV = 0

- When IITV is not 0: Interval counting starts at the end of the first normal reception of data packet after the PID of the selected pipe is changed to BUF.

(Micro) frame	SOF	SOF	SOF	OUT	DATA0	SOF	SOF	OUT	DATA0	SOF	SOF	OUT	DATA0
Setting of PID bits	NAK	BUF	BUF			BUF	BUF			BUF	BUF		
Whether token reception is expected (0: reception expected —: non-reception expected)	—	—	0			—	0			—	0		
Start of interval counting			↑										

Figure 6.5-5 Relationship between (Micro) Frames and Whether Token Reception Is Expected When IITV = 1

b-2) When the selected pipe is used for isochronous IN transfer

The IITV bits are used in combination with the setting of the IFIS bit to 1. When the IFIS bit is 0, this module sends a data packet in response to a received token regardless of the value of the IITV bits.

When the IFIS bit is 1, if this module does not receive any IN token in the (micro) frame sent at intervals specified in the IITV bits although the FIFO buffer has sendable data, this module clears the FIFO buffer.

This module clears the FIFO buffer also when it cannot receive an IN token normally because of a bus error, e.g., CRC error.

This module clears the FIFO buffer when it receives an SOF packet. Even if the SOF packet is corrupted, this module clears the FIFO buffer in the same timing to receive the SOF packet by the use of the internal interpolation function.

The condition for starting interval counting varies by the value of the IITV bits. (The condition is the same as that for isochronous OUT transfer.)

The interval counter is cleared when one of the following conditions (1) to (3) is met:

(1) This module is reset (then, also the IITV bits are cleared).

(2) The ACLRM bit is set.

(3) This module detects a USB bus reset.

6.5.3.2.16 Pipe Control Registers

(1) PIPEn Control Register (USB20_FUNC_PIPEnCTR) (n = 1 to 5)

Access Size : 16 bits

Address : <USB20_func_base> + 0070h + (n - 1) x 0002h

Initial Value : 0000h

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	BSTS	INBUFM	-	-	-	ATREPM	ACLRM	SQCLR	SQSET	SQMON	PBUSY	-	-	-	PID[1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	0	0
R/W	R	R	R	R	R	RW	RW	R0W1	R0W1	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
15	BSTS	0h	R	Buffer status This bit indicates the FIFO buffer status of the specified pipe. 0b: Buffer access is not possible. 1b: Buffer access is possible.
14	INBUFM	0h	R	Transmit buffer monitor When the specified pipe is in the sending direction, this bit indicates the FIFO buffer status of the specified pipe. 0b: The FIFO buffer does not contain data that can be sent. 1b: The FIFO buffer contains data that can be sent.
13 to 11	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
10	ATREPM	0h	RW	Automatic response mode This bit prohibits or enables automatic response of the specified pipe. 0b: Automatic response prohibited 1b: Automatic response enabled. (A zero-length packet response is sent during transmission. For reception, an NAK response is sent and an NRDY interrupt is generated.)
9	ACLRM	0h	RW	Automatic buffer clear mode This bit prohibits or enables automatic buffer clear mode for the specified pipe. 0b: Prohibited 1b: Enabled (all buffers are initialized)
8	SQCLR	0h	R0W1	The read value is always 0b. Toggle bit clear Specify 1b in this bit to clear the expected value of the sequence toggle bit for the next transaction in the specified pipe to DATA0. 0b: Writing disabled 1b: DATA0 specified
7	SQSET	0h	R0W1	The read value is always 0b. Toggle bit set Specify 1b in this bit to set the expected value of the sequence toggle bit for the next transaction in the specified pipe to DATA1. 0b: Writing disabled 1b: DATA1 specified
6	SQMON	0h	R	Sequence toggle bit monitor This bit indicates the expected value of the sequence toggle bit for the next transaction in the specified pipe. 0b: DATA0 1b: DATA1
5	PBUSY	0h	R	Pipe busy This bit indicates whether the specified pipe is being used in the USB bus. 0b: The specified pipe is not used in the USB bus. 1b: The specified pipe is being used in the USB bus.
4 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.

Bit	Bit Name	Initial Value	R/W	Description
1, 0	PID[1:0]	0h	RW	Response PID These bits specify the response method for the next transaction in the specified pipe. 00b: NAK response 01b: BUF response (according to the buffer status) 10b: STALL response 11b: STALL response

(a) Buffer status (BSTS) bit

This bit indicates whether the CPU can access the FIFO buffer allocated to the selected pipe. This bit is operated by this module.

The meaning of this bit varies as follows depending on the value of the values of the DIR, BFRE, and DCLRM bits:

Table 6.5-21 BSTS Bit Operations

DIR bit Setting Value	BFRE bit Setting Value	DCLRM bit Setting Value	Meaning of the BSTS Bit
0	0	0	This bit indicates 1 when reading of received data from the FIFO buffer becomes possible, and indicates 0 when reading data has finished.
		1	Setting prohibited
	1	0	This bit indicates 1 when reading of received data from the FIFO buffer becomes possible. This bit indicates 0 when 1 is written in the BCLF bit after reading data has finished.
		1	This bit indicates 1 when reading of received data from the FIFO buffer becomes possible, and indicates 0 when reading data has finished.
1	0	0	This bit indicates 1 when writing of send data in the FIFO buffer becomes possible, and indicates 0 when writing data has finished.
		1	Setting prohibited
	1	0	Setting prohibited
		1	Setting prohibited

(b) Transmit buffer monitor (INBUFM) bit

When the selected pipe is in the sending direction (DIR = 1), this module sets this bit when software (or the DMAC) has finished writing data to at least one FIFO buffer.

This module clears this bit when this module finishes sending all data from the FIFO buffer to which the data has been written. In double-buffer mode (DBLB = 1), this module clears this bit when this module has finished sending all data from the two FIFO buffers and software (or the DMAC) has not yet finished writing data to one FIFO buffer.

When the selected pipe is in the receiving direction (DIR = 0), this bit indicates the same value as that of the BSTS bit.

(c) Automatic response mode (ATREPM) bit

This bit can be set when the transfer type of the selected pipe is bulk transfer.

When this bit is 1, this module responds to tokens sent from the USB host as described below.

1. When the selected pipe is used for bulk IN transfer (TYPE = 01 and DIR = 1)
   When the ATREPM bit is 1 and the PID of the selected pipe is BUF, this module responds to an IN token by sending a zero-length packet.
   Each time this module receives ACK from the USB host (the sequence of one transaction is receiving an IN token, sending a zero-length packet, and then receiving ACK), this module updates (toggles) the sequence toggle bit (DATA- PID).
   This module does not generate BRDY and BEMP interrupts.

2. When the selected pipe is used for bulk OUT transfer (TYPE = 01 and DIR = 0)
   When the ATREPM bit is 1 and the PID of the selected pipe is BUF, this module responds to an OUT token (or a PING token) by sending an NAK response and generates an NRDY interrupt.

Changing the value of this bit for a selected pipe must be done while the PID of the selected pipe is NAK.

If you change the value of this bit for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that the PBUSY bit is 0 before changing the value of this bit. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

To perform a USB communication with this bit set, the FIFO buffer must be empty. No data must be written to the FIFO buffer during the USB communication with this bit set.

When the transfer type of the selected pipe is isochronous transfer, this bit must always be 0.

(d) Automatic buffer clear mode (ACLRM) bit

When you need to clear the whole FIFO buffer allocated to the selected pipe, write 1 and 0 successively to the ACLRM bit.

Table 6.5-22 shows the buffer contents this module clears when 1 and 0 are written successively to the ACLRM bit.

Table 6.5-23 shows the cases that require this processing.

Table 6.5-22 Buffer Contents This Core Clears When the ACLRM Bit is Set

No.	Contents to be Cleared by Setting the ACLRM Bit
(1)	Whole contents of the FIFO buffer allocated to the specified pipe (if the double buffer is set, both FIFO buffers are cleared)
(2)	If the transfer type of the specified pipe is Isochronous transfer, the interval count value is cleared.

Table 6.5-23 Cases Requiring the ACLRM Bit to be Set

No.	Cases when Data Clear is Required
(1)	The whole contents of the FIFO buffer allocated to the specified pipe needs to be cleared.
(2)	The interval count value needs to be reset.
(3)	The value of the BFRE bit is changed.
(4)	The value of the DBLB bit is changed.
(5)	Forced termination of the transaction count function is performed.

Changing the value of this bit for a selected pipe must be done while the PID of the selected pipe is NAK and the selected pipe is not specified in the CURPIPE bits.

If you change the value of this bit for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that, and the PBUSY bit is 0 before changing the value of this bit. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

(e) Sequence toggle bit clear (SQCLR) bit

When software sets this bit, this module specifies DATA0 as the expected value of the sequence toggle bit for the selected pipe. This module always clears this bit.

Writing 1 to the SQCLR bit must be done when the PID of the selected pipe is NAK.

If you write 1 to this bit for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that the PBUSY bit is 0 before changing the value of this bit. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

(f) Sequence toggle bit set (SQSET) bit

When software sets this bit, this module specifies DATA1 as the expected value of the sequence toggle bit for the selected pipe. This module always clears this bit.

Writing 1 to the SQSET bit must be done when the PID of the selected pipe is NAK.

If you write 1 to this bit for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that the PBUSY bit is 0 before changing the value of this bit. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

(g) Sequence toggle bit monitor (SQMON) bit

This bit indicates the expected value of the sequence toggle bit for the selected pipe. This bit is operated by this module.

When the transfer type of the selected pipe is other than isochronous transfer, this module toggles this bit when a transaction ends normally. This module, however, does not toggle this bit if a DATA-PID mismatch occurs during a transfer in the receiving direction.

(h) Pipe busy (PBUSY) bit

This module changes this bit from 0 to 1 when a USB transaction using the selected pipe starts. This module changes this bit from 1 to 0 when the transaction ends normally.

Reading this bit after software sets the PID to NAK enables you to check whether you can change pipe settings.

(i) Response PID (PID) bits

These bits are used to specify, the type of response of this module for individual pipes.

The default of PID is NAK. When the selected pipe is used for USB transfers, the PID setting muse be changed to BUF. For the basic operations (without communication packet errors involved) of this module depending on the value of the PID bits, see **Table 6.5-24**.

If you have changed the PID of a selected pipe from BUF to NAK while the selected pipe is performing a USB communication, check, that the PBUSY bit is 0 to confirm that the USB transfer through the selected pipe has actually changed to the NAK status. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

This module changes the value of the PID bits in the following cases:

- When the selected pipe is in the receiving direction and set the SHTNAK bit for the selected pipe, this module sets the PID to NAK when this module recognizes the end of a transfer.
- When this module has received a data packet of which the payload size is larger than the maximum packet size, this module sets the PID to STALL (PID = 11).
- If this module detects a USB bus reset, this module sets the PID to NAK.

To change the PID from NAK (PID = 00) to STALL, write 10 to the PID bits. To change the PID from BUF (PID = 01) to STALL, write 11 to the PID bits.

To change the PID from STALL (PID = 11) to NAK, write 10 to the PID bits once, and then write 00 to the PID bits. To change the PID from STALL to BUF, change the PID to NAK once, and then change it to BUF.

Table 6.5-24 Core Operations Depending on the PID Setting

PID bit Setting Value	Transfer Type (TYPE Bit Setting Value)	Transfer Direction (DIR Bit Setting Value)	Operation of This Core
00 (NAK)	Bulk (“TYPE = 01”), or Interrupt ("TYPE = 10”)	Independent of the setting value	Sends a NAK response for a token from the USB host.
	Isochronous (“TYPE = 11”)	Receiving direction (“DIR = 0”)	Does not respond to a token from the USB host.
		Sending direction (“DIR = 1”)	Sends a zero-length packet for a token from the USB host.
01 (BUF)	Bulk (“TYPE = 01”)	Receiving direction (“DIR = 0”)	For an OUT token from the USB host, if the FIFO buffer corresponding to the specified PIPE can receive data, this module receives data and then sends an ACK or NYET response. If receiving data is not possible, this module sends an NAK response. For a PING Token from the USB host, if the FIFO buffer corresponding to the specified PIPE can receive data, this module sends an ACK response. If receiving data is not possible, this module sends an NAK response.
	Interrupt (“TYPE = 10”)	Receiving direction (“DIR = 0”)	For an OUT token from the USB host, if the FIFO buffer corresponding to the specified PIPE can receive data, this module receives data and then sends an ACK response. If receiving data is not possible, this module sends an NAK response.
	Bulk (“TYPE = 01”) or Interrupt (“TYPE = 10”)	Sending direction (“DIR = 1”)	If the corresponding FIFO buffer is available for sending data, this module sends data in response to a token from the USB host. If sending data is not possible, this module sends an NAK response.
	Isochronous (“TYPE = 11”)	Receiving direction (“DIR = 0”)	For an OUT token from the USB host, if the FIFO buffer corresponding to the specified PIPE can receive data, this module receives data. If receiving data is not possible, this module discards data.
		Sending direction (“DIR = 1”)	If the corresponding FIFO buffer is available for sending data, this module sends data in response to a token from the USB host. If sending data is not possible, this module sends a zero-length packet.
10 (STALL) or 11 (STALL)	Bulk (“TYPE = 01”) or Interrupt (“TYPE = 10”)	Independent of the setting value	Sends a STALL response for a token from the USB host.
	Isochronous (“TYPE = 11”)	Independent of the setting value	Does not respond to a token from the USB host.

(2) PIPEn Control Register (USB20_FUNC_PIPEnCTR) (n = 6 to 9)

Access Size : 16 bits

Address : <USB20_func_base> + 0070h + (n - 1) x 0002h

Initial Value : 0000h

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	BSTS	-	-	-	-	-	ACLRM	SQCLR	SQSET	SQMON	PBUSY	-	-	-	PID[1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	0	0
R/W	R	R	R	R	R	R	RW	R0W1	R0W1	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
15	BSTS	0h	R	Buffer status This bit indicates the FIFO buffer status of the specified pipe. 0b: Buffer access is not possible. 1b: Buffer access is possible.
14 to 10	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
9	ACLRM	0h	RW	Automatic buffer clear mode This bit prohibits or enables automatic buffer clear mode for the specified pipe. 0b: Automatic buffer clear mode prohibited 1b: Automatic buffer clear mode enabled (all buffers are initialized)
8	SQCLR	0h	R0W1	The read value is always 0b. Toggle bit clear Specify 1b in this bit to clear the expected value of the sequence toggle bit for the next transaction in the specified pipe to DATA0. 0b: Disabled 1b: DATA0 specified
7	SQSET	0h	R0W1	The read value is always 0b. Toggle bit set Specify 1b in this bit to set the expected value of the sequence toggle bit for the next transaction in the specified pipe to DATA1 0b: Disabled 1b: DATA1 specified
6	SQMON	0h	R	Toggle bit monitor This bit indicates the expected value of the sequence toggle bit for the next transaction in the specified pipe. 0b: DATA0 1b: DATA1
5	PBUSY	0h	R	Pipe busy This bit indicates whether the specified pipe is being used in the USB bus. 0b: The specified pipe is not used in the USB bus. 1b: The specified pipe is being used in the USB bus.
4 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
1, 0	PID[1:0]	0h	RW	Response PID These bits specifies the response method for the next transaction in the specified pipe 00b: NAK response 01b: BUF response (according to the buffer status) 10b: STALL response 11b: STALL response

(a) Buffer status (BSTS) bit

See **(b) Transmit buffer monitor (INBUFM) bit**.

(b) Automatic buffer clear mode (ACLRM) bit

When you need to clear the whole FIFO buffer allocated to the selected pipe, write 1 and 0 successively to the ACLRM bit.

Table 6.5-25 shows the buffer contents this module clears when 1 and 0 are written successively to the ACLRM bit.

Table 6.5-26 shows the cases that require this processing.

Table 6.5-25 Buffer Contents This Core Clears when the ACLRM Bit is Set

No.	Contents Cleared by ACLRM Bit Operation
(1)	All contents of the FIFO buffer allocated to the selected pipe

Table 6.5-26 Cases Requiring the ACLRM Bit to be Set

No.	Contents Cleared by ACLRM Bit Operation
(1)	When clearing contents of the FIFO buffer allocated to the selected pipe
(2)	When resetting the interval counter
(3)	When the value of the BFRE bit is changed
(4)	When the transaction count function is terminated forcibly

Changing the value of this bit for a selected pipe must be done while the PID of the selected pipe is NAK and the selected pipe is not specified in the CURPIPE bits.

If you change the value of this bit for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that, and the PBUSY bit is 0 before changing the value of this bit. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

(c) Sequence toggle bit clear (SQCLR) bit

See **(e) Sequence toggle bit clear (SQCLR) bit**.

(d) Sequence toggle bit set (SQSET) bit

See **(f) Sequence toggle bit set (SQSET) bit**.

(e) Sequence toggle bit monitor (SQMON) bit

See **(g) Sequence toggle bit monitor (SQMON) bit**.

(f) Pipe busy (PBUSY) bit

See **(h) Pipe busy (PBUSY) bit**.

(g) Response PID (PID) bits

See **(i) Response PID (PID) bits**.

6.5.3.2.17 Transaction Counters

(1) PIPEn Transaction Counter Enable Register (USB20_FUNC_PIPEnTRE) (n = 1 to 5)

Access Size : 16 bits
Address : <USB20_func_base> + 0090h + (n - 1) x 0004h
Initial Value : 0000h

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	TRENB	TRCLR	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
R/W	R	R	R	R	R	R	RW	R0W1	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 10	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
9	TRENB	0h	RW	Transaction counter enable This bit enables or disables the transaction counter. 0b: Disables the transaction counter. 1b: Enables the transaction counter.
8	TRCLR	0h	R0W1	The read value is always 0b. Transaction counter clear This bit clears the transaction counter to 0b. To clear the counter, write 1b to this bit. 0b: Invalid 1b: Clears the current transaction counter.
7 to 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.

(a) Transaction counter enable (TRENB) bit

When software sets this bit for the selected pipe in the receiving direction after specifying a total number of packets in the TRNCNT bits, this module performs the following control when it finishes receiving the same number of packets as the total number specified in the TRNCNT bits:

1. When the continuous transfer mode is used (CNTMD = 1), this module switches the FIFO buffer to the CPU side at the end of reception even if the FIFO buffer is not full.
2. When the SHTNAK bit is 1, this module changes the PID of the selected pipe to NAK when it finishes receiving the same number of packets as the total number specified in the TRNCNT bits.
3. When the DENDE bit is 1 and the PKTMD bit is 0, this module asserts the DEND signal when reading the last data after having received the same number of packets as the total number specified in the TRNCNT bits.
4. When the BFRE bit is 1, this module asserts the BRDY interrupt signal when it finishes reading the last data after having received the same number of packets as the total number specified in the TRNCNT bits.

For the pipe in the sending direction, write 0 to this bit (TRENB bit). When not using the transaction count function, write 0 to this bit.

When using the transaction count function, specify a value in the TRNCNT bits before writing 1 to this bit. Also, write 1 to this bit before receiving the first packet among those to be counted by the transaction count function.

(b) Transaction counter clear (TRCLR) bit

When software sets this bit for a selected pipe, this module clears the current value of the transaction counter corresponding to the selected pipe, and then clears this bit.

(2) PIPEn Transaction Counter Register (USB20_FUNC_PIPEnTRN) (n = 1 to 5)

Access Size : 16 bits
Address : <USB20_func_base> + 0092h + (n - 1) x 0004h
Initial Value : 0000h

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TRNCNT[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	TRNCNT[15:0]	0h	RW	When writing: Specifies the total number of packets to be received by the pertinent pipe (number of transactions). When reading: Indicates the specified number of transactions if TRENB is 0b. Indicates the number of the currently counted transaction if TRENB is 1b.

(a) Transaction counter (TRNCNT) bits

When software writes 1 to the TRENB bit after setting the total number of packets to be received for the selected pipe in the receiving direction, this module performs the control described in **(a) Transaction counter enable (TRENB) bit**.

When the TRENB bit is 0, this module indicates, by these bits, the number of transactions set.

When the TRENB bit is 1, this module indicates, by these bits, the current number of transactions counted.

This module increments the value of the TRNCNT bits by 1 when the status of reception meets all the following conditions a) to c):

a) The TRENB bit is 1.

b) When a packet is received, the value of the TRCNT bits is not equal to “current count + 1.”

c) The payload size of received packets has reached the value of the MXPS bits.

This module clears the TRNCNT bits to 0 when any of the following conditions (1) to (3) is met:

(1) All the following conditions a) to c) are met:

a) The TRENB bit is 1.

b) When a packet is received, the value of the TRCNT bits is equal to “current count + 1. ”

c) The payload size of received packets has reached the value of the MXPS bits.

(2) Both of the following conditions a) and b) are met:

a) The TRENB bit is 1.

b) A short packet has been received.

(3) The following condition is met:

a) Written 1 to the TRCLR bit.

For the pipe in the sending direction, write 0 to these bits (TRNCNT bits). When not using the transaction count function, write 0 to these bits.

Changing the value of these bits for a selected pipe must be done while the PID of the selected pipe is NAK and the TRENB bit is 0.

If you change the value of this bit for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that, and the PBUSY bit is 0 before changing the value of this bit. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

If you change the value of these bits, write 1 to the TRCLR bit before writing 1 to the TRENB bit.

6.5.3.2.18 Low Power Control Register

(1) Low Power Control Register (USB20_FUNC_LPCTRL)

Access Size : 16 bits
Address : <USB20_func_base> + 0100h
Initial Value : 0000h

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	HWUPM	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
R/W	R	R	R	R	R	R	R	R	RW	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 8	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
7	HWUPM	0h	RW	0b: Resumes the PHY from the low-power mode while the internal bus clock (P1φ) is operating. 1b: Enables resume from the low-power mode while the internal bus clock (P1φ) is stopped.
6 to 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.

(a) HWUPM

This bit is used to specify whether to enable resumption from the low-power mode even while the internal bus clock (P1ϕ) is stopped.

0: Disables resumption while the internal bus clock (P1ϕ) is stopped.
1: Enables resumption while the internal bus clock (P1ϕ) is stopped.

This bit specifies whether to detect resume signaling while the internal bus clock (P1ϕ) is stopped. Whether to resume is controlled by the L1EXTMD bit. To resume from the low-power mode (LPM L1 state) while the internal bus clock (P1ϕ) is stopped, set both this bit and the L1EXTMD bit.

6.5.3.2.19 Low Power Status Register

(1) Low Power Status Register (USB20_FUNC_LPSTS)

Access Size : 16 bits
Address : <USB20_func_base> + 0102h
Initial Value : 0000h

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	SUSPM	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
R/W	R	RW	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15	-	0h	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
14	SUSPM	0h	RW	USBPHY Suspend M control This bit controls the Suspend M signal to the USBPHY. 0b: USBPHY suspend mode 1b: USBPHY normal mode
13 to 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.

(a) USB2PHY SuspendM control (SUSPM) bit

This bit is used to control the SuspendM signal to the USB2PHY. By default, the value of this bit is 0 and the USB2PHY is in suspend mode. To operate this module, write 1 to this bit.

When the SUSPM bit is 0 (that is, when the UTMI clock is stopped), data cannot be written to this module, but can only be read from this module. Note, however, that data can be written to the registers listed in **Table 6.5-27**.

Table 6.5-27 Registers That Allow Writing when the SUSPM Bit is 0

Address	Register Name
000h	SYSCFG0
002h	BUSWAIT
100h	LPCTRL
102h	SUSPMODE

Note that the values written to the SYSCFG0 register while the USB2PHY clock is stopped (SUSPM = 0) will be applied after the USB2PHY clock starts (SUSPM = 1).

When the L1EXTMD bit is 0, this bit (SUSPM bit) is controlled (set or cleared) by software. When L1EXTMD bit is 1, this bit is controlled by software for the transition to the L1 or L2 state, and controlled by hardware for resumption from the L1 or L2 state, regardless of the level (L1 or L2).

6.5.3.2.20 PHY Function Control Register

(1) PHY Function Control Register (USB20_FUNC_PHYFUNCTR)

Access Size : 16 bits
Address : <USB20_func_base> + 0104h
Initial Value : 0000h

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	SusMon	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15	-	0h	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
14	SusMon	0h	R	This bit allows reading of the status of the Suspend M signal.
13 to 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.

(a) SusMon

SuspendM monitor bit (read only)

The status of the Suspend M signal can be read.

6.5.3.2.21 PHY_OTG Control Register

(1) PHY_OTG Control Register (USB20_FUNC_PHYOTGCTR)

Access Size : 16 bits
Address : <USB20_func_base> + 010Ah
Initial Value : 0600h

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	DmPuDwn	DpPuDwn	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	1	1	0	0	0	0	0	0	0	0	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 11	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
10	DmPuDwn	1h	R	Dm Pulldown monitor bit
9	DpPuDwn	1h	R	Dp Pulldown monitor bit
8 to 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.

(a) DmPuDwn

DmPulldown monitor bit (read only)

0: 15-kΩ Pulldown resistor control on the DM side is disabled.
1: 15-kΩ Pulldown resistor control on the DM side is enabled.

(b) DpPuDwn

DpPulldown monitor bit (read only)

0: 15-kΩ Pulldown resistor control on the DP side is disabled.
1: 15-kΩ Pulldown resistor control on the DP side is enabled.

6.5.3.2.22 Peripheral L1 Control Register 1

(1) Peripheral L1 Control Register 1 (USB20_FUNC_PL1CTRL1)

Access Size : 16 bits
Address : <USB20_func_base> + 0144h
Initial Value : 0000h

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	L1EXTMD	-	-	HIRDTHR[3:0]				DVSQ3	DVSQ(2:0)[2:0]			L1NEGOMD	L1RESPMD[1:0]		L1RESPEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
R/W	R	–	R	R	RW	RW	RW	RW	R	R	R	R	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
15	-	0h	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
14	L1EXTMD	0h	–	USBPHY control mode on resumption from the L1 state This bit controls the USBPHY resume operation on resumption from the L1 state. 0b: Does not set the Suspend M bit when the Host K signal is received. 1b: Sets the Suspend M bit when the Host K signal is received
13, 12	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
11 to 8	HIRDTHR[3:0]	0h	RW	L1 response negotiation threshold HIRD threshold to be used for the L1NEGOMD bit The format is the same as the HIRD field of the HL1CTRL register.
7	DVSQ3	0h	R	DVSQ extension bit This bit combined with the device state (DVSQ[2:0]) bit indicates the L1 state. 0000b: Powered state 0001b: Default state 0010b: Address state 0011b: Configured state 01xxb: Suspended state 10xxb: L1 state
6 to 4	DVSQ(2:0)[2:0]	0h	R	These bits mirror the DVSQ[2:0] bits in INTSTS0.
3	L1NEGOMD	0h	RW	L1 response negotiation control This bit sets the negotiation function using for the HIRD value. 0b: Returns an ACK response if the received HIRD value is larger than the value of the HIRDTHR[3:0] bits. In other cases (including same values), an NYET response is returned. 1b: Returns an ACK response if the received HIRD value is smaller than the value of the HIRDTHR[3:0] bits. In other cases (including same values), an NYET response is returned. This bit is valid only when the value of the L1RESPMD[1:0] bit is 11b.
2, 1	L1RESPMD[1:0]	0h	RW	L1 response mode These bits specify how to respond to an LPM token. 00b: NYET 01b: ACK 10b: STALL 11b: Response according to the value of the L1NEGOMD bit
0	L1RESPEN	0h	RW	L1 response enable This bit enables an L1 response. 0b: Does not support LPM. 1b: Supports LPM.

(a) L1 EXT mode (L1EXTMD) bit

This bit specifies how to control the SuspendM bit upon receiving the Host K signal when the USB2PHY is stopped by setting the SuspendM bit in the L1 state.

0: Does not set the SuspendM bit when this module is resumed from the L1 state.
1: Sets the SuspendM bit when this module is resumed from the L1 state.

Remark 1. The Host K period lasts a minimum of 50 µs. Therefore, the USB2PHY might be unable to be resumed within the Host K period if the software settings for resume same as those for the suspend state are applied. Because the initial value of this bit is controlled by software, set this bit at initialization when the L1 state is to be supported.
For the transition to the L1 state, the SuspendM bit is controlled by software regardless of the value of this bit.

Remark 2. When this bit is set, the SuspendM bit will be set also at resumption from the L2 state.

(b) HIRD negotiation threshold (HIRDTHR[3:0]) bits

These bits specify the value of HIRD threshold to be used for the negotiation specified by the L1NEGOMD bit.

The format of the value is the same as that of the HIRD field in the HL1CTRL register.

(c) Device state extension (DVSQ[3]) bit

This bit is used as the fourth bit for the device state (DVSQ) bits.

0000b: Powered state
0001b: Default state
0010b: Address state
0011b: Configured state
01xxb: Suspended state
10xxb: L1 state

(d) Device status (DVSQ[2:0]) bits

These bits mirror the DVSQ[2:0] bits in the Interrupt Status Register (INTSTS0).

(e) L1 negotiation mode (L1NEGOMD) bit

This bit is used to specify the negotiation function using the HIRD value.

0: Returns an ACK response when the received HIRD value is larger than the value in HIRDTHR[3:0] bits, or returns an NYET response in other cases.

1: Returns an ACK response when the received HIRD value is smaller than the value in HIRDTHR[3:0] bits, or returns an NYET response in other cases.

This bit is valid only when the value of L1RESPMD[1:0] bits is 11b.

(f) L1 response mode (L1RSPMD[1:0]) bits

When the L1RSPED bit is set, this module respond to an LPM token according to the value of these bits. These bits specify how to respond to the LPM token.

00b: NYET
01b: ACK
10b: STALL
11b: Response according to the value of L1NEGOMD bit

(g) L1 response enable (L1RSPEN) bit

When this bit is 0, this module does not respond to the LPM token it receives. When this bit is 1, this module responds to the LPM token (it receives) according to the value of the LPMRESPMD[1:0] bits.

6.5.3.2.23 Peripheral L1 Control Register 2

(1) Peripheral L1 Control Register 2 (USB20_FUNC_PL1CTRL2)

Access Size : 16 bits
Address : <USB20_func_base> + 0146h
Initial Value : 0000h

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	RWEMON	HIRDMON[3:0]				-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
R/W	R	R	R	RW	RW	RW	RW	RW	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 13	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
12	RWEMON	0h	RW	This bit reflects the value of the RWE bit in the LPM token received last.
11 to 8	HIRDMON[3:0]	0h	RW	These bits reflect the value of the HIRD field in the LPM token received last.
7 to 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.

(a) RWE value monitor (RWEMON) bit

This bit is referenced to monitor the value of the RWE bit in a received LPM token.

This bit reflects the value of the RWE bit in the LPM token received last.

(b) HIRD value monitor (HIRDMON) bits

These bits are referenced to monitor the value of the HIRD field in a received LPM token.

These bits reflect the value of the HIRD field in the LPM token received last.

6.5.3.2.24 Next Register Set

(1) Next Source Address Register n

(a) Next k Source Address Register ch n (USB20_FUNC_NkSA_n) (k = 0, 1; n = 0, 1)

Access Size : 32 bits

Address : <USB20_func_base> + 0400h + k x 000Ch + n x 00040h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SA (in normal mode), WD (in writeonly mode)[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SA (in normal mode), WD (in writeonly mode)[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SA (in normal mode), WD (in writeonly mode)[31:0]	0h	RW	SA (in normal mode): Source Address These bits specify the start address of the DMA transfer source. WD (in write-only mode): Write Data These bits specify the write data in write-only mode.

Note: In a transfer in link mode, the data in the N0SA_n register is overwritten with the descriptor read data.

(2) Next Destination Address Register n

(a) Next k Destination Address Register ch n (USB20_FUNC_NkDA_n) (k = 0, 1; n = 0, 1)

Access Size : 32 bits

Address : <USB20_func_base> + 0404h + k x 000Ch + n x 00040h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DA[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DA[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DA[31:0]	0h	RW	Destination Address These bits specify the start address of the DMA transfer destination.

Note: In a transfer in link mode, the data in the N0DA_n register is overwritten with the descriptor read data.

(3) Next Transaction Byte Register n

(a) Next k Transaction Byte Register ch n (USB20_FUNC_NkTB_n) (k = 0, 1; n = 0, 1)

Access Size : 32 bits

Address : <USB20_func_base> + 0408h + k x 000Ch + n x 00040h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TB[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TB[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	TB[31:0]	0h	RW	Transaction Byte These bits specify the total number of transfer bytes. Note: Do not start a DMA transaction with 0b set in these bits.

Note: The N0TB_n register is overwritten by the descriptor read data during link mode transfer.

6.5.3.2.25 Current Register Set

(1) Current Source Address Register

(a) Current Source Address Register ch n (USB20_FUNC_CRSA_n) (n = 0, 1)

Access Size : 32 bits

Address : <USB20_func_base> + 0418h + n x 0040h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CRSA[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CRSA[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CRSA[31:0]	0h	R	Current Source Address Register This register indicates the read address for the next DMA transaction. The value of this register is incremented automatically while DMA transactions are in process. (When the SAD bit in the CHCFG_n register is 1b, the value of this register is fixed. When the WONLY bit in the CHCFG_n register is 1b, the value of this register is undefined.) The initial value of this register is loaded from the following register: In register mode: A transfer source address is loaded from the Next0/1 Register Set. In link mode: A transfer source address is loaded from the descriptor. (The descriptor read data is input to the N0SA_n register, and is loaded into the CRSA_n register when a transfer starts.) The value of this register is incremented when a read transfer ends. Read this register after DMA stops (that is, after the TACT bit in the CHSTAT_n register is cleared). (Handle the value read during DMA only as a reference value.)

(2) Current Destination Address Register

(a) Current Destination Address Register ch n (USB20_FUNC_CRDA_n) (n = 0, 1)

Access Size : 32 bits

Address : <USB20_func_base> + 041Ch + n x 0040h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CRDA[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CRDA[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CRDA[31:0]	0h	R	Current Destination Address Register This register indicates the write address for the next DMA transaction. The value of this register is incremented automatically while DMA transactions are in process. (When the DAD bit in the CHCFG_n register is 1b, the value of this register is fixed.) The initial value of this register is loaded from the following register: In register mode: A transfer destination address is loaded from the Next0/1 Register Set. In link mode: A transfer destination address is loaded from the descriptor. (The descriptor read data is input to the N0DA_n register, and is loaded into the CRDA_n register when a transfer starts.) The value of this register is incremented when a write transfer ends. Read this register after DMA stops (that is, after the TACT bit in the CHSTAT_n register is cleared). (Handle the value read during DMA only as a reference value.)

(3) Current Transaction Byte Register

(a) Current Transaction Byte Register ch n (USB20_FUNC_CRTB_n) (n = 0, 1)

Access Size : 32 bits

Address : <USB20_func_base> + 0420h + n x 0040h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CRTB[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CRTB[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CRTB[31:0]	0h	R	Current Transaction Byte Register This register indicates the remaining number of transfer bytes in the ongoing DMA transaction. The value of this register is decremented automatically while the DMA transaction is in process. The initial value of this register is loaded from the following register: In register mode: The number of transfer bytes is loaded from the Next0/1 Register Set. In link mode: The number of transfer bytes is loaded from the descriptor. (The descriptor read data is input to the N0TB_n register, and is loaded into the CRTB_n register when a transfer starts.) The value of this register is decremented when a write transfer ends. Read this register after DMA stops (that is, after the TACT bit in the CHSTAT_n register is cleared). (Handle the value read during DMA only as a reference value.)

6.5.3.2.26 Channel Register Set

(1) Channel Status Register n

(a) Channel Status Register ch n (USB20_FUNC_CHSTAT_n) (n = 0, 1)

Access Size : 32 bits

Address : <USB20_func_base> + 0424h + n x 0040h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DNUM[7:0]								-	-	-	-	-	SWPRQ	DMARQM	INTM
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	MODE	DER	DW	DL	SR	TC	END	ER	SUS	TACT	RQST	EN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	DNUM[7:0]	0h	R	Data Number These bits indicate the amount of valid data in the buffer. The indicated amount of data is the amount of the data that was read from the source but has not yet been written to the destination. (Unit: byte) Incrementing condition: A DMA read transfer ends. Decrementing condition: A DMA write transfer ends. Clearing conditions: A condition for clearing the EN bit is met. 1b is written to the SWRST bit in the CHCTRL_n register.
23 to 19	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
18	SWPRQ	0h	R	Sweep Request This bit indicates the state of sweep request. This bit indicates the state of software sweep request (which has been activated by the SETSSWPRQ bit in the CHCTRL_n register). 1b: The sweep request signal has been asserted. 0b: The sweep request signal has not been asserted. Setting condition: The SETSSWPRQ bit in the CHCTRL_n register is asserted. Clearing conditions: The buffer becomes empty because of sweep. 1b is written to the CLRHSWPRQM bit in the CHCTRL_n register. 1b is written to the SWRST bit in the CHCTRL_n register.
17	DMARQM	0h	R	DMAREQ Mask This bit indicates the state of temporary masking of the DMA transfer request from the USB control. 1b: The request is temporarily masked. 0b: The request is released from temporary masking. Setting condition: The SETDMARQM bit in the CHCTRL_n register is set. Clearing conditions: 1b is written to the CLRDMARQM bit in the CHCTRL_n register. 1b is written to the SWRST bit in the CHCTRL_n register.

Bit	Bit Name	Initial Value	R/W	Description
16	INTM	0h	R	Interrupt Mask This bit indicates the state of temporary masking of the output from the USBFDMAmn interrupt. 1b: The output is temporarily masked. 0b: The output is released from temporary masking. Setting condition: 1b is written to the SETINTM bit in the CHCTRL_n register. Clearing conditions: 1b is written to the CLRINTM bit in the CHCTRL_n register. 1b is written to the SWRST bit in the CHCTRL_n register.
15 to 12	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
11	MODE	0h	R	DMA Mode This bit indicates the DMA mode. The indicated value is the value of the DMS bit in the CHCFG_n register. 0b: Register mode 1b: Link mode
10	DER	0h	R	Descriptor Error This bit indicates whether the data read from the descriptor is invalid (LV = 0) (regardless of the value of the DIM bit in the CHCFG_n register). 0b: No descriptor error has occurred. 1b: A descriptor error has occurred. Setting condition: In link mode, when the DRRP bit in the CHCFG_n register is 0b, the LV bit value read from the descriptor is 0b. Clearing conditions: 1b is written to the CLRDER bit in the CHCTRL_n register. 1b is written to the SWRST bit in the CHCTRL_n register.
9	DW	0h	R	Descriptor Writeback This bit indicates whether data is being written back to the descriptor. If a bus error occurs during write-back to the descriptor, this bit retains 1b. 0b: Status other than write-back to the header in link mode 1b: (When the ER bit in the CHSTAT_n register is 0b) Data is being written back to the header in link mode. (When the ER bit in the CHSTAT_n register is 1b) A bus error has occurred during write-back to the header in link mode. Setting condition: Write-back to the header is started in link mode. Clearing conditions: Write-back to the header in link mode ends with an OK response. 1b is written to the SWRST bit in the CHCTRL_n register. If the bit retains 1b because of an error response, this bit can be cleared only by setting the SWRST bit.
8	DL	0h	R	Descriptor Load This bit indicates whether data is being read from the descriptor. If a bus error occurs during descriptor reading, this bit retains 1b. 0b: Status other than descriptor reading 1b: (When the ER bit is 0b) Descriptor reading is in process in link mode. (When the ER bit is 1b) A bus error has occurred during descriptor reading in link mode. Setting condition: Descriptor reading is started in link mode. Clearing conditions: Descriptor reading in link mode ends with an OK response. 1b is written to the SWRST bit in the CHCTRL_n register. If the bit retains 1b because of an error response, this bit can be cleared only by setting the SWRST bit.
7	SR	0h	R	Selected Register Set In register mode, this bit indicates the register set that is selected. 0b: Next0 Register Set 1b: Next1 Register Set Setting condition: The RSEL bit in the CHCFG_n register is set. Clearing condition: The RSEL bit in the CHCFG_n register is cleared.

Bit	Bit Name	Initial Value	R/W	Description
6	TC	0h	R	Terminal Count This status bit indicates whether the DMA transaction has ended. This bit is set only when the TCM bit in the CHCFG_n register is 0b. 0b: The DMA transfer has not ended. 1b: The DMA transfer has ended. Setting conditions: In register mode, transfer of the total number of transfer bytes specified in the CRTB bits ends. In link mode, when the WBD bit in the header of the descriptor is 1b, transfer of the total number of transfer bytes specified in the CRTB bits ends. In link mode, when the WBD bit in the header of the descriptor is 0b, write-back to the descriptor ends. Clearing conditions: 1b is written to the CLRTC bit in the CHCTRL_n register. 1b is written to the SWRST bit in the CHCTRL_n register.
5	END	0h	R	USBFDMAmn Interrupted This bit indicates whether the DMA transaction has ended and an USBFDMAmn interrupt has occurred. 0b: The DMA transfer has not ended. 1b: The DMA transfer has ended. Setting conditions: The condition for setting the TC bit is met, and the DEM bit in the CHCFG_n register is 0b. In link mode, when the descriptor is read, the LV bit in the header is 0b, and the DRRP and DIM bits in the CHCFG_n register are 0b. Clearing conditions: 1b is written to the CLREND bit in the CHCTRL_n register. 1b is written to the SWRST bit in the CHCTRL_n register.
4	ER	0h	R	Error This bit indicates whether an error response has been received and a DMAERR interrupt has occurred during the DMA transfer. 0b: No error response has been received. 1b: An error response has been received. Setting condition: An error response is received in a bus cycle. Clearing condition: 1b is written to the SWRST bit in the CHCTRL_n register.
3	SUS	0h	R	Suspend This bit indicates whether the channel is suspended. For details, see **6.5.3.9.13(8)(b) Suspension**. 0b: Channel_n is not suspended. 1b: Channel_n is suspended. Setting condition: 1b is written to the SETSUS bit in the CHCTRL_n register during the DMA transfer using channel_n, and, thereby, the inside of the channel is suspended. Clearing conditions: 1b is written to the CLRSUS bit in the CHCTRL_n register. 1b is written to the CLREN bit in the CHCTRL_n register. A condition for clearing the EN bit in the CHSTAT_n register.
2	TACT	0h	R	Transaction Active This bit indicates whether the DMAC is operating. This bit is used to check whether the channel is stopped fully. For details, see **6.5.3.9.13(8) Transfer state**. 0b: The DMA in channel_n is stopped. 1b: The DMA in channel_n is operating. Setting condition: 1b is written to the SETEN bit in the CHCTRL_n register (to start descriptor reading or wait for a DMA request). Clearing condition: The internal state is the idle state (the EN bit in the register has been cleared, and all transfers have ended).

Bit	Bit Name	Initial Value	R/W	Description
1	RQST	0h	R	Request This bit indicates whether a transfer request has been received. 0b: No DMA transfer request has been received. 1b: A DMA transfer request has been received. Setting conditions: 1b is written to the STG bit in the CHCTRL_n register. A DMA transfer request is received from the USB control. Clearing conditions: 1b is written to the SWRST bit in the CHCTRL_n register. 1b is written to the CLRRQ bit in the CHCTRL_n register. In single transfer mode (the TM bit in the CHCFG_n register is 0b), a transfer is executed on the side specified by the REQD bit in the CHCFG_n register In register mode, all DMA transactions are complete (the REN bit in the CHCFG_n register is 0b). In link mode, the DMA transfer of the last descriptor (LE = 1) ends. In link mode, a DMA transfer is stopped during descriptor reading (the LV bit is 0b and the DRRP bit in the CHCFG_n register is 0b). In link mode, when the DEM bit in the CHCFG_n register is 0b, a DMA transaction ends. The master interface receives a bus error signal.
0	EN	0h	R	Enable This bit indicates whether the operation of DMA channel n is enabled or stopped. 0b: Operation is stopped. 1b: Operation is enabled. Setting conditions: 1b is written to the SETEN bit in the CHCTRL_n register. Clearing conditions: 1b is written to the SWRST bit in the CHCTRL_n register. 1b is written to the CLREN bit in the CHCTRL_n register. An error response is received during transfer. In register mode, all DMA transactions are completed (the REN bit in the CHCFG_n register is 0b). In link mode, DMA transfer of the last descriptor (the LE bit is 1b) ends (if the WBD bit is 0b, write- back to the descriptor ends). In link mode, reading of a descriptor is stopped (the LV bit is 0b and the DRRP bit in the CHCFG_n register is 0b).

Note: When the ER bit in the CHSTAT_n register is set, treat the corresponding series of transfers as invalid transactions.

Note: To interrupt a DMA transaction, mask or clear transfer requests or clear the EN bit in the CHSTAT_n register. (For the procedure to interrupt, see **Section 6.5.3.3.13(8) (c), Transfer suspension**.)

Note: If the DMA transfer request from the USB control and the transfer request by software (setting the STG bit in the CHCFG_n register) are used together, the cause of activating the request that is enabled cannot be identified. Therefore, design the system so that only one type of transfer requests is used.

Note: When using the transfer request by software, operate the STG bit for a new transfer request only after the DMA transfer requested last ends (after checking the end of the last DMA transfer by referencing the Current Register Set or another method).

(2) Channel Control Register n

(a) Channel Control Register ch n (USB20_FUNC_CHCTRL_n) (n = 0, 1)

Access Size : 32 bits

Address : <USB20_func_base> + 0428h + n x 0040h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	CLRDMARQM	SETDMARQM	CLRINTM	SETINTM
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	SETSSWPRQ	-	SETREN	-	-	CLRSUS	SETSUS	CLRDER	CLRTC	CLREND	CLRRQ	SWRST	STG	CLREN	SETEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	RW	R	RW	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 20	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
19	CLRDMARQM	0h	RW	Clear DMAREQ Mask Writing 1b to this bit releases the DMA transfer requests from the USB control from temporary masking. Writing 1b to this bit also clears the DMARQM bit in the CHSTATn register. When this bit is read, 0b is read. 1b: Releases the DNA transfer requests from masking set by using the SETDMARQM bit. 0b: Has no effect on operation.
18	SETDMARQM	0h	RW	SET DMAREQ Mask Writing 1b to this bit temporarily masks the DMA transfer requests from the USB control. Writing 1b to this bit also sets the DMARQM bit in the CHSTATn register. When this bit is read, 0b is read. 1b: Masks the DMA transfer requests from the USB control. 0b: Has no effect on operation.
17	CLRINTM	0h	RW	Clear Interrupt Mask Writing 1b to this bit releases the USBFDMAmn interrupt from masking. Writing 1b to this bit also clears the INTM bit in the CHSTATn register. Releasing the INT_DMA[n] pin output from masking when the LVINT bit in the DCTRL register and the END bit in the CHSTAT_n register are 1b activates the INT_DMA[n] pin output. (The pin output is not activated if the LVINT bit is 0b.) When this bit is read, 0b is read. 1b: Releases the pin output from masking set by using the SETINTM bit. 0b: Has no effect on operation.
16	SETINTM	0h	RW	SETINTMSet Interrupt Mask Writing 1b to this bit temporarily masks the USBFDMAmn interrupt. Writing 1b to this bit also sets the INTM bit in the CHSTATn register. When this bit is read, 0b is read. 1b: Masks the USBFDMAmn interrupt. 0b: Has no effect on operation.
15	-	0h	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
14	SETSSWPRQ	0h	RW	Set Software Sweep Request Writing 1b to this bit sweeps out the data stored in the buffer to the destination (see **6.5.3.9.13(3)(a) Forced software sweeping request**). When this bit is read, 0b is read. 1b: Writes, to the destination, the data that is stored in the buffer and has not yet been written to the destination. 0b: Has no effect on operation. If the destination asserts a hardware request (REQD = 1), the sweep operation cannot be used.

Bit	Bit Name	Initial Value	R/W	Description
13	-	0h	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
12	SETREN	0h	RW	Set Register Set Enable Writing 1b to this bit sets the REN bit in the CHCFG_n register. When this bit is read, 0b is read. 1b: Sets the REN bit in the CHCFG_n register. 0b: Has no effect on operation.
11, 10	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
9	CLRSUS	0h	RW	Clear Suspend Writing 1b to this bit when the SUS bit in the CHSTAT_n register is 1b releases the ongoing DMA transfer from the suspended state. When this bit is read, 0b is read. 1b: Releases the ongoing DMA transfer from the suspended state. 0b: Has no effect on operation.
8	SETSUS	0h	RW	Set Suspend Writing 1b to this bit when the EN bit in the CHSTAT_n register is 1b suspends the ongoing DMA transfer. When this bit is read, 0b is read. 1b: Suspends the ongoing DMA transfer. 0b: Has no effect on operation.
7	CLRDER	0h	RW	Clear DER Writing 1b to this bit clears the DER bit in the CHSTAT_n register. Writing 1b to this bit also clear the USBFDMAmn interrupt. When this bit is read, 0b is read. 1b: Clears the DER bit. 0b: Has no effect on operation.
6	CLRTC	0h	RW	Clear TC Writing 1b to this bit clears the TC bit in the CHSTAT_n register. When this bit is read, 0b is read. 1b: Clears the TC bit. 0b: Has no effect on operation.
5	CLREND	0h	RW	Clear End Writing 1b to this bit clears the END bit in the CHSTAT_n register. Writing 1b to this bit also clear the USBFDMAmn interrupt. When this bit is read, 0b is read. 1b: Clears the END bit. 0b: Has no effect on operation.
4	CLRRQ	0h	RW	Clear Request Writing 1b to this bit clears the RQST bit in the CHSTAT_n register. When this bit is read, 0b is read. 1b: Clears the RQST bit in the CHSTAT_n register. 0b: Has no effect on operation.
3	SWRST	0h	RW	Software Reset Writing 1b to this bit clears individual bits in the CHSTAT_n register (for the bits to be cleared, see the description of each bit). Setting this bit must be done when the EN and TACT bits are 0b. When this bit is read, 0b is read. 1b: Clears individual bits in the CHSTAT_n register. 0b: Has no effect on operation.
2	STG	0h	RW	Software Trigger Writing 1b to this bit makes software set an internal transfer request. If this bit and the SWRST bits are set at the same time, clearing by the SWRST bit takes priority. When this bit is read, 0b is read. 1b: Makes software set a transfer request (set the RQST bit in the CHSTAT_n register). 0b: Has no effect on operation.
1	CLREN	0h	RW	Clear Enable Writing 1b to this bit clears the EN bit in the CHSTAT_n register (for details, see **6.5.3.9.13(8)(c) Transfer suspension**). When this bit is read, 0b is read. 1b: Disables DMA transfers (clears the EN bit in the CHSTAT_n register). 0b: Has no effect on operation.

Bit	Bit Name	Initial Value	R/W	Description
0	SETEN	0h	RW	Set Enable Writing 1b to this bit enables DMA transfers in DMA channel n. If this bit and the SWRST bits are set at the same time, clearing by the SWRST bit takes priority, and DMA transfers do not start. When this bit is read, 0b is read. 1b: Enables DMA transfers (sets the EN bit in the CHSTAT_n register). 0b: Has no effect on operation.

Note: Temporary masking (using the CLRDMARQM, and SETDMARQM bits) of the DMA transfer requests from the USB control applies to only the resources for channel n. Setting the SETDMARQM bit for channel n does not affect the operation of channel m.

(3) Channel Configuration Register

(a) Channel Configuration Register ch n (USB20_FUNC_CHCFG_n) (n = 0, 1)

Access Size : 32 bits

Address : <USB20_func_base> + 042Ch + n x 0040h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DMS	REN	RSW	RSEL	SBE	DIM	TCM	DEM	WONLY	-	DAD	SAD	DDS[3:0]			
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	R	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SDS[3:0]				DRRP	-	-	-	-	-	-	-	REQD	-	-	SEL
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	R	R	R	R	R	R	R	RW	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31	DMS	0h	RW	DMA Mode Select This bit specifies the DMA mode to be used. 0b: Register mode (default) 1b: Link mode
30	REN	0h	RW	Register Set Enable This bit specifies whether to successively perform, after a DMA transaction ends, another DMA transaction using the Next Register Set selected by the RSEL bit. This bit is valid only in register mode. 0b: Does not perform the DMA transaction successively. 1b: Performs the DMA transaction successively. Setting conditions: 1b is written to this bit. 1b is written to the SETREN bit in the CHCTRL_n register. Clearing conditions: 0b is written to this bit. The REN bit is 1b, and a DMA transaction ends. To re-set the REN bit during a transaction, we recommend you to use the SETREN bit in the CHCTRL_n register.
29	RSW	0h	RW	Register Select Switch This bit specifies whether to automatically invert the RSEL bit after a DMA transaction ends. This bit is valid only in register mode. 0b: Does not invert the RSEL bit after a DMA transaction ends. (Default) 1b: Inverts the RSEL bit after a DMA transaction ends.
28	RSEL	0h	RW	Register Set Select This bit is used to select the Next Register Set to be used for the next DMA transaction. This bit is valid only in register mode. When the RSW bit is 1, this bit is inverted automatically at the end of a DMA transaction. 0b: Uses the Next0 Register Set. (Default) 1b: Uses the Next1 Register Set. Transition condition: A DMA transaction ends with the RSW bit set.
27	SBE	0h	RW	Sweep Buffer Enable This bit specifies whether to sweep (write) the data already read and stored in the buffer and stop transfer when the EN bit in the CHSTAT_n register is cleared during a DMA transaction. The sweep mode can be used only when the REQD bit is 0b. 0b: Stops transfer without sweeping out the buffer. (Default) 1b: Stops transfer after sweeping out the buffer.

Bit	Bit Name	Initial Value	R/W	Description
26	DIM	0h	RW	Descriptor Interrupt Mask This bit specifies whether to mask the USBFDMAmn interrupt when the LV bit value read from descriptor header is 0b. 0b: Does not mask the USBFDMAmn interrupt. (Default) 1b: Mask the USBFDMAmn interrupt.
25	TCM	0h	RW	DMATC Mask This bit is used to mask the DMATC signal, which is sent from the DMAC to USB control. When this bit is 1b at the time the DMATC signal is to be output, the DMATC signal is not asserted. Also, the TC bit in the CHSTAT_n register is not asserted in that case. In register mode, this bit is automatically cleared. In link mode, this bit is not cleared automatically. Use this bit when you control DMA transfers by software. 0b: Does not mask the DMATC signal. (Default) 1b: Masks the DMATC signal. Clearing condition: A DMA transaction ends with the TCM bit set.
24	DEM	0h	RW	USBFDMAmn Mask When this bit is 1b at the time the USBFDMAmn interrupt is not asserted. Also, the END bit in the CHSTAT_n register is not asserted in that case. In register mode, this bit is not cleared automatically. In link mode, this bit is automatically cleared. 0b: Does not mask the USBFDMAmn interrupt. (Default) 1b: Masks the USBFDMAmn interrupt. Clearing condition: A DMA transaction ends with the DEM bit set.
23	WONLY	0h	RW	Write Only Mode This bit is used to switch the transfer operation mode to the write-only mode (see **6.5.3.9.12(2) Write only mode**). 0b: Normal operation (default) 1b: Write-only mode
22	-	0h	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
21	DAD	0h	RW	Destination Address Direction This bit specifies the direction of counting the transfer-destination address in DMA channel n. If the transfer destination is on the USB control side, write 1b (fixed) to this bit. 0b: Incrementing (default) 1b: Fixed When the transfer destination uses the skip mode or is beat-unaligned, do not specify 1b (fixed) in this bit.
20	SAD	0h	RW	Source Address Direction This bit specifies the direction of counting the transfer-source address in DMA channel n. If the transfer source is on the USB control side, write 1b (fixed) to this bit. 0b: Incrementing (default) 1b: Fixed When the transfer source uses the skip mode or is beat-unaligned, do not specify 1b (fixed) in this bit.
19 to 16	DDS[3:0]	0h	RW	Destination Data Size These bits specify the size of DMA transfer data. When the transfer destination is on the USB control side, select the normal mode. Use bit 3 to switch between the normal and skip modes. 0b: Normal mode (default) 1b: Skip mode Use bits 2 to 0 to specify the size of transfer data. (For specifiable values, see **Table 6.5-28**.) 000b: 8 bits (default) 001b: 16 bits 010b: 32 bits 011b: 64 bits 100b: 128 bits 101b: 256 bits 110b: 512 bits 111b: Setting prohibited

Bit	Bit Name	Initial Value	R/W	Description
15 to 12	SDS[3:0]	0h	RW	Source Data Size These bits specify the size of DMA transfer data. Use bit 3 to switch between the normal and skip modes. 0b: Normal mode (default) 1b: Skip mode Use bits 2 to 0 to specify the size of transfer data. (For specifiable values, see **Table 6.5-28**.) 000b: 8 bits (default) 001b: 16 bits 010b: 32 bits 011b: 64 bits 100b: 128 bits 101b: 256 bits 110b: 512 bits 111b: Setting prohibited
11	DRRP	0h	RW	Descriptor Read Repeat This bit switches the operation to be performed when the LV value in the header read from the descriptor is 0b. (See **6.5.3.9.12(1)(b) b-1) Operation flow of link mode**.) 0b: This module sets the DER bit in the CHSTAT_n register, and then stops descriptor reading. (Default) 1b: This module keeps reading the same descriptor until the LV value changes to 1b, and, when the LV value becomes 1b, starts the DMA transfer using the values in the descriptor. The interval of descriptor reading is controlled by using the DSCITVL register.
10 to 4	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
3	REQD	0h	RW	Request Direction This bit specifies whether the USB control is on the transfer source side or it is on the transfer destination side. 0b: The USB control is on the transfer source side. (Default) 1b: The USB control is on the transfer destination side.
2, 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
0	SEL	0h	RW	Terminal Select This bit selects the FIFO channel to be used on the USB control side. 0b: D0FIFO 1b: D1FIFO

The range of values specifiable in the SDS[2:0] and DDS[2:0] bits depends on the data bus width, number of implemented buffer stages, and whether the address to be accessed is beat-aligned or not (beat-unaligned). The table below shows the range of specifiable values.

Table 6.5-28 Range of Sizes That Can Be Specified in SDS and DDS Bits

Transfer Address	REQD	SDS[2:0]	DDS[2:0]
Beat aligned	0	This data size should be equal to that of the MBW bits in the DxFIFOSEL register.	8 to 32 bits (000 to 010) 128 to 512 bits (100 to 110)
	1	8 to 32 bits (000 to 010) 128 to 512 bits (100 to 110)	This data size should be equal to that of the MBW bits in the DxFIFOSEL register.
Beat unaligned	0	This data size should be equal to that of the MBW bits in the DxFIFOSEL register.	8 to 32 bits (000 to 010) 128 to 256 bits (100 to 101)
	1	8 to 32 bits (000 to 010) 128 to 256 bits (100 to 101)	This data size should be equal to that of the MBW bits in the DxFIFOSEL register.

Note: When the destination is beat-unaligned with REQD = 0 or the source is beat-unaligned with REQD = 1, specify values in the range of specifiable values for beat-unaligned transfer addresses in both of the SDS[2:0] and DDS[2:0] bits.
Even if the transfer source and destination are beat-aligned when a DMA transaction starts, they might become beat-unaligned in the middle of the transaction when a skip transfer is used. If this might occur, perform settings in the first place on the assumption that the transfer source and destination are beat-unaligned.
If software cannot determine whether the transfer source and/or destination is beat-aligned, use values in the range of specifiable values for beat-unaligned transfer addresses.

(4) Channel Interval Register n

For details, see **(6) Interval Count Function**.

(a) Channel Interval Register ch n (USB20_FUNC_CHITVL_n) (n = 0, 1)

Access Size : 32 bits

Address : <USB20_func_base> + 0430h + n x 0040h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ITVL[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
15 to 0	ITVL[15:0]	0h	RW	Interval These bits specify the DMA transfer interval.

(5) Channel Extension Register n

(a) Channel Extension Register ch n (USB20_FUNC_CHEXT_n) (n = 0, 1)

Access Size : 32 bits

Address : <USB20_func_base> + 0434h + n x 0040h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
R/W	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	DPR[3:0]				-	-	-	-	SPR[3:0]			
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 20	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
19 to 12	-	All 0	RW	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
11 to 8	DPR[3:0]	0h	RW	Destination PROT These bits specify the value to be output to the MHPROT[3:0] pin in a DMA write transfer. The initial value of these bits is 0h.
7 to 4	-	All 0	RW	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
3 to 0	SPR[3:0]	0h	RW	Source PROT These bits specify the value to be output to the MHPROT[3:0] pin in a DMA read transfer. The initial value of these bits is 0h.

6.5.3.2.27 Link Register Set

When software sets a descriptor address in the NXLA_n register and starts the DMAC, hardware loads the value set in the NXLA_n register into the CRLA_n register. Then, the descriptor is read, and the DMAC starts a DMA transaction according to the values read from the descriptor. The value in the NXLA_n register is automatically updated to the Next Link Address value read from the descriptor, and the updated value is used as the descriptor address in the next DMA transaction.

(1) Next Link Address Register n

(a) Next Link Address Register ch n (USB20_FUNC_NXLA_n) (n = 0, 1)

Access Size : 32 bits
Address : <USB20_func_base> + 0438h + n x 0040h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	NXLA[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	NXLA[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	NXLA[31:0]	0h	RW/R	Next Link Address These bits specify the link-destination address. Upper two bits are fixed to 0b, and only the address aligned with a word boundary can be set.

(2) Current Link Address Register n

(a) Current Link Address Register ch n (USB20_FUNC_CRLA_n) (n = 0, 1)

Access Size : 32 bits

Address : <USB20_func_base> + 043Ch + n x 0040h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CRLA[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CRLA[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CRLA[31:0]	0h	R	Current Link Address These bits indicate the address of the descriptor being used for current transaction.

6.5.3.2.28 Skip Register Set

This register set is used to specify settings for a skip (scatter/gather) transfer.

(1) Source Continuous Register n

(a) Source Continuous Register ch n (USB20_FUNC_SCNT_n) (n = 0, 1)

Access Size : 32 bits
Address : <USB20_func_base> + 0600h + n x 0020h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SCNT[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SCNT[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SCNT[31:0]	0h	RW	Source Continuous These bits specify the size of the space to be accessed continuously by source address access. (Unit: byte)

Note: This register is used in pair with the SSKP_n register (see **Figure 6.5-6**). To use this mode, set the SDS[3] bits in the CHCFG_n register to 1b. To perform a skip transfer on the transfer source side, the SAD bit in the CHCFG_n register must not be set to 1b (fixed). Do not perform a skip transfer with the SCNT bits set to 0b.

(2) Source Skip Register n

(a) Source Skip Register ch n (USB20_FUNC_SSKP_n) (n = 0, 1)

Access Size : 32 bits

Address : <USB20_func_base> + 0604h + n x 0020h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SSKP[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SSKP[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SSKP[31:0]	0h	RW	Source Skip These bits specify the size of area to be skipped in a source address access. (Unit: byte)

Note: This register is used in pair with the SCNT_n register (see **Figure 6.5-6**). To use this mode, set the SDS[3] bits in the CHCFG_n register to 1b. To perform a skip transfer on the transfer source side, the SAD bit in the CHCFG_n register must not set to 1b (fixed).

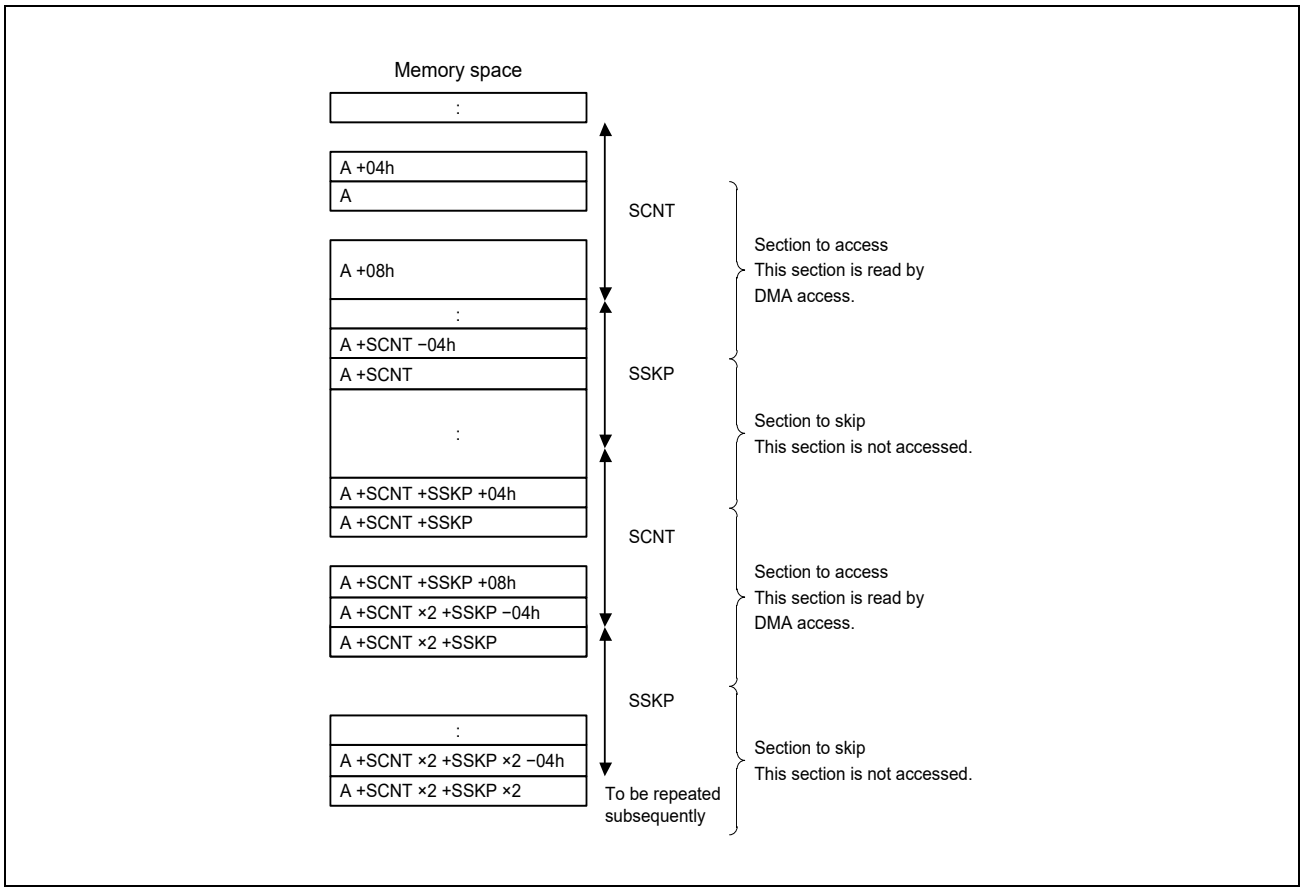


Figure 6.5-6 Relationship between SSKP and SCNT

You can specify values of the SCNT and SSKP bits regardless of the source address and the value of the SDS field in the CHCFG_n register. The DMAC performs access based on the size specified in the SDS field, and fetches only valid data into the buffer (see **(a) Read access**).

(3) Destination Continuous Register n

(a) Destination Continuous Register ch n (USB20_FUNC_DCNT_n) (n = 0, 1)

Access Size : 32 bits

Address : <USB20_func_base> + 0608h + n x 0020h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DCNT[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DCNT[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DCNT[31:0]	0h	RW	Destination Continuous These bits specify the size of the space to be accessed continuously by destination address access. (Unit: byte)

Note: This register is used in pair with the DSKP_n register (see **Figure 6.5-7**). To use this mode, set the DDS[3] bits in the CHCFG_n register to 1b. To perform a skip transfer on the transfer destination side, the DAD bit in the CHCFG_n register must not be set to 1b (fixed). Do not perform a skip transfer with the DCNT bits set to 0b.

(4) Destination Skip Register n

(a) Destination Skip Register ch n (USB20_FUNC_DSKP_n) (n = 0, 1)

Access Size : 32 bits

Address : <USB20_func_base> + 060Ch + n x 0020h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DSKP[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DSKP[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DSKP[31:0]	0h	RW	Destination Skip These bits specify the size of area to be skipped in a destination address access. (Unit: byte)

Note: This register is used in pair with the DCNT_n register (see **Figure 6.5-7**). To use this mode, set the DDS[3] bits in the CHCFG_n register to 1b. To perform a skip transfer on the transfer destination side, the DAD bit in the CHCFG_n register must not be set to 1b (fixed).

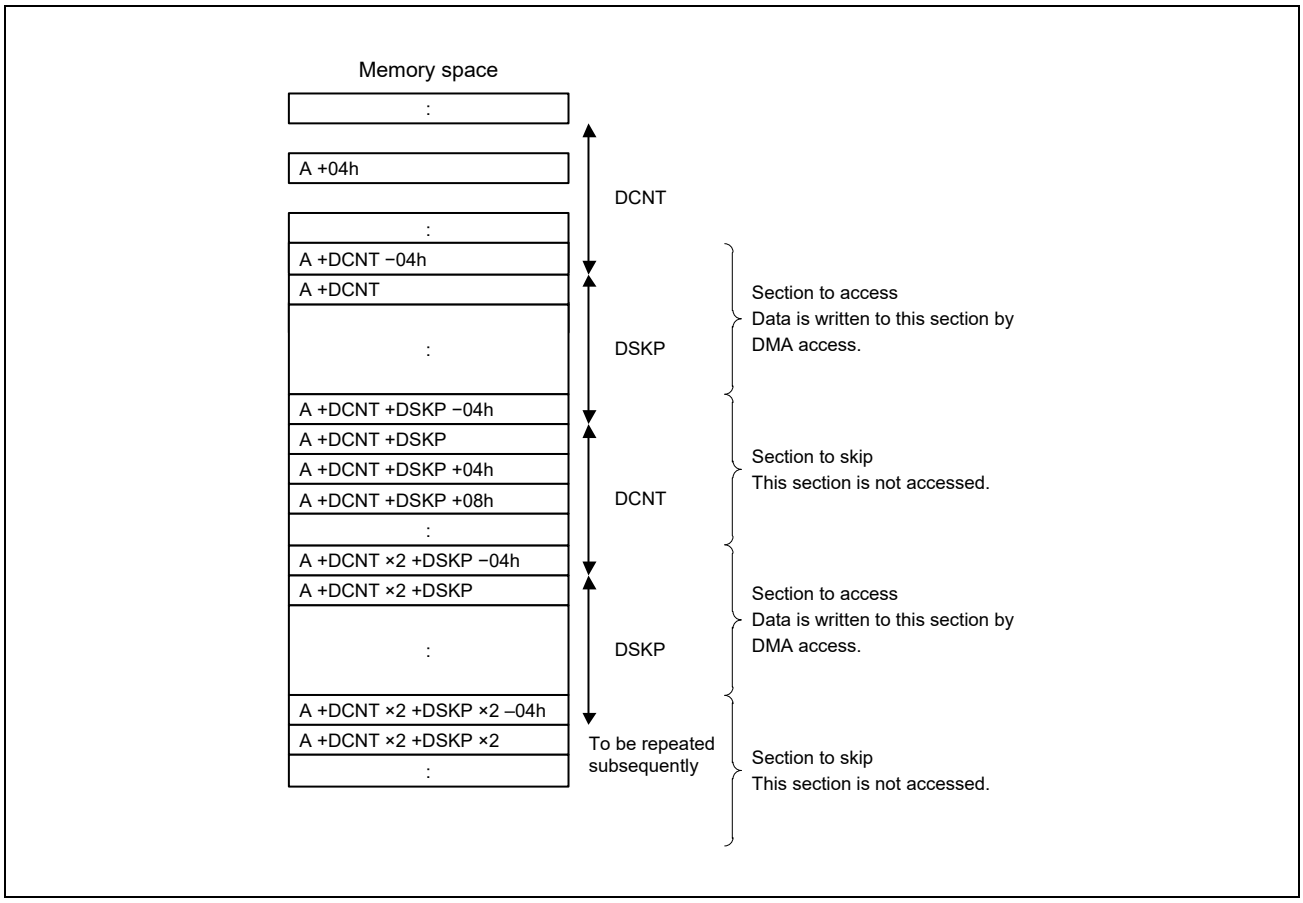

Figure 6.5-7 Relationship between DSKP and DCNT

You can specify values of the DCNT and DSKP bits regardless of the destination address and the value of the DDS field in the CHCFG_n register. The DMAC performs write access to only the specified space that has a combined size not more than the size specified in the DDS field (see **(a) Read access**).

6.5.3.2.29 DMA Register Set

The registers described below are shared by all channels.

(1) DMA Control Register

(a) DMA Control Register (USB20_FUNC_DCTRL)

Access Size : 32 bits
Address : <USB20_func_base> + 0700h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	LWPR[3:0]				-	-	-	-	LDPR[3:0]			
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
R/W	R	R	R	R	RW	RW	RW	RW	R	R	R	R	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	LVINT	PR
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
27 to 24	LWPR[3:0]	0h	RW	Link Writeback PROT These bits specify the value to be output to the MHPROT[3:0] pin at write-back to the descriptor in link mode.
23 to 20	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
19 to 16	LDPR[3:0]	0h	RW	Link Descriptor PROT These bits specify the value to be output to the MHPROT[3:0] pin at reading of the descriptor in link mode.
15 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
1	LVINT	0h	RW	Level Interrupt To use this module, be sure to set this bit to 1b.
0	PR	0h	RW	Priority This bit specifies the transfer priority control mode (see **6.5.3.9.13(2) DMA channel priority control**). 0b: Fixed priority mode 1b: Round-robin mode

(2) Descriptor Interval Register

(a) Descriptor Interval Register (USB20_FUNC_DSCITVL)

Access Size : 32 bits

Address : <USB20_func_base> + 0704h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DITVL[7:0]								-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
R/W	RW	RW	RW	RW	RW	RW	RW	RW	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
15 to 8	DITVL[7:0]	0h	RW	Descriptor Interval These bits specify the interval of descriptor read operation. The descriptor will be reread at intervals of “value of DITVL x 256.”
7 to 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.

(3) DMA Control Register

(a) DMA Status EN Register (USB20_FUNC_DSTAT_EN)

Access Size : 32 bits

Address : <USB20_func_base> + 0710h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	EN1	EN0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
1	EN1	0h	R	This bit indicates the state of the EN bit for DMA channel 1.
0	EN0	0h	R	This bit indicates the state of the EN bit for DMA channel 0.

(4) DMA Status ER Register

(a) DMA Status ER Register (USB20_FUNC_DSTAT_ER)

Access Size : 32 bits

Address : <USB20_func_base> + 0714h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	ER1	ER0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
1	ER1	0h	R	This bit indicates the state of the ER bit for DMA channel 1.
0	ER0	0h	R	This bit indicates the state of the ER bit for DMA channel 0.

(5) DMA Status END Register

(a) DMA Status END Register (USB20_FUNC_DSTAT_END)

Access Size : 32 bits

Address : <USB20_func_base> + 0718h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	END1	END0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
1	END1	0h	R	This bit indicates the state of the END bit for DMA channel 1.
0	END0	0h	R	This bit indicates the state of the END bit for DMA channel 0.

(6) DMA Status TC Register

(a) DMA Status TC Register (USB20_FUNC_DSTAT_TC)

Access Size : 32 bits

Address : <USB20_func_base> + 071Ch

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	TC1	TC0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
1	TC1	0h	R	This bit indicates the state of the TC bit for DMA channel 1.
0	TC0	0h	R	This bit indicates the state of the TC bit for DMA channel 0.

(7) DMA Status SUS Register

(a) DMA Status SUS Register (USB20_FUNC_DSTAT_SUS)

Access Size : 32 bits

Address : <USB20_func_base> + 0720h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	SUS1	SUS0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
1	SUS1	0h	R	This bit indicates the state of the SUS bit for DMA channel 1.
0	SUS0	0h	R	This bit indicates the state of the SUS bit for DMA channel 0.

6.5.3.3 Functions

6.5.3.3.1 System Control and Oscillation Control

This section describes register manipulations required to perform initial setup of this module. This section also describes the registers required to control power consumption.

For the parts of the sequence that are required in both host and peripheral modes, see **6.5.2.9.1 Host/Peripheral Common Setting Sequence**.

(1) USB data bus resistor control

This module controls switchover between the pull-up resistors for the D+ signal and the pull-down resistors for the D- signal of the USB2PHY. Use the DPRPU bit and DRPD bit in the SYSCFG0 register to set pull-up or pull-down of each signal.

Recognize that a connection to the USB host is established, and then set 1 for the DPRPU bit in the SYSCFG0 register to pull up the D+ signal.

After connected to the host, this module automatically switches the resistor when the state changes to reset handshake, suspend, or resume.

If 0 is set for the DPRPU bit in the SYSCFG0 register during communication with the host, the pull-up resistor (or termination resistor) for the USB data line is disabled. This can notify the host controller of disconnection of a device.

6.5.3.3.2 Interrupt Function

(1) Overview of Interrupt Function (other than DMA Master)

The following shows a list of interrupt functions of this module. An interrupt is notified as U2P_IXL_INT. Check the status register to identify the interrupt factor. The interrupt from this module is not asserted when the supply of the internal bus clock (P1ϕ) is stopped.

Table 6.5-29 List of Interrupt functions

Bit	Interrupt name	Interrupt factor	Related status
VBINT	VBUS interrupt	The status change of the VBUS input pin is detected. (Changes from L to H and from H to L are detected.)	VBSTS
RESM	Resume interrupt	In the suspended state, a change of the USB bus status is detected (from J-State to K-State or from J-State to SE0).	—
SOFR	Frame number update interrupt	If SOFRM is 0: An SOF packet with a different frame number is received. If SOFRM is 1: An SOF with µframe number 0 cannot be received due to a problem such as packet corruption.	—
DVST	Device state transition interrupt	A transition of a device state is detected. USB bus reset detected Suspended state detected Set Address request received Set Configuration request received	DVSQ
CTRT	Control transfer stage transition interrupt	A transition of a control transfer stage is detected. Setup stage completed Control Write transfer status stage transition Control Read transfer status stage transition Control transfer completed Control transfer sequence error	CTSQ
BEMP	Buffer empty interrupt	All data in the buffer memory is sent and the buffer becomes empty. A packet exceeding the maximum packet size is received.	PIPEBEMP
NRDY	Buffer not ready interrupt	A token is received when the PID setting is BUF and the buffer memory is not available for sending and receiving data. A CRC error or bit stuff error occurs when data is received in isochronous transfer. An interval error occurs when data is received in isochronous transfer.	PIPENRDY
BRDY	Buffer ready interrupt	The buffer becomes ready (available for reading or writing data).	PIPEBRDY

The following shows the relationship between interrupts of this module.

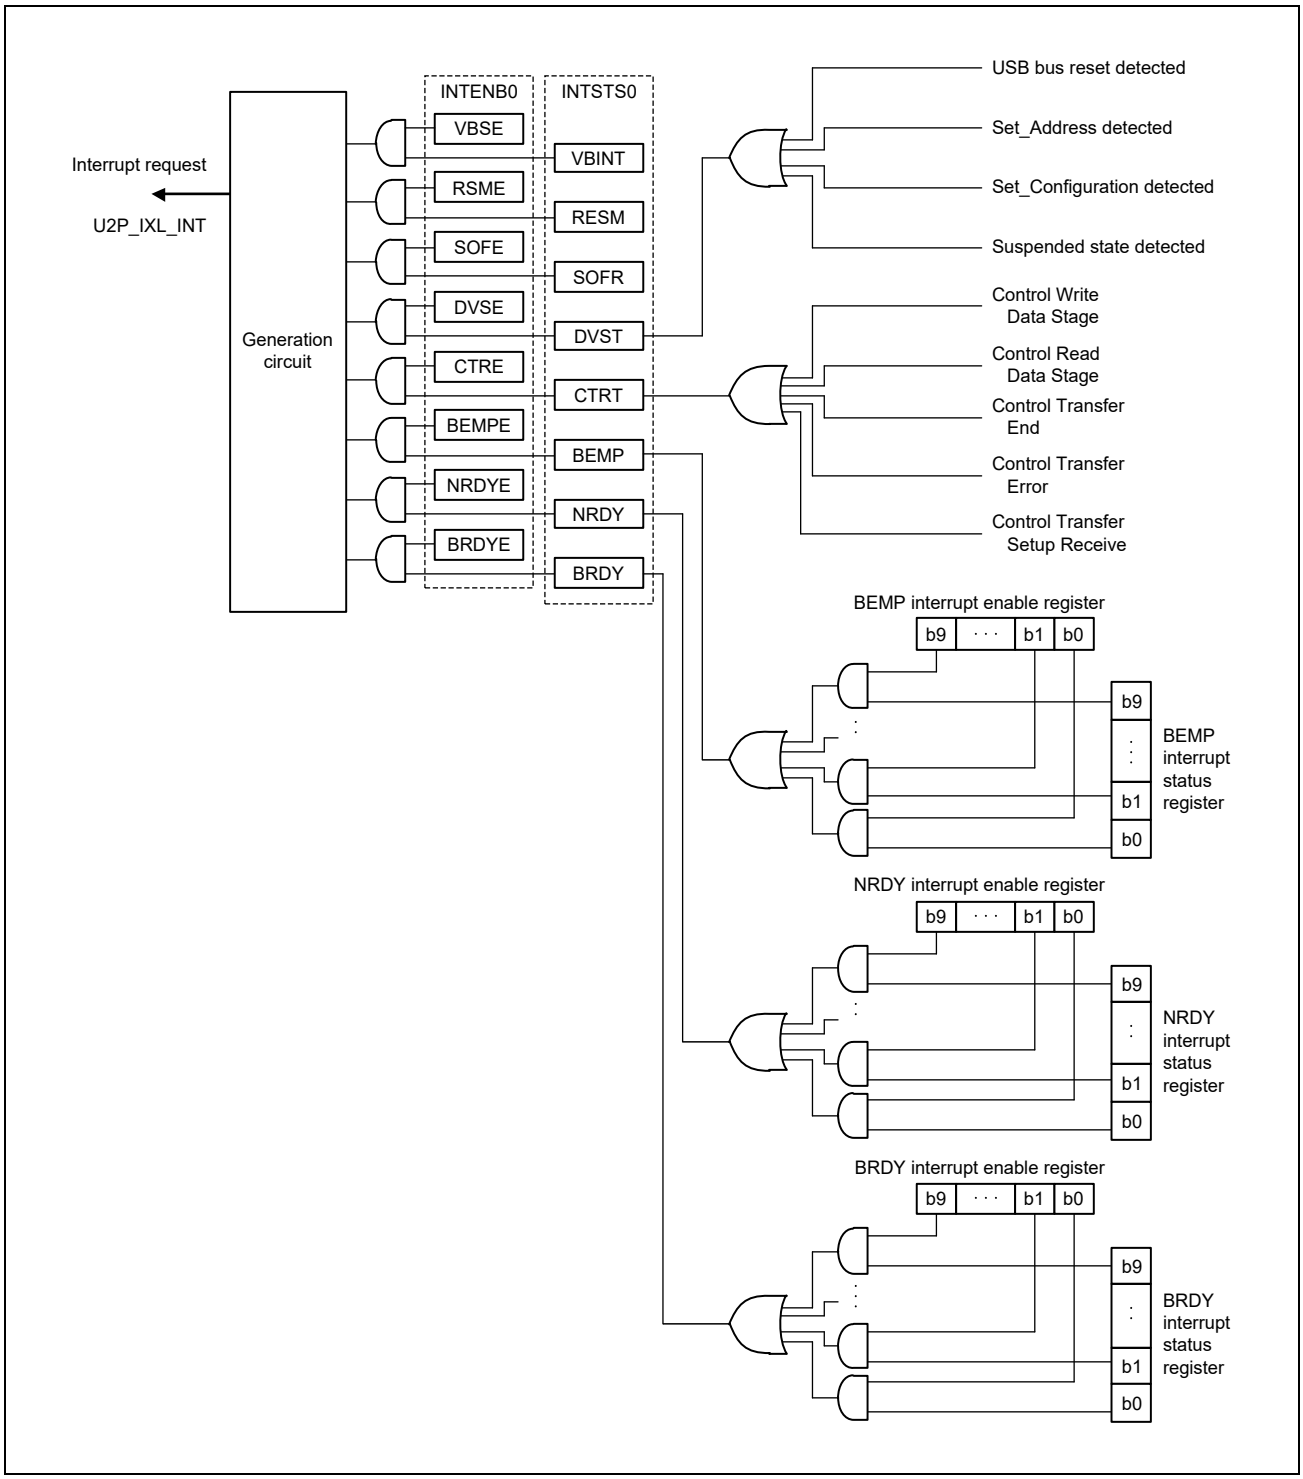

Figure 6.5-8 Interrupt Association Diagram

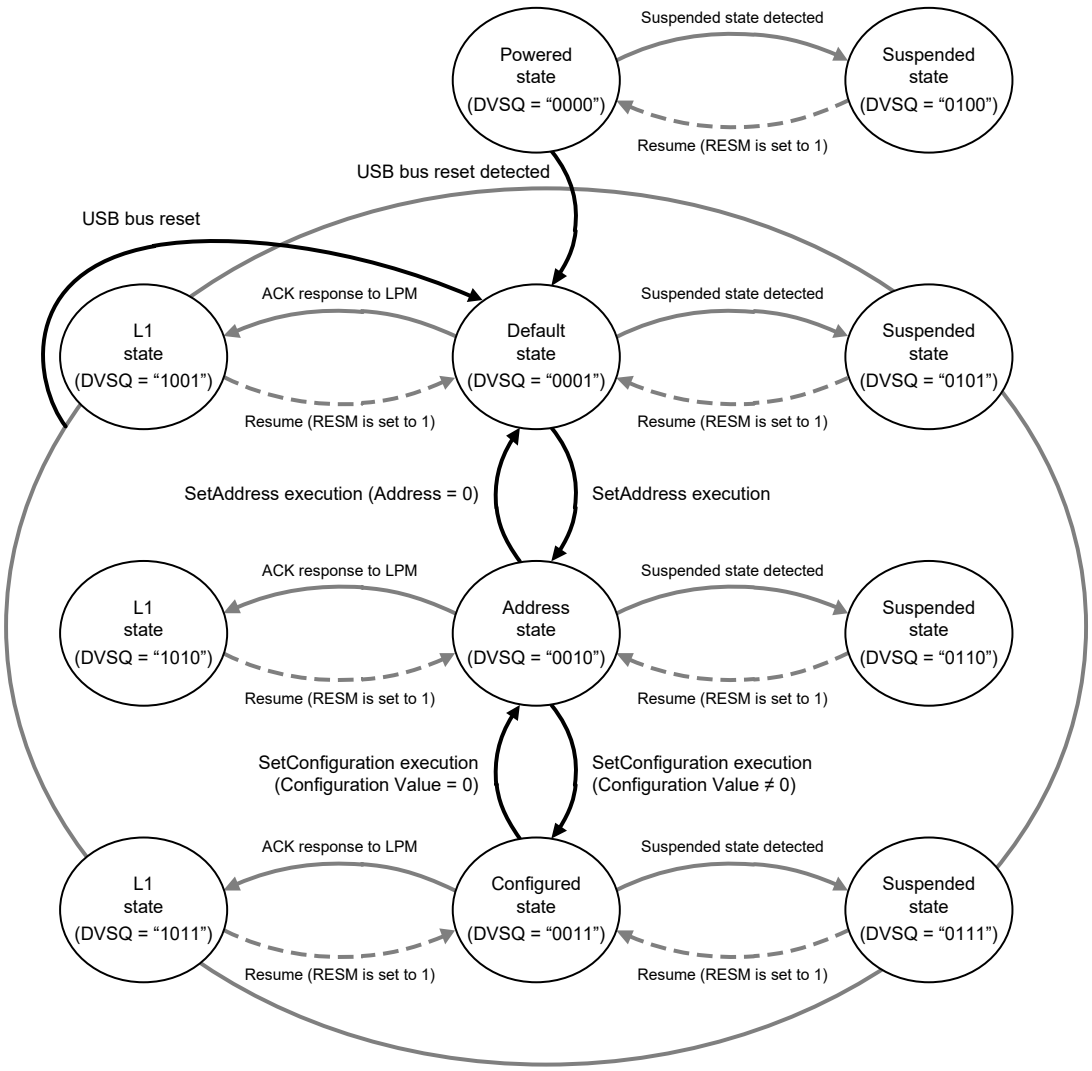
(2) Device State Transition Interrupts

Figure 6.5-9 shows the device state transition diagram of this module.

This module manages device states and generates device state transition interrupts. However, resumption from the suspended state (resume signal detection) is detected by a resume interrupt.

Device state transition interrupts can be enabled and prohibited by using the INTENB0 register. A device state for which a transition has occurred can be checked in the DVSQ bits in the INTSTS0 register.

To trigger a transition to the default state, a device state transition interrupt is generated after a reset hand-shake protocol ends.



Note: When a transition indicated by a solid line occurs, the DVST bits are set to 1.
When a transition indicated by a broken line occurs, the RESM bit is set to 1.

Figure 6.5-9 Device State Transition Diagram

(3) Control Transfer Stage Transition Interrupts

Figure 6.5-10 shows the control transfer stage transition diagram of this module. This module manages a sequence of control transfers, and generates a control transfer stage transition interrupt. Control transfer stage transition interrupts can be enabled and prohibited by using the INTENB0 register. A transfer stage for which a transition has occurred can be checked in the CTSQ bits in the INTSTS0 register.

The following describes sequence errors that can occur during control transfer. If an error occurs, the PID bits in the DCPCTR register are set to 1X (STALL).

(a) For Control Read transfer

a) An OUT or PING token is received in a situation where data has not been transferred yet for an IN token of the data stage.

b) An IN token is received in the status stage.

c) A data packet "DATAPID = DATA0" is received in the status stage.

(b) For Control Write transfer

a) An IN token is received in a situation where an ACK response has not been sent yet for an OUT token of the data stage.

b) The first data packet ”DATAPID = DATA0” is received in the data stage.

c) An OUT or PING token is received in the status stage.

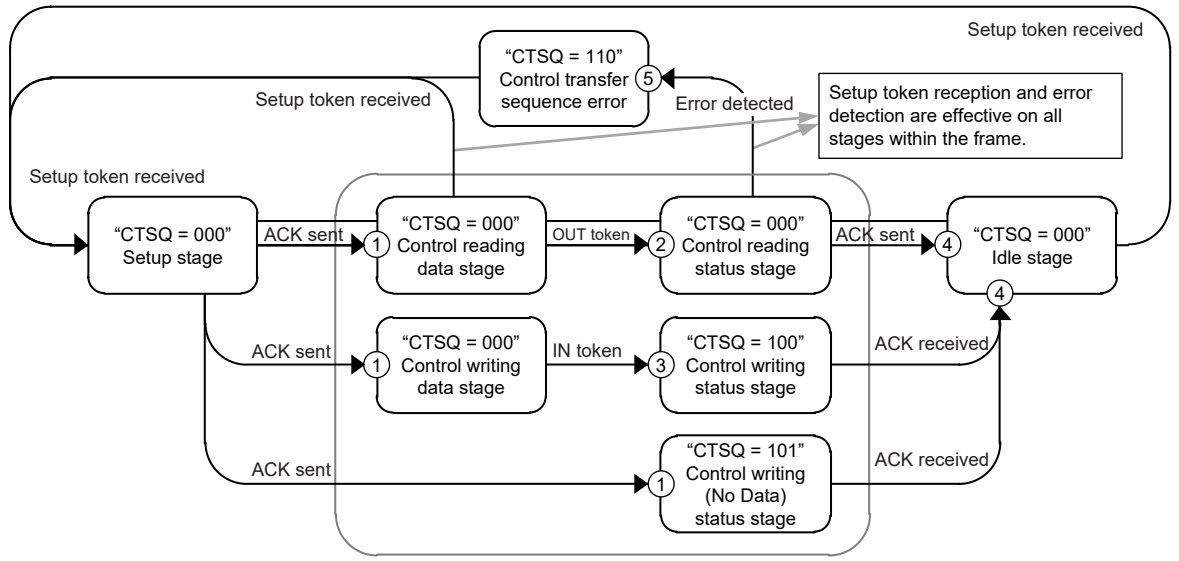
(c) For No-Data Control transfer

a) An OUT or PING token is received in the status stage.

If the amount of received data exceeds the value of the wLength field in a USB request in the Control Write transfer data stage, this module cannot identify this situation as a control transfer sequence error. If a packet other than a zero-length packet is received in the Control Read transfer status stage, this module sends an ACK response and then terminates processing normally.

If a CTRT interrupt is generated (SERR bit is set to 1) due to a sequence error, the CTSQ bits retain 110 until the system writes 0 to the CTRT bits to clear the interrupt status.

Therefore, as long as the CTSQ bits retain 110, even if a new USB request is received, a CTRT interrupt that reports completion of a setup stage is not generated. (Information on completion of the setup stage is retained by this module, and a CTRT interrupt is generated after the interrupt status is cleared.)



Note: CTRT interrupt

① Setup stage completed

② Control Read transfer status stage transition

③ Control Write transfer status stage transition

④ Control transfer completed

⑤ Control transfer sequence error

Figure 6.5-10 Control Transfer Stage Transition Diagram

(4) Interrupts Relating to DMA Master

Table 6.5-30 List of Interrupts

Interrupt Name	Interrupt Type
USBFDMAmn (m, n = 0, 1)	A DMA transaction ends.
	An invalid descriptor is read in link mode.
USBFDMAERRm (m = 0, 1)	An error response is returned for a transfer issued by the master interface.

This module has two types of DMA interrupts USBFDMAmn and USBFDMAERRm.

(1) USBFDMAmn interrupt (m, n = 0, 1)
This interrupt occurs when a DMA transaction ends or when an invalid descriptor is read in link mode.
An interrupt is divided for each DMA channel. USBFDMAm0 corresponds to the interrupt for DMA 0ch, and USBFDMAm1 corresponds to the interrupt for DMA 1ch.

(2) USBFDMAERRm interrupt
This interrupt occurs when an error response is returned for a transfer issued by the master interface. This interrupt applies to all DMA channels.

USBFDMAmn interrupt output can be temporarily masked by setting a register.

Interrupt detection can also be masked by setting the register. If interrupt detection is masked, the status register that indicates generation of an interrupt does not change.

On the other hand, a USBFDMAERRm interrupt signal does not have the masking function.

6.5.3.3.3 Pipe Control

Table 6.5-31 lists the pipe settings for this module. For USB data transfer, logical pipes called endpoints are used to enable data communication. This module provides 16 pipes for data transfer. Set each pipe according to the specification of the system.

Table 6.5-31 PIPE Settings

Register Name	Bit Name	Setting	Comment
DCPCFG	TYPE	Specifies the transfer type.	Pipes 1 to 9: Settable
PIPECFG	BFRE	Selects BRDY interrupt mode.	Pipes 1 to 5: Settable
	DBLB	Selects double-buffer configuration.	Pipes 1 to 5: Settable
	CNTMD	Selects continuous transfer or non-continuous transfer.	DCP: Settable Pipes 1, 2: Settable only in bulk transfers Pipes 3 to 5: Settable
	DIR	Selects transfer direction.	Settable to IN or OUT
	EPNUM	Endpoint number	Pipes 1 to 9: Settable Set to a value other than “0000” when a pipe is in use.
	SHTNAK	Disables pipes when transfer is completed.	DCP: Settable Pipes 1, 2: Settable only in bulk transfers Pipes 3 to 5 Settable
PIPEBUF	BUFSIZE	Buffer memory size	DCP: Unsettable (fixed to 64/256 (CNTMD = 1) bytes) Pipes 1 to 5: Settable (up to 2 Kbytes specifiable) Pipes 6 to 9: Unsettable (fixed to 64 bytes)
	BUFNMB	Buffer memory number	DCP: Unsettable (fixed to area 0 to 3 hex) Pipes 1 to 5 Settable (area 8 to 87 hex specifiable) Pipes 6 to 9: Unsettable (fixed to area 4 to 7 hex)
DCPMAXP PIPEMAXP	MXPS	Maximum packet size	Setting conforming to the USB specification.
PIPEPERI	IFIS	Buffer flush	Pipes 1, 2: Settable only in isochronous transfers Pipes 3 to 5: Unsettable Pipes 6 to 9: Unsettable
	IITV	Interval counter	Pipes 1, 2: Settable only in isochronous transfers Pipes 3 to 5: Unsettable Pipes 6 to 9: Unsettable
DCPCTR PIPExCTR	BSTS	Buffer status	DCP state switched between receive and transmit buffer by ISEL bit
	INBUFM	IN buffer monitor	Available only for pipes 3 to 5
	ACLRM	Auto buffer clear	Pipes 1 to 9: Settable
	SQCLR	Sequence clear	Clears data toggle bit.
	SQSET	Sequence set	Sets data toggle bit.
	SQMON	Sequence monitor	Monitors data toggle bit.
	PBUSY	Pipe busy monitor	
	PID	Response PID	
DCPCTR PIPExCTR	ATREPM	Auto response mode	Pipes 1 to 5: Settable
PIPExTRE	TRENB	Transaction count enable	Pipes 1 to 5: Settable
	TRCLR	Current transaction counter clear	Pipes 1 to 5: Settable
PIPExTRN	TRNCNT	Transaction counter	Pipes 1 to 5: Settable

(1) Maximum packet size setting

Use the MXPS bits in the DCPMAXP and PIPEMAXP registers to specify the maximum packet size for each pipe. The default control pipe (DCP) and pipes 1 to 5 can be set to any of the maximum packet sizes defined by the USB specification. For pipes 6 to 9, 64 bytes are the upper limit of the maximum packet size. Set the maximum packet size before starting transfer (by setting “PID = BUF”).

- DCP: Set 64 for high-speed operation.
- DCP: Set 8, 16, 32, or 64 for full-speed operation. Pipes 1 to 5: Set 512 for high-speed bulk transfer.
- Pipes 1 to 5: Set 8, 16, 32, or 64 for full-speed bulk transfer.
- Pipes 1, 2: Set a value from 1 to 1024 for high-speed isochronous transfer.
- Pipes 1, 2: Set a value from 1 to 1023 for full-speed isochronous transfer.
- Pipes 6 to 9: Set 64.

High-bandwidth transfers used for interrupt transfers and isochronous transfers are not supported.

(2) Response PID

Set the response PID for each pipe with the PID bits in the DCPCTR and PIPExCTR registers.

<Response PID setting>

The response PID specifies the response to a transaction from the host.

- NAK: Always sends a NAK response to a generated transaction.
- BUF: Responds to a transaction in accordance with the buffer memory state.
- STALL: Always sends a STALL response to a generated transaction.

Regardless of the value set in the PID bits, an ACK is always sent as a response to a setup transaction and a USB request is stored in corresponding registers.

This module might write data to the PID bits depending on the transaction result. This module writes data to the PID bits in the following cases:

- NAK:
  - The SETUP token is received normally (for the DCP only).
  - If 1 is set for the SHTNAK bit in the PIPECFG register during bulk transfer, a short packet is received.
  - If 1 is set for the SHTNAK bit during bulk transfer, the transaction counter finishes.
- BUF:
  - This module does not write "BUF".
- STALL:
  - When a maximum packet size over error is detected in a received data packet
  - When a control transfer sequence error is detected

(3) Pipe control register switching procedure

The following bits in the pipe control registers can be modified only when USB transmission is disabled (PID = NAK).

Figure 6.5-11 shows the procedure for changing the pipe control register state from the USB transmission enabled (PID = BUF) state.

The registered that cannot be manipulated in the USB transmission enabled (PID = BUF) state are as follows:

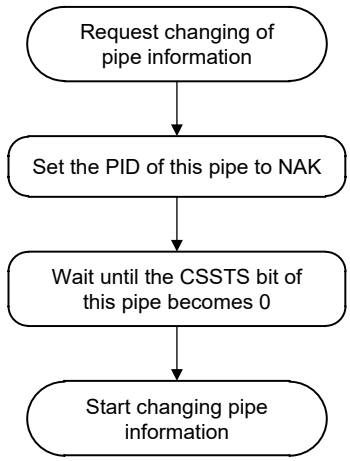
(1) All bits in the DCPCFG and DCPMAXP registers

(2) SQCLR and SQSET bits in the DCPCTR register

(3) All bits in the PIPECFG, PIPEBUF, PIPEMAXP, and PIPEPERI registers

(4) ATREPM, ACLRM, SQCLR, and SQSET bits in the PIPExCTR register

(5) All bits in the PIPExTRE and PIPExTRN registers



Note: If the pipe is detached during a USB transaction, the PBUSY bit might remain 1.

Figure 6.5-11 Procedure for Changing Pipe Information from USB Transmission Enabled (PID = BUF) State

In addition, for the settings of the following bits in pipe control registers, only the pipe information that is not set for the CURPIPE bit in the CPU, DMA0, or DMA1 FIFO port can be changed.

Registers that cannot be set with pipe information that is set for the CURPIPE bit in a FIFO port:

(1) All bits in the DCPCFG and DCPMAXP registers

(2) All bits in the PIPECFG, PIPEBUF, PIPEMAXP, and PIPEPERI registers

(3) ACLRM bit in the PIPExCTR register

If you change the pipe information, make sure that the setting of CURPIPE is different from the new pipe number. For the default control pipe (DCP), after modifying the pipe information, use the BCLR bit to clear the buffer.

(4) Data PID sequence bit

When a normal data transfer is performed during bulk transfer or interrupt transfer, or in the data stage of control transfer, this module automatically toggles the sequence bit of a data PID. The sequence bit of the next data PID to be transferred can be confirmed with the SQMON bit in the DCPCTR or PIPExCTR registers. For data transmission, the sequence bit is switched when an ACK handshake is received. For data reception, the sequence bit is switched when an ACK handshake is sent. The data PID sequence bit can be changed by using the SQCLR and SQSET bits in the DCPCTR and PIPExCTR registers.

During control transfer, this module automatically sets the sequence bit when the stage changes. When the setup stage finishes, the data PID is set to DATA1. In the status stage, this module responds with “PID = DATA1” without referencing the sequence bit.

Note that, the data PID sequence bit must set, when a clear feature request is sent or received.

Also note that for isochronous transfer setting pipes, you cannot use the SQSET bit to manipulate the sequence bit.

6.5.3.3.4 FIFO Buffer

This section describes the processing related to the FIFO buffer of this module.

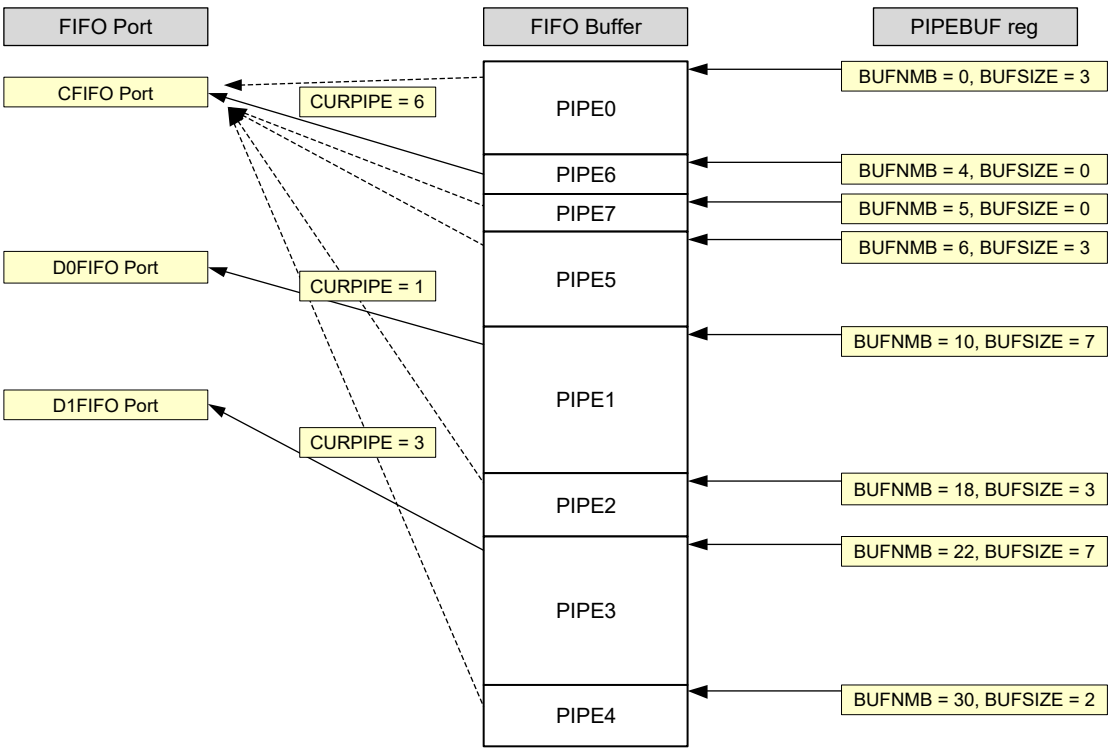
(1) FIFO buffer allocation

Figure 6.5-12 shows an example of FIFO buffer memory mapping of this module. The FIFO buffer area is shared by the CPU and this module. The FIFO buffers can be accessed by either the system (CPU) or this module (SIE).

An independent FIFO buffer area is allocated for each pipe. The memory area is made up of memory blocks (1 block = 64 bytes) and is specified by the starting block number and the number of blocks (specified by the BUFNMB and BUFSIZE bits in the PIPEBUF register). When the CNTMD bit in the PIPExCFG register is used to set "continuous transfer mode", the value set with the BUFSIZE bit must be an integral multiple of the maximum packet size. If the double-buffer configuration is selected by the DBLB bit in the PIPExCFG register, two memory areas the size of which is specified by the BUFSIZE bit in the PIPEBUF register are allocated to a single pipe.

FIFO ports are used to access the FIFO buffer (data read/write). The pipe number of a pipe to be assigned to a FIFO port is specified by the CURPIPE bits in the CFIFOSEL/DxFIFOSEL register.

The FIFO buffer status of each pipe can be confirmed by using the BSTS and INBUFM bits in the DCPCTR and PIPExCTR registers. The access right of a FIFO port can be confirmed by using the FRDY bit in the CFIFOCTR/ DxFIFOCTR register.



Note: If pipes 8 and 9 are not in use: Settings such as BUFSIZE are unspecified.

Figure 6.5-12 Example of FIFO Buffer Memory Mapping

(2) Clearing FIFO buffers

Table 6.5-32 lists the modes in which this module can clear the FIFO buffer. Clearing of the FIFO buffer is controlled by the following bits.

Table 6.5-32 List of FIFO Buffer Clearing Modes

Bit Name	BCLR	DCLRM	ACLRM
Register	CFIFOCTR register DxFIFOCTR register	DxFIFOSEL register	PIPExCTR register
Function	The FIFO buffer on the CPU side is cleared.	The FIFO buffer is automatically cleared after the data is read from the specified pipe.	The buffer is automatically cleared to discard all the received packets.
Clearing method	Write “1” to clear.	1: Mode enabled 0: Mode disabled	1: Mode enabled 0: Mode disabled

6.5.3.3.5 FIFO Port Functions

This section describes FIFO port functions. **Table 6.5-33** shows the FIFO port function settings for this module.

If data write access is enabled and data is written up to buffer full state (in non-continuous transfer: maximum packet size), the port automatically goes to the USB bus transmittable state. To enable transmission of data smaller than the buffer full (in non-continuous transfer: less than the maximum packet size), the BVAL bit in the CFIFOCTR/DxFIFOCTR register must be used to set write end.

To send a zero-length packet, the BCLR bit of that register must be used to clear the buffer before the BVAL bit is used to write end.

When all the data is read in a read access, the port automatically enters the state in which new packets can be received. However, when a zero-length packet is received (DTLN = 0), no data can be read, and therefore the buffer must be cleared by using the BCLR bit.

The receive data length is confirmed with the DTLN bits in the CFIFOCTR/DxFIFOCTR register.

Table 6.5-33 FIFO Port Function Settings

Register Name	Bit Name	Function	Note
C/DxFIFOSEL	RCNT	Selects DTLN read mode	
	REW	Rewinds buffer memory (re-read, re-write)	
	DCLRM	Reads received data of the specified pipe, and then automatically clears the received data	DxFIFO only
	DREQE	Asserts DREQ signal	DxFIFO only
	MBW	Specifies FIFO port access bit width	
	BIGEND	Selects FIFO port endian	CFIFO only
	ISEL	Specifies FIFO port access direction	DCP only
	CURPIPE	Selects current pipe	
C/DxFIFOCTR	BVAL	Finishes buffer memory write	
	BCLR	Clears CPU-side buffer memory	
	FRDY	Monitors FIFO port ready	
	DTLN	Confirms received data length	

(1) FIFO port selection

Table 6.5-34 lists pipes that can be selected for each FIFO port.

Use the CURPIPE bits in the C/DxFIFOSEL register to select the pipe to be accessed. After selecting the pipe, confirm that the value written to the CURPIPE bits can be read correctly (if the previous pipe number is read out, this module is currently changing the pipe), confirm that FRDY = 1, and then access the FIFO port.

Figure 6.5-13 shows the procedure for switching the pipe when accessing a FIFO port.

In addition, use the MBW bit to select the bus width with which to access the FIFO port. If the target pipe is the default control pile (DCP), the ISEL bit determines the buffer memory access direction. If the target pipe is not the DCP, the DIR bit in the PIPExCFG register determines the buffer memory access direction.

Table 6.5-34 FIFO Port Access for Each Pipe

Pipe	Access Method	Usable Port
DCP	CPU access	CFIFO port register
Pipes 1 to 9	CPU access	CFIFO port register
	DMA access	DxFIFO port register

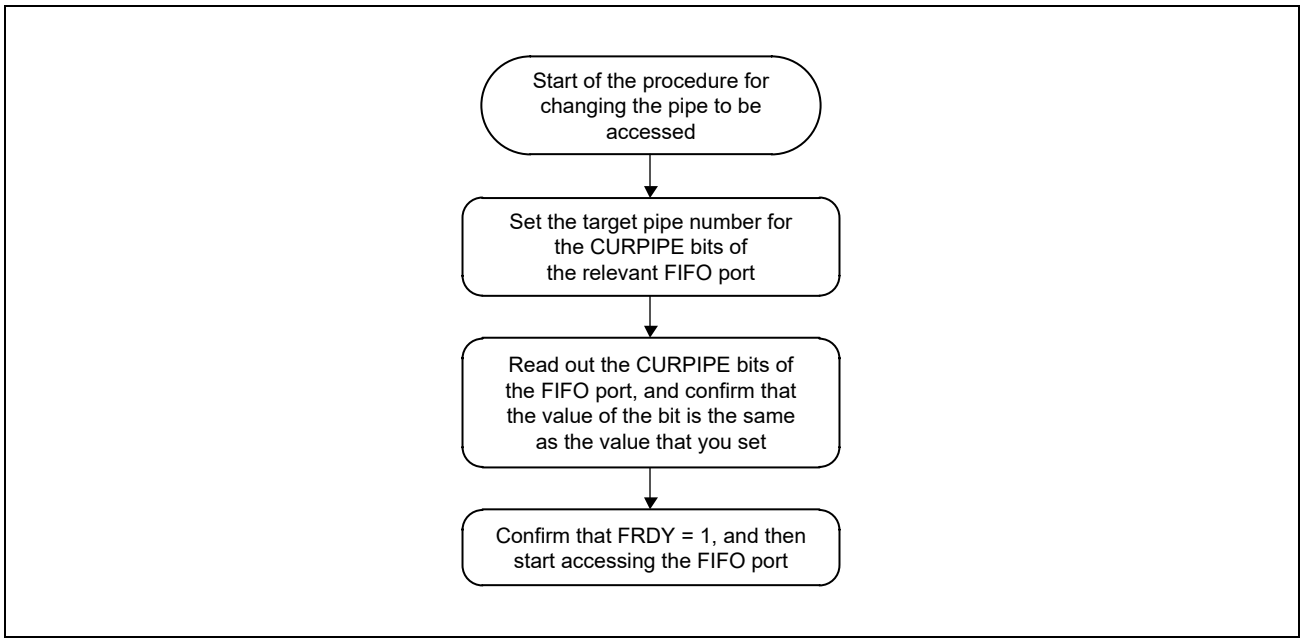


Figure 6.5-13 Pipe Switching Procedure for FIFO Port Access

(2) DxFIFO automatic clear mode (DxFIFO port read direction)

This module automatically clears the buffer memory for a pipe when data is read out from the buffer memory if the DCLRM bit in the DxFIFOSEL register is set to 1.

Table 6.5-35 shows the correspondence between packet reception and buffer memory clear processing by the software for each setting.

As shown in **Table 6.5-35**, the buffer clearing conditions vary with the value that is set for the BFRE bit. However, using the DCLRM bit eliminates the need for buffer clear by the software even in states where clearing is required, which enables DMA transfers without using the software.

Note that for this function, only the buffer memory read direction can be set.

Table 6.5-35 Relationship between Packet Reception and Buffer Memory Clear Processing by the Software

	Register Setting			
	DCLRM = 0		DCLRM = 1	
Buffer State during Packet Reception	BFRE = 0	BFRE = 1	BFRE = 0	BFRE = 1
Buffer full	Clearing unnecessary		Clearing unnecessary	
Zero-length packet received	Clearing necessary			
Normal short packet received	Clearing unnecessary	Clearing necessary		
Transaction count end				

(3) BRDY interrupt timing selection function

The BFRE bit in the PIPECFG register can be set so that a BRDY interrupt is not generated when a data packet of maximum packet size is received.

When using a DMA transfer, this function enables an interrupt to be generated only when the last data is received. The “last data” here indicates either a short packet reception or the transaction count end. If the BFRE bit is set to 1, a BRDY interrupt is generated after the received data is read. By reading the DTLN bits in the DxFIFOCTR register, the receive data length of last data packet received just before the BRDY interrupt is generated can be confirmed.

Table 6.5-36 shows when this module generates a BRDY interrupt.

Table 6.5-36 BRDY Interrupt Generation Timing

	Register Setting	
Buffer State during Packet Reception	BFRE = 0	BFRE = 1
Buffer full (normal packet received)	When packet is received	No interrupt generated
Zero-length packet received	When packet is received	When packet is received
Normal short packet received	When packet is received	When received data has been read from the buffer memory
Transaction count end	When packet is received	When received data has been read from the buffer memory

The BFRE bit function is valid only in the reading direction from the buffer memory. For the writing direction, fix the BFRE bit to 0.

6.5.3.3.6 Control Transfer (DCP)

In the data stage of control transfer, the default control pipe (DCP) is used to transfer data. For the DCP, a single 64-byte buffer is allocated as a fixed area that is used for both control reading and writing (in continuous transfer mode (CNTMD = 1), the size of this area is fixed to 256 bytes). The buffer memory can be accessed through the CFIFO port only.

(1) Control transfer

(a) Setup stage

This module always responds with ACK to any normal setup packet for this module. The following shows the behavior of this module in the setup stage:

1. When this module receives a new setup packet, this module sets the following bits:
   - VALID bit in the INTSTS0 register: 1
   - PID bit in the DCPCTR register: NAK
   - CCPL bit in the DCPCTR register: 0
2. When this module receives a data packet after receiving a setup packet, this module stores USB request parameters in the USBREQ, USBVAL, USBINDX, and USBLENG registers.

Response processing for control transfer must be performed after VALID is set to 0. While VALID is 1, PID cannot be set to BUF, and therefore the data stage cannot end.

By using a function of the VALID bit, when this module receives a new USB request during control transfer, this module can respond to the newest request, canceling the request that is being processed.

This module also automatically recognizes the type of transfer (Control Read, Control Write, or No-Data Control) from the direction bit (bit 8 of bmRequestType) and request data length (wLength) of the received USB request to manage stage transition. For an incorrect sequence, a control transfer stage transition interrupt occurs to report a sequence error to software. For details about stage management by this module, see **Figure 6.5-10**.

(b) Data stage

Use the DCP to transfer data in response to the received USB request. Before the DCP buffer memory is accessed, use the ISEL bit in the CFIFOSEL register to specify the access direction.

A transaction is executed by setting the PID bit in the DCPCTR register to BUF.

The end of data transfer is detected with a BRDY or BEMP interrupt. For Control Write transfer, use a BRDY interrupt. For Control Read transfer, use a BEMP interrupt.

For Control Write transfer in high-speed operation mode, an NYET handshake response is performed in accordance with the buffer memory state.

(c) Status stage

If the PID bit in the DCPCTR register is BUF, setting the CCPL bit to 1 terminates control transfer.

After control transfer is terminated by the above setting, this module automatically executes the status stage according to the data transfer direction determined in the setup stage, as shown below:

(1) For Control Read transfer
Upon receiving a zero-length packet from the USB Host Controller, this module sends an ACK response.

(2) For Control Write or No-Data Control transfer
This module sends a zero-length packet, and then receives an ACK response from the USB Host Controller.

(d) Control transfer automatic response function

This module automatically responds to any normal SET_ADDRESS request. However, if a SET_ADDRESS request has any of the following errors, software must respond, instead of this module:

- bmRequestType ≠ “00h”
- wIndex ≠ “00h”
- wLength ≠ “00h”
- wValue > “7Fh”
- DVSQ = “011 (Configured)”

Software must respond to all requests other than SET_ADDRESS.

6.5.3.3.7 Bulk Transfer (Pipes 1 to 5)

The user can select the buffer memory usage method (single/double buffer, continuous/non-continuous transfer mode) for bulk transfers. The buffer memory size can be set up to 2 KB. The controller manages the buffer memory state and automatically responds to PING packets and NYET handshakes.

(1) NYET handshake control

Table 6.5-37 lists responses to tokens received in a bulk or control transfer.

When an OUT token is received in a bulk or control transfer and there is only an open space for one packet in the buffer memory, this module sends a NYET response. However, when a short packet is received, this module sends an ACK response instead of a NYET response even under these conditions.

Table 6.5-37 List of Responses to Received Tokens

PID bit value	Buffer memory state*1	Received token	Response	Note
NAK/STALL	—	SETUP	ACK	—
	—	IN/OUT/PING	NAK/STALL	—
BUF	—	SETUP	ACK	—
	RCV-BRDY	OUT/PING	ACK	Receives data packet when OUT token is received*1
	RCV-BRDY	OUT	NYET	Receives data packet*2
	RCV-BRDY	OUT (Short)	ACK	Receives data packet*2
	RCV-BRDY	PING	ACK	*2
	RCV-NRDY	OUT/PING	NAK	
	TRN-BRDY	IN	DATA0/1	Sends data packet
	TRN-NRDY	IN	NAK	

Note: Details are described below.
RCV-BRDY*1: Buffer memory has a space for 2 packets or more when an OUT or PING token is received.
RCV-BRDY*2: Buffer memory has only a space for one packet when an OUT token is received.
RCV-NRDY: Buffer memory has no space for any packet when a PING token is received.
TRN-BRDY: Buffer memory has sent data when an IN token is received.
TRN-NRDY: Buffer memory has no send data when an IN token is received.

6.5.3.3.8 Interrupt Transfer (Pipes 6 to 9)

This module performs an interrupt transfer in accordance with the period managed by the host controller. This module ignores (no response) PING packets in interrupt transfers. In addition, this module does not send a NYET handshake, but sends an ACK, NAK or STALL response.

Note that this module does not support high-bandwidth interrupt transfers.

6.5.3.3.9 Isochronous Transfer (Pipes 1 and 2)

This module is provided with the following functions for isochronous transfers:

- Notification of error information about isochronous transfers
- Interval counter (IITV bit)
- Data setup control for isochronous IN transfers (IDLY function)
- Buffer flush function for isochronous IN transfers (IFIS bit)
- SOF pulse output function

This module does not support high-bandwidth Isochronous transfers.

(1) Isochronous transfer error detection

This module has the following error information detection functions for the software to manage errors that occur during isochronous transfer.

Table 6.5-38 and **Table 6.5-39** describe the error checking procedure and interrupts that are generated.

1. PID error
   The PID of the received packet is invalid.
2. CRC error and bit stuffing error
   The received packet has a CRC error or invalid bit stuffing.
3. Max packet size over
   The data size of the received packet is larger than the preset maximum packet size.
4. Overrun error and underrun error
   (a) The buffer memory has no data when an IN token is received during IN-direction (send) transfer.
   (b) The buffer memory has no space although an OUT token is received during OUT-direction (receive) transfer.
5. Interval error
   An interval error occurs in the following cases:
   (a) An IN token cannot be received within the interval frame during isochronous IN transfer.
   (b) An OUT token cannot be received within the interval frame during isochronous OUT transfer.

Table 6.5-38 Error Detection during Transmission/Reception of Token

Error Detection Priority	Error Type	Interrupt Generated at Error Detection and Status
1	PID error	No interrupt is generated (ignored as a corrupted packet).
2	CRC error, bit stuffing error	No interrupt is generated (ignored as a corrupted packet).
3	Overrun error, underrun error	An NRDY interrupt is generated and the OVRN bit is set. A zero-length packet is sent in response to an IN token. A data packet is not received in response to an OUT token.
4	Interval error	An NRDY interrupt is not generated.

Table 6.5-39 Error Detection during Reception of Data Packet

Error Detection Priority	Error Type	Interrupt Generated at Error Detection and Status
1	PID error	No interrupt is generated (ignored as a corrupted packet).
2	CRC error, bit stuffing error	An NRDY interrupt is generated and the CRCE bit is set.
3	Packet size error (too large packet)	A BEMP interrupt is generated and the PID bit is set to STALL.

(2) DATA-PID

This module does not support high-bandwidth transfers.

The following shows actions that can be taken in response to a received PID.

1. IN direction:

   DATA0: Used to send packets.
   DATA1: Not used to send packets.
   DATA2: Not used to send packets.
   mDATA: Not used to send packets.

2. OUT direction (in full-speed operation):

   DATA0: Packets are received normally.
   DATA1: Packets are received normally.
   DATA2: Packets are ignored.
   mDATA: Packets are ignored.

3. OUT direction (in high-speed operation):

   DATA0: Packets are received normally.
   DATA1: Packets are received normally.
   DATA2: Packets are received normally.
   mDATA: Packets are received normally.

(3) Interval counter

(a) Outline of operation

The IITV bit in the PIPEPERI register can be used to set the interval of isochronous transfer. The interval counter enables the functions listed in **Table 6.5-40**.

Table 6.5-40 Functions of the Interval Counter

Transfer Direction	Function	Detecting Condition
IN	Transmit buffer flush function	An IN token cannot successfully be received within the interval frame during isochronous IN transfer.
OUT	Notification of unreceived token	An OUT token cannot successfully be received within the interval frame during isochronous OUT transfer.

Counting of intervals is based on received SOF packets or interpolated SOFs. Therefore, even if SOF packets are damaged, the isochronism can still be maintained. Frame intervals are set as 2n (micro) frames, where n is the value of the IITV bit.

(b) Interval counter initialization

This module initializes the interval counter under the following conditions:

(1) Power on reset
The IITV bit is initialized.

(2) Clearing of the buffer memory by the ACLRM bit
The IITV bit is not initialized but the counter is initialized.

(3) USB bus reset

After the interval counter is initialized and a packet is successfully transferred, counting of intervals starts under the following conditions:

(1) An SOF packet is received after data is sent in response to an IN token when PID = BUF.

(2) An SOF packet is received after data is received in response to an OUT token when PID = BUF.

Note that the interval counter is not initialized in the following conditions:

(1) The PID bit is set to NAK or STALL.
The interval timer is not stopped at this interval. The transaction will be attempted at the next interval.

(2) USB bus reset or USB suspension
The IITV bit is not initialized. When an SOF packet is received, counting starts from the value existing before reception.

(4) Send data setup for isochronous transfer

This module becomes able to send data packets by isochronous transfer from the next frame after data is written to the buffer memory and then an SOF packet is detected. This is called “send data setup for isochronous transfer”.

This function can identify the frame with which data sending started.

If the buffer memory is in a double-buffer configuration and writing to both buffers has been completed, only the buffer to which writing finished earlier can transfer data. Therefore, even when several IN tokens are received within the same frame, only one packet of data is sent from the buffer memory.

When an IN token is received, if the buffer memory is ready for sending data, the data is transferred and a normal response is returned. However, if the buffer memory is not ready for sending data, a zero-length packet is sent and an underrun error occurs.

Figure 6.5-14 shows examples of sending using the send data setup function for isochronous transfer by setting “IITV = 0” (each frame) in this module.

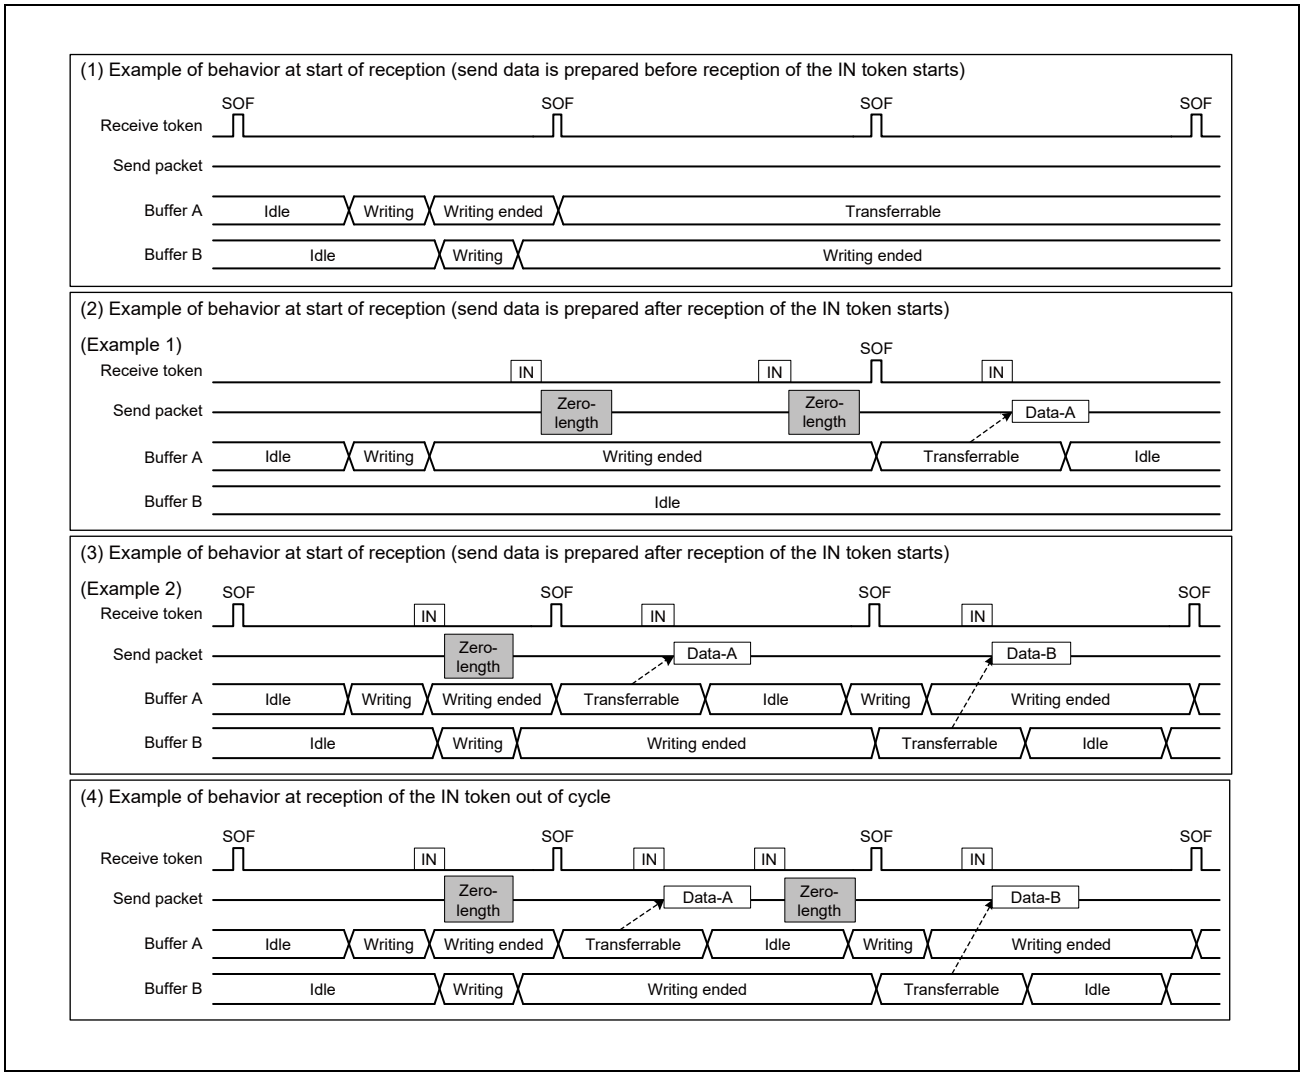

Figure 6.5-14 Examples of Data Setup Function Behavior

(5) Transmit buffer flush for isochronous transfer

If this module does not receive an IN token in an interval frame and receives a (micro) SOF packet in the next frame during isochronous data transfer, this module handles the IN token as a corrupted token and clears the buffer that can send data to make the buffer writable.

At this time, if the buffer memory is in a double-buffer configuration and writing to both buffers has been completed, this module assumes the discarded buffer memory to be sent within the same interval frame. As a result, the buffer memory that is not discarded by reception of a (micro) SOF packet becomes to be able to transfer data.

The operation start timing of the buffer flush function varies with the value of the IITV bit.

- If IITV is 0
  Buffer flush operation is performed from the first frame after the pipe is enabled.
- If IITV is not 0
  Buffer flush operation is performed after the first successful transaction.

Figure 6.5-15 shows an example of how the buffer flush function of this module behaves. For a token outside the set interval (token prior to the interval frame), however, this module sends the written data or a zero-length packet as an underrun error according to the data setup state.

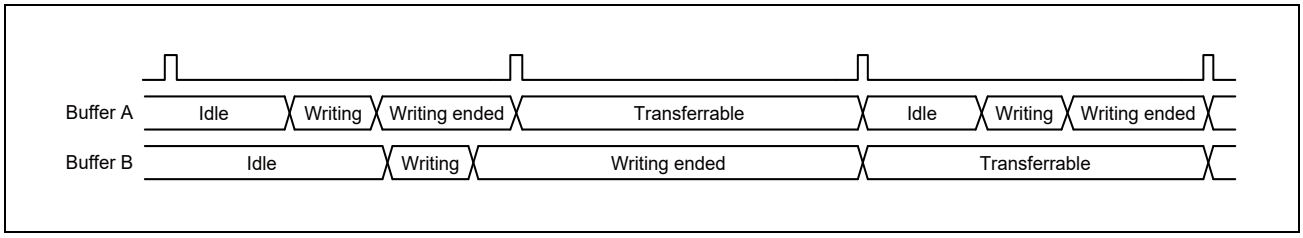

Figure 6.5-15 Example of Buffer Flush Function Behavior

Figure 6.5-16 shows an example of an interval error that occurs in this module.

There are five types of interval errors, as listed below. At timing (1) in the figure, an interval error occurs and the buffer flush function operates.

If an interval error occurs during IN transfer, the buffer flush function starts. If an interval error occurs during OUT transfer, an NRDY interrupt occurs.

Use the OVRN bit to determine whether an error is an NRDY interrupt (such as a receive packet error) or an overrun error.

In the figure, responses to tokens indicated as shaded boxes are made in accordance with the buffer memory state.

- IN direction:
  - If the buffer is ready to transfer data, data is transferred and a normal response is returned.
  - If the buffer is not ready to transfer data, a zero-length packet is sent and an underrun error occurs.
- OUT direction:
  - If the buffer is ready to receive data, data is received and a normal response is returned.
  - If the buffer is not ready to receive data, data is discarded and an overrun error occurs.

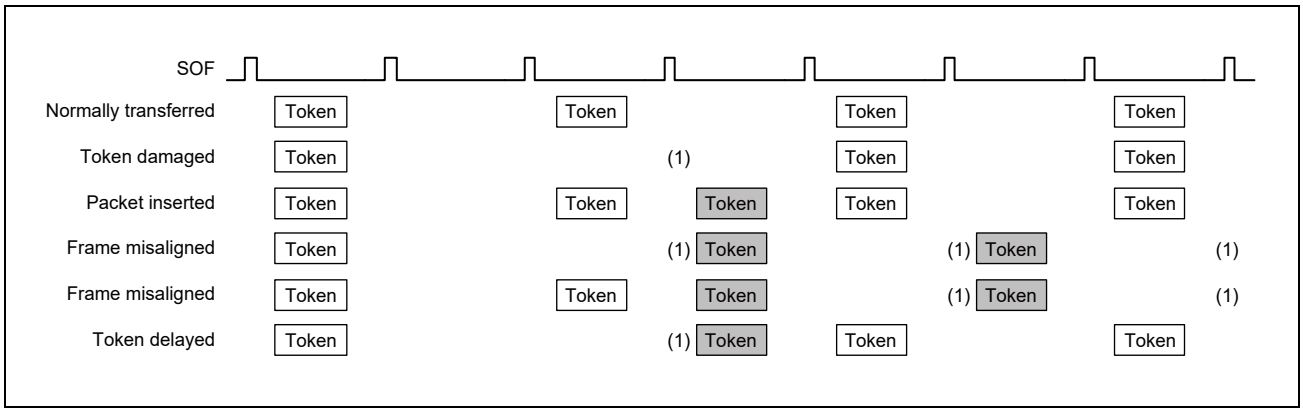

Figure 6.5-16 Example of Occurrence of Interval Error (when IITV is 1)

6.5.3.3.10 SOF Interpolation Function

If the controller cannot receive data at intervals of 1 ms (in full-speed operation) or 125 µs (in high-speed operation) due to corruption or missing of an SOF packet, the controller internally interpolates the SOF. The controller starts SOF interpolation upon receiving an SOF packet when both the USBE bit and SUSPM bit are set to 1.

The interpolation function is initialized under the following conditions:

1) Power on reset
2) USB bus reset
3) Suspended state detected

The SOF interpolation operates according to the following specifications:

1. Frame interval (125 µs or 1 ms) is based on the results of the reset handshake protocol.
2. The interpolation function does not operate until an SOF packet is received.
3. After receiving the first SOF packet, this module interpolates the SOF by using the 60-MHz internal clock to measure 125 µs or 1 ms.
4. After receiving the second or a subsequent SOF packet, this module interpolates the SOF by using the previous reception interval.
5. Interpolation is not performed in the suspended state or while a USB bus reset is being received.
   (If this module enters the suspended state in high-speed operation, interpolation continues for 3 ms after receiving the last packet.)

The SOF interpolation function operates with the following functions:

1) Updating of frame number or micro-frame number
2) SOFR interrupt and micro SOF lock
3) SOF pulse output
4) Counting of isochronous transfer intervals

If an SOF packet is lost in full-speed operation, the FRNM bit in the FRMNUM register is not updated.

If a micro SOF packet is lost in high-speed operation, the UFRNM bit in the uFRMNUM register is updated.

However, if a micro SOF packet for which “micro-FRNM = 000” is set is lost, the FRNM bit is not updated. In this case, the FRNM bit is not updated even if subsequent micro SOF packets for which “micro-FRNM = 000” is not set are successfully received.

6.5.3.3.11 Link Power Management Processing

According to the Link Power Management specification, the existing suspend state is redefined as the L2 state and a new L1 state is defined as a state where transition and resumption at a lower latency than L2 (suspend) are possible.

The table below compares the features of the L2 (suspend) state and L1 state.

Table 6.5-41 Comparison Between Suspend (L2) State and L1 State

Item	L1	Suspend (L2)
Transition	LPM Transaction	3-ms idle period
Host-activated resumption	(Host) Minimum drive period specifiable by the host. Specified between 75 µs to 1.175 ms (Device) 10-µs K drive	(Host) Min. 20-ms K drive (Device) 10-ms K drive
Device-activated resumption	(Device) 50-µs K drive (Host) 60- to 990-µs K drive (Device) 10-µs K drive	(Device) 1-ms to 15-ms K drive (Host) Min. 20-ms K drive (Device) 10-ms K drive
Signaling	Low and Full Speed Idle	Low and Full Speed Idle

The following describes the processing for transition to and resumption from the L1 state.

(1) Descriptor

This module must return its own descriptor when receiving the GetDescriptor command.

Whether the contents of the descriptor to be returned need to be modified is dependent on whether this module responds to the transition to and resumption from the L1 state with an LPM transaction. The details are summarized in the table below.

Table 6.5-42 Relationship between LPM Response and Descriptor

LPM Response	bcdUSB	Presence of USB 2.0 Ex.Desc	USB 2.0 Ex.Desc LPM	Response When LPM Is Received	Remarks
Not respond	0200	Not present	—	Not Respond	Standard action in the case where this module does not respond to LPM
	0201	Present	LPM = 0	STALL	This is when rejection of response to LPM is explicitly declared. In this case, it is necessary to send a STALL response instead of making no response.
Respond	0201	Present	LPM = 1	ACK or NYET	Standard action in the case where this module responds to LPM

Whether to respond to transition to and resumption from L1 is declared by the LPM bit of the USB 2.0 extension descriptor. To provide this module with the USB 2.0 extension descriptor, it is necessary to set the bcdUSB field of the device descriptor to 0201 or greater.

When not responding to LPM, set the bcdUSB value to 0200 without providing this module with the USB 2.0 extension descriptor. In this case, it is necessary to ignore any LPM token received.

When not responding to LPM, it is also possible to set bcdUSB to 0201 and set the LPM bit of the USB 2.0 extension descriptor to 0 (noncompliant). In this case, however, it is not allowed to ignore LPM and is necessary to send a STALL response.

When responding to LPM, set bcdUSB to 0201 and the LPM bit of the USB 2.0 extension descriptor to 1 (compliant). This grants this module to send an NYET or ACK in response to an LPM token.

(2) Basic processing

This module needs to execute the following processing.

1. Responds to the LPM token received from the host with “No response”, “ACK”, “NYET”, or “STALL” according to this module's own state.
2. Transitions to the L1 state if it fails to detect the retransmission of an LPM token for 8 μs after making an ACK response.
3. Detects a K drive of the host and performs resume processing to the idle state.
4. Performs resume processing to the idle state based on the Remote Wake signal.

For 1, the software specifies the response method according to the values of the L1RESPEN, L1RESPMD, and L1NEGOMD bits in the PL1CTRL register. The hardware makes the response that is designated by the software upon receiving an LPM token.

For 2, both retransmission control and transition to the L1 state are processed by the hardware. Transition to the L1 state can be identified through a DVST interrupt.

For 3, a RESM interrupt occurs on detection of host K in the L1 state.

For 4, starting the Remote Wake processing can be instructed to the hardware by setting the WKUP bit by the software. The specification stipulates that the software clears this bit on resumption from the L2 state. On the other hand, the hardware clears this bit on resumption from the L1 state.

(3) HIRD value negotiation

The HIRD value contained in the LPM token is the K period of the host on resumption from the L1 state.

This module can respond with ACK if the received HIRD value falls within the desired range as specified by the L1NEGOMD and HIRDTHR bits in the L1CTRL register; otherwise, this module can respond with NYET and request the host to modify the HIRD value.

Remark This HIRD value negotiation function must also be supported on the host side.

6.5.3.3.12 DMA Mode

(1) Register mode/link mode

The DMS bit in the CHCFG_n register can be used to switch between register mode and link mode.

Table 6.5-43 DMA mode settings

DMS (CHCFG)	Mode	Description
0	Register mode	Performs DMA transfer based on the values set by Next Register Set.
1	Link mode	Accesses the descriptor area, and executes DMA transfer based on the values set by descriptors. This module repeats descriptor reading and DMA transfer unless the descriptor settings are changed or the control register is used to stop the processing.

(a) Register mode

In register mode, this module executes DMA transfer based on the values set in internal registers.

Two sets of the transfer-source address, transfer-destination address, and number of bytes to be transferred can be held (in Next0 Register Set and Next1 Register Set registers). One of these Next registers can be used to execute transfer, and both Next registers can be used to execute continuous transfer.

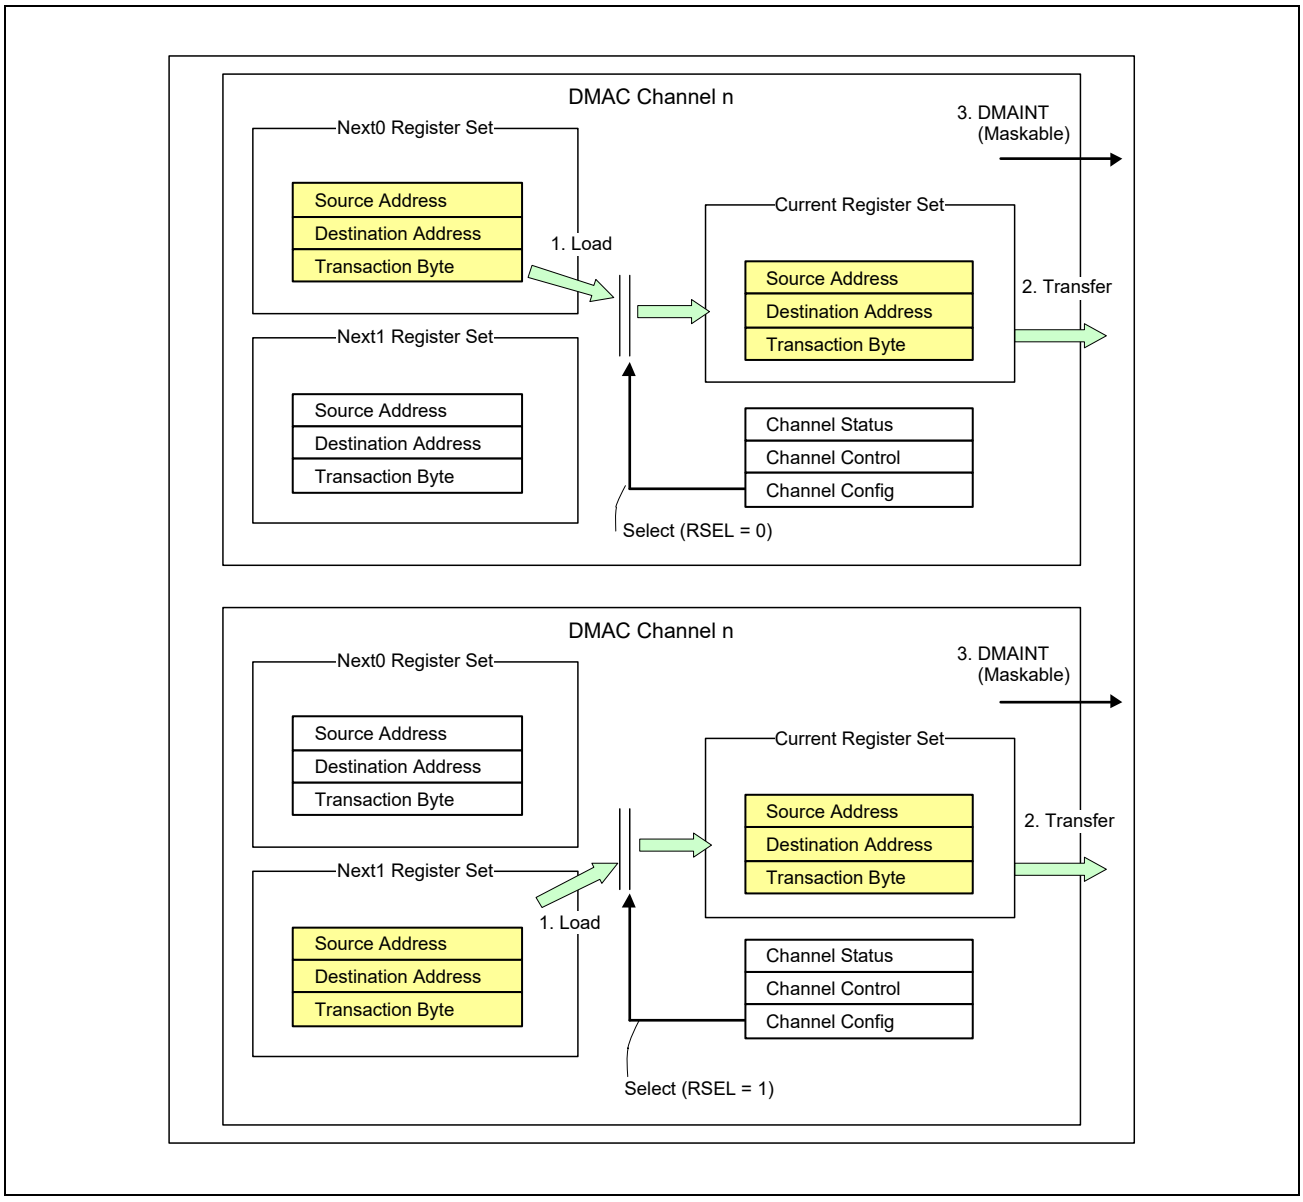

Figure 6.5-17 Overview of Normal Behavior of Register Mode

The upper part of the above figure indicates a case when Next0 Register Set is processed. The lower part of the above figure indicates a case when Next1 Register Set is processed.

a-1) Operation flow of register mode

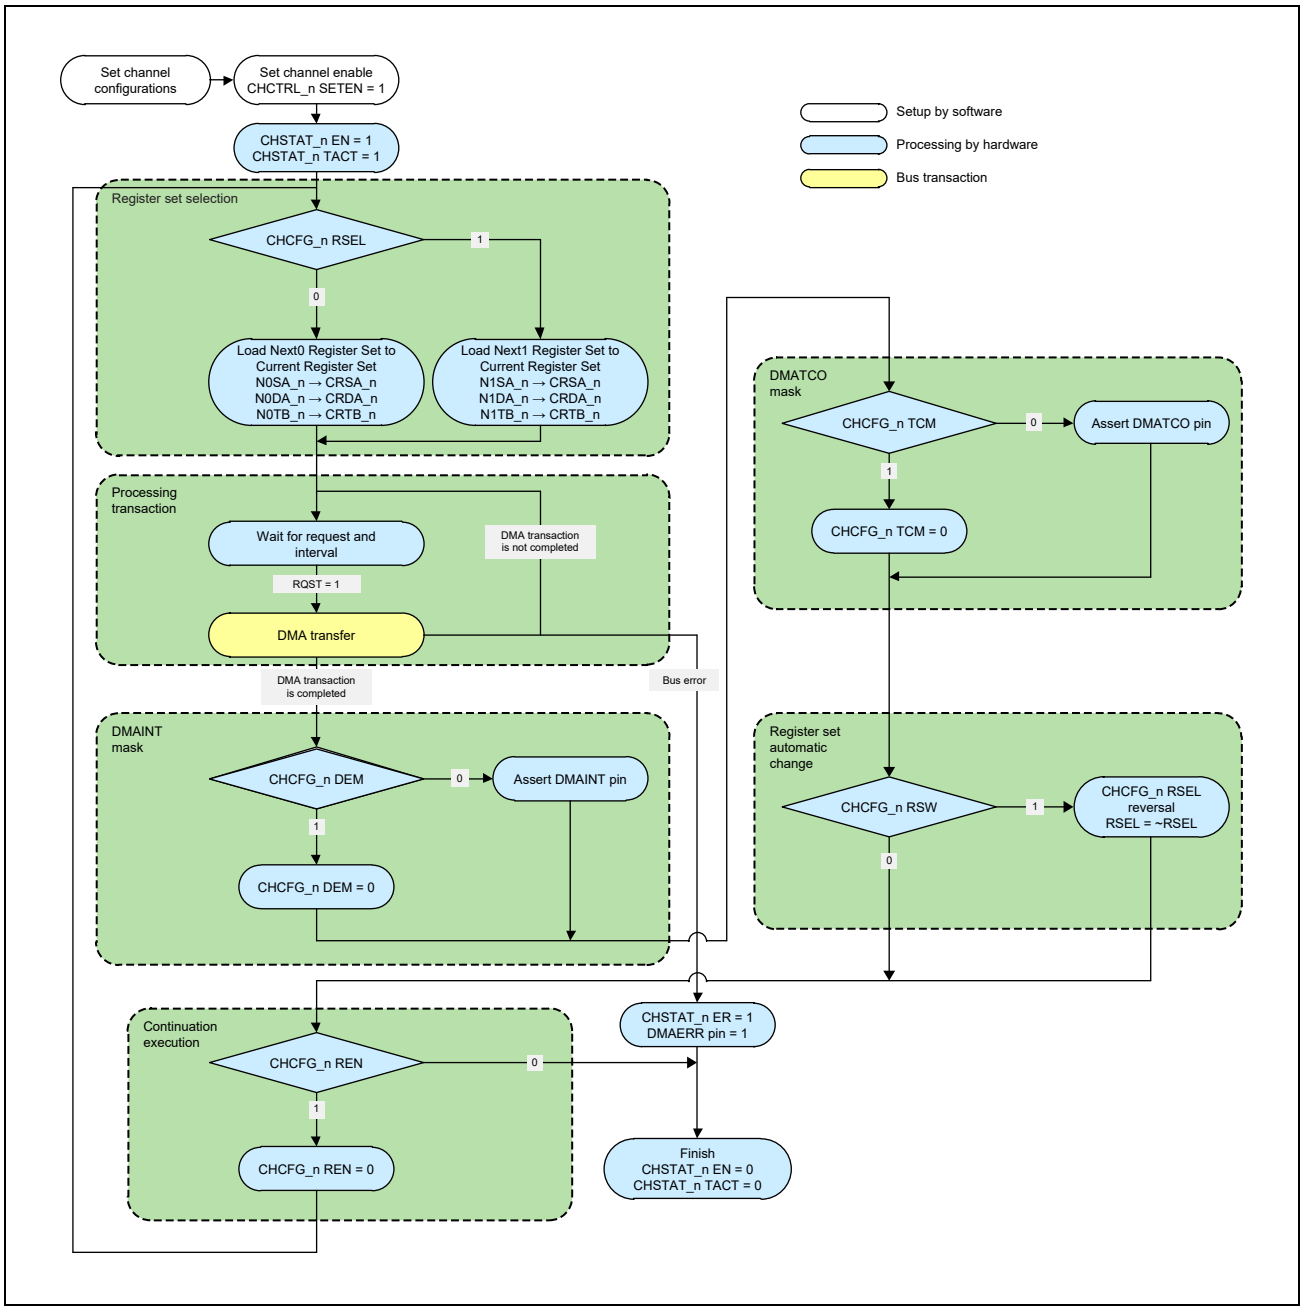

Figure 6.5-18 Register Mode Operation Flow

Description of the register mode operation flow:

1. Channel setting
   The Next0 Register Set or Next1 Register Set register is set (transfer-destination address, transfer-source address, and total number of bytes to be transferred). In addition, the FIFO channel, volume of transfer data, and other items are set for USB control that is used for the Channel Register Set register.
   No software settings are required in OUT transfer (reception in peripheral mode) or in IN transfer (transmission in peripheral mode) because the hardware sets the transfer source or destination address according to the setting of the CURPIPE bits in the DxFIFOSEL register.
   (see **6.5.3.3.13 DMA Transfer**).
2. Register set selection
   When 1 is written to the SETEN bit in the CHCTRL_n register, the EN and TACT bits in the CHSTAT_n register are set to 1. As a result, the values set by the Next Register Set register selected by the RSEL bit in the CHCFG_n register are loaded to the Current Register Set register.
3. DMA transaction
   A DMA transaction is executed based on the values that are set. For details about transfer, **6.5.3.3.13 DMA Transfer**.
4. The USBFDMAmn masking
   The USBFDMAmn interrupt is masked depending on the value of the DEM bit in the CHCFG_n register. If DEM = 1, the USBFDMAmn interrupt is masked, and the DEM bit is automatically cleared to 0.
5. DMATC masking
   DMATC from DMAC control to USB control is masked depending on the value of the TCM bit in the CHCFG_n register. If TCM = 1, DMATC is masked, and the TCM bit is automatically cleared to 0.
6. Automatic register set switchover
   Whether the current Next register set is to be switched to the other Next register set is determined by the value of the RSW bit in the CHCFG_n register.
7. Continuation of execution
   Whether to continue DMA transfer is determined by the value of the REN bit in the CHCFG_n register. If REN = 0, the EN and TACT bits in the CHSTAT_n register are cleared to 0, and DMAC operation stops. If REN = 1, DMAC operation continues, and the REN bit is automatically cleared to 0.

a-2) Register mode setting

(1) Register mode setting

The register set to be processed is selected.

Table 6.5-44 Register Mode Setting

DMS (CHCFG_n)	RSEL (CHCFG_n)	Description
0	0	Processes Next0 Register Set.
	1	Processes Next1 Register Set.

(2) USBFDMAmn masking

The USBFDMAmn interrupt can be masked.

Table 6.5-45 USBFDMAmn Mask Setting

DEM (CHCFG_n)	Description
0	Asserts the USBFDMAmn interrupt when the DMA transaction is completed.
1	Does not assert the USBFDMAmn interrupt even when the DMA transaction is completed. After the DMA transaction is completed, the DEM bit is cleared to 0.

(3) DMATC mask setting

DMATC from DMAC control to USB control can be masked.

Table 6.5-46 DMATC Mask Setting

DEM (CHCFG_n)	Description
0	Asserts DMATC when the DMA transaction is completed.
1	Does not assert DMATC even when the DMA transaction is completed. After the DMA transaction is completed, the TCM bit is cleared to 0.

(4) Automatic transaction execution for a register set

After a DMA transaction finishes, another DMA transaction can be executed.

Table 6.5-47 Automatic Execution Setting for a Register Set

REN (CHCFG_n)	Behavior	Remarks
0	The EN bit is cleared and DMA operation is terminated when the DMA transaction for the register set that is set by RSEL finishes.	Use this setting to execute a DMA transaction only once.
1	After a DMA transaction finishes, DMA transfer of the contents of the next register set continues. The REN bit is cleared to 0 when continuous transfer is successful.	Use this setting to continue processing of register set contents.

(5) Automatic register set switchover setting

After a DMA transaction finishes, the next register set to be processed can be switched.

Table 6.5-48 Automatic Execution Setting for a Register Set

RSW (CHCFG_n)	Behavior	Remarks
0	The register set is not switched when a DMA transaction finishes.	Use this setting to use only one register set.
1	When REN = 1 and a DMA transaction finishes, the RSEL setting is automatically reversed to select the other register set.	Use this setting to switch the register set.

a-3) Example of setting the register mode

(1) Example of setting the register mode when using only the Next0 register set

Table 6.5-49 Register Mode Setting Example

DMS (CHCFG_n)	RSEL (CHCFG_n)	DEM (CHCFG_n)	TCM (CHCFG_n)	RSW (CHCFG_n)	REN (CHCFG_n)
0	0	0	0	0	0
(register mode)	(Next0)	(not masked)	(not masked)	(not switched)	(continuous execution disabled)

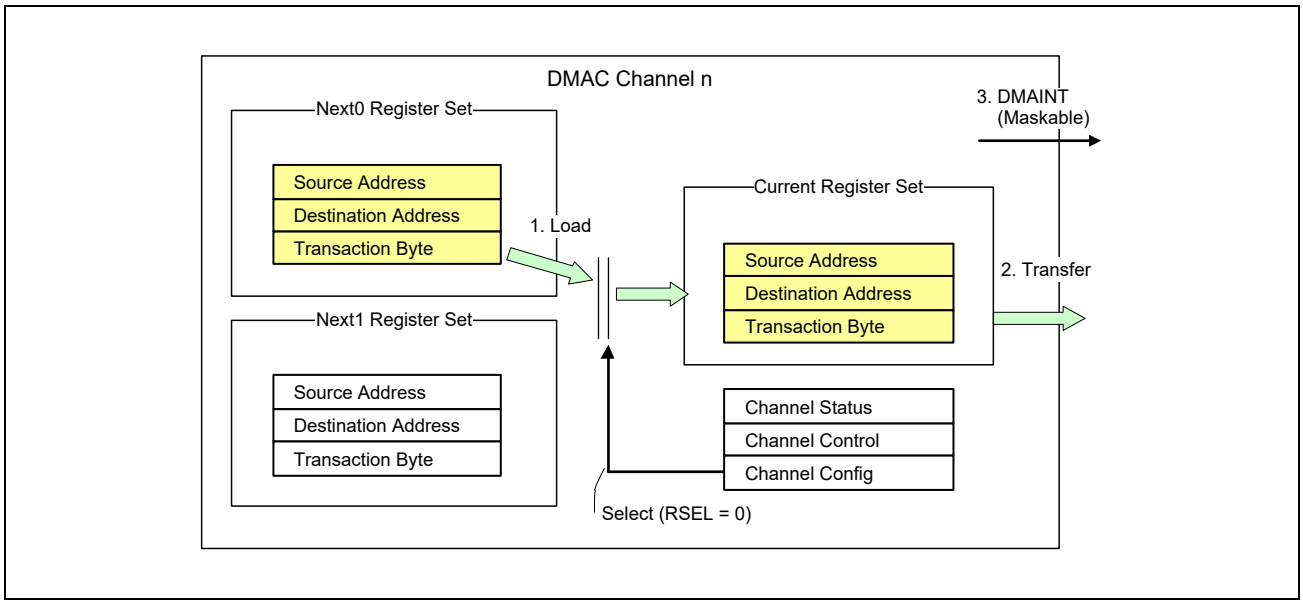

Figure 6.5-19 Register Mode Setting Example 1

1. By writing 1 to the SETEN bit in the CHCTRL_n register, the EN bit in the CHSTAT_n register is set to 1. As a result, the contents of Next0 Register Set are loaded to Current Register Set.
2. A DMA transaction is executed based on the values of Current Register Set and Channel Register Set.
3. Because the DEM bit in the CHCFG_n register is 0, the USBFDMAmn interrupt is asserted after the DMA transaction finishes.
4. Because the TCM bit in the CHCFG_n register is 0, DMATC is asserted after the DMA transaction finishes.
5. Because the REN bit in the CHCFG_n register is 0, the EN bit in the CHSTAT_n register is cleared to 0, and the operation ends.

(2) Example of setting the register mode when using two register sets continuously

Table 6.5-50 Automatic Register Set processing Setting

DMS (CHCFG_n)	RSEL (CHCFG_n)	DEM (CHCFG_n)	TCM (CHCFG_n)	RSW (CHCFG_n)	REN (CHCFG_n)
0 (register mode)	0 (Next0)	1 (masked)	0 (not masked)	1 (switched)	1 (continuous execution enabled)

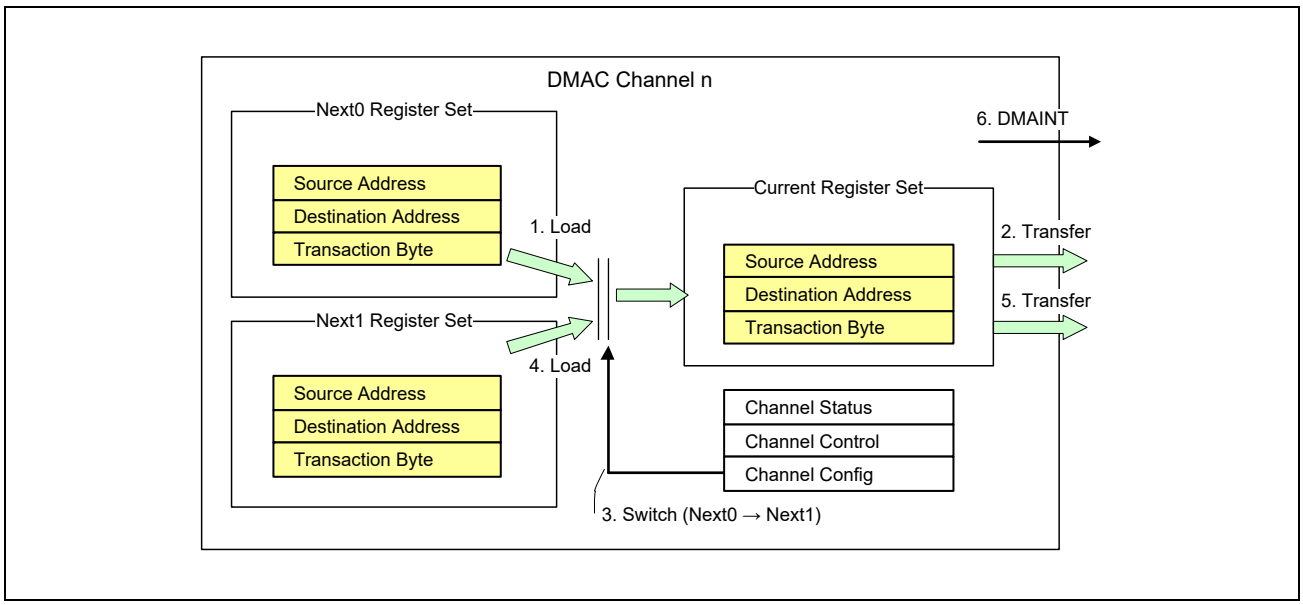

Figure 6.5-20 Register Mode Setting Example 2

1. By writing 1 to the SETEN bit in the CHCTRL_n register, the EN bit in the CHSTAT_n register is set to 1. As a result, the contents of Next0 Register Set are loaded to Current Register Set.
2. A DMA transaction is executed based on the values of Current Register Set and Channel Register Set.
3. Because the DEM bit in the CHCFG_n register is 1, the USBFDMAmn interrupt is not asserted after the DMA transaction finishes.
4. Because the REN bit in the CHCFG_n register is 1, operation continues. The REN bit is automatically cleared to 0.
5. Because the RSW bit in the CHCFG_n register is 1, the next register set to be processed is switched (RSEL = 0 to 1).
6. The contents of Next1 Register Set are loaded to Current Register Set.
7. A DMA transaction is executed based on the values of Current Register Set and Channel Register Set.
8. Because the DEM bit in the CHCFG_n register is 0, the USBFDMAmn interrupt is asserted after the DMA transaction finishes.
9. Because the TCM bit in the CHCFG_n register is 0, DMATC is asserted after the DMA transaction finishes.
10. Because the REN bit in the CHCFG_n register is 0, the EN bit in the CHSTAT_n register is cleared to 0, and the operation ends.

(b) Link mode

In link mode, this module reads the value set in a descriptor placed in an external storage area to execute a DMA transaction. In DMAC, there are Next Link Address (NXLA_n) and Current Link Address (CRLA_n) registers for each channel. The Next Link Address (NXLA_n) register is used to set the address of the descriptor to be read the next time. The Current Link Address (CRLA_n) register is used to display the descriptor address for the current DMA transaction.

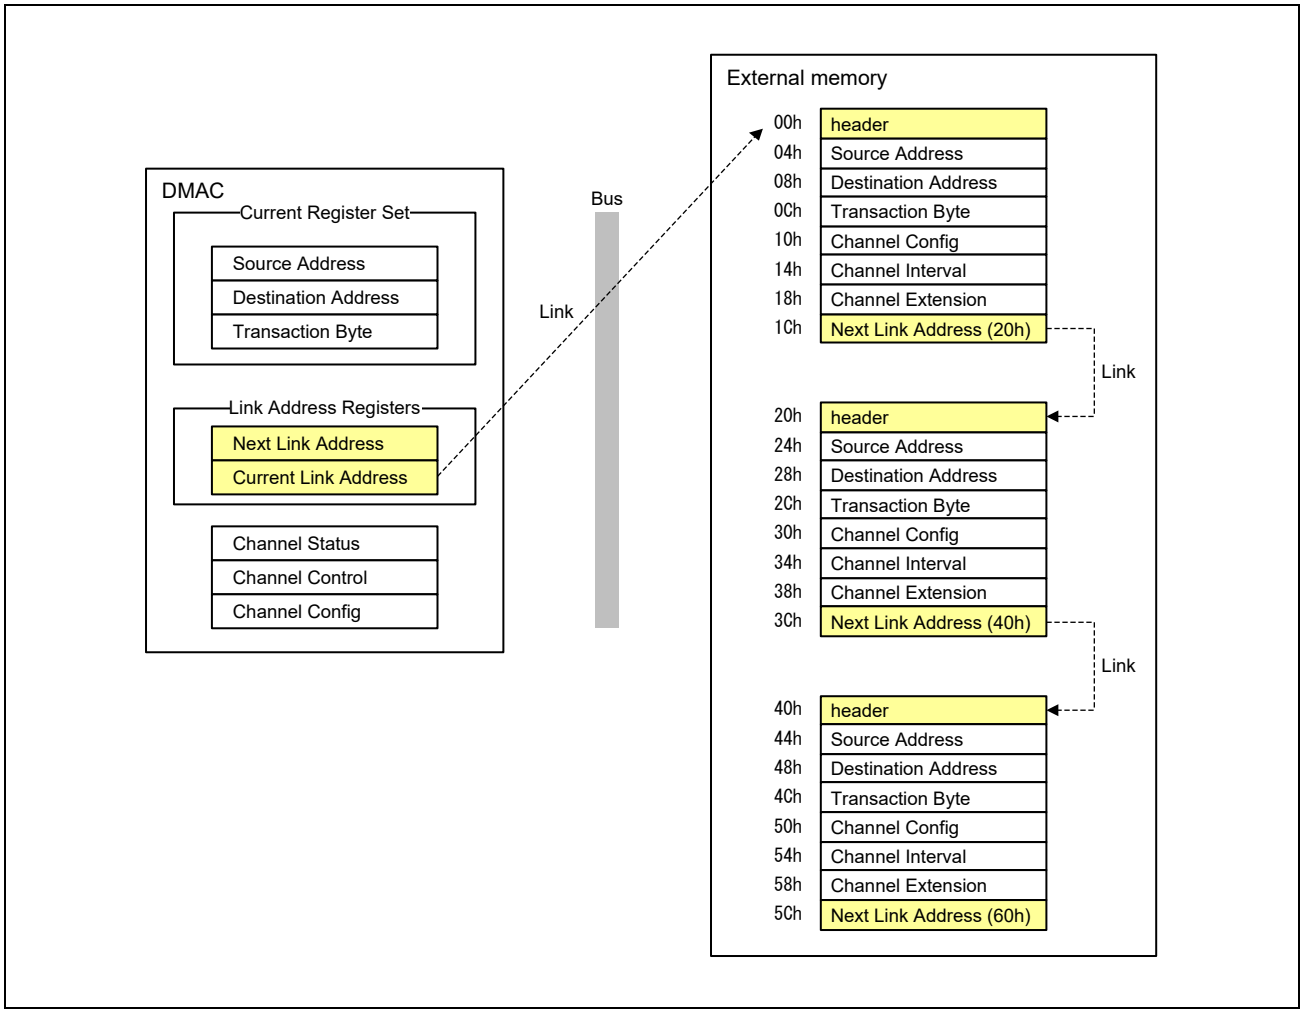

Figure 6.5-21 Overview of Link Mode

b-1) Operation flow of link mode

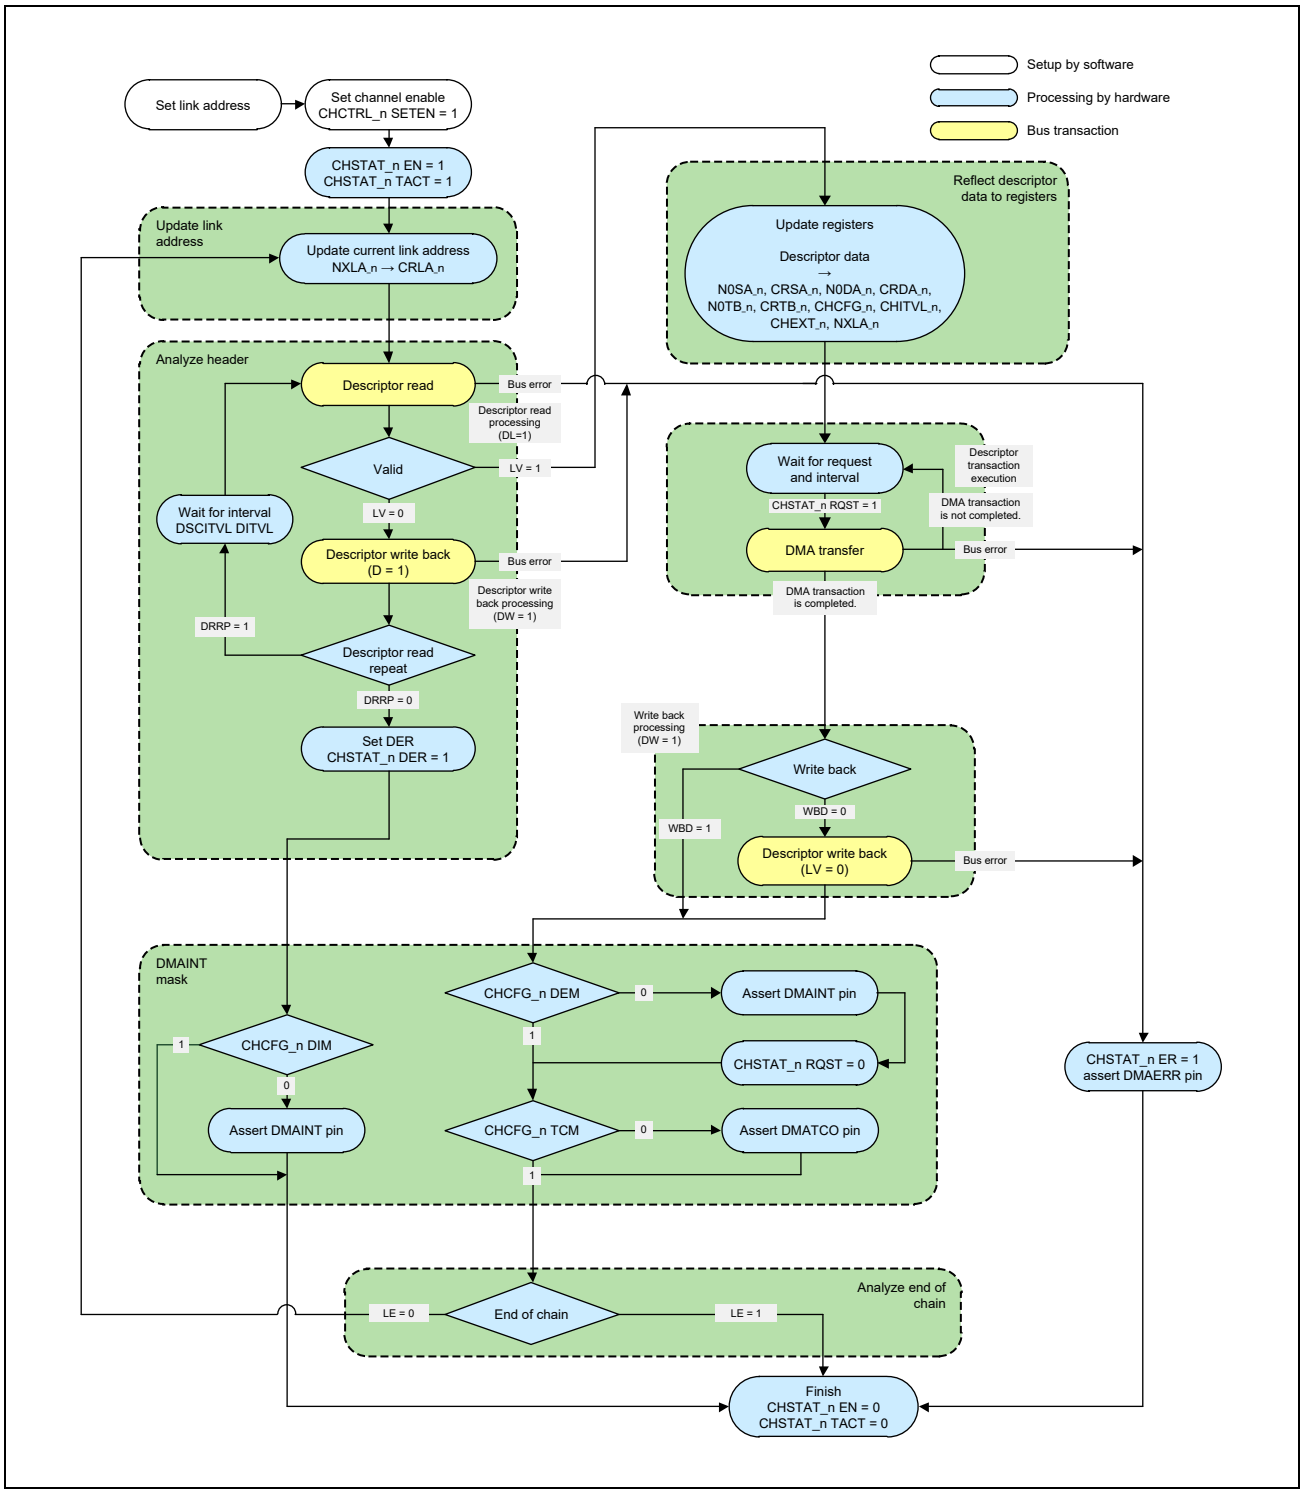

Figure 6.5-22 Link Mode Operation Flow

Description of the link mode operation flow:

1. Channel setting
   The beginning address of the link destination is set in the NXLA_n register.
2. Link address updating
   If 1 is written to the SETEN bit in the CHCTRL_n register, the EN and TACT bits of the CHSTAT_n register are set to 1. As a result, the address set in the NXLA_n register is loaded to the CRLA_n register.
3. Descriptor reading and header judgment
   A read of the descriptor starts, and DMAC checks the contents of header. If LV = 0, this module writes 1 back to the D bit of header. After that, if the DRRP bit in the CHCFG_n register is 1, this module waits for the time intervals set by the DSCITVL register, and then reads the same descriptor again. If DRRP = 0, the DER bit in the CHSTAT_n register is set to 1, and this module is placed in the end state (both EN and TACT bits in the CHSTAT_n register are 0). At this time, if the DIM bit in the CHCFG_n register is 0, this module asserts the USBFDMAmn interrupt.
4. Descriptor setting
   If LV = 1, the data read from the descriptor is loaded to Current Register Set and Channel Register Set. In addition, the next link target is loaded to the NXLA_n register.
5. DMA transaction
   A DMA transaction is executed based on the values that are set. For details about transfer, see **6.5.3.3.13 DMA Transfer**.
6. Header write-back
   If WBD of header is 0, DMAC writes LV = 0 to the header area.
7. USBFDMAmn masking
   If the DEM bit in the CHCFG_n register is 0, this module asserts the USBFDMAmn interrupt.
8. DMATC masking
   If the TCM bit in the CHCFG_n register is 0, this module asserts DMATC.
9. Link end judgment
   If LE of header is 1, the EN and TACT bits in the CHSTAT_n register are cleared to 0, and DMAC terminates operation. If LE is 0, this module updates Current Register Set, and then restarts reading the next descriptor.

b-2) Register setting

(1) Link mode setting

To use link mode, set the DMS bit in the CHCFG_n register to 1.

Table 6.5-51 Link Mode Setting

DMS (CHCFG_n)	Description
1	This module operates in link mode. The setting of this bit cannot be changed by using a descriptor.

(2) Link address setting

The Next Link Address (NXLA_n) and Current Link Address (CRLA_n) registers are used to indicate a link target. Before starting link mode, set the link target in the NXLA_n register.
After reading a descriptor, this module updates the NXLA_n register to the next link. Note that the CRLA_n register indicates the address of the link target that is being executed.

Table 6.5-52 Link Address Register Set

Register	Description
Next Link Address Register (NXLA_n)	This register is used to set and display the next link target. Before starting link mode, set the address of the link target in this register.
Current Link Address Register (CRLA_n)	This register is used to display the link target that is being executed. This is a read-only register.

b-3) Descriptor setting

DMAC supports multiple descriptor formats.

A switchover between formats is specified by using the DSCFM field of bits [31:28] of the 1st word (header) of the descriptor.

The following table shows the relationship between DSCFM values and descriptor formats.

Table 6.5-53 Descriptor Formats

DSCFM	Descriptor Size	Next Link Address	Channel Extension	Channel Interval	Channel Config	Transaction Size	Destination Address	Source Address	header
3	4 words	✓	— (reload)	— (reload)	— (reload)	— (header)	✓	✓	✓ (with STS)
1	8 words	✓	✓	✓	✓	✓	✓	✓	✓ (no STS)
Other than the above	If DSCFM is set to a value that is not 1 or 3, operation cannot be guaranteed. Make sure that DSCFM is set to 1 or 3.								

Table 6.5-54 Explanation of the Marks in **Table 6.5-53**

Field	Mark	Description	Remarks
Header	✓ (with STS)	The STS field of bits [15:0] in the header is valid. The value set in the STS field is used as the total number of transfer bytes (Transaction Size).	—
	✓ (no STS)	The STS field of bits [15:0] in the header is invalid. The value of "Transaction Size" in the descriptor is used as the total number of bytes.	
Source Address	✓	Specify the source address.	—
Destination Address	✓	Specify the destination address.	—
Transaction Size	✓	Specify the transaction size.	—
	— (header)	Omit the transaction size. The value set in the STS field is used as the total number of transfer bytes (Transaction Size)	Because the STS field is of 16 bits, a maximum of 65,535 bytes can be set.
Channel Config Channel Interval Channel Extension	✓	Specify Channel Config, Channel Interval, and Channel Extension.	—
	— (reload)	Omit Channel Config, Channel Interval, and Channel Extension. The previous settings (the values of the CHCFG_n, CHITVL_n, and CHEXT_n registers of the last time) are inherited.	—
Next Link Address	✓	Specify the next descriptor address (Next Link Address) to be read after DMA transfer of the descriptor.	—

DMAC sequentially interprets data read from descriptors. If the number of words specified for DSCFM is less than 8, place the data of descriptors that are indicated by "✓" in **Table 6.5-53** on memory.

No software settings are required in OUT transfer (reception in peripheral mode) or in IN transfer (transmission in peripheral mode) because the hardware sets the transfer source or destination address according to the setting of the CURPIPE bits in the DxFIFOSEL register.

Table 6.5-55 Example of Placing Descriptors

DSCFM	Address							
	Link Address + 1Ch	Link Address + 18h	Link Address + 14h	Link Address + 10h	Link Address + 0Ch	Link Address + 08h	Link Address + 04h	Link Address + 00h
3h	—	—	—	—	Next Link Address	Destination Address	Source Address	header
1h	Next Link Address	Extension	Interval	Config	Transaction Byte	Destination Address	Source Address	header

- header

The header area provides the descriptor status and other information as shown below.

DMAC reads this area before DMA transfer in link mode starts. After a DMA transaction terminates, DMAC writes the transfer status back to this area.

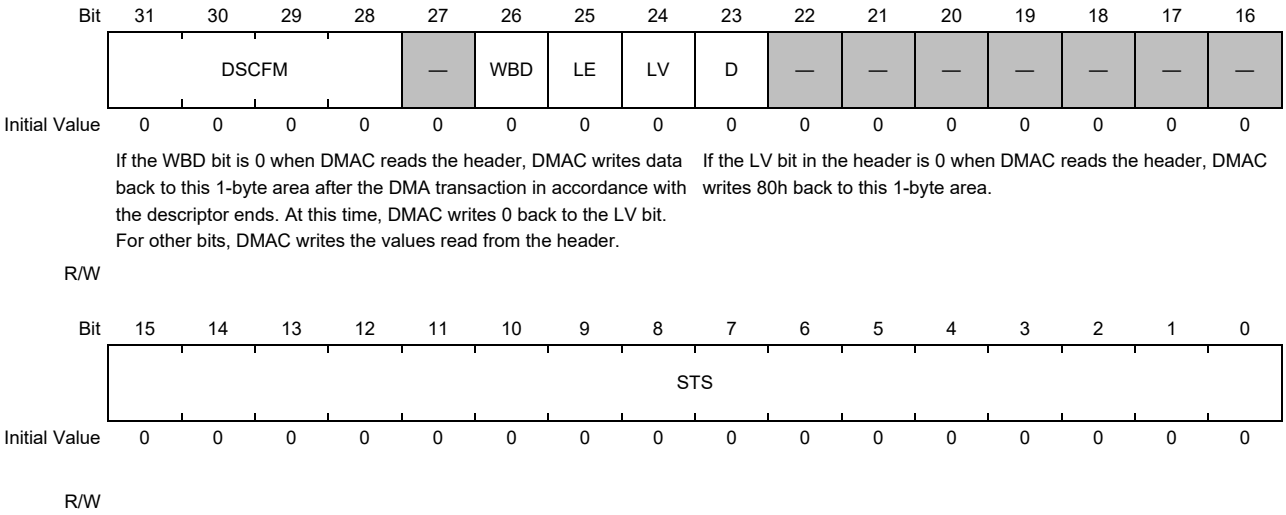

Figure 6.5-23 Header Area

Table 6.5-56 Header Area (1/2)

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	DSCFM			Descriptor Format Specifies the descriptor format (length and combination of descriptors). For details see **Table 6.5-53**.
27	—			Reserved area. Set 0.
26	WBD			Write Back Disable Masks a write-back operation for the LV bit. If this bit is 1, DMAC does not perform a write-back operation. 0: Writes 0 back to the LV bit. 1: Does not perform a write-back operation for the LV bit.
25	LE			Link End Indicates that the link will end with the DMA transaction for this descriptor. Set this bit to 1 to indicate the end of link. 0: The link continues. 1: The link ends.

Table 6.5-56 Header Area (2/2)

Bit	Bit Name	Initial Value	R/W	Description
24	LV			Link Valid Indicates that this descriptor is valid. If WBD = 0, after DMAC executes the DMA transaction written in the descriptor, DMAC writes 0 to this bit. When header is set, set 1 to this bit. 0: This descriptor is invalid. 1: This descriptor is enabled.
23	D			Descriptor Error Indicates a descriptor access error. If LV is 0 when the descriptor is read, DMAC writes 1 back to this bit. 0: A descriptor error has not occurred. 1: LV was 0 when the descriptor was read.
22 to 16	—			Reserved area. Set 0.
15 to 0	STS			Short Transaction Size If DSCFM is 3, the transaction size is set (in bytes). The maximum number of transfer bytes that can be set is 65,535. If DSCFM is 3, Do not set 0 for STS. If 0 is set, operation cannot be guaranteed.

If descriptors are added sequentially while DMAC is operating, the access that the CPU sets 0 to the LV bit and the access that DMAC writes 1 back to the D bit might contend with each other. If this contention occurs, prior-written data is overwritten by latter-written data.

To prevent this problem from occurring, DMAC performs a write-back operation for the D bit in a byte-write manner. Therefore, the CPU must also set LV to 1 in a byte-write manner. Because the byte lanes for the D and LV bits are different, by writing data to different areas, occurrence of this problem can be prevented.

- Settings of descriptors other than header

  The specifications of data of the descriptors other than header are the same as the specifications of internal registers.

- Settings specified when descriptors are accessed

  The MHPROT pin output can be set for the LWPR and LDPR fields of the DCTRL register when descriptors are accessed. Set it according to the access target in which descriptors are deployed.

- Descriptor areas and DMA transfer areas

  The following provides an overview of the descriptor areas and DMA transfer areas that are accessed by DMAC.

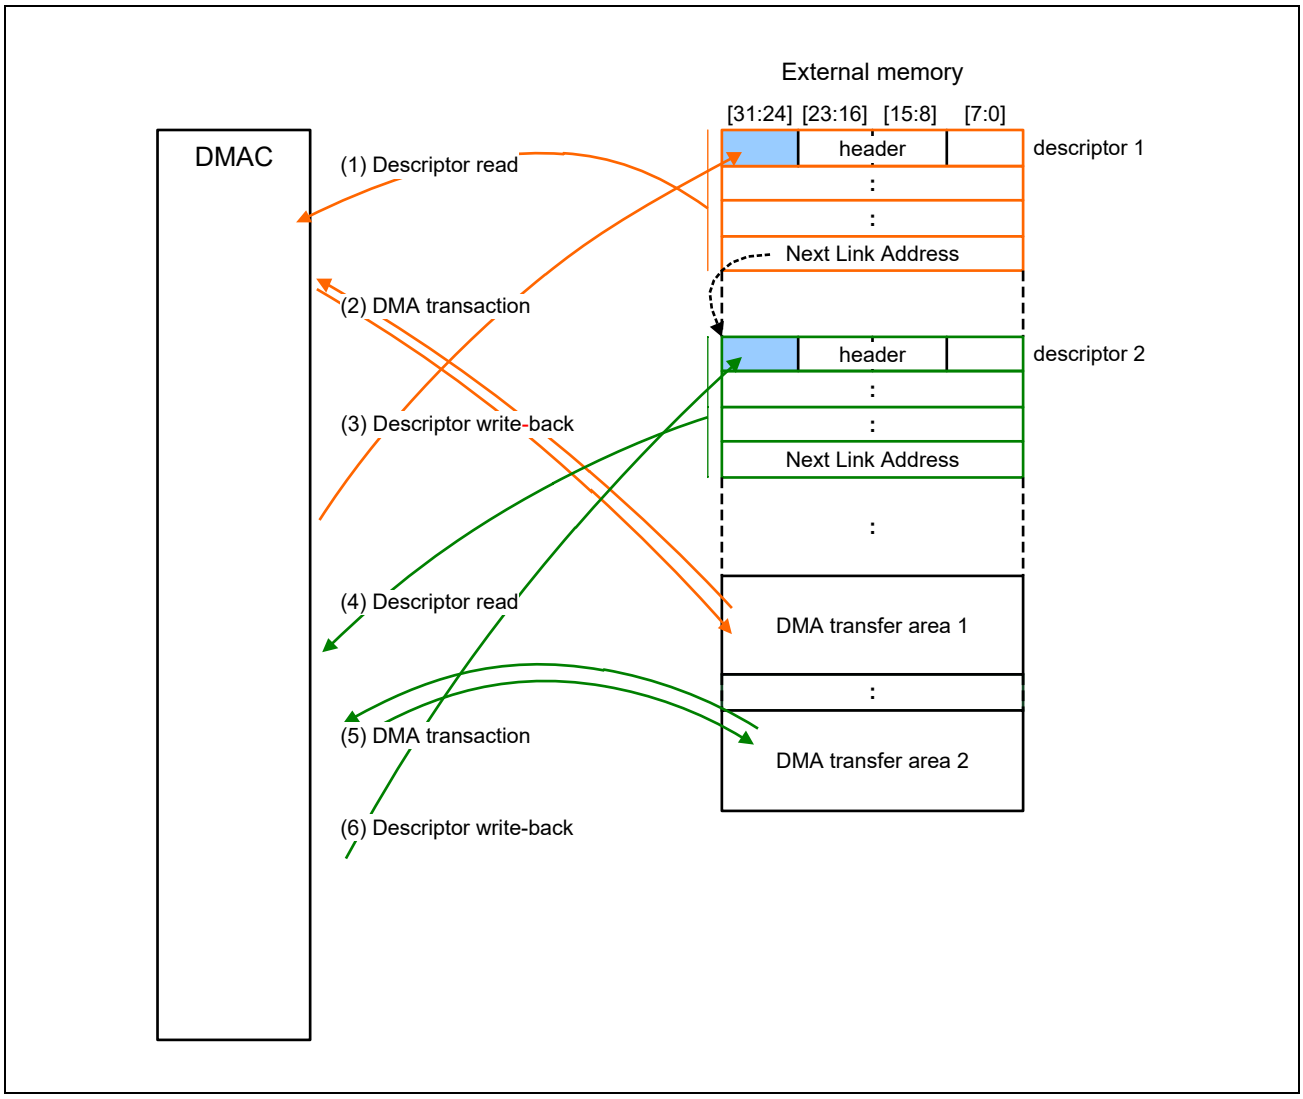

Figure 6.5-24 Overview of Descriptor Areas and DMA Transfer Areas

(1) Descriptor read
DMAC loads a value from the internal NXLA_n register to the CRLA_n register, and then reads a descriptor from the external memory space indicated by the CRLA_n register (descriptor 1).

(2) DMA transfer
If the LV bit of the header descriptor is 1, DMAC performs a DMA transfer in accordance with the descriptor information.

(3) Descriptor write-back
After performing a DMA transfer of data by the number of bytes that are set, if the WBD bit in header is 0, DMAC performs write-back for bits [31:24] in header of Descriptor 1. For the LV field, 0 is written back. For other fields, the values read in (1) are written back on a byte-size basis.

(4) Descriptor read
If the value of the LE bit in the header descriptor that was read previously (in (1)) is 0, DMAC reads the next descriptor from the address (descriptor2) indicated by Next Link Address in the current descriptor.

(5) DMA transfer
If the LV bit in the header descriptor is 1, DMAC performs a DMA transfer in accordance with the descriptor information.

(6) Descriptor write-back
After performing a DMA transfer of data by the number of bytes that are set, if the WBD bit in header is 0, DMAC performs write-back for bits [31:24] in header of Descriptor 2. For the LV field, 0 is written back. For other fields, the values read in (4) are written back on a byte-size basis.

(Steps (4) to (6) are repeated.)

If LE = 1 and WBD = 0 in header, DMAC performs a DMA transfer with the descriptor settings, writes 0 back to the LV bit in header, and then terminates processing.

If LE = 1 and WBD = 1 in header, DMAC performs a DMA transfer with the descriptor settings, and then terminates processing (without performing write-back).

If LV = 0 in header, DMAC writes 1 back to the D bit in header, and then, if the DRRP bit in the CHCFG_n register is 1, DMAC waits for the number of intervals specified by the DITVL field of the DSCITVL_n register, and then reads the descriptor again. If DRRP = 0, DMAC terminates processing.

- Notes on descriptors
  - In link mode, settings can be changed by reading descriptors. However, it is impossible to synchronize the setting change times and hardware requests. Therefore, to use hardware requests, before setting the SETEN bit in the CHCTRL_n register, set the AM, LVL, HIEN, LOEN, and SEL bits in the CHCFG_n register. Note that these setting bits must not be changed in descriptors.
  - Descriptors cannot be used to change the DMS field in the CHCFG_n register (DMAC is always placed in link mode). Although descriptors can be used to change the settings of the REN, RSW, and RSEL fields in the CHCFG_n register, changes of those fields do not affect operation.
  - The descriptor can be initialized by overwriting the memory area corresponding to the descriptor you intend to initialize while the DMAC is not operating. The DMAC determines whether or not the descriptor is valid by referring to the DSCFM field and LV bit in the header. Accordingly, set the areas in memory corresponding to the DSCFM field and LV bit to 1 or 3, and to 1, respectively, before enabling DMAC operation.
  - To set the next descriptor on memory while DMAC is operating, make sure that 1 is written to the LV bit after the descriptors subsequent to header (Source Address, Destination Address, ..., Next Link Address) are set. If this is not performed and descriptor setting by the CPU and descriptor reading by DMAC contend, DMAC performs a DMA transfer using the previous values of those descriptors (Source Address, Destination Address, ..., Next Link Address).
  - To leave the write-back information for the D bit of header, make sure that 1 is written to the LV bit of header in a byte-access manner.

b-4) Link configuration example

In link mode, descriptors can be configured as shown below.

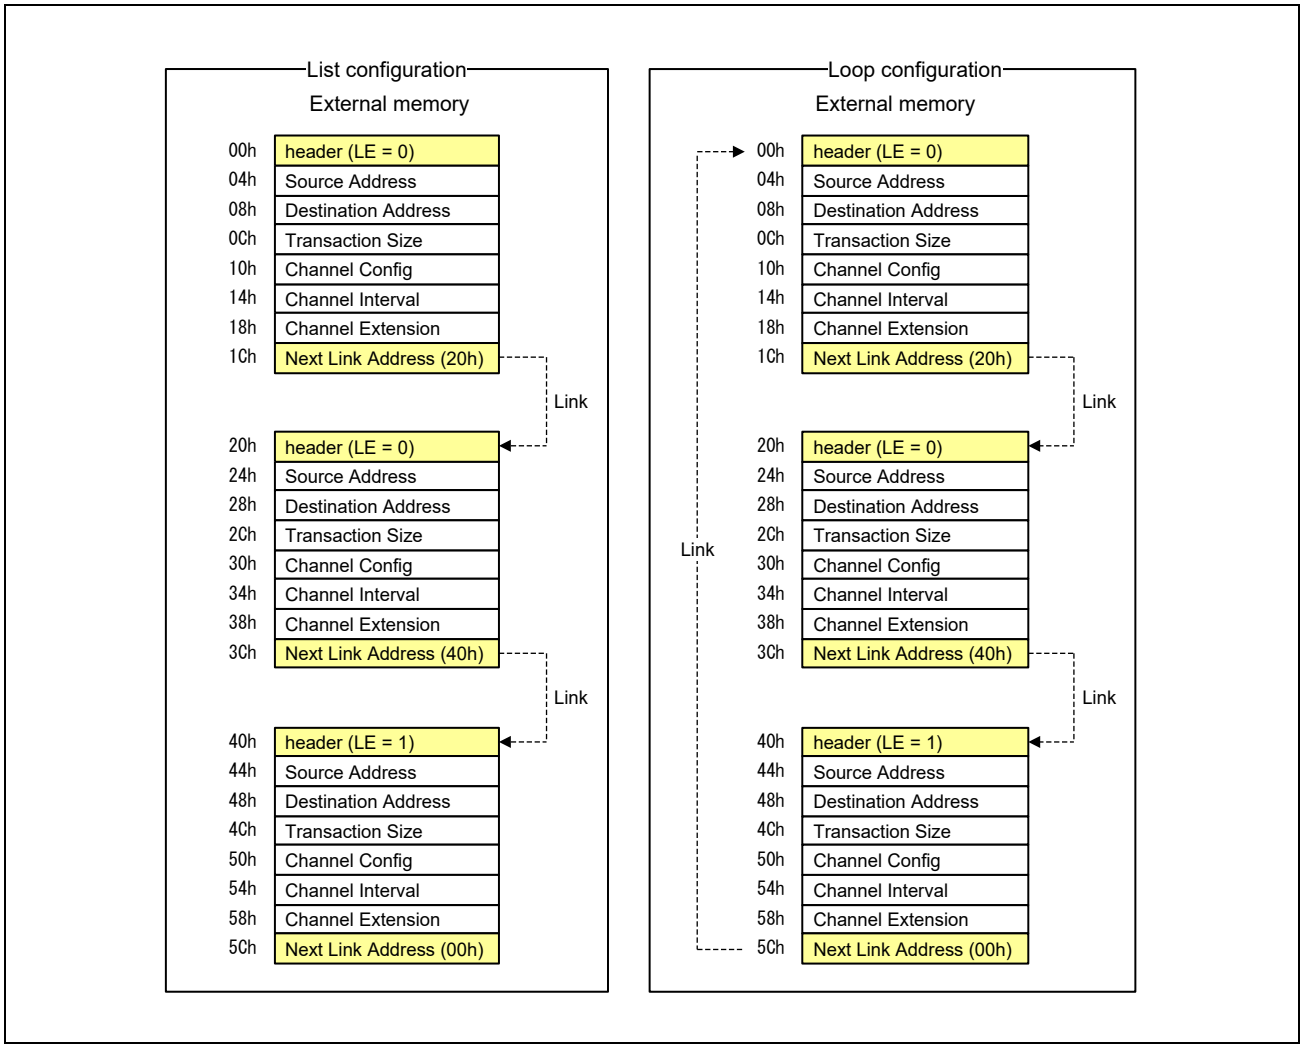

Figure 6.5-25 Link Mode Configuration Example

- List configuration

  The link ends by setting 1 for the LE bit in the header of the last descriptor.

- Loop configuration

  A loop of descriptors can be created by setting the link target of the last descriptor to the address of the first descriptor. To end the loop, change the value of the LE bit of header to 1 or use the transfer interrupt procedure.

(2) Write only mode

Write-only mode is enabled by setting 1 for the WONLY bit in the CHCFG_n register.

Table 6.5-57 Write-Only Mode Setting

WONLY (CHCFG)	Mode	Description
0	Normal mode	A DMA transfer is performed using the values set in Next Register Set.
1	Write-only mode	A DMA write transfer is performed without performing a DMA read transfer.

In write-only mode, no DMA read transfer is performed (note that descriptors are read in the same way as in normal mode). In register mode, the values set in the NxSA_n register (if RSEL = 0, x = 0; if RSEL = 1, x = 1) are used as write data. In link mode, the values of the SA fields of descriptors are used as write data.

Use this mode to, for example, initialize the memory area.

6.5.3.3.13 DMA Transfer

This section describes the basic operation of DMA transfer.

(1) Transfer modes

DMAC supports only single transfer mode.

Upon receiving a DMA transfer request from USB control, DMAC executes a single DMA transfer on the side (source or destination) indicated by the REQD bit in the CHCFG_n register. DMAC then asserts internal DMA permission from internal USB control to DMAC control. DMAC performs a single transfer each time a transfer is received. DMAC continues this operation by the transfer size loaded to the CRTB_n register (arbitration between channels is performed for each DMA transfer).

The timing of internal DMA permission from internal USB control to DMAC control differs depending on the setting of the REQD bit in the CHCFG_n register and the setting of the transfer size (DDS[2:0] and SDS[2:0] in the CHCFG_n register). For details, see **(7) Operational difference depending on the transfer size**.

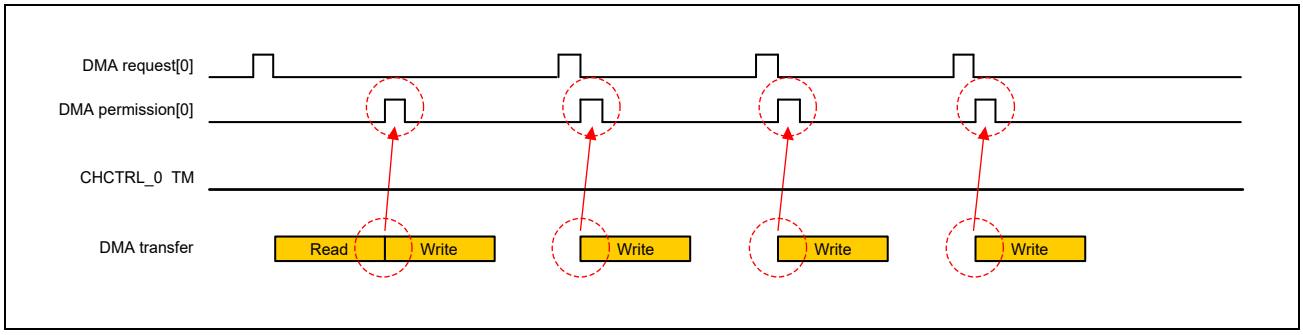

Figure 6.5-26 Single Transfer Mode (REQD = 1, SDS > DDS)

(2) DMA channel priority control

DMAC supports fixed-priority mode and round-robin mode as methods of arbitration between channels. The mode is selected by using the PR bit in the DCTRL register. If the PR bit is 0, fixed-priority mode is selected. If the PR bit is 1, round-robin mode is selected.

Table 6.5-58 Priority Control Setting

Mode	PR (DCTRL)	Description	Remarks
Fixed-priority	0	Controls requests based on fixed priority (CH0 > CH1 > ...).	Use this mode if channels have priority.
Round-robin	1	Controls requests in a round-robin manner.	Use this mode to execute requests equally.

(a) Fixed-priority mode

In fixed-priority mode, a fixed priority level is assigned to each channel as shown below.

(High) CH0 > CH1 (Low)

If DMA transfer requests simultaneously occur over multiple channels, the DMA transfer over the channel whose number is smallest is performed first.

The transfer over channel 0 is performed first. However, while a transfer switches to another transfer over channel 0, a transfer over the channel with the next highest priority level is performed in order to increase the bus usage rate.

(b) Round-Robin Mode

In round-robin mode, each time a transfer over a channel is received, the priority level of the channel that was used for the previous transfer is changed to the lowest level.

In the status immediately after the mode is reset, channels are assigned priority levels in the same way as fixed-priority mode as shown below.

(High) CH0 > CH1 (Low)

In this status, if a transfer request for DMA channel 0 does not occur and a transfer request for DMA channel 1 occurs, the transfer over DMA channel 1 is performed. When the transfer finishes, the channel priority is changed as follows.

(High) CH1 > CH0 (Low)

The following shows an example of DMA transfer in round-robin mode.

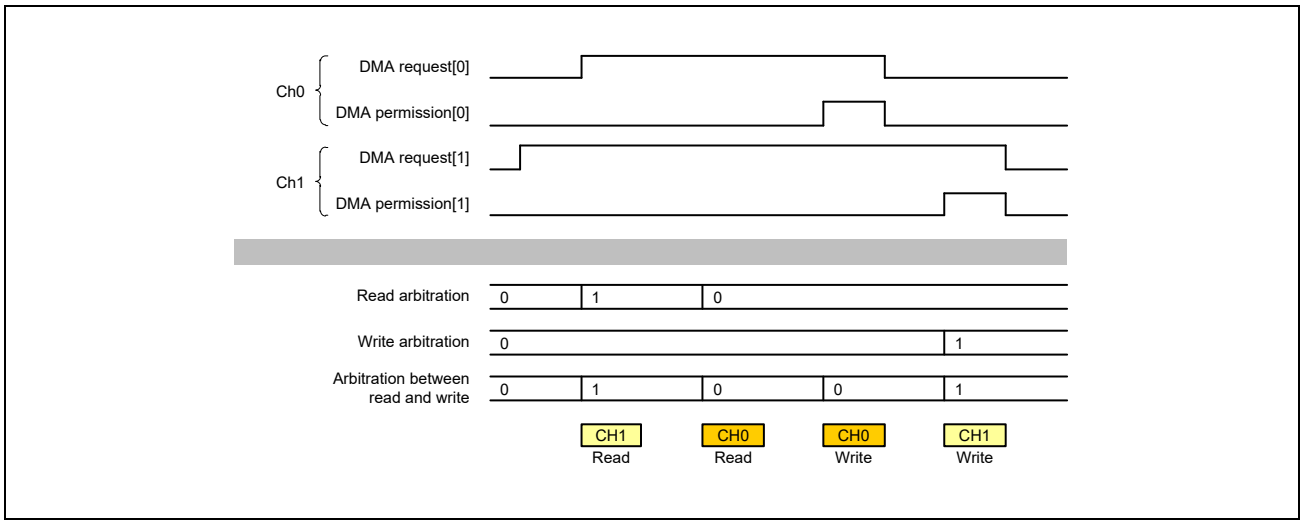

Figure 6.5-27 Example of Operation in Round-Robin Mode (with 4 channels, REQD = 1)

DMAC internally performs arbitration between read channels and arbitration between write channels, further performs arbitration between the arbitration results, and then issues bus access.

(3) Forced sweeping request

When a forced sweeping request is entered, DMAC transfers the data that is left untransferred in the buffer to the destination address. After the sweep processing finishes, DMAC continues DMA transfer.

The following provides notes on forced sweeping requests:

(1) If a forced sweeping request and a transfer request from USB control contend, DMAC performs forced sweeping first, and then performs a DMA transfer.

(2) If the USB-control-side system is the destination (REQD bit in the CHCFG_n register is 1) register REQD = 1, buffer overflow or another error might occur on the destination unit because data is transferred although no DMA transfer request is made on the USB control side. Therefore, the specifications physically prohibit DMAC from using forced sweeping if REQD = 1.

(3) The difference from ordinary sweeping mode described in **c-2) Transfer suspension (buffer sweeping enabled: SBE = 1)** (EN is cleared by setting 1 for the SBE bit in the CHCFG_n register) is as follows: DMAC stops operation after writing data in the buffer in ordinary sweeping mode, whereas DMAC can continue DMA transfer after sweeping the buffer in forced sweeping mode.

(a) Forced software sweeping request

The SETSSWPRQ bit in the CHCTRL_n register determines whether software-based forced sweeping requests can be used. To perform a forced sweeping request, write 1 to the SETSSWPRQ bit. DMAC then outputs the data in the buffer to the destination.

(4) DMA transfer completion interrupt (USBFDMAmn)

USBFDMAmn (m, n = 0, 1) is an interrupt signal that indicates termination of a DMA transaction.

If a transfer for the total number of transfer bytes loaded to the CRTB_n register is completed by an OKAY response, the END bit in the CHSTAT_n register is set to 1. At this time, if the DEM bit in the CHCFG_n register is 0, DMAC generates a USBFDMAmn (m, n = 0, 1) interrupt.
(If a write-back operation is performed in link mode, the interrupt is generated after the write-back operation finishes.)

In link mode, when the DRRP bit in the CHCFG_n register is 0, if the LV bit of the header of the descriptor that is read is 0, the DER bit in the CHSTAT_n register is set to 1. At this time, if the DIM bit in the CHCFG_n register is 0, DMAC generates a USBFDMAmn interrupt.

Use this signal to detect a transfer completion interrupt performed by the interrupt controller.

Table 6.5-59 USBFDMAmn Assertion Conditions

Cause	Condition	INT_DMA[n] mask signal
DMA transaction ended	A transfer of data by the number of transfer bytes loaded to the CRTB_n register is completed by an OKAY response (if a write-back operation is performed in link mode, after the operation finishes)	DEM bit in the CHCFG_n register
Descriptor was invalid	LV of header of the descriptor that is read is 0 when DRRP and DIM in the CHCFG_n register are both 0 in link mode	DIM bit in the CHCFG_n register

(5) DMA error interrupt (USBFDMAERRm)

If an error response is received for DMA transfer or descriptor access, this module stops transfer, assuming that an error occurred. When an error response is received, the EN bit in the CHSTAT_n register for channel n that is being used for transfer is cleared to 0, and the ER bit is set to 1 (n = 1, 0). Also, the USBFDMAERRm interrupt is asserted.

The USBFDMAERRm signal cannot be masked.

For a sequence of transfers for which an error occurred, data integrity cannot be guaranteed. Always use the following procedure to restart the transfer sequence from the beginning.

1. Set the SWRST bit in the CHCTRL_n register to 1.
2. Reset each register.

(6) Interval Count Function

The execution interval of a DMA transfer can be adjusted by using the ITVL field in the CHITVL_n register. This function prevents DMAC from continuously occupying the bus. If this function is enabled, DMAC does not perform a DMA transfer for the next request until the counter value becomes 0.

The following shows an operation example.

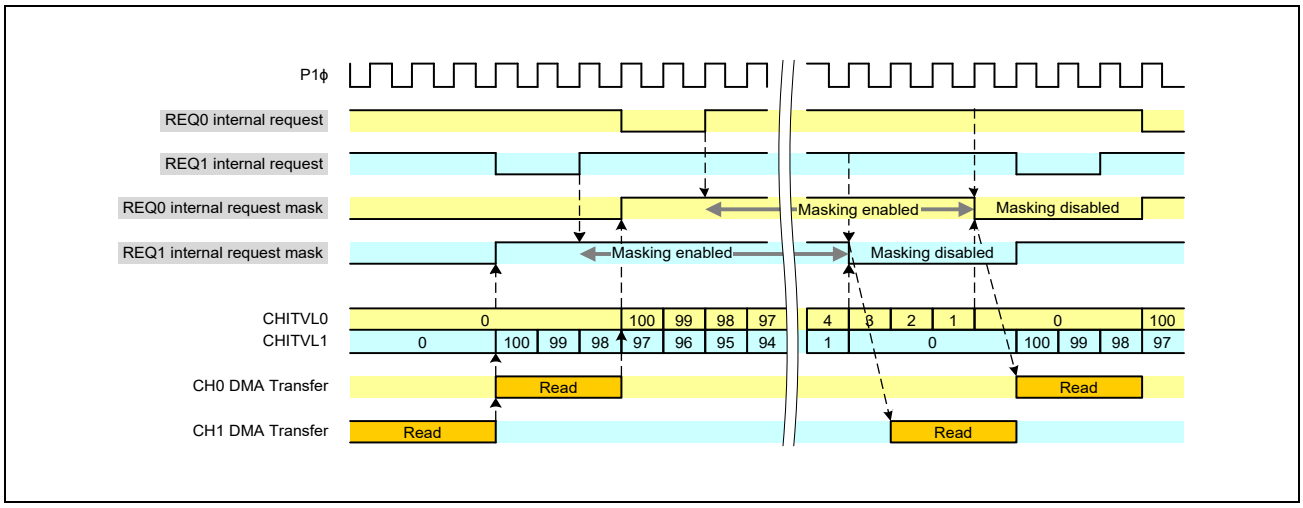

Figure 6.5-28 Example of Counting Intervals (REQD = 0, SDS < DDS)

An interval is inserted after a transfer is performed on the side specified by the REQD bit in the CHCFG_n register. The following shows how the REQD, SDS, and DDS values of the CHCFG_n register are related with the interval.

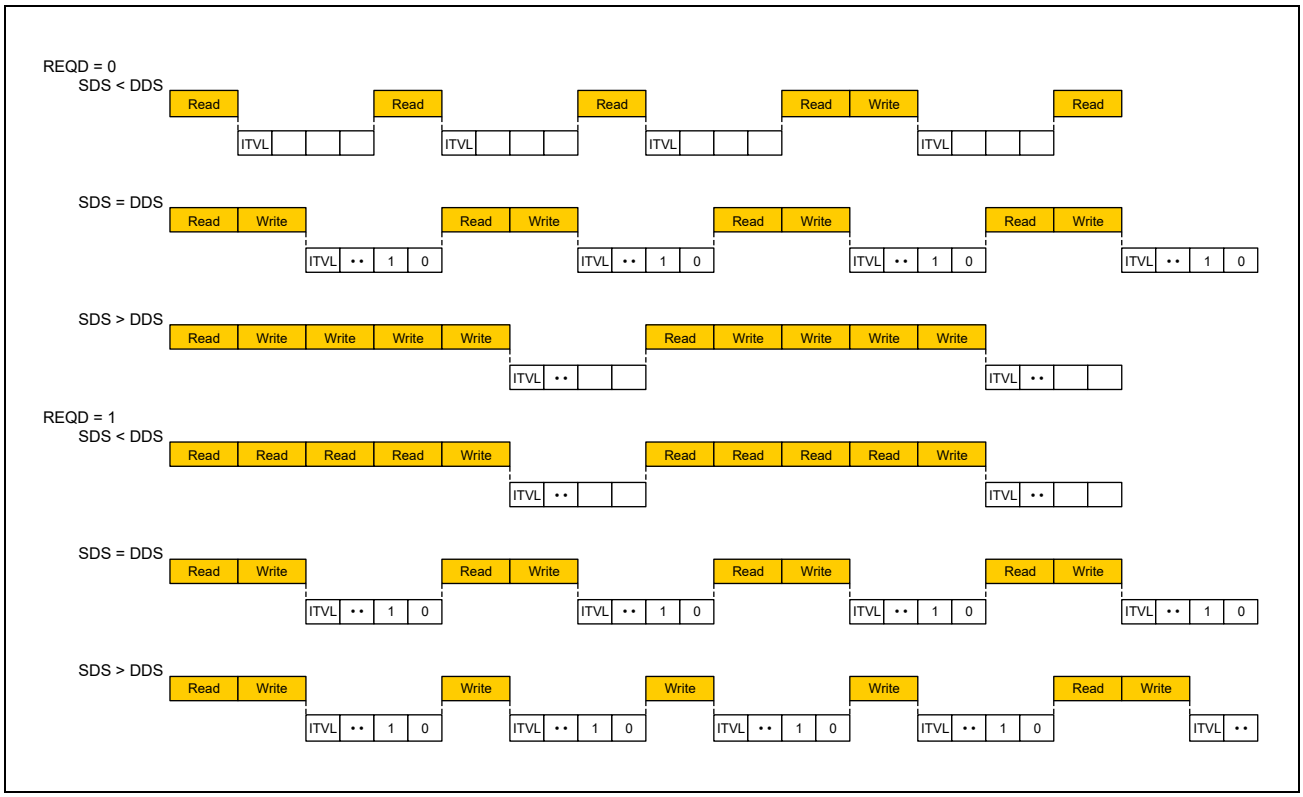

Figure 6.5-29 DMA Transfer Settings and Interval Count

(7) Operational difference depending on the transfer size

(a) If the transfer size on the source side is smaller

When reading of as much data as the destination data size finishes, a write to the destination starts.

The following figure is an example of the timing chart in the case where the source is an 8-bit field and the destination is a 32-bit field (SDS = 0 and DDS = 2 in the CHCFG_n register) (when the rising edge is detected).

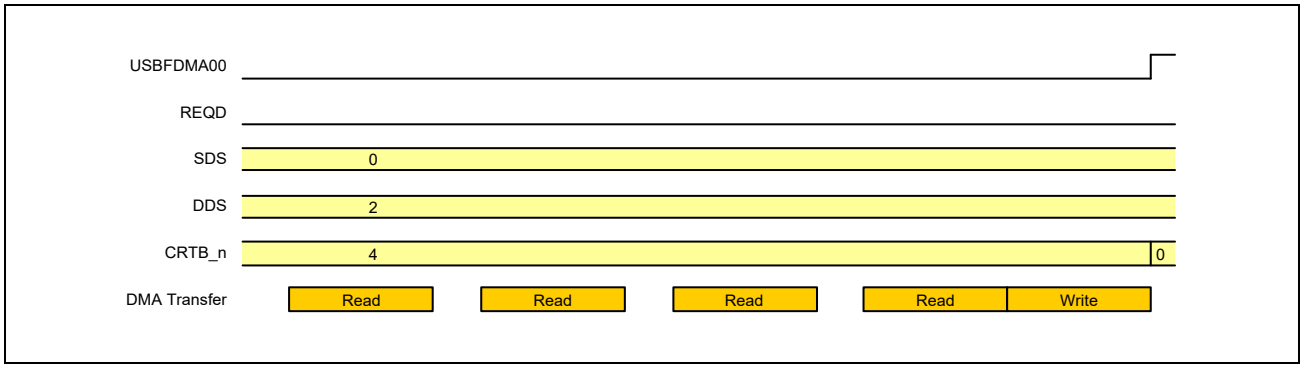

Figure 6.5-30 Example of Timing Chart in the Case Where the Source is Smaller
(LVL = 0, HIEN = 1, REQD = 0, and SDS < DDS)

(b) If the transfer size on the destination side is smaller

Because the source side is larger than the destination side, two or more destination write operations occur for one source read operation. The following is an example of the timing chart in the case where the source is a 64-bit field and the destination is a 16-bit field (SDS = 3 and DDS = 1 in the CHCFG_n register) (when the rising edge is detected).

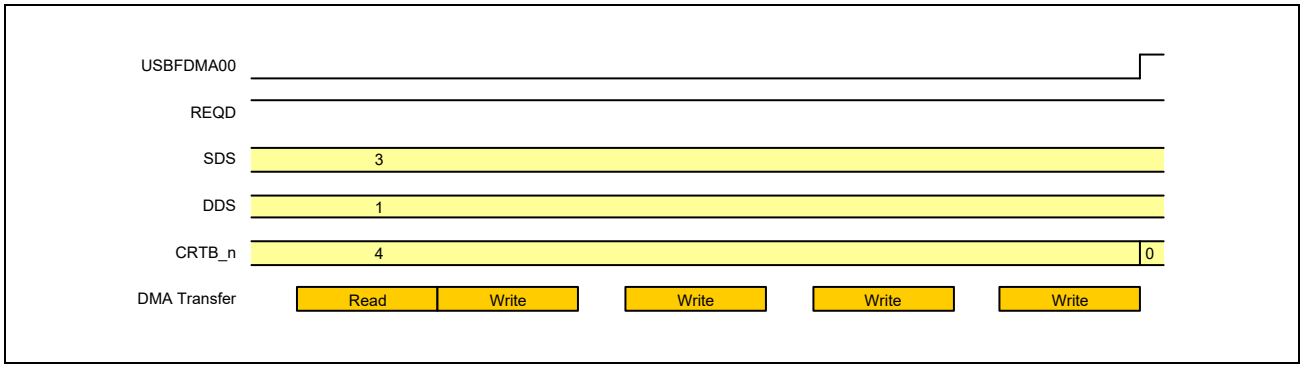

Figure 6.5-31 Example of Timing Chart in the Case Where the Destination Is Smaller
(LVL = 0, HIEN = 1, REQD = 1, and SDS > DDS in the CHCFG_n Register)

(c) If the Source and Destination Transfer Sizes Are the Same

Each time a DMA transfer request is detected, a source read operation and a destination write operation occur.

The following is an example of the timing chart in the case where the source and destination are 8-bit fields (SDS = 0 and DDS = 0 in the CHCFG_n register) (when the rising edge is detected).

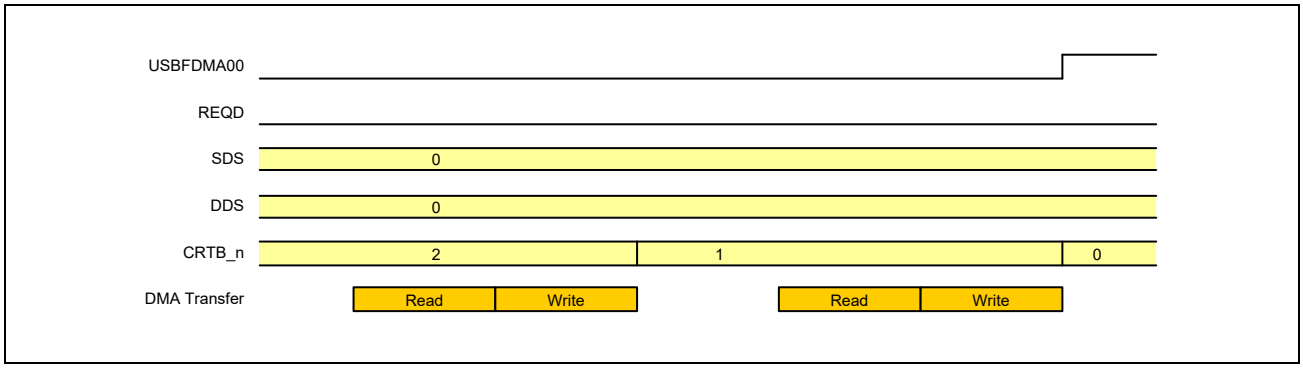

Figure 6.5-32 Example of Timing Chart in the Case where the Source and Destination Sizes are the Same (LVL = 0, HIEN = 1, REQD = 0, and SDS = DDS in the CHCFG_n Register)

(8) Transfer state

The CHSTAT_n register indicates the transfer state of a channel.

(a) Transfer state

The TACT bit in the CHSTAT_n register indicates that channel n is operating. When 1 is written to the SETEN bit in the CHCTRL_n register, the TACT bit is set to 1. The TACT bit continues to be 1 while DMAC is accessing a descriptor or waiting for a DMA request.

The TACT bit is cleared when the EN bit in the CHSTAT_n register is cleared (for details about the conditions in which the EN bit is cleared, see **(1) Current Source Address Register**) and the DMA transfer ends.

If the EN bit is not cleared when the DMA transaction ends (for example, when the REN bit of the CHCFG_n register is 1 in register mode or when DMAC accesses the next descriptor in link mode), the TACT bit is not cleared.

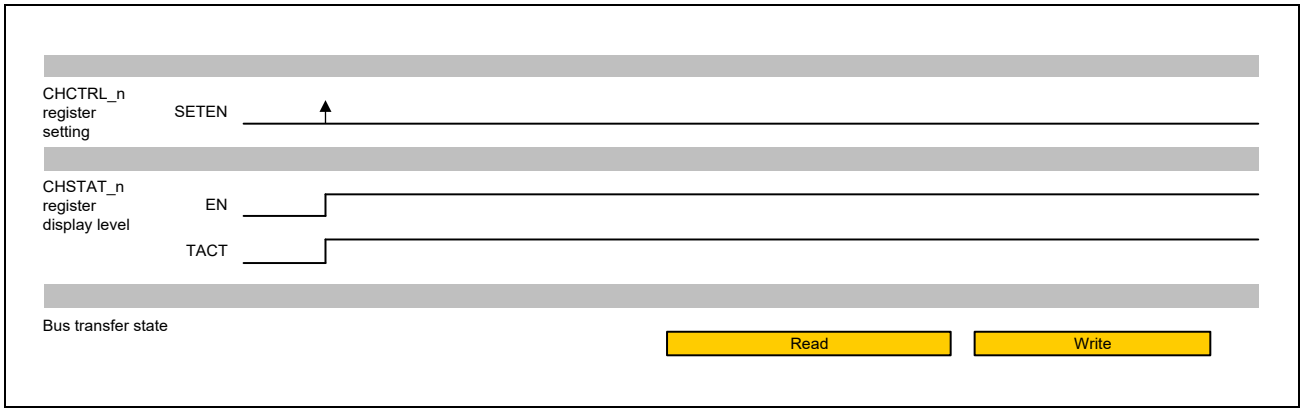

Figure 6.5-33 DMAC State Example 1 (Hardware Request)

(b) Suspension

The SETSUS bit in the CHCTRL_n register can be used to suspend a DMA transfer. If suspension of a DMA transfer is attempted when a bus cycle is running, the DMA transfer is suspended after the bus cycle finishes. The suspended transfer can be resumed by writing 1 to the CLRSUS bit in the CHCTRL_n register.

To check whether a DMA transfer is suspended, after setting the SETSUS bit in the CHCTRL_n register, check the SUS bit in the CHSTAT_n register or the SUS bit for the relevant channel in the DSTAT_SUS register. If The SUS bit is 1, the DMA transfer is currently suspended.

(c) Transfer suspension

By writing 1 to the CLREN bit in the CHCTRL_n register during a DMA transaction, the DMA transaction of the channel can be suspended. As the post-processing for suspension, the SBE bit in the CHCFG_n register can be used to select whether to sweep the data remaining in the buffer when the transaction is suspended. The default is SBE = 0 (do not sweep remaining data).

If the sweep mode is enabled and a transfer is suspended by setting 1 for the CLREN bit in the CHCTRL_n register, DMAC sweeps any data remaining in the buffer and stops operation.

c-1) Transfer suspension (buffer sweeping disabled: SBE = 0)

If 1 is written to the CLREN bit in the CHCTRL_n register during DMA transfer, DMAC suspends DMA transfer and then stops. The timing of stoppage depends on the value set for the REQD bit. After DMAC stops, write 1 to the SWRST bit in the CHCTRL_n register to clear the internal status of DMAC, and then specify the next transfer settings.

Complete deactivation of the channel can be confirmed when the value of the TACT bit in the CHSTAT_n register changes from 1 to 0.

If DMA transfer is suspended before it is completed, the USBFDMAmn interrupt is not asserted.

If the REQD bit in the CHCFG_n register is 0, DMAC stops when the next read operation is completed. However, if data that can be written exists in the buffer, DMAC writes the data and then stops.

If the REQD bit in the CHCFG_n register is 1, DMAC stops when the next read operation is completed.

c-2) Transfer suspension (buffer sweeping enabled: SBE = 1)

If 1 is written to the CLREN bit in the CHCTRL_n register during DMA transfer, DMAC suspends DMA transfer. If the REQD bit in the CHCFG_n register is 0, DMAC sweeps (writes) the already read data, and then stops DMA transfer. If the REQD bit is 1, sweep mode cannot be used physically.

After DMAC stops, set the SWRST bit in the CHCTRL_n register to clear the internal status of DMAC, and then specify the next transfer settings.

Complete deactivation of the channel can be confirmed when the value of the TACT bit in the CHSTAT_n register changes from 1 to 0.

c-3) How to confirm deactivation of the channel

Even when the EN bit of the CHSTAT_n register is cleared to 0 by writing 1 to the CLREN bit in the CHCTRL_n register, if a transfer has already been executed over the bus, DMAC cannot immediately stop. To check whether DMAC has stopped completely, check the EN and TACT bits in the CHSTAT_n register. If both bits are 0, DMAC has stopped completely.

c-4) Procedure for suspending transfer

To suspend transfer:

1. Write 1 to the CLREN bit in the CHCTRL_n register.
2. If the SBE bit in the CHCFG_n register is 0, DMAC stops according to the value of the REQD bit in the CHCFG_n register. If the SBE bit is 1, DMAC is placed in sweep mode.
3. Read the CHSTAT_n register to check whether the TACT bit is 0. If the TACT bit is 0, DMAC has stopped completely. If the TACT bit is 1, continue polling until the bit changes to 0.
4. To perform the next DMA transfer after it is suspended, make sure that the SWRST (software reset) bit in the CHCTRL_n register is turned on before the next DMA transfer starts.

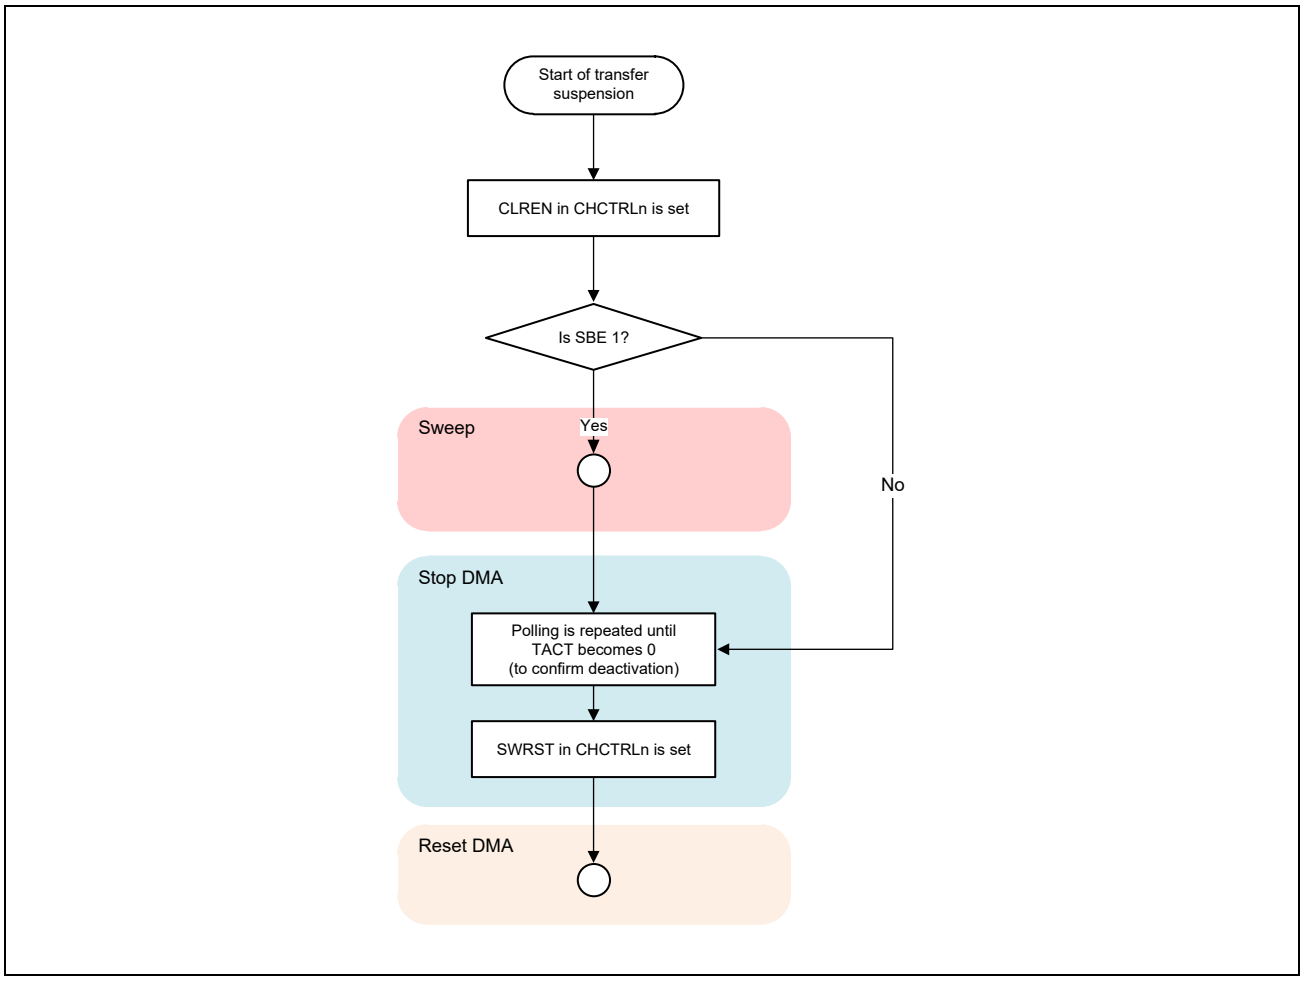

Figure 6.5-34 Transfer Suspension Flowchart

6.5.3.3.14 Access Type

(1) DMA master transfer combination list

(a) Read access

The following describes characteristics of the issuance type for DMA read access.

- An access is performed for a beat align space whose size is set by SDS[2:0] in the CHCFG_n register, including the source address indicated in the CRSA_n register. A beat unaligned transfer for the bus is not performed. An excess area is sometimes read depending on CRSA_n or SKIP settings. In this case, the necessary data is imported into the buffer from the read data.
- The size and burst length are determined based on the value set in the SDS[2:0] field.
  If the value set in the SDS[2:0] field is equal to or less than the bus width
  Size: Value set in SDS[2:0]
  Burst type: SINGLE
  If the value set in the SDS[2:0] field is larger than the bus width
  Size: Bus width
  Burst type: Fixed-length burst (burst length = SDS[2:0] value/bus width)

The following indicates the access types for the bus.

Table 6.5-60 DMA Read Transfer Combination List

SDS	Source Address	AHB transfer					
		First transfer			Second transfer		
		Address	Data Size	Burst Type	Address	Data Size	Burst Type
0 (8 bits)	-	addr	8	SINGLE			
1 (16 bits)	2 byte align	{addr[31:1], 0b}	16	SINGLE			
	2 byte unalign				{addr[31:1], 0b} + 2h	16	SINGLE
2 (32 bits)	4 byte align	{addr[31:2], 00b}	32	SINGLE			
	4 byte unalign				{addr[31:2], 00b} + 4h	32	SINGLE
4 (128 bits)	16 byte align	{addr[31:4], 0h}	32	INCR4			
	16 byte unalign				{addr[31:4], 0h} + 10h	32	INCR4
5 (256 bits)	32 byte align	{addr[31:5], 00h}	32	INCR8			
	32 byte unalign				{addr[31:5], 00h} + 20h	32	INCR8
6 (512 bits)	64 byte align	{addr[31:6], 00h}	32	INCR16			
	64 byte unalign				{addr[31:6], 00h + 40h	32	INCR16

Note: If EBT is detected in the middle of burst, 32-bit INCR burst is used to transfer the remaining data.

(b) Write access

The following describes characteristics of the issuance type for DMA write access.

- An access is performed from the destination address indicated by the CRDA_n register to the beat align boundary whose size is set by DDS[2:0] in the CHCFG_n register.
- The size and burst length are determined based on the value set in the DDS[2:0] field.
  If the value set in the DDS[2:0] field is equal to or less than the bus width
    Size: Value set in DDS[2:0]
    Burst type: SINGLE
  If the value set in the DDS[2:0] field is greater than the bus width
    Size: Bus width
    Burst type: Fixed-length burst (burst length = DDS[2:0] value/bus width)
- In write access, only the specified space is accessed. In the following cases, the combination of values smaller than the value set in the DDS[2:0] field is used for access.
  - The destination address is beat-unaligned for the value set in the DDS[2:0] field.
  - An access specified in the DDS field will be across the SKIP boundary.
  - The size specified in the DDS[2:0] field is too large for the number of remaining bytes to be transferred.

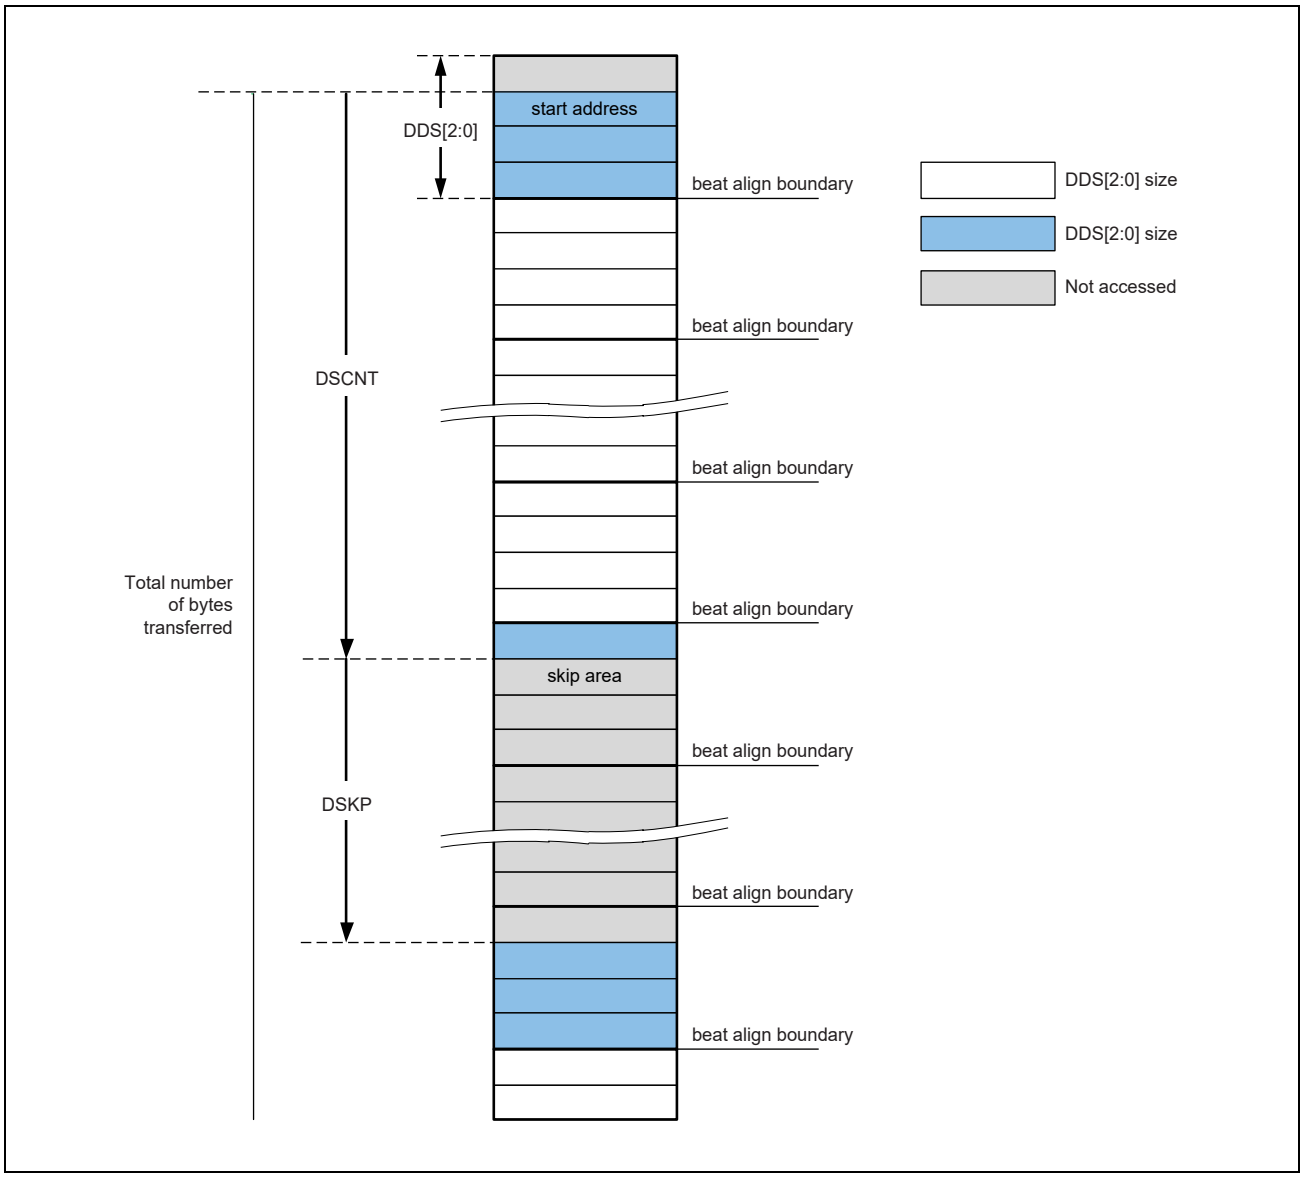

Figure 6.5-35 Example of DMA Write Access Space and Access Types

The following shows the access types for the bus in the case of beat-aligned.

Table 6.5-61 DMA Write Transfer Combination List

	AHB transfer		
	First transfer		
DDS[2:0]	Address	Data Size	Burst Type
0 (8 bits)	addr	8	SINGLE
1 (16 bits)	{addr[31:1], 0b}	16	SINGLE
2 (32 bits)	{addr[31:2], 00b}	32	SINGLE
4 (128 bits)	{addr[31:4], 0h}	32	INCR4
5 (256 bits)	{addr[31:5], 00h}	32	INCR8
6 (512 bits)	{addr[31:6], 00h}	32	INCR16

(2) DMA master descriptor combination list

(a) Read access

The following describes characteristics of a descriptor access.

- Accesses are performed for 8-word beat align space including the LINK address (the address indicated in the CRLA_n register). A beat unaligned transfer is not performed.
- The size and burst length set by INCR8 are used.
- The descriptor format (DSCFM) of the read header is analyzed, and then the descriptor data is set in an internal register.
- If the descriptor extends over the 8-word boundary, an additional read is performed on the succeeding eight words.

The following indicates the types of access to the bus.

Table 6.5-62 Descriptor Read Transfer Combination List

Descriptor Format	Address	AHB Transfer					
		First Transfer			Second Transfer		
	addr[4:0]	Address	Size	Burst	Address	Size	Burst
4 words	00h	{addr[31:4], 0000b}	32	INCR8			
	04h						
	08h						
	0Ch						
	10h						
	14h				{addr[31:4], 0000b} + 20h	32	INCR8
	18h						
	1Ch						
8 words	00h						
	04h				{addr[31:4], 0000b} + 20h	32	INCR8
	08h						
	0Ch						
	10h						
	14h						
	18h						
	1Ch						

Note: If EBT is detected in the middle of burst, 32-bit INCR burst is used to transfer the remaining data.

(b) Write access

Use single transfer as the issuance type for writing data back to a descriptor. The following indicates the types of access to the bus.

Table 6.5-63 Descriptor Write Transfer Combination List

Type	AHB transfer		
	Address	Size	Burst
Write-back in normal mode	{addr[31:2], 00b} + 3h	8	SINGLE
Write-back in the case of an error	{addr[31:2], 00b} + 2h	8	SINGLE

6.5.3.3.15 Arbitration between DMACs

Arbitration between internal DMACs is performed in round-robin mode.

In round-robin mode, the highest priority is given to the DMAC whose DMAC number is the DMC number being used for transfer + 1. Immediately after a reset, DMAC0 has the highest priority.

Table 6.5-64 Priority of a transfer request for DMACs that are performing transfer

	Next DMAC	
Current DMAC	DMAC0	DMAC1
DMAC0	2	1
DMAC1	1	2

Note: Priority: 1 (high), 2 (low)

6.5.3.3.16 Notes

(1) Access

During read access, a beat align area is accessed by one transfer. Therefore, if beat unaligned is set, the beat align area including the specified area is accessed.

For example, if the Source Address is 0000_1038h and SDS is 5 (256-bit), read starts from area 0000_1020h, not from address 0000_1038h. At this time, if the area from 0000_1020h to 0000_1037h contains a register whose value changes by read, the operation might be disrupted.

To prevent problems, use the beat align setting to access a register whose value changes by read access or access to an area adjacent to FIFO.

(2) Level Interrupt bit

This is a DMA interrupt output enable bit. Always set this bit to 1 irrespective of whether peripheral module interrupt USBFDMAmn (m, n = 0, 1) or USBFDMAERRm (m = 0, 1) is used.

To use peripheral module interrupt USBFDMAmn or USBFDMAERRm, set this bit to 1, and then set up the interrupt controller.

SECTION 6 HIGH-SPEED INTERFACE

6.6 PCI Express 3.0 Interface (PCIe)

This section describes the functions of the PCI Express 3.0 interface (PCIe).

6.6.1 Overview

This unit has a dual structure so that the device incorporating it can operate as a root complex or endpoint device, and includes a Type 0/1 Configuration Register for this purpose. Furthermore, it has an internal DMA controller. However, limitations imposed by the AXI place restrictions on some specifications of PCI Express functionality.

■ Unit Function Specifications

AXI Interface Specification

Little endian is only supported.

- Master interface
  - 1 port
  - Bus width: 128 bits
  - ID width: 4 bits (fixed value)
  - Interleave not supported
  - Burst type: Incremental 1 beat (MAxSIZE = 1/2/4 bytes) 2 to 16 beats (MAxSIZE = 16 bytes)
  - Byte-lane transfer and narrow transfer (8, 16, 32-bit lengths, only in 1 dword) are supported. Non-aligned (“unaligned”) transfer is not supported.
  - Allowable number of read/write requests: Variable (1 to 16)
  - Write interleave depth: 1
  - Protection (data/user/non-secure) can be set by using registers.
  - Access type: Normal only (exclusive or locked access not supported)

- Slave interface
  - 1 port
  - Bus width: 128 bits
  - ID width: Up to 20 bits
  - Burst type: Incremental (TYPE = INCR, LENGTH = 1 to 16, SIZE = 1/2/4/8/16 bytes)
  - Support for byte-lane transfer (only when valid bytes are consecutive), unaligned transfer, and narrow transfer (1, 2, and 4 bytes)
  - Number of read transactions which can be accepted: 1 to 8
    Number of write transactions which can be accepted: 1

- Read data reordering depth: 1 to 8
  Write interleave depth: 1
- Required memory area: 16 KB or larger (variable)
- Protection is not distinguished (reception is possible even in the case of protection).
- Access type: Normal only (exclusive or locked access not supported)
- Cache signals (ARCACHE/AWCACHE) are only supported for bufferable bits for writing.

- DMAC
  - DMA method: Register control, descriptor control
  - Number of channels: 8
  - Allowable number of requests to be issued (the maximum total number: 8. When DMAC ch. 1 issues eight PCIe-MRd/MW requests, other channels cannot issue requests).
    - PCIe MRd: Up to 8/ch PCIe MWr: 1/ch
    - AXI Read: 1/ch AXI Write: 1/ch

PCI Express Specification (Compliant with the PCI Express Base Specification 4.0)

- PCI Express Gen1 (2.5 GT/s)/Gen2 (5.0 GT/s)/Gen3 (8.0 GT/s)
- Root Complex (RC) / Endpoint (EP) Applications, Type 0/1 Configuration Register
- Lane implementation x2 / x1 × 1ch
- Data payload: up to 256 bytes; read request size: up to 512 bytes
- Virtual channels are not supported (only VC0 supported)
- Number of outstanding transfers: 1 to 8
- Dynamic control of speed up/down configuration
- Clock Power Management is not supported (P1.CPM, P2.CPM not supported)
- Power Management (ASPM supported not support L1-Substate)
- Error handling/logging (AER supported)
- Replay FIFO with ECC
- Internal Memory without parity
- Number of Support Functions: 2
- Number of DMAC channels: 8
- Supported reference clock architecture
  - Common clock

The initial values of configuration registers for vendor ID, device ID, revision ID, class code, subsystem vendor ID, subsystem ID, and base address register mask are 0. Set appropriate values in the registers before the start of link up.

L1PM substates are not supported.

6.6.2 TOP Pins

6.6.2.1 List of external pins

Table 6.6-1 lists the external pins of the PCI.

Table 6.6-1 List of External Pins

Pin name	Input/Output	Function
PCIE_RXDPL0	Input	PCIe RX data (positive) of Lane 0
PCIE_RXDPL1	Input	PCIe RX data (positive) of Lane 1
PCIE_RXDNL0	Input	PCIe RX data (negative) of Lane 0
PCIE_RXDNL1	Input	PCIe RX data (negative) of Lane 1
PCIE_TXDPL0	Output	PCIe TX data (positive) of Lane 0
PCIE_TXDPL1	Output	PCIe TX data (positive) of Lane 1
PCIE_TXDNL0	Output	PCIe TX data (negative) of Lane 0
PCIE_TXDNL1	Output	PCIe TX data (negative) of Lane 1
PCIE_REFCLKP0	Input	Differential reference clock (positive)
PCIE_REFCLKN0	Input	Differential reference clock (negative)
PCIE0_RSTOUTB	Output	Output the reset signal • When using as RC: Connect to the PERST# pin on Endpoint (opposite device) and use when controlling the initialization of Endpoint from RC • When using as EP: Unused. Open. (High fixed output)

6.6.2.2 List of internal pins

Table 6.6-2 lists the internal pins of this unit.

Table 6.6-2 List of Internal Pins (1/5)

Pin name	Input/Output	Function
FLR_REQ[1:0]	Output	FLR request output
FLR_RESET[1:0]	Input	FLR input
INTX_EP_F0	Input	INTX interrupt signal input for Function #0 for Endpoint (Level signal input: 2 or more cycles of ACLK)
INTX_EP_F1	Input	INTX interrupt signal input for Function #1 for Endpoint (Level signal input: 2 or more cycles of ACLK)
UI_EXTMSI_VAL0	Input	MSI interrupt notification pin for Endpoint
UI_EXTMSI_VAL1	Input	MSI interrupt notification pin for Endpoint
UI_EXTMSI_VAL2	Input	MSI interrupt notification pin for Endpoint
UI_EXTMSI_VAL3	Input	MSI interrupt notification pin for Endpoint
UI_EXTMSI_VAL4	Input	MSI interrupt notification pin for Endpoint
UI_EXTMSI_VEC0 [4:0]	Input	MSI interrupt vector specification pin for Endpoint
UI_EXTMSI_VEC1 [4:0]	Input	MSI interrupt vector specification pin for Endpoint
UI_EXTMSI_VEC2 [4:0]	Input	MSI interrupt vector specification pin for Endpoint
UI_EXTMSI_VEC3 [4:0]	Input	MSI interrupt vector specification pin for Endpoint
UI_EXTMSI_VEC4 [4:0]	Input	MSI interrupt vector specification pin for Endpoint
UI_EXTMSI_FUNC0 [2:0]	Input	MSI interrupt function number specification pin for Endpoint
UI_EXTMSI_FUNC1 [2:0]	Input	MSI interrupt function number specification pin for Endpoint
UI_EXTMSI_FUNC2 [2:0]	Input	MSI interrupt function number specification pin for Endpoint
UI_EXTMSI_FUNC3 [2:0]	Input	MSI interrupt function number specification pin for Endpoint
UI_EXTMSI_FUNC4 [2:0]	Input	MSI interrupt function number specification pin for Endpoint
INTA_RC	Output	INTA interrupt output for Root Complex
INTB_RC	Output	INTB interrupt output for Root Complex
INTC_RC	Output	INTC interrupt output for Root Complex
INTD_RC	Output	INTD interrupt output for Root Complex
INTMSI_RC	Output	MSI Receive interrupt output for Root Complex
INT_LINK_BANDWIDTH	Output	Link Bandwidth change interrupt for Root Complex
INT_LINK_EQUALIZATION_REQUEST	Output	Link Equalization Request interrupt for Root Complex
INT_PM_PME	Output	PM_PME message Receive interrupt for Root Complex
INT_SERR	Output	Error detect interrupt for Root Complex
INT_SERR_COR	Output	Correctable Error detect interrupt for Root Complex
INT_SERR_NONFATAL	Output	Non Fatal Error detect interrupt for Root Complex
INT_SERR_FATAL	Output	Fatal Error detect interrupt for Root Complex
DMA_INT	Output	Event interrupt(DMA)
PCIE_EVT_INT	Output	Event interrupt(PCIe)
AXI_ERR_INT	Output	Event interrupt(AXI)
MSG_INT	Output	Event interrupt(Message Receive)
INT_ALL	Output	Event interrupt
ALLOW_ENTER_L1	Input	ASPM L1 state permission setting input
PME_TIM	Input	Clock input for PM_PME Message for Endpoint
TURN_OFF_EVENT	Output	PME_Turn_Off Msg. Reception flag output for Endpoint

Table 6.6-2 List of Internal Pins (2/5)

Pin name	Input/Output	Function
TURN_OFF_EVENT_ACK	Input	Acknowledge input for Endpoint
D3_EVENT_F0	Output	Non-D0 State transition request reception output for Function #0 for Endpoint
D3_EVENT_F1	Output	Non-D0 State transition request reception output for Function #1 for Endpoint
D3_EVENT_ACK_F0	Input	Acknowledgment input for Function #0 for Endpoint
D3_EVENT_ACK_F1	Input	Acknowledgment input for Function #1 for Endpoint
CFG_PMCSR_PME_STATUS_F0	Input	Power Management Event setting input for Function #0 for Endpoint
CFG_PMCSR_PME_STATUS_F1	Input	Power Management Event setting input for Function #1 for Endpoint
CFG_PMCSR_PME_STATUS_WRITECLEAR_F0	Output	PME_STATUS clear output for Function #0 for Endpoint

SARVALID	Input	AXI Slave Interface Signals-Read Address Channel Read Valid input
SARREADY	Output	AXI Slave Interface Signals-Read Address Channel Read Ready output
SRID[idlen-1:0]	Output	AXI Slave Interface Signals-Read Data Channel Read Data ID tag output
SRDATA[d-1:0]	Output	AXI Slave Interface Signals-Read Data Channel Read Data output
SRRESP[1:0]	Output	AXI Slave Interface Signals-Read Data Channel Read Response output

Table 6.6-2 List of Internal Pins (5/5)

Pin name	Input/Output	Function
SRLAST	Output	AXI Slave Interface Signals-Read Data Channel Raad Last output
SRVALID	Output	AXI Slave Interface Signals-Read Data Channel Read Valid output
SRREADY	Input	AXI Slave Interface Signals-Read Data Channel Read Ready input

6.6.3 Block Diagram

The figure below is a block diagram of the PCI.

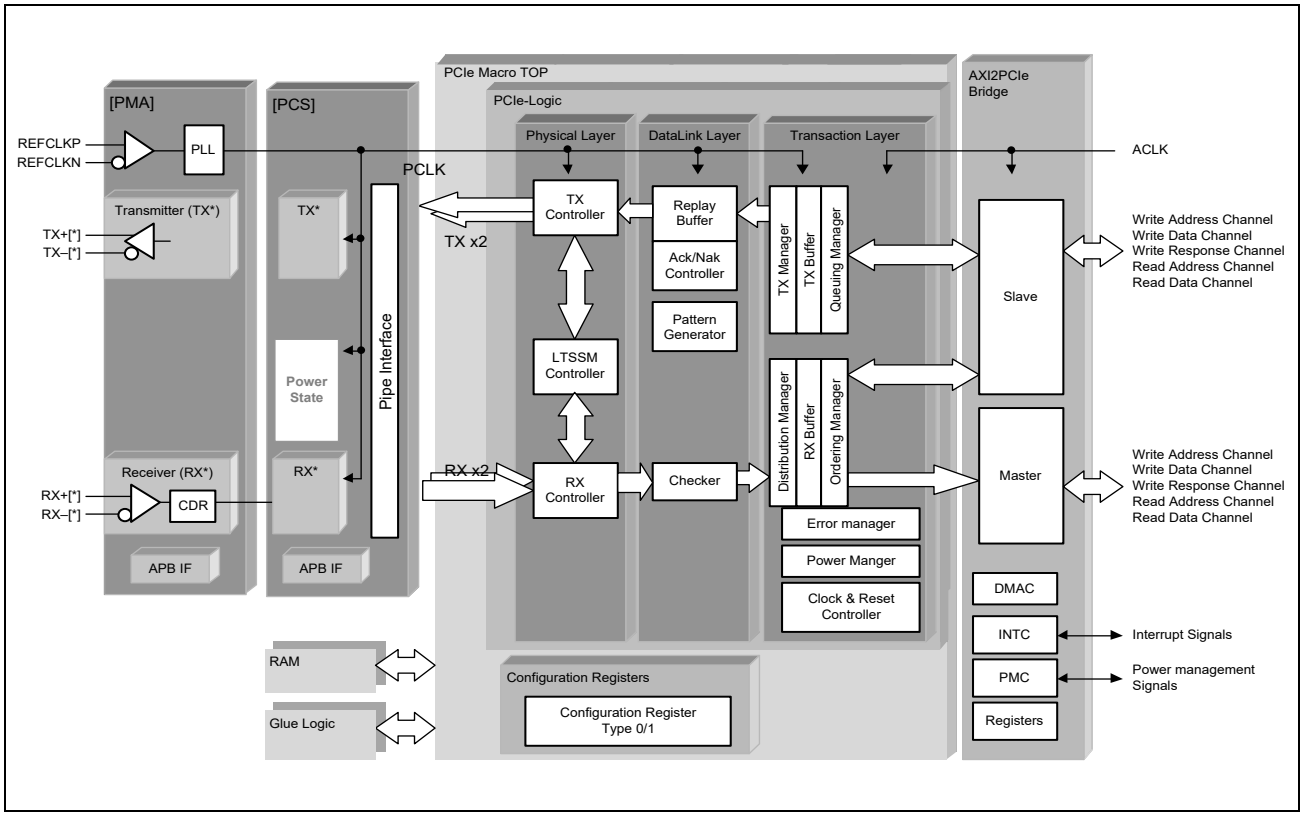

Figure 6.6-1 Block Diagram

6.6.3.1 Reset

A software reset by the register can be used for this unit. **Table 6.6-3** lists the software resets.

Table 6.6-3 List of Software Resets

Reset Name	Reset Control Register
RST_B	Reset Registers (offset:310h) bit 0
RST_GP_B	Reset Registers (offset:310h) bit 1
RST_RSM_B	Reset Registers (offset:310h) bit 2
RST_CFG_B	Reset Registers (offset:310h) bit 3
RST_LOAD_B	Reset Registers (offset:310h) bit 4
RST_PS_B	Reset Registers (offset:310h) bit 5
ARESETn (CPG)	Reset Control Register 3 bit 12

Note: In addition, there is a function level reset (FLR) which is only available in EP operation.

6.6.4 Registers

The register addresses of PCI are given as offsets from the individual base addresses <PCIn_base>. The register base addresses of each PCI are listed in the following table.

Table 6.6-4 Register Base Addresses

Base Address Name	Base Address
<PCI0_base>	0_1340_0000h (5340_0000h*1, 4340_0000h*2)

Note 1. CM33 Address Space Non-Secure

Note 2. CM33 Address Space Secure

6.6.4.1 Register Descriptions (Root Complex Mode)

The following lists the registers incorporated in this unit.

CAUTION

The results of access to reserved bit areas, debug bit areas, and undefined areas are not guaranteed. The combination of reserved, debug, and undefined areas includes cases where the initial values will be non-zero, and the results of changes to such values are not guaranteed.

Registers with the HwInit attribute

Some registers with the RO attribute stated in the PCI Express Base Specification are writable at the time of initialization. When writing to these registers, CFG_HWINIT_EN (Permission Register (offset: 300h) bit [2]) must be set to 1b.

The following is the outline of categories of the register space within this unit.

AXI Bridge Registers	Address 0000h-1FFCh
Physical Layer Control/Status Registers	Address 2000h-5FFCh
PCI Express Configuration Registers (Type1)	Address 6000h-6FFCh
Reserved	Address 7000h-7FFCh

Access to the reserved spaces above is prohibited.

6.6.4.1.1 List of AXI Bridge Registers

The table below lists the AXI bridge registers. Unless specifically stated otherwise, byte, word, and double word access are all possible.

Register Name	Abbreviation	Initial Value	Offset Address	Access Size [bits]
Request Data Register 0	PCI_RC_REQDATA0	xxxx_xxxxh	0080h	32
Request Data Register 1	PCI_RC_REQDATA1	xxxx_xxxxh	0084h	32
Request Data Register 2	PCI_RC_REQDATA2	xxxx_xxxxh	0088h	32
Request Receive Data Register	PCI_RC_REQRCVDAT	xxxx_xxxxh	008Ch	32
Request Address Register 1	PCI_RC_REQADR1	xxxx_xxxxh	0090h	32
Request Address Register 2	PCI_RC_REQADR2	xxxx_xxxxh	0094h	32
Request Byte Enable Register	PCI_RC_REQBE	0000_000Fh	0098h	32
Request Issue Register	PCI_RC_REQISS	0000_0000h	009Ch	32
MSI Receive Window Address (Lower) Register	PCI_RC_MSIRCVWADRL	0000_0000h	0100h	32
MSI Receive Window Address (Higher) Register	PCI_RC_MSIRCVWADRU	0000_0000h	0104h	32
MSI Receive Window Mask (Lower) Register	PCI_RC_MSIRCVWMSKL	0000_0003h	0108h	32
MSI Receive Window Mask (Higher) Register	PCI_RC_MSIRCVWMSKU	0000_0000h	010Ch	32
PCI INTx Receive Interrupt Enable Register	PCI_RC_PINTRCVIE	0000_0000h	0110h	32
PCI INTx Receive Interrupt Status Register	PCI_RC_PINTRCVIS	0000_0000h	0114h	32
Message Receive Interrupt Enable Register	PCI_RC_MSGRCVIE	0000_0000h	0120h	32
Message Receive Interrupt Status Register	PCI_RC_MSGRCVIS	0000_0000h	0124h	32
Message Code Register	PCI_RC_MSGCODE	0000_0000h	0130h	32
Message Data Register	PCI_RC_MSGDATA	0000_0000h	0134h	32
Message Header 3rdDW Register	PCI_RC_MSGH3DW	0000_0000h	0138h	32
Message Header 4thDW Register	PCI_RC_MSGH4DW	0000_0000h	013Ch	32
Interrupt Table Register	PCI_RC_INTTABLE	00xx_0000h	0140h	32
PCIe Event Interrupt Enable 0 Register	PCI_RC_PEIE0	0000_0000h	0200h	32
PCIe Event Interrupt Status 0 Register	PCI_RC_PEIS0	0000_0000h	0204h	32
PCIe Event Interrupt Enable 1 Register	PCI_RC_PEIE1	0000_0000h	0208h	32
PCIe Event Interrupt Status 1 Register	PCI_RC_PEIS1	0000_0000h	020Ch	32
AXI Master Error Interrupt Enable Register	PCI_RC_AMEIE	0000_0000h	0210h	32
AXI Master Error Interrupt Status Register	PCI_RC_AMEIS	0000_0000h	0214h	32
AXI Slave Error Interrupt Enable 1 Register	PCI_RC_ASEIE1	0000_0000h	0220h	32
AXI Slave Error Interrupt Status 1 Register	PCI_RC_ASEIS1	0000_0000h	0224h	32
AXI Slave Error Interrupt Status 3 Register	PCI_RC_ASEIS3	0000_0000h	0230h	32
Permission Register	PCI_RC_PERM	0000_0000h	0300h	32
Reset Register	PCI_RC_RESET	0000_00xxh	0310h	32
Mode Set 0 Register	PCI_RC_MSET0	2001_2000h	0314h	32
Mode Set 1 Register	PCI_RC_MSET1	0000_33F2h	0318h	32
Mode Set 3 Register	PCI_RC_MSET3	0000_0000h	0380h	32
Mode Set 4 Register	PCI_RC_MSET4	0000_0000h	0384h	32
Mode Set 5 Register	PCI_RC_MSET5	0000_0000h	0388h	32
Mode Status 0 Register	PCI_RC_MSTAT0	0000_0000h	0390h	32
PCIe Core Mode Set 1 Register	PCI_RC_PCMSET1	00FA_00F2h	0400h	32
PCIe Core Control 1 Register	PCI_RC_PCCTRL1	0000_0000h	0404h	32
PCIe Core Status 1 Register	PCI_RC_PCSTAT1	0000_0000h	0408h	32
PCIe Core Control 2 Register	PCI_RC_PCCTRL2	003E_0000h	0410h	32
PCIe Core Status 2 Register	PCI_RC_PCSTAT2	xxxx_xxxxh	0414h	32
PCIe Core Status 5 Register	PCI_RC_PCSTAT5	0000_0x00h	042Ch	32
DMA Interrupt Vector 0 Register	PCI_RC_DMAINTVEC0	0000_0000h	04D0h	32
DMA Interrupt Vector 1 Register	PCI_RC_DMAINTVEC1	0000_0000h	04D4h	32
MSI Receive Enable n Register	PCI_RC_MSIRCVEn	0000_0000h	0600h + n x 0010 (n = 0 to 15)	32
MSI Receive Message Data n Register	PCI_RC_MSIRCVMSGDATAn	0000_0000h	0604h + n x 0010 (n = 0 to 15)	32
MSI Receive Mask n Register	PCI_RC_MSIRCVMSKn	FFFF_FFFFh	0608h + n x 0010 (n = 0 to 15)	32

Register Name	Abbreviation	Initial Value	Offset Address	Access Size [bits]
MSI Receive Status n Register	PCI_RC_MSIRCVSTATn	0000_0000h	060Ch + n x 0010 (n = 0 to 15)	32
DMAC Control Register	PCI_RC_DMACTRL	0000_0000h	0800h	32

6.6.4.1.2 List of PCI Express Configuration Registers (Type1)

The table below lists the PCI Express configuration registers.

Register Name	Abbreviation	Initial Value	Offset Address	Access Size [bits]
Vendor and Device ID Register	PCI_RC_VID	0000_0000h	6000h	32
Command and Status Register	PCI_RC_COM_STA	0010_0000h	6004h	32
Revision ID and Class Code Register	PCI_RC_RID_CC	0000_0000h	6008h	32
Cache Line and Header Type Register	PCI_RC_CL_HT	0001_0000h	600Ch	32
Base Address Register 0	PCI_RC_BAR0	0000_0004h	6010h	32
Base Address Register 1	PCI_RC_BAR1	0000_0000h	6014h	32
Bus Number Register	PCI_RC_BNR	0000_0000h	6018h	32
I/O Base/ Limit and Secondary Status	PCI_RC_IOBL_SS	0000_0000h	601Ch	32
Memory Base/ Limit Register	PCI_RC_MEMBL	FFF0_FFF0h	6020h	32
Prefetchable Memory Base/ Limit Register	PCI_RC_PMBL	0001_0001h	6024h	32
Prefetchable Base Higher 32Bits Register	PCI_RC_PBUP32	0000_0000h	6028h	32
Prefetchable Limit Higher 32Bits Register	PCI_RC_PLUP32	0000_0000h	602Ch	32
I/O Base/Limit Higher 16bits Register	PCI_RC_IOBLUP16	0000_0000h	6030h	32
Capabilities Pointer Register	PCI_RC_CP	0000_0040h	6034h	32
Expansion ROM Base Address	PCI_RC_EROMBA	0000_0000h	6038h	32
Bridge Control and Interrupt	PCI_RC_BC_INT	0000_0000h	603Ch	32
PM Capabilities	PCI_RC_PMC	4803_6001h	6040h	32
PM Status/Control Register	PCI_RC_PMSC	0000_0008h	6044h	32
PCI Express Capability Register	PCI_RC_PCIEC	0042_0010h	6060h	32
Device Capabilities Register	PCI_RC_DEVC	0000_8001h	6064h	32
Device Control/Status Register	PCI_RC_DEVCS	0000_2010h	6068h	32
Link Capabilities Register	PCI_RC_LINKC	0072_CC23h	606Ch	32
Link Control/Status Register	PCI_RC_LINKCS	1000_0008h	6070h	32
Slot Capabilities	PCI_RC_SLOTC	0000_0000h	6074h	32
Slot Control/Status	PCI_RC_SLOTCS	0040_0000h	6078h	32
Root Control/Capabilities	PCI_RC_ROOTCC	0000_0000h	607Ch	32
Root Status	PCI_RC_ROOTS	0000_0000h	6080h	32
Device Capabilities 2 Register	PCI_RC_DEVC2	0000_0012h	6084h	32
Device Control 2/Status 2 Register	PCI_RC_DEVCS2	0000_0000h	6088h	32
Link Capabilities 2 Register	PCI_RC_LINKC2	0000_000Eh	608Ch	32
Link Control 2/Status 2 Register	PCI_RC_LINCS2	0000_0003h	6090h	32
Slot Capabilities 2	PCI_RC_SLOTC2	0000_0000h	6094h	32
Slot Control 2 / Status 2	PCI_RC_SLOTCS2	0000_0000h	6098h	32
Base Address Register Mask00 (Lower)	PCI_RC_BARMSK00L	1FFF_FFFFh	60A0h	32
Base Address Register Mask00 (Higher)	PCI_RC_BARMSK00U	0000_0000h	60A4h	32
Base Size 00/01 Register	PCI_RC_BSIZE00_01	0000_0000h	60C8h	32
Type Supported 00/01/02 Register	PCI_RC_TSUPPORT00_01_02	0033_3333h	60D8h	32
Advanced Error Reporting Capability Register	PCI_RC_ADVERC	1501_0001h	6100h	32
Uncorrectable Error Status Register	PCI_RC_UNCESTS	0000_0000h	6104h	32
Uncorrectable Error Mask Register	PCI_RC_UNCEMASK	0000_0000h	6108h	32
Uncorrectable Error Severity Register	PCI_RC_UNCESVY	0046_2030h	610Ch	32
Correctable Error Status Register	PCI_RC_CESTS	0000_0000h	6110h	32
Correctable Error Mask Register	PCI_RC_CEMASK	0000_2000h	6114h	32
Advanced Error Capabilities and Control Register	PCI_RC_ADVECC	0000_00A0h	6118h	32
Header Log Register 0	PCI_RC_HLOG0	0000_0000h	611Ch	32
Header Log Register 1	PCI_RC_HLOG1	0000_0000h	6120h	32
Header Log Register 2	PCI_RC_HLOG2	0000_0000h	6124h	32
Header Log Register 3	PCI_RC_HLOG3	0000_0000h	6128h	32
Root Error Command	PCI_RC_ROOTEC	0000_0000h	612Ch	32
Root Error Status	PCI_RC_ROOTES	0000_0000h	6130h	32

Register Name	Abbreviation	Initial Value	Offset Address	Access Size [bits]
Error source Identification Register	PCI_RC_ERRSI	0000_0000h	6134h	32
Device Serial Number Extended Capability Register	PCI_RC_DEVSNEXTC	1B01_0003h	6150h	32
Serial Number Register (Lower DW)	PCI_RC_SNL	0000_0000h	6154h	32
Serial Number Register (Higher DW)	PCI_RC_SNU	0000_0000h	6158h	32
Secondary PCI Express Extended Capability Header	PCI_RC_SPEECH	0001_0019h	61B0h	32
Link Control 3 Register	PCI_RC_LINC3	0000_0000h	61B4h	32
Lane Error Status Register	PCI_RC_LESTA	0000_0000h	61B8h	32
Lane Equalization Control Register	PCI_RC_LEQCTL	7F7F_7F7Fh	61BCh	32

6.6.4.1.3 AXI Bridge Register Descriptions

The function description of each register is given below.

(1) Request Data Register m (PCI_RC_REQDATAm) (m = 0 to 2)

This register issues various requests.

Access Size : 32 bits
Offset Address : <PCI0_base> + 0080h/ 0084h/ 0088h
Initial Value : xxxx_xxxxh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Request Data[31:16]															
Initial Value	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Request Data[15:0]															
Initial Value	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	Request Data[31:0]	xh	RW	Issue various requests to PCIe

Table 6.6-5 Details of Each Requests

	Request Data Register 0	Request Data Register 1	Request Data Register 2
Offset Address	0080h	0084h	0088h
Zero-Length Read Request	Invalid	Invalid	Invalid
Config Write	Invalid	Invalid	Write data
Config Read	Invalid	Invalid	Invalid
Message Request	3rd Header	4th Header	Invalid
Message Request with data payload	3rd Header	4th Header	Message data

Note: The bits should be set to 0 for the requests indicated as “Invalid”.

(2) Request Receive Data Register (PCI_RC_REQRCVDAT)

This register indicates the data read on reception of the completion response after issuing a read request.

Access Size : 32 bits
Offset Address : <PCI0_base> + 008Ch
Initial Value : xxxx_xxxxh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Request Receive Data[31:16]															
Initial Value	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Request Receive Data[15:0]															
Initial Value	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	Request Receive Data[31:0]	xh	R	After issuing a read request, the data read on reception of the completion response are set in these bits. However, these bits are invalid for Zero-Length Read and any kind of various write requests.

Note: x = Undefined

(3) Request Address Register 1 (PCI_RC_REQADR1)

This register issues requests to PCIe.

Access Size : 32 bits
Offset Address : <PCI0_base> + 0090h
Initial Value : xxxx_xxxxh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Request Address[31:16]															
Initial Value	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Request Address[15:0]															
Initial Value	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	Request Address[31:0]	xh	RW	Set the Address, etc. when issuing a Request.

Table 6.6-6 Details of Each Requests

	[31:27]	[26:24]	[23:19]	[18:16]
Zero-Length Read Request	Address			
Config Write	Bus number		Device number	Function number
Config Read	Bus number		Device number	Function number
Message Request	Reserved	Routing type	Reserved	Reserved
Message Request with data payload	Reserved	Routing type	Reserved	Reserved

	[15:12]	[11:8]	[7:2]	[1:0]
Zero-Length Read Request	Address			Reserved
Config Write	Reserved	Ext. Reg. number	Register number	Reserved
Config Read	Reserved	Ext. Reg. number	Register number	Reserved
Message Request	Reserved	Reserved	Message code	
Message Request with data payload	Reserved	Reserved	Message code	

Note: The bits should be set to 0 for the requests indicated as “Reserved”.

(4) Request Address Register 2 (PCI_RC_REQADR2)

This register issues requests to PCIe.

Access Size : 32 bits
Offset Address : <PCI0_base> + 0094h
Initial Value : xxxx_xxxxh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Request Address63:32[31:16]															
Initial Value	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Request Address63:32[15:0]															
Initial Value	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	Request Address63:32 [31:0]	xh	RW	Set the Address, etc. when issuing a Request.

Table 6.6-7 Details of Each Requests

	[31:0]
Zero-Length Read Request	Address
Config Write	Invalid
Config Read	Invalid
Message Request	Invalid
Message Request with data payload	Invalid

Note: The bits should be set to 0 for the requests indicated as “Invalid”.

(5) Request Byte Enable Register (PCI_RC_REQBE)

This register specifies the 1st DW byte enable bit of the TLP header when issuing a request to PCIe.

Access Size : 32 bits
Offset Address : <PCI0_base> + 0098h
Initial Value : 0000_000Fh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	Request Byte Enable[3:0]			
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
3 to 0	Request Byte Enable[3:0]	Fh	RW	Specify Byte Enable when issuing Cfg Request as required. Normally use 1111b. 1b: Byte Enable enabled 0b: Byte Enable disabled

Table 6.6-8 Details of Each Requests

	[3:0]
Zero-Length Read Request	0000b
Config Write	Random (Usually 1111b)
Config Read	Random (Usually 1111b)
Message Request	Invalid (1111b)
Message Request with data payload	Invalid (1111b)

(6) Request Issue Register (PCI_RC_REQISS)

This register issues requests to PCIe.

Access Size : 32 bits
Offset Address : <PCI0_base> + 009Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	Request Rejection	MOR CD PERR	MOR CH PERR	MOR EP ERR	MOR STATUS[2:0]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	FUNC[2:0]			TR TYPE[3:0]				-	-	-	-	-	-	-	Request Issue
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	RW	RW	RW	RW	RW	RW	RW	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 23	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
22	Request Rejection	0h	R	Indicates that the stopped or hibernated state of the PCI Express transmit (TX) side was detected and the process was forcibly terminated. 0b: Normal state (Request issued) 1b: Rejection
21	MOR CD PERR	0h	R	It is set to 1b when a data error occurs in the Completion TLP for the Non-Posted request issued by this register. Normally not used. It is not updated at the time of Posted request.
20	MOR CH PERR	0h	R	It is set to 1b when a header error occurs in the Completion TLP for the Non-Posted request issued by this register. Normally not used. It is not updated at the time of Posted request.
19	MOR EP ERR	0h	R	It is set to 1b when a Poisoned Completion TLP for a Non-Posted request issued by this register is received. Normally not used. It is not updated at the time of Posted request.
18 to 16	MOR STATUS[2:0]	0h	R	This register retains the MOR Status of Completion TLP for Non-Posted requests issued. It is not updated at the time of Posted request. 000b: Successful Completion (SC) 001b: Unsupported Request (UR) 010b: Configuration Request Retry Status (CRS) (not supported) 011b: Completion Timeout 100b: Completer Abort (CA) 101b: Unexpected Completion and mismatched type (Lock Completion responds to non-Lock Request) 110b: Reserved 111b: Overrun Completion length
15	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
14 to 12	FUNC[2:0]	0h	RW	Set the function of Request.
11 to 8	TR TYPE[3:0]	0h	RW	Sets the type of Request. Refer to **Table 6.6-9** for details.
7 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

Bit	Bit Name	Initial Value	R/W	Description
0	Request Issue	0h	RW	When writing: 1b: Request issuance 0b: No operation When reading: 1b: Processing Request (Indicates that the issued Request is being processed.) 0b: Request can be accepted (Indicates that the processing of the issued Request has ended.)

Table 6.6-9 Details of Each Requests

	TR Type		Device Type	
	[11:8]	Posted/Non-Posted	Root Complex	Endpoint
Zero-Length Read Request	0000b (0h)	Non-posted	Issuable	Issuable
Configuration Read Type0	0100b (4h)	Non-posted	Issuable	Issuing prohibited
Configuration Write Type0	0101b (5h)	Non-posted	Issuable	Issuing prohibited

(7) MSI Receive Window Address (Lower) Register (PCI_RC_MSIRCVWADRL)

This register sets the start address of the MSI memory space for reception.

Access Size : 32 bits
Offset Address : <PCI0_base> + 0100h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	MSI Receive Window Address (Lower)[28:13]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MSI Receive Window Address (Lower)[12:0]													-	Message Data Enable	MSI Receive Window Enable
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	MSI Receive Window Address (Lower)[28:0]	0h	RW	Set Start Address[31:3] of MSI receive window. However, it must be aligned with the size set by MSI Receive Window Mask. Even if you set a non-aligned Address, the Address Bit for which the MSI Receive Window Mask is set will be 0. *Make sure that MSI Receive Window Enable is 0b when changing this register.
2	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
1	Message Data Enable	0h	RW	Control whether to use Message Data in MSI reception judgment. 0b: Not used (conventional mode) 1b: Used (multiple interrupts) The MSI reception judgment result selected by this register is reflected in the INTMSI_RC pin.
0	MSI Receive Window Enable	0h	RW	Enable setting of MSI Receive Window. 0b: Window is disabled. 1b: Window is enabled.

(8) MSI Receive Window Address (Higher) Register (PCI_RC_MSIRCVWADRU)

This register sets the start address of the MSI memory space to receive.

Access Size : 32 bits
Offset Address : <PCI0_base> + 0104h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	MSI Receive Window Address (Higher)[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MSI Receive Window Address (Higher)[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	MSI Receive Window Address (Higher)[31:0]	0h	RW	Set the Start Address[63:32] of the MSI receive window. However, it must be aligned with the size set by MSI Receive Window Mask. Even if you set a non-aligned Address, the Address Bit for which the MSI Receive Window Mask is set will be 0b. *Make sure that MSI Receive Window Enable is 0b when changing this register.

(9) MSI Receive Window Mask (Lower) Register (PCI_RC_MSIRCVWMSKL)

This register specifies the size of the area from the address set in the MSI Receive Window Address bits.

Access Size : 32 bits
Offset Address : <PCI0_base> + 0108h
Initial Value : 0000_0003h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	MSI Receive Window Mask (Lower)[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MSI Receive Window Mask (Lower)[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	MSI Receive Window Mask (Lower)[31:2]	0h	RW	Set the lower bits of the reserved area to 1b (min. 4-byte space; max. 4-Gbyte space). Example settings are as follows. 0h: 4-byte space 1h: 8-byte space 7fh: 512-byte space Note: To change this register, set the MSI Receive Window Enable bit to 0b.
1, 0	MSI Receive Window Mask (Lower)[1:0]	3h	R	11b fixed. MSI Receive Window Mask [1:0] should always be set to Mask.

(10) MSI Receive Window Mask (Higher) Register (PCI_RC_MSIRCVWMSKU)

This register specifies the size of the area from the address set in the MSI Receive Window Address bits.

Access Size : 32 bits
Offset Address : <PCI0_base> + 010Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	MSI Receive Window Mask (Higher)[30:16]														
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MSI Receive Window Mask (Higher)[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
30 to 0	MSI Receive Window Mask (Higher)[30:0]	0h	RW	Set [62:32] for MSI Receive Window Mask.

(11) PCI INTx Receive Interrupt Enable Register (PCI_RC_PINTRCVIE)

This register enables INTx_RC interrupts.

Access Size : 32 bits
Offset Address : <PCI0_base> + 0110h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	MSI Receive Interrupt Enable	INTD Receive Interrupt Enable	INTC Receive Interrupt Enable	INTB Receive Interrupt Enable	INTA Receive Interrupt Enable
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
4	MSI Receive Interrupt Enable	0h	RW	Enable INTMSI_RC with MSI reception. 0b: disable 1b: enable
3	INTD Receive Interrupt Enable	0h	RW	Enable INTD_RC. 0b: disable 1b: enable
2	INTC Receive Interrupt Enable	0h	RW	Enable INTC_RC. 0b: disable 1b: enable
1	INTB Receive Interrupt Enable	0h	RW	Enable INTB_RC. 0b: disable 1b: enable
0	INTA Receive Interrupt Enable	0h	RW	Enable INTA_RC. 0b: disable 1b: enable

(12) PCI INTx Receive Interrupt Status Register (PCI_RC_PINTRCVIS)

This register indicates the INTx_RC interrupt factor. When Assert_INTx is received in response to a message request from PCIe, the corresponding bit in this register is set and interrupt INTx_RC is asserted. When Deassert_INTx is received in response to a message request, the corresponding bit in this register is cleared and interrupt INTx_RC is de-asserted. Although this register can be cleared by writing 1b by software, it is not recommended to clear this bit by the software itself during normal operation for interrupts on the bus for PCIe. The fields of this register are set if each factor is detected, regardless of the setting of the PCI_INTx_Receive_Interrupt_Enable register for RC.

Access Size : 32 bits
Offset Address : <PCI0_base> + 0114h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	MSI Receive Interrupt Status	INTD Receive Interrupt Status	INTC Receive Interrupt Status	INTB Receive Interrupt Status	INTA Receive Interrupt Status
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	RW1	RW1	RW1	RW1	RW1

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
4	MSI Receive Interrupt Status	0h	RW1	MSI Receive Window Set when Memory Write Request is received from the PCI bus side in the set area. This bit is set when MSI is issued to AXI as a Write Transaction and the Response is returned.
3	INTD Receive Interrupt Status	0h	RW1	It is set when an Assert INTD Message is received, and cleared when a Deassert INTD Message is received.
2	INTC Receive Interrupt Status	0h	RW1	It is set when an Assert INTC Message is received, and cleared when a Deassert INTC Message is received.
1	INTB Receive Interrupt Status	0h	RW1	It is set when an Assert INTB Message is received, and cleared when a Deassert INTB Message is received.
0	INTA Receive Interrupt Status	0h	RW1	It is set when an Assert INTA Message is received, and cleared when a Deassert INTA Message is received.

(13) Message Receive Interrupt Enable Register (PCI_RC_MSGRCVIE)

This register controls enabling of MSG_INT in response to the reception of message requests other than INTx and error-related messages.

Access Size : 32 bits
Offset Address : <PCI0_base> + 0120h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	Message Receive Interrupt Enable	-	-	-	-	PM_Active_State_Nak Receive Interrupt Enable	PM_PME Receive Interrupt Enable	PME_Turn_Off Receive Interrupt Enable	PME_TO_Ack Receive Interrupt Enable
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	RW	R	R	R	R	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
24	Message Receive Interrupt Enable	0h	RW	Enable control of MSG_INT assertion by message reception 0b: Disable 1b: Enable
23 to 20	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
19	PM_Active_State_Nak Receive Interrupt Enable	0h	RW	Enable control of MSG_INT assertion by PM_Active_State_Nak reception 0b: Disable 1b: Enable
18	PM_PME Receive Interrupt Enable	0h	RW	Enable control of MSG_INT assertion by PM_PME reception 0b: Disable 1b: Enable
17	PME_Turn_Off Receive Interrupt Enable	0h	RW	Enable control of MSG_INT assertion by PME_Turn_Off reception 0b: Disable 1b: Enable
16	PME_TO_Ack Receive Interrupt Enable	0h	RW	Enable control of MSG_INT assertion by PME_TO_Ack reception 0b: Disable 1b: Enable
15 to 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

(14) Message Receive Interrupt Status Register (PCI_RC_MSGRCVIS)

This register is a status register that indicates the reception of message requests other than INTx and error-related messages. The value of this register is reflected in MSG_INT. Only the message code is used to judge the message type. The validity of routing and validity of Msg/MsgD selection are not verified. The corresponding message is considered to have been received.

Access Size : 32 bits
Offset Address : <PCI0_base> + 0124h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	Message Receive Interrupt	-	-	-	-	PM_Active_State_Nak Receive Interrupt	PM_PME Receive Interrupt	PME_Turn_Off Receive Interrupt	PME_TO_Ack Receive Interrupt
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	RW1	R	R	R	R	RW1	RW1	RW1	RW1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
24	Message Receive Interrupt	0h	RW1	Set when receiving a message (does not depend on the type of message)
23 to 20	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
19	PM_Active_State_Nak Receive Interrupt	0h	RW1	Disabled due to RC
18	PM_PME Receive Interrupt	0h	RW1	Set when receiving a PM_PME message
17	PME_Turn_Off Receive Interrupt	0h	RW1	Disabled due to RC
16	PME_TO_Ack Receive Interrupt	0h	RW1	Set when receiving a PM_TO_Ack message
15 to 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

(15) Message Code Register (PCI_RC_MSGCODE)

This register stores the code and routing of the last received message.

Access Size : 32 bits
Offset Address : <PCI0_base> + 0130h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Message Code[7:0]								Routing[2:0]			-	-	-	-	Message Payload
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
15 to 8	Message Code[7:0]	0h	R	Stores the Code of the last received Message.
7 to 5	Routing[2:0]	0h	R	Stores the Routing of the last received Message.
4 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
0	Message Payload	0h	R	Stores the presence or absence of the data payload of the last received Message. 1b: MsgD (with Payload) 0b: Msg (Without Payload) When Power Management Message (PME_TO_Ack Message , PME_Turn_Off Message , PM_PME Message , PM_Active_State_Nak Message) is received, this register is not written.

(16) Message Data Register (PCI_RC_MSGDATA)

This register stores the data of the last received message.

Access Size : 32 bits
Offset Address : <PCI0_base> + 0134h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Message Data[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Message Data[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	Message Data[31:0]	0h	R	Stores the 1DW data of the last received Message. It is updated only when MsgD(with Data) is received, and the previous value is retained when Msg(without Data) is received. When Power Management Message (PME_TO_Ack Message , PME_Turn_Off Message , PM_PME Message , PM_Active_State_Nak Message) is received, this register is not written.

(17) Message Header 3rdDW Register (PCI_RC_MSGH3DW)

This register stores the header (the 3rd DW) of the last received message.

Access Size : 32 bits
Offset Address : <PCI0_base> + 0138h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Message Header 3rdDW[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Message Header 3rdDW[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	Message Header 3rdDW[31:0]	0h	R	Stores the Header (3rdDW) of the last received Message.

Note: When a Power Management message (PME_TO_Ack Message, PME_Turn_Off Message, PM_PME Message, PM_Active_State_Nak Message) is received, this register is not written.

(18) Message Header 4thDW Register (PCI_RC_MSGH4DW)

This register stores the header (the 4th DW) of the last received message.

Access Size : 32 bits
Offset Address : <PCI0_base> + 013Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Message Header 4thDW Registers[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Message Header 4thDW Registers[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	Message Header 4thDW Registers[31:0]	0h	R	Stores the Header (4thDW) of the last received Message.

Note: When a Power Management message (PME_TO_Ack Message, PME_Turn_Off Message, PM_PME Message, PM_Active_State_Nak Message) is received, this register is not written.

(19) Interrupt Table Register (PCI_RC_INTTABLE)

This register is an index of interrupt factors. The interrupt signal (active high) status of each category can be monitored in a list.

Access Size : 32 bits
Offset Address : <PCI0_base> + 0140h
Initial Value : 00xx_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	x	x	x	x	x	x	x	x
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	INT_LINK_EQUALIZATION_REQUEST	-	-	-	-	AXI_ERR_INT	PCIE_EVT_INT	MSG_INT	-	-	-	INTMSI_RC	INTD_RC	INTC_RC	INTB_RC	INTA_RC
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
23 to 16	-	xh	R	Reserved Whenever it is read, xb is read. The written value will be ignored.
15	INT_LINK_EQUALIZATION_REQUEST	0h	R	LINK_EQUALIZATION_REQUEST Interrupt signal level monitor
14 to 11	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
10	AXI_ERR_INT	0h	R	Error interrupt signal monitor
9	PCIE_EVT_INT	0h	R	Event interrupt signal monitor
8	MSG_INT	0h	R	Message interrupt signal monitor
7 to 5	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
4	INTMSI_RC	0h	R	INT_MSI interrupt signal monitor
3	INTD_RC	0h	R	INTD_RC interrupt signal monitor
2	INTC_RC	0h	R	INTC_RC interrupt signal monitor
1	INTB_RC	0h	R	INTB_RC interrupt signal monitor
0	INTA_RC	0h	R	INTA_RC interrupt signal monitor

Note: x = Undefined

(20) PCIe Event Interrupt Enable 0 Register (PCI_RC_PEIE0)

This register enables interrupts of the various PCI Express event factors. This register enables writing to the PCIe Event Interrupt Status 0 Register. See the description of this status register for details of the factors.

Access Size : 32 bits
Offset Address : <PCI0_base> + 0200h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
8	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
7 to 4	-	All 0	RW	Reserved These bits are read as 0b. The write value should always be 0b.
3 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
0	-	0h	RW	Reserved These bits are read as 0b. The write value should always be 0b.

(21) PCIe Event Interrupt Status 0 Register (PCI_RC_PEIS0)

This register is a status register that indicates each PCI Express event. Set to 1b by the factor in the table. After checking the factor, write 1b to clear it.

Access Size : 32 bits
Offset Address : <PCI0_base> + 0204h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	UI_LINK_WIDTH_CHANGE_DONE	UI_LINK_SPEED_CHANGE_DONE	Request Done	-	-	-	CA	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	RW1	RW1	RW1	R	R	RW	RW1	RW	RW	R	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	RX_DLLP_PM_ENTER_L23	-	ASPM L1 Rejected	DL_Up Down	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	R	RW1	RW	RW1	RW1	R	RW	RW	RW	RW	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
30	UI_LINK_WIDTH_CHANGE_DONE	0h	RW1	Indicates completion of Up/Down Configure operation.
29	UI_LINK_SPEED_CHANGE_DONE	0h	RW1	Indicates completion of Speed Change operation.
28	Request Done	0h	RW1	For requests submitted in the Request Issue Registers (Offset: 9Ch): Non-Posted: Indicates that Completion has been received. Posted: Indicates that the request submission has completed..
27, 26	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
25	-	0h	RW	Reserved These bits are read as 0b. The write value should always be 0b.
24	CA	0h	RW1	Indicates that the device has responded with CA (Completer Abort).
23, 22	-	All 0	RW	Reserved These bits are read as 0b. The write value should always be 0b.
21	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
20 to 14	-	All 0	RW	Reserved These bits are read as 0b. The write value should always be 0b.
13	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
12	RX_DLLP_PM_ENTER_L23	0h	RW1	Indicates transition to L2/L3 State in Power Management control.
11	-	0h	RW	Reserved These bits are read as 0b. The write value should always be 0b.
10	ASPM L1 Rejected	0h	RW1	Indicates rejected ASPM L1 transition
9	DL_UpDown	0h	RW1	Set to 1b on transition from DL_Down state to DL_Up state, or DL_Up state to DL_Down state. Check the DL_Down/DL_Up status with PCIe Core Status 1 Registers (Offset: 408h).
8	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

Bit	Bit Name	Initial Value	R/W	Description
7 to 4	-	All 0	RW	Reserved These bits are read as 0b. The write value should always be 0b.
3 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
0	-	0h	RW	Reserved These bits are read as 0b. The write value should always be 0b.

(22) PCIe Event Interrupt Enable 1 Register (PCI_RC_PEIE1)

This register enables parity error and ECC error interrupts. When each bit is set to the valid setting, the value of each corresponding status bit of the PCIe Event Interrupt Status 1 Register becomes valid.

Access Size : 32 bits
Offset Address : <PCI0_base> + 0208h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	TXB_PARITY_ERR EN	ERR_RPC_REPLAYFIFO_PERR EN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	ERR_REPLAY_HIGHER_CORRECTABLE_ERROR EN	ERR_REPLAY_LOWER_CORRECTABLE_ERROR EN	-	-	-	-	-	-	ERR_REPLAY_HIGHER_UNCORRECTABLE_ERROR EN	ERR_REPLAY_LOWER_UNCORRECTABLE_ERROR EN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	RW	RW	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
17	TXB_PARITY_ERR EN	0h	RW	Enable the TXB_PARITY_ERR interrupt. Parity error interrupt notification enable setting for TX Buffer installed in Transaction Layer 0b: Disable 1b: Enable
16	ERR_RPC_REPLAYFIFO_PERR EN	0h	RW	Enable ERR_RPC_REPLAYFIFO_PERR interrupts. Parity error interrupt notification enable setting for Replay FIFO installed in Data Link Layer 0b: Disable 1b: Enable
15 to 10	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
9	ERR_REPLAY_HIGHER_CORRECTABLE_ERROR EN	0h	RW	Enable ERR_REPLAY_HIGHER_CORRECTABLE_ERROR interrupts. Interrupt notification enable setting when an ECC 1-bit error (Correctable Error) occurs in the upper 64-bit data bus of the Replay FIFO installed in the Data Link Layer 0b: Disable 1b: Enable
8	ERR_REPLAY_LOWER_CORRECTABLE_ERROR EN	0h	RW	Enable ERR_REPLAY_LOWER_CORRECTABLE_ERROR interrupts. Interrupt notification enable setting when an ECC 1-bit error (Correctable Error) occurs in the lower 64-bit data bus of the Replay FIFO installed in the Data Link Layer 0b: Disable 1b: Enable
7 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
1	ERR_REPLAY_HIGHER_UNCORRECTABLE_ERROR EN	0h	RW	Enable ERR_REPLAY_HIGHER_UNCORRECTABLE_ERROR interrupts. Interrupt notification enable setting when an ECC 2-bit or more error (Uncorrectable Error) occurs in the upper 64-bit data bus of the Replay FIFO installed in the Data Link Layer 0b: Disable 1b: Enable

Bit	Bit Name	Initial Value	R/W	Description
0	ERR_REPLAY_LOWER_UNCORRECTABLE_ERROR EN	0h	RW	Enable ERR_REPLAY_LOWER_UNCORRECTABLE_ERROR interrupts. Interrupt notification enable setting when an ECC 2-bit or more error (Uncorrectable Error) occurs in the lower 64-bit data bus of the Replay FIFO installed in the Data Link Layer 0b: Disable 1b: Enable

(23) PCIe Event Interrupt Status 1 Register (PCI_RC_PEIS1)

This register is a status register that indicates parity error and ECC error interrupts. After checking the factor, write 1b to the corresponding bit to clear it.

Access Size : 32 bits
Offset Address : <PCI0_base> + 020Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	TXB_PARITY_ERR	ERR_RPC_REPLAYFIFO_PERR
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW1	RW1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	ERR_REPLAY_HIGHER_CORRECTABLE_ERROR	ERR_REPLAY_LOWER_CORRECTABLE_ERROR	-	-	-	-	-	-	ERR_REPLAY_HIGHER_UNCORRECTABLE_ERROR	ERR_REPLAY_LOWER_UNCORRECTABLE_ERROR
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	RW1	RW1	R	R	R	R	R	R	RW1	RW1

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
17	TXB_PARITY_ERR	0h	RW1	TXB_PARITY_ERR interrupt Parity error interrupt notification of TX Buffer installed in Transaction Layer
16	ERR_RPC_REPLAYFIFO_PERR	0h	RW1	ERR_RPC_REPLAYFIFO_PERR interrupt Parity error interrupt notification of Replay FIFO installed in Data Link Layer
15 to 10	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
9	ERR_REPLAY_HIGHER_CORRECTABLE_ERROR	0h	RW1	ERR_REPLAY_HIGHER_CORRECTABLE_ERROR interrupt Interrupt notification when an ECC 1-bit error (Correctable Error) occurs in the upper 64-bit data bus of the Replay FIFO installed in the Data Link Layer
8	ERR_REPLAY_LOWER_CORRECTABLE_ERROR	0h	RW1	ERR_REPLAY_LOWER_CORRECTABLE_ERROR interrupt Interrupt notification when an ECC 1-bit error (Correctable Error) occurs in the lower 64-bit data bus of the Replay FIFO installed in the Data Link Layer
7 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
1	ERR_REPLAY_HIGHER_UNCORRECTABLE_ERROR	0h	RW1	ERR_REPLAY_HIGHER_UNCORRECTABLE_ERROR interrupt Interrupt notification when an ECC 2-bit or more error (Uncorrectable Error) occurs in the upper 64-bit data bus of the Replay FIFO installed in the Data Link Layer
0	ERR_REPLAY_LOWER_UNCORRECTABLE_ERROR	0h	RW1	ERR_REPLAY_LOWER_UNCORRECTABLE_ERROR interrupt Interrupt notification when an ECC 2-bit or more error (Uncorrectable Error) occurs in the lower 64-bit data bus of the Replay FIFO installed in the Data Link Layer

(24) AXI Master Error Interrupt Enable Register (PCI_RC_AMEIE)

This register enables the AXI master error interrupt.

Access Size : 32 bits
Offset Address : <PCI0_base> + 0210h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	Write MSTERR INT EN[3:0]				-	-	-	-	Read MSTERR INT EN[3:0]			
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	RW	RW	RW	RW	R	R	R	R	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
11 to 8	Write MSTERR INT EN[3:0]	0h	RW	Write MSTERR INT Enable Each corresponding bit can be turned on/off individually. 0b: Disable 1b: Enable
7 to 4	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
3 to 0	Read MSTERR INT EN[3:0]	0h	RW	Read MSTERR INT Enable Each corresponding bit can be turned on/off individually. 0b: Disable 1b: Enable

(25) AXI Master Error Interrupt Status Register (PCI_RC_AMEIS)

This register indicates the AXI master error interrupt status.

Access Size : 32 bits
Offset Address : <PCI0_base> + 0214h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	Write ERR ID[3:0]				-	-	-	-	Read ERR ID[3:0]			
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	Write MSTERR INT[3:0]				-	-	-	-	Read MSTERR INT[3:0]			
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	RW1	RW1	RW1	RW1	R	R	R	R	RW1	RW1	RW1	RW1

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
27 to 24	Write ERR ID[3:0]	0h	R	Save the ID of the first DECERR/SLVERR received. When bits [11:8] are cleared, a new error ID can be saved. 0h: normal access
23 to 20	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
19 to 16	Read ERR ID[3:0]	0h	R	Save the ID of the first DECERR/SLVERR received. A new error ID can be saved when bits [3:0] are cleared. 0h: normal access
15 to 12	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
11 to 8	Write MSTERR INT[3:0]	0h	RW1	Indicates that an error was detected in the AXI Master Port. Only the first detected error is saved, and when bits [11:8] are cleared, a new error can be saved. bit[11]: length error When the length of the data sent by the TEF and the data channel do not match. bit[10]: ID mismatch When the MBID value received on the MAWID response channel is different. bit[9]: When DECERR is received bit[8]: When SLVERR is received
7 to 4	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
3 to 0	Read MSTERR INT[3:0]	0h	RW1	Indicates that an error was detected in the AXI Master Port. Only the first detected error is saved, and when bits [3:0] are cleared, a new error can be saved. bit[3]: length error When the length of the data received on the TER and the data channel do not match. bit[2]: ID mismatch When the MARID and MRID values received on the data channel are different. bit[1]: When DECERR is received bit[0]: When SLVERR is received

(26) AXI Slave Error Interrupt Enable 1 Register (PCI_RC_ASEIE1)

This register enables the AXI slave error interrupt.

Access Size : 32 bits
Offset Address : <PCI0_base> + 0220h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	Write SLVERR INT EN[3:0]				-	-	-	-	-	-	Read SLVERR INT EN[1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	RW	RW	RW	RW	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
11 to 8	Write SLVERR INT EN[3:0]	0h	RW	Enable Write SLVERR INT. Each corresponding bit can be turned on/off individually. 0b: Disable 1b: Enable
7 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
1, 0	Read SLVERR INT EN[1:0]	0h	RW	Enable Read SLVERR INT. Each corresponding bit can be turned on/off individually. 0b: Disable 1b: Enable

(27) AXI Slave Error Interrupt Status 1 Register (PCI_RC_ASEIS1)

This register indicates the AXI slave error interrupt status.

Access Size : 32 bits
Offset Address : <PCI0_base> + 0224h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	Write SLVERR INT[3:0]				-	-	-	-	-	-	Read SLVERR INT[1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	RW1	RW1	RW1	RW1	R	R	R	R	R	R	RW1	RW1

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
11 to 8	Write SLVERR INT[3:0]	0h	RW1	Indicates that an unrecoverable error was detected in the AXI Slave Port. (Transaction response will be SLVERR.) bit[11]: burst length error When the SAWLEN and the burst length of the data received on the data channel do not match. bit[10]: ID mismatch When the SAWID and SWID values received on the data channel are different. bit[9]: Burst type disabled When SAWBURST is 11b (undefined). When SAWBURST is 10b (wrapping) and burst length is other than 2, 4, 8, or 16. bit[8]: data size invalid When SAWSIZE is between 100b and 111b (Exceeding the AXI Bus width is not supported). Each bit means: 0b: No error detected 1b: error detection
7 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
1, 0	Read SLVERR INT[1:0]	0h	RW1	Indicates that an unrecoverable error was detected in the AXI Slave Port. (Transaction response will be SLVERR.) bit1b: Burst type disabled When SARBURST is 11b (undefined). When SARBURST is 10b (wrapping) and burst length is other than 2, 4, 8, or 16. bit0b: Data size invalid When SARSIZE is between 100b and 111b (exceeding the AXI Bus width is not supported). Each bit means: 0b: No error detected 1b: error detection

(28) AXI Slave Error Interrupt Status 3 Register (PCI_RC_ASEIS3)

This register indicates the AXI ID at the time of the first AXI slave error.

Access Size : 32 bits
Offset Address : <PCI0_base> + 0230h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ERR ID[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ERR ID[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	ERR ID[31:0]	0h	R	Save the ID when the first error occurred in the AXI Slave Error Interrupt Status1 register (Offset 224h). Only the first detected error is saved, and when bits [11:8] and bits [1:0] of the AXI Slave Error Interrupt Status1 register are all cleared, a new error ID can be saved.

(29) Permission Register (PCI_RC_PERM)

Access Size : 32 bits
Offset Address : <PCI0_base> + 0300h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	CFG_HWINIT_EN	PIPE PHY Register Enable	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
2	CFG_HWINIT_EN	0h	RW	Enable HwInit attribute registers to be rewritten from AXI. 0b: Disable 1b: Enable
1	PIPE PHY Register Enable	0h	RW	Access permission signal for Physical Layer Control/Status Registers. 0b: Disable register access in PIPE PHY space. 1b: Enable register access in PIPE PHY space.
0	-	0h	RW	Reserved These bits are read as 0b. The write value should always be 0b.

(30) Reset Register (PCI_RC_RESET)

This register resets the PCIe core. Supplied to the internal core by OR with the pin of the same name. For details of each pin, see the terminal information. The write value is saved when accessed from the AXI, but a low-level pulse is generated when the PCIe writes 0b. However, when the AXI has already written 0b, the signal remains at the low level. Writing 1b from the PCIe will be ignored.

Access Size : 32 bits
Offset Address : <PCI0_base> + 0310h
Initial Value : 0000_00xxh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	force to D0

R/W	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
16	force to D0	0h	RW	After sending PME_TO_Ack, force PM Control to transition to D0 State. Auto-cleared when PM Control transitions to D0. This bit is normally prohibited as it can create inconsistencies with the power state of the entire system. 0b: No operation 1b: Transition to D0
15 to 12	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
11 to 8	-	All 0	RW	Reserved These bits are read as 0b. The write value should always be 0b.
7	RST_PREG_B	xh	RW	Not used in this macro. The setting value does not affect macro behavior. 0b: reset 1b: normal operation
6	RST_OUT_B	xh	RW	RST_OUT_B output 0b: reset 1b: normal operation
5	RST_PS_B	xh	RW	Reset to the PCI Express core part (PCLK domain) inside the macro 0b: reset 1b: normal operation
4	RST_LOAD_B	xh	RW	Reset to Configuration Register Reset to bits not initialized by RST_CFG_B. 0b: reset 1b: normal operation
3	RST_CFG_B	xh	RW	Reset to Configuration Register 0b: Reset 1b: normal operation
2	RST_RSM_B	xh	RW	POWERGOOD reset of AUX Power (AUX not supported) Reset to Sticky register. 0b: reset 1b: normal operation
1	RST_GP_B	xh	RW	Reset to the PCI Express core part (ACLK domain) inside the macro 0b: reset 1b: normal operation
0	RST_B	xh	RW	Reset to PCI Express core part inside macro 0b: reset 1b: normal operation

Note: x = Undefined

(31) Mode Set 0 Register (PCI_RC_MSET0)

This register sets AXI mode.

Access Size : 32 bits
Offset Address : <PCI0_base> + 0314h
Initial Value : 2001_2000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	AWPROT[2:0]			AWCACHE_L[3:0]				-	-	AWLOCK[1:0]		AWCACHE_D[3:0]			
Initial Value	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	RW	RW	RW	RW	RW	RW	RW	R	R	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	ARPROT[2:0]			-	-	-	-	-	-	ARLOCK[1:0]		ARCACHE[3:0]			
Initial Value	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	RW	RW	RW	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
30 to 28	AWPROT[2:0]	2h	RW	Sets the protection type for PCIe→AXI transactions. This bit indicates whether the transaction's protection level is Normal, Privileged, or Secure, and whether the transaction is a data or instruction access. Bit[2] 1b: instruction access 0b: data access Bit[1] 1b: non-secure access 0b: secure access Bit[0] 1b: privileged access 0b: normal access
27 to 24	AWCACHE_L[3:0]	0h	RW	Indicates the value of MAWCACHE[3:0] to be issued to AXI. This setting is prohibited when issuing an AXI request containing the last byte. *Recommended value is 0000b. Bit[3] 1b: write allocatable 0b: not write allocatable Bit[2] 1b: Read assignable 0b: Read assignable Bit[1] 1b: cacheable 0b: non-cacheable Bit[0] 1b: Bufferable 0b: Not Bufferable
23, 22	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
21, 20	AWLOCK[1:0]	0h	RW	Lock type for PCIe-to-AXI transactions. This signal provides information about the atomic nature of the transfer. 00b: normal access, 01b: exclusive access, 10b: locked access, 11b: reserved
19 to 16	AWCACHE_D[3:0]	1h	RW	Indicates the value of MAWCACHE[3:0] to be issued to AXI. This setting is output when issuing an AXI request other than the output condition of AWCACHE_L. *Recommended value is 0001b. Bit[3] 1b: write allocatable 0b: not write allocatable Bit[2] 1b: Read assignable 0b: Read assignable Bit[1] 1b: cacheable 0b: non-cacheable Bit[0] 1b: Bufferable 0b: Not Bufferable
15	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
14 to 12	ARPROT[2:0]	2h	RW	Sets the protection type for PCIe→AXI transactions. This bit indicates whether the transaction's protection level is Normal, Privileged, or Secure, and whether the transaction is a data or instruction access. Bit[2] 1b: instruction access 0b: data access Bit[1] 1b: non-secure access 0b: secure access Bit[0] 1b: privileged access 0b: normal access
11 to 6	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
5, 4	ARLOCK[1:0]	0h	RW	Lock type for PCIe-to-AXI transactions. This bit provides information about the atomic nature of the transfer. 00b: normal access, 01b: exclusive access, 10b: locked access, 11b: reserved
3 to 0	ARCACHE[3:0]	0h	RW	Cache type for PCIe-to-AXI transactions. These bits specify “bufferable”, “cacheable”, “writethrough”, “write-back”, or “allocation” as the attribute of the transaction.

(32) Mode Set 1 Register (PCI_RC_MSET1)

This register sets AXI mode.

Access Size : 32 bits
Offset Address : <PCI0_base> + 0318h
Initial Value : 0000_33F2h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	AXI Max Issue Write[3:0]				AXI Max Issue Read[3:0]				AXI Master Max Burst[3:0]				-	-	RAM Parity Enable	PCIe Request Order
Initial Value	0	0	1	1	0	0	1	1	1	1	1	1	0	0	1	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
15 to 12	AXI Max Issue Write[3:0]	3h	RW	Set the number of writes that can be issued by AXI Master. Set within the range allowed by Interconnect. 0h: possible number 1 1h: possible number 2 : Fh: Possible number 16
11 to 8	AXI Max Issue Read[3:0]	3h	RW	Set the number of read issues that can be issued by AXI Master. Set within the range allowed by Interconnect. 0h: possible number 1 1h: possible number 2 : Fh: Possible number 16
7 to 4	AXI Master Max Burst[3:0]	Fh	RW	Sets the maximum burst length as an AXI Master operation.
3, 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
1	RAM Parity Enable	1h	RW	Sets whether or not to check the parity of the internal SRAM. The default value is Enable, but it is ignored by non-Parity macros. 0b: RAM parity check disabled 1b: RAM parity check enabled
0	PCIe Request Order	0h	RW	Issue a Read Request to PCIe from the same AXI master without waiting for Completion. Set to 1 if you want to strictly follow the order of Requests to the Completer. 0b: Do not wait for Completion. 1b: Wait for Completion.

(33) Mode Set 3 Register (PCI_RC_MSET3)

This register outputs the setting value as the ASPM L1 Idle Time bit.

Access Size : 32 bits
Offset Address : <PCI0_base> + 0380h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	ASPM L1 Idle Time[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	-	All 0	RW	Reserved These bits are read as 0b. The write value should always be 0b.
7 to 0	ASPM L1 Idle Time[7:0]	0h	RW	Sets the idle period for AXI transactions that the macro checks on ASPM L1 transitions. One of the conditions for ASPM L1 transition is that the idle period is confirmed for the number of cycles of the 8 bits set by this bit plus 8'hFF to the lower 8 bits. 00h: 256 [ACLK] 01h: 512 [ACLK] : FFh: 65536 [ACLK]

(34) Mode Set 4 Register (PCI_RC_MSET4)

Access Size : 32 bits
Offset Address : <PCI0_base> + 0384h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	MODE_EQ_RX_EVAL_WAIT[19:4]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MODE_EQ_RX_EVAL_WAIT[3:0]				-	-	-	-	MODE_8GT_EQTS2	MODE_EQ_PHASE23_ENABLE1	MODE_EQ_AUTONOMOUS1	-	-	UI_EQ_REQTYPE[1:0]		UI_EQ_REQUEST
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	MODE_EQ_RX_EVAL_WAIT[19:0]	0h	RW	During RxEval (Downstream Port Phase3, Upstream Port Phase2), wait time setting until RxEval is executed when Block Alignment cannot be obtained. Set by the count number of PCLK. Note: It is necessary to set the register value (recommended: equivalent to 1msec) before starting. Please set from the local CPU.
11 to 8	-	All 0	RW	Reserved These bits are read as 0b. The write value should always be 0b.
7	MODE_8GT_EQTS2	0h	RW	8GT EQ TS2OS transmission enable/disable setting for Upstream Port 0b: Do not send, 1b: Send Note: Not used for Downstream Port. (fixed to 0b)
6	MODE_EQ_PHASE23_ENABLE1	0h	RW	Fixed to 0b
5	MODE_EQ_AUTONOMOUS1	0h	RW	Fixed to 0b
4, 3	-	All 0	RW	Reserved These bits are read as 0b. The write value should always be 0b.
2, 1	UI_EQ_REQTYPE[1:0]	0h	RW	Operation specification when sending Equalization Request with Quiesce Guarantee=1 in Recovery.RcvrCfg state 00b: Equalization Request transmission with Equalization Request Data Rate=0 (8G) 01b: Send Equalization Request with Equalization Request Data Rate=1 (16G) (Setting prohibited) 10b: Operation of “0” + set Link Equalization Request 8.0GT/s register 11b: Set “1” operation + Link Equalization Request 16.0GT/s register (setting prohibited)
0	UI_EQ_REQUEST	0h	RW	Set when sending an Equalization Request with Quiesce Guarantee=1 in the Recovery.RcvrCfg state. Setting 1b is prohibited except when MODE_QUIESCE_GUARANTEE=1. After setting 1b, hold until confirmation of UI_EQ_DONE=1. 0b: Do not send Equalization Request 1b: Send Equalization Request

(35) Mode Set 5 Register (PCI_RC_MSET5)

Access Size : 32 bits
Offset Address : <PCI0_base> + 0388h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MODE_8GT_EQTS2_PRESET[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	-	All 0	RW	Reserved These bits are read as 0b. The write value should always be 0b.
15 to 0	MODE_8GT_EQ TS2_PRESET [15:0]	0h	RW	Transmitter Preset value of 8GT EQ TS2OS to transmit at Upstream Port (USP). No setting is required if 8GT_EQTS2 is not sent from USP (DSP Preset is not specified). Settings must be made in advance if necessary. 4-bit configuration for each lane. Gen3/Gen4 supports up to x4 lane configurations. The correspondence between each bit and lane number is as follows. Bit[3:0] Lane #0 Bit[7:4] Lane #1 Bit[11:8] Setting Prohibited, other than default value is not writable. Bit[15:12] Setting Prohibited, other than default value is not writable. The above lane number is the default lane number for circuit implementation. Note that this is not a negotiated lane number. Note: Not used for Downstream Port. (fixed to 0000_0000h)

(36) Mode Status 0 Register (PCI_RC_MSTAT0)

Access Size : 32 bits
Offset Address : <PCI0_base> + 0390h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	RX_EQ_REQTYPE[1:0]		RX_EQ_REQUEST	UI_EQ_DONE
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
3, 2	RX_EQ_REQTYPE[1:0]	0h	R	Quiesce Guarantee and Equalization Request Data Rate bit display when receiving 8 consecutive TS2OS with Request Equalization bit (Symbol6, bit7) = 1 in Recovery. RcvrCfg state EP (USP) (1) When Request Equalization is received bit[0]: Quiesce Guarantee (TS2OS, Symbol6, bit6) (= 1 fixed) bit[1]: Equalization Request Data Rate (TS2OS, Symbol6, bit5) (2) When receiving EQTS2OS bit[0]: 0 (fixed) bit[1]: Equalization Request Data Rate (0b: EQTS2, 1b: 8GT EQTS2) RC (DSP) bit[0]: Quiesce Guarantee (TS2OS, Symbol6, bit6) bit[1]: Equalization Request Data Rate (TS2OS, Symbol6, bit5)
1	RX_EQ_REQUEST	0h	R	Status display when receiving 8 consecutive TS2OS with Request Equalization bit (Symbol6, bit7) = 1 in Recovery.RcvrCfg state 0b: No Equalization Request received 1b: Equalization Request received
0	UI_EQ_DONE	0h	R	Set Equalization Request with Quiesce Guarantee=1 in Recovery.RcvrCfg state when sending 0b: No Equalization Request sent 1b: Sent Equalization Request Related flow: "Set UI_EQ_REQUEST = 1b → Confirm UI_EQ_DONE = 1b → Clear UI_EQ_REQUEST = 0b"

(37) PCIe Core Mode Set 1 Register (PCI_RC_PCMSET1)

This register sets the operating mode of the PCI Express core.

Access Size : 32 bits
Offset Address : <PCI0_base> + 0400h
Initial Value : 00FA_00F2h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	ASPM_L1_INTERVAL_TIME[11:0]											
Initial Value	0	0	0	0	0	0	0	0	1	1	1	1	1	0	1	0
R/W	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	MODE_LINK_UPCONFIGURE_CAPABILITY_DISABLED	-	MODE_TXSWING	-	-	-	-	-	-	-	-	MODE_PORT	-
Initial Value	0	0	0	0	0	0	0	0	1	1	1	1	0	0	1	0
R/W	R	RW	RW	RW	R	RW	RW	RW	RW	RW	RW	RW	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31, 30	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
29, 28	-	All 0	RW	Reserved These bits are read as 0b. The write value should always be 0b.
27 to 16	ASPM_L1_INTERVAL_TIME [11:0]	0FAh	RW	Interval settings for ASPM L1 requests The PCIe Base Spec stipulates that ASPM L1 transition requests must not be accepted continuously within 10 us, and this field sets the timer value to guard against this. Set so that ACLK cycle x set value is 10 us or more. At ACLK: 400[MHz] or higher, this bit setting value should be the value (1/16) of the lower 4 bits of the setting value of the above specifications, and set the clock number as the timer value setting. Settings of this product (Default): When ACLK=400MHz(2.5ns): 4000(d)/16 = FA(h)
15	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
14, 13	-	All 0	RW	Reserved These bits are read as 0b. The write value should always be 0b.
12	MODE_LINK_UPCONFIGURE_CAPABILITY_DISABLED	0h	RW	Setting of Link Upconfigure Capability bit of Training Sequence Ordered-set (TS-OS) 0b: Link Upconfigure Capability bit = 1b setting 1b: Link Upconfigure Capability bit = 0b setting (Gen1 x1) When connecting with a Gen1 PCIe device, Linkup may not occur unless this bit is 0b. In that case, change it to 0b in F/W.
11	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
10	MODE_TXSWING	0h	RW	SerDes serial output amplitude control 0b: Full swing mode (default) 1b: Half swing mode
9, 8	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
7 to 4	-	Fh	RW	Reserved These bits are read as Fh. The write value should always be Fh.
3, 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

Bit	Bit Name	Initial Value	R/W	Description
1	MODE_PORT	1h	RW	Device type setting register. When the bit value of this register is fixed to the initial value 1b, the setting of the external pin MODE_PORT becomes valid. When the external pin MODE_PORT is fixed to 1b, the setting by this register bit becomes valid. 0b: Endpoint 1b: Root Complex
0	-	0h	RW	Reserved These bits are read as 0b. The write value should always be 0b.

(38) PCIe Core Control 1 Register (PCI_RC_PCCTRL1)

This register controls power management and LTSSM (Link Training Sequence State Machine) state transitions of the PCI Express core.

Access Size : 32 bits
Offset Address : <PCI0_base> + 0404h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	BLB_RELAX_ORDERING_EN	-	-	-	-	-	UI_ENTER_L1S	-	RETURN_TO_L0	UI_RC_REJECT_ASPML1	Auto PM_Active_State_Nak	UI_ENTER_L2	UI_ENTER_TXL0S
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	R	R	R	RW	R	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	MODE_QUIESCE_GUARANTEE	-	MODE_EQ_AUTONOMOUS	MODE_EQ_PHASE23_ENABLE	MODE_RESET_EIEOS_INTERVALL0S	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	R	R	R	R	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
28	BLB_RELAX_ORDERING_EN	0h	RW	Control of RO bit of Request to be sent 0b: RO bit of Request TLP to be sent is always 0b (default) 1b: A TLP can be sent with the RO bit of the Request TLP to be sent set to 1b.
27 to 25	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
24	-	0h	RW	Reserved These bits are read as 0b. The write value should always be 0b.
23	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
22	UI_ENTER_L1S	0h	RW	L1SubState transition permission setting 0b : L1 Substate transition disabled (default) 1b: L1 Substate transition permission (setting prohibited)
21	-	0h	RW	Reserved These bits are read as 0b. The write value should always be 0b.
20	RETURN_TO_L0	0h	RW	RC mode L1, L2 state to L0 state control (usually not used) 0b : Normal operation (default) 1b : Start return operation to L0 state when in L1 or L2 state in RC mode Cleared automatically after confirming PMU_LINKSTATE[0] =1.
19	UI_RC_REJECT_ASPML1	0h	RW	ASPM L1 transition rejection control 0b : Accept ASPM L1 transition request from EP device (default) 1b : Reject ASPM L1 transition request from EP device
18	Auto PM_Active_State_Nak	0h	RW	PM_ActiveState_Nak Message Transmission Mode for ASPM L1 Rejection Set to 1b if you want to reject ASPM L1 in RC. This Bit is automatically cleared when PM_ActiveState_Nak is automatically sent. Note: Auto-sent only once.
17	UI_ENTER_L2	0h	RW	RC mode L2 transition control Set to 1b when transitioning to L2 state in RC mode. When transitioning to the L2 state, the PCIe core must be reset by controlling the Reset register. When returning, this bit must be cleared to 0b after releasing the reset.
16	UI_ENTER_TXL0S	0h	RW	TxL0s transition control 0b: Do not perform ASPM L0s transition (default) 1b: Execute ASPM L0s transition when internal conditions are satisfied

Bit	Bit Name	Initial Value	R/W	Description
15 to 13	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
12	MODE_QUIESCE_GUARANTEE	0h	RW	Symbol6 bit6 Quiesce Guarantee control bit of TS2OS 0b: Set 0b to TS2OS (default) 1b: Set 1b to TS2OS
11	-	0h	RW	Reserved These bits are read as 0b. The write value should always be 0b.
10	MODE_EQ_AUTONOMOUS	0h	RW	Gen3 feature: Autonomous Equalization Basically only changeable during the reset period 0b: Do not use Autonomous Mechanism 1b: Use Autonomous Mechanisms
9	MODE_EQ_PHASE23_ENABLE	0h	RW	Gen3 features: Setting whether to execute EQ PHASE2 and EQ PHASE3 in RC mode (MODE_PORT=1). 0b: Do not execute EQ PHASE2/3 1b: Execute EQ PHASE2/3
8	MODE_RESET_EIEOS_INTERVALL0S	0h	RW	Gen3 features: Reset EIEOS Interval information of bit 2, symbol 6 of TS1OS transmitted in Recovery.Equalization state
7 to 4	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
3 to 0	-	All 0	RW	Reserved These bits are read as 0b. The write value should always be 0b.

(39) PCIe Core Status 1 Register (PCI_RC_PCSTAT1)

This register controls power management and LTSSM (Link Training Sequence State Machine) state transitions of the PCI Express core.

Access Size : 32 bits
Offset Address : <PCI0_base> + 0408h
Initial Value : 000x_xxxxh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	bme_down	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	x	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	LTSSM_STATE[6:0]							PMU_LINKSTATE[3:0]				-	-	STATE_VC0_NEGOTIATION_PENDING	DL_Down status
Initial Value	0	x	x	x	x	x	x	x	x	x	x	x	0	x	x	x
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
17	bme_down	xh	R	Indicates that the PCIe core transmitter is in an unusable state.
16, 15	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
14 to 8	LTSSM_STATE[6:0]	xh	R	Indicates the state of the Link Training & Status State Machine in the PCIe Core Link. The following states are indicated by the upper 5 bits [14:10]. 000xxb: Detect 001xxb: Polling 010xxb: Config 01100b: L0 01101b: L1 0111xb: L2 100xxb: Recovery 101xxb: Disable 110xxb: Loopback
7 to 4	PMU_LINKSTATE[3:0]	xh	R	L-state monitor of power management control unit 0100b: L1 state 1000b: L2 state
3	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
2	-	xh	R	Reserved Whenever it is read, xb is read. The written value will be ignored.
1	STATE_VC0_NEGOTIATION_PENDING	xh	R	Flow Control initialization operation monitor If this bit is 1b, do not initiate a transaction from the AXI side. Check that this bit is 0b and DL_Down Status (bit [0]) is 0b. 0b: Indicates that Flow Control initialization is complete 1b: Indicates that Flow Control initialization has not completed
0	DL_Down status	xh	R	Indicates whether PCIe Core is in DL_Down or DL_Up state 0b: DL_Up Status 1b: DL_Down Status

Note: x = Undefined

(40) PCIe Core Control 2 Register (PCI_RC_PCCTRL2)

This register controls the link speed/width change in the PCI Express core.

Access Size : 32 bits
Offset Address : <PCI0_base> + 0410h
Initial Value : 003E_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	UI_LINK_WIDTH_CHANGE_ENABLE[7:0]								MODE_NODEEMPHASIS[1:0]		MODE_PRESET_ENABLE[4:0]					UI_LINK_WIDTH_CHANGE_REQ
Initial Value	0	0	0	0	0	0	0	0	0	0	1	1	1	1	1	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	UI_LINK_SPEED_CHANGE[1:0]		-	-	-	UI_LINK_CHANGE_AUTONOMOUS	-	-	-	UI_LINK_SPEED_CHANGE_REQ
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	RW	RW	R	R	R	RW	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	UI_LINK_WIDTH_CHANGE_ENABLE[7:0]	0h	RW	Link Width setting to change Assert UI_LINK_WIDTH_CHANGE_REQ and set Lane to 1b to operate when Link Width change request is issued. The lower bit (bit [24]) drives Lane0 and the most significant bit (bit [31]) drives Lane7.
23, 22	MODE_NODEEMPHASIS[1:0]	0h	RW	No de-emphasis mode setting pin for Gen1/Gen2 operation Bit[0] Gen1 operation, 0b: Normal operation mode (default), 1b: No de-emphasis mode Bit[1] Gen2 operation, 0b: Normal operation mode (default), 1b: No de-emphasis mode
21 to 17	MODE_PRESET_ENABLE[4:0]	1Fh	RW	Reduced Swing mode setting pin for Gen3 operation Bit[0]: 8GT/s Preset P0, 0b: disable, 1b: enable (default) Bit[1]: 8GT/s Preset P2, 0b: disable, 1b: enable (default) Bit[2]: 8GT/s Preset P7, 0b: disable, 1b: enable (default) Bit[3]: 8GT/s Preset P8, 0b: disable, 1b: enable (default) Bit[4]: 8GT/s Preset P10, 0b: disable, 1b: enable (default)
16	UI_LINK_WIDTH_CHANGE_REQ	0h	RW	Link Width change request control Setting this bit to 1b issues a request to change the Link Width to the configuration set in bits [31:24] UI_LINK_WIDTHCHANGE_ENABLE field. By asserting it in the L0 state, it transitions from the Recovery state to the Configuration state, and performs negotiation with the other device. Set to 0b after confirming that PCIe Core Status 2 Register (Offset: 414h) bit [29] UI_LINK_WIDTH_CHANGE_DONE is asserted.
15 to 10	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
9, 8	UI_LINK_SPEED_CHANGE[1:0]	0h	RW	Link speed setting Set the Link Speed you want to change. 00b: 2.5 GT/s 01b: 5.0 GT/s 10b: 8.0 GT/s 11b: 16.0 GT/s (Setting prohibited)
7 to 5	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
4	UI_LINK_CHANGE_AUTONOMOUS	0h	RW	Link Width/Speed change reason setting 0b: reliability reason (change for reliability, direction of bandwidth reduction) 1b: autonomous reason (intentional change)
3 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

Bit	Bit Name	Initial Value	R/W	Description
0	UI_LINK_SPEED_CHANGE_REQ	0h	RW	Link Speed change request control Setting this bit to 1b requests to change the Link Speed to the speed set in bit [8] UI_LINK_SPEED_CHANGE field. By asserting it in the L0 state, it transitions to the Recovery state and performs negotiation with the peer device. PCIe Core Status 2 Register (Offset: 414h) bit[28] Set to 0b after confirming that UI_LINK_SPEED_CHANGE_DONE has been asserted.

(41) PCIe Core Status 2 Register (PCI_RC_PCSTAT2)

This register indicates the status of the link speed/width change in the PCI Express core.

Access Size : 32 bits
Offset Address : <PCI0_base> + 0414h
Initial Value : xxxx_xxxxh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	UI_LINK_WIDTH_CHANGE_DONE	UI_LINK_SPEED_CHANGE_DONE	-	-	-	STATE_UPCONFIGURE_CAPABLE	-	STATE_NEGOTIATED_LANE_END[2:0]			-	STATE_NEGOTIATED_LANE_START[2:0]		
Initial Value	0	0	x	x	0	0	0	x	0	x	x	x	0	x	x	x
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	STATE_RECEIVER_DETECTED[7:0]								STATE_DATA_RATE_IDENTIFIER_RECEIVED[7:0]							
Initial Value	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31, 30	-	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
29	UI_LINK_WIDTH_CHANGE_DONE	xh	R	Link Width Change operation complete display Notifies completion of Width Change (1b) by setting PCIe Core Status 2 Register (Offset: 410h) bit [16] UI_LINK_WIDTH_CHANGE_REQ. It is set to 0b by setting UI_LINK_WIDTH_CHANGE_REQ to 0b.
28	UI_LINK_SPEED_CHANGE_DONE	xh	R	Link Speed Change operation complete display PCIe Core Status 2 Registers (Offset: 410h) bit[0] Notifies completion of Speed Change (1b) by setting UI_LINK_SPEED_CHANGE_REQ. It is set to 0b by setting UI_LINK_SPEED_CHANGE_REQ to 0b.
27 to 25	-	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
24	STATE_UPCONFIGURE_CAPABLE	xh	R	Upconfigure Capable bit display of opposite device Indicates whether the peer device supports changing the direction of widening the Link Width. If this bit is 0b, changing the Link Width will not restore the original Link Width.
23	-	0h	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
22 to 20	STATE_NEGOTIATED_LANE_END[2:0]	xh	R	Displays the position of Lane Number (n-1) (meaning Lane1 when n=2) after Link Negotiation with the opposite device during n-lane operation. Used to check the state of the current working lane before changing the Link Width. 000b: Lane0 is Lane Number (n-1) 001b: Lane1 is Lane Number (n-1) Others: reserved
19	-	0h	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
18 to 16	STATE_NEGOTIATED_LANE_START[2:0]	xh	R	Displays the position of Lane Number 0 after Link Negotiation with the opposite device during n-lane operation. Used to check the state of the current working lane before changing the Link Width. 000b: Lane0 is Lane Number 0 001b: Lane 1 is Lane Number 0 Others: reserved
15 to 8	STATE_RECEIVER_DETECTED[7:0]	xh	R	Connection status display with other device Receiver Detection results are displayed. Bit[0] Detect opposite device on Lane0 Bit[1] Detect peer device on Lane1 (only for x2) Bit[2:7] reserved

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	STATE_DATA_RATE_IDENTIFIER_RECEIVED [7:0]	xh	R	Link Speed display supported by the opposite device Displays the TS-OS Data Rate Identifier feed received from the peer device. Bit[0] – Reserved Bit[1] – 2.5 GT/s Data Rate Supported. Must be set to 1b. Bit[2] – 5.0 GT/s Data Rate Supported. Must be set to 1b if Bit3 is 1b. Bit[3] – 8.0 GT/s Data Rate Supported. Bits[4:7] – Reserved

Note: x = Undefined

(42) PCIe Core Status 5 Register (PCI_RC_PCSTAT5)

This register indicates the status in the PCI Express core.

Access Size : 32 bits
Offset Address : <PCI0_base> + 042Ch
Initial Value : 0000_0x00h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	ORT_TRANSACTION_PENDING
Initial Value	0	0	0	0	0	0	0	x	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	0000_00x0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
0	ORT_TRANSACTION_PENDING	0h	R	Indicates whether or not there are Outstanding Requests (a state in which all Completions corresponding to Non-Posted Requests sent from the AXI side have not been received). Check with this bit that there is no Outstanding Request before requesting/permitting a transition to TxL0s/L1/L2. 0b: State without Outstanding Request 1b: State with Outstanding Request

(43) DMA Interrupt Vector 0 Register (PCI_RC_DMAINTVEC0)

This register specifies the interrupt vectors for interrupt notification from AXI to PCIe (MSI) during DMA transfer.

Access Size : 32 bits
Offset Address : <PCI0_base> + 04D0h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	DMA_CH3_MSI_EN	DMA_CH3_vec[4:0]					-	-	DMA_CH2_MSI_EN	DMA_CH2_vec[4:0]				
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	RW	RW	RW	RW	RW	RW	R	R	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	DMA_CH1_MSI_EN	DMA_CH1_vec[4:0]					-	-	DMA_CH0_MSI_EN	DMA_CH0_vec[4:0]				
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	RW	RW	RW	RW	RW	RW	R	R	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31, 30	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
29	DMA_CH3_MSI_EN	0h	RW	DMA Ch3 MSI Enable 0b: Do not use MSI (DMA interrupt notification by DMA_INT pin) 1b: Use MSI For the RC function, MSI transmission is prohibited, so please fix it to 0b.
28 to 24	DMA_CH3_vec[4:0]	0h	RW	Vector value of MSI interrupt transmitted by DMAC Ch3
23, 22	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
21	DMA_CH2_MSI_EN	0h	RW	DMA Ch2 MSI Enable 0b: Do not use MSI (DMA interrupt notification by DMA_INT pin) 1b: Use MSI For the RC function, MSI transmission is prohibited, so please fix it to 0b.
20 to 16	DMA_CH2_vec[4:0]	0h	RW	Vector value of MSI interrupt transmitted by DMAC Ch2
15, 14	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
13	DMA_CH1_MSI_EN	0h	RW	DMA Ch1 MSI Enable 0b: Do not use MSI (DMA interrupt notification by DMA_INT pin) 1b: Use MSI For the RC function, MSI transmission is prohibited, so please fix it to 0b.
12 to 8	DMA_CH1_vec[4:0]	0h	RW	Vector value of MSI interrupt transmitted by DMAC Ch1
7, 6	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
5	DMA_CH0_MSI_EN	0h	RW	DMA Ch0 MSI Enable 0b: Do not use MSI (DMA interrupt notification by DMA_INT pin) 1b: Use MSI For the RC function, MSI transmission is prohibited, so please fix it to 0b.
4 to 0	DMA_CH0_vec[4:0]	0h	RW	Vector value of MSI interrupt transmitted by DMAC Ch0

Note 1. DMA_CHx_vec should be fixed to 0h in Root Complex mode.

(44) DMA Interrupt Vector 1 Register (PCI_RC_DMAINTVEC1)

This register specifies the interrupt vectors for interrupt notification from AXI to PCIe (MSI) during DMA transfer.

Access Size : 32 bits
Offset Address : <PCI0_base> + 04D4h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	DMA_CH7_MSI_EN	DMA_CH7_vec[4:0]					-	-	DMA_CH6_MSI_EN	DMA_CH6_vec[4:0]				
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	RW	RW	RW	RW	RW	RW	R	R	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	DMA_CH5_MSI_EN	DMA_CH5_vec[4:0]					-	-	DMA_CH4_MSI_EN	DMA_CH4_vec[4:0]				
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	RW	RW	RW	RW	RW	RW	R	R	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31, 30	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
29	DMA_CH7_MSI_EN	0h	RW	DMA Ch7 MSI Enable 0b: Do not use MSI (DMA interrupt notification by DMA_INT pin) 1b: Use MSI For the RC function, MSI transmission is prohibited, so please fix it to 0b.
28 to 24	DMA_CH7_vec[4:0]	0h	RW	Vector value of MSI interrupt transmitted by DMAC Ch7
23, 22	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
21	DMA_CH6_MSI_EN	0h	RW	DMA Ch6 MSI Enable 0b: Do not use MSI (DMA interrupt notification by DMA_INT pin) 1b: Use MSI For the RC function, MSI transmission is prohibited, so please fix it to 0b.
20 to 16	DMA_CH6_vec[4:0]	0h	RW	Vector value of MSI interrupt transmitted by DMAC Ch6
15, 14	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
13	DMA_CH5_MSI_EN	0h	RW	DMA Ch5 MSI Enable 0b: Do not use MSI (DMA interrupt notification by DMA_INT pin) 1b: Use MSI For the RC function, MSI transmission is prohibited, so please fix it to 0b.
12 to 8	DMA_CH5_vec[4:0]	0h	RW	Vector value of MSI interrupt transmitted by DMAC Ch5
7, 6	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
5	DMA_CH4_MSI_EN	0h	RW	DMA Ch4 MSI Enable 0b: Do not use MSI (DMA interrupt notification by DMA_INT pin) 1b: Use MSI For the RC function, MSI transmission is prohibited, so please fix it to 0b.
4 to 0	DMA_CH4_vec[4:0]	0h	RW	Vector value of MSI interrupt transmitted by DMAC Ch4

Note 1. DMA_CHx_vec should be fixed to 0h in Root Complex mode.

(45) MSI Receive Enable n Register (PCI_RC_MSIRCVEn)

This register enables control of MSI receive (Message Data discrimination) register group with the following as one set.

- MSI Receive Enable n Register (Offset 6x0h)
- MSI Receive message Data n Register (Offset 6x4h)
- MSI Receive Mask n Register (Offset 6x8h)
- MSI Receive Status n Register (Offset 6xCh)

Remark n is 0 to 15; x is the hexadecimal representation of n.

Access Size : 32 bits
Offset Address : <PCI0_base> + 0600h/ 610h/ 620h/ 630h/ 640h/ … /6F0h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	Enable
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
0	Enable	0h	RW	Set enable/disable of the MSI Receive (Message Data discrimination) register group, which sets 1 register for +16 bytes from Offset of this register. 0b: disabled 1b: Enabled

(46) MSI Receive Message Data n Register (PCI_RC_MSIRCVMSGDATAn)

This register is a Message data setting register for MSI reception judgment of registers enabled by MSI Receive Enable n Register.

Remark n is 0 to 15; x is the hexadecimal representation of n.

Access Size : 32 bits
Offset Address : <PCI0_base> + 0604h/ 614h/ 624h/ 634h/ 644h/ … /6F4h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Message Data[26:11]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Message Data[10:0]											-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	Message Data[26:0]	0h	RW	Set Message Data for MSI reception judgment
4 to 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

(47) MSI Receive Mask n Register (PCI_RC_MSIRCVMSKn)

This register masks control of interrupt by the MSI reception status of the register group enabled by MSI Receive Enable n Register.

Remark n is 0 to 15; x is the hexadecimal representation of n.

Access Size : 32 bits
Offset Address : <PCI0_base> + 0608h/ 618h/ 628h/ 638h/ 648h/ … /6F8h
Initial Value : FFFF_FFFFh

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	MSI Status[31:0]	0h	RW1	MSI receive Status. The bit corresponding to Data[4:0] is set when Message Data[31:5] and MSI reception Data[31:5] match. (When Data[4:0]=00h, MSI Status n[0] is set. When Data[4:0]=01h, MSI Status n[1] is set.)

(49) DMAC Control Register (PCI_RC_DMACTRL)

This register sets the maximum size of read requests which can be issued to the PCIe core as a DMAC function. Use the initial setting (128 bytes). This setting is common to all DMA channels.

Access Size : 32 bits
Offset Address : <PCI0_base> + 0800h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

(51) DMAC Interrupt Status Register (PCI_RC_DMAINTS)

This register indicates the state of interrupts from the individual DMA channels.

Access Size : 32 bits
Offset Address : <PCI0_base> + 080Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CH7_ERR	CH7_QUE_EMP	CH7_STOP	CH7_END	CH6_ERR	CH6_QUE_EMP	CH6_STOP	CH6_END	CH5_ERR	CH5_QUE_EMP	CH5_STOP	CH5_END	CH4_ERR	CH4_QUE_EMP	CH4_STOP	CH4_END
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW1	RW1	RW1	RW1	RW1	RW1	RW1	RW1	RW1	RW1	RW1	RW1	RW1	RW1	RW1	RW1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CH3_ERR	CH3_QUE_EMP	CH3_STOP	CH3_END	CH2_ERR	CH2_QUE_EMP	CH2_STOP	CH2_END	CH1_ERR	CH1_QUE_EMP	CH1_STOP	CH1_END	CH0_ERR	CH0_QUE_EMP	CH0_STOP	CH0_END
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW1	RW1	RW1	RW1	RW1	RW1	RW1	RW1	RW1	RW1	RW1	RW1	RW1	RW1	RW1	RW1

Bit	Bit Name	Initial Value	R/W	Description
31	CH7_ERR	0h	RW1	Set when an error occurs during DMA transfer.
30	CH7_QUE_EMP	0h	RW1	Set when the list is removed from the descriptor queue (transferred to the running descriptor list) and the QUE is empty.
29	CH7_STOP	0h	RW1	Set when the DMAC is prematurely stopped. DMA stops under the following conditions: - When RDMA_EN or QUE_EN is cleared to 0 by the S/W during DMA transfer execution and the processing of the request being issued ends.
28	CH7_END	0h	RW1	Set when the DMAC ends normally. Normal termination refers to the following conditions. - Transfer for the amount indicated by DMA_SIZE is completed. - At the end of the descriptor list when the EI field is 1
27	CH6_ERR	0h	RW1	Set when an error occurs during DMA transfer.
26	CH6_QUE_EMP	0h	RW1	Set when the list is removed from the descriptor queue (transferred to the running descriptor list) and the QUE is empty.
25	CH6_STOP	0h	RW1	Set when the DMAC is prematurely stopped. DMA stops under the following conditions: - When RDMA_EN or QUE_EN is cleared to 0 by the S/W during DMA transfer execution and the processing of the request being issued ends.
24	CH6_END	0h	RW1	Set when the DMAC ends normally. Normal termination refers to the following conditions. - Transfer for the amount indicated by DMA_SIZE is completed. - At the end of the descriptor list when the EI field is 1
23	CH5_ERR	0h	RW1	Set when an error occurs during DMA transfer.
22	CH5_QUE_EMP	0h	RW1	Set when the list is removed from the descriptor queue (transferred to the running descriptor list) and the QUE is empty.
21	CH5_STOP	0h	RW1	Set when the DMAC is prematurely stopped. DMA stops under the following conditions: - When RDMA_EN or QUE_EN is cleared to 0 by the S/W during DMA transfer execution and the processing of the request being issued ends.
20	CH5_END	0h	RW1	Set when the DMAC ends normally. Normal termination refers to the following conditions. - Transfer for the amount indicated by DMA_SIZE is completed. - At the end of the descriptor list when the EI field is 1
19	CH4_ERR	0h	RW1	Set when an error occurs during DMA transfer.
18	CH4_QUE_EMP	0h	RW1	Set when the list is removed from the descriptor queue (transferred to the running descriptor list) and the QUE is empty.
17	CH4_STOP	0h	RW1	Set when the DMAC is prematurely stopped. DMA stops under the following conditions: - When RDMA_EN or QUE_EN is cleared to 0 by the S/W during DMA transfer execution and the processing of the request being issued ends.

Bit	Bit Name	Initial Value	R/W	Description
16	CH4_END	0h	RW1	Set when the DMAC ends normally. Normal termination refers to the following conditions. - Transfer for the amount indicated by DMA_SIZE is completed. - At the end of the descriptor list when the EI field is 1
15	CH3_ERR	0h	RW1	Set when an error occurs during DMA transfer.
14	CH3_QUE_EMP	0h	RW1	Set when the list is removed from the descriptor queue (transferred to the running descriptor list) and the QUE is empty.
13	CH3_STOP	0h	RW1	Set when the DMAC is prematurely stopped. DMA stops under the following conditions: - When RDMA_EN or QUE_EN is cleared to 0 by the S/W during DMA transfer execution and the processing of the request being issued ends.
12	CH3_END	0h	RW1	Set when the DMAC ends normally. Normal termination refers to the following conditions. - Transfer for the amount indicated by DMA_SIZE is completed. - At the end of the descriptor list when the EI field is 1
11	CH2_ERR	0h	RW1	Set when an error occurs during DMA transfer.
10	CH2_QUE_EMP	0h	RW1	Set when the list is removed from the descriptor queue (transferred to the running descriptor list) and the QUE is empty.
9	CH2_STOP	0h	RW1	Set when the DMAC is prematurely stopped. DMA stops under the following conditions: - When RDMA_EN or QUE_EN is cleared to 0 by the S/W during DMA transfer execution and the processing of the request being issued ends.
8	CH2_END	0h	RW1	Set when the DMAC ends normally. Normal termination refers to the following conditions. - Transfer for the amount indicated by DMA_SIZE is completed. - At the end of the descriptor list when the EI field is 1
7	CH1_ERR	0h	RW1	Set when an error occurs during DMA transfer.
6	CH1_QUE_EMP	0h	RW1	Set when the list is removed from the descriptor queue (transferred to the running descriptor list) and the QUE is empty.
5	CH1_STOP	0h	RW1	Set when the DMAC is prematurely stopped. DMA stops under the following conditions: - When RDMA_EN or QUE_EN is cleared to 0 by the S/W during DMA transfer execution and the processing of the request being issued ends.
4	CH1_END	0h	RW1	Set when the DMAC ends normally. Normal termination refers to the following conditions. - Transfer for the amount indicated by DMA_SIZE is completed. - At the end of the descriptor list when the EI field is 1
3	CH0_ERR	0h	RW1	Set when an error occurs during DMA transfer.
2	CH0_QUE_EMP	0h	RW1	Set when the list is removed from the descriptor queue (transferred to the running descriptor list) and the QUE is empty.
1	CH0_STOP	0h	RW1	Set when the DMAC is prematurely stopped. DMA stops under the following conditions: - When RDMA_EN or QUE_EN is cleared to 0 by the S/W during DMA transfer execution and the processing of the request being issued ends.
0	CH0_END	0h	RW1	Set when the DMAC ends normally. Normal termination refers to the following conditions. - Transfer for the amount indicated by DMA_SIZE is completed. - At the end of the descriptor list when the EI field is 1

(52) DMAC Channel Control Register m (PCI_RC_DMACHCTLm) (m = 0 to 7)

This register sets the control method for each DMA channel. Set either register type or descriptor type.

- Setting QUE_EN = 1 and QUE_CLR = 1 is prohibited during register-type DMA transfer (RDMA_EN = 1).
- Setting RDMA_EN = 1 is prohibited during descriptor-type DMA transfer (QUE_EN = 1).

Access Size : 32 bits
Offset Address : <PCI0_base> + 0900h + 080h x m (m = 0 to 7) (channel offset)
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	QUE_CLR	-	-	-	-	-	-	QUE_EN	RDMA_EN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	RW	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
8	QUE_CLR	0h	RW	QUE Clear Writing 1 clears QUE. All descriptor lists (waiting for execution and lists currently being executed) registered in QUE are cleared. Do not clear during DMA execution. The read value is always 0. Writing 1 at the same time as setting QUE_EN is prohibited.
7 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
1	QUE_EN	0h	RW	QUE Enable Setting this bit to 1 enables the descriptor list registered in the descriptor queue and starts DMA transfer (descriptor-type). It is automatically cleared to 0 when DMA stops (both normal and abnormal). It is also possible to stop DMA by writing 0. However, DMA will stop after finishing the currently executing request (both PCIe and AXI).
0	RDMA_EN	0h	RW	Register-type DMA transfer Enable Setting this bit to 1 starts DMA transfer (Register-type) and performs the transfer set by RDMA_SIZE. This bit is automatically cleared to 0 when DMA transfer is completed or an error is detected and DMA ends. It is also possible to stop DMA by writing 0. However, DMA will stop after completing the currently executing request (both PCIe and AXI). 1b: Register-type DMA transfer start 0b: Stop register-type DMA transfer

(53) Descriptor Start Address (Lower) Register m (PCI_RC_DPSADRL) (m = 0 to 7)

This register sets the descriptor queue list.

The setting value is registered as the lower 32 bits of DSA (DMA Start Address) in the queue list.

Access Size : 32 bits

Offset Address : <PCI0_base> + 0908h + 080h x m (m = 0 to 7) (channel offset)

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	QUE_ENTRY_DSA[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	QUE_ENTRY_DSA[15:6]										QUE_ENTRY_DSA[5:0]					
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	QUE_ENTRY_DSA[31:6]	0h	RW	Descriptor list queue registration register. This area will be the DSA. Sets the lower 32 bits of the address where the first descriptor is stored.
5 to 0	QUE_ENTRY_DSA[5:0]	0h	R	Descriptor list queue registration register. This area will be the DSA. Sets the lower 32 bits of the address where the first descriptor is stored. (16-byte alignment: Lower 6 bits are fixed to 0.)

Note 1. When these bits are read, any of the following contents will be read depending on the state of DMA.
DMA transfer in progress: The descriptor list in progress
DMA suspended (when QUE_EN is automatically cleared): Last executed list
DMA suspended (when QUE_EN S/W is cleared): Suspended (executing) list

(54) Descriptor Start Address (Higher) Register m (PCI_RC_DPSADRU) (m = 0 to 7)

This register sets the descriptor queue list.

The setting value is registered as the higher 32 bits of DSA (DMA Start Address) in the queue list.

Access Size : 32 bits

Offset Address : <PCI0_base> + 090Ch + 080h x m (m = 0 to 7) (channel offset)

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	QUE_ENTRY_DSA[63:48]

R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	QUE_ENTRY_DSA[47:32]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	QUE_ENTRY_DSA[63:32]	0h	RW	Descriptor list queue registration register. This area will be the DSA. Set the upper 32 bits of the address where the first descriptor is stored.

Note 1. When these bits are read, any of the following contents will be read depending on the state of DMA.
DMA transfer in progress: The descriptor list in progress
DMA suspended (when QUE_EN is automatically cleared): Last executed list
DMA suspended (when QUE_EN S/W is cleared): Suspended (executing) list

(55) QUE Entry Register m (PCI_RC_QUEEm) (m = 0 to 7)

This register sets the descriptor queue list.

The setting value is registered as EI (End Interrupt), LS (List Stop), and LABEL of the queue list. Write to [31:24] to register to the queue.

Access Size : 32 bits

Offset Address : <PCI0_base> + 0910h + 080h x m (m = 0 to 7) (channel offset)

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	QUE_Registration[5:0]						QUE_ENTRY (EI)	QUE_ENTRY (LS)	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	QUE_ENTRY_LABEL[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	QUE_Registration[5:0]	0h	RW	Enqueued by writing to [31:24]. The read value is always 0b.
25	QUE_ENTRY (EI)	0h	RW	Indicates whether an interrupt (Interrupt Status CHx_END) is sent when the processing of the descriptor list is completed. 1b: signal an interrupt 0b: Do not signal interrupts
24	QUE_ENTRY (LS)	0h	RW	Indicates whether to stop the DMA when processing of the descriptor list is complete. 1b: stop 0b: do not stop
23 to 16	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
15 to 0	QUE_ENTRY_LABEL[15:0]	0h	RW	There is no particular rule on how to set the labels in the list. You can set the value freely.

Note 1. When these bits are read, any of the following contents will be read depending on the state of DMA.
DMA transfer in progress: The descriptor list in progress
DMA suspended (when QUE_EN is automatically cleared): Last executed list
DMA suspended (when QUE_EN S/W is cleared): Suspended (executing) list

(56) DMA Descriptor Control (Descriptor 00h) Register m (PCI_RC_DMADPCTLm) (m = 0 to 7)

This register indicates the field value at offset 00h in the descriptor table. Only effective when the descriptor-type DMA transfer is selected (the value read has no meaning in the case of register-type transfer).

Access Size : 32 bits

Offset Address : <PCI0_base> + 0920h + 080h x m (m = 0 to 7) (channel offset)

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DSCFM[3:0]				-	WBD	LE	LV	D	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	STS[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	DSCFM[3:0]	0h	R	Shows the value of the DSCFM field in the running descriptor table.
27	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
26	WBD	0h	R	Shows the value of the WBD field in the running descriptor table.
25	LE	0h	R	Shows the value of the LE field in the running descriptor table.
24	LV	0h	R	Shows the value of the LV field in the running descriptor table.
23	D	0h	R	Shows the value of the D field in the running descriptor table.
22 to 16	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
15 to 0	STS[15:0]	0h	R	Shows the value of the STS field in the running descriptor table.

(57) DMA Transaction Control (Descriptor 04h) Register m (PCI_RC_DMATCTLm) (m = 0 to 7)

This register controls DMA transfer to the AXI and PCIe.

Access Size : 32 bits
Offset Address : <PCI0_base> + 0924h + 080h x m (m = 0 to 7) (channel offset)
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	CCH_L[3:0]				CCH_D[3:0]			
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	DMA_TC[2:0]			-	-	DMA_ATB[1:0]		-	DMA_FUNC[2:0]			-	-	-	DMA_DIR
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	RW	RW	RW	R	R	RW	RW	R	RW	RW	RW	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
23 to 20	CCH_L[3:0]	0h	RW	Indicates the value of A*CACHE[3:0] to be issued to AXI. CCH_L is output when issuing an AXI request containing the last byte in a transfer indicated by SIZE. Recommended value is 0000b. Bit[3] 1b: write allocatable 0b: not write allocatable Bit[2] 1b: read assignable 0b: not read assignable Bit[1] 1b: cacheable 0b: non-cacheable Bit[0] 1b: bufferable 0b: not bufferable
19 to 16	CCH_D[3:0]	0h	RW	Indicates the value of A*CACHE[3:0] to be issued to AXI. CCH_D is output when issuing an AXI request other than the output condition of CCH_L. The recommended value is 0001b when DIR=0 (PCIe→AXI) and 0000b when DIR=1 (AXI→PCIe). Bit[3] 1b: write allocatable 0b: not write allocatable Bit[2] 1b: read assignable 0b: not read assignable Bit[1] 1b: cacheable 0b: non-cacheable Bit[0] 1b: bufferable 0b: not bufferable
15	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
14 to 12	DMA_TC[2:0]	0h	RW	Traffic class to issue to PCIe. Specifies the traffic class value for requests issued to PCIe. Note: This IP does not support Virtual Channel, so please use it with 000b fixed.
11, 10	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
9, 8	DMA_ATB[1:0]	0h	RW	Attributes to issue to PCIe. Bit[1]: Relaxed Ordering (Unsupported function: 0b fixed) Bit[0]: No Snoop (0b recommended)
7	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
6 to 4	DMA_FUNC [2:0]	0h	RW	Specify the function number of the request issued to PCIe.
3 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
0	DMA_DIR	0h	RW	Sets the DMA transfer direction. 1b: AXI to PCIe 0b: PCIe to AXI

Note: When descriptor-type DMA transfer is in process, writing to these bits is prohibited and the value read indicates the value of the CCH_L, CCH_D, TC, ATB, and DIR fields in the descriptor table being executed.

(58) DMA Size (Descriptor 08h) Register m (PCI_RC_DMASIZEm) (m = 0 to 7)

This register sets the number of bytes for DMA transfer. The set value is reflected in the offset 0Ch field of the descriptor table.

Access Size : 32 bits
Offset Address : <PCI0_base> + 0928h + 080h x m (m = 0 to 7) (channel offset)
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DMA_SIZE[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DMA_SIZE[15:3]													DMA_SIZE[2:0]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	DMA_SIZE [31:3]	0h	RW	Sets the number of DMA transfer bytes.
2 to 0	DMA_SIZE[2:0]	0h	R	Sets the number of DMA transfer bytes. The lower 3 bits are fixed to 0 because it is an 8-byte aligned setting.

Note: When descriptor-type DMA transfer is in process, writing to these bits is prohibited and the value read indicates the value of the SIZE field in the descriptor table being executed. The number of bytes for transfer when the setting is 0000_0000h is 1_0000_0000h.

(59) DMA Source Lower Address (Descriptor 10h) Register m (PCI_RC_DMASLAm) (m = 0 to 7)

This register sets the lower 32 bits of the source start address for DMA transfer. The set value is reflected in the offset 10h field of the descriptor table.

Access Size : 32 bits
Offset Address : <PCI0_base> + 0930h + 080h x m (m = 0 to 7) (channel offset)
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DMA_S_ADDR[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DMA_S_ADDR[31:3]													DMA_S_ADDR[2:0]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	DMA_S_ADDR [31:3]	0h	RW	Set the lower 32 bits of the transfer source start address for DMA transfer. The lower 3 bits are fixed to 0 because it is an 8-byte aligned setting. (When the data bus width is 128 bits, 16-byte alignment: lower 4 bits are fixed to 0.)
2 to 0	DMA_S_ADDR [2:0]	0h	R	Set the lower 32 bits of the transfer source start address for DMA transfer. The lower 3 bits are fixed to 0 because it is an 8-byte aligned setting. (When the data bus width is 128 bits, 16-byte alignment: lower 4 bits are fixed to 0.)

Note 1. If the Source Address indicates the PCIe space (DIR=0), the PCIe request address is set in combination with the DMA PCIe Higher Address (Descriptor 10h). When descriptor-type DMA transfer is in process, writing to these bits is prohibited and the value read indicates the value of the SA field in the descriptor table being executed.

(60) DMA Source Higher Address (Descriptor 14h) Register m (PCI_RC_DMASUAm) (m = 0 to 7)

This register sets the higher 32 bits of the source start address for DMA transfer. The set value is reflected in the offset 14h field of the descriptor table.

Access Size : 32 bits
Offset Address : <PCI0_base> + 0934h + 080h x m (m = 0 to 7) (channel offset)
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DMA_S_ADDR[63:48]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DMA_S_ADDR[47:32]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DMA_S_ADDR [63:32]	0h	RW	Set the upper 32 bits of the transfer source start address for DMA transfer.

Note 1. If the Source Address indicates the PCIe space (DIR=0), the PCIe request address is set in combination with the DMA PCIe Higher Address (Descriptor 10h). When descriptor-type DMA transfer is in process, writing to these bits is prohibited and the value read indicates the value of the SA field in the descriptor table being executed.

(61) DMA Destination Lower Address (Descriptor 18h) Register m (PCI_RC_DMADESTLAm) (m = 0 to 7)

This register sets the lower 32 bits of the source start address for DMA transfer. The set value is reflected in the offset 18h field of the descriptor table.

Access Size : 32 bits

Offset Address : <PCI0_base> + 0938h + 080h x m (m = 0 to 7) (channel offset)

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DMA_D_ADDR[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DMA_D_ADDR[15:3]													DMA_D_ADDR[2:0]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	DMA_D_ADDR [31:3]	0h	RW	Set the lower 32 bits of the transfer destination start address for DMA transfer. The lower 3 bits are fixed to 0 because it is an 8-byte aligned setting.
2 to 0	DMA_D_ADDR [2:0]	0h	R	Set the lower 32 bits of the transfer destination start address for DMA transfer. The lower 3 bits are fixed to 0 because it is an 8-byte aligned setting.

Note 1. If the Destination Address indicates the PCIe space (DIR=1), the PCIe request address is set in combination with the DMA PCIe Higher Address (Descriptor 10h). When descriptor-type DMA transfer is in process, writing to these bits is prohibited and the value read indicates the value of the DA field in the descriptor table being executed.

(62) DMA Destination Higher Address (Descriptor 1Ch) Register m (PCI_RC_DMADESTUAm) (m = 0 to 7)

This register sets the higher 32 bits of the source start address for DMA transfer. The set value is reflected in the offset 1Ch field of the descriptor table.

Access Size : 32 bits
Offset Address : <PCI0_base> + 093Ch + 080h x m (m = 0 to 7) (channel offset)
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DMA_D_ADDR[63:48]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DMA_D_ADDR[47:32]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DMA_D_ADDR [63:32]	0h	RW	Set the upper 32 bits of the transfer destination start address for DMA transfer.

Note 1. If the Destination Address indicates the PCIe space (DIR=1), the PCIe request address is set in combination with the DMA PCIe Higher Address (Descriptor 10h). When descriptor-type DMA transfer is in process, writing to these bits is prohibited and the value read indicates the value of the DA field in the descriptor table being executed.

(63) DMA Descriptor Lower Link Pointer (Descriptor 20h) Register m (PCI_RC_DMADPLLPm) (m = 0 to 7)

This register indicates the field value at offset 20h in the descriptor table. Only effective when the descriptor-type DMA transfer is selected (the value read has no meaning in the case of register-type transfer).

Access Size : 32 bits
Offset Address : <PCI0_base> + 0940h + 080h x m (m = 0 to 7) (channel offset)
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DMA_LP[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DMA_LP[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DMA_LP[31:0]	0h	R	Indicates the value of the LP field of the running descriptor table.

(64) DMA Descriptor Higher Link Pointer (Descriptor 24h) Register m (PCI_RC_DMADPULPm) (m = 0 to 7)

This register indicates the field value at offset 24h in the descriptor table. Only effective when the descriptor-type DMA transfer is selected (the value read has no meaning in the case of register-type transfer).

Access Size : 32 bits

Offset Address : <PCI0_base> + 0944h + 080h x m (m = 0 to 7) (channel offset)

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DMA_LP[63:48]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DMA_LP[47:32]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DMA_LP [63:32]	0h	R	Indicates the value of the LP field of the running descriptor table.

(65) DMA Rest Size Register m (PCI_RC_DMARESTSIZEm) (m = 0 to 7)

This register indicates the number of bytes for which DMA transfer has not yet been completed.

Access Size : 32 bits

Offset Address : <PCI0_base> + 0950h + 080h x m (m = 0 to 7) (channel offset)

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DMA_REST_SIZE[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DMA_REST_SIZE[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DMA_REST_SIZE[31:0]	0h	R	Displays the number of bytes for which DMA transfer has not been completed. (Register/descriptor-type common)

(66) AXI Request Address (Lower) Register m (PCI_RC_AREQALm) (m = 0 to 7)

This register indicates the lower 32 bits of the address of the current or most recently completed AXI transfer.

Access Size : 32 bits

Offset Address : <PCI0_base> + 0960h + 080h x m (m = 0 to 7) (channel offset)

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	AXI_REQ_ADDR[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	AXI_REQ_ADDR[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	AXI_REQ_ADDR[31:0]	0h	R	Displays the lower 32 bits of the address of the current or most recently completed AXI transfer. (Register/descriptor-type common)

(67) AXI Request Address (Higher) Register m (PCI_RC_AREQAUm) (m = 0 to 7)

This register indicates the higher 32 bits of the address of the current or most recently completed AXI transfer.

Access Size : 32 bits

Offset Address : <PCI0_base> + 0964h + 080h x m (m = 0 to 7) (channel offset)

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	AXI_REQ_ADDR[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	AXI_REQ_ADDR[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	AXI_REQ_ADDR[31:0]	0h	R	Displays the upper 32 bits of the address of the current or most recently completed AXI transfer. (Register/descriptor-type common)

(68) PCIe Request Address (Lower) Register m (PCI_RC_PREQALm) (m = 0 to 7)

This register indicates the lower 32 bits of the address during PCIe transfer that is in progress or for the most recently completed transfer.

Access Size : 32 bits
Offset Address : <PCI0_base> + 0968h + 080h x m (m = 0 to 7) (channel offset)
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PCIE_REQ_ADDR[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PCIE_REQ_ADDR[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	PCIE_REQ_ADDR[31:0]	0h	R	Displays the lower 32 bits of the address of the current or most recently completed PCIe transfer. (Register/descriptor-type common)

(69) PCIe Request Address (Higher) Register m (PCI_RC_PREQAUm) (m = 0 to 7)

This register indicates the higher 32 bits of the address during PCIe transfer that is in progress or for the most recently completed transfer.

Access Size : 32 bits
Offset Address : <PCI0_base> + 096Ch + 080h x m (m = 0 to 7) (channel offset)
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PCIE_REQ_ADDR[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PCIE_REQ_ADDR[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	PCIE_REQ_ADDR[31:0]	0h	R	Displays the upper 32 bits of the address of the current or most recently completed PCIe transfer. (Register/descriptor-type common)

(70) QUE Status Register m (PCI_RC_QUESTAm) (m = 0 to 7)

This register indicates the state of the descriptor queue.

Access Size : 32 bits

Offset Address : <PCI0_base> + 0970h + 080h x m (m = 0 to 7) (channel offset)

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	GO_LIST	LIST_NUM[3:0]			
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
4	GO_LIST	0h	R	Shows whether there is a running descriptor list. 1b: Yes 0b: No
3 to 0	LIST_NUM[3:0]	0h	R	Displays the number of descriptor lists loaded on QUE (not including the list currently being executed). New registration to QUE (write access to QUE Entry) when this register indicates 8h is invalid (discarded).

(71) DMAC Error Status Register m (PCI_RC_DMACESTAm) (m = 0 to 7)

This register indicates the error status of the DMAC.

Access Size : 32 bits

Offset Address : <PCI0_base> + 0978h + 080h x m (m = 0 to 7) (channel offset)

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	CFG_BM_DIS_EP	BME_SUP	BME_DOWN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	MOR_CD_PERR	MOR_CH_PERR	MOR_EP_ERR	MOR_STATUS[2:0]			-	-	-	-	-	-	AXI_RESP[1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

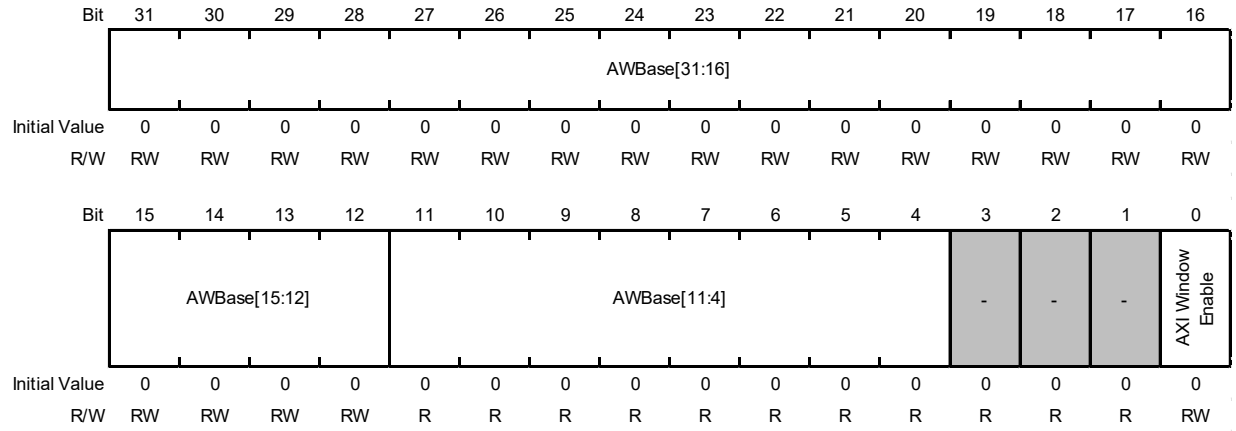
Bit	Bit Name	Initial Value	R/W	Description
31 to 19	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
18	CFG_BM_DIS_EP	0h	R	CHx_ERR is set when the macro operates as an End Point and detects the state of Bus Master Enable Off (Configuration Space 004h bit [2]=0). Holds value until CHx_ERR is cleared.
17	BME_SUP	0h	R	It is set when a sleep signal from the PCIe core is detected as a cause for setting CHx_ERR. Holds value until CHx_ERR is cleared. (Valid only in Endpoint mode)
16	BME_DOWN	0h	R	It is set when a stop signal from the PCIe core is detected as a cause for setting CHx_ERR. Holds value until CHx_ERR is cleared.
15	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
14	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
13	MOR_CD_PERR	0h	R	It is set when MOR_CD_PERR is detected as a set factor for CHx_ERR. Holds value until CHx_ERR is cleared.
12	MOR_CH_PERR	0h	R	It is set when MOR_CH_PERR is detected as a set factor for CHx_ERR. Holds value until CHx_ERR is cleared.
11	MOR_EP_ERR	0h	R	It is set when it is Poisoned Completion as a set factor for CHx_ERR. Holds value until CHx_ERR is cleared.
10 to 8	MOR_STATUS[2:0]	0h	R	Indicates the value when MOR_STATUS is other than 000b (Success) as a set factor for CHx_ERR. Holds value until CHx_ERR is cleared. 000b: initial value 001b: Unsupported Request 010b: CRS 011b: Completion Timeout 100b: Completer Abort 101b: Unexpected Completion 110b: Reserved 111b: Mismatched Length (Length Overrun)
7 to 5	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
4	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
3	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
2	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

Bit	Bit Name	Initial Value	R/W	Description
1, 0	AXI_RESP[1:0]	0h	R	Displays the slave response during AXI Master transactions. It is updated when CHx_ERR is set and retains the value until the bit is cleared. 00b: Initial value 01b: Reserved 10b: SLVERR 11b: DECERR

(72) AXI Window Base (Lower) Register m (PCI_RC_AWBASELm) (m = 0 to 7)

This register is for setting windows for lower address conversion in access from PCIe to AXI. It sets the base address on the PCI. The areas are set in 4-Kbyte boundaries.

Access Size : 32 bits
Offset Address : <PCI0_base> + 1000h + Offset: 00h/ 20h/ 40h/ ・・・ / E0h
Initial Value : 0000_0000h



Bit	Bit Name	Initial Value	R/W	Description
31 to 12	AWBase[31:12]	0h	RW	Window setting register for address conversion when accessing AXI from PCIe. The configurable area is the 4K boundary.
11 to 4	AWBase[11:4]	0h	R	Fixed to 00h
3 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
0	AXI Window Enable	0h	RW	Enable setting of AXI Window. 0b: Window disabled 1b: Window enabled

(73) AXI Window Base (Higher) Register m (PCI_RC_AWBASEUm) (m = 0 to 7)

This register is for setting windows for higher address conversion in access from PCIe to AXI.

Access Size : 32 bits

Offset Address : <PCI0_base> + 1000h + Offset: 04h/ 24h/ 44h/ ・・・ / E4h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	AWBase[63:48]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	AWBase[47:32]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	AWBase[63:32]	0h	RW	Window setting register for address conversion when accessing AXI from PCIe.

(74) AXI Window Mask (Lower) Register m (PCI_RC_AWMASKLm) (m = 0 to 7)

This register is for setting windows for lower address conversion in access from PCIe to AXI. The window is set as the area corresponding to the number of set bits from the address set in the AWBase register. The area which can be set is $4K \times 2^N$ bytes.

Access Size : 32 bits
Offset Address : <PCI0_base> + 1000h + Offset: 08h/ 28h/ 48h/ ・・・ / E8h
Initial Value : 0000_0FFFh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	AWMask[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	AWMask[15:12]				AWMask[11:0]											
Initial Value	0	0	0	0	1	1	1	1	1	1	1	1	1	1	1	1
R/W	RW	RW	RW	RW	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	AWMask[31:12]	0h	RW	Set the window in the area of the set number of bits from the address set in the AWBase register. Set 1 from the lower bit. Therefore, the area that can be set is 4K x 2^N bytes.
11 to 0	AWMask[11:0]	FFFh	R	Fixed to FFFh

(75) AXI Window Mask (Higher) Register m (PCI_RC_AWMASKUm) (m = 0 to 7)

This register is for setting windows for higher address conversion in access from PCIe to AXI.

Access Size : 32 bits

Offset Address : <PCI0_base> + 1000h + Offset: 0Ch/ 2Ch/ 4Ch/ ・・・ / Ech

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	AWMask[62:48]														
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	AWMask[47:32]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
30 to 0	AWMask[62:32]	0h	RW	Set the window in the area of the set number of bits from the address set in the AWBase register. Set 1 from the lower bit.

(76) AXI Destination (Lower) Register m (PCI_RC_ADESTLm) (m = 0 to 7)

This register is for setting windows for lower address conversion in access from PCIe to AXI. The base address of the window in the address space on the AXI is set. The areas are set in 4-Kbyte boundaries.

Access Size : 32 bits
Offset Address : <PCI0_base> + 1000 + Offset: 10h/ 30h/ 50h/ 70h/ ・・・ / F0h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ADest[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ADest[15:12]				Adest[11:0]											
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	ADest[31:12]	0h	RW	Sets the window base point in the address space from the AXI side. The configurable area is the 4K boundary.
11 to 0	Adest[11:0]	0h	R	Fixed to 000h

(77) AXI Destination (Higher) Register m (PCI_RC_ADESTUm) (m = 0 to 7)

This register is for setting windows for higher address conversion in access from PCIe to AXI.

Access Size : 32 bits

Offset Address : <PCI0_base> + 1000 + Offset: 14h/ 34h/ 54h/ 74h/ ・・・ / F4h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ADest[63:48]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

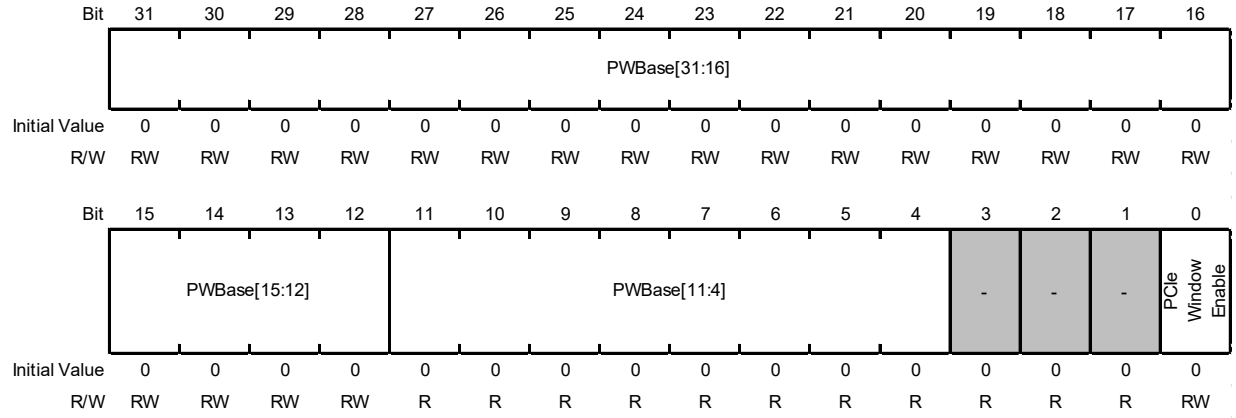
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ADest[47:32]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	ADest[63:32]	0h	RW	Sets the window base point in the address space from the AXI side.

(78) PCIe Window Base (Lower) Register m (PCI_RC_PWBASELm) (m = 0 to 7)

This register is for setting windows for lower address conversion in access from AXI to PCIe. It sets the base address on the AXI. The areas are set in 4-Kbyte boundaries.

Access Size : 32 bits
Offset Address : <PCI0_base> + 1000 + Offset: 100h/ 120h/ 140h/ ・・・ / 1E0h
Initial Value : 0000_0000h



Bit	Bit Name	Initial Value	R/W	Description
31 to 12	PWBase[31:12]	0h	RW	Sets the base point of the address on the AXI side. The configurable area is the 4K boundary.
11 to 4	PWBase[11:4]	0h	R	Fixed to 00h
3 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
0	PCIe Window Enable	0h	RW	Enable setting of PCIe Window. 0b: Window disabled 1b: Window enabled

(79) PCIe Window Base (Higher) Register m (PCI_RC_PWBASEUm) (m = 0 to 7)

This register is for setting windows for higher address conversion in access from AXI to PCIe.

Access Size : 32 bits

Offset Address : <PCI0_base> + 1000 + Offset: 104h/ 124h/ 144h/ ・・・ / 1E4h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PWBase[63:48]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PWBase[47:32]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	PWBase[63:32]	0h	RW	Sets the base point of the address on the AXI side. The configurable area is the 4K boundary.

(80) PCIe Window Mask (Lower) Register m (PCI_RC_PWMASKLm) (m = 0 to 7)

This register is for setting windows for address conversion in access from AXI to PCIe. The window is set as the area corresponding to the number of set bits from the address set in the PWBase register.

Access Size : 32 bits
Offset Address : <PCI0_base> + 1000 + Offset: 108h/ 128h/ 148h/ ・・・ / 1E8h
Initial Value : 0000_0FFFh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PWMask[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PWMask[15:12]				PWMask[11:0]											
Initial Value	0	0	0	0	1	1	1	1	1	1	1	1	1	1	1	1
R/W	RW	RW	RW	RW	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	PWMask[31:12]	0h	RW	Set the window in the area of the set number of bits from the address set in the PWBase register. Set 1 from the lower bit.
11 to 0	PWMask[11:0]	FFFh	R	Fixed to FFFh

(81) PCIe Window Mask (Higher) Register m (PCI_RC_PWMASKUm) (m = 0 to 7)

This register is for setting windows for address conversion in access from AXI to PCIe. The window is set as the area corresponding to the number of set bits from the address set in the PWBase register.

Access Size : 32 bits
Offset Address : <PCI0_base> + 1000 + Offset: 10Ch/ 12Ch/ 14Ch/ ・・・ / 1ECh
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	PWMask[62:48]														
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PWMask[47:32]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
30 to 0	PWMask[62:32]	0h	RW	Set the window in the area of the set number of bits from the address set in the PWBase register. Set 1 from the lower bit.

(82) PCIe Destination (Lower) Register m (PCI_RC_PDESTLOm) (m = 0 to 7)

This register is for setting windows for address conversion in access from AXI to PCIe. The base address of the window in the address space on the AXI is set. The areas are set in 4-Kbyte boundaries.

Access Size : 32 bits
Offset Address : <PCI0_base> + 1000 + Offset: 110h/ 130h/ 150h/ 170h/ ・・・ / 1F0h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PDest[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PDest[15:12]				Pdest[11:0]											
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	PDest[31:12]	0h	RW	Set the window base point in the address space on the PCIe side. The configurable area is the 4k boundary.
11 to 0	Pdest[11:0]	0h	R	Fixed to 000h

(83) PCIe Destination (Higher) Register m (PCI_RC_PDESTUPm) (m = 0 to 7)

This register is for setting windows for higher address conversion in access from AXI to PCIe.

Access Size : 32 bits

Offset Address : <PCI0_base> + 1000 + Offset: 114h/ 134h/ 154h/ 174h/ ・・・ / 1F4h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PDest[63:48]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PDest[47:32]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	PDest[63:32]	0h	RW	Set the window base point in the address space on the PCIe side.

6.6.4.1.4 PCI Express Configuration Register Descriptions (Type1)

(1) Vendor and Device ID Register (PCI_RC_VID)

This register indicates the vendor and device ID. This register can be written during initialization.

Access Size : 32 bits
Offset Address : <PCI0_base> + 6000h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Device ID[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	Hwinit	Hwinit	Hwinit	Hwinit	Hwinit	Hwinit	Hwinit	Hwinit	Hwinit	Hwinit	Hwinit	Hwinit	Hwinit	Hwinit	Hwinit	Hwinit

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Vendor ID[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	Hwinit	Hwinit	Hwinit	Hwinit	Hwinit	Hwinit	Hwinit	Hwinit	Hwinit	Hwinit	Hwinit	Hwinit	Hwinit	Hwinit	Hwinit	Hwinit

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	Device ID[15:0]	0h	Hwinit	The read value is undefined Represents the manufacturer of the device. Set a fixed value.
15 to 0	Vendor ID[15:0]	0h	Hwinit	The read value is undefined Used by the manufacturer specified by the Vendor ID to identify the manufactured device. Set a fixed value.

Table 6.6-10 Valid Reset Signal

Reset Signal	Device ID	Vendor ID
RST_LOAD_B	✓	✓
RST_RSM_B		
RST_CFG_B		

(2) Command and Status Register (PCI_RC_COM_STA)

This register specifies the command and the status.

Access Size : 32 bits
Offset Address : <PCI0_base> + 6004h
Initial Value : 0010_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	Signaled System Error	-	-	-	-	-	-	-	-	-	Capabilities List	Interrupt Status	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0
R/W	R	RW1	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	Interrupt Disable	-	SERR# Enable	-	Parity Error Response	-	-	-	Bus Master Enable	Memory Space Enable	IO Space Enable
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	RW	R	RW	R	RW	R	R	R	RW	RW	R

Bit	Bit Name	Initial Value	R/W	Description
31	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
30	Signaled System Error	0h	RW1	Set to 1b when the SERR Enable bit is 1b and this macro sends an ERR_FATAL or ERR_NONFATAL Message.
29 to 21	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
20	Capabilities List	1h	R	This bit is fixed to 1b because all PCI Express devices must implement PCI Express Capability.
19	Interrupt Status	0h	R	Indicates the interrupt of the device.
18 to 11	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
10	Interrupt Disable	0h	RW	Suppress transmission of Assert_INTx Message. Not used for Root Complex devices.
9	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
8	SERR# Enable	0h	RW	If set to 1b, the Root Complex is notified of Non-Fatal Errors and Fatal Errors by Message Transaction. Note: Even if this bit is not set, if a bit related to Error Reporting in the Device Control register of PCI Express Capability is set to “1”, an error is notified to the Root Complex by Message Transaction.
7	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
6	Parity Error Response	0h	RW	Controls the operation when transferring/receiving Poised TLP. Note: Error logging to the Detected Parity Error field of the Status register, the Device Status register of PCI Express Capability, and the Uncorrectable Error Status register of Advanced Error Reporting Capability is performed regardless of the setting of this bit.
5 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
2	Bus Master Enable	0h	RW	Controls whether to operate as a bus master.
1	Memory Space Enable	0h	RW	Controls whether to respond to accesses to memory space.
0	IO Space Enable	0h	R	0b fixed. It does not support access to the I/O space.

(4) Cache Line and Header Type Register (PCI_RC_CL_HT)

This register indicates the cache line and the header type.

Access Size : 32 bits
Offset Address : <PCI0_base> + 600Ch
Initial Value : 0001_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	Header Type[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	Cache Line Size[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
23 to 16	Header Type[7:0]	1h	R	Root Complex: 01h fixed.
15 to 8	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
7 to 0	Cache Line Size[7:0]	0h	R	Implemented as a read/write field for legacy compatibility, but the value set has no effect on this device.

Table 6.6-13 Valid Reset Signal

Reset Signal	Cache Line Size

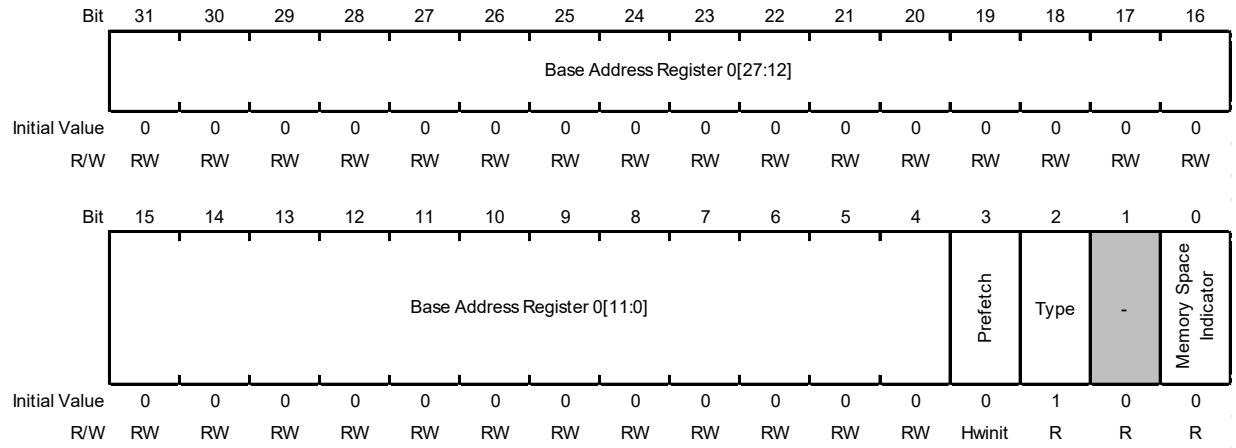
RST_RSM_B	
RST_CFG_B	✓

(5) Base Address Register 0 (PCI_RC_BAR0)

This register forms a 64-bit memory space in combination with Base Address Register 1 (BAR1).

Access Size : 32 bits
Offset Address : <PCI0_base> + 6010h
Initial Value : 0000_0004h



Bit	Bit Name	Initial Value	R/W	Description
31 to 4	Base Address Register 0[27:0]	0h	RW	Indicates the base address. Depending on the size of the address block required, some lower bits of this field are implemented as Read Only bits fixed at 0b. In this macro, the Read Only bits can be set with the Base Address Register Mask00 (Lower)(Offset: 0A0h).
3	Prefetch	0h	Hwinit	0b: disable, 1b: enable
2	Type	1h	R	0b: 32 bit address, 1b: 64-bit address 1b fixed to use 64-bit address
1	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
0	Memory Space Indicator	0h	R	Fixed to 0b to indicate the memory space.

Table 6.6-14 Valid Reset Signal

Reset Signal	Base Address Register 0	Prefetch
RST_LOAD_B		✓
RST_RSM_B

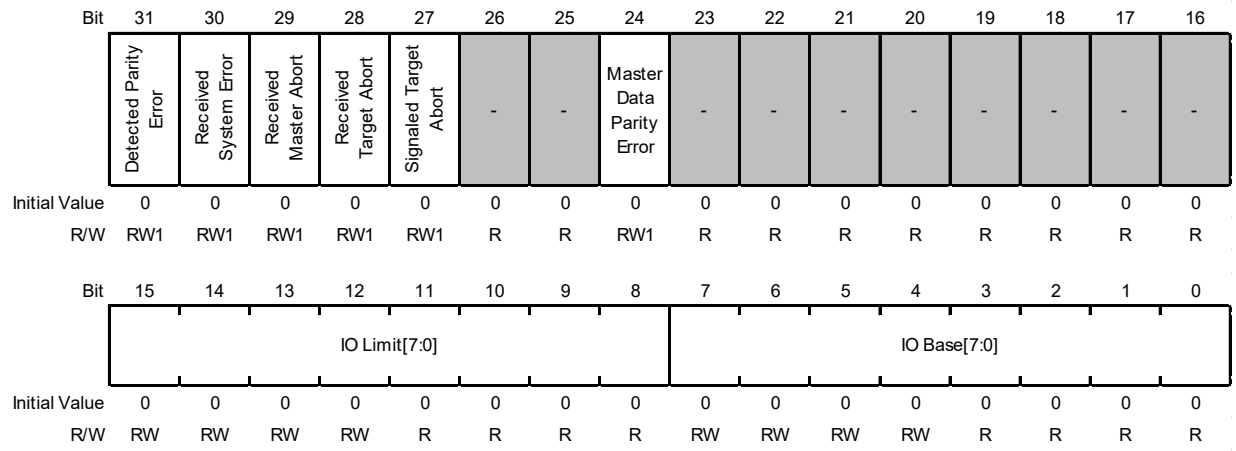
(8) I/O Base/Limit and Secondary Status (PCI_RC_IOBL_SS)

Access Size : 32 bits
Offset Address : <PCI0_base> + 601Ch
Initial Value : 0000_0000h



Bit	Bit Name	Initial Value	R/W	Description
31	Detected Parity Error	0h	RW1	Set to 1b when a Poisoned TLP is received, regardless of the setting of the Parity Error Response Enable bit in the Bridge Control and Interrupt Register (Offset:03Ch).
30	Received System Error	0h	RW1	Set to 1b when an ERR_FATAL or ERR_NONFATAL Message is received.
29	Received Master Abort	0h	RW1	Set to 1b when the Completion Status field receives a Completion of an Unsupported Request.
28	Received Target Abort	0h	RW1	Set to 1b when the Completion Status field receives a Completion for Completer Abort.
27	Signaled Target Abort	0h	RW1	The Completion Status field is set to 1b when sending a Completion of Completer Abort (Posted or Non-Posted Request).
26, 25	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
24	Master Data Parity Error	0h	RW1	Set to 1b when the Parity Error Response bit is set to 1b and the following two conditions occur: 1) Requester (BME) received a Poisoned Completion TLP. 2) Requester (BME) sent Poisoned Write Request TLP. This bit is not set to 1b if the Parity Error Response bit is 0b.
23 to 16	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
15 to 8	IO Limit[7:0]	0h	RW (R)	This is an unused field in this macro. (00h fixed)
7 to 0	IO Base[7:0]	0h	RW (R)	This is an unused field in this macro. (00h fixed)

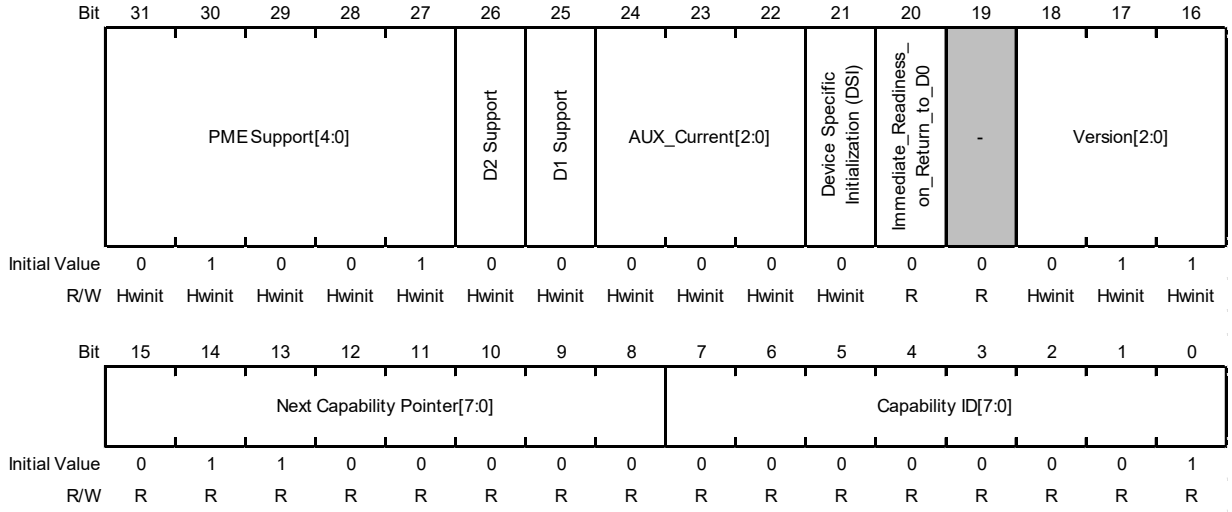
(17) PM Capabilities (PCI_RC_PMC)

This register indicates various support information.

Access Size : 32 bits
Offset Address : <PCI0_base> + 6040h
Initial Value : 4803_6001h



Bit	Bit Name	Initial Value	R/W	Description
31 to 27	PME Support[4:0]	9h	Hwinit	Indicates whether PME is supported in each Device State. xxxx1b: supports D0 xxx1xb: supports D1 xx1xxb: supports D2 x1xxxb: supports D3hot 1xxxxb: D3cold supported (not supported)
26	D2 Support	0h	Hwinit	Indicates whether D2 Power Management State is supported. 0b: not supported 1b: Support
25	D1 Support	0h	Hwinit	Indicates whether the D1 Power Management State is supported. 0b: not supported 1b: Support
24 to 22	AUX_Current [2:0]	0h	Hwinit	Indicates the 3.3-V auxiliary current (the maximum current value supplied from the auxiliary power supply). 111b: 375 mA 110b: 320 mA 101b: 250 mA 100b: 220 mA 011b: 160 mA 010b: 100 mA 001b: 55 mA 000b: 0 (self powered) Reading returns 000b. (AUX not supported)
21	Device Specific Initialization (DSI)	0h	Hwinit	Indicates whether or not DSI (Device Specific Initialization) is used. 0b: not supported 1b: Support
20	Immediate_Readiness_on_Return_to_D0	0h	R	0b fixed
19	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
18 to 16	Version[2:0]	3h	Hwinit	011b is fixed. PCI Power Management Interface Specification Rev.1.2
15 to 8	Next Capability Pointer[7:0]	60h	R	Indicates the PCI Express Capability start address.
7 to 0	Capability ID[7:0]	1h	R	Indicates the PCI Power Management Capability. It is fixed at 01h.

Table 6.6-25 Valid Reset Signal

Reset Signal	PME Support	D2 Support	D1 Support	AUX_Current	DSI	Version
RST_LOAD_B	✓	✓	✓	✓	✓	✓

RST_CFG_B	

(18) PM Status/Control Register (PCI_RC_PMSC)

This register indicates and controls the PME status.

Access Size : 32 bits
Offset Address : <PCI0_base> + 6044h
Initial Value : 0000_0008h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PME Status	-	-	-	-	-	-	PME Enable	-	-	-	-	No_Soft_Reset	-	PowerState [1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0
R/W	RW	R	R	R	R	R	R	RW	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
15	PME Status	0h	RW	Indicates that a PME assert factor has occurred. 1b indicates that there is a PME assertion factor.
14 to 9	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
8	PME Enable	0h	RW	Controls PME assertions. If 1b, PME assertion is enabled. Assert PME if PME_Status is set at this time. PCI Express performs Link Wake-up processing, and then performs PME assert processing by sending PM_PME Message. Note: The specifications are as follows depending on the value of the PM Capabilities register PME Support[4] (PME Support in D3cold). PME Support[4]=1b Reset: RST_RSM_B PME Support[4]=0b Reset: RST_CFG_B
7 to 4	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
3	No_Soft_Reset	1h	R	Indicates that internal reset is not performed inside the device at the power state transition from D3hot to D0.
2	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
1, 0	PowerState [1:0]	0h	RW	Set the PCI Device State. 00b: - D0 (Default) 01b: - D1 (Do not set) 10b: - D2 (Do not set) 11b: - D3hot

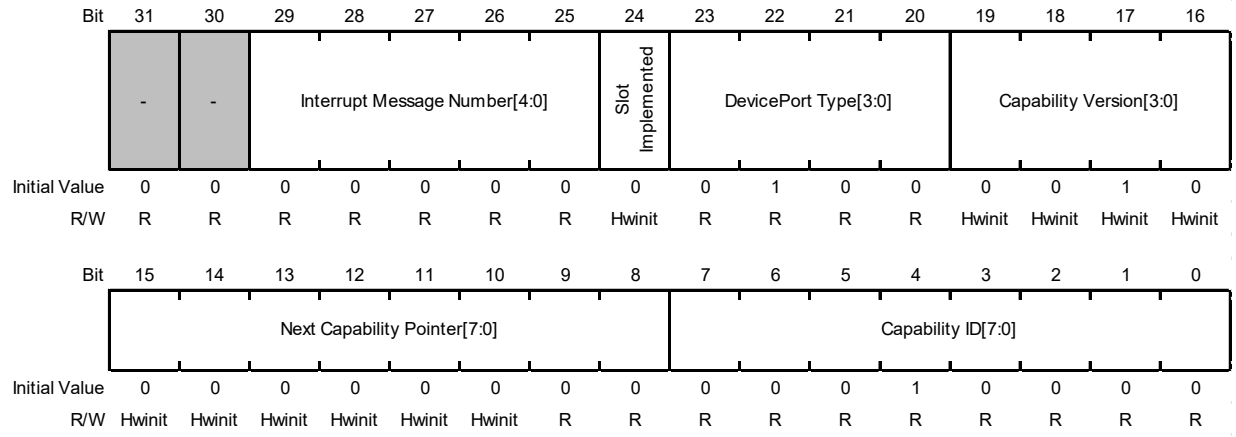
RST_CFG_B		✓

(19) PCI Express Capability Register (PCI_RC_PCIEC)

This register indicates the PCIe capability.

Access Size : 32 bits
Offset Address : <PCI0_base> + 6060h
Initial Value : 0042_0010h



Bit	Bit Name	Initial Value	R/W	Description
31, 30	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
29 to 25	Interrupt Message Number[4:0]	0h	R	00000b fixed.
24	Slot Implemented	0h	Hwinit	Setting it to 1b indicates that the PCI Express Link (Downstream Port) is connected to the Slot.
23 to 20	DevicePort Type[3:0]	4h	R	Indicates that it is a PCI Express Root Complex device. 0000b PCI Express Endpoint device 0001b Legacy PCI Express Endpoint device 0100b Root Port of PCI Express Root Complex (Default) 0101b Upstream Port of PCI Express Switch 0110b Downstream Port of PCI Express Switch 0111b PCI Express-to-PCI/PCI-X Bridge 1000b PCI/PCI-X-to-PCI Express Bridge 1001b Root Complex Integrated Endpoint Device 1010b Root Complex Event Collector All other encodings are reserved.
19 to 16	Capability Version[3:0]	2h	Hwinit	Indicates the version of PCI Express Capability Structure. 0010b fixed.
15 to 8	Next Capability Pointer[7:0]	0h	Hwinit (R)	Indicates that this Capability List is the final list (00h fixed). Lower 2 bits [9:8] are reserved and fixed to 00b.
7 to 0	Capability ID[7:0]	10h	R	Indicates PCI Express Capability. 10h fixed.

RST_RSM_B		
RST_CFG_B		

(20) Device Capabilities Register (PCI_RC_DEVC)

This register indicates the device capability.

Access Size : 32 bits
Offset Address : <PCI0_base> + 6064h
Initial Value : 0000_8001h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Role-Based Error Reporting	-	-	-	-	-	-	-	-	-	-	-	-	Max_Payload_Size Supported[2:0]		
Initial Value	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	Hwinit	Hwinit	Hwinit

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
15	Role-Based Error Reporting	1h	R	Set to 1b if the Error Reporting feature (Compliant with Rev 1.1 or later) is implemented. Fixed to 1b in this core.
14 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
2 to 0	Max_Payload_ Size Supported[2:0]	1h	Hwinit	000b: 128B max payload size 001b: 256B max payload size (Default) 010b: 512B max payload size 011b: 1024B max payload size 100b: 2048B max payload size 101b: 4096B max payload size 110b: Reserved 111b: Reserved

Table 6.6-28 Valid Reset Signal

RST_LOAD_B	✓
RST_RSM_B	
RST_CFG_B	

(21) Device Control/Status Register (PCI_RC_DEVCS)

This register controls the device and indicates the device status.

Access Size : 32 bits
Offset Address : <PCI0_base> + 6068h
Initial Value : 0000_2010h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	Unsupported Request Detected	Fatal Error Detected	Non-Fatal Error Detected	Correctable Error Detected
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	RW1	RW1	RW1	RW1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	Max_Read_Request_Size[2:0]			-	-	-	-	Max_Payload_Size[2:0]			Enable Relaxed Ordering	Unsupported Request Reporting Enable	Fatal Error Reporting Enable	Non-Fatal Error Reporting Enable	Correctable Error Reporting Enable
Initial Value	0	0	1	0	0	0	0	0	0	0	0	1	0	0	0	0
R/W	R	RW	RW	RW	R	RW	R	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 20	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
19	Unsupported Request Detected	0h	RW1	Indicates that an Unsupported Request Error was detected. 1b indicates the detection of an error.
18	Fatal Error Detected	0h	RW1	Indicates that a Fatal Error was detected. 1b indicates the detection of an error.
17	Non-Fatal Error Detected	0h	RW1	Indicates that a Non-Fatal Error was detected. 1b indicates the detection of an error.
16	Correctable Error Detected	0h	RW1	Indicates that a correctable error was detected. 1b indicates the detection of an error.
15	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
14 to 12	Max_Read_Request_Size[2:0]	2h	RW	Set Max_Read_request_Size. 000b: 128B max read request size 001b: 256B max read request size 010b: 512B max read request size (Default) 011b: 1024B max read request size 100b: 2048B max read request size 101b: 4096B max read request size 110b: Reserved 111b: Reserved
11 to 8	-	All 0	R (RW)	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
7 to 5	Max_Payload_Size[2:0]	0h	RW	Set Max_Payload_Size. 000b: 128B max payload size (Default) 001b: 256B max payload size 010b: 512B max payload size 011b: 1024B max payload size 100b: 2048B max payload size 101b: 4096B max payload size 110b: Reserved 111b: Reserved

Bit	Bit Name	Initial Value	R/W	Description
4	Enable Relaxed Ordering	1h	RW	Set whether or not to use Relaxed Ordering as a Requester. 1b: Support 0b: not supported
3	Unsupported Request Reporting Enable	0h	RW	Controls the generation of ERR_NONFATAL and ERR_FATAL messages in response to the detection of unsupported requests. The value 1b enables generation of messages.
2	Fatal Error Reporting Enable	0h	RW	Controls the generation of ERR_FATAL Messages. 1b enables Message generation.
1	Non-Fatal Error Reporting Enable	0h	RW	Controls generation of ERR_NONFATAL Message. 1b enables Message generation.
0	Correctable Error Reporting Enable	0h	RW	Controls the generation of ERR_COR Messages. 1b enables Message generation.

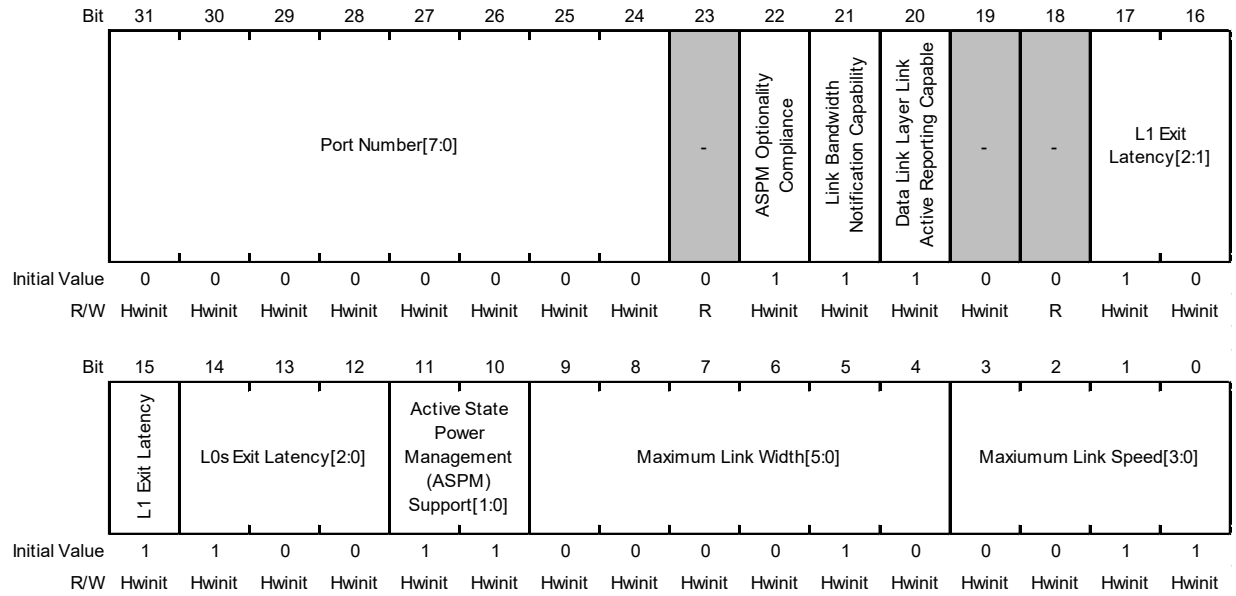
(22) Link Capabilities Register (PCI_RC_LINKC)

This register indicates the link capabilities. This register can be written during initialization.

Access Size : 32 bits
Offset Address : <PCI0_base> + 606Ch
Initial Value : 0072_CC23h



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	Port Number[7:0]	0h	Hwinit	Indicates the port number of PCI Express Link.
23	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
22	ASPM Optionality Compliance	1h	Hwinit	1b fixed
21	Link Bandwidth Notification Capability	1h	Hwinit	Indicates support for Link Bandwidth Notification status and Interrupt functions.
20	Data Link Layer Link Active Reporting Capable	1h	Hwinit	Indicates support for the DL_Active state reporting feature in the Data Link Control and Management State Machine.
19	-	0h	Hwinit	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
18	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
17 to 15	L1 Exit Latency[2:0]	5h	Hwinit	000b: Less than 1µs 001b: 1 µs to less than 2 µs 010b: 2 µs to less than 4 µs 011b: 4 µs to less than 8 µs 100b: 8 µs to less than 16 µs 101b: 16 µs to less than 32 µs (Default) 110b: 32 µs to 64 µs 111b: More than 64 µs
14 to 12	L0s Exit Latency[2:0]	4h	Hwinit	000b: Less than 64 ns 001b: 64 ns to less than 128 ns 010b: 128 ns to less than 256 ns 011b: 256 ns to less than 512 ns 100b: 512 ns to less than 1 µs (Default) 101b: 1 µs to less than 2 µs 110b: 2 µs-4 µs 111b: More than 4 µs

Bit	Bit Name	Initial Value	R/W	Description
11, 10	Active State Power Management (ASPM) Support[1:0]	3h	Hwinit	00b: Reserved 01b: L0s Entry Supported 10b: Reserved 11b: L0s and L1 Entry Supported (Default)
9 to 4	Maximum Link Width[5:0]	2h	Hwinit	000000b: Reserved 000001b: x1 (prohibited) 000010b: x2 (Default) 000100b: x4 (prohibited) 001000b: x8 (prohibited) 001100b: x12 (prohibited) 010000b: x16 (prohibited) 100000b: x32 (prohibited) Ch1 is set to 000010b (x2) in multilink configuration
3 to 0	Maximum Link Speed[3:0]	3h	Hwinit	0001b: 2.5 GT/s Link speed supported 0010b: 5.0 GT/s and 2.5 GT/s Link speeds supported 0011b: 8.0 GT/s Link speed supported (Default) 0100b: 16.0 GT/s Link speed supported (prohibited) All other encodings are reserved.

(23) Link Control/Status Register (PCI_RC_LINKCS)

This register controls the link and indicates the link status.

Access Size : 32 bits
Offset Address : <PCI0_base> + 6070h
Initial Value : 1000_0008h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Link Autonomous Bandwidth Status	Link Bandwidth Management Status	Data Link Layer Link Active	Slot Clock Configuration	Link Training	-	Negotiated Link Width[5:0]						Current Link Speed[1:0]		-	-
Initial Value	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW1	RW1	R	Hwinit	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	Link Autonomous Bandwidth Interrupt Enable	Link Bandwidth Management Interrupt Enable	Hardware Autonomous Width Disable	-	Extended Synch	Common Clock Configuration	Retrain Link	Link Disable	Read Completion Boundary (RCB)	-	Active State Power Management (ASPM) Control[1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0
R/W	R	R	R	R	RW	RW	RW	R	RW	RW	RW	RW	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31	Link Autonomous Bandwidth Status	0h	RW1	This bit is output when Link Autonomous Bandwidth Interrupt Enable is asserted.
30	Link Bandwidth Management Status	0h	RW1	This bit is output when Link Bandwidth Management Interrupt Enable is asserted.
29	Data Link Layer Link Active	0h	R	1b indicates that the Data Link Layer is in the Link Active state.
28	Slot Clock Configuration	1h	Hwinit	Indicates that the reference clock shared with the EP is used. 0b: Do not use Connector Reference Clock 1b: Use Connector Reference Clock (Default)
27	Link Training	0h	R	1b indicates that the Physical layer LTSSM is in Configuration state or Recovery state. This bit is cleared when exiting the Configuration/Recovery state.
26	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
25 to 20	Negotiated Link Width[5:0]	0h	R	Indicates the Link width established as a result of negotiation. 000001b: x1 000010b: x2 000100b: x4 001000b: x8 001100b: x12 010000b: x16 100000b: x32 Other encodings are Reserved.
19, 18	Current Link Speed[1:0]	0h	R	0001b: 2.5GT/s PCI Express Link 0010b: 5.0 GT/s PCI Express Link 0011b: 8.0 GT/s PCI Express Link 0100b: 16.0 GT/s PCI Express Link 0000b during reset period
17 to 12	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

Bit	Bit Name	Initial Value	R/W	Description
11	Link Autonomous Bandwidth Interrupt Enable	0h	RW	Interrupt generation is controlled by the Link Autonomous Bandwidth Management Status bit (bit31). 0b: Interrupt Disable (Default) 1b: Interrupt Enable
10	Link Bandwidth Management Interrupt Enable	0h	RW	Interrupt generation is controlled by the Link Bandwidth Status bit (bit30). 0b: Interrupt Disable (Default) 1b: Interrupt Enable
9	Hardware Autonomous Width Disable	0h	RW	Set the Link Width Change function to Disable. 0b: Link Width Change Enable (Default) 1b: Link Width Change Disable
8	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
7	Extended Synch	0h	RW	If set to 1b, 4096 FTS Ordered-sets will be sent when transitioning from L0s to L0. Also, 1024 TS1 Ordered-sets are transmitted at the beginning of the Recovery state when transitioning from L1 to L0. The default value is 0b.
6	Common Clock Configuration	0h	RW	Sets whether the Common Reference Clock is used. 0b: Provided by non-Common Reference Clock (Default) 1b: Supplied by Common Reference Clock
5	Retrain Link	0h	RW	Setting it to 1b causes the LTSSM to transition to the Recovery state and start Link Retraining. Note that reading is always 0b.
4	Link Disable	0h	RW	Setting it to 1b causes the LTSSM to transition to the Disabled state.
3	Read Completion Boundary (RCB)	1h	R	0b: 64 bytes 1b: 128 bytes (Default)
2	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
1, 0	Active State Power Management (ASPM) Control[1:0]	0h	RW	Sets the permission level for Active State Power Management. 00b Disabled (Default) 01b L0s Entry Supported 10b Reserved 11b L0s and L1 Entry Supported

(24) Slot Capabilities (PCI_RC_SLOTC)

When PCI Express Capability Structure: Configuration Space Bit [24]: Slot Implemented is 0b, the slot is not implemented. Therefore, the bits in this register will be all '0'.

Access Size : 32 bits
Offset Address : <PCI0_base> + 6074h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Physical Slot Number[12:0]													No Command Completed Support	Electromechanical Interlock Present	Slot Power Limit Scale
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	Hwinit	Hwinit	Hwinit	Hwinit	Hwinit	Hwinit	Hwinit	Hwinit	Hwinit	Hwinit	Hwinit	Hwinit	Hwinit	Hwinit	Hwinit	Hwinit

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Slot Power Limit Scale	Slot Power Limit Value[7:0]								Hot-Plug Capable	Hot-Plug Surprise	Power Indicator Present	Attention Indicator Present	MRL Sensor Present	Power Control Present	Attention Button Present
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	Hwinit	Hwinit	Hwinit	Hwinit	Hwinit	Hwinit	Hwinit	Hwinit	Hwinit	Hwinit	Hwinit	Hwinit	Hwinit	Hwinit	Hwinit	Hwinit

Bit	Bit Name	Initial Value	R/W	Description
31 to 19	Physical Slot Number[12:0]	0h	Hwinit	Indicates the slot number connected to the port.
18	No Command Completed Support	0h	Hwinit	Indicates that the Slot will not issue a software notification if the issued command is completed by the Hot-Plug Controller.
17	Electromechanical Interlock Present	0h	Hwinit	Indicates that Electromechanical Interlock is implemented.
16, 15	Slot Power Limit Scale[1:0]	0h	Hwinit	Sets the Scale for the Slot Power Limit Value. This register is enabled when the Slot Implemented bit (Express Capability Register (offset: 060h), bit24) is set. 00b: 1.0x 01b: 0.1x 10b: 0.01x 11b: 0.001x
14 to 7	Slot Power Limit Value[7:0]	0h	Hwinit	In combination with the Slot Power Limit Scale Register value, sets the upper limit of Power for the Slot. This register is enabled when the Slot Implemented bit (Express Capability Register (offset: 060h), bit24) is set. F0h: 250W Slot Power Limit F1h: 275W Slot Power Limit F2h: 300W Slot Power Limit F3h to FFh: reserved
6	Hot-Plug Capable	0h	Hwinit	This bit indicates that this slot is capable of supporting hot-plug operations.
5	Hot-Plug Surprise	0h	Hwinit	This bit indicates that an adapter present in this slot might be removed from the system without any prior notification. This is a form factor specific capability. This bit is an indication to the operating system to allow for such removal without impacting continued software operation.
4	Power Indicator Present	0h	Hwinit	This bit indicates that a Power Indicator is electrically controlled by the chassis for this slot.
3	Attention Indicator Present	0h	Hwinit	This bit indicates that an Attention Indicator is electrically controlled by the chassis.

Bit	Bit Name	Initial Value	R/W	Description
2	MRL Sensor Present	0h	Hwinit	This bit indicates that an MRL Sensor is implemented on the chassis for this slot.
1	Power Control Present	0h	Hwinit	This bit indicates that a software programmable Power Controller is implemented for this slot/adapter (depending on form factor).
0	Attention Button Present	0h	Hwinit	This bit indicates that an Attention Button for this slot is electrically controlled by the chassis.

R/W	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
4	-	0h	RW	Reserved These bits are read as 0b. The write value should always be 0b.
3	PME Interrupt Enable	0h	RW	When a PME Message is received, it is possible to generate a PME interrupt along with setting the PME status bit. An interrupt will also occur if this bit is enabled after PME status is already set.
2	System Error on Fatal Error Enable	0h	RW	This bit makes it possible to generate a system error when ERR_FATAL occurs anywhere in the hierarchy below the root port.
1	System Error on Non-Fatal Error Enable	0h	RW	This bit makes it possible to generate a system error when NON_ERR_FATAL occurs anywhere in the hierarchy below the root port.
0	System Error on Correctable Error Enable	0h	RW	This bit makes it possible to generate a system error when ERR_COR occurs in any of the layers below the root port.

	PME Requester ID[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
17	PME Pending	0h	R	This bit indicates that the PME Status bit is 1 and PME is pending. When the PME status bit is cleared by software, pending PMEs are resent in hardware by resetting the PME status bit and updating the Requester ID field appropriately. The PME pending bit is cleared by hardware when there are no more pending PMEs.
16	PME Status	0h	RW1	This bit indicates that a PME was received by the requestor indicated by the PME Requester ID field. Subsequent PMEs are held off until this bit is cleared by software.
15 to 0	PME Requester ID[15:0]	0h	R	This field indicates the PCI Requester ID of the most recent PME requestor. This field is only valid when the PME status bit is 1b.

Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	Hwinit	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 22	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
21	Link Equalization Request	0h	RW1	This bit is Set by hardware to request the Link equalization process to be performed on the Link. The default value of this bit is 0b. For Multi-Function Upstream Port, this bit must be implemented in Function 0 and RsvdZ in other Functions. Components that only support speeds below 8.0 GT/s are permitted to hardwire this bit to 0b.
20	Equalization Phase 3 Successful	0h	R	When set to 1b, this bit indicates that Phase 3 of the Transmitter Equalization procedure has successfully completed. The default value of this bit is 0b. For Multi-Function Upstream Port, this bit must be implemented in Function 0 and RsvdZ in other Functions. Components that only support speeds below 8.0 GT/s are permitted to hardwire this bit to 0b.
19	Equalization Phase 2 Successful	0h	R	When set to 1b, this bit indicates that Phase 2 of the Transmitter Equalization procedure has successfully completed. The default value of this bit is 0b. For Multi-Function Upstream Port, this bit must be implemented in Function 0 and RsvdZ in other Functions. Components that only support speeds below 8.0 GT/s are permitted to hardwire this bit to 0b.
18	Equalization Phase 1 Successful	0h	R	When set to 1b, this bit indicates that Phase 1 of the Transmitter Equalization procedure has successfully completed. The default value of this bit is 0b. For Multi-Function Upstream Port, this bit must be implemented in Function 0 and RsvdZ in other Functions. Components that only support speeds below 8.0 GT/s are permitted to hardwire this bit to 0b.
17	Equalization Complete	0h	R	When set to 1b, this bit indicates that the Transmitter Equalization procedure has completed. The default value of this bit is 0b. For Multi-Function Upstream Port, this bit must be implemented in Function 0 and RsvdZ in other Functions. Components that only support speeds below 8.0 GT/s are permitted to hardwire this bit to 0b.

Bit	Bit Name	Initial Value	R/W	Description
16	Current De-emphasis Level	0h	R	This is a Status register that indicates the De-emphasis Level during Gen2 operation. 1b: -3.5dB 0b: -6 dB (Default) Note: The initial value of this bit is 0b at reset and after Gen2-Linkup. However, although it indicates 1b at Gen1-Linkup, ignore this bit as it has no meaning in Gen1.
15 to 12	Compliance PresetDe-emphasis[3:0]	0h	RW	Set Transmitter Preset(Gen3) and De-emphasis Level(Gen2) for Polling.Compliance State processing during Enter Compliance. (Gen3) 0000b: P0 (Default) 0001b: P1 0010b: P2 0011b: P3 0100b: P4 0101b: P5 0110b: P6 0111b: P7 1000b: P8 1001b: P9 1010b: P10 Others: Rsvd (Gen2) 0001b: -3.5 dB 0000b: -6 dB (Default)
11	Compliance SOS	0h	RW	When this bit is set to 1b, insert the SKP Ordered-set periodically during compliance pattern transmission.
10	Enter Modified Compliance	0h	RW	Setting bit for transmission of Modified Compliance pattern. 1b: Modified Compliance Pattern 0b: Compliance Pattern (Default)
9 to 7	Transmit Margin[2:0]	0h	RW	Adjust the voltage level of the Transmitter. 000b: Normal operating range 001b-111b: See Base Spec Section 6.6.6.4.4.
6	Selectable De-emphasis	0h	Hwinit	The read value is undefined De-emphasis setting register for RC Gen2 operation. 1b: -3.5dB 0b: -6dB
5	Hardware Autonomous Speed Disable	0h	RW	Controls the Link Speed Change function. 1b: Non-support of Link Speed Change (Disable) 0b: Support of Link Speed Change (Enable)
4	Enter Compliance	0h	RW	Setting to 1b allows transition to Compliance mode. At this time, the Link Speed will be the value set in the Target Link Speed field.
3 to 0	Target Link Speed[3:0]	3h	RW	Set the Link Speed value for notification to the opposite device during training. 0001b: 2.5 GT/s Target Link Speed 0010b: 5.0 GT/s Target Link Speed 0011b: 8.0 GT/s Target Link Speed (Default) 0100b: 16.0 GT/s Target Link Speed (prohibited) All other encodings are reserved.

(45) Advanced Error Reporting Capability Register (PCI_RC_ADVERC)

This register indicates the advanced error reporting capability.

Access Size : 32 bits
Offset Address : <PCI0_base> + 6100h
Initial Value : 1501_0001h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Next Capability Offset[11:0]												Capability Version[3:0]			
Initial Value	0	0	0	1	0	1	0	1	0	0	0	0	0	0	0	1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PCI Express Extended Capability ID[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 20	Next Capability Offset[11:0]	150h	Hwinit (R)	Indicates the starting address for Device Serial Number Capability
19 to 16	Capability Version[3:0]	1h	Hwinit	Indicates the version of the Capability Structure. Default: 0001b
15 to 0	PCI Express Extended Capability ID[15:0]	1h	R	Indicates the Advanced Error Reporting Capability. Default: 0001h

Table 6.6-44 Valid Reset Signal

Reset Signal	Next Capability Offset	Capability Version
RST_LOAD_B	✓	✓
RST_RSM_B		
RST_CFG_B		

(46) Uncorrectable Error Status Register (PCI_RC_UNCESTS)

This register indicates the uncorrectable error status.

Access Size : 32 bits
Offset Address : <PCI0_base> + 6104h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	Unsupported Request Error Status	ECRC Error Status (Optional)	Malformed TLP Status	Receiver Overflow Status (Optional)	Unexpected Completion Status
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	RW1	RW1	RW1	RW1	RW1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Completer Abort Status (Optional)	Completion Timeout Status	-	Poisoned TLP Received Status	-	-	-	-	-	-	-	Data Link Protocol Error Status	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW1	RW1	R	RW1	R	R	R	R	R	R	R	RW1	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
20	Unsupported Request Error Status	0h	RW1	Indicates that an unsupported TLP was received. 0b: No error detected 1b: error detected
19	ECRC Error Status (Optional)	0h	RW1	Indicates that an ECRC Error was received. 0b: No error detected 1b: error detected
18	Malformed TLP Status	0h	RW1	Indicates that a Malformed TLP was received. 0b: No error detected 1b: error detected
17	Receiver Overflow Status (Optional)	0h	RW1	Indicates that a TLP with a size larger than the free credits in the receive buffer was received. 0b: No error detected 1b: error detected
16	Unexpected Completion Status	0h	RW1	Indicates that a Completion was received, but there is no record of a corresponding Non-Posted Request sent (due to a mismatch with the Transaction Descriptor). 0b: No error detected 1b: error detected
15	Completer Abort Status (Optional)	0h	RW1	Indicates that a Completion whose Completion Status is Completer Abort (CA) was returned after receiving a Non-Posted Request. 0b: No error detected 1b: error detected
14	Completion Timeout Status	0h	RW1	Indicates that the corresponding Completion was not received within the specified time after sending a Non-Posted Request. 0b: No error detected 1b: error detected
13	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
12	Poisoned TLP Received Status	0h	RW1	Indicates that a Poisoned TLP (with payload and the EP field in the header is 1b) has been received 0b: No error detected 1b: error detected

Bit	Bit Name	Initial Value	R/W	Description
11 to 5	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
4	Data Link Protocol Error Status	0h	RW1	Indicates that a Sequence Number error was detected in the Data Link Layer. 0b: No error detected 1b: error detected
3 to 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

(47) Uncorrectable Error Mask Register (PCI_RC_UNCEMASK)

This register masks the uncorrectable error status.

Access Size : 32 bits
Offset Address : <PCI0_base> + 6108h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	Unsupported Request Error Mask	ECRC Error Mask (Optional)	Malformed TLP Mask	Receiver Overflow Mask (Optional)	Unexpected Completion Mask
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Completer Abort Mask (Optional)	Completion Timeout Mask	-	Poisoned TLP Received Mask	-	-	-	-	-	-	-	Data Link Protocol Error Mask	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	R	RW	R	R	R	R	R	R	R	RW	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
20	Unsupported Request Error Mask	0h	RW	Masks the error notification when an Unsupported Request Error is detected. 0b: no mask 1b: Masks error message transmission, recording of the header in the Header Log register, and updating of the first error pointer.
19	ECRC Error Mask (Optional)	0h	RW	Masks error notification when ECRC Error is detected. 0b: no mask 1b: mask
18	Malformed TLP Mask	0h	RW	Masks error notification when Malformed TLP Error is detected. 0b: no mask 1b: Masks error message transmission, recording of the header in the Header Log register, and updating of the first error pointer.
17	Receiver Overflow Mask (Optional)	0h	RW	Masks error notification when Receiver Overflow Error is detected. 0b: no mask 1b: Masks error message transmission and updating of the first error pointer.
16	Unexpected Completion Mask	0h	RW	Masks error notification when Unexpected Completion Error is detected. 0b: no mask 1b: Masks error message transmission, recording of the header in the Header Log register, and updating of the first error pointer.
15	Completer Abort Mask (Optional)	0h	RW	Masks the error notification when a Completer Abort Error is detected. 0b: no mask 1b: Masks error message transmission, recording of the header in the Header Log register, and updating of the first error pointer.
14	Completion Timeout Mask	0h	RW	Masks the error notification when Completion Timeout Error is detected. 0b: no mask 1b: Masks error message transmission and updating of the first error pointer.
13	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
12	Poisoned TLP Received Mask	0h	RW	Mask error notification when Poisoned TLP Error is detected. 0b: no mask 1b: Masks error message transmission, recording of the header in the Header Log register, and updating of the first error pointer.

Bit	Bit Name	Initial Value	R/W	Description
11 to 5	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
4	Data Link Protocol Error Mask	0h	RW	Masks error notifications when a Data Link Protocol Error is detected. 0b: no mask 1b: Masks error message transmission and updating of the first error pointer.
3 to 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

(48) Uncorrectable Error Severity Register (PCI_RC_UNCESVY)

This register sets the uncorrectable error severity.

Access Size : 32 bits
Offset Address : <PCI0_base> + 610Ch
Initial Value : 0046_2030h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	Unsupported Request Error Severity	ECRC Error Severity (Optional)	Malformed TLP Severity	Receiver Overflow Severity (Optional)	Unexpected Completion Severity
Initial Value	0	0	0	0	0	0	0	0	0	1	0	0	0	1	1	0
R/W	R	R	R	R	R	R	R	R	R	Hwinit	R	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Completer Abort Severity (Optional)	Completion Timeout Severity	-	Poisoned TLP Received Severity	-	-	-	-	-	-	-	Data Link Protocol Error Severity	-	-	-	-
Initial Value	0	0	1	0	0	0	0	0	0	0	1	1	0	0	0	0
R/W	RW	RW	R	RW	R	R	R	R	R	R	R	RW	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 23	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
22	-	1h	Hwinit	Reserved Whenever it is read, 1b is read. The write value should always be 1b.
21	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
20	Unsupported Request Error Severity	0h	RW	Set the Error Severity when Unsupported Request Error is detected. 0b: Non-Fatal Error 1b: Fatal Error
19	ECRC Error Severity (Optional)	0h	RW	Sets the Error Severity when receiving an ECRC Error. 0b: Non-Fatal Error 1b: Fatal Error
18	Malformed TLP Severity	1h	RW	Sets the Error Severity when Malformed TLP Error is detected. 0b: Non-Fatal Error 1b: Fatal Error
17	Receiver Overflow Severity (Optional)	1h	RW	Set the Error Severity when Receiver Overflow Error is detected. 0b: Non-Fatal Error 1b: Fatal Error
16	Unexpected Completion Severity	0h	RW	Sets the Error Severity when an Unexpected Completion Error is detected. 0b: Non-Fatal Error 1b: Fatal Error
15	Completer Abort Severity (Optional)	0h	RW	Sets the Error Severity when a Completer Abort Error is detected. 0b: Non-Fatal Error 1b: Fatal Error
14	Completion Timeout Severity	0h	RW	Sets the Error Severity when Completion Timeout Error is detected. 0b: Non-Fatal Error 1b: Fatal Error
13	-	1h	R	Reserved Whenever it is read, 1b is read. The written value will be ignored.
12	Poisoned TLP Received Severity	0h	RW	Sets the Error Severity when Poisoned TLP Error is detected. 0b: Non-Fatal Error 1b: Fatal Error

Bit	Bit Name	Initial Value	R/W	Description
11 to 5	-	1h	R	Reserved Whenever it is read, 1h is read. The written value will be ignored.
4	Data Link Protocol Error Severity	1h	RW	Sets the Error Severity when a Data Link Protocol Error is detected. 0b: Non-Fatal Error 1b: Fatal Error
3 to 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

(49) Correctable Error Status Register (PCI_RC_CESTS)

This register indicates the correctable error status.

Access Size : 32 bits
Offset Address : <PCI0_base> + 6110h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	Advisory Non-Fatal Error Status	Replay Timer Timeout Status	-	-	-	REPLAY_NUM Rollover Status	Bad DLLP Status	Bad TLP Status	-	-	-	-	-	Receiver Error Status (optional)
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	RW1	RW1	R	R	R	RW1	RW1	RW1	R	R	R	R	R	RW1

Bit	Bit Name	Initial Value	R/W	Description
31 to 14	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
13	Advisory Non-Fatal Error Status	0h	RW1	Indicates that an Advisory Non-Fatal Error was detected. 0b: No error detected 1b: error detected
12	Replay Timer Timeout Status	0h	RW1	Indicates that a Timeout error occurred when a TLP was sent and an Ack or Nak DLLP could not be received within the specified time. 0b: No error detected 1b: error detected
11 to 9	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
8	REPLAY_NUM Rollover Status	0h	RW1	Replay occurred four times in a row, indicating REPLAY_NUM rolled over from 11b to 00b. 0b: No error detected 1b: error detected
7	Bad DLLP Status	0h	RW1	Indicates that a DLLP CRC error was detected. 0b: No error detected 1b: error detected
6	Bad TLP Status	0h	RW1	Indicates that a TLP CRC error or Sequence Number error was detected. 0b: No error detected 1b: error detected
5 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
0	Receiver Error Status (optional)	0h	RW1	0b: No error detected 1b: error detected

(50) Correctable Error Mask Register (PCI_RC_CEMASK)

This register masks the correctable error status.

Access Size : 32 bits
Offset Address : <PCI0_base> + 6114h
Initial Value : 0000_2000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	Advisory Non-Fatal Error Mask	Replay Timer Timeout Mask	-	-	-	REPLAY_NUM Rollover Mask	Bad DLLP Mask	Bad TLP Mask	-	-	-	-	-	Receiver Error Mask (optional)
Initial Value	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	RW	RW	R	R	R	RW	RW	RW	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 14	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
13	Advisory Non-Fatal Error Mask	1h	RW	Masks error notification when Advisory non-fatal errors are detected. 0b: no mask 1b: Mask Advisory Non-Fatal Error handling (Mask updating First Error Pointer and Header Logging and sending Error Message)
12	Replay Timer Timeout Mask	0h	RW	Masks error notification when Replay Timer Timeout Error is detected. 0b: no mask 1b: Mask error message transmission
11 to 9	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
8	REPLAY_NUM Rollover Mask	0h	RW	REPLAY_NUM Mask error notification when Roll Over Error is detected. 0b: no mask 1b: Mask error message transmission
7	Bad DLLP Mask	0h	RW	Masks error notification when Bad DLLP Error is detected. 0b: no mask 1b: Mask error message transmission
6	Bad TLP Mask	0h	RW	Masks error notification when Bad TLP Error is detected. 0b: no mask 1b: Mask error message transmission
5 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
0	Receiver Error Mask (optional)	0h	RW	0b: no mask 1b: Mask error message transmission

(51) Advanced Error Capabilities and Control Register (PCI_RC_ADVECC)

This register indicates and controls the advanced error capabilities.

Access Size : 32 bits
Offset Address : <PCI0_base> + 6118h
Initial Value : 0000_00A0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	ECRC Check Enable	ECRC Check Capable	ECRC Generation Enable	ECRC Generation Capable	First Error Pointer[4:0]				
Initial Value	0	0	0	0	0	0	0	0	1	0	1	0	0	0	0	0
R/W	R	R	R	R	R	R	R	RW	R	RW	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
8	ECRC Check Enable	0h	RW	ECRC Check Enable setting 0b: Disable (Default) 1b: Enable
7	ECRC Check Capable	1h	R	Presence or absence of ECRC Check function 0b: Absent 1b: Present (Default)
6	ECRC Generation Enable	0h	RW	ECRC Generation Enable setting 0b: Disable (Default) 1b: Enable
5	ECRC Generation Capable	1h	R	Presence or absence of ECRC Generation function 0b: Absent 1b: Present (Default)
4 to 0	First Error Pointer[4:0]	0h	R	Indicates the field value of the Uncorrectable Error Status register for the first detected Uncorrectable Error Bit[4:0] First Error Pointer is reset by RST_GP_B.

Table 6.6-49 Valid Reset Signal

Reset Signal	ECRC Check Enable	ECRC Generation Enable
RST_LOAD_B		
RST_RSM_B	✓	✓
RST_CFG_B		

(52) Header Log Register 0 (PCI_RC_HLOG0)

This register indicates the header log.

Access Size : 32 bits
Offset Address : <PCI0_base> + 611Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Header of TLP associated with error 0[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Header of TLP associated with error 0[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	Header of TLP associated with error 0[31:0]	0h	R	Indicates the 1st DW of Header for the first detected Uncorrectable Error.

(53) Header Log Register 1 (PCI_RC_HLOG1)

This register indicates the header log.

Access Size : 32 bits
Offset Address : <PCI0_base> + 6120h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Header of TLP associated with error 1[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Header of TLP associated with error 1[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	Header of TLP associated with error 1[31:0]	0h	R	Indicates the 2nd DW of Header for the first detected Uncorrectable Error.

(54) Header Log Register 2 (PCI_RC_HLOG2)

This register indicates the header log.

Access Size : 32 bits
Offset Address : <PCI0_base> + 6124h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Header of TLP associated with error 2[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Header of TLP associated with error 2[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	Header of TLP associated with error 2[31:0]	0h	R	Indicates the 3rd DW of Header for the first detected Uncorrectable Error.

(55) Header Log Register 3 (PCI_RC_HLOG3)

This register indicates the header log.

Access Size : 32 bits
Offset Address : <PCI0_base> + 6128h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Header of TLP associated with error 3[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Header of TLP associated with error 3[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	Header of TLP associated with error 3[31:0]	0h	R	Indicates the 4th DW of Header for the first detected Uncorrectable Error.

(56) Root Error Command (PCI_RC_ROOTEC)

Access Size : 32 bits
Offset Address : <PCI0_base> + 612Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	Fatal Error Reporting Enable	Non-Fatal Error Reporting Enable	Correctable Error Reporting Enable
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
2	Fatal Error Reporting Enable	0h	RW	This bit enables an interrupt to be generated when ERR_FATAL occurs in any of the layers below the root port.
1	Non-Fatal Error Reporting Enable	0h	RW	This bit enables an interrupt to be generated when NON_ERR_FATAL occurs in any of the layers below the root port.
0	Correctable Error Reporting Enable	0h	RW	This bit enables an interrupt to be generated when ERR_COR occurs in any of the layers below the root port.

Table 6.6-50 Valid Reset Signal

Reset Signal	Fatal Error Reporting Enable	Non-Fatal Error Reporting Enable	Correctable Error Reporting Enable

RST_CFG_B	✓	✓	✓

(57) Root Error Status (PCI_RC_ROOTES)

Access Size : 32 bits
Offset Address : <PCI0_base> + 6130h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	Fatal Error Message Received	Non-Fatal Error Message Received	First Uncorrectable Fatal	Multiple ERR_FATALNONFATAL Received	ERR_FATALNONFATAL Received	Multiple ERR_COR Received	ERR_COR Received
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	RW1	RW1	RW1	RW1	RW1	RW1	RW1

Bit	Bit Name	Initial Value	R/W	Description
31 to 7	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
6	Fatal Error Message Received	0h	RW1	Set when one or more ERR_FATAL is received.
5	Non-Fatal Error Message Received	0h	RW1	Set when one or more ERR_NON_FATAL is received.
4	First Uncorrectable Fatal	0h	RW1	Set when the first uncorrectable error is received and the error was ERR_FATAL.
3	Multiple ERR_FATALNONFATAL Received	0h	RW1	This means that ERR_FATAL or ERR_NON_FATAL was received while the ERR_FATAL/NONFATAL Received bit was already set.
2	ERR_FATALNONFATAL Received	0h	RW1	Indicates that ERR_FATAL or ERR_NON_FATAL was received with the ERR_FATAL/NONFATAL Received bit cleared.
1	Multiple ERR_COR Received	0h	RW1	It means that another ERR_COR was received while the ERR_COR Received bit was already set.
0	ERR_COR Received	0h	RW1	Indicates that ERR_COR was received with the ERR_COR Received bit cleared.

(60) Serial Number Register (Lower DW) (PCI_RC_SNL)

This register specifies the serial number of the device.

Access Size : 32 bits
Offset Address : <PCI0_base> + 6154h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PCI Express Device Serial Number(Lower DW)[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	Hwinit	Hwinit	Hwinit	Hwinit	Hwinit	Hwinit	Hwinit	Hwinit	Hwinit	Hwinit	Hwinit	Hwinit	Hwinit	Hwinit	Hwinit	Hwinit

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PCI Express Device Serial Number(Lower DW)[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	Hwinit	Hwinit	Hwinit	Hwinit	Hwinit	Hwinit	Hwinit	Hwinit	Hwinit	Hwinit	Hwinit	Hwinit	Hwinit	Hwinit	Hwinit	Hwinit

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	PCI Express Device Serial Number(Lower DW)[31:0]	0h	Hwinit	The lower 32 bits of the IEEE standard 64-bit unique ID (EUI-64). EUI-64 consists of a 24-bit company ID and a 40-bit vendor-defined extension.

Table 6.6-54 Valid Reset Signal

Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
15 to 9	-	0h	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
8 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
1	Link Equalization Request Interrupt Enable	0h	RW	Link Equalization Request Interrupt Enable When Set, this bit enables the generation of an interrupt to indicate that the Link Equalization 8.0 GT/s Request bit or the Link Equalization Request 16.0 GT/s bit has been set. This bit is RW for Downstream Ports and for Upstream Ports when Crosslink Supported is 1b. This bit is not applicable and is RsvdP for Upstream Ports when the Crosslink Supported bit is 0b. The default value for this bit is 0b. RC: Default 0b EP: Fixed to 0 because Crosslink is not supported
0	Perform Equalization	0h	RW	Perform Equalization When this bit is 1b and a 1b is written to the Retrain Link bit with the Target Link Speed field set to 8.0 GT/s or higher, the Downstream Port must perform Link Equalization. This bit is RW for Downstream Ports and for Upstream Ports when Crosslink Supported is 1b. This bit is not applicable and is RsvdP for Upstream Ports when the Crosslink Supported bit is 0b. The default value is 0b. RC: Default 0b EP: Fixed to 0 because Crosslink is not supported

R/W	R	Hwinit	Hwinit	Hwinit	Hwinit	Hwinit	Hwinit	Hwinit	R	Hwinit	Hwinit	Hwinit	Hwinit	Hwinit	Hwinit	Hwinit

Bit	Bit Name	Initial Value	R/W	Description
31	-	0h	R	Reserved Whenever it is read, undefined value is read. The written value will be ignored.
30 to 28	Upstream Port 8.0 GTs Receiver Preset Hint for Lane 1[2:0]	1h	Hwinit	The read value is undefined This field contains the Receiver Preset Hint value sent or received during Link Equalization. Usage of this field varies as follows: A: Downstream Port This field contains the value sent on the associated Lane during Link Equalization. This field is HwInit. B: Upstream Port, Crosslink Supported = 0b This field is intended for debug and diagnostics. It contains the value captured from the associated Lane during Link Equalization. Field is RO. Note: When crosslinks are supported, case C (below) applies and this captured information is not visible to software. Vendors are encouraged to provide an alternate mechanism to obtain this information. C: Upstream Port, Crosslink Supported = 1b This field is not used or affected by the current Link Equalization. The field value will be used if a future crosslink negotiation switches the Operating Port Direction so that case A (above) applies. This field is HwInit. The default value is 111b. RC: Default 111b EP: Input signal

Bit	Bit Name	Initial Value	R/W	Description
27 to 24	Upstream Port 8.0 GTs Transmitter Presetfor Lane 1[3:0]	1h	Hwinit	The read value is undefined This field contains the Transmit Preset value sent or received during Link Equalization. Usage of this field varies as follows: A: Downstream Port This field contains the value sent on the associated Lane during Link Equalization. This field is HwInit. B: Upstream Port, Crosslink Supported = 0b This field is intended for debug and diagnostics. It contains the value captured from the associated Lane during Link Equalization. This field is RO. Note: When crosslinks are supported, case C (below) applies and this captured information is not visible to software. Vendors are encouraged to provide an alternate mechanism to obtain this information. C: Upstream Port, Crosslink Supported = 1b This field is not used or affected by the current Link Equalization. The field value will be used if a future crosslink negotiation switches the Operating Port Direction so that case A (above) applies. This field is HwInit. The default value is 1111b. RC: Default 1111b EP: Input signal
23	-	0h	R	Reserved Whenever it is read, undefined value is read. The written value will be ignored.
22 to 20	Downstream Port 8.0 GTs Receiver Preset Hint for Lane 1[2:0]	1h	Hwinit	The read value is undefined Receiver Preset Hint may be used as a hint for receiver equalization by this Port when the Port is operating as a Downstream Port. This field is ignored when the Port is operating as an Upstream Port. For an Upstream Port if Crosslink Supported is 0b, this field is RsvdP. Otherwise, this field is HwInit. The default value is 111b. RC: Default 111b EP: Fixed to 0 because Crosslink is not supported
19 to 16	Downstream Port 8.0 GTs Transmitter Preset for Lane 1[3:0]	1h	Hwinit	The read value is undefined Transmitter Preset used for equalization by this Port when the Port is operating as a Downstream Port. This field is ignored when the Port is operating as an Upstream Port. For an Upstream Port if Crosslink Supported is 0b, this field is RsvdP. Otherwise, this field is HwInit. The default value is 1111b. RC: Default 1111b EP: Fixed to 0 because Crosslink is not supported
15	-	0h	R	Reserved Whenever it is read, undefined value is read. The written value will be ignored.

Bit	Bit Name	Initial Value	R/W	Description
14 to 12	Upstream Port 8.0 GTs Receiver Preset Hint for Lane 0[2:0]	1h	Hwinit	The read value is undefined This field contains the Receiver Preset Hint value sent or received during Link Equalization. Usage of this field varies as follows: A: Downstream Port This field contains the value sent on the associated Lane during Link Equalization. This field is HwInit. B: Upstream Port, Crosslink Supported = 0b This field is intended for debug and diagnostics. It contains the value captured from the associated Lane during Link Equalization. This field is RO. Note: When crosslinks are supported, case C (below) applies and this captured information is not visible to software. Vendors are encouraged to provide an alternate mechanism to obtain this information. C: Upstream Port, Crosslink Supported = 1b This field is not used or affected by the current Link Equalization. The field value will be used if a future crosslink negotiation switches the Operating Port Direction so that case A (above) applies. This field is HwInit. The default value is 111b. RC: Default 111b EP: Input signal
11 to 8	Upstream Port 8.0 GTs Transmitter Preset for Lane 0[3:0]	1h	Hwinit	The read value is undefined This field contains the Transmit Preset value sent or received during Link Equalization. Usage of this field varies as follows: A: Downstream Port This field contains the value sent on the associated Lane during Link Equalization. This field is HwInit. B: Upstream Port, Crosslink Supported = 0b This field is intended for debug and diagnostics. It contains the value captured from the associated Lane during Link Equalization. This field is RO. Note: When crosslinks are supported, case C (below) applies and this captured information is not visible to software. Vendors are encouraged to provide an alternate mechanism to obtain this information. C: Upstream Port, Crosslink Supported = 1b This field is not used or affected by the current Link Equalization. The field value will be used if a future crosslink negotiation switches the Operating Port Direction so that case A (above) applies. This field is HwInit. The default value is 1111b. RC: Default 1111b EP: Input signal
7	-	0h	R	Reserved Whenever it is read, undefined value is read. The written value will be ignored.
6 to 4	Downstream Port 8.0 GTs Receiver Preset Hint for Lane 0[2:0]	1h	Hwinit	The read value is undefined Receiver Preset Hint may be used as a hint for receiver equalization by this Port when the Port is operating as a Downstream Port. This field is ignored when the Port is operating as an Upstream Port. For an Upstream Port if Crosslink Supported is 0b, this field is RsvdP. Otherwise, this field is HwInit. The default value is 111b. RC: Default 111b EP: Fixed to 0 because Crosslink is not supported

Bit	Bit Name	Initial Value	R/W	Description
3 to 0	Downstream Port 8.0 GTs Transmitter Preset for Lane 0[3:0]	1h	Hwinit	The read value is undefined Transmitter Preset used for equalization by this Port when the Port is operating as a Downstream Port. This field is ignored when the Port is operating as an Upstream Port. For an Upstream Port if Crosslink Supported is 0b, this field is RsvdP. Otherwise, this field is Hwlnit. The default value is 1111b. RC: Default 1111b EP: Fixed to 0 because Crosslink is not supported

Table 6.6-59 Valid Reset Signal

Reset Signal	Upstream Port 8.0GT/s Receiver Preset Hint	Upstream Port 8.0GT/s Transmitter Preset	Downstream Port 8.0GT/s Receiver Preset Hint	Downstream Port 8.0GT/s Transmitter Preset	Upstream Port 8.0GT/s Receiver Preset Hint	Upstream Port 8.0GT/s Transmitter Preset

RST_RSM_B						
RST_CFG_B						

Reset Signal	Downstream Port 8.0GT/s Receiver Preset Hint	Downstream Port 8.0GT/s Transmitter Preset
RST_LOAD_B	✓	✓
RST_RSM_B		
RST_CFG_B		

6.6.4.2 Register Descriptions (Endpoint Mode)

The following lists the registers incorporated in the unit.

CAUTION

The results of access to reserved bit areas, debug bit areas, and undefined areas are not guaranteed. The combination of reserved, debug, and undefined areas includes cases where the initial values will be non-zero, and the results of changes to such values are not guaranteed.

The following is the outline of categories of the register space within this unit.

AXI Bridge Registers	Address 0000h-1FFCh
Physical Layer Control/Status Registers	Address 2000h-5FFCh
PCI Express Configuration Registers (Type0)	Address 6000h-6FFCh (Function #0)
PCI Express Configuration Registers (Type0)	Address 7000h-7FFCh (Function #1)

Access to the reserved spaces above is prohibited.

6.6.4.2.1 List of AXI Bridge Registers

Unless specifically stated otherwise, byte, word, and double word access are all possible.

Access to registers is possible from the AXI-bus side and the PCIe-bus side. Attributes may vary with the register and the direction of access. In the case of registers for which attributes vary, attributes in the higher parts of the cells in the R/W column are for access from the PCIe-bus side and those in the lower parts are for access from the AXI-bus side. However, the cells are not divided into higher and lower parts in cases where access does not vary with the side proceeding with access.

Register Name	Abbreviation	Initial Value	Offset Address	Access Size [bits]
Request Data Register 0	PCI_EP_REQDATA0	xxxx_xxxxh	0080h	32
Request Data Register 1	PCI_EP_REQDATA1	xxxx_xxxxh	0084h	32
Request Data Register 2	PCI_EP_REQDATA2	xxxx_xxxxh	0088h	32
Request Receive Data Register	PCI_EP_REQRCVDAT	xxxx_xxxxh	008Ch	32
Request Address Register 1	PCI_EP_REQADR1	xxxx_xxxxh	0090h	32
Request Address Register 2	PCI_EP_REQADR2	xxxx_xxxxh	0094h	32
Request Byte Enable Register	PCI_EP_REQBE	0000_000Fh	0098h	32
Request Issue Register	PCI_EP_REQISS	0000_0000h	009Ch	32
PCI INTx Out Status Register	PCI_EP_INTXOUTS	0000_0000h	0118h	32
Message Receive Interrupt Enable Register	PCI_EP_MSGRCVIE	0000_0000h	0120h	32
Message Receive Interrupt Status Register	PCI_EP_MSGRCVIS	0000_0000h	0124h	32

Header Log Register 3 (Function #n)	PCI_EP_HLOG3_Fn	0000_0000h	6128h	32
Device Serial Number Extended Capability Register (Function #n)	PCI_EP_DEVSNEXTC_Fn	1B01_0003h	6150h	32
Serial Number Register (Lower DW) (Function #n)	PCI_EP_SNL_Fn	0000_0000h	6154h	32
Serial Number Register (Higher DW) (Function #n)	PCI_EP_SNU_Fn	0000_0000h	6158h	32
Secondary PCI Express Extended Capability Header (Function #0)	PCI_EP_SPEECH_F0	0001_0019h	61B0h	32
Link Control 3 Register (Function #0)	PCI_EP_LINC3_F0	0000_0000h	61B4h	32
Lane Error Status Register (Function #0)	PCI_EP_LESTA_F0	0000_0000h	61B8h	32
Lane Equalization Control Register (Function #0)	PCI_EP_LEQCTL_F0	xx00_xx00h	61BCh	32

6.6.4.2.3 AXI Bridge Register Descriptions

The function of each register is described below.

Registers can be accessed from the AXI and PCIe. Depending on the register, attributes may vary with the direction of access. In the case of registers for which attributes vary, attributes in the higher parts of the cells in the R/W column are for access from the PCIe-bus side and those in the lower parts are for access from the AXI-bus side. However, the cells are not divided into higher and lower parts in cases where access does not vary with the side proceeding with access.

(1) Request Data Register m (PCI_EP_REQDATAm) (m = 0 to 2)

This register issues various requests. Write access to this register is only possible from AXI. In case of write access from PCIe, it returns a response and ends normally without writing data to this register. Read access is possible from both AXI and PCIe.

Access Size : 32 bits
Offset Address : <PCI0_base> + 0080h/ 84h/ 88h
Initial Value : xxxx_xxxxh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Request Data[31:16]															
Initial Value	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x
R/W(PCIe)	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
R/W(AXI)	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Request Data[15:0]															
Initial Value	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x
R/W(PCIe)	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
R/W(AXI)	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	Request Data[31:0]	xh	R (RW)	Issue various requests to PCIe

Note: x = Undefined

Table 6.6-60 Details of Each Requests

	Request Data Register 0	Request Data Register 1	Request Data Register 2
Zero-Length Read Request	Invalid	Invalid	Invalid
Message Request	3rd header	4th header	Invalid
Message Request with data payload	3rd header	4th header	Message data

Note: The bits should be set to 0 for the requests indicated as “Invalid”.

(2) Request Receive Data Register (PCI_EP_REQRCVDAT)

This register indicates the data read on reception of the completion response after issuing a read request.

Access Size : 32 bits
Offset Address : <PCI0_base> + 008Ch
Initial Value : xxxx_xxxxh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Request Receive Data[31:16]															
Initial Value	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Request Receive Data[15:0]															
Initial Value	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	Request Receive Data[31:0]	xh	R	After issuing a read request, the data read on reception of the completion response are set in these bits. However, these bits are invalid for Zero-Length Read and any kind of various write requests.

Note: x = Undefined

(3) Request Address Register 1 (PCI_EP_REQADR1)

This register issues requests. Write access to this register is only possible from AXI. In case of write access from PCIe, it returns a response and ends normally without writing data to this register. Read access is possible from both AXI and PCIe.

Access Size : 32 bits
Offset Address : <PCI0_base> + 0090h
Initial Value : xxxx_xxxxh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Request Address[31:16]															
Initial Value	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x
R/W(PCIe)	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
R/W(AXI)	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Request Address[15:0]															
Initial Value	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x
R/W(PCIe)	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
R/W(AXI)	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	Request Address[31:0]	xh	R (RW)	Set the Address, etc. when issuing a Request.

Note: x = Undefined

Table 6.6-61 Details of Each Requests

Request Address Register 1	[31:27]	[26:24]	[23:19]	[18:16]
Zero-Length Read Request	Address			
Message Request	Reserved	Routing Type	Reserved	Reserved
Message Request with data payload	Reserved	Routing Type	Reserved	Reserved

Request Address Register 1	[15:12]	[11:8]	[7:2]	[1:0]
Zero-Length Read Request	Address			Reserved
Message Request	Reserved	Reserved	Message Code	
Message Request with data payload	Reserved	Reserved	Message Code	

Note: The bits should be set to 0 for the requests indicated as “Reserved”.

(4) Request Address Register 2 (PCI_EP_REQADR2)

This register issues requests. Write access to this register is only possible from AXI. In case of write access from PCIe, it returns a response and ends normally without writing data to this register. Read access is possible from both AXI and PCIe.

Access Size : 32 bits
Offset Address : <PCI0_base> + 0094h
Initial Value : xxxx_xxxxh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Request Address63:32[31:16]															
Initial Value	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x
R/W(PCIe)	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
R/W(AXI)	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Request Address63:32[15:0]															
Initial Value	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x
R/W(PCIe)	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
R/W(AXI)	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	Request Address63:32 [31:0]	xh	R (RW)	Set the Address, etc. when issuing a Request.

Note: x = Undefined

Table 6.6-62 Details of Each Requests

	[31:0]
Zero-Length Read Request	Address
Message Request	Invalid
Message Request with data payload	Invalid

Note: The bits should be set to 0 for the requests indicated as “Invalid”.

(5) Request Byte Enable Register (PCI_EP_REQBE)

This register specifies the first byte enable bit within the TLP header (1st DW byte) when issuing a request to PCIe. Write access to this register is only possible from AXI. In case of write access from PCIe, it returns a response and ends normally without writing data to this register. Read access is possible from both AXI and PCIe.

Access Size : 32 bits
Offset Address : <PCI0_base> + 0098h
Initial Value : 0000_000Fh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W(PCIe)	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
R/W(AXI)	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	Request Byte Enable[3:0]			
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1	1
R/W(PCIe)	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
R/W(AXI)	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
3 to 0	Request Byte Enable[3:0]	Fh	R (RW)	Specify Byte Enable when issuing Cfg Request as required. Normally use 1111b. 1b: Byte Enable enabled 0b: Byte Enable disabled

Table 6.6-63 Details of Each Requests

	[3:0]
Zero-Length Read Request	0000b
Message Request	Invalid (1111b)
Message Request with data payload	Invalid (1111b)

(6) Request Issue Register (PCI_EP_REQISS)

This register issues a request to PCIe. Write access to this register is only possible from AXI. In case of write access from PCIe, it returns a response and ends normally without writing data to this register. Read access is possible from both AXI and PCIe.

Access Size : 32 bits
Offset Address : <PCI0_base> + 009Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	FUNC[2:0]			TR TYPE[3:0]				-	-	-	-	-	-	-	Request Issue
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W(PCIe)	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
R/W(AXI)	R	RW	RW	RW	RW	RW	RW	RW	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 23	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
22	Request Rejection	0h	R	Indicates that the stopped or hibernated state of the PCI Express transmit (TX) side was detected and the process was forcibly terminated. 0b: Normal state (Request issued) 1b: Rejection
21	MOR CD PERR	0h	R	It is set to 1 when a data error occurs in the Completion TLP for the Non-Posted request issued by this register. Normally not used. It is not updated at the time of Posted request.
20	MOR CH PERR	0h	R	It is set to 1 when a header error occurs in the Completion TLP for the Non-Posted request issued by this register. Normally not used. It is not updated at the time of Posted request.
19	MOR EP ERR	0h	R	It is set to 1 when a Poisoned Completion TLP for a Non-Posted request issued by this register is received. Normally not used. It is not updated at the time of Posted request.
18 to 16	MOR STATUS[2:0]	0h	R	This register retains the MOR Status of Completion TLP for Non-Posted requests issued. It is not updated at the time of Posted request. 000b: Successful Completion (SC) 001b: Unsupported Request (UR) 010b: Configuration Request Retry Status (CRS) (not supported) 011b: Completion Timeout 100b: Completer Abort (CA) 101b: Unexpected Completion and mismatched type (Lock Completion responds to non-Lock Request) 110b: Reserved 111b: Overrun Completion length
15	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
14 to 12	FUNC[2:0]	0h	R (RW)	Set the function of Request.

Bit	Bit Name	Initial Value	R/W	Description
11 to 8	TR TYPE[3:0]	0h	R (RW)	Sets the type of Request. Refer to **Table 6.6-64** for details.
7 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
0	Request Issue	0h	R (RW)	When writing: 1b: Request issuance 0b: No operation When reading: 1b: Processing Request (Indicates that the issued Request is being processed.) 0b: Request can be accepted (Indicates that the processing of the issued Request has ended.)

Table 6.6-64 Details of Each Requests

	TR Type		Device Type	
	[11:8]	Posted/Non-Posted	Root Complex	Endpoint
Zero-Length Read Request	0000b (0h)	Non-posted	Issuable	Issuable
Configuration Read Type0	0100b (4h)	Non-posted	Issuable	Issuing prohibited
Configuration Write Type0	0101b (5h)	Non-posted	Issuable	Issuing prohibited
Configuration Read Type1	0110b (6h)	Non-posted	Issuable	Issuing prohibited
Configuration Write Type1	0111b (7h)	Non-posted	Issuable	Issuing prohibited
Message Request	1000b (8h)	Posted	Issuable	Issuable
Message Request with data payload	1001b (9h)	Posted	Issuable	Issuable
	Others	—	Issuing prohibited	Issuing prohibited

(7) PCI INTx Out Status Register (PCI_EP_INTXOUTS)

This register can confirm the PCI INTx status issued by the unit with the interrupt input signal (INTX_EP_F*: active high). In addition, the value of this register is not reflected if the INTx message is asserted or deasserted by issuing a special request (prohibited operation). This register is only valid in endpoint mode.

Access Size : 32 bits
Offset Address : <PCI0_base> + 0118h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	INTD Status	INTC Status	INTB Status	INTA Status
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
3	INTD Status	0h	R	It is set by sending an Assert INTD Message and cleared by sending a Deassert INTD Message. 0b: Deassert 1b: Assert
2	INTC Status	0h	R	It is set by sending an Assert INTC Message and cleared by sending a Deassert INTC Message. 0b: Deassert 1b: Assert
1	INTB Status	0h	R	It is set by sending an Assert INTB Message and cleared by sending a Deassert INTB Message. 0b: Deassert 1b: Assert
0	INTA Status	0h	R	It is set by sending an Assert INTA Message and cleared by sending a Deassert INTA Message. 0b: Deassert 1b: Assert

(8) Message Receive Interrupt Enable Register (PCI_EP_MSGRCVIE)

This register controls enabling of MSG_INT in response to the reception of message requests other than INTx and error-related messages.

Access Size : 32 bits
Offset Address : <PCI0_base> + 0120h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	Message Receive Interrupt Enable	-	-	-	-	PM_Active_State_Nak Receive Interrupt Enable	-	PME_Turn_Off Receive Interrupt Enable	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	RW	R	R	R	R	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
24	Message Receive Interrupt Enable	0h	RW	Enable control of MSG_INT assertion by message reception 0b: Disable 1b: Enable
23 to 20	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
19	PM_Active_State_Nak Receive Interrupt Enable	0h	RW	Enable control of MSG_INT assertion by PM_Active_State_Nak reception 0b: Disable 1b: Enable
18	-	0h	RW	Reserved These bits are read as 0b. The write value should always be 0b.
17	PME_Turn_Off Receive Interrupt Enable	0h	RW	Enable control of MSG_INT assertion by PME_Turn_Off reception 0b: Disable 1b: Enable
16	-	0h	RW	Reserved These bits are read as 0b. The write value should always be 0b.
15 to 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

(9) Message Receive Interrupt Status Register (PCI_EP_MSGRCVIS)

This register is a status register that indicates the reception of message requests other than INTx and error-related messages. The value of this register is reflected in MSG_INT. Only the message code is used to decide the message type, and the corresponding message is assumed to have been received while the validity of the routing and the validity of the Msg/MsgD selection are not verified.

Access Size : 32 bits
Offset Address : <PCI0_base> + 0124h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	Message Receive Interrupt	-	-	-	-	PM_Active_State_Nak Receive Interrupt	-	PME_Turn_Off Receive Interrupt	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	RW1	R	R	R	R	RW1	RW1	RW1	RW1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
24	Message Receive Interrupt	0h	RW1	Set when receiving a message (does not depend on the type of message)
23 to 20	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
19	PM_Active_State_Nak Receive Interrupt	0h	RW1	Disabled due to RC
18	-	0h	RW1	Reserved These bits are read as 0b. The write value should always be 0b.
17	PME_Turn_Off Receive Interrupt	0h	RW1	Disabled due to RC
16	-	0h	RW1	Reserved These bits are read as 0b. The write value should always be 0b.
15 to 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

(10) Message Code Register (PCI_EP_MSGCODE)

This register stores the code and routing of the last received message.

Access Size : 32 bits
Offset Address : <PCI0_base> + 0130h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Message Code[7:0]								Routing[2:0]			-	-	-	-	Message Payload
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
15 to 8	Message Code[7:0]	0h	R	Stores the Code of the last received Message.
7 to 5	Routing[2:0]	0h	R	Stores the Routing of the last received Message.
4 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
0	Message Payload	0h	R	Stores the presence or absence of the data payload of the last received Message. 1b: MsgD (with Payload) 0b: Msg (Without Payload) When Power Management Message (PME_TO_Ack Message, PME_Turn_Off Message, PM_PME Message, PM_Active_State_Nak Message) is received, this register is not written.

(11) Message Data Register (PCI_EP_MSGDATA)

This register stores the data of the last received message.

Access Size : 32 bits
Offset Address : <PCI0_base> + 0134h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Message Data[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Message Data[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	Message Data[31:0]	0h	R	Stores the 1DW data of the last received Message. It is updated only when MsgD(with Data) is received, and the previous value is retained when Msg(without Data) is received. When Power Management Message (PME_TO_Ack Message, PME_Turn_Off Message, PM_PME Message, PM_Active_State_Nak Message) is received, this register is not written.

(12) Message Header 3rdDW Register (PCI_EP_MSGH3DW)

This register stores the header (3rd DW) of the last received message.

Access Size : 32 bits
Offset Address : <PCI0_base> + 0138h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Message Header 3rdDW[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Message Header 3rdDW[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	Message Header 3rdDW[31:0]	0h	R	Stores the Header (3rdDW) of the last received Message.

Note: When a Power Management message (PME_TO_Ack Message, PME_Turn_Off Message, PM_PME Message, PM_Active_State_Nak Message) is received, this register is not written.

(13) Message Header 4thDW Register (PCI_EP_MSGH4DW)

This register stores the header (4th DW) of the last received message.

Access Size : 32 bits
Offset Address : <PCI0_base> + 013Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Message Header 4thDW Registers[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Message Header 4thDW Registers[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	Message Header 4thDW Registers[31:0]	0h	R	Stores the Header (4thDW) of the last received Message.

Note: When a Power Management message (PME_TO_Ack Message, PME_Turn_Off Message, PM_PME Message, PM_Active_State_Nak Message) is received, this register is not written.

(14) Interrupt Table Register (PCI_EP_INTTABLE)

This register is an index of interrupt factors. The interrupt signal (active high) status of each category can be monitored in a list.

Access Size : 32 bits
Offset Address : <PCI0_base> + 0140h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DMA_INT[7:0]								-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	AXI_ERR_IN	PCIE_EVT_INT	MSG_INT	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	DMA_INT[7:0]	0h	R	DMA_INT interrupt signal monitor
23 to 11	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
10	AXI_ERR_IN	0h	R	Error interrupt signal monitor
9	PCIE_EVT_INT	0h	R	Event interrupt signal monitor
8	MSG_INT	0h	R	Message interrupt signal monitor
7 to 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

(15) PCIe Event Interrupt Enable 0 Register (PCI_EP_PEIE0)

This register enables interrupts of each PCI Express event factors. This register enables writing to the PCIe Event Interrupt Status 0 Register (address: <PCI_S0_REG_base> + 0204h).

Access Size : 32 bits
Offset Address : <PCI0_base> + 0200h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	UI_LINK_WIDTH_CHANGE_DONE EN	UI_LINK_SPEED_CHANGE_DONE EN	Request Done EN	-	-	AXI_PERR_EN	CA EN	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	RW	RW	RW	R	R	RW	RW	RW	RW	R	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	BME PERR EN	-	-	RX_DLLP_PM_ENTER_L23 EN	-	ASPM L1 Rejected EN	DL_Up Down EN	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
30	UI_LINK_WIDTH_CHANGE_DONE EN	0h	RW	Up/Down Configure operation complete interrupt enable 0b: Disable 1b: Enable
29	UI_LINK_SPEED_CHANGE_DONE EN	0h	RW	Speed change operation completion interrupt enable 0b: Disable 1b: Enable
28	Request Done EN	0h	RW	Request complete interrupt enable 0b: Disable 1b: Enable
27, 26	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
25	AXI_PERR_EN	0h	RW	Enable AXIM RAM parity error interrupt 0b: Disable 1b: Enable
24	CA EN	0h	RW	CA (Completer Abort) interrupt enable 0b: Disable 1b: Enable
23, 22	-	All 0	RW	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
21	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
20 to 16	-	All 0	RW	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
15	BME PERR EN	0h	RW	Enable BME Parity Error interrupt. 0b: Disable 1b: Enable (Note: Parity Error in AXI bridge internal RAM)
14, 13	-	All 0	RW	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
12	RX_DLLP_PM_ENTER_L23 EN	0h	RW	RX_DLLP_PM_ENTER_L23 interrupt enable 0b: Disable 1b: Enable
11	-	0h	RW	Reserved Whenever it is read, 0b is read. The write value should always be 0b.

Bit	Bit Name	Initial Value	R/W	Description
10	ASPM L1 Rejected EN	0h	RW	ASPM L1 Rejected interrupt enable Do not use this bit in Endpoint mode. 0b: Disable 1b: Enable
9	DL_UpDown EN	0h	RW	Interrupt enable on DL state change 0b: Disable 1b: Enable
8 to 4	-	All 0	RW	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
3 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
0	-	All 0	RW	Reserved Whenever it is read, 0b is read. The write value should always be 0b.

(16) PCIe Event Interrupt Status 0 Register (PCI_EP_PEIS0)

This register is a status register to indicate interrupts of each PCI Express event factors. Set to 1b by the factor in the table. After checking the factor, write 1b to the corresponding bit to clear it.

Access Size : 32 bits
Offset Address : <PCI0_base> + 0204h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	UI_LINK_WIDTH_CHANGE_DONE	UI_LINK_SPEED_CHANGE_DONE	Request Done	-	-	AXIM PERR	CA	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	RW1	RW1	RW1	R	R	RW1	RW1	RW1	RW1	R	RW1	RW1	RW1	RW1	RW1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	BME_PERR	-	-	RX_DLLP_PM_ENTER_L23	-	ASPM L1 Rejected	DL_Up Down	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW1	RW1	RW1	RW1	RW1	RW1	RW1	RW1	RW1	RW1	RW1	RW1	R	R	R	RW1

Bit	Bit Name	Initial Value	R/W	Description
31	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
30	UI_LINK_WIDTH_CHANGE_DONE	0h	RW1	Indicates completion of Up/Down Configure operation.
29	UI_LINK_SPEED_CHANGE_DONE	0h	RW1	Indicates completion of Speed Change operation.
28	Request Done	0h	RW1	For requests submitted in the Request Issue Registers (Offset: 9Ch): Non-Posted: Indicates that Completion has been received. Posted: Indicates that the request submission has completed.
27, 26	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
25	AXIM PERR	0h	RW1	Indicates that a parity error has occurred in the AXIM RAM. (Note: Parity Error in AXI bridge internal RAM)
24	CA	0h	RW1	Indicates that the device has responded with CA (Completer Abort).
23, 22	-	All 0	RW1	Reserved The write value should be 1b.
21	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
20 to 16	-	All 0	RW1	Reserved The write value should be 1b.
15	BME_PERR	0h	RW1	Indicates that a parity error has occurred in the BME RAM.
14, 13	-	All 0	RW1	Reserved These bits are read as 0b. The write value should always be 0b.
12	RX_DLLP_PM_ENTER_L23	0h	RW1	Indicates transition to L2/L3 State in Power Management control.
11	-	0h	RW1	Reserved These bits are read as 0b. The write value should always be 0b.
10	ASPM L1 Rejected	0h	RW1	It is recommended not to use (permit) in Endpoint mode.
9	DL_UpDown	0h	RW1	Set to 1b on transition from DL_Down state to DL_Up state, or DL_Up state to DL_Down state. Check the DL_Down/DL_Up status with PCIe Core Status 1 Registers (Offset: 408h).
8 to 4	-	All 0	RW1	Reserved The write value should be 1b.

Bit	Bit Name	Initial Value	R/W	Description
3 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
0	-	0h	RW1	Reserved These bits are read as 0b. The write value should always be 0b.

(17) PCIe Event Interrupt Enable 1 Register (PCI_EP_PEIE1)

This register enables parity error and ECC error interrupts. When each bit is set to the valid setting, the value of each corresponding status bit of the PCIe Event Interrupt Status 1 register (address: <PCI_S0_REG_base> + 020Ch) becomes valid.

Access Size : 32 bits
Offset Address : <PCI0_base> + 0208h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	TXB_PARITY_ERR EN	ERR_RPC_REPLAYFIFO_PERR EN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	ERR_REPLAY_UPPER_CORRECTABLE_ERROR EN	ERR_REPLAY_LOWER_CORRECTABLE_ERROR EN	-	-	-	-	-	-	ERR_REPLAY_UPPER_UNCORRECTABLE_ERROR EN	ERR_REPLAY_LOWER_UNCORRECTABLE_ERROR EN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	RW	RW	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
17	TXB_PARITY_ERR EN	0h	RW	Enable the TXB_PARITY_ERR interrupt. Parity error interrupt notification enable setting for TX Buffer installed in Transaction Layer 0b: Disable 1b: Enable
16	ERR_RPC_REPLAYFIFO_PERR EN	0h	RW	Enable ERR_RPC_REPLAYFIFO_PERR interrupts. Parity error interrupt notification enable setting for Replay FIFO installed in Data Link Layer 0b: Disable 1b: Enable
15 to 10	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
9	ERR_REPLAY_UPPER_CORRECTABLE_ERROR EN	0h	RW	Enable ERR_REPLAY_UPPER_CORRECTABLE_ERROR interrupts. Interrupt notification enable setting when an ECC 1-bit error (Correctable Error) occurs in the upper 64-bit data bus of the Replay FIFO installed in the Data Link Layer 0b: Disable 1b: Enable
8	ERR_REPLAY_LOWER_CORRECTABLE_ERROR EN	0h	RW	Enable ERR_REPLAY_LOWER_CORRECTABLE_ERROR interrupts. Interrupt notification enable setting when an ECC 1-bit error (Correctable Error) occurs in the lower 64-bit data bus of the Replay FIFO installed in the Data Link Layer 0b: Disable 1b: Enable
7 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
1	ERR_REPLAY_UPPER_UNCORRECTABLE_ERROR EN	0h	RW	Enable ERR_REPLAY_UPPER_UNCORRECTABLE_ERROR interrupts. Interrupt notification enable setting when an ECC 2-bit or more error (Uncorrectable Error) occurs in the upper 64-bit data bus of the Replay FIFO installed in the Data Link Layer 0b: Disable 1b: Enable

Bit	Bit Name	Initial Value	R/W	Description
0	ERR_REPLAY_LOWER_UNCORRECTABLE_ERROR EN	0h	RW	Enable ERR_REPLAY_LOWER_UNCORRECTABLE_ERROR interrupts. Interrupt notification enable setting when an ECC 2-bit or more error (Uncorrectable Error) occurs in the lower 64-bit data bus of the Replay FIFO installed in the Data Link Layer 0b: Disable 1b: Enable

(18) PCIe Event Interrupt Status 1 Register (PCI_EP_PEIS1)

This register is a status register that indicates parity error and ECC error interrupts. After checking the factor, write 1b to the corresponding bit to clear it.

Access Size : 32 bits
Offset Address : <PCI0_base> + 020Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	TXB_PARITY_ERR	ERR_RPC_REPLAYFIFO_PERR
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW1	RW1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	ERR_REPLAY_UPPER_CORRECTABLE_ERROR	ERR_REPLAY_LOWER_CORRECTABLE_ERROR	-	-	-	-	-	-	ERR_REPLAY_UPPER_UNCORRECTABLE_ERROR	ERR_REPLAY_LOWER_UNCORRECTABLE_ERROR
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	RW1	RW1	R	R	R	R	R	R	RW1	RW1

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
17	TXB_PARITY_ERR	0h	RW1	TXB_PARITY_ERR interrupt Parity error interrupt notification of TX Buffer installed in Transaction Layer
16	ERR_RPC_REPLAYFIFO_PERR	0h	RW1	ERR_RPC_REPLAYFIFO_PERR interrupt Parity error interrupt notification of Replay FIFO installed in Data Link Layer
15 to 10	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
9	ERR_REPLAY_UPPER_CORRECTABLE_ERROR	0h	RW1	ERR_REPLAY_UPPER_CORRECTABLE_ERROR interrupt Interrupt notification when an ECC 1-bit error (Correctable Error) occurs in the upper 64-bit data bus of the Replay FIFO installed in the Data Link Layer
8	ERR_REPLAY_LOWER_CORRECTABLE_ERROR	0h	RW1	ERR_REPLAY_LOWER_CORRECTABLE_ERROR interrupt Interrupt notification when an ECC 1-bit error (Correctable Error) occurs in the lower 64-bit data bus of the Replay FIFO installed in the Data Link Layer
7 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
1	ERR_REPLAY_UPPER_UNCORRECTABLE_ERROR	0h	RW1	ERR_REPLAY_UPPER_UNCORRECTABLE_ERROR interrupt Interrupt notification when an ECC 2-bit or more error (Uncorrectable Error) occurs in the upper 64-bit data bus of the Replay FIFO installed in the Data Link Layer
0	ERR_REPLAY_LOWER_UNCORRECTABLE_ERROR	0h	RW1	ERR_REPLAY_LOWER_UNCORRECTABLE_ERROR interrupt Interrupt notification when an ECC 2-bit or more error (Uncorrectable Error) occurs in the lower 64-bit data bus of the Replay FIFO installed in the Data Link Layer

(19) AXI Master Error Interrupt Enable Register (PCI_EP_AMEIE)

This register enables the AXI master error interrupt.

Access Size : 32 bits
Offset Address : <PCI0_base> + 0210h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	Write MSTERR INT EN[3:0]				-	-	-	-	Read MSTERR INT EN[3:0]			
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	RW	RW	RW	RW	R	R	R	R	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
11 to 8	Write MSTERR INT EN[3:0]	0h	RW	Write MSTERR INT Enable Each corresponding bit can be turned on/off individually. 0b: Disable 1b: Enable
7 to 4	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
3 to 0	Read MSTERR INT EN[3:0]	0h	RW	Read MSTERR INT Enable Each corresponding bit can be turned on/off individually. 0b: Disable 1b: Enable

(20) AXI Master Error Interrupt Status Register (PCI_EP_AMEIS)

This register indicates the AXI master error interrupt status.

Access Size : 32 bits
Offset Address : <PCI0_base> + 0214h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	Write ERR ID[3:0]				-	-	-	-	Read ERR ID[3:0]			
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	Write MSTERR INT[3:0]				-	-	-	-	Read MSTERR INT[3:0]			
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	RW1	RW1	RW1	RW1	R	R	R	R	RW1	RW1	RW1	RW1

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
27 to 24	Write ERR ID[3:0]	0h	R	Save the ID of the first DECERR/SLVERR received. When bits [11:8] are is cleared, a new error ID can be saved. 0h: normal access
23 to 20	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
19 to 16	Read ERR ID[3:0]	0h	R	Save the ID of the first DECERR/SLVERR received. A new error ID can be saved when bits [3:0] are cleared. 0h: normal access
15 to 12	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
11 to 8	Write MSTERR INT[3:0]	0h	RW1	Indicates that an error was detected in the AXI Master Port. Only the first detected error is saved, and when bits [11:8] are cleared, a new error can be saved. bit11: length error When the length of the data sent by the TEF and the data channel do not match. bit10: ID mismatch When the MBID value received on the MAWID response channel is different. bit9: When DECERR is received bit8: When SLVERR is received
7 to 4	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
3 to 0	Read MSTERR INT[3:0]	0h	RW1	Indicates that an error was detected in the AXI Master Port. Only the first detected error is saved, and when bits [3:0] are cleared, a new error can be saved. bit3: length error When the length of the data received on the TER and the data channel do not match. bit2: ID mismatch When the MARID and MRID values received on the data channel are different. bit1: When DECERR is received bit0: When SLVERR is received

(21) AXI Slave Error Interrupt Enable 1 Register (PCI_EP_ASEIE1)

This register enables the AXI slave error interrupt.

Access Size : 32 bits
Offset Address : <PCI0_base> + 0220h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	Write SLVERR INT EN[3:0]				-	-	-	-	-	-	Read SLVERR INT EN[1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	RW	RW	RW	RW	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
11 to 8	Write SLVERR INT EN[3:0]	0h	RW	Enable Write SLVERR INT. Each corresponding bit can be turned on/off individually. 0b: Disable 1b: Enable
7 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
1, 0	Read SLVERR INT EN[1:0]	0h	RW	Enable Read SLVERR INT. Each corresponding bit can be turned on/off individually. 0b: Disable 1b: Enable

(22) AXI Slave Error Interrupt Status 1 Register (PCI_EP_ASEIS1)

This register indicates the AXI slave error interrupt status.

Access Size : 32 bits
Offset Address : <PCI0_base> + 0224h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	Write SLVERR INT[3:0]				-	-	-	-	-	-	Read SLVERR INT[1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	RW1	RW1	RW1	RW1	R	R	R	R	R	R	RW1	RW1

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
11 to 8	Write SLVERR INT[3:0]	0h	RW1	Indicates that an unrecoverable error was detected in the AXI Slave Port. (Transaction response will be SLVERR.) bit11: burst length error When the SAWLEN and the burst length of the data received on the data channel do not match. bit10: ID mismatch When the SAWID and SWID values received on the data channel are different. bit9: Burst type disabled When SAWBURST is b11 (undefined). When SAWBURST is b10 (wrapping) and burst length is other than 2, 4, 8, or 16. bit8: data size invalid When SAWSIZE is between b100 and b111 (Exceeding the AXI Bus width is not supported). Each bit means: 0b: No error detected 1b: error detection
7 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
1, 0	Read SLVERR INT[1:0]	0h	RW1	Indicates that an unrecoverable error was detected in the AXI Slave Port. (Transaction response will be SLVERR.) bit1b: Burst type disabled When SARBURST is b11 (undefined). When SARBURST is b10 (wrapping) and burst length is other than 2, 4, 8, or 16. bit0b: Data size invalid When SARSIZE is between b100 and b111 (exceeding the AXI Bus width is not supported). Each bit means: 0b: No error detected 1b: error detection

(23) AXI Slave Error Interrupt Status 3 Register (PCI_EP_ASEIS3)

This register indicates the AXI slave error interrupt status.

Access Size : 32 bits
Offset Address : <PCI0_base> + 0230h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ERR ID[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ERR ID[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	ERR ID[31:0]	0h	R	Save the ID when the first error occurred in the AXI Slave Error Interrupt Status1 register (Offset 224h). Only the first detected error is saved, and when bits [11:8] and bits [1:0] of the AXI Slave Error Interrupt Status1 register are all cleared, a new error ID can be saved.

(24) PCIe Event Interrupt Enable 2 Register (PCI_EP_PEIE2)

This register enables interrupts of the various PCI Express event factors. This register enables writing to the PCIe Event Interrupt Status 2 Register (address: <PCI_S0_REG_base> + 0244h).

Access Size : 32 bits
Offset Address : <PCI0_base> + 0240h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	LTR_MECHANISM_EN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	D3_hot_err_EN[7:0]								CFG_POWER_STATE_EN[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
16	LTR_MECHANISM_EN	0h	RW	Interrupt enable for the ability to detect changes in CFG_LTR_MECHANISM
15 to 8	D3_hot_err_EN[7:0]	0h	RW	When Completion is in Pending state (ORT_TRANSACTION_PENDING=1), transition to D3hot state (CFG_POWERSTATE!=0) or receive PME_TURN_OFF Message, detect the state when D3_EVENT_ACK/TURN_OFF_EVENT_ACK is asserted Interrupt enable for D3_hot_err status detection Bits [15:10] are not used. The lower 2 bits correspond to each function.
7 to 0	CFG_POWER_STATE_EN[7:0]	0h	RW	D_STATE_OUT_Fx(x=Function no.) Interrupt enable bits [7:2] of the function to detect pin change are not used. The lower 2 bits correspond to each function.

(25) PCIe Event Interrupt Status 2 Register (PCI_EP_PEIS2)

This register indicates the state of various PCI Express events.

Access Size : 32 bits
Offset Address : <PCI0_base> + 0244h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	LTR_MECHANISM
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	D3_hot_err[7:0]								CFG_POWER_STATE[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW1	RW1	RW1	RW1	RW1	RW1	RW1	RW1	RW1	RW1	RW1	RW1	RW1	RW1	RW1	RW1

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
16	LTR_MECHANISM	0h	RW1	Status to detect and notify changes in CFG_LTR_MECHANISM
15 to 8	D3_hot_err[7:0]	0h	RW1	Status that detects and notifies the state when D3_EVENT_ACK/TURN_OFF_EVENT_ACK is asserted when transition to D3hot state (CFG_POWERSTATE!=0) or PME_TURN_OFF Message is received in Completion Pending state (ORT_TRANSACTION_PENDING=1) Bit[15:10] are not used. Lower 2bit corresponds to each function.
7 to 0	CFG_POWER_STATE[7:0]	0h	RW1	D_STATE_OUT_Fx(x=Function no.) Status to notify pin change detection Bits [7:2] are not used. The lower 2 bits correspond to each function.

(26) Permission Register (PCI_EP_PERM)

Access Size : 32 bits
Offset Address : <PCI0_base> + 0300h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	PIPE PHY Register Enable	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
2	-	0h	RW	Reserved These bits are read as 0b. The write value should always be 0b.
1	PIPE PHY Register Enable	0h	RW	Access permission signal for Physical Layer Control/Status Registers. 0b: Disable register access in PIPE PHY space. 1b: Enable register access in PIPE PHY space.
0	-	0h	RW	Reserved These bits are read as 0b. The write value should always be 0b.

(27) Reset Register (PCI_EP_RESET)

This register resets the PCIe core. Supplied to the internal core by OR with the pin of the same name. For details of each pin, see the terminal information. The write value is saved when accessed from the AXI, but a low-level pulse is generated when the PCIe writes 0b. However, when the AXI has already written 0b, the signal remains at the low level. Writing 1b from the PCIe is ignored.

Access Size : 32 bits
Offset Address : <PCI0_base> + 0310h
Initial Value : 0000_00xxh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	force to D0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	RST_PREG_B	RST_OUT_B	RST_PS_B	RST_LOAD_B	RST_CFG_B	RST_RSM_B	RST_GP_B	RST_B
Initial Value	0	0	0	0	0	0	0	0	x	x	x	x	x	x	x	x
R/W	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
16	force to D0	0h	RW	After sending PME_TO_Ack, force PM Control to transition to D0 State. Auto-cleared when PM Control transitions to D0. This bit is normally prohibited as it can create inconsistencies with the power state of the entire system. 0b: No operation 1b: Transition to D0
15 to 12	-	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
11 to 8	-	All 0	RW	Reserved These bits are read as 0b. The write value should always be 0b.
7	RST_PREG_B	xh	RW	Not used in this macro. The setting value does not affect macro behavior. 0b: reset 1b: normal operation
6	RST_OUT_B	xh	RW	RST_OUT_B output 0b: reset 1b: normal operation
5	RST_PS_B	xh	RW	Reset to the PCI Express core part (PCLK domain) inside the macro 0b: reset 1b: normal operation
4	RST_LOAD_B	xh	RW	Reset to Configuration Register Reset to bits not initialized by RST_CFG_B. 0b: reset 1b: normal operation
3	RST_CFG_B	xh	RW	Reset to Configuration Register 0b: Reset 1b: normal operation
2	RST_RSM_B	xh	RW	POWERGOOD reset of AUX Power (AUX not supported) Reset to Sticky register. 0b: reset 1b: normal operation
1	RST_GP_B	xh	RW	Reset to the PCI Express core part (ACLK domain) inside the macro 0b: reset 1b: normal operation
0	RST_B	xh	RW	Reset to PCI Express core part inside macro 0b: reset 1b: normal operation

Note: x = Undefined

(28) Mode Set 0 Register (PCI_EP_MSET0)

This register sets AXI mode.

Access Size : 32 bits
Offset Address : <PCI0_base> + 0314h
Initial Value : 2001_2000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	AWPROT[2:0]			AWCACHE_L[3:0]				-	-	AWLOCK[1:0]		AWCACHE_D[3:0]			
Initial Value	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	RW	RW	RW	RW	RW	RW	RW	R	R	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	ARPROT[2:0]			-	-	-	-	-	-	ARLOCK[1:0]		ARCACHE[3:0]			
Initial Value	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	RW	RW	RW	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
30 to 28	AWPROT[2:0]	2h	RW	Sets the protection type for PCIe→AXI transactions. This bit indicates whether the transaction's protection level is Normal, Privileged, or Secure, and whether the transaction is a data or instruction access. Bit[2] 1b: instruction access 0b: data access Bit[1] 1b: non-secure access 0b: secure access Bit[0] 1b: privileged access 0b: normal access
27 to 24	AWCACHE_L [3:0]	0h	RW	Indicates the value of MAWCACHE[3:0] to be issued to AXI. This setting is prohibited when issuing an AXI request containing the last byte. Recommended value is 0000b. Bit[3] 1b: write allocatable 0b: not write allocatable Bit[2] 1b: read assignable 0b: not read assignable Bit[1] 1b: cacheable 0b: non-cacheable Bit[0] 1b: bufferable 0b: not bufferable Note: When issuing an MSI, the setting of bit 0 is ignored and buffering is forcibly disabled (MAWCACHE[0] = 0).
23, 22	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
21, 20	AWLOCK[1:0]	0h	RW	Lock type for PCIe-to-AXI transactions. This signal provides information about the atomic nature of the transfer. 00b: normal access, 01b: exclusive access, 10b: locked access, 11b: reserved
19 to 16	AWCACHE_D [3:0]	1h	RW	Indicates the value of MAWCACHE[3:0] to be issued to AXI. This setting is output when issuing an AXI request other than the output condition of AWCACHE_L. Recommended value is 0001b. Bit[3] 1b: write allocatable 0b: not write allocatable Bit[2] 1b: read assignable 0b: not read assignable Bit[1] 1b: cacheable 0b: non-cacheable Bit[0] 1b: bufferable 0b: not bufferable
15	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
14 to 12	ARPROT[2:0]	2h	RW	Sets the protection type for PCIe→AXI transactions. This bit indicates whether the transaction's protection level is Normal, Privileged, or Secure, and whether the transaction is a data or instruction access. Bit[2] 1b: instruction access 0b: data access Bit[1] 1b: non-secure access 0b: secure access Bit[0] 1b: privileged access 0b: normal access
11 to 6	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
5, 4	ARLOCK[1:0]	0h	RW	Lock type for PCIe-to-AXI transactions. This bit provides information about the atomic nature of the transfer. 00b: normal access, 01b: exclusive access, 10b: locked access, 11b: reserved

Bit	Bit Name	Initial Value	R/W	Description
3 to 0	ARCACHE[3:0]	0h	RW	Cache type for PCIe-to-AXI transactions. These bits specify “bufferable”, “cacheable”, “write-through”, “write-back”, or “allocation” as the attribute of the transaction.

(29) Mode Set 1 Register (PCI_EP_MSET1)

This register sets AXI mode.

Access Size : 32 bits
Offset Address : <PCI0_base> + 0318h
Initial Value : 0000_33F2h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	AXI Max Issue Write[3:0]				AXI Max Issue Read[3:0]				AXI Master Max Burst[3:0]				-	-	RAM Parity Enable	PCIe Request Order
Initial Value	0	0	1	1	0	0	1	1	1	1	1	1	0	0	1	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
15 to 12	AXI Max Issue Write[3:0]	3h	RW	Set the number of writes that can be issued by AXI Master. Set within the range allowed by Interconnect. 0h: possible number 1 1h: possible number 2 : Fh: Possible number 16
11 to 8	AXI Max Issue Read[3:0]	3h	RW	Set the number of read issues that can be issued by AXI Master. Set within the range allowed by Interconnect. 0h: possible number 1 1h: possible number 2 : Fh: Possible number 16
7 to 4	AXI Master Max Burst[3:0]	Fh	RW	Sets the maximum burst length as an AXI Master operation.
3, 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
1	RAM Parity Enable	1h	RW	Sets whether or not to check the parity of the internal SRAM. The default value is Enable, but it is ignored by non-Parity macros. 0b: RAM parity check disabled 1b: RAM parity check enabled
0	PCIe Request Order	0h	RW	Issue a Read Request to PCIe from the same AXI master without waiting for Completion. Set to 1 if you want to strictly follow the order of Requests to the Completer. 0b: Do not wait for Completion. 1b: Wait for Completion.

(30) Mode Set 3 Register (PCI_EP_MSET3)

This register outputs the setting value as the ASPM L1 Idle Time bit.

Access Size : 32 bits
Offset Address : <PCI0_base> + 0380h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	ASPM L1 Idle Time[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	-	All 0	RW	Reserved These bits are read as 0b. The write value should always be 0b.
7 to 0	ASPM L1 Idle Time[7:0]	0h	RW	Sets the idle period for AXI transactions that the macro checks on ASPM L1 transitions. One of the conditions for ASPM L1 transition is that the idle period is confirmed for the number of cycles of the 8 bits set by this bit plus 8'hFF to the lower 8 bits. 00h: 256 [ACLK] 01h: 512 [ACLK] : FFh : 65536 [ACLK]

(31) Mode Set 4 Register (PCI_EP_MSET4)

Access Size : 32 bits
Offset Address : <PCI0_base> + 0384h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	MODE_EQ_RX_EVAL_WAIT[19:4]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MODE_EQ_RX_EVAL_WAIT[3:0]				-	-	-	-	MODE_8GT_EQTS2	MODE_EQ_PHASE23_ENABLE1	MODE_EQ_AUTONOMOUS1	-	-	UI_EQ_REQTYPE[1:0]		UI_EQ_REQUEST
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	MODE_EQ_RX_EVAL_WAIT[19:0]	0h	RW	During RxEval (Downstream Port Phase3, Upstream Port Phase2), wait time setting until RxEval is executed when Block Alignment cannot be obtained. Set by the count number of PCLK. Note: It is necessary to set the register value (recommended: equivalent to 1msec) before starting. Please set from the local CPU.
11 to 8	-	All 0	RW	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
7	MODE_8GT_EQTS2	0h	RW	8GT EQ TS2OS transmission enable/disable setting for Upstream Port 0b: Do not send, 1b: Send Note: Not used for Downstream Port. (fixed to 0b)
6	MODE_EQ_PHASE23_ENABLE1	0h	RW	Fixed to 0b
5	MODE_EQ_AUTONOMOUS1	0h	RW	Fixed to 0b
4, 3	-	All 0	RW	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
2, 1	UI_EQ_REQTYPE[1:0]	0h	RW	Operation specification when sending Equalization Request with Quiesce Guarantee=1 in Recovery.RcvrCfg state 00b: Equalization Request transmission with Equalization Request Data Rate=0 (8G) 01b: Send Equalization Request with Equalization Request Data Rate=1 (16G) (Setting prohibited) 10b: Operation of “0” + set Link Equalization Request 8.0GT/s register 11b: Set “1” operation + Link Equalization Request 16.0GT/s register (setting prohibited)
0	UI_EQ_REQUEST	0h	RW	Set when sending an Equalization Request with Quiesce Guarantee=1 in the Recovery.RcvrCfg state. Setting 1b is prohibited except when MODE_QUIESCE_GUARANTEE=1. After setting 1b, hold until confirmation of UI_EQ_DONE=1. 0b: Do not send Equalization Request 1b: Send Equalization Request

(32) Mode Set 5 Register (PCI_EP_MSET5)

Access Size : 32 bits
Offset Address : <PCI0_base> + 0388h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MODE_8GT_EQTS2_PRESET[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	-	All 0	RW	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
15 to 0	MODE_8GT_EQ TS2_PRESET [15:0]	0h	RW	Transmitter Preset value of 8GT EQ TS2OS to transmit at Upstream Port (USP). No setting is required if 8GT_EQTS2 is not sent from USP (DSP Preset is not specified). Settings must be made in advance if necessary. 4-bit configuration for each lane. Gen3/Gen4 supports up to x4 lane configurations. The correspondence between each bit and lane number is as follows. Bit[3:0] Lane #0 Bit[7:4] Lane #1 Bit[11:8] Setting prohibited, other than default value is not writable. Bit[15:12] Setting prohibited, other than default value is not writable. The above lane number is the default lane number for circuit implementation. Note that this is not a negotiated lane number. Note: Not used for Downstream Port. (fixed to 0000_0000h)

(33) Mode Status 0 Registers (PCI_EP_MSTA0)

Access Size : 32 bits
Offset Address : <PCI0_base> + 0390h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	RX_EQ_REQTYPE[1:0]		RX_EQ_REQUEST	UI_EQ_DONE
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
3, 2	RX_EQ_REQTYPE[1:0]	0h	R	Quiesce Guarantee and Equalization Request Data Rate bit display when receiving 8 consecutive TS2OS with Request Equalization bit (Symbol6, bit7) = 1b in Recovery. RcvrCfg state EP (USP) (1) When Request Equalization is received bit0: Quiesce Guarantee (TS2OS, Symbol6, bit6) (= 1 fixed) bit1: Equalization Request Data Rate (TS2OS, Symbol6, bit5) (2) When receiving EQTS2OS bit0: 0 (fixed) bit1: Equalization Request Data Rate (0b: EQTS2, 1b: 8GT EQTS2)
1	RX_EQ_REQUEST	0h	R	Status display when receiving 8 consecutive TS2OS with Request Equalization bit (Symbol6, bit7) = 1 in Recovery.RcvrCfg state 0b: No Equalization Request received 1b: Equalization Request received
0	UI_EQ_DONE	0h	R	Set Equalization Request with Quiesce Guarantee=1 in Recovery.RcvrCfg state when sending 0b: No Equalization Request sent 1b: Sent Equalization Request Related flow: "Set UI_EQ_REQUEST = 1b → Confirm UI_EQ_DONE = 1b → Clear UI_EQ_REQUEST = 0b"

(34) PCIe Core Mode Set 1 Register (PCI_EP_PCMSET1)

This register sets the operating mode of the PCI Express core.

Access Size : 32 bits
Offset Address : <PCI0_base> + 0400h
Initial Value : 00FA_00F2h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	ASPM_L1_INTERVAL_TIME[11:0]											
Initial Value	0	0	0	0	0	0	0	0	1	1	1	1	1	0	1	0
R/W	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	MODE_LINK_UPCONFIGURE_CAPABILITY_DISABLED	-	MODE_TXSWING	-	MODE_SELECTABLE_DEEMPHASIS	-	-	-	-	-	-	MODE_PORT	-
Initial Value	0	0	0	0	0	0	0	0	1	1	1	1	0	0	1	0
R/W	R	RW	RW	RW	R	RW	RW	RW	RW	RW	RW	RW	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31, 30	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
29, 28	-	All 0	RW	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
27 to 16	ASPM_L1_INTERVAL_TIME [11:0]	0FAh	RW	Interval settings for ASPM L1 requests The PCIe Base Spec stipulates that ASPM L1 transition requests must not be accepted continuously within 10 us, and this field sets the timer value to guard against this. Set so that ACLK cycle x set value is 10 us or more. At ACLK: 400[MHz] or higher, this bit setting value should be the value (1/16) of the lower 4 bits of the setting value of the above specifications, and set the clock number as the timer value setting. Settings of this product (Default): When ACLK=400MHz(2.5ns): 4000(d)/16 = FA(h)
15	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
14, 13	-	All 0	RW	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
12	MODE_LINK_UPCONFIGURE_CAPABILITY_DISABLED	0h	RW	Setting of Link Upconfigure Capability bit of Training Sequence Ordered-set (TS-OS) 0b: Link Upconfigure Capability bit = 1b setting 1b: Link Upconfigure Capability bit = 0b setting (Gen1 x1) When connecting with a Gen1 PCIe device, Linkup may not occur unless this bit is 0b. In that case, change it to 0b in F/W.
11	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
10	MODE_TXSWING	0h	RW	SerDes serial output amplitude control 0b: Full swing mode (default) 1b: Half swing mode
9	-	0h	RW	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
8	MODE_SELECTABLE_DEEMPHASIS	0h	RW	De-emphasis setting in Endpoint mode For Endpoint, set the De-emphasis value for 5.0 GT/s operation. Initial value of select_deemphasis variable described in PCIe Base Spec. 0b: -6 dB (default) 1b: -3.5dB

Bit	Bit Name	Initial Value	R/W	Description
7 to 4	-	All 1	RW	Reserved Whenever it is read, 1111b is read. The write value should always be 1111b.
3, 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
1	MODE_PORT	1h	RW	Device type setting register. When the bit value of this register is fixed to the initial value 1b, the setting of the external pin MODE_PORT becomes valid. When the external pin MODE_PORT is fixed to 1b, the setting by this register bit becomes valid. 0b: Endpoint 1b: Root Complex
0	-	0h	RW	Reserved Whenever it is read, 0b is read. The written value will be ignored.

(35) PCIe Core Control 1 Register (PCI_EP_PCCTRL1)

This register controls power management and LTSSM (Link Training Sequence State Machine) state transitions.

Access Size : 32 bits
Offset Address : <PCI0_base> + 0404h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	BLB_RELAX_ORDERING_EN	-	-	-	-	-	UI_ENTER_L1S	-	-	-	-	-	UI_ENTER_TXL0S
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	R	R	R	RW	R	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	MODE_QUIESCE_GUARANTEE	-	MODE_EQ_AUTONOMOUS	MODE_EQ_PHASE23_ENABLE	MODE_RESET_EIEOS_INTERVALL0S	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	R	R	R	R	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
28	BLB_RELAX_ORDERING_EN	0h	RW	Control of RO bit of Request to be sent 0b: RO bit of Request TLP to be sent is always 0b (default) 1b: A TLP can be sent with the RO bit of the Request TLP to be sent set to 1b.
27 to 25	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
24	-	All 0	RW	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
23	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
22	UI_ENTER_L1S	0h	RW	L1SubState transition permission setting 0b : L1 Substate transition disabled (default) 1b: L1 Substate transition permission (setting prohibited)
21 to 17	-	All 0	RW	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
16	UI_ENTER_TXL0S	0h	RW	TxL0s transition control 0b: Do not perform ASPM L0s transition (default) 1b: Execute ASPM L0s transition when internal conditions are satisfied
15 to 13	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
12	MODE_QUIESCE_GUARANTEE	0h	RW	Symbol6 bit6 Quiesce Guarantee control bit of TS2OS 0b: Set 0b to TS2OS (default) 1b: Set 1b to TS2OS
11	-	0h	RW	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
10	MODE_EQ_AUTONOMOUS	0h	RW	Gen3 feature: Autonomous Equalization Basically only changeable during the reset period 0b: Do not use Autonomous Mechanism 1b: Use Autonomous Mechanisms
9	MODE_EQ_PHASE23_ENABLE	0h	RW	Gen3 features: Setting whether to execute EQ PHASE2 and EQ PHASE3 in RC mode (MODE_PORT=1). 0b: Do not execute EQ PHASE2/3 1b: Execute EQ PHASE2/3

Bit	Bit Name	Initial Value	R/W	Description
8	MODE_RESET_EIEOS_INTERVALL0S	0h	RW	Gen3 features: Reset EIEOS Interval information of bit 2, symbol 6 of TS1OS transmitted in Recovery.Equalization state
7 to 4	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
3 to 0	-	All 0	RW	Reserved Whenever it is read, 0b is read. The write value should always be 0b.

(36) PCIe Core Status 1 Register (PCI_EP_PCSTAT1)

This register indicates the status of the power management in the PCI Express core.

Access Size : 32 bits
Offset Address : <PCI0_base> + 0408h
Initial Value : 0x0x_xxxxh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
27	TURN_OFF_EVENT_ACK	xh	R	TURN_OFF_EVENT_ACK input signal monitor
26	TURN_OFF_EVENT	0h	R	TURN_OFF_EVENT output signal monitor
25 to 18	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
17	bme_down	xh	R	Indicates that the PCIe core transmitter is in an unusable state.
16, 15	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
14 to 8	LTSSM_STATE[6:0]	xh	R	Indicates the state of the Link Training & Status State Machine in the PCIe Core Link. The following states are indicated by the upper 5 bits [14:10]. 000xxb: Detect 001xxb: Polling 010xxb: Config 01100b: L0 01101b: L1 0111xb: L2 100xxb: Recovery 101xxb: Disable 110xxb: Loopback
7 to 4	PMU_LINKSTATE[3:0]	xh	R	L-state monitor of power management control unit 0100b: L1 state 1000b: L2 state
3	-	0h	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
2	-	xh	R	Reserved Whenever it is read, x is read. The written value will be ignored.
1	STATE_VC0_NEGOTIATION_PENDING	xh	R	Flow Control initialization operation monitor If this bit is 1b, do not initiate a transaction from the AXI side. Check that this bit is 0b and DL_Down Status (bit [0]) is 0b. 0b: Indicates that Flow Control initialization is complete 1b: Indicates that Flow Control initialization has not completed

Bit	Bit Name	Initial Value	R/W	Description
0	DL_Down status	xh	R	Indicates whether PCIe Core is in DL_Down or DL_Up state 0b: DL_Up Status 1b: DL_Down Status

Note: x = Undefined

(37) PCIe Core Control 2 Register (PCI_EP_PCCTRL2)

This register controls the link speed/width change in the PCI Express core.

Access Size : 32 bits
Offset Address : <PCI0_base> + 0410h
Initial Value : 003E_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	UI_LINK_WIDTH_CHANGE_ENABLE[7:0]								MODE_NODEEMPHASIS[1:0]		MODE_PRESET_ENABLE[4:0]					UI_LINK_WIDTH_CHANGE_REQ
Initial Value	0	0	0	0	0	0	0	0	0	0	1	1	1	1	1	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	UI_LINK_SPEED_CHANGE[1:0]		-	-	-	UI_LINK_CHANGE_AUTONOMOUS	-	-	-	UI_LINK_SPEED_CHANGE_REQ
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	RW	RW	R	R	R	RW	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	UI_LINK_WIDTH_CHANGE_ENABLE[7:0]	0h	RW	Link Width setting to change Assert UI_LINK_WIDTH_CHANGE_REQ and set Lane to 1b to operate when Link Width change request is issued. The lower bit (bit [24]) drives Lane0 and the most significant bit (bit [31]) drives Lane7. For this LSI effective bits are Bit-25 and Bit-24
23, 22	MODE_NODEEMPHASIS[1:0]	0h	RW	No de-emphasis mode setting pin for Gen1/Gen3 operation [0] Gen1 operation, 0b: Normal operation mode (default), 1b: No de-emphasis mode [1] Gen3 operation, 0b: Normal operation mode (default), 1b: No de-emphasis mode
21 to 17	MODE_PRESET_ENABLE[4:0]	1Fh	RW	Reduced Swing mode setting pin during Gen3 operation (unused) Bit[0]: 8GT/s Preset P0, 0b: disable, 1b: enable (default) Bit[1]: 8GT/s Preset P2, 0b: disable, 1b: enable (default) Bit[2]: 8GT/s Preset P7, 0b: disable, 1b: enable (default) Bit[3]: 8GT/s Preset P8, 0b: disable, 1b: enable (default) Bit[4]: 8GT/s Preset P10, 0b: disable, 1b: enable (default)
16	UI_LINK_WIDTH_CHANGE_REQ	0h	RW	Link Width change request control Setting this bit to 1b issues a request to change the Link Width to the configuration set in bits [31:24] UI_LINK_WIDTHCHANGE_ENABLE field. By asserting it in the L0 state, it transitions from the Recovery state to the Configuration state, and performs negotiation with the other device. Set to 0b after confirming that PCIe Core Status 2 Register (Offset: 414h) bit [29] UI_LINK_WIDTH_CHANGE_DONE is asserted.
15 to 10	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
9, 8	UI_LINK_SPEED_CHANGE[1:0]	0h	RW	Link speed setting Set the Link Speed you want to change. 00b: 2.5 GT/s 01b: 5.0 GT/s 10b: 8.0 GT/s 11b: 16.0 GT/s (Setting prohibited)
7 to 5	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
4	UI_LINK_CHANGE_AUTONOMOUS	0h	RW	Link Width/Speed change reason setting 0b: reliability reason (change for reliability, direction of bandwidth reduction) 1b: autonomous reason (intentional change)
3 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

Bit	Bit Name	Initial Value	R/W	Description
0	UI_LINK_SPEED_CHANGE_REQ	0h	RW	Link Speed change request control Setting this bit to 1b requests to change the Link Speed to the speed set in bit [8] UI_LINK_SPEED_CHANGE field. By asserting it in the L0 state, it transitions to the Recovery state and performs negotiation with the peer device. PCIe Core Status 2 Register (Offset: 414h) bit[28] Set to 0b after confirming that UI_LINK_SPEED_CHANGE_DONE has been asserted.

(38) PCIe Core Status 2 Register (PCI_EP_PCSTAT2)

This register indicates the status of the link speed/width change in the PCI Express core.

Access Size : 32 bits
Offset Address : <PCI0_base> + 0414h
Initial Value : xxxx_xxxxh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	UI_LINK_WIDTH_CHANGE_DONE	UI_LINK_SPEED_CHANGE_DONE	-	-	-	STATE_UPCONFIGURE_CAPABLE	-	STATE_NEGOTIATED_LANE_END[2:0]			-	STATE_NEGOTIATED_LANE_START[2:0]		
Initial Value	0	0	x	x	0	0	0	x	0	x	x	x	0	x	x	x
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	STATE_RECEIVER_DETECTED[7:0]								STATE_DATA_RATE_IDENTIFIER_RECEIVED[7:0]							
Initial Value	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31, 30	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
29	UI_LINK_WIDTH_CHANGE_DONE	xh	R	Link Width Change operation complete display Notifies completion of Width Change (1b) by setting PCIe Core Status 2 Register (Offset: 410h) bit [16] UI_LINK_WIDTH_CHANGE_REQ. It is set to 0b by setting UI_LINK_WIDTH_CHANGE_REQ to 0b.
28	UI_LINK_SPEED_CHANGE_DONE	xh	R	Link Speed Change operation complete display PCIe Core Status 2 Registers (Offset: 410h) bit[0] Notifies completion of Speed Change (1b) by setting UI_LINK_SPEED_CHANGE_REQ. It is set to 0b by setting UI_LINK_SPEED_CHANGE_REQ to 0b.
27 to 25	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
24	STATE_UPCONFIGURE_CAPABLE	xh	R	Upconfigure Capable bit display of opposite device Indicates whether the peer device supports changing the direction of widening the Link Width. If this bit is 0b, changing the Link Width will not restore the original Link Width.
23	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
22 to 20	STATE_NEGOTIATED_LANE_END[2:0]	xh	R	Displays the position of Lane Number (n-1) (meaning Lane1 when n=2) after Link Negotiation with the opposite device during n-lane operation. Used to check the state of the current working lane before changing the Link Width. 000b: Lane0 is Lane Number (n-1) 001b: Lane1 is Lane Number (n-1) Others: reserved
19	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
18 to 16	STATE_NEGOTIATED_LANE_START[2:0]	xh	R	Displays the position of Lane Number 0 after Link Negotiation with the opposite device during n-lane operation. Used to check the state of the current working lane before changing the Link Width. 000b: Lane0 is Lane Number 0 001b: Lane1 is Lane Number 0 Others: reserved
15 to 8	STATE_RECEIVER_DETECTED[7:0]	xh	R	Connection status display with other device Receiver Detection results are displayed. Bit[0] Detect opposite device on Lane0 Bit[1] Detect peer device on Lane1 (only for x2) Bit[2:7] reserved

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	STATE_DATA_ RATE_IDENTIFIE R_RECEIVED [7:0]	xh	R	Link Speed display supported by the opposite device Displays the TS-OS Data Rate Identifier feed received from the peer device. Bit[0] – Reserved Bit[1] – 2.5 GT/s Data Rate Supported. Must be set to 1b. Bit[2] – 5.0 GT/s Data Rate Supported. Must be set to 1b if Bit3 is 1b. Bit[3] – 8.0 GT/s Data Rate Supported. Bits[4:7] – Reserved

Note: x = Undefined

(39) PCIe Core Status 5 Register (PCI_EP_PCSTAT5)

This register indicates the status in the PCI Express core.

Access Size : 32 bits
Offset Address : <PCI0_base> + 042Ch
Initial Value : 0000_0x00h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Suspend_bme[7:0]								D3_EVENT[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	D3_EVENT_ACK[7:0]								ORT_TRANSACTION_PENDING[7:0]							
Initial Value	0	0	0	0	0	0	x	x	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	Suspend_bme [7:0]	0h	R	Indicates the state in which the use of the PCIe core transmitter should be suppressed for each function. Other than the lower 2 bits Reserved (fixed to 0b)
23 to 16	D3_EVENT [7:0]	0h	R	D3_EVENT signal monitor for each function Other than the lower 2 bits Reserved (fixed to 0b)
15 to 8	D3_EVENT_ACK[7:0]	0xh	R	D3_EVENT_ACK signal monitor for each function Other than the lower 2 bits Reserved (fixed to 0b)
7 to 0	ORT_TRANSACTION_PENDING [7:0]	0h	R	Outstanding Request Monitor by Function Other than the lower 2 bits Reserved (fixed to 0b) Indicates whether or not there are Outstanding Requests (a state in which all Completions corresponding to Non-Posted Requests sent from the AXI side have not been received). Check with this bit that there is no Outstanding Request before requesting/permitting a transition to TxL0s/L1/L2. 0b: State without Outstanding Request 1b: State with Outstanding Request

(40) DMA Interrupt Vector 0 Register (PCI_EP_DMAINTVEC0)

This register specifies the interrupt vectors for interrupt notification from AXI to PCIe (MSI) during DMA transfer.

Access Size : 32 bits
Offset Address : <PCI0_base> + 04D0h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	DMA_CH3_MSI_EN	DMA_CH3_vec[4:0]					-	-	DMA_CH2_MSI_EN	DMA_CH2_vec[4:0]				
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	RW	RW	RW	RW	RW	RW	R	R	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	DMA_CH1_MSI_EN	DMA_CH1_vec[4:0]					-	-	DMA_CH0_MSI_EN	DMA_CH0_vec[4:0]				
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	RW	RW	RW	RW	RW	RW	R	R	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31, 30	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
29	DMA_CH3_MSI_EN	0h	RW	DMA Ch3 MSI Enable 0b: Do not use MSI (DMA interrupt notification by DMA_INT pin) 1b: Use MSI
28 to 24	DMA_CH3_vec[4:0]	0h	RW	Vector value of MSI interrupt transmitted by DMAC Ch3
23, 22	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
21	DMA_CH2_MSI_EN	0h	RW	DMA Ch2 MSI Enable 0b: Do not use MSI (DMA interrupt notification by DMA_INT pin) 1b: Use MSI
20 to 16	DMA_CH2_vec[4:0]	0h	RW	Vector value of MSI interrupt transmitted by DMAC Ch2
15, 14	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
13	DMA_CH1_MSI_EN	0h	RW	DMA Ch1 MSI Enable 0b: Do not use MSI (DMA interrupt notification by DMA_INT pin) 1b: Use MSI
12 to 8	DMA_CH1_vec[4:0]	0h	RW	Vector value of MSI interrupt transmitted by DMAC Ch1
7, 6	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
5	DMA_CH0_MSI_EN	0h	RW	DMA Ch0 MSI Enable 0b: Do not use MSI (DMA interrupt notification by DMA_INT pin) 1b: Use MSI
4 to 0	DMA_CH0_vec[4:0]	0h	RW	Vector value of MSI interrupt transmitted by DMAC Ch0

(41) DMA Interrupt Vector 1 Register (PCI_EP_DMAINTVEC1)

This register specifies interrupt vectors for interrupt notification from AXI to PCIe (MSI) during DMA transfer.

Access Size : 32 bits
Offset Address : <PCI0_base> + 04D4h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	DMA_CH7_MSI_EN	DMA_CH7_vec[4:0]					-	-	DMA_CH6_MSI_EN	DMA_CH6_vec[4:0]				
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	RW	RW	RW	RW	RW	RW	R	R	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	DMA_CH5_MSI_EN	DMA_CH5_vec[4:0]					-	-	DMA_CH4_MSI_EN	DMA_CH4_vec[4:0]				
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	RW	RW	RW	RW	RW	RW	R	R	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31, 30	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
29	DMA_CH7_MSI_EN	0h	RW	DMA Ch7 MSI Enable 0b: Do not use MSI (DMA interrupt notification by DMA_INT pin) 1b: Use MSI
28 to 24	DMA_CH7_vec[4:0]	0h	RW	Vector value of MSI interrupt transmitted by DMAC Ch7
23, 22	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
21	DMA_CH6_MSI_EN	0h	RW	DMA Ch6 MSI Enable 0b: Do not use MSI (DMA interrupt notification by DMA_INT pin) 1b: Use MSI
20 to 16	DMA_CH6_vec[4:0]	0h	RW	Vector value of MSI interrupt transmitted by DMAC Ch6
15, 14	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
13	DMA_CH5_MSI_EN	0h	RW	DMA Ch5 MSI Enable 0b: Do not use MSI (DMA interrupt notification by DMA_INT pin) 1b: Use MSI
12 to 8	DMA_CH5_vec[4:0]	0h	RW	Vector value of MSI interrupt transmitted by DMAC Ch5
7, 6	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
5	DMA_CH4_MSI_EN	0h	RW	DMA Ch4 MSI Enable 0b: Do not use MSI (DMA interrupt notification by DMA_INT pin) 1b: Use MSI
4 to 0	DMA_CH4_vec[4:0]	0h	RW	Vector value of MSI interrupt transmitted by DMAC Ch4

(42) DMAC Control Register (PCI_EP_DMACTRL)

This register sets the maximum size of read requests which can be issued to the PCIe Core as a DMAC function. Use the initial setting (128-byte). This setting is common to all DMA channels.

Access Size : 32 bits
Offset Address : <PCI0_base> + 0800h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
2 to 0	D_PMRS[2:0]	0h	RW	DMAC PCIe Max Read Request Size Set the upper limit of Read requests issued from the DMAC to PCIe. 000b: 128 bytes (default) 001b: 256 bytes 010b: 512 bytes (not supported) 011b: 1024 bytes (not supported) 100b: 2048 bytes (not supported) 101b: 4096 bytes (not supported) others: Reserved (prohibited)

(43) DMAC Interrupt Enable Register (PCI_EP_DMAINTE)

This register enables interrupts from the individual DMA channels.

Access Size : 32 bits
Offset Address : <PCI0_base> + 0808h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CH7_ERR_EN	CH7_QUE_EMP_EN	CH7_STOP_EN	CH7_END_EN	CH6_ERR_EN	CH6_QUE_EMP_EN	CH6_STOP_EN	CH6_END_EN	CH5_ERR_EN	CH5_QUE_EMP_EN	CH5_STOP_EN	CH5_END_EN	CH4_ERR_EN	CH4_QUE_EMP_EN	CH4_STOP_EN	CH4_END_EN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

(44) DMAC Interrupt Status Register (PCI_EP_DMAINTS)

This register indicates the state of interrupts from the individual DMA channels.

Access Size : 32 bits
Offset Address : <PCI0_base> + 080Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CH7_ERR	CH7_QUE_EMP	CH7_STOP	CH7_END	CH6_ERR	CH6_QUE_EMP	CH6_STOP	CH6_END	CH5_ERR	CH5_QUE_EMP	CH5_STOP	CH5_END	CH4_ERR	CH4_QUE_EMP	CH4_STOP	CH4_END
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW1	RW1	RW1	RW1	RW1	RW1	RW1	RW1	RW1	RW1	RW1	RW1	RW1	RW1	RW1	RW1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CH3_ERR	CH3_QUE_EMP	CH3_STOP	CH3_END	CH2_ERR	CH2_QUE_EMP	CH2_STOP	CH2_END	CH1_ERR	CH1_QUE_EMP	CH1_STOP	CH1_END	CH0_ERR	CH0_QUE_EMP	CH0_STOP	CH0_END
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW1	RW1	RW1	RW1	RW1	RW1	RW1	RW1	RW1	RW1	RW1	RW1	RW1	RW1	RW1	RW1

Bit	Bit Name	Initial Value	R/W	Description
31	CH7_ERR	0h	RW1	Set when an error occurs during DMA transfer.
30	CH7_QUE_EMP	0h	RW1	Set when the list is removed from the descriptor queue (transferred to the running descriptor list) and the QUE is empty.
29	CH7_STOP	0h	RW1	Set when the DMAC is prematurely stopped. DMA stops under the following conditions: - When RDMA_EN or QUE_EN is cleared to 0 by the S/W during DMA transfer execution and the processing of the request being issued ends.
28	CH7_END	0h	RW1	Set when the DMAC ends normally. Normal termination refers to the following conditions. - Transfer for the amount indicated by DMA_SIZE is completed. - At the end of the descriptor list when the EI field is 1
27	CH6_ERR	0h	RW1	Set when an error occurs during DMA transfer.
26	CH6_QUE_EMP	0h	RW1	Set when the list is removed from the descriptor queue (transferred to the running descriptor list) and the QUE is empty.
25	CH6_STOP	0h	RW1	Set when the DMAC is prematurely stopped. DMA stops under the following conditions: - When RDMA_EN or QUE_EN is cleared to 0 by the S/W during DMA transfer execution and the processing of the request being issued ends.
24	CH6_END	0h	RW1	Set when the DMAC ends normally. Normal termination refers to the following conditions. - Transfer for the amount indicated by DMA_SIZE is completed. - At the end of the descriptor list when the EI field is 1
23	CH5_ERR	0h	RW1	Set when an error occurs during DMA transfer.
22	CH5_QUE_EMP	0h	RW1	Set when the list is removed from the descriptor queue (transferred to the running descriptor list) and the QUE is empty.
21	CH5_STOP	0h	RW1	Set when the DMAC is prematurely stopped. DMA stops under the following conditions: - When RDMA_EN or QUE_EN is cleared to 0 by the S/W during DMA transfer execution and the processing of the request being issued ends.
20	CH5_END	0h	RW1	Set when the DMAC ends normally. Normal termination refers to the following conditions. - Transfer for the amount indicated by DMA_SIZE is completed. - At the end of the descriptor list when the EI field is 1
19	CH4_ERR	0h	RW1	Set when an error occurs during DMA transfer.
18	CH4_QUE_EMP	0h	RW1	Set when the list is removed from the descriptor queue (transferred to the running descriptor list) and the QUE is empty.
17	CH4_STOP	0h	RW1	Set when the DMAC is prematurely stopped. DMA stops under the following conditions: - When RDMA_EN or QUE_EN is cleared to 0 by the S/W during DMA transfer execution and the processing of the request being issued ends.

Bit	Bit Name	Initial Value	R/W	Description
16	CH4_END	0h	RW1	Set when the DMAC ends normally. Normal termination refers to the following conditions. - Transfer for the amount indicated by DMA_SIZE is completed. - At the end of the descriptor list when the EI field is 1
15	CH3_ERR	0h	RW1	Set when an error occurs during DMA transfer.
14	CH3_QUE_EMP	0h	RW1	Set when the list is removed from the descriptor queue (transferred to the running descriptor list) and the QUE is empty.
13	CH3_STOP	0h	RW1	Set when the DMAC is prematurely stopped. DMA stops under the following conditions: - When RDMA_EN or QUE_EN is cleared to 0 by the S/W during DMA transfer execution and the processing of the request being issued ends.
12	CH3_END	0h	RW1	Set when the DMAC ends normally. Normal termination refers to the following conditions. - Transfer for the amount indicated by DMA_SIZE is completed. - At the end of the descriptor list when the EI field is 1
11	CH2_ERR	0h	RW1	Set when an error occurs during DMA transfer.
10	CH2_QUE_EMP	0h	RW1	Set when the list is removed from the descriptor queue (transferred to the running descriptor list) and the QUE is empty.
9	CH2_STOP	0h	RW1	Set when the DMAC is prematurely stopped. DMA stops under the following conditions: - When RDMA_EN or QUE_EN is cleared to 0 by the S/W during DMA transfer execution and the processing of the request being issued ends.
8	CH2_END	0h	RW1	Set when the DMAC ends normally. Normal termination refers to the following conditions. - Transfer for the amount indicated by DMA_SIZE is completed. - At the end of the descriptor list when the EI field is 1
7	CH1_ERR	0h	RW1	Set when an error occurs during DMA transfer.
6	CH1_QUE_EMP	0h	RW1	Set when the list is removed from the descriptor queue (transferred to the running descriptor list) and the QUE is empty.
5	CH1_STOP	0h	RW1	Set when the DMAC is prematurely stopped. DMA stops under the following conditions: - When RDMA_EN or QUE_EN is cleared to 0 by the S/W during DMA transfer execution and the processing of the request being issued ends.
4	CH1_END	0h	RW1	Set when the DMAC ends normally. Normal termination refers to the following conditions. - Transfer for the amount indicated by DMA_SIZE is completed. - At the end of the descriptor list when the EI field is 1
3	CH0_ERR	0h	RW1	Set when an error occurs during DMA transfer.
2	CH0_QUE_EMP	0h	RW1	Set when the list is removed from the descriptor queue (transferred to the running descriptor list) and the QUE is empty.
1	CH0_STOP	0h	RW1	Set when the DMAC is prematurely stopped. DMA stops under the following conditions: - When RDMA_EN or QUE_EN is cleared to 0 by the S/W during DMA transfer execution and the processing of the request being issued ends.
0	CH0_END	0h	RW1	Set when the DMAC ends normally. Normal termination refers to the following conditions. - Transfer for the amount indicated by DMA_SIZE is completed. - At the end of the descriptor list when the EI field is 1

(45) DMAC Channel Control Register m (PCI_EP_DMACHCTLm) (m = 0 to 7)

This register sets the control method for each DMA channel. Set either register type or descriptor type.

- Setting QUE_EN = 1b and QUE_CLR = 1b is prohibited during register-type DMA transfer (TDMA_EN = 1b).
- Setting RDMA_EN = 1b is prohibited during descriptor-type DMA transfer (QUE_EN = 1b).

Access Size : 32 bits
Offset Address : <PCI0_base> + 0900h + 080h x m (m = 0 to 7) (channel offset)
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	QUE_CLR	-	-	-	-	-	-	QUE_EN	RDMA_EN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	RW	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
8	QUE_CLR	0h	RW	QUE Clear Writing 1b clears QUE. All descriptor lists (waiting for execution and lists currently being executed) registered in QUE are cleared. Do not clear during DMA execution. The read value is always 0b. Writing 1b at the same time as setting QUE_EN is prohibited.
7 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
1	QUE_EN	0h	RW	QUE Enable Setting this bit to 1b enables the descriptor list registered in the descriptor queue and starts DMA transfer (descriptor-type). It is automatically cleared to 0 when DMA stops (both normal and abnormal). It is also possible to stop DMA by writing 0b. However, DMA will stop after finishing the currently executing request (both PCIe and AXI).
0	RDMA_EN	0h	RW	Register-type DMA transfer Enable Setting this bit to 1b starts DMA transfer (register-type) and performs the transfer set by RDMA_SIZE. This bit is automatically cleared to 0 when DMA transfer is completed or an error is detected and DMA ends. It is also possible to stop DMA by writing 0b. However, DMA will stop after completing the currently executing request (both PCIe and AXI). 1b: Register method DMA transfer start 0b: Stop register-type DMA transfer

(46) Descriptor Start Address (Lower) Register m (PCI_EP_DPSADRLm) (m = 0 to 7)

This register sets the descriptor queue list.

The setting value is registered as the lower 32 bits of DSA (DMA Start Address) in the queue list.

Access Size : 32 bits

Offset Address : <PCI0_base> + 0908h + 080h x m (m = 0 to 7) (channel offset)

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	QUE_ENTRY_DSA[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	QUE_ENTRY_DSA[15:6]										QUE_ENTRY_DSA5:0[5:0]					
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	QUE_ENTRY_DSA[31:6]	0h	RW	Descriptor list queue registration register. This area will be the DSA. Sets the lower 32 bits of the address where the first descriptor is stored.
5 to 0	QUE_ENTRY_DSA[5:0]	0h	R	Descriptor list queue registration register. This area will be the DSA. Sets the lower 32 bits of the address where the first descriptor is stored. (16-byte alignment: Lower 6 bits are fixed to 0.)

Note 1. When these bits are read, any of the following contents will be read depending on the state of DMA.
DMA transfer in progress: The descriptor list in progress
DMA suspended (when QUE_EN is automatically cleared): Last executed list
DMA suspended (when QUE_EN S/W is cleared): Suspended (executing) list

(47) Descriptor Start Address (Higher) Registers m (PCI_EP_DPSADRUm) (m = 0 to 7)

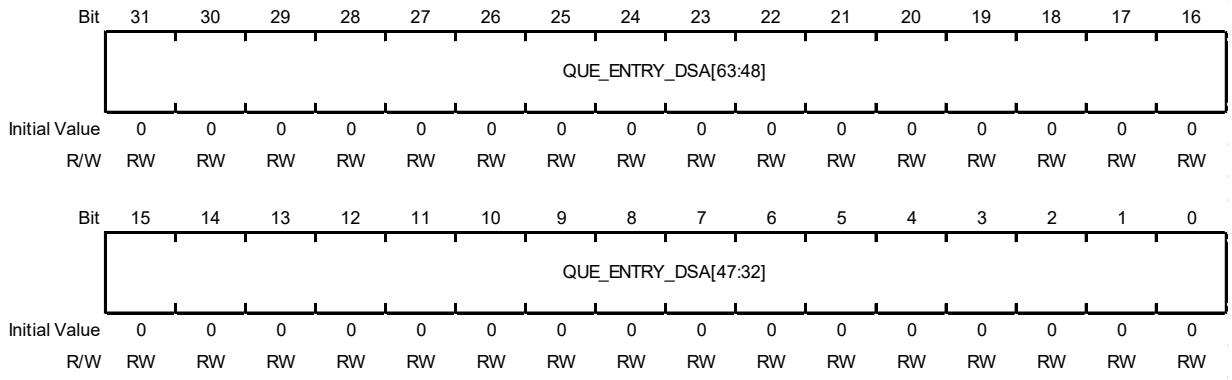
This register sets the descriptor queue list.

The setting value is registered as the higher 32 bits of DSA (DMA Start Address) in the queue list.

Access Size : 32 bits

Offset Address : <PCI0_base> + 090Ch + 080h x m (m = 0 to 7) (channel offset)

Initial Value : 0000_0000h



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	QUE_ENTRY_DSA[63:32]	0h	RW	Descriptor list queue registration register. This area will be the DSA. Set the upper 32 bits of the address where the first descriptor is stored.

Note 1. When these bits are read, any of the following contents will be read depending on the state of DMA.
DMA transfer in progress: The descriptor list in progress
DMA suspended (when QUE_EN is automatically cleared): Last executed list
DMA suspended (when QUE_EN S/W is cleared): Suspended (executing) list

(48) QUE Entry Register m (PCI_EP_QUEEm) (m = 0 to 7)

This register sets the descriptor queue list.

The setting value is registered as EI (End Interrupt), LS (List Stop), and LABEL of the queue list. Write to [31:24] to register to the queue.

Access Size : 32 bits

Offset Address : <PCI0_base> + 0910h + 080h x m (m = 0 to 7) (channel offset)

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	QUE_Registration[5:0]						QUE_ENTRY_EI	QUE_ENTRY_LS	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	QUE_ENTRY_LABEL[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	QUE_Registration[5:0]	0h	RW	Enqueued by writing to [31:24]. The read value is always 0b.
25	QUE_ENTRY_EI	0h	RW	Indicates whether an interrupt (Interrupt Status CHx_END) is sent when the processing of the descriptor list is completed. 1b: signal an interrupt 0b: Do not signal interrupts
24	QUE_ENTRY_LS	0h	RW	Indicates whether to stop the DMA when processing of the descriptor list is complete. 1b: stop 0b: do not stop
23 to 16	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
15 to 0	QUE_ENTRY_LABEL[15:0]	0h	RW	There is no particular rule on how to set the labels in the list. You can set the value freely.

Note 1. When these bits are read, any of the following contents will be read depending on the state of DMA.
DMA transfer in progress: The descriptor list in progress
DMA suspended (when QUE_EN is automatically cleared): Last executed list
DMA suspended (when QUE_EN S/W is cleared): Suspended (executing) list

(49) DMA Descriptor Control (Descriptor 00h) Register m (PCI_EP_DMADPCTLm) (m = 0 to 7)

This register indicates the field value at offset 00h in the descriptor table. Only effective when the descriptor-type DMA transfer is selected (the value read has no meaning in the case of register-type transfer).

Access Size : 32 bits
Offset Address : <PCI0_base> + 0920h + 080h x m (m = 0 to 7) (channel offset)
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DSCFM[3:0]				-	WBD	LE	LV	D	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	STS[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	DSCFM[3:0]	0h	R	Shows the value of the DSCFM field in the running descriptor table.
27	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
26	WBD	0h	R	Shows the value of the WBD field in the running descriptor table.
25	LE	0h	R	Shows the value of the LE field in the running descriptor table.
24	LV	0h	R	Shows the value of the LV field in the running descriptor table.
23	D	0h	R	Shows the value of the D field in the running descriptor table.
22 to 16	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
15 to 0	STS[15:0]	0h	R	Shows the value of the STS field in the running descriptor table.

(50) DMA Transaction Control (Descriptor 04h) Register m (PCI_EP_DMATCTLm) (m = 0 to 7)

This register controls DMA transfer to the AXI and PCIe.

Access Size : 32 bits
Offset Address : <PCI0_base> + 0924h + 080h x m (m = 0 to 7) (channel offset)
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	CCH_L[3:0]				CCH_D[3:0]			
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	DMA_TC[2:0]			-	-	DMA_ATB[1:0]		-	DMA_FUNC[2:0]			-	-	-	DMA_DIR
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	RW	RW	RW	R	R	RW	RW	R	RW	RW	RW	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
23 to 20	CCH_L[3:0]	0h	RW	Indicates the value of A*CACHE[3:0] to be issued to AXI. CCH_L is output when issuing an AXI request containing the last byte in a transfer indicated by SIZE. Recommended value is 0000b. Bit[3] 1b: write allocatable 0b: not write allocatable Bit[2] 1b: read assignable 0b: not read assignable Bit[1] 1b: cacheable 0b: non-cacheable Bit[0] 1b: bufferable 0b: not bufferable
19 to 16	CCH_D[3:0]	0h	RW	Indicates the value of A*CACHE[3:0] to be issued to AXI. CCH_D is output when issuing an AXI request other than the output condition of CCH_L. The recommended value is 0001b when DIR=0 (PCIe→AXI) and 0000b when DIR=1 (AXI→PCIe). Bit[3] 1b: write allocatable 0b: not write allocatable Bit[2] 1b: read assignable 0b: not read assignable Bit[1] 1b: cacheable 0b: non-cacheable Bit[0] 1b: bufferable 0b: not bufferable
15	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
14 to 12	DMA_TC[2:0]	0h	RW	Traffic class to issue to PCIe. Specifies the traffic class value for requests issued to PCIe. Note: This IP does not support Virtual Channel, so please use it with 000b fixed.
11, 10	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
9, 8	DMA_ATB[1:0]	0h	RW	Attributes to issue to PCIe. bit[1]: Relaxed Ordering (Unsupported function: 0b fixed) bit[0]: No Snoop (0b recommended)
7	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
6 to 4	DMA_FUNC [2:0]	0h	RW	Specify the function number of the request issued to PCIe.
3 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
0	DMA_DIR	0h	RW	Sets the DMA transfer direction. 1b: AXI to PCIe 0b: PCIe to AXI

Note 1. When descriptor-type DMA transfer is in progress, writing is prohibited and the value read indicates the value of the CCH_L, CCH_D, TC, ATB, or DIR field of the descriptor table being executed.

(51) DMA Size (Descriptor 08h) Register m (PCI_EP_DMASIZEm) (m = 0 to 7)

This register sets the number of bytes for DMA transfer. The set value is reflected in the offset 0Ch field of the descriptor table.

Access Size : 32 bits
Offset Address : <PCI0_base> + 0928h + 080h x m (m = 0 to 7) (channel offset)
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DMA_SIZE[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DMA_SIZE[15:3]													DMA_SIZE[2:0]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	DMA_SIZE [31:3]	0h	RW	Sets the number of DMA transfer bytes. The lower 3 bits are fixed to 0 because it is an 8-byte aligned setting.
2 to 0	DMA_SIZE [2:0]	0h	R	Sets the number of DMA transfer bytes. The lower 3 bits are fixed to 0 because it is an 8-byte aligned setting.

Note 1. When descriptor-type DMA transfer is in progress, writing is prohibited and the value read indicates the value of the SIZE field of the descriptor table being executed. The number of transfer bytes when 0000_0000h is set is 1_0000_0000h.

(52) DMA Source Lower Address (Descriptor 10h) Register m (PCI_EP_DMASLAm) (m = 0 to 7)

This register sets the lower 32 bits of the source start address for DMA transfer. The set value is reflected in the offset 10h field of the descriptor table.

Access Size : 32 bits
Offset Address : <PCI0_base> + 0930h + 080h x m (m = 0 to 7) (channel offset)
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DMA_S_ADDR[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DMA_S_ADDR[15:3]													DMA_S_ADDR[2:0]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	DMA_S_ADDR [31:3]	0h	RW	Set the lower 32 bits of the transfer source start address for DMA transfer. The lower 3 bits are fixed to 0 because it is an 8-byte aligned setting. (When the data bus width is 128 bits, 16-byte alignment: lower 4 bits are fixed to 0.)
2 to 0	DMA_S_ADDR [2:0]	0h	R	Set the lower 32 bits of the transfer source start address for DMA transfer. The lower 3 bits are fixed to 0 because it is an 8-byte aligned setting. (When the data bus width is 128 bits, 16-byte alignment: lower 4 bits are fixed to 0.)

Note 1. If the Source Address indicates the PCIe space (DIR=0), the PCIe request address is set in combination with the DMA PCIe Higher Address (Descriptor 10h). When descriptor-type DMA transfer is in process, writing to these bits is prohibited and the value read indicates the value of the SA field in the descriptor table being executed.

(53) DMA Source Higher Address (Descriptor 14h) Register m (PCI_EP_DMASUAm) (m = 0 to 7)

This register sets the higher 32 bits of the source start address for DMA transfer. The set value is reflected in the offset 14h field of the descriptor table.

Access Size : 32 bits
Offset Address : <PCI0_base> + 0934h + 080h x m (m = 0 to 7) (channel offset)
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DMA_S_ADDR[63:48]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DMA_S_ADDR[47:32]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DMA_S_ADDR [63:32]	0h	RW	Set the upper 32 bits of the transfer source start address for MA transfer.

Note 1. If the Source Address indicates the PCIe space (DIR=0), the PCIe request address is set in combination with the DMA PCIe Higher Address (Descriptor 10h). When descriptor-type DMA transfer is in process, writing to these bits is prohibited and the value read indicates the value of the SA field in the descriptor table being executed.

(54) DMA Destination Lower Address (Descriptor 18h) Register m (PCI_EP_DMADESTLAm) (m = 0 to 7)

This register sets the lower 32 bits of the source start address for DMA transfer. The set value is reflected in the offset 18h field of the descriptor table.

Access Size : 32 bits
Offset Address : <PCI0_base> + 0938h + 080h x m (m = 0 to 7) (channel offset)
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DMA_D_ADDR[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DMA_D_ADDR[15:3]													DMA_D_ADDR[2:0]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	DMA_D_ADDR [31:3]	0h	RW	Set the lower 32 bits of the transfer destination start address for DMA transfer. The lower 3 bits are fixed to 0 because it is an 8-byte aligned setting.
2 to 0	DMA_D_ADDR [2:0]	0h	R	Set the lower 32 bits of the transfer destination start address for DMA transfer. The lower 3 bits are fixed to 0 because it is an 8-byte aligned setting.

Note 1. If the Destination Address indicates the PCIe space (DIR=1), the PCIe request address is set in combination with the DMA PCIe Higher Address (Descriptor 10h). When descriptor-type DMA transfer is in process, writing to these bits is prohibited and the value read indicates the value of the DA field in the descriptor table being executed.

(55) DMA Destination Higher Address (Descriptor 1Ch) Register m (PCI_EP_DMADESTUAm) (m = 0 to 7)

This register sets the higher 32 bits of the source start address for DMA transfer. The set value is reflected in the offset 1Ch field of the descriptor table.

Access Size : 32 bits
Offset Address : <PCI0_base> + 093Ch + 080h x m (m = 0 to 7) (channel offset)
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DMA_D_ADDR[63:48]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DMA_D_ADDR[47:32]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DMA_D_ADDR [63:32]	0h	RW	Set the upper 32 bits of the transfer destination start address for DMA transfer.

Note 1. If the Destination Address indicates the PCIe space (DIR=1), the PCIe request address is set in combination with the DMA PCIe Higher Address (Descriptor 10h). When descriptor-type DMA transfer is in process, writing to these bits is prohibited and the value read indicates the value of the DA field in the descriptor table being executed.

(56) DMA Descriptor Lower Link Pointer (Descriptor 20h) Register m (PCI_EP_DMADPLLPm) (m = 0 to 7)

This register indicates the field value at offset 20h in the descriptor table. Only effective when descriptor-type DMA transfer is selected (the value read has no meaning in the case of register-type transfer).

Access Size : 32 bits

Offset Address : <PCI0_base> + 0940h + 080h x m (m = 0 to 7) (channel offset)

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DMA_LP[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DMA_LP[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DMA_LP[31:0]	0h	R	Indicates the value of the LP field of the running descriptor table.

(57) DMA Descriptor Higher Link Pointer (Descriptor 24h) Register m (PCI_EP_DMADPULPm) (m = 0 to 7)

This register indicates the field value at offset 24h in the descriptor table. Only effective when descriptor-type DMA transfer is selected (the value read has no meaning in the case of register-type transfer).

Access Size : 32 bits
Offset Address : <PCI0_base> + 0944h + 080h x m (m = 0 to 7) (channel offset)
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DMA_LP[63:48]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DMA_LP[47:32]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DMA_LP[63:32]	0h	R	Indicates the value of the LP field of the running descriptor table.

(58) DMA Rest Size Register m (PCI_EP_DMARESTSIZm) (m = 0 to 7)

This register indicates the number of bytes for which DMA transfer has not yet been completed.

Access Size : 32 bits

Offset Address : <PCI0_base> + 0950h + 080h x m (m = 0 to 7) (channel offset)

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DMA_REST_SIZE[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DMA_REST_SIZE[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DMA_REST_SIZE[31:0]	0h	R	Displays the number of bytes for which DMA transfer has not been completed. (Register/descriptor-type common)

(59) AXI Request Address (Lower) Register m (PCI_EP_AREQALm) (m = 0 to 7)

This register indicates the lower 32 bits of the address of the current or most recently completed AXI transfer.

Access Size : 32 bits

Offset Address : <PCI0_base> + 0960h + 080h x m (m = 0 to 7) (channel offset))

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	AXI_REQ_ADDR[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	AXI_REQ_ADDR[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	AXI_REQ_ADDR[31:0]	0h	R	Displays the lower 32 bits of the address of the current or most recently completed AXI transfer. (Register/descriptor-type common)

(60) AXI Request Address (Higher) Register m (PCI_EP_AREQAUm) (m = 0 to 7)

This register indicates the higher 32 bits of the address of the current or most recently completed AXI transfer.

Access Size : 32 bits

Offset Address : <PCI0_base> + 0964h + 080h x m (m = 0 to 7) (channel offset)

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	AXI_REQ_ADDR[63:48]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	AXI_REQ_ADDR[47:32]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	AXI_REQ_ADDR[63:32]	0h	R	Displays the upper 32 bits of the address of the current or most recently completed AXI transfer. (Register/descriptor method common)

(61) PCIe Request Address (Lower) Register m (PCI_EP_PREQALm) (m = 0 to 7)

This register indicates the lower 32 bits of the address during PCIe transfer that is in progress or for the most recently completed transfer.

Access Size : 32 bits
Offset Address : <PCI0_base> + 0968h + 080h x m (m = 0 to 7) (channel offset)
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PCIE_REQ_ADDR[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PCIE_REQ_ADDR[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	PCIE_REQ_ADDR[31:0]	0h	R	Displays the lower 32 bits of the address of the current or most recently completed PCIe transfer. (Register/descriptor-type common)

(62) PCIe Request Address (Higher) Register m (PCI_EP_PREQAUm) (m = 0 to 7)

This register indicates the higher 32 bits of the address during PCIe transfer that is in progress or for the most recently completed transfer.

Access Size : 32 bits
Offset Address : <PCI0_base> + 096Ch + 080h x m (m = 0 to 7) (channel offset)
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PCIE_REQ_ADDR[63:48]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PCIE_REQ_ADDR[47:32]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	PCIE_REQ_ADDR[63:32]	0h	R	Displays the upper 32 bits of the address of the current or most recently completed PCIe transfer. (Register/descriptor-type common)

(63) QUE Status Register m (PCI_EP_QUESTAm) (m = 0 to 7)

This register indicates the state of the descriptor queue.

Access Size : 32 bits

Offset Address : <PCI0_base> + 0970h + 080h x m (m = 0 to 7) (channel offset)

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	GO_LIST	LIST_NUM[3:0]			
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
4	GO_LIST	0h	R	Shows whether there is a running descriptor list. 1b: Yes 0b: No
3 to 0	LIST_NUM[3:0]	0h	R	Displays the number of descriptor lists loaded on QUE (not including the list currently being executed). New registration to QUE (write access to QUE Entry) when this register indicates 8h is invalid (discarded).

(64) DMAC Error Status Register m (PCI_EP_DMACESTAm) (m = 0 to 7)

This register indicates the error status of the DMAC.

Access Size : 32 bits

Offset Address : <PCI0_base> + 0978h + 080h x m (m = 0 to 7) (channel offset)

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	CFG_BM_DIS_EP	BME_SUP	BME_DOWN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	MOR_CD_PERR	MOR_CH_PERR	MOR_EP_ERR	MOR_STATUS[2:0]			-	-	-	-	-	-	AXI_RESP[1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

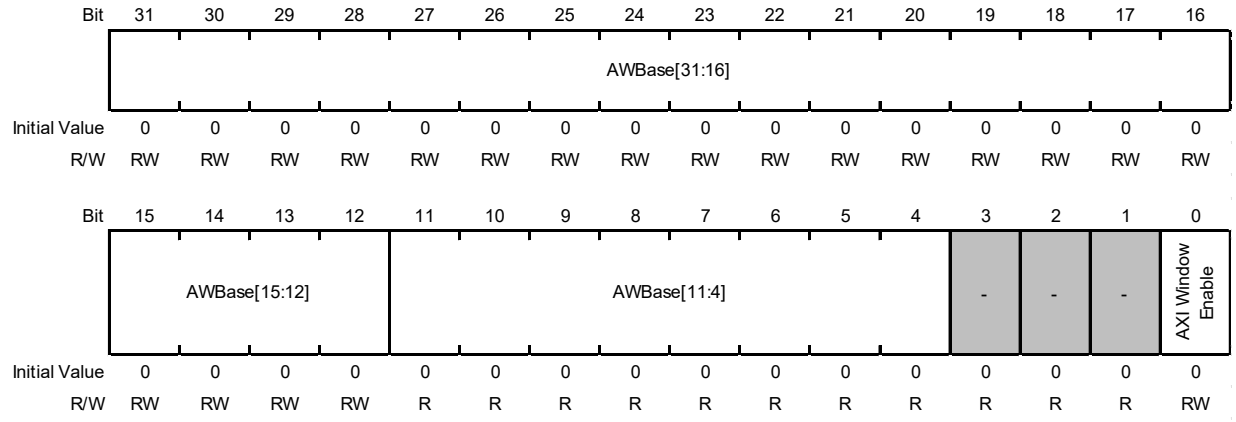
Bit	Bit Name	Initial Value	R/W	Description
31 to 19	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
18	CFG_BM_DIS_EP	0h	R	CHx_ERR is set when the macro operates as an End Point and detects the state of Bus Master Enable Off (Configuration Space 004h bit [2]=0). Holds value until CHx_ERR is cleared.
17	BME_SUP	0h	R	It is set when a sleep signal from the PCIe core is detected as a cause for setting CHx_ERR. Holds value until CHx_ERR is cleared. (Valid only in Endpoint mode)
16	BME_DOWN	0h	R	It is set when a stop signal from the PCIe core is detected as a cause for setting CHx_ERR. Holds value until CHx_ERR is cleared.
15	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
14	-	0h	R	Reserved These bits are read as 0b. The written value will be ignored.
13	MOR_CD_PERR	0h	R	It is set when MOR_CD_PERR is detected as a set factor for CHx_ERR. Holds value until CHx_ERR is cleared.
12	MOR_CH_PERR	0h	R	It is set when MOR_CH_PERR is detected as a set factor for CHx_ERR. Holds value until CHx_ERR is cleared.
11	MOR_EP_ERR	0h	R	It is set when it is Poisoned Completion as a set factor for CHx_ERR. Holds value until CHx_ERR is cleared.
10 to 8	MOR_STATUS [2:0]	0h	R	Indicates the value when MOR_STATUS is other than 000b (Success) as a set factor for CHx_ERR. Holds value until CHx_ERR is cleared. 000b: initial value 001b: Unsupported Request 010b: CRS 011b: Completion Timeout 100b: Completer Abort 101b: Unexpected Completion 110b: Reserved 111b: Mismatched Length (Length Overrun)
7 to 5	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
4	-	0h	R	Reserved These bits are read as 0b. The written value will be ignored.
3	-	0h	R	Reserved These bits are read as 0b. The written value will be ignored.
2	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

Bit	Bit Name	Initial Value	R/W	Description
1, 0	AXI_RESP[1:0]	0h	R	Displays the slave response during AXI Master transactions. It is updated when CHx_ERR is set and retains the value until the bit is cleared. 00b: Initial value 01b: Reserved

(65) AXI Window Base (Lower) m Register (Function #n) (PCI_EP_AWBASELm_Fn) (m = 0 to 7, n = 0, 1)

This register is for setting windows for address conversion in access from PCIe to AXI. It sets the base address on the PCI. The areas are set in 4-Kbyte boundaries.

Access Size : 32 bits
Offset Address : <PCI0_base> + 1000h + Offset: 00h/ 20h/ 40h/ ・・・ / E0h
Initial Value : 0000_0000h



Bit	Bit Name	Initial Value	R/W	Description
31 to 12	AWBase[31:12]	0h	RW	Window setting register for address conversion when accessing AXI from PCIe. The configurable area is the 4K boundary.
11 to 4	AWBase[11:4]	0h	R	Fixed to 00h
3 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
0	AXI Window Enable	0h	RW	Enable setting of AXI Window. 0b: Window disabled 1b: Window enabled

(66) AXI Window Base (Higher) m Register (Function #n) (PCI_EP_AWBASEUm_Fn) (m = 0 to 7, n = 0, 1)

This register is for setting windows for address conversion in access from PCIe to AXI.

Access Size : 32 bits
Offset Address : <PCI0_base> + 1000h + Offset: 04h/ 24h/ 44h/ ・・・ / E4h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	AWBase[63:48]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	AWBase[47:32]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	AWBase[63:32]	0h	RW	Window setting register for address conversion when accessing AXI from PCIe.

(67) AXI Window Mask (Lower) m Register (Function #n) (PCI_EP_AWMASKLm_Fn) (m = 0 to 7, n = 0, 1)

This register is for setting windows for address conversion in access from PCIe to AXI. The window is set as the area corresponding to the number of set bits from the address set in the AWBase register. The area which can be set is 4K × 2^N bytes.

Access Size : 32 bits

Offset Address : <PCI0_base> + 1000h + Offset: 08h/ 28h/ 48h/ ・・・ / E8h

Initial Value : 0000_0FFFh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	AWMask[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	AWMask[15:12]				AWMask[11:0]											
Initial Value	0	0	0	0	1	1	1	1	1	1	1	1	1	1	1	1
R/W	RW	RW	RW	RW	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	AWMask [31:12]	0h	RW	Set the window in the area of the set number of bits from the address set in the AWBase register. Set 1b from the lower bit. Therefore, the area that can be set is 4K x 2^N bytes.
11 to 0	AWMask[11:0]	FFFh	R	Fixed to FFFh

(68) AXI Window Mask (Higher) m Register (Function #n) (PCI_EP_AWMASKUm_Fn) (m = 0 to 7, n = 0, 1)

This register is for setting windows for address conversion in access from PCIe to AXI.

Access Size : 32 bits

Offset Address : <PCI0_base> + 1000h + Offset: 0Ch/ 2Ch/ 4Ch/ ・・・ / Ech

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	AWMask[62:48]														
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	AWMask[47:32]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
30 to 0	AWMask [62:32]	0h	RW	Set the window in the area of the set number of bits from the address set in the AWBase register. Set 1b from the lower bit.

(69) AXI Destination (Lower) m Register (Function #n) (PCI_EP_ADESTLm_Fn) (m = 0 to 7, n = 0, 1)

This register is for setting windows for address conversion in access from PCIe to AXI. It sets the base address on the AXI. The areas are set in 4-Kbyte boundaries.

Access Size : 32 bits
Offset Address : <PCI0_base> + 1000h + Offset: 10h/ 30h/ 50h/ 70h/ ・・・ / F0h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ADest[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ADest[15:12]				ADest[11:0]											
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	ADest[31:12]	0h	RW	Sets the window base point in the address space from the AXI side. The configurable area is the 4K boundary.
11 to 0	ADest[11:0]	0h	R	Fixed to 000h

(70) AXI Destination (Higher) m Register (Function #n) (PCI_EP_ADESTUm_Fn) (m = 0 to 7, n = 0, 1)

This register is for setting windows for address conversion in access from PCIe to AXI.

Access Size : 32 bits

Offset Address : <PCI0_base> + 1000h + Offset: 14h/ 34h/ 54h/ 74h/ ・・・ / F4h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ADest[63:48]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

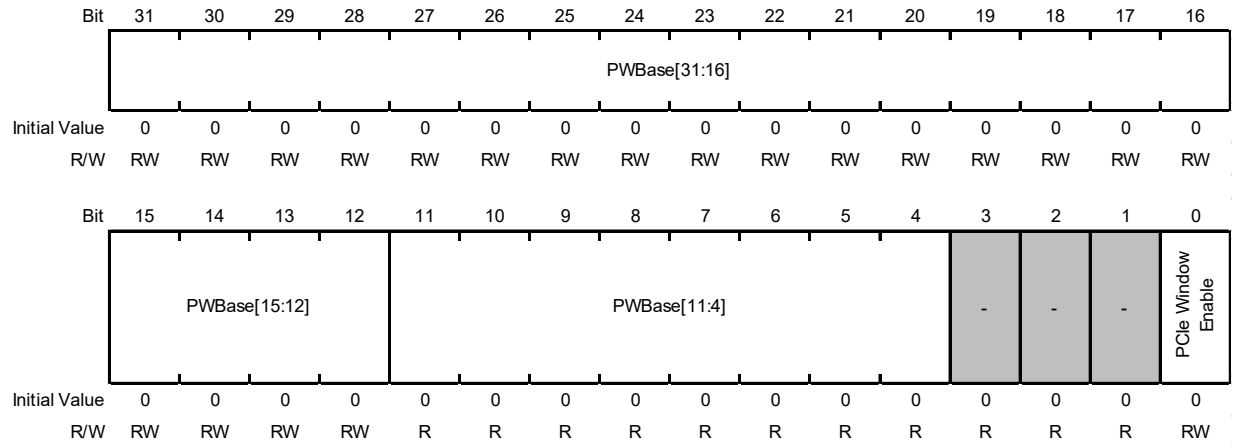
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ADest[47:32]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	ADest[63:32]	0h	RW	Sets the window base point in the address space from the AXI side.

(71) PCIe Window Base (Lower) m Register (Function #n) (PCI_EP_PWBASELm_Fn) (m = 0 to 7, n = 0, 1)

This register is for setting windows for address conversion in access from AXI to PCIe. It sets the base address on the AXI. The areas are set in 4-Kbyte boundaries.

Access Size : 32 bits
Offset Address : <PCI0_base> + 1000h + Offset: 100h/ 120h/ 140h/ ・・・ / 1E0h
Initial Value : 0000_0000h



Bit	Bit Name	Initial Value	R/W	Description
31 to 12	PWBase[31:12]	0h	RW	Sets the base point of the address on the AXI side. The configurable area is the 4K boundary.
11 to 4	PWBase[11:4]	0h	R	Fixed to 00h
3 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
0	PCIe Window Enable	0h	RW	Enable setting of PCIe Window. 0b: Window disabled 1b: Window enabled

(72) PCIe Window Base (Higher) m Register (Function #n) (PCI_EP_PWBASEUm_Fn) (m = 0 to 7, n = 0, 1)

This register is for setting windows for address conversion in access from AXI to PCIe.

Access Size : 32 bits
Offset Address : <PCI0_base> + 1000h + Offset: 104h/ 124h/ 144h/ ・・・ / 1E4h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PWBase[63:48]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PWBase[47:32]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	PWBase[63:32]	0h	RW	Sets the base point of the address on the AXI side. The configurable area is the 4K boundary.

(73) PCIe Window Mask (Lower) m Register (Function #n) (PCI_EP_PWMASKLm_Fn) (m = 0 to 7, n = 0, 1)

This register is for setting windows for address conversion in access from AXI to PCIe. The window is set as the area corresponding to the number of set bits from the address set in the PWBase register.

Access Size : 32 bits
Offset Address : <PCI0_base> + 1000h + Offset: 108h/ 128h/ 148h/ ・・・ / 1E8h
Initial Value : 0000_0FFFh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PWMask[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

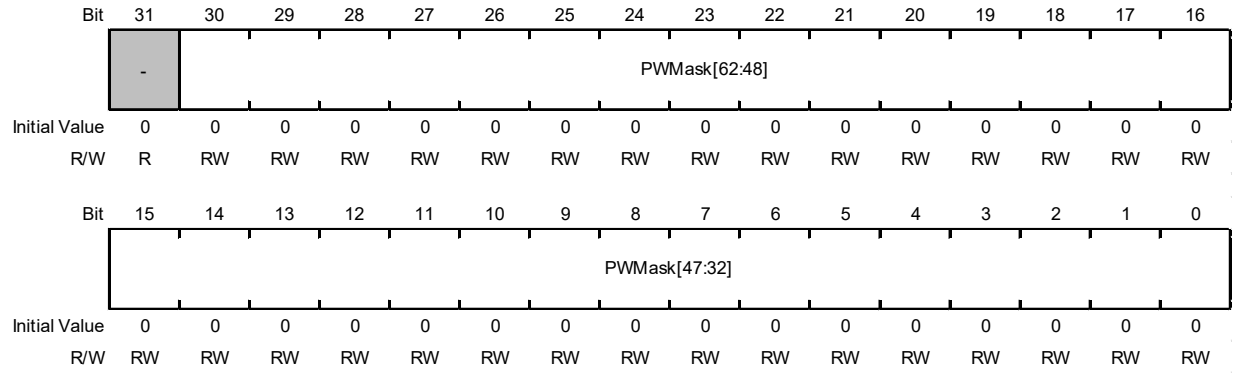
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PWMask[15:12]				PWMask[11:0]											
Initial Value	0	0	0	0	1	1	1	1	1	1	1	1	1	1	1	1
R/W	RW	RW	RW	RW	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	PWMask [31:12]	0h	RW	Set the window in the area of the set number of bits from the address set in the PWBase register. Set 1b from the lower bit.
11 to 0	PWMask[11:0]	FFFh	R	Fixed to FFFh

(74) PCIe Window Mask (Higher) m Register (Function #n) (PCI_EP_PWMASKUm_Fn) (m = 0 to 7, n = 0, 1)

This register is for setting windows for address conversion in access from AXI to PCIe. The window is set as the area corresponding to the number of set bits from the address set in the PWBase register.

Access Size : 32 bits
Offset Address : <PCI0_base> + 1000h + Offset: 10Ch/ 12Ch/ 14Ch/ ・・・ / 1ECh
Initial Value : 0000_0000h



Bit	Bit Name	Initial Value	R/W	Description
31	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
30 to 0	PWMask [62:32]	0h	RW	Set the window in the area of the set number of bits from the address set in the PWBase register. Set 1b from the lower bit.

(75) PCIe Destination m (Lower) Register (Function #n) (PCI_EP_PDESTLOm_Fn) (m = 0 to 7, n = 0, 1)

This register is for setting windows for address conversion in access from AXI to PCIe. It sets the base address on the PCIe. The areas are set in 4-Kbyte boundaries.

Access Size : 32 bits

Offset Address : <PCI0_base> + 1000h + Offset: 110h/ 130h/ 150h/ 170h/ ・・・ / 1F0h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PDest[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PDest[15:12]				PDest[11:0]											
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	PDest[31:12]	0h	RW	Set the window base point in the address space on the PCIe side. The configurable area is the 4k boundary.
11 to 0	PDest[11:0]	0h	R	Fixed to 000h

(76) PCIe Destination m (Higher) Register (Function #n) (PCI_EP_PDESTUPm_Fn) (m = 0 to 7, n = 0, 1)

This register is for setting windows for address conversion in access from AXI to PCIe.

Access Size : 32 bits

Offset Address : <PCI0_base> + 1000h + Offset: 114h/ 134h/ 154h/ 174h/ ・・・ / 1F4h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PDest[63:48]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PDest[47:32]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	PDest[63:32]	0h	RW	Set the window base point in the address space on the PCIe side.

6.6.4.2.4 PCI Express Configuration Register Descriptions (Type0)

(1) Vendor and Device ID (Function #n) Register (PCI_EP_VID_Fn) (n = 0, 1)

This register indicates the vendor and device ID.

Access Size : 32 bits
Offset Address : <PCI0_base> + 6000h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Device ID[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W(PCIe)	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
R/W(UDL)	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Vendor ID[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W(PCIe)	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
R/W(UDL)	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	Device ID[15:0]	0h	R (RW)	Represents the manufacturer of the device. Set a fixed value.
15 to 0	Vendor ID[15:0]	0h	R (RW)	Used by the manufacturer specified by the Vendor ID to identify the manufactured device. Set a fixed value.

(2) Command and Status (Function #n) (PCI_EP_COM_STA_Fn) (n = 0, 1)

This register specifies the command and the status.

Access Size : 32 bits
Offset Address : <PCI0_base> + 6004h
Initial Value : 0010_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Detected Parity Error	Signaled System Error	Received Master Abort	Received Target Abort	Signaled Target Abort	-	-	Master Data Parity Error	-	-	-	Capabilities List	Interrupt Status	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0
R/W(PCIe)	RW1	RW1	RW1	RW1	RW1	R	R	RW1	R	R	R	R	R	R	R	R
R/W(UDL)	RW	RW	RW	RW	RW	R	R	RW	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	Interrupt Disable	-	SERR# Enable	-	Parity Error Response	-	-	-	Bus Master Enable	Memory Space Enable	IO Space Enable
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W(PCIe)	R	R	R	R	R	RW	R	RW	R	RW	R	R	R	RW	RW	R
R/W(UDL)	R	R	R	R	R	RW	R	RW	R	RW	R	R	R	RW	RW	R

Bit	Bit Name	Initial Value	R/W	Description
31	Detected Parity Error	0h	RW1 (RW)	Set to 1b when a Poisoned TLP is received, regardless of the setting of the Parity Error Response bit.
30	Signaled System Error	0h	RW1 (RW)	Set to 1b when the SERR Enable bit is 1b and this macro sends an ERR_FATAL or ERR_NONFATAL Message.
29	Received Master Abort	0h	RW1 (RW)	Set to 1b when the Completion Status field receives a Completion of an Unsupported Request.
28	Received Target Abort	0h	RW1 (RW)	Set to 1b when the Completion Status field receives a Completion for Completer Abort.
27	Signaled Target Abort	0h	RW1 (RW)	Set to 1b when the Completion Status field has sent a Completion of Completer Abort.
26, 25	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
24	Master Data Parity Error	0h	RW1 (RW)	Set to 1b when the Parity Error Response bit is set to 1b and the following two conditions occur: 1) Requester (BME) received a Poisoned Completion TLP. 2) Requester (BME) sent Poisoned Write Request TLP. This bit is not set to 1b if the Parity Error Response bit is 0b.
23 to 21	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
20	Capabilities List	1h	R	This bit is fixed to 1b because all PCI Express devices must implement PCI Express Capability.
19	Interrupt Status	0h	R	Indicates the interrupt status of the device.
18, 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
16	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
15 to 11	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
10	Interrupt Disable	0h	RW	Suppress transmission of Assert_INTx Message. When set to 1b, INTx Message cannot be sent. If this bit is set to 1b while an Assert_INTx Message has been sent, a Deassert_INTx Message must be sent.
9	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

Bit	Bit Name	Initial Value	R/W	Description
8	SERR# Enable	0h	RW	When set to 1b, the Root Complex is notified of Non-Fatal Errors and Fatal Errors by Message Transaction. Note: Even if this bit is not set, if a bit related to Error Reporting in the Device Control register of PCI Express Capability is set to "1", an error is notified to the Root Complex by Message Transaction.
7	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
6	Parity Error Response	0h	RW	Controls the behavior when sending/receiving Poisoned TLP. Note: Error logging to the Detected Parity Error field of the Status register, the Device Status register of PCI Express Capability, and the Uncorrectable Error Status register of Advanced Error Reporting Capability is performed regardless of the setting of this bit.
5 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
2	Bus Master Enable	0h	RW	Controls whether to operate as a bus master.
1	Memory Space Enable	0h	RW	Controls whether to respond to accesses to memory space.
0	IO Space Enable	0h	R	0b fixed. It does not support access to the I/O space.

(17) PM Status/Control (Function #n) (PCI_EP_PMSC_Fn) (n = 0, 1)

This register indicates and controls the PME status.

Access Size : 32 bits
Offset Address : <PCI0_base> + 6044h
Initial Value : 0000_0008h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W(PCIe)	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
R/W(UDL)	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PME Status	-	-	-	-	-	-	PME Enable	-	-	-	-	No_Soft_Reset	-	PowerState [1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0
R/W(PCIe)	RW	R	R	R	R	R	R	RW	R	R	R	R	R	R	RW	RW
R/W(UDL)	RW	R	R	R	R	R	R	RW	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
15	PME Status	0h	RW	Indicates that a PME assert factor has occurred. 1b indicates that there is a PME assertion factor.
14 to 9	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
8	PME Enable	0h	RW	Controls PME assertions. If 1b, PME assertion is enabled. Assert PME if PME_Status is set at this time. PCI Express performs Link Wake-up processing, and then performs PME assert processing by sending PM_PME Message. Note: The specifications are as follows depending on the value of the PM Capabilities register PME Status[4] (PME Support in D3cold). PME Status[4]=1b: Reset: RST_RSM_B EP UDL: RW EP PCIe: RWS PME Status[4]=0b: Reset: RST_RSM_B EP UDL: RW EP PCIe: RW
7 to 4	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
3	No_Soft_Reset	1h	R	Indicates that internal reset is not performed inside the device at the power state transition from D3hot to D0.
2	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
1, 0	PowerState [1:0]	0h	RW	Set the PCI Device State. 00b - D0 (Default) 01b - D1 (Do not set) 10b - D2 (Do not set) 11b - D3hot

R/W(UDL)	RW	RW	RW	RW	R	RW	R	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 22	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
21	Transaction Pending	0h	R	Indicates that the transaction is Pending because Completion has not been received for the sent Non-posted Request. 1b indicates Pending.
20	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
19	Unsupported Request Detected	0h	RW1 (RW)	Indicates that an Unsupported Request Error was detected. 1b indicates the detection of an error.
18	Fatal Error Detected	0h	RW1 (RW)	Indicates that a Fatal Error was detected. 1b indicates the detection of an error.
17	Non-Fatal Error Detected	0h	RW1 (RW)	Indicates that a Non-Fatal Error was detected. 1b indicates the detection of an error.
16	Correctable Error Detected	0h	RW1 (RW)	Indicates that a correctable error was detected. 1b indicates the detection of an error.
15	Initiate Function Level Reset	0h	RW	A write of 1b initiates Function Level Reset to the Function. The value read by software from this bit is always 0b.
14 to 12	Max_Read_Request_Size[2:0]	2h	RW	Set Max_Read_request_Size. 000b: 128B max read request size 001b: 256B max read request size 010b: 512B max read request size (Default) 011b: 1024B max read request size 100b: 2048B max read request size 101b: 4096B max read request size 110b: Reserved 111b: Reserved
11	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
10	-	All 0	RW	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
9	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

Bit	Bit Name	Initial Value	R/W	Description
8	-	All 0	RW	Reserved Whenever it is read, 0b is read. The write value should always be 0b.
7 to 5	Max_Payload_ Size[2:0]	0h	RW	Set Max_Payload_Size. 000b: 128B max payload size (Default) 001b: 256B max payload size 010b: 512B max payload size 011b: 1024B max payload size 100b: 2048B max payload size 101b: 4096B max payload size 110b: Reserved 111b: Reserved:
4	Enable Relaxed Ordering	1h	RW	Set whether or not to use Relaxed Ordering as a Requester. 1b: Support (Default) 0b: not supported
3	Unsupported Request Reporting Enable	0h	RW	ERR_NONFATAL due to Unsupported Request detection Controls the generation of ERR_FATAL Message. 1b: enables Message generation.
2	Fatal Error Reporting Enable	0h	RW	Controls the generation of ERR_FATAL Messages. 1b: enables Message generation.
1	Non-Fatal Error Reporting Enable	0h	RW	Controls generation of ERR_NONFATAL Message. 1b: enables Message generation.
0	Correctable Error Reporting Enable	0h	RW	Controls the generation of ERR_COR Messages. 1b: enables Message generation.

17 to 10	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
9	Hardware Autonomous Width Disable	0h	RW	Controls Link width change. 0b: Enable of Link Width Change 1b: Disable Note: Reserved in Function #1

Bit	Bit Name	Initial Value	R/W	Description
8	Enable Clock Power Management	0h	RW	Controls Enable/Disable of CLKREQ# mechanism in L1 and L2/L3 Ready.
7	Extended Synch	0h	RW	If set to 1b, 4096 FTS Ordered-sets is sent when transitioning from L0s to L0. Also, 1024 TS1 Ordered-sets are transmitted at the beginning of the Recovery state when transitioning from L1 to L0. The default value will be 0b.
6	Common Clock Configuration	0h	RW	Sets whether the Common Reference Clock is used. 0b: Provided by non-Common Reference Clock (Default) 1b: Supplied by Common Reference Clock
5, 4	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
3	Read Completion Boundary (RCB)	0h	RW	0b: 64 bytes (Default) 1b: 128 bytes
2	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
1, 0	Active State Power Management (ASPM) Control[1:0]	0h	RW	Sets the permission level for Active State Power Management. 00b: Disabled (Default) 01b: L0s Entry Supported 10b: L1 Entry Enabled 11b: L0s and L1 Entry Supported

Bit	Bit Name	Initial Value	R/W	Description
31 to 22	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
21	Link Equalization Request	0h	RW1	This bit is Set by hardware to request the Link equalization process to be performed on the Link. The default value of this bit is 0b. For Multi-Function Upstream Port, this bit must be implemented in Function 0 and RsvdZ in other Functions. Components that only support speeds below 8.0 GT/s are permitted to hardwire this bit to 0b.
20	Equalization Phase 3 Successful	0h	R	When set to 1b, this bit indicates that Phase 3 of the Transmitter Equalization procedure has successfully completed. The default value of this bit is 0b. For Multi-Function Upstream Port, this bit must be implemented in Function 0 and RsvdZ in other Functions. Components that only support speeds below 8.0 GT/s are permitted to hardwire this bit to 0b.
19	Equalization Phase 2 Successful	0h	R	When set to 1b, this bit indicates that Phase 2 of the Transmitter Equalization procedure has successfully completed. The default value of this bit is 0b. For Multi-Function Upstream Port, this bit must be implemented in Function 0 and RsvdZ in other Functions. Components that only support speeds below 8.0 GT/s are permitted to hardwire this bit to 0b.
18	Equalization Phase 1 Successful	0h	R	When set to 1b, this bit indicates that Phase 1 of the Transmitter Equalization procedure has successfully completed. The default value of this bit is 0b. For Multi-Function Upstream Port, this bit must be implemented in Function 0 and RsvdZ in other Functions. Components that only support speeds below 8.0 GT/s are permitted to hardwire this bit to 0b.
17	Equalization Complete	0h	R	When set to 1b, this bit indicates that the Transmitter Equalization procedure has completed. The default value of this bit is 0b. For Multi-Function Upstream Port, this bit must be implemented in Function 0 and RsvdZ in other Functions. Components that only support speeds below 8.0 GT/s are permitted to hardwire this bit to 0b.

Bit	Bit Name	Initial Value	R/W	Description
16	Current De-emphasis Level	0h	R	This is a Status register that indicates the De-emphasis Level during Gen3 operation. 1b: -3.5dB 0b: -6 dB (Default) Note: The initial value of this bit is 0b at reset and after Gen3-Linkup. However, although it indicates 1b at Gen1-Linkup, ignore this bit as it has no meaning in Gen1.
15 to 12	Compliance Preset De-emphasis[3:0]	0h	RW	Set Transmitter Preset(Gen3) and De-emphasis Level(Gen2) for Polling.Compliance State processing during Enter Compliance. (Gen3) 0000b: P0 (Default) 0001b: P1 0010b: P2 0011b: P3 0100b: P4 0101b: P5 0110b: P6 0111b: P7 1000b: P8 1001b: P9 1010b: P10 Others: Rsvd (Gen2) 0001b: -3.5 dB 0000b: -6 dB (Default) Note: Reserved in Function #1
11	Compliance SOS	0h	RW	If this bit is set to 1b, insert the SKP Ordered-set periodically during compliance pattern transmission. Note: Reserved in Function #1
10	Enter Modified Compliance	0h	RW	Setting bit for transmission of Modified Compliance pattern. 1b: Modified Compliance Pattern 0b: Compliance Pattern (Default) Note: Reserved in Function #1
9 to 7	Transmit Margin[2:0]	0h	RW	Adjust the voltage level of the Transmitter. 000b: Normal operating range 001b-111b: See Base Spec *Section 8.3.4 in PCIe standard*. Note: Reserved in Function #1
6	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
5	Hardware Autonomous Speed Disable	0h	RW	Controls the Link Speed Change function. 1b: Non-support of Link Speed Change (Disable) 0b: Support of Link Speed Change (Enable) Note: Reserved in Function #1
4	Enter Compliance	0h	RW	Setting to 1b allows transition to Compliance mode. At this time, the Link Speed will be the value set in the Target Link Speed field. Note: Reserved in Function #1
3 to 0	Target Link Speed[3:0]	3h	RW	Sets the Link Speed value for notification to the Root Complex during training. 0001b: 2.5 GT/s Target Link Speed 0010b: 5.0 GT/s Target Link Speed 0011b: 8.0 GT/s Target Link Speed (Default) 0100b: 16.0 GT/s Target Link Speed (Setting prohibited) All other encodings are reserved. Note: Reserved in Function #1

R/W(UDL)	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
25 to 16	Base Size 01[9:0]	0h	R (RW)	Sets the size of the TLP (DW Size) that will be accepted in Address Space 01 set in the Base Address Register and Base Address Mask Register. If a TLP with a packet length larger than the size set here is received (even if it is smaller than the Max Payload Size), a Completer Abort Error (CA) will be detected. Note that the default value is 000h, which disables this function.
15 to 10	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
9 to 0	Base Size 00[9:0]	0h	R (RW)	Sets the size of the TLP (DW Size) that will be accepted in Address Space 00 set in the Base Address Register and Base Address Mask Register. If a TLP with a packet length larger than the size set here is received (even if it is smaller than the Max Payload Size), a Completer Abort Error (CA) will be detected. Note that the default value is 000h, which disables this function.

R/W(UDL)	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
25 to 16	Base Size 03[9:0]	0h	R (RW)	Sets the size of the TLP (DW Size) that will be accepted in Address Space 03 set in the Base Address Register and Base Address Mask Register. If a TLP with a packet length larger than the size set here is received (even if it is smaller than the Max Payload Size), a Completer Abort Error (CA) will be detected. Note that the default value is 000h, which disables this function.
15 to 10	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
9 to 0	Base Size 02[9:0]	0h	R (RW)	Sets the size of the TLP (DW Size) that will be accepted in Address Space 02 set in the Base Address Register and Base Address Mask Register. If a TLP with a packet length larger than the size set here is received (even if it is smaller than the Max Payload Size), a Completer Abort Error (CA) will be detected. Note that the default value is 000h, which disables this function.

(47) Message Data (Function #n) (PCI_EP_MSGDAT_Fn) (n = 0, 1)

Access Size : 32 bits
Offset Address : <PCI0_base> + 60ECh
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W(PCIe)	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
R/W(UDL)	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Message Data[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W(PCIe)	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW
R/W(UDL)	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
15 to 0	Message Data[15:0]	0h	RW	Set Data[15:0] to be set in the MSI Message. If the Multiple Message Enable field is 011b (8), the Function (UDL) side can change the lower 3 bits of the Message data, and 8 types of vectors can be notified to the system as Message_Data. Similarly, in the case of 010b (4), the lower 2 bits can be changed by the function (UDL) side, and 4 types of vector can be changed. In the case of 001b (2), the lower 1 bit can be changed by the function (UDL) side, and 2 types of vector are set. In the case of 000b (1), 1 type of vector is set for the set data only. Note: Specify 0b for invalid high-order bits (in the above example of Multiple Message Enable setting 4, high-order bits other than the low-order 2 bits to be changed on the Function side) for the vector specification value on each Function side.

R/W(UDL)	RW1	RW1	R	RW1	R	R	R	R	R	R	R	RW1	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
20	Unsupported Request Error Status	0h	RW1	Indicates that an unsupported TLP was received. 0b: No error detected 1b: error detected
19	ECRC Error Status Optional	0h	RW1	Indicates that an ECRC Error was received. 0b: No error detected 1b: error detected
18	Malformed TLP Status	0h	RW1	Indicates that a Malformed TLP was received. 0b: No error detected 1b: error detected
17	Receiver Overflow Status Optional	0h	RW1	Indicates that a TLP with a size larger than the free credits in the receive buffer was received. 0b: No error detected 1b: error detected
16	Unexpected Completion Status	0h	RW1	Indicates that a Completion was received, but there is no record of a corresponding Non-Posted Request sent (due to a mismatch with the Transaction Descriptor). 0b: No error detected 1b: error detected
15	Completer Abort Status Optional	0h	RW1	Indicates that a Completion whose Completion Status is Completer Abort (CA) was returned after receiving a Non-Posted Request. 0b: No error detected 1b: error detected
14	Completion Timeout Status	0h	RW1	Indicates that the corresponding Completion was not received within the specified time after sending a Non-Posted Request. 0b: No error detected 1b: error detected
13	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

Bit	Bit Name	Initial Value	R/W	Description
12	Poisoned TLP Received Status	0h	RW1	Indicates that a Poisoned TLP (with payload and the EP field in the header is 1b) has been received 0b: No error detected 1b: error detected
11 to 5	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
4	Data Link Protocol Error Status	0h	RW1	Indicates that a Sequence Number error was detected in the Data Link Layer. 0b: No error detected 1b: error detected
3 to 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

R/W(UDL)	RW	RW	R	RW	R	R	R	R	R	R	R	RW	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	-	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
20	Unsupported Request Error Mask	0h	RW	Masks error notification to Root Complex when Unsupported Request Error is detected. 0b: no mask 1b: Masks error message transmission, recording of the header in the Header Log register, and updating of the first error pointer.
19	ECRC Error Mask Optional	0h	RW	Masks error notification to Root Complex when ECRC Error is detected. 0b: no mask 1b: mask
18	Malformed TLP Mask	0h	RW	Masks error notification to Root Complex when Malformed TLP Error is detected. 0b: no mask 1b: Masks error message transmission, recording of the header in the Header Log register, and updating of the first error pointer.
17	Receiver Overflow Mask Optional	0h	RW	Masks error notification to Root Complex when Receiver Overflow Error is detected. 0b: no mask 1b: Masks error message transmission and updating of the first error pointer.
16	Unexpected Completion Mask	0h	RW	Masks error notification to Root Complex when Unexpected Completion Error is detected. 0b: no mask 1b: Masks error message transmission, recording of the header in the Header Log register, and updating of the first error pointer.
15	Completer Abort Mask Optional	0h	RW	Masks the error notification to the Root Complex when a Completer Abort Error is detected. 0b: no mask 1b: Masks error message transmission, recording of the header in the Header Log register, and updating of the first error pointer.
14	Completion Timeout Mask	0h	RW	Masks error notification to Root Complex when Completion Timeout Error is detected. 0b: no mask 1b: Masks error message transmission and updating of the first error pointer.
13	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

Bit	Bit Name	Initial Value	R/W	Description
12	Poisoned TLP Received Mask	0h	RW	Masks error notification to Root Complex when Poisoned TLP Error is detected. 0b: no mask 1b: Masks error message transmission, recording of the header in the Header Log register, and updating of the first error pointer.
11 to 5	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
4	Data Link Protocol Error Mask	0h	RW	Masks error notification to Root Complex when Data Link Protocol Error is detected. 0b: no mask 1b: Masks error message transmission and updating of the first error pointer.
3 to 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

R/W(UDL)	RW	RW	R	RW	R	R	R	R	R	R	R	RW	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 23	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
22	-	1h	R (RW)	Reserved Whenever it is read, 1b is read. The write value should always be 1b.
21	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
20	Unsupported Request Error Severity	0h	RW	Set the Error Severity when Unsupported Request Error is detected. 0b: Non-Fatal Error 1b: Fatal Error
19	ECRC Error Severity Optional	0h	RW	Sets the Error Severity when receiving an ECRC Error. 0b: Non-Fatal Error 1b: Fatal Error
18	Malformed TLP Severity	1h	RW	Sets the Error Severity when Malformed TLP Error is detected. 0b: Non-Fatal Error 1b: Fatal Error
17	Receiver Overflow Severity Optional	1h	RW	Set the Error Severity when Receiver Overflow Error is detected. 0b: Non-Fatal Error 1b: Fatal Error
16	Unexpected Completion Severity	0h	RW	Sets the Error Severity when an Unexpected Completion Error is detected. 0b: Non-Fatal Error 1b: Fatal Error
15	Completer Abort Severity Optional	0h	RW	Sets the Error Severity when a Completer Abort Error is detected. 0b: Non-Fatal Error 1b: Fatal Error
14	Completion Timeout Severity	0h	RW	Sets the Error Severity when Completion Timeout Error is detected. 0b: Non-Fatal Error 1b: Fatal Error
13	-	1h	R	Reserved Whenever it is read, 1b is read. The written value will be ignored.
12	Poisoned TLP Received Severity	0h	RW	Sets the Error Severity when Poisoned TLP Error is detected. 0b: Non-Fatal Error 1b: Fatal Error

Bit	Bit Name	Initial Value	R/W	Description
11 to 5	-	1h	R	Reserved Whenever it is read, 1h is read. The written value will be ignored.
4	Data Link Protocol Error Severity	1h	RW	Sets the Error Severity when a Data Link Protocol Error is detected. 0b: Non-Fatal Error 1b: Fatal Error
3 to 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

(54) Correctable Error Status Register (Function #n) (PCI_EP_CESTS_Fn) (n = 0, 1)

This register indicates the correctable error status.

Access Size : 32 bits
Offset Address : <PCI0_base> + 6110h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W(PCIe)	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
R/W(UDL)	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	Advisory Non-Fatal Error Status	Replay Timer Timeout Status	-	-	-	REPLAY_NUM Rollover Status	Bad DLLP Status	Bad TLP Status	-	-	-	-	-	Receiver Error Status Optional
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W(PCIe)	R	R	RW1	RW1	R	R	R	RW1	RW1	RW1	R	R	R	R	R	RW1
R/W(UDL)	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 14	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
13	Advisory Non-Fatal Error Status	0h	RW1 (R)	Indicates that an Advisory Non-Fatal Error was detected. 0b: No error detected 1b: error detected
12	Replay Timer Timeout Status	0h	RW1 (R)	Indicates that a Timeout error occurred when a TLP was sent and an Ack or Nak DLLP could not be received within the specified time. 0b: No error detected 1b: error detected
11 to 9	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
8	REPLAY_NUM Rollover Status	0h	RW1 (R)	Replay occurred four times in a row, indicating REPLAY_NUM rolled over from 11b to 00b. 0b: No error detected 1b: error detected
7	Bad DLLP Status	0h	RW1 (R)	Indicates that a DLLP CRC error was detected. 0b: No error detected 1b: error detected
6	Bad TLP Status	0h	RW1 (R)	Indicates that a TLP CRC error or Sequence Number error was detected. 0b: No error detected 1b: error detected
5 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
0	Receiver Error Status Optional	0h	RW1 (R)	0b: No error detected 1b: error detected

R/W(PCIe)	R	R	RW	RW	R	R	R	RW	RW	RW	R	R	R	R	R	RW
R/W(UDL)	R	R	RW	RW	R	R	R	RW	RW	RW	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 14	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
13	Advisory Non-Fatal Error Mask	0h	RW	Masks error notification to Root Complex when an Advisory non-fatal error is detected. 0b: no mask 1b: Mask Advisory Non-Fatal Error handling (Mask updating First Error Pointer and Header Logging and sending Error Message)
12	Replay Timer Timeout Mask	0h	RW	Masks error notification to Root Complex when Replay Timer Timeout Error is detected. 0b: no mask 1b: Mask error message transmission
11 to 9	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
8	REPLAY_NUM Rollover Mask	0h	RW	REPLAY_NUM Mask error notification to Root Complex when Roll Over Error is detected. 0b: no mask 1b: Mask error message transmission
7	Bad DLLP Mask	0h	RW	Masks error notification to Root Complex when Bad DLLP Error is detected. 0b: no mask 1b: Mask error message transmission
6	Bad TLP Mask	0h	RW	Masks error notification to Root Complex when Bad TLP Error is detected. 0b: no mask 1b: Mask error message transmission
5 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
0	Receiver Error Mask Optional	0h	RW	0b: no mask 1b: Mask error message transmission

R/W(UDL)	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	Header of TLP associated with error 2[31:0]	0h	R	Indicates the 3rd DW of Header for the first detected Uncorrectable Error.

(60) Header Log Register 3 (Function #n) (PCI_EP_HLOG3_Fn) (n = 0, 1)

This register indicates the header log.

Access Size : 32 bits
Offset Address : <PCI0_base> + 6128h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Header of TLP associated with error 3[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W(PCIe)	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Header of TLP associated with error 3[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W(PCIe)	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
R/W(UDL)	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	Header of TLP associated with error 3[31:0]	0h	R	Indicates the 4th DW of Header for the first detected Uncorrectable Error.

(61) Root Error Command (Function #n) (PCI_EP_ROOTEC_Fn) (n = 0, 1)

This function is not supported.

(62) Root Error Status (Function #n) (PCI_EP_ROOTES_Fn) (n = 0, 1)

This function is not supported.

(63) Error source Identification Register (Function #n) (PCI_EP_ERRSI_Fn) (n = 0, 1)

This function is not supported.

(64) Device Serial Number Extended Capability Register (Function #n) (PCI_EP_DEVSNEXTC_Fn) (n = 0, 1)

This register specifies the device serial number extended capability.

Access Size : 32 bits
Offset Address : <PCI0_base> + 6150h
Initial Value : 1B01_0003h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Next Capability Offset[11:0]												Capability Version[3:0]			
Initial Value	0	0	0	1	1	0	1	1	0	0	0	0	0	0	0	1
R/W(PCIe)	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

(65) Serial Number Register (Lower DW) (Function #n) (PCI_EP_SNL_Fn) (n = 0, 1)

This register specifies the serial number of the device.

Access Size : 32 bits
Offset Address : <PCI0_base> + 6154h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PCI Express Device Serial Number Lower DW[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W(PCIe)	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PCI Express Device Serial Number Lower DW[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W(PCIe)	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
R/W(UDL)	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	PCI Express Device Serial Number Lower DW[31:0]	0h	R (RW)	The lower 32 bits of the IEEE standard 64-bit unique ID (EUI-64). EUI-64 consists of a 24-bit company ID and a 40-bit vendor-defined extension. When using a unique ID, write from the UDL side.

Note 1. The “PCI Express Device Serial Number” value must be the same value for all functions including lower/higher DW.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	Upstream Port 8.0 GTs Receiver Preset Hint for Lane 0[2:0]			Upstream Port 8.0 GTs Transmitter Preset for Lane 0[3:0]				-	Downstream Port 8.0 GTs Receiver Preset Hint for Lane 0[2:0]			Downstream Port 8.0 GTs Transmitter Preset for Lane 0[3:0]			
Initial Value	0	x	x	x	x	x	x	x	0	0	0	0	0	0	0	0
R/W(PCIe)	R	Hwinit	Hwinit	Hwinit	Hwinit	Hwinit	Hwinit	Hwinit	R	Hwinit	Hwinit	Hwinit	Hwinit	Hwinit	Hwinit	Hwinit
R/W(UDL)	R	Hwinit	Hwinit	Hwinit	Hwinit	Hwinit	Hwinit	Hwinit	R	Hwinit	Hwinit	Hwinit	Hwinit	Hwinit	Hwinit	Hwinit

Bit	Bit Name	Initial Value	R/W	Description
31	-	0h	R	Reserved Whenever it is read, undefined value is read. The written value will be ignored.
30 to 28	Upstream Port 8.0 GTs Receiver Preset Hint for Lane 1[2:0]	xh	Hwinit	The read value is undefined This field contains the Receiver Preset Hint value sent or received during Link Equalization. Usage of this field varies as follows: A: Downstream Port This field contains the value sent on the associated Lane during Link Equalization. This field is HwInit. B: Upstream Port, Crosslink Supported = 0b This field is intended for debug and diagnostics. It contains the value captured from the associated Lane during Link Equalization. This field is RO. Note: When crosslinks are supported, case C (below) applies and this captured information is not visible to software. Vendors are encouraged to provide an alternate mechanism to obtain this information. C: Upstream Port, Crosslink Supported = 1b This field is not used or affected by the current Link Equalization. The field value will be used if a future crosslink negotiation switches the Operating Port Direction so that case A (above) applies. This field is HwInit. The default value is 111b. EP: input signal

Bit	Bit Name	Initial Value	R/W	Description
27 to 24	Upstream Port 8.0 GTs Transmitter Preset for Lane 1[3:0]	xh	Hwinit	The read value is undefined This field contains the Transmit Preset value sent or received during Link Equalization. Usage of this field varies as follows: A: Downstream Port This field contains the value sent on the associated Lane during Link Equalization. This field is HwInit. B: Upstream Port, Crosslink Supported = 0b This field is intended for debug and diagnostics. It contains the value captured from the associated Lane during Link Equalization. Field is RO. Note: When crosslinks are supported, case C (below) applies and this captured information is not visible to software. Vendors are encouraged to provide an alternate mechanism to obtain this information. C: Upstream Port, Crosslink Supported = 1b This field is not used or affected by the current Link Equalization. The field value will be used if a future crosslink negotiation switches the Operating Port Direction so that case A (above) applies. This field is HwInit. The default value is 1111b. EP: input signal
23	-	0h	R	Reserved Whenever it is read, undefined value is read. The written value will be ignored.
22 to 20	Downstream Port 8.0 GTs Receiver Preset Hint for Lane 1[2:0]	All 0	Hwinit	The read value is undefined Receiver Preset Hint may be used as a hint for receiver equalization by this Port when the Port is operating as a Downstream Port. This field is ignored when the Port is operating as an Upstream Port. For an Upstream Port if Crosslink Supported is 0b, this field is RsvdP. Otherwise, this field is HwInit. The default value is 111b. EP: Fixed to 0 because Crosslink is not supported
19 to 16	Downstream Port 8.0 GTs Transmitter Preset for Lane 1[3:0]	All 0	Hwinit	The read value is undefined Transmitter Preset used for equalization by this Port when the Port is operating as a Downstream Port. This field is ignored when the Port is operating as an Upstream Port. For an Upstream Port if Crosslink Supported is 0b, this field is RsvdP. Otherwise, this field is HwInit. The default value is 1111b. EP: Fixed to 0 because Crosslink is not supported
15	-	0h	R	Reserved Whenever it is read, undefined value is read. The written value will be ignored.

Bit	Bit Name	Initial Value	R/W	Description
14 to 12	Upstream Port 8.0 GTs Receiver Preset Hint for Lane 0[2:0]	xh	Hwinit	The read value is undefined This field contains the Receiver Preset Hint value sent or received during Link Equalization. Usage of this field varies as follows: A: Downstream Port This field contains the value sent on the associated Lane during Link Equalization. This field is Hwlnit. B: Upstream Port, Crosslink Supported = 0b This field is intended for debug and diagnostics. It contains the value captured from the associated Lane during Link Equalization. This field is RO. Note: When crosslinks are supported, case C (below) applies and this captured information is not visible to software. Vendors are encouraged to provide an alternate mechanism to obtain this information. C: Upstream Port, Crosslink Supported = 1b This field is not used or affected by the current Link Equalization. The field value will be used if a future crosslink negotiation switches the Operating Port Direction so that case A (above) applies. This field is Hwlnit. The default value is 111b. EP: input signal
11 to 8	Upstream Port 8.0 GTs Transmitter Preset for Lane 0[3:0]	xh	Hwinit	The read value is undefined This field contains the Transmit Preset value sent or received during Link Equalization. Usage of this field varies as follows: A: Downstream Port This field contains the value sent on the associated Lane during Link Equalization. This field is Hwlnit. B: Upstream Port, Crosslink Supported = 0b This field is intended for debug and diagnostics. It contains the value captured from the associated Lane during Link Equalization. This field is RO. Note: When crosslinks are supported, case C (below) applies and this captured information is not visible to software. Vendors are encouraged to provide an alternate mechanism to obtain this information. C: Upstream Port, Crosslink Supported = 1b This field is not used or affected by the current Link Equalization. The field value will be used if a future crosslink negotiation switches the Operating Port Direction so that case A (above) applies. This field is Hwlnit. The default value is 1111b. EP: input signal
7	-	0h	R	Reserved Whenever it is read, undefined value is read. The written value will be ignored.
6 to 4	Downstream Port 8.0 GTs Receiver Preset Hint for Lane 0[2:0]	All 0	Hwinit	The read value is undefined Receiver Preset Hint may be used as a hint for receiver equalization by this Port when the Port is operating as a Downstream Port. This field is ignored when the Port is operating as an Upstream Port. For an Upstream Port if Crosslink Supported is 0b, this field is RsvdP. Otherwise, this field is Hwlnit. The default value is 111b. EP: Fixed to 0 because Crosslink is not supported
3 to 0	Downstream Port 8.0 GTs Transmitter Preset for Lane 0[3:0]	All 0	Hwinit	The read value is undefined Transmitter Preset used for equalization by this Port when the Port is operating as a Downstream Port. This field is ignored when the Port is operating as an Upstream Port. For an Upstream Port if Crosslink Supported is 0b, this field is RsvdP. Otherwise, this field is Hwlnit. The default value is 1111b. EP: Fixed to 0 because Crosslink is not supported

6.6.4.3 PHY Register Descriptions

The following lists the PHY registers. These registers control the PHY layer.

6.6.4.3.1 List of Physical Layer Control/Status Registers

The following is a list of physical layer control/status registers.

These registers control the pins for setting the PHY built into the macro.

When these registers are accessed for writing, PHY_REG_CLK_EN (permission register (offset: 300h) bit[1]) must be set to 1b before a write access is made. In addition, rewrite the registers while the PCIe logic and PHY resets (other than ARESETn, RST_CFG_B, and RST_LOAD_B) are asserted.

Register Name	Abbreviation	Initial Value	Offset Address	Access Size [bits]
XCFGD Setting Register	PCI_PHY_XCFGD	xxxx_xxxxh	2000h / 2010h / 2020h / … / 2230h	32
Reserved	-	-	2244h to 23FFh	-
XCFGA_CMN Setting Register	PCI_PHY_XCFGD_CMN	xxxx_xxxxh	2400h / 2410h / 2420h / … / 24F0h	32
Reserved	-	-	24F4h to 24FFh	-
XCFGA_L0 Setting Register	PCI_PHY_XCFGD_L0	xxxx_xxxxh	2500h / 2510h / 2520h / … / 2550h	32
Reserved	-	-	2554h to 255Fh	-
XCFGA_L1 Setting Register	PCI_PHY_XCFGD_L1	xxxx_xxxxh	2560h / 2570h / 2580h / … / 25B0h	32
Reserved	-	-	25B4h to 27FFh	-
XCFGO Monitor Register	PCI_PHY_XCFGO	xxxx_xxxxh	2800h / 2810h / 2820h / … / 28A0h	32
Reserved	-	-	28A4h to 2BFFh	-
MISC Setting Register	PCI_PHY_MISC	0000_0000h	2A00h	32
Reserved	-	-	2A04h to 2DFFh	-
PHY Monitor Register 1	PCI_PHY_MON1	xxxx_xxxxh	2E00h	32
Reserved	-	-	2E04h to 2E0Fh	-
PHY Monitor Register 2	PCI_PHY_MON2	0000_00x0h	2E10h	32

6.6.4.3.2 Register Descriptions

(1) XCFGD Setting Register (PCI_PHY_XCFGD)

This register is for setting the PHY setting pin XCFGD of the PCI Express core.

Do not change this register from its initial value.

Access Size : 32 bits

Offset Address : <PCI0_base> + 2000h / 2010h / 2020h / … / 2230h

Initial Value : xxxx_xxxxh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	XCFGD[31:16]															
Initial Value	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	XCFGD[15:0]															
Initial Value	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	XCFGD[31:0]	xh	RW	Sets each bit of the PHY setting pin XCFGD.

Note: x = Undefined

(2) XCFGA_CMN Setting Register (PCI_PHY_XCFGD_CMN)

This register is for setting the PHY setting pin XCFGA_CMN of the PCI Express core.

Do not change this register from its initial value.

Access Size : 32 bits

Offset Address : <PCI0_base> + 2400h / 2410h / 2420h / … / 24F0h

Initial Value : xxxx_xxxxh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	XCFGA_CMN[31:16]															
Initial Value	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	XCFGA_CMN[15:0]															
Initial Value	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	XCFGA_CMN [31:0]	xh	RW	Sets each bit of the PHY setting pin XCFGA_CMN

Note: x = Undefined

(3) XCFGA_L0 Setting Register (PCI_PHY_XCFGD_L0)

This register is for setting the PHY setting pin XCFGA_L0 of the PCI Express core.

Do not change this register from its initial value.

Access Size : 32 bits

Offset Address : <PCI0_base> + 2500h / 2510h / 2520h / … / 2550h

Initial Value : xxxx_xxxxh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	XCFGA_L0[31:16]															
Initial Value	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	XCFGA_L0[15:0]															
Initial Value	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	XCFGA_L0 [31:0]	xh	RW	Sets each bit of the PHY setting pin XCFGA_L0

Note: x = Undefined

(4) XCFGA_L1 Setting Register (PCI_PHY_XCFGD_L1)

This register is for setting the PHY setting pin XCFGA_L1 of the PCI Express core.

Do not change this register from its initial value.

Access Size : 32 bits

Offset Address : <PCI0_base> + 2560h / 2570h / 2580h / … / 25B0h

Initial Value : xxxx_xxxxh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	XCFGA_L1[31:16]															
Initial Value	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	XCFGA_L1[15:0]															
Initial Value	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	XCFGA_L1 [31:0]	xh	RW	Sets each bit of the PHY setting pin XCFGA_L1

Note: x = Undefined

(5) XCFGO Monitor Register (PCI_PHY_XCFGO)

This is a register for monitoring the PHY Debug pin XCFGO of the PCI Express core.

Do not change this register from its initial value.

Access Size : 32 bits

Offset Address : <PCI0_base> + 2800h / 2810h / 2820h / … / 29F0h

Initial Value : xxxx_xxxxh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	XCFGO[31:16]															
Initial Value	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	XCFGO[15:0]															
Initial Value	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	XCFGO[31:0]	xh	R	Register for monitoring the PHY Debug pin XCFGO inside the macro

Note: x = Undefined

(6) MISC Setting Register (PCI_PHY_MISC)

This register is for setting the PHY sideband pin of the PCI Express core.

Do not change this register from its initial value.

Access Size : 32 bits
Offset Address : <PCI0_base> + 2A00h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	VCONTROL[4:0]					-	DEBUG_SEL[6:0]						
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	R	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 13	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
12 to 8	VCONTROL [4:0]	0h	RW	This pin is for setting the PHY test mode. Fix to 0b for normal use.
7	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
6 to 0	DEBUG_SEL [6:0]	0h	RW	Switches the PHY internal information output to PHY Monitor register 1 (Offset: 2E00h).

(7) PHY Monitor Register 1 (PCI_PHY_MON1)

This register is monitoring PHY of the PCI Express core.

Do not change this register from its initial value.

Access Size : 32 bits
Offset Address : <PCI0_base> + 2E00h
Initial Value : xxxx_xxxxh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DEBUG_OUT[31:16]															
Initial Value	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DEBUG_OUT[15:0]															
Initial Value	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DEBUG_OUT [31:0]	xh	R	PHY internal state/internal signal monitor area.

Note: x = Undefined

(8) PHY Monitor Register 2 (PCI_PHY_MON2)

This register is monitoring PHY of the PCI Express core.

Do not change this register from its initial value.

Access Size : 32 bits
Offset Address : <PCI0_base> + 2E10h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	RxElecIdle_L1	RxElecIdle_L0	BistOK_G3_L1	BistOK_G2_L1	BistOK_G3_L0	BistOK_G2_L0
Initial Value	0	0	0	0	0	0	0	0	0	0	x	x	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
5	RxElecIdle_L1	xh	R	Electrical idle signal for Lane 1 Receiver
4	RxElecIdle_L0	xh	R	Electrical idle signal for Lane 0 Receiver
3	BistOK_G3_L1	0h	R	BIST test result output pin for Lane1 in 8.0 GT/s mode
2	BistOK_G2_L1	0h	R	BIST test result output pin for Lane1 in 2.5 GT/s and 5.0 GT/s modes.
1	BistOK_G3_L0	0h	R	BIST test result output pin for Lane0 in 8.0 GT/s mode
0	BistOK_G2_L0	0h	R	BIST test result output pin for Lane0 in 2.5 GT/s and 5.0 GT/s modes.

Note: x = Undefined

6.6.5 Functional Description

6.6.5.1 PCIe Core Functions

The functional description of the unit is given below.

This unit is configured based on the Base Spec 4.0. For the detailed specification, refer to the Base Spec 4.0. This section mainly describes the parts specific to Renesas Electronics.

6.6.5.2 Issuing of PCIe Requests and Register Access (by AXI)

The following gives functional description on access to the PCI Express core by the AXI bus.

6.6.5.2.1 PCIe Requests which can be Issued (Supported Commands for TX)

Requests to be issued via pcie windows

MRd: Memory Read Request

MWr: Memory Write Request

Requests to be issued by the registers

MRd: Zero-Length Memory Read Request

CfgRd0: Configuration Read Type 0

CfgWr0: Configuration Write Type 0

CfgRd1: Configuration Read Type 1

CfgWr1: Configuration Write Type 1

Msg: Message Request

MsgD: Message Request with data payload

Unsupported requests (issuance prohibited)

IORd: I/O Read Request

IOWr: I/O Write Request

MRdLk: Memory Read Request-Locked

CplDLk: Completion for Locked Memory Read

CAUTION

If non-posted request with data (CfgWr0/CfgWr1/IOWr) which should not be transmitted is issued inadvertently in EPS mode, an MRd (non-posted request without data) which can be normally transmitted in EP mode may not also be transmitted after that.

6.6.5.2.2 Register Access

1) Internal register read/write

2) Configuration register read/write

The following restrictions apply to access to the configuration registers.

- Byte-lane transfer is only acceptable if the transfer consists of consecutive valid bytes.
- If the valid bytes are not consecutive, only values which are no greater than 32 bits (1 dword) and do not span the dword alignment are acceptable.

  Example) A value which can represent a dword TLP for PCIe

6.6.5.2.3 Issuing Memory Requests

Access from the AXI side is converted into a PCIe request and then issued. Up to eight windows can be allocated. Note that only incremental bursts and fixed bursts (of 1 beat) are acceptable. Wrapping bursts and fixed bursts (of 2 or more beats) are prohibited. If these prohibited bursts are received, the unit operates as follows.

- Although the response will in general be “OKAY” (except in cases that involved a protocol error of the AXI), this is beyond the scope of guaranteed operation.
- Unexpected requests may be issued to the PCIe bus.
- Unexpected registers may be modified.

To maintain the order between memory writing and memory reading, only issue next transactions after the reception of responses to writing. Buffering is not available in the issuing of memory write requests. (Refer to the description of AWCACHE* of Mode Set 0 Register (offset: 314h).)

(1) Memory Write Transaction from the AXI

A write transaction from the AXI via a window is converted into a MWr command and then issued.

- Number of write transactions which can be accepted at a time: 1
- Write data are held in an internal buffer.
- The order between memory write transactions is preserved (with the exception of transactions for messages and configuration).
- The order of memory write and other transactions is not preserved (a preceding memory read may be overtaken).
- To preserve the order between memory writing and memory reading or of Msg and MsgD, make sure that a next transaction is only issued after a response is returned. Buffering is not available in the issuing of memory write requests.
- Writing does not proceed if the PCI power state is not D0.
- Transactions where all bits of WSTRB are 0 during a burst return an “OKAY” response, but the written data are not reflected.
- Memory requests are not issued after an acknowledgement for PME_Turn_Off Message reception/Non-D0 State transition request reception has been asserted (Precautions: Only for Endpoint mode).

(2) Memory Read Transaction from the AXI

A read transaction from the AXI via a window is converted into an MRd command and then issued.

- Number of read transactions which can be accepted at a time: 1 to 8
- Read data are held in an internal buffer to preserve the order of transactions with the same ID.
- To preserve the order of memory read transactions from a given master ID, the system can also wait until the indicator of completion of a preceding read transaction is returned. The method of waiting is selectable as either of the above by the setting of an internal register as listed in the table below.

PCIe Request Order*1	Method of Waiting	Performance	Severity of Order
0 (initial value)	Data read are held in an internal buffer.	✓	—
1	Have the system wait for a read request to be issued.	—	✓

Note 1. The order can be set by using the PCIe Request Order bit (bit [0]) of Mode Set 1 Register (offset: 318h).

- The order of memory read transactions from a different master ID is not preserved.
- The order of memory read and other transactions is not preserved.
- To preserve the order between memory reading and memory writing, make sure that a next transaction is only issued after a response is returned. Buffering is not available in the issuing of memory write requests.
- MRdLk requests are not supported and therefore cannot be issued.
- Reading does not proceed if the PCI power state is not D0.
- Memory requests are not issued after an acknowledgement for PME_Turn_Off Message reception/Non-D0 State transition request reception has been asserted (Precautions: Only for Endpoint mode).

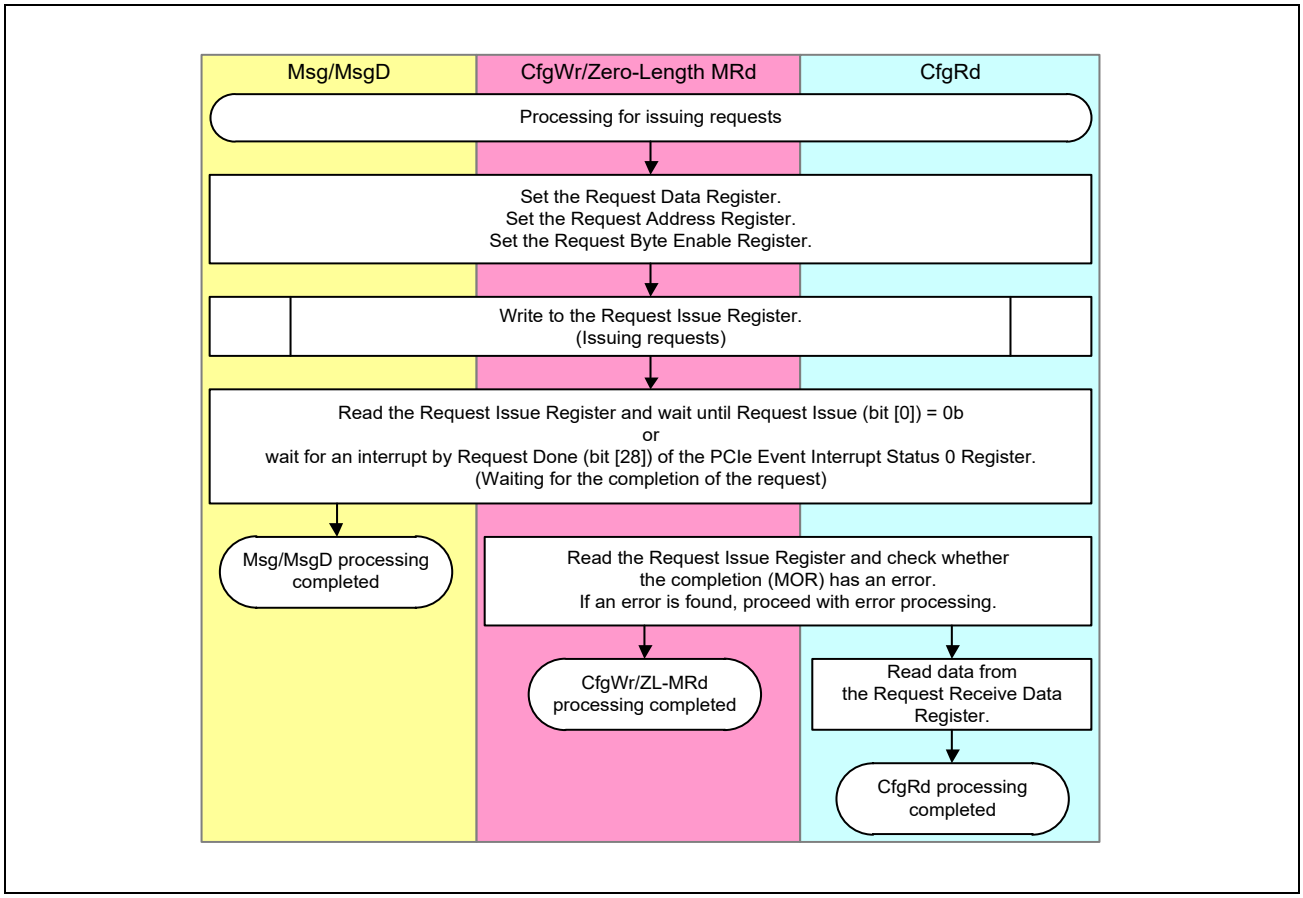
6.6.5.2.4 Issuing Special Requests

The following requests can be issued by controlling the internal registers.

- Configuration Read
- Configuration Write
- Zero-Length Memory Read Request
- Message Request
- Message Request with data payload

The internal registers are only writable from the AXI side. Attempted writing from the PCIe side is ignored and the write operation returns an “OKAY” response, but the written data are not reflected.

The figure below shows the flow of issuing requests by the registers.



(1) Issuing Message Requests

A message request is automatically issued by setting the Request Issue bit (bit [0]) of the Request Issue Register after access to an internal register through the AXI slave interface and setting a destination in Request Address Register 1.

(a) Flow of Issuing Message Requests

An example of the flow of issuing message requests is described below.

1. Set a destination in Request Address Register 1.

Bits [31:27]:	Reserved	Fixed to 0_0000b.
Bits [26:24]:	Routing Type	Specify the message routing.
Bits [23:8]:	Reserved	Fixed to 0000h.
Bits [7:0]:	Message Code	Specify the message code.

2. Set the 3rd header in Request Data Register 1 as required.
3. Set the 4th header in Request Data Register 2 as required.
4. For MsgD, set write data in Request Data Register 3 (not required in the case of Msg).
5. Message requests are automatically issued by setting the Request Issue bit (bit [0]) of the Request Issue Register to 1b (the TR type bits (bits [11:8]) of the Request Issue Register are used to set Msg/MsgD).
6. Read the Request Issue Register and wait (polling) or wait for an interrupt of Request Done (bit [28]) of PCIe Event Interrupt Status 0 Register until the Request Issue bit (bit [0]) is set to 0b, wait for the request to end.

(b) Notes when Issuing Message Requests

Points to note when issuing message requests are described below.

- INTx and error type messages are automatically issued. They do not require issuing as message requests by the user (prohibited).
- Set message headers appropriately.
- A value to be set in a message header must be 0 except when sending a vendor defined message.

(2) Issuing Zero-Length Read Requests

A zero-length read request is automatically issued by setting a destination in Request Address Register 1 after access to an internal register through the AXI slave interface and setting the Request Issue bit (bit [0]) of the Request Issue Register.

(a) Flow of Issuing Zero-Length Read Requests

An example of the flow of issuing zero-length read requests is described below.

1. Set a destination in Request Address Register 1.

   Bits [31:2]: Address Set the address.

   Bits [1:0]: Reserved Fixed to 00b.

2. Set a destination in Request Address Register 1.

   Bits [64:32]: Address Set the address.

3. Set Byte Enable (0000b) in Request Byte Enable Register.
4. Zero-length read requests are automatically issued by setting the Request Issue bit (bit [0]) of the Request Issue Register to 1b (the TR type bits (bits [11:8]) of the Request Issue Register are used to set zero-length read).
5. Read the Request Issue Register and wait (polling) or wait for an interrupt of Request Done (bit [28]) of PCIe Event Interrupt Status 0 Register until the Request Issue bit (bit [0]) is set to 0b, wait for the request to end.

6.6.5.3 Initiation of AXI Transactions and Register Access (by PCIe)

The following gives functional description on access to the AXI bus by the PCI Express core.

6.6.5.3.1 PCIe Requests which can be Received (Supported Commands for RX)

MRd: Memory Read Request

MWr: Memory Write Request

CfgRd0: Configuration Read Type 0

CfgWr0: Configuration Write Type 0

Msg: Message Request

MsgD: Message Request with data payload

Cpl: Completion

CplD: Completion with Data

The following requests are not supported.

MRdLk: Memory Read Request-Locked

IORd: I/O Read Request

IOWr: I/O Write Request

CplLK: Completion for Locked Memory Read without Data

CplDLk: Completion for Locked Memory Read

CfgRd1: Configuration Read Type 1

CfgWr1: Configuration Write Type 1

AtomicOP is not supported.

6.6.5.3.2 Initiation of AXI Transactions

Access from the PCIe side is converted into an AXI transaction and then issued. Up to eight windows can be allocated.

To avoid a read-after-write (RAW) hazard, only issue a next memory write request following reception of the completion TLP for the previous one.

Table 6.6-117 AXI Transaction from PCIe Request

PCIe Request	AXI Burst Type	AXI Bus Size	Division
MWr/MRd	Incremental	64	Yes
		32	No
IOWr/IORd	Unsupported request		
MRdLk	Unsupported request		

(1) Memory Write Transaction from the PCIe

- Allowable number of write requests to be issued: Variable (the value is set by the AXI Max Issue Write bits (bits [15:12]) of Mode Set 1 Register).
- Write data are not held in an internal buffer (buffering within the PCIe core).
- The order between memory write transactions is preserved.
- The order of memory writing and memory reading is not preserved.
- To preserve the order between memory writing and memory reading, make sure that a next request is only issued after a completion TLP is returned.
- AWCACHE and AWPROT can be set by using Mode Set 0 Register.
- In cases of contention between DMA transfer (from PCIe to AXI) and memory write transaction, requests are accepted in turn in round-robin fashion.

(2) Memory Read Transaction from the PCIe

- Allowable number of read requests to be issued: Variable (the value is set by the AXI Max Issue Read bits (bits [11:8]) of Mode Set 1 Register).
- Since the PCI specification requires dword-aligned memory addresses in transfer, invalid byte lanes may be read. If an AXI slave as a read destination has a register or FIFO buffer which has been cleared by being read, the transaction may be non-compliant.
- Data read are held in an internal buffer.
- The order between memory read operations is preserved.
- A preceding memory write is not overtaken.
  Data read are held in an internal buffer until a preceding memory write is completed.
  When a zero-length read request is received, an “OKAY” response is returned, but the written data are not reflected and a completion TLP is transmitted after waiting for the completion of the preceding memory write.
  Data read are held in an internal buffer until a preceding memory write is completed.
- ARCACHE can be set by using Mode Set 0 Register.
- In cases of contention between DMA transfer (from AXI to PCIe) and memory read transaction, requests are accepted in turn in round-robin fashion.

6.6.5.3.3 Narrow Transfer

Narrow transfer to be initiated by the AXI transfer only supports the following AXI transactions.

- MAxBURST = INCR
- MAxSIZE = 0h to 2h (8 bits / 16 bits / 32 bits)
- MAxLEN = 0h (1 beat)

The following restrictions apply to TLPs from the PCIe module in narrow transfer.

- The length is 1 dword.
- The First Byte Enable bit only supports the following.
  - MAxSIZE = 0h (8 bits): 1000b / 0100b / 0010b / 0001b
  - MAxSIZE = 1h (16 bits): 1100b / 0011b
  - MAxSIZE = 2h (32 bits): 1111b

6.6.5.4 DMAC Functions

This section explains functions of the DMAC within the unit. Control by registers and by descriptors are both supported as methods of DMA control. The method of control is independently selected per channel.

6.6.5.4.1 Register-Type Transfer

DMA transfer from AXI to PCIe or vice versa is handled by software making register settings. The table below lists the DMAC registers for execution of register-type DMA transfer.

Table 6.6-118 Registers Related to Register-Type DMA Transfer

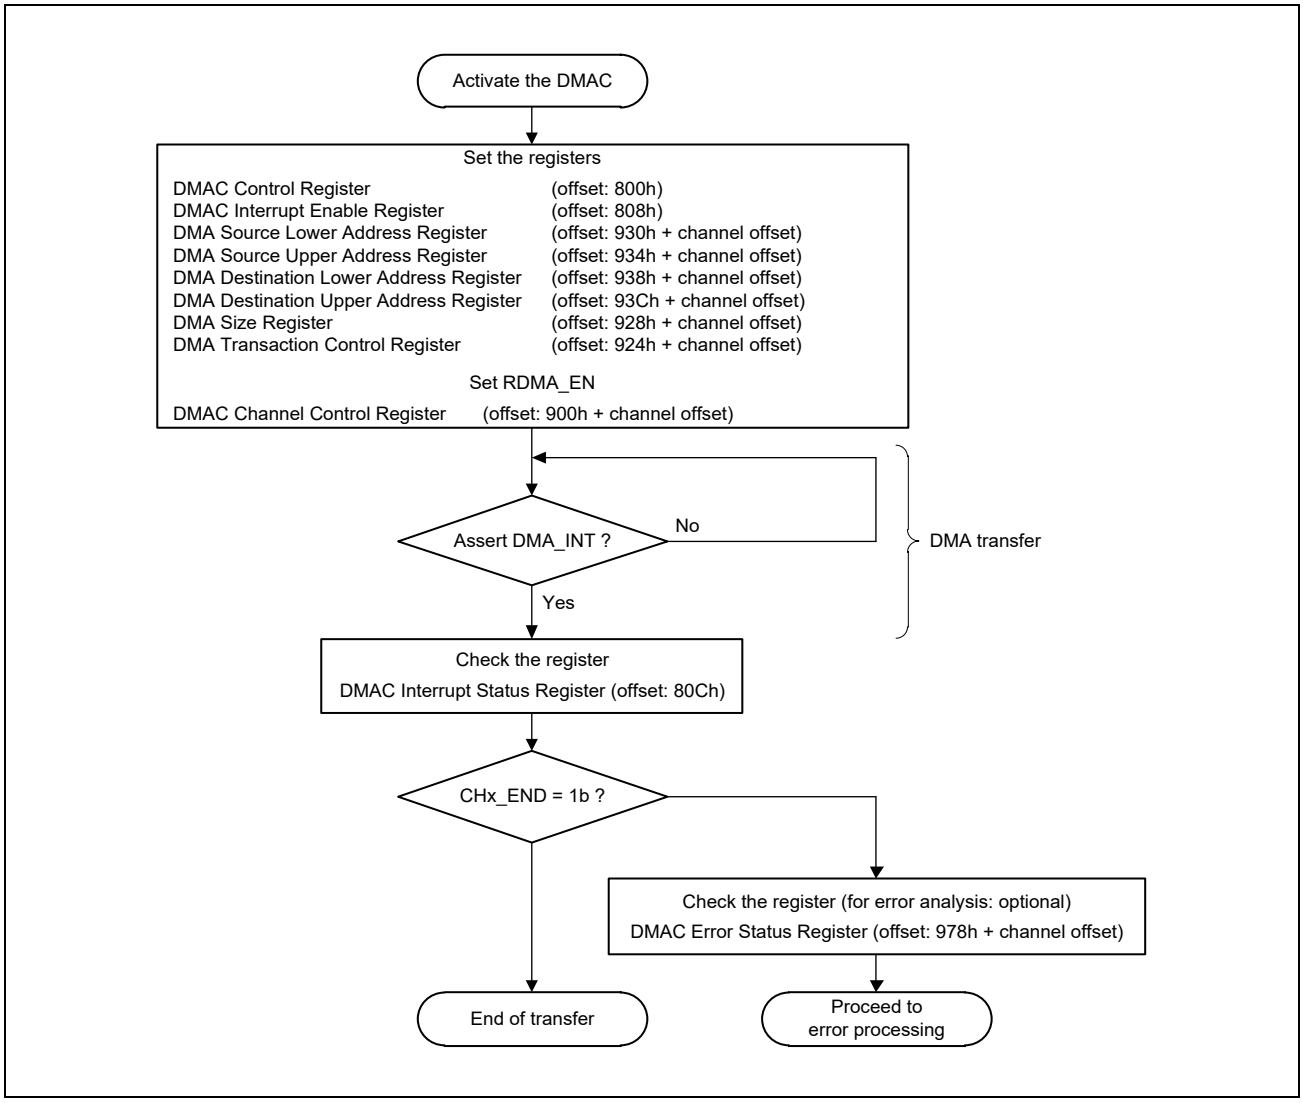
Common Control	
800h	DMAC Control Register
808h	DMAC Interrupt Enable Register
80Ch	DMAC Interrupt Status Register
Channel Control	
900h + channel offset	DMA Channel Control Register m
DMA Setting	
924h + channel offset	DMA Transaction Control Register m
928h + channel offset	DMA Size Register m
930h + channel offset	DMA Source Lower Address Register m
934h + channel offset	DMA Source Higher Address Register m
938h + channel offset	DMA Destination Lower Address Register m
93Ch + channel offset	DMA Destination Higher Address Register m
DMA Status	
950h + channel offset	DMA Rest Size Register m
960h + channel offset	AXI Request Address (Lower) Register m
964h + channel offset	AXI Request Address (Higher) Register m
968h + channel offset	PCIe Request Address(Lower) Register m
96Ch + channel offset	PCIe Request Address(Higher) Register m
978h + channel offset	DMAC Error Status Register m

(1) Flow of Operations

The following describes the procedures for settings to activate and stop the DMAC in the case of register-type transfer.

(a) Activation and Normal Operation

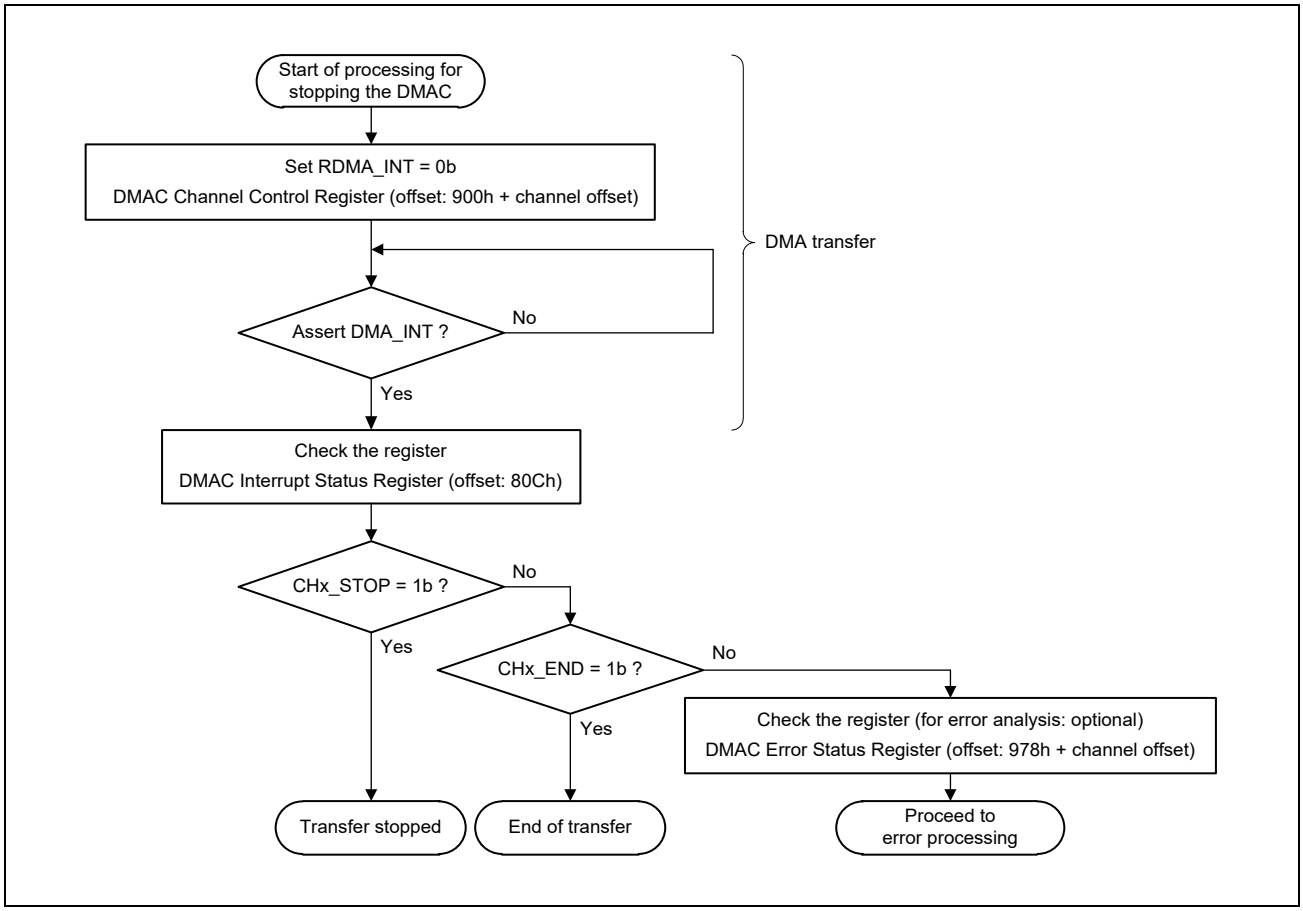
Before activating the DMAC, set the PCIe and AXI windows. After that, set the registers of the DMAC to start the DMAC.



(b) Stopping DMA Transfer

The following describes the procedure for settings to stop DMA transfer under software control.

- DMA transfer can be stopped by writing 0b to the RDMA_EN (register type DMA control enable) bit (bit [0]) of the DMAC channel control register (offset: 900h + channel offset).
- Following the detection of RDMA_EN being 0b, the unit waits for the completion of any request which has already been issued before asserting the interrupt signal (DMA_INT).
- After waiting for the assertion of DMA_INT, poll the CHx_STOP bit of the DMAC Interrupt Status Register (offset: 80Ch) to check that its value is 1b.
- This indicates that DMA transfer has been stopped. If the CHx_STOP bit is 0b, check the CHx_END bit for the given channel in the same register.
- If a last request is still being executed when RDMA_EN is set to 0b, the CHx_END bit indicates the completion of DMA transfer as in normal operation.
- The address to which transfer was most recently completed before it was stopped and the remaining number of bytes for transfer can be checked by reading the DMA Status registers (offset: 950h + channel offset to 978h + channel offset) for the given channel.

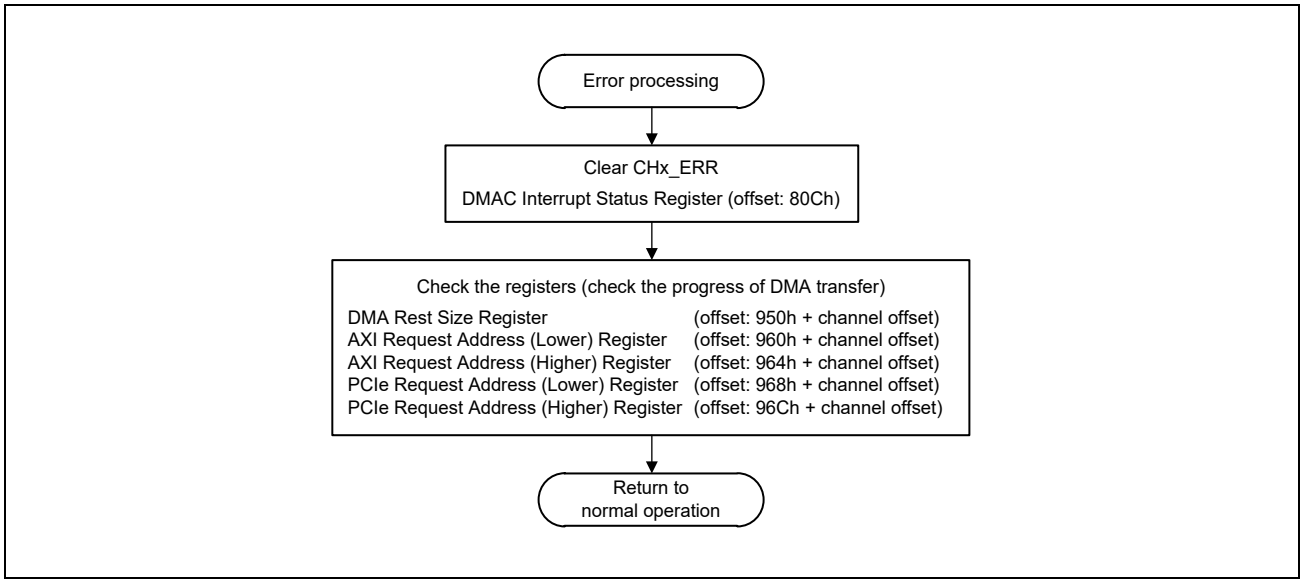


(c) Error Processing

If an error is detected in the AXI bus or a PCIe link while DMA transfer is in progress, the DMA_INT interrupt signal is asserted.

Check the channel where the error was found (CHx_ERR = 1b) by using the DMAC Interrupt Status Register (offset: 80Ch) and also the type of error by using the DMAC Error Status Register (offset: 978h + channel offset) as required.

Clear the CHx_ERR bit that is currently set in the DMAC interrupt status register (offset: 80Ch) by writing 0b to it and check the address to which transfer was most recently completed before it was stopped and the remaining number of bytes for transfer by reading the DMA Status registers (offset: 950h + channel offset to 978h + channel offset) for the given channel.



6.6.5.4.2 Descriptor-Type Transfer

Consecutive DMA transfer is achieved by sequentially reading descriptors which indicate parameters of DMA transfer. Descriptors are allocated to the AXI memory space and the descriptor lists indicate the addresses where the descriptors start. This DMAC has a queue for storing multiple descriptor lists and these descriptor lists are written by software. The first list loaded in the queue is executed after being moved to become the descriptor list for execution following the detection of the condition for starting DMA transfer (the DMAC retains up to nine lists, including the one currently being executed).

Descriptors can have a chained configuration; execution of a descriptor list ends on detection of the last descriptor, and if the queue has a next list, execution of the next descriptor follows.

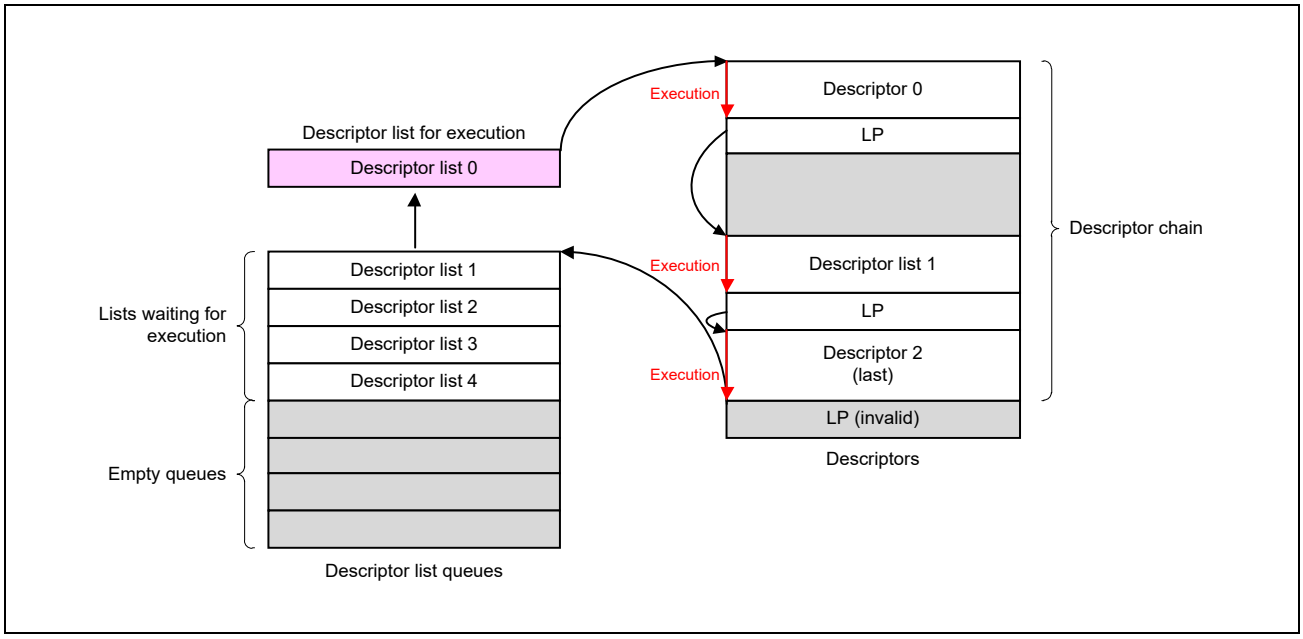


Figure 6.6-2 Descriptor Chain

The table below lists the DMAC registers for execution of descriptor-type DMA transfer.

Table 6.6-119 Registers Related to Descriptor-Type DMA Transfer

Common Control	
800h	DMAC Control Register
808h	DMAC Interrupt Enable Register
80Ch	DMAC Interrupt Status Register
Channel Control	
900h + channel offset	DMA Channel Control Register
908h + channel offset	Descriptor Start Address (Lower) Register m
90Ch + channel offset	Descriptor Start Address (Higher) Register m
910h + channel offset	QUE Entry Register
DMA Setting	
920h + channel offset	DMA Descriptor Control (Descriptor 00h) Register m
924h + channel offset	DMA Transaction Control (Descriptor 04h) Register m
928h + channel offset	DMA Size (Descriptor 08h) Register m
930h + channel offset	DMA Source Lower Address (Descriptor 10h) Register m
934h + channel offset	DMA Source Higher Address (Descriptor 14h) Register m
938h + channel offset	DMA Destination Lower Address (Descriptor 18h) Register m
93Ch + channel offset	DMA Destination Higher Address (Descriptor 1Ch) Register m

978h + channel offset	DMAC Error Status Register m

(1) Descriptor List Queues

The DMAC has queues for storing descriptor lists for each of the channels. The number of FIFO queue stages is eight, so it can hold up to eight descriptor list entries (not including the one currently being executed).

Software places descriptor list entries in the queue. The descriptor lists to be entered are set by the QUE_ENTRY register.

Since the target registers are also accessible in 8-bit units, making the settings in byte units through multiple accesses is also possible. A descriptor list entry is placed in the queue at the time when the QUE_ENTRY (higher) bits [31:24] are written. When making the settings and entering lists in the queue, take care with the order of register access (values written to the QUE_ENTRY (higher) bits [31:26] will not affect the register values and settings because they are read-only bits).

When the DMAC detects the presence of a list which has been entered in the queue, the first list entry is moved to become the pointer to the next descriptor for execution and DMA transfer starts.

(2) Descriptor List Format

The table below is the format of a descriptor list.

Table 6.6-120 Descriptor List Format

Offset	Byte 3			Byte 2	Byte 1	Byte 0
00h	DSA					
04h	Reserved	EI	LS	Reserved	LABEL	

Field Name	Description
DSA[31:0]	Descriptor start address for DMA. This field indicates the address where the first descriptor to be executed is stored. Since the setting is for 8-byte alignment and allocation of a single descriptor (00h to 1Ch) to straddle a 4-K boundary is prohibited, the 5 lower-order bits [4:0] are fixed to 0b.
EI	End Interrupt bit. This bit indicates whether an interrupt (Interrupt Status CHx_END of the DMAC Interrupt Status Register (offset: 80Ch)) is or is not conveyed when processing of this descriptor list is completed. 1b: The interrupt is conveyed. 0b: The interrupt is not conveyed.
LS	List Stop bit. This bit indicates whether DMA transfer is or is not to be stopped on completion of processing for this descriptor list entry. 1b: Stopped 0b: Not stopped On completion of the list in which the setting of this bit is 1b, the QUE_EN bit of the DMAC control register is cleared.
LABEL[15:0]	This field represents the label of the list. There are no special rules for the setting procedures. The value can be set as desired.

Operations by the settings of the EI and LS bits following the completion of the descriptor list are as follows.

Table 6.6-121 Details of the EI/LS Bits

EI	LS	Description
0b	0b	No interrupt. DMA transfer is not stopped. If the queue has a next list, execution of the next descriptor follows.
0b	1b	No interrupt. DMA transfer is stopped (QUE_EN is cleared).
1b	0b	Interrupt (DMAC Interrupt Status Register (Offset: 80Ch), Interrupt Status CHx_END) is present. DMA transfer is not stopped. If the queue has a next list, execution of the next descriptor follows.
1b	1b	Interrupt (DMAC Interrupt Status Register (Offset: 80Ch), Interrupt Status CHx_END) is present. DMA transfer is stopped (QUE_EN is cleared).

(3) Descriptor Format

The table below is the format of descriptors.

Table 6.6-122 Descriptor List Format

Offset	Byte 3								Byte 2								Byte 1								Byte 0							
00h	DSCFM				WBD	LE	LV		D	—	—	—	—	—	—	—	STS (not used)															
04h	SA																															
08h	DA																															
0Ch	SIZE																															
10h	PUA																															
14h	—	—	—	—	—	—	—	—	CCH_L				CCH_D				—	TC		—	—	ATB		—	FUNC				—	—	—	DIR
18h	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
1Ch	LP																															

Field Name	Description
DSCFM[3:0]	The Descriptor Format field specifies the format of descriptors. This DMAC only supports 0001b. Do not set any other value.
WBD	Write Back Disable bit Indicates whether the DMAC writes 0b back to the LV bit when DMA transfer specified by a single descriptor is completed. 1b: The LV bit is not written back. 0b: The LV bit is written back.
LE	List End bit Indicates the end of the current descriptor chain. 1b: The current descriptor is the last of the chain. 0b: The current descriptor is not the last of the chain.
LV	Link Valid bit Indicates that the descriptor is valid. When DMA transfer is completed, the DMAC writes 0b back to this bit. When DMA transfer ends due to an error, write-back does not proceed. 1b: The descriptor is valid (DMA transfer specified by the descriptor is not completed). 0b: The descriptor is not valid (DMA transfer specified by the descriptor is completed).
D	Descriptor error bit Indicates a descriptor access error. If LV = 0 when the descriptor is read, the DMAC writes 1b back to the LV bit. When a descriptor error occurs, if the setting of the LE bit is 0 (indicating that the current descriptor is not the last of the chain), the DMAC continues transfer in accord with the descriptor the LP bits indicate. 1b: A descriptor access error occurred. 0b: No error
STS[15:0]	This field has no effect when DSCFM = 0001b. The DMAC does not use this field.
SA[31:0]	The Source Address field indicates the address of the source data for transfer. Since the setting is for 8-byte alignment, do not set a value other than the 3 lower-order bits ([2:0]).
DA[31:0]	The Destination Address field indicates the destination address. Since the setting is for 8-byte alignment, do not set a value other than the 3 lower-order bits ([2:0]).
SIZE[31:0]	This field indicates the number of bytes for transfer. Since the setting is for 8-byte alignment, do not set a value other than the 3 lower-order bits ([2:0]).
PUA[63:32]	The PCIe Higher Address field indicates the higher-order part ([63:32]) of the address in the PCL2 memory space. In the case of DMA transfer from PCIe to AXI (DIR = 0b), this field indicates the source address; in the case of DMA transfer from AXI to PCIe (DIR = 1b), it indicates the destination address.

Field Name	Description
CCH_L[3:0]	This field indicates the value of A*CACHE[3:0] to be issued through the AXI. The value of CCH_L[3:0] is output when an AXI request including the last byte is issued in transfer specified in the SIZE bits. Bit [3]: Write allocation Bit [2]: Read allocation Bit [1]: Cache enabled Bit [0]: Buffer enabled The recommend value is 0000b regardless of whether DIR is 0 or 1.
CCH_D[3:0]	This field indicates the value of A*CACHE[3:0] to be issued through the AXI. The value of CCH_D[3:0] is output when an AXI request other than the condition for the output of CCH_L[3:0] is issued. Bit [3]: Write allocation Bit [2]: Read allocation Bit [1]: Cache enabled Bit [0]: Buffer enabled The recommended value is 0001b when DIR = 0b (PCIe → AXI) and 0000b when DIR = 1b (AXI → PCIe).
TC[2:0]	This field specifies the value of the traffic class of the request to be issued through the PCIe interface. The value must be fixed to 000b.
ATB[1:0]	This field indicates the value of the attribute to be issued through the PCIe interface. Bit [1]: Relaxed ordering Bit [0]: No-snoop If neither relaxed ordering nor no-snoop is used, this field should be set to 00b (recommended).
FUNC[2:0]	This field specifies the function number of the request to be issued through the PCIe interface.
DIR	This bit indicates the direction of data transfer. 1b: AXI → PCIe 0b: PCIe → AXI
LP[31:0]	This field indicates the address where a next descriptor is stored. Since the setting is for 8-byte alignment, do not set a value other than the 3 lower-order bits ([2:0]).

The conditions where the descriptor is written back after the descriptor is read, the timings, and the corresponding bits are listed below.

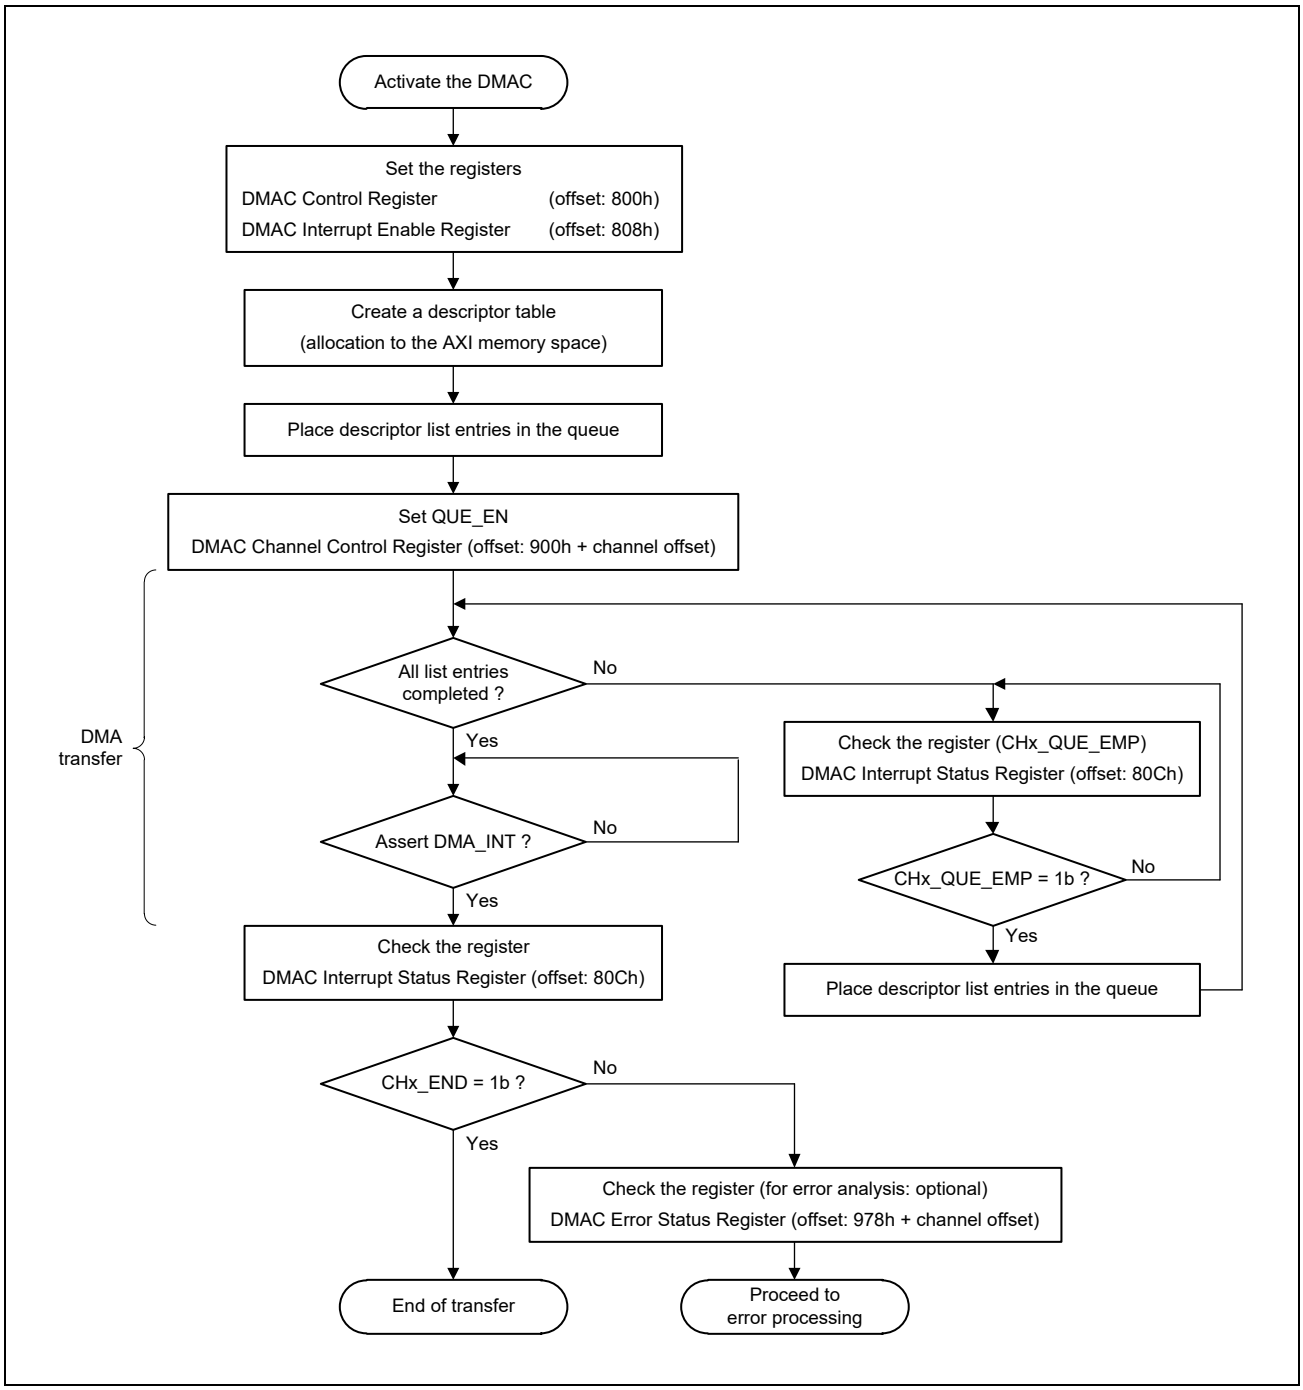
Condition	Timing	Corresponding Bit and Value
WBD = 0b && LV = 1b	After DMA transfer specified by the descriptor is completed	LV = 0b
WBD = (1b or 0b) && LV = 0b	After the descriptor is read (DMA transfer does not proceed)	D = 1b
WBD = 1b && LV = 1b	Write-back does not proceed.	—

(4) Flow of Operations

The following describes the procedures for settings to activate and stop the DMAC in the case of descriptor-type transfer.

(a) Activation and Normal Operation

Before activating the DMAC, set the PCIe and AXI windows. After that, set the registers of the DMAC to start the DMAC.

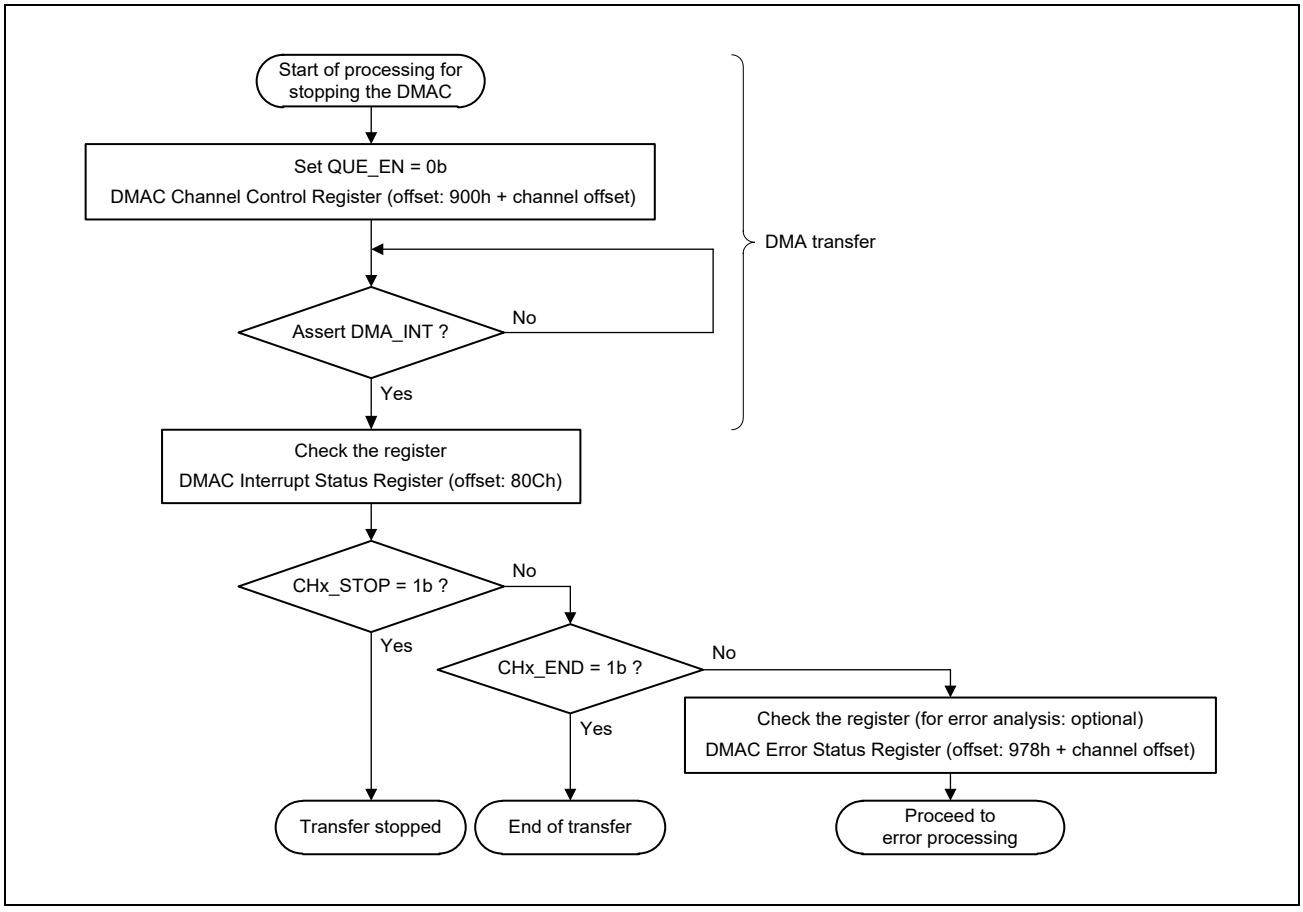


(b) Stopping DMA Transfer

The following describes the procedure for settings to stop DMA transfer under software control.

DMA transfer can be stopped by writing 0b to the QUE_EN (queue enable) bit (bit [1]) of the DMAC channel control register (offset: 900h + channel offset). Following the detection of QUE_EN being 0b, the unit waits for the completion of any request which has already been issued before asserting the interrupt signal (DMA_INT). After waiting for the assertion of DMA_INT, poll the CHx_STOP bit of the DMA interrupt status register (offset: 80Ch) to check that its value is 1b. This indicates that DMA transfer has been stopped. If the CHx_STOP bit is 0b, check the CHx_END bit for the given channel in the same register. If a last request is still being executed when QUE_EN is set to 0b, the CHx_END bit indicates the completion of DMA transfer as in normal operation.

The address to which transfer was most recently completed before it was stopped and the remaining number of bytes for transfer can be checked by reading the DMA Status registers (offset: 950h + channel offset to 978h + channel offset) for the given channel.

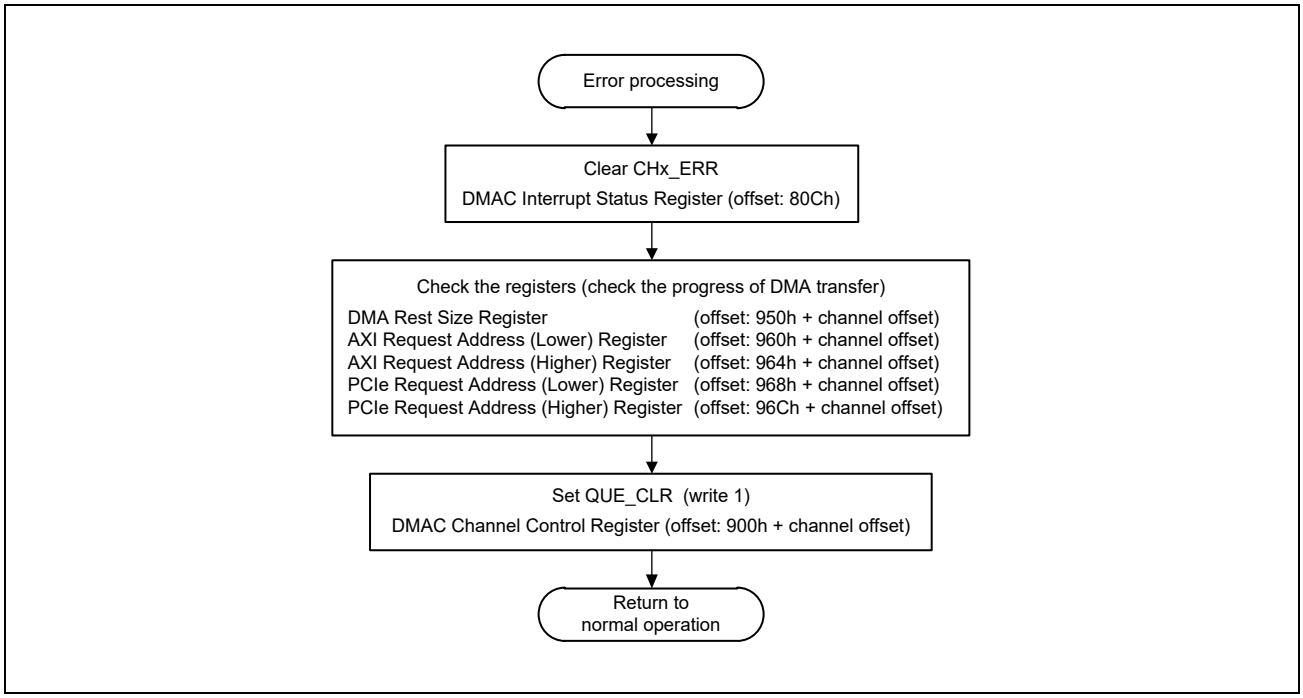


(c) Error Processing

If an error is detected in the AXI bus or a PCIe link while DMA transfer is in progress, the DMA_INT interrupt signal is asserted. Check the channel where the error was found (CHx_ERR = 1b) by using the DMAC interrupt status register and also the type of error by using the DMAC error status register (offset: 978h + channel offset) as required.

Clear the CHx_ERR bit that is currently set in the DMAC interrupt status register (offset: 80Ch) to 0b by writing to it. The address to which transfer was most recently completed before it was stopped and the remaining number of bytes for transfer can be checked by reading the DMA Status registers (offset: 950h + channel offset to 978h + channel offset) for the given channel.

Based on that information, setting the registers as described in **6.6.5.4.2(4)(a) Activation and Normal Operation** and create a descriptor table again. At this time, write 1b to the QUE_CLR bit (bit [8]) of the DMAC channel control register (offset: 900h + channel offset). Writing 1b to it leads to clearing of the queue. The descriptor lists registered in the queue (those waiting for execution and the one currently being executed) are all cleared.



6.6.5.4.3 Method of Transfer

This section describes the issuing of requests to the AXI or PCIe and data transfer in the case of DMA transfer. In either direction of transfer (from AXI to PCIe or vice versa), a request is issued to the reading side. After confirming the completion of preparation (reception) of the data to be read, a request is issued to the writing side for data transfer.

(1) DMA Transfer from PCIe to AXI

An MRd is issued to the PCIe module and an AXI write request is transferred following the reception of CplD from the PCIe. MRd requests corresponding to the number of outstanding transfers can be issued regardless of the reception of CplD. The received CplD (read data) is stored in the data buffer (RAM) once and then transferred by the DMAC to the AXI.

(2) DMA Transfer from AXI to PCIe

After the DMAC is activated, a read request (address channel) is issued to the AXI. The reception of data for reading from the given AXI slave starts and an MWr is issued to the PCIe. Data are repeatedly transferred until the completion of DMA data transfer corresponding to the amount of data set in the DMA Size bits.

6.6.5.4.4 Inter-Channel Arbitration

The DMAC arbitrates the following three types of request between channels.

1) PCIe Read Request
2) AXI Read Request
3) AXI Write Request

PCIe write requests do not require arbitration because data read over the AXI are returned one by one.

In the case of arbitration on the AXI side, not only requests for DMA data, but also reading and writing of descriptor data are subject to arbitration (each channel has a single source of requests for arbitration since a channel will not output a descriptor and request for data at the same time).

(1) Method of Arbitration

An MRd is issued to the PCIe module and an AXI write request is transferred following the reception of CplD from the PCIe. MRd requests corresponding to the number of outstanding transfers (eight) can be issued regardless of the reception of CplD. The received CplD (read data) is stored in the data buffer (RAM) once and then transferred by the DMAC to the AXI.

Arbitration for each type of request 1) to 3) above proceeds in round-robin fashion. A channel for which execution has just been completed is given the lowest priority and each channel which had a lower priority than that channel is raised by one rank in the order of priority.

The initial order of priority is ch. 0 > ch. 1 > ch. 2 > ch. 3 > ch. 4 > ch. 5 > ch. 6 > ch. 7.

The order of priority is changed every time a single request is completed.

There are two types of request for the AXI, requests for DMA data and requests for descriptors, but they are not distinguished for purposes of arbitration.

6.6.5.4.5 DMA Completed Interrupt

The DMAC has interrupt functions. It supports two types of interrupt source: one set is for normal operation and the other is for errors. For details, see **6.6.5.6.5 DMA Interrupt**.

6.6.5.5 Reception of PCIe Commands

6.6.5.5.1 Reception of MSIs (Root Complex)

When an MSI is received (see the judgment conditions below), it is forwarded to AXI as a write transaction and reflected in the MSI reception status (see the description of [Status]). An interrupt signal (INTMSI_RC) is asserted when the MSI reception interrupt generation condition is met (see the description of [Interrupt conditions]). The software identifies an MSI by the interrupt factor. If Message Data Enable=0, the factor can be identified by reading the data on the memory.

[Related registers]

- MSI Receive Window Address (Lower) Registers (Offset: 100h): Message Data Enable
- PCI INTx Receive Interrupt Enable Registers (Offset: 110h): MSI Receive Interrupt Enable
- PCI INTx Receive Interrupt Status Registers (Offset:114h): MSI Receive Interrupt Status
- MSI Receive Mast n Registers (Offset: 6x8h): MSI Mask
- MSI receive Status n Registers (Offset: 6xCh): MSI Status

The conditions for judging a request to be an MSI:

When all of the following conditions are satisfied, a request is judged to be an MSI.

(1) The request is a memory write request.

(2) The request is entered for any area within an AXI window.

(3) The address of an MWr from the PCIe interface must be within the area set by the MSI Reception Window Address register and the MSI Reception Window Mask register.
If a memory read request is received in the MSI reception area, the request is not judged to be an MSI so an interrupt is not generated.

(4) The length of memory write requests is 1 dword

(5) Matching of message data (only when Message Data Enable=1)

[Status]

(1) When Message Data Enable = 0
Set MSI Receive Interrupt Status (bit [4])

(2) When Message Data Enable = 1
Set the corresponding Vector bit in MSI Status

[Interrupt condition]

(1) When Message Data Enable = 0
When MSI Receive Interrupt Enable (bit [4]) is set

(2) When Message Data Enable = 1
When bit 0 of vector corresponding to MSI Mask is set

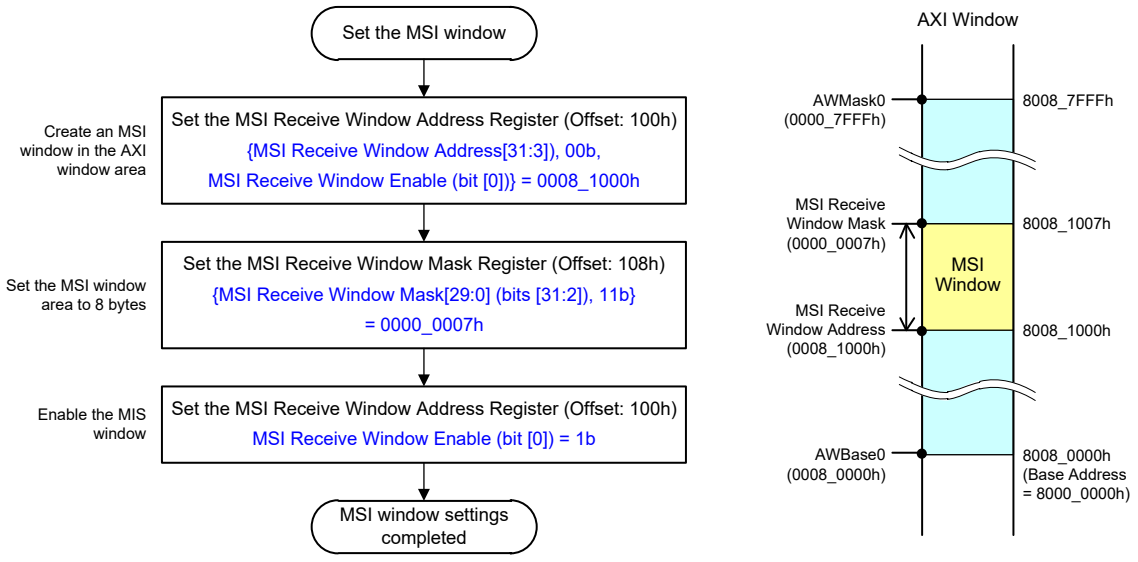
Notes on the MSI:

(1) When a response to the MSI write transaction is returned, this unit judges execution of the MSI to have been completed and asserts an interrupt signal. Depending on the system, however, the MSI memory write transaction may not be completed due to the latency over the AXI to the actual memory even if the interrupt signal is asserted. To avoid this problem, buffering of AXI write transactions must be disabled (MAWCACHE[0] = 0b) at the time an MSI is issued.
For MAWCACHE[3:1], the setting of AWCACHE_L (bits [27:24]) of Mode Set 0 Register is used.

(2) If an MSI is received, the MSI write transaction is executed when MAWID[3:0] = 0001b. This is required for the unit to recognize the reception of the response to the MSI and for assertion of INTMSI_RC.

6.6.5.5.2 Setting the MSI Window

To enable MSI interrupts, the MSI window must be set. **Figure 6.6-3** shows example settings. The MSI window can be allocated within any AXI window.



Note: The values assigned in the figure (values in blue) are examples.

Figure 6.6-3 Settings for the MSI Window

6.6.5.5.3 Reception of an Interrupt in Response to a Message Request (Root Complex)

When Assert_INTx is received in response to an Msg request from the PCIe interface, the corresponding interrupt bit (bits [3] to [0]) is set in the PCI INTx Receive Interrupt Status Register (offset: 114h) and an interrupt (INTx_RC) is asserted. When Deassert_INTx is received in response to a message request, the corresponding interrupt register (bit) is cleared and INTx_RC is de-asserted. The PCI INTx Receive Interrupt Status Register (offset: 114h) can be cleared by writing to it (RW1C) by software. In the PCIe, however, we do not recommend using software to clear an interrupt bit which has been set in response to an Msg in normal operation.

6.6.5.5.4 Reception of Message Requests

When a message is received through the PCIe interface, the relevant information is stored in the following registers.

Table 6.6-123 Message Related Registers

	Related Register
Message Code/Routing	Message Code Register (Offset: 130h)
Message Data	Message Data Register (Offset: 134h)
Message 3rd Header	Message Header 3rdDW Register (Offset: 138h)
Message 4th Header	Message Header 4thDW Register (Offset: 13Ch)

The corresponding bit in the Message Receive Interrupt Status Register is set at the same time as the reception of the following messages, and this is indicated by an interrupt.

Received Message		Corresponding Bit in Message Receive Interrupt Status Register
Type of Message	Message Code	
PM_Active_State_Nak	0001_0100h	Bit [19]
PM_PME	0001_1000h	Bit [18]
PME_Turn_Off	0001_1001h	Bit [17]
PME_TO_Ack	0001_1011h	Bit [16]

In the reception of PM messages other than the above, the relevant information is not written to the registers listed in **Table 6.6-123**.

- Unsupported messages:
  - Unlock
  - Vendor Defined Type 0
  - Vendor Defined Type 1

6.6.5.6 Interrupt

This unit prepares the output of interrupt signals in the ways stated below. The states of all interrupt signals are indicated at a glance in the Interrupt Table Register.

6.6.5.6.1 Error and Event Interrupt Notification

Table 6.6-124 Error/Event Interrupt Outputs

Interrupt Source Name	Active	Attribute	Description
DMA_INT	High	Level	DMA-related event
PCIE_EVT_INT	High	Level	PCIe-related event
MSG_INT	High	Level	Reception of messages
AXI_ERR_INT	High	Level	AXI-related error

Interrupt Output Related Status Registers

DMA_INT: DMAC Interrupt Status Register (Offset: 80Ch)
DMAC Error Status Register (Offset: 978h / + Channel Offset)

PCIE_EVT_INT: PCIe Event Interrupt Status 0 Register (Offset: 204h)
PCIe Event Interrupt Status 1 Register (Offset: 20Ch)
PCIe Event Interrupt Status 2 Register (Offset: 244h)

MSG_INT: Message Receive Interrupt Status Register (Offset: 124h)

AXI_ERR_INT: AXI Master Error Interrupt Status Register (Offset: 214h)
AXI Slave Error Interrupt Status 1 Register (Offset: 224h)

(1) Unit-Internal RAM Parity Error Interrupt Notification

The detection of parity errors in the internal RAM of this unit is indicated by the output of interrupt signals in the ways described below. The type of parity error detecting RAM can be confirmed from the corresponding register bit. A breakdown of the device is a possibility.

PCIE_EVT_INT: PCIe Event Interrupt Status 0 Register (Offset: 204h)
PCIe Event Interrupt Status 1 Register (Offset: 20Ch)

DMA_INT: DMAC Interrupt Status Register (Offset: 80Ch)
DMAC Error Status Register (Offset: 968h / + Channel Offset)

CAUTION

A RAM parity function is not available because it is not implemented in this core.

6.6.5.6.2 INTx/MSI Interrupt Notification (Root Complex)

Table 6.6-125 INTx/MSI Interrupt Outputs

Interrupt Source Name	Active	Attribute	Description
INTA_RC	High	Level	Set in response to the reception of an assert INTA message and cleared in response to the reception of a deassert INTA message.
INTB_RC	High	Level	Set in response to the reception of an assert INTB message and cleared in response to the reception of a deassert INTB message.
INTC_RC	High	Level	Set in response to the reception of an assert INTC message and cleared in response to the reception of a deassert INTC message.
INTD_RC	High	Level	Set in response to the reception of an assert INTD message and cleared in response to the reception of a deassert INTD message.
INTMSI_RC	High	Level	Set when a memory write request comes from the PCIe to the area set in the MSI reception window.
INT_LINK_BANDWIDTH	High	Level	Set when the link width has been changed.
INT_PM_PME	High	Level	Set in response to the reception of PME event notification (PM_PME message).
INT_SERR_COR/ INT_SERR_NONFATAL/ INT_SERR_FATAL	High	Level	Set in response to the reception of a correctable error message, non-fatal error message, or fatal error message.

6.6.5.6.3 Issuing INTx/MSI Interrupts (Endpoint)

An endpoint indicates two types of interrupt to the root complex.

(1) Legacy interrupt (Assert INTx Message/Deassert INTx Message)

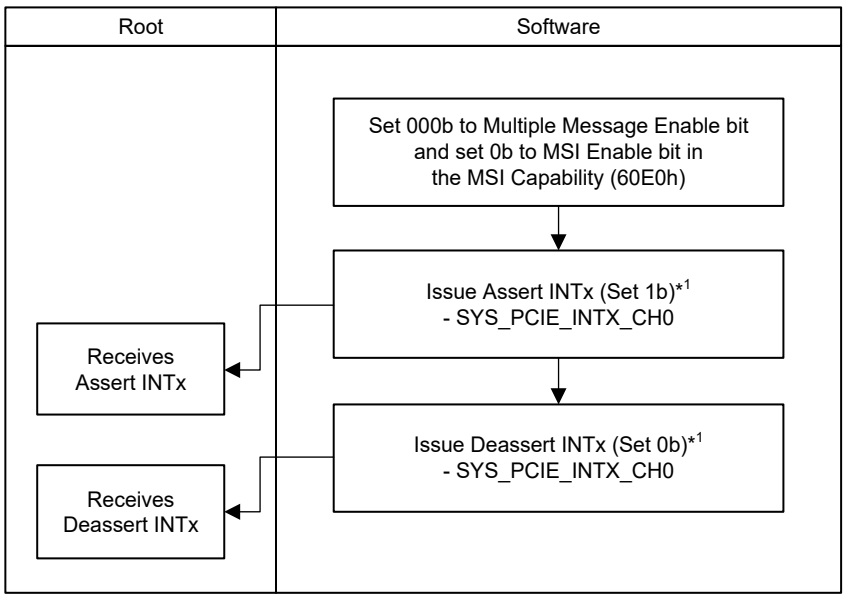
- Issuing INTx Msg specified by an interrupt register by controlling an interrupt input signal (INTX_EP_F*) (recommended)
- Issuing Assert INTx and Deassert INTx messages through the issuing of special requests.

(2) MSI

- Issuing an MSI by generating a memory write transaction directly.

The MSI Enable bit in the MSI Capability Register (PCIe configuration Register) can be used to switch exclusive operation of two interrupts on or off.

The legacy interrupt issuing flow is shown in **Figure 6.6-4** and the MSI issuing flow is shown in **Figure 6.6-5**.



Note 1. For details, refer to **(1) Issuing a Legacy PCI INTx Emulation Interrupt (when MSI Enable = 0b)**.

Figure 6.6-4 Legacy Interrupt Issuing Flow

To issue a legacy interrupt, the Interrupt Disable bit in the Command and Status Register (PCIe Configuration Register) must be cleared.

Furthermore, if writing proceeds in a power state other than D0 or a PME_TURN_OFF message is received, or if FLR_REQ is received, Deassert INTx Msg is automatically generated in response to the corresponding function asserting an INTx, and all active interrupts are withdrawn without waiting for the PME_Turn_Off Message reception/Non-D0 State transition request reception acknowledge/FLR_RESET response. However, when multiple functions share an INTx, the logical OR of the signals from the sharing functions is taken, a Deassert INTx Msg is generated, and the interrupts are withdrawn. If INTX_EP_F0/F1 is being asserted at the time of returning to the D0 state

once more or an FLR sequence is completed (indicated by the de-assertion of FLR_REQ), Assert INTx is generated again in response.

Table 6.6-126 INTx/MSI Interrupt Inputs

Interrupt Factor Name	Active	Attribute	Description
INTX_EP_F0	High	Level	This is the trigger for Assert INTx and Deassert INTx messages.
INTX_EP_F1	High	Level	

[Related registers]

PCI INTx Out Status Register (Offset: 118h)

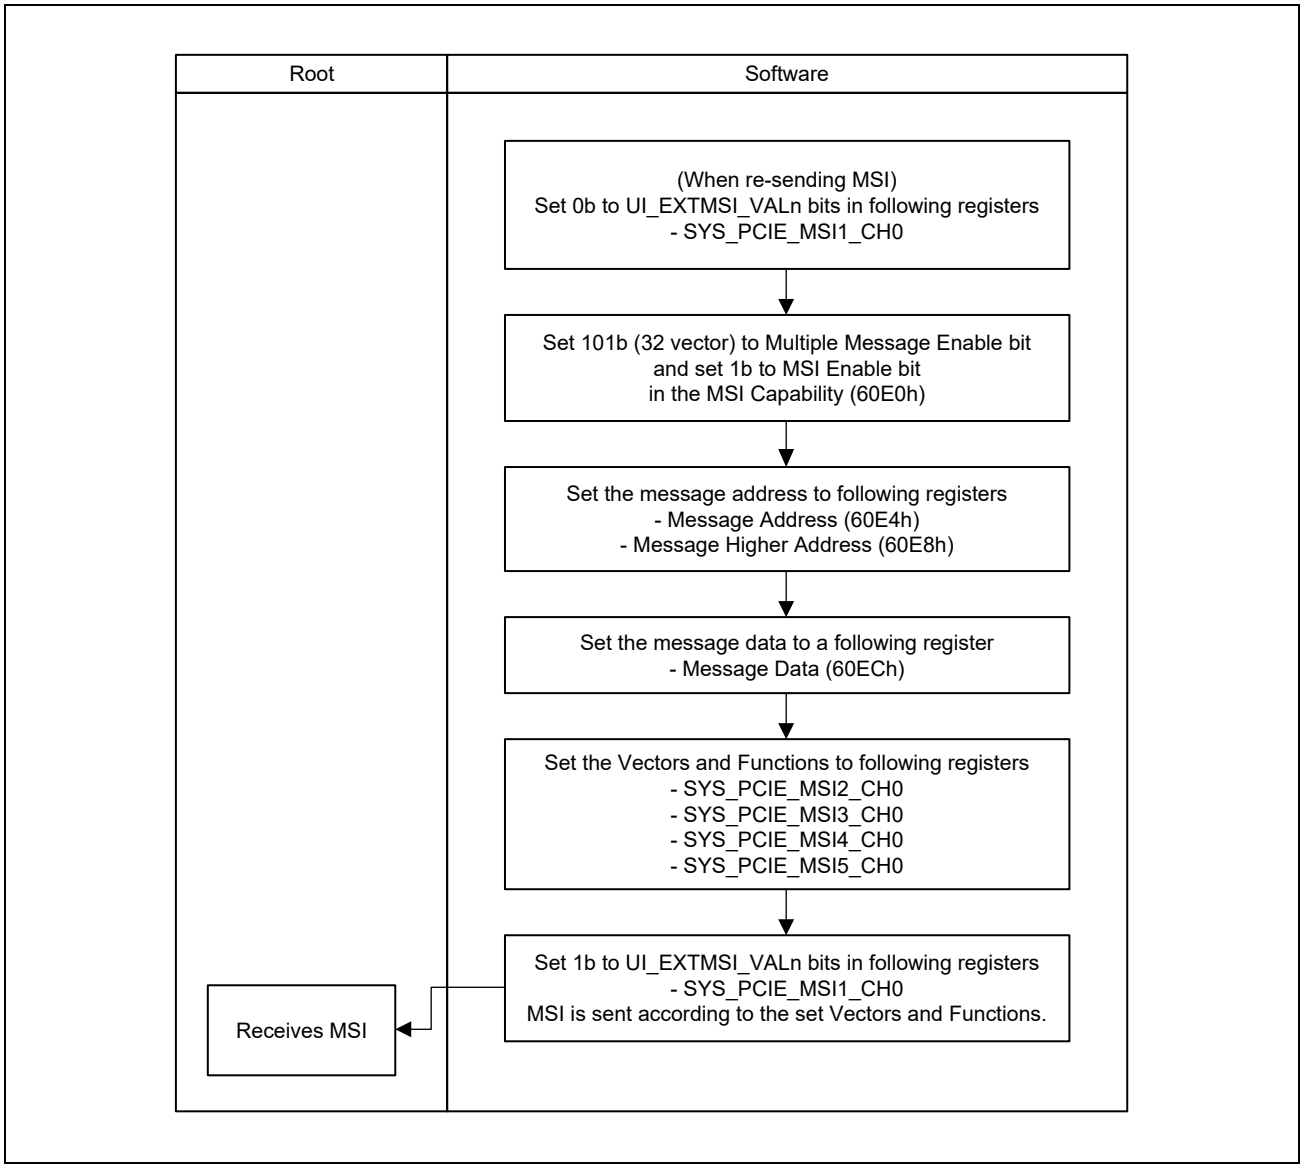


Figure 6.6-5 MSI Issuing Flow

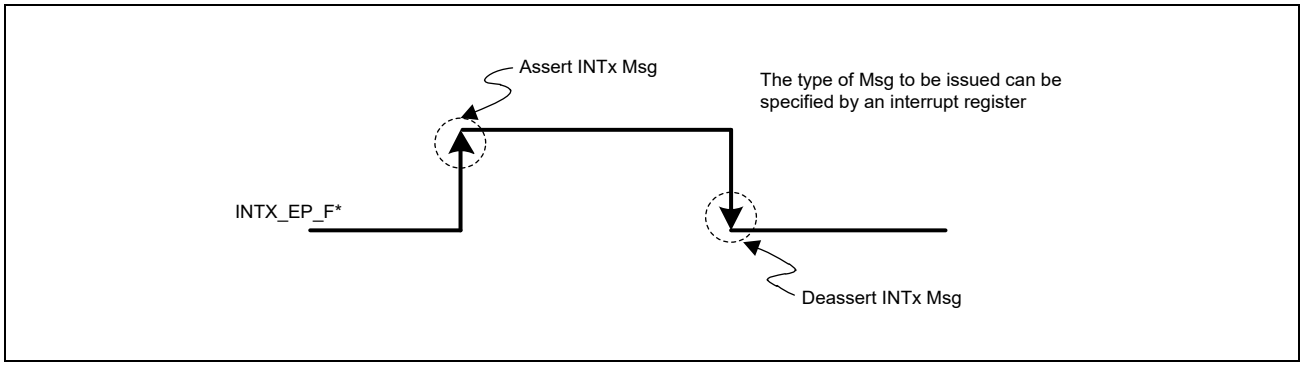
(1) Issuing a Legacy PCI INTx Emulation Interrupt (when MSI Enable = 0b)

A legacy PCI INTx emulation interrupt is issued by controlling INTX_EP_F*.

The type of Assert INTx and Deassert INTx Msg to be issued by controlling an interrupt signal is specified by an interrupt register provided for each of the functions. Assert INTx Msg is issued by setting INTX_EP_F* to 1, and Deassert INTx Msg is issued by clearing INTX_EP_F* to 0.

Make sure that an interrupt signal successfully arrives on the receiving side following the de-assertion of an interrupt signal. After completion of processing for an interrupt from a given source, negating the signal is recommended.



Changing the allocation of the legacy interrupt lines is possible by changing the interrupt register setting of the configuration register. If the same interrupt is shared by multiple functions, the logical OR of INTX_EP_F0 and INTX_EP_F1 is taken to issue an interrupt.

(2) MSI Transmission by Interrupt Input (when MSI Enable = 1b)

Five inputs are used in specifying the interrupt (MSI). In the same way, each interrupt indication has its corresponding specified interrupt vector.

Table 6.6-127 External Interrupt Notification

Interrupt Notification Name	Input/ Output	Note
UI_EXTMSI_VAL0/1/2/3/4	Input	Interrupt notification
UI_EXTMSI_VEC0/1/2/3/4 [4:0]	Input	Interrupt vector specification
UI_EXTMSI_FUNC0/1/2/3/4 [2:0]	Input	Interrupt function number specification

Note: Multiple Message Enable in the Base Spec.: Implemented as a specification that supports 32 (5 bits).
Multiple Message Enable on the RC side: Support for 32 is also required.

CAUTION

Take care that the specified vector value does not impose a related restriction on the Multiple Message Enable register. For example, if the number set for Multiple Message Enable is 4, the two lower-order bits within the value set for the Message Data are overwritten by the value specified for the UI_EXTMSI_VEC[*] bits, and at that time, specify the value 0 for the higher-order bits that are not overwritten by UI_EXTMSI_VEC[*] bits. Convey interrupts in the state where the vector value and function number have been specified.

(3) Flow of Asserting MSI Enable

The following is the flow of asserting the MSI Enable field (bit 16) of the MSI Capability register.

1. Negate all INTx_EP_F0/F1 (processing by the endpoint).
2. Wait until the Interrupt Status field (bit 19) of the Command and Status register becomes 0b (confirm that the device is not in the waiting state for INTx interrupt messages).
   (Processing by the root complex: CfgRd)
3. Write 1b to the MSI Enable field (bit 16) of the MSI Capability register.
   (Processing by the root complex: CfgWr)

6.6.5.6.4 Root Complex Interrupt Notification

When this unit is in the root complex configuration, it has the following interrupt sources.

- INT_LINK_BAND_WIDTH
- INT_PM_PME
- INT_SERR
- INT_SERR_COR
- INT_SERR_FATAL
- INT_SERR_NONFATAL

(1) Interrupt due to the Change to the Link Bandwidth (INT_LINK_BAND_WIDTH)

This interrupt source is conveyed in response to the change to the bandwidth in link negotiation of PCI Express.

Note that this interrupt source is enabled when the root complex in use and it is fixed to “0: Low” when the endpoint is in use.

This interrupt source is only enabled when the Link Bandwidth Notification Capability bit (bit 21) of the Link Capabilities register (offset: 60Ch) is set to 1b. This interrupt signal can also be disabled by setting the Link Bandwidth Notification Capability bit to 0b even in operation as the root complex.

If the Link Bandwidth Notification Capability bit (bit 21) is set to 1b, the Link Bandwidth Management Status bit (bit 30) and the Link Autonomous Bandwidth Status bit (bit 31) in the Link Status register (offset 70h) serve as a source of the interrupt. These bits are set to 1b when the bandwidth is changed.

Whether to enable this interrupt source corresponds to the respective states of the Link Bandwidth Management Interrupt Enable bit (bit 10) and the Link Autonomous Bandwidth Interrupt Enable (bit 11) of the Link Control register (offset: 70h).

[Related Registers]

Offset	Bit	Description
PCI Express Capability Structure: Link Control / Status		
06Ch	21	Link Bandwidth Notification Capability
070h	10	Link Bandwidth Management Interrupt Enable
	11	Link Autonomous Bandwidth Interrupt Enable
	30	Link Bandwidth Management Status
	31	Link Autonomous Bandwidth Status

(2) PM-PME Reception Interrupt (INT_PM_PME)

This interrupt source is conveyed when the notification of a PME event (PM_PME message) is received from the other-party device.

Note that this interrupt source is enabled when the root complex in use and it is fixed to “0: Low” when the endpoint is in use.

This interrupt source is only conveyed when the PME Interrupt Enable bit (bit 3) of the Root Control/Capabilities Register (offset: 7Ch) is set to 1b. This interrupt source is not conveyed when the PME Interrupt Enable bit (bit 3) is set to 0b.

Note that the reception state of the received PM_PME message and the ID information, etc. are stored in the Root Status Register (offset: 80h) regardless of the setting of the PME Interrupt Enable bit mentioned above.

[Related Registers]

Offset	Bit	Description
PCI Express Capability Structure: Root Control Capabilities		
07Ch	3	PME Interrupt Enable
PCI Express Capability Structure: Root Status		
080h	15:0	PME Requester ID
	16	PME Status
	17	PME Pending

(3) System Error Interrupt (INT_SERR_xxx)

This interrupt is conveyed when a correctable error message, non-fatal error message, or fatal error message is received.

INT_SERR: The system error notification mentioned in the Base Spec. is obtained as the logical OR of the following three signals.

INT_SERR_COR: System Error on Correctable Error

INT_SERR_FATAL: System Error on Fatal Error

INT_SERR_NONFATAL: System Error on Non-Fatal Error

These interrupt sources are enabled when the root complex is in use and these are fixed to “0: Low” when the endpoint is in use.

(a) Correctable Error Interrupt (INT_SERR_COR)

To proceed with interrupt control due to a correctable error, set the interrupt enable bits of the following registers to 1b.

No.	Offset	Bit	Description
1	PCI Compatible Configuration: Bridge Control and Interrupt		
	03Ch	17	SERR# Enable
2	PCI Express Capability Structure: Device Control		
	068h	0	Correctable Error Reporting Enable
3	Advanced Error Reporting (AER) Capability: Root Error Command		
	12Ch	0	Correctable Error Reporting Enable

<Interrupt Source>

(1) ERR_COR Message Reception

If an ERR_COR message is received from the other-party device (endpoint), the INT_SERR_COR interrupt will be asserted. The following status register will be set at the same time.

Offset	Bit	Description
Advanced Error Reporting (AER) Capability: Root Error Status		
130h	0	ERR_COR Received

Note: If the Enable bits in no. 1, 2, and 3 are not set, the interrupt source will not be generated.
If the Enable bits in no. 1 and 2 are not set, writing will be masked.

(2) Correctable Error Detection

Any of the following correctable errors being detected within the unit will be written to the corresponding status register.

Error	Offset	Bit	Description
	Advanced Error Reporting (AER) Capability: Correctable Error Status		
8B10B Decode Error 8B10B RD Error	110h	0	Receiver Error Status
Bad TLP		6	Bad TLP Status
Bad DLLP		7	Bad DLLP Status
REPLAY_NUM Roll over		8	REPLAY_NUM Rollover Status
Replay Timer Timeout		12	Replay Timer Timeout Status
Advisory Non-Fatal Error		13	Advisory Non-Fatal Error Status

Note: If the Mask bit (Correctable Error Mask Register: Offset 114h) corresponding to each bit is set (masked), the corresponding error will not be detected and the interrupt source will not be generated.

At the same time, the INT_SERR_COR interrupt will be generated and the following status registers will be set to 1b.

Offset	Bit	Description
PCI Express Capability Structure: Device Status		
068h	16	Correctable Error Detect
Advanced Error Reporting (AER) Capability : Root Error Status		
130h	0	ERR_COR Received

Note: If the Enable bit in no. 2 is not set, the interrupt source will not be generated.
If the Enable bit in no. 2 is not set, writing to the Root Error Status Register will be masked.

If the Correctable Error Reporting Enable bit listed in no. 3 is not set, the source due to (1) and (2) stated above will be generated and INT_SERR_COR will not be asserted even if writing to the Root Error Register has proceeded.

(b) Fatal Error Interrupt (INT_SERR_FATAL)

To proceed with interrupt control due to a fatal error, set the interrupt enable bits of the following registers to 1b.

No.	Offset	Bit	Description
1	PCI Compatible Configuration: Bridge Control and Interrupt		
	03Ch	17	SERR# Enable
2	PCI Express Capability Structure: Device Control		
	068h	2	Fatal Error Reporting Enable
3	Common Configuration Space: Command and Status		
	004h	8	SERR# Enable
4	Advanced Error Reporting (AER) Capability: Root Error Command		
	12Ch	2	Fatal Error Reporting Enable

<Interrupt Source>

(1) ERR_FATAL Message Reception

If an ERR_FATAL message is received from the other-party device (endpoint), the INT_SERR_FATAL interrupt will be asserted (if the Enable bits in no.1 and 2 or no.3 and 4 are not set, the interrupt source will not be generated). The following status registers will be set at the same time.

Offset	Bit	Description	Remarks
Type1 Configuration Space: Secondary Status			Writing to this status register proceeds at the point a message is received regardless of the settings of the Enable bits.
01Ch	30	Received System Error	
Common Configuration Space: Status Register			If the Enable bits in no. 1 and 2 are not set, writing will be masked.
004h	30	Signaled System Error	
Advanced Error Reporting (AER) Capability: Root Error Status			If the Enable bit in no. 1, 2, or 3 is not set, writing will be masked.
130h	6	Fatal Error Message Received	

(2) Fatal Error Detection

Any of the following fatal errors being detected within the unit will be written to the corresponding status register.

Error	Offset	Bit	Description
	Advanced Error Reporting (AER) Capability: Uncorrectable Error Status		
Data Link Protocol Error	104h	4	Data Link Protocol Error Status
Poisoned TLP		12	Poisoned TLP Status
Completion Timeout		14	Completion Timeout Status
Completer Abort		15	Completer Abort Status
Unexpected Completion		16	Unexpected Completion Status
Receiver Overflow		17	Receiver Overflow Status
Malformed TLP		18	Malformed TLP Status
ECRC Error		19	ECRC Error Status
Unsupported Request		20	Unsupported Request Error Status

Note: If the Mask bit (Uncorrectable Error Mask Register: Offset 108h) corresponding to each bit is set (masked), the corresponding error will not be detected and the interrupt source will not be generated.
Also, the setting of the corresponding Severity bit (Uncorrectable Error Severity: Offset 10Ch) must be 1b (Fatal).

The INT_SERR_FATAL interrupt will be generated at the same time (if the Enable bits in no. 2 or no.3 and 4 are not set, the interrupt source will not be generated). The following status registers will be set at the same time.

Offset	Bit	Description	Remarks
PCI Express Capability Structure: Device Status			
068h	18	Fatal Error Detect	
Common Configuration Space: Status Register			If the Enable bit in no. 3 is not set, writing will be masked.
004h	30	Signaled System Error	
Advanced Error Reporting (AER) Capability: Root Error Status			If the Enable bit in no. 2 or 3 is not set, writing will be masked.
130h	6	Fatal Error Message Received	

If the Fatal Error Reporting Enable bit listed in no. 4 is not set, the source due to (1) and (2) stated above will be generated and INT_SERR_FATAL will not be generated even if writing to the Root Error Status Register has proceeded.

(c) Non-Fatal Error Interrupt (INT_SERR_NONFATAL)

To proceed with interrupt control due to a non-fatal error, set the interrupt enable bits of the following registers to 1b.

No.	Offset	Bit	Description
1	PCI Compatible Configuration: Bridge Control and Interrupt		
	03Ch	17	SERR# Enable
2	PCI Express Capability Structure: Device Control		
	068h	1	Non-Fatal Error Reporting Enable
3	Common Configuration Space: Command and Status		
	004h	8	SERR# Enable
4	Advanced Error Reporting (AER) Capability: Root Error Command		
	12Ch	1	Non-Fatal Error Reporting Enable

<Interrupt Source>

(1) ERR_FATAL Message Reception

If an ERR_NONFATAL message is received from the other-party device (endpoint), the INT_SERR_NONFATAL interrupt will be generated (if the Enable bits in no.1 and 2 or no.3 and 4 are not set, the interrupt source will not be generated). The following status registers will be set at the same time.

Offset	Bit	Description	Remarks
Type1 Configuration Space: Secondary Status			Writing to this status register proceeds at the point a message is received regardless of the settings of the Enable bits.
01Ch	30	Received System Error	
Common Configuration Space: Status Register			If the Enable bits in no. 1 and 3 are not set, writing will be masked.
004h	30	Signaled System Error	
Advanced Error Reporting (AER) Capability: Root Error Status			If the Enable bit in no. 1, 2, or 3 is not set, writing will be masked.
130h	5	Non-Fatal Error Message Received	

(2) Non-Fatal Error Detection

Any of the following non-fatal errors being detected within the unit will be written to the corresponding status register.

Error	Offset	Bit	Description
	Advanced Error Reporting (AER) Capability: Uncorrectable Error Status		
Data Link Protocol Error	104h	4	Data Link Protocol Error Status
Poisoned TLP		12	Poisoned TLP Status
Completion Timeout		14	Completion Timeout Status
Completer Abort		15	Completer Abort Status
Unexpected Completion		16	Unexpected Completion Status
Receiver Overflow		17	Receiver Overflow Status
Malformed TLP		18	Malformed TLP Status
ECRC Error		19	ECRC Error Status
Unsupported Request		20	Unsupported Request Error Status

Note: If the Mask bit (Uncorrectable Error Mask Register: Offset 108h) corresponding to each bit is set (masked), the corresponding error will not be detected and the interrupt source will not be generated.
Also, the setting of the corresponding Severity bit (Uncorrectable Error Severity: Offset 10Ch) must be 0b (Non-fatal).

The INT_SERR_NONFATAL interrupt will be generated at the same time (if the Enable bits in no. 2 or no.3 and 4 are not set, the interrupt source will not be generated). The following status registers will be set at the same time.

Offset	Bit	Description	Remarks
PCI Express Capability Structure: Device Status			—
068h	17	Non-Fatal Error Detect	
Common Configuration Space: Status Register			If the Enable bit in no. 3 is not set, writing will be masked.
004h	30	Signaled System Error	
Advanced Error Reporting (AER) Capability: Root Error Status			If the Enable bit in no. 2 or 3 is not set, writing will be masked.
130h	5	Non-Fatal Error Message Received	

If the Non-Fatal Error Reporting Enable bit listed in no. 4 is not set, the source due to (1) and (2) stated above will be generated and INT_SERR_NONFATAL will not be generated even if writing to the Root Error Status Register has proceeded.

6.6.5.6.5 DMA Interrupt

The DMAC has interrupt functions. It supports two types of interrupt source: one set is for normal operation and the other is for errors. Use the DMAC Interrupt Enable Register to select the interrupt sources and control masking. DMA interrupt notification includes notification by DMA_INT in the direction of the AXI bus (local bus direction) and notification by issuing an MSI to an other-party RC.

On completion of DMA transfer, either conveying a DMA_INT interrupt or transmitting an MSI to the RC, but not both, is selected per-channel by a register setting (transmitting an MSI is prohibited in RC mode).

The DMA_CH*_MSI_EN bits of the DMA Interrupt Vector 0 Register and the DMA Interrupt Vector 1 Register are used to switch the setting (“*” corresponds to the channel number of a given DMA and per-channel control is possible). If an MSI is to be issued, the value of its traffic class (TC) bits is fixed to 0. The vector value can be specified by using the DMA_CH*_vec bits of these registers.

CAUTION

Take care that the specified vector value does not impose a related restriction on the Multiple Message Enable register. For example, if the number set for Multiple Message Enable is 4, the two lower-order bits within the value set for the Message Data are overwritten by the value specified for the DMA_CH*_vec bits, and at that time, specify the value 0b for the higher-order bits that are not overwritten by DMA_CH*_vec bits.

6.6.5.7 Power Management (Root Complex Mode)

6.6.5.7.1 PCI Power Management (PCI-PM)

An endpoint is placed in non-D0 (the D3 hot state) by changing the setting of the Power State field register of the endpoint by the root complex., which causes a transition of the link state of both RC and EP to L1.

This unit does not support the AUX power supply function. D3 cold is not supported. Implementing the L2 function goes to implementation of L2/L3 ready.

(1) Flow of Transition to the L2/L3 Ready State (RC)

< For transition via PCIPM L1 >

1. A root complex (RC) issues a config write to change the D-state of an endpoint (EP) to D3 (D3 hot).
2. The RC is automatically placed in L1 by automatic response of the other-party EC.
3. The RC transmits a PME_Turn_Off message.
4. Confirm the reception of a PME_TO_Ack Message from the EP by reading the value of the PME_TO_Ack Receive Interrupt bit (bit 16) in the Message Receive Interrupt Status Register of the RC.
5. Set UI_ENTER_L2 of PCIe Core Control 1 Registers to 1b.
6. Confirm the transition to the L2/L3 ready state by reading the value of the LTSSM_STATE bits (bits [14:8]) in the PCIe Core Status 1 Register (5 higher-order bits [14:10] = 0111xb: L2).

< For direct transition to the L2/L3 ready state >

Steps 3 to 6 above apply.

(2) Flow of Return from the L2/L3 Ready State (RC)

< Return from the L2/L3 ready state by the RC >

1. Assert the following reset signals.

   RST_B, RST_GP_B, RST_PS_B, RST_CFG_B
2. Deassert the reset signals at a desired time and wait for return to L0 (wait for linkup).
3. If the link is not up, repeat steps 1 and 2.

< Return from the L2/L3 ready state by the EP >

1. Wait for the reception of a beacon by the EP. Read the LINKDN bit (0204h, bit 9) in the PCIe Event Interrupt Status register regularly to check whether ELECTRICAL_IDLE_BROKEN has been generated.
2. Assert the following reset signals.

   RST_B, RST_GP_B, RST_PS_B, RST_CFG_B
3. Deassert the reset signals at a desired time, clear UI_ENTER_L2 of PCIe Core Control 1 Registers to 0b, and wait for it to return to L0 (wait for linkup).
4. If the link is not up, repeat steps 2 and 3.

6.6.5.7.2 Active State Power Management (ASPM)

The ASPM L0s and L1 states can be used by the setting of the Active State PM Control bits (bits [1:0]) in the Link Control/Status Register (PCIe Configuration Register: 6070h).

ASPM L0s: The module is automatically placed in the ASPM L0s state following setting of the Active State PM Control bits to 01b or 11b. When to initiate a transition to this state is determined by judgment of the idle state by the PCIe core.

ASPM L1: An RC is placed in the ASPM L1 state in response a request for transition to the ASPM L1 state from an EP following setting of the Active State PM Control bit to 11b. When to initiate a transition to this state is determined by judgment of the idle state by the PCIe core.
A transition to the ASPM L1 state is enabled by setting the UI_RC_REJECT_ASPM_L1 bit (bit [19]) of the PCIe Core Control 1 Register (offset: 404h) to 0b. To reject a transition to the ASPM L1 state on the RC side, set the UI_RC_REJECT_ASPM_L1 bit to 1b.

Return to the L0 state from the L1 state:

Resuming access from the AXI master side:

Return to the L0 state is initiated in response to the other-party PCIe device resuming access.

Resuming access from the AXI slave side:

The AXI can be returned to the L0 state in response to the AXI starting access to a PCIe device. Access to an AXI configuration register also returns the AXI to the L0 state.

6.6.5.8 Power Management (Endpoint Mode)

6.6.5.8.1 PCI Power Management (PCI-PM)

The endpoint unit can be placed in the D3 hot state by changing the setting of the Power State field register by the root complex. A PME_Turn_Off message can be received even after the transition to the D3 state. The turning-off procedure described below starts in such cases.

D0: This is a full-power state in which no restrictions apply. The link state is basically L0. However, if the ASPM generates a source for a transition, the latter takes priority.

D3hot: The link state basically changes to L1. By changing the value of the Power State bits of the PM Status/Control register in response to the reception of CfgWr, the unit sets D3_EVENT to 1 when a transition to the non-D0 state is requested per function, and issues Deassert_INTx in response to the assertion of any of the INTx signals. The EP should set D3_EVENT_ACK to 1 after preparation for low power consumption. After D3_EVEMT_ACK is set to 1, issuing of the AXI transaction to the PCIe is prohibited.(this does not apply to access to internal registers which include the configuration register).

This unit does not support the AUX power supply function. D3 cold is not supported. Implementing the L2 function goes to implementation of L2/L3 ready.

(1) Flow of Transition to the L2/L3 Ready State (EP)

< For transition via PCIPM L1 >

1. The D-state of an endpoint (EP) is changed to D3 (D3 hot) in response to the reception of a config write from a root complex (RC).
2. Check that D3_EVENT has been set to 1, and clear D3_EVENT_ACK to 0 after setting it to 1.
3. A transition to the L1 state is automatically initiated.
4. The EC receives a PME_Turn_Off message from the RC.
5. Check that TURN_OFF_EVENT has been set to 1, and clear TURN_OFF_EVENT_ACK to 0 after setting it to 1.
6. A transition to the L2/L3 ready state is automatically initiated.

< For direct transition to the L2/L3 ready state >

Steps 4 to 6 above apply.

(2) Flow of Return from the L2/L3 Ready State (EP)

< Return from to the L2/L3 ready state by the RC >

1. Wait for an Electrical Idle exit from the RC.
2. After that, follow the instruction by the RC to return to L0 (the following is an example).
   - Example 2-1. Follow the instruction by the RC to reset the EP (assert RST_B, RST_GP_B, RST_PS_B, and RST_CFG_B).
   - Example 2-2. Follow the instruction by the RC to release the EP from the reset state at a desired time.
   - Example 2-3. Return to L0.

< Return from to the L2/L3 ready state by the EP >

1. Check that the value of the LTSSM_STATE bits (bits [14:8]) in the PCIe Core Status 1 Register is 3Ah.

   Note: As a criterion for judgment at this time, checking the value read from this register requires consecutively checking the above value several times. Since the value of the LTSSM bits is checked by direct reference to the internal circuit state information, an undefined state value may be read depending on the timing of the operation for transition. To make sure that the current state is the L2 idle state, we recommend checking the state by access more than once. Only check all seven bits of LTSSM_STATE (bits [14:8]) of the PCIe Core Status 1 Register at this time in the flow of return.

2. Assert the Power Management Event setting input pin to 1b.
3. Assert RST_B (the EP transmits a beacon).
4. After that, follow the instruction by the RC to return to L0 (the following is an example).
   - Example 4-1. The RC detects the reception of a beacon from the EP and initiates return to L0 on the RC side.
   - Example 4-2. Follow the instruction by the RC to reset the EP (assert RST_B, RST_GP_B, and RST_PS_B, RST_CFG_B).
   - Example 4-3. Follow the instruction by the RC to release the EP from the reset state at a desired time.
   - Example 4-4. Return to L0.

6.6.5.8.2 Active State Power Management (ASPM)

The ASPM L0 and L1 states can be used by setting the Active State PM Control bits (bits [1:0]) of the Link Control/Status Register (PCIe Configuration Register: 6070h).

Permit a transition to ASPM L1 by setting ALLOW_ENTER_L1 to 1b.

The ASPM L1 Idle Time bits of the registers must be set in advance to suit the AXI bus specifications (the range of settings is for from 256 to 65536 cycles of ACLK). If transfer does not proceed for the time set in the ASPM L1 Idle Time bits within the unit, the module is automatically placed in the ASPM L1 state.

ASPM L0s: A transition to the ASPM L0s state is automatically initiated by setting the Active State PM Control bits to 01b or 11b. When to initiate a transition to this state is determined by judgment of the idle state by the PCIe core, so your operation will not be especially required.

A transition to L0s can be controlled by setting the UI_ENTER_TXL0S bit (bit [16]) of the PCIe Core Control 1 Register.

ASPM L1: A transition to the ASPM L1 state can be initiated by setting the Active State PM Control bits to 10b or 11b. When to initiate a transition to this state is determined by judgment of the idle state by the PCIe core. A transition to the L1 state is enabled by setting ALLOW_ENTER_L1 to 1b.

Return from the L1 state to the L0 state

Resuming access from the AXI master side:

Return to the L0 state is initiated in response to the other-party PCIe device resuming access.

Resuming access from the AXI slave side:

The AXI can be returned to the L0 state in response to the AXI starting access to a PCIe device. Access to an AXI configuration register also returns the AXI to the L0 state.

(1) ASPM L1 Idle Time Setting

The Mode Set 3 registers (offset: 380h) are defined as the ASPM L1 Idle Time registers. These registers are used to set the counter for monitoring the state of the AXI bus or internal transactions in terms of remaining activity when this unit is placed in the ASPM L1 state. The counter monitors whether the AXI bus and transactions within this unit are idle based on one of the following settings and uses this as the condition for triggering the transition to the ASPM L1 state.

“ASPM L1 Idle Time[7:0]” = 00h: 256 cycles of ACLK
“ASPM L1 Idle Time[7:0]” = 01h: 512 cycles of ACLK
:
“ASPM L1 Idle Time[7:0]” = FFh: 65536 cycles of ACLK

6.6.5.9 Power Management (Common)

6.6.5.9.1 Turn Off (PME Turn Off Message Recept)

Upon the reception of a PME_Turn_Off message, the TURN_OFF_EVENT signal is asserted and Deassert_INTx is issued for all of the INTx that are asserted. Moreover, preparation for sending PME_TO_Ack message is automatically started.

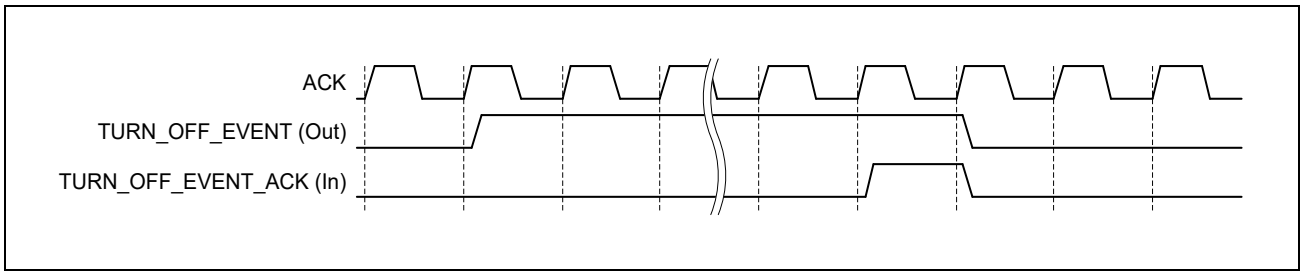


Figure 6.6-6 Relationship between TURN_OFF_EVENT and TURN_OFF_EVENT_ACK

6.6.5.9.2 Wake Up (PME Message transmit)

When CFG_PMCSR_PME_STATUS is 1b, preparation for automatic transmission of PME message is made. The transmission timing is set by the edge detection after the toggle timing of the PME_TIM signal is synchronized by ACLK.

Note that when a PME Turn Off message is received, automatic transmission of PME message will be stopped until ARESETn is generated or the DL_Up state is reached once after the DL_Down state is reached.

<Control procedure>

1. Among the configuration registers, when PME Enable = 1b in the PCI power management capability structure register, a PM_PME message can be sent from the EP to the RC by asserting the input pin, CFG_PMCSR_PME_STATUS, high and toggling the PME_TIM input.
2. The RC issues CfgWr to write 1b to and clear the PME_STATUS field of the device that has received the PM_PME message. At the same time, it sends CfgWr0 to change the Power State bit to D0.
3. When the EP enters the D0 state, the CFG_PMCSR_PME_STATUS_WRITECLEAR output signal of the EP is asserted.
4. By toggling the PME_TIM signal every 100 to 150 ms, the PM_PME Msg retransmission can be instructed in accordance with the following base spec. regulations.

Note that the PME_TIM, CFG_PMCSR_PME_STATUS, and CFG_PMCSR_PME_STATUS_WRITECLEAR signals are not used when there is no need to request the endpoint side to change the power state to D0.

6.6.5.10 Error Processing

Two error reporting paradigms are defined for PCI Express: baseline error reporting capability, which is the minimal requirement, and advanced error reporting (AER) capability, which can provide greater stability, as an optional error reporting facility. Our unit supports both error reporting functions.

6.6.5.10.1 Error Classification

PCI Express errors are of two types, correctable and uncorrectable. Uncorrectable errors are further classified into two types, non-fatal and fatal.

Error Type	Description
Correctable Error	An error which cannot be recovered by hardware
Uncorrectable Error (Non-Fatal)	An error which causes a particular transaction in PCI Express to be unreliable (but the PCI Express link itself is functional).
Uncorrectable Error (Fatal)	An error which causes the PCI Express link itself to be unreliable

In operation as a root complex, the above types of error are indicated by the individual interrupt names.

- INT_SERR_COR
- INT_SERR_NONFATAL
- INT_SERR_FATAL

6.6.5.10.2 Error Checking Mechanism

(1) Physical Layer Error List

The following type of error is to be detected in the physical layer.

- Receiver Error

(2) Data Link Layer Error List

The following type of error is to be detected in the link layer.

- Bad TLP Error
- Bad DLLP Error
- REPLAY_NUM Rollover
- Replay Timer Timeout
- Receiver Overflow Error

(3) Transaction Layer Error List

The following type of error is to be detected in the transaction layer.

- Completion Timeout
- Completer Abort
- Unsupported Request
- Unexpected Completion
- Malformed TLP
- Poisoned TLP

CAUTION

The specifications of the receiver error detection function in each LTSSM state are as listed below.

LTSSM State	Unit Specification	Base Spec Specifications
Configuration	Support	Gen1/Gen3 (Must)
Recovery	Non-Support	Option
L0	Support	Must
Disabled	Support	Option
Hot Reset	Support	Option

6.6.5.10.3 Error Message

The PCI Express Base Specification defines error messages as one of the mechanisms for notifying the system or another device of an error when it is detected by a PCI Express agent.

Error Message	Description
ERR_COR	Used when a correctable error is detected
ERR_NONFATAL	Used when a non-fatal, uncorrectable error is detected
ERR_FATAL	Used when a fatal, uncorrectable error is detected

Advisory Non-Fatal Error

The PCI Express Base Specification states that when a PCI Express agent as the detecting agent detects a non-fatal error, it handles the error as an advisory non-fatal error whether it does or does not support AER. In handling a non-fatal error as an advisory non-fatal error, the agent sends an ERR_COR message instead of an ERR_NONFATAL message and sends an advisory notification to the software. At this time, the advisory non-fatal error status bit of the correctable error status register is set to indicate the error state. Note that subsequent setting of the first error pointer register, logging of the header, and message transmission only proceed if the Advisory Non-Fatal Error Mask bit of the Correctable Error Mask Register is clear (no masking). They do not proceed if the bit is set.

The error cases which are handled as advisory non-fatal errors are as follows.

- Reception of unsupported non-posted requests
- Reception of a non-posted request with a completer abort completion response
- Reception of an unexpected completion
- Reception of a poisoned TLP (this is not handled as an advisory non-fatal error in this core)
- Detection of a completion timeout (this is not handled as an advisory non-fatal error in this core)

This unit may merge multiple error messages with the same ID. This would occur when multiple errors are detected during the wait for the unit to be ready for the transmission of messages after an error condition is detected. However, messages will not always be merged in such cases.

6.6.6 Operation

6.6.6.1 Setting Up

Set the internal registers of the unit including the configuration registers.

This section explains the procedure for setting up until the PCI Express link is up (the module is ready for data transfer).

For detailed procedures on releasing the reset and setting registers, see **6.6.6.5 PCIe Initialization Procedure**.

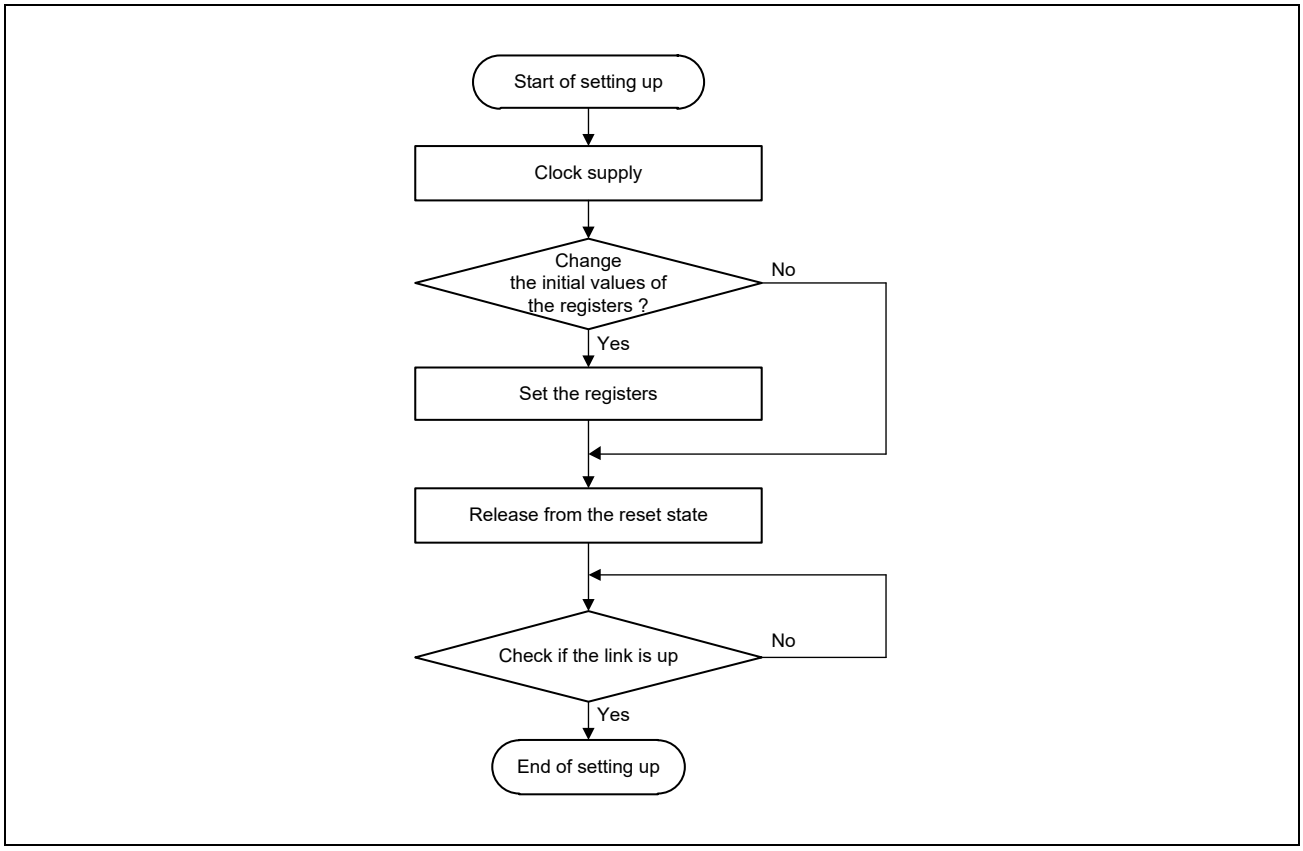

Figure 6.6-7 Setting Up

6.6.6.1.1 Changing the Initial Values of the Registers

Of the internal registers, the initial values of the configuration registers can be changed via the AXI slave interface.

1) AXI Bridge Registers

De-asserting ARESETn following supply of CLK allows access to these registers. In the case of resetting of the PCIe core, write to the registers while the reset signal is being asserted.

2) PCIe Configuration Register

De-asserting ARESETn following supply of CLK allows access to these registers. Of the reset signals of the PCIe core, those related to the configuration register must be de-asserted.

3) Physical Layer Control/Monitor Registers

De-asserting ARESETn following supply of CLK allows access to these registers. In the case of resetting of the PCIe core, write to the registers while the reset signal is being asserted. It is necessary to set the Permission Registers (<PCI0_base> + 0300h) bit[1] to 1b beforehand to allow access to the PIPE_PHY Register.

(1) Setting the initial values of the registers

The initial values of the registers listed below are 0. Set appropriate values in the registers before the start of link up.

- Device ID: Vendor and Device ID Register (<PCI0_base> + 6000h)
- Vendor ID: Vendor and Device ID Register (<PCI0_base> + 6000h)
- Class Code (base class/sub-class/programming interface):
  Revision ID and Class Code Register (<PCI0_base> + 6008h)
- Revision ID: Revision ID and Class Code Register (<PCI0_base> + 6008h)
- Subsystem ID: Subsystem ID (Function #n) (<PCI0_base> + 602Ch)
- Subsystem Vendor ID: Subsystem ID (Function #n) (<PCI0_base> + 602Ch)

(2) Setting the initial values of the registers

Make the following settings.

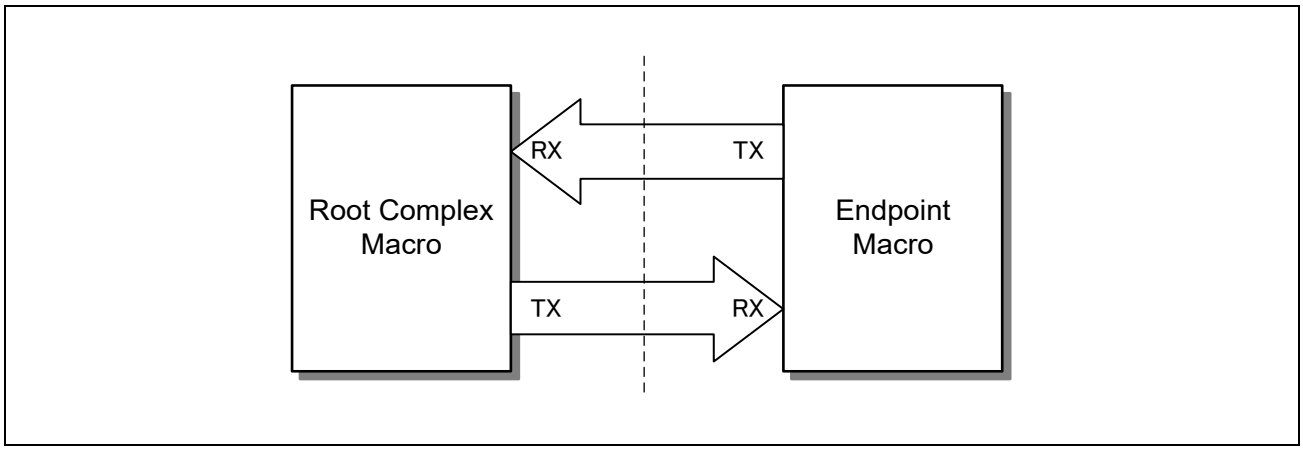
- Set the Upstream Port 8.0 GT/s Transmitter Preset and Downstream Port 8.0 GT/s Transmitter Preset in the Lane Equalization Control Register as follows:
  - <PCI0_base> + 61BCh: 0808_0808h (n = 0)
- Set the XCFGD Setting Resister.
  - <PCI0_base> + 20A0h: 05DB_B800h

6.6.6.1.2 De-asserting the Reset

In this unit, software reset control by the register is possible.

De-asserting of the reset of the core (the reset register in the case of register control) automatically starts operations such as receiver detection and the training sequence with the other-party device.

Note that our unit requires a wait of at least 5 ms from power-on to de-assertion of the reset.



Check that link negotiation with the other party has been completed and the link with the unit is up.

6.6.6.1.3 Checking if the Link is Up

Checking if the link is up can be done through either of the following methods. This is usually done by the root complex.

1) Polling

Have the CPU of the chip poll the DL_Down Status bit (bit [0]) of the PCIe core Status 1 Register in AXI bridge registers until the value of the bit is 0 (indicating the DL_Up state).

2) Interrupt

After assertion of the PCIE_EVT_INT pin of the interrupt signal, check the interrupt source by reading the DL_UpDown bit (bit [9]) in the PCIe Event Interrupt Status 0 register in AXI Bridge Registers. After that, check that the DL_Down Status bit (bit [0]) of the PCIe Core Status 1 Register is 0 (indicating the DL_Up state)

The settings above make the unit ready for transfer with the other party device.

However, data transfer such as reading or writing memory is not yet possible in this state. This requires subsequent window settings.

6.6.6.2 Setting the Windows (Root Complex Mode)

When using the window settings in the root complex configuration, the recommended settings in the BAR and BAR Mask registers are “BAR: All 0s” and “BAR Mask: All 1s”.

6.6.6.3 Setting the Windows (Endpoint Mode)

All PCI Express commands are issued via the set memory spaces or register spaces. After making the window settings and the configuration register settings, data such as PCIe MRd and MWr can be transferred. All PCI Express commands are issued via the set memory spaces or register spaces. After making the window settings and the configuration register settings, data can be transferred in response to PCIe MRd and MWr requests and so on.

6.6.6.3.1 BAR Specification (Two-Function Configuration)

Our unit has functionality for dividing the 64-bit memory space into window spaces for AXI access. Windows for access from PCIe to AXI and from AXI to PCIe are respectively referred to as AXI windows and PCI windows.

The AXI Bridge Registers (unit-specific registers) are accessible regardless of the function being used.

The 64-bit memory spaces must be set exclusively of each other and have no overlaps.

Set the AXI window spaces such that they do not overlap.

Table 6.6-128 Example BAR Settings (64 bits × 3, Function = 2)

Function	BAR (Memory Space)	AXI Window	Note
Function #0	64-bit memory space (1) {BAR1, BAR0}	AXI #0	
		AXI #1	
		AXI #2	
		AXI #3	
	64-bit memory space (2) {BAR3, BAR2}	AXI #4	
		AXI #5	
		AXI #6	
		AXI #7	
	64-bit memory space (3) {BAR5, BAR4}	—	AXI Bridge Registers
Function #1	64-bit memory space (1) {BAR1, BAR0}	AXI #0	
		AXI #1	
		AXI #2	
		AXI #3	
		AXI #4	
		AXI #5	
		AXI #6	
		AXI #7	
	64-bit memory space (2) {BAR3, BAR2}	—	Not allocated
	64-bit memory space (3) {BAR5, BAR4}	—	AXI Bridge Registers

Remarks: BAR: Abbreviation of Base Address Register

Note: The address spaces are invalid when the corresponding BAR values are all 0s. The BAR settings are required for each function.

The base addresses of the 64-bit memory spaces (1), (2), and (3) above are set by using the following configuration registers.

64-bit memory space (1): Configuration registers {BAR1, BAR0}
64-bit memory space (2): Configuration registers {BAR3, BAR2}
64-bit memory space (3): Configuration registers {BAR5, BAR4}

CAUTION

- Up to eight AXI windows can be set by dividing the 64-bit memory space (1).
- Up to eight AXI windows can be set by dividing the 64-bit memory space (2).
- The number of AXI windows allocated to each of the BAR areas is as follows.
  64-bit memory space (1): 64-bit memory space (2) = 8:0 or 4:4;
  Select either of the above settings. Note that all of the allocated AXI windows do not need to be used effectively.
- The 64-bit memory space (3) is dedicated for access to the AXI Bridge Registers.
- The base addresses of each of the AXI windows are limited within the 4-Gbyte space from the BAR base address.

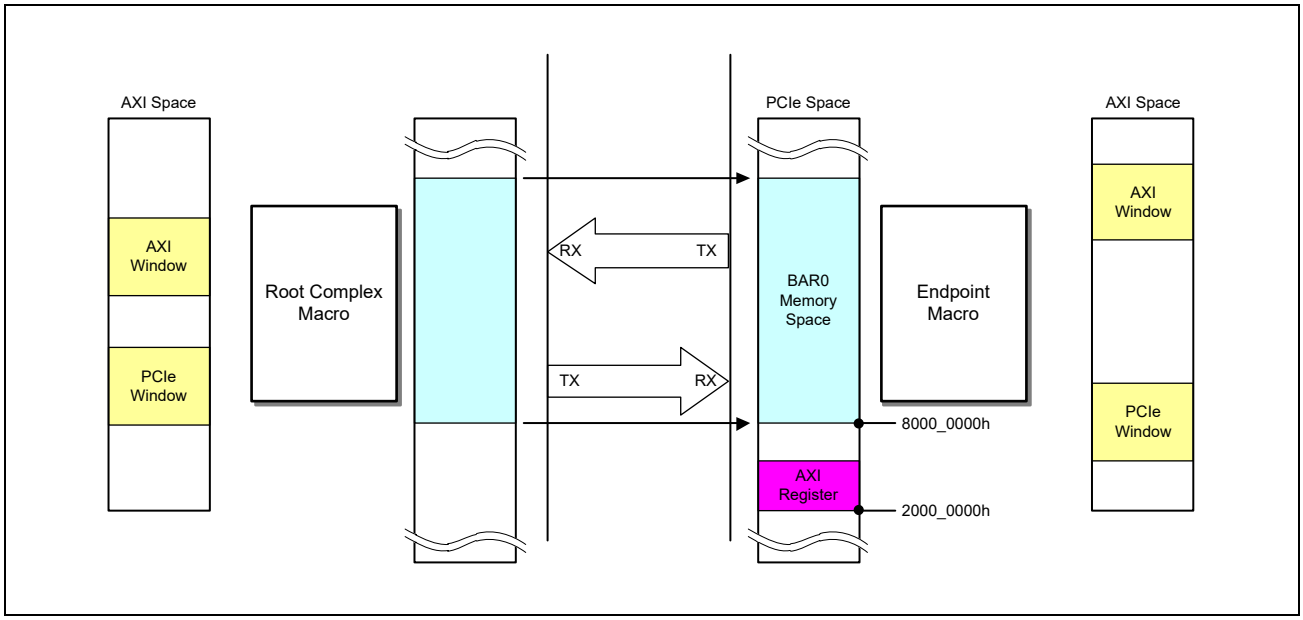
6.6.6.3.2 Setting the AXI Windows

In operation as an endpoint device, the AXI windows can be set in the following two ways.

1. The root complex issuing memory read and memory write requests.
2. Setting from the CPU of the endpoint under software control.

The following shows the procedure for making the settings by method 1.

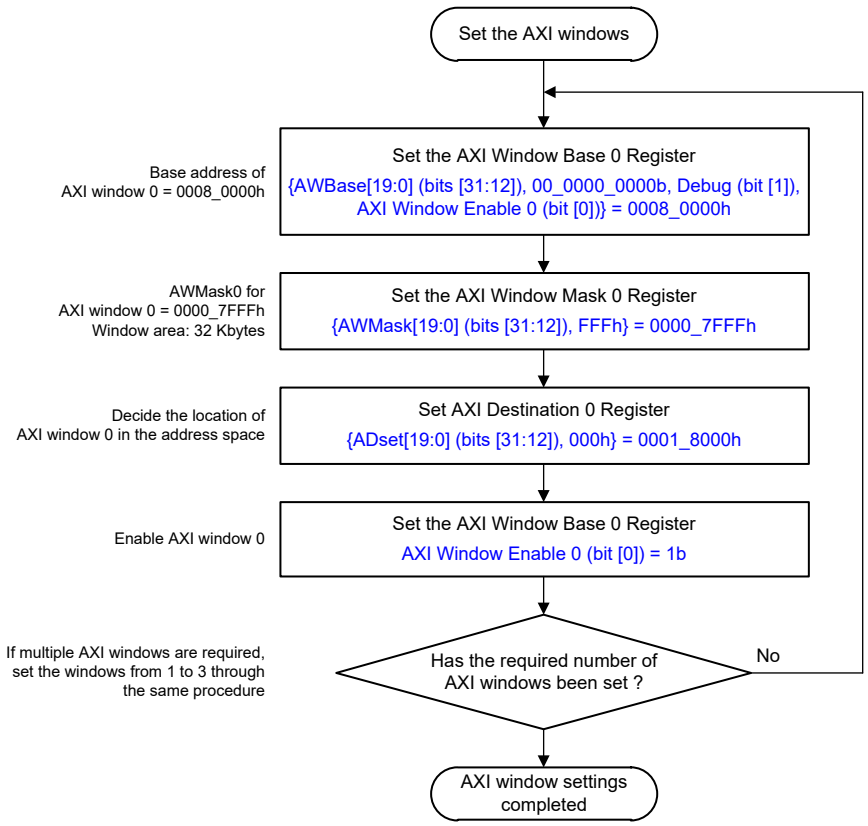
Set the AXI windows on the endpoint side by issuing memory read (MRd) and memory write (MWr) requests to the AXI Bridge Register access space set in the previous section.



Data transfer is possible when setting of the windows is completed and the Bus Master Enable bit and the Memory Space Enable bit of the given configuration register are set to the enabled state.

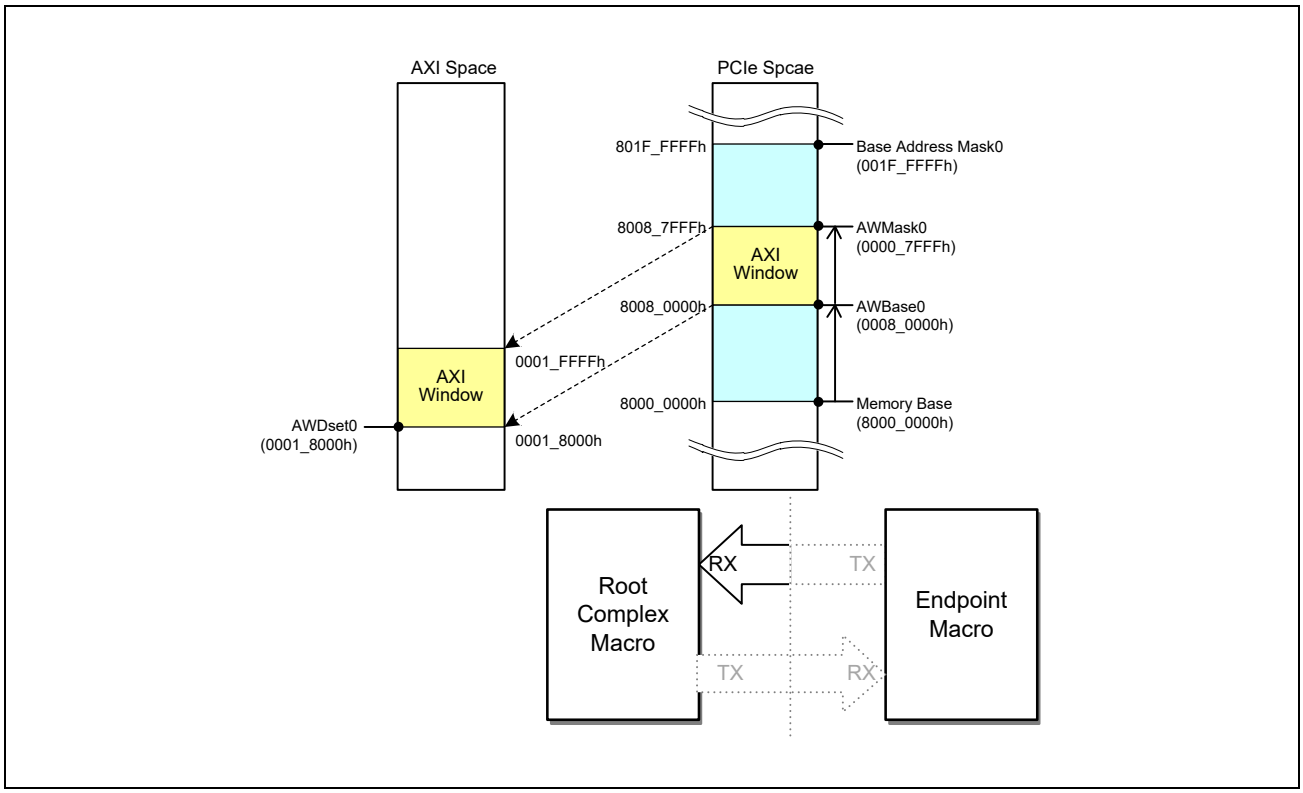
The following shows the procedure for making the settings by method 2.

The AXI windows can be set by write access to the registers through the AXI slave interface.



Note: The values assigned in the figure (values in blue) are examples.

Figure 6.6-8 Example Settings of the AXI Windows



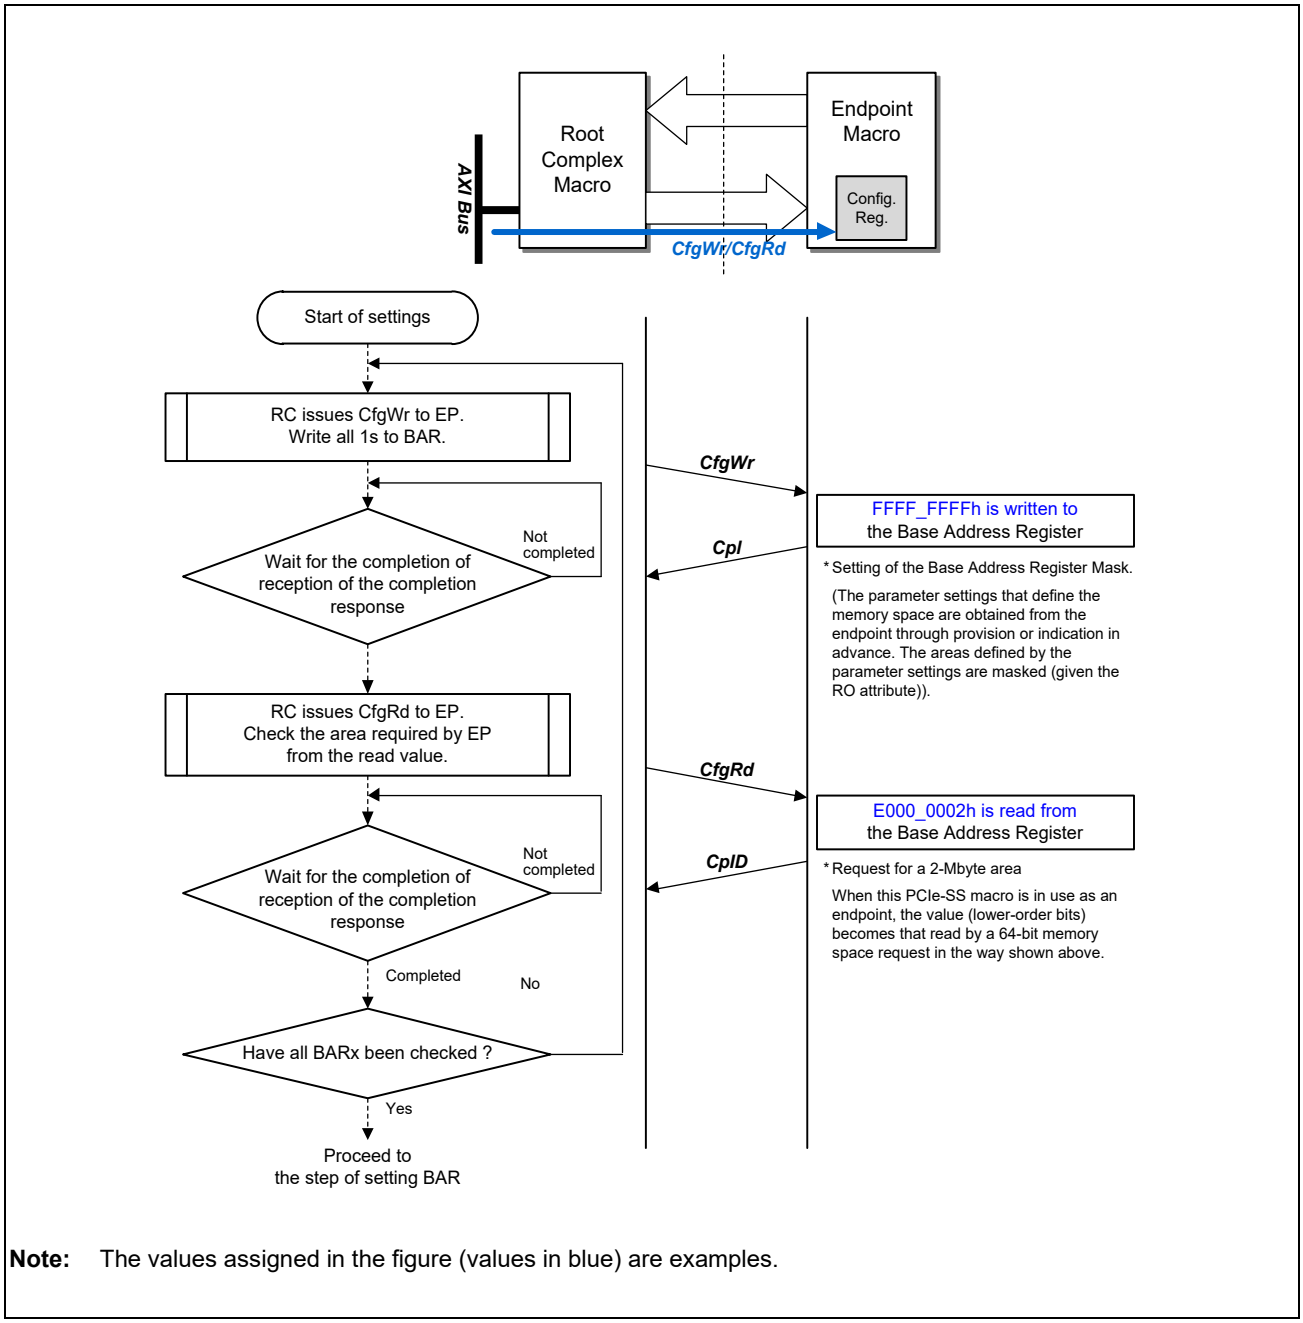
At this time, three address space settings, namely the AXI address space for the root complex device, the AXI address space for the endpoint device, and the PCI address space between the root complex and the endpoint, must be consistent within the system. If they are not, data cannot be transferred. Take care with the settings.

6.6.6.3.3 Setting the PCIe Address Space

A PC or similar system recognizes information on the areas of the memory space which are required by other-party endpoint devices by access to the configuration registers of the endpoints through software processing by the CPU on the root-complex side. In the case of embedded systems, etc., the areas required by the other-party devices will generally be known in advance, so this processing is not usually required.

The following is an example procedure for setting of the PCIe memory space for an other-party endpoint by the root complex.

Configuration requests are made to be issued to the other-party endpoint devices by register access through the AXI slave interface.



Note: The values assigned in the figure (values in blue) are examples.

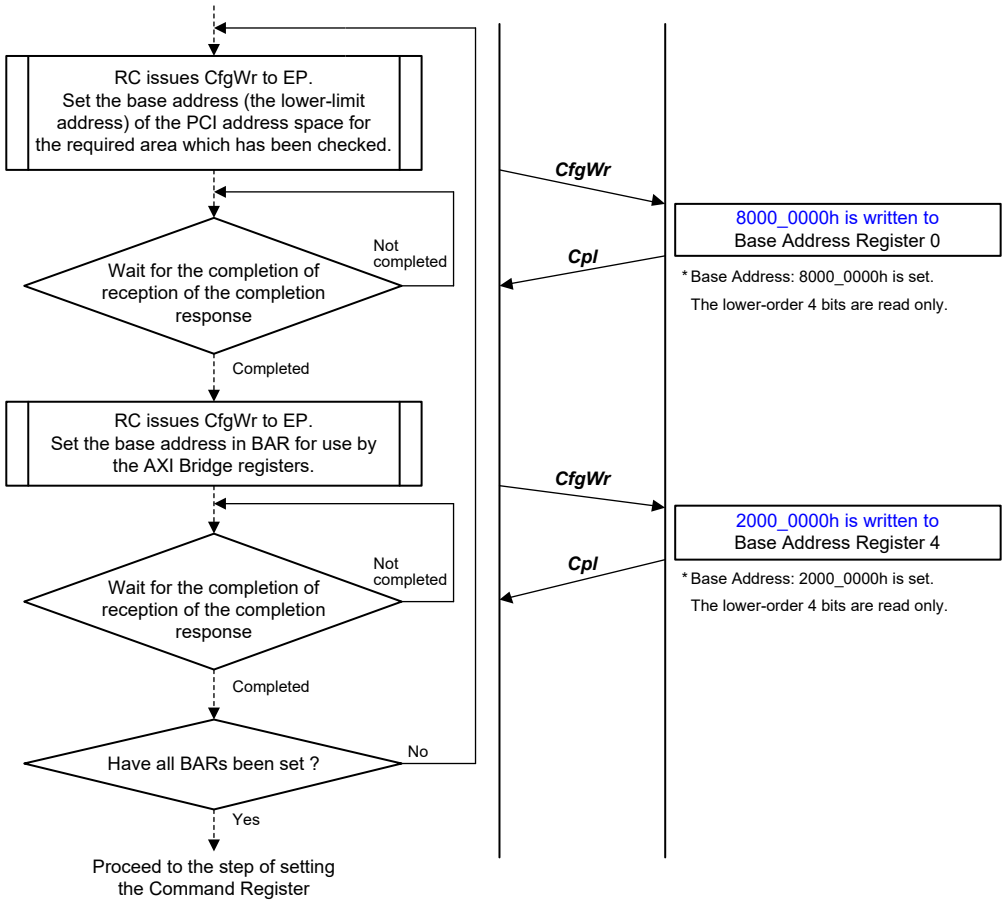
Figure 6.6-9 Example Settings for the PCIe Address Space

After issuing a configuration write request for writing all 1s (FFFF_FFFFh), a configuration read request is issued and if the result of reading is all 0s (0000_0000h), the given base address register (BAR) is judged to be reserved and the corresponding space is considered to be unused.

From the result of reading, software on the root complex side writes the base address (the lower-limit address) of the PCI address space to be allocated to the endpoint device by issuing a configuration write request.*1 At this time, setting of a BAR for which the area requested by the endpoint device was found to be reserved and thus unused is not required.

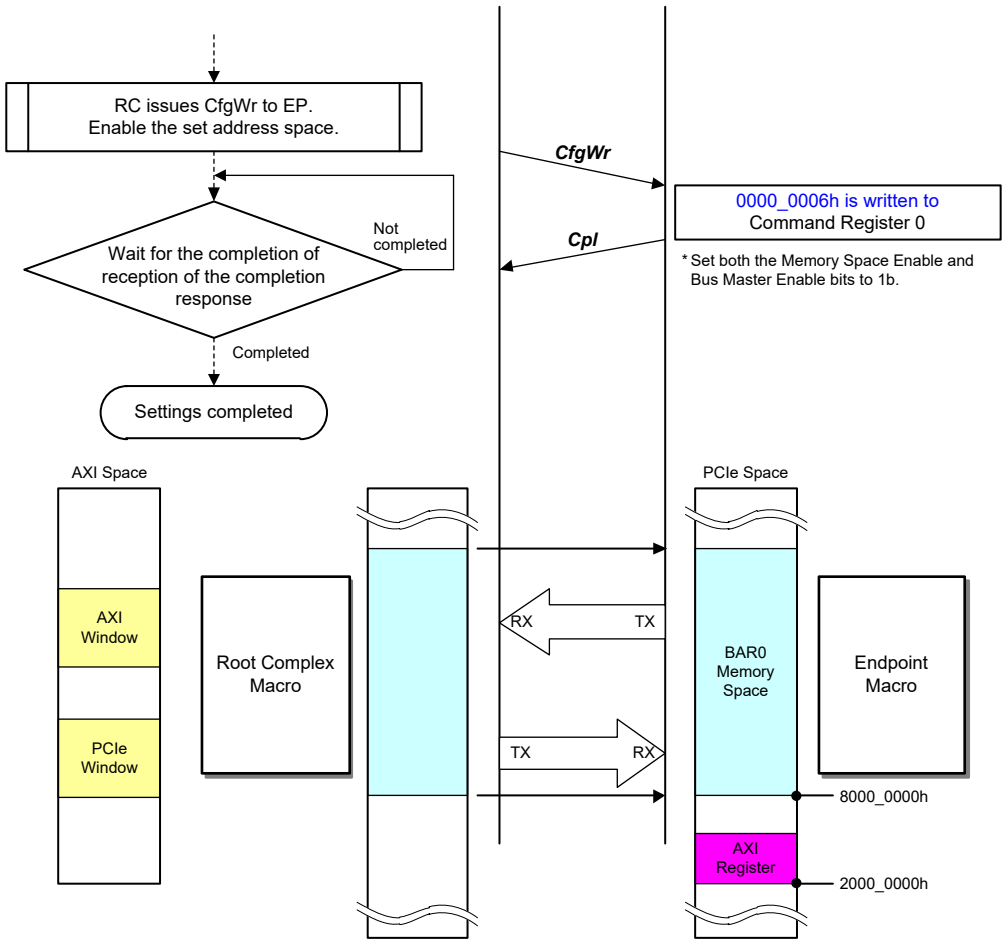
Also, if an address space which includes the other party has been prepared in advance, the above confirmation is not required. Set the base address directly.

Note 1. Setting a base address register to all 0s is prohibited.



Note: The values assigned in the figure (values in blue) are examples.

The completion of settings for the PCIe address space means that the root complex is ready for data transfer to the corresponding endpoint. Finally, set the Bus Master Enable bit and the Memory Space Enable bit of the given command register to enable the memory space.



Note: The values assigned in the figure (values in blue) are examples.

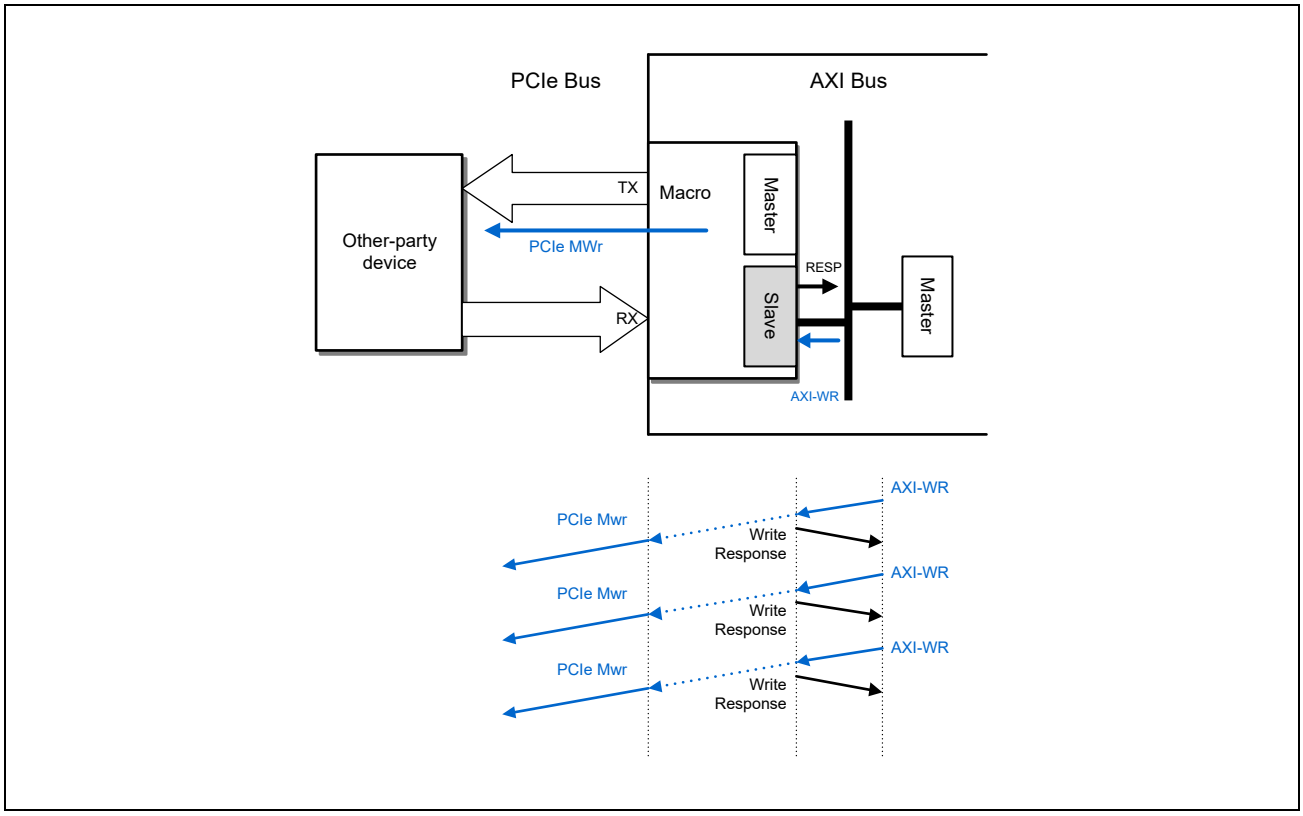
6.6.6.4 Data Transfer

This unit has one port each for master and slave operation as an AXI interface. For PCIe requests which can be issued through the master and slave ports, see **6.6.5.2 Issuing of PCIe Requests and Register Access (by AXI)** and **6.6.5.3 Initiation of AXI Transactions and Register Access (by PCIe)**.

The focus of this explanation is on normal memory data transfer.

6.6.6.4.1 PCIe MWr (when the AXI Slave is in Use)

A write transaction from the AXI bus (AXI-WR) via a window set as a PCIe window is converted into an MWr command (PCIe MWr) and then issued. If a PCIe MWr request is to be issued through the AXI interface slave port of the unit by using a DMAC, etc. external to the unit, the number of write transactions which can be accepted at a time is one, so the operation is as follows.



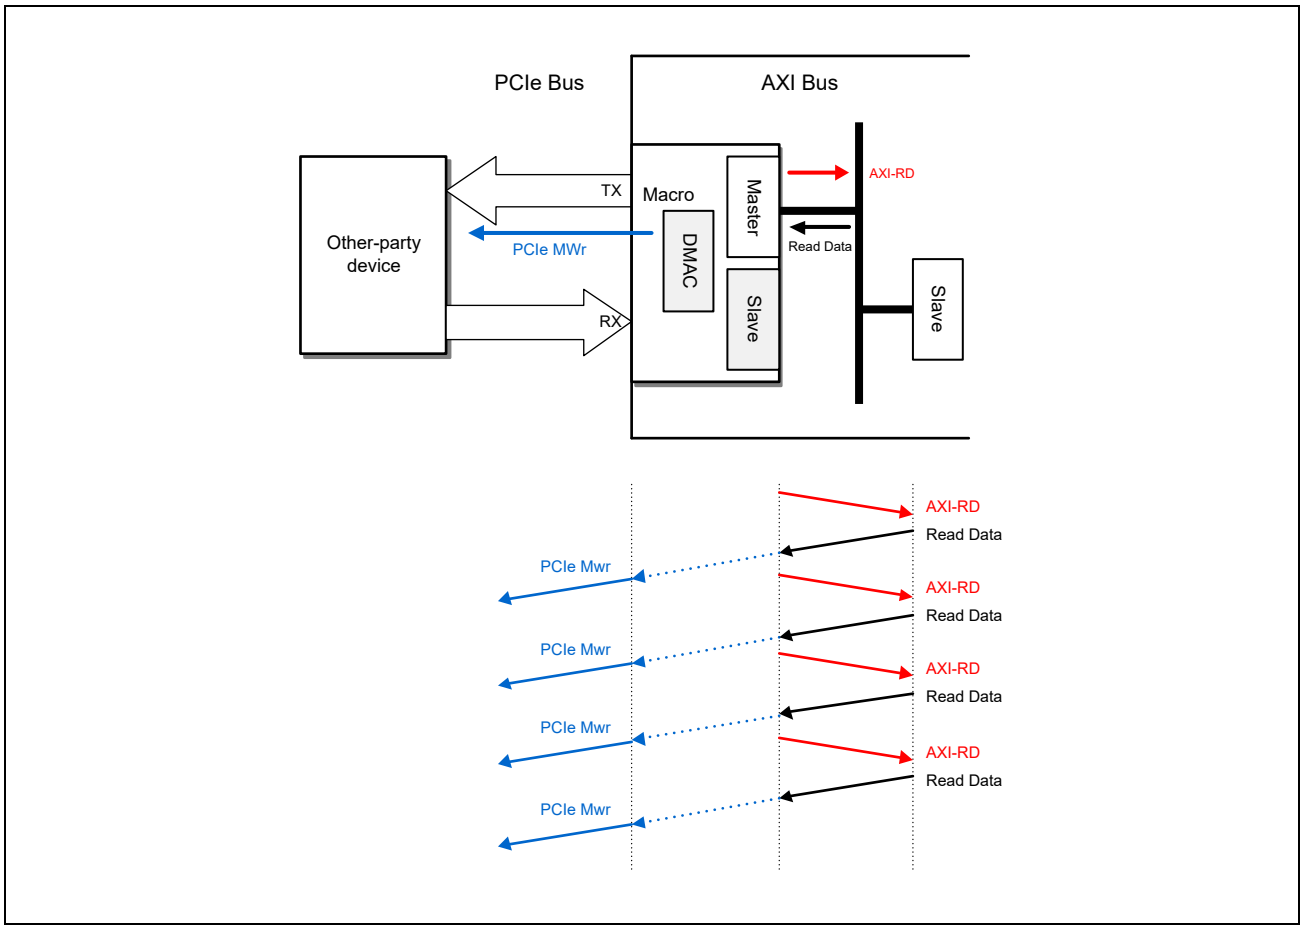
1. A write transaction from the AXI bus is issued through the AXI slave interface (write address channel, write data channel).
2. The transaction is converted into a PCIe MWr command and data are transferred to the other-party device via the PCIe bus.
3. After a wait for a response from the AXI slave interface (write response channel), a next AXI write transaction is issued.

A write response is issued after writing data to the transmission buffer (SRAM) within the unit. If this transmission buffer is full, the unit receives as much data as it can capture and then places the READY signal at the low level. Accordingly, the AXI bus may be placed in the hold state during transfer.

Since this depends not only on the specifications of the PCIe module (the number of lanes, rate, maximum payload size, etc.) but also on the size of the transmission buffer, the size of the reception buffer of the other-party device, and the external system configuration (the time for access to the external DRAM, etc.), care should be taken when considering the system configuration in general.

6.6.6.4.2 PCIe MWr (when the DMAC is in Use)

If a PCIe MWr request is to be issued through the AXI master port by using the DMAC within the unit, the number of requests which can be read by the internal DMAC is one transaction per channel, so the operation is as follows.



1. An AXI read (AXI-RD) request is issued through the AXI master interface (read address channel).
2. After the AXI master interface (read data channel) receives read data, this is converted into a PCIe MWr command and data are transferred to the other-party device via the PCIe bus.
3. Following the completion of the reception of read data, a next AXI-RD is issued.
4. The above steps are repeated until transfer of all bytes set in the DMA Size bits is completed.

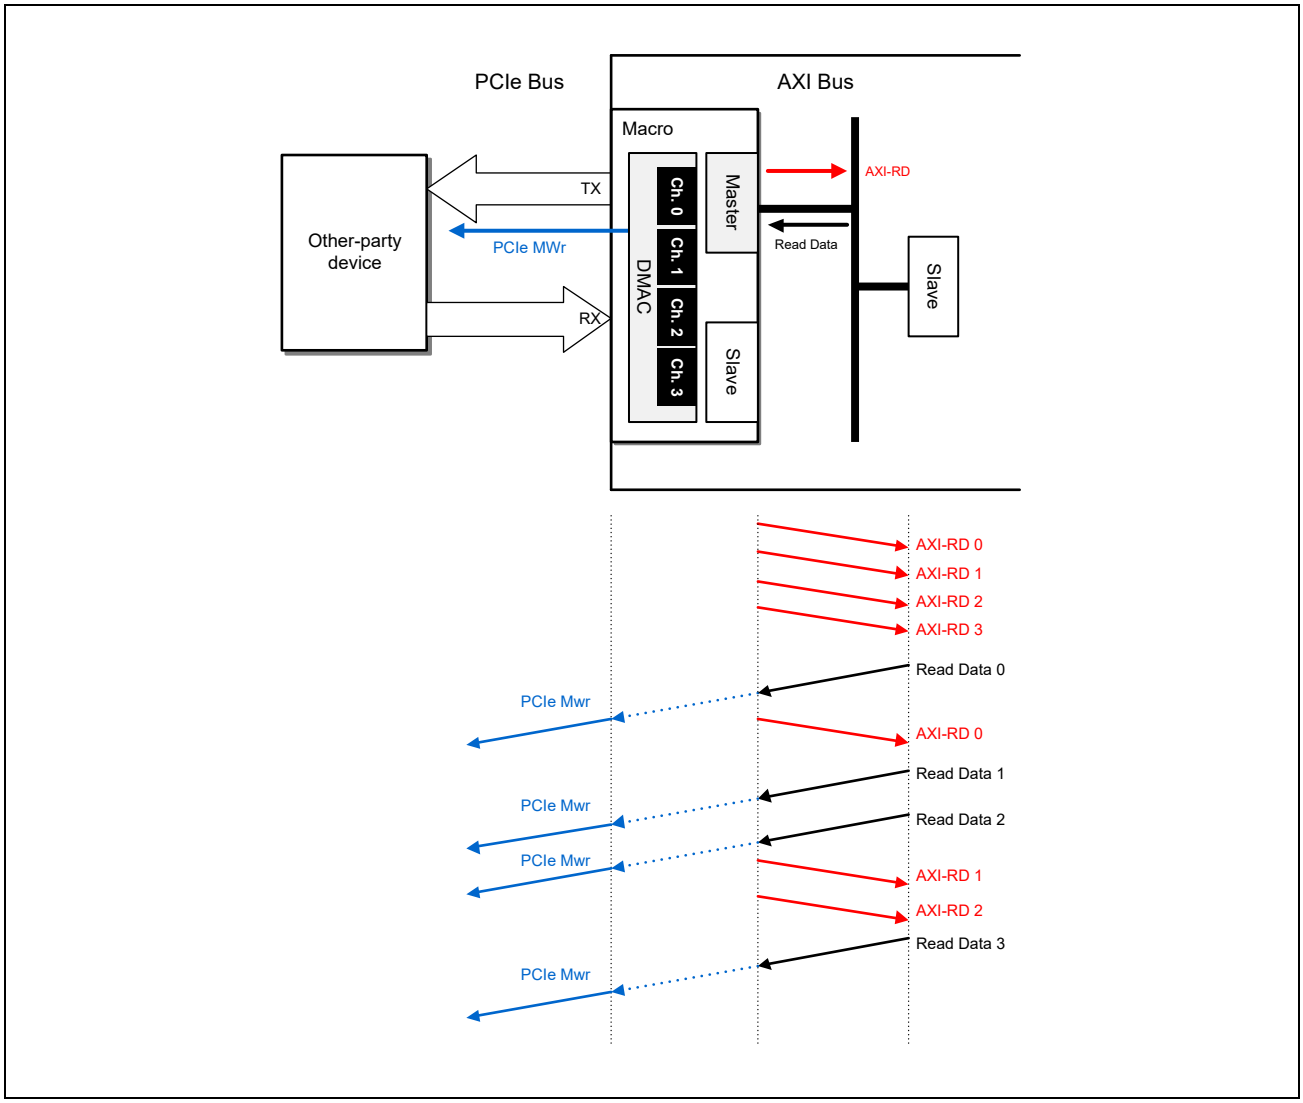
The read data channel checks that the data that have been read are valid and indicates the readiness of the data for reception. Even when the transmission buffer (SRAM) within the unit is full, the unit issues read requests through the read address channel. Also, it receives as much data as it can capture and places subsequent data in the non-receivable state. Accordingly, depending on the state of the transmission buffer, data may not be transferred regardless of a request having been issued, or the AXI bus may be placed in the hold state during transfer. This lengthens the period of waiting for data that have been read, leading to the deterioration of transfer performance as well as the deterioration of overall system performance.

Likewise, contention with write access by the slave interface and contention in write access between channels may decrease performance in transfer.

Since this depends not only on the specifications of the PCIe module (the number of lanes, rate, maximum payload size, etc.) but also on the size of the transmission buffer, the size of the reception buffer of the other-party device, and the

external system configuration (the time for access to the external DRAM, etc.), care should be taken when considering the system configuration in general.

The following is an example where the number of requests which can be read by the AXI master interfaced through four DMAC channels is 4.



1. An AXI read (AXI-RD0: DMAC ch. 0) request is issued through the AXI master interface (read address channel).
2. Since the number of requests which can be read by the unit = 4, AXI read requests are subsequently issued through DMAC ch. 1, ch. 2, and ch. 3.

   Note: No order of priority applies to the issuing of requests through these channels.

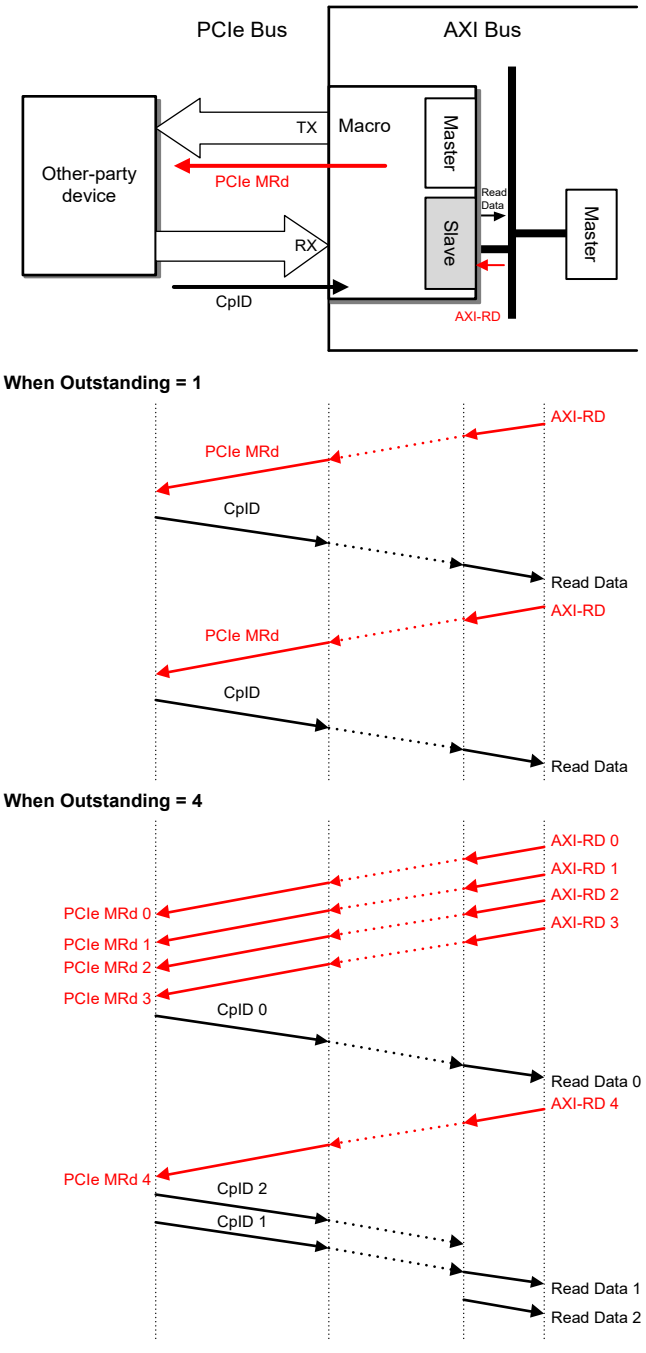
3. Following the completion of the reception of data read in response to the read request through ch. 0, ch. 0 is able to issue a next AXI-RD0.
4. The above steps are repeated until transfer of all bytes set in the DMA Size bits for each channel is completed.

Configuring data transfer as described above allows increased performance, although such a configuration complicates software control.

6.6.6.4.3 PCIe MRd (when the AXI Slave is in Use)

In usage as an AXI slave, memory read requests (PCIe MRd) are issued to the PCIe interface, a completion (CplD) is received from the PCIe interface, and an AXI write transfer (AXI-WR) is initiated (this unit supports eight outstanding transfers). Therefore, only the number of PCIe MRd requests that corresponds to this set number of outstanding transfers can be issued first, regardless of the reception of CplD. The received CplDs are stored in a data buffer (RAM) and then transferred through the AXI bus.

If a PCIe MRd is issued through the AXI interface slave port of the unit, the number of read requests which can be accepted by the AXI slave at a time = 1 to 8 corresponding to the PCIe section.



When outstanding = 1

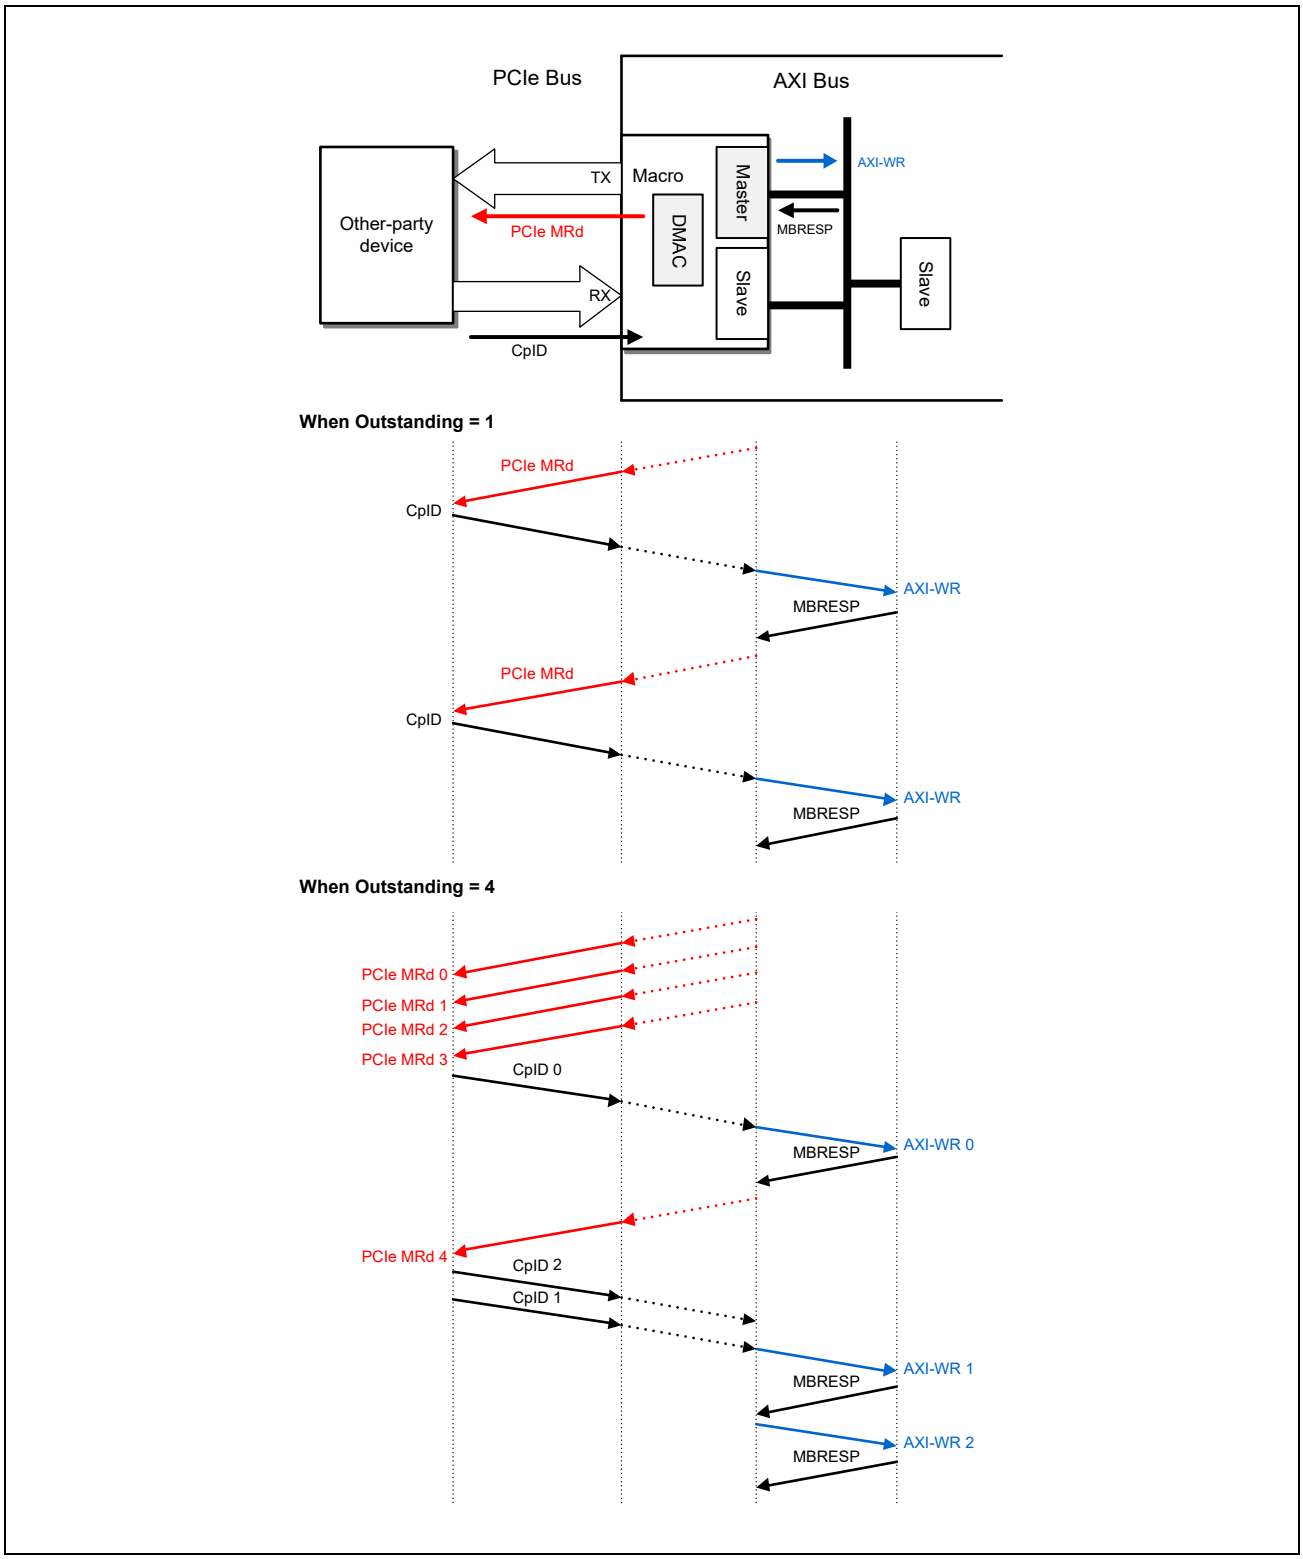
1. An AXI read transaction is issued through the AXI slave interface (read address channel).
2. A transaction is converted into a PCIe MRd command and the request for data reading is issued to the other-party device via the PCIe bus.
3. CplD is received from the other-party device and an AXI read response is issued through the AXI slave interface (read data channel).
4. Steps 1 to 3 are repeated.

When outstanding = 4

1. An AXI read transaction is issued through the AXI slave interface (read address channel).
2. A transaction is converted into a PCIe MRd command and the request for data reading is issued to the other-party device via the PCIe bus.
   Steps 1 and 2 can be repeated until up to four consecutive requests have been issued.
3. CplD is received from the other-party device and an AXI read response is issued through the AXI slave interface (read data channel).
   At this time, the PCIe module can operate with out-of-order transactions, so the order of CplDs from the other-party device may not be preserved. The unit also includes a buffer to support in-order transactions with the AXI bus. If this is used and the CplD for a preceding PCIe MRd is never returned, however, the next request cannot be issued and performance deteriorates accordingly.
   After that, steps 1 to 3 are repeated.

6.6.6.4.4 PCIe MRd (when the DMAC is in Use)

If a PCIe MRd request is to be issued by using the DMAC within the unit, the overall number of requests is also 1 to 8 when the DMAC is incorporated depending on the number of outstanding transfers.



1. Activate the internal DMAC through the AXI slave interface or from an other-party device.

When outstanding = 1

2. The DMAC issues a read request and this is converted to a PCIe MRd command within the unit. The request for data reading is issued to the other-party device via the PCIe bus.
3. CplD is received from the other-party device and an AXI write transaction is issued through the AXI master interface (write address channel, write data channel).
4. Following the completion of the AXI write transfer, a next request is issued.
5. Steps 2 to 4 are repeated until transfer of all bytes set in the DMA Size bits is complete

When outstanding = 4

2. The DMAC issues a read request and this is converted to a PCIe MRd command within the unit. The request for data reading is issued to the other-party device via the PCIe bus. Up to four consecutive requests can be issued.
3. CplD is received from the other-party device and an AXI write transaction is issued through the AXI master interface (write address channel, write data channel).
   At this time, the PCIe module can operate with out-of-order transactions, so the order of CplDs from the other-party device may not be preserved. The unit also includes a buffer to support in-order transactions with the AXI bus. If this is used and the CplD for a preceding PCIe MRd is never returned, however, the next request cannot be issued and performance deteriorates accordingly.
4. Following the completion of the AXI write transfer, a next request is issued.
5. Steps 2 to 4 are repeated until transfer of all bytes set in the DMA Size bits is completed.

6.6.6.5 PCIe Initialization Procedure

6.6.6.5.1 Initialization Procedure

(1) Root Complex Mode

An example of the initialization procedure for PCIe Root Complex mode is described in steps 1 to 13.

Table 6.6-129 Initialization Procedure (RC) (1/2)

Step 1	Set the Root Complex mode by the PCI Device Type setting register. SYS: Write 0000_0001h to the SYS_PCIE_MODE_CH0 register (1024h) (Root Complex mode)
Step 2	Set to the reset state. CPG: Write 0004_0000h to the CPG_RST11 register (92Ch) (PCIE_0_ARESETN (TYPE-A))
Step 3	Clock OFF setting CPG: Write 0030_0000h to the CPG_CLKON_12 register (630h) (PCIE_0_ACLK, PCIE_0_CLK_PMU)
Step 4	Release the reset. CPG: Write 0004_0004h to the CPG_RST11 register (92Ch) (PCIE_0_ARESETN (TYPE-A))
Step 5	Set the clock output to “On”. CPG: Write 0030_0030h to the CPG_CLKON_12 register (630h) (PCIE_0_ACLK, PCIE_0_CLK_PMU)
Step 6	Set to the PCIe reset state. PCI: Set bits [6:0] = 000_0000b in the PCI_RC_RESET register (310h) (RST_OUT_B, RST_PS_B, RST_LOAD_B, RST_CFG_B, RST_RSM_B, RST_GP_B, RST_B)
Step 7	Release the PCIe reset. PCI: Set bit 4 = 1b and bit 3 = 1b in the PCI_RC_RESET register (0310h) (RST_LOAD_B, RST_CFG_B)
Step 8*1	Setting of HWINT and PIPE_PHY related registers PCI: Set bit 2 = 1b in the PCI_RC_PERM register (300h) (CFG_HWINIT_EN) (access enable setting) PCI: Set bit 1 = 1b in the PCI_RC_PERM register (300h) (PIPE PHY Register Enable) (access enable setting) PCI: Write xxxx_xxxxh to the PCI_RC_VID register (6000h) (Device ID, Vendor ID) PCI: Write FFFF_FFDFh to the PCI_RC_RID_CC register (6008h) (Revision ID, Class Code) PCI: Write FFFF_FFFFh to the PCI_RC_BARMSK00L register (60A0h) PCI: Write FFFF_FFFFh to the PCI_RC_BARMSK00U register (60A4h) PCI: Write 0000_0000h to the PCI_RC_BSIZE00_01 register (60C8h) PCI: Write 0808_0808h to the PCI_RC_LEQCTL register (61BCh)*3 PCI: Write 05DB_B800h to the PCI_PHY_XCFGD register (20A0h)*3 PCI: Set bit 2 = 0b in the PCI_RC_PERM register (300h) (CFG_HWINIT_EN) (access disable setting) PCI: Set bit 1 = 0b in the PCI_RC_PERM register (300h) (PIPE PHY Register Enable) (access disable setting)
Step 9	SYS setting (ALLOW_ENTER_L1) SYS: Set bit 0 = 1b in the SYS_PCIE_MISC_CH0 register (1020h) SYS: Set bit 0 = 1b in the SYS_PCIE_MISC_CH1 register (1050h)

Table 6.6-129 Initialization Procedure (RC) (2/2)

Step 10*2	Interrupt settings PCI: Write 0000_1200h to the PCI_RC_PEIS0 register (0204h) PCI: Set bit 30 = 1b, bit 29 = 1b, bit 12 = 1b, and bit 9 = 1b in the PCI_RC_PEIE0 register (0200h) (UI_LINK_WIDTH_CHANGE_DONE EN, UI_LINK_SPEED_CHANGE_DONE EN, RX_DLLP_PM_ENTER_L23 EN, DL_UpDown EN) PCI: Write 0003_0303h to the PCI_RC_PEIS1 register (020ch) PCI: Set bit 17 = 1b, bit 16 = 1b, bit 9 = 1b, bit 8 = 1b, bit 1 = 1b, and bit 0 = 1b in the PCI_RC_PEIE1 register (0208h) (TXB_PARITY_ERR EN, ERR_RPC_REPLAYFIFO_PERR EN, ERR_REPLAY_HIGHER_CORRECTABLE_ERROR EN, ERR_REPLAY_LOWER_CORRECTABLE_ERROR EN, ERR_REPLAY_HIGHER_UNCORRECTABLE_ERROR EN, ERR_REPLAY_LOWER_UNCORRECTABLE_ERROR EN) PCI: Write 0000_0F0Fh to the PCI_RC_AMEIS register (0214h) PCI: Set bits [11:8] = 1111b and bits [3:0] = 1111b in the PCI_RC_AMEIE register (0210h) (Write MSTERR INT EN [3:0], Read MSTERR INT EN [3:0]) PCI: Write 0000_0F03h to the PCI_RC_ASEIS1 register (0224h) PCI: Set bits [11:8] = 1111b, bit 1 = 1b, and bit 0 = 1b in the PCI_RC_ASEIE1 register (0220h) (Write SLVERR INT EN [3:0], Read SLVERR INT EN [1:0]) PCI: Write 010F_0000h to the PCI_RC_MSGRCVIS register (0124h) PCI: Write 0105_0000h to the PCI_RC_MSGRCVIE register (0120h)
Step 11	Release the reset. PCI: Set bit 5 = 1b, bit 1 = 1b, and bit 0 = 1b in the PCI_RC_RESET register (0310h) (RST_PS_B, RST_GP_B, RST_B)
Step 12	Wait for 500 µs or more
Step 13	Release the reset. PCI: Set bit 6 = 1b and bit 2 = 1b in the PCI_RC_RESET register (0310h) (RST_OUT_B, RST_RSM_B)

Note 1. Change the setting values according to the operating conditions.

Note 2. Set the corresponding interrupt handler prior to using this function.

Note 3. For details, refer to **6.6.6.1.1 Changing the Initial Values of the Registers**.

(2) Endpoint Mode

An example of the initialization procedure for PCIe End Point mode is described in steps 1 to 14.

Table 6.6-130 Initialization Procedure (EP) (1/2)

Step 1	Set the End Point mode by the PCI Device Type setting register SYS: Write 0000_0000h to the SYS_PCIE_MODE_CH0 register (1024h) (End Point mode)
Step 2	Set to the reset state. CPG: Write 0004_0000h to the CPG_RST11 register (92Ch) (PCIE_0_ARESETN (TYPE-A))
Step 3	Clock OFF setting CPG: Write 0030_0000h to the CPG_CLKON_12 register (630h) (PCIE_0_ACLK, PCIE_0_CLK_PMU)
Step 4	Release the reset. CPG: Write 0004_0004h to the CPG_RST11 register (92Ch) (PCIE_0_ARESETN (TYPE-A))
Step 5	Set the clock output to “On”. CPG: Write 0030_0030h to the CPG_CLKON_12 register (630h) (PCIE_0_ACLK, PCIE_0_CLK_PMU)
Step 6	Set to the PCIe reset state. PCI: Set bits [6:0] = 000_0000b in the PCI_EP_RESET register (310h) (RST_OUT_B, RST_PS_B, RST_LOAD_B, RST_CFG_B, RST_RSM_B, RST_GP_B, RST_B)
Step 7	Release the PCIe reset. PCI: Set bit 4 = 1b and bit 3 = 1b in the PCI_EP_RESET register (0310h) (RST_LOAD_B, RST_CFG_B)
Step 8	Setting of HWINT and PIPE_PHY related registers (Function #0) PCI: Set bit 2 = 1b in the PCI_EP_PERM register (300h) (CFG_HWINIT_EN) (access enable setting) PCI: Set bit 1 = 1b in the PCI_EP_PERM register (300h) (PIPE PHY Register Enable) (access enable setting) PCI: Write xxxx_xxxxh to the PCI_EP_VID_F0 register (6000h) (Device ID, Vendor ID) PCI: Write FFFF_FFFFh to the PCI_EP_RID_CC_F0 register (6008h) (Revision ID, Class Code) PCI: Write FFDF_FFFFh to the PCI_EP_SSID_F0 register (602Ch) (Subsystem ID, Subsystem Vendor ID) PCI: Write 1FFF_FFFFh to the PCI_EP_BARMSK00L_F0 register (60A0h) PCI: Write 0000_0000h to the PCI_EP_BARMSK00U_F0 register (60A4h) PCI: Write 0000_0000h to the PCI_EP_BSIZE00_01_F0 register (60C8h) PCI: Write 0000_0000h to the PCI_EP_BARMSK01L_F0 register (60A8h) PCI: Write 0000_0000h to the PCI_EP_BARMSK01U_F0 register (60ACh) PCI: Write 0000_1FFFh to the PCI_EP_BARMSK02L_F0 register (60B0h) PCI: Write 0000_0000h to the PCI_EP_BARMSK02U_F0 register (60B4h) PCI: Write 0000_0000h to the PCI_EP_BSIZE02_03_F0 register (60CCh) PCI: Write 0000_0000h to the PCI_EP_BSIZE04_05_F0 register (60D0h) PCI: Write 0000_0000h to the PCI_EP_BSIZE06_F0 register (60D4h) PCI: Write 0808_0808h to the PCI_EP_LEQCTL_F0 register (61BCh)*3 PCI: Write 05DB_B800h to the PCI_PHY_XCFGD register (20A0h)*3 PCI: Set bit 2 = 0b in the PCI_EP_PERM register (300h) (CFG_HWINIT_EN) (access disable setting) PCI: Set bit 1 = 0b in the PCI_EP_PERM register (300h) (PIPE PHY Register Enable) (access disable setting)

Table 6.6-130 Initialization Procedure (EP) (2/2)

Step 9*1	Setting of HWINT related registers (Function #1) PCI: Set bit 2 = 1b in the PCI_EP_PERM register (300h) (CFG_HWINIT_EN) (access enable setting) PCI: Write xxxx_xxxxh to the PCI_EP_VID_F1 register (7000h) (Device ID, Vendor ID) PCI: Write FFFF_FFFFh to the PCI_EP_RID_CC_F1 register (7008h) (Revision ID, Class Code) PCI: Write FDDF_FFFFh to the PCI_EP_SSID_F1 register (702Ch) (Subsystem ID, Subsystem Vendor ID) PCI: Write 1FFF_FFFFh to the PCI_EP_BARMSK00L_F1 register (70A0h) PCI: Write 0000_0000h to the PCI_EP_BARMSK00U_F1 register (70A4h) PCI: Write 0000_0000h to the PCI_EP_BSIZE00_01_F1 register (70C8h) PCI: Write 0000_0000h to the PCI_EP_BARMSK01L_F1 register (70A8h) PCI: Write 0000_0000h to the PCI_EP_BARMSK01U_F1 register (70ACh) PCI: Write 0000_1FFFh to the PCI_EP_BARMSK02L_F1 register (70B0h) PCI: Write 0000_0000h to the PCI_EP_BARMSK02U_F1 register (70B4h) PCI: Write 0000_0000h to the PCI_EP_BSIZE02_03_F1 register (70CCh) PCI: Write 0000_0000h to the PCI_EP_BSIZE04_05_F1 register (70D0h) PCI: Write 0000_0000h to the PCI_EP_BSIZE06_F1 register (70D4h) PCI: Set bit 2 = 0b in the PCI_EP_PERM register (300h) (CFG_HWINIT_EN) (access disable setting)
Step 10	SYS setting (ALLOW_ENTER_L1) SYS: Set bit 0 = 1b in the SYS_PCIE_MISC_CH0 register (1020h) SYS: Set bit 0 = 1b in the SYS_PCIE_MISC_CH1 register (1050h)
Step 11*2	Interrupt settings PCI: Write 0000_1200h to the PCI_EP_PEIS0 register (0204h) PCI: Set bit 30 = 1b, bit 29 = 1b, bit 12 = 1b, and bit 9 = 1b in the PCI_EP_PEIE0 register (0200h) (UI_LINK_WIDTH_CHANGE_DONE EN, UI_LINK_SPEED_CHANGE_DONE EN, RX_DLLP_PM_ENTER_L23 EN, DL_UpDown EN) PCI: Write 0003_0303h to the PCI_EP_PEIS1 register (020Ch) PCI: Set bit 17 = 1b, bit 16 = 1b, bit 9 = 1b, bit 8 = 1b, bit 1 = 1b, and bit 0 = 1b in the PCI_EP_PEIE1 register (0208h) (TXB_PARITY_ERR EN, ERR_RPC_REPLAYFIFO_PERR EN, ERR_REPLAY_HIGHER_CORRECTABLE_ERROR EN, ERR_REPLAY_LOWER_CORRECTABLE_ERROR EN, ERR_REPLAY_HIGHER_UNCORRECTABLE_ERROR EN, ERR_REPLAY_LOWER_UNCORRECTABLE_ERROR EN) PCI: Write 0000_0F0Fh to the PCI_EP_AMEIS register (0214h) PCI: Set bits [11:8] = 1111b and bits [3:0] = 1111b in the PCI_EP_AMEIE register (0210h) (Write MSTERR INT EN [3:0], Read MSTERR INT EN [3:0]) PCI: Write 0000_0F03h to the PCI_EP_ASEIS1 register (0224h) PCI: Set bits [11:8] = 1111b, bit 1 = 1b, and bit 0 = 1b in the PCI_EP_ASEIE1 register (0220h) (Write SLVERR INT EN [3:0], Read SLVERR INT EN [1:0]) PCI: Write 010F_0000h to the PCI_EP_MSGRCVIS register (0124h) PCI: Write 010A_0000h to the PCI_EP_MSGRCVIE register (0120h)
Step 12	Release the reset. PCI: Set bit 5 = 1b, bit 1 = 1b, and bit 0 = 1b in the PCI_EP_RESET register (0310h) (RST_PS_B, RST_GP_B, RST_B)
Step 13	Wait for 500 µs or more
Step 14	Release the reset. PCI: Set bit 6 = 1b and bit 2 = 1b in the PCI_EP_RESET register (0310h) (RST_OUT_B, RST_RSM_B)

Note 1. Change the setting values according to the operating conditions.

Note 2. Set the corresponding interrupt handler prior to using this function.

Note 3. For details, refer to **6.6.6.1.1 Changing the Initial Values of the Registers**.

6.6.7 Points for Caution and Restrictions

6.6.7.1 Points for Caution and Prohibited Items in the Issuing of Requests

The following describes the restrictions in the issuing of various requests.

(1) Prohibition of fixed bursts of 2 or more beats

Fixed bursts for 2 or more beats are prohibited. If an attempt to use these is made, an OKAY response is returned to the AXI bus, but this may lead to issuing of the unexpected requests to the PCIe side, or unexpected register access which will change register values, and so on.

(2) Points for caution in the issuing of special requests

The requests listed below are issued by access to the internal registers. The registers are only accessible from the AXI side and writing to them while requests are being processed is prohibited. Attempted access from the PCIe side will be ignored.

[Special Requests]

— Zero-Length Memory Read Request
— Configuration Read
— Configuration Write
— Message Request
— Message Request with data payload

CAUTION

Do not issue a special request for which issuing of the request is prohibited. Operation is not guaranteed if this is done.

6.6.7.2 Ordering Specifications of Received Non-Posted and Posted Requests

In the specifications of this unit, a non-posted request is not overtaken by a posted request on the receiving side.

Requests received from another party are output to the higher-level bus in the order of reception.

6.6.7.3 Caution when Changing the Speed Spontaneously by the EP Unit

Follow the procedure below. The following control bits are present in the PCI Core Control 2 Register and PCI Core Status 2 Register among the AXI-Bridge registers.

1. Wait until the home node is placed in the L0 state.
2. Read the value of the STATE_DATA_RATE_IDENTIFIER_RECEIVED bit to check the supported speed of the other-party node.
3. If the home node supports the speed to which the other-party node wants to change, set the UI_LINK_SPEED_CHANGE[1:0] bits and assert the UI_LINK_SPEED_CHANGE_REQ bit.
4. Wait for the UI_LINK_SPEED_CHANGE_DONE bit to be asserted (wait for the completion).

Remark UI_LINK_SPEED_CHANGE_REQ is retained until UI_LINK_SPEED_CHANGE_DONE is asserted. It should be de-asserted after checking the assertion of UI_LINK_SPEED_CHANGE_DONE.

6.6.7.4 Error Processing of Unsupported Requests

The following describes the flow of processing for error reporting and error logging.

(1) Access that straddles a 4-KB boundary

Data transfer to a memory space which straddles a 4-KB boundary cannot proceed (this is stipulated by the PCI Express Base Specification). In our unit, the reception of a memory write or read request for a memory space which straddles a 4-KB boundary is handled as a malformed TLP.

(2) RCB violations

The PCI Express Base Specification states that error processing in response to violations of the read completion boundary (RCB) is optional. The PCIe module of this LSI chip does not support the detection of RCB violations at the time of the reception of completion responses.

(3) Error processing in response to byte enable fields

The PCI Express Base Specification states that error processing in response to Byte Enable fields is optional. Our unit does not support the detection of errors in the form of violations of Byte Enable rules.

(4) Request that extends beyond the base address boundary

This core does not detect a request that starts within the range set in the Base Address Register but extends beyond the boundary from the base address as an error.

(5) Processing when a TPL that is ready to be transferred by the transmitter is a malformed TLP

Even if malformation of a TLP that is ready to be transferred by the transmitter is detected, due to the detection of parity errors when it is read from the FIFO buffer and so on, this unit does not suspend the transmission of such a TLP. Received malformed TLPs must be handled appropriately by other-party devices.

6.6.7.5 Processing on Reception of the Message

The following lists the messages to be detected as a silent drop or UR on reception of the given message.

Table 6.6-131 Operations on Message Reception

Received Message	Root Complex	Endpoint
Assert_INTx	Normal processing	Silent Drop
Deassert_INTx	Normal processing	Silent Drop
ERR_COR	Normal processing	Silent Drop
ERR_NONFATAL	Normal processing	Silent Drop
ERR_FATAL	Normal processing	Silent Drop
UNLOCK	Silent Drop	Silent Drop
Set_Slot_Power_Limit	Silent Drop	Normal processing
Vendor_Defined_Type0	UR	UR
Vendor_Defined_Type1	Silent Drop	Silent Drop
Ignore	Silent Drop	Silent Drop
LTR	UR	UR
OBFF	UR	UR
PM_PME	Normal processing	Silent Drop
PME_TO_Ack	Normal processing	Silent Drop
PM_Active_State_Nak	Silent Drop	Normal processing
PME_Turn_Off	Silent Drop	Normal processing
PTM_Request	UR	UR
PTM_Response	UR	UR
PTM_ResponseD	UR	UR
Invalidate_Request	Silent Drop	UR
Invalidate_Completion	Normal processing	Silent Drop
Page_Request	UR	UR
Page_Response	UR	UR

Note: Silent Drop: Normal completion, data are not reflected
UR: Unsupported Request

6.6.7.6 Notes on Window Settings

Note the following precautions and limitations when setting the window address.

- When adding the setting values of BAR* and the corresponding BAR MASK* register, make sure that bit carry does not occur.
- When adding the setting values of PCIe Window Base* and the corresponding PCIe Window Mask* register, make sure that bit carry does not occur.
- When adding the setting values of AXI Window Mask* and the corresponding AXI Destination* register, make sure that bit carry does not occur.
- When adding the setting values of PCIe Window Mask* and the corresponding PCIe Destination* register, make sure that bit carry does not occur.
- The values of the BAR Mask*, AXI Window Mask* and PCIe Window Mask* registers should be set to $2n - 1$.
- Each window should be a single memory size with a power of 2.
- The minimum area between BAR and BAR Mask is 4 Kbytes.
- Make sure that each window area and AXI Bridge register area (BAR4/5) do not overlap.

6.6.7.7 Other Points for Caution

(1) Access after the de-assertion of the reset signal

When a cycle of writing starts before the value of the SAWREADY bit has become 1b following the de-assertion of the reset signal, access in the second and subsequent cycles produces slave errors.

After the reset signal has been de-asserted, do not assert the SAWVALID signal until SAWREADY has become 1b.

(2) Point for caution at times of register writing

In some cases of writing 2DW or more and skipping over with the use of byte enable to a register from the AXI side, writing might not proceed as expected.

Using a pin reset or register reset from the AXI side as a non-consecutive SWSTRB, restricts writing to no more than 1DW (32 bits).

(3) Point for caution on register reading

In the case of reading a register from the AXI side, values read from invalid byte lanes are from undefined outputs (meaningless garbage data).

(4) Generation of unexpected correctable errors

A correctable error may be detected at the time of EIOS reception following low power state transitions of this unit such as from L0s to L1. If this happens, processing to send a message or assert an interrupt flag signal is to proceed. Take care on this point and respond appropriately so that a correctable error is not handled as a fatal error (a mask setting by a register to switch the notification of unexpected correctable errors off is recommended).

(5) Reset interval in transitions from a hot reset to detection in RC mode

In generations of PCI Express after Gen1, at the time of transitions from a hot reset to detection in accord with the operating rate, the base specification prescribes securing a 1-ms waiting interval for changes to the rate, so secure a reset interval of 1 ms.

SECTION 7 LOW-SPEED INTERFACE

7.1 Low-Speed Interface Overview

This section describes the Low-Speed Interface unit of this LSI. For details, refer to the sections of each unit.

■ Expanded Serial Peripheral Interface (xSPI) (See 7.2)

Supports connection of Serial flash memory. By setting the MD_BOOT[0:1] pin, it can be specified as a boot device.

■ Serial Communications Interface (RSCI) (See 7.3)

This LSI equips 10ch of SCI. SCI can communicate with UART, Simple SPI, Simple I2C.

■ Serial Communications Interface with FIFO (SCIF) (See 7.4)

In this LSI, SCIF executes UART communication. By setting the MD_BOOT[0:1] pin, download boot can be specified.

■ Serial Peripheral Interface (RSPI) (See 7.5)

This LSI equips 3ch of RSPI.

■ CRC Operation Unit (CRC) (See 7.6)

This unit generates the cyclic redundancy check (CRC) codes.

■ I^2C Bus Interface (RIIC) (See 7.7)

This LSI equips 9ch of RIIC.

RIIC8 is located in PD_AWO and can be used for PMIC control during boot.

■ I^3C Bus Interface (I3C) (See 7.8)

■ CAN-FD Interface (See 7.9)

■ A/D Converter (ADC) (See 7.10)

For each 3 units, analog inputs of up to 8 channels are selectable.

A signal from GPT or ELC can be used as an A/D conversion start trigger.

■ Temperature Sensor Unit (TSU) (See 7.11)

This LSI equips 2ch of TSU.

SECTION 7 LOW-SPEED INTERFACE

7.2 Expanded Serial Peripheral Interface (xSPI)

7.2.1 Overview

The xSPI protocol specifies the interface for Memory Devices, which provides high data throughput, low signal count, and limited backward compatibility with legacy SPI devices. The electrical interface can deliver up to 200 MB per second raw data throughput.

Table 7.2-1 lists the xSPI specifications, **Figure 7.2-1** shows a block diagram, and **Table 7.2-2** lists the I/O pins.

Table 7.2-1 xSPI Specifications

Item	Description
Number of channels	1 unit
Protocol	Compliant for the xSPI protocol
Data transmission and reception	Issue the transaction for up to 2 Slave as Master
Transfer speed	Support the transfer at xSPI200
Mode	• Support Protocol modes below – 1/4/8pin with SDR/DDR (1S-1S-1S, 4S-4D-4D*1, 8D-8D-8D*1) – 2/4pin with SDR (1S-2S-2S, 2S-2S-2S, 1S-4S-4S, 4S-4S-4S) • Configurable address length • Configurable initial access latency cycle • Support XiP mode
xSPI function	• Support Write Data Mask • Support In-band Reset • Memory-mapping – Support up to 256 MB address space (128 MB for each CS, or 256 MB for CS0 only) – Prefetch function for burst-read with low latency – Outstanding buffer for burst-write with high throughput • Manual command – Configurable up to 4 commands – Status Register Polling function • Input Strobe port timing shift
Interrupt source	2 interrupts

Note 1. DDR access without XSPI0_DS is not supported.

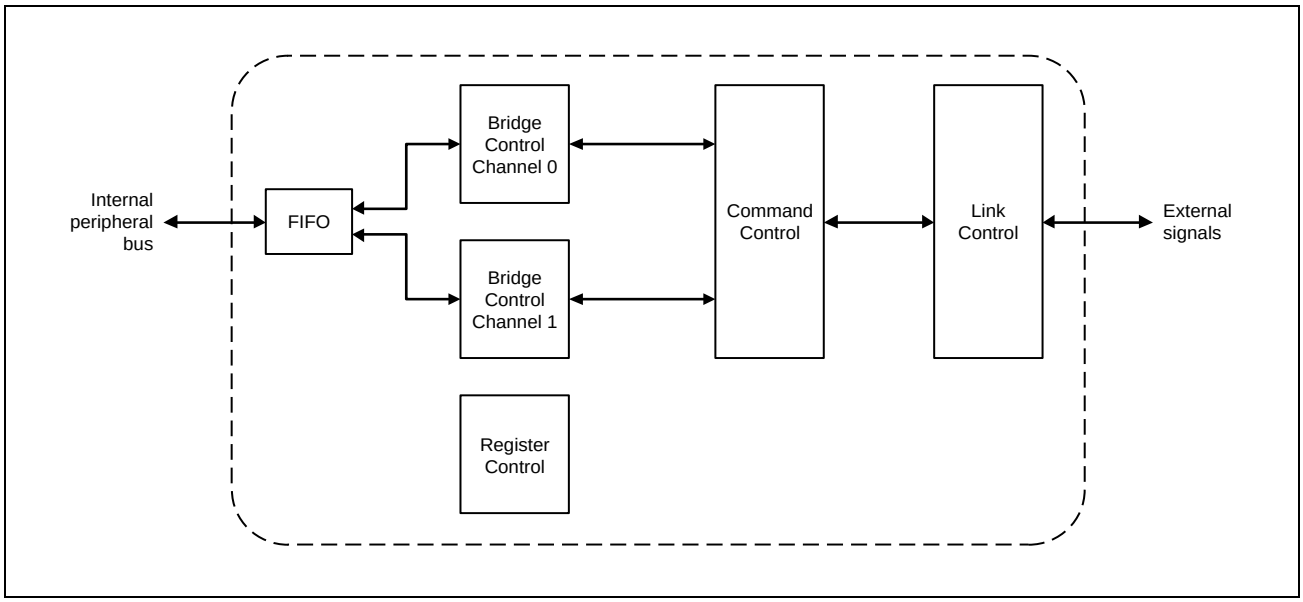


Figure 7.2-1 Block Diagram

Table 7.2-2 xSPI I/O Pins

Channel	Pin Name	Input/Output	Function
xSPIm (m = 0)	XSPIm_CKP	Output	Clock Positive
	XSPIm_CKN	Output	Clock Negative
	XSPIm_CS0N	Output	Chip Select for slave0
	XSPIm_CS1N	Output	Chip Select for slave1
	XSPIm_DS	I/O	Read Data Strobe / Write Data Mask
	XSPIm_IO0	I/O	Data 0 input/output
	XSPIm_IO1	I/O	Data 1 input/output
	XSPIm_IO2	I/O	Data 2 input/output
	XSPIm_IO3	I/O	Data 3 input/output
	XSPIm_IO4	I/O	Data 4 input/output
	XSPIm_IO5	I/O	Data 5 input/output
	XSPIm_IO6	I/O	Data 6 input/output
	XSPIm_IO7	I/O	Data 7 input/output
	XSPIm_RESET0N	Output	Master reset status for slave0
	XSPIm_RESET1N	Output	Master reset status for slave1
	XSPIm_RSTO0N	Input	Slave reset status for slave0
	XSPIm_RSTO1N	Input	Slave reset status for slave1
	XSPIm_INT0N	Input	Interrupt for slave0
	XSPIm_INT1N	Input	Interrupt for slave1
	XSPIm_ECS0N	Input	Error Correction Status for slave0
	XSPIm_ECS1N	Input	Error Correction Status for slave1
	XSPIm_WP0N	Output	Write Protect for slave0
	XSPIm_WP1N	Output	Write Protect for slave1

Table 7.2-3 Address Map

Space	Internal Address
CS0	0_2000_0000h (7000_0000h*1, 6000_0000h*2)
CS1	0_2800_0000h (7800_0000h*1, 6800_0000h*2)

Note: This table shows the default address map. The address map can be changed by SYS_SPI_STAADDCS1 and SYS_SPI_ENDADDCS0-1 registers.

Note 1. CM33 address space (non-secure)

Note 2. CM33 address space (secure)

7.2.2 Registers

Table 7.2-4 Register Base Address

Base Address Name	Base Address
<XSPIm_base>	0_1103_0000h (5103_0000h*1, 4103_0000h*2)

Note 1. CM33 address space (non-secure)

Note 2. CM33 address space (secure)

7.2.2.1 List of Registers

The registers are listed below.

Register Name	Abbreviation	Initial Value	Offset Address	Access Size [bits]
xSPI Wrapper Configuration Register	XSPIm_WRAPCFG	0000_0000h	0000h	32
xSPI Common Configuration Register	XSPIm_COMCFG	0000_0000h	0004h	32
xSPI Bridge Map Configuration Register CH0	XSPIm_BMCFGCH0	0000_0000h	0008h	32
xSPI Bridge Map Configuration Register CH1	XSPIm_BMCFGCH1	0000_0000h	000Ch	32
xSPI Command Map Configuration Register 0 CS0	XSPIm_CMCFG0CS0	0000_0000h	0010h	32
xSPI Command Map Configuration Register 1 CS0	XSPIm_CMCFG1CS0	0008_0000h	0014h	32
xSPI Command Map Configuration Register 2 CS0	XSPIm_CMCFG2CS0	0008_0000h	0018h	32
Reserve	-	-	001Ch to 001Fh	-
xSPI Command Map Configuration Register 0 CS1	XSPIm_CMCFG0CS1	0000_0000h	0020h	32
xSPI Command Map Configuration Register 1 CS1	XSPIm_CMCFG1CS1	0008_0000h	0024h	32
xSPI Command Map Configuration Register 2 CS1	XSPIm_CMCFG2CS1	0008_0000h	0028h	32
Reserve	-	-	002Ch to 004Fh	-
xSPI Link I/O Configuration Register CS0	XSPIm_LIOCFGCS0	0007_0000h	0050h	32
xSPI Link I/O Configuration Register CS1	XSPIm_LIOCFGCS1	0007_0000h	0054h	32
Reserve	-	-	0058h to 005Fh	-
xSPI Bridge Map Control Register 0	XSPIm_BMCTL0	0000_00FFh	0060h	32
xSPI Bridge Map Control Register 1	XSPIm_BMCTL1	xxxx_xxxxh	0064h	32
xSPI Command Map Control Register CH0	XSPIm_CMCTLCH0	0000_0000h	0068h	32
xSPI Command Map Control Register CH1	XSPIm_CMCTLCH1	0000_0000h	006Ch	32
xSPI Command Manual Control Register 0	XSPIm_CDCTL0	0000_0000h	0070h	32
xSPI Command Manual Control Register 1	XSPIm_CDCTL1	0000_0000h	0074h	32
xSPI Command Manual Control Register 2	XSPIm_CDCTL2	0000_0000h	0078h	32
Reserve	-	-	007Ch to 007Fh	-
xSPI Command Manual Type Buf 0	XSPIm_CDTBUF0	0000_0000h	0080h	32
xSPI Command Manual Address Buf 0	XSPIm_CDABUF0	0000_0000h	0084h	32

7.2.2.2 Register Description

The prefix (XSPIm_) of the register names is omitted in this and subsequent sections.

7.2.2.2.1 xSPI Configuration Registers

These registers configure xSPI Master function. These registers should be configured in the initialization phase. When the setting is needed to be changed after beginning xSPI transaction, stop all communicaitons (see **7.2.3.6.3 Flow of communication stop**) before changing the value of xSPI Configuration Register.

NOTE

The initialization phase means the period between reset releasing and issuing 1st xSPI transaction by memory mapping, manual-command or calibration.

(1) xSPI Wrapper Configuration Register (XSPIm_WRAPCFG)

This register has functions to configure xSPI Master function.

Access Size : 32 bits
Offset Address : <XSPIm_base> + 0000h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	DSSFTCS1[4:0]					-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	DSSFTCS0[4:0]					-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
28 to 24	DSSFTCS1 [4:0]	0h	RW	DS shift for slave1 The function is same as one of slave0.
23 to 13	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
12 to 8	DSSFTCS0 [4:0]	0h	RW	DS shift for slave0 This field configures the number of delay cells for XSPIm_DS pin. It is used to adjust the DS sampling timing. 1 cell delay is around 125 ps. When automatic calibration is enabled, it can be updated automatically. 00h: No shift 01h: Add a delay of 1 cell : 1Eh: Add a delay of 30 cells 1Fh: Add a delay of 31 cells
7 to 0	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.

(2) xSPI Common Configuration Register (XSPIm_COMCFG)

This register has functions to configure xSPI Master function.

Access Size : 32 bits
Offset Address : <XSPIm_base> + 0004h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	OENEGEX	OEASTEX
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	ARBMD[1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
17	OENEGEX	0h	RW	Output Enable Negating extension This field extends 1 cycle output enable of Data and DS during output enable negating. This bit should not be used in case of no latency cycle, because xSPI output data could be conflicted with xSPI input data. 0b: No extend 1 cycle Output enable 1b: Extend 1 cycle Output enable
16	OEASTEX	0h	RW	Output Enable Asserting extension This field extends 1 cycle output enable of Data and DS during output enable asserting. When set to 1, CS asserting should be extended (LIOCFGCSn.CSASTEX = 1 (n = 0, 1)). This field should not be used in case of no latency cycle, because xSPI output data could be conflicted with xSPI input data. 0b: No extend 1 cycle Output enable 1b: Extend 1 cycle Output enable
15 to 2	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
1, 0	ARBMD[1:0]	0h	RW	Channel arbitration mode This field selects the behavior when system bus accesses from ch0 and ch1 to slave devices occurred simultaneously. It is used only for memory-mapping mode. 00b: Round-Robbin (ch0-ch1-ch0-ch1…) 01b: Always ch0 win 10b: Always ch1 win 11b: Reserved

(3) xSPI Bridge Map Configuration Register CHn (XSPIm_BMCFGCHn) (n = 0, 1)

This register has functions to configure xSPI Master function.

Access Size : 32 bits
Offset Address : <XSPIm_base> + 0008h + n x 0004h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CMBTIM[7:0]								-	-	-	-	-	-	-	PREEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MWRSIZE[7:0]								MWRCOMB	-	-	-	-	-	-	WRMD
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	CMBTIM[7:0]	0h	RW	Combination timer This field specifies the expiration period of the combination timer. 00h means disabling the combination timer. When the timer is expired, the data in the combination buffer is pushed to memory device.
23 to 17	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
16	PREEN	0h	RW	Prefetch enable This field enables prefetch function for read transaction in memory-mapping mode. It could reduce the latency for read transaction with incremental address. 0b: Disable prefetch function 1b: Enable prefetch function
15 to 8	MWRSIZE[7:0]	0h	RW	Memory Write Size This field selects the size to combine incremental address in memory-mapping mode. It transmits an xSPI frame with the data combined up to the configured size while the address is incremental. Before the target size is reached, when non-incremental address or a read transaction are detected, pending data is transmitted to xSPI bus. 00h: Combine incremental address up to 4 bytes 01h: Combine incremental address up to 8 bytes : 0Eh: Combine incremental address up to 60 bytes 0Fh: Combine incremental address up to 64 bytes FFh: Combine incremental address up to 2 bytes Others: Setting prohibited
7	MWRCOMB	0h	RW	Memory Write Combination mode This field selects to combine the xSPI data in write access of memory-mapping mode. When this field is set to 0, xSPI data size depends on system bus's burst type and size. When this field is set to 1, the data size depends on MWRSIZE field. When this field is set to 1, any write transaction could be held in this xSPI master temporarily. 0b: Disable combination mode 1b: Enable combination mode
6 to 1	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
0	WRMD	0h	RW	System bus Write Response mode This field selects the timing of system bus write response in memory-mapping mode. When this field is set to 1, it returns the response after transmitting a frame on xSPI bus. When this mode is enabled, Memory Write Combination mode must be disabled. 0b: Return response after storing to Internal Write Buffer 1b: Return response after issuing write transaction to xSPI bus

(4) xSPI Command Map Configuration Register 0 CSn (XSPIm_CMCFG0CSn) (n = 0, 1)

This register has functions to configure xSPI Master function.

Access Size : 32 bits
Offset Address : <XSPIm_base> + 0010h + n x 0010h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ADDRPCD[7:0]								ADDRPEN[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	ARYAMD	WPBSTMD	ADDSIZE[1:0]		FFMT[1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	ADDRPCD [7:0]	0h	RW	Address Replace Code This field configures the code to replace the MSByte of system bus address in memory-mapping mode. It replaces the corresponding bits when Address Replace Enable bit is set to 1b.
23 to 16	ADDRPEN[7:0]	0h	RW	Address Replace Enable This field selects the bits to replace for the MSByte of system bus address in memory-mapping mode. 0b: No replacement (xSPI frame address field is same as system bus address) 1b: Replacement
15 to 6	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
5	ARYAMD	0h	RW	Array address mode When this field is set to 1b, address for memory is mapped as {A[25:4], 00_0000b, A[3:0]} where A[25:0] is normal address. This field is effective only when FFMT=01b. 0b : Normal address mode 1b : Array address mode
4	WPBSTMD	0h	RW	Wrapping burst mode When this field is set to 1b, the wrapping boundary between system bus access and xSPI memory should be matched. 0b: Separate xSPI transfer at the wrapping address boundary 1b: Not separate xSPI transfer at the wrapping address boundary
3, 2	ADDSIZE[1:0]	0h	RW	Address size This field configures the number of address bytes in memory-mapping mode. In case of 8D-8D-8D profile 2.0, it should be configured to 4 bytes. 00b: 1 byte (256-byte address space) 01b: 2 bytes (64 KB address space) 10b: 3 bytes (16 MB address space) 11b: 4 bytes (4 GB address space)
1, 0	FFMT[1:0]	0h	RW	Frame format This field configures xSPI frame format in memory-mapping mode. See **Table 7.2-11** for detail. 00b: Normal format: Command 1 byte, Address ADDSIZE, Data up to system bus transaction. 01b: 8D-8D-8D profile 1.0 format: Command 2 bytes, Address ADDSIZE, Data up to system bus transaction 10b: 8D-8D-8D profile 2.0 Command Modifier format: Command & Modifier 6 bytes, Data up to system bus transaction 11b: 8D-8D-8D profile 2.0 Commands with Extended Command Modifier format: Command & Modifier 6 bytes, Data up to system bus transaction

(5) xSPI Command Map Configuration Register 1 CSn (XSPIm_CMCFG1CSn) (n = 0, 1)

This register has functions to configure xSPI Master function.

Access Size : 32 bits
Offset Address : <XSPIm_base> + 0014h + n x 0010h
Initial Value : 0008_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	RDLATE[4:0]				
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RDCMD[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
20 to 16	RDLATE[4:0]	8h	RW	Read latency cycle This field configures the latency cycle of read transaction in memory-mapping mode. 00h: No latency 01h: 1 cycle : 1Eh: 30 cycles 1Fh: 31 cycles
15 to 0	RDCMD[15:0]	0h	RW	Read command This field configures the command field of read transaction in memory-mapping mode. Normal format and 8D-8D-8D profile 2.0 format use only upper 1 byte. 8D-8D-8D profile 1.0 format uses 2 bytes.

(6) xSPI Command Map Configuration Register 2 CSn (XSPIm_CMCFG2CSn) (n = 0, 1)

This register has functions to configure xSPI Master function.

Access Size : 32 bits
Offset Address : <XSPIm_base> + 0018h + n x 0010h
Initial Value : 0008_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	WRLATE[4:0]				
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	WRCMD[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
20 to 16	WRLATE[4:0]	8h	RW	Write latency cycle This field configures the latency cycle of write transaction in memory-mapping mode. 00h: No latency 01h: 1 cycle : 1Eh: 30 cycles 1Fh: 31 cycles
15 to 0	WRCMD[15:0]	0h	RW	Write command This field configures the command field of write transaction in memory-mapping mode. Normal format and 8D-8D-8D profile 2.0 format use only upper 1 byte. 8D-8D-8D profile 1.0 format uses 2 bytes.

(7) xSPI Link I/O Configuration Register CSn (XSPIm_LIOCFGCSn) (n = 0, 1)

This register has functions to configure xSPI Master function.

Access Size : 32 bits
Offset Address : <XSPIm_base> + 0050h + n x 0004h
Initial Value : 0007_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DDRSMPEX[3:0]				SDRSMPSFT[3:0]				SDRSMPMD	SDRDRV	CSNEGEX	CSASTEX	CSMIN[3:0]			
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	WRMSKMD	LATEMD	PRTMD[9:0]									
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	DDRSMPEX [3:0]	0h	RW	DDR sampling window extend This field configures the cycle of extending the sampling window in DDR. In DDR, the input data is sampled during the expected cycle soon after latency cycle. The input data out of range is ignored. It can be configured depending on DS propagation delay. 0h: Expand no cycle 1h: Expand 1 cycle : 6h: Expand 6 cycles 7h: Expand 7 cycles Others: Setting prohibited
27 to 24	SDRSMPSFT [3:0]	0h	RW	SDR Sampling window shift This field shifts the timing of CK sampling in SDR. In case of using DS in SDR, there is no influence on the behavior. In case of DDR or using DS in SDR, it should be set to 0. 0h: Sample without delay 1h: Sample at 1 cycle delay : 6h: Sample at 6 cycle delay 7h: Sample at 7 cycle delay Others: Setting prohibited
23	SDRSMPMD	0h	RW	SDR Sampling mode This field selects the edge of sampling in SDR. In DDR, regardless of this setting, it samples data input ports with both edges of DS. When this field is set to 1b, data is sampled at rising-edge before falling-edge. 0b: Samples data input at falling-edge 1b: Samples data input at rising-edge
22	SDRDRV	0h	RW	SDR driving timing This field configures the timing of data output in SDR. This field should not be set to 1b in case of no latency cycle, because xSPI output data could be conflicted with xSPI input data. 0b: Drive at 1/2 cycle before CK rising-edge 1b: Drive at CK rising-edge
21	CSNEGEX	0h	RW	CS negating extension This field extends 1 cycle chip select pins when negating. 0b: No extension 1b: Extend 1 cycle

Bit	Bit Name	Initial Value	R/W	Description
20	CSASTEX	0h	RW	CS asserting extension This field extends 1 cycle chip select pins when asserting. 0b: No extension 1b: Extend 1 cycle
19 to 16	CSMIN[3:0]	7h	RW	CS minimum idle term This field configures the minimum cycle between xSPI frames. 0h: 1 cycle 1h: 2 cycles : Eh: 15 cycles Fh: 16 cycles
15 to 12	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
11	WRMSKMD	0h	RW	Write mask mode This field selects to use Data strobe port as write data mask. It is used only for 8D-8D-8D protocol mode. 0b: Write mask disable 1b: Write mask enable
10	LATEMD	0h	RW	Latency mode This field selects the behavior of initial access latency phase for both direct-manual mode and memory-mapping mode. When this field is set to 0b, the latency cycle is equal to each configured cycle from transmitting address field. When this field is set to 1b, the latency cycle is incremented from the last byte-pair of Address field and is extended 2 times of each configured cycle depending on data strobe port. It is used only for profile 2.0 frame format of 8D-8D-8D protocol mode with 6 bytes command/address field. Refer to xSPI protocol for detail. For this bit, refer to **Table 7.2-5**.
9 to 0	PRTMD[9:0]	0h	RW	Protocol mode This field configures the protocol mode and the pin to sample data inputs. In case of using not xSPI clock but Data strobe for sampling in SDR mode, it is required to set PRTMD[9] to 1. 000h: 1S-1S-1S 3B2h: 4S-4D-4D 3FFh: 8D-8D-8D 048h: 1S-2S-2S 049h: 2S-2S-2S 090h: 1S-4S-4S 092h: 4S-4S-4S Others: Setting prohibited

Table 7.2-5 LATEMD Bit Description

Value	Frame format	Usage
0b: Configurable latency	Profile 2.0	The configurable latency cycle should be set as minus 1.
	Others	Latency cycle increments after address field.
1b: Variable latency	Profile 2.0	Latency cycle increments from address [23:16]. And it should not be set to 1.
	Others	Not supported

7.2.2.2.2 xSPI Control Registers

These registers control xSPI Master function.

(1) xSPI Bridge Map Control Register 0 (XSPIm_BMCTL0)

This register has functions to control xSPI Master function.

This register should be configured in the initialization phase. When the setting is needed to be changed after beginning xSPI transaction, stop all communications (see **7.2.3.6.3 Flow of communication stop**) before changing the value of BMCTL0.

Access Size : 32 bits
Offset Address : <XSPIm_base> + 0060h
Initial Value : 0000_00FFh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	CH1CS1ACC [1:0]		CH1CS0ACC [1:0]		CH0CS1ACC [1:0]		CH0CS0ACC [1:0]	
Initial Value	0	0	0	0	0	0	0	0	1	1	1	1	1	1	1	1
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
7, 6	CH1CS1ACC [1:0]	3h	RW	System bus ch1 to slave1 memory area access enable This field enables the access from ch1 to CS1 memory. 00b: Read/Write disable 01b: Read enable, Write disable 10b: Read disable, Write enable 11b: Read/Write enable
5, 4	CH1CS0ACC [1:0]	3h	RW	System bus ch1 to slave0 memory area access enable This field enables the access from ch1 to CS0 memory. 00b: Read/Write disable 01b: Read enable, Write disable 10b: Read disable, Write enable 11b: Read/Write enable
3, 2	CH0CS1ACC [1:0]	3h	RW	System bus ch0 to slave1 memory area access enable This field enables the access from ch0 to CS1 memory. 00b: Read/Write disable 01b: Read enable, Write disable 10b: Read disable, Write enable 11b: Read/Write enable
1, 0	CH0CS0ACC [1:0]	3h	RW	System bus ch0 to slave0 memory area access enable This field enables the access from ch0 to CS0 memory. 00b: Read/Write disable 01b: Read enable, Write disable 10b: Read disable, Write enable 11b: Read/Write enable

(2) xSPI Bridge Map Control Register 1 (XSPIm_BMCTL1)

This register has functions to control xSPI Master function.

Access Size : 32 bits
Offset Address : <XSPIm_base> + 0064h
Initial Value : xxxx_xxxxh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	PBUFCLRCH1	PBUFCLRCH0	MWRPUSHCH1	MWRPUSHCH0	-	-	-	-	-	-	-	-
Initial Value	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	-	x	W	Reserved Whenever it is read, undefined value is read. The written value should always be 0b.
11	PBUFCLRCH1	x	W	The read value is undefined Prefetch Buffer clear for ch1 This function is same as PBUFCLRCH0. 0b: No command 1b: Clear request
10	PBUFCLRCH0	x	W	The read value is undefined Prefetch Buffer clear for ch0 This field requests to clear the prefetch buffer when the prefetch function is enabled. It should not be set during memory access (COMSTT.MEMACCCHn = 1). 0b: No command 1b: Clear request
9	MWRPUSHCH1	x	W	The read value is undefined Memory Write Data Push for ch1 The function is same as MWRPUSHCH0. 0b: No command 1b: Push request
8	MWRPUSHCH0	x	W	The read value is undefined Memory Write Data Push for ch0 This field requests to push the pending data in combination mode. 0b: No command 1b: Push request
7 to 0	-	x	W	Reserved Whenever it is read, undefined value is read. The written value should always be 0b.

(3) xSPI Command Map Control Register CHn (XSPIm_CMCTLCHn) (n = 0, 1)

This register has functions to control xSPI Master function.

Access Size : 32 bits
Offset Address : <XSPIm_base> + 0068h + n x 0004h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	XIPEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	XIPEXCODE[7:0]								XIPENCODE[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
16	XIPEN	0h	RW	XiP mode enable This field enables XiP mode in memory-mapping mode. When this field is set to 1, XiP enter code is inserted in the latency field, and the command field in next transaction is omitted. When this field is set to 0, XiP exit code is inserted in the latency field. And it is set to 0 automatically when transmitting XiP disable pattern. It should not be used for 8D-8D-8D protocol mode profile 2.0 frame format. 0b: Disable XiP mode 1b: Enable XiP mode
15 to 8	XIPEXCODE [7:0]	0h	RW	XiP mode exit code This field configures the code to exit XiP mode in memory-mapping mode.
7 to 0	XIPENCODE [7:0]	0h	RW	XiP mode enter code This field configures the code to enter XiP mode in memory-mapping mode.

(4) xSPI Command Manual Control Register 0 (XSPIm_CDCTL0)

This register has functions to control xSPI Master function.

Access Size : 32 bits
Offset Address : <XSPIm_base> + 0070h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	PERREP[3:0]				-	-	-	PERITV[4:0]				
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	TRNUM[1:0]		CSSEL	-	PERMD	TRREQ
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
27 to 24	PERREP[3:0]	0h	RW	Periodic transaction repeat This field configures the number of transaction repetitions in periodic manual-command mode. 0h: 1 (= 2^0) time 1h: 2 (= 2^1) times : Eh: 16384 (= 2^{14}) times Fh: 32768 (= 2^{15}) times
23 to 21	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
20 to 16	PERITV[4:0]	0h	RW	Periodic transaction interval This field configures the interval of transaction in periodic manual-command mode. Too short interval compared with CPU bus cycle could result in no store into command buffer0. The interval should be longer than 4 times the system bus clock cycle. 00h: 2 (= 2^1) cycles 01h: 4 (= 2^2) cycles : 1Eh: 2,147,483,648 (= 2^{31}) cycles 1Fh: 4,294,967,296 (= 2^{32}) cycles
15 to 6	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
5, 4	TRNUM[1:0]	0h	RW	Transaction number This field configures the number of transactions in normal manual-command mode. In periodic manual-command, the read data of last command is compared. 00b: Issue 1 command (using command buffer 0) 01b: Issue 2 commands (using command buffer 0-1) 10b: Issue 3 commands (using command buffer 0-2) 11b: Issue 4 commands (using command buffer 0-3)
3	CSSEL	0h	RW	Chip select This field selects a target memory to issue manual-command. 0b: CS0 1b: CS1
2	-	0h	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.

Bit	Bit Name	Initial Value	R/W	Description
1	PERMD	0h	RW	Periodic mode This field enables the periodic transaction mode. When set to 1b, it repeats a transaction periodically and compares the read value with the expected value. It alternates the status polling operation for external memory. 0b: Direct manual-command mode 1b: Periodic manual-command mode
0	TRREQ	0h	RW	Transaction request This field requests to issue the transaction of manual-command. When this field is set to 1b, the transaction is started. This field is cleared to 0 when the transaction is completed. The transaction is canceled by clearing to 0 while the transaction is ongoing. 0b: No transaction 1b: Request transaction

(5) xSPI Command Manual Control Register 1 (XSPIm_CDCTL1)

This register has functions to control xSPI Master function.

Access Size : 32 bits
Offset Address : <XSPIm_base> + 0074h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PEREXP[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PEREXP[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	PEREXP[31:0]	0h	RW	Periodic transaction expected value This field configures the expected value to compare with the read value in periodic manual-command mode. For example, in case of comparing 1 byte, the lower byte should be configured.

(6) xSPI Command Manual Control Register 2 (XSPIm_CDCTL2)

This register has functions to control xSPI Master function.

Access Size : 32 bits
Offset Address : <XSPIm_base> + 0078h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PERMSK[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PERMSK[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	PERMSK[31:0]	0h	RW	Periodic transaction masked value This field configures the masked value for the expected value in periodic manual-command mode. When this field is set 1 to any bit, the corresponding bit configured as expected value (CDCTL1.PEREXP[31:0]) is ignored. In 8D-8D-8D, the data bytes are transferred only in byte pairs on xSPI bus. It means the dummy read data could be stored. It should be masked for unused bits. For example, in case of read lower 1 byte, it should be configured to FFFF_FF00h.

(7) xSPI Command Manual Type Buf n (XSPIm_CDTBUFn) (n = 0 to 3)

This register has functions to control xSPI Master function.

Access Size : 32 bits
Offset Address : <XSPIm_base> + 0080h + n x 0010h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CMD[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TRTYPE	-	LATE[4:0]					DATASIZE[3:0]				ADDSIZE[2:0]			CMDSIZE[1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	CMD[15:0]	0h	RW	Command (1-2 bytes) This field configures the command field in manual-command mode. The number of bytes configured in Command Size bit is transferred. 1S-1S-1S, 4S-4D-4D: CMD[15:8] is command field, CMD[7:0] is not used. 8D-8D-8D profile 1.0: CMD[15:8] is command field, CMD[7:0] is extension field. 8D-8D-8D profile 2.0: CMD[15:0] is upper 2 bytes of command & modifier field. (bit 47-32 in xSPI protocol)
15	TRTYPE	0h	RW	Transaction Type This field selects the type of transaction. 0b: Read transaction (Readout data from slave device) 1b: Not read transaction
14	-	0h	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
13 to 9	LATE[4:0]	0h	RW	Latency cycle This field configures the latency cycle in manual-command mode. 0h: No latency 1h: 1 cycle : 1Eh: 30 cycles 1Fh: 31 cycles
8 to 5	DATASIZE[3:0]	0h	RW	Write/Read Data Size This field configures the size of data field. In 8D-8D-8D, the data bytes are transferred only in byte pairs on xSPI bus. For example, even if configuring 1 byte for read, 2 bytes data is received. The last byte should be ignored. The 0 bytes must not configured for read transaction. 0h: 0 bytes (No data phase) 1h: 1 byte : 7h: 7 bytes 8h: 8 bytes Others: Setting prohibited

Bit	Bit Name	Initial Value	R/W	Description
4 to 2	ADDSIZE[2:0]	0h	RW	Address size This field configures the size of address field. 000b: 0 bytes (No address phase) 001b: 1 byte 010b: 2 bytes 011b: 3 bytes 100b: 4 bytes Others: Setting prohibited
1, 0	CMDSIZE[1:0]	0h	RW	Command Size This field configures the size of command field. In case of 8D-8D-8D, it should be fixed to 10b. It should not be configured both command size and address size to zero. 00b: 0 bytes (No command phase) 01b: 1 byte 10b: 2 bytes Others: Setting prohibited

(8) xSPI Command Manual Address Buf n (XSPIm_CDABUFn) (n = 0 to 3)

This register has functions to control xSPI Master function.

Access Size : 32 bits
Offset Address : <XSPIm_base> + 0084h + n x 0010h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ADD[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ADD[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	ADD[31:0]	0h	RW	Address This field configures the address field in manual-command mode. 1S-1S-1S, 4S-4D-4D, 8D-8D-8D profile 1.0: It is address field. 8D-8D-8D profile 2.0: It is lower 4 bytes of command & modifier field. (bit 31-0 in xSPI protocol)

(9) xSPI Command Manual Data 0 Buf n (XSPIm_CDD0BUFn) (n = 0 to 3)

This register has functions to control xSPI Master function.

Access Size : 32 bits

Offset Address : <XSPIm_base> + 0088h + n x 0010h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DATA[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DATA[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DATA[31:0]	0h	RW	Write/Read Data This field configures the data field in manual-command mode. In case of write transaction, the write data should be configured. In case of read transaction, the read data is stored.

(10) xSPI Command Manual Data 1 Buf n (XSPIm_CDD1BUFn) (n = 0 to 3)

This register has functions to control xSPI Master function.

Access Size : 32 bits

Offset Address : <XSPIm_base> + 008Ch + n x 0010h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DATA[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DATA[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DATA[31:0]	0h	RW	Write/Read Data This field configures the data field in manual-command mode. In case of write transaction, the write data should be configured. In case of read transaction, the read data is stored.

(11) xSPI Link Pattern Control Register 0 (XSPIm_LPCTL0)

This register has functions to control xSPI Master function.

Access Size : 32 bits
Offset Address : <XSPIm_base> + 0100h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	XD2VAL	-	-	XD2LEN[4:0]					XD1VAL	-	-	XD1LEN[4:0]				
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	XDPIN[1:0]		CSSEL	-	-	PATREQ
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31	XD2VAL	0h	RW	XiP Disable pattern 2nd phase value This field selects the value of 2nd phase in XiP disable pattern. 0b: Low drive 1b: High drive
30, 29	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
28 to 24	XD2LEN[4:0]	0h	RW	XiP Disable pattern 2nd phase length This field selects the length of 2nd phase in XiP disable pattern. 00h: 0 cycles 01h: 1 cycle : 1Eh: 30 cycles 1Fh: 31 cycles
23	XD1VAL	0h	RW	XiP Disable pattern 1st phase value This field selects the value of 1st phase in XiP disable pattern. 0b: Low drive 1b: High drive
22, 21	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
20 to 16	XD1LEN[4:0]	0h	RW	XiP Disable pattern 1st phase length This field selects the length of 1st phase in XiP disable pattern. The pattern with zero-length both 1st phase and 2nd phase should not be configured. 0h: 0 cycles 1h: 1 cycle : 1Eh: 30 cycles 1Fh: 31 cycles
15 to 6	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
5, 4	XDPIN[1:0]	0h	RW	XiP Disable pattern pin This field selects the data output pins to transmit XiP Disable pattern. 00b: 1 pin 01b: 2 pins 10b: 4 pins 11b: 8 pins

Bit	Bit Name	Initial Value	R/W	Description
3	CSSEL	0h	RW	Chip select This field selects a target memory to issue a pattern. 0b: slave0 (CS0) 1b: slave1 (CS1)
2, 1	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
0	PATREQ	0h	RW	Pattern request This field requests to issue the pattern. When set to 1, it starts the pattern. It is cleared to 0 when the pattern completed. 0b: No request XiP Disable pattern 1b: Request XiP Disable pattern

(12) xSPI Link Pattern Control Register 1 (XSPIm_LPCTL1)

This register has functions to control xSPI Master function.

Access Size : 32 bits
Offset Address : <XSPIm_base> + 0104h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	RSTSU[2:0]			-	RSTWID[2:0]			-	-	RSTREP[1:0]		CSSEL	-	PATREQ[1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 15	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
14 to 12	RSTSU[2:0]	0h	RW	Reset pattern data output setup time This field configures the number of setup cycles for data output based on the edge of CS in reset pattern. It needs enough setup time because xSPI slave samples any data at the rising edge of CS. This cycle of setup time should be less than the cycle of reset pattern width (RSTWID[2:0]). 000b: 1 cycle 001b: 2 cycles : 110b: 7 cycles 111b: 8 cycles
11	-	0h	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
10 to 8	RSTWID[2:0]	0h	RW	Reset pattern width This field configures the width of cycle in reset pattern and CS only pattern. It toggles CS with the configured cycle. 000b: 2 (= 2^1) cycles 001b: 4 (= 2^2) cycles : 110b: 128 (= 2^7) cycles 111b: 256 (= 2^8) cycles
7, 6	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
5, 4	RSTREP[1:0]	0h	RW	Reset pattern repeat This field selects the repeating time to toggle CS from LOW to HIGH. 00b: 4 times (Specified on Reset Signaling Protocol) 01b: 5 times 10b: 6 times 11b: 7 times
3	CSSEL	0h	RW	Chip select This field selects a target memory to issue a pattern. 0b: slave0 (CS0) 1b: slave1 (CS1)
2	-	0h	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.

Bit	Bit Name	Initial Value	R/W	Description
1, 0	PATREQ[1:0]	0h	RW	Pattern request This field requests to issue the pattern. When set to 01b or 10b, it starts the pattern. It is cleared to 00b when the pattern completed. 00b: No request 01b: Request Reset pattern 10b: Request CS only pattern 11b: Setting prohibited

(13) xSPI Link I/O Control Register (XSPIm_LIOCTL)

This register has functions to control xSPI Master function.

Access Size : 32 bits
Offset Address : <XSPIm_base> + 0108h
Initial Value : 0003_0003h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	RSTCS1	RSTCS0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	WPCS1	WPCS0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
17	RSTCS1	1h	RW	Reset drive for slave1 This function is same as RSTCS0. 0b: Drive Low level 1b: Drive High level
16	RSTCS0	1h	RW	Reset drive for slave0 This field controls the value of xSPI reset port. It can be useful only for xSPI slave with reset port. 0b: Drive Low level 1b: Drive High level
15 to 2	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
1	WPCS1	1h	RW	WP drive for slave1 This function is same as WPCS0. 0b: Drive Low level 1b: Drive High level
0	WPCS0	1h	RW	WP drive for slave0 This field controls the value of Write Protect port. It can be useful only for xSPI slave with write protect port. 0b: Drive Low level 1b: Drive High level

(14) xSPI Command Calibration Control Register 0 CSn (XSPIm_CCCTL0CSn) (n = 0, 1)

This register has functions to control xSPI Master function.

Access Size : 32 bits
Offset Address : <XSPIm_base> + 0130h + n x 0020h
Initial Value : 1F00_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	CASFTEND[4:0]					-	-	-	CASFTSTA[4:0]				
Initial Value	0	0	0	1	1	1	1	1	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	CAITV[4:0]					-	-	-	-	-	-	CANOWR	CAEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
28 to 24	CASFTEND [4:0]	1Fh	RW	Calibration DS shift end value This field configures the end value of DS shift. It should be equal or more than the start value (CASFTSTA).
23 to 21	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
20 to 16	CASFTSTA [4:0]	0h	RW	Calibration DS shift start value This field configures the start value of DS shift.
15 to 13	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
12 to 8	CAITV[4:0]	0h	RW	Calibration interval This field configures the interval between calibration patterns. 00h: 2 (= 2^1) cycle wait 01h: 4 (= 2^2) cycle wait : 1Eh: 2,147,483,648 (= 2^{31}) cycle wait 1Fh: 4,294,967,296 (= 2^{32}) cycle wait
7 to 2	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
1	CANOWR	0h	RW	Calibration no write mode This field selects to omit write command in calibration sequence. It can be used for any slave device with fixed calibration pattern data. 0b: Calibration sequence with write command 1b: Calibration sequence without write command
0	CAEN	0h	RW	Automatic Calibration Enable This field enables the automatic calibration. When this field is set to 1, it transmits the calibration sequence periodically and adjusts the value of phase shift. When this field is set to 0 during the calibration sequence, it stops after completed ongoing calibration sequence, and then this field is cleared. 0b: Disable automatic calibration 1b: Enable automatic calibration

(15) xSPI Command Calibration Control Register 1 CSn (XSPIm_CCCTL1CSn) (n = 0, 1)

This register has functions to control xSPI Master function. It should be updated while Automatic Calibration Enable is disabled.

Access Size : 32 bits
Offset Address : <XSPIm_base> + 0134h + n x 0020h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	CARDLATE[4:0]					-	-	-	CAWRLATE[4:0]				
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	CADATASIZE[3:0]				CAADDSIZE[2:0]			CACMDSIZE [1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
28 to 24	CARDLATE [4:0]	0h	RW	Read Latency cycle This field configures the latency cycle in calibration frame. 00h: No latency 01h: 1 cycle : 1Eh: 30 cycles 1Fh: 31 cycles
23 to 21	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
20 to 16	CAWRLATE [4:0]	0h	RW	Write Latency cycle This field configures the latency cycle in calibration frame. 00h: No latency 01h: 1 cycle : 1Eh: 30 cycles 1Fh: 31 cycles
15 to 9	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
8 to 5	CADATASIZE [3:0]	0h	RW	Write/Read Data Size This field configures the size of data field. In 8D-8D-8D, it should be configured with even byte. 0h: 1 byte 1h: 2 bytes : Eh: 15 bytes Fh: 16 bytes
4 to 2	CAADDSIZE [2:0]	0h	RW	Address size This field configures the size of address field. 000b: 0 bytes (No address phase) 001b: 1 byte 010b: 2 bytes 011b: 3 bytes 100b: 4 bytes Others: Setting prohibited

Bit	Bit Name	Initial Value	R/W	Description
1, 0	CACMDSIZE [1:0]	0h	RW	Command Size This field configures the size of command field. In case of 8D-8D-8D, it should be fixed to 10b. It should not be configured both command size and address size to zero. 00b: 0 bytes (No command phase) 01b: 1 byte 10b: 2 bytes 11b: Setting prohibited

(16) xSPI Command Calibration Control Register 2 CSn (XSPIm_CCCTL2CSn) (n = 0, 1)

This register has functions to control xSPI Master function. It should be updated while Automatic Calibration Enable is disabled.

Access Size : 32 bits
Offset Address : <XSPIm_base> + 0138h + n x 0020h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CARDCMD[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	CARDCMD [15:0]	0h	RW	Calibration pattern read command This field configures the calibration pattern read command.
15 to 0	CAWRCMD [15:0]	0h	RW	Calibration pattern write command This field configures the calibration pattern write command.

(17) xSPI Command Calibration Control Register 3 CSn (XSPIm_CCCTL3CSn) (n = 0, 1)

This register has functions to control xSPI Master function. It should be updated while Automatic Calibration Enable is disabled.

Access Size : 32 bits

Offset Address : <XSPIm_base> + 013Ch + n x 0020h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CAADD[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CAADD[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CAADD[31:0]	0h	RW	Calibration pattern address This field configures the calibration pattern address.

(18) xSPI Command Calibration Control Register 4 CSn (XSPIm_CCCTL4CSn) (n = 0, 1)

This register has functions to control xSPI Master function. It should be updated while Automatic Calibration Enable is disabled.

Access Size : 32 bits
Offset Address : <XSPIm_base> + 0140h + n x 0020h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CADATA[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CADATA[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CADATA[31:0]	0h	RW	Calibration pattern data This field configures the calibration pattern data.

(19) xSPI Command Calibration Control Register 5 CSn (XSPIm_CCCTL5CSn) (n = 0, 1)

This register has functions to control xSPI Master function. It should be updated while Automatic Calibration Enable is disabled.

Access Size : 32 bits
Offset Address : <XSPIm_base> + 0144h + n x 0020h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CADATA[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CADATA[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CADATA[31:0]	0h	RW	Calibration pattern data This field configures the calibration pattern data.

(20) xSPI Command Calibration Control Register 6 CSn (XSPIm_CCCTL6CSn) (n = 0, 1)

This register has functions to control xSPI Master function. It should be updated while Automatic Calibration Enable is disabled.

Access Size : 32 bits

Offset Address : <XSPIm_base> + 0148h + n x 0020h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CADATA[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CADATA[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CADATA[31:0]	0h	RW	Calibration pattern data This field configures the calibration pattern data.

(21) xSPI Command Calibration Control Register 7 CSn (XSPIm_CCCTL7CSn) (n = 0, 1)

This register has functions to control xSPI Master function. It should be updated while Automatic Calibration Enable is disabled.

Access Size : 32 bits

Offset Address : <XSPIm_base> + 014Ch + n x 0020h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CADATA[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CADATA[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CADATA[31:0]	0h	RW	Calibration pattern data This field configures the calibration pattern data.

7.2.2.2.3 xSPI Status Registers

These registers monitor the status of xSPI Master.

(1) xSPI Version Register (XSPIm_VERSTT)

This register indicates the status of xSPI Master.

Access Size : 32 bits
Offset Address : <XSPIm_base> + 0180h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	VER[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	VER[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	VER[31:0]	0h	R	Version This field indicates this IP version.

(2) xSPI Common Status Register (XSPIm_COMSTT)

This register indicates the status of xSPI Master.

Access Size : 32 bits
Offset Address : <XSPIm_base> + 0184h
Initial Value : 0070_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	RSTOCS1	INTCS1	ECSCS1	-	RSTOCS0	INTCS0	ECSCS0
Initial Value	0	0	0	0	0	0	0	0	0	1	1	1	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	WRBUFNECH1	WRBUFNECH0	PBUFNECH1	PBUFNECH0	-	-	MEMACCCH1	MEMACCCH0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 23	-	All 0	R	Reserved Whenever it is read, 0b is read.
22	RSTOCS1	1h	R	RSTO monitor for slave1 This function is same as RSTOCS0. 0b: Low level 1b: High level
21	INTCS1	1h	R	INT monitor for slave1 This function is same as INTCS0. 0b: Low level 1b: High level
20	ECSCS1	1h	R	ECS monitor for slave1 This function is same as ECSCS0. 0b: Low level 1b: High level
19	-	0h	R	Reserved Whenever it is read, 0b is read.
18	RSTOCS0	0h	R	RSTO monitor for slave0 This field indicates the value of RSTO port. 0b: Low level 1b: High level
17	INTCS0	0h	R	INT monitor for slave0 This field indicates the value of INT port. 0b: Low level 1b: High level
16	ECSCS0	0h	R	ECS monitor for slave0 This field indicates the value of ECS port. 0b: Low level 1b: High level
15 to 8	-	All 0	R	Reserved Whenever it is read, 0b is read.
7	WRBUFNECH1	0h	R	Write Buffer Not Empty for ch1 This function is same as WRBUFNECH0. 0b: Empty 1b: Not empty

Bit	Bit Name	Initial Value	R/W	Description
6	WRBUFNECH0	0h	R	Write Buffer Not Empty for ch0 This bit is only valid in the **7.2.3.6.3** and **7.2.3.6.7** flows. 0b: Empty 1b: Not empty
5	PBUFNECH1	0h	R	Prefetch Buffer Not Empty for ch1 0b: Empty 1b: Not empty
4	PBUFNECH0	0h	R	Prefetch Buffer Not Empty for ch0 0b: Empty 1b: Not empty
3, 2	-	All 0	R	Reserved Whenever it is read, 0b is read.
1	MEMACCCH1	0h	R	Memory access ongoing from ch1 0b: System bus bridge ch1 is not accessing memory. 1b: System bus bridge ch1 is accessing memory.
0	MEMACCCH0	0h	R	Memory access ongoing from ch0 0b: System bus bridge ch0b is not accessing memory. 1b: System bus bridge ch0 is accessing memory.

(3) xSPI Calibration Status Register CSn (XSPIm_CASTTCSn) (n = 0, 1)

This register indicates the status of xSPI Master.

Access Size : 32 bits

Offset Address : <XSPIm_base> + 0188h + n x 0004h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CASUC[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CASUC[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CASUC[31:0]	0h	R	Calibration Success This field indicates the calibration success for each DS shift value. It is updated when each calibration sequence is completed. CASUC[x] indicates calibration success in DS shift value = x.

7.2.2.2.4 xSPI Interrupt Registers

These registers control the interrupt function of xSPI Master.

(1) xSPI Interrupt Status Register (XSPIm_INTS)

This register indicates the status of interrupt. The bits in this register are cleared to 0 when writing 1 on the corresponding bit of INTC register.

Access Size : 32 bits
Offset Address : <XSPIm_base> + 0190h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CASUCCS1	CASUCCS0	CAFAILCS1	CAFAILCS0	-	-	-	-	-	-	BUSERRCH1	BUSERRCH0	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	INTCS1	INTCS0	-	-	ECSCS1	ECSCS0	-	-	DSTOCS1	DSTOCS0	PERTO	INICMP	PATCMP	CMDCMP
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	CASUCCS1	0h	R	Calibration success for slave1 This function is same as CASUCCS0. 0b: No detection 1b: Detection
30	CASUCCS0	0h	R	Calibration success for slave0 This field is set to 1b when calibration succeeded. 0b: No detection 1b: Detection
29	CAFAILCS1	0h	R	Calibration failed for slave1 This function is same as CAFAILCS0. 0b: No detection 1b: Detection
28	CAFAILCS0	0h	R	Calibration failed for slave0 This field is set to 1b when calibration failed. 0b: No detection 1b: Detection
27 to 22	-	All 0	R	Reserved Whenever it is read, 0b is read.
21	BUSERRCH1	0h	R	System bus error for ch1 This field is set to 1b when system bus channel1 responds error.
20	BUSERRCH0	0h	R	System bus error for ch0 This field is set to 1b when system bus channel0 responds error.
19 to 14	-	All 0	R	Reserved Whenever it is read, 0b is read.
13	INTCS1	0h	R	Interrupt detection for slave1 This function is same as INTCS0. 0b: No detection 1b: Detection

Bit	Bit Name	Initial Value	R/W	Description
12	INTCS0	0h	R	Interrupt detection for slave0 This field is set to 1b when the falling edge on INT port is detected. It can be useful only for xSPI slave with interrupt function. 0b: No detection 1b: Detection
11, 10	-	All 0	R	Reserved Whenever it is read, 0b is read.
9	ECSCS1	0h	R	ECC error detection for slave1 This function is same as ECSCS0. 0b: No detection 1b: Detection
8	ECSCS0	0h	R	ECC error detection for slave0 This field is set to 1b when the falling edge on ECS port is detected. It can be useful only for xSPI slave with ECC detection function. 0b: No detection 1b: Detection
7, 6	-	All 0	R	Reserved Whenever it is read, 0b is read.
5	DSTOCS1	0h	R	DS timeout for slave1 This function is same as DSTOCS0. 0b: No detection 1b: Detection
4	DSTOCS0	0h	R	DS timeout for slave0 This field is set to 1b when DS is lost in read transaction with using DS. It means not receiving the data during expected read phase. In this case, xSPI master stops the read transaction and the following transaction. This error may issue an error response to system bus. 0b: No detection 1b: Detection
3	PERTO	0h	R	Periodic transaction timeout This field is set to 1b when the read value does not match with the expected value in periodic manual-command mode. 0b: No detection 1b: Detection
2	INICMP	0h	R	Initial Sequence Completed This field is set to 1b when the initial sequence is completed. 0b: No detection 1b: Detection
1	PATCMP	0h	R	Pattern Completed This field is set to 1b when the requested pattern is completed. 0b: No detection 1b: Detection
0	CMDCMP	0h	R	Command Completed This field is set to 1b when the requested manual-command is completed. In direct manual-command, it means all transactions completed. In periodic manual-command, it means the read data matches with the expected data. 0b: No detection 1b: Detection

(2) xSPI Interrupt Clear Register (XSPIm_INTC)

This register clears the status of interrupt.

Access Size : 32 bits
Offset Address : <XSPIm_base> + 0194h
Initial Value : xxxx_xxxxh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CASUCCS1C	CASUCCS0C	CAFAILCS1C	CAFAILCS0C	-	-	-	-	-	-	BUSERRCH1C	BUSERRCH0C	-	-	-	-
Initial Value	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	INTCS1C	INTCS0C	-	-	ECSCS1C	ECSCS0C	-	-	DSTOCS1C	DSTOCS0C	PERTOC	INICMPC	PATCMPC	CMDCMPC
Initial Value	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Bit	Bit Name	Initial Value	R/W	Description
31	CASUCCS1C	x	W	The read value is undefined Calibration success for slave1 interrupt clear 0b: No change in interrupt status 1b: Clear interrupt status
30	CASUCCS0C	x	W	The read value is undefined Calibration success for slave0 interrupt clear 0b: No change in interrupt status 1b: Clear interrupt status
29	CAFAILCS1C	x	W	The read value is undefined Calibration failed for slave1 interrupt clear 0b: No change in interrupt status 1b: Clear interrupt status
28	CAFAILCS0C	x	W	The read value is undefined Calibration failed for slave0 interrupt clear 0b: No change in interrupt status 1b: Clear interrupt status
27 to 22	-	x	W	Reserved Whenever it is read, undefined value is read. The written value should always be 0b.
21	BUSERRCH1C	x	W	The read value is undefined System bus error for ch1 interrupt clear 0b: No change in interrupt status 1b: Clear interrupt status
20	BUSERRCH0C	x	W	The read value is undefined System bus error for ch0 interrupt clear 0b: No change in interrupt status 1b: Clear interrupt status
19 to 14	-	x	W	Reserved Whenever it is read, undefined value is read. The written value should always be 0b.
13	INTCS1C	x	W	The read value is undefined Interrupt detection for slave1 interrupt clear 0b: No change in interrupt status 1b: Clear interrupt status

Bit	Bit Name	Initial Value	R/W	Description
12	INTCS0C	x	W	The read value is undefined Interrupt detection for slave0 interrupt clear 0b: No change in interrupt status 1b: Clear interrupt status
11, 10	-	x	W	Reserved Whenever it is read, undefined value is read. The written value should always be 0b.
9	ECSCS1C	x	W	The read value is undefined ECC error detection for slave1 interrupt clear 0b: No change in interrupt status 1b: Clear interrupt status
8	ECSCS0C	x	W	The read value is undefined ECC error detection for slave0 interrupt clear 0b: No change in interrupt status 1b: Clear interrupt status

7.2.3 Operation

xSPI Master interface has the functions to issue the transaction for external memory with xSPI Slave interface. It allows to write to registers in external memory or read from it.

This xSPI Master mainly has two modes to issue the transaction. One is a manual-command mode; Software configures all fields of xSPI frame and starts the transaction by software request. The other is a memory-mapping mode; it automatically converts system bus access for pre-configured memory area into xSPI transaction. It enables to access from system bus to external memory area outside of chip via xSPI bus.

This section describes the xSPI bus operation, the direct control of xSPI frame (manual-command), the control of memory access (memory-mapping), the error operation, and the flow to operation.

7.2.3.1 xSPI Bus

This section describes the xSPI bus operation.

7.2.3.1.1 Supported protocol mode

This xSPI Master supports various protocol modes. It is configured by Protocol mode bits (LIOCFGCSn.PRTMD[9:0]). The table below shows the summary of protocol modes.

Table 7.2-6 Supported Protocol Mode

Protocol Mode	Function	PRTMD[9:0]	Note
1S-1S-1S	Command, Address, and Data fields are transferred at SDR with using 1 data input pin and 1 data output pin. Read data is sampled with CK.	0x000	Specified by xSPI protocol
4S-4D-4D	Command field is transferred at SDR with using 4 data pins. Address and Data fields are transferred at DDR with using 4 data pins. Read data is sampled with DS.	0x3B2	Specified by xSPI protocol
8D-8D-8D	Command, Address, and Data fields are transferred at DDR with using 8 data pins. Read data is sampled with DS.	0x3FF	Specified by xSPI protocol
1S-2S-2S	Command field is transferred at SDR with using 1 data pin. Address and Data fields are transferred at SDR with using 2 data pins. Read data is sampled with CK.	0x048	—
2S-2S-2S	Command, Address, and Data fields are transferred at SDR with using 2 data pins. Read data is sampled with CK.	0x049	—
1S-4S-4S	Command field is transferred at SDR with using 1 data pin. Address and Data fields are transferred at SDR with using 4 data pins. Read data is sampled with CK.	0x090	—
4S-4S-4S	Command, Address, and Data fields are transferred at SDR with using 4 data pins. Read data is sampled with CK.	0x092	—

Note: In case of XiP mode enable, XiP code is inserted in Latency field. It is valid only for memory-mapping mode.

The table below shows a description of the main internal signals.

Table 7.2-7 Internal Signals

Signal Name	I/O	Function
clk_spi	I	xSPI control clock
spi_ck	O	xSPI Clock (Same as XSPIm_CKP pin)
spi_cs0	O	xSPI Chip Select for slave0 (Same as XSPIm_CS0# pin)
spi_cs1	O	xSPI Chip Select for slave1 (Same as XSPIm_CS1# pin)
spi_doe[7:0]	O	xSPI Data Output Enable
spi_do[7:0]	O	xSPI Data Output
spi_di[7:0]	I	xSPI Data Input
spi_dsoe	O	xSPI Data Strobe Output Enable
spi_dso	O	xSPI Data Strobe Output
spi_dsi	I	xSPI Data Strobe Input

The bytes of Command and Address fields are transferred in highest order to lowest order sequence. The sequential bytes of Data field are transferred in lowest address to highest address order. In case of using multiple pins, the least significant bit of each byte is placed on spi_do/di[0] with each higher order bit on the successively higher numbered spi_do/di signals.

The figure below shows timing-chart for 1S-1S-1S protocol mode. The spi_do[0] signal is used for output data and the spi_di[1] signal is used for input data.

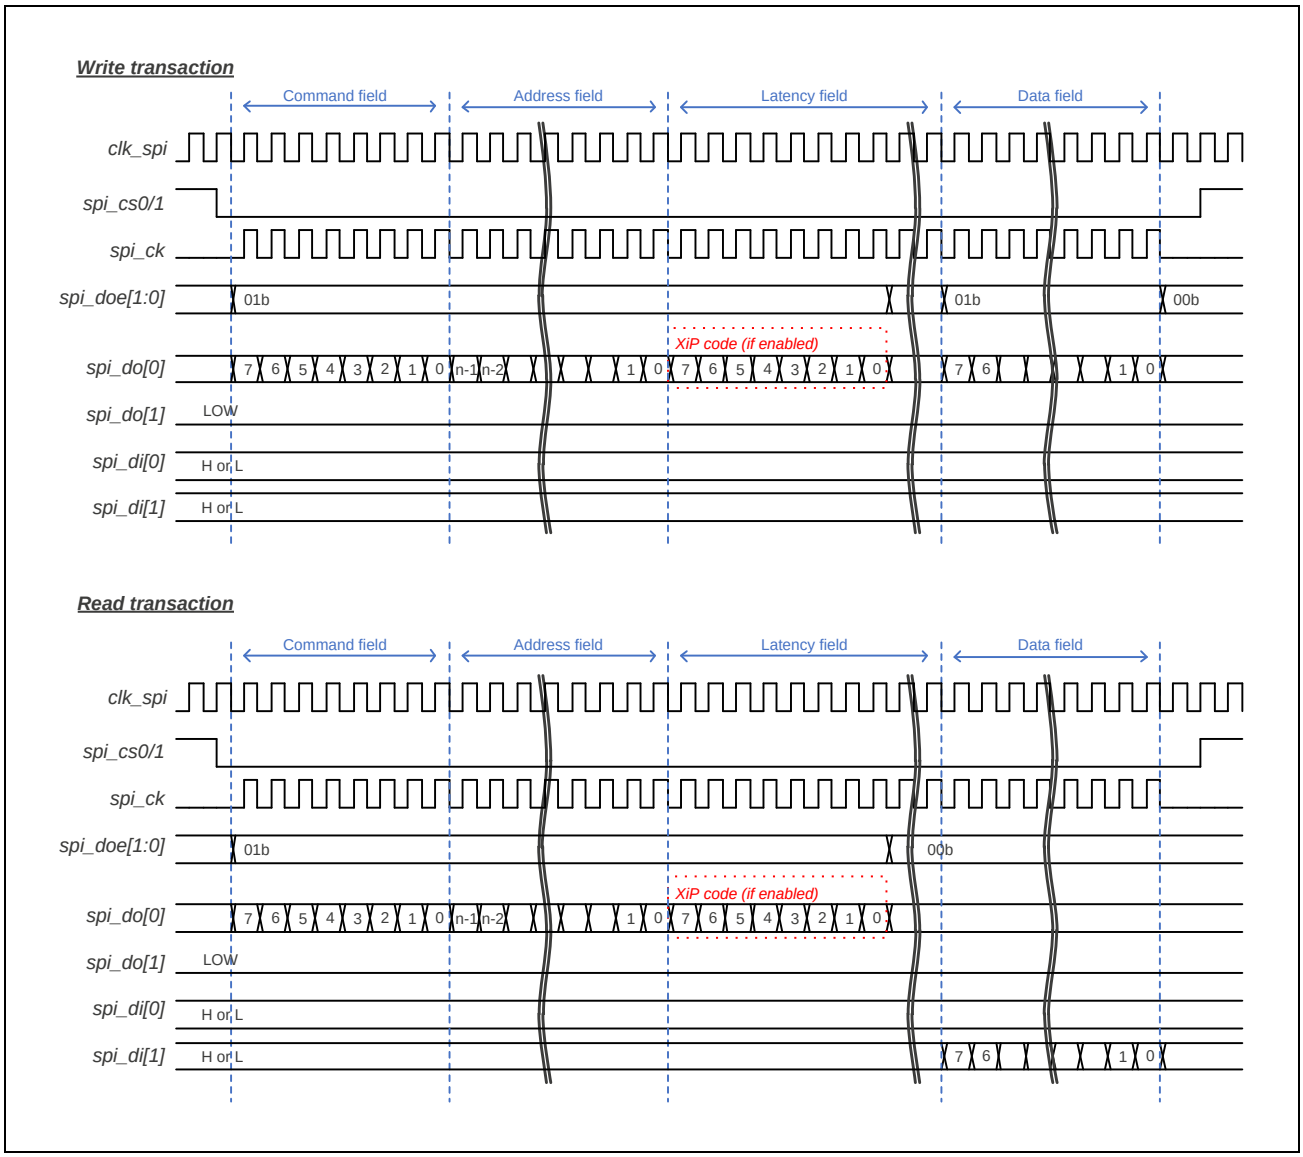

Figure 7.2-2 1S-1S-1S Timing-Chart

The figure below shows timing-chart for 1S-2S-2S protocol mode.

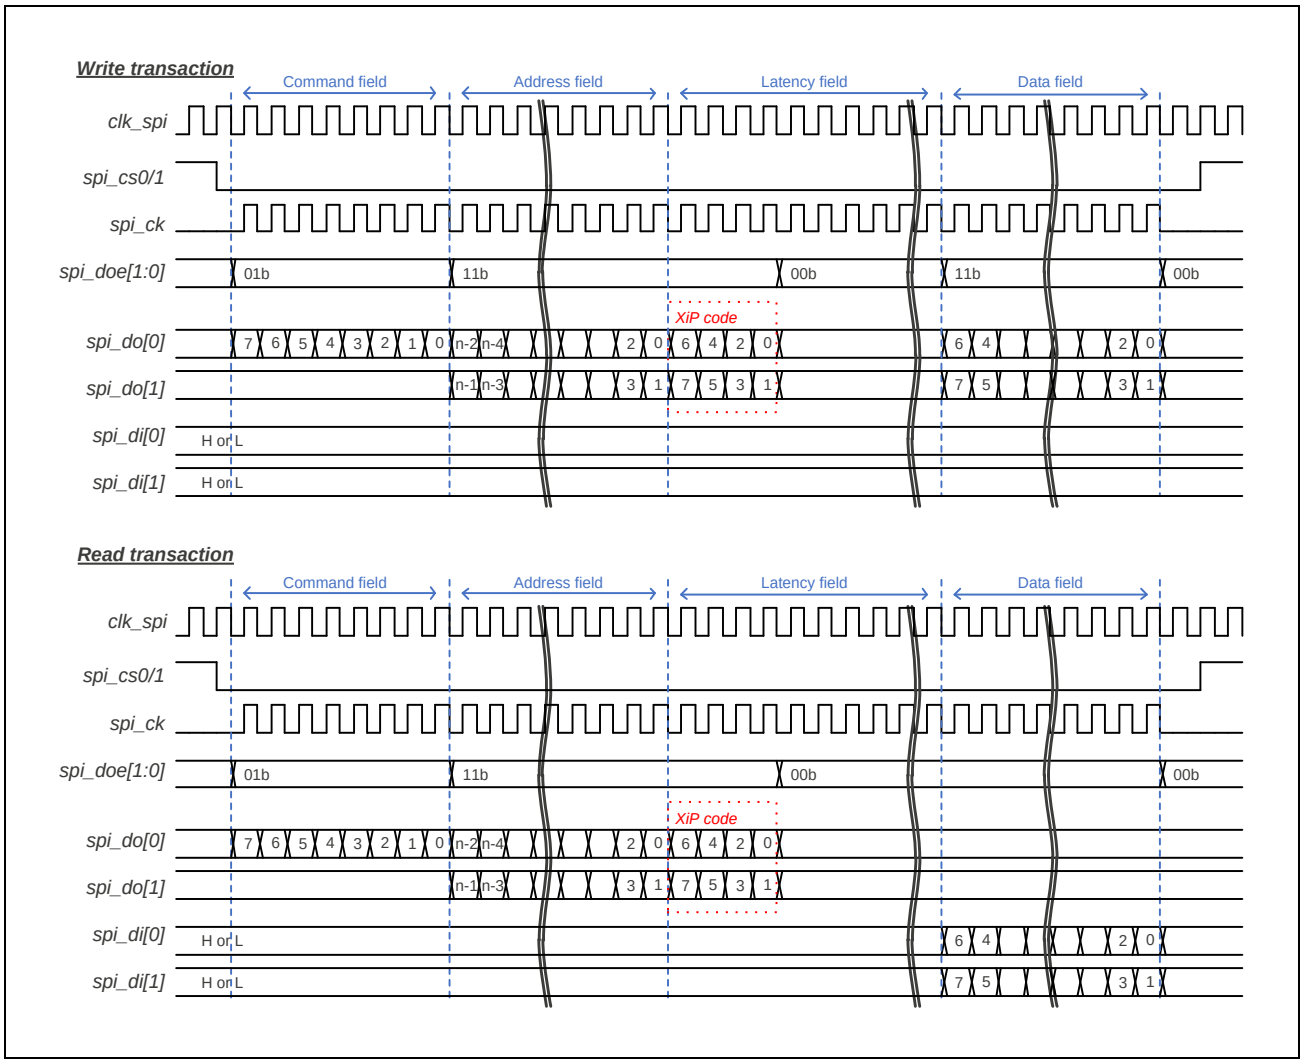

Figure 7.2-3 1S-2S-2S Timing-Chart

The figure below shows timing-chart for 4S-4D-4D protocol mode.

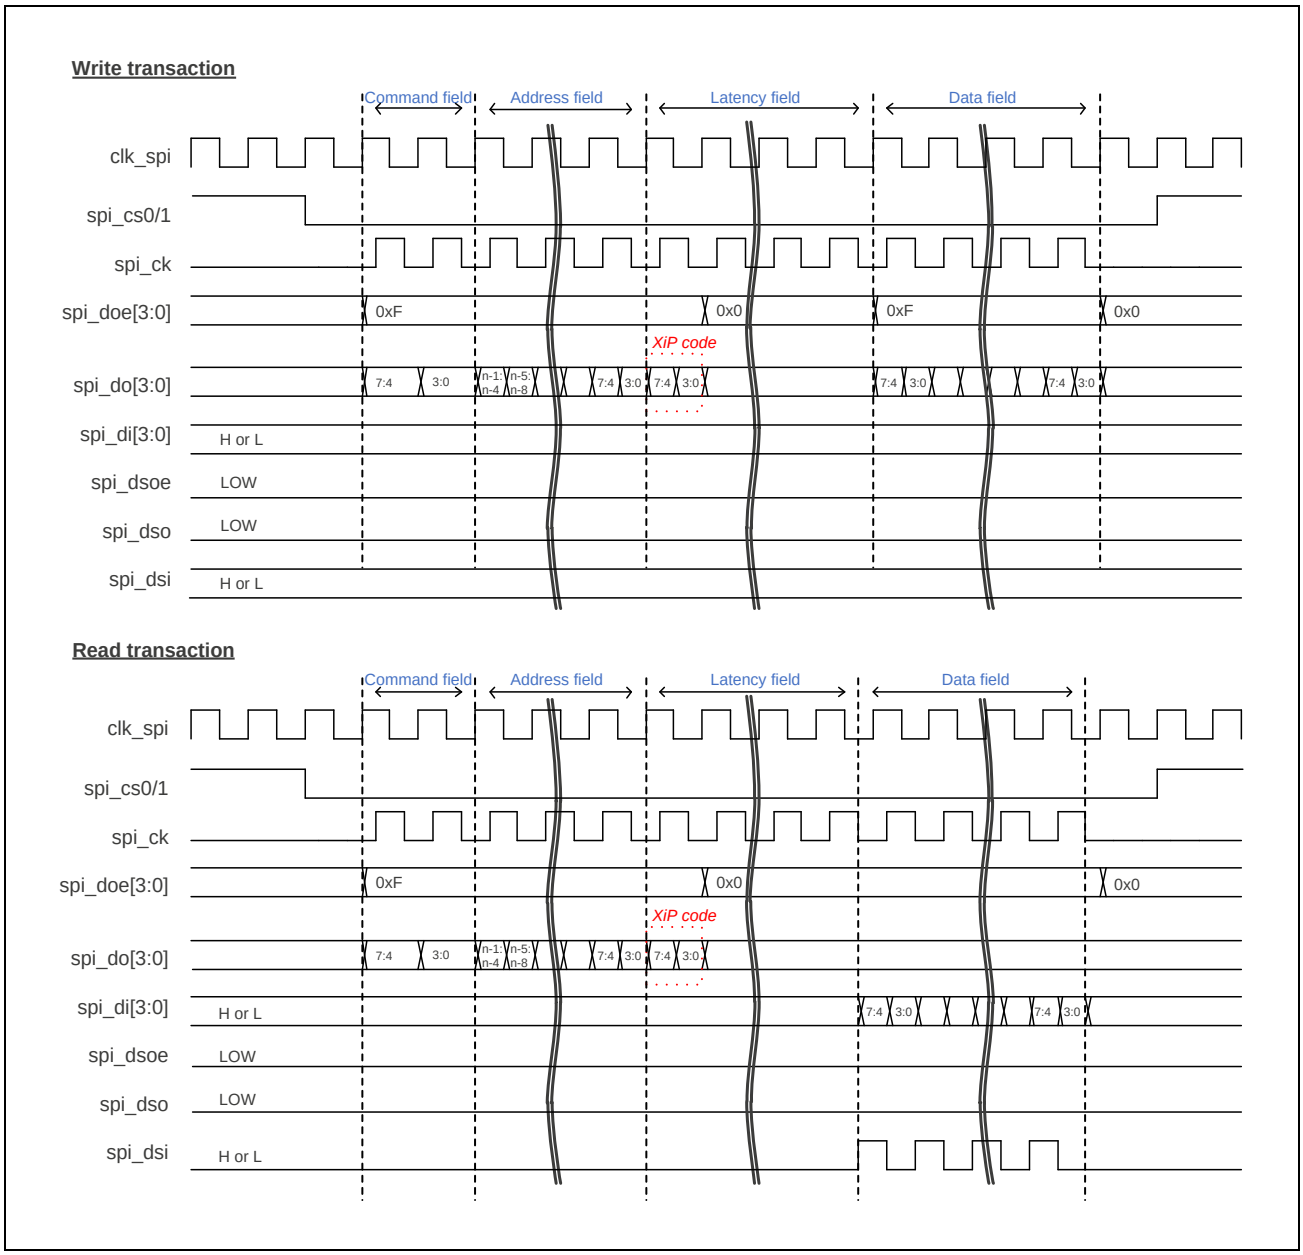

Figure 7.2-4 4S-4D-4D Timing-Chart

The figure below shows timing-chart for 8D-8D-8D profile 1.0 protocol mode. In 8D-8D-8D, the data is always transmitted with byte-pair. In case each field is odd byte, last one byte is padded with invalid data.

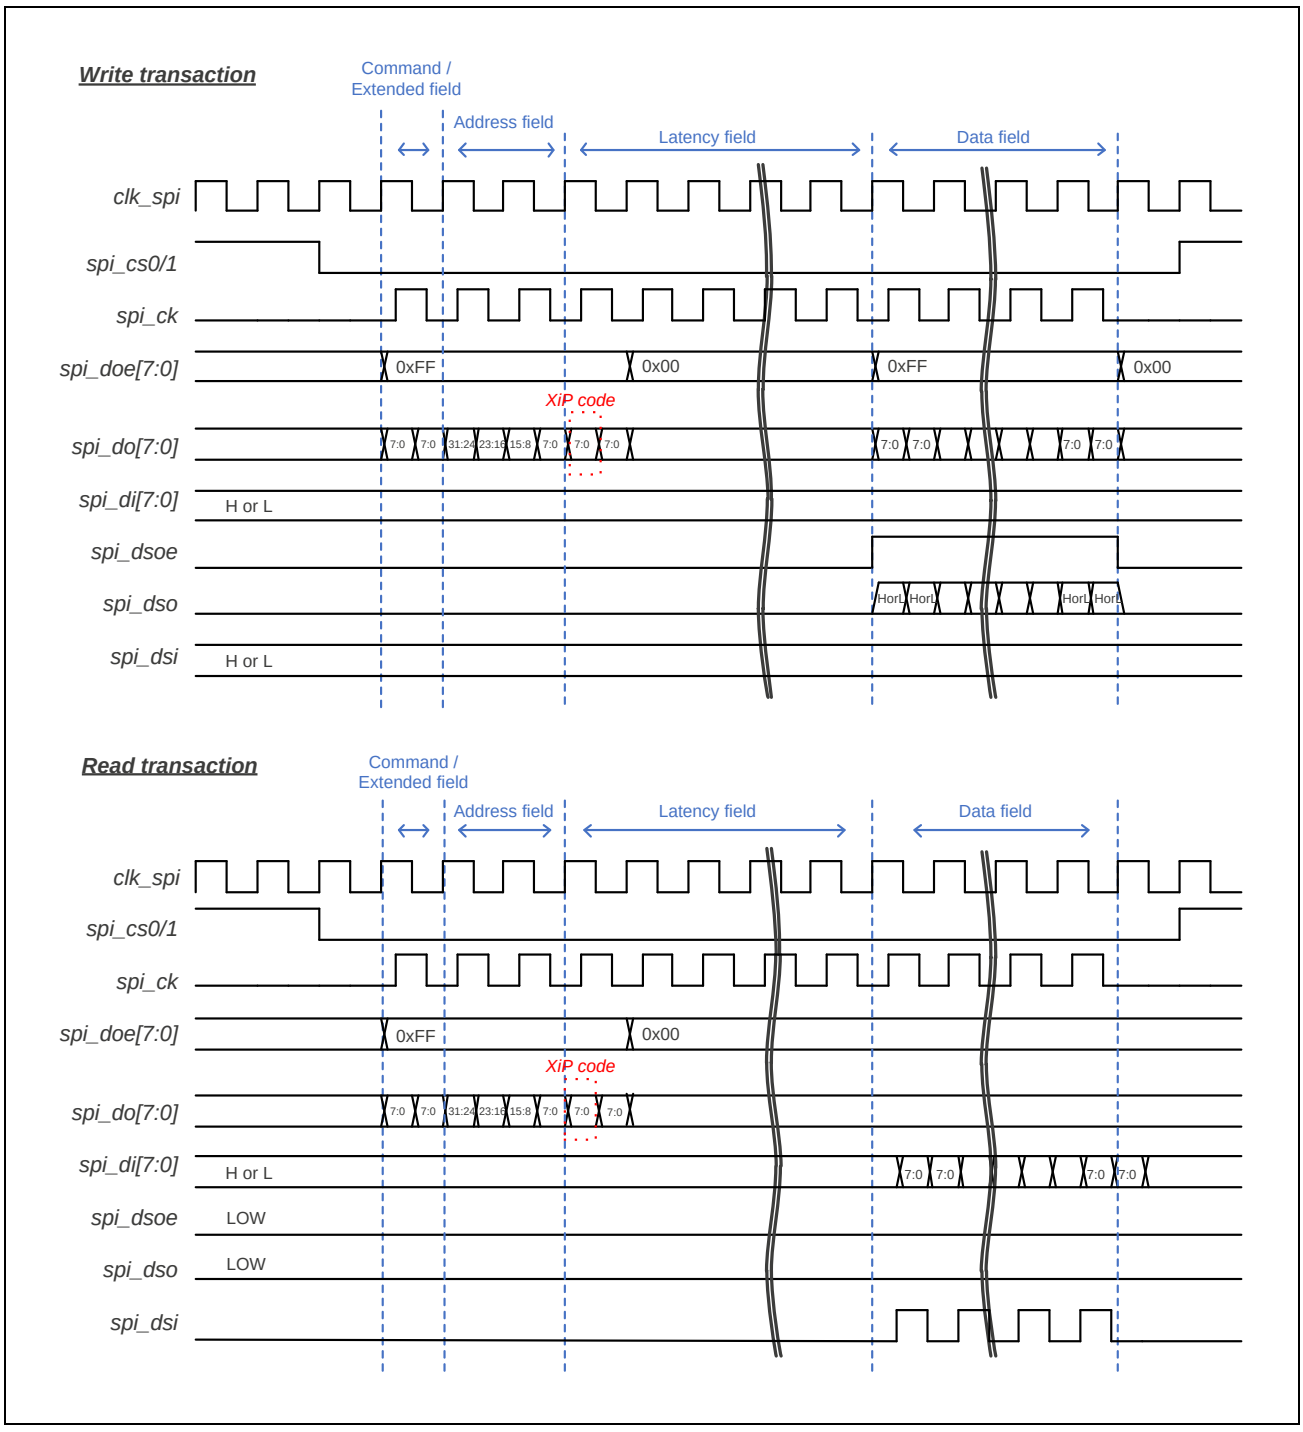

Figure 7.2-5 8D-8D-8D profile 1.0 Timing-Chart

The figure below shows timing-chart for 8D-8D-8D profile 2.0 protocol mode. In 8D-8D-8D, the data is always transmitted with byte-pair. In case each field is odd byte, last one byte is padded with invalid data.

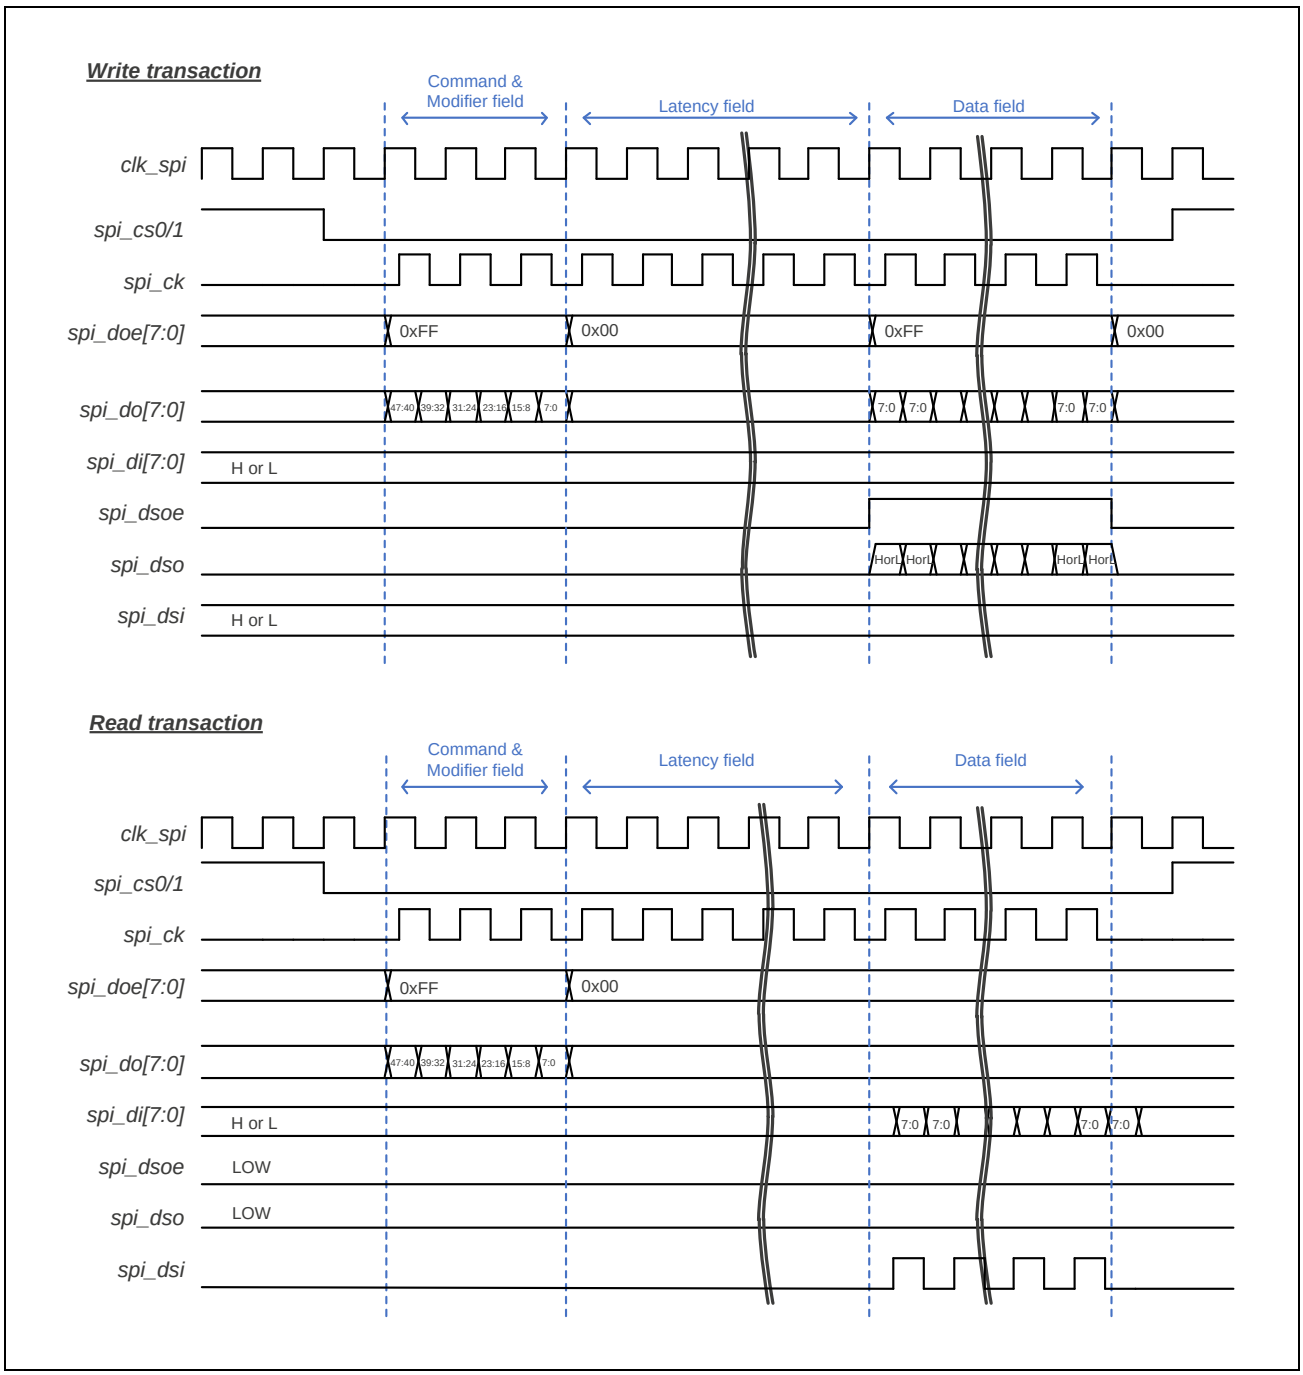

Figure 7.2-6 8D-8D-8D Profile 2.0 Timing-Chart

7.2.3.1.2 xSPI frame interval

The interval between xSPI frames is configured with CS minimum idle term bits (LIOCFGCSn.CSMIN[3:0]). It depends on the specification of xSPI slave device.

7.2.3.1.3 xSPI signals timing control

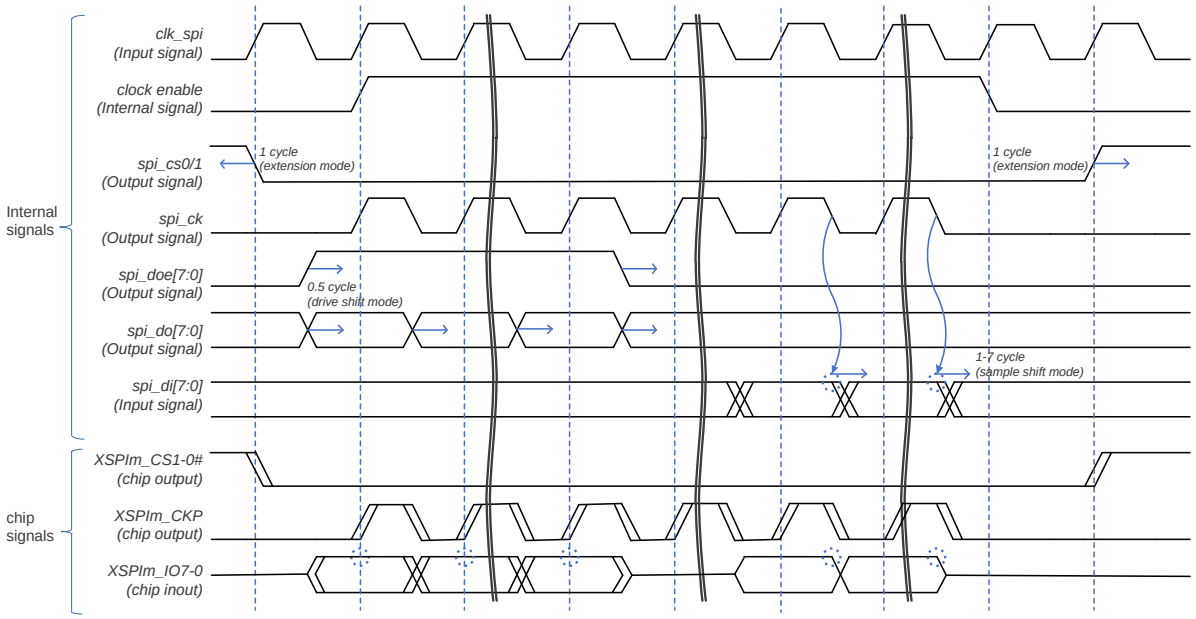
This xSPI Master supports both SDR and DDR. And it is possible to sample input data with Data-Strobe (DS) signal at SDR. For support of various modes and easy implementation, this xSPI Master could adjust the timing to drive/sample xSPI interface signals statically. The table below shows the summary of xSPI Interface signal timing control.

Table 7.2-8 Summary of xSPI Signals Timing Control

Signal	Mode	Default Operation	Timing Control (n = 0, 1)
CS (spi_cs) drive	—	Asserting 1 cycle before the rising-edge of first spi_ck	1 cycle extension for asserting with LIOCFGCSn.CSASTEX bit
		Negating 1.5 cycle after the falling-edge of last spi_ck	1 cycle extension for negating with LIOCFGCSn.CSNEGEX bit
CK (spi_ck) drive	SDR without DS	Reference point	—
	SDR with DS		
	DDR with DS	Reference point	—
DO/DOE (spi_do/doe) drive	SDR without DS	Falling edge of clk_spi	0 or 0.5 cycle shift with LIOCFGCSn.SDRDRV bit
	SDR with DS		
	DDR with DS	Both edges of clk_spi	—
DI (spi_di) sample	SDR without DS	Falling edge of spi_ck on expected data size	0 to 7 cycle shift (1 cycle unit) with LIOCFGCSn.SDRSMPSFT[3:0] bits 0 or 0.5 cycle shift with LIOCFGCSn.SDRSMPMD bit
	SDR with DS	Falling edge of spi_dsi signal on expected data size	Sample at rising edge with LIOCFGCSn.SDRSMPMD bit 0 to 1 cycle phase shift with WRAPCFG.DSSFTCSn[4:0] bits 0 to 7 cycle extension with LIOCFGCSn.DDRSMPEX[3:0] bits
	DDR with DS	Both edges of spi_dsi signal on expected data size	0 to 1 cycle phase shift with WRAPCFG.DSSFTCSn[4:0] bits 0 to 7 cycle extension with LIOCFGCSn.DDRSMPEX[3:0] bits

Note: In DDR on xSPI protocol, CK or DS should be aligned for center of data. It means to shift the phase by 0.25 cycle (90 degrees). This xSPI master supports to adjust this phase depending on the usage conditions.

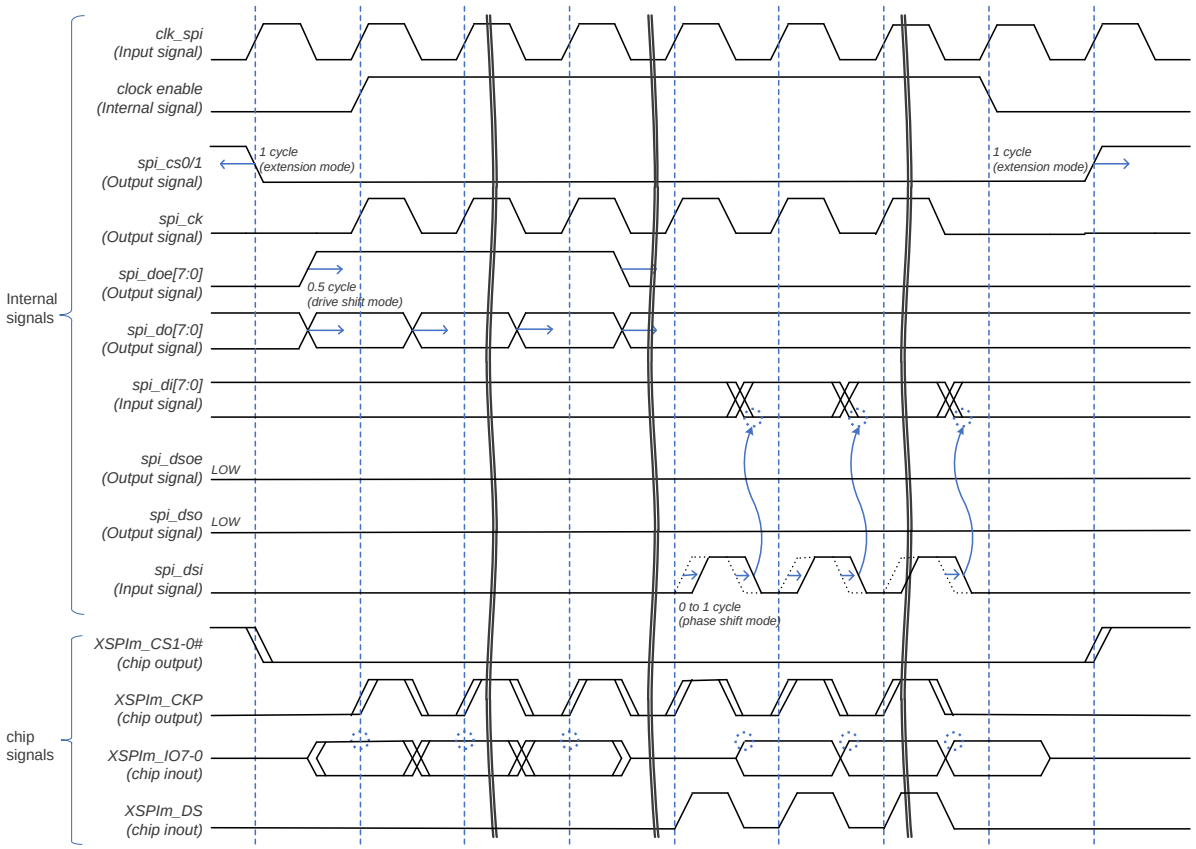
The figure below shows the default operation and timing control for SDR without DS.



Note: m = 0

Figure 7.2-7 Timing Control for SDR without DS

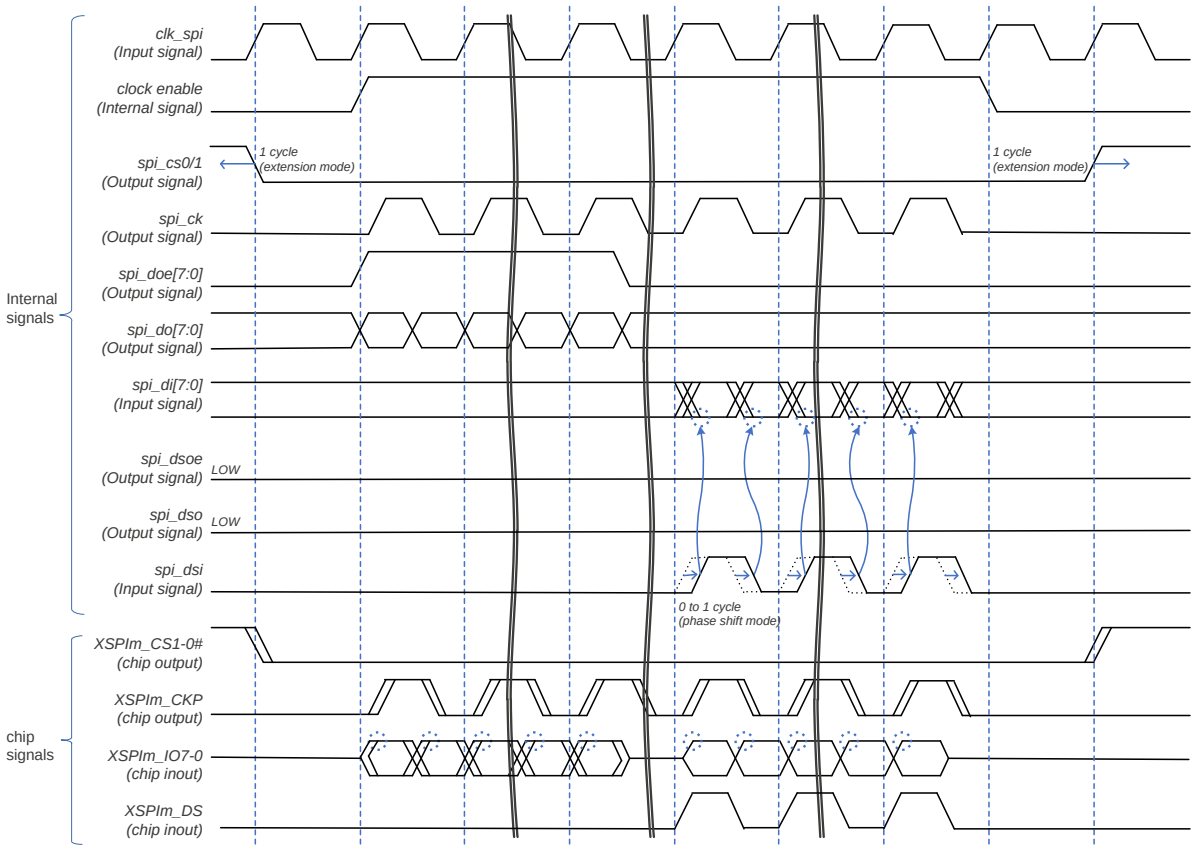
The figure below shows the default operation and timing control for SDR with DS.



Note: m = 0

Figure 7.2-8 Timing Control for SDR with DS

The figure below shows the default operation and timing control for DDR with DS.



Note: m = 0

Figure 7.2-9 Timing Control for DDR with DS

7.2.3.1.4 Automatic calibration

This xSPI master supports the function to adjust DS shift value (WRAPCFG.DSSFTCSn) automatically. When this function is enabled (CCCTL0CSn.CAEN = 1b), this xSPI master transmits the calibration sequence periodically and adjusts the value of phase shift.

When all read compare is mismatched in read transaction during the calibration sequence, the calibration fail bit (INTS.CAFAILCSn) is asserted and DS shift value is not updated. When at least one read compare is matched, the calibration success bit (INTS.CASUCCSn) is asserted and DS shift value is updated. The result of each DS shift value could be monitored by Calibration Status register (CASTTCSn).

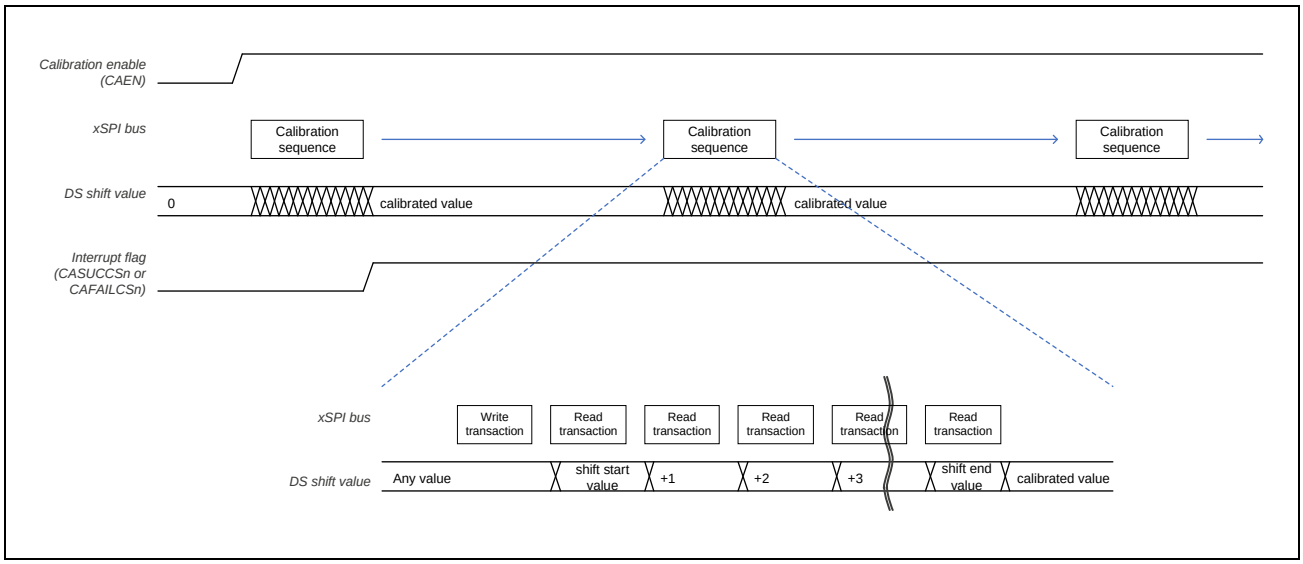


Figure 7.2-10 Automatic Calibration

7.2.3.2 Manual-command

This section describes the manual-command mode. The manual-command has two functional modes: direct mode and periodic mode.

7.2.3.2.1 Direct mode

This mode sequentially can issue up to four xSPI transactions configured and requested by Software. A series of transaction can be issued by a transaction request (CDCTL0.TRREQ = 1b with PERMD = 0b). The number of transactions (CDCTL0.TRNUM[1:0]) can be configured up to 4. It can be used to change the mode or read the status of xSPI slave device.

The table below shows the configured register bits for direct manual-command. The operating flow is illustrated in **Figure 7.2-25**.

Table 7.2-9 Manual-Command Configuration for Direct Mode

Transaction	Transaction Type	Command	Command Size	Address	Address Size	Data (x = 0, 1)	Data Size	Latency Cycle
1st Transaction	CDTBUF0.TRTYPE	CDTBUF0.CMD[15:0]	CDTBUF0.CMDSIZE[1:0]	CDABUF0.ADD[31:0]	CDTBUF0.ADDSIZE[2:0]	CDDxBUF0.DATA[31:0]	CDTBUF0.DATASIZE[3:0]	CDTBUF0.LATE[4:0]
2nd Transaction	CDTBUF1.TRTYPE	CDTBUF1.CMD[15:0]	CDTBUF1.CMDSIZE[1:0]	CDABUF1.ADD[31:0]	CDTBUF1.ADDSIZE[2:0]	CDDxBUF1.DATA[31:0]	CDTBUF1.DATASIZE[3:0]	CDTBUF1.LATE[4:0]
3rd Transaction	CDTBUF2.TRTYPE	CDTBUF2.CMD[15:0]	CDTBUF2.CMDSIZE[1:0]	CDABUF2.ADD[31:0]	CDTBUF2.ADDSIZE[2:0]	CDDxBUF2.DATA[31:0]	CDTBUF2.DATASIZE[3:0]	CDTBUF2.LATE[4:0]
4th Transaction	CDTBUF3.TRTYPE	CDTBUF3.CMD[15:0]	CDTBUF3.CMDSIZE[1:0]	CDABUF3.ADD[31:0]	CDTBUF3.ADDSIZE[2:0]	CDDxBUF3.DATA[31:0]	CDTBUF3.DATASIZE[3:0]	CDTBUF3.LATE[4:0]

7.2.3.2.2 Periodic mode

This mode periodically issues an xSPI read transaction configured and requested by Software. And it can compare the read value up to 4 bytes with expected value. The transaction is issued by a transaction request (CDCTL0.TRREQ = 1b with PERMD = 1b). It can be used to alternate the status polling operation of xSPI slave device.

The periodic term is configured in Periodic transaction interval bits (CDCTL0.PERITV[4:0]). The expected value is configured in Periodic transaction expected and masked value bits (CDCTL1.PEREXP[31:0] and CDCTL2.PERMSK[31:0]). The table below shows the configured register bits for periodic manual-command. The operating flow is illustrated in **Figure 7.2-26**.

Table 7.2-10 Manual-Command Configuration for Periodic Mode

Transaction	Transaction Type	Command	Command Size	Address	Address Size	Data (x = 0, 1)	Data Size	Latency Cycle
Read Transaction	CDTBUF0.TRTYPE = 0b	CDTBUF0.CMD[15:0]	CDTBUF0.CMDSIZE[1:0]	CDABUF0.ADD[31:0]	CDTBUF0.ADDSIZE[2:0]	CDDxBUF0.DATA[31:0]	CDTBUF0.DATASIZE[3:0]	CDTBUF0.LATE[4:0]

7.2.3.3 Memory-mapping

This section describes the memory-mapping mode. This mode automatically converts system bus access for pre-configured memory area into xSPI transaction.

7.2.3.3.1 Configuration

In this operation, the payload of address and data field are delivered from system bus signals. The information of command field and size are delivered from the configured register bits. The table below shows the register bits configured for memory- mapping.

Table 7.2-11 Memory-Mapping Configuration for Memory Area Access (n = 0, 1)

AHB Transaction	Format Change Mode	Command	Command Size	Address Size	Latency Cycle
Write for slave n memory area	Normal	CMCFG2CSn.WRCMD [15:8]	1 byte	CMCFG0CSn.ADDSIZE[1:0]	CMCFG2CSn.WRLATE[4:0]
	8D-8D-8D profile 1.0	CMCFG2CSn.WRCMD [15:0]	2 bytes		
	8D-8D-8D profile 2.0 Command Modifier	CMCFG2CSn.WRCMD [15:8]	1 byte	5 bytes	
	8D-8D-8D profile 2.0 Extended Command Modifier	CMCFG2CSn.WRCMD [15:13]	3 bits	45 bits	
Read for slave n memory area	Normal	CMCFG1CSn.RDCMD [15:8]	1 byte	CMCFG0CSn.ADDSIZE[1:0]	CMCFG1CSn.RDLATE[4:0]
	8D-8D-8D profile 1.0	CMCFG1CSn.RDCMD [15:0]	2 bytes		
	8D-8D-8D profile 2.0 Command Modifier	CMCFG1CSn.RDCMD [15:8]	1 byte	5 bytes	
	8D-8D-8D profile 2.0 Extended Command Modifier	CMCFG1CSn.RDCMD [15:13]	3 bits	45 bits	

Note: The MSByte of Address can be replaced with Address Replace Enable and Code bits (CMCFG0CSn.ADDRPEN[7:0]/ADDRPCD[7:0]).

7.2.3.3.2 Write access operation

When write access to memory area from system bus is accepted, this xSPI Master stores all payload data in internal bridge buffer and then issues a write transaction to xSPI slave. The figure below shows the operation summary.

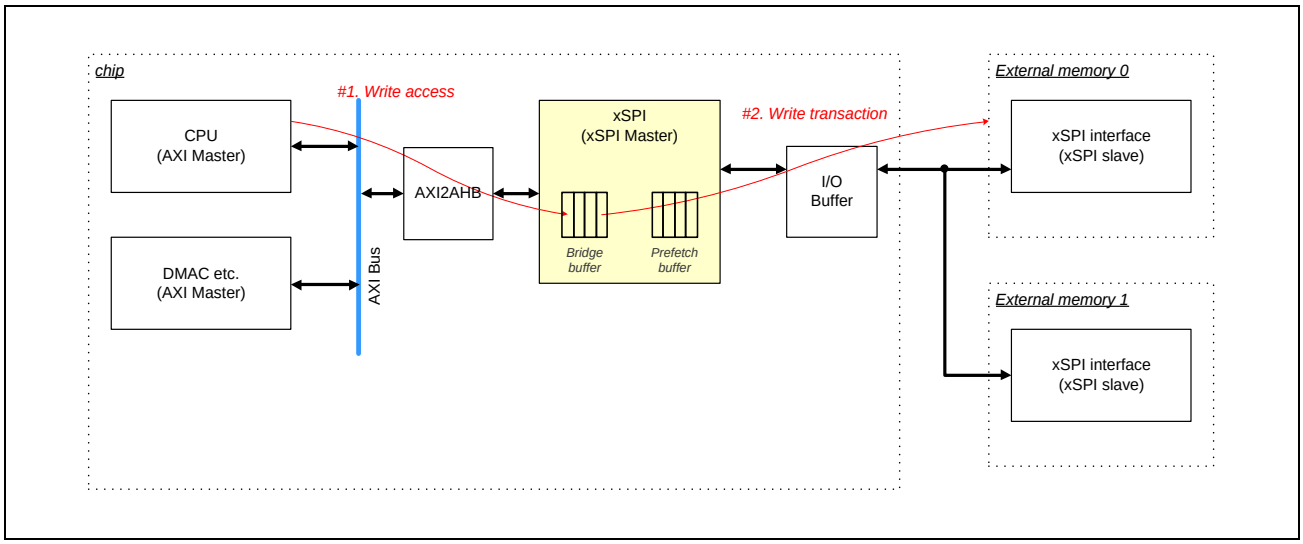

Figure 7.2-11 Write Access for Memory Area

The operation of xSPI bus changes depending on the system bus's burst type. When the burst type is single type or incremental type, one system bus transaction triggers one xSPI frame. When the burst type is wrap type and CMCFG0CSn.WPBSTMD is 0, one system bus transaction triggers two xSPI frames. The figure below shows the relationship between AXI and xSPI frame.

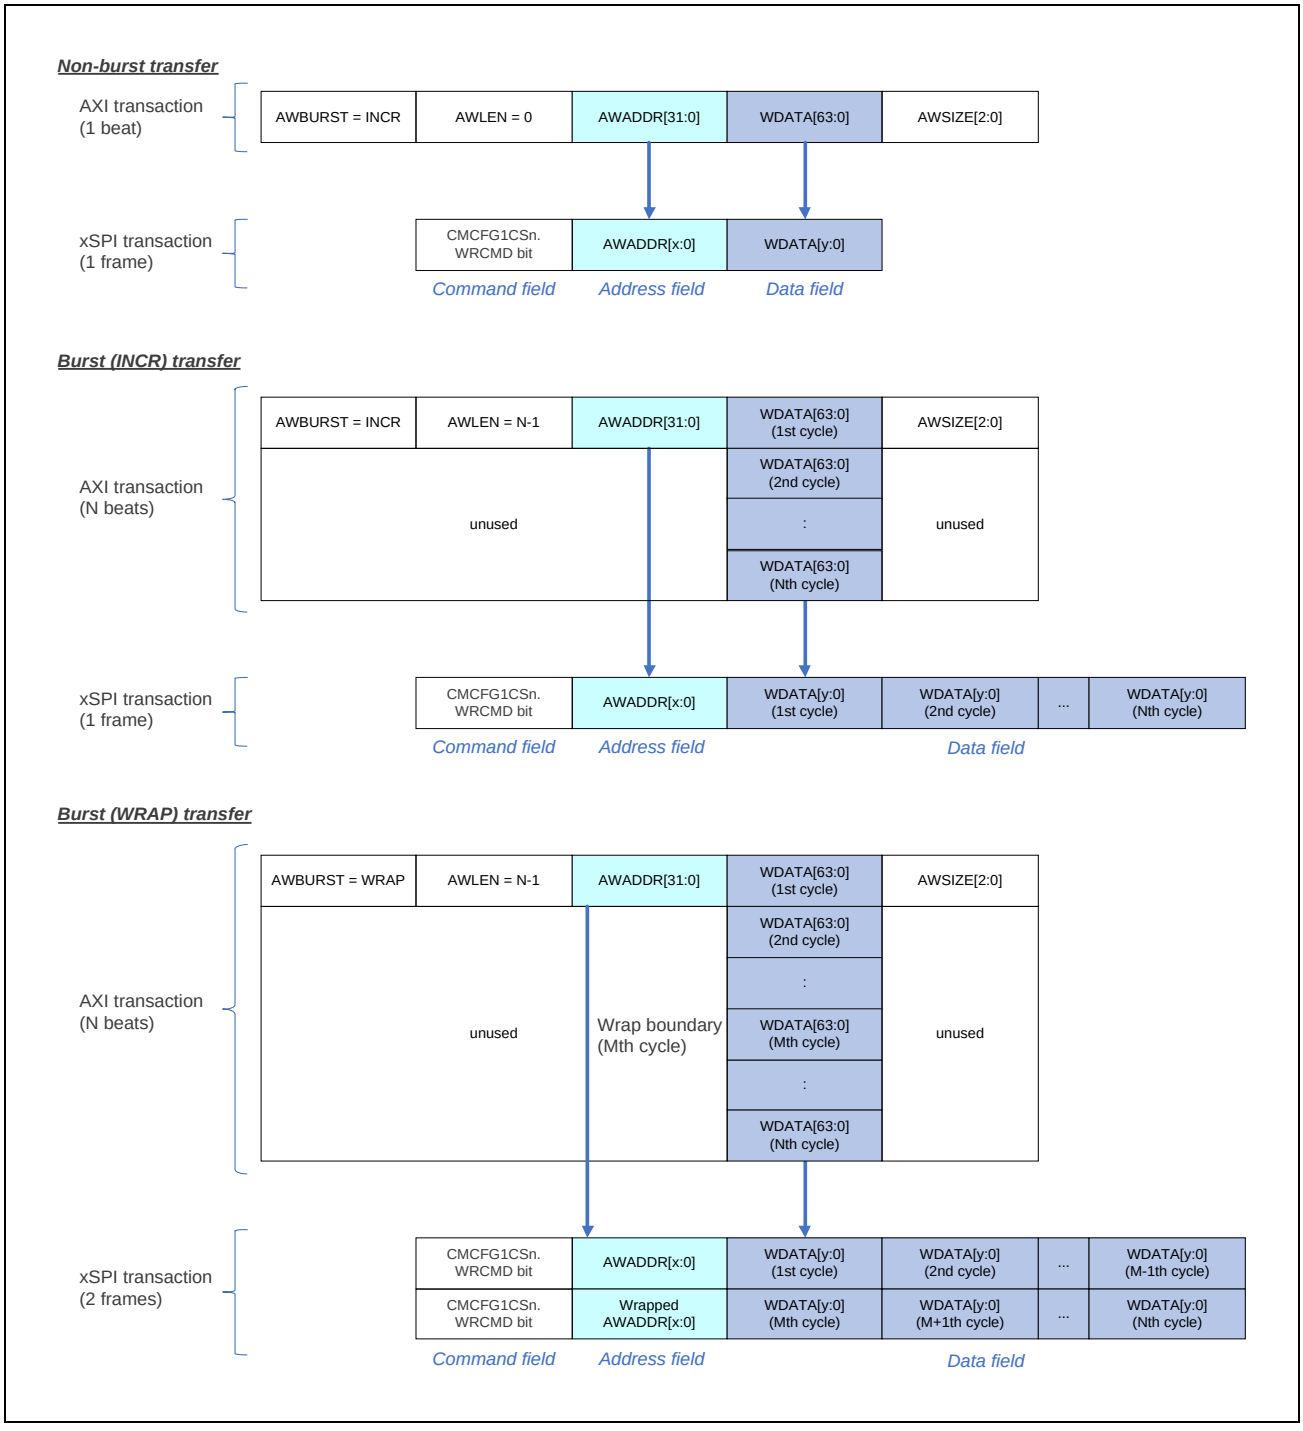

Figure 7.2-12 xSPI Frame Format in Write Access (Normal Format)

7.2.3.3.3 Combination function

At system bus write access to memory area, this xSPI master has the function to combine the write data for high throughput on xSPI bus. When this function is enabled (BMCFGCHn.MWRCOMB = 1b), this xSPI master transmits an xSPI frame with the selected size while the sequential address is incremental. When one of the below conditions is detected, even though the target size (BMCFGCHn.MWRSIZE[7:0]) is not reached, this xSPI master transmits the pending data to xSPI bus.

- Non-incremental address is detected.
- Different burst type is detected.
- Read transaction is detected.
- Access to a different slave is detected.
- Memory Write Data Push bit (BMCTL1.MWRPUSHCHx) is set.

This function could be useful for any slave device to request a chunk of data at a time. In this case, the system bus master should continue to provide the fixed data size with incremental address, e.g. if there is any device to request to write in page unit. The figure below shows the operation when the combination function is enabled.

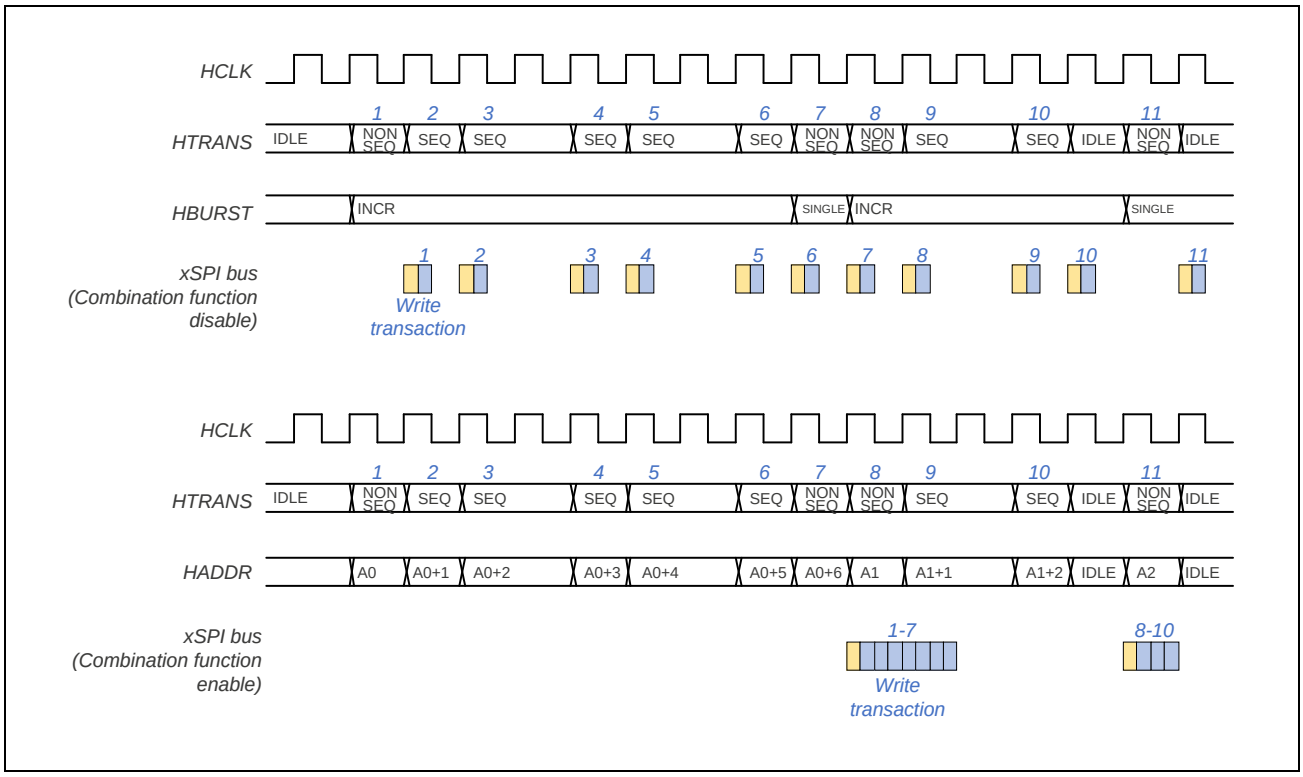

Figure 7.2-13 Combination Function

NOTE

The access which comply with any condition below is considered as incremental address.

- Transaction type is INCR.
- The access's start address is continuous to the previous last write address.
  - The access's start position of WSTRB is treated as the start address.
  - Previous access's last WSTRB is treated as the last write address.

The figure below shows a data combined example with AXI access.

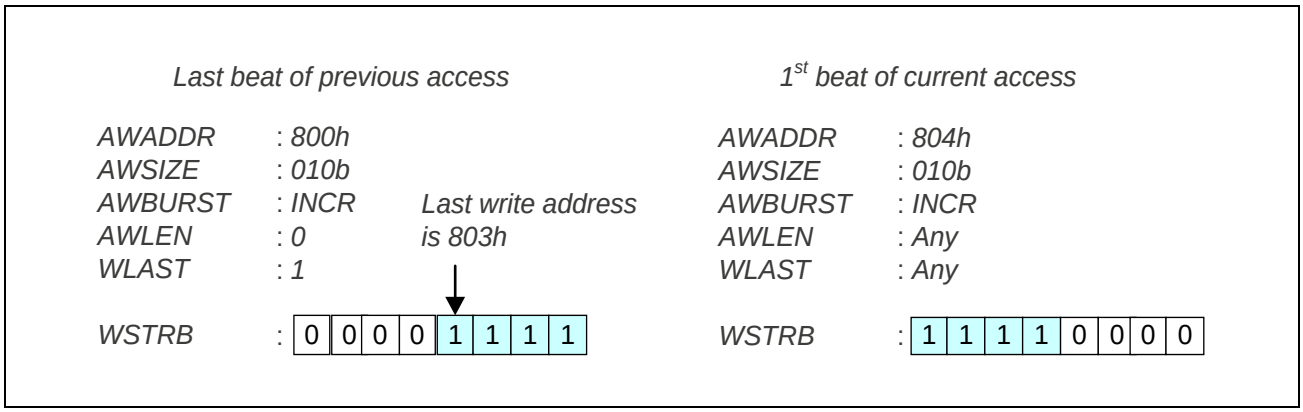

Figure 7.2-14 Data combined example with AXI access

7.2.3.3.4 Read access operation

At read access to memory area, soon after the read access is detected, this xSPI Master issues a read transaction to xSPI slave. The figure below shows the operation summary.

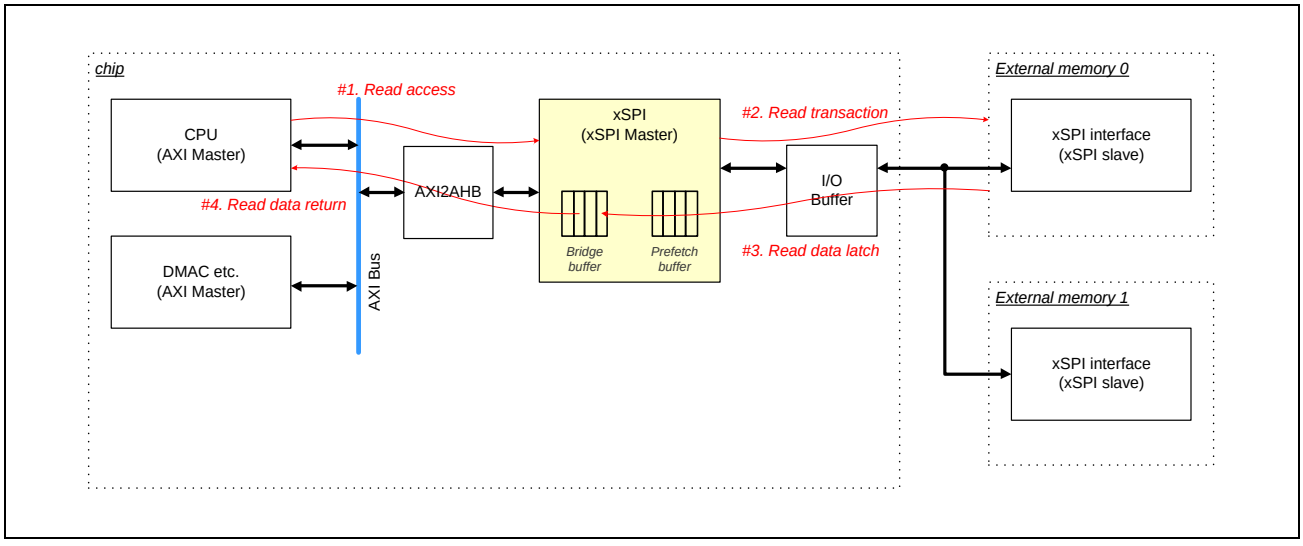

Figure 7.2-15 Read Access for Memory Area

The operation of xSPI bus changes depending on burst type. When the type is single or increment type, one system bus read transaction triggers one xSPI frame. When the type is wrap type and CMCFG0CSn.WPBSTMD is 0b, one system bus read transaction triggers two xSPI frame. The figure below shows the relationship between AXI and xSPI frame.

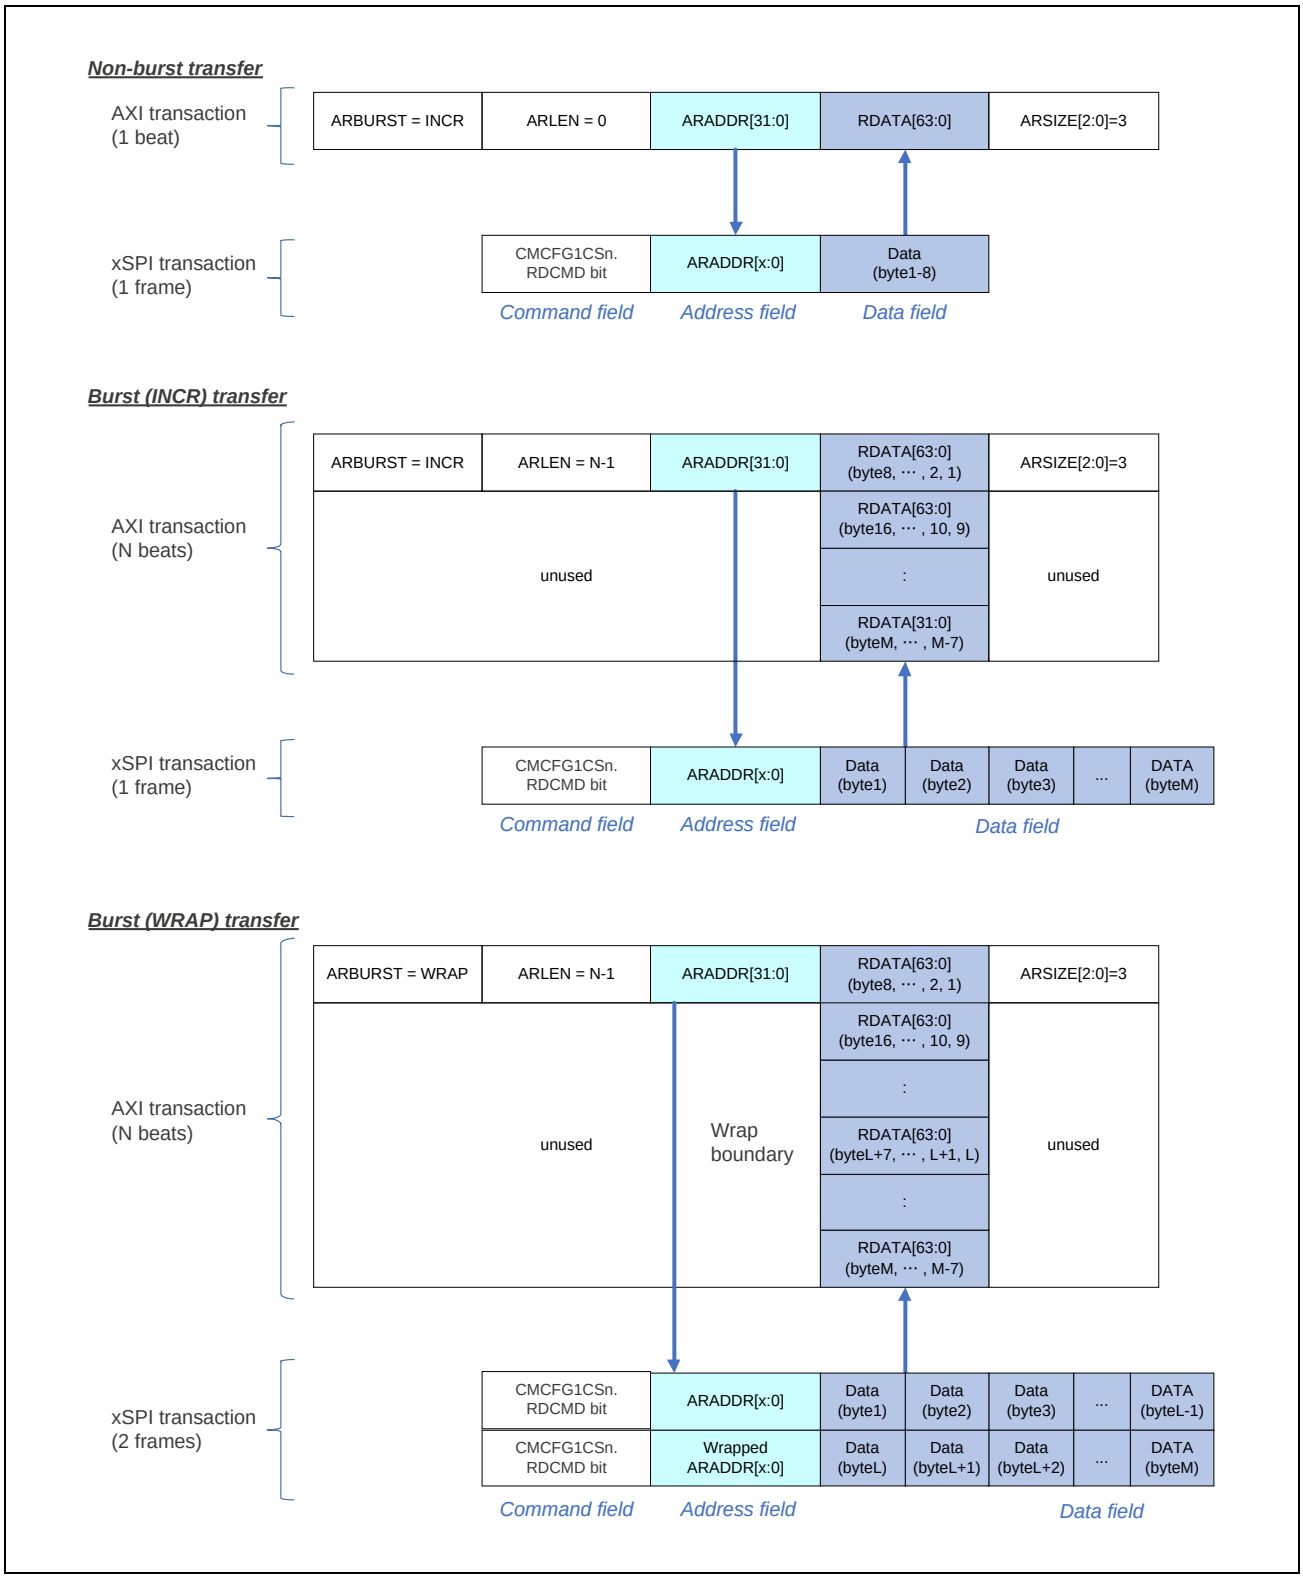

Figure 7.2-16 xSPI Frame Format in Read Access (Normal Format)

7.2.3.3.5 Prefetch function

At read access to memory area from system bus, this xSPI Master has the function to prefetch the read data to reduce the latency. When this function is enabled (BMCFGCHn.PREEN = 1b), this xSPI Master continues to read the incremental address and store the read data from xSPI slave in the internal prefetch buffer. And this xSPI master searches in the prefetch buffer for the following read access from system bus. If the target read data is found in the prefetch buffer, this xSPI Master returns the data from the prefetch buffer. If it is not found, this xSPI Master clears the prefetch buffer and newly issues a read transaction to xSPI slave. This function is effective in application such as the consecutive read addresses are close. But it is not effective in application such as the consecutive read addresses are not incremental because xSPI read frame for prefetch uses xSPI bus. The figure below shows the operation summary.

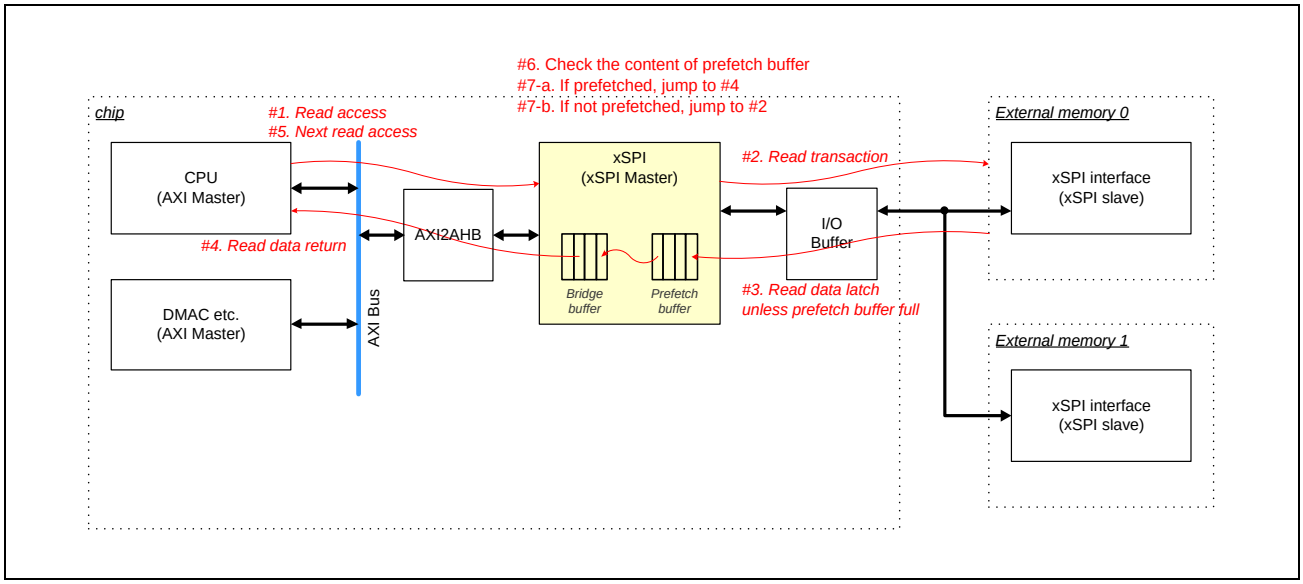

Figure 7.2-17 Read Access for Memory Area with Prefetch Enabled

NOTE

- When this prefetch function is enabled, Bus Master could read from not a slave device but the internal prefetch buffer. When accessed to the same address from multiple Bus Masters, this xSPI Master does not guarantee to read the latest data. If Bus Master intends to read the latest data from a slave device, the Master should clear the prefetch buffer (BMCTL1.PBUFCLRCHn) before issuing read.
- Prefetch buffer is implemented as FIFO-based, and when read access is issued, the data before the access address is discarded from the buffer. And when next access is issued to the region which is discarded at previous access, this module issues the xSPI read access again to fill the prefetch buffer.
- This module has the 1-line buffer which keeps the last 8-byte read data from the prefetch buffer. When read access is issued to the same address to the data in the 1-line buffer, this module returns read data from the 1-line buffer.

7.2.3.3.6 XiP mode

Some slave devices have XiP mode in which the command phase can be omitted for low latency. While in this mode, the xSPI master skips sending the command and the slave device implicitly performs the command that was executed in the previous transaction. When XiP mode bit is enabled (CMCTLCHn.XIPEN = 1b), this xSPI master inserts XiP enter code (CMCTLCHn.XIPENCODE[7:0]) in latency field. When XiP mode bit is disabled (CMCTLCHn.XIPEN = 0b), this xSPI master inserts XiP exit code (CMCTLCHn.XIPEXCODE[7:0]) in latency field. This function is available only for memory-mapping mode.

And when this xSPI master transmits XiP disable pattern, this master clears XiP mode bit and disables XiP mode configured for both channels. Note that it is not possible to disable XiP mode for only one channel by transmitting XiP disable pattern.

NOTE

- When enough latency cycle does not exist for XiP code, this xSPI Master could not insert XiP code.
- XiP mode could be used only for unidirectional access to a slave. The write transaction and read transaction should be separated.

7.2.3.4 Pattern Control

This xSPI Master has the function to transmit 3 types of pattern which are not in xSPI frame format. The pattern is triggered by setting trigger bits (LPCTL0-1.PATREQ[1:0]).

7.2.3.4.1 XiP disable pattern

XiP Disable pattern's length and value are configured by LPCTL0.XD1LEN[4:0] / XD1VAL / XD2LEN[4:0] / XD2VAL. It uses spi_ck, spi_doe/do signals. The number of output pins can be configured by XiP Disable pattern pin bits (LPCTL0.XDPIN[1:0]). It may be used to disable XiP mode for legacy SPI. The figure below shows the timing-chart.

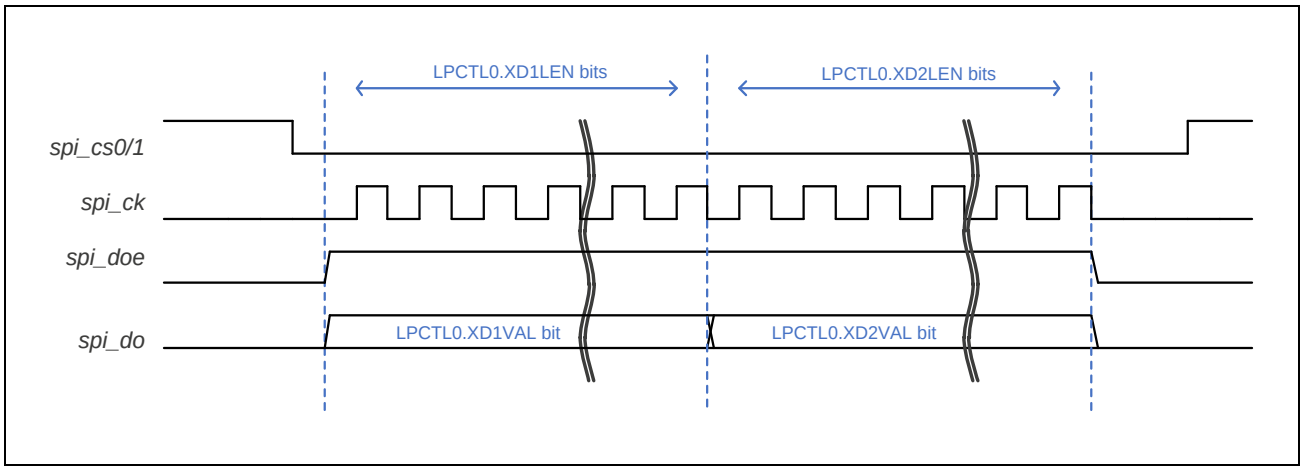

Figure 7.2-18 XiP Disable Pattern

7.2.3.4.2 Reset pattern

Reset pattern is specified in Serial Flash Reset Signaling Protocol. CS Low/High width is configured with Reset Pattern Length bits (LPCTL1.RSTWID[2:0]). xSPI slave will sample the data input at the rising edge of CS. Setup time for data output is configured with Reset pattern data output setup time bits (LPCTL1.RSTSU[2:0]). The setup time should be always less than Reset pattern width. The figure below shows the timing-chart.

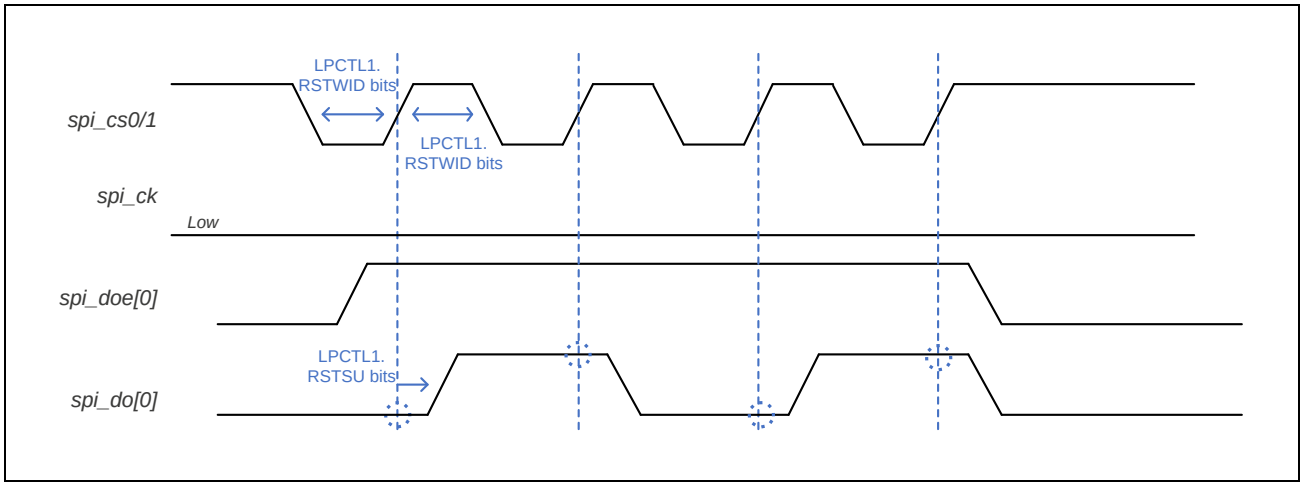

Figure 7.2-19 Reset Pattern

NOTE

In the protocol specification, CS Low/High width is defined as minimum 500 ns and Setup time is defined as minimum 6 ns.

7.2.3.4.3 CS only pattern

CS Only pattern activates CS port with the configured length bits (LPCTL1.RSTWID[2:0]). It may be used to resume from Deep Power Down state. The figure below shows the timing-chart.

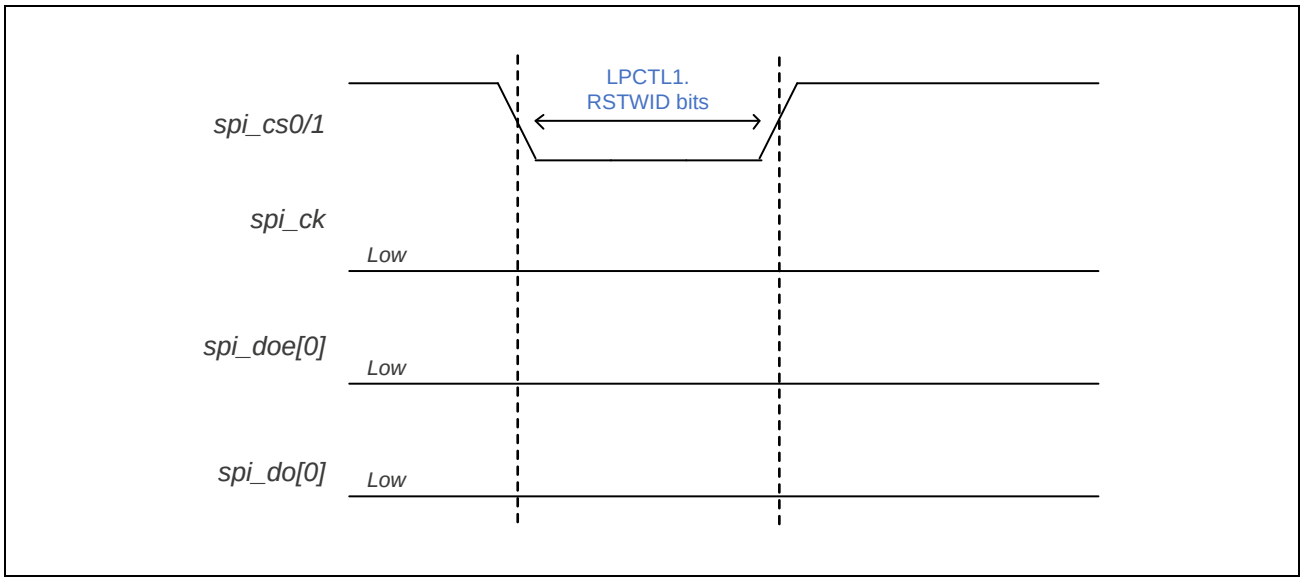

Figure 7.2-20 CS Only Pattern

7.2.3.5 Integrity Checking

This xSPI Master can detect some errors. The table below shows the error list and the detail behavior.

When reset of xSPI master is needed due to fatal error, set RESET ON/OFF control register (CPG_RST_10) to reset xSPI master. After confirming it is reset surely, release the reset.

Table 7.2-12 Error List

Error Type	Event	Flag Bit	Note (Action)
Calibration failed	The read data does not match the expected value during automatic calibration.	INTS.CAFAILCS0-1	It results in writing unexpected data to xSPI slave.
System bus error	This xSPI Master responds error on system bus for memory-mapping.	INTS.BUSERRCH0-1	This xSPI master should be reset for fatal error.
ECC error detection	Falling edge on ECS port is detected. It could be useful only for xSPI slave with ECC detection function.	INTS.ECSCS0-1	Only notify the error event of xSPI slave.
DS timeout	DS does not toggle in read transaction with using DS.	INTS.DSTOCS0-1	Both xSPI master and xSPI slave should be reset for fatal error.
Periodic transaction timeout	Read value does not match with the expected value in periodic manual-command mode.	INTS.PERTO	Depending on the status of function

7.2.3.5.1 Interrupts

This xSPI Master has interrupt ports.

It can be monitored with Interrupt Status Register (INTS). And it can be programmable with Interrupt Enable register (INTE). The table below shows the related register bits.

Table 7.2-13 xSPI Interrupt Sources

Name	ICU input	Interrupt Sources	CA55 GIC Request	CM33 GIC Request
XSPI0_INT	int_spi_pulse	Interrupt	Possible	Possible
XSPI0_INTERR	int_spi_err_pulse	Error interrupt	Possible	Possible

Table 7.2-14 Interrupt Register Bit

Flag Bit	Enable Bit	Clear Bit	Interrupt Sources (m = 0)
CASUCCS1	CASUCCS1E	CASUCCS1C	XSPIm_INT
CASUCCS0	CASUCCS0E	CASUCCS0C	
CAFAILCS1	CAFAILCS1E	CAFAILCS1C	XSPIm_INTERR
CAFAILCS0	CAFAILCS0E	CAFAILCS0C	
BUSERRCH1	BUSERRCH1E	BUSERRCH1C	XSPIm_INTERR
BUSERRCH0	BUSERRCH0E	BUSERRCH0C

7.2.3.6 Flows of Operations

7.2.3.6.1 Flow of startup

The figure below shows flow of startup.

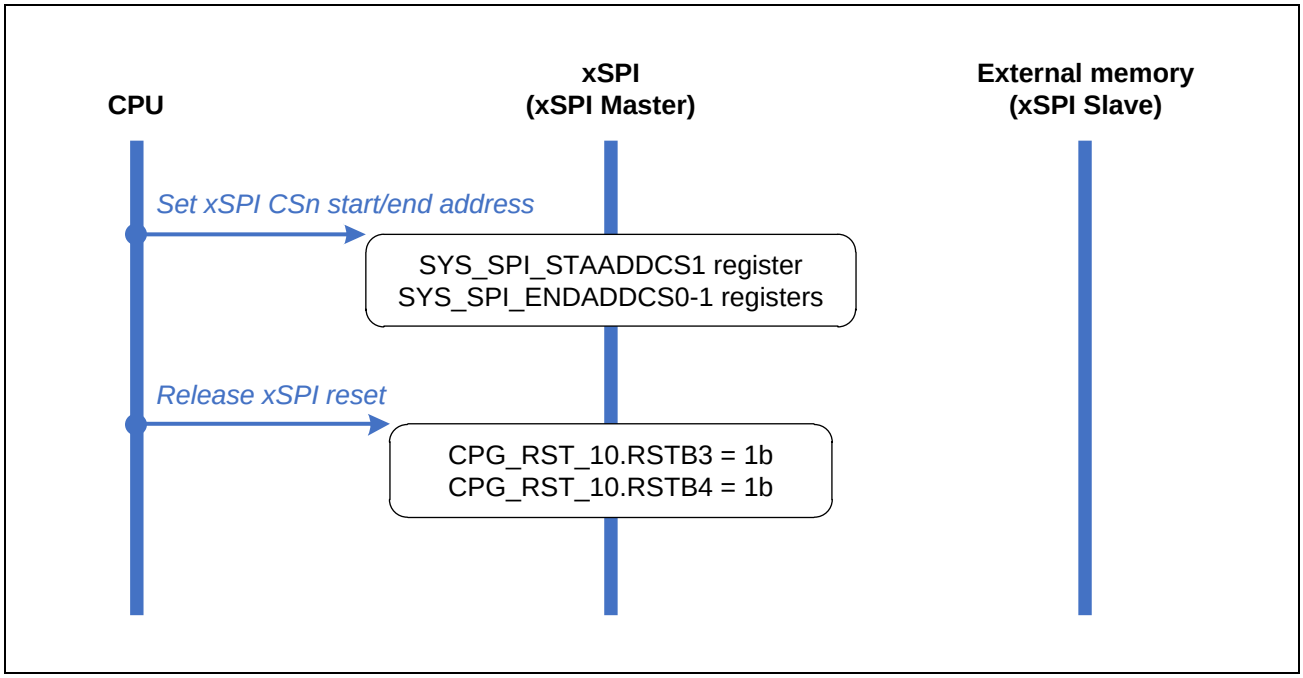

Figure 7.2-21 Flow of Startup

NOTE

SYS_SPI_STAADDCS1 and SYS_SPI_ENDADDCS0-1 registers should be set while xSPI reset is asserted.

7.2.3.6.2 Flow of configuration

The figure below shows flow of configuration.

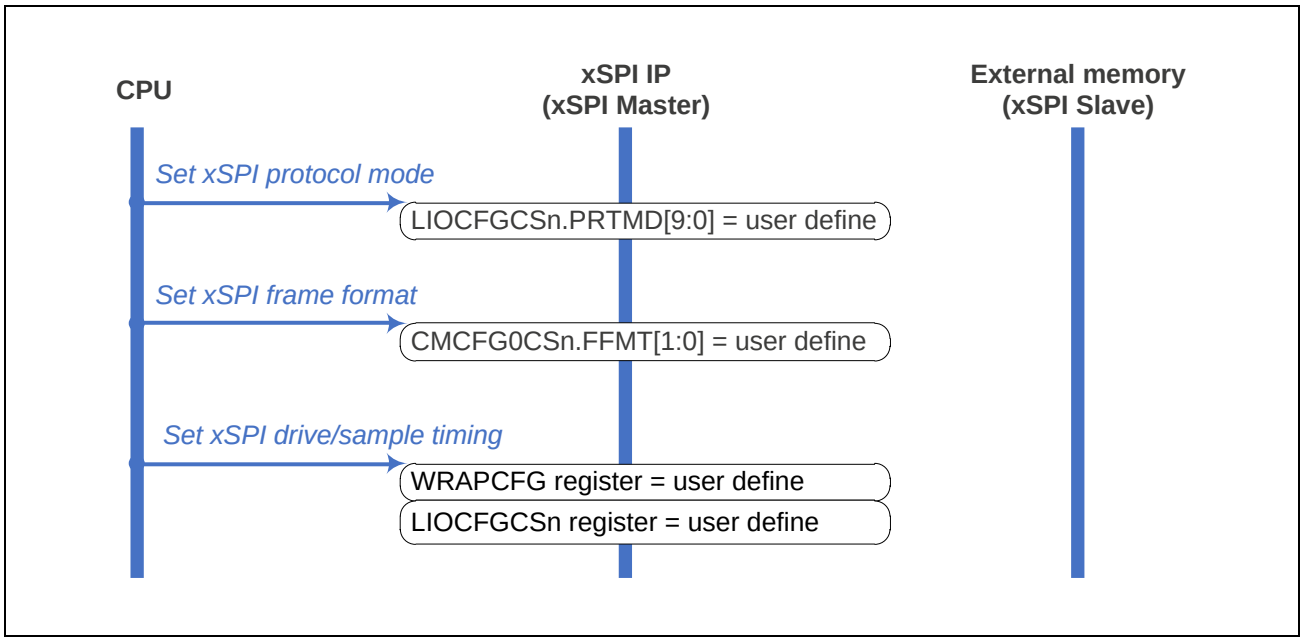

Figure 7.2-22 Flow of Configuration

7.2.3.6.3 Flow of communication stop

The figure below shows flow of communication stop.

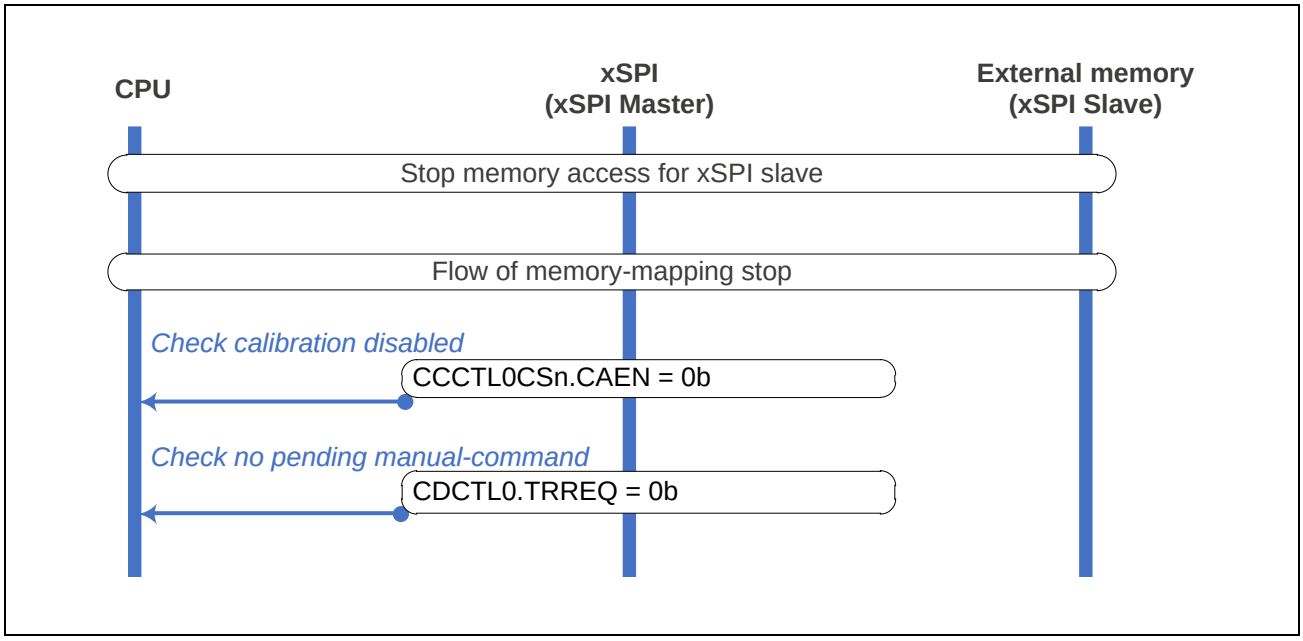

Figure 7.2-23 Flow of Communication Stop

NOTE

In case of re-config of any configuration register, all communications with xSPI slave should be stopped surely to avoid race condition between register setting and memory access. It means that automatic calibration is disabled, and there is no pending manual-command and memory-mapping access.

7.2.3.6.4 Flow of automatic calibration

The figure below shows flow of automatic calibration.

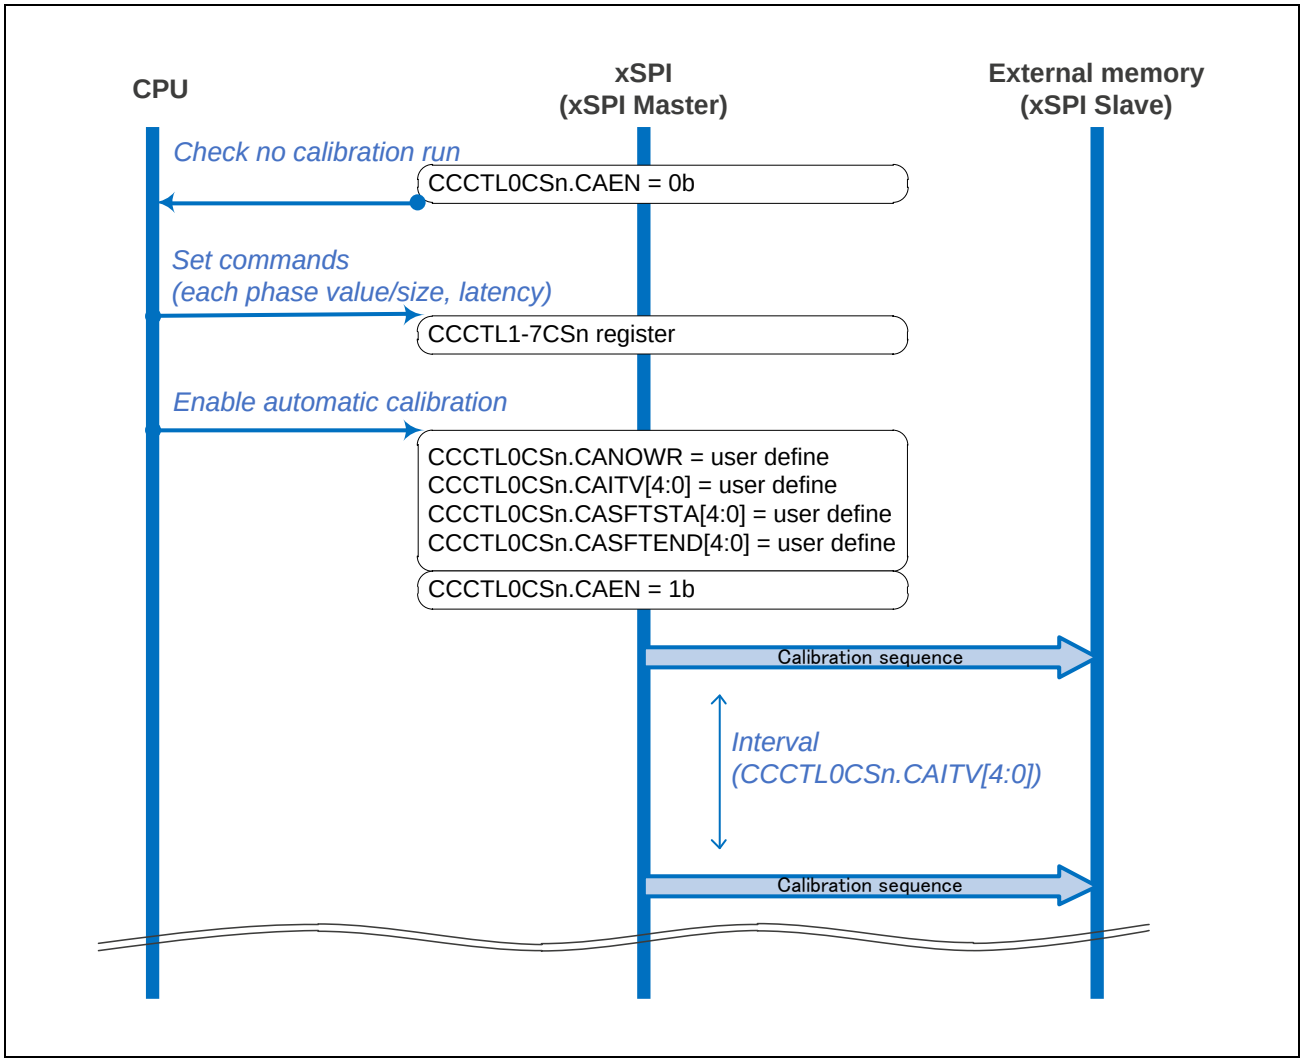

Figure 7.2-24 Flow of Automatic Calibration

7.2.3.6.5 Flow of manual-command procedure

The figure below shows manual-command procedure for direct mode.

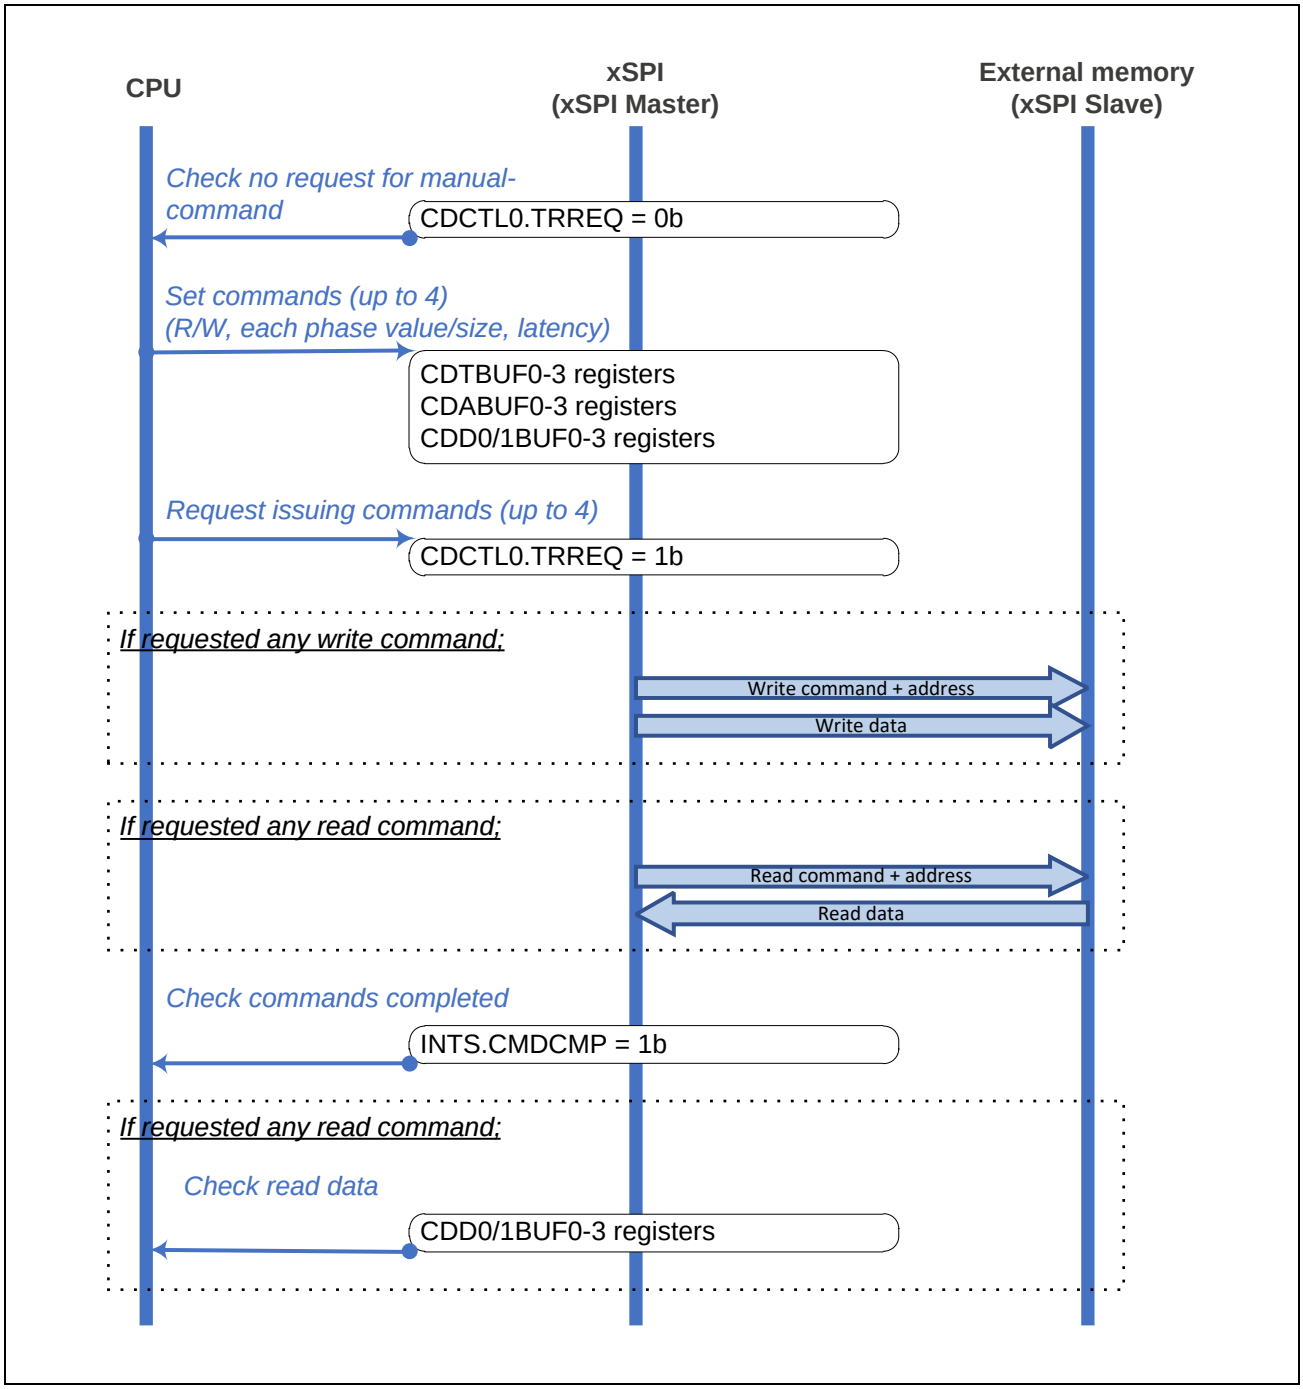

Figure 7.2-25 Flow of Manual-Command Procedure for Direct Mode

The figure below shows manual-command procedure for periodic mode.

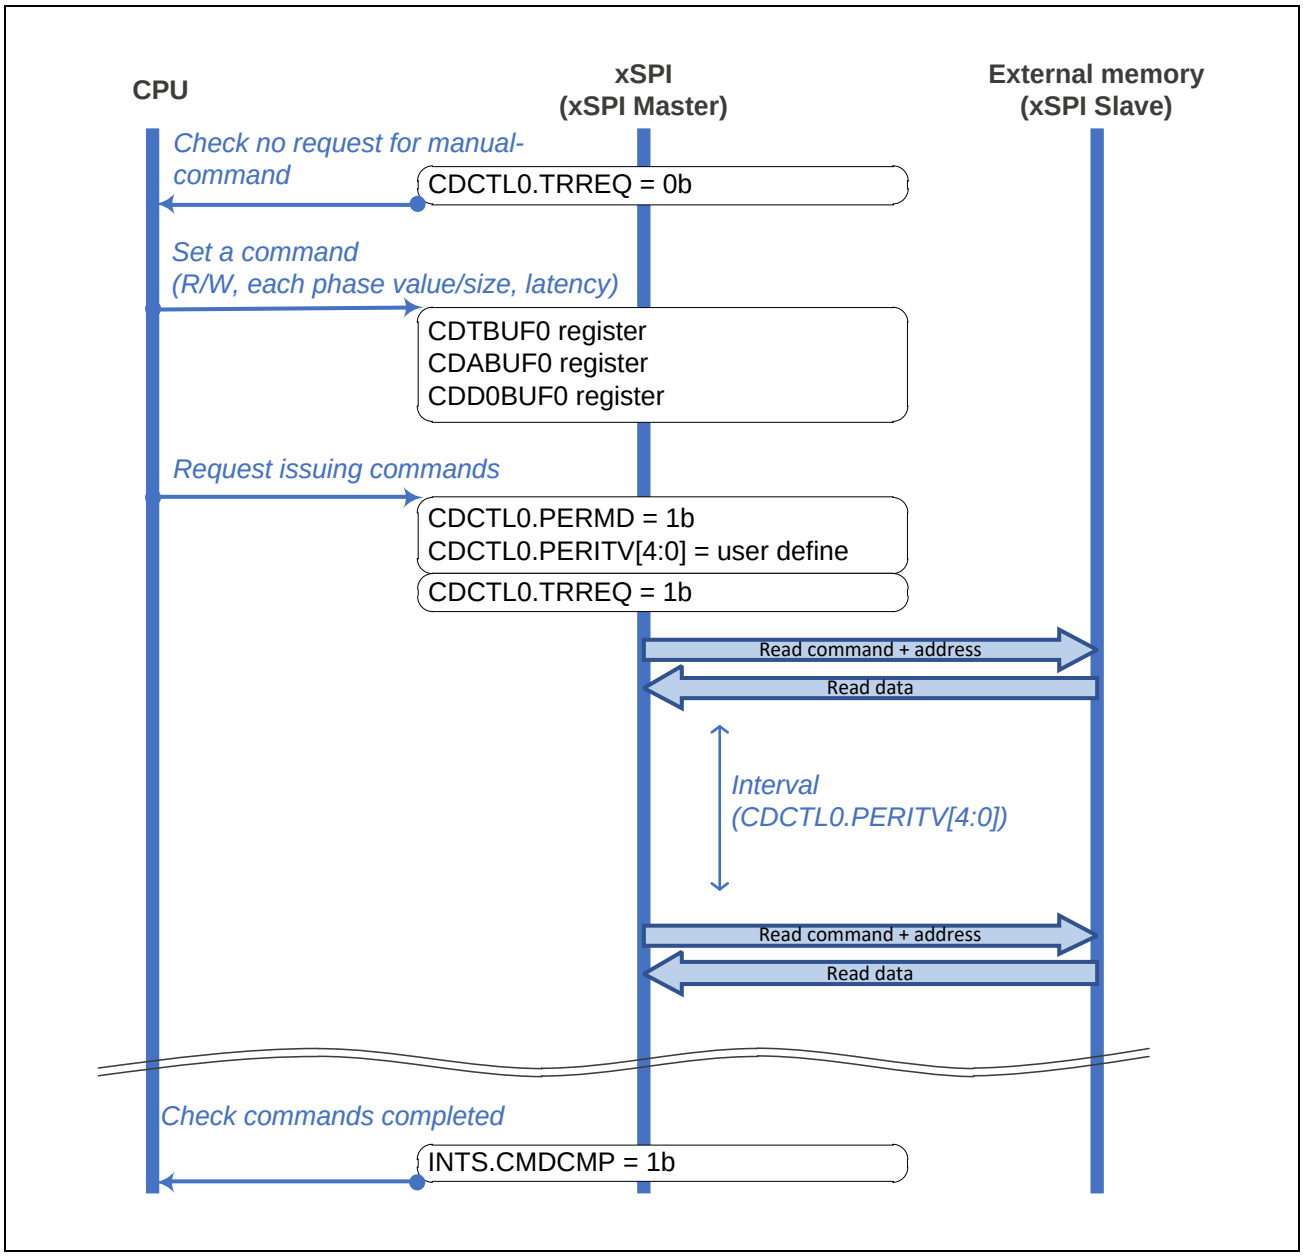

Figure 7.2-26 Flow of Manual-Command Procedure for Periodic Mode

7.2.3.6.6 Flow of memory-mapping

The figure below shows flow of memory-mapping.

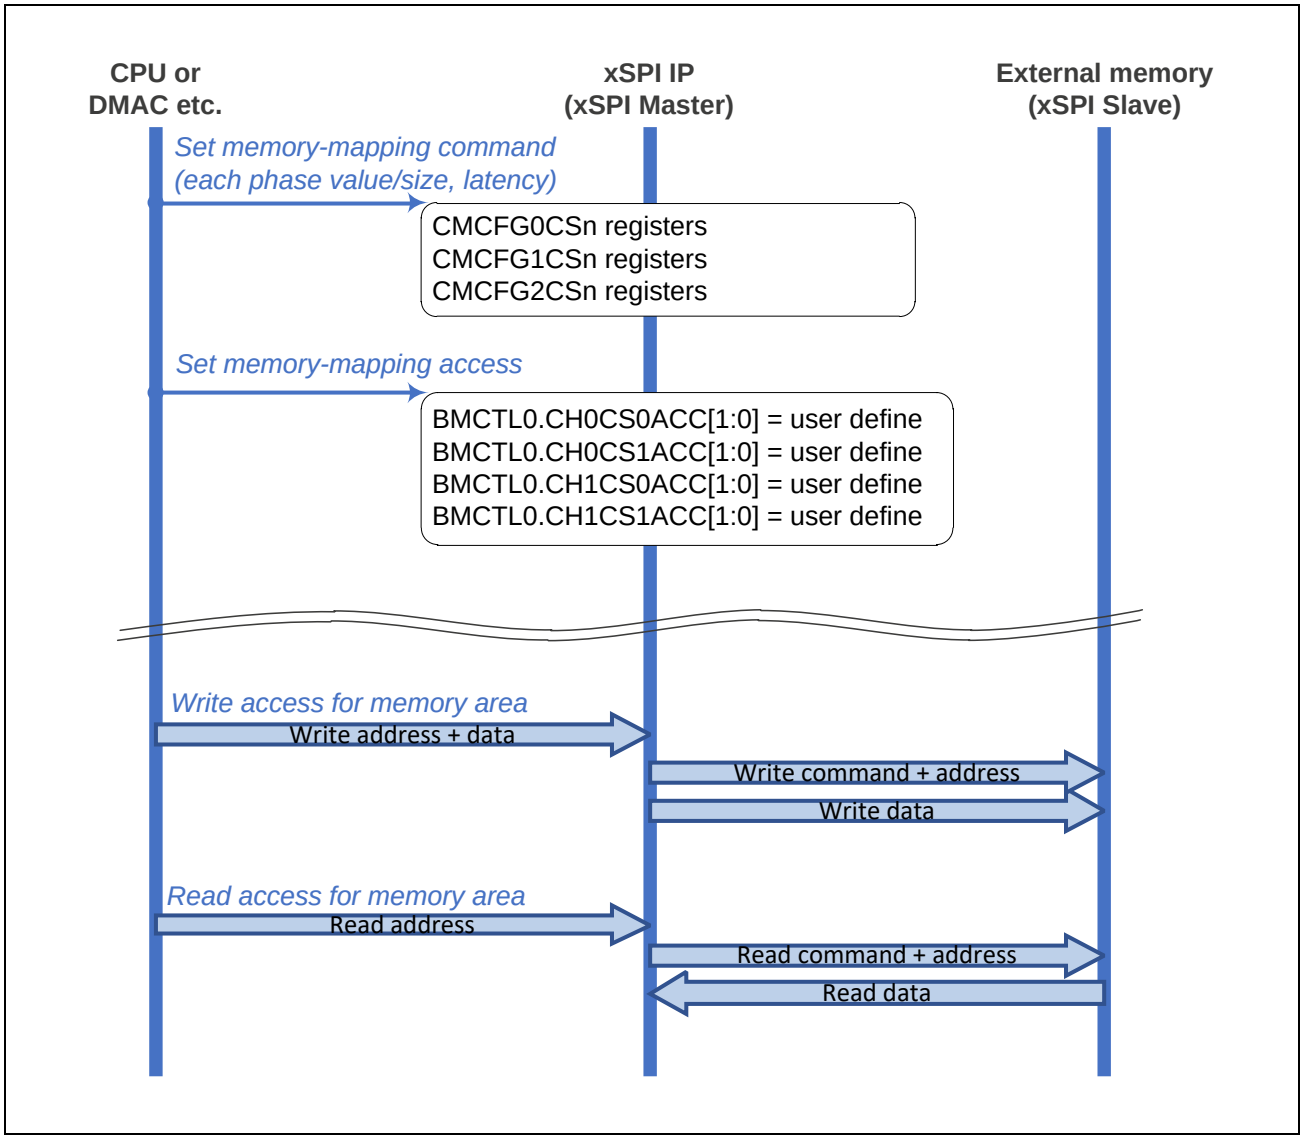

Figure 7.2-27 Flow of Memory-Mapping

7.2.3.6.7 Flow of memory-mapping stop

The figure below shows flow of memory-mapping stop. This flow should be used in the flow of **7.2.3.6.3 Flow of communication stop**.

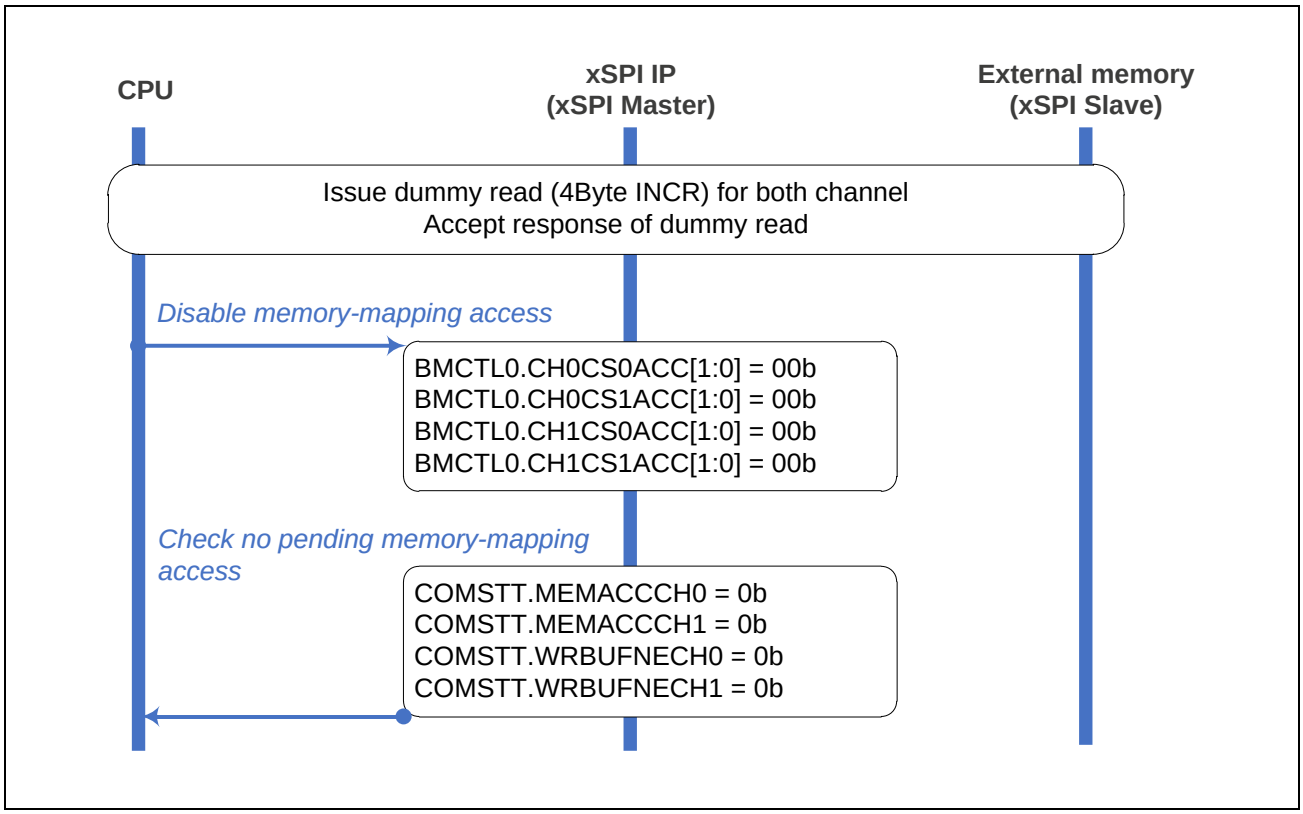

Figure 7.2-28 Flow of Memory-Mapping Stop

7.2.3.6.8 Flow of pattern request

The figure below shows flow of pattern request. Before requesting any pattern, any ongoing commands should be completed or canceled.

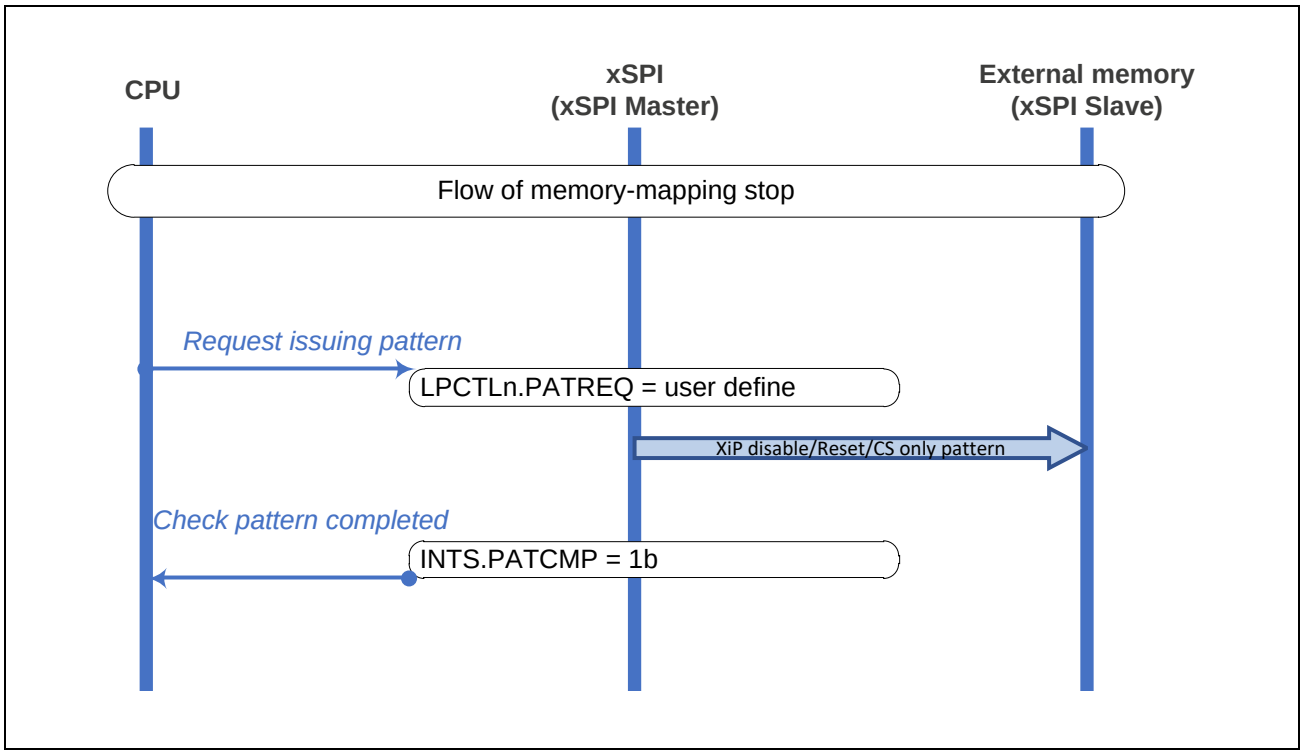

Figure 7.2-29 Flow of Pattern Request

7.2.3.6.9 Flow of XiP mode

The figure below shows flow of XiP mode enable/disable.

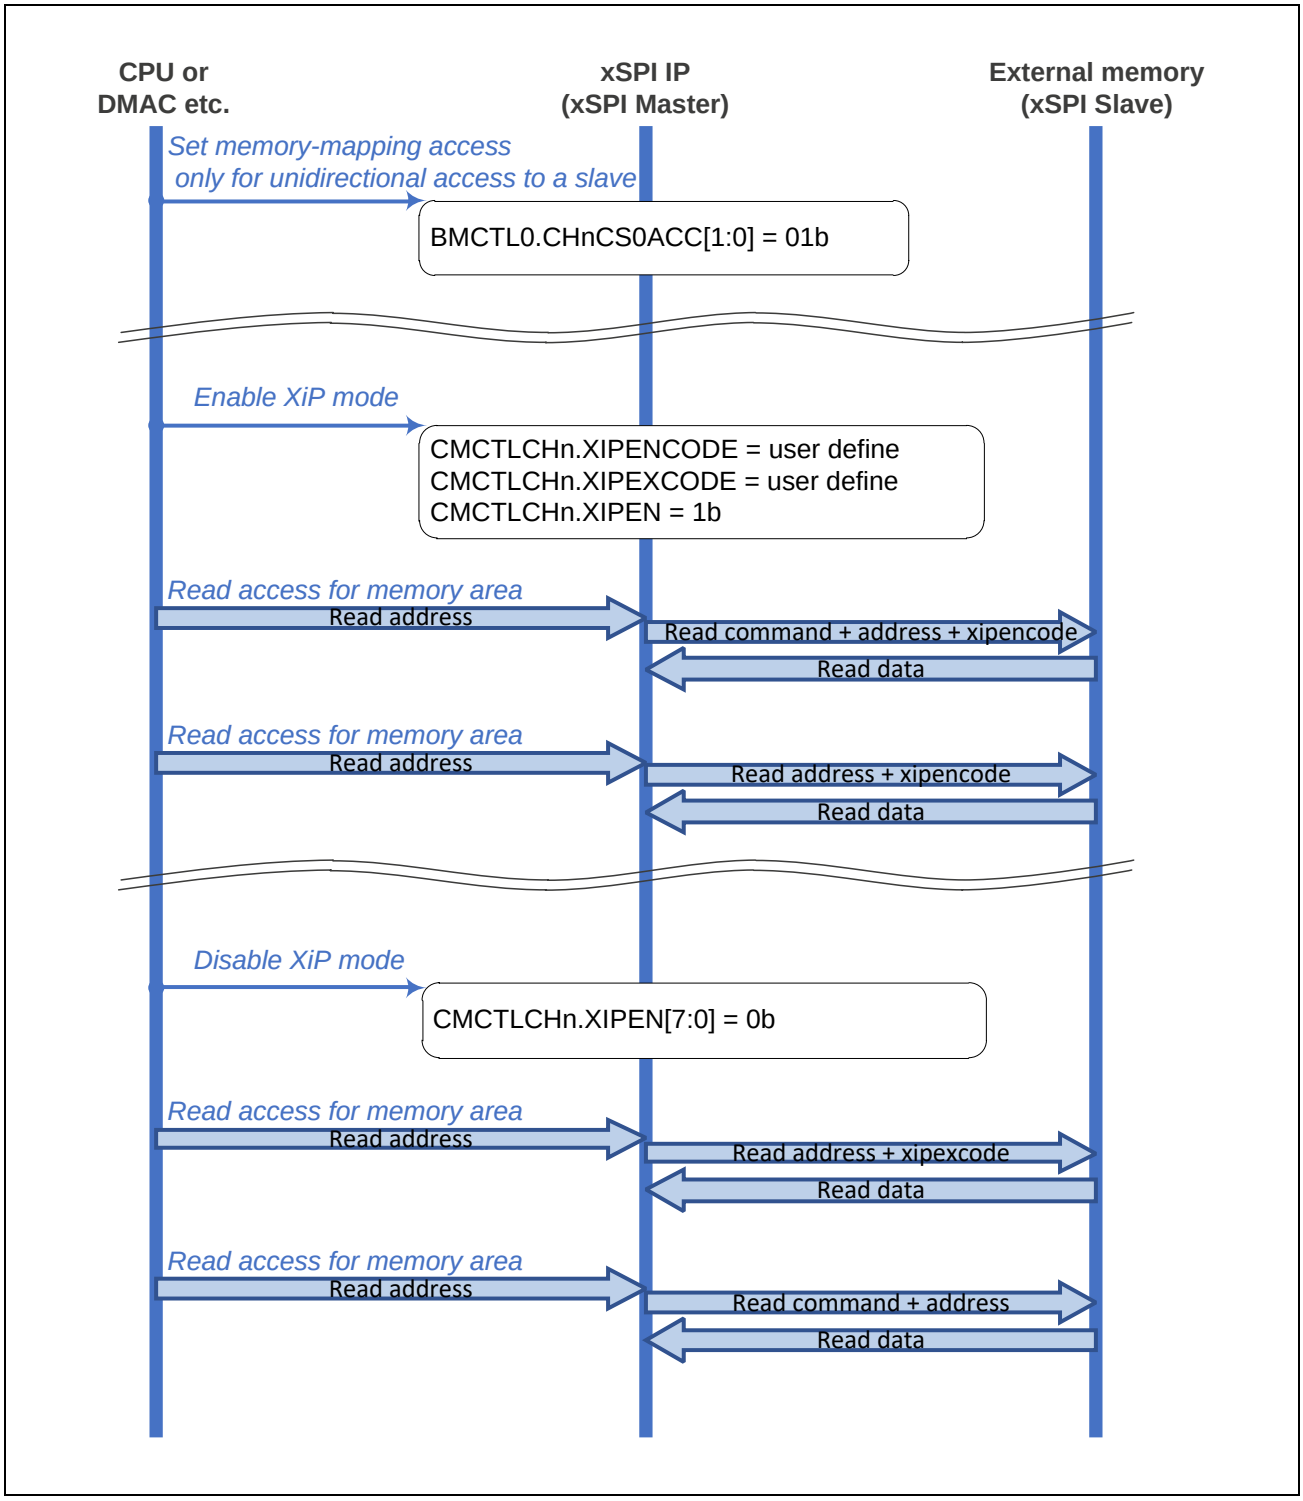

Figure 7.2-30 Flow of XiP Mode Enable/Disable

7.2.3.7 Usage Notes

- If prefetch function is enabled and CSn end address register (SYS_SPI_ENDADDCSn) is not set correctly compared to size of connected slave device, xSPI master may access outside of the slave device address. It may cause DS timeout in case of 8D-8D-8D. Make sure to set the correct slave device size to SYS_SPI_ENDADDCSn register.

- DDR access without DS is not supported.

SECTION 7 LOW-SPEED INTERFACE

7.3 Serial Communications Interface (RSCI)

7.3.1 Overview

This LSI has ten independent serial communications interface (RSCI) channels. The RSCI (hereinafter referred to as SCI) is configurable to six asynchronous and synchronous serial interfaces:

- Asynchronous interfaces (UART and Asynchronous Communications Interface Adapter (ACIA))
- 8-bit clock synchronous interface
- Simple I2C (master-only)
- Simple SPI
- Smart card interface
- Simple LIN interface

The smart card interface complies with the ISO/IEC 7816-3 standard for electronic signals and transmission protocol. Each SCI has FIFO buffers to enable continuous and full-duplex communication, and the data transfer speed can be configured independently using a baud rate generator.

Table 7.3-1 lists the SCI specifications, **Figure 7.3-1** shows a block diagram of SCI channel n, and **Table 7.3-2** lists the I/O pins.

Table 7.3-1 SCI Specifications (1/3)

Item	Specifications
Number of channels	10 channels
Serial communication modes	• Asynchronous • Clock synchronous • Smart card interface • Simple I2C • Simple SPI • Simple LIN
Transfer speed	Bit rate specifiable with the baud rate generator
Full-duplex communications	Transmitter: Continuous transmission possible using double- buffering Receiver: Continuous reception possible using double-buffering
Half-duplex communication	Possible by using TXD pins
Data transfer	Selectable as LSB-first or MSB-first transfer
RXD/TXD polarity	Selectable polarity for TXD and RXD independently
Interrupt sources	• Transmit end, transmit data empty, receive data full, receive error, receive data ready, and address match, break field detection/output, bus collision detection, active edge detection • Completion of generation of a start condition, restart condition, or stop condition (for simple I2C mode)
RS-485 driver control function	Output DE pin to enable transmission mode of external transceiver
Loopback function	Self-diagnosis of communication function inside module supported
Synchronizing circuit bypass function	Bus clock (RSCI_m_PCLK) can be used as operation clock (RSCI_m_TCLK) when bypass function is enabled.

Table 7.3-1 SCI Specifications (2/3)

Item		Specifications
Asynchronous mode	Data length	7, 8, or 9 bits
	Transmission stop bit	1 or 2 bits
	Reception sampling timing adjustment	Adjustable reception sampling timing from default timing
	Transmission timing adjustment	Adjustable timing of transmission wave edge by register
	Parity	Even parity, odd parity, or no parity
	Receive error detection	Parity, overrun, and framing errors
	Hardware flow control	Transmission and reception controllable with CTSm# and RTSm# pins
	Transmission/ reception	Selectable to 1-stage register or 32-stage FIFO
	Address match	Interrupt request/event output can be issued upon detecting a match between received data and the value in the compare match register.
	Start-bit detection	Selectable to low level or falling edge detection
	Break detection	Breaks from framing errors detectable by reading register
	Clock source	Selectable to internal or external clock
	Double-speed mode	Baud rate generator double-speed mode is selectable.
	Multi-processor communications function	Serial communication enabled between multiple processors
	Noise cancellation	Digital noise filters included on signal paths from RXDn pin inputs
	Half data communication function	Half data communication function makes data “0” low pulse only in the first half of 1-bit period
Simple-LIN	Start frame transmission/ Start frame reception	• Break field output possible • Break field output complete interrupt output possible • Bus collision detection possible • Bus collision detection interrupt output possible • Break field detectable • Break field detected interrupt output possible • Control field 0/1 data comparison function • Control field 1 can set two types of comparison data of primary and secondary. • Priority interrupt bit can be set in control field 1b. • Bit rate measurement function
	Input/output control function	When the simple-LIN function is OFF, the RXD receive signal can be input to the core section.
Clock synchronous mode	Data length	8 bits
	Reception sampling timing adjustment	Adjustable reception sampling timing to backward from default timing in case internal clock used
	Receive error detection	Overrun error
	Clock source	Selectable to internal clock (master mode) or external clock (slave mode)
	Double-speed mode	Baud rate generator double-speed mode is selectable.
	Hardware flow control	Transmission and reception controllable with CTSm# and RTSm# pins
	Transmission/ reception	Selectable to 1-stage register or 32-stage FIFO

Table 7.3-1 SCI Specifications (3/3)

Item		Specifications
Smart card interface mode	Error processing	Error signal can be automatically transmitted on detecting a parity error during reception.
		Data can be automatically retransmitted on receiving an error signal during transmission.
	Data type	Both direct and inverse convention supported
Simple I2C mode	Transfer format	I2C bus format (MSB-first only)
	Operating mode	Master (single-master operation only)
	Transfer rate	Up to 400 kbps
	Noise cancellation	The signal paths from input on the SCLn and SDAn pins incorporate digital noise filters and provide an adjustable interval for noise cancellation.
Simple SPI mode	Data length	8 bits
	Error detection	Overrun error
	Clock source	Selectable to internal clock (master mode) or external clock (slave mode)
	Double-speed mode	Baud rate generator double-speed mode is selectable.
	Reception sampling timing adjustment	Adjustable reception sampling timing to backward from default timing in case internal clock used
	SS input pin function	High impedance state can be invoked on the output pins by driving the SSn# pin high.
	Clock settings	Configurable between four clock phase and clock polarity settings
	Transmission/ reception	Selectable to 1-stage register or 32-stage FIFO
Bit rate modulation function		Error reduction through correction of outputs from the baud rate generator

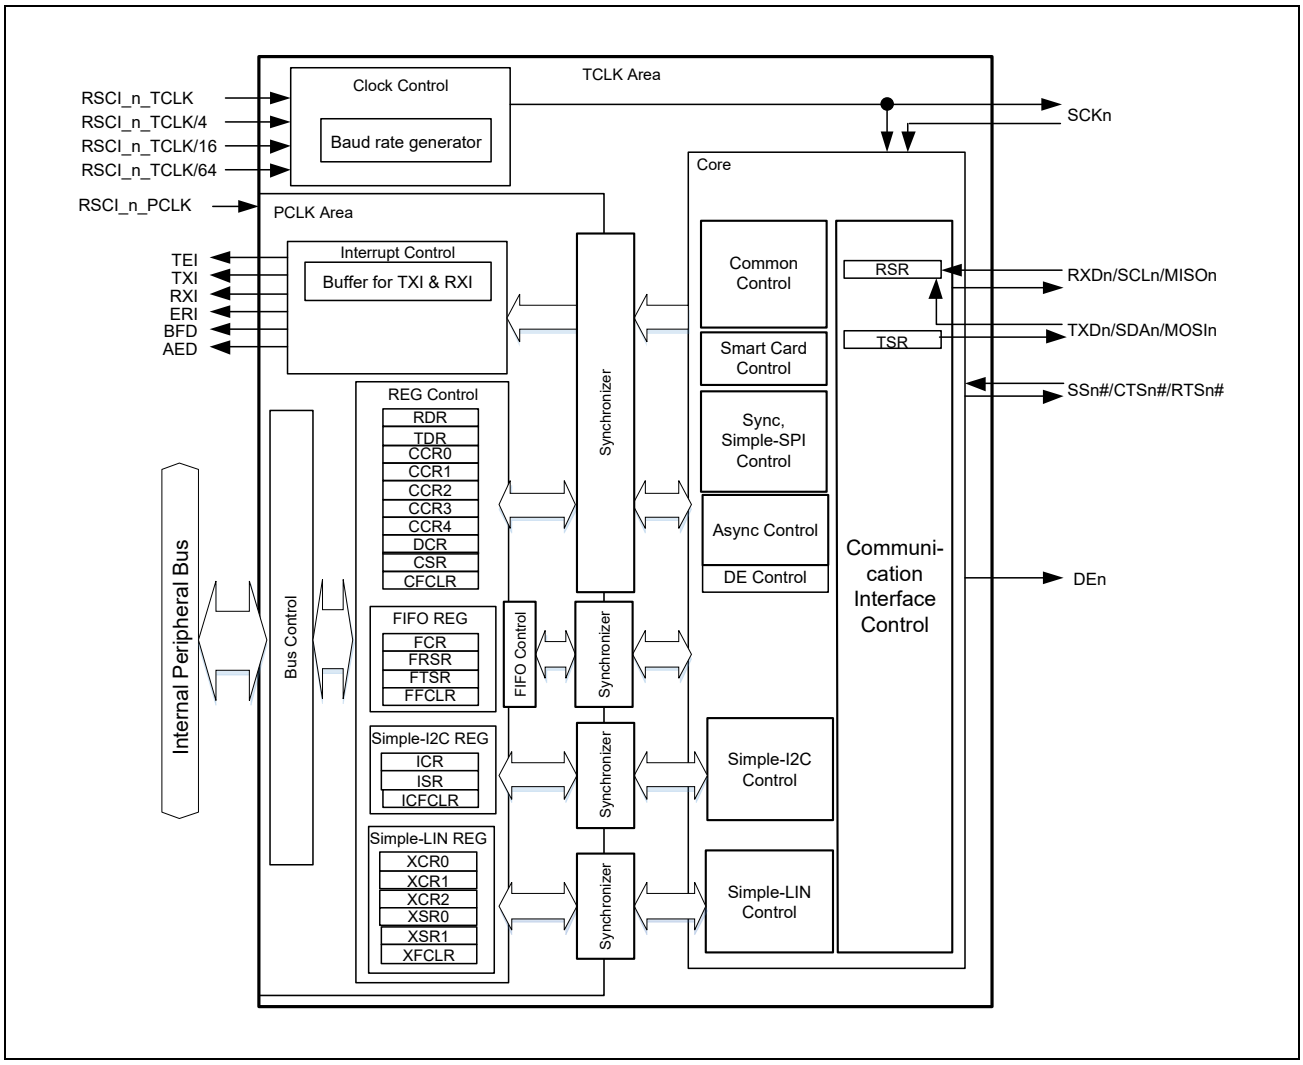

Figure 7.3-1 RSCI Block Diagram

Table 7.3-2 SCI Input/Output Pins

Channel	Pin Name	Signal name	Input/ Output	Function
RSCIm	SCKm	SCKm	I/O	RSCIm clock input/output
	RXDm_MISOm_SCLm	RXDm/SCLm/ MISOm	I/O	RSCIm receive data input RSCIm I2C clock input/output RSCIm data input (master), data output (slave)
	TXDm_MOSIm_SDAm	TXDm/SDAm/ MOSIm	I/O	RSCIm transmit data output RSCIm I2C data input/output RSCIm data output (master), data input (slave)
	SSm_CTSmN_RTSmN	SSm#/CTSm#/ RTSm#	I/O	RSCIm chip select input RSCIm transfer start control output RSCIm transfer start control input
	CTSmN	CTSm#	Input	RSCIm transfer start control input (exclusive use)
	DEm	DEm	Output	RSCIm Driver Enable output

Note: m = 0 to 9

7.3.2 SCI Registers

This section explains each register specification.

Table 7.3-3 shows a list of registers/bits that cannot be rewritten during communication. Also, check the notes on register rewriting described in **7.3.18 Usage Notes**.

Table 7.3-3 Bits that cannot be Rewritten during Communication

Register	Bit	Write Constraint
CCR0	RE	In Clock synchronous mode, Simple-SPI and Simple-I2C, 1b can be written only when TE = 0b and RE = 0b. After setting TE or RE to 1b, only 0b can be written in TE and RE.
CCR0	TE	
CCR0	IDSEL	Writable only when TE = 0b and RE = 0b.
CCR0	SSE	Writable only when TE = 0b and RE = 0b.
CCR1	CTSE	Writable only when TE = 0b and RE = 0b.
CCR1	CTSPEN	Writable only when TE = 0b and RE = 0b.
CCR1	PE	Writable only when TE = 0b and RE = 0b.
CCR1	PM	Writable only when TE = 0b and RE = 0b.
CCR1	TINV	Writable only when TE = 0b and RE = 0b.
CCR1	RINV	Writable only when TE = 0b and RE = 0b.
CCR1	SPLP	Writable only when TE = 0b and RE = 0b.
CCR1	SHARPS	Writable only when TE = 0b and RE = 0b.
CCR1	NFCS[2:0]	Writable only when TE = 0b and RE = 0b.
CCR1	NFEN	Writable only when TE = 0b and RE = 0b.
CCR2	All bits	Writable only when TE = 0b and RE = 0b.
CCR3	All bits	Writable only when TE = 0b and RE = 0b.
CCR4	All bits	Writable only when TE = 0b and RE = 0b.
ICR	IICDL[4:0]	Writable only when TE = 0b and RE = 0b.
ICR	IICINTM	Writable only when TE = 0b and RE = 0b.
ICR	IICCSC	Writable only when TE = 0b and RE = 0b.
FCR	All bits	Writable only when TE = 0b and RE = 0b.
DCR	All bits	Writable only when TE = 0b and RE = 0b.
XCR0	All bits	Writable only when TE = 0b and RE = 0b.
XCR1	TCST	Writable only when TE = 0b and RE = 0b.
XCR1	SDST	Writable only when TE = 0b and RE = 0b.
XCR1	PCF1D [7:0]	Writable only when TE = 0b and RE = 0b.
XCR1	SCF1D [7:0]	Writable only when TE = 0b and RE = 0b.
XCR1	CF1CE [7:0]	Writable only when TE = 0b and RE = 0b.
XCR2	All bits	Writable only when TE = 0b and RE = 0b.
HCH	All bits	Writable only when TE = 0b and RE = 0b.

The base addresses for the respective channels are as follows.

Table 7.3-4 Register Base Addresses

Base Register Name	Ch	Base Address
<RSCI0_base>	RSCI0	0_1280_0C00h (5280_0C00h*1, 4280_0C00h*2)
<RSCI1_base>	RSCI1	0_1280_1000h (5280_1000h*1, 4280_1000h*2)
<RSCI2_base>	RSCI2	0_1280_1400h (5280_1400h*1, 4280_1400h*2)
<RSCI3_base>	RSCI3	0_1280_1800h (5280_1800h*1, 4280_1800h*2)
<RSCI4_base>	RSCI4	0_1280_1C00h (5280_1C00h*1, 4280_1C00h*2)
<RSCI5_base>	RSCI5	0_1280_2000h (5280_2000h*1, 4280_2000h*2)
<RSCI6_base>	RSCI6	0_1280_2400h (5280_2400h*1, 4280_2400h*2)
<RSCI7_base>	RSCI7	0_1280_2800h (5280_2800h*1, 4280_2800h*2)
<RSCI8_base>	RSCI8	0_1280_2C00h (5280_2C00h*1, 4280_2C00h*2)
<RSCI9_base>	RSCI9	0_1280_3000h (5280_3000h*1, 4280_3000h*2)

Note 1. CM33 Address Space Non-Secure

Note 2. CM33 Address Space Secure

7.3.2.1 List of Registers

The registers are listed below.

Register Name	Abbreviation	Initial Value	Offset Address	Access Size [bits]*1
Receive Data Register	RSCIm_RDR	0000_0000h	0000h	32
Transmit Data Register	RSCIm_TDR	FFFF_FFFFh	0004h	8, 16, 32
Common Control Register 0	RSCIm_CCR0	0000_0000h	0008h	8, 16, 32
Common Control Register 1	RSCIm_CCR1	0000_0000h	000Ch	8, 16, 32
Common Control Register 2	RSCIm_CCR2	FF00_FF04h	0010h	8, 16, 32
Common Control Register 3	RSCIm_CCR3	0000_1203h	0014h	8, 16, 32
Common Control Register 4	RSCIm_CCR4	0000_0000h	0018h	8, 16, 32
Communication Enable Status Register	RSCIm_CESR	00h	001Ch	8
Reserve	-	-	001Dh	-
Half data communication Control Register	RSCIm_HCR	00h	001Eh	8
Reserve	-	-	001Fh	-
Simple I2C Control Register	RSCIm_ICR	0000_0000h	0020h	8, 16, 32
FIFO Control Register	RSCIm_FCR	1F1F_0000h	0024h	8, 16, 32
Reserve	-	-	0028h to 002Fh	-
Driver Control Register	RSCIm_DCR	0000_0000h	0030h	8, 16, 32
Simple-LIN(SCIX) Control Register 0	RSCIm_XCR0	0000_0000h	0034h	8, 16, 32
Simple-LIN(SCIX) Control Register 1	RSCIm_XCR1	0000_0000h	0038h	8, 16, 32
Simple-LIN(SCIX) Control Register 2	RSCIm_XCR2	FFFE_0000h	003Ch	8, 16, 32
Reserve	-	-	0040h to 0047h	-
Common Status Register	RSCIm_CSR	6000_8000h	0048h	32
Simple I2C Status Register	RSCIm_ISR	0000_00xxh	004Ch	32
FIFO Receive Status Register	RSCIm_FRSR	0000_0000h	0050h	32
FIFO Transmit Status Register	RSCIm_FTSR	0000_0000h	0054h	32
Reserve	-	-	0058h to 005Bh	-
Simple-LIN(SCIX) Status Register 0	RSCIm_XSR0	0000_0000h	005Ch	32
Simple-LIN(SCIX) Status Register 1	RSCIm_XSR1	0000_0000h	0060h	32
Reserve	-	-	0064h to 0067h	-
Common Flag Clear Register	RSCIm_CFCLR	0000_0000h	0068h	8, 16, 32
Simple I2C Flag Clear Register	RSCIm_ICFCLR	0000_0000h	006Ch	8, 16, 32
FIFO Flag Clear Register	RSCIm_FFCLR	0000_0000h	0070h	8, 16, 32
Reserve	-	-	0074h to 0077h	-
Simple-LIN(SCIX) Flag Clear Register	RSCIm_XFCLR	0000_0000h	0078h	8, 16, 32

Note 1. The read access size is fixed at 32 bits.

7.3.2.2 SCI Register Descriptions

The prefix (RSCIm_) of the register names is omitted in this and subsequent sections.

7.3.2.2.1 Receive Shift Register (RSCIm_RSR)

RSR is a shift register which is used to receive serial data input from the RXDn pin and converts it into parallel data. When one frame of data has been received, it is automatically transferred to the RDR register.

The RSR register cannot be directly accessed by the CPU.

7.3.2.2.2 Receive Data Register (RSCIm_RDR)

In FIFO mode (CCR3.FM = 1b), this register has 32-stage FIFO structure.

Access Size : 32 bits
Address : <RSCIm_base> + 0000h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	FER	PER	-	-	ORER	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	FFER	FPER	DR	MPB	RDAT[8:0]								
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	R	Reserved Whenever it is read, 0b is read.
28	FER	0h	R	Framing error flag CSR.FER can be read.
27	PER	0h	R	Parity error flag CSR.PER can be read.
26, 25	-	All 0	R	Reserved Whenever it is read, 0b is read.
24	ORER	0h	R	Overrun Error flag CSR.ORER can be read.
23 to 13	-	All 0	R	Reserved Whenever it is read, 0b is read.
12	FFER	0h	R	FIFO framing error flag (Valid only in Asynchronous mode) 0b: There is no framing error in the data read from the receive FIFO. 1b: There is framing error in the data read from the receive FIFO.
11	FPER	0h	R	FIFO parity error flag (Valid only in Asynchronous mode) 0b: There is no parity error in the data read from the receive FIFO. 1b: There is parity error in the data read from the receive FIFO.
10	DR	0h	R	Receive data ready flag FRSR.DR can be read.
9	MPB	0h	R	Multi-processor flag 0b: Data transmission cycles 1b: ID transmission cycles
8 to 0	RDAT[8:0]	0h	R	Serial receive data RDAT is a 9-bit register for storing received data. Received data is stored in [6:0] when 7-bit data is selected, in [7:0] when 8-bit data is selected, and in [8:0] when 9-bit data is selected. And 0 is stored in the unused bit.

RDAT[8:0] bits (Serial receive data)

After one frame of data is received, the received data is transferred from the RSR register to this registers, thus allowing the RSR register to receive the next data.

The RSR and RDR registers have a double-buffered structure to enable continuous reception.

In Non-FIFO mode (CCR3.FM=0b), read RDR only once when a receive data full interrupt (RXI) request is issued. Without reading received data from RDR, if the next one frame is received, an overrun error occurs.

In FIFO mode, continuous reception is executed until 32 stages are stored. If data is read when there is no received data in the receive FIFO (RDR), the value is undefined. When the receive FIFO (RDR) are full of received data, subsequent serial receive data is lost.

The CPU cannot write to RDR.

0b is stored in the bit position which is not received (bit 8 or bit 7 of RDR) at the time of 7-bit or 8-bit communication in asynchronous mode.

MPB bit (Multi-processor flag)

In asynchronous mode, during multi-processor communication (CCR3.MP = 1b), the value of the multi-processor bit corresponding to the received data (RDAT[8:0]) can be read.

FPER bit (FIFO parity error flag)

Indicates whether the data read from the receive FIFO has a parity error.

In Non-FIFO mode (CCR3.FM=0b), 0b is stored.

FFER bit (FIFO framing error flag)

Indicates whether the data read from receive FIFO has a framing error.

In Non-FIFO mode (CCR3.FM=0b), 0b is stored.

7.3.2.2.3 Transmit Data Register (RSCIm_TDR)

In FIFO mode (CCR3.FM = 1b), this register has 32-stage FIFO structure.

Access Size : 8, 16, 32 bits
Address : <RSCIm_base> + 0004h
Initial Value : FFFF_FFFFh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	MPBT	TDAT[8:0]								
Initial Value	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	-	All 1	RW	Reserved Whenever it is read, 1b is read. The written value should always be 1b.
9	MPBT	1h	RW	Multi-processor transfer bit flag Value of the multi-processor bit in the transmission frame. This bit is use in Asynchronous mode. When writing to this bit when not used, write the initial value. 0b: Data transmission cycles 1b: ID transmission cycles
8 to 0	TDAT[8:0]	1FFh	RW	Serial transmit data TDAT is a 9-bit register for setting transmit data. Transmit data is set in [6:0] when 7-bit data is selected, in [7:0] when 8-bit data is selected, and in [8:0] when 9-bit data is selected. When byte access for 9-bit data, write TDR[15:8] and then write TDR[7:0].

Note: The read access size is fixed at 32 bits.

TDAT[8:0] bits (Serial transmit data)

The TDR is a 9-bit register for storing transmit data.

When empty space is detected in the TSR register, the transmit data stored in the TDR registers is transferred to TSR, and transmitting is started.

The TSR and TDR registers have a double-buffer structure to realize continuous transmission. When the next data to be transmitted is stored in TDR after one frame of data has been transmitted, the transmitting operation is continued by transfer to the TSR register.

In Non-FIFO mode, when a transmit data empty interrupt (TXI) request is issued and CCR0.TE is 1b, write transmit data to the TDR only once.

In FIFO mode, when the SCI detects that the transmit shift register (TSR) is empty, it transmits data in the transmit FIFO (TDR) into TSR and starts serial transmission. Continuous serial transmission is executed until there is no transmit data left in the transmit FIFO (TDR).

When transmit FIFO is full of transmit data (32 frames), no more data can be written. If new data is written, the data is ignored.

When using bytes access, write TDR[15:8] and then write TDR[7:0].

MPBT bit (Multi-processor transfer bit flag)

Selects the multi-processor bit of transmit frame.

7.3.2.2.4 Transmit Shift Register (RSCIm_TSR)

TSR is a shift register that transmits serial data. TSR cannot be directly accessed by the CPU.

To perform serial data transmission, the SCI first automatically transfers transmit data from TDR to TSR, and then sends the data to the TXDn pin.

7.3.2.2.5 Common Control Register 0 (RSCIm_CCR0)

Access Size : 8, 16, 32 bits

Address : <RSCIm_base> + 0008h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	SSE	-	-	TEIE	TIE	-	-	-	RIE
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	IDSEL	DCME	MPIE	-	-	-	TE	-	-	-	RE
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
24	SSE	0h	RW	SSn# Pin Function Enable (Valid in Simple-SPI mode.) In slave mode (CCR3.CKE[1:0] = 1xb), set 1b to this bit. 0b: SSn# pin function is disabled. 1b: SSn# pin function is enabled.
23, 22	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
21	TEIE	0h	RW	Transmit End Interrupt Enable This bit should be set to 0 in smart card interface mode. 0b: TEI interrupt request is disabled. 1b: TEI interrupt request is enabled.
20	TIE	0h	RW	Transmit Interrupt Enable 0b: TXI interrupt request is disabled. 1b: TXI interrupt request is enabled.
19 to 17	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
16	RIE	0h	RW	Receive Interrupt Enable 0b: RXI and ERI interrupt requests are disabled. 1b: RXI and ERI interrupt requests are enabled.
15 to 11	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
10	IDSEL	0h	RW	ID frame select (Valid only in asynchronous mode with multi-processor mode) 0b: All data is to be compared. 1b: The data with RDR.MPB = 1b is to be compared.
9	DCME	0h	RW*2	Data Compare Match Enable (Valid only in asynchronous mode) 0b: Address match function is disabled. 1b: Address match function is enabled.
8	MPIE	0h	RW*2	Multi-Processor Interrupt Enable (Valid in asynchronous mode when CCR3.MP = 1b.) This bit should be set to 0 in smart card interface mode. When the data with the multiprocessor bit set to 1b is received, the MPIE bit is automatically cleared to 0b, and non-multiprocessor reception is resumed. If you want to continue receiving operation using the multiprocessor function, set this bit to 1 sufficiently earlier than receiving the STOP bit of the next received frame. (Consider the synchronization delay time.) 0b: Non-Multi-Processor reception 1b: Multi-Processor reception
7 to 5	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.

Bit	Bit Name	Initial Value	R/W	Description
4	TE*3	0h	RW*1	Transmit Enable 0b: Serial transmission is disabled. 1b: Serial transmission is enabled.
3 to 1	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
0	RE*3	0h	RW*1	Receive Enable In clock synchronous mode and simple-SPI mode, receive only setting is prohibited (TE = 0 and RE = 1b setting prohibited). 0b: Serial reception is disabled. 1b: Serial reception is enabled.

Note: The read access size is fixed at 32 bits.

Note 1. In clock-synchronous mode (CCR3.MOD[2:0] = 010b), simple-SPI mode (CCR3.MOD[2:0] = 011b), and simple-I2C mode (CCR3.MOD[2:0] = 100b), 1b can be written only when TE = 0b and RE = 0b. After setting TE or RE to 1b, only 0b can be written in TE and RE. In other mode, writing is enabled under any condition.

Note 2. This bit is a bit that is cleared by hardware. Note that writing to a bit other than this bit with a bit manipulation instruction may cause this bit to be unintentionally set to 1b by a read-modify-write operation.

Note 3. In clock-synchronous mode or simple-SPI mode and internal clock (master mode), the receive-only setting is prohibited (TE = 0b and RE = 1b settings are prohibited).

RE bit (Receive Enable)

Enables or disables serial receive operation.

When this bit is set to 1b, serial reception becomes possible after the synchronization delay time has elapsed in asynchronous mode or the synchronous clock input in clock synchronous mode or start bit in smart-card-interface mode.

Note that CCR3 should be set prior to setting the RE bit to 1b in order to designate the reception format.

Except smart-card-interface-mode, even if reception is halted by setting the RE bit to 0b, the CSR.RDRF, FER, PER, ORER, FRSR.DR flags are not affected and the previous values are retained. In smart-card-interface-mode, even if reception is halted by setting the RE bit to 0b, the CSR.FER, PER, ORER flags are not affected and the previous value is retained. Also, to stop the reception operation, synchronization delay time will be required from when the RE bit is set to 0b until the reception operation is stopped.

TE bit (Transmit Enable)

Enables or disables serial transmission.

When this bit is set to 1b, serial transmission becomes possible after the synchronization delay time has elapsed. After the synchronization delay time, transmission is started by writing transmit data to TDR. Note that CCR3 should be set prior to setting the TE bit to 1b in order to designate the transmission format. In addition, the synchronization delay time is required until the transmission control circuit is stopped after the TE bit is set to 0b.

MPIE bit (Multi-Processor Interrupt Enable)

When this bit is set to 1b and the data with the multi-processor bit set to 0b is received, the data is not read and setting the status flags (CSR.RDRF, ORER, FER, FRSR.DR) are not set.

When the data with the multi-processor bit set to 1b is received, the MPIE is automatically cleared to 0b, and normal reception is resumed. For details, see **7.3.4 Multi-Processor Communication Function**. If you want to continue receiving operation using the multiprocessor function, set this bit to 1b sufficiently earlier than receiving the STOP bit of the next received frame.

When the receive data includes the MPB bit set to 0b, the receive data is not transferred from the RSR to the RDR, a receive error is not detected, and setting the flags ORER and FER to 1b is disabled.

When the receive data includes the MPB bit set to 1b, the MPIE bit is automatically cleared to 0b, the RXI and ERI interrupt requests are enabled (if CCR0.RIE is set to 1b), and setting the flags ORER, FER to 1b is enabled.

MPIE should be set to 0b if multi-processor communications function is not to be used.

DCME bit (Data Compare Match Enable)

It can select whether the Address match function (data compare match function) uses or not.

When DCME is 1b, if SCI detects the match to the comparison data (CCR4.CMPD) with receive data, DCME is cleared automatically, and after that, SCI operation mode will be receive mode without data compare match function.

See **7.3.3.6 Address Match (Receive Data Match Detection) Function**.

The write value should be 0b other than asynchronous mode.

IDSEL bit (ID frame select)

It can select whether it's compared in spite of the value of MPB bit or it's compared only the data of MPB bit = 1b (ID frame) when the Address match function is valid. Please set at the same time as DCME.

RIE bit (Receive Interrupt Enable)

Enables or disables RXI and ERI interrupt requests.

RXI and ERI interrupt request is disabled by setting the RIE bit to 0b.

An ERI interrupt request can be canceled by reading 1b from the CSR.ORER, FER, or PER and then setting the flag to 0, or setting the RIE bit to 0b.

TIE bit (Transmit Interrupt Enable)

Enables or disables a TXI interrupt request.

A TXI interrupt request is disabled by setting the TIE bit to 0b. At the beginning of transmission, set 1b to CCR0.TE and CCR0.TIE simultaneously. Then the TXI interrupt request is generated.

TEIE bit (Transmit End Interrupt Enable)

Enables or disables a TEI interrupt request.

A TEI interrupt request is disabled by setting the TEIE bit to 0b.

In simple I2C mode, the TEI is allocated to the interrupt on completion of issuing a start, restart, or stop condition (STI). In this case, the TEIE bit can be used to enable or disable the STI.

SSE bit (SSn# Pin Function Enable)

Set this bit to 1b if the SSn# pin is to be used in control of transmission and reception (in simple SPI mode). Set this bit to 0b in any other mode. Do not set both the SSE and CTSE (even if this setting is made, operation is the same as that when these bits are set to 0b).

In the slave mode (CCR3.CKE[1:0] = 10b or 11b), SSE should be set to 1b.

In the master mode (CCR3.CKE[1:0] = 00b or 01b) and single-master, the SSn# pin on the master side is not required to control reception and transmission, so SSE should be set to 0b.

7.3.2.2.6 Common Control Register 1 (RSCIm_CCR1)

Access Size : 8, 16, 32 bits

Address : <RSCIm_base> + 000Ch

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	NFEN	-	NFCS[2:0]			-	-	-	SHARPS	-	-	-	SPLP
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	RINV	TINV	-	-	PM	PE	-	-	SPB2IO	SPB2DT	-	-	CTSPEN	CTSE
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
28	NFEN	0h	RW	Digital Noise Filter Function Enable (Valid in asynchronous mode, simple-LIN mode and simple-I2C mode) Noise filter function is available for RXD only in asynchronous mode and simple-LIN mode, for SCL and SDA inputs in simple-I2C mode. 0b: Noise filter disabled 1b: Noise filter enabled
27	-	0h	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
26 to 24	NFCS[2:0]	0h	RW	Noise Filter Clock Select (Valid in asynchronous mode, simple-LIN mode and simple-I2C mode.) Select for the noise filter's clock source. In simple-I2C mode, 000b setting is prohibited. "The baud rate generator source clock" means the clock selected by CCR2.CKS[1:0]. 000b: The base clock signal divided by 1. 001b: The baud rate generator source clock divided by 1. 010b: The baud rate generator source clock divided by 2. 011b: The baud rate generator source clock divided by 4. 100b: The baud rate generator source clock divided by 8. Others: Setting prohibited
23 to 21	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
20	SHARPS	0h	RW	Half-duplex communication select In the simple I2C mode or in the simple SPI mode, this bit should be set to 0. 0b: The TXD pin and the RXD pin independent 1b: Half-duplex communication using TXD pin
19 to 17	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
16	SPLP	0h	RW	Loopback Control This function is available in asynchronous mode and clock synchronous mode. 0b: Normal mode 1b: Loopback mode
15, 14	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
13	RINV	0h	RW	RXD invert 0b: Received data from RXD is not inverted and input.*2 1b: Received data from RXD is inverted and input.
12	TINV	0h	RW	TXD invert 0b: Transmit data is not inverted and output to TXD.*2 1b: Transmit data is inverted and output to TXD.
11, 10	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.

Bit	Bit Name	Initial Value	R/W	Description
9	PM	0h	RW	Parity Mode (Valid only when PE = 1b) 0b: Selects even parity 1b: Selects odd parity
8	PE	0h	RW	Parity Enable (Valid only in asynchronous mode. In Smart Card Interface mode, set 1b to this bit.) 0b: Parity bit addition is not performed during transmission. Parity bit checking is not performed during reception. 1b: The parity bit is added during transmission. The parity bit is checked during reception.
7, 6	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
5	SPB2IO	0h	RW	Serial port break I/O This bit selects output or no output on the TXD pin when CCR0.TE = 0b.*1 0b: The value of SPB2DT bit is not output on the TXD pin. 1b: The value of SPB2DT bit is output on the TXD pin.
4	SPB2DT	0h	RW	Serial port break data select The output level of TXD pin is selected when CCR0.TE = 0b.*1 0b: Low level is output on the TXD pin when TINV = 0b. High level is output on the TXD pin when TINV = 1b. 1b: High level is output on the TXD pin when TINV = 0b. Low level is output on the TXD pin when TINV = 1b.
3, 2	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
1	CTSPEN	0h	RW	CTS external pin Enable 0b: 1-pin mode, CTS and RTS share 1 pin. 1b: 2-pin mode, CTS and RTS have dedicated pins.
0	CTSE	0h	RW	CTS Enable 0b: CTS function is disabled (RTS output function is enabled). 1b: CTS function is enabled.

Note: The read access size is fixed at 32 bits.

Note 1. Use this bit in asynchronous mode. Operation in any other mode is not guaranteed.

Note 2. RINV/TINV should be set to 0b in smart card interface mode and simple I2C mode.

CTSE bit (CTS Enable)

Set this bit to 1b if the SSn# pin is to be used for CTS input. The RTS signal is output when this bit is set to 0b. Set this bit to 0b in smart card interface mode, simple SPI mode, simple-LIN mode, and simple I2C mode. Do not set both the CTSE and SSE bits (even if this setting is made, operation is the same as that when these bits are set to 0b).

CTSPEN bit (CTS external pin Enable)

When CTSE is 1b, select the terminals usage method when using the CTS and RTS functions. Set this bit to 1b when assigning the CTS/RTS function to 2 terminals and using them at the same time. Set it to 0b except in asynchronous mode.

Table 7.3-5 shows the relationship between the CTSE bit and CTSPEN bit settings and the functions of the CTSn#/RTSn# terminals.

Table 7.3-5 CTSE Bit and CTSPEN Bit Settings and Pin Functions

CTSE Bit	CTSPEN Bit	CTSn#/RTSn# Pin	CTSn# Pin
0	0	Output RTS	Not used
1	0	Input CTS	Not used
1	1	Output RTS	Input CTS
0	1	Prohibited	Prohibited

SPB2DT bit (Serial port break data select), SPB2IO bit (Serial port break I/O)

The TXD pin status decided by combination of CCR0.TE bit, CCR1.SPB2IO bit and CCR1.SPB2DT bit is indicated in **Table 7.3-6**.

Table 7.3-6 TXD Pin Status

CCR0.TE	CCR1.SPB2IO	CCR1.SPB2DT	TXD Pin Status (when CCR1.TINV = 0b)
0	0	x	Hi-Z (initial value)
0	1	0	Low level output
0	1	1	High level output
1	x	x	Serial transmission data is output.

PE bit (Parity Enable)

When PE bit to 1b, the parity bit is added to transmit data before transmission, and the parity bit is checked in reception.

In the multiprocessor format, the parity bit is not added or checked regardless of this bit setting.

PM bit (Parity Mode)

Selects the parity mode for transmission and reception (even or odd). In multi-processor mode, this bit is invalid.

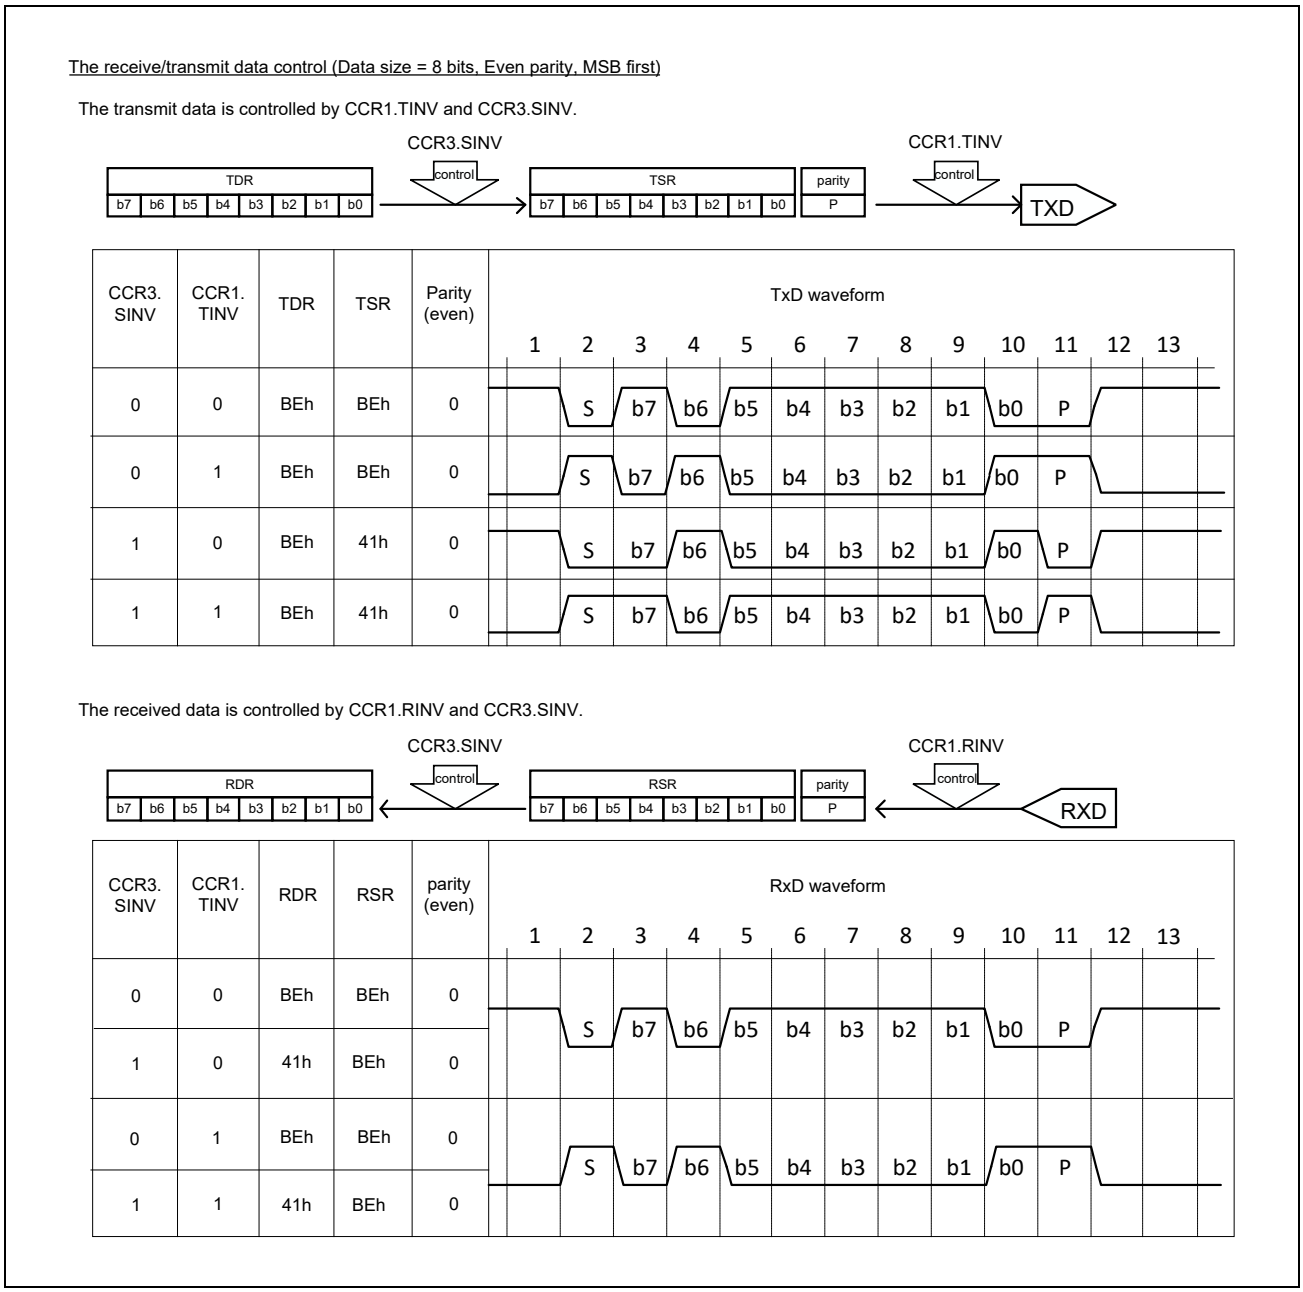
For details on the usage of this bit in smart card interface mode, see **7.3.5.2 Data Format (Except in Block Transfer Mode)**.

TINV bit (TXD invert), RINV bit (RXD invert)

The data of RDR is controlled by RINV and CCR3.SINV. And the data from TXD pin is controlled by TINV and CCR3.SINV. The control by RINV/TINV are done to communication pins (RXD/TXD), so they can control not only data- bits but also other bits (start bit, stop bit, parity bit). For details, see **Figure 7.3-2**.

During half-duplex communication and slave operation in simple SPI mode, use the TXD pin for reception, so set the inversion control of the received data with the TINV bit.

Note: Description and timing charts in this section assumes CCR1.TINV = 0b and CCR1.RINV = 0b when TINV and RINV value are not specified.



CCR3. SINV	CCR1. TINV	TDR	TSR	Parity (even)
0	0	BEh	BEh	0
0	1	BEh	BEh	0
1	0	BEh	41h	0
1	1	BEh	41h	0

CCR3. SINV	CCR1. TINV	RDR	RSR	parity (even)
0	0	BEh	BEh	0
1	0	41h	BEh	0
0	1	BEh	BEh	0
1	1	41h	BEh	0

Figure 7.3-2 Example of the Receive/Transmit Data Control

SPLP bit (Loopback Control)

When SPLP = 1b, TXD is connected to RXD internally.

Transmit data can be inverted and received by TINV = 1b.

Set to 0b in asynchronous mode with external clock, clock synchronous mode, slave, and Simple-LIN mode.

SHARPS bit (Half-duplex communication select)

Setting this bit to 1b enables half-duplex communication using the TXD pin. However, it cannot be used in Simple-SPI mode, Simple-I2C mode, and Smart Card Interface mode.

If this bit is set to 1b and CCR0.TE = 1b, CCR0.RE = 0b, the TXD pin is for communication output. If this bit is set to 1b and CCR0.TE = 0b, CCR0.RE = 1b, the TXD pin is for communication input. For details, see **7.3.12 RS-485 Driver Control Function**.

NFCS[2:0] bits (Noise Filter Clock Select)

These bits select the sampling clock for the digital noise filter.

To use the noise filter in asynchronous mode and simple-LIN mode, set these bits from 000b to 100b. In simple I2C mode, set the bits to a value in the range from 001b to 100b.

NFEN bit (Digital Noise Filter Function Enable)

This bit enables or disables the digital noise filter function. When the function is enabled, noise cancellation is applied to the RXDn input in asynchronous mode and simple-LIN mode, and noise cancellation is applied to the SDAn and SCLn input in simple I2C mode. In any mode other than above, set the NFEN bit to 0b.

7.3.2.2.7 Common Control Register 2 (RSCIm_CCR2)

Access Size : 8, 16, 32 bits
Address : <RSCIm_base> + 0010h
Initial Value : FF00_FF04h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	MDDR[7:0]								-	-	CKS[1:0]		-	-	-	BRME

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	BRR[7:0]								-	ABCSE	ABCS	BGDM	-	BCP[2:0]		
Initial Value	1	1	1	1	1	1	1	1	0	0	0	0	0	1	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	MDDR[7:0]	FFh	RW	Modulation Duty setting MDDR corrects the bit rate adjusted by the BRR register.
23, 22	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
21, 20	CKS[1:0]	0h	RW	Clock Select 00b: RSCI_m_TCLK clock (n = 0)*2 01b: RSCI_m_TCLK/4 clock (n = 1)*2 10b: RSCI_m_TCLK/16 clock (n = 2)*2 11b: RSCI_m_TCLK/64 clock (n = 3)*2
19 to 17	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
16	BRME	0h	RW	Bit Rate Modulation Enable 0b: Bit rate modulation function is disabled. 1b: Bit rate modulation function is enabled.
15 to 8	BRR[7:0]	FFh	RW	Bit rate setting BRR is an 8-bit register that adjusts the bit rate.
7	-	0h	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
6	ABCSE	0h	RW	Asynchronous Mode Extended Base Clock Select (Valid only in asynchronous mode and CCR3.CKE[1] = 0b) 0b: Clock cycles for 1-bit period are decided in combination with CCR2.BGDM and CCR2.ABCS. 1b: 6 base clock cycles for 1-bit period and doubled frequency is output from the baud rate generator.
5	ABCS	0h	RW	Asynchronous Mode Base Clock Select (Valid only in Asynchronous mode and simple-LIN mode) 0b: Selects 16 base clock cycles for 1-bit period. 1b: Selects 8 base clock cycles for 1-bit period.
4	BGDM	0h	RW	Baud Rate Generator Double-Speed Mode Select Valid in asynchronous/clock-synchronous/simple-SPI mode and CCR3.CKE[1] = 0b. 0b: Baud rate generator outputs the clock with single frequency. 1b: Baud rate generator outputs the clock with doubled frequency.
3	-	0h	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
2 to 0	BCP[2:0]	4h	RW	Base Clock Pulse Selects the number of base clock cycles in smart card interface mode. 000b: 93 clock cycles (S = 93)*1 001b: 128 clock cycles (S = 128)*1 010b: 186 clock cycles (S = 186)*1 011b: 512 clock cycles (S = 512)*1 100b: 32 clock cycles (S = 32)*1 (Initial value) 101b: 64 clock cycles (S = 64)*1 110b: 372 clock cycles (S = 372)*1 111b: 256 clock cycles (S = 256)*1

Note: The read access size is fixed at 32 bits.

Note 1. S is the value of S in **Table 7.3-8**.

Note 2. n is the decimal notation of the value of n in **Table 7.3-8**.

BCP[2:0] bits (Base Clock Pulse)

The BCP[2:0] bits select the number of base clock cycles in a 1-bit data transfer time in smart card interface mode.

For details, see **7.3.5.4 Receive Data Sampling Timing and Reception Margin**.

BGDM bit (Baud Rate Generator Double-Speed Mode Select)

The BGDM bit is valid when the baud rate generator is selected as the clock source (CCR3.CKE[1] = 0b) in asynchronous mode, clock synchronous mode, simple-SPI mode. When external clock is selected (CCR3.CKE[1] = 1b), set it to 0b. For the clock output from the baud rate generator, either single or doubled frequency can be selected. The base clock is generated by the clock output from the baud rate generator. When the BGDM bit is set to 1b, the base clock cycle is halved and the bit rate is doubled.

Set this bit to 0b in modes other than asynchronous mode or clock synchronous mode or simple-SPI.

ABCS bit (Asynchronous Mode Base Clock Select)

Selects the clock cycles for 1-bit period.

Set it to 0b in modes other than asynchronous mode and simple-LIN mode.

ABCSE bit (Asynchronous Mode Extended Base Clock Select)

The pulse number for a base clock at 1-bit period is 6b and the clock of a double frequency is output from baud rate generator. Only when the bit rate is set to 6 dividing frequency of the bus clock, please use this bit and set CCR2.CKS[1:0] = 00b and BRR = 0b.

Set it to 0b in modes other than asynchronous mode. Even in asynchronous mode, set it to 0b when using external clock.

Table 7.3-7 Base Clock Cycle Number per 1-Bit

ABCSE Bit	ABCS Bit	BGDM Bit	The Base Clock Cycles/1 Bit	The Frequency of the Baud Rate Generator
0	0	0	16	×1
0	0	1	16	×2
0	1	0	8	×1
0	1	1	8	×2
1	x	x	6	×2

BRR[7:0] bits (Bit rate setting)

BRR is an 8-bit register that adjusts the bit rate.

SCI has independent baud rate generator control, different bit rates can be set for each. **Table 7.3-8** shows the relationship between the setting (N) in the BRR and the bit rate (B) for asynchronous mode, multiprocessor transfer, clock synchronous mode, smart card interface mode, simple SPI mode, and simple I2C mode.

Table 7.3-8 Relationship between N Setting in BRR and Bit Rate B

Mode	BGDM Bit	ABCS Bit	ABCSE Bit	BRR[7:0] Setting	Error (%)
Asynchronous multiprocessor transfer	0	0	0	$N = \frac{RSCI_{m_{TCLK}} \times 10^6}{64 \times 2^{2n-1} \times B} - 1$	$Error = \left\{\frac{RSCI\_m\_TCLK \times 10^6}{B \times 64 \times 2^{2n-1} \times (N+1)} - 1\right\} \times 100$
Simple-LIN*2	1	0	0		
	0	1	0	$N = \frac{RSCI\_m\_TCLK \times 10^6}{32 \times 2^{2n-1} \times B} - 1$	$Error = \left\{\frac{RSCI\_m\_TCLK \times 10^6}{B \times 32 \times 2^{2n-1} \times (N+1)} - 1\right\} \times 100$
	1	1	0	$N = \frac{RSCI\_m\_TCLK \times 10^6}{16 \times 2^{2n-1} \times B} - 1$	$Error = \left\{\frac{RSCI\_m\_TCLK \times 10^6}{B \times 16 \times 2^{2n-1} \times (N+1)} - 1\right\} \times 100$
	x	x	1	$N = \frac{RSCI\_m\_TCLK \times 10^6}{12 \times 2^{2n-1} \times B} - 1$	$Error = \left\{\frac{RSCI\_m\_TCLK \times 10^6}{B \times 12 \times 2^{2n-1} \times (N+1)} - 1\right\} \times 100$
Clock synchronous, Simple-SPI	0	0	0	$N = \frac{RSCI\_m\_TCLK \times 10^6}{8 \times 2^{2n-1} \times B} - 1$	—
	1	0	0	$N = \frac{RSCI\_m\_TCLK \times 10^6}{4 \times 2^{2n-1} \times B} - 1$	—
Smart card interface				$N = \frac{RSCI\_m\_TCLK \times 10^6}{S \times 2^{2n+1} \times B} - 1$	$Error = \left\{\frac{RSCI\_m\_TCLK \times 10^6}{B \times S \times 2^{2n+1} \times (N+1)} - 1\right\} \times 100$
Simple-I2C*1				$N = \frac{RSCI\_m\_TCLK \times 10^6}{64 \times 2^{2n-1} \times B} - 1$	—

Note: B: Bit rate (bps)
N: BRR setting for baud rate generator (0 ≤ N ≤ 255)
RSCI_m_TCLK: Operating frequency (MHz)
n and S: Determined by the settings of the CCR2 registers as listed in the table below. Please be careful about 2^{2n+1} is used in the expression for Smart card interface, 2^{2n-1} is used in other modes.

Note 1. Adjust the bit rate so that the widths at high and low level of the SCL output in simple I2C mode satisfy the I2C standard.

Note 2. In simple-LIN mode, BGDM = 0b and ABCSE = 0b can be selected.

Table 7.3-9 Calculating Widths at High and Low Level for SCL

Mode	SCL	Formula (Result in Seconds)
I^2C	Width at high level (minimum value)	$(N+1) \times 4 \times 2^{2n-1} \times 7 \times \frac{1}{RSCI\_m\_TCLK \times 10^6}$
	Width at low level (minimum value)	$(N+1) \times 4 \times 2^{2n-1} \times 8 \times \frac{1}{RSCI\_m\_TCLK \times 10^6}$

Table 7.3-10 Clock Source Settings

CCR2 Setting	Clock Source	n
CKS[1:0] = 00b	RSCI_m_TCLK clock	0
CKS[1:0] = 01b	RSCI_m_TCLK/4 clock	1
CKS[1:0] = 10b	RSCI_m_TCLK/16 clock	2
CKS[1:0] = 11b	RSCI_m_TCLK/64 clock	3

Table 7.3-11 Base Clock Settings in Smart Card Interface Mode

CCR2 Setting	Base Clock Cycles for 1-Bit Period	S
BCP[2:0] = 000b	93 clock cycles	93
BCP[2:0] = 001b	128 clock cycles	128
BCP[2:0] = 010b	186 clock cycles	186
BCP[2:0] = 011b	512 clock cycles	512
BCP[2:0] = 100b	32 clock cycles	32
BCP[2:0] = 101b	64 clock cycles	64
BCP[2:0] = 110b	372 clock cycles	372
BCP[2:0] = 111b	256 clock cycles	256

Table 7.3-12 lists examples of N settings in BRR in asynchronous mode. **Table 7.3-13** and **Table 7.3-18** list the maximum bit rate settable for each operating frequency. Examples of BRR (N) settings in clock synchronous mode and simple SPI mode are listed in **Table 7.3-15**. Examples of BRR (N) settings in smart card interface mode are listed in **Table 7.3-17**. Examples of BRR (N) settings in simple I2C mode are listed in **Table 7.3-19**. In smart card interface mode, the number of base clock cycles S in a 1-bit data transfer time can be selected. For details, see **7.3.5.4 Receive Data Sampling Timing and Reception Margin**. **Table 7.3-14** and **Table 7.3-16** list the maximum bit rates with external clock input. **Table 7.3-20** lists the minimum widths at high and low level for SCL at various bit rates.

When either the asynchronous mode base clock select bit (ABCS) or the baud rate generator double-speed mode select bit (BGDM) is set to 1b in asynchronous mode, the bit rate becomes twice that listed in **Table 7.3-12**.

When both of those registers are set to 1b, the bit rate becomes four times the listed value.

Table 7.3-12 Examples of BRR Settings for Various Bit Rates (Asynchronous Mode)

	RSCI_m_TCLK = 100 MHz		
Bit Rate (bps)	n	N	Error (%)
9600	—	—	—
19200	0	162	−0.15
38400	0	80	0.47
57600	0	53	0.47
115200	0	26	0.47

Note: This is an example when CCR2.ABCS = 0b, CCR2.BGDM = 0b and CCR2.ABCSE = 0b.
When either ABCS bit or BGDM bit is set to 1b, the bit rate doubles.
When both ABCS = 1b and BGDM = 1b, the bit rate increases four times.

Table 7.3-13 Maximum Bit Rate for Each Operating Frequency (Asynchronous Mode)

RSCI_m_TCLK (MHz)	BGDM Bit	ABCS Bit	ABCSE Bit	n	N	MAX Baud Rate (Baud)
100	0	0	0	0	0	3,125,000
		1	0	0	0	6,250,000
	1	0	0	0	0	
		1	0	0	0	12,500,000
	x	x	1	0	0	16,666,667

Table 7.3-14 Maximum Bit Rate with External Clock Input (Asynchronous Mode)

RSCI_m_TCLK (MHz)	External Clock (MHz)	Max Baud Rate (Baud)	
		CCR2.ABCS = 0b	CCR2.ABCS = 1b
100	25	1,562,500	3,125,000

Table 7.3-15 BRR Settings for Various Bit Rates (Clock Synchronous Mode, Simple SPI Mode)

	RSCI_m_TCLK = 100 MHz		
Bit Rate (bps)	BGDM Bit	n	N
2.5 M	0	0	9
4 M	—	—	—
5 M	0	0	4
7.5 M	—	—	—
8 M	—	—	—
10 M	1	0	4
12 M	—	—	—
12.5 M	0	0	1
24 M	—	—	—
18.75 M	—	—	—
25 M	0	0	0
37.5 M	—	—	—

Note: '—' can be set, but an error over 10% will occur.

Table 7.3-16 Maximum Bit Rate with External Clock Input (Clock Synchronous Mode, Simple SPI Mode)

RSCI_m_TCLK (MHz)	External Clock (MHz)	MAX Bit Rate (Mbps)
100	25.00	25.00

Note: 37.5 MHz is max AC spec in this LSI.

Table 7.3-17 BRR Settings for Various Bit Rates (Smart Card Interface Mode, n = 0, S = 372)

	RSCI_m_TCLK = 100 MHz		
Bit Rate (bps)	n	N	Error (%)
9600	0	13	0.01

Table 7.3-18 Maximum Bit Rate for Each Operating Frequency (Smart Card Interface Mode, S = 32)

RSCI_m_TCLK (MHz)	MAX Bit Rate (bps)	n	N
100	1,562,500	0	0

Table 7.3-19 BRR Settings for Various Bit Rates (Simple I2C Mode)

Bit Rate (kbps)	RSCI_m_TCLK = 100 MHz		
	n	N	Error (%)
100	0	30	0.81
400	0	7	−2.34

Table 7.3-20 Minimum Widths at High and Low Level for SCL at Various Bit Rates (Simple I2C Mode)

	RSCI_m_TCLK = 100 MHz		
Bit Rate (kbps)	n	N	Minimum Width of High/Low Level (µs)
100	0	30	4.34/4.96
400	0	7	1.12/1.28

BRME bit (Bit Rate Modulation Enable)

Enables and disables the bit rate modulation function. The bit rate generated by baud rate generator is evenly corrected when this function is enabled.

Set to 0b in Clock-synchronous mode, Simple-SPI mode, Smart Card Interface mode and simple-LIN mode.

CKS[1:0] bits (Clock Select)

These bits select the clock source for the baud rate generator.

For the relationship between the settings of these bits and the baud rate, refer to BRR explanation.

MDDR[7:0] bits (Modulation Duty setting)

When the BRME bit is set to 1b, the bit rate generated by the baud rate generator is evenly corrected according to the settings of MDDR (M/256). The relationship between the MDDR setting (M) and the bit rate (B) is given in **Table 7.3-21**.

The initial value of MDDR is FFh. Bit 7 in this register is fixed to 1b.

Table 7.3-21 Relationship between MDDR Setting (M) and Bit Rate (B) Using Bit Rate Modulation Function

Mode*1	BGDM Bit	ABCS Bit	ABCSE Bit	BRR Setting	Error (%)
Asynchronous Multiprocessor transfer	0	0	0	$N = \frac{RSCI\_m\_TCLK \times 10^6}{64 \times 2^{2n-1} \times (256/M) \times B} - 1$	$Error = \left\{\frac{RSCI\_m\_TCLK \times 10^6}{B \times 64 \times 2^{2n-1} \times (256/M) \times (N+1)} - 1\right\} \times 100$
	1	0	0	$N = \frac{RSCI\_m\_TCLK \times 10^6}{32 \times 2^{2n-1} \times (256/M) \times B} - 1$	$Error = \left\{\frac{RSCI\_m\_TCLK \times 10^6}{B \times 32 \times 2^{2n-1} \times (256/M) \times (N+1)} - 1\right\} \times 100$
	0	1	0		
	1	1	0	$N = \frac{RSCI\_m\_TCLK \times 10^6}{16 \times 2^{2n-1} \times (256/M) \times B} - 1$	$Error = \left\{\frac{RSCI\_m\_TCLK \times 10^6}{B \times 16 \times 2^{2n-1} \times (256/M) \times (N+1)} - 1\right\} \times 100$
	x	x	1	$N = \frac{RSCI\_m\_TCLK \times 10^6}{12 \times 2^{2n-1} \times (256/M) \times B} - 1$	$Error = \left\{\frac{RSCI\_m\_TCLK \times 10^6}{B \times 12 \times 2^{2n-1} \times (256/M) \times (N+1)} - 1\right\} \times 100$
Simple-I2C*2				$N = \frac{RSCI\_m\_TCLK \times 10^6}{64 \times 2^{2n-1} \times (256/M) \times B} - 1$	

Note: B: Bit rate (bps)
M: MDDR setting (128 ≤ M ≤ 255)
N: BRR setting for bound rate generator (0 ≤ N ≤ 255)
RSCI_m_TCLK: Operating frequency (MHz)
n and S: Determined by the settings of the CCR2.BCP[2:0] and CKS[1:0] as listed in **Table 7.3-10** and **Table 7.3-11**.
Please be careful about 2^{2n+1} is used in the expression for Smart card interface, 2^{2n-1} is used in other modes.

Note 1. Do not use this function in Clock-synchronous mode, Simple-SPI mode, Smart card Interface mode and Simple-LIN mode.

Note 2. Adjust the bit rate so that the widths at high and low level of the SCL output in simple I2C mode satisfy the I2C standard.

Table 7.3-22 lists examples of N settings in BRR and M settings in MDDR in asynchronous mode.

Table 7.3-22 Examples of BRR and MDDR Settings for Various Bit Rates (Asynchronous Mode)

	RSCI_m_TCLK = 100 MHz				
Bit Rate (bps)	n	N	M	BGDM Bit	Error (%)
38400	0	47	151	0	0.00
57600	0	31	151	0	0.00
115200	0	15	151	0	0.00
230400	0	7	151	0	0.00
460800	0	3	151	0	0.00

Note: In this example when CCR2.ABCS = 0b and CCR2.ABCSE = 0b.
CCR2.BRME = 0b (M = 256) disables the bit rate modulation function.

7.3.2.2.8 Common Control Register 3 (RSCIm_CCR3)

Access Size : 8, 16, 32 bits

Address : <RSCIm_base> + 0014h

Initial Value : 0000_1203h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31, 30	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
29	BLK	0h	RW	Block Transfer Mode (Valid only in Smart card interface mode) 0b: Non-block transfer mode operation 1b: Block transfer mode operation
28	GM	0h	RW	GSM Mode (Valid only in Smart card interface mode) 0b: Non-GSM mode operation 1b: GSM mode operation
27, 26	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
25, 24	CKE[1:0]	0h	RW	Clock enable In the case of asynchronous mode When using the external clock 16 times the bit rate should be input from the SCKm pin when CCR2.ABCS bit is 0b. Input a clock signal with a frequency 8 times the bit rate when the CCR2.ABCS bit is 1b. 00b: The baud rate generator The SCKm pin is available for use as an I/O port in accord with the I/O port settings. 01b: The baud rate generator The clock with the same frequency as the bit rate is output from the SCKm pin. 1xb: External clock In the case of simple-LIN mode 00b:The baud rate generator The SCKm pin is available for use as an I/O port in accord with the I/O port settings. Others: Setting prohibited In the case of Clock synchronous mode, Simple-SPI 0xb: Internal clock (Master operation) The SCKm pin functions as the clock output pin. 1xb: External clock (Slave operation) The SCKm pin functions as the clock input pin. In the case of Smart card interface mode When CCR3.GM = 0b 00b: Output disabled (The SCKm pin can be used for other peripherals.) 01b: Clock output 1xb: Setting prohibited When CCR3.GM = 1b 00b: Output fixed low 10b: Output fixed high x1b: Clock output
23, 22	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.

Bit	Bit Name	Initial Value	R/W	Description
21	DEN	0h	RW	Driver enable (Valid only in Asynchronous mode) 0b: RS-485 Driver control function disable. 1b: RS-485 Driver control function enable.
20	FM	0h	RW	FIFO Mode select (Valid in Asynchronous mode (including multi-processor mode), Clock synchronous mode, and Simple SPI mode) 0b: Non-FIFO mode (TDR and RDR registers are non-FIFO). 1b: FIFO mode (TDR and RDR registers are FIFO). Note: When using DMAC, set to 1b
19	MP	0h	RW	Multi-Processor Mode (Valid in Asynchronous mode) 0b: Multi-processor communications function is disabled. 1b: Multi-processor communications function is enabled.
18 to 16	MOD[2:0]	0h	RW	Communication mode select Select the SCI communication mode. 000b: Asynchronous mode (Multi-processor mode) 001b: Smart card interface mode 010b: Clock synchronous mode 011b: Simple SPI mode 100b: Simple I2C mode 110b: Simple-LIN mode Others: Setting prohibited
15	RXDESEL	0h	RW	Asynchronous Start Bit Edge Detection Select (Valid only in asynchronous mode) Set this bit to 1b in simple-LIN mode. 0b: The low level on the RXDn pin is detected as the start bit. 1b: A falling edge on the RXDn pin is detected as the start bit.
14	STP	0h	RW	Stop Bit Length (Valid in asynchronous mode and simple-LIN mode) 0b: 1 stop bit / Break delimiter length = 1 bit length 1b: 2 stop bits / Break delimiter length = 2 bits length
13	SINV	0h	RW	Transmitted/Received Data Invert The level of communication pins (RXD/TXD) is controlled by the combination of this bit and CCR1.TINV/RINV. For details, see **Figure 7.3-2**. Set this bit to 0 in simple-I2C mode. 0b: TDR contents are transmitted to TSR as they are. RSR contents are stored to RDR as they are. 1b: TDR contents are inverted before being transmitted to TSR. RSR contents are inverted and stored to RDR.
12	LSBF	1h	RW	LSB First select Set this bit to 0b in simple I2C mode. Set this bit to 1b in simple-LIN mode. 0b: MSB first 1b: LSB first
11, 10	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
9, 8	CHR[1:0]	2h	RW	Character Length (Valid in Asynchronous mode)*1 Select the data length for transmission and reception. 00b: Transmit/receive in 9-bit data length 01b: Transmit/receive in 9-bit data length 10b: Transmit/receive in 8-bit data length (initial value) 11b: Transmit/receive in 7-bit data length*2
7	BPEN	0h	RW	Synchronizer bypass enable This bit controls whether to bypass the synchronizer circuit between the bus clock and operation clock. When BPEN = 1, PCLKSPIn (operation clock) is input from RSCI_m_PCLK (Bus clock) and the synchronization circuit is bypassed. See **4.4 Clock Pulse Generator (CPG)**. 0b: Synchronizer circuit is not bypassed. 1b: Synchronizer circuit is bypassed.
6 to 2	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
1	CPOL	1h	RW	Clock Polarity Select (Valid in Clock-synchronous mode and Simple-SPI mode. Set this bit only when CCR0.TE = 0b and RE = 0b.) 0b: SCKm in idle state is 0. 1b: SCKm in idle state is 1.

Bit	Bit Name	Initial Value	R/W	Description
0	CPHA	1h	RW	Clock Phase Select (Valid in Clock-synchronous mode and Simple-SPI mode. Set this bit only when CCR0.TE = 0b and RE = 0b.) 0b: Data is sampled at an odd edge and changes at an even edge. (Clock is delayed.) 1b: Data changes at an odd edge and is sampled at an even edge. (Clock is not delayed.)

Note: The read access size is fixed at 32 bits.

Note 1. In modes other than asynchronous mode, the setting of these bits is invalid and a fixed data length of 8 bits is used. In simple-LIN mode, the data length of 8 bits can only be used, so set these bits to their initial value.

Note 2. LSB first is fixed and the MSB (bit 7) in TDR is not transmitted in transmission.

CPHA bit (Clock Phase Select)

This bit selects the phase of the clock signal output through the SCKm pin. For details, see **Figure 7.3-96**.

Set the bit to 1b in other than simple SPI mode and clock synchronous mode.

CPOL bit (Clock Polarity Select)

This bit selects the polarity of the clock signal output through the SCKm pin. For details, see **Figure 7.3-96**.

Set the bit to 1b in other than simple SPI mode and clock synchronous mode.

BPEN bit (Synchronizer bypass enable)

The synchronization circuit can be bypassed by this bit only when the same clock is input to the bus clock and the operation clock (RSCI_m_TCLK). For details, see **7.3.15 Synchronizer Bypass Function**.

CHR[1:0] bits (Character Length)

Selects the data length for transmission and reception.

Except of asynchronous mode, a fixed data length of 8 bits is used.

LSBF bit (LSB First select)

Select whether to transmit/receive data in MSB first or LSB first.

SINV bit (Transmitted/Received Data Invert)

SINV can invert the transmit data-bit from TDR to TSR, and also can invert the received data from RSR to RDR. This bit does not affect the logic level of the parity bit. To invert the parity bit, invert the CCR1.PM.

STP bit (Stop Bit Length)

Selects the stop bit length in transmission.

In reception, only the first stop bit is checked regardless of this bit setting. If the second stop bit is 0b, it is treated as the start bit of the next transmit frame.

In addition, it is used as the Break delimiter length setting when sending Start Frame in simple-LIN mode.

RXDESEL bit (Asynchronous Start Bit Edge Detection Select)

Selects the detection method of the start bit for reception in asynchronous mode. When a break occurs, data receiving operation depends on the settings of this bit. Set this bit to 1b when reception should be stopped while a break occurs or when reception should be started without retaining the RXDn pin input at high level for the period of one data frame or longer after completion of the break.

Set this bit to 1b in simple-LIN mode. Set this bit to 0b in modes other than asynchronous mode and simple-LIN mode.

MOD[2:0] bits (Communication mode select)

Selects the SCI communication mode.

Table 7.3-23 Relationship between Communication Mode Selection Bits (MOD[2:0]), Other Operation Mode Setting Bits

Communication Mode	Asynchronous								SMIF*1	Clock Synchronous		Simple SPI		Simple I2C	Simple LIN
CCR3.MOD[2:0]	000b								001b	010b		011b		100b	110b
CCR3.MP	0				1				—	—		—		—	—
CCR3.FM	0		1		0		1		—	0	1	0	1	—	—
CCR3.DEN	0	1	0	1	0	1	0	1	—	—		—		—	—
CCR0.SSE	—								—	—		0	1	—	—

Note: '—' means setting prohibited.

Note 1. Smart card interface

MP bit (Multi-Processor Mode)

Disables/enables the multi-processor communications function. The settings of the PE bit and PM bit are invalid in multi- processor mode.

FM bit (FIFO Mode select)

When FM = 1b, the TDR register/RDR register switches to FIFO mode.

DEN bit (Driver enable)

Select RS-485 Driver control function disable or enable.

CKE[1:0] bits (Clock enable)

These bits select the clock source and SCKm pin function.

In smart card interface mode, these bits control the clock output from the SCKm pin.

In GSM mode, clock output can be dynamically switched. For details, see **7.3.5.8 Clock Output Control**.

GM bit (GSM Mode)

Setting this bit to 1b allows GSM mode operation.

In GSM mode, the CSR.TEND flag set timing is put forward to 11.0 etu (elementary time unit = 1-bit transfer time) from the start and the clock output control function is appended. For details, see **7.3.5.6 Serial Data Transmission (Except in Block Transfer Mode)** and **7.3.5.8 Clock Output Control**.

BLK bit (Block Transfer Mode)

Setting this bit to 1b allows block transfer mode operation.

For details, see **7.3.5.3 Block Transfer Mode**.

7.3.2.2.9 Common Control Register 4 (RSCIm_CCR4)

Access Size : 8, 16, 32 bits
Address : <RSCIm_base> + 0018h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	AET	ATT[2:0]			AJD	AST[2:0]			-	-	-	-	-	-	ATEN	ASEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	CMPD[8:0]								
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31	AET	0h	RW	Adjustment edge for transmit timing (Valid in Asynchronous mode using internal clock and simple-LIN mode using internal clock) The adjustable edge is set by this bit. This bit is valid only when ATEN = 1b. For details, see **7.3.3.11 The Function of Adjust Transmit Timing (Asynchronous Mode)**. The function of adjust transmit timing (Asynchronous Mode). 0b: Adjust the rising edge timing, when CCR1.TINV = 0b. Adjust the falling edge timing, when CCR1.TINV = 1b. 1b: Adjust the falling edge timing, when CCR1.TINV = 0b. Adjust the rising edge timing, when CCR1.TINV = 1b.
30 to 28	ATT[2:0]	0h	RW	Adjustment value for Transmit timing (Valid in Asynchronous mode using internal clock and simple-LIN mode using internal clock) This bit is valid only when ATEN is 1b. The selected edge timing of TxD is adjusted by the following formula. Adjustment edge timing = base clock × the setting value of ATT[2:0] This setting timing is limited by setting the base clock cycles. For details, see **7.3.3.11 The Function of Adjust Transmit Timing (Asynchronous Mode)**. The function of adjust transmit timing (Asynchronous Mode).
27	AJD	0h	RW	Adjustment Direction for receive sampling timing (Valid in Asynchronous mode using internal clock and simple-LIN mode using internal clock) This bit is valid only when ASEN is 1b. Adjustment direction for RxD receive sampling timing is determined by this bit. For details, see **7.3.3.10 The Function of Adjust Receive Sampling Timing (Asynchronous Mode)**. The function of adjust receive sampling timing (Asynchronous Mode). 0b: The sampling timing is adjusted backward to the middle of bit. 1b: The sampling timing is adjusted forward to the middle of bit.
26 to 24	AST[2:0]	0h	RW	Adjustment value for receive Sampling Timing This bit is valid only when ASEN is 1b. In asynchronous mode and simple-LIN mode using internal clock The sampling timing of RXDn pin is adjusted from the middle of bit by the following formula. Adjustment sampling timing = base clock × the setting value of AST[2:0]. In Clock-synchronous mode and Simple-SPI mode using internal clock The RxD sampling timing can be adjusted by delaying by 1 to 4 RSCI_m_TCLK. 000b: 1 RSCI_m_TCLK delay 001b: 2 RSCI_m_TCLK delay 010b: 3 RSCI_m_TCLK delay 011b: 4 RSCI_m_TCLK delay Others: Setting prohibited
23 to 18	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.

Bit	Bit Name	Initial Value	R/W	Description
17	ATEN	0h	RW	Adjust transmit timing enable (Valid only in asynchronous mode using internal clock) 0b: Adjust transmit timing disable. 1b: Adjust transmit timing enable.
16	ASEN	0h	RW	Adjust receive sampling timing enable (Valid in Asynchronous mode using internal clock, simple-LIN mode using internal clock, Clock-synchronous mode operating as master, and Simple-SPI mode operating as master) 0b: Adjust sampling timing disable. 1b: Adjust sampling timing enable.
15 to 9	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
8 to 0	CMPD[8:0]	0h	RW	Compare Match Data (Valid only in Asynchronous mode) Set the compare data pattern for address match function.

Note: If the description in this document and the timing chart do not specify the ASEN / ATEN setting value, it means that the reception sampling adjustment function and transmission timing adjustment function are OFF (CCR4.ASEN = 0b, CCR4.ATEN = 0b).

Note: The read access size is fixed at 32 bits.

CMPD[8:0] bits (Compare Match Data)

Set the comparison data for receive data when the address match function is enabled (CCR0.DCME = 1b). CCR4.CMPD[8:0] should be written while CCR0.DCME is 0b.

For the comparison data, the length can be selected from 3 types: these are CMPD[6:0] for 7-bit length, CMPD[7:0] for 8-bit length, and CMPD[8:0] for 9-bit length.

ASEN bit (Adjust receive sampling timing enable)

When this bit is 1b, the receive sampling timing adjustment function is enabled. Control is different in Asynchronous mode, Simple-LIN mode, Clock-synchronous mode, and Simple-SPI mode.

For Asynchronous mode using internal clock, see **7.3.3.10 The Function of Adjust Receive Sampling Timing (Asynchronous Mode)** in details.

For Clock-synchronous mode operating as master and Simple-SPI mode operating as master, see **7.3.8.7 Reception Sampling Timing Adjustment Function in Clock Synchronous Mode with Internal Clock Used** in details. Only the digital delay of the master mode receive sampling clock (MRCLK) can be controlled by this bit.

ATEN bit (Adjust transmit timing enable)

When this bit is 1b, the transmission timing adjustment function is enabled. The transmission timing adjustment function can adjust the edge timing of the waveform output from the TXD pin. See **7.3.3.11 The Function of Adjust Transmit Timing (Asynchronous Mode)** in details.

AST[2:0] bits (Adjustment value for receive Sampling Timing)

When ASEN = 1b, the receive sampling timing can be adjusted according to this bit setting value.

In Asynchronous mode and Simple-LIN mode using internal clock

The sampling timing of RXD pin is adjusted from the middle of bit by the following formula. This setting value is limited by setting the base clock cycles. For details, see **7.3.3.10 The Function of Adjust Receive Sampling Timing (Asynchronous Mode)**.

Adjustment sampling timing = base clock × the setting value of AST[2:0].

In Clock-synchronous mode and Simple-SPI mode using internal clock

The RxD sampling timing can be adjusted by delaying 1 to 4 RSCI_m_TCLK. For details, see **7.3.8.7 Reception Sampling Timing Adjustment Function in Clock Synchronous Mode with Internal Clock Used**.

000: 1 RSCI_m_TCLK delay

001: 2 RSCI_m_TCLK delay

010: 3 RSCI_m_TCLK delay

011: 4 RSCI_m_TCLK delay 1xx: Setting prohibited

AJD bit (Adjustment Direction for receive sampling timing)

Set the RXD pin sampling timing adjustment direction from the bit center to the rear or front. See **7.3.3.10 The Function of Adjust Receive Sampling Timing (Asynchronous Mode)** for details.

ATT[2:0] bits (Adjustment value for Transmit timing)

The edge timing of the TXD pin specified by the AET bit is adjusted by the base clock × ATT[2:0] setting value. The upper limit of the adjustment time that can be set is limited by the number of base clock cycles. See **7.3.3.11 The Function of Adjust Transmit Timing (Asynchronous Mode)** for details.

AET bit (Adjustment edge for transmit timing)

Set the TXD pin edge for timing adjustment. See **7.3.3.11 The Function of Adjust Transmit Timing (Asynchronous Mode)** for details.

7.3.2.2.10 Communication Enable Status Register (RSCIm_CESR)

Access Size : 8 bits
Address : <RSCIm_base> + 001Ch
Initial Value : 00h

Bit	7	6	5	4	3	2	1	0
	-	-	-	TIST	-	-	-	RIST
Initial Value	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

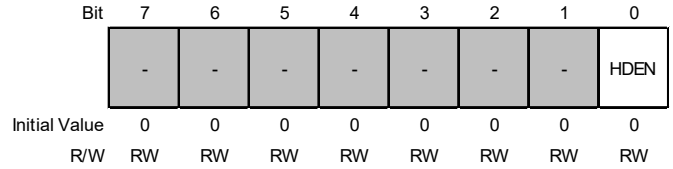
Bit	Bit Name	Initial Value	R/W	Description
7 to 5	-	All 0	R	Reserved Whenever it is read, 0b is read.
4	TIST	0h	R	0b: TE signal internal state value “0” 1b: TE signal internal state value ”1”
3 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read.
0	RIST	0h	R	0b: RE signal internal state value “0” 1b: RE signal internal state value “1”

The operation clocks of the communication module and control register can be used asynchronously. Since some control register values are transmitted internally via the synchronization circuit so that they operate correctly even if they are asynchronous, it takes some time for the state to be reflected internally after rewriting the control register.

Communication enable CCR0.TE and CCR0.RE correspond to this register, and when these control bits are changed from 1b to 0b to rewrite the control bits for the next communication, it is necessary to rewrite these control bits after the internal state of the TE and RE signals becomes 0b. If a very slow clock is used as the clock for the communication module, the TE and RE bit values will be reflected slowly internally. At this time, you can check the internal state using this register.

7.3.2.2.11 Half Data Communication Control Register (RSCIm_HCR)

Access Size : 8 bits
Address : <RSCIm_base> + 001Eh
Initial Value : 00h



Bit	Bit Name	Initial Value	R/W	Description
7 to 1	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
0	HDEN	0h	RW	0b: HDC(Half data communication) function is disabled. 1b: HDC function is enabled.

HDEN (Half Data Communication Enable)

When this bit is 1b, data 0b is communicated as a low pulse only in the first half of the 1-bit period. This function permits setting to 1b only in asynchronous mode.

7.3.2.2.12 Simple I2C Control Register (RSCIm_ICR)

Access Size : 8, 16, 32 bits

Address : <RSCIm_base> + 0020h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	IICSCLS[1:0]		IICSDAS[1:0]		-	IICSTPREQ	IICRSTAREQ	IICSTAREQ
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	IICACKT	-	-	-	IICCSC	IICINTM	-	-	-	IICDL[4:0]				
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
23, 22	IICSCLS[1:0]	0h	RW	SCL Output Select 00b: Serial clock output 01b: Generate a start, restart, or stop condition. 10b: Output the low level on the SCLn pin. 11b: Place the SCLn pin in the high-impedance state.
21, 20	IICSDAS[1:0]	0h	RW	SDA Output Select 00b: Serial data output 01b: Generate a start, restart, or stop condition. 10b: Output the low level on the SDAn pin. 11b: Place the SDAn pin in the high-impedance state.
19	-	0h	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
18	IICSTPREQ	0h	RW	Stop Condition Generation 0b: A stop condition is not generated. 1b: A stop condition is generated. *2 *3 *4 *5
17	IICRSTAREQ	0h	RW	Restart Condition Generation 0b: A restart condition is not generated. 1b: A restart condition is generated. *2 *3 *4 *5
16	IICSTAREQ	0h	RW	Start Condition Generation 0b: A start condition is not generated. 1b: A start condition is generated. *1 *3 *4 *5
15, 14	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
13	IICACKT	0h	RW	ACK Transmission Data 0b: ACK transmission 1b: NACK transmission and reception of ACK/NACK
12 to 10	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
9	IICCSC	0h	RW	Clock Synchronization 0b: No synchronization with the clock signal 1b: Synchronization with the clock signal
8	IICINTM	0h	RW	I2C Interrupt Mode Select 0b: Use ACK/NACK interrupts. 1b: Use reception and transmission interrupts.
7 to 5	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.

Bit	Bit Name	Initial Value	R/W	Description
4 to 0	IICDL[4:0]	0h	RW	SDA Delay Output Select (Cycles below are of the clock signal from the baud rate generator.) 00h: No output delay 01h: 0 to 1 cycle 02h: 1 to 2 cycles 03h: 2 to 3 cycles 04h: 3 to 4 cycles 05h: 4 to 5 cycles ⋮ 1Eh: 29 to 30 cycles 1Fh: 30 to 31 cycles

Note: The read access size is fixed at 32 bits.

Note 1. In the bus free state, perform the start condition generation.

Note 2. In the bus busy state, perform restart or stop condition generation when the SCLn pin after acknowledgment described in **7.3.7 Simple I2C Mode** in **Figure 7.3-66** and **Figure 7.3-67** is low level.

Note 3. Do not set more than one from among the IICSTAREQ, IICRSTAREQ, and IICSTPREQ bits to 1b at a given time.

Note 4. Execute the generation of a condition after the value of the IICSTIF flag is 0b.

Note 5. Do not write 0b to this bit while it is 1b. Generation of a condition is suspended by writing 0b to this bit while it is 1b.

IICDL[4:0] bits (SDA Delay Output Select)

These bits are used to set a delay for output on the SDAn pin relative to the falling edge of the output on the SCLn pin. The available delay settings range from no delay to 31 cycles, with the clock signal from the baud rate generator as the base. The signal obtained by frequency-dividing RSCI_m_TCLK by the divisor set in CCR2.CKS[1:0] is supplied as the clock signal from the baud rate generator.

Set these bits to 00h unless operation is in simple I2C mode. In simple I2C mode, set these bits from 01h to 1Fh.

IICINTM bit (I2C Interrupt Mode Select)

This bit selects the sources of interrupt requests in simple I2C mode.

IICCSC bit (Clock Synchronization)

Set the IICCSC bit to 1b if the internally generated SCLn clock signal is to be synchronized when the SCLn pin has been placed at the low level in the case of a wait inserted by the other device, etc.

The SCLn clock signal is not synchronized if the IICCSC bit is 0b. The SCLn clock signal is generated in accord with the rate selected in the BRR regardless of the level being input on the SCLn pin.

Set the IICCSC bit to 1b except during debugging.

IICACKT bit (ACK Transmission Data)

Transmitted data contains ACK bits. Set this bit to 1b when ACK and NACK bits are received.

IICSTAREQ bit (Start Condition Generation)

When a start condition is to be generated, set both the IICSDAS[1:0] and IICSCLS[1:0] bits to 01b as well as setting the IICSTAREQ bit to 1b.

If you want to generate the start condition after generating the stop condition, start the generation of the start condition with a half cycle period of the bit rate from the stop condition generation interrupt request output.

[Setting condition]

- Writing 1b to the bit

[Clearing condition]

- Completion of generation of the start condition

IICRSTAREQ bit (Restart Condition Generation)

When a restart condition is to be generated, set both the IICSDAS[1:0] and IICSCLS[1:0] bits to 01b as well as setting the IICRSTAREQ bit to 1b.

[Setting condition]

- Writing 1b to the bit

[Clearing condition]

- Completion of generation of the restart condition

IICSTPREQ bit (Stop Condition Generation)

When a stop condition is to be generated, set both the IICSDAS[1:0] and IICSCLS[1:0] bits to 01b as well as setting the IICSTPREQ bit to 1b.

[Setting condition]

- Writing 1b to the bit

[Clearing condition]

- Completion of stop condition

IICSDAS[1:0] bits (SDA Output Select)

These bits control output from the SDAn pin.

IICSCLS[1:0] bits (SCL Output Select)

These bits control output from the SCLn pin.

7.3.2.2.13 FIFO Control Register (RSCIm_FCR)

Access Size : 8, 16, 32 bits

Address : <RSCIm_base> + 0024h

Initial Value : 1F1F_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	RSTRG[4:0]					RFRST	-	-	RTRG[4:0]				
Initial Value	0	0	0	1	1	1	1	1	0	0	0	1	1	1	1	1
R/W	RW	RW	RW	RW	RW	RW	RW	RW	W	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TFRST	-	-	TTRG[4:0]					-	-	-	-	-	-	-	DRES
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
28 to 24	RSTRG[4:0]	1Fh	RW	RTS# Output Active Trigger Number Select (Valid in Asynchronous mode (including multi-processor mode) and Clock-synchronous mode) These bits are valid only when CCR3.FM = 1b and CCR1.CTSE = 0b and CCR0.SSE = 0b. Trigger number must be set to 31 or less. 00h: Trigger number 0 ⋮ 1Fh: Trigger number 31
23	RFRST	0h	W	The read value is undefined Receive FIFO Data Register Reset This bit is valid only when CCR3.FM is 1b. The read value is always 0b. 0b: Invalid. This does not affect the operation. 1b: The number of data stored in receive FIFO (RDR register) is 0.
22 to 21	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
20 to 16	RTRG[4:0]	1Fh	RW	Receive FIFO data trigger number (Valid in Asynchronous mode (including multi-processor mode), Clock-synchronous mode, and Simple-SPI mode) Trigger number must be set to 31 or less. When DMAC transfer is used, set RTRG[4:0] = 00h. 00h: Trigger number 0 ⋮ 1Fh: Trigger number 31
15	TFRST	0h	W	The read value is undefined Transmit FIFO Data Register Reset This bit is valid only when CCR3.FM is 1b. The read value is always 0b. 0b: Invalid. This does not affect the operation. 1b: The number of data stored in transmit FIFO (TDR register) is 0.
14 to 13	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
12 to 8	TTRG[4:0]	0h	RW	Transmit FIFO data trigger number (Valid in Asynchronous mode (including multi-processor mode), Clock-synchronous mode, and Simple-SPI mode) Trigger number must be set to 31 or less. When DMAC transfer is used, set TTRG[4:0] = 1Fh. 00h: Trigger number 0 ⋮ 1Fh: Trigger number 31

Bit	Bit Name	Initial Value	R/W	Description
7 to 1	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
0	DRES	0h	RW	Receive data ready error select (Valid in Asynchronous mode) This bit selects the interrupt request for receive data ready detection. 0b: Receive data full interrupt (RXI) 1b: Receive error interrupt (ERI)

Note: The read access size is fixed at 32 bits.

DRES bit (Receive data ready error select)

Select whether the detection of receive data ready (FRSR.DR = 1b) is the cause of RXI interrupt request or the cause of ERI interrupt request.

TTRG[4:0] bits (Transmit FIFO data trigger number)

The TDRE flag is set to 1b when the quantity of transmit data in the transmit FIFO (TDR register) is equal to or less than the specified transmit triggering number. If CCR0.TIE = 1b, TXI interrupt request is occurred.

TFRST bit (Transmit FIFO Data Register Reset)

When the TFRST bit is set to 1b, the number of the transmission data stored in transmit FIFO (TDR register) is made 0b.

RTRG[4:0] bits (Receive FIFO data trigger number)

The CSR.RDRF flag is set to 1b when the quantity of receive data in the receive FIFO (RDR register) is equal to or greater than the specified receive triggering number. If CCR0.RIE = 1b, RXI interrupt request is occurred. When FCR.RTRG is set to 0b, RDRF bit is set if the quantity of data in receive FIFO is greater than or equal to 1b.

RFRST bit (Receive FIFO Data Register Reset)

When the RFRST bit is set to 1b, the number of the reception data stored in receive FIFO (RDR register) is made 0b.

RSTRG[4:0] bits (RTS# Output Active Trigger Number Select)

When the quantity of receive data stored in the receive FIFO (RDR register) is equal to or greater than this number, the RTS# signal is in the High state. When FCR.RSTRG is set to 0b, RTS# is in the high state if the quantity of data in receive FIFO is greater than or equal to 1b.

7.3.2.2.14 Driver Control Register (RSCIm_DCR)

Access Size : 8, 16, 32 bits
Address : <RSCIm_base> + 0030h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	DENGT[4:0]				
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	DEAST[4:0]					-	-	-	-	-	-	-	DEPOL
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
20 to 16	DENGT[4:0]	0h	RW	Driver negation time (Valid only in Asynchronous mode) Set the driver negation time. When CCR3.DEN = 1b, the driver negation time is inserted after STOP bit transmission end. Setting DENGT[4:0] = 00h is prohibited.
15 to 13	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
12 to 8	DEAST[4:0]	0h	RW	Driver Assertion Time (Valid only in Asynchronous mode) Set the driver assertion time. When CCR3.DEN = 1b, the driver assertion time is inserted in addition to the normal transmission waiting time. Setting DEAST[4:0] = 00h is prohibited.
7 to 1	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
0	DEPOL	0h	RW	Driver effective polarity select (Valid only in Asynchronous mode) 0b: The DE signal is active high. 1b: The DE signal is active low.

Note: The read access size is fixed at 32 bits.

DEPOL bit (Driver effective polarity select)

Select the active level of the DE signal.

DEAST[4:0] bits (Driver Assertion Time)

Set the driver assertion time (= time from the activation of the DE (Driver Enable) signal to the start of the start bit). It is expressed in base clock units (1/8 or 1/16 bit period) as follows.

Driver assertion time = value of DEAST[4:0] × base clock period + transmission waiting time

DENGT[4:0] bits (Driver negate time)

Set the driver negation time (= time from the end of the last stop bit of the transmitted message until the DE (Driver Enable) signal is disabled). It is expressed in base clock units (1/8 or 1/16 bit period) as follows.

Driver negation time = value of DENGT[4:0] × base clock period

If the transmission data is written during the driver negate time, transmit starting operation is different depends on the writing timing. (The DE signal remains valid, and transmission of the start bit may start after the transmission wait time

has elapsed. Also, the DE signal may become invalid once, and start bit transmission may start after the Driver assertion time + transmission wait time has elapsed.)

7.3.2.2.15 Simple-LIN (SCIX) Control Register 0 (RSCIm_XCR0)

Access Size : 8, 16, 32 bits
Address : <RSCIm_base> + 0034h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	BCCS[1:0]		-	AEDIE	COFIE	BFDIE	-	-	BCDIE	BFOIE
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PIBS[2:0]			PIBE	CF1DS[1:0]		CF0RE	BFE	-	-	-	-	-	-	TCSS[1:0]

R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
25, 24	BCCS[1:0]	0h	RW	Select the sampling clock for the bus conflict detection circuit. When CCR2.ABCS=1b, setting BCCS[1:0]=1xb is prohibited. 00b: Base clock 01b: Base clock/2 10b: Base clock/4 11b: Prohibited (same as 10b)
23	-	0h	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
22	AEDIE	0h	RW	Select whether to output an AED interrupt when a valid edge is detected. 0b: Active edge detection interrupt disabled 1b: Active edge detection interrupt enabled
21	COFIE	0h	RW	Select whether to include counter overflow as an ERI interrupt factor. 0b: Counter overflow is not included as an ERI interrupt factor 1b: Counter overflow is included as an ERI interrupt factor
20	BFDIE	0h	RW	Select whether to output a BFD interrupt when a break field is detected. 0b: Break Field detection interrupt disabled 1b: Break Field detection interrupt enabled
19, 18	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
17	BCDIE	0h	RW	Select whether to output an ERI interrupt when a bus collision is detected. 0b: Bus conflict detection is not included as an ERI interrupt factor 1b: Bus conflict detection is included as an ERI interrupt factor
16	BFOIE	0h	RW	Select whether to include Break Field output completion as a TXI interrupt factor. 0b: Break field output completion is not included as a TXI interrupt factor 1b: Break Field output completion is included as a TXI interrupt factor
15 to 13	PIBS[2:0]*2	0h	RW	Specify one of bits 0 to 7 of Control Field 1 as the priority interrupt bit. 000b: bit 0 of Control Field 1 001b: bit 1 of Control Field 1 010b: bit 2 of Control Field 1 011b: bit 3 of Control Field 1 100b: bit 4 of Control Field 1 101b: bit 5 of Control Field 1 110b: bit 6 of Control Field 1 111b: bit 7 of Control Field 1
12	PIBE	0h	RW	0b: Priority interrupt bit disable 1b: Priority interrupt bit enable

Bit	Bit Name	Initial Value	R/W	Description
11, 10	CF1DS[1:0]*2	0h	RW	Select the compare data for Control Field 1 00b: Select XCR1.PCF1D[7:0] as the compare data 01b: Select XCR1.SCF1D[7:0] as the compare data 10b: Select both XCR1.PCF1D[7:0] and XCR1.SCF1D[7:0] as the compare data 11b: Prohibited (same as 10b)
9	CF0RE*2	0h	RW	Set the presence or absence of Control Field 0 of Start Frame 0b: No Control Field 0 1b: With Control Field 0
8	BFE*2	0h	RW	Set the presence or absence of Break Field of Start Frame. 0b: No Break Field 1b: With Break Field
7 to 2	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
1, 0	TCSS[1:0]*1	0h	RW	(Valid in Simple-LIN mode) Select the clock source of the timer in the LIN module. 00b: TCLK 01b: TCLK/4 10b: TCLK/16 11b: TCLK/64

Note: The read access size is fixed at 32 bits.

Note: Base clock: 1/16 period of 1 bit period when CCR2.ABCS = 0b, 1/8 period of 1 bit period when CCR2.ABCS = 1b.

Note 1. You can rewrite TCSS[1:0] only when the timer is stopped (TCST = 0b and SDST = 0b and BMEN = 0b)

Note 2. This bit is a setting bit required for Start Frame reception operation. Rewrite this bit when Start Frame reception or transmission is not in progress (XCR1.SDST = 0b and XCR1.TCST = 0b).

TCSS[1:0] (Timer count clock source select)

Select the clock source of the timer in Simple-LIN module.

BFE (Break Field enable)

Set the presence or absence of Break Field of Start Frame.

CF0RE (Control Field 0 enable)

Set the presence or absence of Control Field 0b of Start Frame.

CF1DS[1:0] (Control Field 1 compare data select)

Select the compare data for Control Field 1b.

PIBE (Priority interrupt bit enable)

Select whether to enable comparison of the priority interrupt bit with Control Field 1b. When this bit is 1b, regardless of the XCR1.CF1CE[7:0] setting value, the bit specified in PIBS[2:0] is compared with the primary comparison data for Control Field 1b (XCR1.PCF1D[7:0]).

PIBS[2:0] (Priority interrupt bit select)

Specify bit N (N = 0 to 7) of Control Field 1 as the priority interrupt bit.

BFOIE (Break Field output completion interrupt enable)

Select whether to include Break Field output completion as a TXI interrupt factor. Set CCR0.TIE = 1b and CCR3.MOD[1:0] = 110b, to output TXI upon completion of Break Field output.

BCDIE (Bus conflict detection interrupt enable)

Select whether to output an ERI interrupt when a bus collision is detected. In Simple-LIN mode (CCR3.MOD[1:0] = 110b), ERI output control is performed with this bit. When CCR3.MOD[1:0] = 110b and BCDIE = 1b, an ERI interrupt is issued when a bus collision is detected even if CCR0.RIE = 0b.

COFIE (Conter overflow interrupt enable)

Select whether to include counter overflow as an ERI interrupt factor. Setting CCR0.RIE = 1b and CCR3.MOD[1:0] = 110b is required to output ERI upon counter overflow.

AEDIE (Active edge detection interrupt enable)

Select whether to output an AED interrupt when a valid edge is detected. To output AED with valid edge detection, XCR1.BMEN = 1b and CCR3.MOD[1:0] = 110b must be set.

BCCS[1:0] (Bus conflict detection clock select)

Select the sampling clock for the bus conflict detection circuit.

7.3.2.2.16 Simple-LIN (SCIX) Control Register 1 (RSCIm_XCR1)

Access Size : 8, 16, 32 bits
Address : <RSCIm_base> + 0038h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CF1CE[7:0]								SCF1D[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PCF1D[7:0]								-	-	BMEN	SDST	-	-	-	TCST
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	CF1CE[7:0]	0h	RW	Select whether to compare bit N of Control Field 1. (N = 0-7) 0b: Control Field 1 bit N compare disabled 1b: Control Field 1 bit N compare enabled
23 to 16	SCF1D[7:0]	0h	RW	The secondary compare data for Control Field 1
15 to 8	PCF1D[7:0]	0h	RW	The priority compare data for Control Field 1
7, 6	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
5	BMEN	0h	RW	0b: Bit rate measurement disabled 1b: Bit rate measurement enabled Set this bit to 1b simultaneously with the SDST bit. When this bit is set to 0b, it can be set to 0b at any timing.
4	SDST	0h	RW	0b: Start Frame/Break Field detection disabled 1b: Start Frame/Break Field detection enabled Do not set this bit and TCST bit to 1b at the same time.
3 to 1	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
0	TCST	0h	RW	0b: Break Field output timer count stopped 1b: Break Field output timer count start Do not set this bit and SDST bit to 1b at the same time.

Note: The read access size is fixed at 32 bits.

TCST (Break Field output start trigger)

[Clearing conditions]

- When 0b is written to TCST. Break Field output timer count is stopped and TXD output becomes idle.
- When Break Field output for the period set in XCR2.BFLW[15:0] is completed.

[Setting condition]

- When 1b is written to TCST. Start Break Field output from TXD. Holds 1b during Break Field output.

SDST (Start Frame detection start enable)

When 1b is written to this bit, Start Frame detection starts. When XCR0.BFE = 1b is set, Break Field can be detected during and after Start frame detection. When XCR0.BFE = 0b is set, Break Field is not detected. When 0b is written to this bit, Start Frame detection and Break Field detection are stopped. However, if XSR0.RXDSF = 0b when stopped, it is not possible to stop data reception of the SCI core with this bit. Write 0b to CCR0.RE to stop the reception operation or perform reception completion processing (CSR.RDRF clear or RDR read) after reception is completed.

BMEN (Bit rate measurement enable)

Set this bit to 1b simultaneously with the SDST bit. When this bit is set to 1b, the valid edge interval of Control Field 0b and Control Field 1b data is measured.

PCF1D[7:0] (Priority compare data for Control Field 1)

Set the priority compare data for Control Field 1.

SCF1D[7:0] (Secondary compare data for Control Field 1)

Set the secondary compare data for Control Field 1.

CF1CE[7:0] (Control Field 1 compare bit enable)

Select whether to compare bit N of Control Field 1. (N = 0 to 7)

When all of these bits are set to 0b (CF1CE[7:0] = 00h), it is always judged that Control Field 1 matches when reception is completed, and XSR0.CF1MF is set. This bit is a comparison enable with PCF1D[7:0] or SCF1D[7:0], and it is not a priority interrupt bit comparison enable.

7.3.2.2.17 Simple-LIN (SCIX) Control Register 2 (RSCIm_XCR2)

Access Size : 8, 16, 32 bits
Address : <RSCIm_base> + 003Ch
Initial Value : FFFE_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	BFLW[15:0]															
Initial Value	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CF0CE[7:0]								CF0D[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	BFLW[15:0]	FFFEh	RW	This register sets the Break Field length. The break field length is (BFLW [15:0] setting value + 1) x clock of the timer. The upper limit for setting this register is FFFEh. (Setting prohibited for FFFFh)
15 to 8	CF0CE[7:0]	0h	RW	Select whether to compare bit N of Control Field 0. (N = 0 - 7) 0b: Control Field 0 bit N compare disabled 1b: Control Field 0 bit N compare enabled
7 to 0	CF0D[7:0]	0h	RW	The compare data for Control Field 0

Note: The read access size is fixed at 32 bits.

CF0D[7:0] (Control Field 0 compare data)

The compare data for Control Field 0.

CF0CE[7:0] (Control Field 0 compare bit enable)

Select whether to compare bit N of Control Field 0. (N = 0 to 7)

When all of these bits are set to 0b (CF0CE[7:0] = 00h), it is always judged that Control Field 0 matches when reception is completed, and XSR0.CF0MF is set.

BFLW[15:0] (Break Field length setting)

BFLW[15:0] are 16-bit Break Field length setting bits and the initial value is FFFEh.

Set the break field length to 1 frame or more. The LIN standard stipulates that the Break Field length is 13 bits or more.

When sending the Break Field, write 1b to TCST. SCI starts output of the Break Field on TXD. Up-counting is performed with the clock of the timer selected by XCR0.TCSS[1:0]. When the count value matches the value set in this register, up-counting is stopped and Break Field output from TXD is also stopped.

When receiving the Break Field, write 1b to SDST to enable Start-Frame detection. SCI starts counting from the negative edge of RXD. The clock of the timer is selected by XCR0.TCSS[1:0]. When the count value matches the value set in this register, it is determined that a break field has been detected. Up-counting continues until the next valid edge or counter overflow.

7.3.2.2.18 Common Status Register (RSCIm_CSR)

Access Size : 32 bits
Address : <RSCIm_base> + 0048h
Initial Value : 6000_8000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RDRF	TEND	TDRE	FER	PER	MFF	-	ORER	-	-	-	-	-	DFER	DPER	DCMF
Initial Value	0	1	1	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RXDMON	-	-	-	-	-	-	-	-	-	-	ERS	-	-	-	-
Initial Value	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	RDRF	0h	R	Receive Data Full Flag 0b: No received data is in RDR register (Non-FIFO mode) The quantity of receive data written in receive FIFO falls below the specified receive triggering number (FIFO mode) 1b: Received data is in RDR register (Non-FIFO mode) The quantity of receive data written in receive FIFO is equal to or greater than the specified receive triggering number (FIFO mode)
30	TEND	1h	R	Transmit End Flag 0b: A character is being transmitted or standing by for transmission. 1b: Character transfer has been completed or Break field is being transmitted.
29	TDRE	1h	R	Transmit Data Empty Flag 0b: Transmit data is in TDR register (Non-FIFO mode) The quantity of transmit data written in transmit FIFO exceeds the specified transmit triggering number. (FIFO mode) 1b: No transmit data is in TDR register (Non-FIFO mode) The quantity of transmit data written in transmit FIFO is equal to or less than the specified transmit triggering number. (FIFO mode)
28	FER	0h	R	Framing Error Flag 0b: No framing error occurred (Non-FIFO mode) No framing error in all received data in receive FIFO (FIFO mode) 1b: A framing error has occurred (Non-FIFO mode) One or more framing errors occurred in received data in receive FIFO (FIFO mode)
27	PER	0h	R	Parity Error Flag 0b: No parity error occurred (Non-FIFO mode) No parity error in all received data in receive FIFO (FIFO mode) 1b: A parity error has occurred (Non-FIFO mode) One or more parity errors occurred in received data in receive FIFO (FIFO mode)
26	MFF	0h	R	Mode Fault Error Flag (Valid only in Simple-SPI mode) 0b: No mode fault error 1b: Mode fault error
25	-	0h	R	Reserved Whenever it is read, 0b is read.
24	ORER	0h	R	Overrun Error Flag 0b: No overrun error occurred. 1b: An overrun error has occurred.
23 to 19	-	All 0	R	Reserved Whenever it is read, 0b is read.
18	DFER	0h	R	Data Compare Match Framing Error Flag (Valid only in Asynchronous mode) 0b: No framing error occurred at address match detection. 1b: A framing error has occurred at address match detection.

Bit	Bit Name	Initial Value	R/W	Description
17	DPER	0h	R	Data Compare Match Parity Error Flag (Valid only in Asynchronous mode) 0b: No parity error occurred at address match detection. 1b: A parity error has occurred at address match detection.
16	DCMF	0h	R	Data Compare Match Flag (Valid only in Asynchronous mode) 0b: Not matched 1b: Matched
15	RXDMON	1h	R	Serial input data monitor The state of the RXD pin without synchronizing by bus clock is shown. 0b: RXD pin is at the Low level when CCR1.RINV = 0b. RXD pin is at the High level when CCR1.RINV = 1b. 1b: RXD pin is at the High level when CCR1.RINV = 0b. RXD pin is at the Low level when CCR1.RINV = 1b.
14 to 5	-	All 0	R	Reserved Whenever it is read, 0b is read.
4	ERS	0h	R	Error Signal Status Flag (Valid only in Smart card interface mode) 0b: Error signal Low not responded 1b: Error signal Low responded
3 to 0	-	All 0	R	Reserved Whenever it is read, 0b is read.

ERS bits (Error Signal Status Flag)

[Setting condition]

- When an error signal LOW is sampled.

[Clearing condition]

- When 1b is written to CFCLR.ERSC.

DCMF bit (Data Compare Match Flag)

Indicates that SCI detects the match to the comparison data (CCR4.CMPD) with receive data.

Clearing the CCR0.RE bit to 0b does not affect the DCMF flag, which retains its previous state.

[Setting condition]

- Matching of the comparison data (CCR4.CMPD) with receive data, while CCR0.DCME = 1b.

[Clearing condition]

- When 1b is written to CFCLR.DCMFC.

DPER bit (Data Compare Match Parity Error Flag)

Indicates that a parity error occurred at Address Match detection (reception data match detection).

Clearing the CCR0.RE bit to 0b does not affect the DPER flag, which retains its previous state.

[Setting condition]

- When a parity error was detected by the frame in which an address match was detected.

[Clearing condition]

- When 1b is written to CFCLR.DPERC.

DFER bit (Data Compare Match Framing Error Flag)

Indicates that a framing error occurred at Address Match detection (reception data match detection).

Clearing the CCR0.RE bit to 0b does not affect the DFER flag, which retains its previous state.

[Setting condition]

- When a stop bit of the frame in which an Address Match was detected is 0b.
  When it is a 2-stop mode, the 1st bit of stop bit judges only whether it's 1 and does not check the 2nd bit of stop bit.

[Clearing condition]

- When 1b is written to CFCLR.DFERC.

ORER bit (Overrun Error Flag)

Indicates that an overrun error has occurred during reception and the reception ends abnormally.

Clearing the CCR0.RE bit to 0b does not affect the ORER flag, which retains its previous state. In simple-I2C mode, this bit is not use.

[Setting condition in Non-FIFO mode (CCR3.FM = 0b)]

- When the next data is received before reading out RDR with no-error reception data stored in RDR.
  In RDR, receive data prior to an overrun error occurrence is retained, but data received after the overrun error occurrence is lost. When the ORER flag is set to 1b, reception data is not forwarded to RDR register.
  Note that, in clock synchronous mode and simple-SPI mode, serial reception will be stopped.

[Setting condition in FIFO mode (CCR3.FM = 1b)]

- When the next serial reception is completed while the receive FIFO is full of NFIFO (= 32) receive data. (NFIFO: Indicates the number of available FIFO stages)

[Clearing condition]

- When 1b is written to CFCLR.ORERC.

MFF bit (Mode Fault Error Flag)

This bit indicates mode fault errors. In a multi-master mode, determine the mode fault error occurrence by reading the MFF flag.

[Setting condition]

- Input on the SSn# pin being at the low level during master operation (CCR3.CKE[1:0] = 00b or 01b) in simple SPI mode.

[Clearing condition]

- When 1b is written to CFCLR.MFFC.

PER bit (Parity Error Flag)

Indicates that a parity error has occurred during reception and the reception ends abnormally.

Clearing the CCR0.RE bit to 0b does not affect the PER flag, which retains its previous state.

In Clock-synchronous mode, Simple-SPI mode, and Simple-I2C mode, this bit is not used.

[Setting condition]

- When a parity error is detected during reception.
  In FIFO mode, when one or more parity errors are detected in receive FIFO data.
  In non-FIFO mode, although receive data where the parity error has occurred is transferred to RDR, no RXI interrupt request occurs. Note that while the PER flag is set to 1b, the subsequent receive data is not transferred to RDR.

[Clearing condition]

- When 1b is written to CFCLR.PERC.

FER bit (Framing Error Flag)

Indicates that a framing error has occurred during reception and the reception ends abnormally.

Clearing the CCR0.RE bit to 0b does not affect the FER flag, which retains its previous state.

In Clock-synchronous mode, Simple-SPI mode, and Simple-I2C mode, this bit is not used.

[Setting condition]

- When 0 is sampled as the stop bit during reception.
  In FIFO mode, when one or more framing errors are detected in receive FIFO data. In simple-LIN mode, even if a condition that the bit changes to 1b occurs when XCR1.SDST = 1b, the FER set timing is delayed up to the Break Field judgment timing at the longest, since it may be a Break Field. If an edge is detected on the RXD signal before the Break Field judgment timing, FER is detected. If no edge is detected in the RXD signal before the Break Field judgment timing, Break Field is detected.
  In 2-stop-bit mode, only the first stop bit is checked whether it is 1b but the second stop bit is not checked. Note that in non-FIFO mode, although receive data where the framing error has occurred is transferred to RDR, no RXI interrupt request occurs. In addition, while the FER flag is set to 1b, the subsequent receive data is not transferred to RDR.

[Clearing condition]

- When 1b is written to CFCLR.FERC.

TDRE bit (Transmit Data Empty Flag)

[Non-FIFO selected (CCR3.FM = 0b)]

Indicates the presence of transmit data in the TDR register.

The condition of CCR0.TE = 0b has priority over the condition of 0b.

If other conditions that become 1b and conditions that become 0b are satisfied at the same time, the TDRE flag is set to 0b.

[Setting condition]

- When CCR0.TE is 0b.
- When data is transmitted from the TDR register to the TSR register.

[Clearing condition]

- When 1b is written to CFCLR.TDREC.
- When the transmission data is written to the TDR register during CCR0.TE = 1b.

[FIFO selected (CCR3.FM = 1b)]

- Indicates that data has been transferred from the transmit FIFO (TDR) into the transmit shift register (TSR), the quantity of data in transmit FIFO has fallen below the specified transmit triggering number.
  When the condition which becomes 1b and the condition which becomes 0b were formed at the same time, TDRE flag will be 0b. After that, when the number of data stored in transmit FIFO is judged, and if that is equal to or less than TTRG value, TDRE is set to 1b after 1b RSCI_m_PCLK.

[Setting condition]

- When the quantity of transmit data written in transmit FIFO is equal to or less than the specified transmit triggering number.*[1]

[Clearing condition]

- When 1b is written to CFCLR.TDREC.

- When the transmission data is written to transmit FIFO by the DMAC.

Note 1. The transmit FIFO is 32-stage FIFO, the maximum number of data that can be written when the TDRE flag is 1b is “NFIFO (= 32) - FTSR.T[5:0]”. Even if data any more is written, data is discarded.

TEND bit (Transmit End Flag)

[Non-FIFO selected (CCR3.FM = 0b), and Not Smart card interface mode (CCR3.MOD[2:0] ≠ 001b)]

Indicates completion of transmission.

[Setting condition]

- When CCR0.TE is 0b.
- When the CCR0.TE bit is changed from 0b to 1b, the TEND flag is not affected and retains the value 1b.
- When the TDR register is not updated at transmission of the tail-end bit of a character.
- When the TDR register is not updated at the end of DE negate time with DE control function enable (CCR3.DEN = 1b).
- When Break Field is sent.

[Clearing condition]

- After the synchronization delay time has elapsed since the transmission data was written to the TDR register during CCR0.TE = 1b.
- When 1b is written to CFCLR.TDREC during CCR0.TE = 1b.

[Non-FIFO selected (CCR3.FM = 0b), and Smart card interface mode (CCR3.MOD[2:0] = 001b)]

With no error signal from the receiving side, this bit is set to 1b when next data is ready to be transferred to the TDR register.

[Setting condition]

- When CCR0.TE is 0b.
- When the CCR0.TE bit is changed from 0b to 1b, the TEND flag is not affected and retains the value 1.
- When ERS flag is 0b and TDR register is not updated after 1-byte transmission + fixed time, the set timing is determined by setting CCR3 register as listed below.
  - When GM = 0b and BLK = 0b, 12.5 etu after the start of transmission
  - When GM = 0b and BLK = 1b, 11.5 etu after the start of transmission
  - When GM = 1b and BLK = 0b, 11.0 etu after the start of transmission
  - When GM = 1b and BLK = 1b, 11.0 etu after the start of transmission

[Clearing condition]

- After the synchronization delay time has elapsed since the transmission data was written to the TDR register during CCR0.TE = 1b.
- When 1b is written to CFCLR.TDREC during CCR0.TE = 1b.

[FIFO selected (CCR3.FM = 1b)]

Indicates that the transmit FIFO does not contain valid data when transmitting the last bit of a serial character, so the transmission is halted.

[Setting condition]

- TEND is set to 1b when transmit FIFO does not contain transmit data when the last bit of a one-byte serial character is transmitted.
- When the TDR register is not updated at the end of DE negate time with DE control function enable (CCR3.DEN = 1b).

[Clearing condition]

- After the synchronization delay time has elapsed since the transmission data was written to the TDR register during CCR0.TE = 1b.

RDRF bit (Receive Data Full Flag)

[Non-FIFO selected (CCR3.FM = 0b)]

Indicates the presence of receive data in the RDR register.

[Setting condition]

- When the reception ends normally, and receive data is forwarded from the RSR register to the RDR register.

[Clearing condition]

- When 1b is written to CFCLR.RDRFC.
- When a data is read from the RDR register.

[FIFO selected (CCR3.FM = 1b)]

Indicates that receive data has been transferred to the receive FIFO data register (RDR), and the quantity of data in receive FIFO is equal to or greater than the specified receive triggering number. When FCR.RTRG is set to 0b, RDRF is set if receive FIFO is not empty.

[Setting condition]

RDRF is set to 1b when the quantity of receive data in receive FIFO is equal to or greater than the specified receive triggering number.*[1]

[Clearing condition]

- When 1b is written to CFCLR.RDRFC.
- When the reception data is read from receive FIFO by the DMAC.
  When setting condition and clearing condition are occurred at the same time, RDRF flag will be 0b. After that, if the data count in receive FIFO is equal to or greater than RTRG value, RDRF is set to 1b after 1 RSCI_m_PCLK.

Note 1. Since the receive FIFO is NFIFO (= 32) stage, the maximum quantity of data that can be read when RDRF is 1b is equal to FRSR.R[5:0]. Further data can be read, but the value is undefined.

Note: In Non-FIFO mode, except when interrupting communication, RDRF and TDRE should not be cleared by CFCLR register.

7.3.2.2.19 Simple I2C Status Register (RSCIm_ISR)

Access Size : 32 bits
Address : <RSCIm_base> + 004Ch
Initial Value : 0000_00xxh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	IICSTIF	-	-	IICACKR
Initial Value	0	0	0	0	0	0	0	0	0	0	x	x	0	x	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	-	All 0	R	Reserved Whenever it is read, 0b is read.
5 to 4	-	xh	R	Reserved Whenever it is read, undefined value is read.
3	IICSTIF	0h	R	Issuing of Start, Restart, or Stop Condition Completed Flag 0b: There are no requests for generating conditions or a condition is being generated. 1b: A start, restart, or stop condition is completely generated.
2	-	xh	R	Reserved Whenever it is read, undefined value is read.
1	-	0h	R	Reserved Whenever it is read, 0b is read.
0	IICACKR	0h	R	ACK Reception Data Flag 0b: ACK received 1b: NACK received

Note: x: Undefined

IICACKR bit (ACK Reception Data Flag)

Received ACK and NACK bits can be read from this bit.

The IICACKR flag is updated at the rising of SCLn clock for the ACK/NACK receiving bit.

IICSTIF bit (Issuing of Start, Restart, or Stop Condition Completed Flag)

After generating a condition, this bit indicates that the generation is completed. When using the IICSTAREQ, IICRSTAREQ, or IICSTPREQ, do it after clearing the IICSTIF flag.

When the IICSTIF flag is 1b while CCR0.TEIE = 1b, an STI request is output.

[Setting condition]

Completion of the generation of a start, restart, or stop condition (when setting condition and clearing condition are occurred at the same time, IICSTIF will be 0b).

[Clearing condition]

- Writing 1b to ICFCLR.IICSTIFC bit
- When operation is not in simple-I2C
- Writing 0b to CCR0.TE bit

7.3.2.2.20 FIFO Receive Status Register (RSCIm_FRSR)

Access Size : 32 bits
Address : <RSCIm_base> + 0050h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	FNUM[5:0]						-	-	PNUM[5:0]					
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 30	-	All 0	R	Reserved Whenever it is read, 0b is read.
29 to 24	FNUM[5:0]	0h	R	Framing Error Count (Valid only in Asynchronous mode) Indicates the quantity of data with a framing error among the data in receive FIFO.
23 to 22	-	All 0	R	Reserved Whenever it is read, 0b is read.
21 to 16	PNUM[5:0]	0h	R	Parity Error Count (Valid only in Asynchronous mode) Indicates the quantity of data with a parity error among the data in receive FIFO.
15 to 14	-	All 0	R	Reserved Whenever it is read, 0b is read.
13 to 8	R[5:0]	0h	R	Receive FIFO Data Count (Valid in Asynchronous mode (including multi-processor), Clock synchronous mode, Simple SPI mode, when CCR3.FM is 1b.) Indicate the quantity of data in receive FIFO.
7 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read.
0	DR	0h	R	Receive Data Ready flag 0b: Receiving is in progress, or no received data has remained in receive FIFO after normally completed reception. (Receive FIFO is empty.) 1b: The following receive data does not come for a fixed period after storing data below the threshold.

DR bit (Receive Data Ready flag)

Indicates that the quantity of data stored in the receive FIFO falls below the specified receive triggering number, and that no next data has been received yet after the elapse of 15 etu from the last stop bit in asynchronous mode. This bit is valid only asynchronous mode (including multi-processor mode) and FIFO selected. In other modes, this bit does not set to 1b.

[Setting conditions]

DR is set to 1b when both of the following conditions are met.

- Data in receive FIFO is less than the specified receive triggering number, and no next data is received after the elapse of 15 etu*1 from the last stop bit.
- CSR.FER, PER flags are 0b.

[Clearing conditions]

- When all receive data in the receive FIFO is read and 1b is written to FFCLR.DRC.

- When CCR3.FM bit is 0b.

Note 1. This is equivalent to one and a half (1.5) frames in the 8-bit format with one stop bit (etu: elementary time unit).

R[5:0] bits (Receive FIFO Data Count)

Indicate the quantity of receive data stored in receive FIFO.

00h means no receive data. NFIFO (= 32) means receive FIFO is full.

PNUM[5:0] bits (Parity Error Count)

Indicate the quantity of data with parity error in the received FIFO.

FNUM[5:0] bits (Framing Error Count)

Indicate the quantity of data with framing error in the received FIFO.

7.3.2.2.21 FIFO Transmit Status Register (RSCIm_FTSR)

Access Size : 32 bits

Address : <RSCIm_base> + 0054h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	T[5:0]					
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	-	All 0	R	Reserved Whenever it is read, 0b is read.
5 to 0	T[5:0]	0h	R	Transmit FIFO Data Count (Valid in Asynchronous mode (including multi-processor), Clock synchronous mode, and Simple SPI mode, when CCR3.FM is 1b.) Indicate the quantity of non-transmitted data stored in transmit FIFO.

T[5:0] bits (Transmit FIFO Data Count)

Indicate the quantity of non-transmitted data stored in transmit FIFO.

00h means no un-transmit data. NFIFO (= 32) means transmit FIFO is full.

7.3.2.2.22 Simple-LIN (SCIX) Status Register 0 (RSCIm_XSR0)

Access Size : 32 bits
Address : <RSCIm_base> + 005Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CF1RD[7:0]								CF0RD[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	AEDF	COF	PIBDF	CF1MF	CF0MF	BFDF	BCDF	BFOF	-	-	-	-	-	-	RXDSF	SFSF
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	CF1RD[7:0]	0h	R	Control Field 1 received data
23 to 16	CF0RD[7:0]	0h	R	Control Field 0 received data
15	AEDF	0h	R	0b: No valid edge detected 1b: Detected a valid edge
14	COF	0h	R	0b: Break Field detection counter has not overflowed 1b: Break Field detection counter
13	PIBDF	0h	R	0b: Priority interrupt bit is not detected 1b: Priority interrupt bit is detected
12	CF1MF	0h	R	0b: Control Field 1 received data does not match the setting data 1b: Control Field 1 received data matches the setting data
11	CF0MF	0h	R	0b: Control Field 0 received data does not match the setting data 1b: Control Field 0 received data matches the setting data
10	BFDF	0h	R	0b: BF is not detected 1b: BF is detected
9	BCDF	0h	R	0b: No bus collision detected 1b: Detected a bus collision
8	BFOF	0h	R	0b: Break Field is being output or is not being output 1b: Completed BF output
7 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read.
1	RXDSF	0h	R	0b: RXD input to RSCI core is enabled 1b: RXD input to RSCI core is disabled (RXD is not input to the RSCI core)
0	SFSF	0h	R	0b: Start Frame detection disabled or Start Frame detection complete 1b: Before Start Frame detection or during detection

Note: When RSCI_m_PCLK is faster than RSCI_m_TCLK, the flag set timing is delayed from the receive data full interrupt (RXI) output. To see this flag under these conditions, wait at least 1 RSCI_m_TCLK cycle after the receive data full interrupt (RXI) before reading this register.

SFSF (Start Frame status flag)

Indicates whether Start Frame is being detected.

[Setting conditions]

- When 1b is written to XCR1.SDST.
- When a Break Field is detected in the Control Field 0/ Control Field 1/Information Field phase and the transition to the Control Field 0 or Control Field 1 reception state occurs.

[Clearing conditions]

- When XCR1.SDST is 0b.
- When Start Frame detection is completed.

RXDSF (RXD input status flag)

Indicates the RXD input status to the SCI core. When this bit is 1b, RXD input is received only by the simple LIN module and the Break Field is detected and is not input to the SCI core.

BFOF (Break Field output completion flag)

Indicates the completion of Break Field output.

[Setting condition]

- When Break Field output is completed

[Clearing condition]

- When 1b is written to XFCLR.BFOC

BCDF (Bus conflict detection flag)

Indicates the detection of bus conflict in Simple-LIN transmit operation.

[Setting condition]

- When Bus Conflict is detected

[Clearing condition]

- When 1b is written to XFCLR.BCDC

BFDF (Break Field detection flag)

Indicates Break Field detection.

[Setting condition]

- When Break Field is detected

[Clearing condition]

- When 1b is written to XFCLR.BFDC

CF0MF (Control Field 0 compare match flag)

Indicates compare match between Control Field 0 and compare data.

[Setting condition]

- When Control-Field-0 data and the compare data match

[Clearing condition]

- When 1b is written to XFCLR.CF0MC

CF1MF (Control Field 1 compare match flag)

Indicates the detection of a compare match between Control Field 1 and compare data.

[Setting condition]

- When Control-Field-1 data and the compare data match

[Clearing condition]

- When 1b is written to XFCLR.CF1MC

PIBDF (Priority interrupt bit detection flag)

Indicates the detection of a compare match between Control Field 1 and priority interrupt bit.

[Setting condition]

- When the priority interrupt bit is detected

[Clearing condition]

- When 1b is written to XFCLR.PIBDC

COF (Counter overflow flag)

Indicates that the 16-bit counter in the simple LIN module has overflowed.

[Setting condition]

- When the counter for Break Field detection overflows

[Clearing condition]

- When 1b is written to XFCLR.COFC

AEDF (Active edge detection flag)

Indicates active edge detection.

[Setting condition]

- When Active edge is detected

[Clearing condition]

- When 1b is written to XFCLR.AEDC
- When XSR1.TCNT[15:0] are read out

CF0RD[7:0] (Control Field 0 received data)

Stores the received data with a Control Field 0 match detected.

CF1RD[7:0] (Control Field 1 received data)

Stores the received data with a Control Field 1 match detected.

7.3.2.2.23 Simple-LIN (SCIX) Status Register 1 (RSCIm_XSR1)

Access Size : 32 bits
Address : <RSCIm_base> + 0060h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TCNT[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	-	All 0	R	Reserved Whenever it is read, 0b is read.
15 to 0	TCNT[15:0]	0h	R	Stores the 16-bit counter capture value. The initial value is 0000h.

TCNT[15:0] (Timer count capture value)

Stores the capture value of the 16-bit counter of the simple-LIN module.

When sending Start Frame, this register holds the previous value.

When receiving Start frame with Bit rate measurement disabled, if a break field is detected in the break field detection state (see **Figure 7.3-61**), the break field length is captured and held (counter value is captured at the rising edge of RXD). If a Break Field is detected in a state other than the Break Field detection state, the previous value is retained. If the counter overflows, it will not be captured.

When receiving Start frame with Bit rate measurement enabled, the count value is captured and held at the valid edge (both RXD edges). However, in the Break Field detection state, the count value is not captured even if a valid edge occurs. Counter capture value retention is canceled by reading this register. Even if a valid edge occurs before reading, the counter value is not captured.

7.3.2.2.24 Common Flag Clear Register (RSCIm_CFCLR)

Access Size : 8, 16, 32 bits

Address : <RSCIm_base> + 0068h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RDRFC	-	TDREC	FERC	PERC	MFFC	-	ORERC	-	-	-	-	-	DFERC	DPERC	DCMFC
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Bit	Bit Name	Initial Value	R/W	Description
31	RDRFC	0h	W	RDRF clear 0b: No effect 1b: Clear the CSR.RDRF bit
30	-	0h	W	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
29	TDREC	0h	W	TDRE clear 0b: No effect 1b: Clear the CSR.TDRE bit
28	FERC	0h	W	FER clear 0b: No effect 1b: Clear the CSR.FER bit
27	PERC	0h	W	PER clear 0b: No effect 1b: Clear the CSR.PER bit
26	MFFC	0h	W	MFF clear 0b: No effect 1b: Clear the CSR.MFF bit
25	-	0h	W	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
24	ORERC	0h	W	ORER clear 0b: No effect 1b: Clear the CSR.ORER bit
23 to 19	-	All 0	W	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
18	DFERC	0h	W	DFER clear 0b: No effect 1b: Clear the CSR.DFER bit
17	DPERC	0h	W	DPER clear 0b: No effect 1b: Clear the CSR.DPER bit
16	DCMFC	0h	W	DCMF clear 0b: No effect 1b: Clear the CSR.DCMF bit
15 to 5	-	All 0	W	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
4	ERSC	0h	W	ERS clear 0b: No effect 1b: Clear the CSR.ERS bit
3 to 0	-	All 0	W	Reserved Whenever it is read, 0b is read. The written value should always be 0b.

Note: The read access size is fixed at 32 bits.

7.3.2.2.25 Simple I2C Flag Clear Register (RSCIm_ICFCLR)

Access Size : 8, 16, 32 bits

Address : <RSCIm_base> + 006Ch

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	-	All0	W	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
15	AEDC	0h	W	Setting this bit to 1b clears the XSR0.AEDF bit and cancels holding the XSR1 register. The read value is always 0b.
14	COFC	0h	W	Setting this bit to 1b clears the XSR0.COFbit. The read value is always 0b.
13	PIBDC	0h	W	Setting this bit to 1b clears the XSR0.PIBDFbit. The read value is always 0b.
12	CF1MC	0h	W	Setting this bit to 1b clears the XSR0.CF1MF bit. The read value is always 0b.
11	CF0MC	0h	W	Setting this bit to 1b clears the XSR0.CF0MF bit. The read value is always 0b.
10	BFDC	0h	W	Setting this bit to 1b clears the XSR0.BFDFbit. The read value is always 0b.
9	BCDC	0h	W	Setting this bit to 1b clears the XSR0.BCDFbit. The read value is always 0b.
8	BFOC	0h	W	Setting this bit to 1b clears the XSR0.BFOF bit. The read value is always 0b.
7 to 0	-	All 0	W	Reserved Whenever it is read, 0b is read. The written value should always be 0b.

Note: The read access size is fixed at 32 bits.

7.3.3 Asynchronous Mode

Figure 7.3-3 shows the general format for asynchronous serial communications.

One frame consists of a start bit (low level), transmit/receive data, a parity bit, and stop bits (high level).

In asynchronous serial communications, the communications line is held in the mark state (high level) when not communicating.

The SCI monitors the communications line. When the SCI detects a start bit, it starts serial communication. The detection condition of the start bit changes according to the CCR3.RXDESEL setting. SCI regards space (Low level) as a start bit when CCR3.RXDESEL is 0b. SCI regards a fall edge as a start bit when RXDESEL is 1b.

Inside the SCI, the transmitter and receiver are independent units, enabling full-duplex communications. Both the transmitter and the receiver also have a double-buffered structure (it has also FIFO mode), so that data can be read or written during transmission or reception, enabling continuous data transmission and reception.

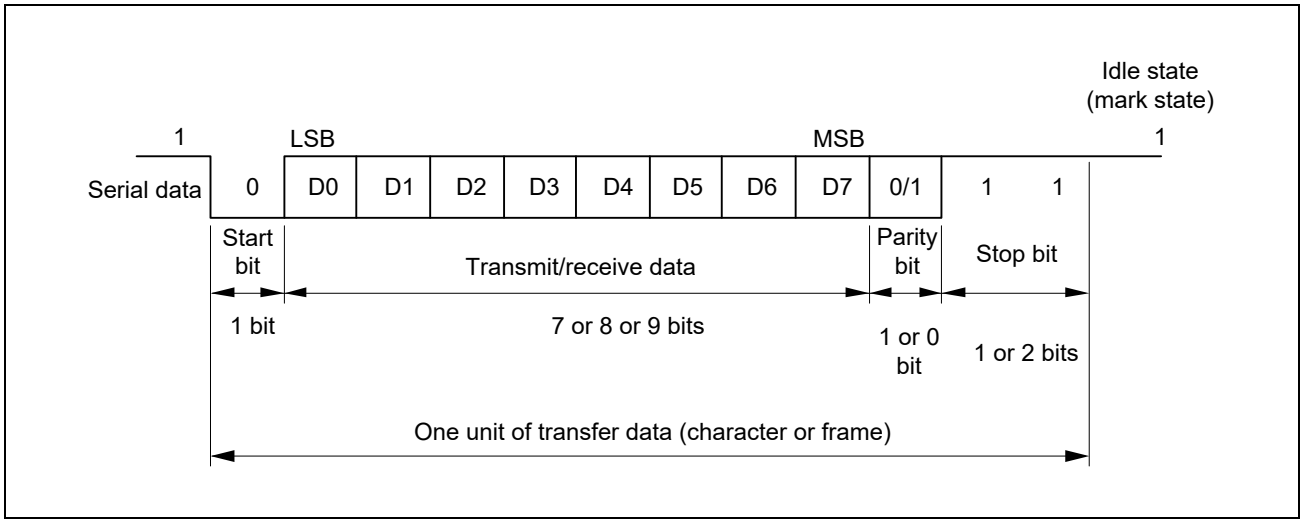

Figure 7.3-3 Data Format in Asynchronous Serial Communications (Example with 8-Bit Data, Parity, 2 Stop Bits)

7.3.3.1 Serial Data Transfer Format

Table 7.3-24 lists the serial data transfer formats that can be used in asynchronous mode. Any of 18 transfer formats can be selected according to the CCR1 and CCR3 settings.

For details of multi-processor function, see **7.3.4 Multi-Processor Communication Function**.

Table 7.3-24 Serial Transfer Formats (Asynchronous Mode)

CCR3				CCR1	Serial Transfer Format and Frame Length
CHR[1]	CHR[0]	MP	STP	PE	1 2 3 4 5 6 7 8 9 10 11 12 13
0	0	0	0	0	St 9-bit data STP
0	0	0	1	0	St 9-bit data STP STP
0	0	0	0	1	St 9-bit data P STP
0	0	0	1	1	St 9-bit data P STP STP
1	0	0	0	0	St 8-bit data STP
1	0	0	1	0	St 8-bit data STP STP
1	0	0	0	1	St 8-bit data P STP
1	0	0	1	1	St 8-bit data P STP STP
1	1	0	0	0	St 7-bit data STP
1	1	0	1	0	St 7-bit data STP STP
1	1	0	0	1	St 7-bit data P STP
1	1	0	1	1	St 7-bit data P STP STP
0	0	1	0	—	St 9-bit data MPB STP
0	0	1	1	—	St 9-bit data MPB STP STP
1	0	1	0	—	St 8-bit data MPB STP
1	0	1	1	—	St 8-bit data MPB STP STP
1	1	1	0	—	St 7-bit data MPB STP
1	1	1	1	—	St 7-bit data MPB STP STP

Note: St: Start bit
STP: Stop bit
P: Parity bit
MPB: Multi-processor bit

7.3.3.2 Receive Data Sampling Timing and Reception Margin in Asynchronous Mode

In asynchronous mode, the SCI operates on a base clock with a frequency of 16 times*1 the bit rate. In reception, the SCI samples the falling edge of the start bit using the base clock and performs internal synchronization*2. When sampling timing does not adjust (“CCR4.ASEN = 0b” or ”CCR4.ASEN = 1b and CCR4.AST[2:0] = 000b”), receive data is sampled at the rising edge of the 8th pulse*1 of the base clock, data is latched at the middle of each bit, as shown in **Figure 7.3-4**. Thus, the reception margin in asynchronous mode is determined by formula (1) below.

$$M = \left| \left(0.5 - \frac{1}{2N}\right) - (L - 0.5)F - \frac{|D - 0.5|}{N}(1 + F) \right| \times 100[\%] \cdots \text{Equation (1)}$$

M: Reception margin
N: Ratio of bit rate to clock

(N = 16, when CCR2.ABCSE = 0b and CCR2.ABCS = 0b, N = 8, when CCR2.ABCS = 1b, N = 6, when CCR2.ABCSE = 1b)

D: Duty cycle of clock (D = 0.5 to 1.0)
L: Frame length (L = 9 to 13)
F: Absolute value of clock frequency deviation

Assuming values of N = 16, F = 0 and D = 0.5 in formula (1), the reception margin is determined by the formula below.

$$M = \left\{\frac{0.5 - 1}{2 \times 16}\right\} \times 100(\%) = 46.875\%$$

However, this is only the computed value, and a margin of 20% to 30% should be allowed in system design.

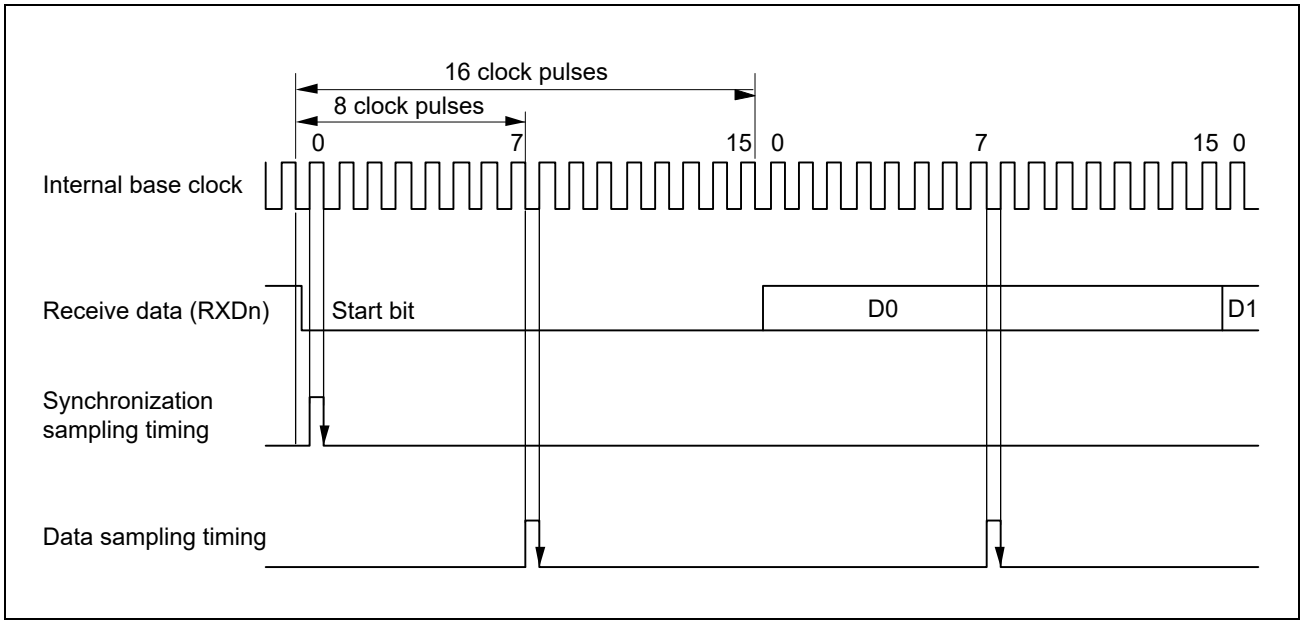

Figure 7.3-4 Receive Data Sampling Timing in Asynchronous Mode

Note 1. This is an example when CCR2.ABCS = 0b and CCR2.ABCSE = 0b. When CCR2.ABCS = 1b and CCR2.ABCS = 0b, a frequency of 8 times the bit rate is used as a base clock and receive data is sampled at

the rising edge of the 4th pulse of the base clock. When CCR2.ABCSE is 1b, a sextuple frequency of a bit rate is a base clock and receive data is sampled at the rising edge of the 3rd pulse of the base clock.

Note 2. The determination condition of the start bit is as follows.
In the case of the function of adjust sampling timing is OFF (CCR4.ASEN = 0b):
The determination condition of a start bit is that Low beyond half bit length continues. It is same as the sampling timing.
In **Figure 7.3-4**, the low period should be kept over 8 cycles to detect a start bit. If Low period does not keep over 8 cycles, the module judges this as a noise. So, the module does not start reception and wait start bit.
In the case of the function of adjust sampling timing is ON (CCR4.ASEN = 1b):
The determination condition of a start bit is that Low keeps up until the sampling timing.
Adjusting the sampling timing forward (CCR4.AJD = 1b) increases the possibility of erroneously determining a noise as the start bit.

7.3.3.3 Clock

Either an internal clock generated by the baud rate generator or an external clock input to the SCKm pin can be selected as the SCI's transfer clock, according to the setting of CCR3.CKE[1:0]. When an external clock is input to the SCKm pin, the clock frequency should be 16 times the bit rate (when CCR2.ABCS = 0b) and 8 times the bit rate (when CCR2.ABCS = 1b).

When the SCI is operated on an internal clock, the clock can be output from the SCKm pin. The frequency of the clock output in this case is equal to the bit rate, and the phase is such that the rising edge of the clock is in the middle of the transmit data, as shown in **Figure 7.3-5**.

If you selected an internal clock, the SCK pin is outputted after CCR0.TE is set to 1b or CCR0.RE is set to 1b.

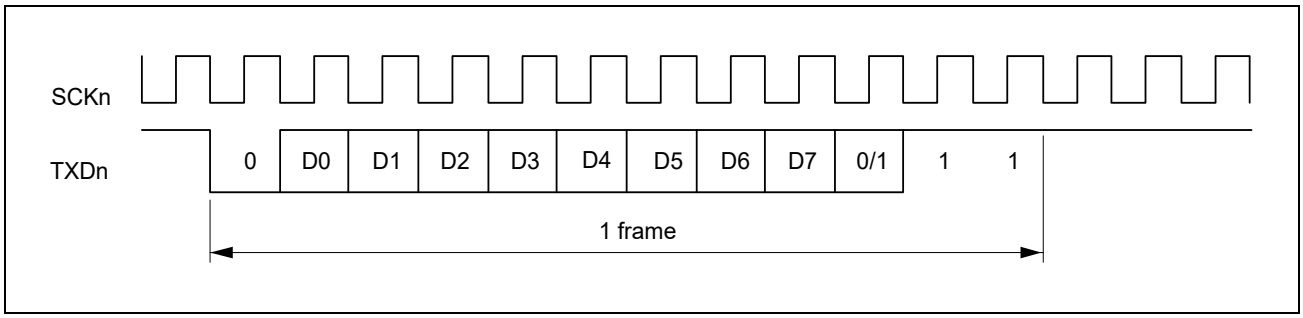

Figure 7.3-5 Phase Relationship between Output Clock and Transmit Data (Asynchronous Mode: CHR[1:0] = 10b, PE = 1b, MP = 0b, STP = 1b)

7.3.3.4 Double-Speed Operation and Frequency of 6 Times the Bit Rate

When CCR2.ABCS is set to 1b, the SCI operates on the bit rate twice that in the case where ABCS is set to 0b. And when CCR2.BGDM is set to 1b, the cycle of the base clock is halved and the bit rate is doubled from that in the case where BGDM is set to 0b. When CCR3.CKE[1] is set to 0b and the baud rate generator is selected, setting the ABCS and BGDM bits to 1b allows the SCI to operate on a bit rate four times that in the case ABCS = 0b and BGDM = 0b.

When CCR2.ABCSE is set to 1b, the number of base clock pulses are 6 during a period of 1 bit, and the base clock frequency is half. And SCI works 16/3 times of bit rate compared with a case of CCR2.ABCS = 0b, CCR2.BGDM = 0b and CCR2.ABCSE = 0b.

As shown by Formula (1) in **7.3.3.2 Receive Data Sampling Timing and Reception Margin in Asynchronous Mode**, the reception margin decreases when CCR2.ABCS is set to 1b or CCR2.ABCSE is set to 1b.

Therefore, if the desired bit rate can be obtained with CCR2.ABCS set to 0b and/or CCR2.ABCSE set to 0b, it is recommended to use the SCI with CCR2.ABCS set to 0b and/or CCR2.ABCSE set to 0b.

7.3.3.5 CTS and RTS Function

The CTS function is the transmission control function by the CTSm# pin. Setting the CCR1.CTSE bit to 1b enables the CTS function. For the functions of CTS and RTS, you can select the alternate setting that uses either function with one terminal or the dedicated setting that uses each function independently with two terminals. This setting is done with the CCR1.CTSPEN bit.

When the CTS function is enabled, placing the low level on the CTSm# pin, causes transmission to start.

Even if the CTSm# pin goes high after transmission starts, the frame being transmitted is not affected and transmission will continue.

The RTS function is the transmission request function by the RTSn# pin. In the RTS function, the RTSm# pin output low level, when reception becomes possible. Conditions for output of the low and high levels are shown below.

[Conditions of low-level output]

(1) Non-FIFO selected when all of the following conditions are satisfied.

- CCR0.RE is 1b
- When in receivable state
- There are no received data yet to be read and not receiving.
- CSR.ORER, FER, PER flags are all 0b

(2) FIFO selected when all of the following conditions are satisfied.

- CCR0.RE is 1b
- When the quantity of receive data written in receive FIFO (RDR) are less than the setting value of FCR.RSTRG[4:0]
- CSR.ORER (RDR.ORER) is 0b

[Condition for high-level output]

When the conditions of low-level output have not been satisfied.

7.3.3.6 Address Match (Receive Data Match Detection) Function

The address match function can be used only for the asynchronous mode.

If CCR0.DCME is set to 1b,*2 when one frame of data has been received, SCI compares that receive data with the data which is set to CCR4.CMPD. If SCI detects the match to the comparison data (CCR4.CMPD*1) with receive data, SCI can issue RXI interrupt request.

If CCR3.MP bit is set to 0b, this comparative target in communication data is valid only data field in receive format. In multi- processor mode (CCR3.MP = 1b), if CCR0.IDSEL bit is set to 1b, the reception data at which MPB bit is 1b detects an address match or mismatch, and the reception data at which MPB bit is 0b detects always a mismatch. If CCR0.IDSEL bit is set to 0b, SCI detects an address match or mismatch despite the value of the MPB bit of the reception data at every reception complete.

Until SCI detects the match to the comparison data (CCR4.CMPD) with receive data, the communication data is skipped (discarded), and SCI cannot detect parity error, framing error.

When SCI detects the match, the CCR0.DCME is automatically cleared, and CSR.DCMF is set to 1b. If CCR0.IDSEL bit is set to 1b at this time, CCR0.MPIE bit is automatically cleared. If CCR0.IDSEL bit is set to 0b at this time, CCR0.MPIE bit is kept. At the same time, if CCR0.RIE is set to 1b, SCI issues RXI interrupt request.

If SCI detects framing error in comparative receive data which is detected the match, CSR.DFER is set to 1b, and if SCI detects parity error in that frame, CSR.DPER is set to 1b. That comparative receive data and MPB bit are not stored to RDR register, and CSR.RDRF is retained to 0b.

After SCI detects the match, and the CCR0.DCME is automatically cleared, it receives next data continuously in current register setting.

When CSR.DFER flag or CSR.DPER flag is set, the address much is not detected. Before making the address match function effective, please be sure to set CSR.DFER and CSR.DPER flag as 0b.

Figure 7.3-6 and **Figure 7.3-7** show the address match function example.

Note 1. This comparative target can select one length of 3 types, they are CMPD[6:0] with 7-bit length enable, CMPD[7:0] with 8-bit, and CMPD[8:0] with 9-bit length.

Note 2. Set the CCR0.DCME bit to 1b before receiving the start bit of the received frame that performs address matching.

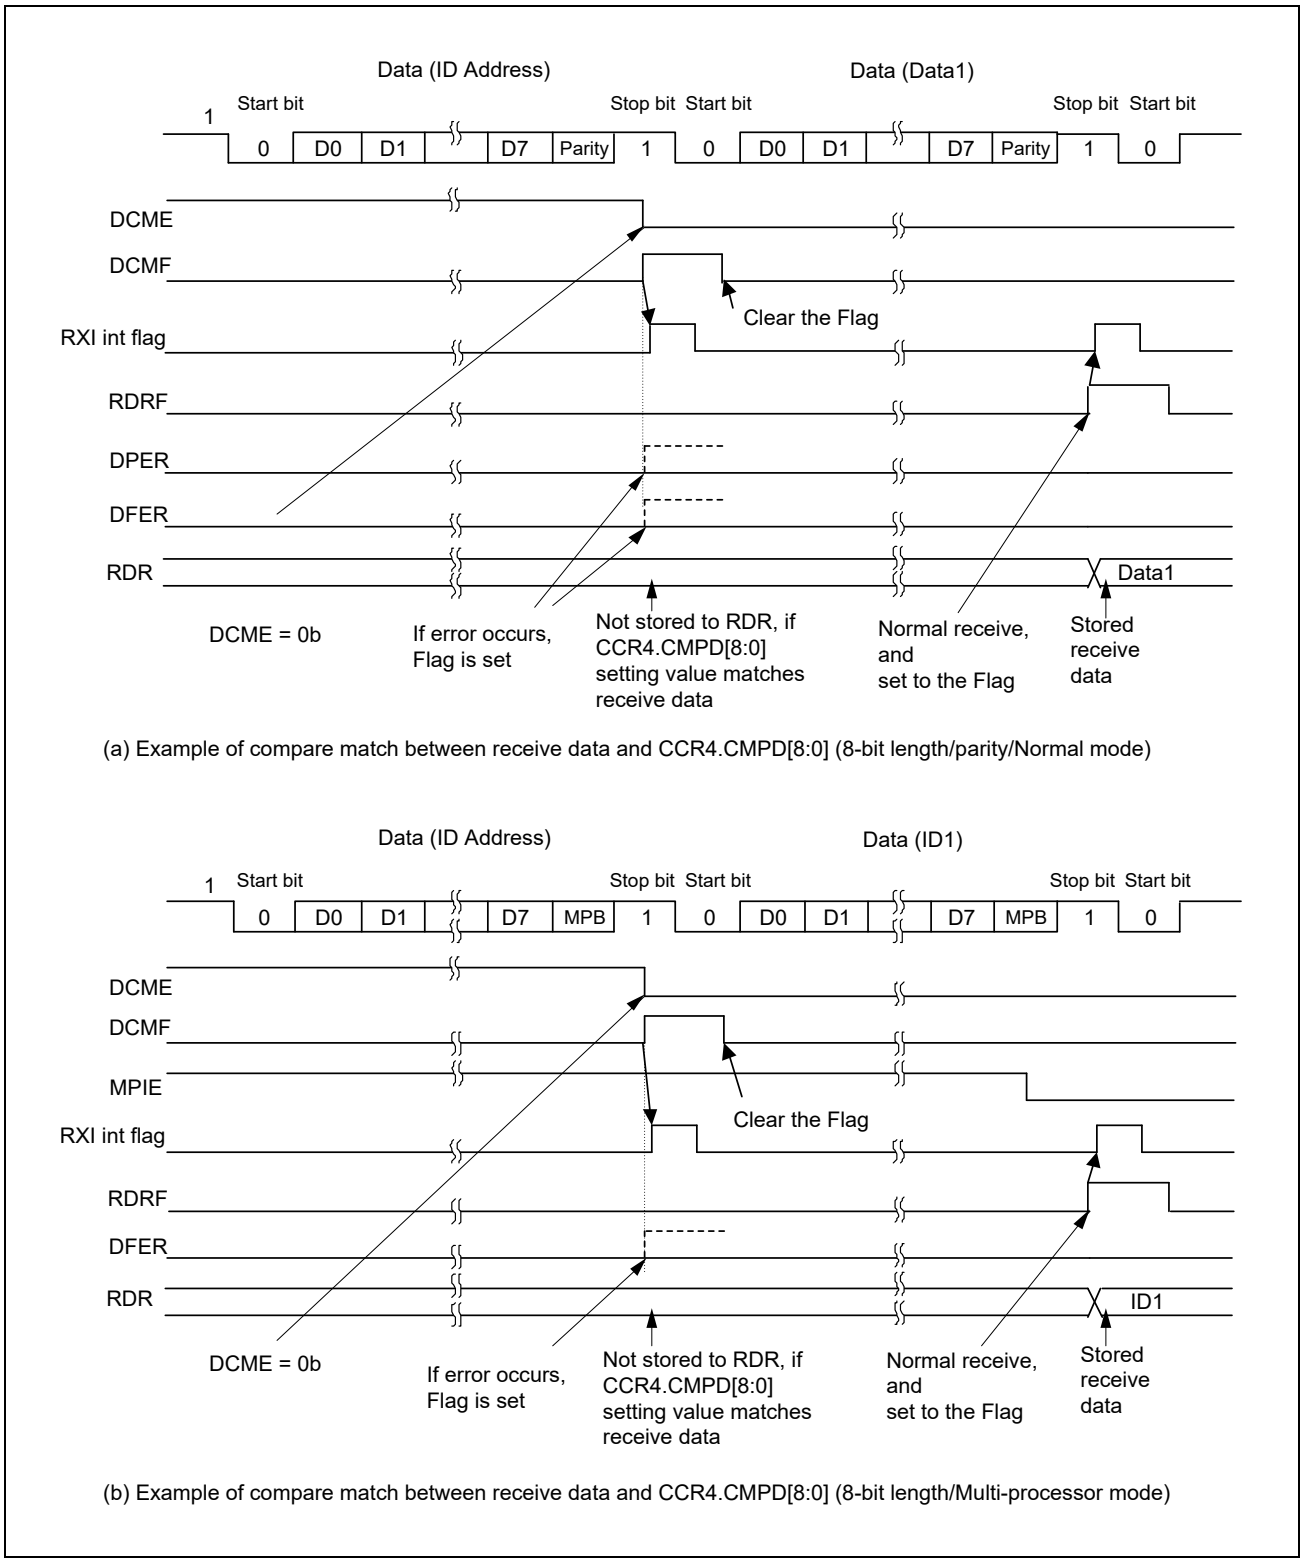

Figure 7.3-6 Example of Address Match (1) 8-Bit Data

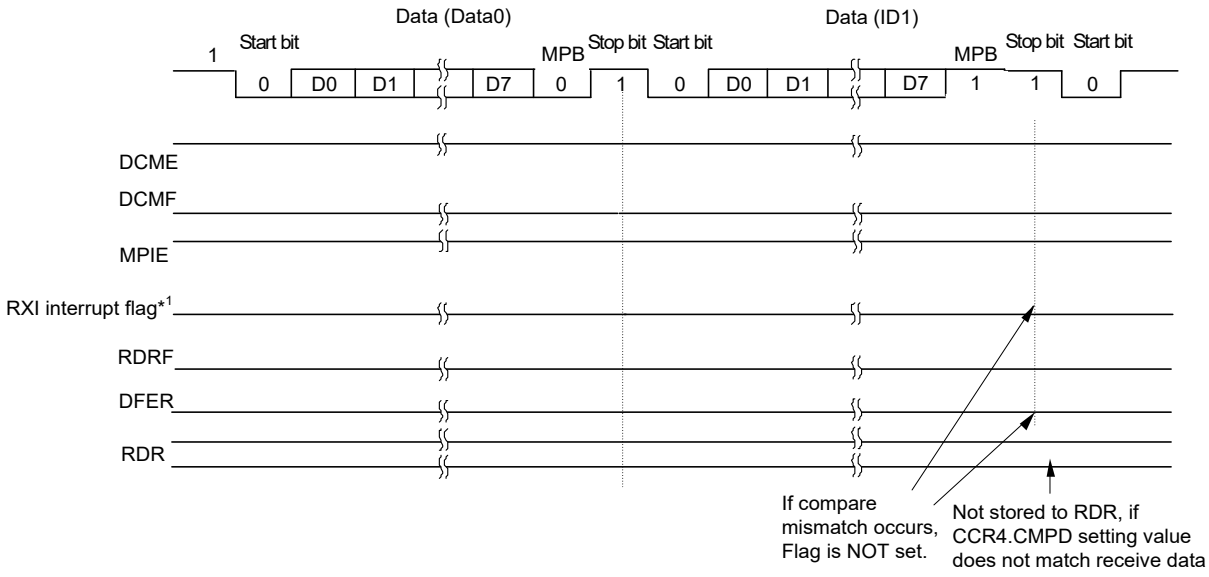
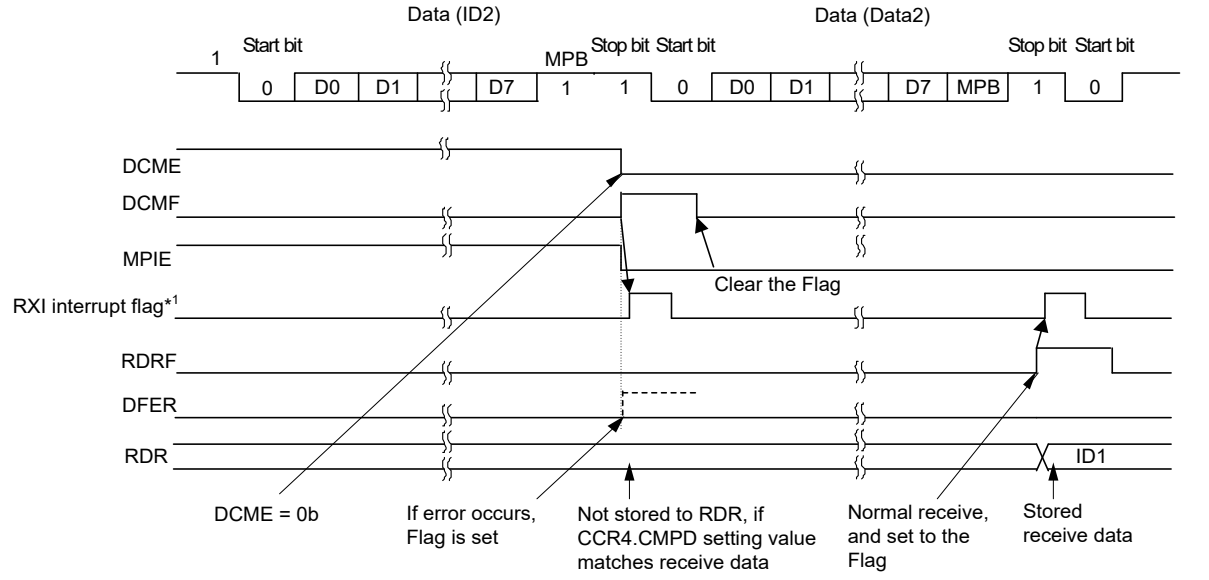


(a) Example of compare mismatch between receive data and CCR4.CMPD (8-bit length / IDSEL = 1 / Multi-processor mode)



(b) Example of compare match between receive data and CCR4.CMPD (8-bit length / IDSEL = 1 / Multi-processor mode)

Note 1. See **4.6 Interrupt Controller** for details on the corresponding interrupt vector number.

Figure 7.3-7 Example of Address Match (2) Multi-Processor Mode/8-Bit Data

7.3.3.7 SCI Initialization (Asynchronous Mode)

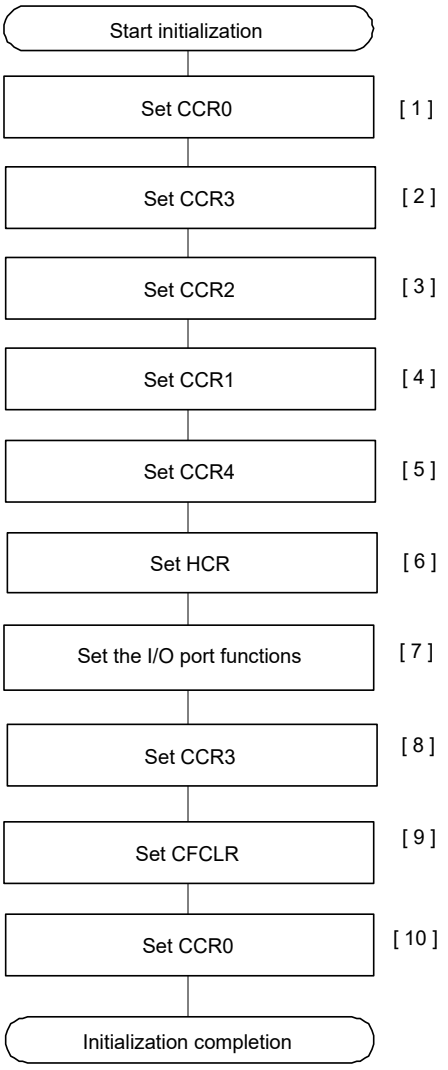
Before transmitting and receiving data, start by writing 0b to CCR0.TE and CCR0.RE (or writing the initial value to CCR0) and then continue through the Procedure (select to Non-FIFO or FIFO) for SCI given in **Figure 7.3-8** or **Figure 7.3-9**. Whenever the operating mode or transfer format is changed, CCR0.TE and CCR0.RE must be initialized before the change is made.

When the external clock is used in asynchronous mode, ensure that the clock signal is supplied even during initialization.

Note that setting the CCR0.RE bit to 0b initializes neither the ORER, FER, PER, RDRF, DR and RDAT. When FIFO selected, even if the TE bit is set as 0b, the TEND flag is not initialized, so please be careful.

Please be also careful at the time of change in the operation mode.

Moreover, note that switching the value of the CCR0.TE bit from 0b to 1b while the CCR0.TIE bit is 1b leads to the generation of a TXI interrupt request.



[1] Set the following bits of CCR0 to 0.
TEIE, TIE, RIE, TE, RE
If you have not changed from the initial settings, you can skip this step.

[2] Set up following function and communication mode.
Driver control function for RS-485
FIFO no-use
Multi-Processor mode
Communication mode (MOD[2:0] = 000b)
Transmission / reception format
Clock enable (Leave the initial value in this step when outputting the clock)
Leave unused bits at their initial values.

[3] Set up the bit-rate-modulation function*1,*2, select clock, set bit rate*2.

[4] Set up the Noise-filter function, the loop-back function, communication terminal status, the parity check function, and the CTS/RTS function.

[5] Set up the adjust sampling timing function and the adjust transmit timing function.

[6] When using the half data communication function, enable or set the function. If this function is not used, leave the default value.

[7] Make I/O port settings to enable input and output functions as required for TXDn, RXDn, and SCKn pins.

[8] Set clock enable bit (CKE[1:0]) at this step when outputting the clock. After this register setting, a clock will be output immediately.

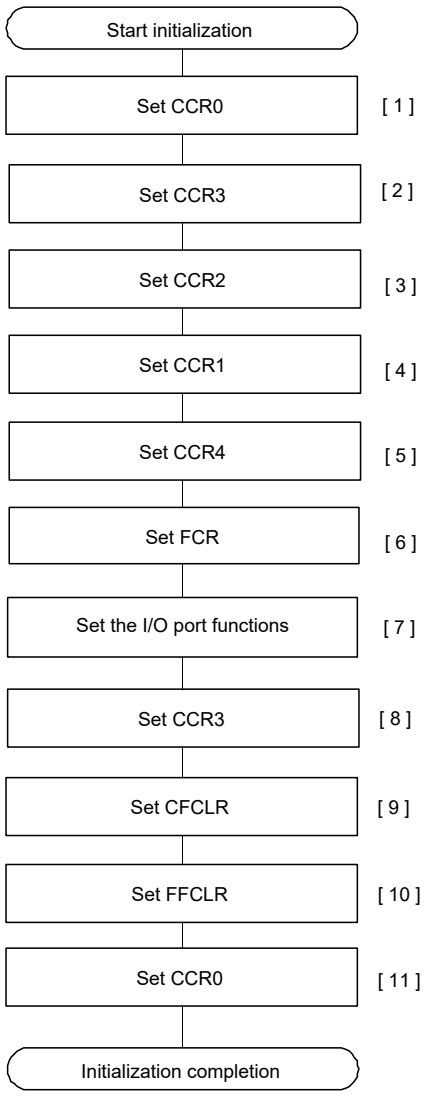
[9] Write 1 to the following bits and clear the corresponding flag.
CFCLR.RDRFC, FERC, PERC, MFFC, ORERC, DFERC, DPERC, DCMFC, ERSC
If it's initialization flow after a reset, you can skip this step.

[10] Set the TE or RE bit to 1.
To enable interrupts, set the TE bit and TIE bit, and the RE bit and RIE bit to 1 with one instruction at the same time.
Setting the TE and RE bits allows TXDn and RXDn to be used.

Note 1. If you do not use the bit rate modulation function, you do not need to set it.

Note 2. If you use an external clock, you do not need to set it.

Figure 7.3-8 Sample SCI Initialization Flowchart (Asynchronous Mode/Non-FIFO Selected)



[1] Set the following bits of CCR0 to 0.
TEIE, TIE, RIE, TE, RE
If you have not changed from the initial settings, you can skip this step.

[2] Set up following function and communication mode.
Driver control function for RS-485
FIFO use
Multi-Processor mode
Communication mode (MOD[2:0] = 000b)
Transmission / reception format
Clock enable (Leave the initial value in this step when outputting the clock)
Leave unused bits at their initial values.

[3] Set up the bit-rate-modulation function*1,*2, select clock, set bit rate*2.

[4] Set up the Noise-filter function, the loop-back function, communication terminal status, the parity check function, and the CTS/RTS function.

[5] Set up the adjust sampling timing function and the adjust transmit timing function.

[6] Set the TFRST and RFRST to 1 to empty FIFO.
Set the DRES, TTRG[4:0], RTRG[4:0], and RSTRG[4:0] bits

[7] Make I/O port settings to enable input and output functions as required for TXDn, RXDn, and SCKn pins.

[8] Set clock enable bit (CKE[1:0]) at this step when outputting the clock. After this register setting, a clock will be output immediately.

[9] Write 1 to the following bits and clear the corresponding flag.
CFCLR.RDRFC, FERC, PERC, MFFC, ORERC, DFERC, DPERC, DCMFC, ERSC
If it's initialization flow after a reset, you can skip this step.

[10] Write 1 to the FFCLR.DRC and clear the corresponding flag.
If it's initialization flow after a reset, you can skip this step.

[11] Set the TE or RE bit to 1.
To enable interrupts, set the TE bit and TIE bit, and the RE bit and RIE bit to 1 with one instruction at the same time.
Setting the TE and RE bits allows TXDn and RXDn to be used.

Note 1. If you do not use the bit rate modulation function, you do not need to set it.

Note 2. If you use an external clock, you do not need to set it.

Figure 7.3-9 Sample SCI Initialization Flowchart (Asynchronous Mode/FIFO Selected)

Figure 7.3-10 shows an example of the timing when data is transmitted after reset is released, and SCI is set to asynchronous mode according to **Figure 7.3-8** or **Figure 7.3-9**. As shown in the figure, when the pin function is set to the TXD pin, the CCR0.TE bit is 0b, so the pin is high impedance. When transmit data is written after setting the CCR0.TE bit to 1b, data transmission starts. There is a transmission wait time from writing TDR to data transmission starts. In asynchronous mode, TXD is high during this period.

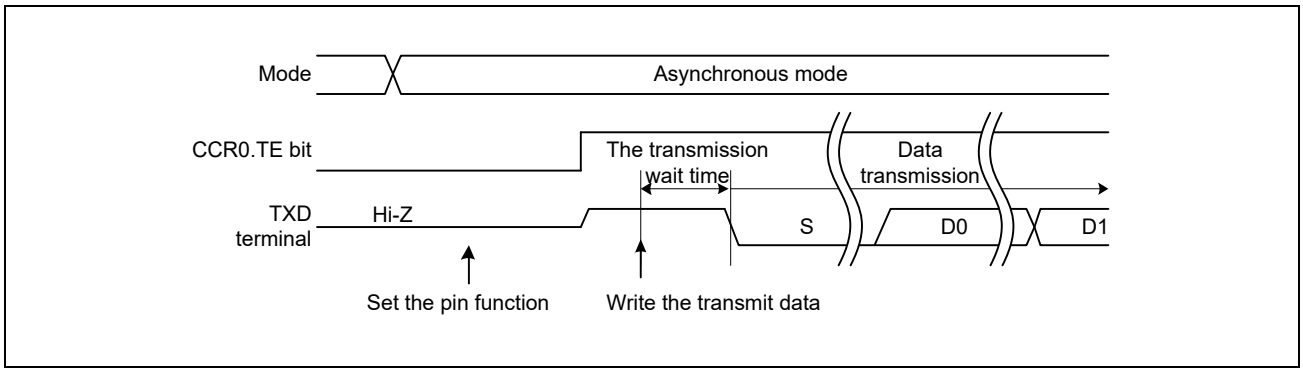


Figure 7.3-10 Data Transmission Timing Example in Asynchronous Mode

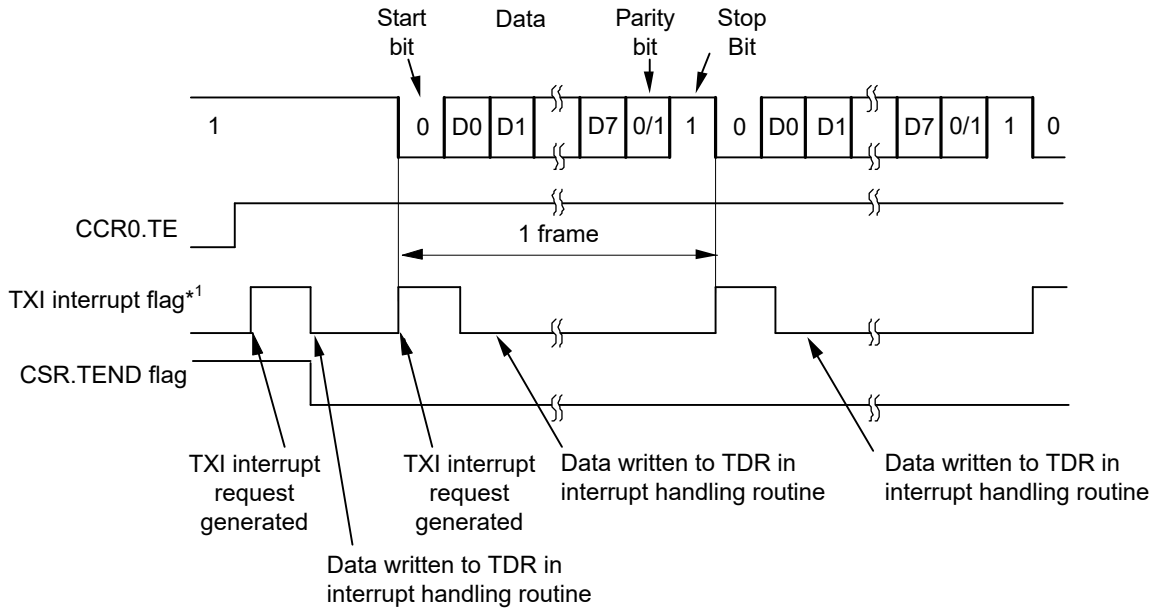
7.3.3.8 Serial Data Transmission (Asynchronous Mode)

(1) Non-FIFO selected

Figure 7.3-11, **Figure 7.3-12**, and **Figure 7.3-13** show an example of the operation for serial transmission in asynchronous mode. In serial transmission, the SCI operates as described below.

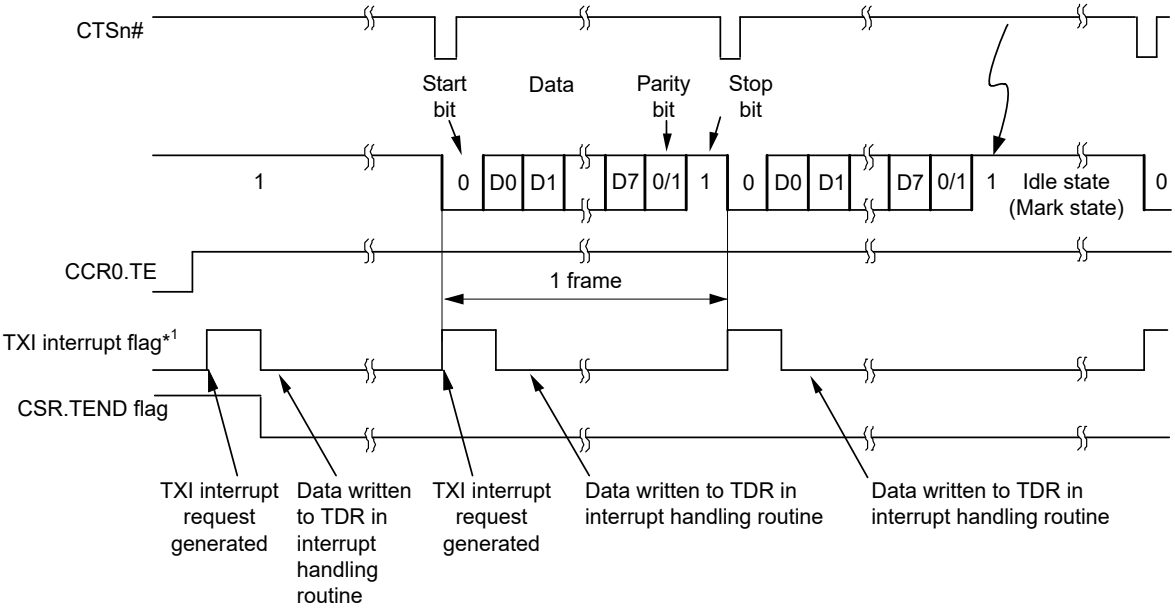
1. The SCI transfers data from TDR to TSR when data is written to TDR in the TXI interrupt handling routine. At the beginning of transmission, set 1b to CCR0.TE and CCR0.TIE simultaneously. Then the TXI interrupt request is generated.
2. Transmission starts at data transfer from TDR to TSR when CCR1.CTSE = 0b (CTS function is disabled) or when the CTS# pin level is low. If CCR0.TIE is 1b at this time, a TXI interrupt request is generated. Continuous transmission is obtainable by writing the next transmit data to TDR in the TXI interrupt handling routine before transmission of the current transmit data is completed. Write the last transmission data, then the last data transmit start, and TXI is generated. When TEI interrupt requests are in use, before the last data transmit end, set the CCR0.TIE bit to 0b (a TXI interrupt request is disabled) and the CCR0.TEIE bit to 1b (a TEI interrupt request is enabled) using the TXI handling routine.
3. Data is sent from the TXDn pin in the following order: start bit, transmit data, parity bit or multi-processor bit (may be omitted depending on the format), and stop bit.
4. The SCI checks for updating of (writing to) TDR at the time of stop bit output.
5. When TDR is updated, setting of CCR1.CTSE to 0b (CTS function is disabled) or a low level input on the CTSn# pin cause the next transfer of the next transmit data from TDR to TSR and sending of the stop bit, after which serial transmission of the next frame starts.
6. If TDR is not updated, CSR.TEND is set to 1b, the stop bit is sent, and then the mark state is entered in which 1 is output. If the CCR0.TEIE is 1b at this time, a TEI interrupt request is generated.

Figure 7.3-15 shows the example of Serial Transmission Flowchart.



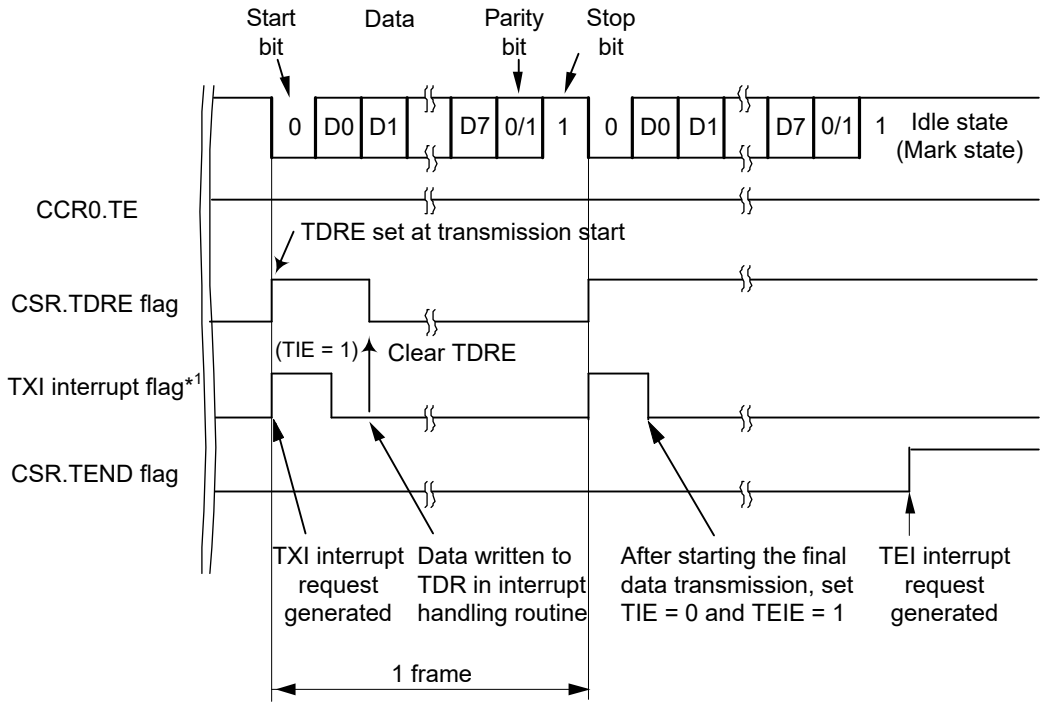
Note 1. See **4.6 Interrupt Controller** for details on the corresponding interrupt vector number.

Figure 7.3-11 Example of Operation for Serial Transmission in Asynchronous Mode (1) (with 8-Bit Data, Parity, 1 Stop Bit, CTS Function Not Used, at the Beginning of Transmission)



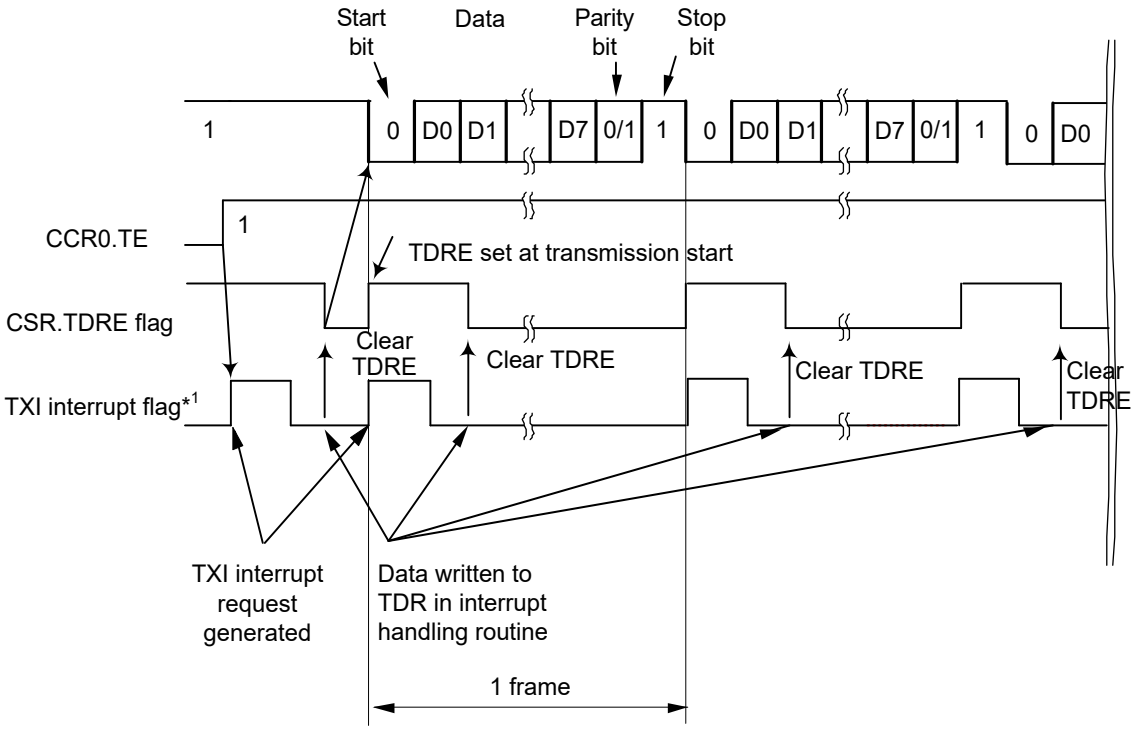
Note 1. See **4.6 Interrupt Controller** for details on the corresponding interrupt vector number.

Figure 7.3-12 Example of Operation for Serial Transmission in Asynchronous Mode (2) (with 8-Bit Data, Parity, 1 Stop Bit, CTS Function Used, at the Beginning of Transmission)



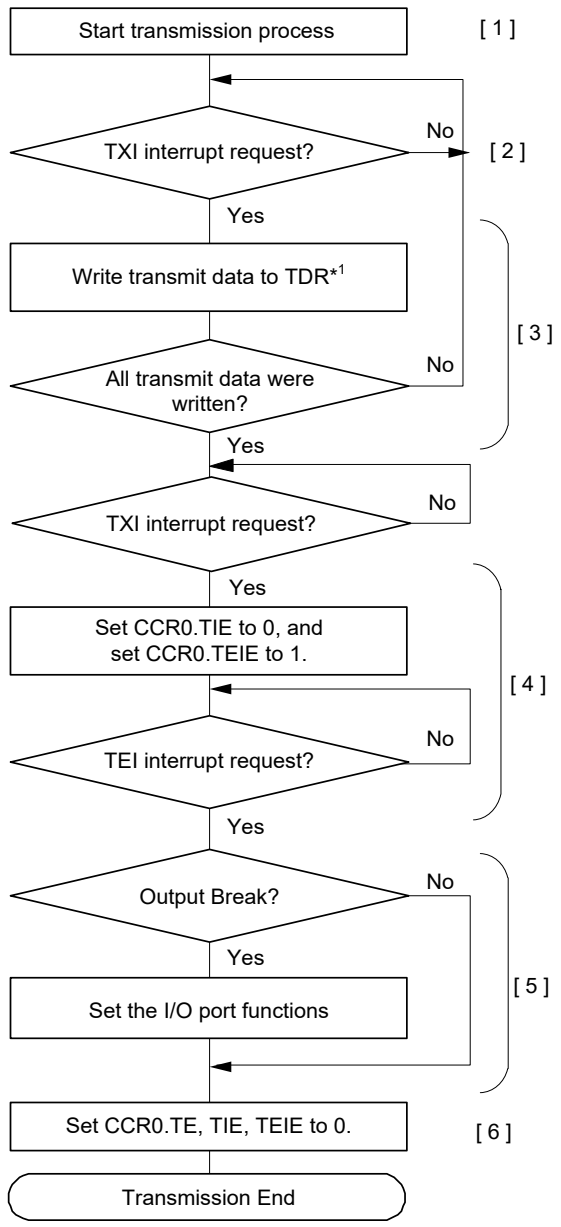
Note 1. See **4.6 Interrupt Controller** for details on the corresponding interrupt vector number.

Figure 7.3-13 Example of Operation for Serial Transmission in Asynchronous Mode (3) (with 8-Bit Data, Parity, 1 Stop Bit, CTS Function Not Used, from the Middle of Transmission until Transmission Completion)



Note 1. See **4.6 Interrupt Controller** for details on the corresponding interrupt vector number.

Figure 7.3-14 Example of Operation for Serial Transmission in Asynchronous Mode (4) (with 8-Bit Data, Parity, 1 Stop Bit, CTS Function Not Used, in the Middle of Transmission)



[1] Start transmission process

[2] TXI interrupt request:
The transmit-data-empty-interrupt (TXI) is generated at following conditions.
When set TE and TIE to 1 at same time.
When transmission-data forwards to TSR from TDR.

[3] Serial transmission continuation procedure:
To continue serial transmission write transmit data to TDR*1 once by using a TXI.
Transmit data can also be written by activating the DMAC.

[4] If you use TEI, set TIE = 0 and TEIE = 1 after writing the last-transmit-data to TDR*1 and transmission is started.

[5] Break output at the end of serial transmission:
To output a break, it is necessary to set SPB2IO and SPB2DT, for output status setting when TE is 0.
(If you set these bits at initialization, you can skip this step.)

[6] Set CCR0.TE, TIE, TEIE to 0.

Note 1. In case of byte access with data length 9 bits, write transmit data in order of TDR[15:8] and TDR[7:0].

Figure 7.3-15 Example of Serial Transmission Flowchart in Asynchronous Mode (Non-FIFO Selected)

(2) FIFO selected

Figure 7.3-16 shows an example of data format that is written to transmit FIFO (TDR) in asynchronous mode with FIFO selected. MPBT write to transmit FIFO (TDR) bit 9. Data is set to TDR.TDAT[8:0] corresponded to data length. It should write to 0b for unused bits. It should write it in order of the TDR[15:8] register and the TDR[7:0] register at byte-access.

Data Length	Register Setting CCR3.CHR[1:0]		Transmit data in TDR[15:0]															
			b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
7 bits	1	1	—	—	—	—	—	—	MPBT	—	—	TDAT[6:0]						
8 bits	1	0	—	—	—	—	—	—	MPBT	—	TDAT[7:0]							
9 bits	0	x	—	—	—	—	—	—	MPBT	TDAT[8:0]								

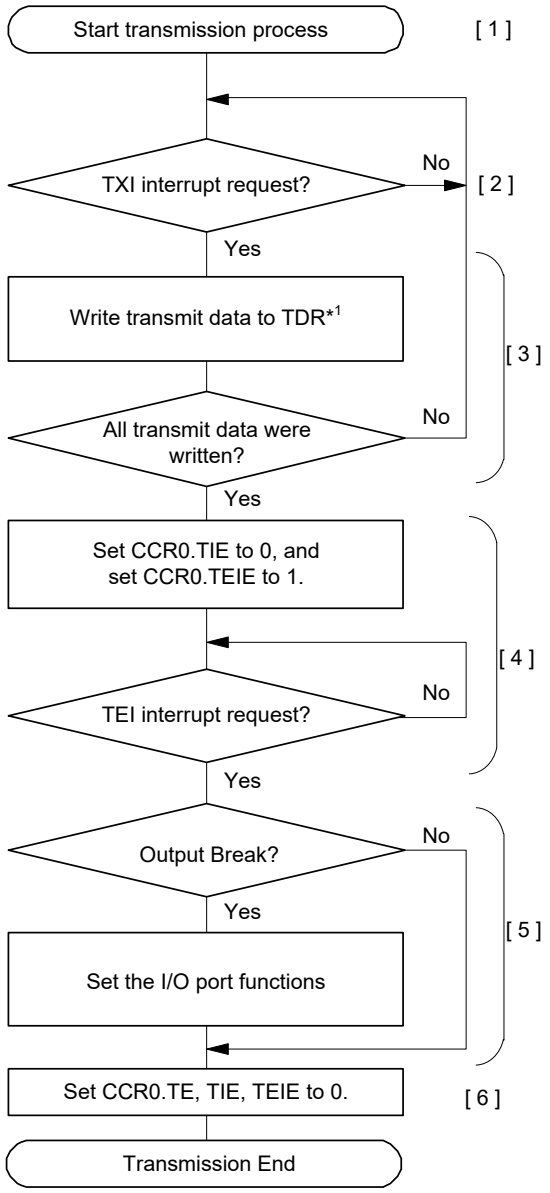
Note: —: Do not used. It should write to 0b

Figure 7.3-16 Data Format that is Written to Transmit FIFO (TDR) (FIFO Selected)

In serial transmission, the SCI operates as described below.

1. The SCI transfers data from TDR to TSR when data is written to TDR in the TXI interrupt handling routine. The writable transmit data number is until (NFIFO (= 32) − FTSR.T) bytes. At the beginning of transmission, set 1b to CCR0.TE and CCR0.TIE simultaneously. Then the TXI interrupt request is generated.
2. Transmission starts at data transfer from TDR to TSR when CCR1.CTSE = 0b (CTS function is disabled) or when the CTS# pin level is low. When the quantity of transmit data written in transmit FIFO (TDR) is equal to or less than the specified transmit triggering number, CSR.TDRE is set to 1b. If CCR0.TIE is 1b at this time, a TXI interrupt request is generated. Continuous transmission is obtainable by writing the next transmit data to TDR in the TXI interrupt handling routine before transmission of the current transmit data is completed. Write the last transmission data, then the last data transmit start, and TXI is generated. When TEI interrupt requests are in use, before the last data transmit end, set the CCR0.TIE bit to 0b (a TXI interrupt request is disabled) and the CCR0.TEIE bit to 1b (a TEI interrupt request is enabled) using the TXI handling routine.
3. Data is sent from the TXDn pin in the following order: start bit, transmit data, parity bit or multi-processor bit (may be omitted depending on the format), and stop bit.
4. The SCI checks whether non-transmitted data in transmit FIFO (TDR) or not at the time of stop bit output.
5. When data is set to transmit FIFO (TDR), setting of CCR1.CTSE to 0b (CTS function is disabled) or a low level input on the CTSn# pin cause the next transfer of the next transmit data from transmit FIFO (TDR) to TSR and sending of the stop bit, after which serial transmission of the next frame starts.
6. If data is not set to transmit FIFO (TDR), CSR.TEND is set to 1b, the stop bit is sent, and then the mark state is entered in which 1 is output. If CCR0.TEIE is 1b at this time, a TEI interrupt request is generated.

Figure 7.3-17 shows a sample flowchart for serial transmission in asynchronous mode at FIFO selected.



[1] Start transmission process:
Set transmit-data to the transmit FIFO (TDR):
The number of transmittable data that can be set is 32.

[2] TXI interrupt request:
The transmit-data-empty-interrupt (TXI) is generated when transmission-data forwards to TSR from the transmit FIFO (TDR) and the number of transmit-data written in the transmit FIFO is equal to or less than the transmit FIFO threshold.

[3] Serial transmission continuation procedure:
To continue serial transmission, write all transmit data to the transmit FIFO (TDR) by using a TXI interrupt and clear TDRE flag to 0. (Transmit data can also be written to the transmit FIFO (TDR) by activating the DMAC. In this case, the TDRE flag is cleared automatically, so please do not operate the TDRE flag.)
The number of transmission data it's possible to write in is N_{FIFO} (= 32) - (the number of stored transmit FIFO data).

[4] If you use TEI, set TIE = 0 and TEIE = 1 after writing the last-transmit-data to TDR.*1

[5] Break output at the end of serial transmission:
To output a break, it is necessary to set SPB2IO and SPB2DT, for output status setting when TE is 0.
(If you set these bits at initialization, you can skip this step.)

[6] Set CCR0.TE, TIE, TEIE to 0.

Note 1. In case of byte access with data length 9 bits, write transmit data in order of TDR[15:8] and TDR[7:0].

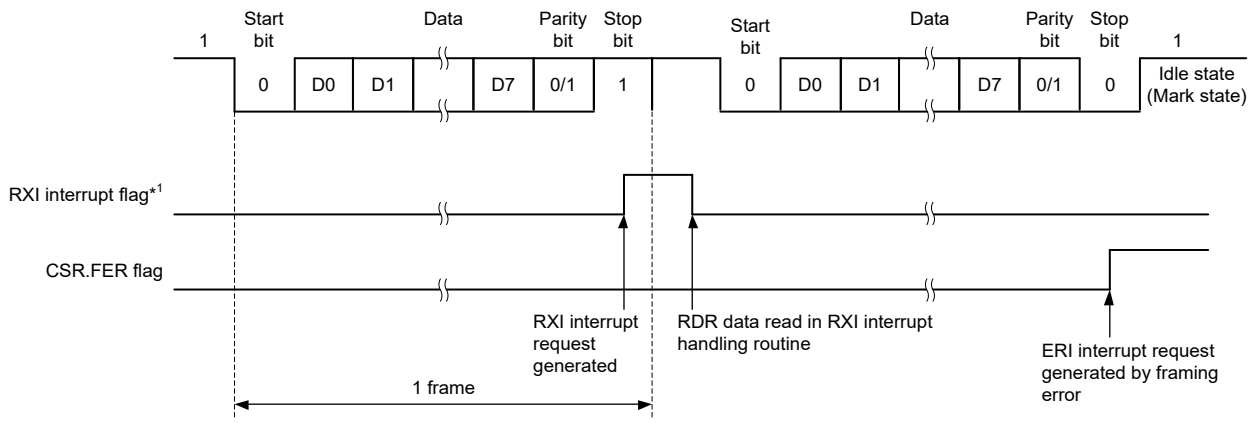
Figure 7.3-17 Example of Serial Transmission Flowchart in Asynchronous Mode (FIFO Selected)

7.3.3.9 Serial Data Reception (Asynchronous Mode)

(1) Non-FIFO selected

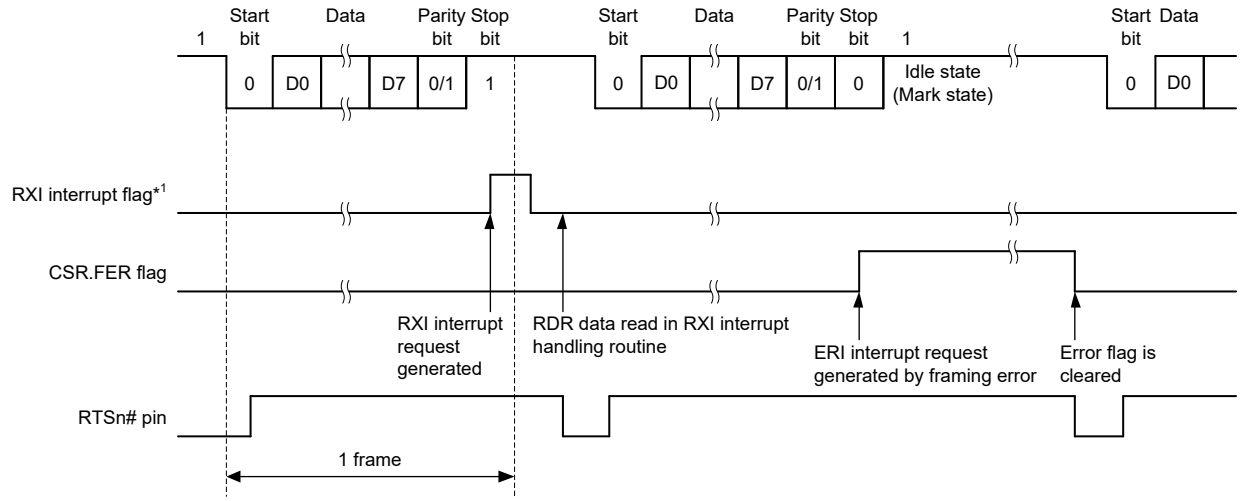
Figure 7.3-18 and **Figure 7.3-19** show an example of the operation for serial data reception in asynchronous mode. In serial data reception, the SCI operates as described below.

1. When the value of CCR0.RE becomes 1b, the output signal on the RTSn# pin goes to the low level in the case of RTS function use.
2. When the SCI monitors the communications line and detects a start bit, it performs internal synchronization, stores receive data in RSR, and checks the parity bit and stop bit.
3. If an overrun error occurs, CSR.ORER is set to 1b. If CCR0.RIE is 1b at this time, an ERI interrupt request is generated. Receive data is not transferred to RDR.
4. If a parity error is detected, CSR.PER is set to 1b and receive data is transferred to RDR. If the CCR0.RIE is 1b at this time, an ERI interrupt request is generated.
5. If a framing error (when the stop bit is 0b) is detected, CSR.FER is set to 1b and receive data is transferred to RDR. If CCR0.RIE is 1b at this time, an ERI interrupt request is generated.
6. When reception finishes successfully, receive data is transferred to RDR. If CCR0.RIE is 1b at this time, an RXI interrupt request is generated. Continuous reception is enabled by reading the receive data transferred to RDR in this RXI interrupt handling routine before reception of the next receive data is completed. Reading the received data that have been transferred to RDR causes the RTSn# pin to output the low level in the case of RTS function use. If you do not want to turn the RTSn# pin output low after receiving the last data, set CCR0.RE bit to 0b, before reading the RDR.



Note 1. See **4.6 Interrupt Controller** for details on the corresponding interrupt vector number.

Figure 7.3-18 Example of SCI Operation for Serial Reception in Asynchronous Mode (1) (Example with 8-Bit Data, Parity, 1 Stop Bit, RTS Function is Not Used)



Note 1. See **4.6 Interrupt Controller** for details on the corresponding interrupt vector number.

Figure 7.3-19 Example of SCI Operation for Serial Reception in Asynchronous Mode (2) (Example with 8-Bit Data, Parity, 1 Stop Bit, RTS Function is Used)

Table 7.3-25 lists the states of the flags in CSR status register and receive data handling when a receive error is detected. If a receive error is detected, an ERI interrupt request is generated but an RXI interrupt request is not generated. Data reception cannot be resumed while the receive error flag is 1. Accordingly, set the ORER, FER, and PER bits to 0b before resuming reception. Moreover, be sure to read the RDR during overrun error processing. When a reception is forcibly terminated by setting CCR0.RE bit to 0b during operation, read the RDR register because received data which has not yet been read may be left in RDR. **Figure 7.3-20** and **Figure 7.3-21** show samples of flowcharts for serial data reception.

Table 7.3-25 Flags in the CSR Status Register and Receive Data Handling

Flags in the CSR Status Register			Receive Data	Receive Error Type
ORER	FER	PER		
1	0	0	Lost	Overrun error
0	1	0	Transferred RDR	Framing error
0	0	1	Transferred RDR	Parity error
1	1	0	Lost	Overrun error + Framing error
1	0	1	Lost	Overrun error + Parity error
0	1	1	Transferred RDR	Framing error + Parity error
1	1	1	Lost	Overrun error + Framing error + Parity error

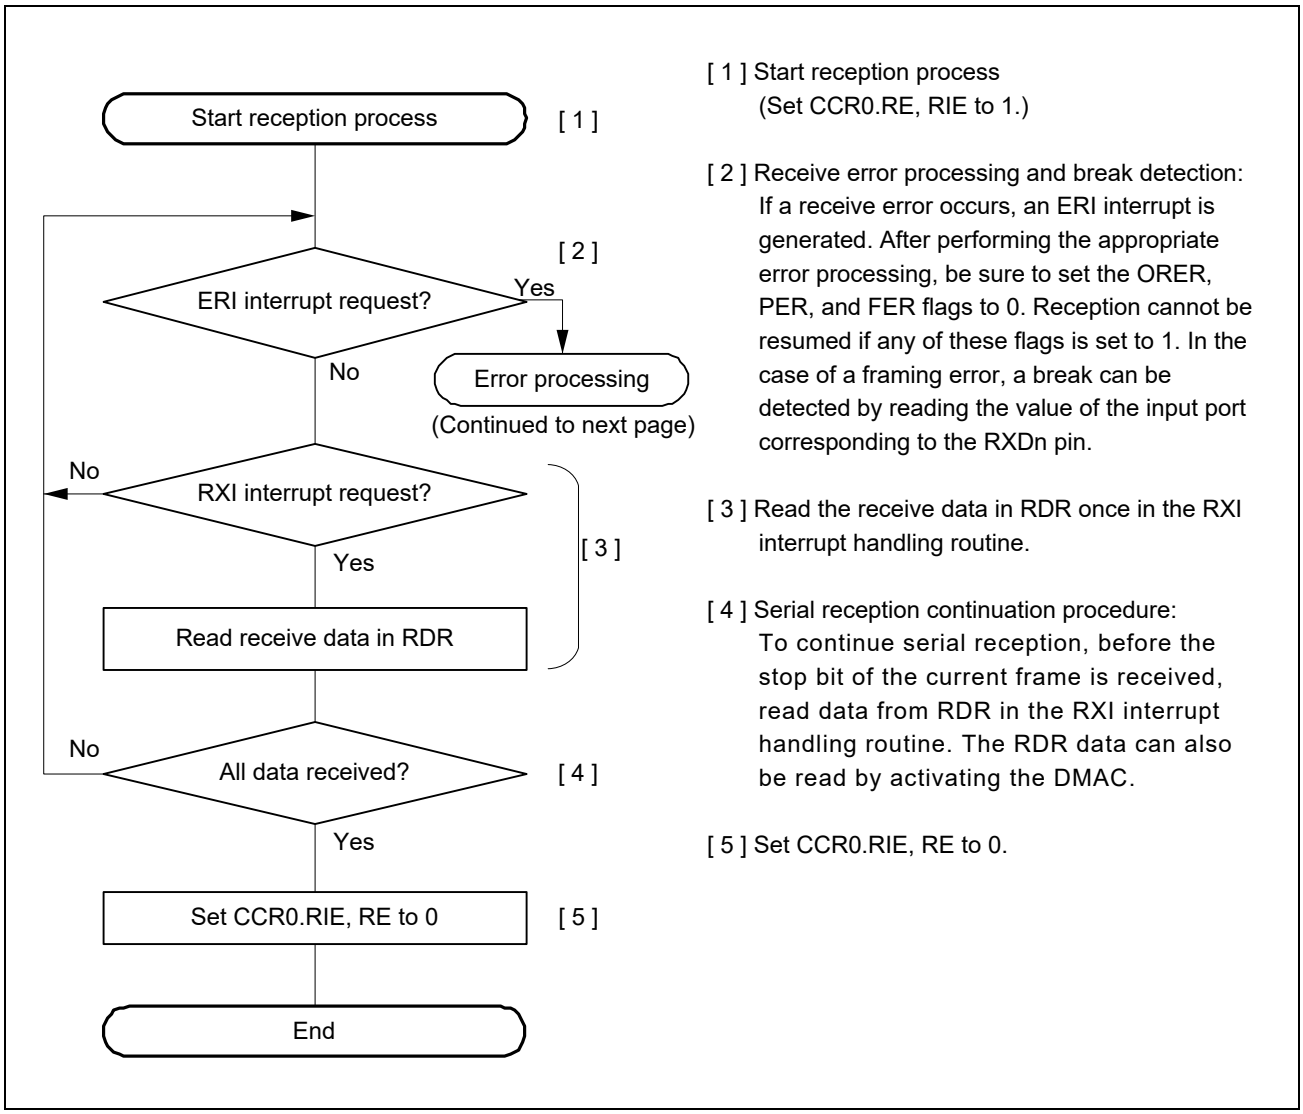


Figure 7.3-20 Example Flowchart of Serial Reception in Asynchronous Mode (Non-FIFO Selected) (1)

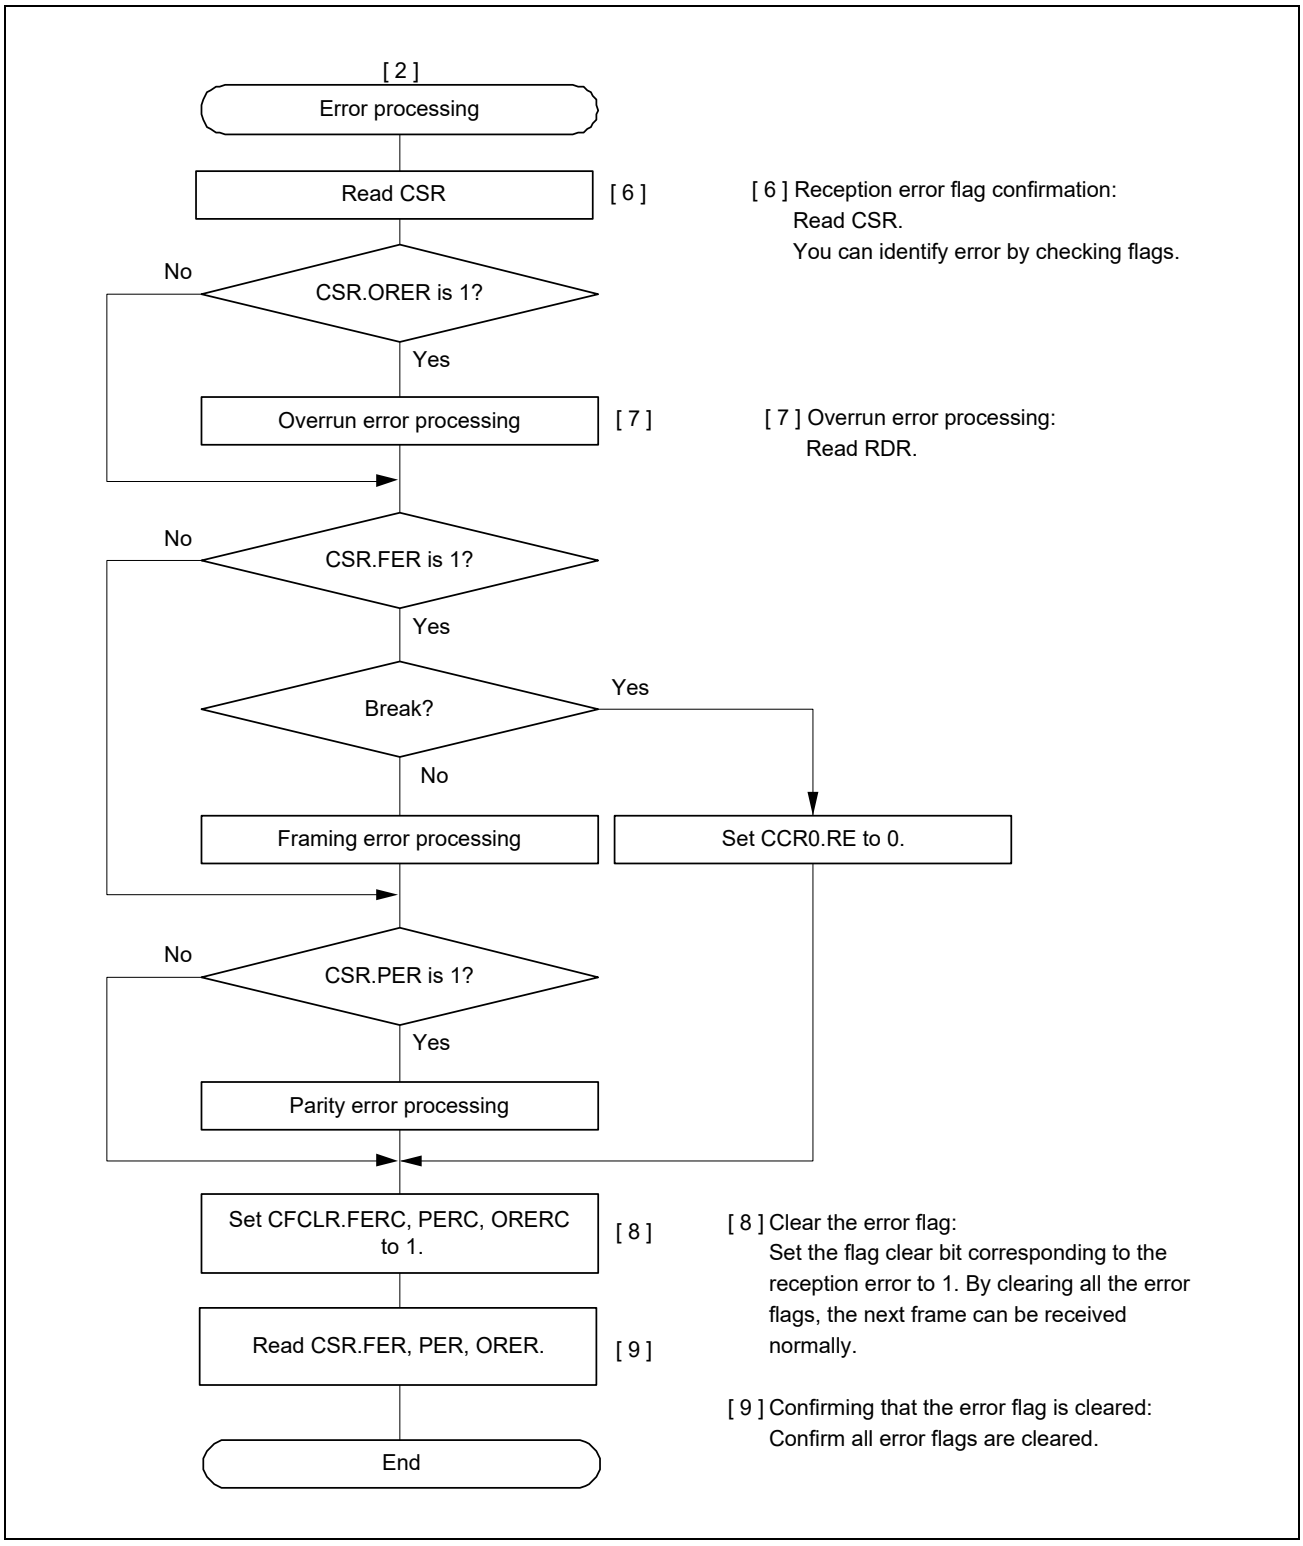

Figure 7.3-21 Example Flowchart of Serial Reception in Asynchronous Mode (Non-FIFO Selected) (2)

(2) FIFO selected

Figure 7.3-22 shows an example of data format that is stored to receive FIFO (RDR) in asynchronous mode.

MPB (Receive FIFO (RDR) bit 9) is stored 0. Data is stored to receive FIFO (RDR) corresponded to data length. It is stored 0 for unused bits. If reading receive FIFO (RDR), SCI updates to next data which are FER, PER and receive data

(RDAT[8:0]) in receive FIFO. The flags which are BRK, RDRF, ORER and DR in receive FIFO, are always indicated to the flags corresponded to CSR register.

Data Length	Register Setting CCR3.CHR[1:0]		Receive flag in RDR[31:0], MPB, RDAT[8:0] b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
7 bits	1	1	—	—	—	FFER	FPER	DR	MPB	0	0	RDAT[6:0]						
8 bits	1	0	—	—	—	FFER	FPER	DR	MPB	0	RDAT[7:0]							
9 bits	0	x	—	—	—	FFER	FPER	DR	MPB	RDAT[8:0]								
Data Length	Register Setting CCR3.CHR[1:0]		b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
7 bits	1	1	—	—	—	FER	PER	—	—	ORER	—	—	—	—	—	—	—	—
8 bits	1	0	—	—	—	FER	PER	—	—	ORER	—	—	—	—	—	—	—	—
9 bits	0	x	—	—	—	FER	PER	—	—	ORER	—	—	—	—	—	—	—	—

Note: The MPB flag, the RDR[9] bit, is always read as 0b.
When a 7-bit data length is selected, the RDAT[8:7] bits are read as 00b.
When an 8-bit data length is selected, the RDAT[8] bit is read as 0b.

Figure 7.3-22 Data Format that is Stored to Receive FIFO (RDR) (FIFO Selected)

Table 7.3-26 lists the states of the flags in CSR status register and receive data handling when a receive error is detected with FIFO selected. **Figure 7.3-23** and **Figure 7.3-24** show samples of flowcharts for serial data reception with FIFO selected.

In serial data reception, the SCI operates as described below.

1. When the value of CCR0.RE becomes 1b, the output signal on the RTSn# pin goes to the low level in the case of RTS function use.
2. When the SCI monitors the communications line and detects a start bit, it performs internal synchronization, stores receive data in RSR, and checks the parity bit and stop bit.
3. If there is no space in RDR, CSR.ORER is set to 1b. If CCR0.RIE is 1b at this time, an ERI interrupt request is generated. Receive data is not transferred to receive FIFO (RDR).
4. If a parity error is detected, CSR.PER is set to 1b and receive data is transferred to receive FIFO (RDR). If the CCR0.RIE is 1b at this time, an ERI interrupt request is generated.
5. If a framing error (when the stop bit is 0b) is detected, CSR.FER is set to 1b and receive data is transferred to RDR. If CCR0.RIE is 1b at this time, an ERI interrupt request is generated.
6. After framing error is detected, when SCI detects that continuous receive data is 0b for 1 frame, reception stops.
7. When quantity of data stored in the receive FIFO data register (RDR) falls the specified receive triggering number, and that no next data has been received yet after the elapse of 15 etu from the last stop bit in asynchronous mode, FRSR.DR is set to 1b. If RIE bit is set to 1b, SCI occurs RXI interrupt request when FCR.DRES bit is 0b and SCI occurs ERI interrupt request when FCR.DRES = 1b.
8. When reception finishes successfully, receive data is transferred to receive FIFO (RDR). RDRF is set to 1b when the quantity of receive data which is equal to or greater than the specified receive triggering number are stored in receive FIFO (RDR). If CCR0.RIE is 1b at this time, an RXI interrupt request is generated. Continuous reception

is enabled by reading the receive data transferred to receive FIFO (RDR) in this RXI interrupt handling routine before overrun error is occurred. Reading the received data that have been transferred to receive FIFO (RDR), and if it is less than RTS trigger number, causes the RTSn# pin to output the low level in the case of RTS function use.

Table 7.3-26 Flags in the CSR Status Register and Receive Data Handling (FIFO Selected)

CSR Value			Receive FIFO (RDR)	
ORER	FER*1	PER*1	RDAT[8:0]	Receive Error Type
1	0	0	Lost	Overrun error
0	1	0	Transferred RDR	Framing error
0	0	1	Transferred RDR	Parity error
1	1	0	Lost	Overrun error + Framing error
1	0	1	Lost	Overrun error + Parity error
0	1	1	Transferred RDR	Framing error + Parity error
1	1	1	Lost	Overrun error + Framing error + Parity error

Note 1. This flag indicates whether there is an error in received data when reception is completed.

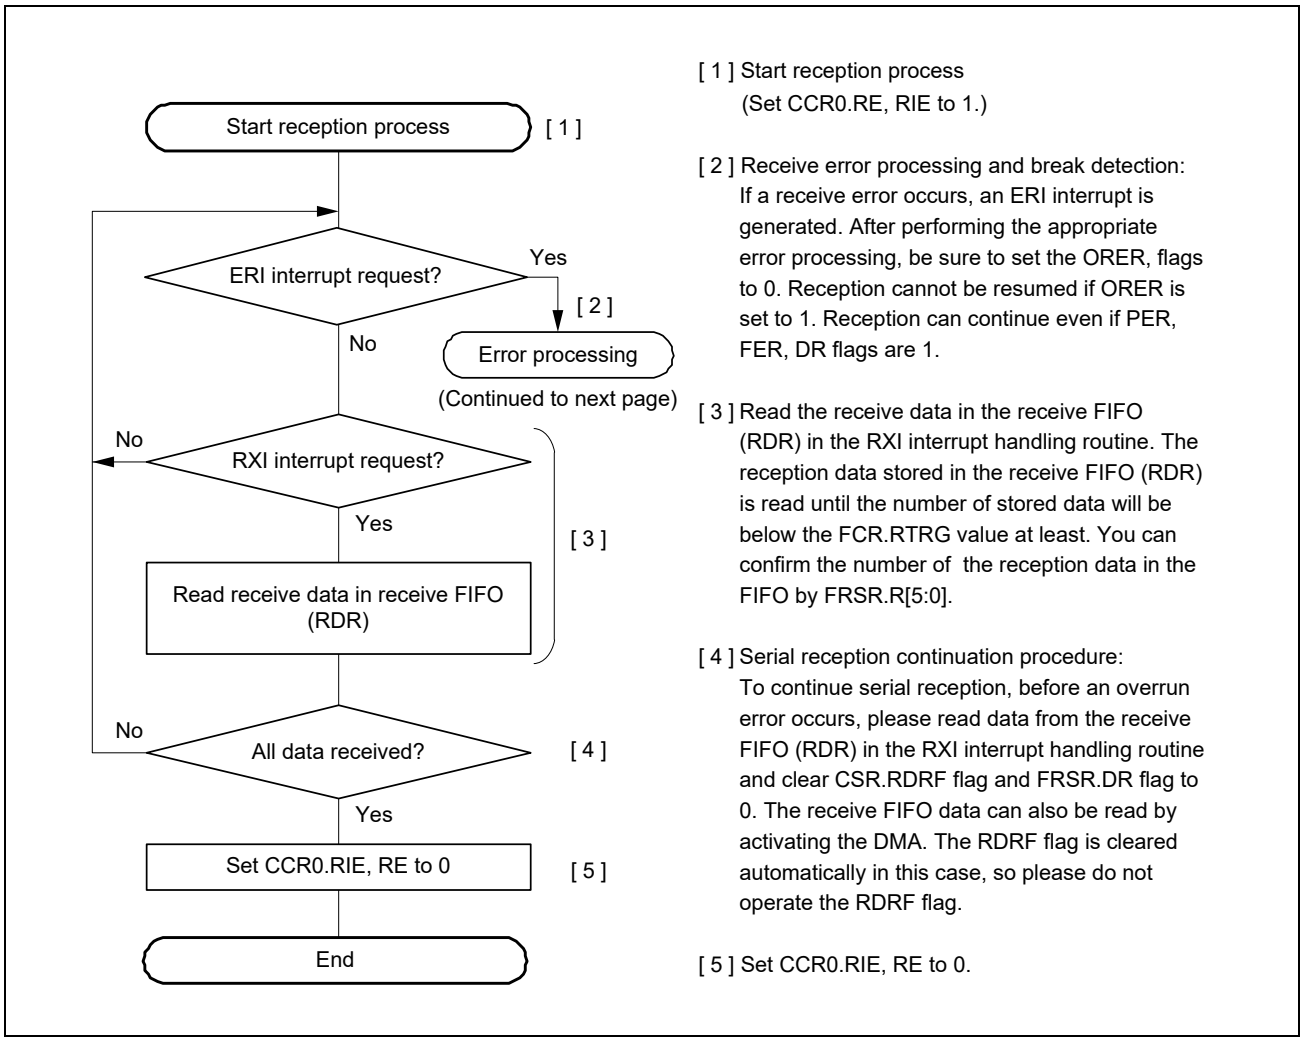

Figure 7.3-23 Example Flowchart of Serial Reception in Asynchronous Mode (FIFO Selected) (1)

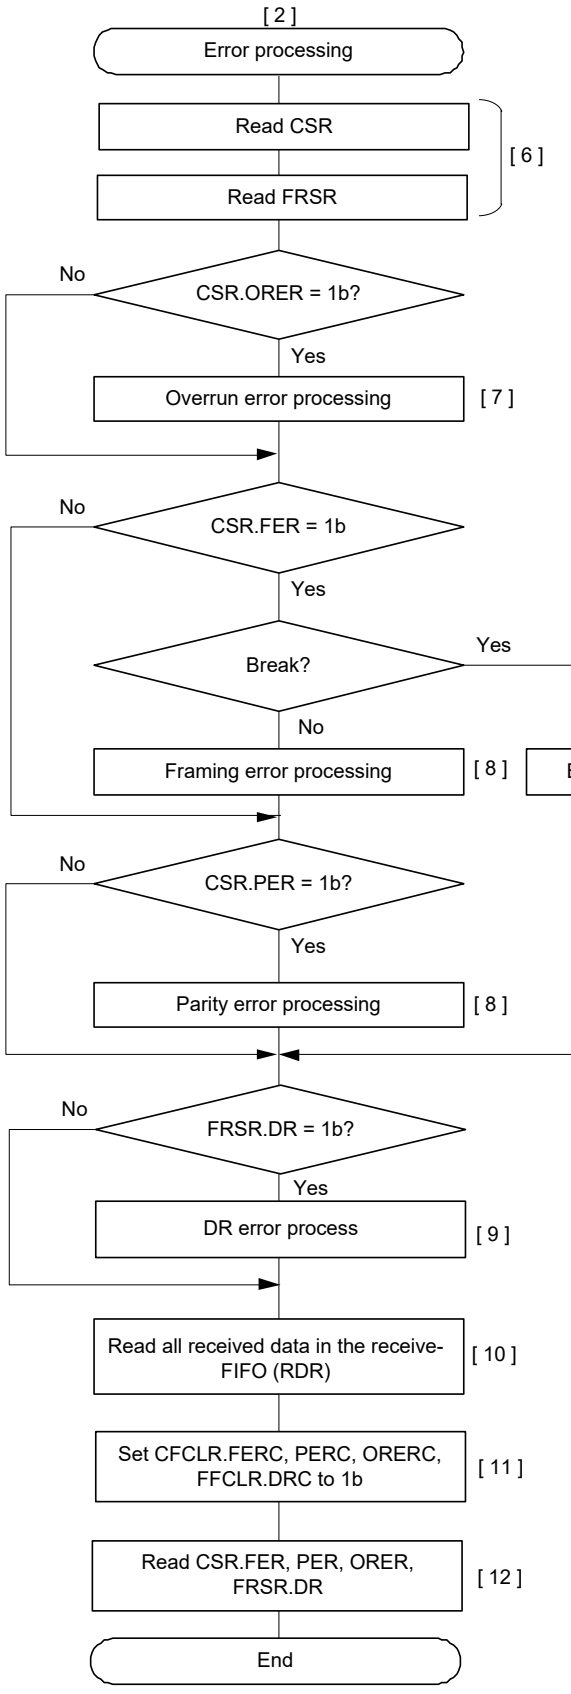


[6] Reception error flag confirmation:
Read CSR and FRSR.
You can identify error by checking flags.

[7] Overrun error processing:
Read the receive FIFO (RDR) and make space in the receive FIFO (RDR).

[8] Break processing:
When CCR3.RXDESEL is 0b, the latest receive data in the receive FIFO (RDR) is the break-data which has framing error and all data-bits are 0b. So, discard the latest receive data.

[8] Framing error / Parity error processing:
Read all error occurrence data stored in the receive FIFO (RDR). (You can substitute to write 1b in FCR.RFRST bit and empty the receive FIFO (RDR).)
When [10] is handled in addition to this processing, the next frame can be normally received.

[9] DR error process when FCR.DRES is 1b.
Performs error processing required for the system (for example, setting a counter for data number management).

[10] Read all received data in the receive-FIFO (RDR).

[11] Clear the error flag:
Make clear FER, PER, ORER, DR

[12] Confirming that the error flag is cleared:
Confirm FER, PER, ORER, DR are cleared.

Figure 7.3-24 Example Flowchart of Serial Reception in Asynchronous Mode (FIFO Selected) (2)

7.3.3.10 The Function of Adjust Receive Sampling Timing (Asynchronous Mode)

When there is the difference between the rising transfer time and the falling transfer time through a photo coupler, the receive sampling timing at middle of bit affects the reception margin. In this case, the receive sampling timing can adjust from the middle of bit to the optimum timing by using this function.

The receive sampling timing is adjusted from the middle of bit by following formula. And the adjustable direction is set by CCR4.AJD. You can select forward or backward from the middle of bit. When adjusting backward (CCR4.AJD = 0b), substitute AJD = +1 and substitute AJD = -1 when adjusting forward (CCR4.AJD = 1b).

Adjusted sampling timing = the middle of bit + AJD × (base clock × the setting value of CCR4.AST[2:0]) The setting timing is limited by base clock cycles per 1 bit. Please see **Table 7.3-27** in detail.

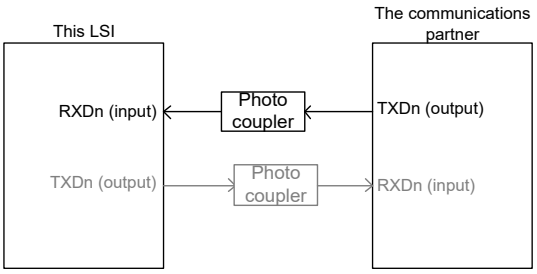
A reception movement image figure of the communication through a photo coupler with this function is shown in **Figure 7.3-25** and **Figure 7.3-26**, the movement explanation of this function is shown in **Figure 7.3-27**.

Do not use this function when there is no difference between the rising transfer time and the falling transfer time, because there is a possibility of deteriorating the reception margin.

Table 7.3-27 The Acceptable Value of Setting Register (Asynchronous Mode Using Internal Clock)

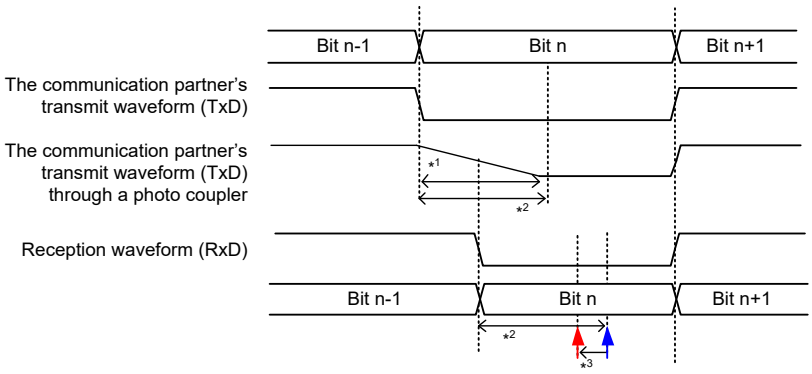
CCR2.ABCSE	CCR2.ABCS	The Number of Base Cycles/1 Bit	The Acceptable Value	
			CCR4.AJD	CCR4.AST
1	x	6	0	000b to 010b*1
			1	
0	1	8	0	000b to 011b*1
			1	
0	0	16	0	000b to 111b
			1	

Note 1. When the value of CCR4.AST is over the acceptable value, sampling is done at default timing. (Adjustment of sampling is not done.)



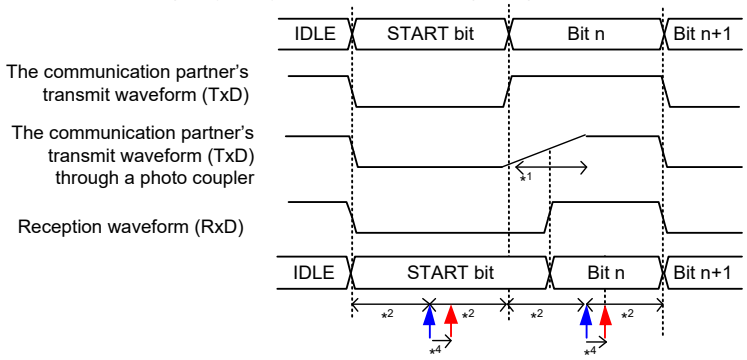
(a) In the case of the falling transfer time >> rising transfer time

The falling edge of reception waveform is made dull like following chart.
In this case, you can sampling at the middle of bit if you adjust the receive sampling timing to forward (AJD = 1b).



(b) In the case of the falling transfer time << rising transfer time

The rising edge of reception waveform is made dull like following chart.
So, the reception margin of communications partner will be bad. In this case, you can improve the reception margin if you adjust the receive sampling timing to back.



The receive sampling timing when unadjusted (middle of bit)

The adjusted receive sampling timing

Note: This waveform shows the operation image of adjustment receive sampling timing.

Note 1. The dull period by a photo coupler

Note 2. Bit center timing at set communication rate

Note 3. When CCR4.AJD is 1b, the receive sampling timing is shifted to forward by the setting value of CCR4.AST[2:0].

Note 4. When CCR4.AJD is 0b, the Receive sampling timing is shifted to backward by the setting value of CCR4.AST[2:0].

Figure 7.3-25 The Reception Movement Image Figure of the Communication through a Photo Coupler

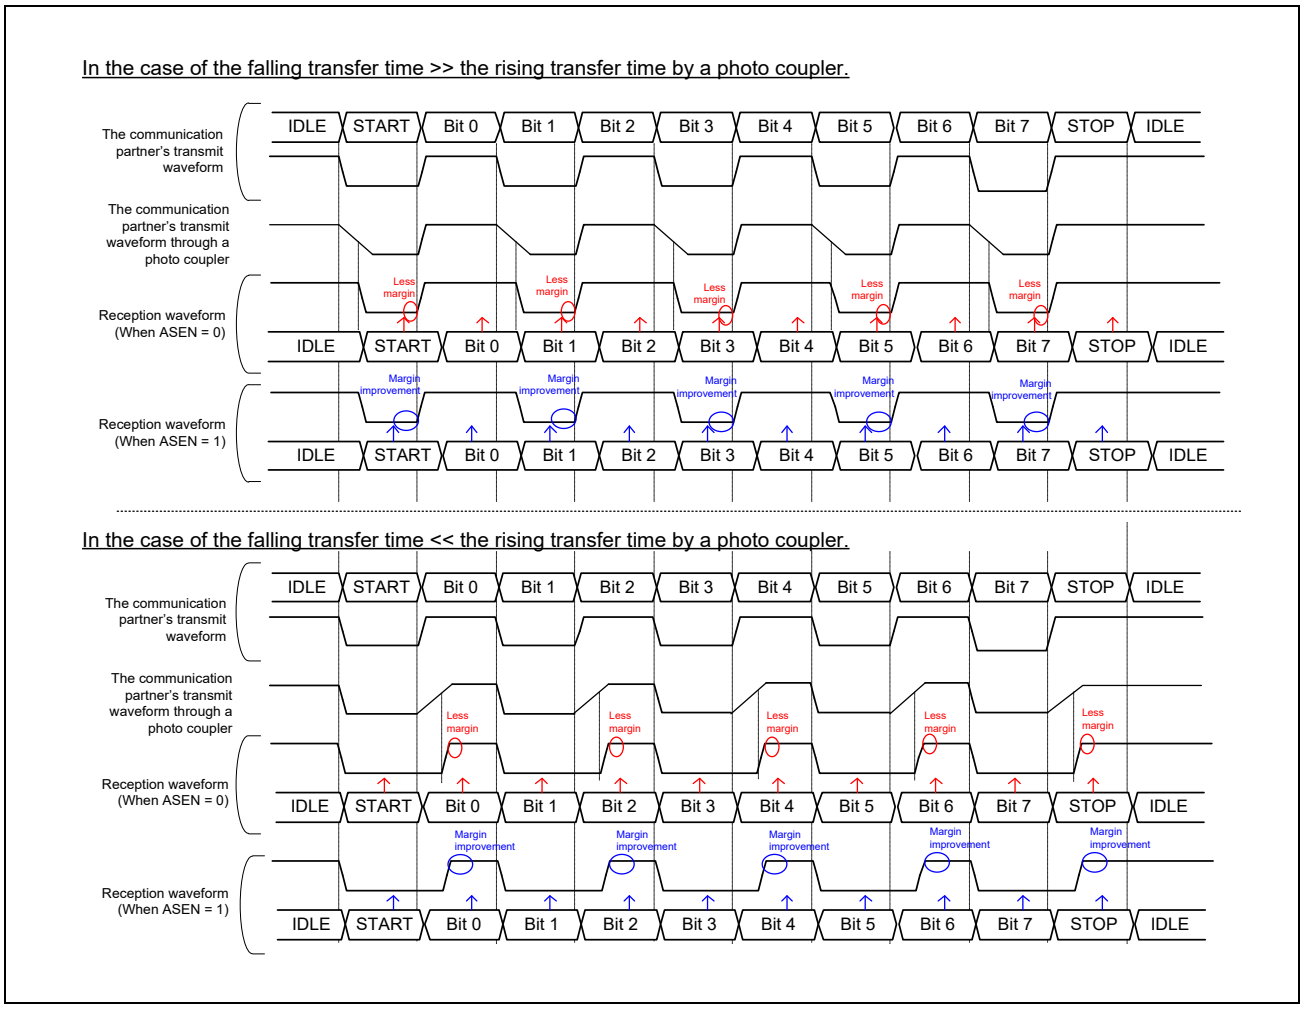


Figure 7.3-26 Improvement of Reception Margin when Receive Sampling Timing Adjustment Function Image

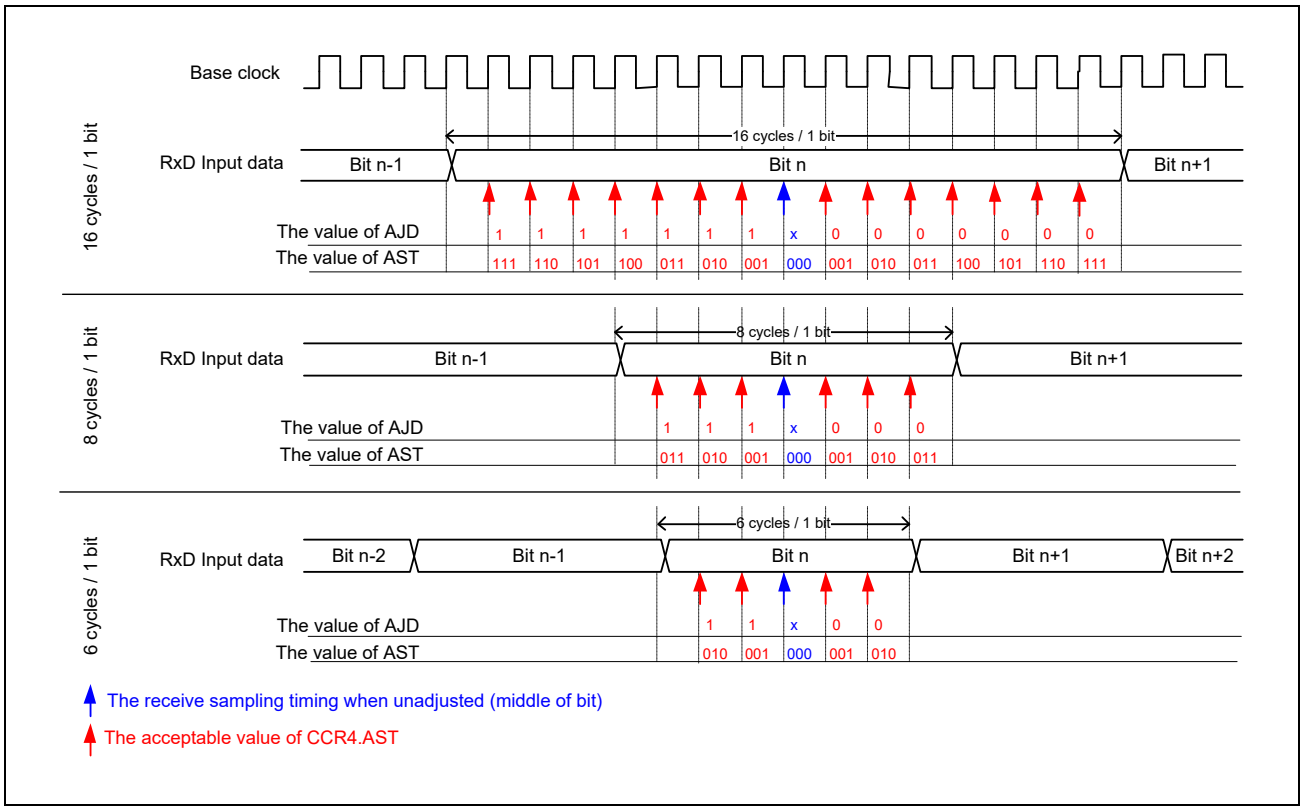

Figure 7.3-27 The Adjustment Operation Explanation for the Receive Sampling Timing (Asynchronous Mode Using Internal Clock)

7.3.3.11 The Function of Adjust Transmit Timing (Asynchronous Mode)

In communication via a photo coupler or the like, when either the rising or falling transition time of the TxD output signal is long, then a communication partner receive dulled waveform. In this case, the reception margin may be affected.

In these cases, make a communication partner to be sampling at middle of bit using the function of adjust transmit timing. When CCR4.ATEN is 1b, this function can adjust the edge timing at the timing calculated by the following formula for the edge set with CCR4.AET.

$$\text{The adjustment edge timing} = \text{base clock} \times \text{CCR4.ATT}[2:0]$$

In addition, the upper limit of the adjustment edge timing is limited by setting the base clock cycles. For details, see **Table 7.3-28**.

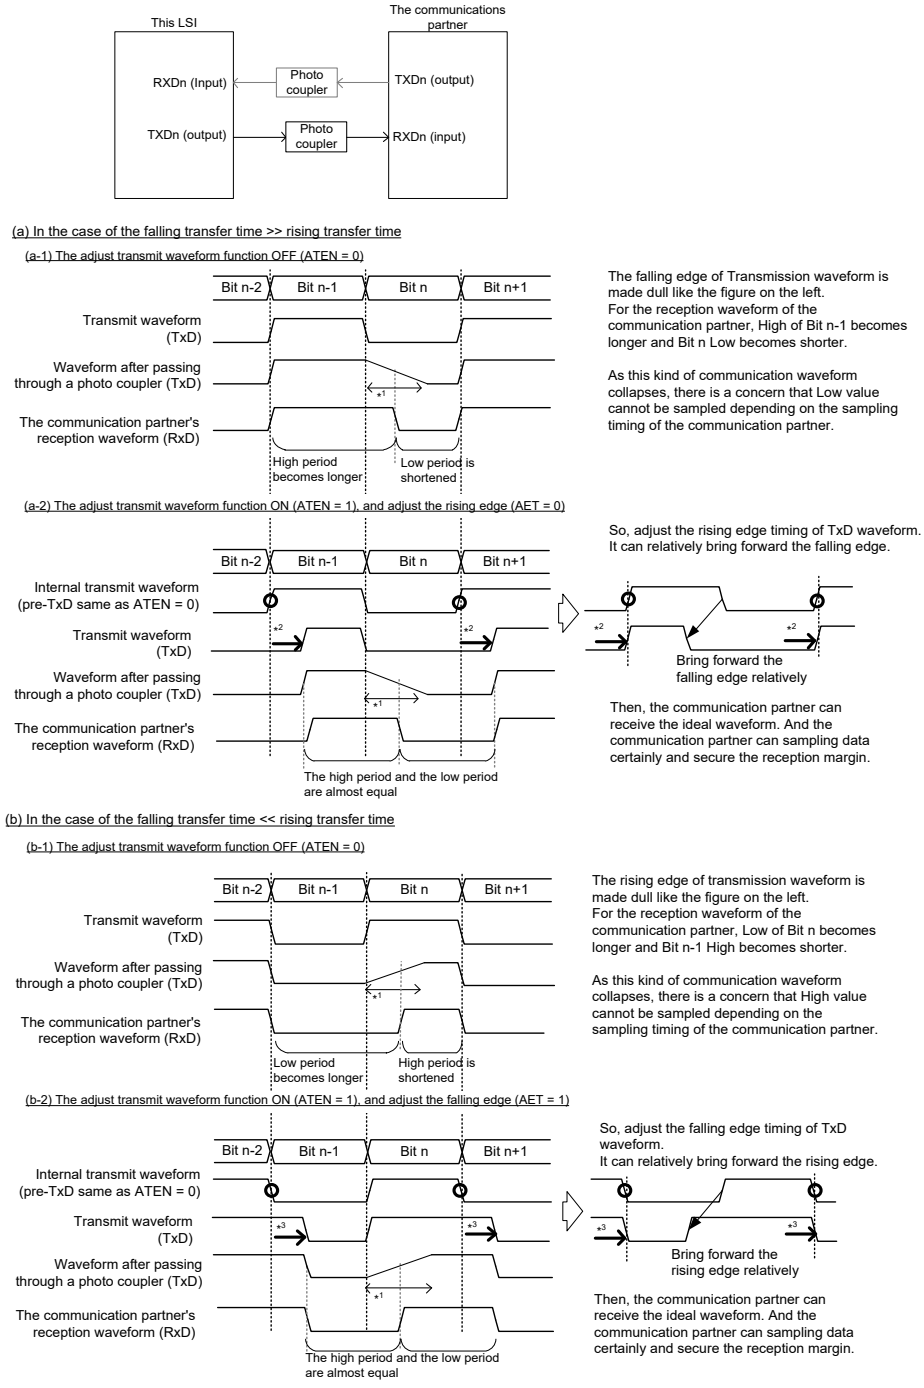
A transmission movement image figure of the communication through a photo coupler with this function is shown in **Figure 7.3-28** and **Figure 7.3-29**, the movement explanation of this function is shown in **Figure 7.3-30** and **Figure 7.3-31**.

Do not use this function when there is not the difference between the rising transfer time and the falling transfer time, there is a possibility of deteriorating the reception margin of a communication partner.

Table 7.3-28 The Acceptable Value of CCR4.AET and CCR4.ATT (Asynchronous Mode Using Internal Clock)

ABCSE	ABCS	The Number of Base Clock Cycles/1 Bit	The Acceptable Value	
			AET	ATT[2:0]
1	x	6	0	000b to 101b
			1	
0	1	8	0	000b to 111b
			1	
0	0	16	0	000b to 111b
			1	

Note: When the value of CCR4.AET/ATT is out of the acceptable value, this module does not adjust transmit timing.



Note 1. The dull period by a photo coupler

Note 2. When CCR4.AET is 0b, the rising edge of transmit waveform timing is shifted to back by the setting value of CCR4.ATT[2:0]. It can transmit waveform bringing forward the falling edge relatively.

Note 3. When CCR4.AET is 1b, the falling edge of transmit waveform timing is shifted to back by the setting value of CCR4.ATT[2:0]. It can transmit waveform bringing forward the rising edge relatively.

Note: This waveform shows the operation image of adjustment transmit waveform.

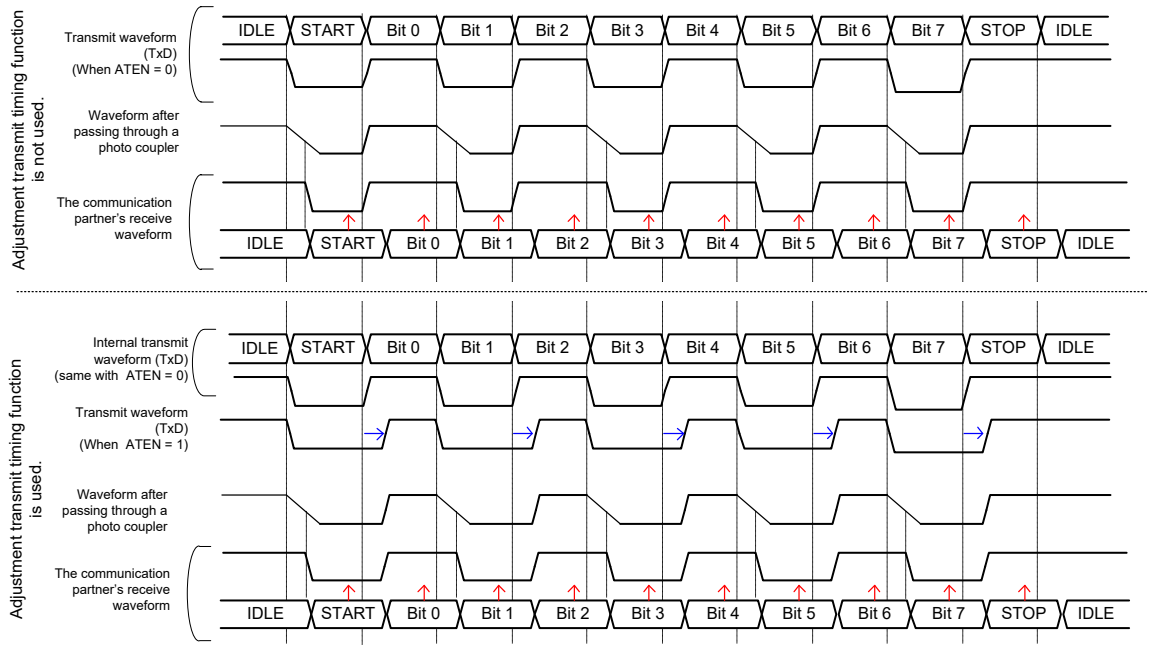
Figure 7.3-28 The Transmission Movement Image Figure of the Communication through a Photo Coupler

The explanation of transmit waveforms of the communication through a photo coupler using adjust transmit timing function

When using the transmission timing adjustment function, adjust the edge timing of the transmission waveform and correct the reception waveform of the communication partner

The following example is 8 bit long data.

(a) In the case of the falling edge transfer time >> the rising transfer time



(b) In the case of the falling edge transfer time << the rising transfer time

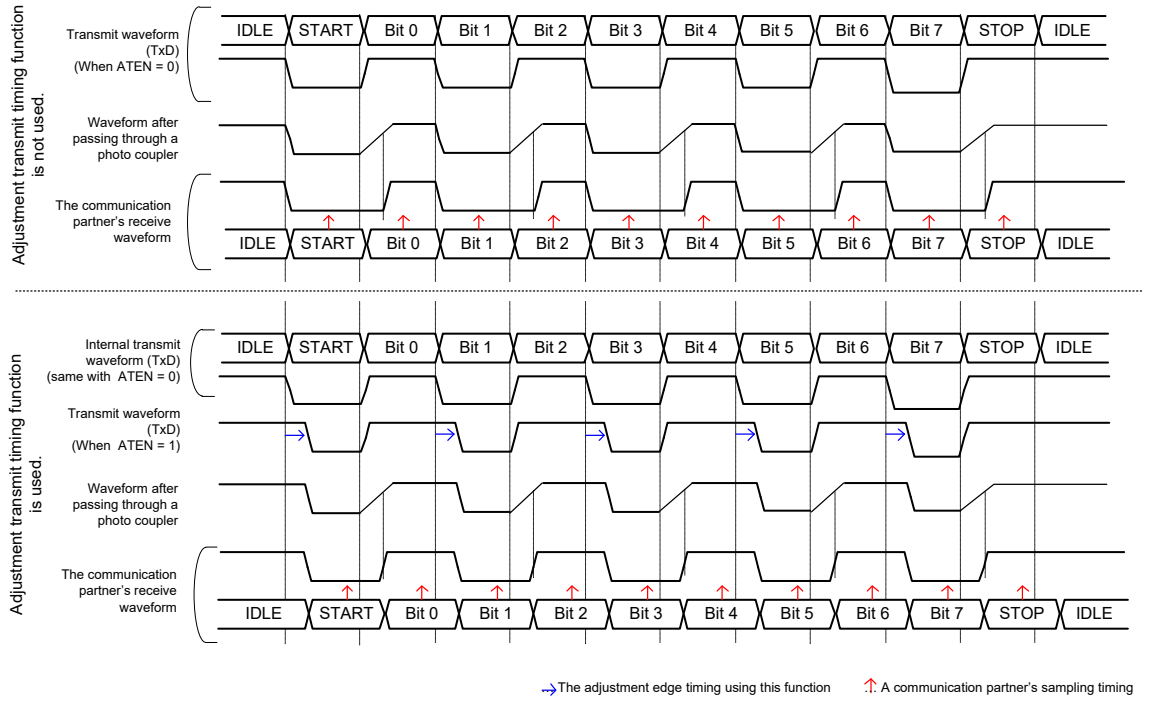


Figure 7.3-29 The Explanation for the Transmit Waveform through a Photo Coupler

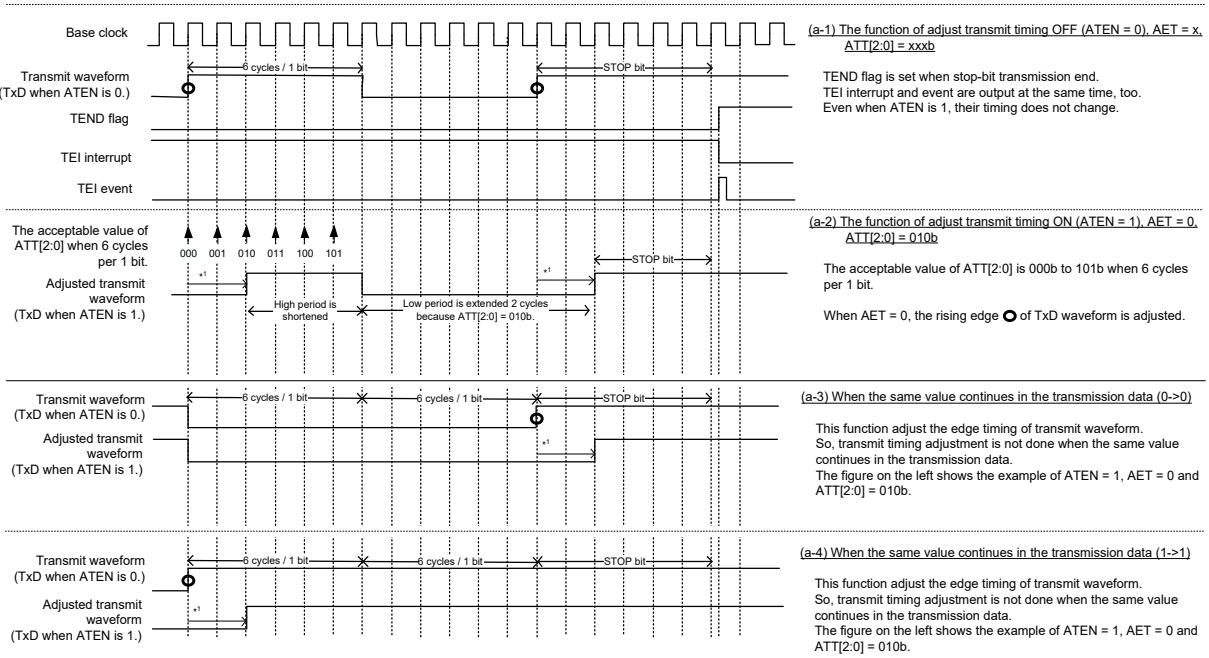
The operation explanation of adjustment the transmit timing

(a) In the case of the falling transfer time >> rising transfer time

In this case, the high period of a communication partner's reception waveform is made long, and the low period is made short.
Therefore, the LSI transmits the waveform with the falling edge relatively brought forward by adjusting the rising edge timing.
Then adjust value (ATT[2:0]) should be set to make equal the low-period/1 bit and high-period/1 bit for a communication partner.

This function's operation is explained as an example of 6 cycles/1 bit.



Note 1. The rising edge of transmit timing is shifted to back by the setting value of CCR4.ATT[2:0].

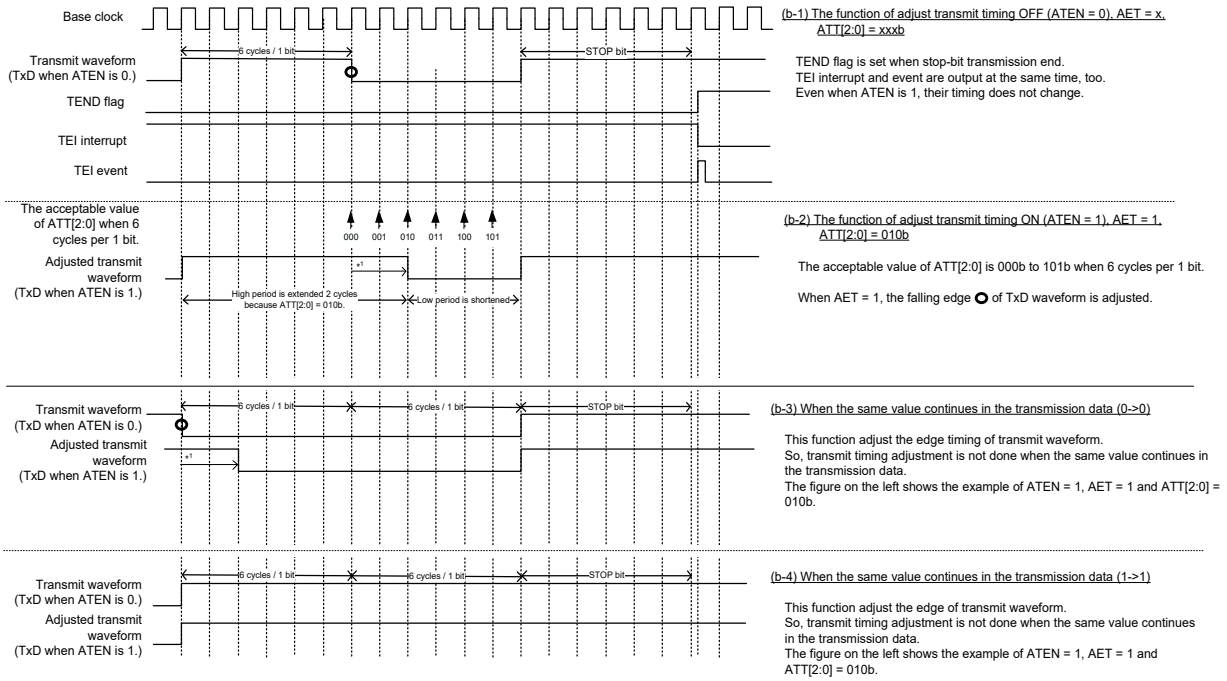
Figure 7.3-30 The Adjustment Operation Explanation for the Transmit Timing when AET is 0b

The operation explanation of adjustment the transmit timing

(b) In the case of the falling transfer time << rising transfer time

In this case, the low period of a communication partner's reception waveform is made long, and the high period is made short.
Therefore, the LSI transmits the waveform with the rising edge relatively brought forward by adjusting the falling edge timing.
The adjust value (ATT[2:0]) should be set to make equal the low-period/1 bit and high-period/1 bit for a communication partner.

This function's operation is explained as an example of 6 cycles/1 bit.



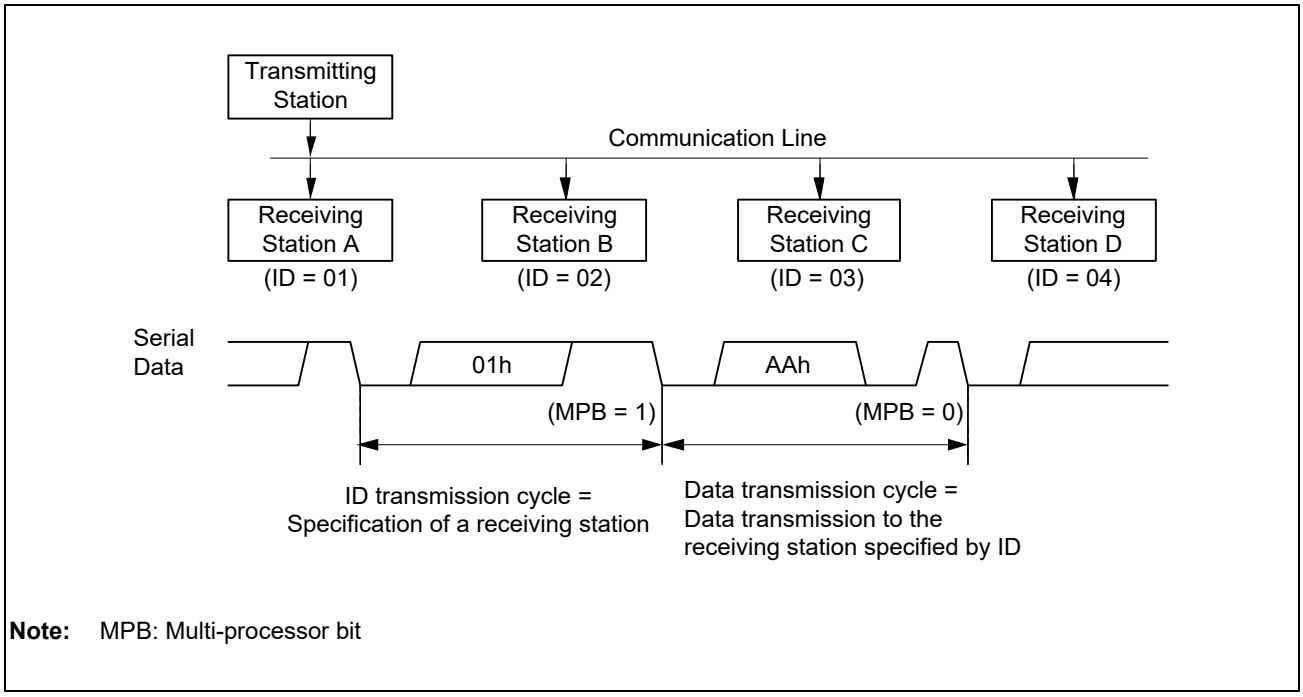
Note 1. The falling edge of transmit timing is shifted to back by the setting value of CCR4.ATT[2:0].

Figure 7.3-31 The Adjustment Operation Explanation for the Transmit Timing when AET is 1b

7.3.4 Multi-Processor Communication Function

Using the multi-processor communication functions enables to transmit and receive data by sharing a communication line between multiple processors by using asynchronous serial communication in which the multi-processor bit is added. In multi-processor communication, a unique ID code is allocated to each receiving station. Serial communication cycles consist of an ID transmission cycle to specify the receiving station and a data transmission cycle to transmit data to the specified receiving station. The multi-processor bit is used to distinguish between the ID transmission cycle and the data transmission cycle. When the multi-processor bit is set to 1b, it indicates the ID transmission cycle and when the multiprocessor bit is set to 0b, it indicates the data transmission cycle. **Figure 7.3-32** shows an example of communication between processors by using a multi-processor format. First, a transmitting station transmits communication data in which the multi-processor bit set to 1b is added to the ID code of the receiving station. Next, the transmitting station transmits the communication data in which the multi-processor bit set to 0b is added to the transmit data. On receiving the communication data in which the multi-processor bit is set to 1b, the receiving station compares the received ID with the ID of the receiving station itself and if the two matches, receives the communication data that is subsequently transmitted. If the received ID does not match with the ID of the receiving station, the receiving station skips the communication data until again receiving the communication data in which the multi-processor bit is set to 1b.

RTS control cannot be used at the time of multi-processor communication function use, because this is a function corresponding to one-to-many communications.



Note: MPB: Multi-processor bit

Figure 7.3-32 An Example of Communication Using the Multi-Processor Format (Example of Transmission of Data AAh to Receiving Station A)

(1) Non-FIFO selected

For supporting this function, the SCI provides the MPIE bit in CCR0. When the MPIE bit is set to 1b, transfer of receive data from the RSR to the RDR, detection of a receive error, and setting the respective status flags RDRF, ORER, and FER in CSR are disabled until reception of data in which the multi-processor bit is set to 1b.

On receiving a reception character in which the multi-processor bit is set to 1b, the MPB bit in RDR is set to 1b and the MPIE bit in CCR0 is automatically cleared, thus returning to a non-multi-processor reception operation. At this time, an RXI interrupt is generated if the RIE bit in CCR0 is set.

When the multi-processor format is specified, specification of the parity bit is disabled.

Apart from this, there is no difference from the operation in the non-multi-processor asynchronous mode. A clock which is used for the multi-processor communication is also the same as the clock used in the non-multi-processor asynchronous mode.

(2) FIFO selected

For transmission, it should write to TDR.MPBT (Multi-Processor Bit Transfer) which corresponds to transmit data in TDR.TDAT. For reception, Multi-processor bit that is a part of receive data, is stored to RDR.MPB, and receive data is stored to RDR.RDAT. When the MPIE bit is set to 1b, transfer of receive data from the RSR to the RDR.RDAT, detection of a receive error, and detection of DR, and setting the respective status flags RDRF, ORER, and FER in CSR are disabled until reception of data in which the multi-processor bit is set to 1b.

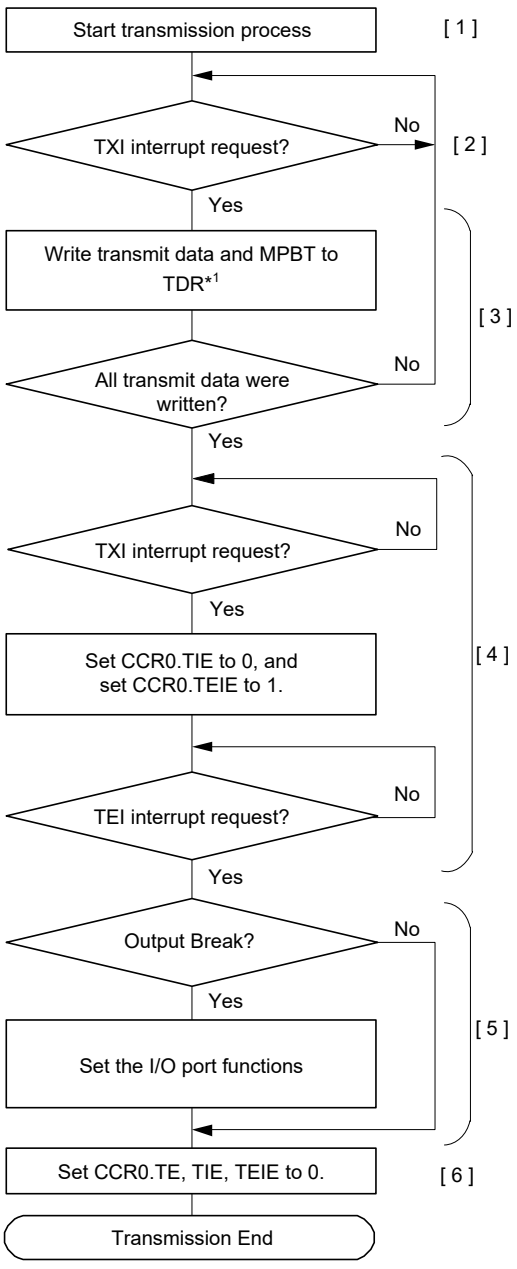
On receiving a reception character in which the multi-processor bit is set to 1b, the MPB bit in RDR is set to 1b, and receive data is stored to receive FIFO (RDR.RDAT), and the MPIE bit in CCR0 is automatically cleared, thus returning to a non- multi-processor reception operation. At this time, an RXI interrupt is generated if the RIE bit in CCR0 is set.

When the multi-processor format is specified, specification of the parity bit is disabled. Apart from this, there is no difference from the operation in the non-multi-processor asynchronous mode and non-FIFO selected.

7.3.4.1 Multi-Processor Serial Data Transmission

(1) Non-FIFO selected

Figure 7.3-33 shows a sample flowchart of multi-processor data transmission. In the ID transmission cycle, the ID should be transmitted with the MPBT bit in TDR set to 1b. In the data transmission cycle, the data should be transmitted with the MPBT bit set to 0b. The other operations are the same as the operations in asynchronous mode.



[1] Start transmission process:
To enable TXI interrupt at the start of transmission, set TE and TIE to 1 with one instruction at the same time. And set CCR3.MP to 1.

[2] TXI interrupt request:
The transmit-data-empty-interrupt (TXI) is generated at following conditions:
When set TE and TIE to 1 at same time.
When transmission-data forwards to TSR from TDR.

[3] Serial transmission continuation procedure:
To continue serial transmission write transmit data and MPBT setting value to TDR*1 once by using a TXI. Transmit data and MPBT setting value can also be written by activating the DMAC.

[4] If you use TEI, set TIE = 0 and TEIE = 1 after writing the last-transmit-data to TDR*1 and transmission is started.

[5] Break output at the end of serial transmission:
To output a break, it is necessary to set SPB2IO and SPB2DT, for output status setting when TE is 0.
(If you set these bits at initialization, you can skip this step.)

[6] Set CCR0.TE, TIE, TEIE to 0.

Note 1. In case of byte access with data length 9 bits, write transmit data in order of TDR[15:8] and TDR[7:0].

Figure 7.3-33 Example of Multi-Processor Serial Transmission Flowchart (Non-FIFO Selected)

(2) FIFO selected

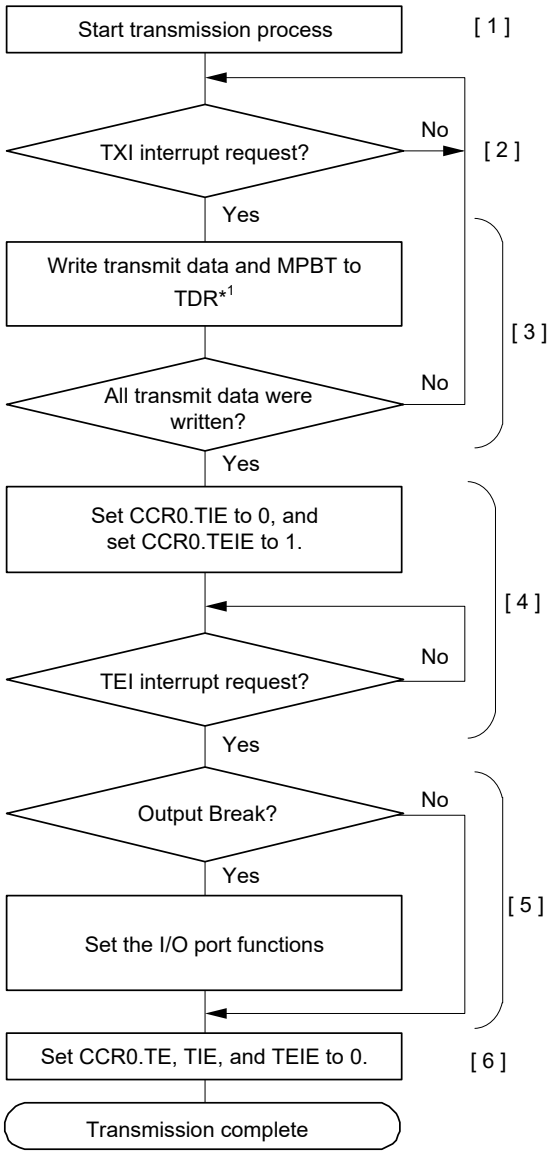
Figure 7.3-34 shows an example of data format that is written to transmit FIFO (TDR.TDAT) in multi-processor mode. Write MPBT in bit 9 of TDR. And write data to transmit FIFO (TDR.TDAT) corresponded to data length. It should write to 0b for unused bits.

Data Length	Register Setting CCR3.CHR[1:0]		Transmit data in TDR[15:0]															
			b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
7 bits	1	1	—	—	—	—	—	—	MPBT	—	—	TDAT[6:0]						
8 bits	1	0	—	—	—	—	—	—	MPBT	—	TDAT[7:0]							
9 bits	0	x	—	—	—	—	—	—	MPBT	TDAT[8:0]								

Note: The bits Indicated by "—" are not used. Therefore, those bits should be set to 0b.

Figure 7.3-34 Data Format in Multi-Processor Mode that is Written to Transmit FIFO (TDR.TDAT)

Figure 7.3-35 shows a sample flowchart for multi-processor data transmission with FIFO selected. In the ID transmission cycle, the ID should be transmitted with the MPBT bit in TDR set to 1b. In the data transmission cycle, the data should be transmitted with the MPBT bit set to 0b. The other operations are the same as the operations in asynchronous mode with FIFO selected.



[1] Start transmission process.
To enable TXI interrupt at he start of transmission, set TE and TIE to 1 with one instructions at the same time. And set CCR3.FM and MP to 1.

[2] TXI interrupt request:
The transmit-data-empty-interrupt (TXI) is generated when transmission-data forwards to TSR from the transmit FIFO (TDR) and the number of transmit-data written in the transmit FIFO is equal to or less than the transmit FIFO threshold.

[3] Serial transmission continuation procedure:
To continue serial transmission, write all transmit data and MPBT setting value to the transmit FIFO (TDR) by using a TXI interrupt. Transmit data and MPBT setting value can also be written to the transmit FIFO (TDR) by activating the DMAC.

[4] If you use TEI, set TIE = 0 and TEIE = 1 after writing the last-transmit-data to TDR*1.

[5] Break output at the end of serial transmission:
To output a break, it is necessary to set SPB2IO and SPB2DT, for output status setting when TE is 0.
(If you set these bits at initialization, you can skip this step.)

[6] Set CCR0.TE, TIE, and TEIE to 0.

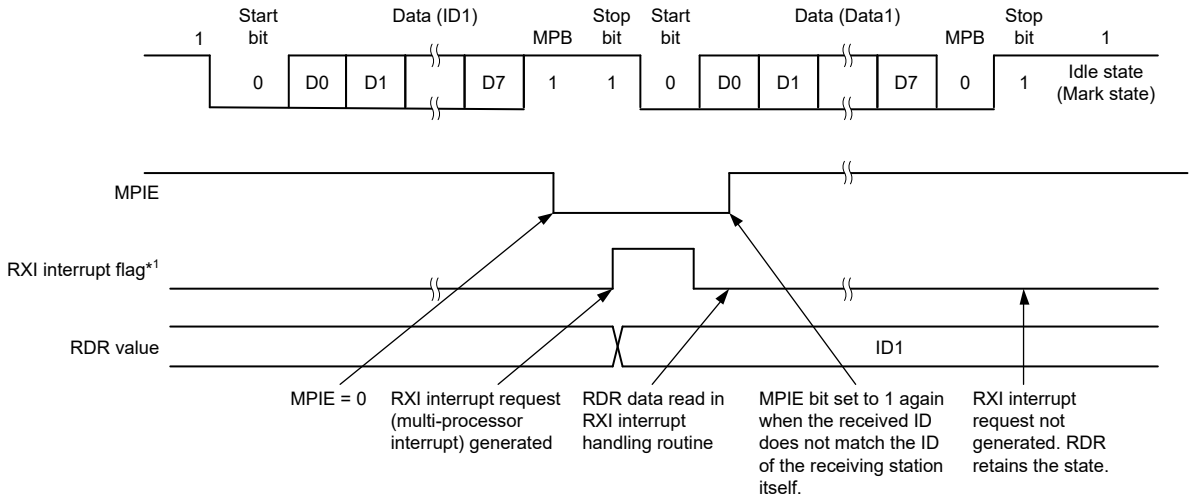
Note 1. In case of byte access with data length 9 bits, write transmit data in order of TDR[15:8] and TDR[7:0].

Figure 7.3-35 Example of Serial Transmission Flowchart in Multi-Processor Mode (FIFO Selected)

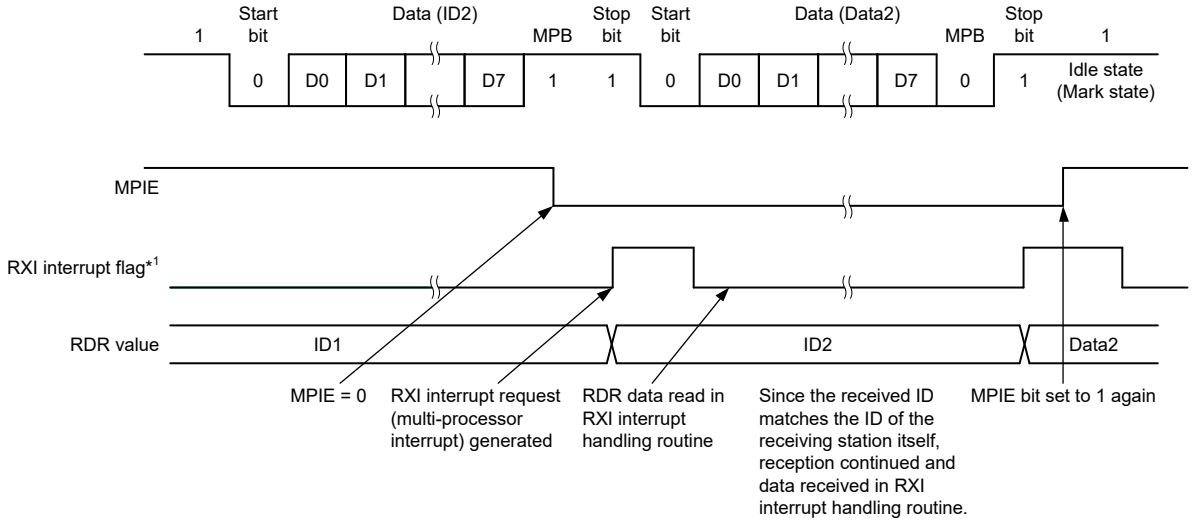
7.3.4.2 Multi-Processor Serial Data Reception

(1) Non-FIFO selected

Figure 7.3-37 and **Figure 7.3-38** are sample flowcharts of multi-processor data reception. When the MPIE bit in CCR0 is set to 1b, reading the communication data is skipped until reception of the communication data in which the multi-processor bit is set to 1b. When the communication data in which the multi-processor bit is set to 1b is received, the received data is transferred to RDR. At this time, the RXI interrupt request is generated. The other operations are the same as the operations in asynchronous mode. **Figure 7.3-36** is the example of operation for reception.



(a) When the received ID does not match the ID of the receiving station itself



(b) When the received ID matches the ID of the receiving station itself

Note 1. See **4.6 Interrupt Controller** for details on the corresponding interrupt vector number.

Figure 7.3-36 Example of SCI Reception (8-Bit Data/Multi-Processor Bit/1 Stop Bit)

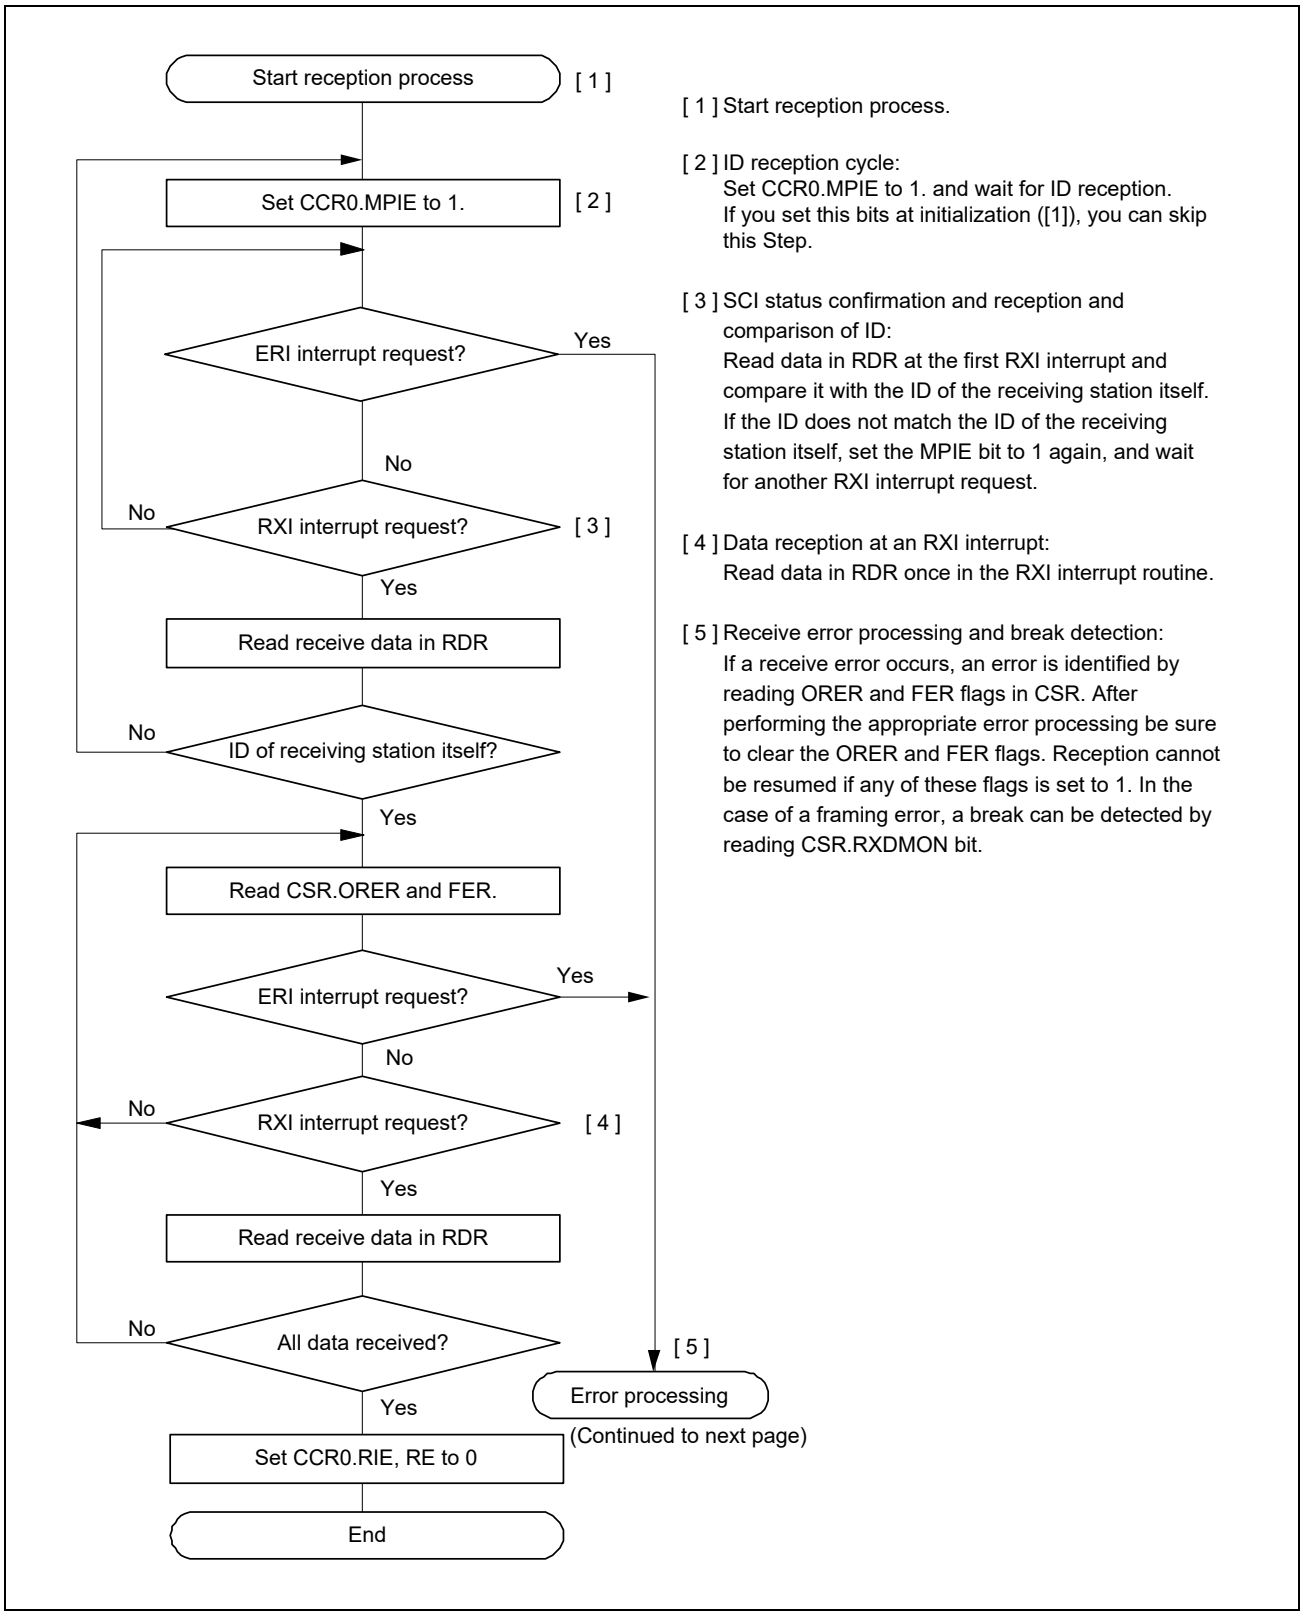


Figure 7.3-37 Example of Multi-Processor Serial Reception Flowchart (1) (Non-FIFO Selected)

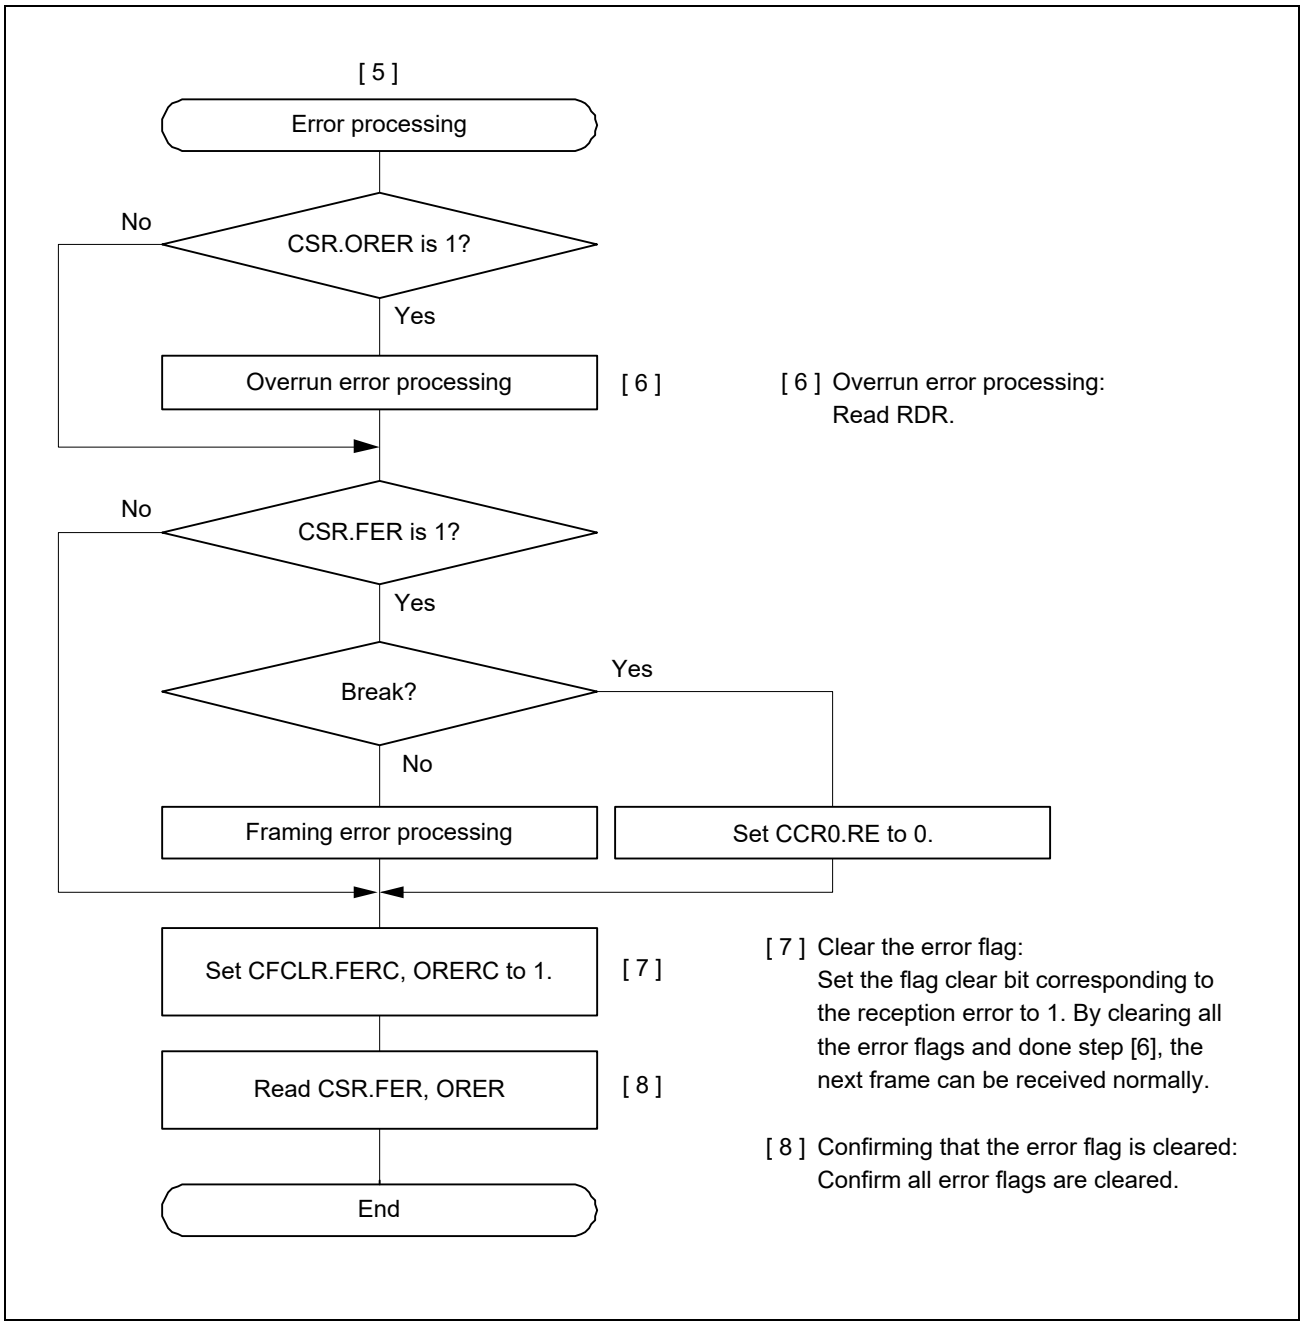

Figure 7.3-38 Example of Multi-Processor Serial Reception Flowchart (2) (Non-FIFO Selected)

(2) FIFO selected

Figure 7.3-39 shows an example of data format that is stored to receive FIFO (RDR) in multi-processor mode. MPB is stored in bit 9 of RDR. 0b is stored to FPER and PER flag bit. Data is stored to receive FIFO (RDR) corresponded to data length. It is stored to 0b for unused bits. Reading the receive FIFO (RDR register) updates the FFER, FPER, MPB flags and receive data (RDAT[8:0]) in the receive FIFO (RDR register) with the next received data. The FER, PER, and ORER flags in the receive FIFO (RDR register) always reflect the status of the corresponding flags in the CSR and FRSR registers.

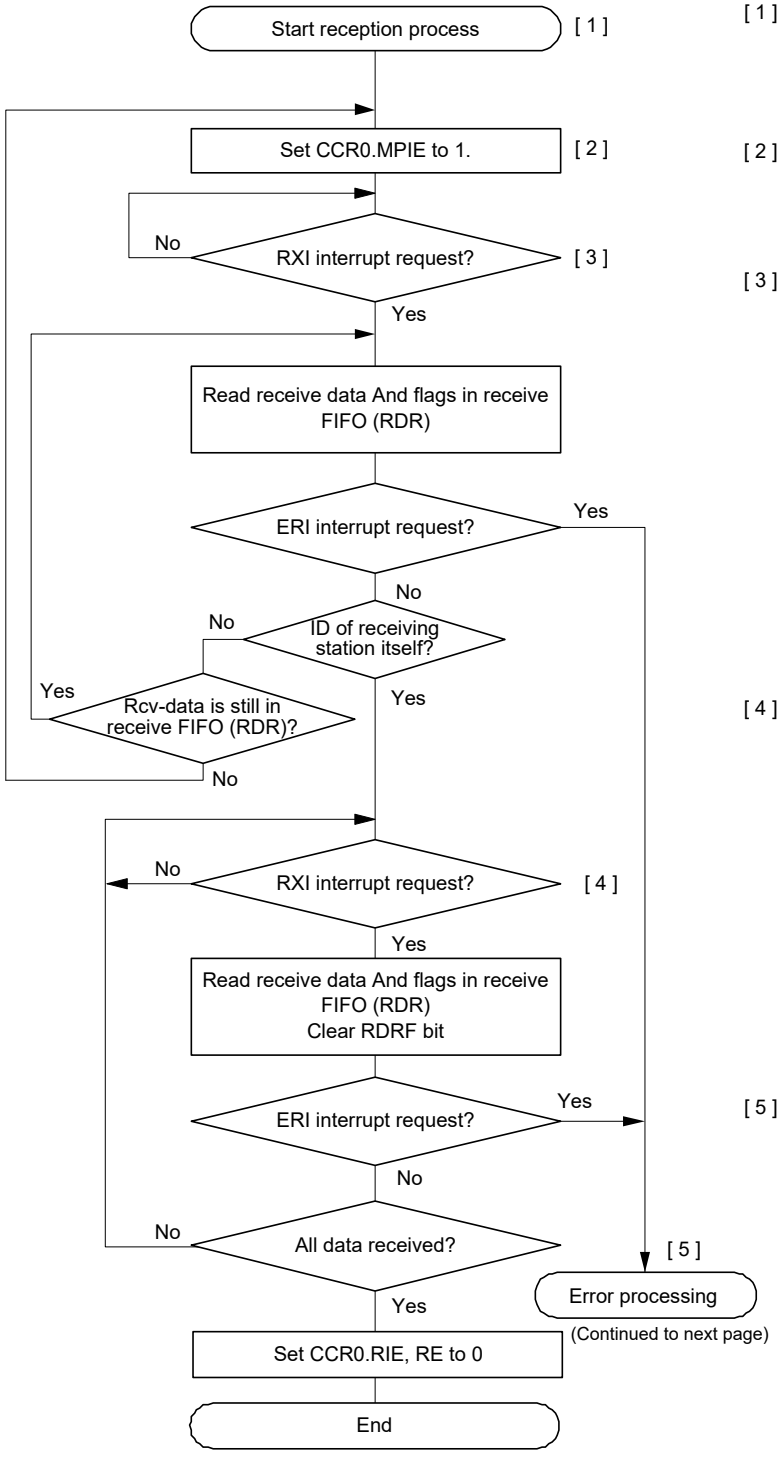
Data Length	Register Setting CCR3.CHR[1:0]		Receive data in RDR[31:0] b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
7 bits	1	1	0	0	0	FFER	FPER	DR	MPB	0	0	RDAT[6:0]						
8 bits	1	0	0	0	0	FFER	FPER	DR	MPB	0	RDAT[7:0]							
9 bits	0	x	0	0	0	FFER	FPER	DR	MPB	RDAT[8:0]								
Data Length	Register Setting CCR3.CHR[1:0]		b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
7 bits	1	1	0	0	0	FER	PER	0	0	ORER	0	0	0	0	0	0	0	0
8 bits	1	0	0	0	0	FER	PER	0	0	ORER	0	0	0	0	0	0	0	0
9 bits	0	x	0	0	0	FER	PER	0	0	ORER	0	0	0	0	0	0	0	0

Note: When a 7-bit data length is selected, the RDAT[8:7] bits are always read as 00b.
When an 8-bit data length is selected, the RDAT[8] bit is always read as 0b.

Figure 7.3-39 Data Format in Multi-Processor Mode that is Stored to Receive FIFO (FIFO Selected)

Figure 7.3-40 shows a sample flowchart for multi-processor data reception at FIFO selected. When the MPIE bit in CCR0 is set to 1b, reading the communication data is skipped until reception of the communication data in which the multiprocessor bit is set to 1b. When the communication data in which the multi-processor bit is set to 1b is received, the received data, MPB, and each errors are transferred to receive FIFO (RDR), and the MPIE bit in CCR0 is automatically cleared, thus returning to a normal reception operation. After a framing error occurred and CSR.FER flag is set to 1b, but SCI continues data reception.

The other operations are the same as the operations in asynchronous mode at non-FIFO selected.



[1] Start reception process
To generate an RXI interrupt request with MP detection, please set FCR.RTRG=1 and FCR.DRES=0.

[2] ID reception cycle:
Set CCR0.MPIE to 1. and wait for ID reception. If you set this bits at Initialization ([1]), you can skip this Step.

[3] SCI status confirmation and reception and comparison of ID:
Skip the communication data until the MPB bit receives data "1".
When the MPB bit receives data "1", an RXI interrupt request is generated.
When an RXI interrupt request is received, read the data in the receiving FIFO (RDR register) and compare it to the ID of my station.
If it is not my station's ID, set the MPIE bit to "1" again and wait for the RXI interrupt request. For my station's ID, set the received FIFO threshold to the necessary value.

[4] Data reception at an RXI interrupt:
When the number of received data stored in the received FIFO (RDR register) exceeds the received FIFO threshold, the CSR.RDRF bit becomes "1" and an RXI interrupt request is generated. In addition, if the number of received data stored in the received FIFO (RDR register) is "1" or more and less than the received FIFO threshold, the FRSR.DR bit becomes "1" after 15 ETU, and an RXI interrupt request is generated. The RXI interrupt routine reads the data from the received FIFO (RDR register).

[5] Receive error processing and break detection:
If a receive error occurs, an error is identified by reading ORER and FER flags in CSR. After performing the appropriate error processing be sure to clear the ORER and FER flags. In the case of a framing error, a break can be detected by reading the CSR.RXDMON bit.

Figure 7.3-40 Example Flowchart of Serial Reception in Multi-Processor Mode (1) (FIFO Selected)

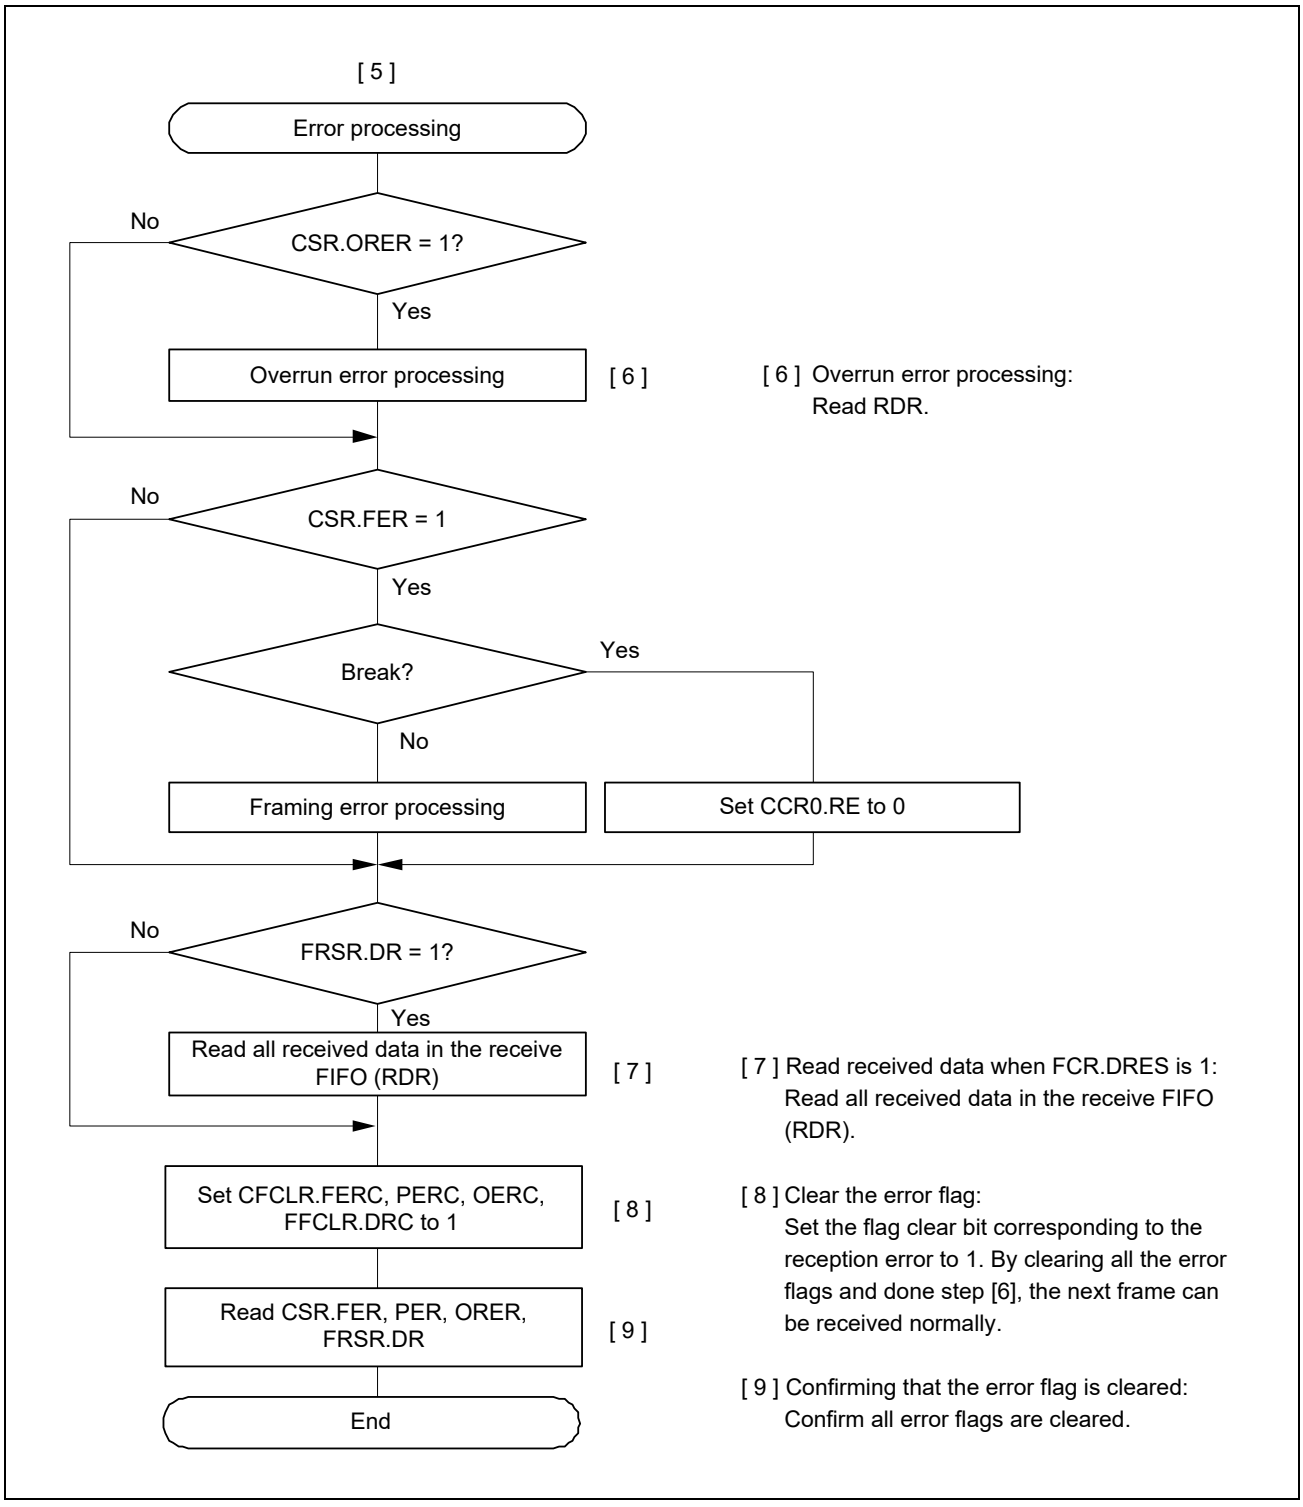


Figure 7.3-41 Example Flowchart of Serial Reception in Multi-Processor Mode (2) (FIFO Selected)

7.3.5 Smart Card Interface Mode

The SCI supports smart card (IC card) interfaces conforming to ISO/IEC 7816-3 (standard for Identification Cards), as an extended function.

Smart card interface mode can be selected using the appropriate register.

7.3.5.1 Sample Connection

Figure 7.3-42 shows a sample connection between a smart card (IC card) and this LSI.

As in the figure, since this LSI communicates with an IC card using a single transmission line, interconnect the TXDn and RXDn pins and pull up the data transmission line to VCC using a resistor. Setting the TE and RE bits in CCR0 to 1b with an IC card disconnected enables closed transmission/reception allowing self-diagnosis.

To supply an IC card with the clock pulses generated by the SCI, input the SCKm pin output to the CLK pin of an IC card.

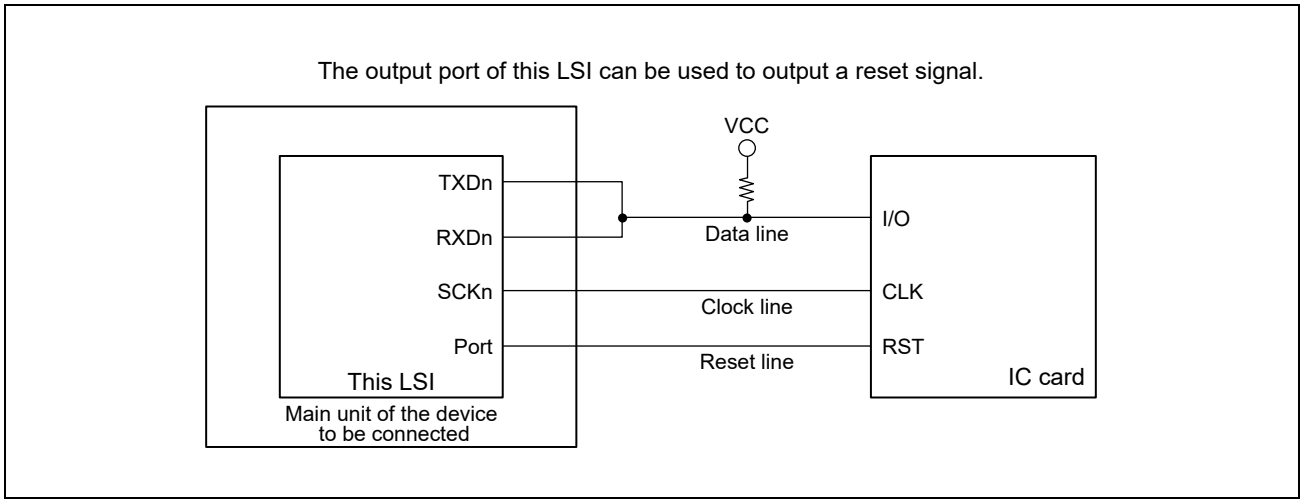

Figure 7.3-42 Sample Connection with a Smart Card (IC Card)

7.3.5.2 Data Format (Except in Block Transfer Mode)

Figure 7.3-43 shows the data transfer formats in smart card interface mode.

- One frame consists of 8-bit data and a parity bit in asynchronous mode.
- During transmission, at least 2 etu (elementary time unit: time required for transferring 1 bit) is secured as a guard time from the end of the parity bit until the start of the next frame.
- If a parity error is detected during reception, a low-level error signal is output for 1 etu after 10.5 etu has passed from the start bit.
- If an error signal is sampled during transmission, the same data is automatically retransmitted after at least 2 etu.

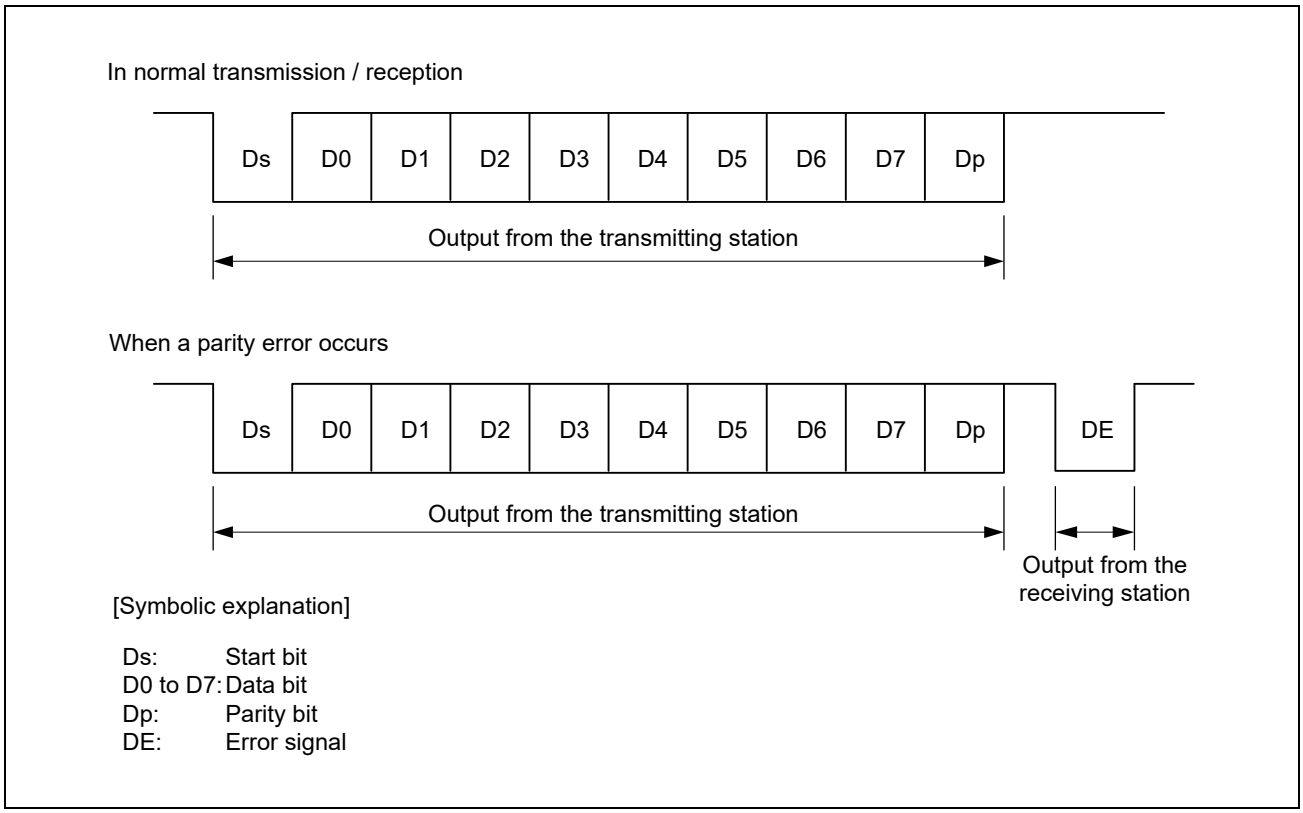

Figure 7.3-43 Data Formats in Smart Card Interface Mode

For communications with IC cards of the direct convention type and inverse convention type, follow the procedure below.

(1) Direct Convention Type

For the direct convention type, logic levels 1 and 0 correspond to states Z and A, respectively, and data is transferred with LSB first as the start character, as shown in **Figure 7.3-44**. Therefore, data in the start character in the figure is 3Bh.

When using the direct convention type, write 0b to the CCR3.SINV bit and write 1b to the CCR3.LSBF bit. Write 0b to CCR1.PM in order to use even parity, which is prescribed by the smart card standard.

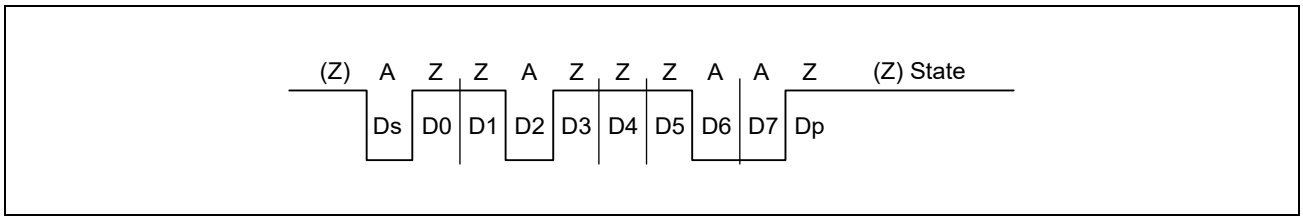

Figure 7.3-44 Direct Convention Type (CCR3.LSBF = 1b, CCR3.SINV = 0b, CCR1.PM = 0b)

(2) Inverse Convention Type

For the inverse convention type, logic levels 1 and 0 correspond to states A and Z, respectively and data is transferred with MSB first as the start character, as shown in **Figure 7.3-45**. Therefore, data in the start character in the figure is 3Fh.

When using the inverse convention type, write 1b to the CCR3.SINV bit and write 0b to the CCR3.LSBF bit. The parity bit is logic level 0 to produce even parity, which is prescribed by the smart card standard, and corresponds to state Z. Since the SINV bit of this LSI only inverts data bits D7 to D0, write 1b to CCR1.PM to invert the parity bit for both transmission and reception.

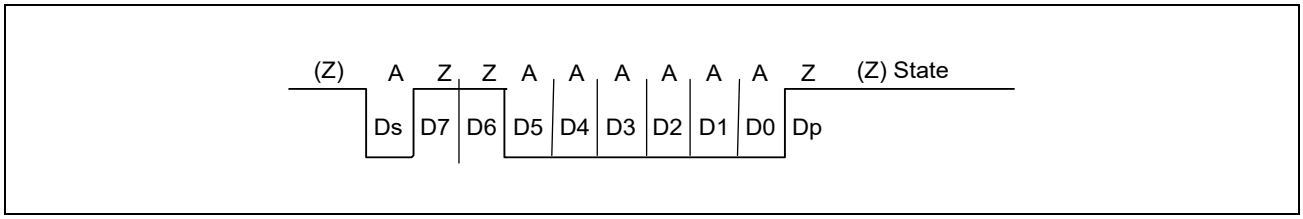

Figure 7.3-45 Inverse Convention Type (CCR3.LSBF = 0b, CCR3.SINV = 1b, CCR1.PM = 1b)

7.3.5.3 Block Transfer Mode

Block transfer mode is different from non-block-transfer-mode of smart card interface mode in the following respects.

- Even if a parity error is detected during reception, no error signal is output. Since CSR.PER is set by error detection, clear the PER bit before receiving the parity bit of the next frame.
- During transmission, at least 1 etu is secured as a guard time from the end of the parity bit until the start of the next frame.
- Since the same data is not retransmitted during transmission, CSR.TEND is set for 11.5 etu after transmission start.
- In block transfer mode, CSR.ERS flag indicates the error signal status as in non-block-transfer-mode of smart card interface mode, but the flag is always read as 0b because no error signal is transferred.

7.3.5.4 Receive Data Sampling Timing and Reception Margin

Only the internal clock generated by the baud rate generator can be used as a transfer clock in smart card interface mode. In this mode, the SCI can operate on a base clock with a frequency of 32, 64, 372, 256, 93, 128, 186, or 512 times the bit rate according to the settings of CCR2.BCP[2:0]. For data reception, the falling edge of the start bit is sampled with the base clock to perform synchronization. Receive data is sampled on the 16th, 32nd, 186th, 128th, 46th, 64th, 93rd, and 256th rising edges of the base clock so that it can be latched at the middle of each bit as shown in **Figure 7.3-46**. The reception margin here is determined by the following formula.

$$M = \left| \left(0.5 - \frac{1}{2N}\right) - (L - 0.5)F - \frac{|D - 0.5|}{N}(1 + F) \right| \times 100\%$$

M: Reception margin (%)
N: Ratio of bit rate to clock (N = 32, 64, 372, 256)
D: Duty cycle of clock (D = 0 to 1.0)

L: Frame length (L = 10)
F: Absolute value of clock frequency deviation

Assuming values of F = 0, D = 0.5, and N = 372 in the above formula, the reception margin is determined by the formula below.

$$M = \left\{\frac{0.5 - 1}{2 \times 372}\right\} \times 100\% = 49.866\%$$

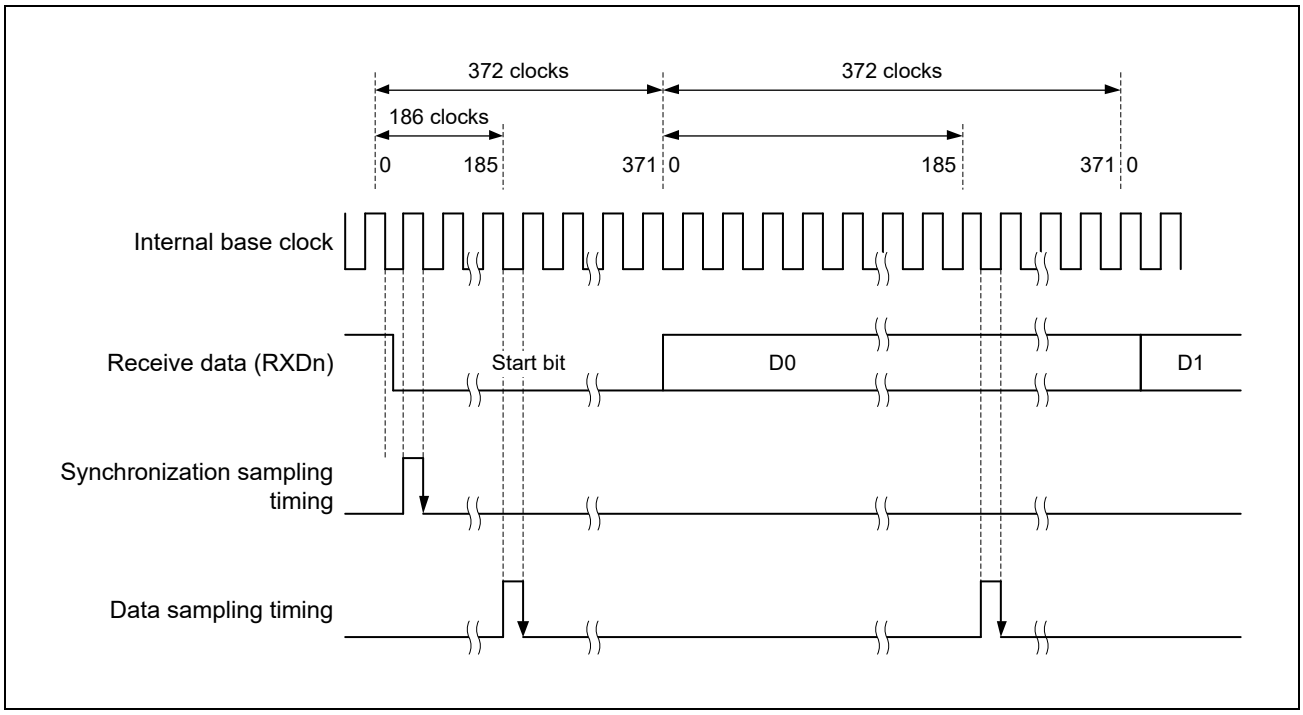

Figure 7.3-46 Receive Data Sampling Timing in Smart Card Interface Mode (when Clock Frequency is 372 Times the Bit Rate)

7.3.5.5 Initialization of SCI (Smart Card Interface Mode)

Before transmitting and receiving data, write 0b to CCR0.TE and CCR0.RE (Or write the initial value to CCR0). And initialize SCI following example flowchart in **Figure 7.3-47**.

Be sure to set the initial value in the TIE, RIE, TE, RE, and TEIE bits in CCR0 register before switching from transmission mode to reception mode and vice versa. Even if the RE bit is set to 0b, the RDR register is not initialized. In transmission mode, set 1b to the TE bit and TIE bit simultaneously, then the TXI interrupt request is generated. To change reception mode to transmission mode, first check that reception has completed, and then initialize SCI. At the end of initialization, set TE = 1b and RE = 0b. Reception completion can be verified by RXI request, CSR.ORER, or CSR.PER. To change transmission mode to reception mode, first check that transmission has completed, and then initialize SCI. At the end of initialization, set TE = 0b and RE = 1b. Transmission completion can be verified by reading CSR.TEND.

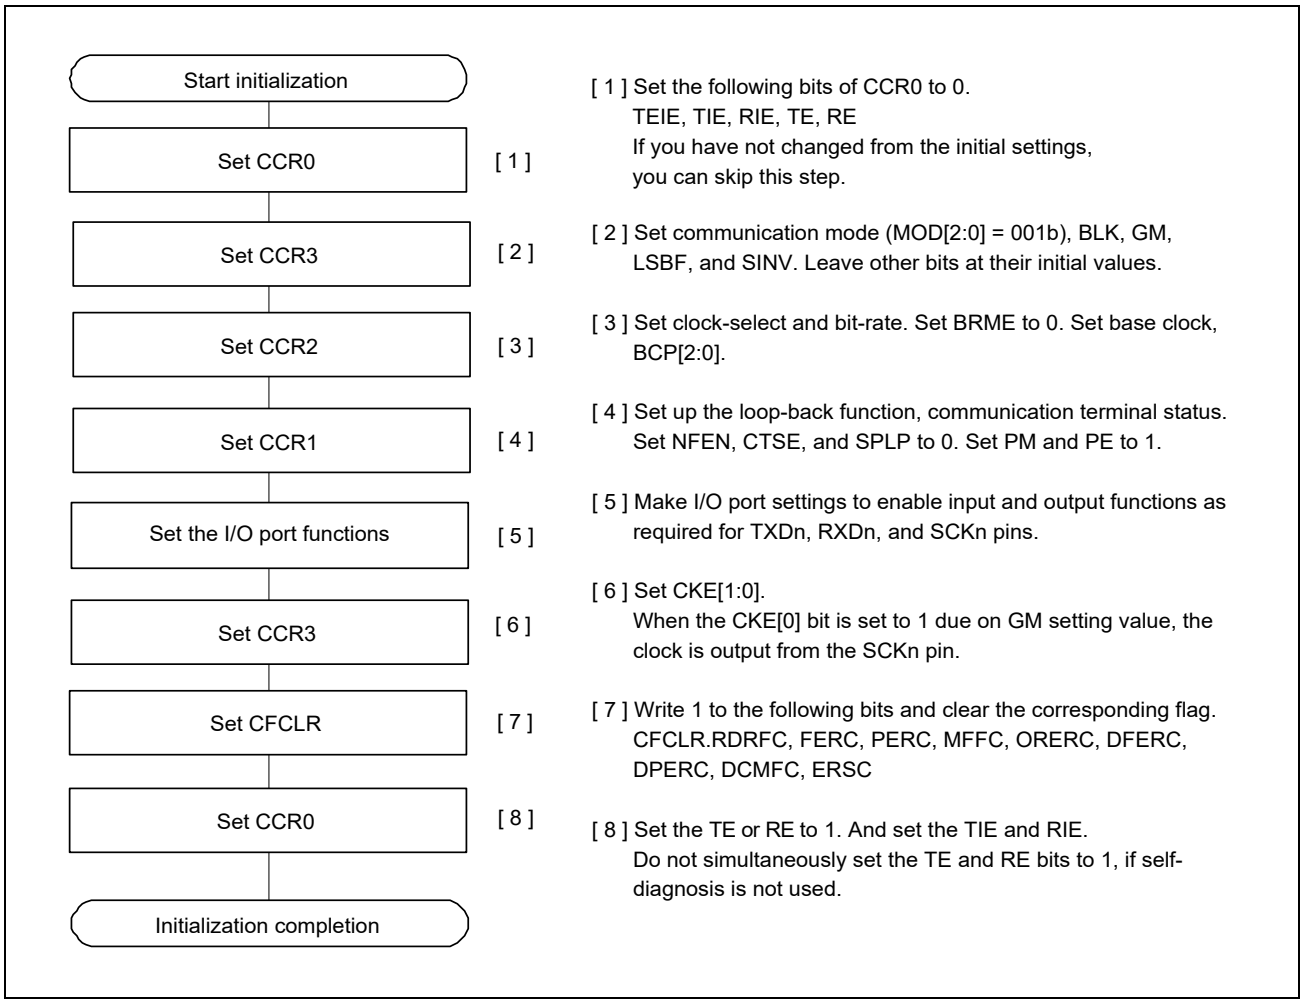

Figure 7.3-47 Example of SCI Initialization Flowchart (Smart Card Interface Mode)

Figure 7.3-48 is a timing chart when data transmission is performed by making transition to the Smart Card Interface mode according to the above flow chart. The figure shows the case when CCR3.GM bit is 0b. As shown in the figure, when the pin function is set to the SCK pin, the SCK pin is high impedance because the CCR3.CKE[0] bit is 0b. When the TXD pin is set, the TXD pin is high impedance because the CCR0.TE bit is 0b. Start clock output to the SCK pin with the clock output setting CCR3.CKE[0] to 1b, start data transmission by writing transmit data after setting CCR0.TE to 1b.

In the smart card interface mode, even if not communicating at CCR0.TE = 0b and CCR0.RE = 0b, the clock is continuously output if the clock output setting is used.

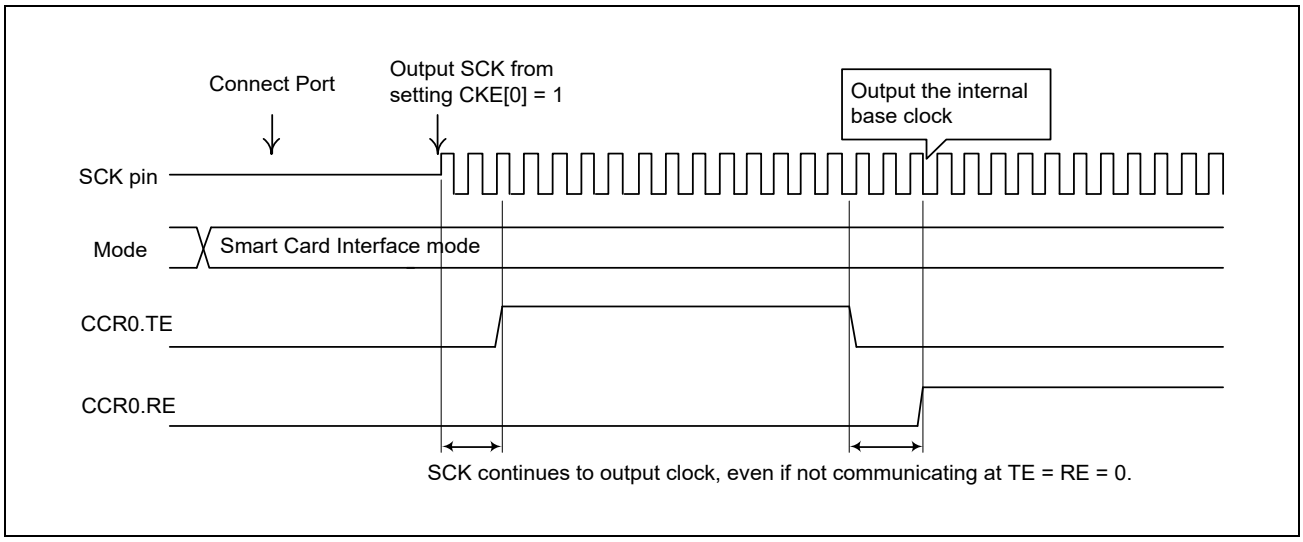

Figure 7.3-48 Example of Timing Chart of Data Transmission (Smart Card Interface Mode)

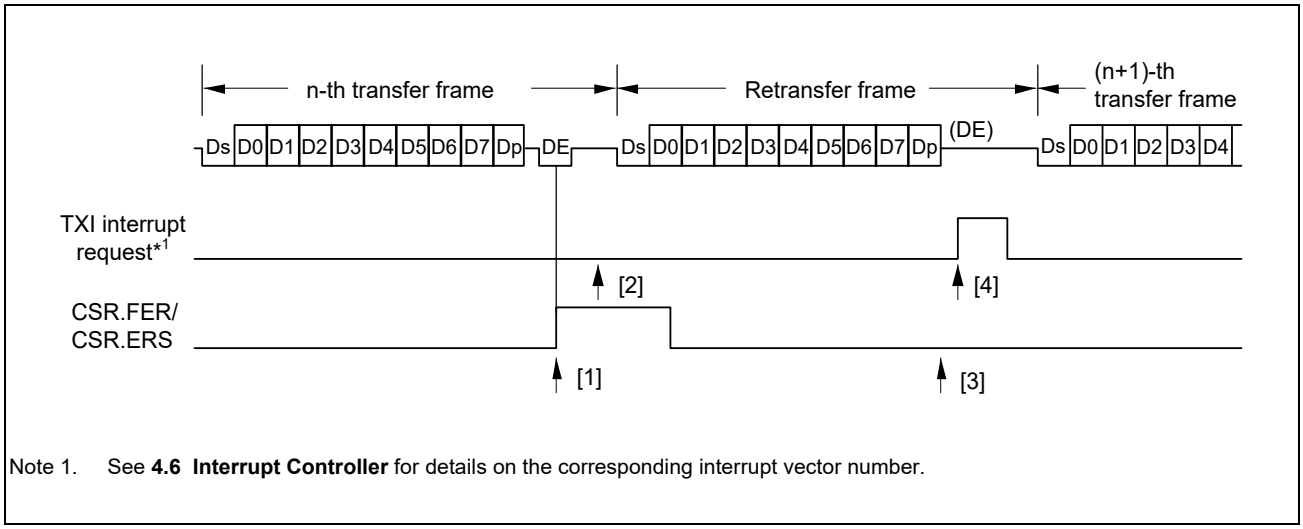
7.3.5.6 Serial Data Transmission (Except in Block Transfer Mode)

Serial data transmission in smart card interface mode (except in block transfer mode), in that an error signal is sampled and data can be retransmitted, is different from that in non-smart card interface mode. **Figure 7.3-49** shows the data retransfer operation during transmission.

1. When an error signal from the receiver end is sampled after one-frame data has been transmitted, CSR.ERS is set to 1b. If CCR0.RIE is 1b at this time, an ERI interrupt request is generated. Clear the ERS flag to 0b before the next parity bit is sampled.
2. For a frame in which an error signal is received, CSR.TEND is not set. Data is retransferred from TDR to TSR allowing data retransmission automatically.
3. If no error signal is returned from the receiver, the ERS flag is not set to 1b.
4. In this case, the SCI judges that transmission of one-frame data (including retransfer) has been completed, and the TEND flag is set. If CCR0.TIE is 1b at this time, a TXI interrupt request is generated. Writing transmit data to TDR starts transmission of the next data.



Note 1. See **4.6 Interrupt Controller** for details on the corresponding interrupt vector number.

Figure 7.3-49 Data Retransfer Operation in SCI Transmission Mode

Figure 7.3-51 shows a sample flowchart of serial transmission. All the processing steps are automatically performed by using a TXI interrupt request to activate the DMAC. When CSR.TEND is set to 1b in transmission, if the CCR0.TIE is 1b, a TXI interrupt request is generated. The DMAC is activated by a TXI interrupt request if the TXI interrupt request is specified as a source of DMAC activation beforehand, allowing transfer of transmit data. The TEND flag is automatically set to 0b when the DMAC transfers the data. If an error occurs, the SCI automatically retransmits the same data. During this retransmission, the TEND flag is kept to 0b and the DMAC is not activated. Therefore, the SCI and DMAC automatically transmit the specified number of bytes, including retransmission in the case of error occurrence. However, since the ERS flag is not automatically cleared, set the RIE bit to 1b beforehand to enable an ERI interrupt request to be generated at error occurrence, and clear the ERS flag to 0b.

When transmitting/receiving data using the DMAC, be sure to make settings to enable the DMAC before making SCI settings. For DMAC settings, see **4.7 DMA Controller (DMAC)**.

Note that CSR.TEND flag is set in different timings depending on the CCR3.GM bit setting. **Figure 7.3-50** shows the TEND flag generation timing.

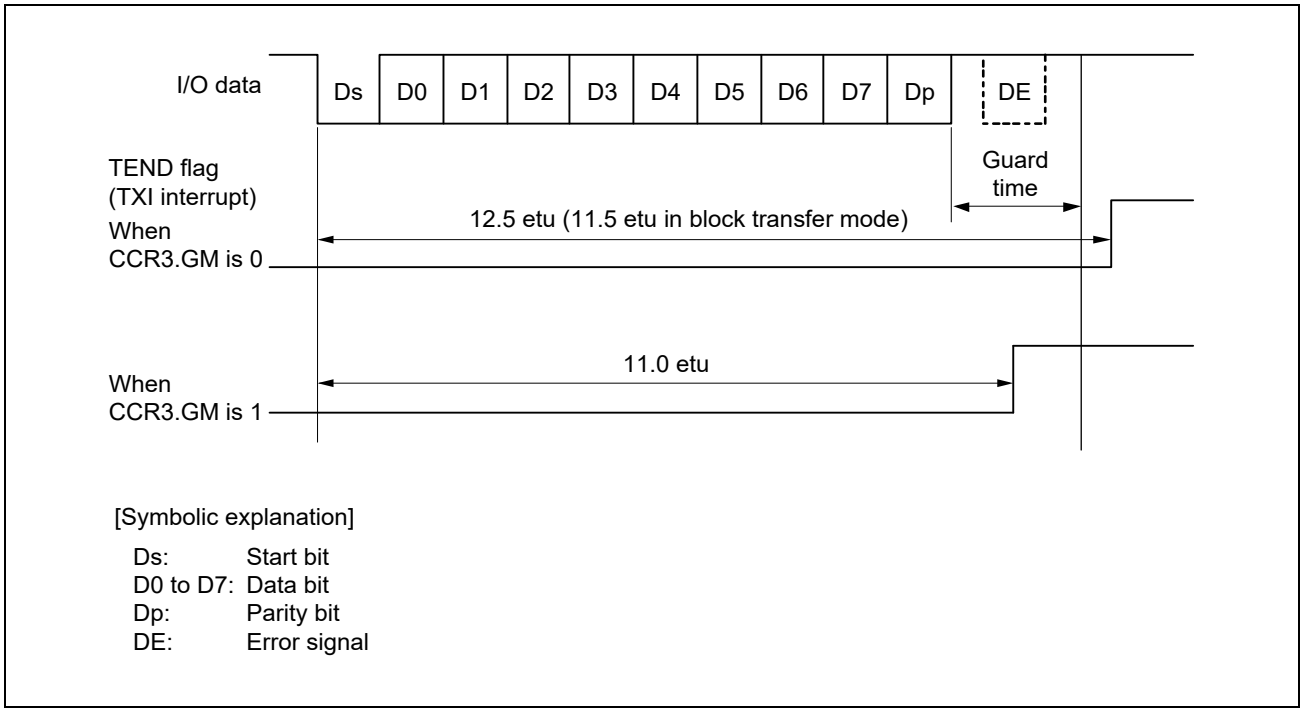


Figure 7.3-50 CSR.TEND Flag Generation Timing during Transmission

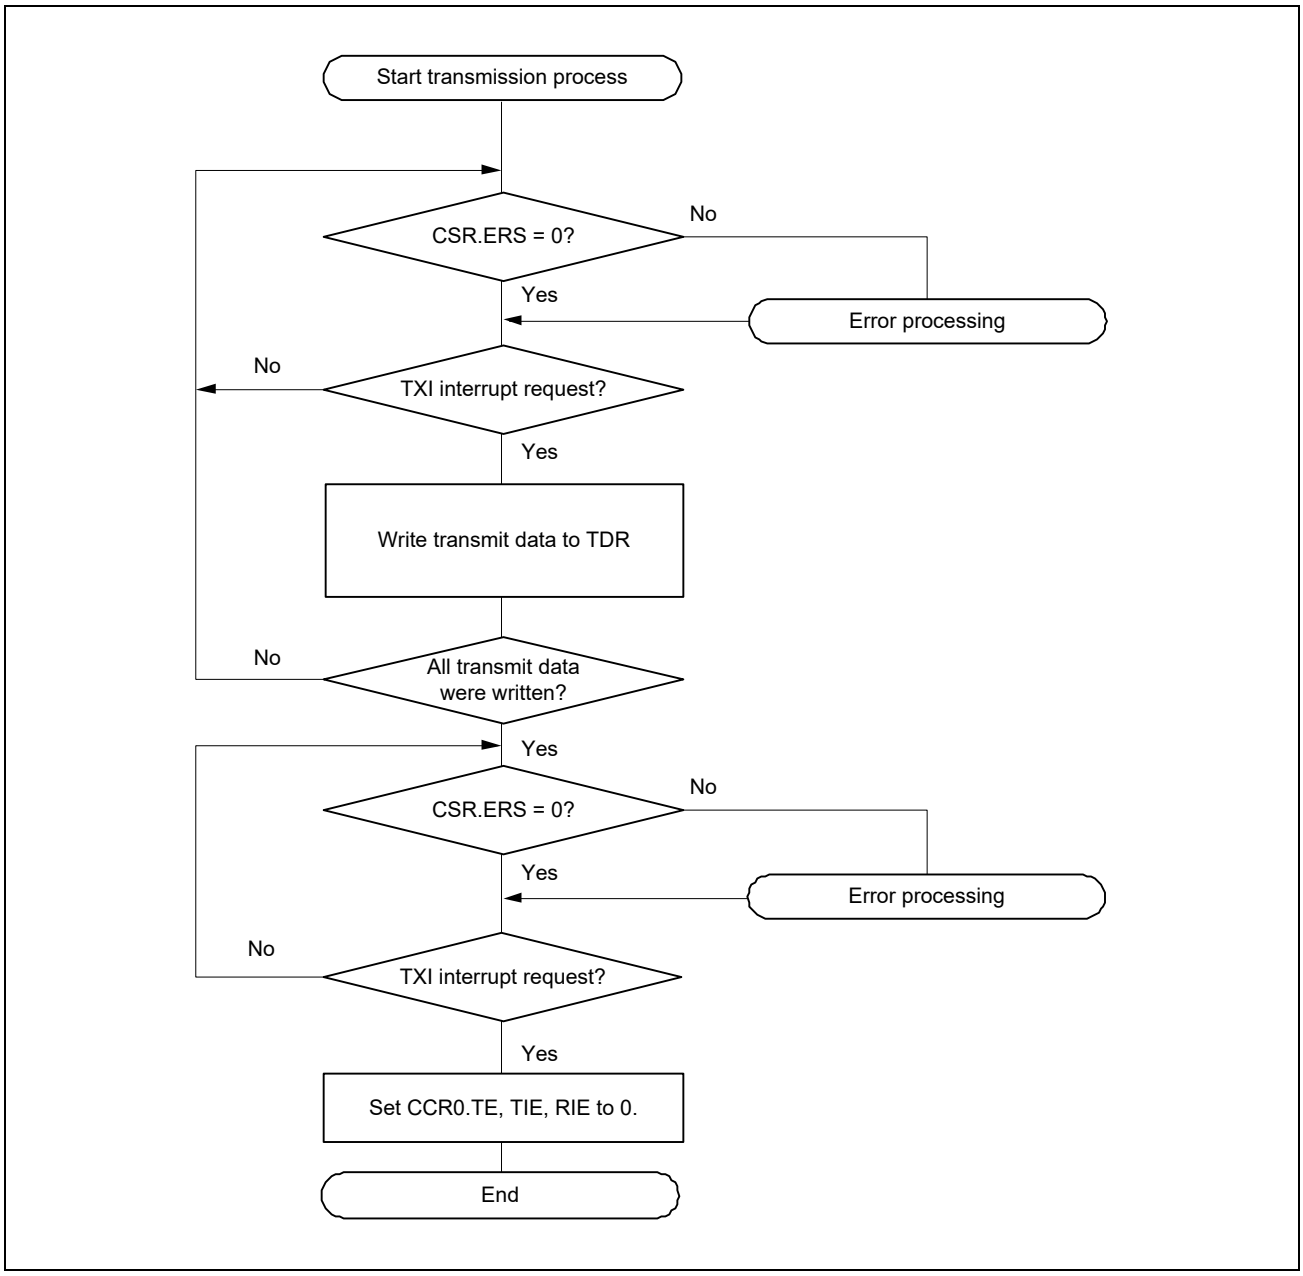

Figure 7.3-51 Sample Smart Card Interface Transmission Flowchart

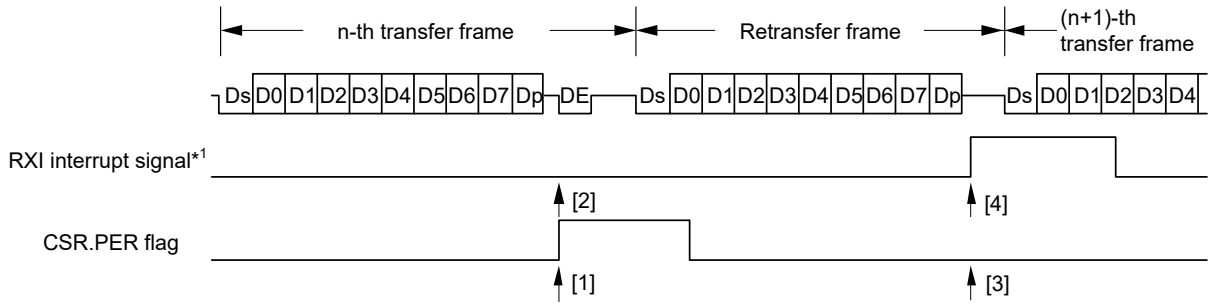
7.3.5.7 Serial Data Reception (Except in Block Transfer Mode)

Serial data reception in smart card interface mode is like that in non-smart card interface mode. **Figure 7.3-52** shows the data retransfer operation in reception mode.

1. If a parity error is detected in receive data, the CSR.PER flag is set to 1b. When the CCR0.RIE is 1b at this time, an ERI interrupt request is generated. Clear the PER flag to 0b before the next parity bit is sampled.
2. For a frame in which a parity error is detected, no RXI interrupt is generated.
3. When no parity error is detected, the CSR.PER flag is not set to 1b.
4. In this case, data is determined to have been received successfully. When the CCR0.RIE is 1b, an RXI interrupt request is generated.



Note 1. See **4.6 Interrupt Controller** for details on the corresponding interrupt vector number.

Figure 7.3-52 Data Retransfer Operation in SCI Reception Mode (Data Retransfer Operation during Reception)

Figure 7.3-53 shows a sample flowchart for serial data reception. All the processing steps are automatically performed using an RXI interrupt request to activate the DMAC. In reception, setting the RIE bit to 1b allows an RXI interrupt request to be generated. The DMAC is activated by an RXI interrupt request if the RXI interrupt request is specified as a source of DMAC activation beforehand, allowing transfer of receive data. If an error occurs during reception and either the CSR.ORER or PER flag is set to 1b, a receive error interrupt (ERI) request is generated. Clear the error flag after the error occurrence. If an error occurs, the DMAC is not activated and receive data is skipped. Therefore, the number of bytes of receive data specified in the DMAC is transferred.

Even if a parity error occurs and the PER flag is set to 1b during reception, receive data is transferred to RDR, thus allowing the data to be read. When a reception is forcibly terminated by setting the CCR0.RE to 0b during operation, read the RDR register because the received data which has not yet been read may be left in RDR.

NOTE

For operations in block transfer mode, see **7.3.3 Asynchronous Mode**.

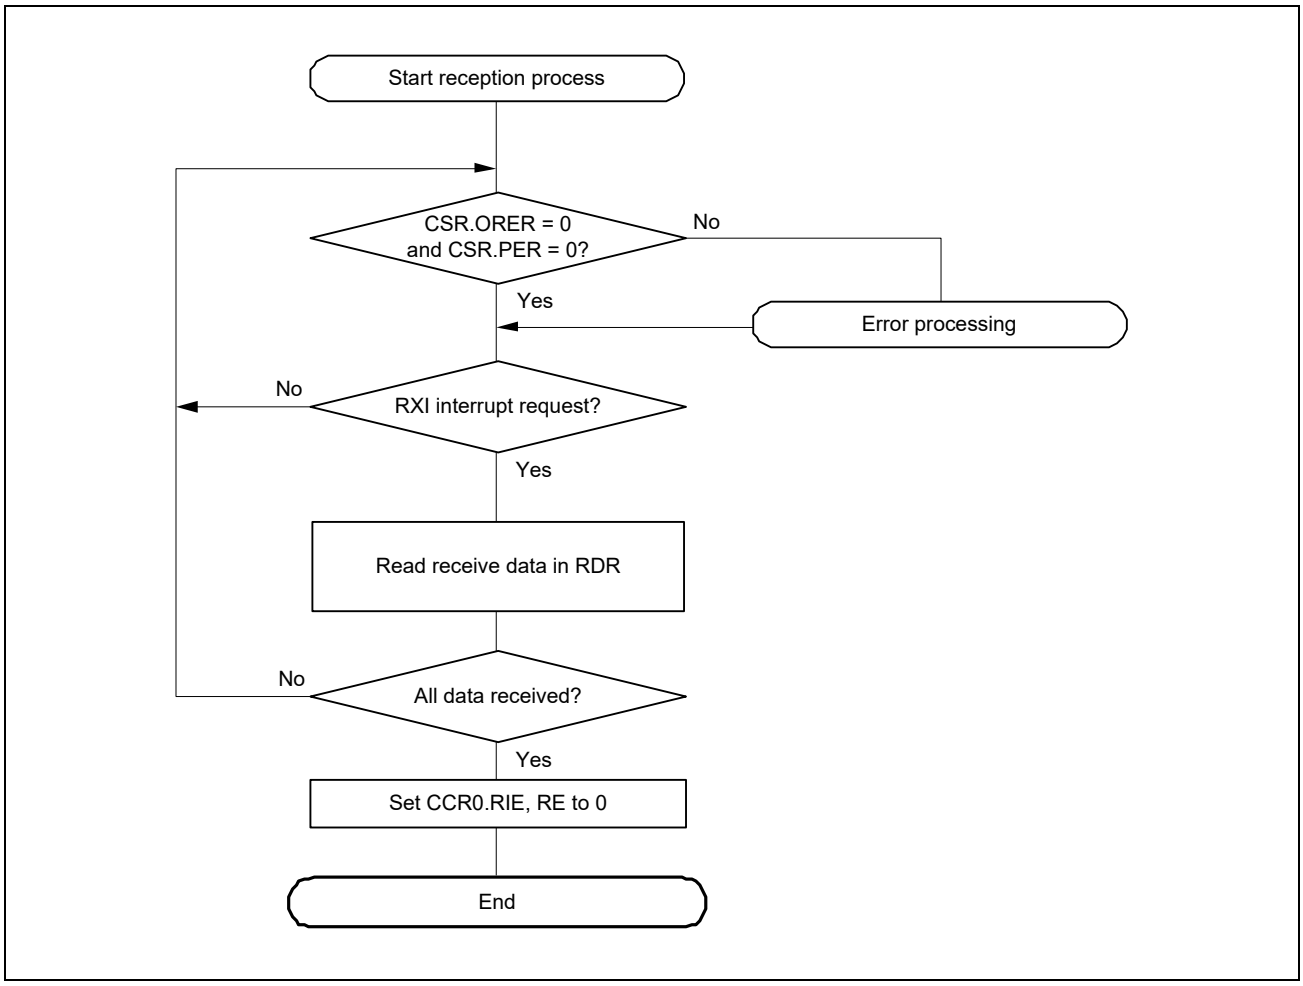


Figure 7.3-53 Sample Smart Card Interface Reception Flowchart

7.3.5.8 Clock Output Control

When the CCR3.GM is set to 1b, the clock output can be controlled by the CCR3.CKE[1:0]. Refer to the description of the CKE in **7.3.2.2.8 Common Control Register 3 (RSCIm_CCR3)**. When setting the clock output, the base clock described in **7.3.3.3 Clock** is output, so the width of the clock pulse can be kept to the width specified by setting the bit rate. It is described in **7.3.2.2.7 Common Control Register 2 (RSCIm_CCR2)**, the bit rate is set by CCR2.CKS[1:0], CCR2.BCP[2:0], and BRR[7:0].

Figure 7.3-54 shows the timing chart for explaining clock output control. This is an example when the CCR3.CKE[1] is set to 0b and the CCR3.CKE[0] is controlled.

When the CCR3.GM is 0b, output control by the CCR3.CKE[0] is immediately reflected on the SCK pin, so there is a possibility that pulses with an unintended width may be output from the SCK pin.

When the CCR3.GM is 1b, the output pulse control by the CCR3.CKE[0] controls the pulse width set to be based on the state of the base clock.

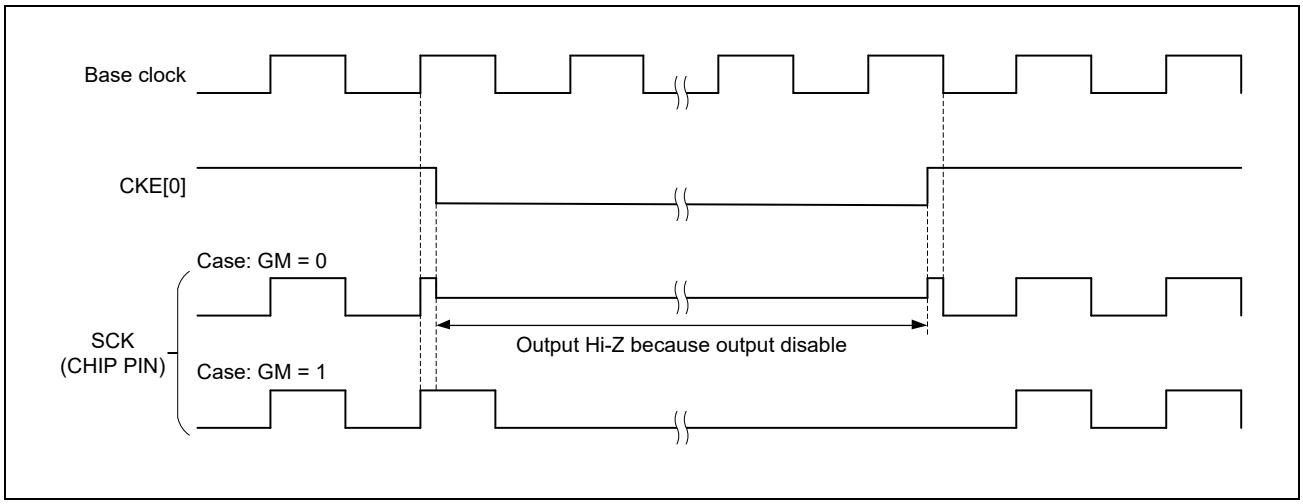

Figure 7.3-54 Clock Control Timing Chart by CCR3.GM

7.3.6 Simple-LIN Mode

As an extended function of the RSCI, the RSCI supports the serial communication protocol (**Figure 7.3-55**) consisting of a Start Frame and an Information Frame as Simple-LIN. Simple-LIN mode is enabled by setting the CCR3.MOD[2:0] = 110b. Since the simple-LIN mode uses the same circuit as the asynchronous mode for transmission/reception control other than Break Field, the basic communication settings required for the asynchronous mode are also required for simple-LIN mode. (For the setting value when using Simple-LIN mode, see the explanation of **7.3.2 SCI Registers**. In particular, note that CCR3.RXDESEL needs to be changed from the initial value and set to 1b.) The Start Frame consists of a Break Field, Control Field 0, and Control Field 1. The Information Frame can be configured with some Data Fields, a CRC16 Upper Field, and a CRC16 Lower Field.

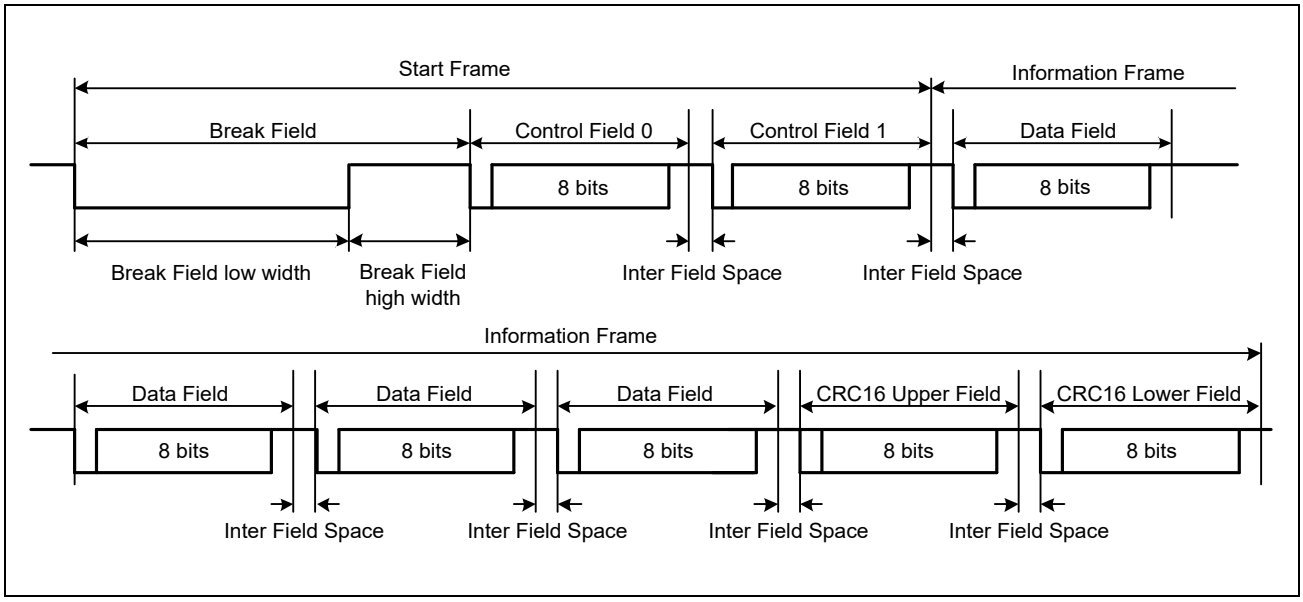

Figure 7.3-55 Clock Control Timing Chart by CCR3.GM

The following describes operations when the simple-LIN is used. In this section, operations are described with the following conditions: Communication pin (RXD/TXD) level inversion function: OFF (RINV = TINV = 0b). When using the simple LIN with the communication pin (RXD/TXD) level inversion function enabled, replace the RXD and TXD signal levels with their inverted levels.

7.3.6.1 Simple-LIN Start Frame Transmission

Figure 7.3-56 shows an example of transmission of the Start Frame consisting of a Break Field, Control Field 0, and Control Filed 1. (Omit Break Field and Control Field 0 according to the Start Frame configuration.)

Figure 7.3-57 shows a flowchart for Start Frame transmission.

The RSCI operates as follows during Start Frame transmission.

1. Make the initial settings for the RSCI according to the RSCI initialization flow (**Figure 7.3-8**) in asynchronous mode. In simple-LIN mode, do not set CCR0.TE and TIE to 1b at the same time to avoid TXI output before the Break Field. Therefore, perform the following two steps sequentially to set the SCI initialization flow (asynchronous mode) procedure [9].
   - Set the bits except CCR0.TIE. (CCR0.TIE = 0b, CCR0.TE = 1b, and CCR0.RE = 0b)
   - Set CCR0.TIE to 1b.
2. When 1b is written to TCST, the SCIX timer starts counting and outputs a low level (Break Field) from the TXD pin for the period set in XCR2.BFLW[15:0]. A timer count clock source can be selected by XCR0.TCSS[1:0]. Writing 0b to XCR1.TCST suspends output of the Break Field. After the suspension, set CCR0.TE = 0b and turn off the transmission.
3. When the simple-LIN module timer count value matches the set XCR2.BFLW[15:0] value, the timer stops counting and inverts the TXD pin output level, and the XSR0.BFOF flag is set to 1b*[1]. Furthermore, if XCR0.BFOIE has been set to 1b at this time, a TXI interrupt is generated.
4. After confirming XSR0.BFOF=1b after TXI interrupt, write transmission data and transmit Control Field 0 data.

Remark LIN communication requires a Break delimiter (IDLE period) of 1 bit or more from the end of Break Field output until the next data transmission starts. For this reason, the Break delimiter length is counted upon completion of Break Field output. If transmit data is written while the Break delimiter length is being counted, transmission does not start until the Break delimiter length counting is completed. When transmit data is written after the Break delimiter length has been counted, transmission starts at the same timing as normal data transmission (bit boundary).
Break delimiter length count time after Break Field output:
- 1-bit to 2-bit length (CCR3.STP = 0b)
- 2-bit to 3-bit length (CCR3.STP = 1b)

5. After the Control Field 0 data has been transmitted, write the Control Field 1 data to TDR. And it is transmitted.
6. After the Control Field 1 data has been transmitted, the Information Frame data is transmitted.

Note 1. After XSR0.BFOF is set to 1b, if 1b is written to XCR1.TCST without clearing it, no TXI interrupt is output at the end of Break Field transmission. Clear XSR0.BFOF before writing 1b to XCR1.TCST.

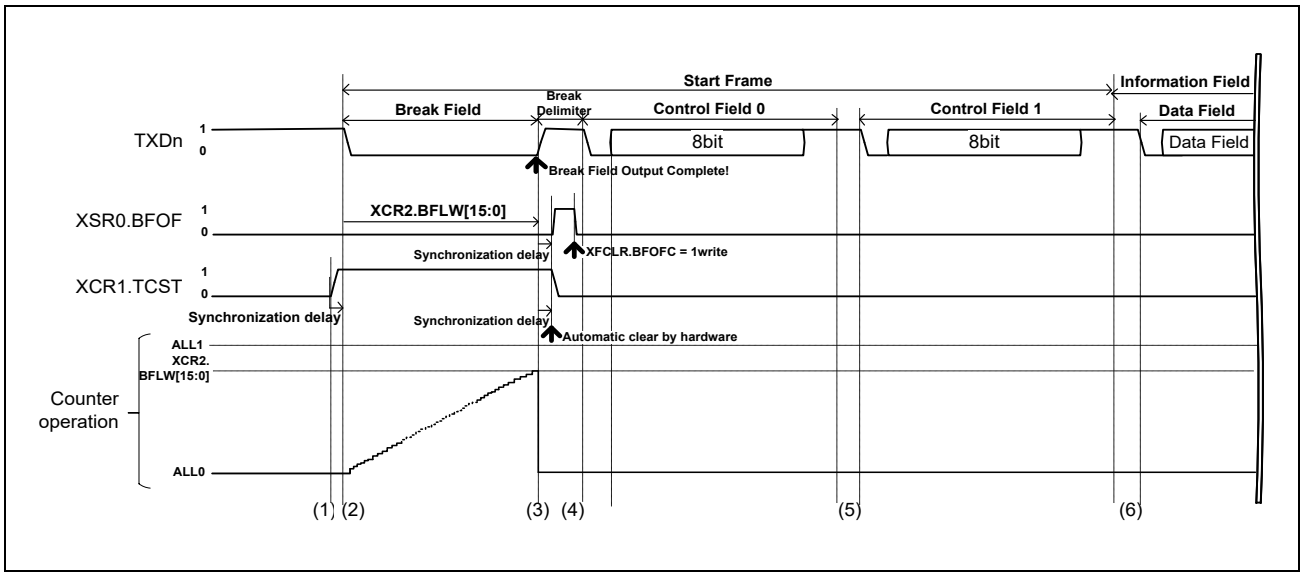

Figure 7.3-56 Start Frame Transmission Example

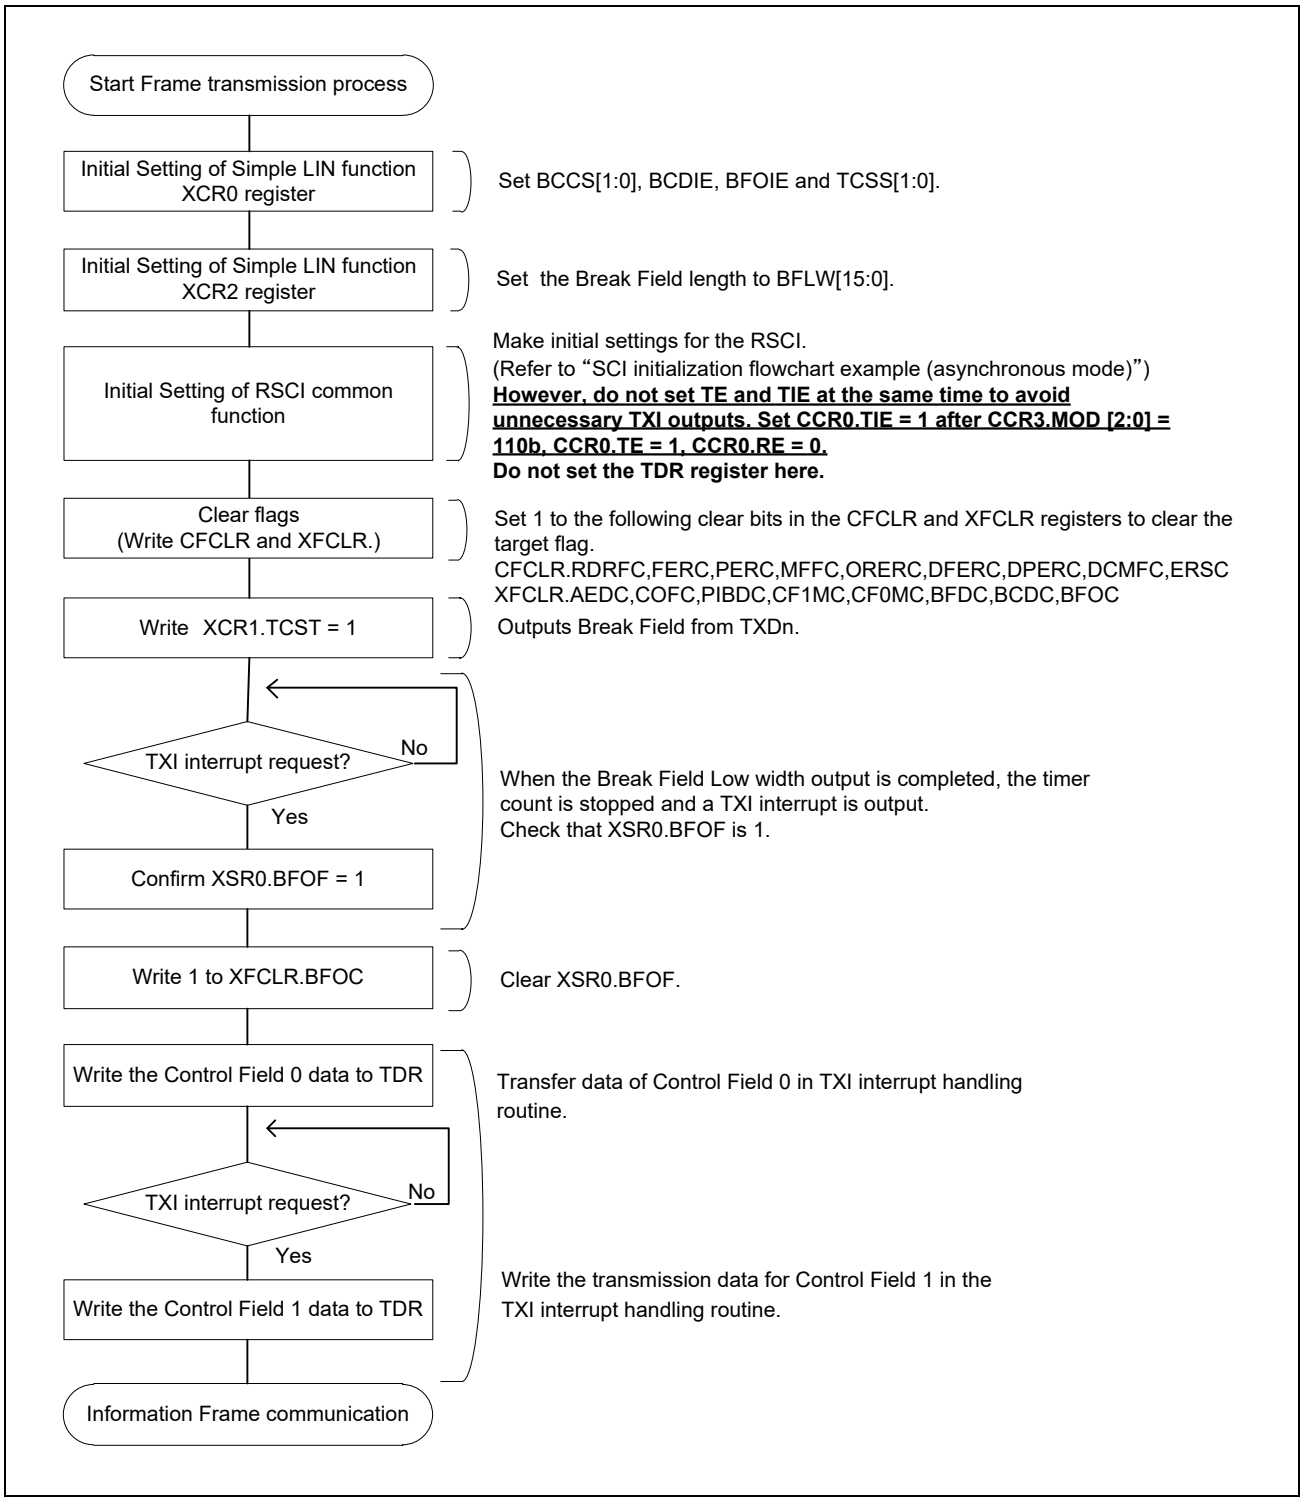

Figure 7.3-57 Start Frame Transmission Flowchart Example

7.3.6.2 Simple-LIN Start Frame Reception

The RSCI can detect Start Frames configured as shown in **Table 7.3-29**.

Table 7.3-29 Start Frame Configuration

XCR0		Start Frame Configuration
BFE	CF0RE	
0	0	Control Field 1 (8bit) Information Field (DATAn)
0	1	Control Field 0 (8bit) Control Field 1 (8bit) Information Field (DATAn)
1	0	Break Field (Low width) Control Field 1 (8bit) Information Field (DATAn)
1	1	Break Field (Low width) Control Field 0 (8bit) Control Field 1 (8bit) Information Field (DATAn)

7.3.6.2.1 Simple-LIN Normal Reception of Start Frame (PIB Not Used)

Figure 7.3-58 shows an example of normal reception of the Start Frame consisting of a Break Field, Control Field 0, and Control Field 1. **Figure 7.3-59** shows an example of reception to detect the Break Field during Control Field 1. **Figure 7.3-60** shows a flowchart to receive the Start Frame, and **Figure 7.3-61** shows a state transition diagram.

When receiving the Start Frame, the RSCI operates as follows. Omit the processing of Break Field and Control Field 0 according to the Start Frame configuration.

(1) Writing 1b to XCR1.SDST makes it possible to detect the Start Frame. When XCR0.BFE = 1b, RXD input to the SCI core is disabled until the Break Field is detected (because XSR0.RXDSF is set to 1b). Once the Break Field is detected, RXD input can be received by the SCI core (XSR0.RXDSF = 0b).

(2) When a low level is input from the RXD pin, the Break Field detection count starts. A timer count clock source can be selected by XCR0.TCSS[1:0].

(3) When a low level that is equal to or longer than the period set in XCR2.BFLW[15:0] is input from the RXD pin, it is determined as Break Field. At this time, XSR0.BFDF is set to 1b. If XCR0.BFDIE has been set to 1b at this time, a BFD interrupt is generated.
The timer continues counting until the RXD rising edge or counter overflow.

(4) After the Break Field is detected, when the input level from the RXD pin becomes high, the count value is captured to XSR1.TCNT[15:0] when BMEN = 0b. At this time, XSR0.RXDSF is cleared to 0b and the SCI core starts receiving the RXD input.

(5) The SCI core starts receiving Control Field 0. Because the simple LIN continuously counts the edge interval, it determines a low level that is equal to or longer than the period set in XCR2.BFLW[15:0] as detection of the Break Field. When the Break Field is detected in the Control Field 0 phase, the SCI core waits for reception of Control Field 0 again (**Figure 7.3-59**).

(6) When Control Field 0 has been received, an RXI interrupt is generated and the Control Field 0 data is stored in XSR0.CF0RD[7:0]. When the received data matches the set XCR2.CF0D[7:0] value, XSR0.CF0MF is set to 1b. If

the received data differs from the set XCR2.CF0D[7:0] value, the SCI transitions to the state before the Break Field is detected.

(7) The SCI core starts receiving Control Field 1. When BFE = 1b, the Break Field detection function is continuously enabled while SDST = 1b as in the case of Control Field 0. When the Break Field is detected in the Control Field 1 phase, the SCI core waits for reception of Control Field 0 again.

(8) When Control Field 1 has been received, an RXI interrupt is generated and the Control Field 1 data is stored in XSR0.CF1RD[7:0]. When the received data matches the set XCR1.PCF1D[7:0] value or the set XCR1.SCF1D[7:0] value, XSR0.CF1MF is set to 1b. If the received Control Field 1 data matches neither the set XCR1.PCF1D[7:0] value nor the set XCR1.SCF1D[7:0] value, the SCI transitions to the state before the Break Field is detected.

(9) The RSCI core performs Information Frame communication.

(10) When communication is completed, write 0b to XCR1.SDST and 0b to CCR0.RE to stop reception.

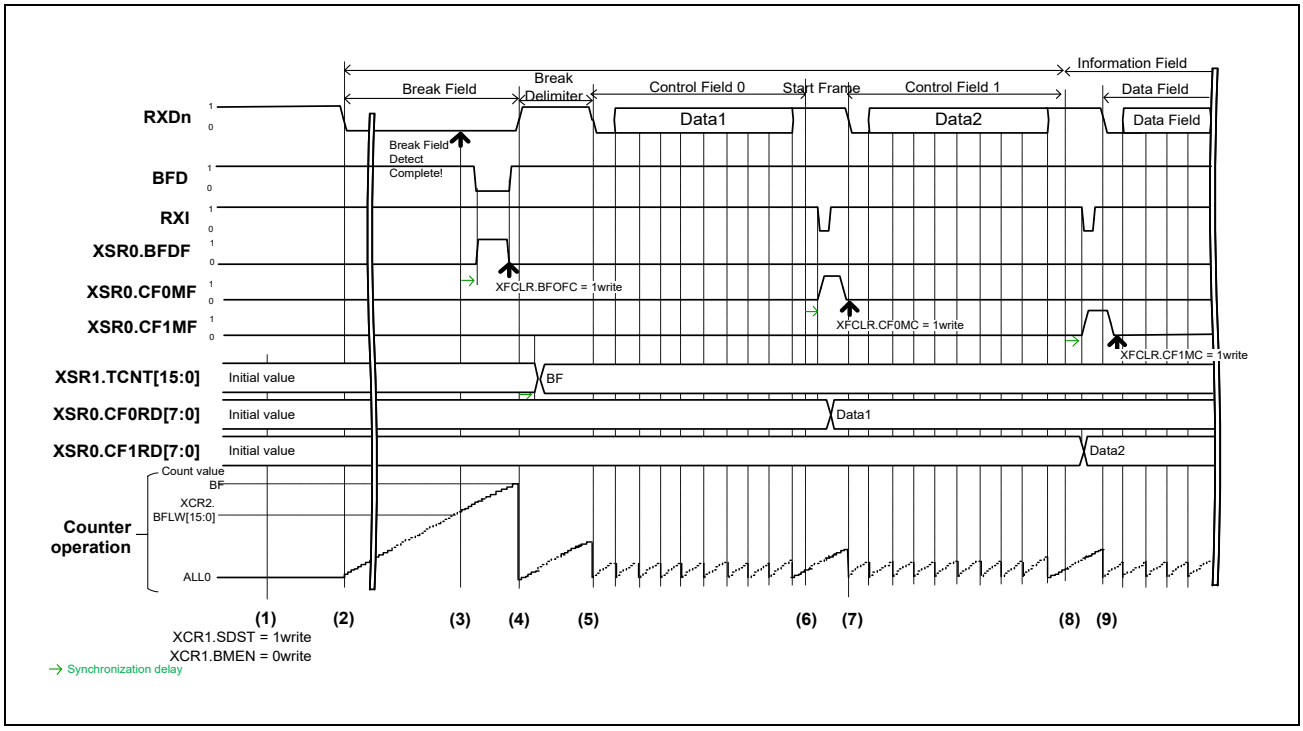

Figure 7.3-58 Normal Reception Example of Start Frame (PIB Not Used)

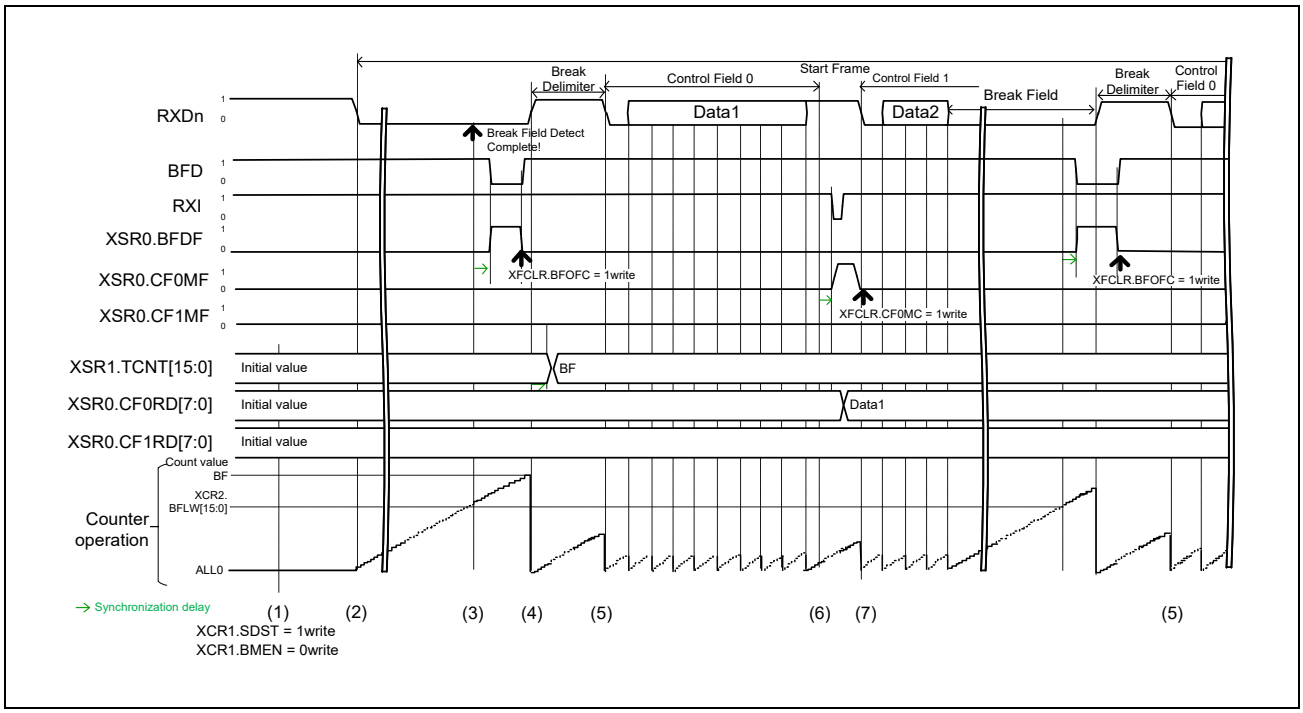

Figure 7.3-59 Start Frame Reception Example (PIB Not Used) Break Field Detected during Control Field 1

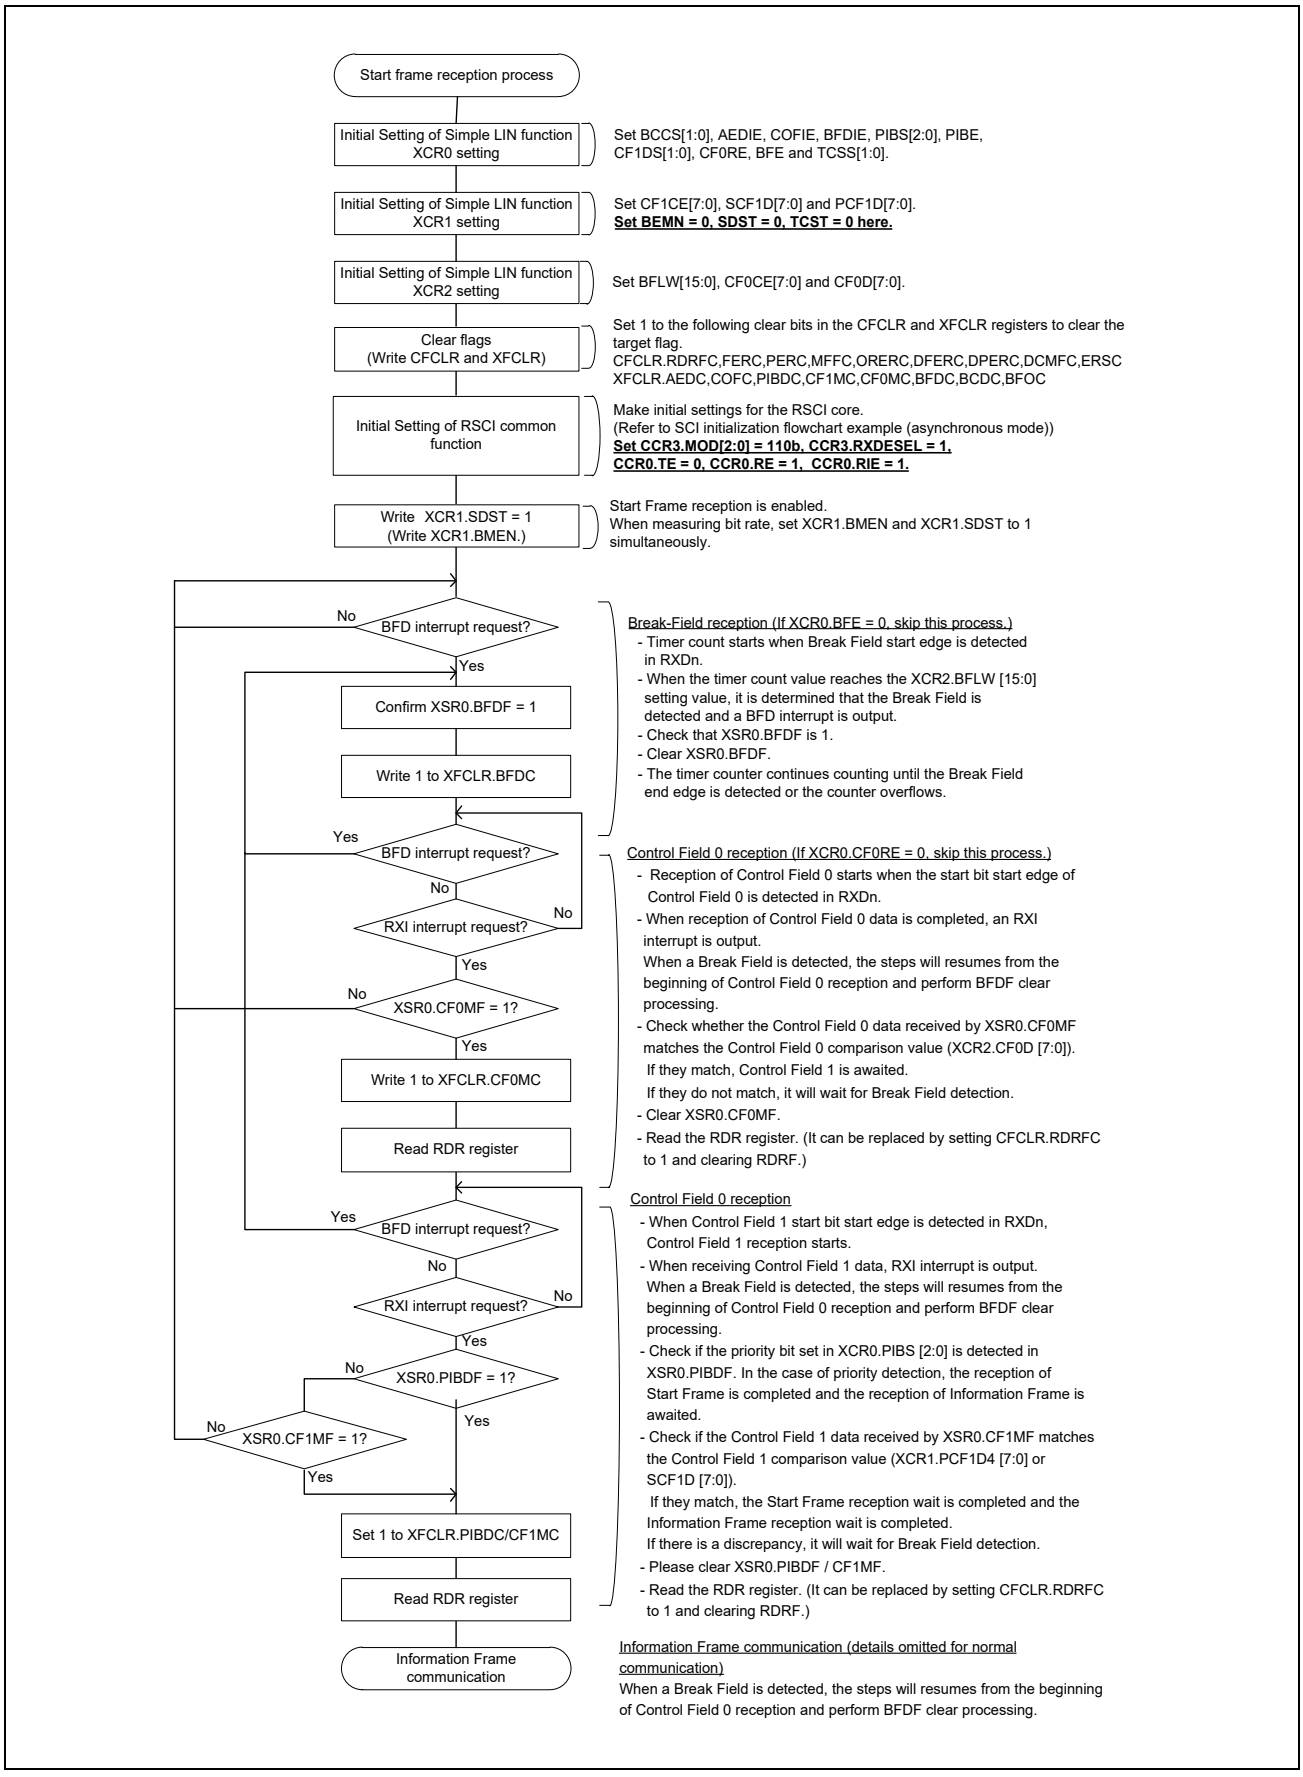

Figure 7.3-60 Example of Start Frame Reception Flowchart

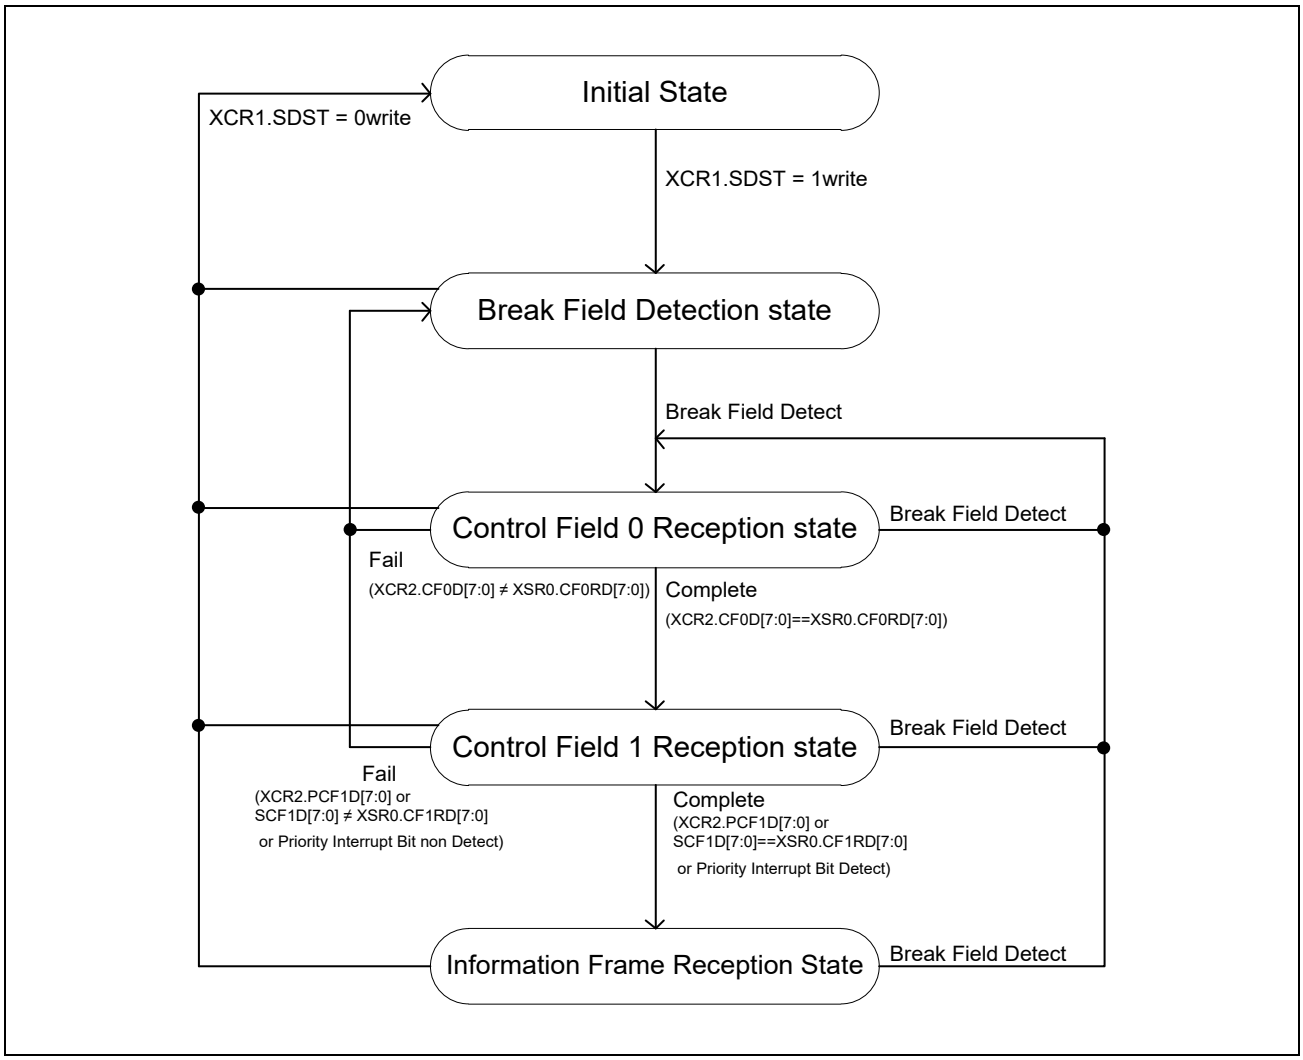

Figure 7.3-61 State Transition Diagram of Start Frame Reception

7.3.6.2.2 Simple-LIN Start Frame reception (using the priority interrupt bit)

Figure 7.3-62 shows an example of Start Frame reception using the priority interrupt bit. The priority interrupt bit is enabled by setting XCR0.PIBE to 1b.

The RSCI operates as follows during Start Frame reception using the priority interrupt bit.

Steps (1) to (7) are the same as steps (1) to (7) in the Start Frame reception example in **Figure 7.3-59**.

(8) When the value specified in the XCR0.PIBS[2:0] bits matches the set XCR1.PCF1D[7:0] value, XSR0.PIBDF is set to 1b and the RSCI core performs communication of the Information Frame. If the data received in Control Field 1 matches neither the set XCR1.PCF1D[7:0] value nor the set XCR1.SCF1D[7:0] value and the priority interrupt bit is not detected, the RSCI transitions to the state before the Break Field is detected.

(9) Communicate information frame at the RSCI core.

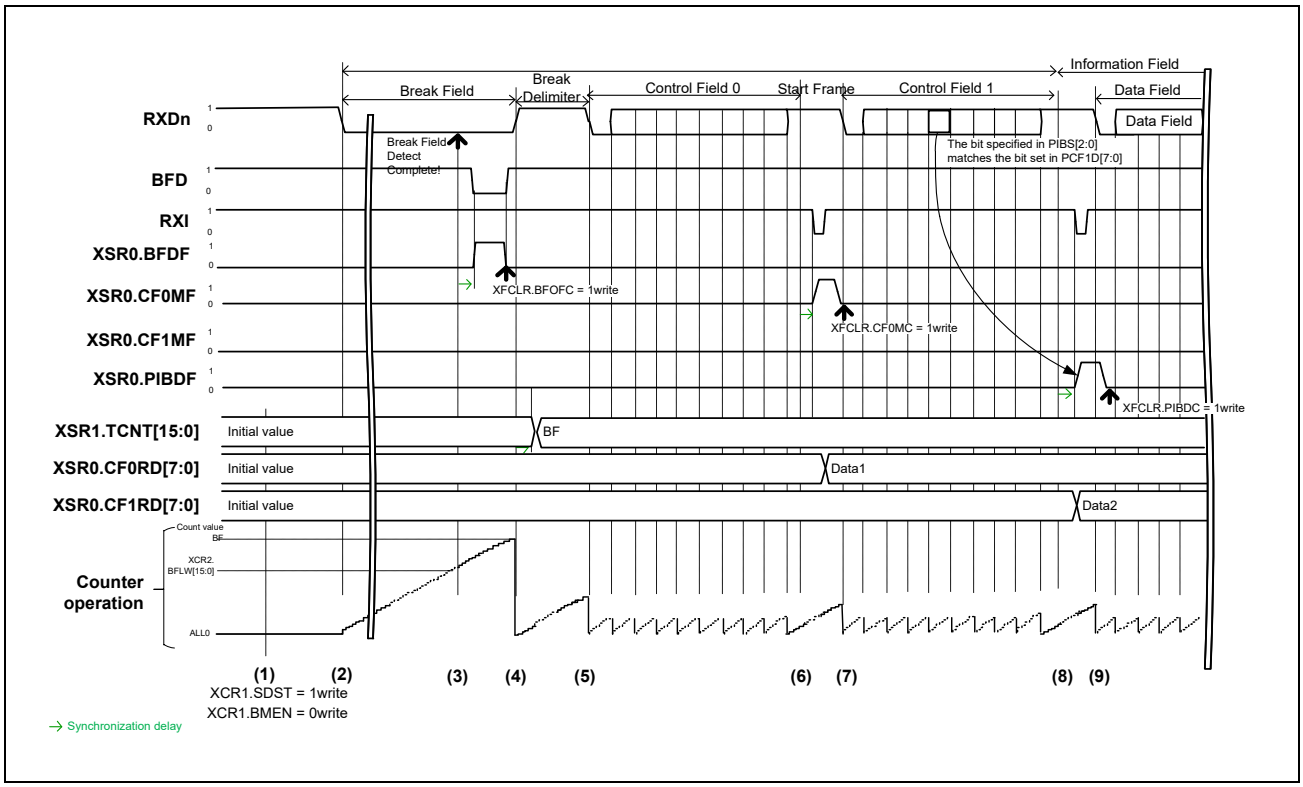

Figure 7.3-62 Start Frame Reception Example (Priority Interrupt Bit Used)

7.3.6.3 Simple-LIN Bus Conflict Detection Function

In simple-LIN mode (CCR3MOD[2:0] = 110b) when TE = 1b, the bus conflict detection function works during Break Field output and during data transmission.

Figure 7.3-63 shows an operation example of the bus conflict detection function. The TXD pin output and the RXD pin input are sampled by the bus conflict detection clock set in XCR0.BCCS[1:0]. When a mismatch occurs three times in a row, XSR0.BCDF is set to 1b, and if XCR0.BCDIE has been set to 1b at this time, an ERI interrupt is generated.

When an ERI interrupt is generated, stop transmission according to **Figure 7.3-64**. Check the bus state to decide whether to resume transmission.

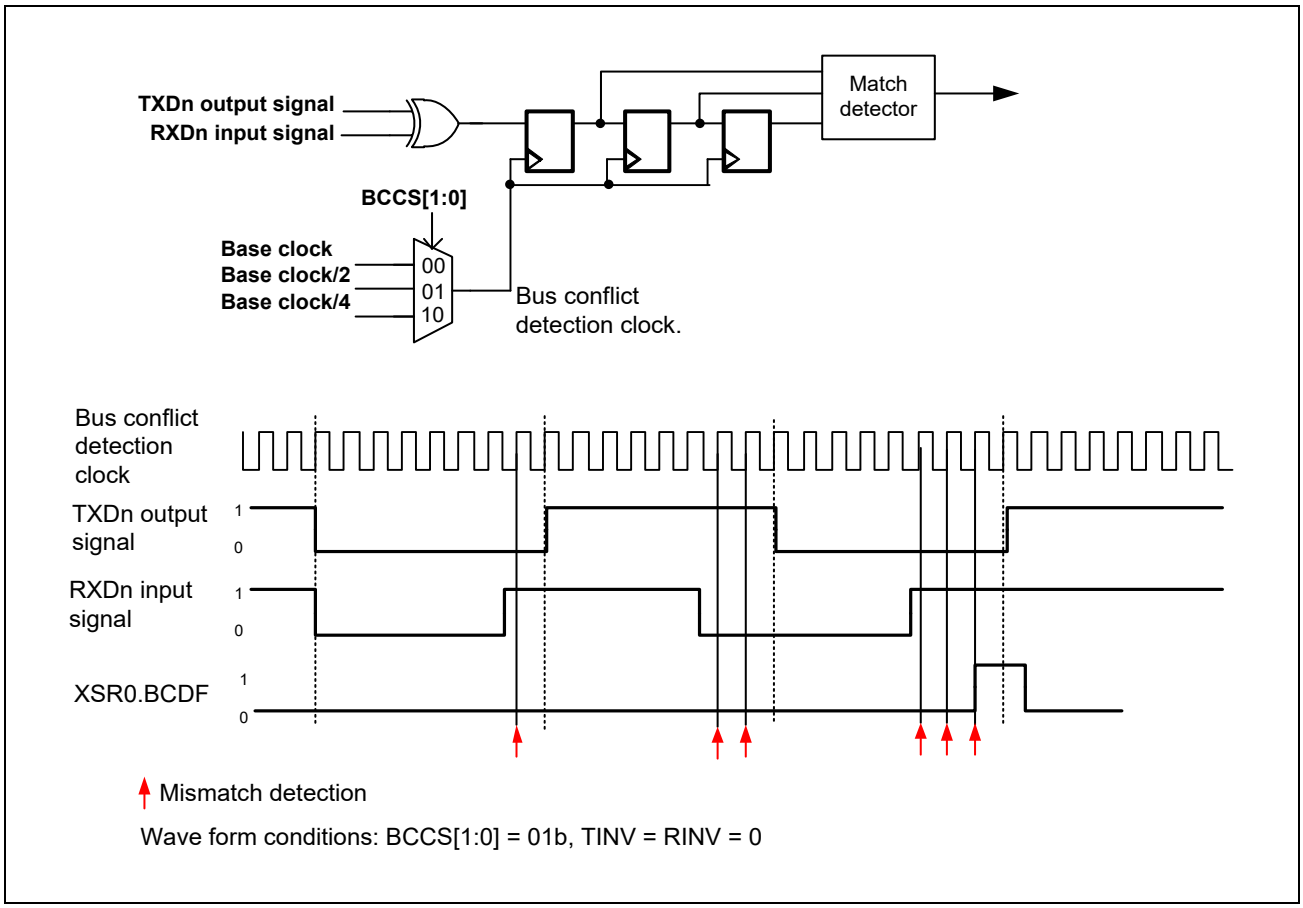

Figure 7.3-63 Operation Example of the Bus Conflict Detection Function

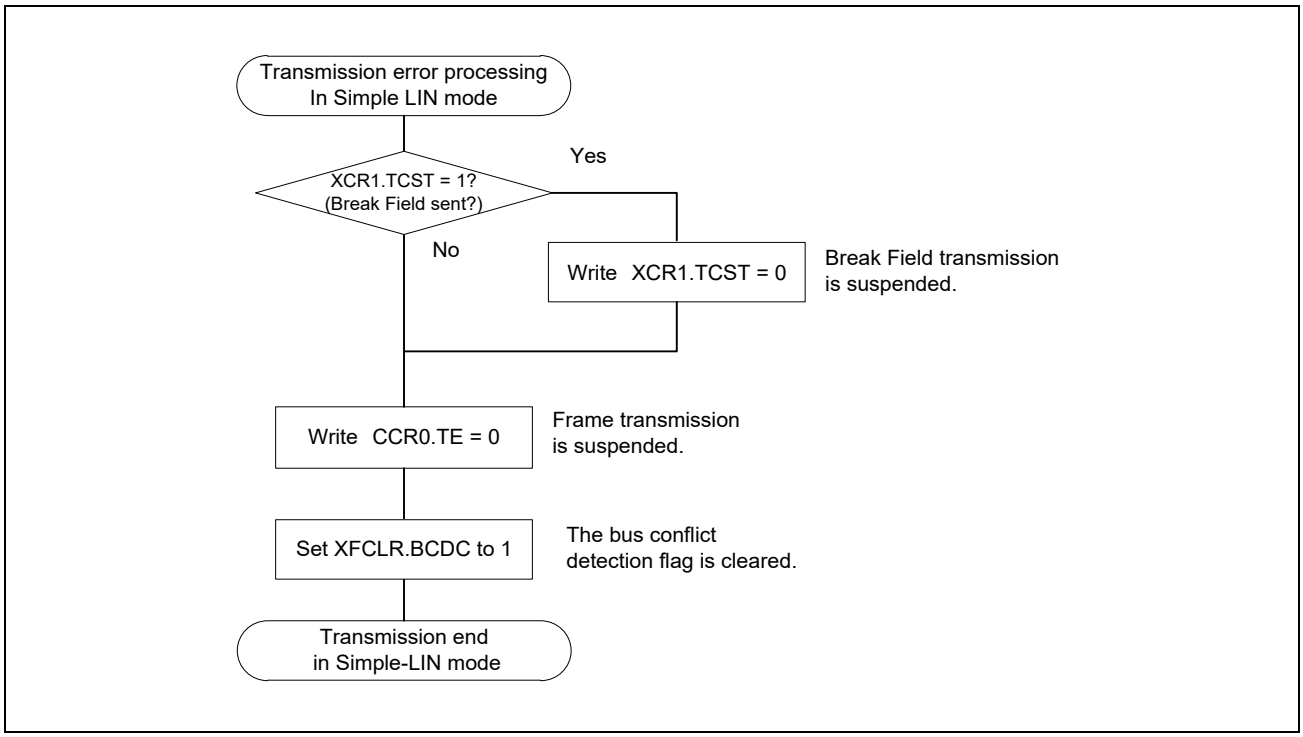

Figure 7.3-64 ERI Interrupt Handling Flow at Transmission in Simple-LIN Mode

7.3.6.4 Simple-LIN Bit Rate Measurement Function

This function measures a bit rate between the effective edges of the input signal from the RXD pin. **Figure 7.3-65** shows an operation example of the bit rate measurement function.

(1) Writing 1b to XCR1.SDST and XCR1.BMEN enables bit rate measurement. When this bit is set to 1b, the valid edge interval of Control Field 0 and Control Field 1 data is measured. However, the bit rate is not measured between the Break Field and the Break Delimiter. Set XCR1.BMEN and XCR1.SDST to 1b simultaneously only when measuring the bit rate.

(2) Because the bit rate is not measured in the Break Field, the effective edge detection flag is not set to 1b at the rising edge at the end of the Break Field, and the counter capture value is not stored in XSR1.TCNT[15:0].

(3) The counter starts counting from the falling edge of the start bit in Control Field 0. The Break Delimiter count value is not captured in XSR1.TCNT[15:0].

(4) The rising edge of the start bit is detected as an effective edge, and then the XSR0.AEDF flag is set to 1b. If XCR0.AEDIE has been set to 1b at this time, an AED interrupt is output. The start bit count value is stored in XSR1.TCNT[15:0]. The XSR1.TCNT[15:0] value is retained until the effective capture value is read.

(5) Even if an effective edge is input from the RXD input pin, the count value of this effective edge timing is not captured because the XRS1.TCNT[15:0] value has not been read and retention has not been released. In this case, an AED interrupt is not output.

(6) The XSR1.TCNT[15:0] value is read. Then the retention of XSR1.TCNT[15:0] is released and the XSR0.AEDF flag is cleared by hardware.

(7) Because the retention of XSR1.TCNT[15:0] has been released, the count value is captured at the effective edge and is retained. At the same time, the XSR0.AEDF flag is set to 1b, and if XCR0.AEDIE has been set to 1b, an AED interrupt is output. The bit rate can be adjusted by calculating it from the count value between effective edges by software and by changing the RSCI settings.

(8) To disable bit rate measurement, write 0b to XCR1.BMEN.

(9) The XSR0.AEDF value and the XSR1.TCNT[15:0] value remain unchanged at the effective edge timing because the bit rate measurement function is disabled.

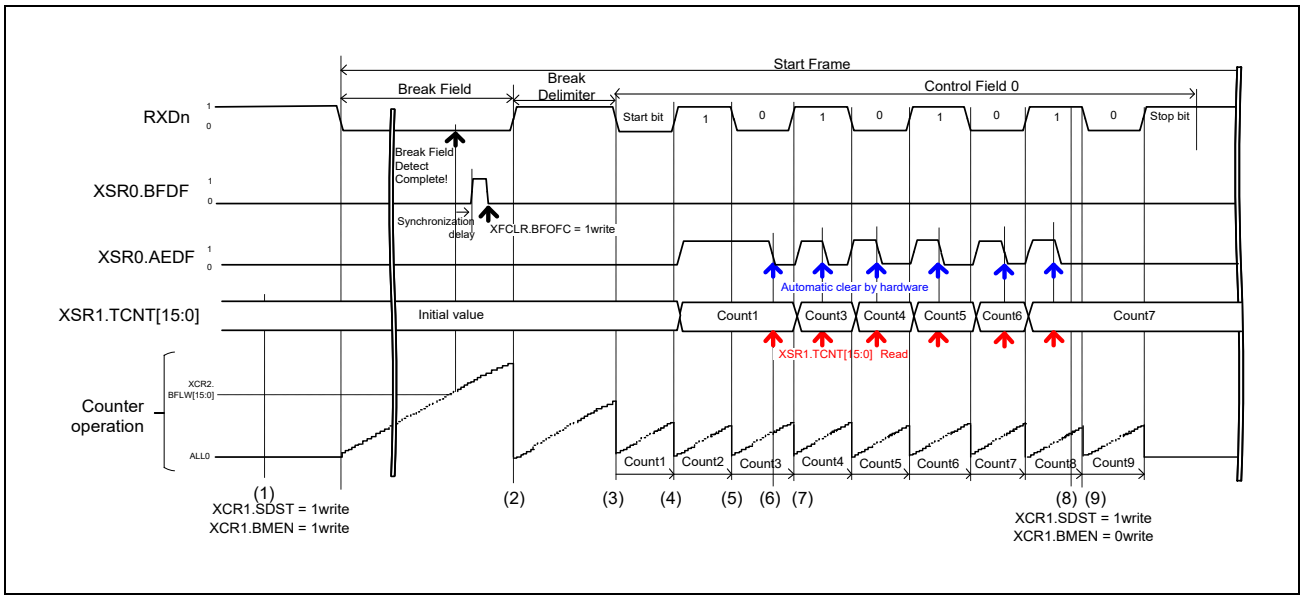

Figure 7.3-65 Operation Example of the Bit Rate Measurement Function

7.3.7 Simple I2C Mode

Simple I2C mode supports master operation only. Simple I2C bus format is composed of 8 data bits and an acknowledge bit. A slave-address frame follows start condition or restart condition. And the slave-address frame is used to specify a slave device as the partner by master device. The currently specified slave device remains valid until a new slave device is specified or a stop condition is satisfied. The 8-bit data of each frame is transmitted from MSB.

Figure 7.3-66 shows I2C bus format, and **Figure 7.3-67** shows the timing of I2C.

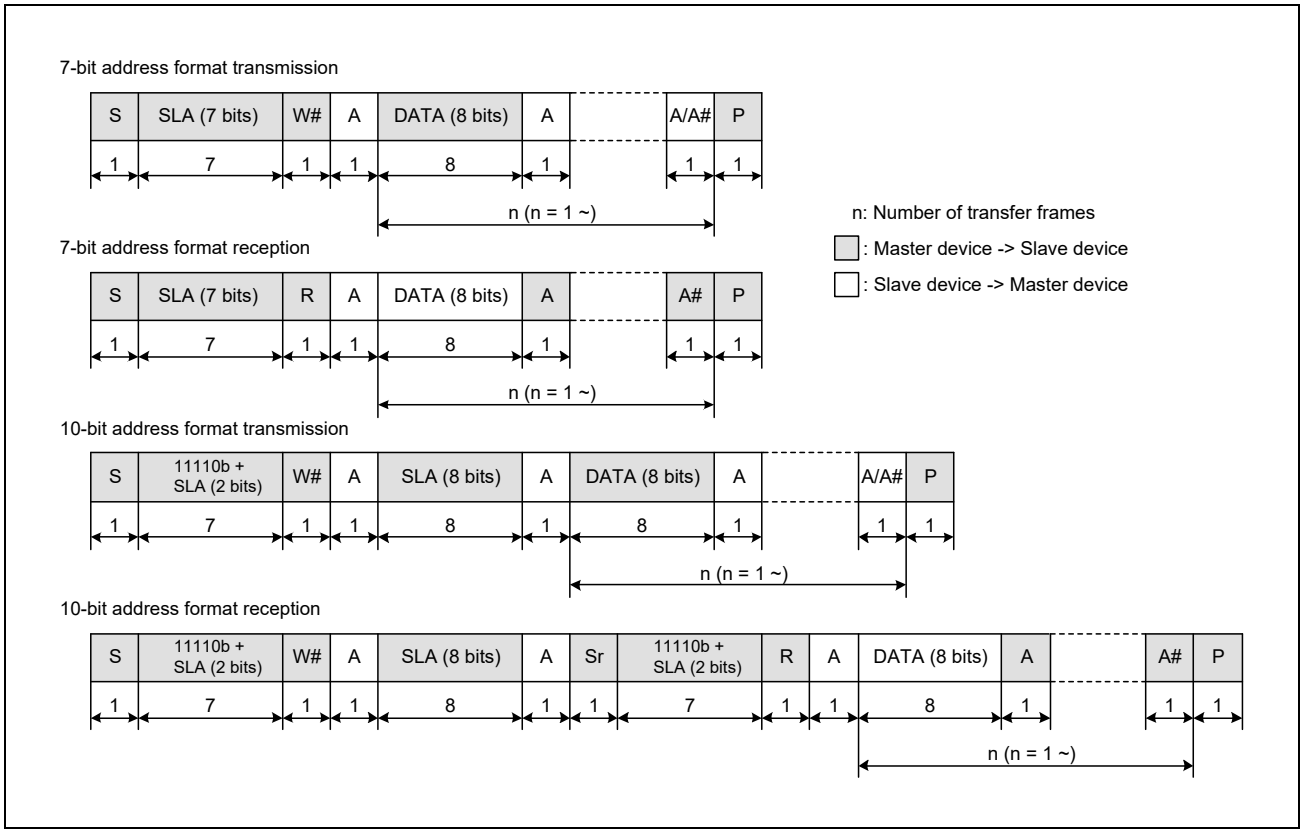

Figure 7.3-66 I2C Bus Format

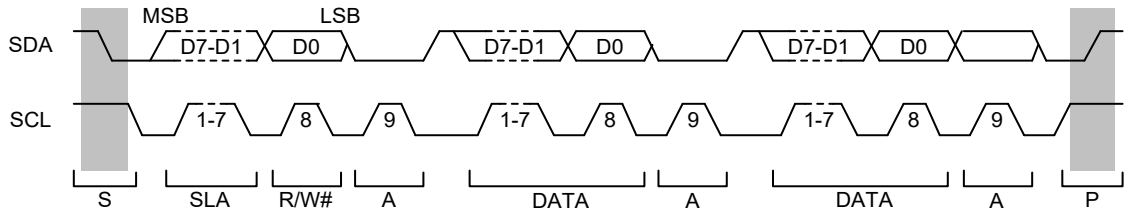

[Symbol explanation]

S: Indicates a start condition. The master device changing the level on the SDAn line from the high to the low level when the SCLn line is at the high level.

SLA: Indicates a slave address. The master device selects a slave device.

R/W#: Indicates the direction of transfer (reception or transmission). When R/W# is high, the transfer direction is from the slave device to the master device. When R/W# is low, the transfer direction is from the master device to the slave device.

A/A#: Indicates an acknowledge. This is returned by the slave device for master transmission and by the master device for master reception. The low level indicates ACK and the high level indicates NACK.

Sr: Indicates a restart condition. The master device changing the level on the SDAn line from the high to the low level when the SCLn line is at the high level.

DATA: Indicates the received or transmitted data.

P: Indicates a stop condition. The master device changing the level on the SDAn line from the low to the high level when the SCLn line is at the high level.

Figure 7.3-67 I2C Bus Timing (SLA = 7 Bit)

7.3.7.1 Generation of Start, Restart, and Stop Conditions

Writing 1b to ICR.IICSTAREQ causes the generation of a start condition. The following operations are done at the generation of a start condition.

- The level on the SDAn line falls (from the high level to the low level) and the SCLn line is kept in the released state.
- The hold time for the start condition is secured as half of a bit period at the bit rate determined by the setting of the CCR2.BRR.
- The level on the SCLn line falls (from the high level to the low level), the ICR.IICSTAREQ is set (to 0b), and a start condition generated STI interrupt (TEI) is output.

Writing 1b to ICR.IICRSTAREQ causes the generation of a restart condition. The following operations are done at the generation of a restart condition.

- The SDAn line is released and the SCLn line is kept at the low level.
- The period at low level for the SCLn line is secured as half of a bit period at the bit rate determined by the setting of the CCR2.BRR.
- The SCLn line is released (transition from the low to the high level).
- Once the high level on the SCLn line is detected, the setup time for the restart condition is secured as half of a bit period at the bit rate determined by the setting of the CCR2.BRR.
- The level on the SDAn line falls (from the high level to the low level).
- The hold time for the restart condition is secured as half of a bit period at the bit rate determined by the setting of the CCR2.BRR.

- The level on the SCLn line falls (from the high level to the low level), the ICR.IICRSTAREQ is set (to 0b), and a restart condition generated STI interrupt (TEI) is output.

Writing 1b to ICR.IICSTPREQ causes the generation of a stop condition. The following operations are done at the generation of a stop condition.

- The level on the SDAn line falls (from the high level to the low level) and the SCLn line is kept at the low level.
- The period at low level for the SCLn line is secured as half of a bit period at the bit rate determined by the setting of the CCR2.BRR.
- The SCLn line is released (transition from the low to the high level).
- Once the high level on the SCLn line is detected, the setup time for the stop condition is secured as half of a bit period at the bit rate determined by the setting of the CCR2.BRR.
- The SDAn is released (transition from the low to the high level), the ICR.IICSTPREQ is set (to 0b), and a stop condition generated STI interrupt (TEI) is output.

Figure 7.3-68 shows the timing of operations in the generation of start, restart and stop conditions.

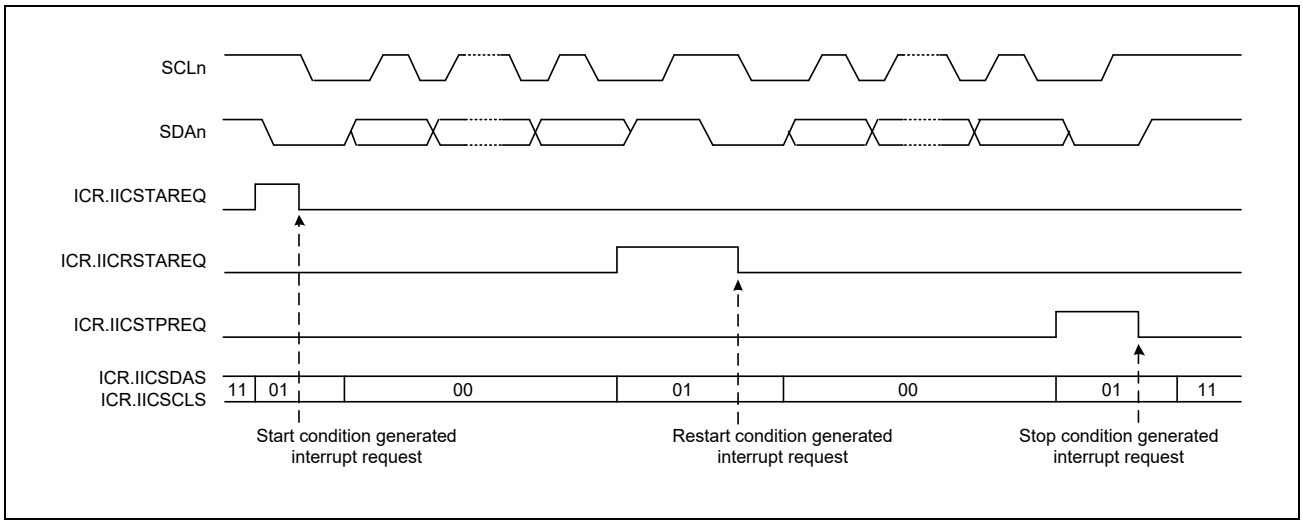

Figure 7.3-68 The Timing of Operations in the Generation of Start, Restart and Stop Conditions

7.3.7.2 Clock Synchronization

The slave device of the communication partner may make SCLn line Low-level with a view to insert a wait. Setting the ICR.IICCSC to 1b, applies control to obtain synchronization when the levels of the internal SCLn clock signal and the level being input on the SCLn pin differ.

When the ICR.IICCSC is set to 1b, the level of the internal SCLn clock signal changes from low to high, counting to determine the period at high level is stopped while the low level is being input on the SCLn pin, and counting to determine the period at high level starts after the transition of the input on the SCLn pin to the high level. The interval until counting to determine the period at high level starts on the transition of the SCLn pin to the high level is the total time which contains the SCLn input delay, the noise filtering delay of the SCLn pin (2 or 3 cycles of the filtering clock), and the internal processing delay (1 or 2 cycles of RSCI_m_TCLK). The period at high level of the internal SCLn clock is extended even if other devices are not placing the low level on the SCLn line.

If the ICR.IICCSC is 1b, synchronization is obtained for the transmission and reception of data by taking the logical AND of the input on the SCLn pin and the internal SCLn clock. If the ICR.IICCSC is 0b, synchronization with the internal SCLn clock is obtained for the transmission and reception of data.

If a slave device inserts a period of waiting into the interval until the transition of the internal SCLn clock signal from the low to the high level after a request for the generation of a start, restart, or stop condition is issued, the time until generation is prolonged by that period.

If a slave device inserts a period of waiting after the transition of the internal SCLn clock signal from the low to the high level, although the generation-completed interrupt is issued without stopping the period of waiting, generation of the condition itself is not guaranteed.

Figure 7.3-69 shows an example of operations to synchronize the clocks.

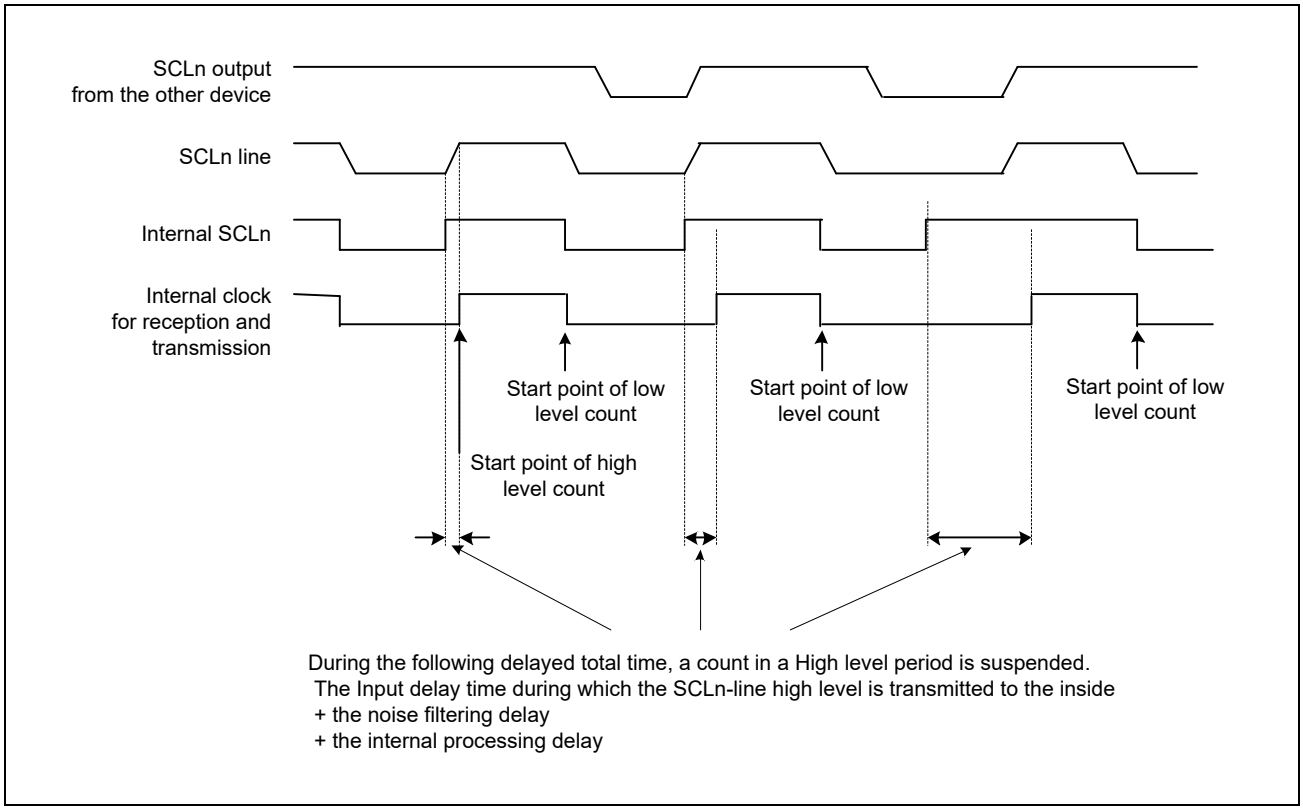

Figure 7.3-69 Example of Operations for Clock Synchronization

7.3.7.3 SDA Output Delay

The ICR.IICDL[4:0] can be used to set a delay for output on the SDAn pin relative to falling edges of output on the SCLn pin. The delay-time settings are selectable from 0 to 31 cycles of the clock signal from the baud rate generator (The base is RSCI_m_TCLK and selected the divided clock by the CCR2.CKS[1:0]). About Start/Restart/Stop conditions, 8-bit transmission data and acknowledge, the SDAn pin output can be delayed.

If the SDA output delay is shorter than the falling time of the SCLn output pin, the change of the SDAn output pin will start while the SCLn output pin level is falling, then there is a possibility of erroneous operation for slave devices. Ensure setting the SDA output delay greater than the SCLn maximum falling time (300 ns for I2C normal/fast mode).

Figure 7.3-70 shows the timing of SDA output delay.

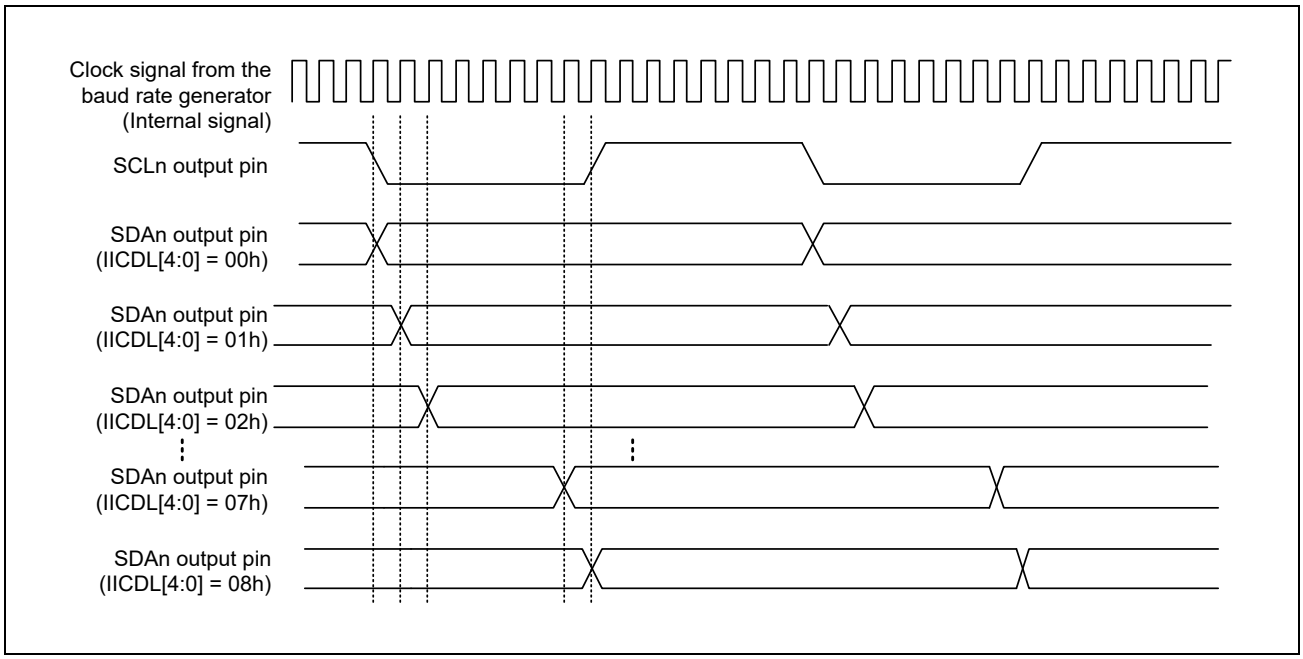

Figure 7.3-70 Timing of SDA Output Delay

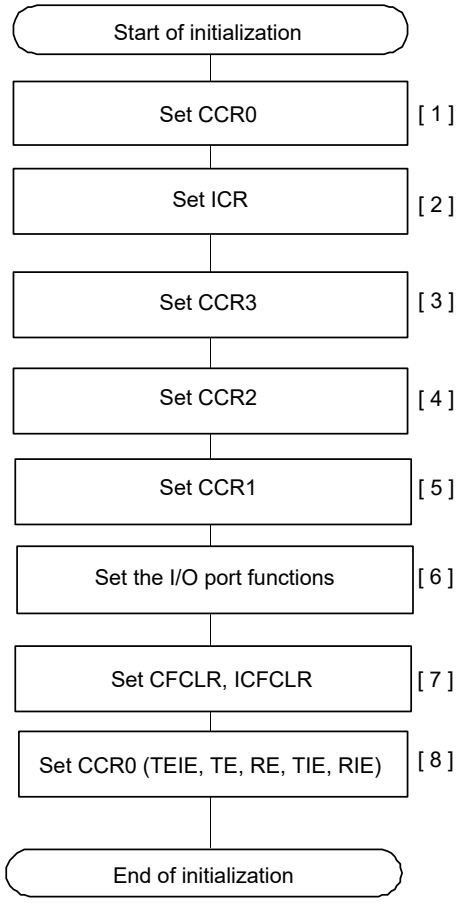
7.3.7.4 SCI Initialization (Simple I2C Mode)

Write initial value (all 0) to CCR0, then initialize SCI according to **Figure 7.3-71**.

When changing the operating mode, transfer format, and so on, be sure to set 0b to CCR0.TE and CCR0.RE before proceeding with the changes. (Or write initial value to CCR0 again.)



[1] Set the following bits of CCR0 to 0.
TEIE, TIE, RIE, TE, RE
If you have not changed from the initial settings, you can skip this step.

[2] Set the IICSDAS[1:0] and IICSCLS[1:0] to 11b.
Set the IICDL[4:0] and IICINTM as required.
Set the IICACKT and the IICCSC bits to 1.

[3] Set the transmission/reception format as the communication mode (MOD[2:0] = 100b) and CCR3.LSBF = 0.

[4] Set the bit rate modulation function*1, the clock selection, and the bit rate.

[5] Set up the Noise-filter function.

[6] Set I/O port settings that allow use of the SCLn and SDAn pin functions.

[7] Write 1 to the following bits and clear the corresponding flag.
CFCLR.RDRFC, FERC, PERC, MFFC, ORERC, DFERC, DPERC, DCMFC, ERSC
ICFCLR.IICSTIFC

[8] Set the TE and RE to 1.
To enable interrupts, set the TE bit, TIE bit, TEIE bit, RE bit, and RIE bit to 1 with one instruction at the same time.
(for transmission and when the IICINTM bit is 1, clear the RIE bit.)
Setting the TE and RE bits to 1 makes the SCLn and SDAn pin functions available.

Note: Set the CCR0.TE and RE bits to 0b or 1b at the same time.

Note 1. If you do not use the bit rate modulation function, you do not need to set it.

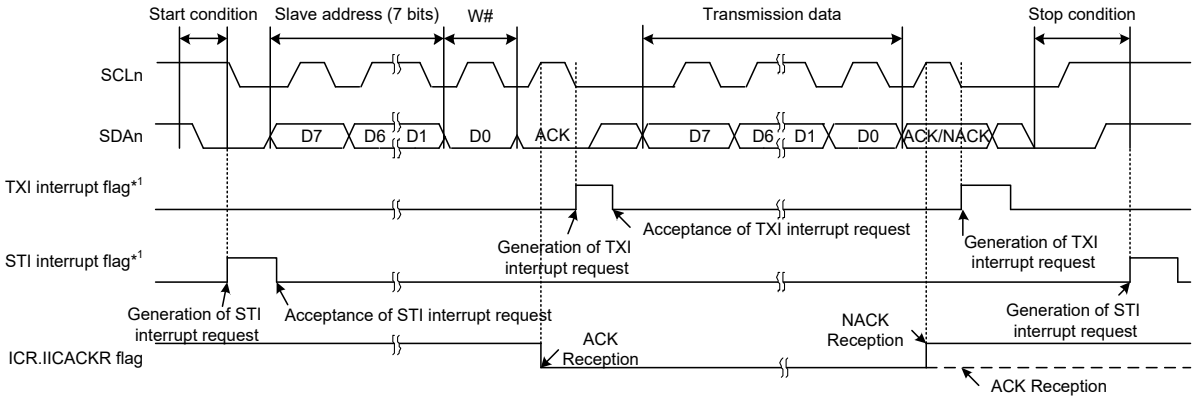
Figure 7.3-71 Example of the Flow of SCI Initialization (for Simple I2C Mode)

7.3.7.5 Operation in Master Transmission (Simple I2C Mode)

Figure 7.3-72 and **Figure 7.3-73** show examples of operations in master transmission, **Figure 7.3-74**, **Figure 7.3-75**, and **Figure 7.3-76** show the example flowcharts. See **Table 7.3-37** about the STI interrupt.

Figure 7.3-72 shows the operation example when ICR.IICINTM is 1b (reception/transmission interrupts are in use). In this case, you can start the DMAC by using the TXI interrupt. However, if the DMAC is used, ACK/NACK cannot be confirmed. If you need to confirm ACK/NACK, use the CPU to prepare transmit data. In simple I2C mode, the TXI interrupt is generated when communication of one frame is completed. In master transmission, the RXI interrupt is not used, so set the CCR0.RIE bit to 0b.

Figure 7.3-74 shows a flow chart in the case of ICR.IICINTM is 1b and address transmission by CPU and data transmission by DMAC. **Figure 7.3-75** shows a flow chart of address and data transmission by CPU. When 10-bit slave addresses are in use, steps [3] and [4] are repeated twice.



Note 1. See **4.6 Interrupt Controller** for details on the corresponding interrupt vector number.

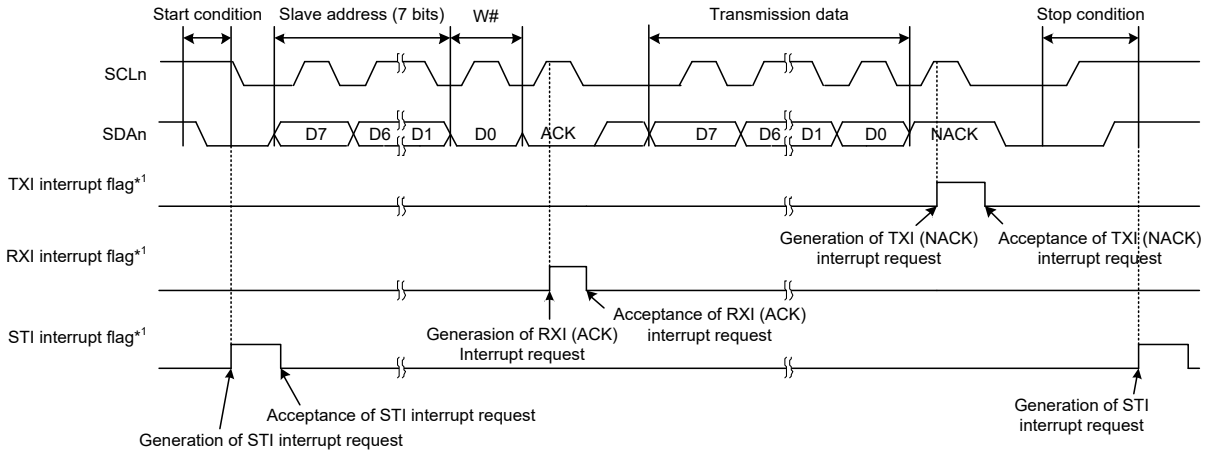
Figure 7.3-72 Example 1 of Operations for Master Transmission in Simple I2C Bus Mode (7-Bit Slave Address, Transmission and Reception Interrupt in Use (ICR.IICINTM = 1b))

Figure 7.3-73 shows an example of operations when ICR.IICINTM is 0b (ACK and NACK interrupt in use). In this case, DMAC is activated by the ACK (RXI) interrupt, and necessary number of data bytes are transmitted. When the NACK is received, error processing, such as transmission stop and retransmission, is performed by the NACK (TXI) interrupt as the trigger.

Figure 7.3-76 shows a flow chart of ICR.IICINTM is 0b.

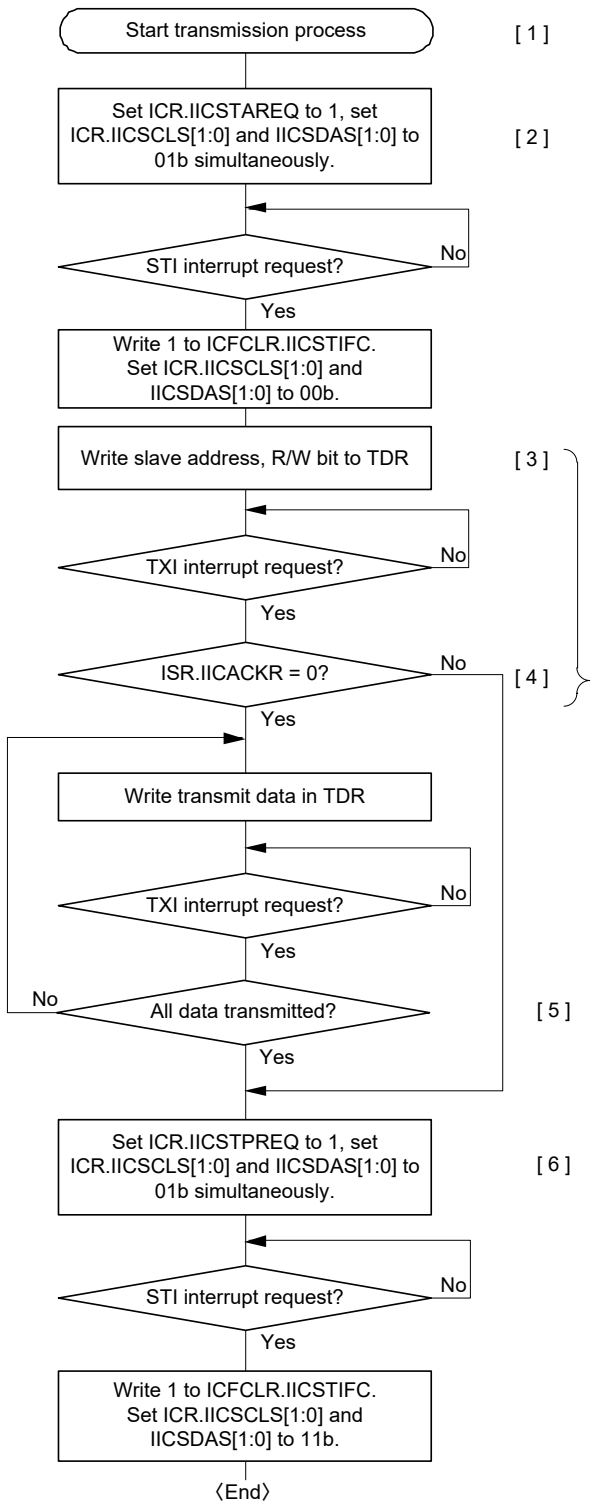
To resume communication after interrupting communication for some reason after writing transmit data to TDR, follow the procedure below.

1. Set the CCR0.TE and CCR0.RE bits to 0b to stop communication.
2. Set ICR.IICSCLS[1:0] and ICR.IICSDAS[1:0] to 11b, release the I2C bus, and clear various condition generation requests.
3. When CSR.RDRF = 1b, the RDR register is read by dummy and the RDRF bit is set to 0b.
4. Set the CCR0.TE and CCR0.RE bits to 1b and restart communication.



Note 1. See **4.6 Interrupt Controller** for details on the corresponding interrupt vector number.

Figure 7.3-73 Example 2 of Operations for Master Transmission in Simple I2C Bus Mode (7-Bit Slave Address, ACK and NACK Interrupt in Use (ICR.IICINTM = 0b))



[1] Start transmission process
For transmission, set the CCR0.RIE to 0.
(RXI and ERI interrupts requests are disabled)

[2] Generate a start condition.

[3] Writing to TDR:
Writing the slave address and value for the R/W bit to TDR.

[4] Confirm ACK response from the slave device:
Check the ISR.IICACKR bit. If its value is 0, it is indicated that the slave device responded with ACK and operations proceed. If its value is 1, it is indicated that there was no response from a slave device so the next transition is to generation of the stop condition.

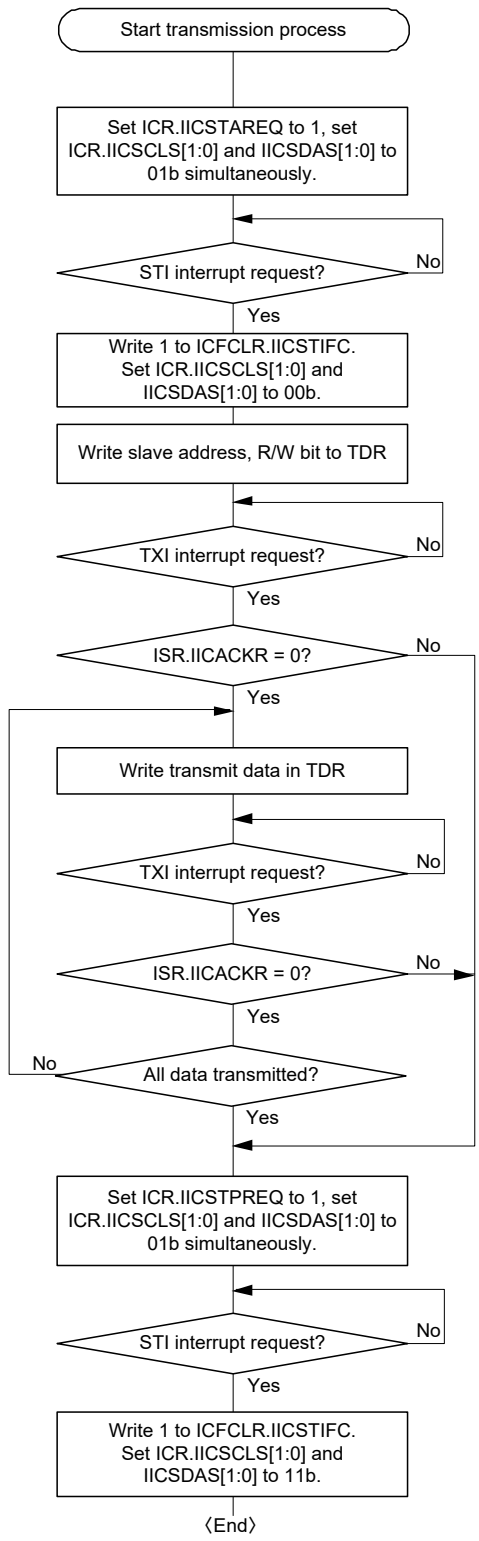
[5] Steps for continuing with serial transmission:
When transmission is to continue, write further transmit data to TDR. Except for the first data to be transmitted, a TXI interrupt request can activate the DMAC to handle writing of data to TDR.
But it cannot be confirmed status of ACK or NACK in this case.

[6] Generation of a stop condition.

If 10-bits slave address are in use, processing from [3] to [4] is repeated twice.

Note: In simple I2C mode, the TXI interrupt request is generated when communication is completed.

Figure 7.3-74 Example of the Procedure for Master Transmission Operations in Simple I2C Mode (when ICR.IICINTM is 1b, and when Confirming ACK/NACK by Address Transmission Only.)



[1] [1] Start transmission process
For transmission, set the CCR0.RIE to 0.
(RXI and ERI interrupts requests are disabled)

[2] Generate a start condition.

[2] [3] Writing to TDR:
Writing the slave address and value for the R/W bit to TDR.

[4] Confirm ACK response from the slave device:
Check the ISR.IICACKR bit. If its value is 0, it is indicated that the slave device responded with ACK and operations proceed. If its value is 1, it is indicated that there was no response from a slave device so the next transition is to generation of the stop condition.

[3] [5] Steps for continuing with serial transmission:
When transmission is to continue, write further transmit data to TDR. If ACK or NACK is checked in every transmission, DMAC cannot be used.

[6] Generation of a stop condition.

[4] If 10-bits slave address are in use, processing from [3] to [4] is repeated twice.

[5]

[6]

Note: In simple I2C mode, the TXI interrupt request is generated when communication is completed.

Figure 7.3-75 Example of the Procedure for Master Transmission Operations in Simple I2C Mode (when ICR.IICINTM is 1b, and when Confirming ACK/NACK in All Transmissions.)

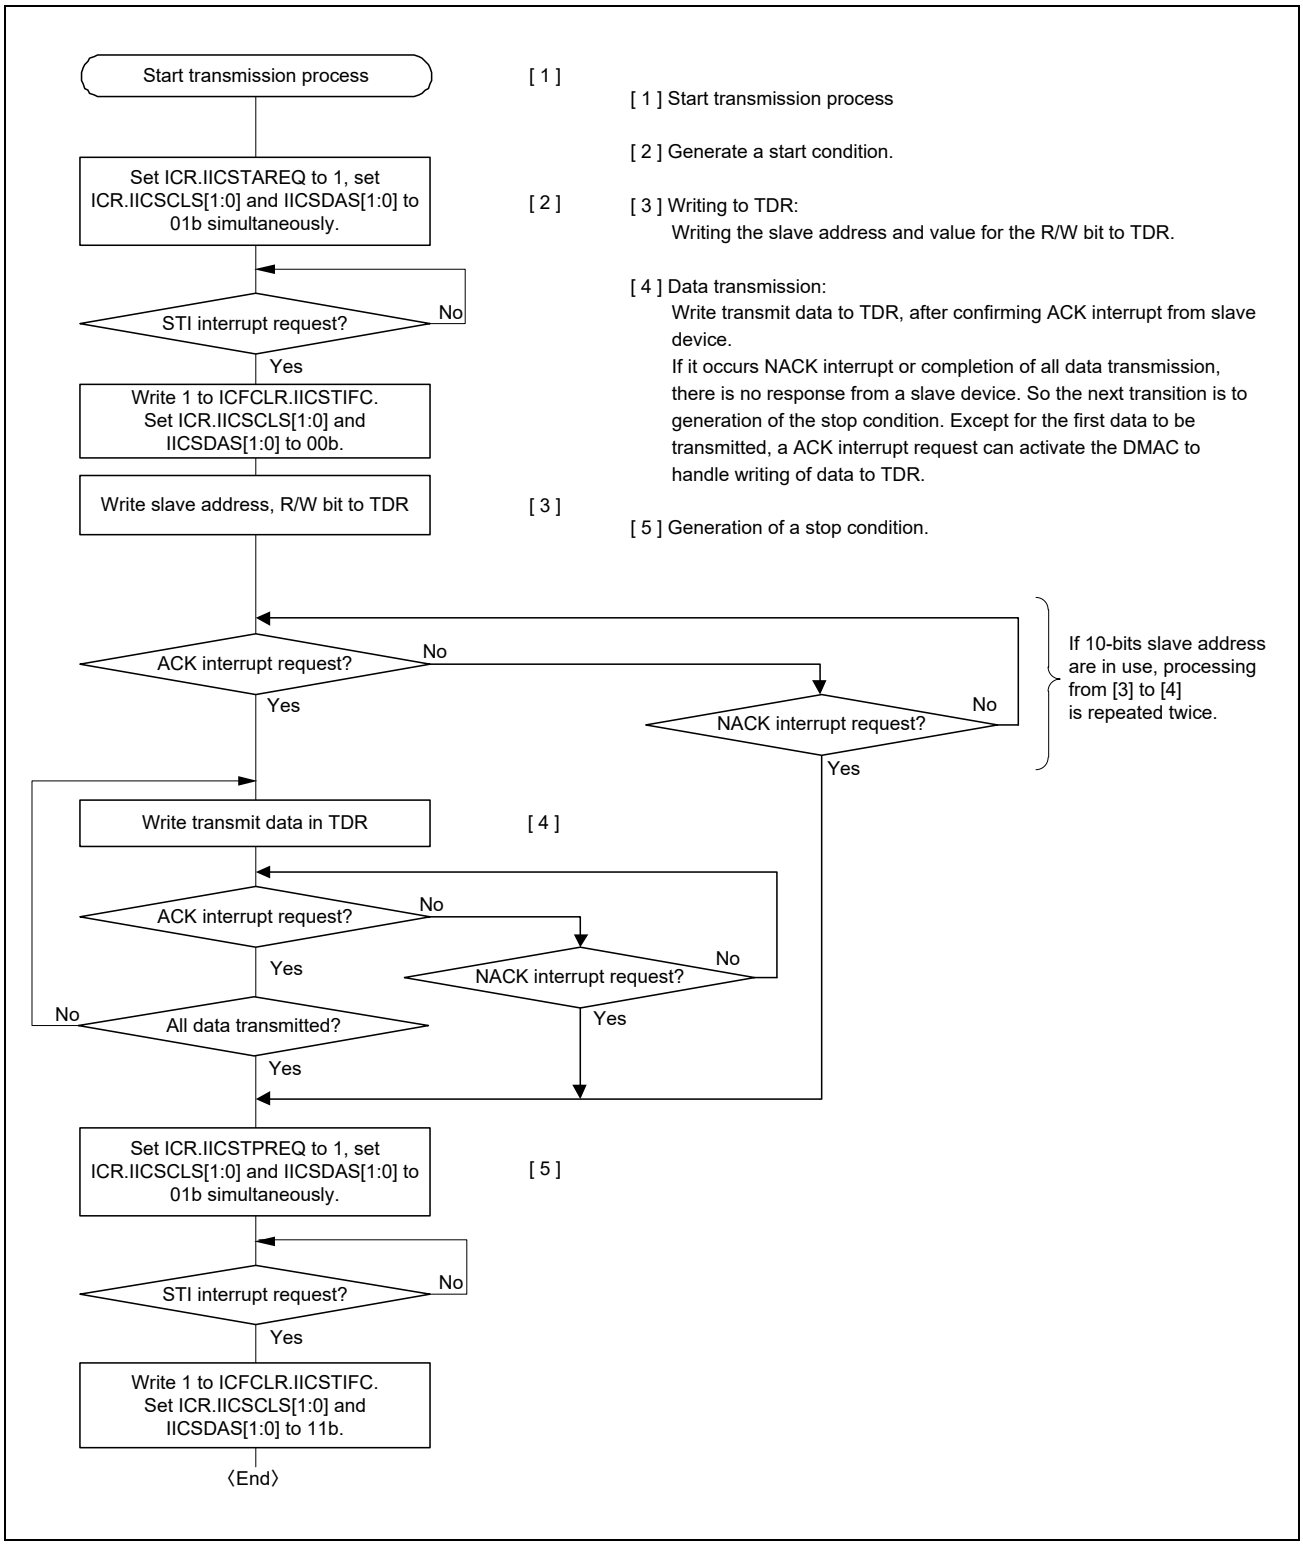


Figure 7.3-76 Example of the Procedure for Master Transmission Operations in Simple I2C Mode (when ICR.IICINTM is 0b.)

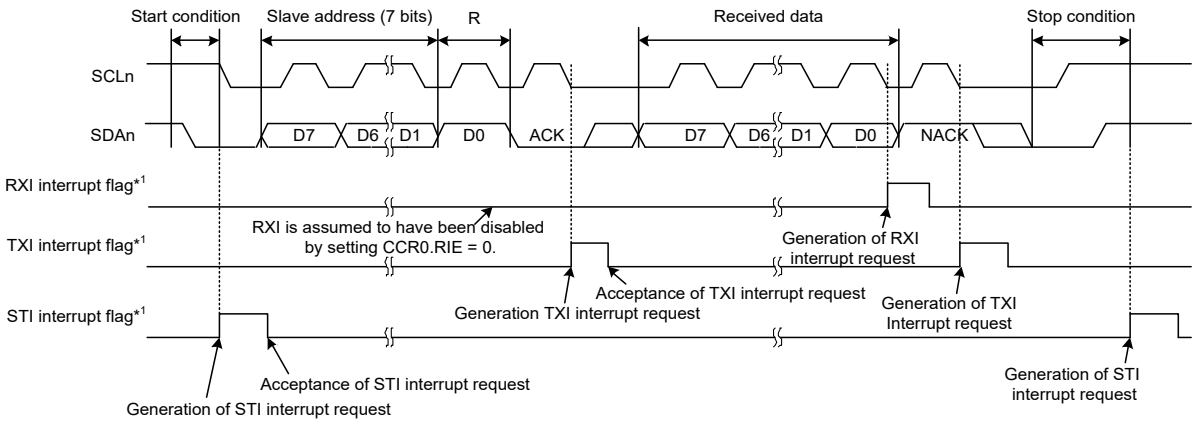
7.3.7.6 Master Reception (Simple I2C Mode)

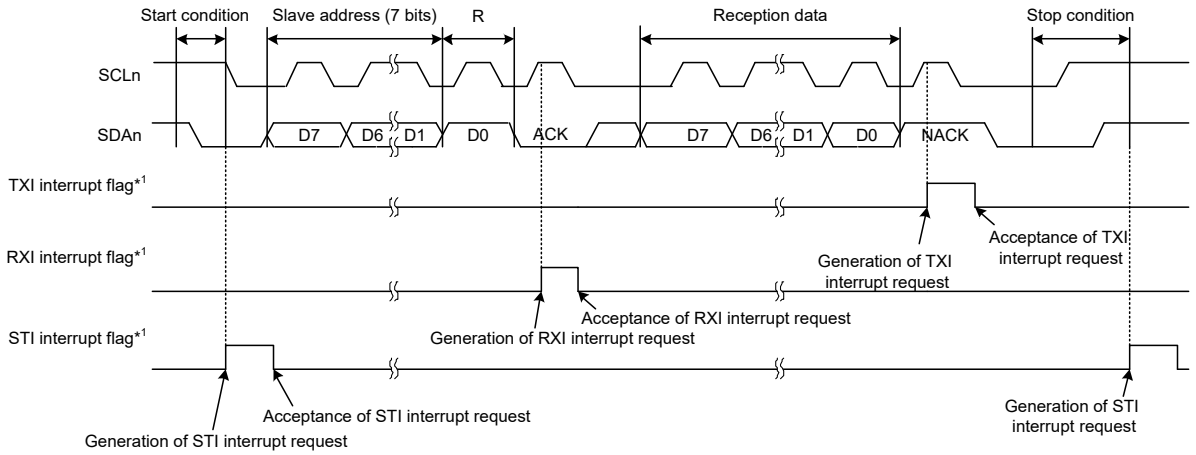
Figure 7.3-77 and **Figure 7.3-78** show example of operations in simple I2C mode master reception. **Figure 7.3-79** and **Figure 7.3-80** show flowchart of the master reception. The value of the ICR.IICINTM bit is assumed to be 1b (use reception and transmission interrupts) and 0b (use ACK and NACK interrupts).

In simple I2C mode, the transmit data empty interrupt (TXI) is generated when communication of one frame is completed.



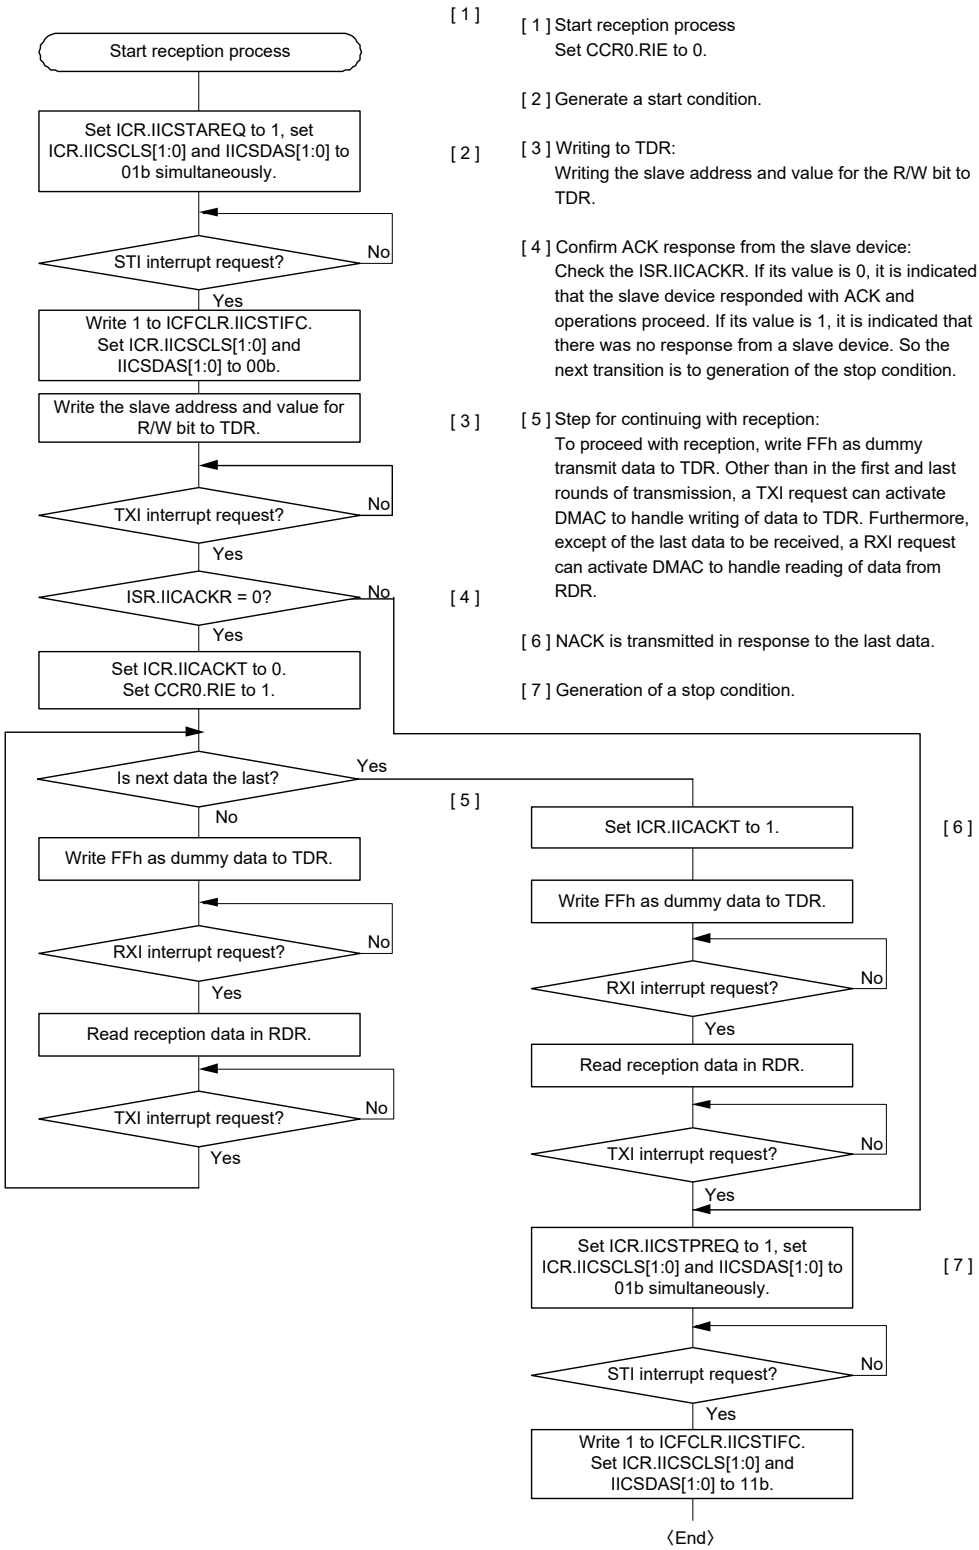
Note 1. See **4.6 Interrupt Controller** for details on the corresponding interrupt vector number.

Figure 7.3-77 Example of Operations for Master Reception in Simple I2C Bus Mode (7-Bit Slave Address, Transmission and Reception Interrupt in Use (ICR.IICINTM = 1b))



Note 1. See **4.6 Interrupt Controller** for details on the corresponding interrupt vector number.

Figure 7.3-78 Example of Operations for Master Reception in Simple I2C Bus Mode (7-Bit Slave Address, ACK and NACK Interrupt in Use (ICR.IICINTM = 0b))



Note: In simple I2C mode, the TXI interrupt request is generated when communication is completed.

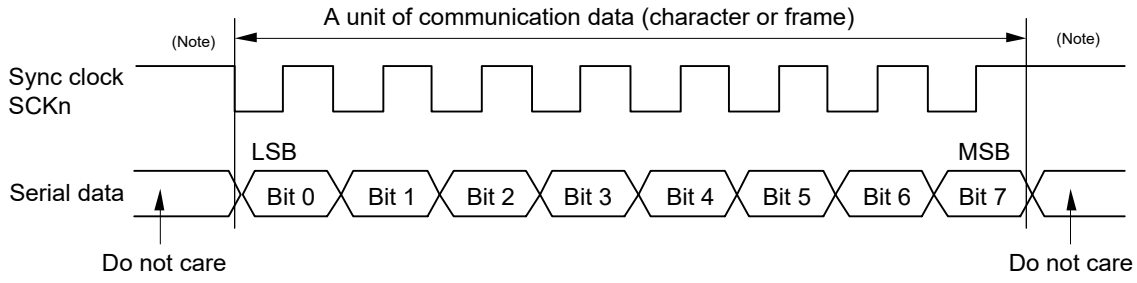
7.3.8 Clock Synchronous Mode

Figure 7.3-81 shows the communication data format of clock synchronous serial communication.

In clock synchronous mode, data is transmitted and received in synchronization with clock pulses. A communication data character consists of 8-bit data. In clock synchronous mode, no parity bit can be added. In data transmission when CPHA = 1b and CPOL = 1b, the SCI outputs data from the falling edge of the sync clock until the next falling edge. In data reception, data is read at the rising edges of the sync clock. After 8-bit data is output, the communication line holds the final-bit output state. In slave communication when CPHA = 0b, however, the communication line holds the first-bit output state.

Because the SCI has an internal transmitter and a receiver independently, SCI enable full-duplex communication by sharing a communication clock of the transmitter and the receiver. Furthermore, because both the transmitter and the receiver have a double- buffer structure, continuous transmission and reception are possible by writing the next transmit data during transmission and reading the previous receive data during reception.



Note: High level (except for continuous transmission or reception)

Figure 7.3-81 Data Format of Clock Synchronous Serial Communication (LSB First, CPHA = 1b, CPOL = 1b)

7.3.8.1 Clock

(1) When the internal clock is selected

When the CCR3.CKE[1:0] bits are set to 00b or 01b (master mode), the internal clock generated by the baud rate generator can be selected and the sync clock is output from the SCKm pin. Eight pulses of the sync clock are output during single- character transmission/reception. The sync clock remains at a high level*[1] while no transmission or reception is performed. In transmission-only or transmission/reception, the sync clock is not output unless transmit data is prepared.

When the internal clock is selected, the clock with a delay from the SCKm signal is used for the master reception sampling clock. This ensures the data setup time and hold time for high-speed communication.

Note 1. When CCR3.CPOL = 1b, the sync clock stops at a high level. When CCR3.CPOL = 0b, the sync clock stops at a low level.

(2) When the external clock is selected

When the CCR3.CKE[1:0] bits are set to 10b or 11b (slave mode), data is transmitted and received using the external clock that is input from the SCKm pin.

7.3.8.2 CTS and RTS Functions

The CTS function performs transmission/reception and controls transmission start using the CTSn# pin input when the internal clock is selected. Setting the CCR1.CTSE bit to 1b enables the CTS function. Two settings are possible for the CTS/RTS pin: dual setting for using either function with a single pin, and dedicated setting for using each function simultaneously with two pins. The CCR1.CTSPEN register is used for these settings.

When the CTS function is enabled, transmission/reception and transmission start only when the CTSn# pin input level is low. Even if the CTSn# pin input becomes high level during transmission/reception or transmission operation, frames that are being transmitted/received or being transmitted are not affected and transmission/reception or transmission operation continues.

The RTS function makes a serial communication start request using the RTSn# pin output when the external sync clock is selected. When serial communication is enabled, the RTSn# pin outputs a low level. A low level and a high level are output under the following conditions.

[Conditions for low level]

1. When a non-FIFO buffer is selected, all the following conditions are met.
   - CCR0.RE bit or TE bit = 1b
   - Serial communication is enabled.
   - No receive data is present before reading. (when CCR0.RE bit = 1b)
   - Data before transmission start is remaining in the TSR register. (when CCR0.TE bit = 1b)
   - CSR.ORER flag = 0b
2. When a FIFO buffer is selected, all the following conditions are met.
   - CCR0.RE bit or TE bit = 1b
   - Serial communication is enabled
   - The number of receive data stored in the receive FIFO (RDR register) is less than the value set in FCR.RSTRG[4:0]. (when CCR0.RE bit = 1b)
   - Unsent data is remaining in the transmit FIFO (TDR register). (when CCR0.TE bit = 1b and CCR3.CKE[1] bit = 0b)
   - Data before transmission start is remaining in the TSR register. (when CCR0.TE bit = 1b and CCR3.CKE[1] bit = 1b)
   - ORER (RDR.ORER) flag = 0b

[Conditions for high level]

1. When a non-FIFO buffer is selected If conditions for low level are not met:
   When CCR0.RE is set to 0b without reading the RDR register to terminate reception after reception is complete, the RTSn# pin output level remains high. At this time, write 0b to CCR0.RE.
2. When a FIFO buffer is selected
   If conditions for low level are not met:

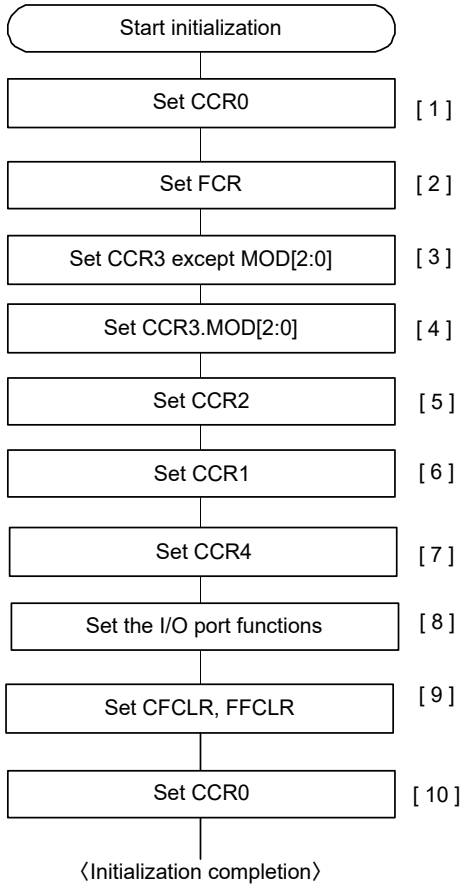
7.3.8.3 Initializing the SCI (Clock Synchronous Mode)

Before starting data transmission/reception, write 0b to CCR0.TE and CCR0.RE (or write initial values to the CCR0 register) and initialize the SCI according to the flowchart example in **Figure 7.3-82**.

Before changing operating mode or communication format, also be sure to write 0b to CCR0.TE and CCR0.RE.

Note that writing 0b to the RE bit does not initialize the ORER, FER, PER, and RDRF flags in CSR and the RDR register. Also note that writing 0b to the TE bit does not initialize the TEND flag when a FIFO buffer is selected. Attention is also needed for changing operating mode.

When CCR0.TIE = 1b, note that setting the TE bit to 1b from 0b generates a TXI interrupt.



[1] Set the following bits of CCR0 to 0*1.
TEIE, TIE, RIE, TE, RE
If you have not changed from the initial settings, you can skip this step.

[2] Set the TFRST and RFRST to 1 to empty FIFO.
Set the TTRG[4:0], RTRG[4:0], and RSTRG[4:0] bits.

[3] Set CCR3 except of communication mode.
FIFO use / no-use
Transmission / reception format
Clock setting
Leave unused bits (CHR[1:0], STP, RXDESEL, MP, DE, ACS0,GM,BLK) at their initial values.

[4] Set communication mode (MOD[2:0] = 010b)*2.

[5] Select clock, set bit rate*3. Leave unused bits (BCP[2:0], ABCS, ABCSE) at their initial values.

[6] Set up the loop-back function, communication terminal status, and the CTS/RTS function.

[7] Set up the adjust sampling timing function.
Leave unused bits (CMPD[8:0], ATEN, ATT[2:0], AET) at their initial values.

[8] Make I/O port settings to enable input and output functions as required for TXDn, RXDn, SCKn, CTS#, and RTSn# pins.

[9] Write 1 to the following bits and clear the corresponding flag.
CFCLR.RDRFC, FERC, PERC, MFFC, ORERC, DFERC, DPERC, DCMFC, ERSC
FFCLR.DRC

[10] Set the TE or RE bit to 1.*1,*4 To enable interrupts, set the TE bit and TIE bit, and the RE bit and RIE bit to 1 with one instruction at the same time.
Setting the TE and RE bits allows TXDn and RXDn to be used.

Note 1. In simultaneous transmit and receive operations, the TE and RE bits in CCR0 should both be to 0b or set to 1b simultaneously.

Note 2. Set CPOL and CPHA before setting the Communication mode.

Note 3. If you use an external clock, you do not need to set it.

Note 4. When using the internal clock (master), the setting of reception only is prohibited.

Figure 7.3-82 SCI Initialization Flowchart Example (Clock Synchronous Mode)

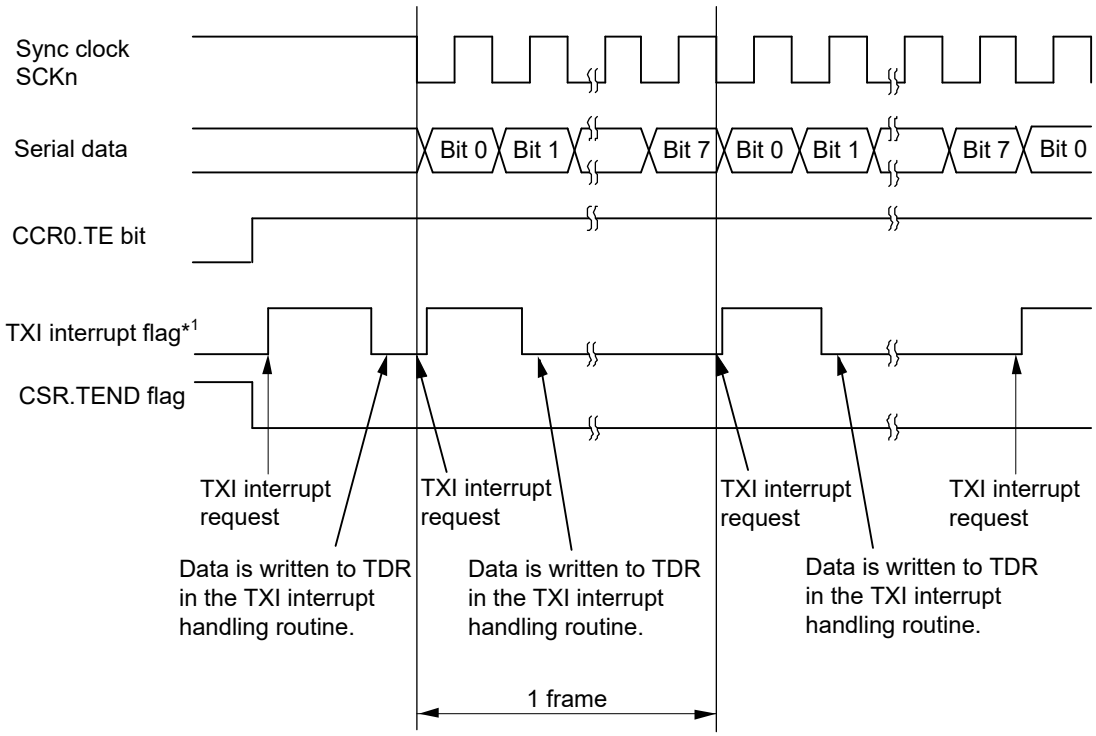
7.3.8.4 Serial Data Transmission (Clock Synchronous Mode)

(1) Non-FIFO selected

Figure 7.3-83, **Figure 7.3-84**, and **Figure 7.3-85** show operation examples of serial transmission in clock synchronous mode. The SCI operates as follows during serial data transmission.

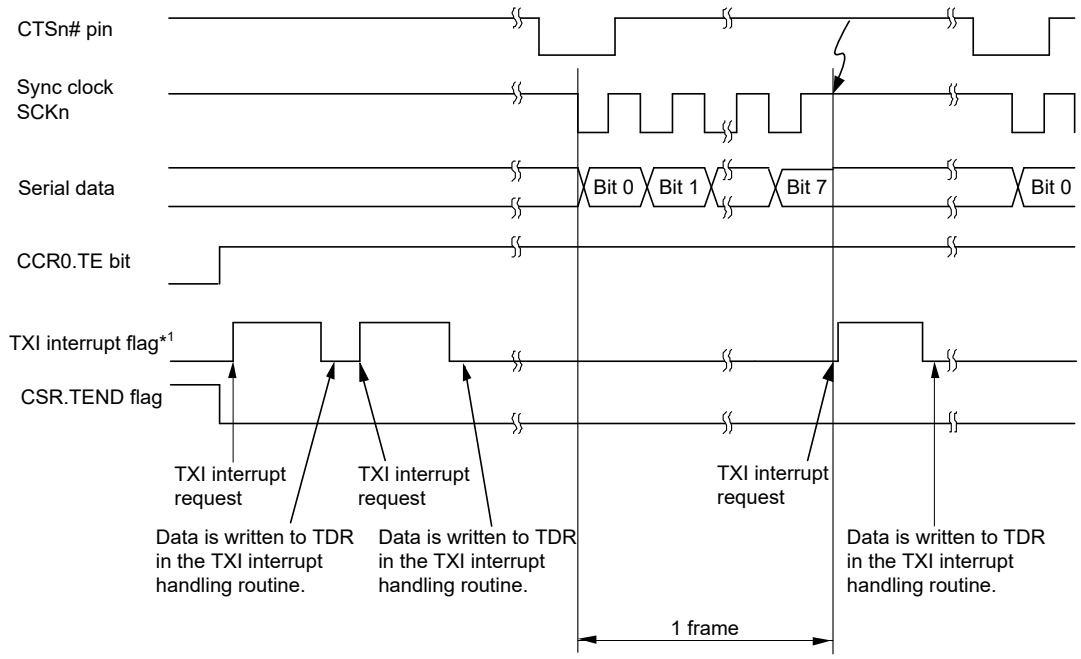
1. When data is written to the TDR register in the TXI interrupt routine, the SCI transfers the data from the TDR register to the TSR register. When starting data transmission, set the CCR0.TIE bit and the CCR0.TE bit to 1b simultaneously by a single instruction. Then a TXI interrupt request is generated.
2. The written data is transferred from the TDR register to the TSR register, which starts transmission. When the CCR0.TIE bit is set to 1b at this time, a TXI interrupt request is generated. Writing the next transmit data to the TDR register before transmission of data transferred previously in the TXI interrupt routine is complete enables continuous transmission. When a TEI interrupt request is used, after the final transmit data is written to the TDR register in the TXI interrupt request processing routine and the final data's transmission is started, set 0b to the CCR0.TIE bit and set 1b to the TEIE bit.
3. The TXDn pin outputs 8-bit data in synchronization with the output clock (in clock output mode) or with the input clock (when external clock is selected). When the CCR1.CTSE bit = 1b (CTS function enabled), the output clock starts after the CTS signal input becomes low level.
4. Update (data write) of the TDR register is checked at the final-bit transmission timing.
5. When the TDR register has been updated, data is transferred from the TDR register to the TSR register to start sending the next frame.
6. If the TDR register has not been updated, the CSR.TEND flag is set to 1b and the final-bit output state is retained. When the CCR0.TEIE bit is set to 1b at this time, a TEI interrupt request is generated. The SCKm pin is held high.

Figure 7.3-86 shows an example of data transmission flowchart.



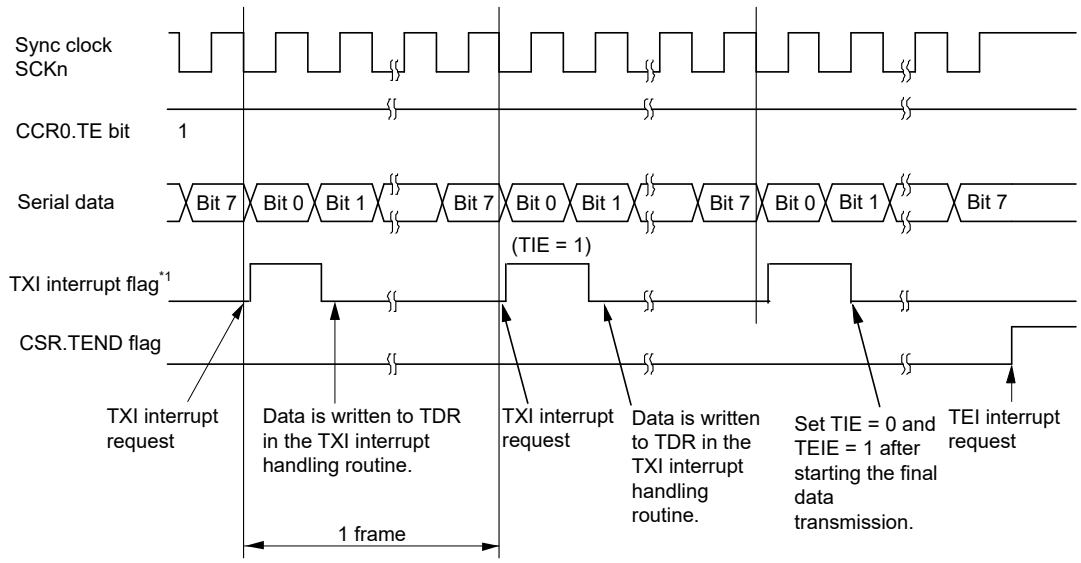
Note 1. For corresponding interrupt source numbers, see **4.6 Interrupt Controller**.

Figure 7.3-83 Serial Transmission Example in Clock Synchronous Mode (1) (CTS Function Not Used/Transmission Start/CPHA = 1b, CPOL = 1b)



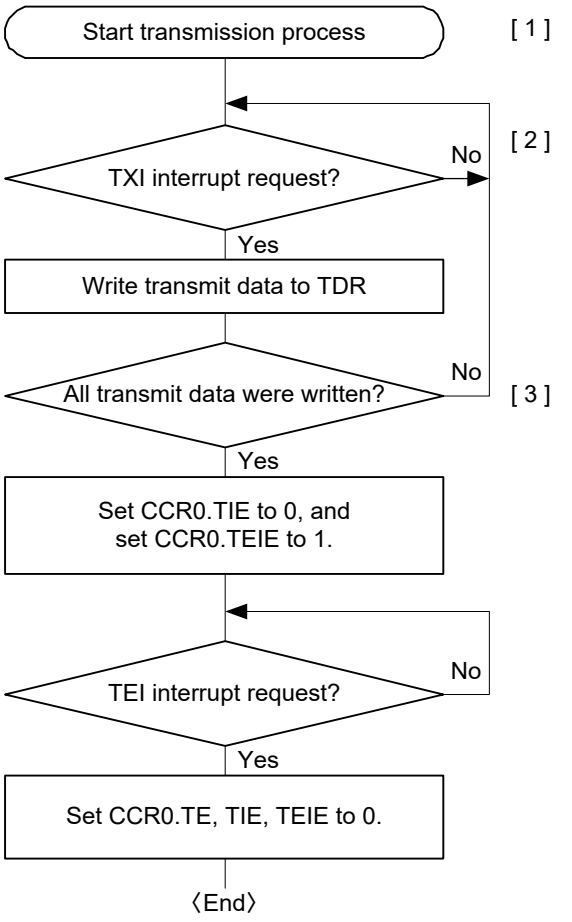
Note 1. For corresponding interrupt source numbers, see **4.6 Interrupt Controller**.

Figure 7.3-84 Serial Transmission Example in Clock Synchronous Mode (2) (CTS Function Used/Transmission Start/CPHA = 1b, CPOL = 1b)



Note 1. For corresponding interrupt source numbers, see **4.6 Interrupt Controller**.

Figure 7.3-85 Serial Transmission Example in Clock Synchronous Mode (3) (during Transmission to Transmission End/CPHA = 1b, CPOL = 1b)



[1] Start transmission process

[2] Write transmit data to TDR by using TXI:
The transmit-data-empty-interrupt (TXI) is generated when transmission-data forwards to TSR from TDR.
Write transmit data to TDR once by using a TXI.

[3] Serial transmission continuation procedure:
To continue serial transmission write transmit data to TDR by using a TXI.
Transmit data can also be written by activating the DMAC.
If you use TEI, set TIE = 0 and TEIE = 1 after writing the last-transmit-data to TDR.

Note: When the external clock is in use (the value of the CKE[1:0] is 10b or 11b), the rising edge on the SCK pin for the last bit sets the TEND flag to 1b. Setting TE to 0b immediately after this, then it may lead to insufficient received data hold time on the receiver side.

Figure 7.3-86 Serial Transmission Flowchart Example in Clock Synchronous Mode (Non-FIFO Selected)

(2) FIFO selected

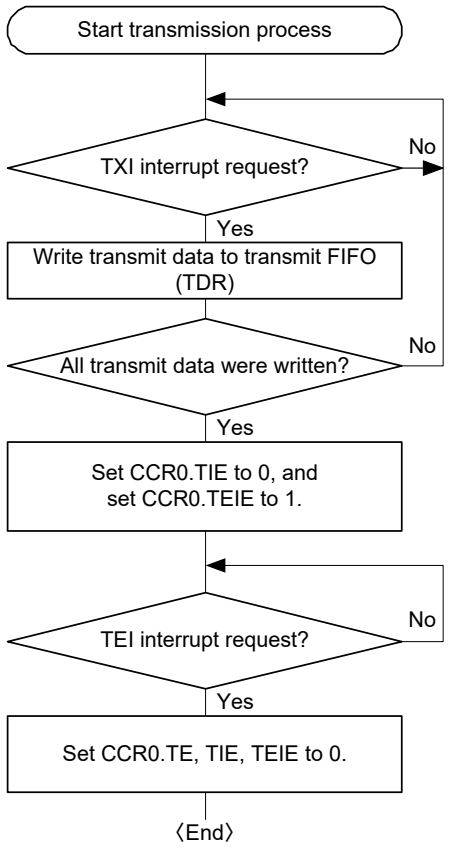
Figure 7.3-87 shows an example of flowchart of serial transmission (a FIFO buffer selected) in clock synchronous mode. The SCI operates as follows when serial data transmission.

1. When data is written to the transmit FIFO (TDR register) in the TXI interrupt routine, the SCI transfers the data from the transmit FIFO (TDR register) to the TSR register. The number of writable transmit data is [NFIFO (= 32) - number of unsent transmit data stored in the transmit FIFO (TDR register)]. In addition, when starting data transmission, set the CCR0.TIE bit and the CCR0.TE bit to 1b simultaneously by a single instruction. Then a TXI interrupt request is generated.
2. Data is transferred from the transmit FIFO (TDR register) to the TSR register and transmission starts. When the number of data stored in the transmit FIFO (TDR register) is equal to or less than the threshold value of the transmit FIFO, the CSR.TDRE flag is set to 1b. When the CCR0.TIE bit is set to 1b at this time, a TXI interrupt request is generated. Writing the next transmit data to the transmit FIFO (TDR register) in the TXI interrupt routine before transmission of data written to the transmit FIFO (TDR register) is complete enables continuous

transmission. When a TEI interrupt request is used, after the final transmit data is written to the transmit FIFO (TDR register) in the TXI interrupt request processing routine, set 0b to the CCR0.TIE bit and set 1b to the TEIE bit.

3. The TXDn pin outputs 8-bit data in synchronization with the output clock (in clock output mode) or with the input clock (when external clock is selected). When CCR1.CTSE = 1b (CTS function enabled), the output clock starts after the CTS signal input becomes low level.
4. The SCI checks whether unsent transmit data is remaining in the transmit FIFO (TDR register)*1 at the final-bit transmission timing.
5. When data is remaining in the transmit FIFO (TDR register), the data is transferred from the transmit FIFO (TDR register) to the TSR register to start sending the next frame.
6. If no data is remaining in the transmit FIFO (TDR register), the CSR.TEND flag is set to 1b and the final-bit output state is retained. When the CCR0.TEIE bit is set to 1b at this time, a TEI interrupt request is generated. The SCKm pin is held high.

Note 1. The number of unsent transmit data stored in the TDR register (transmit FIFO) can be monitored by reading the FTSR.T[5:0] bits.



[1] Start transmission process

[2] Write transmit data to transmit FIFO (TDR) by using TXI:
The transmit-data-empty-interrupt (TXI) is generated when transmission-data forwards to TSR from the transmit FIFO (TDR) and the number of transmit-data written in the transmit FIFO is equal to or less than the transmit FIFO threshold.

[3] Serial transmission continuation procedure:
To continue serial transmission, write transmit data to the transmit FIFO (TDR) by using a TXI interrupt and clear TDRE flag to 0.
The number of transmission data it's possible to write in is N_{FIFO} (= 32) - (the number of stored transmit FIFO data).
Transmit data can also be written to the transmit FIFO (TDR) by activating the DMAC. In this case, the TDRE flag is cleared automatically, so please do not operate the TDRE flag.
If you use TEI, set TIE = 0 and TEIE = 1 after writing the last-transmit-data to TDR.

Note: When the external clock is in use (the value of the CKE[1:0] is 10b or 11b), the rising edge on the SCK pin for the last bit sets the TEND flag to 1b. Setting TE to 0b immediately after this, then it may lead to insufficient received data hold time on the receiver side.

Figure 7.3-87 Serial Transmission Flowchart Example in Clock Synchronous Mode (FIFO Buffer Selected)

7.3.8.5 Serial Data Reception (Clock Synchronous Mode)

(1) Non-FIFO selected

Figure 7.3-88 and **Figure 7.3-89** show operation examples of serial data reception in clock synchronous mode.

The SCI operates as follows during serial data reception. Reception-only operation is possible only in slave mode. (In master mode, reception-only operation is prohibited.)

1. When the CCR0.RE bit is set to 1b, the RTSn# pin output becomes low level (when the RTS function is used).
2. The SCI starts data reception in synchronization with input or output of the sync clock, and transfers receive data to the RSR register.
3. When an overrun error occurs, the CSR.ORER flag is set to 1b. When the CCR0.RIE bit = 1b at this time, an ERI interrupt request is generated and the received data is not transferred to the RDR register.
4. When data is normally received, the received data is transferred to the RDR register. When the RIE bit = 1b at this time, an RXI interrupt request is generated. Reading the received data transferred to the RDR register in the RXI interrupt handling routine before the next data is completely received enables continuous reception. When the received data transferred to the RDR register is read, the RTSn# pin output becomes low level (when the RTS function is used).
