6	FS2S	0h	RW1	SVC2 Frame start interrupt status Write 0b: Invalid, 1b: Clears the interrupt & status Read 0b: No interrupts generated, 1b: Interrupts generated Note: This bit is only valid when CRUnIE2.FS2E = 1b. Note: This status is detected in SVC2 image clipping.
5	SL1S	0h	RW1	SVC1 Scan line interrupt status Write 0b: Invalid, 1b: Clears the interrupt & status Read 0b: No interrupts generated, 1b: Interrupts generated Note: This bit is only valid when CRUnIE2.SL1E = 1b. Note: This status is detected in SVC1 image clipping.
4	FE1S	0h	RW1	SVC1 Frame end interrupt status Write 0b: Invalid, 1b: Clears the interrupt & status Read 0b: No interrupts generated, 1b: Interrupts generated Note: This bit is only valid when CRUnIE2.FE1E = 1b. Note: This status is detected in SVC1 image clipping.
3	FS1S	0h	RW1	SVC1 Frame start interrupt status Write 0b: Invalid, 1b: Clears the interrupt & status Read 0b: No interrupts generated, 1b: Interrupts generated Note: This bit is only valid when CRUnIE2.FS1E = 1b. Note: This status is detected in SVC1 image clipping.
2	SL0S	0h	RW1	SVC0 Scan line interrupt status Write 0b: Invalid, 1b: Clears the interrupt & status Read 0b: No interrupts generated, 1b: Interrupts generated Note: This bit is only valid when CRUnIE2.SL0E = 1b. Note: This status is detected in SVC0 image clipping.
1	FE0S	0h	RW1	SVC0 Frame end interrupt status Write 0b: Invalid, 1b: Clears the interrupt & status Read 0b: No interrupts generated, 1b: Interrupts generated Note: This bit is only valid when CRUnIE2.FE0E = 1b. Note: This status is detected in SVC0 image clipping.
0	FS0S	0h	RW1	SVC0 Frame start interrupt status Write 0b: Invalid, 1b: Clears the interrupt & status Read 0b: No interrupts generated, 1b: Interrupts generated Note: This bit is only valid when CRUnIE2.FS0E = 1b. Note: This status is detected in SVC0 image clipping.

(7) CRU Reset Register (CRUm_CRUnRST) (m = 0, 1)

Access Size : 32 bits

Address : <CRUm_base> + 0018h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	VRESETN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
0	VRESETN	0h	RW	0b: Resets the Image Converter module. 1b: Releases the Image Converter module from the reset state.

(8) CRU General Read/Write Register (CRUm_CRUnCOM) (m = 0, 1)

Access Size : 32 bits
Address : <CRUm_base> + 002Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	COMMON[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	COMMON[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	COMMON [31:0]	0h	RW	General register The value written to this register can be read.

(9) Memory Bank 1 Base Address Lower Register for Video Data (CRUm_AMnMB1ADDRL) (m = 0, 1)

Access Size : 32 bits
Address : <CRUm_base> + 0040h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	MB1ADDRL[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MB1ADDRL[15:9]							-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	MB1ADDRL [31:9]	0h	RW	Video data transfer destination base address 1 (valid bits: [31:9]) Set it as the base address in units of 512 bytes. Note: The 9 lower-order bits cannot be written. (These bits cannot be modified while the AXI-VD is operating.)
8 to 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

(10) Memory Bank 1 Base Address Higher Register for Video Data (CRUm_AMnMB1ADDRH) (m = 0, 1)

Access Size : 32 bits

Address : <CRUm_base> + 0044h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	MB1ADDRH[34:32]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
2 to 0	MB1ADDRH [34:32]	0h	RW	Video data transfer destination base address 1 (valid bits: [34:32]) (These bits cannot be modified while the AXI-VD is operating.)

(11) Memory Bank 2 Base Address Lower Register for Video Data (CRUm_AMnMB2ADDRL) (m = 0, 1)

Access Size : 32 bits
Address : <CRUm_base> + 0048h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	MB2ADDRL[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MB2ADDRL[15:9]							-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	MB2ADDRL [31:9]	0h	RW	Video data transfer destination base address 2 (valid bits: [31:9]) Set it as the base address in units of 512 bytes. Note: The 9 lower-order bits cannot be written. (These bits cannot be modified while the AXI-VD is operating.)
8 to 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

(12) Memory Bank 2 Base Address Higher Register for Video Data (CRUm_AMnMB2ADDRH) (m = 0, 1)

Access Size : 32 bits

Address : <CRUm_base> + 004Ch

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	MB2ADDRH[34:32]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
2 to 0	MB2ADDRH [34:32]	0h	RW	Video data transfer destination base address 2 (valid bits: [34:32]) (These bits cannot be modified while the AXI-VD is operating.)

(13) Memory Bank 3 Base Address Lower Register for Video Data (CRUm_AMnMB3ADDRL) (m = 0, 1)

Access Size : 32 bits
Address : <CRUm_base> + 0050h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	MB3ADDRL[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MB3ADDRL[15:9]							-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	MB3ADDRL [31:9]	0h	RW	Video data transfer destination base address 3 (valid bits: [31:9]) Set it as the base address in units of 512 bytes. Note: The 9 lower-order bits cannot be written. (These bits cannot be modified while the AXI-VD is operating.)
8 to 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

(14) Memory Bank 3 Base Address Higher Register for Video Data (CRUm_AMnMB3ADDRH) (m = 0, 1)

Access Size : 32 bits

Address : <CRUm_base> + 0054h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	MB3ADDRH[34:32]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
2 to 0	MB3ADDRH [34:32]	0h	RW	Video data transfer destination base address 3 (valid bits: [34:32]) (These bits cannot be modified while the AXI-VD is operating.)

(15) Memory Bank 4 Base Address Lower Register for Video Data (CRUm_AMnMB4ADDRL) (m = 0, 1)

Access Size : 32 bits
Address : <CRUm_base> + 0058h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	MB4ADDRL[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MB4ADDRL[15:9]							-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	MB4ADDRL [31:9]	0h	RW	Video data transfer destination base address 4 (valid bits: [31:9]) Set it as the base address in units of 512 bytes. Note: The 9 lower-order bits cannot be written. (These bits cannot be modified while the AXI-VD is operating.)
8 to 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

(16) Memory Bank 4 Base Address Higher Register for Video Data (CRUm_AMnMB4ADDRH) (m = 0, 1)

Access Size : 32 bits

Address : <CRUm_base> + 005Ch

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	MB4ADDRH[34:32]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
2 to 0	MB4ADDRH [34:32]	0h	RW	Video data transfer destination base address 4 (valid bits: [34:32]) (These bits cannot be modified while the AXI-VD is operating.)

(17) Memory Bank 5 Base Address Lower Register for Video Data (CRUm_AMnMB5ADDRL) (m = 0, 1)

Access Size : 32 bits
Address : <CRUm_base> + 0060h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	MB5ADDRL[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MB5ADDRL[15:9]							-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	MB5ADDRL [31:9]	0h	RW	Video data transfer destination base address 5 (valid bits: [31:9]) Set it as the base address in units of 512 bytes. Note: The 9 lower-order bits cannot be written. (These bits cannot be modified while the AXI-VD is operating.)
8 to 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

(18) Memory Bank 5 Base Address Higher Register for Video Data (CRUm_AMnMB5ADDRH) (m = 0, 1)

Access Size : 32 bits

Address : <CRUm_base> + 0064h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	MB5ADDRH[34:32]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
2 to 0	MB5ADDRH [34:32]	0h	RW	Video data transfer destination base address 5 (valid bits: [34:32]) (These bits cannot be modified while the AXI-VD is operating.)

(19) Memory Bank 6 Base Address Lower Register for Video Data (CRUm_AMnMB6ADDRL) (m = 0, 1)

Access Size : 32 bits
Address : <CRUm_base> + 0068h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	MB6ADDRL[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MB6ADDRL[15:9]							-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	MB6ADDRL [31:9]	0h	RW	Video data transfer destination base address 6 (valid bits: [31:9]) Set it as the base address in units of 512 bytes. Note: The 9 lower-order bits cannot be written. (These bits cannot be modified while the AXI-VD is operating.)
8 to 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

(20) Memory Bank 6 Base Address Higher Register for Video Data (CRUm_AMnMB6ADDRH) (m = 0, 1)

Access Size : 32 bits

Address : <CRUm_base> + 006Ch

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	MB6ADDRH[34:32]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
2 to 0	MB6ADDRH [34:32]	0h	RW	Video data transfer destination base address 6 (valid bits: [34:32]) (These bits cannot be modified while the AXI-VD is operating.)

(21) Memory Bank 7 Base Address Lower Register for Video Data (CRUm_AMnMB7ADDRL) (m = 0, 1)

Access Size : 32 bits
Address : <CRUm_base> + 0070h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	MB7ADDRL[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MB7ADDRL[15:9]							-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	MB7ADDRL [31:9]	0h	RW	Video data transfer destination base address 7 (valid bits: [31:9]) Set it as the base address in units of 512 bytes. Note: The 9 lower-order bits cannot be written. (These bits cannot be modified while the AXI-VD is operating.)
8 to 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

(22) Memory Bank 7 Base Address Higher Register for Video Data (CRUm_AMnMB7ADDRH) (m = 0, 1)

Access Size : 32 bits

Address : <CRUm_base> + 0074h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	MB7ADDRH[34:32]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
2 to 0	MB7ADDRH [34:32]	0h	RW	Video data transfer destination base address 7 (valid bits: [34:32]) (These bits cannot be modified while the AXI-VD is operating.)

(23) Memory Bank 8 Base Address Lower Register for Video Data (CRUm_AMnMB8ADDRL) (m = 0, 1)

Access Size : 32 bits
Address : <CRUm_base> + 0078h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	MB8ADDRL[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MB8ADDRL[15:9]							-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	MB8ADDRL [31:9]	0h	RW	Video data transfer destination base address 8 (valid bits: [31:9]) Set it as the base address in units of 512 bytes. Note: The 9 lower-order bits cannot be written. (These bits cannot be modified while the AXI-VD is operating.)
8 to 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

(24) Memory Bank 8 Base Address Higher Register for Video Data (CRUm_AMnMB8ADDRH) (m = 0, 1)

Access Size : 32 bits

Address : <CRUm_base> + 007Ch

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	MB8ADDRH[34:32]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
2 to 0	MB8ADDRH [34:32]	0h	RW	Video data transfer destination base address 8 (valid bits: [34:32]) (These bits cannot be modified while the AXI-VD is operating.)

(25) UV Data Address Offset Lower Register for Video Data (CRUm_AMnUVAOFL) (m = 0, 1)

Access Size : 32 bits
Address : <CRUm_base> + 0080h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	UVAOFL[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	UVAOFL[15:9]							-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	UVAOFL [31:9]	0h	RW	UV data address offset for image processing data YUV output (valid bits: [31:9]) Set it as the base address in units of 512 bytes. Note: The 9 lower-order bits cannot be written. (These bits cannot be modified while the AXI-VD is operating.)
8 to 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

(26) UV Data Address Offset Higher Register for Video Data (CRUm_AMnUVAOFH) (m = 0, 1)

Access Size : 32 bits
Address : <CRUm_base> + 0084h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	UVAOFH[34:32]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
2 to 0	UVAOFH [34:32]	0h	RW	UV data address offset for image processing data YUV output (valid bits: [34:32]) (These bits cannot be modified while the AXI-VD is operating.)

(27) Memory Bank Enable Register for Video Data (CRUm_AMnMBVALID) (m = 0, 1)

Access Size : 32 bits
Address : <CRUm_base> + 0088h
Initial Value : 0000_0001h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	MBVALID[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
7 to 0	MBVALID[7:0]	1h	RW	Video data transfer destination valid address (the details are described in **9.2.4.3.3 Transfer to DRAM**.) [0]: 0: MB1 invalid, 1: MB1 valid [1]: 0: MB2 invalid, 1: MB2 valid [2]: 0: MB3 invalid, 1: MB3 valid [3]: 0: MB4 invalid, 1: MB4 valid [4]: 0: MB5 invalid, 1: MB5 valid [5]: 0: MB6 invalid, 1: MB6 valid [6]: 0: MB7 invalid, 1: MB7 valid [7]: 0: MB8 invalid, 1: MB8 valid Note: Set the valid destination address from the LSB continuously. Data transferred from the LSB are written sequentially only to valid memory banks, and the processing is repeated from the start (LSB) when the last address is reached. (These bits cannot be modified while the AXI-VD is operating.)

(28) Memory Address Lower Status Register for Video Data (CRUm_AMnMADRSL) (m = 0, 1)

Access Size : 32 bits
Address : <CRUm_base> + 008Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	MADRSL[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MADRSL[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	MADRSL [31:0]	0h	R	Memory address for video data (lower) Reads the memory address (lower) to which the current video data was written. Note: When this register is read, AMnMADRSH of the higher-order address also latches the address. Note: Be sure to read AMnMADRSH after AMnMADRSL has been read.

(29) Memory Address Higher Status Register for Video Data (CRUm_AMnMADRSH) (m = 0, 1)

Access Size : 32 bits
Address : <CRUm_base> + 0090h
Initial Value : 0000_0000h

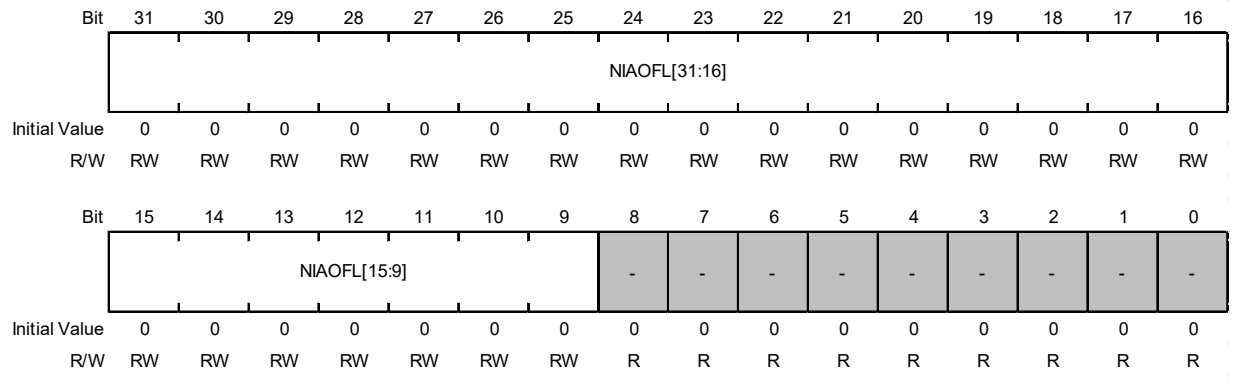
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	MADRSH[34:32]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
2 to 0	MADRSH [34:32]	0h	R	Memory address for video data (higher) Read the memory address (higher) to which the current video data was written. Note: When the AMnMADRSL register is read, the higher address AMnMADRSH also latches the address. Note: Be sure to lead AMnMADRSH after AMnMADRSL lead.

(30) Non Image Process Address Offset Lower Register (CRUm_AMnNIAOFL) (m = 0, 1)

Access Size : 32 bits
Address : <CRUm_base> + 0094h
Initial Value : 0000_0000h



Bit	Bit Name	Initial Value	R/W	Description
31 to 9	NIAOFL[31:9]	0h	RW	Non-image processing address offset (lower) for image processing for video data (significant bits [31:9]) Set it as the base address in units of 512 bytes. Note: The 9 lower-order bits cannot be written. (These bits cannot be modified while the AXI-VD is operating.)
8 to 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

(31) Non Image Process Address Offset Higher Register (CRUm_AMnNIAOFH) (m = 0, 1)

Access Size : 32 bits

Address : <CRUm_base> + 0098h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	NIAOFH[34:32]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
2 to 0	NIAOFH [34:32]	0h	RW	Non-image processing address offset (higher) for image processing for video data (valid bits [34:32]) (These bits cannot be modified while the AXI-VD is operating.)

(32) SVC Data Address Offset Lower Register for Video Data (CRUm_AMnSVCAOFL) (m = 0, 1)

Access Size : 32 bits
Address : <CRUm_base> + 009Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SVCAOFL[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SVCAOFL[15:9]							-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	SVCAOFL [31:9]	0h	RW	SVC data address offset (lower) for video data (valid bits [31:9]) Set it as the base address in units of 512 bytes. Note: The 9 lower-order bits cannot be written. (These bits cannot be modified while the AXI-VD is operating.)
8 to 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

(33) SVC Data Address Offset Higher Register for Video Data (CRUm_AMnSVCAOFH) (m = 0, 1)

Access Size : 32 bits

Address : <CRUm_base> + 00A0h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	SVCAOFH[34:32]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
2 to 0	SVCAOFH [34:32]	0h	RW	SVC data address offset (higher) for video data (valid bits [34:32]) (These bits cannot be modified while the AXI-VD is operating.)

(34) AXI-VD Bus Transfer Completion Event Address 0 Lower Register (CRUm_AMnIVT0ADDRL) (m = 0, 1)

Access Size : 32 bits

Address : <CRUm_base> + 00B4h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	IVT0ADDRL[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	IVT0ADDRL[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	IVT0ADDRL [31:0]	0h	RW	AXI-VD bus transfer completion event address 0 for video data (lower) Note: The completion of transfer of video data to the address set in this register is notified by an interrupt.

(35) AXI-VD Bus Transfer Completion Event Address 0 Higher Register (CRUm_AMnIVT0ADDRH) (m = 0, 1)

Access Size : 32 bits
Address : <CRUm_base> + 00B8h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	IVT0ADDRH[34:32]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
2 to 0	IVT0ADDRH [34:32]	0h	RW	AXI-VD bus transfer completion event address 0 for video data (higher) Note: The completion of transfer of video data to the address set in this register is notified by an interrupt.

(36) AXI-VD Bus Transfer Completion Event Address 1 Lower Register (CRUm_AMnIVT1ADDRL) (m = 0, 1)

Access Size : 32 bits

Address : <CRUm_base> + 00BCh

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	IVT1ADDRL[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	IVT1ADDRL[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	IVT1ADDRL [31:0]	0h	RW	AXI-VD bus transfer completion event address 1 for video data (lower) Note: The completion of transfer of video data to the address set in this register is notified by an interrupt.

(37) AXI-VD Bus Transfer Completion Event Address 1 Higher Register (CRUm_AMnIVT1ADDRH) (m = 0, 1)

Access Size : 32 bits
Address : <CRUm_base> + 00C0h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	IVT1ADDRH[34:32]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
2 to 0	IVT1ADDRH [34:32]	0h	RW	AXI-VD bus transfer completion event address 1 for video data (higher) Note: The completion of transfer of video data to the address set in this register is notified by an interrupt.

(38) AXI-VD Bus Transfer Completion Event Address 2 Lower Register (CRUm_AMnIVT2ADDRL) (m = 0, 1)

Access Size : 32 bits

Address : <CRUm_base> + 00C4h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	IVT2ADDRL[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	IVT2ADDRL[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	IVT2ADDRL [31:0]	0h	RW	AXI-VD bus transfer completion event address 2 for video data (lower) Note: The completion of transfer of video data to the address set in this register is notified by an interrupt.

(39) AXI-VD Bus Transfer Completion Event Address 2 Higher Register (CRUm_AMnIVT2ADDRH) (m = 0, 1)

Access Size : 32 bits

Address : <CRUm_base> + 00C8h

Initial Value : 0000_0000h

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
2 to 0	IVT4ADDRH [34:32]	0h	RW	AXI-VD bus transfer completion event address 4 for video data (higher) Note: The completion of transfer of video data to the address set in this register is notified by an interrupt.

(44) AXI-VD Bus Master Transfer Setting Register (CRUm_AMnAXIATTR) (m = 0, 1)

Access Size : 32 bits
Address : <CRUm_base> + 00ECh
Initial Value : 0020_0150h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0
R/W	R	R	R	R	RW	RW	RW	RW	R	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	AXILEN[3:0]			
Initial Value	0	0	0	0	0	0	0	1	0	1	0	1	0	0	0	0
R/W	R	R	R	R	R	R	RW	RW	R	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
27 to 24	-	0h	RW	Reserved A register that can be read and written. Do not change the value of this bit from the initial value.
23	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
22 to 16	-	20h	RW	Reserved A register that can be read and written. Do not change the value of this bit from the initial value.
15 to 10	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
9, 8	-	1h	RW	Reserved A register that can be read and written. Do not change the value of this bit from the initial value.
7	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
6 to 4	-	5h	RW	Reserved A register that can be read and written. Do not change the value of this bit from the initial value.
3 to 0	AXILEN[3:0]	0h	RW	Maximum value setting of AXI-VD burst length for video data (changing the value during AXI-VD operation is prohibited) Note: If the transfer speed is given priority, set AXILEN[3:0] = H'F. When YUV is not separated (ICnDMR.YCMODE[2:0] = 3'b010): 0h: Up to 1 burst (initial value) 1h: Up to 2 bursts 2h: Up to 3 bursts 3h: Up to 4 bursts 4h: Up to 5 bursts 5h: Up to 6 bursts ⋮ Fh: Up to 16 bursts When YUV is separated (ICnDMR.YCMODE[2:0] = 3'b010): 0h: Up to 1 burst 1h: Up to 1 burst 2h: Up to 2 bursts 3h: Up to 2 bursts 4h: Up to 3 bursts 5h: Up to 3 bursts ⋮ Eh: Up to 8 bursts Fh: Up to 8 bursts

(45) AXI-VD Bus Master FIFO Setting Register (m = 0, 1) (CRUm_AMnFIFO)

Access Size : 32 bits

Address : <CRUm_base> + 00F0h

Initial Value : 0000_0001h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	RETSVC[2:0]			-	-	-	FIFOOVFREC
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	RW	RW	RW	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 7	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
6 to 4	RETSVC[2:0]	0h	RW	SVC number setting to resume when FIFO-VD overflow 000b : Resume from the beginning of SVC0 frame (initial value) 001b : Resume from the beginning of the SVC1 frame 010b : Resume from the beginning of the SVC2 frame 011b: Resume from the beginning of the SVC3 frame 1xxb : Resume from the VC first frame that came, without SVC designation
3 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
0	FIFOOVFREC	1h	RW	Mode setting when image data FIFO-VD overflows When a FIFO-VD overflows, the FIFO-VD is cleared and the AXI-VD master stops transferring to memory. There are two methods as shown below. 0b: Recovery mode: The AXI-VD Master performs the following operations after stopped. - Resume import from SVC selected by AMnFIFO.RETSVC[2:0] - Resume writing from the beginning of the overflow MB 1b: Stop mode (default): The FIFO remains stopped after the overflow occurs. [How to resume] When the AXI-VD master stops, it updates the FOS bit in the CRUnINTS1 register and reg_axi_mst_err_int Interrupts are generated. Set the AXI_TRANS_START bit of the AMnFIFOTRST register to 1 after detection. After this, the operation resumes with the same behavior as in recovery mode. Note 1: The image data being processed will be corrupted during FIFO overflow. FIFO overflow may be caused by bus congestion. Please take measures to alleviate bus congestion. Note 2: The data for the first horizontal line after FIFO-VD overflow return is not guaranteed. Note 3: If set Footer appending ON (ICnDTVP.FTON=1), only if no FIFO-VD overflow occurs. Set to Footer appending OFF (ICnDTVP.FTON=0), when FIFO-VD will overflow occurs.

(46) AXI-VD Bus Master Transfer Resume Register (m = 0, 1) (CRUm_AMnFIFOTRST)

Access Size : 32 bits

Address : <CRUm_base> + 00F4h

Initial Value : 0000_0000h

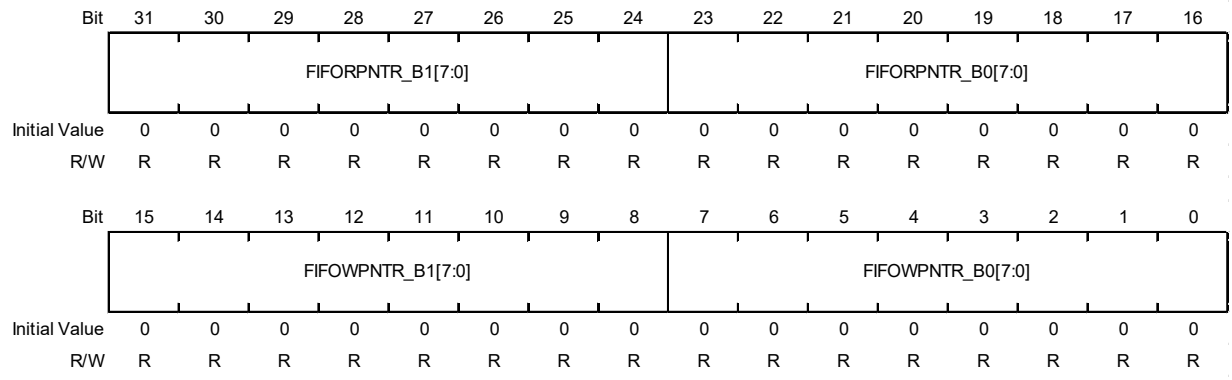
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	AXI_TRANS_START
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW1

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
0	AXI_TRANS_START	0h	RW1	AXI-VD transfer control for image data (valid when AMnFIFO.FIFOOVFREC = 1). 0b: Writing prohibited. Write 1 to this bit to recover the image-related AXI-VD (transfer resume) (This bit returns to 0 when transfer is resumed.)

(47) AXI-VD Bus Master FIFO Pointer Register (CRUm_AMnFIFOPNTR) (m = 0, 1)

Access Size : 32 bits
Address : <CRUm_base> + 00F8h
Initial Value : 0000_0000h



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	FIFORPNTR_B1[7:0]	0h	R	FIFO-VD read pointer (bank 1) The read pointer and write pointer comparison allows checking if there are data in the FIFO. Bank 1 FIFO-VD read pointer [7:0] Real RAM address for FIFO-VD (Max.: FFh) Note: When (AMnFIFOPNTR.FIFOWPNTR_B0[7:0]≠ AMnFIFOPNTR.FIFORPNTR_B0[7:0])‖(AMnFIFOPNTR.FIFOWPNTR_B1[7:0]≠ AMnFIFOPNTR.FIFORPNTR_B1[7:0], data are present in the FIFO-VD.
23 to 16	FIFORPNTR_B0[7:0]	0h	R	FIFO-VD read pointer (bank 0) The read pointer and write pointer comparison allows checking if there are data in the FIFO. Bank 0 FIFO-VD read pointer [7:0] Real RAM address for FIFO-VD (Max.: FFh) Note: When (AMnFIFOPNTR.FIFOWPNTR_B0[7:0]≠ AMnFIFOPNTR.FIFORPNTR_B0[7:0])‖(AMnFIFOPNTR.FIFOWPNTR_B1[7:0]≠ AMnFIFOPNTR.FIFORPNTR_B1[7:0], data are present in the FIFO-VD.
15 to 8	FIFOWPNTR_B1[7:0]	0h	R	FIFO-VD write pointer (bank 1) The read pointer and write pointer comparison allows checking if there are data in the FIFO. Bank 1 FIFO-VD write pointer [7:0] Real RAM address for FIFO-VD (Max.: FFh) Note: When (AMnFIFOPNTR.FIFOWPNTR_B0[7:0]≠ AMnFIFOPNTR.FIFORPNTR_B0[7:0])‖(AMnFIFOPNTR.FIFOWPNTR_B1[7:0]≠ AMnFIFOPNTR.FIFORPNTR_B1[7:0], data are present in the FIFO-VD.
7 to 0	FIFOWPNTR_B0[7:0]	0h	R	FIFO-VD write pointer (bank 0) The read pointer and write pointer comparison allows checking if there are data in the FIFO. Bank 0 FIFO-VD write pointer [7:0] Real RAM address for FIFO-VD (Max.: FFh) Note: When (AMnFIFOPNTR.FIFOWPNTR_B0[7:0]≠ AMnFIFOPNTR.FIFORPNTR_B0[7:0])‖(AMnFIFOPNTR.FIFOWPNTR_B1[7:0]≠ AMnFIFOPNTR.FIFORPNTR_B1[7:0], data are present in the FIFO-VD.

(48) AXI-VD Bus Master Transfer Stop Register (CRUm_AMnAXISTP) (m = 0, 1)

Access Size : 32 bits
Address : <CRUm_base> + 0110h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	AXI_STOP
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
0	AXI_STOP	0h	RW	AXI-VD bus transfer stop (used to stop the CRU receiving data. Follow the procedure for stopping reception described in **9.2.5.2 Stopping Reception for the MIPI CSI-2 Input**.) 0b: Does not stop the AXI-VD master transferring data. 1b: Stops the AXI-VD master transferring data.

(49) AXI-VD Bus Master Transfer Stop Status Register (CRUm_AMnAXISTPACK) (m = 0, 1)

Access Size : 32 bits
Address : <CRUm_base> + 0114h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	AXI_STOP_ACK
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
0	AXI_STOP_ACK	0h	R	AXI-VD bus transfer stop response (used to stop the CRU receiving data. Follow the procedure for stopping reception described in **9.2.5.2 Stopping Reception for the MIPI CSI-2 Input**.) 0b: The AXI-VD master is transferring data. 1b: The AXI-VD master has finished transferring data (valid when AXI_STOP = 1)

(50) Image Stride Setting Register (CRUm_AMnIS) (m = 0, 1)

Access Size : 32 bits
Address : <CRUm_base> + 0128h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	IS[7:0]								-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	RW	RW	RW	RW	RW	RW	RW	RW	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 15	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
14 to 7	IS[7:0]	0h	RW	Line start address offset setting for image stride You can set 128 to 32640 bytes (with a 128-byte step) by setting IS[7:0]. IS[7:0] = 00h: Setting prohibited IS[7:0] = 01h: 128 bytes IS[7:0] = 02h: 256 bytes IS[7:0] = 03h: 384 bytes IS[7:0] = 04h: 512 bytes : IS[7:0] = 80h: 16384 bytes : IS[7:0] = FFh: 32640 bytes Note: For output format RGB888 (24 bits), the setting must be in units of 384 bytes (multiples of 3 for IS [7:0]). Note: If the output format is other than RGB888 (24 bits), the setting must be in units of 128 bytes. Note: The setting must be at least the number of bytes per line. Note: When adding a header and footer, set the value including a header and footer. Note: Only data output from the video data bus are supported. Statistics data output is not supported.
6 to 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

(51) Memory Bank 1 Base Address Lower Register for CRU Statistics Data (CRUm_AMnSDMB1ADDRL) (m = 0, 1)

Access Size : 32 bits

Address : <CRUm_base> + 013Ch

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SDMB1ADDRL[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SDMB1ADDRL[15:9]							-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	SDMB1ADDRL [31:9]	0h	RW	Statistics data transfer destination base address 1 (valid bits: [31:9]) Set it as the base address in units of 512 bytes. Note: The 9 lower-order bits cannot be written. (These bits cannot be modified while the AXI-VD is operating.)
8 to 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

(52) Memory Bank 1 Base Address Higher Register for CRU Statistics Data (CRUm_AMnSDMB1ADDRH) (m = 0, 1)

Access Size : 32 bits

Address : <CRUm_base> + 0140h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	SDMB8ADDRL [31:9]	0h	RW	Statistics data transfer destination base address 8 (valid bits: [31:9]) Set it as the base address in units of 512 bytes. Note: The 9 lower-order bits cannot be written. (These bits cannot be modified while the AXI-VD is operating.)
8 to 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

(66) Memory Bank 8 Base Address Higher Register for CRU Statistics Data (CRUm_AMnSDMB8ADDRH) (m = 0, 1)

Access Size : 32 bits

Address : <CRUm_base> + 0178h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	SDMB8ADDRH[34:32]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
2 to 0	SDMB8ADDRH [34:32]	0h	RW	Statistics data transfer destination base address 8 (valid bits: [34:32]) (These bits cannot be modified while the AXI-SD is operating.)

(67) Memory Bank Enable Register for CRU Statistics Data (CRUm_AMnSDMBVALID) (m = 0, 1)

Access Size : 32 bits
Address : <CRUm_base> + 018Ch
Initial Value : 0000_0001h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	SDMBVALID[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
7 to 0	SDMBVALID [7:0]	1h	RW	Statistics data transfer destination valid address (the details are described in **9.2.4.3.3 Transfer to DRAM**.) [0]: 0: SDMB1 invalid, 1: SDMB1 valid [1]: 0: SDMB2 invalid, 1: SDMB2 valid [2]: 0: SDMB3 invalid, 1: SDMB3 valid [3]: 0: SDMB4 invalid, 1: SDMB4 valid [4]: 0: SDMB5 invalid, 1: SDMB5 valid [5]: 0: SDMB6 invalid, 1: SDMB6 valid [6]: 0: SDMB7 invalid, 1: SDMB7 valid [7]: 0: SDMB8 invalid, 1: SDMB8 valid Note: Set the valid destination address from the LSB continuously. Data transferred from the LSB are written sequentially only to valid memory banks, and the processing is repeated from the start (LSB) when the last address is reached. (These bits cannot be modified while the AXI-SD is operating.)

(68) Memory Bank Status Register for CRU Statistics Data (CRUm_AMnSDMBS) (m = 0, 1)

Access Size : 32 bits
Address : <CRUm_base> + 0190h
Initial Value : 0000_0000h

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
2 to 0	SDIVT1ADDRH [34:32]	0h	RW	AXI-SD bus transfer completion event address 1 for statistics data (higher) Note: The completion of transfer of statistics data to the address set in this register is notified by an interrupt.

(73) AXI-SD Bus Master FIFO Pointer Register (CRUm_AMnSDFIFOPNTR) (m = 0, 1)

Access Size : 32 bits

Address : <CRUm_base> + 01C0h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	SDFIFORPNTR[5:0]					
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	SDFIFOWPNTR[5:0]					
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 22	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
21 to 16	SDFIFORPNTR [5:0]	0h	R	FIFO-SD read pointer for statistics data The read pointer and write pointer comparison allows checking if there are data in the FIFO. FIFO-SD read pointer [5:0] Real RAM address for FIFO-SD (Max.: 3Fh) Note: When (AMnSDFIFOPNTR.SDFIFOWPNTR[5:0]≠ AMnSDFIFOPNTR.SDFIFORPNTR[5:0]), data are present in the FIFO-SD.
15 to 6	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
5 to 0	SDFIFOWPNTR [5:0]	0h	R	FIFO-SD write pointer for statistics data The read pointer and write pointer comparison allows checking if there are data in the FIFO. Bank 1 FIFO-SD write pointer [5:0] Real RAM address for FIFO-SD (Max.: 3Fh) Note: When (AMnSDFIFOPNTR.SDFIFOWPNTR[5:0]≠ AMnSDFIFOPNTR.SDFIFORPNTR[5:0]), data are present in the FIFO-SD.

(74) AXI-SD Bus Master Transfer Stop Register (CRUm_AMnSDAXISTP) (m = 0, 1)

Access Size : 32 bits

Address : <CRUm_base> + 01D8h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	SD_AXI_STOP
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
0	SD_AXI_STOP	0h	RW	Statistics data AXI-SD transfer stop (used to stop the CRU receiving data. Follow the procedure for stopping reception described in **9.2.5.2 Stopping Reception for the MIPI CSI-2 Input**.) 0b: Does not stop the AXI-SD master transferring data. 1b: Stops the AXI-SD master transferring data.

(75) AXI-SD Bus Master Transfer Stop Status Register (CRUm_AMnSDAXISTPACK) (m = 0, 1)

Access Size : 32 bits

Address : <CRUm_base> + 01DCh

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	SD_AXI_STOP_ACK
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
0	SD_AXI_STOP_ACK	0h	R	Statistics data AXI-SD transfer stop response (used to stop the CRU receiving data. Follow the procedure for stopping reception described in **9.2.5.2 Stopping Reception for the MIPI CSI-2 Input**.) 0b: The AXI-SD master is transferring data. 1b: The AXI-SD master has finished transferring data (valid when AXI_STOP = 1)

(76) CRU Image Converter Enable Register (CRUm_ICnEN) (m = 0, 1)

Access Size : 32 bits
Address : <CRUm_base> + 01F0h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	ICEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
0	ICEN	0h	RW	Enables the operation of the Image Converter module. (Enable or disable the operation according to **9.2.5 Operation**.) 0b: Disables the Image Converter module. 1b: Enables the Image Converter module. Note: If this bit is set to 0b, a frame start is not detected. If this bit is changed from 1b to 0b while a frame is being processed, the data at that time is processed as the frame end and then the next frames are not processed.

(77) CRU Data Value Processing (CRUm_ICnDTVP) (m = 0, 1)

Access Size : 32 bits
Address : <CRUm_base> + 01F4h
Initial Value : 0000_0003h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	FTON	HDON	-	IBINSEL	CLP[1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
5	FTON	0h	RW	Footer appending ON/OFF 0b: Do not append a footer 1b: Append a footer Note: The footers of both video data and statistics data are turned on or off. Note: For the video data footer, 256 bits (256'h1/256'h0) are written at the end of each line. Initially, 1h is written as a footer. The next time the memory bank is overwritten after one round of writing, 0h is written as the footer. After that, 1h and 0h are written alternately every time the memory bank is overwritten. Note: For the footer of statistics data, 512 bits ({higher-order 256 bits: reserved (indefinite value); lower-order 256 bits: 256'h1} or 512 bits {higher-order 256 bits: reserved (indefinite value); lower-order 256 bits: 256'h0}) are written at the end of each frame unit. The higher-order 256 bits of 512 bits are reserved (indefinite value), so skip reading them. Initially, 512 bits {higher-order 256 bits: reserved (indefinite value); lower-order 256 bits: 256'h1} are written as a footer. Next, when the memory bank is overwritten after one round of writing, 512 bits {higher-order 256 bits: reserved (indefinite value); lower-order 256 bits: 256'h0} are written as a footer. After that, 512 bits {higher-order 256 bits: reserved (indefinite value); lower-order 256 bits: 256'h1} and 512 bits {higher-order 256 bits: reserved (indefinite value); lower-order 256 bits: 256'h0} are written alternately each time the memory bank is overwritten.
4	HDON	0h	RW	Header appending ON/OFF ON/OFF selection for whether to append a header to the start of a line for data transfer from the AXI-VD bus to DRAM 0b: Do not append a header 1b: Append a header Note: The data type, byte number, and virtual channel number are added to the header (256 bits). Note: See **9.2.4.3.3 (5) Frame Structure**.
3	-	0h	RW	Reserved A register that can be read and written. Do not change the value of this bit from the initial value.
2	IBINSEL	0h	RW	Data Arranger 1 UV(CbCr) binary type selection for YUV422(YCbCr) data 0b: Offset binary (straight binary) 1b: Two's complement binary Note: Valid when the input is YUV422/420.

Bit	Bit Name	Initial Value	R/W	Description
1, 0	CLP[1:0]	3h	RW	Data clipping setting for the YCbCr422 (YUV422) format To make the input data compliant with the ITU-R BT.601 standard, specify whether to clip the values below 16 and above 240 (when YCbCr is 8 bits). When CRUm_ICnIPMC_C0/X.CSCTHR is set to 1, CLP[1:0] are set to 00b. 00b: No clipping for Y When CbCr is 8 bits: Values below 16 and above 240 are clipped for CbCr When CbCr is 10 bits: Values below 64 and above 960 are clipped for CbCr 01b: When YCbCr is 8 bits: Values below 16 and above 240 are clipped for Y : Values below 16 and above 240 are clipped for CbCr When YCbCr is 10 bits: Values below 64 and above 960 are clipped for Y : Values below 64 and above 960 are clipped for CbCr 10b: No clipping for Y When CbCr is 8 bits: Values below 16 are increased to 128 and values above 240 are clipped to 128 for CbCr When CbCr is 10 bits: Values below 64 are increased to 512 and values above 960 are clipped to 512 for CbCr 11b: No clipping for Y and CbCr (initial value) Note: See **9.2.4.3.11 Data Clipping**.

(78) CRU SVC Number Register (CRUm_ICnSVCNUM) (m = 0, 1)

Access Size : 32 bits

Address : <CRUm_base> + 01F8h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	SVCNUM [1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
1, 0	SVCNUM[1:0]	0h	RW	Set how many channels are used from among SVC0 to 3. 00b: Only SVC0 enabled; SVC1 to 3 disabled (initial value) 01b: SVC0 and 1 enabled; SVC2 and 3 disabled 10b: SVC0 to 2 enabled; SVC3 disabled 11b: SVC0 to 3 enabled Note: When changing the frame synchronization register, only the setting of ICnSVCNUM.SVCNUM [1:0] = 00 can be used. Note: Select virtual channels for SVC0 to 3 by the ICnSVC register setting. Note: When using demosaicing, linear matrix, or statistics, the setting of this must be 00b.

(79) CRU VC Select Register (CRUm_ICnSVC) (m = 0, 1)

Access Size : 32 bits
Address : <CRUm_base> + 01FCh
Initial Value : 0000_3210h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SVC3[3:0]				SVC2[3:0]				SVC1[3:0]				SVC0[3:0]			
Initial Value	0	0	1	1	0	0	1	0	0	0	0	1	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
15 to 12	SVC3[3:0]	3h	RW	Selected Virtual Channel 3 (SVC3) The maximum number of channels that can be used by the image converter is 4 (SVC0~3). Assign one of VC0~15 to SVC3. 0h: Virtual channel 0 selected 1h: Virtual channel 1 selected 2h: Virtual channel 2 selected : Eh: Virtual channel 14 selected Fh: Virtual channel 15 selected Note: Do not set the same value as other SVC0/1/2[3:0].
11 to 8	SVC2[3:0]	2h	RW	Selected Virtual Channel 2 (SVC2) The maximum number of channels that can be used by the image converter is 4 (SVC0~3). Assign one of VC0~15 to SVC2. 0h: Virtual channel 0 selected 1h: Virtual channel 1 selected 2h: Virtual channel 2 selected : Eh: Virtual channel 14 selected Fh: Virtual channel 15 selected Note: Do not set the same value as other SVC0/1/3[3:0].
7 to 4	SVC1[3:0]	1h	RW	Selected Virtual Channel 1 (SVC1) The maximum number of channels that can be used by the image converter is 4 (SVC0~3). Assign one of VC0~15 to SVC1. 0h: Virtual channel 0 selected 1h: Virtual channel 1 selected 2h: Virtual channel 2 selected : Eh: Virtual channel 14 selected Fh: Virtual channel 15 selected Note: Do not set the same value as other SVC0/2/3[3:0].
3 to 0	SVC0[3:0]	0h	RW	Selected Virtual Channel 0 (SVC0) The maximum number of channels that can be used by the image converter is 4 (SVC0~3). Assign one of VC0~15 to SVC0. 0h: Virtual channel 0 selected 1h: Virtual channel 1 selected 2h: Virtual channel 2 selected : Eh: Virtual channel 14 selected Fh: Virtual channel 15 selected Note: Do not set the same value as other SVC1/2/3[3:0].

(80) CRU Image Converter Main Control Register (SVC0) (CRUm_ICnIPMC_C0) (m = 0, 1)

Access Size : 32 bits

Address : <CRUm_base> + 0200h

Initial Value : 001E_00FEh

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
25, 24	RAWSTTYP [1:0]	0h	RW	Specify the color component of the first pixel of the first line of RAW data for SVC0 00b: R (RGrRGr...) 01b: Gr (GrRGrR...) 10b: Gb (GbBGbB...) 11b: B (BGbBGb...)
23, 22	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
21 to 16	INF[5:0]	1Eh	RW	Specify the MIPI input image formats for SVC0 to be processed by the image converter module. For details about the formats, see Data Type Codes in the MIPI CSI-2 V2.1 specification. Of the formats specified here, only one format is processed. Note 1. Initial value: YUV422 8-bit Note 2. The following values can be set. Other settings are prohibited. 13h to 16h: Generic Long Packet Data Type 18h to 1Ah, 1Ch to 1Fh: YUV Data 20h to 24h: RGB Data 28h to 2Fh: RAW Data 30h to 37h: User-Defined Byte-based Data The data types specified here must be set in CSI2nDTEL.DTEN and CSI2nDTEH.DTEN of MIPI CSI2.
15 to 8	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
7	STITHR	1h	RW	Bypassing statistics processing for SVC0 (the details are described in **9.2.4.3.19 Statistics**.) 0b: Statistics processing is performed. 1b: Statistics processing is not performed (bypassed). Note: The setting 0b only applies for the corresponding formats shown in **9.2.4.3.1 Input Formats and Image Processing**.
6	LUTTHR	1h	RW	Bypassing LUT-based image color conversion for SVC0 Regardless of whether the setting of this bit is 0b or 1b, the output of the LUT is 8 bits for 10-bit input. (the details are described in **9.2.4.3.15 LUT (Lookup Table)**.) 0b: Image color conversion is performed. 1b: Image color conversion is not performed (bypassed). Note: The setting 0b only applies for the corresponding formats shown in **9.2.4.3.1 Input Formats and Image Processing**.

Bit	Bit Name	Initial Value	R/W	Description
5	CSCTHR	1h	RW	Bypassing color space conversion and Data clipping for SVC0 (YCbCr(YUV) → RGB, RGB → YCbCr(YUV)) (the details are described in **9.2.4.3.14 Color Space Conversion**.) 0b: Color space conversion and Data clipping are performed. 1b: Color space conversion and Data clipping are not performed (bypassed). Note 1. The setting 0b only applies for the corresponding formats shown in **9.2.4.3.1 Input Formats and Image Processing**. Note 2. Even when this bit is 1, the data is expanded from 8 bits to 10 bits.
4	LMXTHR	1h	RW	Bypassing liner matrix processing for SVC0 (the details are described in **9.2.4.3.13 Liner Matrix**.) 0b: Liner matrix processing is performed. 1b: Liner matrix processing is not performed (bypassed). Note: The setting 0b only applies for the corresponding formats shown in **9.2.4.3.1 Input Formats and Image Processing1**.
3	DEMTHR	1h	RW	Bypassing demosaicing of RAW data for SVC0 (the details are described in Section **9.2.4.3.12 Demosaicing**.) 0b: Demosaicing is performed. 1b: Demosaicing is not performed (bypassed). Note: The setting 0b only applies for the corresponding formats shown in **9.2.4.3.1 Input Formats and Image Processing**.
2	CLPTHR	1h	RW	Bypassing image clipping for SVC0 (the details are described in **9.2.4.3.8 Image Clipping**.) 0b: Image clipping is performed. 1b: Image clipping is not performed (bypassed). Note: The setting 0b only applies for the corresponding formats shown in **9.2.4.3.1 Input Formats and Image Processing**.
1	DECTHR	1h	RW	Bypassing frame subsampling for SVC0 (the details are described in **9.2.4.3.9 Frame Subsampling**.) 0b: Subsampling is performed. 1b: Subsampling is not performed (bypassed). Note: Image processing, non-image processing, and statistics data are supported. Note: The setting 0b only applies for the corresponding formats shown in **9.2.4.3.1 Input Formats and Image Processing**.
0	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

(81) CRU Image Converter Main Control Register (SVCx) (CRUm_ICnIPMC_Cx) (m = 0, 1)

Note: x = 1 to 3 CRU Non Image Process Data Type Code Select Lower Register

Access Size : 32 bits

Address : <CRUm_base> + 0258h (x = 1)
<CRUm_base> + 025Ch (x = 2)
<CRUm_base> + 0260h (x = 3)

Initial Value : 001E_0066h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
25, 24	-	All 0	RW	Reserved These bits are read as 0b. The write value should always be 0b.
23, 22	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
21 to 16	INF[5:0]	1Eh	RW	Specify the MIPI input image formats for SVCx to be processed by the image converter module. For details about the formats, see Data Type Codes in the MIPI CSI-2 V2.1 specification. Of the formats specified here, only one format is processed. Note 1. Initial value: YUV422 8-bit Note 2. The following values can be set. Other settings are prohibited. 13h to 16h: Generic Long Packet Data Type 18h to 1Ah, 1Ch to 1Fh: YUV Data 20h to 24h: RGB Data 28h to 2Fh: RAW Data 30h to 37h: User-Defined Byte-based Data The data types specified here must be set in CSI2nDTEL.DTEN and CSI2nDTEH.DTEN of MIPI CSI2.
15 to 7	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
6	LUTTHR	1h	RW	Bypassing LUT-based image color conversion for SVCx (the details are described in **9.2.4.3.15 LUT (Lookup Table)**.) Regardless of whether the setting of this bit is 0b or 1b, the output of the LUT is 8 bits for 10-bit input. 0b: Image color conversion is performed. 1b: Image color conversion is not performed (bypassed). Note: The setting 0b only applies for the corresponding formats shown in **9.2.4.3.1 Input Formats and Image Processing**.
5	CSCTHR	1h	RW	Bypassing color space conversion and Data clipping for SVCx (YCbCr(YUV) → RGB, RGB → YCbCr(YUV)) (the details are described in **9.2.4.3.14 Color Space Conversion**.) 0b: Color space conversion and data clipping are performed. 1b: Color space conversion and data clipping are not performed (bypassed). Note1. The setting 0b only applies for the corresponding formats shown in **9.2.4.3.1 Input Formats and Image Processing**. Note2. Even when this bit is 1, the data is expanded from 8 bits to 10 bits.
4, 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

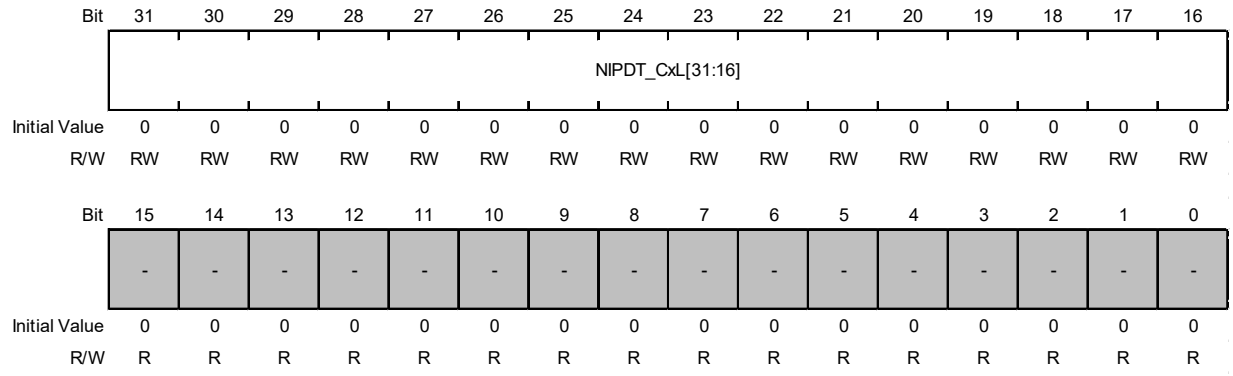
Bit	Bit Name	Initial Value	R/W	Description
2	CLPTHR	1h	RW	Bypassing image clipping for SVCx (the details are described in **9.2.4.3.8 Image Clipping**.) 0b: Image clipping is performed. 1b: Image clipping is not performed (bypassed). Note: The setting 0b only applies for the corresponding formats shown in **9.2.4.3.1 Input Formats and Image Processing**.
1	DECTHR	1h	RW	Bypassing frame subsampling for SVCx (the details are described in **9.2.4.3.9 Frame Subsampling**.) 0b: Subsampling is performed. 1b: Subsampling is not performed (bypassed). Note: Image processing, non-image processing, and statistics data are supported. Note: The setting 0b only applies for the corresponding formats shown in **9.2.4.3.1 Input Formats and Image Processing**.
0	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

(82) CRU Non Image Process Data Type Code Select Lower Register (SVCx) (CRUm_ICnNIPDT_CxL) (m = 0, 1)

Access Size : 32 bits

Address : <CRUm_base> + 0204h (x = 0)
<CRUm_base> + 0264h (x = 1)
<CRUm_base> + 026Ch (x = 2)
<CRUm_base> + 0274h (x = 3)

Initial Value : 0000_0000h



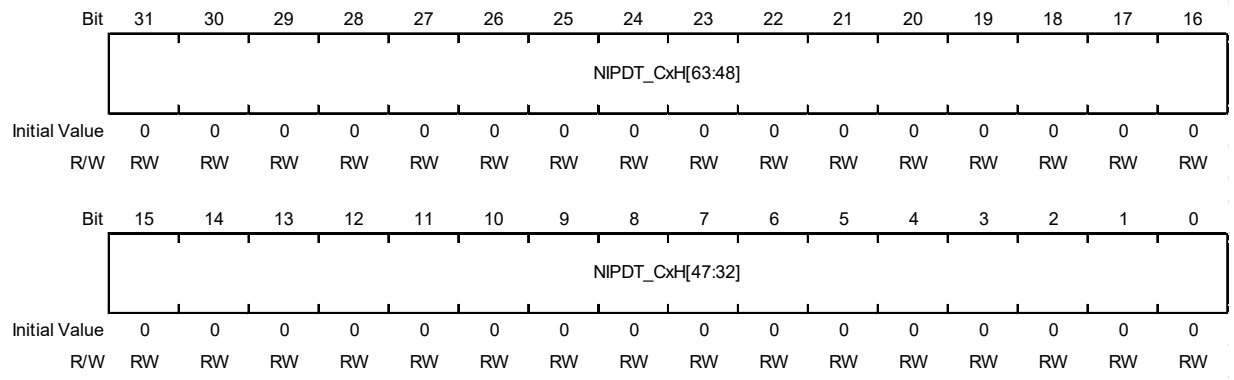
Bit	Bit Name	Initial Value	R/W	Description
31 to 16	NIPDT_CxL [31:16]	0h	RW	Non-image processing/full-bypass data type code selection (lower) selected by SVCx Each bit number in NIPDT_CxL [31:16] matches the decimal value of the data type number specified in MIPI CSI-2 v2.1. Select whether to send the data type corresponding to that number. NIPDT_CxL Corresponding data types [16] 10h [17] 11h ⋮ ⋮ [31] 1Fh When each bit is 0b: Do not send data of the corresponding data type as SVCx. When each bit is 1b: Data of the corresponding data type is transmitted as SVCx.
15 to 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

(83) CRU Non Image Process Data Type Code Select Higher Register (SVCx) (CRUm_ICnNIPDT_CxH) (m = 0, 1)

Access Size : 32 bits

Address : <CRUm_base> + 0208h (x = 0)
<CRUm_base> + 0268h (x = 1)
<CRUm_base> + 0270h (x = 2)
<CRUm_base> + 0278h (x = 3)

Initial Value : 0000_0000h



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	NIPDT_CxH [63:32]	0h	RW	Non-image processing/full-bypass data type code selection (higher) selected by SVCx Each bit number in NIPDT_CxH [63:32] matches the decimal value of the data type number specified in MIPI CSI-2 v2.1. Select whether to send the data type corresponding to that number. NIPDT_CxH Corresponding data types [32] 20h [33] 21h ⋮ ⋮ [63] 3Fh When each bit is 0b: Do not send data of the corresponding data type as SVCx. When each bit is 1b: Data of the corresponding data type is transmitted as SVCx.

(84) CRU Image Clipping Start Line Register (SVCx) (CRUm_ICnSLPrC_Cx) (m = 0, 1)

Access Size : 32 bits

Address : <CRUm_base> + 020Ch (x = 0)
<CRUm_base> + 028Ch (x = 1)
<CRUm_base> + 02A0h (x = 2)
<CRUm_base> + 02B4h (x = 3)

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-

R/W	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 13	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
12 to 0	SPPrC[12:0]	0h	RW	Start pixel for SVCx in the horizontal direction when clipping the input image to the specified area. Set a value of 1 or greater because the line start is processed as the first pixel. The image is output from the specified pixel data. (If 0 is specified, the same operation as for setting of 1 is performed.) Note 1. Set a value such that 1 ≤ ICnSPPrC_Cx.SPPrC ≤ (ICnEPPrC_Cx.EPPrC+1-320). Note 2. Specify an odd value when the input format is YUV422 (ICnIPMC_Cx.INF[5:0] = 1Eh to 1Fh). If an even number of 2 or greater is specified, the CRU operates as if an odd number (the specified number - 1) is specified. (Example: When 34 is specified, the data is output from the 33rd pixel.) Note 3. Even when the input format is RGB, etc., set a value that satisfies the following formula so that a line consists of an even number of pixels if the RGBtoYCbCr output is YUV422/420. ICnEPPrC_Cx.EPPrC - ICnSPPrC_Cx.SPPrC = 2N - 1 (N = 160, 161, 162,...) Note: Only image processing data are supported.

(87) CRU Image Clipping End Pixel Register (SVCx) (CRUm_ICnEPPrC_Cx) (m = 0, 1)

Access Size : 32 bits

Address : <CRUm_base> + 0218h (x = 0)
<CRUm_base> + 0298h (x = 1)
<CRUm_base> + 02ACh (x = 2)
<CRUm_base> + 02C0h (x = 3)

Bit	Bit Name	Initial Value	R/W	Description
31 to 13	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
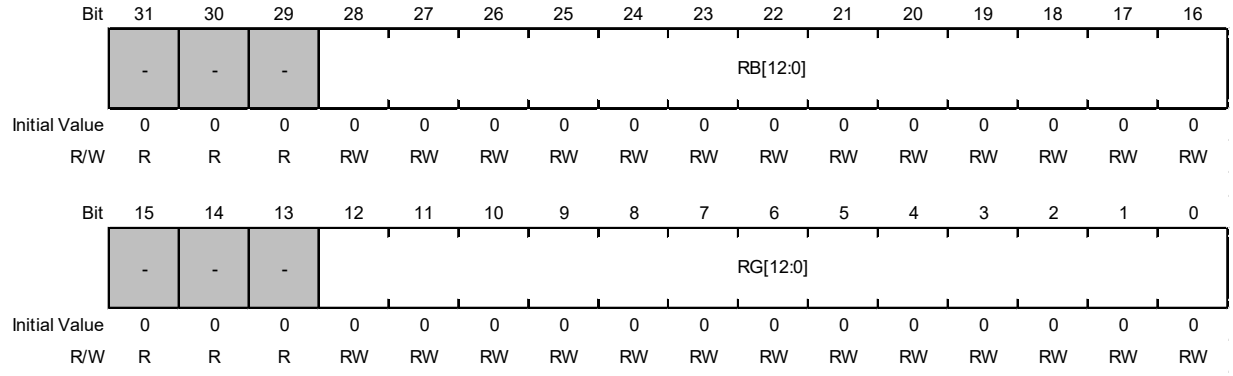
12 to 0	RR[12:0]	400h	RW	Coefficient R of R data for SVC0 linear matrix calculation (bit12: sign) Note: Specify a signed 13-bit integer by multiplying the desired coefficient value (-4 to approx. 4) by 1024 Setting range: -4096 (1000h) to 4095 (0FFFh) Note: Only image processing data are supported.

(91) CRU Linear Matrix R coefficient 2 Register (SVC0 only) (CRUm_ICnLMXRC2) (m = 0, 1)

Access Size : 32 bits
Address : <CRUm_base> + 0228h
Initial Value : 0000_0000h



Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
28 to 16	RB[12:0]	0h	RW	Coefficient B of R data for SVC0 linear matrix calculation (bit12: sign) Note: Specify a signed 13-bit integer by multiplying the desired coefficient value (-4 to approx. 4) by 1024 Setting range: -4096 (1000h) to 4095 (0FFFh) Note: Only image processing data are supported.
15 to 13	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
12 to 0	RG[12:0]	0h	RW	Coefficient G of R data for SVC0 linear matrix calculation (bit12: sign) Note: Specify a signed 13-bit integer by multiplying the desired coefficient value (-4 to approx. 4) by 1024 Setting range: -4096 (1000h) to 4095 (0FFFh) Note: Only image processing data are supported.

(92) CRU Linear Matrix G coefficient 1 Register (SVC0 only) (CRUm_ICnLMXGC1) (m = 0, 1)

Access Size : 32 bits
Address : <CRUm_base> + 022Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
28 to 16	BB[12:0]	400h	RW	Coefficient B of B data for SVC0 linear matrix calculation (bit12: sign) Note: Specify a signed 13-bit integer by multiplying the desired coefficient value (-4 to approx. 4) by 1024 Setting range: -4096 (1000h) to 4095 (0FFFh) Note: Only image processing data are supported.
15 to 13	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
12 to 0	BG[12:0]	0h	RW	Coefficient G of B data for SVC0 linear matrix calculation (bit12: sign) Note: Specify a signed 13-bit integer by multiplying the desired coefficient value (-4 to approx. 4) by 1024 Setting range: -4096 (1000h) to 4095 (0FFFh) Note: Only image processing data are supported.

(96) CRU Statistics Control 1 Register (SVC0 only) (CRUm_ICnSTIC1) (m = 0, 1)

Access Size : 32 bits

Address : <CRUm_base> + 023Ch

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	STSADPOS[3:0]			
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	STUNIT[1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 20	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
19 to 16	STSADPOS [3:0]	0h	RW	Input data bit position selection (0-8) for the sum of absolute values for adjacent pixels for statistics processing of SVC0 Use the 8 lower-order bits from the MSB-"n" bit for each type of RAW. Example: For RAW 16, use input data [15-n:8-n]. Note: Comply with the restrictions described in ICnSTIC1.STUNIT. Note: Only image processing data are supported.
15 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
1, 0	STUNIT[1:0]	0h	RW	Selecting an arithmetic processing unit for SVC0 statistics processing 0: 16x16 pixels 1: 32x32 pixels 2: 64x64 pixels 3: 128x128 pixels Note: Only image processing data are supported.

(97) CRU Image Converter Register Setting Change Control Register (CRUm_ICnREGC) (m = 0, 1)

Access Size : 32 bits
Address : <CRUm_base> + 0244h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	REFEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW1

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
0	REFEN	0h	RW1	Allows register setting changes to be reflected. By using this register for an MIPI CSI-2 input, the registers at offset addresses 01FCh to 023Ch can be changed through frame synchronization during operation. (Allow or disallow this according to **9.2.5.3 Frame Synchronization Settings**.) 0b: Does not allow register setting changes to be reflected. 1b: Allows register setting changes to be reflected. Note: If this bit is set to 1 while the Image Converter module is operating (ICnEN.ICEN = 1), the register setting values (at offset addresses 01FCh to 023Ch) are reflected at a frame start, and then the bit is cleared to 0 automatically. Note: If the Image Converter module is stopped (ICnEN.ICEN = 0), the register setting values can be reflected irrespective of this register. Note that registers other than the above cannot be changed during operation. Note: Only image processing data are supported.

(98) CRU Module Status Register (CRUm_ICnMS) (m = 0, 1)

Access Size : 32 bits
Address : <CRUm_base> + 02D8h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	IA3	AV3	CA3	-	IA2	AV2	CA2	-	IA1	AV1	CA1	-	IA0	AV0	CA0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 15	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
14	IA3	0h	R	Indicates whether the Image Converter block (the module converting the video data input up to the pre-FIFO-VD/SD stage) is processing data. (for SVC3) 0b: Video/statistics data have not been received. 1b: Video/statistics data are being converted.
13	AV3	0h	R	Indicates whether processing is performed within the image-clipped area. (for SVC3) (For details, see **9.2.4.3.8 Image Clipping**.) 0b: Processing is performed outside the image-clipped area. 1b: Processing is performed within the image-clipped area. Note: Only image processing data are supported.
12	CA3	0h	R	Indicates whether the frame is subsampled. (for SVC3) (For details, see **9.2.4.3.9 Frame Subsampling**.) 0b: A subsampled frame is being processed. 1b: A frame which is not subsampled is being processed. Note: This bit is 0 when CRUnRST.VRESETN is 0. This bit is set to 1 two cycles of PCLK after CRUnRST.VRESETN has been changed from 0 to 1. Note: Only image processing data are supported.
11	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
10	IA2	0h	R	Indicates whether the Image Converter block (the module converting the video data input up to the pre-FIFO-VD/SD stage) is processing data. (for SVC2) 0b: Video/statistics data have not been received. 1b: Video/statistics data are being converted.
9	AV2	0h	R	Indicates whether processing is performed within the image-clipped area. (for SVC2) (For details, see **9.2.4.3.8 Image Clipping**.) 0b: Processing is performed outside the image-clipped area. 1b: Processing is performed within the image-clipped area. Note: Only image processing data are supported.
8	CA2	0h	R	Indicates whether the frame is subsampled. (for SVC2) (For details, see **9.2.4.3.9 Frame Subsampling**.) 0b: A subsampled frame is being processed. 1b: A frame which is not subsampled is being processed. Note: This bit is 0 when CRUnRST.VRESETN is 0. This bit is set to 1 two cycles of PCLK after CRUnRST.VRESETN has been changed from 0 to 1.
7	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
6	IA1	0h	R	Indicates whether the Image Converter block (the module converting the video data input up to the pre-FIFO-VD/SD stage) is processing data. (for SVC1) 0b: Video/statistics data have not been received. 1b: Video/statistics data are being converted. Note: Only image processing data are supported.

Bit	Bit Name	Initial Value	R/W	Description
5	AV1	0h	R	Indicates whether processing is performed within the image-clipped area. (for SVC1) (For details, see **9.2.4.3.8 Image Clipping**.) 0b: Processing is performed outside the image-clipped area. 1b: Processing is performed within the image-clipped area.
4	CA1	0h	R	Indicates whether the frame is subsampled. (for SVC1) (For details, see **9.2.4.3.9 Frame Subsampling**.) 0b: A subsampled frame is being processed. 1b: A frame which is not subsampled is being processed. Note: This bit is 0 when CRUnRST.VRESETN is 0. This bit is set to 1 two cycles of PCLK after CRUnRST.VRESETN has been changed from 0 to 1.
3	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
2	IA0	0h	R	Indicates whether the Image Converter block (the module converting the video data input up to the pre-FIFO-VD/SD stage) is processing data. (for SVC0) 0b: Video/statistics data have not been received. 1b: Video/statistics data are being converted.
1	AV0	0h	R	Indicates whether processing is performed within the image-clipped area. (for SVC0) (For details, see **9.2.4.3.8 Image Clipping**.) 0b: Processing is performed outside the image-clipped area. 1b: Processing is performed within the image-clipped area. Note: Only image processing data are supported.
0	CA0	0h	R	Indicates whether the frame is subsampled. (for SVC0) (For details, see **9.2.4.3.9 Frame Subsampling**.) 0b: A subsampled frame is being processed. 1b: A frame which is not subsampled is being processed. Note: This bit is 0 when CRUnRST.VRESETN is 0. This bit is set to 1 two cycles of PCLK after CRUnRST.VRESETN has been changed from 0 to 1.

(99) CRU Frame Subsampling Control Register (CRUm_ICnDEC) (m = 0, 1)

Access Size : 32 bits

Address : <CRUm_base> + 02DCh

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	FRMDEC[3:0]			
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
3 to 0	FRMDEC[3:0]	0h	RW	Subsampling interval in frame subsampling (For details, see **9.2.4.3.9 Frame Subsampling**.) 0h: All images are passed. 1h: One pass every two frames 2h: One pass every three frames Omitted 14h: One pass every 15 frames 15h: One pass every 16 frames Note: Image processing and non-image processing and statistics data are supported.

(100) CRU Line Count Register (SVCx) (CRUm_ICnLC_Cx) (m = 0, 1)

Access Size : 32 bits

Address : <CRUm_base> + 02E0h (x = 0)
<CRUm_base> + 02E4h (x = 1)
<CRUm_base> + 02E8h (x = 2)
<CRUm_base> + 02ECh (x = 3)

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	LC[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 13	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
12 to 0	LC[12:0]	0h	R	Indicate the line counter value before image clipping and subsampling by the Image Converter module. (for SVCx) Note: Only image processing data are supported. Note: The maximum line value is 1000h.

(101) CRU Frame Subsampling Interrupt Control Register (CRUm_ICnINTCTRL) (m = 0, 1)

Access Size : 32 bits
Address : <CRUm_base> + 0300h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	DECINTE
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
0	DECINTE	0h	RW	Specifies whether an interrupt (CRUnINTS2.FS0/1/2/3S, CRUnINTS2.FE0/1/2/3S, or CRUnINTS2.SL0/1/2/3S) is generated for a subsampled frame. 0b: No interrupt is generated for a subsampled frame. (Initial value) 1b: An interrupt is generated for a subsampled frame. Note: Image processing and non-image processing and statistics data are supported. Note: The maximum line value is 1000h.

(102) CRU Output Image Format Register (CRUm_ICnDMR) (m = 0, 1)

Access Size : 32 bits
Address : <CRUm_base> + 0304h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	A8BIT[7:0]								-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	OBINSEL	-	YCMODE[2:0]			-	-	RGBMODE[1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	RW	R	RW	RW	RW	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	A8BIT[7:0]	0h	RW	Alpha bit for AXI-VD bus Alpha value in the ARGB8888 format output Note: The default value is 0h, so it is transparent. Note: This bit is valid when ICnDMR.RGBMODE[1:0]=10b,11b.
23 to 9	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
8	OBINSEL	0h	RW	Data Arranger 2 UV(CbCr) binary type selection for YUV422(YCbCr) data 0b: Offset binary (straight binary) 1b: Two's complement binary Note: Valid when the output is YUV422/420.
7	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
6 to 4	YCMODE[2:0]	0h	RW	YC output data format selection for AXI-VD bus 000b: YCbCr422, 8-bit multiplexed (YUYV format (Y 1st)) 001b: YCbCr422, 8-bit multiplexed (UYVY format (Cb 1st)) 010b: YC separation from YCbCr422 011b: Y component extraction from YCbCr422 100b: YCbCr420, 8-bit multiplexed (YUYV format (Y 1st)) 101b: YCbCr420, 8-bit multiplexed (UYVY format (Cb 1st)) 110b: YC Separation of YCbCr420. *The CbCr(U/V) side is Image Stride (AMnIS) ×2. 111b: Y component extraction of YCbCr420 (equivalent to YUV422)
3, 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
1, 0	RGBMODE[1:0]	0h	RW	RGB output data format selection for AXI-VD bus 00b: RGB888 (24-bit) 01b: RGB888 (32-bit) (The eight higher-order bits are padded with 00h.) 10b: ARBG888 (32-bit, B First A Last) 11b: ARBG888 (32-bit, A First B Last)

(103) CRU YCbCr → RGB Color Space Conversion Coefficient 1 Register (CRUm_ICnCSCC1) (m = 0, 1)

Access Size : 32 bits

Address : <CRUm_base> + 0308h

Initial Value : 0000_129Fh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-

16	CRCLCEN	0h	RW	Cr Calculation Data Clip Enable (Data Clipping Process Control for Cr Data Calculation in RGB→ YCbCr Color Space Conversion) 0b: Data clipping is not performed 1b: Data clipping is performed
15 to 12	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
11 to 0	CRCLAP[11:0]	800h	RW	Value added for normalization of Cr calculation data (specification of Cr data addition constant in RGB → YCbCr color space conversion)

(116) CRU Lookup Table Control Register (CRUm_ICnLUT) (m = 0, 1)

Access Size : 32 bits

Address : <CRUm_base> + 034Ch

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	LUTWR	LUTSEL
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
1	LUTWR	0h	RW	Enables APB read/write access to the lookup table (LUT). 0b: Disables APB access (set this bit to 0 in operation with the normal path). 1b: Enables APB access (normal access is unavailable in this case). Note: See **Figure 9.2-60 Storing LUT Data** for the LUT setting procedure.
0	LUTSEL	0h	RW	Specifies the access path of the lookup table (LUT). 0b: Normal path (image conversion by using the LUT) 1b: APB I/F (read/write from registers) Used to write (and confirm) data to the LUT in initial setting. Set this bit to 0 after finishing writing and reading data. Note that the LUT data is retained even after a reset. Note: See **Figure 9.2-60 Storing LUT Data** for the LUT setting procedure.

(117) CRU Lookup Table Status Register (CRUm_ICnLUTS) (m = 0, 1)

Access Size : 32 bits

Address : <CRUm_base> + 0350h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	LUTREGSEL
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
0	LUTREGSEL	0h	R	Indicates that the lookup table (LUT)is writable and readable from the APB. The LUTWR register value is reflected in this register after a while. Access the lookup table after confirming this bit. 0b: Neither writable nor readable. 1b: Writable and readable. Note: See **Figure 9.2-60 Storing LUT Data** for the LUT setting procedure.

(118) CRU Lookup Table Pointer Register (CRUm_ICnLUTP) (m = 0, 1)

Access Size : 32 bits

Address : <CRUm_base> + 0354h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	LTCRPR[9:0]										LTCBPR[9:6]			
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	LTCBPR[5:0]						LTYPR[9:0]									
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31, 30	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
29 to 20	LTCRPR[9:0]	0h	RW	Lookup table (LUT) Cr/B pointer Specify the current pointer (access point) to the lookup table Cr/B in APB access. The pointer is incremented automatically when ICnLUTD.LTCRDT[7:0] are written. It returns to 0 upon an overflow. It is not incremented when reading these bits. Note: See **Figure 9.2-60 Storing LUT Data** for the LUT setting procedure.
19 to 10	LTCBPR[9:0]	0h	RW	Lookup table (LUT) Cb/G pointer Specify the current pointer (access point) to lookup table Cb/G in APB access. The pointer is incremented automatically when ICnLUTD.LTCBDT[7:0] are written. It returns to 0 upon an overflow. It is not incremented when reading these bits. Note: See **Figure 9.2-60 Storing LUT Data** for the LUT setting procedure.
9 to 0	LTYPR[9:0]	0h	RW	Lookup table (LUT) Y/R pointer Specify the current pointer (access point) to lookup table Y/R in APB access. The pointer is incremented automatically when ICnLUTD.LTYDT[7:0] are written. It returns to 0 upon an overflow. It is not incremented when reading these bits. Note: See **Figure 9.2-60 Storing LUT Data** for the LUT setting procedure.

(119) CRU Lookup Table Data Register (CRUm_ICnLUTD) (m = 0, 1)

Access Size : 32 bits

Address : <CRUm_base> + 0358h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	LTCRDT[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	LTCBDT[7:0]								LTYDT[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
23 to 16	LTCRDT[7:0]	0h	RW	Lookup table (LUT) Cr/B data Read and write data to the location indicated by the ICnLUTP.LTCRPR[9:0] pointer in lookup table Cr/B through the APB interface.
15 to 8	LTCBDT[7:0]	0h	RW	Lookup table (LUT) Cb/G data Read and write data to the location indicated by the ICnLUTP.LTCBPR[9:0] pointer in lookup table Cb/G through the APB interface.
7 to 0	LTYDT[7:0]	0h	RW	Lookup table (LUT) Y/R data Read and write data to the location indicated by the ICnLUTP.LTYPR[9:0] pointer in lookup table Y/R through the APB interface.

(120) CRU Test Image Generation Control 1 Register (CRUm_ICnTICTRL1) (m = 0, 1)

Access Size : 32 bits
Address : <CRUm_base> + 035Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	TIRATE[4:0]				
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TIPTNV1[3:0]				TIPTNU1[3:0]				TIPTNY1[3:0]				-	TIROTSEL	TIMODE	TIEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	R	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
20 to 16	TIRATE[4:0]	0h	RW	Specify the test image generation rate. 16 pixels / (18 + TIRATE) cycles
15 to 12	TIPTNV1[3:0]	0h	RW	Specify the pixel (V) counter bits for the test image pattern. 0000b: Selects bits [3:0]. 0001b: Selects bits [4:1]. 0010b: Selects bits [5:2]. Omitted 1100b: Selects bits [15:12]. 1101b to 1111b: Setting prohibited
11 to 8	TIPTNU1[3:0]	0h	RW	Specify the pixel (U) counter bits for the test image pattern. 0000b: Selects bits [3:0]. 0001b: Selects bits [4:1]. 0010b: Selects bits [5:2]. Omitted 1100b: Selects bits [15:12]. 1101b to 1111b: Setting prohibited
7 to 4	TIPTNY1[3:0]	0h	RW	Specify the pixel (Y) counter bits for the test image pattern. 0000b: Selects bits [3:0]. 0001b: Selects bits [4:1]. 0010b: Selects bits [5:2]. Omitted 1100b: Selects bits [15:12]. 1101b to 1111b: Setting prohibited
3	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
2	TIROTSEL	0h	RW	Image processing/non-image processing route selection for test image output 0b: Input for image processing 1b: Input for non-image processing
1	TIMODE	0h	RW	Specifies a test image generation pattern. 0b: Selects a counter value for YUV output. 1b: Same-color YUV output for the entire screen
0	TIEN	0h	RW	Enables generation of a test image pattern. This test image works with VC0 only. 0b: Does not generate a test image pattern (processes the data type from the LINK). 1b: Generates a test image pattern (process test image pattern data). Note: When this bit is set to 1b, test data is forcibly selected regardless of CRUnCTRL.VINSEL.

(121) CRU Test Image Generation Control 2 Register (CRUm_ICnTICTRL2) (m = 0, 1)

Access Size : 32 bits
Address : <CRUm_base> + 0360h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	TIPTNV2[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TIPTNU2[7:0]								TIPTNY2[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
23 to 16	TIPTNV2[7:0]	0h	RW	Specify V for the entire-screen same-color test image pattern. Note: This bit is valid when ICnTICTRL1.TIMODE=1b.
15 to 8	TIPTNU2[7:0]	0h	RW	Specify U for the entire-screen same-color test image pattern. Note: This bit is valid when ICnTICTRL1.TIMODE=1b.
7 to 0	TIPTNY2[7:0]	0h	RW	Specify Y for the entire-screen same-color test image pattern. Note: This bit is valid when ICnTICTRL1.TIMODE=1b.

(122) CRU Test Image Size Setting 1 Register (CRUm_ICnTISIZE1) (m = 0, 1)

Access Size : 32 bits
Address : <CRUm_base> + 0364h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	TIPPL[11:0]											
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
11 to 0	TIPPL[11:0]	0h	RW	Number of valid pixels per line in the test image pattern Note 1. If a value from 0 to 15 is specified, operation is for the setting of 16. Note 2. The four lower-order bits are invalid.

(123) CRU Test Image Size Setting 2 Register (CRUm_ICnTISIZE2) (m = 0, 1)

Access Size : 32 bits
Address : <CRUm_base> + 0368h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	TIM[11:0]											
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	TIN[11:0]											
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
27 to 16	TIM[11:0]	0h	RW	Invalid period (number of lines) per frame in the test image pattern Note: If 0 is specified, operation is for the setting of 1.
15 to 12	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
11 to 0	TIN[11:0]	0h	RW	Valid period (number of lines) per frame in the test image pattern Note: If 0 is specified, operation is for the setting of 1.

9.2.4.3 Function Description

The prefix “CRUm (m = 0, 1)” of the register names is omitted in the following subsections.

9.2.4.3.1 Input Formats and Image Processing

Table 9.2-11, **Table 9.2-12**, and **Table 9.2-13** list the input formats in which images can be processed by this module and the corresponding available forms of image processing.

Table 9.2-11 Input Formats and Corresponding Forms of Image Processing (for Image Processing) (1/3)

Input Format					Processing Indicator														Interrupt			Output Format																
					COMMON					RAW			YUV					RGB				YCbCr 422			YCbCr 420		RGB			RAW

MIPI recommended memory storage format (full bypass)*2		Both	Non-use	CRUnCTRL.ATH = 1	Byte 32 [7:0]*1	Byte 31 [7:0]*1	Byte 30 [7:0]*1	Byte 29 [7:0]*1	Byte 28 [7:0]*1	Byte 27 [7:0]*1	Byte 26 [7:0]*1	Byte 25 [7:0]*1	Byte 24 [7:0]*1	Byte 23 [7:0]*1	Byte 22 [7:0]*1	Byte 21 [7:0]*1	Byte 20 [7:0]*1	Byte 19 [7:0]*1	Byte 18 [7:0]*1	Byte 17 [7:0]*1

Note 1. Data from MIPI CSI-2 LINK is output in 8-bit units. However, it is output in the data array of the Recommended Memory Storage of the MIPI CSI-2 V2.1 standard.

Note 2. Only data types marked with ✓ in “MIPI Recommended Memory Storage Format” in **Table 9.2-12** are output in this format. Otherwise, the data will be output in one of the above formats.

Note 3. The CbCr(U/V) side is Image Stride(AMnIS) × 2. See **Image Stride** in **9.2.4.3.3(5)(a) Video data frame** for details.

Note 4. The entries in this column have the following meanings.
“Odd” means the image has an odd number of horizontal lines.
“Even” means the image has an even number of horizontal lines.
“Both” means the image has an odd and even number of horizontal lines.

Note 5. When transferring data to memory, there are cases where Cb and Cr data are transferred to one area as Y, or data is divided into two independent areas.
The entries in this column represent the following.
Non-use: Cb and Cr data are transferred to the same area as Y when transferred to memory.
Use: When Cb and Cr data are transferred to memory, they are transferred to an area separate from Y. This separate area is transferred to the area specified in the AMnUVAOFH/L register for the Y data storage destination.

Note 1. Data from MIPI CSI-2 LINK is output in 8-bit units. However, it is output in the data array of the Recommended Memory Storage of the MIPI CSI-2 V2.1 standard.

Note 2. Only data types marked with ✓ in “MIPI Recommended Memory Storage Format” in **Table 9.2-12** are output in this format. Otherwise, the data will be output in one of the above formats.

Note 3. The CbCr(U/V) side is Image Stride(AMnIS) × 2. See Image Stride in **9.2.4.3.3(5)(a) Video data frame** for details.

Note 4. The entries in this column have the following meanings.
“Odd” means the image has an odd number of horizontal lines.
“Even” means the image has an even number of horizontal lines.
“Both” means the image has an odd and even number of horizontal lines.

Note 5. When transferring data to memory, there are cases where Cb and Cr data are transferred to one area as Y, or data is divided into two independent areas.
The entries in this column represent the following.
Non-use: Cb and Cr data are transferred to the same area as Y when transferred to memory.
Use: When Cb and Cr data are transferred to memory, they are transferred to an area separate from Y. This separate area is transferred to the area specified in the AMnUVAOFH/L register for the Y data storage destination.

9.2.4.3.3 Transfer to DRAM

In data transfer from the CRU to the DRAM, data are transferred frame by frame separately based on the concept of memory banks. The memory banks can be set to operate with from 1 to 8 planes. As the transfer destination address for each memory bank, the transfer destination start address of the memory bank must be set such that it does not overlap with memory for the previous frames of data. Operation takes a cyclic form whereby the frame data returns to 1 when it reaches the last plane (see **Figure 9.2-11**). Accordingly, data on the DRAM must have been taken for next processing before overwriting. Set the number of memory banks so that this can be done before overwriting.

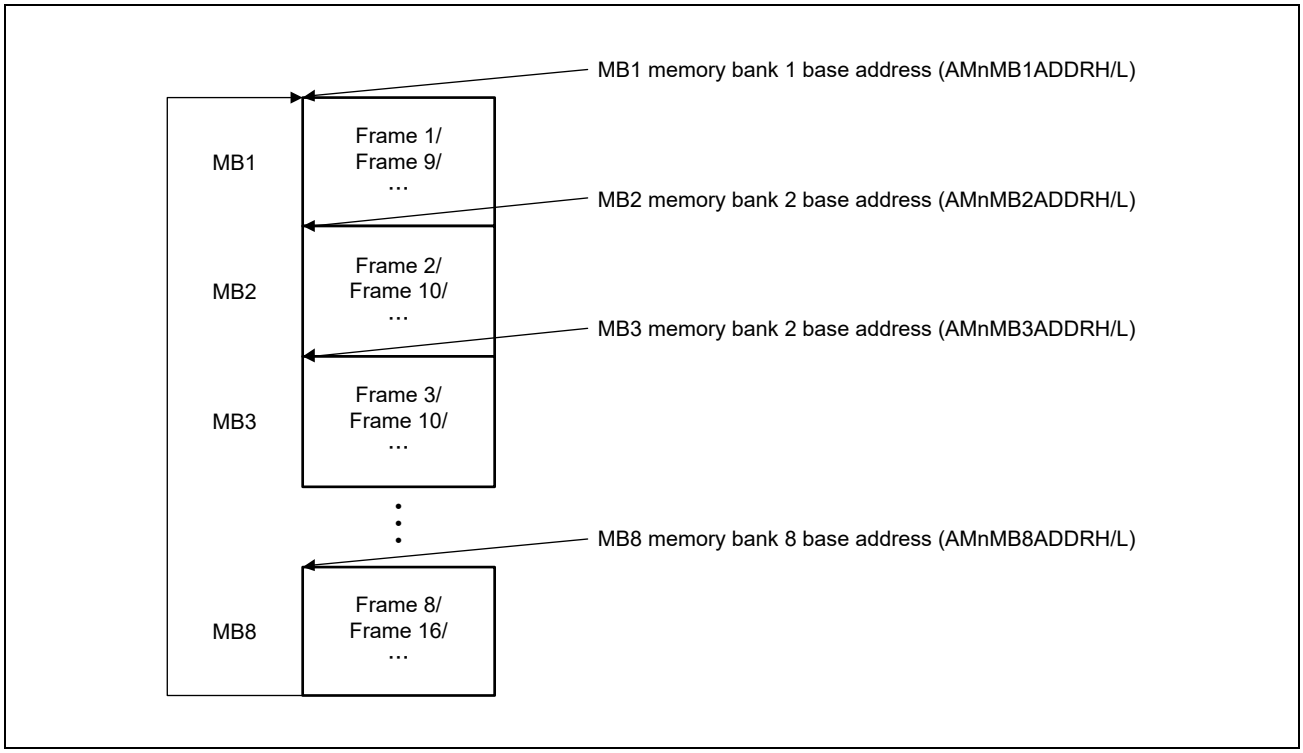

Figure 9.2-11 Image of Data Transfer to DRAM (Example: Eight Destinations in DRAM for the Transfer of Image-Processing Data)

Table 9.2-17 lists the memory bank setting addresses required for the DRAM. In this module, the transfer destination start addresses for the transfer of image data can be specified by setting the offsets listed below to proceed with transfer of up to four planes for SVC, transfer of the UV plane at the time of Y/UV separation, and transfer of non-image processing data or full-bypass data.

Furthermore, the transfer destination start addresses can be specified independently of those for statistics data that are transferred through the statistics bus.

Table 9.2-17 Memory Bank Setting Addresses

x = 0 to 7 (number of memory banks); y = 0 to 3 (number of SVC channels)

Transfer Bus	Processing	Transfer Destination Start Address	Description	Related Section
Video data bus	Image processing data	AMnMBxADDRH/L + AMnSVCAOFH/Lxy	Image data transfer destination. Transfer is possible for SVC0 to 3.	**(1) Video Data Transfer Destination Address (Video Data Storage Destination)**
		AMnMBxADDRH/L + AMnSVCAOFH/Lxy + AMnUVAOFH/L	Transfer destination of the CbCr (UV) plane at the time of YCbCb separation in image data. Transfer is possible for SVC0 to 3.	**(2) Video Data Transfer Destination Address (Storage in Y/UV Separation)**
	Non-Image processing data/ full bypass	AMnMBxADDRH/L + AMnSVCAOFH/Lxy + MnNIAOFH/L	Non-image data/full-bypass transfer destination. Transfer is possible for SVC0 to 3.	**(3) Video Data Transfer Destination Address (Image Processing/Non-Image Processing, 4-ch. SVC, Y/UV Separated Data)**
Statistics data bus	Statistics processing	AMnSDMBxADDRH/L	Statistics data transfer destination. Transfer is only possible for SVC0.	**(4) Statistics Data Transfer Destination Address (Statistics Data Storage Destination)**

Note: x represents the number of planes of each memory bank and it can be set from one to eight planes by the AMnMBVALID and AMnSDMBVALID registers (the number differs between video and statistics).
y represents the channel number of SVC and it can be set from SVC0 to SVC3 by the ICnSVCNUM register.

Data are transferred to the address obtained by adding the given offset to AMnMBxADDRH/L, the image processing data transfer destination start address for SVC0.

1) SVC OFFSET

SVCs from SVC0 to 3 are supported. Data are transferred to the address obtained by adding the offset of SVC1 to 3 to the image data transfer destination start address for SVC0.

SVC1: AMnMBxADDRH/L + AMnSVCAOFH/L
SVC2: AMnMBxADDRH/L + AMnSVCAOFH/L × 2
SVC3: AMnMBxADDRH/L + AMnSVCAOFH/L × 3

2) UV OFFSET

In the separate transfer of Y and CbCr (UV), the CbCr (UV) plane is transferred to the address obtained by adding AMnUVAOFH/L to AMnMBxADDRH/L, the image data transfer destination start address for SVC0.

UV plane for SVC0: AMnMBxADDRH/L + AMnUVAOFH/L
UV plane for SVC1: AMnMBxADDRH/L + AMnSVCAOFH/L + AMnUVAOFH/L
UV plane for SVC2: AMnMBxADDRH/L + AMnSVCAOFH/L × 2 + AMnUVAOFH/L
UV plane for SVC3: AMnMBxADDRH/L + AMnSVCAOFH/L × 3 + AMnUVAOFH/L

3) Non-Image Processing Data

Data are transferred to the address obtained by adding AMnNIAOFH/L to AMnMBxADDRH/L, the image data transfer destination start address for SVC0.

Non-image data plane for SVC0: AMnMBxADDRH/L + AMnNIAOFH/L
Non-image data plane for SVC1: AMnMBxADDRH/L + AMnSVCAOFH/L + AMnNIAOFH/L
Non-image data plane for SVC2: AMnMBxADDRH/L + AMnSVCAOFH/L × 2 + AMnNIAOFH/L
Non-image data plane for SVC3: AMnMBxADDRH/L + AMnSVCAOFH/L × 3 + AMnNIAOFH/L

4) Statistics Data

Statistics data are transferred through the static data (SD) bus, which is independent of the video data bus. Therefore, the destination addresses for these data are defined in the following form, regardless of the address settings for image data. In addition, such data are only transferred to the following set locations, since they are only supported for SVC0.

AMnSDMBxADDRH/L

(1) Video Data Transfer Destination Address (Video Data Storage Destination)

- The start address of each memory bank as the video data transfer destination is determined by the AMnMB1 to 8ADDRL and AMnMB1 to 8ADDRH registers. Valid AMnMB1ADDRH/L, AMnMB2ADDRH/L, … registers are switched by AMnMBVALID. 1 to 8 can be set for one step of memory-bank transfer (examples for settings of 8, 4, and 1 are shown in **(a) AMnMBVALID[7:0] = 1111_1111b (eight transfer destinations)**, **(b) AMnMBVALID[7:0] = 0000_1111b (four transfer destinations)**, and **(c) AMnMBVALID[7:0] = 0000_0001b (one transfer destination)**, respectively).

Set the following offset addresses as required based on the above. Set the following offset addresses as required based on the above description.

- Set the SVC offset addresses, AMnSVCAOFL and AMnSVCAOFH, when SVC1 to 3 are used.
- Set the non-image processing offset addresses, AMnNIAOFL and AMnNIAOFH, when non-image processing/full bypass is selected.
- Set the YC offset addresses, AMnUVAOFL and AMnUVAOFH, when YC separation (ICnDMR.YCMODE[2:0] = 010b/110b) is selected.

(a) AMnMBVALID[7:0] = 1111_1111b (eight transfer destinations)

Order of transfer destinations: MB1 → MB2 → …. → MB8 → MB1 → MB2 → …

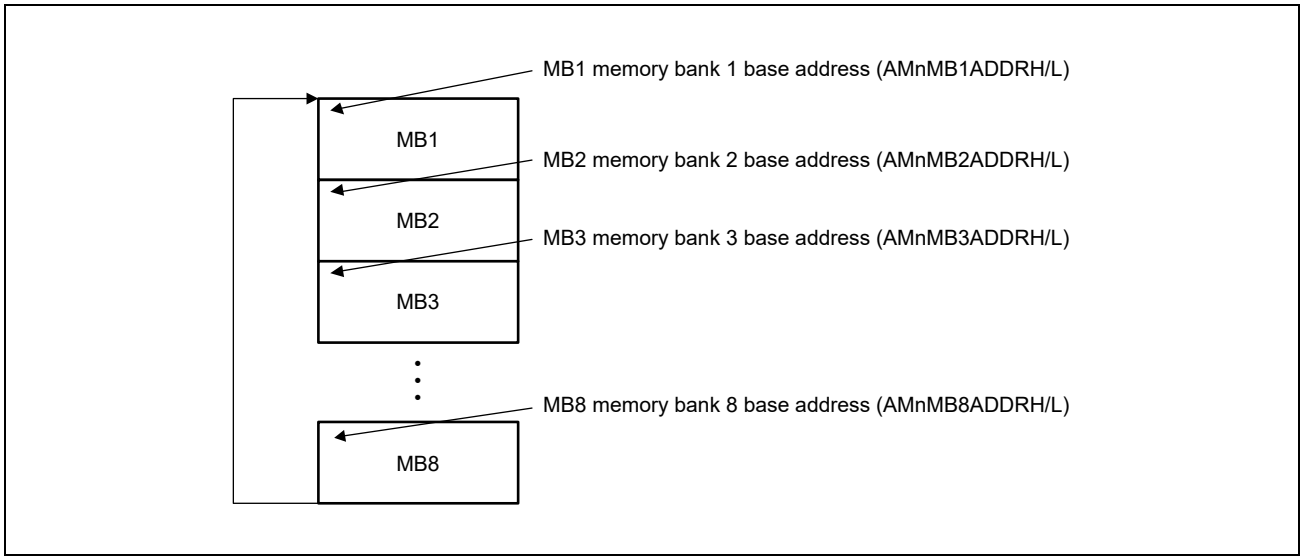

Figure 9.2-12 Image of Memory Bank (Eight Transfer Destinations)

(b) AMnMBVALID[7:0] = 0000_1111b (four transfer destinations)

Order of transfer destinations: MB1 → MB2 → MB3 → MB4 → MB1 → MB2 → …

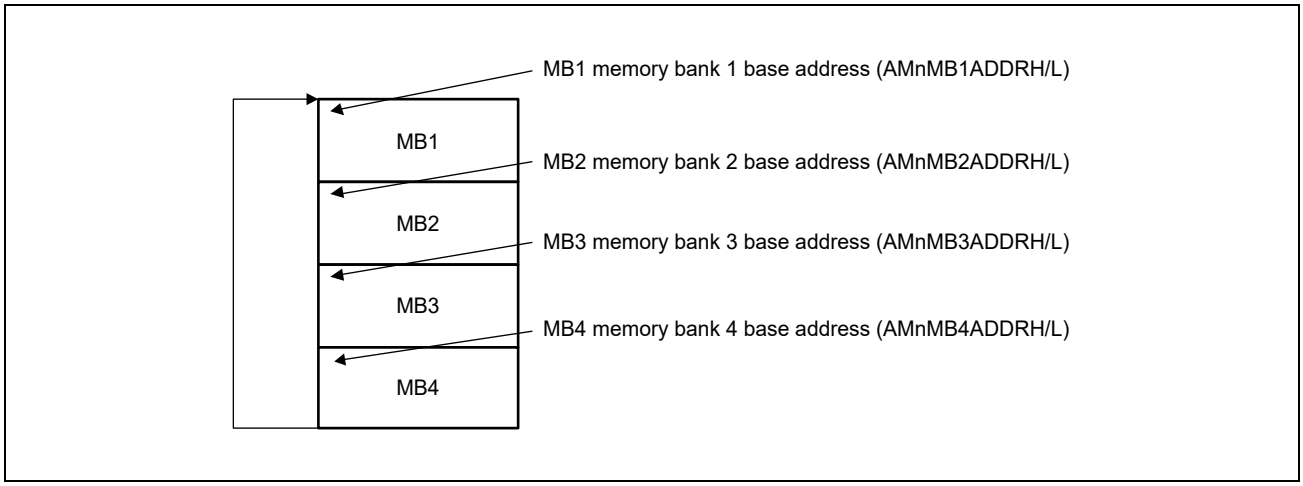

Figure 9.2-13 Image of Memory Bank (Four Transfer Destinations)

(c) AMnMBVALID[7:0] = 0000_0001b (one transfer destination)

Order of transfer destinations: MB1 → MB1 → MB1 → …

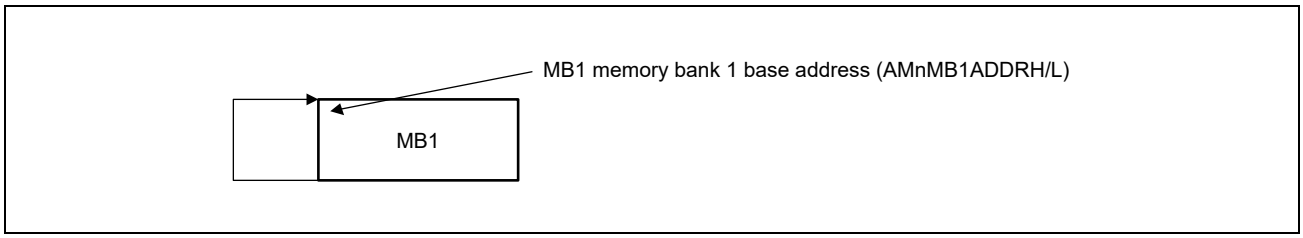

Figure 9.2-14 Image of Memory Bank (One Transfer Destination)

(2) Video Data Transfer Destination Address (Storage in Y/UV Separation)

The order of storing data in the MB1 transfer destination start address (AMnMB1ADDRH/L) in the case of Y-first (YUYV..) is shown below.

(a) When YUV is not separated (ICnDMR.YCMODE[2:0] = 000b to 001b, 100b to 101b)

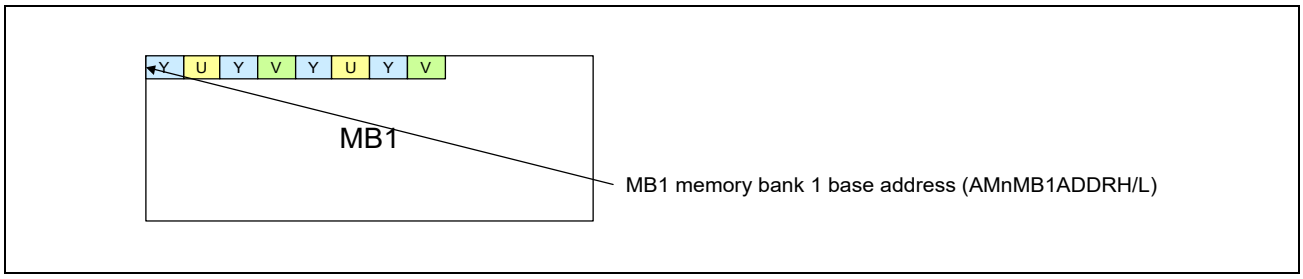

Figure 9.2-15 Image of Data Storage (in the case of no separation of YUV)

(b) When YUV is separated (ICnDMR.YCMODE[2:0] = 010b)

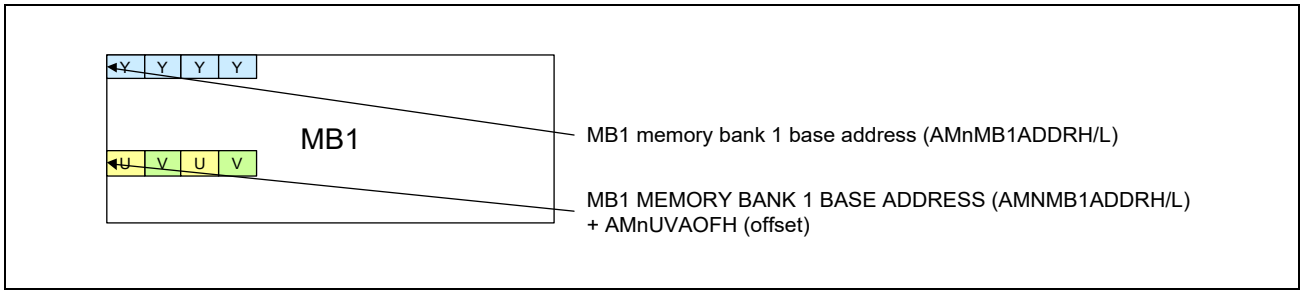

Figure 9.2-16 Image of Data Storage (in the case of separation of YUV)

(c) When only Y is separated (ICnDMR.YCMODE[2:0] = 011b)

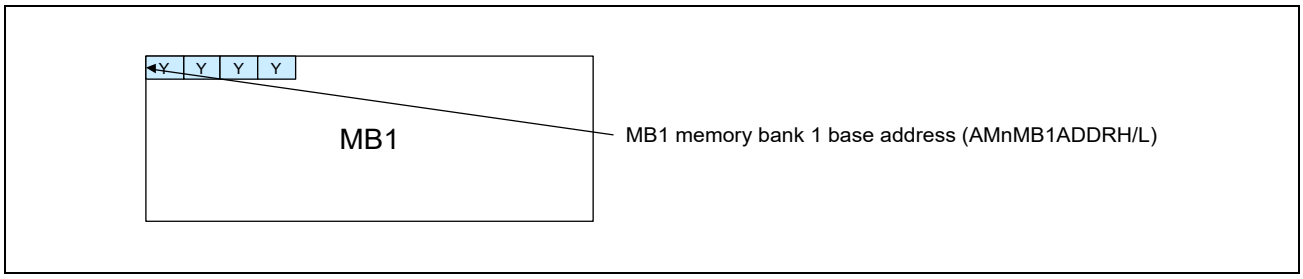

Figure 9.2-17 Image of Data Storage (in the case of only Y)

(3) Video Data Transfer Destination Address (Image Processing/Non-Image Processing, 4-ch. SVC, Y/UV Separated Data)

Figure 9.2-18 shows an image of memory to illustrate how image data of image processing/non-image processing, 4-ch. SVC, and Y/UV separated data are stored in memory.

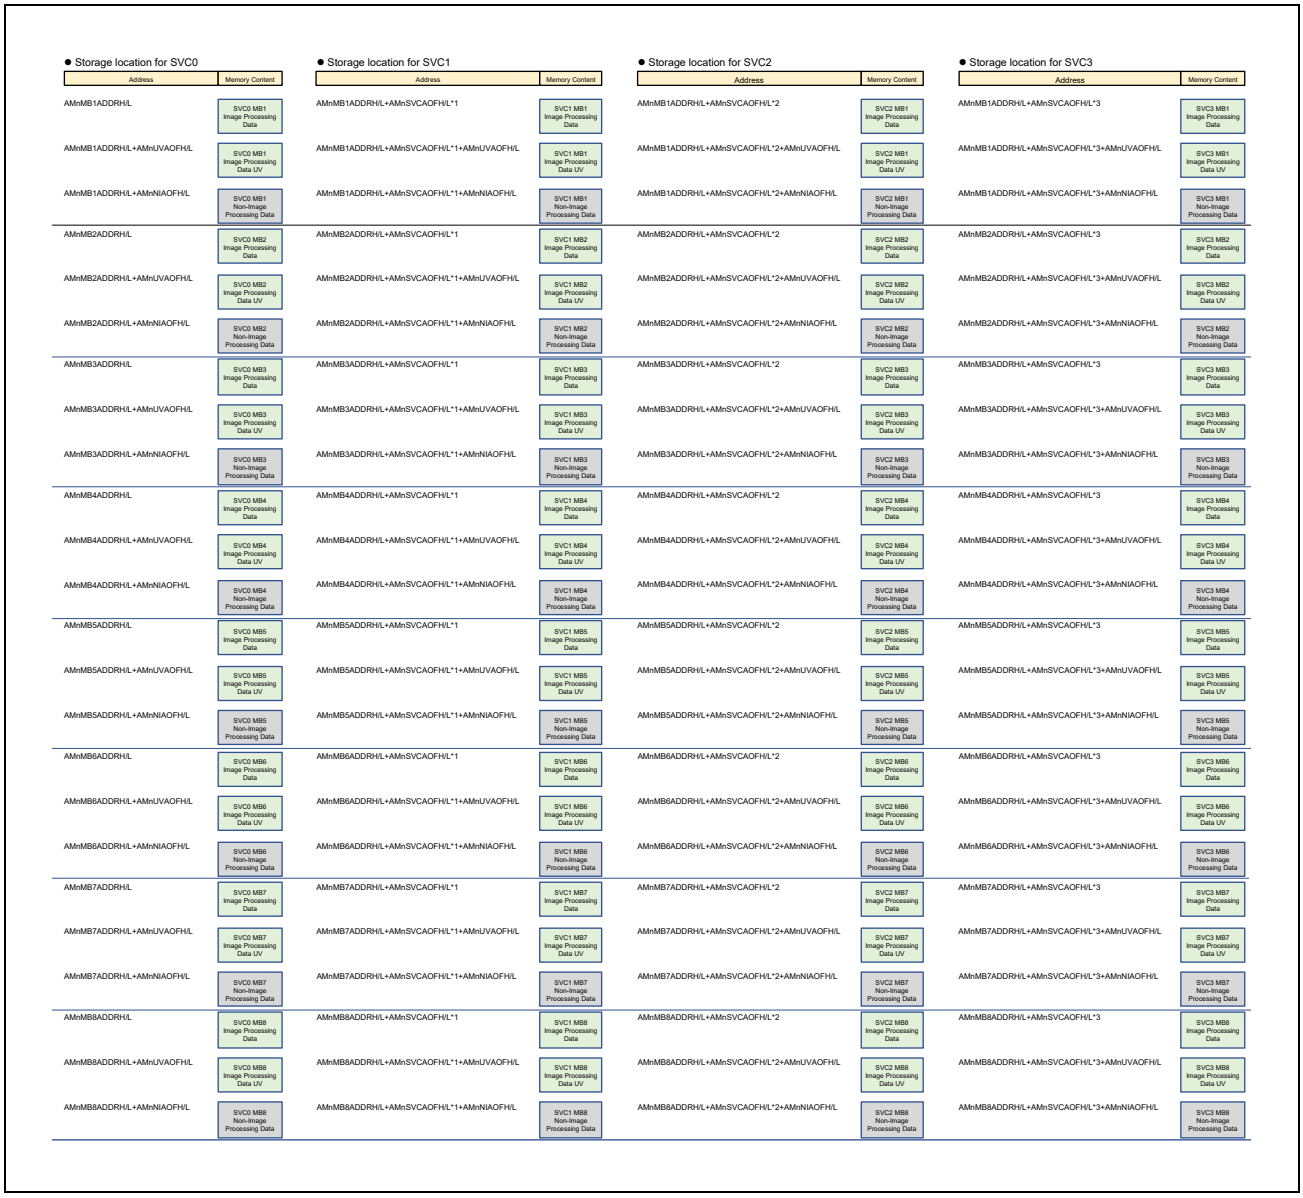

Figure 9.2-18 Image of Data Storage (Image Processing/Non-Image Processing, 4-ch. SVC, and Y/UV Separated Data)

(a) Example of Division by VC and by MB

Figure 9.2-19 shows an image of memory when data are to be stored separately by VC and by memory bank.

Figure 9.2-20 Image of Data Storage (Example of Division by MB)

(4) Statistics Data Transfer Destination Address (Statistics Data Storage Destination)

The results of statistics processing are transferred from the statistics data bus to external memory. Since this statistics function is limited to SVC0, the external transfer destination start address is determined by AMnSDMB1 to 8ADDRL and AMnSDMB1 to 8ADDRH.

The number of planes of the memory bank is determined by AMnSDMBVALID. The transfer start address (statistics data storage destination) is determined by the MnSDMB1 to 8ADDRL and AMnSDMB1 to 8ADDRH registers.

The valid AMnSDMB1ADDR, AMnSDMB2ADDR, …registers are switched by AMnSDMBVALID.

(a) AMnSDMBVALID[7:0] = 1111_1111b (eight transfer destinations)

- Order of transfer destinations: SDMB1 → SDMB2 → … → SDMB8 → SDMB1 → SDMB2 → …

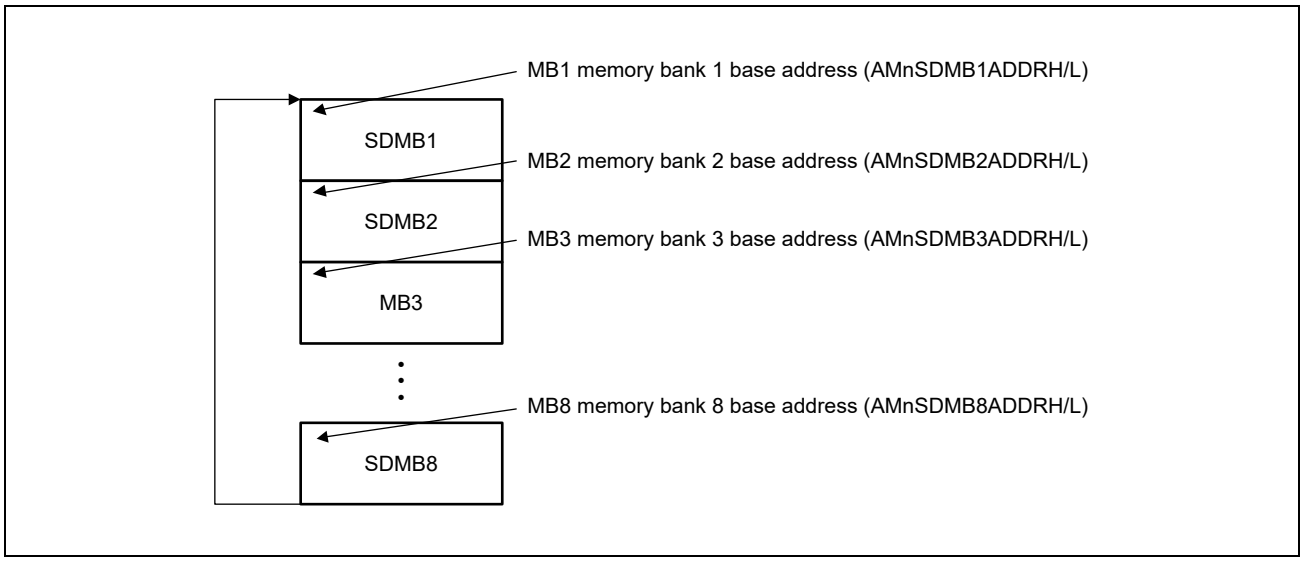

Figure 9.2-21 Image of Memory Bank (Eight Transfer Destinations)

(5) Frame Structure

(a) Video data frame

Image Stride

The image stride function is always handled for image processing and non-image processing from the video data system.

Figure 9.2-22 through **Figure 9.2-24** show the image of the storage of data with the image stride function. The image stride function involves writing from the memory write start address of each line in memory in units of address with the value set by the AMnIS (128-byte Step) register. The end of the line for writing is determined in multiples of 256 bits (32 bytes), so take this into account when setting the address. Furthermore, if a header and footer are to be appended, make the setting in consideration of that amount of data.

The following are the descriptions of storage in memory for each output format.

TYPE1: When the output format is YUV without separation (ICnDMR.YCMODE[2:0] = 000b to 001b, 011b to 101b,111b), RGB, RAW or MIPI Recommended Memory Storage Format.

As shown in **Figure 9.2-22**, the first address of memory write for each horizontal line is written to memory in address units.

TYPE2: When the output format is YUV422 (ICnDMR.YCMODE[2:0] = 010b)

As shown in **Figure 9.2-23**, the first address of memory write for each horizontal line is written to memory in address units.

TYPE3: When the output format is YUV420 (ICnDMR.YCMODE[2:0] = 110b)

As shown in **Figure 9.2-24**, Y writes the first address of memory write for each line to memory in address units of the value set in the AMnIS register.

Note that UV writes the first address of each line to memory in units of twice the value set in the AMnIS register.

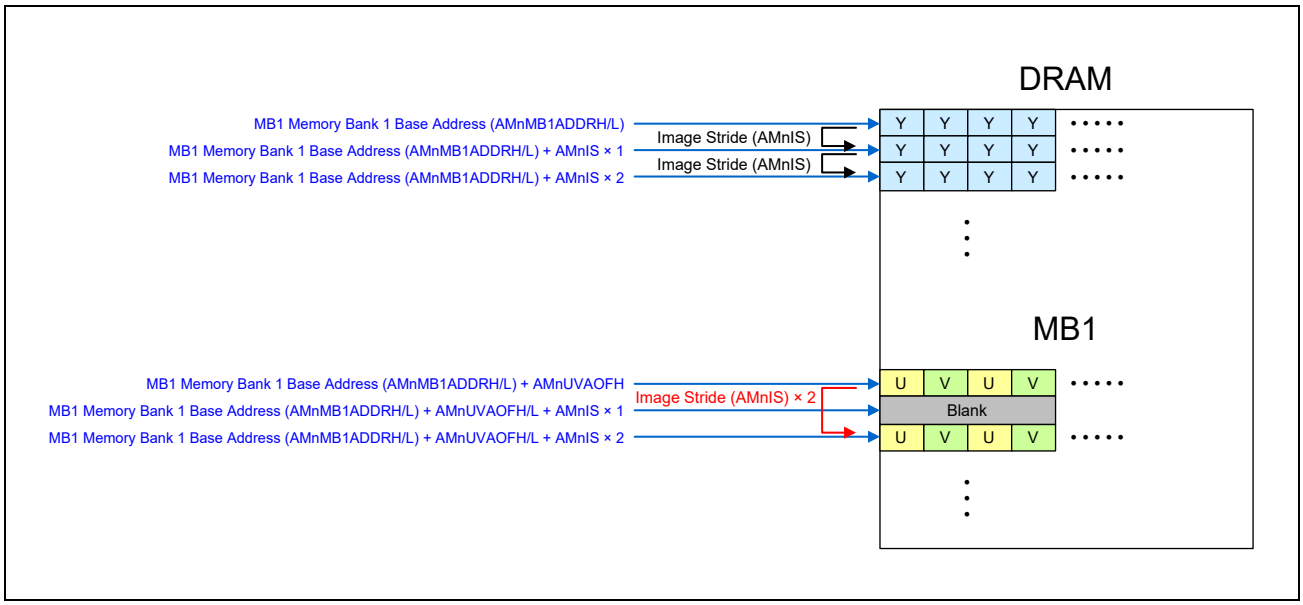

Figure 9.2-24 Image of Data Storage with Image Stride Function (TYPE3)

Image Processing Data Frame

Figure 9.2-25 shows the structure of the image processing data frame.

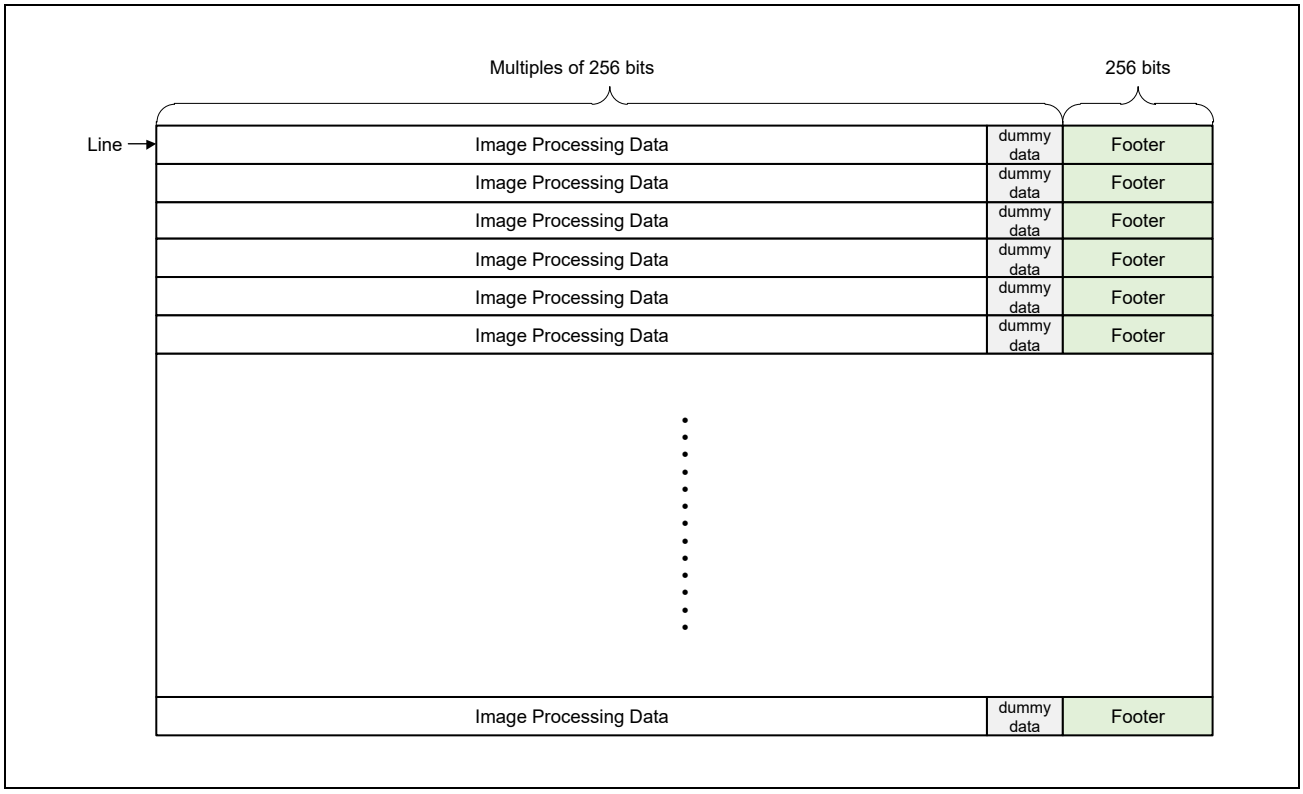

Figure 9.2-25 Image Processing Data Frame Structure

1) Dummy data

Transfer from this module to external memory proceeds in units of 256 bits (32 bytes). Therefore, only the amount of dummy data which is required to reach a 32-byte boundary is transferred. When processing images, ignore the dummy data.

2) Footer

Whether or not to insert footer with the image data can be selected by using the ICnDTVP.FTON register. For the data format of 256 bits of footer data, see **Footer Appending Function**. The value of this footer is updated alternately every time data at the target address are updated. The state of progress can be checked by monitoring which horizontal line has been updated.

This module has functionality for checking the address for transfer from the AXI bus via a register or using an interrupt to indicate the transfer of data to the specified address. Actually, whether or not data have been written to the DRAM can be checked by inspecting the footer to confirm the updating of data.

Non-Image Processing Data/Full-Bypass Data Frame

Figure 9.2-26 shows the structure of the non-image processing data/full-bypass data frame.

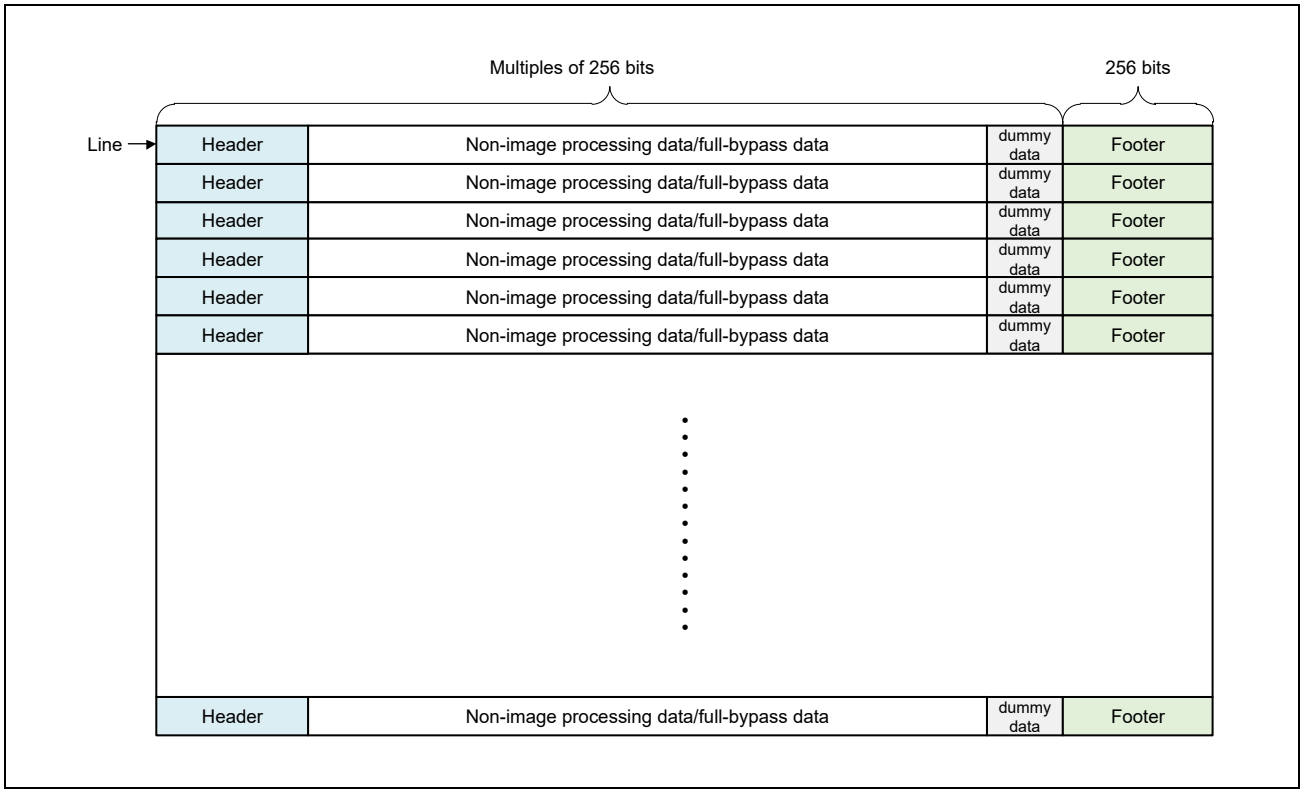

Figure 9.2-26 Non-Image Processing Data/Full-Bypass Data Frame Structure

A difference from an image processing frame is that a header can be inserted for these frame types.

Insertion of the header can be set by using the ICnDTVP.HDON register. For the format of the header, see **Header Appending Function (for Non-Image Processing Data/Full-Bypass Data)**.

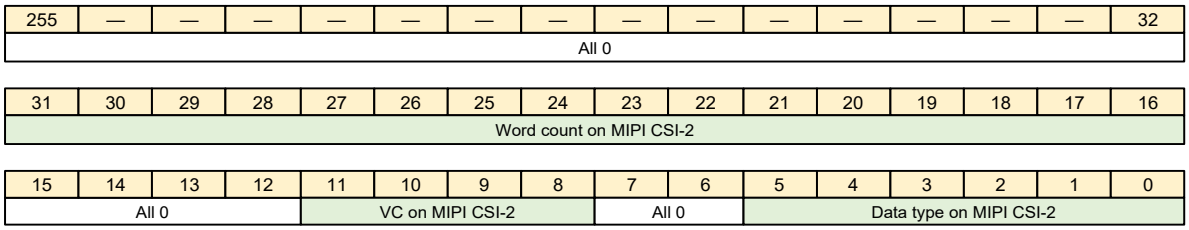
Since there are several data types for non-image processing and full-bypass data whereas image processing data are of one data type, the purpose of the header is to allow the CRU to identify the data type in line units. If the CRU has recognized the data type beforehand or a single data type is selected, headers need not be inserted.

Header Appending Function (for Non-Image Processing Data/Full-Bypass Data)

The data types for non-image processing and full-bypass are selectable from among several data types and the data are stored in a state such that they are mixed in the same SVC memory area, so a header can be appended at the start of each line for non-image processing or full-bypass data so that the data type and data length can be identified when read. Since this header appending function is not required for a sensor that can identify the data types by their order, etc., it can be switched on or off.

However, when the pattern generator is selected for output, a header will not be appended regardless of whether the setting for header appending is on or off.

Figure 9.2-27 shows the contents of the header.



Note: Since “Word count” is the word count value based on MIPI CSI-2, it does not include data such as headers and footers which have been appended by the CRU.

Figure 9.2-27 Header Contents

Footer Appending Function

This function writes footer data to memory so that the user can see up to which horizontal line data has been written in the memory bank set by AMnMB1-8ADDRH/L (for video data).

This function can be switched on or off with ICnDTVP.FTON.

For the video data footer, 256 bits (256’h1/256’h0) are written at the end of each line unit.

At first, 256’h1 is written as a footer. The next time the memory bank is overwritten after round of writing, 256’h0 is written as a footer. Subsequently, 256’h1 and 256’h0 are written alternately each time the memory bank is overwritten.

Accordingly, by checking the value of the footer, it is possible to prevent erroneous use of data before it is overwritten.

A 256-bit footer (256’d1/256’d0) is appended to the end of each line unit from the image system (image processing, non-image processing, or full bypass) and to the end of each frame unit from the statistics system.

(b) Statistics data frame

Figure 9.2-28 shows the structure of the image processing data frame.

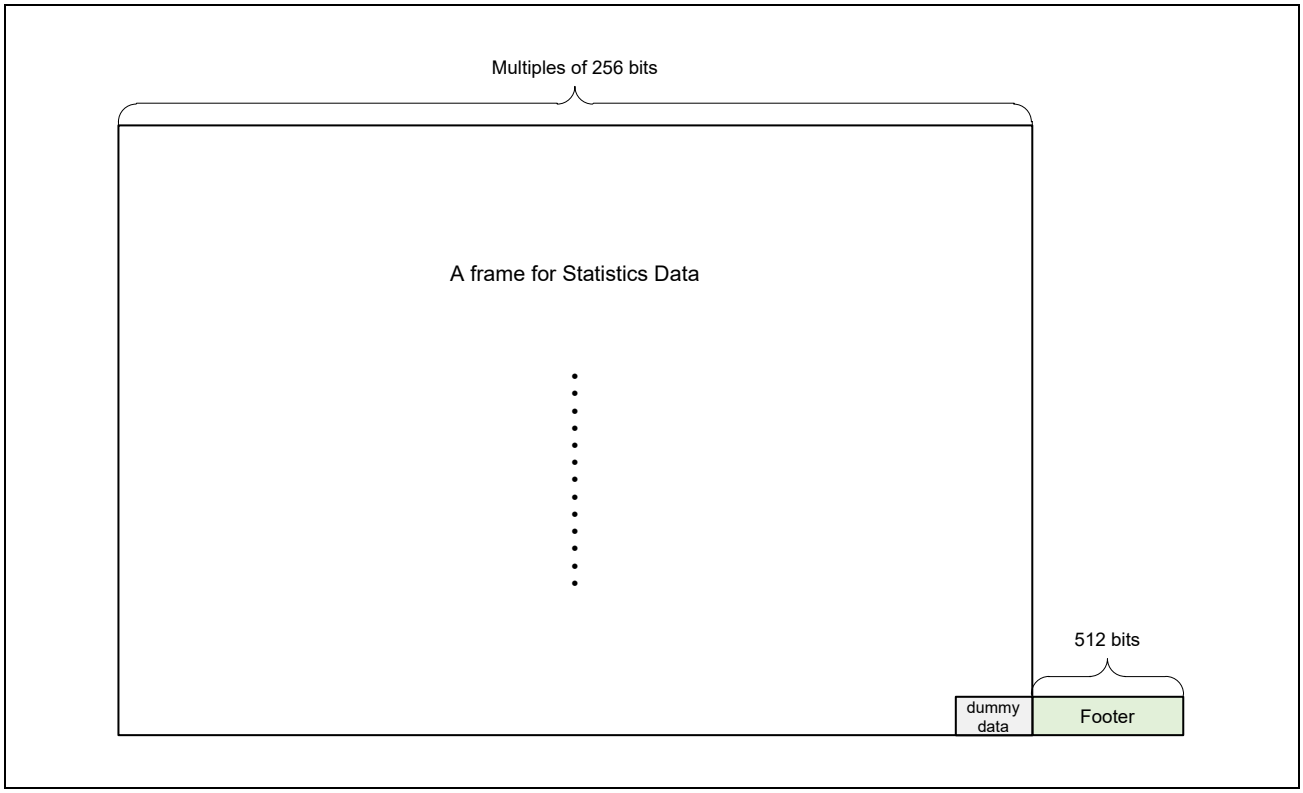


Figure 9.2-28 Statistics Data Frame Structure

Two differences between statistics frames and frames from image processing and non-image processing are that statistics frames have no concept of image striding and that footers are added in frame units. This is because statistics are processed in block units so that line-by-line processing is not possible.

Processing of the Last Line in a Frame (for Statistics Data)

Figure 9.2-29 shows an image of storing frames of statistics data. Statistics data are written to memory with no intervals in the data to reflect line transitions. The end of the frame for writing is determined in multiples of 256 bits (32 bytes), so take this into account when setting the address.

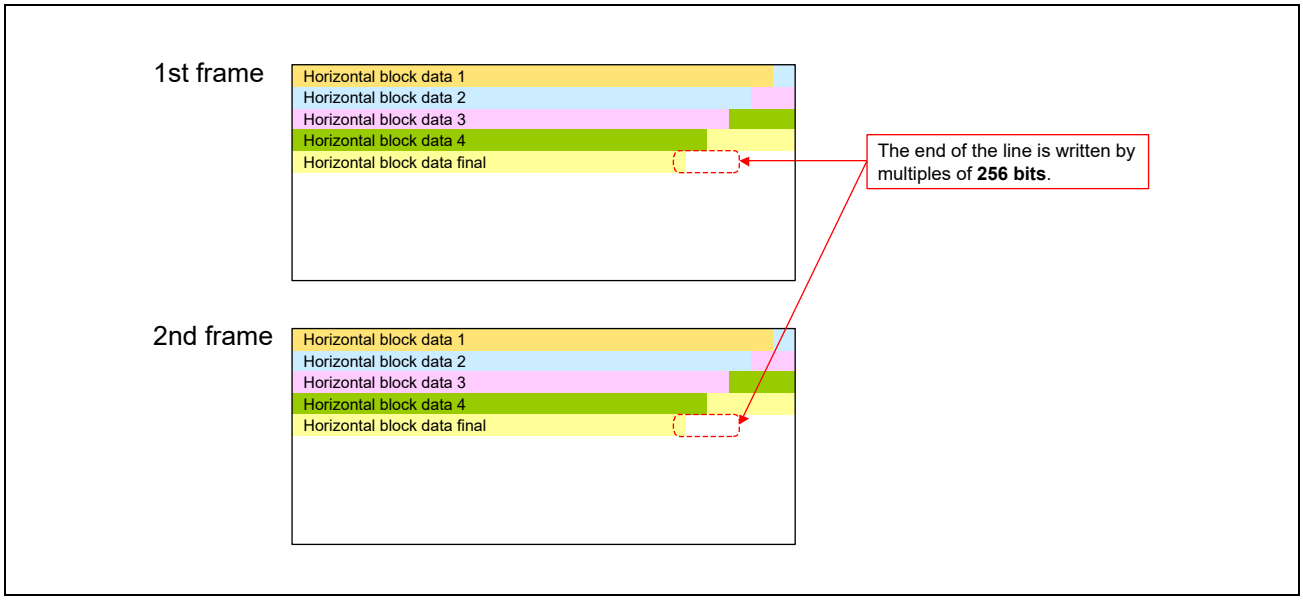

Figure 9.2-29 Image of Storing Frames of Statistics Data

Footer Appending Function

This function writes a footer to the end of each memory so that the user can see which bank number of the memory bank set by MnSDMB1-8ADDRH/L (for statistics data) has been written to the memory.

This function can be switched on or off with ICnDTVP.FTON.

A 512-bit ({higher-order 256 bits: reserved (indefinite value); lower-order 256 bits: 256'h1} or 512-bit {higher-order 256 bits: reserved (indefinite value); lower-order 256 bits: 256'h0}) footer of statistics data is written at the end of each frame unit.

Ignore the higher-order 256 bits of 512 bits because they are reserved (indefinite value).

At first, 512 bits {higher-order 256 bits: reserved (indefinite value); lower-order 256 bits: 256'h1} are written as a footer.

The next time the memory bank is overwritten after one round of writing, 512 bits {higher-order 256 bits: reserved (indefinite value); lower-order 256 bits: 256'h0} are written as a footer.

After that, 512 bits {higher-order 256 bits: reserved (indefinite value); lower-order 256 bits: 256'h1} and 512 bits {higher-order 256 bits: reserved (indefinite value); lower-order 256 bits: 256'h0} are alternately written each time overwriting is done.

Therefore, by checking the footer value as the video data footer, it is possible to prevent the data from being inadvertently used before overwriting.

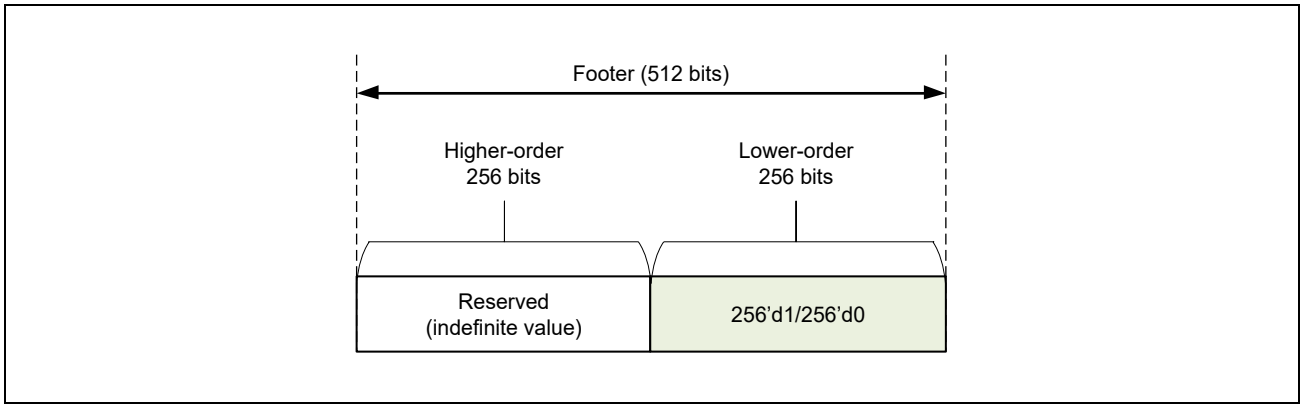

Figure 9.2-30 Statistics Data Footer Structure

9.2.4.3.4 Select Channel MIPI Data Input

This function selects signals for input to the image converter as link data for the given channels, link data for the paired channel, or pattern generator data. Selection of the inputs as link data for the given channel or link data for the paired channel can be set by using the CRUnCTRL.VINSEL registers. However, as shown below, paired channels are only selectable for CRU1 and the given channels are only selectable for CRU0. If you want to select the pattern generator data input, set this by using the ICnTICTRL1.TIEN register (for details of pattern generator data selection, see **9.2.4.3.5 Pattern Generator (for Debugging)**).

Here, examples of using the input of MIPI data from the paired channels are shown in **Figure 9.2-31**. This function is used in the following cases that cannot be handled by only one image converter.

- Since a single channel only supports up to four VCs, when five or more VCs are required
- When demosaicing and statistics are to be applied to two raw data sets because only one demosaicing and one statistics section are present.

The examples shown in the figure are for when 8 VCs are to be handled.

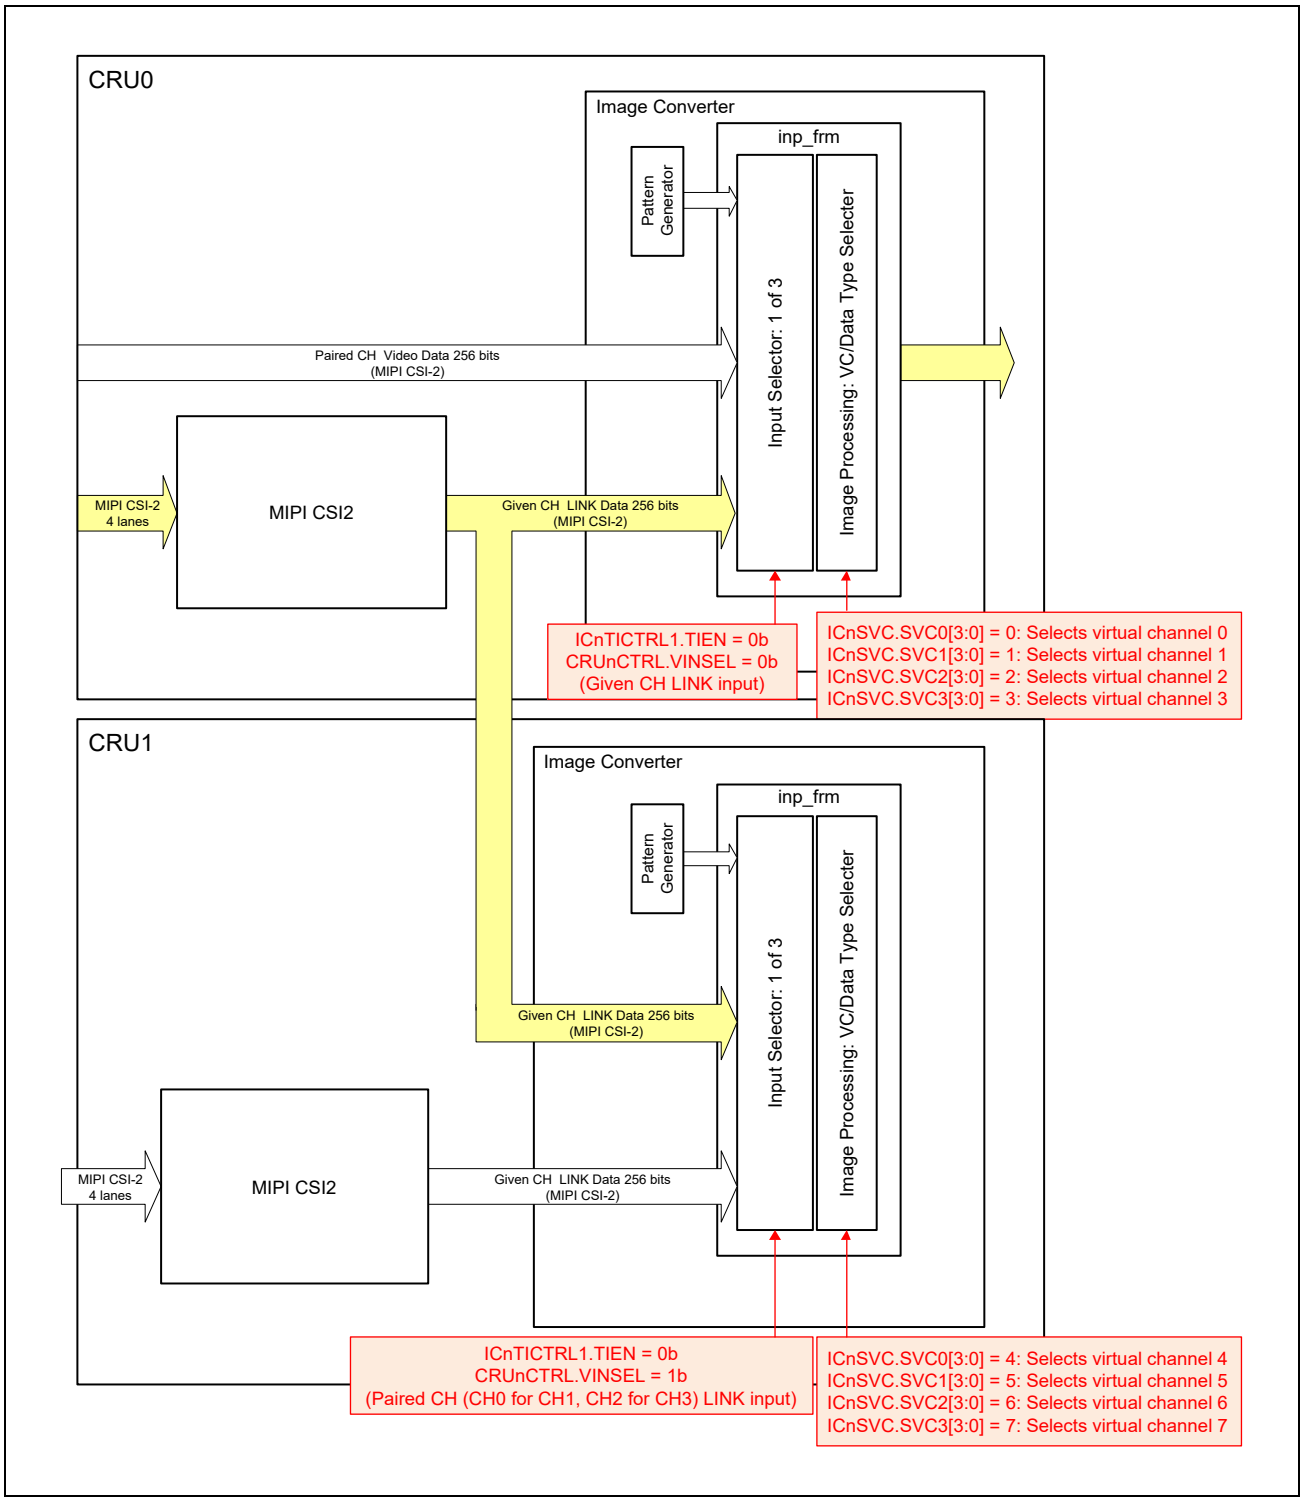

Figure 9.2-31 Example when 8 VCs are to be Handled

9.2.4.3.5 Pattern Generator (for Debugging)

A test image (YUV422 only) can be generated for use as an image converter input by setting the following registers. This function is used for debugging to identify where the problem is originated (in the sensor or in the internal settings). Two modes are implemented for this pattern (monochrome or pattern). This pattern generator operates as VC0. You can select the route of image processing/non-image processing. See **9.2.5 Operation** for the setting procedure.

TIEN = ICnTICTRL1.TIEN: Enables generation of a test image pattern.
TIMODE = ICnTICTRL1.TIMODE: Selects a test image generation pattern (monochrome or pattern).

TIROTSEL = ICnTICTRL1.TIROTSEL: Selects the route of image processing/non-image processing.

TIPTNY1[3:0] = ICnTICTRL1.TIPTNY1[3:0]: Bit settings for the pixel (Y) counter
TIPTNU1[3:0] =ICnTICTRL1.TIPTNU1[3:0]: Bit settings for the pixel (U) counter
TIPTNV1[3:0] = ICnTICTRL1.TIPTNV1[3:0]: Bit settings for the pixel (V) counter

TIRATE[4:0] = ICnTICTRL1.TIRATE[4:0]: Specify a test image generation rate.

TIPTNY2[7:0] = ICnTICTRL2.TIPTNY2[7:0]: Specify V for the entire-screen same-color test image pattern.
TIPTNU2[7:0] = ICnTICTRL2.TIPTNU2[7:0]: Specify U for the entire-screen same-color test image pattern.
TIPTNV2[7:0] = ICnTICTRL2.TIPTNV2[7:0]: Specify Y for the entire-screen same-color test image pattern.

TIPPL[11:0] = ICnTISIZE1.TIPPL[11:0]: Number of valid pixels per line in the test image pattern
TIN[11:0] = ICnTISIZE2.TIN[11:0]: Valid period (number of lines) per frame in the test image pattern
TIM[11:0] = ICnTISIZE2.TIM[11:0]: Invalid period (number of lines) per frame in the test image pattern

(1) Image and Settings (Common to Monochrome and Pattern Generation)

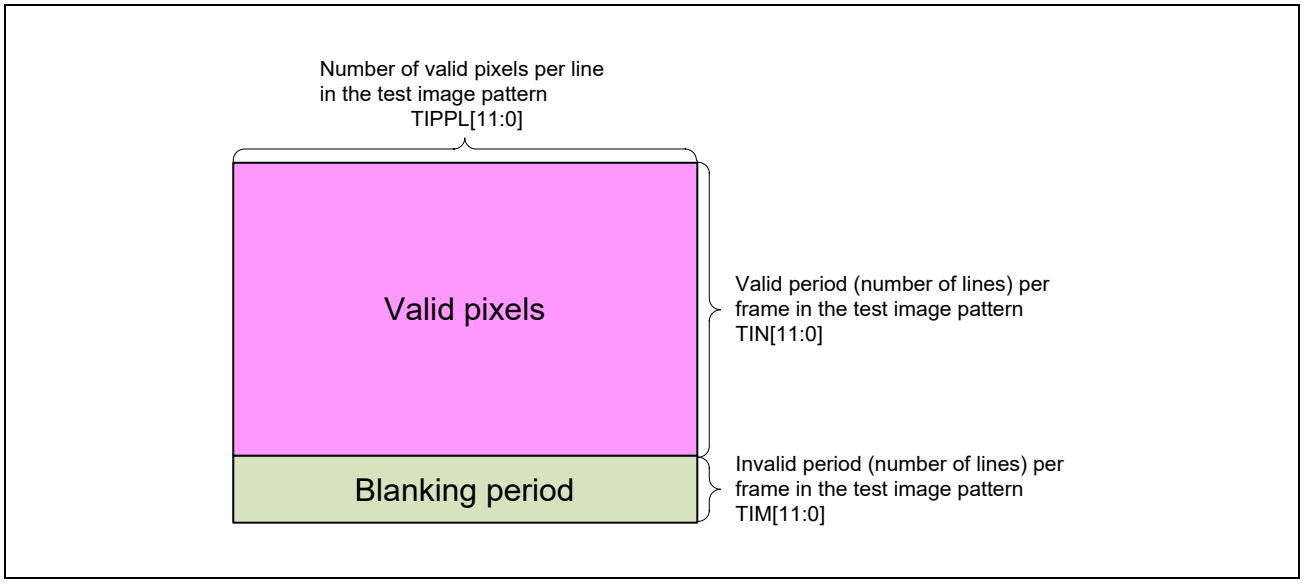

Figure 9.2-32 Image and Settings

(2) Timing Generation and Settings (Common to Monochrome and Pattern Generation)

(Bits TIRATE[4:0] allow the test image generation rate to be set in the range between 3.291 Gbps and 8.960 Gbps with VCLK at 630 MHz.)

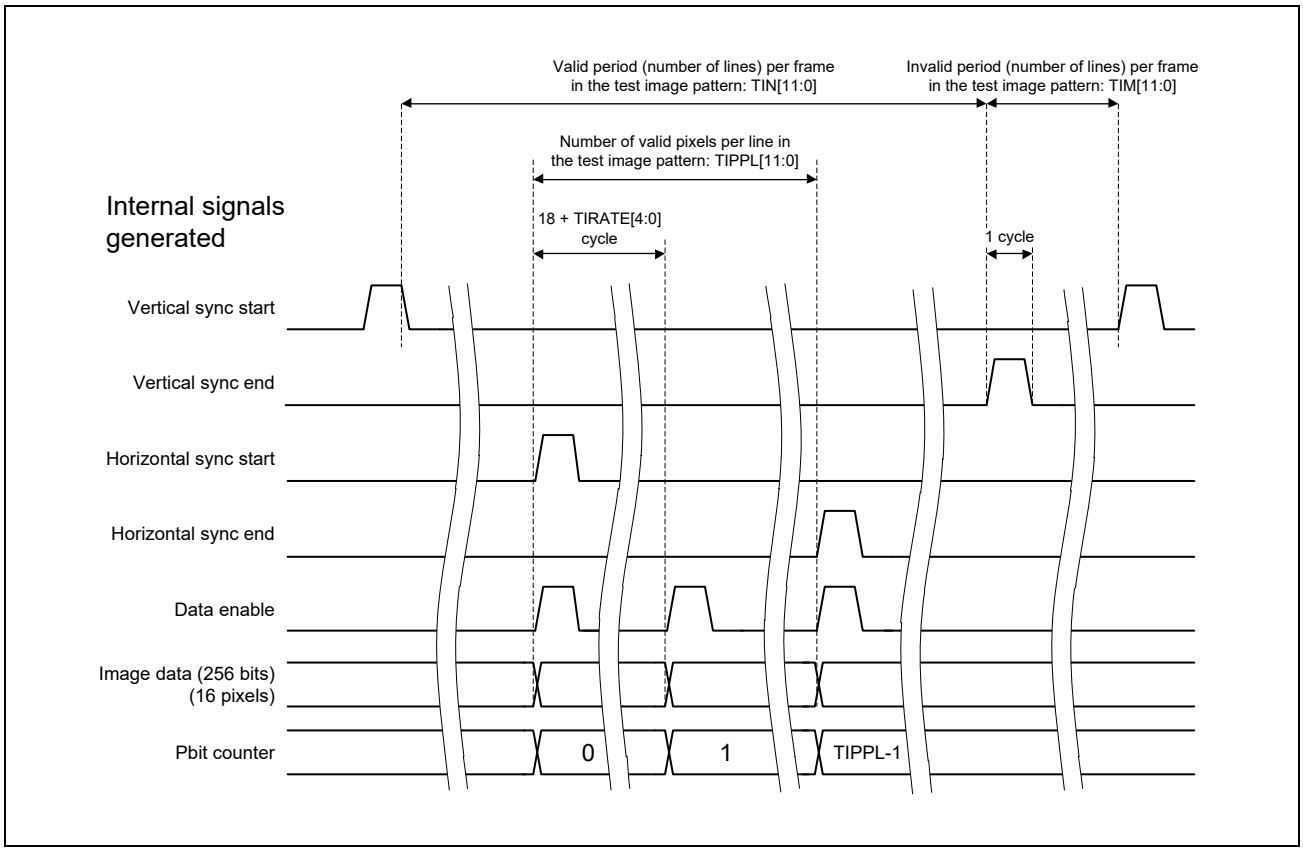

Figure 9.2-33 Timing Generation and Settings

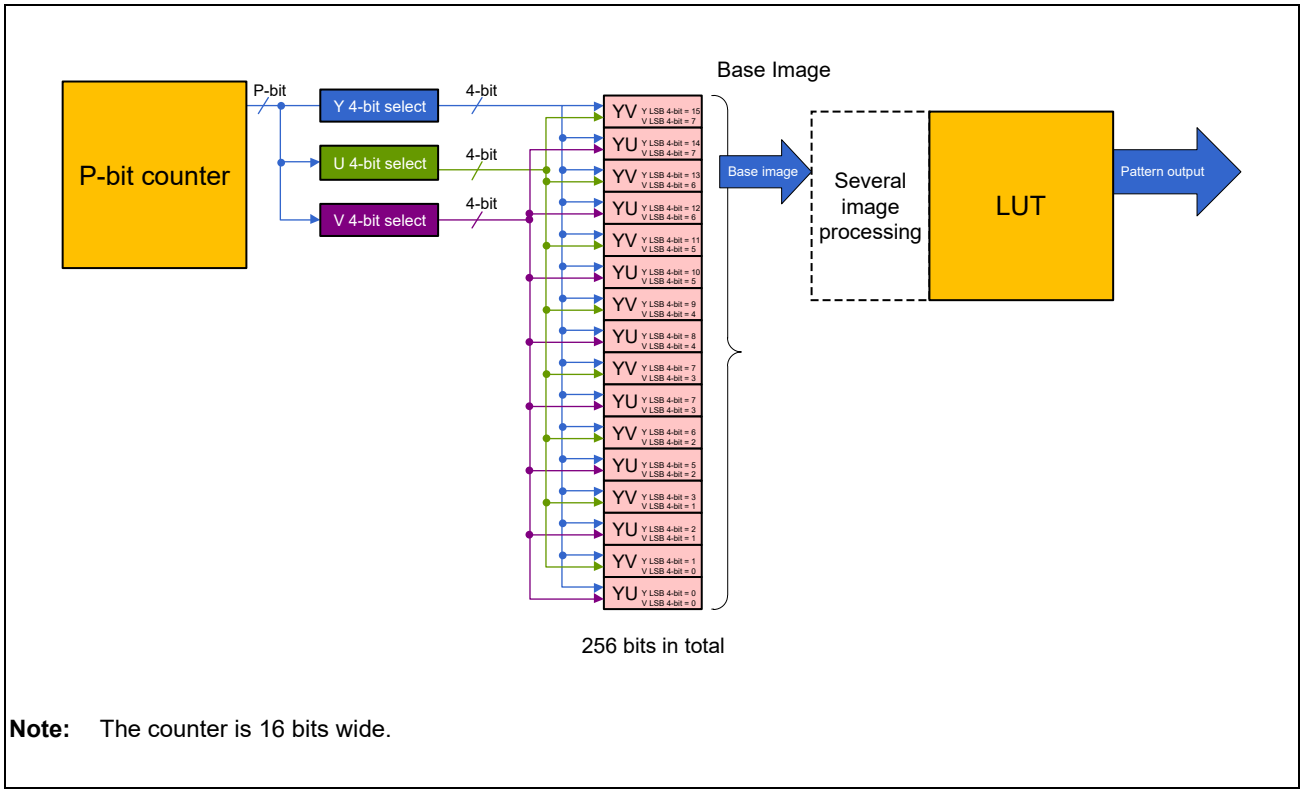
(3) Data Generation Circuit (in the Case of Pattern Generation)

Image YUV422 8-bit data of 256 bits (16 pixels) is generated as follows (other formats cannot be generated). The 16-bit Pbit counter is incremented in 18 + TIRATE[4:0] (cycles at 630 MHz). The bits of this Pbit counter are selected by the TIPTNV1[3:0], TIPTNU1[3:0], and TIPTNY1[3:0] bits, and then they are packed and sent as follows:



Note: The counter is 16 bits wide.

Figure 9.2-34 Data Generation Circuit (in the Case of Pattern Generation)

(4) Data Generation Circuit (in the Case of Monochrome Generation)

Image YUV422 8-bit data of 256 bits (16 pixels) is generated in monochrome as follows (other formats cannot be generated). The values set by the TIPTNV2[7:0], TIPTNU2[7:0], and TIPTNY2[7:0] bits are packed and sent as follows:

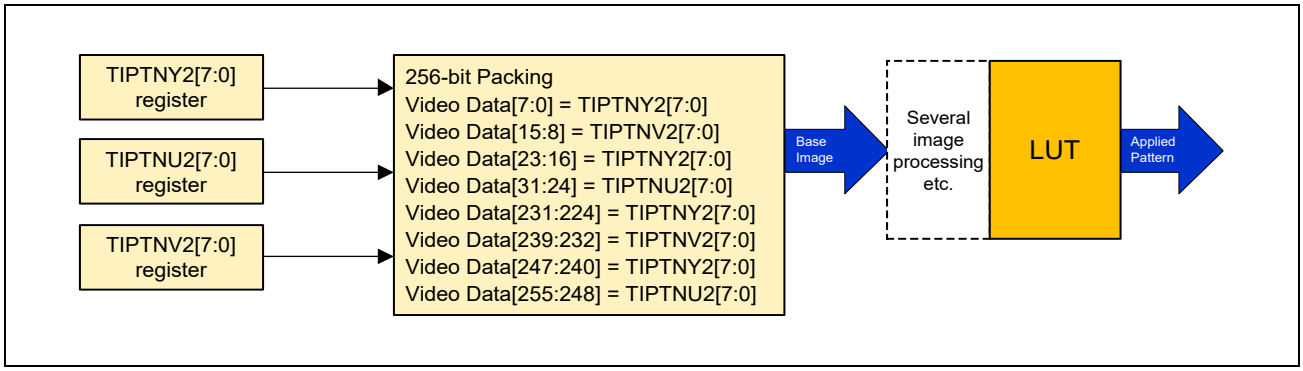


Figure 9.2-35 Data Generation Circuit (in the Case of Monochrome Generation)

(5) Generated Image Data Example (in the Case of Pattern Generation)

VGA (640 × 480): TIEN = 1b, TIMODE = 0b, TIPTNY1[3:0] = 0000b, TIPTNU1[3:0] = 0100b, TIPTNV1[3:0] = 1000b (Offset binary: ICnIPMC_C0/1/2/3.IBINSEL = 0b, ICnDMR.OBINSEL = 0b)

9.2.4.3.6 VC/Data Type Selector (for Image Processing)

Virtual channels from VC0 to VC15 are supported for video input data input from the MIPI CSI2 block. On the other hand, the number of channels which can be handed in image processing is up to four. This block handles assignment of the selected virtual channels (SVCs).

Only one data type can be handled by each SVC and the data types are selected in the ICnIPMC_C0 to 3.INF[5:0] registers.

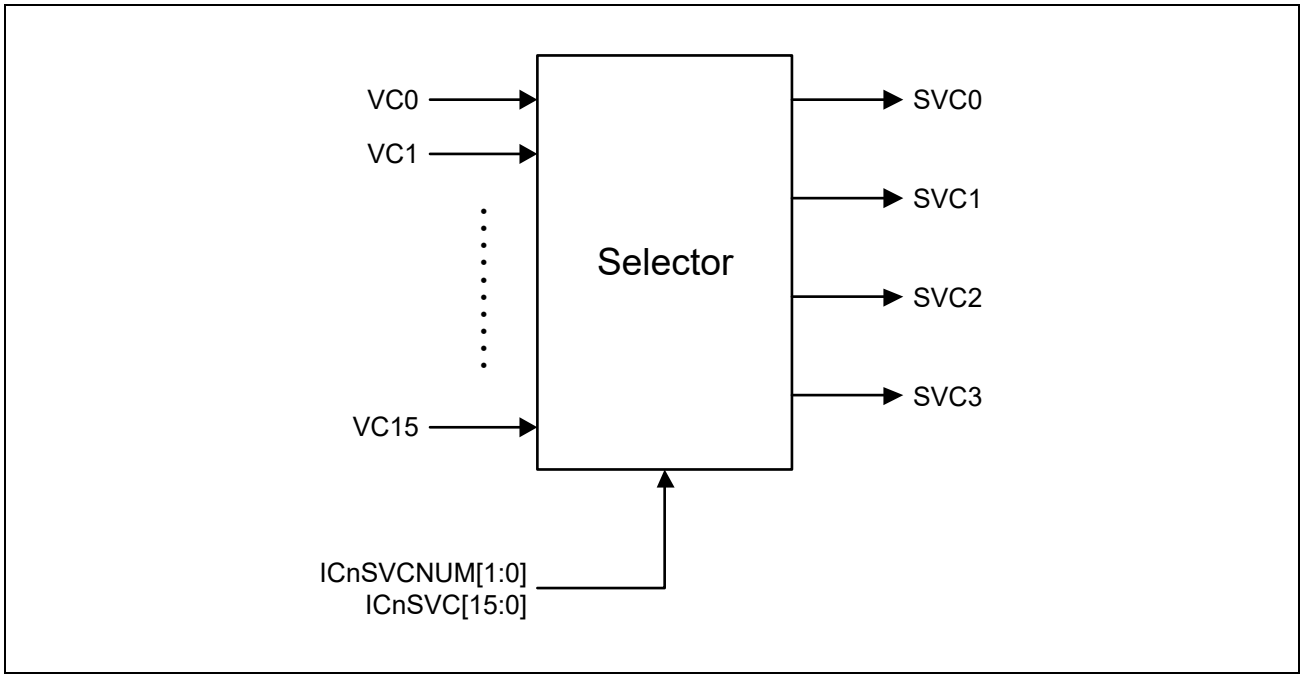

Figure 9.2-38 VC Selector Image

9.2.4.3.7 8-bit Expansion

(1) RGB444/RGB555/RGB565/RGB666 to RGB888

This block handles internal processing of RGB with 8 bits for each color. Inputs with fewer color bits are expanded to 8 bits. The conversion of inputs in the RGB444 and RGB555 and in the RGB565 and RGB666 formats to RGB888 is shown in **Table 9.2-20** and **Table 9.2-21**, respectively.

Table 9.2-20 RGB444/RGB555 to RGB888 Conversion

RGB444	RGB888
R[3:0]	{R[3:0],R[3:0]}

(2) RAW6/7 to RAW8

This block handles internal processing of RAW with 8 bits for each color. Inputs with fewer color bits are expanded to 8 bits. The conversion of inputs in the RAW6 and RAW7 formats to RGB888 is shown in **Table 9.2-22**.

Table 9.2-22 RAW6/7 to RAW8 Conversion

RAW6	RAW8
RAW[5:0]	{RAW[5:0],RAW[5:4]}

RAW7	RAW8
RAW[6:0]	{RAW[6:0],RAW[6]}

9.2.4.3.8 Image Clipping

Ranges for the clipping of input images are controlled by register settings. Specifically, the ranges of clipping for each SVC are set through the following register settings.

(Horizontal direction)

- Image clipping start pixel registers: ICnSPPrC_C0~3.SPPrC[12:0]
- Image clipping end pixel registers: ICnEPPrC_C0~3.EPPrC[12:0]

(Vertical direction)

- Image clipping start line registers: ICnSLPrC_C0~3.SLPrC[12:0]
- Image clipping end line registers: ICnELPrC_C0~3.ELPrC[12:0]

While the part of the image with the size after clipping (the gray part below) is being processed, the value of register ICnMS.AV0/1/2/3 = 1b. For the rest of the image, ICnMS.AV0/1/2/3 = 0b. When subsampling is done, operation proceeds in the same way for the subsampled images.

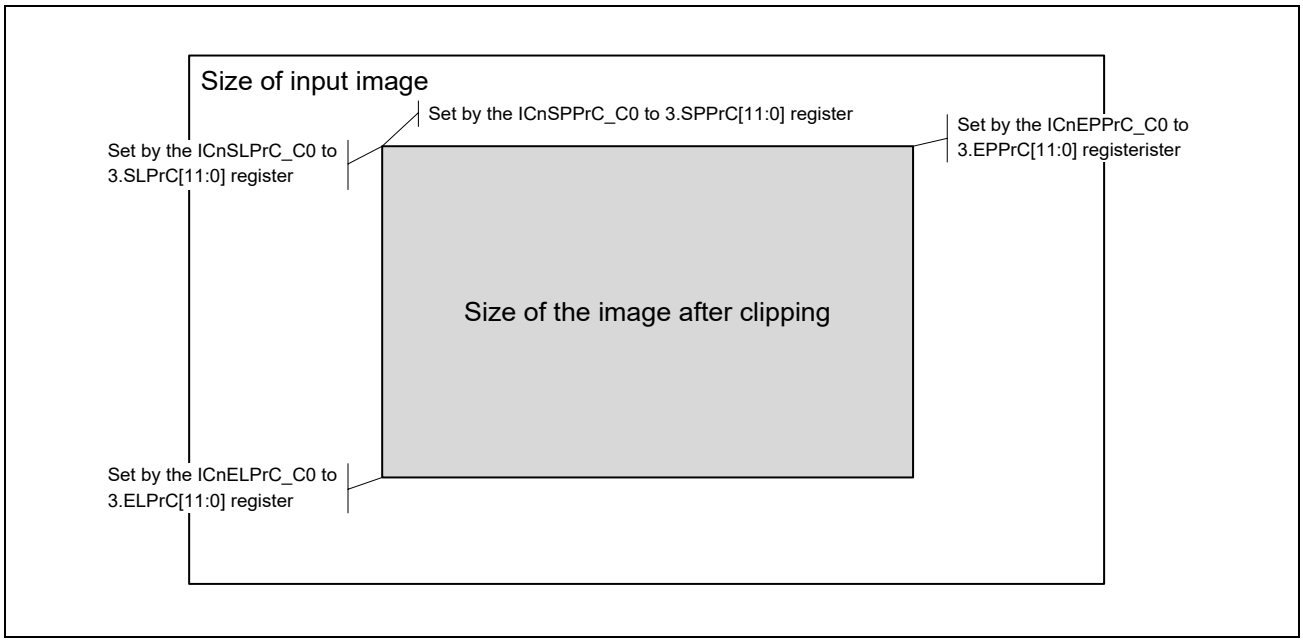

Figure 9.2-39 Image of Image Clipping

9.2.4.3.9 Frame Subsampling

Image frames are subsampled with the use of the registers which set input images. The settings of the following bit fields select the number of frames to be transferred in each round of transfer.

- Frame subsampling control register: ICnDEC.FRMDEC[3:0] (common to all SVCs)

Operation when the setting of ICnDEC.FRMDEC[3:0] = 2h is as follows:

Images are transferred in units of (the above register value + 1) frames. The state of ICnMS.CA0/1/2/3 is 1b when an image which is not to be eliminated by subsampling is being processed, as shown below.

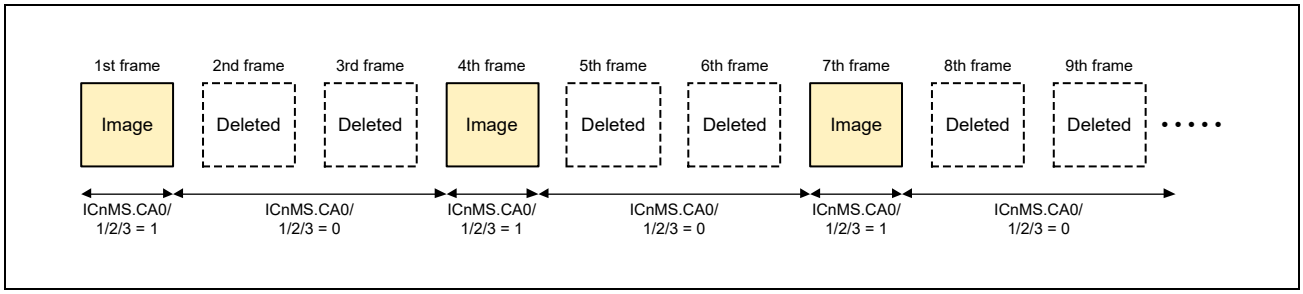

Figure 9.2-40 Frame Subsampling when ICnDEC.FRMDEC[3:0] = 2h

9.2.4.3.10 Data Arrangers 1 and 2

When image data are input and output, UV values expressed in negative form in YUV (YCbCr) data are converted. The data arranger 1 input side and data arranger 2 output side settings can be made by using the ICnDTVP.IBINSEL and ICnDMR.OBINSEL registers, respectively.

Settings for data arranger 1 must suit the specifications of the sensor. Data arranger 1 supports 8 or 10 bits depending on the number of bits of input data. Settings for data arranger 2 must suit the specifications of the destination for output. Data arranger 2 supports 8 bits depending on the output data. YUV of MIPI CSI-2 is usually used in offset binary. However, this depends on the sensor, and it may be output as two's complements. **Table 9.2-23** shows an example of processing when the input is 8 bits. Data arranger 1 also has 10-bit input, and when 10-bit input is used, it can be converted to 10-bit offset binary/2's complement as well as 8-bit.

Table 9.2-23 Input Formats and Corresponding Forms of Image Processing (at 8-bit input)

UV Value (Hex)	Offset Binary (Dec) Register Settings: Data Arranger 1: ICnDTVP.IBINSEL = 0b Data Arranger 2: ICnDMR. OBINSEL =0b	Two's Complements (Dec) Register Settings: Data Arranger 1: ICnDTVP.IBINSEL = 1b Data Arranger 2: ICnDMR. OBINSEL = 1b
FFh	127	−1
FEh	126	−2
…	…	…
81h	1	−127
80h	0	−128
7Fh	−1	127
…	…	…
01h	−127	1
00h	−128	0

9.2.4.3.11 Data Clipping

Data clipping is performed on the YUV (YCbCr) format. To make input data for RGB conversion compliant with the ITU-R BT.601 standard, whether or not to clip values less than or equal to 16 and greater than or equal to 240 in 8-bit encoding (or less than or equal to 64 and greater than or equal to 960 in 10-bit encoding) is specified. This setting is made by using the ICnDTVP.CLP[1:0] register.

9.2.4.3.12 Demosaicing

This function is only valid on input data of the RAW type. Its operation is on the assumption that the RAW data are Bayer data and generates pixel data that are interpolated from the RAW data.

The demosaicing function uses a bilinear method. Of the peripheral 3 × 3 pixels at the position to be calculated, 2 or 4 pixels are used for interpolation processing. The interpolation formula is given below.

The following describes the method of calculating the RGB components (R22, Gb22/Gr22, B22) of the pixels at the center position.

In the case of RAW10/12/14/16/20, the eight higher-order bits are used for the calculation.

(1) RAW20 to RAW16

For a RAW20 input, the higher-order bits of RAW20 are extracted and the lower-order bits are truncated in preprocessing for demosaicing and statistics.

RAW20 → RAW8 (RAW[19:4])

(2) Calculating the Gb22 data portion

Figure 9.2-41 shows the method of interpolation calculation for pixel data (R/G/B) of Gb22.

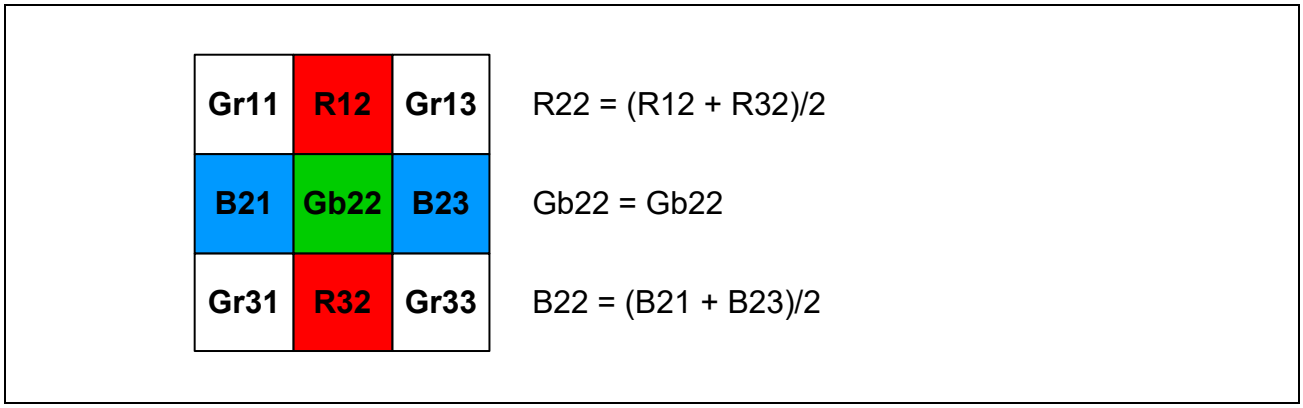

Figure 9.2-41 Calculation of the Gb22 Data Portion

(3) Calculating the B22 data portion

Figure 9.2-42 shows the method of interpolation calculation for pixel data (R/G/B) of B22.

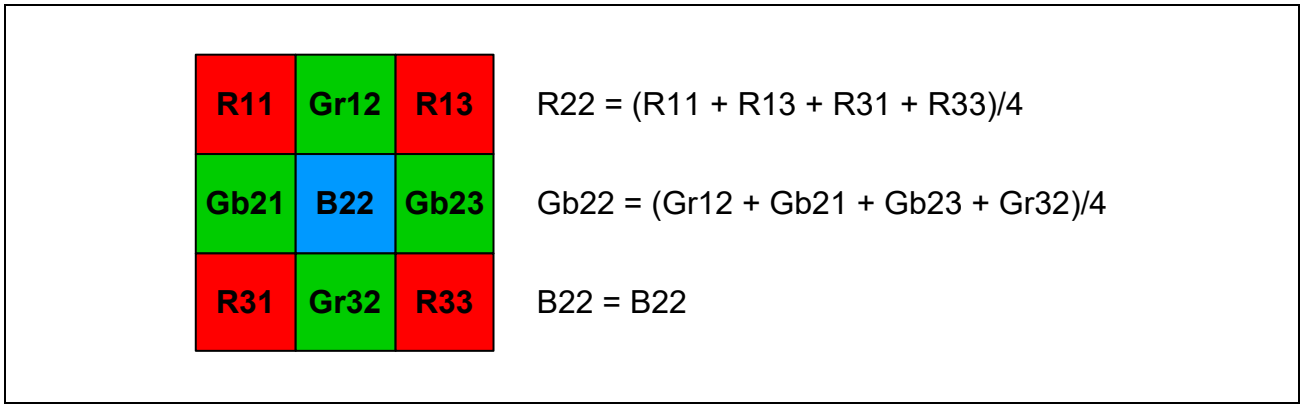

Figure 9.2-42 Calculation of the B22 Data Portion

(4) Calculating the R22 data portion

Figure 9.2-43 shows the method of interpolation calculation for pixel data (R/G/B) of R22.

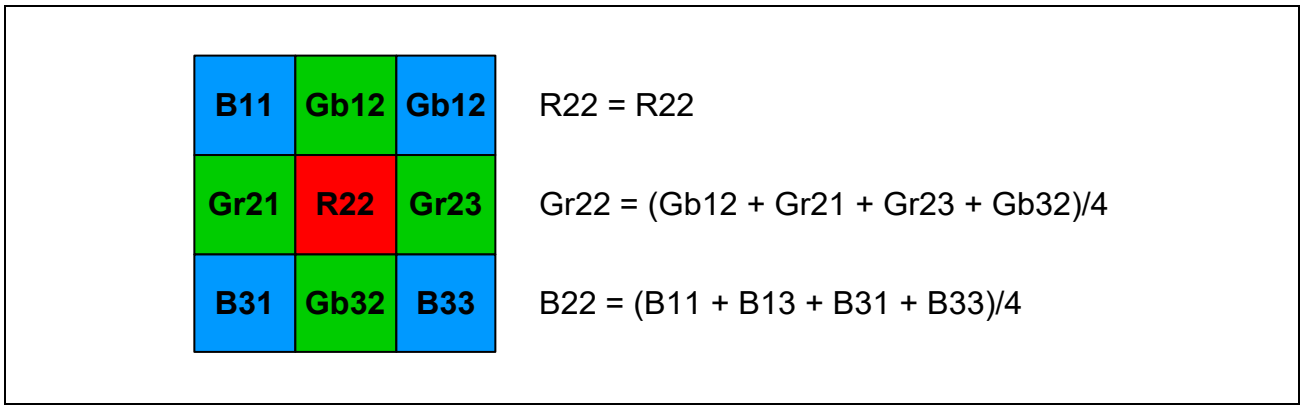

Figure 9.2-43 Calculation of the R22 Data Portion

(5) Calculating the Gr22 data portion

Figure 9.2-44 shows the method of interpolation calculation for pixel data (R/G/B) of G22.

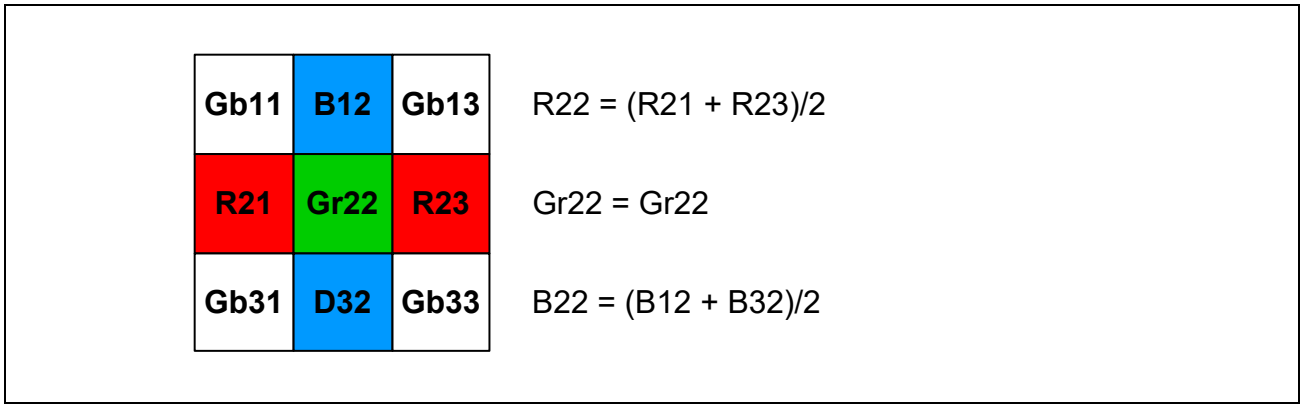

Figure 9.2-44 Calculation of the Gr22 Data Portion

9.2.4.3.13 Linear Matrix

Linear matrix processing involves calculation of the matrix of R', G', and B' (8 bits per color) by using the registers listed below to set the following coefficients for R, G, and B (8 bits per color) after demosaicing as the previous stage.

Gof = Register ICnLMXOF.GOF[7:0]
Rof = Register ICnLMXOF.ROF[7:0]
Bof= Register ICnLMXOF.BOF[7:0]

Rr = Register ICnLMXRC1.RR[12:0]
Rb = Register ICnLMXRC2.RB[12:0]
Rg = Register ICnLMXRC2.RG[12:0]

Gr = Register ICnLMXGC1.GR[12:0]
Gb = Register ICnLMXGC2.GB[12:0]
Gg = Register ICnLMXGC2.GG[12:0]

Br = Register ICnLMXBC1.BR[12:0]
Bb = Register ICnLMXBC2.BB[12:0]
Bg = Register ICnLMXBC2.BG[12:0]

$$R' = \frac{Rr \cdot (R + Rof)^{*1} + Rg \cdot (G + Gof)^{*1} + Rb \cdot (B + Bof)^{*1}}{1024}$$

$$G' = \frac{Gr \cdot (R + Rof)^{*1} + Gg \cdot (G + Gof)^{*1} + Gb \cdot (B + Bof)^{*1}}{1024}$$

$$B' = \frac{Br \cdot (R + Rof)^{*1} + Bg \cdot (G + Gof)^{*1} + Bb \cdot (B + Bof)^{*1}}{1024}$$

Note 1. When the result of addition is a negative value, it is converted to 0.

9.2.4.3.14 Color Space Conversion

(1) RGB to YCbCr

RGB (8/10 bits) data to which image clipping, frame subsampling, or demosaicing has been applied are expanded to 12 bits and then converted to 10-bit YCbCr. Calculations equivalent to those specified in ITU-R BT.601 or ITU-R BT.709 are performed by setting coefficients through registers.

The calculations proceed according to the coefficients and expressions set in the following registers.

YCLRP = Register ICnYCCR1.YCLRP[12:0]
YCLBP = Register ICnYCCR2.YCLBP[12:0]
YCLGP = Register ICnYCCR2.YCLGP[12:0]
YCLSFT = Register ICnYCCR3.YCLSFT[4:0]
YCLAP = Register ICnYCCR3.YCLAP[11:0]

CBCLRP = Register ICnCBCCR1.CBCLRP[12:0]
CBCLBP = Register ICnCBCCR2.CBCLBP[12:0]
CBCLGP = Register ICnCBCCR2.CBCLGP[12:0]
CBCLSFT = Register ICnCBCCR3.CBCLSFT[4:0]
CBCLAP = Register ICnCBCCR3.CBCLAP[11:0]

CRCLRP = Register ICnCRCCR1.CRCLRP[12:0]
CRCLBP = Register ICnCRCCR2.CRCLBP[12:0]
CRCLGP = Register ICnCRCCR2.CRCLGP[12:0]
CRCLSFT = Register ICnCRCCR3.CRCLSFT[4:0]
CRCLAP = Register ICnCRCCR3.CRCLAP[11:0]

$$Y = \left(\frac{YCLRP \times R + YCLGP \times G + YCLBP \times B}{2^{YCLSFT}}\right) + YCLAP$$

$$Cb = \left(\frac{CBCLRP \times R + CBCLGP \times G + CBCLBP \times B}{2^{CBCLSFT}}\right) + CBCLAP$$

$$Cr = \left(\frac{CRCLRP \times R + CRCLGP \times G + CRCLBP \times B}{2^{CRCLSFT}}\right) + CRCLAP$$

For ITU-R BT.601 (8 bits): (Same as the default values)

$Y = 0.257 \times R + 0.504 \times G + 0.098 \times B + 16$
$Cb = -0.148 \times R - 0.291 \times G + 0.439 \times B + 128$
$Cr = 0.439 \times R - 0.368 \times G - 0.071 \times B + 128$

[Register settings]

YCLRP = 0107h
YCLBP = 0064h
YCLGP = 0204h
YCLSFT = 0Ah
YCLAP = 100h

CBCLRP = 1F68h
CBCLBP = 01C2h
CBCLGP = 1ED6h

CBCLSFT = 0Ah
CBCLAP = 800h

CRCLRP = 01C2h
CRCLBP = 1FB7h
CRCLGP = 1E87h
CRCLSFT = 0Ah
CRCLAP = 800h

(2) YCbCr to RGB

YCbCr (8/10 bits) data which have been arranged and clipped are expanded to 12 bits (by appending zeros as the lower-order bits) and then converted to 10-bit RGB. Calculations equivalent to those specified in ITU-R BT.601 or ITU-R BT.709 are performed by setting coefficients through registers.

The calculations proceed according to the coefficients and expressions set in the following registers.

YMUL = Register ICnCSCC1.YMUL[13:0]
YSUB = RegisterICnCSCC2.YSUB[11:0]
RCRMUL = Register ICnCSCC2.CSUB[11:0]
GCRMUL = Register ICnCSCC3.RCRMUL[13:0]
GCBMUL = Register ICnCSCC3.GCRMUL[13:0]
BCBMUL = Register ICnCSCC4.GCBMUL[13:0]
CSUB = Register ICnCSCC4.BCBMUL[13:0]

$$R = \frac{(YMUL \times (Y - YSUB)^{*1} + RCRMUL \times (Cr - CSUB)}{4096}$$

$$G = \frac{YMUL \times (Y - YSUB)^{*1} - GCRMUL \times (Cr - CSUB) - GCBMUL \times (Cb - CSUB)}{4096}$$

$$B = \frac{YMUL \times (Y - YSUB)^{*1} + BCBMUL \times (Cb - CSUB)}{4096}$$

Note 1. A negative value is rounded up to 0.

For ITU-R BT.601 (8 bits): (Same as the default values)

R = 1.164 × (Y − 16) + 1.596 × (Cr − 128)
G = 1.164 × (Y − 16) − 0.813 × (Cr − 128) − 0.392 × (Cb − 128)
B = 1.164 × (Y − 16) + 2.017 × (Cb − 128)

[Register settings]

YMUL = 129Fh
YSUB = 100h
RCRMUL = 1989h
GCRMUL = 0D02h
GCBMUL = 0645h
BCBMUL = 2045h
CSUB = 800h

9.2.4.3.15 LUT (Lookup Table)

This is used to convert 10-bit data after color space conversion (YCbCr to RGB or RGB to YCbCr) into 8-bit data.

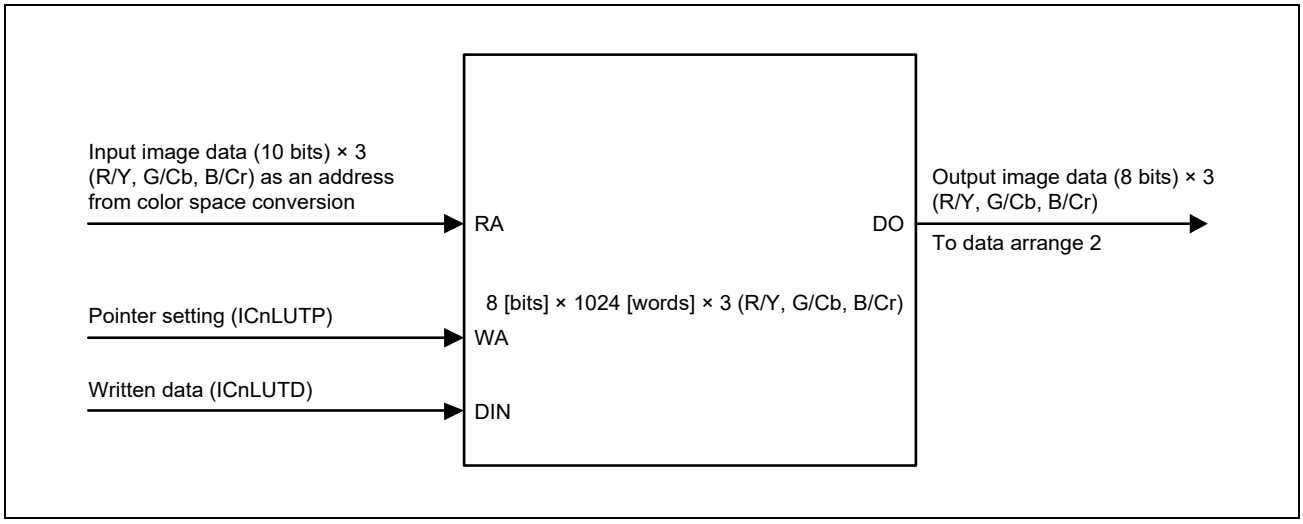

Figure 9.2-45 Lookup Table (LUT)

(1) Pointer Access

The pointer is incremented every time the ICnLUTD register is written.

The incremented value can be read from the ICnLUTP register. When the ICnLUTD register is read, the pointer is not incremented. The pointer must be set immediately before the register is read.

Follow the procedure below to access the lookup table. See **9.2.5.1 Starting Reception for the MIPI CSI-2 Input**.

The lookup table cannot be accessed from the CPU in normal mode.

(2) Usage Notes on LUT

1. Set the lookup table only after the CRU has stopped its operation.
2. Rewrite the entire lookup table before use because the initial values are not guaranteed after the power is turned on.
3. Data to be set in the lookup table must be restricted to the range that is compatible with the input bit width.

9.2.4.3.16 YC Post Processing

(1) YCbCr422 to 420

This function thins out the even-line CbCr data for the image processed in the previous stage and outputs only Y. Averaging or any other calculations are not performed. This conversion can be set by ICnDMR.YCMODE[2:0]=100b/101b/110b.

(2) Y/C Separation

This function separates the Y and C (CbCr) components for storage in two separate memory banks of the DRAM. For details, see **9.2.4.3.3 Transfer to DRAM**.

(3) Y Only

This function changes the method of storage in the DRAM. For details, see **9.2.4.3.3 Transfer to DRAM**.

9.2.4.3.17 VC/Data Type Selector (for Non-Image Processing)

When non-image processing is selected, set the target SVC and data types. When selecting the number of channels of SVC to be used, use the ICnSVCNUM.SVCNUM[1:0] register to set how many channels are used from among SVC0 to 3. Selection of SVCs with the ICnSVC.SVC0~3[3:0] registers determines the allocation of which channels are to be selected from among VC0 to VC15 for SVC0 to 3.

In data type selection, the required type can be selected with the ICnNIPDT_C0~3H/L registers and selection of several types is also possible (see **Figure 9.2-46**).

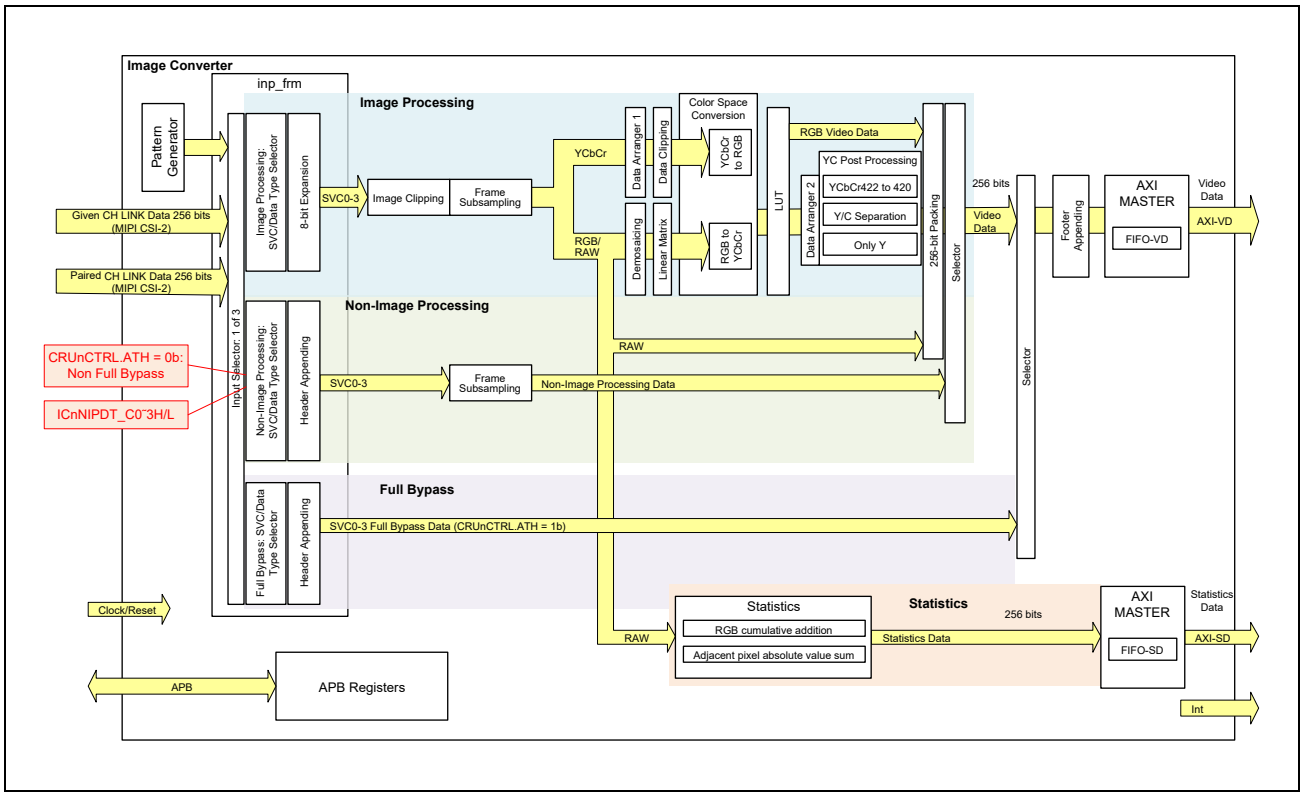

Figure 9.2-46 Example of VC Specification and Selection of Several Data Types for Non-Image Processing

9.2.4.3.18 Full Bypass function

Figure 9.2-47 shows an example of the settings for full bypass. These settings are used when you want to store images in memory without processing them within the CRU (for example, when you want to process images with the unit).

The full bypass function handles the transfer of data of the data type selected for the specified single VC from the video data bus to memory. Data are not corrected at all and are transferred in the recommended memory storage format for MIPI CSI-2.

The data types are not limited to one and several types can be selected by the settings of ICnNIPDT_C0~3H/L.

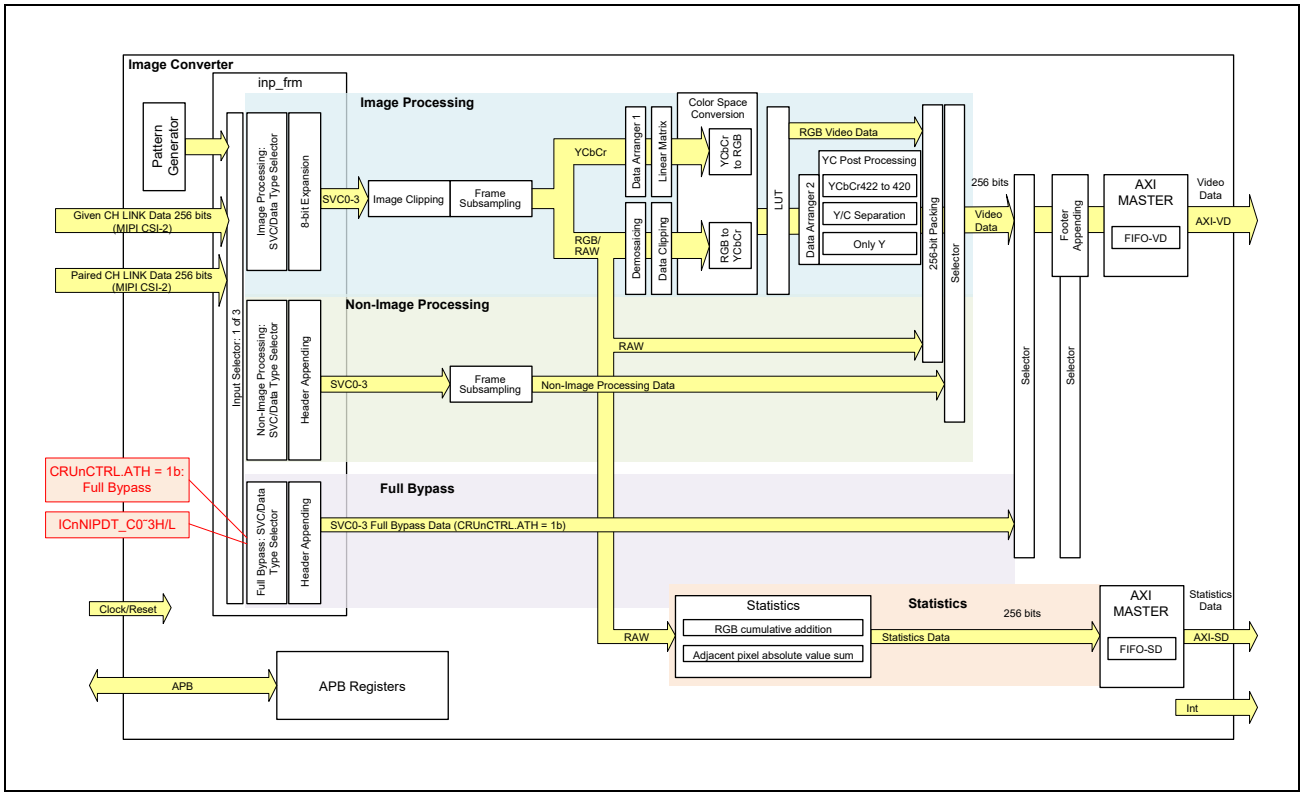

Figure 9.2-47 Example of Settings for Full Bypass

9.2.4.3.19 Statistics

This function is limited to a RAW data input through SVC0 . This module divides one image vertically and horizontally into blocks (see **Figure 9.2-48**). The statistical information within this block is transferred to memory and the image is adjusted by weighting the information of every block by the CPU and providing feedback to the external video state.

The number of block divisions can be determined by the setting of register ICnSTIC1.STUNIT[1:0].

The statistical information of each block has two types and their respective purposes are as follows.

1) In-block accumulation

Accumulation of each color component, R, G, and B, is performed within each block.

On the CPU side, the weighting is applied per block based on the information from each block, and the obtained evaluation values can be used for exposure control, etc. from the next frame.

The weighting could in general be center-weighted allocation, weighted allocation according to the subject, and so on. If the subject is judged to be dark, exposure control is applied to widen the aperture, and if the subject is judged to be bright, the aperture is made narrower.

Additionally, each color component among the R, G, and B components is adjusted and the latter stage performs operations in such a way that the B component is reduced, for example, in video which appears bluish in white regions.

This adjustment of each color includes changing the coefficients of the sensor or the linear matrix as the latter stage.

2) In-block sum of absolute difference values

Focusing on the G component within the block, the overall value for the differences from the adjacent parts of the image is extracted and accumulation is performed within the block.

On the CPU side, the weighting is applied per block based on the information from each block, and the obtained evaluation values can be used for focus adjustment, etc. from the next frame.

The weighing could in general be center-weighted allocation, weighted allocation according to the subject, and so on. If the obtained evaluation value is compared with the previous frame and if the amount continues to be reduced, the evaluation value is increased to adjust the focus, for example, by adjusting the distance between the lens and the sensor toward the opposite direction.

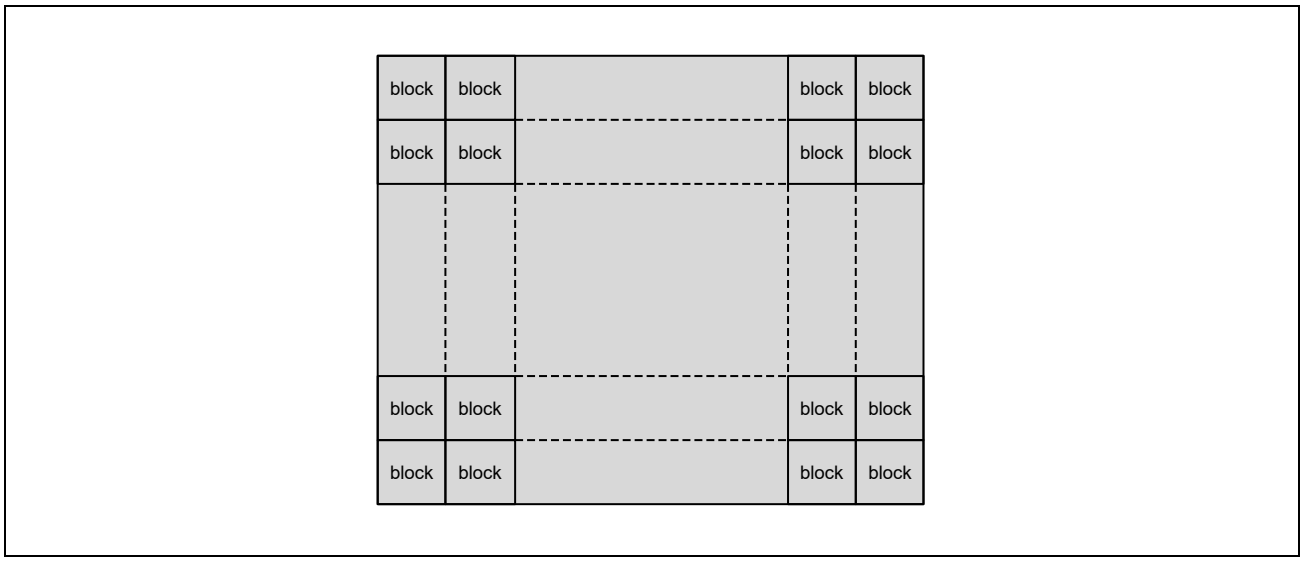

Figure 9.2-48 Image of Dividing an Image into Blocks Vertically and Horizontally

Figure 9.2-49 is a block diagram of statistics. The result of AE/AWB statistical calculations for per block is 8 bits × 3 = 3 bytes, respectively, and that of the AF statistical calculations is 1 byte for G only, so a total of 4 bytes of data are output.

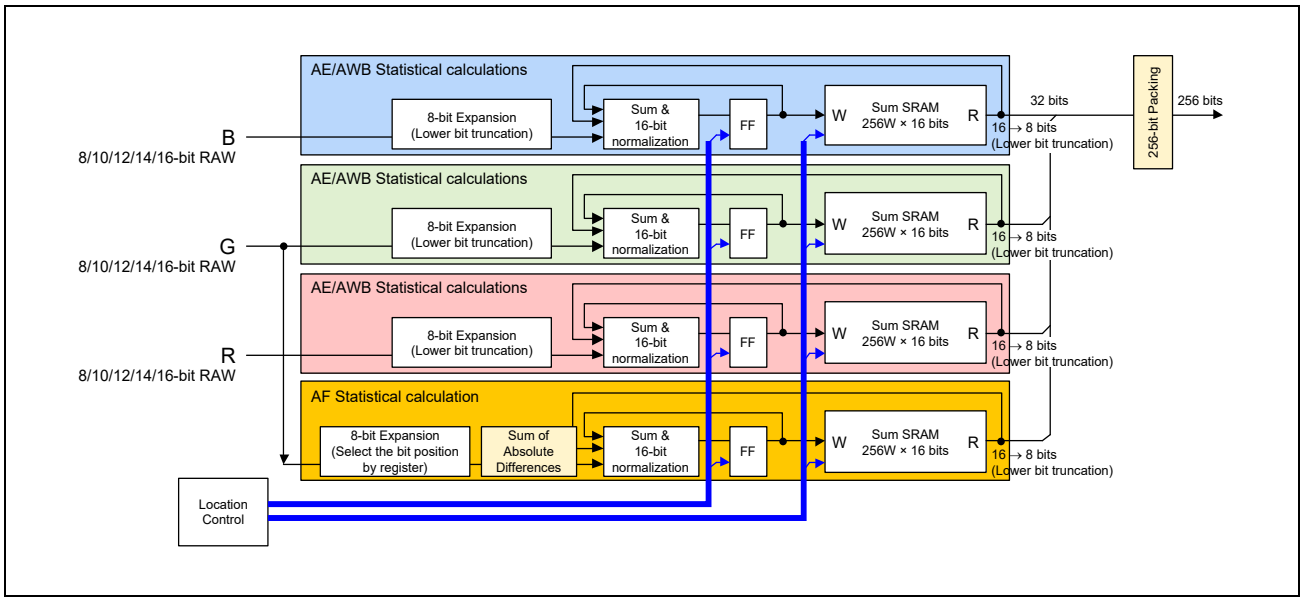

Figure 9.2-49 Statistics Block Diagram

(1) RGB cumulative addition

The STUNIT[1:0] bit fields in each of the ICnSTIC1 registers are used to select the pixel (block) sizes for statistical calculations from among four values, 16×16, 32×32, 64×64, and 128×128. The target pixels when the setting is 16×16 are described in **(a) Target pixels when the block size is selected as 16×16 (ICnSTIC1.STUNIT[1:0] = 0b)** and the methods of calculation for each block-size setting are described in **(b) Methods of calculation for each block-size setting**.

(a) Target pixels when the block size is selected as 16×16 (ICnSTIC1.STUNIT[1:0] = 0b)

G component: 128 pixels are present in the area of 16×16
R and B components: 32 pixels are present in the area of 16×16

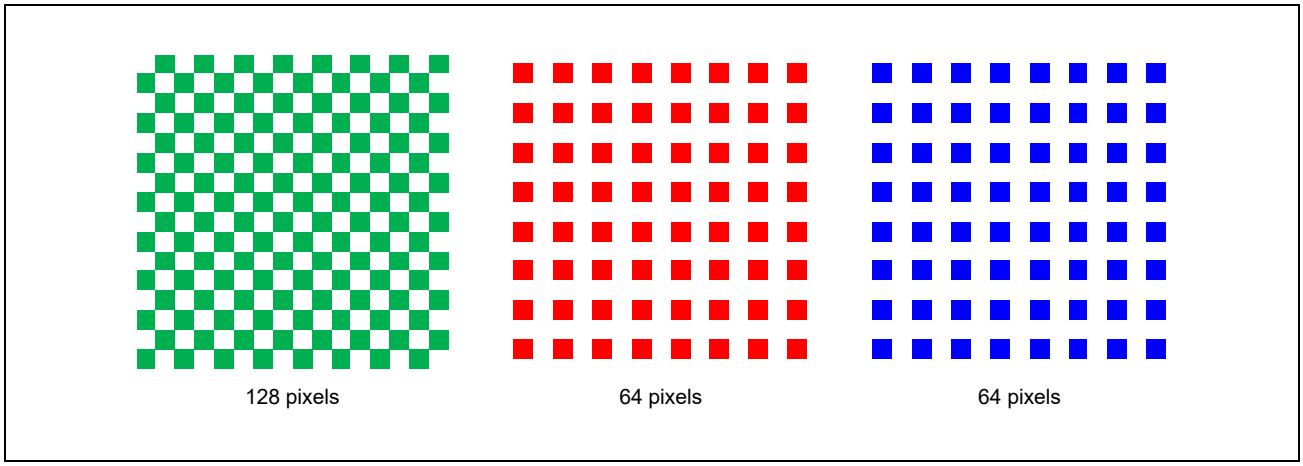

Figure 9.2-50 Target Pixels when the Block Size is Selected as 16×16

(b) Methods of calculation for each block-size setting

[G component]

- When the block size is 16×16: 8 bits × 128 pixels are accumulated: The eight higher-order bits are output after accumulation and normalization with a 16-bit precision.
- When the block size is 32×32: 8 bits × 512 pixels are accumulated: The eight higher-order bits are output after accumulation and normalization with a 16-bit precision.
- When the block size is 64×64: 8 bits × 2048 pixels are accumulated: The eight higher-order bits are output after accumulation and normalization with a 16-bit precision.
- When the block size is 128×128: 8 bits × 8192 pixels are accumulated: The eight higher-order bits are output after accumulation and normalization with a 16-bit precision.

[R and B components]

- When the block size is 16×16: 8 bits × 64 pixels are accumulated: The eight higher-order bits are output after accumulation and normalization with a 16-bit precision.
- When the block size is 32×32: 8 bits × 256 pixels are accumulated: The eight higher-order bits are output after accumulation and normalization with a 16-bit precision.
- When the block size is 64×64: 8 bits × 1024 pixels are accumulated: The eight higher-order bits are output after accumulation and normalization with a 16-bit precision.
- When the block size is 128×128: 8 bits × 4096 pixels are accumulated: The eight higher-order bits are output after accumulation and normalization with a 16-bit precision.

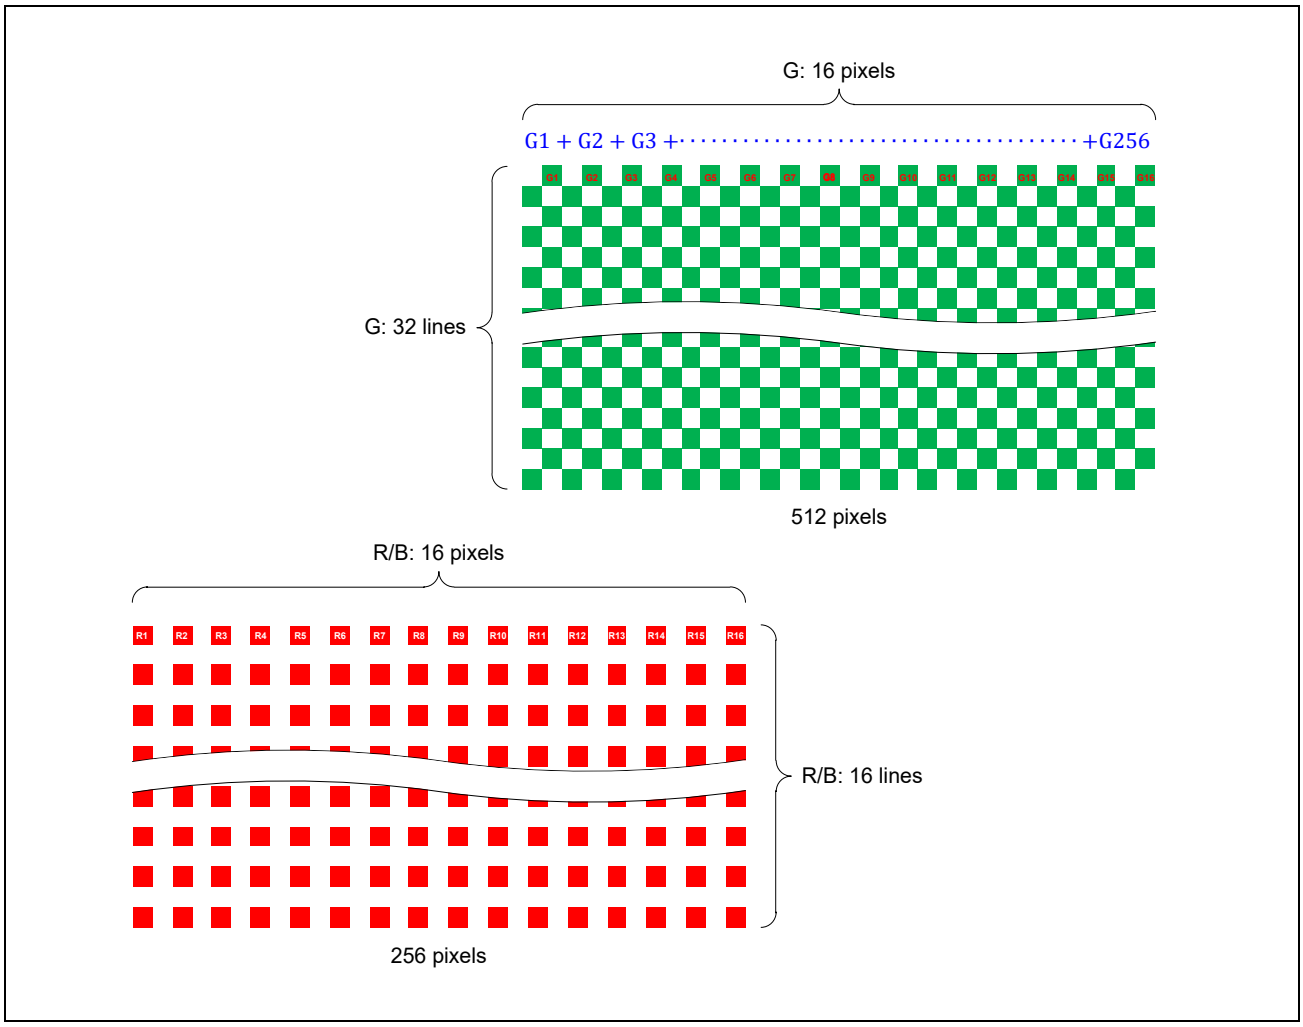

Figure 9.2-51 Illustration Diagram of Accumulation within the Block when the Block Size is 32×32

(2) Sum of absolute values for adjacent pixels

Set the area for which the sum of absolute values for adjacent pixels is taken with the use of register ICnSTIC1.STUNIT[1:0] to make the calculations in the following ways.

- **In the case of 16×16 pixel unit operations (ICnSTIC1.STUNIT[1:0] = 0b):**
  - For 8-bit data: Up to 16 bits
  - For 10- to 16-bit data: A sum-of-absolute-differences (SAD) operation is performed with the eight higher-order bits (default).
  - Addition can also be performed with the eight lower-order bits by shifting the bits by setting register ICnSTIC1.STSADPOS[3:0].

- **Methods of calculation for the setting area:**

[G component calculation]

- When the block size is 16×16: Adjacent differences × 112 are accumulated: The eight higher-order bits are output after accumulation and normalization with a 16-bit precision.
- When the block size is 32×32: Adjacent differences × 480 are accumulated: The eight higher-order bits are output after accumulation and normalization with a 16-bit precision.
- When the block size is 64×64: Adjacent differences × 1984 are accumulated: The eight higher-order bits are output after accumulation and normalization with a 16-bit precision.
- When the block size is 128×128: Adjacent differences × 8064 are accumulated: The eight higher-order bits are output after accumulation and normalization with a 16-bit precision.

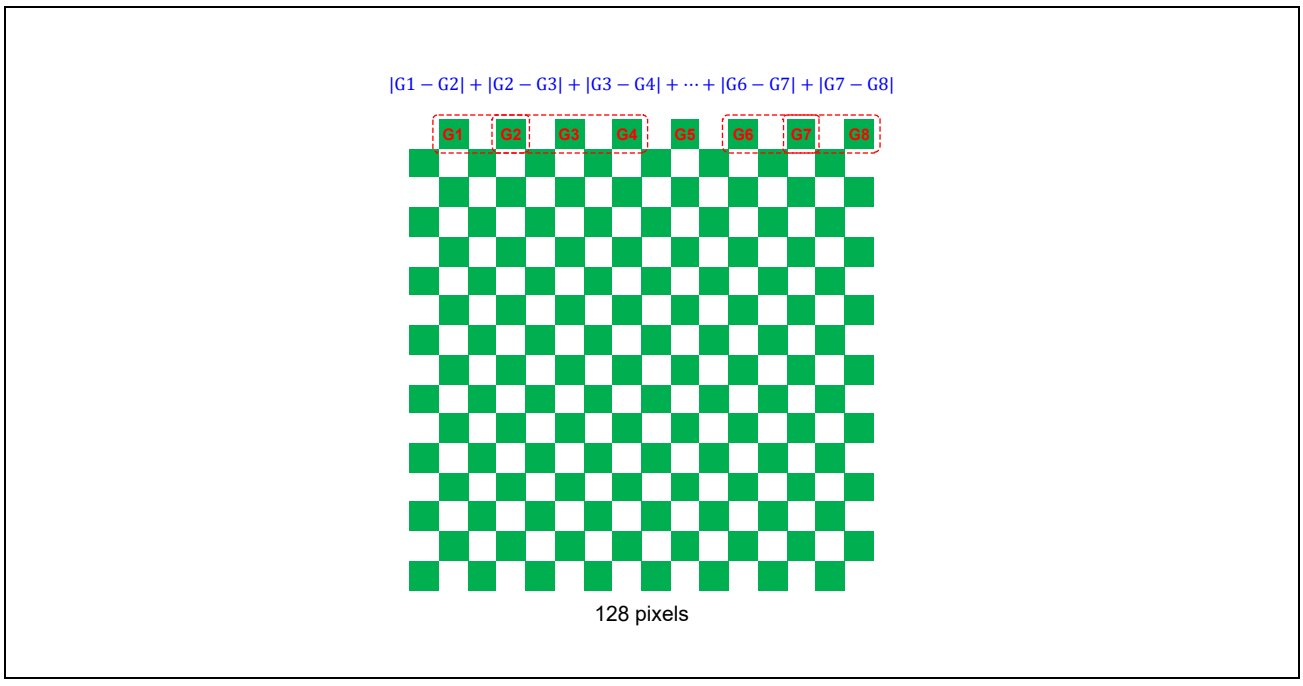

Figure 9.2-52 Illustration Diagram of Sum of Absolute Values for Adjacent Pixels when the Block Size is 16×16

(3) Statistics data generated image

The following describes the amounts of data in the operations when a 1920×1080 pixel area is set as 16×16 blocks and as 128×128 blocks for the statistics function. The numerals in the figures below represent the block numbers. In processing of the right end or bottom of the image, if the input image size is greater than the size specified as the number of blocks in the horizontal direction, that difference does not fall within the target range for arithmetic processing. This also applies in the vertical direction.

● In the case of operations for a 1920×1080 pixel area as 16×16 blocks:

As shown in **Figure 9.2-53**, the calculated values for each of the blocks are transferred sequentially. A total of 31 Kbytes of data are transferred for one frame. For the format of data for transmission, see **Table 9.2-16**.

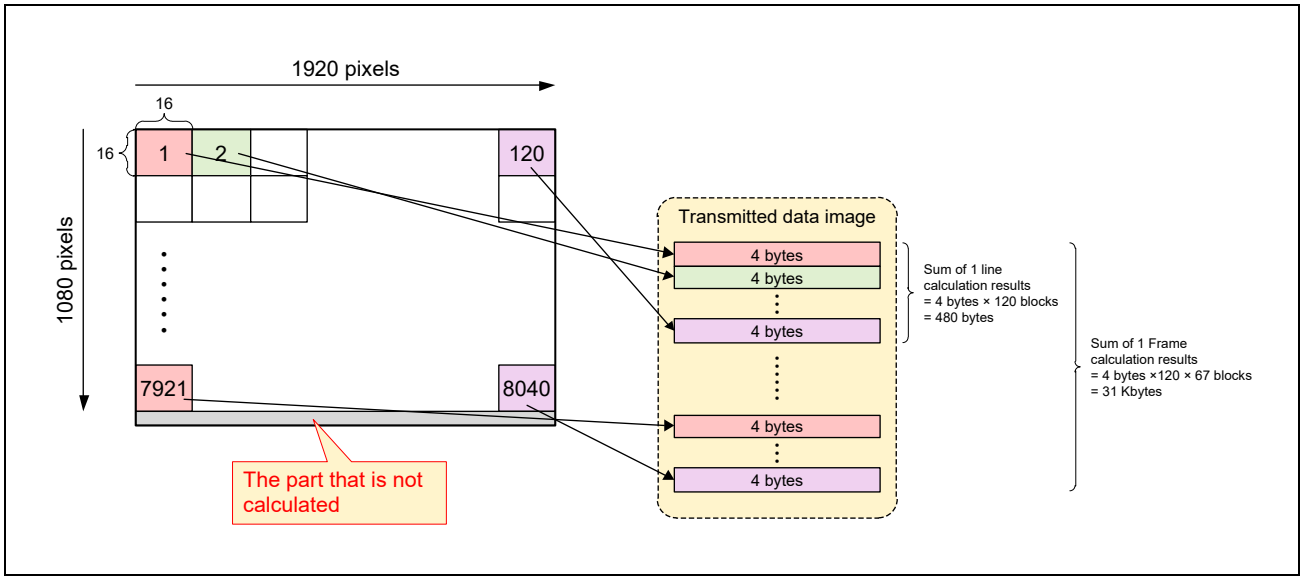

Figure 9.2-53 Illustration Diagram of the Amounts of Data in the Operations when a 1920×1080 Pixel Area is Set as 16×16 Blocks

● **In the case of operations for a 1920×1080 pixel area as 128×128 blocks:**

The calculated values for the corresponding blocks are sequentially transferred. A total of 480 bytes of data are transferred for one frame.

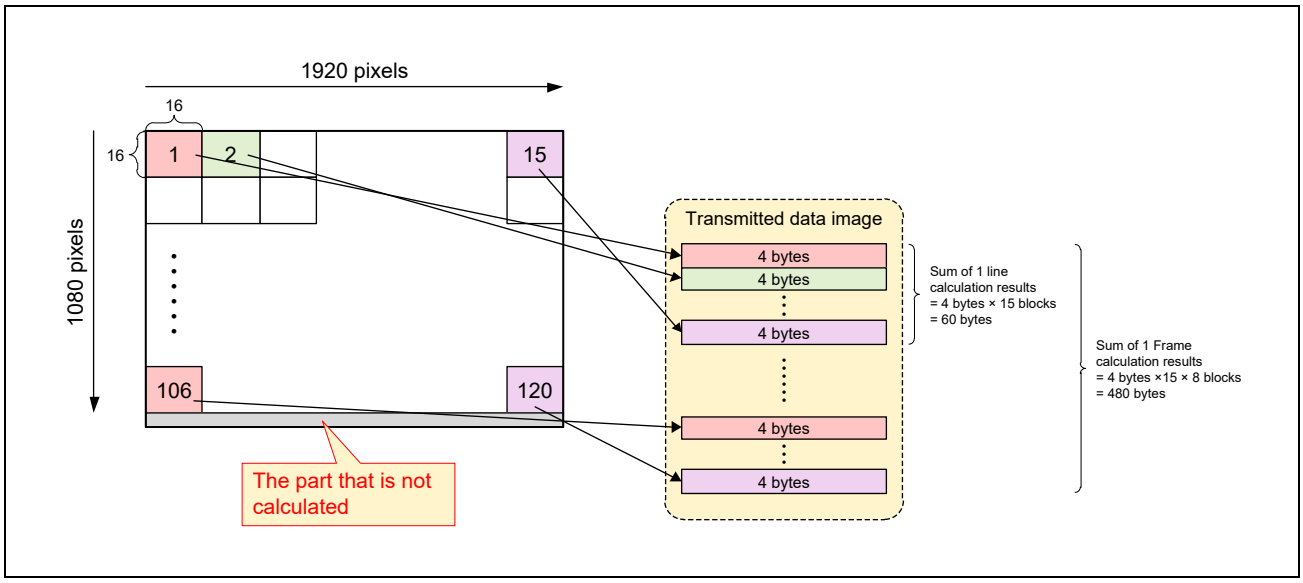

Figure 9.2-54 Illustration Diagram of the Amounts of Data in the Operations when a 1920×1080 Pixel Area is Set as 16×16 Blocks

Confirm the completion of transfer for one frame by setting the specified address interrupt described in **9.2.4.4.2 Designated address forwarding completion interrupt**.

9.2.4.4 Interrupts

9.2.4.4.1 Interrupt list

Table 9.2-24 lists the interrupt sources and registers, and the interrupt signals to the interrupt controller.

Table 9.2-24 Interrupt Sources and Registers, and Interrupt Signals (1/2) [n = 0, 1]

Internal Signal Name	Kind	Item	Interrupt Source Status/Clear	Interrupt Enable Register Field	Generated Blocks	Conditions for Occurrence
axi_mst_err_int*4	Level	FIFO-VD overflow (video data) (for debugging)	CRUnINTS.FOS	CRUnIE1.FOE	FIFO-VD	When Video data FIFO-VD overflows.
		SLVERR error (video data)	CRUnINTS.SLVES	CRUnIE1.SLVEE	AXI-VD	When Video Data AXI-VD SLVERR error occurs.
		DECERR error (video data)	CRUnINTS.DECES	CRUnIE1.DECEE	AXI-VD	When Video Data AXI-VD SLVERR error occurs.
		FIFO-SD overflow*1 (statistics data) (for debugging)	CRUnINTS.SDFOS	CRUnIE1.SDFOE	FIFO-SD	When Statistics Data FIFO-SD overflows.
		SLVERR error*1 (statistics data)	CRUnINTS.SDSLVES	CRUnIE1.SDSLVEE	AXI-SD	When the SLVERR error of Statistics Data AXI-SD occurs.
		DECERR error*1 (statistics data)	CRUnINTS.SDDECES	CRUnIE1.SDDECEE	AXI-SD	When the Statistics Data AXI-SD DECERR error.
image_conv_int*2	Level	SVC0 frame start	CRUnINTS2.FS0S	CRUnIE2.FS0E	Image Clipping	When SVC0 frame starts.*3
	Level	SVC0 frame end	CRUnINTS2.FE0S	CRUnIE2.FE0E	Image Clipping	When SVC0 frame ends.*3
	Level	SVC0 scan line	CRUnINTS2.SL0S	CRUnIE2.SL0E	Image Clipping	When the SVC0 register (ICnSI_C0.SI[11:0]) matches the set number of lines.*3
	Level	SVC1 frame start	CRUnINTS2.FS1S	CRUnIE2.FS1E	Image Clipping	When SVC1 frame starts.*3
	Level	SVC1 frame end	CRUnINTS2.FE1S	CRUnIE2.FE1E	Image Clipping	When SVC1 frame ends.*3
	Level	SVC1 scan line	CRUnINTS2.SL1S	CRUnIE2.SL1E	Image Clipping	When the SVC1 register (ICnSI_C1.SI[11:0]) matches the set number of lines.*3
	Level	SVC2 frame start	CRUnINTS2.FS2S	CRUnIE2.FS2E	Image Clipping	When SVC2 frame starts.*3
	Level	SVC2 frame end	CRUnINTS2.FE2S	CRUnIE2.FE2E	Image Clipping	When SVC2 frame ends.*3
	Level	SVC2 scan line	CRUnINTS2.SL2S	CRUnIE2.SL2E	Image Clipping	When the SVC2 register (ICnSI_C2.SI[11:0]) matches the set number of lines.*3
	Level	SVC3 frame start	CRUnINTS2.FS3S	CRUnIE2.FS3E	Image Clipping	When SVC3 frame starts.*3
	Level	SVC3 frame end	CRUnINTS2.FE3S	CRUnIE2.FE3E	Image Clipping	When SVC3 frame ends.*3
	Level	SVC3 scan line	CRUnINTS2.SL3S	CRUnIE2.SL3E	Image Clipping	When the SVC3 register (ICnSI_C3.SI[11:0]) matches the set number of lines.*3
cru_vd_addr_wend	Edge	Specified address 0 write completed (video data)	—	CRUnIE2.VDADR0WE	AXI-VD	When AXI-VD bus write to the AXI-VD Bus Transfer Completion Event Address 0 Higher/Lower Register (AMnIVT0ADDRH/L) address is completed.
cru_sd_addr_wend	Edge	Specified address 0 write completed*1 (statistics data)	—	CRUnIE2.SDADR0WE	AXI-SD	When AXI-SD bus write to the AXI-SD Bus Transfer Completion Event Address 0 Higher/Lower Register (AMnSDIVT0ADDRH/L) address is completed.

Table 9.2-24 Interrupt Sources and Registers, and Interrupt Signals (2/2) [n = 0, 1]

Internal Signal Name	Kind	Item	Interrupt Factor Status/Clear	Interrupt Enable Register Field	Generation Blocks	Conditions of Occurrence
cru_vsd_addr_wend	Level	Specified address 1 write completed (video data)	CRUnINTS2. VDADR1WS	CRUnIE2.VDADR1WE	AXI-VD	When AXI-VD bus write to the AXI-VD Bus Transfer Completion Event Address 1 Higher/Lower Register (AMnIVT1ADDRH/L) address is completed.
		Specified address 2 write completed (video data)	CRUnINTS2. VDADR2WS	CRUnIE2.VDADR2WE	AXI-VD	When AXI-VD bus write to the AXI-VD Bus Transfer Completion Event Address 2 Higher/Lower Register (AMnIVT2ADDRH/L) address is completed.
		Specified address 3 write completed (video data)	CRUnINTS2. VDADR3WS	CRUnIE2.VDADR3WE	AXI-VD	When AXI-VD bus write to the AXI-VD Bus Transfer Completion Event Address 3 Higher/Lower Register (AMnIVT3ADDRH/L) address is completed.
		Specified address 4 write completed (video data)	CRUnINTS2. VDADR4WS	CRUnIE2.VDADR4WE	AXI-VD	When AXI-VD bus write to the AXI-VD Bus Transfer Completion Event Address 4 Higher/Lower Register (AMnIVT4ADDRH/L) address is completed.
		Specified address 1 write completed*1 (statistics data)	CRUnINTS2. SDADR1WS	CRUnIE2.SDADR1WE	AXI-SD	When AXI-SD bus write to the AXI-SD Bus Transfer Completion Event Address 1 Higher/Lower Register (AMnISDIVT1ADDRH/L) address is completed.

Note 1. CRU0 and 1 are valid.

Note 2. An interrupt from SVC is detected in image processing. It is not detected in non-image processing/full bypass.

Note 3. The ICnINTCTRL.DECINT register allows you to set whether or not interrupts are issued for subsampled frames.

Note 4. If an error interrupt occurs, a reset is required after the CRU has been stopped.

9.2.4.4.2 Designated address forwarding completion interrupt

This interrupt function is used to notify the CPU of the timing of fetching video and statistics data by using an interrupt.

Set the desired addresses in the DRAM as the destinations for data transfer by using the AMnIVT0/1/2/3/4ADDRH/L (for video data) and AMnSDIVT0ADDRH/L (for statistics data) registers. Up to four addresses can be set for video data and up to two addresses can be set for statistics data. These must be set according to the number of memory banks and the speed of reading by the CPU. An interrupt is generated upon the completion of writing to the address set by the AXI master (AXI-VD, AXI-SD).

Figure 9.2-55 shows an example when the number of memory banks is 4 for video data and the last addresses of memory banks 2 and 4 are set as the completion addresses.

The CPU reads data from the initial data in bank 1 in response to the first interrupt as a trigger and then reads up to the end of bank 2. When the next interrupt arrives, the CPU reads data from the initial data in bank 3 and then reads up to the end of bank 4. This is thereafter repeated and consecutive data can thus be read.

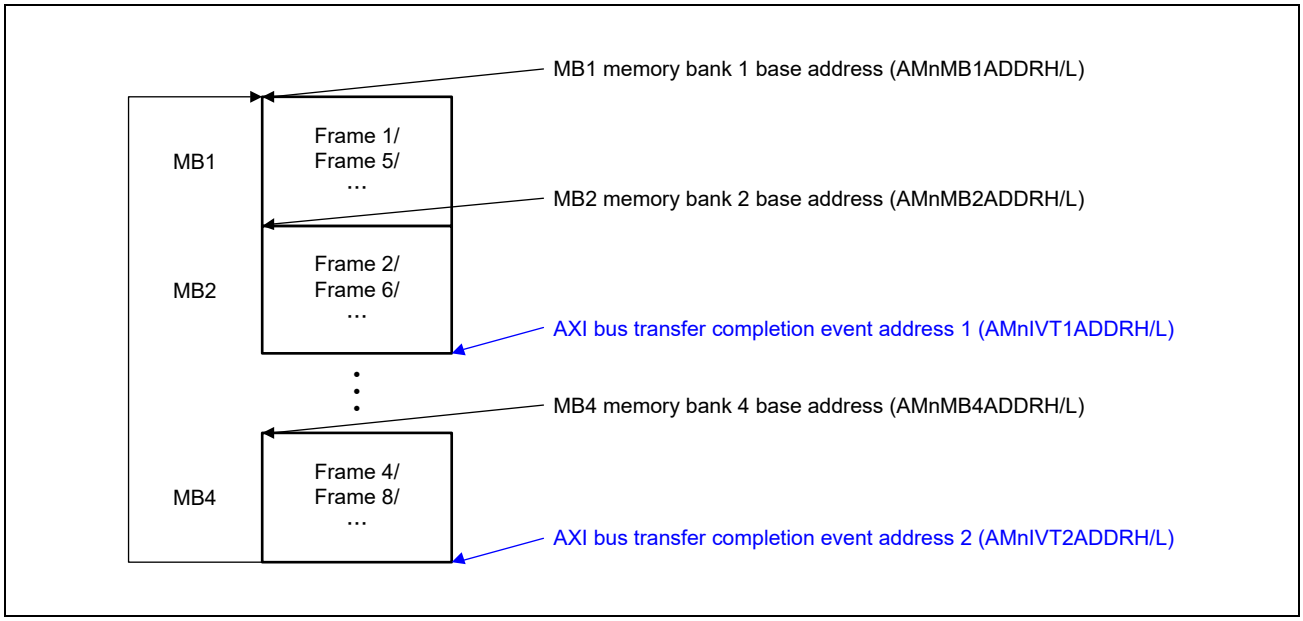

Figure 9.2-55 Example when the Number of Memory Banks is 4 for Video Data and the Last Addresses of Memory Banks 2 and 4 are Set as the Completion Addresses

9.2.4.5 Usage Notes

Use of this CRU requires caution on the following points.

(1) When the paired channels are used, set VCLK for CRU0 and CRU1 to the same frequency.

(2) The following functions can only be used with SVC0 (that is, they cannot be used with SVC1 to SVC3).
- Demosaicing
- Statistics
- Changing the frame synchronization

(3) The same data (the same data type for the same VC) cannot be set for image processing and non-image processing. For example, making the following register settings is prohibited.

(Case1) This is an example of setting the same VC data type in Image Process to SVC0 and SVC1.
- SVC0: VC0, YUV422 8-bit: ICnSVC.SVC0[3:0] = 0h, ICnIPMC_C0.INF[5:0] = 1Eh
- SVC1: VC0, YUV422 8-bit: ICnSVC.SVC1[3:0] = 0h, ICnIPMC_C1.INF[5:0] = 1Eh

(Case2) This is an example of setting the same VC data type in Non Image Process to SVC0 and SVC1.
- SVC0: VC0, YUV422 8-bit: ICnSVC.SVC0[3:0] = 0h, ICnNIPDT_C0L.INF[5:0] =1b
- SVC1: VC0, YUV422 8-bit: ICnSVC.SVC1[3:0] = 0h, ICnNIPDT_C1L.INF[5:0] = 1b

(Case3) This is an example of setting the same VC data type in Image Process and Non Image Process on the same SVC0.
- SVC0: VC0, YUV422 8-bit: ICnSVC.SVC0[3:0] = 0h, ICnIPMC_C0.INF[5:0] = 1Eh
- SVC1: VC0, YUV422 8-bit: ICnNIPDT_C0L[30]=1b

(4) Interlacing is not supported.

(5) The timing for periodic deskewing calibration for the DPHY is 2^13 to 10 µs. Be sure to use a sensor that conforms to this specification.

(6) When FIFO-VD and FIFO-SD are in use, make sure that they do not overflow. In the event that an overflow occurs during operation with footers appended, the footer value following the overflow is not guaranteed. In such cases, reset the CRU after it has been stopped.

(7) An interrupt will not occur unless the addresses that are set for the specified address 0 to 4 write completed interrupt are set as addresses to which video or statistics data are to be written, so take care on this point. For example, an interrupt will not occur if video or statistics data are not written to the address which has been set for the specified address 0 to 4 write completed interrupt and the address jumps to the start of the next line due to the image-stride setting.

(8) For the order of the startup of the sensor and CRU, be sure to initialize the CRU before sending data from the sensor, as stated in **9.2.5.1 Starting Reception for the MIPI CSI-2 Input**. If this order is not observed, the CRU may receive incomplete packets of MIPI CSI-2 signals and various errors may occur.

(9) Parameter setting of the SVCs are as follows.

Table 9.2-25 Parameter Setting of the SVCs

Function	SVC0	SVC1	SVC2	SVC3	Note
Image Clipping	(A)	(A)	(A)	(A)	—
Frame Subsampling	(B)	(B)	(B)	(B)	—
Data Arrange 1/2	(B)	(B)	(B)	(B)	—
Data Clip	(B)	(B)	(B)	(B)	—
Color Space Conversion	(B)	(B)	(B)	(B)	—
Demosaic	(C)	(D)	(D)	(D)	When any of the Demosaic, Linear Matrix, and Statistic functions are used, SVC1 to SVC3 cannot be used for other functions.
Linear Matrix	(C)	(D)	(D)	(D)	
Statistics	(C)	(D)	(D)	(D)	
LUT	(B)	(B)	(B)	(B)	—
YCbCr422 to a420	(A)	(A)	(A)	(A)	—
Y/C Separation	(A)	(A)	(A)	(A)	—
Only Y	(A)	(A)	(A)	(A)	—

Note: (A): Can be set independently of other SVCs
(B): Parameter setting common to SVC0 to SVC3
(C): Functions only with SVC0
(D): Cannot be set

(10) Image Stride when output format is YUV420

Note that when the output format is set to YUV420 (ICnDMR.YCMODE[2:0] = 110b), the U/V side is written to RAM as Image Stride (AMnIS) × 2.

See **Image Stride** in **9.2.4.3.3(5)(a) Video data frame** for details.

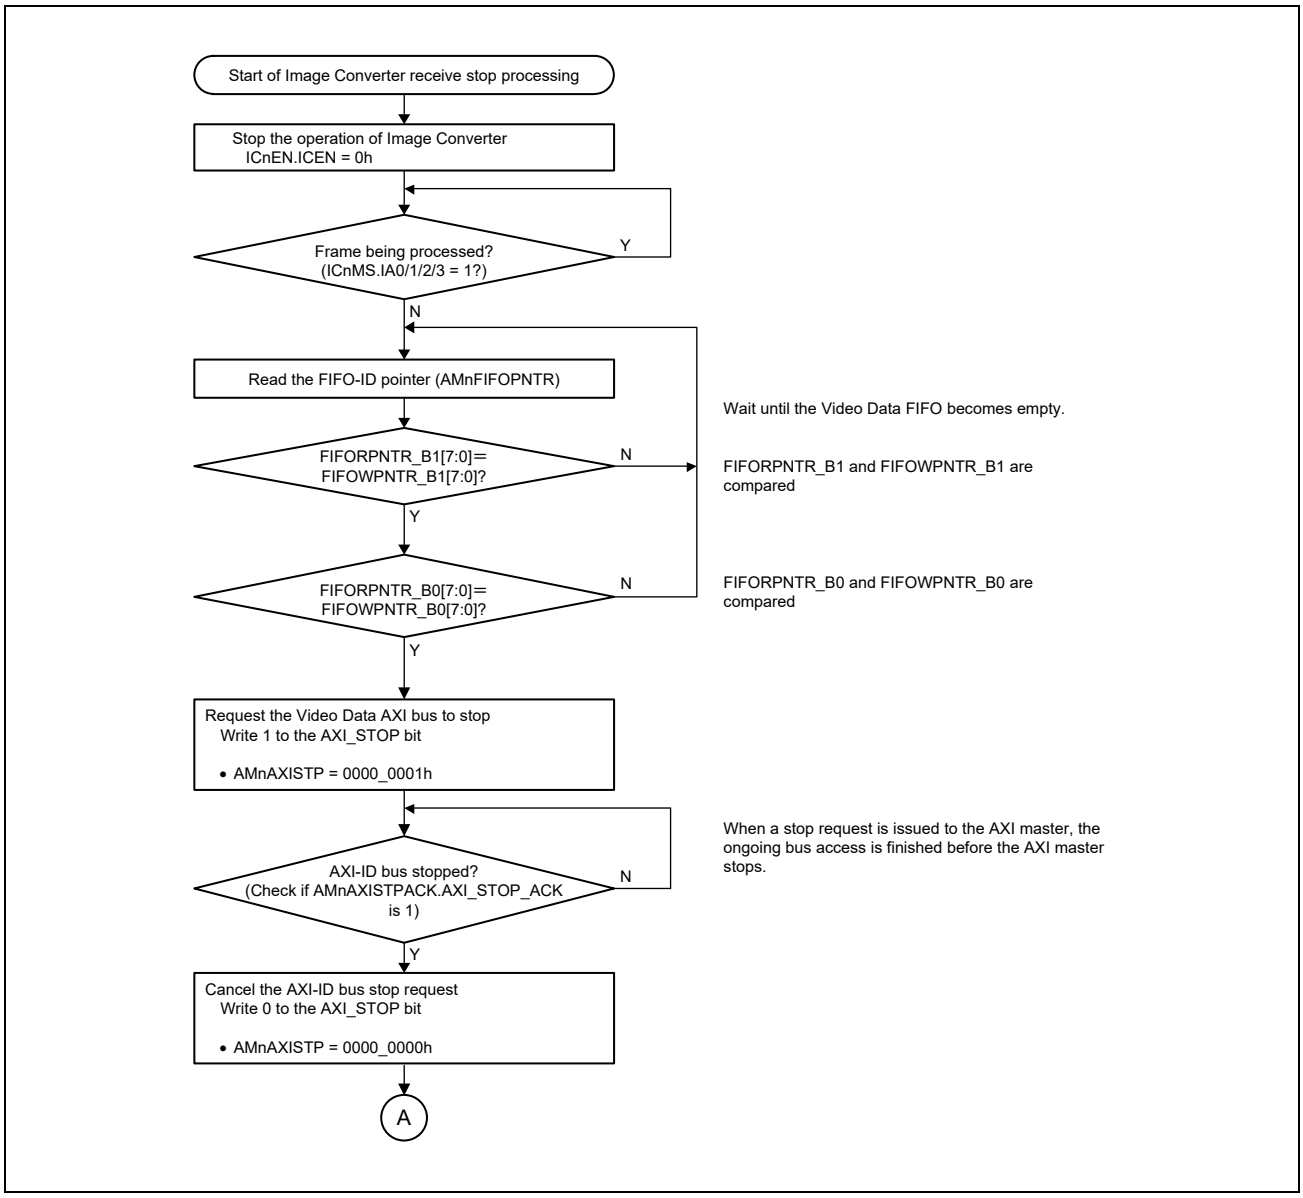

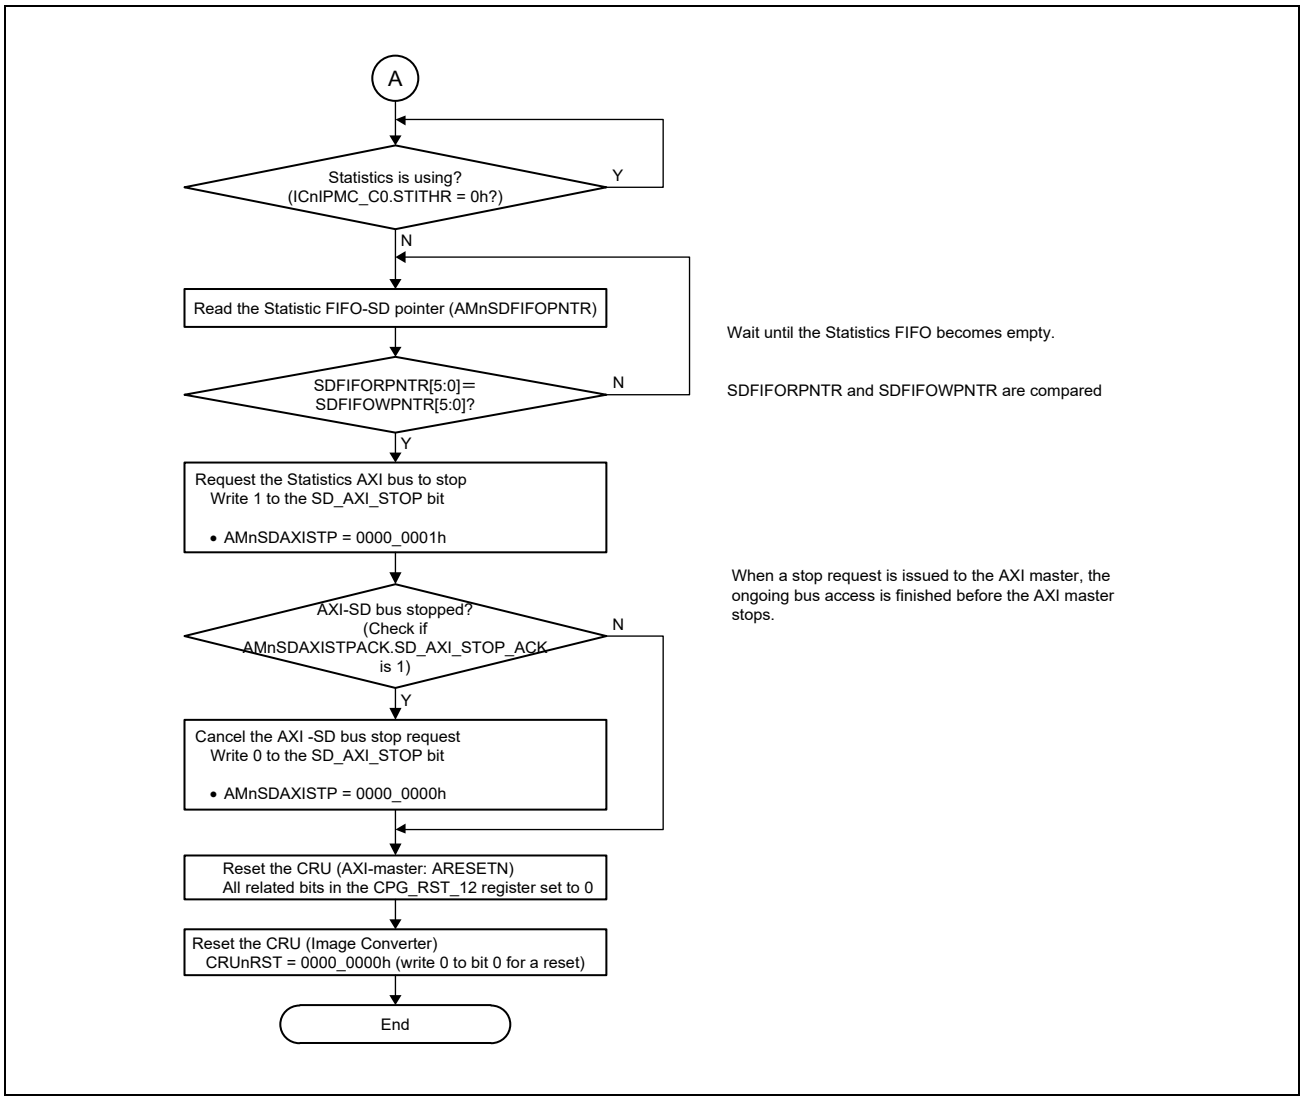

Figure 9.2-65 Stopping Image Processing Reception

9.2.5.3 Frame Synchronization Settings

While the CRU is receiving data using SVC0, the following registers can only be changed with frame synchronization:

- ICnSVC.SVC0[3:0]
- ICnIPMC_C0.STITHR
- ICnNIPDT_C0L
- ICnNIPDT_C0H
- ICnSLPrC_C0
- ICnELPrC_C0
- ICnSPPrC_C0
- ICnEPPrC_C0
- ICnSI_C0
- ICnLMXOF
- ICnLMXRC1
- ICnLMXRC2
- ICnLMXGC1
- ICnLMXGC2
- ICnLMXBC1
- ICnLMXBC2
- ICnSTIC1

9.2.5.3.1 Changing Frame Synchronization Settings (by Setting Registers)

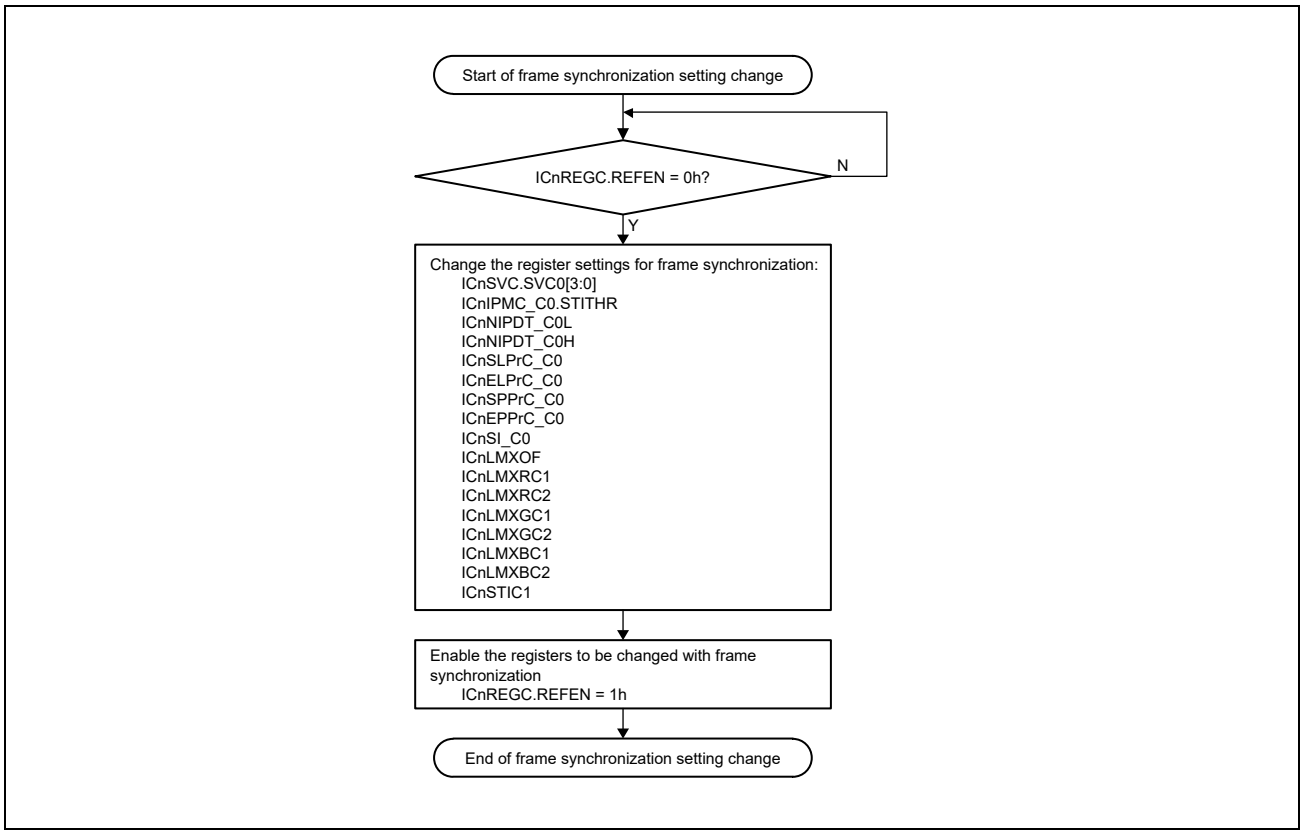

Figure 9.2-66 Flow for Changing the Frame Synchronization Settings (by Setting Registers)

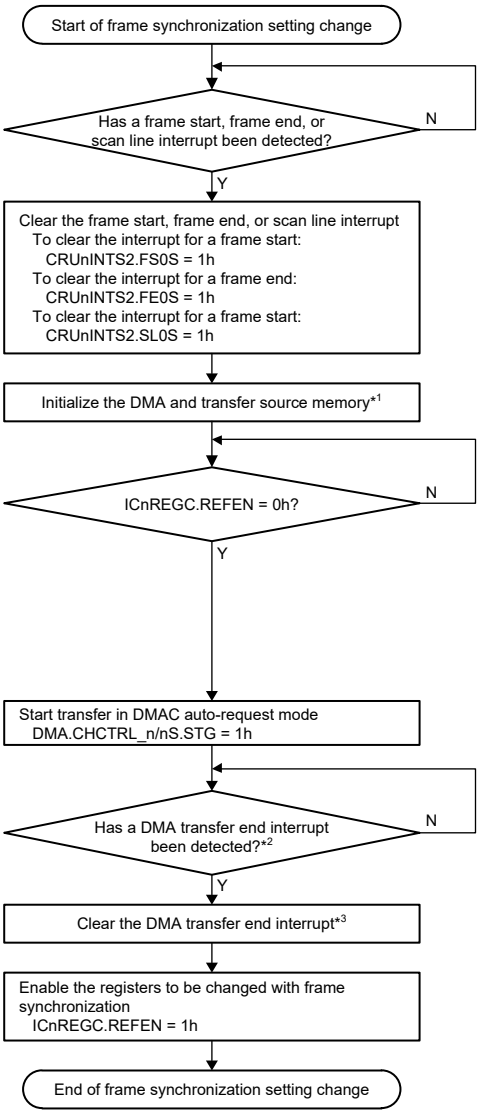
9.2.5.3.2 Changing Frame Synchronization Settings (by Using the DMAC)



NOTES:

1. This flow for changing the frame synchronization settings is only valid for the MIPI CSI-2 input. It cannot be used for the parallel input.
2. In the initial settings when the CRU starts, interrupts for a frame start, frame end and scan line must be set.

   To set an interrupt for a frame start:
   CRUnIE2.FS0E = 1h

   To set an interrupt for a frame end:
   CRUnIE2.FE0E = 1h

   To set an interrupt for a frame start:
   CRUnIE2.SL0E = 1h

   In addition, CRU and DMA interrupts must be enabled by seeing the section about the interrupt controller.

Note 1. Perform initialization by seeing the section about DMA.

- Note that the following register settings are required:
  DMA.CHCFG_n/nS.DAD = 0h: Increment
  DMA.CHCFG_n/nS.SAD = 0h: Increment
  DMA.CHCFG_n/nS.DDS = 3h: 32 bits
- Set the DMA transfer size to 32 bits for both transfer destination and transfer source
- In transfer source memory initialization, store the values that set the following register: (Start address: Up to 68 bytes in ICnSVC)

  ICnSVC.SVC0[3:0]
  ICnIPMC_C0.STITHR
  ICnNIPDT_C0L
  ICnNIPDT_C0H
  ICnSLPrC_C0
  ICnELPrC_C0
  ICnSPPrC_C0
  ICnEPPrC_C0
  ICnSI_C0
  ICnLMXOF
  ICnLMXRC1
  ICnLMXRC2
  ICnLMXGC1
  ICnLMXGC2
  ICnLMXBC1
  ICnLMXBC2
  ICnSTIC1

Note 2. A setting is required in advance (see the sections about DMA and interrupt controller).

Note 3. Clear the interrupt by seeing the section about DMA and interrupt controller.

9.2.5.4 Starting Reception for the Pattern Generator Input

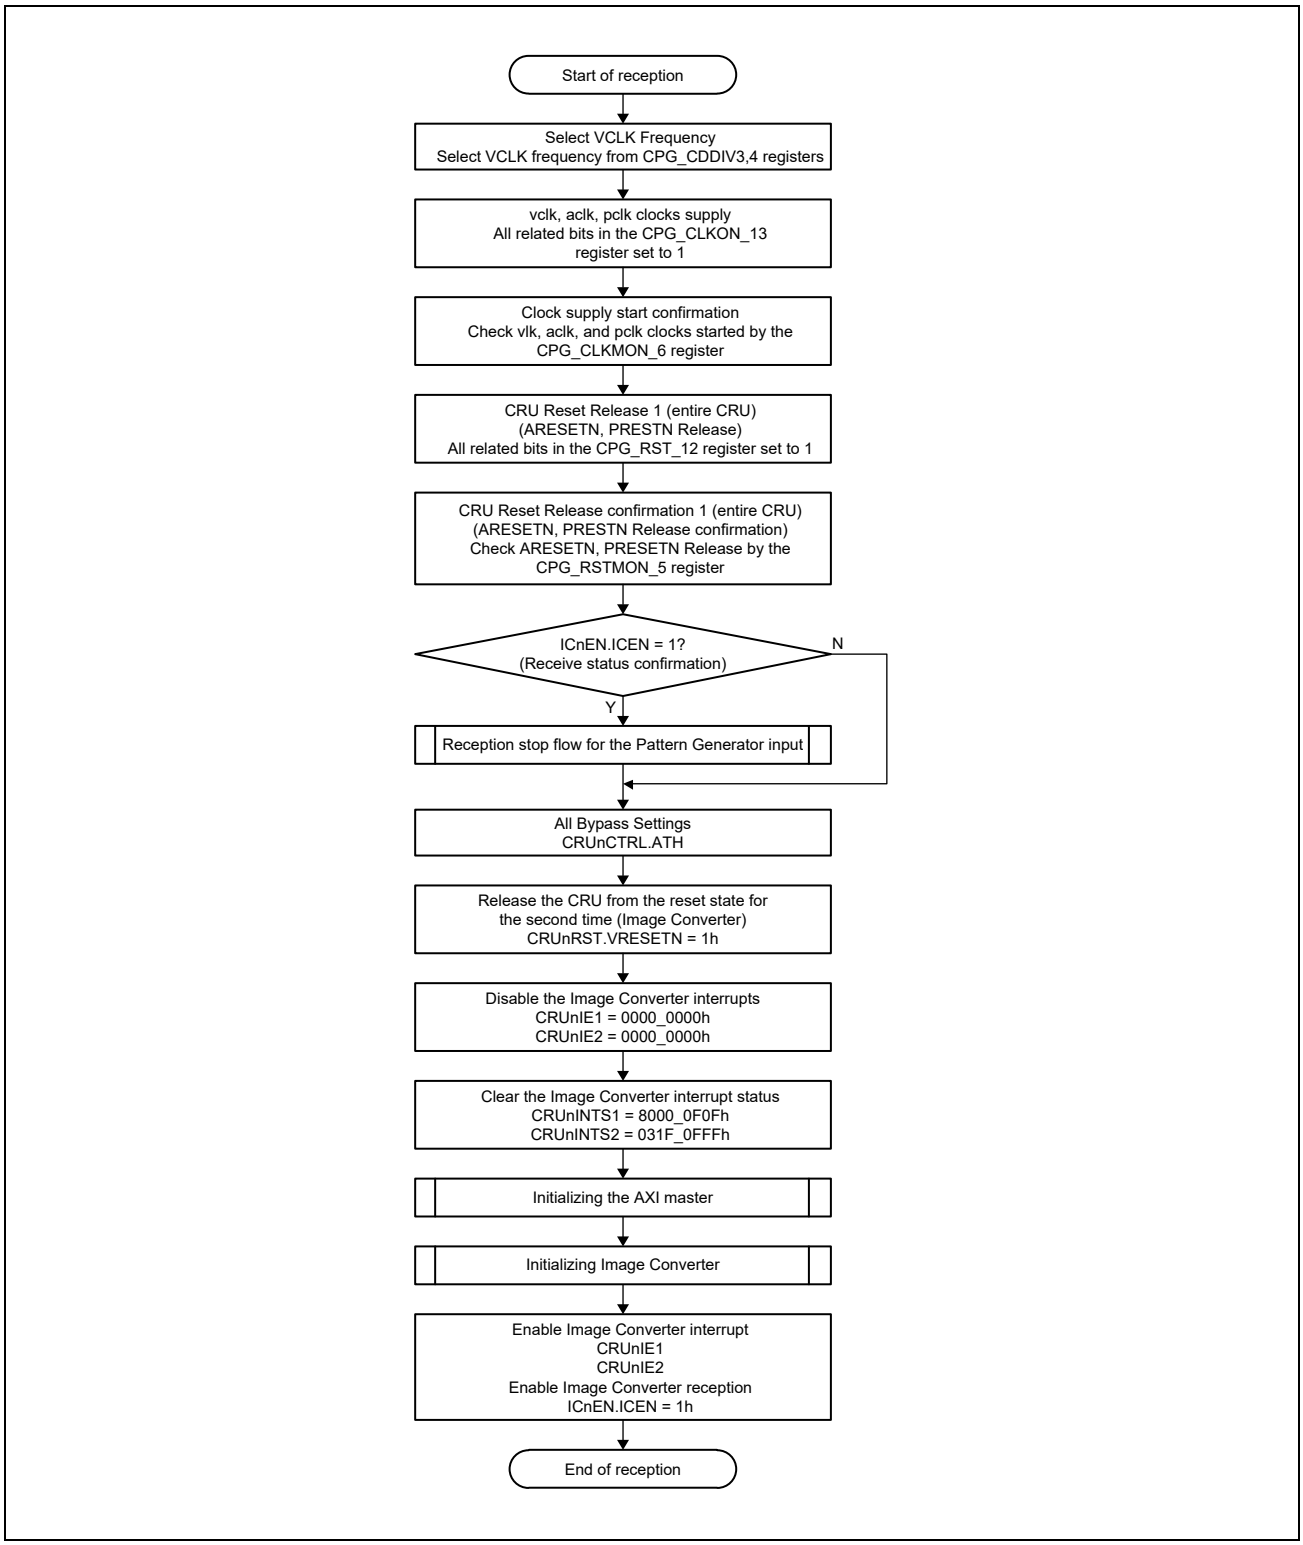

Figure 9.2-68 Reception Start Flow for the Pattern Generator Input

9.2.5.5 Stopping Reception for the Pattern Generator Input

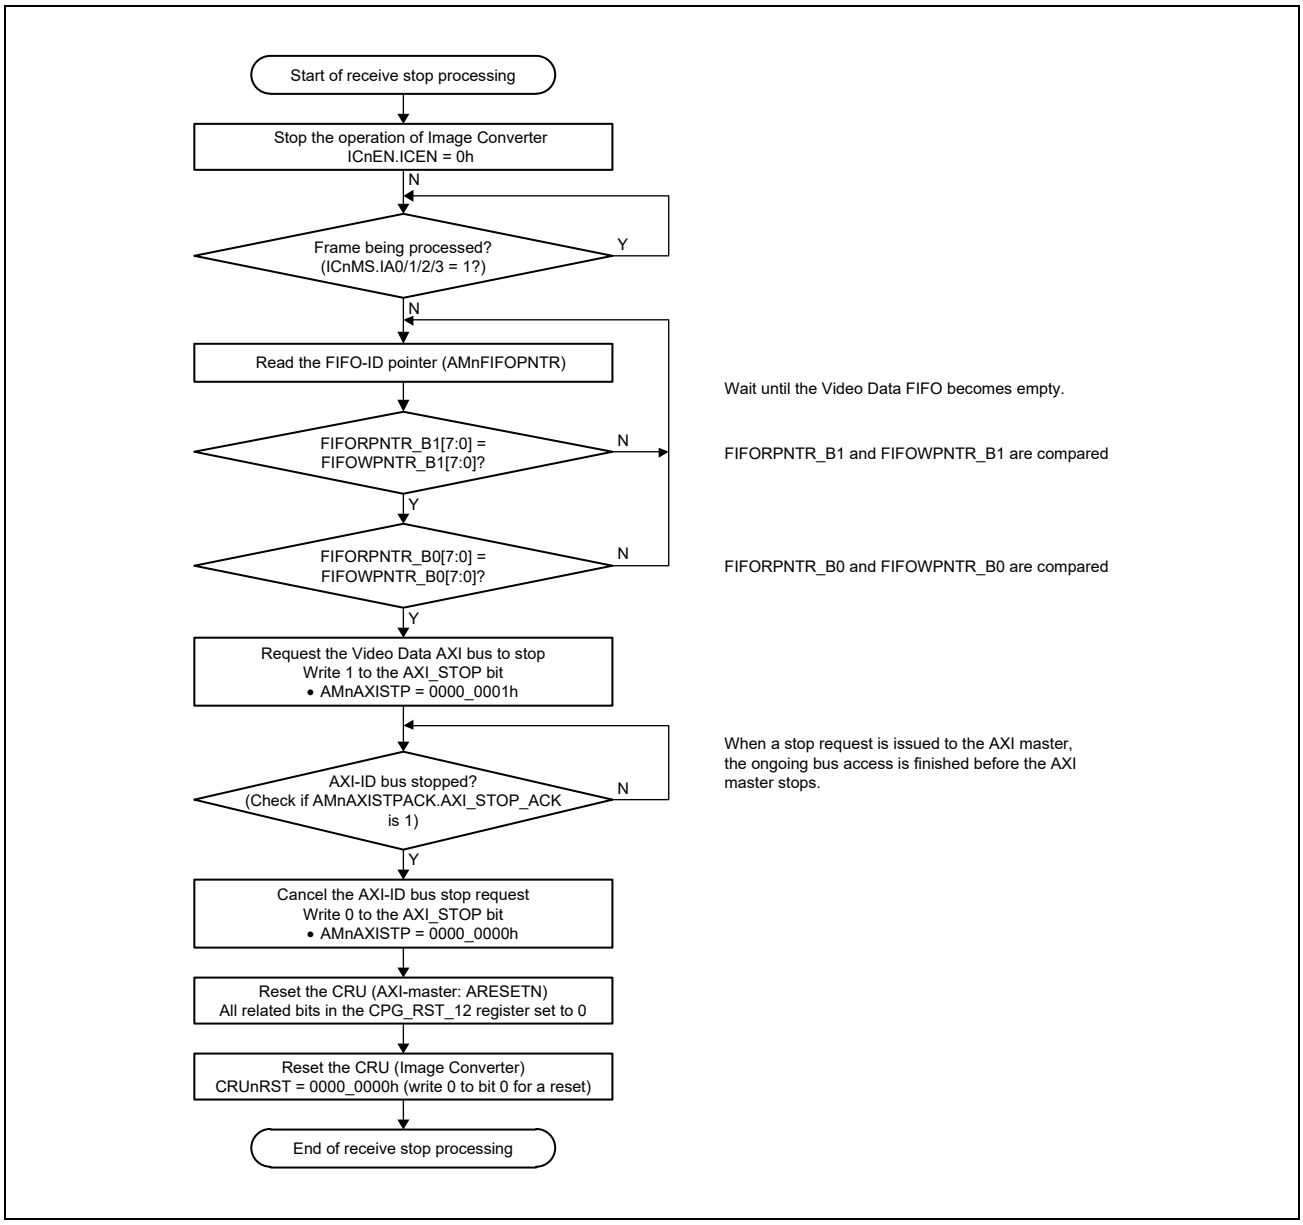

Figure 9.2-69 Flow of Stopping Reception for the Pattern Generator Input

9.2.5.6 How to Synchronize CRU0 to CRU1

If CRU0 to 1 are connected with several cameras, they must be synchronized on the sensor side basically in accord with the sensor specification. This section describes the methods for checking synchronization.

Making the interrupt settings described below allows the CPU to adjust the timing of fetching data and to check synchronization with each camera.

(1) CRU0/1 specified address interrupt setting

To obtain synchronization for CRU0/1, by setting the specified address interrupts (AMnIVT1 to 4ADDRH/L) respectively for the video data bus and statistics data bus, the state of synchronization with each CRU can be confirmed. For example, **Figure 9.2-70** illustrates an example in which the given address of the same memory bank is set per CRU. This is an example of setting the specified address interrupt (AMnIVT1ADDRH/L) for the last address of the MB2 frame for each CRU. In this case, if the same amount of data is accumulated in each CRU, interrupts occur in the order in which data have been accumulated, so the state of synchronization can be identified by having the CPU check the occurrence of an interrupt in each CRU.

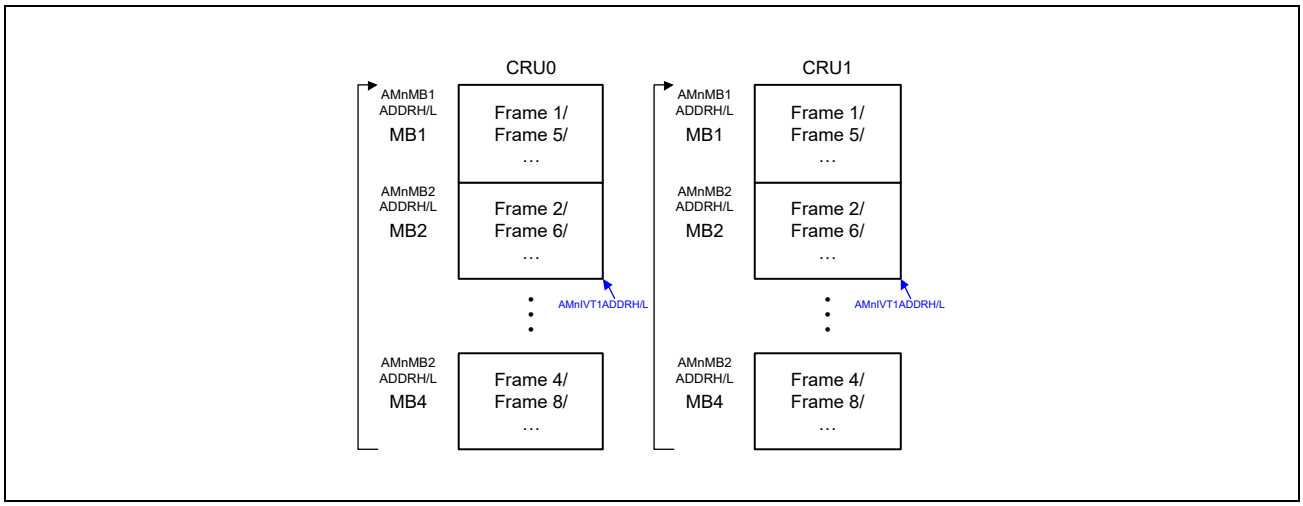

Figure 9.2-70 Example in which the Given Address of the Same Memory Bank is Set per CRU

(2) Footer function of memory bank (option for when stagnation due to congestion is a concern)

If only making the setting (1) above raises a concern with stagnation due to congestion on the buses, whether or not the data have actually been written can be checked by the CPU reading the footers at the above address, which allows judging whether the actual data from the past frames have been updated.

SECTION 9 IMAGE

9.3 Image Scaling Unit (ISU)

The ISU is a module that reads out the image stored in the external DRAM, scales down image size, and outputs the reduced image into the DRAM. The ISU also support a color format conversion and cropping image.

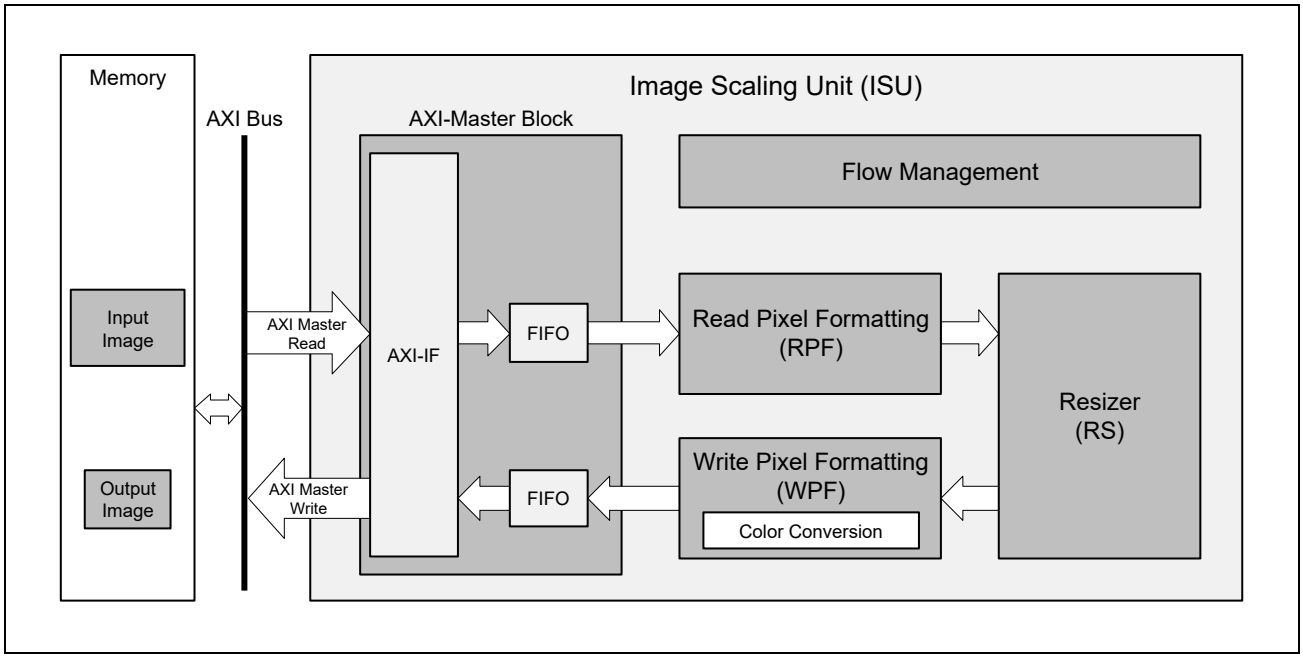

Figure 9.3-1 ISU Block Diagram

9.3.1 Features

The ISU functionality consists of “Resizer” and “Color Format Conversion”. “Color Format Conversion” can convert color space and color format (RGB/ARGB, YCbCr/YUV, RAW).

- Resizer
  - Scaling ratio: ×1/1 to 1/15 (Scale down)
  - Scaling algorithm: Bilinear
  - Horizontal and Vertical image scaling ratio are adjustable individually.
  - Cropping image

- Color Space and Color Format Conversion
  - Supported color format: RGB/ARGB, YCbCr/YUV, RAW (Grayscale)
    A (Alpha) of ARGB format is transparency. Zero is transparent (colorless).
  - Color space conversion by using 3 × 3 matrix which coefficients can be set arbitrary.
  - Convert color space and color format each other.
  - Endian correction

Table 9.3-1 Supported Image Format

Item	Description
Input	• Color Format – RGB/ARGB: 8 formats RGB565, RGB888, BGR888, BGR666, ARGB8888, ARGB1555, RGBA8888, ABGR8888 – YCbCr/YUV: 4 formats YCbCr422 (Interleave) = UYVY YCbCr422 (Interleave) = YUY2 (YUYV) YCbCr422 (Semi-Planar) = NV16 YCbCr420 (Semi-Planar) = NV12 – RAW: 8 formats RAW6, RAW7, RAW8, RAW10, RAW12, RAW14, RAW16, RAW20 (Grayscale)*1 • Maximum Size 4096 × 4096
Output	• Color Format – RGB/ARGB: 8 formats RGB565, RGB888, BGR888, BGR666, ARGB8888, ARGB1555, RGBA8888, ABGR8888 – YCbCr/YUV: 4 formats YCbCr422 (Interleave) = UYVY YCbCr422 (Interleave) = YUY2 (YUYV) YCbCr422 (Semi-Planar) = NV16 YCbCr420 (Semi-Planar) = NV12 – RAW: 8 formats RAW6, RAW7,RAW8, RAW10, RAW12, RAW14, RAW16, RAW20 (Grayscale)*1 • Maximum Size 4096 × 4096

Note 1. RAW10, RAW12, RAW14, RAW16, and RAW20 are rounded to 8-bit, and RAW6 and RAW7 are expanded to 8-bit internally.

9.3.1.1 Flow Management (FM)

Controls the processing of the entire ISU. The frame processing is controlled by receiving the frame processing start instruction from the register. There are three types of frame processing:

1. Register Mode
2. Descriptor Mode (without automatic start of next frame)
3. Descriptor Mode (with automatic start of next frame)

9.3.1.1.1 Frame Processing Mode

There are the following three types of frame processing methods depending on the register settings.

- Register Setting Mode (1) is one-time processing operation according to the register setting at once.
- Descriptor Mode without Auto-start (2) is also one-time processing operation according to the descriptor, not the register setting. Descriptor Mode with Auto-start (3) automatically reads out the descriptor and continues its operation until all descriptors have been processed.

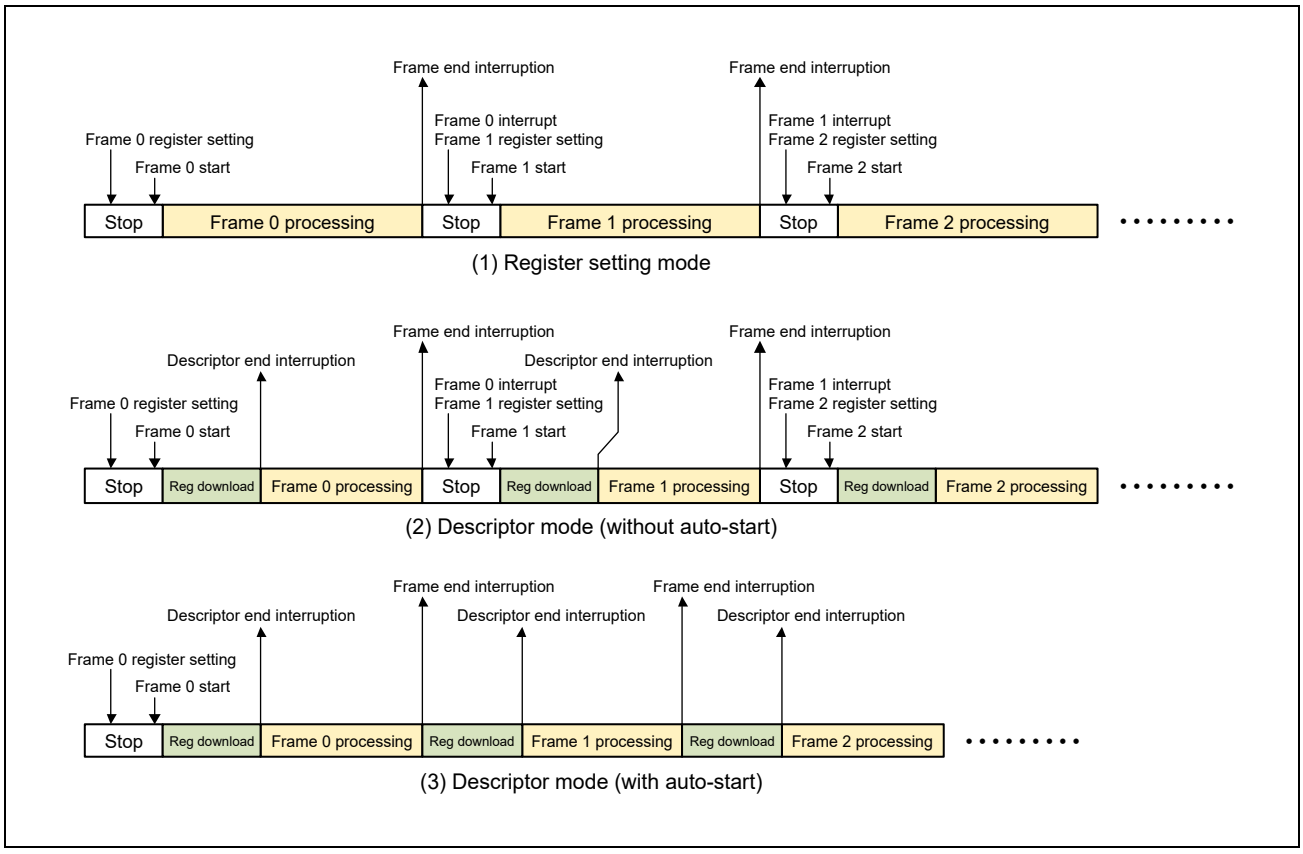

Figure 9.3-2 Frame Processing Mode

9.3.1.1.2 Descriptor

Descriptor Mode is the processing which reads out the descriptor format data stored in the memory and sets the registers automatically. It also includes the Auto-start setting for the next frame.

Flow Management (FM) reads this descriptor setting data while not frame processing.

(1) Descriptor format

The descriptor format is shown below.

Table 9.3-2 Descriptor Format

No.	Category	Item	Byte	Setting Range	Description
1	Header*1,*2	Descriptor Table Byte Count Setting	4 bytes	0000_0000h to 0000_2000h	Up to 8 Kbytes. The total number of bytes of register address and register setting data.
2	Register Setting Main body*3,*4,*5	Register Address 1	4 bytes	0000_0100h to 0000_01F0h	1st Register Setting Address
		Register Setting Data 1	4 bytes	0000_0000h to FFFF_FFFFh	1st Register Setting Data
		Register Address 2	4 bytes	0000_0100h to 0000_01F0h	2nd Register Setting Address
		Register Setting Data 2	4 bytes	0000_0000h to FFFF_FFFFh	2nd Register Setting Data
		Register Address 3	4 bytes	0000_0100h to 0000_01F0h	3rd Register Setting Address
		Register Setting Data 3	4 bytes	0000_0000h to FFFF_FFFFh	3rd Register Setting Data
		Register Address 4	4 bytes	0000_0100h to 0000_01F0h	4th Register Setting Address
		Register Setting Data 4	4 bytes	0000_0000h to FFFF_FFFFh	4th Register Setting Data
		•	•	•	•
		•	•	•	•
		•	•	•	•
3	Footer*2	Next Descriptor Table Address	8 bytes	0000_0000_0000_0000h to 0000_0002_3FFF_FFFFh	The next address is a multiple of 32 bytes. The setting range will be changed according to the product specifications.
		Control identifier register	4 bytes	0000_0000h to 0000_0003h	b31 to 2: All-0
					b1: Select bit to generate a frame end interruption. 0: Does not generate a Frame end interruption. 1: Generate a Frame end interruption.
					b0: Select bit for auto-start of next frame or end at this frame. 0: Disable next frame auto-start. (Exit without next frame operation.) 1: Enable next frame auto-start.

Note 1. The location of the Descriptor List is a 32-byte boundary. (Address that is a multiple of 32-byte) 0,32,64 ...

Note 2. The number of bytes is fixed for the header and footer. The register body is 8 bytes per set (address 4 bytes, data 4 bytes)

Note 3. The registers that can be set in the descriptor are limited to the Common register.

Note 4. Operation when the same register address is described in multiple addresses is not guaranteed.

Note 5. Specify in the offset address to be added to the ISU Base Address. Specifically, the lower 10 bits [9:0] should be the address of the register map, and the higher 22 bits [31:10] should be the address of All 0b. If the higher 22 bits are other than All 0b, it will be out of the register area and a list error will occur.

(2) Descriptor error

An error flag is issued in the following cases.

a) When the number of bytes in the header exceeds the limit, or when the value is not in units of 8 bytes

- An error interrupt is generated, and subsequent frame processing is not executed.
- Normal operation and recovery are not guaranteed unless the system is reset.

b) When the register address is outside the specified address

- A decoding error will occur if decoding is performed for items outside the register area.
- Ignore the write to the register where the error occurred and continue the process itself.

9.3.1.2 AXI-Master

In response to a descriptor read request or input image read request from Flow Management (FM), the descriptor or input image is read from the DRAM. It also writes a reduced image to DRAM in response to a reduced image write request from the WPF.

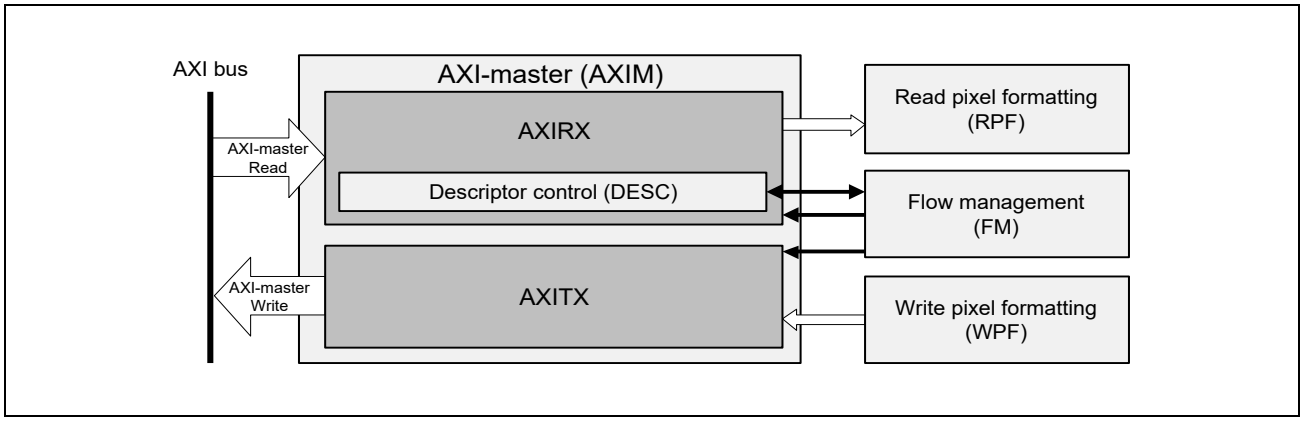

Figure 9.3-3 AXI-Master Block Diagram

9.3.1.2.1 Read input image (AXIRX)

In response to the descriptor read request from FM or the frame transfer start request, the descriptor or input image data is read from DRAM by AXI.

(1) Image input format

AXIRX support to read following formats from memory.

Table 9.3-3 Input Image Format

Read Method	Image Format	Variation
Interleave (Plane Number = 1)	ARGB (8 types)	• The order of colors is different / the number of color bits is different. • There may or may not be A.
	YCbCr422 8-bit (2 types)	The two types differ only in the order of the colors of Cb and Cr.
	RAW (8 types)	Grayscale 6-/7-/8-/10-/12-/14-/16-/20-bit.
Semi-Planner (Plane Number = 2)	YCbCr422 8-bit (1 type)	
	YCbCr420 8-bit (1 type)	

- Interleave

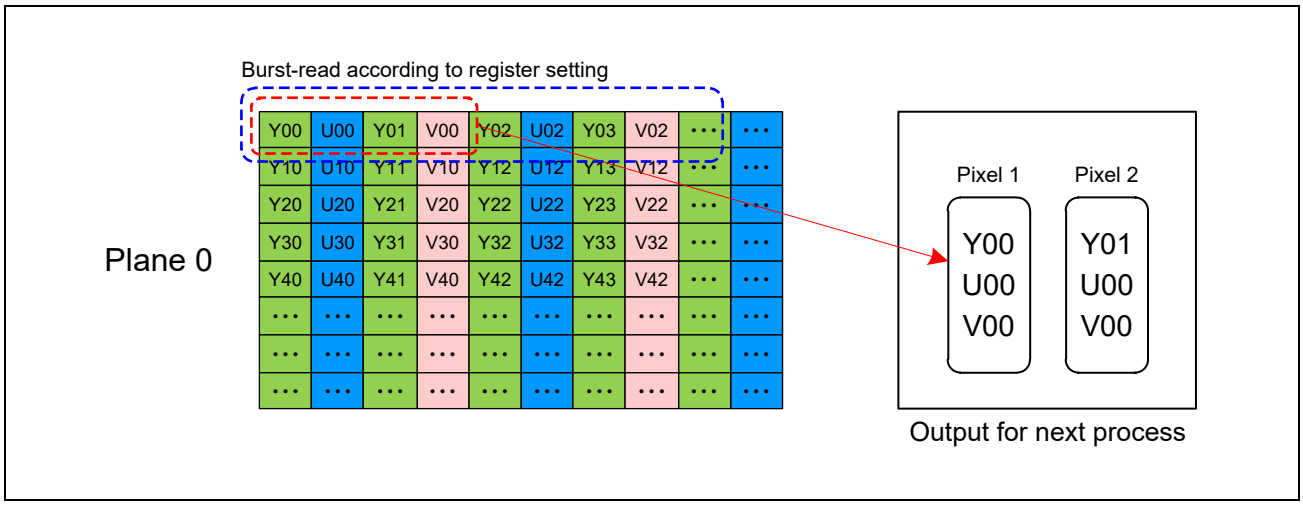

Figure 9.3-4 Example of Interleave Format for YCbCr422 (YUV422)

- Semi-planar

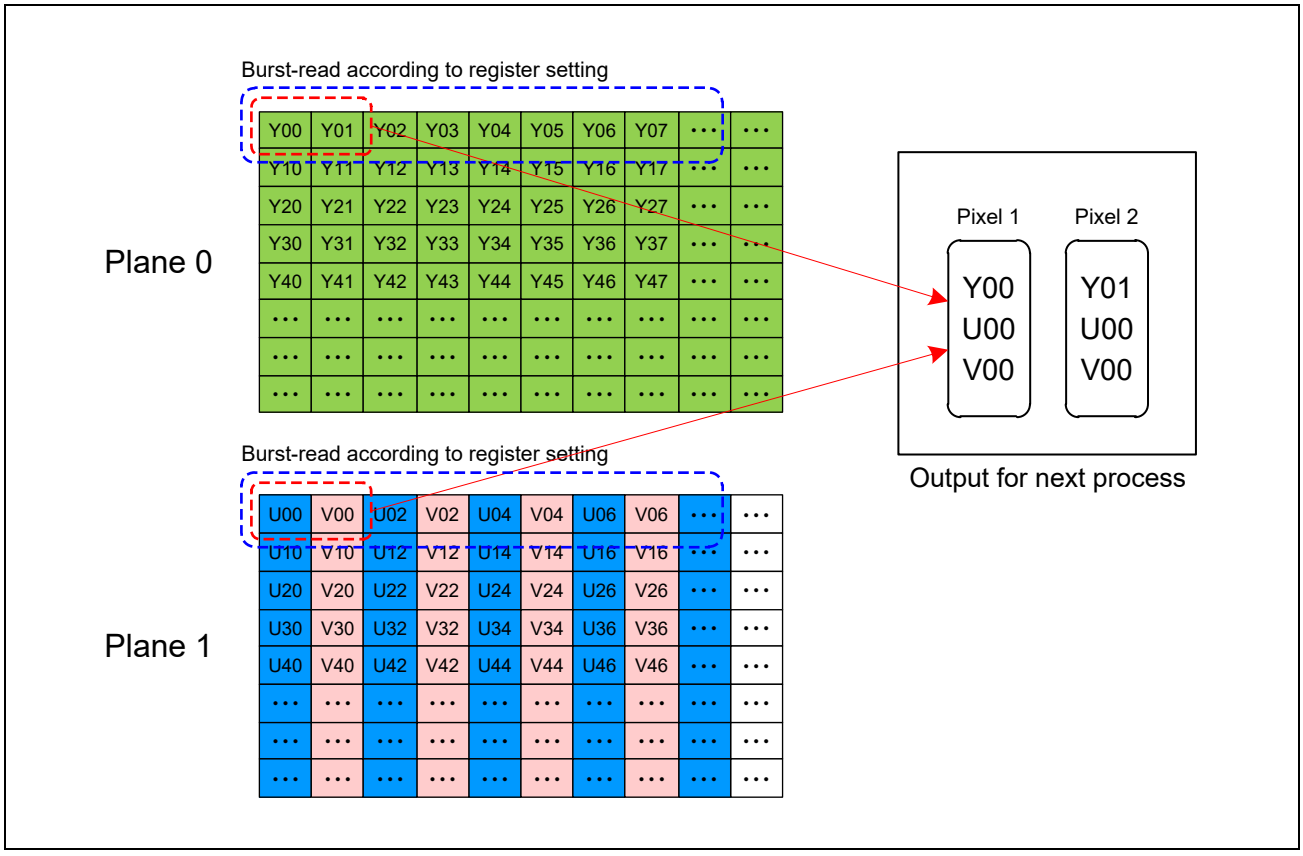

Figure 9.3-5 Example of Semi-planar Format for YCbCr422 (YUV422)

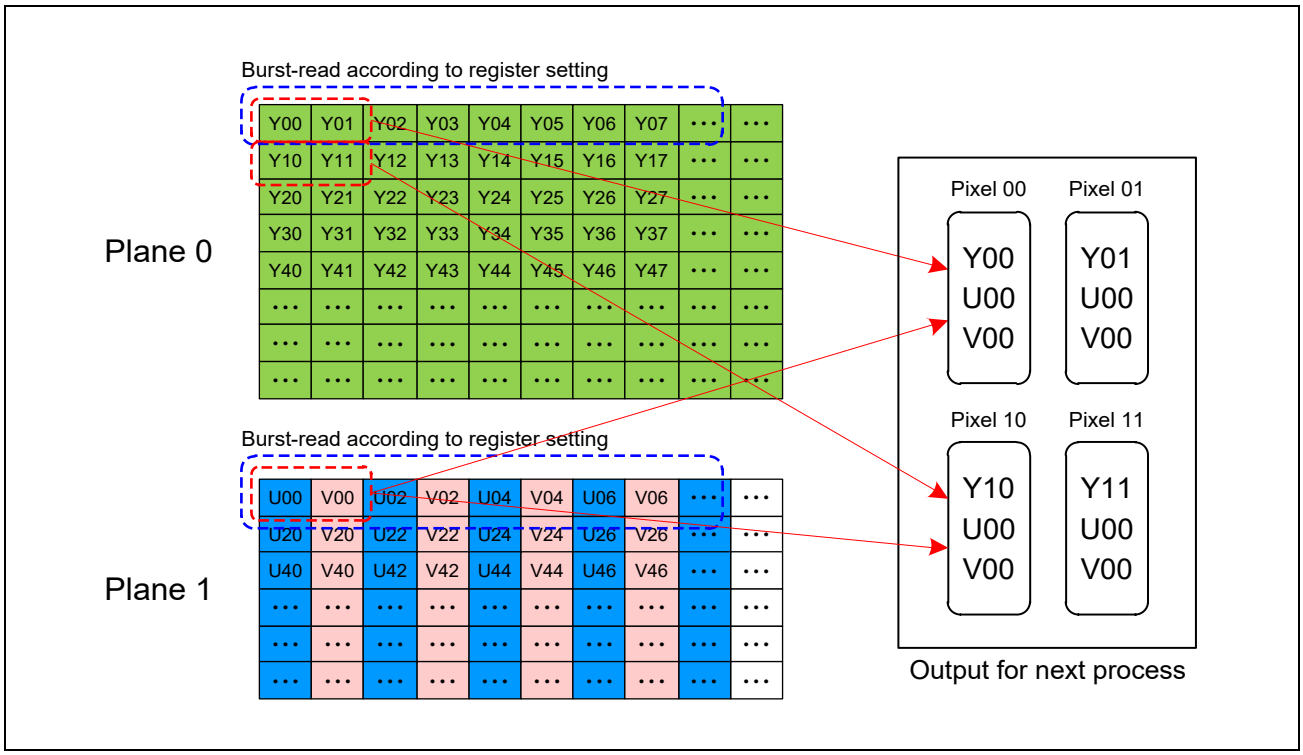

Figure 9.3-6 Example of Semi-planar format for YCbCr420 (YUV420)

(2) Input setting

Data is read from each plane according to the following register setting. Registers are required to set for each plane (Max 2 Plane).

Table 9.3-4 Input Image Setting

No.	Category	Register	Variation
(1)	Start Address	ISU_RPF_SRC_ADDH_PL0.SADD_PL0[2:0] ISU_RPF_SRC_ADDL_PL0.SADD_PL0[31:0]	• Start address for Plane 0 of input image.
		ISU_RPF_SRC_ADDH_PL0.SADD_PL1[2:0] ISU_RPF_SRC_ADDL_PL0.SADD_PL1[31:0]	• Start address for Plane 1 of input image.
(2)	Image Stride	ISU_RPF_SRC_STRD.SSTRPL0[15:0]	• Image stride of Plane 0 [Byte]
		ISU_RPF_SRC_STRD.SSTRPL1[15:0]	• Image stride of Plane 1 [Byte]
(3)	Input Area	ISU_RPF_SRC_SIZE.S_HSIZE[12:0]	• Horizontal size of processing area [Pixel] • Max 4096 pixels
(4)		ISU_RPF_SRC_SIZE.S_VSIZE[12:0]	• Vertical size of processing area [Pixel] • Max 4096 pixels

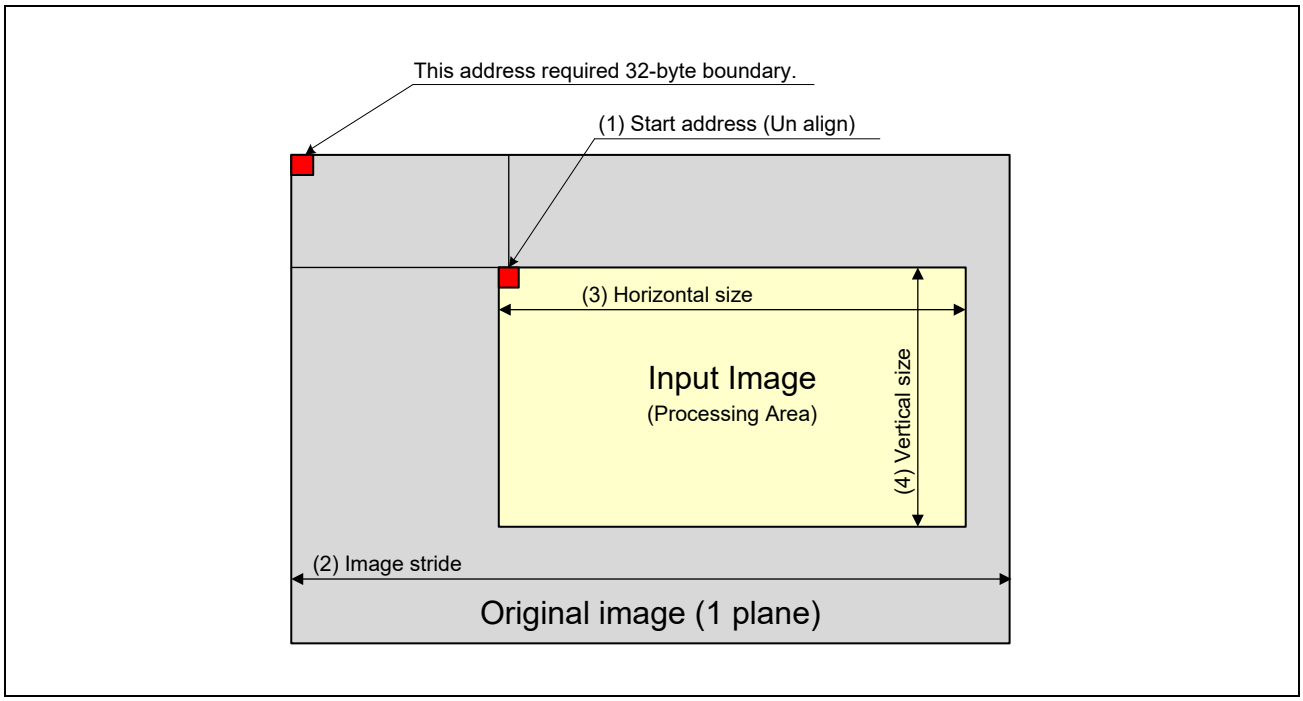

Figure 9.3-7 Input Area (Processing Area) Setting

(3) Write output image (AXITX)

This function write the resized (reduced) image data to DRAM.

(4) Support format

AXITX support the same format as AXIRX.

(5) Output setting

Data is written out for each plane according to the following setting. Registers are required to set for each plane (Max plane number is 2).

Table 9.3-5 Output Image Setting

No.	Category	Register	Variation
(1)	Start Address	ISU_WPF_DST_ADDH_PL0.DADD_PL0[2:0] ISU_WPF_DST_ADDL_PL0.DADD_PL0[31:0]	• Start address of Plane 0 for output image.
		ISU_WPF_DST_ADDH_PL1.DADD_PL1[2:0] ISU_WPF_DST_ADDL_PL1.DADD_PL1[31:0]	• Start address of Plane 1 for output image.
(2)	Image Stride	ISU_WPF_DST_STRD.DSTRPL0[15:0]	• Image stride of Plane 0 [Byte]
		ISU_WPF_DST_STRD.DSTRPL1[15:0]	• Image stride of Plane 1 [Byte]
(3)	Processing Area	ISU_RS_OS_CROP.O_HSIZE[12:0]	• Horizontal crop size [Pixel] • Max 4096 pixels
(4)		ISU_RS_OS_CROP.O_VSIZE[12:0]	• Vertical crop size [Pixel] • Max 4096 pixels

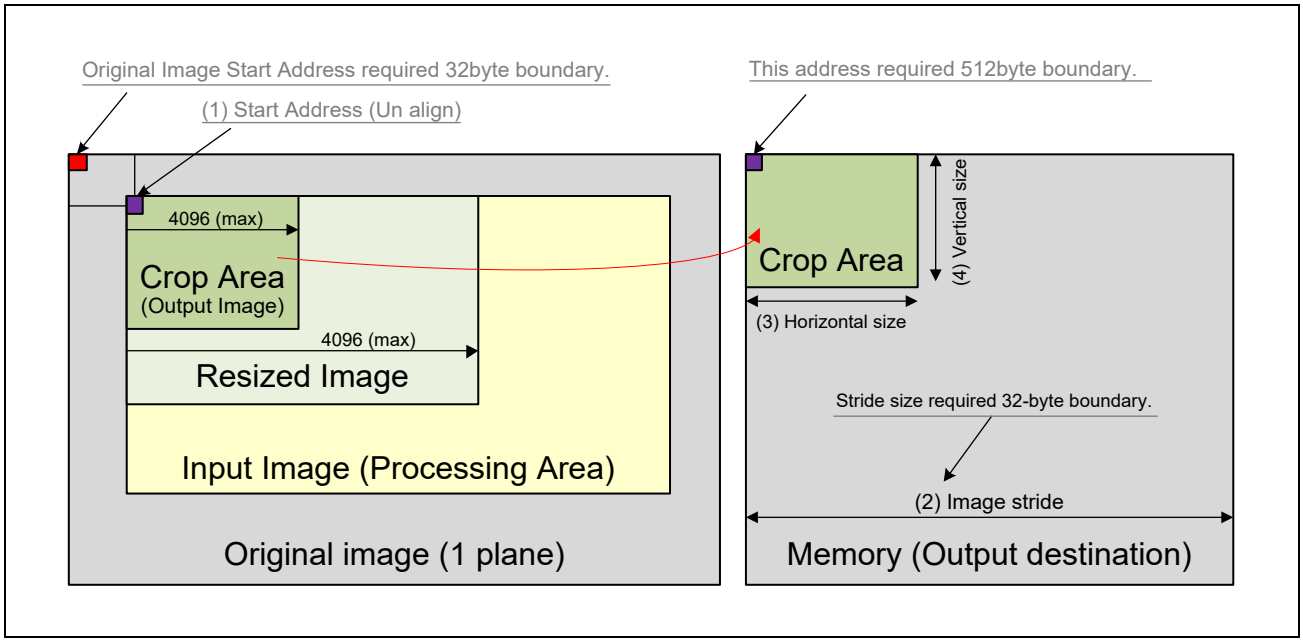

Figure 9.3-8 Output Setting

9.3.1.3 Read Pixel Formatting (RPF)

This function converts the input image data from the AXI-Master and outputs it to the resizer. There are four types of conversion: Data swap, Data extraction, Offset binary conversion (YCbCr only), and pixel normalization. RPF also includes a test pattern generation function.

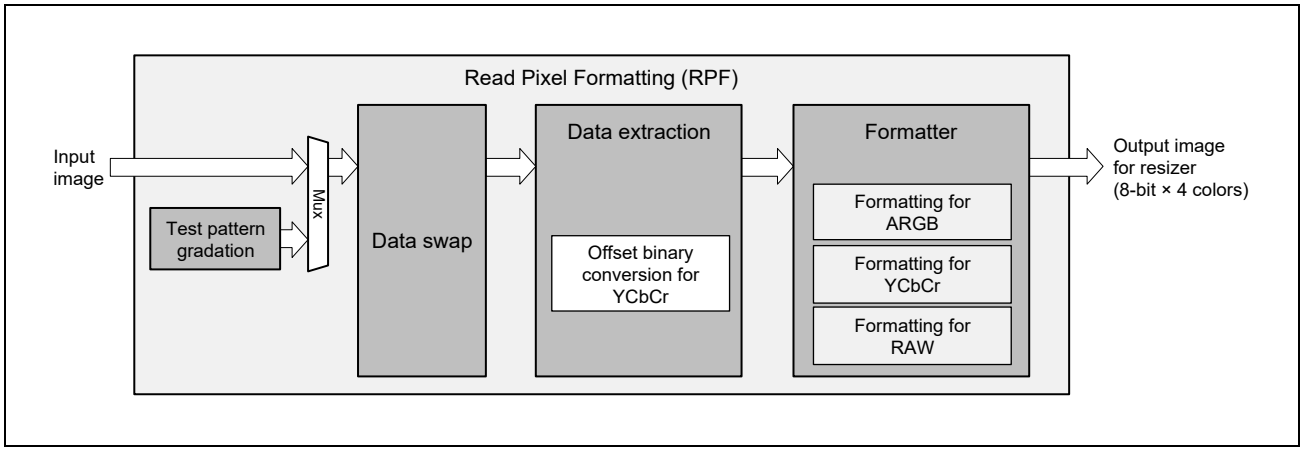

Figure 9.3-9 RPF Block Diagram

9.3.1.3.1 Data swap (endian correction)

This function corrects byte order so that image data can be handled by the ISU. Each bytes can be arranged any order according to the register setting of ISU_RPF_SRC_DSWAP.RD_SWAP[2:0].

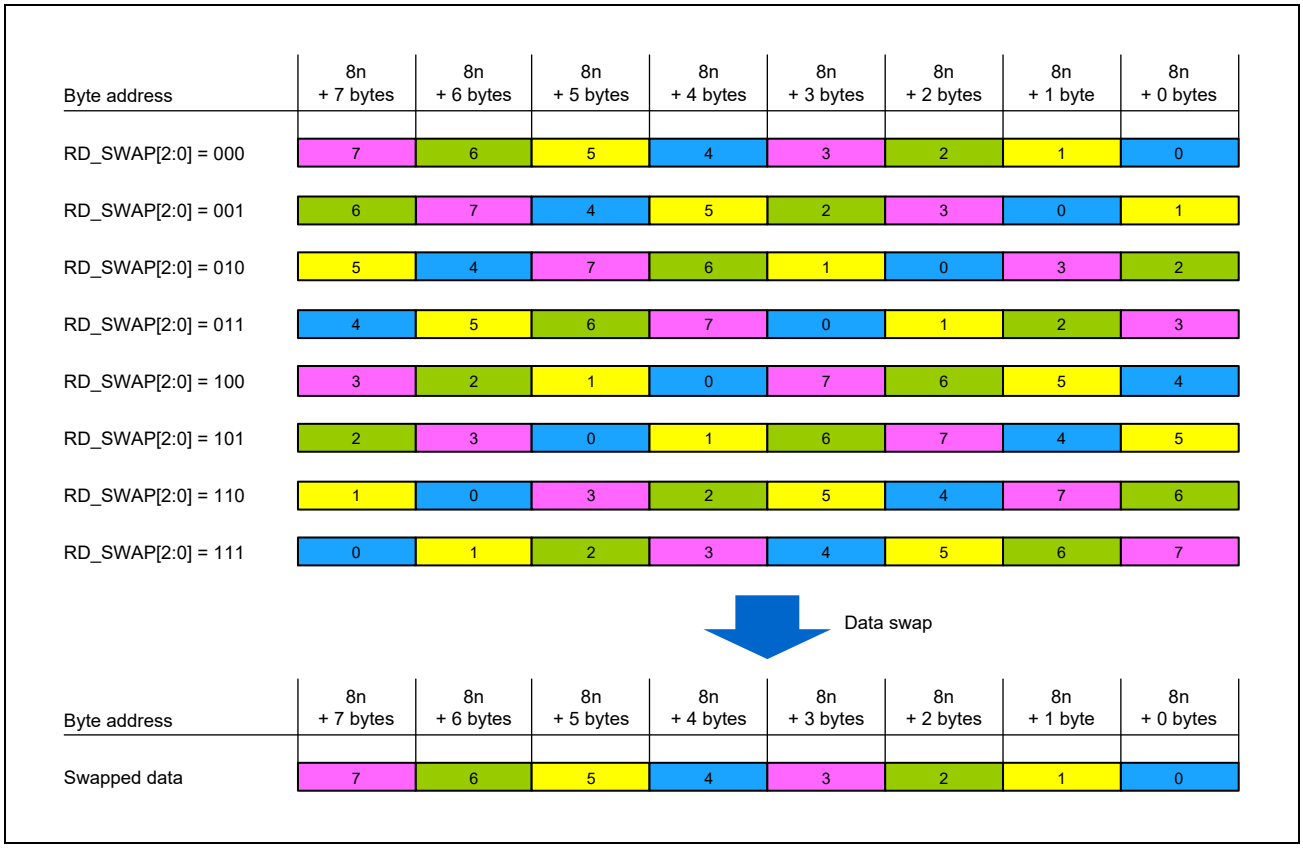

Figure 9.3-10 Data Swap Correction

9.3.1.3.2 RPF Formatter

These functions extract each color components (ex. R, G, B) and normalized as 8-bit for each so that image data can be handled by Resizer. Appropriate processing is performed for each input color format (RGB/ARGB, YCbCr/YUV, RAW) by setting of ISU_RPF_FMT.RDFMT[5:0].

■ RGB/ARGB

This function supports 8 ARGB/RGB formats as shown below. All formats are “Number of planes = 1”.

Table 9.3-6 ARGB Support Format

	Format				n								n + 1								n + 2								n + 3							
RDFMT [5:0]	Color Format	Padding	bit/pixel	phase	7	6	5	4	3	2	1	0	7	6	5	4	3	2	1	0	7	6	5	4	3	2	1	0	7	6	5	4	3	2	1	0

■ YCbCr/YUV

This function supports 4 YCrCb/YUV formats as shown below.

Table 9.3-7 YCbCr/YUV Support Format

Data Format	RDFMT[5:0]	Color Format	Alias	Figure Index
Interleave (Number of Planes = 1)	20h	YCbCr422 8-bit	UYVY	(1)
	21h	YCbCr422 8-bit	YUY2	(2)
Semi-Planar (Number of Planes = 2)	22h	YCbCr422 8-bit	NV16	(3)
	23h	YCbCr420 8-bit	NV12	(4)

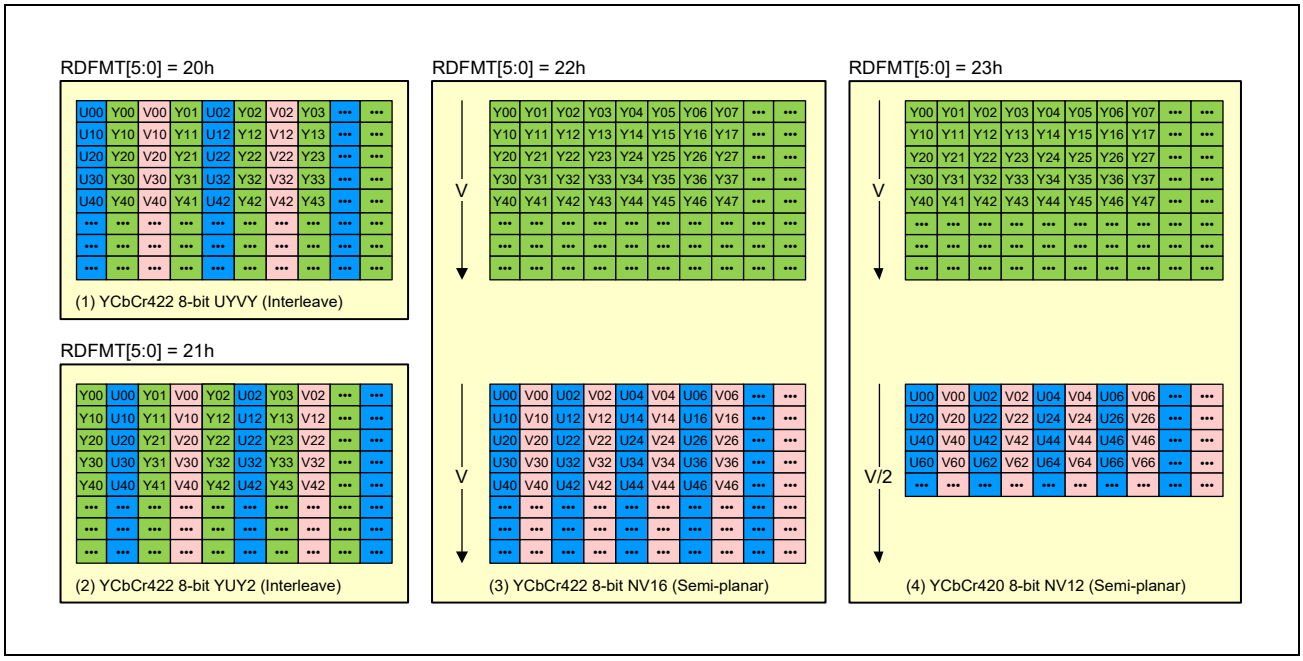

Figure 9.3-11 YCbCr/YUV Support Format

ISU can handle only Offset Binary as the chroma data format (CbCr/UV). Therefore, it is necessary to convert from Two's Complement Binary to Offset Binary.

■ ISU_RPF_UVBIN.UVCHG = 0 (Default)

ISU uses original data on DRAM as chroma value when RDFMT = 20h to 23h.
(CrCb/UV is Offset Binary.)

■ ISU_RPF_UVBIN.UVCHG = 1

ISU convert chroma data (CrCb/UV) from Two's Complement Binary to Offset Binary.

Decimal Number	Offset Binary	Decimal Number	Two's Compliment Binary
127	1111 1111	127	0111 1111
126	1111 1110	126	0111 1110
1	1000 0001	1	0000 0001
0	1000 0000	0	0000 0000
–1	0111 1111	–1	1111 1111
–128	0000 0000	–128	1000 0000

Figure 9.3-12 Types of Binary Expression

■ RAW

This function supports 8 RAW formats as shown below. All formats are “Number of planes = 1”.

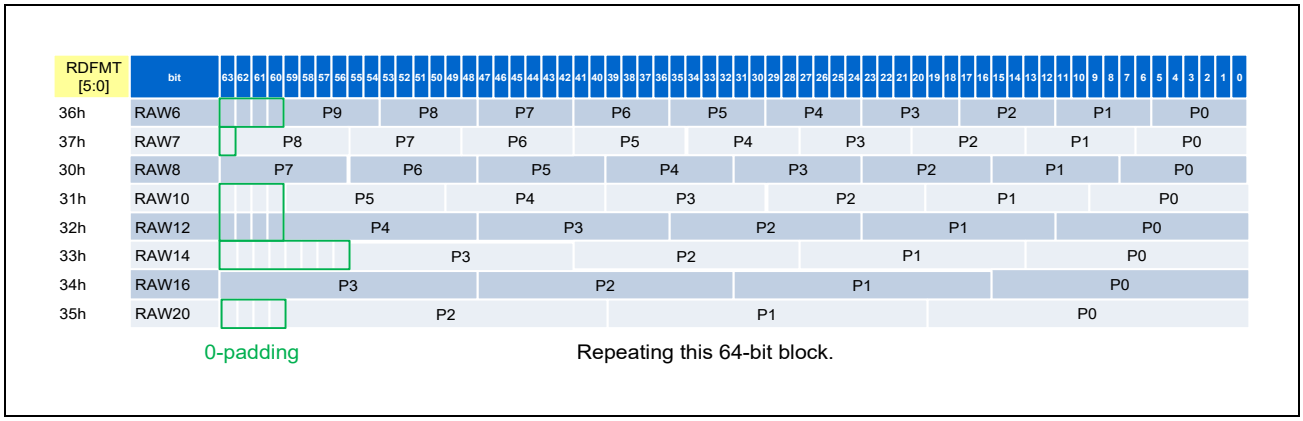

Figure 9.3-13 RAW Support Format

9.3.1.3.3 Data extraction

The 8-bit normalization is required for ARGB/RGB and RAW formats since Resizer can handle the 8-bit format only.

On the other hand, although YCbCr/YUV does not need the 8-bit normalization since its components are already 8-bit, it is necessary to exchange into the YCbCr/YUV444 format.

■ **RGB/ARGB**

For the RGB/ARGB format normalization, higher bits are copied to lower bits.

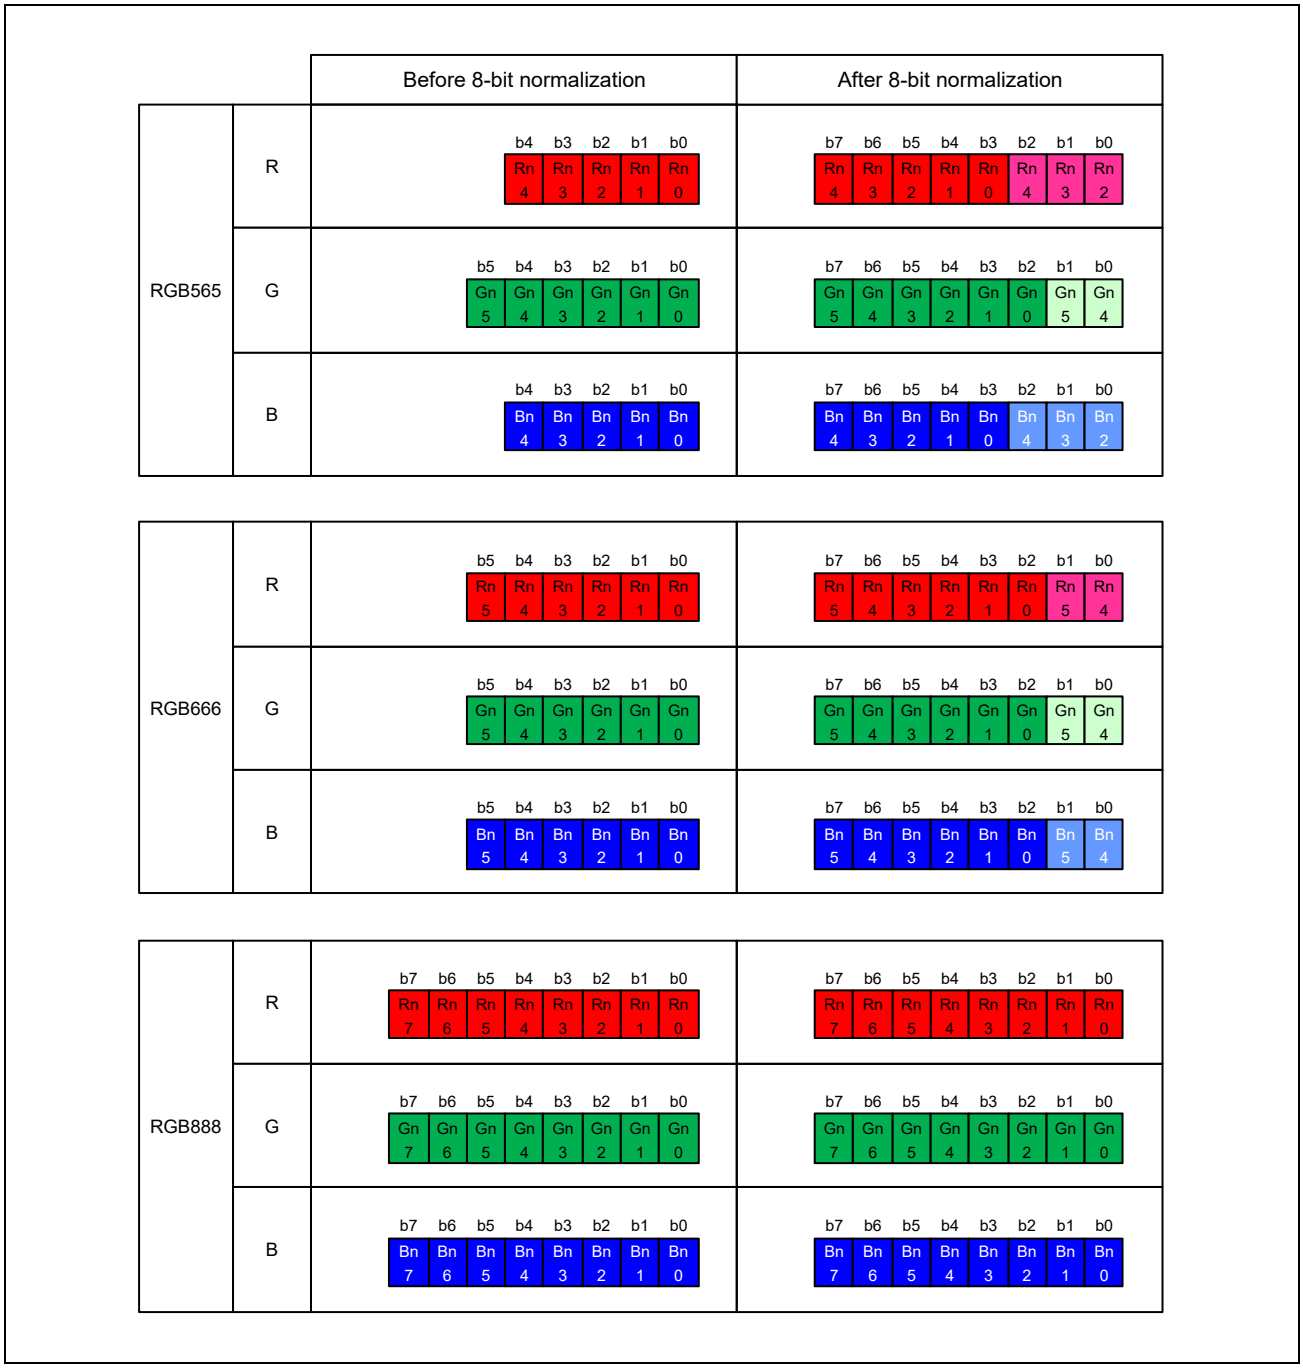

Figure 9.3-14 8-bit Normalization for RGB Format

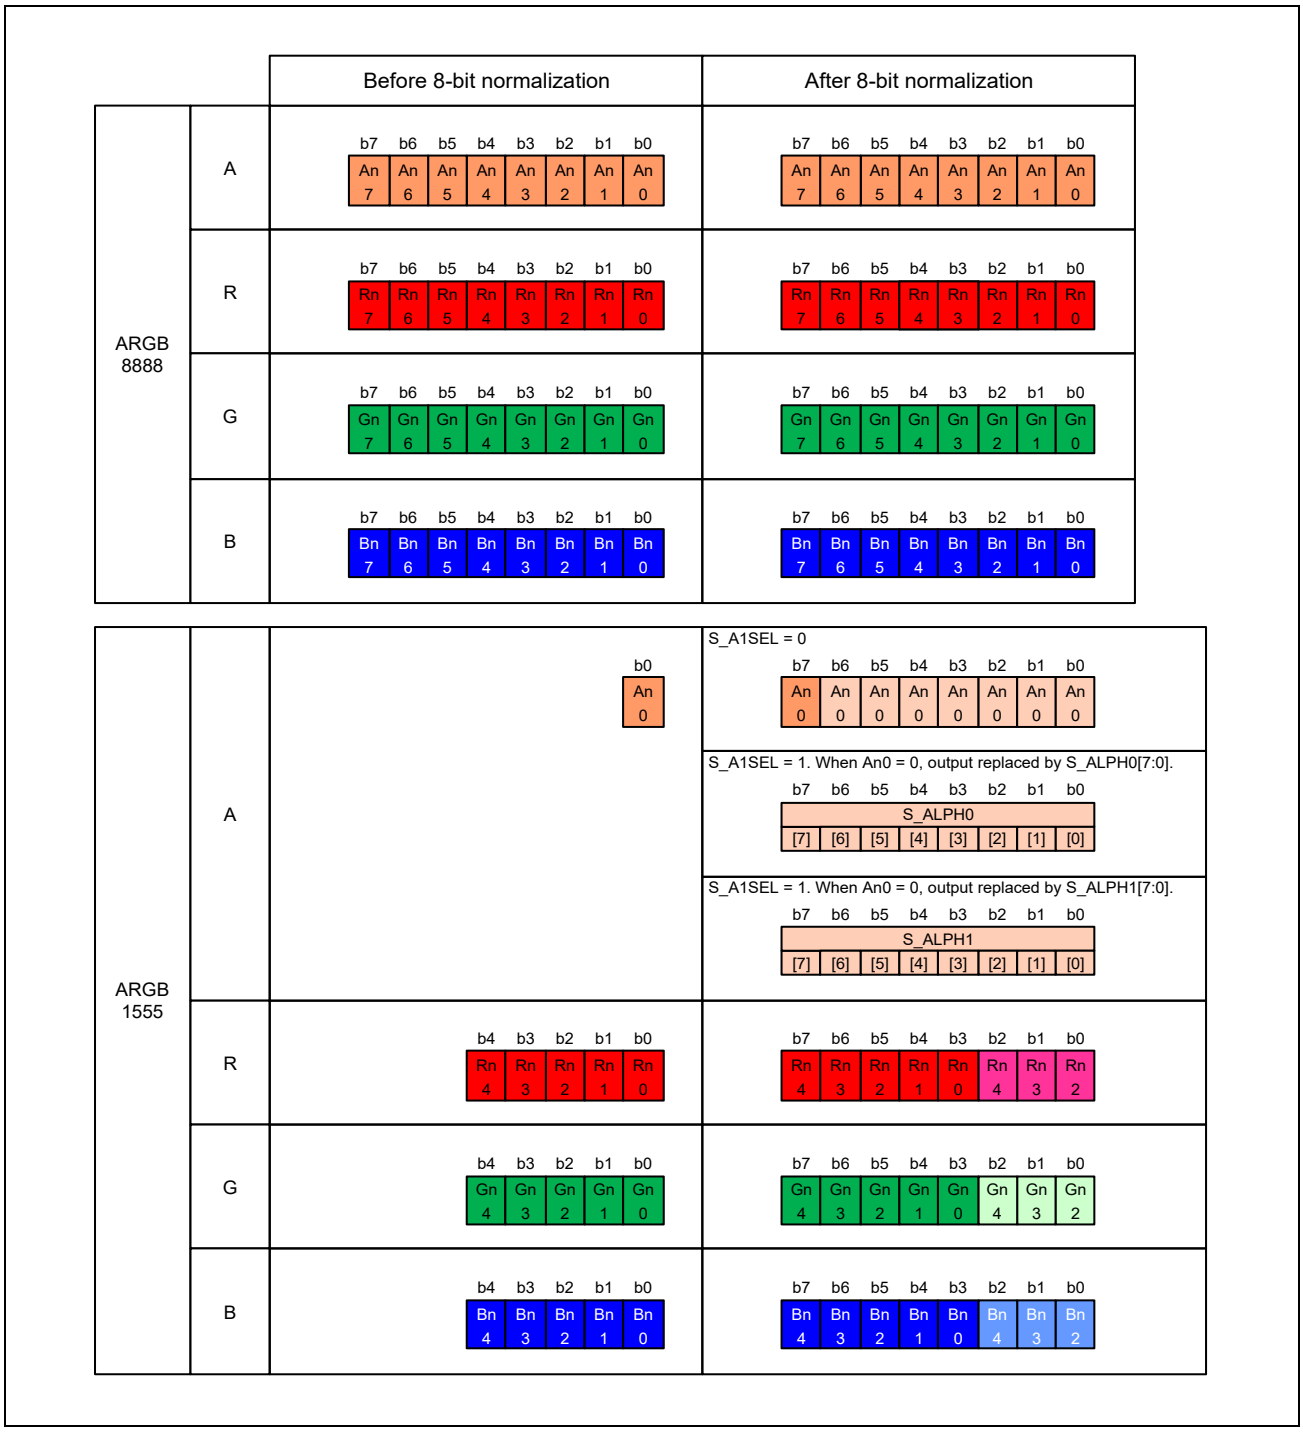

Figure 9.3-15 8-bit Normalization for ARGB Format

■ YCbCr/YUV

For YCbCr/YUV420 Semi-Planar format, even line re-use previous odd line's chroma information.

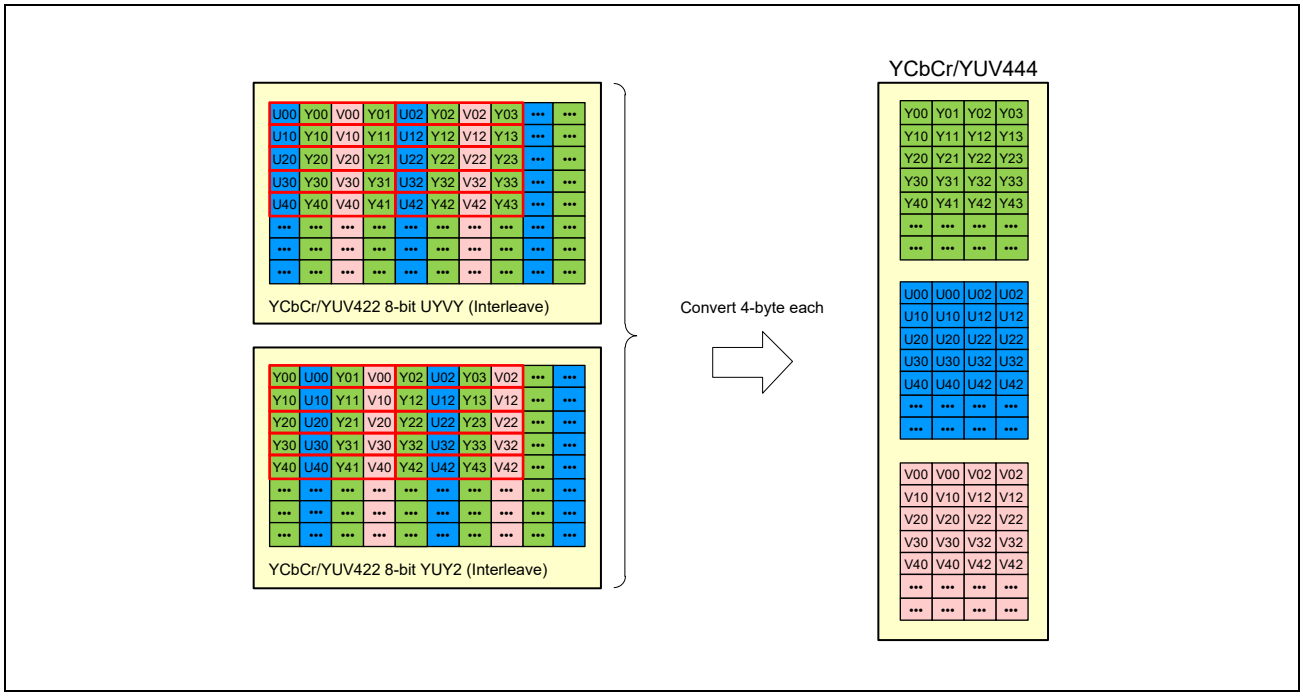

Figure 9.3-16 YCbCr/YUV444 Conversion from YCbCr/YUV422 Format

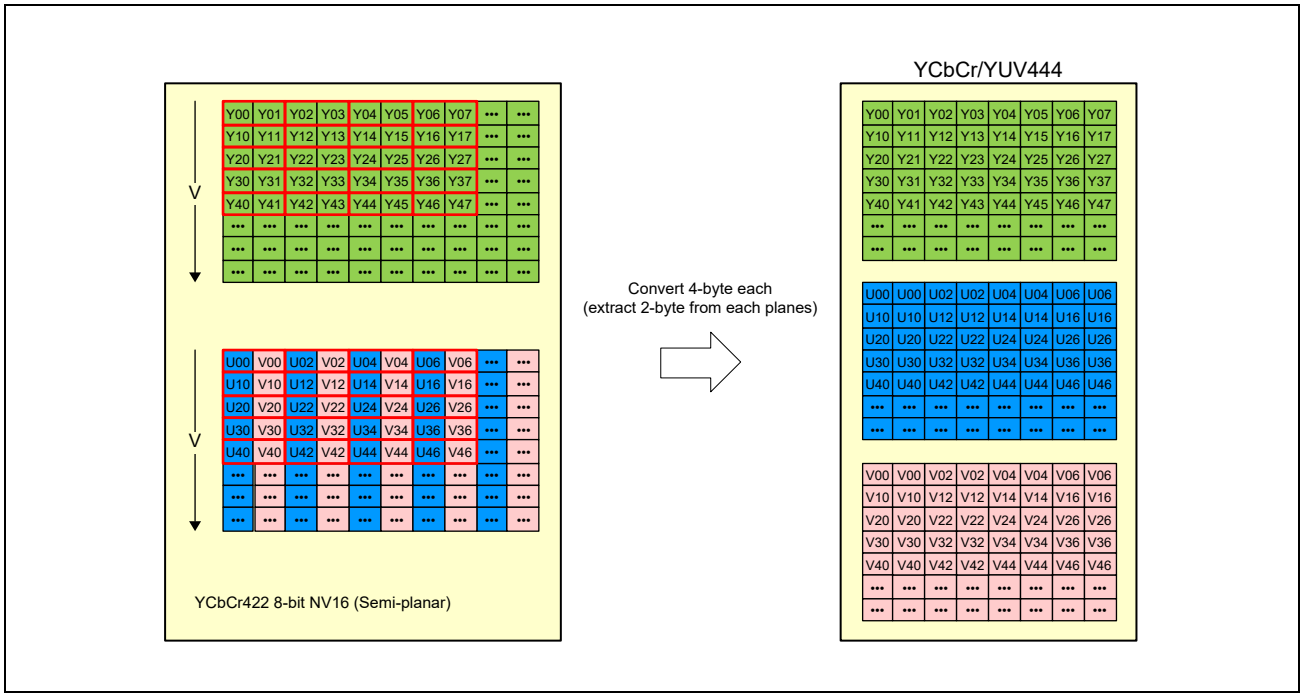

Figure 9.3-17 YCbCr/YUV444 Conversion from YCbCr/YUV422 Semi-Planar Format

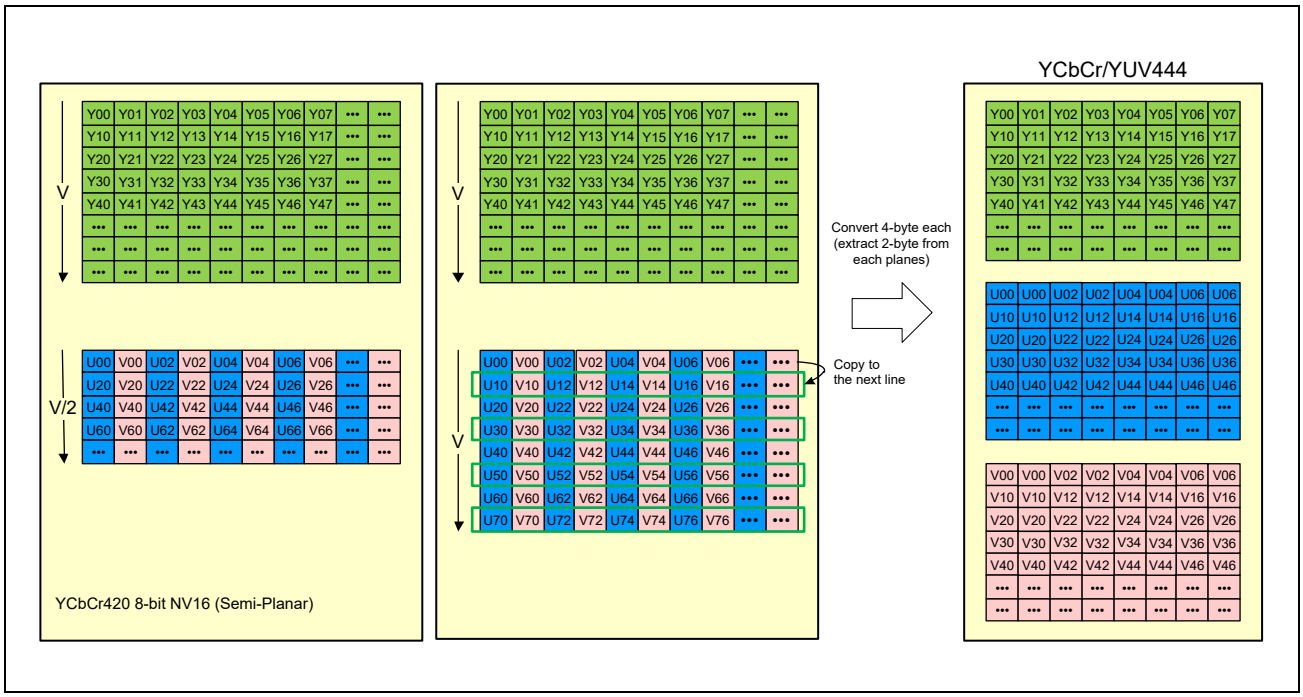

Figure 9.3-18 YCbCr/YUV444 Conversion from YCbCr/YUV420 Semi-Planar Format

■ RAW

RAW is converted to 8 bits by using higher 8 bits of RAW6-/7-/8-/10-/12-/14-/16-/20-bit data.

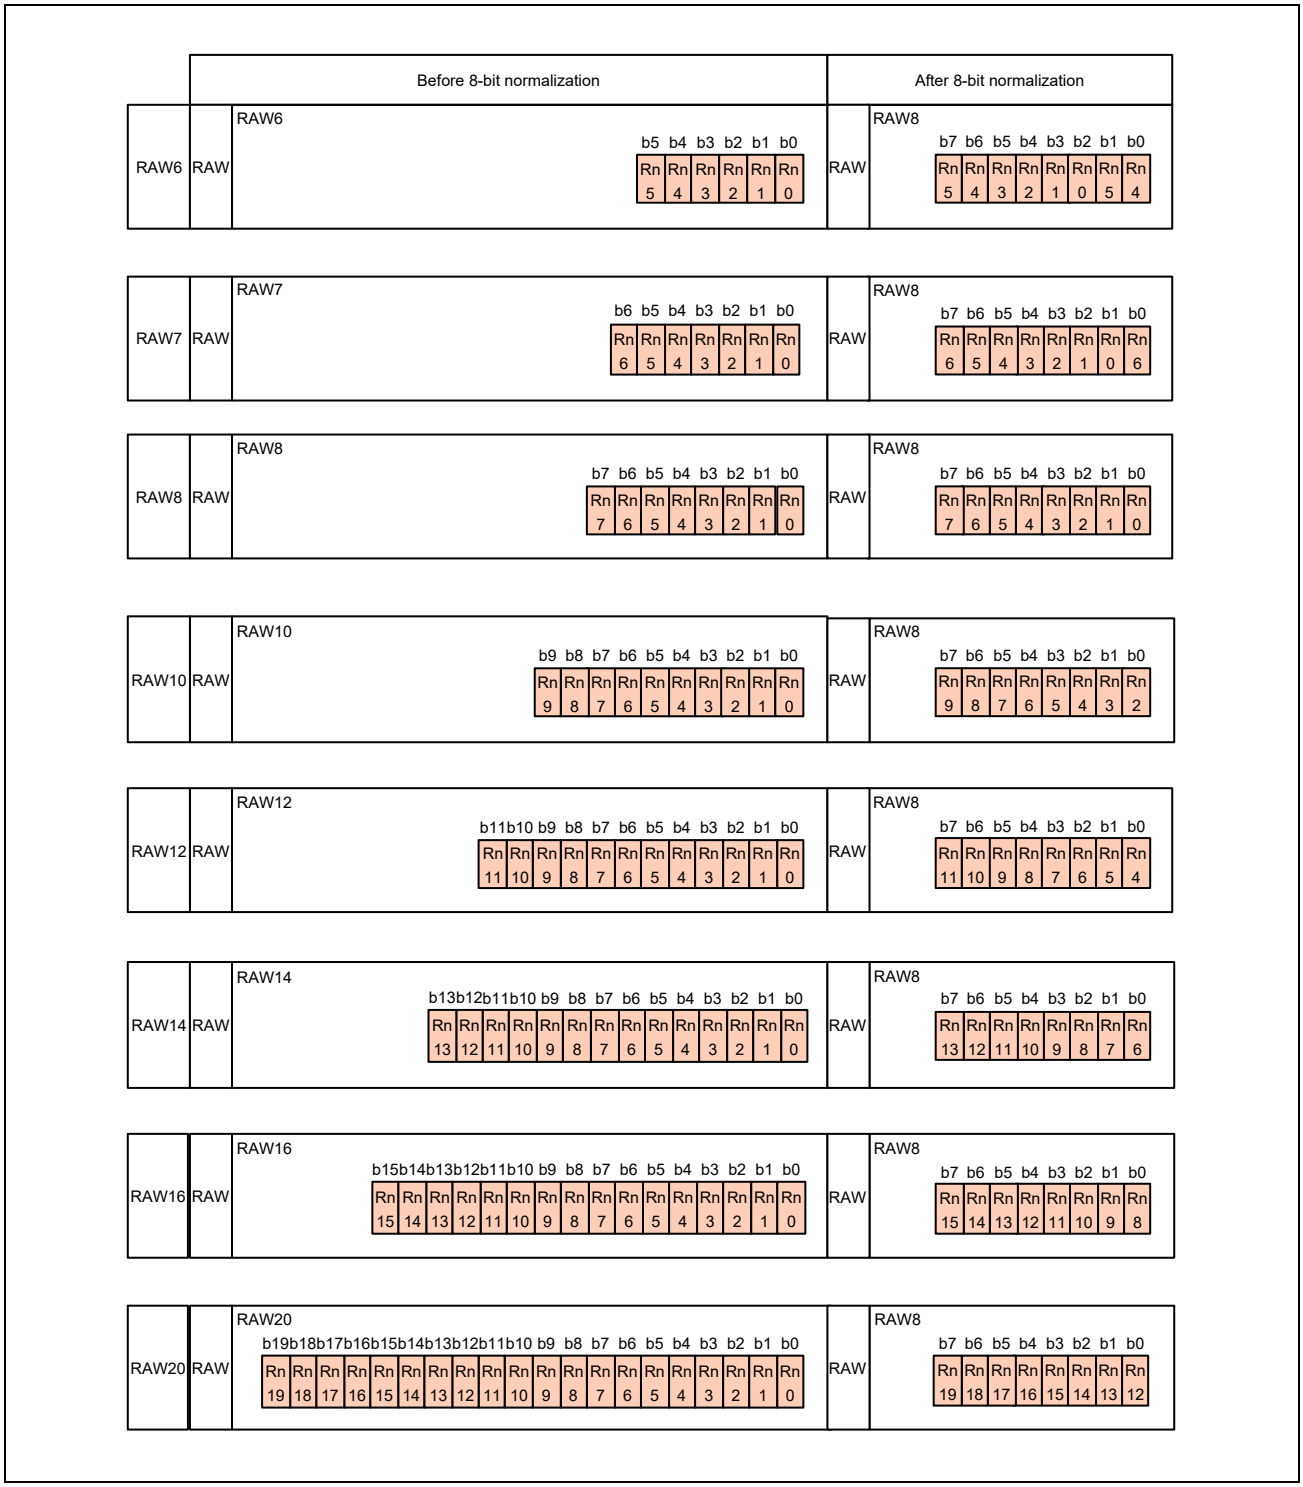

Figure 9.3-19 8-bit Normalization for RAW Format

9.3.1.3.4 Test Pattern Generation

Instead of the input image data from the AXI-Master, RPF can generates a test pattern and outputs it to the Resizer.

The test pattern is an 8-bit gradation image from the upper left to the lower right in the ARGB8888 format according to the register setting.

Please switch between the test pattern and the input image data from the AXI-Master according below procedure.

1. Enable the test pattern. (ISU_RPF_SRC_TD1.TMODE_EN = 1b)
2. Start the resizing process. (ISU_FM_FRCON.START = 1b)

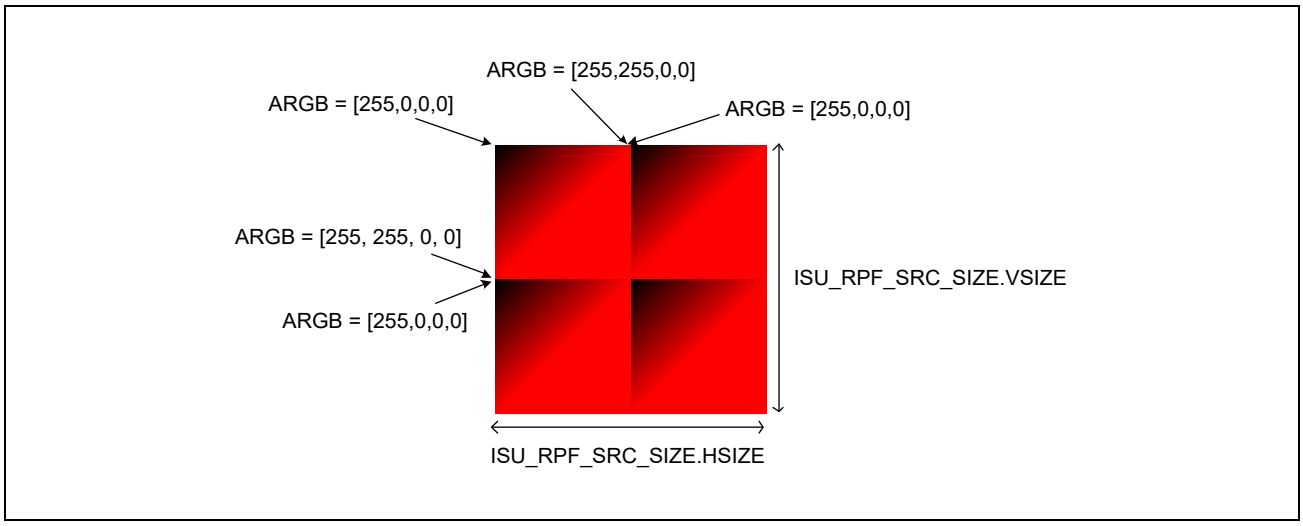

Figure 9.3-20 Test Pattern of R Gradation

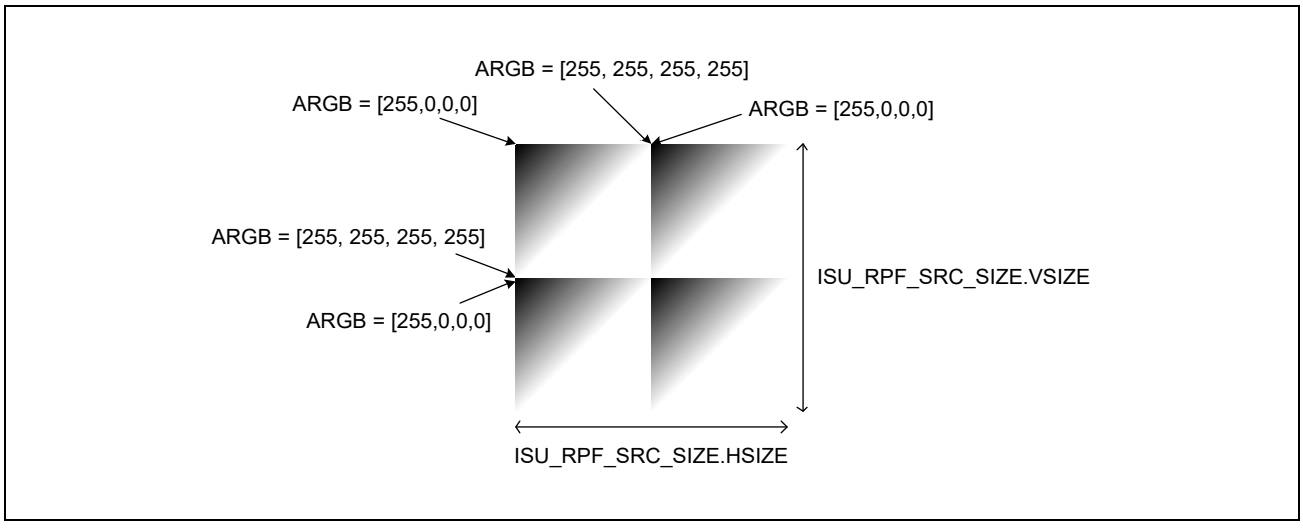

Figure 9.3-21 Pattern of R,G,B Gradation

9.3.1.4 Resizer (RS)

Resizer (RS) reduces the image size by using bi-linear algorithm (4-point linear interpolation) according to register setting of horizontal / vertical resize ratio.

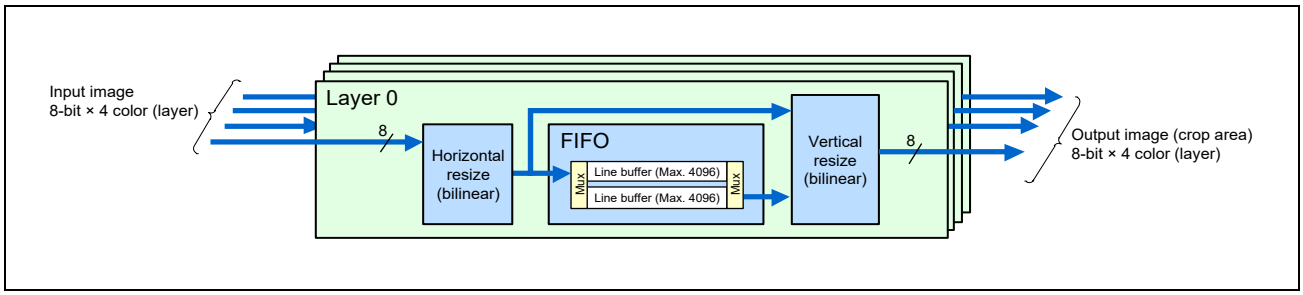

Figure 9.3-22 Resizer Block Diagram

The resize processing is different whether the Resized image size is smaller or larger than the Crop area.

If the Resized image size is smaller than the Crop area, fill in the missing edge pixels according to the register settings below.

When ISU_RS_PADDMODE.PADDSEL = 0b, fill in the padding area by copying the right / bottom edge pixels after the reduction.

When ISU_RS_PADDMODE.PADDSEL = 1b, fill in the padding area with the value specified by the register.

If the Resized image size is larger than the Crop area, it will be cut off by the Crop area.

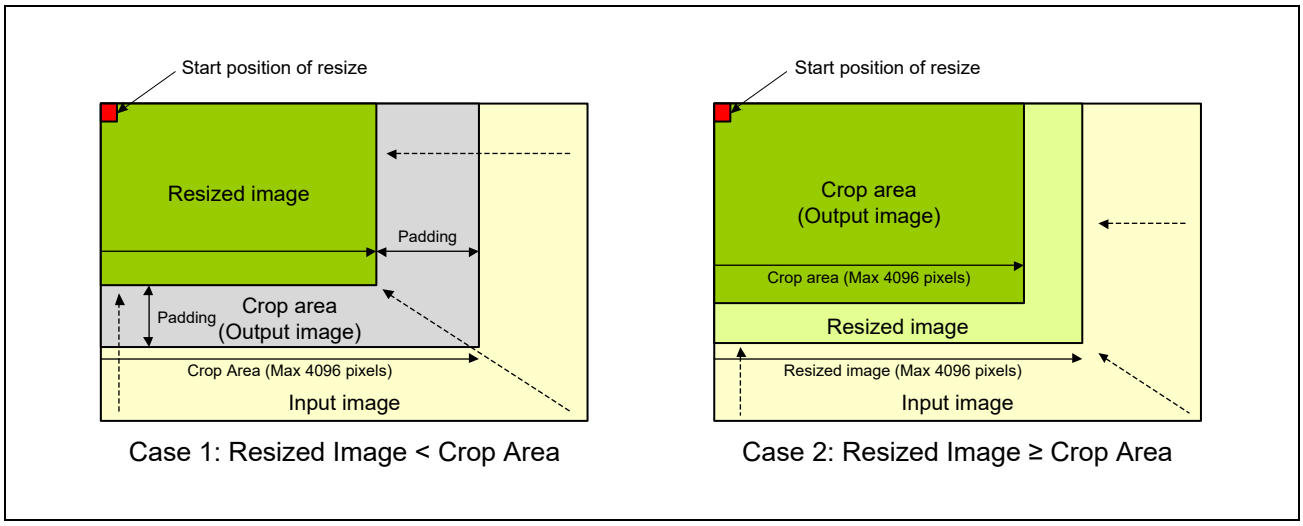

Figure 9.3-23 Relationship of Resized Image and Crop Area

9.3.1.4.1 Resize start position

The resize processing start from Resize Start Position (ISU_RS_STPOS) on the input image in according to the register setting. This position setting is specified in pixel coordinates from the top left of the image. If 0 is specified, the input image will be the Resizer (RS) target image as it is.

Padding area will be filled based on the setting of ISU_RS_PADDMODE.PADDSEL.

- Register ISU_RS_STPOS.HSTART = Resize Start H position
- Register ISU_RS_STPOS.VSTART = Resize Start V position

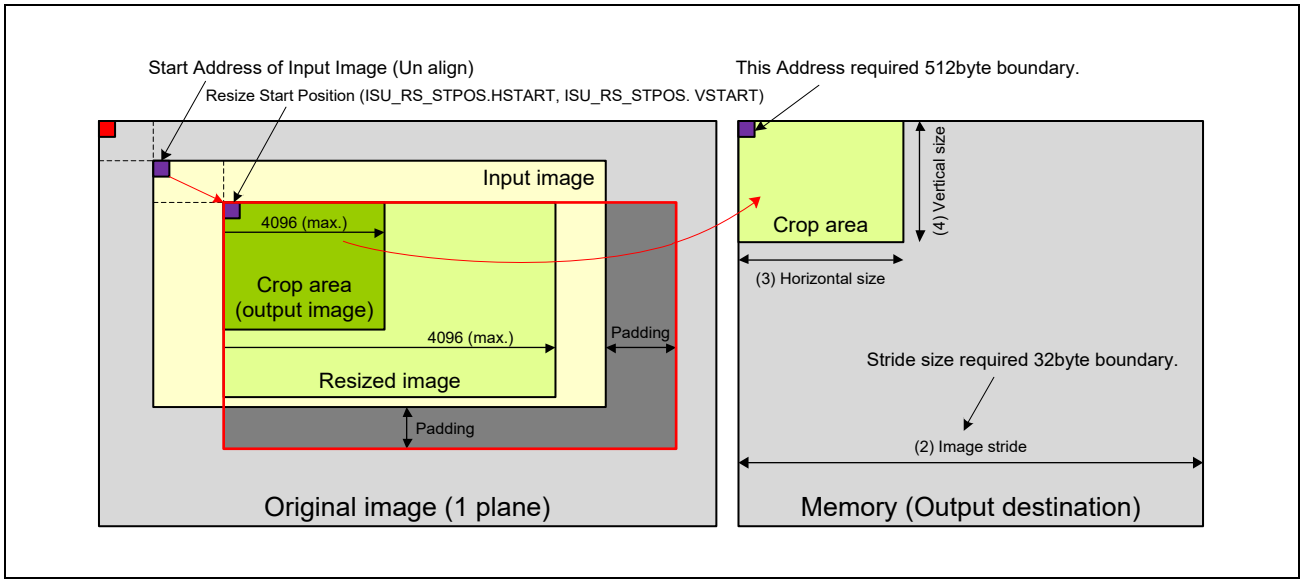

Figure 9.3-24 Resize Start Position

9.3.1.4.2 Sub pixel offset

The Resize Start Position Tuning (ISU_RS_POS_TUNE) can be used to adjust the start position by sub pixel level to reduce moiré.

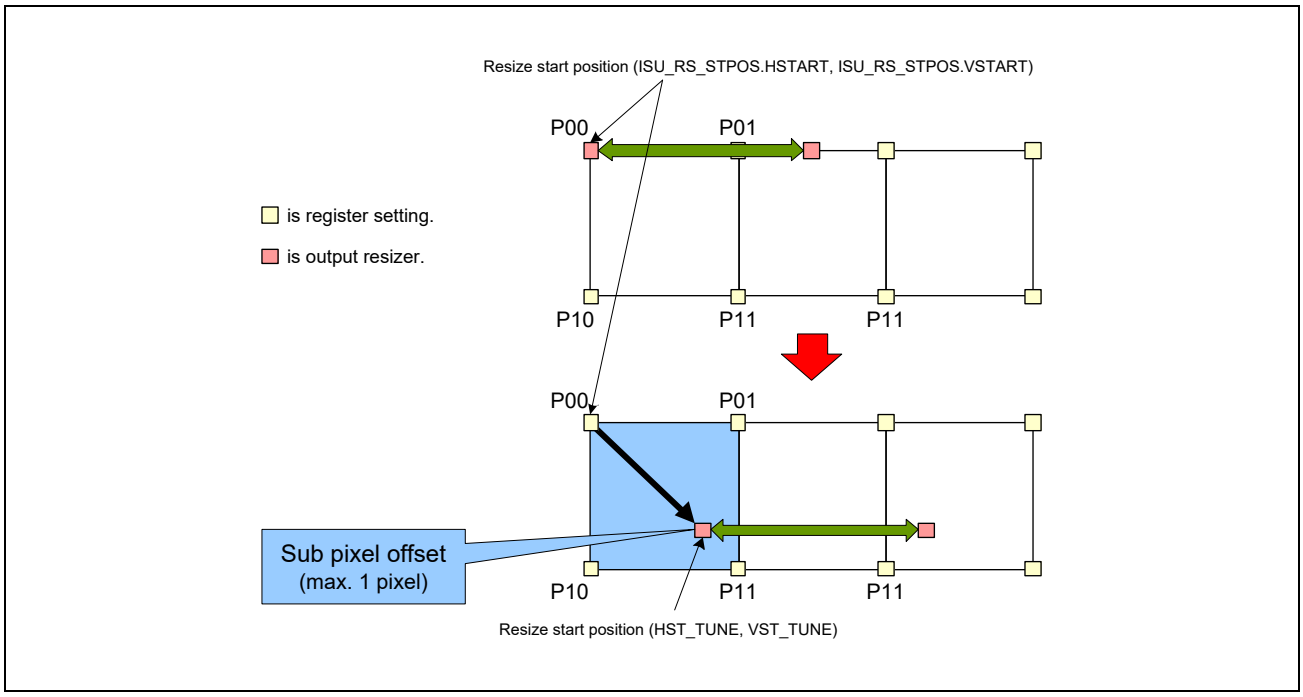

Figure 9.3-25 Sub Pixel Position Adjustment

9.3.1.4.3 Scaling calculation

The coefficients are defined in **Table 9.3-8**.

Table 9.3-8 Scaling Coefficient Setting

No.	Category	Register	Variation
(1)	Horizontal Scaling Ratio	RS_HSCALE.HMANT[3:0]	• m_h: Integer part of Horizontal scaling coefficient
		RS_HSCALE.HFRAC[11:0]	• f_h: Fraction part of Horizontal scaling coefficient
(2)	Vertical Scaling Ratio	RS_VSCALE.VMANT[3:0]	• m_v: Integer part of Vertical scaling coefficient
		RS_VSCALE.VFRAC[11:0]	• f_v: Fraction part of Vertical scaling coefficient

Follow the procedure below to set the coefficients.

Step 1: Estimation of scaling factor

The resizer can be handled resizing magnification independently for horizontally and vertically. The image size of this processing result can be calculated approximately by using “Input image horizontal size × hscale” and “Input image vertical size × vscale”.

$$\text{hascale} = \frac{4096}{4096 \times m_h + f_h} \qquad \text{vscale} = \frac{4096}{4096 \times m_v + f_v}$$

Figure 9.3-26 Sub Pixel Position Adjustment

Step 2: Conversion of set values

Convert the set values according to **Table 9.3-9**.

Table 9.3-9 m_h' or m_v' Settings

ISU_RS_HSCALE.HMANTsetting (ISU_RS_VSCALE.VMANTsetting)	m_h' (m_v')
1 to 3	1
4 to 7	2
8 to 15	4

Step 3: Fine-tuning of size calculations

- Definitions

  $hsize_{org}$: Input horizontal image size
  $vsize_{org}$: Input vertical image size
  $hsize_{down\_scaled}$: Horizontal image size after scale down
  $vsize_{down\_scaled}$: Vertical image size after scale down
  < >: Rounding down to the decimal point

- Formula

$$hsize_{down\_scaled} = \langle 1 + \left[\left[\langle 1 + \frac{hsize_{org} - 1}{m_{\acute{h}}} \rangle - 1 \right] \times m_{\acute{h}} \times 4096 \right] / (4096 \times m_h + f_h) \rangle$$

$$vsize_{down\_scaled} = \langle 1 + \left[\left[\langle 1 + \frac{vsize_{org} - 1}{m_{\acute{v}}} \rangle - 1 \right] \times m_{\acute{v}} \times 4096 \right] / (4096 \times m_v + f_v) \rangle$$

Step 4: Adjustment

If the down scaled image size does not match the intended size, the values of f_h and f_v are fine-tuned and recalculated to find f_h and f_v that result in the desired output down scaled size.

The values thus obtained are set to the corresponding register values RS_HSCALE and RS_VSCALE.

9.3.1.4.4 Resize processing

The following figure shows the processing image of bi-linear algorithm (4-point interpolation).

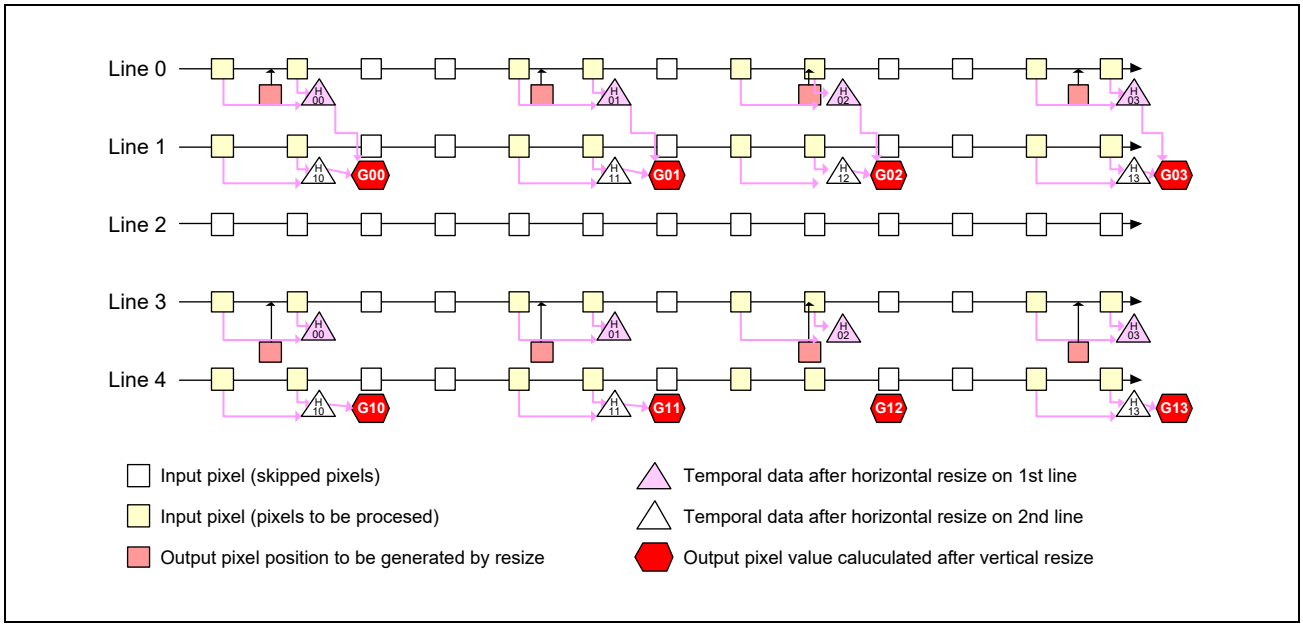

Figure 9.3-27 Points Bi-Linear Resize

The outline of the calculation procedure of 4-point linear interpolation is shown below.

Although dH and dV are not exist actually, it is used to help understanding for this algorithm. The pixel value of the target pixel position G00 will be calculated from the nearest 4 input pixels, and dH and dV indicate sub pixel position of G00 calculated from Horizontal/Vertical scaling ratio.

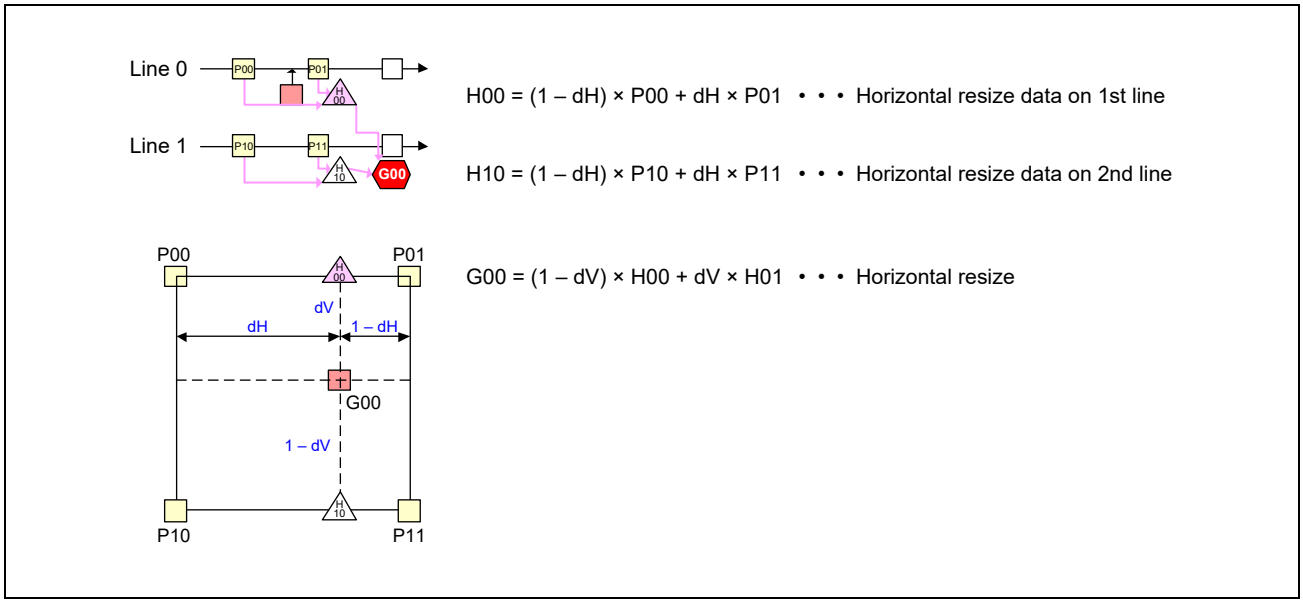

Figure 9.3-28 Calculation for 4 Points Bi-linear Resize

9.3.1.5 Write Pixel Formatting (WPF)

The WPF converts the resized image data from RS and outputs it to the AXI-Master.

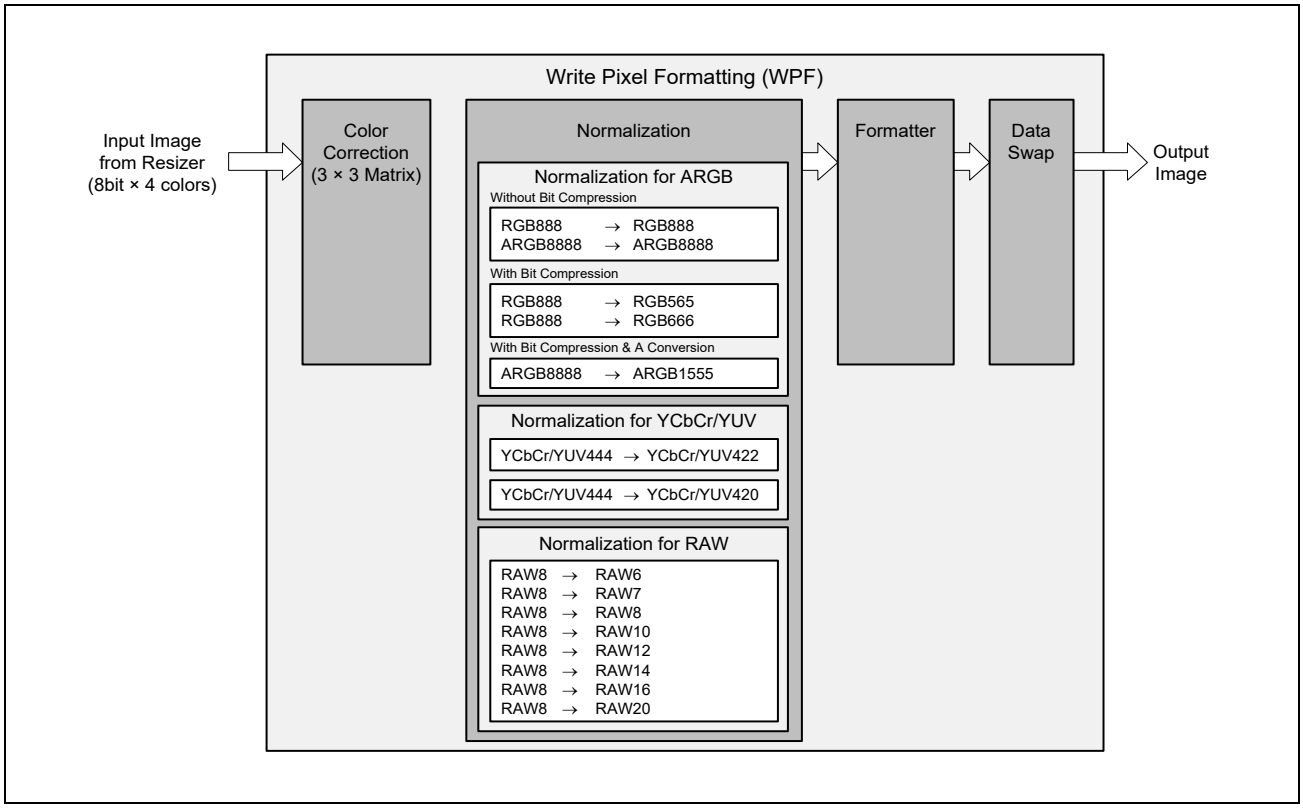

Figure 9.3-29 WPF Block Diagram

9.3.1.5.1 Color correction

This function is for the color space conversion among RGB, YCbCr, and YUV by using 3 × 3 color matrix. Matrix coefficients can be set by registers. The matrix calculation formula and circuit block diagram are shown below.

3 × 3 matrix

$$\begin{bmatrix} C1' \\ C2' \\ C3' \end{bmatrix} = \begin{bmatrix} K11 & K12 & K13 \\ K21 & K22 & K23 \\ K31 & K32 & K33 \end{bmatrix} \cdot \begin{bmatrix} A - OFST\_A1 \\ B - OFST\_B1 \\ C - OFST\_C1 \end{bmatrix} + \begin{bmatrix} OFST\_A2 \\ OFST\_B2 \\ OFST\_C2 \end{bmatrix}$$

Level clipping

$$C1'' = MAX\ (CLPMIN\_A, MIN\ (CLPMAX\_A, C1'))$$
$$C2'' = MAX\ (CLPMIN\_B, MIN\ (CLPMAX\_B, C2'))$$
$$C3'' = MAX\ (CLPMIN\_C, MIN\ (CLPMAX\_C, C3'))$$

Figure 9.3-30 Color Correction Equation

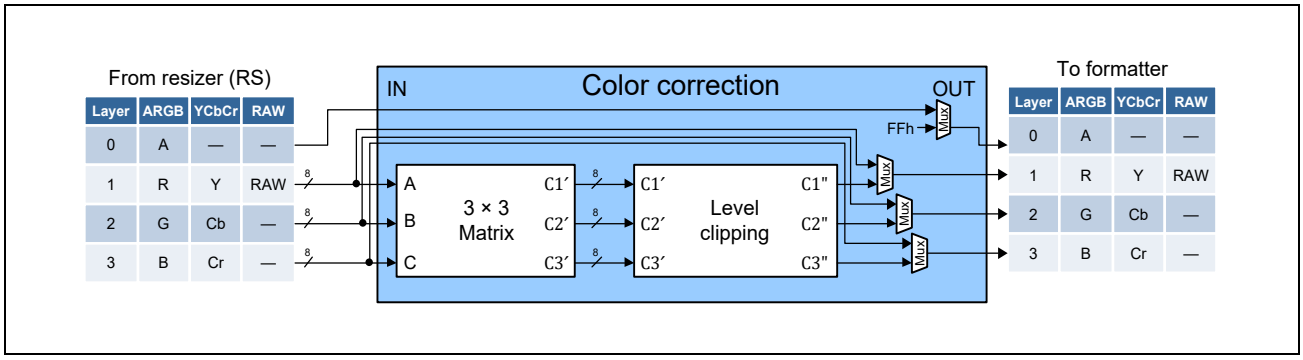

Figure 9.3-31 Color Correction Block Diagram

Sample settings of color matrix are shown below.

Conversion between RGB and YUV (PAL, SECAM)

$$\begin{bmatrix} Y_{OUT} \\ U_{OUT} \\ V_{OUT} \end{bmatrix} = \begin{bmatrix} 0.299 & 0.587 & 0.114 \\ -0.147 & -0.289 & 0.436 \\ 0.615 & -0.515 & -0.100 \end{bmatrix} \begin{bmatrix} R_{in} \\ G_{in} \\ B_{in} \end{bmatrix} + \begin{bmatrix} 0 \\ 128 \\ 128 \end{bmatrix} \qquad \begin{bmatrix} R_{OUT} \\ G_{OUT} \\ B_{OUT} \end{bmatrix} = \begin{bmatrix} 1.000 & 0.000 & 1.140 \\ 1.000 & -0.395 & -0.580 \\ 1.000 & 2.032 & -0.000 \end{bmatrix} \begin{bmatrix} Y_{in} \\ (U_{in} - 128) \\ (V_{in} - 128) \end{bmatrix} + \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

Conversion between RGB and YCbCr ITU-R BT.601 / BT.709 (1250/50/2:1)

$$\begin{bmatrix} Y_{OUT} \\ Cb_{OUT} \\ Cr_{OUT} \end{bmatrix} = \begin{bmatrix} 0.299 & 0.587 & 0.114 \\ -0.169 & -0.331 & 0.500 \\ 0.500 & -0.419 & -0.081 \end{bmatrix} \begin{bmatrix} R_{in} \\ G_{in} \\ B_{in} \end{bmatrix} + \begin{bmatrix} 0 \\ 128 \\ 128 \end{bmatrix} \qquad \begin{bmatrix} R_{OUT} \\ G_{OUT} \\ B_{OUT} \end{bmatrix} = \begin{bmatrix} 1.000 & 0.000 & 1.402 \\ 1.000 & -0.344 & -0.714 \\ 1.000 & 1.772 & -0.000 \end{bmatrix} \begin{bmatrix} Y_{in} \\ (Cb_{in} - 128) \\ (Cr_{in} - 128) \end{bmatrix} + \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

Conversion between RGB and YCbCr ITU-R BT.709 (1125/60/2:1)

$$\begin{bmatrix} Y_{OUT} \\ Cb_{OUT} \\ Cr_{OUT} \end{bmatrix} = \begin{bmatrix} 0.213 & 0.715 & 0.072 \\ -0.115 & -0.385 & 0.500 \\ 0.500 & -0.454 & -0.046 \end{bmatrix} \begin{bmatrix} R_{in} \\ G_{in} \\ B_{in} \end{bmatrix} + \begin{bmatrix} 0 \\ 128 \\ 128 \end{bmatrix} \qquad \begin{bmatrix} R_{OUT} \\ G_{OUT} \\ B_{OUT} \end{bmatrix} = \begin{bmatrix} 1.000 & 0.000 & 1.575 \\ 1.000 & -0.187 & -0.468 \\ 1.000 & 1.856 & -0.000 \end{bmatrix} \begin{bmatrix} Y_{in} \\ (Cb_{in} - 128) \\ (Cr_{in} - 128) \end{bmatrix} + \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

Conversion from RAW to RGB or YCbCr/YUV (Grayscale)

$$\begin{bmatrix} R_{OUT} \\ G_{OUT} \\ B_{OUT} \end{bmatrix} = \begin{bmatrix} 1.000 & 0.000 & 0.000 \\ 1.000 & 0.000 & 0.000 \\ 1.000 & 0.000 & 0.000 \end{bmatrix} \begin{bmatrix} RAW_{in} \\ 0 \\ 0 \end{bmatrix} + \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix} \qquad \begin{bmatrix} Y_{OUT} \\ Cb_{OUT} \\ Cr_{OUT} \end{bmatrix} = \begin{bmatrix} 1.000 & 0.000 & 0.000 \\ 0.000 & 0.000 & 0.000 \\ 0.000 & 0.000 & 0.000 \end{bmatrix} \begin{bmatrix} RAW_{in} \\ 0 \\ 0 \end{bmatrix} + \begin{bmatrix} 0 \\ 128 \\ 128 \end{bmatrix}$$

9.3.1.5.2 Normalization

This function converts each color data into appropriate bit depth.

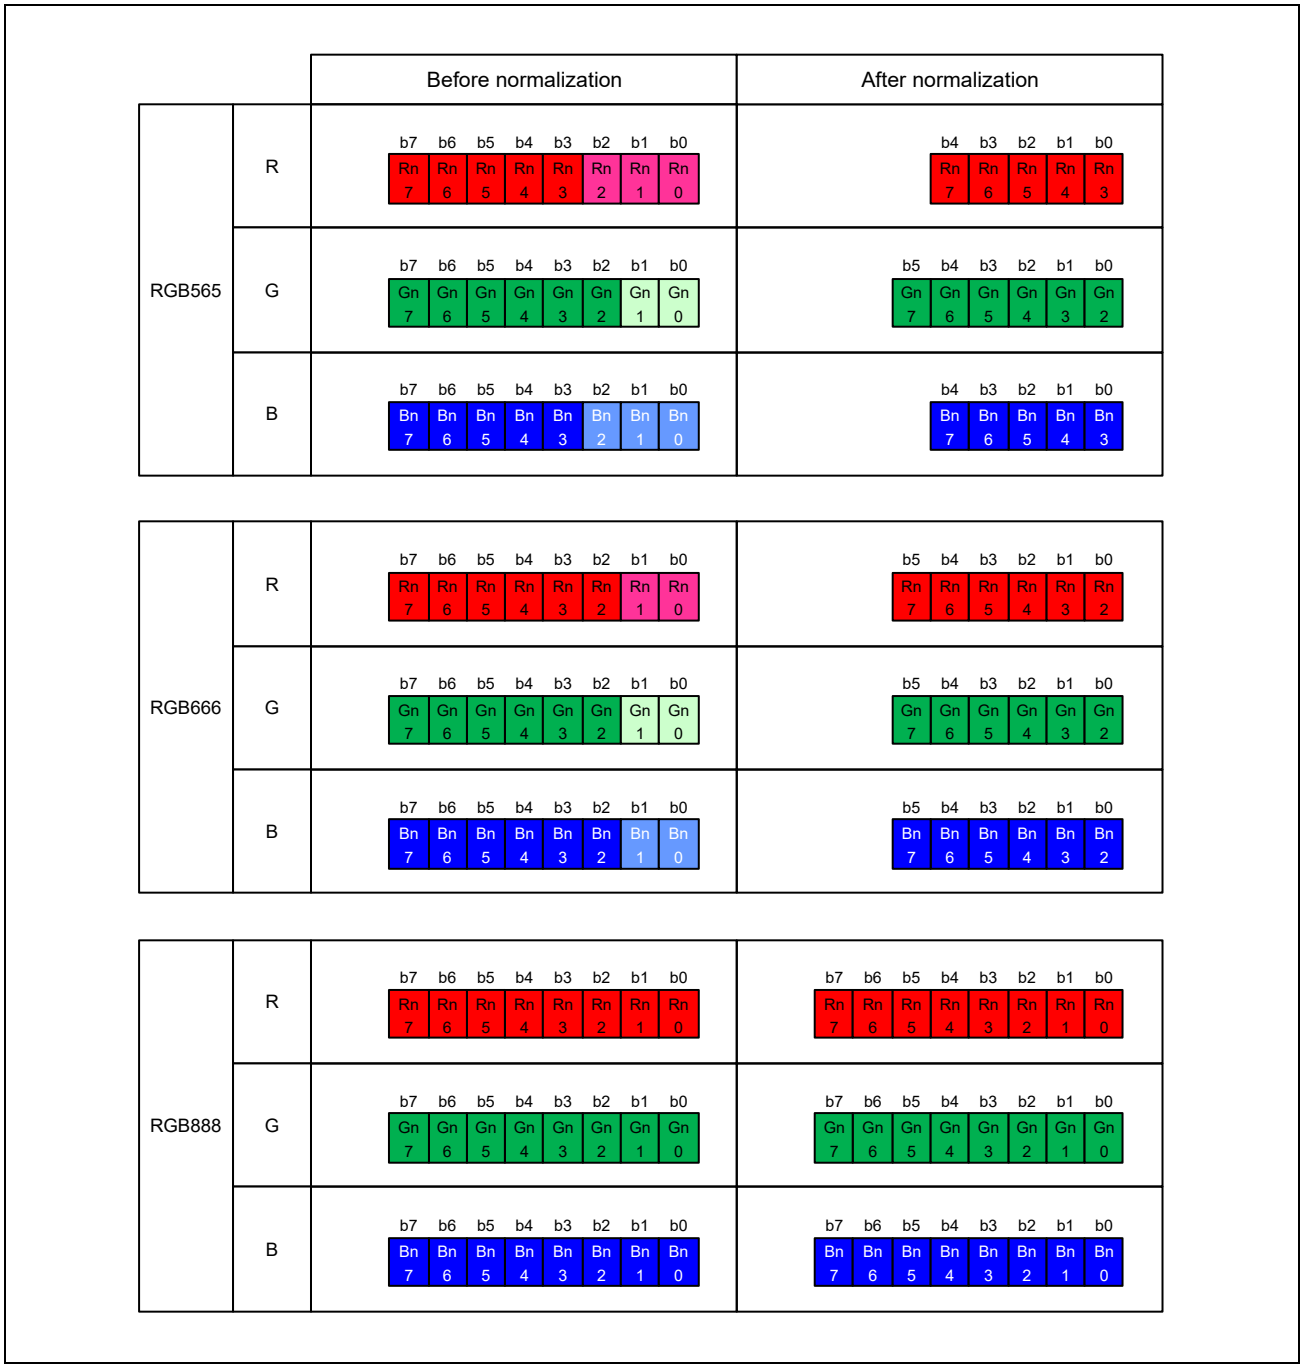

Figure 9.3-32 Normalization for RGB Format

■ **ARGB**

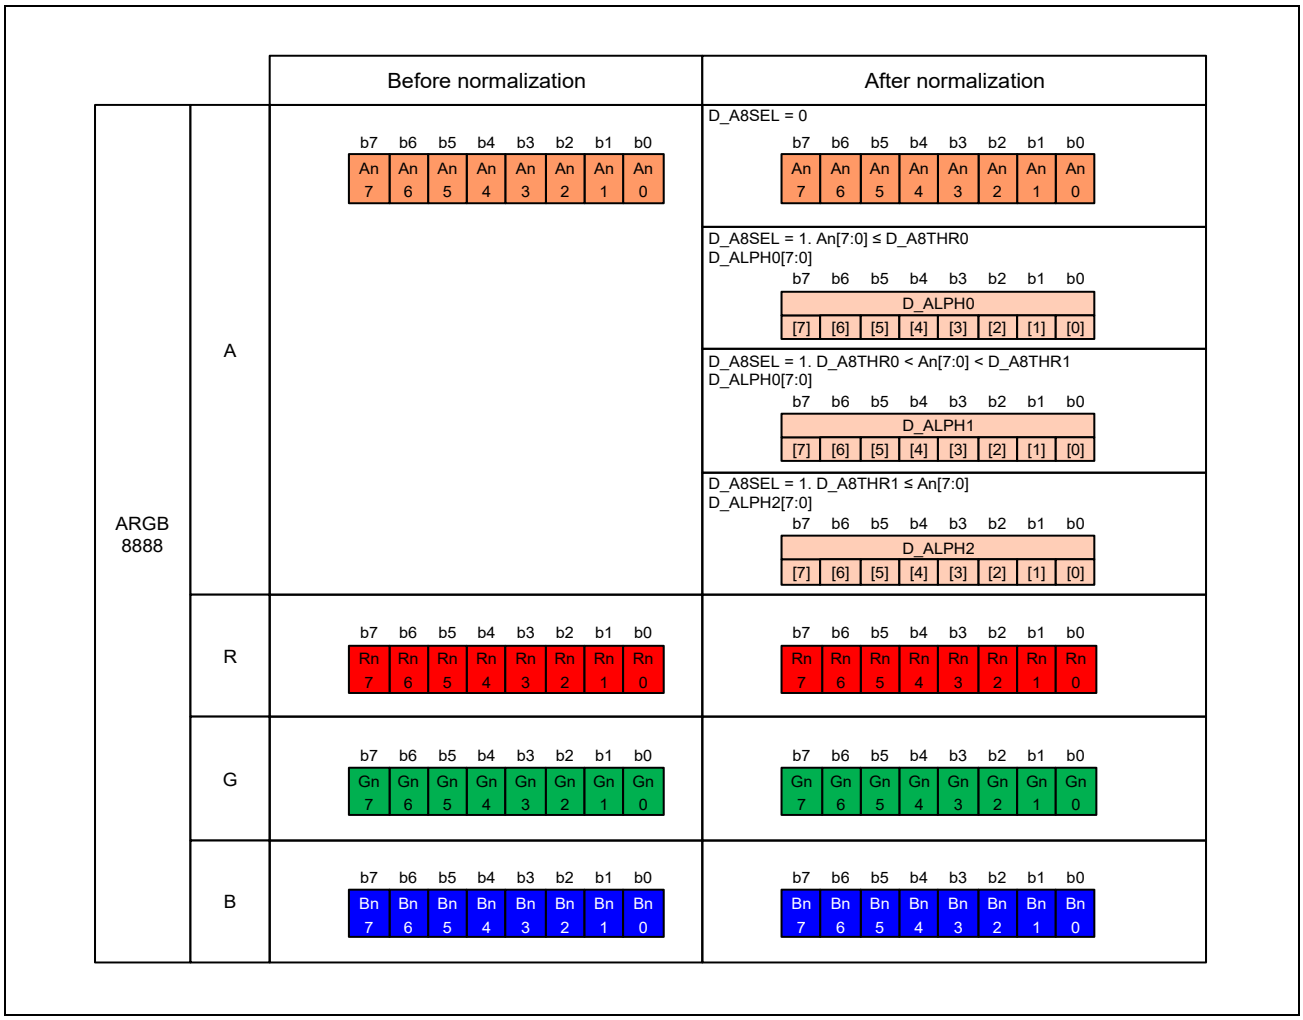

Figure 9.3-33 Normalization for ARGB8888 Format

“A(An)” of ARGB8888 is normalized according to the following logic.

If ISU_WPF_ALPH_SEL2.D_A8SEL = 0b, An is output as it is.

If ISU_WPF_ALPH_SEL2.D_A8SEL = 1b, replace it with the following value according to the relationship between ISU_WPF_ALPH_SEL2.D_A8THR0 to 1 and An.

If An ≤ D_A8THR0, replace it with ISU_WPF_ALPH_VAL.D_ALPH0.

If D_A8THR0 < An <D_A8THR1, replace it with ISU_WPF_ALPH_VAL.D_ALPH1.

If D_A8THR1 ≤ An, replace it with ISU_WPF_ALPH_VAL.D_ALPH2.

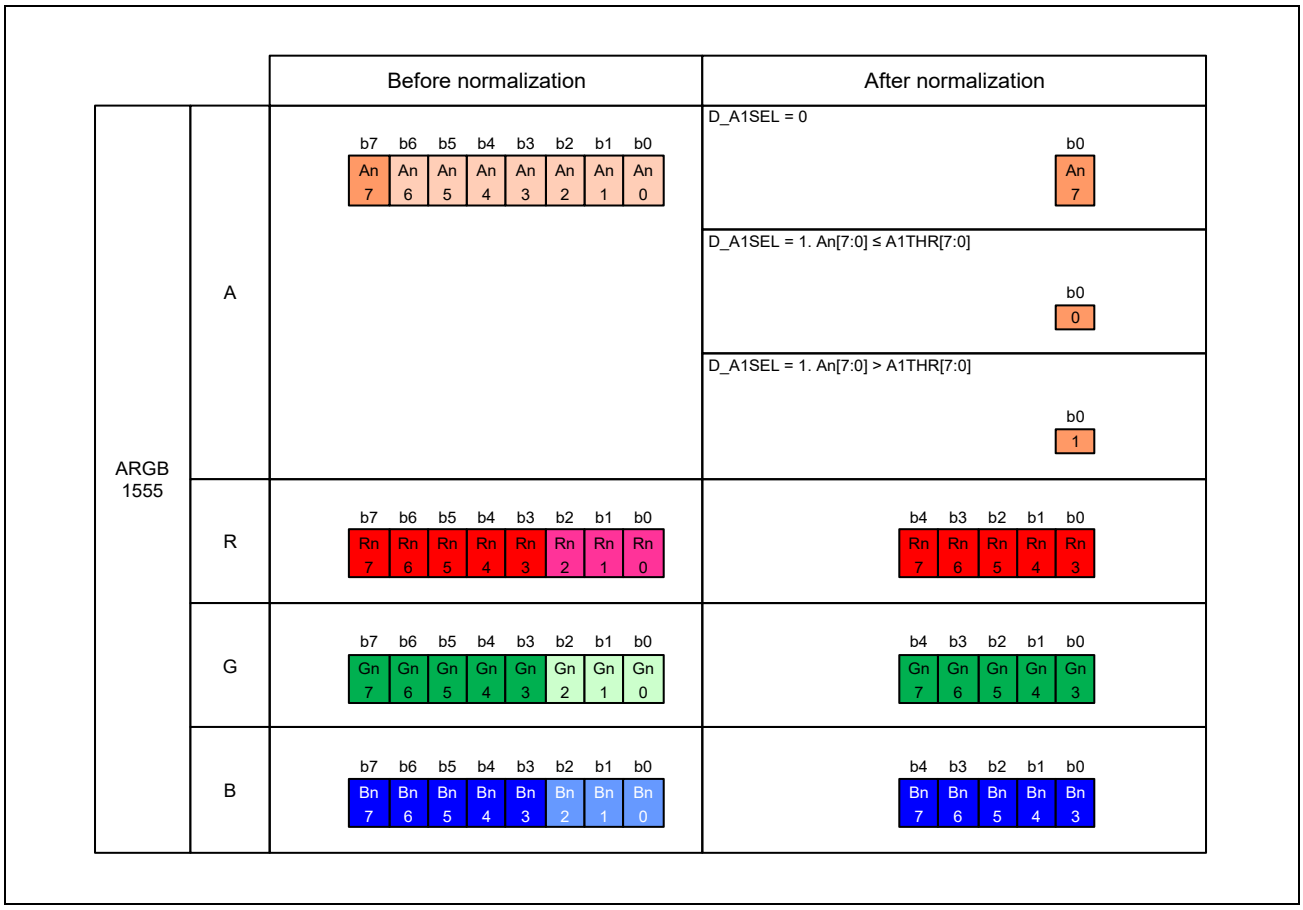

Figure 9.3-34 Normalization for ARGB1555 Format

“A(An)” of ARGB1555 A is compressed according to the following.

If ISU_WPF_ALPH_SEL1.D_A1SEL = 0b, An7 is output.

If ISU_WPF_ALPH_SEL1.D_A1SEL = 1b, replace it with the following value according to the relationship between ISU_WPF_ALPH_SEL1.D_A1THR and An.

If An ≤ D_A1THR, 0 is output.

If D_A1THR < An, 1 is output.

■ YCbCr/YUV

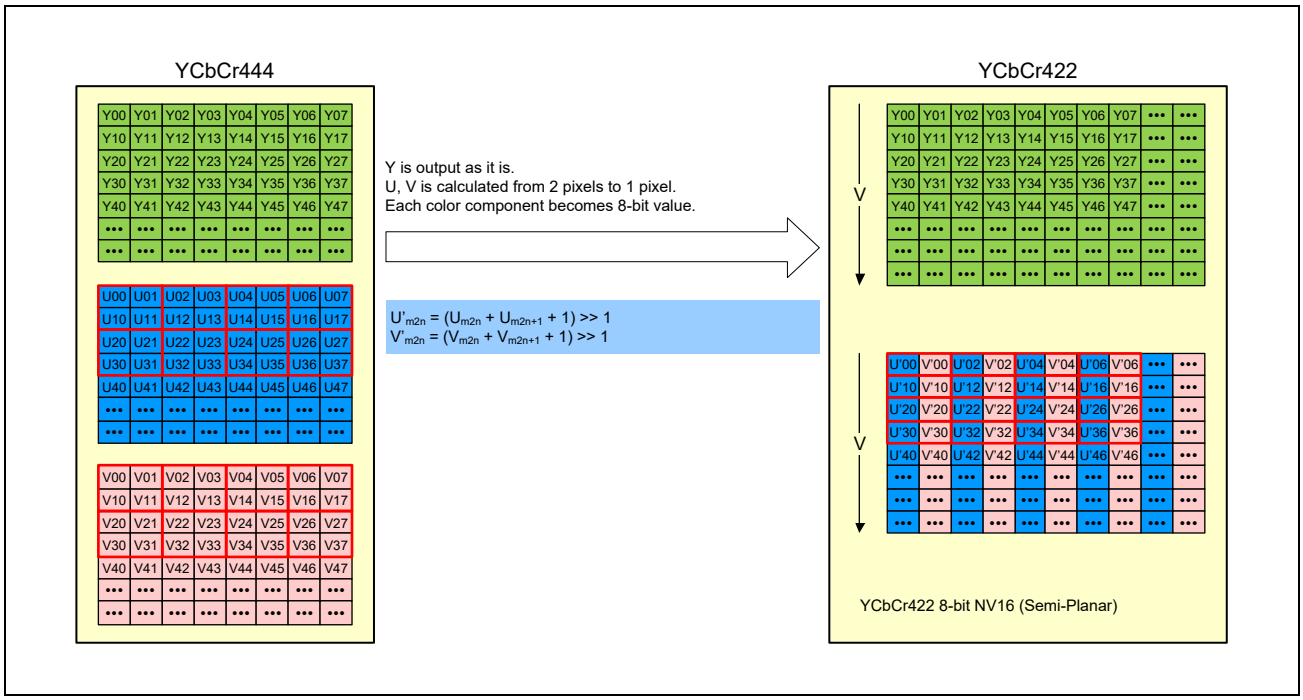

Figure 9.3-36 Normalization for YCbCr/YUV422 (Semi-Planar) Format

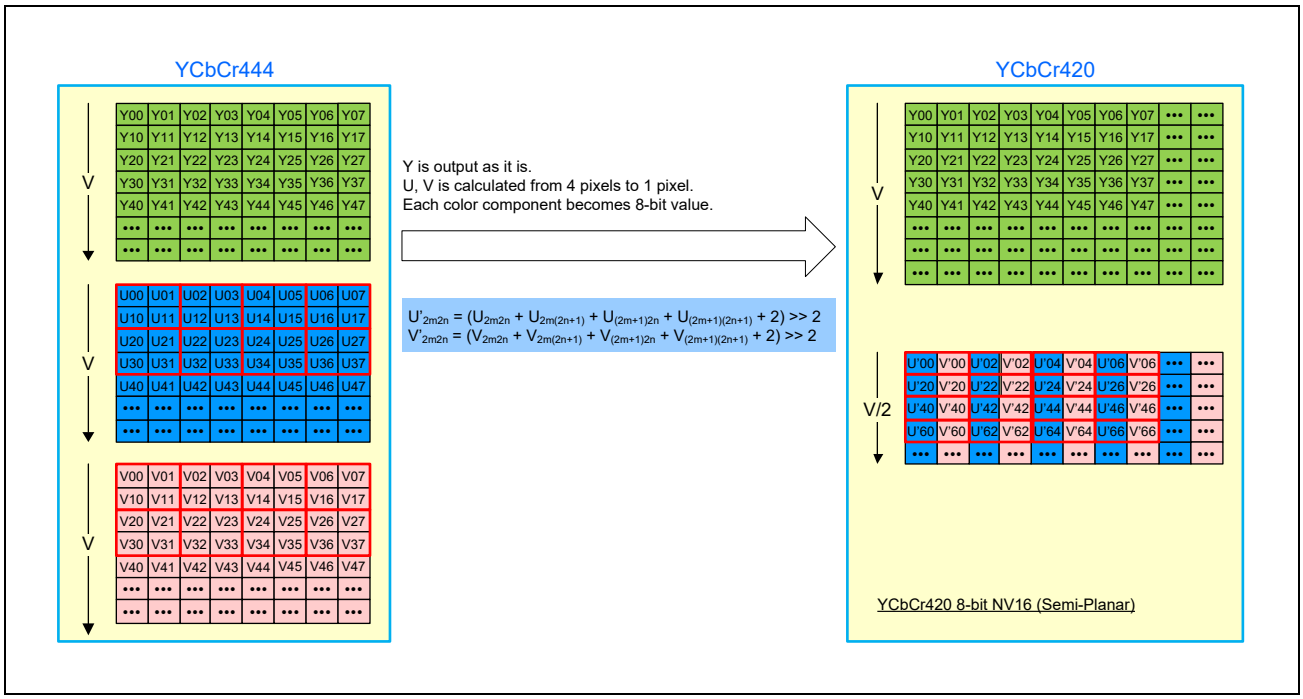

Figure 9.3-37 Normalization for YCbCr/YUV420 Format

■ RAW

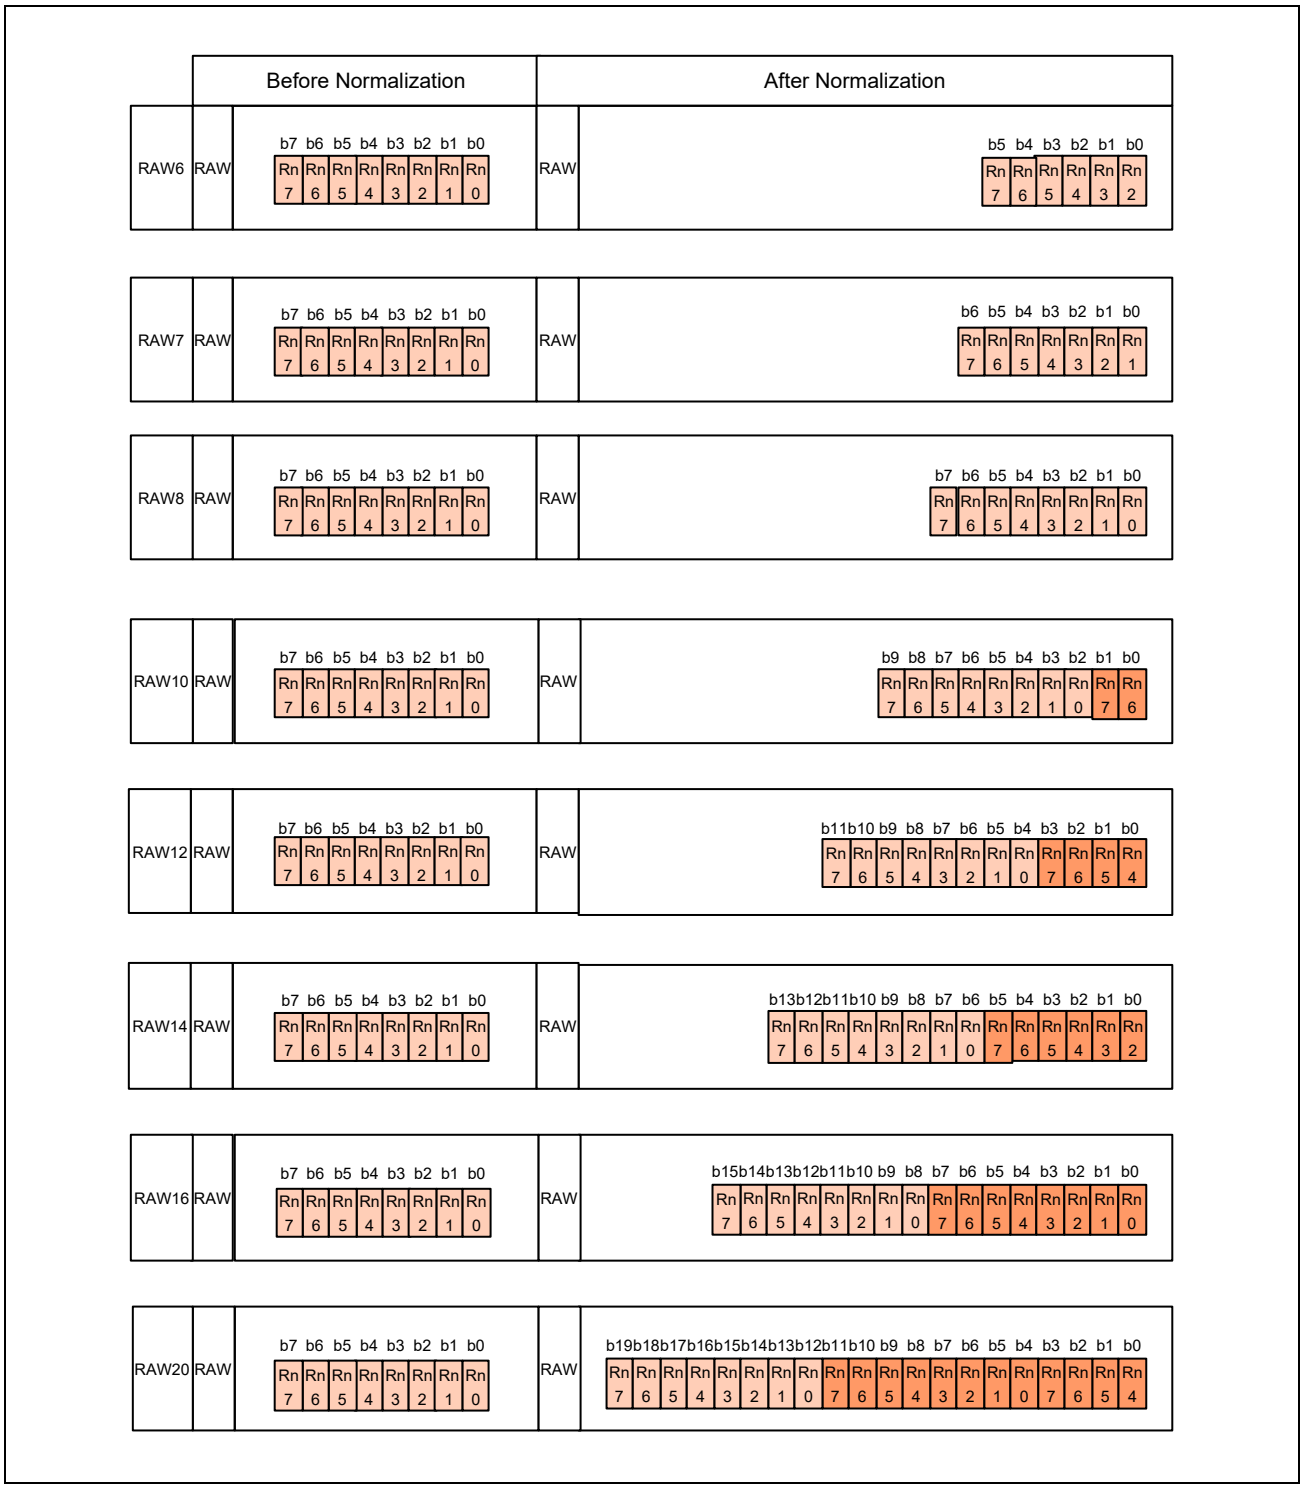

Figure 9.3-38 Normalization for RAW Format

9.3.1.5.3 WPF Formatter

The following data formats are described as 2-/3-/4-/8-byte per unit. Eventually, these data unit are packed in 32-byte (256-bit) each so that it can be handled in next process. Image format setting is indicated by ISU_WPF_FMT.WDFMT[5:0].

■ RGB/ARGB

This function supports 8 ARGB/RGB formats as shown below. All formats are “Number of planes = 1”.

Table 9.3-10 ARGB Support Format

	Format				n								n + 1								n + 2								n + 3

■ YCbCr/YUV

This function supports 4 YCrCb/YUV formats as shown below.

Table 9.3-11 YCbCr/YUV Support Format

Data Format	RDFMT[5:0]	Color Format	Alias	Figure Index
Interleave (Number of Planes = 1)	20h	YCbCr422 8-bit	UYVY	(1)
	21h	YCbCr422 8-bit	YUY2	(2)
Semi-Planar (Number of Planes = 2)	22h	YCbCr422 8-bit	NV16	(3)
	23h	YCbCr420 8-bit	NV12	(4)

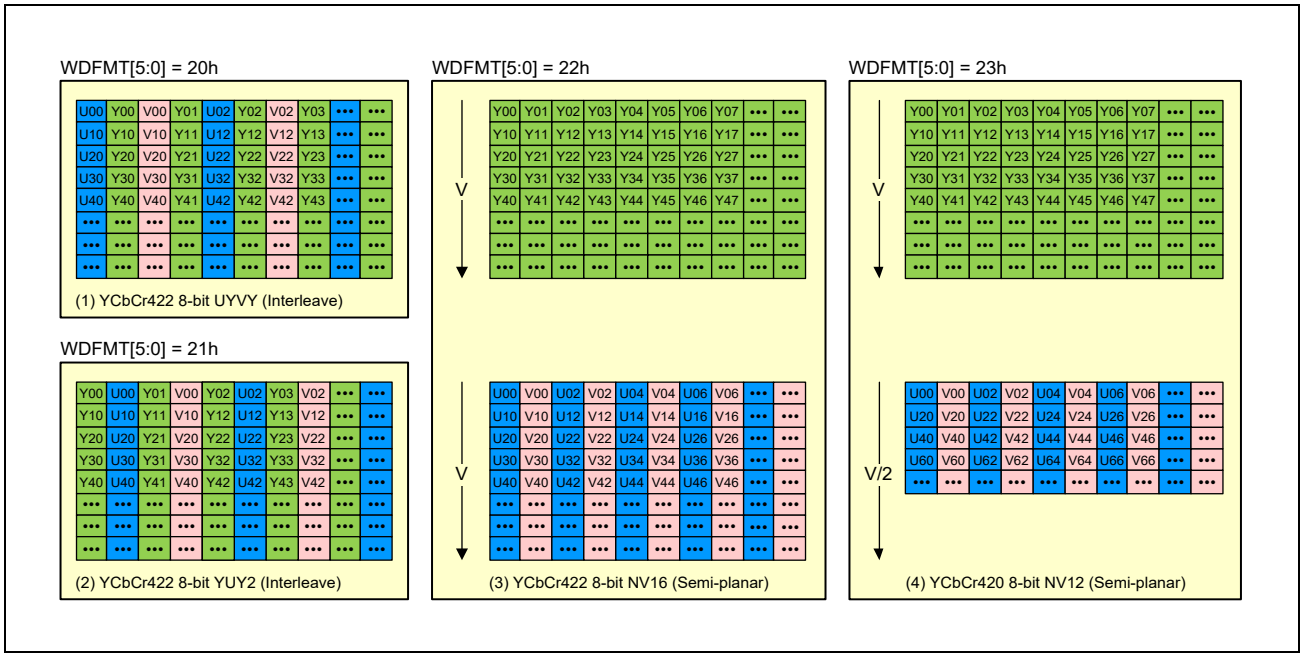

Figure 9.3-39 YCbCr/YUV Support Format

■ RAW

This function supports 8 RAW formats as shown below. All formats are “Number of planes = 1”.

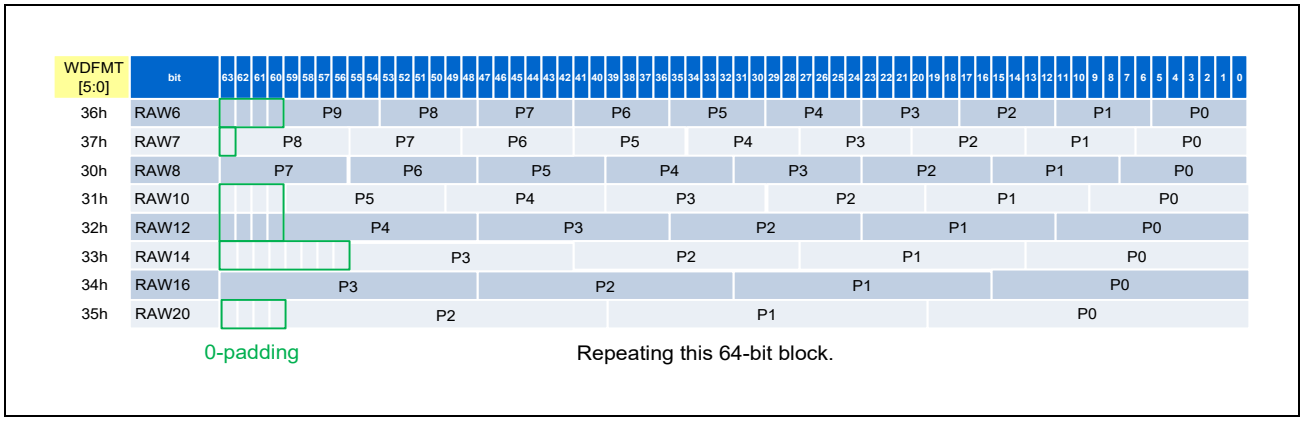

Figure 9.3-40 RAW Support Format

9.3.1.5.4 Data Swap (Endian Correction)

This function corrects the byte order so that modify endian of data on memory. Each bytes can be arranged any order according to the register setting.

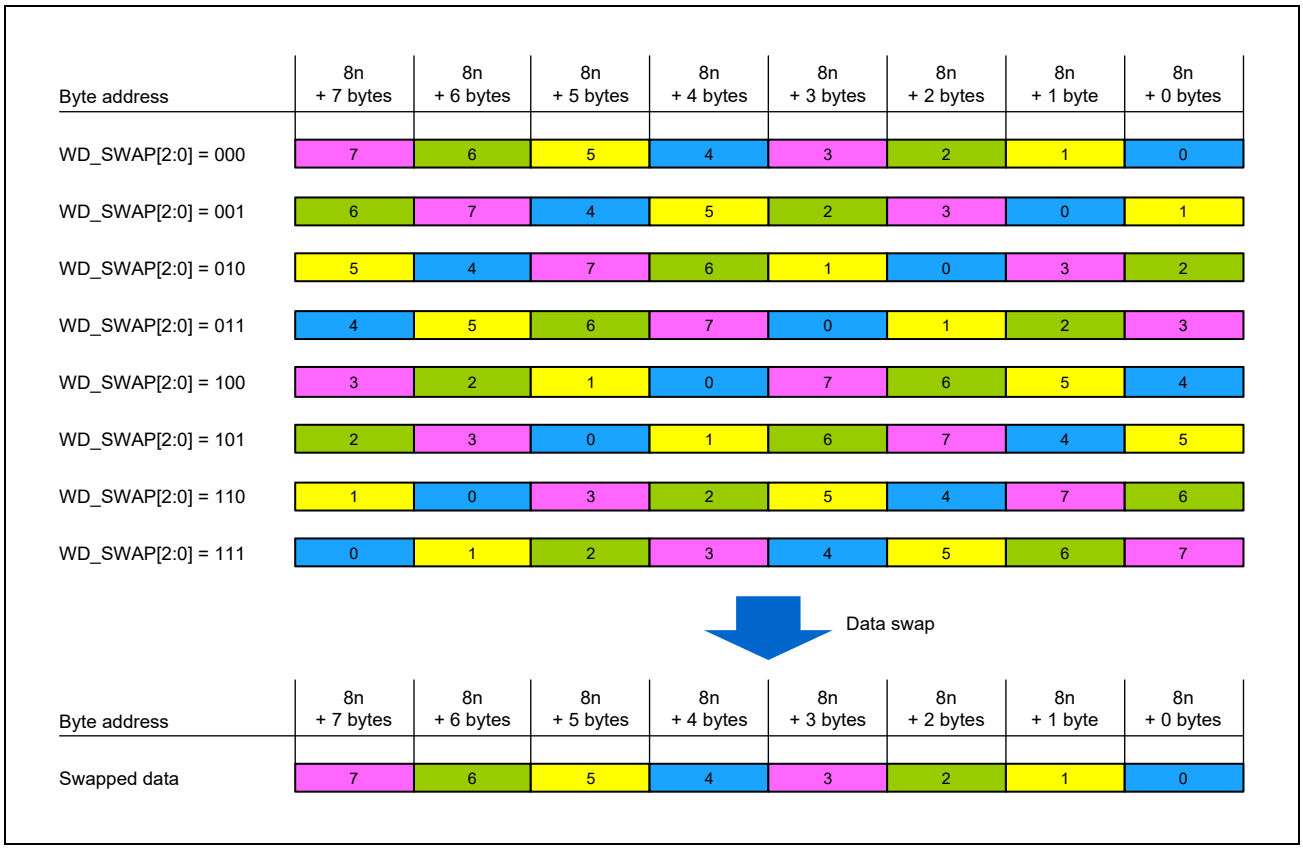

Figure 9.3-41 Data Swap Correction

9.3.2 Registers

The address of the ISU register is represented by the offset address from the base address. ISU base address is as follows:

Table 9.3-12 Register Base Address

Base Register Name	Base Address
<ISU_base>	0_1645_0000h (5645_0000h*1, 4645_0000h*2)

Note 1. CM33 address space (non-secure)

Note 2. CM33 address space (secure)

9.3.2.1 List of Registers

9.3.2.1.1 System Management Register

“System Management Register” sets descriptor processing and interrupts control.

The descriptor cannot access these registers.

Register Name	Abbreviation	Initial Value	Offset Address	Access Size [bits]
FM Descriptor List Address Registers 0	ISU_FM_DL_STADDH	0000_0000h	0000h	32
FM Descriptor List Address Registers 1	ISU_FM_DL_STADDL	0000_0000h	0004h	32
FM Frame Control Registers	ISU_FM_FRCON	0000_0000h	0008h	32
FM Module Stop Registers	ISU_FM_STOP	0000_0000h	000Ch	32
FM Interrupt Enable Registers	ISU_FM_INT_EN	0000_0000h	0010h	32
FM Interrupt Status Registers	ISU_FM_INT_STA	0000_0000h	0014h	32
FM Frame End Interrupt Control Registers	ISU_FM_INT_FREC	0000_0000h	0018h	32
Reserve	-	-	001Ch to 001Fh	-
AXI Error Action Registers	ISU_AXI_ERACT	0000_0000h	0020h	32
Reserve	-	-	0024h to 002Bh	-
AXI FIFO Capability Registers	ISU_AXI_FIFO_CAP	4000_4000h	002Ch	32
Reserve	-	-	0030h to 00FFh	-

9.3.2.1.2 Common Register

“Common Register” sets input/output, reduction ratio and color conversion coefficient.

Prohibits write to these registers during frame processing.

The descriptor can access these registers.

Register Name	Abbreviation	Initial Value	Offset Address	Access Size [bits]
RPF Source Image Size Registers	ISU_RPF_SRC_SIZE	0000_0000h	0100h	32
RPF Source Stride Registers	ISU_RPF_SRC_STRD	0000_0000h	0104h	32
RPF Source Plane0 Address Registers 0	ISU_RPF_SRC_ADDH_PL0	0000_0000h	0108h	32
RPF Source Plane0 Address Registers 1	ISU_RPF_SRC_ADDL_PL0	0000_0000h	010Ch	32
RPF Source Plane1 Address Registers 0	ISU_RPF_SRC_ADDH_PL1	0000_0000h	0110h	32
RPF Source Plane1 Address Registers 1	ISU_RPF_SRC_ADDL_PL1	0000_0000h	0114h	32
RPF Source Image Format Registers	ISU_RPF_FMT	0000_0000h	0118h	32
RPF Source Image UV Format Registers	ISU_RPF_UVBIN	0000_0000h	011Ch	32

9.3.2.2 Register Descriptions

9.3.2.2.1 FM Descriptor List Address Register 0 (ISU_FM_DL_STADDH)

This register sets the start address [34:32] of the “Descriptor List”.

Access Size : 32 bits
Address : <ISU_base> + 0000h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	DLADD[34:32]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
2 to 0	DLADD[34:32]	0h	RW	Set the start address [34:32] of the “Descriptor-List”.

9.3.2.2.2 FM Descriptor List Address Register 1 (ISU_FM_DL_STADDL)

This register sets the start address [31:0] of the “Descriptor List”.

Access Size : 32 bits
Address : <ISU_base> + 0004h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DLADD[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DLADD[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DLADD[31:0]	0h	RW	Set the start address [31:0] of the “Descriptor List”. Note: Set an address that is a multiple of 32 bytes.

9.3.2.2.3 FM Frame Control Register (ISU_FM_FRCON)

This register controls the frame processing method selection and processing start.

Access Size : 32 bits
Address : <ISU_base> + 0008h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	DESON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	START
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
16	DESON	0h	RW	Processing method selection Select “Register Mode” or “Descriptor Mode”. 0b: Register Mode When executing in this mode, set the register before starting frame processing. 1b: Descriptor Mode When executing in this mode, write a “Descriptor List” before starting frame processing.
15 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
0	START	0h	RW	Frame processing start instruction [Write] 0b: NOP 1b: Start frame processing [Read] This bit is always read as 0. Note: If 1 is written during frame processing, it will be ignored. Note: When 1 is written, the descriptor footer read completion interrupt (ISU_FM_INT_STA.DESEND) is automatically cleared.

9.3.2.2.4 FM Module Stop Register (ISU_FM_STOP)

This register controls an emergency stop.

Access Size : 32 bits
Address : <ISU_base> + 000Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	STOP
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
0	STOP	0h	RW	Emergency stop instruction [Write] 0b: NOP 1b: Start emergency stop [Read] This bit is always read as 0. Note: It will be cleared automatically after the emergency stop is completed. If 1 is written during the emergency stop process, it will be ignored. Note: If you want to stop frame synchronously, you can stop it by setting the footer of the “Descriptor List” not to process the next frame.

9.3.2.2.5 FM Interrupt Enable Register (ISU_FM_INT_EN)

This register controls the interrupt factor.

Access Size : 32 bits
Address : <ISU_base> + 0010h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	AXIRXERRE	-	-	-	AXITXERRE	-	-	-	-	-	-	-	LISTERRE
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	R	R	R	RW	R	R	R	R	R	R	R	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	SRSTENDE	-	-	-	-	-	-	DESENDE	FRENDE
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	RW	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
28	AXIRXERRE	0h	RW	Control of AXI bus read error interrupt (ISU_INT_ERR) Controls interrupt by "ISU_FM_INT_STA.RRESPERR". 0b: Do not output interrupt factors 1b: Output interrupt factor
27 to 25	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
24	AXITXERRE	0h	RW	Control of AXI bus write error interrupt (ISU_INT_ERR) Controls interrupt by "ISU_FM_INT_STA.BRESPERR". 0b: Do not output interrupt factors 1b: Output interrupt factor
23 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
16	LISTERRE	0h	RW	Control of "Descriptor List" format violation interrupt (ISU_INT_ERR) Controls interrupt by the number of bytes set in the header exceeding the limit or not being in 8-byte units. 0b: Do not output interrupt factors 1b: Output interrupt factor
15 to 9	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
8	SRSTENDE	0h	RW	Control of emergency stop completion interrupt (ISU_INT_STOPE) Controls interrupt by the completion of emergency stop. 0b: Do not output interrupt factors 1b: Output interrupt factor
7 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
1	DESENDE	0h	RW	Control of descriptor footer read completion interrupt (ISU_INT_DESE) Controls interrupt by the completion of descriptor footer read. 0b: Do not output interrupt factors 1b: Output interrupt factor Note: When an error occurs due to a format violation of "Descriptor List", the ISU_INT_DESE interrupt does not occur even if this bit is set to 1.
0	FRENDE	0h	RW	Control of frame processing end interrupt (ISU_INT_FRE) Controls interrupt by the frame processing end. 0b: Not output interrupt factor 1b: Output interrupt factor Note: This bit is updated according to the setting of the footer, if the descriptor mode is set.

9.3.2.2.6 FM Interrupt Status Register (ISU_FM_INT_STA)

This register displays the status of the interrupt factors.

Access Size : 32 bits
Address : <ISU_base> + 0014h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	RRESPERR[2:0]			-	BRESPERR[2:0]			-	-	-	-	-	-	LISTERR
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	RW0	RW0	RW0	R	RW0	RW0	RW0	R	R	R	R	R	R	RW0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	SRSTEND	-	-	-	-	-	-	DESEND	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	RW0	R	R	R	R	R	R	RW0	R

Bit	Bit Name	Initial Value	R/W	Description
31, 30	-	0h	R	When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
29 to 27	RRESPERR [2:0]	0h	RW0	Displays the status of the AXI read response. Each bit means the following. [0] EXOKAY 0b: No EXOKAY response 1b: EXOKAY response [1] SLVERR 0b: No SLVERR response 1b: SLVERR response [2] DECERR 0b: No DECERR response 1b: DECERR response Note: If you want to clear these bits, clear the 3 bits at the same time.
26	-	0h	R	When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
25 to 23	BRESPERR [2:0]	0h	RW0	Displays the status of the AXI write response. Each bit means the following. [0] EXOKAY 0b: No EXOKAY response 1b: EXOKAY response [1] SLVERR 0b: No SLVERR response 1b: SLVERR response [2] DECERR 0b: No DECERR response 1b: DECERR response Note: If you want to clear these bits, clear the 3 bits at the same time.
22 to 17	-	0h	R	When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
16	LISTERR	0h	RW0	Displays the status of “Descriptor List” format violation (ISU_INT_ERR). 0b: Descriptor list does not violate format 1b: Descriptor list does violate format
15 to 9	-	0h	R	When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
8	SRSTEND	0h	RW0	Displays the status of the emergency stop completion (ISU_INT_STOPE). 0b: Emergency stop not completed 1b: Emergency stop completed
7 to 2	-	0h	R	When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.

Bit	Bit Name	Initial Value	R/W	Description
1	DESEND	0h	RW0	Displays the status of the descriptor footer read completion (ISU_INT_DESE). 0b: Descriptor footer read incomplete 1b: Descriptor footer read completed
0	-	0h	R	When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.

9.3.2.2.7 FM Frame End Interrupt Control Register (ISU_FM_INT_FREC)

This register sets the number of toggles when issuing an ISU_INT_FRE interrupt.

Access Size : 32 bits
Address : <ISU_base> + 0018h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	FREC[1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	-	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1, 0	FREC[1:0]	0h	RW	Sets the number of ISU_INT_FRE interrupt toggles. ISU_INT_FRE interrupt toggle counter is reset by writing 1b to ISU_FM_FRCON.START. 0: Always outputs a frame end interrupt from ISU_INT_FRE0. 1: A frame end interrupt is output from ISU_INT_FRE0 to FRE1. ISU_INT_FRE0 to FRE1 are toggled in order each time the frame ends. 2: A frame end interrupt is output from ISU_INT_FRE0 to FRE2. ISU_INT_FRE0 to FRE2 are toggled in order each time the frame ends. 3: A frame end interrupt is output from ISU_INT_FRE0 to FRE3. ISU_INT_FRE0 to FRE3 are toggled in order each time the frame ends.

9.3.2.2.8 AXI Error Action Register (ISU_AXI_ERACT)

This register sets the operation of the AXI-Master after an AXI error occurs.

For each AXI error condition, choose whether to ignore and continue or stop subsequent transactions.

Transaction continuation settings are used for debugging purposes.

Access Size : 32 bits

Address : <ISU_base> + 0020h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	RRESPEXO_ACT	RRESPSLV_ACT	RRESPDEC_ACT	-	BRESPEXO_ACT	BRESPSLV_ACT	BRESPDEC_ACT	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	RW	RW	RW	R	RW	RW	RW	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31, 30	-	0h	R	When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
29	RRESPEXO_ACT	0h	RW	Operation setting after AXI read response EXOKAY occurs 0b: Transaction stop 1b: Transaction continuation (For debugging)
28	RRESPSLV_ACT	0h	RW	Operation setting after AXI read response SLVERR occurs 0b: Transaction stop 1b: Transaction continuation (For debugging)
27	RRESPDEC_ACT	0h	RW	Operation setting after AXI read response DECERR occurs 0b: Transaction stop 1b: Transaction continuation (For debugging)
26	-	0h	R	When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
25	BRESPEXO_ACT	0h	RW	Operation setting after AXI write response EXOKAY occurs 0b: Transaction stop 1b: Transaction continuation (For debugging)
24	BRESPSLV_ACT	0h	RW	Operation setting after AXI write response SLVERR occurs 0b: Transaction stop 1b: Transaction continuation (For debugging)
23	BRESPDEC_ACT	0h	RW	Operation setting after AXI write response DECERR occurs 0b: Transaction stop 1b: Transaction continuation (For debugging)
22 to 0	-	0h	R	When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.

9.3.2.2.9 AXI FIFO Capability Register (ISU_AXI_FIFO_CAP)

This register is a register that displays the free space of the FIFO in the AXI-Master.

Access Size : 32 bits
Address : <ISU_base> + 002Ch
Initial Value : 4000_4000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	SCAP_PL0[6:0]							-	-	SCAP_PL1[5:0]					
Initial Value	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	DCAP_PL0[6:0]							-	-	DCAP_PL1[5:0]					
Initial Value	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
30 to 24	SCAP_PL0[6:0]	40h	R	Free space in FIFO of the input image “Plane 0” 0 to 32 in Semi-Planar mode. 0 to 64 in other modes. The result of multiplying the value of this register by 32 bytes indicates the free space of the FIFO.
23, 22	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
21 to 16	SCAP_PL1[5:0]	0h	R	Free space in FIFO of the input image “Plane 1” 0 to 32 in Semi-Planar mode. 0 in other modes. The result of multiplying the value of this register by 32 bytes indicates the free space of the FIFO.
15	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
14 to 8	DCAP_PL0 [6:0]	40h	R	Free space in FIFO of the output image “Plane 0” 0 to 32 in Semi-Planar mode. 0 to 64 in other modes. The result of multiplying the value of this register by 32 bytes indicates the free space of the FIFO.
7, 6	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
5 to 0	DCAP_PL1 [5:0]	0h	R	Free space in FIFO of the output image “Plane 1” 0 to 32 in Semi-Planar mode. 0 in other modes. The result of multiplying the value of this register by 32 bytes indicates the free space of the FIFO.

9.3.2.2.10 RPF Source Image Size Register (ISU_RPF_SRC_SIZE)

This register sets the size of the input image.

Access Size : 32 bits
Address : <ISU_base> + 0100h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	S_HSIZE[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	S_VSIZE[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
28 to 16	S_HSIZE[12:0]	0h	RW	Horizontal size of the input image Set the horizontal size of the input image in pixels. Set the size from 1 to 4096. 0: Setting prohibited 4097 or higher: Setting prohibited Note: For YCbCr type, set it to an even number.
15 to 13	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
12 to 0	S_VSIZE[12:0]	0h	RW	Vertical size of the input image Set the vertical size of the input image in pixels. Set the size from 1 to 4096. 0: Setting prohibited 4097 or higher: Setting prohibited Note: For YCbCr420, set it to an even number.

9.3.2.2.11 RPF Source Stride Register (ISU_RPF_SRC_STRD)

This register sets the stride of the input image.

Access Size : 32 bits
Address : <ISU_base> + 0104h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SSTRPL0[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SSTRPL1[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	SSTRPL0[15:0]	0h	RW	Set the “Plane 0 (Y/RGB/RAW)” stride Set the “Plane 0 (Y/RGB/RAW)” stride in bytes. Note: The setting must be a multiple of 32 bytes and at least the number of horizontal pixels (ISU_RPF_SRC_SIZE.S_HSIZE).
15 to 0	SSTRPL1[15:0]	0h	RW	Set the “Plane 1 (C(Cb/Cr))” stride Set the “Plane 1 (C(Cb/Cr))” stride in bytes. Note: The setting must be a multiple of 32 bytes and at least the number of horizontal pixels (ISU_RPF_SRC_SIZE.S_HSIZE).

9.3.2.2.12 RPF Source Plane 0 Address Register 0 (ISU_RPF_SRC_ADDH_PL0)

This register sets the start address [34:32] of the input image of “Plane 0”.

Access Size : 32 bits
Address : <ISU_base> + 0108h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	SADD_PL0[34:32]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
2 to 0	SADD_PL0 [34:32]	0h	RW	Set the start address [34:32] for “Plane 0 (Y/RGB/RAW)”.

9.3.2.2.13 RPF Source Plane 0 Address Register 1 (ISU_RPF_SRC_ADDL_PL0)

This register sets the start address [31:0] of the input image of “Plane 0”.

Access Size : 32 bits
Address : <ISU_base> + 010Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SADD_PL0[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SADD_PL0[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SADD_PL0 [31:0]	0h	RW	Set the start address [31:0] of “Plane 0 (Y/RGB/RAW)”. Note: Set an address that is a multiple of 32 bytes.

9.3.2.2.14 RPF Source Plane 1 Address Register 0 (ISU_RPF_SRC_ADDH_PL1)

This register sets the start address [34:32] of the input image of “Plane 1”.

Access Size : 32 bits
Address : <ISU_base> + 0110h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	SADD_PL1[34:32]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
2 to 0	SADD_PL1 [34:32]	0h	RW	Set the start address [34:32] of “Plane 1 (C(Cb/Cr))”.

9.3.2.2.15 RPF Source Plane 1 Address Register 1 (ISU_RPF_SRC_ADDL_PL1)

This register sets the start address [31:0] of the input image of “Plane 1”.

Access Size : 32 bits
Address : <ISU_base> + 0114h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SADD_PL1[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SADD_PL1[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SADD_PL1 [31:0]	0h	RW	Set the start address [31:0] for “Plane 1 (C(Cb/Cr))”. Note: Set an address that is a multiple of 32 bytes.

9.3.2.2.16 RPF Source Image Format Register (ISU_RPF_FMT)

This register sets the color format of the input image.

For details, see **9.3.1.3.2 RPF** Formatter.

Access Size : 32 bits
Address : <ISU_base> + 0118h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	RDFMT[5:0]					
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
5 to 0	RDFMT[5:0]	0h	RW	Color format of input image The following formats can be configured. 00h: ARGB1555 01h: RGB565 02h BGR666 03h: RGB888 04h: BGR888 05h: ARGB8888 06h: RGBA8888 07h: ABGR8888 20h: YCbCr422 8-bit UYVY 21h: YCbCr422 8-bit YUY2 22h: YCbCr422 8-bit NV16 23h: YCbCr420 8-bit NV12 30h: RAW8 31h: RAW10 32h: RAW12 33h: RAW14 34h: RAW16 35h: RAW20 36h: RAW6 37h: RAW7 Others: Setting prohibited

9.3.2.2.17 RPF Source Image UV Format Register (ISU_RPF_UVBIN)

This register sets whether to convert CbCr/UV to offset binary.

For details, see **9.3.1.3.2 RPF** Formatter.

Access Size : 32 bits

Address : <ISU_base> + 011Ch

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	UVCHG
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
0	UVCHG	0h	RW	Offset binary conversion selection for CbCr / UV data 0b: No conversion 1b: Conversion

9.3.2.2.18 RPF Source Image Data Swap Register (ISU_RPF_SRC_DSWAP)

This register sets the data swap of the input image.

For details, see **9.3.1.3.1 Data swap (endian correction)**.

Access Size : 32 bits
Address : <ISU_base> + 0120h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	RD_SWAP[2:0]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
2 to 0	RD_SWAP[2:0]	0h	RW	Data swap for input images

9.3.2.2.19 RPF Source ALPHA Data Selection Register (ISU_RPF_ALPH_SEL)

This register sets the extension method from A (Alpha) 1-bit to 8-bit at the time of ARGB1555 input.

For details, see **9.3.1.3.3 Data extraction**.

Access Size : 32 bits
Address : <ISU_base> + 0124h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	S_A1SEL
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	S_ALPH1[7:0]								S_ALPH0[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
16	S_A1SEL	0h	RW	Setting of how to extend A(Alpha) from 1-bit to 8-bit 0b: Copy input Alpha value 1-bit to all 8-bit 1b: Select the register value according to the input Alpha value 1 bit S_ALPH0 when Alpha = 0b S_ALPH1 when Alpha = 1b
15 to 8	S_ALPH1[7:0]	0h	RW	Extended Alpha value when S_A1SEL = 1b and input Alpha value is 1b.
7 to 0	S_ALPH0[7:0]	0h	RW	Extended Alpha value when S_A1SEL = 1b and input Alpha value is 0b.

9.3.2.2.20 RPF Source TEST Data Register 1 (ISU_RPF_SRC_TD1)

This register controls the test pattern generation.

For details, see **9.3.1.3.4 Test Pattern Generation**.

Access Size : 32 bits

Address : <ISU_base> + 0128h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TMODE_EN	-	-	-	-	-	-	-	-	-	-	-	GRADA_A	GRADA_R	GRADA_G	GRADA_B
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	GRADA_TYPE	GRADA_STEP[3:0]			
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31	TMODE_EN	0h	RW	Control of test pattern generation 0b: Normal operation 1b: Test pattern generation After one frame of the test pattern is generated, it is automatically cleared to 0b. Note: Setting in descriptor mode is prohibited.
30 to 20	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
19	GRADA_A	0h	RW	A color when generating a test pattern 0b: Fixed initial value (ISU_RPF_SRC_TD2.INIT_A) 1b: Gradation
18	GRADA_R	0h	RW	R color when generating a test pattern 0b: Fixed initial value (ISU_RPF_SRC_TD2.INIT_R) 1b: Gradation
17	GRADA_G	0h	RW	G color when generating a test pattern 0b: Fixed initial value (ISU_RPF_SRC_TD2.INIT_G) 1b: Gradation
16	GRADA_B	0h	RW	B color when generating a test pattern 0b: Fixed initial value (ISU_RPF_SRC_TD2.INIT_B) 1b: Gradation
15 to 5	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
4	GRADA_TYPE	0h	RW	Gradient type 0b: Gradation from 0 to 255 1b: Gradation from 255 to 0
3 to 0	GRADA_STEP [3:0]	0h	RW	Gradient step Note: If the setting is 0b, the initial value (ISU_RPF_SRC_TD2.INIT_*) is entered.

9.3.2.2.21 RPF Source TEST Data Register 2 (ISU_RPF_SRC_TD2)

This register sets the initial value of each color of ARGB for test pattern generation.

For details, see **9.3.1.3.4 Test Pattern Generation**.

Access Size : 32 bits
Address : <ISU_base> + 012Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	INIT_A[7:0]								INIT_R[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	INIT_G[7:0]								INIT_B[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	INIT_A[7:0]	0h	RW	Initial value of A color
23 to 16	INIT_R[7:0]	0h	RW	Initial value of R color
15 to 8	INIT_G[7:0]	0h	RW	Initial value of G color
7 to 0	INIT_B[7:0]	0h	RW	Initial value of B color

9.3.2.2.22 RS Scaling Factor Register 0 (ISU_RS_HSCALE)

This register sets the reduction factor of the input image in the horizontal direction.

For details, see **9.3.1.4.3 Scaling calculation**.

Access Size : 32 bits
Address : <ISU_base> + 0140h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	HMANT[3:0]			
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	HFRAC[11:0]											
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 20	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
19 to 16	HMANT[3:0]	0h	RW	Horizontal reduction factor (integer part) 0: Setting prohibited
15 to 12	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
11 to 0	HFRAC[11:0]	0h	RW	Horizontal multiplication factor (decimal part)

9.3.2.2.23 RS Scaling Factor Register 1 (ISU_RS_VSCALE)

This register sets the reduction factor of the input image in the vertical direction.

For details, see **9.3.1.4.3 Scaling calculation**.

Access Size : 32 bits
Address : <ISU_base> + 0144h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	VMANT[3:0]			
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	VFRAC[11:0]											
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 20	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
19 to 16	VMANT[3:0]	0h	RW	Vertical reduction factor (integer part) 0: Setting prohibited
15 to 12	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
11 to 0	VFRAC[11:0]	0h	RW	Vertical reduction factor (decimal part)

9.3.2.2.24 RS Output Image Start Position Register (ISU_RS_STPOS)

This register sets the resize start position.

For details, see **9.3.1.4.1 Resize start position**.

Access Size : 32 bits
Address : <ISU_base> + 0148h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	HSTART[11:0]											
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	VSTART[11:0]											
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
27 to 16	HSTART[11:0]	0h	RW	Resize start horizontal position Set the resizing start horizontal position by the number of pixels with the upper left of the input image as the origin. Set it with less than the number of input horizontal pixels (ISU_RPF_SRC_SIZE.S_HSIZE).
15 to 12	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
11 to 0	VSTART[11:0]	0h	RW	Resize start vertical position Set the resizing start vertical position by the number of pixels with the upper left of the input image as the origin. Set it with less than the number of input vertical pixels (ISU_RPF_SRC_SIZE.S_VSIZE).

9.3.2.2.25 RS Output Image Start Position Tuning Register (ISU_RS_POS_TUNE)

This register sets the offset for fine adjustment of the reduction start position.

For details, see **9.3.1.4.2 Sub pixel offset**.

Access Size : 32 bits

Address : <ISU_base> + 014Ch

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	HST_TUNE[11:0]											
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	VST_TUNE[11:0]											
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
27 to 16	HST_TUNE [11:0]	0h	RW	Offset from the resize-starting horizontal position (ISU_RS_STPOS.HSTART) Set the offset to be added to the horizontal position at the start of resizing in 4,096 steps (0 to less than 1 pixel of the input image).
15 to 12	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
11 to 0	VST_TUNE [11:0]	0h	RW	Offset from the resize-starting vertical position (ISU_RS_STPOS.VSTART) Set the offset to be added to the vertical position at the start of resizing in 4,096 steps (0 to less than 1 pixel of the input image).

9.3.2.2.26 RS Output Size Crop Register (ISU_RS_OS_CROP)

This register sets the crop size of the reduced image.

For details, see **9.3.1.4 Resizer (RS)**.

Access Size : 32 bits
Address : <ISU_base> + 0150h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	O_HSIZE[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	O_VSIZE[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
28 to 16	O_HSIZE[12:0]	0h	RW	Horizontal crop size Set the horizontal crop size in pixels. Set it in the range of 1 to 4096. 0: Setting prohibited 4097 or higher: Setting prohibited Note: For YCbCr type, set it to an even number.
15 to 13	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
12 to 0	O_VSIZE[12:0]	0h	RW	Vertical crop size Set the vertical crop size in pixels. Set it in the range of 1 to 4096. 0: Setting prohibited 4097 or higher: Setting prohibited Note: For YCbCr420, set it to an even number.

9.3.2.2.27 RS CROP Padding Mode Register (ISU_RS_PADDMODE)

This register sets the padding method when the reduced image is smaller than the set crop size.

For details, see **9.3.1.4 Resizer (RS)**.

Access Size : 32 bits
Address : <ISU_base> + 0154h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	PADDSEL
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
0	PADDSEL	0h	RW	Selecting a padding method Set the padding method when the reduced image is smaller than the set crop size. 0b: Fill in the padding area by copying the edge pixels after the reduction. 1b: Fill in the padding area with the color specified by the register (ISU_RS_PADDVAL.VAL_*).

9.3.2.2.28 RS CROP Padding Value Register (ISU_RS_PADDVAL)

This register sets the color that fills the edges with padding.

For details, see **9.3.1.4 Resizer (RS)**.

Access Size : 32 bits
Address : <ISU_base> + 0158h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	VAL_L3[7:0]								VAL_L2[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	VAL_L1[7:0]								VAL_L0[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	VAL_L3[7:0]	0h	RW	The value to fill Layer 3, if the reduced image is smaller than the set crop size.
23 to 16	VAL_L2[7:0]	0h	RW	The value to fill Layer 2, if the reduced image is smaller than the set crop size.
15 to 8	VAL_L1[7:0]	0h	RW	The value to fill Layer 1, if the reduced image is smaller than the set crop size.
7 to 0	VAL_L0[7:0]	0h	RW	The value to fill Layer 0, if the reduced image is smaller than the set crop size.

9.3.2.2.29 WPF Destination Plane 0 Address Register 0 (ISU_WPF_DST_ADDH_PL0)

This register sets the start address [34:32] of the output image of “Plane 0”.

Access Size : 32 bits
Address : <ISU_base> + 0180h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	DADD_PL0[34:32]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
2 to 0	DADD_PL0 [34:32]	0h	RW	Set the write start address [34:32] for “Plane 0 (Y/RGB/RAW)”.

9.3.2.2.30 WPF Destination Plane 0 Address Register 1 (ISU_WPF_DST_ADDL_PL0)

This register sets the start address [31:0] of the output image of “Plane 0”.

Access Size : 32 bits
Address : <ISU_base> + 0184h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DADD_PL0[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DADD_PL0[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DADD_PL0 [31:0]	0h	RW	Set the write start address [31:0] for “Plane 0 (Y/RGB/RAW)”. Note: Set an address that is a multiple of 512 bytes.

9.3.2.2.31 WPF Destination Plane 1 Address Register 0 (ISU_WPF_DST_ADDH_PL1)

This register sets the start address [34:32] of the output image of “Plane 1”.

Access Size : 32 bits
Address : <ISU_base> + 0188h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	DADD_PL1[34:32]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
2 to 0	DADD_PL1 [34:32]	0h	RW	Set the write start address [34:32] for “Plane 1 (C(Cb/Cr))”.

9.3.2.2.32 WPF Destination Plane 1 Address Register 1 (ISU_WPF_DST_ADDL_PL1)

This register sets the start address [31:0] of the output image of “Plane 1”.

Access Size : 32 bits
Address : <ISU_base> + 018Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DADD_PL1[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DADD_PL1[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DADD_PL1 [31:0]	0h	RW	Set the write start address [31:0] for “Plane 1 (C(Cb/Cr))”. Note: Set an address that is a multiple of 512 bytes.

9.3.2.2.33 WPF Destination Stride Register (ISU_WPF_DST_STRD)

This register sets the stride of the output image.

Access Size : 32 bits
Address : <ISU_base> + 0190h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DSTRPL0[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DSTRPL1[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	DSTRPL0[15:0]	0h	RW	Set the “Plane 0 (Y/RGB/RAW)” stride Set the “Plane 0 (Y/RGB/RAW)” stride in bytes. Note: The setting must be a multiple of 32 bytes and at least the number of horizontal crop size (ISU_RS_OS_CROP.O_HSIZE).
15 to 0	DSTRPL1[15:0]	0h	RW	Set the “Plane 1 (C(Cb/Cr))” stride Set the “Plane 1 (C(Cb/Cr))” stride in bytes. Note: The setting must be a multiple of 32 bytes and at least the number of horizontal crop size (ISU_RS_OS_CROP.O_HSIZE).

9.3.2.2.34 WPF Destination Image Format Register (ISU_WPF_FMT)

This register sets the color format of the output image.

For details, see **9.3.1.5.3 WPF** Formatter.

Access Size : 32 bits
Address : <ISU_base> + 0194h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	WDFMT[5:0]					
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
5 to 0	WDFMT[5:0]	0h	RW	Color format of output image The following formats can be configured. 00h: ARGB1555 01h: RGB565 02h: BGR666 03h: RGB888 04h: BGR888 05h: ARGB8888 06h: RGBA8888 07h: ABGR8888 20h: YCbCr422 8-bit UYVY 21h: YCbCr422 8-bit YUY2 22h: YCbCr422 8-bit NV16 23h: YCbCr420 8-bit NV12 30h: RAW8 31h: RAW10 32h: RAW12 33h: RAW14 34h: RAW16 35h: RAW20 36h: RAW6 37h: RAW7 Others: Setting prohibited

9.3.2.2.35 WPF Color Correction Control Register (ISU_WPF_CCOL)

This register sets the color conversion correction control.

For details, see **9.3.1.5.1 Color correction**.

Access Size : 32 bits
Address : <ISU_base> + 0198h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CMAT_SEL	CMAT_ASEL
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
1	CMAT_SEL	0h	RW	Color conversion correction control 0b: No conversion 1b: Conversion
0	CMAT_ASEL	0h	RW	A (Alpha) color conversion correction control 0b: No conversion 1b: Conversion

9.3.2.2.36 WPF Color Correction MUL Coefficient Register 1 (ISU_WPF_MUL1)

This register sets the matrix value K11 for the color conversion correction.

For details, see **9.3.1.5.1 Color correction**.

Access Size : 32 bits
Address : <ISU_base> + 019Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	K11[13:0]													
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 14	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
13 to 0	K11[13:0]	0h	RW	Color Correction Coefficient K11 Signed fixed point: 4-bit integer part, 10-bit decimal part

9.3.2.2.37 WPF Color Correction MUL Coefficient Register 2 (ISU_WPF_MUL2)

This register sets the matrix values K12 and K13 for the color conversion correction.

For details, see **9.3.1.5.1 Color correction**.

Access Size : 32 bits

Address : <ISU_base> + 01A0h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	K12[13:0]													
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	K13[13:0]													
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31, 30	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
29 to 16	K12[13:0]	0h	RW	Color Correction Coefficient K12 Signed fixed point: 4-bit integer part, 10-bit decimal part
15, 14	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
13 to 0	K13[13:0]	0h	RW	Color Correction Coefficient K13 Signed fixed point: 4-bit integer part, 10-bit decimal part

9.3.2.2.38 WPF Color Correction MUL Coefficient Register 3 (ISU_WPF_MUL3)

This register sets the matrix value K21 for the color conversion correction.

For details, see **9.3.1.5.1 Color correction**.

Access Size : 32 bits
Address : <ISU_base> + 01A4h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	K21[13:0]													
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 14	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
13 to 0	K21[13:0]	0h	RW	Color Correction Coefficient K21 Signed fixed point: 4-bit integer part, 10-bit decimal part

9.3.2.2.39 WPF Color Correction MUL Coefficient Register 4 (ISU_WPF_MUL4)

This register sets the matrix values K22 and K23 for the color conversion correction.

For details, see **9.3.1.5.1 Color correction**.

Access Size : 32 bits

Address : <ISU_base> + 01A8h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	K22[13:0]													
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	K23[13:0]													
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31, 30	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
29 to 16	K22[13:0]	0h	RW	Color Correction Coefficient K22 Signed fixed point: 4-bit integer part, 10-bit decimal part
15, 14	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
13 to 0	K23[13:0]	0h	RW	Color Correction Coefficient K23 Signed fixed point: 4-bit integer part, 10-bit decimal part

9.3.2.2.40 WPF Color Correction MUL Coefficient Register 5 (ISU_WPF_MUL5)

This register sets the matrix value K31 for the color conversion correction.

For details, see **9.3.1.5.1 Color correction**.

Access Size : 32 bits
Address : <ISU_base> + 01ACh
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	K31[13:0]													
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 14	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
13 to 0	K31[13:0]	0h	RW	Color Correction Coefficient K31 Signed fixed point: 4-bit integer part, 10-bit decimal part

9.3.2.2.41 WPF Color Correction MUL Coefficient Register 6 (ISU_WPF_MUL6)

This register sets the matrix values K32 and K33 for the color conversion correction.

For details, see **9.3.1.5.1 Color correction**.

Access Size : 32 bits
Address : <ISU_base> + 01B0h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	K32[13:0]													
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	K33[13:0]													
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31, 30	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
29 to 16	K32[13:0]	0h	RW	Color Correction Coefficient K32 Signed fixed point: 4-bit integer part, 10-bit decimal part
15, 14	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
13 to 0	K33[13:0]	0h	RW	Color Correction Coefficient K33 Signed fixed point: 4-bit integer part, 10-bit decimal part

9.3.2.2.42 WPF Color Correction Offset Coefficient Register 1 (ISU_WPF_OFST1)

This register sets the offset 1 of the color conversion correction.

For details, see **9.3.1.5.1 Color correction**.

Access Size : 32 bits
Address : <ISU_base> + 01B4h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	OFST_A1[7:0]								OFST_B1[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	OFST_C1[7:0]								-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	OFST_A1[7:0]	0h	RW	Color Correction Offset value A1 Unsigned integer 8-bit
23 to 16	OFST_B1[7:0]	0h	RW	Color Correction Offset value B1 Unsigned integer 8-bit
15 to 8	OFST_C1[7:0]	0h	RW	Color Correction Offset value C1 Unsigned integer 8-bit
7 to 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

9.3.2.2.43 WPF Color Correction Offset Coefficient Register 2 (ISU_WPF_OFST2)

This register sets the offset 2 of the color conversion correction.

For details, see **9.3.1.5.1 Color correction**.

Access Size : 32 bits
Address : <ISU_base> + 01B8h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	OFST_A2[7:0]								OFST_B2[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	OFST_C2[7:0]								-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	OFST_A2[7:0]	0h	RW	Color Correction Offset value A2 Unsigned integer 8-bit
23 to 16	OFST_B2[7:0]	0h	RW	Color Correction Offset value B2 Unsigned integer 8-bit
15 to 8	OFST_C2[7:0]	0h	RW	Color Correction Offset value C2 Unsigned integer 8-bit
7 to 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

9.3.2.2.44 WPF Color Correction Clip Register 1 (ISU_WPF_CLP1)

This register sets the maximum and minimum values of the color conversion correction for Layer 1.

For details, see **9.3.1.5.1 Color correction**.

Access Size : 32 bits

Address : <ISU_base> + 01BCh

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CLPMAX_A[7:0]								CLPMIN_A[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
15 to 8	CLPMAX_A [7:0]	0h	RW	Color Correction maximum clip level value A Set the value to CLPMAX_A ≥ CLPMIN_A
7 to 0	CLPMIN_A[7:0]	0h	RW	Color Correction minimum clip level value A Set the value to CLPMAX_A ≥ CLPMIN_A

9.3.2.2.45 WPF Color Correction Clip Register 2 (ISU_WPF_CLP2)

This register sets the maximum and minimum values of the color conversion correction for Layer 2 and Layer 3.

For details, see **9.3.1.5.1 Color correction**.

Access Size : 32 bits
Address : <ISU_base> + 01C0h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CLPMAX_B[7:0]								CLPMIN_B[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CLPMAX_C[7:0]								CLPMIN_C[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	CLPMAX_B [7:0]	0h	RW	Color Correction maximum clip level value B Set the value to CLPMAX_B ≥ CLPMIN_B
23 to 16	CLPMIN_B [7:0]	0h	RW	Color Correction minimum clip level value B Set the value to CLPMAX_B ≥ CLPMIN_B
15 to 8	CLPMAX_C [7:0]	0h	RW	Color Correction maximum clip level value C Set the value to CLPMAX_C ≥ CLPMIN_C
7 to 0	CLPMIN_C [7:0]	0h	RW	Color Correction minimum clip level value C Set the value to CLPMAX_C ≥ CLPMIN_C

9.3.2.2.46 WPF Destination Image Data Swap Register (ISU_WPF_DST_DSWAP)

This register sets the data swap of the output image data.

For details, see **9.3.1.5.4 Data Swap (Endian Correction)**.

Access Size : 32 bits
Address : <ISU_base> + 01C4h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	WD_SWAP[2:0]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
2 to 0	WD_SWAP [2:0]	0h	RW	Data swap for output images

9.3.2.2.47 WPF Destination ALPHA Selection Register 1 (ISU_WPF_ALPH_SEL1)

This register sets the method of compressing the A (Alpha) value at the ARGB1555 output from 8-bit to 1-bit.

For details, see **9.3.1.5.2 Normalization**.

Access Size : 32 bits

Address : <ISU_base> + 01C8h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	D_A1SEL
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	D_A1THR[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
16	D_A1SEL	0h	RW	Setting of how to compress A (Alpha) from 8-bit to 1-bit 0b: Outputs the MSB of alpha value 1b: Selects the output according to the alpha value and threshold level Outputs 0b when Alpha ≤ D_A1THR Outputs 1b when Alpha > D_A1THR
15 to 8	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
7 to 0	D_A1THR[7:0]	0h	RW	Threshold level value Value used to determine when D_A1SEL = 1b.

9.3.2.2.48 WPF Destination ALPHA Selection Register 2 (ISU_WPF_ALPH_SEL2)

This register sets the 8-bit A (Alpha) value at the time of ARGB8888 output.

For details, see **9.3.1.5.2 Normalization**.

Access Size : 32 bits
Address : <ISU_base> + 01CCh
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	D_A8SEL
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	D_A8THR1[7:0]								D_A8THR0[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

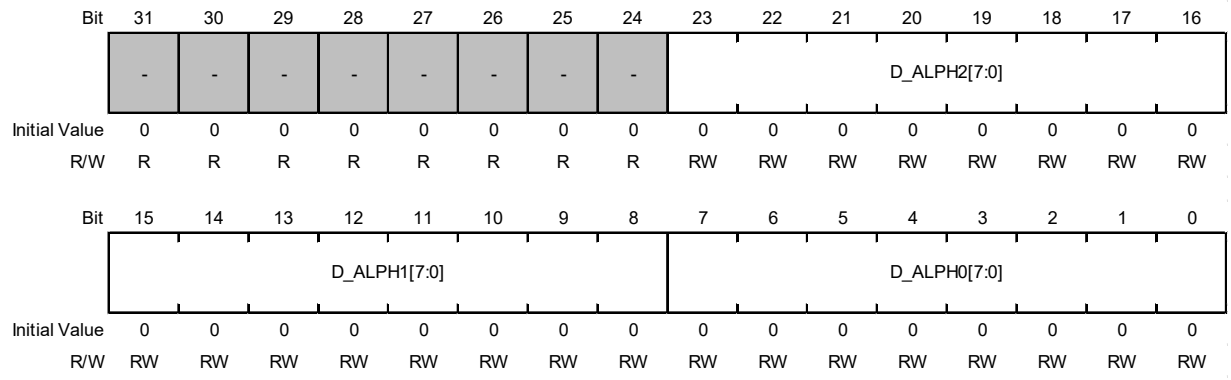
Bit	Bit Name	Initial Value	R/W	Description
31 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
16	D_A8SEL	0h	RW	A (Alpha) 8-bit output selection 0b: Output Alpha value as it is 1b: Outputs the register value according to the alpha value and the threshold level (D_A8THR0 and D_A8THR1) Outputs D_ALPH2 when D_A8THR1 ≤ Alpha Outputs D_ALPH1 when D_A8THR0 < Alpha < D_A8THR1 Outputs D_ALPH0 when Alpha ≤ D_A8THR0
15 to 8	D_A8THR1 [7:0]	0h	RW	Threshold level value 1 Value used to determine which register value is output as Alpha when D_A8SEL = 1b. Set the value to D_A8THR0 < D_A8THR1.
7 to 0	D_A8THR0 [7:0]	0h	RW	Threshold level value 0 Value used to determine which register value is output as Alpha when D_A8SEL = 1b. Set the value to D_A8THR0 < D_A8THR1.

9.3.2.2.49 WPF Destination ALPHA Value Register (ISU_WPF_ALPH_VAL)

This register sets the A (Alpha) value to be output when ARGB8888 and D_A8SEL = 1.

For details, see **9.3.1.5.2 Normalization**.

Access Size : 32 bits
Address : <ISU_base> + 01D0h
Initial Value : 0000_0000h



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
23 to 16	D_ALPH2[7:0]	0h	RW	Conversion Alpha value 2 The value to be output when D_A8THR1 ≤ Alpha.
15 to 8	D_ALPH1[7:0]	0h	RW	Conversion Alpha value 1 The value to be output when D_A8THR0 < Alpha < D_A8THR1.
7 to 0	D_ALPH0[7:0]	0h	RW	Conversion Alpha value 0 The value to be output when Alpha ≤ D_A8THR0.

9.3.2.2.50 AXI Max Burst Length Register (ISU_AXI_BLEN)

This register sets the upper limit to the burst length of the AXI-Master.

Access Size : 32 bits
Address : <ISU_base> + 01F0h
Initial Value : 000F_000Fh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	ARLEN_MAX[3:0]			
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	AWLEN_MAX[3:0]			
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 20	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
19 to 16	ARLEN_MAX [3:0]	Fh	RW	Upper limit of read data burst length 3h: Up to 4-beat burst 7h: Up to 8-beat burst Fh: Up to 16-beat burst Others: Setting prohibited
15 to 4	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
3 to 0	AWLEN_MAX [3:0]	Fh	RW	Upper limit of write data burst length 3h: Up to 4-beat burst 7h: Up to 8-beat burst Fh: Up to 16-beat burst Others: Setting prohibited

9.3.3 Operation

9.3.3.1 Start Processing

After setting various registers, write 1b to the start instruction bit to start.

At that time, start it together with the setting of whether to execute by the descriptor method.

Table 9.3-13 Explanation for ISU FM Frame Control Registers (ISU_FM_FRCON)

ICU_FM_FRCON		Description
Bit 16	DESON	0b: Execute with Descriptor read OFF. 1b: Execute with Descriptor read ON.
Bit 0	START	When the frame processing start is executed, the frame completion interrupt and descriptor capture completion interrupt are automatically cleared. [Write] 0b: NOP 1b: Start Frame Processing [Read] Always Zero is read.

9.3.3.1.1 Descriptor List Address

In the case of the descriptor method (DESON = 1 and START is set to 1), the access to acquire the descriptor list is performed first. The access destination is set in advance in the following register.

- FM Descriptor List Address Register 0 (ISU_FM_DL_STADDH [2: 0])
- FM Descriptor List Address Register 1 (ISU_FM_DL_STADDL [31: 0])

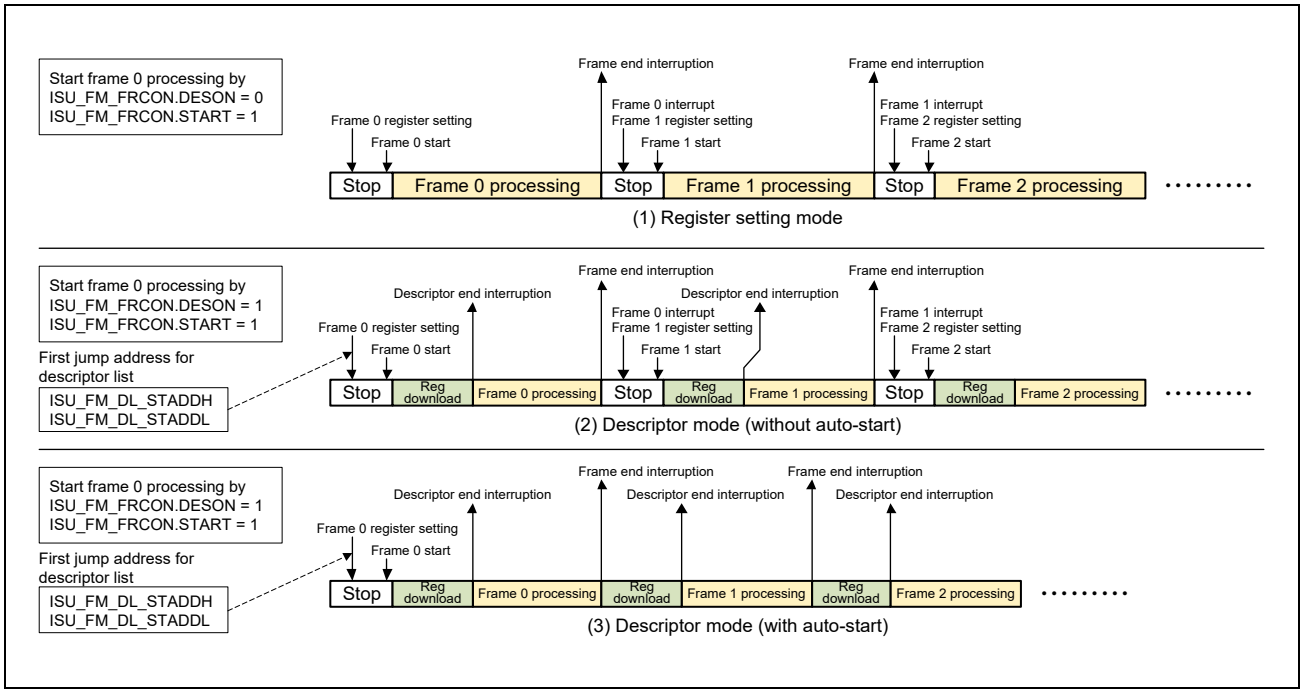


Figure 9.3-42 Relationship Between Register ISU_FM_FRCON Setting and Frame Processing Mode

9.3.3.1.2 Frame End Interruption

- When started with ISU_FM_FRCON.DESON = 0
  - An interrupt is generated when one frame processing is completed inside the ISU.
  - Completion of 1-frame processing shall meet the following conditions.
    1) Write the reduced data from the AXI bus and receive the response of the response channel.
    2) The FIFO pointer of the input image is in the initial state (empty state), and the FIFO pointer of the output image is also in the initial state (empty state).
    3) You have not accidentally started capturing the image of the next frame.
  - Always generate an interrupt from ISU_INT_FRE0, regardless of ISU_FM_INT_FREC.

- When started with ISU_FM_FRCON.DESON = 1
  - One frame processing by the descriptor is completed, and an interrupt is issued in the descriptor list. An interrupt is generated when it is enabled (see the corresponding bit in the footer).
  - In the descriptor method, it advances to the next frame without doing anything after the interrupt occurs. In this case, the interrupt remains on.
  - ISU_INT_FRE0 to 3 (maximum) will be issued in sequence each time the frame ends.
  - The number of toggles for ISU_INT_FRE0 to 3 can be set in the register ISU_FM_INT_FREC.
  - ISU_INT_FRE interrupt toggle counter is reset by writing 1 to ISU_FM_FRCON.START.

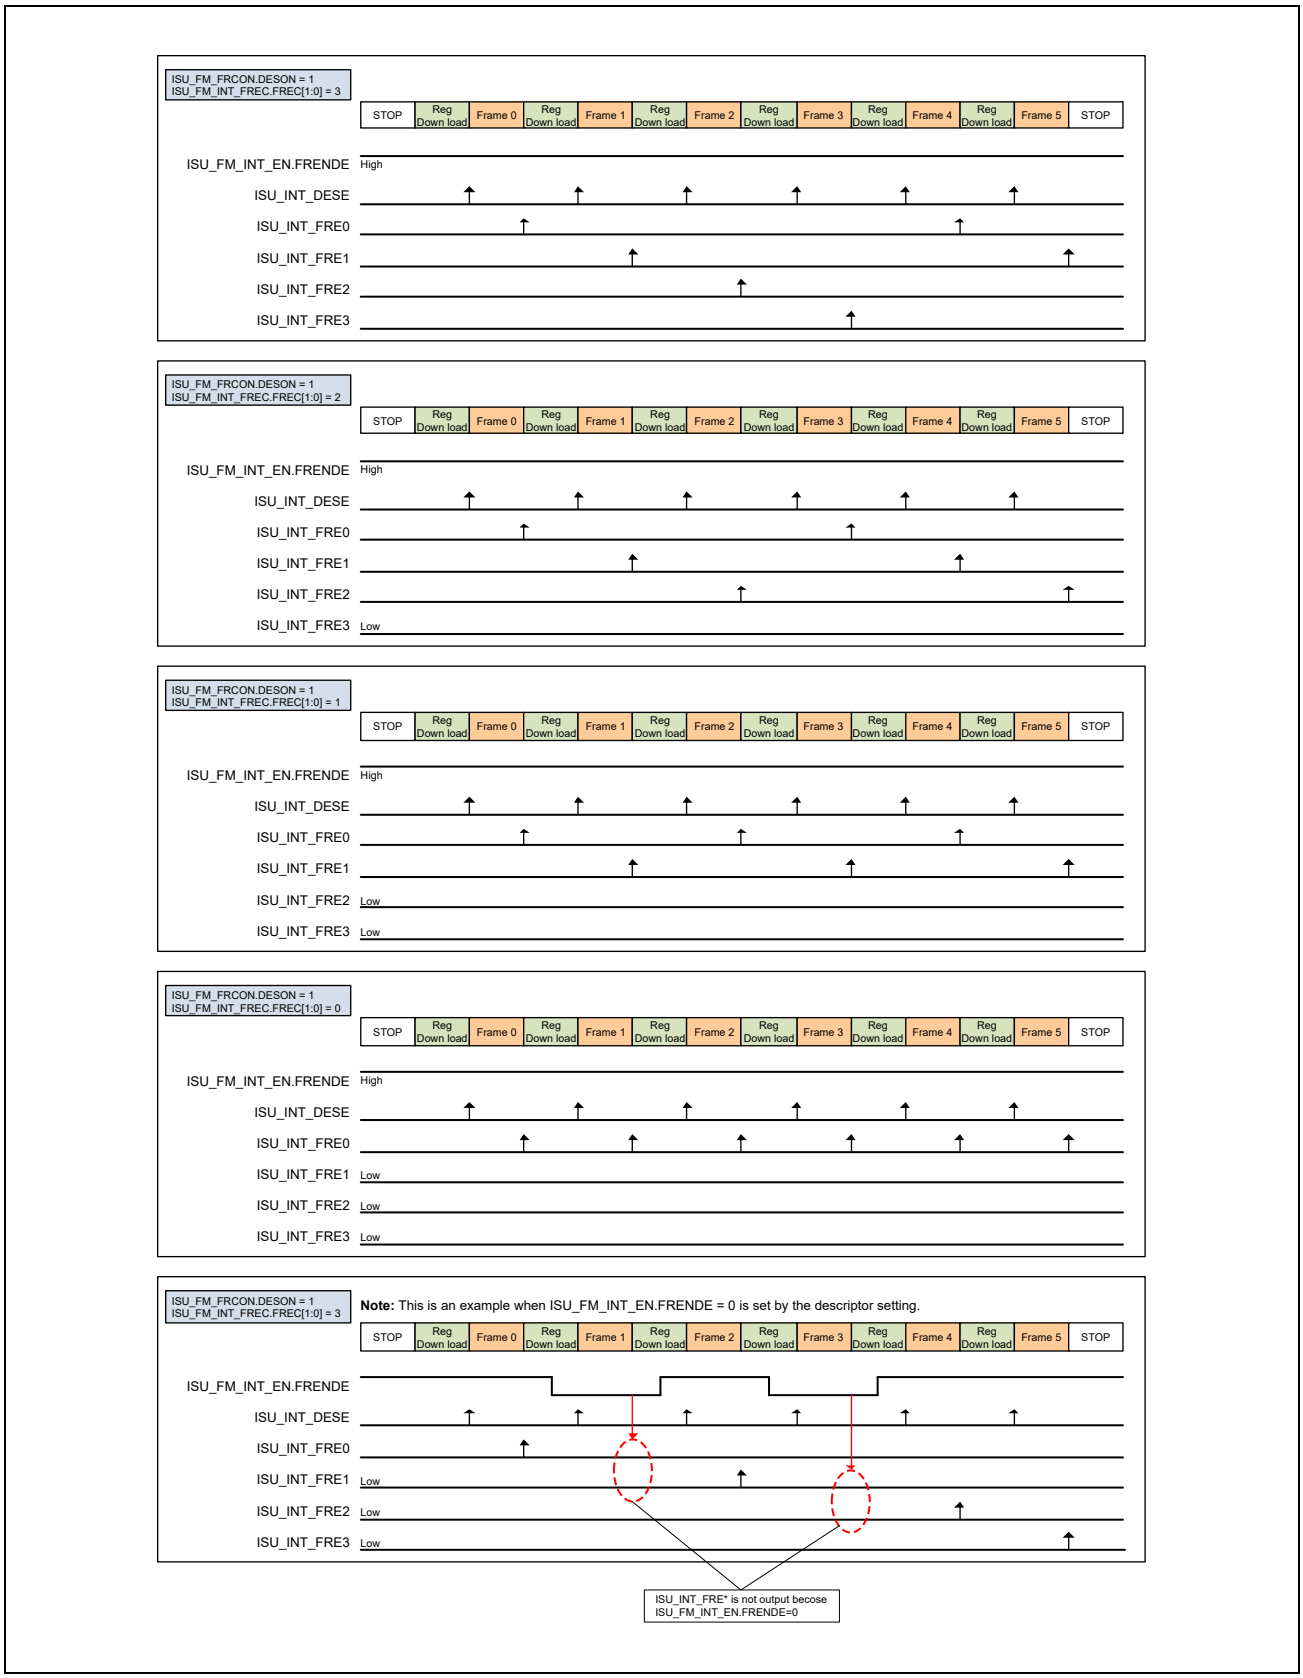

Figure 9.3-43 Relationship Between Register ISU_FM_INT_FREC Setting and ISU_INT_FRE0 to FRE3

9.3.3.2 Stop Processing

There are two ways to stop it.

- Normal stop
  - When started with ISU_FM_FRCON.DESON = 0b
    It will end automatically when the processing of one frame is completed. After completion, the read and write FIFOs on the AXI-Master side will also be empty.
  - When started with ISU_FM_FRCON.DESON = 1b
    If there is no instruction to execute the next frame in the footer of the descriptor, it will automatically end after executing one frame. After completion, the read and write FIFOs on the AXI-Master side will also be empty.

- Emergency stop

  Emergency stop will be stopped by register setting from APB.
  In response to the instruction from APB, the transfer to the bus in process of the AXI-Master is executed until a correct response is made, and after it is completed, an interrupt signal is issued. After that, when restarting from the system side, the ISU system reset is always applied from the outside and executed from initialization.
  If the APB instructs the emergency stop again during the emergency stop process, only the first emergency stop instruction will be valid.

9.3.3.3 Interrupt

Table 9.3-14 lists the interrupt sources, registers, and interrupt signals to the ICU.

Table 9.3-14 List of Interrupts

Interrupt Signal	Function	Interrupt Source Status/clear	Interrupt Enable register	Pulse/ Level	Min Pulse	Active Level	Clock
ISU_INT_FRE0	ISU Frame end interrupt 0	—	ISU_FM_INT_EN. FRENDE	Pulse	1	High	ACLK
ISU_INT_FRE1	ISU Frame end interrupt 1	—		Pulse	1	High	ACLK
ISU_INT_FRE2	ISU Frame end interrupt 2	—		Pulse	1	High	ACLK
ISU_INT_FRE3	ISU Frame end interrupt 3	—		Pulse	1	High	ACLK
ISU_INT_ERR	ISU AXI bus read error interrupt	ISU_FM_INT_STA. RRESPERR[2:0]	ISU_FM_INT_EN. AXIRXERRE	Level	—	High	PCLK
	ISU AXI bus write error interrupt	ISU_FM_INT_STA. BRESPERR[2:0]	ISU_FM_INT_EN. AXITXERRE	Level	—	High	PCLK
	ISU Descriptor List format violation interrupt	ISU_FM_INT_STA. LISTERR	ISU_FM_INT_EN. LISTERRE	Level	—	High	PCLK
ISU_INT_STOPE	ISU Stop completion interrupt	ISU_FM_INT_STA. SRSTEND	ISU_FM_INT_EN. SRSTEND	Level	—	High	PCLK
ISU_INT_DESE	ISU Descriptor footer receive interrupt	ISU_FM_INT_STA. DESEND	ISU_FM_INT_EN. DESENDE	Level	—	High	PCLK

9.3.4 Usage Notes

This section shows examples of converting image size and color format using the image scaling unit (ISU).

9.3.4.1 List of Setting Examples

Table 9.3-15 List of Examples

Item	Exec. Mode	Description
Image Size Conversion 1	Descriptor Mode Next frame auto-start on	Input size: 3840 × 2160 (YUV422 UYVY) Output size: 1920 × 1080 (ARGB8888) *Note*: ALPHA = FFh Scaling Ratio 1st frame: H = 1/2, V = 1/2 2nd frame: H = 1/3, V = 1/3
Image Size Conversion 2	Descriptor Mode Next frame auto-start off	Input size: 4096 × 4096 (YUV422 UYVY) Output size: 4096 × 4096 (ARGB8888) *Note*: ALPHA = 5Ah Scaling Ratio 1st frame: H = 1/1, V = 1/1 2nd frame: H = 1/2, V = 1/2
Image Size Conversion 3	Descriptor Mode Next frame auto-start on	Input size: 4096 × 2160 (YUV422 UYVY) Output size: 4096 × 2160 (ARGB8888) *Note*: ALPHA = A5h Scaling Ratio 1st frame: H = 1/1, V = 1/1 2nd frame: H = 1/2, V = 1/2
Image Size Conversion 4	Register Mode	5M (2800 × 2047) → FullHD (1920 × 1080) Input size: 5M (2800 × 2047) (ARGB8888) Output size: FullHD (1920 × 1080) (ARGB8888) Scaling Ratio 1st frame: H = 1920/2800, V = 1080/2047
Color format Conversion 1	Register Mode	YCbCr422 → YCbCr420 Input size: 320 × 240 (YCbCr422 UYVY) Output size: 320 × 240 (YCbCr420 NV12) Scaling Ratio 1st frame: H = 1/1, V = 1/1
Color format Conversion 2	Register Mode	YCbCr422 → ARGB8888 Input size: 320 × 240 (YCbCr422 UYVY) Output size: 320 × 240 (ARGB8888) Scaling Ratio 1st frame: H = 1/1, V = 1/1
Color format Conversion 3	Register Mode	BGR888 → YCbCr422 Input size: 320 × 240 (BGR888) Output size: 320 × 240 (YCbCr422 UYVY) Scaling Ratio 1st frame: H = 1/1, V = 1/1

For details on the settings, refer to each setting example.

9.3.4.2 Image Size Conversion

9.3.4.2.1 Example 1: 3840 × 2160 (YUV422 UYVY) → 1920 × 1080 (ARGB8888)

Set as follows to handle image size conversion.

Table 9.3-16 Image Size Conversion Example 1

Item	Description
Assuming that the following image is stored in DDR memory	
Input size	3840 × 2160
Input format	YCbCr422 8-bit UYVY (Interleave)
Input start address	1st frame: Plane 0 = 0_5000_0000h 2nd frame: Plane 0 = 0_7000_0000h
Input stride	Plane 0 = 7680 (1E00h) *Note*: 3840 × 2 bytes/pixel
ISU setting	
Output (CROP) size	1920 × 1080
Output format	ARGB8888
Output start address	1st frame: Plane 0 = 0_6000_0000h 2nd frame: Plane 0 = 0_8000_0000h
Output stride	Plane 0 = 7680 (1E00h) *Note*: 1920 × 4 bytes/pixel
Scaling ratio	1st frame: H = 1/2, V = 1/2 2nd frame: H = 1/3, V = 1/3
Processing method	Descriptor method with automatic start of the next frame
Color format conversion	YCbCr422 → RGB (BT.601 SDTV)
Descriptor address	Table 1: 0_4000_0000h Table 2: 0_4000_0100h
Padding mode	PADDSEL = 1 (Register value)

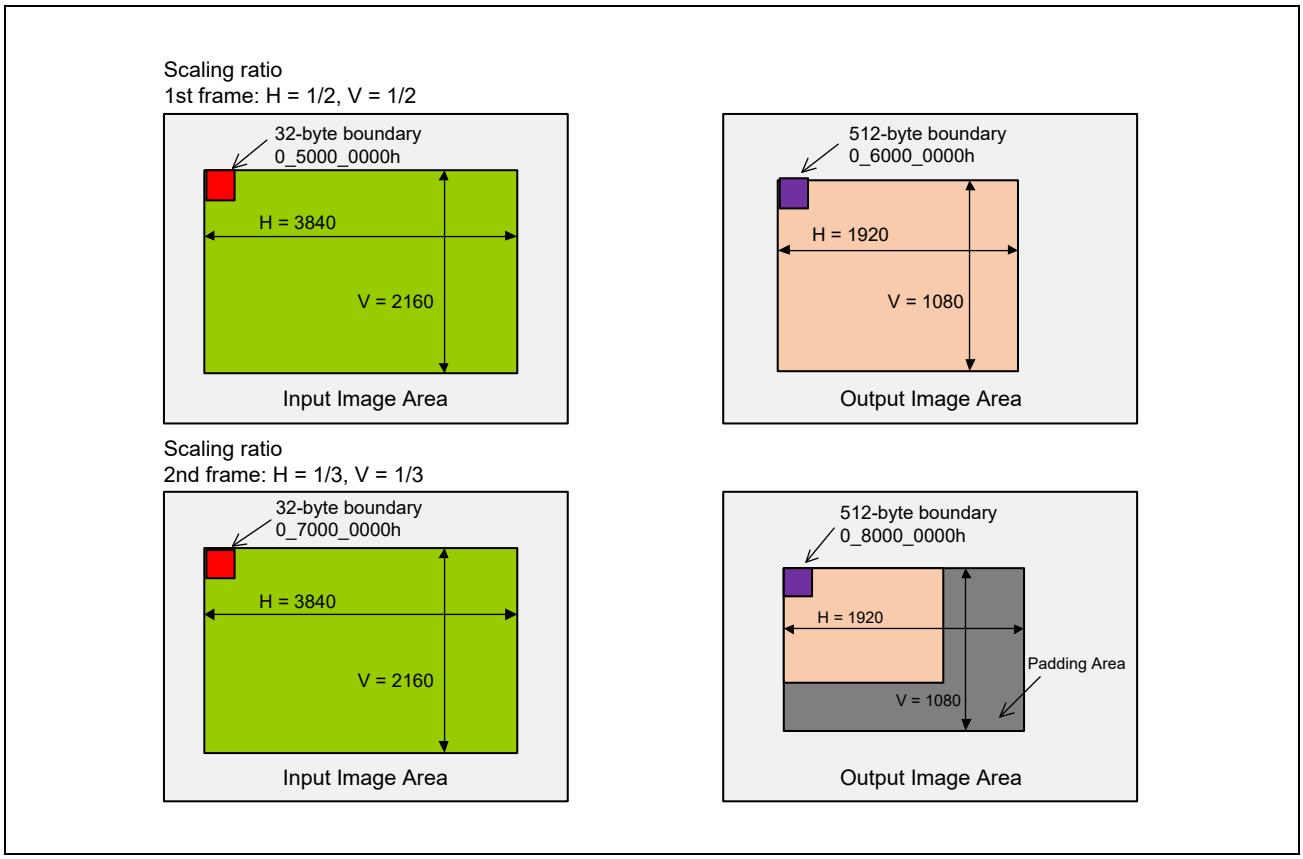

Figure 9.3-44 Image Size Conversion Example 1

The following shows the matrix operation formula for conversion and color correction.

$$\begin{bmatrix} C1' \\ C2' \\ C3' \end{bmatrix} = \begin{bmatrix} K11 & K12 & K13 \\ K21 & K22 & K23 \\ K31 & K32 & K33 \end{bmatrix} \cdot \begin{bmatrix} A - OFS\_A1 \\ B - OFS\_B1 \\ C - OFS\_C1 \end{bmatrix} + \begin{bmatrix} OFST\_A2 \\ OFST\_B2 \\ OFST\_C2 \end{bmatrix}$$

$$C1'' = MAX\ (CLPMIN\_A, Min\ (CLPMAX\_A, C1'))$$
$$C2'' = MAX\ (CLPMIN\_B, Min\ (CLPMAX\_B, C2'))$$
$$C3'' = MAX\ (CLPMIN\_C, Min\ (CLPMAX\_C, C3'))$$

Figure 9.3-45 Matrix Operation Formula for Conversion and Color Correction

The following shows the YCbCr422-to-RGB conversion formula (BT.601 SDTV).

$R = 1.164\ (Y - 16) + 1.596\ (Cr - 128)$
$G = 1.164\ (Y - 16) - 0.391\ (Cb - 128) - 0.813\ (Cr - 128)$
$B = 1.164\ (Y - 16) + 2.018\ (Cb - 128)$

Note: R/G/B: 0 to 255

Perform YCbCr-to-RGB conversion with the following allocation.

$R = K11\ (Y - OFST\_A1) + K12\ (Cb - OFST\_B1) + K13\ (Cr - OFST\_C1) + OFST\_A2$
$G = K21\ (Y - OFST\_A1) + K22\ (Cb - OFST\_B1) + K23\ (Cr - OFST\_C1) + OFST\_B2$
$B = K31\ (Y - OFST\_A1) + K32\ (Cb - OFST\_B1) + K33\ (Cr - OFST\_C1) + OFST\_C2$

Note: K** is set by signed fixed point Q10.
Example: K11 = 1.164 × 1024 = 1191.936 = 4A8h
Rounded to the nearest whole number.

9.3.4.2.3 Example 3: 4096 × 2160 (YUV422 UYVY) → 4096 × 2160 (ARGB8888)

Set as follows to handle image size conversion.

Table 9.3-22 Image Size Conversion Example 3

Item	Description
Assuming that the following image is stored in DDR memory	
Input size	4096 × 2160
Input format	YCbCr422 8-bit UYVY (Interleave)
Input start address	1st frame: Plane 0 = 0_4100_0000h 2nd frame: Plane 0 = 0_4100_0000h
Input stride	Plane 0 = 8192 (2000h) *Note*: 4096 × 2 byte/pixel
ISU setting	
Output (CROP) size	4096 × 2160
Output format	ARGB8888
Output start address	1st frame: Plane 0 = 0_4300_0000h 2nd frame: Plane 0 = 2_4000_0000h
Output stride	Plane 0 = 16384 (4000h) *Note*: 4096 × 4 byte/pixel
Scaling ratio	1st frame: H = 1/1, V = 1/1 2nd frame: H = 1/2, V = 1/2
Processing method	Descriptor method with automatic start of the next frame
Color format conversion	YCbCr422 → RGB (BT.601 SDTV)
Descriptor address	Table 1: 0_4000_0000h Table 2: 0_4000_0100h
Padding mode	PADDSEL = 1b (Register value)

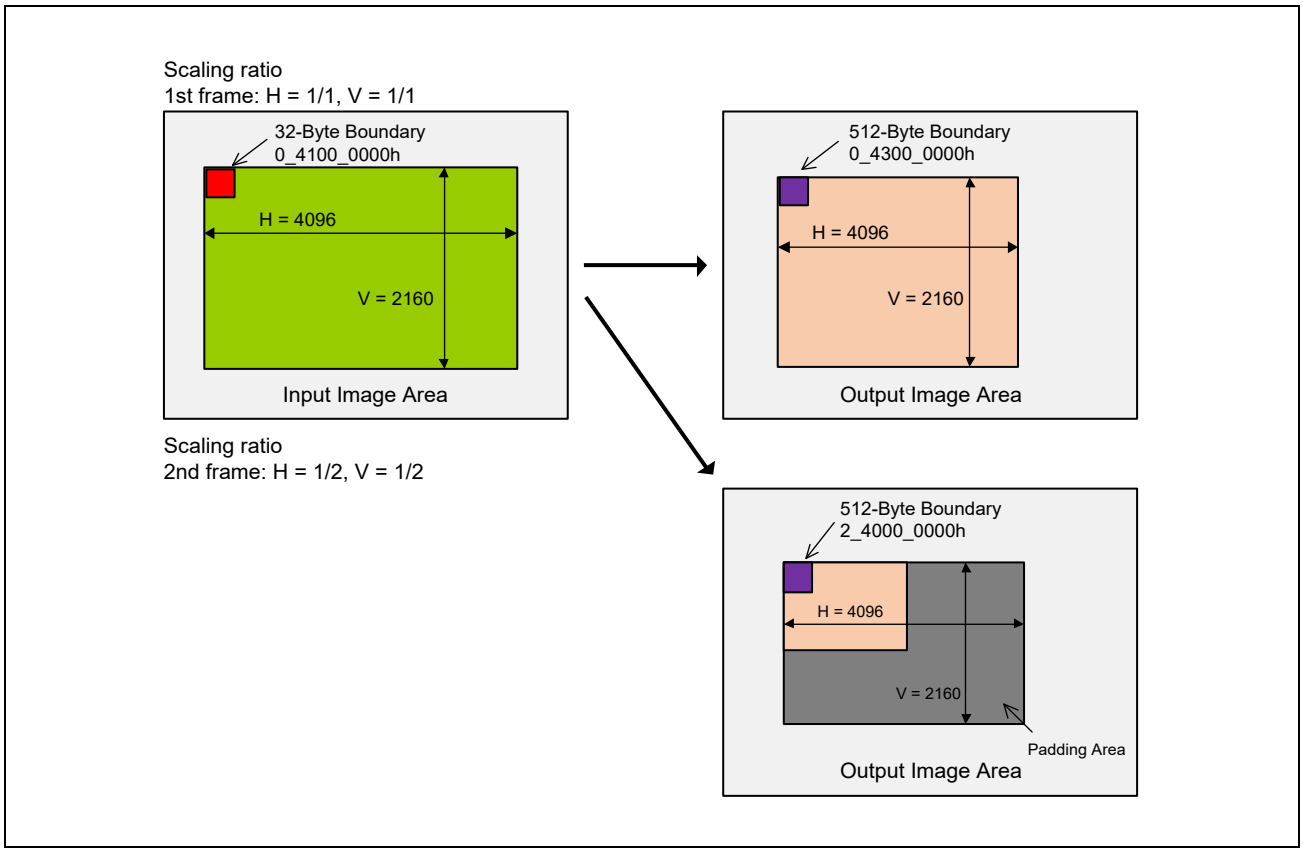

Figure 9.3-49 Image Size Conversion Example 3

Set the color conversion coefficient in the same way as in Image Size Conversion Example 1.

9.3.4.2.4 5M (2800 × 2047) → Full HD (1920 × 1080)

Set as follows to handle image size conversion.

Table 9.3-25 Image Size Conversion Example 4

Item	Description
Assuming that the following image is stored in DDR memory	
Input size	2800 × 2047
Input format	ARGB8888 * (The ISU swaps data because of the BGRA format.)
Input start address	Plane 0 = 0_5000_0000h
Input stride	Plane 0 = 2BC0h
ISU setting	
Output (CROP) size	1920 × 1080
Output format	ARGB8888
Output start address	Plane 0 = 0_6000_000h
Output stride	Plane 0 = 1E00h
Processing method	Register
Color format conversion	None
Padding mode	PADDSEL = 0 (Last pixel copy)

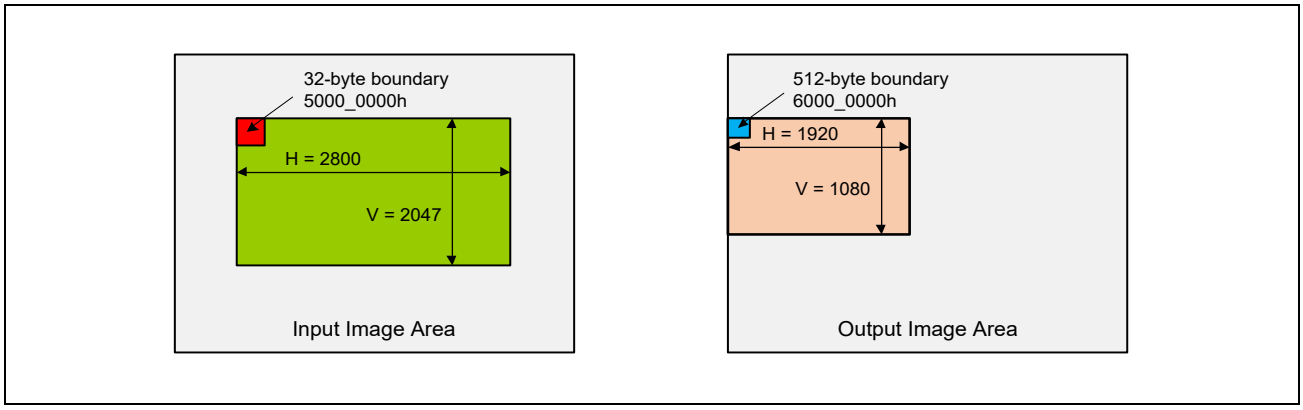

Figure 9.3-51 Image Size Conversion Example 4

Obtain the multiplication coefficient in the horizontal direction/

2800 / 1920 = 1.458333...
HMANT (integer part) = 1 = 1h
HFRAC (decimal part) = 0.458333 × 4096 (Q12) = 1877.3320 ... = 755h

Obtain the multiplication coefficient in the vertical direction.

2047 / 1080 = 1.895370...
VMANT (integer part) = 1 = 1h
VFRAC (decimal part) = 0.895370 × 4096 (Q12) = 3667.43552... = E53h

Note: HFRAC and VFRAC are set by unsigned fixed point Q12 and are truncated after the decimal point.

Output stride	Plane 0 = 500h
Processing method	Register
Color format conversion	YCbCr → RGB (BT.601 SDTV)

The following shows the matrix operation formula for conversion and color correction.

$$\begin{bmatrix} C1' \\ C2' \\ C3' \end{bmatrix} = \begin{bmatrix} K11 & K12 & K13 \\ K21 & K22 & K23 \\ K31 & K32 & K33 \end{bmatrix} \cdot \begin{bmatrix} A - OFS\_A1 \\ B - OFS\_B1 \\ C - OFS\_C1 \end{bmatrix} + \begin{bmatrix} OFST\_A2 \\ OFST\_B2 \\ OFST\_C2 \end{bmatrix}$$

$$C1'' = MAX\,(CLPMIN\_A, Min\,(CLPMAX\_A, C1'))$$
$$C2'' = MAX\,(CLPMIN\_B, Min\,(CLPMAX\_B, C2'))$$
$$C3'' = MAX\,(CLPMIN\_C, Min\,(CLPMAX\_C, C3'))$$

Figure 9.3-54 Matrix Operation Formula for Conversion and Color Correction

The following shows the YCbCr422-to-RGB conversion formula (BT.601 SDTV).

$$R = 1.164\,(Y - 16) + 1.596\,(Cr - 128)$$
$$G = 1.164\,(Y - 16) - 0.391\,(Cb - 128) - 0.813\,(Cr - 128)$$
$$B = 1.164\,(Y - 16) + 2.018\,(Cb - 128)$$

Note: R/G/B: 0 to 255

Perform YCbCr-to-RGB conversion with the following allocation.

$$R = K11\,(Y - OFST\_A1) + K12\,(Cb - OFST\_B1) + K13\,(Cr - OFST\_C1) + OFST\_A2$$
$$G = K21\,(Y - OFST\_A1) + K22\,(Cb - OFST\_B1) + K23\,(Cr - OFST\_C1) + OFST\_B2$$
$$B = K31\,(Y - OFST\_A1) + K32\,(Cb - OFST\_B1) + K33\,(Cr - OFST\_C1) + OFST\_C2$$

Note: K** is set by signed fixed point Q10.
Example: K11 = 1.164 × 1024 = 1191.936 = 4A8h
Rounded to the nearest whole number.

9.3.4.3.3 BGR888 → YCbCr422

Set as follows to handle color format conversion.

Table 9.3-31 Color Format Conversion Example 3

Item	Description
Assuming that the following image is input from the CRU	
Input size	320 × 240
Input format	BGR888
Input start address	Plane 0 = 0_5000_0000h
Input stride	Plane 0 = 03C0h
ISU setting	
Output (CROP) size	320 × 240
Output format	YCbCr422 8-bit UYVY (Interleave)
Output start address	Plane 0 = 0_6000_000h
Output stride	Plane 0 = 0280h
Processing method	Register
Color format conversion	RGB → YCbCr (BT.601 SDTV)

The following shows the matrix operation formula for conversion and color correction.

$$\begin{bmatrix} C1' \\ C2' \\ C3' \end{bmatrix} = \begin{bmatrix} K11 & K12 & K13 \\ K21 & K22 & K23 \\ K31 & K32 & K33 \end{bmatrix} \cdot \begin{bmatrix} A - OFS\_A1 \\ B - OFS\_B1 \\ C - OFS\_C1 \end{bmatrix} + \begin{bmatrix} OFST\_A2 \\ OFST\_B2 \\ OFST\_C2 \end{bmatrix}$$

$$C1'' = MAX\,(CLPMIN\_A, Min\,(CLPMAX\_A, C1'))$$
$$C2'' = MAX\,(CLPMIN\_B, Min\,(CLPMAX\_B, C2'))$$
$$C3'' = MAX\,(CLPMIN\_C, Min\,(CLPMAX\_C, C3'))$$

Figure 9.3-56 Matrix Operation Formula for Conversion and Color Correction

The following shows the RGB-to-YCbCr422 conversion formula (BT.601 SDTV).

$$Y = 0.257R + 0.504G + 0.098B + 16$$
$$Cb = -0.148R - 0.291G + 0.439B + 128$$
$$Cr = 0.439R - 0.368G - 0.071B + 128$$

Note: Brightness: 16 to 235
Color difference: 16 to 240

Perform RGB-to-YCbCr conversion with the following allocation.

$$Y = K11\,(R - OFST\_A1) + K12\,(G - OFST\_B1) + K13\,(B - OFST\_C1) + OFST\_A2$$
$$Cb = K21\,(R - OFST\_A1) + K22\,(G - OFST\_B1) + K23\,(B - OFST\_C1) + OFST\_B2$$
$$Cr = K31\,(R - OFST\_A1) + K32\,(G - OFST\_B1) + K33\,(B - OFST\_C1) + OFST\_C2$$

Note: K** is set by signed fixed point Q10.
Example: K11 = 0.257 × 1024 = 263.168 = 107h
Rounded to the nearest whole number.

SECTION 9 IMAGE

9.4 LCD Controller (LCDC)

9.4.1 Overview

This chapter describes the features of the LCDC unit of this LSI.

This unit is an LCD controller and it is composed of Frame Compression Processor (FCPVD), Video Signal Processor (VSPD), and Display Unit (DU).

This LSI has one this unit and it is connected to DSI. The video data, which is output by this unit, is input to DSI, and DSI converts to MIPI DSI (Display Serial Interface) and output.

9.4.1.1 Features

The following is key features of this unit.

- FCPVD
  - Supports out-of-order for the whole outstanding transactions
  - Read linear addressing image data
  - Read display list data
  - Write image data

- VSPD
  - Supports various data formats and conversion
    - Supports YCbCr444/422/420, RGB, α RGB, α plane
    - Color space conversion and changes to the number of colors by dithering
    - Color keying
    - Supports combination between pixel alpha and global alpha
    - Supports generating pre multiplied alpha
  - Video processing
    - Blending of two picture layers and raster operations (ROPs)
    - Clipping
    - 1D look up table
    - Vertical flipping in case of output to memory
  - Direct connection to display module
    - Supports up to 1920 pixels in horizontal direction
    - Writing back image data which is transferred to Display Unit (DU) to memory

- DU
  - Display timing master
    - Generates video timings (Front porch, Back porch, Sync active, Active video area)
    - Selects the polarity of output DCLK, HSYNC, VSYNC, and DE
  - Supports Progressive (Non-interlace)
  - Not supports Interlace
  - Input data format (from VSPD): RGB888, RGB666 (not supports dithering of RGB565)
  - Output data format: same as Input data format
  - Supports up to 187.5 MHz of the pixel clock frequency
  - Examples of the supported resolutions is below:
    - RGB888, 1920 pixels × 1200 lines, 60 fps
    - RGB888, 1920 pixels × 1080 lines, 60 fps (FHD)
    - RGB888, 1280 pixels × 1024 lines, 120 fps

9.4.1.2 Block Diagram

Figure 9.4-1 shows a block diagram.

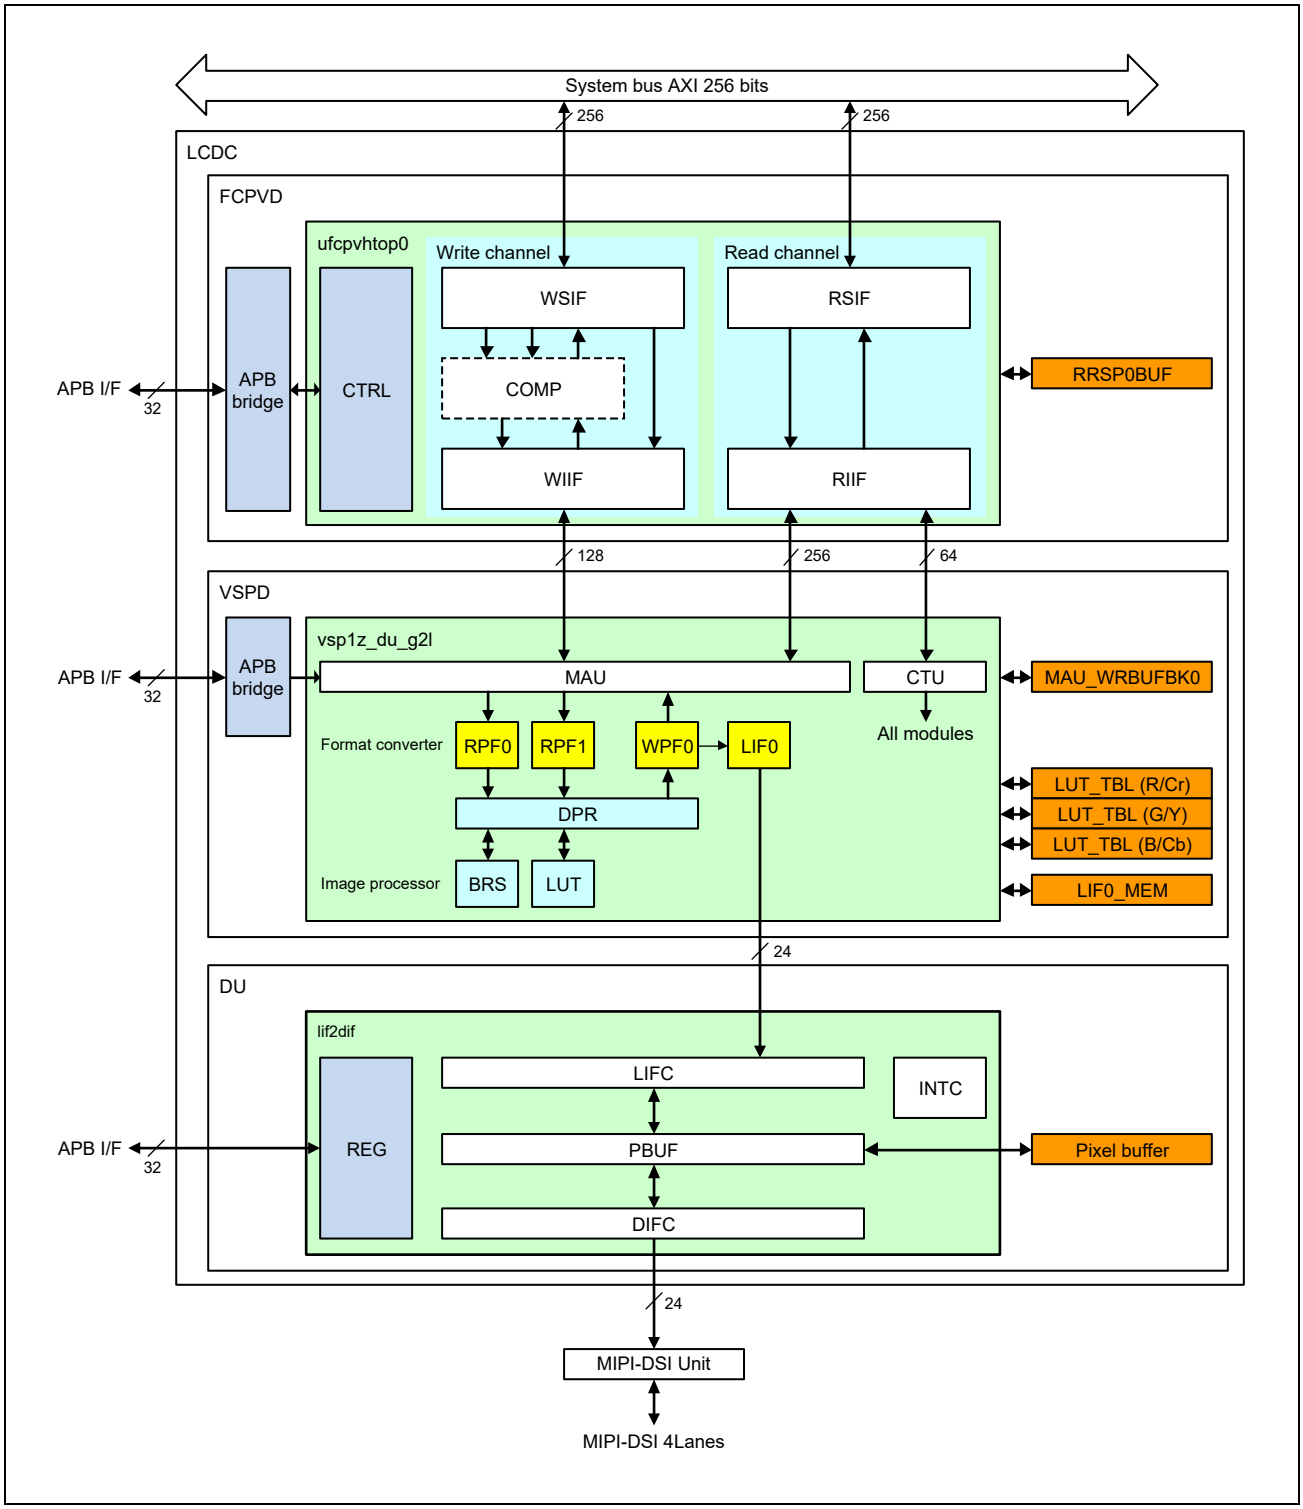

Figure 9.4-1 Block Diagram

9.4.1.2.1 FCPVD

FCPVD has the following sub modules.

Table 9.4-1 Sub Modules in FCPVD

Abbreviation	Description
CTRL	FCPVD controller
WIIF	VSPD write channel interface
WSIF	System AXI write channel interface
RIIF	VSPD read channel interface
RSIF	System AXI read channel interface
COMP	Compression module (This is a dummy module)

9.4.1.2.2 VSPD

VSPD has the following sub modules.

(1) Memory Access Unit (MAU)

The VSPD applies processing to the image data stored in the external memory and writes the resultant data back to the external memory. The data transfer between the external memory and VSPD necessary for this operation is done by the MAU, which works as the bus master, according to the register settings. The MAU executes this data transfer between the external memory and VSPD.

(2) Command Transfer Unit (CTU)

The VSPD can directly read register parameters for image processing by display lists stored in external memory. The CTU module is a bus interface and controls display lists when the CTU reads display lists as a bus master.

(3) Read Pixel Formatter (RPF)

The RPF reads image data from the external memory through the MAU, unpacks data according to the specified format, converts the color space, converts the number of colors, executes color keying, ROP operation, Multiply-alpha and OSD processing, and outputs the resultant data to the DPR. The RPF has an input format unpacking unit, a 1-bit mask generator, a raster operation unit (ROP unit), a color keying unit, a color space converter and multiply-alpha. **Figure 9.4-2** show the processing flow in the RPF.

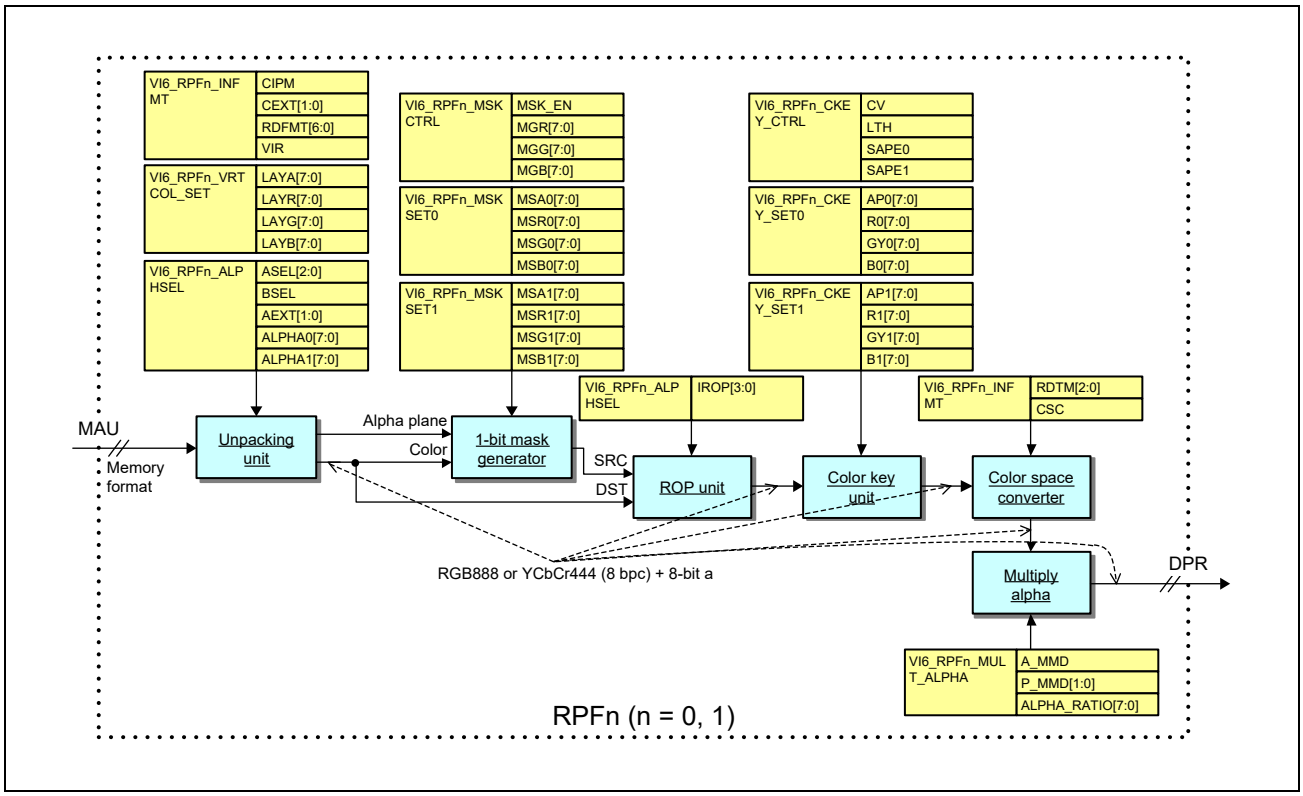

Figure 9.4-2 RPF Processing Flow

The input format unpacking unit expand the image data input from the MAU into the image format for internal processing (YCbCr444 8bpc or RGB888 8bpc), and the 1-bit mask generator generates a 1-bit image mask from the image data expanded through the unpacking unit. Alternately, a 1-bit image mask can be generated from the alpha plane that is different from the picture plane read through the MAU.

The raster operation unit (ROP unit) executes raster operation between the data from the 1-bit mask generator and the image data expanded from the input format, and the color keying unit applies color replacement and specifies the transparent color for the image data input from the ROP unit. The color space converter converts the color space (RGB-YCbCr) of the image data input from the color keying unit as necessary. The multiply-alpha unit multiplies pixel-alpha by specified alpha or/and multiplies image data by pixel-alpha or/and specified alpha.

The VSPD provides maximum two RPF modules (RPF0 to RPF1).

(4) Data Path Router (DPR)

The DPR controls the data paths among RPFs, function modules, and WPFs. The DPR selects one of the images input from RPFs, outputs it to a function module (BRS or LUT), and selects one of WPFs as the destination where the image data processed in the function module will be output. Before output to the WPF, the output from each function module can be input to another function module, which enables multiple image processing functions to be executed continuously without involving the external memory.

(5) Look Up Table (LUT)

This is a 1D-LUT that converts each of three color components by using a lookup table. The LUT is connected to the DPR and can be used for gamma correction, negative-positive conversion, posterization, and binarization through desired tone curve settings.

The LUT supports local area processing for Y component. The LUT can apply 1D look up table for Y component per area where a image is divided into multiple area specified by registers and command list.

(6) Blend ROP Sub Unit (BRS)

The BRS is a module connected to the DPR, which executes the image blending processing and ROP operation. The BRS has two blend/ROP operation units (blend/ROP unit m, m = A to B), a blend/ROP input switch (SEL) for selecting the input to these operation units, and a divider for normalization (div unit).

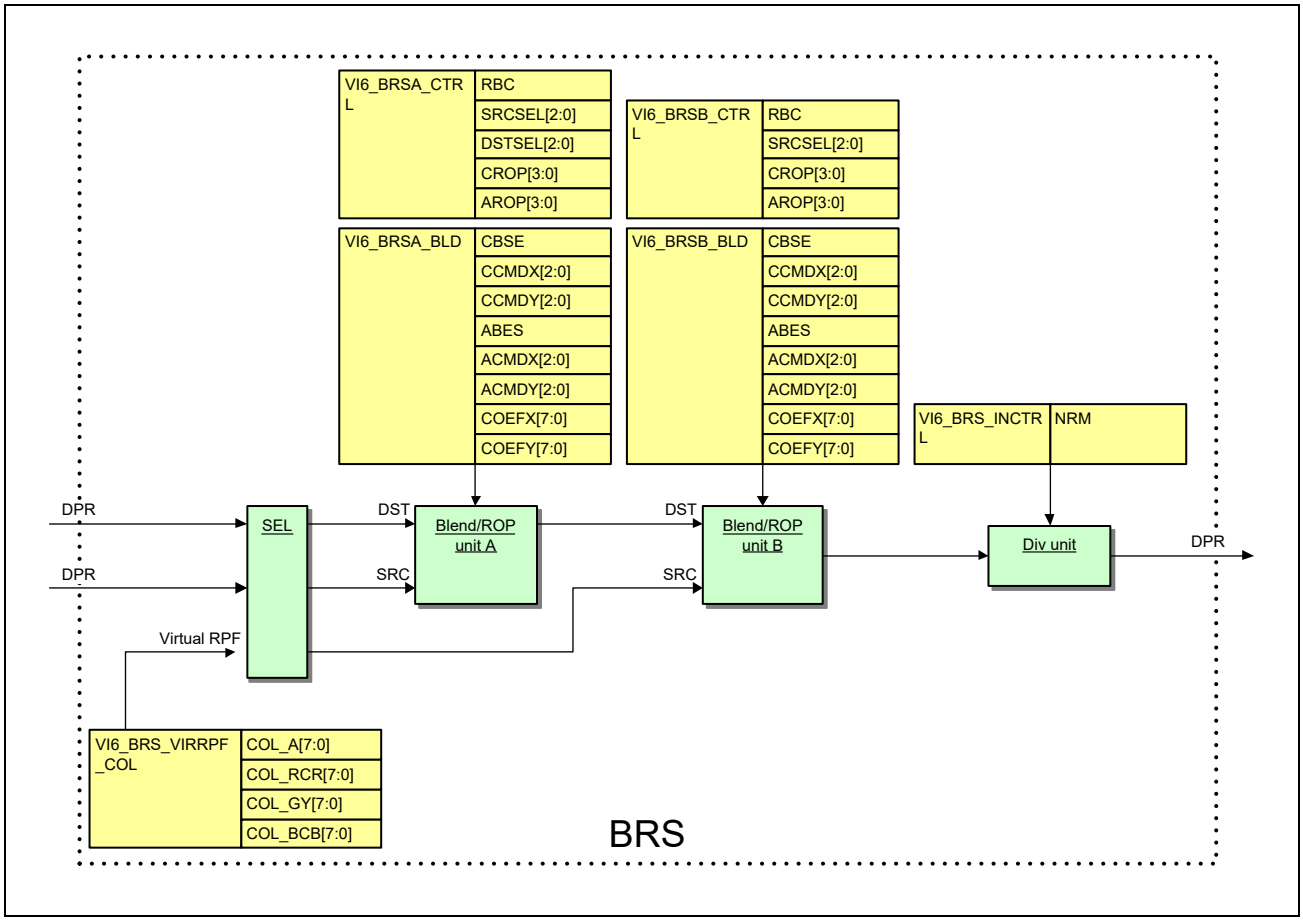

Figure 9.4-3 BRS Processing Flow

Each of the two blend-ROP operation units (blend/ROP unit m) receives the output from the SEL or blend/ROP Unit m, and executes blending or raster operation (ROP) of images.

The divider for normalization (div unit) divides the pixel value by the α value.

(7) Write Pixel Formatter (WPF)

The WPF is an output module that receives 32bits image data (YCbCr444 or RGB888 + 8-bitα) from the DPR, converts the color space, number of colors, and format of the data, and outputs the results of VSPD image processing to external memory through the MAU. The WPF is mainly configured from a color space converter and an output format converter (the packing unit).

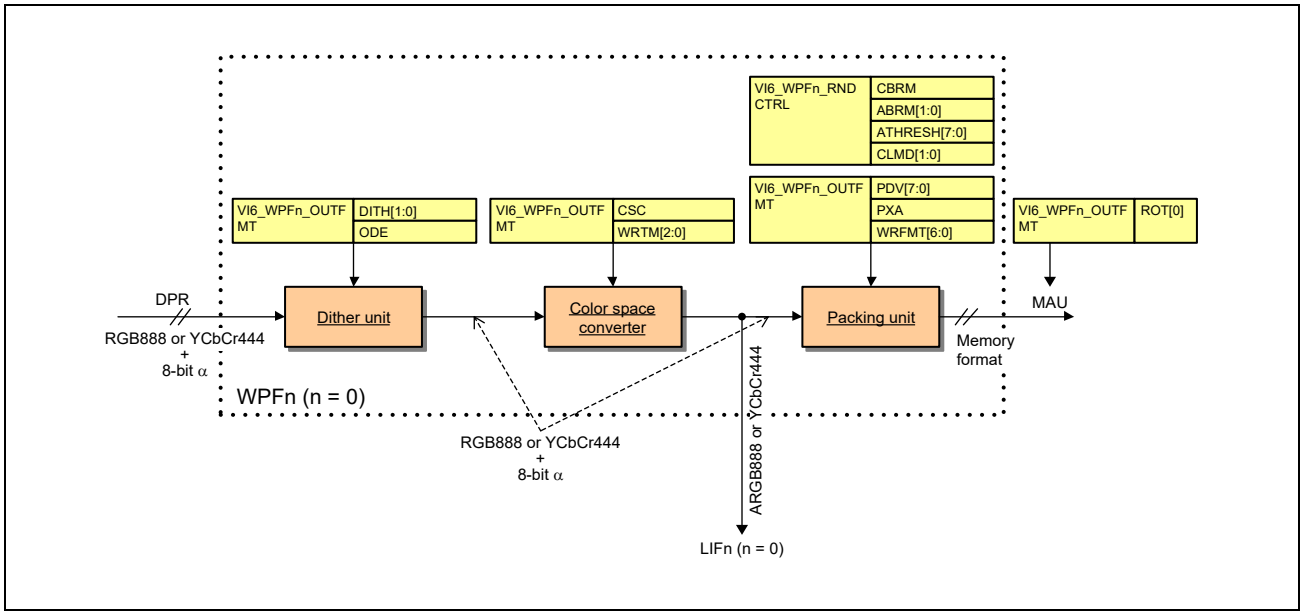

Figure 9.4-4 WPF Processing Flow

The color space converter converts the color space between RGB and YCbCr, and the packing unit converts the format into the picture plane storing format. The VSPD provides one WPF (WPF0). The WPF has the output to LIF module after the color space conversion for transferring the video data to the display module. Image data to LIF is 24bits (YCbCr444 or RGB888) format, and its' color space is after color space conversion.

(8) Display Unit Interface (LIF)

The LIF module is used for transferring image data to the display module. The input port of the LIFn (n = 0) module is connected to WPFn (n = 0), and the output port of the LIF module is connected to DU (Display Unit). Data flow in LIF is shown in **Figure 9.4-30**.

(9) Detail Function

Table 9.4-2 Detail Function of VSPD (1/4)

• Image Data Transfer Function			
Bus interface	Protocol		AXI 256 bits through FCPVD
	Data alignment	Conversion method	Byte, Word, LW, or LLW data swapping
		Channel	Data alignment can be specified separately for each input/output channel
Image memory	Input	Address setting	1-byte units
	Output	Address setting	1-byte units
		Memory area	Images can be written to the same memory area where the master layer is stored. Note the restrictions shown in **Table 9.4-38**
Tile transfer mode			Supported by RPF0 to RPF1
YCbCr memory storage format			Interleaved, planar, or semi-planar
• Display list/Extended Display List Transfer Function			
Bus interface	Protocol		AXI 256 bits through FCPVD
	Data alignment	Conversion method	Byte, Word, LW data swapping
			Data alignment can be specified separately for display list and each entry of extended display list
Data memory	Load	Address setting	8-byte units
	Store	—	Not available

Table 9.4-2 Detail Function of VSPD (2/4)

• Read Pixel Formatter (RPF)			
Number of channels			Two channels (RPF0 to RPF1)
Input color bit-depth		Color	2- to 8-bit
		Alpha	1-/2-/4-/8-bit
Operation bit-depth		Color	8-bit
		Alpha	8-bit
Image format	Input	RGB	RGB888, RGB565, RGB666, αRGB8888, αRGB4444, αRGB1555 α plane (8 bpp, 1 bpp)
		YCbCr	YCbCr4:4:4 (8 bpc) Planar/Semi planar/Interleaved YCbCr4:2:2 (8 bpc) Planar/Semi planar/Interleaved YCbCr4:2:0 (8 bpc) Planar/Semi planar/Interleaved α plane (8 bpp, 1 bpp)
		Maximum size	1920 × 1200 pixels The internal data path modules have separate restrictions on the maximum image size. For details, refer to **9.4.6.3 Input Image Size**.
		Minimum size	1 × 1 pixel The internal data path modules have separate restrictions on the minimum image size. For details, refer to **9.4.6.3 Input Image Size**.
		Size setting unit	YCbCr420: 2-pixel units both horizontally and vertically. YCbCr422: 2-pixel units horizontally and 1-pixel units vertically. In other formats, the size can be set in 1-pixel units.
Color keying	Color replacement	Compared data	RGB or Y (8 bpc)
		Replaced data	αRGB or αYCbCr (8 bpc for R, G, B, Y, Cb, Cr, α)
		Comparison Mode	Matched color mode
		Input source	RPF0 to RPF1
	Transparent color	Compared data	RGB or Y (8 bpc)
		Replaced data	α 8 bpp
		Comparison Mode	Matched color mode, Luma threshold mode
		Input source	RPF0 to RPF1
Raster operation	ROP2 (within input channels)	Operator	16 types (OpenGL2.0 is supported)
		Sources of operation	ROP2 operation between the 1-bpp α plane and RGB/YCbCr data in RPF0 to RPF1. Note that 1-bpp α is converted to αRGB or αYCbCr4:4:4. (8 bpc)
Color space conversion	RGB to YCbCr	Conversion expression	RGB (0, $2^n - 1$) to BT601 (2^{n-4}, $235\times2^{n-8}/240\times2^{n-8}$) RGB (0, $2^n - 1$) to BT709 (2^{n-4}, $235\times2^{n-8}/240\times2^{n-8}$) RGB (0, $2^n - 1$) to BT601 (0, $2^n - 1$) RGB (2^{n-4}, $235\times2^{n-8}$) to BT709 (2^{n-4}, $235\times2^{n-8}/240\times2^{n-8}$) (n = 8)
		Target of conversion	RPF0 to RPF1
	YCbCr to RGB	Conversion expression	BT.601 (2^{n-4}, $235\times2^{n-8}/240\times2^{n-8}$) to RGB (0, $2^n - 1$) BT.709 (2^{n-4}, $235\times2^{n-8}/240\times2^{n-8}$) to RGB (0, $2^n - 1$) BT.601 (0, $2^n - 1$) to RGB (0, $2^n - 1$) BT.709 (2^{n-4}, $235\times2^{n-8}/240\times2^{n-8}$) to RGB ($2^{n-4}$, $235\times2^{n-8}$) (n = 8)
		Target of conversion	RPF0 to RPF1

Table 9.4-2 Detail Function of VSPD (3/4)

• Read Pixel Formatter (RPF)			
Changing number of colors	Bit extension	Extended bits	Input bitdepth (2bpc to 6bpc) to operation bitdepth 8bpc
		Target format	RGB666, RGB565, RGB555, RGB444, or RGB332
		Bit reduction method	Padded with 0. Copied from the most significant bits.
		Target of conversion	RPF0 to RPF1
	YCbCr444 generation	Vertical	CbCr copying
		Horizontal	copying or interpolation.
α bit count conversion	Bit extension	Extended bits	Input bitdepth 1bpc to operation bitdepth 8bpc
		Method	Padded with 0. Copied from the most significant bits.
Multiply-alpha function	Fade-alpha		RPF0 to RPF1 Available for straight pixel and pre-multiplied pixel.
	Generate pre-multiplied alpha		RPF0 to RPF1
Virtual display	RPF0 to RPF1	Color format	αRGB8888 or αYCbCr4:4:4 single-color
		Display size	Same as the size of the input channel
	Virtual RPF	Color format	αRGB8888 or αYCbCr4:4:4 single-color
		Display size	Maximum: 1920 × 1200 pixels Minimum: 4 × 4 pixels
• Write Pixel Formatter (WPF)			
Number of channels			One channel (WPF0)
Image format	Output	RGB	RGB332, RGB444, RGB565, RGB666, RGB888, αRGB8666, αRGB8888, αRGB4444, αRGB1555
		YCbCr	YCbCr4:4:4, YCbCr4:2:2, YCbCr4:2:0
		Maximum size	1920 × 1200 pixels The internal data path modules have separate restrictions on the maximum image size. For details, refer to **9.4.6.4 Output Image Size**.
		Minimum size	1 × 1 pixel The internal data path modules have separate restrictions on the minimum image size. For details, refer to **9.4.6.4 Output Image Size**.
		Size setting unit	YCbCr420: 2-pixel units both horizontally and vertically. YCbCr422: 2-pixel units horizontally and 1-pixel units vertically. In other formats, the size can be set in 1-pixel units.
Color space conversion	RGB to YCbCr	Conversion expression	RGB (0, 255) to BT.601 (16, 235/240) RGB (0, 255) to BT.709 (16, 235/240) RGB (0, 255) to BT.601 (0, 255) RGB (16, 235) to BT.709 (16, 235/240)
		Target of conversion	WPF0
	YCbCr to RGB	Conversion expression	BT.601 (16, 235/240) to RGB (0, 255) BT.709 (16, 235/240) to RGB (0, 255) BT.601 (0, 255) to RGB (0, 255) BT.709 (16, 235/240) to RGB (16, 235)
		Target of conversion	WPF0
Changing number of colors	Output	Reducing RGB color depth	Dithering, lower-order bit truncation, or rounding
		YCbCr422/420	CbCr skipping or CbCr vertical skipping and horizontal skipping
α bit count conversion	Output	Bit reduction	Truncation, rounding, or comparison with threshold (for 1 bpp)

Table 9.4-2 Detail Function of VSPD (4/4)

• Image Compositing			
α blending	Input α value selection	RGB	Pixel α, fixed α value, α plane, or 1-bit α converted from the color specified for pixels
		YCbCr	α plane, fixed α value, or 1-bit α converted from the color specified for pixels
	α blending expression	Layer A: Upper layer Layer B: Lower layer	xA + yB, xA − yB Coefficients x and y should be selected from the following. Fixed α value, (α for layer A), (1 − α for layer A), (α for layer B), (1 − α for layer B)
	Output α value selection	RGB	Fixed α value, x (α for layer A) + y (α for layer B), x (α for layer A) – y (α for layer B) Coefficients x and y should be selected from the following. Fixed α value, (α for layer A), (1 − α for layer A), (α for layer B), (1 − α for layer B)
	Blending layers	Number of layers	Two layers selected from RPF0 to RPF1 and video processing function output, and virtual RPF; three layers in total
		Order of layers	The order of three layers selected from RPF0 to RPF1, virtual RPF, and video processing function output can be changed as desired.
	α plane	Format	8 bpp or 1 bpp (α value can be specified through register)
		Input source	RPF0 to RPF1
	Fixed α value	Format	8 bpp
		Input source	RPF0 to RPF1, virtual RPF, or video processing function output
Raster operation	ROP2 (between input channels)	Operator	16 types (OpenGL2.0 is supported)
		Sources of operation	RPF0 to RPF1, virtual RPF, and video processing function output
		Operation control	RGB/YCbCr and α are operated separately.
	ROP3 (between input channels)	Operator	256-type ROP3 is available by combining ROP2 operations
		Sources of operation	RPF0 to RPF1, virtual RPF, and video processing function output
		Operation control	RGB/YCbCr and α are operated separately.
• Color Adjustment Function			
1D-LUT	LUT configuration		Independent R/Y, G/Cb, and B/Cr. 256 entries each
• Direct connection to Display module			
Display I/F	Destination		DU
	Direct connection		Can transfer data without going through external memory to DU
Line padding	Padding cycles		1 to 32 cycles
	Padding pattern		Arbitrarily setting up to 32 cycles

9.4.1.2.3 DU

DU has the following sub modules.

(1) REG

The REG controls registers for DU. The DU has APB4 interface, its transaction is transfer with no wait states.

(2) LIFC

The LIFC is the interface block from/to VSPD. The LIFC receives image data from VSPD, sends to PBUF in a pixel unit. The LIFC continues to receive the image data from VSPD unless FIFO will be full.

(3) PBUF

The PBUF is the asynchronous FIFO which convert clock domain of image data from System Bus Clock to Video Clock. The PBUF monitors the FIFO underflow.

(4) DIFC

The DIFC is the display timing master. The DIFC controls the polarity and the timing of the Video Output signals. Controllable timings are the followings.

- Hfront: Horizontal front porch (pixels)
- Hback: Horizontal back porch (pixels)
- Hsync: Horizontal sync active (pixels)
- Hactive: Horizontal active area (pixels)
- Vfront: Vertical front porch (lines)
- Vback: Vertical back porch (lines)
- Vsync: Vertical sync active (lines)
- Vactive: Vertical active area (lines)

(5) INTC

The INTC generates the interrupt when PBUF will detect a FIFO underflow. The interrupt is level signal.

9.4.1.3 Clock and Interrupt signal

The following clocks are supplied to the LCDC.

Table 9.4-3 Clock List

Clock Name	Clock Symbol	Description	Frequency (MHz)
LCDC_0_clk_a	M0ϕ	AXI clock.	400/200/100/50/13
LCDC_0_clk_p	ZTϕ	APB clock.	100
LCDC_0_clk_d	M3ϕ	Video clock.	5.44 to 187.5

The LCDC transmits the following interrupt signals to the interrupt controller.

Table 9.4-4 Interrupt List

Signal Name	Interrupt Condition	Interrupt Source Register
VSPD_INT	Frame End	VI6_WPF0_IRQ_STA.FRE
	Display List Frame End	VI6_WPF0_IRQ_STA.DFE
	DU Connection UnderRun Error	VI6_WPF0_IRQ_STA.UND
DU_INT	RBUF FIFO Underflow	DU_MSR0.ST_PB_RUF

Note: Refer to **(13) WPF0 Interrupt Status Register (LCDC_VSPD_VI6_WPF0_IRQ_STA)** and **9.4.4.2.1 DU Module Control Register 0 (LCDC_DU_MCR0)** for details.

9.4.2 FCPVD Registers

The FCPVD contains the registers which can directly be read and written to by the host CPU. The host can access any long word (32 bits) in the registers. Therefore, read-modify-write is needed to change partial bits in the 32-bit register.

Never access the registers when the FCPVD is in the module standby mode (with the operation clock placed in hold status).

Table 9.4-5 FCPVD Register Base Address

Base Register Name	Base Address
<LCDC_fcpvd_base>	0_1647_0000h (5647_0000h*1, 4647_0000h*2)

Note 1. CM33 address space (non-secure)

Note 2. CM33 address space (secure)

9.4.2.1 List of FCPVD Registers

The registers are listed below.

Register Name	Abbreviation	Initial Value	Offset Address	Access Size [bits]
FCPV version control register	LCDC_FCPVD_FCP_VCR	0000_0109h	0000h	32

9.4.2.2 FCPVD Register Description

The prefix (LCDC_FCPVD_) of the register names is omitted in this and subsequent sections.

9.4.2.2.1 FCPVD Version Control Register (LCDC_FCPVD_FCP_VCR)

FCP_VCR is the version control register of the FCPVD. The value read is fixed.

Access Size : 32 bits
Address : <LCDC_fcpvd_base> + 0000h
Initial Value : 0000_0109h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CATEGORY[7:0]								REVISION[7:0]							
Initial Value	0	0	0	0	0	0	0	1	0	0	0	0	1	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
15 to 8	CATEGORY [7:0]	1h	R	FCP use case category.
7 to 0	REVISION[7:0]	9h	R	Version of LSI product 09h: FCP revision is the Simple LCDC

9.4.3 VSPD Registers

In the following, “n” in a register name or a offset address indicates an integer, and the range of value n is defined when necessary. For RPFn and WPFn, when the range of value n is not defined, RPFn (n = 0, 1) and WPFn (n = 0) are assumed.

Table 9.4-6 VSPD Register Base Address

Base Register Name	Base Address
<LCDC_vspd_base>	0_1648_0000h (5648_0000h*1, 4648_0000h*2)

Note 1. CM33 address space (non-secure)

Note 2. CM33 address space (secure)

9.4.3.1 List of VSPD Registers

The registers are listed below.

Register Name	Abbreviation	Initial Value	Offset Address	Access Size [bits]
VSPD Start Register 0	LCDC_VSPD_VI6_CMD0	0000_0000h	0000h	32
Reserve	-	-	0004h to 000Fh	-
Clock Control Register 0	LCDC_VSPD_VI6_CLK_CTRL0	0000_0000h	0010h	32
Clock Control Register 1	LCDC_VSPD_VI6_CLK_CTRL1	0000_0000h	0014h	32
Dynamic Clock Stop Control Register	LCDC_VSPD_VI6_CLK_DCSWT	0000_0000h	0018h	32
Dynamic Clock Stop Disable Register 0	LCDC_VSPD_VI6_CLK_DCSM0	0000_0000h	001Ch	32
Dynamic Clock Stop Disable Register 1	LCDC_VSPD_VI6_CLK_DCSM1	0000_0000h	0020h	32
Reserve	-	-	0024h to 0027h	-
Software Reset Register	LCDC_VSPD_VI6_SRESET	0000_0000h	0028h	32
Module Reset Enable Register 0	LCDC_VSPD_VI6_MRESET_ENB 0	0000_0000h	002Ch	32
Module Reset Enable Register 1	LCDC_VSPD_VI6_MRESET_ENB 1	0000_0000h	0030h	32
Module Reset Issuing Register	LCDC_VSPD_VI6_MRESET	0000_0000h	0034h	32
Operating Status Register	LCDC_VSPD_VI6_STATUS	0000_0000h	0038h	32
Reserve	-	-	003Ch to 0047h	-
WPF0 Interrupt Enable Register	LCDC_VSPD_VI6_WPF0_IRQ_EN B	0000_0000h	0048h	32
WPF0 Interrupt Status Register	LCDC_VSPD_VI6_WPF0_IRQ_ST A	0000_0000h	004Ch	32
Reserve	-	-	0050h to 0077h	-
Display-0 Interrupt Enable Register	LCDC_VSPD_VI6_DISP0_IRQ_EN B	0000_0000h	0078h	32
Display-0 Interrupt Status Register	LCDC_VSPD_VI6_DISP0_IRQ_ST A	0000_0000h	007Ch	32
Reserve	-	-	0080h to 00FFh	-
Display List Control Register	LCDC_VSPD_VI6_DL_CTRL	0000_0000h	0100h	32
Reserve	-	-	0108h to 0113h	-
Display List-0 Data Swapping Register	LCDC_VSPD_VI6_DL_SWAP0	0000_0000h	0114h	32

Register Name	Abbreviation	Initial Value	Offset Address	Access Size [bits]
Reserve	-	-	0118h to 011Bh	-
Extended Display List-0 Control Register	LCDC_VSPD_VI6_DL_EXT_CTRL0	0000_0000h	011Ch	32
Display List Body Size Register 0	LCDC_VSPD_VI6_DL_BODY_SIZE0	0000_0000h	0120h	32
Display List-0 Header Address Register	LCDC_VSPD_VI6_DL_HDR_ADDR0	0000_0000h	0104h	32
Reserve	-	-	0124h to 012Fh	-
Display List-0 Header Reference Address Register	LCDC_VSPD_VI6_DL_HDR_REF_ADDR0	0000_0000h	0130h	32
Reserve	-	-	0134h to 0157h	-
Display List-0 Wake Up Counter Register	LCDC_VSPD_VI6_DL_WUPCNT0	0000_0000h	0158h	32
Reserve	-	-	015Ch to 02FFh	-
RPF0 Basic Read Size Register	LCDC_VSPD_VI6_RPF0_SRC_BSIZE	0000_0000h	0300h	32

Note: Read only bits or write only bits or read/write bits are mixed in the registers.

9.4.3.2 VSPD Register Description

The prefix (LCDC_VSPD_) of the register names is omitted in this and subsequent sections.

9.4.3.2.1 Notational Conventions for Registers and Bit Fields

This section uses the following notational conventions for the VSPD registers and bit fields.

1. The names of registers and bits are written in uppercase.
2. A bit or bit field in a register is indicated as [register name.bit name]. For example, the STRCMD bit in the VI6_CMD0 register is indicated as VI6_CMD0.STRCMD.
3. Lowercase “n” in a register name or a bit name indicates an integer and the range of value n is defined when necessary. For RPFn, and WPFn, when the range of value n is not defined, RPFn (n = 0, 1), WPFn (n = 0) are assumed.
4. In each subsection for register description in **9.4.3.2 VSPD Register Description**, when only a bit name is written without showing its register name, the bit is in the register described in that subsection.
5. A wildcard (*) indicates any characters in a name and represents all registers or bits that match the specified first part of a name. For example, when there are two registers VI6_RPF_SRC_BSIZE and VI6_RPF_SRC_ESIZE, VI6_RPF_SRC_* indicates both registers.

9.4.3.2.2 Register Classification

The VSPD registers are arranged in the following order; the general control registers to display list control registers control operation of the entire VSPD, and the other registers control each image processing and specify parameters for the processing. The functions of the registers are described in this order starting from **9.4.3.2.4 General Control Registers**.

1. General control registers (VI6_CMDn (n = 0, 1), VI6_SRESET, VI6_STATUS, VI6_WPFn_IRQ_* (n = 0))
2. Display list control registers (VI6_DL_*)
3. RPF control registers (VI6_RPFn_* (n = 0, 1))
4. WPF control registers (VI6_WPFn_* (n = 0))
5. DPR control registers (VI6_DPR_*)
6. LUT control register (VI6_LUT_CTRL)
7. BRS control registers (VI6_BRS_*)
8. LIFn control registers (VI6_LIFn_* (n = 0))

The VSPD has two RPF channels and the register configuration is the same for all of RPFn (n = 0, 1). However, some bit fields have restrictions in certain RPFs. These restrictions are included in the description of the corresponding bit fields and registers. Likewise, the register configuration is the same for all WPFn (n = 0), but some bit fields have restrictions in certain WPFs; the restrictions are included in the description of the corresponding bit fields and registers.

For each register address, refer to **9.4.3.1 List of VSPD Registers**.

9.4.3.2.3 Restrictions on Access to Registers and Lookup Tables

The VSPD has control registers and lookup tables. All VSPD registers are writable and readable by only 32 bits unit. To write partial bits in each register, read-modify-write is needed. When accessing the addresses where these registers and lookup tables are allocated, the following restrictions should be satisfied. If any restriction is violated, the VSPD will not operate correctly.

1. For the read-only bits and reserved bits in all VSPD registers, writing 1 is prohibited unless otherwise specified.
2. Addresses undefined in **9.4.3.1 List of VSPD Registers** are reserved areas and write access is prohibited in these areas.
3. For all registers and lookup tables, except VI6_CMDn, VI6_SRESET, VI6_*IRQ* and two plane registers such as VI6_DL_HDR_ADDRn, VI6_DL_BODY_SIZE0, modifying register values during operation of the module is prohibited. Modify registers while the corresponding module is stopped. For the operating status of the target module, refer to **9.4.5.4 Concept of VSPD Operation Starting and Stopping**.
4. There are three types about General control registers (**9.4.3.2.4 General Control Registers**) and Display List Control Registers (**9.4.3.2.5 Display List Control Registers**) as below.
   - Controlling WPF0 (ex. VI6_CMD0, VI6_SRESET.SRST0)
   - Common setting of WPF0 (ex. VI6_DL_CTRL.AR_WAIT [15:0])

Table 9.4-7 Correspondence between Modules and Register Names

Module Name	Register Name
RPFn (n = 0, 1)	VI6_RPFn_*
WPFn (n = 0)	VI6_WPFn_*
DPR	VI6_DPR_*
LUT	VI6_LUT_CTRL
BRS	VI6_BRS_*
LIFn (n = 0)	VI6_LIFn_*

9.4.3.2.4 General Control Registers

(1) VSPD Start Register 0 (LCDC_VSPD_VI6_CMD0)

Access Size : 32 bits
Address : <LCDC_vspd_base> + 0000h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	UPDHDR	-	-	-	STRCMD
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	RW	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
4	UPDHDR	0h	RW	Reserved state of updating Display List Header (DLH) address. UPDHDR can be negated by software reset (VI6_SRESET.SRST0). [Write] 0b: NOP 1b: Do not set 1b to this bit [Read] 0b: Not reserved to update DLH address. 1b: Reserved to update DLH address. Set 0b to this bit when STRCMD bit is set to 1b.
3 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
0	STRCMD	0h	RW	Start reservation of WPF VI6_CMD0.STRCMD controls WPF0. Writing 1b to this bit starts WPF0 in VSPD. Set this bit for activation only after all register settings in each output channel have been completed. If WPF0 is idle, WPF0 starts right after this bit is set to 1b. If WPF0 is active, writing 1b to this bit reserves starting WPF0 operation. Wait to set 1b to VI6_CMD0.STRCMD until this bit is read as 0b. VI6_CMD0.STRCMD can be negated by software reset (VI6_SRESET.SRST0). [Write] 0b: Start reservation of WPF0 is canceled. 1b: Start reservation of WPF0 is set. [Read] 0b: Starting VSPD is not reserved. 1b: Starting VSPD is reserved.

The basic concept of image processing operation started by activating the VSPD is shown in **Figure 9.4-5**. The actual data input/output is executed by the MAU, which is the bus interface module, as described in **9.4.1.2 Block Diagram**, but conceptually the RPF works as the data entry point to the VSPD and the WPF works as the data exit point. To process images through the VSPD, the RPF (entrance) and WPF (exit) should be connected and a data path from the RPF to the WPF should be formed.

To connect RPFn to WPFn, specify RPFn as the source RPF for WPFn in VI6_WPFn_SRCRPF, which is a register for WPFn (refer to **(1) WPF0-Source-RPF Register (LCDC_VSPD_VI6_WPF0_SRCRPF)**). This setting determines that RPFn will be started when WPFn is started through VI6_CMDn.

A data path to execute desired image processing should then be formed between the RPF (entrance) and WPF (exit). To form a data path, connect the necessary function modules in the VSPD between RPF and WPF. This function is

provided by the DPR; specify the information for each module connection in data path routing registers VI6_DPR_*_ROUTE (refer to **9.4.3.2.8 DPR Control Registers**).

After a data path is formed (RPFn → WPFn) as described above, starting output module WPFn in the VSPD through VI6_CMDn starts all function modules connected to WPFn and the desired image processing is executed. According to this design concept, starting a WPF module means starting the VSPD.

There are two types of data path configuration in the VSPD; one is “a single input module to a single output module” as shown in **Figure 9.4-5** (A), and the other is “multiple input modules to a single output module” as shown in **Figure 9.4-5** (B).

Figure 9.4-5 (A) shows an example of a configuration where modules with single input and single output are implemented through the DPR.

Figure 9.4-5 (B) shows another configuration example where the module with multiple input and single output is implemented through the DPR.

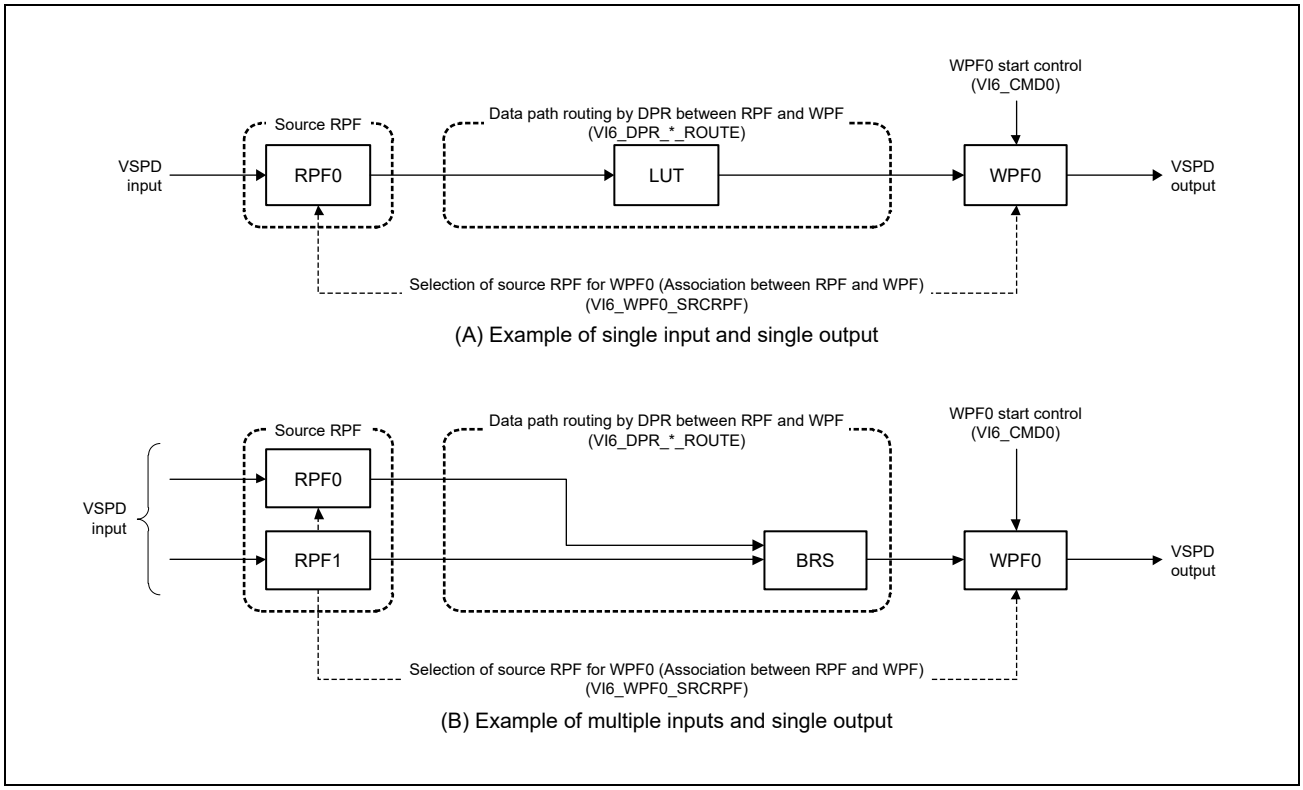

Figure 9.4-5 Basic Concept of VSPD Startup

(2) Clock Control Register 0 (LCDC_VSPD_VI6_CLK_CTRL0)

Access Size : 32 bits
Address : <LCDC_vspd_base> + 0010h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	GCS0	-	-	-	-	-	-	-	-	-	-	-	GCS1
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	GCS2[3:0]				-	-	-	GCS3[4:0]				
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	RW	RW	RW	RW	R	R	R	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
28	GCS0	0h	RW	Clock Control Setting0
27 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
16	GCS1	0h	RW	Clock Control Setting1
15 to 12	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
11 to 8	GCS2[3:0]	0h	RW	Clock Control Setting2
7 to 5	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
4 to 0	GCS3[4:0]	00h	RW	Clock Control Setting3

VSPD can stop its operating clock for reducing power consumption.

To enable clock stop function, set following registers:

- VI6_CLK_CTRL0 = H’0000 0000
- VI6_CLK_CTRL1 = H’0000 0000
- VI6_CLK_DCSWT = H’0000 0808
- VI6_CLK_DCSM0 = H’0000 0000
- VI6_CLK_DCSM1 = H’0000 0000

To disable clock stop function, set following registers:

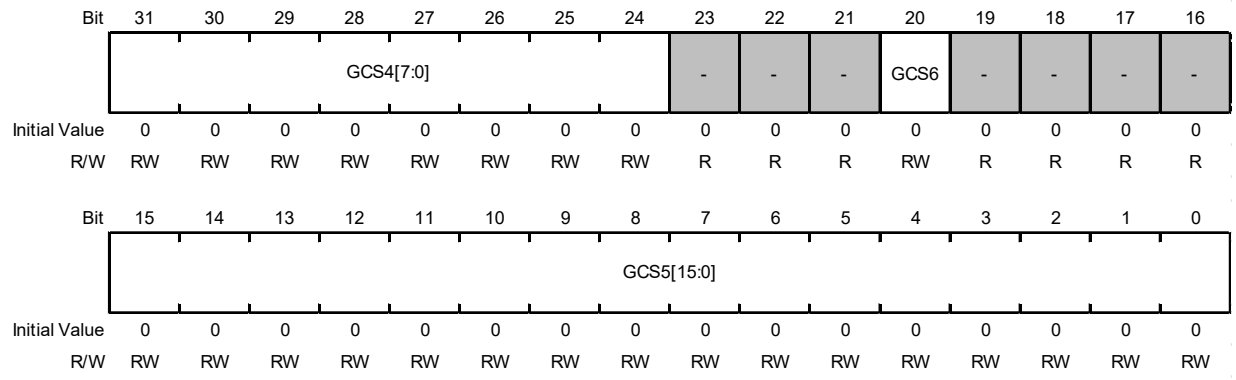
- VI6_CLK_CTRL0 = H’1001 0F1F
- VI6_CLK_CTRL1 = H’FF10 FFFF
- VI6_CLK_DCSWT = H’0033 0808
- VI6_CLK_DCSM0 = H’1FFF 0F1F
- VI6_CLK_DCSM1 = H’FF10 FFFF

When the clock gating is enabled, the supply of the clock signal is stopped for the module which is not operated. If the bit field of this register is changed from 0 to 1, the supply of the clock signal for the module is immediately started. If

the bit field of the register is changed from 1 to 0, the clock supply is immediately stopped. Therefore, please do not change this register field from 1 to 0 in operation because the VSPD may be stalled.

(3) Clock Control Register 1 (LCDC_VSPD_VI6_CLK_CTRL1)

Access Size : 32 bits
Address : <LCDC_vspd_base> + 0014h
Initial Value : 0000_0000h



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GCS4[7:0]	00h	RW	Clock Control Setting4
23 to 21	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
20	GCS6	0h	RW	Clock Control Setting6
19 to 16	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
15 to 0	GCS5[15:0]	0000h	RW	Clock Control Setting5

See **(2) Clock Control Register 0 (LCDC_VSPD_VI6_CLK_CTRL0)** for detail.

(4) Dynamic Clock Stop Control Register (LCDC_VSPD_VI6_CLK_DCSWT)

Access Size : 32 bits
Address : <LCDC_vspd_base> + 0018h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	DCC0[1:0]		-	-	DCC1	DCC2

23 to 21	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
20	DCD5	0h	RW	Dynamic Clock Stop Disable Setting5
19 to 16	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
15 to 0	DCD4[15:0]	0000h	RW	Dynamic Clock Stop Disable Setting4

See **(2) Clock Control Register 0 (LCDC_VSPD_VI6_CLK_CTRL0)** for detail.

(7) Software Reset Register (LCDC_VSPD_VI6_SRESET)

Access Size : 32 bits
Address : <LCDC_vspd_base> + 0028h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	SRST0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
0	SRST0	0h	RW	WPF0 Software Reset Writing 1b to this bit aborts the current processing in WPF0 (the partially-completed image undergoing processing is output). The period until this software reset processing is completed depends on the bus state. When this reset processing is completed, the VI6_WPF0_IRQ_STA.FRE interrupt source bit is set to 1b; when the FRE interrupt is enabled, the FRE end interrupt is output to notify the end of the reset processing. This bit is always read as 0b. 0b: NOP 1b: WPF0 software reset*1

Note 1. Applying a software reset to each WPF has the following restrictions.

1. A software reset can be applied to only one of WPF0 through single write access to VI6_SRESET.
2. After a software reset is issued, no more software reset can be issued to another WPF until the issued software reset processing is completed
3. The end of software reset processing is notified through the FRE bit in VI6_WPFn_IRQ_STA, but the software reset issued while WPF is stopped is ignored as NOP. As it takes a while until the reset is actually issued after the reset bit is set, the VSPD may complete operation before the reset is actually issued. In this case, no interrupt is output for the software reset that is issued after the VSPD completes operation.
4. If a software reset is issued during downloading of a display list, the downloading processing is not aborted. After the end of downloading that is in progress when a software reset is issued, a frame end interrupt is output.

(8) Module Reset Enable Register 0 (LCDC_VSPD_VI6_MRESET_ENB0)

Access Size : 32 bits
Address : <LCDC_vspd_base> + 002Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	MRSTE0[1:0]		-	-	-	-	-	-	-	-	-	-	-	-

Bit	Bit Name	Initial Value	R/W	Description
31, 30	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
29, 28	MRSTE0[1:0]	0h	RW	Module Reset Enable 0
27 to 12	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
11 to 8	MRSTE1[3:0]	0h	RW	Module Reset Enable 1
7 to 5	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
4 to 0	MRSTE2[4:0]	00h	RW	Module Reset Enable 2

This register is for purpose of h/w debugging.

(9) Module Reset Enable Register 1 (LCDC_VSPD_VI6_MRESET_ENB1)

Access Size : 32 bits

Address : <LCDC_vspd_base> + 0030h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	MRSTE3[7:0]								-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MRSTE4[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	MRSTE3[7:0]	00h	RW	Module Reset Enable 3
23 to 16	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
15 to 0	MRSTE4[15:0]	0000h	RW	Module Reset Enable 4

This register is for purpose of h/w debugging.

(10) Module Reset Issuing Register (LCDC_VSPD_VI6_MRESET)

Access Size : 32 bits

Address : <LCDC_vspd_base> + 0034h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	MRST
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
0	MRST	0h	RW	Module Reset Assertion

This register is for purpose of h/w debugging.

(11) Operating Status Register (LCDC_VSPD_VI6_STATUS)

Access Size : 32 bits

Address : <LCDC_vspd_base> + 0038h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	FLDST0	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	SYS0_ACT	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
28	FLDST0	0h	R	Field status of previous frame of WPF0. 0b: Previous finished frame is TOP field. 1b: Previous finished frame is BOT field. This bit can be referred in case of AUTO-FLD or AUTO-DISP. This bit is changed at the timing of VI6_WPF0_IRQ_STA.FRE.
27 to 9	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
8	SYS0_ACT	0h	R	WPF0 Operating Status Each bit indicates the operating or stopped state of control channel n (WPF0). 0b: WPF0 is stopped. 1b: WPF0 is operating.
7 to 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

(12) WPF0 Interrupt Enable Register (LCDC_VSPD_VI6_WPF0_IRQ_ENB)

Each bit controls the interrupt enable of the corresponding interrupt source.

0: Interrupt disabled
1: Interrupt enabled

Access Size : 32 bits
Address : <LCDC_vspd_base> + 0048h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	UNDE
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	DFEE	FREE
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
16	UNDE	0h	RW	Interrupt Enable for WPF0 Underrun in case of DU connection.
15 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
1	DFEE	0h	RW	Interrupt Enable for WPF0 Display List Frame End
0	FREE	0h	RW	Interrupt Enable for WPF0 Frame End

Each bit in VI6_WPFn_IRQ_STA is set to 1 when the corresponding interrupt source is generated. VI6_WPFn_IRQ_ENB specifies whether to output an interrupt signal for the generated source. When an interrupt is disabled in this register, no interrupt signal is generated even when the corresponding bit in VI6_WPFn_IRQ_STA is set to 1. When an interrupt is enabled in this register, an interrupt signal is output when the corresponding bit in VI6_WPFn_IRQ_STA is set to 1.

(13) WPF0 Interrupt Status Register (LCDC_VSPD_VI6_WPF0_IRQ_STA)

The read value from each bit is the status of the interrupt source, and the write access to each bit controls the interrupt status.

[Read Access] Interrupt Status

0: No interrupt
1: Interrupt activated

[Write Access] Interrupt Clear

0: The interrupt status is cleared to 0
1: Hold the interrupt status value

Access Size : 32 bits
Address : <LCDC_vspd_base> + 004Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	UND
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	DFE	FRE
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
16	UND	0h	RW	Interrupt Status and Clear for WPF0 Underrun in case of DU connection. This interrupt source bit is set to 1b when data underrun occurs in case of DU connection. Timing that this bit is set to 1b is at end of 1 frame.
15 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
1	DFE	0h	RW	Interrupt Status and Clear for WPF0 Display List Frame End This interrupt source bit is set to 1b when VSPD completes one-frame processing while the current frame in enable value stored in the display list header is 1 (refer to **9.4.5.4 Concept of VSPD Operation Starting and Stopping**). When display lists are not used, this bit is not used. In this case, clear VI6_WPF0_IRQ_ENB.DFEE to 0b to mask the interrupt generation by this interrupt source. This bit can hold the most recent of two times of interrupt status at the maximum. When writing 0b to this bit, the oldest interrupt status is cleared. And the status bit becomes 0b after all interrupt statuses are cleared.
0	FRE	0h	RW	Interrupt Status and Clear for WPF0 Frame End This interrupt source bit is set to 1b when VSPD completes one-frame processing. This bit is also set to 1b when one-frame processing using a display list is completed. The interrupt status is set to 1b by any of the following conditions. a) Processing one frame is finished normally b) Software reset is issued during VSPD is processing. c) One frame's data from DU is displayed while VSPD couldn't transfer one frame data to DU. (in case of Linked with DU) This bit can hold the most recent of two times of interrupt status at the maximum. When writing 0b to this bit, the oldest interrupt status is cleared. And the status bit becomes 0b after all interrupt statuses are cleared.

VI6_WPFn_IRQ_STA indicates the state of the interrupt sources generated in the VSPD. Whether to output a VSPD interrupt when an interrupt source is generated and the corresponding bit is set to 1 is determined by the corresponding bit setting in VI6_WPFn_IRQ_ENB. While an interrupt is disabled in VI6_WPFn_IRQ_ENB, the VSPD does not output an interrupt signal even when an interrupt source is generated, but the source flag in this register is set to 1.

Note that the interrupt source bits in this register cannot be cleared by write access using a display list.

(14) Display-0 Interrupt Enable Register (LCDC_VSPD_VI6_DISP0_IRQ_ENB)

Each bit controls the interrupt enable of the corresponding interrupt source.

0: Interrupt disabled
1: Interrupt enabled

Access Size : 32 bits
Address : <LCDC_vspd_base> + 0078h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	DSTE	-	-	MAEE	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	RW	R	R	RW	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
8	DSTE	0h	RW	Interrupt Enable for Display Start
7 to 6	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
5	MAEE	0h	RW	Interrupt Enable for Display Read Data End
4 to 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

(15) Display-0 Interrupt Status Register (LCDC_VSPD_VI6_DISP0_IRQ_STA)

The read value from each bit is the status of the interrupt source, and the write access to each bit controls the interrupt status.

[Read Access] Interrupt Status

0: No interrupt
1: Interrupt activated

[Write Access] Interrupt Clear

0: The interrupt status is cleared to 0
1: Hold the interrupt status value

Access Size : 32 bits
Address : <LCDC_vspd_base> + 007Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	DST	-	-	MAE	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	RW	R	R	RW	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
8	DST	0h	RW	Interrupt Status and Clear for Display Start This bit is set to 1b when LIF module transfers the first data to the display module at the beginning of each frame. The timing depends on the output buffer status of LIF module.
7 to 6	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
5	MAE	0h	RW	Interrupt Status and Clear for Display Read Data End This bit is set to 1b when all RPFs transfer the last data of the frame to LIF module. The RPF module which is not used by LIF module does not affect this bit.
4 to 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

9.4.3.2.5 Display List Control Registers

(1) Display List Control Register (LCDC_VSPD_VI6_DL_CTRL)

Access Size : 32 bits
Address : <LCDC_vspd_base> + 0100h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	AR_WAIT[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	DC2	-	-	-	DC1	-	-	-	DLE1	RLM0	CFM0	NH0	DLE0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	R	R	R	RW	R	R	R	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	AR_WAIT[15:0]	0000h	RW	Display List Control Setting Always specify 256.
15 to 13	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
12	DC2	0h	RW	This bit doesn't affect anything to VSPD (NOP)
11 to 9	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
8	DC1	0h	RW	This bit doesn't affect anything to VSPD (NOP)
7 to 5	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
4	DLE1	0h	RW	This bit doesn't affect anything to VSPD (NOP)
3	RLM0	0h	RW	Loading two plane Registers Mode for WPF0. 0b: Reserved status (VI6_CMD0.UPDHDR) is accepted by next frame auto start. Two plane registers are downloaded by next_frame_start also. 1b: Reserved status (VI6_CMD0.UPDHDR) is not accepted by next frame auto start. pNextHeader in previous frame's DLH is used for loading DisplayList. Two plane registers are not downloaded by next_frame_start also.
2	CFM0	0h	RW	Continuous Frame Mode for Header-less Display List for WPF0 This bit determines whether the next frame is automatically started or not. When the updated flag of the display list, VI6_DL_BODY_SIZE0.UPD0, is not updated, the display list of the next frame is not transferred and the same register values are used for the next frame. When the value of VI6_DL_BODY_SIZE0.UPD0 is updated, the new display list is transferred. 0b: Stopped at the end of every frame 1b: The next frame is automatically started
1	NH0	0h	RW	Header-less Display List Mode This bit is used for specifying the header-less display list mode. In case of header-less mode, the number of the display lists is 1. The address of the display body is set in VI6_DL_HDR_ADDR0 register, and the body size is set in VI6_DL_BODY_SIZE0 register. When this bit is changed, make sure that VSPD is stopped. And also make sure the following before starting VSPD. - Header Address (VI6_DL_HDR_ADDR0) - Body Size (VI6_DL_BODY_SIZE0) in case of header-less mode 0b: Use Display List Header (Normal DL Mode) 1b: Do not use Display List Header (Header-less Mode) Note1: Only WPF0 supports header-less display list. WPF1 work as the normal display list mode even if the WPF0 is set to header-less display list mode. Note2: When DLE0 bit is 0b, set 0b to NH0 bit.

Bit	Bit Name	Initial Value	R/W	Description
0	DLE0	0h	RW	Display List Enable/Disable for WPF0 Enables or disables the WPF0 display list function. When the display list function is enabled through this bit, all WPF processing channels work in display list mode. When using display lists, note the restrictions in **9.4.3.2.3 Restrictions on Access to Registers and Lookup Tables**. 0b: The display list function is disabled 1b: The display list function is enabled

(2) Display List-0 Header Address Register (LCDC_VSPD_VI6_DL_HDR_ADDR0)

Access Size : 32 bits
Address : <LCDC_vspd_base> + 0104h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DL_HDR_PTR-0[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DL_HDR_PTR-0[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DL_HDR_PTR-0[31:0]	0000_0000h	RW	Display List-0 Header Address These bits specify the address of the display list header to be read for display list-n in 16-byte units (the lower-order four bits are read-only). When WPF0 is first started in display list mode, the display list header is loaded from the address specified in this register. After loading of the header is completed, the register value of the display list address is updated to the next header address stored in the loaded header to prepare for loading of the next display list header. After that, this header address updating is repeated. A value from 0000 0000h to FFFF FFF0h can be specified.

(3) Display List-0 Data Swapping Register (LCDC_VSPD_VI6_DL_SWAP0)

Access Size : 32 bits
Address : <LCDC_vspd_base> + 0114h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	IND	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	LWS	WDS	BTS
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31	IND	0h	RW	Enabling independent swap setting per WPF. This bit is available only for VI6_DL_SWAP1. This bit is reserved for VI6_DL_SWAP0. 0b: Display list swap for WPF1 is specified by LWS, WDS and BTS in VI6_DL_SWAP0. 1b: Display list swap for WPF1 is specified by LWS, WDS and BTS in VI6_DL_SWAP1
30 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
2	LWS	0h	RW	Display List Data Swapping in long word Units The effect of this bit setting is defined in **Table 9.4-8**. 0b: Data swapping in long word (32-bit) units is disabled 1b: Data swapping in long word (32-bit) units is enabled
1	WDS	0h	RW	Display List Data Swapping in Word Units The effect of this bit setting is defined in **Table 9.4-8**. 0b: Data swapping in word (16-bit) units is disabled 1b: Data swapping in word (16-bit) units is enabled
0	BTS	0h	RW	Display List Data Swapping in Byte Units The effect of this bit setting is defined in **Table 9.4-8**. 0b: Data swapping in byte (8-bit) units is disabled 1b: Data swapping in byte (8-bit) units is enabled

Table 9.4-8 shows the data order before and after swapping according to the long word, word, and byte swapping settings.

When data order in memory for each format is the same as **Table 9.4-34**, set 111b to {LWS, WDS, BTS}. If data order is not the same as the definition, change data order within 8byte unit by these bits as shown in **Table 9.4-8**.

Table 9.4-8 Changing Data Order According to Display List Swap Register

Data order in memory											
Byte address	8n+0	8n+1	8n+2	8n+3	8n+4	8n+5	8n+6	8n+7	*_LWS	*_WDS	*_BTS
Data	0	1	2	3	4	5	6	7	1	1	1
	1	0	3	2	5	4	7	6	1	1	0
	2	3	0	1	6	7	4	5	1	0	1
	3	2	1	0	7	6	5	4	1	0	0
	4	5	6	7	0	1	2	3	0	1	1
	5	4	7	6	1	0	3	2	0	1	0
	6	7	4	5	2	3	0	1	0	0	1
	7	6	5	4	3	2	1	0	0	0	0

Data order defined in **Table 9.4-34**								
Byte address	8n+0	8n+1	8n+2	8n+3	8n+4	8n+5	8n+6	8n+7
Data	0	1	2	3	4	5	6	7

(4) Extended Display List-0 Control Register (LCDC_VSPD_VI6_DL_EXT_CTRL0)

Access Size : 32 bits
Address : <LCDC_vspd_base> + 011Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	NWE
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	POLINT[5:0]						-	-	DLPRI	EXPRI	-	-	-	EXT
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	RW	RW	RW	RW	RW	RW	R	R	RW	RW	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
16	NWE	0h	RW	No Wait for Polling When this bit is set to 1b, the polling condition for extended display lists is always assumed to be true.
15 to 14	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
13 to 8	POLINT[5:0]	00h	RW	Extended Display List Command Control Always specify 2h.
7 to 6	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
5	DLPRI	0h	RW	Display List Control 0 Always specify 1b.
4	EXPRI	0h	RW	Display List Control 1 Always specify 0b.
3 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
0	EXT	0h	RW	Extended Display List for WPF0 Enables or disables the extended display list function. When extended display lists are used, the display list header size is 96 bytes; when they are not used, the header size is 80 bytes. 0b: No extended display lists are used 1b: Extended display lists are used [Note] When using extended display lists, be sure to also use normal display list mode (VI6_DL_CTRL.DLE0); executing only extended display lists is not possible. When the header-less display list mode is activated, this bit should be set to 0. The extended display list cannot be used with the header-less display list mode. Extended Display List is available only for VSPD/LIF0 to realized AUTO-FLD or AUTO-DISP.

(5) Display List Body Size Register-0 (LCDC_VSPD_VI6_DL_BODY_SIZE0)

Access Size : 32 bits
Address : <LCDC_vspd_base> + 0120h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	UPD0	-	-	-	-	-	-	-	BS0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	RW	R	R	R	R	R	R	R	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	BS0[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
24	UPD0	0h	RW	Update Flag This bit controls the download of the display list at the next downloading timing in case that the header-less display list mode is used. Set 1b to this bit when display list need to be downloaded for next frame. This bit is automatically cleared to 0b after VI6_DL_HDR_ADDRn and VI6_DL_BODY_SIZE0.BS0 is downloaded in H/W side. When this bit is set to 1b, the value of VI6_DL_HDR_ADDR0 and VI6_DL_BODY_SIZE0.BS0 should not be changed. 0b: Updating display list for the next frame is not reserved 1b: Updating display list for the next frame is reserved
23 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
16 to 0	BS0[16:0]	00000h	RW	Header-less Display List Body Size (WPF0) These bits are used for specifying the body size of the display list in case of header-less display list mode. The unit of the size is byte. The value should be set in multiples of 8.

See **9.4.5.8.2 Controlling two register planes using display lists** for detail.

(6) Display List-0 Header Reference Address Register (LCDC_VSPD_VI6_DL_HDR_REF_ADDR0)

Access Size : 32 bits
Address : <LCDC_vspd_base> + 0130h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DL_HDR_REF_PTR-0[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DL_HDR_REF_PTR-0[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DL_HDR_REF_PTR-0[31:0]	00000000h	R	Display List-n reference Header Address Following value is read out from the VI6_DL_HDR_REF_ADDR0 for each period. (1) When H/W is reading display list from external memory, header address of the display list referred by VSPD-H/W is read out. (2) When H/W is not reading display list from external memory, the value of VI6_DL_HDR_ADDR0 is read out. For details, refer to **9.4.5.8.1 Operation flow of VSPD and DU**.

(7) Display List-0 Wake Up Counter Register (VI6_DL_WUPCNT0)

Access Size : 32 bits
Address : <LCDC_vspd_base> + 0158h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

9.4.3.2.6 RPF Control Registers

(1) RPFn Basic Read Size Registers (LCDC_VSPD_VI6_RPFn_SRC_BSIZE) (n = 0, 1)

Access Size : 32 bits

Address : <LCDC_vspd_base> + 0300h (n = 0)
<LCDC_vspd_base> + 0400h (n = 1)

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	BHSIZE[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	BVSIZE[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
28 to 16	BHSIZE[12:0]	0000h	RW	Horizontal Size of RPF Basic Read Area These bits specify the horizontal size of the basic area to be read from the external RAM by the RPFn. When the input format is YCbCr4:2:2 or YCbCr4:2:0, specify the size in 2-pixel units. A value from 1 to 8190 can be specified. Specify a value equal to or smaller than the extended read size (VI6_RPFn_SRC_ESIZE.EHSIZE).
15 to 13	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
12 to 0	BVSIZE[12:0]	0000h	RW	Vertical Size of RPF Basic Read Area These bits specify the vertical size of the basic area to be read from the external RAM by the RPFn. When the input format is YCbCr4:2:0, specify the size in 2-pixel units. A value from 1 to 8190 can be specified. Specify a value equal to or smaller than the extended read size (VI6_RPFn_SRC_ESIZE.EVSIZE).

Figure 9.4-6 shows the relationship between the basic read size and extended read size. The RPF reads data from the source memory area specified by the basic read size. The RPF repeats reading the basic read area in the horizontal and vertical directions up to the extended read size and sends the read data to the processing modules in the VSPD.

For basic read size reading, the reading start address, called the RPFn source image storing address, should be specified in VI6_RPFn_SRCM_ADDR_*. In the memory area where the basic read area image is stored, the distance (number of bytes) between addresses for lines n and n + 1 of two-dimensional image data, called the memory stride, should be specified in VI6_RPFn_SRCM_PSTRIDE.

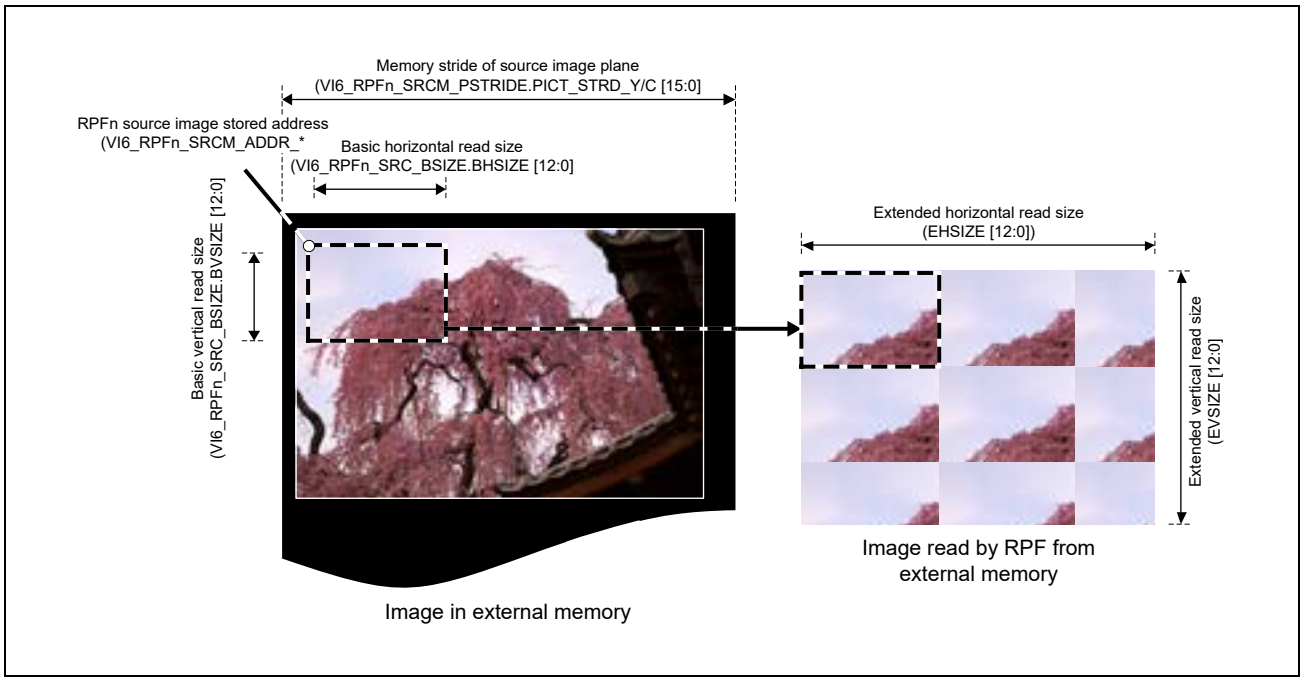

Figure 9.4-6 Relationship between Basic Read Size and Extended Read Size

Refer also to the following sections.

- **(2) RPFn Extended Read Size Registers (LCDC_VSPD_VI6_RPFn_SRC_ESIZE)**
- **(13) RPFn Source Picture Memory Stride Setting Registers (LCDC_VSPD_VI6_RPFn_SRCM_PSTRIDE)**
- **(15) RPFn Source Y/RGB Address Registers (LCDC_VSPD_VI6_RPFn_SRCM_ADDR_Y)**
- **(16) RPFn Source Chroma Address Registers 0 (LCDC_VSPD_VI6_RPFn_SRCM_ADDR_C0)**
- **(17) RPFn Source Chroma Address Registers 1 (LCDC_VSPD_VI6_RPFn_SRCM_ADDR_C1)**

(2) RPFn Extended Read Size Registers (LCDC_VSPD_VI6_RPFn_SRC_ESIZE)

Access Size : 32 bits

Address : <LCDC_vspd_base> + 0304h (n = 0)
<LCDC_vspd_base> + 0404h (n = 1)

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	EHSIZE[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	EVSIZE[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
28 to 16	EHSIZE[12:0]	0000h	RW	RPF Extended Horizontal Read Size These bits specify the horizontal size of the extended read area to which the RPFn reads data from the external RAM. As shown in **Figure 9.4-6**, the basic read area image is repeatedly placed in the extended read area; in the EHSIZE bits, specify a value not smaller than the horizontal size of the basic read area. When the input format is YCbCr4:2:2 or YCbCr4:2:0, specify the size in 2-pixel units (an even value). A value from 1 to 1920 (8190) can be specified.
15 to 13	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
12 to 0	EVSIZE[12:0]	0000h	RW	RPF Extended Vertical Read Size These bits specify the vertical size of the extended read area to which the RPFn reads data from the external RAM. As shown in **Figure 9.4-6**, the basic read area image is repeatedly placed in the extended read area; in the EVSIZE bits, specify a value not smaller than the vertical size of the basic read area. When the input format is YCbCr4:2:0, specify the size in 2-pixel units (an even value). A value from 1 to 1920 (8190) can be specified.

VI6_RPFn_SRC_ESIZE specifies the extended size for RPFn. The extended horizontal and vertical sizes should be equal to or greater than the basic sizes specified in VI6_RPFn_SRC_BSIZE. The RPF internal data processing described later and image processing described in **9.4.3.2.8 DPR Control Registers** and later sections are all applied to the image in the extended read size shown on the right side in **Figure 9.4-6**.

(3) RPFn Input Format Registers (LCDC_VSPD_VI6_RPFn_INFMT) (n = 0, 1)

Access Size : 32 bits

Address : <LCDC_vspd_base> + 0308h (n = 0)
<LCDC_vspd_base> + 0408h (n = 1)

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

	SPYCS	SPUVS	CEXT[1:0]		RDTM[2:0]			CSC	-	RDFMT[6:0]						
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	R	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
28	VIR	0h	RW	Virtual Input Enable Enables or disables the virtual input function of the RPF0. The image to be processed by the RPF0 is usually read from the external memory by the MAU. Instead of this input, the virtual input function generates a single-color image within the RPF0 and sends it to the modules in VSPD. When the virtual input function is enabled, the fixed value specified in VI6_RPF0_VRTCOL_SET is used as the input to the RPF0. While the virtual input function is enabled, data is not read from the external memory; that is, the α plane is not read and the IROP calculation thus cannot be executed. In this case, set VI6_RPF0_ALPH_SEL.ASEL to 4. Neither the color space conversion through CSC nor the color keying described in **9.4.3.2.6 (11) RPFn Color Keying Control Registers (VI6_RPFn_CKEY_CTRL)** can be used. 0b: RPF0 uses general input. 1b: RPF0 uses virtual input.
27 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
16	CIPM	0h	RW	Horizontal Chrominance Interpolation Method Setting Image data is processed in the YCbCr444 format inside VSPD in case of YCbCr color space. When the chrominance format of the input image is YCbCr422 or YCbCr420, data is up-sampled as shown in **Figure 9.4-7** for internal processing. This bit specifies the method of up-sampling for this purpose. 0b: The nearest-neighbor method is used for horizontal chrominance interpolation. 1b: The bilinear method is used for horizontal chrominance interpolation.
15	SPYCS	0h	RW	RPF Input Mode Setting 1 When the input format is YUY2, set this bit to 1b and set the RDFMT bits to 71 (47h). When the input format is YVYU, set this bit and the SPUVS bit to 1b and set the RDFMT bits to 71 (47h). In other cases, set this bit to 0b.
14	SPUVS	0h	RW	RPF Input Mode Setting 2 When the input format is NV61, set this bit to 1b and set the RDFMT bits to 65 (41h). When the input format is NV21, set this bit to 1b and set the RDFMT bits to 66 (42h). When the input format is YVYU, set this bit and the SPYCS bit to 1b and set the RDFMT bits to 71 (47h). In other cases, set this bit to 0b.
13, 12	CEXT[1:0]	0h	RW	Lower-Bit Color Data Extension Method Setting When an RGB input format where each color component is expressed in less than 8 bits are selected from **Table 9.4-10** through the RDFMT bits, VSPD internally extends each color component to 8 bits before using the data. These bits select this extension method. 00b: Lower-order bits of color data are extended with 0. 01b: Upper-order bits of color data are copied to the lower -order bits. 10b: Lower-order bits of color data are extended with 0. The maximum value is limited to 0xFF. 11b: Setting prohibited

Bit	Bit Name	Initial Value	R/W	Description
11 to 9	RDTM[2:0]	0h	RW	CSC Conversion Expression Setting These bits select the expression used for color space conversion. The conversion direction is RGB → YCbCr when RGB is selected through the RDFMT bits; the direction is YCbCr → RGB when YCbCr is selected. 0h: BT.601 YCbCr [16,235/240] ↔ RGB [0,255] 1h: BT.601 YCbCr [0,255] ↔ RGB [0,255] 2h: BT.709 YCbCr [16,235/240] ↔ RGB [0,255] 3h: BT.709 YCbCr [16,235/240] ↔ RGB [16,235] 4h to 7h: Setting prohibited
8	CSC	0h	RW	Color Space Conversion Enable Enables or disables color space conversion between YCbCr and RGB to be executed in RPF0. The characteristics of color space conversion are determined by the RDTM bit setting.*1 When using the virtual input (VIR = 1b), specify 0b. 0b: Color space conversion is disabled. 1b: Color space conversion is enabled.
7	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
6 to 0	RDFMT[6:0]	00h	RW	RPF Input Image Format Setting These bits select the format of the image input from the external RAM to the RPF0. Select a value corresponding to the desired format from those shown in **Table 9.4-10**, **Table 9.4-11**, and **Table 9.4-12**. When the virtual input function is used (VIR = 1b), the color information for the virtual input should be specified in VI6_RPF0_VRTCOL_SET. If this color information is in the RGB format, set the RDFMT bits to 19. If the color information is in the YCbCr format, set these bits to 64. [Note] Number of input pixels When YCbCr4:2:2 is selected through the RDFMT bits, the horizontal size of the input image should be specified in 2-pixel units. When YCbCr4:2:0 is selected, the vertical and horizontal sizes should be specified in 2-pixel units. Observe these restrictions when specifying the image size in VI6_RPF0_SRC_BSIZE and VI6_RPF0_SRC_ESIZE.

Note 1. Note on color space settings

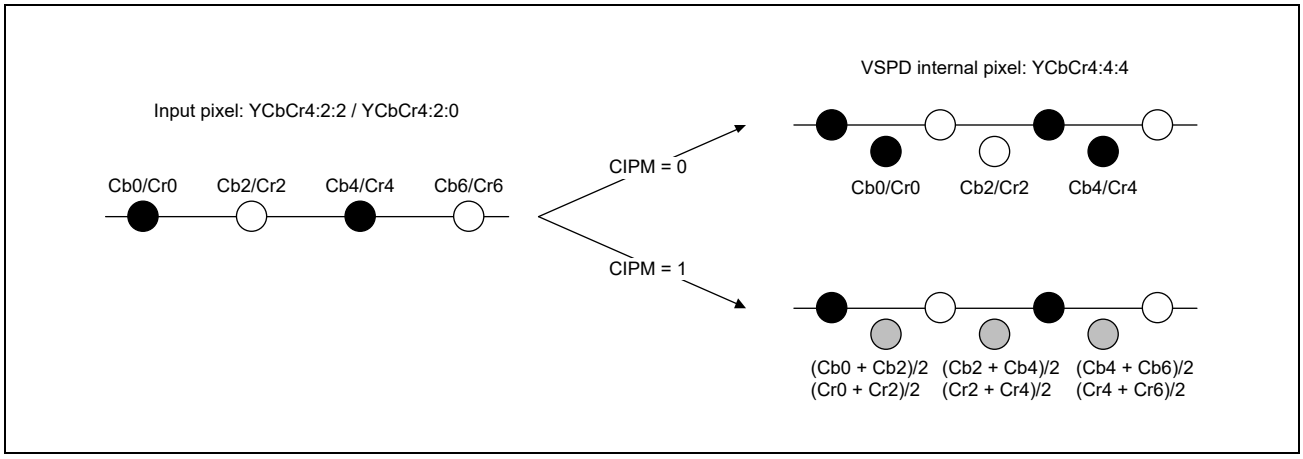

Figure 9.4-7 Chrominance Interpolation Methods Selectable through CIPM Setting

The color space for the image output from the RPF to VSPD internal modules is determined by the combination of the color space for the image input to the RPF, which is selected through the VI6_RPFn_INFMT.RDFMT setting, and the enabled or disabled state of the color space conversion function, which is selected through the VI6_RPFn_INFMT.CSC setting (**Table 9.4-9**). For example, when the image input to the RPF is in the YCbCr format, the RPF outputs data to VSPD internal modules in the YCbCr format if color space conversion is disabled through the CSC bit, and the RPF outputs data in the RGB format if color space conversion is enabled. When the image input to the RPF is in the RGB format, the relationship between the output format and the color space conversion setting is the opposite of the YCbCr case. For some VSPD internal modules, the YCbCr format is recommended for image processing because of the characteristics of the processing, or the same color space needs to be specified between multiple RPF outputs. In these

cases, set VI6_RPFn_INFMT.RDFMT and VI6_RPFn_INFMT.CSC appropriately so that the RPFs can output the required color space according to the color space conditions described above.

Table 9.4-9 RPFn Input Color Space and Output Color Space

RPFn Input Color Space (VI6_RPFn_INFMT. RDFMT)		Color Space Conversion Setting (VI6_RPFn_INFMT.CSC)		RPFn Output Color Space
RGB	(00h to 3Fh)*1	Disabled	(0)*1	RGB
		Enabled	(1)*1	YCbCr
YCbCr	(40h to 7Fh)*1	Disabled	(0)*1	YCbCr
		Enabled	(1)*1	RGB

Note 1. Value specified in the register

A color space conversion function equivalent to that in the RPFn is also provided by the WPF. As shown in **Table 9.4-9**, the color space (YCbCr or RGB) output from the RPF becomes the input format for the WPF. Here, the color space of the output image obtained by the color space conversion function of the WPF must match the color space of the format specified through VI6_WPFn_OUTFMT.WRFMT.

Figure 9.4-8 shows the relationship between the input/output format and color space. The input color space for the RPF is determined when the input image format for the RPF is specified through the RDFMT bits. The color space for the image output from the RPF to subsequent VSPD internal modules depends on the combination of the RPF input format and CSC (color space conversion function) enabled or disabled state in the RPF as shown in **Table 9.4-9** and **Figure 9.4-8**. The user should first determine whether the image processing in the VSPD is done in YCbCr or RGB, and then specify the RPF input format and CSC enabled or disabled state to obtain the desired color space. The color space of the RPF output image is also that of the WPF input image; the color space of the data output from the WPF to the outside of VSPD depends on the combination of the WPF input color space and the enabled or disabled state of the CSC implemented in the WPF as shown in **Figure 9.4-8**. The color space of the WPF output image must match that of the WPF output format (determined by VI6_WPFn_OUTFMT.WRFMT). For example, in the flow shown in **Figure 9.4-8**, YCbCr should not be specified as the WPF output format regardless of the fact that the color space of the WPF output image is in RGB format.

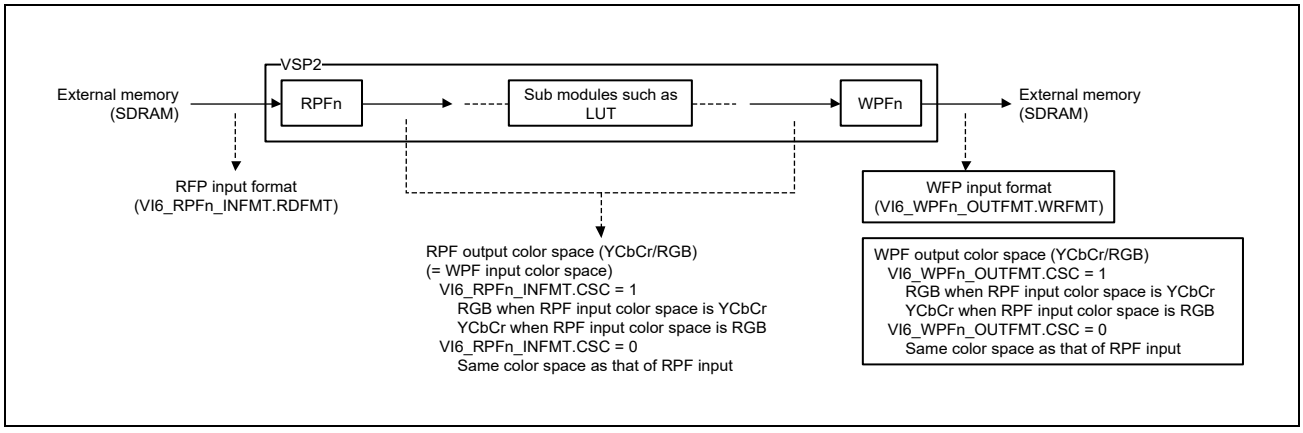

Figure 9.4-8 Relationship between Input/output Format and Color Space

Table 9.4-12 Packed YCbCr Formats for RPF Input

RDFMT[6:0]	Packed YCbCr Input Format	Reference
40h	YCbCr4:4:4 semi-planar	**Figure 9.4-9***4
41h	YCbCr4:2:2 semi-planar (NV16, NV61*1)	
42h	YCbCr4:2:0 semi-planar (NV12, NV21*1)*5	
43h to 45h	Reserved	—
46h	YCbCr4:4:4 interleaved	**Figure 9.4-10***4
47h	YCbCr4:2:2 interleaved type 0 (UYVY, YUY2*2, YVYU*3)	
48h	YCbCr4:2:2 interleaved type 1	
49h	YCbCr4:2:0 interleaved*6	
4Ah	YCbCr4:4:4 planar	**Figure 9.4-11***4
4Bh	YCbCr4:2:2 planar (YV16)	
4Ch	YCbCr4:2:0 planar (YV12, I420)*5	
4Dh to 7Eh	Reserved	—
7Fh	Reserved	—

Note 1. When the input format is NV61 or NV21, set the SPUVS bit to 1.

Note 2. When the input format is YUY2, set the SPYCS bit to 1.

Note 3. When the input format is YVYU, set the SPUVS bit to 1 and SPYCS bit to 1.

Note 4. **Figure 9.4-12** shows the definition of memory address for each pixel in **Figure 9.4-9** to **Figure 9.4-11**.

Note 5. Each line of C plane is read twice, so byte/pixel of YCbCr420 is 2 byte/pixel (same as YCbCr422).

Note 6. Each line of plane is read twice, so byte/pixel of YCbCr420ITL is 3 byte/pixel (same as YCbCr444ITL).

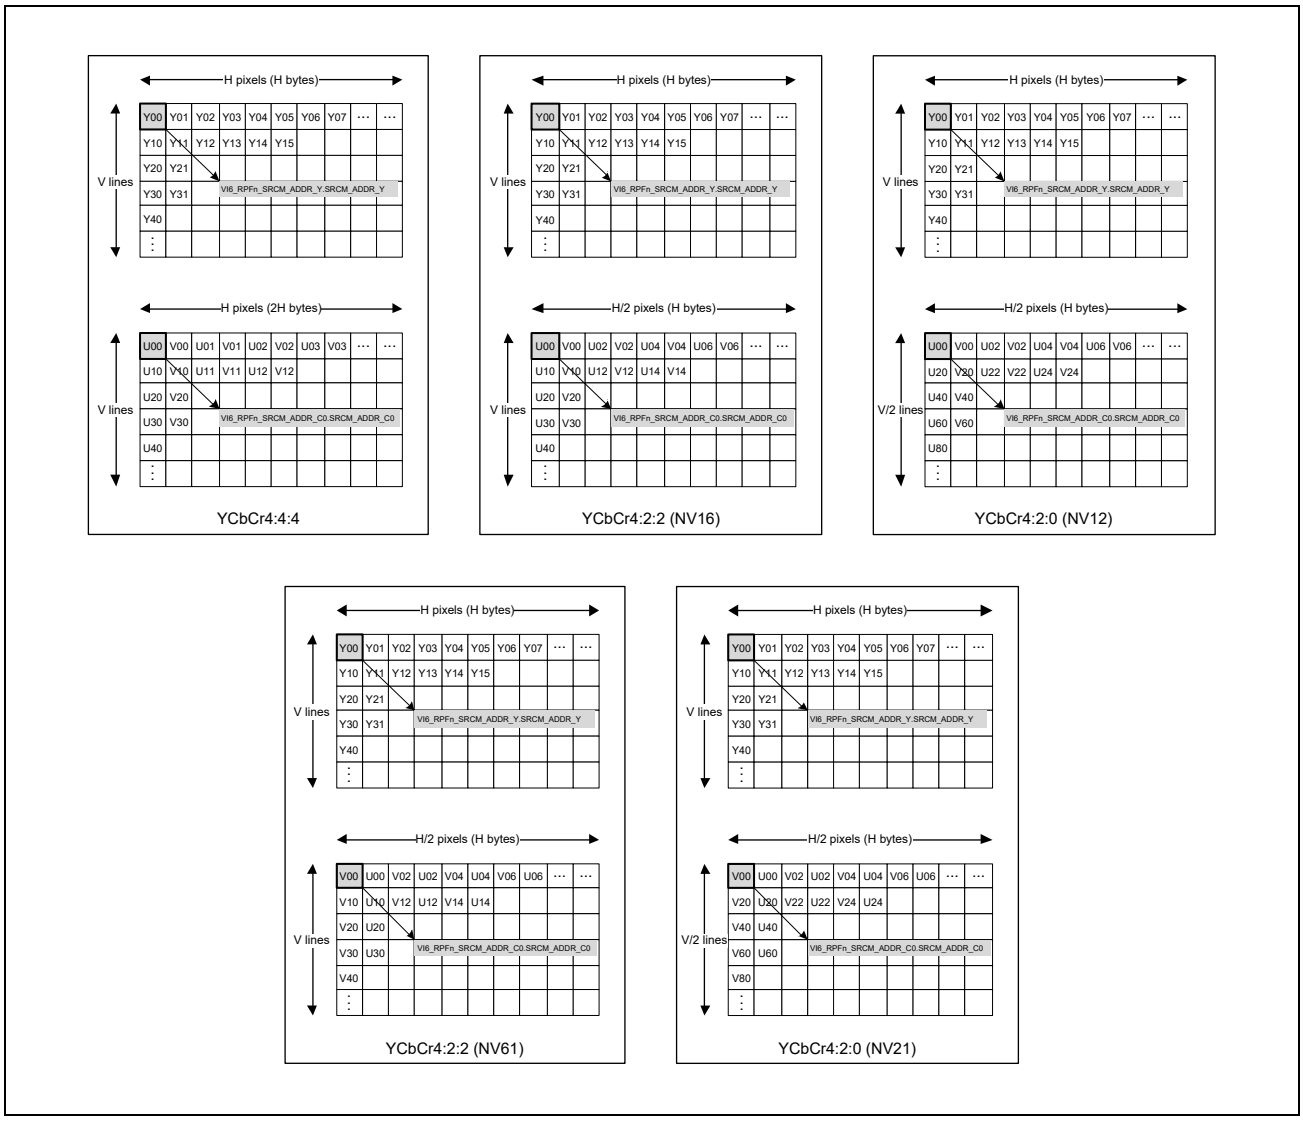

Figure 9.4-9 YCbCr Semi-Planar Formats*1

Note 1. This figure is for 8 bpc.

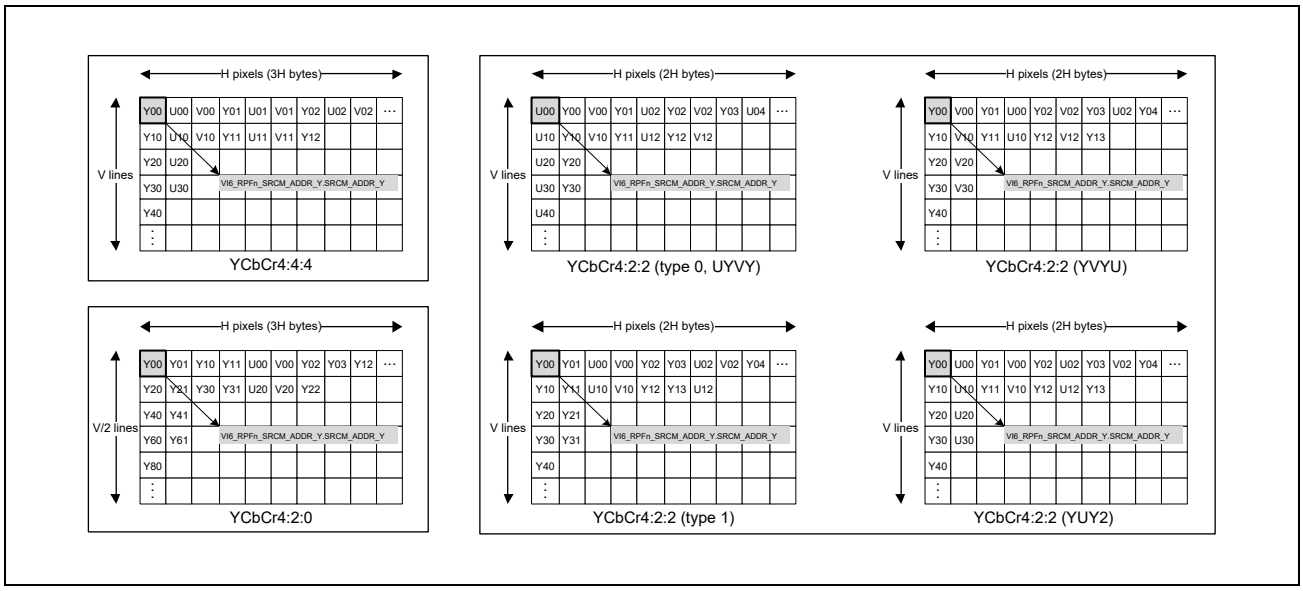

Figure 9.4-10 YCbCr Interleaved Formats*1

Note 1. This figure is for 8 bpc.

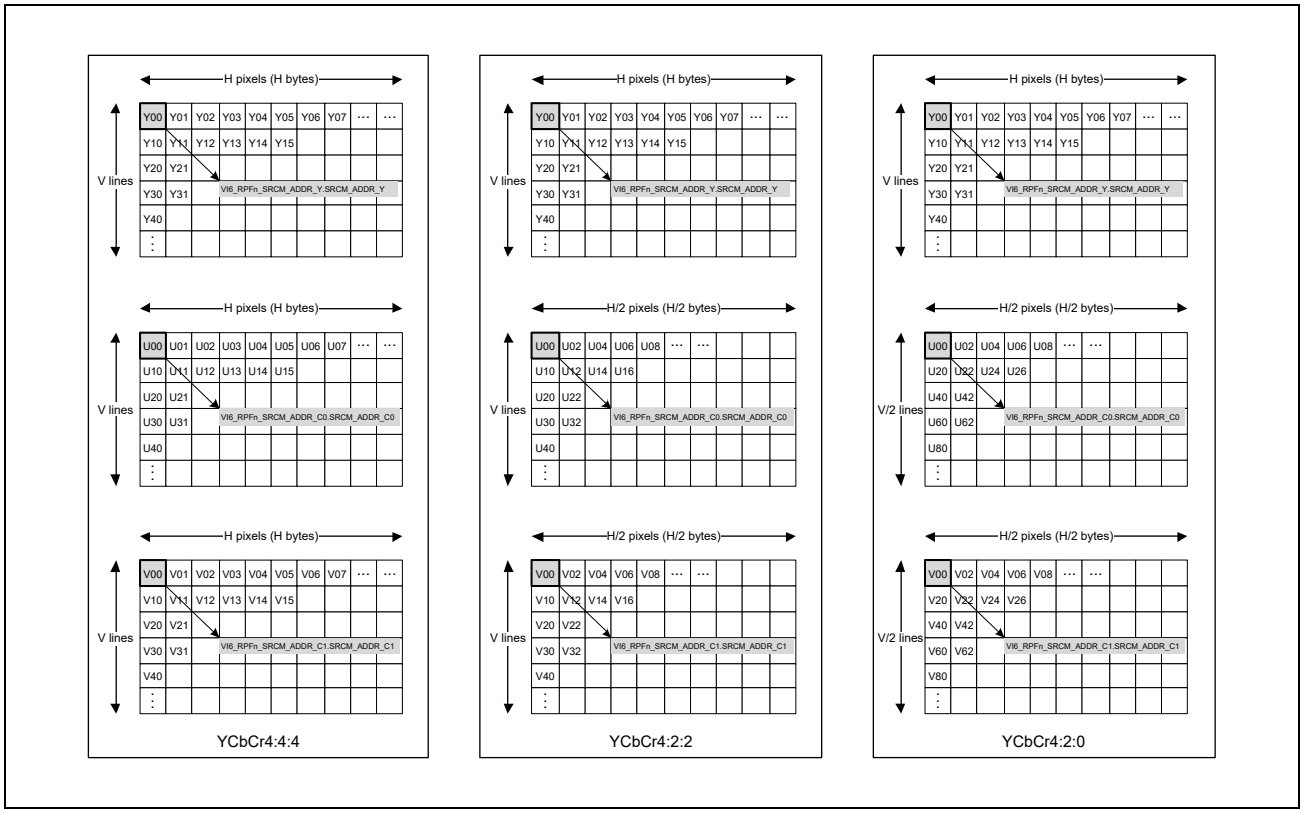

Figure 9.4-11 YCbCr Planar Formats*1

Note 1. This figure is for 8 bpc.

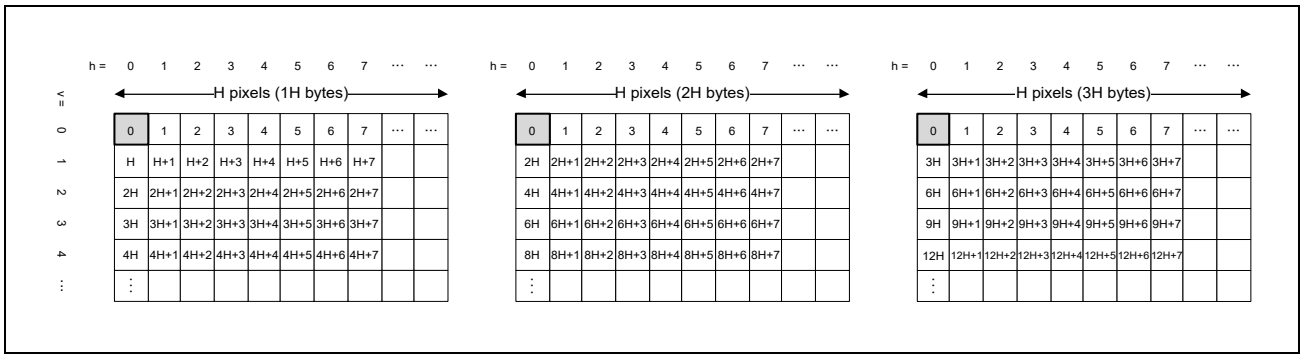

Figure 9.4-12 Memory Address for the Corresponding Pixel's Position

Legend in **Figure 9.4-12**

- H is horizontal image size in pixel unit.
- 1H, 2H, and 3H correspond to the case where 1 pixel has 1 byte, 2 bytes, and 3 bytes of data, respectively.

(4) RPFn Data Swapping Registers (LCDC_VSPD_VI6_RPFn_DSWAP) (n = 0, 1)

7 to 4	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
3	P_LLS	0h	RW	Picture Plane Data Swapping in LONG LWORD Units The effect of this bit setting is defined in **Table 9.4-14**. 0b: Data swapping in LONG LWORD (64-bit) units is disabled 1b: Data swapping in LONG LWORD (64-bit) units is enabled This register is available for only Luma plane (Y) in the case input data format is YUV Planar or Semi-Planar and input bit-depth is 2bypc (IPBD_Y != 0 or IPBD_C != 0), and available for both Luma plane (Y) and Chroma plane (CbCr/U/V) in other cases.
2	P_LWS	0h	RW	Picture Plane Data Swapping in long word Units The effect of this bit setting is defined in **Table 9.4-14**. 0b: Data swapping in long word (32-bit) units is disabled 1b: Data swapping in long word (32-bit) units is enabled This register is available for only Luma plane (Y) in the case input data format is YUV Planar or Semi-Planar and input bit-depth is 2bypc (IPBD_Y != 0 or IPBD_C != 0), and available for both Luma plane (Y) and Chroma plane (CbCr/U/V) in other cases.
1	P_WDS	0h	RW	Picture Plane Data Swapping in Word Units The effect of this bit setting is defined in **Table 9.4-14**. 0b: Data swapping in Word (16-bit) units is disabled 1b: Data swapping in Word (16-bit) units is enabled This register is available for only Luma plane (Y) in the case input data format is YUV Planar or Semi-Planar and input bit-depth is 2bypc (IPBD_Y != 0 or IPBD_C != 0), and available for both Luma plane (Y) and Chroma plane (CbCr/U/V) in other cases.

Bit	Bit Name	Initial Value	R/W	Description
0	P_BTS	0h	RW	Picture Plane Data Swapping in Byte Units The effect of this bit setting is defined in **Table 9.4-14**. 0b: Data swapping in Byte (8-bit) units is disabled 1b: Data swapping in Byte (8-bit) units is enabled This register is available for only Luma plane (Y) in the case input data format is YUV Planar or Semi-Planar and input bit-depth is 2bypc (IPBD_Y != 0 or IPBD_C != 0), and available for both Luma plane (Y) and Chroma plane (CbCr/U/V) in other cases.

When the virtual input function of the RPFn is used (VI6_RPFn_INFMT.VIR = 1), this register setting is ignored. Swapping of RPF input data can be specified separately for the α plane and picture plane.

Table 9.4-13 shows the data order before and after swapping according to the long long word, long word, word, and byte swapping settings.

When data order in memory for each format is the same as **Table 9.4-10** for RGB format and **Figure 9.4-9** to **Figure 9.4-12** for YCbCr format, set 1111b to {*_LLS, *_LWS, *_WDS, *_BTS}. If data order is not the same as the definition, change data order within 16byte unit by these bits as shown in **Table 9.4-13**.

Table 9.4-13 Changing Data Order According to Swap Register

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
28 to 16	HCOORD[12:0]	0000h	RW	Horizontal Coordinate of Sublayer Display Location on Master Layer These bits specify the left-end location of the sublayer displayed by the RPFn and the subsequent module connected through the DPR. Specify the horizontal coordinate of the location in pixel units with the left-end pixel of the master layer set at coordinate 0. When the RPFn is the master layer, set these bits to 0b. If the sublayer extends beyond the master layer according to the HCOORD setting, the extended section is cut off at the right end of the master layer. Even in this case, however, a bus transfer that is unnecessary for output image generation is executed since the whole sublayer data is read from the external memory. Appropriate coordinate setting is required so that the sublayer does not extend beyond the right end of the master layer. A value from 0 to 8189 can be specified.
15 to 13	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
12 to 0	VCOORD[12:0]	0000h	RW	Vertical Coordinate of Sublayer Display Location on Master Layer These bits specify the top-end location of the sublayer displayed by the RPFn and the subsequent module connected through the DPR. Specify the vertical coordinate of the location in pixel units with the top-end pixel of the master layer set at coordinate 0. When the RPFn is the master layer, set these bits to 0b. If the sublayer extends beyond the master layer according to the VCOORD setting, the extended section is cut off at the bottom end of the master layer. Even in this case, however, a bus transfer that is unnecessary for output image generation is executed since the whole sublayer data is read from the external memory. Appropriate coordinate setting is required so that the sublayer does not extend beyond the bottom end of the master layer. A value from 0 to 8189 can be specified.

Figure 9.4-13 shows an example of RPF1 offsets with respect to master layer RPF0. Although this figure only shows sublayers RPF1, specify offsets for all RPFs other than the master layer in the same way as shown in this example.

Whether an RPFn is the master layer or a sublayer is determined through the selection of the source RPF for WPFn (the VI6_WPFn_SRCRPF setting). For details, refer to **(1) WPF0-Source-RPF Register (LCDC_VSPD_VI6_WPF0_SRCRPF)**.

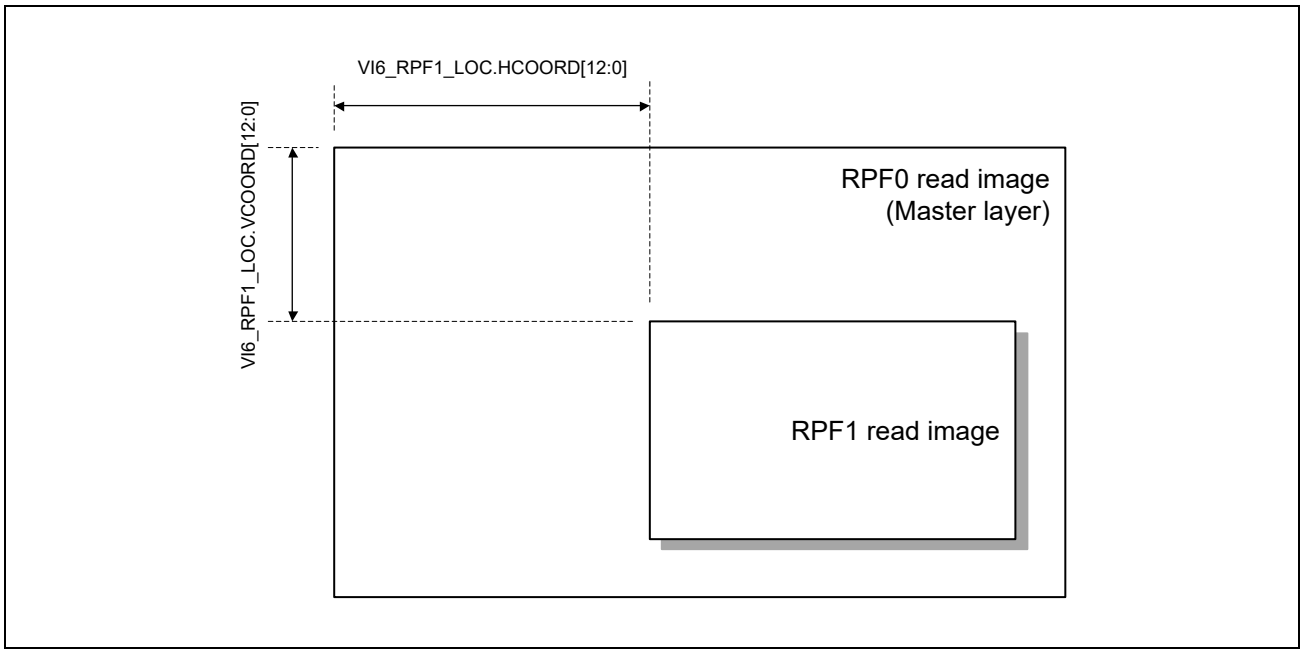

Figure 9.4-13 RPF1 Offsets from Master Layer

(6) RPFn α Plane Selection Control Registers (LCDC_VSPD_VI6_RPFn_ALPH_SEL) (n = 0, 1)

Access Size : 32 bits

Address : <LCDC_vspd_base> + 0314h (n = 0)
<LCDC_vspd_base> + 0414h (n = 1)

Initial Value : 0000_0000h

Bit	Bit Name	Initial Value	R/W	Description
31	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
30 to 28	ASEL[2:0]	0h	RW	α Format and Processing Method Select These bits select how to handle the α value to be used. The RPF handles two types of α value; 8-bit and 1-bit values. When a 1-bit α value is used, VSPD assumes that the 1-bpp α value for each pixel is stored in the order from MSB to LSB in each byte (big endian). The α value is used as either transparency information or mask information. Transparency information is included in the α plane read from external memory when the ASEL bits are set to 1 or 3 and in the α value stored in the packed RGB bit field when these bits are set to 0 or 2. The α value as transparency information is sent as the destination value to the IROP as shown in **Figure 9.4-14** and then output to the subsequent modules. The output α value is used, for example, for blending in the BRS. The α value as mask information is used for IROP operation in the RPF. The mask information is included in the α plane read from external RAM when the ASEL bits are set to 0 or 2 and the source value is used in IROP operation (IROP setting other than 0, 5, 10, or 15). This α value is sent as the source value to the IROP as shown in **Figure 9.4-14**. Note that the α value selected through the ASEL bits has a lower priority than the VI6_RPFn_CKEY_SET*.AP* value replaced through the color keying function. When the color keying function is used, the α value may be replaced with the VI6_RPFn_CKEY_SET*.AP* value regardless of the ASEL bit setting. When using the virtual input function (VI6_RPFn_INFMT.VIR = 1b), specify 4. 0h: 1, 4, or 8-bit packed α + plane α (IROP ! = 0, 5, 10, 15) The α bit field in 1, 4, or 8-bit packed α is handled as transparency information. Be sure to specify the packed format that includes α through VI6_RPFn_INFMT.RDFMT. When VI6_RPFn_MSKCTRL.MSK_EN is 0b and the IROP bit value is not 0, 5, 10, or 15, the α plane should be read as mask information. Specify the number of α data bits (BSEL) stored in the α plane and the α plane read start address (VI6_RPFn_SRCM_ADDR_AI). When the IROP bits are set to 0, 5, 10, or 15, the α plane is not read. 1h: 8-bit plane α The 8-bit α plane is read from external RAM as transparency information. When the packed RGB format has a bit field for α, the information in the α bit field is discarded. The α plane read start address (VI6_RPFn_SRCM_ADDR_AI) should be specified. The α value goes through the 8-bit transparent α generator shown in **Figure 9.4-14** without change. When VI6_RPFn_MSKCTRL.MSK_EN is 0b, IROP operation cannot be executed; set the IROP bits to 0 in this case. When VI6_RPFn_MSKCTRL.MSK_EN is 1b. IROP operation can be executed.

Bit	Bit Name	Initial Value	R/W	Description
				2h: 1-bit packed α + plane α (IROP ! = 0, 5, 10, 15) The 1-bit packed α input is converted by the 8-bit transparent α generator shown in **Figure 9.4-14** according to the ALPHA0/1 setting into the 8-bit α value as transparency information. Select the packed input format that includes a 1-bit α field. When VI6_RPFn_MSKCTRL.MSK_EN is 0b and the IROP value is not 0, 5, 10, or 15, the α plane should be read as mask information. Specify the number of α data bits (BSEL) stored in the α plane and the α plane read start address (VI6_RPFn_SRCM_ADDR_AI). When the IROP bits are set to 0, 5, 10, or 15, the α plane is not read. 3h: 1-bit plane α The 1-bit α plane is read from external RAM and converted by the 8-bit transparent α generator shown in **Figure 9.4-14** according to the ALPHA0/1 setting into the 8-bit α value as transparency information. When the packed RGB format has a bit field for α, the information in the α bit field is discarded. The α plane read start address (VI6_RPFn_SRCM_ADDR_AI) should be specified. When VI6_RPFn_MSKCTRL.MSK_EN is 0b, IROP operation cannot be executed; set the IROP bits to 0b in this case. When VI6_RPFn_MSKCTRL.MSK_EN is 1b. IROP operation can be executed. 4h: Fixed α The fixed α value (VI6_RPFn_VRTCOL_SET.LAYA value) is output from the RPF. IROP operation cannot be executed; set the IROP bits to 0 in this case. 5 to 7: Setting prohibited.
27 to 24	IROP[3:0]	0h	RW	IROP Operation Setting These bits specify the operator to be executed in the IROP operation unit shown in **Figure 9.4-14**. The source (S) for the IROP operation is the pixel data and α data specified in the VI6_RPFn_MSKSET0 or VI6_RPFn_MSKSET1 IROP input value register, which is selected according to the value (0 or 1) generated by the 1-bit mask generator. The destination (D) is the image data (RGB/YCbCr) and 8-bit α data output from the unpack/OSD processor. IROP operation is applied both for the image data and α data between the source and destination data. If these bits are set to the operation that involves the source (S) (IROP setting other than 0, 5, 10, or 15) while VI6_RPFn_MSKCTRL.MSK_EN is 0b, the α plane is read from the external RAM to be used for the α value for IROP operation; specify the α plane read start address (VI6_RPFn_SRCM_ADDR_A). When the virtual input function is used (VI6_RPFn_INFMT.VIR = 1b), IROP operation is not available; set these bits to 0000b. 0000b: NOP(D) 0001b: AND(S & D) 0010b: AND_REVERSE(S & ~D) 0011b: COPY(S) 0100b: AND_INVERTED(~S & D) 0101b: CLEAR(0) 0110b: XOR(S ^ D) 0111b: OR(S | D) 1000b: NOR(~(S | D)) 1001b: EQUIV(~(S ^ D)) 1010b: INVERT(~D) 1011b: OR_REVERSE(S | ~D) 1100b: COPY_INVERTED(~S) 1101b: OR_INVERTED(~S | D) 1110b: NAND(~(S & D)) 1111b: SET(all 1)
23	BSEL	0h	RW	α Bit Count Conversion Selection for 1-Bit Mask Generator Specifies the number of bits in the α plane to be read as mask information from the external RAM. The α value in mask information is used for the source (S) in IROP. When α plane data is 8 bits, it is converted to one bit through the 1-bit mask generator shown in **Figure 9.4-14**. Note that this bit setting is valid when the ASEL bits are set to 0 or 2 and VI6_RPFn_MSKCTRL.MSK_EN is set to 0b. In other cases, this bit setting has no effect. 0b: 8-bit α is converted to 1-bit α through the 1-bit mask generator. When the 8-bit α value input to the RPF is not 0, it is converted to 1b; when the value is 0, it is converted to 0b. 1b: α value goes through the 1-bit mask generator. The 1-bit α value input to the RPF is output through the 1-bit mask generator without change.
22 to 20	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

Bit	Bit Name	Initial Value	R/W	Description
19, 18	AEXT[1:0]	0h	RW	Lower-Bit α Value Extension Method Set These bits specify the method for extending the input α data to 8 bits through the unpack processing. 00b: The lower-order bits of α value are extended with 0. 01b: The upper-order bits of α value are copied to the lower-order bits. 10b: The lower-order bits of α value are extended with 0. The maximum value is limited to FFh. 11b: Setting prohibited
17, 16	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
15 to 8	ALPHA1[7:0]	00h	RW	8-Bit α Value Output when 1-Bit α Value is 1 These bits specify the 8-bit α value to be output when 1-bit α data is input and the α value input to the 8-bit transparent α generator shown in **Figure 9.4-14** is 1b. This setting is valid when the ASEL bits are set to 010b or 011b. A value from 0 to 255 can be specified.
7 to 0	ALPHA0[7:0]	00h	RW	8-Bit α Value Output when 1-Bit α Value is 0 These bits specify the 8-bit α value to be output when 1-bit α data is input and the α value input to the 8-bit transparent α generator shown in **Figure 9.4-14** is 0b. This setting is valid when the ASEL bits are set to 010b or 011b. A value from 0 to 255 can be specified.

Figure 9.4-14 shows the relationship between the α selector, IROP operation unit, color keying unit, and related registers. The IROP operation unit receives two inputs, source and destination. The image data input from the external memory is processed through the unpack processor and 8-bit transparent α generator and then input to the IROP operation unit as destination data. The α plane data input from the external memory is sent to the 8-bit transparent α generator when the ASEL bits are set to 1 or 3, or sent to the 1-bit mask α generator when the ASEL bits are set to 0 or 2. For the pixel data and 8-bit α value on the source side of the IROP operation unit, either the VI6_RPFn_MSKSET0 value or VI6_RPFn_MSKSET1 values will be selected according to the 1-bit α value output by the 1-bit mask α generator.

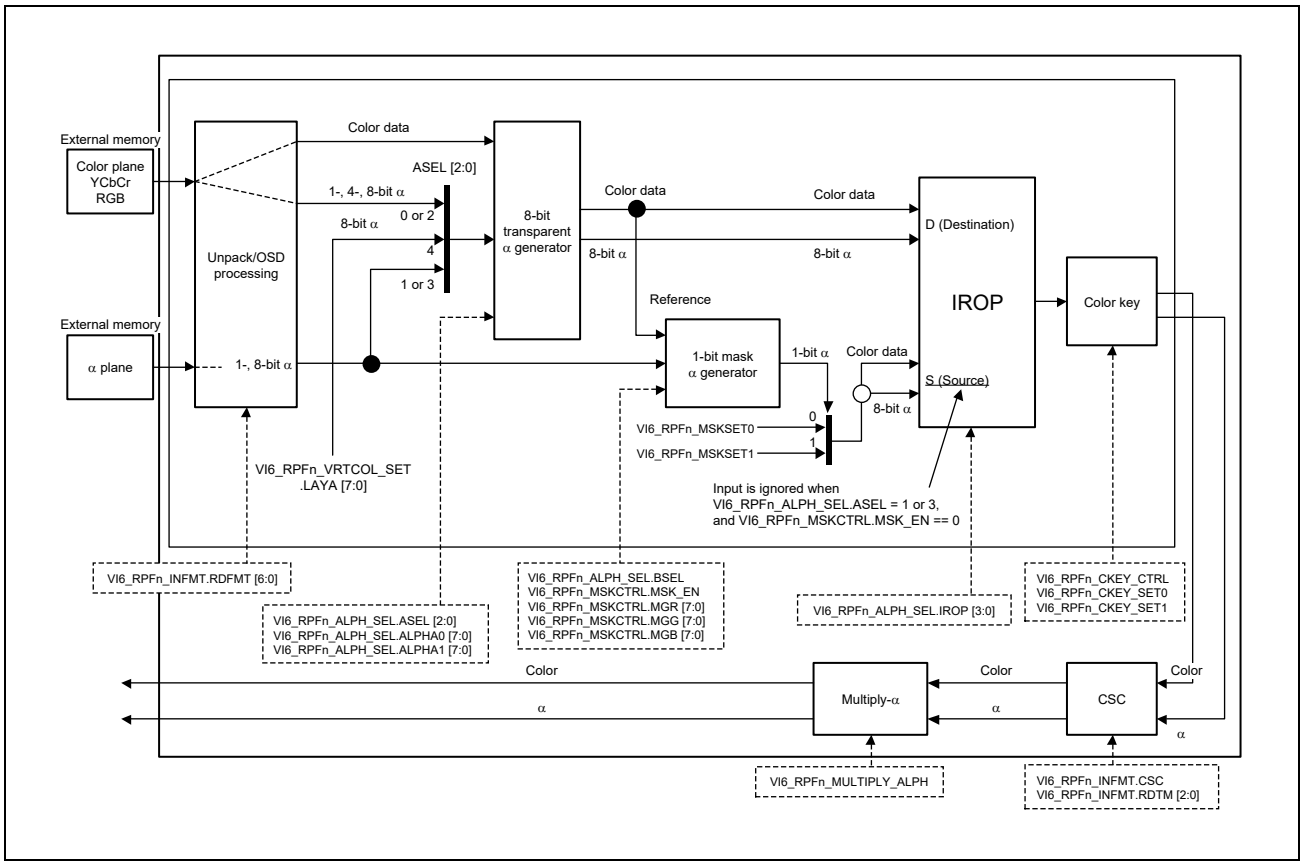

Figure 9.4-14 Configuration of alpha Selector and IROP Operation Unit in RPF

The following describes the function of each block shown in **Figure 9.4-14**. Read the following while referring to the figure as necessary.

Unpack/OSD processor:

Unpacks each component and α value of the image data according to the packed format specified in VI6_RPFn_INFMT.RDFMT.

8-bit transparent α generator:

Converts the input α value into 8-bit α when the input α is four bits or one bit.

When VI6_RPFn_ALPH_SEL.ASEL are set to 0 (8-, 4-, or 1-bit packed α), this generator outputs the input α value without change if the α bit field in the packed α data is 8 bits; if the α bit field is less than 8 bits, it is converted to an 8-bit α value by extending the LSB side according to the VI6_RPFn_ALPH_SEL.AEXT setting.

When VI6_RPFn_ALPH_SEL.ASEL are set to 1 (8-bit plane α) or 4 (fixed α), this generator outputs the input 8-bit plane α without change. If a packed α value is included in RGB data, it is discarded.

When VI6_RPFn_ALPH_SEL.ASEL are set to 2 (1-bit packed α) or 3 (8-bit α generated from 1-bit plane α), an 8-bit α value is generated by using the VI6_RPFn_ALPH_SEL.ALPHA0 [7:0] value when the input 1-bit α value is 0 or by using the VI6_RPFn_ALPH_SEL.ALPHA1 [7:0] value when the input 1-bit α value is 1. When VI6_RPFn_ALPH_SEL.ASEL is set to 3, a packed α value that is included in RGB data is discarded.

1-bit mask α generator:

Generates 1-bit α data from the input 8-bit α data or pixel data. When the input α data is one bit, this generator outputs it without change.

When VI6_RPFn_ALPH_SEL.ASEL are set to 0 (8-, 4-, or 1-bit packed α) or 2 (plane α) and VI6_RPFn_MSKCTRL.MSK_EN is set to 0, the α plane read from the external memory to be used in IROP is converted to 1-bit α data when necessary. When the α plane data read from the external RAM is 8 bits (BSEL = 0), if the value is 0, a 1-bit α value of 0b is generated; if the value is not 0, a 1-bit α value of 1b is generated. When the α plane data is one bit (BSEL = 1), this generator outputs it without change.

When the value of the 1-bit α generated by the 1-bit mask α generator is 0b, the 8-bit α and pixel data specified in VI6_RPFn_MSKSET0 are output as the source. When the generated 1-bit α value is 1b, the 8-bit α and pixel data specified in VI6_RPFn_MSKSET1 are output as the source.

As shown in **Figure 9.4-14**, when VI6_RPFn_ALPH_SEL.ASEL are set to 1 (8-bit plane α) or 3 (1-bit plane α), the α plane read from the external RAM is sent to the 8-bit transparent α generator as transparency information. When VI6_RPFn_MSKCTRL.MSK_EN is set to 0, the 1-bit α for masking is generated according to the input α plane (refer to **(8) RPFn Mask Control Registers (LCDC_VSPD_VI6_RPFn_MSKCTRL)**), but the 1-bit mask α generator does not refer to the input α plane because it is input to the 8-bit transparent α generator as transparency information. Accordingly, the 1-bit mask α generator does not generate a 1-bit α for masking and the data on the source side becomes invalid; that is, IROP operation cannot be executed. Set the IROP bits to 0 in this case. In contrast, when VI6_RPFn_MSKCTRL.MSK_EN is set to 1, the 1-bit mask α generator creates α data for masking according to the pixel data instead of the input α plane data, and IROP operation can be executed in this case.

IROP operation unit:

Executes ROP operation according to the opcode specified in VI6_RPFn_ALPH_SEL.IROP. For ROP operation (other than NOP), valid values should be input both for the source and destination. As described in the above (description of the 1-bit mask α generator), when VI6_RPFn_ALPH_SEL.ASEL are set to 1 or 3 and VI6_RPFn_MSKCTRL.MSK_EN is set to 0, the source data for the IROP operation unit is treated as invalid; set VI6_RPFn_ALPH_SEL.IROP to 0 (NOP). When VI6_RPFn_ALPH_SEL.ASEL are set to 4, a fixed α value is output from the RPF and IROP operation is not available. In the same way as the above case, set VI6_RPFn_ALPH_SEL.IROP to 0 (NOP).

To specify a valid source value for the IROP operation unit and execute IROP operation (specify an opcode other than NOP in the IROP bits), specify register values as shown in **Table 9.4-14**. Where the source input state is indicated as “Valid” in the table, IROP operation can be executed. In the cases where IROP operation is not available, set the IROP bits to 0 (NOP).

Table 9.4-14 Source Input State in IROP Operation Unit

VI6_RPFn_ALPH_SEL.ASEL[2:0]		VI6_RPFn_MSKCTRL.MSK_EN		
		0 (Source data is generated according to input α plane)		1 (Source data is generated according to the destination-side pixel data)
000b	(1-, 4-, or 8-bit packed α + plane α)	Valid	(α plane input)	Valid
001b	(8-bit α plane)	Invalid	(IROP operation is not available; α plane is output to the subsequent modules behind RPF)	Valid
010b	(8-bit α generated from 1-bit packed α + plane α)	Valid	(α plane input)	Valid
011b	(8-bit α generated from 1-bit plane α)	Invalid	(IROP operation is not available; α plane is output to the subsequent modules behind RPF)	Valid
100b	(Fixed α)	Invalid (IROP operation is not available; fixed α is output to the subsequent modules behind RPF)		

For the handling of the α values shown in **Figure 9.4-14** and **Table 9.4-14**, the relationship between the RPF input format and RPF output α value is shown in **Table 9.4-15**. Where only bit names are shown in the table, the bits are in VI6_RPFn_ALPH_SEL described in this section.

Table 9.4-15 α Value Selected and Output according to ASEL Bits in Each Input Format

ASEL Setting		α Value Output for Each Input Format	
		RGB	YCbCr
000b	(8-, 4-, or 1-bit packed α is input)	1-, 4-, or 8-bit pixel α	FFh*1
001b	(8-bit plane α is input)	8-bit α plane	8-bit α plane
010b	(8-bit α is generated from the 1-bit packed α input)	ALPHA0 or ALPHA1 setting	FFh*1
011b	(8-bit α is generated from the 1-bit plane α input)	ALPHA0 or ALPHA1 setting	ALPHA0 or ALPHA1 setting
100b	(Fixed α is output)	VI6_RPFn_VRTCOL_SET.LAYA setting	

Note 1. Fixed value FFh is output because packed α is not included in YCbCr.

(7) RPFn Virtual Plane Color Information Registers (LCDC_VSPD_VI6_RPFn_VRTCOL_SET) (n = 0, 1)

Access Size : 32 bits

Address : <LCDC_vspd_base> + 0318h (n = 0)
<LCDC_vspd_base> + 0418h (n = 1)

Initial Value : 0000_0000h

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	LAYA[7:0]	00h	RW	Virtual-Input Fixed α Value These bits specify the fixed α value generated in the RPFn when the virtual input function is enabled through the VI6_RPFn_INFMT.VIR setting. When the virtual input function is disabled (VI6_RPFn_INFMT.VIR = 0b), these bits are used to specify the fixed α value to be output from the RPF while VI6_RPFn_ALPH_SEL.ASEL are set to 4. A value from 0 to 255 can be specified.
23 to 16	LAYR[7:0]	00h	RW	Virtual-Input Fixed R/Cr Component Value These bits specify the fixed R or Cr value generated in the RPFn when the virtual input function is enabled through the VI6_RPFn_INFMT.VIR setting. When VI6_RPFn_INFMT.RDFMT is set to 19, the value specified in these bits is used as the R value. When VI6_RPFn_INFMT.RDFMT is set to 64, the value specified in these bits is used as the Cr value. A value from 0 to 255 can be specified.
15 to 8	LAYG[7:0]	00h	RW	Virtual-Input Fixed G/Y Component Value These bits specify the fixed G or Y value generated in the RPFn when the virtual input function is enabled through the VI6_RPFn_INFMT.VIR setting. When VI6_RPFn_INFMT.RDFMT is set to 19, the value specified in these bits is used as the G value. When VI6_RPFn_INFMT.RDFMT is set to 64, the value specified in these bits is used as the Y value. A value from 0 to 255 can be specified.
7 to 0	LAYB[7:0]	00h	RW	Virtual-Input Fixed B/Cb Component Value These bits specify the fixed B or Cb value generated in the RPFn when the virtual input function is enabled through the VI6_RPFn_INFMT.VIR setting. When VI6_RPFn_INFMT.RDFMT is set to 19, the value specified in these bits is used as the B value. When VI6_RPFn_INFMT.RDFMT is set to 64, the value specified in these bits is used as the Cb value. A value from 0 to 255 can be specified.

(8) RPFn Mask Control Registers (LCDC_VSPD_VI6_RPFn_MSKCTRL) (n = 0, 1)

Access Size : 32 bits

Address : <LCDC_vspd_base> + 031Ch (n = 0)
<LCDC_vspd_base> + 041Ch (n = 1)

Initial Value : 0000_0000h

R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	-	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
24	MSK_EN	0h	RW	Mask Generation Specification Specifies the method of α value generation in the 1-bit mask α generator shown in **Figure 9.4-14**. 0b: A 1-bit mask value is generated according to the input α plane value. When the input α is in the 1-bit format (VI6_RPFn_ALPH_SEL.BSEL = 1b), the 1-bit mask value is output without change. When the input α is in the 8-bit format (VI6_RPFn_ALPH_SEL.BSEL = 0b), the 1-bit mask value is 0 if the α value is 0x00; otherwise, the 1-bit mask value is 1. 1b: The R/Cr, G/Y, and B/Cb components of the image input to the destination side of the IROP operation unit are compared with the values specified in the MGR, MGG, and MGB bits, respectively. When all values match, 1 is output as the 1-bit mask value, and in other cases, 0 is output. When the generated 1-bit mask data is not used, set VI6_RPFn_ALPH_SEL.IROP to 0b.
23 to 16	MGR[7:0]	00h	RW	R/Cr Comparison Value for 1-Bit α Generation These bits specify the R/Cr value to be compared for 1-bit α generation by using the pixel data on the destination side. When RGB is specified as the RPFn input format through VI6_RPFn_INFMT.RDFMT, specify an R value for comparison. When YCbCr is specified, specify a Cr value for comparison. This setting is ignored when the MSK_EN bit is set 0b. A value from 0 to 255 can be specified.
15 to 8	MGG[7:0]	00h	RW	G/Y Comparison Value for 1-Bit α Generation These bits specify the G/Y value to be compared for 1-bit α generation by using the pixel data on the destination side. When RGB is specified as the RPFn input format through VI6_RPFn_INFMT.RDFMT, specify a G value for comparison. When YCbCr is specified, specify a Y value for comparison. This setting is ignored when MSK_EN is set to 0b. A value from 0 to 255 can be specified.
7 to 0	MGB[7:0]	00h	RW	B/Cb Comparison Value for 1-Bit α Generation These bits specify the B/Cb value to be compared for 1-bit α generation by using the pixel data on the destination side. When RGB is specified as the RPFn input format through VI6_RPFn_INFMT.RDFMT, specify a B value for comparison. When YCbCr is specified, specify a Cb value for comparison. This setting is ignored when MSK_EN is set to 0b. A value from 0 to 255 can be specified.

(9) RPFn IROP-SRC Input Value Registers 0 (LCDC_VSPD_VI6_RPFn_MSKSET0) (n = 0, 1)

Access Size : 32 bits

Address : <LCDC_vspd_base> + 0320h (n = 0)
<LCDC_vspd_base> + 0420h (n = 1)

Initial Value : 0000_0000h

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	MSA0[7:0]	00h	RW	IROP-Source Input α Value when 1-Bit α is 0 These bits specify the 8-bit α value to be input as the source to the IROP operation unit when the internal 1-bit α value generated through the 1-bit mask generator is 0 (**Figure 9.4-14**). A value from 0 to 255 can be specified.
23 to 16	MSR0[7:0]	00h	RW	IROP-Source Input R/Cr Value when 1-Bit α is 0 These bits specify the R/Cr value to be input as the source to the IROP operation unit when the internal 1-bit α value generated through the 1-bit mask generator is 0 (**Figure 9.4-14**). When RGB is specified as the RPFn input format through VI6_RPFn_INFMT.RDFMT, specify an R component value. When YCbCr is specified, specify a Cr component value. A value from 0 to 255 can be specified.
15 to 8	MSG0[7:0]	00h	RW	IROP-Source Input G/Y Value when 1-Bit α is 0 These bits specify the G/Y value to be input as the source to the IROP operation unit when the internal 1-bit α value generated through the 1-bit mask generator is 0 (**Figure 9.4-14**). When RGB is specified as the RPFn input format through VI6_RPFn_INFMT.RDFMT, specify a G component value. When YCbCr is specified, specify a Y component value. A value from 0 to 255 can be specified.
7 to 0	MSB0[7:0]	00h	RW	IROP-Source Input B/Cb Value when 1-Bit α is 0 These bits specify the B/Cb value to be input as the source to the IROP operation unit when the internal 1-bit α value generated through the 1-bit mask generator is 0 (**Figure 9.4-14**). When RGB is specified as the RPFn input format through VI6_RPFn_INFMT.RDFMT, specify a B component value. When YCbCr is specified, specify a Cb component value. A value from 0 to 255 can be specified.

(10) RPFn IROP-SRC Input Value Registers 1 (LCDC_VSPD_VI6_RPFn_MSKSET1) (n = 0, 1)

Access Size : 32 bits

Address : <LCDC_vspd_base> + 0324h (n = 0)
<LCDC_vspd_base> + 0424h (n = 1)

Initial Value : 0000_0000h

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	LTH	-	-	-	CV	-	-	SAPE1	SAPE0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	RW	R	R	R	RW	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
8	LTH	0h	RW	Transparent color-luma Threshold Mode Enable/Disable This bit enables or disables transparent color-luma threshold mode for the color keying module. In transparent color-luma threshold mode, color information 0 (GY0) specified in VI6_RPFn_CKEY_SET0 register is compared with the input luma values. When the input data is in YCbCr format, and if input Y value is equal to or smaller than specified color information (VI6_RPFn_CKEY_SET0.GY0), the input α value is replaced with the value specified in VI6_RPFn_CKEY_SET0.AP0. This bit is available only when the input data is in YCbCr format. When the input data is in an RGB format, set this bit to 0b. This bit setting is valid only when the CV bit is set to 0b; it is ignored when the CV bit is set to 1b. When using the virtual input function (VI6_RPFn_INFMT.VIR = 1b), set this bit to 0b. 0b: Luma threshold mode is disabled (Matched color mode) 1b: Luma threshold mode is enabled
7 to 5	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
4	CV	0h	RW	Color Replacement Control This bit controls the color replacement function in the color keying module shown in Figure 9.4-2. When an RGB format is specified as the color space of the RPFn input data through VI6_RPFn_INFMT.RDFMT, and if all components of an input pixel match the color components specified in VI6_RPFn_CKEY_SET0, the color replacement function replaces the values of the input α and all RGB components with the α and color components specified in VI6_RPFn_CKEY_SET1. When a YCbCr format is specified as the color space of the RPFn input data through VI6_RPFn_INFMT.RDFMT, only the Y data is compared; if the luminance component of an input pixel matches the value specified in VI6_RPFn_CKEY_SET0.GY0, the color replacement function replaces the values of the input α and all YCbCr components with the α and color components specified in VI6_RPFn_CKEY_SET1. When the CV bit is set to 1, the color replacement function is enabled. When using the virtual input function (VI6_RPFn_INFMT.VIR = 1), set this bit to 0. 0b: Color replacement function is disabled (transparent color mode). 1b: Color replacement function is enabled.
3, 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

Bit	Bit Name	Initial Value	R/W	Description
1	SAPE1	0h	RW	Comparison Color Data Setting 1 Enable/Disable This bit enables or disables comparison color data setting 1 in the transparent color mode for the color keying module. This bit setting is valid only when the CV bit is set to 0; it is ignored when the CV bit is set to 1. In transparent color mode, color information 1 (VI6_RPFn_CKEY_SET1.R1/GY1/B1) specified in VI6_RPFn_CKEY_SET1 is compared with the input component values. When the input data is in an RGB format, and if all input values match the specified color information, the input α value is replaced with the value specified in VI6_RPFn_CKEY_SET1.AP. When the input data is in YCbCr format, only the Y data is compared. When using the virtual input function (VI6_RPFn_INFMT.VIR = 1), set this bit to 0. 0b: Comparison color data setting 1 is disabled. 1b: Comparison color data setting 1 is enabled.
0	SAPE0	0h	RW	Comparison Color Data Setting 0 Enable/Disable This bit enables or disables comparison color data setting 0 in the transparent color mode for the color keying module. This bit setting is valid only when the CV bit is set to 0b; it is ignored when the CV bit is set to 1b. In transparent color mode, color information 0 (VI6_RPFn_CKEY_SET0.R0/GY0/B0) specified in VI6_RPFn_CKEY_SET0 is compared with the input component values. When the input data is in an RGB format, and if all input values match the specified color information, the input α value is replaced with the value specified in VI6_RPFn_CKEY_SET0.AP. When the input data is in YCbCr format, only the Y data is compared. When using the virtual input function (VI6_RPFn_INFMT.VIR = 1b), clear this bit to 0b. 0b: Comparison color data setting 0 is disabled. 1b: Comparison color data setting 0 is enabled.

(12) RPFn Color Keying Color Setting Registers-m (LCDC_VSPD_VI6_RPFn_CKEY_SETm) (n = 0, 1) (m = 0, 1)

Access Size : 32 bits

Address : <LCDC_vspd_base> + 032Ch + m x 0004h (n = 0)
<LCDC_vspd_base> + 042Ch + m x 0004h (n = 1)

Initial Value : 0000_0000h

R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	AP0[7:0]	00h	RW	α Data in Color Keying Color Information-1 - In transparent color-matched color mode for color keying When the input data matches color setting-0 (R0, GY0, and B0) for transparent color comparison in the color keying module, the input α value is replaced with the value specified in these bits. Specify the α value to replace the input value. - In transparent color-luma threshold mode for color keying When the input data is in YCbCr format, and if input Y value is equal to or smaller than GY0, the input α value is replaced with the value specified in this bit field (AP0). Specify the α value in this bit field (AP0) to replace the input value. - In color replacement mode for color keying These bits are not used in this mode. Clear them to 0. α value replacement through these bits in transparent color mode for color keying takes priority over the α value selected through the VI6_RPFn_ALPH_SEL.ASEL setting. A value from 0 to 255 can be specified.
23 to 16	R0[7:0]	00h	RW	R*[1]/Cr Component Data in Color Keying Color Information-1 - In transparent color-matched color mode for color keying Specify the R component value for comparison enabled through the VI6_RPFn_CKEY_CTRL.SAPE0 setting. When the RPFn input is in YCbCr format, the color keying module does not compare the Cr component, and the setting of these bits is ignored. - In transparent color-luma threshold mode for color keying The color keying module does not refer this bit field, and the setting of these bits is ignored. - In color replacement mode for color keying Specify the R component value to be compared with the input data in the color replacement function of the color keying module. A value from 0 to 255 can be specified.
15 to 8	GY0[7:0]	00h	RW	G*[1]/Y Component Data in Color Keying Color Information-1 - In transparent color-matched color mode for color keying Specify the G/Y component value for comparison enabled through the VI6_RPFn_CKEY_CTRL.SAPE0 setting. - In transparent color-luma threshold mode for color keying Specify the Y component value in the GY0 to be compared. - In color replacement mode for color keying Specify the G/Y component value to be compared with the input data in the color replacement function of the color keying module. A value from 0 to 255 can be specified.

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	B0[7:0]	00h	RW	B*[1]/Cb Component Data in Color Keying Color Information-1 - In transparent color-matched color mode for color keying Specify the B component value for comparison enabled through the VI6_RPFn_CKEY_CTRL.SAPE0 setting. When the RPFn input is in YCbCr format, the color keying module does not compare the Cb component, and the setting of these bits is ignored. - In transparent color-luma threshold mode for color keying The color keying module does not refer this bit field, and the setting of these bits is ignored. - In color replacement mode for color keying Specify the B component value to be compared with the input data in the color replacement function of the color keying module. A value from 0 to 255 can be specified.

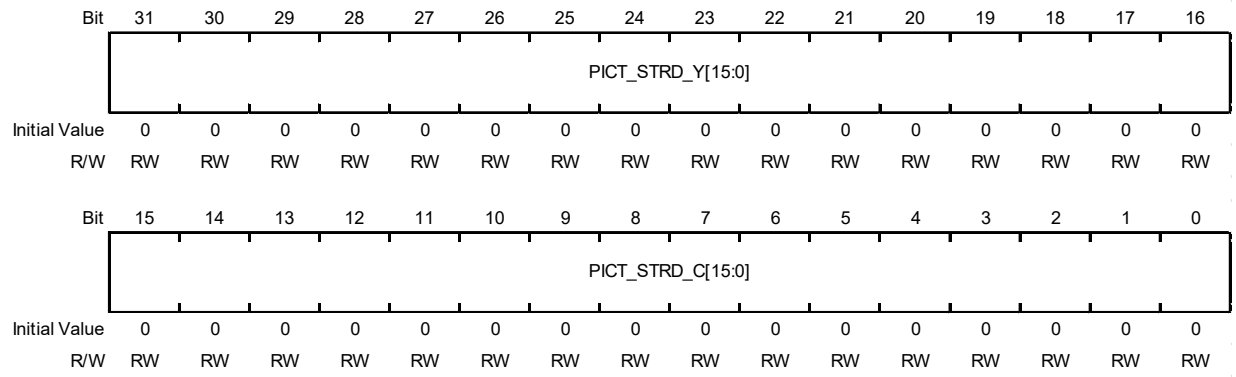
Note 1. When comparison data is specified in an RGB format, if a packed format is selected for RGB input and each of the RGB components is not 8 bits, the lower-order bits of input data are extended as specified through VI6_RPFn_INFMT.CEXT before comparison. The RGB components to be compared with the input should also be extended in the same way and the extended values should be specified in this register.

(13) RPFn Source Picture Memory Stride Setting Registers (LCDC_VSPD_VI6_RPFn_SRCM_PSTRIDE) (n = 0, 1)

Access Size : 32 bits

Address : <LCDC_vspd_base> + 0334h (n = 0)
<LCDC_vspd_base> + 0434h (n = 1)

Initial Value : 0000_0000h



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	PICT_STRD_Y [15:0]	0000h	RW	Memory Stride of Source Picture Y/RGB Plane These bits specify in 1-byte units the memory stride of the source picture Y/RGB plane read by the RPFn. A value from 0 to 65535 can be specified. Refer to **Figure 9.4-15** for settings.
15 to 0	PICT_STRD_C [15:0]	0000h	RW	Memory Stride of Source Picture C Plane These bits specify in 1-byte units the memory stride of the source picture C plane read by the RPFn. When an RGB-format picture is read, these bits do not need to be set. A value from 0 to 65535 can be specified. Refer to **Figure 9.4-15** for settings. In the YCbCr planar format, this setting is used as the memory stride of the Cb and Cr planes.

This register specifies the memory stride of the picture planes in the source area as shown in **Figure 9.4-15**. The memory stride of the α plane should be specified through VI6_RPFn_SRCM_ASTRIDE.ALPH_STRD. When the RPF input is in an RGB format, only the RGB plane is read; when the input is in YCbCr format, the Y and C planes are read as shown in **Figure 9.4-15**. When the α plane is used, the α plane is also read. According to the image format and the necessity of the α plane, specify the necessary addresses where the source image is stored (VI6_RPFn_SRCM_ADDR_Y, VI6_RPFn_SRCM_ADDR_C, and VI6_RPFn_SRCM_ADDR_AI).

Whether the α plane needs to be read is determined according to the α plane selection method and IROP operation type. For details, refer to **(6) RPFn α Plane Selection Control Registers (LCDC_VSPD_VI6_RPFn_ALPH_SEL)**.

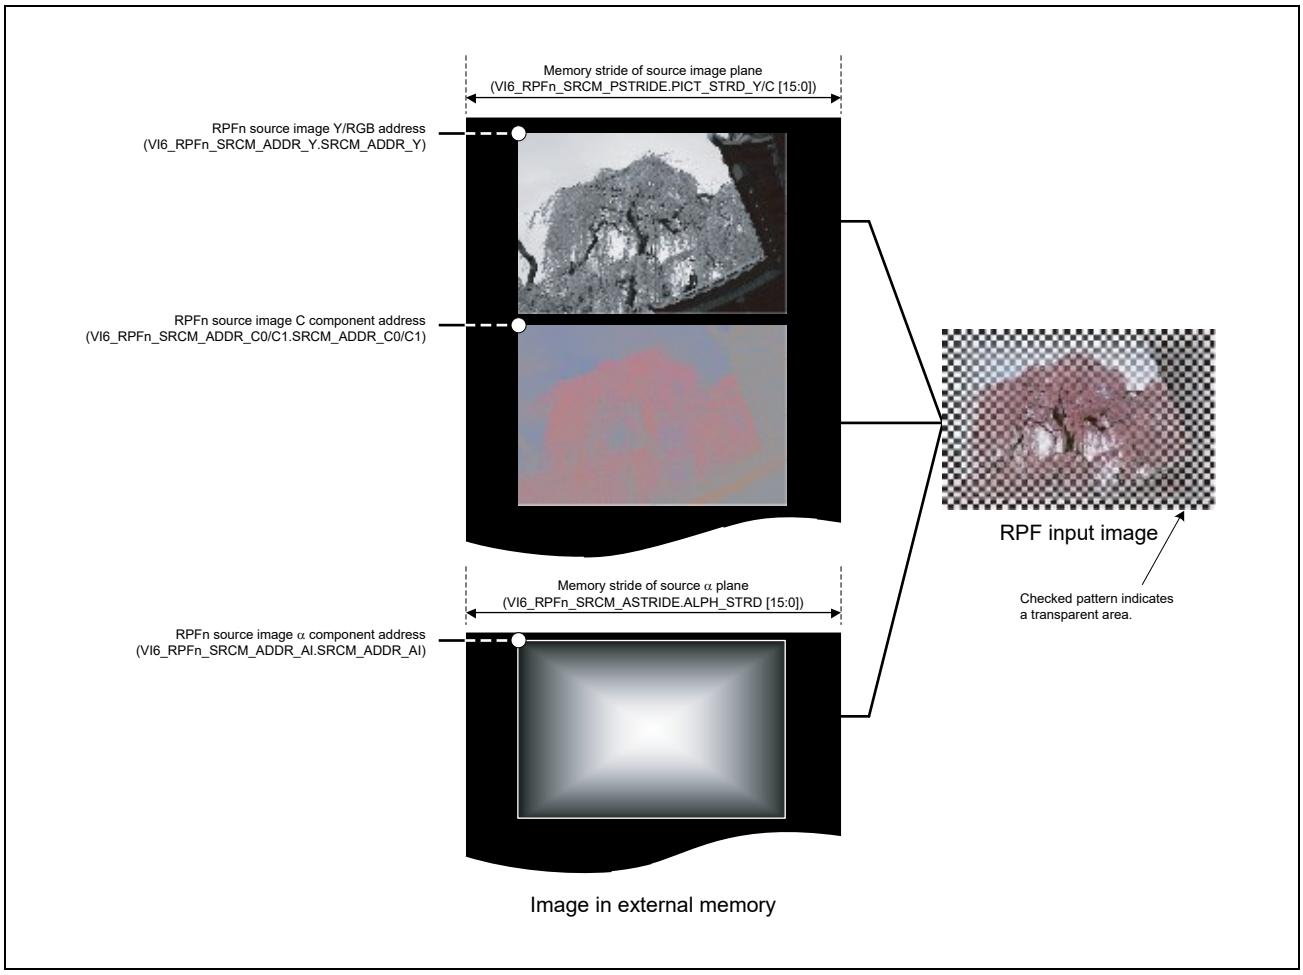


Figure 9.4-15 Reading an Image from RPFn Source Area

(14) RPFn Source α Memory Stride Setting Registers (LCDC_VSPD_VI6_RPFn_SRCM_ASTRIDE) (n = 0, 1)

R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SRCM_ADDR_C1[31:0]	0000_0000h	RW	Source Image C Plane Storing Address 1 These bits specify in 1-byte units the start address of the Cr plane when a planar YCbCr format shown in **Figure 9.4-15** is read by the RPFn. This setting is not used when the RPF input is in YCbCr format that is not a planar format or in an RGB format. A value from 0000_0000h to FFFF_FFFFh can be specified. Refer to **Figure 9.4-15** in **(13) RPFn Source Picture Memory Stride Setting Registers (VI6_RPFn_SRCM_PSTRIDE)** for settings.

(18) RPFn Source α Address Registers (LCDC_VSPD_VI6_RPFn_SRCM_ADDR_AI) (n = 0, 1)

Access Size : 32 bits

Address : <LCDC_vspd_base> + 0348h (n = 0)
<LCDC_vspd_base> + 0448h (n = 1)

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

9.4.3.2.7 WPF Control Registers

(1) WPF0-Source-RPF Register (LCDC_VSPD_VI6_WPF0_SRCRPF)

Access Size : 32 bits
Address : <LCDC_vspd_base> + 1000h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	VIR_ACT2[1:0]		-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	RW	RW	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	RPF1_ACT [1:0]		RPF0_ACT [1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
25, 24	VIR_ACT2[1:0]	0h	RW	Virtual RPF Start Enable in BRS These bits enable start of the virtual RPF in the BRS as the source RPF for the WPF0 when the WPF0 is started. For details of the virtual RPF, refer to the following. **9.4.3.2.10 (1) BRS Input Control Register (VI6_BRS_INCTRL)** **9.4.3.2.10 (2) Size Register of BRS Input Virtual RPF (VI6_BRS_VIRRPF_SIZE)** **9.4.3.2.10 (3) Display Location Register of BRS Input Virtual RPF (VI6_BRS_VIRRPF_LOC)** **9.4.3.2.10 (4) Color Information Register of BRS Input Virtual RPF (VI6_BRS_VIRRPF_COL)** Note that the virtual RPF is in the BRS as shown in **Figure 9.4-28** and there are no register bits for DPR setting related to the virtual RPF. 0h: The virtual RPF in the BRS is not started. 1h: The virtual RPF in the BRS is started as a sublayer source RPF for the WPF0. 2h: The virtual RPF in the BRS is started as the master-layer source RPF for the WPF0. 3h: Setting prohibited
23 to 4	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
3, 2	RPF1_ACT[1:0]	0h	RW	RPF1 Start Enable These bits enable start of RPF1 as the source RPF for the WPF0 when the WPF0 is started. When RPF1 is not started by the WPF0, set the VI6_DPR_RPF1_ROUTE.RT_RPF1 bits to 63. 0h: RPF1 is not started. 1h: RPF1 is started as a sublayer source RPF for the WPF0. 2h: RPF1 is started as the master-layer source RPF for the WPF0. 3h: Setting prohibited
1, 0	RPF0_ACT[1:0]	0h	RW	RPF0 Start Enable These bits enable start of RPFn as the source RPF for the WPF0 when the WPF0 is started. When RPF0 is not started by the WPF0, set the VI6_DPR_RPF0_ROUTE.RT_RPF0 bits to 63. 0h: RPF0 is not started. 1h: RPF0 is started as a sublayer source RPF for the WPF0. 2h: RPF0 is started as the master-layer source RPF for the WPF0. 3h: Setting prohibited

When the WPFn is started through the VSPD start register n (VI6_CMDn: n = 0), the RPF and virtual RPF in the BRS specified as the source RPF in this register are also started to supply data to the VSPD internal modules.

Note the following when specifying the source RPF.

(1) When blending or ROP operation is applied to multiple images through the BRS, multiple source RPFs are necessary for one WPF. When multiple source RPFs are used, images should be classified into a master layer and sublayers; assign one of the source RPFs as the master-layer source RPF and other RPFs as sublayer source RPFs. Do not assign all RPFs as sublayer source RPFs (VI6_WPF1_SRCRPF = 00000015h) or two or more RPFs as the master-layer source RPF (VI6_WPF0_SRCRPF = 0000025Ah) (such settings are prohibited).

(2) When the BRS is not used, there should be only one source RPF for one WPF. In this case, the source RPF should be assigned as the master-layer source RPF.

(2) WPF0 Horizontal Input Size Clipping Register (LCDC_VSPD_VI6_WPF0_HSZCLIP)

Access Size : 32 bits
Address : <LCDC_vspd_base> + 1004h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	HCEN	-	-	-	-	HCL_OFST[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	HCL_SIZE[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
28	HCEN	0h	RW	Horizontal Size Clipping Enable/Disable Enables or disables clipping of the horizontal size of the WPF0 input image. 0b: Horizontal size clipping is disabled 1b: Horizontal size clipping is enabled
27 to 24	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
23 to 16	HCL_OFST[7:0]	00h	RW	Horizontal Size Clipping Offset Value Setting These bits specify the offset size (pixels) from the left end of the image in horizontal size clipping when the HCEN bit is 1b (**Figure 9.4-16**). The left side of the image input to the WPF is cut off for the size specified in these bits. When the HCEN bit is 0b, this setting is ignored. A value from 0 to 255 can be specified. (HCL_OFST + HCL_SIZE) should not exceed the horizontal size of the WPF input. If the setting shown in the bottom example in **Figure 9.4-16** is made, VSPD does not operate correctly.
15 to 13	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
12 to 0	HCL_SIZE[12:0]	0000h	RW	Horizontal Clipping Size Setting When the HCEN bit is 1b, these bits specify the clipping size for horizontal clipping processing. Through this processing, the area of the horizontal size specified through the HCL_SIZE bits starting from the offset position specified through the HCL_OFST bits is determined as the valid image area. Accordingly, the right-side pixels beyond the (HCL_OFST + HCL_SIZE) size in the WPF0 input image are discarded. When the HCEN bit is 0b, this setting is ignored. A value from 1 to 8190 can be specified. (HCL_OFST + HCL_SIZE) should not exceed the horizontal size of the WPF input. If the setting shown in the bottom example in **Figure 9.4-16** is made, VSPD does not operate correctly. When the WPF0 output format is YCbCr4:2:2 or YCbCr4:2:0, specify an even value in these bits.

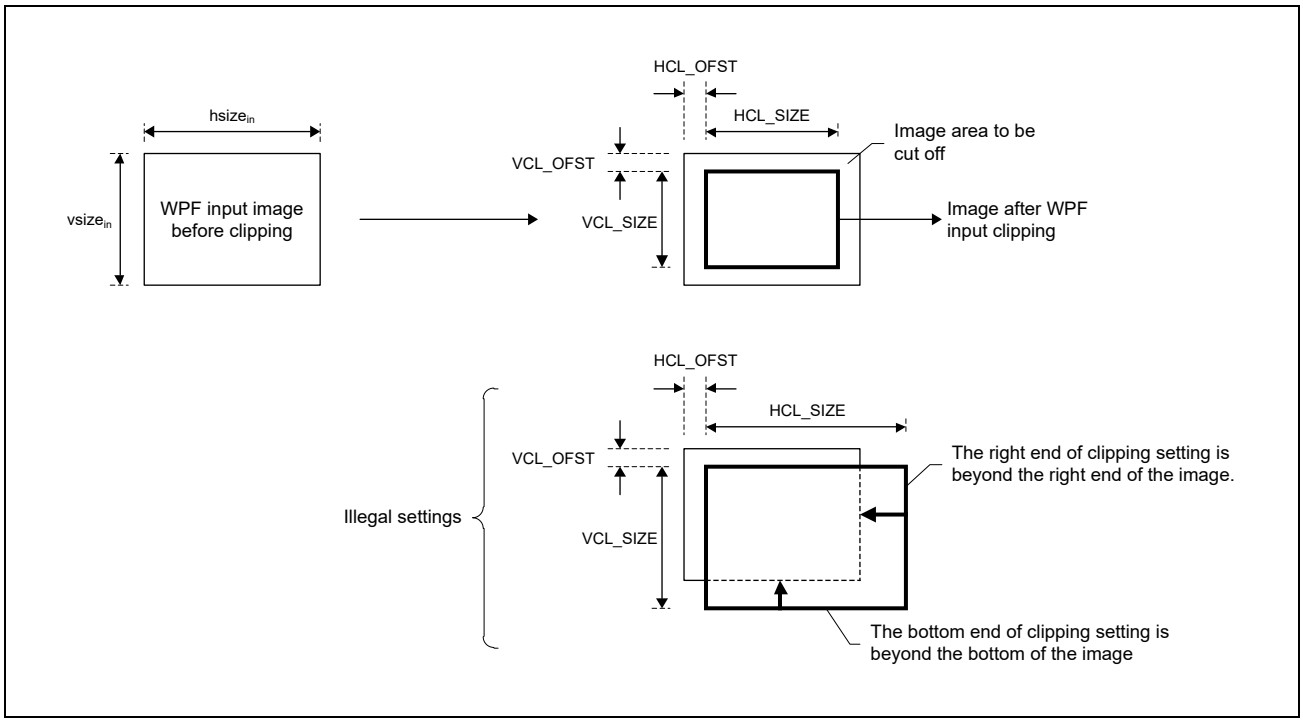

Figure 9.4-16 Image Clipping in WPF Input Section

(3) WPF0 Vertical Input Size Clipping Register (LCDC_VSPD_VI6_WPF0_VSZCLIP)

Access Size : 32 bits
Address : <LCDC_vspd_base> + 1008h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	VCEN	-	-	-	-	VCL_OFST[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	VCL_SIZE[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
28	VCEN	0h	RW	Vertical Size Clipping Enable/Disable Enables or disables clipping of the vertical size of the WPF0 input image. 0b: Vertical size clipping is disabled 1b: Vertical size clipping is enabled
27 to 24	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
23 to 16	VCL_OFST [7:0]	00h	RW	Vertical Size Clipping Offset Value Setting These bits specify the offset size (pixels) from the top end of the image in vertical size clipping when the VCEN bit is 1 (**Figure 9.4-16**). The top of the image input to the WPF is cut off for the size specified in these bits. When the VCEN bit is 0b, this setting is ignored. A value from 0 to 255 can be specified. (VCL_OFST + VCL_SIZE) should not exceed the vertical size of the WPF input. If the setting shown in the bottom example in **Figure 9.4-16** is made, VSPD does not operate correctly.
15 to 13	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
12 to 0	VCL_SIZE [12:0]	0000h	RW	Vertical Clipping Size Setting When the VCEN bit is 1b, these bits specify the clipping size for vertical clipping processing. Through this processing, the area of the vertical size specified through the VCL_SIZE bits starting from the offset position specified through the VCL_OFST bits is determined as the valid image area. Accordingly, the bottom pixels beyond the (VCL_OFST + VCL_SIZE) size in the WPF0 input image are discarded. When the VCEN bit is 0b, this setting is ignored. A value from 1 to 8190 can be specified. (VCL_OFST + VCL_SIZE) should not exceed the vertical size of the WPF input. If the setting shown in the bottom example in **Figure 9.4-16** is made, VSPD does not operate correctly. When the WPF0 output format is YCbCr4:2:0, specify an even value in these bits.

(4) WPF0 Output Format Register (LCDC_VSPD_VI6_WPF0_OUTFMT)

Access Size : 32 bits
Address : <LCDC_vspd_base> + 100Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PDV [7:0]								PXA	ODE	-	-	-	ROT[2:0]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	R	R	R	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SPYCS	SPUVS	DITH[1:0]		WRTM[2:0]			CSC	-	WRFMT[6:0]						
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	R	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	PDV [7:0]	00h	RW	PAD Value in Output Packed Data These bits specify the value to be stored in the bit field indicated as PAD or P in the output formats shown in **Table 9.4-18**. To store this value in PAD, specify 0 in the PXA bit. A value from 0 to 255 can be specified.
23	PXA	0h	RW	PAD Data Select Selects the value to be stored in the bit field indicated as PAD or P in the packed RGB output formats shown in **Table 9.4-19**. Both the value specified in the PDV bits and the α data input from the DPR to WPF are 8 bits, but some of the PAD and P bit fields shown in **Table 9.4-18** are four bits or one bit. When the target bit field is not 8 bits, the number of bits in the PDV value and the α data input from the DPR to WPF is reduced according to the VI6_WPF0_RNDCTRL.ABRM setting. For bit count reduction, refer to **Figure 9.4-17** and the description of VI6_WPF0_RNDCTRL.ABRM. 0b: The value specified in the PDV bits is stored in the PAD shown in **Table 9.4-18**. 1b: The α value output from DPR in pixel units is stored in the PAD shown in **Table 9.4-18**.
22	ODE	0h	RW	Ordered Dither (mode A) Enable/Disable 0b: Ordered dither (mode A) is disabled. 1b: Ordered dither (mode A) is enabled. When the output format specified through the WRFMT bits is YCbCr, specify 0b in this bit. And when VI6_WPF0_OUTFMT.CSC is set to 1b, specify 0b in this bit even in the case that the output format specified through the WRFMT bits is RGB. Ordered dither is available only for 18bpp. So, when ODE bit is equal to 1b, set WRFMT at 18bpp format. When ODE bit is equal to 0, WPF dither method is specified by DITH[1:0] in the register Ordered dither (mode A) is recommended rather than ordered dither (mode B) in case of 18bpp.
21 to 19	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
18 to 16	ROT[2:0]	0h	RW	Rotation Processing Select These bits select the flipping processing to be applied to the WPF0 output image. **Figure 9.4-18** shows the correspondence between the original image and the flipping result according to each setting. 0b: No flipping 1b: Vertical flipping Note that the destination address setting should be changed according to the setting of these bits. For details, refer to **9.4.3.2.7 (9) WPFn Destination Y/RGB Address Registers (VI6_WPFn_DSTM_ADDR_Y)**. When the LIF module is used (VI6_LIF_CTRL.LIF_EN = 1b), set 0b to ROT[2:0].
15	SPYCS	0h	RW	WPF Output Mode Setting 1 When the output format is YUY2, set this bit to 1b and set the WRFMT bits to 71 (47h). When the output format is YVYU, set this bit and the SPUVS bit to 1b and set the WRFMT bits to 71 (47h). In other cases, set this bit to 0b.

Bit	Bit Name	Initial Value	R/W	Description
14	SPUVS	0h	RW	WPF Output Mode Setting 2 When the output format is NV61, set this bit to 1b and set the WRFMT bits to 65 (41h). When the output format is NV21, set this bit to 1b and set the WRFMT bits to 66 (42h). When the output format is YVYU, set this bit and the SPYCS bit to 1b and set the WRFMT bits to 71 (47h). In other cases, set this bit to 0b.
13, 12	DITH[1:0]	0h	RW	Ordered Dither (mode B) Enable/Disable When the output format specified through the WRFMT bits is RGB with 18 bpp (260000 colors) or less, the color reduction processing is applied to match the number of colors. The color reduction processing may generate the artifacts of pseudo gradation, which can be suppressed through dithering. The DITH bits enable or disable dithering during color reduction. When the output format specified through the WRFMT bits is YCbCr, specify 0 in these bits. And when VI6_WPF0_OUTFMT.CSC is set to 1, specify 0 in these bits even in the case that the output format specified through the WRFMT bits is RGB. 0h: Dithering (mode B) is disabled 3h: Dithering (mode B) is enabled 1, 2h: Setting prohibited When ODE bit in the register is 1b, set this bit to 0h.
11 to 9	WRTM[2:0]	0h	RW	CSC Conversion Expression Setting These bits select the expression for color space conversion. The conversion direction is RGB to YCbCr when the format specified in the WRFMT bits is RGB, or YCbCr to RGB when the format is YCbCr. 0h: BT.601 YCbCr [16,235/240] ↔ RGB [0,255] 1h: BT.601 YCbCr [0,255] ↔ RGB [0,255] 2h: BT.709 YCbCr [16,235/240] ↔ RGB [0,255] 3h: BT.709 YCbCr [16,235/240] ↔ RGB [16,235] 4h to 7h: Setting prohibited
8	CSC	0h	RW	Color Space Conversion Setting Enables or disables YCbCr ↔ RGB color space conversion to be executed in the WPF0. The characteristics of color space conversion are determined by the WRTM setting. There are some points to be noted about the relationship between the CSC setting and output format (WRFMT). For details refer to (*1) in **9.4.3.2.6 (3) RPFn Input Format Registers (VI6_RPFn_INFMT)**. 0b: Color space is not converted. 1b: Color space is converted.
7	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
6 to 0	WRFMT[6:0]	00h	RW	WPF Output Image Format Setting These bits select the format of the image output from the WPF0 to the external memory from among those listed in **Table 9.4-18** and **Table 9.4-19**. [Note] Number of output pixels When YCbCr4:2:2 is specified through WRFMT, the horizontal size of the output image should be a multiple of 2 pixels. When YCbCr4:2:0 is specified, the vertical and horizontal sizes of the output image should be multiples of 2 pixels. Specify an appropriate data flow of the source RPF → DPR → target WPF so that the size of the image input to the target WPF satisfies the above restrictions. In particular, when the data flow includes a module or a function that modifies (up-scales, down-scales, or clips) the image size, take special care about the module or function settings. [Note] Output lines in YCbCr4:2:0 In the YCbCr4:2:0 output format, the number of chrominance lines in the vertical direction is one-half the number of luminance lines. For this reason, the WPF outputs only even-numbered chrominance lines (lines 0, 2, 4, 6, ...) (conversion from (A) to (B) in. When vertical flipping is also specified through the ROT bits, the flipping processing is executed last and the chrominance line locations are inverted (lines 1, 3, 5, 7, …) in the output image ((C) in **Figure 9.4-19**). [Note] Down sampling of CbCr in horizontal direction in YCbCr4:2:0 or YCbCr4:2:2 In the YCbCr4:2:2 or YCbCr4:2:0 output format, method of down sample of Cb/Cr in horizontal direction is average of neighbor two pixels.

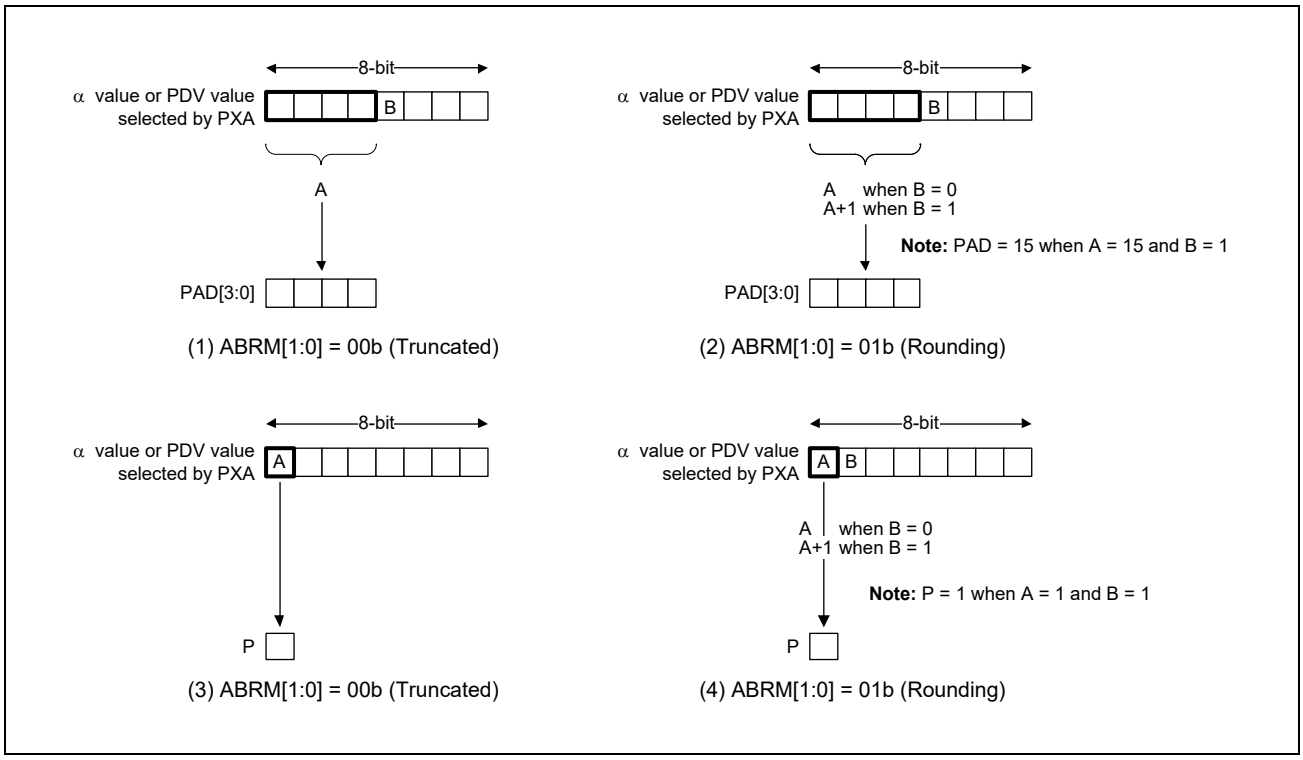

Figure 9.4-17 Selection of PAD Value and Reduction of Bit Count through PXA Setting

Without flipping (ROT = 0)

Vertical flipping

Vertical flipping (ROT = 1)

Table 9.4-19 Packed YCbCr Formats for WPF Output

WRFMT[6:0]	Packed YCbCr Output Format	Reference
40h	YCbCr4:4:4 semi-planar	**Figure 9.4-9***4
41h	YCbCr4:2:2 semi-planar (NV16, NV61*1)	
42h	YCbCr4:2:0 semi-planar (NV12, NV21*1)	
43h to 45h	Reserved	—
46h	YCbCr4:4:4 interleaved	**Figure 9.4-10***4
47h	YCbCr4:2:2 interleaved type 0 (UYVY, YUY2*2, YVYU*3)	
48h	YCbCr4:2:2 interleaved type 1	
49h	YCbCr4:2:0 interleaved*5	
4Ah	YCbCr4:4:4 planar	**Figure 9.4-11***4
4Bh	YCbCr4:2:2 planar (YV16)	
4Ch	YCbCr4:2:0 planar (YV12, I420)	
4Dh to 7Fh	Reserved	—

Note 1. When the output format is NV61 or NV21, set SPUVS (bit 14) to 1.

Note 2. When the output format is YUY2, set SPYCS (bit 15) to 1.

Note 3. When the output format is YVYU, set SPUVS (bit 14) to 1 and SPYCS (bit 15) to 1.

Note 4. **Figure 9.4-12** shows the definition of memory address for each pixel in **Figure 9.4-9** to **Figure 9.4-11**.

Note 5. Each line of plane is written twice, so byte/pixel of YCbCr420ITL is 3 byte/pixel (same as YCbCr444ITL).

For details of each YCbCr format, refer to **Figure 9.4-9** to **Figure 9.4-12**. In these figures, registers for the RPF are indicated; read them as registers for the WPF as follows.

(RPF registers in the figures)	→	(Corresponding WPF registers)
VI6_RPFn_SRCM_ADDR_Y.SRCM_ADDR_Y	→	VI6_WPFn_DSTM_ADDR_Y.DSTM_ADDR_Y
VI6_RPFn_SRCM_ADDR_C0.SRCM_ADDR_C0	→	VI6_WPFn_DSTM_ADDR_C0.DSTM_ADDR_C0
VI6_RPFn_SRCM_ADDR_C1.SRCM_ADDR_C1	→	VI6_WPFn_DSTM_ADDR_C1.DSTM_ADDR_C1

(5) WPF0 Data Swapping Register (LCDC_VSPD_VI6_WPF0_DSWAP)

Access Size : 32 bits
Address : <LCDC_vspd_base> + 1010h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	P_LLS	P_LWS	P_WDS	P_BTS
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
3	P_LLS	0h	RW	WPF Output Data Swapping in LONG LWORD Units The effect of this bit setting is the same as data swapping in the RPF; refer to **Table 9.4-13**. 0b: Data swapping in LONG LWORD (64-bit) units is disabled 1b: Data swapping in LONG LWORD (64-bit) units is enabled
2	P_LWS	0h	RW	WPF Output Data Swapping in long word Units The effect of this bit setting is the same as data swapping in the RPF; refer to **Table 9.4-13**. 0b: Data swapping in long word (32-bit) units is disabled 1b: Data swapping in long word (32-bit) units is enabled
1	P_WDS	0h	RW	WPF Output Data Swapping in Word Units The effect of this bit setting is the same as data swapping in the RPF; refer to **Table 9.4-13**. 0b: Data swapping in word (16-bit) units is disabled 1b: Data swapping in word (16-bit) units is enabled
0	P_BTS	0h	RW	WPF Output Data Swapping in Byte Units The effect of this bit setting is the same as data swapping in the RPF; refer to **Table 9.4-13**. 0b: Data swapping in byte (8-bit) units is disabled 1b: Data swapping in byte (8-bit) units is enabled

Table 9.4-13 shows the data order before and after swapping according to the long long word, long word, word, and byte swapping settings.

When data order in memory for each format is the same as in **Table 9.4-18** for RGB format and **Figure 9.4-9** to **Figure 9.4-12** for YCbCr format, set 1111b to {*_LLS, *_LWS, *_WDS, *_BTS}. If data order is not the same as the definition, change data order within 16byte unit by these bits as shown in **Table 9.4-13**.

(6) WPF0 Rounding Control Register (LCDC_VSPD_VI6_WPF0_RNDCTRL)

Access Size : 32 bits
Address : <LCDC_vspd_base> + 1014h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	CBRM	-	-	ABRM[1:0]		ATHRESH[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	CLMD[1:0]		-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	RW	RW	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
28	CBRM	0h	RW	Bit Count Reduction Method Selection for Data Storage in Packed RGB This bit specifies the method for reducing the number of bits when data is stored in the bit fields indicated as R, G, and B in **Table 9.4-18** and the target bit fields are not 8 bits. 0b: Bit count conversion: The lower-order bits are truncated 1b: Bit count conversion: Rounding (rounding off)
27 to 26	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
25, 24	ABRM[1:0]	0h	RW	Bit Count Reduction Method Selection for Data Storage in PAD These bits specify the method for reducing the number of bits when the data selected through VI6_WPF0_OUTFMT.PXA is stored in the bit fields indicated as PAD or P in **Table 9.4-18** and the target bit field is four bits or one bit. A value of 10b can be specified only when the packed RGB format specified through VI6_WPF0_OUTFMT.WRFMT includes a 1-bit P field. In this case, when the data selected through VI6_WPF0_OUTFMT.PXA is greater than the ATHRESH value, 1 is stored in the P field; when the selected data is not greater than the ATHRESH value, 0 is stored. 00b: Bit count conversion: The lower-order bits are truncated 01b: Bit count conversion: Rounding (rounding off) 10b: Bit count conversion: Comparison with the threshold value (this setting is allowed only when the storage field is one bit) 11b: Setting prohibited
23 to 16	ATHRESH[7:0]	00h	RW	Threshold for Conversion to 1-Bit α Data These bits specify the threshold value used for conversion from 8-bit α data to one bit when the ABRM bits are set to 10b. When the 8-bit α value before bit count reduction is equal to or smaller than the ATHRESH value, 0 is stored as the reduced 1-bit α data. In other cases, 1 is stored as the 1-bit α data. A value from 0 to 255 can be specified.
15 to 14	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
13, 12	CLMD[1:0]	0h	RW	Color Data Clipping These bits specify the method for clipping the YCbCr color data output from the WPF. When RGB color data is output from the WPF, specify 0b in these bits. 00b: Output value is not clipped (0-255) 01b: Output value is clipped: YCbCr mode 1 (16-235 (Y), 16-240 (Cb/Cr)) 10b: Output value is clipped: YCbCr mode 2 (Y/Cb/Cr = 1-254) 11b: Setting prohibited
11 to 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

(7) WPF0 Destination Y Plane Memory Stride Register (LCDC_VSPD_VI6_WPF0_DSTM_STRIDE_Y)

Access Size : 32 bits
Address : <LCDC_vspd_base> + 101Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
15 to 0	PICT_STRD_Y [15:0]	0000h	RW	Memory Stride of Destination Picture Y/RGB Plane These bits specify in 1-byte units the memory stride of the destination picture in the external memory to be written to by the WPF0 as shown in **Figure 9.4-20**. A value from 0000h to FFFFh can be specified.

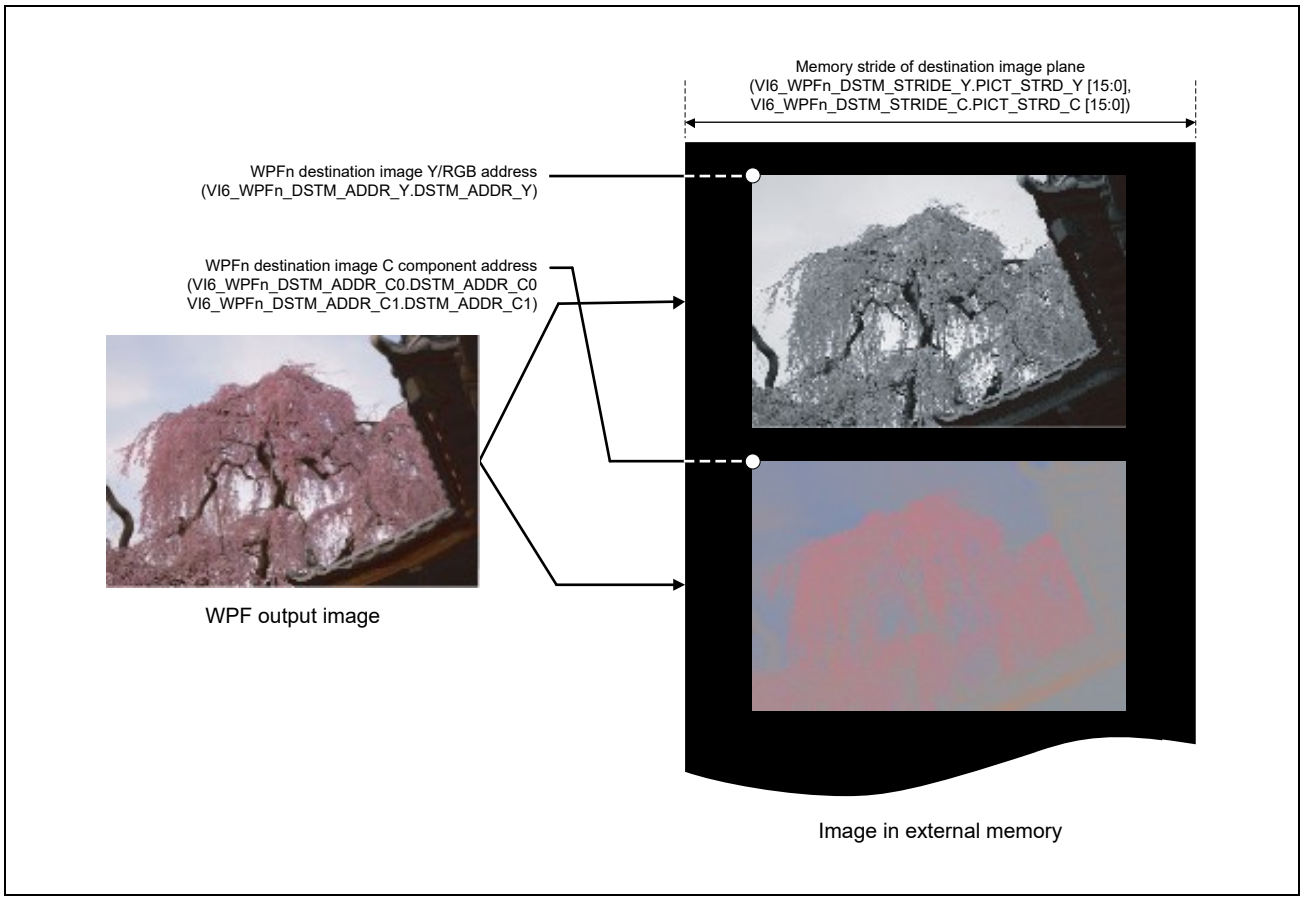

Figure 9.4-20 Writing Image Data to Destination Area in WPFn

(8) WPF0 Destination C Plane Memory Stride Register (LCDC_VSPD_VI6_WPF0_DSTM_STRIDE_C)

Access Size : 32 bits

Address : <LCDC_vspd_base> + 1020h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PICT_STRD_C[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
15 to 0	PICT_STRD_C [15:0]	0000h	RW	Memory Stride of Destination Picture C Plane These bits specify in 1-byte units the memory stride for the C plane of the destination picture in the external memory to be written to by the WPF0 as shown in **Figure 9.4-20**. When the WPF0 outputs images in an RGB format, this setting is not used. When the WPF0 outputs images in YCbCr planar format, this setting is applied to both the Cb and Cr planes. A value from 0000h to FFFFh can be specified.

(9) WPF0 Destination Y/RGB Address Register (LCDC_VSPD_VI6_WPF0_DSTM_ADDR_Y)

Access Size : 32 bits
Address : <LCDC_vspd_base> + 1024h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DSTM_ADDR_Y[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DSTM_ADDR_Y[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DSTM_ADDR_Y [31:0]	0000_0000h	RW	Destination Image Y/RGB Plane Storing Address These bits specify in 1-byte units the address for storing the destination-image Y plane or packed RGB plane to be written to by the WPF0 in the method described later. A value from 0000 0000h to FFFF FFFFh can be specified.

[Destination Address Specification Method]

When flipping is not used, the start address of a frame (address FHA shown in **Figure 9.4-21**) should be specified as the destination address. When flipping is used, the destination address is not the frame start address (FHA); one of addresses A0 and A2 shown in **Figure 9.4-21** should be selected according to the combination of desired flipping (VI6_WPFn_OUTFMT.ROT setting).

To strictly define locations A0 and A2, let the horizontal size of the output image be H, the vertical size of the output image be V, and the memory stride (VI6_WPFn_DSTM_STRIDE_Y/C setting) be S as shown in **Figure 9.4-21**. Calculate the destination address (one of A0 and A2) using the formula shown in **Table 9.4-20** and specify it in the destination address storing register.

The values of variables L in **Table 9.4-20** depend on the other register settings and luminance and chrominance components. These values should be obtained by referring to **Table 9.4-21** when calculating the address to be specified in VI6_WPFn_DSTM_ADDR_Y, or **Table 9.4-22** when calculating the address to be specified in VI6_WPFn_DSTM_ADDR_C0 or VI6_WPFn_DSTM_ADDR_C1.

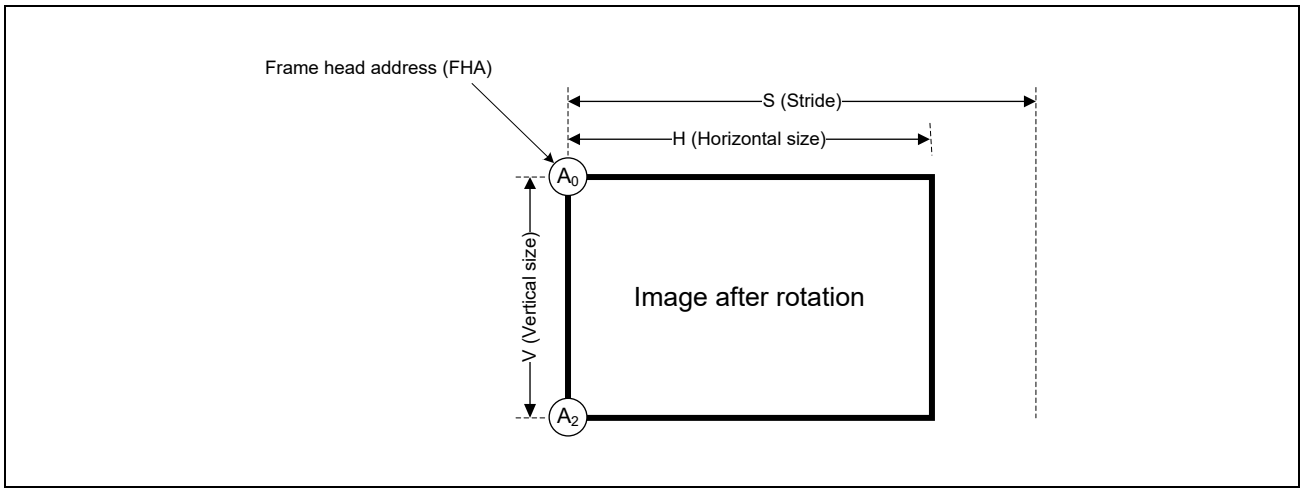

Figure 9.4-21 Location of Destination Address to be Specified for Flipping

Table 9.4-20 Destination Address A_0, A_1, A_2, and A3 Calculation Formulas

VI6_WPFn_OUTFMT.ROT Setting	Formula for Calculating Address to be Set in VI6_WPFn_DSTM_ADDR_Y, VI6_WPFn_DSTM_ADDR_C0, and VI6_WPFn_DSTM_ADDR_C1
0	A_0 = FHA
1	A_2 = FHA + (V×L – 1) × S

Table 9.4-21 Value of L according to VI6_WPFn_OUTFMT.WRFMT Setting (for RGB and Luminance Y Address Calculation)

VI6_WPFn_OUTFMT.WRFMT	L
73	0.5
0 to 2, 4 to 35, 64 to 66, 70 to 72, or 74 to 76	1

Table 9.4-22 Value of L according to VI6_WPFn_OUTFMT.WRFMT Setting (for Chrominance C0 and C1 Address Calculation)

VI6_WPFn_OUTFMT.WRFMT	L
70 to 73	Not defined
66, 76	0.5
64 to 65, 74 to 75	1

(10) WPF0 Destination Chroma Address Register 0 (LCDC_VSPD_VI6_WPF0_DSTM_ADDR_C0)

Access Size : 32 bits
Address : <LCDC_vspd_base> + 1028h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DSTM_ADDR_C0[31:16]

Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DSTM_ADDR_C0[31:0]	0000_0000h	RW	Destination Image C Plane Storing Address 0 These bits specify in 1-byte units the address for storing the destination-image C plane to be written to by the WPF0. Refer to the description of VI6_WPF0_DSTM_ADDR_Y for settings. Here, the C plane indicates the combined CbCr plane when a semi-planar format is selected from the packed YCbCr formats shown in **Table 9.4-19** or the Cb plane when a planar format is selected. When an interleaved format is selected or the output is in an RGB format, this setting is not used. A value from 0000 0000h to FFFF FFFFh can be specified. Refer to **Figure 9.4-21** in **9.4.3.2.7 (9) WPFn Destination Y/RGB Address Registers (VI6_WPFn_DSTM_ADDR_Y)** for settings.

(11) WPF0 Destination Chroma Address Register 1 (LCDC_VSPD_VI6_WPF0_DSTM_ADDR_C1)

Access Size : 32 bits

Address : <LCDC_vspd_base> + 102Ch

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DSTM_ADDR_C1[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DSTM_ADDR_C1[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DSTM_ADDR_C1[31:0]	0000_0000h	RW	Destination Image C Plane Storing Address 1 These bits specify in 1-byte units the address for storing the Cr plane when the WPF0 outputs images to the external memory in YCbCr planar format shown in **Table 9.4-19**. Refer to the description of VI6_WPF0_DSTM_ADDR_Y for settings. This setting is not used when the WPF outputs in YCbCr format that is not a planar format or in an RGB format. A value from 0000 0000h to FFFF FFFFh can be specified. Refer to **Figure 9.4-21** in **9.4.3.2.7 (9) WPFn Destination Y/RGB Address Registers (VI6_WPFn_DSTM_ADDR_Y)** for settings.

(12) WPF0 LIF Write Back Control Register (LCDC_VSPD_VI6_WPF0_WRBCK_CTRL)

Access Size : 32 bits

Address : <LCDC_vspd_base> + 1034h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	WBMD[1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
1, 0	WBMD[1:0]	0h	RW	Display Data Write Back Control This bit is used for selecting the write back mode when the value of VI6_LIF0_CTRL.LIF_EN bit is set to 1b. 0b: Write Back Disabled 1b: Write Back Enabled

9.4.3.2.8 DPR Control Registers

(1) Concept of DPR Settings

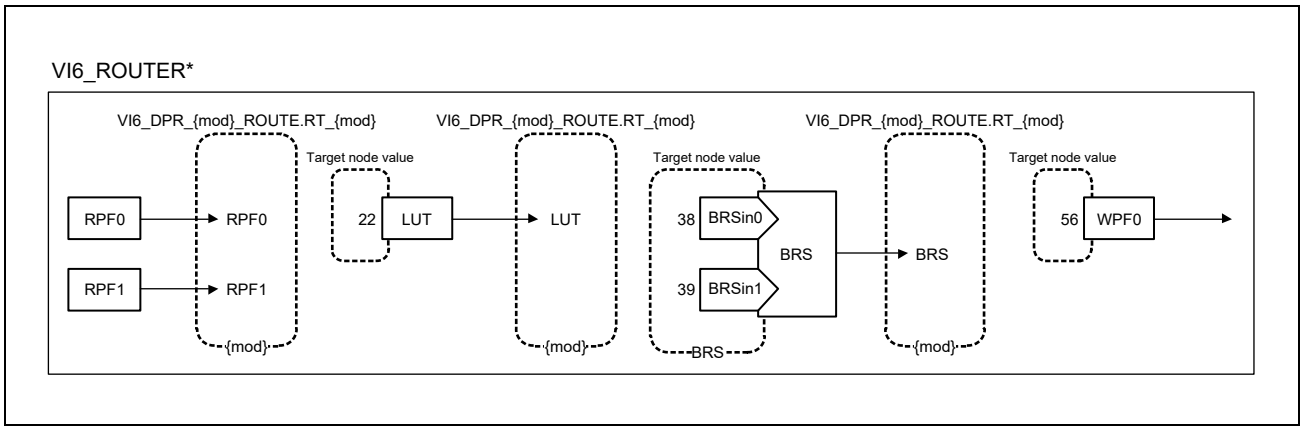

Figure 9.4-22 Node Register Names and Target Node Values on Data Path Router

In the VSPD internal data path, the order of processes can be specified as desired. The module for performing each process has a unique node value. Set each bit field in VI6_DPR_*_ROUTE to an appropriate node value shown in **Figure 9.4-22** to specify the target node to be connected behind each module.

For DPR settings, all of the following restrictions should be observed. If any of them is violated, even the WPF paths operating correctly at that time will be affected as well as the WPF paths connected through the DPR, and correct operation will not be guaranteed.

1. Specify 63 for the output node values of all RPFs and processing modules that are not used in the DPR. Here, make sure that no module is connected to a module for which 63 is specified as the node value. Note: VI6_DPR_{mod}_ROUTE.RT are not implemented in VSPD which doesn't have {mod}. See **Figure 9.4-1** whether VSPD has {mod} or not.
2. When specifying a value other than 63 for an output node value in the DPR, make sure that valid inputs (RPF0 to RPF1 or virtual RPF) and a target WPF are determined.
3. Only one module can be connected to each module; specifying the same target node value for two or more modules is prohibited.
4. Desired modules can be connected between each RPF and BRS input port, but all RPFs specified as the sources for a BRS input port should have the same target WPF.
5. Make appropriate routing or RPF register settings so that the color space formats (RGB/YCbCr) for all BRS input ports are the same.
6. Do not connect the output of any module as the input to the same module (in the BRS case, any input port) even when there is another module between the output and input (creating a loop is prohibited).
7. Each node can be used only once throughout all paths from RPFn to WPFn. When a module shown in **Figure 9.4-22** is assigned in one RPF to WPF path, it cannot be used in another RPF to WPF path.
8. While a WPF is operating, modifying the DPR connection settings in VI6_DPR_*_ROUTE is prohibited for modules used by the WPF but allowed for modules not used by the WPF. Be careful not to accidentally modify the settings of the modules included in the WPF path that is operating.
9. Be careful to do the following setting when BRS is used.
   VI6_DPR_ILV_BRS_ROUTE.BRSSEL = 1

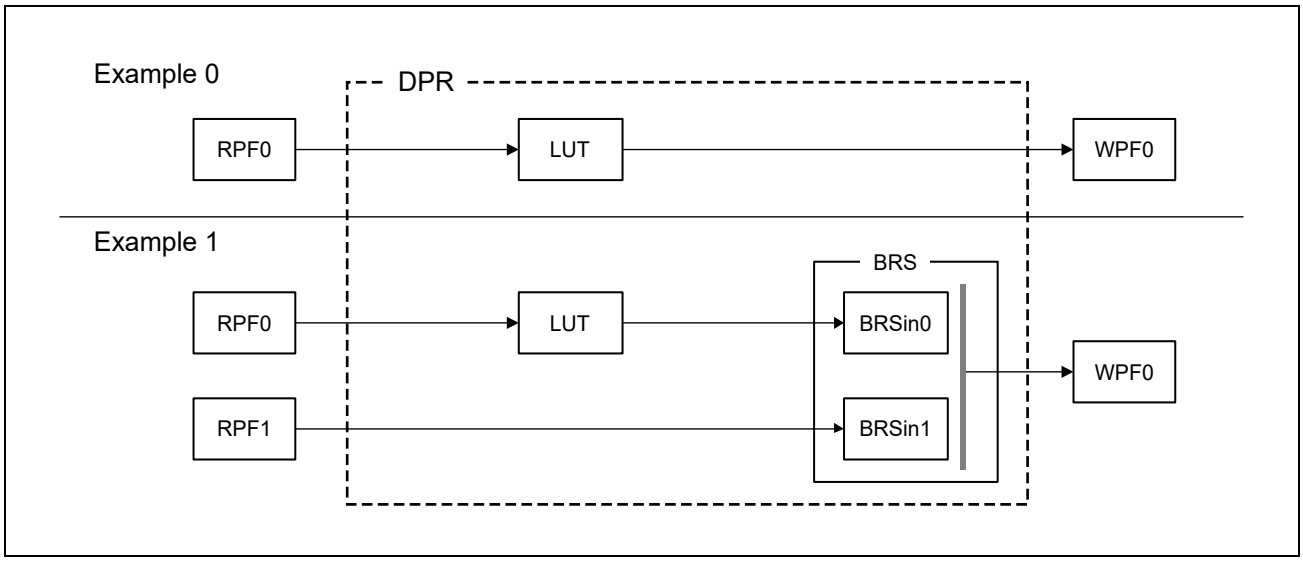

Figure 9.4-23 Examples of Internal Data Path Routing

Figure 9.4-23 shows examples of internal data path routing. Example 0 is WPF0 processing (RPF0 is the source RPF), and example 1 is also WPF0 (RPF0 to RPF1 are the source RPFs). Each example has the configuration shown in **Figure 9.4-23**. Example 0 performs LUT (e.g. γ correction) processing. Example 1 performs LUT processing (e.g. γ correction), for input 0 (RPF0) and then applies blending or raster operation between the resultant data and input data 1 (RPF1). The VI6_ DPR_*_ROUTE settings for these examples are shown in **Table 9.4-23**. The bit fields for the modules that are not used in the examples should be set to 63.

Table 9.4-23 VI6_DPR_*_ROUTE Register Settings in Connection Examples Shown in **Figure 9.4-23**. Although both examples show in **Figure 9.4-23** include operation in image processing modules, connect the RPF to the WPF directly when only image format conversion or packed format conversion is required.

Table 9.4-23 Examples of Internal Data Path Routing

	Register Name	Setting	
Example 0	VI6_DPR_RPF0_ROUTE.RT_RPF0	22	(To LUT)
	VI6_DPR_RPF1_ROUTE.RT_RPF1	63	(UNUSED)
	VI6_DPR_LUT_ROUTE.RT	56	(To WPF0)
	VI6_DPR_ILV_BRS_ROUTE.RT	63	(UNUSED)
Example 1	VI6_DPR_RPF0_ROUTE.RT_RPF0	22	(To LUT)
	VI6_DPR_RPF1_ROUTE.RT_RPF1	39	(To BRSin1)
	VI6_DPR_LUT_ROUTE.RT	38	(To BRSin0)
	VI6_DPR_ILV_BRS_ROUTE.RT	56	(To WPF0)

(2) RPFn Routing Register (LCDC_VSPD_VI6_DPR_RPFn_ROUTE) (n = 0, 1)

Access Size : 32 bits

Address : <LCDC_vspd_base> + 2000h (n=0)
<LCDC_vspd_base> + 2004h (n=1)

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	RT_RPF0[5:0]					
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
5 to 0	RT_RPF0[5:0]	00h	RW	RPF0 Target Node Value These bits specify the target node value for RPF0. When using RPF0, refer to **Figure 9.4-22** for settings. When RPF0 is not started through the VI6_WPF0_SRCRPF setting, specify 63.

(3) WPF0 Timing Control Register (LCDC_VSPD_VI6_DPR_WPF0_FPORCH)

Access Size : 32 bits
Address : <LCDC_vspd_base> + 2014h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	FP_WPF0[5:0]						-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	RW	RW	RW	RW	RW	RW	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 14	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
13 to 8	FP_WPF0[5:0]	00h	RW	WPF0 Internal Operation Timing Setting Specify 5.
7 to 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

(4) LUT Routing Register (LCDC_VSPD_VI6_DPR_LUT_ROUTE)

Access Size : 32 bits
Address : <LCDC_vspd_base> + 203Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	FXA[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	FP[5:0]						-	-	RT[5:0]					
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	RW	RW	RW	RW	RW	RW	R	R	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
23 to 16	FXA[7:0]	00h	RW	Fixed α Output Value for LUT The LUT does not support input/output of the α value. The α value input to the LUT is discarded, and the fixed α value specified in these bits is always output from the LUT. A value from 0 to 255 can be specified.
15, 14	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
13 to 8	FP[5:0]	00h	RW	LUT Internal Operation Timing Setting Specify 0.
7, 6	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
5 to 0	RT[5:0]	00h	RW	LUT Target Node Value These bits specify the target node value for the LUT. When using the LUT, refer to **Figure 9.4-22** for settings. When not using the LUT, specify 63.

(5) BRS Routing Register (LCDC_VSPD_VI6_DPR_BRS_ROUTE)

Access Size : 32 bits
Address : <LCDC_vspd_base> + 2050h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	BRSSEL	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	FP[5:0]						-	-	RT[5:0]					
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	RW	RW	RW	RW	RW	RW	R	R	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
28	BRSSEL	0h	RW	Always specify 1.
27 to 14	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
13 to 8	FP[5:0]	00h	RW	BRS Internal Operation Timing Setting Specify 0.
7, 6	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
5 to 0	RT[5:0]	00h	RW	BRS Target Node Value These bits specify the target node value for the BRS. When using the BRS, refer to **Figure 9.4-22** for settings. When not using the BRS, specify 63.

9.4.3.2.9 LUT Control Register

(1) LUT Control Register (LCDC_VSPD_VI6_LUT_CTRL)

Access Size : 32 bits
Address : <LCDC_vspd_base> + 2800h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
0	LUT_EN	0h	RW	1D-LUT Enable/Disable Enables or disables the 1D-LUT function by the LUT. When the 1D-LUT is used, the color component curve information needs to be set separately in the LUT table. For the LUT table settings, refer to **9.4.4.7.1 LUT**. 0b: 1D-LUT function is disabled 1b: 1D-LUT function is enabled

In the LUT, various image processing, such as curves with high operation load (e.g., γ correction), negative-positive conversion, and gain adjustment of images, can be achieved by the data replacement processing by the 1D-LUT. As shown in **Figure 9.4-24**, the LUT replaces each component of the input pixel data using the set replacement table of 256 entries. For example, if the LUT is set as in **Figure 9.4-25**, when there is an input of 150, the data stored in address 150 of the 1D-LUT is read and output as the LUT output. **Figure 9.4-25** shows a case in which the input and output become equal for convenience in explaining.

In the LUT settings shown in **Figure 9.4-26**, the input bits are reversed. This has the effect of negative-positive flipping. In **Figure 9.4-27**, γ correction (γ = 1.8 is shown as an example) is possible. As described above, information to be set in the LUT indicates LUT processing characteristics. If the same value is set for each component in the LUT, an equal effect can be obtained for each component of the input image when it is processed. If the LUT is set with different characteristics for each component, the processing characteristics can be changed for each component.

9.4.3.2.10 BRS Control Registers

(1) BRS Input Control Register (LCDC_VSPD_VI6_BRS_INCTRL)

Access Size : 32 bits

Address : <LCDC_vspd_base> + 3900h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	NRM	-	-	-	-	-	-	-	-	-	-	D1ON	D0ON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	ODE1	DITH1[2:0]			ODE0	DITH0 [2:0]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
28	NRM	0h	RW	Color Data Normalization Enables or disables division by the α value of the color data in BRS blending operation. This is used when converting the RGB color data format to which the α value is multiplied (pre-multiplied color) into the RGB color data format to which the α value is not multiplied (non pre-multiplied color). Do not use this for the YCbCr format. 0b: Divider (DIV unit in Figure 9.4-28) does not divide the color value by α 1b: Divider (DIV unit in Figure 9.4-28) divides the color value by α
27 to 18	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
17	D1ON	0h	RW	Ordered dither (mode B) Enable of BRS Input 1 Enables or disables dithering (color reduction) of BRS input 1 (BRSin1 in Figure 9.4-28). 0b: Dithering (mode B) of BRSin1 is disabled 1b: Dithering (mode B) of BRSin1 is enabled When ODE1 in this bit is set to 1, set 0 to this bit.
16	D0ON	0h	RW	Ordered dither (mode B) Enable of BRS Input 0 Enables or disables dithering (color reduction) of BRS input 0 (BRSin0 in Figure 9.4-28). 0b: Dithering (mode B) of BRSin0 is disabled 1b: Dithering (mode B) of BRSin0 is enabled When ODE0 in this bit is set to 1, set 0 to this bit.
15 to 8	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
7	ODE1	0h	RW	Ordered Dither (mode A) of CH1 Input to BRS Enable/Disable 0b: Ordered dither (mode A) of BRSin1 is disabled. 1b: Ordered dither (mode A) of BRSin1 is enabled. Ordered dither is available only for 18bpp. So, when ODE1 bit is equal to 1, set DITH1 = 1. When ODE1 bit is equal to 0, BRSin1 dither method is specified by D1ON in the register Ordered dither (mode A) is recommended rather than ordered dither (mode B) in case of 18bpp.
6 to 4	DITH1[2:0]	0h	RW	Dithering of CH1 Input to BRS These bits specify the number of colors for pixels after dithering (color reduction) when dithering (color reduction) for pixel information is enabled through the D1ON bit. When dithering (color reduction) for pixel information is disabled, specify 0h in these bits. 0h: Dithering of BRSin1 input image is disabled 1h: Dithering of BRSin1 input image at 18 bpp (RGB666: 260000 colors) 2h: Dithering of BRSin1 input image at 16 bpp (RGB565: 65535 colors) 3h: Dithering of BRSin1 input image at 15 bpp (RGB555: 32768 colors) 4h: Dithering of BRSin1 input image at 12 bpp (RGB444: 4096 colors) 5h: Dithering of BRSin1 input image at 8 bpp (RGB332: 256 colors) 6, 7h: Setting prohibited

Bit	Bit Name	Initial Value	R/W	Description
3	ODE0	0h	RW	Ordered Dither (mode A) of CH0 Input to BRS Enable/Disable 0b: Ordered dither (mode A) of BRSin0 is disabled. 1b: Ordered dither (mode A) of BRSin0 is enabled. Ordered dither is available only for 18bpp. So, when ODE0 bit is equal to 1b, set DITH0 = 1b. When ODE0 bit is equal to 0, BRSin0 dither method is specified by D0ON in the register Ordered dither (mode A) is recommended rather than ordered dither (mode B) in case of 18bpp.
2 to 0	DITH0 [2:0]	0h	RW	Dithering of CH0 Input to BRS These bits specify how to perform dithering of the CH0 input to the BRS. The setting method is the same as that for the DITH1 bits. Read the description of the DITH1 bits with BRSin0 and D0ON replacing BRSin1 and D1ON, respectively.

Figure 9.4-28 shows the configuration of the BRS. For the BRS inputs, there are two inputs from the DPR and one internal input as a virtual RPF. BRSin0 to BRSin1 are input ports that have the target node values shown in **Figure 9.4-22**, and they can be connected to any module on the DPR. The same color space (YCbCr or RGB) has to be used for the two inputs from the DPR to the BRS.

The virtual RPF inside the BRS is an input unit not connected to the DPR. It is called the "virtual RPF" because it outputs images internally created by the BRS. Starting of the virtual RPF is controlled by VI6_WPFn_SRCRPF.VIR_ACT2, and the single-color data created at the virtual RPF can be used for blending or raster operation (ROP) with data from the other input units BRSin0 to BRSin1. The color space for the single color to be set for the virtual RPF needs to match the color space of the two inputs from the DPR to the BRS. For this setting method, see **(4) Color Information Register of BRS Input Virtual RPF (LCDC_VSPD_VI6_BRS_VIRRPF_COL)**.

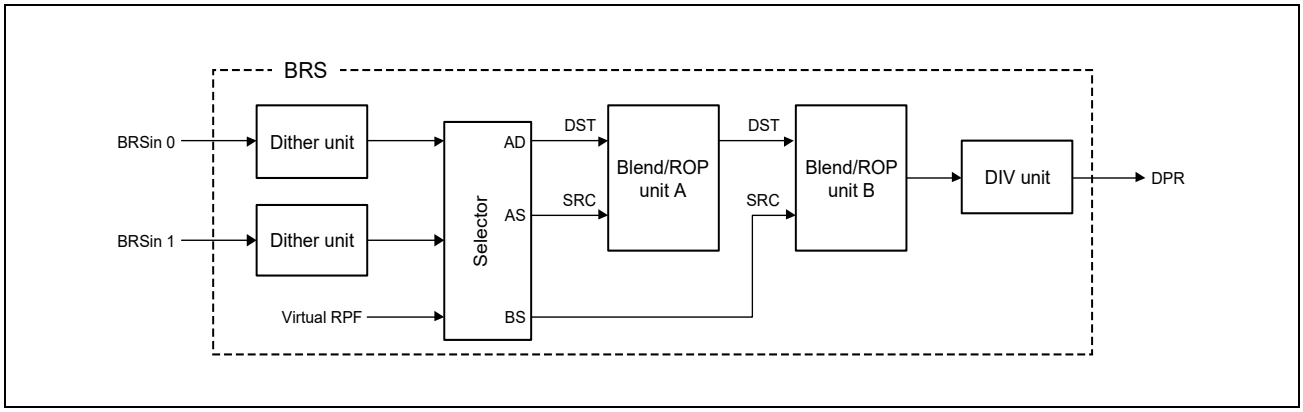

Figure 9.4-28 BRS Configuration

The selector in **Figure 9.4-28** is used to select the SRC and DST inputs to blending/ROP units A to B from BRSin0 to BRSin1 which are inputs from the DPR and the virtual RPF. The SRC and DST input sources for blending/ROP units A to B are either uniquely determined based on the configuration shown in **Figure 9.4-28** or selected as desired by registers. The input sources that can be arbitrarily selected by registers are AD, AS and BS, which correspond to the registers shown in **Table 9.4-24**.

Table 9.4-24 Correspondence between Selector Output Destinations and Register Bits for BRS

Selector Output	Output Destination	Register Bits
AD	Blending/ROP unit A - DST	VI6_BRSA_CTRL.DSTSEL
AS	Blending/ROP unit A - SRC	VI6_BRSA_CTRL.SRCSEL
BS	Blending/ROP unit B - SRC	VI6_BRSB_CTRL.SRCSEL

(2) Size Register of BRS Input Virtual RPF (LCDC_VSPD_VI6_BRS_VIRRPF_SIZE)

Access Size : 32 bits
Address : <LCDC_vspd_base> + 3904h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	VIR_HSIZE[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	VIR_VSIZE[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
28 to 16	VIR_HSIZE [12:0]	0000h	RW	Virtual RPF Horizontal Size These bits set the horizontal size of an image from the virtual RPF shown in **Figure 9.4-28**. A value from 1 to 8190 can be specified.
15 to 13	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
12 to 0	VIR_VSIZE [12:0]	0000h	RW	Virtual RPF Vertical Size These bits set the vertical size of an image from the virtual RPF shown in **Figure 9.4-28**. A value from 1 to 8190 can be specified.

The virtual RPF has only a function to output a fixed α value and a fixed pixel value. The virtual RPF can internally create a single-color image without accessing external memory via the MAU. Same as images from the other BRS input ports, a sublayer can be blended on an image created in this manner with the image used as the background (master layer). In turn, when using the image as a sublayer, it can be drawn on the master layer as a window.

(3) Display Location Register of BRS Input Virtual RPF (LCDC_VSPD_VI6_BRS_VIRRPF_LOC)

Access Size : 32 bits
Address : <LCDC_vspd_base> + 3908h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	HCOORD[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	VCOORD[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
28 to 16	HCOORD [12:0]	0000h	RW	Horizontal Coordinate of Virtual RPF Location on Master Layer These bits specify the horizontal coordinate of where to locate the left-edge pixel of the virtual RPF's layer, with the left-edge pixel of the master layer set at coordinate 0. This setting should be made in pixel units. A value from 0 to 8189 can be specified. When the virtual RPF is specified as the master layer by VI6_WPF0_SRCRPF.VIR_ACT2, set these bits to 0b.
15 to 13	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
12 to 0	VCOORD[12:0]	0000h	RW	Vertical Coordinate of Virtual RPF Location on Master Layer These bits specify the vertical coordinate of where to locate the top-edge pixel of the virtual RPF's layer, with the top-edge pixel of the master layer set at coordinate 0. This setting should be made in pixel units. A value from 0 to 8189 can be specified. When the virtual RPF is specified as the master layer by VI6_WPF0_SRCRPF.VIR_ACT2, set these bits to 0b.

(4) Color Information Register of BRS Input Virtual RPF (LCDC_VSPD_VI6_BRS_VIRRPF_COL)

Access Size : 32 bits
Address : <LCDC_vspd_base> + 390Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	COL_A[7:0]								COL_RCR[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	COL_GY[7:0]								COL_BCB[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	COL_A[7:0]	00h	RW	Fixed α of Virtual RPF These bits set the fixed α value when the virtual RPF creates a virtual plane. A value from 0 to 255 can be specified.
23 to 16	COL_RCR[7:0]	00h	RW	Fixed R/Cr of Virtual RPF These bits set the fixed R/Cr value when the virtual RPF creates a virtual plane. A value from 0 to 255 can be specified.
15 to 8	COL_GY[7:0]	00h	RW	Fixed G/Y of Virtual RPF These bits set the fixed G/Y value when the virtual RPF creates a virtual plane. A value from 0 to 255 can be specified.
7 to 0	COL_BCB[7:0]	00h	RW	Fixed B/Cb of Virtual RPF These bits set the fixed B/Cb value when the virtual RPF creates a virtual plane. A value from 0 to 255 can be specified.

The transparency information and color information of the single color that is created by the virtual RPF are set in the bits of this register. As described earlier, the color information is set for the YCbCr or RGB color space. The color space to be set in this register depends on the register settings of the environment and other modules to which the BRS is connected by the DPR. Two cases can be considered. Since the α value (COL_A) is transparency information and irrelevant to the concept of color space, the same setting is made for either the YCbCr or RGB color space.

[Case 1: When an input other than the virtual RPF is used]

When the source RPF is connected to any one of the BRS input ports (BRSin0 to BRSin1) other than the virtual RPF and valid data is being supplied, the same color space data as the color space for the BRS inputs should be set in this register as the color space for the virtual RPF's color information. This is based on the restriction of "all BRS inputs must have the same color space", as described in **(1) Concept of DPR Settings or (1) BRS Input Control Register (LCDC_VSPD_VI6_BRS_INCTRL)**.

[Case 2: When only the virtual RPF is used]

When only the virtual RPF is used as the source RPF of WPFn, RPFn is not connected to the BRS, as shown in **Figure 9.4-29**. Thus, there is no color space for another input that the color space for the virtual RPF has to follow, as in case 1. This means that the color space of the data output by the BRS is determined by the WPF setting.

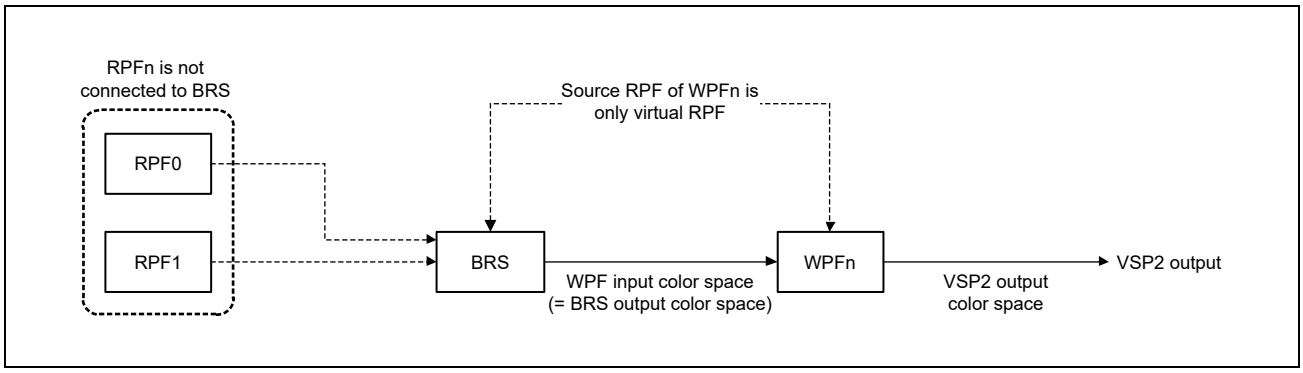

Figure 9.4-29 Relationship between DPR Connection and Color Space When Only Virtual RPF is Used

Figure 9.4-29, the output color space of the VSPD (= output color space of WPFn) is determined by VI6_WPFn_OUTFMT.WRFMT. When bit 6 in VI6_WPFn_OUTFMT.WRFMT (WRFMT [6]) is 0, the color space is RGB, while when it is 1, the color space is YCbCr. Next, the WPF input color space (= BRS output color space) is determined by the relationship between the WPF output color space and VI6_WPFn_OUTFMT.CSC. When VI6_WPFn_OUTFMT.CSC is 0, the WPF output color space and WPF input color space (= BRS output color space) are the same. When VI6_WPFn_OUTFMT.CSC is 1, the WPF output color space and WPF input color space (= BRS output color space) are the opposite. This relationship is summarized in **Table 9.4-25**.

The color space for the virtual RPF's color information should be set in this register according to the "BRS output color space" shown in **Table 9.4-25**.

Table 9.4-25 Relationship between WPF Output Color Space and BRS Output Color Space

VI6_WPFn_OUTFMT Register Bit Settings				BRS Output Color Space (= WPF Input Color Space)
Bit 6 in WRFMT		CSC		
0	(WPF output is RGB)	0	(YCbCr to RGB conversion is disabled)	RGB
0	(WPF output is RGB)	1	(YCbCr to RGB conversion is enabled)	YCbCr
1	(WPF output is YCbCr)	0	(RGB to YCbCr conversion is disabled)	YCbCr
1	(WPF output is YCbCr)	1	(RGB to YCbCr conversion is enabled)	RGB

(5) BRS Control Register A (LCDC_VSPD_VI6_BRSA_CTRL)

Access Size : 32 bits

Address : <LCDC_vspd_base> + 3910h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RBC	-	-	-	-	-	-	-	-	DSTSEL[2:0]			-	SRCSEL[2:0]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	R	R	R	R	R	R	R	R	RW	RW	RW	R	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	CROP[3:0]				AROP[3:0]			
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31	RBC	0h	RW	Operation Type of Blending/ROP Unit A Specifies the operation type for blending/ROP unit A shown in **Figure 9.4-28**. 0b: ROP (raster operation) 1b: Blending operation
30 to 23	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
22 to 20	DSTSEL[2:0]	0h	RW	Input Selection for DST Side of Blending/ROP Unit A These bits select the input for the DST side of blending/ROP unit A shown in Figure 9.4-28. These bits specify the connection between the BRS input port and the DST separately from the setting of connections between other modules and the BRS input port through the DPR. 000b: BRS input 0 (BRSin0) is input to DST 001b: BRS input 1 (BRSin1) is input to DST 100b: Virtual RPF is input to DST 010b, 011b, 101b to 111b: Setting prohibited [Note] The DSTSEL bits for blending/ROP unit B are reserved. The write value should always be 0b.
19	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
18 to 16	SRCSEL[2:0]	0h	RW	Input Selection for SRC Side of Blending/ROP Unit A These bits select the input for the SRC side of blending/ROP unit A shown in **Figure 9.4-28**. These bits specify the connection between the BRS input port and the SRC separately from the setting of connections between other modules and the BRS input port through the DPR. 000b: BRS input 0 (BRSin0) is input to SRC 001b: BRS input 1 (BRSin1) is input to SRC 100b: Virtual RPF is input to SRC 010b, 011b, 101b to 111b: Setting prohibited
15 to 8	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
7 to 4	CROP[3:0]	0h	RW	Color Data ROP Operator These bits select the ROP operator of the color data in blending/ROP unit A. Select the opcode for ROP operation from **Table 9.4-26**.
3 to 0	AROP[3:0]	0h	RW	α Data ROP Operator These bits select the ROP operator of the α data in blending/ROP unit A. Select the opcode for ROP operation from **Table 9.4-26**.

Table 9.4-26 ROP Operator of Blending/ROP Unit m (m = A, B)

Opcode	Operator
0000b	NOP(D)
0001b	AND(S & D)
0010b	AND_REVERSE(S & ~D)
0011b	COPY(S)
0100b	AND_INVERTED(~S & D)
0101b	CLEAR(0)
0110b	XOR(S ^ D)
0111b	OR(S | D)
1000b	NOR(~(S | D))
1001b	EQUIV(~(S ^ D))
1010b	INVERT(~D)
1011b	OR_REVERSE(S | ~D)
1100b	COPY_INVERTED(~S)
1101b	OR_INVERTED(~S | D)
1110b	NAND(~(S & D))
1111b	SET(all1)

(6) BRS Blend Control Register A (LCDC_VSPD_VI6_BRSA_BLD)

Access Size : 32 bits
Address : <LCDC_vspd_base> + 3914h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CBES	CCMDX[2:0]			-	CCMDY[2:0]			ABES	ACMDX[2:0]			-	ACMDY[2:0]

Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31	CBES	0h	RW	Blending Expression Selection Selects the blending expression of the color data in the BRS (VI6_BRSA_CTRL.RBC = 1b). Blending coefficients are specified by the CCMDX and CCMDY bits. 0b: CCMDX × (DST color data) + CCMDY × (SRC color data) 1b: CCMDX × (DST color data) - CCMDY × (SRC color data)
30 to 28	CCMDX[2:0]	0h	RW	Blending Coefficient X Selection These bits specify coefficient X used in the blending expression determined by the CBES bit. 000b: DST α data is used as blending coefficient X 001b: 255 - (DST α data) is used as blending coefficient X 010b: SRC α data is used as blending coefficient X 011b: 255 - (SRC α data) is used as blending coefficient X 100b: Fixed α value 0 (COEFX setting)
27	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
26 to 24	CCMDY[2:0]	0h	RW	Blending Coefficient Y Selection These bits specify coefficient Y used in the blending expression determined by the CBES bit. 000b: DST α data is used as blending coefficient Y 001b: 255 - (DST α data) is used as blending coefficient Y 010b: SRC α data is used as blending coefficient Y 011b: 255 - (SRC α data) is used as blending coefficient Y 100b: Fixed α value 1 (COEFY setting)
23	ABES	0h	RW	Blending α Creation Expression Specifies the expression for creating α data after blending by blending/ROP unit m (m = A, B). α creation coefficients are specified by the ACMDX and ACMDY bits. 0b: ACMDX × (DST α data) + ACMDY × (SRC α data) 1b: ACMDX × (DST α data) - ACMDY × (SRC α data)
22 to 20	ACMDX[2:0]	0h	RW	α Creation Coefficient X These bits specify α creation coefficient X used in the α creation expression determined by the ABES bit. 000b: (α creation coefficient X) = (DST α data) 001b: (α creation coefficient X) = 255 - (DST α data) 010b: (α creation coefficient X) = (SRC α data) 011b: (α creation coefficient X) = 255 - (SRC α data) 100b: (α creation coefficient X) = Fixed α value 0 (COEFX setting) 101b to 111b: Setting prohibited
19	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

Bit	Bit Name	Initial Value	R/W	Description
18 to 16	ACMDY[2:0]	0h	RW	α Creation Coefficient Y These bits specify α creation coefficient Y used in the α creation expression determined by the ABES bit. 000b: (α creation coefficient Y) = (DST α data) 001b: (α creation coefficient Y) = 255 - (DST α data) 010b: (α creation coefficient Y) = (SRC α data) 011b: (α creation coefficient Y) = 255 - (SRC α data) 100b: (α creation coefficient Y) = Fixed α value 1 (COEFY setting) 101b to 111b: Setting prohibited
15 to 8	COEFX[7:0]	00h	RW	Fixed α Value 0 These bits specify fixed α value 0 used when the CCMDX or ACMDX bits are set to 100b. A value from 00h to FFh can be specified.
7 to 0	COEFY[7:0]	00h	RW	Fixed α Value 1 These bits specify fixed α value 1 used when the CCMDY or ACMDY bits are set to 100b. A value from 00h to FFh can be specified.

(7) BRS Control Register B (LCDC_VSPD_VI6_BRSB_CTRL)

Access Size : 32 bits

Address : <LCDC_vspd_base> + 3918h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RBC	-	-	-	-	-	-	-	-	-	-	-	-	SRCSEL[2:0]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	CROP[3:0]				AROP[3:0]			
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31	RBC	0h	RW	Operation Type of Blending/ROP Unit B Specifies the operation type for blending/ROP unit B shown in **Figure 9.4-28**. 0b: ROP (raster operation) 1b: Blending operation
30 to 19	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
18 to 16	SRCSEL[2:0]	0h	RW	Input Selection for SRC Side of Blending/ROP Unit B These bits select the input for the SRC side of blending/ROP unit A shown in **Figure 9.4-28**. These bits specify the connection between the BRS input port and the SRC separately from the setting of connections between other modules and the BRS input port through the DPR. 000b: BRS input 0 (BRSin0) is input to SRC 001b, 010b, 011b, 100b, 101b to 111b: Setting prohibited
15 to 8	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
7 to 4	CROP[3:0]	0h	RW	Color Data ROP Operator These bits select the ROP operator of the color data in blending/ROP unit B. Select the opcode for ROP operation from **Table 9.4-26**.
3 to 0	AROP[3:0]	0h	RW	α Data ROP Operator These bits select the ROP operator of the α data in blending/ROP unit B. Select the opcode for ROP operation from **Table 9.4-26**.

(8) BRS Blend Control Register B (LCDC_VSPD_VI6_BRSB_BLD)

Access Size : 32 bits

Address : <LCDC_vspd_base> + 391Ch

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CBES	CCMDX[2:0]			-	CCMDY[2:0]			ABES	ACMDX[2:0]			-	ACMDY[2:0]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	R	RW	RW	RW	RW	RW	RW	RW	R	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	COEFX[7:0]								COEFY[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31	CBES	0h	RW	Blending Expression Selection Selects the blending expression of the color data in the BRS (VI6_BRSB_CTRL.RBC = 1). Blending coefficients are specified by the CCMDX and CCMDY bits. 0b: CCMDX × (DST color data) + CCMDY × (SRC color data) 1b: CCMDX × (DST color data) - CCMDY × (SRC color data)
30 to 28	CCMDX[2:0]	0h	RW	Blending Coefficient X Selection These bits specify coefficient X used in the blending expression determined by the CBES bit. 000b: DST α data is used as blending coefficient X 001b: 255 - (DST α data) is used as blending coefficient X 010b: SRC α data is used as blending coefficient X 011b: 255 - (SRC α data) is used as blending coefficient X 100b: Fixed α value 0 (COEFX setting)
27	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
26 to 24	CCMDY[2:0]	0h	RW	Blending Coefficient Y Selection These bits specify coefficient Y used in the blending expression determined by the CBES bit. 000b: DST α data is used as blending coefficient Y 001b: 255 - (DST α data) is used as blending coefficient Y 010b: SRC α data is used as blending coefficient Y 011b: 255 - (SRC α data) is used as blending coefficient Y 100b: Fixed α value 1 (COEFY setting)
23	ABES	0h	RW	Blending α Creation Expression Specifies the expression for creating α data after blending by blending/ROP unit m (m = A, B). α creation coefficients are specified by the ACMDX and ACMDY bits. 0b: ACMDX × (DST α data) + ACMDY × (SRC α data) 1b: ACMDX × (DST α data) - ACMDY × (SRC α data)
22 to 20	ACMDX[2:0]	0h	RW	α Creation Coefficient X These bits specify α creation coefficient X used in the α creation expression determined by the ABES bit. 000b: (α creation coefficient X) = (DST α data) 001b: (α creation coefficient X) = 255 - (DST α data) 010b: (α creation coefficient X) = (SRC α data) 011b: (α creation coefficient X) = 255 - (SRC α data) 100b: (α creation coefficient X) = Fixed α value 0 (COEFX setting) 101b to 111b: Setting prohibited
19	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

Bit	Bit Name	Initial Value	R/W	Description
18 to 16	ACMDY[2:0]	0h	RW	α Creation Coefficient Y These bits specify α creation coefficient Y used in the α creation expression determined by the ABES bit. 000b: (α creation coefficient Y) = (DST α data) 001b: (α creation coefficient Y) = 255 - (DST α data) 010b: (α creation coefficient Y) = (SRC α data) 011b: (α creation coefficient Y) = 255 - (SRC α data) 100b: (α creation coefficient Y) = Fixed α value 1 (COEFY setting) 101b to 111b: Setting prohibited
15 to 8	COEFX[7:0]	00h	RW	Fixed α Value 0 These bits specify fixed α value 0 used when the CCMDX or ACMDX bits are set to 100b. A value from 00h to FFh can be specified.
7 to 0	COEFY[7:0]	00h	RW	Fixed α Value 1 These bits specify fixed α value 1 used when the CCMDY or ACMDY bits are set to 100b. A value from 00h to FFh can be specified.

9.4.3.2.11 LIF Control Registers

(1) LIF0 Control Register (LCDC_VSPD_VI6_LIF0_CTRL)

Access Size : 32 bits
Address : <LCDC_vspd_base> + 3B00h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	OBTH [11:0]											
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	PADL	-	-	-	CFMT	-	-	REQSEL	LIF_EN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	RW	R	R	R	RW	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
27 to 16	OBTH [11:0]	000h	RW	Buffer Threshold for Start Ready Notification to Display Module Always specify 1500, when LIF_EN is set to 1b.
15 to 9	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
8	PADL	0h	RW	Enable/Disable of padding with dummy lines to output-image to the DU. Enables or disables of padding with dummy lines to output-image to the DU. 0b: Padding with dummy lines to output image to DU is disabled. 1b: Padding with dummy lines to output image to DU is enabled.
7 to 5	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
4	CFMT	0h	RW	Chroma Format This bit selects the output format from the LIF module to the display module. When RGB format is used, this bit shall be set to 0b. 0b: YCbCr444 or RGB Format 1b: YCbCr422 Format [Note] The DU cannot receive YCbCr422 format. Therefore, when CFMT is 1, YCbCr444 data which information contents is equal to YCbCr422 is output to DU as shown in **Figure 9.4-30**.
3, 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
1	REQSEL	0h	RW	External Display Module Selection 0b: This value is setting prohibited when 1b is set to LIF_EN 1b: DU is selected as the destination external display module.
0	LIF_EN	0h	RW	Enable/Disable of Data Output to External Display Module Enables or disables data output from the LIF to the external display module (DU). 0b: Data output to the external display module is disabled. 1b: Data output to the external display module is enabled.

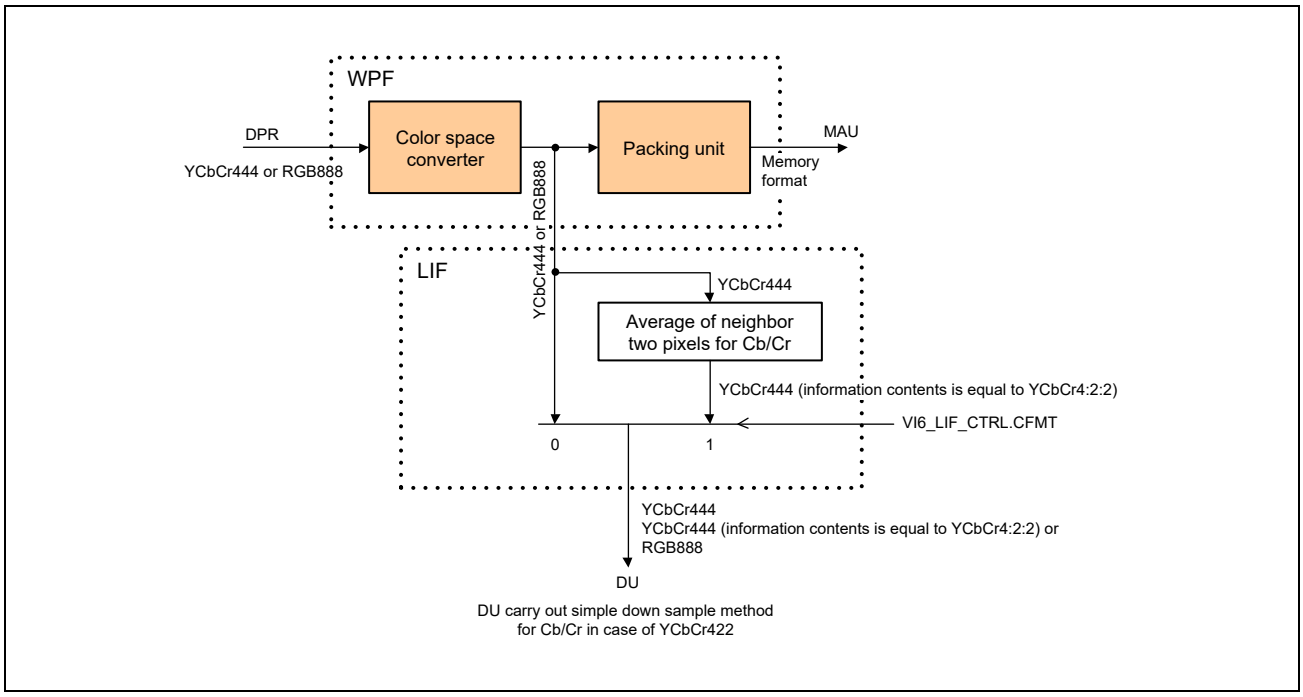

Figure 9.4-30 Data flow between LIF and DU

(2) LIF0 Clock Stop Buffer Control Register (LCDC_VI6_LIF0_CSBTH)

Access Size : 32 bits

Address : <LCDC_vspd_base> + 3B04h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	HBTH[11:0]											
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	LBTH[11:0]											
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
27 to 16	HBTH[11:0]	000h	RW	Buffer Threshold for Clock Stop in Dynamic Clock Control Set HBTH[11:0] = 0 (fixed value)
15 to 12	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
11 to 0	LBTH[11:0]	000h	RW	Buffer Threshold for Clock Start in Dynamic Clock Control Set LBTH[11:0] = 0 (fixed value)

(3) LIF0 Buffer Attribute Register (LCDC_VI6_LIF0_LBA)

Access Size : 32 bits
Address : <LCDC_vspd_base> + 3B0Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	LBA0	-	-	-	LBA1[11:0]											
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	LBA2[11:0]											
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	LBA0	0h	RW	LIF Buffer Attribute Register0 Always specify 1b, when LIF_EN is set to 1b
30 to 28	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
27 to 16	LBA1[11:0]	000h	RW	LIF Buffer Attribute Register1 Always specify 1536, when LIF_EN is set to 1b
15 to 12	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
11 to 0	LBA2[11:0]	000h	R	LIF Buffer Attribute Register2 These bits are internal status for purpose of h/w debugging.

(4) LIF0 Padding Line Cycle Register (LCDC_VI6_LIF0_PADLN_CYC)

Access Size : 32 bits

Address : <LCDC_vspd_base> + 3B30h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	PADLN_CYC[5:0]					
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	-	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
5 to 0	PADLN_CYC [5:0]	00h	RW	Cycle of padding pattern. These bits specify the minimum number of cycles of the padding pattern of valid lines and dummy lines. For example, if PADLN_CYC[5:0] is 4, lower 4 bits of PADLN_PATTERN[3:0] indicates padding pattern. A value from 1 to 32 can be specified.

(5) LIF0 Padding Line Pattern Register (LCDC_VI6_LIF0_PADLN_PT)

Access Size : 32 bits

Address : <LCDC_vspd_base> + 3B34h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PADLN_PATTERN[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PADLN_PATTERN[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	PADLN_PATTERN[31:0]	0000_0000h	RW	Pattern of padding with dummy lines These bits specify the padding pattern of valid lines and dummy lines. In each bit, 0b indicates an active line, 1b indicates a dummy line. It starts from the lower bit (Bit 0). First line should be valid line (Always set 0 to PADLN_PATTERN[0]).

(6) LIF0 Padding Line Value Register (LCDC_VI6_LIF0_PADLN_VAL)

Access Size : 32 bits
Address : <LCDC_vspd_base> + 3B38h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PADA[7:0]								PADR[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PADG[7:0]								PADB[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	PADA[7:0]	00h	RW	Padding data of EDC code for dummy line.
23 to 16	PADR[7:0]	00h	RW	Padding data of R/Cr for dummy line.
15 to 8	PADG[7:0]	00h	RW	Padding data of G/Y for dummy line.
7 to 0	PADB[7:0]	00h	RW	Padding data of B/Cb for dummy line.

Note: Set the register to 24FF_FFFFh when the output format is YUV422.
Otherwise, set it 2EFF_FFFFh.

(7) LIF0 Padding Line Size Register (LCDC_VI6_LIF0_PADLN_SIZE)

Access Size : 32 bits

Address : <LCDC_vspd_base> + 3B3Ch

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	PADLN_VSIZE[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 13	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
12 to 0	PADLN_VSIZE [12:0]	0000h	RW	Vertical Size of LIF output in case of enabling Padding line When VI6_LIF0_CTRL.PADL is 1b, dummy lines are included in the output data from LIF, so set the LIF output VSIZE including dummy lines to these bits. If the number of output lines does not reach the value of PADLN_VSIZE [12:0] even if all valid lines are output according to padding pattern, dummy lines are inserted until the number of output lines reaches PADLN_VSIZE [12:0]. - Output vsize of LIF is same with input vsize to LIF when VI6_LIF0_CTRL.PADL is 0b - Output vsize of LIF is PADLN_VSIZE [12:0] when VI6_LIF0_CTRL.PADL is 1b

9.4.4 DU Registers

The DU contains the registers which can directly be read and written to by the host CPU. The host can access any long word (32 bits), word (16 bits), and byte (8 bits) in the registers. Therefore, read-modify-write is needed to change partial bits not more than 8 bits in the 32-bit register.

Never access the registers when the DU is in the module standby mode (with the operation clock placed in hold status).

Table 9.4-27 DU Register Base Address

Base Register Name	Base Address
<LCDC_du_base>	0_1646_0000h (5646_0000h*1, 4646_0000h*2)

Note 1. CM33 address space (non-secure)

Note 2. CM33 address space (secure)

9.4.4.1 List of DU Registers

The registers are listed below.

Register Name	Abbreviation	Initial Value	Offset Address	Access Size [bits]
DU Module Control Register 0	LCDC_DU_MCR0	0000_0000h	0000h	32, 16, 8
DU Module Status Register 0	LCDC_DU_MSR0	0054_0000h	0004h	32, 16, 8
DU Module Status Register 1	LCDC_DU_MSR1	0000_0000h	0008h	32, 16, 8
DU Interrupt Mask Register 0	LCDC_DU_IMR0	0000_0000h	000Ch	32, 16, 8
DU Display I/F Timing Register 0	LCDC_DU_DITR0	0003_0300h	0010h	32, 16, 8
DU Display I/F Timing Register 1	LCDC_DU_DITR1	0000_0000h	0014h	32, 16, 8
DU Display I/F Timing Register 2	LCDC_DU_DITR2	0000_0000h	0018h	32, 16, 8
DU Display I/F Timing Register 3	LCDC_DU_DITR3	0000_0000h	001Ch	32, 16, 8
DU Display I/F Timing Register 4	LCDC_DU_DITR4	0000_0000h	0020h	32, 16, 8
Reserve	-	-	0024h to 003Fh	-
DU Module Control Register 1	LCDC_DU_MCR1	0000_0000h	0040h	32, 16, 8
Reserve	-	-	0044h to 004Bh	-
DU PBUF Control Register 0	LCDC_DU_PBCR0	0000_001Fh	004Ch	32, 16, 8
DU PBUF Control Register 1	LCDC_DU_PBCR1	0000_0000h	0050h	32, 16, 8
DU PBUF Control Register 2	LCDC_DU_PBCR2	0000_0000h	0054h	32, 16, 8

9.4.4.2 DU Register Description

The prefix (LCDC_) of the register names is omitted in this and subsequent sections.

9.4.4.2.1 DU Module Control Register 0 (LCDC_DU_MCR0)

Access Size : 32, 16, 8 bits
Address : <LCDC_du_base> + 0000h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	PB_CLR
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	DI_EN	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	RW	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
16	PB_CLR	0h	RW	Clear PBUF pointers. This parameter must be changed while VSPD is not running and DU_MSR0.ST_DIF_BSY is '0b'. Writing '1b' to this parameter starts clearing the PBUF pointers. After clearing the PBUF pointers is completed, DU_MSR0.ST_PB_WINIT and DU_MSR0.ST_PB_RINIT are read as 1b, this parameter must be written back to '0b'.
15 to 9	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
8	DI_EN	0h	RW	Display enable. 1b: Enabled 0b: Disabled
7 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
0	-	0h	RW	Reserved These bits are read as 0b. The write value should always be 0b.

9.4.4.2.2 DU Module Status Register 0 (LCDC_DU_MSR0)

Access Size : 32, 16, 8 bits

Address : <LCDC_du_base> + 0004h

Initial Value : 0054_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	ST_PB_RINIT	ST_PB_RUF	ST_PB_REMPTY	-	ST_PB_WINIT	-	ST_PB_WFULL
Initial Value	0	0	0	0	0	0	0	0	0	1	0	1	0	1	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	ST_DI_BSY	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 23	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
22	ST_PB_RINIT	1h	R	PBUF FIFO read pointer cleared status. 1b: Cleared (initial value) 0b: Not cleared
21	ST_PB_RUF	0h	R	PBUF read underflow status. This parameter clears when PBUF pointers are cleared. 1b: Occur PBUF underflow 0b: Not occur PBUF underflow
20	ST_PB_REMPTY	1h	R	PBUF read empty status. 1b: Empty 0b: Not empty
19	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
18	ST_PB_WINIT	1h	R	PBUF FIFO write pointer cleared status. 1b: Cleared (initial value) 0b: Not cleared
17	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
16	ST_PB_WFULL	0h	R	PBUF write full status. 1b: Full 0b: Not full
15 to 9	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
8	ST_DI_BSY	0h	R	Display I/F status. 1b: Busy 0b: Idle
7 to 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

9.4.4.2.3 DU Module Status Register 1 (LCDC_DU_MSR1)

Access Size : 32, 16, 8 bits

Address : <LCDC_du_base> + 0008h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	UF_VACT[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	UF_HACT[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
28 to 16	UF_VACT[12:0]	0000h	R	Vactive counter when the PBUF underflow occurs. This parameter is value latched the down counter starting from VACTIVE. This parameter is cleared when DU_MSR0.ST_PB_RUF is cleared.
15 to 13	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
12 to 0	UF_HACT[12:0]	0000h	R	Hactive counter when the PBUF underflow occurs. This parameter is value latched the down counter starting from HACTIVE. This parameter is cleared when DU_MSR0.ST_PB_RUF is cleared.

9.4.4.2.4 DU Interrupt Mask Register 0 (LCDC_DU_IMR0)

Access Size : 32, 16, 8 bits

Address : <LCDC_du_base> + 000Ch

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	IM_PB_RUF
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
0	IM_PB_RUF	0h	RW	Mask PBUF read underflow interrupt. 1b: Mask interrupt 0b: Not mask interrupt

9.4.4.2.5 DU Display I/F Timing Register 0 (LCDC_DU_DITR0)

Access Size : 32, 16, 8 bits

Address : <LCDC_du_base> + 0010h

Initial Value : 0003_0300h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	HSPOL	VSPOL
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	DEMD[1:0]		-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	1	1	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	RW	RW	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
17	HSPOL	1h	RW	hsync polarity. 1b: High active 0b: Low active
16	VSPOL	1h	RW	vsync polarity. 1b: High active 0b: Low active
15 to 10	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
9, 8	DEMD[1:0]	3h	RW	de output mode. 00b: Reserved (Fixed to High) 01b: Fixed to Low 10b: Reserved (Low active) 11b: Data enable (High active)
7 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
0	-	0h	RW	Reserved These bits are read as 0b. The write value should always be 0b.

9.4.4.2.6 DU Display I/F Timing Register 1 (LCDC_DU_DITR1)

Access Size : 32, 16, 8 bits
Address : <LCDC_du_base> + 0014h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	VACTIVE[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	VSA[11:0]											
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
28 to 16	VACTIVE[12:0]	0000h	RW	The number of lines in the Vactive period. This parameter should be set from 1 to 8190.
15 to 12	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
11 to 0	VSA[11:0]	000h	RW	The number of lines in the Vsync period. This parameter should be set from 0 to 4095, and DU_DITR1.VSA + DU_DITR2.VBP should be set more than 0. If set to 0, vsync is not asserted to DU_DITR0.VSPOL.

Figure 9.4-31 shows the relationship between the parameters and the video output timings.

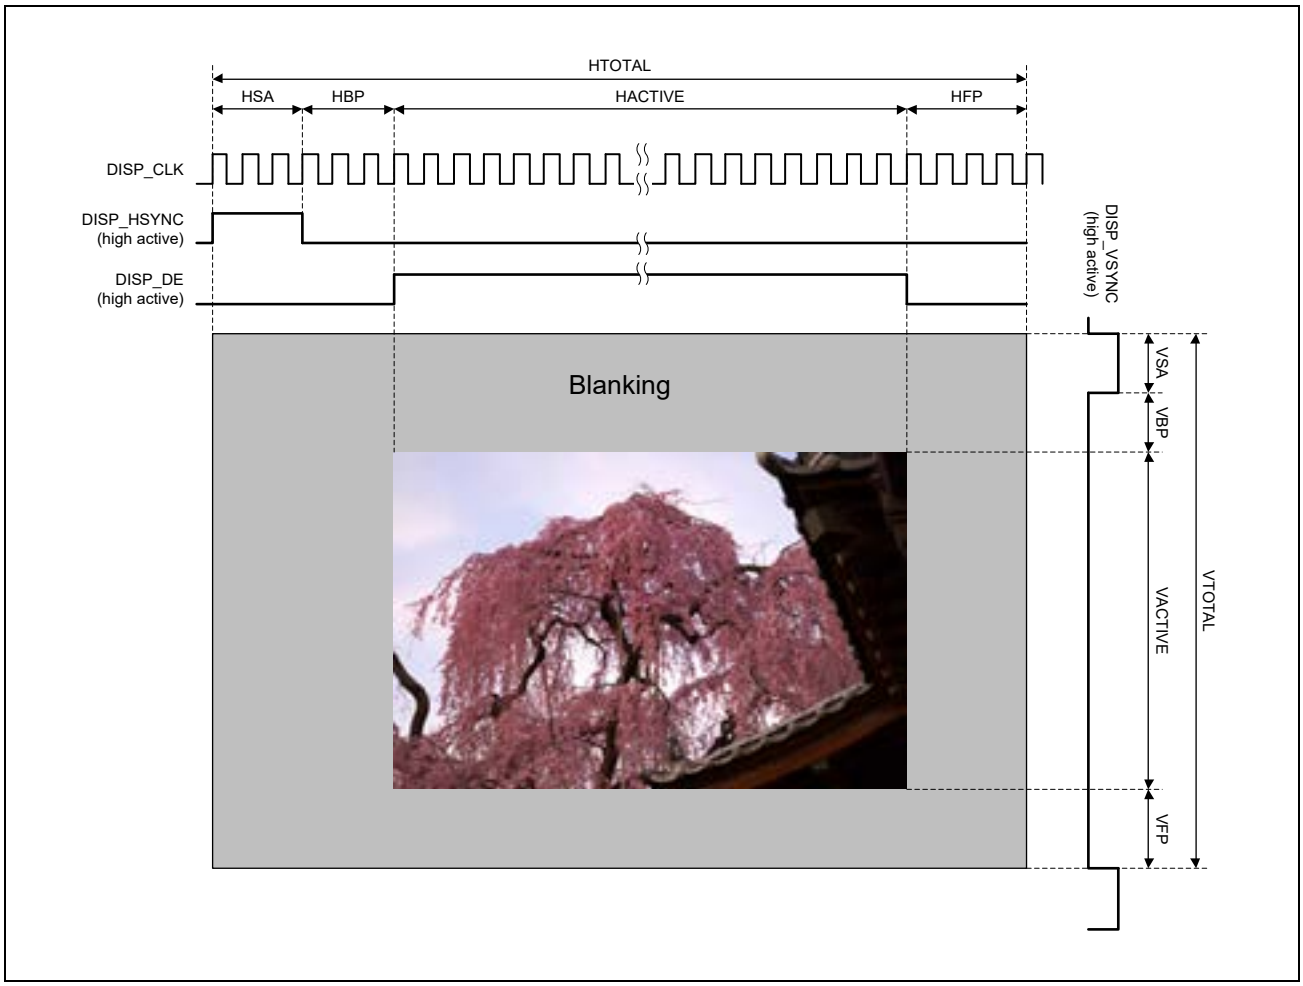

Figure 9.4-31 Video Output Timings

9.4.4.2.7 DU Display I/F Timing Register 2 (LCDC_DU_DITR2)

Access Size : 32, 16, 8 bits

Address : <LCDC_du_base> + 0018h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	VFP[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	VBP[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
28 to 16	VFP[12:0]	0000h	RW	The number of lines in the Vfront period. This parameter should be set from 0 to 8191.
15 to 13	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
12 to 0	VBP[12:0]	0000h	RW	The number of lines in the Vback period. This parameter should be set from 0 to 8191, and DU_DITR1.VSA + DU_DITR2.VBP should be set more than 0.

9.4.4.2.8 DU Display I/F Timing Register 3 (LCDC_DU_DITR3)

Access Size : 32, 16, 8 bits

Address : <LCDC_du_base> + 001Ch

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	HACTIVE[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	HSA[11:0]											
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
28 to 16	HACTIVE[12:0]	0000h	RW	The number of cycles (pixels) in the Hactive period. This parameter should be set from 1 to 8190.
15 to 12	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
11 to 0	HSA[11:0]	000h	RW	The number of cycles in the Hsync period. This parameter should be set from 0 to 4095, and DU_DITR3.HSA + DU_DITR4.HBP + DU_DITR4.HFP (=Hblank) should be set 3 or more. If set to 0, hsync is not asserted to DU_DITR0.HSPOL.

9.4.4.2.9 DU Display I/F Timing Register 4 (LCDC_DU_DITR4)

Access Size : 32, 16, 8 bits

Address : <LCDC_du_base> + 0020h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	HFP[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	HBP[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
28 to 16	HFP[12:0]	0000h	RW	The number of cycles in the Hfront period. This parameter should be set from 1 to 8191, and DU_DITR3.HSA + DU_DITR4.HBP + DU_DITR4.HFP (=Hblank) should be set 3 or more.
15 to 13	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
12 to 0	HBP[12:0]	0000h	RW	The number of cycles in the Hback period. This parameter should be set from 0 to 8191, and DU_DITR3.HSA + DU_DITR4.HBP + DU_DITR4.HFP (=Hblank) should be set 3 or more.

9.4.4.2.10 DU Module Control Register 1 (LCDC_DU_MCR1)

Access Size : 32, 16, 8 bits

Address : <LCDC_du_base> + 0040h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	PB_AUTOCLR
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	OPMD[1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	RW	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
16	PB_AUTOCLR	0h	RW	PBUF pointers auto clear enable. Specify timing to clear the PBUF pointers. 0b: Not clear until DU_MCR0.PB_CLR is asserted 1b: Clear during blanking (according to DU_MCR1.OPMD)
15 to 9	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
8	-	0h	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
7 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
1, 0	OPMD[1:0]	0h	RW	Operation mode. Specify behavior of LIFC and PBUF during Vfront and Hfront period. This parameter must be changed while VSPD is not running. 00b: After frame end, LIFC wait, and PBUF pointers are cleared if DU_MCR1.PB_AUTOCLR is set to '1b'. 01b: After line end, LIFC wait, and PBUF pointers are cleared if DU_MCR1.PB_AUTOCLR is set to '1'. 10b: Reserved 11b: LIFC always request to VSPD. PBUF pointers are not cleared until DU_MCR0.PB_CLR is set to '1b'.

9.4.4.2.11 DU PBUF Control Register 0 (LCDC_DU_PBCR0)

Access Size : 32, 16, 8 bits

Address : <LCDC_du_base> + 004Ch

Initial Value : 0000_001Fh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	PB_DEP[4:0]				
Initial Value	0	0	0	0	0	0	0	0	0	0	0	1	1	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
4 to 0	PB_DEP[4:0]	1Fh	RW	Valid PBUF depth. This parameter should be set 1Fh. This parameter should be set $((2^n) - 1)$.

9.4.4.2.12 DU PBUF Control Register 1 (LCDC_DU_PBCR1)

Access Size : 32, 16, 8 bits

Address : <LCDC_du_base> + 0050h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	PB_RUFOP
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
0	PB_RUFOP	0h	RW	Specify behavior when the PBUF underflow occurs. 0b: Continue outputting invalid data 1b: Output DU_PBCR2.PB_RUFDAT

9.4.4.2.13 DU PBUF Control Register 2 (LCDC_DU_PBCR2)

Access Size : 32, 16, 8 bits

Address : <LCDC_du_base> + 0054h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	PB_RUFDAT[23:16]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PB_RUFDAT[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
23 to 0	PB_RUFDAT [23:0]	00_0000h	RW	Read data when the PBUF underflow occurs.

9.4.5 Operation

9.4.5.1 Operation Control Setting

(a) To start image process

FCPVD registers do not need to be set when starting an image process. Therefore, refer **9.4.5.4 Concept of VSPD Operation Starting and Stopping** for the guidance of starting an image process.

9.4.5.2 Reset Operation

This unit can be reset by hardware reset. The hardware reset is controlled by LCDC_0_RESET_N of CPG, and this reset initializes the whole this unit immediately.

9.4.5.3 Registers to set fixed value

Set fixed value to following registers in any case.

[1] Always set 0000 0808h to VI6_CLK_DCSWT

[2] Always set 256 to VI6_DL_CTRL.AR_WAIT [7:0] in case of using display list.

[3] Always set 2 to VI6_DL_EXT_CTRLn.POLINT [5:0] in case of using extended display list of WPFn.

[4] Always set 1 to VI6_DL_EXT_CTRLn.DLPRI in case of using extended display list of WPFn.

[5] Always set 0 to VI6_DL_EXT_CTRLn.EXPRI in case of using extended display list of WPFn.

[6] Always set 0000 0500h toVI6_DPR_WPFn_FPORCH (n = 0, 1) in case of using WPFn.

[7] Always set 1500 to VI6_LIF0_CTRL.OBTH [11:0] in case of using LIF (VI6_LIF0_CTRL.LIF_EN = 1).

[8] Always set 8600 0000h to VI6_LIF0_LBA in case of using LIF0 (VI6_LIF0_CTRL.LIF_EN = 1).

[9] Always set 1 to VI6_LIFn_CTRL.REQSEL in case of using LIFn (VI6_LIFn_CTRL.LIF_EN = 1).

[10] Always set 0 to VI6_LIFn_CSBTH in case of using LIFn (VI6_LIFn_CTRL.LIF_EN = 1).

[11] Always set 1Fh to DU_PBCR0 in case of using DU (DU_MCR0.DI_EN = 1).

9.4.5.4 Concept of VSPD Operation Starting and Stopping

The VSPD provides one channel of image processing. Each channel is started by setting the corresponding start register. Here, starting a processing channel means starting one of WPF0, which are output modules of the VSPD. Use the start registers shown in **Table 9.4-28** to start WPF modules.

After a WPF module is started and specified processing is completed, the corresponding channel stops operation and notifies the end of processing through an end interrupt. End interrupts are generated through the end interrupt source registers shown in **Table 9.4-28**; clearing a source register cancels the corresponding interrupt signal. Each of the operating status registers shown in the table indicates the busy state after the corresponding channel is started through the start register until processing is completed and operation stops. **Figure 9.4-33** shows these operation timings.

Table 9.4-28 Target Module and Corresponding Registers for Starting and Stopping Operation

Target Module	Start Register	End Interrupt Source Register	Operating Status Register
WPF0	VI6_CMD0.STRCMD	VI6_WPF0_IRQ_STA. FRE	VI6_STATUS.SYS0_ACT

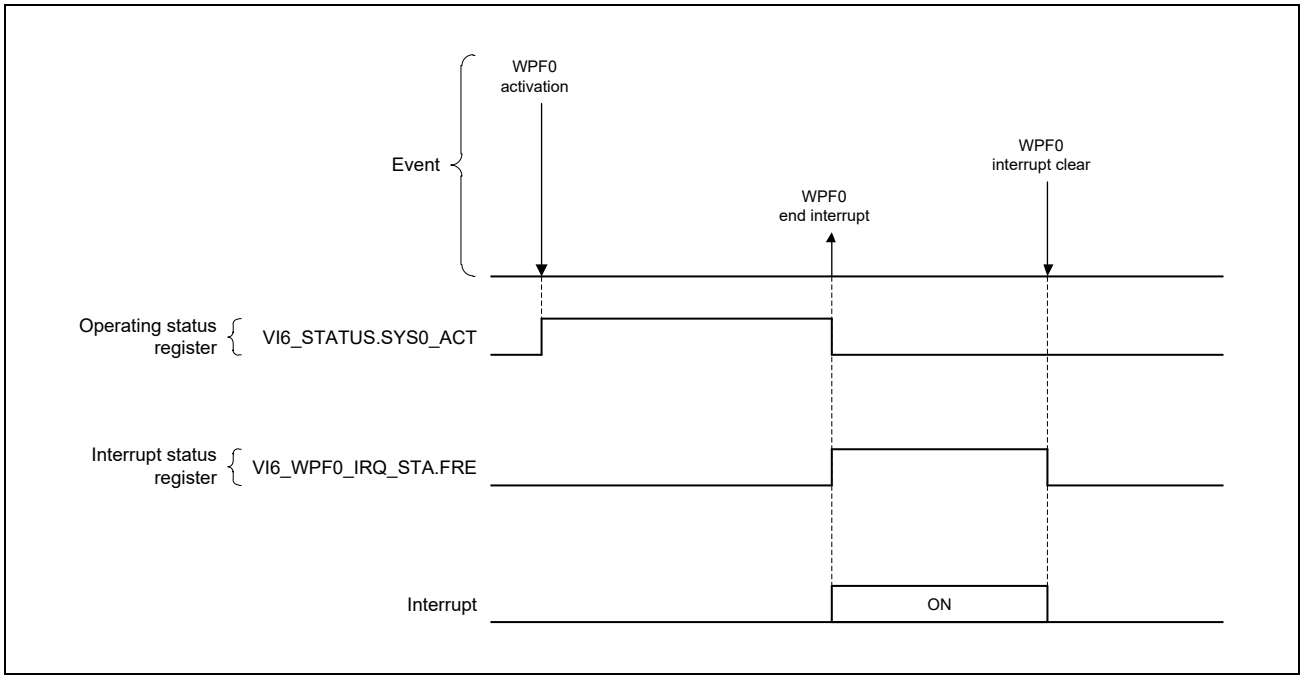

Figure 9.4-32 VSPD Startup and Status of Each Register and Interrupt

The following describes the operating states (operating or stopped) of VSPD internal modules. As described in **9.4.3.2 VSPD Register Description**, the VSPD has several image processing modules and the connections between modules are determined by the DPR. Accordingly, the operating state of a module is the same as that of the target WPF for that module. For example, when the target WPF for the BRS is WPF0, the BRS operating state is the same as that of WPF0; that is, the BRS operating state is indicated by the VI6_STATUS.SYS0_ACT as shown in **Table 9.4-28** and the status change timing is shown as VI6_STATUS. SYS0_ACT in **Figure 9.4-32**. Likewise, the operating states of all modules connected to WPF0 is indicated by VI6_STATUS. SYS0_ACT.

Connections should be changed through the DPR-related registers (described later) while all modules to be affected by any change in connections are stopped. If connections through the DPR are changed during operation, the VSPD will hang.

Figure 9.4-33 shows relation between start reservation and operating status. When start is reserved while VSPD is operating, the reservation is accepted after VSPD status is moved from “operating” into “idle” as shown in **Figure 9.4-33**.

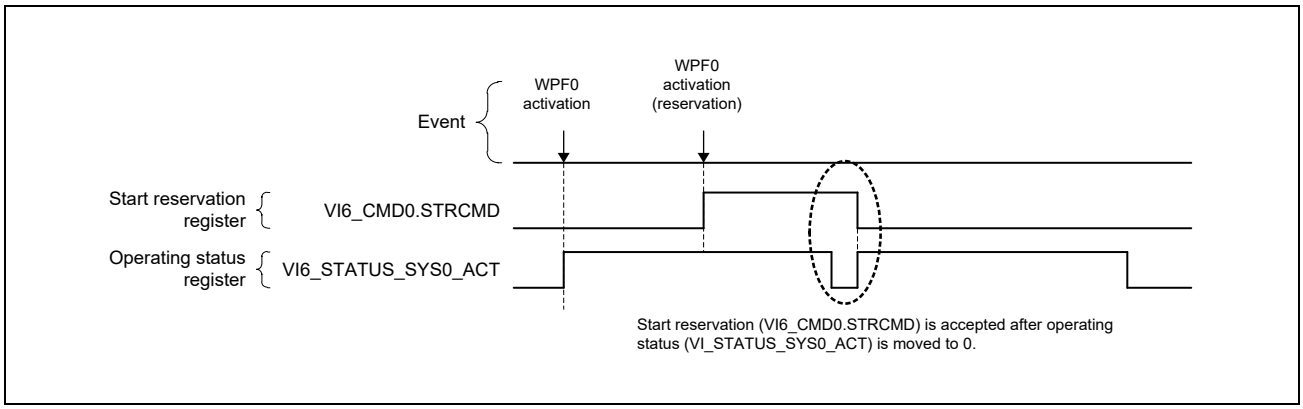

Figure 9.4-33 VSPD Start Reservation and Operating Status

9.4.5.5 Display List

9.4.5.5.1 Functional description

The VSPD provides the display list function. As a display list, the VSPD automatically downloads the register settings except for the control registers (**9.4.3.2.4 General Control Registers** and **9.4.3.2.5 Display List Control Registers**) from external memory and stores the settings in the VSPD registers. This function is advantageous in that the interrupt processing or register setting modification processing can be executed without CPU intervention during multiple-frame processing because the register settings used for VSPD processing are prepared in advance in external memory such as SDRAM.

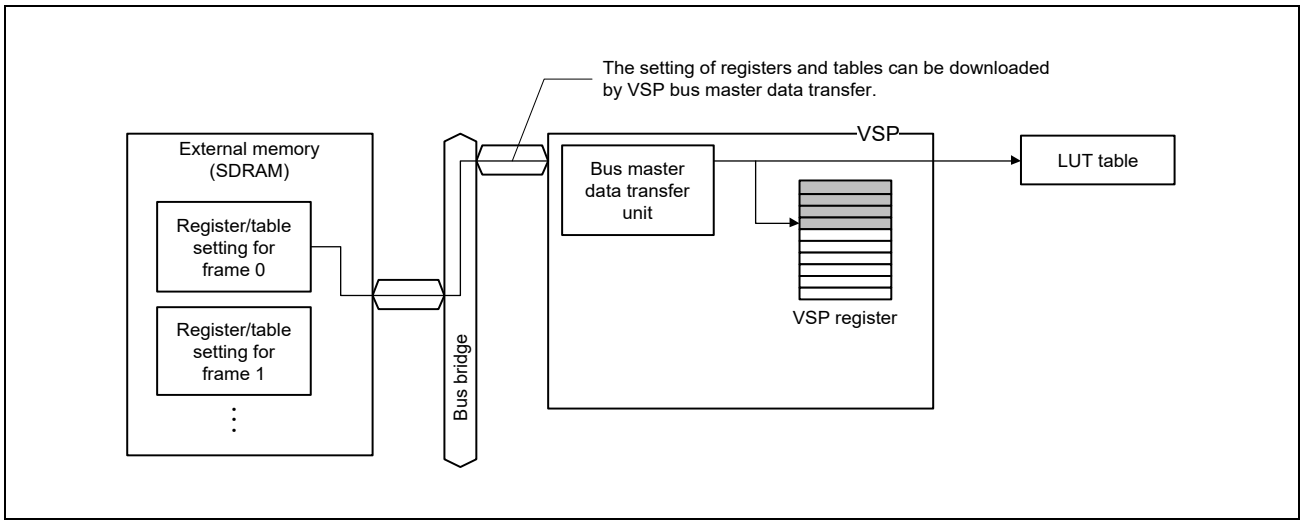

Figure 9.4-34 Concept of Display List

To use display lists, specify the external memory addresses to the display list control registers described in **9.4.3.2.5 Display List Control Registers**. The register settings or various types of information should be stored in external memory in the format described in **9.4.5.5.2 Normal display list mode**. **Figure 9.4-35** shows the difference between VSPD operation through normal register settings and through display lists.

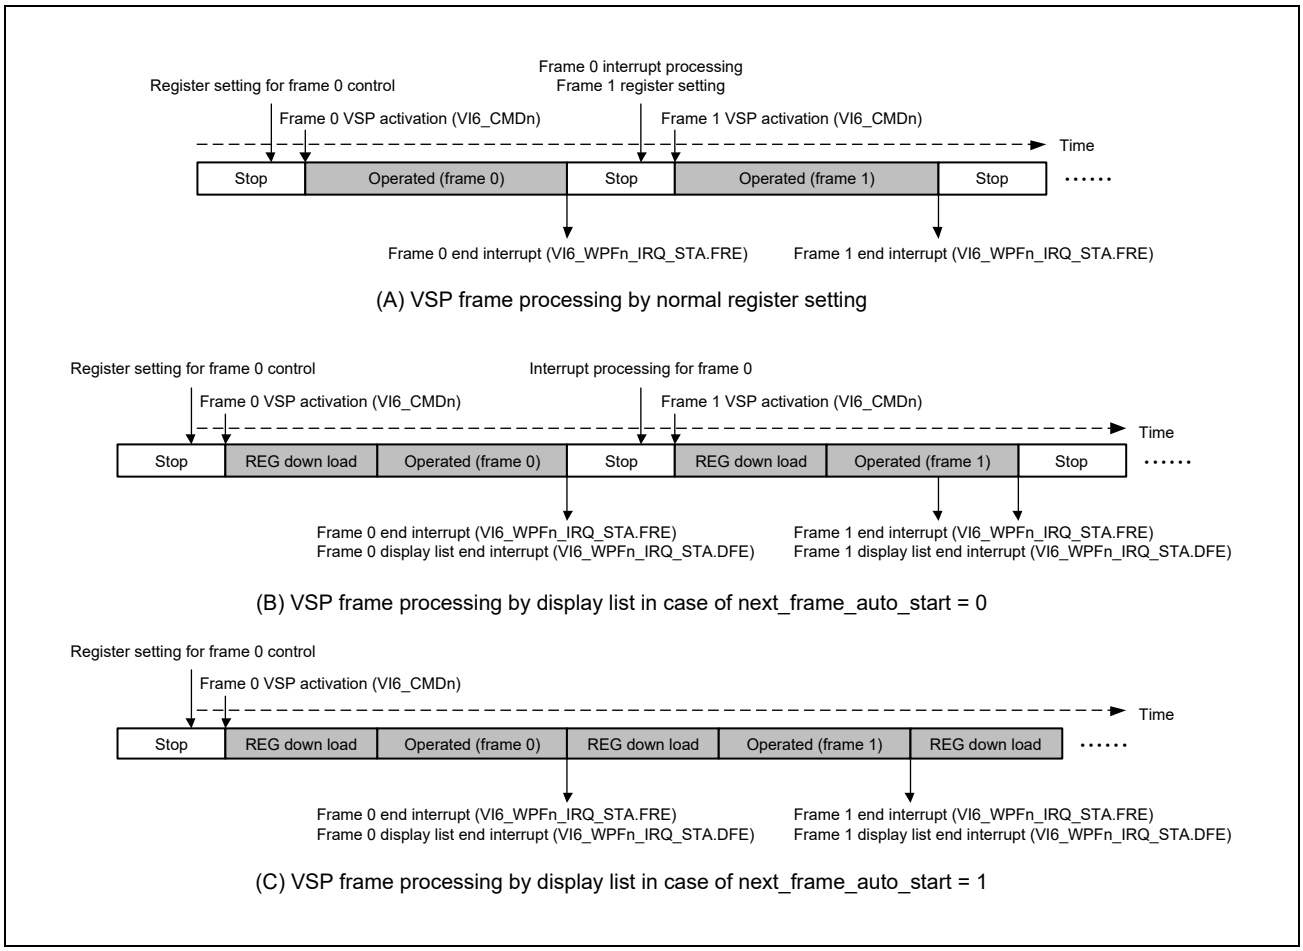

Figure 9.4-35 Comparison of VSPD Operation between Normal Register Settings and Display Lists

As shown in **Figure 9.4-35** (A), in the VSPD processing through normal register settings, all registers should be set up before the VSPD is started for each frame. After the VSPD processing is completed, the VSPD outputs a frame end interrupt (VI6_WPFn_IRQ_STA.FRE). This method requires a certain amount of time for register settings or interrupt processing by the CPU between frames. In contrast, when display lists are used, the VSPD automatically downloads register settings from external memory as shown in **Figure 9.4-35** (B) and (C), which reduces the load on the CPU between frames.

Figure 9.4-35 (B) shows the display list usage where the VSPD stops at the end of every frame; only the VSPD start processing for each frame is done by the CPU. This is suitable for the cases when the CPU controls synchronization of frame processing in frame buffer management or when the amount of register values or table data to be set in the VSPD is large. In the case shown in **Figure 9.4-35** (C), as soon as the frame processing ends, the VSPD automatically begins next frame operation and starts downloading new register settings. This is the fastest operation using display lists.

Table 9.4-29 shows the modes of the display list and the supported functions for each mode. The detail of each mode is described in the following sections.

Table 9.4-29 Display list mode and supported functions

Mode	Extended Display List	Continuous Frames
Normal Display List Mode	Supported	Controlled by “next frame auto start” in the header of the display list.
Header-less Display List Mode	Not Supported	Controlled by VI6_DL_CTRL.CFM0 bit.

9.4.5.5.2 Normal display list mode

The VSPD display lists include control information as well as simple register settings in order to control multiple-frame processing in an optimum way for each application. **Figure 9.4-36** shows the display list structure.

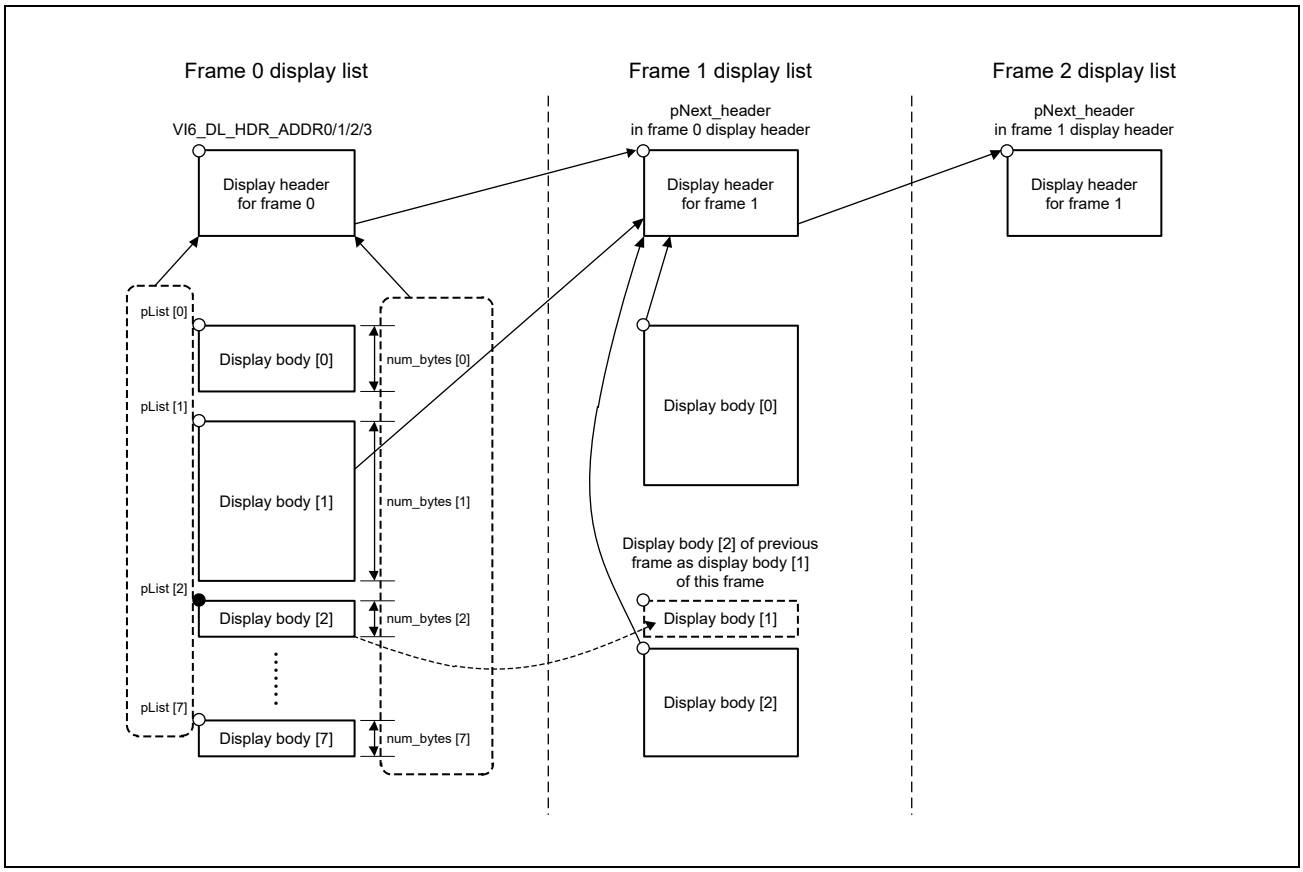

Figure 9.4-36 Structure and Concept of VSPD Display List

A VSPD display list consists of two sections; a header section for storing various information and control flags and a body section for storing register and table settings. A combination of these two sections is defined as a display list for a frame. The register and table settings can be divided and stored in up to eight separate bodies allocated in memory. Therefore, the separate bodies storing the register settings for one frame (for example, frame 0) can have non-sequential start addresses; that is, the bodies for one frame can be allocated to areas distant from each other in memory. To gather these bodies and configure the register settings for one frame, a header is used. A display header stores the number of bodies linked with the header and the start address and size of each body.

The VSPD analyzes the header to gather register and table settings stored in separate memory areas and reconfigures the complete register settings.

The addresses of display headers should be specified in the VSPD registers described in **9.4.3.2.5 Display List Control Registers**. When activated in a mode that uses display lists, the VSPD downloads display headers from the

addresses specified in VI6_DL_HDR_ADDR0 (number 0 correspond to the WPF channel index numbers), analyzes the numbers of bodies and the address and data size of each body, downloads the bodies, and completes register and table settings. After display list downloading is completed, the VSPD becomes ready for frame image processing; the VSPD then starts the actual frame processing.

After processing of a frame ends, the VSPD proceeds to the next frame processing. Here, there are two modes for starting the next frame processing as shown in **Figure 9.4-35**. In one mode, the VSPD stops operation and waits for the next activation by the CPU in the same way as when display lists are not used. In this mode, the address used for downloading the display header of the next frame is kept by the internal hardware. Therefore, if valid address information is not stored in the display header for the previous frame, a correct value should be specified in VI6_DL_HDR_ADDR0 while the VSPD is stopped. When the VSPD is started after a correct value is specified, the VSPD starts next frame processing with the same procedure for the previous frame. In contrast to this mode, which stops the VSPD after the end of one-frame processing, there is another mode for automatically starting next frame processing. In automatic start mode, the VSPD downloads the next display header as soon as the previous frame processing ends. After downloading ends, the VSPD starts image processing. The information regarding mode selection, that is, whether to automatically start next frame processing, should be stored in the display header downloaded for the previous frame.

To strictly define the display list format described above, the following shows the grammatical structure of a display list using pseudo-code. First, to simplify the description of the display list format in the following pages, **Table 9.4-30** defines a function. Function zero bits (num bits) generates a string of one-bit 0s for the number of bits specified by the parameter for the function. By using this function, **Table 9.4-31** defines the header section format of a display list and **Table 9.4-32** defines the body section format and **Table 9.4-33** defines the extended display list body section format.

Data order of Display List Header Section, Display List Body Section and Extended Display List Body Section are assumed as the data is stored in SDRAM by big endian. **Table 9.4-34** shows an example of data order. If data order is not same as the definition, data order within 8byte unit can be adjusted by setting VI6_DL_SWAP (see **(3) Display List-0 Data Swapping Register (LCDC_VSPD_VI6_DL_SWAP0)**).

Table 9.4-30 Definition of a Function for Simple Description

Syntax	Bit Count
zero_bits (num_bits)	
{	
for (i = 0; i<num_bits; i++) {	
zero_bit	1
}	
}	

Bit String	Contents
zero_bit	zero_bit indicates a 1-bit integer having a value of 0.

Table 9.4-31 Format of Display List Header Section

Syntax	Bit Count
display_header () /* Fixed length */	
{	
zero_bits (29)	
num_list_minus1	3
for (i=0; i<8; i++)	
zero_bits (15)	
num_bytes [i]	17
pList [i]	32
}	
pNext_header	32
zero_bits (23)	
wait_wup	1
zero_bits (3)	
ignore_upd_dl	1
zero_bits (2)	
current_frame_int_enable	1
next_frame_auto_start /* 76 bytes from the beginning of this header*/	1
if (VI6_DL_EXT_CTRL.EXT) {	
zero_bits (32) /* padding zero 4 bytes for alignment */	
zero_bits (6)	
pre_ext_dl_exec	1
post_ext_dl_exec	1
zero_bits (8)	
pre_ext_dl_num_cmd	16
pre_ext_dl_pList	32
zero_bits (16)	
post_ext_dl_num_cmd	16
post_ext_dl_pList /* 96 bytes from the beginning of this header*/	32
}	
}	

Bit String	Contents
num_list_minus1	Specifies the value obtained by subtracting 1 from the total number of display list bodies linked with the display header. For example, when this bit field is set to 0, this display list uses one body.
num_bytes [i]	Specifies the number of bytes in the i-th display list body (indicated by index i). Be sure to specify a multiple of eight bytes. For the bodies that are not defined in num_list_minus1 (for example, i = 5 to 7 when num_list_minus1 is set to 4), specify 0.
pList [i]	Specifies the start address of the i-th display list body (indicated by index i). Be sure to specify an address aligned with an 8-byte boundary (the lower-order three bits are 0). For the bodies that are not defined in num_list_minus1 (for example, i = 5 to 7 when num_list_minus1 is set to 4), specify 0.
pNext_header	Specifies the address of the display list header for the next frame. After display list downloading ends, the VSPD keeps its value in the internal memory and uses it in the next display list header downloading. Be sure to specify an address aligned with an 8-byte boundary (the lower-order three bits are 0).
wait_wup	When this bit is 1, VSPD starts reading image data from external memory after WUP (Wake Up) signal from any channel of VIN asserts. This bit is available for WPF0.
ignore_upd_dl	If this bit is set to 1, new display list pointed by VI6_DL_HDR_ADDR0 is not downloaded in VSPD H/W for the next frame, even if S/W sets VI6_DL_HDR_ADDR0 during the frame. New display list is downloaded in VSPD H/W at next frame of the processing which this bit is 0. This bit is available for WPF0.
current_frame_int_enable	This is a flag that indicates whether to set the display list end interrupt source (VI6_WPFn_IRQ_STA.DFE) to 1 when the current frame processing ends. If this flag is set to 0, the display list end interrupt source (VI6_WPFn_IRQ_STA.DFE) is not set to 1 when one-frame processing by this display header ends. In this state, even if the display list end interrupt is enabled (VI6_WPFn_IRQ_ENB.DFEE is set to 1), no interrupt will be generated. If this flag is set to 1, the display list end interrupt source (VI6_WPFn_IRQ_STA.DFE) is set to 1 when one-frame processing by this display header ends. In this state, if the display list end interrupt is enabled (VI6_WPFn_IRQ_ENB.DFEE is set to 1), the VSPD generates an interrupt.
Next_frame_auto_start	Enables or disables automatic start of next frame processing when one-frame processing by this display header ends. If this bit is set to 1, the VSPD starts next frame processing as soon as one-frame processing by this display header ends, and starts downloading the next frame display header from the pNext_header address specified in this display header. If this bit is set to 0, the VSPD stops operation when one-frame processing by this display header ends. In this case, start the VSPD through VI6_CMDn to process the next frame.
pre_ext_dl_exec	Enables execution of the extended display list for frame preprocessing when VI6_DL_EXT_CTRL.EXT is 1. If this bit is set to 1, the VSPD executes the extended display list for frame preprocessing. The VSPD does not execute it if this bit is set to 0. This bit setting is ignored when VI6_DL_EXT_CTRL.EXT is 0.
post_ext_dl_exec	Set 0 to this bit.
pre_ext_dl_num_cmd	Specifies the number of commands in the extended display list body section for frame preprocessing when VI6_DL_EXT_CTRL.EXT is 1. The number of commands that can be specified is 1, and a command is 16 bytes. When pre_ext_dl_exec is set to 0, the extended display list for frame preprocessing is not executed; specify 0 in this bit. This bit setting is ignored when VI6_DL_EXT_CTRL.EXT is 0.
pre_ext_dl_pList	Specifies the start address of the area where the extended display list body section for frame preprocessing is stored when VI6_DL_EXT_CTRL.EXT is 1. Be sure to specify an address aligned with a 16-byte boundary (lower-order four bits are 0). When pre_ext_dl_exec is set to 0, the extended display list for frame preprocessing is not executed; specify 0 in this bit. This bit setting is ignored when VI6_DL_EXT_CTRL.EXT is 0.
post_ext_dl_num_cmd	Set 0 to this bit.
post_ext_dl_pList	Set 0 to this bit.

Table 9.4-32 Format of Display List Body Section

Syntax	Bit Count
display_list (num_bytes) /* Variable length (num_bytes) */	
{	
for (i=0; i<num_bytes; i+=8) {	
set_address	32
set_data	32
}	
}	

Bit String	Contents
set_address	Specifies the address where the value specified by set_data is to be stored. Specify a register address. *Note*: Register space of VSPD is 32 Kbyte (0000h - 7FFCh). So, set 0 to upper 17-bit of set_address in Display List Body Section.
set_data	Specifies the value to be stored in the address specified by set_address. Specify a value to be set in a register.

Table 9.4-33 Format of Extended Display List Body Section

~~	~~~

9.4.5.5.3 Header-less display list mode

The header-less display list does not have the display header listed in **Table 9.4-31**, and it has the simplest structure that has only single body. The extended display list function is not available in case of the header-less display list mode. Set the value 1 to VI6_DL_CTRL.NH0 (see **(1) Display List Control Register (LCDC_VSPD_VI6_DL_CTRL)**) to use the header-less display list. The start address downloaded by the header-less display list should be set to VI6_DL_HDR_ADDR0. And the size of the display body which is originally defined in the display header should be set to VI6_DL_BODY_SIZE0. The header-less display list is available only in WPF0.

9.4.5.5.4 Restrictions on display list usage

Access to the general control registers and display list control registers through a display list is prohibited. When using display lists, be sure to observe the following restrictions on register access by the CPU.

1. Do not execute write access to the same register (same address) from the CPU and through a display list at the same time. If such a conflict occurs, correct operation of the VSPD is not guaranteed.
2. Do not execute write access to the same LUT lookup table from the CPU and through a display list at the same time. If such a conflict occurs, correct operation of the VSPD is not guaranteed. Here, the same lookup table means the address space having the same space name shown in **Table 9.4-35**.
3. When read access by the CPU and write access through a display list to the same register (same address) occur at the same time, the read value returned to the CPU is not guaranteed.
4. When read access by the CPU and write access through a display list to the same LUT lookup table occur at the same time, the read value returned to the CPU is not guaranteed. Here, the same lookup table means the address space having the same space name shown in **Table 9.4-35**.
5. For other restrictions on values and timing of register setting through display lists, refer to the restrictions on normal register settings described in **9.4.3.2.3 Restrictions on Access to Registers and Lookup Tables**.
6. Manipulation and setting of the registers described in **9.4.3.2.4 General Control Registers** and **9.4.3.2.5 Display List Control Registers** through a display list is prohibited.
7. Do not use extended display lists.

9.4.5.6 Interrupt Processing

9.4.5.6.1 vs1o_intreq_n

When a WPF module generates an internal source that should be notified, an interrupt signal is output. As internal sources are generated in WPF independently, the VSPD has the following registers to control interrupts in WPF.

- WPFn Interrupt Enable Registers (VI6_WPFn_IRQ_ENB: n = 0) (refer to **(12) WPF0 Interrupt Enable Register (LCDC_VSPD_VI6_WPF0_IRQ_ENB)**)
- WPFn Interrupt Status Registers (VI6_WPFn_IRQ_STA: n = 0) (refer to **(13) WPF0 Interrupt Status Register (LCDC_VSPD_VI6_WPF0_IRQ_STA)**)

CAUTION

To use interrupts, enable them through WPF interrupt enable registers. If an interrupt source register has already been set to 1 for some reason, an unintended interrupt will occur as soon as the corresponding interrupt enable register is set as enabled. To avoid this, before enabling interrupts through WPF interrupt enable registers, be sure to clear all WPF interrupt sources to be enabled to 0. Be careful about this procedure when setting up registers before starting the VSPD.

9.4.5.6.2 duo_intr_n

When the PBUF will detect a FIFO underflow, an interrupt signal is output. The DU has the following registers to control the interrupt.

- DU Module Status Register 0 (DU_MSR0) (refer to **9.4.4.2.2 DU Module Status Register 0 (LCDC_DU_MSR0)**)
- DU Interrupt Mask Register 0 (DU_IMR0) (refer to **9.4.4.2.4 DU Interrupt Mask Register 0 (LCDC_DU_IMR0)**)

CAUTION

To use interrupts, enable them through DU Interrupt Mask Register. If an interrupt is asserted, the PBUF is underflowing and invalid display data is being output. When an interrupt occurs, the interrupt can only be cleared by DU_MCR0.PB_CLR register.

If DU_MCR1.PB_AUTOCLR is set a value other than 0, an interrupt is cleared according to the DU_MCR1.OPMD register.

9.4.5.7 Lookup Table Settings

9.4.5.7.1 LUT

For a single entry to the LUT space (see **Table 9.4-35**) of the VSPD, the LUT data is set by a write access in the format shown in **Figure 9.4-37**.

The entry address of each space is (start address of the space) + (entry number counting from the base point 0 × 4). For example, the address of entry 7 to the LUT space is (offset address) + 7000h + 7 × 4 = (offset address) + 701Ch.

Table 9.4-35 shows the spaces for which entries can be made. Note that if the module that references that space is operating, write accesses to the relevant space are prohibited. For example, while RPF2 is operating, accesses to the entire space of VI6_CLUT2_TBL are prohibited. When a read access is made to the relevant space during operation of the referencing module, undefined values will be read out.

The operating/stopped state of each module in **Table 9.4-35** is the operating state of the WPF to which each module is connected. Determine whether the module is operating or stopped using each WPF operating status bit in the VI6_STATUS register.

Table 9.4-35 LUT Space Addresses

Space Name	Space Addresses	Entry Count	Module that References the Space in the Left Column
VI6_LUT_TBL	(offset address) + 7000h to (offset address) + 73FCh	256	LUT

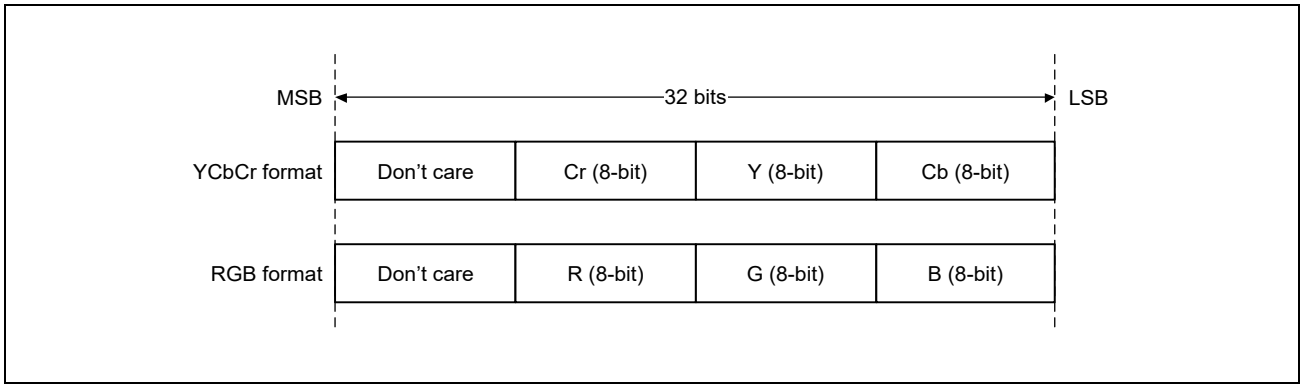

Figure 9.4-37 VI6_LUT_TBL Formats

9.4.5.8 Linked with DU

9.4.5.8.1 Operation flow of VSPD and DU

This section shows operation flow of VSPD by using Normal Display List Mode. For details of Normal Display List Mode, refer to **9.4.5.5.2 Normal display list mode**.

Figure 9.4-38 and **Figure 9.4-39** shows a procedure (register setting flow) to display image data to display panel.

Figure 9.4-38 shows setting flow to start VSPD/LIF0 linked with DU. **Figure 9.4-39** shows setting flow to update display image.

Using display list with enabling next_frame_auto_start shown in **9.4.5.5 Display List** is required to take the flow from **Figure 9.4-38** and **Figure 9.4-39**.

NOTE

If display sync operation ([1-7] step in **Figure 9.4-38**) is set before activating the VSPD, invalid data is displayed until image data read from external memory is ready to be transferred to DU. In this case, image data from external memory is displayed late by one vsync or more.

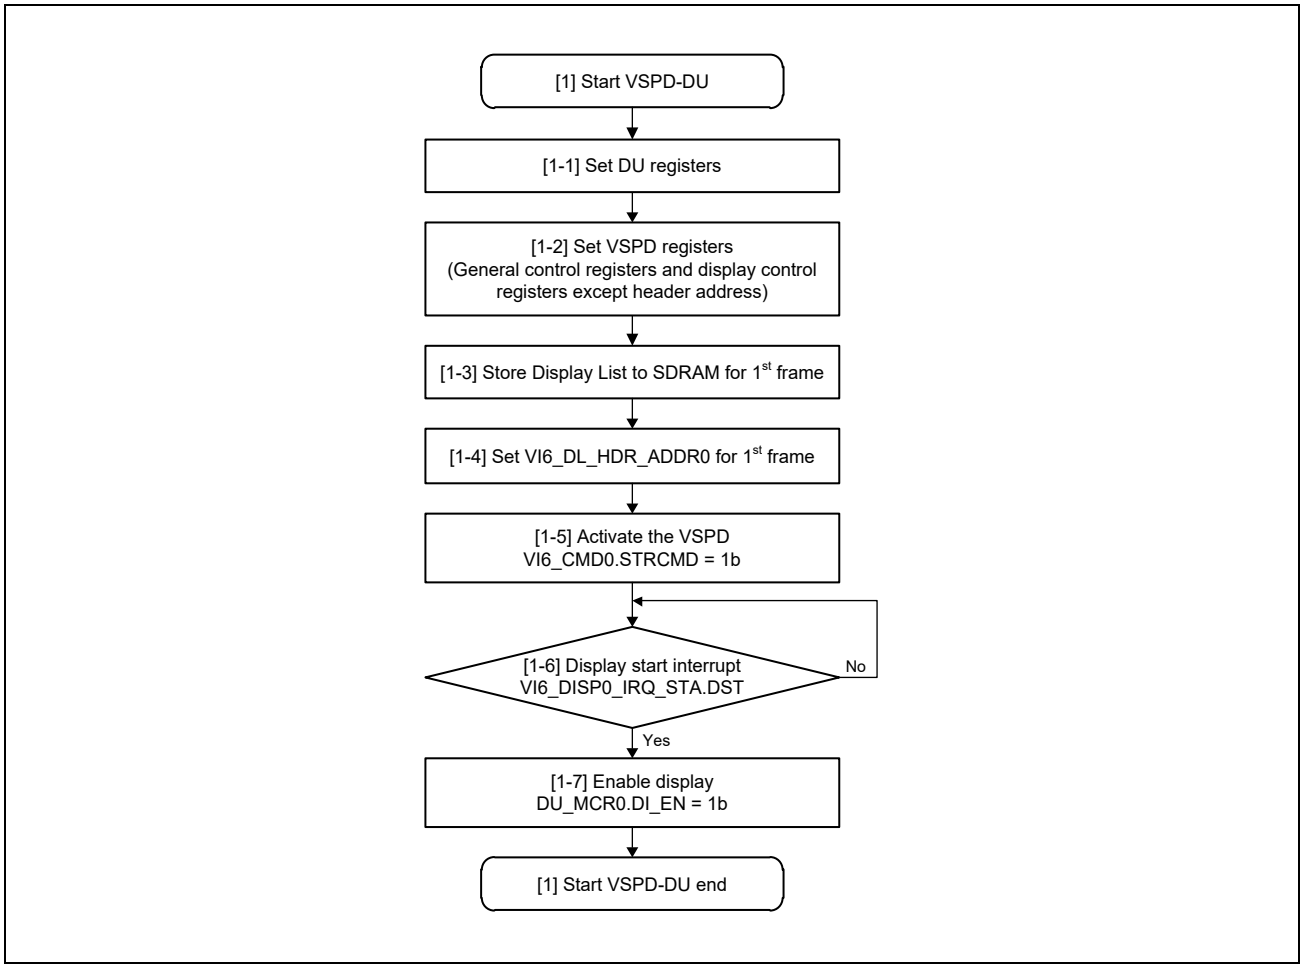

Figure 9.4-38 Setting Flow to Start VSPD Linked with DU

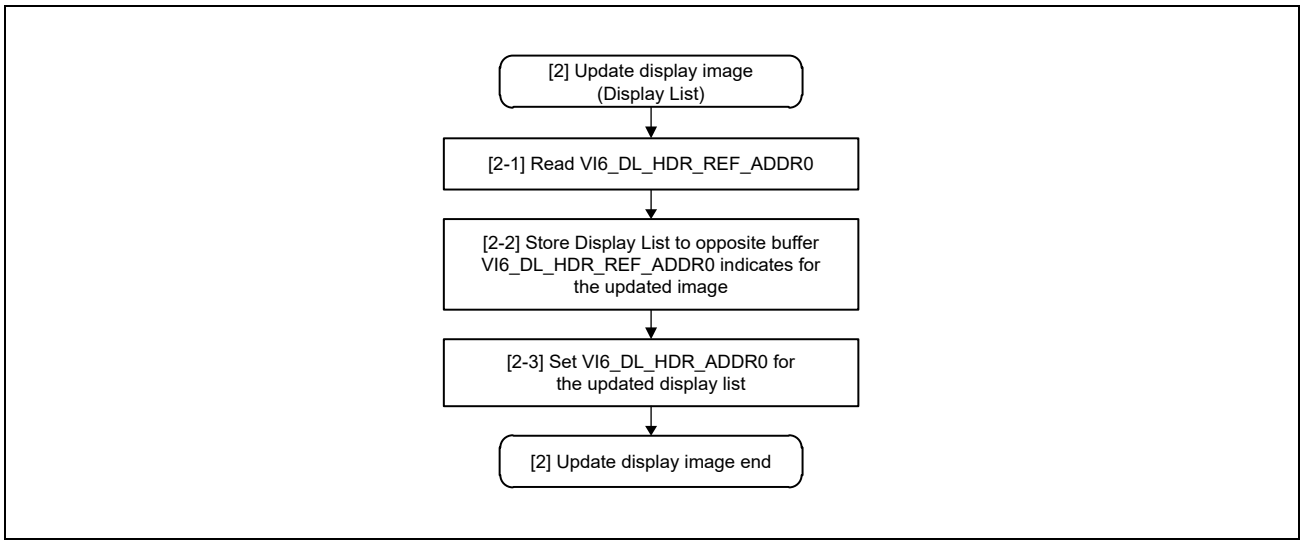

Figure 9.4-39 Setting flow to update display image

It is possible to update display list at any time (arbitrary timing) as shown in **Figure 9.4-39**. Don't overwrite display list in external memory pointed by VI6_DL_HDR_REF_ADDR. It is because VSPD is reading the display list pointed by VI6_DL_HDR_REF_ADDR or will be reading the display list soon.

Detail explanation is shown below.

As shown in **(6) Display List-0 Header Reference Address Register (LCDC_VSPD_VI6_DL_HDR_REF_ADDR0)**, when VSPD is reading display list from external memory (Period [A] in **Figure 9.4-40**), VI6_DL_HDR_REF_ADDRn indicates header address of the display list referred by VSPD. When VSPD is not reading display list from external memory (Period [B] in **Figure 9.4-40**), VI6_DL_HDR_REF_ADDRn indicates the value of VI6_DL_HDR_ADDRn, and there is possibility that the display list is being read soon by VSPD at next frame start timing. Therefore, keep display list in external memory pointed by VI6_DL_HDR_REF_ADDR. Detail software sequence to update display list and VSPD -H/W behavior are shown below.

[1] Store latest display list in external memory area different from the area pointed by VI6_DL_HDR_REF_ADDR, because the area pointed by VI6_DL_HDR_REF_ADDR is being read or is being read soon by VSPD.

[2] Set header address of new display list into VI6_DL_HDR_ADDRn.

[3] VSPD reads display list from the external memory area pointed by VI6_DL_HDR_ADDRn at frame start timing.

Refer also to **(2) Display List-0 Header Address Register (LCDC_VSPD_VI6_DL_HDR_ADDR0)** and **(6) Display List-0 Header Reference Address Register (LCDC_VSPD_VI6_DL_HDR_REF_ADDR0)**.

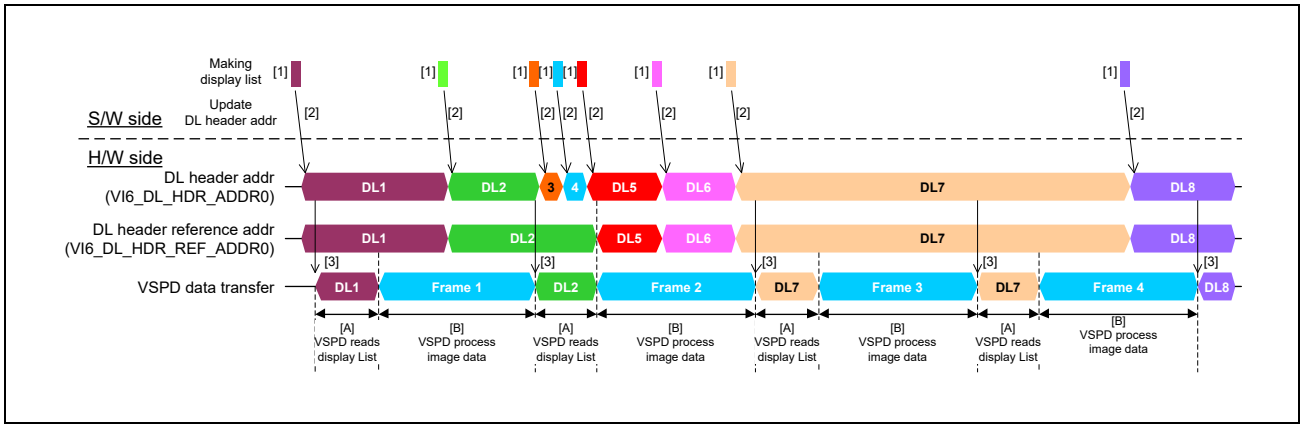

Figure 9.4-40 Updating display list at arbitrary timing

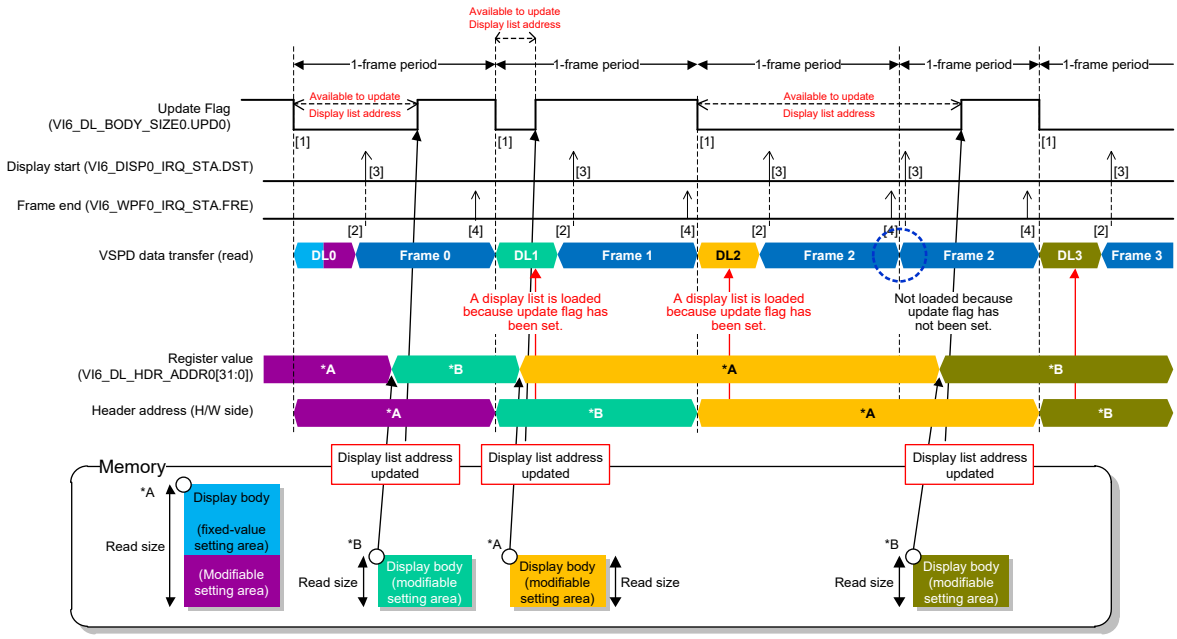
9.4.5.8.2 Controlling two register planes using display lists

This section shows operation flow of VSPD by using Header-less Display List Mode. Start procedure and stop procedure are same with Normal Display List Mode in **9.4.5.8.1 Operation flow of VSPD and DU** except for the point that VI6_DL_BODY_SIZE0 should be set before step [1-5] in start procedure shown in **Figure 9.4-38**. The procedure to update display list is different with Normal Display List Mode, and is described later. **Figure 9.4-41** shows the control of two register planes using header-less display lists (see **9.4.5.5.3 Header-less display list mode**) and its timing. In the description hereafter, the use of header-less display lists is always assumed and they are simply called display lists.



Display list plane A: “Fixed-value settings” and “modifiable settings” are stored as a set in contiguous area A.
Display list plane B: Only the “modifiable settings” are stored in area B, which is separate from display list A.

To switch settings for every frame, modify two display list planes alternately. After every modification, update the display list address register (VI6_DL_HDR_ADDR0[31:0]) and writing 1 to update flag (VI6_DL_BODY_SIZE0.UPD0) in the VSPD.
Update flag (VI6_DL_BODY_SIZE0.UPD0) is negated automatically after Header Address is loaded into H/W side.

Figure 9.4-41 Controlling Two Register Planes Using a Display List

The VSPD downloads a display list immediately after activation. In the start frame, download the display list that contains all necessary settings. From the next frame on, only the necessary register or table values should be specified in a display list.

When the update flag of VI6_DL_BODY_SIZE0.UPD0 is set to 1, VSPD downloads a new display list at the start of the next frame. When the update flag of VI6_DL_BODY_SIZE0.UPD0 is set to 0, the register settings acquired from the display list previously downloaded are retained and used for the next operation without downloading a new display list.

Order of each VSPD -H/W Events mentioned as [1], [2], [3] and [4] in **Figure 9.4-41** are shown below.

[1] VI6_DL_BODY_SIZE0.BS0 and VI6_DL_HDR_ADDR0 are downloaded in H/W side. And Update Flag (VI6_DL_BODY_SIZE0.UPD0) is negated automatically.

[2] Reading DisplayList from external memory into VSPD -H/W is finished through master access.

[3] Display start interrupt status (VI6_DISP_IRQ_STA.DST) asserts.

[4] Frame end interrupt status (VI6_WPF0_IRQ_STA.FRE) asserts.

Don’t overwrite the display list in external memory for a period from “[4] VI6_WPF0_IRQ_STA.FRE” to next “[3] VI6_DISP_IRQ_STA.DST”, because VSPD is reading the display list for the period.

9.4.6 Usage Note

9.4.6.1 Assignment in Memory Space

Make sure that VSPD memory space shall be mapped to Non-Cache region.

9.4.6.2 Limitations on Software Reset and Module Standby

Stop LCDC with the software reset sequence following to the guidance in **9.4.5.1 Operation Control Setting**.

9.4.6.3 Input Image Size

Table 9.4-36 is a list of input size specifications.

Table 9.4-36 List of Input Size Specifications

Module	Min. Input Size	Max. Input Size	Restriction on Setting Unit
RPF	1 (horizontal) × 1 (vertical) pixel	1920 (horizontal) × 1200 (vertical) pixels	YCbCr422: 2-pixel units horizontally and 1-pixel units vertically. YCbCr420: 2-pixel units both horizontally and vertically. Other formats: 1-pixel units both horizontally and vertically. *Note 1.* When the 1-bpp alpha plane*1 is input, the size can always be specified in 8-pixel units both horizontally and vertically regardless of the input format. *Note 2.* These restrictions including note 1 are applied to the following. VI6_RPFn_SRC_BSIZE VI6_RPFn_SRC_ESIZE
LUT	1 (horizontal) × 1 (vertical) pixel	1920 (horizontal) × 1200 (vertical) pixels	1-pixel units both horizontally and vertically.
BRS	1 (horizontal) × 1 (vertical) pixel	1920 (horizontal) × 1200 (vertical) pixels	1-pixel units both horizontally and vertically.
LIF	1 (horizontal) × 1 (vertical) pixel	1920 (horizontal) × 1200 (vertical) pixels	1-pixel units both horizontally and vertically.
WPF	1 (horizontal) × 1 (vertical) pixel	1920 (horizontal) × 1200 (vertical) pixels	YCbCr422: 2-pixel units horizontally and 1-pixel units vertically. YCbCr420: 2-pixel units both horizontally and vertically. Other formats: 1-pixel units both horizontally and vertically. *Note 1.* This restriction on the WPF only applies to the WPF output size. The WPF input size should be specified in 1-pixel units.

Note 1. When VI6_RPFn_ALPH_SEL.ASEL is set to 011b.

The most important restriction shown in **Table 9.4-36** is the setting unit. Make appropriate register settings so that the size of the image input to each module does comply with setting units and does not exceed the limits shown in **Table 9.4-36**.

9.4.6.4 Output Image Size

The size of the output from each WPF is determined by the results of processing in the modules connected with the DPR. As shown in **Figure 9.4-1**, the data input to the VSPD is sent to the WPF output modules through the RPF and the modules connected with the DPR. When there is no processing that changes the image size through this data path, the WPF output size is the same as the RPF input size. **Table 9.4-37** is a list of the processing that changes image size.

Table 9.4-37 Image Processing that changes image size

Module	Function*1	Related Register	Size of Output from Module
WPF	Input size clipping	VI6_WPFn_HSZCLIP VI6_WPFn_VSZCLIP	When this function is disabled, the input size and the output size are the same. When this function is enabled, the output is in the following size. Horizontal output size: VI6_WPFn_HSZCLIP.HCL_SIZE × 2 setting Vertical output size: VI6_WPFn_VSZCLIP.VCL_SIZE × 2 setting
LIF	Padding line	VI6_LIFn_CTRL	When padding with dummy lines is disabled, output size is same with Input size. When padding with dummy lines is enabled: Horizontal output size: input size Vertical output size: VI6_LIF0_PADLN_SIZE setting

Note 1. For details of each function, refer to the descriptions of the related registers.

Note 2. Refer to **9.4.3.2.1 Notational Conventions for Registers and Bit Fields** for explanation of register bit field.

The input image size can be changed only with the modules and functions shown in **Table 9.4-37**. With the other modules and functions, the input size and output size are the same. Accordingly, after module connections with the DPR are determined, the VSPD output size can also be determined through the following steps.

1. The image size (VI6_RPFn_SRC_ESIZE) read from the external memory and sent to the DPR by the RPFn is the initial value.
2. When the module connected with the DPR is not a module (function) shown in **Table 9.4-37**, the output size from the module is the same as the input size; the image size does not need to be updated.
3. When a module connected with the DPR is a module (function) shown in **Table 9.4-37**, the output image size should be updated to the size shown in the table, which should be used as the input image size for the module connected behind it.
4. When the final image size at the WPFn is determined, this size is the VSPD output size for that WPFn path.

Figure 9.4-42 shows how to determine the image size in a sample DPR connection through the above steps. The related conditions that determine the image size are also shown.

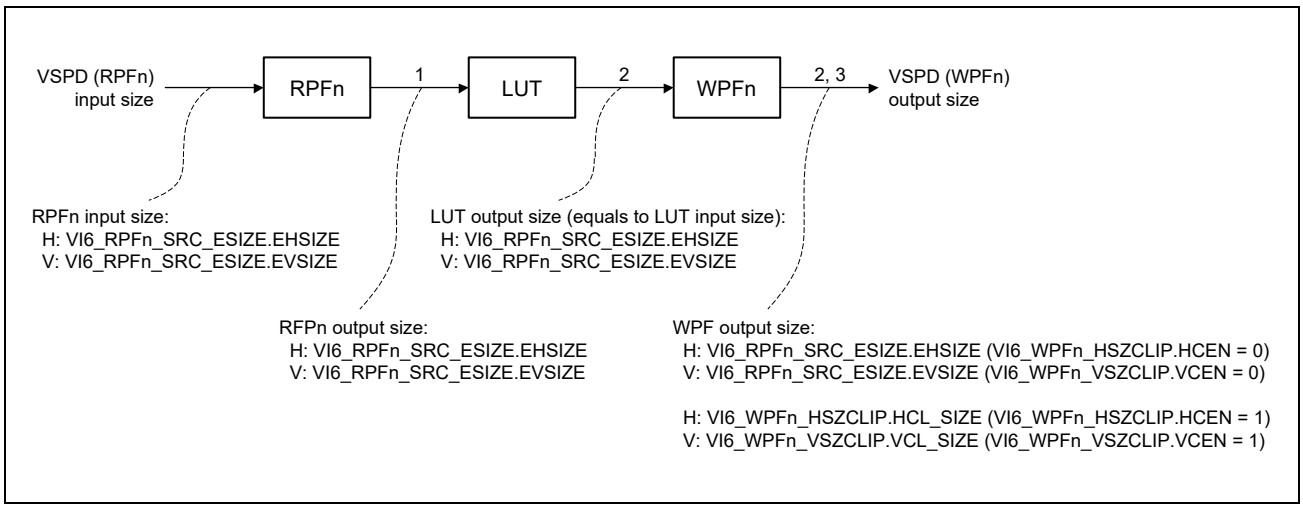


Figure 9.4-42 Input/output Size for Each Module in a Sample DPR Connection

Make appropriate register settings in each module so that the VSPD output image size determined as shown in the figure does not violate the restrictions shown in **Table 9.4-37**.

9.4.6.5 Restriction

When the data output from this unit is written back to the same memory area where the input data for this unit has been read, this unit has the following restrictions.

1. The access order and format on the frame memory are the same between the input pixels and output pixels.
2. Specifying a larger output image size than the input image size, either vertically or horizontally or both vertically and horizontally, is prohibited.
3. When the YCbCr4:2:0 format is input, operation between color components is prohibited.

These restrictions are summarized in. Refer to the descriptions of the registers related to each restriction. In the table, RPFm indicates the RPFn that inputs the master layer, and WPFwb indicates the WPFn that writes back the output image to the source image area for the master layer.

Table 9.4-38 Restrictions on Use when Output Data is Written Back to Input Data Area

No.	Restriction	Related Registers
Restriction 1	The RPFm input format and the WPFwb output format should be the same.	VI6_RPFn_INFMT.RDFMT VI6_RPFn_INFMT.VIR
	The RPFm source image storing address and the WPFwb destination address should be the same.	VI6_RPFn_SRCM_ADDR_*
	The RPFm source picture memory stride and the WPFwb destination memory stride should be the same.	VI6_RPFn_SRCM_PSTRIDE VI6_RPFn_SRCM_ASTRIDE
	The RPFm and WPFwb data swapping settings should be the same.	VI6_WPFn_DSWAP
Restriction 2	The RPFm basic read size and extended read size should be the same.	VI6_RPFn_SRC_BSIZE VI6_RPFn_SRC_ESIZE
	Color space conversion is prohibited in RPFm and WPFwb.	VI6_RPFn_INFMT.CSC VI6_WPFn_OUTFMT.CSC
Restriction 3*1	NOP should be specified for IROP operation.	VI6_RPFn_ALPH_SEL.IROP
	Color keying is prohibited.	VI6_RPFn_CKEY_CTRL.CV

Note 1. When the input format is not YCbCr4:2:0, restriction 3 in not applied.

SECTION 9 IMAGE

9.5 MIPI DSI Interface (DSI)

9.5.1 Overview

This section describes the features of the MIPI-DSI unit of this LSI.

This unit is the MIPI-DSI Tx Module; it is composed of the MIPI DSI-2 host controller (LINK) and the MIPI D-PHY Tx (D-PHY).

This unit supports the MIPI Alliance Specification for Display Serial Interface (DSI) Specification. This unit provides a solution for transmitting MIPI DSI compliant digital video and packets. The normative references are listed below.

- MIPI Alliance Specification for Display Serial Interface Version 1.3.1
- MIPI Alliance Specification for D-PHY Version 1.2

9.5.1.1 Features

The following is key features of this unit.

In this document the word “DSI” means “Display Serial Interface Version 1.3.1”.

Overview

- 1 channel
- The number of lanes: 4 lanes
- Supports up to Full HD (1920 × 1200), 60 fps (RGB888)
- Maximum bandwidth: 1.5 Gbps per lane
- Supports the output data format: RGB666 / RGB888

Protocol Interface

- PPI interface (8 bits)
- Packet generation from Video Input signal for Video Mode (Video-Input Operation)
  - Supports the RGB format (18-bit, 18-bit loosely and 24-bit)
  - Not supports the RGB format (30-bit and 36-bit)
  - Not supports the YCbCr 4:2:2 format (16-bit, 20-bit loosely and 24-bit)
  - Not supports the YCbCr 4:2:0 format (12-bit)
  - Not supports Compressed Pixel Stream
  - Supports Blanking Packet or LP-11 selection during each of HSA, HBP, and HFP blanking interval
  - Supports “Non-Burst Mode with Sync Pulse”, “Non-Burst Mode with Sync Event”, and “Burst Mode”
  - Not supports interlaced video
  - Not supports deskew pattern insertion after vertical video data timing

- LP only packet generation and LP packet reception from descriptor list (Sequence Operation channel 0)
  - Supports one sequence input channel
- HS or LP packet generation and LP packet reception from descriptor list (Sequence Operation channel 1)
  - Supports one sequence input channel

Link Layer

- Supports 1, 2, 3, and 4 lane configurations
- Supports unidirectional high-speed mode Tx
- Supports bidirectional LP mode Tx/Rx (Only Lane0)
- Supports ECC/Checksum generation for Tx packet
- Supports ECC/Checksum verification and ECC error correction for Rx packet
- Supports automated insertion of EoTp in HS mode
- Supports ULPS (Tx)
- Supports automated power change to LP mode and return to HS mode
- Supports automated clock stop and resume (non-continuous clock mode)
- Supports assignment for Virtual Channel for video input channel in Video-Input Operation
- Supports assignment for individual Virtual Channel for each packet in Sequence Operation
- Supports detection for PHY contention error and timeout error
- Supports generation of scrambled packets
- Not supports input of TE signal

PHY Layer

- Synchronous link between Master (data source) and Slave (data sink)
- All lanes support high-speed transmission in the forward direction.
- Bi-directional data transmission in Low-Power mode at the Master Data Lane 0 only
- Uses token passing to control the communication direction of the link.
- High-Speed mode for fast data traffic and Low-Power mode for controls and low-speed data transmission.
- High-Speed mode: Differential and terminated, 200 mV swing, and 80 - 1500 Mbps operation speed.
- Low-Power mode: Single-ended and non-terminated, 1.2 V swing, and maximum 10 Mbps speed.
- Number of lanes
  - Master data lane: 4 lanes
  - Master clock lane: 1 lane
- Lane module functions
  - Master data lane 0: CIL-MFAA (HS-TX, LP-TX, LP-RX, LP-CD)
  - Master data lanes 1 to 3: CIL-MFEN (HS-TX, LP-TX)
  - Master clock lane: CIL-MCNN (HS-TX, LP-TX)

- Optional functions

  [Escape mode]

  - LPDT
    - LP transmit: Supported
    - LP receive: Supported (only Master Data Lane 0)
    - ULPS: Supported
    - Reset trigger: Supported
  - Bi-direction
    - Bus turn-around: Supported
    - Contention detection: Supported
  - Calibration
    - Deskew calibration / Preamble: Not-supported
    - Pre/De-Emphasis: Not-supported
    - Equalization: Not-Supported

9.5.1.2 Block Diagram

Figure 9.5-1 shows a block diagram.

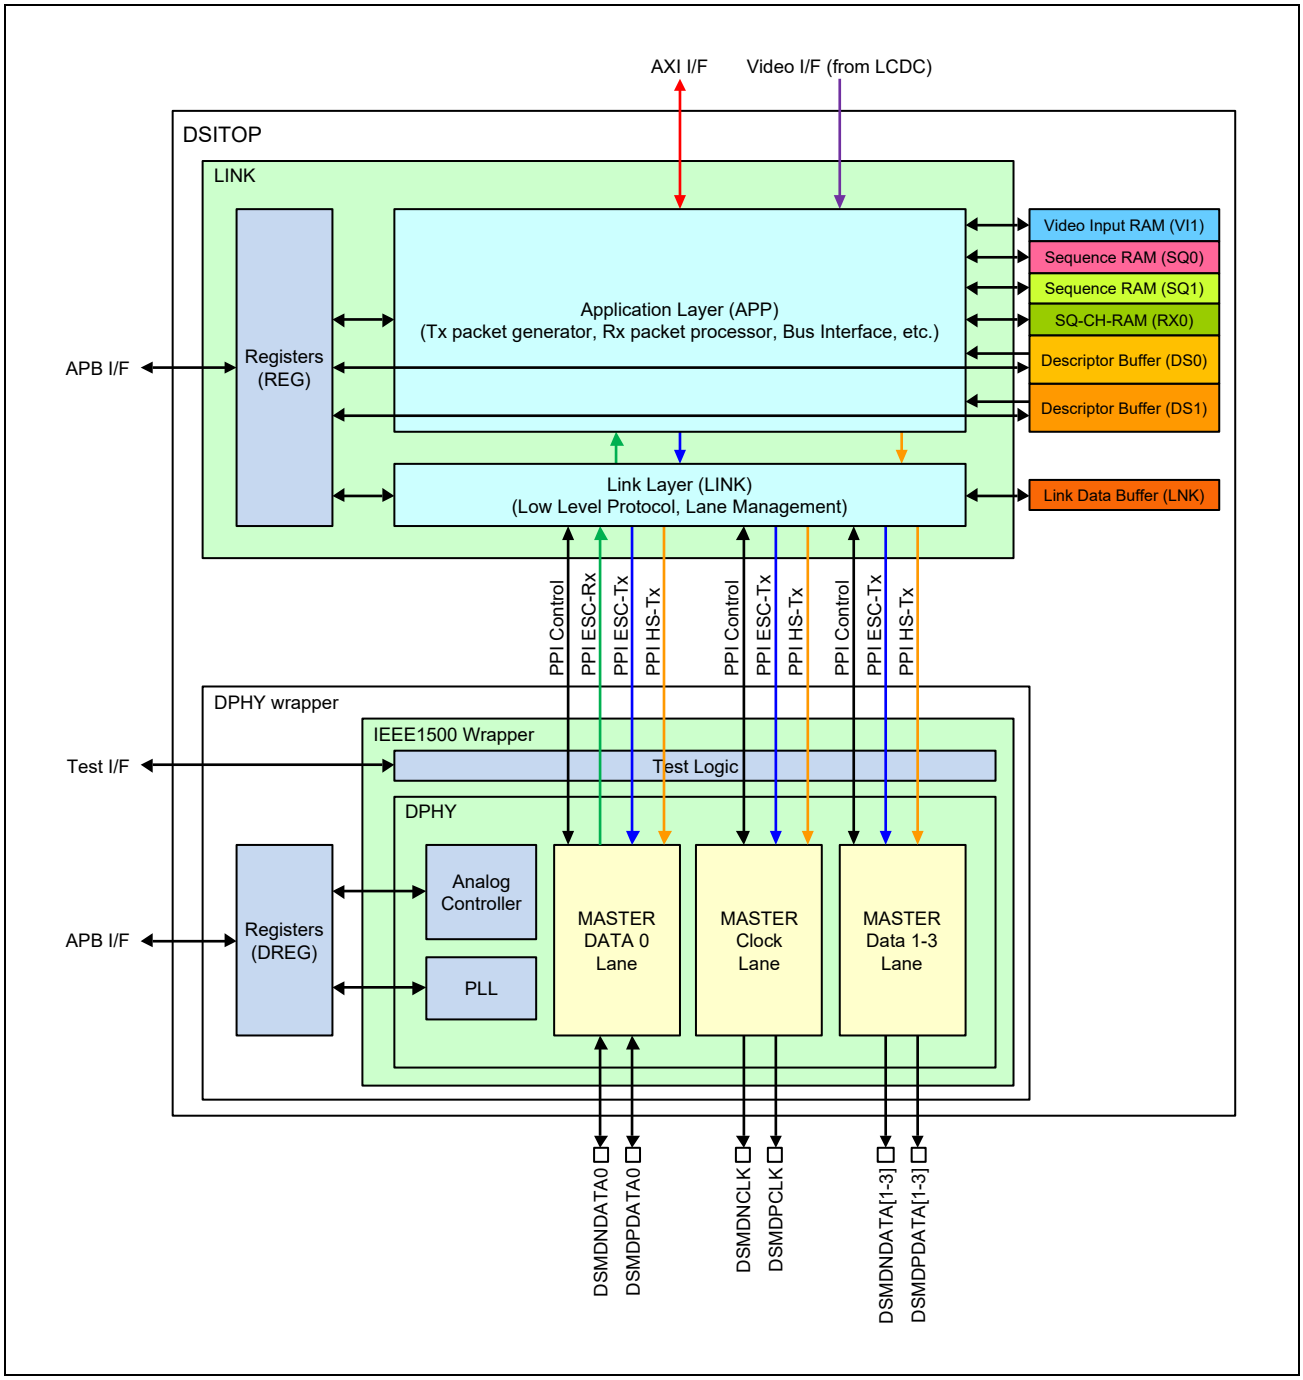

Figure 9.5-1 Block Diagram

9.5.1.3 External Pins

Table 9.5-1 shows the pin configuration.

Table 9.5-1 External Pins

Pin Name	Input/Output	Function
DSI_DPCLK	Output	MIPI DSI Tx clock lane (pos)
DSI_DNCLK	Output	MIPI DSI Tx clock lane (neg)
DSI_DPDATA0	Output	MIPI DSI Tx data 0 lane (pos)
DSI_DNDATA0	Output	MIPI DSI Tx data 0 lane (neg)
DSI_DPDATA1	Output	MIPI DSI Tx data 1 lane (pos)
DSI_DNDATA1	Output	MIPI DSI Tx data 1 lane (neg)
DSI_DPDATA2	Output	MIPI DSI Tx data 2 lane (pos)
DSI_DNDATA2	Output	MIPI DSI Tx data 2 lane (neg)
DSI_DPDATA3	Output	MIPI DSI Tx data 3 lane (pos)
DSI_DNDATA3	Output	MIPI DSI Tx data 3 lane (neg)

9.5.1.4 Clocks

The following shows a list of clocks for this unit.

- T_{LPX}: Transmitted length of any low-power state period (Min: 50 ns)
- $T_{LPX(H)}$: TLPX of the host processor (the DSI-2 TX module)
- $T_{LPX(P)}$: TLPX of the peripheral device (connected device)

Table 9.5-2 Clocks and the Frequency Range

Clock Name	CPG Clock Name	Input/ Output	Description	Frequency (MHz)
pclk	DSI_0_pclk	Input	APB clock	100
aclk	DSI_0_aclk	Input	AXI clock	400/200/100/50/13
vclk1	DSI_0_vclk1	Input	Video clock	187.5 to 5.44
lpclk	DSI_0_lpclk	Input	DSI Escape mode Transmit Clock (TxClkEsc) Set D-PHY TxClkEsc ($1/T_{LPX(H)}$) frequency. $T_{LPX(H)}/T_{LPX(P)}$ needs to set between 2/3 to 3/2.	16/8/4/2
PLLREFCLK	DSI_0_PLLREFCLK	Input	PLL reference input clock	24
hsclk	—	—	DSI High-Speed Transmit Word Clock (TxWordClkHS) Upper limit for D-PHY 1.5 Gbps Lower limit for D-PHY 80 Mbps This clock is supplied from D-PHY directly, and its frequency is 1/8 of the PLL clock frequency (F_{FOUT}).	10 to 187.5
lppclk	—	—	DSI Escape mode Receive Clock (RxClkEsc) This clock is supplied from D-PHY directly, and its frequency is ($1/T_{LPX(P)}$). This clock is generated dividing in D-PHY.	2 to 20

Video clock and DSI HS Byte clock must follow the relationship.

Video clock Frequency [Hz] × Video Pixel Bit Depth [bit]
<= DSI HS Byte clock Frequency [Hz] × 8 [bit] × Number of DSI HS Data Lane

9.5.2 DSI Registers

The base addresses for the DSI are as follows.

Table 9.5-3 Register Base Addresses

Base Register Name	Unit Name	Base Address
<DSI_LINK_base>	DSI (LINK)	0_1643_0000h (5643_0000h*1, 4643_0000h*2)
<DSI_DPHY_base>	DSI (DPHY)	0_1644_0000h (5644_0000h*1, 4644_0000h*2)

Note 1. CM33 address space (non-secure)

Note 2. CM33 address space (secure)

9.5.2.1 List of Registers

9.5.2.1.1 Registers in LINK

This section describes the registers in LINK. All registers can be accessed in 8/16/32 bits.

Register Name	Abbreviation	Initial Value	Offset Address	Access Size [bits]
Interrupt Status Register	DSI_LINK_ISR	0000_0000h	0000h	8, 16, 32
Reserve	-	-	0004h to 000Fh	-
Link Status Register	DSI_LINK_LINKSR	0000_0000h	0010h	8, 16, 32
Reserve	-	-	0014h to 00FFh	-
Tx Set Register	DSI_LINK_TXSETR	0003_0003h	0100h	8, 16, 32
HS Clock Set Register	DSI_LINK_HSCLKSETR	0000_0000h	0104h	8, 16, 32
ULPS Set Register	DSI_LINK_ULPSSETR	0000_00A0h	0108h	8, 16, 32
ULPS Control Register	DSI_LINK_ULPSCR	0000_0000h	010Ch	8, 16, 32
Reset Control Register	DSI_LINK_RSTCR	0000_0000h	0110h	8, 16, 32
Reset Status Register	DSI_LINK_RSTSR	0000_0F00h	0114h	8, 16, 32
Reserve	-	-	0118h to 011Fh	-
DSI Set Register	DSI_LINK_DSISETR	80F1_0001h	0120h	8, 16, 32
Receive Buffer Size Register	DSI_LINK_RXBUFSZR	0000_0000h	0124h	8, 16, 32
Reserve	-	-	0128h to 015Fh	-
Tx Packet Payload Data 0 Register	DSI_LINK_TXPPD0R	0000_0000h	0160h	8, 16, 32
Tx Packet Payload Data 1 Register	DSI_LINK_TXPPD1R	0000_0000h	0164h	8, 16, 32
Tx Packet Payload Data 2 Register	DSI_LINK_TXPPD2R	0000_0000h	0168h	8, 16, 32
Tx Packet Payload Data 3 Register	DSI_LINK_TXPPD3R	0000_0000h	016Ch	8, 16, 32
Reserve	-	-	0170h to 01FFh	-
Rx Status Register	DSI_LINK_RXSR	0000_0000h	0200h	8, 16, 32
Rx Status Clear Register	DSI_LINK_RXSCR	0000_0000h	0204h	8, 16, 32
Rx Interrupt Enable Register	DSI_LINK_RXIER	0000_0000h	0208h	8, 16, 32
Reserve	-	-	020Ch to 020Fh	-
Peripheral Response Timeout BTA Set Register	DSI_LINK_PRESPTOBTASETR	0000_0000h	0210h	8, 16, 32
Peripheral Response Timeout LP Set Register	DSI_LINK_PRESPTOLPSETR	0000_0000h	0214h	8, 16, 32

Register Name	Abbreviation	Initial Value	Offset Address	Access Size [bits]
Peripheral Response Timeout HS Set Register	DSI_LINK_PRESPTOHSSETR	0000_0000h	0218h	8, 16, 32
Reserve	-	-	021Ch to 021Fh	-
Acknowledge and Error Report Packet Parameter Latest Info Register	DSI_LINK_AKEPLATIR	0000_0000h	0220h	8, 16, 32
Acknowledge and Error Report Packet Parameter Accumulate Status Register	DSI_LINK_AKEPACMSR	0000_0000h	0224h	8, 16, 32
Acknowledge and Error Report Packet Parameter Status Clear Register	DSI_LINK_AKEPSCR	0000_0000h	0228h	8, 16, 32
Reserve	-	-	022Ch to 022Fh	-
Rx Result Saved Status Register	DSI_LINK_RXRSSR	0000_0000h	0230h	8, 16, 32
Rx Result Saved Status Clear Register	DSI_LINK_RXRSSCR	0000_0000h	0234h	8, 16, 32
Rx Result Info Overwrite Status Register	DSI_LINK_RXRINFOOWSR	0000_0000h	0238h	8, 16, 32
Rx Result Info Overwrite Status Clear Register	DSI_LINK_RXRINFOOWSCR	0000_0000h	023Ch	8, 16, 32
Rx Result Save Slot 0 Register	DSI_LINK_RXRSS0R	0000_0000h	0240h	8, 16, 32
Rx Result Save Slot 1 Register	DSI_LINK_RXRSS1R	0000_0000h	0244h	8, 16, 32
Rx Result Save Slot 2 Register	DSI_LINK_RXRSS2R	0000_0000h	0248h	8, 16, 32
Rx Result Save Slot 3 Register	DSI_LINK_RXRSS3R	0000_0000h	024Ch	8, 16, 32
Reserve	-	-	0250h to 02BFh	-
Rx Packet Payload Data 0 Register	DSI_LINK_RXPPD0R	0000_0000h	02C0h	8, 16, 32
Rx Packet Payload Data 1 Register	DSI_LINK_RXPPD1R	0000_0000h	02C4h	8, 16, 32
Rx Packet Payload Data 2 Register	DSI_LINK_RXPPD2R	0000_0000h	02C8h	8, 16, 32
Rx Packet Payload Data 3 Register	DSI_LINK_RXPPD3R	0000_0000h	02CCh	8, 16, 32
Reserve	-	-	02D0h to 02DFh	-
HSTX Timeout Set Register	DSI_LINK_HSTXTOSETR	0000_0000h	02E0h	8, 16, 32
LRX-H Timeout Set Register	DSI_LINK_LRXHTOSETR	0000_0000h	02E4h	8, 16, 32
TA Timeout Set Register	DSI_LINK_TATOSETR	0000_0000h	02E8h	8, 16, 32
Reserve	-	-	02ECh to 02FFh	-
Fatal Error Status Register	DSI_LINK_FERRSR	0000_0000h	0300h	8, 16, 32
Fatal Error Status Clear Register	DSI_LINK_FERRSCR	0000_0000h	0304h	8, 16, 32
Fatal Error Interrupt Enable Register	DSI_LINK_FERRIER	0000_0000h	0308h	8, 16, 32
Reserve	-	-	030Ch to 0313h	-
Clock Lane Stop Time Set Register	DSI_LINK_CLSTPTSETR	0000_0000h	0314h	8, 16, 32
LP Transition Time Set Register	DSI_LINK_LPTRNSTSETR	0000_0000h	0318h	8, 16, 32
Reserve	-	-	031Ch to 031Fh	-
Physical Lane Status Register	DSI_LINK_PLSR	0000_0FF3h	0320h	8, 16, 32
Physical Lane Status Clear Register	DSI_LINK_PLSCR	0000_0000h	0324h	8, 16, 32
Physical Lane Interrupt Enable Register	DSI_LINK_PLIER	0000_0000h	0328h	8, 16, 32
Reserve	-	-	032Ch to 03FFh	-
Video-Input Channel 1 Set 0 Register	DSI_LINK_VICH1SET0R	0000_0000h	0400h	8, 16, 32
Video-Input Channel 1 Set 1 Register	DSI_LINK_VICH1SET1R	1093_0000h	0404h	8, 16, 32
Reserve	-	-	0408h to 040Fh	-
Video-Input Channel 1 Status Register	DSI_LINK_VICH1SR	0000_0000h	0410h	8, 16, 32

Register Name	Abbreviation	Initial Value	Offset Address	Access Size [bits]
Video-Input Channel 1 Status Clear Register	DSI_LINK_VICH1SCR	0000_0000h	0414h	8, 16, 32
Video-Input Channel 1 Interrupt Enable Register	DSI_LINK_VICH1IER	0000_0000h	0418h	8, 16, 32
Reserve	-	-	041Ch to 041Fh	-
Video-Input Channel 1 Pixel Packet Set Register	DSI_LINK_VICH1PPSETR	000E_0000h	0420h	8, 16, 32
Reserve	-	-	0424h to 0427h	-
Video-Input Channel 1 Vertical Size Set Register	DSI_LINK_VICH1VSSETR	0000_0000h	0428h	8, 16, 32
Video-Input Channel 1 Vertical Porch Set Register	DSI_LINK_VICH1VPSETR	0000_0000h	042Ch	8, 16, 32
Video-Input Channel 1 Horizontal Size Set Register	DSI_LINK_VICH1HSSETR	0000_0000h	0430h	8, 16, 32
Video-Input Channel 1 Horizontal Porch Set Register	DSI_LINK_VICH1HPSETR	0000_0000h	0434h	8, 16, 32
Reserve	-	-	0438h to 05BFh	-
Sequence Channel 0 Set 0 Register	DSI_LINK_SQCH0SET0R	0080_0000h	05C0h	8, 16, 32
Sequence Channel 0 Set 1 Register	DSI_LINK_SQCH0SET1R	0800_0000h	05C4h	8, 16, 32
Reserve	-	-	05C8h to 05CFh	-
Sequence Channel 0 Status Register	DSI_LINK_SQCH0SR	0000_0000h	05D0h	8, 16, 32
Sequence Channel 0 Status Clear Register	DSI_LINK_SQCH0SCR	0000_0000h	05D4h	8, 16, 32
Sequence Channel 0 Interrupt Enable Register	DSI_LINK_SQCH0IER	0000_0000h	05D8h	8, 16, 32
Reserve	-	-	05DCh to 05FFh	-
Sequence Channel 1 Set 0 Register	DSI_LINK_SQCH1SET0R	0000_0000h	0600h	8, 16, 32
Sequence Channel 1 Set 1 Register	DSI_LINK_SQCH1SET1R	0830_0000h	0604h	8, 16, 32
Reserve	-	-	0608h to 060Fh	-
Sequence Channel 1 Status Register	DSI_LINK_SQCH1SR	0000_0000h	0610h	8, 16, 32
Sequence Channel 1 Status Clear Register	DSI_LINK_SQCH1SCR	0000_0000h	0614h	8, 16, 32
Sequence Channel 1 Interrupt Enable Register	DSI_LINK_SQCH1IER	0000_0000h	0618h	8, 16, 32
Reserve	-	-	061Ch to 077Fh	-
Sequence Channel 0 Descriptor 00-A Register	DSI_LINK_SQCH0DSC00AR	xxxx_xxxxh	0780h	32
Sequence Channel 0 Descriptor 00-B Register	DSI_LINK_SQCH0DSC00BR	xxxx_xxxxh	0784h	32
Sequence Channel 0 Descriptor 00-C Register	DSI_LINK_SQCH0DSC00CR	xxxx_xxxxh	0788h	32
Sequence Channel 0 Descriptor 00-D Register	DSI_LINK_SQCH0DSC00DR	xxxx_xxxxh	078Ch	32
Sequence Channel 0 Descriptor 01-A Register	DSI_LINK_SQCH0DSC01AR	xxxx_xxxxh	0790h	32
Sequence Channel 0 Descriptor 01-B Register	DSI_LINK_SQCH0DSC01BR	xxxx_xxxxh	0794h	32
Sequence Channel 0 Descriptor 01-C Register	DSI_LINK_SQCH0DSC01CR	xxxx_xxxxh	0798h	32
Sequence Channel 0 Descriptor 01-D Register	DSI_LINK_SQCH0DSC01DR	xxxx_xxxxh	079Ch	32

Register Name	Abbreviation	Initial Value	Offset Address	Access Size [bits]
Sequence Channel 0 Descriptor 02-A Register	DSI_LINK_SQCH0DSC02AR	xxxx_xxxxh	07A0h	32
Sequence Channel 0 Descriptor 02-B Register	DSI_LINK_SQCH0DSC02BR	xxxx_xxxxh	07A4h	32
Sequence Channel 0 Descriptor 02-C Register	DSI_LINK_SQCH0DSC02CR	xxxx_xxxxh	07A8h	32
Sequence Channel 0 Descriptor 02-D Register	DSI_LINK_SQCH0DSC02DR	xxxx_xxxxh	07ACh	32

9.5.2.1.2 Registers in D-PHY

This section describes the registers in D-PHY. All registers can be accessed in 8/16/32 bits.

Register Name	Abbreviation	Initial Value	Offset Address	Access Size [bits]
DSI PLL Enable Register	DSI_DPHY_PLLENR	0000_0000h	0000h	8, 16, 32
DSI PHY Reset Register	DSI_DPHY_PHYRSTR	0000_0000h	0004h	8, 16, 32
Reserve	-	-	0008h to 000Fh	-
DSI PLL Clock Setting 0 Register	DSI_DPHY_PLLCLKSET0R	0000_0000h	0010h	8, 16, 32
DSI PLL Clock Setting 1 Register	DSI_DPHY_PLLCLKSET1R	0000_0000h	0014h	8, 16, 32
Reserve	-	-	0018h to 001Fh	-
DSI PHY TCLK Setting Register	DSI_DPHY_PHYTCLKSETR	0000_0000h	0020h	8, 16, 32
DSI PHY THS Setting Register	DSI_DPHY_PHYTHSSETR	0000_0000h	0024h	8, 16, 32
DSI PHY TLPX Setting Register	DSI_DPHY_PHYTLPXSETR	0000_0000h	0028h	8, 16, 32
Reserve	-	-	002Ch to 002Fh	-
DSI PHY Control Register	DSI_DPHY_PHYCR	0000_0000h	0030h	8, 16, 32
DSI PHY Control 1 Register	DSI_DPHY_PHYC1R	0000_0000h	0034h	8, 16, 32
DSI PHY Control 2 Register	DSI_DPHY_PHYC2R	0000_0000h	0038h	8, 16, 32
DSI PHY Control 3 Register	DSI_DPHY_PHYC3R	0000_0000h	003Ch	8, 16, 32

9.5.2.2 MIPI DSI Register Descriptions

The prefix (DSI_LINK_, DSI_DPHY_) of the register names is omitted in this and subsequent sections.

9.5.2.2.1 Interrupt Status Register (DSI_LINK_ISR)

Access Size : 8, 16, 32 bits
Address : <DSI_LINK_base> + 0000h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	PPI	-	-	-	FERR
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	RCV	-	-	-	VIN1	-	-	-	SQ1	-	-	-	SQ0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
20	PPI	0h	R	PPI Interrupt When this value is 1b, a DSI D-PHY PPI related interrupt exists. Refer to the description of the PLSR register for more information.
19 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
16	FERR	0h	R	FERR Interrupt When this value is 1b, a DSI Fatal Error interrupt exists. Refer to the description of the FERRSR register for more information.
15 to 13	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
12	RCV	0h	R	RCV Interrupt When this value is 1b, a DSI Packet Receive interrupt exists. Refer to the description of the RXSR register for more information.
11 to 9	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
8	VIN1	0h	R	VIN1 Interrupt When this value is 1b, a Video Input-Operation channel 1 interrupt exists. Refer to the description of the VICH1SR register for more information.
7 to 5	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
4	SQ1	0h	R	SQ1 Interrupt When this value is 1b, a Sequence Operation channel 1 interrupt exists. Refer to the description of the SQCH1SR register for more information.
3 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
0	SQ0	0h	R	SQ1 Interrupt When this value is 1b, a Sequence Operation channel 0 interrupt exists. Refer to the description of the SQCH0SR register for more information.

9.5.2.2.2 Link Status Register (DSI_LINK_LINKSR)

Access Size : 8, 16, 32 bits

Address : <DSI_LINK_base> + 0010h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	LPBUSY	HSBUSY	-	-	-	VICHRUN1	-	-	-	SQCHRUN1	-	-	-	SQCHRUN0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 14	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
13	LPBUSY	0h	R	LP Operation Busy The setting 1b indicates that an operation related to LP is in progress.
12	HSBUSY	0h	R	HS Operation Busy The setting 1b indicates that an operation related to HS is in progress.
11 to 9	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
8	VICHRUN1	0h	R	Video-Input Channel 1 Running This bit is a copy of VICH1SR.RUNNING.
7 to 5	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
4	SQCHRUN1	0h	R	Sequence Channel 1 Running This bit is a copy of SQCH1SR.RUNNING.
3 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
0	SQCHRUN0	0h	R	Sequence Channel 0 Running This bit is a copy of SQCH0SR.RUNNING.

9.5.2.2.3 Tx Set Register (DSI_LINK_TXSETR)

Access Size : 8, 16, 32 bits

Address : <DSI_LINK_base> + 0100h

Initial Value : 0003_0003h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	NUMLANE CAP[1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	DLEN	CLEN	-	-	-	-	-	-	NUMLANE USE[1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W	R	R	R	R	R	R	RW	RW	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
17, 16	NUMLANE CAP[1:0]	3h	R	Number of Lanes Capability 3h: The maximum Lane count is 4 (Lanes 0 to 3 can be used)
15 to 10	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
9	DLEN	0h	RW	Data Lane Enable When this bit is 1b, Data Lanes are enabled by the PHY interface. Lanes to be enabled are determined by NUMLANEUSE.
8	CLEN	0h	RW	Clock Lane Enable When this bit is 1b, Clock Lane is enabled by the PHY interface.
7 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
1, 0	NUMLANE USE[1:0]	3h	RW	Number of Lanes for Use Set the Lane count for use. Selected Data Lanes are enabled if DLEN is “1”. 0h: 1 Lane (use of Lane 0) 1h: 2 Lane (use of Lanes 0 and 1) 2h: 3 Lane (use of Lanes 0 to 2) 3h: 4 Lane (use of Lanes 0 to 3) Setting a value over NUMLANECAP is prohibited.

9.5.2.2.4 HS Clock Set Register (DSI_LINK_HSCLKSETR)

Access Size : 8, 16, 32 bits

Address : <DSI_LINK_base> + 0104h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	HSCLKMO DE	HSCLKRUN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
1	HSCLKMO DE	0h	RW	HS Clock running Mode 0b: Requests Clock Lane HS transmission when HS transmission is scheduled (non-continuous clock mode). 1b: Keeps Clock Lane HS transmission (continuous clock mode). If HSCLKRUN = 0, this field has no meaning. Changing the value of this bit while HSCLKRUN = 1 is prohibited.
0	HSCLKRUN	0h	RW	Start HS Clock running on Clock Lane 0b: No HS transmission (keep LP) 1b: Allows HS transmission according to HSCLKMODE Confirm stable TxWordClkHS (hsclk) before setting this field to 1. Setting this field to “1” while TXSETR.CLEN = 0 is prohibited.

9.5.2.2.5 ULPS Set Register (DSI_LINK_ULPSSETR)

Access Size : 8, 16, 32 bits

Address : <DSI_LINK_base> + 0108h

Initial Value : 0000_00A0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	ULPSWKUP[7:0]							
Initial Value	0	0	0	0	0	0	0	0	1	0	1	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
7 to 0	ULPSWKUP [7:0]	A0h	RW	Twakeup period of ULPS This period is specified by the count value of lpclk *128. This period should be longer than 1 ms. For example, - In the case lpclk is 4/3 MHz and lpclk*128 = 96 µs, set ULPSWKUP = 0Bh and Twakeup period = 1.06 ms (11*96 µs) - In the case lpclk is 20 MHz and lpclk*128 = 6.4 µs, set ULPSWKUP = A0h and Twakeup period = 1.02 ms (160*6.4 µs)

9.5.2.2.6 ULPS Control Register (DSI_LINK_ULPSCR)

Access Size : 8, 16, 32 bits

Address : <DSI_LINK_base> + 010Ch

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	DLULPSEXT	DLULPSENT	-	-	CLULPSEXT	CLULPSENT	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R0W	R0W	R	R	R0W	R0W	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31, 30	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
29	DLULPSEXT	0h	R0W	The read value is always 0b. DL ULPS Exit Writing 1b to this bit issues a request for all enabled Data Lanes to exit the Ultra-Low Power State (ULPS). Writing 1b while enabled Data Lanes are not in ULPS is prohibited. Writing 0b has no effect.
28	DLULPSENT	0h	R0W	The read value is always 0b. DL ULPS Enter Writing 1b to this bit issues a request for enabled Data Lanes to enter the Ultra- Low Power State (ULPS). Writing 1b while the enabled Data Lanes are in ULPS is prohibited. Writing 0b has no effect.
27, 26	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
25	CLULPSEXT	0h	R0W	The read value is always 0b. CL ULPS Exit Writing 1b to this bit issues a request for Clock Lane to exit the Ultra-Low Power State (ULPS). Writing 1b while Clock Lane is not in ULPS is prohibited. Writing 0b has no effect.
24	CLULPSENT	0h	R0W	The read value is always 0b. CL ULPS Enter Writing 1b to this bit issues a request for Clock Lane to enter the Ultra-Low Power State (ULPS). Before setting this field, HSCLKSETR.HSCLKRUN must be set to 0b. Writing 1b while Clock Lane is in ULPS is prohibited. Writing 0b has no effect.
23 to 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

9.5.2.2.7 Reset Control Register (DSI_LINK_RSTCR)

Access Size : 8, 16, 32 bits

Address : <DSI_LINK_base> + 0110h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	FCETXSTP
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	RW	R	R	R	R	R	R	R	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	SWRST
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
24	-	0h	RW	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
23 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
16	FCETXSTP	0h	RW	Force Tx Stop Mode When this bit is 1b, change to Transmit mode and Stop State is forced by ForceTxStopmode on all PPI Data Lanes. Setting this bit to 1b when SWRST = 0 is prohibited.
15 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
0	SWRST	0h	RW	Request for Software Reset Set this bit to 1b to request a software reset. Then, wait until you confirm the completion of the Reset procedure by RSTSR.SWRSTx = 1. And set to 0b after that.

9.5.2.2.8 Reset Status Register (DSI_LINK_RSTSR)

Access Size : 8, 16, 32 bits

Address : <DSI_LINK_base> + 0114h

Initial Value : 0000_0F00h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-

9.5.2.2.9 DSI Set Register (DSI_LINK_DSISETR)

Access Size : 8, 16, 32 bits

Offset Address : <DSI_LINK_base> + 0120h

Initial Value : 80F1_0001h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	EOTPEN	TEIDIR	SCREN	-	-	-	-	-	CRCEN[3:0]				-	-	-	ECCEN
Initial Value	1	0	0	0	0	0	0	0	1	1	1	1	0	0	0	1
R/W	RW	RW	RW	R	R	R	R	R	RW	RW	RW	RW	R	R	R	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MRPSZ[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31	EOTPEN	1h	RW	HS Transfer EoTp Enable 0b: Transfer of EoTp is disabled. 1b: Transfer of EoTp is enabled. EoTp is always disabled in LP Transfer.
30	TEIDIR	0h	RW	Tearing Effect Input Direction External Tearing Effect Setting 0b: Rise edge detection. 1b: Fall edge detection.
29	SCREN	0h	RW	Scramble Enable 0b: Scrambling data is disabled. 1b: Scrambling data is enabled. This bit should not be set to “1” if the peer-device does not support a data scrambling function.
28 to 24	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
23 to 20	CRCEN[3:0]	Fh	RW	Enable Received CRC check for Virtual Channel Bit 3: Enable Received CRC check for Virtual Channel 3 (0b: Disabled, 1b: Enabled). Bit 2: Enable Received CRC check for Virtual Channel 2 (0b: Disabled, 1b: Enabled). Bit 1: Enable Received CRC check for Virtual Channel 1 (0b: Disabled, 1b: Enabled). Bit 0: Enable Received CRC check for Virtual Channel 0 (0b: Disabled, 1b: Enabled).
19 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
16	ECCEN	1h	RW	Enable Received ECC Check 0b: Received ECC check is disabled. 1b: Received ECC check is enabled.
15 to 0	MRPSZ[15:0]	1h	RW	Maximum Return Packet Size If the returned Long Packet’s WC is over this value, the DSI-Tx module asserts the RXSR.MAXRPSZERR error. In that case, data will not be saved to the memory space. Setting this field to 0b is prohibited. Set this field to a value greater than or equal to the peripheral setting.

9.5.2.2.10 Receive Buffer Size Register (DSI_LINK_RXBUFSZR)

Access Size : 8, 16, 32 bits
Offset Address : <DSI_LINK_base> + 0124h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	RXBUFSZ[3:0]				-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
30	RXAKE	0h	R	Rx Acknowledge and Error Report When this value is 1b, the Acknowledge and Error Report Packet is received. Write 1b to the RXSCR.RXAKE register to clear this field.
29	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
28	ECCERR1B	0h	R	ECC Error (1 bit) When this value is 1b, the Rx ECC Error (1 bit) is detected. Write 1b to the RXSCR.ECCERR1B register to clear this field.
27	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
26	MAXRPSZERR	0h	R	Maximum Return Packet Size Error When this value is 1b, the WC value of Rx Long Packet is larger than DSISETR.MRPSZ. Write 1b to the RXSCR.MAXRPSZERR register to clear this field.
25	NORETERR	0h	R	Nothing Return Error When this value is 1b, no trigger or packet is returned in BTA period. Write 1b to the RXSCR.NORETERR register to clear this field.
24	PRESPTOERR	0h	R	Peripheral Response Timeout Error When this value is 1b, the Rx Peripheral Response Timeout is detected after the transition to Rx mode along with Bus Turn-Around and within the time specified by PRESPTOBTASETR.PRESPTOBTA, PRESPTOLPSETR.PRESPTOLPR, PRESPTOLPSETR.PRESPTOLPW, PRESPTOLPSETR.PRESPTOHSR or PRESPTOLPSETR.PRESPTOHSW. The value is selected from kind of BTA. Write 1b to the RXSCR.PRESPTOERR register to clear this field.
23	RXOVFERR	0h	R	Receive Buffer Overflow Error When this value is 1b, the Buffer Overflow Error is detected at Rx Long Packet. Write 1b to the RXSCR.RXOVFERR register to clear this field.
22	IBERR	0h	R	Internal Bus Error When this value is 1b, the Internal Bus Write had failed to respond. Write 1b to the RXSCR.IBERR register to clear this field.
21	CRCERR	0h	R	CRC Error When this value is 1b, the Rx CRC Error is detected. Write 1b to the RXSCR.CRCERR register to clear this field.
20	WCERR	0h	R	Word Count Error When this value is 1b, the Rx packet's actual WC length is shorter than the packet header's WC. Write 1b the to RXSCR.WCERR register to clear this field.
19	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
18	UEXPKTERR	0h	R	Unexpected Packet Error When this value is 1b, an unexpected packet is received. "Unexpected Packet" means unexpected DT for receive or an unexpected response for receive. Write 1b to the RXSCR.UEXPKTERR register to clear this field.

Bit	Bit Name	Initial Value	R/W	Description
17	ECCERR	0h	R	ECC Error (over 1 bit) When this value is 1b, the Rx ECC Error (over 1 bit) is detected. Write 1b to the RXSCR.ECCERR register to clear this field.
16	MLFERR	0h	R	Malform Error When this value is 1b, the Rx packet shorter than 4 bytes is received. Write 1b to the RXSCR.MLFERR register to clear this field.
15	EXTTEDET	0h	R	External Tearing Effect Detect When this value is 1b, External Tearing Effect is detected. Write 1b to the RXSCR.EXTTEDET register to clear this field.
14	RXACK	0h	R	Rx ACK Trigger When this value is 1b, the ACK trigger is received. Write 1b to the RXSCR.RXACK register to clear this field.
13	RXTE	0h	R	Rx Tearing Effect Trigger When this value is 1b, Tearing Effect Trigger is received. Write 1b to the RXSCR.RXTE register to clear this field.
12	RXRTRG	0h	R	Rx Reset Trigger When this value is 1b, Reset Trigger is received. Normally, the DSI-Tx module does not receive Reset Trigger. Write 1b to the RXSCR.RXRTRG register to clear this field.
11	RXUK5TRG	0h	R	Rx Unknown-5 Trigger When this value is 1b, Unknown-5 Trigger is received. Normally, the DSI-Tx module does not receive Unknown-5 Trigger. Write 1b to the RXSCR.RXUK5TRG register to clear this field.
10	RXEOTP	0h	R	Rx EoTp When this value is 1b, the EoTp is received. Write 1b to the RXSCR.RXEOTP register to clear this field.
9	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
8	RXRESP	0h	R	Rx Response Packet When this value is 1b, the Response Packet is received. Write 1b to the RXSCR.RXRESP register to clear this field.
7 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
2	TATO	0h	R	Turnaround Acknowledge Timeout When this value is 1b, the Turnaround Acknowledge Timeout (TA_TO) is detected. Write 1b to the RXSCR.TATO register to clear this field.
1	LRXHTO	0h	R	LP-RX Host Processor Timeout When this value is 1b, the LP-RX Host Processor Timeout (LRX-H_TO) is detected. Write 1b to RXSCR.LRXHTO register to clear this field.
0	BTAREQEN D	0h	R	BTA Request End When this value is 1b, the completion of the transmission request which includes Rx is detected. This bit is set if all BTA requests are finished including error. The BTA request status is indicated by RXSR[31:1]. Write 1b to the RXSCR.BTAREQEND register to clear this field.

9.5.2.2.16 Rx Status Clear Register (DSI_LINK_RXSCR)

Access Size : 8, 16, 32 bits

Offset Address : <DSI_LINK_base> + 0204h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
30	RXAKE	0h	R0W	The read value is always 0b. RXSR.RXAKE Clear Set to 1b to clear RXSR.RXAKE. Writing 0b has no effect.
29	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
28	ECCERR1B	0h	R0W	The read value is always 0b. RXSR.ECCERR1B Clear Set to 1b to clear RXSR.ECCERR1B. Writing 0b has no effect.
27	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
26	MAXRPSZERR	0h	R0W	The read value is always 0b. RXSR.MAXRPSZERR Clear Set to 1b to clear RXSR.MAXRPSZERR. Writing 0b has no effect.
25	NORETERR	0h	R0W	The read value is always 0b. RXSR.NORETERR Clear Set to 1b to clear RXSR.NORETERR. Writing 0b has no effect.
24	PRESPTOERR	0h	R0W	The read value is always 0b. RXSR.PRESPTOERR Clear Set to 1b to clear RXSR.PRESPTOERR. Writing 0b has no effect.
23	RXOVFERR	0h	R0W	The read value is always 0b. RXSR.RXOVFERR Clear Set to 1b to clear RXSR.RXOVFERR. Writing 0b has no effect.
22	IBERR	0h	R0W	The read value is always 0b. RXSR.IBERR Clear Set to 1b to clear RXSR.IBERR. Writing 0b has no effect.
21	CRCERR	0h	R0W	The read value is always 0b. RXSR.CRCERR Clear Set to 1b to clear RXSR.CRCERR. Writing 0b has no effect.
20	WCERR	0h	R0W	The read value is always 0b. RXSR.WCERR Clear Set to 1b to clear RXSR.WCERR. Writing 0b has no effect.
19	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

Bit	Bit Name	Initial Value	R/W	Description
18	UEXPKTER R	0h	R0W	The read value is always 0b. RXSR.UEXPKTERR Clear Set to 1b to clear RXSR.UEXPKTERR. Writing 0b has no effect.
17	ECCERR	0h	R0W	The read value is always 0b. RXSR.ECCERR Clear Set to 1b to clear RXSR.ECCERR. Writing 0b has no effect.
16	MLFERR	0h	R0W	The read value is always 0b. RXSR.MLFERR Clear Set to 1b to clear RXSR.MLFERR. Writing 0b has no effect.
15	EXTTEDET	0h	R0W	The read value is always 0b. RXSR.EXTTTEDET Clear Set to 1b to clear RXSR.EXTTTEDET. Writing 0b has no effect.
14	RXACK	0h	R0W	The read value is always 0b. RXSR.RXACK Clear Set to 1b to clear RXSR.RXACK. Writing 0b has no effect.
13	RXTE	0h	R0W	The read value is always 0b. RXSR.RXTE Clear Set to 1b to clear RXSR.RXTE. Writing 0b has no effect.
12	RXRTRG	0h	R0W	The read value is always 0b. RXSR.RXRTRG Clear Set to 1b to clear RXSR.RXRTRG. Writing 0b has no effect.
11	RXUK5TRG	0h	R0W	The read value is always 0b. RXSR.RXUK5TRG Clear Set to 1b to clear RXSR.RXUK5TRG. Writing 0b has no effect.
10	RXEOTP	0h	R0W	The read value is always 0b. RXSR.RXEOTP Clear Set to 1b to clear RXSR.RXEOTP. Writing 0b has no effect.
9	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
8	RXRESP	0h	R0W	The read value is always 0b. RXSR.RXRESP Clear Set to 1b to clear RXSR.RXRESP. Writing 0b has no effect.
7 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
2	TATO	0h	R0W	The read value is always 0b. RXSR.TATO Clear Set to 1b to clear RXSR.TATO. Writing 0b has no effect.
1	LRXHTO	0h	R0W	The read value is always 0b. RXSR.LRXHTO Clear Set to 1b to clear RXSR.LRXHTO. Writing 0b has no effect.
0	BTAREQEN D	0h	R0W	The read value is always 0b. RXSR.BTAREQEND Clear Set to 1b to clear RXSR.BTAREQEND. Writing 0b has no effect.

9.5.2.2.17 Rx Interrupt Enable Register (DSI_LINK_RXIER)

Access Size : 8, 16, 32 bits

Offset Address : <DSI_LINK_base> + 0208h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	RXAKE	-	ECCERR1B	-	MAXRPSZERR	NORETERR	PRESPTOERR	RXOVFERR	IBERR	CRCERR	WCERR	-	UEXPKTERR	ECCERR	MLFERR
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	RW	R	RW	R	RW	RW	RW	RW	RW	RW	RW	R	RW	RW	RW

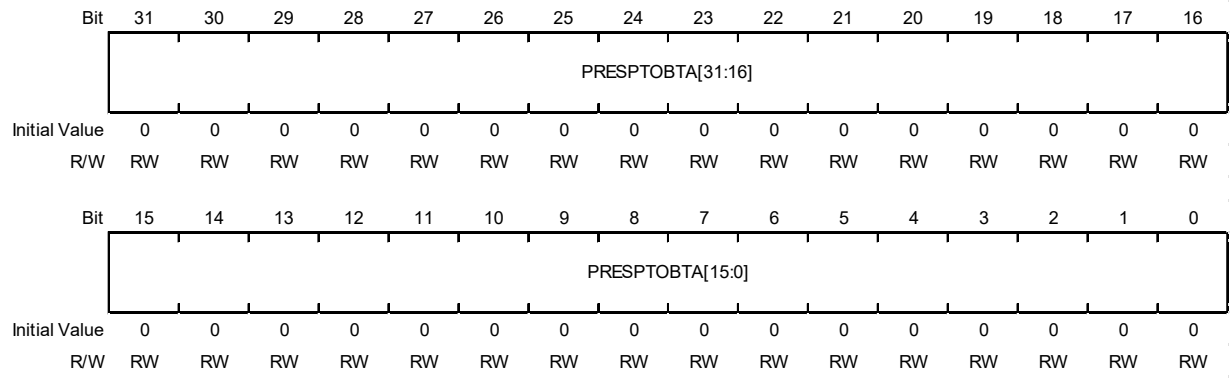
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	EXTTEDET	RXACK	RXTE	RXRTRG	RXUK5TRG	RXEOTP	-	RXRESP	-	-	-	-	-	TATO	LRXHTO	BTAREQEND
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	R	RW	R	R	R	R	R	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
30	RXAKE	0h	RW	Interrupt enable for RXSR.RXAKE 0b: Disables interrupt dsi_int_rcv when RXSR.RXAKE = 1. 1b: Enables interrupt dsi_int_rcv when RXSR.RXAKE = 1.
29	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
28	ECCERR1B	0h	RW	Interrupt enable for RXSR.ECCERR1B 0b: Disables interrupt dsi_int_rcv when RXSR.ECCERR1B = 1. 1b: Enables interrupt dsi_int_rcv when RXSR.ECCERR1B = 1.
27	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
26	MAXRPSZERR	0h	RW	Interrupt enable for RXSR.MAXRPSZERR 0b: Disables interrupt dsi_int_rcv when RXSR.MAXRPSZERR = 1. 1b: Enables interrupt dsi_int_rcv when RXSR.MAXRPSZERR = 1.
25	NORETERR	0h	RW	Interrupt enable for RXSR.NORETERR 0b: Disables interrupt dsi_int_rcv when RXSR.NORETERR = 1. 1b: Enables interrupt dsi_int_rcv when RXSR.NORETERR = 1.
24	PRESPTOERR	0h	RW	Interrupt enable for RXSR.PRESPTOERR 0b: Disables interrupt dsi_int_rcv when RXSR.PRESPTOERR = 1. 1b: Enables interrupt dsi_int_rcv when RXSR.PRESPTOERR = 1.
23	RXOVFERR	0h	RW	Interrupt enable for RXSR.RXOVFERR 0b: Disables interrupt dsi_int_rcv when RXSR.RXOVFERR = 1. 1b: Enables interrupt dsi_int_rcv when RXSR.RXOVFERR = 1.
22	IBERR	0h	RW	Interrupt enable for RXSR.IBERR 0b: Disables interrupt dsi_int_rcv when RXSR.IBERR = 1. 1b: Enables interrupt dsi_int_rcv when RXSR.IBERR = 1.
21	CRCERR	0h	RW	Interrupt enable for RXSR. CRCERR 0b: Disables interrupt dsi_int_rcv when RXSR.CRCERR = 1. 1b: Enables interrupt dsi_int_rcv when RXSR.CRCERR = 1.
20	WCERR	0h	RW	Interrupt enable for RXSR. WCERR 0b: Disables interrupt dsi_int_rcv when RXSR.WCERR = 1. 1b: Enables interrupt dsi_int_rcv when RXSR.WCERR = 1.
19	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
18	UEXPKTERR	0h	RW	Interrupt enable for RXSR.UEXPKTERR 0b: Disables interrupt dsi_int_rcv when RXSR.UEXPKTERR = 1. 1b: Enables interrupt dsi_int_rcv when RXSR.UEXPKTERR = 1.
17	ECCERR	0h	RW	Interrupt enable for RXSR.ECCERR 0b: Disables interrupt dsi_int_rcv when RXSR.ECCERR = 1. 1b: Enables interrupt dsi_int_rcv when RXSR.ECCERR = 1.
16	MLFERR	0h	RW	Interrupt enable for RXSR.MLFERR 0b: Disables interrupt dsi_int_rcv when RXSR.MLFERR = 1. 1b: Enables interrupt dsi_int_rcv when RXSR.MLFERR = 1.

Bit	Bit Name	Initial Value	R/W	Description
15	EXTTEDET	0h	RW	Interrupt enable for RXSR.EXTTEDET 0b: Disables interrupt dsi_int_rcv when RXSR.EXTTEDET = 1. 1b: Enables interrupt dsi_int_rcv when RXSR.EXTTEDET = 1.
14	RXACK	0h	RW	Interrupt enable for RXSR.RXACK 0b: Disables interrupt dsi_int_rcv when RXSR.RXACK = 1. 1b: Enables interrupt dsi_int_rcv when RXSR.RXACK = 1.
13	RXTE	0h	RW	Interrupt enable for RXSR.RXTE 0b: Disables interrupt dsi_int_rcv when RXSR.RXTE = 1. 1b: Enables interrupt dsi_int_rcv when RXSR.RXTE = 1.
12	RXRTRG	0h	RW	Interrupt enable for RXSR.RXRTRG 0b: Disables interrupt dsi_int_rcv when RXSR.RXRTRG = 1. 1b: Enables interrupt dsi_int_rcv when RXSR.RXRTRG = 1.
11	RXUK5TRG	0h	RW	Interrupt enable for RXSR.RXUK5TRG 0b: Disables interrupt dsi_int_rcv when RXSR.RXUK5TRG = 1. 1b: Enables interrupt dsi_int_rcv when RXSR.RXUK5TRG = 1.
10	RXEOTP	0h	RW	Interrupt enable for RXSR.RXEOTP 0b: Disables interrupt dsi_int_rcv when RXSR.RXEOTP = 1. 1b: Enables interrupt dsi_int_rcv when RXSR.RXEOTP = 1.
9	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
8	RXRESP	0h	RW	Interrupt enable for RXSR.RXRESP 0b: Disables interrupt dsi_int_rcv when RXSR.RXRESP = 1. 1b: Enables interrupt dsi_int_rcv when RXSR.RXRESP = 1.
7 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
2	TATO	0h	RW	Interrupt enable for RXSR.TATO 0b: Disables interrupt dsi_int_rcv when RXSR.TATO = 1. 1b: Enables interrupt dsi_int_rcv when RXSR.TATO = 1.
1	LRXHTO	0h	RW	Interrupt enable for RXSR.LRXHTO 0b: Disables interrupt dsi_int_rcv when RXSR.LRXHTO = 1. 1b: Enables interrupt dsi_int_rcv when RXSR.LRXHTO = 1.
0	BTAREQEND	0h	RW	Interrupt enable for RXSR.BTAREQEND 0b: Disables interrupt dsi_int_rcv when RXSR.BTAREQEND = 1. 1b: Enables interrupt dsi_int_rcv when RXSR.BTAREQEND = 1.

9.5.2.2.18 Peripheral Response Timeout BTA Set Register (DSI_LINK_PRESPTOBTASETR)

Access Size : 8, 16, 32 bits
Offset Address : <DSI_LINK_base> + 0210h
Initial Value : 0000_0000h



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	PRESPTOBTA [31:0]	0h	RW	Peripheral Response Timeout (Bus Turn Around) Count Set the timeout value to measure the interval between the start of Rx mode and the start of packet reception along with Bus Turn-Around while SQCHxDSCyAR.BTA = 3h. The limit time for timeout is calculated by the formula of PRESPTOBTA * (the period of DSI_0_lpclk). When RXSR.PRESPTOERR is 1b, a timeout is detected. Note that no timeout is detected when PRESPTOBTA = 0. Since the counting clock is asynchronous with packet reception, there is some jitter in the timeout.

9.5.2.2.19 Peripheral Response Timeout LP Set Register (DSI_LINK_PRESPTOLPSETR)

Access Size : 8, 16, 32 bits
Offset Address : <DSI_LINK_base> + 0214h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PRESPTOLPR[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PRESPTOLPW[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

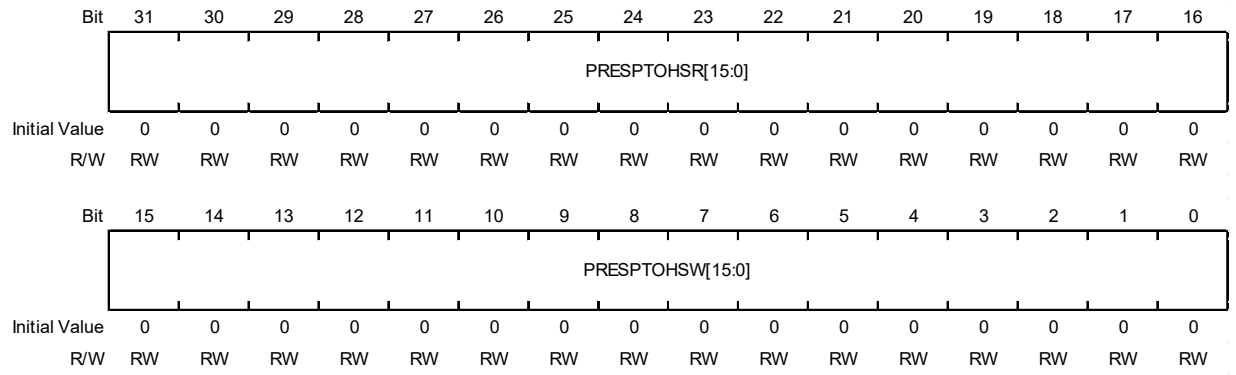
Bit	Bit Name	Initial Value	R/W	Description
31 to 16	PRESPTOLPR [15:0]	0h	RW	Peripheral Response Timeout (LPDT READ Request) Count Set the timeout value to measure the interval between the start of Rx mode and the start of packet reception along with Bus Turn-Around while SQCHxDSCyAR.BTA = 2h and SQCHxDSCyAR.SPD = 1b. The limit time for timeout is calculated by the formula of PRESPTOLPR * (the period of DSI_0_lpclk). When RXSR.PRESPTOERR is 1b, a timeout is detected. Note that no timeout is detected when PRESPTOLPR = 0. Since the counting clock is asynchronous with packet reception, there is some jitter in the timeout.
15 to 0	PRESPTOLPW [15:0]	0h	RW	Peripheral Response Timeout (LPDT WRITE Request) Count Set the timeout value to measure the interval between the start of Rx mode and the start of packet reception along with Bus Turn-Around while SQCHxDSCyAR.BTA = 01b and SQCHxDSCyAR.SPD = 1b. The limit time for timeout is calculated by the formula of PRESPTOLPW * (the period of DSI_0_lpclk). When RXSR.PRESPTOERR is 1b, a timeout is detected. Note that no timeout is detected when PRESPTOLPW = 0. Since the counting clock is asynchronous with packet reception, there is some jitter in the timeout.

9.5.2.2.20 Peripheral Response Timeout HS Set Register (DSI_LINK_PRESPTOHSSETR)

Access Size : 8, 16, 32 bits

Offset Address : <DSI_LINK_base> + 0218h

Initial Value : 0000_0000h



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	PRESPTOHSR [15:0]	0h	RW	Peripheral Response Timeout (HS READ Request) Count Set the timeout value to measure the interval between the start of Rx mode and the start of packet reception along with Bus Turn-Around while SQCHxDSCyAR.BTA = 2h and SQCHxDSCyAR.SPD = 0b. The limit time for timeout is calculated by the formula of PRESPTOHSR * (the period of DSI_0_lpclk). When RXSR.PRESPTOERR is 1b, a timeout is detected. Note that no timeout is detected when PRESPTOHSR = 0. Since the counting clock is asynchronous with packet reception, there is some jitter in the timeout.
15 to 0	PRESPTOHSW [15:0]	0h	RW	Peripheral Response Timeout (HS WRITE Request) Count Set the timeout value to measure the interval between the start of Rx mode and the start of packet reception along with Bus Turn-Around while SQCHxDSCyAR.BTA = 1h and SQCHxDSCyAR.SPD = 0b. The limit time for timeout is calculated by the formula of PRESPTOHSW * (the period of DSI_0_lpclk). When RXSR.PRESPTOERR is 1b, a timeout is detected. Note that no timeout is detected when PRESPTOHSW = 0. Since the counting clock is asynchronous with packet reception, there is some jitter in the timeout.

9.5.2.2.21 Acknowledge and Error Report Packet Parameter Latest Info Register (DSI_LINK_AKEPLATIR)

Access Size : 8, 16, 32 bits

Offset Address : <DSI_LINK_base> + 0220h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	VC3	VC2	VC1	VC0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ERRRPTLAT[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 20	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
19	VC3	0h	R	Virtual Channel Identifier 3 Latest This field indicates the Virtual Channel identifier of a received Acknowledge and Error Report Packet. 0b: Virtual Channel identifier is not 3. 1b: Virtual Channel identifier is 3. This field indicates the latest information. Whenever an Acknowledge and Error Report Packet is received, this field is updated.
18	VC2	0h	R	Virtual Channel Identifier 2 Latest This field indicates the Virtual Channel identifier of a received Acknowledge and Error Report Packet. 0b: Virtual Channel identifier is not 2. 1b: Virtual Channel identifier is 2. This field indicates the latest information. Whenever an Acknowledge and Error Report Packet is received, this field is updated.
17	VC1	0h	R	Virtual Channel Identifier 1 Latest This field indicates the Virtual Channel identifier of a received Acknowledge and Error Report Packet. 0b: Virtual Channel identifier is not 1. 1b: Virtual Channel identifier is 1. This field indicates the latest information. Whenever an Acknowledge and Error Report Packet is received, this field is updated.
16	VC0	0h	R	Virtual Channel Identifier 0 Latest This field indicates the Virtual Channel identifier of a received Acknowledge and Error Report Packet. 0b: Virtual Channel identifier is not 0. 1b: Virtual Channel identifier is 0. This field indicates the latest information. Whenever an Acknowledge and Error Report Packet is received, this field is updated.
15 to 0	ERRRPTLAT [15:0]	0h	R	Error Report Latest This field indicates the Error Report of a received Acknowledge and Error Report Packet. This field indicates the latest information. Whenever an Acknowledge and Error Report Packet is received, this field is updated.

9.5.2.2.22 Acknowledge and Error Report Packet Parameter Accumulate Status Register (DSI_LINK_AKEPACMSR)

Access Size : 8, 16, 32 bits

Offset Address : <DSI_LINK_base> + 0224h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	VC3	VC2	VC1	VC0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ERRRPTACM[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 20	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
19	VC3	0h	R	Virtual Channel Identifier 3 Accumulate This field is set to 1b when an Acknowledge and Error Report Packet whose Virtual Channel identifier = 3 is received. This field indicates accumulated information. This bit is cleared by AKEPSCR.VC3.
18	VC2	0h	R	Virtual Channel Identifier 2 Accumulate This field is set to 1b when an Acknowledge and Error Report Packet whose Virtual Channel identifier = 2 is received. This field indicates accumulated information. This bit is cleared by AKEPSCR.VC2.
17	VC1	0h	R	Virtual Channel Identifier 1 Accumulate This field is set to 1b when an Acknowledge and Error Report Packet whose Virtual Channel identifier = 1 is received. This field indicates accumulated information. This bit is cleared by AKEPSCR.VC1.
16	VC0	0h	R	Virtual Channel Identifier 0 Accumulate This field is set to 1b when an Acknowledge and Error Report Packet whose Virtual Channel identifier = 0 is received. This field indicates accumulated information. This bit is cleared by AKEPSCR.VC0.
15 to 0	ERRRPTACM [15:0]	0h	R	Error Report Accumulate Each bit of this field is set to 1b, when an Acknowledge and Error Report Packet whose each Error Report bit = 1 is received. This field indicates accumulated information. Each bit is cleared by the corresponding AKESCR.ERRRPTACM.

9.5.2.2.23 Acknowledge and Error Report Packet Parameter Status Clear Register (DSI_LINK_AKEPSCR)

Access Size : 8, 16, 32 bits

Offset Address : <DSI_LINK_base> + 0228h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	VC3	VC2	VC1	VC0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R0W	R0W	R0W	R0W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ERRRPTACM[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R0W	R0W	R0W	R0W	R0W	R0W	R0W	R0W	R0W	R0W	R0W	R0W	R0W	R0W	R0W	R0W

Bit	Bit Name	Initial Value	R/W	Description
31 to 20	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
19	VC3	0h	R0W	The read value is always 0b. AKEPACMSR.VC3 Clear Set to 1b to clear AKEPACMSR.VC3. Writing 0b has no effect.
18	VC2	0h	R0W	The read value is always 0b. AKEPACMSR.VC2 Clear Set to 1b to clear AKEPACMSR.VC2. Writing 0b has no effect.
17	VC1	0h	R0W	The read value is always 0b. AKEPACMSR.VC1 Clear Set to 1b to clear AKEPACMSR.VC1. Writing 0b has no effect.
16	VC0	0h	R0W	The read value is always 0b. AKEPACMSR.VC0 Clear Set to 1b to clear AKEPACMSR.VC0. Writing 0b has no effect.
15 to 0	ERRRPTACM[15:0]	0h	R0W	The read value is always 0b. Error Report Accumulate Clear Set to 1b to clear each AKEPACMSR.ERRRPTACM. Writing 0b has no effect.

9.5.2.2.24 Rx Result Saved Status Register (DSI_LINK_RXRSSR)

Access Size : 8, 16, 32 bits

Offset Address : <DSI_LINK_base> + 0230h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	SLT3VLD	SLT2VLD	SLT1VLD	SLT0VLD
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
3	SLT3VLD	0h	R	Slot 3 Valid Response packet is received, or information is saved to RXRSS3R. Write 1b to RXRSSCR.SLT3C to clear this bit. This bit and RXRSS3R are set if the next receive action is caused with SQCHxDSCyCR.ACTCODE = 03 again.
2	SLT2VLD	0h	R	Slot 2 Valid Response packet is received, or information is saved to RXRSS2R. Write 1b to RXRSSCR.SLT2C to clear this bit. This bit and RXRSS2R are set if the next receive action is caused with SQCHxDSCyCR.ACTCODE = 02 again.
1	SLT1VLD	0h	R	Slot 1 Valid Response packet is received, or information is saved to RXRSS1R. Write 1b to RXRSSCR.SLT1C to clear this bit. This bit and RXRSS1R are set if the next receive action is caused with SQCHxDSCyCR.ACTCODE = 01 again.
0	SLT0VLD	0h	R	Slot 0 Valid Response packet is received, or information is saved to RXRSS0R. Write 1b to RXRSSCR.SLT0C to clear this bit. This bit and RXRSS0R are set if the next receive action is caused with SQCHxDSCyCR.ACTCODE = 00 again.

9.5.2.2.25 Rx Result Saved Status Clear Register (DSI_LINK_RXRSSCR)

Access Size : 8, 16, 32 bits

Offset Address : <DSI_LINK_base> + 0234h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	SLT3C	SLT2C	SLT1C	SLT0C
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R0W	R0W	R0W	R0W

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
3	SLT3C	0h	R0W	The read value is always 0b. RXRSSR.SLT3VLD Clear Write 1b to clear RXRSSR.SLT3VLD. Writing 0b has no effect.
2	SLT2C	0h	R0W	The read value is always 0b. RXRSSR.SLT2VLD Clear Write 1b to clear RXRSSR.SLT2VLD. Writing 0b has no effect.
1	SLT1C	0h	R0W	The read value is always 0b. RXRSSR.SLT1VLD Clear Write 1b to clear RXRSSR.SLT1VLD. Writing 0b has no effect.
0	SLT0C	0h	R0W	The read value is always 0b. RXRSSR.SLT0VLD Clear Write 1b to clear RXRSSR.SLT0VLD. Writing 0b has no effect.

9.5.2.2.26 Rx Result Info Overwrite Status Register (DSI_LINK_RXRINFOOWSR)

Access Size : 8, 16, 32 bits

Offset Address : <DSI_LINK_base> + 0238h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
3	SLT3INFOOW	0h	R	Slot 3 Information Overwrite This bit is a copy of RXRSS3R.INFOOW.
2	SLT2INFOOW	0h	R	Slot 2 Information Overwrite This bit is a copy of RXRSS2R.INFOOW.
1	SLT1INFOOW	0h	R	Slot 1 Information Overwrite This bit is a copy of RXRSS1R.INFOOW.
0	SLT0INFOOW	0h	R	Slot 0 Information Overwrite This bit is a copy of RXRSS0R.INFOOW.

9.5.2.2.27 Rx Result Info Overwrite Status Clear Register (DSI_LINK_RXRINFOOWSCR)

Access Size : 8, 16, 32 bits

Offset Address : <DSI_LINK_base> + 023Ch

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	SLT3INFOOWC	SLT2INFOOWC	SLT1INFOOWC	SLT0INFOOWC
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R0W	R0W	R0W	R0W

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
3	SLT3INFOOWC	0h	R0W	The read value is always 0b. RXRSS3R.INFOOW Clear Write 1b to clear RXRSS3R.INFOOW. Writing 0b has no effect. To prevent missing of RXRSS3R.INFOOW, clear RXRSS3R.INFOOW before clearing RXRSSR.SLT3VLD.
2	SLT2INFOOWC	0h	R0W	The read value is always 0b. RXRSS2R.INFOOW Clear Write 1b to clear RXRSS2R.INFOOW. Writing 0b has no effect. To prevent missing of RXRSS2R.INFOOW, clear RXRSS2R.INFOOW before clearing RXRSSR.SLT2VLD.
1	SLT1INFOOWC	0h	R0W	The read value is always 0b. RXRSS1R.INFOOW Clear Write 1b to clear RXRSS1R.INFOOW. Writing 0b has no effect. To prevent missing of RXRSS1R.INFOOW, clear RXRSS1R.INFOOW before clearing RXRSSR.SLT1VLD.
0	SLT0INFOOWC	0h	R0W	The read value is always 0b. RXRSS0R.INFOOW Clear Write 1b to clear RXRSS0R.INFOOW. Writing 0b has no effect. To prevent missing of RXRSS0R.INFOOW, clear RXRSS0R.INFOOW before clearing RXRSSR.SLT0VLD.

9.5.2.2.28 Rx Result Save Slot x Register (DSI_LINK_RXRSSxR) (x = 0, 1, 2, 3)

Access Size : 8, 16, 32 bits

Offset Address : <DSI_LINK_base> + 0240h + 0004h × (x)

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	INFOOW	RXAKE	RXCORERR	RXPKTDFAIL	RXFAIL	RXFATALERR	RXSUC	FMT	VC[1:0]		DT[5:0]					
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DATA1[7:0]								DATA0[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	INFOOW	0h	R	Information Overwrite This bit is set if the information of RXRSSxR is updated when RXRSSR.SLTxVLD is 1b. Write 1b to RXRINFOOWSCR.SLTxINFOOWC to clear this bit.
30	RXAKE	0h	R	Receive Acknowledge and Error Report Packet RXSR.RXAKE is also reported.
29	RXCORERR	0h	R	Receive Correctable Error The received packet has a correctable error. RXSR.ECCERR1B is also reported.
28	RXPKTDFAIL	0h	R	Receive Packet Data Fail The packet header was saved correctly but data were not. One or more of the following bits are also reported. RXSR.CRCERR, RXSR.WCERR, RXSR.MAXRPSZERR, RXSR.UEXPKTERR, RXSR.RXOVFERR and RXSR.IBERR. When both of this bit and RXRESP are asserted, it means a redundant packet was received in BTA.
27	RXFAIL	0h	R	Receive Fail Expected reception did not proceed. One or more of the following bits are also reported. RXSR.PRESPTOERR, RXSR.ECCERR, RXSR.MLFERR and RXSR.NORETERR.
26	RXFATALERR	0h	R	Fatal Error A fatal timeout occurred during BTA. One or more of the following bits are also reported. FERRSR.TATO and FERRSR.LRXHTO.
25	RXSUC	0h	R	Receive Success When this value is 1b, the Response Packet or ACK trigger is received. One or more of the following bits are also reported. RXSR.RXRESP and RXSR.RXACK.
24	FMT	0h	R	Packet format of Rx Packet Header 0b: Short Packet 1b: Long Packet This field is valid when RXPKTDFAIL = 1 or (RXSUC = 1 and DT != 0).
23, 22	VC[1:0]	0h	R	Identifier of Virtual Channel of Rx Packet Header This field is valid when (RXSUC = 1 and DT != 0).
21 to 16	DT[5:0]	0h	R	Data Type of Rx Packet Header 00h: ACK trigger received 01h to 3Fh: Data Type This field is valid when RXSUC = 1.
15 to 8	DATA1[7:0]	0h	R	Data1 of Rx Packet Header When the Rx packet format is Long Packet, this value is the upper 8 bits of the word count. This field is valid when (RXSUC = 1 and DT != 0).
7 to 0	DATA0[7:0]	0h	R	Data0 of Rx Packet Header When Rx packet format is Long Packet, this value is the lower 8 bits of the word count. This field is valid when (RXSUC = 1 and DT != 0).

9.5.2.2.29 Rx Packet Payload Data 0 Register (DSI_LINK_RXPPD0R)

Access Size : 8, 16, 32 bits
Offset Address : <DSI_LINK_base> + 02C0h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DATA[31:16]

Bit	Bit Name	Initial Value	R/W	Description
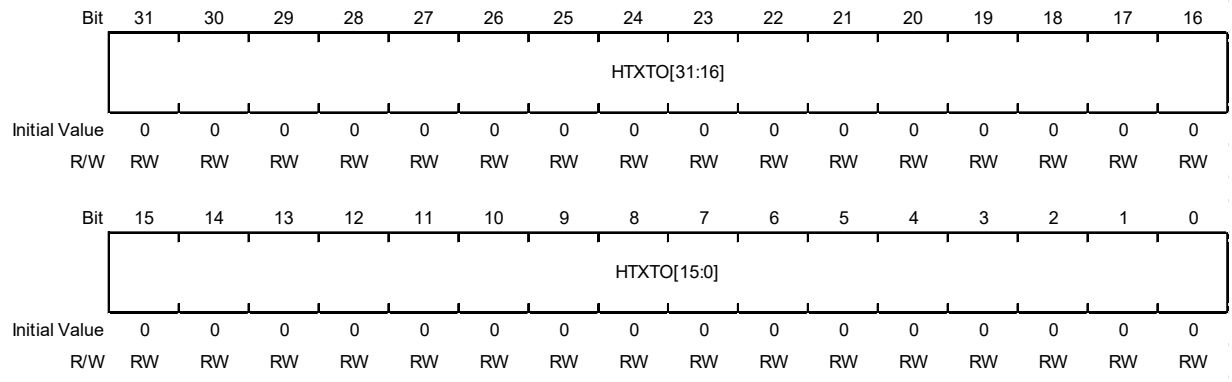
31 to 0	DATA[31:0]	0h	R	Rx Packet Payload Data 3 When a Long Packet is received with SQCHxDSCyBR.DTSEL = 0h, the received packet payload is saved. [7: 0]: Data 12 [15: 8]: Data 13 [23: 16]: Data 14 [31: 24]: Data 15

9.5.2.2.33 HSTX Timeout Set Register (DSI_LINK_HSTXTOSETR)

Access Size : 8, 16, 32 bits

Offset Address : <DSI_LINK_base> + 02E0h

Initial Value : 0000_0000h



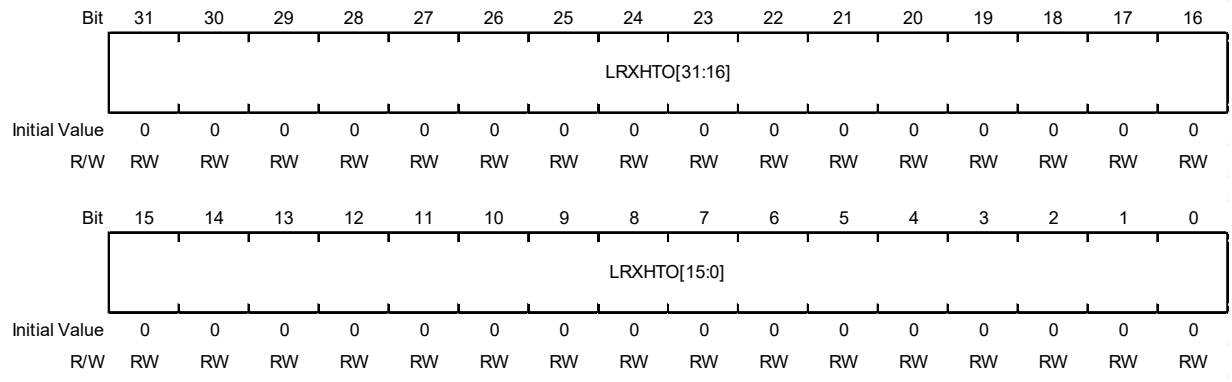
Bit	Bit Name	Initial Value	R/W	Description
31 to 0	HTXTO[31:0]	0h	RW	HS TX Timeout Count (HTX_TO) The limit time for timeout is calculated by the formula of HTXTO * (the period of high-speed serial UI * 32). When FERRSR.HTXTO is 1b, a timeout is detected. Note that no timeout is detected when HTXTO = 0.

9.5.2.2.34 LRX-H Timeout Set Register (DSI_LINK_LRXHTOSETR)

Access Size : 8, 16, 32 bits

Offset Address : <DSI_LINK_base> + 02E4h

Initial Value : 0000_0000h



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	LRXHTO[31:0]	0h	RW	LP-RX Host Processor Timeout (LRX-H_TO) The limit time for timeout is calculated by the formula of LRXHTO * (the period of lpclk). When FERRSR.LRXHTO is 1b, a timeout is detected. Note that no timeout is detected when LRXHTO = 0.

9.5.2.2.35 TA Timeout Set Register (DSI_LINK_TATOSETR)

Access Size : 8, 16, 32 bits

Offset Address : <DSI_LINK_base> + 02E8h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TATO[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TATO[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	TATO[31:0]	0h	RW	Turnaround Acknowledge Timeout (TA_TO) The limit time for timeout is calculated by the formula of TATO * (the period of lpclk). When FERRSR.TATO is 1b, a timeout is detected. Note that no timeout is detected when TATO = 0.

9.5.2.2.36 Fatal Error Status Register (DSI_LINK_FERRSR)

Access Size : 8, 16, 32 bits

Offset Address : <DSI_LINK_base> + 0300h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	ERRCLP1S	ERRCLP0S	-	-	-	-	-	-	ERRCLP1	ERRCLP0	ERRCTRL	ERRSYNESC	ERRESC
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	TATO	LRXHTO	HTXTO
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
28	ERRCLP1S	0h	R	Status of Contention Error of LP1 (ErrContentionLP1)
27	ERRCLP0S	0h	R	Status of Contention Error of LP0 (ErrContentionLP0)
26 to 21	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
20	ERRCLP1	0h	R	Contention Error of LP1 (ErrContentionLP1) When this value is 1b, the Contention Error of LP1 (ErrContentionLP1) is detected on PPI Data Lane 0. Write 1b to the FERRSCR.ERRCLP1 register to clear this field.
19	ERRCLP0	0h	R	Contention Error of LP0 (ErrContentionLP0) When this value is 1b, the Contention Error of LP0 (ErrContentionLP0) is detected on PPI Data Lane 0. Write 1b to the FERRSCR.ERRCLP0 register to clear this field.
18	ERRCTRL	0h	R	Control Error (ErrControl) When this value is 1b, the Control Error (ErrControl) is detected on PPI Data Lane 0. Write 1b to the FERRSCR.ERRCTRL register to clear this field.
17	ERRSYNESC	0h	R	Sync Error of LPDT (ErrSyncEsc) When this value is 1b, the Sync Error of LPDT (ErrSyncEsc) is detected on PPI Data Lane 0. Write 1b to the FERRSCR.ERRSYNESC register to clear this field.
16	ERRESC	0h	R	Escape mode Entry Error (ErrEsc) When this value is 1b, the Escape mode Entry Error (ErrEsc) is detected on PPI Data Lane 0. Write 1b to the FERRSCR.ERRESC register to clear this field.
15 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
2	TATO	0h	R	Turnaround Acknowledge Timeout (TA_TO) When this value is 1b, the Turnaround Acknowledge Timeout (TA_TO) is detected. Write 1b to the FERRSCR.TATO register to clear this field.
1	LRXHTO	0h	R	LP-RX Host Processor Timeout (LRX-H_TO) When this value is 1b, the LP-RX Host Processor Timeout (LRX-H_TO) is detected. Write 1b to the FERRSCR.LRXHTO register to clear this field.
0	HTXTO	0h	R	HS TX Timeout (HTX_TO) When this value is 1b, the HS TX Timeout (HTX_TO) is detected. Write 1b to the FERRSCR.HTXTO register to clear this field.

9.5.2.2.37 Fatal Error Status Clear Register (DSI_LINK_FERRSCR)

Access Size : 8, 16, 32 bits

Offset Address : <DSI_LINK_base> + 0304h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	ERRCLP1	ERRCLP0	ERRCTRL	ERRSYNESC	ERRESC
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R0W	R0W	R0W	R0W	R0W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	TATO	LRXHTO	HTXTO
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W	R0W	R0W

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
20	ERRCLP1	0h	R0W	The read value is always 0b. FERRSR.ERRCLP1 Clear Set to 1b to clear FERRSR.ERRCLP1. Writing 0b has no effect.
19	ERRCLP0	0h	R0W	The read value is always 0. FERRSR.ERRCLP0 Clear Set to 1b to clear FERRSR.ERRCLP0. Writing 0b has no effect.
18	ERRCTRL	0h	R0W	The read value is always 0. FERRSR.ERRCTRL Clear Set to 1b to clear FERRSR.ERRCTRL. Writing 0b has no effect.
17	ERRSYNESC	0h	R0W	The read value is always 0. FERRSR.ERRSYNESC Clear Set to 1b to clear FERRSR.ERRSYNESC. Writing 0b has no effect.
16	ERRESC	0h	R0W	The read value is always 0. FERRSR.ERRESC Clear Set to 1b to clear FERRSR.ERRESC. Writing 0b has no effect.
15 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
2	TATO	0h	R0W	The read value is always 0b. FERRSR.TATO Clear Set to 1b to clear FERRSR.TATO. Writing 0b has no effect.
1	LRXHTO	0h	R0W	The read value is always 0b. FERRSR.LRXHTO Clear Set to 1b to clear FERRSR.LRXHTO. Writing 0b has no effect.
0	HTXTO	0h	R0W	The read value is always 0. FERRSR.HTXTO Clear Set to 1b to clear FERRSR.HTXTO. Writing 0b has no effect.

9.5.2.2.38 Fatal Error Interrupt Enable Register (DSI_LINK_FERRIER)

Access Size : 8, 16, 32 bits

Offset Address : <DSI_LINK_base> + 0308h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	ERRCLP1	ERRCLP0	ERRCTRL	ERRSYNESC	ERRESC
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	TATO	LRXHTO	HTXTO
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
20	ERRCLP1	0h	RW	Interrupt enable for the Contention Error of LP1 on PPI Data Lane 0 (ErrContentionLP1) 0b: Disables interrupt dsi_int_ferr when FERRSR.ERRCLP1 = 1 1b: Enables interrupt dsi_int_ferr when FERRSR.ERRCLP1 = 1
19	ERRCLP0	0h	RW	Interrupt enable for the Contention Error of LP0 on PPI Data Lane 0 (ErrContentionLP0) 0b: Disables interrupt dsi_int_ferr when FERRSR.ERRCLP0 = 1 1b: Enables interrupt dsi_int_ferr when FERRSR.ERRCLP0 = 1
18	ERRCTRL	0h	RW	Interrupt enable for the Control Error on PPI Data Lane 0 (ErrControl) 0b: Disables interrupt dsi_int_ferr when FERRSR.ERRCTRL = 1 1b: Enables interrupt dsi_int_ferr when FERRSR.ERRCTRL = 1
17	ERRSYNESC	0h	RW	Interrupt enable for the LPDT Sync Error on PPI Data Lane 0 (ErrSyncEsc) 0b: Disables interrupt dsi_int_ferr when FERRSR.ERRSYNESC = 1 1b: Enables interrupt dsi_int_ferr when FERRSR.ERRSYNESC = 1
16	ERRESC	0h	RW	Interrupt enable for the Escape mode Error on PPI Data Lane 0 (ErrEsc) 0b: Disables interrupt dsi_int_ferr when FERRSR.ERRESC = 1 1b: Enables interrupt dsi_int_ferr when FERRSR.ERRESC = 1
15 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
2	TATO	0h	RW	Interrupt enable for Turnaround Acknowledge Timeout (TA_TO) 0b: Disables interrupt dsi_int_ferr when FERRSR.TATO = 1 1b: Enables interrupt dsi_int_ferr when FERRSR.TATO = 1
1	LRXHTO	0h	RW	Interrupt enable for LP-RX Host Processor Timeout (LRX_H_TO) 0b: Disables interrupt dsi_int_ferr when FERRSR.LRXHTO = 1 1b: Enables interrupt dsi_int_ferr when FERRSR.LRXHTO = 1
0	HTXTO	0h	RW	Interrupt enable for HS TX Timeout (HTX_TO) 0b: Disables interrupt dsi_int_ferr when FERRSR.HTXTO = 1 1b: Enables interrupt dsi_int_ferr when FERRSR.HTXTO = 1

9.5.2.2.39 Clock Lane Stop Time Set Register (DSI_LINK_CLSTPTSETR)

Access Size : 8, 16, 32 bits
Offset Address : <DSI_LINK_base> + 0314h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CLKKPT[7:0]								CLKBFHT[7:0]

R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	CLKSTPT[9:0]										-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	CLKKPT[7:0]	0h	RW	Clock Keep Time The time period over which the HS Clock Lane keeps active after HS packet transfer. The time is calculated by the formula of CLKKPT * (the period of high-speed serial UI * 32). This time corresponds to the D-PHY specification's ($T_{HS-TRAIL}$ + $T_{CLK-POST}$). The value must be greater than the one calculated. For information about each parameter, see **Table 9.5-4**. Set an appropriate value (other than 0) before HSCLKSETR.HSCLKRUN is set to "1".
23 to 16	CLKBFHT[7:0]	0h	RW	Clock Beforehand Time The time period over which Clock Lane is changed back to HS before HS packet transfer. If HS transfers are scheduled in LP, Clock Lane will start before HS transfer by this setting. The time is calculated by the formula of CLKBFHT * (the period of high-speed serial UI * 32). This time corresponds to the D-PHY specification's (T_{LPX}(For Clock Lane HS Entry) + $T_{CLK-PREPARE}$ + $T_{CLK-ZERO}$ + $T_{CLK-PRE}$). The value must be greater than the one calculated. For information about each parameter, see **Table 9.5-4**. Set an appropriate value (other than 0) before HSCLKSETR.HSCLKRUN is set to "1". The "T_{LPX}(For Clock Lane HS Entry)" means the period of LP-01 in HS entry sequence of Clock Lane. If this period is not same as normal T_{LPX} value of host device (in the range of 67% to 150% of the T_{LPX} value of peripheral device), use the actual period for this calculation.
15 to 12	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
11 to 2	CLKSTPT[9:0]	0h	RW	Clock Stop Time The time period over which the HS Clock Lane is changed to LP and back to HS. If Data Lanes exit HS and the time of CLKKPT expires, and the scheduled time till the next HS transfer is more than this setting, Clock Lane will be changed to LP. This setting has no meaning if HSCLKSETR.HSCLKMODE is 1b or if HSCLKSETR.HSCLKRUN is 0b. The time is calculated by the formula of CLKSTPT * (the period of high-speed serial UI * 32) This time corresponds to the D-PHY specification's ($T_{HS-TRAIL}$ + $T_{CLK-POST}$ + $T_{CLK-TRAIL}$ + $T_{HS-EXIT}$ + T_{LPX} * 2 + T_{LPX}(For Clock Lane HS Entry) + $T_{CLK-PREPARE}$ + $T_{CLK-ZERO}$ + $T_{CLK-PRE}$ + T_{LPX}(For Data Lane HS Entry) + $T_{HS-PREPARE}$ + $T_{HS-ZERO}$ + $T_{HS-SYNC}$). For information about each parameter, see **Figure 9.5-2** and **Table 9.5-4**. Of these parameters, it is necessary to set the time actually set in CLKKPT for ($T_{HS-TRAIL}$ + $T_{CLK-POST}$) and that actually set in CLKBFHT for (T_{LPX}(For Clock Lane HS Entry) + $T_{CLK-PREPARE}$ + $T_{CLK-ZERO}$ + $T_{CLK-PRE}$). Set the rounded-up value plus at least 3. Setting this field to "0" is prohibited. The "T_{LPX}(For Clock Lane HS Entry)" means the period of LP-01 in HS entry sequence of Clock Lane. And the "T_{LPX}(For Data Lane HS Entry)" means the period of LP-01 in HS entry sequence of Data Lane. If these periods are not same as normal T_{LPX} value of host device (in the range of 67% to 150% of the T_{LPX} value of peripheral device), use the actual periods for this calculation.
1, 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

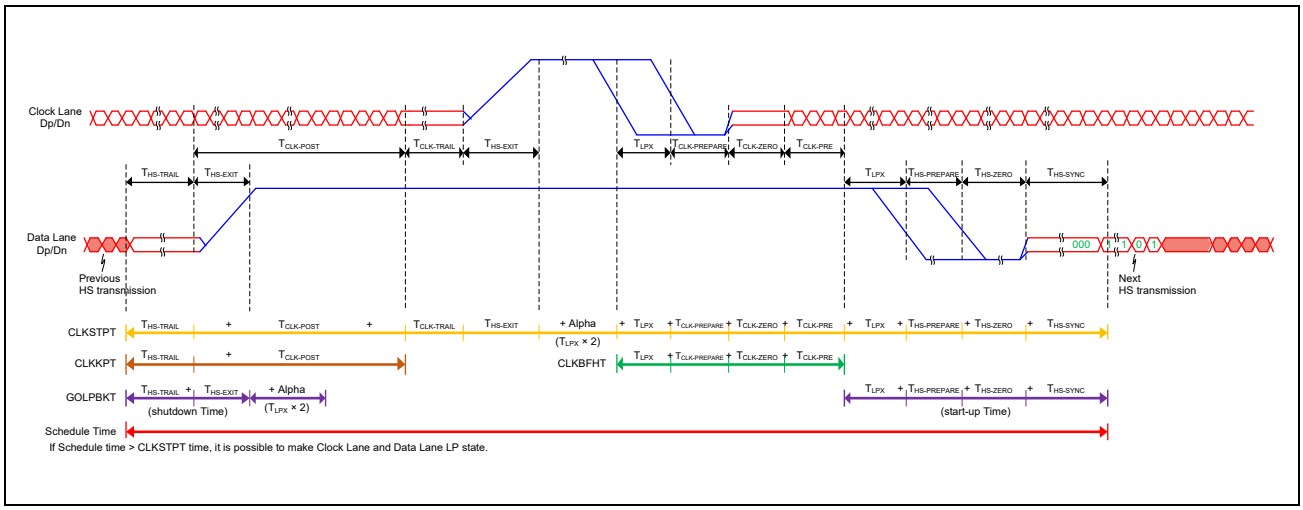

Figure 9.5-2 Switching the Clock Lane between Clock Transmission and Low-Power Mode

9.5.2.2.40 LP Transition Time Set Register (DSI_LINK_LPTRNSTSETR)

Access Size : 8, 16, 32 bits
Offset Address : <DSI_LINK_base> + 0318h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	GOLPBKT[9:0]									
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
9 to 0	GOLPBKT[9:0]	0h	RW	Go LP and Back Time The time period over which the HS Data Lanes are changed to LP and back to HS. If the scheduled time between HS transfers is more than this setting, Data Lanes will be changed to LP. The time is calculated by the formula of GOLPBKT * (the period of high-speed serial 8 * UI). This time corresponds to D-PHY specification's ($T_{HS-TRAIL}$ + $T_{HS-EXIT}$ + T_{LPX} * 2 + T_{LPX}(For Data Lane HS Entry) + $T_{HS-PREPARE}$ + $T_{HS-ZERO}$ + $T_{HS-SYNC}$). For information about each parameter, see **Figure 9.5-3** and **Table 9.5-4**. The unit of this setting is 8 UIs, so if the result of this formula contains a fraction of less than 8 UIs, round it up. Set the rounded-up value plus at least 3. The "T_{LPX}(For Data Lane HS Entry)" means the period of LP-01 in HS entry sequence of Data Lane. If this period is not same as normal T_{LPX} value of host device (in the range of 67% to 150% of the T_{LPX} value of peripheral device), use the actual period for this calculation.

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31, 30	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
29	DLFROMULPS	0h	R	From ULPS (Data Lane) When this value is 1b, all PPI Data Lanes enabled by TXSETR.NUMLANEUSE were changed from ULPS to Stop State by exiting ULPS. Write 1b to the PLSCR.DLFROMULPS register to clear this field.
28	DLTOULPS	0h	R	To ULPS (Data Lane) When this value is 1b, all PPI Data Lanes enabled by TXSETR.NUMLANEUSE were changed from Stop State to ULPS by entering ULPS. Write 1b to the PLSCR.DLTOULPS register to clear this field.
27	CLHS2LP	0h	R	HS to LP (Clock Lane) When this value is 1b, a transition of Clock Lane from HS to LP is detected. Checking this bit during non-continuous clock mode operation has no meaning. Therefore, ignore this bit when HSCLKSETR.HSCLKMODE = 0b. Write 1b to the PLSCR.CLHS2LP register to clear this field.
26	CLLP2HS	0h	R	LP to HS (Clock Lane) When this value is 1b, a transition of Clock Lane from LP to HS is detected. Checking this bit during non-continuous clock mode operation has no meaning. Therefore, ignore this bit when HSCLKSETR.HSCLKMODE = 0b. Write 1b to the PLSCR.CLLP2HS register to clear this field.
25	CLFROMULPS	0h	R	From ULPS (Clock Lane) When this value is 1b, Clock Lane exiting ULPS is detected. Write 1b to the PLSCR.CLFROMULPS register to clear this field.
24	CLTOULPS	0h	R	To ULPS (Clock Lane) When this value is 1b, Clock Lane entering ULPS is detected. Write 1b to the PLSCR.CLTOULPS register to clear this field.
23 to 16	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
15	DL0DIR	0h	R	Direction (Tx or Rx) of Data Lane 0 0b: PHY is in Tx Mode 1b: PHY is in Rx Mode This field indicates Direction of PPI Data Lane 0 after synchronization to lpclk. This field does not indicate the current status while lpclk is not running.
14	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
13	DL0TX2RX	0h	R	Tx to Rx on Data Lane 0 When this value is 1b, a transition of Direction from 0 (Tx) to 1 (Rx) is detected on Data Lane 0. Write 1b to the PLSCR.DL0TX2RX register to clear this field.
12	DL0RX2TX	0h	R	Rx to Tx on Data Lane 0 When this value is 1b, a transition of Direction from 1 (Rx) to 0 (Tx) is detected on Data Lane 0. Write 1b to the PLSCR.DL0RX2TX register to clear this field.

Bit	Bit Name	Initial Value	R/W	Description
11 to 8	DLSTPST[3:0]	Fh	R	Stop State of Data Lane bit 3: Stop State of Data Lane 3 bit 2: Stop State of Data Lane 2 bit 1: Stop State of Data Lane 1 bit 0: Stop State of Data Lane 0 This field indicates Stop State of a PPI Data Lane after synchronization to lpclk. This field does not indicate the current status while lpclk is not running.
7 to 4	DLULPSACTN [3:0]	Fh	R	UlpsActiveNot of Data Lane bit 3: UlpsActiveNot of Data Lane 3 bit 2: UlpsActiveNot of Data Lane 2 bit 1: UlpsActiveNot of Data Lane 1 bit 0: UlpsActiveNot of Data Lane 0 This field indicates UlpsActiveNot of a PPI Data Lane after synchronization to lpclk. This field does not indicate the current status while lpclk is not running.
3	DL0RXULPSESC	0h	R	RxUlpsEsc of Data Lane 0 This field indicates RxUlpsEsc of PPI Data Lane 0 after synchronization to lpclk. This field does not indicate the current status while lpclk is not running.
2	DL0RXLPDTESC	0h	R	RxLpdtEsc of Data Lane 0 This field indicates RxLpdtEsc of PPI Data Lane 0 after synchronization to lpclk. This field does not indicate the current status while lpclk is not running.
1	CLSTPST	1h	R	Stop State of PPI Clock Lane This field indicates Stop State of the PPI Clock Lane after synchronization to lpclk. This field does not indicate the current status while lpclk is not running.
0	CLULPSACTN	1h	R	UlpsActiveNot of PPI Clock Lane This field indicates UlpsActiveNot of the PPI Clock Lane after synchronization to lpclk. This field does not indicate the current status while lpclk is not running.

9.5.2.2.42 Physical Lane Status Clear Register (DSI_LINK_PLSCR)

Access Size : 8, 16, 32 bits

Offset Address : <DSI_LINK_base> + 0324h

Initial Value : 0000_0000h

	-	-	-	VSEN	-	HFPNOLP	HBPNOLP	HSANOLP	-	-	-	-	-	-	VSTPAFT	VSTART
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	RW	RW	RW	RW	RW	RW	R	R	R	R	R	R0W	R0W	R0W

Bit	Bit Name	Initial Value	R/W	Description
31 to 14	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
13	-	0h	RW	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
12	VSEN	0h	RW	Video Skew Calibration Enable 0b: No skew calibration is issued by this channel. 1b: Periodic skew calibration is issued in the first line of VBP. When periodic skew calibration is enabled, set HSCLKSETR.HSCLKMODE = 1.
11	-	0h	RW	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
10	HFPNOLP	0h	RW	HFP period No LP Specifies whether suppress to transition to LP during the HFP period. 0b: Does not suppress transition to LP during the period 1b: Suppresses transition to LP during the period and keeps HS. HS is kept by sending a blanking packet.
9	HBPNOLP	0h	RW	HBP period No LP Specifies whether suppress transition to LP during the HBP period. 0b: Does not suppress transition to LP during the period 1b: Suppresses transition to LP during the period and keeps HS. HS is kept by sending a blanking packet.
8	HSANOLP	0h	RW	HSA period No LP Specifies whether suppress transition to LP during the HSA period. When TXESYNC=0, this field has no meaning. 0b: Does not suppress transition to LP during the period 1b: Suppresses transition to LP during the period and keeps HS. HS is kept by sending a blanking packet.
7 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
2	-	0h	R0W	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
1	VSTPAFT	0h	R0W	The read value is always 0b. Video-Input signals stop after Video-Input Operation stop Stop Video-Input Operation. Video-Input Operation will end at the end of video-frame. After Video-Input Operation end, stop Video-Input signals. If Video-Input Operation is stopped, VICH1SR.RUNNING bit will change to 0b. Set 1b to both VSTPAFT and VSTART is prohibited. Set 1b during VICH1SR.RUNNING = 0 is prohibited. Writing 0b has no effect.

Bit	Bit Name	Initial Value	R/W	Description
0	VSTART	0h	R0W	The read value is always 0b. Video-Input Operation Start Write 1b to start Video-Input Operation. Setting both VSTART and VSTPAFT to 1b is prohibited. Setting this bit to 1b while VICH1SR.RUNNING = 1 is prohibited. Writing 0b has no effect.

9.5.2.2.45 Video-Input Channel 1 Set 1 Register (DSI_LINK_VICH1SET1R)

Access Size : 8, 16, 32 bits
Offset Address : <DSI_LINK_base> + 0404h
Initial Value : 1093_0000h

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
23	VBUFOVF	0h	R	Video-Input Buffer Overflow Error A data overflow has occurred in Video-Input Buffer. Write 1b to the VICH1SCR.VBUFOVF register to clear this field.
22	VBUFUDF	0h	R	Video-Input Buffer Underflow Error A data underflow has occurred in Video-Input Buffer. Write 1b to the VICH1SCR.VBUFUDF register to clear this field.
21	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
20	TIMERR	0h	R	Timing Error A timing error has occurred during Video-Input Operation. Write 1b to the VICH1SCR.TIMERR register to clear this field.
19 to 4	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
3	VIRDY	0h	R	Video-Input Signal Accept Ready The value will be set to 1b when the input signal can be accepted by Video-Input Operation channel 1 ready.
2	RUNNING	0h	R	Video-Input Operation channel 1 Transfer Running The value will be set to 1b while Video-Input Operation channel 1 transfer is in progress. Changing the values of the VICH1SET0R, VICH1SET1R, VICH1PPSETR, VICH1VSSETR, VICH1VPSETR, VICH1HSSETR and VICH1HPSETR is prohibited while the transfer is in progress (VICH1SR.RUNNING = 1).
1	STOP	0h	R	Video Input Operation channel 1 Transfer Stop Write 1b to the VICH1SCR.STOP register to clear this field.
0	START	0h	R	Video Input Operation channel 1 Transfer Start. Write 1b to the VICH1SCR.START register to clear this field.

9.5.2.2.47 Video-Input Channel 1 Status Clear Register (DSI_LINK_VICH1SCR)

Access Size : 8, 16, 32 bits
Offset Address : <DSI_LINK_base> + 0414h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	VBUFOVF	VBUFUDF	-	TIMERR	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R0W	R0W	R0W	R0W	R0W	R	R	R0W	R0W	R0W	R0W	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	VIRDY	-	STOP	START
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R0W	R	R	R	R	R	R	R	R	R	R	R0W	R	R0W	R0W

Bit	Bit Name	Initial Value	R/W	Description
31	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
30 to 26	-	All 0	R0W	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
25 to 24	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
23	VBUFOVF	0h	R0W	The read value is always 0b. VICH1SR.VBUFOVF Clear Set to 1b to clear VICH1SR.VBUFOVF. Writing 0b has no effect.
22	VBUFUDF	0h	R0W	The read value is always 0b. VICH1SR.VBUFUDF Clear Set to 1b to clear VICH1SR.VBUFUDF. Writing 0b has no effect.
21	-	0h	R0W	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
20	TIMERR	0h	R0W	The read value is always 0b. VICH1SR.TIMERR Clear Set to 1b to clear VICH1SR.TIMERR. Writing 0b has no effect.
19 to 15	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
14	-	0h	R0W	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
13 to 4	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
3	VIRDY	0h	R0W	The read value is always 0b. VICH1SR.VIRDY Clear Set to 1b to clear VICH1SR.VIRDY. Writing 0b has no effect.
2	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
1	STOP	0h	R0W	The read value is always 0b. VICH1SR.STOP Clear Set to 1b to clear VICH1SR.STOP. Writing 0b has no effect.
0	START	0h	R0W	The read value is always 0b. VICH1SR.START Clear Set to 1b to clear VICH1SR.START. Writing 0b has no effect.

9.5.2.2.48 Video-Input Channel 1 Interrupt Enable Register (DSI_LINK_VICH1IER)

Access Size : 8, 16, 32 bits
Offset Address : <DSI_LINK_base> + 0418h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	VBUFOVF	VBUFUDF	-	TIMERR	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	RW	RW	RW	RW	RW	R	R	RW	RW	RW	RW	R	R	R	R

	-	-	-	-	-	-	-	-	-	-	-	-	VIRDY	-	STOP	START
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	RW	R	R	R	R	R	R	R	R	R	R	RW	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
30 to 26	-	All 0	RW	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
25, 24	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
23	VBUFOVF	0h	RW	Interrupt enable for the Video-Input Buffer Overflow Error 0b: Disables interrupt dsi_int_vin1 when VICH1SR.VBUFOVF = 1. 1b: Enables interrupt dsi_int_vin1 when VICH1SR.VBUFOVF = 1.
22	VBUFUDF	0h	RW	Interrupt enable for the Video-Input Buffer Underflow Error 0b: Disables interrupt dsi_int_vin1 when VICH1SR.VBUFUDF = 1. 1b: Enables interrupt dsi_int_vin1 when VICH1SR.VBUFUDF = 1.
21	-	0h	RW	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
20	TIMERR	0h	RW	Interrupt enable for the Timing Error 0b: Disables interrupt dsi_int_vin1 when VICH1SR.TIMERR = 1. 1b: Enables interrupt dsi_int_vin1 when VICH1SR.TIMERR = 1.
19 to 15	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
14	-	0h	RW	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
13 to 4	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
3	VIRDY	0h	RW	Interrupt enable for the Video Input Accept Ready 0b: Disables interrupt dsi_int_vin1 when VICH1SR.VIRDY = 1. 1b: Enables interrupt dsi_int_vin1 when VICH1SR.VIRDY = 1.
2	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
1	STOP	0h	RW	Interrupt enable for the Video Input Operation channel 1 Transfer Stop 0b: Disables interrupt dsi_int_vin1 when VICH1SR.STOP = 1. 1b: Enables interrupt dsi_int_vin1 when VICH1SR.STOP = 1.
0	START	0h	RW	Interrupt enable for the Video Input Operation channel 1 Transfer Start 0b: Disables interrupt dsi_int_vin1 when VICH1SR.START = 1. 1b: Enables interrupt dsi_int_vin1 when VICH1SR.START = 1.

9.5.2.2.49 Video-Input Channel 1 Pixel Packet Set Register (DSI_LINK_VICH1PPSETR)

Access Size : 8, 16, 32 bits
Offset Address : <DSI_LINK_base> + 0420h
Initial Value : 000E_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	VC[1:0]		DT[5:0]					
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1	0
R/W	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TXESYNC	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
23, 22	VC[1:0]	0h	RW	Video-Input Operation Channel 1 Pixel Stream Packet Header Virtual Channel Identifier
21 to 16	DT[5:0]	Eh	RW	Video-Input Operation Channel 1 Pixel Stream Packet Header Data Type The following values can be set. 0Eh: Packed Pixel Stream, 16-bit RGB 1Eh: Packed Pixel Stream, 18-bit RGB 2Eh: Loosely Packed Pixel Stream, 18-bit RGB 3Eh: Packed Pixel Stream, 24-bit RGB Setting any other values is prohibited.
15	TXESYNC	0h	RW	Transmit End of Sync Pulse 0b: HSE and VSE are NOT transmitted 1b: HSE and VSE are transmitted The setting 0b is used for “Burst Mode” sequence or “Non-Burst Mode with Sync Events” sequence. The setting 1b is used for “Non-Burst Mode with Sync Pulse” sequence.
14 to 4	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
3 to 0	-	All 0	RW	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.

9.5.2.2.50 Video-Input Channel 1 Vertical Size Set Register (DSI_LINK_VICH1VSSETR)

Access Size : 8, 16, 32 bits

Offset Address : <DSI_LINK_base> + 0428h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	VACTIVE[14:0]														
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	VSPOL	-	-	-	VSA[11:0]											
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
30 to 16	VACTIVE[14:0]	0h	RW	Sets the Line count of VACTIVE (Vertical Active lines)
15	VSPOL	0h	RW	Polarity of VSYNC Sets the polarity (active state) of the VSYNC signal. 0b: Active high 1b: Active low
14 to 12	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
11 to 0	VSA[11:0]	0h	RW	VSA Count Sets the Line count of VSA (Vertical Sync Active)

9.5.2.2.51 Video-Input Channel 1 Vertical Porch Set Register (DSI_LINK_VICH1VPSETR)

Access Size : 8, 16, 32 bits

Offset Address : <DSI_LINK_base> + 042Ch

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	VFP[12:0]

Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

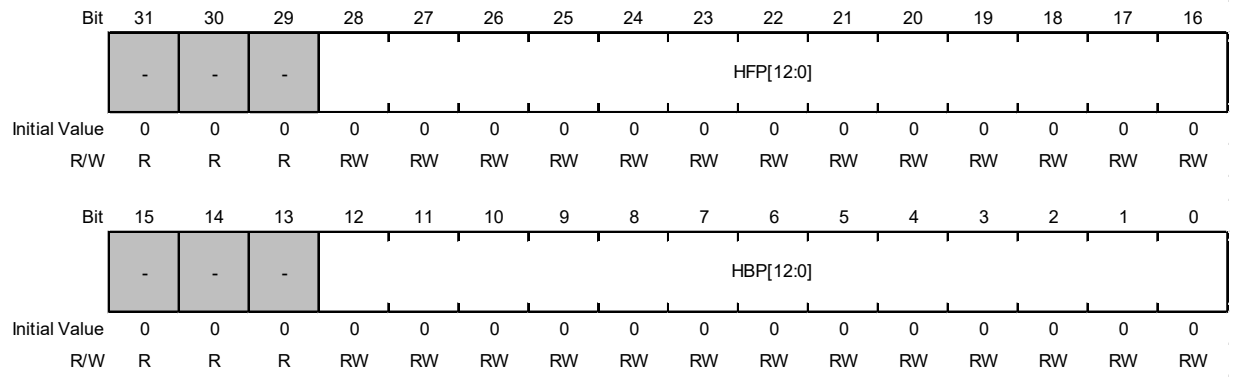
Bit	Bit Name	Initial Value	R/W	Description
31	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
30 to 16	HACTIVE [14:0]	0h	RW	HACTIVE Count Sets the pixel count of HACTIVE (Horizontal Active pixels)
15	HSPOL	0h	RW	Polarity of HSYNC Sets the polarity (active state) of the HSYNC signal. 0b: Active high 1b: Active low
14 to 12	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
11 to 0	HSA[11:0]	0h	RW	HSA Count Sets the pixel count of HSA (Horizontal Sync Active)

9.5.2.2.53 Video-Input Channel 1 Horizontal Porch Set Register (DSI_LINK_VICH1HPSETR)

Access Size : 8, 16, 32 bits

Offset Address : <DSI_LINK_base> + 0434h

Initial Value : 0000_0000h



Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
28 to 16	HFP[12:0]	0h	RW	HFP Count Sets the pixel count of HFP (Horizontal Front Porch)
15 to 13	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
12 to 0	HBP[12:0]	0h	RW	HBP Count Sets the pixel count of HBP (Horizontal Back Porch)

9.5.2.2.54 Sequence Channel x Set 0 Register (DSI_LINK_SQCHxSET0R)

"x" indicates the channel number.

Note: "x" is 0 or 1.

Access Size : 8, 16, 32 bits

Offset Address : <DSI_LINK_base> + 05C0h (x = 0)
<DSI_LINK_base> + 0600h (x = 1)

Initial Value : 0080_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0
R/W	R0W	R0W	R0W	R0W	R0W	R0W	R0W	R0W	RW	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	START
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	R	R	R0W	R0W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	-	All 0	R0W	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
23	-	1h	RW	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
22 to 9	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
8 to 4	-	All 0	RW	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
3, 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
1	-	0h	R0W	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
0	START	0h	R0W	The read value is always 0b. Sequence Operation Start Write 1b to start running from Descriptor #0. Setting it to 1b while RUNNING = 1 is prohibited. Writing 0b has no effect.

9.5.2.2.55 Sequence Channel x Set 1 Register (DSI_LINK_SQCHxSET1R)

"x" indicates the channel number.

Note: "x" is 0 or 1.

Access Size : 8, 16, 32 bits

Offset Address : <DSI_LINK_base> + 05C4h (x = 0)
<DSI_LINK_base> + 0604h (x = 1)

Initial Value : 0800_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	MAXDESNUM[7:0]								CHBUFSZ[3:0]				-	-	-	-
Initial Value	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	MAXDESNUM [7:0]	8h	RW	Max Descriptor Number This field indicates the maximum number of descriptors, with the descriptor numbers starting from zero (e.g. the setting 8 means #0 to #7 can be used as descriptors). Writing a value other than the initial value is prohibited.
23 to 20	CHBUFSZ [3:0]	0h	R	Sequence Channel x Buffer Size 0h: 128 B 1h: 256 B 2h: 512 B 3h: 1 kB 4h: 2 kB 5h: 4 kB 6h: 8 kB 7h: 16 kB 8h: 32 kB 9h: 64 kB Buffer size = 128 x 2 CHBUFSZ Setting a transfer packet size larger than this field is prohibited.
19 to 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

9.5.2.2.56 Sequence Channel x Status Register (DSI_LINK_SQCHxSR)

"x" indicates the channel number.

Note: "x" is 0 or 1.

Access Size : 8, 16, 32 bits

Offset Address : <DSI_LINK_base> + 05D0h (x = 0)
<DSI_LINK_base> + 0610h (x = 1)

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
30	RXAKE	0h	R	Receive Acknowledge and Error Report Packet RXSR.RXAKE is also reported. Write 1b to the SQCHxSCR.RXAKE register to clear this field.
29	RXCORERR	0h	R	Receive Correctable Error The received packet has a correctable error. RXSR.ECCERR1B is also reported. Write 1b to the SQCHxSCR.RXCORERR register to clear this field.
28	RXPKTDFAIL	0h	R	Receive Packet Data Fail The packet Header was saved correctly but data were not. One or more of the following bits are also reported. RXSR.CRCERR, RXSR.WCERR, RXSR.UEXPKTERR, RXSR.MAXRPSZERR, RXSR.RXOVFERR and RXSR.IBERR. Write 1b to the SQCHxSCR.RXPKTDFAIL register to clear this field.
27	RXFAIL	0h	R	Receive Fail Expected reception did not proceed. One or more of the following bits are also reported. RXSR.PRESPTOERR, RXSR.ECCERR, RXSR.MLFERR and RXSR.NORETERR. Write 1b to the SQCHxSCR.RXFAIL register to clear this field.
26	RXFATALERR	0h	R	Receive Fatal Error A fatal timeout occurred during BTA. One or more of the following bits are also reported. FERRSR.TATO and FERRSR.LRXHTO. Write 1b to the SQCHxSCR.RXFATALERR register to clear this field.
25	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
24	TXIBERR	0h	R	Tx Internal Bus Error When this value is 1b, the Internal Bus Read had failed to respond. Write 1b to the SQCHxSCR.TXIBERR register to clear this field.
23 to 20	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
19	PKTBIGERR	0h	R	Packet is too big Error Sequence Operation channel 0: Hard wired to 0b. Sequence Operation channel 1: This bit is set when the length of a sequence packet is bigger than Video-Input channel's BLLP. Write 1b to the SQCHxSCR.PKTBIGERR register to clear this field.
18 to 9	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

Bit	Bit Name	Initial Value	R/W	Description
8	ADESFIN	0h	R	All Descriptor Finished by Setting The descriptor is finished by setting SQCHxDSCyAR.NXACT = 0h for the descriptor. Write 1b to the SQCHxSCR.ADESFIN register to clear this field.
7 to 5	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
4	AACTFIN	0h	R	Descriptor's All Action Finished This bit is set if this descriptor's all actions are finished with SQCHxDSCyCR.FINACT[0] = 1b. Write 1b to the SQCHxSCR.AACTFIN register to clear this field.
3	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
2	RUNNING	0h	R	Sequence Operation Running The value will be set to "1" during Sequence Operation. Do not change descriptor values while this bit is 1b. Do not change the values in SQCHxSET0R and SQCHxSET1R.
1, 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

9.5.2.2.57 Sequence Channel x Status Clear Register (DSI_LINK_SQCHxSCR)

"x" indicates the channel number.

Note: "x" is 0 or 1.

Access Size : 8, 16, 32 bits

Offset Address : <DSI_LINK_base> + 05D4h (x = 0)
<DSI_LINK_base> + 0614h (x = 1)

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	RXAKE	RXCORERR	RXPKTDFAIL	RXFAIL	RXFATALERR	-	TXIBERR	-	-	-	-	PKTBIGERR	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R0W	R0W	R0W	R0W	R0W	R	R0W	R	R0W	R	R	R0W	R	R	R0W

R/W	R0W	R	R	R	R	R	R	R0W	R	R	R	R0W	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
30	RXAKE	0h	R0W	The read value is always 0b. SQCHxSR.RXAKE Clear Set to 1b to clear SQCHxSR.RXAKE. Writing 0b has no effect.
29	RXCORERR	0h	R0W	The read value is always 0b. SQCHxSR.RXCORERR Clear Set to 1b to clear SQCHxSR.RXCORERR. Writing 0b has no effect.
28	RXPKTDFAIL	0h	R0W	The read value is always 0b. SQCHxSR.RXPKTDFAIL Clear Set to 1b to clear SQCHxSR.RXPKTDFAIL. Writing 0b has no effect.
27	RXFAIL	0h	R0W	The read value is always 0b. SQCHxSR.RXFAIL Clear Set to 1b to clear SQCHxSR.RXFAIL. Writing 0b has no effect.
26	RXFATALERR	0h	R0W	The read value is always 0b. SQCHxSR.RXFATALERR Clear Set to 1b to clear SQCHxSR.RXFATALERR. Writing 0b has no effect.
25	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
24	TXIBERR	0h	R0W	The read value is always 0b. SQCHxSR.TXIBERR Clear Set to 1b to clear SQCHxSR.TXIBERR. Writing 0b has no effect.
23	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
22	-	0h	R0W	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
21, 20		All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
19	PKTBIGERR	0h	R0W	The read value is always 0b. SQCHxSR.PKTBIGERR Clear Set to 1b to clear SQCHxSR.PKTBIGERR. Writing 0b has no effect.
18, 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

Bit	Bit Name	Initial Value	R/W	Description
16, 15	-	All 0	R0W	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
14 to 9	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
8	ADESFIN	0h	R0W	The read value is always 0b. SQCHxSR.ADESFIN Clear Set to 1b to clear SQCHxSR.ADESFIN. Writing 0b has no effect.
7 to 5	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
4	AACTFIN	0h	R0W	The read value is always 0b. SQCHxSR.AACTFIN Clear Set to 1b to clear SQCHxSR.AACTFIN. Writing 0b has no effect.
3 to 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

9.5.2.2.58 Sequence Channel x Interrupt Enable Register (DSI_LINK_SQCHxIER)

"x" indicates the channel number.

Note: "x" is 0 or 1.

Access Size : 8, 16, 32 bits

Offset Address : <DSI_LINK_base> + 05D8h (x = 0)
<DSI_LINK_base> + 0618h (x = 1)

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	RXAKE	RXCORERR	RXPKTDFAIL	RXFAIL	RXFATALERR	-	TXIBERR	-	-	-	-	PKTBIGERR	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	RW	RW	RW	RW	RW	R	RW	R	RW	R	R	RW	R	R	RW

Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	R	R	R	R	R	R	RW	R	R	R	RW	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
30	RXAKE	0h	RW	Interrupt enable for the Receive Acknowledge and Error Report Packet 0b: Disables interrupt dsi_int_sqx when SQCHxSR.RXAKE = 1. 1b: Enables interrupt dsi_int_sqx when SQCHxSR.RXAKE = 1.
29	RXCORERR	0h	RW	Interrupt enable for the Receive Correctable Error 0b: Disables interrupt dsi_int_sqx when SQCHxSR.RXCORERR = 1. 1b: Enables interrupt dsi_int_sqx when SQCHxSR.RXCORERR = 1.
28	RXPKTDFAIL	0h	RW	Interrupt enable for the Receive Packet Data Fail 0b: Disables interrupt dsi_int_sqx when SQCHxSR.RXPKTDFAIL = 1. 1b: Enables interrupt dsi_int_sqx when SQCHxSR.RXPKTDFAIL = 1.
27	RXFAIL	0h	RW	Interrupt enable for the Receive Fail 0b: Disables interrupt dsi_int_sqx when SQCHxSR.RXFAIL = 1. 1b: Enables interrupt dsi_int_sqx when SQCHxSR.RXFAIL = 1.
26	RXFATALERR	0h	RW	Interrupt enable for the Receive Fatal Error 0b: Disables interrupt dsi_int_sqx when SQCHxSR.RXFATALERR = 1. 1b: Enables interrupt dsi_int_sqx when SQCHxSR.RXFATALERR = 1.
25	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
24	TXIBERR	0h	RW	Interrupt enable for the Tx Internal Bus Error 0b: Disables interrupt dsi_int_sqx when SQCHxSR.TXIBERR = 1. 1b: Enables interrupt dsi_int_sqx when SQCHxSR.TXIBERR = 1.
23	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
22	-	0h	RW	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
21, 20		All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
19	PKTBIGERR	0h	RW	Interrupt enable for the Packet is too big Error Sequence Operation channel 0: This field has no meaning. Sequence Operation channel 1: 0b: Disables interrupt dsi_int_sqx when SQCHxSR.PKTBIGERR = 1. 1b: Enables interrupt dsi_int_sqx when SQCHxSR.PKTBIGERR = 1.
18, 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
16, 15	-	All 0	RW	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.

Bit	Bit Name	Initial Value	R/W	Description
14 to 9	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
8	ADESFIN	0h	RW	Interrupt enable for the Descriptor Finished by Setting 0b: Disables interrupt dsi_int_sqx when SQCHxSR.ADESFIN = 1. 1b: Enables interrupt dsi_int_sqx when SQCHxSR.ADESFIN = 1.
7 to 5	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
4	AACTFIN	0h	RW	Interrupt enable for the Descriptor's All Action Finished 0b: Disables interrupt dsi_int_sqx when SQCHxSR.AACTFIN = 1. 1b: Enables interrupt dsi_int_sqx when SQCHxSR.AACTFIN = 1.
3 to 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

9.5.2.2.59 Sequence Channel x Descriptor y-A Register (DSI_LINK_SQCHxDSCyAR)

"x" indicates the channel number.

Note: "x" is 0 or 1.

"y" indicates the descriptor number.

Note: "y" is 00 to 07.

Access Size : 32 bits

Offset Address : <DSI_LINK_base> + 0780h + 0010h × (y) (x = 0)
<DSI_LINK_base> + 0800h + 0010h × (y) (x = 1)

Initial Value : xxxx_xxxxh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	NXACT[1:0]		BTA[1:0]		SPD	FMT	VC[1:0]		DT[5:0]

	DATA1[7:0]								DATA0[7:0]							
Initial Value	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31, 30	-	xh*2	RW	Reserved When read, the last written value is read. When writing, be sure to write 0b. Operation is not guaranteed if a value other than 0b is written.
29, 28	NXACT[1:0]	xh*2	RW	Next Action 0h: Terminates operation after this descriptor is finished. 1h: Operates the next descriptor after this descriptor is finished. 2h: Reserved 3h: Reserved
27, 26	BTA[1:0]	xh*2	RW	Bus Turn Around Sets Tx Request without either Bus Turn-Around (BTA) or no-operation. Or else, sets Tx Request with BTA. 0h: Tx Request without BTA or no-operation. 1h: Tx non-Read Request with BTA. 2h: Tx Read Request with BTA. 3h: BTA only
25	SPD	xh*2	RW	Speed Sets the speed type in Tx Request. 0b: High Speed 1b: Low Power Setting this bit to "1" during Video-Input Operation is prohibited.
24	FMT	xh*2	RW	Format Packet format of Tx Packet Header. This field should be set by Data Type. 0b: Short Packet 1b: Long Packet
23, 22	VC[1:0]	xh*2	RW	Virtual Channel Identifier of Virtual Channel of Tx Packet Header.
21 to 16	DT[5:0]	xh*2	RW	Data Type Data Type of Tx Packet Header.
15 to 8	DATA1[7:0]	xh*2	RW	Data 1 Data 1 of Tx Packet Header*1. When Tx Packet format is Long Packet, this value is the upper 8 bits of the word count. The maximum Long Packet size in Command Transfer mode which uses registers is 16 bytes. (SQCHxDSCyBR.DTSEL = 0h and SQCHxDSCyAR.FMT = 1) The maximum Long Packet size in Command Transfer mode which uses the internal bus memory is the number of bytes indicated by SQCHxSET1R.CHBUFSZ. (SQCHxDSCyBR.DTSEL = 1h and SQCHxDSCyAR.FMT = 1)

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	DATA0[7:0]	xh*2	RW	Data 0 Data 0 of Tx Packet Header*1. When Tx Packet format is Long Packet, this value is the lower 8 bits of the word count. The maximum Long Packet size in Command Transfer mode which uses registers is 16 bytes. (SQCHxDSCyBR.DTSEL = 0h and SQCHxDSCyAR.FMT = 1) The maximum Long Packet size in Command Transfer mode which uses the internal bus memory is the number of bytes indicated by SQCHxSET1R.CHBUFSZ. (SQCHxDSCyBR.DTSEL = 1h and SQCHxDSCyAR.FMT = 1)

x = Undefined

Note 1. The maximum size for Command Transfer mode Long Packet by using the register is 16 bytes. (SQCHxDSCyBR.DTSEL = 0h and SQCHxDSCyAR.FMT = 1h)
The maximum size for Command Transfer mode Long Packet by using the internal bus memory is SQCHxSET1R.CHBUFSZ bytes. (SQCHxDSCyBR.DTSEL = 1h and SQCHxDSCyAR.FMT = 1h)

Note 2. The initial values are determined by the initial value of Descriptor RAM.

9.5.2.2.60 Sequence Channel x Descriptor y-B Register (DSI_LINK_SQCHxDSCyBR)

"x" indicates the channel number.

Note: "x" is 0 or 1.

"y" indicates the descriptor number.

Note: "y" is 00 to 07.

Access Size : 32 bits

Offset Address : <DSI_LINK_base> + 0784h + 0010h × (y) (x = 0)
<DSI_LINK_base> + 0804h + 0010h × (y) (x = 1)

Initial Value : xxxx_xxxxh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	-	xh*[1]	RW	Reserved When read, the last written value is read. When writing, be sure to write 0b. Operation is not guaranteed if a value other than 0b is written.
25, 24	DTSEL[1:0]	xh*[1]	RW	Data Select 0h: Packet Payload Data register 1h: Long Packet data use memory space. In the case of writing, internal read causes reading from the SQCHxDSCyDR address. In the case of reading, internal write causes writing to the SQCHxDSCyDR address. Note: Read Header is always saved to the RXRSSxR register. 2h, 3h: Reserved If a write request with Short packet, then set 0h. When DTSEL = 0h, Long packet write request data size shall be equal to or smaller than 16 bytes. If read request data to save exceeds 16 bytes, this is reported as an error.
23 to 0	-	xh*[1]	RW	Reserved When read, the last written value is read. When writing, be sure to write 0b. Operation is not guaranteed if a value other than 0b is written.

x = Undefined

Note 1. The initial values are determined by the initial value of Descriptor RAM.

9.5.2.2.61 Sequence Channel x Descriptor y-C Register (DSI_LINK_SQCHxDSCyCR)

"x" indicates the channel number.

Note: "x" is 0 or 1.

"y" indicates the descriptor number.

Note: "y" is 00 to 07.

Access Size : 32 bits

Offset Address : <DSI_LINK_base> + 0788h + 0010h × (y) (x = 0)
<DSI_LINK_base> + 0808h + 0010h × (y) (x = 1)

Initial Value : xxxx_xxxxh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ACTCODE[7:0]								-	AUXOP	-	-	-	-	-	-

R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	ACTCODE[7:0]	xh*[1]	RW	Action Code Indicates the rx result same slot number for BTA action. Setting a value greater than or equal to 4 is prohibited. Setting the same rx result save slot number to a different descriptor is prohibited. When AUXOP is 1. 00h: Sends Reset-Trigger. 04h: Sends initial skew calibration Prohibited to use in channel 0 (LP only). 05h: Sends periodic skew calibration Prohibited to use in channel 0 (LP only). 08h: No-operation Other: Reserved Set 00h in other cases.
23	-	xh*[1]	RW	Reserved When read, the last written value is read. When writing, be sure to write 0b. Operation is not guaranteed if a value other than 0b is written.
22	AUXOP	xh*[1]	RW	Auxiliary Operation Used for auxiliary operation execution. When this bit is set to 1b, SQCHxDSCyBR.BTA should be set to 0h. Set this bit to 1b with BTA = 0h. Setting this bit to 1b during Video-Input Operation is prohibited.
21 to 3	-	xh*[1]	RW	Reserved When read, the last written value is read. When writing, be sure to write 0b. Operation is not guaranteed if a value other than 0b is written.
2 to 0	FINACT[2:0]	xh*[1]	RW	Finish Action Bit 2: Set to 0b. Bit 1: Set to 0b. Bit 0: Sets SQCHxSR.AACTFIN if this descriptor's all actions have finished. (0b: Disabled, 1b: Enabled). Since each descriptor's operation is not the same, descriptors may finish out of order. For example, Descriptor#1 may finish before Descriptor#0.

x = Undefined

Note 1. The initial values are determined by the initial value of Descriptor RAM.

9.5.2.2.62 Sequence Channel x Descriptor y-D Register (DSI_LINK_SQCHxDSCyDR)

"x" indicates the channel number.

Note: "x" is 0 or 1.

"y" indicates the descriptor number.

Note: "y" is 00 to 07.

Access Size : 32 bits

Offset Address : <DSI_LINK_base> + 078Ch + 0010h × (y) (x = 0)
<DSI_LINK_base> + 080Ch + 0010h × (y) (x = 1)

Initial Value : xxxx_xxxxh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	LADDR[31:16]															
Initial Value	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	LADDR[15:0]															
Initial Value	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	LADDR[31:0]	xh*[1]	RW	Lower Address Sets the lower 32-bit address for Long Packet Payload Data in Sequence Operation channel x Descriptor y. When Sequence Operation Data Select is "use memory space" (SQCHxDSCyBR.DTSEL =1h) and Sequence Operation Format is Long packet (SQCHxDSCyAR.FMT=1b), the DSI-Tx module accesses the address by internal bus Master Read in Write action and internal bus Write in Read action. Set the lower three bits to "000b".

x = Undefined

Note 1. The initial values are determined by the initial value of Descriptor RAM.

9.5.2.3 Resisters in D-PHY

9.5.2.3.1 DSI PLL Enable Register (DSI_DPHY_PLLENR)

Access Size : 8, 16, 32 bits

Address : <DSI_DPHY_base> + 0000h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
0	PHYMRSTN	0h	RW	PHY Master Clock and Data Lane Reset

9.5.2.3.3 DSI PLL Clock Setting 0 Register (DSI_DPHY_PLLCLKSET0R)

Access Size : 8, 16, 32 bits
Address : <DSI_DPHY_base> + 0010h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	PLL_M[9:0]									
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	PLL_P[5:0]						-	-	-	-	-	PLL_S[2:0]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	RW	RW	RW	RW	RW	RW	R	R	R	R	R	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
25 to 16	PLL_M[9:0]	0h	RW	Value of the main-divider in PLL Can be set in the range of 64 to 1023. Values outside this range are prohibited.
15, 14	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
13 to 8	PLL_P[5:0]	0h	RW	Value of the pre-divider in PLL Can be set in the range of 1 to 4. Values outside this range are prohibited.
7 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
2 to 0	PLL_S[2:0]	0h	RW	Value of Scaler in PLL Can be set in the range of 0 to 5. Values outside this range are prohibited.

The PLL clock frequency (F_{FOUT}) is expressed by the following equation.

$$F_{FREF} = 24MHz/PLL\_P, 6MHz \leq F_{FREF} \leq 24MHz$$

$$F_{FVCO} = (PLL\_M + (PLL\_K/65536)) \times F_{FREF}, 1050MHz \leq F_{FVCO} \leq 2100MHz$$

$$F_{FOUT} = F_{FVCO}/2^{PLL\_S}, 80MHz \leq F_{FOUT} \leq 1500MHz$$

$$1 \leq PLL\_P \leq 4, 64 \leq PLL\_M \leq 1023, 0 \leq PLL\_S \leq 5, -32768 \leq PLL\_K \leq 32767$$

9.5.2.3.4 DSI PLL Clock Setting 1 Register (DSI_DPHY_PLLCLKSET1R)

Access Size : 8, 16, 32 bits

Address : <DSI_DPHY_base> + 0014h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PLL_K[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
15 to 0	PLL_K[15:0]	0h	RW	Value of DSM in PLL PLL_K is a two's complement, and the range is -32768 to 32767.

9.5.2.3.5 DSI PHY TCLK Setting Register (DSI_DPHY_PHYTCLKSETR)

Access Size : 8, 16, 32 bits

Address : <DSI_DPHY_base> + 0020h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TCLKPRPRCTL[7:0]								TCLKZEROCTL[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TCLKPOSTCTL[7:0]								TCLKTRAILCTL[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

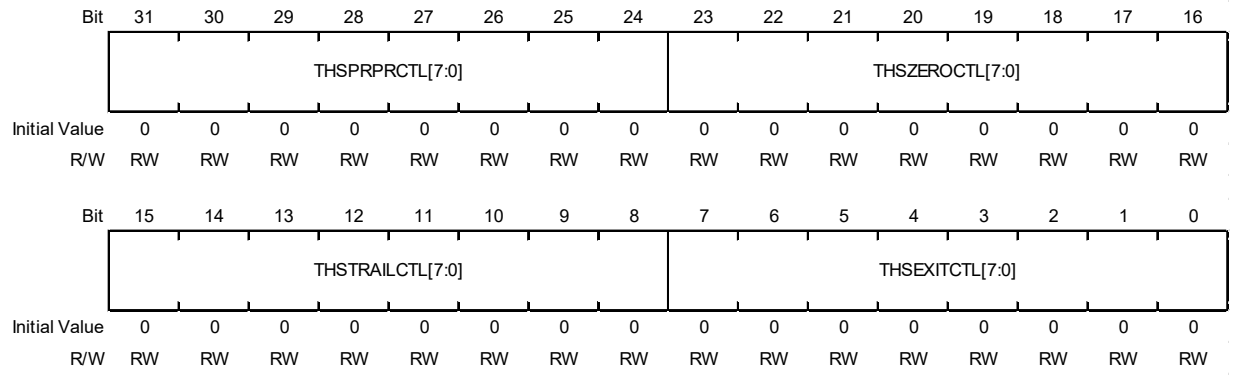
Bit	Bit Name	Initial Value	R/W	Description
31 to 24	TCLKPRPRCTL [7:0]	0h	RW	Control TCLK-PREPARE of the Master Clock Lane.
23 to 16	TCLKZEROCTL [7:0]	0h	RW	Control TCLK-ZERO of the Master Clock Lane.
15 to 8	TCLKPOSTCTL [7:0]	0h	RW	Control TCLK-POST of the Master Clock Lane.
7 to 0	TCLKTRAILCTL [7:0]	0h	RW	Control TCLK-TRAIL of the Master Clock Lane.

9.5.2.3.6 DSI PHY THS Setting Register (DSI_DPHY_PHYTHSSETR)

Access Size : 8, 16, 32 bits

Address : <DSI_DPHY_base> + 0024h

Initial Value : 0000_0000h



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	THSPRPRCTL [7:0]	0h	RW	Control THS-PREPARE of the Master Data Lanes.
23 to 16	THSZEROCTL [7:0]	0h	RW	Control THS-ZERO of the Master Data Lanes.
15 to 8	THSTRAILCTL [7:0]	0h	RW	Control THS-TRAIL of the Master Data Lanes.
7 to 0	THSEXITCTL [7:0]	0h	RW	Control THS-EXIT of the Master Clock and Data Lanes.

9.5.2.3.7 DSI PHY TLPX Setting Register (DSI_DPHY_PHYTLPXSETR)

Access Size : 8, 16, 32 bits

Address : <DSI_DPHY_base> + 0028h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-

	-	-	-	-	-	-	-	-	TLPXCTL[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
7 to 0	TLPXCTL[7:0]	0h	RW	Control TLPX of the Master Clock and Data Lanes.

9.5.2.3.8 DSI PHY Control Register (DSI_DPHY_PHYCR)

Access Size : 8, 16, 32 bits

Address : <DSI_DPHY_base> + 0030h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	ULPSEXIT[9:0]									
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
9 to 0	ULPSEXIT[9:0]	0h	RW	ULPS EXIT Counter Value Control Should be set during the initialization or power-up sequence. Set 100 [µsec] x lpclk / 4.

9.5.2.3.9 DSI PHY Control 1 Register (DSI_DPHY_PHYC1R)

Access Size : 8, 16, 32 bits

Address : <DSI_DPHY_base> + 0034h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	BIASREFVCNT [1:0]		-	-	-	-	-	-	-	-	-	-	-	CLLTX SLWD WN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	RW	RW	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31, 30	DL3LTXSLEWDWN[1:0]	0h	RW	Master Data 3 Lane's LP-TX Driver Slew Rate Down Control 00b: No change (default) 01b: Decrease the slew rate by about 15% 10b: Decrease the slew rate by about 15% 11b: Decrease the slew rate by about 30%
29	DL3LTXSLEWUP	0h	RW	Master Data 3 Lane's LP-TX Driver Slew Rate Up Control 0b: No change (default) 1b: Slew rate up
28, 27	DL2LTXSLEWDWN[1:0]	0h	RW	Master Data 2 Lane's LP-TX Driver Slew Rate Down Control 00b: No change (default) 01b: Decrease the slew rate by about 15% 10b: Decrease the slew rate by about 15% 11b: Decrease the slew rate by about 30%
26	DL2LTXSLEWUP	0h	RW	Master Data 2 Lane's LP-TX Driver Slew Rate Up Control 0b: No change (default) 1b: Slew rate up
25, 24	DL1LTXSLEWDWN[1:0]	0h	RW	Master Data 1 Lane's LP-TX Driver Slew Rate Down Control 00b: No change (default) 01b: Decrease the slew rate by about 15% 10b: Decrease the slew rate by about 15% 11b: Decrease the slew rate by about 30%
23	DL1LTXSLEWUP	0h	RW	Master Data 1 Lane's LP-TX Driver Slew Rate Up Control 0b: No change (default) 1b: Slew rate up
22, 21	DL0LTXSLEWDWN[1:0]	0h	RW	Master Data 0 Lane's LP-TX Driver Slew Rate Down Control 00b: No change (default) 01b: Decrease the slew rate by about 15% 10b: Decrease the slew rate by about 15% 11b: Decrease the slew rate by about 30%
20	DL0LTXSLEWUP	0h	RW	Master Data 0 Lane's LP-TX Driver Slew Rate Up Control 0b: No change (default) 1b: Slew rate up
19 to 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

9.5.2.3.11 DSI PHY Control 3 Register (DSI_DPHY_PHYC3R)

Access Size : 8, 16, 32 bits

Address : <DSI_DPHY_base> + 003Ch

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	HSTXRFTIM[2:0]			-	-	-	-	HSTXTMIMPD[2:0]			HSTXTMIMPU[2:0]			-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	RW	RW	RW	R	R	R	R	RW	RW	RW	RW	RW	RW	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

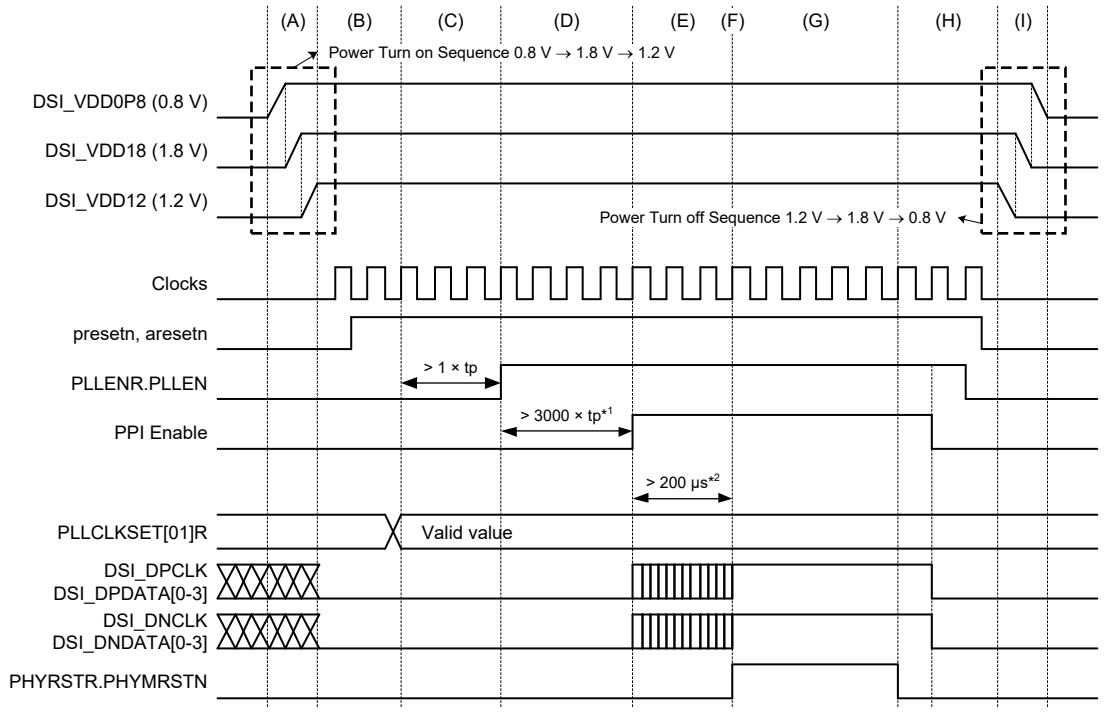
Bit	Bit Name	Initial Value	R/W	Description
31, 30	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
29 to 27	HSTXRFTIM [2:0]	0h	RW	HS-TX Rise & Fall Time Control 000b: 135 ps (default) 001b: 130 ps 010b: 125 ps 011b: 120 ps 100b: 230 ps 101b: 225 ps 110b: 220 ps 111b: 215 ps This is common to both Clock Lane and Data Lane.
26 to 23	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
22 to 20	HSTXTMIMPD [2:0]	0h	RW	HS-TX Driver Termination Impedance Control (Down) 000b: 50 ohm (default) 001b: 52 ohm 010b: 54 ohm 011b: 56 ohm 100b: 44 ohm 101b: 46 ohm 110b: 47 ohm 111b: 48 ohm Note: Set the same value to HSTXMIMPU and HSTXMIMPD. Note: These bits are common to both Clock Lane and Data Lane.
19 to 17	HSTXTMIMPU [2:0]	0h	RW	HS-TX Driver Termination Impedance Control (Up) 000b: 50 ohm (default) 001b: 52 ohm 010b: 54 ohm 011b: 56 ohm 100b: 44 ohm 101b: 46 ohm 110b: 47 ohm 111b: 48 ohm Note: Set the same value to HSTXMIMPU and HSTXMIMPD. Note: These bits are common to both Clock Lane and Data Lane.
16 to 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

9.5.3 Operation

This section shows various operation procedures for using the DSI-Tx Module. As for the interrupt operation, Interrupt Enable bit of each interrupt source is enabled (set to 1b) before use, and after confirming the interrupt, the interrupt source is cleared. And more, previous action's interrupt source must be cleared before setting the interrupt enable. Flows in this section indicate only interrupt bit. The DSI-Tx Module does not care whether firmware use the bits by interrupt action or flag polling action. These descriptions are omitted in each flow in this section unless otherwise specified. Error checks are also omitted in normal flow.

9.5.3.1 Power on Reset and Initial Settings for All Operations

The power on/off sequence of the DSI-Tx Module is shown **Figure 9.5-4**.



Note: tp = 1 / (PLLREFCLK / PLLCLKSET0R.PLL_P)

Note 1. PLL Locking Time

Note 2. LP regulator initial time

Figure 9.5-4 Power On/Off Sequence

(A) Bring up DSI_VDD0P8, DSI_VDD18, and DSI_VDD12 in that order.

(B) De-assert presetn and aresetn after clocks are stable.

(C) Write appropriate values to D-PHY registers except PLLENR and PHYRSTR, then wait for more than 1 × tp.

(D) Write 1b to PLLENR.PLLEN, then wait for more than 3000 × tp.

(E) Write TXSETR, then wait for more than 200 µsec.

(F) Write 1b to PHYRSTR.PHYMRSTN and write LINK registers.

(G) The DSI-Tx Module is ready.

At power-on reset, all registers of the DSI-Tx Module are initialized.

Perform the initial settings of the register at Step (C) and (F) in the power-on sequence. It is not necessary to set the register that is used with the default value.

The value to be written to the D-PHY register in Step (C) is as follows.

- Set PLLCLKSET0R and PLLCLKSET1R so that the PLL clock frequency (F_{FOUT}) equals the data rate.
- Follow **Table 9.5-4** to set PHYTCLKSETR, PHYTHSSETR, and PHYTLPXSETR.
- Follow **Table 9.5-5** to set PHYCR.
- Follow register descriptions to set PHYC1R, PHYC2R, and PHYC3R.

7.8125	195
3.90625	98
1.953125	49

The LINK registers that need to be initialized in Step (F) are as follows.

- Common Settings
  - TXSETR
  - ULPSSETR
  - DSISETR
  - CLSTPTSETR
  - LPTRNSTSETR
- Timeout Settings
  - PRESPTOBTASETR
  - PRESPTOLPSETR
  - PRESPTOHSSETR
  - HSTXTOSETR
  - LRXHTOSETR
  - TATOSETR

These registers and D-PHY registers can only be changed during the initial setup after a power-on reset and during a software reset in **9.5.3.2.1 Software Reset**. It is prohibited to change at any other time.

9.5.3.2 Reset

9.5.3.2.1 Software Reset

Figure 9.5-5 shows the operation during software reset. Make sure that APB clock (pclk), Internal Bus clock (aclk), Video clock (vclk1), PLL Multiplied clock (PLLREFCLK), and Escape mode Transmit clock (lpclk) are running and PHYRSTR.PHYMRSTN is high before starting software reset.

Writing 1b to RSTCR.SWRST will issue a software reset. After issuing the software reset, check the start of the software reset process with RSTSR.SWRSTxx = 1b. Then write 1b to RSTCR.FCETXSTP to transition the valid data lane of the D-PHY to the Tx Stop State. By checking RSTSR.DL0DIR = 0b and RSTSR.DLSTPST [x] = 1b of the valid data lane, it is possible to confirm that the valid data lane of D-PHY has transitioned to Tx Stop State. After confirming that the valid data lane of the D-PHY has transitioned to the Tx Stop State, write 0b to RSTCR.FCETXSTP. Then write 0b to RSTCR.SWRST and check the completion of the software reset process with RSTSR.SWRSTx = 0b. Since all registers are synchronously reset except for some registers*[1], the software reset process is not completed even if a software reset is issued while the clock is stopped.

Note 1. Registers that require initial settings as described in **9.5.3.1 Power on Reset and Initial Settings for All Operations**, GPO0R register, GPO1R register, RSTCR register, RSTSR register, and SQCHxDSCyAR – SQCHxDSCyDR register are not initialized by software reset.

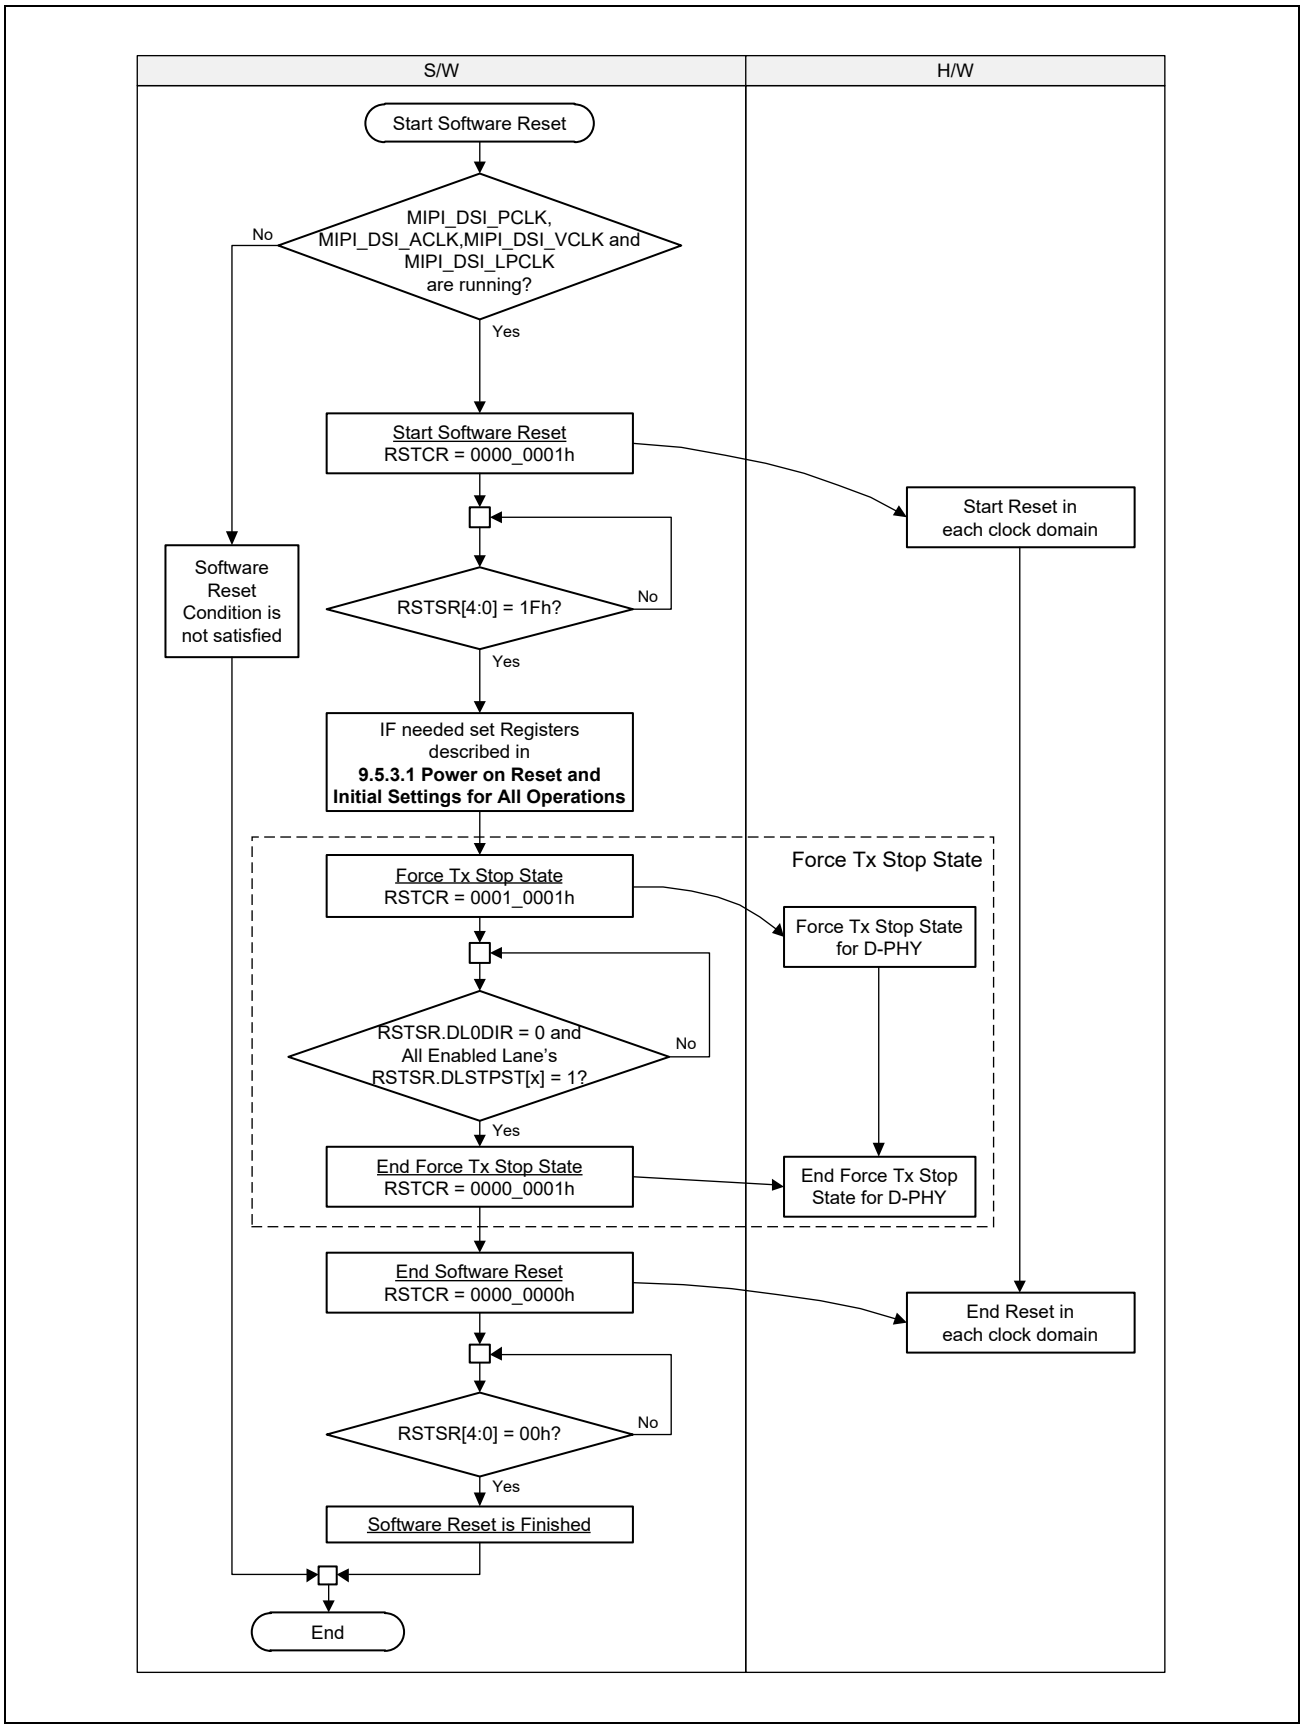

Figure 9.5-5 Software Reset

9.5.3.3 Start/Stop of HS Clock

The following describes the HS Clock Start / Stop sequence. HS Clock Start / Stop is controlled by software.

Figure 9.5-6 shows the operation at HS Clock Start.

Write 1b to TXSETR.CLEN to enable DPHY clock lanes before starting Video-Input Operation or Sequence Operation channel 1 operation.

After the clock lane is enabled and the source clock of the clock lane is stable, write 1b to HSCLKSETR.HSCLKRUN to set the clock lane to HS. It is forbidden to change HSCLKRUN while Sequence Channel is in operation.

At the same time as writing 1b to HSCLKSETR.HSCLKRUN, set continuous clock mode and non-continuous clock mode with HSCLKSETR.HSCLKMODE.

In continuous clock mode, always set the clock lane to HS. PLSR.CLLP2HS is set to 1b when the clock lane transitions from LP to HS. After checking, perform the following operations.

In non-continuous clock mode, the DSI-Tx Module automatically transitions the clock lane from LP to HS depending on the presence or absence of HS Transmission. PLSR.CLLP2HS and PLSR.CLHS2LP are set for each transition, but confirmation is not required.

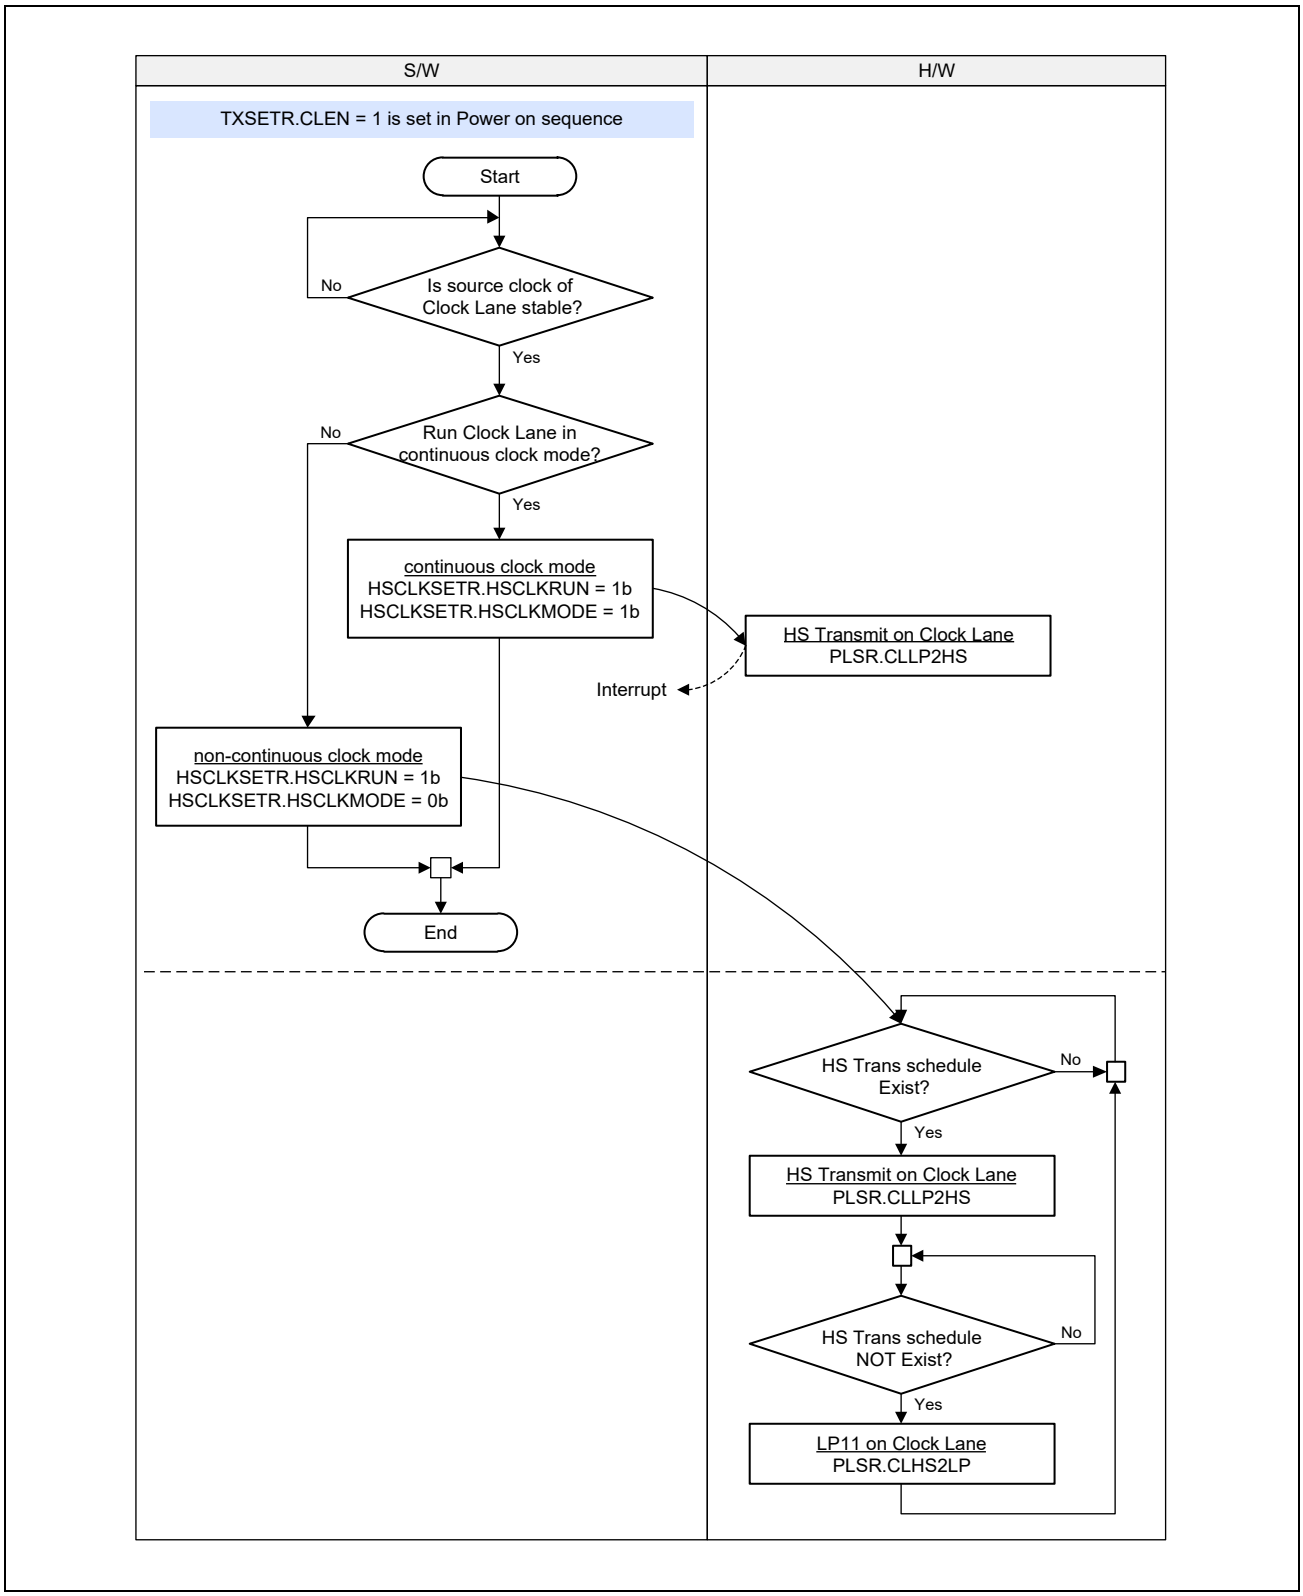

Figure 9.5-6 Start of HS Clock

Figure 9.5-7 shows the operation when HS Clock Stop. After confirming that Video-Input Operation and Sequence Operation channel 1 are not running, write 0b to HSCLKSETR.HSCLKRUN to make the clock lane LP. PLSR.CLHS2LP is set to 1b when the clock lane transitions from HS to LP. In non-continuous clock mode, you do not need to check PLSR.CLHS2LP because the clock lane is likely to be LP already when you write 0b to HSCLKSETR.HSCLKRUN. It is possible to check the clock lane status by reading PLSR.CLSTPST.

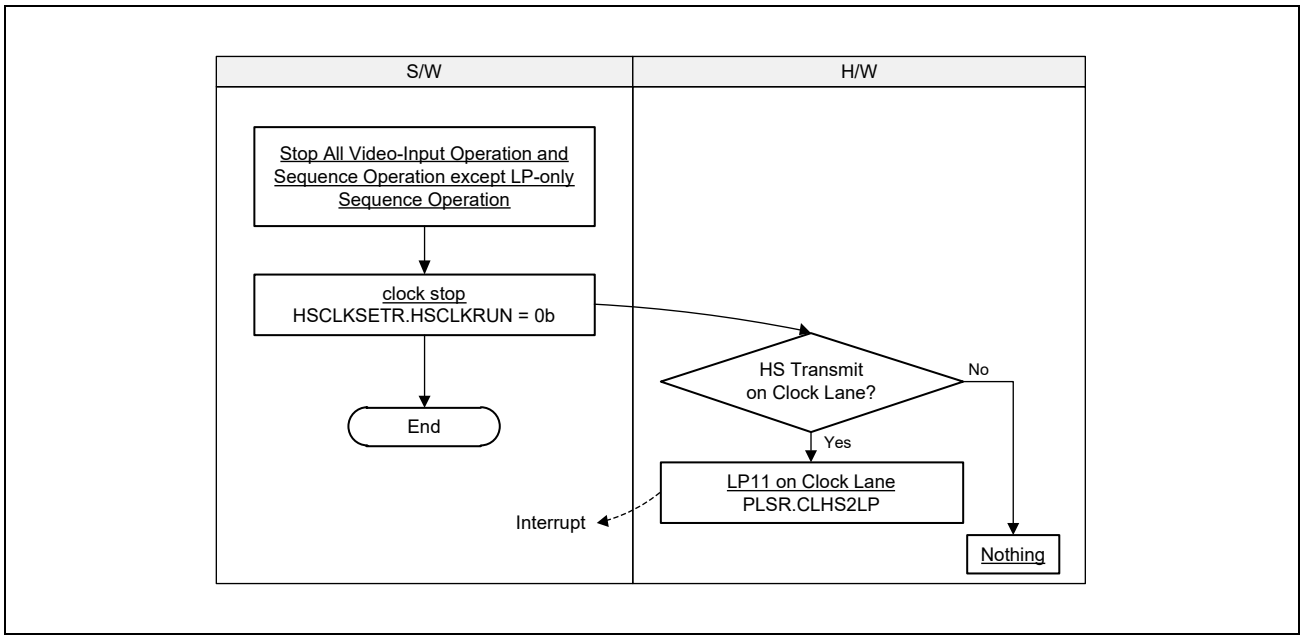

Figure 9.5-7 Stop of HS Clock

9.5.3.4 Sequence Operation

9.5.3.4.1 Basic Running Sequence

Sequence Operation requires initial settings before the operation starts.

- Channel Register Setting
  - Set SQCHxSET1R, SQCHxIER
- Prepare Write Data
  - Prepare Write Data to Memory Area
  - Prepare Write Data to TXPPDxR Registers
- Allocate Read Data Area
  - Clear RXRSSR Register if previous valid flag remains.
  - Allocate each read action's Memory area.
- Write all Descriptors
- Confirm running HSCLK if Sequence channel 1 is targeted to run.

When "1b" is written to SQCHxSET0R.START, Sequence Operation channel x starts the processing of Descriptor, and when the processing of Descriptor of SQCHxDSCyAR.NXACT = "00b" is completed, the processing of Descriptor ends.

Since Descriptor consists of SRAM, the initial value is indefinite. When the user sets the Descriptor, set all the bits.

After writing 1b to SQCHxSET0R.START on Sequence Operation channel x and SQCHxSR.RUNNING becomes 1b, It is prohibited to change the settings of SQCHxSET1R, SQCHxDSCyAR, SQCHxDSCyBR, SQCHxDSCyCR, and SQCHxDSCyDR until SQCHxSR.RUNNING becomes 0b.

HS-related operations are prohibited on Sequence Operation channel 0.

9.5.3.4.2 Single Packet Transmission

The following describes sending non-read packets using the Sequence Operation channel.

For non-read packet transmission, set the following registers before packet transmission.

- SQCHxDSCyAR.NXACT: "00b"
- SQCHxDSCyAR.FMT: "0b" Short Packet or "1b" Long Packet
- SQCHxDSCyAR.SPD: "0b" High Speed or "1b" Low Speed
- SQCHxDSCyAR.BTA: "00b" without BTA or "01b" with BTA
- SQCHxDSCyAR.VC, DT, DATA0, DATA1
- SQCHxDSCyBR.DTSEL: Specify payload data storage location for non-read packets
  - "00b" TXPPD0R – TXPPD3R. Payloads size is limited up to 16 Bytes.
  - "01b" Memory space. Payloads size is limited up to SQCHxSET1R.CHBUFSZ Bytes.
- SQCHxDSCyCR.AUXOP "0b"

When setting a Long Packet with SQCHxDSCyAR.FMT, prepare the payload data in the location specified by SQCHxDSCyBR.DTSEL in the form of little endian.

No payload data is required when configuring Short Packets with SQCHxDSCyAR.FMT.

After the above settings, write “1b” to SQCHxSET0R.START to send non-read packets.

The user can know the completion of Single Packet Transmission by asserting SQCHxSR.ADESFIN.

If “01b” is set in SQCHxDSCyAR.BTA, BTA is performed after sending a non-read packet.

An ACK trigger or Acknowledge and Error Report Packet may be received when the bus rights are transferred to the peripheral.

The user can get an overview of the reception result by reading the RXRSSxR register with the number specified by SQCHxDSCyCR.ACTCODE. Also, by reading the RXSR register, the user can know the details of the reception result.

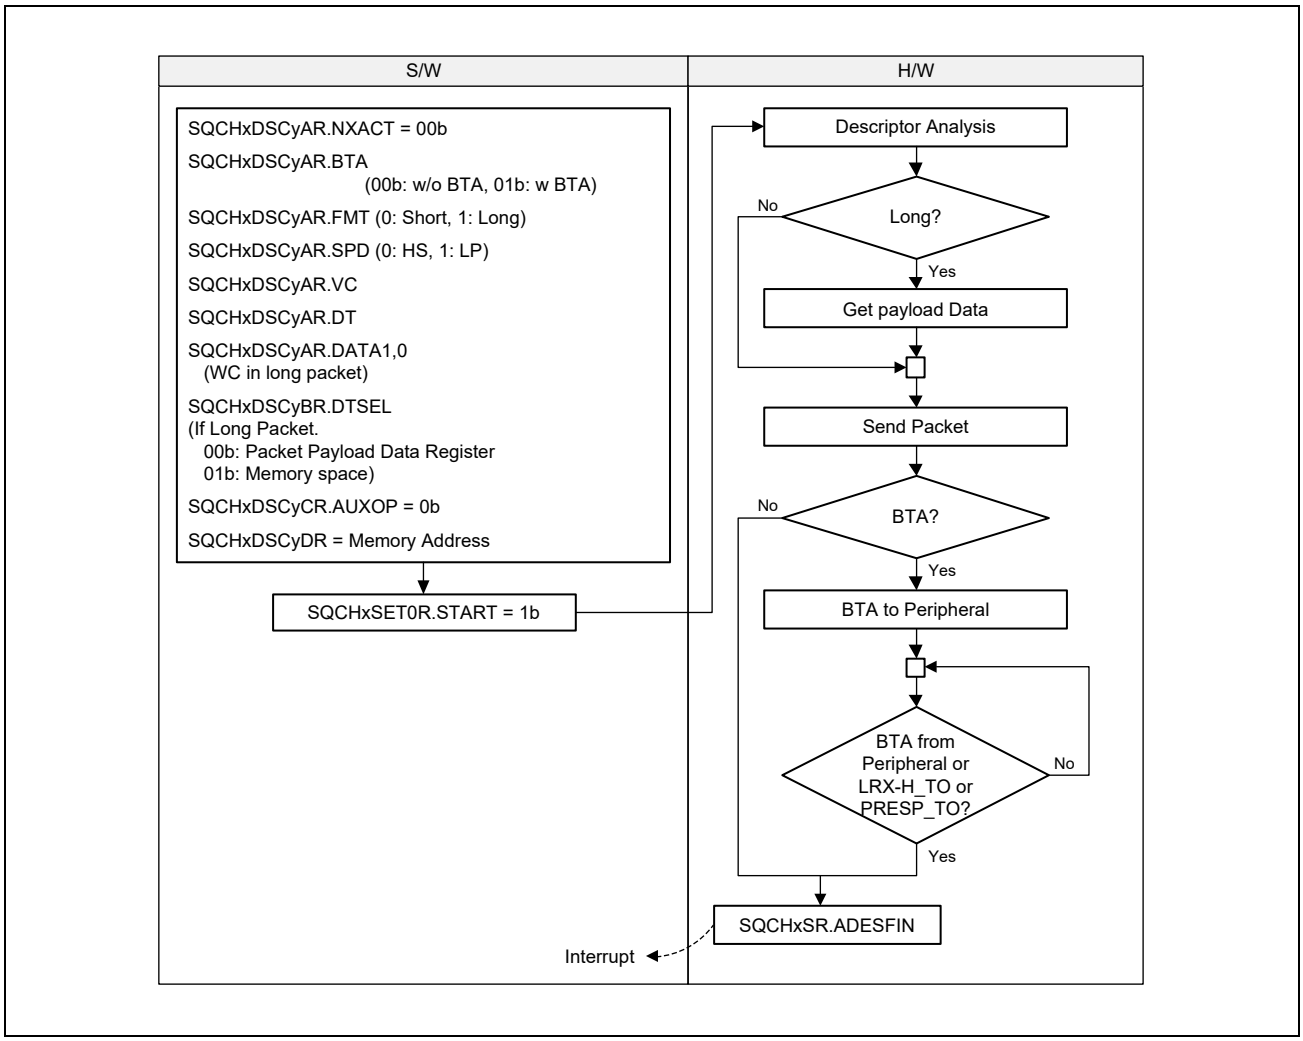

Figure 9.5-8 Single Packet Transfer

9.5.3.4.3 Single Packet Reception

This section describes sending read packets and receiving response packets using the Sequence Operation channel.

Since the read packet is a short packet, set the following registers before sending the packet.

- SQCHxDSCyAR.NXACT: “00b”
- SQCHxDSCyAR.FMT: “0b” Short Packet
- SQCHxDSCyAR.SPD: “0b” High Speed or “1b” Low Speed
- SQCHxDSCyAR.BTA: “10b” Read Request with BTA
- SQCHxDSCyAR.VC, DT, DATA0, DATA1
- SQCHxDSCyBR.DTSEL: Specify the payload data storage location of the response packet
  - “00b” RXPPD0R – RXPPD3R. Payloads size is limited up to 16 Bytes.
  - “01b” Memory space. Payloads size is limited up to RXBUFSZR.RXBUFSZ Bytes.
- SQCHxDSCyCR.AUXOP: “0b”
- SQCHxDSCyCR.ACTCODE: Rx Result Save Slot number

When SQCHxDSC00BR.DTSEL = “00b” is set, receiving payload data of 17 bytes or more is not supported. Therefore, if there is a possibility of receiving payload data of 17 bytes or more, set SQCHxDSC00BR.DTSEL = “01b”.

After the above settings, write “1b” to SQCHxSET0R.START to send the read packet.

BTA is performed after sending the read packet. When the bus right is transferred to the peripheral, the response packet is received. At this time, the Acknowledge and Error Report Packet may also be received at the same time.

The user can know the completion of Single Packet Reception by asserting SQCHxSR.ADESFIN.

The user can get an overview of the reception result by reading the RXRSSxR register with the number specified by SQCHxDSCyCR.ACTCODE, and can know the details of the previous reception result by reading the RXSR register.

If the received response packet is a Short Packet or a Long Packet with WC = 0b, the setting value of SQCHxDSC00BR.DTSEL is meaningless.

Figure 9.5-9 shows the flow of Single Packet Reception.

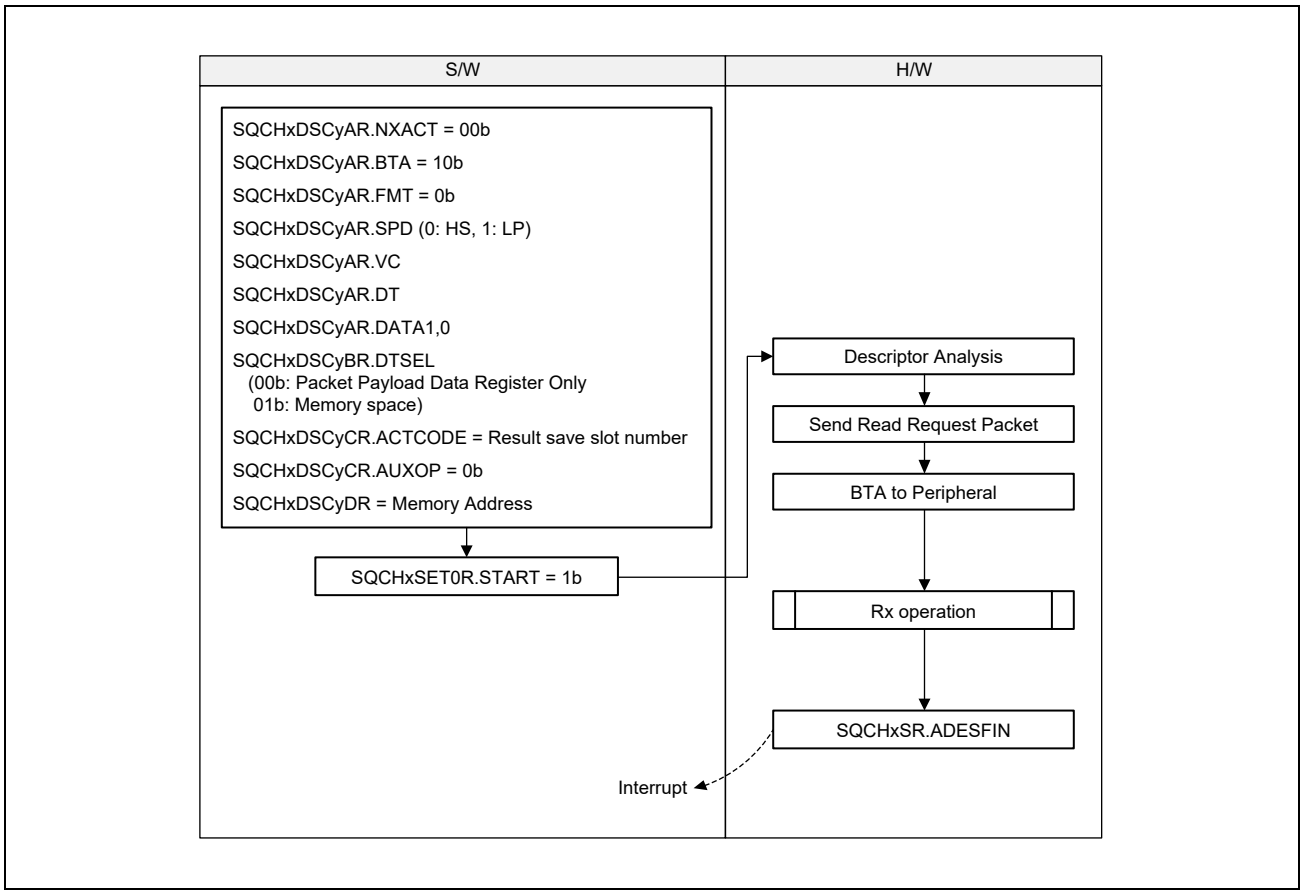

Figure 9.5-9 Single Packet Receive

9.5.3.4.4 Reset Trigger Transmission

The DSI-Tx Module can send triggers using the Sequence Operation channel.

Since the DSI-Tx Module is a host, the only trigger that can be sent is a reset trigger.

After setting SQCHxDSCyAR.NXACT = “00b”, SQCHxDSCyCR.AUXOP = “1b”, and SQCHxDSCyCR.ACTCODE = “00h”, write “1b” to SQCHxSET0R.START to send a reset trigger.

The user can know the completion of reset trigger transmission by asserting SQCHxSR.ADESFIN.

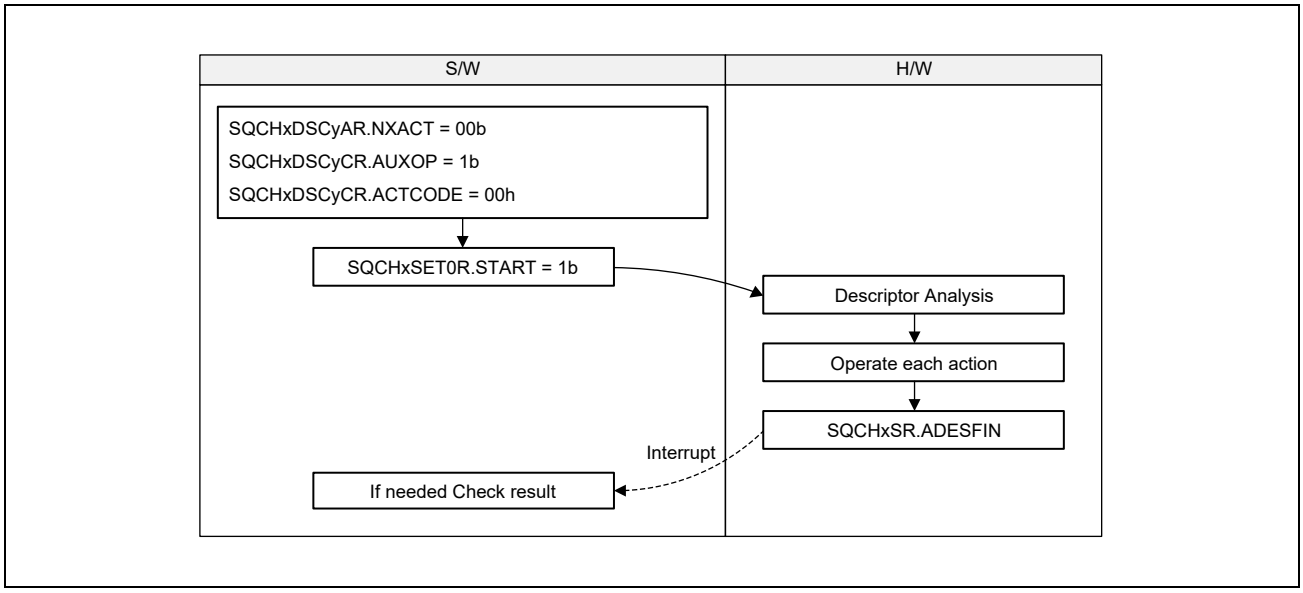

Figure 9.5-10 Trigger Transmission

9.5.3.4.5 Execute Operation in Sequence

The following describes the descriptor in Sequence Operation.

- By writing “1b” to SQCHxSET0R.START, Sequence Operation channel x will be enabled and processing will be performed from descriptor # 0.
- When the processing of the corresponding descriptor is completed, the next processing follows SQCHxDSCyAR.NXACT.
  - SQCHxDSCyAR.NXACT= “00b”:
    Sequence Operation channel x stop after the processing of the corresponding descriptor is completed
  - SQCHxDSCyAR.NXACT= “01b”:
    After the processing of the corresponding descriptor is completed, the next descriptor is executed. The next descriptor after descriptor # N is descriptor # (N + 1).

9.5.3.4.6 Receiving EoTp

The DSI-Tx Module can receive End of Transmission Packets (EoTp).

The DSI-Tx Module notifies the reception of EoTp by setting RXSR.RXEOTP to “1b”.

9.5.3.4.7 Acknowledge and Error Reporting Mechanism

The user can know the reliability of the serial bus by using “Acknowledge and Error Reporting Mechanism”.

If Peripheral detects an error on the serial bus during the period from the previous Peripheral to Host communication to this Peripheral to Host communication, Peripheral will send an “Acknowledge and Error Report” packet.

When the DSI-Tx Module receives the “Acknowledge and Error Report” packet, it sets “1b” to RXRSSxR.RXAKE, RXSR.RXAKE, and SQCHxSR.RXAKE. The Virtual Channel Identifier and Error Report of the latest “Acknowledge and Error Report” packet received are stored in the AKEPLATIR register, and the integrated value is displayed in the AKEPACMSR register.

9.5.3.5 Video-Input Operation

9.5.3.5.1 Video-Input Timing

Video-Input Timing and Video-Input Parameters are described in **Figure 9.5-11** and **Table 9.5-6**.

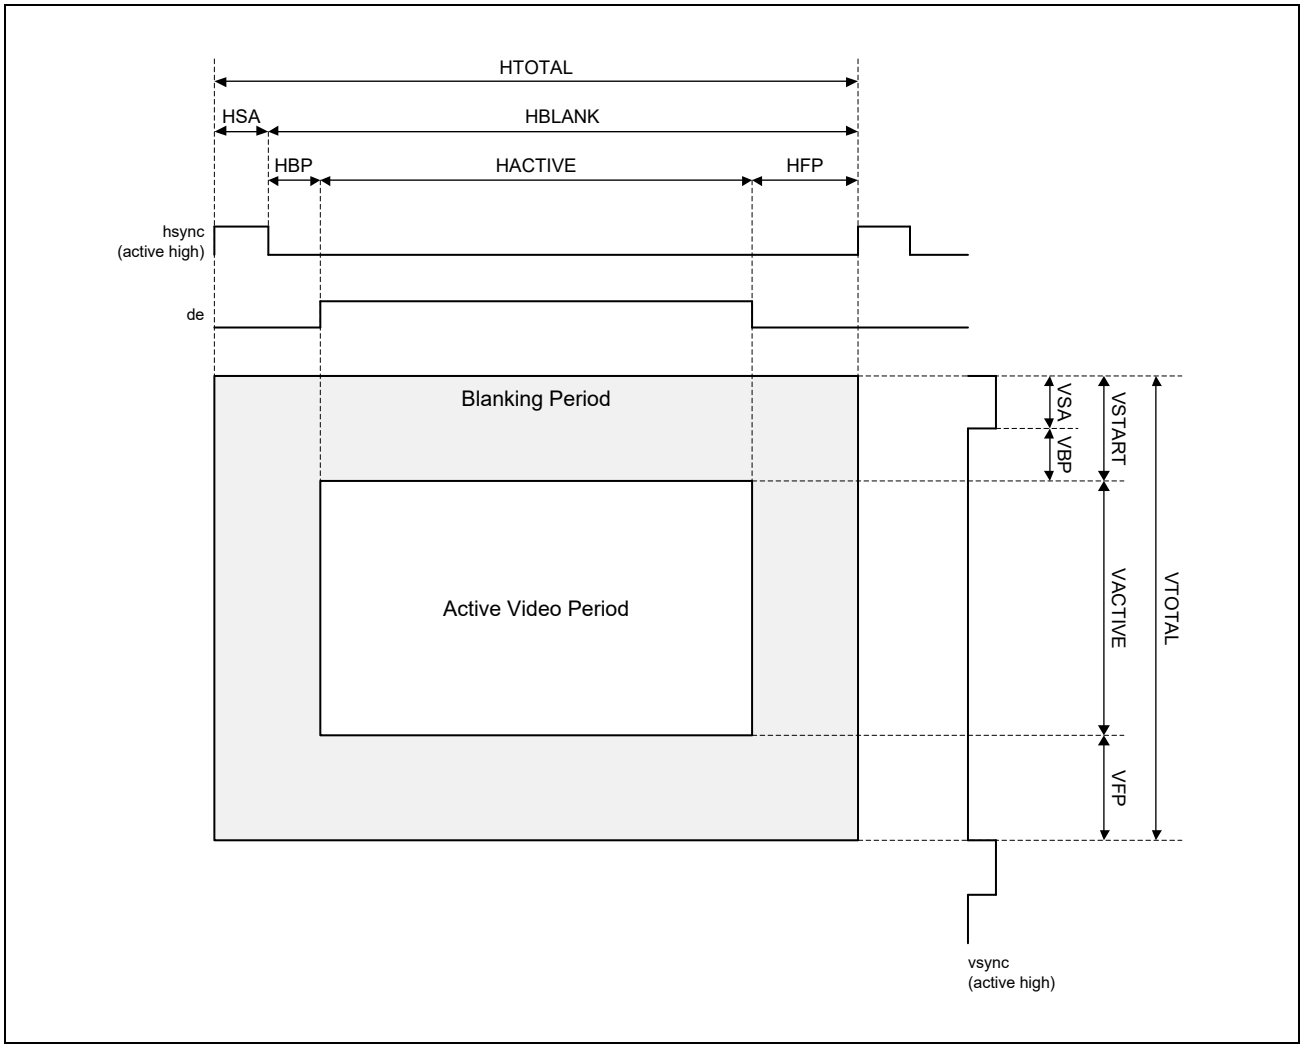

Figure 9.5-11 Video Input Timing

Table 9.5-6 Configurations for Video Input Interface (1/2)

- Common Rules for all mode

Parameter	Description
All	All parameters related to Input Video should be set to the value of not less than 1b. Example for “All parameters”: HSA, HBP, HACTIVE, HFP, VSA, VBP, VACTIVE, VFP
HACTIVE	

VICH1PPSETR.DT	VICH1HSSETR.HACTIVE
1Eh: Packed Pixel Stream, 18-bit RGB	This value should be the multiple of 4.
2Eh: Loosely Packed Pixel Stream, 18-bit RGB 3Eh: Packed Pixel Stream, 24-bit RGB	No limitation

Parameter	Description
HFP	Round down (HFP × BPP/ 8, 0) >= 12, (12 = means Pixel Packet Header & footer 6 + Blanking Packet Header & footer 6)
HTOTAL	

VICH1PPSETR.DT	VICH1HSSETR.HSA + VICH1HPSETR.HBP + VICH1HSSETR.HACTIVE + VICH1HPSETR.HFP
1Eh: Packed Pixel Stream, 18-bit RGB	This value should be the multiple of 4.
2Eh: Loosely Packed Pixel Stream, 18-bit RGB 3Eh: Packed Pixel Stream, 24-bit RGB	No limitation

- Additional Rules for non-burst Sync Pulse mode

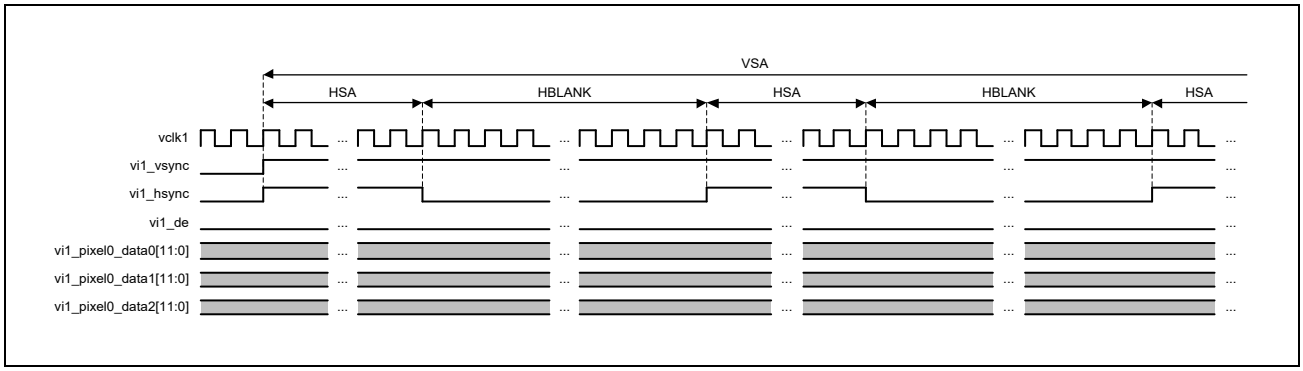
Parameter	Description
Sequence Operation Packet	When a packet by sequence operation is transmitted during Video Operation (VICH1SR.RUNNING=1b), the period of (HBP + HACTIVE + HFP) should be set the value longer than sum of below periods. • Period for the Tx Sync Event packet (4 bytes) • Period for the packet by sequence operation • Period for the Header and CRC of a Blanking Packet (6 bytes)
HBP+HACTIVE+HFP	Transition of HS-LP-HS is caused within the period between current Sync Event Packet and next Sync Event Packet, the period of (HBP+HACTIVE+HFP) should be set to the value within the range described below. (HBP + HACTIVE + HFP) > (period for the Tx Sync Event Packet) + (period for transition time as HS-LP-HS)
HSA	Transmission of Blanking Packet is caused within the period between current Sync Event Packet and next Sync Event Packet, the period of HSA should be set to the value within the range described below. (HSA × BPP)/8 >= 10b Notice, HSA should be set to the value not less than minimum value of (period for the Tx Sync Event Packet) + (period for the Tx Blanking Packet).
HBP	Transmission of Blanking Packet is caused within the period between current Sync Event Packet and next Sync Event Packet, the period of HPB should be set to the value within the range described below. (HBP × BPP)/8 >= 10b Notice, HPB should be set to the value not less than minimum value of (period for the Tx Sync Event Packet) + (period for the Tx Blanking Packet).

Table 9.5-6 Configurations for Video Input Interface (2/2)

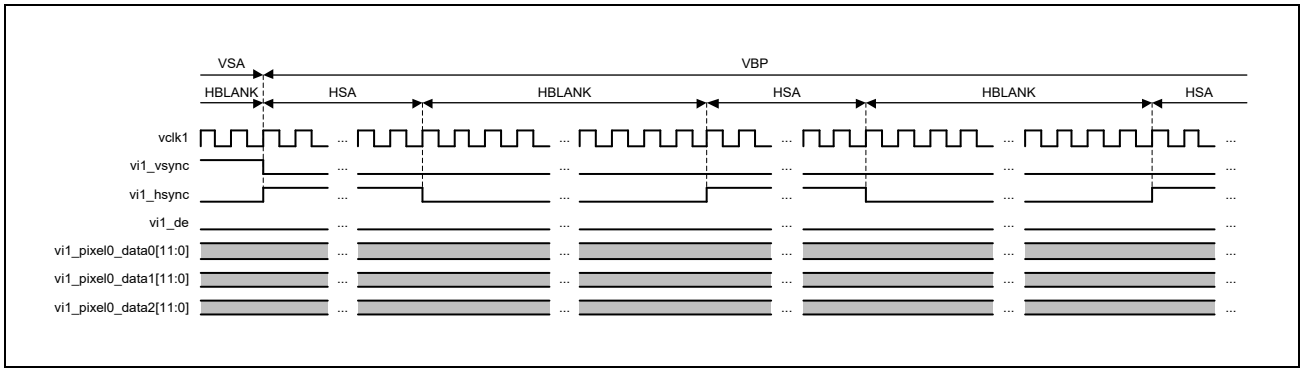
- Additional Rules for non-burst Sync-Event mode and Burst mode

Parameter	Description
Sequence Operation Packet	When a packet by sequence operation is transmitted during Video Operation (VICH1SR.RUNNING=1), the period of HTOTAL should be set the value longer than sum of below periods. • Period for the Tx Sync Event packet (4 bytes) • Period for the packet by sequence operation • Period for the Header and CRC of a Blanking Packet (6 bytes)
HTOTAL	Transition of HS-LP-HS is caused within the period between current Sync Event Packet and next Sync Event Packet, the period of HTOTAL should be set to the value within the range described below. HTOTAL > (period for the Tx Sync Event Packet) +(period for transition time as HS-LPHS)
HSA+HBP	Transmission of Blanking Packet is caused within the period between current Sync Event Packet and next Sync Event Packet, the period of (HSA+HBP) should be set to the value within the range described below. ((HAS + HBP) × BPP)/8 >= 10b Notice, HAS + HBP should be set to the value not less than minimum value of (period for the Tx Sync Event Packet) + (period for the Tx Blanking Packet).

(1) VSA Start (and VFP End)

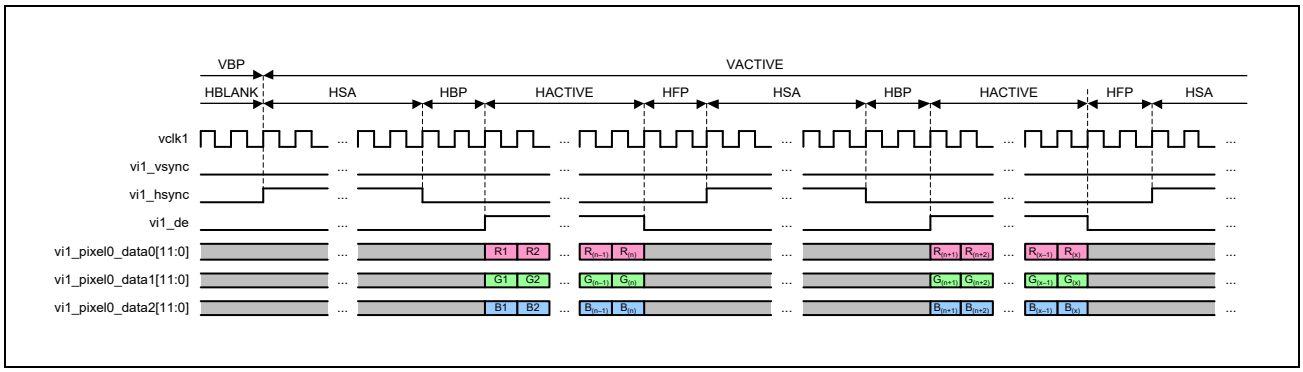


(2) VSA End and VBP Start

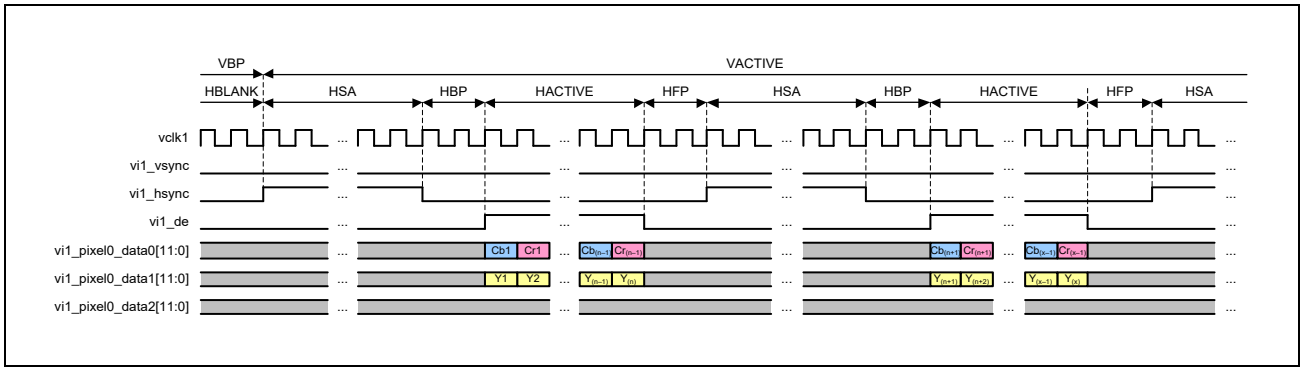


(3) VBP End and VACTIVE Start

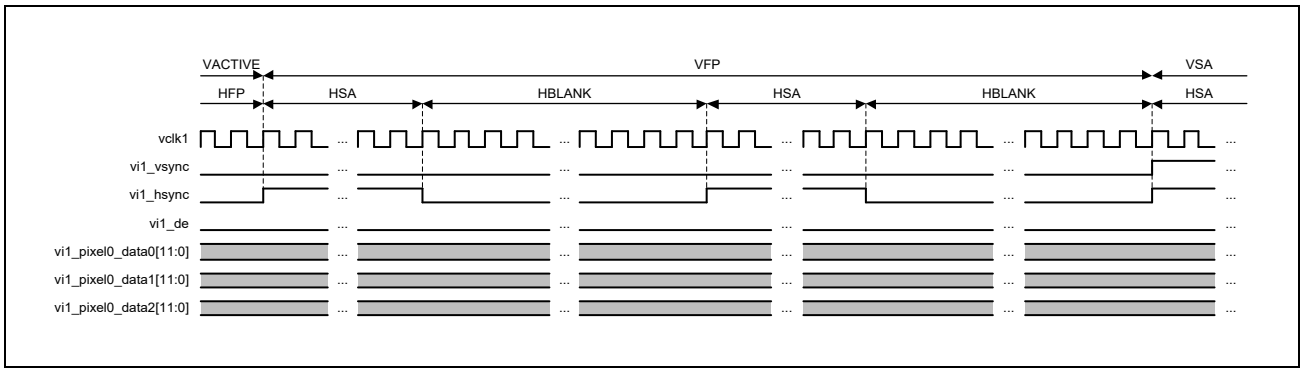
(a) RGB



(b) YCbCr 4: 2: 2



(4) VACTIVE End and VFP Start



9.5.3.5.2 Video-Input Start, End, Change Setting

1) Video Input Start

Video input must be started after Video-Input Operation Start sequence. It must be start from V-Sync start edge.

2) Video Input End

End of Video Input must follow sequence of **9.5.3.5.4 End of Video-Input Operation**.

3) Change of Video Input Setting

Changing of Video-Input setting must be done during Video-Input operation is not running.

9.5.3.5.3 Start of Video-Input Operation

The procedure for Start of Video-Input Operation is shown in **Figure 9.5-12**.

1. Initialize common settings. See **9.5.3.1 Power on Reset and Initial Settings for All Operations**.
2. Some peripheral setting may be done by Sequence operation. Since it is differed from peripheral devices, it is out of this document.
3. Confirm Video-Input clock and hsclk stable and set HS clock. See **9.5.3.3 Start/Stop of HS Clock**.
4. Set Video-Input Operation channel parameters (VICH1PPSETR, VICH1VSSETR, VICH1VPSETR,VICH1HSSETR, VICH1HPSETR)
5. Calculate VICH1SET1R.DLY value and set. See **9.5.3.5.9 Delay about Video-Input Operation**.
6. Set “1b” to VICH1SET0R.VSTART with other VICH1SET0R setting values.
7. Wait until VICH1SR.VIRDY = 1b.
8. Start Video signal input

VICH1SET0R, VICH1SET1R, VICH1PPSETR, VICH1VSSETR, VICH1VPSETR, VICH1HSSETR and VICH1HPSETR are prohibited to change value between VICH1SET0R.VSTART = 1b and VICH1SR.RUNNING=0b after VICH1SET0R.STOP = 1b.

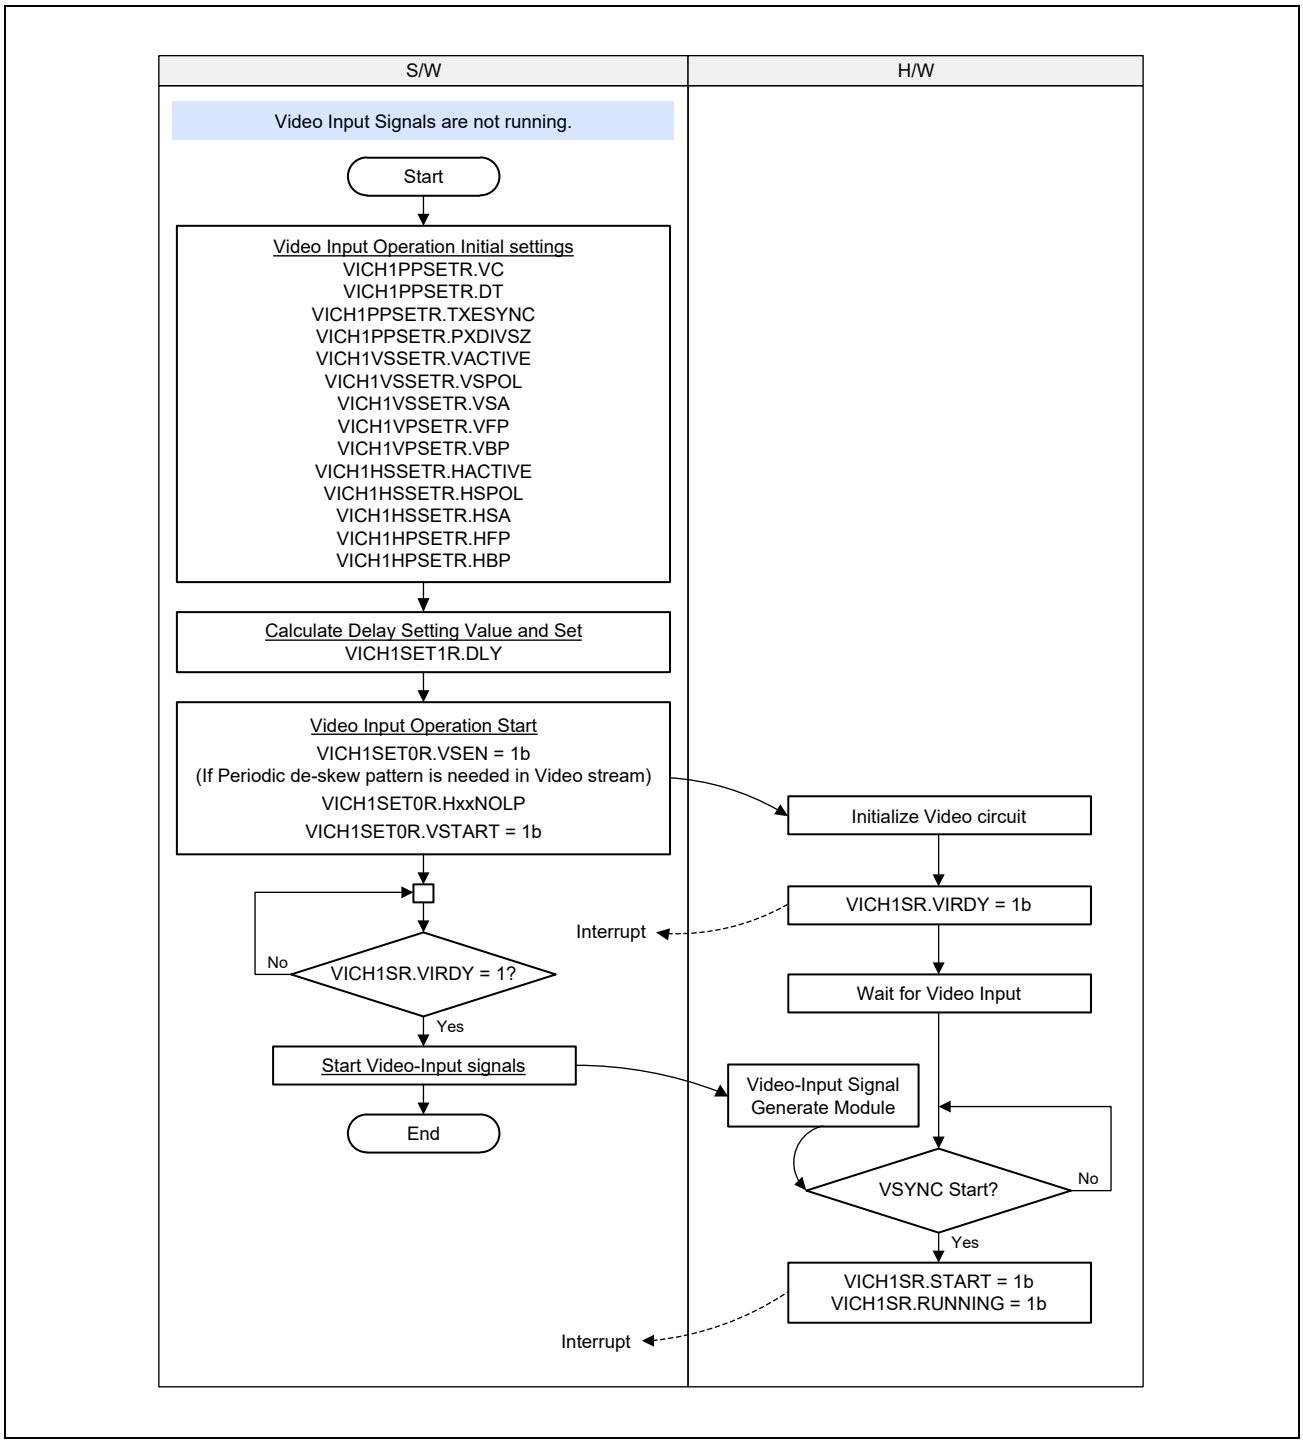


Figure 9.5-12 Video-Input Channel Start

9.5.3.5.4 End of Video-Input Operation

The video-input operation stop flow is shown in **Figure 9.5-13**. Execute the flow when VICH1SR.RUNNING = 1b.

1) VICH1SET0R.VSTPAFT (Figure 9.5-13)

Write 1b to VICH1SET0R.VSTPAFT to request the Video-Input Operation to stop. When the DSI-Tx Module detects the start of one frame (assertion of VSYNC), it stops sending video mode packets and sets VICH1SR.STOP to 1b.
After checking VICH1SR.STOP, stop the video input. The video input can be stopped at any time after VICH1SR.STOP becomes 1b.
After stopping the video input, wait for LINKSR.HSBUSY to become 0b.

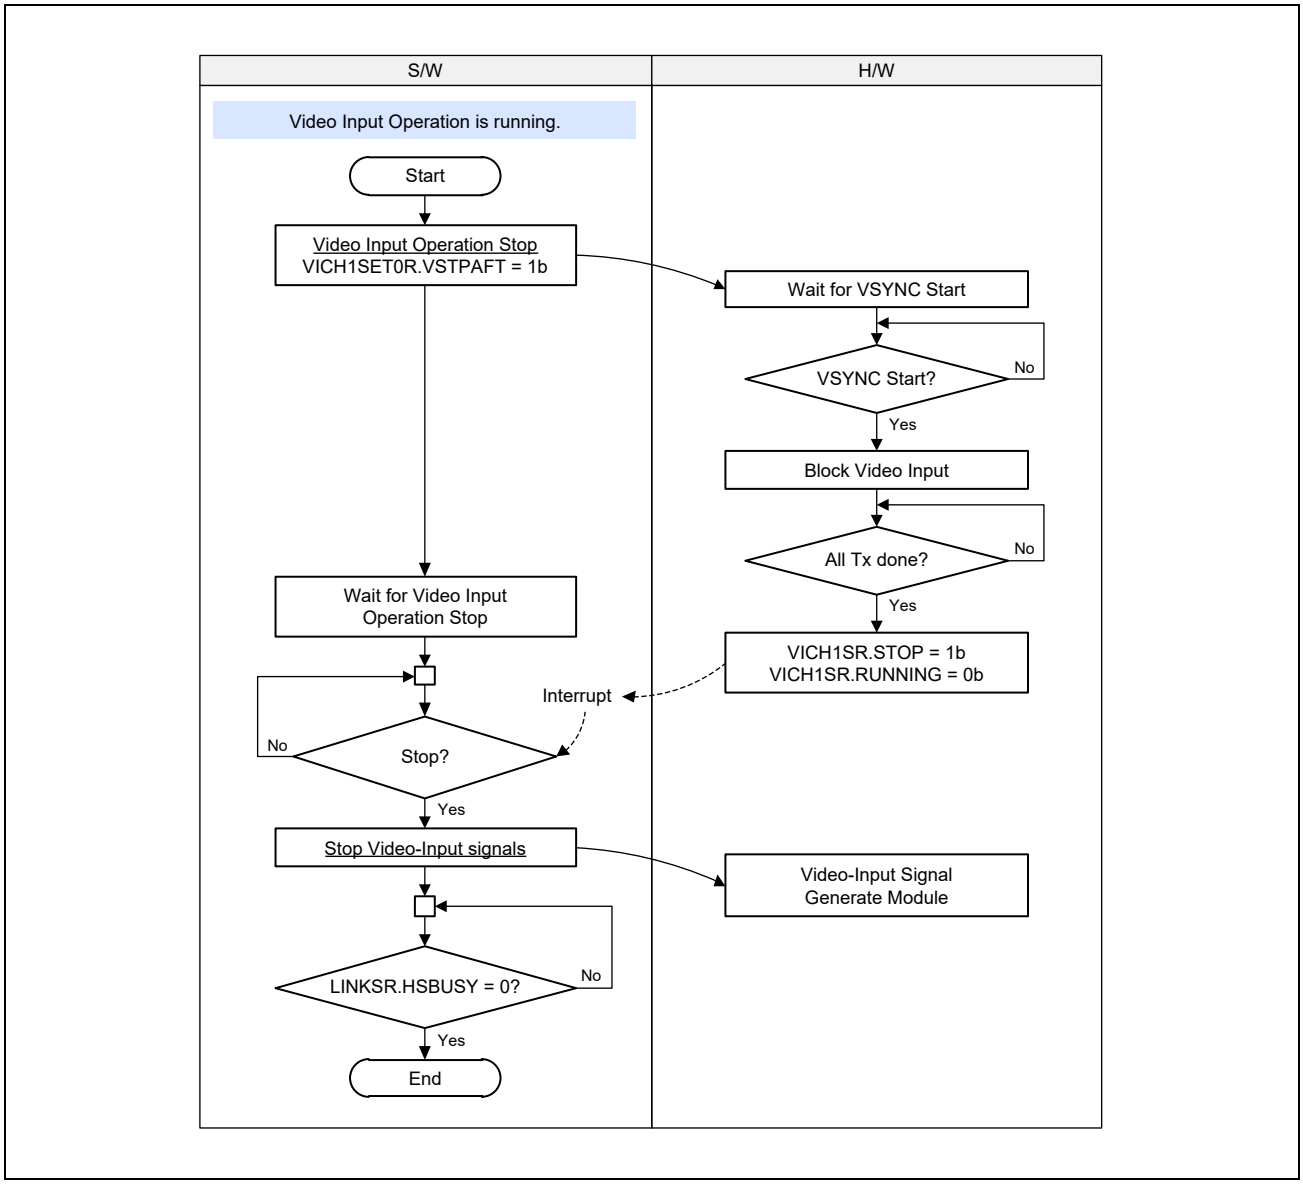

Figure 9.5-13 End of Video-Input Operation (VICH1SET0R.VSTPAFT)

9.5.3.5.5 Burst Mode

The DSI-Tx Module supports Burst Mode.

Burst Mode is a mode that time-compresses pixel data.

Make the D-PHY bandwidth wider than the Video-Input bandwidth for time compression of pixel data. Video transmissions with a 1-line pixel data size (VICH1HSSETR.HACTIVE × VICH1SET1R.BPP / 8) greater than 65,535 Bytes are not supported.

Video clock Frequency [Hz] × Video Pixel Bit Depth (BPP) [bit]
<= DSI HS Byte clock Frequency[Hz] × 8[bit] × Number of DSI HS Data Lane

In the case of Video-Input bandwidth equals DSI output bandwidth, it will be indistinguishable from non-burst sync-event mode.

9.5.3.5.6 Non-Burst Mode

The DSI-Tx Module supports Non-Burst Mode.

Make the D-PHY bandwidth the same as the Video-Input bandwidth. Video transmissions with a 1-line pixel data size (VICH1HSSETR.HACTIVE × VICH1SET1R.BPP / 8) greater than 65,535 bytes are not supported.

Video clock Frequency [Hz] × Video Pixel Bit Depth (BPP) [bit]
= DSI HS Byte clock Frequency[Hz] × 8[bit] × Number of DSI HS Data Lane

9.5.3.5.7 LP Transition and Blanking

The DSI-Tx Module automatically transitions the Data Lane from HS to LP if both of the following two conditions are met:

If it does not transition from HS to LP, it sends a Blanking Packet with the same VC as the VC in the previous packet to maintain the HS.

- There is time to make an HS => LP => HS transition before the next HS transfer starts.
- The period is not prohibited by VICH1SET0R.xxxNOLP to transition to LP

9.5.3.5.8 Non video packet action during Video-Input Operation Running

1) Packet Transmission/Reception by Sequence operation

The DSI-Tx Module can send and receive packets (see **9.5.3.4.2 Single Packet Transmission** and **9.5.3.4.3 Single Packet Reception**) using Sequence Operation while Video-Input Operation is operating*[1].

Make sure that all Sequence Operations are finished before starting the Video-Input Operation.

While Video-Input Operation is operating*[1], packet transmission / reception using Sequence Operation is performed only immediately after the HSE packet (VICH1PPSETR.TXESYNC = 1b) or VSS packet (VICH1PPSETR.TXESYNC = 0b) on the first horizontal line. Also, sending packets using Sequence Operation is possible only with HS (SQCHxDSCyAR.SPD = 0b). Sending with LP (SQCHxDSCyAR.SPD = 1b) is not supported. Send and receive packets that are completed within the BLLP period of the first horizontal line.

Execution of Sequence Operation processing is prohibited except for sending and receiving HS packets.

Note 1. “While Video-Input Operation is operating” here is different from VICH1SR.RUNNING. It means the period from setting VICH1SET0R.VSTART to 0b in the flow of **Figure 9.5-12** until VICH1SR.RUNNING becomes 0 in the flow of **Figure 9.5-13**. Also, Note that there is some latency from executing VICH1SET0R.VSTART to being transmitted to the inside of the module for clock transfer.

9.5.3.5.9 Delay about Video-Input Operation

Video-Input Operation run in some latency which call in the DSI-Tx Module “Delay”. “Delay” value must set to VICH1SET1R.DLY before operation.

“Delay” value is defined by calculation using below parameters.

- Clock frequencies
  - Video channel 1 clock (MIPI_DSI_VCLK) frequency
  - DSI High-Speed Transmit Word Clock (TxWordClkHS, hsclk) frequency
- Video parameters
  - HSA period, set by VICH1HSSETR.HSA
  - HACTIVE period, set by VICH1HSSETR.HACTIVE
  - HBP period, set by VICH1HPSETR.HBP
  - HFP period, set by VICH1HPSETR.HFP
  - BPP value, shown in VICH1SET1R.BPP and derived from VICH1PPSETR.DT
- Video transmit settings
  - The number of active lanes, set by TXSETR.NUMLANEUSE
  - Transmit mode, set by VICH1PPSETR.TXESYNC
  - No LP, set by VICH1SET0R.HSANOLP, HBPNOLP, HFPNOLP
  - Clock mode, set by HSCLKSETR.HSCLKMODE
  - Clock stop time, set by CLSTPTSETR.CLKSTPT
  - Go LP and back time, set by LPTRNSTSETR.GOLPBKT
- Other parameters
  - Video-Input channel buffer size, shown in VICH1SET1R.CHBUFSZ

9.5.3.6 Enter/Exit of ULPS

The following describes the ULPS transition / return sequence.

The clock lane and data lane (lanes 0 to 3) can be independently transitioned / restored to ULPS.

The clock lane can make ULPS transitions when TXSETR.CLEN = 1b. It is forbidden to change TXSETR.CLEN to 0b while the clock lane is ULPS.

The data lane can make ULPS transitions when TXSETR.DLEN = 1b. It is forbidden to change TXSETR.DLEN to 0b while the data lane is ULPS.

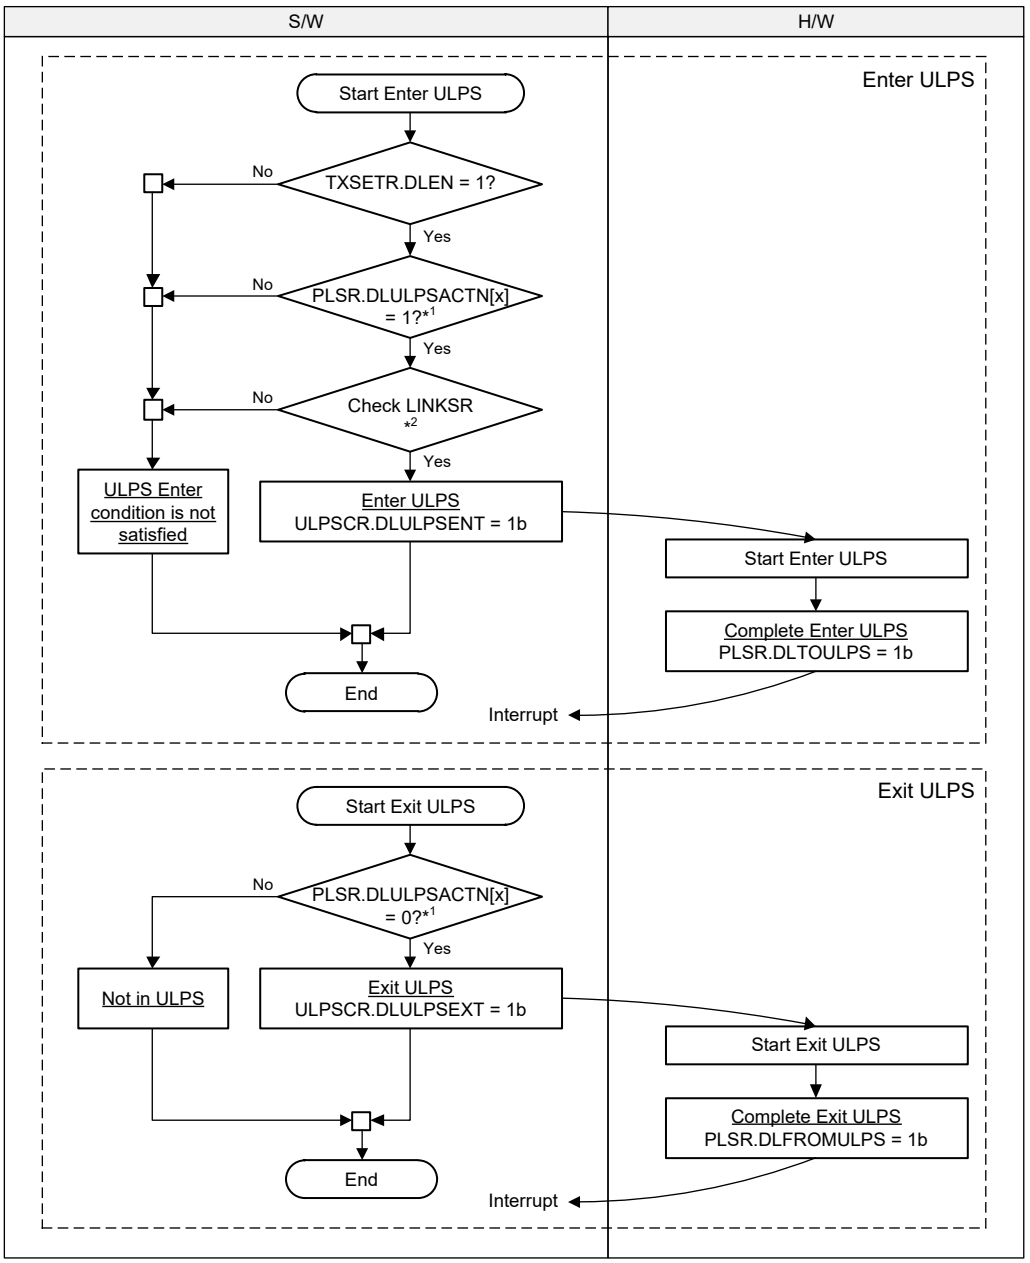
Data lanes enabled in TXSETR.NUMLANEUSE can be ULPS transitioned / restored. ULPS transition / return of data lanes is done simultaneously for all valid lanes. Only certain data lanes cannot be ULPS transitioned / restored.

When the data lane transitions to ULPS, another operation*[1] using the data lane cannot be performed until ULPS is restored.

When the clock lane transitions to ULPS, another operation*[2] using the clock lane cannot be performed until ULPS is restored.

Note 1. Sequence Operation, Video-Input Operation.

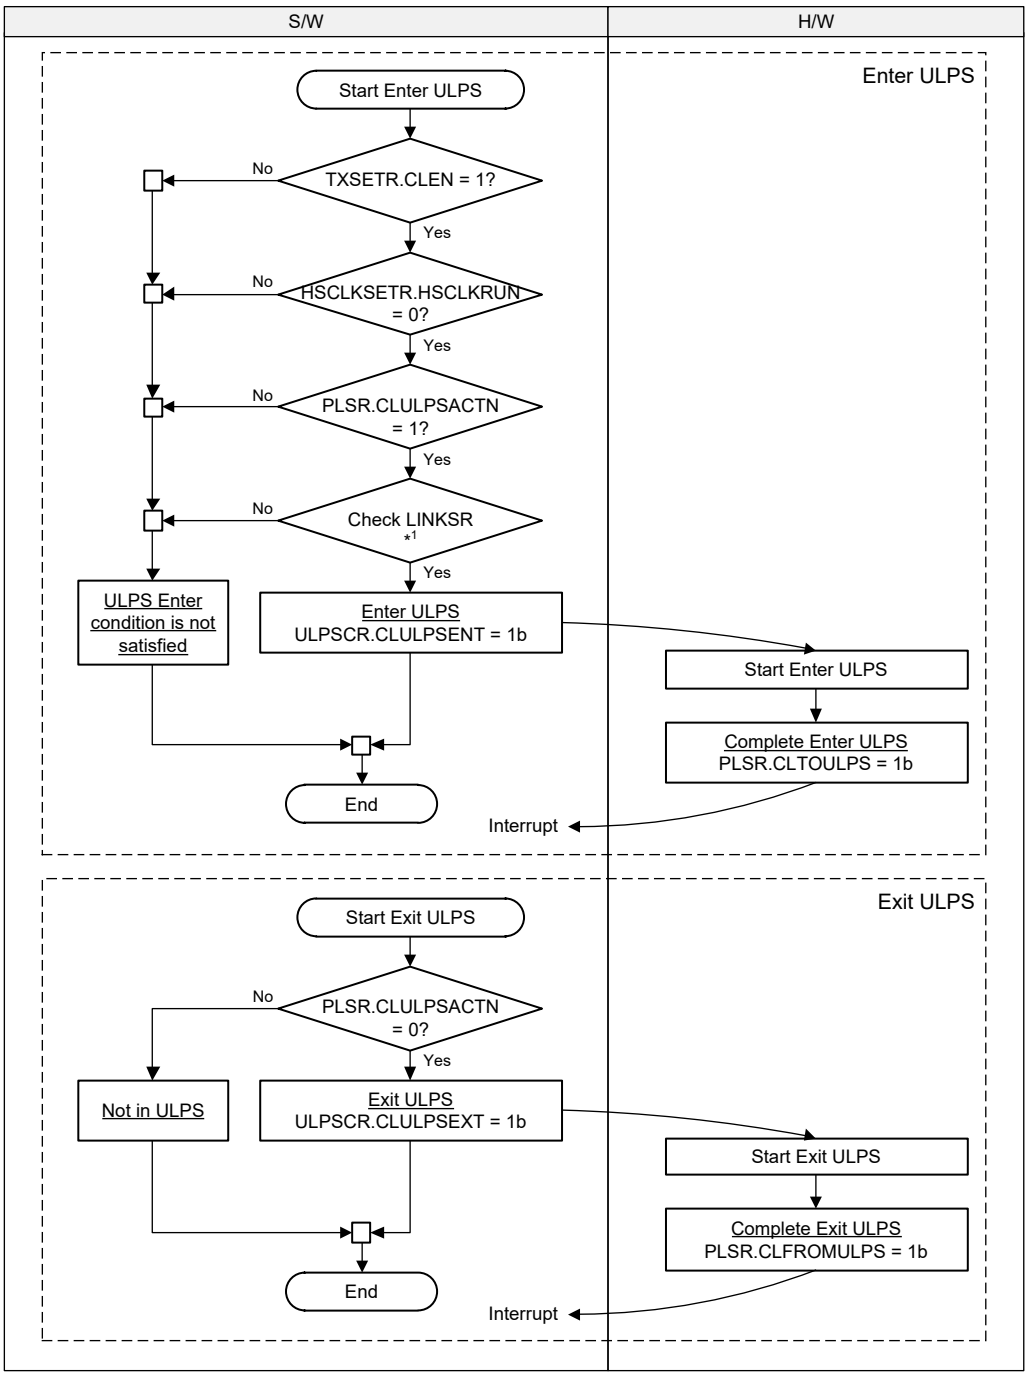
Note 2. HS Sequence Operation, Video-Input Operation.



Note 1. Check all enabled data lanes selected by TXSETR.NUMLANEUSE

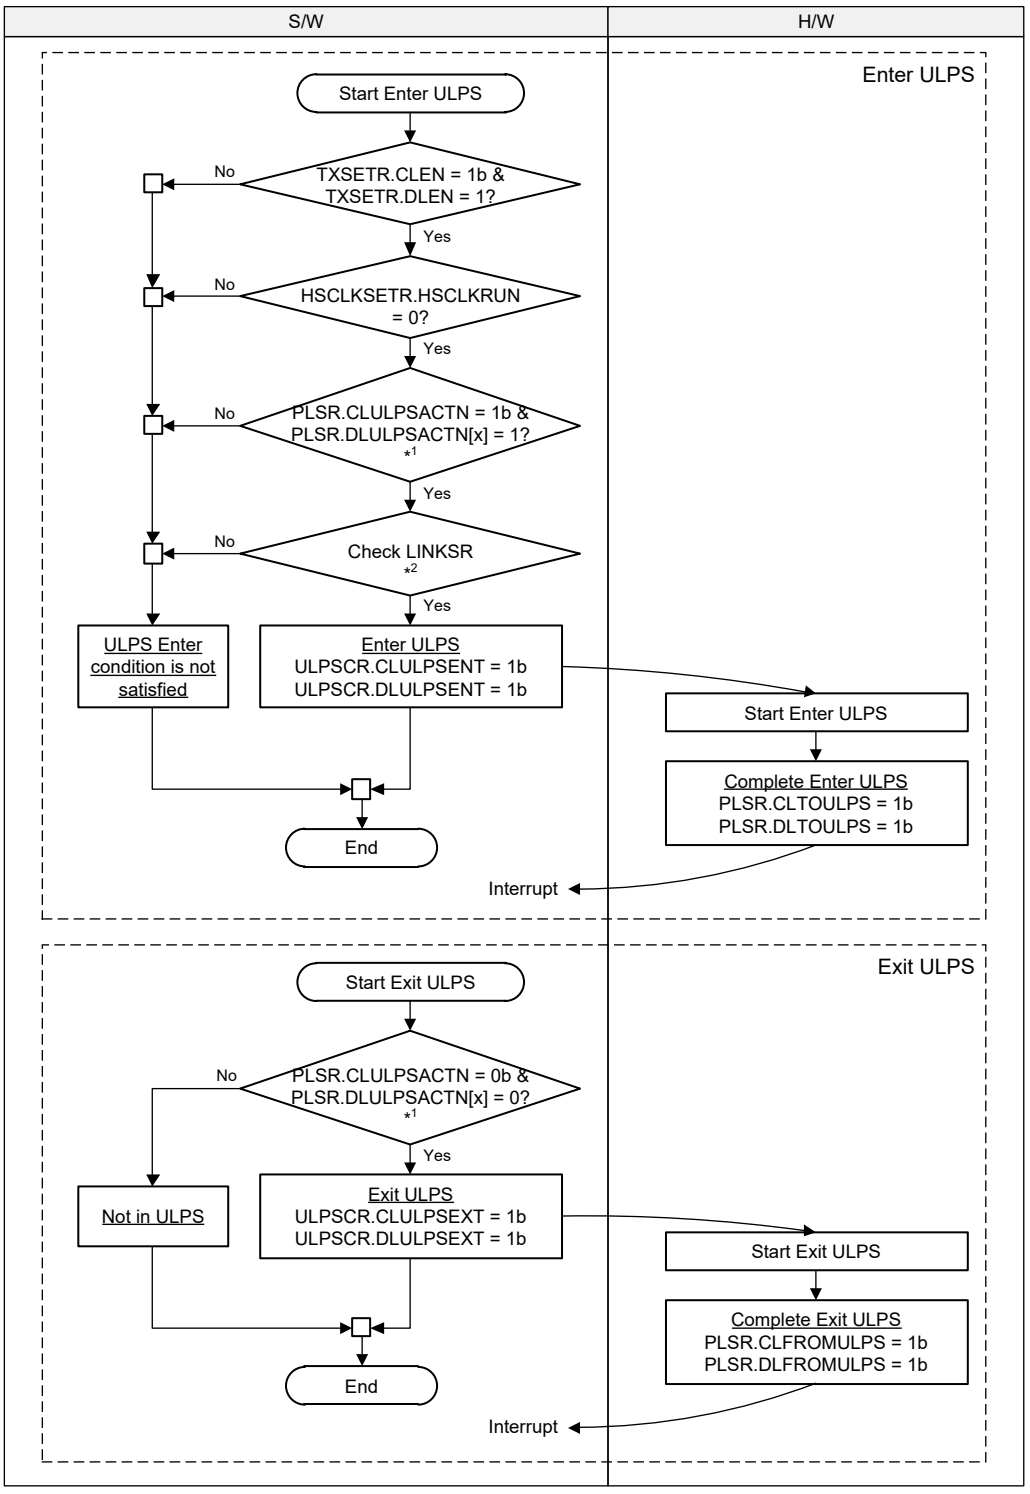
Note 2. (SQCHRUN0 = 0b and SQCHRUN1 = 0b and VICHRUN1 = 0b and HSBUSY = 0b and LPBUSY = 0b)?

Figure 9.5-14 Enter/Exit of ULPS (Data Lane)



Note 1. (SQCHRUN1 = 0b and VICHRUN1 = 0b and HSBUSY = 0b)?

Figure 9.5-15 Enter/Exit of ULPS (Clock Lane)



Note 1. Check all enabled data lanes selected by TXSETR.NUMLANEUSE

Note 2. (SQCHRUN0 = 0b and SQCHRUN1 = 0b and VICHRUN1 = 0b and HSBUSY = 0b and LPBUSY = 0b)?

Figure 9.5-16 Enter/Exit of ULPS (Clock and Data Lane)

9.5.3.7 Error Handling

9.5.3.7.1 Error Detection by Peripheral

Peripheral will notify you of the detected error by “Acknowledge and Error Report” packet.

When the DSI-Tx Module receives the “Acknowledge and Error Report” packet, it displays the latest result in the AKEPLATIR register and the accumulated result in the AKEPACMSR register.

When the user receives the “Acknowledge and Error Report” packet, review and change various settings as necessary.

9.5.3.7.2 Error Detection in D-PHY

If the D-PHY detects an error, the DSI-Tx Module sets the corresponding register flag.

The errors supported by the DSI-Tx Module are as follows. For details on the error, refer to Annex A Logical PHY-Protocol Interface Description of MIPI Alliance Specification for D-PHY Version 1.2.

- ErrEsc
- ErrSyncEsc
- ErrControl
- ErrContentionLP0
- ErrContentionLP1

If the user detects this error, perform Software Reset (**9.5.3.2.1 Software Reset**) and Reset Trigger Transmission (**9.5.3.4.4 Reset Trigger Transmission**) if necessary.

When an ErrContentionLP0 / ErrContentionLP1 error occurs, be sure to execute Software Reset (**9.5.3.2.1 Software Reset**). At that time, write 1b to RSTCR.FCETXSTP, wait for the time when Contention is resolved (equivalent to LRX-H_TO), and then write 0b to RSTCR.FCETXSTP. Also, if necessary, perform Reset Trigger Transmission (**9.5.3.4.4 Reset Trigger Transmission**).

For more information on returning from Contention, see Section 7.2, Contention Detection and Recovery in the MIPI Alliance Specification for Display Serial Interface 1.3.1.

9.5.3.7.3 Timeout Error

The DSI-Tx Module has the timers defined in Section 7.2.2, Contention Recovery Using Timers of the DSI standard and the DSI-Tx Module original timers.

- Timers defined in DSI Specification
  - HS TX Timeout Error (HTX_TO)
  - LP-RX Host Processor Timeout Error (LRX-H_TO)
  - Turnaround Acknowledge Timeout Error (TA_TO)
- Original Timers
  - Rx Response Timeout Error

(1) HS TX Timeout (HTX_TO) Error

If this error occurs, perform Software Reset (**9.5.3.2.1 Software Reset**). In addition, perform Reset Trigger Transmission (**9.5.3.4.4 Reset Trigger Transmission**) if necessary.

If this error is detected, the setting value of HSTXTOSETR.HTXTO may be too small. When multiple channels are operating at the same time, multiple HS packets may be concatenated and transmitted continuously by HS. Set HSTXTOSETR.HTXTO to a value larger than the HS transmission period.

(2) LP-RX Host Processor Timeout (LRX-H_TO) Error

If this error occurs, perform Software Reset (**9.5.3.2.1 Software Reset**). In addition, perform Reset Trigger Transmission (**9.5.3.4.4 Reset Trigger Transmission**) if necessary.

If this error is detected, the setting value of LRXHTOSETR. LRXHTO may be too small.

There is a possibility of receiving multiple packets such as response packet and “Acknowledge and Error Report” packet in one reception.

Measure the time from the completion of the Bus Turnaround sequence from Host to Peripheral (LP-11 drive detection by Peripheral) to the completion of Bus Turnaround sequence from Peripheral to Host (LP-11 drive start by Host).

Check the Peripheral specifications, and set the value of DSI_LPCLK cycle count (rounded up) + X or more corresponding to the above time in the LRXHTOSETR.LRXHTO register.

(3) Turnaround Acknowledge Timeout (TA_TO) Error

If this error occurs, perform Software Reset (**9.5.3.2.1 Software Reset**) and Reset Trigger Transmission (**9.5.3.4.4 Reset Trigger Transmission**) if necessary.

If this error is detected, the setting value of TATOSETR.TATO may be too small.

Measure the time from the start of the Peripheral Bus Turnaround sequence (LP-10 drive by the Host) to the completion (LP-11 drive detection by the Peripheral) from the Host.

Check the Peripheral specifications and set the value of DSI_LPCLK cycle count (rounded up) + X or more corresponding to the above time in the TATOSETR.TATO register. This error also occurs if the Peripheral does not support bidirectional communication.

(4) Rx Response Timeout Error

Refer to the Peripheral Response Timeout Error (**(a) Peripheral Response Timeout Error**) for more information.

9.5.3.7.4 Rx Related Error in Sequence Operation

(1) Rx Packet Related Error in Sequence Operation

The following describes the received packet error detected by the DSI-Tx Module.

Detects up to one error per packet. (However, ECC 1bit Error may occur at the same time as other errors.)

Errors are determined in the following order:

Peripheral Response Timeout Error, Malformed Packet Error, ECC Error, Unexpected Packet Error, WC Error, CRC Error, Nothing Return Error

(a) Peripheral Response Timeout Error

RXSR.PRESPTOERR is set to 1b if the BTA does not start receiving packets or triggers within the time set in the register after the bus right transitions from Host to Peripheral.

If this error is detected, packets and triggers will not be received until the bus right transitions from Peripheral to Host.

[Timeout time setting register]

- Peripheral Response Timeout value for BTA-only is set by PRESPTOBTASETR.
- Peripheral Response Timeout value for LP Read with BTA is set by PRESPTOLPSETR.PRESPTOLPR.
- Peripheral Response Timeout value for LP Write with BTA is set by PRESPTOLPSETR.PRESPTOLPW.
- Peripheral Response Timeout value for HS Read with BTA is set by PRESPTOHSSETR.PRESPTOHSR.
- Peripheral Response Timeout value for HS Write with BTA is set by PRESPTOHSSETR.PRESPTOHSW.

If this error is detected, the register setting value may be too small, Measure the time from the completion of the Bus Turnaround sequence of Peripheral from the Host (LP-11 drive detection by Peripheral) to the completion of reception of the first byte of the packet or the completion of trigger reception. After checking the Peripheral specifications, set the value of DSI_LPCLK cycle number (rounded up) + X or more corresponding to the above time.

If this error occurs, perform the necessary processing such as resending the previous command.

(b) Malformed Packet Error

If a packet less than 4 bytes is received, RXSR.MLFERR is set to 1b. Since there is an error in the received data, perform necessary processing such as resending the previous command.

(c) ECC Error

ECC generation is required for DSI v1.3.1 standard compliant Peripherals. However, since ECC generation is an option for “earlier revision of DSI Peripherals”, the DSI-Tx Module can select whether to enable or disable ECC checks using DSISETR.ECCEN.

When connecting to a Peripheral that does not support ECC generation, disable ECC checking by setting DSISETR.ECCEN to 0b.

(d) ECC 1-bit Error

If an ECC 1bit error is detected, RXSR.ECCERR1B is set to 1b and 1bit error correction is performed.

The DSI-Tx Module automatically corrects the error and restores the normal packet header, so the subsequent packet reception processing continues.

(e) ECC Multi-bit Error

If an ECC multi-bit error is detected, RXSR.ECCERR is set to 1b and the received packet is discarded. If this error occurs, perform the necessary processing such as resending the previous command.

(f) Unexpected Packet Error

If an Unexpected Packet is received, RXSR.UEXPKTERR is set to 1b.

When this error occurs, the packet header is stored in the RXRSSxR register, and the subsequent reception processing is stopped until the bus right transitions from Peripheral to Host.

The DSI-Tx Module determines the following packets as Unexpected Packets.

- Received packets in which Data Type field of the packet header is “Reserved” as described in Table 23 Data Types for Peripheral-Sourced Packets of the DSI standard
- Received packets other than “Acknowledge and Error Report” packet and “EoTp” in BTA after sending non-read packet
- Received packets other than “Acknowledge and Error Report” packet and “EoTp” when the BTA is BTA only
- BTA after sending read packet receives response packet and then receives response packet again

(g) WC Error

RXSR.WCERR is set to 1b if a long packet with payload data shorter than the WC value is received.

When this error occurs, there is an error in the payload data length, but the payload data is not discarded due to this error, and the packet header is stored in the RXRSSxR register.

Since there is an error in the received data, perform necessary processing such as resending the previous command.

(h) CRC Error

To connect to Peripherals that do not support CRC generation, the DSI-Tx Module can enable or disable CRC checking for each Virtual Channel using DSISETR.CRCEN[3:0]. When connecting to a Peripheral that does not support CRC generation, disable the CRC check by setting the corresponding bit in DSISETR.CRCEN to 0b.

When this error occurs, there is an error in the payload data, but the payload data is not discarded due to this error, and the packet header is stored in the RXRSSxR register.

If this error occurs, perform the necessary processing such as resending the previous command.

(i) Nothing Return Error

RXSR.NORETERR is set to 1b if the BTA transitions the bus right from Host to Peripheral and then does not receive packets or triggers and the bus right transitions from Peripheral to Host.

If this error occurs, perform the necessary processing such as resending the command. If the error recurs, perform Software Reset (**9.5.3.2.1 Software Reset**) and Reset Trigger Transmission (**9.5.3.4.4 Reset Trigger Transmission**) as necessary.

(2) Rx Long Packet Data Payload Related Error in Sequence Operation

(a) Maximum Return Packet Size Error

RXSR.MAXRPSZERR is set to 1b if the WC value of the received long packet is greater than the DSISETR.MRPSZ setting.

When this error occurs, the packet header is stored in the RXRSSxR register and the payload data is discarded.

Although the payload data is discarded, errors related to payload data reception (WC Error, CRC Error) are detected.

If this error occurs, set DSISETR.MRPSZ to a value greater than or equal to the value set by the Set Max Return Packet Size command.

If you still get this error despite the correct settings, consider setting DSISETR.MRPSZ to a larger value because Peripheral is returning a large packet in violation of the DSI standard.

(b) Internal Bus Error

If Internal Bus Write detects an error, RXSR.IBERR is set to 1b.

Review the settings of SQCHxDSCyDR.LADDR and DSISETR.MRPSZ.

(c) Rx Buffer Overflow Error

If the following Rx Buffer Overflow Error is detected, RXSR.RXOVFERR is set to 1b.

In the case of SQCHxDSCyBR.DTSEL = 00b Packet Payload Data register Mode:

- The Rx Payload Data is over 16 Byte length

In the case of SQCHxDSCyBR.DTSEL = 01b Long Packet data use memory space Mode:

- RAM Overflow for the LP Rx is detected

If this error occurs, execute the following.

In the case of Data register Mode:

- Change to use memory space Mode
- Change peripheral device’s Maximum Return Packet Size as not over 16 bytes

In the case of memory space Mode:

- Change peripheral device’s Maximum Return Packet Size smaller
- Make Internal Bus faster

9.5.3.7.5 Tx Packet Related Error in Sequence Operation

(1) Internal Bus Error

If Internal Bus Read detects an error, SQCHxSR.TXIBERR is set to 1b. Review the settings of SQCHxDSCyAR.DATA1 / 0b and SQCHxDSCyDR.LADDR.

(2) Packet too Big Error

SQCH1SR.PKTBIGERR is set to 1b if the Sequence Operation packet is of a size that cannot be sent within the BLLP period of the first horizontal line of the Video-Input Operation.

If this error occurs, the Sequence Operation packet will not be sent until the Video-Input Operation is completed.

9.5.3.7.6 Error in Video-Input Operation

(1) Video-Input Buffer Overflow Error

VICH1SR.VBUFOVF is set to 1b if Overflow of Video-Input Buffer is detected.

If this error occurs, perform Software Reset (**9.5.3.2.1 Software Reset**). Also, take necessary measures such as increasing the frequency of TxWordClkHS (hsclk) and decreasing the VICH1SET1R.DLY value. In addition, perform Reset Trigger Transmission (**9.5.3.4.4 Reset Trigger Transmission**) if necessary.

(2) Video-Input Buffer Underflow Error

If the Video-Input Buffer Underflow is detected, VICH1SR.VBUFUDF is set to 1b.

If this error occurs, perform Software Reset (**9.5.3.2.1 Software Reset**). Also, take necessary measures such as lowering the frequency of TxWordClkHS (hsclk) and increasing the VICH1SET1R.DLY value. In addition, perform Reset Trigger Transmission (**9.5.3.4.4 Reset Trigger Transmission**) if necessary.

(3) Timing Error

VICH1SR.TIMERR is set to 1b if no video packets (including Sync Event packets) were sent during the Video-Input Operation at the intended timing.

If this error occurs, perform Software Reset (**9.5.3.2.1 Software Reset**). Also, take necessary measures such as reviewing the setting value of LPTRNSTSETR.GOLPBKT. In addition, perform Reset Trigger Transmission (**9.5.3.4.4 Reset Trigger Transmission**) if necessary.

9.5.4 Interrupts

9.5.4.1 Interrupt List

Interrupts can be divided into the following categories:

Table 9.5-7 Interrupt Signals (1/2)

Interrupt Signal	Category	Interrupt Condition	Interrupt Source Register
dsi_int_sq0	Sequence operation channel 0 interrupt	Receive Acknowledge and Error Report Packet in Sequence Operation BTA	SQCH0SR.RXAKE
		Receive Correctable Error in Sequence Operation BTA	SQCH0SR.RXCORERR
		Receive Packet Data Error in Sequence Operation BTA	SQCH0SR.RXPKTDFAIL
		Receive Fail Error in Sequence Operation BTA	SQCH0SR.RXFAIL
		Receive Fatal Error in Sequence Operation BTA	SQCH0SR.RXFATALERR
		Transmit Internal Bus Error in Sequence Operation	SQCH0SR.TXIBERR
		Descriptor Finished by Setting in Sequence Operation	SQCH0SR.ADESFIN
		Descriptor’s All Action Finished in Sequence Operation	SQCH0SR.AACTFIN
dsi_int_sq1	Sequence operation channel 1 interrupt	Receive Acknowledge and Error Report Packet in Sequence Operation BTA	SQCH1SR.RXAKE
		Receive Correctable Error in Sequence Operation BTA	SQCH1SR.RXCORERR
		Receive Packet Data Error in Sequence Operation BTA	SQCH1SR.RXPKTDFAIL
		Receive Fail Error in Sequence Operation BTA	SQCH1SR.RXFAIL
		Receive Fatal Error in Sequence Operation BTA	SQCH1SR.RXFATALERR
		Transmit Internal Bus Error in Sequence Operation	SQCH1SR.TXIBERR
		Transmit Packet is too big Error in Sequence Operation	SQCH1SR.PKTBIGERR
		Descriptor Finished by Setting in Sequence Operation	SQCH1SR.ADESFIN
		Descriptor’s All Action Finished in Sequence Operation	SQCH1SR.AACTFIN
dsi_int_vin1	Video-Input operation channel 1 interrupt	Transmit Buffer Overflow in Video-Input Operation	VICH1SR.VBUFOVF
		Transmit Buffer Underflow in Video-Input Operation	VICH1SR.VBUFUDF
		Transmit Timing Error in Video-Input Operation	VICH1SR.TIMERR
		Video-Input Signal Accept Ready	VICH1SR.VIRDY
		Video-Input Operation Stopped	VICH1SR.STOP
		Video-Input Operation Started	VICH1SR.START

Table 9.5-7 Interrupt Signals (2/2)

Interrupt Signal	Category	Interrupt Condition	Interrupt Source Register
dsi_int_rcv	DSI Packet Receive interrupt	Receive Acknowledge and Error Report Packet	RXSR.RXAKE
		Single-bit ECC Error	RXSR.ECCERR1B
		Maximum Return Packet Size Error	RXSR.MAXRPSZERR
		No Return Error	RXSR.NORETERR
		Peripheral Response timeout	RXSR.PRESPTOERR
		Receive Buffer overflow error	RXSR.RXOVFERR
		Internal Bus Error detect on data save	RXSR.IBERR
		CRC Error	RXSR.CRCERR
		Word Count Error	RXSR.WCERR
		Unexpected Packet Error	RXSR.UEXPKTERR
		Multi-bit ECC Error	RXSR.ECCERR
		Malformed Error	RXSR.MLFERR
		External Tearing Effect	RXSR.EXTTEDET
		Receive ACK trigger	RXSR.RXACK
		Receive Tearing Effect trigger	RXSR.RXTE
		Receive Reset trigger	RXSR.RXRTRG
		Receive Unknown-5 trigger	RXSR.RXUK5TRG
		Receive EoTp	RXSR.RXEOTP
		Receive Response packet	RXSR.RXRESP
		Turnaround Acknowledge Timeout	RXSR.TATO
		LP-RX Host Processor Timeout	RXSR.LRXHTO
		BTA request End	RXSR.BTAREQEND
dsi_int_ferr	DSI Fatal Error interrupt	Contention Error LP1	FERRSR.ERRCLP1
		Contention Error LP0	FERRSR.ERRCLP0
		Control Error	FERRSR.ERRCTRL
		Sync Escape Error	FERRSR.ERRSYNESC
		Error Escape	FERRSR.ERRESC
		Turnaround Acknowledge Timeout	FERRSR.TATO
		LP-RX Host Processor Timeout	FERRSR.LRXHTO
		HS TX Timeout	FERRSR.HTXTO
dsi_int_ppi	DSI D-PHY PPI interrupt	Data Lanes return from ULPS	PLSR.DLFROMULPS
		Data Lanes go to ULPS	PLSR.DLTOULPS
		Clock Lane change HS to LP	PLSR.CLHS2LP
		Clock Lane change LP to HS	PLSR.CLLP2HS
		Clock Lanes return from ULPS	PLSR.CLFROMULPS
		Clock Lanes go to ULPS	PLSR.CLTOULPS
		Data Lane 0 change TX to RX	PLSR.DL0TX2RX
		Data Lane 0 change RX to TX	PLSR.DL0RX2TX

The interrupt signal consists of combination logic. The interrupt signal from a Status Register is enabled by the signal related Interrupt Enable Register. These interrupt signals are bound by OR logic.

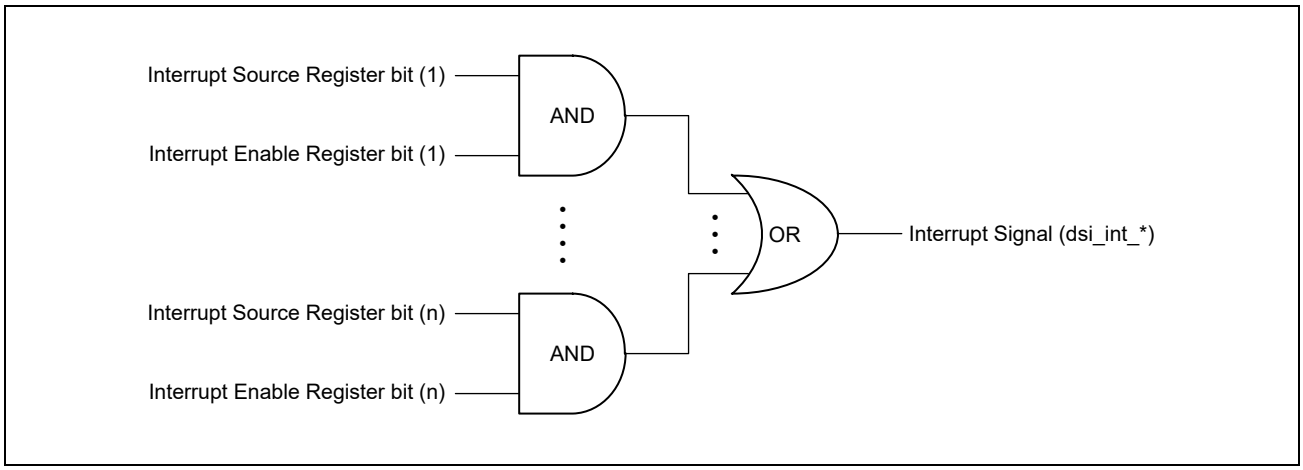


Figure 9.5-17 Interrupt Signal Output

9.5.5 Usage Notes

9.5.5.1 Restriction and Notes

In this section, the restriction and notes on the DSI-Tx Module are described.

Table 9.5-8 Note and Restriction List

Items	Restriction and Notes
TxWordClkHS	Each Lanes TxWordClkHS must be synchronized. The DSI-Tx Module uses Data Lane0 TxWordClkHS as hsclk.
Unused input signals	All unused input signals must be input 0, except following signals. Following signals must be input 1, when they are not used. • ppi_dl1_ulpsactivenot • ppi_dl2_ulpsactivenot • ppi_dl3_ulpsactivenot
TxReadyHS assert	D-PHY must be asserted TxReadyHS within ($2^{RELDSI2TX\_LNK\_RAM\_WORD\_DEPTH}$ – 2) hsclk cycles after TxRequestHS asserted.

SECTION 9 IMAGE

9.6 H.265/H.264 Multi Codec (VCD)

This section describes the functions of the H.265/H.264 multi codec (VCD).

9.6.1 Functional Overview

The VCD is a video codec that supports H.264 and H.265. It has the features shown below.

- H.265/HEVC MP (main profile) supported
  - H.265/HEVC main profile at level 5
- H.264/AVC constrained baseline/main/high profile supported
  - High profile at level 4.2,
  - Main profile at level 4.2,
  - Baseline profile at level 4.2
- H.265 encoding and decoding performance
  - 3840 × 2160 encoding, 3840 × 2160 decoding
- H.264 encoding and decoding performance
  - 1920 × 1080 p encoding, 1920 × 1080 p decoding
- Equipped with lossless compression and reference image buffer to reduce memory bandwidth

9.6.2 Connection Configuration

Figure 9.6-1 shows the connection configuration for the H.265/H.264 multi codec (VCD).

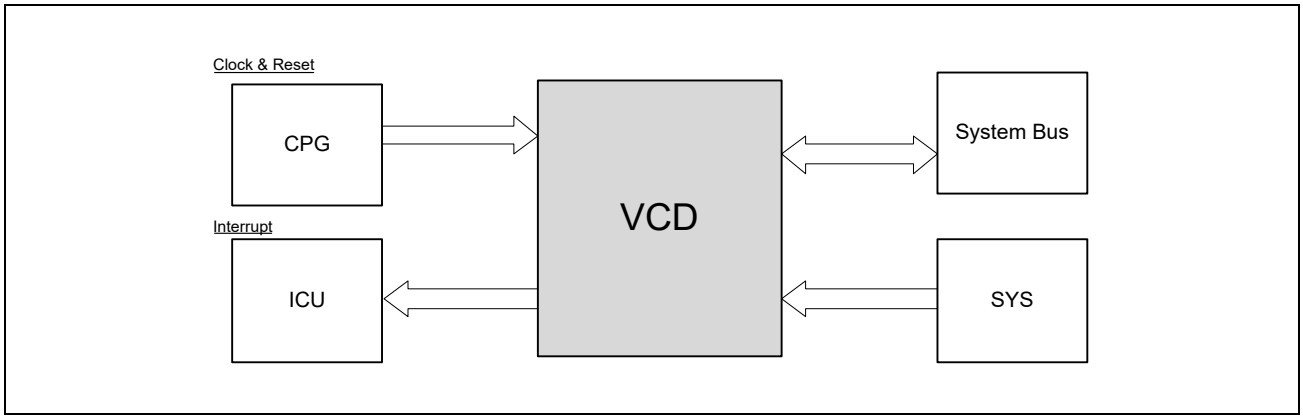

Figure 9.6-1 Configuration Diagram of VCD Connection

9.6.3 Operation Procedure

Use the driver provided by Renesas to operate this unit.

SECTION 9 IMAGE

9.7 3D Graphics Engine (GE3D)

9.7.1 Overview

This LSI includes the Arm Mali-G31 GPU as a 3D Graphics Engine (GE3D). The Arm Mali-G31 GPU is a graphics acceleration platform that is based on open standards. It supports 2D graphics, 3D graphics, and General Purpose computing on GPU (GPGPU).

9.7.1.1 Features

The GE3D has the following features.

- One single-pixel shader core
- 8 Kbytes L2 cache
- A programmable architecture.
- An API feature set with support for shader-based and fixed-function graphics APIs.
- Anti-aliasing capabilities.
- An effective core for General Purpose computing on GPU (GPGPU) applications.
- High memory bandwidth and low power consumption for 3D graphics content.
- Latency tolerance.
- Compressed texture formats.
- Coherency aware interconnects for system memory and resource sharing.

The GE3D and software support compute and graphics API standards.

— The GE3D supports these compute API standards:

OpenCL 2.0 Full Profile.

— The GE3D supports these graphics API standards:

OpenGLES 1.1, 2.0, 3.0, 3.1 and 3.2.

9.7.1.2 Block Diagram

The GE3D contains the shader processor core and associated blocks, including the tiler, the memory-management unit, and the level 2 cache memory subsystem.

Figure 9.7-1 shows a block diagram.

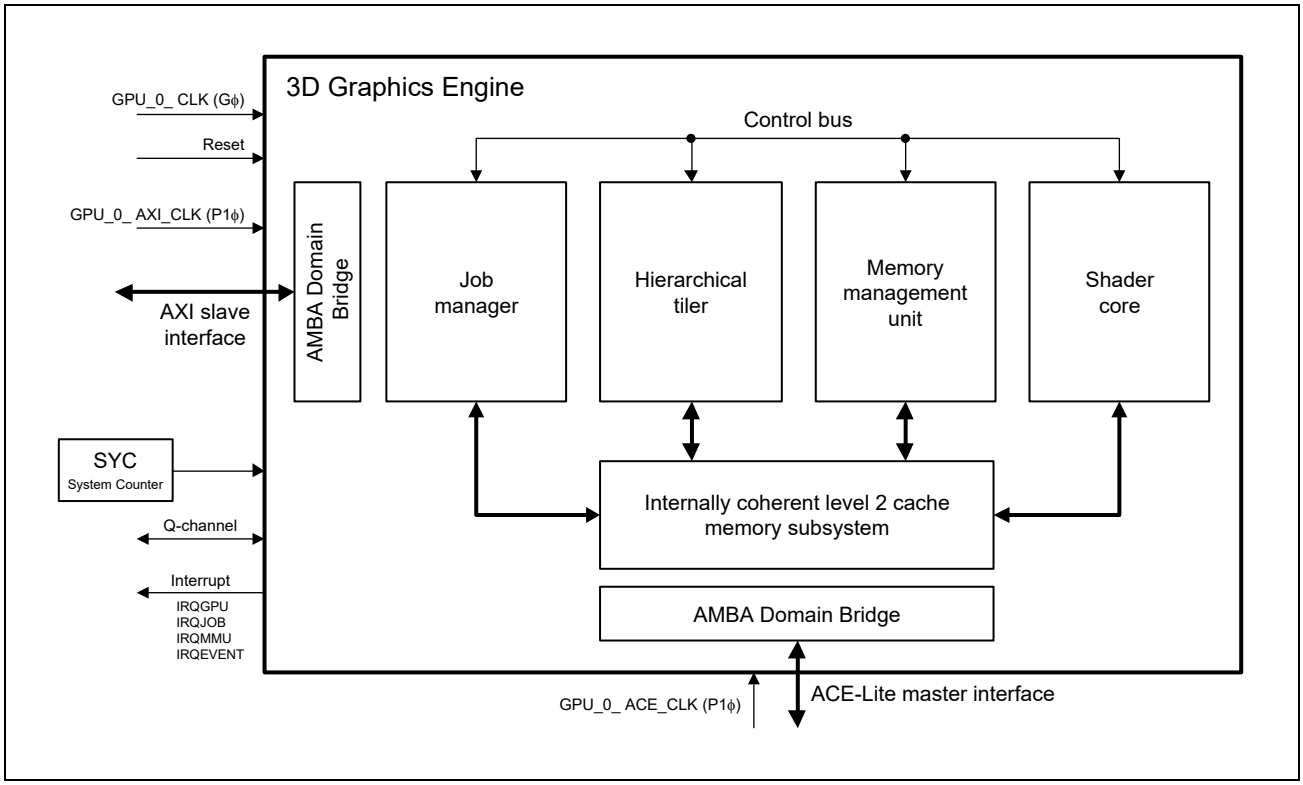

Figure 9.7-1 Block Diagram

The GE3D uses a centralized hardware resource manager, called the job manager, that controls the internal GPU functions.

The application software runs on the application processor. When it requires graphics to be displayed on screen, it uses the graphics device driver to send a graphics job to the GE3D. In the GE3D, the job manager receives the job, interprets it, and then sends a series of graphics tasks to the internal functional units.

The job manager issues and sends commands to specific functional blocks in the GE3D.

- The shader core is the main processing engines of the GE3D. The shader core carries out all the rendering and computation operations.
- The tiler creates lists of all the objects in a scene, so that the shader core processes the objects efficiently.
- The memory management unit performs virtual address to physical address translation of external bus interface accesses.
- The Level 2 cache memory subsystem provides caching for all internal master blocks. It also supports cache coherency for caches in the shader cores. The L2 cache sits between the internal master blocks and the external interconnect. All transactions go through the cache. If the cache cannot service an internal transaction, it performs an external transaction to read or write data.

9.7.1.3 External Pins

In 3D Graphics Engine, there are no external pins.

9.7.1.4 Register Configuration

Base address of registers is allocated to 0_1485_0000h. The address range is 64 KB (0_1485_0000h - 0_1485_FFFFh).

9.7.1.5 Usage Note

Renesas does not provide technical support for users to program GE3D registers directly. Renesas provides users with drivers to program GE3D. GE3D supports OpenGLES as a graphics API. When drawing graphics, control according to this API.

9.7.1.6 Starting SYC

When using GE3D, it is necessary to supply the clock to the SYC (system counter) and release the reset to keep it running.

SECTION 9 IMAGE

9.8 Image Signal Processor (ISP)

This manual is a simplified version. For more information, refer to the User's Manual Additional Document.

9.8.1 Overview

The image signal processor (ISP) is a unit that performs image correction on RAW data stored in memory and transfers the processed image in YUV or RGB format to memory.

This unit consists of the ISP Core (Mali™-C55 from Arm®) and the Input Video Control block.

9.8.1.1 Features

9.8.1.1.1 Input/output specifications

- Video Input interface
  - Bus architecture: AXI3 Data = 256 bits, 400 MHz (max)
  - Pixel size: Min 640 pixels × 480 pixels
Max 4096 pixels × 2160 pixels
  - Exposure: 1 or 2 (Maximum number of memory planes is 2)

- Video Input format
  - Format: MIPI CSI-2 Recommended Memory Storage format / CRU 64-bit packed pixel format
  - Data type: RAW8 / 10 / 12 / 16 / 20 (Only Bayer-RAW is supported for RAW)
  - CFA pattern: 2×2 RGGB Bayer

- Video Output Interface
  - Bus architecture: AXI-3 Data = 128 bits, 630 MHz (max)
  - Pixel size: Max 4096 pixels × 2160 pixels

- Video Output format
  - 13 color formats supported (6 types of RGB, 7 types of YUV)

- Others bus interface
  - Temper bus: AXI3 Data = 128 bits, 640 MHz (max)
  - ISP Core Register bus: AXI4 Data = 64 bits, 400 MHz (max)
  - Input Video Control block Register bus: APB4 Data = 32 bits, 100 MHz (max)

9.8.1.2 Image Processing Functions

For more information, refer to the User's Manual Additional Document.

SECTION 10 ELECTRICAL CHARACTERISTICS

10.1 Electrical Characteristics

This section describes the electrical characteristics of this LSI.

10.1.1 Absolute Maximum Ratings

Permanent damage to the LSI may result if absolute maximum ratings are exceeded.

Table 10.1-1 Absolute Maximum Ratings (1/3)

Unit Name	Item	Symbol	Min.	Max.	Unit
CA55	VDD09_CA55	CA55_V_{DD09}	−0.4	1.2	V

Table 10.1-1 Absolute Maximum Ratings (3/3)

Unit Name	Item	Symbol	Min.	Max.	Unit
—	Input voltage (3.3-V I/O)	V_{in33}	−0.4	V_{33} + 0.3*5	V
—	Analog input voltage (ADC I/O)	V_{ain18}	0	$ADAV_{DD18}$	V
—	Junction temperature	T_j	−40	125	°C
—	Storage temperature	T_{stg}	−40	150	°C

Note 1. n = 0, 1. The voltage to be applied must be within the absolute maximum rating (1.5 V).

Note 2. The voltage to be applied must be within the absolute maximum rating (2.5 V). V_{12} indicates the power supply voltage for 1.2-V I/O pins.

Note 3. The voltage to be applied must be within the absolute maximum rating (2.5 V). V_{18} indicates the power supply voltage for 1.8-V I/O pins. When 1.8 V is used for the 3.3/1.8-V switching I/O, this specification is applied.

Note 4. Pxx pins (with the exceptions of P2x, P90, P91, P92, and PBx)

Note 5. The voltage to be applied must be within the absolute maximum rating (3.8 V). V_{33} indicates the power supply voltage for 3.3-V I/O pins. When 3.3 V is used for the 3.3/1.8-V switching I/O, this specification is applied.

Note 1. OD: Over drive (up to 1.8-GHz operation frequency)
ND: Normal drive (up to 1.1-GHz operation frequency)

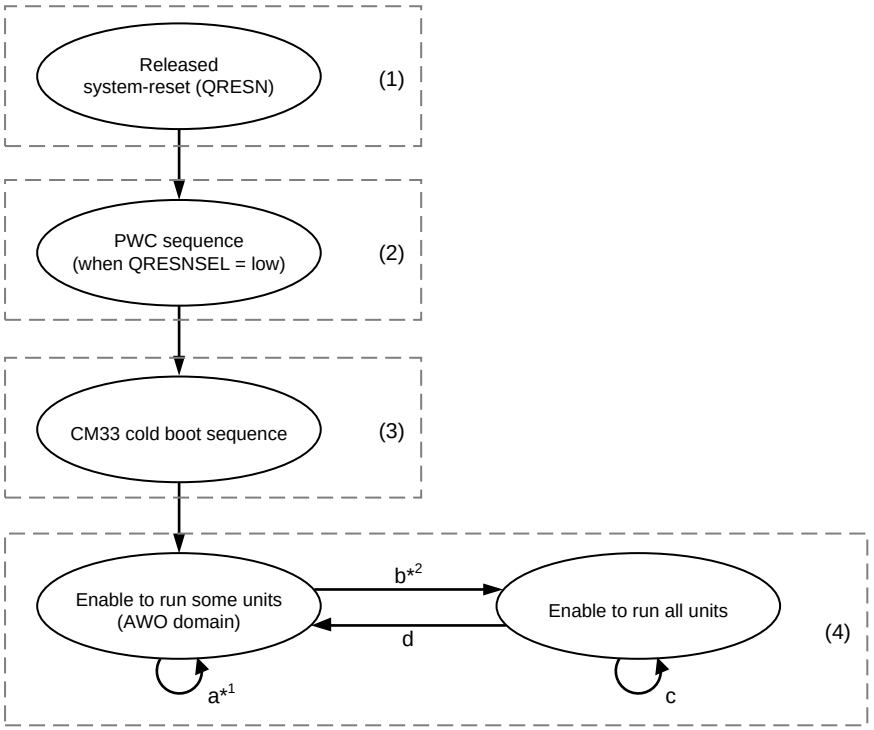
Note 2. To avoid the possibility of noise, separating this power supply from other power supply terminals is recommended.

10.1.3 Power-On/Off Sequence

10.1.3.1 CM33 Boot Mode (PWC Enabled)

The state diagram of CM33 cold boot is shown in **Figure 10.1-1**. The boot mode states (1) to (4) refer to the sequence of (1) to (4) in **Figure 10.1-2**.

For the details of boot mode, refer to **4.4.7 Control of Booting**.



Note 1. CM33 operates the system managements.

Note 2. When the power mode switches from AWO to ALL_ON depending on the user system, CM33 sets the LSI registers and PMIC registers to supply power to the OTHERS domain.

(Continued from previous page)

Software control: RIIC or PFC (GPIO) control
For details of the procedure, refer to **4.5.3 Power Domains**.

Note: The clock stabilization time depends on the board design. Make the setting according to the results of evaluation.

Note: Refer to the notes in **10.1.3.3** and **10.1.3.4** for details on the restrictions on the rise time and fall time of each power supply.

Note: When the QRESN pin becomes low, the PWEN0 to PWEN2 pins become low simultaneously.

Note: When using the PWC, set QRESN to the low level at the same time as or after the 1st Grp power off.

Note 1. Only for the TRSTN pin

Note 2. When the RIIC function is in use or the value of the PFC_SMT_mn register is 1

Note 3. Only for the P20 and P21 pins (when the value of the PFC_PUPD_mn register is 10b)

Note 4. Only for the P20 and P21 pins (when the value of the PFC_PUPD_mn register is 11b)

Note 5. Only for the QBYPASS, BSCANP, MD_BOOT0, MD_BOOT3, MD_BOOT4, BOOTSELCPU, and BOOTPLLCA_0 pins

Note 6. Only for the MD_BOOT1, MD_BOOT2, BOOTPLLCA_1, and MD_CLKS pins

Note 7. Only for the WDTUDFCA, WDTUDFCM, and SCIF_RXD, SCIF_TXD, XSPI0_CS0N, XSPI0_RESET0N, XSPI0_RSTO0N, XSPI0_INT0N, and XSPI0_ECS0N pins (when the value of the PFC_PUPD_mn register is 10b)

Note 8. Only for the WDTUDFCA, WDTUDFCM, and SCIF_RXD, SCIF_TXD, XSPI0_CS0N, XSPI0_RESET0N, XSPI0_RSTO0N, XSPI0_INT0N, and XSPI0_ECS0N pins (when the value of the PFC_PUPD_mn register is 11b)

Note 9. When the value of the PFC_PUPD_mn register is 10b

Note 10. When the value of the PFC_PUPD_mn register is 11b

Note 11. Only for the pins other than SD0CLK, SD0RSTN, SD1CLK, ET0_PHYINTR, and ET1_PHYINTR (when the value of the PFC_PUPD_mn register is 10b)

Note 12. Only for the pins other than SD0CLK, SD0RSTN, SD1CLK, ET0_PHYINTR, and ET1_PHYINTR (when the value of the PFC_PUPD_mn register is 11b)

Note 13. Only for the P90, P91, P92, PB0, PB1, PB2, PB3, PB4, and PB5 pins (when the RIIC function is in use or the value of the PFC_SMT_mn register is 1)

10.1.5 AC Characteristics

Conditions:

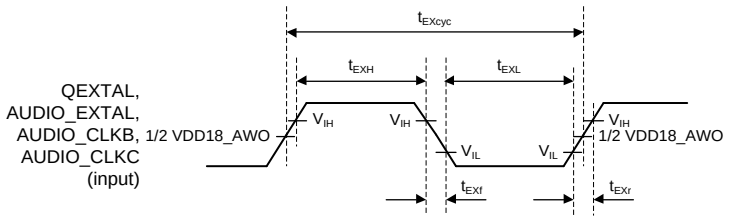
VDD18 = VDD18_AWO = VDD1833_* (1.8 V mode)

VDD33 = VDD1833_* (3.3 V mode)

10.1.5.1 Clock Timing

Table 10.1-5 Clock Timing Table

Item	Symbol	Min.	Max.	Unit	Figures
QEXTAL clock input frequency	f_{EX}	24 −50 ppm	24 +50 ppm	MHz	**Figure 10.1-8**
QEXTAL clock input cycle time	t_{EXcyc}	41.67	41.67	ns	
AUDIO_EXTAL clock input frequency	f_{EX}	4	48	MHz	
AUDIO_EXTAL clock input cycle time	t_{EXcyc}	20.83	250	ns	
AUDIO_CLKB, AUDIO_CLKC clock input frequency (external clock is input)	f_{EX}	4	50	MHz	
AUDIO_CLKB, AUDIO_CLKC clock input cycle time (external clock is input)	t_{EXcyc}	20	250	ns	
QEXTAL clock input low-level pulse width	t_{EXL}	0.4	0.6	t_{EXcyc}	
QEXTAL clock input high-level pulse width	t_{EXH}	0.4	0.6	t_{EXcyc}	
AUDIO_EXTAL, AUDIO_CLKB, AUDIO_CLKC clock input low-level pulse width	t_{EXL}	0.45	0.55	t_{EXcyc}	
AUDIO_EXTAL, AUDIO_CLKB, AUDIO_CLKC clock input high-level pulse width	t_{EXH}	0.45	0.55	t_{EXcyc}	
QEXTAL, AUDIO_EXTAL, AUDIO_CLKB, AUDIO_CLKC clock input rise time	t_{EXr}	—	4	ns	
QEXTAL, AUDIO_EXTAL, AUDIO_CLKB, AUDIO_CLKC clock input fall time	t_{EXf}	—	4	ns	
Mode hold time	t_{MDH}	—	100	ns	**Figure 10.1-9**
Mode setup time	t_{MDS}	—	100	ns	



Note: When the clock is input on the QEXTAL, AUDIO_EXTAL, AUDIO_CLKB, or AUDIO_CLKC

DS Tri-state to CS low	t_{DSTCSL}	0.0	—	0.0	—	ns	

Note: CK: XSPI0_CKP (XSPI0_CKN)
DS: XSPI0_DS
CS: XSPI0_CS0N, XSPI0_CS1N

Note 1. Specification at 133 MHz / Specification at 100 MHz

Note 2. These are values when the OEN assertion is extended in the Output Enable Asserting extension bit (COMCFG.OEASTEX = 1b).

Note 3. These are the values when the CS assertion is extended in the CS asserting extension bit (LIOCFGCSn.CSASTEX = 1b).

Note 4. The standard value for xSPI266 is 0.8 ns.

Note 5. If the DS is high during the command & modifier phase when using JESD251 Profile 2.0 memory, the time from CS low to DS high must also meet this specification.

Note 6. When using JESD251 Profile 1.0 memory or JESD251 Profile 2.0 memory with LIOCFGCSn.LATEMD set to 0, this constraint does not apply if the internal pull-down resistor of the DS pin is enabled.

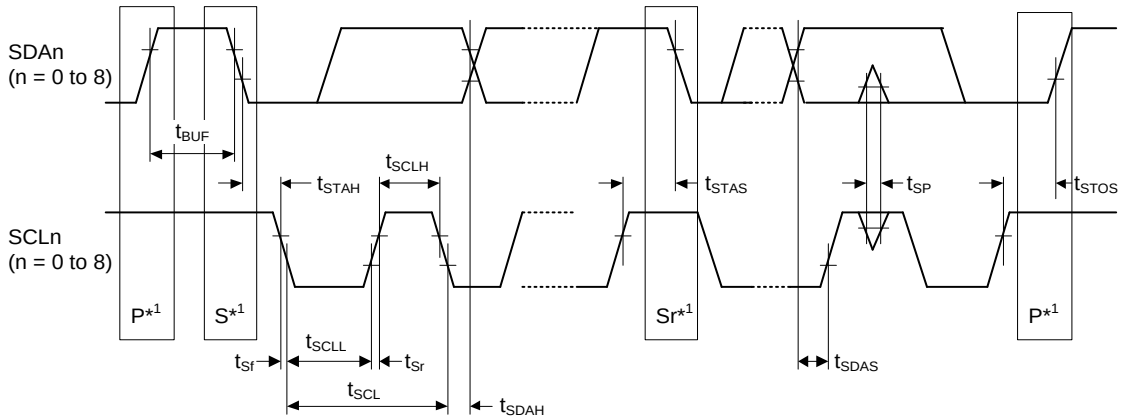
	SCL, SDA capacitive load*3	C_b	—	550	pF	

Note 1. t_{IICcyc}: RIIC internal reference clock (IICϕ) cycle

Note 2. The values outside parentheses apply when the value of the ICMR3.NF[1:0] bits is 00b while the digital filter is enabled by setting ICFER.NFE = 1. The values within parentheses apply when the value of the ICMR3.NF[1:0] bits is 11b while the digital filter is enabled by setting ICFER.NFE = 1.

Note 3. C_b is the total capacitance of the bus lines.

Note 4. The minimum values are not specified for t_{sr} and t_{sf} in Fast-mode or Fast-mode Plus.



Note 1. S, P, and Sr indicate the following conditions.
S: Start condition
P: Stop condition
Sr: Restart condition

Figure 10.1-43 RIIC Bus Interface Input/Output Timing

10.1.5.17 I3C Timing

Conditions: V_{OH} = VDD1218_I3C × 0.5, V_{OL} = VDD1218_I3C × 0.5, C = 30 pF (1.2 V or 1.8 V)

Drive strength: ×6

Table 10.1-22 I3C Timing

Parameter		Symbol	Min.*1	Max.	Unit	Figure
IIC (Standard mode, SMBus)	SCL3n cycle time	t_{SCL}	4(36) × t_{IICcyc} + 4 × t_{Pcyc} + 1300	—	ns	**Figure 10.1-44**
	SCL3n high-level pulse width	t_{SCLH}	2(18) × t_{IICcyc} + 2 × t_{Pcyc} + 300	—	ns

	SCL3n, SDA3n fall time	t_{Sf}	—	300	ns	
	SCL3n, SDA3n spike pulse removal time	t_{SP}	0	1(16) × t_{IICcyc}	ns	
	SDA3n bus free time	t_{BUF}	3(20) × t_{IICcyc} + 300	—	ns	
	Hold time for START condition	t_{STAH}	t_{IICcyc} + 300	—	ns	
	Setup time for repeated START condition	t_{STAS}	300	—	ns	
	Setup time for STOP condition	t_{STOS}	300	—	ns	
	Data setup time	t_{SDAS}	t_{IICcyc} + 50	—	ns	
	Data hold time	t_{SDAH}	0	—	ns	
	SCL3n, SDA3n capacitive load	C_b	—	400	pF	

Note 1. t_{IICcyc}: I3C internal reference clock (I3Cϕ) cycle, t_{Pcyc}: I3C_0_TCLK cycle
Refer to **7.8.3.2.14 Reference Clock Control Register** for details.
Values in parentheses apply when INCTL.DNFS[3:0] is set to 1111b while the digital filter is enabled with DNFE.DNFE set to 1b.

Table 10.1-23 IIC Timing (Fast-mode+)

Parameter		Symbol	Min.*1	Max.	Unit	Figure
IIC (Fast-mode+)	SCL3n cycle time	t_{SCL}	4(26) × t_{IICcyc} + 4 × t_{Pcyc} + 240	—	ns	**Figure 10.1-44**
	SCL3n high-level pulse width	t_{SCLH}	2(18) × t_{IICcyc} + 2 × t_{Pcyc} + 120	—	ns	
	SCL3n low-level pulse width	t_{SCLL}	2(18) × t_{IICcyc} + 2 × t_{Pcyc} + 120	—	ns	
	SCL3n, SDA3n rise time	t_{Sr}	—	120	ns	
	SCL3n, SDA3n fall time	t_{Sf}	—	120	ns	
	SCL3n, SDA3n spike pulse removal time	t_{SP}	—	1(16) × t_{IICcyc}	ns	
	SDA3n bus free time	t_{BUF}	3(20) × t_{IICcyc} + 120	—	ns	
	Hold time for START condition	t_{STAH}	t_{IICcyc} + 135	—	ns	
	Setup time for repeated START condition	t_{STAS}	260	—	ns	
	Setup time for STOP condition	t_{STOS}	260	—	ns	
	Data setup time	t_{SDAS}	50	—	ns	
	Data hold time	t_{SDAH}	0	—	ns	
	SCL3n, SDA3n capacitive load	C_b	—	550	pF	

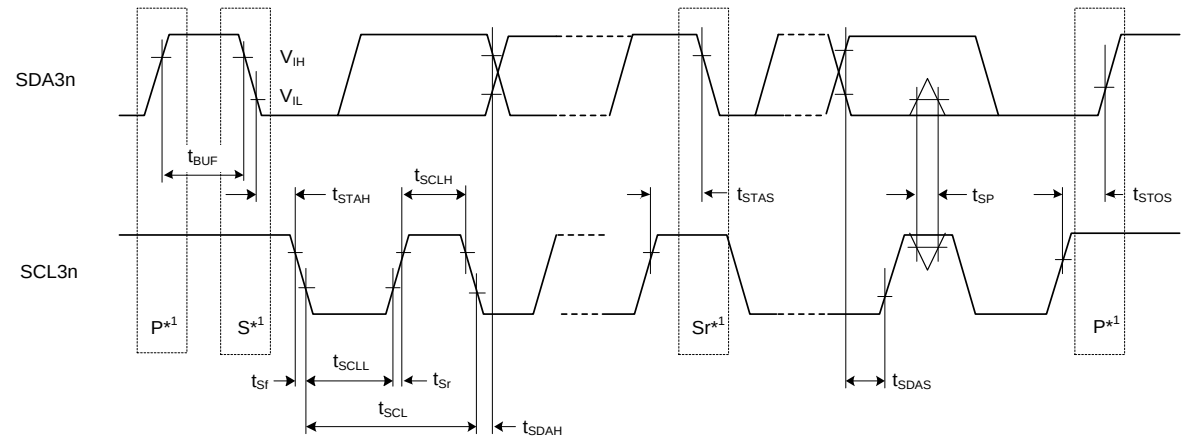
Note 1. t_{IICcyc}: I3C internal reference clock (I3Cϕ) cycle, t_{Pcyc}: I3C_0_TCLK cycle.
Refer to **7.8.3.2.14 Reference Clock Control Register** for details.
Values in parentheses apply when INCTL.DNFS[3:0] is set to 1111b while the digital filter is enabled with INCTL.DNFE set to 1b.

Table 10.1-24 IIC Timing (HS mode)

Parameter		Symbol	Cb = 100 pF		Cb = 400 pF		Unit	Figure
			Min.*1	Max.	Min.*1	Max.		
IIC (HS mode)	SCL3n cycle time	t_{SCL}	3(36) × t_{IICcyc} + 4 × t_{Pcyc} + 240	—	3(36) × t_{IICcyc} + 4 × t_{Pcyc} + 240	—	ns	**Figure 10.1-44**
	SCL3n high-level pulse width	t_{SCLH}	2(18) × t_{IICcyc} + 2 × t_{Pcyc} + 120	—	2(18) × t_{IICcyc} + 2 × t_{Pcyc} + 120	—	ns	
	SCL3n low-level pulse width	t_{SCLL}	2(18) × t_{IICcyc} + 2 × t_{Pcyc} + 120	—	2(18) × t_{IICcyc} + 2 × t_{Pcyc} + 120	—	ns	
	SCL3n rise time	t_{Sr}	—	40	—	80	ns	
	SCL3n rise time after a repeated START condition and after an acknowledge bit	t_{Sr}	—	80	—	160	ns	
	SDA3n rise time	t_{Sr}	—	80	—	160	ns	
	SCL3n fall time	t_{Sf}	—	40	—	80	ns	
	SDA3n fall time	t_{Sf}	—	80	—	160	ns	
	SCL3n, SDA3n spike pulse removal time	t_{SP}	0	1(16) × t_{IICcyc}	0	1(16) × t_{IICcyc}	ns	
	Hold time for START condition	t_{STAH}	t_{IICcyc} + 135	—	t_{IICcyc} + 135	—	ns	
	Setup time for repeated START condition	t_{STAS}	160	—	160	—	ns	
	Setup time for STOP condition	t_{STOS}	160	—	160	—	ns	
	Data setup time	t_{SDAS}	10	—	10	—	ns	
	Data hold time	t_{SDAH}	0	80	0	150	ns	
	SCL3n, SDA3n capacitive load	C_b	—	100	—	400	pF	

Note 1. t_{IICcyc}: I3C internal reference clock (I3Cϕ) cycle, t_{Pcyc}: I3C_0_TCLK cycle.
Refer to **7.8.3.2.14 Reference Clock Control Register** for details.
Values in parentheses apply when INCTL.DNFS[3:0] is set to 1111b while the digital filter is enabled with INCTL.DNFE set to 1b.

Note 2. The maximum SCL clock frequency is 1.7 MHz.



Note: n = 0

Note 1. S, P, and Sr indicate the following conditions
S: Start condition
P: Stop condition
Sr: Restart condition

Figure 10.1-44 I3C Bus Interface Input/Output Timing

Table 10.1-25 I3C Timing (Open Drain Timing Parameters)

Parameter		Symbol	Min.*1	Max.	Unit	Figure	Notes
SCL3n clock Low period		t_{LOW_OD}	200	—	ns	**Figure 10.1-47**	1, 2
		$t_{DIG\_OD\_L}$	t_{LOW_ODmin} + t_{fDA_ODmin}	—		**Figure 10.1-47**	—
SCL3n clock High period		t_{HIGH}	—	41	ns	**Figure 10.1-47**	3, 4
		t_{DIG_H}	36 (when 1.8 V) 40 (when 1.2 V)	t_{HIGH} + t_{CF}	ns	**Figure 10.1-47**	—
SDA3n signal fall time		t_{fDA_OD}	t_{CF}	33	ns	**Figure 10.1-47**	—
SDA3n data setup time open drain mode	V_{DD1218} = 1.8 V	t_{SU_OD}	12	—	ns	**Figure 10.1-46**, **Figure 10.1-47**	1
	V_{DD1218} = 1.2 V		13.9	—	ns	**Figure 10.1-46**, **Figure 10.1-47**	
Clock after START (S) condition		t_{CAS}	38.4	For ENTAS0: 1 µ	seconds	**Figure 10.1-47**	5, 6
				For ENTAS1: 100 µ			
				For ENTAS2: 2 m			
				For ENTAS3: 50 m			
Clock before STOP (P) condition		t_{CBP}	t_{CASmin}/2	—	seconds	**Figure 10.1-48**	—
Current master to secondary master overlap time during handoff		$t_{MMOverlap}$	$t_{DIG\_OD\_Lmin}$	—	ns	**Figure 10.1-53**	—
Bus available condition		t_{AVAL}	1	—	us	—	7
Bus idle condition		t_{IDLE}	1	—	ms	—	—
Time internal where new master not driving SDA3n low		t_{MMLock}	$t_{AVALmin}$	—	us	**Figure 10.1-53**	—

Note 1. This is approximately equal to t_{LOWmin} + t_{DS_ODmin} + t_{rDA_ODtyp} + t_{SU_ODmin}.

Note 2. The Master may use a shorter Low period if it knows that this is safe, i.e., that SDA is already above VIH.

Note 3. This is based on t_{SPIKE}, rise and fall times, and interconnect.

Note 4. This maximum High period may be exceeded when the signals can be safely seen by Legacy I^2C Devices, and/or in consideration of the interconnect (e.g., a short bus).

Note 5. On a Legacy Bus where I2C Devices need to see Start.

Note 6. Slaves that do not support the optional ENTASx CCCs shall use the t_{CAS} Max value shown for ENTAS3

Note 7. On a Mixed Bus with Fm Legacy I2C Devices, t_{AVAL} is 300 ns shorter than the Fm Bus Free Condition time (t_{BUF})

Table 10.1-26 I3C Timing (Push-Pull Timing Parameters for SDR)

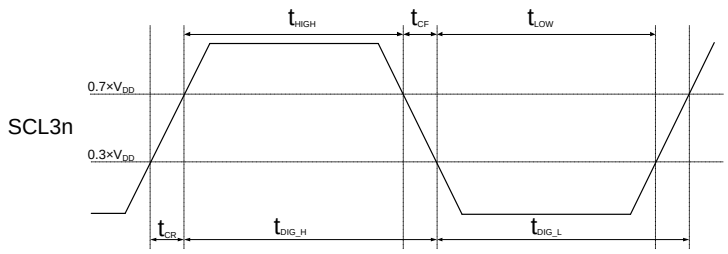
Parameter		Symbol	Min.*1	Max.	Unit	Figure	Notes
SCL3n clock frequency	V_{DD1218} = 1.8 V	t_{SCL}	0.01	12.5	MHz	—	1
	V_{DD1218} = 1.2 V		0.01	12.39	MHz	—	
SCL3n clock Low period		t_{LOW}	24	—	ns	**Figure 10.1-45**	—
		t_{DIG_L}	32	—	ns	**Figure 10.1-45**	2, 4
SCL3n clock High period for Mixed Bus		t_{HIGH}	24	—	ns	**Figure 10.1-45**	—
		t_{DIG_H}	32	45	ns	**Figure 10.1-45**	2, 3
SCL3n clock High period		t_{HIGH}	24	—	ns	**Figure 10.1-45**	—
		t_{DIG_H}	32	45	ns	**Figure 10.1-45**	2
Clock in to data out for a slave	V_{DD1218} = 1.8 V	t_{SCO}	—	12	ns	**Figure 10.1-50**	—
	V_{DD1218} = 1.2 V		—	12.7	ns		
SCL3n clock rise time		t_{CR}	—	150 × 1/f_{SCL} (capped at 60)	ns	**Figure 10.1-45**	—
SCL3n clock fall time		t_{CF}	—	150 × 1/f_{SCL} (capped at 60)	ns	**Figure 10.1-45**	—
SDA3n signal data hold in push-pull mode	Master	t_{HD_PP}	t_{CR} + 3 and t_{CF} + 3	—	—	**Figure 10.1-49**	4
	Slave		0	—	—	**Figure 10.1-51**	—
SDA3n signal data setup in push-pull mode	V_{DD1218} = 1.8 V	t_{SU_PP}	12	N/A	ns	**Figure 10.1-49**, **Figure 10.1-50**, **Figure 10.1-51**	—
	V_{DD1218} = 1.2 V		13.9	N/A	ns		
Clock after repeated START (Sr)		t_{CASr}	t_{CASmin}	N/A	ns	**Figure 10.1-52**	—
Clock before repeated START (Sr)		t_{CBSr}	t_{CASmin}/2	N/A	ns	**Figure 10.1-52**	—
Capacitive load per bus line (SDA3n / SCL3n)		C_b	—	50	pF	—	—

Note 1. FSCL = 1/(t_{DIG_L} + t_{DIG_H})

Note 2. t_{DIG_L} and t_{DIG_H} are the clock Low and High periods as seen at the receiver end of the I3C Bus using VIL and VIH (see **Figure 10.1-45**)

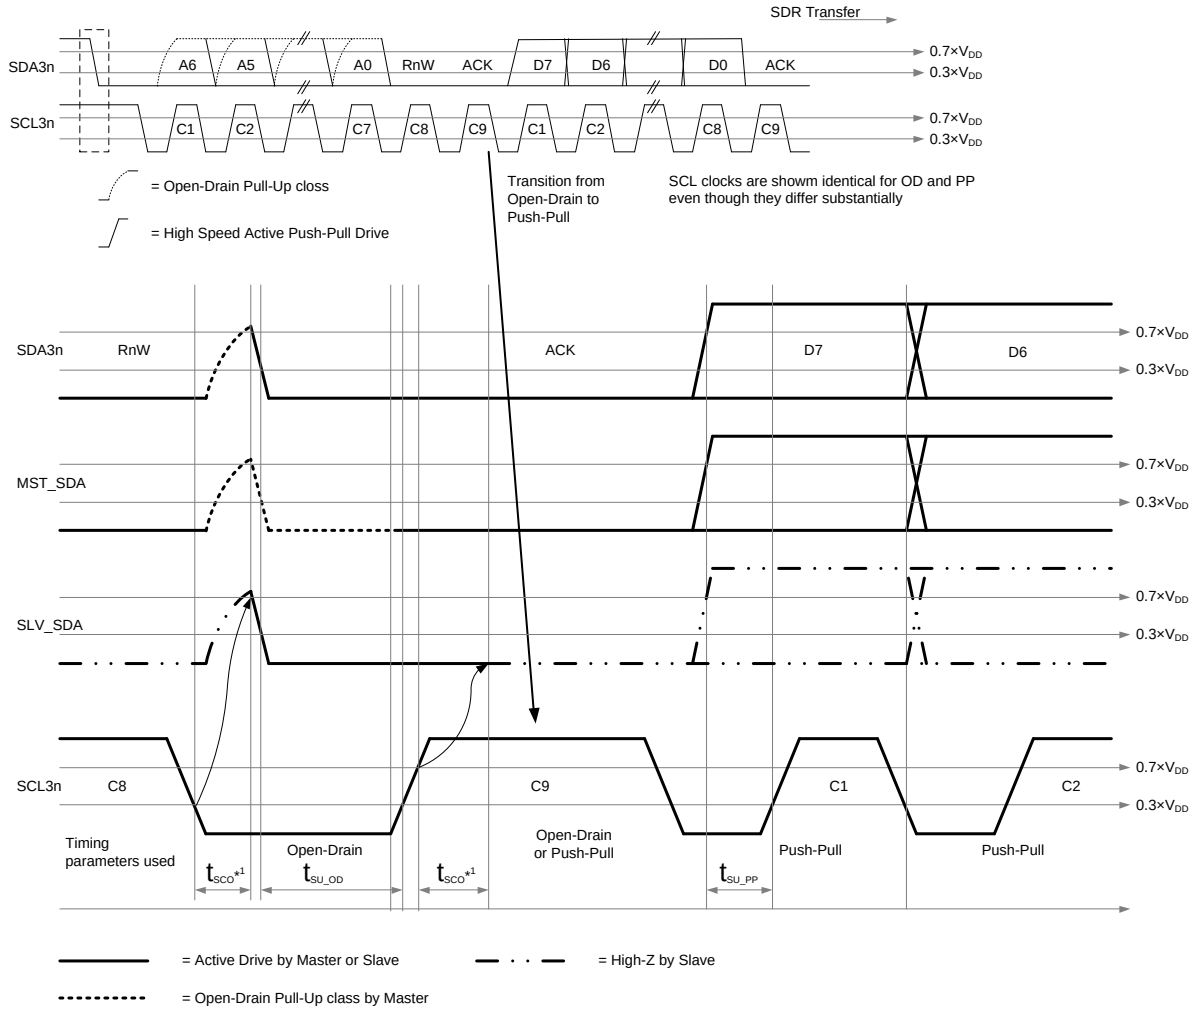
Note 3. When communicating with an I3C Device on a mixed bus, the $t_{DIG\_H\_MIXED}$ period must be constrained in order to make sure that I^2C Devices do not interpret I3C signaling as valid I^2C signaling.

Note 4. As both edges are used, the hold time must be satisfied for the respective edges, for example, t_{CF} + 3 for falling edge clocks, and t_{CR} + 3 for rising edge clocks.



Note: V_{DD}: VDD1218_I3C

Figure 10.1-45 t_{DIG_H} and t_{DIG_L}



Note: V_{DD}: VDD1218_I3C

Note: Open-Drain: Master releases SDA after a suitable delay from SCL edges
Push-Pull: Master drives SDA after a suitable delay from SCL edges

Note 1. t_{SCO} is depicted for informative purposes only

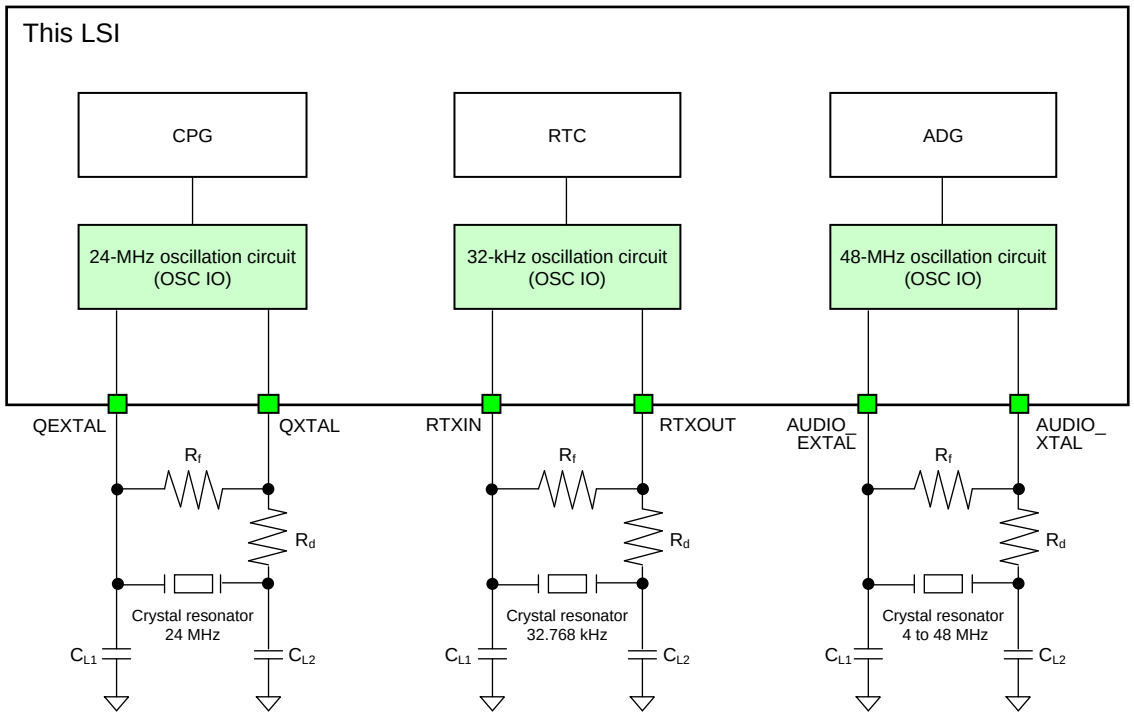
10.1.7 Oscillation Circuits for Connecting Crystal Resonators (OSC)

This LSI chip includes two oscillation circuits (OSC) for connection to crystal resonators, specifically a 24-MHz crystal resonator for the system clock and a 32.768-kHz crystal resonator for the real-time clock. **Table 10.1-36** lists the pins for connecting the crystal resonators and the clock frequencies. **Figure 10.1-70** shows an example of the connections with crystal resonators.

Table 10.1-36 Pins for Connecting Crystal Resonators and Clock Frequency

External Pin Name	I/O	Clock Frequency
For the system clock		
QEXTAL	Input	24 MHz (frequency deviation: ±50 ppm)
QXTAL	Output	24 MHz
For the real-time clock		
RTXIN	Input	32.768 kHz (frequency deviation: ±50 ppm)
RTXOUT	Output	32.768 kHz
For the audio clocks		
AUDIO_EXTAL	Input	4 to 48 MHz
AUDIO_XTAL	Output	4 to 48 MHz



Note: R_f: Feedback resistor
R_d: Dumping resistor
C_{load} (load capacitance of the crystal): See below for the formula.

$$C_{load} = \{C_{L1} \times C_{L2} / (C_{L1} + C_{L2})\} + \text{PCB's floating capacitance}$$

Figure 10.1-70 Example of Connections with Crystal Resonators

Place the crystal resonators and the capacitors C_{L1} and C_{L2} as close as possible to the pins to connect crystal resonators. To avoid interference and to ensure correct oscillation, the grounding points of the capacitors appended to the crystal resonators should be shared, and no wiring patterns should be placed near these components.

The characteristics of the crystal resonators are closely related to the design of the user board. Therefore, the user should sufficiently evaluate them with reference to the example of connection of crystal resonators in **Figure 10.1-70**.

The circuit rating of a crystal resonator depends on the crystal resonator and the stray capacitance of the mounting circuit. Therefore, contact the manufacturer of the crystal resonator before deciding upon the circuit rating. The user should thoroughly evaluate and then set the parameters (resistor and capacitor values).

Table 10.1-37 is a list of recommended values for the crystal resonators.

Table 10.1-37 Recommended Model Values for the Crystal Resonators

	Model Values for the Crystal Resonators			
Clock Frequency	Max. ESR*1	Max. C_L*2	Max. C_0*3	Max. Drive Level
32.768 kHz	70 kΩ	12.5 pF	1.4 pF	1 µW
24 MHz	60 Ω	12 pF	7 pF	100 µW
48 MHz	50 Ω	10 pF	7 pF	100 µW

Note 1. ESR means the equivalent series resistor of the crystal resonator.

Note 2. C_L is the load capacitance of the crystal resonator.

Note 3. C_0 is the parallel capacitance of the crystal resonator.

		Page	Summary
1.10	Feb 28, 2025	667	4.4.4.31 PMU Control Register 2 (CPG_LP_PWC_CTL2) The initial value, modified The main text, modified
		668	4.4.4.32 OTP Handshaking Monitor Register (CPG_OTP_HANDSHAKE_MON) The initial value, modified
		669	4.4.4.33 Reset Control for the PD_OTHERS Domain (CPG_OTHERS_INI) The initial value, modified
		670	4.4.4.34 MSTOP Registers (CPG_BUS_m_MSTOP) (m = 1 to 12) The initial value, modified
		679	Table 4.4-43 PLL Initial Settings Notes 3, 4, 5, and 6, modified (BOOTPLLCA1 and BOOTPLLCA0 → BOOTPLLCA_1 and BOOTPLLCA_0)
		682	Table 4.4-47 Relationship between the BOOTPLLCA Pins and PLLCA55 Frequency Settings, modified (BOOTPLLCA1, BOOTPLLCA0 → BOOTPLLCA_1, BOOTPLLCA_0)
		4.5 Power Management Unit (PMU)	
		733	Table 4.5-4 Switching Procedure from AWO to ALL_ON Step 2 of pre-process: The remark, modified Step 4 of post-process, deleted
		734	Table 4.5-5 Switching Procedure from ALL_ON to AWO Step 2 of pre-process, deleted Step 3 of post-process, modified (Step 3 → Step 2)
		736	4.5.4.2 CM33 Boot Mode OTHERS is off, AWO is off: The description, modified (0b → 1b) Note 1, added
		4.6 Interrupt Controller	
		739	Figure 4.6-1 Block Diagram of the ICU, modified
		767	(19) SW Interrupt Generation Register (ICU_SWINT) The description of bits 31 to 20, 15 to 4, modified
		779	(27) GPT Interrupt CA55 Status Register (ICU_GPTINTA55CTL) The main text, modified The description of bits 31 to 0, modified
		791	(35) DMAC TEND Selection Register k (ICU_DMTENDSELk) (k = 0, 1) The main text, modified (Table 4.6-13 → Table 4.6-11)
		801	(1) Input event normalization/synchronization and event output The description of “Register access security control”, added
		825	4.6.1.4 Restrictions The description of “Restriction on the interval for the input of DMAC requests”, deleted
		826 to 883	Table 4.6-23 List of Input Events The “Active” column, deleted
		894	4.6.3.1 Features The description of “Non-secure interrupt control register (Channels NS0-41)”, deleted The description of “Secure interrupt control register (Channels S0-41)”, deleted
		920	4.6.3.4.2 Software interrupt, added
		923	4.6.3.5.3 Software interrupt sequence, added
		4.7 DMA Controller (DMAC)	
		944	4.7.5.2.10 Channel Status Register n (DMACm_CHSTAT_n) (m = 0 to 4, n = 0 to 15) The description of bits 31 to 17 and 15 to 12, modified
		957	4.7.5.2.18 DMA Status EN Register (DMACm_DST_EN) (m = 0 to 4) The description of bits 31 to 8, modified

Rev.	Date	Description	
		Page	Summary
1.10	Feb 28, 2025	958	4.7.5.2.19 DMA Status ER Register (DMACm_DST_ER) (m = 0 to 4) The description of bits 31 to 8, modified
		959	4.7.5.2.20 DMA Status END Register (DMACm_DST_END) (m = 0 to 4) The description of bits 31 to 8, modified
		960	4.7.5.2.21 DMA Status TC Register (DMACm_DST_TC) (m = 0 to 4) The description of bits 31 to 8, modified
		961	4.7.5.2.22 DMA Status SUS Register (DMACm_DST_SUS) (m = 0 to 4) The description of bits 31 to 8, modified
		1000	Figure 4.7-18 Level Detection Timing (HIEN = 1b, REQD = 0b, AM[2:0] = 001b), modified (HCLK → ACLK)
		—	4.7.8.1 Problem of DMAACK Overtaking DMA Transfer, deleted
		1034	4.7.8.1 DMA Transfer Requests by External Devices, added
		1035	4.7.8.2.2 Workarounds The main text, modified
		4.9 Debug Interface	
		1056	4.9.2.1 List of Registers CST_BSID: The initial value, modified
		1057	4.9.2.2.1 ID Register (CST_BSID) The initial value of 31 to 28, modified The description of bits 31 to 0, modified
		SECTION 5 TIMER	
		5.3 Realtime Clock (RTC)	
		1077	5.3.2.2.2 Second Counter (RTC_RSECCNT)/Binary Counter 0 (RTC_BCNT0) RW and the description of bit 7, modified
		1079	5.3.2.2.3 Minute Counter (RTC_RMINCNT)/Binary Counter 1 (RTC_BCNT1) RW and the description of bit 7, modified
		1081	5.3.2.2.4 Hour Counter (RTC_RHRCNT)/Binary Counter 2 (RTC_BCNT2) RW and the description of bit 7, modified
		1083	5.3.2.2.5 Day-of-Week Counter (RTC_RWKCNT)/Binary Counter 3 (RTC_BCNT3) RW and the description of bits 7 to 3, modified
		1085	5.3.2.2.6 Date Counter (RTC_RDAYCNT) RW and the description of bits 7, 6, modified
		1086	5.3.2.2.7 Month Counter (RTC_RMONCNT) RW and the description of bits 7 to 5, modified
		1087	5.3.2.2.8 Year Counter (RTC_RYRCNT) RW and the description of bits 15 to 8, modified
		1094	5.3.2.2.12 Day-of-Week Alarm Register (RTC_RWKAR)/Binary Counter 3 Alarm Register (RTC_BCNT3AR) RW and the description of bits 6 to 3, modified
		1096	5.3.2.2.13 Date Alarm Register (RTC_RDAYAR)/Binary Counter 0 Alarm Enable Register (RTC_BCNT0AER) RW and the description of bit 6, modified
		1098	5.3.2.2.14 Month Alarm Register (RTC_RMONAR)/Binary Counter 1 Alarm Enable Register (RTC_BCNT1AER) RW and the description of bits 6, 5, modified
		1100	5.3.2.2.15 Year Alarm Register (RTC_RYRAR)/Binary Counter 2 Alarm Enable Register (RTC_BCNT2AER) RW and the description of bits 15 to 8, modified
		1102	5.3.2.2.16 Year Alarm Enable Register (RTC_RYRAREN)/Binary Counter 3 Alarm Enable Register (RTC_BCNT3AER) RW and the description of bits 6 to 0, modified

Rev.	Date	Description	
		Page	Summary
1.10	Feb 28, 2025	1104	5.3.2.2.17 RTC Status Register (RTC_RSR) RW and the description of bits 7 to 3, modified
		1105	5.3.2.2.18 RTC Control Register 1 (RTC_RCR1) RW and the description of bit 3, modified
		1106	5.3.2.2.19 RTC Control Register 2 (RTC_RCR2) RW and the description of bit 3, modified
		5.4 Watchdog Timer (WDT)	
		1125	5.4.2.1 List of Registers (m = 0 to 3) WDT Count Stop Control Register, deleted
		1123	Table 5.4-1 WDT Specifications Count source: The specification, modified (clk_loco → LOCO clock)
		1124	Figure 5.4-1 WDT Block Diagram, modified (clk_loco → LOCO clock)
		1127	5.4.2.2.2 WDT Control Register (WDTm_WDTCR) The description of bits 7 to 4, modified (clk_loco → LOCO clock) RPES[1:0] bits (Window End Position Select): The description, modified RPSS[1:0] bits (Window Start Position Select): The description, modified
		1130	5.4.2.2.3 WDT Status Register (WDTm_WDTSR) UNDFF flag (Underflow Flag): The description, modified (bus clock → WDT_n_clkp (n = 0 to 3)) REFEF flag (Refresh Error Flag): The description, modified (IWDTCLK → LOCO clock)(clk_loco → WDT_n_clkp (n = 0 to 3))
		1133	5.4.3.1 Register Start Mode The main text, modified
		1136	5.4.3.3 Refresh Operation The main text, modified
		1137	Figure 5.4-5 WDT Refresh Operation Waveforms when WDTCR.CKS[3:0] = 4h and WDTCR.TOPS[1:0] = 01b, modified (clk_loco → LOCO clock)(clkp → WDT_n_clkp)
		1139	5.4.3.6 Reading the Down-Counter Value The main text, modified (clk_loco → LOCO clock)
		1139	Figure 5.4-6 Processing for Reading WDT Down-Counter Value when WDTCR.CKS[3:0] = 4h and WDTCR.TOPS[1:0] = 01b, modified (clk_loco → LOCO clock) (clkp → WDT_n_clkp)
		1140	Table 5.4-6 WDT1 Setting Procedure for Error System Reset Step 6: The description, modified (clk_loco → LOCO clock)
		5.6 Compare Match Timer W (CMTW)	
		1165	5.6.2.2.3 Timer I/O Control Register (CMTWm_CMWIOR) The description of bit 14, and bits 7, 6, modified
		5.7 General-Purpose Timer (GPT)	
		1195	5.7.2.2.1 General-Purpose Timer Write-Protection Register (GPTm_n_GTWP) The description of bits 31 to 16 and 7 to 5, modified
		1203	5.7.2.2.5 General-Purpose Timer Start Source Select Register (GPTm_n_GTSSR) R/W and the description of bits 30 to 24, modified
		1207	5.7.2.2.6 General-Purpose Timer Stop Source Select Register (GPTm_n_GTPSR) R/W and the description of bits 30 to 24, modified
		1211	5.7.2.2.7 General-Purpose Timer Clear Source Select Register (GPTm_n_GTCSR) R/W and the description of bits 30 to 24, modified
		1215	5.7.2.2.8 General-Purpose Timer Up Count Source Select Register (GPTm_n_GTUPSR) R/W and the description of bits 31 to 24, modified
		1219	5.7.2.2.9 General-Purpose Timer Down Count Source Select Register (GPTm_n_GTDNSR) R/W and the description of bits 31 to 24, modified

Rev.	Date	Description	
		Page	Summary
1.10	Feb 28, 2025	1223	5.7.2.2.10 General-Purpose Timer Input Capture Source Select Register A (GPTm_n_GTICASR) R/W and the description of bits 31 to 24, modified
		1227	5.7.2.2.11 General-Purpose Timer Input Capture Source Select Register B (GPTm_n_GTICBSR) R/W and the description of bits 31 to 24, modified
		1231	5.7.2.2.12 General-Purpose Timer Control Register (GPTm_n_GTCR) R/W and the description of bits 31 to 27, 22 to 19, and 15 to 1, modified
		1233	5.7.2.2.13 General-Purpose Timer Count Direction and Duty Setting Register (GPTm_n_GTUDDTYC) R/W and the description of bits 31 to 28, 23 to 20, and 15 to 2, modified
		1236	5.7.2.2.14 General-Purpose Timer I/O Control Register (GPTm_n_GTIOR) R/W and the description of bits 28, 27, 21, 12, 11, and 5, modified
		1240	5.7.2.2.15 General-Purpose Timer Interrupt Output Setting Register (GPTm_n_GTINTAD) R/W and the description of bits 31, 27, 26, 23 to 20, and 15 to 8, modified
		1243	5.7.2.2.16 General-Purpose Timer Status Register (GPTm_n_GTST) R/W and the description of bits 27 to 25, 23 to 20, and 14 to 11, modified
		1250	5.7.2.2.17 General-Purpose Timer Buffer Enable Register (GPTm_n_GTBER) R/W and the description of bits 31, 27, 23, and 7 to 4, modified
		1255	5.7.2.2.18 General-Purpose Timer Interrupt and A/D Converter Start Request Setting Register (GPTm_n_GTITC) R/W and the description of bits 31 to 15, 13, and 11, modified
		1266	5.7.2.2.27 General-Purpose Timer Dead Time Control Register (GPTm_n_GTDTCR) R/W and the description of bits 31 to 9, 7, 6, and 3 to 1, modified
		1271	5.7.2.2.31 General-Purpose Timer Output Protection Function Temporary Release Register (GPTm_n_GTSOTR) R/W and the description of bits 31 to 1, modified
		1272	5.7.2.2.32 General-Purpose Timer Extended Interrupt Skipping Counter Control Register (GPTm_n_GTEITC) R/W and the description of bits 19, 18, 11 to 8, 3, and 2, modified
		1278	5.7.2.2.34 General-Purpose Timer Extended Interrupt Skipping Setting Register 2 (GPTm_n_GTEITLI2) R/W and the description of bits 31 to 8, modified
		1280	5.7.2.2.35 General-Purpose Timer Extended Buffer Transfer Skipping Setting Register (GPTm_n_GTEITLB) R/W and the description of bits 31, 27, 23, 19, 15 to 11, 7, and 3, modified
		1282	5.7.2.2.36 General-Purpose Timer Inter Channel Logical Operation Function Setting Register (GPTm_n_GTICLF) R/W and the description of bits 31 to 26, 19, 15 to 10, and 3, modified
		1287	5.7.2.2.38 General-Purpose Timer Operation Enable Bit Simultaneous Control Register (GPTm_n_GTSECR) R/W and the description of bits 31 to 25, 23 to 17, 15 to 10, and 7 to 2, modified
		1308	Table 5.7-22 Example for Setting GTCCRA and GTCCRB Buffer Operation for Output Compare The description of No.6, modified (Figure 5.7-15 → Figure 5.7-16)
		5.8 Port Output Enable for GPT (POEG)	
		1412	5.8.2.2.1 POEG Group n Setting Register (POEG_POEGGn) (n = A to H) The description of bits 6 and 2, modified
		1416	5.8.3.4 Release from Output-Disable The main text, modified

Rev.	Date	Description	
		Page	Summary
1.10	Feb 28, 2025	SECTION 6 HIGH-SPEED INTERFACE	
		6.1 High-Speed Interface Overview	
		1420	6.1 High-Speed Interface Overview PCI Express 3.0 Interface (PCIe) (See 6.6): The description, modified
		6.2 SD/MMC Host Interface (SD)	
		1423	Table 6.2-1 Pin Configuration SD0DAT6: The function, modified
		1444	6.2.2.2.7 SD Card Interrupt Flag Register 2 (SDm_SD_INFO2) The description of bit 11, modified
		1481	6.2.3.1.2 Bus signal voltage switch The description in step 4, modified
		1529	6.2.7.2.7 Sampling Data Comparison Register (SDm_SCC_SMPCMP) The description of bits 8 to 0, modified
		6.4 USB3.2 Gen2x1 Interface (USB3)	
		1542	Figure 6.4-1 USB Connection Configuration: The title, modified
		1550	6.4.4.3.2 Register List USB3m_HOST_U2HCSPC2: The register name, modified USB3m_HOST_DCDn: The register name and offset address, modified
		1558	(5) Capability Parameter 1 Register (USB3m_HOST_HCCPARAMS1) The description of bits 10, modified (xHCI 1.1 → xHCI 1.2)
		1574	(1) U3P1 Port Status and Control Register (USB3m_HOST_U3P1PORTSC) The description of bits 22, modified The description of bits 8 to 5, modified (the U0 state → the U3 state)
		1578	(3) U3P1 Port Link Info Register (USB3m_HOST_U3P1PORTLI) R/W and the description of bits 15 to 0, modified
		1583	(6) U2P1 Port Power Management Status and Control Register (USB3m_HOST_U2P1PORTPMSC) The description of bits 31 to 28, 16, 7 to 4, 2 to 0, modified (xHCI 1.1 → xHCI 1.2)
		1586	(8) U2P1 Port Hardware LPM Power Control Register (USB3m_HOST_U2P1PORTHLPMC) The description of bits 13 to 10 and 9 to 2, modified (xHCI 1.1 → xHCI 1.2)
		1591	(c) Offset 08h - xHCI Supported Protocol Capability Field Definitions (USB3.2) Register (USB3m_HOST_U3HCSPC3) The description of bits 27 to 25, modified (USB2 → USB3)
		1597	(c) Offset 08h - xHCI Supported Protocol Capability Field Definitions (USB2.0) Register (USB3m_HOST_U2HCSPC3) The description of bit 20, modified (xHCI 1.1 → xHCI 1.2)
		1614	(2) Device Context Doorbell Register (Slot #n) (USB3m_HOST_DCDn) (n = 1 to 32) The address, modified
		1616	(b) Configuration Status1 Register (USB3m_HOST_CFGSTS1) The initial value of bits 27, 26, modified
		1630	(n) PHY Control Register (USB3m_HOST_PHYCTRL) The description of bits 19, 18, and 17, modified
		1637	(a) Battery Charging Control Register (USB3m_HOST_BCCTRL) The description of bits 7 to 2, modified
		1641	(4) PIPE Status and Control Register 3 (USB3m_HOST_U3P0PIPESC3) The description of bits 21 to 16, modified

Rev.	Date	Description	
		Page	Summary
1.10	Feb 28, 2025	6.5 USB2.0 Interface	
		1672	(1) HcRevision Register (USB2m_HOST_HcRevision) The description of bits 31 to 8, modified
		1673	(2) HcControl Register (USB2m_HOST_HcControl) The description of bits 31 to 10 and 8, modified
		1675	(3) HcCommandStatus Register (USB2m_HOST_HcCommandStatus) The description of bits 31 to 18 and 15 to 3, modified
		1676	(4) HcInterruptStatus Register (USB2m_HOST_HcInterruptStatus) The description of bits 31 to 7, modified
		1678	(5) HcInterruptEnable Register (USB2m_HOST_HcInterruptEnable) The description of bits 29 to 7, modified
		1680	(6) HcInterruptDisable Register (USB2m_HOST_HcInterruptDisable) The description of bits 29 to 7, modified
		1681	(7) HcHCCA Register (USB2m_HOST_HcHCCA) The description of bits 7 to 0, modified
		1682	(8) HcPeriodicCurrentED Register (USB2m_HOST_HcPeriodCurrentED) The description of bits 3 to 0, modified
		1683	(9) HcControlHeadED Register (USB2m_HOST_HcControlHeadED) The description of bits 3 to 0, modified
		1684	(10) HcControlCurrentED Register (USB2m_HOST_HcControlCurrentED) The description of bits 3 to 0, modified
		1685	(11) HcBulkHeadED Register (USB2m_HOST_HcBulkHeadED) The description of bits 3 to 0, modified
		1686	(12) HcBulkCurrentED Register (USB2m_HOST_HcBulkCurrentED) The description of bits 3 to 0, modified
		1687	(13) HcDoneHead Register (USB2m_HOST_HcDoneHead) The description of bits 3 to 0, modified
		1689	(15) HcFmRemaining Register (USB2m_HOST_HcFmRemaining) The description of bits 30 to 14, modified
		1691	(17) HcPeriodicStart Register (USB2m_HOST_HcPeriodicStart) The description of bits 31 to 14, modified
		1692	(18) HcLSThreshold Register (USB2m_HOST_HcLSThreshold) The description of bits 31 to 12, modified
		1693	(19) HcRhDescriptorA Register (USB2m_HOST_HcRhDescriptorA) The description of bits 23 to 13, modified
		1694	(20) HcRhDescriptorB Register (USB2m_HOST_HcRhDescriptorB) The description of bits 31 to 18, 16 to 2, and 0, modified
		1695	(21) HcRhStatus Register (USB2m_HOST_HcRhStatus) The description of bits 30 to 18 and 14 to 2, modified
		1697	(22) HcRhPortStatus[1:NDP] Register (USB2m_HOST_HcRhPortStatus1) The description of bits 31 to 21, 15 to 10, and 7 to 5, modified
		1700	(1) HCIVERSION/CAPLENGTH Register (USB2m_HOST_CAPL_VERSION) The description of bits 15 to 8, modified
		1701	(2) HCSPARAMS Register (USB2m_HOST_HCSPARAMS) The description of bits 31 to 24, 19 to 17, and 6, 5, modified
		1702	(3) HCCPARAMS Register (USB2m_HOST_HCCPARAMS) The description of bits 31 to 20, and 3, modified
		1705	(1) USBCMD Register (USB2m_HOST_USBCMD) The description of bits 31 to 28, 14 to 12, 10, and 7, modified

Rev.	Date	Description	
		Page	Summary
1.10	Feb 28, 2025	1707	(2) USBSTS Register (USB2m_HOST_USBSTS) The description of bits 31 to 17 and 11 to 6, modified
		1709	(3) SBINTR Register (USB2m_HOST_USBINTR) The description of bits 31 to 17 and 15 to 6, modified
		1710	(4) FRINDEX Register (USB2m_HOST_FRINDEX) The description of bits 31 to 14, modified
		1712	(6) PERIODICLISTBASE Register (USB2m_HOST_PERIODICLISTBASE) The description of bits 11 to 0, modified
		1713	(7) ASYNCLISTADDR Register (USB2m_HOST_ASYNCLISTADDR) The description of bits 4 to 0, modified
		1714	(8) CONFIGFLAG Register (USB2m_HOST_CONFIGFLAG) The description of bits 31 to 1, modified
		1715	(9) PORTSC1Register (USB2m_HOST_PORTSC1) The description of bits 15, 14, modified
		1719	(1) INT_ENABLE Register (USB2m_HOST_INT_ENABLE) The description of bits 31 to 5, modified
		1720	(2) INT_STATUS Register (USB2m_HOST_INT_STATUS) The description of bits 31 to 5, modified
		1721	(3) AHB_BUS_CTR Register (USB2m_HOST_AHB_BUS_CTR) The description of bits 31 to 16, 11 to 9, 7, 6, 3, and 2, modified
		1722	(4) USBCTR Register (USB2m_HOST_USBCTR) The description of bits 31 to 3, modified
		1723	(5) Register Enable/Clock Gating Control Register (USB2m_HOST_REGEN_CG_CTRL) The description of bits 30 and 27 to 1, modified
		1724	(6) Suspend Control Register (USB2m_HOST_SPD_CTRL) The description of bits 29 to 24 and 22 to 1, modified
		1727	(8) Overcurrent Detection/Sleep Timer Setting Register (USB2m_HOST_OC_SLP_TIMSET) The description of bits 31 to 29, modified
		1729	(10) UTMI+PHY Control Register (USB2m_HOST_UTMI_CTRL) The description of bits 30 to 9, modified
		1730	(11) PORT_LPM_CTR1 Register (USB2m_HOST_PORT_LPM_CTRL1) The description of bits 31 to 8, modified
		1731	(1) Common Control Register (USB2m_HOST_COMMCTRL) The description of bits 30 to 0, modified
		1732	(2) OTG-BC Interrupt Status Register (USB2m_HOST_OBINTSTA) The description of bits 31 to 18, 15 to 7, and 5, modified The bit name, R/W, and description of bits 3, 2, modified
		1733	(3) OTG-BC Interrupt Enable Register (USB2m_HOST_OBINTEN) The description of bits 31 to 18, 15 to 7, and 5, modified The bit name, R/W, and description of bits 3, 2, modified
		1734	(4) VBUS Control Register (USB2m_HOST_VBCTRL) The description of bits 31 to 5 and 3 to 1, modified
		1735	(5) Line Control Port 1 Register (USB2m_HOST_LINECTRL1) The description of bits 31 to 26, 23, 22, 15 to 4, and 1, modified The bit name and description of bits 25, 24, modified
		1736	(6) BC Control Port 1 Register (USB2m_HOST_BCCTRL1) The description of bits 31 to 26, 23 to 10, and 7, 6, modified

Rev.	Date	Description	
		Page	Summary
1.10	Feb 28, 2025	1741	(3) U2H_EHCI_INT assertion source and control Interrupt enable control by register: The description, modified (bit[17:16] → bit[16]) Interrupt source: The table, modified
		1743	(5) U2H_OBINT assertion source and control Interrupt enable control by register: The description, modified (bit[27:24], bit[18:16], bit[12:8], bit[3:0] → bit[17:16], bit[6], bit[4], bit[1:0]) Interrupt source: The table, modified Clearing the interrupt: The description, modified (bit[27:24], bit[18:16], bit[12:8], bit[3:0] → bit[17:16], bit[6], bit[4], bit[1:0])
		1750	6.5.2.8.3 Port Power (VBUS) control specifications The main text, modified
		1764	(1) System Configuration Control Register 0 (USB20_FUNC_SYSCFG0) The description of bits 15 to 9, 6, and 3 to 1, modified
		1766	(2) System Configuration Control Register 1 (USB20_FUNC_SYSCFG1) The description of bits 15 to 12, 11 to 8, and 7, 6, modified
		1768	(1) Device State Control Register 0 (USB20_FUNC_DVSTCTR0) The description of bits 15 to 9 and 7 to 3, modified
		1770	(1) USB Test Mode Register (USB20_FUNC_TESTMODE) The description of bits 15 to 4, modified
		1773	(2) CFIFO Port Select Register (USB20_FUNC_CFIFOSEL) The description of bits 13, 12, 9, 7, 6, and 4, modified
		1775	(3) DnFIFO Port Select Register (USB20_FUNC_DnFIFOSEL) (n = 0, 1) The description of bits 9 to 4, modified
		1777	(4) CFIFO Port Control Register (USB20_FUNC_CFIFOCTR) D0FIFO Port Control Register (USB20_FUNC_D0FIFOCTR) D1FIFO Port Control Register (USB20_FUNC_D1FIFOCTR) The description of bit 12, modified
		1779	(1) Interrupt Enable Register 0 (USB20_FUNC_INTENB0) The description of bits 7 to 0, modified
		1783	(1) SOF Pin Configuration Register (USB20_FUNC_SOFCFG) The description of bits 15 to 7, 5, 4, and 1, 0, modified
		1793	(1) Frame Number Register (USB20_FUNC_FRMNUM) The description of bits 13 to 11, modified
		1795	(2) Micro Frame Number Register (USB20_FUNC_UFRMNUM) The description of bits 15 to 3, modified
		1796	(1) USB Address Register (USB20_FUNC_USBADDR) The description of bits 15 to 7, modified
		1801	(1) DCP Configuration Register (USB20_FUNC_DCPCFG) The description of bits 15 to 9 and 6 to 0, modified
		1802	(2) DCP Max. Packet Size Register (USB20_FUNC_DCPMAXP) The description of bits 15 to 7, modified
		1803	(3) DCP Control Register (USB20_FUNC_DCPCTR) The description of bits 14 to 9 and 4, 3, modified
		1806	(1) Pipe Window Select Register (USB20_FUNC_PIPESEL) The description of bits 15 to 4, modified
		1807	(2) Pipe Configuration Register (USB20_FUNC_PIPECFG) The description of bits 13 to 11 and 6, 5, modified
		1811	(3) Pipe Buffer Setting Register (USB20_FUNC_PIPEBUF) The description of bits 15 and 9, 8, modified
		1813	(4) Pipe Maximum Packet Size Register (USB20_FUNC_PIPEMAXP) The description of bits 15 to 11, modified

Rev.	Date	Description	
		Page	Summary
1.10	Feb 28, 2025	1814	(5) Pipe Cycle Control Register (USB20_FUNC_PIPEPERI) The description of bits 15 to 13 and 11 to 3, modified
		1817	(1) PIPEn Control Register (USB20_FUNC_PIPEnCTR) (n = 1 to 5) The description of bits 13 to 11 and 4 to 2, modified
		1822	(2) PIPEn Control Register (USB20_FUNC_PIPEnCTR) (n = 6 to 9) The description of bits 14 to 10 and 4 to 2, modified
		1824	(1) PIPEn Transaction Counter Enable Register (USB20_FUNC_PIPEnTRE) (n = 1 to 5) The description of bits 15 to 10 and 7 to 0, modified
		1827	(1) Low Power Control Register (USB20_FUNC_LPCTRL) The description of bits 15 to 8 and 6 to 0, modified
		1828	(1) Low Power Status Register (USB20_FUNC_LPSTS) The description of bits 15 and 13 to 0, modified
		1829	(1) PHY Function Control Register (USB20_FUNC_PHYFUNCTR) The description of bits 15 and 13 to 0, modified
		1830	(1) PHY_OTG Control Register (USB20_FUNC_PHYOTGCTR) The description of bits 15 to 11 and 8 to 0, modified
		1831	(1) Peripheral L1 Control Register 1 (USB20_FUNC_PL1CTRL1) The description of bits 15 and 13, 12, modified
		1833	(1) Peripheral L1 Control Register 2 (USB20_FUNC_PL1CTRL2) The description of bits 15 to 13 and 7 to 0, modified
		1840	(a) Channel Status Register ch n (USB20_FUNC_CHSTAT_n) (n = 0, 1) The description of bits 23 to 19 and 15 to 12, modified
		1844	(a) Channel Control Register ch n (USB20_FUNC_CHCTRL_n) (n = 0, 1) The description of bits 31 to 20, 15, 13, and 11, 10, modified
		1847	(a) Channel Configuration Register ch n (USB20_FUNC_CHCFG_n) (n = 0, 1) The description of bits 22, 10 to 4, and 2, 1, modified
		1850	(a) Channel Interval Register ch n (USB20_FUNC_CHITVL_n) (n = 0, 1) The description of bits 31 to 16, modified
		1860	(a) DMA Control Register (USB20_FUNC_DCTRL) The description of bits 31 to 28, 23 to 20, and 15 to 2, modified
		1861	(a) Descriptor Interval Register (USB20_FUNC_DSCITVL) The description of bits 31 to 16 and 7 to 0, modified
		1862	(a) DMA Status EN Register (USB20_FUNC_DSTAT_EN) The description of bits 31 to 2, modified
		1863	(a) DMA Status ER Register (USB20_FUNC_DSTAT_ER) The description of bits 31 to 2, modified
		1864	(a) DMA Status END Register (USB20_FUNC_DSTAT_END) The description of bits 31 to 2, modified
		1865	(a) DMA Status TC Register (USB20_FUNC_DSTAT_TC) The description of bits 31 to 2, modified
		1866	(a) DMA Status SUS Register (USB20_FUNC_DSTAT_SUS) The description of bits 31 to 2, modified
		6.6 PCI Express 3.0 Interface (PCIe)	
		1930	6.6.1 Overview PCI Express Specification (Compliant with the PCI Express Base Specification 4.0): The description, modified
		1932	Table 6.6-1 List of External Pins PCIE0_RSTOUTB: The function, modified
		1939	Table 6.6-4 Register Base Addresses Base Address Name: <PCI_PHY_base>, deleted

Rev.	Date	Description	
		Page	Summary
1.10	Feb 28, 2025	1940	6.6.4.1 Register Descriptions (Root Complex Mode) Registers with the HwInit attribute: The table, modified
		1991	(38) PCIe Core Control 1 Register (PCI_RC_PCCTRL1) The bit name and description of bit 11, modified
		1998	(42) PCIe Core Status 5 Register (PCI_RC_PCSTAT5) The description of bit 0, modified
		2005	(49) DMAC Control Register (PCI_RC_DMACTRL) The initial value of bits 2 to 0, modified
		2062	(18) PM Status/Control Register (PCI_RC_PMSC) R/W of bit 15, modified
		2065	(21) Device Control/Status Register (PCI_RC_DEVCS) The description of bits 11 to 8, modified
		2078	(29) Device Control 2/Status 2 Register (PCI_RC_DEVCS2) The description of bits 31 to 5, modified
		—	Table 6.6-45 Valid Reset Signal, deleted
		2117	(63) Link Control 3 Register (PCI_RC_LINC3) The bit name and description of bits 15 to 9, modified
		2120	(65) Lane Equalization Control Register (PCI_RC_LEQCTL): The title, modified
		2124	6.6.4.2 Register Descriptions (Endpoint Mode) The table, modified
		2173	(35) PCIe Core Control 1 Register (PCI_EP_PCCTRL1) The bit name and description of bit 11, modified
		2306	(68) Link Control 3 Register (Function #0) (PCI_EP_LINC3_F0) The bit name and description of bits15 to 9, modified
		2308	(70) Lane Equalization Control Register (Function #0) (PCI_EP_LEQCTL_F0): The title, modified R/W(PCIe) and R/W(UDL) of bits 30 to 24, 22 to 16, 14 to 8, and 6 to 0, modified
		2351	6.6.5.6.3 Issuing INTx/MSI Interrupts (Endpoint) The main text, modified
		2351	Figure 6.6-4 Legacy Interrupt Issuing Flow, added Figure 6.6-5 MSI Issuing Flow, added
		2353	Table 6.6-127 External Interrupt Notification Interrupt Notification Name: UI_EXTMSI_FUNC0/1/2/3/4 [2:0], modified
		2372	6.6.6.1 Setting Up The main text, modified
		2373	6.6.6.1.1 Changing the Initial Values of the Registers The main text, modified (1) Setting the Initial Values of the Registers, deleted (3) Physical Layer Control/Monitor Registers, added
		2391	Table 6.6-129 Initialization Procedure (RC) Step 1, 5, 8: The description, modified Note 3, added
		2393	Table 6.6-130 Initialization Procedure (EP) Step 1, 5, 8, 9: The description, modified Note 3, added
		SECTION 7 LOW-SPEED INTERFACE	
		7.2 Expanded Serial Peripheral Interface (xSPI)	
		2401	Table 7.2-1 xSPI Specifications Note 1, added

Rev.	Date	Description	
		Page	Summary
1.10	Feb 28, 2025	2404	7.2.2.1 List of Registers The table, modified XSPIm_COMSTT: The initial value, modified
		2441	(2) xSPI Common Status Register (XSPIm_COMSTT) The initial value of bits 22 to 20, modified
		7.3 Serial Communications Interface (SCI)	
		2529	7.3.2.2.15 Simple-LIN (SCIX) Control Register 0 (RSCIm_XCR0) The description of bits 25, 24, modified (Note 2, deleted)
		7.4 Serial Communications Interface with FIFO (SCIF)	
		2724	Figure 7.4-12 Receive Data Sampling Timing, modified
		7.5 Serial Peripheral Interface (RSPI)	
		2727	Table 7.5-1 SPI Specifications (2/3) SSL control function: The description, modified
		2728	Table 7.5-1 SPI Specifications (3/3) Others: The description, modified
		2726	7.5.1.1 Features The main text, modified
		2731	7.5.2.1 List of Registers RSPIm_SPSCR, RSPIm_SPDCR2: The access size, modified
		2741	7.5.2.2.6 SPI Control Register (RSPIm_SPCR) SPFRF bit (SPI Frame Format Select): The description, modified
		2749	7.5.2.2.9 SPI Pin Control Register (RSPIm_SPPCR) The bit name and description of bit 2, modified SPOM bit (SPI Output Pin Mode): The description, deleted
		2751	7.5.2.2.11 SPI Slave Select Polarity Register (RSPIm_SSLP) SSLnP bits (SSLn Signal Polarity Setting): The description, modified
		2752	Table 7.5-6 Corresponding between Bit Rates and Set Values (Examples) RSPI_n_TCLK = 200 MHz, modified
		2753	7.5.2.2.13 SPI Sequence Control Register (RSPIm_SPSCR) The access size, modified
		2754	7.5.2.2.14 SPI Command Register n (RSPIm_SPCMDn) (n = 0 to 7) SSLA[1:0] bits (SSL Signal Assertion): The description, modified
		2757, 2758	7.5.2.2.15 SPI Data Control Register (RSPIm_SPDCR) The bit name and description of bits 2, 1, modified SLSEL[1:0] bits (SSL Pin Output Select): The description, deleted
		2759	7.5.2.2.16 SPI Data Control Register 2 (RSPIm_SPDCR2) The access size, modified
		2761	7.5.2.2.18 SPI Status Register (RSPIm_SPSR) MODF bit (Mode Fault Error Flag): The description, modified (the description of [Multi-master mode], deleted)
		2772	7.5.3.1 Overview of SPI Operations The main text, modified
		2772	Table 7.5-7 Relationship between SPI Modes and SPCR Settings and Description of Each Mode, modified (Single-Master → Master) (Multi-Master(SPI Operation), deleted) (Output pin mode, deleted)
		2773, 2774	7.5.3.2 SPI Pin Control The main text, modified
		2773	Table 7.5-8 Relationship between Pin States and Set Control Bit Values, modified

Rev.	Date	Description

		4138	Figure 9.2-68 Reception Start Flow for the Pattern Generator Input, modified (CPG_RSTMON_6, deleted)
		9.4 LCD Controller (LCDC)	
		4267	9.4.1.1 Features DU: The description, modified
		4281	9.4.3.1 List of VSPD Registers Display List-0 Wake Up Counter Register, added
		4314	(7) Display List-0 Wake Up Counter Register (VI6_DL_WUPCNT0), added
		4319	Figure 9.4-7 Chrominance Interpolation Methods Selectable through CIPM Setting, modified (VSP → VSPD)
		4392	(6) BRS Blend Control Register A (LCDC_VSPD_VI6_BRSA_BLD) The description of bit 23, modified (m = A, B, C, D, E → m = A, B)
		4394	(7) BRS Control Register B (LCDC_VSPD_VI6_BRSB_CTRL) The bit name, R/W, and description of bits 18 to 16, modified
		4395	(8) BRS Blend Control Register B (LCDC_VSPD_VI6_BRSB_BLD) The description of bit 23, modified (m = A, B, C, D, E → m = A, B)
		4406	9.4.4.2.1 DU Module Control Register 0 (LCDC_DU_MCR0) The bit name and description of bit 0, modified
		4410	9.4.4.2.5 DU Display I/F Timing Register 0 (LCDC_DU_DITR0) The bit name and description of bit 0, modified
		4414	9.4.4.2.8 DU Display I/F Timing Register 3 (LCDC_DU_DITR3) The description of bits 11 to 0, modified (DU_DITR5.HSFT, deleted)
		4415	9.4.4.2.9 DU Display I/F Timing Register 4 (LCDC_DU_DITR4) The description of bits 28 to 16 and 12 to 0, modified (DU_DITR5.HSFT, deleted)
		9.5 MIPI DSI Interface (DSI)	
		4447	Table 9.5-2 Clocks and the Frequency Range hsclk: The description, modified
		4513	9.5.2.2.54 Sequence Channel x Set 0 Register (DSI_LINK_SQCHxSET0R) R/W of bit 23, modified
		4523	9.5.2.2.60 Sequence Channel x Descriptor y-B Register (DSI_LINK_SQCHxDSCyBR) The access size, added
		4528	9.5.2.3.3 DSI PLL Clock Setting 0 Register (DSI_DPHY_PLLCLKSET0R) The main text, modified (F_{FOUT}, modified)
		SECTION 10 ELECTRICAL CHARACTERISTICS	
		10.1 Electrical Characteristics	
		4586	Table 10.1-1 Absolute Maximum Ratings Notes 3 and 5, modified
		4592	Figure 10.1-2 Power-On/Power-Off Sequence (CM33 Boot) QRESN, modified Note, modified (The clock settling time → The clock stabilization time) Note, added
		4594	Figure 10.1-3 Power-On/Power-Off Sequence (CA55 Boot) QRESN, modified Note, modified (The clock settling time → The clock stabilization time) Note, added

Rev.	Date	Description	
		Page	Summary
1.10	Feb 28, 2025	4596	Figure 10.1-4 Power-On Sequence (CM33 Boot Mode) Note, modified (The clock settling time → The clock stabilization time)
		4600	Figure 10.1-6 Power-On Sequence (CA55 Boot Mode) Note, modified (The clock settling time → The clock stabilization time)
		4607	Table 10.1-4 DC Characteristics Notes 5 and 6, modified (BOOTPLLCA0, BOOTPLLCA1 → BOOTPLLCA_0, BOOTPLLCA_1)
		4608	10.1.5 AC Characteristics Conditions, modified
		4611	10.1.5.5 DMAC Timing, added
		4617	10.1.5.9 Ethernet Interface Timing Conditions, modified Drive strength, added
		4617	Table 10.1-16 Ethernet Interface Timing (n = 0, 1) ETn_TXD0 to ETn_TXD3, ETn_TXCTL_TXEN, ETn_TXER output delay time: The min. value, modified Note 1, added
		4621	Table 10.1-17 xSPI Timing (2/2) CS low to DS low: The max. value, modified Notes 5 and 6, added
		4624	10.1.5.14 Serial Communications Interface (RSCI) Access Timing Drive strength, modified
		4625	Table 10.1-19 RSCI Timing (2/2) RSCI (Clock sync, Simple SPI) and SCK clock rise/fall time, deleted RSCI (Clock sync, Simple SPI), Input clock rise time, Input clock fall time, Output clock rise time, and Output clock fall time, added
		4626	Figure 10.1-30 RSCI Simple SPI Mode Clock Timing, modified
		4629	Table 10.1-20 RSPI Timing SSL Activation to Data Output Delay, added Notes 1, 2, 3, and 4, modified
		4630	Figure 10.1-35 RSPI Clock Timing, modified Figure 10.1-36 RSPI Timing (Master, Motorola RSPI, CPHA = 0), modified
		4636	Table 10.1-22 I3C Timing Note 1, modified
		4637	Table 10.1-23 IIC Timing (Fast-mode+) Note 1, modified
		4638	Table 10.1-24 IIC Timing (HS mode) SCL3n cycle time: The min. values under “Cb = 100 pF” and “Cb = 400 pF”, modified Note 1, modified
		4640	Table 10.1-25 I3C Timing (Open Drain Timing Parameters) SCL3n clock High period: The min. value and note, modified Clock before STOP (P) condition: The min. value, modified Notes 3 and 4, added
		4641	Table 10.1-26 I3C Timing (Push-Pull Timing Parameters for SDR) SCL3n clock High period for Mixed Bus, added Note 3, added
		4650	10.1.5.20 SSIU Timing Condition, modified Drive strength, added
		4650	Table 10.1-29 SSIU Signal Timing Note 2, added

Rev.	Date	Description	
		Page	Summary
1.10	Feb 28, 2025	4653	10.1.5.21 PDM Timing Conditions, modified Output load conditions, deleted Drive strength, added
		4653	Table 10.1-30 PDM Interface Timing Note 2, added
		4658	Table 10.1-34 Recommended External Input Resistance Item, modified
		4658	Figure 10.1-69 A/D Converter Equivalent Circuit and Peripheral Configuration Diagram, modified (ADC_ANIn00 to ANIn07 → ANIn00 to ANIn07)
