Clock Configuration

Set used clock with included GPT timer.

Pin Configuration

Depend on included GPT Three Phase Module and ADC Module.

Usage Notes

When shared ADC instance is used, please perform below sequence.

1. Add (New) shared ADC instance.
2. Set configurations of below ADC module for your use.
3. Select "Common | Shared ADC support" to "Enabled".

Limitations

Basically no limitation exists.

Examples

Basic Example

This is a basic example of minimal use of the Motor Driver in an application.

```
void motor_driver_basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;

    /* Initializes the module. */
    err = RM_MOTOR_DRIVER_Open(&g_motor_driver0.p_ctrl, &g_motor_driver0.p_cfg);
    assert(FSP_SUCCESS == err);

    /* Basically run this module at cyclic interrupt (e.g. included GPT PWM Carrier
    interrupt).

    * This implementation is an example. */
}
```

```

// while (true)
{
/* Application work here. */
/* Get electric current, main line voltage and maximum voltage component */
    (void) RM_MOTOR_DRIVER_CurrentGet(&g_motor_driver0.p_ctrl, &f_get_iu,
&f_get_iw, &f_get_vdc, &f_get_va_max);
/* Get the flag of A/D converted current offset */
    (void) RM_MOTOR_DRIVER_FlagCurrentOffsetGet(&g_motor_driver0.p_ctrl,
&ul_get_flg_offset);
// Perform current control process here
/* Set phase voltage */
    (void) RM_MOTOR_DRIVER_PhaseVoltageSet(&g_motor_driver0.p_ctrl, 1.0F, 1.0F,
1.0F);
    (void) RM_MOTOR_DRIVER_ParameterUpdate(&g_motor_driver0.p_ctrl,
&g_motor_driver0.p_cfg);
}
(void) RM_MOTOR_DRIVER_Reset(&g_motor_driver0.p_ctrl);
//

(void) RM_MOTOR_DRIVER_Close(&g_motor_driver0.p_ctrl);
}

```

Function Documentation

◆ **RM_MOTOR_DRIVER_Open()**

```
fsp_err_t RM_MOTOR_DRIVER_Open ( motor_driver_ctrl_t *const p_ctrl, motor_driver_cfg_t const *const p_cfg )
```

Opens and configures the Motor Driver module. Implements `motor_driver_api_t::open`.

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Motor Driver successfully configured. |
| FSP_ERR_ASSERTION | Null pointer, or one or more configuration options is invalid. |
| FSP_ERR_ALREADY_OPEN | Module is already open. This module can only be opened once. |

◆ **RM_MOTOR_DRIVER_Close()**

```
fsp_err_t RM_MOTOR_DRIVER_Close ( motor_driver_ctrl_t *const p_ctrl)
```

Disables specified Motor Driver Module. Implements `motor_driver_api_t::close`.

Return values

| | |
|-------------------|----------------------|
| FSP_SUCCESS | Successfully closed. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_DRIVER_Reset()**

```
fsp_err_t RM_MOTOR_DRIVER_Reset ( motor_driver_ctrl_t *const p_ctrl)
```

Reset variables of Motor Driver Module. Implements `motor_driver_api_t::reset`.

Return values

| | |
|-------------------|---------------------|
| FSP_SUCCESS | Successfully reset. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_MOTOR_DRIVER_PhaseVoltageSet()

```
fsp_err_t RM_MOTOR_DRIVER_PhaseVoltageSet ( motor_driver_ctrl_t *const p_ctrl, float const u_voltage, float const v_voltage, float const w_voltage )
```

Set Phase Voltage Data to calculate PWM duty. Implements `motor_driver_api_t::phaseVoltageSet`.

Return values

| | |
|-------------------|---------------------------|
| FSP_SUCCESS | Successfully data is set. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_MOTOR_DRIVER_CurrentGet()

```
fsp_err_t RM_MOTOR_DRIVER_CurrentGet ( motor_driver_ctrl_t *const p_ctrl, motor_driver_current_get_t *const p_current_get )
```

Get calculated phase Current, Vdc & Va_max data. Implements `motor_driver_api_t::currentGet`.

Return values

| | |
|--------------------------|------------------------|
| FSP_SUCCESS | Successful data get. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter error. |

◆ RM_MOTOR_DRIVER_FlagCurrentOffsetGet()

```
fsp_err_t RM_MOTOR_DRIVER_FlagCurrentOffsetGet ( motor_driver_ctrl_t *const p_ctrl, uint8_t *const p_flag_offset )
```

Get the flag of finish current offset detection. Implements `motor_driver_api_t::flagCurrentOffsetGet`.

Return values

| | |
|--------------------------|------------------------|
| FSP_SUCCESS | Successful data get. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter error. |

◆ **RM_MOTOR_DRIVER_CurrentOffsetRestart()**

```
fsp_err_t RM_MOTOR_DRIVER_CurrentOffsetRestart ( motor_driver_ctrl_t *const p_ctrl)
```

Restart the current offset detection. Implements `motor_driver_api_t::currentOffsetRestart`.

Return values

| | |
|-------------------|-------------------------|
| FSP_SUCCESS | Successfully restarted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_DRIVER_ParameterUpdate()**

```
fsp_err_t RM_MOTOR_DRIVER_ParameterUpdate ( motor_driver_ctrl_t *const p_ctrl,
motor_driver_cfg_t const *const p_cfg )
```

Update the parameters of Driver Module. Implements `motor_driver_api_t::parameterUpdate`.

Return values

| | |
|-------------------|--------------------------------|
| FSP_SUCCESS | Successfully data was updated. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

Detailed Description

Calculation process for the motor control on RA MCUs. This module implements the Motor 120-Degree Driver Interface.

Overview

The motor 120 degree driver module is used to translate phase voltage to PWM duty and output PWM, and detect phase current, voltage and main line voltage. This module should be called cyclically at included A/D conversion finish interrupt.

BLOCK DIAGRAM OF SENSORLESS VECTOR CONTROL

It is a block diagram of sensorless vector control. This shows the correspondence between modules and functional blocks.

Figure 215: Image of Current Control Module(yellow block)

Features

The motor 120 degree driver module has below features.

- Calculate each phase(U/V/W) PWM duty according to reference and output PWM.
- Detect each phase current, phase voltage and main line voltage.
- Detect and correct A/D offset at phase current and voltage channel

Configuration

Build Time Configurations for rm_motor_120_driver

The following build time configurations are defined in fsp_cfg/rm_motor_120_driver_cfg.h:

| Configuration | Options | Default | Description |
|--------------------|--|---------------|---|
| Parameter Checking | <ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

Configurations for Motor > ADC and PWM modulation (rm_motor_120_driver)

This module can be added to the Stacks tab via New Stack > Motor > ADC and PWM modulation (rm_motor_120_driver).

| Configuration | Options | Default | Description |
|--|--|------------------------|---|
| General > Name | Name must be a valid C symbol | g_motor_120_driver0 | Module name. |
| General > 120 degree control type | <ul style="list-style-type: none"> • Sensorless • Hall | Sensorless | 120 degree control type |
| General > PWM output port UP | Manual Entry | BSP_IO_PORT_06_PIN_0_1 | PWM output port UP |

| General > A/D conversion channel for W phase voltage | Manual Entry | ADC_CHANNEL_6 | Specify the A/D channel for W phase voltage |
| General > GTIOCA stop level | <ul style="list-style-type: none"> • Pin Level Low • Pin Level High | Pin Level High | Select the behavior of the output pin when the timer is stopped. |
| General > GTIOCB stop level | <ul style="list-style-type: none"> • Pin Level Low • Pin Level High | Pin Level High | Select the behavior of the output pin when the timer is stopped. |
| Modulation > Maximum duty | Must be a valid non-negative value. | 0.9375 | Maximum duty of PWM |
| Interrupts > Callback | Name must be a valid C symbol | NULL | A user callback function. If this callback function is provided, it is called at A/D conversion finish interrupt. |

Clock Configuration

Set used clock with included GPT timer.

Pin Configuration

Depend on included GPT three phase module and ADC module.

Usage Notes

Limitations

Basically no limitation exists.

Examples

Basic Example

This is a basic example of minimal use of the Motor 120 degree driver in an application.

```
void motor_120_driver_basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;
    /* Initializes the module. */
    err = RM_MOTOR_120_DRIVER_Open(&g_motor_120_driver0.p_ctrl,
&g_motor_120_driver0.p_cfg);
    /* Start PWM output */
    err = RM_MOTOR_120_DRIVER_Run(&g_motor_120_driver0.p_ctrl);
    assert(FSP_SUCCESS == err);
    /* Basically run this module at cyclic interrupt (e.g. included GPT PWM carrier
interrupt).
    * This implementation is an example. */
    // while (true)
    {
        /* Application work here. */
        /* Caclutarion of current offset */
        (void) RM_MOTOR_120_DRIVER_CurrentOffsetCalc(&g_motor_120_driver0.p_ctrl);
        /* Get electric current, main line voltage and maximum voltage component */
        (void) RM_MOTOR_120_DRIVER_CurrentGet(&g_motor_120_driver0.p_ctrl,
&g_current_status);
        /* Get the flag of A/D converted current offset */
        (void) RM_MOTOR_120_DRIVER_FlagCurrentOffsetGet(&g_motor_120_driver0.p_ctrl,
&ul_get_flg_offset);
        // Perform current control process here
        /* Set phase voltage */
```

```

        (void) RM_MOTOR_120_DRIVER_PhaseVoltageSet(&g_motor_120_driver0.p_ctrl, 1.0F,
1.0F, 1.0F);
    /* Set phase pattern */
        (void) RM_MOTOR_120_DRIVER_PhasePatternSet(&g_motor_120_driver0.p_ctrl,
MOTOR_120_DRIVER_API_VP_ON_WN_PWM);
        (void) RM_MOTOR_120_DRIVER_ParameterUpdate(&g_motor_120_driver0.p_ctrl,
&g_motor_120_driver0.p_cfg);
    }
    (void) RM_MOTOR_120_DRIVER_Stop(&g_motor_120_driver0.p_ctrl);
    (void) RM_MOTOR_120_DRIVER_Reset(&g_motor_120_driver0.p_ctrl);
    //

    (void) RM_MOTOR_120_DRIVER_Close(&g_motor_120_driver0.p_ctrl);
}

```

motor_120_driver_cfg_t const *const p_cfg )
```

Opens and configures the motor 120 driver module. Implements [motor_120_driver_api_t::open](#).

Example:

```
/* Initializes the module. */
err = RM_MOTOR_120_DRIVER_Open(&g_motor_120_driver0.p_ctrl,
&g_motor_120_driver0.p_cfg);
```

Return values

| | |
|--------------------------|--|
| FSP_SUCCESS | Motor 120 driver successfully configured. |
| FSP_ERR_ASSERTION | Null pointer, or one or more configuration options is invalid. |
| FSP_ERR_ALREADY_OPEN | Module is already open. This module can only be opened once. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter error. |

◆ **RM_MOTOR_120_DRIVER_Close()**

```
fsp_err_t RM_MOTOR_120_DRIVER_Close ( motor_120_driver_ctrl_t *const p_ctrl)
```

Disables specified motor 120 driver module. Implements `motor_120_driver_api_t::close`.

Example:

```
(void) RM_MOTOR_120_DRIVER_Close(&g_motor_120_driver0.p_ctrl);
```

Return values

| | |
|-------------------|----------------------|
| FSP_SUCCESS | Successfully closed. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_120_DRIVER_Run()**

```
fsp_err_t RM_MOTOR_120_DRIVER_Run ( motor_120_driver_ctrl_t *const p_ctrl)
```

Run motor (Start motor rotation). Implements `motor_120_driver_api_t::run`.

Example:

```
/* Start PWM output */
err = RM_MOTOR_120_DRIVER_Run(&g_motor_120_driver0.p_ctrl);
```

Return values

| | |
|-------------------|------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_120_DRIVER_Stop()**

```
fsp_err_t RM_MOTOR_120_DRIVER_Stop ( motor_120_driver_ctrl_t *const p_ctrl)
```

Stop motor (Stop motor rotation). Implements `motor_120_driver_api_t::stop`.

Example:

```
(void) RM_MOTOR_120_DRIVER_Stop(&g_motor_120_driver0.p_ctrl);
```

Return values

| | |
|-------------------|------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_120_DRIVER_Reset()**

```
fsp_err_t RM_MOTOR_120_DRIVER_Reset ( motor_120_driver_ctrl_t *const p_ctrl)
```

Reset variables of motor 120 driver module. Implements `motor_120_driver_api_t::reset`.

Example:

```
(void) RM_MOTOR_120_DRIVER_Reset(&g_motor_120_driver0.p_ctrl);
```

Return values

| | |
|-------------------|---------------------|
| FSP_SUCCESS | Successfully reset. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_MOTOR_120_DRIVER_PhaseVoltageSet()

```
fsp_err_t RM_MOTOR_120_DRIVER_PhaseVoltageSet ( motor_120_driver_ctrl_t *const p_ctrl, float
const u_voltage, float const v_voltage, float const w_voltage )
```

Set phase voltage data to calculate PWM duty. Implements `motor_120_driver_api_t::phaseVoltageSet`.

Example:

```
/* Set phase voltage */
(void) RM_MOTOR_120_DRIVER_PhaseVoltageSet(&g_motor_120_driver0.p_ctrl, 1.0F,
1.0F, 1.0F);
```

Return values

| | |
|-------------------|---------------------------|
| FSP_SUCCESS | Successfully data is set. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_MOTOR_120_DRIVER_PhasePatternSet()

```
fsp_err_t RM_MOTOR_120_DRIVER_PhasePatternSet ( motor_120_driver_ctrl_t *const p_ctrl,
motor_120_driver_phase_pattern_t const pattern )
```

Set phase voltage pattern. Implements `motor_120_driver_api_t::phasePatternSet`.

Example:

```
/* Set phase pattern */
(void) RM_MOTOR_120_DRIVER_PhasePatternSet(&g_motor_120_driver0.p_ctrl,
MOTOR_120_DRIVER_API_VP_ON_WN_PWM);
```

Return values

| | |
|-------------------|---------------------------|
| FSP_SUCCESS | Successfully data is set. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_MOTOR_120_DRIVER_CurrentGet()

```
fsp_err_t RM_MOTOR_120_DRIVER_CurrentGet ( motor_120_driver_ctrl_t *const p_ctrl,
motor_120_driver_current_status_t *const p_current_status )
```

Get calculated phase current, Vdc & Va_max data. Implements `motor_120_driver_api_t::currentGet`

Example:

```
/* Get electric current, main line voltage and maximum voltage component */
(void) RM_MOTOR_120_DRIVER_CurrentGet(&g_motor_120_driver0.p_ctrl,
&g_current_status);
```

Return values

| | |
|--------------------------|------------------------|
| FSP_SUCCESS | Successful data get. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter error. |

◆ RM_MOTOR_120_DRIVER_CurrentOffsetCalc()

```
fsp_err_t RM_MOTOR_120_DRIVER_CurrentOffsetCalc ( motor_120_driver_ctrl_t *const p_ctrl)
```

current offset detection. Implements `motor_120_driver_api_t::currentOffsetCalc`

Example:

```
/* Caclutarion of current offset */
(void) RM_MOTOR_120_DRIVER_CurrentOffsetCalc(&g_motor_120_driver0.p_ctrl);
```

Return values

| | |
|--------------------------|------------------------|
| FSP_SUCCESS | Successful data get. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter error. |

◆ RM_MOTOR_120_DRIVER_FlagCurrentOffsetGet()

```
fsp_err_t RM_MOTOR_120_DRIVER_FlagCurrentOffsetGet ( motor_120_driver_ctrl_t *const p_ctrl,
motor_120_driver_flag_offset_calc_t *const p_flag_offset )
```

Get the flag of finish current offset detection. Implements `motor_120_driver_api_t::flagCurrentOffsetGet`.

Example:

```
/* Get the flag of A/D converted current offset */
(void) RM_MOTOR_120_DRIVER_FlagCurrentOffsetGet(&g_motor_120_driver0.p_ctrl,
&ul_get_flg_offset);
```

Return values

| | |
|--------------------------|------------------------|
| FSP_SUCCESS | Successful data get. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter error. |

◆ RM_MOTOR_120_DRIVER_ParameterUpdate()

```
fsp_err_t RM_MOTOR_120_DRIVER_ParameterUpdate ( motor_120_driver_ctrl_t *const p_ctrl,
motor_120_driver_cfg_t const *const p_cfg )
```

Update the parameters of 120 driver module. Implements `motor_120_driver_api_t::parameterUpdate`.

Example:

```
(void) RM_MOTOR_120_DRIVER_ParameterUpdate(&g_motor_120_driver0.p_ctrl,
&g_motor_120_driver0.p_cfg);
```

Return values

| | |
|--------------------------|--------------------------------|
| FSP_SUCCESS | Successfully data was updated. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter error. |

5.2.11.5 Motor 120 degree control (rm_motor_120_degree)

Modules » Motor

Functions

`fsp_err_t RM_MOTOR_120_DEGREE_Open (motor_ctrl_t *const p_ctrl, motor_cfg_t const *const p_cfg)`

Configure the motor in register start mode. Implements `motor_api_t::open`. [More...](#)

`fsp_err_t RM_MOTOR_120_DEGREE_Close (motor_ctrl_t *const p_ctrl)`

Disables specified motor control block. Implements `motor_api_t::close`. [More...](#)

`fsp_err_t RM_MOTOR_120_DEGREE_Reset (motor_ctrl_t *const p_ctrl)`

Reset motor control block. Implements `motor_api_t::reset`. [More...](#)

`fsp_err_t RM_MOTOR_120_DEGREE_Run (motor_ctrl_t *const p_ctrl)`

Run motor (Start motor rotation). Implements `motor_api_t::run`. [More...](#)

`fsp_err_t RM_MOTOR_120_DEGREE_Stop (motor_ctrl_t *const p_ctrl)`

Stop motor (Stop motor rotation). Implements `motor_api_t::stop`. [More...](#)

`fsp_err_t RM_MOTOR_120_DEGREE_ErrorSet (motor_ctrl_t *const p_ctrl, motor_error_t const error)`

Set error information. Implements `motor_api_t::errorSet`. [More...](#)

`fsp_err_t RM_MOTOR_120_DEGREE_SpeedSet (motor_ctrl_t *const p_ctrl, float const speed_rpm)`

Set speed reference[rpm]. Implements `motor_api_t::speedSet`. [More...](#)

`fsp_err_t RM_MOTOR_120_DEGREE_StatusGet (motor_ctrl_t *const p_ctrl, uint8_t *const p_status)`

Get current control status. Implements `motor_api_t::statusGet`. [More...](#)

`fsp_err_t RM_MOTOR_120_DEGREE_SpeedGet (motor_ctrl_t *const p_ctrl, float *const p_speed_rpm)`

Get rotational speed. Implements `motor_api_t::speedGet`. [More...](#)

`fsp_err_t` `RM_MOTOR_120_DEGREE_WaitStopFlagGet` (`motor_ctrl_t *const p_ctrl, motor_wait_stop_flag_t *const p_flag_wait_stop`)
Get wait stop flag. Implements `motor_api_t::waitStopFlagGet`. [More...](#)

`fsp_err_t` `RM_MOTOR_120_DEGREE_ErrorCheck` (`motor_ctrl_t *const p_ctrl, uint16_t *const p_error`)
Check the occurrence of error. Implements `motor_api_t::errorCheck`. [More...](#)

`fsp_err_t` `RM_MOTOR_120_DEGREE_PositionSet` (`motor_ctrl_t *const p_ctrl, motor_speed_position_data_t const *const p_position`)
Set position reference. Implements `motor_api_t::positionSet`. [More...](#)

`fsp_err_t` `RM_MOTOR_120_DEGREE_AngleGet` (`motor_ctrl_t *const p_ctrl, float *const p_angle_rad`)
Set position reference. Implements `motor_api_t::angleGet`. [More...](#)

`fsp_err_t` `RM_MOTOR_120_DEGREE_FunctionSelect` (`motor_ctrl_t *const p_ctrl, motor_function_select_t const function`)
Select using function. Implements `motor_api_t::functionSelect`. [More...](#)

Detailed Description

Usual control of a SPM (Surface Permanent Magnet) motor on RA MCUs. This module implements the [Motor 120 degree control \(rm_motor_120_degree\)](#).

Overview

The motor 120 degree control is used to control a motor rotation in an application. This module is implemented with using a SPM motor. User can start/stop motor rotation simply.

Features

The motor 120 degree module has below features.

- Start/Stop a motor rotation
- Error detection (over current, over speed, over voltage, low voltage)

Configuration

Build Time Configurations for `rm_motor_120_degree`

The following build time configurations are defined in fsp_cfg/rm_motor_120_degree_cfg.h:

| Configuration | Options | Default | Description |
|--------------------|--|---------------|---|
| Parameter Checking | <ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

Configurations for Motor > Motor 120 degree control (rm_motor_120_degree)

This module can be added to the Stacks tab via New Stack > Motor > Motor 120 degree control (rm_motor_120_degree).

| Configuration | Options | Default | Description |
|-------------------------------------|-------------------------------------|---------------------|---|
| General > Name | Name must be a valid C symbol | g_motor_120_degree0 | Module name. |
| General > Limit of over current (A) | Must be a valid non-negative value. | 4.0 | Limit of over current.(Detection threshold) |
| General > Limit of over voltage (V) | Must be a valid non-negative value. | 28.0 | Limit of over voltage.(Detection threshold) |
| General > Limit of over speed (rpm) | Must be a valid non-negative value. | 3000.0 | Limit of over speed.(Detection threshold) |
| General > Limit of low voltage (V) | Must be a valid non-negative value. | 14.0 | Limit of low voltage.(Detection threshold) |
| Interrupts > Callback | Name must be a valid C symbol | NULL | A user callback function. |

Clock Configuration

This module doesn't depend on clock setting, because this module is a simple status transition process.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Limitations

- Set the limit of electric current with non-negative value.
- Set the limit of input voltage with non-negative value.
- Set the limit of rotational speed with non-negative value.

Examples

Basic Example

This is a basic example of minimal use of the motor 120 degree in an application.

```
void motor_120_degree_basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;
    /* Initializes the module. */
    err = RM_MOTOR_120_DEGREE_Open(g_motor_120_degree0.p_ctrl,
g_motor_120_degree0.p_cfg);
    assert(FSP_SUCCESS == err);
    /* Set speed reference before motor run */
    (void) RM_MOTOR_120_DEGREE_SpeedSet(g_motor_120_degree0.p_ctrl,
DEF_120_DEGREE_SPEED_REF);
    /* Start motor rotation */
    (void) RM_MOTOR_120_DEGREE_Run(g_motor_120_degree0.p_ctrl);
    /* Get current status */
    (void) RM_MOTOR_120_DEGREE_StatusGet(g_motor_120_degree0.p_ctrl, &smpl_status);
    /* Get current motor speed */
    (void) RM_MOTOR_120_DEGREE_SpeedGet(g_motor_120_degree0.p_ctrl, &smpl_speed);
    /* Get wait stop flag */
    (void) RM_MOTOR_120_DEGREE_WaitStopFlagGet(g_motor_120_degree0.p_ctrl,
&smpl_wait_stop_flag);
    /* Check error */
    (void) RM_MOTOR_120_DEGREE_ErrorCheck(g_motor_120_degree0.p_ctrl, &smpl_error);
    /* Stop motor rotation */
    (void) RM_MOTOR_120_DEGREE_Stop(g_motor_120_degree0.p_ctrl);
    (void) RM_MOTOR_120_DEGREE_ErrorSet(g_motor_120_degree0.p_ctrl,
MOTOR_ERROR_OVER_CURRENT_HW);
    /* Reset the process. */
    (void) RM_MOTOR_120_DEGREE_Reset(g_motor_120_degree0.p_ctrl);
    /* Close the module. */
    (void) RM_MOTOR_120_DEGREE_Close(g_motor_120_degree0.p_ctrl);
}
```

Data Structures

```
struct motor_120_degree_statemachine_t
```

```
struct motor_120_degree_extended_cfg_t
```

Enumerations

```
enum motor_120_degree_ctrl_status_t
```

```
enum motor_120_degree_ctrl_event_t
```

Data Structure Documentation

◆ motor_120_degree_statemachine_t

| struct motor_120_degree_statemachine_t | | |
|--|-----------------|----------------------------|
| Statemachine structure for motor 120 degree | | |
| Data Fields | | |
| motor_120_degree_ctrl_status_t | status | The current system status. |
| motor_120_degree_ctrl_status_t | status_next | The next system status. |
| motor_120_degree_ctrl_event_t | current_event | The current event index. |
| uint16_t | u2_error_status | The error information. |

◆ motor_120_degree_extended_cfg_t

| struct motor_120_degree_extended_cfg_t | | |
|---|------------------------------|-----------------------------|

| MOTOR_120_DEGREE_CTRL_EVENT_RESET | Reset event. |

Function Documentation

◆ **RM_MOTOR_120_DEGREE_Open()**

```
fsp_err_t RM_MOTOR_120_DEGREE_Open ( motor_ctrl_t *const p_ctrl, motor_cfg_t const *const p_cfg )
```

Configure the motor in register start mode. Implements `motor_api_t::open`.

Example:

```
/* Initializes the module. */
err = RM_MOTOR_120_DEGREE_Open(g_motor_120_degree0.p_ctrl,
g_motor_120_degree0.p_cfg);
```

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Successfully configured. |
| FSP_ERR_ASSERTION | Null pointer, or one or more configuration options is invalid. |
| FSP_ERR_ALREADY_OPEN | Module is already open. This module can only be opened once. |

Note

This function should only be called once as motor configuration registers can only be written to once so subsequent calls will have no effect.

◆ **RM_MOTOR_120_DEGREE_Close()**

```
fsp_err_t RM_MOTOR_120_DEGREE_Close ( motor_ctrl_t *const p_ctrl)
```

Disables specified motor control block. Implements `motor_api_t::close`.

Example:

```
/* Close the module. */
(void) RM_MOTOR_120_DEGREE_Close(g_motor_120_degree0.p_ctrl);
```

Return values

| | |
|-------------------|----------------------|
| FSP_SUCCESS | Successfully closed. |
| FSP_ERR_ASSERTION | p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

Note

◆ **RM_MOTOR_120_DEGREE_Reset()**

```
fsp_err_t RM_MOTOR_120_DEGREE_Reset ( motor_ctrl_t *const p_ctrl)
```

Reset motor control block. Implements `motor_api_t::reset`.

Example:

```
/* Reset the process. */
(void) RM_MOTOR_120_DEGREE_Reset(g_motor_120_degree0.p_ctrl);
```

Return values

| | |
|-------------------|------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

Note

◆ **RM_MOTOR_120_DEGREE_Run()**

```
fsp_err_t RM_MOTOR_120_DEGREE_Run ( motor_ctrl_t *const p_ctrl)
```

Run motor (Start motor rotation). Implements `motor_api_t::run`.

Example:

```
/* Start motor rotation */
(void) RM_MOTOR_120_DEGREE_Run(g_motor_120_degree0.p_ctrl);
```

Return values

| | |
|-------------------|-----------------------|
| FSP_SUCCESS | Successfully started. |
| FSP_ERR_ASSERTION | p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

Note

◆ **RM_MOTOR_120_DEGREE_Stop()**

```
fsp_err_t RM_MOTOR_120_DEGREE_Stop ( motor_ctrl_t *const p_ctrl)
```

Stop motor (Stop motor rotation). Implements `motor_api_t::stop`.

Example:

```
/* Stop motor rotation */
(void) RM_MOTOR_120_DEGREE_Stop(g_motor_120_degree0.p_ctrl);
```

Return values

| | |
|-------------------|-----------------------|
| FSP_SUCCESS | Successfully stopped. |
| FSP_ERR_ASSERTION | p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

Note

◆ **RM_MOTOR_120_DEGREE_ErrorSet()**

```
fsp_err_t RM_MOTOR_120_DEGREE_ErrorSet ( motor_ctrl_t *const p_ctrl, motor_error_t const error )
```

Set error information. Implements `motor_api_t::errorSet`.

Example:

```
(void) RM_MOTOR_120_DEGREE_ErrorSet(g_motor_120_degree0.p_ctrl,
MOTOR_ERROR_OVER_CURRENT_HW);
```

Return values

| | |
|-------------------|-------------------------------------|
| FSP_SUCCESS | Successfully set error information. |
| FSP_ERR_ASSERTION | p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

Note

◆ **RM_MOTOR_120_DEGREE_SpeedSet()**

```
fsp_err_t RM_MOTOR_120_DEGREE_SpeedSet ( motor_ctrl_t *const p_ctrl, float const speed_rpm )
```

Set speed reference[rpm]. Implements `motor_api_t::speedSet`.

Example:

```
/* Set speed reference before motor run */
(void) RM_MOTOR_120_DEGREE_SpeedSet(g_motor_120_degree0.p_ctrl,
DEF_120_DEGREE_SPEED_REF);
```

Return values

| | |
|-------------------|-----------------------------------|
| FSP_SUCCESS | Successfully set speed reference. |
| FSP_ERR_ASSERTION | p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

Note

◆ **RM_MOTOR_120_DEGREE_StatusGet()**

```
fsp_err_t RM_MOTOR_120_DEGREE_StatusGet ( motor_ctrl_t *const p_ctrl, uint8_t *const p_status )
```

Get current control status. Implements `motor_api_t::statusGet`.

Example:

```
/* Get current status */
(void) RM_MOTOR_120_DEGREE_StatusGet(g_motor_120_degree0.p_ctrl, &smpl_status);
```

Return values

| | |
|-------------------------|--|
| FSP_SUCCESS | Successfully got current control status. |
| FSP_ERR_ASSERTION | p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_POINTER | Data received pointer is invalid. |

Note

◆ **RM_MOTOR_120_DEGREE_SpeedGet()**

```
fsp_err_t RM_MOTOR_120_DEGREE_SpeedGet ( motor_ctrl_t *const p_ctrl, float *const
p_speed_rpm )
```

Get rotational speed. Implements `motor_api_t::speedGet`.

Example:

```
/* Get current motor speed */
(void) RM_MOTOR_120_DEGREE_SpeedGet(g_motor_120_degree0.p_ctrl, &smpl_speed);
```

Return values

| | |
|-------------------------|------------------------------------|
| FSP_SUCCESS | Successfully got rotational speed. |
| FSP_ERR_ASSERTION | p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_POINTER | Data received pointer is invalid. |

Note

◆ **RM_MOTOR_120_DEGREE_WaitStopFlagGet()**

```
fsp_err_t RM_MOTOR_120_DEGREE_WaitStopFlagGet ( motor_ctrl_t *const p_ctrl,
motor_wait_stop_flag_t *const p_flag_wait_stop )
```

Get wait stop flag. Implements `motor_api_t::waitStopFlagGet`.

Example:

```
/* Get wait stop flag */
(void) RM_MOTOR_120_DEGREE_WaitStopFlagGet(g_motor_120_degree0.p_ctrl,
&smpl_wait_stop_flag);
```

Return values

| | |
|-------------------------|-----------------------------------|
| FSP_SUCCESS | Successfully got wait stop flag. |
| FSP_ERR_ASSERTION | p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_POINTER | Data received pointer is invalid. |

Note

◆ **RM_MOTOR_120_DEGREE_ErrorCheck()**

```
fsp_err_t RM_MOTOR_120_DEGREE_ErrorCheck ( motor_ctrl_t *const p_ctrl, uint16_t *const p_error )
```

Check the occurrence of error. Implements `motor_api_t::errorCheck`.

Example:

```
/* Check error */
(void) RM_MOTOR_120_DEGREE_ErrorCheck(g_motor_120_degree0.p_ctrl, &smpl_error);
```

Return values

| | |
|-------------------------|------------------------------------|
| FSP_SUCCESS | Successfully error checke process. |
| FSP_ERR_ASSERTION | p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_POINTER | Data received pointer is invalid. |

Note

◆ **RM_MOTOR_120_DEGREE_PositionSet()**

```
fsp_err_t RM_MOTOR_120_DEGREE_PositionSet ( motor_ctrl_t *const p_ctrl, motor_speed_position_data_t const *const p_position )
```

Set position reference. Implements `motor_api_t::positionSet`.

Return values

| | |
|---------------------|--------------|
| FSP_ERR_UNSUPPORTED | Unsupported. |
|---------------------|--------------|

Note

◆ **RM_MOTOR_120_DEGREE_AngleGet()**

```
fsp_err_t RM_MOTOR_120_DEGREE_AngleGet ( motor_ctrl_t *const p_ctrl, float *const p_angle_rad )
```

Set position reference. Implements `motor_api_t::angleGet`.

Return values

| | |
|---------------------|--------------|
| FSP_ERR_UNSUPPORTED | Unsupported. |
|---------------------|--------------|

Note

◆ RM_MOTOR_120_DEGREE_FunctionSelect()

```
fsp_err_t RM_MOTOR_120_DEGREE_FunctionSelect ( motor_ctrl_t *const p_ctrl,
motor_function_select_t const function )
```

Select using function. Implements `motor_api_t::functionSelect`.

Return values

| | |
|---------------------|--------------|
| FSP_ERR_UNSUPPORTED | Unsupported. |
|---------------------|--------------|

Encoder Cyclic Process (Call in cyclic timer). Implements [motor_angle_api_t::encoderCyclic](#). [More...](#)

`fsp_err_t RM_MOTOR_ESTIMATE_InfoGet (motor_angle_ctrl_t *const p_ctrl, motor_angle_encoder_info_t *const p_info)`

Gets information of Encoder Angle Module. Implements [motor_angle_api_t::infoGet](#). [More...](#)

`fsp_err_t RM_MOTOR_ESTIMATE_CyclicProcess (motor_angle_ctrl_t *const p_ctrl)`

Perform induction cyclic process. Implements `motor_angle_api_t::cyclicProcess`. [More...](#)

`fsp_err_t RM_MOTOR_ESTIMATE_SensorDataSet (motor_angle_ctrl_t *const p_ctrl, motor_angle_ad_data_t *const p_ad_data)`

Set sensor data. Implements `motor_angle_api_t::sensorDataSet`. [More...](#)

Detailed Description

Calculation process for the motor control on RA MCUs. This module implements the [Motor angle Interface](#).

Overview

The motor angle and speed estimation module is used to calculate rotor angle and rotational speed in an application. This module should be called cyclically after the A/D conversion of electric current of each phase in an application.

Features

The Motor Angle and Speed Estimation Module has below features.

- Calculate rotor angle [radian].
- Calculate rotational speed [radian/second].

Configuration

Build Time Configurations for `rm_motor_estimate`

The following build time configurations are defined in `fsp_cfg/rm_motor_estimate_cfg.h`:

| Configuration | Options | Default | Description |
|--------------------|--|---------------|---|
| Parameter Checking | <ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

Configurations for Motor > Motor Angle and Speed Estimation (`rm_motor_estimate`)

This module can be added to the Stacks tab via New Stack > Motor > Motor Angle and Speed Estimation (`rm_motor_estimate`).

| Configuration | Options | Default | Description |
|-------------------|--------------|---------|-------------|
| Motor Parameter > | Manual Entry | 2 | Pole pairs |

Pole pairs

| | | | |
|---|---|----------------|---|
| Motor Parameter > Resistance[ohm] | Must be a valid value | 8.5F | Resistance |
| Motor Parameter > Inductance of d-axis[H] | Must be a valid value | 0.0045F | Inductance of d-axis |
| Motor Parameter > Inductance of q-axis[H] | Must be a valid value | 0.0045F | Inductance of q-axis |
| Motor Parameter > Permanent magnetic flux[Wb] | Must be a valid value | 0.02159F | Permanent magnetic flux |
| Motor Parameter > Rotor inertia[kgm ²] | Must be a valid value | 0.0000028F | Rotor inertia |
| Motor Parameter > Nominal current[Arms] | Must be a valid value | 1.67 | Nominal current |
| Name | Name must be a valid C symbol | g_motor_angle0 | Module name. |
| Openloop damping | <ul style="list-style-type: none"> • Disable • Enable | Enable | Openloop damping functionally enable or disable |
| Natural frequency of BEMF observer | Must be a valid value | 1000.0F | Natural frequency of BEMF observer |
| Damping ratio of BEMF observer | Must be a valid value | 1.0F | Damping ratio of BEMF observer |
| Natural frequency of PLL Speed estimate loop | Must be a valid value | 20.0F | Natural frequency of PLL Speed estimate loop |
| Damping ratio of PLL Speed estimate loop | Must be a valid value | 1.0F | Damping ratio of PLL Speed estimate loop |
| Control period | Must be a valid value | 0.00005F | Control period |

Clock Configuration

This module doesn't depend on clock setting, because this module is a simple calculation process.

Pin Configuration

This module does not use I/O pins.

Usage Notes**Limitations**

Developers should be aware of the following limitations when using the Motor Angle and Speed Estimation:

Examples

Basic Example

This is a basic example of minimal use of the Motor Angle and Speed Estimation in an application.

```
void motor_estimate_basic_example (void)
{
    fsp_err_t          err = FSP_SUCCESS;
    motor_angle_current_t smpl_current;
    motor_angle_voltage_reference_t smpl_voltage;
    /* Initializes the module. */
    err = RM_MOTOR_ESTIMATE_Open(&g_mtr_angle0_ctrl, &g_mtr_angle_set0_cfg);
    assert(FSP_SUCCESS == err);
    /* Basically run this module at A/D conversion finish interrupt.
     * This implementation is an example. */
    while (true)
    {
        /* Application work here. */
        /* Set PI Control Flag before get Angle/Speed and Estimated Component */
        (void) RM_MOTOR_ESTIMATE_FlagPiCtrlSet(&g_mtr_angle0_ctrl, 1U);
        smpl_current.id = 1.0F;
        smpl_current.iq = 1.0F;
        smpl_voltage.vd = 10.0F;
        smpl_voltage.vq = 10.0F;
        /* Set Current and Speed data before get Angle/Speed and Estimated Component */
        (void) RM_MOTOR_ESTIMATE_CurrentSet(&g_mtr_angle0_ctrl, smpl_current,
smpl_voltage);
        /* Set Internal Speed Reference & damping speed data before get Angle/Speed and
Estimated Component */
        (void) RM_MOTOR_ESTIMATE_SpeedSet(&g_mtr_angle0_ctrl, 104.27F, 10.0F);
        /* Get Angle/Speed data */
        (void) RM_MOTOR_ESTIMATE_AngleSpeedGet(&g_mtr_angle0_ctrl, &f_get_angle,
&f_get_speed, &f_get_phase_err);
        /* Get Estimated Component */
        (void) RM_MOTOR_ESTIMATE_EstimatedComponentGet(&g_mtr_angle0_ctrl, &f_get_ed,
&f_get_eq);
    }
}
```

}

Function Documentation

◆ RM_MOTOR_ESTIMATE_Open()

```
fsp_err_t RM_MOTOR_ESTIMATE_Open ( motor_angle_ctrl_t *const p_ctrl, motor_angle_cfg_t const *const p_cfg )
```

Opens and configures the Angle Estimation module. Implements [motor_angle_api_t::open](#).

Return values

| | |
|--------------------------|--|
| FSP_SUCCESS | MTR_ANGL_EST successfully configured. |
| FSP_ERR_ASSERTION | Null pointer, or one or more configuration options is invalid. |
| FSP_ERR_ALREADY_OPEN | Module is already open. This module can only be opened once. |
| FSP_ERR_INVALID_ARGUMENT | Configuration parameter error. |

◆ RM_MOTOR_ESTIMATE_Close()

```
fsp_err_t RM_MOTOR_ESTIMATE_Close ( motor_angle_ctrl_t *const p_ctrl)
```

Disables specified Angle Estimation module. Implements [motor_angle_api_t::close](#).

Return values

| | |
|-------------------|----------------------|
| FSP_SUCCESS | Successfully closed. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_MOTOR_ESTIMATE_Reset()

```
fsp_err_t RM_MOTOR_ESTIMATE_Reset ( motor_angle_ctrl_t *const p_ctrl)
```

Reset variables of Angle Estimation module. Implements [motor_angle_api_t::reset](#).

Return values

| | |
|-------------------|---------------------|
| FSP_SUCCESS | Successfully reset. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_ESTIMATE_CurrentSet()**

```
fsp_err_t RM_MOTOR_ESTIMATE_CurrentSet ( motor_angle_ctrl_t *const p_ctrl,
motor_angle_current_t *const p_st_current, motor_angle_voltage_reference_t *const p_st_voltage
)
```

Set d/q-axis Current Data & Voltage Reference. Implements `motor_angle_api_t::currentSet`.

Return values

| | |
|-------------------|---------------------|
| FSP_SUCCESS | Successfully set. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_ESTIMATE_SpeedSet()**

```
fsp_err_t RM_MOTOR_ESTIMATE_SpeedSet ( motor_angle_ctrl_t *const p_ctrl, float const
speed_ctrl, float const damp_speed )
```

Set Speed Information. Implements `motor_angle_api_t::speedSet`.

Return values

| | |
|-------------------|---------------------|
| FSP_SUCCESS | Successfully set. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_ESTIMATE_FlagPiCtrlSet()**

```
fsp_err_t RM_MOTOR_ESTIMATE_FlagPiCtrlSet ( motor_angle_ctrl_t *const p_ctrl, uint32_t const
flag_pi )
```

Set the flag of PI Control runs. Implements `motor_angle_api_t::flagPiCtrlSet`.

Return values

| | |
|-------------------|---------------------|
| FSP_SUCCESS | Successfully set. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_ESTIMATE_AngleSpeedGet()**

```
fsp_err_t RM_MOTOR_ESTIMATE_AngleSpeedGet ( motor_angle_ctrl_t *const p_ctrl, float *const p_angle, float *const p_speed, float *const p_phase_err )
```

Gets the current rotor's angle and rotation speed. Implements [motor_angle_api_t::angleSpeedGet](#).

Return values

| | |
|-------------------|----------------------|
| FSP_SUCCESS | Successful data get. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_ESTIMATE_EstimatedComponentGet()**

```
fsp_err_t RM_MOTOR_ESTIMATE_EstimatedComponentGet ( motor_angle_ctrl_t *const p_ctrl, float *const p_ed, float *const p_eq )
```

Gets estimated d/q-axis component. Implements [motor_angle_api_t::estimatedComponentGet](#).

Return values

| | |
|-------------------|---------------------------|
| FSP_SUCCESS | Successfully data gotten. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_ESTIMATE_ParameterUpdate()**

```
fsp_err_t RM_MOTOR_ESTIMATE_ParameterUpdate ( motor_angle_ctrl_t *const p_ctrl, motor_angle_cfg_t const *const p_cfg )
```

Update the parameters of Angle&Speed Estimation. Implements [motor_angle_api_t::parameterUpdate](#).

Return values

| | |
|-------------------|------------------------------|
| FSP_SUCCESS | Successfully data is update. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_ESTIMATE_InternalCalculate()**

```
fsp_err_t RM_MOTOR_ESTIMATE_InternalCalculate ( motor_angle_ctrl_t *const p_ctrl)
```

Calculate internal parameters. Implements `motor_angle_api_t::internalCalculate`.

Return values

| | |
|---------------------|---------------------|
| FSP_ERR_UNSUPPORTED | Unsupported. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_ESTIMATE_AngleAdjust()**

```
fsp_err_t RM_MOTOR_ESTIMATE_AngleAdjust ( motor_angle_ctrl_t *const p_ctrl)
```

Angle Adjustment Process. Implements `motor_angle_api_t::angleAdjust`.

Return values

| | |
|---------------------|---------------------|
| FSP_ERR_UNSUPPORTED | Unsupported. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_ESTIMATE_EncoderCyclic()**

```
fsp_err_t RM_MOTOR_ESTIMATE_EncoderCyclic ( motor_angle_ctrl_t *const p_ctrl)
```

Encoder Cyclic Process (Call in cyclic timer). Implements `motor_angle_api_t::encoderCyclic`.

Return values

| | |
|---------------------|---------------------|
| FSP_ERR_UNSUPPORTED | Unsupported. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_ESTIMATE_InfoGet()**

```
fsp_err_t RM_MOTOR_ESTIMATE_InfoGet ( motor_angle_ctrl_t *const p_ctrl,
motor_angle_encoder_info_t *const p_info )
```

Gets information of Encoder Angle Module. Implements [motor_angle_api_t::infoGet](#).

Return values

| | |
|---------------------|---------------------|
| FSP_ERR_UNSUPPORTED | Unsupported. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_ESTIMATE_CyclicProcess()**

```
fsp_err_t RM_MOTOR_ESTIMATE_CyclicProcess ( motor_angle_ctrl_t *const p_ctrl)
```

Perform induction cyclic process. Implements [motor_angle_api_t::cyclicProcess](#).

Return values

| | |
|---------------------|--------------|
| FSP_ERR_UNSUPPORTED | Unsupported. |
|---------------------|--------------|

◆ **RM_MOTOR_ESTIMATE_SensorDataSet()**

```
fsp_err_t RM_MOTOR_ESTIMATE_SensorDataSet ( motor_angle_ctrl_t *const p_ctrl,
motor_angle_ad_data_t *const p_ad_data )
```

Set sensor data. Implements [motor_angle_api_t::sensorDataSet](#).

Return values

| | |
|---------------------|--------------|
| FSP_ERR_UNSUPPORTED | Unsupported. |
|---------------------|--------------|

Detailed Description

Calculation process for the motor control on RA MCUs. This module implements the [Motor angle Interface](#).

Overview

The motor angle and speed calculation with an encoder module is used to calculate rotor angle and rotational speed in an application. This module is designed to be used with the motor current module ([rm_motor_current](#)).

Features

The motor angle and speed calculation with an encoder module has the features listed below.

- Calculate rotor angle [radian].
- Calculate rotational speed [radian/second].

Configuration

Build Time Configurations for rm_motor_sense_encoder

The following build time configurations are defined in fsp_cfg/rm_motor_sense_encoder_cfg.h:

| Configuration | Options | Default | Description |
|--------------------|--|---------------|---|
| Parameter Checking | <ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

Configurations for Motor > Motor Angle and Speed Calculation with encoder (rm_motor_sense_encoder)

This module can be added to the Stacks tab via New Stack > Motor > Motor Angle and Speed Calculation with encoder (rm_motor_sense_encoder).

| Configuration | Options | Default | Description |
|---|---|----------------------------|---------------------------|
| General > Name | Name must be a valid C symbol | g_motor_sense_encode r0 | Module name. |
| Motor Parameter > Pole pairs | Must be a valid non-negative value. | 7 | Pole pairs |
| Motor Parameter > Resistance (ohm) | Must be a valid value | 0.453F | Resistance |
| Motor Parameter > Inductance of d-axis (H) | Must be a valid value | 0.0009447F | Inductance of d-axis |
| Motor Parameter > Inductance of q-axis (H) | Must be a valid value | 0.0009447F | Inductance of q-axis |
| Motor Parameter > Permanent magnetic flux (Wb) | Must be a valid value | 0.006198F | Permanent magnetic flux |
| Motor Parameter > Rotor inertia (kgm ²) | Must be a valid value | 0.00000962F | Rotor inertia |
| Control Type | <ul style="list-style-type: none"> • Speed • Position | Position | Select control Type |
| Period of Current control (kHz) | Must be a valid value | 20.0F | Period of Current control |
| Period of Speed control | Must be a valid value | 0.0005F | Period of Speed control |

(sec)

| | | | |
|------------------------------------|-------------------------------------|-----------|--|
| PWM Carrier Frequency (kHz) | Must be a valid value | 20.0F | PWM Carrier Frequency |
| Decimation of Interrupt | Manual Entry | 0U | Decimation of Interrupt |
| Counts per Rotation | Must be a valid non-negative value. | 1200U | Encoder Counts per One Rotation |
| Counts for Angle Adjust | Must be a valid non-negative value. | 512U | Counts for Angle Adjust (as working time) |
| Zero speed counts | Must be a valid non-negative value. | 20000000U | Threshold counts to judge zero speed |
| Occupancy Time | Must be a valid value | 0.30F | Occupancy time of carrier interrupt |
| Carrier Time | Must be a valid value | 0.000013F | Processing time of carrier interrupt |
| Process Time | Must be a valid value | 0.000001F | Processing time of encoder interrupt |
| Highspeed Change Margin (rpm) | Must be a valid non-negative value. | 150U | Margin of toggle speed for high speed mode |
| LPF parameter for Highspeed Filter | Must be a valid value | 0.1F | Highspeed mode speed LPF parameter |
| Counts to change speed | Must be a valid non-negative value. | 8U | Counts for mode change of position speed calculation |

Clock Configuration

Pin Configuration

Usage Notes

Limitations

Developers should be aware of the following limitations when using the motor angle and speed calculation with an encoder: all configurations should be set as positive values.

Examples

Basic Example

This is a basic example of minimal use of the motor angle and speed calculation with an encoder in an application.

```
void motor_sense_encoder_basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;
```

```
/* Initializes the module. */
err = RM_MOTOR_SENSE_ENCODER_Open(&g_mtr_angle0_ctrl, &g_mtr_angle_set0_cfg);
assert(FSP_SUCCESS == err);

/* Basically run this module at A/D conversion finish interrupt.
 * This implementation is an example. */
// while (true)
{
/* Application work here. */
/* Initialize motor with the encoder */
(void) RM_MOTOR_SENSE_ENCODER_AngleAdjust(&g_mtr_angle0_ctrl);
/* Perform cyclic encoder process*/
(void) RM_MOTOR_SENSE_ENCODER_CyclicProcess(&g_mtr_angle0_ctrl);
/* Calculate information with encoder signal input */
(void) RM_MOTOR_SENSE_ENCODER_InternalCalculate(&g_mtr_angle0_ctrl);
/* Get angle/speed data */
(void) RM_MOTOR_SENSE_ENCODER_AngleSpeedGet(&g_mtr_angle0_ctrl, &f_get_angle,
&f_get_speed, &f_get_phase_err);
/* Get calculated component */
(void) RM_MOTOR_SENSE_ENCODER_InfoGet(&g_mtr_angle0_ctrl, &temp_info);
}
/* Reset the module */
(void) RM_MOTOR_SENSE_ENCODER_Reset(&g_mtr_angle0_ctrl);
/* Close the module */
(void) RM_MOTOR_SENSE_ENCODER_Close(&g_mtr_angle0_ctrl);
}
```

Enumerations

enum [motor_sense_encoder_loop_t](#)

enum [motor_sense_encoder_mode_t](#)

Function Documentation◆ **RM_MOTOR_SENSE_ENCODER_Open()**

`fsp_err_t RM_MOTOR_SENSE_ENCODER_Open (motor_angle_ctrl_t *const p_ctrl, motor_angle_cfg_t const *const p_cfg)`

Opens and configures the Angle Encoder module. Implements `motor_angle_api_t::open`.

Return values

| | |
|--------------------------|--|
| FSP_SUCCESS | Angle Encoder module successfully configured. |
| FSP_ERR_ASSERTION | Null pointer, or one or more configuration options is invalid. |
| FSP_ERR_ALREADY_OPEN | Module is already open. This module can only be opened once. |
| FSP_ERR_INVALID_ARGUMENT | Configuration parameter error. |

◆ **RM_MOTOR_SENSE_ENCODER_Close()**

```
fsp_err_t RM_MOTOR_SENSE_ENCODER_Close ( motor_angle_ctrl_t *const p_ctrl)
```

Disables specified Angle Encoder module. Implements [motor_angle_api_t::close](#).

Return values

| | |
|-------------------|----------------------|
| FSP_SUCCESS | Successfully closed. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_SENSE_ENCODER_Reset()**

```
fsp_err_t RM_MOTOR_SENSE_ENCODER_Reset ( motor_angle_ctrl_t *const p_ctrl)
```

Reset variables of Angle Encoder module. Implements [motor_angle_api_t::reset](#).

Return values

Detailed Description

Calculation process for the motor control on RA MCUs. This module implements the [Motor angle Interface](#).

Overview

The motor angle and speed calculation with hall sensors module is used to calculate rotor angle and rotational speed in an application. This module is designed to be used with the motor current module (rm_motor_current).

Features

The motor angle and speed calculation with hall sensors module has the features listed below.

- Calculate rotor angle [radian].
- Calculate rotational speed [radian/second].

Configuration

Build Time Configurations for rm_motor_sense_hall

The following build time configurations are defined in `fsp_cfg/rm_motor_sense_hall_cfg.h`:

| Configuration | Options | Default | Description |
|--------------------|--|---------------|---|
| Parameter Checking | <ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

Configurations for Motor > Motor Angle and Speed Calculation with Hall sensors (rm_motor_sense_hall)

This module can be added to the Stacks tab via `New Stack > Motor > Motor Angle and Speed Calculation with Hall sensors (rm_motor_sense_hall)`.

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

| | | | |
|--|-------------------------------------|-----------------------|---|
| General > Name | Name must be a valid C symbol | g_motor_angle0 | Module name. |
| Hall sensor > U phase input port | Manual Entry | BSP_IO_PORT_12_PIN_04 | Hall sensor port U |
| Hall sensor > V phase input port | Manual Entry | BSP_IO_PORT_12_PIN_05 | Hall sensor port V |
| Hall sensor > W phase input port | Manual Entry | BSP_IO_PORT_11_PIN_01 | Hall sensor port W |
| Hall sensor > sensor pattern #1 | Manual Entry | 1 | Hall sensor pattern #1 |
| Hall sensor > sensor pattern #2 | Manual Entry | 5 | Hall sensor pattern #2 |
| Hall sensor > sensor pattern #3 | Manual Entry | 4 | Hall sensor pattern #3 |
| Hall sensor > sensor pattern #4 | Manual Entry | 6 | Hall sensor pattern #4 |
| Hall sensor > sensor pattern #5 | Manual Entry | 2 | Hall sensor pattern #5 |
| Hall sensor > sensor pattern #6 | Manual Entry | 3 | Hall sensor pattern #6 |
| PWM Carrier Frequency (kHz) | Must be a valid value | 20.0F | PWM Carrier Frequency |
| Correction parameter of rotor angle | Must be a valid value | 0.0F | Correction parameter of rotor angle |
| Default counts of carrier interrupt | Must be a valid non-negative value. | 300U | Default counts of carrier interrupt during a period of Hall signal change |
| Maximum counts of one rotation | Must be a valid non-negative value. | 500U | Maximum counts of carrier interrupt during one rotor rotation |
| Target value for pseudo speed (rad/s) | Must be a valid non-negative value. | 100.0 | Target value for pseudo speed (rad/s). |
| Target time until the pseudo speed update reaches (msec) | Must be a valid non-negative value. | 300.0 | Target time until the pseudo speed update reaches (msec). |
| Rotation counts to start speed estimation | Must be a valid non-negative value. | 2 | Rotation counts to start of speed estimation. |
| Carrier counts at startup | Must be a valid non-negative value. | 400 | Carrier counts to wait the start timing of pseudo speed update |

Clock Configuration

Pin Configuration

Usage Notes

Limitations

Developers should be aware of the following limitations when using the motor angle and speed calculation with hall sensors: all configurations should be set as positive values.

Examples

Basic Example

This is a basic example of minimal use of the motor angle and speed calculation with hall sensors in an application.

```
void motor_sense_hall_basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;

    /* Initializes the module. */
    err = RM_MOTOR_SENSE_HALL_Open(&g_mtr_angle0_ctrl, &g_mtr_angle_set0_cfg);
    assert(FSP_SUCCESS == err);

    /* Basically run this module at A/D conversion finish interrupt.
     * This implementation is an example. */
    // while (true)
    {
        /* Application work here. */
        /* Get angle/speed data */
        (void) RM_MOTOR_SENSE_HALL_AngleSpeedGet(&g_mtr_angle0_ctrl, &f_get_angle,
        &f_get_speed, &f_get_phase_err);
    }

    /* Reset the module */
    (void) RM_MOTOR_SENSE_HALL_Reset(&g_mtr_angle0_ctrl);

    /* Close the module */
    (void) RM_MOTOR_SENSE_HALL_Close(&g_mtr_angle0_ctrl);
}
```

Data Structures

```
struct motor_sense_hall_input_t
```

```
struct motor_sense_hall_extended_cfg_t
```

```
struct motor_sense_hall_instance_ctrl_t
```

Enumerations

```
enum motor_sense_hall_direction_t
```

```
enum motor_sense_hall_signal_status_t
```

Data Structure Documentation

◆ motor_sense_hall_input_t

| struct motor_sense_hall_input_t | | |
|--|-----------------------|----------------------------|
| This structure is provided to receive speed information. | | |
| Data Fields | | |
| float | f4_ref_speed_rad_ctrl | Speed Reference [rad/sec]. |

◆ motor_sense_hall_extended_cfg_t

| struct motor_sense_hall_extended_cfg_t | | |
|---|--|---|
| Optional Motor sense hall extension data structure. | | |
| Data Fields | | |
| bsp_io_port_pin_t | port_hall_sensor_u | Hall U-signal input port BSP_IO_PORT_12_PIN_04. |
| bsp_io_port_pin_t | port_hall_sensor_v | Hall V-signal input port BSP_IO_PORT_12_PIN_05. |
| bsp_io_port_pin_t | port_hall_sensor_w | Hall W-signal input port BSP_IO_PORT_11_PIN_01. |
| uint8_t | u1_hall_pattern[MOTOR_SENSE_HALL_SPEED_COUNTS+1] | The order of hall signal pattern. |
| float | f_pwm_carrier_freq | PWM carrier frequency 20.0kHz. |
| float | f_angle_correct | Coefficient to correct angle 0.4. |
| uint8_t | u1_trigger_hall_signal_count | Rotation counts to wait the stability. |
| float | f4_target_pseudo_speed_rad | Target value for pseudo speed estimates [radian/second]. |
| float | f4_reach_time_msec | Time until the pseudo speed estimate reaches the target value [msec]. |
| uint16_t | u2_trigger_carrier_count | Estimated speed 0 until this trigger. |
| uint16_t | u2_default_counts | Default counts for period of hall signal to reset. |
| uint16_t | u2_maximum_period | Maximum counts of hall signal |

| | | |
|---------|-------------------|------------------|
| | | period. |
| uint8_t | u1_hall_polepairs | Hall pole pairs. |

◆ motor_sense_hall_instance_ctrl_t

| struct motor_sense_hall_instance_ctrl_t | | |
|---|---|---|
| SENSE_HALL control block. DO NOT INITIALIZE. Initialization occurs when <code>motor_angle_api_t::open</code> is called. | | |
| Data Fields | | |
| uint32_t | open | |
| uint8_t | u1_hall_signal | Hall signal pattern. |
| uint8_t | u1_last_hall_signal | Last hall signal pattern. |
| motor_sense_hall_direction_t | direction | Rotation direction. |
| motor_sense_hall_direction_t | last_direction | Last rotation direction. |
| uint16_t | u2_carrier_count | Carrier count. |
| uint16_t | u2_hall_period[MOTOR_SENSE_HALL_SPEED_COUNTS] | Array of carrier count to calculate 2PI. |
| uint8_t | u1_period_counter | Counter for above array. |
| float | f_angle | Rotor angle [radian]. |
| float | f_angle_per_count | Angle per 1 count. |
| float | f_calculated_speed | Calculated speed [radian/second]. |
| uint8_t | u1_hall_signal_memory | Memorized hall signal at startup. |
| motor_sense_hall_signal_status_t | hall_signal_status | Hall signal status. |
| uint8_t | u1_hall_signal_count | Rotation counter. |
| float | f4_pseudo_speed_rad | Pseudo speed used for startup [radian/second]. |
| float | f4_add_pseudo_speed_rad | Step of pseudo speed to update [radian/second]. |
| uint16_t | u2_startup_carrier_count | Counter of carrier interrupt for startup. |
| motor_sense_hall_input_t | st_input | Input parameter structure. |
| motor_angle_cfg_t const * | p_cfg | |

Enumeration Type Documentation

◆ **motor_sense_hall_direction_t**

| enum motor_sense_hall_direction_t | |
|-----------------------------------|---------------------------------------|
| Enumerator | |
| MOTOR_SENSE_HALL_DIRECTION_CW | Rotation direction clockwise. |
| MOTOR_SENSE_HALL_DIRECTION_CCW | Rotation direction counter clockwise. |

◆ **motor_sense_hall_signal_status_t**

| enum motor_sense_hall_signal_status_t | |
|---|---------------------------------------|
| Enumerator | |
| MOTOR_SENSE_HALL_SIGNAL_STATUS_INITIAL | Hall signal isn't captured. (Initial) |
| MOTOR_SENSE_HALL_SIGNAL_STATUS_CAPTURED | Hall signal is captured. |

Function Documentation◆ **RM_MOTOR_SENSE_HALL_Open()**

`fsp_err_t RM_MOTOR_SENSE_HALL_Open (motor_angle_ctrl_t *const p_ctrl, motor_angle_cfg_t const *const p_cfg)`

Opens and configures the angle hall sensor module. Implements `motor_angle_api_t::open`.

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | MTR_ANGL_EST successfully configured. |
| FSP_ERR_ASSERTION | Null pointer, or one or more configuration options is invalid. |
| FSP_ERR_ALREADY_OPEN | Module is already open. This module can only be opened once. |

◆ **RM_MOTOR_SENSE_HALL_Close()**

```
fsp_err_t RM_MOTOR_SENSE_HALL_Close ( motor_angle_ctrl_t *const p_ctrl)
```

Disables specified Angle Estimation module. Implements `motor_angle_api_t::close`.

Return values

| | |
|-------------------|----------------------|
| FSP_SUCCESS | Successfully closed. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_SENSE_HALL_Reset()**

```
fsp_err_t RM_MOTOR_SENSE_HALL_Reset ( motor_angle_ctrl_t *const p_ctrl)
```

Reset variables of Angle Estimation module. Implements `motor_angle_api_t::reset`.

Return values

| | |
|-------------------|---------------------|
| FSP_SUCCESS | Successfully reset. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_SENSE_HALL_CurrentSet()**

```
fsp_err_t RM_MOTOR_SENSE_HALL_CurrentSet ( motor_angle_ctrl_t *const p_ctrl,
motor_angle_current_t *const p_st_current, motor_angle_voltage_reference_t *const p_st_voltage
)
```

Set d/q-axis Current Data & Voltage Reference. Implements `motor_angle_api_t::currentSet`.

Return values

| | |
|---------------------|--------------|
| FSP_ERR_UNSUPPORTED | Unsupported. |
|---------------------|--------------|

◆ RM_MOTOR_SENSE_HALL_SpeedSet()

```
fsp_err_t RM_MOTOR_SENSE_HALL_SpeedSet ( motor_angle_ctrl_t *const p_ctrl, float const speed_ctrl, float const damp_speed )
```

Set Speed Information. Implements `motor_angle_api_t::speedSet`.

Return values

| | |
|-------------------|------------------------|
| FSP_SUCCESS | Data get successfully. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_MOTOR_SENSE_HALL_FlagPiCtrlSet()

```
fsp_err_t RM_MOTOR_SENSE_HALL_FlagPiCtrlSet ( motor_angle_ctrl_t *const p_ctrl, uint32_t const flag_pi )
```

Set the flag of PI Control runs. Implements `motor_angle_api_t::flagPiCtrlSet`.

Return values

| | |
|---------------------|--------------|
| FSP_ERR_UNSUPPORTED | Unsupported. |
|---------------------|--------------|

◆ RM_MOTOR_SENSE_HALL_AngleSpeedGet()

```
fsp_err_t RM_MOTOR_SENSE_HALL_AngleSpeedGet ( motor_angle_ctrl_t *const p_ctrl, float *const p_angle, float *const p_speed, float *const p_phase_err )
```

Gets the current rotor's angle and rotation speed. Implements `motor_angle_api_t::angleSpeedGet`.

Return values

| | |
|--------------------------|----------------------------|
| FSP_SUCCESS | Successful data get. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Output pointer is invalid. |

◆ **RM_MOTOR_SENSE_HALL_EstimatedComponentGet()**

```
fsp_err_t RM_MOTOR_SENSE_HALL_EstimatedComponentGet ( motor_angle_ctrl_t *const p_ctrl,
float *const p_ed, float *const p_eq )
```

Gets estimated d/q-axis component. Implements `motor_angle_api_t::estimatedComponentGet`.

Return values

| | |
|---------------------|--------------|
| FSP_ERR_UNSUPPORTED | Unsupported. |
|---------------------|--------------|

◆ **RM_MOTOR_SENSE_HALL_ParameterUpdate()**

```
fsp_err_t RM_MOTOR_SENSE_HALL_ParameterUpdate ( motor_angle_ctrl_t *const p_ctrl,
motor_angle_cfg_t const *const p_cfg )
```

Update the parameters of Angle&Speed Estimation. Implements `motor_angle_api_t::parameterUpdate`.

Return values

| | |
|-------------------|------------------------------|
| FSP_SUCCESS | Successfully data is update. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_SENSE_HALL_InternalCalculate()**

```
fsp_err_t RM_MOTOR_SENSE_HALL_InternalCalculate ( motor_angle_ctrl_t *const p_ctrl)
```

Calculate internal parameters. Implements `motor_angle_api_t::internalCalculate`.

Return values

| | |
|---------------------|--------------|
| FSP_ERR_UNSUPPORTED | Unsupported. |
|---------------------|--------------|

◆ **RM_MOTOR_SENSE_HALL_AngleAdjust()**

```
fsp_err_t RM_MOTOR_SENSE_HALL_AngleAdjust ( motor_angle_ctrl_t *const p_ctrl)
```

Angle Adjustment Process. Implements `motor_angle_api_t::angleAdjust`.

Return values

| | |
|---------------------|--------------|
| FSP_ERR_UNSUPPORTED | Unsupported. |
|---------------------|--------------|

◆ **RM_MOTOR_SENSE_HALL_EncoderCyclic()**

```
fsp_err_t RM_MOTOR_SENSE_HALL_EncoderCyclic ( motor_angle_ctrl_t *const p_ctrl)
```

Encoder Cyclic Process (Call in cyclic timer). Implements `motor_angle_api_t::encoderCyclic`.

Return values

| | |
|---------------------|--------------|
| FSP_ERR_UNSUPPORTED | Unsupported. |
|---------------------|--------------|

◆ **RM_MOTOR_SENSE_HALL_InfoGet()**

```
fsp_err_t RM_MOTOR_SENSE_HALL_InfoGet ( motor_angle_ctrl_t *const p_ctrl,
motor_angle_encoder_info_t *const p_info )
```

Gets information of Encoder Angle Module. Implements `motor_angle_api_t::infoGet`.

Return values

| | |
|---------------------|--------------|
| FSP_ERR_UNSUPPORTED | Unsupported. |
|---------------------|--------------|

5.2.11.9 Motor Angle and Speed Calculation with induction sensor (rm_motor_sense_induction)

Modules » Motor

Functions

```
fsp_err_t RM_MOTOR_SENSE_INDUCTION_Open (motor_angle_ctrl_t *const

`fsp_err_t RM_MOTOR_SENSE_INDUCTION_InfoGet (motor_angle_ctrl_t *const p_ctrl, motor_angle_encoder_info_t *const p_info)`

Gets information of Angle Module. Implements `motor_angle_api_t::infoGet`. [More...](#)

`fsp_err_t RM_MOTOR_SENSE_INDUCTION_CorrectReset (motor_angle_ctrl_t *const p_ctrl)`

Reset to restart calibration Angle module. [More...](#)

`fsp_err_t RM_MOTOR_SENSE_INDUCTION_ErrorGet (motor_angle_ctrl_t *const p_ctrl, motor_angle_error_t *const p_error)`

Gets the error information about induction correction. [More...](#)

`fsp_err_t RM_MOTOR_SENSE_INDUCTION_ParameterUpdate`

(motor_angle_ctrl_t *const p_ctrl, motor_angle_cfg_t const *const p_cfg)

Update the parameters of angle & speed calculation. Implements [motor_angle_api_t::parameterUpdate](#). [More...](#)

fsp_err_t [RM_MOTOR_SENSE_INDUCTION_SensorDataSet](#) (motor_angle_ctrl_t *const p_ctrl, motor_angle_ad_data_t *const p_ad_data)

Set A/D Converted Data. Implements [motor_angle_api_t::sensorDataSet](#). [More...](#)

fsp_err_t [RM_MOTOR_SENSE_INDUCTION_CurrentSet](#) (motor_angle_ctrl_t *const p_ctrl, motor_angle_current_t *const p_st_current, motor_angle_voltage_reference_t *const p_st_voltage)

Set d/q-axis Current Data & Voltage Reference. Implements [motor_angle_api_t::currentSet](#). [More...](#)

fsp_err_t [RM_MOTOR_SENSE_INDUCTION_SpeedSet](#) (motor_angle_ctrl_t *const p_ctrl, float const speed_ctrl, float const damp_speed)

Set Speed Information. Implements [motor_angle_api_t::speedSet](#). [More...](#)

fsp_err_t [RM_MOTOR_SENSE_INDUCTION_FlagPiCtrlSet](#) (motor_angle_ctrl_t *const p_ctrl, uint32_t const flag_pi)

Set the flag of PI Control runs. Implements [motor_angle_api_t::flagPiCtrlSet](#). [More...](#)

fsp_err_t [RM_MOTOR_SENSE_INDUCTION_EstimatedComponentGet](#) (motor_angle_ctrl_t *const p_ctrl, float *const p_ed, float *const p_eq)

Gets estimated d/q-axis component. Implements [motor_angle_api_t::estimatedComponentGet](#). [More...](#)

Detailed Description

Calculation process for the motor control on RA MCUs. This module implements the [Motor angle Interface](#).

Overview

The motor angle and speed calculation with induction sensor module is used to calculate rotor angle and rotational speed in an application. This module is designed to be used with the motor current module (rm_motor_current).

Features

The motor angle and speed calculation with induction sensor module has the features listed below.

- Calculate rotor angle [radian].
- Calculate rotational speed [radian/second].

Configuration

Build Time Configurations for rm_motor_sense_induction

The following build time configurations are defined in fsp_cfg/rm_motor_sense_induction_cfg.h:

| Configuration | Options | Default | Description |
|--------------------|--|---------------|---|
| Parameter Checking | <ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

Configurations for Motor > Motor Angle and Speed Calculation with induction sensor (rm_motor_sense_induction)

This module can be added to the Stacks tab via New Stack > Motor > Motor Angle and Speed Calculation with induction sensor (rm_motor_sense_induction).

| Configuration | Options | Default | Description |
|------------------------------------|---|----------------|--|
| General > Name | Name must be a valid C symbol | g_motor_angle0 | Module name. |
| Control type | <ul style="list-style-type: none"> • Speed • Position | Position | Select control Type |
| Frequency of current control (kHz) | Must be a valid non-negative value. | 20.0 | Frequency of current control |
| Decimation of Interrupt | Must be a valid non-negative value. | 1 | Decimation of Interrupt |
| Counts to get signal | Must be a valid non-negative value. | 10 | Counts to get analog input signal |
| Limit of signal error | Must be a valid non-negative value. | 100 | Limit of signal error |
| Coefficient of speed LPF | Manual Entry | 0.07 | Coefficient of speed LPF |
| A/D reference voltage | Must be a valid non-negative value. | 3.3 | Reference voltage of A/D converter |
| A/D conversion scale | Must be a valid non-negative value. | 4095.0 | Conversion scale of A/D converter |
| Openloop speed (rpm) | Must be a valid non-negative value. | 6.0 | Rotation speed at calibration openloop (rpm) |

| | | | |
|--------------------------------|---|--------|---|
| D-axis current at openloop (A) | Must be a valid non-negative value. | 1.0 | D-axis current at calibration openloop (A) |
| Angle adjustment times | Must be a valid non-negative value. | 512 | Times to get signal at angle adjustment |
| Calibration enable | <ul style="list-style-type: none"> • Disable • Enable | Enable | Select enable/disable of signal calibration |
| Induction sensor pole pairs | Must be a valid non-negative value. | 4 | Induction sensor pole pairs |
| Motor pole pairs | Must be a valid non-negative value. | 4 | Motor pole pairs |

Clock Configuration

Pin Configuration

Usage Notes

Limitations

Developers should be aware of the following limitations when using the motor angle and speed calculation with induction sensor: all configurations should be set as positive values.

Examples

Basic Example

This is a basic example of minimal use of the motor angle and speed calculation with induction sensor in an application.

```
void motor_sense_encoder_basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;

    /* Initializes the module. */
    err = RM_MOTOR_SENSE_INDUCTION_Open(&g_mtr_angle0_ctrl, &g_mtr_angle_set0_cfg);
    assert(FSP_SUCCESS == err);

    /* Basically run this module at A/D conversion finish interrupt.
     * This implementation is an example. */
    // while (true)
    {
        /* Application work here. */
        /* Initialize motor */
        (void) RM_MOTOR_SENSE_INDUCTION_AngleAdjust(&g_mtr_angle0_ctrl);
    }
}
```

```

/* Perform cyclic process*/
    (void) RM_MOTOR_SENSE_INDUCTION_CyclicProcess(&g_mtr_angle0_ctrl);
/* Calculate information with induction sensor signal input */
    (void) RM_MOTOR_SENSE_INDUCTION_InternalCalculate(&g_mtr_angle0_ctrl);
/* Get angle/speed data */
    (void) RM_MOTOR_SENSE_INDUCTION_AngleSpeedGet(&g_mtr_angle0_ctrl,
&f_get_angle, &f_get_speed, &f_get_phase_err);
}
/* Reset the module */
    (void) RM_MOTOR_SENSE_INDUCTION_Reset(&g_mtr_angle0_ctrl);
/* Close the module */
    (void) RM_MOTOR_SENSE_INDUCTION_Close(&g_mtr_angle0_ctrl);
}

```

Function Documentation◆ **RM_MOTOR_SENSE_INDUCTION_Open()**

```
fsp_err_t RM_MOTOR_SENSE_INDUCTION_Open ( motor_angle_ctrl_t *const p_ctrl,
motor_angle_cfg_t const *const p_cfg )
```

Opens and configures the Angle module. Implements [motor_angle_api_t::open](#).

Return values

| | |
|--------------------------|--|
| FSP_SUCCESS | Angle Induction module successfully configured. |
| FSP_ERR_ASSERTION | Null pointer, or one or more configuration options is invalid. |
| FSP_ERR_ALREADY_OPEN | Module is already open. This module can only be opened once. |
| FSP_ERR_INVALID_ARGUMENT | Configuration parameter error. |

◆ **RM_MOTOR_SENSE_INDUCTION_Close()**

```
fsp_err_t RM_MOTOR_SENSE_INDUCTION_Close ( motor_angle_ctrl_t *const p_ctrl)
```

Disables specified Angle module. Implements [motor_angle_api_t::close](#).

Return values

| | |
|-------------------|----------------------|
| FSP_SUCCESS | Successfully closed. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_SENSE_INDUCTION_Reset()**

```
fsp_err_t RM_MOTOR_SENSE_INDUCTION_Reset ( motor_angle_ctrl_t *const p_ctrl)
```

Reset variables of Angle module. Implements `motor_angle_api_t::reset`.

Return values

| | |
|-------------------|----------------------|
| FSP_SUCCESS | Successfully closed. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_SENSE_INDUCTION_InternalCalculate()**

```
fsp_err_t RM_MOTOR_SENSE_INDUCTION_InternalCalculate ( motor_angle_ctrl_t *const p_ctrl)
```

Calculate internal parameters. Implements `motor_angle_api_t::internalCalculate`.

Return values

| | |
|-------------------|----------------------|
| FSP_SUCCESS | Successfully closed. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_SENSE_INDUCTION_AngleSpeedGet()**

```
fsp_err_t RM_MOTOR_SENSE_INDUCTION_AngleSpeedGet ( motor_angle_ctrl_t *const p_ctrl, float *const p_angle, float *const p_speed, float *const p_phase_err )
```

Gets the current rotor's angle and rotation speed. Implements `motor_angle_api_t::angleSpeedGet`.

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Successfully data calculated. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_SENSE_INDUCTION_AngleAdjust()**

```
fsp_err_t RM_MOTOR_SENSE_INDUCTION_AngleAdjust ( motor_angle_ctrl_t *const p_ctrl)
```

Angle Adjustment Process. Implements `motor_angle_api_t::angleAdjust`.

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Successfully data calculated. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_SENSE_INDUCTION_EncoderCyclic()**

```
fsp_err_t RM_MOTOR_SENSE_INDUCTION_EncoderCyclic ( motor_angle_ctrl_t *const p_ctrl)
```

Encoder Cyclic Process (Call in cyclic timer). Implements `motor_angle_api_t::encoderCyclic`.

Return values

| | |
|---------------------|--|
| FSP_ERR_UNSUPPORTED | Motor sense induction software encoderCyclic is not supported. |
|---------------------|--|

◆ **RM_MOTOR_SENSE_INDUCTION_CyclicProcess()**

```
fsp_err_t RM_MOTOR_SENSE_INDUCTION_CyclicProcess ( motor_angle_ctrl_t *const p_ctrl)
```

Induction sensor Cyclic Process (Call in cyclic timer). Implements `motor_angle_api_t::cyclicProcess`.

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Successfully data calculated. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_SENSE_INDUCTION_InfoGet()**

```
fsp_err_t RM_MOTOR_SENSE_INDUCTION_InfoGet ( motor_angle_ctrl_t *const p_ctrl,
motor_angle_encoder_info_t *const p_info )
```

Gets information of Angle Module. Implements `motor_angle_api_t::infoGet`.

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Successfully data calculated. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_SENSE_INDUCTION_CorrectReset()**

```
fsp_err_t RM_MOTOR_SENSE_INDUCTION_CorrectReset ( motor_angle_ctrl_t *const p_ctrl)
```

Reset to restart calibration Angle module.

Return values

| | |
|-------------------|----------------------|
| FSP_SUCCESS | Successfully closed. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_SENSE_INDUCTION_ErrorGet()**

```
fsp_err_t RM_MOTOR_SENSE_INDUCTION_ErrorGet ( motor_angle_ctrl_t *const p_ctrl,
motor_angle_error_t *const p_error )
```

Gets the error information about induction correction.

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Successfully data calculated. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_SENSE_INDUCTION_ParameterUpdate()**

```
fsp_err_t RM_MOTOR_SENSE_INDUCTION_ParameterUpdate ( motor_angle_ctrl_t *const p_ctrl,
motor_angle_cfg_t const *const p_cfg )
```

Update the parameters of angle & speed calculation. Implements [motor_angle_api_t::parameterUpdate](#).

Return values

| | |
|-------------------|------------------------------|
| FSP_SUCCESS | Successfully data is update. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_SENSE_INDUCTION_SensorDataSet()**

```
fsp_err_t RM_MOTOR_SENSE_INDUCTION_SensorDataSet ( motor_angle_ctrl_t *const p_ctrl,
motor_angle_ad_data_t *const p_ad_data )
```

Set A/D Converted Data. Implements [motor_angle_api_t::sensorDataSet](#).

Return values

| | |
|-------------------|------------------------------|
| FSP_SUCCESS | Successfully data is update. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_SENSE_INDUCTION_CurrentSet()**

```
fsp_err_t RM_MOTOR_SENSE_INDUCTION_CurrentSet ( motor_angle_ctrl_t *const p_ctrl,
motor_angle_current_t *const p_st_current, motor_angle_voltage_reference_t *const p_st_voltage
)
```

Set d/q-axis Current Data & Voltage Reference. Implements [motor_angle_api_t::currentSet](#).

Return values

| | |
|---------------------|---|
| FSP_ERR_UNSUPPORTED | Motor sense induction software currentSet is not supported. |
|---------------------|---|

◆ RM_MOTOR_SENSE_INDUCTION_SpeedSet()

`fsp_err_t RM_MOTOR_SENSE_INDUCTION_SpeedSet (motor_angle_ctrl_t *const p_ctrl, float const speed_ctrl, float const damp_speed)`

Set Speed Information. Implements `motor_angle_api_t::speedSet`.

Return values

| | |
|---------------------|---|
| FSP_ERR_UNSUPPORTED | Motor sense induction software speedSet is not supported. |
|---------------------|---|

◆ RM_MOTOR_SENSE_INDUCTION_FlagPiCtrlSet()

`fsp_err_t RM_MOTOR_SENSE_INDUCTION_FlagPiCtrlSet (motor_angle_ctrl_t *const p_ctrl, uint32_t const flag_pi)`

Set the flag of PI Control runs. Implements `motor_angle_api_t::flagPiCtrlSet`.

Return values

| | |
|---------------------|--|
| FSP_ERR_UNSUPPORTED | Motor sense induction software flagPiCtrlSet is not supported. |
|---------------------|--|

◆ RM_MOTOR_SENSE_INDUCTION_EstimatedComponentGet()

`fsp_err_t RM_MOTOR_SENSE_INDUCTION_EstimatedComponentGet (motor_angle_ctrl_t *const p_ctrl, float *const p_ed, float *const p_eq)`

Gets estimated d/q-axis component. Implements `motor_angle_api_t::estimatedComponentGet`.

Return values

| | |
|---------------------|--|
| FSP_ERR_UNSUPPORTED | Motor sense induction software estimatedComponentGet is not supported. |
|---------------------|--|

Detailed Description

Calculation process for the motor control on RA MCUs. This module implements the [Motor current Interface](#).

Overview

The motor current is used to control the electric current of motor rotation in an application. This module should be called cyclically after the A/D conversion of electric current of each phase in an application. This module calculates each phase voltage with input current reference, electric current and rotor angle.

Features

The Motor Current Module has below features.

- Calculate each phase(U/V/W) voltage.
- Decoupling Control.
- Voltage Error Compensation.

Configuration

Build Time Configurations for rm_motor_current

The following build time configurations are defined in fsp_cfg/rm_motor_current_cfg.h:

| Configuration | Options | Default | Description |
|--------------------|--|---------------|--|
| Parameter Checking | <ul style="list-style-type: none"> • Default (BSP) • Enabled | Default (BSP) | If selected code for parameter checking is |

- Disabled

included in the build.

Configurations for Motor > Motor Current Controller (rm_motor_current)

This module can be added to the Stacks tab via New Stack > Motor > Motor Current Controller (rm_motor_current).

| Configuration | Options | Default | Description |
|---|--|------------------|---|
| General > Name | Name must be a valid C symbol | g_motor_current0 | Module name. |
| General > Sensor type | <ul style="list-style-type: none"> • Sensorless • Encoder • Induction • Hall | Sensorless | Select sensor type |
| General > Shunt type | <ul style="list-style-type: none"> • 1 shunt • 2 shunt • 3 shunt | 2 shunt | Select shunt type |
| General > Current control decimation | Must be a valid non-negative value. | 0 | Decimation of current control. |
| General > PWM carrier frequency (kHz) | Must be a valid value | 20.0F | PWM carrier frequency. |
| General > Input voltage (V) | Must be a valid value | 24.0F | Input voltage for limitation of current PI control. |
| General > Sample delay compensation | <ul style="list-style-type: none"> • Disable • Enable | Enable | Select enable/disable sample delay compensation. |
| General > Voltage error compensation | <ul style="list-style-type: none"> • Disable • Enable | Enable | Select enable/disable voltage error compensation. |
| General > Voltage error compensation table of voltage 1 | Must be a valid value | 0.672F | Voltage error compensation table of voltage. |
| General > Voltage error compensation table of voltage 2 | Must be a valid value | 0.945F | Voltage error compensation table of voltage. |
| General > Voltage error compensation table of voltage 3 | Must be a valid value | 1.054F | Voltage error compensation table of voltage. |
| General > Voltage error compensation table of voltage 4 | Must be a valid value | 1.109F | Voltage error compensation table of voltage. |
| General > Voltage error compensation table of voltage 5 | Must be a valid value | 1.192F | Voltage error compensation table of voltage. |
| General > Voltage | Must be a valid value | 0.013F | Voltage error |

| | | | |
|---|-------------------------------------|------------|---|
| error compensation table of current 1 | | | compensation table of current. |
| General > Voltage error compensation table of current 2 | Must be a valid value | 0.049F | Voltage error compensation table of current. |
| General > Voltage error compensation table of current 3 | Must be a valid value | 0.080F | Voltage error compensation table of current. |
| General > Voltage error compensation table of current 4 | Must be a valid value | 0.184F | Voltage error compensation table of current. |
| General > Voltage error compensation table of current 5 | Must be a valid value | 0.751F | Voltage error compensation table of current. |
| Interrupts > Callback | Name must be a valid C symbol | NULL | A user callback function. If this callback function is provided, it is called at A/D conversion finish interrupt. |
| Design Parameter > Current PI loop omega (Hz) | Must be a valid value | 300.0F | Current PI loop omega |
| Design Parameter > Current PI loop zeta | Must be a valid value | 1.0F | Current PI loop zeta |
| Motor Parameter > Pole pairs | Must be a valid non-negative value. | 2 | Pole pairs |
| Motor Parameter > Resistance (ohm) | Must be a valid value | 8.5F | Resistance |
| Motor Parameter > Inductance of d-axis (H) | Must be a valid value | 0.0045F | Inductance of d-axis |
| Motor Parameter > Inductance of q-axis (H) | Must be a valid value | 0.0045F | Inductance of q-axis |
| Motor Parameter > Permanent magnetic flux (Wb) | Must be a valid value | 0.02159F | Permanent magnetic flux |
| Motor Parameter > Rotor inertia (kgm ²) | Must be a valid value | 0.0000028F | Rotor inertia |

Clock Configuration

This module doesn't depend on clock setting, because this module is a simple calculation process.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Limitations

- Set the Period of Current Control with none-negative value.
- Set the Reference Voltage with none-negative value.

Examples

Basic Example

This is a basic example of minimal use of the Motor Current in an application.

```
void motor_current_basic_example (void)
{
    motor_current_input_current_t temp_input_current;
    motor_current_input_voltage_t temp_input_voltage;
    motor_current_get_voltage_t temp_get_voltage;
    fsp_err_t err = FSP_SUCCESS;
    /* Initializes the module. */
    err = RM_MOTOR_CURRENT_Open(g_test_motor_current.p_ctrl,
g_test_motor_current.p_cfg);
    assert(FSP_SUCCESS == err);
    /* Basically run this module at A/D conversion finish interrupt.
    * This implementation is an example. */
    // while (true)
    {
        /* Application work here. */
        /* Set current reference before get phase voltage */
        (void) RM_MOTOR_CURRENT_CurrentReferenceSet(g_test_motor_current.p_ctrl, 1.0F,
1.0F);
        /* Set speed and phase data before get phase voltage */
        (void) RM_MOTOR_CURRENT_SpeedPhaseSet(g_test_motor_current.p_ctrl, 104.72F,
1.0F);

        temp_input_current.iu = 1.0F;
        temp_input_current.iv = 1.0F;
        temp_input_current.iw = 1.0F;
    }
}
```

```
temp_input_voltage.vdc      = 24.0F;
temp_input_voltage.va_max   = 24.0F;

/* Set electric current and voltage before get phase voltage */
(void) RM_MOTOR_CURRENT_CurrentSet(g_test_motor_current.p_ctrl,
temp_input_current, temp_input_voltage);

/* Activate the process. */
(void) RM_MOTOR_CURRENT_Run(g_test_motor_current.p_ctrl);

/* Get d/q-axis current*/
(void) RM_MOTOR_CURRENT_CurrentGet(g_test_motor_current.p_ctrl, &f_get_id,
&f_get_iq);

/* Get the flag of PI control */
(void) RM_MOTOR_CURRENT_PhaseVolageGet(g_test_motor_current.p_ctrl,
&temp_get_voltage);

/* Get Output Parameter */
(void) RM_MOTOR_CURRENT_ParameterGet(g_test_motor_current.p_ctrl,
&test_output);

(void) RM_MOTOR_CURRENT_ParameterUpdate(g_test_motor_current.p_ctrl,
g_test_motor_current.p_cfg);
}

/* Reset the process. */
(void) RM_MOTOR_CURRENT_Reset(g_test_motor_current.p_ctrl);

/* Close the module. */
(void) RM_MOTOR_CURRENT_Close(g_test_motor_current.p_ctrl);
}
```

Enumerations

```
enum motor_current_shunt_type_t
```

Enumeration Type Documentation

◆ **motor_current_shunt_type_t**

| | |
|---|----------------------------|
| enum <code>motor_current_shunt_type_t</code> | |

| <code>FSP_ERR_INVALID_ARGUMENT</code> | Configuration parameter error. |

◆ **RM_MOTOR_CURRENT_Close()**

| | |
|---|----------------------|
| <code>fsp_err_t RM_MOTOR_CURRENT_Close (motor_current_ctrl_t *const p_ctrl)</code> | |
| Disables specified Motor Current Module. Implements <code>motor_current_api_t::close</code> . | |
| Return values | |
| <code>FSP_SUCCESS</code> | Successfully closed. |
| <code>FSP_ERR_ASSERTION</code> | Null pointer. |
| <code>FSP_ERR_NOT_OPEN</code> | Module is not open. |

◆ **RM_MOTOR_CURRENT_Reset()**

```
fsp_err_t RM_MOTOR_CURRENT_Reset ( motor_current_ctrl_t *const p_ctrl)
```

Reset variables of Motor Current Module. Implements `motor_current_api_t::reset`.

Return values

| | |
|-------------------|---------------------|
| FSP_SUCCESS | Successfully reset. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_CURRENT_Run()**

```
fsp_err_t RM_MOTOR_CURRENT_Run ( motor_current_ctrl_t *const p_ctrl)
```

Run(Start) the Current Control. Implements `motor_current_api_t::run`.

Return values

| | |
|-------------------|---------------------|
| FSP_SUCCESS | Successfully run. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_CURRENT_ParameterSet()**

```
fsp_err_t RM_MOTOR_CURRENT_ParameterSet ( motor_current_ctrl_t *const p_ctrl,
motor_current_input_t const *const p_st_input )
```

Set (Input) Parameter Data. Implements `motor_current_api_t::parameterSet`.

Return values

| | |
|--------------------------|---------------------------|
| FSP_SUCCESS | Successfully data is set. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input argument error. |

◆ **RM_MOTOR_CURRENT_CurrentReferenceSet()**

```
fsp_err_t RM_MOTOR_CURRENT_CurrentReferenceSet ( motor_current_ctrl_t *const p_ctrl, float
const id_reference, float const iq_reference )
```

Set Current Reference Data. Implements `motor_current_api_t::currentReferenceSet`.

Return values

| | |
|-------------------|---------------------------|
| FSP_SUCCESS | Successfully data is set. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_CURRENT_SpeedPhaseSet()**

```
fsp_err_t RM_MOTOR_CURRENT_SpeedPhaseSet ( motor_current_ctrl_t *const p_ctrl, float const
speed, float const phase )
```

Set Current Speed & rotor phase Data. Implements `motor_current_api_t::speedPhaseSet`.

Return values

| | |
|-------------------|---------------------------|
| FSP_SUCCESS | Successfully data is set. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_CURRENT_CurrentSet()**

```
fsp_err_t RM_MOTOR_CURRENT_CurrentSet ( motor_current_ctrl_t *const p_ctrl,
motor_current_input_current_t const *const p_st_current, motor_current_input_voltage_t const
*const p_st_voltage )
```

Set d/q-axis Current & Voltage Data. Implements `motor_current_api_t::currentSet`.

Return values

| | |
|--------------------------|---------------------------|
| FSP_SUCCESS | Successfully data is set. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter error. |

◆ **RM_MOTOR_CURRENT_ParameterGet()**

```
fsp_err_t RM_MOTOR_CURRENT_ParameterGet ( motor_current_ctrl_t *const p_ctrl,
motor_current_output_t *const p_st_output )
```

Get Output Parameters. Implements `motor_current_api_t::parameterGet`.

Return values

| | |
|--------------------------|------------------------|
| FSP_SUCCESS | Successful data get. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter error. |

◆ **RM_MOTOR_CURRENT_CurrentGet()**

```
fsp_err_t RM_MOTOR_CURRENT_CurrentGet ( motor_current_ctrl_t *const p_ctrl, float *const p_id,
float *const p_iq )
```

Get d/q-axis Current. Implements `motor_current_api_t::currentGet`.

Return values

| | |
|--------------------------|------------------------|
| FSP_SUCCESS | Successful data get. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter error. |

◆ **RM_MOTOR_CURRENT_PhaseVoltageGet()**

```
fsp_err_t RM_MOTOR_CURRENT_PhaseVoltageGet ( motor_current_ctrl_t *const p_ctrl,
motor_current_get_voltage_t *const p_voltage )
```

Gets the set phase voltage. Implements `motor_current_api_t::phaseVoltageGet`.

Return values

| | |
|--------------------------|------------------------------|
| FSP_SUCCESS | Successful data calculation. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter error. |

◆ **RM_MOTOR_CURRENT_ParameterUpdate()**

```
fsp_err_t RM_MOTOR_CURRENT_ParameterUpdate ( motor_current_ctrl_t *const p_ctrl,
motor_current_cfg_t const *const p_cfg )
```

Update the parameters of Current Control. Implements `motor_current_api_t::parameterUpdate`.

Return values

| | |
|-------------------|--------------------------------|
| FSP_SUCCESS | Successfully data was updated. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **rm_motor_current_encoder_cyclic()**

```
void rm_motor_current_encoder_cyclic ( motor_current_instance_t const * p_ctrl)
```

```
(end addtogroup MOTOR_CURRENT)
```

Detailed Description

Control a SPM motor on RA MCUs. This module implements the [Motor Encoder Vector Control \(rm_motor_encoder\)](#).

Overview

The motor encoder vector control is used to control motor rotation in an application. This module is meant to be used with Surface Permanent Magnet (SPM) motors and allows applications to start or stop motor rotation easily.

Features

The motor encoder module has below features.

- Start/stop motor rotation
- Error detection (over current, over speed, over voltage, low voltage)

Configuration

Build Time Configurations for `rm_motor_encoder`

The following build time configurations are defined in `fsp_cfg/rm_motor_encoder_cfg.h`:

| Configuration | Options | Default | Description |
|--------------------|--|---------------|---|
| Parameter Checking | <ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

Configurations for Motor > Motor Encoder Vector Control (rm_motor_encoder)

This module can be added to the Stacks tab via New Stack > Motor > Motor Encoder Vector Control (rm_motor_encoder).

| Configuration | Options | Default | Description |
|-------------------------------------|-------------------------------|------------------|--|
| General > Name | Name must be a valid C symbol | g_motor_encoder0 | Module name. |
| General > Limit of over current (A) | Must be a valid value | 2.0F | Limit of over current.(Detection threshold) |
| General > Limit of over voltage (V) | Must be a valid value | 28.0F | Limit of over voltage.(Detection threshold) |
| General > Limit of over speed (rpm) | Must be a valid value | 2100.0F | Limit of over speed.(Detection threshold) |
| General > Limit of low voltage (V) | Must be a valid value | 18.0F | Limit of low voltage.(Detection threshold) |
| Interrupts > Callback | Name must be a valid C symbol | NULL | A user callback function. If this callback function is provided, it is called at speed control cyclic interrupt. |

Clock Configuration

This module doesn't depend on clock setting, because this module is a simple status transition process.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Limitations

Examples

Basic Example

This is a basic example of minimal use of the motor encoder module in an application.

```
void motor_encoder_basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;

    /* Initializes the module. */
    err = RM_MOTOR_ENCODER_Open(g_motor_encoder0.p_ctrl, g_motor_encoder0.p_cfg);
    handle_error(err);

    /* Set speed reference before motor run */
    (void) RM_MOTOR_ENCODER_SpeedSet(g_motor_encoder0.p_ctrl,
RM_MOTOR_ENCODER_TEST_OVER_SPEED_LIMIT);

    /* Set position reference before motor run */
    (void) RM_MOTOR_ENCODER_PositionSet(g_motor_encoder0.p_ctrl, &g_posref_sample1);

    /* Start motor rotation */
    (void) RM_MOTOR_ENCODER_Run(g_motor_encoder0.p_ctrl);

    /* Get current status */
    (void) RM_MOTOR_ENCODER_StatusGet(g_motor_encoder0.p_ctrl, &smpl_status);

    /* Get current rotor angle */
    (void) RM_MOTOR_ENCODER_AngleGet(g_motor_encoder0.p_ctrl, &smpl_angle);

    /* Get current motor speed */
    (void) RM_MOTOR_ENCODER_SpeedGet(g_motor_encoder0.p_ctrl, &smpl_speed);

    /* Check error */
    (void) RM_MOTOR_ENCODER_ErrorCheck(g_motor_encoder0.p_ctrl, &smpl_error);

    /* Stop motor rotation */
    (void) RM_MOTOR_ENCODER_Stop(g_motor_encoder0.p_ctrl);

    /* Stop motor rotation */
    (void) RM_MOTOR_ENCODER_ErrorSet(g_motor_encoder0.p_ctrl,
MOTOR_ERROR_OVER_CURRENT_HW);

    /* Reset Speed Control */
    (void) RM_MOTOR_ENCODER_Reset(g_motor_encoder0.p_ctrl);

    /* Close Speed Control */
    (void) RM_MOTOR_ENCODER_Close(g_motor_encoder0.p_ctrl);
}
```

Enumerations

enum [motor_encoder_ctrl_t](#)

enum `motor_encoder_ctrl_event_t`

Enumeration Type Documentation

◆ `motor_encoder_ctrl_t`

| enum <code>motor_encoder_ctrl_t</code> | |
|--|-------------|
| Enumerator | |
| <code>MOTOR_ENCODER_CTRL_STOP</code> | Stop mode. |
| <code>MOTOR_ENCODER_CTRL_RUN</code> | Run mode. |
| <code>MOTOR_ENCODER_CTRL_ERROR</code> | Error mode. |

◆ `motor_encoder_ctrl_event_t`

| enum <code>motor_encoder_ctrl_event_t</code> | |
|--|--------------|
| Enumerator | |
| <code>MOTOR_ENCODER_CTRL_EVENT_STOP</code> | Stop event. |
| <code>MOTOR_ENCODER_CTRL_EVENT_RUN</code> | Run event. |
| <code>MOTOR_ENCODER_CTRL_EVENT_ERROR</code> | Error event. |
| <code>MOTOR_ENCODER_CTRL_EVENT_RESET</code> | Reset event. |

Function Documentation

◆ **RM_MOTOR_ENCODER_Open()**

```
fsp_err_t RM_MOTOR_ENCODER_Open ( motor_ctrl_t *const p_ctrl, motor_cfg_t const *const p_cfg )
```

Configure the MOTOR in register start mode. Implements `motor_api_t::open`.

This function should only be called once as MOTOR configuration registers can only be written to once so subsequent calls will have no effect.

Example:

```
/* Initializes the module. */
err = RM_MOTOR_ENCODER_Open(g_motor_encoder0.p_ctrl, g_motor_encoder0.p_cfg);
```

Return values

| | |
|--------------------------|--|
| FSP_SUCCESS | MOTOR successfully configured. |
| FSP_ERR_ASSERTION | Null pointer, or one or more configuration options is invalid. |
| FSP_ERR_ALREADY_OPEN | Module is already open. This module can only be opened once. |
| FSP_ERR_INVALID_ARGUMENT | Configuration parameter error. |

Note

◆ **RM_MOTOR_ENCODER_Close()**

```
fsp_err_t RM_MOTOR_ENCODER_Close ( motor_ctrl_t *const p_ctrl)
```

Disables specified Motor Encoder Control block. Implements `motor_api_t::close`.

Example:

```
/* Close Speed Control */
(void) RM_MOTOR_ENCODER_Close(g_motor_encoder0.p_ctrl);
```

Return values

| | |
|-------------------|----------------------|
| FSP_SUCCESS | Successfully closed. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

Note

◆ **RM_MOTOR_ENCODER_Reset()**

```
fsp_err_t RM_MOTOR_ENCODER_Reset ( motor_ctrl_t *const p_ctrl)
```

Reset Motor Encoder Control block. Implements `motor_api_t::reset`.

Example:

```
/* Reset Speed Control */
(void) RM_MOTOR_ENCODER_Reset(g_motor_encoder0.p_ctrl);
```

Return values

| | |
|-------------------|------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

Note

◆ **RM_MOTOR_ENCODER_Run()**

```
fsp_err_t RM_MOTOR_ENCODER_Run ( motor_ctrl_t *const p_ctrl)
```

Run Motor (Start motor rotation). Implements `motor_api_t::run`.

Example:

```
/* Start motor rotation */
(void) RM_MOTOR_ENCODER_Run(g_motor_encoder0.p_ctrl);
```

Return values

| | |
|-------------------|------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

Note

◆ **RM_MOTOR_ENCODER_Stop()**

```
fsp_err_t RM_MOTOR_ENCODER_Stop ( motor_ctrl_t *const p_ctrl)
```

Stop Motor (Stop motor rotation). Implements `motor_api_t::stop`.

Example:

```
/* Stop motor rotation */
(void) RM_MOTOR_ENCODER_Stop(g_motor_encoder0.p_ctrl);
```

Return values

| | |
|-------------------|------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

Note

◆ **RM_MOTOR_ENCODER_ErrorSet()**

```
fsp_err_t RM_MOTOR_ENCODER_ErrorSet ( motor_ctrl_t *const p_ctrl, motor_error_t const error )
```

Set error information. Implements `motor_api_t::errorSet`.

Example:

```
/* Stop motor rotation */
(void) RM_MOTOR_ENCODER_ErrorSet(g_motor_encoder0.p_ctrl,
MOTOR_ERROR_OVER_CURRENT_HW);
```

Return values

| | |
|-------------------|------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

Note

◆ **RM_MOTOR_ENCODER_SpeedSet()**

```
fsp_err_t RM_MOTOR_ENCODER_SpeedSet ( motor_ctrl_t *const p_ctrl, float const speed_rpm )
```

Set speed reference[rpm]. Implements `motor_api_t::speedSet`.

Example:

```
/* Set speed reference before motor run */
(void) RM_MOTOR_ENCODER_SpeedSet(g_motor_encoder0.p_ctrl,
RM_MOTOR_ENCODER_TEST_OVER_SPEED_LIMIT);
```

Return values

| | |
|-------------------|------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

Note

◆ **RM_MOTOR_ENCODER_PositionSet()**

```
fsp_err_t RM_MOTOR_ENCODER_PositionSet ( motor_ctrl_t *const p_ctrl,
motor_speed_position_data_t const *const p_position )
```

Set position reference[degree]. Implements `motor_api_t::positionSet`.

Example:

```
/* Set position reference before motor run */
(void) RM_MOTOR_ENCODER_PositionSet(g_motor_encoder0.p_ctrl, &g_posref_sample1);
```

Return values

| | |
|--------------------------|-------------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Data set pointer is invalid.. |

Note

◆ **RM_MOTOR_ENCODER_StatusGet()**

```
fsp_err_t RM_MOTOR_ENCODER_StatusGet ( motor_ctrl_t *const p_ctrl, uint8_t *const p_status )
```

Get current control status. Implements `motor_api_t::statusGet`.

Example:

```
/* Get current status */
(void) RM_MOTOR_ENCODER_StatusGet(g_motor_encoder0.p_ctrl, &smpl_status);
```

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Data received pointer is invalid.. |

Note

◆ **RM_MOTOR_ENCODER_AngleGet()**

```
fsp_err_t RM_MOTOR_ENCODER_AngleGet ( motor_ctrl_t *const p_ctrl, float *const p_angle_rad )
```

Get current rotor angle. Implements `motor_api_t::angleGet`.

Example:

```
/* Get current rotor angle */
(void) RM_MOTOR_ENCODER_AngleGet(g_motor_encoder0.p_ctrl, &smpl_angle);
```

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Data received pointer is invalid.. |

Note

◆ **RM_MOTOR_ENCODER_SpeedGet()**

```
fsp_err_t RM_MOTOR_ENCODER_SpeedGet ( motor_ctrl_t *const p_ctrl, float *const p_speed_rpm )
```

Get rotational speed. Implements `motor_api_t::speedGet`.

Example:

```
/* Get current motor speed */
(void) RM_MOTOR_ENCODER_SpeedGet(g_motor_encoder0.p_ctrl, &smpl_speed);
```

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Data received pointer is invalid.. |

Note

◆ **RM_MOTOR_ENCODER_ErrorCheck()**

```
fsp_err_t RM_MOTOR_ENCODER_ErrorCheck ( motor_ctrl_t *const p_ctrl, uint16_t *const p_error )
```

Check the occurrence of Error. Implements `motor_api_t::errorCheck`.

Example:

```
/* Check error */
(void) RM_MOTOR_ENCODER_ErrorCheck(g_motor_encoder0.p_ctrl, &smpl_error);
```

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Data received pointer is invalid.. |

Note

◆ **RM_MOTOR_ENCODER_WaitStopFlagGet()**

```
fsp_err_t RM_MOTOR_ENCODER_WaitStopFlagGet ( motor_ctrl_t *const p_ctrl,
motor_wait_stop_flag_t *const p_flag )
```

Get wait stop flag. Implements `motor_api_t::waitStopFlagGet`.

Example:

Return values

| | |
|---------------------|--------------|
| FSP_ERR_UNSUPPORTED | Unsupported. |
|---------------------|--------------|

Note

◆ **RM_MOTOR_ENCODER_FunctionSelect()**

```
fsp_err_t RM_MOTOR_ENCODER_FunctionSelect ( motor_ctrl_t *const p_ctrl,
motor_function_select_t const function )
```

Select using function. Implements `motor_api_t::functionSelect`.

Return values

| | |
|----------------------|------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_MODE | Mode unmatch |

Note

◆ **RM_MOTOR_ENCODER_InertiaEstimateStart()**

```
fsp_err_t RM_MOTOR_ENCODER_InertiaEstimateStart ( motor_ctrl_t *const p_ctrl)
```

Start inertia estimation function.

Return values

| | |
|----------------------|------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_MODE | Mode unmatch |

Note

◆ **RM_MOTOR_ENCODER_InertiaEstimateStop()**

```
fsp_err_t RM_MOTOR_ENCODER_InertiaEstimateStop ( motor_ctrl_t *const p_ctrl)
```

Stop(Cancel) inertia estimation function.

Return values

| | |
|----------------------|------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_MODE | Mode unmatched |

Note

◆ **RM_MOTOR_ENCODER_ReturnOriginStart()**

```
fsp_err_t RM_MOTOR_ENCODER_ReturnOriginStart ( motor_ctrl_t *const p_ctrl)
```

Start return origin function.

Return values

| | |
|----------------------|------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_MODE | Mode unmatched |

Note

◆ RM_MOTOR_ENCODER_ReturnOriginStop()

`fsp_err_t RM_MOTOR_ENCODER_ReturnOriginStop (motor_ctrl_t *const p_ctrl)`

Stop(Cancel) return origin function.

Return values

| | |
|----------------------|------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_MODE | Mode unmatch |

Stop (Cancel) inertia estimation. Implements [motor_inertia_estimate_api_t::stop](#). [More...](#)

fsp_err_t RM_MOTOR_INERTIA_ESTIMATE_Reset (motor_inertia_estimate_ctrl_t *const p_ctrl)

Reset variables of inertia estimate module. Implements [motor_inertia_estimate_api_t::reset](#). [More...](#)

fsp_err_t RM_MOTOR_INERTIA_ESTIMATE_InfoGet (motor_inertia_estimate_ctrl_t *const p_ctrl, motor_inertia_estimate_info_t *const p_info)

Get information of inertia estimation. Implements [motor_inertia_estimate_api_t::infoGet](#). [More...](#)

fsp_err_t RM_MOTOR_INERTIA_ESTIMATE_DataSet (motor_inertia_estimate_ctrl_t *const p_ctrl, motor_inertia_estimate_set_data_t *const p_set_data)

Set necessary data to inertia estimation. Implements [motor_inertia_estimate_api_t::dataSet](#). [More...](#)

fsp_err_t RM_MOTOR_INERTIA_ESTIMATE_SpeedCyclic (motor_inertia_estimate_ctrl_t *const p_ctrl)

Cyclic process of inertia estimation at speed control period. Implements [motor_inertia_estimate_api_t::speedCyclic](#). [More...](#)

fsp_err_t RM_MOTOR_INERTIA_ESTIMATE_CurrentCyclic (motor_inertia_estimate_ctrl_t *const p_ctrl)

Cyclic process of inertia estimation at current control period (called at A/D conversion finish interrupt). Implements [motor_inertia_estimate_api_t::currentCyclic](#). [More...](#)

fsp_err_t RM_MOTOR_INERTIA_ESTIMATE_ParameterUpdate (motor_inertia_estimate_ctrl_t *const p_ctrl, motor_inertia_estimate_cfg_t const *const p_cfg)

Update the parameters of inertia estimate. Implements [motor_inertia_estimate_api_t::parameterUpdate](#). [More...](#)

Detailed Description

Measurement and calculation process for the motor control on RA MCUs. This module implements the [Motor Inertia Estimate Interface](#).

Overview

The motor inertia estimation module is used to measure and calculate rotor inertia in an application.

This module should be used with Renesas Motor Workbench (RMW) basically.

Features

The Motor Inertia Estimation Module has below features.

- Measurement process work automatically
- Calculate rotor inertia [kgm^2].

Configuration

Build Time Configurations for rm_motor_inertia_estimate

The following build time configurations are defined in fsp_cfg/rm_motor_inertia_estimate_cfg.h:

| Configuration | Options | Default | Description |
|--------------------|--|---------------|---|
| Parameter Checking | <ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

Configurations for Motor > Motor inertia estimation (rm_motor_inertia_estimate)

This module can be added to the Stacks tab via New Stack > Motor > Motor inertia estimation (rm_motor_inertia_estimate).

| Configuration | Options | Default | Description |
|---|--|---------------------------|---|
| General > Name | Name must be a valid C symbol | g_motor_inertia_estimate0 | Module name. |
| Moved position distance to measure (degree) | Must be set -360 to -10 or 10 to 360. | 360 | Moved position distance to measure inertia (degree) |
| Maximum speed (rpm) | Must be set over 60. | 500 | Maximum rotation speed (rpm) |
| Acceleration time | Must be a valid non-negative value. | 0.3 | Acceleration time |
| Motor inertia | Manual Entry | 0.0000041 | Motor inertia |
| Low threshold to judge speed | Must be set 0.1 to 0.5 | 0.1 | Low threshold to judge speed reached |
| High threshold to judge speed | Must be set 0.5 to 0.9, and greater than low threshold | 0.9 | High threshold to judge speed reached |
| Time to wait moving stability (sec) | Must be a valid non-negative value. | 0.8 | Time to wait moving stability |
| Cyclic period of current control (sec) | Must be a valid non-negative value. | 0.00005 | Cyclic period of current control (sec) |
| Cyclic period of speed control (sec) | Must be a valid non-negative value. | 0.0005 | Cyclic period of speed control (sec) |

| | | | |
|------------------------|-------------------------------------|---------|--|
| Motor pole pairs | Must be a valid non-negative value. | 4 | Motor pole pairs |
| Motor magnet flux (Wb) | Must be a valid non-negative value. | 0.00623 | Motor magnet flux (Wb) |
| Interval time | Must be a valid non-negative value. | 400.0 | Interval time. Please set same value as Position control |

Clock Configuration

This module doesn't depend on clock setting, because this module is a simple calculation process.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Limitations

Examples

Basic Example

This is a basic example of minimal use of the Motor Inertia Estimation in an application.

```
void motor_inertia_estimate_basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;
    /* Initializes the module. */
    err = RM_MOTOR_INERTIA_ESTIMATE_Open(&g_mtr_inertia_estimate0_ctrl,
    &g_mtr_inertia_estimate0_cfg);
    assert(FSP_SUCCESS == err);
    /* Start process. */
    err = RM_MOTOR_INERTIA_ESTIMATE_Start(&g_mtr_inertia_estimate0_ctrl);
    temp_set_data.f_iq = 1.0F;
    temp_set_data.f_speed_radian_control = 1.04F;
    temp_set_data.s2_position_degree = 180;
    temp_set_data.u1_position_state = 0;
    /* Set data to the module. */
    err = RM_MOTOR_INERTIA_ESTIMATE_DataSet(&g_mtr_inertia_estimate0_ctrl,
    &temp_set_data);
    /* Get information from the module. */
}
```

```

err = RM_MOTOR_INERTIA_ESTIMATE_InfoGet(&g_mtr_inertia_estimate0_ctrl,
&temp_information);
/* Stop process. */
err = RM_MOTOR_INERTIA_ESTIMATE_Stop(&g_mtr_inertia_estimate0_ctrl);
/* Close the module. */
err = RM_MOTOR_INERTIA_ESTIMATE_Close(&g_mtr_inertia_estimate0_ctrl);
}

```

Data Structures

```
struct motor_inertia_estimate_extended_cfg_t
```

```
struct motor_inertia_estimate_instance_ctrl_t
```

Data Structure Documentation

◆ motor_inertia_estimate_extended_cfg_t

| struct motor_inertia_estimate_extended_cfg_t | | |
|--|------------------------|--|
| Extended configurations for motor inertia estimate | | |
| Data Fields | | |
| int16_t | s2_move_degree | Moving position reference [degree]. |

Function Documentation

◆ RM_MOTOR_INERTIA_ESTIMATE_Open()

```
fsp_err_t RM_MOTOR_INERTIA_ESTIMATE_Open ( motor_inertia_estimate_ctrl_t *const p_ctrl,
motor_inertia_estimate_cfg_t const *const p_cfg )
```

Opens and configures the motor inertia estimate module. Implements `motor_inertia_estimate_api_t::open`.

Example:

```
/* Initializes the module. */
err = RM_MOTOR_INERTIA_ESTIMATE_Open(&g_mtr_inertia_estimate0_ctrl,
&g_mtr_inertia_estimate0_cfg);
```

Return values

| | |
|--------------------------|--|
| FSP_SUCCESS | Motor inertia estimate module successfully configured. |
| FSP_ERR_ASSERTION | Null pointer, or one or more configuration options is invalid. |
| FSP_ERR_ALREADY_OPEN | Module is already open. This module can only be opened once. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter error. |

◆ RM_MOTOR_INERTIA_ESTIMATE_Close()

`fsp_err_t RM_MOTOR_INERTIA_ESTIMATE_Close (motor_inertia_estimate_ctrl_t *const p_ctrl)`

Disables specified motor inertia estimate module. Implements `motor_inertia_estimate_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MOTOR_INERTIA_ESTIMATE_Close(&g_mtr_inertia_estimate0_ctrl);
```

Return values

| | |
|-------------------|----------------------|
| FSP_SUCCESS | Successfully closed. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_MOTOR_INERTIA_ESTIMATE_Start()

`fsp_err_t RM_MOTOR_INERTIA_ESTIMATE_Start (motor_inertia_estimate_ctrl_t *const p_ctrl)`

Start inertia estimation. Implements `motor_inertia_estimate_api_t::start`.

Example:

```
/* Start process. */
err = RM_MOTOR_INERTIA_ESTIMATE_Start(&g_mtr_inertia_estimate0_ctrl);
```

Return values

| | |
|-------------------|-----------------------|
| FSP_SUCCESS | Successfully started. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_INERTIA_ESTIMATE_Stop()**

```
fsp_err_t RM_MOTOR_INERTIA_ESTIMATE_Stop ( motor_inertia_estimate_ctrl_t *const p_ctrl)
```

Stop (Cancel) inertia estimation. Implements `motor_inertia_estimate_api_t::stop`.

Example:

```
/* Stop process. */
err = RM_MOTOR_INERTIA_ESTIMATE_Stop(&g_mtr_inertia_estimate0_ctrl);
```

Return values

| | |
|-------------------|----------------------------------|
| FSP_SUCCESS | Successfully stopped (canceled). |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_INERTIA_ESTIMATE_Reset()**

```
fsp_err_t RM_MOTOR_INERTIA_ESTIMATE_Reset ( motor_inertia_estimate_ctrl_t *const p_ctrl)
```

Reset variables of inertia estimate module. Implements `motor_inertia_estimate_api_t::reset`.

Return values

| | |
|-------------------|---------------------|
| FSP_SUCCESS | Successfully reset. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_INERTIA_ESTIMATE_InfoGet()**

```
fsp_err_t RM_MOTOR_INERTIA_ESTIMATE_InfoGet ( motor_inertia_estimate_ctrl_t *const p_ctrl,
motor_inertia_estimate_info_t *const p_info )
```

Get information of inertia estimation. Implements `motor_inertia_estimate_api_t::infoGet`.

Example:

```
/* Get information from the module. */
err = RM_MOTOR_INERTIA_ESTIMATE_InfoGet(&g_mtr_inertia_estimate0_ctrl,
&temp_information);
```

Return values

| | |
|--------------------------|------------------------------|
| FSP_SUCCESS | Successfully get data. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Argument pointer is invalid. |

◆ **RM_MOTOR_INERTIA_ESTIMATE_DataSet()**

```
fsp_err_t RM_MOTOR_INERTIA_ESTIMATE_DataSet ( motor_inertia_estimate_ctrl_t *const p_ctrl,
motor_inertia_estimate_set_data_t *const p_set_data )
```

Set necessary data to inertia estimation. Implements `motor_inertia_estimate_api_t::dataSet`.

Example:

```
/* Set data to the module. */
err = RM_MOTOR_INERTIA_ESTIMATE_DataSet(&g_mtr_inertia_estimate0_ctrl,
&temp_set_data);
```

Return values

| | |
|--------------------------|------------------------|
| FSP_SUCCESS | Successfully set data. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter error. |

◆ **RM_MOTOR_INERTIA_ESTIMATE_SpeedCyclic()**

`fsp_err_t RM_MOTOR_INERTIA_ESTIMATE_SpeedCyclic (motor_inertia_estimate_ctrl_t *const p_ctrl)`

Cyclic process of inertia estimation at speed control period. Implements `motor_inertia_estimate_api_t::speedCyclic`.

Return values

| | |
|-------------------|-----------------------------------|
| FSP_SUCCESS | Successfully perform the process. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_INERTIA_ESTIMATE_CurrentCyclic()**

`fsp_err_t RM_MOTOR_INERTIA_ESTIMATE_CurrentCyclic (motor_inertia_estimate_ctrl_t *const p_ctrl)`

Cyclic process of inertia estimation at current control period (called at A/D conversion finish interrupt). Implements `motor_inertia_estimate_api_t::currentCyclic`.

Return values

| | |
|-------------------|-----------------------------------|
| FSP_SUCCESS | Successfully perform the process. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_INERTIA_ESTIMATE_ParameterUpdate()**

`fsp_err_t RM_MOTOR_INERTIA_ESTIMATE_ParameterUpdate (motor_inertia_estimate_ctrl_t *const p_ctrl, motor_inertia_estimate_cfg_t const *const p_cfg)`

Update the parameters of inertia estimate. Implements `motor_inertia_estimate_api_t::parameterUpdate`.

Return values

| | |
|--------------------------|--------------------------------|
| FSP_SUCCESS | Successfully data was updated. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter error. |

5.2.11.13 Motor Position Controller (rm_motor_position)

Modules » Motor

Functions

`fsp_err_t` `RM_MOTOR_POSITION_Open` (`motor_position_ctrl_t *const p_ctrl`,
`motor_position_cfg_t const *const p_cfg`)

Opens and configures the Motor Position Module. Implements `motor_position_api_t::open`. [More...](#)

`fsp_err_t` `RM_MOTOR_POSITION_Close` (`motor_position_ctrl_t *const p_ctrl`)

Disables specified Motor Position Module. Implements `motor_position_api_t::close`. [More...](#)

`fsp_err_t` `RM_MOTOR_POSITION_Reset` (`motor_position_ctrl_t *const p_ctrl`)

Reset the variables of Motor Position Module. Implements `motor_position_api_t::reset`. [More...](#)

`fsp_err_t` `RM_MOTOR_POSITION_PositionGet` (`motor_position_ctrl_t *const p_ctrl`,
`int16_t *const p_position`)

Get Rotor Position Data [degree]. Implements `motor_position_api_t::positionGet`. [More...](#)

`fsp_err_t` `RM_MOTOR_POSITION_PositionSet` (`motor_position_ctrl_t *const p_ctrl`,
`float const position_rad`)

Set Position Data from Encoder [radian]. Implements `motor_position_api_t::positionSet`. [More...](#)

`fsp_err_t` `RM_MOTOR_POSITION_PositionReferenceSet` (`motor_position_ctrl_t *const p_ctrl`,
`int16_t const position_reference_deg`)

Set Position Reference Data [degree]. Implements `motor_position_api_t::positionReferenceSet`. [More...](#)

`fsp_err_t` `RM_MOTOR_POSITION_ControlModeSet` (`motor_position_ctrl_t *const p_ctrl`,
`motor_position_ctrl_mode_t const mode`)

Set Position Control Mode. Implements `motor_position_api_t::controlModeSet`. [More...](#)

`fsp_err_t` `RM_MOTOR_POSITION_PositionControl` (`motor_position_ctrl_t *const p_ctrl`)

Calculates internal position reference.(Main process of Position Control) Implements [motor_position_api_t::positionControl](#). [More...](#)

`fsp_err_t` [RM_MOTOR_POSITION_IpdSpeedPControl](#) ([motor_position_ctrl_t](#) *const p_ctrl, float const ref_speed_rad, float const speed_rad, float *const p_iq_ref)

Calculates the q-axis current reference by P control. Implements [motor_position_api_t::ipdSpeedPControl](#). [More...](#)

`fsp_err_t` [RM_MOTOR_POSITION_SpeedReferencePControlGet](#) ([motor_position_ctrl_t](#) *const p_ctrl, float *const p_speed_ref)

Get Speed Reference by P Control. Implements [motor_position_api_t::speedReferencePControlGet](#). [More...](#)

`fsp_err_t` [RM_MOTOR_POSITION_SpeedReferenceIpdControlGet](#) ([motor_position_ctrl_t](#) *const p_ctrl, float const max_speed_rad, float *const p_speed_ref)

Get Speed Reference by IPD Control. Implements [motor_position_api_t::speedReferenceIpdControlGet](#). [More...](#)

`fsp_err_t` [RM_MOTOR_POSITION_SpeedReferenceFeedforwardGet](#) ([motor_position_ctrl_t](#) *const p_ctrl, float *const p_speed_ref)

Get Speed Reference by Feedforward. Implements [motor_position_api_t::speedReferenceFeedforwardGet](#). [More...](#)

`fsp_err_t` [RM_MOTOR_POSITION_InfoGet](#) ([motor_position_ctrl_t](#) *const p_ctrl, [motor_position_info_t](#) *const p_info)

Get position information. [More...](#)

`fsp_err_t` [RM_MOTOR_POSITION_ParameterUpdate](#) ([motor_position_ctrl_t](#) *const p_ctrl, [motor_position_cfg_t](#) const *const p_cfg)

Update the parameters of Position Control Calculation. Implements [motor_position_api_t::parameterUpdate](#). [More...](#)

Detailed Description

Calculation process for the motor control on RA MCUs. This module implements the [Motor position Interface](#).

Overview

The motor position is used to control the position of motor rotor in an application. This module should be called cyclically in an application (e.g. in cyclic timer interrupt). This module calculates speed reference with inputted position reference and current rotational speed.

Features

The Motor Position Module has below features.

- Calculate speed reference.

Configuration

Build Time Configurations for rm_motor_position

The following build time configurations are defined in fsp_cfg/rm_motor_position_cfg.h:

| Configuration | Options | Default | Description |
|--------------------|--|---------------|---|
| Parameter Checking | <ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

Configurations for Motor > Motor Position Controller (rm_motor_position)

This module can be added to the Stacks tab via New Stack > Motor > Motor Position Controller (rm_motor_position).

| Configuration | Options | Default | Description |
|---|---|-------------------|-----------------------------------|
| General > Name | Name must be a valid C symbol | g_motor_position0 | Module name. |
| General > Position dead band | Manual Entry | 1U | Ignored area of position control. |
| General > Position band limit | Manual Entry | 3U | Ignored area of position control. |
| General > Speed feedforward ratio | Must be a valid value | 0.8F | Speed feedforward ratio. |
| General > Encoder counts per one rotation | Must be a valid value | 1200.0F | Encoder counts per one rotation. |
| General > Position omega | Must be a valid value | 10.0F | Position control omega. |
| General > Period of speed control (sec) | Must be a valid value | 0.0005F | Period of speed control. |
| IPD > IPD LPF | <ul style="list-style-type: none"> • Disable • Enable | Disable | IPD LPF process enable or disable |
| IPD > Position Kp ratio | Must be a valid value | 0.3F | Position Kp ratio. |
| IPD > Position feedforward ratio | Must be a valid value | 0.0F | Position feedforward ratio. |

| | | | |
|---|-----------------------|-------------|---------------------------------|
| IPD > Speed K ratio | Must be a valid value | 2.0F | Speed K ratio |
| IPD > Error Limit #1 | Must be a valid value | 10.0F | Error limitation #1 |
| IPD > Error limit #2 | Must be a valid value | 0.2F | Error limitation #2 |
| IPD > LPF omega | Must be a valid value | 500.0F | LPF omega. |
| IPD > LPF zeta | Must be a valid value | 1.0F | LPF zeta. |
| Position Profiling > Interval time | Manual Entry | 400U | Interval time. |
| Position Profiling > Accel time | Must be a valid value | 0.3F | Accel time. |
| Position Profiling > Maximum accel time (sec) | Must be a valid value | 8117.96F | Maximum acceleration time (sec) |
| Position Profiling > Acceleration maximum speed | Must be a valid value | 2000.0F | Acceleration maximum speed. |
| Position Profiling > Update step of timer | Must be a valid value | 0.0005F | Update step of timer. |
| Motor Parameter > Pole pair | Manual Entry | 7 | Pole pair |
| Motor Parameter > Resistance (ohm) | Must be a valid value | 0.453F | Resistance |
| Motor Parameter > Inductance of d-axis (H) | Must be a valid value | 0.0009447F | Inductance of d-axis |
| Motor Parameter > Inductance of q-axis (H) | Must be a valid value | 0.0009447F | Inductance of q-axis |
| Motor Parameter > Permanent magnetic flux (Wb) | Must be a valid value | 0.006198F | Permanent magnetic flux |
| Motor Parameter > Motor inertia (kgm ²) | Must be a valid value | 0.00000962F | Motor inertia |

Clock Configuration

This module doesn't depend on clock setting, because this module is a simple calculation process.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Limitations

- Set the period of speed control with non-negative value.
- Set the limit of speed change step with non-negative value.
- Set the maximum speed with non-negative value.

Examples

Basic Example

This is a basic example of using the Motor Position module in an application.

```
void motor_position_basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;
    /* Initializes the module. */
    err = RM_MOTOR_POSITION_Open(g_motor_position0.p_ctrl, g_motor_position0.p_cfg);
    handle_error(err);
    /* Set working mode */
    RM_MOTOR_POSITION_ModeSet(g_motor_position0.p_ctrl,
MOTOR_POSITION_CTRL_MODE_STEP);
    /* Set position reference */
    RM_MOTOR_POSITION_PositionReferenceSet(g_motor_position0.p_ctrl, 180U);
    /* Basically run this module at cyclic interrupt (e.g. AGT timer).
    * This implementation is an example. */
    // while (true)
    {
        /* Application work here. */
        /* Perform Position Control Process */
        RM_MOTOR_POSITION_PositionControl(g_motor_position0.p_ctrl);
        /* Perform Speed IPD Control Process */
        RM_MOTOR_POSITION_IpdSpeedPControl(g_motor_position0.p_ctrl, 0.0F, 0.0F,
&temp_iq_ref);
        /* Get Position */
        RM_MOTOR_POSITION_PositionGet(g_motor_position0.p_ctrl, &temp_position);
        /* Update parameters */
        RM_MOTOR_POSITION_ParameterUpdate(g_motor_position0.p_ctrl,
&g_motor_position0.p_cfg);
    }
    /* Reset Speed Control */
}
```

```

RM_MOTOR_POSITION_Reset(g_motor_position0.p_ctrl);

/* Close Speed Control */

RM_MOTOR_POSITION_Close(g_motor_position0.p_ctrl);
}

```

Enumerations

```
enum motor_position_ipd_lpf_t
```

Enumeration Type Documentation

◆ motor_position_ipd_lpf_t

| enum motor_position_ipd_lpf_t | |
|--------------------------------|-------------------------|
| Enumerator | |
| MOTOR_POSITION_IPD_LPF_DISABLE | ipd control is disabled |
| MOTOR_POSITION_IPD_LPF_ENABLE | ipd control is enabled |

Function Documentation

◆ RM_MOTOR_POSITION_Open()

```
fsp_err_t RM_MOTOR_POSITION_Open ( motor_position_ctrl_t *const p_ctrl, motor_position_cfg_t
const *const p_cfg )
```

Opens and configures the Motor Position Module. Implements [motor_position_api_t::open](#).

Return values

| | |
|--------------------------|--|
| FSP_SUCCESS | Motor Position Module successfully configured. |
| FSP_ERR_ASSERTION | Null pointer, or one or more configuration options is invalid. |
| FSP_ERR_ALREADY_OPEN | Module is already open. This module can only be opened once. |
| FSP_ERR_INVALID_ARGUMENT | Set parameter is invalid. |

◆ **RM_MOTOR_POSITION_Close()**

```
fsp_err_t RM_MOTOR_POSITION_Close ( motor_position_ctrl_t *const p_ctrl)
```

Disables specified Motor Position Module. Implements `motor_position_api_t::close`.

Return values

| | |
|-------------------|----------------------|
| FSP_SUCCESS | Successfully closed. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_POSITION_Reset()**

```
fsp_err_t RM_MOTOR_POSITION_Reset ( motor_position_ctrl_t *const p_ctrl)
```

Reset the variables of Motor Position Module. Implements `motor_position_api_t::reset`.

Return values

| | |
|-------------------|---------------------|
| FSP_SUCCESS | Successfully reset. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_POSITION_PositionGet()**

```
fsp_err_t RM_MOTOR_POSITION_PositionGet ( motor_position_ctrl_t *const p_ctrl, int16_t *const p_position )
```

Get Rotor Position Data [degree]. Implements `motor_position_api_t::positionGet`.

Return values

| | |
|--------------------------|---------------------------|
| FSP_SUCCESS | Successfully data is set. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Output pointer is NULL. |

◆ **RM_MOTOR_POSITION_PositionSet()**

```
fsp_err_t RM_MOTOR_POSITION_PositionSet ( motor_position_ctrl_t *const p_ctrl, float const position_rad )
```

Set Position Data from Encoder [radian]. Implements [motor_position_api_t::positionSet](#).

Return values

| | |
|-------------------|---------------------------|
| FSP_SUCCESS | Successfully data is set. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_POSITION_PositionReferenceSet()**

```
fsp_err_t RM_MOTOR_POSITION_PositionReferenceSet ( motor_position_ctrl_t *const p_ctrl, int16_t const position_reference_deg )
```

Set Position Reference Data [degree]. Implements [motor_position_api_t::positionReferenceSet](#).

Return values

| | |
|-------------------|---------------------------|
| FSP_SUCCESS | Successfully data is set. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_POSITION_ControlModeSet()**

```
fsp_err_t RM_MOTOR_POSITION_ControlModeSet ( motor_position_ctrl_t *const p_ctrl, motor_position_ctrl_mode_t const mode )
```

Set Position Control Mode. Implements [motor_position_api_t::controlModeSet](#).

Return values

| | |
|-------------------|---------------------------|
| FSP_SUCCESS | Successfully data is set. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_POSITION_PositionControl()**

`fsp_err_t RM_MOTOR_POSITION_PositionControl (motor_position_ctrl_t *const p_ctrl)`

Calculates internal position reference.(Main process of Position Control) Implements `motor_position_api_t::positionControl`.

Return values

| | |
|-------------------|------------------------------|
| FSP_SUCCESS | Successful data calculation. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_POSITION_IpdSpeedPControl()**

`fsp_err_t RM_MOTOR_POSITION_IpdSpeedPControl (motor_position_ctrl_t *const p_ctrl, float const ref_speed_rad, float const speed_rad, float *const p_iq_ref)`

Calculates the q-axis current reference by P control. Implements `motor_position_api_t::ipdSpeedPControl`.

Return values

| | |
|--------------------------|------------------------------|
| FSP_SUCCESS | Successful data calculation. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Output pointer is NULL. |

◆ **RM_MOTOR_POSITION_SpeedReferencePControlGet()**

`fsp_err_t RM_MOTOR_POSITION_SpeedReferencePControlGet (motor_position_ctrl_t *const p_ctrl, float *const p_speed_ref)`

Get Speed Reference by P Control. Implements `motor_position_api_t::speedReferencePControlGet`.

Return values

| | |
|--------------------------|---------------------------|
| FSP_SUCCESS | Successfully data is set. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Output pointer is NULL. |

◆ **RM_MOTOR_POSITION_SpeedReferenceIpdControlGet()**

```
fsp_err_t RM_MOTOR_POSITION_SpeedReferenceIpdControlGet ( motor_position_ctrl_t *const p_ctrl,
float const max_speed_rad, float *const p_speed_ref )
```

Get Speed Reference by IPD Control. Implements `motor_position_api_t::speedReferenceIpdControlGet`.

Return values

| | |
|--------------------------|---------------------------|
| FSP_SUCCESS | Successfully data is set. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Output pointer is NULL. |

◆ **RM_MOTOR_POSITION_SpeedReferenceFeedforwardGet()**

```
fsp_err_t RM_MOTOR_POSITION_SpeedReferenceFeedforwardGet ( motor_position_ctrl_t *const
p_ctrl, float *const p_speed_ref )
```

Get Speed Reference by Feedforward. Implements `motor_position_api_t::speedReferenceFeedforwardGet`.

Return values

| | |
|--------------------------|---------------------------|
| FSP_SUCCESS | Successfully data is set. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Output pointer is NULL. |

◆ **RM_MOTOR_POSITION_InfoGet()**

```
fsp_err_t RM_MOTOR_POSITION_InfoGet ( motor_position_ctrl_t *const p_ctrl, motor_position_info_t
*const p_info )
```

Get position information.

Return values

| | |
|--------------------------|---------------------------|
| FSP_SUCCESS | Successfully data is set. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Output pointer is NULL. |

◆ RM_MOTOR_POSITION_ParameterUpdate()

```
fsp_err_t RM_MOTOR_POSITION_ParameterUpdate ( motor_position_ctrl_t *const p_ctrl,
motor_position_cfg_t const *const p_cfg )
```

Update the parameters of Position Control Calculation. Implements [motor_position_api_t::parameterUpdate](#).

Return values

| | |
|--------------------------|--------------------------------|
| FSP_SUCCESS | Successfully data was updated. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Configuration parameter error. |

`fsp_err_t` `RM_MOTOR_SENSORLESS_FunctionSelect` (`motor_ctrl_t *const p_ctrl`, `motor_function_select_t const function`)

Select function. Implements `motor_api_t::functionSelect`. [More...](#)

Detailed Description

Usual control of a SPM motor on RA MCUs. This module implements the [Motor Sensorless Vector Control \(rm_motor_sensorless\)](#).

Overview

The motor sensorless vector control is used to control a motor rotation in an application. This module is implemented with using SPM motor. User can start/stop motor rotation simply.

Features

The Motor Sensorless Module has below features.

- Start/Stop a motor rotation
- Error detection (over current, over speed, over voltage, low voltage)

Configuration

Build Time Configurations for rm_motor_sensorless

The following build time configurations are defined in fsp_cfg/rm_motor_sensorless_cfg.h:

| Configuration | Options | Default | Description |
|--------------------|--|---------------|---|
| Parameter checking | <ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

Configurations for Motor > Motor Sensorless Vector Control (rm_motor_sensorless)

This module can be added to the Stacks tab via New Stack > Motor > Motor Sensorless Vector Control (rm_motor_sensorless).

| Configuration | Options | Default | Description |
|-------------------------------------|-------------------------------|---------------------|---|
| General > Name | Name must be a valid C symbol | g_motor_sensorless0 | Module name. |
| General > Limit of over current (A) | Must be a valid value | 0.42F | Limit of over current.(Detection threshold) |
| General > Limit of over voltage (V) | Must be a valid value | 28.0F | Limit of over voltage.(Detection threshold) |
| General > Limit of over speed (rpm) | Must be a valid value | 3000.0F | Limit of over speed.(Detection threshold) |
| General > Limit of low voltage (V) | Must be a valid value | 14.0F | Limit of low voltage.(Detection threshold) |
| Interrupts > Callback | Name must be a valid | NULL | A user callback |

C symbol

function. If this callback function is provided, it is called at speed control cyclic interrupt.

Clock Configuration

This module doesn't depend on clock setting, because this module is a simple status transition process.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Limitations

- Set the limit of electric current with non-negative value.
- Set the limit of input voltage with non-negative value.
- Set the limit of rotational speed with non-negative value.

Examples

Basic Example

This is a basic example of minimal use of the Motor Sensorless in an application.

```
void motor_sensorless_basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;
    /* Initializes the module. */
    err = RM_MOTOR_SENSORLESS_Open(g_motor_sensorless0.p_ctrl,
g_motor_sensorless0.p_cfg);
    assert(FSP_SUCCESS == err);
    /* Set speed reference before motor run */
    (void) RM_MOTOR_SENSORLESS_SpeedSet(g_motor_sensorless0.p_ctrl,
DEF_SENSORLESS_TEST_OVSPD_LIM);
    /* Start motor rotation */
    (void) RM_MOTOR_SENSORLESS_Run(g_motor_sensorless0.p_ctrl);
    /* Get current status */
    (void) RM_MOTOR_SENSORLESS_StatusGet(g_motor_sensorless0.p_ctrl, &smpl_status);
    /* Get current rotor angle */
    (void) RM_MOTOR_SENSORLESS_AngleGet(g_motor_sensorless0.p_ctrl, &smpl_angle);
}
```

```

/* Get current motor speed */
    (void) RM_MOTOR_SENSORLESS_SpeedGet(g_motor_sensorless0.p_ctrl, &smpl_speed);
/* Check error */
    (void) RM_MOTOR_SENSORLESS_ErrorCheck(g_motor_sensorless0.p_ctrl, &smpl_error);
/* Stop motor rotation */
    (void) RM_MOTOR_SENSORLESS_Stop(g_motor_sensorless0.p_ctrl);
/* Stop motor rotation */
    (void) RM_MOTOR_SENSORLESS_ErrorSet(g_motor_sensorless0.p_ctrl,
MOTOR_ERROR_OVER_CURRENT_HW);
/* Reset Speed Control */
    (void) RM_MOTOR_SENSORLESS_Reset(g_motor_sensorless0.p_ctrl);
/* Close Speed Control */
    (void) RM_MOTOR_SENSORLESS_Close(g_motor_sensorless0.p_ctrl);
}

```

Function Documentation

◆ RM_MOTOR_SENSORLESS_Open()

```
fsp_err_t RM_MOTOR_SENSORLESS_Open ( motor_ctrl_t *const p_ctrl, motor_cfg_t const *const p_cfg )
```

Configure the MOTOR in register start mode. Implements `motor_api_t::open`.

This function should only be called once as MOTOR configuration registers can only be written to once so subsequent calls will have no effect.

Example:

```

/* Initializes the module. */
    err = RM_MOTOR_SENSORLESS_Open(g_motor_sensorless0.p_ctrl,
g_motor_sensorless0.p_cfg);

```

Return values

| | |
|--------------------------|--|
| FSP_SUCCESS | MOTOR successfully configured. |
| FSP_ERR_ASSERTION | Null pointer, or one or more configuration options is invalid. |
| FSP_ERR_ALREADY_OPEN | Module is already open. This module can only be opened once. |
| FSP_ERR_INVALID_ARGUMENT | Configuration parameter error. |

Note

◆ RM_MOTOR_SENSORLESS_Close()

`fsp_err_t RM_MOTOR_SENSORLESS_Close (motor_ctrl_t *const p_ctrl)`

Disables specified Motor Sensorless Control block. Implements `motor_api_t::close`.

Example:

```
/* Close Speed Control */
(void) RM_MOTOR_SENSORLESS_Close(g_motor_sensorless0.p_ctrl);
```

Return values

| | |
|-------------------|----------------------|
| FSP_SUCCESS | Successfully closed. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

Note

◆ RM_MOTOR_SENSORLESS_Reset()

`fsp_err_t RM_MOTOR_SENSORLESS_Reset (motor_ctrl_t *const p_ctrl)`

Reset Motor Sensorless Control block. Implements `motor_api_t::reset`.

Example:

```
/* Reset Speed Control */
(void) RM_MOTOR_SENSORLESS_Reset(g_motor_sensorless0.p_ctrl);
```

Return values

| | |
|-------------------|------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

Note

◆ RM_MOTOR_SENSORLESS_Run()

```
fsp_err_t RM_MOTOR_SENSORLESS_Run ( motor_ctrl_t *const p_ctrl)
```

Run Motor (Start motor rotation). Implements [motor_api_t::run](#).

Example:

```
/* Start motor rotation */
(void) RM_MOTOR_SENSORLESS_Run(g_motor_sensorless0.p_ctrl);
```

Return values

| | |
|-------------------|------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

Note

◆ RM_MOTOR_SENSORLESS_Stop()

```
fsp_err_t RM_MOTOR_SENSORLESS_Stop ( motor_ctrl_t *const p_ctrl)
```

Stop Motor (Stop motor rotation). Implements [motor_api_t::stop](#).

Example:

```
/* Stop motor rotation */
(void) RM_MOTOR_SENSORLESS_Stop(g_motor_sensorless0.p_ctrl);
```

Return values

| | |
|-------------------|------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

Note

◆ **RM_MOTOR_SENSORLESS_ErrorSet()**

```
fsp_err_t RM_MOTOR_SENSORLESS_ErrorSet ( motor_ctrl_t *const p_ctrl, motor_error_t const error )
```

Set error information. Implements `motor_api_t::errorSet`.

Example:

```
/* Stop motor rotation */
(void) RM_MOTOR_SENSORLESS_ErrorSet(g_motor_sensorless0.p_ctrl,
MOTOR_ERROR_OVER_CURRENT_HW);
```

Return values

| | |
|-------------------|------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

Note

◆ **RM_MOTOR_SENSORLESS_SpeedSet()**

```
fsp_err_t RM_MOTOR_SENSORLESS_SpeedSet ( motor_ctrl_t *const p_ctrl, float const speed_rpm )
```

Set speed reference[rpm]. Implements `motor_api_t::speedSet`.

Example:

```
/* Set speed reference before motor run */
(void) RM_MOTOR_SENSORLESS_SpeedSet(g_motor_sensorless0.p_ctrl,
DEF_SENSORLESS_TEST_OVSPD_LIM);
```

Return values

| | |
|-------------------|------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

Note

◆ RM_MOTOR_SENSORLESS_StatusGet()

```
fsp_err_t RM_MOTOR_SENSORLESS_StatusGet ( motor_ctrl_t *const p_ctrl, uint8_t *const p_status )
```

Get current control status. Implements `motor_api_t::statusGet`.

Example:

```
/* Get current status */
(void) RM_MOTOR_SENSORLESS_StatusGet(g_motor_sensorless0.p_ctrl, &smpl_status);
```

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Data received pointer is invalid.. |

Note

◆ RM_MOTOR_SENSORLESS_AngleGet()

```
fsp_err_t RM_MOTOR_SENSORLESS_AngleGet ( motor_ctrl_t *const p_ctrl, float *const p_angle_rad )
```

Get current rotor angle. Implements `motor_api_t::angleGet`.

Example:

```
/* Get current rotor angle */
(void) RM_MOTOR_SENSORLESS_AngleGet(g_motor_sensorless0.p_ctrl, &smpl_angle);
```

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Data received pointer is invalid.. |

Note

◆ **RM_MOTOR_SENSORLESS_SpeedGet()**

```
fsp_err_t RM_MOTOR_SENSORLESS_SpeedGet ( motor_ctrl_t *const p_ctrl, float *const
p_speed_rpm )
```

Get rotational speed. Implements `motor_api_t::speedGet`.

Example:

```
/* Get current motor speed */
(void) RM_MOTOR_SENSORLESS_SpeedGet(g_motor_sensorless0.p_ctrl, &smpl_speed);
```

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Data received pointer is invalid.. |

Note

◆ **RM_MOTOR_SENSORLESS_ErrorCheck()**

```
fsp_err_t RM_MOTOR_SENSORLESS_ErrorCheck ( motor_ctrl_t *const p_ctrl, uint16_t *const
p_error )
```

Check the occurrence of Error. Implements `motor_api_t::errorCheck`.

Example:

```
/* Check error */
(void) RM_MOTOR_SENSORLESS_ErrorCheck(g_motor_sensorless0.p_ctrl, &smpl_error);
```

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Data received pointer is invalid.. |

Note

◆ **RM_MOTOR_SENSORLESS_PositionSet()**

```
fsp_err_t RM_MOTOR_SENSORLESS_PositionSet ( motor_ctrl_t *const p_ctrl,
motor_speed_position_data_t const *const p_position )
```

Set position reference. Implements `motor_api_t::positionSet`.

Return values

| | |
|---------------------|--------------|
| FSP_ERR_UNSUPPORTED | Unsupported. |
|---------------------|--------------|

Note

◆ **RM_MOTOR_SENSORLESS_WaitStopFlagGet()**

```
fsp_err_t RM_MOTOR_SENSORLESS_WaitStopFlagGet ( motor_ctrl_t *const p_ctrl,
motor_wait_stop_flag_t *const p_flag )
```

Get wait stop flag. Implements `motor_api_t::waitStopFlagGet`.

Return values

| | |
|---------------------|--------------|
| FSP_ERR_UNSUPPORTED | Unsupported. |
|---------------------|--------------|

Note

◆ **RM_MOTOR_SENSORLESS_FunctionSelect()**

```
fsp_err_t RM_MOTOR_SENSORLESS_FunctionSelect ( motor_ctrl_t *const p_ctrl,
motor_function_select_t const function )
```

Select function. Implements `motor_api_t::functionSelect`.

Return values

| | |
|---------------------|--------------|
| FSP_ERR_UNSUPPORTED | Unsupported. |
|---------------------|--------------|

Note

Detailed Description

Calculation process for the motor control on RA MCUs. This module implements the [Motor speed Interface](#).

Overview

The motor speed is used to control the speed of motor rotation in an application. This module should be called cyclically in an application (e.g. in cyclic timer interrupt). This module calculates d/q-axis current reference with input speed reference, current rotational speed, and d/q-axis current.

Features

The motor speed module has below features.

- Calculate d/q-axis electric current reference.
- Flux weakening process at high speed rotation.
- Open loop damping control when using sensorless type.
- Low pass filter of input rotational speed.
- Speed observer function when using encoder type.

Configuration

Build Time Configurations for `rm_motor_speed`

The following build time configurations are defined in `fsp_cfg/rm_motor_speed_cfg.h`:

| Configuration | Options | Default | Description |
|--------------------|--|---------------|---|
| Parameter Checking | <ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| Position Support | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | Enable position algorithm support. |

Configurations for Motor > Motor Speed Controller (`rm_motor_speed`)

This module can be added to the Stacks tab via New Stack > Motor > Motor Speed Controller (`rm_motor_speed`).

| Configuration | Options | Default | Description |
|----------------|-------------------------------|-----------------------------|--------------|
| General > Name | Name must be a valid C symbol | <code>g_motor_speed0</code> | Module name. |

| | | | |
|---|---|-------------|--|
| General > Speed control period (sec) | Must be a valid value | 0.0005F | Period of speed control function. |
| General > Step of speed climbing (rpm) | Must be a valid value | 0.5F | Step of speed change at start of open-loop. |
| General > Maximum rotational speed (rpm) | Manual Entry | 2650 | Maximum rotational speed (Limit speed). |
| General > Speed LPF omega | Must be a valid value | 10.0F | Design parameter for speed LPF. |
| General > Limit of q-axis current (A) | Must be a valid value | 0.42F | Limit of q-axis current. |
| General > Step of speed feedback at open-loop | Must be a valid value | 0.20F | Step of speed feedback at open-loop. |
| General > Natural frequency | Must be a valid non-negative value. | 100.0 | Natural frequency for disturbance speed observer. |
| General > Open-loop damping | <ul style="list-style-type: none"> • Disable • Enable | Enable | Select enable/disable Open-loop damping control. |
| General > Flux weakening | <ul style="list-style-type: none"> • Disable • Enable | Disable | Select enable/disable flux weakening control. |
| General > Torque compensation for sensorless transition | <ul style="list-style-type: none"> • Disable • Enable | Enable | Select enable/disable torque compensation for sensorless transition. |

Clock Configuration

This module doesn't depend on clock setting, because this module is a simple calculation process.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Limitations

- Set the period of speed control with none-negative value.
- Set the limit of speed change step with none-negative value.
- Set the maximum speed with none-negative value.

Examples

Basic Example

This is a basic example of minimal use of the motor speed in an application.

```
void motor_speed_basic_example (void)
{
```

```
fsp_err_t err = FSP_SUCCESS;

/* Initializes the module. */
err = RM_MOTOR_SPEED_Open(g_motor_speed0.p_ctrl, g_motor_speed0.p_cfg);
handle_error(err);

/* Set speed reference before get current reference */
(void) RM_MOTOR_SPEED_SpeedReferenceSet(g_motor_speed0.p_ctrl, 104.72F);

/* Set position reference before get current reference
 * (Basically Exclusive to SpeedReferenceSet. This is only sample,) */
(void) RM_MOTOR_SPEED_PositionReferenceSet(g_motor_speed0.p_ctrl,
&g_posref_sample);

/* Basically run this module at cyclic interrupt (e.g. AGT timer).
 * This implementation is an example. */
// while (true)
{
/* Application work here. */

/* Set input parameter data before get current reference */
(void) RM_MOTOR_SPEED_ParameterSet(g_motor_speed0.p_ctrl,
&g_test_speed_input);

/* Activate Speed Process */
(void) RM_MOTOR_SPEED_Run(g_motor_speed0.p_ctrl);

/* Perform Speed Control Process */
(void) RM_MOTOR_SPEED_SpeedControl(g_motor_speed0.p_ctrl);

/* Get output parameters */
(void) RM_MOTOR_SPEED_ParameterGet(g_motor_speed0.p_ctrl,
&g_test_speed_output);

//

/* Update parameters */
(void) RM_MOTOR_SPEED_ParameterUpdate(g_motor_speed0.p_ctrl,
&g_motor_speed0.p_cfg);
}

/* Reset Speed Control */
(void) RM_MOTOR_SPEED_Reset(g_motor_speed0.p_ctrl);

/* Close Speed Control */
```

```
(void) RM_MOTOR_SPEED_Close(g_motor_speed0.p_ctrl);
}
```

Function Documentation◆ **RM_MOTOR_SPEED_Open()**

```
fsp_err_t RM_MOTOR_SPEED_Open ( motor\_speed\_ctrl\_t *const p_ctrl, motor\_speed\_cfg\_t const *const p_cfg )
```

Opens and configures the Motor Speed Module. Implements [motor_speed_api_t::open](#).

Return values

| | |
|--------------------------|--|
| FSP_SUCCESS | Motor Speed Module successfully configured. |
| FSP_ERR_ASSERTION | Null pointer, or one or more configuration options is invalid. |
| FSP_ERR_ALREADY_OPEN | Module is already open. This module can only be opened once. |
| FSP_ERR_INVALID_ARGUMENT | Configuration parameter error. |

◆ **RM_MOTOR_SPEED_Close()**

```
fsp_err_t RM_MOTOR_SPEED_Close ( motor\_speed\_ctrl\_t *const p_ctrl)
```

Disables specified Motor Speed Module. Implements [motor_speed_api_t::close](#).

Return values

| | |
|-------------------|----------------------|
| FSP_SUCCESS | Successfully closed. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_SPEED_Reset()**

```
fsp_err_t RM_MOTOR_SPEED_Reset ( motor_speed_ctrl_t *const p_ctrl)
```

Reset the variables of Motor Speed Module. Implements `motor_speed_api_t::reset`.

Return values

| | |
|-------------------|---------------------|
| FSP_SUCCESS | Successfully reset. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_SPEED_Run()**

```
fsp_err_t RM_MOTOR_SPEED_Run ( motor_speed_ctrl_t *const p_ctrl)
```

Run(Start) the Motor Speed Control. Implements `motor_speed_api_t::run`.

Return values

| | |
|-------------------|---------------------|
| FSP_SUCCESS | Successfully start. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_SPEED_SpeedReferenceSet()**

```
fsp_err_t RM_MOTOR_SPEED_SpeedReferenceSet ( motor_speed_ctrl_t *const p_ctrl, float const speed_reference_rpm )
```

Set Speed Reference Data. Implements `motor_speed_api_t::speedReferenceSet`.

Return values

| | |
|-------------------|---------------------------|
| FSP_SUCCESS | Successfully data is set. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_SPEED_PositionReferenceSet()**

```
fsp_err_t RM_MOTOR_SPEED_PositionReferenceSet ( motor_speed_ctrl_t *const p_ctrl,
motor_speed_position_data_t const *const p_position_data )
```

Set Position Reference Data. Implements `motor_speed_api_t::positionReferenceSet`.

Return values

| | |
|--------------------------|----------------------------------|
| FSP_SUCCESS | Successfully data is set. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input structure pointer is NULL. |

◆ **RM_MOTOR_SPEED_ParameterSet()**

```
fsp_err_t RM_MOTOR_SPEED_ParameterSet ( motor_speed_ctrl_t *const p_ctrl,
motor_speed_input_t const *const p_st_input )
```

Set Input parameters. Implements `motor_speed_api_t::parameterSet`.

Return values

| | |
|--------------------------|---------------------------|
| FSP_SUCCESS | Successfully data is set. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Output pointer is NULL. |

◆ **RM_MOTOR_SPEED_SpeedControl()**

```
fsp_err_t RM_MOTOR_SPEED_SpeedControl ( motor_speed_ctrl_t *const p_ctrl)
```

Calculates the d/q-axis current reference.(Main process of Speed Control) Implements `motor_speed_api_t::speedControl`.

Return values

| | |
|-------------------|------------------------------|
| FSP_SUCCESS | Successful data calculation. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_MOTOR_SPEED_ParameterGet()

```
fsp_err_t RM_MOTOR_SPEED_ParameterGet ( motor_speed_ctrl_t *const p_ctrl,
motor_speed_output_t *const p_st_output )
```

Get Speed Control Parameters. Implements [motor_speed_api_t::parameterGet](#).

Return values

| | |
|--------------------------|----------------------------------|
| FSP_SUCCESS | Successfully the flag is gotten. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Output pointer is NULL. |

◆ RM_MOTOR_SPEED_ParameterUpdate()

```
fsp_err_t RM_MOTOR_SPEED_ParameterUpdate ( motor_speed_ctrl_t *const p_ctrl,
motor_speed_cfg_t const *const p_cfg )
```

Update the parameters of Speed Control Calculation. Implements [motor_speed_api_t::parameterUpdate](#).

Return values

| | |
|--------------------------|--------------------------------|
| FSP_SUCCESS | Successfully data was updated. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Configuration parameter error. |

Detailed Description

Usual control of a SPM motor on RA MCUs. This module implements the [Motor Vector Control with hall sensors \(rm_motor_hall\)](#).

Overview

The motor vector control with hall sensors is used to control a motor rotation in an application. This module is meant to be used with Surface Permanent Magnet (SPM) motors and allows applications to start or stop motor rotation easily.

Features

The motor vector control with hall sensors has below features.

- Start/Stop a motor rotation
- Error detection (over current, over speed, over voltage, low voltage)

Configuration

Build Time Configurations for `rm_motor_hall`

The following build time configurations are defined in `fsp_cfg/rm_motor_hall_cfg.h`:

| Configuration | Options | Default | Description |
|--------------------|--|---------------|---|
| Parameter checking | <ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

Configurations for Motor > Motor Vector Control with hall sensors(`rm_motor_hall`)

This module can be added to the Stacks tab via New Stack > Motor > Motor Vector Control with hall sensors(`rm_motor_hall`).

| Configuration | Options | Default | Description |
|-------------------------------------|-------------------------------|---------------|--|
| General > Name | Name must be a valid C symbol | g_motor_hall0 | Module name. |
| General > Limit of over current (A) | Must be a valid value | 0.42F | Limit of over current.(Detection threshold) |
| General > Limit of over voltage (V) | Must be a valid value | 28.0F | Limit of over voltage.(Detection threshold) |
| General > Limit of over speed (rpm) | Must be a valid value | 3000.0F | Limit of over speed.(Detection threshold) |
| General > Limit of low voltage (V) | Must be a valid value | 14.0F | Limit of low voltage.(Detection threshold) |
| Interrupts > Callback | Name must be a valid C symbol | NULL | A user callback function. If this callback function is provided, it is called at speed control cyclic interrupt. |

Clock Configuration

This module doesn't depend on clock setting, because this module is a simple status transition process.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Limitations

- Set the limit of electric current with non-negative value.
- Set the limit of input voltage with non-negative value.
- Set the limit of rotational speed with non-negative value.

Examples

Basic Example

This is a basic example of minimal use of the motor vector control with hall sensors in an application.

```
void motor_hall_basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;

    /* Initializes the module. */
}
```

```
err = RM_MOTOR_HALL_Open(g_motor_hall0_smpl.p_ctrl, g_motor_hall0_smpl.p_cfg);
assert(FSP_SUCCESS == err);

/* Set speed reference before motor run */
(void) RM_MOTOR_HALL_SpeedSet(g_motor_hall0_smpl.p_ctrl,
DEF_HALL_TEST_OVSPD_LIM);

/* Start motor rotation */
(void) RM_MOTOR_HALL_Run(g_motor_hall0_smpl.p_ctrl);

/* Get current status */
(void) RM_MOTOR_HALL_StatusGet(g_motor_hall0_smpl.p_ctrl, &smpl_status);

/* Get current rotor angle */
(void) RM_MOTOR_HALL_AngleGet(g_motor_hall0_smpl.p_ctrl, &smpl_angle);

/* Get current motor speed */
(void) RM_MOTOR_HALL_SpeedGet(g_motor_hall0_smpl.p_ctrl, &smpl_speed);

/* Check error */
(void) RM_MOTOR_HALL_ErrorCheck(g_motor_hall0_smpl.p_ctrl, &smpl_error);

/* Stop motor rotation */
(void) RM_MOTOR_HALL_Stop(g_motor_hall0_smpl.p_ctrl);

/* When error is detected with extra Hardware */
(void) RM_MOTOR_HALL_ErrorSet(g_motor_hall0_smpl.p_ctrl,
MOTOR_ERROR_OVER_CURRENT_HW);

/* Reset motor control (Clear error status) */
(void) RM_MOTOR_HALL_Reset(g_motor_hall0_smpl.p_ctrl);

/* Close motor control */
(void) RM_MOTOR_HALL_Close(g_motor_hall0_smpl.p_ctrl);
}
```

Function Documentation

◆ **RM_MOTOR_HALL_Open()**

```
fsp_err_t RM_MOTOR_HALL_Open ( motor_ctrl_t *const p_ctrl, motor_cfg_t const *const p_cfg )
```

Configure the MOTOR HALL in register start mode. Implements `motor_api_t::open`.

This function should only be called once as MOTOR configuration registers can only be written to once so subsequent calls will have no effect.

Example:

```
/* Initializes the module. */
err = RM_MOTOR_HALL_Open(g_motor_hall0_smpl.p_ctrl, g_motor_hall0_smpl.p_cfg);
```

Return values

| | |
|--------------------------|--|
| FSP_SUCCESS | MOTOR HALL successfully configured. |
| FSP_ERR_ASSERTION | Null pointer, or one or more configuration options is invalid. |
| FSP_ERR_ALREADY_OPEN | Module is already open. This module can only be opened once. |
| FSP_ERR_INVALID_ARGUMENT | Configuration parameter error. |

Note

◆ **RM_MOTOR_HALL_Close()**

```
fsp_err_t RM_MOTOR_HALL_Close ( motor_ctrl_t *const p_ctrl)
```

Disables specified Motor Hall Control block. Implements `motor_api_t::close`.

Example:

```
/* Close motor control */
(void) RM_MOTOR_HALL_Close(g_motor_hall0_smpl.p_ctrl);
```

Return values

| | |
|-------------------|----------------------|
| FSP_SUCCESS | Successfully closed. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

Note

◆ **RM_MOTOR_HALL_Reset()**

```
fsp_err_t RM_MOTOR_HALL_Reset ( motor_ctrl_t *const p_ctrl)
```

Reset Motor Hall Control block. Implements [motor_api_t::reset](#).

Example:

```
/* Reset motor control (Clear error status) */
(void) RM_MOTOR_HALL_Reset(g_motor_hall0_smpl.p_ctrl);
```

Return values

| | |
|-------------------|------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

Note

◆ **RM_MOTOR_HALL_Run()**

```
fsp_err_t RM_MOTOR_HALL_Run ( motor_ctrl_t *const p_ctrl)
```

Run Motor (Start motor rotation). Implements [motor_api_t::run](#).

Example:

```
/* Start motor rotation */
(void) RM_MOTOR_HALL_Run(g_motor_hall0_smpl.p_ctrl);
```

Return values

| | |
|-------------------|------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

Note

◆ **RM_MOTOR_HALL_Stop()**

```
fsp_err_t RM_MOTOR_HALL_Stop ( motor_ctrl_t *const p_ctrl)
```

Stop Motor (Stop motor rotation). Implements `motor_api_t::stop`.

Example:

```
/* Stop motor rotation */
(void) RM_MOTOR_HALL_Stop(g_motor_hall0_smpl.p_ctrl);
```

Return values

| | |
|-------------------|------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

Note

◆ **RM_MOTOR_HALL_ErrorSet()**

```
fsp_err_t RM_MOTOR_HALL_ErrorSet ( motor_ctrl_t *const p_ctrl, motor_error_t const error )
```

Set error information. Implements `motor_api_t::errorSet`.

Example:

```
/* When error is detected with extra Hardware */
(void) RM_MOTOR_HALL_ErrorSet(g_motor_hall0_smpl.p_ctrl,
MOTOR_ERROR_OVER_CURRENT_HW);
```

Return values

| | |
|-------------------|------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

Note

◆ **RM_MOTOR_HALL_SpeedSet()**

```
fsp_err_t RM_MOTOR_HALL_SpeedSet ( motor_ctrl_t *const p_ctrl, float const speed_rpm )
```

Set speed reference[rpm]. Implements `motor_api_t::speedSet`.

Example:

```
/* Set speed reference before motor run */
(void) RM_MOTOR_HALL_SpeedSet(g_motor_hall0_smpl.p_ctrl,
DEF_HALL_TEST_OVSPD_LIM);
```

Return values

| | |
|-------------------|------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

Note

◆ **RM_MOTOR_HALL_StatusGet()**

```
fsp_err_t RM_MOTOR_HALL_StatusGet ( motor_ctrl_t *const p_ctrl, uint8_t *const p_status )
```

Get current control status. Implements `motor_api_t::statusGet`.

Example:

```
/* Get current status */
(void) RM_MOTOR_HALL_StatusGet(g_motor_hall0_smpl.p_ctrl, &smpl_status);
```

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Data received pointer is invalid.. |

Note

◆ **RM_MOTOR_HALL_AngleGet()**

```
fsp_err_t RM_MOTOR_HALL_AngleGet ( motor_ctrl_t *const p_ctrl, float *const p_angle_rad )
```

Get current rotor angle. Implements `motor_api_t::angleGet`.

Example:

```
/* Get current rotor angle */
(void) RM_MOTOR_HALL_AngleGet(g_motor_hall0_smpl.p_ctrl, &smpl_angle);
```

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Data received pointer is invalid.. |

Note

◆ **RM_MOTOR_HALL_SpeedGet()**

```
fsp_err_t RM_MOTOR_HALL_SpeedGet ( motor_ctrl_t *const p_ctrl, float *const p_speed_rpm )
```

Get rotational speed. Implements `motor_api_t::speedGet`.

Example:

```
/* Get current motor speed */
(void) RM_MOTOR_HALL_SpeedGet(g_motor_hall0_smpl.p_ctrl, &smpl_speed);
```

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Data received pointer is invalid.. |

Note

◆ **RM_MOTOR_HALL_ErrorCheck()**

```
fsp_err_t RM_MOTOR_HALL_ErrorCheck ( motor_ctrl_t *const p_ctrl, uint16_t *const p_error )
```

Check the occurrence of Error. Implements `motor_api_t::errorCheck`.

Example:

```
/* Check error */
(void) RM_MOTOR_HALL_ErrorCheck(g_motor_hall0_smpl.p_ctrl, &smpl_error);
```

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Data received pointer is invalid.. |

Note

◆ **RM_MOTOR_HALL_PositionSet()**

```
fsp_err_t RM_MOTOR_HALL_PositionSet ( motor_ctrl_t *const p_ctrl, motor_speed_position_data_t
const *const p_position )
```

Set position reference. Implements `motor_api_t::positionSet`.

Return values

| | |
|---------------------|--------------|
| FSP_ERR_UNSUPPORTED | Unsupported. |
|---------------------|--------------|

Note

◆ **RM_MOTOR_HALL_WaitStopFlagGet()**

```
fsp_err_t RM_MOTOR_HALL_WaitStopFlagGet ( motor_ctrl_t *const p_ctrl, motor_wait_stop_flag_t
*const p_flag )
```

Get wait stop flag. Implements `motor_api_t::waitStopFlagGet`.

Return values

| | |
|---------------------|--------------|
| FSP_ERR_UNSUPPORTED | Unsupported. |
|---------------------|--------------|

Note

◆ RM_MOTOR_HALL_FunctionSelect()

```
fsp_err_t RM_MOTOR_HALL_FunctionSelect ( motor_ctrl_t *const p_ctrl, motor_function_select_t
const function )
```

Select function. Implements `motor_api_t::functionSelect`.

Return values

| | |
|---------------------|--------------|
| FSP_ERR_UNSUPPORTED | Unsupported. |
|---------------------|--------------|

`fsp_err_t` [RM_MOTOR_RETURN_ORIGIN_InfoGet](#) (`motor_return_origin_ctrl_t *const p_ctrl, motor_return_origin_info_t *const p_info`)

Get information of return origin. Implements [motor_return_origin_api_t::infoGet. More...](#)

`fsp_err_t` [RM_MOTOR_RETURN_ORIGIN_DataSet](#) (`motor_return_origin_ctrl_t *const p_ctrl, motor_return_origin_set_data_t *const p_set_data`)

Set necessary data to return origin function. Implements [motor_return_origin_api_t::dataSet. More...](#)

`fsp_err_t` [RM_MOTOR_RETURN_ORIGIN_SpeedCyclic](#) (`motor_return_origin_ctrl_t *const p_ctrl`)

Cyclic process of return origin function at speed control period. (Called at timer interrupt.) Implements [motor_return_origin_api_t::speedCyclic. More...](#)

`fsp_err_t` [RM_MOTOR_RETURN_ORIGIN_ParameterUpdate](#) (`motor_return_origin_ctrl_t *const p_ctrl, motor_return_origin_cfg_t const *const p_cfg`)

Update the parameters of return origin function. Implements [motor_return_origin_api_t::parameterUpdate. More...](#)

Detailed Description

Search origin position process for the motor control on RA MCUs. This module implements the [Motor Return Origin Function Interface](#).

Overview

The motor return origin module is used to search origin position in an application. This module should be used with Renesas Motor Workbench (RMW) basically.

Features

The Motor return origin module has below features.

- Search origin position automatically.

Configuration

Build Time Configurations for `rm_motor_return_origin`

The following build time configurations are defined in fsp_cfg/rm_motor_return_origin_cfg.h:

| Configuration | Options | Default | Description |
|--------------------|--|---------------|---|
| Parameter Checking | <ul style="list-style-type: none"> Default (BSP) Enabled Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

Configurations for Motor > Motor return origin function (rm_motor_return_origin)

This module can be added to the Stacks tab via New Stack > Motor > Motor return origin function (rm_motor_return_origin).

| Configuration | Options | Default | Description |
|--|-------------------------------------|------------------------|---|
| General > Name | Name must be a valid C symbol | g_motor_return_origin0 | Module name. |
| General > Using mode | Search by pushing | Search by pushing | Select using mode |
| Search speed (rpm) | Manual Entry | 10.0 | Speed to search origin position (rpm) |
| Acceleration of speed (rpm/sec) | Must be set 1 to 10000. | 10000.0 | Acceleration of rotation speed at return moving (rpm/sec) |
| Cyclic period of speed control (sec) | Must be a valid non-negative value. | 0.0005 | Cyclic period of speed control (sec) |
| Maximum current (A) | Must be a valid non-negative value. | 1.8 | Maximum current (A). Please set to match used motor. |
| Percentage of current to judge pushing (%) | Must be a valid non-negative value. | 30.0 | Percentage of current to judge pushing (%) |
| Pushing time (sec) | Must be a valid non-negative value. | 1.0 | Time to push the stopper (sec) |
| Degree to judge none stopper | Must be set -360 to 360. | 360.0 | When the motor runs over this value, it is judged impossible to search the stopper. |
| Degree to return | Must be a valid non-negative value. | 3.0 | Degree to return from the stopper (degree) |
| Mechanical gear ratio | Must be a valid non-negative value. | 1.0 | Mechanical gear ratio |

Clock Configuration

This module doesn't depend on clock setting.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Limitations

Examples

Basic Example

This is a basic example of minimal use of the Motor Return origin in an application.

```
void motor_return_origin_basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;
    /* Initializes the module. */
    err = RM_MOTOR_RETURN_ORIGIN_Open(&g_mtr_return_origin0_ctrl,
&g_mtr_return_origin0_cfg);
    assert(FSP_SUCCESS == err);
    /* Start process. */
    err = RM_MOTOR_RETURN_ORIGIN_Start(&g_mtr_return_origin0_ctrl);
    temp_set_data.f_iq          = 1.0F;
    temp_set_data.f_position_degree = 180.0F;
    /* Set data to the module. */
    err = RM_MOTOR_RETURN_ORIGIN_DataSet(&g_mtr_return_origin0_ctrl, &temp_set_data);
    /* Get information from the module. */
    err = RM_MOTOR_RETURN_ORIGIN_InfoGet(&g_mtr_return_origin0_ctrl, &temp_info);
    /* Stop process. */
    err = RM_MOTOR_RETURN_ORIGIN_Stop(&g_mtr_return_origin0_ctrl);
    /* Close the module. */
    err = RM_MOTOR_RETURN_ORIGIN_Close(&g_mtr_return_origin0_ctrl);
}
```

Function Documentation

◆ RM_MOTOR_RETURN_ORIGIN_Open()

```
fsp_err_t RM_MOTOR_RETURN_ORIGIN_Open ( motor_return_origin_ctrl_t *const p_ctrl,
motor_return_origin_cfg_t const *const p_cfg )
```

Opens and configures the motor return origin module. Implements [motor_return_origin_api_t::open](#).

Example:

```
/* Initializes the module. */
err = RM_MOTOR_RETURN_ORIGIN_Open(&g_mtr_return_origin0_ctrl,
&g_mtr_return_origin0_cfg);
```

Return values

| | |
|--------------------------|--|
| FSP_SUCCESS | Motor return origin module successfully configured. |
| FSP_ERR_ASSERTION | Null pointer, or one or more configuration options is invalid. |
| FSP_ERR_ALREADY_OPEN | Module is already open. This module can only be opened once. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter error. |

◆ **RM_MOTOR_RETURN_ORIGIN_Close()**

```
fsp_err_t RM_MOTOR_RETURN_ORIGIN_Close ( motor_return_origin_ctrl_t *const p_ctrl)
```

Disables specified motor return origin module. Implements `motor_return_origin_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MOTOR_RETURN_ORIGIN_Close(&g_mtr_return_origin0_ctrl);
```

Return values

| | |
|-------------------|----------------------|
| FSP_SUCCESS | Successfully closed. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_RETURN_ORIGIN_Start()**

```
fsp_err_t RM_MOTOR_RETURN_ORIGIN_Start ( motor_return_origin_ctrl_t *const p_ctrl)
```

Start return origin function. Implements `motor_return_origin_api_t::start`.

Example:

```
/* Start process. */
err = RM_MOTOR_RETURN_ORIGIN_Start(&g_mtr_return_origin0_ctrl);
```

Return values

| | |
|-------------------|-----------------------|
| FSP_SUCCESS | Successfully started. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_RETURN_ORIGIN_Stop()**

```
fsp_err_t RM_MOTOR_RETURN_ORIGIN_Stop ( motor_return_origin_ctrl_t *const p_ctrl)
```

Stop (Cancel) return origin function. Implements `motor_return_origin_api_t::stop`.

Example:

```
/* Stop process. */
err = RM_MOTOR_RETURN_ORIGIN_Stop(&g_mtr_return_origin0_ctrl);
```

Return values

| | |
|-------------------|----------------------------------|
| FSP_SUCCESS | Successfully stopped (canceled). |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_RETURN_ORIGIN_Reset()**

```
fsp_err_t RM_MOTOR_RETURN_ORIGIN_Reset ( motor_return_origin_ctrl_t *const p_ctrl)
```

Reset variables of return origin module. Implements `motor_return_origin_api_t::reset`.

Return values

| | |
|-------------------|---------------------|
| FSP_SUCCESS | Successfully reset. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_RETURN_ORIGIN_InfoGet()**

```
fsp_err_t RM_MOTOR_RETURN_ORIGIN_InfoGet ( motor_return_origin_ctrl_t *const p_ctrl,
motor_return_origin_info_t *const p_info )
```

Get information of return origin. Implements `motor_return_origin_api_t::infoGet`.

Example:

```
/* Get information from the module. */
err = RM_MOTOR_RETURN_ORIGIN_InfoGet(&g_mtr_return_origin0_ctrl, &temp_info);
```

Return values

| | |
|--------------------------|------------------------|
| FSP_SUCCESS | Successfully get data. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter error. |

◆ **RM_MOTOR_RETURN_ORIGIN_DataSet()**

```
fsp_err_t RM_MOTOR_RETURN_ORIGIN_DataSet ( motor_return_origin_ctrl_t *const p_ctrl,
motor_return_origin_set_data_t *const p_set_data )
```

Set necessary data to return origin function. Implements `motor_return_origin_api_t::dataSet`.

Example:

```
/* Set data to the module. */
err = RM_MOTOR_RETURN_ORIGIN_DataSet(&g_mtr_return_origin0_ctrl, &temp_set_data);
```

Return values

| | |
|--------------------------|------------------------|
| FSP_SUCCESS | Successfully set data. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter error. |

◆ RM_MOTOR_RETURN_ORIGIN_SpeedCyclic()

`fsp_err_t RM_MOTOR_RETURN_ORIGIN_SpeedCyclic (motor_return_origin_ctrl_t *const p_ctrl)`

Cyclic process of return origin function at speed control period. (Called at timer interrupt.)
Implements `motor_return_origin_api_t::speedCyclic`.

Return values

| | |
|-------------------|-----------------------------------|
| FSP_SUCCESS | Successfully perform the process. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_MOTOR_RETURN_ORIGIN_ParameterUpdate()

`fsp_err_t RM_MOTOR_RETURN_ORIGIN_ParameterUpdate (motor_return_origin_ctrl_t *const p_ctrl, motor_return_origin_cfg_t const *const p_cfg)`

Update the parameters of return origin function. Implements `motor_return_origin_api_t::parameterUpdate`.

Return values

| | |
|--------------------------|--------------------------------|
| FSP_SUCCESS | Successfully data was updated. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter error. |

Detailed Description

Control a SPM motor on RA MCUs. This module implements the [Motor vector control with induction sensor \(rm_motor_induction\)](#).

Overview

The motor vector control with induction sensor is used to control motor rotation in an application. This module is meant to be used with Surface Permanent Magnet (SPM) motors and allows applications to start or stop motor rotation easily.

Features

The motor induction module has below features.

- Start/stop motor rotation
- Error detection (over current, over speed, over voltage, low voltage)

Configuration

Build Time Configurations for rm_motor_induction

The following build time configurations are defined in fsp_cfg/rm_motor_induction_cfg.h:

| Configuration | Options | Default | Description |
|--------------------|--|---------------|---|
| Parameter Checking | <ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

Configurations for Motor > Motor vector control with induction sensor (rm_motor_induction)

This module can be added to the Stacks tab via New Stack > Motor > Motor vector control with induction sensor (rm_motor_induction).

| Configuration | Options | Default | Description |
|-------------------------------------|-------------------------------|--------------------|--|
| General > Name | Name must be a valid C symbol | g_motor_induction0 | Module name. |
| General > Limit of over current (A) | Must be a valid value | 2.0F | Limit of over current.(Detection threshold) |
| General > Limit of over voltage (V) | Must be a valid value | 28.0F | Limit of over voltage.(Detection threshold) |
| General > Limit of over speed (rpm) | Must be a valid value | 3000.0F | Limit of over speed.(Detection threshold) |
| General > Limit of low voltage (V) | Must be a valid value | 18.0F | Limit of low voltage.(Detection threshold) |
| Interrupts > Callback | Name must be a valid C symbol | NULL | A user callback function. If this callback function is provided, it is called at speed control cyclic interrupt. |

Clock Configuration

This module doesn't depend on clock setting, because this module is a simple status transition process.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Limitations

- Set the limit of electric current with non-negative value.
- Set the limit of input voltage with non-negative value.
- Set the limit of rotational speed with non-negative value.

Examples

Basic Example

This is a basic example of minimal use of the motor induction module in an application.

```
void motor_induction_basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;
    /* Initializes the module. */
    err = RM_MOTOR_INDUCTION_Open(g_motor_induction0_smpl.p_ctrl,
g_motor_induction0_smpl.p_cfg);
    handle_error(err);
    /* Set speed reference before motor run */
    (void) RM_MOTOR_INDUCTION_SpeedSet(g_motor_induction0_smpl.p_ctrl,
RM_MOTOR_INDUCTION_TEST_OVER_SPEED_LIMIT);
    /* Set position reference before motor run */
    (void) RM_MOTOR_INDUCTION_PositionSet(g_motor_induction0_smpl.p_ctrl,
&g_posref_sample1);
    /* Start motor rotation */
    (void) RM_MOTOR_INDUCTION_Run(g_motor_induction0_smpl.p_ctrl);
    /* Get current status */
    (void) RM_MOTOR_INDUCTION_StatusGet(g_motor_induction0_smpl.p_ctrl,
&smpl_status);
    /* Get current rotor angle */
    (void) RM_MOTOR_INDUCTION_AngleGet(g_motor_induction0_smpl.p_ctrl, &smpl_angle);
    /* Get current motor rotational speed */
    (void) RM_MOTOR_INDUCTION_SpeedGet(g_motor_induction0_smpl.p_ctrl, &smpl_speed);
    /* Check error */
    (void) RM_MOTOR_INDUCTION_ErrorCheck(g_motor_induction0_smpl.p_ctrl,
```

```

&smpl_error);

/* Stop motor rotation */
(void) RM_MOTOR_INDUCTION_Stop(g_motor_induction0_smpl.p_ctrl);

/* If need, set extra error status */
(void) RM_MOTOR_INDUCTION_ErrorSet(g_motor_induction0_smpl.p_ctrl,
MOTOR_ERROR_OVER_CURRENT_HW);

/* Reset motor control */
(void) RM_MOTOR_INDUCTION_Reset(g_motor_induction0_smpl.p_ctrl);

/* Close motor control */
(void) RM_MOTOR_INDUCTION_Close(g_motor_induction0_smpl.p_ctrl);
}

```

Enumerations

enum [motor_induction_ctrl_t](#)

enum [motor_induction_ctrl_event_t](#)

Enumeration Type Documentation

◆ motor_induction_ctrl_t

| enum motor_induction_ctrl_t | |
|---|-------------|
| Enumerator | |
| MOTOR_INDUCTION_CTRL_STOP | Stop mode. |
| MOTOR_INDUCTION_CTRL_RUN | Run mode. |
| MOTOR_INDUCTION_CTRL_ERROR | Error mode. |

◆ motor_induction_ctrl_event_t

| enum motor_induction_ctrl_event_t | |
|---|--------------|
| Enumerator | |
| MOTOR_INDUCTION_CTRL_EVENT_STOP | Stop event. |
| MOTOR_INDUCTION_CTRL_EVENT_RUN | Run event. |
| MOTOR_INDUCTION_CTRL_EVENT_ERROR | Error event. |
| MOTOR_INDUCTION_CTRL_EVENT_RESET | Reset event. |

Function Documentation

◆ RM_MOTOR_INDUCTION_Open()

```
fsp_err_t RM_MOTOR_INDUCTION_Open ( motor_ctrl_t *const p_ctrl, motor_cfg_t const *const p_cfg )
```

Configure the MOTOR in register start mode. Implements `motor_api_t::open`.

This function should only be called once as MOTOR configuration registers can only be written to once so subsequent calls will have no effect.

Example:

```
/* Initializes the module. */
err = RM_MOTOR_INDUCTION_Open(g_motor_induction0_smpl.p_ctrl,
g_motor_induction0_smpl.p_cfg);
```

Return values

| | |
|--------------------------|--|
| FSP_SUCCESS | MOTOR successfully configured. |
| FSP_ERR_ASSERTION | Null pointer, or one or more configuration options is invalid. |
| FSP_ERR_ALREADY_OPEN | Module is already open. This module can only be opened once. |
| FSP_ERR_INVALID_ARGUMENT | Configuration parameter error. |

Note

◆ RM_MOTOR_INDUCTION_Close()

```
fsp_err_t RM_MOTOR_INDUCTION_Close ( motor_ctrl_t *const p_ctrl)
```

Disables specified Motor Induction Control block. Implements `motor_api_t::close`.

Example:

```
/* Close motor control */
(void) RM_MOTOR_INDUCTION_Close(g_motor_induction0_smpl.p_ctrl);
```

Return values

| | |
|-------------------|----------------------|
| FSP_SUCCESS | Successfully closed. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

Note

◆ RM_MOTOR_INDUCTION_Reset()

```
fsp_err_t RM_MOTOR_INDUCTION_Reset ( motor_ctrl_t *const p_ctrl)
```

Reset Motor Induction Control block. Implements `motor_api_t::reset`.

Example:

```
/* Reset motor control */
(void) RM_MOTOR_INDUCTION_Reset(g_motor_induction0_smpl.p_ctrl);
```

Return values

| | |
|-------------------|------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

Note

◆ RM_MOTOR_INDUCTION_Run()

```
fsp_err_t RM_MOTOR_INDUCTION_Run ( motor_ctrl_t *const p_ctrl)
```

Run Motor (Start motor rotation). Implements `motor_api_t::run`.

Example:

```
/* Start motor rotation */
(void) RM_MOTOR_INDUCTION_Run(g_motor_induction0_smpl.p_ctrl);
```

Return values

| | |
|-------------------|------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

Note

◆ **RM_MOTOR_INDUCTION_Stop()**

```
fsp_err_t RM_MOTOR_INDUCTION_Stop ( motor_ctrl_t *const p_ctrl)
```

Stop Motor (Stop motor rotation). Implements `motor_api_t::stop`.

Example:

```
/* Stop motor rotation */
(void) RM_MOTOR_INDUCTION_Stop(g_motor_induction0_smpl.p_ctrl);
```

Return values

| | |
|-------------------|------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

Note

◆ **RM_MOTOR_INDUCTION_ErrorSet()**

```
fsp_err_t RM_MOTOR_INDUCTION_ErrorSet ( motor_ctrl_t *const p_ctrl, motor_error_t const error )
```

Set error information. Implements `motor_api_t::errorSet`.

Example:

```
/* If need, set extra error status */
(void) RM_MOTOR_INDUCTION_ErrorSet(g_motor_induction0_smpl.p_ctrl,
MOTOR_ERROR_OVER_CURRENT_HW);
```

Return values

| | |
|-------------------|------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

Note

◆ **RM_MOTOR_INDUCTION_SpeedSet()**

```
fsp_err_t RM_MOTOR_INDUCTION_SpeedSet ( motor_ctrl_t *const p_ctrl, float const speed_rpm )
```

Set speed reference[rpm]. Implements `motor_api_t::speedSet`.

Example:

```
/* Set speed reference before motor run */
(void) RM_MOTOR_INDUCTION_SpeedSet(g_motor_induction0_smpl.p_ctrl,
RM_MOTOR_INDUCTION_TEST_OVER_SPEED_LIMIT);
```

Return values

| | |
|-------------------|------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

Note

◆ **RM_MOTOR_INDUCTION_PositionSet()**

```
fsp_err_t RM_MOTOR_INDUCTION_PositionSet ( motor_ctrl_t *const p_ctrl,
motor_speed_position_data_t const *const p_position )
```

Set position reference[degree]. Implements `motor_api_t::positionSet`.

Example:

```
/* Set position reference before motor run */
(void) RM_MOTOR_INDUCTION_PositionSet(g_motor_induction0_smpl.p_ctrl,
&g_posref_sample1);
```

Return values

| | |
|--------------------------|-------------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Data set pointer is invalid.. |

Note

◆ RM_MOTOR_INDUCTION_StatusGet()

```
fsp_err_t RM_MOTOR_INDUCTION_StatusGet ( motor_ctrl_t *const p_ctrl, uint8_t *const p_status )
```

Get current control status. Implements `motor_api_t::statusGet`.

Example:

```
/* Get current status */
(void) RM_MOTOR_INDUCTION_StatusGet(g_motor_induction0_smpl.p_ctrl,
&smpl_status);
```

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Data received pointer is invalid.. |

Note

◆ RM_MOTOR_INDUCTION_AngleGet()

```
fsp_err_t RM_MOTOR_INDUCTION_AngleGet ( motor_ctrl_t *const p_ctrl, float *const p_angle_rad )
```

Get current rotor angle. Implements `motor_api_t::angleGet`.

Example:

```
/* Get current rotor angle */
(void) RM_MOTOR_INDUCTION_AngleGet(g_motor_induction0_smpl.p_ctrl, &smpl_angle);
```

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Data received pointer is invalid.. |

Note

◆ **RM_MOTOR_INDUCTION_SpeedGet()**

```
fsp_err_t RM_MOTOR_INDUCTION_SpeedGet ( motor_ctrl_t *const p_ctrl, float *const p_speed_rpm )
```

Get rotational speed. Implements `motor_api_t::speedGet`.

Example:

```
/* Get current motor rotational speed */
(void) RM_MOTOR_INDUCTION_SpeedGet(g_motor_induction0_smpl.p_ctrl, &smpl_speed);
```

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Data received pointer is invalid.. |

Note

◆ **RM_MOTOR_INDUCTION_ErrorCheck()**

```
fsp_err_t RM_MOTOR_INDUCTION_ErrorCheck ( motor_ctrl_t *const p_ctrl, uint16_t *const p_error )
```

Check the occurrence of Error. Implements `motor_api_t::errorCheck`.

Example:

```
/* Check error */
(void) RM_MOTOR_INDUCTION_ErrorCheck(g_motor_induction0_smpl.p_ctrl,
&smpl_error);
```

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Data received pointer is invalid.. |

Note

◆ **RM_MOTOR_INDUCTION_WaitStopFlagGet()**

```
fsp_err_t RM_MOTOR_INDUCTION_WaitStopFlagGet ( motor_ctrl_t *const p_ctrl,
motor_wait_stop_flag_t *const p_flag )
```

Get wait stop flag. Implements `motor_api_t::waitStopFlagGet`.

Example:

Return values

| | |
|---------------------|--------------|
| FSP_ERR_UNSUPPORTED | Unsupported. |
|---------------------|--------------|

Note

◆ **RM_MOTOR_INDUCTION_FunctionSelect()**

```
fsp_err_t RM_MOTOR_INDUCTION_FunctionSelect ( motor_ctrl_t *const p_ctrl,
motor_function_select_t const function )
```

Select using function. Implements `motor_api_t::functionSelect`.

Return values

| | |
|----------------------|------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_MODE | Mode unmatched |

Note

◆ **RM_MOTOR_INDUCTION_InertiaEstimateStart()**

```
fsp_err_t RM_MOTOR_INDUCTION_InertiaEstimateStart ( motor_ctrl_t *const p_ctrl)
```

Start inertia estimation function.

Return values

| | |
|----------------------|------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_MODE | Mode unmatched |

Note

◆ **RM_MOTOR_INDUCTION_InertiaEstimateStop()**

fsp_err_t RM_MOTOR_INDUCTION_InertiaEstimateStop (motor_ctrl_t *const p_ctrl)

Stop(Cancel) inertia estimation function.

Return values

| | |
|----------------------|------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_MODE | Mode unmatch |

Note◆ **RM_MOTOR_INDUCTION_ReturnOriginStart()**

fsp_err_t RM_MOTOR_INDUCTION_ReturnOriginStart (motor_ctrl_t *const p_ctrl)

Start return origin function.

Return values

| | |
|----------------------|------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_MODE | Mode unmatch |

Note

◆ RM_MOTOR_INDUCTION_ReturnOriginStop()

`fsp_err_t RM_MOTOR_INDUCTION_ReturnOriginStop (motor_ctrl_t *const p_ctrl)`

Stop(Cancel) return origin function.

Return values

| | |
|----------------------|------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_MODE | Mode unmatch |

Note

5.2.12 Networking

Modules

Detailed Description

Networking Modules.

Modules

[AWS Cellular Interface on RYZ \(rm_cellular_ryz_aws\)](#)

Middleware implementing the AWS Cellular API for RYZ cellular modems.

[AWS MQTT](#)

This module provides the AWS MQTT integration documentation.

[AWS OTA PAL on MCUBoot \(rm_aws_ota_pal_mcuboot\)](#)

AWS OTA PAL layer implementation for downloading firmware updates.

[AWS PKCS11 PAL on LittleFS \(rm_aws_pkcs11_pal_littlefs\)](#)

PKCS#11 PAL LittleFS layer implementation for use by FreeRTOS TLS.

[AWS coreHTTP](#)

This module provides the AWS coreHTTP library.

[Azure Embedded Wireless Framework RYZ Port \(rm_azure_ewf_ryz\)](#)

[BLE Abstraction \(rm_ble_abs\)](#)

Middleware for the Bluetooth peripheral on RA MCUs. This module implements the [BLE ABS Interface](#).

[BLE Driver \(r_ble_balance\)](#)

Driver for the Radio peripheral on RA MCUs. This module implements the [BLE Interface](#).

[BLE Driver \(r_ble_compact\)](#)

Driver for the Radio peripheral on RA MCUs. This module implements the [BLE Interface](#).

[BLE Driver \(r_ble_extended\)](#)

Driver for the Radio peripheral on RA MCUs. This module implements the [BLE Interface](#).

[Bluetooth Low Energy Mesh Network Modules](#)

This is a subcategory for Bluetooth Low Energy Mesh Network modules.

[Cellular Comm Interface on UART \(rm_cellular_comm_uart_aws\)](#)

Middleware implementing the AWS Cellular Comm Interface for the FSP UART API.

[Ethernet \(r_ether\)](#)

Driver for the Ethernet peripheral on RA MCUs. This module implements the [Ethernet Interface](#).

[Ethernet \(r_ether_phy\)](#)

The Ethernet PHY module ([r_ether_phy](#)) provides an API for standard Ethernet PHY communications applications that use the ETHERC peripheral. It implements the [Ethernet PHY Interface](#).

[FreeRTOS+TCP Wrapper to r_ether \(rm_freertos_plus_tcp\)](#)

Middleware for using TCP on RA MCUs.

[GTL BLE Abstraction \(rm_ble_abs_gtl\)](#)

Middleware for the Bluetooth peripheral on RA MCUs. This module implements the [BLE ABS Interface](#).

[NetX Duo Ethernet Driver \(rm_netxduo_ether\)](#)[NetX Duo WiFi Driver \(rm_netxduo_wifi\)](#)[On Chip MQTT Client on DA16XXX \(rm_mqtt_onchip_da16xxx\)](#)

MQTT client implementation using the DA16XXX WiFi module on RA MCUs.

[PTP \(r_ptp\)](#)

Driver for the PTP peripheral on RA MCUs. This module implements the [PTP Interface](#).

[SPP BLE Abstraction \(rm_ble_abs_spp\)](#)

Middleware for the Bluetooth peripheral on RA MCUs. This module implements the [BLE ABS Interface](#).

[WiFi Onchip DA16XXX Driver using r_sci_uart \(rm_wifi_onchip_da16xxx\)](#)

Wifi and Socket implementation using the da16xxx WiFi module on RA MCUs.

[WiFi Onchip Silex Driver using r_sci_uart \(rm_wifi_onchip_silex\)](#)

Wifi and Socket implementation using the Silex SX-ULPGN WiFi module on RA MCUs.

5.2.12.1 AWS Cellular Interface on RYZ (rm_cellular_ryz_aws)

[Modules](#) » [Networking](#)

Middleware implementing the AWS Cellular API for RYZ cellular modems.

Overview

See AWS documentation for how the Cellular API works: <https://www.freertos.org/Documentation/api-ref/cellular/index.html>

Features

The following RYZ modems are supported by this port:

- RYZ014A
(<https://www.renesas.com/us/en/products/interface-connectivity/wireless-communications/cellular-iot-modules/ryz014a-lte-cat-m1-cellular-iot-module>)
- RYZ024A
(<https://www.renesas.com/us/en/products/interface-connectivity/wireless-communications/cellular-iot-modules/ryz024a-lte-cat-m1-cellular-iot-module-global-deployment>)

Please see the data sheets for hardware configuration for modems. Some notable differences between the two are:

- RYZ014A default baud is 921600. RYZ024A default baud is 115200.
- RYZ014A reset pin has to be toggled high to reset the modem. RYZ024A is the opposite and has to be toggled low.
- RYZ024A doesn't support AT+CREG. AT+CEREG should be used instead.

All APIs are supported by the RYZ port with the exception of the following RAT APIs:

- Cellular_SetRatPriority
- Cellular_GetRatPriority

The following URCs are supported by the RYZ port:

- CEREG (Cellular_RegisterUrcNetworkRegistrationEventCallback)
- SYSSTART (Cellular_RegisterModemEventCallback)
- SHUTDOWN (Cellular_RegisterModemEventCallback)
- SQNSRING (Cellular_SocketRegisterDataReadyCallback)

Support for other RYZ URCs can be possibly added by request in future releases.

Limitations

- RYZ024A doesn't support AT+CREG. API implementations don't use AT+CREG and use AT+CEREG instead.
- This module does not handle the RYZ reset pin. The user should manually configure this pin in order to reset the module.
- The RYZ can only be used in buffer reception mode, not transparent mode. When calling Cellular_SocketConnect only CELLULAR_ACCESSMODE_BUFFER is supported.
- The AWS Cellular APIs don't currently allow the local port to be set for UDP. It can be set by modifying the localPort field in CellularSocketHandle_t after calling Cellular_CreateSocket but before calling Cellular_SocketConnect.

Configuration

AWS Cellular Interface

Build Time Configurations for source

The following build time configurations are defined in `aws/cellular_interface/cellular_config.h`:

| Configuration | Options | Default | Description |
|---|----------------------------------|---------|--|
| Mobile Country Code Max Size | Value must be a positive integer | 3 | Mobile country code max size. |
| Mobile Network Node Max Size | Value must be a positive integer | 3 | Mobile network code max size. |
| Integrated Circuit Card Identity Max Size | Value must be a positive integer | 20 | Integrated circuit card identity max size. |
| International Mobile Subscriber Identity Max Size | Value must be a positive integer | 15 | International Mobile Subscriber Identity max size. |
| Firmware Version Max Size | Value must be a positive integer | 32 | Cellular module firmware version max size. |
| Hardware Version Max Size | Value must be a positive integer | 12 | Cellular module hardware version max size. |
| Serial Number Max Size | Value must be a positive integer | 12 | Cellular module serial number max size. |
| International Mobile Equipment Identity Max Size | Value must be a positive integer | 15 | International Mobile Equipment Identity number max size. |
| Registered Network operator Name Max Size | Value must be a positive integer | 32 | Registered network operator name max size. |
| Access Point Name Max Size | Value must be a positive integer | 64 | Access point name max size. |
| Packet Data Network Username Max Size | Value must be a positive integer | 32 | Packet data network username max size. |
| Packet Data Network Password Max Size | Value must be a positive integer | 32 | Packet data network password max size. |
| Data Network IP Address Max Size | Value must be a positive integer | 40 | Cellular data network IP address max size. |
| AT Command Max Size | Value must be a positive integer | 200 | Cellular AT command max size. |
| Max Number of Sockets | Value must be a positive integer | 6 | Cellular module number of socket max size. |
| Manufacturer ID Max Size | Value must be a positive integer | 20 | Cellular module manufacturer ID max |

size.

| | | | |
|--|---|--------------------|---|
| Model ID Max Size | Value must be a positive integer | 10 | Model ID max size. |
| EDRX List Max Size | Value must be a positive integer | 4 | EDRX list max size. |
| PDN Context ID Min Value | Value must be a positive integer | 1 | PDN context ID min value. |
| PDN Context ID Max Value | Value must be a positive integer | 16 | PDN context ID max value. |
| RAT Priority Count | Value must be a positive integer | 3 | RAT (radio access technology) priority count. |
| Socket Max Send Data Length (bytes) | Value must be a positive integer | 1460 | Socket max send data length. |
| Socket Max Receive Data Length (bytes) | Value must be a positive integer | 1500 | Socket max receive data length. |
| GetHostByName Support | <ul style="list-style-type: none"> Enabled (default) Disabled | Enabled (default) | Enables/disable GetHostByName. |
| Comm Interface Send Timeout (ms) | Value must be a positive integer | 1000 | Cellular comm interface receive timeout in ms. |
| Comm Interface Receive Timeout (ms) | Value must be a positive integer | 50 | Cellular comm interface receive timeout in ms. |
| Static Allocation Context | <ul style="list-style-type: none"> Enabled Disabled (default) | Disabled (default) | Use statically allocated context. |
| Comm Interface Static Allocation Context | <ul style="list-style-type: none"> Enabled Disabled (default) | Disabled (default) | Use statically allocated context for comm interface. |
| Default RAT | <ul style="list-style-type: none"> GSM WCDMA EDGE HSDPA HSUPA HSDPAHSUPA LTE CATM1 NBIOT | CATM1 | Default Radio Access Technology. |
| GSM Support | <ul style="list-style-type: none"> Enabled Disabled (default) | Disabled (default) | This should be disabled when a modem doesn't support GSM or the AT+CGREG command. |
| Static Socket Context | <ul style="list-style-type: none"> Enabled | Disabled (default) | Use statically allocated |

| | | | |
|-----------|--|-----|---|
| | <ul style="list-style-type: none"> • Disabled (default) | | socket. |
| Log Level | <ul style="list-style-type: none"> • Off • Error • Warning • Info • Debug | Off | Log level for the cellular interface. Defaults to using printf when enabled |

RYZ Cellular Interface Port

Configurations for Networking > AWS Cellular Interface on RYZ (rm_cellular_ryz_aws)

This module can be added to the Stacks tab via New Stack > Networking > AWS Cellular Interface on RYZ (rm_cellular_ryz_aws).

| Configuration | Options | Default | Description |
|--------------------------------|---|---------|---|
| Module Reset Pin (Port Number) | Refer to the RA Configuration tool for available options. | 00 | Specify the reset control port for the RYZ module. This property is only used in devassist. |
| Module Reset Pin (Pin Number) | Refer to the RA Configuration tool for available options. | 00 | Specify the reset control pin for the RYZ module. This property is only used in devassist. |

Examples

Basic Example

```
void rm_cellular_ryz_aws_basic_example (void)
{
    CellularHandle_t      cellular_handle = NULL;
    CellularSimCardStatus_t sim_card_status;

    /* Initialize Cellular Modem. */
    CellularError_t err = Cellular_Init(&cellular_handle,
&g_cellular_comm_interface_on_uart);
    assert(CELLULAR_SUCCESS == err);

    /* Get the SIM card status */
    err = Cellular_GetSimCardStatus(cellular_handle, &sim_card_status);
    assert(CELLULAR_SUCCESS == err);
    assert(CELLULAR_SIM_CARD_INSERTED == sim_card_status.simCardState);
}

```

Socket Example

```
#define SOCKET_EXAMPLE_BUFFER_SIZE (256)
#define SOCKET_EXAMPLE_TIMEOUT (UINT32_MAX)
#define SOCKET_EXAMPLE_IP ("255.255.255.255")
#define SOCKET_EXAMPLE_PORT (80)
uint32_t g_recv_event_count = 0;
void socket_example_data_ready_callback (CellularSocketHandle_t socketHandle, void *
pCallbackContext)
{
    FSP_PARAMETER_NOT_USED(socketHandle);
    FSP_PARAMETER_NOT_USED(pCallbackContext);
    g_recv_event_count++;
}
void rm_cellular_ryz_aws_socket_example (void)
{
    CellularHandle_t cellular_handle = NULL;
    char * p_data = "hello_world";
    char recv_buffer[SOCKET_EXAMPLE_BUFFER_SIZE] = "\0";
    uint32_t sent_data_length = 0;
    uint32_t received_data_length = 0;
    uint32_t timeout_ms = SOCKET_EXAMPLE_TIMEOUT;
    CellularSocketHandle_t socket_handle;
    CellularSocketAddress_t socket_address =
    {
        .ipAddress =
        {
            CELLULAR_IP_ADDRESS_V4,
            SOCKET_EXAMPLE_IP
        },
        .port = SOCKET_EXAMPLE_PORT
    };
    /* Initialize Cellular Modem. */
    CellularError_t err = Cellular_Init(&cellular_handle,
```

```
&g_cellular_comm_interface_on_uart);
    assert(CELLULAR_SUCCESS == err);
/* Create a TCP socket */
    err = Cellular_CreateSocket(cellular_handle,
                               1,
                               CELLULAR_SOCKET_DOMAIN_AF_INET,
                               CELLULAR_SOCKET_TYPE_STREAM,
                               CELLULAR_SOCKET_PROTOCOL_TCP,
                               &socket_handle);

    assert(CELLULAR_SUCCESS == err);
/* Register the data ready callback */
    err = Cellular_SocketRegisterDataReadyCallback(cellular_handle,
                                                    socket_handle,
                                                    socket_example_data_ready_callback
,
                                                    NULL);

    assert(CELLULAR_SUCCESS == err);
    g_rcv_event_count = 0;
/* Connect the TCP socket */
    err = Cellular_SocketConnect(cellular_handle, socket_handle,
CELLULAR_ACCESSMODE_BUFFER, &socket_address);

    assert(CELLULAR_SUCCESS == err);
/* Send data over the socket */
    err = Cellular_SocketSend(cellular_handle, socket_handle, (uint8_t *) p_data,
strlen(p_data), &sent_data_length);

    assert(CELLULAR_SUCCESS == err);
    assert(strlen(p_data) == sent_data_length);
/* Wait for data ready callback */
    timeout_ms = SOCKET_EXAMPLE_TIMEOUT;
while (timeout_ms > 0)
    {
if (g_rcv_event_count > 0)
    {
break;

```

```
    }  
    R_BSP_SoftwareDelay(1, BSP_DELAY_UNITS_MILLISECONDS);  
    timeout_ms--;  
    }  
    assert(0 != timeout_ms);  
    /* Receive data back */  
    err = Cellular_SocketRecv(cellular_handle,  
                             socket_handle,  
                             (uint8_t *) recv_buffer,  
                             SOCKET_EXAMPLE_BUFFER_SIZE,  
                             &received_data_length);  
    assert(CELLULAR_SUCCESS == err);  
    /* Close the socket */  
    err = Cellular_SocketClose(cellular_handle, socket_handle);  
    assert(CELLULAR_SUCCESS == err);  
}
```

Setting UDP local port

```
#define UDP_EXAMPLE_IP ("255.255.255.255")  
#define UDP_EXAMPLE_REMOTE_PORT (80)  
#define UDP_EXAMPLE_LOCAL_PORT (5000)  
void rm_cellular_ryz_aws_udp_local_port_set_example (void)  
{  
    CellularHandle_t      cellular_handle = NULL;  
    CellularSocketHandle_t socket_handle  = NULL;  
    CellularSocketAddress_t socket_address =  
    {  
        .ipAddress =  
        {  
            CELLULAR_IP_ADDRESS_V4,  
            UDP_EXAMPLE_IP  
        },  
        .port      = UDP_EXAMPLE_REMOTE_PORT  
    };  
};
```

```
/* Initialize Cellular Modem. */
    CellularError_t err = Cellular_Init(&cellular_handle,
&g_cellular_comm_interface_on_uart);
    assert(CELLULAR_SUCCESS == err);
/* Create a UDP socket */
    err = Cellular_CreateSocket(cellular_handle,
                                1,
                                CELLULAR_SOCKET_DOMAIN_AF_INET,
                                CELLULAR_SOCKET_TYPE_DGRAM,
                                CELLULAR_SOCKET_PROTOCOL_UDP,
                                &socket_handle);
    assert(CELLULAR_SUCCESS == err);
/* Set the local port */
    socket_handle->localPort = UDP_EXAMPLE_LOCAL_PORT;
/* Connect the UDP socket */
    err = Cellular_SocketConnect(cellular_handle, socket_handle,
CELLULAR_ACCESSMODE_BUFFER, &socket_address);
    assert(CELLULAR_SUCCESS == err);
}
```

5.2.12.2 AWS MQTT

Modules » Networking

This module provides the AWS MQTT integration documentation.

Overview

Note

This documentation is for CoreMQTT libraries. If you are using the deprecated MQTT Client library APIs (included as part of MQTT Client and MQTT Wrapper modules) see the following migration guide: https://aws.github.io/aws-iot-device-sdk-embedded-C/202103.00/docs/doxygen/output/html/mqtt_migration.html

The AWS MQTT library can connect to either AWS or a third party MQTT broker such as [Mosquitto](#). The documentation for the library can be found at the following link: [coreMQTT](#).

Features

- MQTT connections over TLS to an AWS IoT Endpoint or Mosquitto server

Configuration

Memory Usage

The AWS CoreMQTT library relies heavily on dynamic memory allocation for thread/task creation as well as other uses. Depending on the configuration it may be required to provide as much as 110k heap. To decrease this it is recommended to tweak the thread stack configuration values based on usage. Notable values are:

FreeRTOS Thread

- General|Minimal Stack Size

FreeRTOS Plus TCP

- Stack size in words (not bytes)

Usage Notes

- A transport interface is required to use the CoreMQTT library (<https://www.freertos.org/network-interface.html>).
- For FSP, a transport interface over MbedTLS is provided. This transport interface can connect to RA ethernet, WiFi, and cellular modules via sockets wrappers for each module.
- TLS_FreeRTOS_Connect should be used before calling any CoreMQTT APIs. See the example for more information.

Limitations

- aws_clientcredential.h and aws_clientcredential_keys.h need to be added manually.
- MbedTLS must be initialized and key provisioning must be done before starting a secure connection.

Examples

Connection example using MbedTLS/PKCS11 Transport Interface

```
#define EXAMPLE_PDN_CONTEXT_NUMBER (1)
#define EXAMPLE_TIMEOUT_MS (5000)
#define EXAMPLE_DISABLE_SNI (false)
#define EXAMPLE_MQTT_HOST ("mqtt_host_server")
#define EXAMPLE_MQTT_HOST_PORT (8883)
#define EXAMPLE_MQTT_SEND_TIMEOUT (5000)
#define EXAMPLE_MQTT_RECEIVE_TIMEOUT (5000)
#define EXAMPLE_MQTT_TOPIC ("example_topic")
#define EXAMPLE_MQTT_CLIENT_IDENTIFIER ("client_id")
#define EXAMPLE_MQTT_KEEP_ALIVE_SECONDS (60)
#define EXAMPLE_MQTT_PAYLOAD ("helloworld")
```

```

5.2.12.3 AWS OTA PAL on MCUBoot (rm_aws_ota_pal_mcuboot)

Modules » Networking

AWS OTA PAL layer implementation for downloading firmware updates.

Overview

This module provides the hardware port layer for the AWS IoT Over-the-air Update Library. Refer to the AWS OTA documentation: <https://docs.aws.amazon.com/freertos/latest/userguide/integrate-ota-agent.html>.

Configuration

Build Time Configurations for rm_aws_ota_pal_mcuboot

The following build time configurations are defined in fsp_cfg/rm_aws_ota_pal_mcuboot_cfg.h:

| Configuration | Options | Default | Description |
|---------------------------------------|--|------------------|--|
| Parameter Checking | <ul style="list-style-type: none"> Default (BSP) Enabled Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| Filepath to Slot ID Callback Function | Must be a valid C symbol | NULL | Callback function for determining which Slot ID the image should be downloaded to. |
| OTA code signing signature algorithm | sig-sha256-ecdsa | sig-sha256-ecdsa | Code signing algorithm used by AWS to sign the downloaded image. |

Configurations for Storage > AWS OTA PAL (rm_aws_ota_pal_mcuboot)

| Configuration | Options | Default | Description |
|---------------|-------------------------------|----------------------------|--------------|
| Name | Name must be a valid C symbol | g_rm_aws_ota_pal_mcu_boot0 | Module name. |

Common AWS Configuration

Build Time Configurations for source

The following build time configurations are defined in aws/ota_config.h:

| Configuration | Options | Default | Description |
|------------------------------|--------------------------------------|---------|--|
| Version > Major | Value must be a non-negative integer | 0 | Major Version number used when updating. |
| Version > Minor | Value must be a non-negative integer | 0 | Minor Version number used when updating. |
| Version > Build | Value must be a non-negative integer | 1 | Build Version number used when updating. |
| Custom ota_config.h | Manual Entry | | Add a path to your custom ota_config.h file. It can be used to override some or all of the configurations defined here, and to define additional configurations. |
| Log2 File Block Size | Value must be a non-negative integer | 11 | Log base 2 of the size of the file data block message (excluding the header). e.g. 11: $2^{11} = 2048$ bytes |
| Self Test Response Wait (ms) | Value must be a non-negative integer | 16000 | Milliseconds to wait for the self test phase to succeed before we force reset. |
| File Request Wait (ms) | Value must be a non-negative integer | 10000 | Milliseconds to wait before requesting data blocks from the OTA service if nothing is happening. |
| Max Thingname Length | Value must be a non-negative integer | 64 | The maximum allowed length of the thing name used by the OTA agent. |
| Max Num Blocks Request | Value must be a non-negative integer | 1 | The maximum number of data blocks requested from OTA streaming service. |
| Max Num Request | Value must be a non- | 32 | The maximum number |

| | | | |
|----------------------------------|---|-----------------------|---|
| Momentum | negative integer | | of requests allowed to send without a response before we abort. |
| Ota Update Status Frequency | Value must be a non-negative integer | 64 | How frequently the device will report its OTA progress to the cloud. |
| Max Num OTA Data Buffers | Value must be a non-negative integer | 1 | The number of data buffers reserved by the OTA agent. |
| Allow Downgrade | <ul style="list-style-type: none"> Allowed Disallowed | Disallowed | Flag to enable booting into updates that have an identical or lower version than the current version. |
| Ota Firmware Update File Type ID | Value must be a non-negative integer | 0 | The file type id received in the job document. |
| Enabled Control Protocol | OTA Control Over MQTT | OTA Control Over MQTT | The protocol selected for OTA control operations. |
| Enabled Data Protocols | <ul style="list-style-type: none"> OTA Data Over MQTT OTA Data Over HTTP OTA Data Over MQTT and HTTP | OTA Data Over MQTT | The protocol selected for OTA data operations. |
| OTA Primary Data Protocol | <ul style="list-style-type: none"> OTA Data Over MQTT OTA Data Over HTTP | OTA Data Over MQTT | The preferred protocol selected for OTA data operations. |

Usage Notes

The current implementation utilizes [MCUboot Port \(rm_mcuboot_port\)](#) for switching images.

Limitations

- Currently only the only supported signature method is sig-sha256-ecdsa.

5.2.12.4 AWS PKCS11 PAL on LittleFS (rm_aws_pkcs11_pal_littlefs)

[Modules](#) » [Networking](#)

PKCS#11 PAL LittleFS layer implementation for use by FreeRTOS TLS.

Overview

Note

The PKCS#11 PAL LittleFS Interface does not provide any interfaces to the user. Consult the AWS documentation for more info: <https://docs.aws.amazon.com/freertos/latest/portingguide/afr-porting-pkcs.html>.

Configuration

There is no user configuration for this module

Usage Notes

The current implementation utilizes [LittleFS on Flash \(rm_littlefs_flash\)](#) for storage.

Limitations

- Credential access is not limited in any way.

5.2.12.5 AWS coreHTTP

[Modules](#) » [Networking](#)

This module provides the AWS coreHTTP library.

Overview

The AWS coreHTTP library can be used to send HTTP and HTTPS requests. The documentation for the library can be found at the following link: [coreHTTP](#).

Features

- Secure and Non-secure HTTP requests
- [Mutually authenticated connections](#)

Configuration

Memory Usage

The AWS coreHTTP stack relies on dynamic memory allocation for thread/task creation as well as other uses. It is recommended to tweak the thread stack configuration values based on usage. Notable values are:

FreeRTOS Thread

- General|Minimal Stack Size
- Memory Allocation|Total Heap Size

FreeRTOS Plus TCP

- Stack size in words (not bytes)

Usage Notes

- A transport interface is required to use the CoreHTTP library (<https://www.freertos.org/network-interface.html>).
- For FSP, a transport interface over MbedTLS is provided. This transport interface can connect to RA ethernet, WiFi, and cellular modules via sockets wrappers for each module.
- TLS_FreeRTOS_Connect should be used before calling any CoreHTTP APIs. See the example for more information.

Limitations

- MbedTLS must be initialized and key provisioning must be done before starting a secure connection.

Examples

HTTPS GET request

```
/* Certificate copied from https://www.amazontrust.com/repository/AmazonRootCA1.pem
*/

5.2.12.6 Azure Embedded Wireless Framework RYZ Port (rm_azure_ewf_ryz)

Modules » Networking

Note

The Azure Embedded Wireless Framework is still in beta and not all APIs may be fully implemented yet.

Overview

This documentation is for the RYZ014A/RYZ024A ports of the Azure Embedded Wireless Framework.

- For more information on the framework see the documentation:
<https://azure.github.io/embedded-wireless-framework/html/index.html>.
 - There are also various examples available for the RA6M4_EK:
<https://github.com/Azure/embedded-wireless-framework/tree/main/examples/EK-RA6M4>.
- For more RYZ014A hardware information including pin and baud rate info please see the RYZ014A page:
<https://www.renesas.com/us/en/products/interface-connectivity/wireless-communications/cellular-iot-modules/ryz014a-lte-cat-m1-cellular-iot-module>.
- For more RYZ024A hardware information including pin and baud rate info please see the RYZ024A page:
<https://www.renesas.com/us/en/products/interface-connectivity/wireless-communications/cellular-iot-modules/ryz024a-lte-cat-m1-cellular-iot-module-global-deployment>.

Features

- Various APIs to control/access RYZ modem features via AT commands.
- Raw AT command APIs
- IPv4 sockets using TCP/UDP
- The EWF framework is usable standalone with bare metal and ThreadX.
- The framework can also be used with NetX when coupled with a EWF NetX middleware layer.

Limitations

The following are the limitations of the Azure EWF Library:

- DTC is not supported. The lower level interface using R_UART relies on processing data one byte at a time via the interrupt callback and UART_EVENT_RX_CHAR.
- Server mode sockets should be supported but have not been fully tested due to APN limitations.
- There are potential issues when using the default (-Os) optimization or above with AC6. All files under embedded_wireless_framework should be set to compile with no optimization (-O0) when using AC6.
- nx_ip_status_check does not currently work for the EWF middleware.
- When using socket send functions (ewf_adapter_tcp_send and ewf_adapter_udp_send) the RYZ port is limited to sending only 1460 bytes at a time. Data sent using these functions should be broken into 1460 byte chunks or less.
 - When using NetX the packet size for the driver packet pool should be set to 1460 bytes or less. Using larger packet sizes will work but the NetX Middleware Driver will potentially break up the packets inefficiently.

Unsupported NetX Duo Features

These features are handled directly on the RYZ hardware or are not supported yet in the EWF library. NetX APIs for these features should not be used:

- IPv6 functionality (the EWF library doesn't yet support IPv6)
- ARP is handled directly by the cellular modem
- DHCP is handled directly by the cellular modem.

Configuration

The RYZ014A port for the Embedded Wireless Framework can be added to the Stacks tab via New Stack > Networking > Azure EWF Adapter on RYZ014A.

The RYZ024A port for the Embedded Wireless Framework can be added to the Stacks tab via New Stack > Networking > Azure EWF Adapter on RYZ024A.

Build Time Configurations for Common

The following build time configurations are defined in `fsp_cfg/azure/ewf/ewf.config.h`:

| Configuration | Options | Default | Description |
|------------------------|---|----------------------------------|--|
| Parameter Checking | <ul style="list-style-type: none"> • Enabled • Disabled | Enabled | This enables checking of function parameters. When this is disabled, parameter checking code is not present and the footprint is reduced |
| Enable Logging | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | This enables logging and the compilation of debug code. When disabled, logging and debug code is not present and the footprint is reduced. |
| Verbose Logging | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | This enables verbose logging. Verbose logging will only work if a EWF Log Function is set and logging is enabled. |
| EWF Log Function | Manual Entry | <code>printf(__VA_ARGS__)</code> | Function the library uses for standard log messages when logging is enabled. |
| EWF Log Error Function | Manual Entry | <code>printf(__VA_ARGS__)</code> | Function the library uses for error log messages when logging is enabled. |

Usage Notes

The basic setup for the library is as follows:

Note

The message allocator (EWF_ALLOCATOR_THREADX_STATIC_DECLARE) should be at least 1500 bytes for RYZ

1. Declare an allocator, interface, and adapter using appropriate macros (EWF_ALLOCATOR_THREADX_STATIC_DECLARE/EWF_ALLOCATOR_MEMORY_POOL_STATIC_DECLARE/EWF_ALLOCATOR_C_HEAP_STATIC_DECLARE, EWF_INTERFACE_RA_UART_STATIC_DECLARE, EWF_ADAPTER_RENESAS_RYZ014_STATIC_DECLARE/EWF_ADAPTER_RENESAS_RYZ024A_STATIC_DECLARE).
2. Start the adapter with `ewf_adapter_start`.
3. Setup modem service if necessary with functions from `ewf_adapter_api_modem.h` and other included `api_modem_*` files.
4. Set functionality with `ewf_adapter_modem_functionality_set`.
5. Wait for network registration (can use `ewf_adapter_modem_network_registration_check` to wait).
6. Do a service activate to set desired PDP context with `ewf_adapter_modem_packet_service_activate`. This should be called regardless of whether context is already activated as it sets an internal library context number for functions like `ewf_adapter_get_ipv4_address`.
7. Call other network functions as needed from desired headers (i.e. TCP functions are in `ewf_adapter_api_tcp.h`).

When using NetX Duo the following must be done:

- Before creating an IP instance make sure that the modem adapter is started and connected to a network.
- After creating an IP instance the adapter pointer has to be stored manually to the IP instance: `g_ip.nx_ip_interface->nx_interface_additional_link_info = adapter_ptr;`
- After creating an IP instance the gateway address should be set to the IP of the modem in order to satisfy NetX Duo's internal routing algorithms (packets are actually routed by the modem hardware): `nx_ip_gateway_address_set(&g_ip, RM_NETXDUIO_TESTS_IP_ADDR);`

Examples

Basic TCP Socket Example

Note

The user should choose the relevant EWF_ALLOCATOR and EWF_ADAPTER macros from this example to use based on the hardware and RTOS being used

```
#define EWF_LOG_BUFFER_SIZE (256)

#define EWF_MODEM_NETWORK_WAIT_TIME_SECONDS (30)

#define EWF_HTTP_GET_SERVER "www.microsoft.com"

#define EWF_HTTP_GET "GET / HTTP/1.1\r\nHost:www.microsoft.com\r\n\r\n"

#define EWF_HTTP_PORT (80)

ewf_allocator * message_allocator_ptr = NULL;
ewf_interface * interface_ptr = NULL;
ewf_adapter * adapter_ptr = NULL;
```

```
char ewf_log_buffer[EWF_LOG_BUFFER_SIZE];
void rm_azure_ewf_ryz_example ()
{
    static uint8_t buffer[2048];          // NOLINT
        uint32_t      buffer_length = sizeof(buffer);
    /* Azure library has macros to declare/allocate structs and pointers.
     * Different ones should be used depending on Adapter and whether the library is
being used on bare metal or ThreadX */
    /* This is for the memory allocator using ThreadX block pools */
        EWF_ALLOCATOR_THREADX_STATIC_DECLARE(message_allocator_ptr, message_allocator,
12, 2048);
    /* This is for the memory allocator using static memory on bare metal */
        EWF_ALLOCATOR_MEMORY_POOL_STATIC_DECLARE(message_allocator_ptr,
message_allocator, 12, 2048);
    /* This is for the memory allocator using the heap on bare metal */
        EWF_ALLOCATOR_C_HEAP_STATIC_DECLARE(message_allocator_ptr, message_allocator, 12,
2048);
    /* This is for the communications interface using R_UART */
        EWF_INTERFACE_RA_UART_STATIC_DECLARE(interface_ptr, sci_uart);
    /* If using RYZ014A */
        EWF_ADAPTER_RENESAS_RYZ014_STATIC_DECLARE(adapter_ptr, renesas_ryz014,
message_allocator_ptr, NULL, interface_ptr);
    /* If using RYZ024A */
        EWF_ADAPTER_RENESAS_RYZ024A_STATIC_DECLARE(adapter_ptr, renesas_ryz024,
message_allocator_ptr, NULL, interface_ptr);
    /* Start the adapter */
        assert(EWF_RESULT_OK == ewf_adapter_start(adapter_ptr));
    /* Set the ME functionality */
        assert(EWF_RESULT_OK == ewf_adapter_modem_functionality_set(adapter_ptr, "1"));
    /* Wait for the modem functionality to be up */
        assert(EWF_RESULT_OK ==
            ewf_adapter_modem_network_registration_check(adapter_ptr,
EWF_ADAPTER_MODEM_CMD_QUERY_EPS_NETWORK_REG,
```

```

EWF_MODEM_NETWORK_WAIT_TIME_SECONDS));

/* Do a service activate to set context num correctly */
ewf_adapter_modem_packet_service_activate(adapter_ptr, 1);

ewf_socket_tcp socket_tcp = {0};

/* Open TCP Socket */
assert(EWF_RESULT_OK == ewf_adapter_tcp_open(adapter_ptr, &socket_tcp));

/* Connect to server */
assert(EWF_RESULT_OK == ewf_adapter_tcp_connect(&socket_tcp, EWF_HTTP_GET_SERVER,
EWF_HTTP_PORT));

/* Send HTTP GET */
assert(EWF_RESULT_OK == ewf_adapter_tcp_send(&socket_tcp, (const uint8_t *)
EWF_HTTP_GET, strlen(EWF_HTTP_GET)));

/* Receive HTTP GET response */
assert(EWF_RESULT_OK == ewf_adapter_tcp_receive(&socket_tcp, buffer,
&buffer_length, true));

/* Shutdown socket connection to server */
assert(EWF_RESULT_OK == ewf_adapter_tcp_shutdown(&socket_tcp));

/* Close/destroy socket */
assert(EWF_RESULT_OK == ewf_adapter_tcp_close(&socket_tcp));
}

```

NetX Duo Example

```

#define NETXDUEXAMPLE_PACKET_SIZE (1568U)
#define NETXDUEXAMPLE_PACKET_NUM (100U)
#define NETXDUEXAMPLE_PACKET_POOL_SIZE ((sizeof(NX_PACKET) +
NETXDUEXAMPLE_PACKET_SIZE) * \
NETXDUEXAMPLE_PACKET_NUM)
#define NETXDUEXAMPLE_IP_STACK_SIZE (2048U)
NX_PACKET_POOL g_packet_pool;
NX_IP g_ip;
static uint8_t g_ip_stack_memory[NETXDUEXAMPLE_IP_STACK_SIZE]
BSP_ALIGN_VARIABLE(4);
static uint8_t g_packet_pool_memory[NETXDUEXAMPLE_PACKET_POOL_SIZE]
BSP_ALIGN_VARIABLE(4);

```

```
void rm_azure_ewf_ryz_netx_example ()
{
    uint32_t modem_ip_addr;
    /* Azure library has macros to declare/allocate structs and pointers.
     * Different ones should be used depending on Adapter and whether the library is
    being used on bare metal or ThreadX */
    /* This is for the memory allocator using ThreadX block pools */

Detailed Description

Middleware for the Bluetooth peripheral on RA MCUs. This module implements the [BLE ABS Interface](#).

Overview

This module provides BLE GAP functionality that complies with the Bluetooth Core Specification version 5.0 specified by the Bluetooth SIG. This module is configured via the [QE for BLE](#). QE for BLE provides standard services defined by standardization organization and custom services defined by user. [Bluetooth LE Profile API Document User's Manual](#) describes the APIs for standard services.

Features

The Bluetooth Low Energy Abstraction module supports the following features:

- following GAP Role support
 - Central: The device that sends a connection request to the Peripheral device.
 - Peripheral: The device that accepts a connection request from Central and establishes a connection.
 - Observer : The device that scans for advertising.
 - Broadcaster : The device that sends advertising.
- LE 2M PHY
 - BLE communication is supported on the 2 Msym/s PHY.
- LE Coded PHY -Supports BLE communication on the Coded PHY. This enables communication over longer distances than 1M PHY and 2M PHY.
- LE Advertising Extensions
 - Up to four independent adverts can be executed simultaneously.
 - The size of Advertising Data/Scan Response Data has been expanded to a maximum of 1650 bytes.
 - Periodic Advertising is available.
- LE Channel Selection Algorithm #2
 - With the hopping channel selection algorithm added in Version 5.0, the machine that selects the channel It is possible.
- High Duty Cycle Non-Connectable Advertising
 - The ability to support non-connectable advertising with a minimum interval of up to 20 msec.
- LE Secure Connections
 - Elliptic curve Diffie-Hellman key sharing (ECDH) for pairing with passive eavesdropping support.
- Link Layer privacy
 - This feature avoids being tracked by other BLE devices by periodically changing the Bluetooth device address.
- Link Layer Extended Scanner Filter policies
 - Scan Filter support for Resolvable private addresses.
- LE Data Packet Length Extension
 - This function expands the packet size of BLE data communications. It is possible to scale up to 251 bytes.
- LE L2CAP Connection Oriented Channel Support
 - The ability to support communication using the L2CAP credit based flow control channel.
- Low Duty Cycle Directed Advertising
 - The ability to support the advertising of the Low Duty Cycle for reconnecting to a known device.
- LE Link Layer Topology
 - It supports both Master and Slave roles and can operate as Master when connected to one remote device and as Slave when connected to another remote device.
- LE Ping
 - This function checks whether the link is maintained or not by requesting the transmission of packets containing MIC after link encryption.

BLE Library Configuration

There are three types of BLE Protocol Stacks, and the functions provided are different depending on the type of BLE Protocol Stack you select.

| BLE library feature | Extended | Balance | Compact |
|--|--|--|------------------------|
| GAP Role | Central Peripheral Observer Broadcaster | Central Peripheral Observer Broadcaster | Peripheral Broadcaster |
| LE 2M PHY | Yes | Yes | No |
| LE Coded PHY | Yes | Yes | No |
| LE Advertising Extensions | Yes | No | No |
| LE Channel Selection Algorithm #2 | Yes | Yes | No |
| High Duty Cycle Non- Connectable Advertising | Yes | Yes | Yes |
| LE Secure Connections | Yes | Yes | Yes |
| Link Layer privacy | Yes | Yes | Yes |
| Link Layer Extended Scanner Filter policies | Yes | Yes | No |
| LE Data Packet Length Extension | Yes | Yes | Yes |
| LE L2CAP Connection Oriented Channel Support | Yes | No | No |
| Low Duty Cycle Directed Advertising | Yes | Yes | Yes |
| LE Link Layer Topology | Yes | Yes | No |
| LE Ping | Yes | Yes | Yes |
| 32-bit UUID Support in LE | Yes | Yes | Yes |

Target Devices

The Bluetooth Low Energy Abstraction module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_ble_abs

The following build time configurations are defined in fsp_cfg/rm_ble_abs_cfg.h:

| Configuration | Options | Default | Description |
|------------------------------------|--|-------------------|---|
| Parameter Checking | <ul style="list-style-type: none"> Default (BSP) Enable Disable | Default (BSP) | Specify whether to include code for API parameter checking. Valid settings include. |
| Debug Public Address | Must be a valid device address | FF:FF:FF:50:90:74 | Public Address of firmware initial value. |
| Debug Random Address | Must be a valid device address | FF:FF:FF:FF:FF:FF | Random Address of firmware initial value. |
| Maximum number of connections | Value must be an integer between 1 and 7, and lower than the value defined in ble module. | 7 | Maximum number of connections. |
| Maximum connection data length | Value must be an integer between 27 and 251, and lower than the value defined in ble module. | 251 | Maximum connection data length. |
| Maximum advertising data length | Value must be an integer between 31 and 1650, and lower than the value defined in ble module. | 1650 | Maximum advertising data length. |
| Maximum advertising set number | Value must be an integer between 1 and 4, and lower than the value defined in ble module. | 4 | Maximum advertising set number. |
| Maximum periodic sync set number. | Value must be an integer between 1 and 2, and lower than the value defined in ble module. | 2 | Maximum periodic sync set number. |
| Store Security Data | <ul style="list-style-type: none"> Disable Enable | Disable | Store Security Data in DataFlash. |
| Data Flash Block for Security Data | Value must be an integer between 0 and 7, and lower than the value defined in ble module. | 0 | Data Flash Block for Security Data Management. |
| Remote Device Bonding Number | Value must be an integer between 1 and 7, and lower than the value defined in ble module. | 7 | Number of remote device bonding information. |
| Connection Event Start | <ul style="list-style-type: none"> Disable | Disable | Set Connection event |

| | | | |
|--------------------------------|---|--------------------------------|---|

| MTU Size Configured | Value must be an integer between 23 and 247, and lower than the value defined in ble module. | 247 | MTU Size configured by GATT MTU exchange procedure. |
| Timer Slot Maximum Number | Value must be an integer between 1 and 10, and lower than the value defined in ble module. | 10 | The maximum number of timer slot. |

Configurations for Networking > BLE Abstraction (rm_ble_abs)

This module can be added to the Stacks tab via New Stack > Networking > BLE Abstraction (rm_ble_abs).

| Configuration | Options | Default | Description |
|--|-------------------------------|-----------------------|---|
| General > Name | Name must be a valid C symbol | g_ble_abs0 | Module name. |
| General > Gap callback | Name must be a valid C symbol | gap_cb | A user callback function must be provided if the BLE_ABS is configured to generate a GAP. If QE is used, set to NULL. |
| General > Vendor specific callback | Name must be a valid C symbol | vs_cb | A user callback function must be provided if the BLE_ABS is configured to generate a Vendor Specific. If QE is used, set to NULL. |
| General > GATT server callback parameter | Name must be a valid C symbol | gs_abs_gatts_cb_param | Set GATT server callback parameter. If QE is used, set to NULL. |
| General > GATT server callback number | Must be a valid number | 2 | The number of GATT Server callback functions. |

| | | | |
|--|--|--------------------------------|---|
| General > GATT client callback parameter | Name must be a valid C symbol | gs_abs_gattc_cb_param | Set GATT client callback parameter. If QE is used, set to NULL. |
| General > GATT client callback number | Must be a valid number | 2 | The number of GATT Server callback functions. |
| Security > Pairing parameters | Name must be a valid C symbol | gs_abs_pairing_param | Set pairing parameters. |
| Security > IO capabilities of local device. | <ul style="list-style-type: none"> • BLE_GAP_IOCAP_DISPLAY_ONLY • BLE_GAP_IOCAP_DISPLAY_YESNO • BLE_GAP_IOCAP_KEYBOARD_ONLY • BLE_GAP_IOCAP_NOINPUT_NOOUTPUT • BLE_GAP_IOCAP_KEYBOARD_DISPLAY | BLE_GAP_IOCAP_NOINPUT_NOOUTPUT | Select IO capabilities of local device. |
| Security > MITM protection policy. | <ul style="list-style-type: none"> • BLE_GAP_SEC_MITM_BEST EffORT • BLE_GAP_SEC_MITM_STRICT | BLE_GAP_SEC_MITM_BEST EffORT | Select MITM protection policy. |
| Security > Determine whether to accept only Secure Connections or not. | <ul style="list-style-type: none"> • BLE_GAP_SC_BEST EffORT • BLE_GAP_SC_STRICT | BLE_GAP_SC_BEST EffORT | Select determine whether to accept only Secure Connections or not. |
| Security > Type of keys to be distributed from local device. | <ul style="list-style-type: none"> • BLE_GAP_KEY_DIST_ENCKEY • BLE_GAP_KEY_DIST_IDKEY • BLE_GAP_KEY_DIST_SIGNKEY | | Select type of keys to be distributed from local device. |
| Security > Type of keys which local device requests a remote device to distribute. | <ul style="list-style-type: none"> • BLE_GAP_KEY_DIST_ENCKEY • BLE_GAP_KEY_DIST_IDKEY • BLE_GAP_KEY_DIST_SIGNKEY | | Set type of keys which local device requests a remote device to distribute. |
| Security > Maximum LTK size. | Valid range is 7 - 16 | 16 | Set Maximum LTK size. |
| Interrupts > Callback provided when an ISR occurs | Name must be a valid C symbol | NULL | Callback provided when BLE ABS ISR occurs |

Clock Configuration

Note

System clock (ICLK): 8 MHz or more

Peripheral module clock A (PCLKA): 8MHz or more

The BLE Protocol Stack is optimized for ICLK and PCLKA frequencies of 32 MHz.

It is recommended that the clock be set so that the ICLK and PCLKA frequencies are 32MHz in order to get the best performance from the BLE.

Pin Configuration

This module does not use I/O pins.

Stack Size Configuration

Note

When you use BLE on RTOS environment, make sure that thread stack size must be 0x1000 or more which call [R_BLE_Execute](#).

Usage Notes

Limitations

Developers should be aware of the following limitations when using the BLE_ABS:

Examples

BLE_ABS Basic Example

This is a basic example of minimal use of the BLE_ABS in an application.

```
#define BLE_ABS_EVENT_FLAG_STACK_ON (0x01 << 0)
#define BLE_ABS_EVENT_FLAG_CONN_IND (0x01 << 1)
#define BLE_ABS_EVENT_FLAG_ADV_ON (0x01 << 2)

| <code>uint32_t</code> | <code>connection_timer_handle</code> | Cancel a request for connection timer. |
| <code>uint32_t</code> | <code>advertising_timer_handle</code> | Advertising timer for legacy advertising. |
| <code>uint32_t</code> | <code>scan_timer_handle</code> | Scan interval timer. |
| <code>abs_advertising_parameter_t</code> | <code>advertising_sets[BLE_MAX_NO_OF_ADV_SETS_SUPPORTED]</code> | Advertising set information. |
| <code>abs_scan_parameter_t</code> | <code>abs_scan</code> | Scan information. |
| <code>st_ble_dev_addr_t</code> | <code>loc_bd_addr</code> | Local device address. |
| <code>uint8_t</code> | <code>privacy_mode</code> | Privacy mode. |
| <code>uint32_t</code> | <code>set_privacy_status</code> | Local privacy status. |
| <code>ble_abs_timer_t</code> | <code>timer[BLE_ABS_CFG_TIMER_NUMBER_OF_SLOT]</code> | |
| <code>uint8_t</code> | <code>local_irk[BLE_GAP_IRK_SIZE]</code> | |
| <code>ble_abs_identity_address_info_t</code> | <code>identity_address_info</code> | |
| <code>uint32_t</code> | <code>current_timeout_ms</code> | Current timeout. |
| <code>uint32_t</code> | <code>elapsed_timeout_ms</code> | Elapsed timeout. |
| <code>ble_abs_cfg_t const *</code> | <code>p_cfg</code> | Pointer to the BLE ABS configuration block. |

Typedef Documentation

◆ `ble_abs_timer_cb_t`

```
typedef void(* ble_abs_timer_cb_t) (uint32_t timer_hdl)
```

The timer callback invoked when the timer expired.

Enumeration Type Documentation

◆ **e_ble_timer_type_t**

| | |
|-------------------------|---------------------|
| enum e_ble_timer_type_t | |
| The timer type. | |
| Enumerator | |
| BLE_TIMER_ONE_SHOT | One shot timer type |
| BLE_TIMER_PERIODIC | Periodic timer type |

Function Documentation◆ **RM_BLE_ABS_Open()**

```
fsp_err_t RM_BLE_ABS_Open ( ble_abs_ctrl_t *const p_ctrl, ble_abs_cfg_t const *const p_cfg )
```

Host stack is initialized with this function. Before using All the R_BLE APIs, it's necessary to call this function. A callback functions are registered with this function. In order to receive the GAP, GATT, Vendor specific event, it's necessary to register a callback function. The result of this API call is notified in BLE_GAP_EVENT_STACK_ON event. Implements [ble_abs_api_t::open](#).

Example:

```
/* Open the module. */
err = RM_BLE_ABS_Open(&g_ble_abs0_ctrl, &g_ble_abs0_cfg);
```

Return values

| | |
|--------------------------|---|
| FSP_SUCCESS | Channel opened successfully. |
| FSP_ERR_ASSERTION | Null pointer presented. |
| FSP_ERR_ALREADY_OPEN | Requested channel is already open in a different configuration. |
| FSP_ERR_INVALID_ARGUMENT | Invalid input parameter. |
| FSP_ERR_INVALID_MODE | Invalid mode during open call |

Host stack is initialized with this function. Before using All the R_BLE APIs, it's necessary to call this function. A callback functions are registered with this function. In order to receive the GAP, GATT, Vendor specific event, it's necessary to register a callback function. The result of this API call is notified in BLE_GAP_EVENT_STACK_ON event. Implements [ble_abs_api_t::open](#).

Example:

```
/* Open the module. */
err = RM_BLE_ABS_Open(&g_ble_abs0_ctrl, &g_ble_abs0_cfg);
```

Return values

| | |
|-------------------|------------------------------|
| FSP_SUCCESS | Channel opened successfully. |
| FSP_ERR_ASSERTION | Null pointer presented. |

| | |
|--------------------------|---|
| FSP_ERR_ALREADY_OPEN | Requested channel is already open in a different configuration. |
| FSP_ERR_INVALID_ARGUMENT | Invalid input parameter. |
| FSP_ERR_INVALID_MODE | Invalid mode during open call |

Host stack is initialized with this function. Before using All the R_BLE APIs, it's necessary to call this function. A callback functions are registered with this function. In order to receive the GAP, GATT, Vendor specific event, it's necessary to register a callback function. The result of this API call is notified in BLE_GAP_EVENT_STACK_ON event. Implements [ble_abs_api_t::open](#).

Example:

```
/* Open the module. */
err = RM_BLE_ABS_Open(&g_ble_abs0_ctrl, &g_ble_abs0_cfg);
```

Return values

| | |
|--------------------------|---|
| FSP_SUCCESS | Channel opened successfully. |
| FSP_ERR_ASSERTION | Null pointer presented. |
| FSP_ERR_INVALID_CHANNEL | The channel number is invalid. |
| FSP_ERR_ALREADY_OPEN | Requested channel is already open in a different configuration. |
| FSP_ERR_INVALID_ARGUMENT | Invalid input parameter. |

◆ **RM_BLE_ABS_Close()**

```
fsp_err_t RM_BLE_ABS_Close ( ble_abs_ctrl_t *const p_ctrl)
```

Close the BLE channel. Implements `ble_abs_api_t::close`.

Example:

```
/* Close BLE driver */
err = RM_BLE_ABS_Close(&g_ble_abs0_ctrl);
```

Return values

| | |
|-------------------|------------------------------|
| FSP_SUCCESS | Channel closed successfully. |
| FSP_ERR_ASSERTION | Null pointer presented. |
| FSP_ERR_NOT_OPEN | Control block not open. |

Example:

```
/* Close BLE driver */
err = RM_BLE_ABS_Close(&g_ble_abs0_ctrl);
```

Return values

| | |
|-------------------|------------------------------|
| FSP_SUCCESS | Channel closed successfully. |
| FSP_ERR_ASSERTION | Null pointer presented. |
| FSP_ERR_NOT_OPEN | Control block not open. |

Example:

```
/* Close BLE driver */
err = RM_BLE_ABS_Close(&g_ble_abs0_ctrl);
```

Return values

| | |
|-------------------|------------------------------|
| FSP_SUCCESS | Channel closed successfully. |
| FSP_ERR_ASSERTION | Null pointer presented. |
| FSP_ERR_NOT_OPEN | Control block not open. |

◆ **RM_BLE_ABS_Reset()**

```
fsp_err_t RM_BLE_ABS_Reset ( ble_abs_ctrl_t *const p_ctrl, ble_event_cb_t init_callback )
```

This function is not implemented. To perform this function call R_BLE_Close followed by R_BLE_Open. Implements `ble_abs_api_t::reset`.

Return values

| | |
|---------------------|---------------------------|
| FSP_ERR_UNSUPPORTED | Function is not supported |
|---------------------|---------------------------|

BLE is reset with this function. The process is carried out in the following order. `R_BLE_Close()` -> `R_BLE_GAP_Terminate()` -> `R_BLE_Open()` -> `R_BLE_SetEvent()`. The `init_cb` callback initializes the others (Host Stack, timer, etc...). Implements `ble_abs_api_t::reset`.

Return values

| | |
|-------------------|------------------------------|
| FSP_SUCCESS | Channel closed successfully. |
| FSP_ERR_ASSERTION | Null pointer presented. |
| FSP_ERR_NOT_OPEN | Control block not open. |

◆ RM_BLE_ABS_StartLegacyAdvertising()

```
fsp_err_t RM_BLE_ABS_StartLegacyAdvertising ( ble_abs_ctrl_t *const p_ctrl,
ble_abs_legacy_advertising_parameter_t const *const p_advertising_parameter )
```

Start Legacy Advertising after setting advertising parameters, advertising data and scan response data. The legacy advertising uses the advertising set whose advertising handle is 0. The advertising type is connectable and scannable(ADV_IND). The address type of local device is Public Identity Address or RPA(If the resolving list contains no matching entry, use the public address.). Scan request event(BLE_GAP_EVENT_SCAN_REQ_RECV) is not notified. Implements [ble_abs_api_t::startLegacyAdvertising](#)

Example:

```
/* Start advertising. */
err = RM_BLE_ABS_StartLegacyAdvertising(&g_ble_abs0_ctrl,
&legacy_advertising_parameter);
```

Return values

| | |
|--------------------------|---|
| FSP_SUCCESS | Operation succeeded |
| FSP_ERR_ASSERTION | p_instance_ctrl is specified as NULL. |
| FSP_ERR_NOT_OPEN | Control block not open. |
| FSP_ERR_INVALID_STATE | Host stack hasn't been initialized. |
| FSP_ERR_INVALID_POINTER | p_advertising_parameter is specified as NULL. |
| FSP_ERR_INVALID_ARGUMENT | The advertising parameter is out of range. |

Start Legacy Advertising after setting advertising parameters, advertising data and scan response data. The legacy advertising uses the advertising set whose advertising handle is 0. The advertising type is connectable and scannable(ADV_IND). The address type of local device is Public Identity Address or RPA(If the resolving list contains no matching entry, use the public address.). Scan request event(BLE_GAP_EVENT_SCAN_REQ_RECV) is not notified. Implements [ble_abs_api_t::startLegacyAdvertising](#)

Example:

```
/* Start advertising. */
err = RM_BLE_ABS_StartLegacyAdvertising(&g_ble_abs0_ctrl,
&legacy_advertising_parameter);
```

Return values

| | |
|-----------------------|---------------------------------------|
| FSP_SUCCESS | Operation succeeded |
| FSP_ERR_ASSERTION | p_instance_ctrl is specified as NULL. |
| FSP_ERR_NOT_OPEN | Control block not open. |
| FSP_ERR_INVALID_STATE | Host stack hasn't been initialized. |
| | |

| | |
|--------------------------|---|
| FSP_ERR_INVALID_POINTER | p_advertising_parameter is specified as NULL. |
| FSP_ERR_INVALID_ARGUMENT | The advertising parameter is out of range. |

Start Legacy Advertising after setting advertising parameters, advertising data and scan response data. The legacy advertising uses the advertising set whose advertising handle is 0. The advertising type is connectable and scannable(ADV_IND). The address type of local device is Public Identity Address or RPA(If the resolving list contains no matching entry, use the public address.). Scan request event(BLE_GAP_EVENT_SCAN_REQ_RECV) is not notified. Implements [ble_abs_api_t::startLegacyAdvertising](#)

Example:

```
/* Start advertising. */
err = RM_BLE_ABS_StartLegacyAdvertising(&g_ble_abs0_ctrl,
&legacy_advertising_parameter);
```

Return values

| | |
|--------------------------|---|
| FSP_SUCCESS | Operation succeeded |
| FSP_ERR_ASSERTION | p_instance_ctrl is specified as NULL. |
| FSP_ERR_NOT_OPEN | Control block not open. |
| FSP_ERR_INVALID_STATE | Host stack hasn't been initialized. |
| FSP_ERR_INVALID_POINTER | p_advertising_parameter is specified as NULL. |
| FSP_ERR_INVALID_ARGUMENT | The advertising parameter is out of range. |

◆ RM_BLE_ABS_StartExtendedAdvertising()

```
fsp_err_t RM_BLE_ABS_StartExtendedAdvertising ( ble_abs_ctrl_t *const p_ctrl,
ble_abs_extend_advertising_parameter_t const *const p_advertising_parameter )
```

Start Extended Advertising after setting advertising parameters, advertising data. The extended advertising uses the advertising set whose advertising handle is 1. The advertising type is connectable and non-scannable. The address type of local device is Public Identity Address or RPA(If the resolving list contains no matching entry, use the public address.). Scan request event(BLE_GAP_EVENT_SCAN_REQ_RECV) is not notified. Implements [ble_abs_api_t::startExtendedAdvertising](#)

Return values

| | |
|-------------------------|--|
| FSP_ERR_ASSERTION | p_instance_ctrl is specified as NULL. |
| FSP_ERR_NOT_OPEN | Control block not open. |
| FSP_ERR_INVALID_POINTER | p_advertising_parameter is specified as NULL. |
| FSP_ERR_UNSUPPORTED | Subordinate modules do not support this feature. |

Start Extended Advertising after setting advertising parameters, advertising data. The extended advertising uses the advertising set whose advertising handle is 1. The advertising type is connectable and non-scannable. The address type of local device is Public Identity Address or RPA(If the resolving list contains no matching entry, use the public address.). Scan request event(BLE_GAP_EVENT_SCAN_REQ_RECV) is not notified. Implements [ble_abs_api_t::startExtendedAdvertising](#)

Return values

| | |
|--------------------------|--|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | p_instance_ctrl is specified as NULL. |
| FSP_ERR_NOT_OPEN | Control block not open. |
| FSP_ERR_INVALID_POINTER | p_advertising_parameter is specified as NULL. |
| FSP_ERR_INVALID_STATE | Host stack hasn't been initialized. |
| FSP_ERR_INVALID_ARGUMENT | The advertising parameter is out of range. |
| FSP_ERR_UNSUPPORTED | Subordinate modules do not support this feature. |

◆ RM_BLE_ABS_StartNonConnectableAdvertising()

```
fsp_err_t RM_BLE_ABS_StartNonConnectableAdvertising ( ble_abs_ctrl_t *const p_ctrl,
ble_abs_non_connectable_advertising_parameter_t const *const p_advertising_parameter )
```

Start Non-Connectable Advertising after setting advertising parameters, advertising data. The non-connectable advertising uses the advertising set whose advertising handle is 2. The advertising type is non-connectable and non-scannable. The address type of local device is Public Identity Address or RPA(If the resolving list contains no matching entry, use the public address.). Scan request event(BLE_GAP_EVENT_SCAN_REQ_RECV) is not notified. Secondary Advertising Max Skip is 0. Implements [ble_abs_api_t::startNonConnectableAdvertising](#).

Return values

| | |
|-------------------------|---|
| FSP_ERR_ASSERTION | p_instance_ctrl is specified as NULL. |
| FSP_ERR_NOT_OPEN | Control block not open. |
| FSP_ERR_INVALID_POINTER | p_advertising_parameter is specified as NULL. |
| FSP_ERR_UNSUPPORTED | Feature not yet supported. |

Start Non-Connectable Advertising after setting advertising parameters, advertising data. The non-connectable advertising uses the advertising set whose advertising handle is 2. The advertising type is non-connectable and non-scannable. The address type of local device is Public Identity Address or RPA(If the resolving list contains no matching entry, use the public address.). Scan request event(BLE_GAP_EVENT_SCAN_REQ_RECV) is not notified. Secondary Advertising Max Skip is 0. Implements [ble_abs_api_t::startNonConnectableAdvertising](#).

Return values

| | |
|--------------------------|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | p_instance_ctrl is specified as NULL. |
| FSP_ERR_NOT_OPEN | Control block not open. |
| FSP_ERR_INVALID_POINTER | p_advertising_parameter is specified as NULL. |
| FSP_ERR_INVALID_STATE | Host stack hasn't been initialized. |
| FSP_ERR_INVALID_ARGUMENT | The advertising parameter is out of range. |

◆ RM_BLE_ABS_StartPeriodicAdvertising()

```
fsp_err_t RM_BLE_ABS_StartPeriodicAdvertising ( ble_abs_ctrl_t *const p_ctrl,
ble_abs_periodic_advertising_parameter_t const *const p_advertising_parameter )
```

Start Periodic Advertising after setting advertising parameters, periodic advertising parameters, advertising data and periodic advertising data. The periodic advertising uses the advertising set whose advertising handle is 3. The advertising type is non-connectable and non-scannable. The address type of local device is Public Identity Address or RPA(If the resolving list contains no matching entry, use the public address.). Scan request event(BLE_GAP_EVENT_SCAN_REQ_RECV) is not notified. Secondary Advertising Max Skip is 0. Implements [ble_abs_api_t::startPeriodicAdvertising](#)

Return values

| | |
|-------------------------|--|
| FSP_ERR_ASSERTION | p_instance_ctrl is specified as NULL. |
| FSP_ERR_NOT_OPEN | Control block not open. |
| FSP_ERR_INVALID_POINTER | p_advertising_parameter is specified as NULL. |
| FSP_ERR_UNSUPPORTED | Subordinate modules do not support this feature. |

Start Periodic Advertising after setting advertising parameters, periodic advertising parameters, advertising data and periodic advertising data. The periodic advertising uses the advertising set whose advertising handle is 3. The advertising type is non-connectable and non-scannable. The address type of local device is Public Identity Address or RPA(If the resolving list contains no matching entry, use the public address.). Scan request event(BLE_GAP_EVENT_SCAN_REQ_RECV) is not notified. Secondary Advertising Max Skip is 0. Implements [ble_abs_api_t::startPeriodicAdvertising](#)

Return values

| | |
|--------------------------|--|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | p_instance_ctrl is specified as NULL. |
| FSP_ERR_NOT_OPEN | Control block not open. |
| FSP_ERR_INVALID_POINTER | p_advertising_parameter is specified as NULL. |
| FSP_ERR_INVALID_ARGUMENT | The advertising parameter is out of range. |
| FSP_ERR_UNSUPPORTED | This feature is not supported in this configuration. |

◆ RM_BLE_ABS_StartScanning()

```
fsp_err_t RM_BLE_ABS_StartScanning ( ble_abs_ctrl_t *const p_ctrl, ble_abs_scan_parameter_t
const *const p_scan_parameter )
```

Start scanning after setting scan parameters. The scanner address type is Public Identity Address. Fast scan is followed by slow scan. The end of fast scan or slow scan is notified with BLE_GAP_EVENT_SCAN_TO event. If fast_period is 0, only slow scan is carried out. If scan_period is 0, slow scan continues. Implements [ble_abs_api_t::startScanning](#).

Example:

```
/* Start scanning. */
err = RM_BLE_ABS_StartScanning(&g_ble_abs0_ctrl, &scan_parameter);
```

Return values

| | |
|-------------------------|--|
| FSP_ERR_ASSERTION | p_instance_ctrl is specified as NULL. |
| FSP_ERR_NOT_OPEN | Control block not open. |
| FSP_ERR_INVALID_POINTER | p_scan_parameter is specified as NULL. |
| FSP_ERR_UNSUPPORTED | Function is not supported |

Start scanning after setting scan parameters. The scanner address type is Public Identity Address. Fast scan is followed by slow scan. The end of fast scan or slow scan is notified with BLE_GAP_EVENT_SCAN_TO event. If fast_period is 0, only slow scan is carried out. If scan_period is 0, slow scan continues. Implements [ble_abs_api_t::startScanning](#).

Example:

```
/* Start scanning. */
err = RM_BLE_ABS_StartScanning(&g_ble_abs0_ctrl, &scan_parameter);
```

Return values

| | |
|-------------------------|--|
| FSP_ERR_ASSERTION | p_instance_ctrl is specified as NULL. |
| FSP_ERR_NOT_OPEN | Control block not open. |
| FSP_ERR_INVALID_POINTER | p_scan_parameter is specified as NULL. |
| FSP_ERR_UNSUPPORTED | Function is not supported |

Start scanning after setting scan parameters. The scanner address type is Public Identity Address. Fast scan is followed by slow scan. The end of fast scan or slow scan is notified with BLE_GAP_EVENT_SCAN_TO event. If fast_period is 0, only slow scan is carried out. If scan_period is 0, slow scan continues. Implements [ble_abs_api_t::startScanning](#).

Example:

```
/* Start scanning. */
err = RM_BLE_ABS_StartScanning(&g_ble_abs0_ctrl, &scan_parameter);
```

Return values

| | |
|---------------------------|--|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | p_instance_ctrl is specified as NULL. |
| FSP_ERR_NOT_OPEN | Control block not open. |
| FSP_ERR_INVALID_POINTER | p_scan_parameter is specified as NULL. |
| FSP_ERR_INVALID_ARGUMENT | The scan parameter is out of range. |
| FSP_ERR_IN_USE | This API is called in scanning. |
| FSP_ERR_BLE_ABS_NOT_FOUND | Usable timer slot not found. |
| FSP_ERR_UNSUPPORTED | This feature is not supported in this configuration. |

◆ RM_BLE_ABS_CreateConnection()

```
fsp_err_t RM_BLE_ABS_CreateConnection ( ble_abs_ctrl_t*const p_ctrl,
ble_abs_connection_parameter_t const *const p_connection_parameter )
```

Request create connection. The initiator address type is Public Identity Address. The scan interval is 60ms and the scan window is 30ms in case of 1M PHY or 2M PHY. The scan interval is 180ms and the scan window is 90ms in case of coded PHY. The Minimum CE Length and the Maximum CE Length are 0xFFFF. When the request for a connection has been received by the Controller, BLE_GAP_EVENT_CREATE_CONN_COMP event is notified. When a link has been established, BLE_GAP_EVENT_CONN_IND event is notified. Implements [ble_abs_api_t::createConnection](#).

Example:

```
/* Create connection with remote device. */
err = RM_BLE_ABS_CreateConnection(&g_ble_abs0_ctrl, &g_connection_parameter);
```

Return values

| | |
|--------------------------|--|
| FSP_ERR_ASSERTION | p_instance_ctrl is specified as NULL. |
| FSP_ERR_NOT_OPEN | Control block not open. |
| FSP_ERR_INVALID_POINTER | p_connection_parameter is specified as NULL. |
| FSP_ERR_INVALID_ARGUMENT | The create connection parameter is out of range. |
| FSP_ERR_UNSUPPORTED | Function is not supported |

Request create connection. The initiator address type is Public Identity Address. The scan interval is 60ms and the scan window is 30ms in case of 1M PHY or 2M PHY. The scan interval is 180ms and the scan window is 90ms in case of coded PHY. The Minimum CE Length and the Maximum CE Length are 0xFFFF. When the request for a connection has been received by the Controller, BLE_GAP_EVENT_CREATE_CONN_COMP event is notified. When a link has been established, BLE_GAP_EVENT_CONN_IND event is notified. Implements [ble_abs_api_t::createConnection](#).

Example:

```
/* Create connection with remote device. */
err = RM_BLE_ABS_CreateConnection(&g_ble_abs0_ctrl, &g_connection_parameter);
```

Return values

| | |
|--------------------------|--|
| FSP_ERR_ASSERTION | p_instance_ctrl is specified as NULL. |
| FSP_ERR_NOT_OPEN | Control block not open. |
| FSP_ERR_INVALID_POINTER | p_connection_parameter is specified as NULL. |
| FSP_ERR_INVALID_ARGUMENT | The create connection parameter is out of range. |
| FSP_ERR_UNSUPPORTED | Function is not supported |

Request create connection. The initiator address type is Public Identity Address. The scan interval is 60ms and the scan window is 30ms in case of 1M PHY or 2M PHY. The scan interval is 180ms and the scan window is 90ms in case of coded PHY. The Minimum CE Length and the Maximum CE Length are 0xFFFF. When the request for a connection has been received by the Controller, BLE_GAP_EVENT_CREATE_CONN_COMP event is notified. When a link has been established, BLE_GAP_EVENT_CONN_IND event is notified. Implements [ble_abs_api_t::createConnection](#).

Example:

```
/* Create connection with remote device. */
err = RM_BLE_ABS_CreateConnection(&g_ble_abs0_ctrl, &g_connection_parameter);
```

Return values

| | |
|---------------------------|--|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | p_instance_ctrl is specified as NULL. |
| FSP_ERR_NOT_OPEN | Control block not open. |
| FSP_ERR_INVALID_POINTER | p_connection_parameter is specified as NULL. |
| FSP_ERR_INVALID_ARGUMENT | The create connection parameter is out of range. |
| FSP_ERR_IN_USE | This API is called while creating a link by previous API call. |
| FSP_ERR_BLE_ABS_NOT_FOUND | Couldn't find a valid timer. |
| FSP_ERR_UNSUPPORTED | This feature is not supported in this configuration. |

◆ RM_BLE_ABS_SetLocalPrivacy()

```
fsp_err_t RM_BLE_ABS_SetLocalPrivacy ( ble_abs_ctrl_t *const p_ctrl, uint8_t const *const p_lc_irk,
uint8_t privacy_mode )
```

Generate a IRK, add it to the resolving list, set privacy mode and enable RPA function. Register vendor specific callback function, if IRK is generated by this function. After configuring local device privacy, BLE_GAP_ADDR_RPA_ID_PUBLIC is specified as own device address in the advertising/scan/create connection API. Implements [ble_abs_api_t::setLocalPrivacy](#)

Return values

| | |
|--------------------------|---|
| FSP_ERR_ASSERTION | p_instance_ctrl is specified as NULL. |
| FSP_ERR_NOT_OPEN | Control block not open. |
| FSP_ERR_INVALID_ARGUMENT | The privacy_mode parameter is out of range. |
| FSP_ERR_UNSUPPORTED | Function is not supported |

Generate a IRK, add it to the resolving list, set privacy mode and enable RPA function. Register vendor specific callback function, if IRK is generated by this function. After configuring local device privacy, BLE_GAP_ADDR_RPA_ID_PUBLIC is specified as own device address in the advertising/scan/create connection API. Implements [ble_abs_api_t::setLocalPrivacy](#)

Example:

```
/* Set local privacy. */
err = RM_BLE_ABS_SetLocalPrivacy(&g_ble_abs0_ctrl, p_local_irk, privacy_mode);
```

Return values

| | |
|--------------------------|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | p_instance_ctrl is specified as NULL. |
| FSP_ERR_NOT_OPEN | Control block not open. |
| FSP_ERR_INVALID_ARGUMENT | The privacy_mode parameter is out of range. |

◆ RM_BLE_ABS_StartAuthentication()

```
fsp_err_t RM_BLE_ABS_StartAuthentication ( ble_abs_ctrl_t *const p_ctrl, uint16_t
connection_handle )
```

Start pairing or encryption. If pairing has been done, start encryption. The pairing parameters are configured by [RM_BLE_ABS_Open\(\)](#) or [R_BLE_GAP_SetPairingParams\(\)](#). If the pairing parameters are configure by [RM_BLE_ABS_Open\(\)](#),

- bonding policy is that bonding information is stored.
- Key press notification is not supported. Implements [ble_abs_api_t::startAuthentication](#).

Example:

```
/* Start authentication with remote device. */
err = RM_BLE_ABS_StartAuthentication(&g_ble_abs0_ctrl, g_connection_handle);
```

Return values

| | |
|---------------------|---|
| FSP_ERR_ASSERTION | p_instance_ctrl or connection_handle are specified as NULL. |
| FSP_ERR_NOT_OPEN | Control block not open. |
| FSP_ERR_UNSUPPORTED | Function is not supported |

Start pairing or encryption. If pairing has been done, start encryption. The pairing parameters are configured by [RM_BLE_ABS_Open\(\)](#) or [R_BLE_GAP_SetPairingParams\(\)](#). If the pairing parameters are configure by [RM_BLE_ABS_Open\(\)](#),

- bonding policy is that bonding information is stored.
- Key press notification is not supported. Implements [ble_abs_api_t::startAuthentication](#).

Example:

```
/* Start authentication with remote device. */
err = RM_BLE_ABS_StartAuthentication(&g_ble_abs0_ctrl, g_connection_handle);
```

Return values

| | |
|---------------------|---|
| FSP_ERR_ASSERTION | p_instance_ctrl or connection_handle are specified as NULL. |
| FSP_ERR_NOT_OPEN | Control block not open. |
| FSP_ERR_UNSUPPORTED | Function is not supported |

Start pairing or encryption. If pairing has been done, start encryption. The pairing parameters are configured by [RM_BLE_ABS_Open\(\)](#) or [R_BLE_GAP_SetPairingParams\(\)](#). If the pairing parameters are configure by [RM_BLE_ABS_Open\(\)](#),

- bonding policy is that bonding information is stored.
- Key press notification is not supported. Implements [ble_abs_api_t::startAuthentication](#).

Example:

```
/* Start authentication with remote device. */
err = RM_BLE_ABS_StartAuthentication(&g_ble_abs0_ctrl, g_connection_handle);
```

Return values

| | |
|--------------------------|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | p_instance_ctrl or connection_handle are specified as NULL. |
| FSP_ERR_NOT_OPEN | Control block not open. |
| FSP_ERR_INVALID_ARGUMENT | The connection handle parameter is out of range. |

◆ RM_BLE_ABS_DeleteBondInformation()

```
fsp_err_t RM_BLE_ABS_DeleteBondInformation ( ble_abs_ctrl_t *const p_ctrl,
ble_abs_bond_information_parameter_t const *const p_bond_information_parameter )
```

Delete bonding information from BLE stack and storage. Implements [ble_abs_api_t::deleteBondInformation](#).

Example:

```
/* Delete bonding information. */
err = RM_BLE_ABS_DeleteBondInformation(&g_ble_abs0_ctrl,
&g_bond_information_parameter);
```

Return values

| | |
|-------------------------|---|
| FSP_SUCCESS | Operation was successful |
| FSP_ERR_ASSERTION | The parameter p_instance_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_bond_information_parameter is NULL. |
| FSP_ERR_NOT_OPEN | Control block not open. |

Delete bonding information from BLE stack and storage. Implements [ble_abs_api_t::deleteBondInformation](#).

Example:

```
/* Delete bonding information. */
err = RM_BLE_ABS_DeleteBondInformation(&g_ble_abs0_ctrl,
&g_bond_information_parameter);
```

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | Operation was successful |
| FSP_ERR_ASSERTION | The parameter p_instance_ctrl is NULL. |

| | |
|-------------------------|--|
| FSP_ERR_INVALID_POINTER | The parameter <code>p_bond_information_parameter</code> is NULL. |
| FSP_ERR_NOT_OPEN | Control block not open. |

Delete bonding information from BLE stack and storage. Implements [ble_abs_api_t::deleteBondInformation](#).

Example:

```
/* Delete bonding information. */
err = RM_BLE_ABS_DeleteBondInformation(&g_ble_abs0_ctrl,
&g_bond_information_parameter);
```

Return values

| | |
|-------------------------|--|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter <code>p_instance_ctrl</code> is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter <code>p_bond_information_parameter</code> is NULL. |
| FSP_ERR_NOT_OPEN | Control block not open. |

◆ RM_BLE_ABS_ImportKeyInformation()

```
fsp_err_t RM_BLE_ABS_ImportKeyInformation ( ble_abs_ctrl_t*const p_ctrl, ble_device_address_t*
p_local_identity_address, uint8_t* p_local_irk, uint8_t* p_local_csrk )
```

Import key information to BLE stack and storage. Implements [ble_abs_api_t::importKeyInformation](#).

Example:

```
/* Import local key information. */
err = RM_BLE_ABS_ImportKeyInformation(&g_ble_abs0_ctrl, &local_identity_address,
local_irk, local_csrk);
```

Return values

| | |
|------------------------------|--|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter <code>p_instance_ctrl</code> is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter <code>p_local_identity_address</code> , <code>p_local_irk</code> or <code>p_local_csrk</code> is NULL. |
| FSP_ERR_NOT_OPEN | Control block not open. |
| FSP_ERR_INVALID_HW_CONDITION | Failure to access internal storage. |
| FSP_ERR_UNSUPPORTED | Not supported in this configuration. |

◆ RM_BLE_ABS_ExportKeyInformation()

```
fsp_err_t RM_BLE_ABS_ExportKeyInformation ( ble_abs_ctrl_t *const p_ctrl, ble_device_address_t *
p_local_identity_address, uint8_t * p_local_irk, uint8_t * p_local_csrk )
```

Export key information to BLE stack and storage. Implements `ble_abs_api_t::exportKeyInformation`.

Example:

```
/* Export local key information. */
err = RM_BLE_ABS_ExportKeyInformation(&g_ble_abs0_ctrl, &local_identity_address,
local_irk, local_csrk);
```

Return values

| | |
|-------------------------|--|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_instance_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_local_identity_address, p_local_irk or p_local_csrk is NULL. |
| FSP_ERR_NOT_OPEN | Control block not open. |
| FSP_ERR_BUFFER_EMPTY | Dynamic memory allocation failed. |
| FSP_ERR_OUT_OF_MEMORY | Failure to access internal storage. |
| FSP_ERR_NOT_INITIALIZED | Not initialized internal storage. |
| FSP_ERR_UNSUPPORTED | Not supported in this configuration. |

5.2.12.8 BLE Driver (r_ble_balance)

Modules » [Networking](#)

Driver for the Radio peripheral on RA MCUs. This module implements the [BLE Interface](#).

Overview

The bluetooth low energy library of balance configuration (r_ble) provides an API to control the Radio peripheral. This module is configured via the [QE for BLE](#). QE for BLE provides standard services defined by standardization organization and custom services defined by user. [Bluetooth LE Profile API Document User's Manual](#) describes the APIs for standard services.

Features

- Common
 - Open/Close the BLE protocol stack.
 - Execute the BLE job.

- Add an event in the BLE protocol stack internal queue.
- **GAP**
 - Initialization of the Host stack.
 - Start/Stop Advertising.
 - Start/Stop Scan.
 - Connect/Disconnect a link.
 - Initiate/Respond a pairing request.
- **GATT Common**
 - Get MTU size.
- **GATT Server**
 - Initialization of GATT Server.
 - Notification/Indication.
- **GATT Client**
 - Discovery services, characteristics.
 - Read/Write characteristic.
- **Vendor Specific**
 - DTM.
 - Set/Get transmit power.
 - Set/Get BD_ADDR.

Supported functions

The supported functions are listed in the table below. Choose the configuration that best suits the functions that target system requires.

| BLE library feature | Extended | Balance | Compact |
|---------------------|------------|----------------------|---------------|
| Common API | Supported | Supported | Supported |
| GAP API | Supported | *1 Limited | *1 *2 Limited |
| GATT Common API | Supported | Supported | Supported |
| GATT Client API | Supported | Supported | Supported |
| GATT Client API | Supported | Supported | Supported |
| L2CAP API | Supported | Not Supported | Not supported |
| Vendor Specific API | *3 Limited | *3 Limited | *3 Limited |

Note

1. This configuration dose not support LE Advertising Extensions functionality APIs.
2. This configuration dose not support Central and Observer functionality APIs.
3. This configuration dose not support vender specific firmware update functionality APIs.

Target Devices

The Renesas Bluetooth Low Energy Library supports the following devices.

- RA4W1

Configuration

Clock Configuration

Note

System clock (ICLK): 8 MHz or more

Peripheral module clock A (PCLKA): 8MHz or more

The BLE Protocol Stack is optimized for ICLK and PCLKA frequencies of 32 MHz.

It is recommended that the clock be set so that the ICLK and PCLKA frequencies are 32MHz in order to get the best performance from the BLE.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Figure shows the software structure of the BLE FSP module.

Figure 216: BLE software structure

The BLE FSP module consists of the BLE library.

The BLE Application uses the BLE functions via the [R_BLE API](#) provided by the BLE Library.

The QE for BLE generates the source codes (BLE base skeleton program) as a base for the BLE Application and the BLE Profile codes including the Profile API.

Initialize the BLE protocol stack**Note**

It takes around 250msec to initialize BLE protocol stack.

[R_BLE_Open](#) API will be occupied MCU resources during the initialization.

Limitations

Developers should be aware of the following limitations when using the ble:

Note

- This configuration dose not support LE Advertising Extensions functionality APIs.

If those functionalities need your system, select [BLE Driver \(r_ble_extended\)](#) configuration.

- This configuration dose not support L2CAP functionality APIs.

If those functionalities need your system, select [BLE Driver \(r_ble_extended\)](#) configuration.

- This configuration dose not support vender specific firmware update functionality APIs.

Those APIs are only supported by [SPP BLE Abstraction \(rm_ble_abs_spp\)](#) module.

Limitations on FreeRTOS environment

Developers should be aware of the following limitations when using the ble on FreeRTOS environment: When use deep sleep, sleep mode or standby mode, there is following two wake up option from RF module.

- Using Semaphore
- Using Event Groups

Note

Event Groups is processing as a delay handler by timer task.

Therefore, if blocked by interrupts or if the timer task is blocked by another high-priority task, the existing connection will be broken.

5.2.12.9 BLE Driver (r_ble_compact)

[Modules](#) » [Networking](#)

Driver for the Radio peripheral on RA MCUs. This module implements the [BLE Interface](#).

Overview

The bluetooth low energy library of compact configuration (r_ble) provides an API to control the Radio peripheral. This module is configured via the [QE for BLE](#). QE for BLE provides standard services defined by standardization organization and custom services defined by user. [Bluetooth LE Profile API Document User's Manual](#) describes the APIs for standard services.

Features

- Common
 - Open/Close the BLE protocol stack.
 - Execute the BLE job.
 - Add an event in the BLE protocol stack internal queue.
- [GAP](#)
 - Initialization of the Host stack.
 - Start/Stop Advertising.
 - Initiate/Respond a pairing request.
- [GATT Common](#)
 - Get MTU size.
- [GATT Server](#)
 - Initialization of GATT Server.
 - Notification/Indication.
- [GATT Client](#)
 - Discovery services, characteristics.

- Read/Write characteristic.
- **Vendor Specific**
 - DTM.
 - Set/Get transmit power.
 - Set/Get BD_ADDR.

Supported functions

The supported functions are listed in the table below. Choose the configuration that best suits the functions that target system requires.

| BLE library feature | Extended | Balance | Compact |
|---------------------|------------|---------------|----------------------|
| Common API | Supported | Supported | Supported |
| GATT Common API | Supported | *1 Limited | *1 *2 Limited |
| GATT Common API | Supported | Supported | Supported |
| GATT Server API | Supported | Supported | Supported |
| GATT Client API | Supported | Supported | Supported |
| L2CAP API | Supported | Not supported | Not supported |
| Vendor Specific API | *3 Limited | *3 Limited | *3 Limited |

Note

1. This configuration dose not support LE Advertising Extensions functionality APIs.
2. This configuration dose not support Central and Observer functionality APIs.
3. This configuration dose not support vender specific firmware update functionality APIs.

Target Devices

The Renesas Bluetooth Low Energy Library supports the following devices.

- RA4W1

Configuration

Clock Configuration

Note

System clock (ICLK): 8 MHz or more

Peripheral module clock A (PCLKA): 8MHz or more

The BLE Protocol Stack is optimized for ICLK and PCLKA frequencies of 32 MHz.

It is recommended that the clock be set so that the ICLK and PCLKA frequencies are 32MHz in order to get the best performance from the BLE.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Figure shows the software structure of the BLE FSP module.

Figure 217: BLE software structure

The BLE FSP module consists of the BLE library. The BLE Application uses the BLE functions via the `R_BLE API` provided by the BLE Library. The QE for BLE generates the source codes (BLE base skeleton program) as a base for the BLE Application and the BLE Profile codes including the Profile API.

Initialize the BLE protocol stack

Note

*It takes around 250msec to initialize BLE protocol stack.
`R_BLE_Open` API will be occupied MCU resources during the initialization.*

Limitations

Developers should be aware of the following limitations when using the ble:

Note

- This configuration dose not supports LE Advertising Extensions functionality APIs.
 If those functionalities need your system, select `BLE Driver (r_ble_extended)` configuration.
- This configuration dose not supports Central and Observer functionality APIs.
 If those functionalities need your system, select `BLE Driver (r_ble_extended)` or `BLE Driver (r_ble_balance)` configuration.
- This configuration dose not supports L2CAP functionality APIs.
 If those functionalities need your system, select `BLE Driver (r_ble_extended)` configuration.
- This configuration dose not supports vender specific firmware update functionality APIs.
 Those APIs are only supported by `SPP BLE Abstraction (rm_ble_abs_spp)` module.

Limitations on FreeRTOS environment

Developers should be aware of the following limitations when using the ble on FreeRTOS environment: When use deep sleep, sleep mode or standby mode, there is following two wake up option from RF module.

- Using Semaphore
- Using Event Groups

Note

*Event Groups is processing as a delay handler by timer task.
Therefore, if blocked by interrupts or if the timer task is blocked by another high-priority task,
the existing connection will be broken.*

5.2.12.10 BLE Driver (r_ble_extended)

[Modules](#) » [Networking](#)

Driver for the Radio peripheral on RA MCUs. This module implements the [BLE Interface](#).

Overview

The bluetooth low energy library of extended configuration (r_ble) provides an API to control the Radio peripheral. This module is configured via the [QE for BLE](#). QE for BLE provides standard services defined by standardization organization and custom services defined by user. [Bluetooth LE Profile API Document User's Manual](#) describes the APIs for standard services.

Features

- Common
 - Open/Close the BLE protocol stack.
 - Execute the BLE job.
 - Add an event in the BLE protocol stack internal queue.
- [GAP](#)
 - Initialization of the Host stack.
 - Start/Stop Advertising (Support LE Advertising Extensions).
 - Start/Stop Scan.
 - Connect/Disconnect a link.
 - Initiate/Respond a pairing request.
- [GATT Common](#)
 - Get MTU size.
- [GATT Server](#)
 - Initialization of GATT Server.
 - Notification/Indication.
- [GATT Client](#)
 - Discovery services, characteristics.
 - Read/Write characteristic.
- [L2CAP](#)
 - Credit-based flow control transaction.
- [Vendor Specific](#)
 - DTM.
 - Set/Get transmit power.
 - Set/Get BD_ADDR.

Supported functions

The supported functions are listed in the table below. Choose the configuration that best suits the functions that target system requires.

| BLE library feature | Extended | Balance | Compact |
|---------------------|-------------------|---------------|---------------|
| Common API | Supported | Supported | Supported |
| GAP API | Supported | *1 Limited | *1 *2 Limited |
| GATT Common API | Supported | Supported | Supported |
| GATT Server API | Supported | Supported | Supported |
| GATT Client API | Supported | Supported | Supported |
| L2CAP API | Supported | Not supported | Not supported |
| Vendor Specific API | *3 Limited | *3 Limited | *3 Limited |

Note

1. This configuration dose not support LE Advertising Extensions functionality APIs.
2. This configuration dose not support Central and Observer functionality APIs.
3. This configuration dose not support vender specific firmware update functionality APIs.

Target Devices

The Renesas Bluetooth Low Energy Library supports the following devices.

- RA4W1

Configuration

Clock Configuration

Note

System clock (ICLK): 8 MHz or more

Peripheral module clock A (PCLKA): 8MHz or more

The BLE Protocol Stack is optimized for ICLK and PCLKA frequencies of 32 MHz.

It is recommended that the clock be set so that the ICLK and PCLKA frequencies are 32MHz in order to get the best performance from the BLE.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Figure shows the software structure of the BLE FSP module.

Figure 218: BLE software structure

The BLE FSP module consists of the BLE library. The BLE Application uses the BLE functions via the `R_BLE API` provided by the BLE Library. The QE for BLE generates the source codes (BLE base skeleton program) as a base for the BLE Application and the BLE Profile codes including the Profile API.

Initialize the BLE protocol stack

Note

*It takes around 250msec to initialize BLE protocol stack.
`R_BLE_Open` API will be occupied MCU resources during the initialization.*

Limitations

Developers should be aware of the following limitations when using the ble:

Note

*- This configuration dose not support vender specific firmware update functionality APIs.
 Those APIs are only supported by `SPP BLE Abstraction (rm_ble_abs_spp)` module.*

Limitations on FreeRTOS environment

Developers should be aware of the following limitations when using the ble on FreeRTOS environment: When use deep sleep, sleep mode or standby mode, there is following two wake up option from RF module.

- Using Semaphore
- Using Event Groups

Note

*Event Groups is processing as a delay handler by timer task.
 Therefore, if blocked by interrupts or if the timer task is blocked by another high-priority task, the existing connection will be broken.*

5.2.12.11 Bluetooth Low Energy Mesh Network Modules

[Modules](#) » [Networking](#)

Detailed Description

This is a subcategory for Bluetooth Low Energy Mesh Network modules.

Modules

[Bluetooth Low Energy Mesh Network \(rm_ble_mesh\)](#)

[Bluetooth Low Energy Mesh Network Bearer \(rm_ble_mesh_bearer\)](#)

[Bluetooth Low Energy Mesh Network Provision \(rm_ble_mesh_provision\)](#)

[Bluetooth Low Energy Mesh Network Network \(rm_ble_mesh_network\)](#)

[Bluetooth Low Energy Mesh Network Lower Trans \(rm_ble_mesh_lower_trans\)](#)

[Bluetooth Low Energy Mesh Network Upper Trans \(rm_ble_mesh_upper_trans\)](#)

Detailed Description

Overview

Bluetooth Mesh defines a managed-flood-based mesh network. Any device in the network can send a message at any time as long as there is a sufficient density of devices that are listening and relaying messages. See [sample application document](#) and [start up guide](#) for information on how to create a BLE MESH application.

Figure 219: Overview Of Bluetooth Mesh

Features

The BLE Mesh middleware has the following features:

- Supports one-to-one and one-to-many message transmission
- Supports relay messages to other nodes
- Supports secure message transmission against the following attack
 - Wiretap attack
 - Man-in-the-middle attack
 - Replay attack
 - Trash-can attack
 - Brute Force Key attack
- Supports following optional features
 - Supports Relay feature
 - Supports Proxy feature
 - Supports Friend feature
 - Supports Low Power feature

Target Devices

The Bluetooth Low Energy Energy Mesh Network module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_ble_mesh

The following build time configurations are defined in fsp_cfg/rm_ble_mesh_cfg.h:

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

| | | | |
|--------------------|--|---------------|---|
| Parameter Checking | <ul style="list-style-type: none"> • Default (BSP) • Enable • Disable | Default (BSP) | Specify whether to include code for API parameter checking. Valid settings include. |
|--------------------|--|---------------|---|

Configurations for Networking > Bluetooth Low Energy Mesh Network modules > BLE Mesh (rm_ble_mesh)

This module can be added to the Stacks tab via New Stack > Networking > Bluetooth Low Energy Mesh Network modules > BLE Mesh (rm_ble_mesh).

| Configuration | Options | Default | Description |
|--|---|----------------|--|
| General > Name | Name Must Be a Valid C Symbol | g_rm_ble_mesh0 | Module name. |
| General > Channel Number | Invalid Channel Number | 0 | Select channel corresponding to the channel number of the hardware. |
| Bearer > Network Interface Number | Invalid Network Interface Number | 2 | Network interfaces number. |
| Bearer > Provisioning Interface Number | Invalid Provisioning Interface Number | 2 | Provisioning interfaces number. |
| Provisioning > Unprovisioned Device Beacon Timeout in Milliseconds | Invalid Unprovisioned Device Beacon Timeout in Milliseconds | 200 | Unprovisioned device beacon timeout in milliseconds. |
| Network > Network Cache Size | Invalid Network Cache Size | 10 | Network cache size. |
| Network > Network Sequence Number Cache Size | Invalid Network Sequence Number Cache Size | 32 | Network sequence number cache size. |
| Network > Maximum Number of Subnet | Invalid Maximum Number of Subnets | 4 | Maximum number of subnets |
| Network > Maximum Number of Device Key | Invalid Maximum Number of Device Keys | 4 | Maximum number of device keys. |
| Network > Proxy Filter List Size | Invalid Proxy Filter List Size | 2 | Maximum number of addresses present in each proxy filter list. |
| Network > Network Sequence Number Block Size | Invalid Network Sequence Number Block Size | 2048 | The distance between the network sequence numbers, for every persistent storage write. |
| Network > Network Transmit Count for Network Packets | Invalid Network Transmit Count for Network Packets | 1 | Network transmit count for network packets. |

| | | | |
|---|---|-----|--|
| Network > Network Interval Steps for Network Packets | Invalid Network Interval Steps for Network Packets | 4 | Network interval steps for network packets. |
| Network > Network Transmit Count for Relayed Packets | Invalid Network Transmit Count for Relayed Packets | 0 | Network transmit count for relayed packets. |
| Network > Network Interval Steps for Relayed Packets | Invalid Network Interval Steps for Relayed Packets | 9 | Network interval steps for relayed packets. |
| Network > Proxy ADV Network ID Timeout for Each Subnet in Milliseconds. | Invalid Proxy ADV Network ID Timeout | 100 | Proxy ADV network ID timeout for each subnet in milliseconds. |
| Network > Proxy ADV Node Identity Timeout for Each Subnet in Milliseconds | Invalid Proxy ADV Node Identity Timeout for Each Subnet in Milliseconds | 300 | Proxy ADV node identity timeout for each subnet in milliseconds. |
| Network > Proxy ADV Node Identity Overall Time Period in Seconds | Invalid Proxy ADV Node Identity Overall Time Period in Seconds | 60 | Proxy ADV node identity overall time period in seconds. |
| Network > Maximum Number of Queued Messages for Transmission | Invalid Maximum Number of Queued Messages for Transmission | 64 | Maximum number of queued messages for transmission. |
| Transport > Maximum Number of LPN | Invalid Maximum Number of LPNs | 1 | Maximum number of LPNs. |
| Transport > Replay Protection Cache Size | Invalid Replay Protection Cache Size | 10 | Replay protection cache size. |
| Transport > Reassembled Cache Size | Invalid Reassembled Cache Size | 8 | Reassembled cache size. |
| Transport > Friend Poll Retry Count | Invalid Friend Poll Retry Count | 10 | Friend poll retry count. |
| Transport > Maximum Number of Segmentation and Reassembly Context | Invalid Maximum Number of Segmentation and Reassembly Context | 8 | Number of segmentation and reassembly contexts. |
| Transport > Lower Transport Segment Transmission Timeout in Milliseconds | Invalid Lower Transport Segment Transmission Timeout in Milliseconds | 300 | Lower transport segment transmission timeout in milliseconds. |
| Transport > Lower Transport Segment Re-Transmission Count | Invalid Lower Transport Segment Re-Transmission Count | 2 | Lower transport segment re-transmission count. |
| Transport > Lower Transport | Invalid Lower Transport Acknowledgement | 200 | Lower transport acknowledgement |

| | | | |
|---|---|------|---|
| Acknowledgement Timeout in Milliseconds | Timeout in Milliseconds | | timeout in milliseconds. |
| Transport > Lower Transport Incomplete Timeout in Seconds | Invalid Lower Transport Incomplete Timeout in Seconds | 20 | Lower transport incomplete timeout in seconds. |
| Transport > Friendship Receive Window | Invalid Friendship Receive Window | 100 | Friendship receive window. |
| Transport > Maximum Number of Friend Message Queue | Invalid Maximum Number of Friend Messages Queue | 15 | Maximum number of messages that the friend is capable to queue for a single Low Power Node. |
| Transport > Maximum Number of Friend Subscription List | Invalid Maximum Number of Friend Subscription List | 8 | Maximum number of subscription addresses that the friend is capable to store for a single Low Power Node. |
| Transport > Friend Clear Confirmation Timeout in Milliseconds | Invalid Friend Clear Confirmation Timeout in Milliseconds | 1000 | Friend clear confirmation timeout in milliseconds. |
| Transport > Friend Clear Retry Count | Invalid Friend Clear Retry Count | 5 | Friend clear retry count. |
| Transport > Friendship Retry Timeout in Milliseconds | Invalid Friendship Retry Timeout in Milliseconds | 1200 | Friendship retry timeout in milliseconds. |
| Access > Maximum Number of Element | Invalid Maximum Number of Element | 4 | Maximum number of elements. |
| Access > Maximum Number of Model | Invalid Maximum Number of Model | 60 | Maximum number of models. |
| Access > Maximum Number of Application | Invalid Maximum Number of Application | 8 | Maximum number of applications (keys) the device can store information about. |
| Access > Maximum Number of Virtual Address | Invalid Maximum Number of Virtual Address | 8 | Maximum number of virtual addresses the device can store information about. |
| Access > Maximum Number of Non-Virtual Address | Invalid Maximum Number of Non-Virtual Address | 8 | Maximum number of non-virtual addresses the device can store information about. |
| Access > Maximum Number of Transition Timers | Invalid Maximum Number of Transition Timers | 5 | Maximum number of transition timers. |
| Access > Maximum Number of Periodic | Invalid Maximum Number of Periodic | 5 | Maximum number of periodic step timers. |

| Step Timers | Step Timers | | |
|--|---|--------|--|
| Foundation > Config Server Secure Network Beacon Interval | Invalid Config Server Secure Network Beacon Interval | 10 | Config server secure network beacon interval. |
| Foundation > Maximum Number of Health Server Instance | Invalid Maximum Number of Health Server Instance | 2 | Maximum number of health server instances. |
| Model > Maximum Number of Light Lightness Controller Server Instance | Invalid Maximum Number of Light Lightness Controller Server Instance | 1 | Maximum number of light lightness controller server instances. |
| ID > Company ID | Invalid Company ID | 0x0036 | Company ID. |
| ID > Product ID | Invalid Product ID | 0x0001 | Product ID. |
| ID > Vendor ID | Invalid Vendor ID | 0x0100 | Vendor ID. |
| Platform > Storage > Block Number | Invalid Block Number | 5 | Block number. |
| Platform > Memory Pool > Memory Pool Size | Invalid Memory Pool Size | 0x4000 | Memory pool size. |
| Platform > Logging > Packet Bitfield | <ul style="list-style-type: none"> • Network • Lower Trans • Upper Trans • Access | | Specifies if this is included in the packet_bitfield mask. |
| Platform > Logging > Module Info Bitfield | <ul style="list-style-type: none"> • Network • Lower Trans • Upper Trans • Access | | Specifies if this is included in the module information bitfield mask. |
| Platform > Logging > Generic Log Bitfield | <ul style="list-style-type: none"> • Network • Lower Trans • Upper Trans • Access | | Specifies if this is included in the generic log bitfield mask. |
| Platform > Logging > function | Name Must Be a Valid C Symbol | NULL | |

Clock Configuration

Note

System clock (ICLK): 8 MHz or more

Peripheral module clock A (PCLKA): 8MHz or more

The BLE Protocol Stack is optimized for ICLK and PCLKA frequencies of 32 MHz.

It is recommended that the clock be set so that the ICLK and PCLKA frequencies are 32MHz in order to get the best performance from the BLE.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Mesh System Architecture

Purpose of each layer is,

Model layer

Model is a standardized typical functionality so that nodes perform operations in accordance with application scenario.

Foundation Model layer

Foundation Models are models to configure and manage operations of elements.

Access layer

The access layer defines how higher layer applications can use the upper transport layer.

Upper transport layer

The upper transport layer encrypts, decrypts, and authenticates application data and is designed to provide confidentiality of access messages.

Lower transport layer

The lower transport layer defines how upper transport layer messages are segmented and reassembled into multiple Lower Transport PDUs to deliver large upper transport layer messages to other nodes.

Network layer

The network layer defines how transport messages are addressed towards one or more elements.

Bearer layer

The bearer layer defines how network messages are transported between nodes.

Device Life Cycle

The device not joined in the mesh network is an Unprovisioned Device and the device joined in the mesh network is called a Node.

- **Unprovisioned Device**
Unprovisioned device cannot send or receive mesh messages. However, it will advertise its presence to the provisioner. By the provisioner, Unprovisioned Devices are invited to join the mesh network and become nodes(Provisioning).
- **Node**
Nodes can send and receive mesh messages. It is managed by the configuration client through the mesh network, which configures how the nodes communicate. The configuration client can also remove a Node from the mesh network, which will return the node to an Unprovisioned Device.

To communicate with other nodes by using Models, each node needs Configuration. By Configuration

process, information required for Model operation such as Application Keys, Publish Address, Subscription Address is configured. Following shows a typical lifecycle of a node.

Figure 220: Device Life Cycle Image

Newly introduced device is provisioned by Provisioner and joins a network. Furthermore, this device is configured by Configuration Client and becomes to be able to communicate with other nodes with Mesh Model. Generally, Configuration Client is a smart phone or other mobile computing device. Configuration Client removes a node from a network by sending Config Node Reset message. Besides, Configuration Client updates encryption keys used in the network, and the removed node becomes unable to communicate with other nodes.

Examples

BLE_MESH Basic Example

This is a basic example of minimal use of the BLE_MESH in an application.

Data Structures

```
struct rm_ble_mesh_instance_ctrl_t
```

Data Structure Documentation

◆ rm_ble_mesh_instance_ctrl_t

```
struct rm_ble_mesh_instance_ctrl_t
```

RM_BLE_MESH_BEARER private control block. DO NOT MODIFY. Initialization occurs when `RM_BLE_MESH_BEARER_Open()` is called.

Function Documentation

◆ RM_BLE_MESH_Open()

```
fsp_err_t RM_BLE_MESH_Open ( rm_ble_mesh_ctrl_t *const p_ctrl, rm_ble_mesh_cfg_t const *const p_cfg )
```

Open ble mesh middleware. API to initialize Mesh Stack. This is the first API that the application should call before any other API. This function initializes all the internal stack modules and data structures.

Implements `rm_ble_mesh_api_t::open`.

Example:

```
/* Open the module. */
err = RM_BLE_MESH_Open(&g_ble_mesh0_ctrl, &g_ble_mesh0_cfg);
```

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Module opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Module is already open. |

◆ RM_BLE_MESH_Close()

```
fsp_err_t RM_BLE_MESH_Close ( rm_ble_mesh_ctrl_t *const p_ctrl)
```

Close ble mesh middleware. API to turn off Bluetooth Hardware. This API should be called after `RM_BLE_MESH_Open`.

Implements `rm_ble_mesh_api_t::close`.

Example:

```
/* Close the module. */
err = RM_BLE_MESH_Close(&g_ble_mesh0_ctrl);
```

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | Module successfully closed. |
| FSP_ERR_ASSERTION | The parameter <code>p_ctrl</code> is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_BLE_MESH_StartTransitionTimer()

```
fsp_err_t RM_BLE_MESH_StartTransitionTimer ( rm_ble_mesh_ctrl_t *const p_ctrl,
rm_ble_mesh_access_state_transition_t const *const p_transition, uint16_t *const
p_transition_time_handle )
```

To start transition timer. API to start a transition timer.

Implements `rm_ble_mesh_api_t::startTransitionTimer`.

Example:

```
/* Start transition timer. */
err = RM_BLE_MESH_StartTransitionTimer(&g_ble_mesh0_ctrl, &transition,
&transition_time_handle);
```

Return values

| | |
|-------------------------|-------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_transition is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |

◆ RM_BLE_MESH_StopTransitionTimer()

```
fsp_err_t RM_BLE_MESH_StopTransitionTimer ( rm_ble_mesh_ctrl_t *const p_ctrl, uint16_t
transition_time_handle )
```

To stop transition timer. API to stop a transition timer.

Implements `rm_ble_mesh_api_t::stopTransitionTimer`.

Example:

```
/* Stop transition timer. */
err = RM_BLE_MESH_StopTransitionTimer(&g_ble_mesh0_ctrl, transition_time_handle);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_BLE_MESH_GetRemainingTransitionTime()

```
fsp_err_t RM_BLE_MESH_GetRemainingTransitionTime ( rm_ble_mesh_ctrl_t*const p_ctrl, uint16_t
transition_time_handle, uint8_t*const p_remaining_transition_time )
```

To get remaining Transition Time. API to get remaining Transition Time.

Implements `rm_ble_mesh_api_t::getRemainingTransitionTime`.

Example:

```
/* Get remaining transition time. */
err = RM_BLE_MESH_GetRemainingTransitionTime(&g_ble_mesh0_ctrl,
transition_time_handle, &remaining_transition_time);
```

Return values

| | |
|-------------------------|--|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_remaining_transition_time is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |

◆ RM_BLE_MESH_GetRemainingTransitionTimeWithOffset()

```
fsp_err_t RM_BLE_MESH_GetRemainingTransitionTimeWithOffset ( rm_ble_mesh_ctrl_t *const
p_ctrl, uint16_t transition_time_handle, uint32_t offset_in_ms, uint8_t *const
p_remaining_transition_time )
```

To get remaining Transition Time, with offset. API to get remaining Transition Time with offset in ms.

Implements `rm_ble_mesh_api_t::getRemainingTransitionTimeWithOffset`.

Example:

```
/* Get remaining transition time with offset. */
err = RM_BLE_MESH_GetRemainingTransitionTimeWithOffset(&g_ble_mesh0_ctrl,
                                                    transition_time_handle,
                                                    offset_in_ms,
&remaining_transition_time);
```

Return values

| | |
|-------------------------|--|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_remaining_transition_time is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |

◆ RM_BLE_MESH_ConvertTransitionTimeFromMs()

```
fsp_err_t RM_BLE_MESH_ConvertTransitionTimeFromMs ( rm_ble_mesh_ctrl_t *const p_ctrl,
uint32_t transition_time_in_ms, uint8_t *const p_transition_time )
```

To convert transition time from millisecond. API to convert transition timer in millisecond to Generic Default Transition Time state format.

Implements `rm_ble_mesh_api_t::convertTransitionTimeFromMs`.

Example:

```
/* Convert transition time from milliseconds. */
err = RM_BLE_MESH_ConvertTransitionTimeFromMs(&g_ble_mesh0_ctrl,
transition_time_in_ms, &transition_time);
```

Return values

| | |
|-------------------------|--|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_transition_time is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_BLE_MESH_ConvertTransitionTimeToMs()

```
fsp_err_t RM_BLE_MESH_ConvertTransitionTimeToMs ( rm_ble_mesh_ctrl_t *const p_ctrl, uint8_t
transition_time, uint32_t *const p_transition_time_in_ms )
```

To convert transition time to millisecond. API to convert Generic Default Transition Time state format to required transition time value in milliseconds.

Implements `rm_ble_mesh_api_t::convertTransitionTimeToMs`.

Example:

```
/* Convert transition time to milliseconds. */
err = RM_BLE_MESH_ConvertTransitionTimeToMs(&g_ble_mesh0_ctrl, transition_time,
&transition_time_in_ms);
```

Return values

| | |
|-------------------------|--|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_transition_time_in_ms is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

Detailed Description

Overview

Target Devices

The Bluetooth Low Energy Energy Mesh Network Bearer module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_ble_mesh_bearer

The following build time configurations are defined in fsp_cfg/rm_ble_mesh_bearer_cfg.h:

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Configurations for Networking > Bluetooth Low Energy Mesh Network modules > BLE Mesh Bearer (rm_ble_mesh_bearer)

This module can be added to the Stacks tab via New Stack > Networking > Bluetooth Low Energy Mesh Network modules > BLE Mesh Bearer (rm_ble_mesh_bearer).

| Configuration | Options | Default | Description |
|----------------|-------------------------------|---------------------------|---|
| General > Name | Name Must Be a Valid C Symbol | g_rm_ble_mesh_bearer 0 | Module name. |
| Channel Number | Invalid Channel Number | 0 | Select channel corresponding to the channel number of the hardware. |

Data Structures

```
struct rm_ble_mesh_bearer_instance_ctrl_t
```

Data Structure Documentation

◆ **rm_ble_mesh_bearer_instance_ctrl_t**

```
struct rm_ble_mesh_bearer_instance_ctrl_t
```

RM_BLE_MESH_BEARER private control block. DO NOT MODIFY. Initialization occurs when [RM_BLE_MESH_BEARER_Open\(\)](#) is called.

Function Documentation◆ **RM_BLE_MESH_BEARER_Open()**

```
fsp_err_t RM_BLE_MESH_BEARER_Open ( rm_ble_mesh_bearer_ctrl_t *const p_ctrl,
rm_ble_mesh_bearer_cfg_t const *const p_cfg )
```

Open bearer middleware.

Implements [rm_ble_mesh_bearer_api_t::open](#).

Example:

```
/* Open the module. */
err = RM_BLE_MESH_BEARER_Open(&g_ble_mesh_bearer0_ctrl, &g_ble_mesh_bearer0_cfg);
```

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Module opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |

◆ **RM_BLE_MESH_BEARER_Close()**

```
fsp_err_t RM_BLE_MESH_BEARER_Close ( rm_ble_mesh_bearer_ctrl_t *const p_ctrl)
```

Close bearer middleware. Implements [rm_ble_mesh_bearer_api_t::close](#).

Example:

```
/* Open the module. */
err = RM_BLE_MESH_BEARER_Close(&g_ble_mesh_bearer0_ctrl);
```

Return values

| | |
|-----------------------|--|
| FSP_SUCCESS | Module successfully closed. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Lower layer is invalid state. |

◆ RM_BLE_MESH_BEARER_RegisterInterface()

```
fsp_err_t RM_BLE_MESH_BEARER_RegisterInterface ( rm_ble_mesh_bearer_ctrl_t *const p_ctrl,
rm_ble_mesh_bearer_type_t brr_type, rm_ble_mesh_bearer_ntf_callback_result_t(*)
rm_ble_mesh_bearer_ntf_callback_args_t *p_args) p_callback )
```

Register interface with Bearer Layer. This routine registers interface with the Bearer Layer. Bearer Layer supports single Application, hence this routine shall be called once.

Implements `rm_ble_mesh_bearer_api_t::registerInterface`.

Example:

```
/* Register Bearer interface. */
err = RM_BLE_MESH_BEARER_RegisterInterface(&g_ble_mesh_bearer0_ctrl, brr_type,
rm_ble_mesh_bearer_ntf_callback);
```

Return values

| | |
|--------------------------|--|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

◆ RM_BLE_MESH_BEARER_RegisterBeaconHandler()

```
fsp_err_t RM_BLE_MESH_BEARER_RegisterBeaconHandler ( rm_ble_mesh_bearer_ctrl_t *const
p_ctrl, rm_ble_mesh_bearer_beacon_type_t bcon_type,
void(*) (rm_ble_mesh_bearer_beacon_callback_args_t *p_args) p_handler )
```

Register beacon interface with Bearer Layer. This routine registers interface with the Bearer Layer to process Beacons. Bearer Layer supports single Application, hence this routine shall be called once.

Implements `rm_ble_mesh_bearer_api_t::registerBeaconHandler`.

Example:

```
/* Register beacon handler. */
err = RM_BLE_MESH_BEARER_RegisterBeaconHandler(&g_ble_mesh_bearer0_ctrl,
RM_BLE_MESH_BEARER_TYPE_BCON,
rm_ble_mesh_bearer_beacon_callback
);
```

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_BLE_MESH_BEARER_AddBearer()

```
fsp_err_t RM_BLE_MESH_BEARER_AddBearer ( rm_ble_mesh_bearer_ctrl_t *const p_ctrl,
rm_ble_mesh_bearer_type_t brr_type, rm_ble_mesh_bearer_info_t const *const p_brr_info,
rm_ble_mesh_bearer_handle_t *const p_brr_handle )
```

Add a bearer to Bearer Layer. This routine adds a bearer that is setup by the application for use by the Mesh Stack. Bearer Layer supports single Application, hence this routine shall be called once.

Implements `rm_ble_mesh_bearer_api_t::addBearer`.

Example:

```
/* Add Bearer. */
err = RM_BLE_MESH_BEARER_AddBearer(&g_ble_mesh_bearer0_ctrl,
RM_BLE_MESH_BEARER_TYPE_BCON, &brr_info, &brr_handle);
```

Return values

| | |
|-------------------------|--|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_brr_info and p_brr_handle are NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_BLE_MESH_BEARER_RemoveBearer()

```
fsp_err_t RM_BLE_MESH_BEARER_RemoveBearer ( rm_ble_mesh_bearer_ctrl_t *const p_ctrl,
rm_ble_mesh_bearer_type_t brr_type, rm_ble_mesh_bearer_handle_t const *const p_brr_handle )
```

Remove a bearer from Bearer Layer. This routine removes a bearer from the Mesh Stack. Bearer Layer supports single Application, hence this routine shall be called once.

Implements `rm_ble_mesh_bearer_api_t::removeBearer`.

Example:

```
/* Remove Bearer. */
err = RM_BLE_MESH_BEARER_RemoveBearer(&g_ble_mesh_bearer0_ctrl,
RM_BLE_MESH_BEARER_TYPE_BCON, &brr_handle);
```

Return values

| | |
|-------------------------|--|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_brr_handle is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_BLE_MESH_BEARER_ObserveBeacon()

```
fsp_err_t RM_BLE_MESH_BEARER_ObserveBeacon ( rm_ble_mesh_bearer_ctrl_t *const p_ctrl,
uint8_t bcon_type, uint8_t enable )
```

Observe on/off for the beacon type. This routine sends enables/disables the observation procedure for the given beacon type.

Implements `rm_ble_mesh_bearer_api_t::observeBeacon`.

Example:

```
/* Observe beacon. */
err = RM_BLE_MESH_BEARER_ObserveBeacon(&g_ble_mesh_bearer0_ctrl, bcon_type,
enable);
```

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_BLE_MESH_BEARER_BcastUnprovisionedBeacon()

```
fsp_err_t RM_BLE_MESH_BEARER_BcastUnprovisionedBeacon ( rm_ble_mesh_bearer_ctrl_t *const
p_ctrl, uint8_t type, uint8_t const *const p_dev_uuid, uint16_t oob_info, rm_ble_mesh_buffer_t
const *const p_uri )
```

API to send unprovisioned device beacon. This routine sends Unprovisioned Device Beacon.

Implements `rm_ble_mesh_bearer_api_t::bcastUnprovisionedBeacon`.

Example:

```
/* Broadcast unprovisioned beacon. */
err = RM_BLE_MESH_BEARER_BcastUnprovisionedBeacon(&g_ble_mesh_bearer0_ctrl, type,
&dev_uuid, oob_info, &uri);
```

Return values

| | |
|-------------------------|--|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_dev_uuid and p_uri are NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_BLE_MESH_BEARER_BroadcastBeacon()**

```
fsp_err_t RM_BLE_MESH_BEARER_BroadcastBeacon ( rm_ble_mesh_bearer_ctrl_t *const p_ctrl,
uint8_t type, uint8_t const *const p_packet, uint16_t length )
```

API to broadcast a beacon. This routine sends the beacon of given type on Adv and GATT bearers.

Implements `rm_ble_mesh_bearer_api_t::broadcastBeacon`.

Example:

```
/* Broadcast beacon. */
err = RM_BLE_MESH_BEARER_BroadcastBeacon(&g_ble_mesh_bearer0_ctrl, type, &packet,
length);
```

Return values

| | |
|-------------------------|--|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_packet is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Lower layer is invalid state. |

◆ RM_BLE_MESH_BEARER_StartProxyAdv()

```
fsp_err_t RM_BLE_MESH_BEARER_StartProxyAdv ( rm_ble_mesh_bearer_ctrl_t *const p_ctrl, uint8_t
type, uint8_t const *const p_data, uint16_t datalen )
```

API to send proxy device ADV. This routine sends Proxy Device ADV.

Implements `rm_ble_mesh_bearer_api_t::startProxyAdv`.

Example:

```
/* Start proxy advertising. */
err = RM_BLE_MESH_BEARER_StartProxyAdv(&g_ble_mesh_bearer0_ctrl, type, &data,
length);
```

Return values

| | |
|-------------------------|--|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_data is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Lower layer is invalid state. |

◆ **RM_BLE_MESH_BEARER_SendPdu()**

```
fsp_err_t RM_BLE_MESH_BEARER_SendPdu ( rm_ble_mesh_bearer_ctrl_t *const p_ctrl,
rm_ble_mesh_bearer_handle_t const *const p_brr_handle, rm_ble_mesh_bearer_type_t brr_type,
rm_ble_mesh_buffer_t const *const p_buffer )
```

Send a bearer PDU. This routine sends a PDU from the Mesh stack to over the bearer indicated by the bearer handle.

Implements `rm_ble_mesh_bearer_api_t::sendPdu`.

Example:

```
/* Send common Bearer PDUs. */
err = RM_BLE_MESH_BEARER_SendPdu(&g_ble_mesh_bearer0_ctrl, &brr_handle,
RM_BLE_MESH_BEARER_TYPE_BCON, &buffer);
```

Return values

| | |
|--------------------------|--|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_brr_handle and p_buffer are NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

◆ RM_BLE_MESH_BEARER_GetPacketRssi()

```
fsp_err_t RM_BLE_MESH_BEARER_GetPacketRssi ( rm_ble_mesh_bearer_ctrl_t *const p_ctrl, uint8_t * p_rssi_value )
```

Get the RSSI of current received packet being processed. This routine returns the RSSI value of the received packet in its context when called from the Mesh stack.

Implements `rm_ble_mesh_bearer_api_t::getPacketRssi`.

Example:

```
/* Get the RSSI of current received packet being processed. */
err = RM_BLE_MESH_BEARER_GetPacketRssi(&g_ble_mesh_bearer0_ctrl, &rssi_value);
```

Return values

| | |
|-------------------------|--|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_rssi_value is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_BLE_MESH_BEARER_Sleep()

```
fsp_err_t RM_BLE_MESH_BEARER_Sleep ( rm_ble_mesh_bearer_ctrl_t *const p_ctrl)
```

Put the bearer to sleep. This routine requests the underlying bearer interface to sleep. Default bearer interface is that of advertising bearer.

Implements `rm_ble_mesh_bearer_api_t::sleep`.

Example:

```
/* Put the bearer to sleep. */
err = RM_BLE_MESH_BEARER_Sleep(&g_ble_mesh_bearer0_ctrl);
```

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_BLE_MESH_BEARER_Wakeup()

```
fsp_err_t RM_BLE_MESH_BEARER_Wakeup ( rm_ble_mesh_bearer_ctrl_t *const p_ctrl, uint8_t mode )
```

Wakeup the bearer. This routine requests the underlying bearer interface to wakeup. Default bearer interface is that of advertising bearer.

Implements `rm_ble_mesh_bearer_api_t::wakeup`.

Example:

```
/* Wakeup the bearer. */
err = RM_BLE_MESH_BEARER_Wakeup(&g_ble_mesh_bearer0_ctrl, mode);
```

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

Detailed Description

Overview

Target Devices

The Bluetooth Low Energy Energy Mesh Network Provision module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_ble_mesh_provision

The following build time configurations are defined in fsp_cfg/rm_ble_mesh_provision_cfg.h:

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Configurations for Networking > Bluetooth Low Energy Mesh Network modules > BLE Mesh Provision (rm_ble_mesh_provision)

This module can be added to the Stacks tab via New Stack > Networking > Bluetooth Low Energy Mesh Network modules > BLE Mesh Provision (rm_ble_mesh_provision).

| Configuration | Options | Default | Description |
|---|--------------------------------|--------------------------|---|
| General > Name | Name Must Be a Valid C Symbol | g_rm_ble_mesh_provision0 | Module name. |
| Provision Capabilities > Number of Elements | Invalid Number of Elements | 1 | Provision capabilities number of elements. |
| Provision Capabilities > Supported Algorithms | Invalid Supported Algorithms | 0 | Provision capabilities supported algorithms. |
| Provision Capabilities > Public Key Type | Invalid Public Key Type | 0 | Provision capabilities public key type. |
| Provision Capabilities > Static OOB Type | Invalid Static OOB Type | 0 | Provision capabilities static OOB type. |
| Provision Capabilities > Output OOB Action | Invalid Output OOB Action | 0 | Provision capabilities output OOB action. |
| Provision Capabilities > Output OOB Size | Invalid Output OOB Size | 0 | Provision capabilities output OOB size. |
| Provision Capabilities > Input OOB Action | Invalid Input OOB Action | 0 | Provision capabilities input OOB action. |
| Provision Capabilities > Input OOB Size | Invalid Input OOB Size | 0 | Provision capabilities input OOB size. |
| Channel Number | Invalid Channel Number | 0 | Select channel corresponding to the channel number of the hardware. |
| Provision Callback | Name Must Be a Valid C Symbol. | NULL | Provision callback function name. |

Data Structures

```
struct rm_ble_mesh_provision_instance_ctrl_t
```

Data Structure Documentation

◆ rm_ble_mesh_provision_instance_ctrl_t

```
struct rm_ble_mesh_provision_instance_ctrl_t
```

RM_BLE_MESH_PROVISION private control block. DO NOT MODIFY. Initialization occurs when RM_BLE_MESH_PROVISION_Open() is called.

Function Documentation

◆ RM_BLE_MESH_PROVISION_Open()

```
fsp_err_t RM_BLE_MESH_PROVISION_Open ( rm_ble_mesh_provision_ctrl_t *const p_ctrl,
rm_ble_mesh_provision_cfg_t const *const p_cfg )
```

Open access middleware. This function registers the provisioning capabilities of the application along with the application callback to notify events during the provisioning procedure.

Implements `rm_ble_mesh_provision_api_t::open`.

Example:

```
/* Open the module. */
err = RM_BLE_MESH_PROVISION_Open(&g_ble_mesh_provision0_ctrl,
&g_ble_mesh_provision0_cfg);
```

Return values

| | |
|-----------------------|--|
| FSP_SUCCESS | Module opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Module is already open. |
| FSP_ERR_INVALID_STATE | Lower layer is invalid state. |

◆ RM_BLE_MESH_PROVISION_Close()

```
fsp_err_t RM_BLE_MESH_PROVISION_Close ( rm_ble_mesh_provision_ctrl_t *const p_ctrl)
```

Close access middleware. Implements `rm_ble_mesh_provision_api_t::close`.

Example:

```
/* Close the module. */
err = RM_BLE_MESH_PROVISION_Close(&g_ble_mesh_provision0_ctrl);
```

Return values

| | |
|-----------------------|-------------------------------|
| FSP_SUCCESS | Module successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Lower layer is invalid state. |

◆ RM_BLE_MESH_PROVISION_Setup()

```
fsp_err_t RM_BLE_MESH_PROVISION_Setup ( rm_ble_mesh_provision_ctrl_t *const p_ctrl,
rm_ble_mesh_provision_role_t role, rm_ble_mesh_provision_device_info_t info, uint16_t timeout )
```

Setup the device for provisioning. This function configures the device to get in a provisionable state by specifying the role, bearer and creating a context.

Implements `rm_ble_mesh_provision_api_t::setup`.

Example:

```
/* Setup the device for provisioning. */
err = RM_BLE_MESH_PROVISION_Setup(&g_ble_mesh_provision0_ctrl, role, info,
timeout);
```

Return values

| | |
|--------------------------|---------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_POINTER | The parameter info->p_device is NULL. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_STATE | Lower layer is invalid state. |

◆ RM_BLE_MESH_PROVISION_Bind()

```
fsp_err_t RM_BLE_MESH_PROVISION_Bind ( rm_ble_mesh_provision_ctrl_t *const p_ctrl,
rm_ble_mesh_provision_device_info_t info, uint8_t attention, rm_ble_mesh_provision_handle_t
*const p_handle )
```

Bind to the peer device for provisioning. This function establishes a provisioning link with the peer device and exchanges the capabilities for provisioning.

Implements `rm_ble_mesh_provision_api_t::bind`.

Example:

```
/* Bind to the peer device for provisioning. */
err = RM_BLE_MESH_PROVISION_Bind(&g_ble_mesh_provision0_ctrl, info, attention,
&provision_handle);
```

Return values

| | |
|--------------------------|---------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_POINTER | The parameter p_handle is NULL. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_STATE | Lower layer is invalid state. |

◆ RM_BLE_MESH_PROVISION_SendPdu()

```
fsp_err_t RM_BLE_MESH_PROVISION_SendPdu ( rm_ble_mesh_provision_ctrl_t *const p_ctrl,
rm_ble_mesh_provision_handle_t const *const p_handle, rm_ble_mesh_provision_pdu_type_t type,
rm_ble_mesh_buffer_t pdu_data )
```

Send provisioning PDUs to the peer. This function is used by the provisioning application to send the provisioning PDUs to the peer device during the procedure.

Implements `rm_ble_mesh_provision_api_t::sendPdu`.

Example:

```
/* Send provisioning PDUs to the peer. */
err = RM_BLE_MESH_PROVISION_SendPdu(&g_ble_mesh_provision0_ctrl,
&provision_handle, type, pdu_data);
```

Return values

| | |
|--------------------------|---------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_POINTER | The parameter p_handle is NULL. |
| FSP_ERR_UNSUPPORTED | The pdu type is not supported. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

◆ RM_BLE_MESH_PROVISION_SetAuthVal()

```
fsp_err_t RM_BLE_MESH_PROVISION_SetAuthVal ( rm_ble_mesh_provision_ctrl_t *const p_ctrl,
rm_ble_mesh_provision_handle_t const *const p_handle, rm_ble_mesh_buffer_t auth_value )
```

Set the display authval. This function shall be used by the provisioning application to set the authval being displayed to the user on receiving **RM_BLE_MESH_PROVISION_EVENT_TYPE_OOB_DISPLAY** event with the respective OOB Action and Size.

Implements `rm_ble_mesh_provision_api_t::setAuthVal`.

Example:

```
rm_ble_mesh_buffer_t auth_value = {.payload = NULL, .length = 0};
/* Set the display authval. */
err = RM_BLE_MESH_PROVISION_SetAuthVal(&g_ble_mesh_provision0_ctrl,
&provision_handle, auth_value);
```

Return values

| | |
|-------------------------|---------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_handle is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_BLE_MESH_PROVISION_Abort()**

```
fsp_err_t RM_BLE_MESH_PROVISION_Abort ( rm_ble_mesh_provision_ctrl_t *const p_ctrl,
rm_ble_mesh_provision_handle_t const *const p_handle,
rm_ble_mesh_provision_link_close_reason_t reason )
```

Abort the provisioning procedure. This API can be used by the application to abort the ongoing provisioning procedure. This routine closes the provisioning link with the reason as specified.

Implements `rm_ble_mesh_provision_api_t::abort`.

Example:

```
/* Abort the provisioning procedure. */
err = RM_BLE_MESH_PROVISION_Abort(&g_ble_mesh_provision0_ctrl, &provision_handle,
reason);
```

Return values

| | |
|--------------------------|---------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_handle is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_STATE | Lower layer is invalid state. |

◆ RM_BLE_MESH_PROVISION_GetLocalPublicKey()

```
fsp_err_t RM_BLE_MESH_PROVISION_GetLocalPublicKey ( rm_ble_mesh_provision_ctrl_t *const
p_ctrl, uint8_t *const p_public_key )
```

Utility API to get current ECDH public key to be used for provisioning. This API can be used by the application to fetch the current ECDH P256 Public Key which is to be used for the Provisioning Procedure.

Implements `rm_ble_mesh_provision_api_t::getLocalPublicKey`.

Example:

```
/* Get current ECDH Public Key to be used for Provisioning. */
err = RM_BLE_MESH_PROVISION_GetLocalPublicKey(&g_ble_mesh_provision0_ctrl,
&public_key);
```

Return values

| | |
|--------------------------|-------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_public_key is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

◆ RM_BLE_MESH_PROVISION_SetLocalPublicKey()

```
fsp_err_t RM_BLE_MESH_PROVISION_SetLocalPublicKey ( rm_ble_mesh_provision_ctrl_t *const
p_ctrl, uint8_t const *const p_public_key )
```

Utility API to set current ECDH public key to be used for provisioning. This API can be used by the application to fetch the current ECDH P256 Public Key which is to be used for the Provisioning Procedure.

Implements `rm_ble_mesh_provision_api_t::setLocalPublicKey`.

Example:

```
/* Set current ECDH Public Key to be used for Provisioning. */
err = RM_BLE_MESH_PROVISION_SetLocalPublicKey(&g_ble_mesh_provision0_ctrl,
&public_key);
```

Return values

| | |
|--------------------------|-------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_public_key is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

◆ RM_BLE_MESH_PROVISION_GenerateRandomizedNumber()

```
fsp_err_t RM_BLE_MESH_PROVISION_GenerateRandomizedNumber ( rm_ble_mesh_provision_ctrl_t
*const p_ctrl, uint8_t *const p_key )
```

Utility API to generate 128bits (16 bytes) randomized number to be used for provisioning. The randomized number can be used for UUID, Net Key and Application Key.

Implements `rm_ble_mesh_provision_api_t::generateRandomizedNumber`.

Example:

```
/* Generate 128bits (16 bytes) randomized number. */
err = RM_BLE_MESH_PROVISION_GenerateRandomizedNumber(&g_ble_mesh_provision0_ctrl,
p_net_key);
```

Return values

| | |
|-------------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_key is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_BLE_MESH_PROVISION_SetOobPublicKey()

```
fsp_err_t RM_BLE_MESH_PROVISION_SetOobPublicKey ( rm_ble_mesh_provision_ctrl_t *const p_ctrl,
uint8_t const *const p_key, uint8_t size )
```

Utility API to set device out of band public key for provisioning.

Implements `rm_ble_mesh_provision_api_t::setOobPublicKey`.

Example:

```
/* Set device out of band public key. */
err = RM_BLE_MESH_PROVISION_SetOobPublicKey(&g_ble_mesh_provision0_ctrl,
p_public_key, size);
```

Return values

| | |
|--------------------------|-------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_key is NULL. |
| FSP_ERR_INVALID_ARGUMENT | The parameter size is more than 64. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_BLE_MESH_PROVISION_SetOobAuthInfo()

```
fsp_err_t RM_BLE_MESH_PROVISION_SetOobAuthInfo ( rm_ble_mesh_provision_ctrl_t *const p_ctrl,
uint8_t const *const p_auth_info, uint8_t size )
```

Utility API to set device out of band authentication information for provisioning.

Implements `rm_ble_mesh_provision_api_t::setOobAuthInfo`.

Example:

```
/* Set device out of band authentication information. */
err = RM_BLE_MESH_PROVISION_SetOobAuthInfo(&g_ble_mesh_provision0_ctrl,
p_auth_info, size);
```

Return values

| | |
|--------------------------|-------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_auth_info is NULL. |
| FSP_ERR_INVALID_ARGUMENT | The parameter size is more than 16. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_BLE_MESH_PROVISION_GenerateEcdhKey()

```
fsp_err_t RM_BLE_MESH_PROVISION_GenerateEcdhKey ( rm_ble_mesh_provision_ctrl_t *const
p_ctrl, uint8_t *const p_public_key )
```

Utility API to generate ECDH public key to be used for provisioning.

Implements `rm_ble_mesh_provision_api_t::generateEcdhKey`.

Example:

```
/* Generate ECDH Public Key for Provisioning. */
err = RM_BLE_MESH_PROVISION_GenerateEcdhKey(&g_ble_mesh_provision0_ctrl,
&public_key);
```

Return values

| | |
|-------------------------|-------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_public_key is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

|--------------------------|-------------------------------|----------|---|
| Enable | • Disabled | | RX callback event or not. |
| TX Callback Event Enable | • Enabled • Disabled | Disabled | Whether to enable the TX callback event or not. |
| Callback | Name Must Be a Valid C Symbol | NULL | Callback function name. |

Data Structures

```
struct rm\_ble\_mesh\_network\_instance\_ctrl\_t
```

Data Structure Documentation

◆ [rm_ble_mesh_network_instance_ctrl_t](#)

```
struct rm\_ble\_mesh\_network\_instance\_ctrl\_t
```

[RM_BLE_MESH_NETWORK](#) private control block. DO NOT MODIFY. Initialization occurs when [RM_BLE_MESH_NETWORK_Open\(\)](#) is called.

Function Documentation

◆ [RM_BLE_MESH_NETWORK_Open\(\)](#)

```
fsp\_err\_t RM\_BLE\_MESH\_NETWORK\_Open ( rm\_ble\_mesh\_network\_ctrl\_t *const p_ctrl,  
rm\_ble\_mesh\_network\_cfg\_t const *const p_cfg )
```

Register Interface with Network Layer. This routine registers interface with the Network Layer. Network Layer supports only one upper layer, hence this routine shall be called once.

Implements [rm_ble_mesh_network_api_t::open](#).

Example:

```
/* Open the module. */  
err = RM\_BLE\_MESH\_NETWORK\_Open(&g_ble_mesh_network0_ctrl,  
&g_ble_mesh_network0_cfg);
```

Return values

| | |
|-----------------------|--|
| FSP_SUCCESS | Module opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_INVALID_STATE | Lower layer is invalid state. |
| FSP_ERR_ALREADY_OPEN | Module is already open. |

◆ **RM_BLE_MESH_NETWORK_Close()**

```
fsp_err_t RM_BLE_MESH_NETWORK_Close ( rm_ble_mesh_network_ctrl_t *const p_ctrl)
```

Unregister Interface with Network Layer. Implements `rm_ble_mesh_network_api_t::close`.

Example:

```
/* Close the module. */
err = RM_BLE_MESH_NETWORK_Close(&g_ble_mesh_network0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Module successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_BLE_MESH_NETWORK_BroadcastSecureBeacon()**

```
fsp_err_t RM_BLE_MESH_NETWORK_BroadcastSecureBeacon ( rm_ble_mesh_network_ctrl_t *const
p_ctrl, rm_ble_mesh_network_subnet_handle_t subnet_handle )
```

API to send Secure Network Beacon. This routine sends Secure Network Beacon for the given subnet handle.

Implements `rm_ble_mesh_network_api_t::broadcastSecureBeacon`.

Example:

```
/* Send secure network beacon. */
err = RM_BLE_MESH_NETWORK_BroadcastSecureBeacon(&g_ble_mesh_network0_ctrl,
subnet_handle);
```

Return values

| | |
|-----------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |

◆ RM_BLE_MESH_NETWORK_SendPduOnInterface()

```
fsp_err_t RM_BLE_MESH_NETWORK_SendPduOnInterface ( rm_ble_mesh_network_ctrl_t *const
p_ctrl, rm_ble_mesh_network_route_info_t const *const p_route_info,
rm_ble_mesh_network_header_t const *const p_header, rm_ble_mesh_buffer_t const *const
p_buffer )
```

Extension API to send Network PDUs on selected network interfaces. This routine sends NETWORK PDUs on all or selected Network Interfaces.

Implements `rm_ble_mesh_network_api_t::sendPduOnInterface`.

Example:

```
/* Send network PDUs on selected network interfaces. */
err = RM_BLE_MESH_NETWORK_SendPduOnInterface(&g_ble_mesh_network0_ctrl,
&route_info, &header, &buffer);
```

Return values

| | |
|--------------------------|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_route_info, p_header and p_buffer are NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

◆ RM_BLE_MESH_NETWORK_GetAddressType()

```
fsp_err_t RM_BLE_MESH_NETWORK_GetAddressType ( rm_ble_mesh_network_ctrl_t *const p_ctrl,
rm_ble_mesh_network_address_t addr, rm_ble_mesh_network_address_type_t *const p_type )
```

To get address type. This routine is to get address type for a given address.

Implements `rm_ble_mesh_network_api_t::getAddressType`.

Example:

```
/* Get address type. */
err = RM_BLE_MESH_NETWORK_GetAddressType(&g_ble_mesh_network0_ctrl, addr, &type);
```

Return values

| | |
|-------------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_type is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_BLE_MESH_NETWORK_FetchProxyState()

```
fsp_err_t RM_BLE_MESH_NETWORK_FetchProxyState ( rm_ble_mesh_network_ctrl_t *const p_ctrl,
rm_ble_mesh_network_gatt_proxy_state_t *const p_proxy_state )
```

Check if the proxy module is ready to handle proxy messages/events. This routine returns the current state of the Proxy. The valid states of proxy are:

1. RM_BLE_MESH_NETWORK_GATT_PROXY_STATE_NULL - If no callback registered by Upper Layers
2. RM_BLE_MESH_NETWORK_GATT_PROXY_STATE_READY - If callback registered and Proxy not connected
3. RM_BLE_MESH_NETWORK_GATT_PROXY_STATE_CONNECTED - if callback registered and Proxy connected

Implements `rm_ble_mesh_network_api_t::fetchProxyState`.

Example:

```
/* Check if the proxy module is ready to handle proxy messages/events. */
err = RM_BLE_MESH_NETWORK_FetchProxyState(&g_ble_mesh_network0_ctrl,
&proxy_state);
```

Return values

| | |
|-------------------------|--------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_proxy_state is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_BLE_MESH_NETWORK_SetProxyFilter()

```
fsp_err_t RM_BLE_MESH_NETWORK_SetProxyFilter ( rm_ble_mesh_network_ctrl_t *const p_ctrl,
rm_ble_mesh_network_route_info_t const *const p_route_info, rm_ble_mesh_proxy_filter_type_t
type )
```

Set proxy server's filter type. This function is used by the Proxy Client to set the filter type on the Proxy Server.

Implements `rm_ble_mesh_network_api_t::setProxyFilter`.

Example:

```
/* Set proxy server's filter type. */
err = RM_BLE_MESH_NETWORK_SetProxyFilter(&g_ble_mesh_network0_ctrl, &route_info,
filter_type);
```

Return values

| | |
|-------------------------|-------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_route_info is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_BLE_MESH_NETWORK_ConfigProxyFilter()

```
fsp_err_t RM_BLE_MESH_NETWORK_ConfigProxyFilter ( rm_ble_mesh_network_ctrl_t *const p_ctrl,
rm_ble_mesh_network_route_info_t const *const p_route_info,
rm_ble_mesh_proxy_config_opcode_t opcode, rm_ble_mesh_network_proxy_address_list_t *const
p_addr_list )
```

Add or Delete/Remove addresses to/from proxy filter list. This function is used by the Proxy Client to add/delete Addresses to/from the Proxy Server's filter List.

Implements `rm_ble_mesh_network_api_t::configProxyFilter`.

Example:

```
/* Add or delete/remove addresses to/from proxy filter list. */
err = RM_BLE_MESH_NETWORK_ConfigProxyFilter(&g_ble_mesh_network0_ctrl,
&route_info, opcode, &addr_list);
```

Return values

| | |
|-------------------------|--|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_route_info and p_addr_list are NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_BLE_MESH_NETWORK_StartProxyServerAdv()

```
fsp_err_t RM_BLE_MESH_NETWORK_StartProxyServerAdv ( rm_ble_mesh_network_ctrl_t *const
p_ctrl, rm_ble_mesh_network_subnet_handle_t subnet_handle,
rm_ble_mesh_network_gatt_proxy_adv_mode_t proxy_adv_mode )
```

Start connectable advertisements for a proxy server. This function is used by the Proxy Server to start Connectable Undirected Advertisements.

Implements `rm_ble_mesh_network_api_t::startProxyServerAdv`.

Example:

```
/* Start connectable advertisements for a proxy server. */
err = RM_BLE_MESH_NETWORK_StartProxyServerAdv(&g_ble_mesh_network0_ctrl,
subnet_handle, proxy_adv_mode);
```

Return values

| | |
|--------------------------|---------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The internal parameter is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

◆ RM_BLE_MESH_NETWORK_StopProxyServerAdv()

```
fsp_err_t RM_BLE_MESH_NETWORK_StopProxyServerAdv ( rm_ble_mesh_network_ctrl_t *const
p_ctrl)
```

Stop connectable advertisements for a proxy server. This function is used by the Proxy Server to stop Connectable Undirected Advertisements.

Implements `rm_ble_mesh_network_api_t::stopProxyServerAdv`.

Example:

```
/* Stop connectable advertisements for a proxy server. */
err = RM_BLE_MESH_NETWORK_StopProxyServerAdv(&g_ble_mesh_network0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_BLE_MESH_NETWORK_AllocateSeqNumber()

```
fsp_err_t RM_BLE_MESH_NETWORK_AllocateSeqNumber ( rm_ble_mesh_network_ctrl_t *const
p_ctrl, uint32_t *const p_seq_num )
```

To allocate sequence number. This function is used to allocate Sequence Number.

Implements `rm_ble_mesh_network_api_t::allocateSeqNumber`.

Example:

```
/* Allocate sequence number. */
err = RM_BLE_MESH_NETWORK_AllocateSeqNumber(&g_ble_mesh_network0_ctrl, &seq_num);
```

Return values

| | |
|-------------------------|----------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_seq_num is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_BLE_MESH_NETWORK_GetSeqNumberState()

```
fsp_err_t RM_BLE_MESH_NETWORK_GetSeqNumberState ( rm_ble_mesh_network_ctrl_t *const
p_ctrl, rm_ble_mesh_network_seq_number_state_t *const p_seq_num_state )
```

To get current sequence number state. This function is used to get current Sequence Number state.

Implements `rm_ble_mesh_network_api_t::getSeqNumberState`.

Example:

```
/* Get current sequence number state. */
err = RM_BLE_MESH_NETWORK_GetSeqNumberState(&g_ble_mesh_network0_ctrl,
&seq_num_state);
```

Return values

| | |
|-------------------------|--|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_seq_num_state is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_BLE_MESH_NETWORK_SetSeqNumberState()

```
fsp_err_t RM_BLE_MESH_NETWORK_SetSeqNumberState ( rm_ble_mesh_network_ctrl_t *const
p_ctrl, rm_ble_mesh_network_seq_number_state_t const *const p_seq_num_state )
```

To set current sequence number state. This function is used to get current Sequence Number state, which acquiring lock. Used from persistent storage.

Implements `rm_ble_mesh_network_api_t::setSeqNumberState`.

Example:

```
/* Set current sequence number state. */
err = RM_BLE_MESH_NETWORK_SetSeqNumberState(&g_ble_mesh_network0_ctrl,
&seq_num_state);
```

Return values

| | |
|-------------------------|--|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_seq_num_state is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_BLE_MESH_NETWORK_ResetNetCache()

```
fsp_err_t RM_BLE_MESH_NETWORK_ResetNetCache ( rm_ble_mesh_network_ctrl_t *const p_ctrl)
```

To reinitialize all Network Layer cache entries. This routine clears and reinitializes all Network Cache Entries. This needs to be invoked by the upper layer when the Network moves to a newer IV Index (Normal State) and the Sequence numbers are reset.

Implements `rm_ble_mesh_network_api_t::resetNetCache`.

Example:

```
/* Reinitialize all Network Layer cache entries. */
err = RM_BLE_MESH_NETWORK_ResetNetCache(&g_ble_mesh_network0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

Bluetooth Low Energy Mesh Network Lower Trans (rm_ble_mesh_lower_trans)

(rm_ble_mesh_lower_trans_ctrl_t *const p_ctrl)
```

Detailed Description

Overview

Target Devices

The Bluetooth Low Energy Mesh Network Lower Trans module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_ble_mesh_lower_trans

The following build time configurations are defined in fsp_cfg/rm_ble_mesh_lower_trans_cfg.h:

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Configurations for Networking > Bluetooth Low Energy Mesh Network modules > BLE Mesh Lower Trans (rm_ble_mesh_lower_trans)

This module can be added to the Stacks tab via New Stack > Networking > Bluetooth Low Energy Mesh Network modules > BLE Mesh Lower Trans (rm_ble_mesh_lower_trans).

| Configuration | Options | Default | Description |
|---------------------|---|----------------------------|---|
| General > Name | Name Must Be a Valid C Symbol | g_rm_ble_mesh_lower_trans0 | Module name. |
| Channel Number | Invalid Channel Number | 0 | Select channel corresponding to the channel number of the hardware. |
| Notification Enable | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | Whether to enable the notification or not. |
| Callback | Name Must Be a Valid C Symbol | NULL | Callback function name. |

Data Structures

```
struct rm_ble_mesh_lower_trans_instance_ctrl_t
```

Data Structure Documentation

◆ rm_ble_mesh_lower_trans_instance_ctrl_t

```
struct rm_ble_mesh_lower_trans_instance_ctrl_t
```

RM_BLE_MESH_LOWER_TRANS private control block. DO NOT MODIFY. Initialization occurs when RM_BLE_MESH_LOWER_TRANS_Open() is called.

Function Documentation

◆ RM_BLE_MESH_LOWER_TRANS_Open()

```
fsp_err_t RM_BLE_MESH_LOWER_TRANS_Open ( rm_ble_mesh_lower_trans_ctrl_t *const p_ctrl,
rm_ble_mesh_lower_trans_cfg_t const *const p_cfg )
```

Register Interface with Lower Transport Layer. This routine registers interface with the Lower Transport Layer. Transport Layer supports single Application, hence this routine shall be called once.

Implements `rm_ble_mesh_lower_trans_api_t::open`.

Example:

```
/* Open the module. */
err = RM_BLE_MESH_LOWER_TRANS_Open(&g_ble_mesh_lower_trans0_ctrl,
&g_ble_mesh_lower_trans0_cfg);
```

Return values

| | |
|-----------------------|--|
| FSP_SUCCESS | Module opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Module is already open. |
| FSP_ERR_INVALID_STATE | Lower layer is invalid state. |

◆ RM_BLE_MESH_LOWER_TRANS_Close()

```
fsp_err_t RM_BLE_MESH_LOWER_TRANS_Close ( rm_ble_mesh_provision_ctrl_t *const p_ctrl)
```

Unregister Interface with Lower Transport Layer. Implements `rm_ble_mesh_lower_trans_api_t::close`.

Example:

```
/* Close the module. */
err = RM_BLE_MESH_LOWER_TRANS_Close(&g_ble_mesh_lower_trans0_ctrl);
```

Return values

| | |
|-----------------------|-------------------------------|
| FSP_SUCCESS | Module successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Lower layer is invalid state. |

◆ RM_BLE_MESH_LOWER_TRANS_SendPdu()

```
fsp_err_t RM_BLE_MESH_LOWER_TRANS_SendPdu ( rm_ble_mesh_lower_trans_ctrl_t *const p_ctrl,
rm_ble_mesh_lower_trans_transmit_setting_t const *const p_transmit_setting,
rm_ble_mesh_buffer_t const *const p_buffer, rm_ble_mesh_lower_trans_reliable_t reliable )
```

API to send transport PDUs. This routine sends transport PDUs to peer device.

Implements `rm_ble_mesh_lower_trans_api_t::sendPdu`.

Example:

```
/* Send transport PDUs. */
err = RM_BLE_MESH_LOWER_TRANS_SendPdu(&g_ble_mesh_lower_trans0_ctrl,
                                     &transmit_setting,
                                     &buffer,
                                     RM_BLE_MESH_LOWER_TRANS_RELIABLE_ENABLE);
```

Return values

| | |
|--------------------------|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_transmit_setting and p_buffer are NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |

◆ RM_BLE_MESH_LOWER_TRANS_ClearSarContexts()

```
fsp_err_t RM_BLE_MESH_LOWER_TRANS_ClearSarContexts ( rm_ble_mesh_lower_trans_ctrl_t *const p_ctrl)
```

To clear all segmentation and reassembly contexts. This routine clears all segmentation and reassembly contexts.

Implements `rm_ble_mesh_lower_trans_api_t::clearSarContexts`.

Example:

```
/* Clear all segmentation and reassembly contexts. */
err = RM_BLE_MESH_LOWER_TRANS_ClearSarContexts(&g_ble_mesh_lower_trans0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_BLE_MESH_LOWER_TRANS_ClearSubnetSarContexts()

```
fsp_err_t RM_BLE_MESH_LOWER_TRANS_ClearSubnetSarContexts ( rm_ble_mesh_lower_trans_ctrl_t *const p_ctrl, rm_ble_mesh_network_subnet_handle_t subnet_handle )
```

To clear all segmentation and reassembly contexts for a given subnet. This routine clears all segmentation and reassembly contexts.

Implements `rm_ble_mesh_lower_trans_api_t::clearSubnetSarContexts`.

Example:

```
/* Clear all segmentation and reassembly contexts for a given subnet. */
err =
RM_BLE_MESH_LOWER_TRANS_ClearSubnetSarContexts(&g_ble_mesh_lower_trans0_ctrl,
subnet_handle);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_BLE_MESH_LOWER_TRANS_ReinitReplayCache()

```
fsp_err_t RM_BLE_MESH_LOWER_TRANS_ReinitReplayCache ( rm_ble_mesh_lower_trans_ctrl_t
*const p_ctrl)
```

To reinitialize all Lower Transport replay cache entries. This routine clears and reinitializes all Transport Replay Cache Entries. This needs to be invoked by the upper layer when the Network moves to a newer IV Index (Normal State) and the Sequence numbers are reset.

Implements `rm_ble_mesh_lower_trans_api_t::reinitReplayCache`.

Example:

```
/* Reinitialize all Lower Transport replay cache Entries. */
err = RM_BLE_MESH_LOWER_TRANS_ReinitReplayCache(&g_ble_mesh_lower_trans0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_BLE_MESH_LOWER_TRANS_TriggerPendingTransmits()

```
fsp_err_t RM_BLE_MESH_LOWER_TRANS_TriggerPendingTransmits ( rm_ble_mesh_lower_trans_ctrl_t
*const p_ctrl)
```

To trigger any LTRN pending transmissions. Trigger pending transmits is an interface to check for pending segments in the tx queue and schedule for transmission, which is mainly used by the LPN operation.

Implements `rm_ble_mesh_lower_trans_api_t::triggerPendingTransmits`.

Example:

```
/* Trigger any Lower Transport pending transmissions. */
err =
RM_BLE_MESH_LOWER_TRANS_TriggerPendingTransmits(&g_ble_mesh_lower_trans0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

Bluetooth Low Energy Mesh Network Upper Trans (rm_ble_mesh_upper_trans)

Modules » Networking » Bluetooth Low Energy Mesh Network Modules

Functions

rm_ble_mesh_upper_trans_heartbeat_subscription_info_t *const
p_info)
```

```
fsp_err_t RM_BLE_MESH_UPPER_TRANS_TriggerHeartbeat
(rm_ble_mesh_upper_trans_ctrl_t *const p_ctrl, uint8_t
change_in_feature_bit)
```

Detailed Description

Overview

Target Devices

The Bluetooth Low Energy Energy Mesh Network Upper Trans module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_ble_mesh_upper_trans

The following build time configurations are defined in fsp_cfg/rm_ble_mesh_upper_trans_cfg.h:

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Configurations for Networking > Bluetooth Low Energy Mesh Network modules > BLE Mesh Upper Trans (rm_ble_mesh_upper_trans)

This module can be added to the Stacks tab via New Stack > Networking > Bluetooth Low Energy Mesh Network modules > BLE Mesh Upper Trans (rm_ble_mesh_upper_trans).

| Configuration | Options | Default | Description |
|------------------------------|---|----------------------------|---|
| General > Name | Name Must Be a Valid C Symbol | g_rm_ble_mesh_upper_trans0 | Module name. |
| Channel Number | Invalid Channel Number | 0 | Select channel corresponding to the channel number of the hardware. |
| Control Message Event Enable | <ul style="list-style-type: none"> Enabled Disabled | Disabled | Whether to enable the control message event or not. |
| Access Message Event Enable | <ul style="list-style-type: none"> Enabled Disabled | Disabled | Whether to enable the access message event or not. |
| Callback | Name Must Be a Valid C Symbol | NULL | Callback function name. |

Data Structures

```
struct rm_ble_mesh_upper_trans_instance_ctrl_t
```

Data Structure Documentation

◆ rm_ble_mesh_upper_trans_instance_ctrl_t

```
struct rm_ble_mesh_upper_trans_instance_ctrl_t
```

RM_BLE_MESH_UPPER_TRANS private control block. DO NOT MODIFY. Initialization occurs when [RM_BLE_MESH_UPPER_TRANS_Open\(\)](#) is called.

Function Documentation

◆ **RM_BLE_MESH_UPPER_TRANS_Open()**

```
fsp_err_t RM_BLE_MESH_UPPER_TRANS_Open ( rm_ble_mesh_upper_trans_ctrl_t *const p_ctrl,
rm_ble_mesh_upper_trans_cfg_t const *const p_cfg )
```

Register Interface with Transport Layer. This routine registers interface with the Transport Layer. Transport Layer supports single Application, hence this routine shall be called once.

Implements `rm_ble_mesh_upper_trans_api_t::open`.

Example:

```
/* Open the module. */
err = RM_BLE_MESH_UPPER_TRANS_Open(&g_ble_mesh_upper_trans0_ctrl,
&g_ble_mesh_upper_trans0_cfg);
```

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Module opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Module is already open. |

◆ **RM_BLE_MESH_UPPER_TRANS_Close()**

```
fsp_err_t RM_BLE_MESH_UPPER_TRANS_Close ( rm_ble_mesh_provision_ctrl_t *const p_ctrl)
```

Unregister Interface with Transport Layer. Implements `rm_ble_mesh_upper_trans_api_t::close`.

Example:

```
/* Close the module. */
err = RM_BLE_MESH_UPPER_TRANS_Close(&g_ble_mesh_upper_trans0_ctrl);
```

Return values

| | |
|-----------------------|-------------------------------|
| FSP_SUCCESS | Module successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Lower layer is invalid state. |

◆ **RM_BLE_MESH_UPPER_TRANS_SendAccessPdu()**

```
fsp_err_t RM_BLE_MESH_UPPER_TRANS_SendAccessPdu ( rm_ble_mesh_upper_trans_ctrl_t *const
p_ctrl, rm_ble_mesh_upper_trans_access_layer_pdu_t const *const p_access_layer_pdu,
rm_ble_mesh_lower_trans_reliable_t reliable )
```

API to send Access Layer PDUs. This routine sends Access Layer PDUs to peer device.

Implements `rm_ble_mesh_upper_trans_api_t::sendAccessPdu`.

Example:

```
/* Send Access Layer PDUs. */
err = RM_BLE_MESH_UPPER_TRANS_SendAccessPdu(&g_ble_mesh_upper_trans0_ctrl,
                                             &access_layer_pdu,
RM_BLE_MESH_LOWER_TRANS_RELIABLE_ENABLE);
```

Return values

| | |
|--------------------------|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_access_layer_pdu is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |

◆ RM_BLE_MESH_UPPER_TRANS_SendControlPdu()

```
fsp_err_t RM_BLE_MESH_UPPER_TRANS_SendControlPdu ( rm_ble_mesh_upper_trans_ctrl_t *const
p_ctrl, rm_ble_mesh_upper_trans_control_pdu_t const *const p_control_pdu )
```

API to send transport Control PDUs. This routine sends transport Control PDUs to peer device.

Implements `rm_ble_mesh_upper_trans_api_t::sendControlPdu`.

Example:

```
/* Send Upper Transport control PDUs. */
err = RM_BLE_MESH_UPPER_TRANS_SendControlPdu(&g_ble_mesh_upper_trans0_ctrl,
&control_pdu);
```

Return values

| | |
|--------------------------|--------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_control_pdu is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |

◆ RM_BLE_MESH_UPPER_TRANS_LpnSetupFriendship()

```
fsp_err_t RM_BLE_MESH_UPPER_TRANS_LpnSetupFriendship ( rm_ble_mesh_upper_trans_ctrl_t
*const p_ctrl, rm_ble_mesh_upper_trans_friendship_setting_t const *const p_setting )
```

API to setup Friendship. This routine is used by the device acting as a low power node to setup a friendship procedure to any available friend nodes.

Implements `rm_ble_mesh_upper_trans_api_t::lpnSetupFriendship`.

Example:

```
/* Setup friendship. */
err = RM_BLE_MESH_UPPER_TRANS_LpnSetupFriendship(&g_ble_mesh_upper_trans0_ctrl,
&setting);
```

Return values

| | |
|-------------------------|----------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_setting is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Lower layer is invalid state. |

◆ RM_BLE_MESH_UPPER_TRANS_LpnClearFriendship()

```
fsp_err_t RM_BLE_MESH_UPPER_TRANS_LpnClearFriendship ( rm_ble_mesh_upper_trans_ctrl_t
*const p_ctrl)
```

API to terminate friendship. This routine is used by the device acting as a low power node terminate friendship with an active Friend node.

Implements `rm_ble_mesh_upper_trans_api_t::lpnClearFriendship`.

Example:

```
/* Terminate friendship. */
err = RM_BLE_MESH_UPPER_TRANS_LpnClearFriendship(&g_ble_mesh_upper_trans0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_BLE_MESH_UPPER_TRANS_LpnManageSubscription()

```
fsp_err_t RM_BLE_MESH_UPPER_TRANS_LpnManageSubscription ( rm_ble_mesh_upper_trans_ctrl_t
*const p_ctrl, rm_ble_mesh_upper_trans_control_opcode_t action, uint16_t const *const
p_addr_list, uint16_t count )
```

API to manage friend subscription list. This routine is used by the device acting as a low power node add/remove addresses to/from the friends subscription list.

Implements `rm_ble_mesh_upper_trans_api_t::lpnManageSubscription`.

Example:

```
/* Manage friend subscription list. */
err =
RM_BLE_MESH_UPPER_TRANS_LpnManageSubscription(&g_ble_mesh_upper_trans0_ctrl,
RM_BLE_MESH_UPPER_TRANS_CONTROL_OPCODE_FRIEND_POLL,
&addr_list,
count);
```

Return values

| | |
|-------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_addr_list is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |

◆ RM_BLE_MESH_UPPER_TRANS_LpnPoll()

```
fsp_err_t RM_BLE_MESH_UPPER_TRANS_LpnPoll ( rm_ble_mesh_upper_trans_ctrl_t *const p_ctrl)
```

To trigger Friend Poll from application. This routine enables the application to trigger a Friend Poll even before the expiry of an active poll period configured during the friendship establishment. The poll period will get reset at this point.

Implements `rm_ble_mesh_upper_trans_api_t::lpnPoll`.

Example:

```
/* Trigger friend poll from application. */
err = RM_BLE_MESH_UPPER_TRANS_LpnPoll(&g_ble_mesh_upper_trans0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_BLE_MESH_UPPER_TRANS_IsValidLpnElementAddress()

```
fsp_err_t RM_BLE_MESH_UPPER_TRANS_IsValidLpnElementAddress (
rm_ble_mesh_upper_trans_ctrl_t *const p_ctrl, rm_ble_mesh_network_address_t addr,
rm_ble_mesh_lower_trans_lpn_handle_t *const p_lpn_handle )
```

To check if address matches with any of the LPN. This routine checks if destination address in a received packet matches with any of the known element address of LPN.

Implements `rm_ble_mesh_upper_trans_api_t::isValidLpnElementAddress`.

Example:

```
/* Check if address matches with any of the LPN. */
err =
RM_BLE_MESH_UPPER_TRANS_IsValidLpnElementAddress(&g_ble_mesh_upper_trans0_ctrl, addr,
&lpn_handle);
```

Return values

| | |
|-------------------------|-------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_lpn_handle is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |

◆ RM_BLE_MESH_UPPER_TRANS_IsValidLpnSubscriptionAddress()

```
fsp_err_t RM_BLE_MESH_UPPER_TRANS_IsValidLpnSubscriptionAddress (
  rm_ble_mesh_upper_trans_ctrl_t *const p_ctrl, rm_ble_mesh_network_address_t addr,
  rm_ble_mesh_lower_trans_lpn_handle_t *const p_lpn_handle )
```

To check if valid subscription address of an LPN to receive a packet. This routine checks if destination address in a received packet matches with any of the known subscription address of an LPN.

Implements `rm_ble_mesh_upper_trans_api_t::IsValidLpnSubscriptionAddress`.

Example:

```
/* Check if valid subscription address of an LPN to receive a packet. */
err =
RM_BLE_MESH_UPPER_TRANS_IsValidLpnSubscriptionAddress(&g_ble_mesh_upper_trans0_ctrl,
addr, &lpn_handle);
```

Return values

| | |
|-------------------------|-------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_lpn_handle is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |

◆ RM_BLE_MESH_UPPER_TRANS_GetLpnPolltimeout()

```
fsp_err_t RM_BLE_MESH_UPPER_TRANS_GetLpnPolltimeout ( rm_ble_mesh_upper_trans_ctrl_t
*const p_ctrl, rm_ble_mesh_network_address_t lpn_addr, uint32_t *const p_poll_timeout )
```

To get Poll Timeout of an LPN. This routine checks if LPN address is valid and then returns Poll Timeout configured for the LPN.

Implements `rm_ble_mesh_upper_trans_api_t::getLpnPolltimeout`.

Example:

```
/* Get poll timeout of an LPN. */
err = RM_BLE_MESH_UPPER_TRANS_GetLpnPolltimeout(&g_ble_mesh_upper_trans0_ctrl,
addr, &poll_timeout);
```

Return values

| | |
|-------------------------|---------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_poll_timeout is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_BLE_MESH_UPPER_TRANS_GetFriendshipInfo()

```
fsp_err_t RM_BLE_MESH_UPPER_TRANS_GetFriendshipInfo ( rm_ble_mesh_upper_trans_ctrl_t *const
p_ctrl, rm_ble_mesh_upper_trans_friend_role_t role, uint16_t lpn_index,
rm_ble_mesh_upper_trans_friendship_info_t *const p_node )
```

To get the LPN node information. This routine fetches the node information of the LPN element at the given index

Implements `rm_ble_mesh_upper_trans_api_t::getFriendshipInfo`.

Example:

```
/* Get the LPN node information. */
err = RM_BLE_MESH_UPPER_TRANS_GetFriendshipInfo(&g_ble_mesh_upper_trans0_ctrl,
RM_BLE_MESH_UPPER_TRANS_FRIEND_ROLE_FRIEND,
                                lpn_index,
                                &node);
```

Return values

| | |
|-------------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_node is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_BLE_MESH_UPPER_TRANS_LpnRegisterSecurityUpdate()

```
fsp_err_t RM_BLE_MESH_UPPER_TRANS_LpnRegisterSecurityUpdate (
  rm_ble_mesh_upper_trans_ctrl_t *const p_ctrl, rm_ble_mesh_network_subnet_handle_t
  subnet_handle, uint8_t flag, uint32_t ivindex )
```

To add the security update information. This routine updates the security state of the network to all the active LPN elements. This will be forwarded to the elements when it polls for the next packet available.

Implements `rm_ble_mesh_upper_trans_api_t::lpnRegisterSecurityUpdate`.

Example:

```
/* Add the security update information. */
err =
  RM_BLE_MESH_UPPER_TRANS_LpnRegisterSecurityUpdate(&g_ble_mesh_upper_trans0_ctrl,
  subnet_handle, flag, ivindex);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_BLE_MESH_UPPER_TRANS_ClearAllLpn()

```
fsp_err_t RM_BLE_MESH_UPPER_TRANS_ClearAllLpn ( rm_ble_mesh_upper_trans_ctrl_t *const
  p_ctrl)
```

To clear information related to all LPNs. This routine clears information related to all LPNs.

Implements `rm_ble_mesh_upper_trans_api_t::clearAllLpn`.

Example:

```
/* Clear information related to all LPNs. */
err = RM_BLE_MESH_UPPER_TRANS_ClearAllLpn(&g_ble_mesh_upper_trans0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_BLE_MESH_UPPER_TRANS_SetHeartbeatPublication()

```
fsp_err_t RM_BLE_MESH_UPPER_TRANS_SetHeartbeatPublication ( rm_ble_mesh_upper_trans_ctrl_t
*const p_ctrl, rm_ble_mesh_upper_trans_heartbeat_publication_info_t *const p_info )
```

To set the Heartbeat publication data. This routine configures the Heartbeat publication information

Implements `rm_ble_mesh_upper_trans_api_t::setHeartbeatPublication`.

Example:

```
/* Set the heartbeat publication data. */
err =
RM_BLE_MESH_UPPER_TRANS_SetHeartbeatPublication(&g_ble_mesh_upper_trans0_ctrl,
&ut_hp_info);
```

Return values

| | |
|--------------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_info is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

◆ RM_BLE_MESH_UPPER_TRANS_GetHeartbeatPublication()

```
fsp_err_t RM_BLE_MESH_UPPER_TRANS_GetHeartbeatPublication ( rm_ble_mesh_upper_trans_ctrl_t
*const p_ctrl, rm_ble_mesh_upper_trans_heartbeat_publication_info_t *const p_info )
```

To get the Heartbeat publication data. This routine retrieves the Heartbeat publication information
Implements `rm_ble_mesh_upper_trans_api_t::getHeartbeatPublication`.

Example:

```
/* Get the heartbeat publication data. */
err =
RM_BLE_MESH_UPPER_TRANS_GetHeartbeatPublication(&g_ble_mesh_upper_trans0_ctrl,
&ut_hp_info);
```

Return values

| | |
|-------------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_info is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_BLE_MESH_UPPER_TRANS_SetHeartbeatSubscription()

```
fsp_err_t RM_BLE_MESH_UPPER_TRANS_SetHeartbeatSubscription ( rm_ble_mesh_upper_trans_ctrl_t
*const p_ctrl, rm_ble_mesh_upper_trans_heartbeat_subscription_info_t *const p_info )
```

To set the Heartbeat subscription data. This routine configures the Heartbeat subscription information

Implements `rm_ble_mesh_upper_trans_api_t::setHeartbeatSubscription`.

Example:

```
/* Set the heartbeat subscription data. */
err =
RM_BLE_MESH_UPPER_TRANS_SetHeartbeatSubscription(&g_ble_mesh_upper_trans0_ctrl,
&ut_hs_info);
```

Return values

| | |
|-------------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_info is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |

◆ RM_BLE_MESH_UPPER_TRANS_GetHeartbeatSubscription()

```
fsp_err_t RM_BLE_MESH_UPPER_TRANS_GetHeartbeatSubscription (
  rm_ble_mesh_upper_trans_ctrl_t *const p_ctrl,
  rm_ble_mesh_upper_trans_heartbeat_subscription_info_t *const p_info )
```

To get the Heartbeat subscription data. This routine retrieves the Heartbeat subscription information

Implements `rm_ble_mesh_upper_trans_api_t::getHeartbeatSubscription`.

Example:

```
/* Get the heartbeat subscription data. */
err =
RM_BLE_MESH_UPPER_TRANS_GetHeartbeatSubscription(&g_ble_mesh_upper_trans0_ctrl,
&ut_hs_info);
```

Return values

| | |
|-------------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_info is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_BLE_MESH_UPPER_TRANS_TriggerHeartbeat()

```
fsp_err_t RM_BLE_MESH_UPPER_TRANS_TriggerHeartbeat ( rm_ble_mesh_upper_trans_ctrl_t *const
p_ctrl, uint8_t change_in_feature_bit )
```

To trigger Heartbeat send on change in feature. This routine triggers the Heartbeat send on change in state of supported features.

Implements `rm_ble_mesh_upper_trans_api_t::triggerHeartbeat`.

Example:

```
/* Trigger heartbeat send on change in feature. */
err = RM_BLE_MESH_UPPER_TRANS_TriggerHeartbeat(&g_ble_mesh_upper_trans0_ctrl,
change_in_feature_bit);
```

Return values

| | |
|--------------------------|---------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_POINTER | The internal parameter is NULL. |

Detailed Description

Overview

Target Devices

The Bluetooth Low Energy Energy Mesh Network Access module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_ble_mesh_access

The following build time configurations are defined in fsp_cfg/rm_ble_mesh_access_cfg.h:

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Configurations for Networking > Bluetooth Low Energy Mesh Network modules > BLE Mesh Access (rm_ble_mesh_access)

This module can be added to the Stacks tab via New Stack > Networking > Bluetooth Low Energy Mesh Network modules > BLE Mesh Access (rm_ble_mesh_access).

| Configuration | Options | Default | Description |
|---------------------|-------------------------------|---------------------------|---|
| General > Name | Name Must Be a Valid C Symbol | g_rm_ble_mesh_access 0 | Module name. |
| Channel Number | Invalid Channel Number | 0 | Select channel corresponding to the channel number of the hardware. |
| Location Descriptor | Invalid Descriptor | 0 | Location descriptor. |
| Element Number | Invalid Descriptor | 0 | Element number to register the model. |

Data Structures

```
struct rm_ble_mesh_access_instance_ctrl_t
```

Data Structure Documentation

◆ rm_ble_mesh_access_instance_ctrl_t

```
struct rm_ble_mesh_access_instance_ctrl_t
```

RM_BLE_MESH_ACCESS private control block. DO NOT MODIFY. Initialization occurs when `RM_BLE_MESH_ACCESS_Open()` is called.

Function Documentation

◆ RM_BLE_MESH_ACCESS_Open()

```
fsp_err_t RM_BLE_MESH_ACCESS_Open ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_access_cfg_t const *const p_cfg )
```

Open access middleware. This routine creates a new node in the device. This can be used by the application to create extra nodes if required in addition to the default primary node. And this routine registers an element that can be populated with the models information to a specific node in the device identified by the node id.

Implements `rm_ble_mesh_access_api_t::open`.

Example:

```
/* Open the module. */
err = RM_BLE_MESH_ACCESS_Open(&g_ble_mesh_access0_ctrl, &g_ble_mesh_access0_cfg);
```

Return values

| | |
|--------------------------|--|
| FSP_SUCCESS | Module opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Module is already open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

◆ **RM_BLE_MESH_ACCESS_Close()**

```
fsp_err_t RM_BLE_MESH_ACCESS_Close ( rm_ble_mesh_access_ctrl_t *const p_ctrl)
```

Close access middleware. Implements `rm_ble_mesh_access_api_t::close`.

Example:

```
/* Close the module. */
err = RM_BLE_MESH_ACCESS_Close(&g_ble_mesh_access0_ctrl);
```

Return values

| | |
|-----------------------|--|
| FSP_SUCCESS | Module successfully closed. |
| FSP_ERR_ASSERTION | The parameter <code>p_ctrl</code> is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Lower layer is invalid state. |

◆ **RM_BLE_MESH_ACCESS_RegisterModel()**

```
fsp_err_t RM_BLE_MESH_ACCESS_RegisterModel ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_access_model_t const *const p_model, rm_ble_mesh_access_model_handle_t *const
p_model_handle )
```

Register a model with the access layer. This routine registers a model associated with an element with the access layer.

Implements `rm_ble_mesh_access_api_t::registerModel`.

Example:

```
/* Register a model with the access layer. */
err = RM_BLE_MESH_ACCESS_RegisterModel(&g_ble_mesh_access0_ctrl, &model,
&model_handle);
```

Return values

| | |
|-------------------------|--|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter <code>p_ctrl</code> is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter <code>p_model</code> and <code>p_model_handle</code> are NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_BLE_MESH_ACCESS_GetElementHandle()

```
fsp_err_t RM_BLE_MESH_ACCESS_GetElementHandle ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_network_address_t elem_addr, rm_ble_mesh_access_element_handle_t *const
p_handle )
```

Get element handle. This routine searches for the element handle associated with specific element address.

Implements `rm_ble_mesh_access_api_t::getElementHandle`.

Example:

```
/* Get element handle. */
err = RM_BLE_MESH_ACCESS_GetElementHandle(&g_ble_mesh_access0_ctrl, elem_addr,
&elem_handle);
```

Return values

| | |
|-------------------------|---------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_handle is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |

◆ RM_BLE_MESH_ACCESS_GetElementHandleForModelHandle()

```
fsp_err_t RM_BLE_MESH_ACCESS_GetElementHandleForModelHandle ( rm_ble_mesh_access_ctrl_t
*const p_ctrl, rm_ble_mesh_access_model_handle_t model_handle,
rm_ble_mesh_access_element_handle_t *const p_elem_handle )
```

Get element handle for a given model handle. This routine searches for the element handle associated with specific model handle.

Implements `rm_ble_mesh_access_api_t::getElementHandleForModelHandle`.

Example:

```
/* Get element handle for a given model handle. */
err = RM_BLE_MESH_ACCESS_GetElementHandleForModelHandle(&g_ble_mesh_access0_ctrl,
model_handle, &elem_handle);
```

Return values

| | |
|-------------------------|--------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_elem_handle is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_BLE_MESH_ACCESS_GetModelHandle()

```
fsp_err_t RM_BLE_MESH_ACCESS_GetModelHandle ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_access_element_handle_t elem_handle, rm_ble_mesh_access_model_id_t model_id,
rm_ble_mesh_access_model_handle_t *const p_handle )
```

Get model handle. This routine searches for the model handle associated with specific model ID.

Implements `rm_ble_mesh_access_api_t::getModelHandle`.

Example:

```
/* Get model handle. */
err = RM_BLE_MESH_ACCESS_GetModelHandle(&g_ble_mesh_access0_ctrl, elem_handle,
model_id, &model_handle);
```

Return values

| | |
|--------------------------|---------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_handle is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

◆ RM_BLE_MESH_ACCESS_Publish()

```
fsp_err_t RM_BLE_MESH_ACCESS_Publish ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_access_model_handle_t const *const p_handle, rm_ble_mesh_access_req_msg_raw_t
const *const p_publish_message, uint8_t reliable )
```

API to publish access layer message. This routine publishes Access Layer message to the publish address associated with the model.

Implements `rm_ble_mesh_access_api_t::publish`.

Example:

```
/* Publish access layer message. */
err = RM_BLE_MESH_ACCESS_Publish(&g_ble_mesh_access0_ctrl, &model_handle,
&publish_message, reliable);
```

Return values

| | |
|--------------------------|--|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_handle and p_publish_message are NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_STATE | Lower layer is invalid state. |

◆ RM_BLE_MESH_ACCESS_ReliablePublish()

```
fsp_err_t RM_BLE_MESH_ACCESS_ReliablePublish ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_access_model_handle_t const *const p_handle, rm_ble_mesh_access_req_msg_raw_t
const *const p_publish_message, uint32_t rsp_opcode )
```

API to reliably publish Access layer message. This routine reliably publishes Access Layer message to the publish address associated with the model.

Implements `rm_ble_mesh_access_api_t::reliablePublish`.

Example:

```
/* Reliably publish access layer message. */
err = RM_BLE_MESH_ACCESS_ReliablePublish(&g_ble_mesh_access0_ctrl, &model_handle,
&req_msg_raw, rsp_opcode);
```

Return values

| | |
|--------------------------|--|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_handle and p_publish_message are NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_STATE | Lower layer is invalid state. |

◆ RM_BLE_MESH_ACCESS_Reply()

```
fsp_err_t RM_BLE_MESH_ACCESS_Reply ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_access_model_req_msg_context_t const *const p_req_msg_context, uint8_t ttl,
rm_ble_mesh_access_req_msg_raw_t const *const p_req_msg_raw )
```

API to reply to Access Layer message. This routine replies to Access Layer message.

Implements `rm_ble_mesh_access_api_t::reply`.

Example:

```
/* Reply to access layer message. */
err = RM_BLE_MESH_ACCESS_Reply(&g_ble_mesh_access0_ctrl, &req_msg_context, ttl,
&req_msg_raw);
```

Return values

| | |
|--------------------------|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter <code>p_ctrl</code> is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter <code>p_req_msg_context</code> and <code>p_req_msg_raw</code> are NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_STATE | Lower layer is invalid state. |

◆ RM_BLE_MESH_ACCESS_ReplyAndPublish()

```
fsp_err_t RM_BLE_MESH_ACCESS_ReplyAndPublish ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_access_model_req_msg_context_t const *const p_req_msg_context,
rm_ble_mesh_access_req_msg_raw_t const *const p_req_msg_raw,
rm_ble_mesh_access_publish_setting_t const *const p_publish_setting )
```

API to reply to Access Layer message and optionally also to publish. This routine replies to Access Layer message and also publish if requested by application.

Implements `rm_ble_mesh_access_api_t::replyAndPublish`.

Example:

```
/* Reply to access layer message. */
err =
RM_BLE_MESH_ACCESS_ReplyAndPublish(&g_ble_mesh_access0_ctrl, &req_msg_context,
&req_msg_raw, &publish_setting);
```

Return values

| | |
|--------------------------|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_req_msg_context and p_req_msg_raw are NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_STATE | Lower layer is invalid state. |

◆ RM_BLE_MESH_ACCESS_SendPdu()

```
fsp_err_t RM_BLE_MESH_ACCESS_SendPdu ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_access_pdu_t const *const p_pdu, uint8_t reliable )
```

API to send access PDUs. This routine sends transport PDUs to peer device.

Implements `rm_ble_mesh_access_api_t::sendPdu`.

Example:

```
/* Send Access PDUs. */
err = RM_BLE_MESH_ACCESS_SendPdu(&g_ble_mesh_access0_ctrl, &pdu, reliable);
```

Return values

| | |
|--------------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_pdu is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |

◆ **RM_BLE_MESH_ACCESS_GetCompositionData()**

```
fsp_err_t RM_BLE_MESH_ACCESS_GetCompositionData ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_buffer_t *const p_buffer )
```

Get composition data.

Implements `rm_ble_mesh_access_api_t::getCompositionData`.

Example:

```
/* Get composition data. */
err = RM_BLE_MESH_ACCESS_GetCompositionData(&g_ble_mesh_access0_ctrl, &buffer);
```

Return values

| | |
|--------------------------|---------------------------------|
| FSP_SUCCESS | Module successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_buffer is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

◆ **RM_BLE_MESH_ACCESS_Reset()**

```
fsp_err_t RM_BLE_MESH_ACCESS_Reset ( rm_ble_mesh_access_ctrl_t *const p_ctrl)
```

To reset a node. This routine resets a node (other than a Provisioner) and removes it from the network.

Implements `rm_ble_mesh_access_api_t::reset`.

Example:

```
/* Reset a node. */
err = RM_BLE_MESH_ACCESS_Reset(&g_ble_mesh_access0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_BLE_MESH_ACCESS_GetElementCount()

```
fsp_err_t RM_BLE_MESH_ACCESS_GetElementCount ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
uint8_t *const p_count )
```

To get the number of elements in local node. This routine retrieves the number of elements in local node.

Implements `rm_ble_mesh_access_api_t::getElementCount`.

Example:

```
/* Get the number of elements in local node. */
err = RM_BLE_MESH_ACCESS_GetElementCount(&g_ble_mesh_access0_ctrl, &count);
```

Return values

| | |
|-------------------------|--------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_count is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_BLE_MESH_ACCESS_SetPrimaryUnicastAddress()

```
fsp_err_t RM_BLE_MESH_ACCESS_SetPrimaryUnicastAddress ( rm_ble_mesh_access_ctrl_t *const
p_ctrl, rm_ble_mesh_network_address_t addr )
```

To set primary unicast address. This routine sets primary unicast address.

Implements `rm_ble_mesh_access_api_t::setPrimaryUnicastAddress`.

Example:

```
/* Set primary unicast address. */
err = RM_BLE_MESH_ACCESS_SetPrimaryUnicastAddress(&g_ble_mesh_access0_ctrl,
addr);
```

Return values

| | |
|-------------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |

◆ **RM_BLE_MESH_ACCESS_GetPrimaryUnicastAddress()**

```
fsp_err_t RM_BLE_MESH_ACCESS_GetPrimaryUnicastAddress ( rm_ble_mesh_access_ctrl_t *const
p_ctrl, rm_ble_mesh_network_address_t *const p_addr )
```

To get primary unicast address. This routine gets primary unicast address.

Implements `rm_ble_mesh_access_api_t::getPrimaryUnicastAddress`.

Example:

```
/* Get primary unicast address. */
err = RM_BLE_MESH_ACCESS_GetPrimaryUnicastAddress(&g_ble_mesh_access0_ctrl,
&addr);
```

Return values

| | |
|--------------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_addr is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

◆ **RM_BLE_MESH_ACCESS_SetDefaultTtl()**

```
fsp_err_t RM_BLE_MESH_ACCESS_SetDefaultTtl ( rm_ble_mesh_access_ctrl_t *const p_ctrl, uint8_t
ttl )
```

To set default TTL. This routine sets default TTL.

Implements `rm_ble_mesh_access_api_t::setDefaultTtl`.

Example:

```
/* Set default TTL. */
err = RM_BLE_MESH_ACCESS_SetDefaultTtl(&g_ble_mesh_access0_ctrl, ttl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_BLE_MESH_ACCESS_GetDefaultTtl()**

```
fsp_err_t RM_BLE_MESH_ACCESS_GetDefaultTtl ( rm_ble_mesh_access_ctrl_t *const p_ctrl, uint8_t
const *const p_ttl )
```

To get default TTL. This routine gets default TTL.

Implements `rm_ble_mesh_access_api_t::getDefaultTtl`.

Example:

```
/* Get default TTL. */
err = RM_BLE_MESH_ACCESS_GetDefaultTtl(&g_ble_mesh_access0_ctrl, &t1);
```

Return values

| | |
|--------------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_ttl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

◆ **RM_BLE_MESH_ACCESS_SetIvIndex()**

```
fsp_err_t RM_BLE_MESH_ACCESS_SetIvIndex ( rm_ble_mesh_access_ctrl_t *const p_ctrl, uint32_t
iv_index, uint8_t iv_update_flag )
```

To set IV Index. This routine sets IV Index.

Implements `rm_ble_mesh_access_api_t::setIvIndex`.

Example:

```
/* Set IV Index. */
err = RM_BLE_MESH_ACCESS_SetIvIndex(&g_ble_mesh_access0_ctrl, iv_index,
iv_update_flag);
```

Return values

| | |
|-----------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Lower layer is invalid state. |
| FSP_ERR_IN_USE | Resource is busy. |

◆ **RM_BLE_MESH_ACCESS_GetIvIndex()**

```
fsp_err_t RM_BLE_MESH_ACCESS_GetIvIndex ( rm_ble_mesh_access_ctrl_t *const p_ctrl, uint32_t
*const p_iv_index, uint8_t *const p_iv_update_flag )
```

To get IV Index. This routine gets IV Index.

Implements `rm_ble_mesh_access_api_t::getIvIndex`.

Example:

```
/* Get IV Index. */
err = RM_BLE_MESH_ACCESS_GetIvIndex(&g_ble_mesh_access0_ctrl, &iv_index,
&iv_update_flag);
```

Return values

| | |
|--------------------------|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_iv_index and p_iv_update_flag are NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

◆ **RM_BLE_MESH_ACCESS_GetIvIndexByIvi()**

```
fsp_err_t RM_BLE_MESH_ACCESS_GetIvIndexByIvi ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
uint8_t ivi, uint32_t *const p_iv_index )
```

To get IV Index by IVI. This routine gets IV Index based on the IVI in the received packet.

Implements `rm_ble_mesh_access_api_t::getIvIndexByIvi`.

Example:

```
/* Get IV Index by IVI. */
err = RM_BLE_MESH_ACCESS_GetIvIndexByIvi(&g_ble_mesh_access0_ctrl, ivi,
&iv_index);
```

Return values

| | |
|--------------------------|-----------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_iv_index is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

◆ **RM_BLE_MESH_ACCESS_SetFeaturesField()**

```
fsp_err_t RM_BLE_MESH_ACCESS_SetFeaturesField ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
uint8_t enable, uint8_t feature )
```

To enable/disable a feature. This routine enables/disables a feature field.

Implements `rm_ble_mesh_access_api_t::setFeaturesField`.

Example:

```
/* Enable/Disable a feature. */
err = RM_BLE_MESH_ACCESS_SetFeaturesField(&g_ble_mesh_access0_ctrl, enable,
features);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_BLE_MESH_ACCESS_GetFeaturesField()**

```
fsp_err_t RM_BLE_MESH_ACCESS_GetFeaturesField ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
uint8_t *const p_enable, uint8_t feature )
```

To get state of a feature. This routine gets the state of a feature field.

Implements `rm_ble_mesh_access_api_t::getFeaturesField`.

Example:

```
/* Get state of a feature. */
err = RM_BLE_MESH_ACCESS_GetFeaturesField(&g_ble_mesh_access0_ctrl, &enable,
features);
```

Return values

| | |
|-------------------------|---------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_enable is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_BLE_MESH_ACCESS_GetFeatures()

```
fsp_err_t RM_BLE_MESH_ACCESS_GetFeatures ( rm_ble_mesh_access_ctrl_t *const p_ctrl, uint8_t *const p_features )
```

To get state of all features. This routine gets the state of all features.

Implements `rm_ble_mesh_access_api_t::getFeatures`.

Example:

```
/* Get state of all features. */
err = RM_BLE_MESH_ACCESS_GetFeatures(&g_ble_mesh_access0_ctrl, &features);
```

Return values

| | |
|-------------------------|-----------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_features is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_BLE_MESH_ACCESS_GetFriendshipRole()

```
fsp_err_t RM_BLE_MESH_ACCESS_GetFriendshipRole ( rm_ble_mesh_access_ctrl_t *const p_ctrl, uint8_t *const p_friend_role )
```

To get friendship role of the node. This routine gets the current friendship role of the node.

Implements `rm_ble_mesh_access_api_t::getFriendshipRole`.

Example:

```
/* Get friendship role of the node. */
err = RM_BLE_MESH_ACCESS_GetFriendshipRole(&g_ble_mesh_access0_ctrl,
&friend_role);
```

Return values

| | |
|-------------------------|--------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_friend_role is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_BLE_MESH_ACCESS_SetFriendshipRole()

```
fsp_err_t RM_BLE_MESH_ACCESS_SetFriendshipRole ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
uint8_t friend_role )
```

To set friendship role of the node. This routine sets the current friendship role of the node.

Implements `rm_ble_mesh_access_api_t::setFriendshipRole`.

Example:

```
/* Set friendship role of the node. */
err = RM_BLE_MESH_ACCESS_SetFriendshipRole(&g_ble_mesh_access0_ctrl,
friend_role);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_BLE_MESH_ACCESS_AddDeviceKey()

```
fsp_err_t RM_BLE_MESH_ACCESS_AddDeviceKey ( rm_ble_mesh_access_ctrl_t *const p_ctrl, uint8_t
const *const p_dev_key, rm_ble_mesh_network_address_t uaddr, uint8_t num_elements )
```

To add Device Key. This routine adds Device Key entry, along with corresponding Primary Device Address and Number of elements.

Implements `rm_ble_mesh_access_api_t::addDeviceKey`.

Example:

```
/* Add Device Key. */
err = RM_BLE_MESH_ACCESS_AddDeviceKey(&g_ble_mesh_access0_ctrl, &dev_key, uaddr,
num_elements);
```

Return values

| | |
|-------------------------|----------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_dev_key is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_OVERFLOW | Device key table is full. |

◆ RM_BLE_MESH_ACCESS_GetDeviceKey()

```
fsp_err_t RM_BLE_MESH_ACCESS_GetDeviceKey ( rm_ble_mesh_access_ctrl_t *const p_ctrl, uint8_t dev_key_index, uint8_t **const p_dev_key )
```

To get Device Key. This routine gets Device Key entry.

Implements `rm_ble_mesh_access_api_t::getDeviceKey`.

Example:

```
/* Get Device Key. */
err = RM_BLE_MESH_ACCESS_GetDeviceKey(&g_ble_mesh_access0_ctrl, dev_key_index,
p_dev_key);
```

Return values

| | |
|--------------------------|----------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_dev_key is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

◆ RM_BLE_MESH_ACCESS_RemoveAllDeviceKeys()

```
fsp_err_t RM_BLE_MESH_ACCESS_RemoveAllDeviceKeys ( rm_ble_mesh_access_ctrl_t *const p_ctrl)
```

To remove all Device Keys. This routine removes all Device Keys from table.

Implements `rm_ble_mesh_access_api_t::removeAllDeviceKeys`.

Example:

```
/* Remove all Device Keys. */
err = RM_BLE_MESH_ACCESS_RemoveAllDeviceKeys(&g_ble_mesh_access0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_BLE_MESH_ACCESS_GetProvisionedDeviceList()

```
fsp_err_t RM_BLE_MESH_ACCESS_GetProvisionedDeviceList ( rm_ble_mesh_access_ctrl_t *const
p_ctrl, rm_ble_mesh_access_provisioned_device_entry_t const *const p_prov_dev_list, uint16_t
*const p_num_entries )
```

To get list of Provisioned Device List. This routine returns list of Provisioned Devices from the Device Key Table.

Implements `rm_ble_mesh_access_api_t::getProvisionedDeviceList`.

Example:

```
/* Get list of provisioned device list. */
err = RM_BLE_MESH_ACCESS_GetProvisionedDeviceList(&g_ble_mesh_access0_ctrl,
&prov_dev_list, &num_entries);
```

Return values

| | |
|--------------------------|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_prov_dev_list and p_num_entries are NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

◆ RM_BLE_MESH_ACCESS_GetDeviceKeyHandle()

```
fsp_err_t RM_BLE_MESH_ACCESS_GetDeviceKeyHandle ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_network_address_t prim_elem_uaddr, rm_ble_mesh_access_device_key_handle_t
*const p_handle )
```

To get device key handle. This routine returns Device Key Handle for a given Primary Element Address entry in Device Key Table.

Implements `rm_ble_mesh_access_api_t::getDeviceKeyHandle`.

Example:

```
/* Get Device Key handle. */
err = RM_BLE_MESH_ACCESS_GetDeviceKeyHandle(&g_ble_mesh_access0_ctrl,
prim_elem_uaddr, &handle);
```

Return values

| | |
|--------------------------|---------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_handle is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

◆ RM_BLE_MESH_ACCESS_GetAppKey()

```
fsp_err_t RM_BLE_MESH_ACCESS_GetAppKey ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_network_appkey_handle_t appkey_handle, uint8_t **const p_app_key, uint8_t
*const p_aid )
```

To get AppKey. This routine gets AppKey along with AID entry.

Implements `rm_ble_mesh_access_api_t::getAppKey`.

Example:

```
/* Get AppKey. */
err = RM_BLE_MESH_ACCESS_GetAppKey(&g_ble_mesh_access0_ctrl, appkey_handle,
p_app_key, &aid);
```

Return values

| | |
|--------------------------|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_app_key and p_aid are NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

◆ RM_BLE_MESH_ACCESS_AddUpdateNetkey()

```
fsp_err_t RM_BLE_MESH_ACCESS_AddUpdateNetkey ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
uint16_t netkey_index, uint32_t opcode, uint8_t const *const p_net_key )
```

To add/update NetKey. This routine adds/updates NetKey entry. Each NetKey is associated with a subnet.

Implements `rm_ble_mesh_access_api_t::addUpdateNetkey`.

Example:

```
/* Add/Update NetKey. */
err = RM_BLE_MESH_ACCESS_AddUpdateNetkey(&g_ble_mesh_access0_ctrl, netkey_index,
opcode, &net_key);
```

Return values

| | |
|--------------------------|----------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_net_key is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

◆ RM_BLE_MESH_ACCESS_AddFriendSecurityCredential()

```
fsp_err_t RM_BLE_MESH_ACCESS_AddFriendSecurityCredential ( rm_ble_mesh_access_ctrl_t *const
p_ctrl, rm_ble_mesh_network_subnet_handle_t subnet_handle, uint16_t friend_index,
rm_ble_mesh_access_friend_security_credential_info_t info )
```

To add Security Credential of a LPN or the Friend. This routine adds NID, privacy and encryption keys associated with a friendship.

Implements `rm_ble_mesh_access_api_t::addFriendSecurityCredential`.

Example:

```
/* Add security credential of a LPN or the friend. */
err =
RM_BLE_MESH_ACCESS_AddFriendSecurityCredential(&g_ble_mesh_access0_ctrl,
subnet_handle, friend_index, info);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |

◆ RM_BLE_MESH_ACCESS_DeleteFriendSecurityCredential()

```
fsp_err_t RM_BLE_MESH_ACCESS_DeleteFriendSecurityCredential ( rm_ble_mesh_access_ctrl_t
*const p_ctrl, rm_ble_mesh_network_subnet_handle_t subnet_handle, uint16_t friend_index )
```

To delete the Security Credential of a LPN or the Friend. This routine deletes NID, privacy and encryption keys associated with a friendship.

Implements `rm_ble_mesh_access_api_t::deleteFriendSecurityCredential`.

Example:

```
/* Delete the security credential of a LPN or the Friend. */
err = RM_BLE_MESH_ACCESS_DeleteFriendSecurityCredential(&g_ble_mesh_access0_ctrl,
subnet_handle, friend_index);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_BLE_MESH_ACCESS_FindSubnet()

```
fsp_err_t RM_BLE_MESH_ACCESS_FindSubnet ( rm_ble_mesh_access_ctrl_t *const p_ctrl, uint16_t
netkey_index, rm_ble_mesh_network_subnet_handle_t *const p_subnet_handle )
```

To find a Subnet associated with the NetKey. This routine finds a Subnet based on the NetKey entry. Each NetKey is associated with a subnet.

Implements `rm_ble_mesh_access_api_t::findSubnet`.

Example:

```
/* Find a subnet associated with the NetKey. */
err = RM_BLE_MESH_ACCESS_FindSubnet(&g_ble_mesh_access0_ctrl, netkey_index,
&subnet_handle);
```

Return values

| | |
|-------------------------|--|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_subnet_handle is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |

◆ RM_BLE_MESH_ACCESS_FindMasterSubnet()

```
fsp_err_t RM_BLE_MESH_ACCESS_FindMasterSubnet ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_network_subnet_handle_t friend_subnet_handle,
rm_ble_mesh_network_subnet_handle_t *const p_master_subnet_handle )
```

To find the Master Subnet associated with the friend security credential, identified by Friend Subnet Handle. This routine finds the Master Subnet based on the friend security credential, identified by Friend Subnet Handle.

Implements `rm_ble_mesh_access_api_t::findMasterSubnet`.

Example:

```
/* Close the module. */
err =
RM_BLE_MESH_ACCESS_FindMasterSubnet(&g_ble_mesh_access0_ctrl, friend_subnet_handle,
&master_subnet_handle);
```

Return values

| | |
|-------------------------|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_master_subnet_handle is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_BLE_MESH_ACCESS_DeleteNetKey()

```
fsp_err_t RM_BLE_MESH_ACCESS_DeleteNetKey ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_network_subnet_handle_t subnet_handle )
```

To delete NetKey. This routine deletes a NetKey entry. Each NetKey is associated with a subnet.

Implements `rm_ble_mesh_access_api_t::deleteNetKey`.

Example:

```
/* Delete NetKey. */
err = RM_BLE_MESH_ACCESS_DeleteNetKey(&g_ble_mesh_access0_ctrl, subnet_handle);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_BLE_MESH_ACCESS_GetNetKey()

```
fsp_err_t RM_BLE_MESH_ACCESS_GetNetKey ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_network_subnet_handle_t subnet_handle, uint8_t *const p_net_key )
```

To get NetKey. This routine fetches a NetKey entry. Each NetKey is associated with a subnet.

Implements `rm_ble_mesh_access_api_t::getNetKey`.

Example:

```
/* Close the module. */
err = RM_BLE_MESH_ACCESS_GetNetKey(&g_ble_mesh_access0_ctrl, subnet_handle,
&net_key);
```

Return values

| | |
|-------------------------|----------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_net_key is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |

◆ RM_BLE_MESH_ACCESS_GetNetKeyIndexList()

```
fsp_err_t RM_BLE_MESH_ACCESS_GetNetKeyIndexList ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
uint16_t *const p_netkey_count, uint16_t *const p_netkey_index_list )
```

To get list of all known NetKeys. This routine returns a list of known NetKey Indices.

Implements `rm_ble_mesh_access_api_t::getNetKeyIndexList`.

Example:

```
/* Get list of all known NetKeys. */
err = RM_BLE_MESH_ACCESS_GetNetKeyIndexList(&g_ble_mesh_access0_ctrl,
&netkey_count, &netkey_index_list);
```

Return values

| | |
|-------------------------|--|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_netkey_count and p_netkey_index_list are NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |

◆ **RM_BLE_MESH_ACCESS_LookUpNid()**

```
fsp_err_t RM_BLE_MESH_ACCESS_LookUpNid ( rm_ble_mesh_access_ctrl_t *const p_ctrl, uint8_t
nid, rm_ble_mesh_network_subnet_handle_t *const p_subnet_handle,
rm_ble_mesh_access_associated_keys_t *const p_key_set )
```

To search for NID. This routine searches for matching NID in subnet table.

Implements `rm_ble_mesh_access_api_t::lookUpNid`.

Example:

```
/* Search for NID. */
err = RM_BLE_MESH_ACCESS_LookUpNid(&g_ble_mesh_access0_ctrl, nid, &subnet_handle,
&key_set);
```

Return values

| | |
|--------------------------|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_subnet_handle and p_key_set are NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

◆ RM_BLE_MESH_ACCESS_LookUpNetworkId()

```
fsp_err_t RM_BLE_MESH_ACCESS_LookUpNetworkId ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
uint8_t const *const p_network_id, rm_ble_mesh_network_subnet_handle_t *const
p_subnet_handle, rm_ble_mesh_access_associated_keys_t *const p_key_set )
```

To search for Network ID. This routine searches for matching Network ID in subnet table.

Implements `rm_ble_mesh_access_api_t::lookUpNetworkId`.

Example:

```
/* Search for NID. */
err = RM_BLE_MESH_ACCESS_LookUpNid(&g_ble_mesh_access0_ctrl, nid, &subnet_handle,
&key_set);
```

Return values

| | |
|--------------------------|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_network_id, p_subnet_handle and p_key_set are NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

◆ RM_BLE_MESH_ACCESS_LookUpAid()

```
fsp_err_t RM_BLE_MESH_ACCESS_LookUpAid ( rm_ble_mesh_access_ctrl_t *const p_ctrl, uint8_t
aid, rm_ble_mesh_network_appkey_handle_t *const p_appkey_handle, uint8_t *const p_app_key )
```

To search for AID. This routine searches for matching NID in subnet table.

Implements `rm_ble_mesh_access_api_t::lookUpAid`.

Example:

```
/* Search for AID. */
err = RM_BLE_MESH_ACCESS_LookUpAid(&g_ble_mesh_access0_ctrl, aid, &appkey_handle,
&app_key);
```

Return values

| | |
|--------------------------|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter <code>p_ctrl</code> is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter <code>p_appkey_handle</code> and <code>p_app_key</code> are NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

◆ RM_BLE_MESH_ACCESS_SetProvisioningData()

```
fsp_err_t RM_BLE_MESH_ACCESS_SetProvisioningData ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_provision_data_t const *const p_prov_data )
```

Set Provisioning Data. This routine configures the provisioning data with Access Layer.

Implements `rm_ble_mesh_access_api_t::setProvisioningData`.

Example:

```
/* Set provisioning data. */
err = RM_BLE_MESH_ACCESS_SetProvisioningData(&g_ble_mesh_access0_ctrl,
&prov_data);
```

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_prov_data is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

◆ RM_BLE_MESH_ACCESS_GetSubnetNid()

```
fsp_err_t RM_BLE_MESH_ACCESS_GetSubnetNid ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_network_subnet_handle_t handle, uint8_t *const p_nid )
```

To get NID associated with a subnet. This routine fetches the NID associated with a subnet.

Implements `rm_ble_mesh_access_api_t::getSubnetNid`.

Example:

```
/* Get NID associated with a subnet. */
err = RM_BLE_MESH_ACCESS_GetSubnetNid(&g_ble_mesh_access0_ctrl, subnet_handle,
&nid);
```

Return values

| | |
|--------------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_nid is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

◆ RM_BLE_MESH_ACCESS_GetSubnetPrivacyKey()

```
fsp_err_t RM_BLE_MESH_ACCESS_GetSubnetPrivacyKey ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_network_subnet_handle_t handle, uint8_t *const p_privacy_key )
```

To get Privacy Key associated with a subnet. This routine fetches the Privacy Key associated with a subnet.

Implements `rm_ble_mesh_access_api_t::getSubnetPrivacyKey`.

Example:

```
/* Get Privacy Key associated with a subnet. */
err = RM_BLE_MESH_ACCESS_GetSubnetPrivacyKey(&g_ble_mesh_access0_ctrl,
subnet_handle, &privacy_key);
```

Return values

| | |
|--------------------------|--------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_privacy_key is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

◆ RM_BLE_MESH_ACCESS_GetSubnetNetworkId()

```
fsp_err_t RM_BLE_MESH_ACCESS_GetSubnetNetworkId ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_network_subnet_handle_t handle, uint8_t *const p_network_id )
```

To get Network ID associated with a subnet. This routine fetches the Network ID associated with a subnet.

Implements `rm_ble_mesh_access_api_t::getSubnetNetworkId`.

Example:

```
/* Get Network ID associated with a subnet. */
err = RM_BLE_MESH_ACCESS_GetSubnetNetworkId(&g_ble_mesh_access0_ctrl,
subnet_handle, &network_id);
```

Return values

| | |
|--------------------------|-------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_network_id is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

◆ RM_BLE_MESH_ACCESS_GetSubnetBeaconKey()

```
fsp_err_t RM_BLE_MESH_ACCESS_GetSubnetBeaconKey ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_network_subnet_handle_t handle, uint8_t *const p_beacon_key )
```

To get Beacon Key associated with a subnet. This routine fetches the Beacon Key associated with a subnet.

Implements `rm_ble_mesh_access_api_t::getSubnetBeaconKey`.

Example:

```
/* Get Beacon Key associated with a subnet. */
err = RM_BLE_MESH_ACCESS_GetSubnetBeaconKey(&g_ble_mesh_access0_ctrl,
subnet_handle, &beacon_key);
```

Return values

| | |
|--------------------------|-------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_beacon_key is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

◆ RM_BLE_MESH_ACCESS_GetSubnetIdentityKey()

```
fsp_err_t RM_BLE_MESH_ACCESS_GetSubnetIdentityKey ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_network_subnet_handle_t handle, uint8_t *const p_identity_key )
```

To get Identity Key associated with a subnet. This routine fetches the Identity Key associated with a subnet.

Implements `rm_ble_mesh_access_api_t::getSubnetIdentityKey`.

Example:

```
/* Get Identity Key associated with a subnet. */
err = RM_BLE_MESH_ACCESS_GetSubnetIdentityKey(&g_ble_mesh_access0_ctrl,
subnet_handle, &identity_key);
```

Return values

| | |
|--------------------------|---------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_identity_key is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

◆ RM_BLE_MESH_ACCESS_GetSubnetEncryptionKey()

```
fsp_err_t RM_BLE_MESH_ACCESS_GetSubnetEncryptionKey ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_network_subnet_handle_t handle, uint8_t *const p_encrypt_key )
```

To get Encryption Key associated with a subnet. This routine fetches the Encryption Key associated with a subnet.

Implements `rm_ble_mesh_access_api_t::getSubnetEncryptionKey`.

Example:

```
/* Get Encryption Key associated with a subnet. */
err = RM_BLE_MESH_ACCESS_GetSubnetEncryptionKey(&g_ble_mesh_access0_ctrl,
subnet_handle, &encrypt_key);
```

Return values

| | |
|--------------------------|--------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_encrypt_key is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

◆ RM_BLE_MESH_ACCESS_GetNodeIdentity()

```
fsp_err_t RM_BLE_MESH_ACCESS_GetNodeIdentity ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_network_subnet_handle_t subnet_handle, uint8_t *const p_id_state )
```

To get Node Identity. This routine gets Node Identity State of a node

Implements `rm_ble_mesh_access_api_t::getNodeIdentity`.

Example:

```
/* Get node identity. */
err = RM_BLE_MESH_ACCESS_GetNodeIdentity(&g_ble_mesh_access0_ctrl, subnet_handle,
&id_state);
```

Return values

| | |
|-------------------------|-----------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_id_state is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |

◆ RM_BLE_MESH_ACCESS_SetNodeIdentity()

```
fsp_err_t RM_BLE_MESH_ACCESS_SetNodeIdentity ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_network_subnet_handle_t subnet_handle, uint8_t *const p_id_state )
```

To set Node Identity. This routine sets Node Identity State of a node.

Implements `rm_ble_mesh_access_api_t::setNodeIdentity`.

Example:

```
/* Set node identity. */
err = RM_BLE_MESH_ACCESS_SetNodeIdentity(&g_ble_mesh_access0_ctrl, subnet_handle,
&id_state);
```

Return values

| | |
|-------------------------|-----------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_id_state is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |

◆ RM_BLE_MESH_ACCESS_GetKeyRefreshPhase()

```
fsp_err_t RM_BLE_MESH_ACCESS_GetKeyRefreshPhase ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_network_subnet_handle_t subnet_handle, uint8_t *const p_key_refresh_state )
```

To get Key Refresh Phase. This routine gets Key Refresh Phase State of a node

Implements `rm_ble_mesh_access_api_t::getKeyRefreshPhase`.

Example:

```
/* Get key refresh phase. */
err = RM_BLE_MESH_ACCESS_GetKeyRefreshPhase(&g_ble_mesh_access0_ctrl,
subnet_handle, &key_refresh_state);
```

Return values

| | |
|-------------------------|--|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_key_refresh_state is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |

◆ RM_BLE_MESH_ACCESS_SetKeyRefreshPhase()

```
fsp_err_t RM_BLE_MESH_ACCESS_SetKeyRefreshPhase ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_network_subnet_handle_t subnet_handle, uint8_t const *const p_key_refresh_state
)
```

To set Key Refresh Phase. This routine sets Key Refresh Phase State of a node.

Implements `rm_ble_mesh_access_api_t::setKeyRefreshPhase`.

Example:

```
/* Set key refresh phase. */
err = RM_BLE_MESH_ACCESS_SetKeyRefreshPhase(&g_ble_mesh_access0_ctrl,
subnet_handle, &key_refresh_state);
```

Return values

| | |
|-------------------------|--|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_key_refresh_state is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |

◆ RM_BLE_MESH_ACCESS_SetTransmitState()

```
fsp_err_t RM_BLE_MESH_ACCESS_SetTransmitState ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
uint8_t tx_state_type, uint8_t tx_state )
```

To set Network/Relay Transmit state. This routine sets Network/Relay Transmit state.

Implements `rm_ble_mesh_access_api_t::setTransmitState`.

Example:

```
/* Set network/relay transmit state. */
err = RM_BLE_MESH_ACCESS_SetTransmitState(&g_ble_mesh_access0_ctrl,
tx_state_type, tx_state);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_BLE_MESH_ACCESS_GetTransmitState()**

```
fsp_err_t RM_BLE_MESH_ACCESS_GetTransmitState ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
uint8_t tx_state_type, uint8_t *const p_tx_state )
```

To get Network/Relay Transmit state. This routine gets Network/Relay Transmit state.

Implements `rm_ble_mesh_access_api_t::getTransmitState`.

Example:

```
/* Get network/relay transmit state. */
err = RM_BLE_MESH_ACCESS_GetTransmitState(&g_ble_mesh_access0_ctrl,
tx_state_type, &tx_state);
```

Return values

| | |
|-------------------------|-----------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_tx_state is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_BLE_MESH_ACCESS_AddAppKey()**

```
fsp_err_t RM_BLE_MESH_ACCESS_AddAppKey ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_network_subnet_handle_t subnet_handle, uint16_t appkey_index, uint8_t const
*const p_app_key )
```

To add AppKey. This routine adds AppKey entry. Each AppKey is associated with a subnet.

Implements `rm_ble_mesh_access_api_t::addAppKey`.

Example:

```
/* Add AppKey. */
err = RM_BLE_MESH_ACCESS_AddAppKey(&g_ble_mesh_access0_ctrl, subnet_handle,
appkey_index, &app_key);
```

Return values

| | |
|--------------------------|----------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_app_key is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

◆ RM_BLE_MESH_ACCESS_UpdateAppKey()

```
fsp_err_t RM_BLE_MESH_ACCESS_UpdateAppKey ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_network_subnet_handle_t subnet_handle, uint16_t appkey_index, uint8_t const
*const p_app_key )
```

To update AppKey. This routine updates AppKey entry. Each AppKey is associated with a subnet. Implements `rm_ble_mesh_access_api_t::updateAppKey`.

Example:

```
/* Update AppKey. */
err = RM_BLE_MESH_ACCESS_UpdateAppKey(&g_ble_mesh_access0_ctrl, subnet_handle,
appkey_index, &app_key);
```

Return values

| | |
|--------------------------|----------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_app_key is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

◆ RM_BLE_MESH_ACCESS_DeleteAppKey()

```
fsp_err_t RM_BLE_MESH_ACCESS_DeleteAppKey ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_network_subnet_handle_t subnet_handle, uint16_t appkey_index, uint8_t const
*const p_app_key )
```

To delete AppKey. This routine deletes AppKey entry. Each AppKey is associated with a subnet. Implements `rm_ble_mesh_access_api_t::deleteAppKey`.

Example:

```
/* Delete AppKey. */
err = RM_BLE_MESH_ACCESS_DeleteAppKey(&g_ble_mesh_access0_ctrl, subnet_handle,
appkey_index, &app_key);
```

Return values

| | |
|--------------------------|----------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_app_key is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

◆ RM_BLE_MESH_ACCESS_GetAppKeyHandle()

```
fsp_err_t RM_BLE_MESH_ACCESS_GetAppKeyHandle ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_network_subnet_handle_t subnet_handle, uint16_t appkey_index, uint8_t const
*const p_app_key, rm_ble_mesh_network_appkey_handle_t *const p_appkey_handle )
```

To get AppKey Handle for a given AppKey Index. This routine gets AppKey Handle for a given AppKey Index. Each AppKey is associated with a subnet.

Implements `rm_ble_mesh_access_api_t::getAppKeyHandle`.

Example:

```
/* Get AppKey handle for a given AppKey index. */
err = RM_BLE_MESH_ACCESS_GetAppKeyHandle(&g_ble_mesh_access0_ctrl,
                                         subnet_handle,
                                         appkey_index,
                                         &app_key,
                                         &appkey_handle);
```

Return values

| | |
|-------------------------|--|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_appkey_handle is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |

◆ RM_BLE_MESH_ACCESS_GetAppKeyIndexList()

```
fsp_err_t RM_BLE_MESH_ACCESS_GetAppKeyIndexList ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_network_subnet_handle_t subnet_handle, uint16_t *const p_appkey_count, uint16_t
*const p_appkey_index_list )
```

To get list of all known AppKeys. This routine returns a list of known AppKey Indices associated with a subnet.

Implements `rm_ble_mesh_access_api_t::getAppKeyIndexList`.

Example:

```
/* Get list of all known AppKeys. */
err = RM_BLE_MESH_ACCESS_GetAppKeyIndexList(&g_ble_mesh_access0_ctrl,
                                             subnet_handle,
                                             &appkey_count,
                                             &appkey_index_list);
```

Return values

| | |
|-------------------------|--|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_appkey_count and p_appkey_index_list are NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |

◆ RM_BLE_MESH_ACCESS_BindModelWithAppKey()

```
fsp_err_t RM_BLE_MESH_ACCESS_BindModelWithAppKey ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_access_model_handle_t model_handle, uint16_t appkey_index )
```

To bind a model with an AppKey. This routine binds a model with an AppKey.

Implements `rm_ble_mesh_access_api_t::bindModelWithAppKey`.

Example:

```
/* Bind a model with an AppKey. */
err = RM_BLE_MESH_ACCESS_BindModelWithAppKey(&g_ble_mesh_access0_ctrl,
model_handle, appkey_index);
```

Return values

| | |
|--------------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |

◆ RM_BLE_MESH_ACCESS_UnbindModelWithAppKey()

```
fsp_err_t RM_BLE_MESH_ACCESS_UnbindModelWithAppKey ( rm_ble_mesh_access_ctrl_t *const
p_ctrl, rm_ble_mesh_access_model_handle_t model_handle, uint16_t appkey_index )
```

To unbind a model with an AppKey. This routine unbinds a model with an AppKey.

Implements `rm_ble_mesh_access_api_t::unbindModelWithAppKey`.

Example:

```
/* Unbind a model with an AppKey. */
err = RM_BLE_MESH_ACCESS_UnbindModelWithAppKey(&g_ble_mesh_access0_ctrl,
model_handle, appkey_index);
```

Return values

| | |
|--------------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |

◆ RM_BLE_MESH_ACCESS_GetModelAppKeyList()

```
fsp_err_t RM_BLE_MESH_ACCESS_GetModelAppKeyList ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_access_model_handle_t model_handle, uint16_t *const p_appkey_count, uint16_t
*const p_appkey_index_list )
```

To get list of all AppKeys associated with a model. This routine returns a list of known AppKey Indices associated with a model.

Implements `rm_ble_mesh_access_api_t::getModelAppKeyList`.

Example:

```
/* Get list of all AppKeys associated with a model. */
err = RM_BLE_MESH_ACCESS_GetModelAppKeyList(&g_ble_mesh_access0_ctrl,
                                           model_handle,
                                           &appkey_count,
                                           &appkey_index_list);
```

Return values

| | |
|-------------------------|--|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_appkey_count and p_appkey_index_list are NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |

◆ RM_BLE_MESH_ACCESS_SetModelPublication()

```
fsp_err_t RM_BLE_MESH_ACCESS_SetModelPublication ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_access_model_handle_t model_handle, rm_ble_mesh_access_publish_info_t *const
p_publish_info )
```

To set Publication information associated with a model. This routine sets Publication information associated with a model.

Implements `rm_ble_mesh_access_api_t::setModelPublication`.

Example:

```
/* Set publication information associated with a model. */
err = RM_BLE_MESH_ACCESS_SetModelPublication(&g_ble_mesh_access0_ctrl,
model_handle, &publish_info);
```

Return values

| | |
|--------------------------|---------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_publish_info is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |

◆ RM_BLE_MESH_ACCESS_SetModelPublicationPeriodDivisor()

```
fsp_err_t RM_BLE_MESH_ACCESS_SetModelPublicationPeriodDivisor ( rm_ble_mesh_access_ctrl_t
*const p_ctrl, rm_ble_mesh_access_model_handle_t model_handle, uint8_t period_divisor )
```

To set Publication Fast Period Divisor information associated with a model. This routine sets Publication Fast Period Divisor information associated with a model.

Implements `rm_ble_mesh_access_api_t::setModelPublicationPeriodDivisor`.

Example:

```
/* Set publication fast period divisor information associated with a model. */
err =
RM_BLE_MESH_ACCESS_SetModelPublicationPeriodDivisor(&g_ble_mesh_access0_ctrl,
model_handle, period_divisor);
```

Return values

| | |
|--------------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

◆ RM_BLE_MESH_ACCESS_GetModelPublication()

```
fsp_err_t RM_BLE_MESH_ACCESS_GetModelPublication ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_access_model_handle_t model_handle, rm_ble_mesh_access_publish_info_t *const
p_publish_info )
```

To get Publication information associated with a model. This routine returns Publication information associated with a model.

Implements `rm_ble_mesh_access_api_t::getModelPublication`.

Example:

```
/* Get publication information associated with a model. */
err = RM_BLE_MESH_ACCESS_GetModelPublication(&g_ble_mesh_access0_ctrl,
model_handle, &publish_info);
```

Return values

| | |
|-------------------------|---------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_publish_info is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |

◆ RM_BLE_MESH_ACCESS_AddModelSubscription()

```
fsp_err_t RM_BLE_MESH_ACCESS_AddModelSubscription ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_access_model_handle_t model_handle, rm_ble_mesh_access_address_t const *const
p_sub_addr )
```

To add an address to a model subscription list. This routine adds an address to a subscription list of a model.

Implements `rm_ble_mesh_access_api_t::addModelSubscription`.

Example:

```
/* Add an address to a model subscription list. */
err = RM_BLE_MESH_ACCESS_AddModelSubscription(&g_ble_mesh_access0_ctrl,
model_handle, &sub_addr);
```

Return values

| | |
|-------------------------|-----------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_sub_addr is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |

◆ RM_BLE_MESH_ACCESS_DeleteModelSubscription()

```
fsp_err_t RM_BLE_MESH_ACCESS_DeleteModelSubscription ( rm_ble_mesh_access_ctrl_t *const
p_ctrl, rm_ble_mesh_access_model_handle_t model_handle, rm_ble_mesh_access_address_t const
*const p_sub_addr )
```

To delete an address to a model subscription list. This routine deletes an address to a subscription list of a model.

Implements `rm_ble_mesh_access_api_t::deleteModelSubscription`.

Example:

```
/* Delete an address to a model subscription list. */
err = RM_BLE_MESH_ACCESS_DeleteModelSubscription(&g_ble_mesh_access0_ctrl,
model_handle, &sub_addr);
```

Return values

| | |
|--------------------------|--|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter <code>p_ctrl</code> is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter <code>p_sub_addr</code> is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

◆ RM_BLE_MESH_ACCESS_DeleteAllModelSubscription()

```
fsp_err_t RM_BLE_MESH_ACCESS_DeleteAllModelSubscription ( rm_ble_mesh_access_ctrl_t *const
p_ctrl, rm_ble_mesh_access_model_handle_t model_handle )
```

To discard a model subscription list. This routine discards a subscription list of a model.

Implements `rm_ble_mesh_access_api_t::deleteAllModelSubscription`.

Example:

```
/* Discard a model subscription list. */
err = RM_BLE_MESH_ACCESS_DeleteAllModelSubscription(&g_ble_mesh_access0_ctrl,
model_handle);
```

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter <code>p_ctrl</code> is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |

◆ RM_BLE_MESH_ACCESS_GetModelSubscriptionList()

```
fsp_err_t RM_BLE_MESH_ACCESS_GetModelSubscriptionList ( rm_ble_mesh_access_ctrl_t *const
p_ctrl, rm_ble_mesh_access_model_handle_t model_handle, uint16_t *const p_sub_addr_count,
uint16_t *const p_sub_addr_list )
```

To get list of subscription addresses of a model. This routine returns a list of subscription addresses of a model.

Implements `rm_ble_mesh_access_api_t::getModelSubscriptionList`.

Example:

```
/* Get list of subscription addresses of a model. */
err = RM_BLE_MESH_ACCESS_GetModelSubscriptionList(&g_ble_mesh_access0_ctrl,
                                                model_handle,
                                                &sub_addr_count,
                                                &sub_addr_list);
```

Return values

| | |
|-------------------------|--|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_sub_addr_count and p_sub_addr_list are NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |

◆ RM_BLE_MESH_ACCESS_GetAllModelSubscriptionList()

```
fsp_err_t RM_BLE_MESH_ACCESS_GetAllModelSubscriptionList ( rm_ble_mesh_access_ctrl_t *const
p_ctrl, uint16_t *const p_sub_addr_count, uint16_t *const p_sub_addr_list )
```

To get list of subscription addresses of all the models. This routine returns a consolidated list of subscription addresses of all the models.

Implements `rm_ble_mesh_access_api_t::getAllModelSubscriptionList`.

Example:

```
/* Get list of subscription addresses of all the models. */
err = RM_BLE_MESH_ACCESS_GetAllModelSubscriptionList(&g_ble_mesh_access0_ctrl,
&sub_addr_count, &sub_addr_list);
```

Return values

| | |
|--------------------------|--|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_sub_addr_count and p_sub_addr_list are NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

◆ RM_BLE_MESH_ACCESS_IsValidElementAddress()

```
fsp_err_t RM_BLE_MESH_ACCESS_IsValidElementAddress ( rm_ble_mesh_access_ctrl_t *const
p_ctrl, rm_ble_mesh_network_address_t addr )
```

To check if valid element address to receive a packet. This routine checks if destination address in a received packet matches with any of the known element address of local or friend device.

Implements `rm_ble_mesh_access_api_t::isValidElementAddress`.

Example:

```
/* Check if valid element address to receive a packet. */
err = RM_BLE_MESH_ACCESS_IsValidElementAddress(&g_ble_mesh_access0_ctrl, addr);
```

Return values

| | |
|-------------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |

◆ RM_BLE_MESH_ACCESS_IsFixedGroupAddressToBeProcessed()

```
fsp_err_t RM_BLE_MESH_ACCESS_IsFixedGroupAddressToBeProcessed ( rm_ble_mesh_access_ctrl_t
*const p_ctrl, rm_ble_mesh_network_address_t addr )
```

To check if Fixed Group Address in receive packet to be processed. This routine checks if destination address in a received packet as a Fixed Group Address to be processed.

Implements `rm_ble_mesh_access_api_t::isFixedGroupAddressToBeProcessed`.

Example:

```
/* Check if fixed group address in receive packet to be processed. */
err =
RM_BLE_MESH_ACCESS_IsFixedGroupAddressToBeProcessed(&g_ble_mesh_access0_ctrl, addr);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_BLE_MESH_ACCESS_IsValidSubscriptionAddress()

```
fsp_err_t RM_BLE_MESH_ACCESS_IsValidSubscriptionAddress ( rm_ble_mesh_access_ctrl_t *const
p_ctrl, rm_ble_mesh_network_address_t addr )
```

To check if valid subscription address to receive a packet. This routine checks if destination address in a received packet matches with any of the known subscription address of local or friend device.

Implements `rm_ble_mesh_access_api_t::isValidSubscriptionAddress`.

Example:

```
/* Check if valid subscription address to receive a packet. */
err = RM_BLE_MESH_ACCESS_IsValidSubscriptionAddress(&g_ble_mesh_access0_ctrl,
addr);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |

◆ RM_BLE_MESH_ACCESS_EnableIvUpdateTestMode()

```
fsp_err_t RM_BLE_MESH_ACCESS_EnableIvUpdateTestMode ( rm_ble_mesh_access_ctrl_t *const
p_ctrl, rm_ble_mesh_access_iv_update_test_mode_t mode )
```

To set the IV Update Test Mode feature. This routine is used to set the IV Update Test Mode flag.

Implements `rm_ble_mesh_access_api_t::enableIvUpdateTestMode`.

Example:

```
/* Set the IV update test mode feature. */
err = RM_BLE_MESH_ACCESS_EnableIvUpdateTestMode(&g_ble_mesh_access0_ctrl, mode);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

Bluetooth Low Energy Mesh Network Config Server (rm_mesh_config_srv)

Modules » Networking » Bluetooth Low Energy Mesh Network Modules

Functions

```
fsp_err_t RM_MESH_CONFIG_SRV_Open (rm_ble_mesh_model_server_ctrl_t
*const p_ctrl, rm_ble_mesh_model_server_cfg_t const *const p_cfg)
```

```
fsp_err_t RM_MESH_CONFIG_SRV_Close (rm_ble_mesh_model_server_ctrl_t
*const p_ctrl)
```

```
fsp_err_t RM_MESH_CONFIG_SRV_StateUpdate
(rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_ble_mesh_access_server_state_t const *const p_state)
```

Detailed Description**Overview****Target Devices**

The Bluetooth Low Energy Energy Mesh Network Config Server module supports the following devices.

- RA4W1

Configuration**Build Time Configurations for rm_mesh_config_srv**

The following build time configurations are defined in fsp_cfg/rm_mesh_config_srv_cfg.h:

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Configurations for Networking > Bluetooth Low Energy Mesh Network modules > BLE Mesh Config Server (rm_mesh_config_srv)

This module can be added to the Stacks tab via New Stack > Networking > Bluetooth Low Energy Mesh Network modules > BLE Mesh Config Server (rm_mesh_config_srv).

| Configuration | Options | Default | Description |
|---|-------------------------------|---------------------------|--|
| Interrupts > Callback | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh config client ISR occurs |
| Interrupts > Callback Provided When an Timeout ISR Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh generic admin property server timeout ISR occurs |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_config_srv 0 | Module name. |

Data Structures

```
struct rm_mesh_config_srv_instance_ctrl_t
```

Data Structure Documentation

◆ rm_mesh_config_srv_instance_ctrl_t

```
struct rm_mesh_config_srv_instance_ctrl_t
```

BLE mesh config instance control block. DO NOT INITIALIZE. Initialization occurs when `RM_MESH_CONFIG_SRV_Open()` is called.

Function Documentation

◆ RM_MESH_CONFIG_SRV_Open()

```
fsp_err_t RM_MESH_CONFIG_SRV_Open ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_ble_mesh_model_server_cfg_t const *const p_cfg )
```

API to initialize configuration server model. This is to initialize configuration server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_CONFIG_SRV_Open(&g_mesh_config_srv0_ctrl, &g_mesh_config_srv0_cfg);
```

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

◆ RM_MESH_CONFIG_SRV_Close()

```
fsp_err_t RM_MESH_CONFIG_SRV_Close ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl)
```

API to terminate configuration server model. This is to terminate configuration server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_CONFIG_SRV_Close(&g_mesh_config_srv0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ RM_MESH_CONFIG_SRV_StateUpdate()

```
fsp_err_t RM_MESH_CONFIG_SRV_StateUpdate ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_ble_mesh_access_server_state_t const *const p_state )
```

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements `rm_ble_mesh_model_server_api_t::stateUpdate`.

Example:

```
/* Update server status. */
err = RM_MESH_CONFIG_SRV_StateUpdate(&g_mesh_config_srv0_ctrl, &state);
```

Return values

| | |
|---------------------|-------------------------------|
| FSP_ERR_UNSUPPORTED | This function is unsupported. |
|---------------------|-------------------------------|

Bluetooth Low Energy Mesh Network Config Client (rm_mesh_config_clt)

Modules » Networking » Bluetooth Low Energy Mesh Network Modules

Functions

```
fsp_err_t RM_MESH_CONFIG_CLT_Open (rm_ble_mesh_config_client_ctrl_t
*const p_ctrl, rm_ble_mesh_config_client_cfg_t const *const p_cfg)
```

| | |
|-----------|--|
| fsp_err_t | RM_MESH_CONFIG_CLT_Close (rm_ble_mesh_config_client_ctrl_t *const p_ctrl) |
| fsp_err_t | RM_MESH_CONFIG_CLT_SetServer (rm_ble_mesh_config_client_ctrl_t *const p_ctrl, rm_ble_mesh_network_address_t server_addr, uint8_t *p_dev_key) |
| fsp_err_t | RM_MESH_CONFIG_CLT_SendReliablePdu (rm_ble_mesh_config_client_ctrl_t *const p_ctrl, uint32_t req_opcode, void const *const p_parameter, uint32_t rsp_opcode) |
| fsp_err_t | RM_MESH_CONFIG_CLT_BeaconGet (rm_ble_mesh_config_client_ctrl_t *const p_ctrl) |
| fsp_err_t | RM_MESH_CONFIG_CLT_BeaconSet (rm_ble_mesh_config_client_ctrl_t *const p_ctrl, void const *const p_parameter) |
| fsp_err_t | RM_MESH_CONFIG_CLT_CompositionDataGet (rm_ble_mesh_config_client_ctrl_t *const p_ctrl, void const *const p_parameter) |
| fsp_err_t | RM_MESH_CONFIG_CLT_DefaultTtlGet (rm_ble_mesh_config_client_ctrl_t *const p_ctrl) |
| fsp_err_t | RM_MESH_CONFIG_CLT_DefaultTtlSet (rm_ble_mesh_config_client_ctrl_t *const p_ctrl, void const *const p_parameter) |
| fsp_err_t | RM_MESH_CONFIG_CLT_GattProxyGet (rm_ble_mesh_config_client_ctrl_t *const p_ctrl) |
| fsp_err_t | RM_MESH_CONFIG_CLT_GattProxySet (rm_ble_mesh_config_client_ctrl_t *const p_ctrl, void const *const p_parameter) |
| fsp_err_t | RM_MESH_CONFIG_CLT_RelayGet (rm_ble_mesh_config_client_ctrl_t *const p_ctrl) |
| fsp_err_t | RM_MESH_CONFIG_CLT_RelaySet (rm_ble_mesh_config_client_ctrl_t *const p_ctrl, void const *const p_parameter) |
| fsp_err_t | RM_MESH_CONFIG_CLT_ModelPublicationGet (rm_ble_mesh_config_client_ctrl_t *const p_ctrl, void const *const p_parameter) |
| fsp_err_t | RM_MESH_CONFIG_CLT_ModelPublicationSet (rm_ble_mesh_config_client_ctrl_t *const p_ctrl, void const *const p_parameter) |
| fsp_err_t | RM_MESH_CONFIG_CLT_ModelPublicationVaddrSet (rm_ble_mesh_config_client_ctrl_t *const p_ctrl, void const *const |

| | |

| fsp_err_t | RM_MESH_CONFIG_CLT_HeartbeatSubscriptionGet (rm_ble_mesh_config_client_ctrl_t *const p_ctrl) |
| fsp_err_t | RM_MESH_CONFIG_CLT_HeartbeatSubscriptionSet (rm_ble_mesh_config_client_ctrl_t *const p_ctrl, void const *const p_parameter) |
| fsp_err_t | RM_MESH_CONFIG_CLT_LpnPolltimeoutGet (rm_ble_mesh_config_client_ctrl_t *const p_ctrl, void const *const p_parameter) |
| fsp_err_t | RM_MESH_CONFIG_CLT_NetworkTransmitGet (rm_ble_mesh_config_client_ctrl_t *const p_ctrl) |
| fsp_err_t | RM_MESH_CONFIG_CLT_NetworkTransmitSet (rm_ble_mesh_config_client_ctrl_t *const p_ctrl, void const *const p_parameter) |

Detailed Description

Overview

Target Devices

The Bluetooth Low Energy Energy Mesh Network Config Client module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_config_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_config_clt_cfg.h:

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Configurations for Networking > Bluetooth Low Energy Mesh Network modules > BLE Mesh Config Client (rm_mesh_config_clt)

This module can be added to the Stacks tab via New Stack > Networking > Bluetooth Low Energy Mesh Network modules > BLE Mesh Config Client (rm_mesh_config_clt).

| Configuration | Options | Default | Description |
|--|-------------------------------|-----------------------|--|
| Interrupts > Callback Provided when Timeout Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh config client ISR occurs |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_config_clt0 | Module name. |

Data Structures

```
struct rm\_mesh\_config\_clt\_instance\_ctrl\_t
```

Data Structure Documentation

◆ [rm_mesh_config_clt_instance_ctrl_t](#)

```
struct rm\_mesh\_config\_clt\_instance\_ctrl\_t
```

BLE mesh config instance control block. DO NOT INITIALIZE. Initialization occurs when [RM_MESH_CONFIG_CLT_Open\(\)](#) is called.

Function Documentation

◆ RM_MESH_CONFIG_CLT_Open()

```
fsp_err_t RM_MESH_CONFIG_CLT_Open ( rm_ble_mesh_config_client_ctrl_t *const p_ctrl,
rm_ble_mesh_config_client_cfg_t const *const p_cfg )
```

Open Configuration Client middleware. This is to initialize Configuration Client model and to register with Access layer.

Implements `rm_ble_mesh_config_client_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_CONFIG_CLT_Open(&g_mesh_config_clt0_ctrl, &g_mesh_config_clt0_cfg);
```

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

◆ RM_MESH_CONFIG_CLT_Close()

```
fsp_err_t RM_MESH_CONFIG_CLT_Close ( rm_ble_mesh_config_client_ctrl_t *const p_ctrl)
```

Close Configuration Client middleware.

Implements `rm_ble_mesh_config_client_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_CONFIG_CLT_Close(&g_mesh_config_clt0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ RM_MESH_CONFIG_CLT_SetServer()

```
fsp_err_t RM_MESH_CONFIG_CLT_SetServer ( rm_ble_mesh_config_client_ctrl_t *const p_ctrl,
rm_ble_mesh_network_address_t server_addr, uint8_t * p_dev_key )
```

This is to sets the information about server which is to be configured.

Implements `rm_ble_mesh_config_client_api_t::setServer`.

Example:

```
/* Sets the information about server which is to be configured. */
err = RM_MESH_CONFIG_CLT_SetServer(&g_mesh_config_clt0_ctrl, server_addr,
&dev_key);
```

Return values

| | |
|--------------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |

◆ RM_MESH_CONFIG_CLT_SendReliablePdu()

```
fsp_err_t RM_MESH_CONFIG_CLT_SendReliablePdu ( rm_ble_mesh_config_client_ctrl_t *const p_ctrl,
uint32_t req_opcode, void const *const p_parameter, uint32_t rsp_opcode )
```

This is to initialize sending acknowledged commands.

Implements `rm_ble_mesh_config_client_api_t::sendReliablePdu`.

Example:

```
/* Initialize sending acknowledged commands. */
err = RM_MESH_CONFIG_CLT_SendReliablePdu(&g_mesh_config_clt0_ctrl, req_opcode,
p_parameter, rsp_opcode);
```

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_CONFIG_CLT_BeaconGet()**

```
fsp_err_t RM_MESH_CONFIG_CLT_BeaconGet ( rm_ble_mesh_config_client_ctrl_t *const p_ctrl)
```

The Config Beacon Get is an acknowledged message used to get the current Secure Network Beacon state of a node.

Parameters

| | | |
|------|--------|-----------------------------------|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
|------|--------|-----------------------------------|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_CONFIG_CLT_BeaconSet()

```
fsp_err_t RM_MESH_CONFIG_CLT_BeaconSet ( rm_ble_mesh_config_client_ctrl_t *const p_ctrl, void
const *const p_parameter )
```

The Config Beacon Set is an acknowledged message used to set the current Secure Network Beacon state of a node.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_beacon_set_parameter_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_CONFIG_CLT_CompositionDataGet()**

```
fsp_err_t RM_MESH_CONFIG_CLT_CompositionDataGet ( rm_ble_mesh_config_client_ctrl_t *const
p_ctrl, void const *const p_parameter )
```

The Config Composition Data Get is an acknowledged message used to read one page of the Composition Data.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_composition_data_get_parameter_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_CONFIG_CLT_DefaultTtlGet()**

```
fsp_err_t RM_MESH_CONFIG_CLT_DefaultTtlGet ( rm_ble_mesh_config_client_ctrl_t *const p_ctrl)
```

Config Default TTL Get is an acknowledged message used to get the current Default TTL state of a node.

Parameters

| | | |
|------|--------|-----------------------------------|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
|------|--------|-----------------------------------|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_CONFIG_CLT_DefaultTtlSet()**

```
fsp_err_t RM_MESH_CONFIG_CLT_DefaultTtlSet ( rm_ble_mesh_config_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

The Config Default TTL Set is an acknowledged message used to set the Default TTL state of a node.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_default_ttl_set_parameter_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_CONFIG_CLT_GattProxyGet()**

```
fsp_err_t RM_MESH_CONFIG_CLT_GattProxyGet ( rm_ble_mesh_config_client_ctrl_t *const p_ctrl)
```

The Config GATT Proxy Get is an acknowledged message used to get the GATT Proxy state of a node.

Parameters

| | | |
|------|--------|-----------------------------------|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
|------|--------|-----------------------------------|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_CONFIG_CLT_GattProxySet()**

```
fsp_err_t RM_MESH_CONFIG_CLT_GattProxySet ( rm_ble_mesh_config_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

The Config GATT Proxy Set is an acknowledged message used to set the GATT Proxy state of a node.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_gatt_proxy_set_parameter_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_CONFIG_CLT_RelayGet()**

```
fsp_err_t RM_MESH_CONFIG_CLT_RelayGet ( rm_ble_mesh_config_client_ctrl_t *const p_ctrl)
```

The Config Relay Get is an acknowledged message used to get the current Relay and Relay Retransmit states of a node.

Parameters

| | | |
|------|--------|-----------------------------------|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
|------|--------|-----------------------------------|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_CONFIG_CLT_RelaySet()**

```
fsp_err_t RM_MESH_CONFIG_CLT_RelaySet ( rm_ble_mesh_config_client_ctrl_t *const p_ctrl, void
const *const p_parameter )
```

The Config Relay Set is an acknowledged message used to set the current Relay and Relay Retransmit states of a node.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_relay_set_parameter_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_CONFIG_CLT_ModelPublicationGet()**

```
fsp_err_t RM_MESH_CONFIG_CLT_ModelPublicationGet ( rm_ble_mesh_config_client_ctrl_t *const
p_ctrl, void const *const p_parameter )
```

The Config Model Publication Get is an acknowledged message used to get the publish address and parameters of an outgoing message that originates from a model.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_model_publication_get_parameter_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_CONFIG_CLT_ModelPublicationSet()**

```
fsp_err_t RM_MESH_CONFIG_CLT_ModelPublicationSet ( rm_ble_mesh_config_client_ctrl_t *const
p_ctrl, void const *const p_parameter )
```

The Config Model Publication Set is an acknowledged message used to set the Model Publication state of an outgoing message that originates from a model.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_model_publication_set_parameter_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_CONFIG_CLT_ModelPublicationVaddrSet()

```
fsp_err_t RM_MESH_CONFIG_CLT_ModelPublicationVaddrSet ( rm_ble_mesh_config_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

The Config Model Publication Set is an acknowledged message used to set the Model Publication state of an outgoing message that originates from a model.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_model_publication_virtual_address_set_parameter_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_CONFIG_CLT_ModelSubscriptionAdd()

```
fsp_err_t RM_MESH_CONFIG_CLT_ModelSubscriptionAdd ( rm_ble_mesh_config_client_ctrl_t *const p_ctrl, void const *const p_parameter )
```

The Config Model Subscription Add is an acknowledged message used to add an address to a Subscription List of a model.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_model_subscription_add_parameter_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_CONFIG_CLT_ModelSubscriptionVaddrAdd()**

```
fsp_err_t RM_MESH_CONFIG_CLT_ModelSubscriptionVaddrAdd ( rm_ble_mesh_config_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

The Config Model Subscription Add is an acknowledged message used to add an address to a Subscription List of a model.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_model_subscription_virtual_address_add_parameter_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_CONFIG_CLT_ModelSubscriptionDelete()**

```
fsp_err_t RM_MESH_CONFIG_CLT_ModelSubscriptionDelete ( rm_ble_mesh_config_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

The Config Model Subscription Delete is an acknowledged message used to delete a subscription address from the Subscription List of a model.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_model_subscription_delete_parameter_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_CONFIG_CLT_ModelSubscriptionVaddrDelete()

```
fsp_err_t RM_MESH_CONFIG_CLT_ModelSubscriptionVaddrDelete ( rm_ble_mesh_config_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

The Config Model Subscription Delete is an acknowledged message used to delete a subscription address from the Subscription List of a model.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_model_subscription_virtual_address_delete_parameter_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_CONFIG_CLT_ModelSubscriptionOverwrite()**

```
fsp_err_t RM_MESH_CONFIG_CLT_ModelSubscriptionOverwrite ( rm_ble_mesh_config_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

The Config Model Subscription Overwrite is an acknowledged message used to discard the Subscription List and add an address to the cleared Subscription List of a model.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_model_subscription_overwrite_parameter_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_CONFIG_CLT_ModelSubscriptionVaddrOverwrite()**

```
fsp_err_t RM_MESH_CONFIG_CLT_ModelSubscriptionVaddrOverwrite (
rm_ble_mesh_config_client_ctrl_t *const p_ctrl, void const *const p_parameter )
```

The Config Model Subscription Overwrite is an acknowledged message used to discard the Subscription List and add an address to the cleared Subscription List of a model.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_model_subscription_virtual_address_overwrite_parameter_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_CONFIG_CLT_ModelSubscriptionDeleteAll()**

```
fsp_err_t RM_MESH_CONFIG_CLT_ModelSubscriptionDeleteAll ( rm_ble_mesh_config_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

The Config Model Subscription Delete All is an acknowledged message used to discard the Subscription List of a model.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_model_subscription_delete_all_parameter_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_CONFIG_CLT_SigModelSubscriptionGet()

```
fsp_err_t RM_MESH_CONFIG_CLT_SigModelSubscriptionGet ( rm_ble_mesh_config_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

The Config SIG Model Subscription Get is an acknowledged message used to get the list of subscription addresses of a model within the element. This message is only for SIG Models.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_sig_model_subscription_get_parameter_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_CONFIG_CLT_VendorModelSubscriptionGet()**

```
fsp_err_t RM_MESH_CONFIG_CLT_VendorModelSubscriptionGet ( rm_ble_mesh_config_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

The Config SIG Model Subscription Get is an acknowledged message used to get the list of subscription addresses of a model within the element. This message is only for Vendor Models.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_vendor_model_subscription_get_parameter_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_CONFIG_CLT_NetkeyAdd()**

```
fsp_err_t RM_MESH_CONFIG_CLT_NetkeyAdd ( rm_ble_mesh_config_client_ctrl_t *const p_ctrl, void
const *const p_parameter )
```

The Config NetKey Add is an acknowledged message used to add a NetKey to a NetKey List on a node. The added NetKey is then used by the node to authenticate and decrypt messages it receives, as well as authenticate and encrypt messages it sends.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_netkey_add_parameter_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_CONFIG_CLT_NetkeyUpdate()

```
fsp_err_t RM_MESH_CONFIG_CLT_NetkeyUpdate ( rm_ble_mesh_config_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

The Config NetKey Update is an acknowledged message used to update a NetKey on a node. The updated NetKey is then used by the node to authenticate and decrypt messages it receives, as well as authenticate and encrypt messages it sends, as defined by the Key Refresh procedure.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_netkey_update_parameter_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_CONFIG_CLT_NetkeyDelete()**

```
fsp_err_t RM_MESH_CONFIG_CLT_NetkeyDelete ( rm_ble_mesh_config_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

The Config NetKey Delete is an acknowledged message used to delete a NetKey on a NetKey List from a node.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_netkey_delete_parameter_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_CONFIG_CLT_NetkeyGet()**

```
fsp_err_t RM_MESH_CONFIG_CLT_NetkeyGet ( rm_ble_mesh_config_client_ctrl_t *const p_ctrl)
```

The Config NetKey Get is an acknowledged message used to report all NetKeys known to the node.

Parameters

| | | |
|------|--------|-----------------------------------|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
|------|--------|-----------------------------------|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_CONFIG_CLT_AppkeyAdd()**

```
fsp_err_t RM_MESH_CONFIG_CLT_AppkeyAdd ( rm_ble_mesh_config_client_ctrl_t *const p_ctrl, void
const *const p_parameter )
```

The Config AppKey Add is an acknowledged message used to add an AppKey to the AppKey List on a node and bind it to the NetKey identified by NetKeyIndex. The added AppKey can be used by the node only as a pair with the specified NetKey. The AppKey is used to authenticate and decrypt messages it receives, as well as authenticate and encrypt messages it sends.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_appkey_add_parameter_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_CONFIG_CLT_AppkeyUpdate()**

```
fsp_err_t RM_MESH_CONFIG_CLT_AppkeyUpdate ( rm_ble_mesh_config_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

The Config AppKey Update is an acknowledged message used to update an AppKey value on the AppKey List on a node. The updated AppKey is used by the node to authenticate and decrypt messages it receives, as well as authenticate and encrypt messages it sends, as defined by the Key Refresh procedure.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_appkey_update_parameter_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_CONFIG_CLT_AppkeyDelete()**

```
fsp_err_t RM_MESH_CONFIG_CLT_AppkeyDelete ( rm_ble_mesh_config_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

The Config AppKey Delete is an acknowledged message used to delete an AppKey from the AppKey List on a node

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_appkey_delete_parameter_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_CONFIG_CLT_AppkeyGet()**

```
fsp_err_t RM_MESH_CONFIG_CLT_AppkeyGet ( rm_ble_mesh_config_client_ctrl_t *const p_ctrl, void
const *const p_parameter )
```

The AppKey Get is an acknowledged message used to report all AppKeys bound to the NetKey.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_appkey_get_parameter_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_CONFIG_CLT_NodeIdentityGet()**

```
fsp_err_t RM_MESH_CONFIG_CLT_NodeIdentityGet ( rm_ble_mesh_config_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

The Config Node Identity Get is an acknowledged message used to get the current Node Identity state for a subnet.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_node_id_get_parameter_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_CONFIG_CLT_NodeIdentitySet()**

```
fsp_err_t RM_MESH_CONFIG_CLT_NodeIdentitySet ( rm_ble_mesh_config_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

The Config Node Identity Set is an acknowledged message used to set the current Node Identity state for a subnet.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_node_id_set_parameter_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_CONFIG_CLT_ModelAppBind()**

```
fsp_err_t RM_MESH_CONFIG_CLT_ModelAppBind ( rm_ble_mesh_config_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

The Config Model App Bind is an acknowledged message used to bind an AppKey to a model.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_model_app_bind_parameter_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_CONFIG_CLT_ModelAppUnbind()**

```
fsp_err_t RM_MESH_CONFIG_CLT_ModelAppUnbind ( rm_ble_mesh_config_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

The Config Model App Unbind is an acknowledged message used to remove the binding between an AppKey and a model.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_model_app_unbind_parameter_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_CONFIG_CLT_SigModelAppGet()**

```
fsp_err_t RM_MESH_CONFIG_CLT_SigModelAppGet ( rm_ble_mesh_config_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

The Config SIG Model App Get is an acknowledged message used to request report of all AppKeys bound to the SIG Model.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_sig_model_app_get_parameter_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_CONFIG_CLT_VendorModelAppGet()**

```
fsp_err_t RM_MESH_CONFIG_CLT_VendorModelAppGet ( rm_ble_mesh_config_client_ctrl_t *const
p_ctrl, void const *const p_parameter )
```

The Config Vendor Model App Get is an acknowledged message used to request report of all AppKeys bound to the Vendor Model.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_vendor_model_app_get_parameter_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_CONFIG_CLT_NodeReset()**

```
fsp_err_t RM_MESH_CONFIG_CLT_NodeReset ( rm_ble_mesh_config_client_ctrl_t *const p_ctrl)
```

The Config Node Reset is an acknowledged message used to reset a node (other than a Provisioner) and remove it from the network.

Parameters

| | | |
|------|--------|-----------------------------------|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
|------|--------|-----------------------------------|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_CONFIG_CLT_FriendGet()**

```
fsp_err_t RM_MESH_CONFIG_CLT_FriendGet ( rm_ble_mesh_config_client_ctrl_t *const p_ctrl)
```

The Config Friend Get is an acknowledged message used to get the current Friend state of a node.

Parameters

| | | |
|------|--------|-----------------------------------|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
|------|--------|-----------------------------------|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_CONFIG_CLT_FriendSet()**

```
fsp_err_t RM_MESH_CONFIG_CLT_FriendSet ( rm_ble_mesh_config_client_ctrl_t *const p_ctrl, void
const *const p_parameter )
```

The Config Friend Set is an acknowledged message used to set the Friend state of a node.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_friend_set_parameter_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_CONFIG_CLT_KeyrefreshPhaseGet()

```
fsp_err_t RM_MESH_CONFIG_CLT_KeyrefreshPhaseGet ( rm_ble_mesh_config_client_ctrl_t *const p_ctrl, void const *const p_parameter )
```

The Config Key Refresh Phase Get is an acknowledged message used to get the current Key Refresh Phase state of the identified network key.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_key_refresh_phase_get_parameter_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_CONFIG_CLT_KeyrefreshPhaseSet()**

```
fsp_err_t RM_MESH_CONFIG_CLT_KeyrefreshPhaseSet ( rm_ble_mesh_config_client_ctrl_t *const
p_ctrl, void const *const p_parameter )
```

The Config Key Refresh Phase Set is an acknowledged message used to set the current Key Refresh Phase state of the identified network key.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_key_refresh_phase_set_parameter_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_CONFIG_CLT_HeartbeatPublicationGet()**

```
fsp_err_t RM_MESH_CONFIG_CLT_HeartbeatPublicationGet ( rm_ble_mesh_config_client_ctrl_t
*const p_ctrl)
```

The Config Heartbeat Publication Get is an acknowledged message used to get the current Heartbeat Publication state of an element.

Parameters

| | | |
|------|--------|-----------------------------------|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
|------|--------|-----------------------------------|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_CONFIG_CLT_HeartbeatPublicationSet()

```
fsp_err_t RM_MESH_CONFIG_CLT_HeartbeatPublicationSet ( rm_ble_mesh_config_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

The Config Heartbeat Publication Set is an acknowledged message used to set the current Heartbeat Publication state of an element.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_heartbeat_publication_set_parameter_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_CONFIG_CLT_HeartbeatSubscriptionGet()**

```
fsp_err_t RM_MESH_CONFIG_CLT_HeartbeatSubscriptionGet ( rm_ble_mesh_config_client_ctrl_t
*const p_ctrl)
```

The Config Heartbeat Subscription Get is an acknowledged message used to get the current Heartbeat Subscription state of an element.

Parameters

| | | |
|------|--------|-----------------------------------|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
|------|--------|-----------------------------------|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_CONFIG_CLT_HeartbeatSubscriptionSet()

```
fsp_err_t RM_MESH_CONFIG_CLT_HeartbeatSubscriptionSet ( rm_ble_mesh_config_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

The Config Heartbeat Publication Set is an acknowledged message used to set the current Heartbeat Subscription state of an element.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_heartbeat_subscription_set_parameter_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_CONFIG_CLT_LpnPolltimeoutGet()

```
fsp_err_t RM_MESH_CONFIG_CLT_LpnPolltimeoutGet ( rm_ble_mesh_config_client_ctrl_t *const
p_ctrl, void const *const p_parameter )
```

The Config Low Power Node PollTimeout Get is an acknowledged message used to get the current value of PollTimeout timer of the Low Power node within a Friend node. The message is sent to a Friend node that has claimed to be handling messages by sending ACKs On Behalf Of (OBO) the indicated Low Power node. This message should only be sent to a node that has the Friend feature supported and enabled.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_low_power_node_polling_timeout_get_parameter_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_CONFIG_CLT_NetworkTransmitGet()**

```
fsp_err_t RM_MESH_CONFIG_CLT_NetworkTransmitGet ( rm_ble_mesh_config_client_ctrl_t *const p_ctrl)
```

The Config Network Transmit Get is an acknowledged message used to get the current Network Transmit state of a node.

Parameters

| | | |
|------|--------|-----------------------------------|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
|------|--------|-----------------------------------|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_CONFIG_CLT_NetworkTransmitSet()

```
fsp_err_t RM_MESH_CONFIG_CLT_NetworkTransmitSet ( rm_ble_mesh_config_client_ctrl_t *const
p_ctrl, void const *const p_parameter )
```

The Config Network Transmit Set is an acknowledged message used to set the current Network Transmit state of a node.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_network_transmit_set_parameter_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

Bluetooth Low Energy Mesh Network Health Server (rm_mesh_health_srv)

Modules » Networking » Bluetooth Low Energy Mesh Network Modules

Functions

```
fsp_err_t RM_MESH_HEALTH_SERVER_Open (rm_ble_mesh_health_server_ctrl_t
*const p_ctrl, rm_ble_mesh_health_server_cfg_t const *const p_cfg)
```

```
fsp_err_t RM_MESH_HEALTH_SERVER_Close (rm_ble_mesh_health_server_ctrl_t
*const p_ctrl)
```

```
fsp_err_t RM_MESH_HEALTH_SERVER_ReportFault
(rm_ble_mesh_health_server_ctrl_t *const p_ctrl, const
rm_ble_mesh_access_model_handle_t *const model_handle, uint8_t
test_id, uint16_t company_id, uint8_t fault_code)
```

```
fsp_err_t RM_MESH_HEALTH_SERVER_PublishCurrentStatus
(rm_ble_mesh_health_server_ctrl_t *const p_ctrl, uint8_t *status,
uint16_t length)
```

Detailed Description

Overview

Target Devices

The Bluetooth Low Energy Energy Mesh Network Health Server module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_health_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_health_srv_cfg.h:

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Configurations for Networking > Bluetooth Low Energy Mesh Network modules > BLE Mesh Model Health Server (rm_mesh_health_srv)

This module can be added to the Stacks tab via New Stack > Networking > Bluetooth Low Energy Mesh Network modules > BLE Mesh Model Health Server (rm_mesh_health_srv).

| Configuration | Options | Default | Description |
|--|-------------------------------|---------------------------|--|
| Interrupts > Callback Provided when Timeout Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh health server ISR occurs |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_health_srv 0 | Module name. |
| Company ID | Invalid Company Id | 0 | Select company id. |
| Number of Self Tests | Invalid Number of Self Tests | 0 | Select number of self tests. |
| Self Tests | Name Must Be a Valid C Symbol | NULL | Self test |

Data Structures

```
struct rm_mesh_health_server_instance_ctrl_t
```

Data Structure Documentation

◆ rm_mesh_health_server_instance_ctrl_t

```
struct rm_mesh_health_server_instance_ctrl_t
```

BLE mesh health server instance control block. DO NOT INITIALIZE. Initialization occurs when `RM_MESH_HEALTH_SERVER_Open()` is called.

Function Documentation

◆ RM_MESH_HEALTH_SERVER_Open()

```
fsp_err_t RM_MESH_HEALTH_SERVER_Open ( rm_ble_mesh_health_server_ctrl_t *const p_ctrl,
rm_ble_mesh_health_server_cfg_t const *const p_cfg )
```

API to initialize Health Server model. This is to initialize Health Server model and to register with Access layer.

Implements `rm_ble_mesh_health_server_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_HEALTH_SERVER_Open(&g_mesh_health_srv0_ctrl,
&g_mesh_health_srv0_cfg);
```

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

◆ RM_MESH_HEALTH_SERVER_Close()

```
fsp_err_t RM_MESH_HEALTH_SERVER_Close ( rm_ble_mesh_health_server_ctrl_t *const p_ctrl)
```

API to terminate Health Server model. This is to terminate Health Server model and to register with Access layer.

Implements `rm_ble_mesh_health_server_api_t::close`.

Example:

```
/* Close the module. */  
err = RM_MESH_HEALTH_SERVER_Close(&g_mesh_health_srv0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ RM_MESH_HEALTH_SERVER_ReportFault()

```
fsp_err_t RM_MESH_HEALTH_SERVER_ReportFault ( rm_ble_mesh_health_server_ctrl_t *const p_ctrl,
const rm_ble_mesh_access_model_handle_t *const model_handle, uint8_t test_id, uint16_t
company_id, uint8_t fault_code )
```

API to report self-test fault. This is to report fault observed during self-test procedure.

Parameters

| | | |
|------|--------------|--|
| [in] | p_ctrl | rm_mesh_health_srv control block. |
| [in] | model_handle | Model Handle identifying the Health Server model instance. |
| [in] | test_id | Identifier of the self-test. |
| [in] | company_id | Company Identifier. |
| [in] | fault_code | Fault value indicating the error. |

Return values

| | |
|--------------------------|--------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_state is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

◆ RM_MESH_HEALTH_SERVER_PublishCurrentStatus()

```
fsp_err_t RM_MESH_HEALTH_SERVER_PublishCurrentStatus ( rm_ble_mesh_health_server_ctrl_t
*const p_ctrl, uint8_t* status, uint16_t length )
```

API to publish current status.

Parameters

| | | |
|------|--------|-----------------------------------|
| [in] | p_ctrl | rm_mesh_health_srv control block. |
| [in] | status | Current status. |
| [in] | length | Length of status. |

Return values

| | |
|--------------------------|--------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_state is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

Bluetooth Low Energy Mesh Network Health Client (rm_mesh_health_clt)

Modules » Networking » Bluetooth Low Energy Mesh Network Modules

Functions

```
fsp_err_t RM_MESH_HEALTH_CLIENT_Open (rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, rm_ble_mesh_model_client_cfg_t const *const p_cfg)
```

```
fsp_err_t RM_MESH_HEALTH_CLIENT_Close (rm_ble_mesh_model_client_ctrl_t
*const p_ctrl)
```

```
fsp_err_t RM_MESH_HEALTH_CLIENT_GetModelHandle
```

```
(rm_ble_mesh_model_client_ctrl_t *const p_ctrl,  
rm_ble_mesh_access_model_handle_t *const p_model_handle)
```

```
fsp_err_t RM_MESH_HEALTH_CLIENT_SetModelHandle  
(rm_ble_mesh_model_client_ctrl_t *const p_ctrl,  
rm_ble_mesh_access_model_handle_t model_handle)
```

```
fsp_err_t RM_MESH_HEALTH_CLIENT_SendReliablePdu  
(rm_ble_mesh_model_client_ctrl_t *const p_ctrl, uint32_t req_opcode,  
void const *const p_parameter, uint32_t rsp_opcode)
```

```
fsp_err_t RM_MESH_HEALTH_CLIENT_FaultGet  
(rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const  
p_parameter)
```

```
fsp_err_t RM_MESH_HEALTH_CLIENT_FaultClearUnacknowledged  
(rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const  
p_parameter)
```

```
fsp_err_t RM_MESH_HEALTH_CLIENT_FaultClear  
(rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const  
p_parameter)
```

```
fsp_err_t RM_MESH_HEALTH_CLIENT_FaultTest  
(rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const  
p_parameter)
```

```
fsp_err_t RM_MESH_HEALTH_CLIENT_FaultTestUnacknowledged  
(rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const  
p_parameter)
```

```
fsp_err_t RM_MESH_HEALTH_CLIENT_PeriodGet  
(rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

```
fsp_err_t RM_MESH_HEALTH_CLIENT_PeriodSetUnacknowledged  
(rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const  
p_parameter)
```

```
fsp_err_t RM_MESH_HEALTH_CLIENT_PeriodSet  
(rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const  
p_parameter)
```

```
fsp_err_t RM_MESH_HEALTH_CLIENT_AttentionGet  
(rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

```
fsp_err_t RM_MESH_HEALTH_CLIENT_AttentionSet  
(rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const  
p_parameter)
```

```
fsp_err_t RM_MESH_HEALTH_CLIENT_AttentionSetUnacknowledged  
(rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const
```

p_parameter)

Detailed Description

Overview

Target Devices

The Bluetooth Low Energy Energy Mesh Network Health Client module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_health_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_health_clt_cfg.h:

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Configurations for Networking > Bluetooth Low Energy Mesh Network modules > BLE Mesh Model Health Client (rm_mesh_health_clt)

This module can be added to the Stacks tab via New Stack > Networking > Bluetooth Low Energy Mesh Network modules > BLE Mesh Model Health Client (rm_mesh_health_clt).

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

| | | | |
|--|-------------------------------|-----------------------|--|
| Interrupts > Callback Provided when Timeout occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh health client ISR occurs |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_health_clt0 | Module name. |

Data Structures

```
struct rm_mesh_health_clt_instance_ctrl_t
```

Data Structure Documentation

◆ rm_mesh_health_clt_instance_ctrl_t

```
struct rm_mesh_health_clt_instance_ctrl_t
```

BLE mesh health client instance control block. DO NOT INITIALIZE. Initialization occurs when [RM_MESH_HEALTH_CLIENT_Open\(\)](#) is called.

Function Documentation

◆ **RM_MESH_HEALTH_CLIENT_Open()**

```
fsp_err_t RM_MESH_HEALTH_CLIENT_Open ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
rm_ble_mesh_model_client_cfg_t const *const p_cfg )
```

Open Health Client middleware. This is to initialize Health Client model and to register with Access layer.

Implements `rm_ble_mesh_model_client_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_HEALTH_CLIENT_Open(&g_mesh_health_clt0_ctrl,
&g_mesh_health_clt0_cfg);
```

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

◆ **RM_MESH_HEALTH_CLIENT_Close()**

```
fsp_err_t RM_MESH_HEALTH_CLIENT_Close ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Close Health Client middleware.

Implements `rm_ble_mesh_model_client_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_HEALTH_CLIENT_Close(&g_mesh_health_clt0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ **RM_MESH_HEALTH_CLIENT_GetModelHandle()**

```
fsp_err_t RM_MESH_HEALTH_CLIENT_GetModelHandle ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, rm_ble_mesh_access_model_handle_t *const p_model_handle )
```

This is to get the handle of Health client model.

Implements `rm_ble_mesh_model_client_api_t::getModelHandle`.

Example:

```
/* Get the handle of health client model. */
err = RM_MESH_HEALTH_CLIENT_GetModelHandle(&g_mesh_health_clt0_ctrl,
&model_handle);
```

Return values

| | |
|-------------------------|---------------------------------------|
| FSP_SUCCESS | Got model handle successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_POINTER | The parameter p_model_handle is NULL. |

◆ **RM_MESH_HEALTH_CLIENT_SetModelHandle()**

```
fsp_err_t RM_MESH_HEALTH_CLIENT_SetModelHandle ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, rm_ble_mesh_access_model_handle_t model_handle )
```

DEPRECATED This is to set the handle of Health client model.

Implements `rm_ble_mesh_model_client_api_t::setModelHandle`.

Return values

| | |
|---------------------|---------------------------------|
| FSP_ERR_UNSUPPORTED | This function is not supported. |
|---------------------|---------------------------------|

◆ RM_MESH_HEALTH_CLIENT_SendReliablePdu()

```
fsp_err_t RM_MESH_HEALTH_CLIENT_SendReliablePdu ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, uint32_t req_opcode, void const *const p_parameter, uint32_t rsp_opcode )
```

This is to set the handle of Health client model.

Implements `rm_ble_mesh_model_client_api_t::sendReliablePdu`.

Example:

```
/* Initialize sending acknowledged commands. */
err = RM_MESH_HEALTH_CLIENT_SendReliablePdu(&g_mesh_health_clt0_ctrl, req_opcode,
p_parameter, rsp_opcode);
```

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_HEALTH_CLIENT_FaultGet()

```
fsp_err_t RM_MESH_HEALTH_CLIENT_FaultGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void
const *const p_parameter )
```

The Health Fault Get is an acknowledged message used to get the current Registered Fault state identified by Company ID of an element.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_health_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_health_clt_fault_get_clear_info_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_HEALTH_CLIENT_FaultClearUnacknowledged()

```
fsp_err_t RM_MESH_HEALTH_CLIENT_FaultClearUnacknowledged ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

The Health Fault Clear Unacknowledged is an unacknowledged message used to clear the current Registered Fault state identified by Company ID of an element.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_health_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_health_clt_fault_get_clear_info_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_HEALTH_CLIENT_FaultClear()**

```
fsp_err_t RM_MESH_HEALTH_CLIENT_FaultClear ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

The Health Fault Clear is an acknowledged message used to clear the current Registered Fault state identified by Company ID of an element.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_health_ct control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_health_ct_fault_get_clear_info_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_HEALTH_CLIENT_FaultTest()

```
fsp_err_t RM_MESH_HEALTH_CLIENT_FaultTest ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

The Health Fault Test is an acknowledged message used to invoke a self-test procedure of an element. The procedure is implementation specific and may result in changing the Health Fault state of an element.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_health_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_health_clt_fault_test_info_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_HEALTH_CLIENT_FaultTestUnacknowledged()

```
fsp_err_t RM_MESH_HEALTH_CLIENT_FaultTestUnacknowledged ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

The Health Fault Test Unacknowledged is an unacknowledged message used to invoke a self-test procedure of an element. The procedure is implementation specific and may result in changing the Health Fault state of an element.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_health_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_health_clt_fault_test_info_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_HEALTH_CLIENT_PeriodGet()**

```
fsp_err_t RM_MESH_HEALTH_CLIENT_PeriodGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

The Health Period Get is an acknowledged message used to get the current Health Period state of an element.

Parameters

| | | |
|------|--------|-----------------------------------|
| [in] | p_ctrl | rm_mesh_health_clt control block. |
|------|--------|-----------------------------------|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_HEALTH_CLIENT_PeriodSetUnacknowledged()

```
fsp_err_t RM_MESH_HEALTH_CLIENT_PeriodSetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

The Health Period Set Unacknowledged is an unacknowledged message used to set the current Health Period state of an element.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_health_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_health_clt_period_info_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_HEALTH_CLIENT_PeriodSet()**

```
fsp_err_t RM_MESH_HEALTH_CLIENT_PeriodSet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

The Health Period Set is an acknowledged message used to set the current Health Period state of an element.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_health_ct control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_health_ct_period_info_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_HEALTH_CLIENT_AttentionGet()**

```
fsp_err_t RM_MESH_HEALTH_CLIENT_AttentionGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

The Health Attention Get is an acknowledged message used to get the current Attention Timer state of an element.

Parameters

| | | |
|------|--------|-----------------------------------|
| [in] | p_ctrl | rm_mesh_health_clt control block. |
|------|--------|-----------------------------------|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_HEALTH_CLIENT_AttentionSet()**

```
fsp_err_t RM_MESH_HEALTH_CLIENT_AttentionSet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

The Health Attention Set is an acknowledged message used to set the Attention Timer state of an element.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_health_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_health_clt_attention_info_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_HEALTH_CLIENT_AttentionSetUnacknowledged()

```
fsp_err_t RM_MESH_HEALTH_CLIENT_AttentionSetUnacknowledged (
  rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter )
```

The Health Attention Set Unacknowledged is an unacknowledged message used to set the Attention Timer state of an element.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_health_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_health_clt_attention_info_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

Detailed Description

Overview

Target Devices

The Bluetooth Low Energy Energy Mesh Network Bearer Platform module supports the following

devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_bearer_platform

The following build time configurations are defined in fsp_cfg/rm_mesh_bearer_platform_cfg.h:

| Configuration | Options | Default | Description |
|------------------------------------|---|-------------------|--|
| Debug Public Address | Must be a valid device address | FF:FF:FF:50:90:74 | Public Address of firmware initial value. |
| Debug Random Address | Must be a valid device address | FF:FF:FF:FF:FF:FF | Random Address of firmware initial value. |
| Maximum number of connections | Value must be an integer between 1 and 7, and lower than the value defined in ble module. | 7 | Maximum number of connections. |
| Maximum connection data length | Value must be an integer between 27 and 251, and lower than the value defined in ble module. | 251 | Maximum connection data length. |
| Maximum advertising data length | Value must be an integer between 31 and 1650, and lower than the value defined in ble module. | 1650 | Maximum advertising data length. |
| Maximum advertising set number | Value must be an integer between 1 and 4, and lower than the value defined in ble module. | 4 | Maximum advertising set number. |
| Maximum periodic sync set number. | Value must be an integer between 1 and 2, and lower than the value defined in ble module. | 2 | Maximum periodic sync set number. |
| Store Security Data | <ul style="list-style-type: none"> • Disable • Enable | Disable | Store Security Data in DataFlash. |
| Data Flash Block for Security Data | Value must be an integer between 0 and 7, and lower than the value defined in ble module. | 0 | Data Flash Block for Security Data Management. |
| Remote Device | Value must be an | 7 | Number of remote |

| | | | |
|--------------------------------|---|-------------|--|
| Bonding Number | integer between 1 and 7, and lower than the value defined in ble module. | | device bonding information. |
| Connection Event Start Notify | <ul style="list-style-type: none"> • Disable • Enable | Disable | Set Connection event start notify enable/disable. |
| Connection Event Close Notify | <ul style="list-style-type: none"> • Disable • Enable | Disable | Set Connection event close notify enable/disable. |
| Advertising Event Start Notify | <ul style="list-style-type: none"> • Disable • Enable | Disable | Set Advertising event start notify enable/disable. |
| Advertising Event Close Notify | <ul style="list-style-type: none"> • Disable • Enable | Disable | Set Advertising event close notify enable/disable. |
| Scanning Event Start Notify | <ul style="list-style-type: none"> • Disable • Enable | Disable | Set Scanning event start notify enable/disable. |
| Scanning Event Close Notify | <ul style="list-style-type: none"> • Disable • Enable | Disable | Set Scanning event close notify enable/disable. |
| Initiating Event Start Notify | <ul style="list-style-type: none"> • Disable • Enable | Disable | Set Initiating event start notify enable/disable. |
| Initiating Event Close Notify | <ul style="list-style-type: none"> • Disable • Enable | Disable | Set Initiating event close notify enable/disable. |
| RF Deep Sleep Start Notify | <ul style="list-style-type: none"> • Disable • Enable | Disable | Set RF_DEEP_SLEEP start notify enable/disable. |
| RF Deep Sleep Wakeup Notify | <ul style="list-style-type: none"> • Disable • Enable | Disable | Set RF_DEEP_SLEEP wakeup notify enable/disable. |
| Bluetooth dedicated clock | Value must be an integer between 0 and 15, and lower than the value defined in ble module. | 6 | Load capacitance adjustment. |
| DC-DC converter | <ul style="list-style-type: none"> • Disable • Enable | Disable | Set DC-DC converter for RF part. |
| Slow Clock Source | <ul style="list-style-type: none"> • Use RF_LOCO • Use External 32.768kHz | Use RF_LOCO | Set slow clock source for RF part. |
| MCU CLKOUT Port | <ul style="list-style-type: none"> • P109 • P205 | P109 | When MESH_BEARER_P LATFORM_CFG_RF_EXT |

| | | | |
|----------------------------------|---|---|---|
| | | | ERNAL_32K_ENABLE = 1, Set port of MCU CLKOUT. |
| MCU CLKOUT Frequency Output | <ul style="list-style-type: none"> MCU CLKOUT frequency 32.768kHz MCU CLKOUT frequency 16.384kHz | MCU CLKOUT frequency 32.768kHz | When MESH_BEARER_PLATFORM_CFG_RF_EXTERNAL_32K_ENABLE = 1, set frequency output from CLKOUT of MCU part. |
| Sleep Clock Accuracy(SCA) | Value must be an integer between 0 and 500, and lower than the value defined in ble module. | 250 | When MESH_BEARER_PLATFORM_CFG_RF_EXTERNAL_32K_ENABLE = 1, set Sleep Clock Accuracy(SCA) for RF slow clock. |
| Transmission Power Maximum Value | <ul style="list-style-type: none"> max +0dBm max +4dBm | max +4dBm | Set transmission power maximum value. |
| Transmission Power Default Value | <ul style="list-style-type: none"> High 0dBm(Transmission Power Maximum Value = +0dBm) / +4dBm(Transmission Power Maximum Value = +4dBm) Mid 0dBm(Transmission Power Maximum Value = +0dBm) / 0dBm(Transmission Power Maximum Value = +4dBm) Low -18dBm(Transmission Power Maximum Value = +0dBm) / -20dBm(Transmission Power Maximum Value = +4dBm) | High 0dBm(Transmission Power Maximum Value = +0dBm) / +4dBm(Transmission Power Maximum Value = +4dBm) | Set default transmit power. Default transmit power is dependent on the configuration of Maximum transmission power(MESH_BEARER_PLATFORM_CFG_RF_MAX_TX_POW). |
| CLKOUT_RF Output | <ul style="list-style-type: none"> No output 4MHz output 2MHz output 1MHz output | No output | Set CLKOUT_RF output setting. |
| RF_DEEP_SLEEP Transition | <ul style="list-style-type: none"> Disable Enable | Enable | Set RF_DEEP_SLEEP transition. |
| MCU Main Clock Frequency | Value must be an integer between 1000 | 8000 | Set MCU Main Clock Frequency (kHz). Set |

| | | | |
|-----------------------------------|--|-----|--|
| | and 20000, and lower than the value defined in ble module. | | clock source according to your board environment. HOCO: don't care. / Main Clock: 1000 to 20000 kHz / PLL Circuit: 4000 to 12500 kHz |
| Code Flash(ROM) Device Data Block | Value must be an integer between -1 and 255, and lower than the value defined in ble module. | 255 | Device specific data block on Code Flash (ROM). |
| Device Specific Data Flash Block | Value must be an integer between -1 and 7, and lower than the value defined in ble module. | -1 | Device specific data block on E2 Data Flash. |
| MTU Size Configured | Value must be an integer between 23 and 247, and lower than the value defined in ble module. | 247 | MTU Size configured by GATT MTU exchange procedure. |
| Timer Slot Maximum Number | Value must be an integer between 1 and 10, and lower than the value defined in ble module. | 10 | The maximum number of timer slot. |

Configurations for Networking > Bluetooth Low Energy Mesh Network modules > BLE Mesh Bearer Platform (rm_mesh_bearer_platform)

This module can be added to the Stacks tab via New Stack > Networking > Bluetooth Low Energy Mesh Network modules > BLE Mesh Bearer Platform (rm_mesh_bearer_platform).

| Configuration | Options | Default | Description |
|-----------------------------|-------------------------------|----------------------------|---|
| General > Name | Name Must Be a Valid C Symbol | g_rm_mesh_bearer_platform0 | Module name. |
| Channel Number | Invalid Channel Number | 0 | Select channel corresponding to the channel number of the hardware. |
| Device Address Type | Invalid Device Address Type | 0 | Select device address type (public : 0, random : 1). |
| GATT Server Callback Number | Invalid Callback Number | 1 | Number of GATT server callback. |
| GATT Client Callback Number | Invalid Callback Number | 1 | Number of GATT client callback. |

| | | | |
|--------------------------|--------------------------------|------|---|
| Vender Specific Callback | Name Must Be a Valid C Symbol. | NULL | Vendor specific callback function name. |
|--------------------------|--------------------------------|------|---|

Data Structures

```
struct rm_mesh_bearer_platform_instance_ctrl_t
```

```
struct rm_mesh_bearer_platform_extended_cfg_t
```

Typedefs

```
typedef void(* rm_mesh_bearer_platform_gatt_iface_cb_t) (uint8_t event_name,
uint8_t event_param, uint16_t conn_hdl, st_ble_dev_addr_t
*peer_addr)
```

Callback function for GATT interface event. [More...](#)

Enumerations

```
enum rm_mesh_bearer_platform_interface_event_t
```

Data Structure Documentation

◆ rm_mesh_bearer_platform_instance_ctrl_t

```
struct rm_mesh_bearer_platform_instance_ctrl_t
```

RM_BLE_MESH_BEARER private control block. DO NOT MODIFY. Initialization occurs when [RM_BLE_MESH_BEARER_Open\(\)](#) is called.

◆ rm_mesh_bearer_platform_extended_cfg_t

```
struct rm_mesh_bearer_platform_extended_cfg_t
```

Bearer port extension for renesas BLE stack.

Typedef Documentation

◆ **rm_mesh_bearer_platform_gatt_iface_cb_t**

```
typedef void(* rm_mesh_bearer_platform_gatt_iface_cb_t) (uint8_t event_name, uint8_t event_param, uint16_t conn_hdl, st_ble_dev_addr_t *peer_addr)
```

Callback function for GATT interface event.

Parameters

| | |
|-------------|---|
| event_name | The event defined by rm_mesh_bearer_platform_interface_event_t |
| event_param | The mode of GATT connection rm_mesh_bearer_platform_gatt_mode_t |
| conn_hdl | The connection handle |
| peer_addr | Pointer to the connected device address |

Enumeration Type Documentation◆ **rm_mesh_bearer_platform_interface_event_t**

```
enum rm_mesh_bearer_platform_interface_event_t
```

GATT Interface Events

Enumerator

| | |
|---|---|
| RM_MESH_BEARER_PLATFORM_INTERFACE_EVENT_UP | The event GATT Bearer BLE Link Layer connected |
| RM_MESH_BEARER_PLATFORM_INTERFACE_EVENT_DOWN | The event GATT Bearer BLE Link Layer disconnected |
| RM_MESH_BEARER_PLATFORM_INTERFACE_EVENT_ENABLE | The event GATT Bearer service enabled for communication |
| RM_MESH_BEARER_PLATFORM_INTERFACE_EVENT_DISABLE | The event GATT Bearer service disabled for communication |
| RM_MESH_BEARER_PLATFORM_INTERFACE_EVENT_NOT_FOUND | The event discovery process is not completed |
| RM_MESH_BEARER_PLATFORM_INTERFACE_EVENT_SCAN | The event that connectable device having Mesh GATT Service is found |
| RM_MESH_BEARER_PLATFORM_INTERFACE_EVENT_CANCEL | The Event GATT/BLE link layer connection creation is canceled |

Function Documentation

◆ RM_MESH_BEARER_PLATFORM_Open()

```
fsp_err_t RM_MESH_BEARER_PLATFORM_Open ( rm_mesh_bearer_platform_ctrl_t *const p_ctrl,
rm_mesh_bearer_platform_cfg_t const *const p_cfg )
```

Open Bearer Platform middleware. Initialize underlying BLE Protocol Stack to use as a Mesh Bearer. API to initialize underlying BLE Protocol Stack to use as a Mesh Bearer. Completion of the initialization is notified by the callback function.

Implements `rm_mesh_bearer_platform_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_BEARER_PLATFORM_Open(&g_mesh_bearer_platform0_ctrl,
&g_mesh_bearer_platform0_cfg);
```

Return values

| | |
|--------------------------|--|
| FSP_SUCCESS | Module opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Module is already open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

◆ RM_MESH_BEARER_PLATFORM_Close()

```
fsp_err_t RM_MESH_BEARER_PLATFORM_Close ( rm_mesh_bearer_platform_ctrl_t *const p_ctrl)
```

Close Bearer Platform middleware. Terminate BLE stack.

Implements `rm_mesh_bearer_platform_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_BEARER_PLATFORM_Close(&g_mesh_bearer_platform0_ctrl);
```

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | Module opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MESH_BEARER_PLATFORM_Setup()**

```
fsp_err_t RM_MESH_BEARER_PLATFORM_Setup ( rm_mesh_bearer_platform_ctrl_t *const p_ctrl)
```

Register ADV bearer with Mesh stack and start scan. API to register ADV bearer with Mesh stack. After registering, this routine starts Scan.

Parameters

| | | |
|------|--------|--|
| [in] | p_ctrl | rm_mesh_bearer_platform control block. |
|------|--------|--|

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ **RM_MESH_BEARER_PLATFORM_CallbackSet()**

```
fsp_err_t RM_MESH_BEARER_PLATFORM_CallbackSet ( rm_mesh_bearer_platform_ctrl_t *const p_ctrl, rm_mesh_bearer_platform_gatt_iface_cb_t callback )
```

Register callback function to receive GATT interface events. API to register callback function to receive GATT interface events.

Parameters

| | | |
|------|----------|--|
| [in] | p_ctrl | rm_mesh_bearer_platform control block. |
| [in] | callback | Callback function. |

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ **RM_MESH_BEARER_PLATFORM_SetGattMode()**

```
fsp_err_t RM_MESH_BEARER_PLATFORM_SetGattMode ( rm_mesh_bearer_platform_ctrl_t *const
p_ctrl, rm_mesh_bearer_platform_gatt_mode_t mode )
```

Set GATT Bearer mode.

Parameters

| | | |
|------|--------|---|
| [in] | p_ctrl | rm_mesh_bearer_platform control block. |
| [in] | mode | GATT interface mode, either RM_MESH_BEARER_PLATFORM_GATT_MODE_PROVISION or RM_MESH_BEARER_PLATFORM_GATT_MODE_PROXY. |

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ **RM_MESH_BEARER_PLATFORM_GetGattMode()**

```
fsp_err_t RM_MESH_BEARER_PLATFORM_GetGattMode ( rm_mesh_bearer_platform_ctrl_t *const
p_ctrl, rm_mesh_bearer_platform_gatt_mode_t * p_mode )
```

Get current GATT Bearer mode.

Parameters

| | | |
|------|--------|---|
| [in] | p_ctrl | rm_mesh_bearer_platform control block. |
| [in] | p_mode | GATT interface mode, either RM_MESH_BEARER_PLATFORM_GATT_MODE_PROVISION or RM_MESH_BEARER_PLATFORM_GATT_MODE_PROXY. |

Return values

| | |
|-------------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_mode is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ RM_MESH_BEARER_PLATFORM_SetScanResponseData()

```
fsp_err_t RM_MESH_BEARER_PLATFORM_SetScanResponseData ( rm_mesh_bearer_platform_ctrl_t
*const p_ctrl, uint8_t* p_data, uint8_t len )
```

Set scan response data in connectable and scannable undirected advertising event. API to Set Scan Response Data in Connectable and scannable undirected Advertising event. Scan Response Data can be used for indicating additional information such as << Complete Local Name>>.

Implements `rm_mesh_bearer_platform_api_t::setScanResponseData`.

Example:

```
/* Set scan response data in connectable and scannable undirected advertising
event.. */
err = RM_MESH_BEARER_PLATFORM_SetScanResponseData(&g_mesh_bearer_platform0_ctrl,
&data, length);
```

Return values

| | |
|-------------------------|--|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_data is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_MESH_BEARER_PLATFORM_ScanGattBearer()

```
fsp_err_t RM_MESH_BEARER_PLATFORM_ScanGattBearer ( rm_mesh_bearer_platform_ctrl_t *const
p_ctrl, rm_mesh_bearer_platform_state_t state, rm_mesh_bearer_platform_gatt_mode_t mode )
```

Manage reporting connectable device having Mesh GATT service. API to manage reporting connectable device having Mesh GATT service.

Parameters

| | | |
|------|--------|---|
| [in] | p_ctrl | rm_mesh_bearer_platform control block. |
| [in] | state | Notification configuration flag; enable if RM_MESH_BEARER_PLATFORM_STATE_ENABLE, or disable if RM_MESH_BEARER_PLATFORM_STATE_DISABLE. |
| [in] | mode | GATT interface mode, either RM_MESH_BEARER_PLATFORM_GATT_MODE_PROVISION or RM_MESH_BEARER_PLATFORM_GATT_MODE_PROXY. |

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ RM_MESH_BEARER_PLATFORM_Connect()

```
fsp_err_t RM_MESH_BEARER_PLATFORM_Connect ( rm_mesh_bearer_platform_ctrl_t *const p_ctrl,
uint8_t * p_remote_address, uint8_t address_type, rm_mesh_bearer_platform_gatt_mode_t mode
)
```

Request to create connection. API to request to Create Connection. Completion of the establishing a connection is notified by RM_BLE_MESH_BEARER_IFACE_UP. After establishing a connection, RM_MESH_BEARER_PLATFORM_DiscoverService() is invoked automatically.

Implements `rm_mesh_bearer_platform_api_t::connect`.

Example:

```
/* Request to create connection. */
err = RM_MESH_BEARER_PLATFORM_Connect (&g_mesh_bearer_platform0_ctrl,
                                         &remote_address,
                                         bearer_address_type,
                                         RM_MESH_BEARER_PLATFORM_GATT_MODE_PROVISION);
```

Return values

| | |
|-------------------------|--|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_remote_address is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_MESH_BEARER_PLATFORM_DiscoverService()

```
fsp_err_t RM_MESH_BEARER_PLATFORM_DiscoverService ( rm_mesh_bearer_platform_ctrl_t *const
p_ctrl, uint16_t handle, rm_mesh_bearer_platform_gatt_mode_t mode )
```

Start service discovery for Mesh GATT service. API to start Service Discovery for Mesh GATT Service. If Mesh GATT Service specified by the "mode" argument, this routine enables Notification of the Mesh GATT Service by invoking [RM_MESH_BEARER_PLATFORM_ConfigureNotification\(\)](#).

Implements [rm_mesh_bearer_platform_api_t::discoverService](#).

Example:

```
/* Start service discovery for Mesh GATT service. */
err = RM_MESH_BEARER_PLATFORM_DiscoverService(&g_mesh_bearer_platform0_ctrl,
                                             handle,
RM_MESH_BEARER_PLATFORM_GATT_MODE_PROVISION);
```

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_MESH_BEARER_PLATFORM_ConfigureNotification()

```
fsp_err_t RM_MESH_BEARER_PLATFORM_ConfigureNotification ( rm_mesh_bearer_platform_ctrl_t
*const p_ctrl, uint16_t handle, rm_mesh_bearer_platform_state_t state,
rm_mesh_bearer_platform_gatt_mode_t mode )
```

Configure GATT notification of Mesh GATT service. API to configure GATT Notification of Mesh GATT Service.

Implements `rm_mesh_bearer_platform_api_t::configureNotification`.

Example:

```
/* Configure GATT notification of Mesh GATT service. */
err =
RM_MESH_BEARER_PLATFORM_ConfigureNotification(&g_mesh_bearer_platform0_ctrl,
                                             handle,
RM_MESH_BEARER_PLATFORM_STATE_ENABLE,
RM_MESH_BEARER_PLATFORM_GATT_MODE_PROVISION);
```

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_MESH_BEARER_PLATFORM_Disconnect()

```
fsp_err_t RM_MESH_BEARER_PLATFORM_Disconnect ( rm_mesh_bearer_platform_ctrl_t *const
p_ctrl, uint16_t handle )
```

Terminate Connection. API to terminate connection.

Implements `rm_mesh_bearer_platform_api_t::disconnect`.

Example:

```
/* Terminate Connection. */
err = RM_MESH_BEARER_PLATFORM_Disconnect(&g_mesh_bearer_platform0_ctrl, handle);
```

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

Bluetooth Low Energy Mesh Network Generic Admin Property Server (rm_mesh_generic_admin_prop_srv)

Modules » Networking » Bluetooth Low Energy Mesh Network Modules

Functions

```
fsp_err_t RM_MESH_GENERIC_ADMIN_PROP_SRV_Open
          (rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
           rm_ble_mesh_model_server_cfg_t const *const p_cfg)
```

```
fsp_err_t RM_MESH_GENERIC_ADMIN_PROP_SRV_Close
          (rm_ble_mesh_model_server_ctrl_t *const p_ctrl)
```

```
fsp_err_t RM_MESH_GENERIC_ADMIN_PROP_SRV_StateUpdate
          (rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
           rm_ble_mesh_access_server_state_t const *const p_state)
```

Detailed Description

Overview

Target Devices

The Bluetooth Low Energy Energy Mesh Network Generic Admin Property Server module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_generic_admin_prop_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_admin_prop_srv_cfg.h:

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Configurations for Networking > Bluetooth Low Energy Mesh Network modules > BLE Mesh Model Generic Admin Property Server (rm_mesh_generic_admin_prop_srv)

This module can be added to the Stacks tab via New Stack > Networking > Bluetooth Low Energy Mesh Network modules > BLE Mesh Model Generic Admin Property Server (rm_mesh_generic_admin_prop_srv).

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

| | | | |
|-------------------------------------|-------------------------------|------|-------------------------------------|
| Interrupts > Callback Provided When | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh generic |
|-------------------------------------|-------------------------------|------|-------------------------------------|

| | | | |
|---|----------------------------------|---------------------------------------|---|
| Timeout Occurs | | | admin property server ISR occurs |
| Interrupts > Callback Provided When an Timeout ISR Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh generic admin property server timeout ISR occurs |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_generic_ad min_prop_srv0 | Module name. |

Data Structures

```
struct rm_mesh_generic_admin_prop_srv_info_t
```

```
struct rm_mesh_generic_admin_prop_srv_instance_ctrl_t
```

Data Structure Documentation

◆ rm_mesh_generic_admin_prop_srv_info_t

| | | |
|--|--------------------|--|
| struct rm_mesh_generic_admin_prop_srv_info_t | | |
| Generic Admin Property is a state representing a device property of an element that can be read or written | | |
| Data Fields | | |
| uint16_t | property_id | Admin Property ID field is a 2-octet Assigned Number value referencing a device property |
| uint8_t | user_access | Admin User Access field is an enumeration indicating whether the device property can be read or written as a Generic User Property |
| uint8_t* | property_value | Admin Property Value field is a conditional field |
| uint16_t | property_value_len | |

◆ rm_mesh_generic_admin_prop_srv_instance_ctrl_t

| |
|---|
| struct rm_mesh_generic_admin_prop_srv_instance_ctrl_t |
| BLE mesh generic admin prop instance control block. DO NOT INITIALIZE. Initialization occurs when <code>RM_MESH_GENERIC_ADMIN_PROP_SRV_Open()</code> is called. |

Function Documentation

◆ RM_MESH_GENERIC_ADMIN_PROP_SRV_Open()

```
fsp_err_t RM_MESH_GENERIC_ADMIN_PROP_SRV_Open ( rm_ble_mesh_model_server_ctrl_t *const
p_ctrl, rm_ble_mesh_model_server_cfg_t const *const p_cfg )
```

API to initialize Generic_Admin_Property Server model. This is to initialize Generic_Admin_Property Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::open`.

Example:

```
/* Open the module. */
err =
RM_MESH_GENERIC_ADMIN_PROP_SRV_Open(&g_mesh_generic_admin_prop_srv0_ctrl,
&g_mesh_generic_admin_prop_srv0_cfg);
```

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

◆ RM_MESH_GENERIC_ADMIN_PROP_SRV_Close()

```
fsp_err_t RM_MESH_GENERIC_ADMIN_PROP_SRV_Close ( rm_ble_mesh_model_server_ctrl_t *const
p_ctrl)
```

API to terminate Generic_Admin_Property Server model. This is to terminate Generic_Admin_Property Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_GENERIC_ADMIN_PROP_SRV_Close(&g_mesh_generic_admin_prop_srv0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ RM_MESH_GENERIC_ADMIN_PROP_SRV_StateUpdate()

```
fsp_err_t RM_MESH_GENERIC_ADMIN_PROP_SRV_StateUpdate ( rm_ble_mesh_model_server_ctrl_t
*const p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state )
```

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements `rm_ble_mesh_model_server_api_t::stateUpdate`.

Example:

```
/* Update server status. */
err =
RM_MESH_GENERIC_ADMIN_PROP_SRV_StateUpdate(&g_mesh_generic_admin_prop_srv0_ctrl,
&state);
```

Return values

| | |
|--------------------------|-------------------------------------|
| FSP_SUCCESS | Updated server status successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_state is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

Bluetooth Low Energy Mesh Network Generic Battery Client (rm_mesh_generic_battery_clt)

Modules » Networking » Bluetooth Low Energy Mesh Network Modules

Functions

```
fsp_err_t RM_MESH_GENERIC_BATTERY_CLT_Open
(rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
rm_ble_mesh_model_client_cfg_t const *const p_cfg)
```

| | |
|-----------|--|
| fsp_err_t | RM_MESH_GENERIC_BATTERY_CLT_Close (rm_ble_mesh_model_client_ctrl_t *const p_ctrl) |
| fsp_err_t | RM_MESH_GENERIC_BATTERY_CLT_GetModelHandle (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, rm_ble_mesh_access_model_handle_t *const p_model_handle) |
| fsp_err_t | RM_MESH_GENERIC_BATTERY_CLT_SetModelHandle (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, rm_ble_mesh_access_model_handle_t model_handle) |
| fsp_err_t | RM_MESH_GENERIC_BATTERY_CLT_SendReliablePdu (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, uint32_t req_opcode, void const *const p_parameter, uint32_t rsp_opcode) |
| fsp_err_t | RM_MESH_GENERIC_BATTERY_CLT_Get (rm_ble_mesh_model_client_ctrl_t *const p_ctrl) |

Detailed Description

Overview

Target Devices

The Bluetooth Low Energy Energy Mesh Network Generic Battery Client module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_generic_battery_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_battery_clt_cfg.h:

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Configurations for Networking > Bluetooth Low Energy Mesh Network modules > BLE Mesh Model Generic Battery Client (rm_mesh_generic_battery_clt)

This module can be added to the Stacks tab via New Stack > Networking > Bluetooth Low Energy Mesh Network modules > BLE Mesh Model Generic Battery Client (rm_mesh_generic_battery_clt).

| Configuration | Options | Default | Description |
|--|-------------------------------|----------------------|---|
| Interrupts > Callback Provided when Timeout Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh generic battery client ISR occurs |
| Name | Name Must Be a Valid | g_rm_mesh_generic_ba | Module name. |

C Symbol

battery_clt0

Data Structures

struct `rm_mesh_generic_battery_clt_instance_ctrl_t`

Data Structure Documentation

◆ `rm_mesh_generic_battery_clt_instance_ctrl_t`

struct `rm_mesh_generic_battery_clt_instance_ctrl_t`

BLE mesh generic battery instance control block. DO NOT INITIALIZE. Initialization occurs when `RM_MESH_GENERIC_BATTERY_CLT_Open()` is called.

Function Documentation

◆ `RM_MESH_GENERIC_BATTERY_CLT_Open()`

```
fsp_err_t RM_MESH_GENERIC_BATTERY_CLT_Open ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
rm_ble_mesh_model_client_cfg_t const *const p_cfg )
```

Open Generic Battery Client middleware. This is to initialize Generic_Battery Client model and to register with Access layer.

Implements `rm_ble_mesh_model_client_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_GENERIC_BATTERY_CLT_Open(&g_mesh_generic_battery_clt0_ctrl,
&g_mesh_generic_battery_clt0_cfg);
```

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

◆ RM_MESH_GENERIC_BATTERY_CLT_Close()

```
fsp_err_t RM_MESH_GENERIC_BATTERY_CLT_Close ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Close Generic Battery Client middleware.

Implements `rm_ble_mesh_model_client_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_GENERIC_BATTERY_CLT_Close(&g_mesh_generic_battery_clt0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ RM_MESH_GENERIC_BATTERY_CLT_GetModelHandle()

```
fsp_err_t RM_MESH_GENERIC_BATTERY_CLT_GetModelHandle ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, rm_ble_mesh_access_model_handle_t *const p_model_handle )
```

This is to get the handle of Generic_Battery client model.

Implements `rm_ble_mesh_model_client_api_t::getModelHandle`.

Example:

```
/* Get the handle of generic battery client model. */
err =
RM_MESH_GENERIC_BATTERY_CLT_GetModelHandle(&g_mesh_generic_battery_clt0_ctrl,
&model_handle);
```

Return values

| | |
|-------------------------|---------------------------------------|
| FSP_SUCCESS | Got model handle successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_POINTER | The parameter p_model_handle is NULL. |

◆ RM_MESH_GENERIC_BATTERY_CLT_SetModelHandle()

```
fsp_err_t RM_MESH_GENERIC_BATTERY_CLT_SetModelHandle ( rm_ble_mesh_model_client_ctrl_t  
*const p_ctrl, rm_ble_mesh_access_model_handle_t model_handle )
```

DEPRECATED This is to set the handle of Generic_Battery client model.

Implements `rm_ble_mesh_model_client_api_t::setModelHandle`.

Return values

| | |
|-------------------|------------------------------------|
| FSP_SUCCESS | Changed model handle successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ RM_MESH_GENERIC_BATTERY_CLT_SendReliablePdu()

```
fsp_err_t RM_MESH_GENERIC_BATTERY_CLT_SendReliablePdu ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, uint32_t req_opcode, void const *const p_parameter, uint32_t rsp_opcode )
```

This is to initialize sending acknowledged commands.

Implements `rm_ble_mesh_model_client_api_t::sendReliablePdu`.

Example:

```
/* Initialize sending acknowledged commands. */
err =
RM_MESH_GENERIC_BATTERY_CLT_SendReliablePdu(&g_mesh_generic_battery_clt0_ctrl,
                                             req_opcode,
                                             p_parameter,
                                             rsp_opcode);
```

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_GENERIC_BATTERY_CLT_Get()

`fsp_err_t RM_MESH_GENERIC_BATTERY_CLT_Get (rm_ble_mesh_model_client_ctrl_t *const p_ctrl)`

Generic Battery Get message is an acknowledged message used to get the Generic Battery state of an element. The response to the Generic Battery Get message is a Generic Battery Status message. There are no parameters for this message.

Parameters

| | | |
|------|--------|--|
| [in] | p_ctrl | rm_mesh_generic_battery_clt control block. |
|------|--------|--|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

Data Structure Documentation

◆ rm_mesh_generic_battery_srv_info_t

```
struct rm_mesh_generic_battery_srv_info_t
```

| Generic Battery state is a set of four values representing the state of a battery | | |
|---|-----------------------------------|--|
| Data Fields | | |
| uint8_t | generic_battery_level | Generic Battery Level state is a value ranging from 0 percent through 100 percent |
| uint32_t | generic_battery_time_to_discharge | Generic Battery Time to Discharge state is a 24-bit unsigned value ranging from 0 through 0xFFFFFFFF |
| uint32_t | generic_battery_time_to_charge | Generic Battery Time to Charge state is a 24-bit unsigned value ranging from 0 through 0xFFFFFFFF |
| uint8_t | generic_battery_flags | Generic Battery Flags state is a concatenation of four 2-bit bit fields: Presence, Indicator, Charging, and Serviceability |

◆ rm_mesh_generic_battery_srv_instance_ctrl_t

| |
|--|
| struct rm_mesh_generic_battery_srv_instance_ctrl_t |
| BLE mesh generic_battery instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_GENERIC_BATTERY_SRV_Open() is called. |

Function Documentation

◆ RM_MESH_GENERIC_BATTERY_SRV_Open()

```
fsp_err_t RM_MESH_GENERIC_BATTERY_SRV_Open ( rm_ble_mesh_model_server_ctrl_t *const
p_ctrl, rm_ble_mesh_model_server_cfg_t const *const p_cfg )
```

API to initialize Generic_Battery Server model. This is to initialize Generic_Battery Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_GENERIC_BATTERY_SRV_Open(&g_mesh_generic_battery_srv0_ctrl,
&g_mesh_generic_battery_srv0_cfg);
```

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

◆ RM_MESH_GENERIC_BATTERY_SRV_Close()

```
fsp_err_t RM_MESH_GENERIC_BATTERY_SRV_Close ( rm_ble_mesh_model_server_ctrl_t *const
p_ctrl)
```

API to terminate Generic_Battery Server model. This is to terminate Generic_Battery Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_GENERIC_BATTERY_SRV_Close(&g_mesh_generic_battery_srv0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ RM_MESH_GENERIC_BATTERY_SRV_StateUpdate()

```
fsp_err_t RM_MESH_GENERIC_BATTERY_SRV_StateUpdate ( rm_ble_mesh_model_server_ctrl_t
*const p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state )
```

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements `rm_ble_mesh_model_server_api_t::stateUpdate`.

Example:

```
/* Update server status. */
err = RM_MESH_GENERIC_BATTERY_SRV_StateUpdate(&g_mesh_generic_battery_srv0_ctrl,
&state);
```

Return values

| | |
|--------------------------|-------------------------------------|
| FSP_SUCCESS | Updated server status successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_state is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

Bluetooth Low Energy Mesh Network Generic Client Property Server (rm_mesh_generic_client_prop_srv)

Modules » Networking » Bluetooth Low Energy Mesh Network Modules

Functions

```
fsp_err_t RM_MESH_GENERIC_CLIENT_PROP_SRV_Open
(rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_ble_mesh_model_server_cfg_t const *const p_cfg)
```

```
fsp_err_t RM_MESH_GENERIC_CLIENT_PROP_SRV_Close
```

```
(rm_ble_mesh_model_server_ctrl_t *const p_ctrl)
```

fsp_err_t RM_MESH_GENERIC_CLIENT_PROP_SRV_StateUpdate
(rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_ble_mesh_access_server_state_t const *const p_state)
```

Detailed Description

Overview

Target Devices

The Bluetooth Low Energy Energy Mesh Network Generic Client Property Server module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_generic_client_prop_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_client_prop_srv_cfg.h:

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Configurations for Networking > Bluetooth Low Energy Mesh Network modules > BLE Mesh Model Generic Client Property Server (rm_mesh_generic_client_prop_srv)

This module can be added to the Stacks tab via New Stack > Networking > Bluetooth Low Energy Mesh Network modules > BLE Mesh Model Generic Client Property Server (rm_mesh_generic_client_prop_srv).

| Configuration | Options | Default | Description |
|---|-------------------------------|------------------------------------|---|
| Interrupts > Callback Provided When Timeout Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh generic client property server ISR occurs |
| Interrupts > Callback Provided When an Timeout ISR Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh generic client property server timeout ISR occurs |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_generic_client_prop_srv0 | Module name. |

Data Structures

```
struct rm_mesh_generic_client_prop_srv_instance_ctrl_t
```

Data Structure Documentation

◆ **rm_mesh_generic_client_prop_srv_instance_ctrl_t**

```
struct rm_mesh_generic_client_prop_srv_instance_ctrl_t
```

BLE mesh generic client prop instance control block. DO NOT INITIALIZE. Initialization occurs when [RM_MESH_GENERIC_CLIENT_PROP_SRV_Open\(\)](#) is called.

Function Documentation◆ **RM_MESH_GENERIC_CLIENT_PROP_SRV_Open()**

```
fsp_err_t RM_MESH_GENERIC_CLIENT_PROP_SRV_Open ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_model_server_cfg_t const *const p_cfg )
```

API to initialize Generic_Client_Property Server model. This is to initialize Generic_Client_Property Server model and to register with Access layer.

Implements [rm_ble_mesh_model_server_api_t::open](#).

Example:

```
/* Open the module. */
err = RM_MESH_GENERIC_CLIENT_PROP_SRV_Open(&g_mesh_generic_client_prop_srv0_ctrl,
                                           &g_mesh_generic_client_prop_srv0_cfg);
```

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

◆ RM_MESH_GENERIC_CLIENT_PROP_SRV_Close()

```
fsp_err_t RM_MESH_GENERIC_CLIENT_PROP_SRV_Close ( rm_ble_mesh_model_server_ctrl_t *const  
p_ctrl)
```

API to terminate Generic_Client_Property Server model. This is to terminate Generic_Client_Property Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::close`.

Example:

```
/* Close the module. */  
err =  
RM_MESH_GENERIC_CLIENT_PROP_SRV_Close(&g_mesh_generic_client_prop_srv0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ RM_MESH_GENERIC_CLIENT_PROP_SRV_StateUpdate()

```
fsp_err_t RM_MESH_GENERIC_CLIENT_PROP_SRV_StateUpdate ( rm_ble_mesh_model_server_ctrl_t
*const p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state )
```

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements `rm_ble_mesh_model_server_api_t::stateUpdate`.

Example:

```
/* Update server status. */
err =
RM_MESH_GENERIC_CLIENT_PROP_SRV_StateUpdate(&g_mesh_generic_client_prop_srv0_ctrl,
&state);
```

Return values

| | |
|--------------------------|-------------------------------------|
| FSP_SUCCESS | Updated server status successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_state is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

Detailed Description

Overview

Target Devices

The Bluetooth Low Energy Energy Mesh Network Generic Default Transition Time Client module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_generic_dtt_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_dtt_clt_cfg.h:

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Configurations for Networking > Bluetooth Low Energy Mesh Network modules > BLE Mesh Model Generic Default Transition Time Client (rm_mesh_generic_dtt_clt)

This module can be added to the Stacks tab via New Stack > Networking > Bluetooth Low Energy Mesh Network modules > BLE Mesh Model Generic Default Transition Time Client (rm_mesh_generic_dtt_clt).

| Configuration | Options | Default | Description |
|--|-------------------------------|----------------------------|---|
| Interrupts > Callback Provided When Timeout Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh generic default transition time client ISR occurs |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_generic_dtt_clt0 | Module name. |

Data Structures

```
struct rm_mesh_generic_dtt_clt_instance_ctrl_t
```

Data Structure Documentation

◆ rm_mesh_generic_dtt_clt_instance_ctrl_t

```
struct rm_mesh_generic_dtt_clt_instance_ctrl_t
```

BLE mesh generic dtt instance control block. DO NOT INITIALIZE. Initialization occurs when [RM_MESH_GENERIC_DTT_CLT_Open\(\)](#) is called.

Function Documentation

◆ RM_MESH_GENERIC_DTT_CLT_Open()

```
fsp_err_t RM_MESH_GENERIC_DTT_CLT_Open ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
rm_ble_mesh_model_client_cfg_t const *const p_cfg )
```

Open Generic Default Transition Time Client middleware. This is to initialize Generic_Default_Transition_Time Client model and to register with Access layer.

Implements [rm_ble_mesh_model_client_api_t::open](#).

Example:

```
/* Open the module. */
err = RM_MESH_GENERIC_DTT_CLT_Open(&g_mesh_generic_dtt_clt0_ctrl,
&g_mesh_generic_dtt_clt0_cfg);
```

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

◆ RM_MESH_GENERIC_DTT_CLT_Close()

```
fsp_err_t RM_MESH_GENERIC_DTT_CLT_Close ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Close Generic Default Transition Time Client middleware.

Implements `rm_ble_mesh_model_client_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_GENERIC_DTT_CLT_Close(&g_mesh_generic_dtt_clt0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ RM_MESH_GENERIC_DTT_CLT_GetModelHandle()

```
fsp_err_t RM_MESH_GENERIC_DTT_CLT_GetModelHandle ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, rm_ble_mesh_access_model_handle_t *const p_model_handle )
```

This is to get the handle of Generic_Default_Transition_Time client model.

Implements `rm_ble_mesh_model_client_api_t::getModelHandle`.

Example:

```
/* Get the handle of generic default transition time client model. */
err = RM_MESH_GENERIC_DTT_CLT_GetModelHandle(&g_mesh_generic_dtt_clt0_ctrl,
&model_handle);
```

Return values

| | |
|-------------------------|---------------------------------------|
| FSP_SUCCESS | Got model handle successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_POINTER | The parameter p_model_handle is NULL. |

◆ RM_MESH_GENERIC_DTT_CLT_SetModelHandle()

```
fsp_err_t RM_MESH_GENERIC_DTT_CLT_SetModelHandle ( rm_ble_mesh_model_client_ctrl_t *const  
p_ctrl, rm_ble_mesh_access_model_handle_t model_handle )
```

DEPRECATED This is to set the handle of Generic_Default_Transition_Time client model.

Implements `rm_ble_mesh_model_client_api_t::setModelHandle`.

Return values

| | |
|-------------------|------------------------------------|
| FSP_SUCCESS | Changed model handle successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ RM_MESH_GENERIC_DTT_CLT_SendReliablePdu()

```
fsp_err_t RM_MESH_GENERIC_DTT_CLT_SendReliablePdu ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, uint32_t req_opcode, void const *const p_parameter, uint32_t rsp_opcode )
```

This is to initialize sending acknowledged commands.

Implements `rm_ble_mesh_model_client_api_t::sendReliablePdu`.

Example:

```
/* Initialize sending acknowledged commands */
err = RM_MESH_GENERIC_DTT_CLT_SendReliablePdu(&g_mesh_generic_dtt_clt0_ctrl,
req_opcode, p_parameter, rsp_opcode);
```

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_GENERIC_DTT_CLT_Get()**

```
fsp_err_t RM_MESH_GENERIC_DTT_CLT_Get ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Generic Default Transition Time Get is an acknowledged message used to get the Generic Default Transition Time state of an element. The response to the Generic Default Transition Time Get message is a Generic Default Transition Time Status message. There are no parameters for this message.

Parameters

| | | |
|------|--------|--|
| [in] | p_ctrl | rm_mesh_generic_dtt_clt control block. |
|------|--------|--|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_GENERIC_DTT_CLT_Set()

```
fsp_err_t RM_MESH_GENERIC_DTT_CLT_Set ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void
const *const p_parameter )
```

Generic Default Transition Time Set is an acknowledged message used to set the Generic Default Transition Time state of an element. The response to the Generic Default Transition Time Set message is a Generic Default Transition Time Status message.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_generic_dtt_clt control block. |
| [in] | p_parameter | Pointer to transition time. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_GENERIC_DTT_CLT_SetUnacknowledged()

```
fsp_err_t RM_MESH_GENERIC_DTT_CLT_SetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

Generic Default Transition Time Set Unacknowledged is an unacknowledged message used to set the Generic Default Transition Time state of an element.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_generic_dtt_clt control block. |
| [in] | p_parameter | Pointer to transition time. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

```

Detailed Description

Overview

Target Devices

The Bluetooth Low Energy Energy Mesh Network Generic Default Transition Time Server module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_generic_dtt_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_dtt_srv_cfg.h:

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Configurations for Networking > Bluetooth Low Energy Mesh Network modules > BLE Mesh Model Generic Default Transition Time Server (rm_mesh_generic_dtt_srv)

This module can be added to the Stacks tab via New Stack > Networking > Bluetooth Low Energy Mesh Network modules > BLE Mesh Model Generic Default Transition Time Server (rm_mesh_generic_dtt_srv).

| Configuration | Options | Default | Description |
|---|-------------------------------|----------------------------|---|
| Interrupts > Callback Provided When Tmeout Occurs | Name must Be a Valid C Symbol | NULL | Callback provided when mesh generic default transition time server ISR occurs |
| Interrupts > Callback Provided When an Timeout ISR Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh generic default transition time server timeout ISR occurs |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_generic_dtt_srv0 | Module name. |

Data Structures

```
struct rm_mesh_generic_dtt_srv_instance_ctrl_t
```

Data Structure Documentation

◆ rm_mesh_generic_dtt_srv_instance_ctrl_t

```
struct rm_mesh_generic_dtt_srv_instance_ctrl_t
```

BLE mesh generic dtt instance control block. DO NOT INITIALIZE. Initialization occurs when `RM_MESH_GENERIC_DTT_SRV_Open()` is called.

Function Documentation

◆ RM_MESH_GENERIC_DTT_SRV_Open()

```
fsp_err_t RM_MESH_GENERIC_DTT_SRV_Open ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_ble_mesh_model_server_cfg_t const *const p_cfg )
```

API to initialize Generic_Default_Transition_Time Server model. This is to initialize Generic_Default_Transition_Time Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_GENERIC_DTT_SRV_Open(&g_mesh_generic_dtt_srv0_ctrl,
&g_mesh_generic_dtt_srv0_cfg);
```

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

◆ RM_MESH_GENERIC_DTT_SRV_Close()

```
fsp_err_t RM_MESH_GENERIC_DTT_SRV_Close ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl)
```

API to terminate Generic_Default_Transition_Time Server model. This is to terminate Generic_Default_Transition_Time Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_GENERIC_DTT_SRV_Close(&g_mesh_generic_dtt_srv0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ RM_MESH_GENERIC_DTT_SRV_GetTime()

```
fsp_err_t RM_MESH_GENERIC_DTT_SRV_GetTime ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_mesh_generic_dtt_srv_transtion_time_info_t *const p_info )
```

API to get default transition time. This is to get default transition time.

Parameters

| | | |
|------|--------|---|
| [in] | p_ctrl | rm_mesh_generic_dtt_srv control block. |
| [in] | p_info | rm_mesh_generic_dtt_srv status information. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |

Detailed Description

Overview

Target Devices

The Bluetooth Low Energy Energy Mesh Network Generic Level Client module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_generic_level_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_level_clt_cfg.h:

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Configurations for Networking > Bluetooth Low Energy Mesh Network modules > BLE Mesh Model Generic Level Client (rm_mesh_generic_level_clt)

This module can be added to the Stacks tab via New Stack > Networking > Bluetooth Low Energy Mesh Network modules > BLE Mesh Model Generic Level Client (rm_mesh_generic_level_clt).

| Configuration | Options | Default | Description |
|--|-------------------------------|------------------------------|---|
| Interrupts > Callback Provided When Timeout Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh generic level client ISR occurs |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_generic_level_clt0 | Module name. |

Data Structures

```
struct rm_mesh_generic_level_clt_instance_ctrl_t
```

Data Structure Documentation

◆ rm_mesh_generic_level_clt_instance_ctrl_t

```
struct rm_mesh_generic_level_clt_instance_ctrl_t
```

BLE mesh generic level instance control block. DO NOT INITIALIZE. Initialization occurs when [RM_MESH_GENERIC_LEVEL_CLT_Open\(\)](#) is called.

Function Documentation

◆ RM_MESH_GENERIC_LEVEL_CLT_Open()

```
fsp_err_t RM_MESH_GENERIC_LEVEL_CLT_Open ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
rm_ble_mesh_model_client_cfg_t const *const p_cfg )
```

Open Generic_Level Client middleware. This is to initialize Generic_Level Client model and to register with Access layer.

Implements `rm_ble_mesh_model_client_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_GENERIC_LEVEL_CLT_Open(&g_mesh_generic_level_clt0_ctrl,
&g_mesh_generic_level_clt0_cfg);
```

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

◆ RM_MESH_GENERIC_LEVEL_CLT_Close()

```
fsp_err_t RM_MESH_GENERIC_LEVEL_CLT_Close ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Close Generic_Level Client middleware.

Implements `rm_ble_mesh_model_client_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_GENERIC_LEVEL_CLT_Close(&g_mesh_generic_level_clt0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ **RM_MESH_GENERIC_LEVEL_CLT_GetModelHandle()**

```
fsp_err_t RM_MESH_GENERIC_LEVEL_CLT_GetModelHandle ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, rm_ble_mesh_access_model_handle_t *const p_model_handle )
```

This is to get the handle of Generic_Level client model.

Implements `rm_ble_mesh_model_client_api_t::getModelHandle()`.

Example:

```
/* Get the handle of generic level client model. */
err = RM_MESH_GENERIC_LEVEL_CLT_GetModelHandle(&g_mesh_generic_level_clt0_ctrl,
&model_handle);
```

Return values

| | |
|-------------------------|---------------------------------------|
| FSP_SUCCESS | Got model handle successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_POINTER | The parameter p_model_handle is NULL. |

◆ **RM_MESH_GENERIC_LEVEL_CLT_SetModelHandle()**

```
fsp_err_t RM_MESH_GENERIC_LEVEL_CLT_SetModelHandle ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, rm_ble_mesh_access_model_handle_t model_handle )
```

DEPRECATED This is to set the handle of Generic_Level client model.

Implements `rm_ble_mesh_model_client_api_t::setModelHandle`.

Return values

| | |
|-------------------|------------------------------------|
| FSP_SUCCESS | Changed model handle successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ RM_MESH_GENERIC_LEVEL_CLT_SendReliablePdu()

```
fsp_err_t RM_MESH_GENERIC_LEVEL_CLT_SendReliablePdu ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, uint32_t req_opcode, void const *const p_parameter, uint32_t rsp_opcode )
```

This is to initialize sending acknowledged commands.

Implements `rm_ble_mesh_model_client_api_t::sendReliablePdu`.

Example:

```
/* Initialize sending acknowledged commands. */
err =
RM_MESH_GENERIC_LEVEL_CLT_SendReliablePdu(&g_mesh_generic_level_clt0_ctrl,
req_opcode, p_parameter, rsp_opcode);
```

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_GENERIC_LEVEL_CLT_Get()**

```
fsp_err_t RM_MESH_GENERIC_LEVEL_CLT_Get ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Generic Level Get is an acknowledged message used to get the Generic Level state of an element. The response to the Generic Level Get message is a Generic Level Status message. There are no parameters for this message.

Parameters

| | | |
|------|--------|--|
| [in] | p_ctrl | rm_mesh_generic_level_clt control block. |
|------|--------|--|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_GENERIC_LEVEL_CLT_Set()

```
fsp_err_t RM_MESH_GENERIC_LEVEL_CLT_Set ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void
const *const p_parameter )
```

Generic Level Set is an acknowledged message used to set the Generic Level state of an element to a new absolute value. The response to the Generic Level Set message is a Generic Level Status message.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_generic_level_clt control block. |
| [in] | p_parameter | Pointer to Generic Level Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_GENERIC_LEVEL_CLT_SetUnacknowledged()

```
fsp_err_t RM_MESH_GENERIC_LEVEL_CLT_SetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

Generic Level Set Unacknowledged is an unacknowledged message used to set the Generic Level state of an element to a new absolute value.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_generic_level_clt control block. |
| [in] | p_parameter | Pointer to Generic Level Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_GENERIC_LEVEL_CLT_DeltaSet()

```
fsp_err_t RM_MESH_GENERIC_LEVEL_CLT_DeltaSet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

Generic Delta Set is an acknowledged message used to set the Generic Level state of an element by a relative value. The message is transactional, it supports changing the state by a cumulative value with a sequence of messages that are part of a transaction. The response to the Generic Delta Set message is a Generic Level Status message.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_generic_level_clt control block. |
| [in] | p_parameter | Pointer to Generic Level Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_GENERIC_LEVEL_CLT_DeltaSetUnacknowledged()

```
fsp_err_t RM_MESH_GENERIC_LEVEL_CLT_DeltaSetUnacknowledged (
rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter )
```

Generic Delta Set Unacknowledged is an unacknowledged message used to set the Generic Level state of an element by a relative value.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_generic_level_clt control block. |
| [in] | p_parameter | Pointer to Generic Level Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_GENERIC_LEVEL_CLT_MoveSet()

```
fsp_err_t RM_MESH_GENERIC_LEVEL_CLT_MoveSet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

Generic Move Set is an acknowledged message used to start a process of changing the Generic Level state of an element with a defined transition speed. The response to the Generic Move Set message is a Generic Level Status message.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_generic_level_clt control block. |
| [in] | p_parameter | Pointer to Generic Level Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_GENERIC_LEVEL_CLT_MoveSetUnacknowledged()

```
fsp_err_t RM_MESH_GENERIC_LEVEL_CLT_MoveSetUnacknowledged (
  rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter )
```

Generic Move Set Unacknowledged is an unacknowledged message used to start a process of changing the Generic Level state of an element with a defined transition speed.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_generic_level_clt control block. |
| [in] | p_parameter | Pointer to Generic Level Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

Bluetooth Low Energy Mesh Network Generic Level Server (rm_mesh_generic_level_srv)

Modules » Networking » Bluetooth Low Energy Mesh Network Modules

Functions

```
fsp_err_t RM_MESH_GENERIC_LEVEL_SRV_Open
  (rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
  rm_ble_mesh_model_server_cfg_t const *const p_cfg)
```

```
fsp_err_t RM_MESH_GENERIC_LEVEL_SRV_Close
  (rm_ble_mesh_model_server_ctrl_t *const p_ctrl)
```

```
fsp_err_t RM_MESH_GENERIC_LEVEL_SRV_StateUpdate
(rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_ble_mesh_access_server_state_t const *const p_state)
```

Detailed Description

Overview

Target Devices

The Bluetooth Low Energy Energy Mesh Network Generic Level Server module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_generic_level_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_level_srv_cfg.h:

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Configurations for Networking > Bluetooth Low Energy Mesh Network modules > BLE Mesh Model Generic Level Server (rm_mesh_generic_level_srv)

This module can be added to the Stacks tab via New Stack > Networking > Bluetooth Low Energy Mesh Network modules > BLE Mesh Model Generic Level Server (rm_mesh_generic_level_srv).

| Configuration | Options | Default | Description |
|---|-------------------------------|------------------------------|---|
| Interrupts > Callback Provided When Timeout Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh generic level server ISR occurs |
| Interrupts > Callback Provided When an Timeout ISR Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh generic level server timeout ISR occurs |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_generic_level_srv0 | Module name. |

Data Structures

```
struct rm_mesh_generic_level_srv_info_t
```

```
struct rm_mesh_generic_level_srv_instance_ctrl_t
```

Data Structure Documentation

◆ rm_mesh_generic_level_srv_info_t

struct rm_mesh_generic_level_srv_info_t

Generic Level state is a 16-bit signed integer (2-s complement) representing the state of an element

Data Fields

| | | |
|----------|-----------------|---------------|
| uint16_t | level | Generic Level |
| uint32_t | delta_level | Delta Level |
| uint16_t | move_level | Move Level |
| uint8_t | tid | |
| uint8_t | transition_time | |
| uint8_t | delay | |
| uint16_t | target_level | Target Level |

◆ **rm_mesh_generic_level_srv_instance_ctrl_t**

struct rm_mesh_generic_level_srv_instance_ctrl_t

BLE mesh generic level instance control block. DO NOT INITIALIZE. Initialization occurs when [RM_MESH_GENERIC_LEVEL_SRV_Open\(\)](#) is called.

Function Documentation

◆ RM_MESH_GENERIC_LEVEL_SRV_Open()

```
fsp_err_t RM_MESH_GENERIC_LEVEL_SRV_Open ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_ble_mesh_model_server_cfg_t const *const p_cfg )
```

API to initialize Generic_Level Server model. This is to initialize Generic_Level Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_GENERIC_LEVEL_SRV_Open(&g_mesh_generic_level_srv0_ctrl,
&g_mesh_generic_level_srv0_cfg);
```

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

◆ RM_MESH_GENERIC_LEVEL_SRV_Close()

```
fsp_err_t RM_MESH_GENERIC_LEVEL_SRV_Close ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl)
```

API to terminate Generic_Level Server model. This is to terminate Generic_Level Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_GENERIC_LEVEL_SRV_Close(&g_mesh_generic_level_srv0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ RM_MESH_GENERIC_LEVEL_SRV_StateUpdate()

```
fsp_err_t RM_MESH_GENERIC_LEVEL_SRV_StateUpdate ( rm_ble_mesh_model_server_ctrl_t *const
p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state )
```

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements `rm_ble_mesh_model_server_api_t::stateUpdate`.

Example:

```
/* Update server status. */
err = RM_MESH_GENERIC_BATTERY_SRV_StateUpdate(&g_mesh_generic_battery_srv0_ctrl,
&state);
```

Return values

| | |
|--------------------------|-------------------------------------|
| FSP_SUCCESS | Updated server status successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_state is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

Bluetooth Low Energy Mesh Network Generic Location Client (rm_mesh_generic_loc_clt)

Modules » Networking » Bluetooth Low Energy Mesh Network Modules

Functions

```
fsp_err_t RM_MESH_GENERIC_LOC_CLT_Open
(rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
rm_ble_mesh_model_client_cfg_t const *const p_cfg)
```

```
fsp_err_t RM_MESH_GENERIC_LOC_CLT_Close
(rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

| | |
|-----------|--|

```

Data Structure Documentation

◆ rm_mesh_generic_loc_clt_instance_ctrl_t

```
struct rm_mesh_generic_loc_clt_instance_ctrl_t
```

BLE mesh generic loc instance control block. DO NOT INITIALIZE. Initialization occurs when [RM_MESH_GENERIC_LOC_CLT_Open\(\)](#) is called.

Function Documentation

◆ RM_MESH_GENERIC_LOC_CLT_Open()

```
fsp_err_t RM_MESH_GENERIC_LOC_CLT_Open ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
rm_ble_mesh_model_client_cfg_t const *const p_cfg )
```

Open Generic_Location Client middleware. This is to initialize Generic_Location Client model and to register with Access layer.

Implements `rm_ble_mesh_model_client_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_GENERIC_LOC_CLT_Open(&g_mesh_generic_loc_clt0_ctrl,
&g_mesh_generic_loc_clt0_cfg);
```

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

◆ RM_MESH_GENERIC_LOC_CLT_Close()

```
fsp_err_t RM_MESH_GENERIC_LOC_CLT_Close ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Close Generic_Location Client middleware.

Implements `rm_ble_mesh_model_client_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_GENERIC_LOC_CLT_Close(&g_mesh_generic_loc_clt0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ **RM_MESH_GENERIC_LOC_CLT_GetModelHandle()**

```
fsp_err_t RM_MESH_GENERIC_LOC_CLT_GetModelHandle ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, rm_ble_mesh_access_model_handle_t *const p_model_handle )
```

This is to get the handle of Generic_Location client model.

Implements `rm_ble_mesh_model_client_api_t::getModelHandle`.

Example:

```
/* Get the handle of generic_location client model. */
err = RM_MESH_GENERIC_LOC_CLT_GetModelHandle(&g_mesh_generic_loc_clt0_ctrl,
&model_handle);
```

Return values

| | |
|-------------------------|---------------------------------------|
| FSP_SUCCESS | Got model handle successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_POINTER | The parameter p_model_handle is NULL. |

◆ **RM_MESH_GENERIC_LOC_CLT_SetModelHandle()**

```
fsp_err_t RM_MESH_GENERIC_LOC_CLT_SetModelHandle ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, rm_ble_mesh_access_model_handle_t model_handle )
```

DEPRECATED This is to set the handle of Generic_Location client model.

Implements `rm_ble_mesh_model_client_api_t::setModelHandle`.

Return values

| | |
|-------------------|------------------------------------|
| FSP_SUCCESS | Changed model handle successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ RM_MESH_GENERIC_LOC_CLT_SendReliablePdu()

```
fsp_err_t RM_MESH_GENERIC_LOC_CLT_SendReliablePdu ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, uint32_t req_opcode, void const *const p_parameter, uint32_t rsp_opcode )
```

This is to initialize sending acknowledged commands.

Implements `rm_ble_mesh_model_client_api_t::sendReliablePdu`.

Example:

```
/* Initialize sending acknowledged commands */
err = RM_MESH_GENERIC_LOC_CLT_SendReliablePdu(&g_mesh_generic_loc_clt0_ctrl,
req_opcode, p_parameter, rsp_opcode);
```

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_GENERIC_LOC_CLT_LocationGlobalGet()**

```
fsp_err_t RM_MESH_GENERIC_LOC_CLT_LocationGlobalGet ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl)
```

Generic Location Global Get message is an acknowledged message used to get the selected fields of the Generic Location state of an element. The response to the Generic Location Global Get message is a Generic Location Global Status message. There are no parameters for this message.

Parameters

| | | |
|------|--------|--|
| [in] | p_ctrl | rm_mesh_generic_loc_clt control block. |
|------|--------|--|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_GENERIC_LOC_CLT_LocationGlobalSet()

```
fsp_err_t RM_MESH_GENERIC_LOC_CLT_LocationGlobalSet ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

Generic Location Global Set is an acknowledged message used to set the selected fields of the Generic Location state of an element. The response to the Generic Location Global Set message is a Generic Location Global Status message.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_generic_loc_clt control block. |
| [in] | p_parameter | Pointer to Generic Location Global Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_GENERIC_LOC_CLT_LocationGlobalSetUnacknowledged()

```
fsp_err_t RM_MESH_GENERIC_LOC_CLT_LocationGlobalSetUnacknowledged (
rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter )
```

Generic Location Global Set Unacknowledged is an unacknowledged message used to set the selected fields of the Generic Location state of an element.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_generic_loc_clt control block. |
| [in] | p_parameter | Pointer to Generic Location Global Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_GENERIC_LOC_CLT_LocationLocalGet()

```
fsp_err_t RM_MESH_GENERIC_LOC_CLT_LocationLocalGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Generic Location Local Get message is an acknowledged message used to get the selected fields of the Generic Location state of an element. The response to the Generic Location Local Get message is a Generic Location Local Status message. There are no parameters for this message.

Parameters

| | | |
|------|--------|--|
| [in] | p_ctrl | rm_mesh_generic_loc_clt control block. |
|------|--------|--|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_GENERIC_LOC_CLT_LocationLocalSet()

```
fsp_err_t RM_MESH_GENERIC_LOC_CLT_LocationLocalSet ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, void const *const p_parameter )
```

Generic Location Local Set is an acknowledged message used to set the selected fields of the Generic Location state of an element. The response to the Generic Location Local Set message is a Generic Location Local Status message.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_generic_loc_clt control block. |
| [in] | p_parameter | Pointer to Generic Location Local Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_GENERIC_LOC_CLT_LocationLocalSetUnacknowledged()

```
fsp_err_t RM_MESH_GENERIC_LOC_CLT_LocationLocalSetUnacknowledged (
  rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter )
```

Generic Location Local Set Unacknowledged is an unacknowledged message used to set the selected fields of the Generic Location state of an element.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_generic_loc_clt control block. |
| [in] | p_parameter | Pointer to Generic Location Local Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

Bluetooth Low Energy Mesh Network Generic Location Server (rm_mesh_generic_loc_srv)

```

Detailed Description

Overview

Target Devices

The Bluetooth Low Energy Energy Mesh Network Generic Location Server module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_generic_loc_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_loc_srv_cfg.h:

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Configurations for Networking > Bluetooth Low Energy Mesh Network modules > BLE Mesh Model Generic Location Server (rm_mesh_generic_loc_srv)

This module can be added to the Stacks tab via New Stack > Networking > Bluetooth Low Energy Mesh Network modules > BLE Mesh Model Generic Location Server (rm_mesh_generic_loc_srv).

| Configuration | Options | Default | Description |
|---|-------------------------------|----------------------------|--|
| Interrupts > Callback Provided When Timeout Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh generic location server ISR occurs |
| Interrupts > Callback Provided When an Timeout ISR Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh generic location server timeout ISR occurs |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_generic_loc_srv0 | Module name. |

Data Structures

```
struct rm_mesh_generic_loc_srv_global_info_t
```

```
struct rm_mesh_generic_loc_srv_local_info_t
```

```
struct rm_mesh_generic_loc_srv_state_info_t
```

```
struct rm_mesh_generic_loc_srv_instance_ctrl_t
```

Data Structure Documentation

◆ rm_mesh_generic_loc_srv_global_info_t

| | | |
|--|------------------|--------------------------------|
| struct rm_mesh_generic_loc_srv_global_info_t | | |
| Generic Global Location state defines location information of an element | | |
| Data Fields | | |
| uint32_t | global_latitude | Global Coordinates (Latitude) |
| uint32_t | global_longitude | Global Coordinates (Longitude) |
| uint16_t | global_altitude | Global Altitude |

◆ rm_mesh_generic_loc_srv_local_info_t

| | | |
|---|----------------|---------------------------|
| struct rm_mesh_generic_loc_srv_local_info_t | | |
| Generic Local Location state defines location information of an element | | |
| Data Fields | | |
| uint16_t | local_north | Local Coordinates (North) |
| uint16_t | local_east | Local Coordinates (East) |
| uint16_t | local_altitude | Local Altitude |
| uint8_t | floor_number | Floor Number |
| uint16_t | uncertainty | Uncertainty |

◆ rm_mesh_generic_loc_srv_state_info_t

| | | |
|--|-----------------|-----------------|
| struct rm_mesh_generic_loc_srv_state_info_t | | |
| Generic Location state is a composite state that includes a Generic Location Global state and a Generic Location Local state | | |
| Data Fields | | |
| rm_mesh_generic_loc_srv_global_info_t | global_location | Global Location |
| rm_mesh_generic_loc_srv_local_info_t | local_location | Local Location |

◆ rm_mesh_generic_loc_srv_instance_ctrl_t

| | | |
|---|--|--|
| struct rm_mesh_generic_loc_srv_instance_ctrl_t | | |
| BLE mesh generic loc instance control block. DO NOT INITIALIZE. Initialization occurs when <code>RM_MESH_GENERIC_LOC_SRV_Open()</code> is called. | | |

Function Documentation

◆ RM_MESH_GENERIC_LOC_SRV_Open()

```
fsp_err_t RM_MESH_GENERIC_LOC_SRV_Open ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_ble_mesh_model_server_cfg_t const *const p_cfg )
```

API to initialize Generic_Location Server model and to initialize Generic_Location_Setup Server model. This is to initialize Generic_Location Server model and to register with Access layer. And this is to initialize Generic_Location_Setup Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_GENERIC_LOC_SRV_Open(&g_mesh_generic_loc_srv0_ctrl,
&g_mesh_generic_loc_srv0_cfg);
```

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

◆ RM_MESH_GENERIC_LOC_SRV_Close()

```
fsp_err_t RM_MESH_GENERIC_LOC_SRV_Close ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl)
```

API to terminate Generic_Location Server model. This is to terminate Generic_Location Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_GENERIC_LOC_SRV_Close(&g_mesh_generic_loc_srv0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ RM_MESH_GENERIC_LOC_SRV_StateUpdate()

```
fsp_err_t RM_MESH_GENERIC_LOC_SRV_StateUpdate ( rm_ble_mesh_model_server_ctrl_t *const
p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state )
```

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements `rm_ble_mesh_model_server_api_t::stateUpdate`.

Example:

```
/* Update server status. */
err = RM_MESH_GENERIC_LOC_SRV_StateUpdate(&g_mesh_generic_loc_srv0_ctrl, &state);
```

Return values

| | |
|--------------------------|-------------------------------------|
| FSP_SUCCESS | Updated server status successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_state is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_GENERIC_LOC_SRV_SetupServerStateUpdate()

```
fsp_err_t RM_MESH_GENERIC_LOC_SRV_SetupServerStateUpdate (
  rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_access_server_state_t const *const
  p_state )
```

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Parameters

| | | |
|------|---------|---|
| [in] | p_ctrl | rm_mesh_generic_loc_srv control block. |
| [in] | p_state | To send reply for a request or to inform change in state. |

Return values

| | |
|--------------------------|--------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_state is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

Bluetooth Low Energy Mesh Network Generic Manufacturer Property Server (rm_mesh_generic_mfr_prop_srv)

Modules » Networking » Bluetooth Low Energy Mesh Network Modules

Functions

```
fsp_err_t RM_MESH_GENERIC_MFR_PROP_SRV_Open

```

Detailed Description

Overview

Target Devices

The Bluetooth Low Energy Energy Mesh Network Generic Manufacturer Property Server module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_generic_mfr_prop_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_mfr_prop_srv_cfg.h:

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Configurations for Networking > Bluetooth Low Energy Mesh Network modules > BLE Mesh Model Generic Manufacturer Property Server (rm_mesh_generic_mfr_prop_srv)

This module can be added to the Stacks tab via New Stack > Networking > Bluetooth Low Energy Mesh Network modules > BLE Mesh Model Generic Manufacturer Property Server (rm_mesh_generic_mfr_prop_srv).

| Configuration | Options | Default | Description |
|---|-------------------------------|---------------------------------|---|
| Interrupts > Callback Provided When Timeout Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh generic manufacturer property server ISR occurs |
| Interrupts > Callback Provided When an Timeout ISR Occurs | Name Must be a Valid C Symbol | NULL | Callback provided when mesh generic manufacturer property server timeout ISR occurs |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_generic_mfr_prop_srv0 | Module name. |

Data Structures

```
struct rm_mesh_generic_mfr_prop_srv_info_t
```

```
struct rm_mesh_generic_mfr_prop_srv_instance_ctrl_t
```

Data Structure Documentation

◆ rm_mesh_generic_mfr_prop_srv_info_t

| | | |
|--|--------------------|---|
| struct rm_mesh_generic_mfr_prop_srv_info_t | | |
| Generic Manufacturer Property is a state representing a device property of an element that is programmed by a manufacturer and can be read | | |
| Data Fields | | |
| uint16_t | property_id | Manufacturer Property ID field is a 2-octet Assigned Number value that references a device property |
| uint8_t | user_access | Manufacturer User Access field is an enumeration indicating whether or not the device property can be read as a Generic User Property |
| uint8_t * | property_value | Manufacturer Property Value field is a conditional field |
| uint16_t | property_value_len | |

◆ rm_mesh_generic_mfr_prop_srv_instance_ctrl_t

| | |
|--|--|
| struct rm_mesh_generic_mfr_prop_srv_instance_ctrl_t | |
| BLE mesh generic mfr prop instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_GENERIC_MFR_PROP_SRV_Open() is called. | |

Function Documentation

◆ RM_MESH_GENERIC_MFR_PROP_SRV_Open()

```
fsp_err_t RM_MESH_GENERIC_MFR_PROP_SRV_Open ( rm_ble_mesh_model_server_ctrl_t *const
p_ctrl, rm_ble_mesh_model_server_cfg_t const *const p_cfg )
```

API to initialize Generic_Manufacturer_Property Server model. This is to initialize Generic_Manufacturer_Property Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_GENERIC_MFR_PROP_SRV_Open(&g_mesh_generic_mfr_prop_srv0_ctrl,
&g_mesh_generic_mfr_prop_srv0_cfg);
```

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

◆ RM_MESH_GENERIC_MFR_PROP_SRV_Close()

```
fsp_err_t RM_MESH_GENERIC_MFR_PROP_SRV_Close ( rm_ble_mesh_model_server_ctrl_t *const
p_ctrl)
```

API to terminate Generic_Manufacturer_Property Server model. This is to terminate Generic_Manufacturer_Property Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_GENERIC_MFR_PROP_SRV_Close(&g_mesh_generic_mfr_prop_srv0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ RM_MESH_GENERIC_MFR_PROP_SRV_StateUpdate()

```
fsp_err_t RM_MESH_GENERIC_MFR_PROP_SRV_StateUpdate ( rm_ble_mesh_model_server_ctrl_t
*const p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state )
```

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements `rm_ble_mesh_model_server_api_t::stateUpdate`.

Example:

```
/* Update server status. */
err =
RM_MESH_GENERIC_MFR_PROP_SRV_StateUpdate(&g_mesh_generic_mfr_prop_srv0_ctrl, &state);
```

Return values

| | |
|--------------------------|-------------------------------------|
| FSP_SUCCESS | Updated server status successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_state is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

Detailed Description

Overview

Target Devices

The Bluetooth Low Energy Energy Mesh Network Generic On Off Client module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_generic_on_off_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_on_off_clt_cfg.h:

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Configurations for Networking > Bluetooth Low Energy Mesh Network modules > BLE Mesh Model Generic On Off Client (rm_mesh_generic_on_off_clt)

This module can be added to the Stacks tab via New Stack > Networking > Bluetooth Low Energy Mesh Network modules > BLE Mesh Model Generic On Off Client (rm_mesh_generic_on_off_clt).

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

| | | | |
|--|-------------------------------|-------------------------------|--|
| Interrupts > Callback Provided When Timeout Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh generic on off client ISR occurs |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_generic_on_off_clt0 | Module name. |

Data Structures

```
struct rm_mesh_generic_on_off_clt_instance_ctrl_t
```

Data Structure Documentation

◆ rm_mesh_generic_on_off_clt_instance_ctrl_t

```
struct rm_mesh_generic_on_off_clt_instance_ctrl_t
```

BLE mesh generic on off instance control block. DO NOT INITIALIZE. Initialization occurs when [RM_MESH_GENERIC_ON_OFF_CLT_Open\(\)](#) is called.

Function Documentation

◆ RM_MESH_GENERIC_ON_OFF_CLT_Open()

```
fsp_err_t RM_MESH_GENERIC_ON_OFF_CLT_Open ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
rm_ble_mesh_model_client_cfg_t const *const p_cfg )
```

Open Generic_Onoff Client middleware. This is to initialize Generic_Onoff Client model and to register with Access layer.

Implements [rm_ble_mesh_model_client_api_t::open](#).

Example:

```
/* Open the module. */
err = RM_MESH_GENERIC_ON_OFF_CLT_Open(&g_mesh_generic_on_off_clt0_ctrl,
&g_mesh_generic_on_off_clt0_cfg);
```

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

◆ RM_MESH_GENERIC_ON_OFF_CLT_Close()

```
fsp_err_t RM_MESH_GENERIC_ON_OFF_CLT_Close ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Close Generic_Onoff Client middleware.

Implements `rm_ble_mesh_model_client_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_GENERIC_ON_OFF_CLT_Close(&g_mesh_generic_on_off_clt0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ RM_MESH_GENERIC_ON_OFF_CLT_GetModelHandle()

```
fsp_err_t RM_MESH_GENERIC_ON_OFF_CLT_GetModelHandle ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, rm_ble_mesh_access_model_handle_t *const p_model_handle )
```

This is to get the handle of Generic_Onoff client model.

Implements `rm_ble_mesh_model_client_api_t::getModelHandle`.

Example:

```
/* Get the handle of generic on_off client model. */
err = RM_MESH_GENERIC_ON_OFF_CLT_GetModelHandle(&g_mesh_generic_on_off_clt0_ctrl,
&model_handle);
```

Return values

| | |
|-------------------------|---------------------------------------|
| FSP_SUCCESS | Got model handle successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_POINTER | The parameter p_model_handle is NULL. |

◆ RM_MESH_GENERIC_ON_OFF_CLT_SetModelHandle()

```
fsp_err_t RM_MESH_GENERIC_ON_OFF_CLT_SetModelHandle ( rm_ble_mesh_model_client_ctrl_t  
*const p_ctrl, rm_ble_mesh_access_model_handle_t model_handle )
```

DEPRECATED This is to set the handle of Generic_Onoff client model.

Implements `rm_ble_mesh_model_client_api_t::setModelHandle`.

Return values

| | |
|-------------------|------------------------------------|
| FSP_SUCCESS | Changed model handle successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ **RM_MESH_GENERIC_ON_OFF_CLT_SendReliablePdu()**

```
fsp_err_t RM_MESH_GENERIC_ON_OFF_CLT_SendReliablePdu ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, uint32_t req_opcode, void const *const p_parameter, uint32_t rsp_opcode )
```

This is to initialize sending acknowledged commands.

Implements `rm_ble_mesh_model_client_api_t::sendReliablePdu`.

Example:

```
/* Initialize sending acknowledged commands. */
err =
RM_MESH_GENERIC_ON_OFF_CLT_SendReliablePdu(&g_mesh_generic_on_off_clt0_ctrl,
                                             req_opcode,
                                             p_parameter,
                                             rsp_opcode);
```

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_GENERIC_ON_OFF_CLT_Get()**

```
fsp_err_t RM_MESH_GENERIC_ON_OFF_CLT_Get ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

The Generic OnOff Get is an acknowledged message used to get the Generic OnOff state of an element.

Parameters

| | | |
|------|--------|---|
| [in] | p_ctrl | rm_mesh_generic_on_off_clt control block. |
|------|--------|---|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_GENERIC_ON_OFF_CLT_Set()**

```
fsp_err_t RM_MESH_GENERIC_ON_OFF_CLT_Set ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

The Generic OnOff Set is an acknowledged message used to get the Generic OnOff state of an element.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_generic_on_off_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_generic_on_off_set_info_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_GENERIC_ON_OFF_CLT_SetUnacknowledged()

```
fsp_err_t RM_MESH_GENERIC_ON_OFF_CLT_SetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

The Generic OnOff Set is an unacknowledged message used to get the Generic OnOff state of an element.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_generic_on_off_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_generic_on_off_set_info_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

Bluetooth Low Energy Mesh Network Generic On Off Server (rm_mesh_generic_on_off_srv)

Modules » Networking » Bluetooth Low Energy Mesh Network Modules

Functions

```
fsp_err_t RM_MESH_GENERIC_ON_OFF_SRV_Open
(rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_ble_mesh_model_server_cfg_t const *const p_cfg)
```

```
fsp_err_t RM_MESH_GENERIC_ON_OFF_SRV_Close
          (rm_ble_mesh_model_server_ctrl_t *const p_ctrl)
```

```
fsp_err_t RM_MESH_GENERIC_ON_OFF_SRV_StateUpdate
          (rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
          rm_ble_mesh_access_server_state_t const *const p_state)
```

Detailed Description

Overview

Target Devices

The Bluetooth Low Energy Energy Mesh Network Generic On Off Server module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_generic_on_off_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_on_off_srv_cfg.h:

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Configurations for Networking > Bluetooth Low Energy Mesh Network modules > BLE Mesh Model Generic On Off Server (rm_mesh_generic_on_off_srv)

This module can be added to the Stacks tab via New Stack > Networking > Bluetooth Low Energy Mesh Network modules > BLE Mesh Model Generic On Off Server (rm_mesh_generic_on_off_srv).

| Configuration | Options | Default | Description |
|---|-------------------------------|-------------------------------|--|
| Interrupts > Callback Provided When Timeout Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh generic on off server ISR occurs |
| Interrupts > Callback Provided When an Timeout ISR Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh generic on off server timeout ISR occurs |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_generic_on_off_srv0 | Module name. |

Data Structures

```
struct rm_mesh_generic_on_off_srv_info_t
```

```
struct rm_mesh_generic_on_off_srv_instance_ctrl_t
```

Data Structure Documentation

◆ rm_mesh_generic_on_off_srv_info_t

| | | |
|--|------------------------|--|
| struct rm_mesh_generic_on_off_srv_info_t | | |
| Generic OnOff state is a Boolean value that represents the state of an element | | |
| Data Fields | | |
| uint8_t | onoff | Generic On/Off |
| uint8_t | target_onoff | Target On/Off - Used in response path |
| uint8_t | last_onoff | Last On/Off |
| uint8_t | tid | TID - Used in request path |
| uint8_t | transition_time | Transition Time - Used in request path. Used as remaining time in response path. |
| uint8_t | delay | Delay - Used in request path |
| uint16_t | transition_time_handle | Transition Timer Handle |

◆ rm_mesh_generic_on_off_srv_instance_ctrl_t

| | |
|--|--|
| struct rm_mesh_generic_on_off_srv_instance_ctrl_t | |
| BLE mesh generic on off instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_GENERIC_ON_OFF_SRV_Open() is called. | |

Function Documentation

◆ RM_MESH_GENERIC_ON_OFF_SRV_Open()

```
fsp_err_t RM_MESH_GENERIC_ON_OFF_SRV_Open ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_ble_mesh_model_server_cfg_t const *const p_cfg )
```

API to initialize Generic_Onoff Server model. This is to initialize Generic_Onoff Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_GENERIC_ON_OFF_SRV_Open(&g_mesh_generic_on_off_srv0_ctrl,
&g_mesh_generic_on_off_srv0_cfg);
```

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

◆ RM_MESH_GENERIC_ON_OFF_SRV_Close()

```
fsp_err_t RM_MESH_GENERIC_ON_OFF_SRV_Close ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl)
```

API to terminate Generic_Onoff Server model. This is to terminate Generic_Onoff Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_GENERIC_ON_OFF_SRV_Close(&g_mesh_generic_on_off_srv0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ RM_MESH_GENERIC_ON_OFF_SRV_StateUpdate()

```
fsp_err_t RM_MESH_GENERIC_ON_OFF_SRV_StateUpdate ( rm_ble_mesh_model_server_ctrl_t *const
p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state )
```

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements `rm_ble_mesh_model_server_api_t::stateUpdate`.

Example:

```
/* Update server status. */
err = RM_MESH_GENERIC_ON_OFF_SRV_StateUpdate(&g_mesh_generic_on_off_srv0_ctrl,
&state);
```

Return values

| | |
|--------------------------|-------------------------------------|
| FSP_SUCCESS | Updated server status successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_state is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

Bluetooth Low Energy Mesh Network Generic Power Level Client (rm_mesh_generic_pl_clt)

Modules » Networking » Bluetooth Low Energy Mesh Network Modules

Functions

```
fsp_err_t RM_MESH_GENERIC_PL_CLT_Open (rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, rm_ble_mesh_model_client_cfg_t const *const p_cfg)
```

```
fsp_err_t RM_MESH_GENERIC_PL_CLT_Close (rm_ble_mesh_model_client_ctrl_t
*const p_ctrl)
```

| | |
|-----------|---|
| fsp_err_t | RM_MESH_GENERIC_PL_CLT_GetModelHandle (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, rm_ble_mesh_access_model_handle_t *const p_model_handle) |
| fsp_err_t | RM_MESH_GENERIC_PL_CLT_SetModelHandle (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, rm_ble_mesh_access_model_handle_t model_handle) |
| fsp_err_t | RM_MESH_GENERIC_PL_CLT_SendReliablePdu (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, uint32_t req_opcode, void const *const p_parameter, uint32_t rsp_opcode) |
| fsp_err_t | RM_MESH_GENERIC_PL_CLT_LevelGet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl) |
| fsp_err_t | RM_MESH_GENERIC_PL_CLT_LevelSet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter) |
| fsp_err_t | RM_MESH_GENERIC_PL_CLT_LevelSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter) |
| fsp_err_t | RM_MESH_GENERIC_PL_CLT_LastGet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl) |
| fsp_err_t | RM_MESH_GENERIC_PL_CLT_DefaultGet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl) |
| fsp_err_t | RM_MESH_GENERIC_PL_CLT_DefaultSet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter) |
| fsp_err_t | RM_MESH_GENERIC_PL_CLT_DefaultSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter) |
| fsp_err_t | RM_MESH_GENERIC_PL_CLT_RangeGet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl) |
| fsp_err_t | RM_MESH_GENERIC_PL_CLT_RangeSet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter) |
| fsp_err_t | RM_MESH_GENERIC_PL_CLT_RangeSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter) |

Detailed Description

Overview

Target Devices

The Bluetooth Low Energy Energy Mesh Network Generic Power Level Client module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_generic_pl_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_pl_clt_cfg.h:

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Configurations for Networking > Bluetooth Low Energy Mesh Network modules > BLE Mesh Model Generic Power Level Client (rm_mesh_generic_pl_clt)

This module can be added to the Stacks tab via New Stack > Networking > Bluetooth Low Energy Mesh Network modules > BLE Mesh Model Generic Power Level Client (rm_mesh_generic_pl_clt).

| Configuration | Options | Default | Description |
|--|-------------------------------|---------------------------|---|
| Interrupts > Callback Provided When Timeout Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh generic power level client ISR occurs |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_generic_pl_clt0 | Module name. |

Data Structures

```
struct rm_mesh_generic_pl_clt_instance_ctrl_t
```

Data Structure Documentation

◆ rm_mesh_generic_pl_clt_instance_ctrl_t

```
struct rm_mesh_generic_pl_clt_instance_ctrl_t
```

BLE mesh generic pl instance control block. DO NOT INITIALIZE. Initialization occurs when [RM_MESH_GENERIC_PL_CLT_Open\(\)](#) is called.

Function Documentation

◆ RM_MESH_GENERIC_PL_CLT_Open()

```
fsp_err_t RM_MESH_GENERIC_PL_CLT_Open ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
rm_ble_mesh_model_client_cfg_t const *const p_cfg )
```

Open Generic_Power_Level Client middleware. This is to initialize Generic_Power_Level Client model and to register with Access layer.

Implements `rm_ble_mesh_model_client_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_GENERIC_PL_CLT_Open(&g_mesh_generic_pl_clt0_ctrl,
&g_mesh_generic_pl_clt0_cfg);
```

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

◆ RM_MESH_GENERIC_PL_CLT_Close()

```
fsp_err_t RM_MESH_GENERIC_PL_CLT_Close ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Close Generic_Power_Level Client middleware.

Implements `rm_ble_mesh_model_client_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_GENERIC_PL_CLT_Close(&g_mesh_generic_pl_clt0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ RM_MESH_GENERIC_PL_CLT_GetModelHandle()

```
fsp_err_t RM_MESH_GENERIC_PL_CLT_GetModelHandle ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, rm_ble_mesh_access_model_handle_t *const p_model_handle )
```

This is to get the handle of Generic_Power_Level client model. Implements `rm_ble_mesh_model_client_api_t::getModelHandle`.

Example:

```
/* Get the handle of generic power level client model. */
err = RM_MESH_GENERIC_PL_CLT_GetModelHandle(&g_mesh_generic_pl_clt0_ctrl,
&model_handle);
```

Return values

| | |
|-------------------------|---------------------------------------|
| FSP_SUCCESS | Got model handle successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_POINTER | The parameter p_model_handle is NULL. |

◆ RM_MESH_GENERIC_PL_CLT_SetModelHandle()

```
fsp_err_t RM_MESH_GENERIC_PL_CLT_SetModelHandle ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, rm_ble_mesh_access_model_handle_t model_handle )
```

DEPRECATED This is to set the handle of Generic_Power_Level client model.

Implements `rm_ble_mesh_model_client_api_t::setModelHandle`.

Return values

| | |
|-------------------|------------------------------------|
| FSP_SUCCESS | Changed model handle successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ RM_MESH_GENERIC_PL_CLT_SendReliablePdu()

```
fsp_err_t RM_MESH_GENERIC_PL_CLT_SendReliablePdu ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, uint32_t req_opcode, void const *const p_parameter, uint32_t rsp_opcode )
```

This is to initialize sending acknowledged commands. Implements `rm_ble_mesh_model_client_api_t::sendReliablePdu`.

Example:

```
/* Initialize sending acknowledged commands. */
err = RM_MESH_GENERIC_PL_CLT_SendReliablePdu(&g_mesh_generic_pl_clt0_ctrl,
req_opcode, p_parameter, rsp_opcode);
```

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_GENERIC_PL_CLT_LevelGet()**

```
fsp_err_t RM_MESH_GENERIC_PL_CLT_LevelGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Generic Power Level Get message is an acknowledged message used to get the Generic Power Actual state of an element. The response to the Generic Power Level Get message is a Generic Power Level Status message. There are no parameters for this message.

Parameters

| | | |
|------|--------|---------------------------------------|
| [in] | p_ctrl | rm_mesh_generic_pl_clt control block. |
|------|--------|---------------------------------------|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_GENERIC_PL_CLT_LevelSet()

```
fsp_err_t RM_MESH_GENERIC_PL_CLT_LevelSet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

Generic Power Level Set is an acknowledged message used to set the Generic Power Actual state of an element. The response to the Generic Power Level Set message is a Generic Power Level Status message.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_generic_pl_clt control block. |
| [in] | p_parameter | Pointer to Generic Power Level Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_GENERIC_PL_CLT_LevelSetUnacknowledged()

```
fsp_err_t RM_MESH_GENERIC_PL_CLT_LevelSetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

Generic Power Level Set Unacknowledged is an unacknowledged message used to set the Generic Power Actual state of an element.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_generic_pl_clt control block. |
| [in] | p_parameter | Pointer to Generic Power Level Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_GENERIC_PL_CLT_LastGet()**

```
fsp_err_t RM_MESH_GENERIC_PL_CLT_LastGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Generic Power Last Get is an acknowledged message used to get the Generic Power Last state of an element. The response to a Generic Power Last Get message is a Generic Power Last Status message. There are no parameters for this message.

Parameters

| | | |
|------|--------|---------------------------------------|
| [in] | p_ctrl | rm_mesh_generic_pl_clt control block. |
|------|--------|---------------------------------------|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_GENERIC_PL_CLT_DefaultGet()**

```
fsp_err_t RM_MESH_GENERIC_PL_CLT_DefaultGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Generic Power Default Get is an acknowledged message used to get the Generic Power Default state of an element. The response to a Generic Power Default Get message is a Generic Power Default Status message. There are no parameters for this message.

Parameters

| | | |
|------|--------|---------------------------------------|
| [in] | p_ctrl | rm_mesh_generic_pl_clt control block. |
|------|--------|---------------------------------------|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_GENERIC_PL_CLT_DefaultSet()

```
fsp_err_t RM_MESH_GENERIC_PL_CLT_DefaultSet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

Generic Power Default Set is an acknowledged message used to set the Generic Power Default state of an element. The response to the Generic Power Default Set message is a Generic Power Default Status message.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_generic_pl_clt control block. |
| [in] | p_parameter | Pointer to Generic Power Default Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_GENERIC_PL_CLT_DefaultSetUnacknowledged()

```
fsp_err_t RM_MESH_GENERIC_PL_CLT_DefaultSetUnacknowledged (
  rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter )
```

Generic Power Default Set Unacknowledged is an unacknowledged message used to set the Generic Power Default state of an element.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_generic_pl_clt control block. |
| [in] | p_parameter | Pointer to Generic Power Default Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_GENERIC_PL_CLT_RangeGet()**

```
fsp_err_t RM_MESH_GENERIC_PL_CLT_RangeGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Generic Power Range Get is an acknowledged message used to get the Generic Power Range state of an element. The response to the Generic Power Range Get message is a Generic Power Range Status message. There are no parameters for this message.

Parameters

| | | |
|------|--------|---------------------------------------|
| [in] | p_ctrl | rm_mesh_generic_pl_clt control block. |
|------|--------|---------------------------------------|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_GENERIC_PL_CLT_RangeSet()

```
fsp_err_t RM_MESH_GENERIC_PL_CLT_RangeSet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

Generic Power Range Set is an acknowledged message used to set the Generic Power Range state of an element. The response to the Generic Power Range Set message is a Generic Power Range Status message.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_generic_pl_clt control block. |
| [in] | p_parameter | Pointer to Generic Power Range Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_GENERIC_PL_CLT_RangeSetUnacknowledged()

```
fsp_err_t RM_MESH_GENERIC_PL_CLT_RangeSetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

Generic Power Range Set Unacknowledged is an unacknowledged message used to set the Generic Power Range state of an element.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_generic_pl_clt control block. |
| [in] | p_parameter | Pointer to Generic Power Range Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

Detailed Description

Overview

Target Devices

The Bluetooth Low Energy Energy Mesh Network Generic Power Level Server module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_generic_pl_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_pl_srv_cfg.h:

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Configurations for Networking > Bluetooth Low Energy Mesh Network modules > BLE Mesh Model Generic Power Level Server (rm_mesh_generic_pl_srv)

This module can be added to the Stacks tab via New Stack > Networking > Bluetooth Low Energy Mesh Network modules > BLE Mesh Model Generic Power Level Server (rm_mesh_generic_pl_srv).

| Configuration | Options | Default | Description |
|---|-------------------------------|---------------------------|---|
| Interrupts > Callback Provided when Timeout Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh generic power level server ISR occurs |
| Interrupts > Callback Provided when an Timeout ISR Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh generic power level server timeout ISR occurs |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_generic_pl_srv0 | Module name. |

Data Structures

```
struct rm_mesh_generic_pl_srv_actual_state_info_t
```

```
struct rm_mesh_generic_pl_srv_last_state_info_t
```

```
struct rm_mesh_generic_pl_srv_default_state_info_t
```

```
struct rm_mesh_generic_pl_srv_range_state_info_t
```

```
struct rm_mesh_generic_pl_srv_state_info_t
```

```
struct rm_mesh_generic_pl_srv_instance_ctrl_t
```

Data Structure Documentation

◆ rm_mesh_generic_pl_srv_actual_state_info_t

| Data Fields | | |
|-------------|------------------------|---|
| uint16_t | power_actual | Generic Power Actual |
| uint8_t | tid | |
| uint16_t | power_target | Generic Power Target - Used only in response path |
| uint8_t | transition_time | Transition Time - Used in request path Used as Remaining Time in response path |
| uint8_t | delay | |
| uint16_t | transition_time_handle | Transition Timer Handle |

◆ rm_mesh_generic_pl_srv_last_state_info_t

| Data Fields | | |
|-------------|------------|--------------------|
| uint16_t | power_last | Generic Power Last |

◆ rm_mesh_generic_pl_srv_default_state_info_t

| Data Fields | | |
|-------------|---------------|-----------------------|
| uint16_t | power_default | Generic Power Default |

◆ rm_mesh_generic_pl_srv_range_state_info_t

| struct rm_mesh_generic_pl_srv_range_state_info_t | | |
|---|-----------------|---|
| Generic Power Range state determines the minimum and maximum power levels of an element relative to the maximum power level an element can output | | |
| Data Fields | | |
| uint16_t | power_range_min | Generic Power Range - Minimum |
| uint16_t | power_range_max | Generic Power Range - Maximum |
| uint8_t | status | Status - Used only in the response path |

◆ rm_mesh_generic_pl_srv_state_info_t

| struct rm_mesh_generic_pl_srv_state_info_t | | |
|---|-----------------------|-----------------------|
| Generic Power Level state is a composite state that includes a Generic Power Actual state, a Generic Power Last state, a Generic Power Default state, and a Generic Power Range state | | |
| Data Fields | | |
| rm_mesh_generic_pl_srv_actual_state_info_t | generic_power_actual | Generic Power Actual |
| rm_mesh_generic_pl_srv_last_state_info_t | generic_power_last | Generic Power Last |
| rm_mesh_generic_pl_srv_default_state_info_t | generic_power_default | Generic Power Default |
| rm_mesh_generic_pl_srv_range_state_info_t | generic_power_range | Generic Power Range |

◆ rm_mesh_generic_pl_srv_instance_ctrl_t

| struct rm_mesh_generic_pl_srv_instance_ctrl_t |
|--|
| BLE mesh generic pl instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_GENERIC_PL_SRV_Open() is called. |

Function Documentation

◆ RM_MESH_GENERIC_PL_SRV_Open()

```
fsp_err_t RM_MESH_GENERIC_PL_SRV_Open ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_ble_mesh_model_server_cfg_t const *const p_cfg )
```

API to initialize Generic_Power_Level Server model and to initialize Generic_Power_Level_Setup Server model. This is to initialize Generic_Power_Level Server model and to register with Access layer. And this is to initialize Generic_Power_Level_Setup Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_GENERIC_PL_SRV_Open(&g_mesh_generic_pl_srv0_ctrl,
&g_mesh_generic_pl_srv0_cfg);
```

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

◆ RM_MESH_GENERIC_PL_SRV_Close()

```
fsp_err_t RM_MESH_GENERIC_PL_SRV_Close ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl)
```

API to terminate Generic_Power_Level Server model. This is to terminate Generic_Power_Level Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_GENERIC_PL_SRV_Close(&g_mesh_generic_pl_srv0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ RM_MESH_GENERIC_PL_SRV_StateUpdate()

```
fsp_err_t RM_MESH_GENERIC_PL_SRV_StateUpdate ( rm_ble_mesh_model_server_ctrl_t *const
p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state )
```

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements `rm_ble_mesh_model_server_api_t::stateUpdate`.

Example:

```
/* Update server status. */
err = RM_MESH_GENERIC_PL_SRV_StateUpdate(&g_mesh_generic_pl_srv0_ctrl, &state);
```

Return values

| | |
|--------------------------|-------------------------------------|
| FSP_SUCCESS | Updated server status successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_state is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_GENERIC_PL_SRV_SetupServerStateUpdate()

```
fsp_err_t RM_MESH_GENERIC_PL_SRV_SetupServerStateUpdate ( rm_ble_mesh_model_server_ctrl_t
*const p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state )
```

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Parameters

| | | |
|------|---------|---|
| [in] | p_ctrl | rm_mesh_generic_pl_srv control block. |
| [in] | p_state | To send reply for a request or to inform change in state. |

Return values

| | |
|--------------------------|--------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_state is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

| Name | Name Must Be a Valid C Symbol | g_rm_mesh_generic_poo_clt0 | Module name. |

Data Structures

```
struct rm_mesh_generic_poo_clt_instance_ctrl_t
```

Data Structure Documentation

◆ rm_mesh_generic_poo_clt_instance_ctrl_t

```
struct rm_mesh_generic_poo_clt_instance_ctrl_t
```

BLE mesh generic poo instance control block. DO NOT INITIALIZE. Initialization occurs when [RM_MESH_GENERIC_POO_CLT_Open\(\)](#) is called.

Function Documentation

◆ RM_MESH_GENERIC_POO_CLT_Open()

```
fsp_err_t RM_MESH_GENERIC_POO_CLT_Open ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
rm_ble_mesh_model_client_cfg_t const *const p_cfg )
```

Open Generic_Power_Onoff Client middleware. This is to initialize Generic_Power_Onoff Client model and to register with Access layer.

Implements [rm_ble_mesh_model_client_api_t::open](#).

Example:

```
/* Open the module. */
err = RM_MESH_GENERIC_POO_CLT_Open(&g_mesh_generic_poo_clt0_ctrl,
&g_mesh_generic_poo_clt0_cfg);
```

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

◆ RM_MESH_GENERIC_POO_CLT_Close()

```
fsp_err_t RM_MESH_GENERIC_POO_CLT_Close ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Close Generic_Power_Onoff Client middleware.

Implements `rm_ble_mesh_model_client_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_GENERIC_POO_CLT_Close(&g_mesh_generic_poo_clt0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ RM_MESH_GENERIC_POO_CLT_GetModelHandle()

```
fsp_err_t RM_MESH_GENERIC_POO_CLT_GetModelHandle ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl, rm_ble_mesh_access_model_handle_t *const p_model_handle )
```

This is to get the handle of Generic_Power_Onoff client model.

Implements `rm_ble_mesh_model_client_api_t::getModelHandle`.

Example:

```
/* Get the handle of generic power on off client model. */
err = RM_MESH_GENERIC_POO_CLT_GetModelHandle(&g_mesh_generic_poo_clt0_ctrl,
&model_handle);
```

Return values

| | |
|-------------------------|---------------------------------------|
| FSP_SUCCESS | Got model handle successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_POINTER | The parameter p_model_handle is NULL. |

◆ RM_MESH_GENERIC_POO_CLT_SetModelHandle()

```
fsp_err_t RM_MESH_GENERIC_POO_CLT_SetModelHandle ( rm_ble_mesh_model_client_ctrl_t *const  
p_ctrl, rm_ble_mesh_access_model_handle_t model_handle )
```

DEPRECATED This is to set the handle of Generic_Power_Onoff client model.

Implements `rm_ble_mesh_model_client_api_t::setModelHandle`.

Return values

| | |
|-------------------|------------------------------------|
| FSP_SUCCESS | Changed model handle successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ RM_MESH_GENERIC_POO_CLT_SendReliablePdu()

```
fsp_err_t RM_MESH_GENERIC_POO_CLT_SendReliablePdu ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, uint32_t req_opcode, void const *const p_parameter, uint32_t rsp_opcode )
```

This is to initialize sending acknowledged commands.

Implements `rm_ble_mesh_model_client_api_t::sendReliablePdu`

Example:

```
/* Initialize sending acknowledged commands. */
err = RM_MESH_GENERIC_POO_CLT_SendReliablePdu(&g_mesh_generic_poo_clt0_ctrl,
req_opcode, p_parameter, rsp_opcode);
```

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_GENERIC_POO_CLT_OnpowerupGet()

```
fsp_err_t RM_MESH_GENERIC_POO_CLT_OnpowerupGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Generic OnPowerUp Get is an acknowledged message used to get the Generic OnPowerUp state of an element. The response to the Generic OnPowerUp Get message is a Generic OnPowerUp Status message. There are no parameters for this message.

Parameters

| | | |
|------|--------|--|
| [in] | p_ctrl | rm_mesh_generic_poo_clt control block. |
|------|--------|--|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_GENERIC_POO_CLT_OnpowerupSet()

```
fsp_err_t RM_MESH_GENERIC_POO_CLT_OnpowerupSet ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, void const *const p_parameter )
```

Generic OnPowerUp Set is an acknowledged message used to set the Generic OnPowerUp state of an element. The response to the Generic OnPowerUp Set message is a Generic OnPowerUp Status message.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_generic_poo_clt control block. |
| [in] | p_parameter | Pointer to Generic OnPowerUp Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_GENERIC_POO_CLT_OnpowerupSetUnacknowledged()

```
fsp_err_t RM_MESH_GENERIC_POO_CLT_OnpowerupSetUnacknowledged (
rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter )
```

Generic OnPowerUp Set Unacknowledged is an unacknowledged message used to set the Generic OnPowerUp state of an element.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_generic_poo_clt control block. |
| [in] | p_parameter | Pointer to Generic OnPowerUp Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

Bluetooth Low Energy Mesh Network Generic Power On Off Server (rm_mesh_generic_poo_srv)

Modules » Networking » Bluetooth Low Energy Mesh Network Modules

Functions

```
fsp_err_t RM_MESH_GENERIC_POO_SRV_Open
(rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_ble_mesh_model_server_cfg_t const *const p_cfg)
```

```
fsp_err_t RM_MESH_GENERIC_POO_SRV_Close
(rm_ble_mesh_model_server_ctrl_t *const p_ctrl)
```

```
fsp_err_t RM_MESH_GENERIC_POO_SRV_StateUpdate
          (rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
           rm_ble_mesh_access_server_state_t const *const p_state)
```

```
fsp_err_t RM_MESH_GENERIC_POO_SRV_SetupServerStateUpdate
          (rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
           rm_ble_mesh_access_server_state_t const *const p_state)
```

Detailed Description

Overview

Target Devices

The Bluetooth Low Energy Energy Mesh Network Generic Power On Off Server module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_generic_poo_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_poo_srv_cfg.h:

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Configurations for Networking > Bluetooth Low Energy Mesh Network modules > BLE Mesh Model Generic Power On Off Server (rm_mesh_generic_poo_srv)

This module can be added to the Stacks tab via New Stack > Networking > Bluetooth Low Energy Mesh Network modules > BLE Mesh Model Generic Power On Off Server (rm_mesh_generic_poo_srv).

| Configuration | Options | Default | Description |
|---|-------------------------------|----------------------------|--|
| Interrupts > Callback Provided when Timeout Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh generic power on off server ISR occurs |
| Interrupts > Callback Provided when an Timeout ISR Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh generic power on off server timeout ISR occurs |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_generic_poo_srv0 | Module name. |

Data Structures

```
struct rm_mesh_generic_poo_srv_on_power_up_state_info_t
```

```
struct rm_mesh_generic_poo_srv_instance_ctrl_t
```

Data Structure Documentation

◆ rm_mesh_generic_poo_srv_on_power_up_state_info_t

```
struct rm_mesh_generic_poo_srv_on_power_up_state_info_t
```

Generic OnPowerUp state is an enumeration representing the behavior of an element when powered up

Data Fields

| | | |
|---------|-----------|-------------------|
| uint8_t | onpowerup | Generic OnPowerUp |
|---------|-----------|-------------------|

◆ rm_mesh_generic_poo_srv_instance_ctrl_t

```
struct rm_mesh_generic_poo_srv_instance_ctrl_t
```

BLE mesh generic poo instance control block. DO NOT INITIALIZE. Initialization occurs when `RM_MESH_GENERIC_POO_SRV_Open()` is called.

Function Documentation

◆ RM_MESH_GENERIC_POO_SRV_Open()

```
fsp_err_t RM_MESH_GENERIC_POO_SRV_Open ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_ble_mesh_model_server_cfg_t const *const p_cfg )
```

API to initialize Generic_Power_Onoff Server model and to initialize Generic_Power_Onoff_Setup Server model. This is to initialize Generic_Power_Onoff Server model and to register with Access layer. And this is to initialize Generic_Power_Onoff_Setup Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_GENERIC_POO_SRV_Open(&g_mesh_generic_poo_srv0_ctrl,
&g_mesh_generic_poo_srv0_cfg);
```

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

◆ RM_MESH_GENERIC_POO_SRV_Close()

```
fsp_err_t RM_MESH_GENERIC_POO_SRV_Close ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl)
```

API to terminate Generic_Power_Onoff Server model. This is to terminate Generic_Power_Onoff Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::close`.

Example:

```
/* Close the module. */  
err = RM_MESH_GENERIC_POO_SRV_Close(&g_mesh_generic_poo_srv0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ RM_MESH_GENERIC_POO_SRV_StateUpdate()

```
fsp_err_t RM_MESH_GENERIC_POO_SRV_StateUpdate ( rm_ble_mesh_model_server_ctrl_t *const
p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state )
```

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements `rm_ble_mesh_model_server_api_t::stateUpdate`.

Example:

```
/* Update server status. */
err = RM_MESH_GENERIC_POO_SRV_StateUpdate(&g_mesh_generic_poo_srv0_ctrl, &state);
```

Return values

| | |
|--------------------------|-------------------------------------|
| FSP_SUCCESS | Updated server status successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_state is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_GENERIC_POO_SRV_SetupServerStateUpdate()

```
fsp_err_t RM_MESH_GENERIC_POO_SRV_SetupServerStateUpdate (
  rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_access_server_state_t const *const
  p_state )
```

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Parameters

| | | |
|------|---------|---|
| [in] | p_ctrl | rm_mesh_generic_poo_srv control block. |
| [in] | p_state | To send reply for a request or to inform change in state. |

Return values

| | |
|--------------------------|--------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_state is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

Detailed Description

Overview

Target Devices

The Bluetooth Low Energy Energy Mesh Network Generic Property Client module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_generic_prop_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_prop_clt_cfg.h:

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Configurations for Networking > Bluetooth Low Energy Mesh Network modules > BLE Mesh Model Generic Property Client (rm_mesh_generic_prop_clt)

This module can be added to the Stacks tab via New Stack > Networking > Bluetooth Low Energy Mesh Network modules > BLE Mesh Model Generic Property Client (rm_mesh_generic_prop_clt).

| Configuration | Options | Default | Description |
|--|-------------------------------|------------------------------|--|
| Interrupts > Callback Provided when Timeout Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh generic property client ISR occurs |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_generic_pr op_clt0 | Module name. |

Data Structures

```
struct rm_mesh_generic_prop_clt_instance_ctrl_t
```

Data Structure Documentation

◆ **rm_mesh_generic_prop_clt_instance_ctrl_t**

```
struct rm_mesh_generic_prop_clt_instance_ctrl_t
```

BLE mesh generic prop instance control block. DO NOT INITIALIZE. Initialization occurs when [RM_MESH_GENERIC_PROP_CLT_Open\(\)](#) is called.

Function Documentation◆ **RM_MESH_GENERIC_PROP_CLT_Open()**

```
fsp_err_t RM_MESH_GENERIC_PROP_CLT_Open ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
rm_ble_mesh_model_client_cfg_t const *const p_cfg )
```

Open Generic_Property Client middleware. This is to initialize Generic_Property Client model and to register with Access layer.

Implements [rm_ble_mesh_model_client_api_t::open](#).

Example:

```
/* Open the module. */
err = RM_MESH_GENERIC_PROP_CLT_Open(&g_mesh_generic_prop_clt0_ctrl,
&g_mesh_generic_prop_clt0_cfg);
```

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

◆ RM_MESH_GENERIC_PROP_CLT_Close()

```
fsp_err_t RM_MESH_GENERIC_PROP_CLT_Close ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Close Generic_Property Client middleware. Example:

```
/* Close the module. */
err = RM_MESH_GENERIC_PROP_CLT_Close(&g_mesh_generic_prop_clt0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ RM_MESH_GENERIC_PROP_CLT_GetModelHandle()

```
fsp_err_t RM_MESH_GENERIC_PROP_CLT_GetModelHandle ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, rm_ble_mesh_access_model_handle_t *const p_model_handle )
```

This is to get the handle of Generic_Property client model.

Implements `rm_ble_mesh_model_client_api_t::getModelHandle`.

Example:

```
/* Get the handle of generic property client model. */
err = RM_MESH_GENERIC_PROP_CLT_GetModelHandle(&g_mesh_generic_prop_clt0_ctrl,
&model_handle);
```

Return values

| | |
|-------------------------|---------------------------------------|
| FSP_SUCCESS | Got model handle successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_POINTER | The parameter p_model_handle is NULL. |

◆ RM_MESH_GENERIC_PROP_CLT_SetModelHandle()

```
fsp_err_t RM_MESH_GENERIC_PROP_CLT_SetModelHandle ( rm_ble_mesh_model_client_ctrl_t *const  
p_ctrl, rm_ble_mesh_access_model_handle_t model_handle )
```

DEPRECATED This is to set the handle of Generic_Property client model.

Implements `rm_ble_mesh_model_client_api_t::setModelHandle`.

Return values

| | |
|-------------------|------------------------------------|
| FSP_SUCCESS | Changed model handle successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ **RM_MESH_GENERIC_PROP_CLT_SendReliablePdu()**

```
fsp_err_t RM_MESH_GENERIC_PROP_CLT_SendReliablePdu ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, uint32_t req_opcode, void const *const p_parameter, uint32_t rsp_opcode )
```

This is to initialize sending acknowledged commands.

Implements `rm_ble_mesh_model_client_api_t::sendReliablePdu`.

Example:

```
/* Initialize sending acknowledged commands. */
err = RM_MESH_GENERIC_PROP_CLT_SendReliablePdu(&g_mesh_generic_prop_clt0_ctrl,
req_opcode, p_parameter, rsp_opcode);
```

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_GENERIC_PROP_CLT_UserPropertiesGet()

```
fsp_err_t RM_MESH_GENERIC_PROP_CLT_UserPropertiesGet ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl)
```

Generic User Properties Get is an acknowledged message used to get the list of Generic User Property states of an element. The response to the Generic User Properties Get message is a Generic User Properties Status message. The message has no parameters.

Parameters

| | | |
|------|--------|---|
| [in] | p_ctrl | rm_mesh_generic_prop_clt control block. |
|------|--------|---|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_GENERIC_PROP_CLT_UserPropertyGet()

```
fsp_err_t RM_MESH_GENERIC_PROP_CLT_UserPropertyGet ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

Generic User Property Get is an acknowledged message used to get the Generic User Property state of an element. The response to the Generic User Property Get message is a Generic User Property Status message.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_generic_prop_clt control block. |
| [in] | p_parameter | Pointer to Generic User Property Get message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_GENERIC_PROP_CLT_UserPropertySet()**

```
fsp_err_t RM_MESH_GENERIC_PROP_CLT_UserPropertySet ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

Generic User Property Set is an acknowledged message used to set the Generic User Property state of an element. The response to the Generic User Property Set message is a Generic User Property Status message.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_generic_prop_clt control block. |
| [in] | p_parameter | Pointer to Generic User Property Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_GENERIC_PROP_CLT_UserPropertySetUnacknowledged()

```
fsp_err_t RM_MESH_GENERIC_PROP_CLT_UserPropertySetUnacknowledged (
rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter )
```

Generic User Property Set Unacknowledged is an unacknowledged message used to set the Generic User Property state of an element.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_generic_prop_clt control block. |
| [in] | p_parameter | Pointer to Generic User Property Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_GENERIC_PROP_CLT_AdminPropertiesGet()

```
fsp_err_t RM_MESH_GENERIC_PROP_CLT_AdminPropertiesGet ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl)
```

Generic Admin Properties Get is an acknowledged message used to get the list of Generic Admin Property states of an element. The response to the Generic Admin Properties Get message is a Generic Admin Properties Status message. The message has no parameters.

Parameters

| | | |
|------|--------|---|
| [in] | p_ctrl | rm_mesh_generic_prop_clt control block. |
|------|--------|---|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_GENERIC_PROP_CLT_AdminPropertyGet()

```
fsp_err_t RM_MESH_GENERIC_PROP_CLT_AdminPropertyGet ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

Generic Admin Property Get is an acknowledged message used to get the Generic Admin Property state of an element. The response to the Generic Admin Property Get message is a Generic Admin Property Status message.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_generic_prop_clt control block. |
| [in] | p_parameter | Pointer to Generic Admin Property Get message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_GENERIC_PROP_CLT_AdminPropertySet()

```
fsp_err_t RM_MESH_GENERIC_PROP_CLT_AdminPropertySet ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

Generic Admin Property Set is an acknowledged message used to set the Generic Admin Property state of an element. The response to the Generic Admin Property Set message is a Generic Admin Property Status message.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_generic_prop_clt control block. |
| [in] | p_parameter | Pointer to Generic Admin Property Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_GENERIC_PROP_CLT_AdminPropertySetUnacknowledged()

```
fsp_err_t RM_MESH_GENERIC_PROP_CLT_AdminPropertySetUnacknowledged (
rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter )
```

Generic Admin Property Set Unacknowledged is an unacknowledged message used to set the Generic Admin Property state of an element.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_generic_prop_clt control block. |
| [in] | p_parameter | Pointer to Generic Admin Property Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_GENERIC_PROP_CLT_ManufacturerPropertiesGet()

```
fsp_err_t RM_MESH_GENERIC_PROP_CLT_ManufacturerPropertiesGet (
rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Generic Manufacturer Properties Get is an acknowledged message used to get the list of Generic Manufacturer Property states of an element. The response to the Generic Manufacturer Properties Get message is a Generic Manufacturer Properties Status message. The message has no parameters.

Parameters

| | | |
|------|--------|---|
| [in] | p_ctrl | rm_mesh_generic_prop_clt control block. |
|------|--------|---|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_GENERIC_PROP_CLT_ManufacturerPropertyGet()**

```
fsp_err_t RM_MESH_GENERIC_PROP_CLT_ManufacturerPropertyGet (
rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter )
```

Generic Manufacturer Property Get is an acknowledged message used to get the Generic Manufacturer Property state of an element. The response to the Generic Manufacturer Property Get message is a Generic Manufacturer Property Status message.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_generic_prop_clt control block. |
| [in] | p_parameter | Pointer to Generic Manufacturer Property Get message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_GENERIC_PROP_CLT_ManufacturerPropertySet()

```
fsp_err_t RM_MESH_GENERIC_PROP_CLT_ManufacturerPropertySet (
rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter )
```

Generic Manufacturer Property Set is an acknowledged message used to set the Generic Manufacturer Property User Access state of an element. The response to the Generic Manufacturer Property Set message is a Generic Manufacturer Property Status message.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_generic_prop_clt control block. |
| [in] | p_parameter | Pointer to Generic Manufacturer Property Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_GENERIC_PROP_CLT_ManufacturerPropertySetUnacknowledged()

```
fsp_err_t RM_MESH_GENERIC_PROP_CLT_ManufacturerPropertySetUnacknowledged (
rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter )
```

The Generic Manufacturer Property Set Unacknowledged is an unacknowledged message used to set the Generic Manufacturer Property User Access state of an element.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_generic_prop_clt control block. |
| [in] | p_parameter | Pointer to Generic Manufacturer Property Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_GENERIC_PROP_CLT_ClientPropertiesGet()

```
fsp_err_t RM_MESH_GENERIC_PROP_CLT_ClientPropertiesGet ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

Generic Client Properties Get is an acknowledged message used to get the list of Generic Client Property states of an element. The response to the Generic Client Properties Get message is a Generic Client Properties Status message.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_generic_prop_clt control block. |
| [in] | p_parameter | Pointer to Generic Client Properties Get message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

Bluetooth Low Energy Mesh Network Generic User Property Server (rm_mesh_generic_user_prop_srv)

Modules » Networking » Bluetooth Low Energy Mesh Network Modules

Functions

```
fsp_err_t RM_MESH_GENERIC_USER_PROP_SRV_Open
(rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_ble_mesh_model_server_cfg_t const *const p_cfg)
```

```
fsp_err_t RM_MESH_GENERIC_USER_PROP_SRV_Close
```

```
(rm_ble_mesh_model_server_ctrl_t *const p_ctrl)
```

```
fsp_err_t RM_MESH_GENERIC_USER_PROP_SRV_StateUpdate
(rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_ble_mesh_access_server_state_t const *const p_state)
```

Detailed Description

Overview

Target Devices

The Bluetooth Low Energy Energy Mesh Network Generic User Property Server module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_generic_user_prop_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_user_prop_srv_cfg.h:

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Configurations for Networking > Bluetooth Low Energy Mesh Network modules > BLE Mesh Model Generic User Property Server (rm_mesh_generic_user_prop_srv)

This module can be added to the Stacks tab via New Stack > Networking > Bluetooth Low Energy Mesh Network modules > BLE Mesh Model Generic User Property Server (rm_mesh_generic_user_prop_srv).

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

| | | | |
|--|-------------------------------|------|---|
| Interrupts > Callback Provided when Timeout Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh generic user property server ISR occurs |
|--|-------------------------------|------|---|

| | | | |
|---|-------------------------------|------|---|
| Interrupts > Callback Provided when an Timeout ISR Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh generic user property server timeout ISR occurs |
|---|-------------------------------|------|---|

| | | | |
|------|-------------------------------|----------------------------------|--------------|
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_generic_user_prop_srv0 | Module name. |
|------|-------------------------------|----------------------------------|--------------|

Data Structures

```
struct rm_mesh_generic_user_prop_srv_info_t
```

```
struct rm_mesh_generic_user_prop_srv_instance_ctrl_t
```

Data Structure Documentation

◆ rm_mesh_generic_user_prop_srv_info_t

| | | |
|---|--------------------|--|
| struct rm_mesh_generic_user_prop_srv_info_t | | |
| Generic User Property is a state representing a device property of an element | | |
| Data Fields | | |
| uint16_t | property_id | User Property ID field is a 2-octet Assigned Number value referencing a device property |
| uint8_t | user_access | User Access field is an enumeration indicating whether the device property can be read or written as a Generic User Property |
| uint8_t* | property_value | User Property Value field is a conditional field |
| uint16_t | property_value_len | |

◆ rm_mesh_generic_user_prop_srv_instance_ctrl_t

| | | |
|--|--|--|
| struct rm_mesh_generic_user_prop_srv_instance_ctrl_t | | |
| BLE mesh generic user prop instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_GENERIC_USER_PROP_SRV_Open() is called. | | |

Function Documentation

◆ RM_MESH_GENERIC_USER_PROP_SRV_Open()

```
fsp_err_t RM_MESH_GENERIC_USER_PROP_SRV_Open ( rm_ble_mesh_model_server_ctrl_t *const
p_ctrl, rm_ble_mesh_model_server_cfg_t const *const p_cfg )
```

API to initialize Generic_User_Property Server model. This is to initialize Generic_User_Property Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_GENERIC_USER_PROP_SRV_Open(&g_mesh_generic_user_prop_srv0_ctrl,
&g_mesh_generic_user_prop_srv0_cfg);
```

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

◆ RM_MESH_GENERIC_USER_PROP_SRV_Close()

```
fsp_err_t RM_MESH_GENERIC_USER_PROP_SRV_Close ( rm_ble_mesh_model_server_ctrl_t *const
p_ctrl)
```

API to terminate Generic_User_Property Server model. This is to terminate Generic_User_Property Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_GENERIC_USER_PROP_SRV_Close(&g_mesh_generic_user_prop_srv0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ RM_MESH_GENERIC_USER_PROP_SRV_StateUpdate()

```
fsp_err_t RM_MESH_GENERIC_USER_PROP_SRV_StateUpdate ( rm_ble_mesh_model_server_ctrl_t
*const p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state )
```

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements `rm_ble_mesh_model_server_api_t::stateUpdate`.

Example:

```
/* Update server status. */
err =
RM_MESH_GENERIC_USER_PROP_SRV_StateUpdate(&g_mesh_generic_user_prop_srv0_ctrl,
&state);
```

Return values

| | |
|--------------------------|-------------------------------------|
| FSP_SUCCESS | Updated server status successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_state is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

Bluetooth Low Energy Mesh Network Light Control Client (rm_mesh_light_ctl_clt)

Modules » Networking » Bluetooth Low Energy Mesh Network Modules

Functions

```
fsp_err_t RM_MESH_LIGHT_CTL_CLT_Open (rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, rm_ble_mesh_model_client_cfg_t const *const p_cfg)
```

```
fsp_err_t RM_MESH_LIGHT_CTL_CLT_Close (rm_ble_mesh_model_client_ctrl_t
*const p_ctrl)
```

| | |
|-----------|--|
| fsp_err_t | RM_MESH_LIGHT_CTL_CLT_GetModelHandle (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, rm_ble_mesh_access_model_handle_t *const p_model_handle) |
| fsp_err_t | RM_MESH_LIGHT_CTL_CLT_SetModelHandle (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, rm_ble_mesh_access_model_handle_t model_handle) |
| fsp_err_t | RM_MESH_LIGHT_CTL_CLT_SendReliablePdu (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, uint32_t req_opcode, void const *const p_parameter, uint32_t rsp_opcode) |
| fsp_err_t | RM_MESH_LIGHT_CTL_CLT_Get (rm_ble_mesh_model_client_ctrl_t *const p_ctrl) |
| fsp_err_t | RM_MESH_LIGHT_CTL_CLT_Set (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter) |
| fsp_err_t | RM_MESH_LIGHT_CTL_CLT_SetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter) |
| fsp_err_t | RM_MESH_LIGHT_CTL_CLT_TemperatureGet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl) |
| fsp_err_t | RM_MESH_LIGHT_CTL_CLT_TemperatureSet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter) |
| fsp_err_t | RM_MESH_LIGHT_CTL_CLT_TemperatureSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter) |
| fsp_err_t | RM_MESH_LIGHT_CTL_CLT_DefaultGet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl) |
| fsp_err_t | RM_MESH_LIGHT_CTL_CLT_DefaultSet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter) |
| fsp_err_t | RM_MESH_LIGHT_CTL_CLT_DefaultSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter) |
| fsp_err_t | RM_MESH_LIGHT_CTL_CLT_TemperatureRangeGet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl) |
| fsp_err_t | RM_MESH_LIGHT_CTL_CLT_TemperatureRangeSet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter) |

```
fsp_err_t RM_MESH_LIGHT_CTL_CLT_TemperatureRangeSetUnacknowledged
(rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const
p_parameter)
```

Detailed Description

Overview

Target Devices

The Bluetooth Low Energy Mesh Network Light Control Client module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_light_ctl_ctl

The following build time configurations are defined in fsp_cfg/rm_mesh_light_ctl_ctl_cfg.h:

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Configurations for Networking > Bluetooth Low Energy Mesh Network modules > BLE Mesh Model Light Control Client (rm_mesh_light_ctl_ctl)

This module can be added to the Stacks tab via New Stack > Networking > Bluetooth Low Energy Mesh Network modules > BLE Mesh Model Light Control Client (rm_mesh_light_ctl_ctl).

| Configuration | Options | Default | Description |
|--|-------------------------------|---------------------------|---|
| Interrupts > Callback Provided when Timeout Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh light control client ISR occurs |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_light_ctl_ctl_0 | Module name. |

Data Structures

```
struct rm_mesh_light_ctl_ctl_instance_ctrl_t
```

Data Structure Documentation

◆ rm_mesh_light_ctl_ctl_instance_ctrl_t

```
struct rm_mesh_light_ctl_ctl_instance_ctrl_t
```

BLE mesh light ctl instance control block. DO NOT INITIALIZE. Initialization occurs when [RM_MESH_LIGHT_CTL_CLT_Open\(\)](#) is called.

Function Documentation

◆ RM_MESH_LIGHT_CTL_CLT_Open()

```
fsp_err_t RM_MESH_LIGHT_CTL_CLT_Open ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
rm_ble_mesh_model_client_cfg_t const *const p_cfg )
```

Open Light_Ctl Client middleware. This is to initialize Light_Ctl Client model and to register with Access layer.

Implements `rm_ble_mesh_model_client_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_LIGHT_CTL_CLT_Open(&g_mesh_light_ctl_clt0_ctrl,
&g_mesh_light_ctl_clt0_cfg);
```

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

◆ RM_MESH_LIGHT_CTL_CLT_Close()

```
fsp_err_t RM_MESH_LIGHT_CTL_CLT_Close ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Close Light_Ctl Client middleware.

Implements `rm_ble_mesh_model_client_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_LIGHT_CTL_CLT_Close(&g_mesh_light_ctl_clt0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ **RM_MESH_LIGHT_CTL_CTL_GetModelHandle()**

```
fsp_err_t RM_MESH_LIGHT_CTL_CTL_GetModelHandle ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, rm_ble_mesh_access_model_handle_t *const p_model_handle )
```

This is to get the handle of Light_Ctl client model.

Implements `rm_ble_mesh_model_client_api_t::getModelHandle`.

Example:

```
/* Get the handle of light ctl client model. */
err = RM_MESH_LIGHT_CTL_CTL_GetModelHandle(&g_mesh_light_ctl_ctl0_ctrl,
&model_handle);
```

Return values

| | |
|-------------------------|---------------------------------------|
| FSP_SUCCESS | Got model handle successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_POINTER | The parameter p_model_handle is NULL. |

◆ **RM_MESH_LIGHT_CTL_CTL_SetModelHandle()**

```
fsp_err_t RM_MESH_LIGHT_CTL_CTL_SetModelHandle ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, rm_ble_mesh_access_model_handle_t model_handle )
```

DEPRECATED This is to set the handle of Light_Ctl client model.

Implements `rm_ble_mesh_model_client_api_t::setModelHandle`.

Return values

| | |
|-------------------|------------------------------------|
| FSP_SUCCESS | Changed model handle successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ RM_MESH_LIGHT_CTL_CTL_SendReliablePdu()

```
fsp_err_t RM_MESH_LIGHT_CTL_CTL_SendReliablePdu ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, uint32_t req_opcode, void const *const p_parameter, uint32_t rsp_opcode )
```

This is to initialize sending acknowledged commands.

Implements `rm_ble_mesh_model_client_api_t::sendReliablePdu`.

Example:

```
/* Initialize sending acknowledged commands. */
err = RM_MESH_LIGHT_CTL_CTL_SendReliablePdu(&g_mesh_light_ctl_ctl0_ctrl,
req_opcode, p_parameter, rsp_opcode);
```

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_LIGHT_CTL_CLT_Get()**

```
fsp_err_t RM_MESH_LIGHT_CTL_CLT_Get ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Light CTL Get is an acknowledged message used to get the Light CTL state of an element. The response to the Light CTL Get message is a Light CTL Status message. There are no parameters for this message.

Parameters

| | | |
|------|--------|--------------------------------------|
| [in] | p_ctrl | rm_mesh_light_ctl_clt control block. |
|------|--------|--------------------------------------|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_LIGHT_CTL_CLI_Set()**

```
fsp_err_t RM_MESH_LIGHT_CTL_CLI_Set ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void
const *const p_parameter )
```

Light CTL Set is an acknowledged message used to set the Light CTL Lightness state, Light CTL Temperature state, and the Light CTL Delta UV state of an element. The response to the Light CTL Set message is a Light CTL Status message.

Parameters

| | | |
|------|-------------|--------------------------------------|
| [in] | p_ctrl | rm_mesh_light_ctl_cli control block. |
| [in] | p_parameter | Pointer to Light CTL Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_LIGHT_CTL_CTL_SetUnacknowledged()**

```
fsp_err_t RM_MESH_LIGHT_CTL_CTL_SetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, void const *const p_parameter )
```

Light CTL Set Unacknowledged is an unacknowledged message used to set the Light CTL Lightness state, Light CTL Temperature state, and the Light CTL Delta UV state of an element

Parameters

| | | |
|------|-------------|--------------------------------------|
| [in] | p_ctrl | rm_mesh_light_ctl_ctl control block. |
| [in] | p_parameter | Pointer to Light CTL Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_LIGHT_CTL_CTL_TemperatureGet()**

```
fsp_err_t RM_MESH_LIGHT_CTL_CTL_TemperatureGet ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl)
```

Light CTL Temperature Get is an acknowledged message used to get the Light CTL Temperature state of an element. The response to the Light CTL Temperature Get message is a Light CTL Temperature Status message. There are no parameters for this message.

Parameters

| | | |
|------|--------|--------------------------------------|
| [in] | p_ctrl | rm_mesh_light_ctl_ctl control block. |
|------|--------|--------------------------------------|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_LIGHT_CTL_CLT_TemperatureSet()

```
fsp_err_t RM_MESH_LIGHT_CTL_CLT_TemperatureSet ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, void const *const p_parameter )
```

The Light CTL Temperature Set is an acknowledged message used to set the Light CTL Temperature state and the Light CTL Delta UV state of an element. The response to the Light CTL Temperature Set message is a Light CTL Temperature Status message.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_light_ctl_ctl control block. |
| [in] | p_parameter | Pointer to Light CTL Temperature Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_LIGHT_CTL_CLT_TemperatureSetUnacknowledged()**

```
fsp_err_t RM_MESH_LIGHT_CTL_CLT_TemperatureSetUnacknowledged (
rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter )
```

The Light CTL Temperature Set Unacknowledged is an unacknowledged message used to set the Light CTL Temperature state and the Light CTL Delta UV state of an element

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_light_ctl_clt control block. |
| [in] | p_parameter | Pointer to Light CTL Temperature Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_LIGHT_CTL_CLT_DefaultGet()

`fsp_err_t RM_MESH_LIGHT_CTL_CLT_DefaultGet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl)`

Light CTL Default Get is an acknowledged message used to get the Light CTL Temperature Default and Light CTL Delta UV Default states of an element. The response to the Light CTL Default Get message is a Light CTL Default Status message. There are no parameters for this message.

Parameters

| | | |
|------|--------|--------------------------------------|
| [in] | p_ctrl | rm_mesh_light_ctl_clt control block. |
|------|--------|--------------------------------------|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_LIGHT_CTL_CTL_DefaultSet()

```
fsp_err_t RM_MESH_LIGHT_CTL_CTL_DefaultSet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

The Light CTL Default Set is an acknowledged message used to set the Light CTL Temperature Default state and the Light CTL Delta UV Default state of an element. The response to the Light CTL Set message is a Light CTL Status message.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_light_ctl_ctl control block. |
| [in] | p_parameter | Pointer to Light CTL Default Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_LIGHT_CTL_CTL_DefaultSetUnacknowledged()

```
fsp_err_t RM_MESH_LIGHT_CTL_CTL_DefaultSetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

The Light CTL Default Set Unacknowledged is an unacknowledged message used to set the Light CTL Temperature Default state and the Light CTL Delta UV Default state of an element.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_light_ctl_ctl control block. |
| [in] | p_parameter | Pointer to Light CTL Default Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_LIGHT_CTL_CLT_TemperatureRangeGet()

```
fsp_err_t RM_MESH_LIGHT_CTL_CLT_TemperatureRangeGet ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl)
```

The Light CTL Temperature Range Get is an acknowledged message used to get the Light CTL Temperature Range state of an element. The response to the Light CTL Temperature Range Get message is a Light CTL Temperature Range Status message. There are no parameters for this message.

Parameters

| | | |
|------|--------|--------------------------------------|
| [in] | p_ctrl | rm_mesh_light_ctl_ctl control block. |
|------|--------|--------------------------------------|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_LIGHT_CTL_CLT_TemperatureRangeSet()

```
fsp_err_t RM_MESH_LIGHT_CTL_CLT_TemperatureRangeSet ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

Light CTL Temperature Range Set Unacknowledged is an unacknowledged message used to set the Light CTL Temperature Range state of an element.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_light_ctl_clt control block. |
| [in] | p_parameter | Pointer to Light CTL Temperature Range Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_LIGHT_CTL_CLT_TemperatureRangeSetUnacknowledged()

```
fsp_err_t RM_MESH_LIGHT_CTL_CLT_TemperatureRangeSetUnacknowledged (
rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter )
```

Light CTL Temperature Range Set is an acknowledged message used to set the Light CTL Temperature Range state of an element. The response to the Light CTL Temperature Range Get message is a Light CTL Temperature Range Status message.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_light_ctl_clt control block. |
| [in] | p_parameter | Pointer to Light CTL Temperature Range Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

Bluetooth Low Energy Mesh Network Light Control Server (rm_mesh_light_ctl_srv)

Modules » Networking » Bluetooth Low Energy Mesh Network Modules

Functions

```
fsp_err_t RM_MESH_LIGHT_CTL_SRV_Open (rm_ble_mesh_model_server_ctrl_t
*const p_ctrl, rm_ble_mesh_model_server_cfg_t const *const p_cfg)
```

```

Detailed Description

Overview

Target Devices

The Bluetooth Low Energy Energy Mesh Network Light Control Server module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_light_ctl_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_light_ctl_srv_cfg.h:

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Configurations for Networking > Bluetooth Low Energy Mesh Network modules > BLE Mesh Model Light Control Server (rm_mesh_light_ctl_srv)

This module can be added to the Stacks tab via New Stack > Networking > Bluetooth Low Energy Mesh Network modules > BLE Mesh Model Light Control Server (rm_mesh_light_ctl_srv).

| Configuration | Options | Default | Description |
|---|-------------------------------|------------------------------|---|
| Interrupts > Callback Provided when Timeout Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh light control server ISR occurs |
| Interrupts > Callback Provided when an Timeout ISR Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh light control server timeout ISR occurs |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_light_ctl_sr v0 | Module name. |

Data Structure Documentation

◆ rm_mesh_light_ctl_srv_info_t

| Data Fields | | |
|-------------|------------------------|--|
| uint16_t | ctl_lightness | Light CTL Lightness |
| uint16_t | target_ctl_lightness | Target Light CTL Lightness - Used in response path |
| uint16_t | ctl_temperature | Light CTL Temperature |
| uint16_t | target_ctl_temperature | Target Light CTL Temperature - Used in response path |
| uint16_t | ctl_delta_uv | Light CTL Delta UV |
| uint8_t | tid | TID - Used in request path |
| uint8_t | transition_time | Transition Time - Used in request path. Used as remaining time in response path. |
| uint8_t | delay | Delay - Used in request path |
| uint16_t | transition_time_handle | Transition Timer Handle |

◆ rm_mesh_light_ctl_srv_default_info_t

| Data Fields | | |
|-------------|-----------------|-----------------------|
| uint16_t | ctl_lightness | Light CTL Lightness |
| uint16_t | ctl_temperature | Light CTL Temperature |
| uint16_t | ctl_delta_uv | Light CTL Delta UV |

◆ rm_mesh_light_ctl_srv_temperature_info_t

| struct rm_mesh_light_ctl_srv_temperature_info_t | | |
|--|------------------------|--|
| Light CTL Temperature state is a composite state that includes the Light CTL Temperature and the Light CTL Delta UV states | | |
| Data Fields | | |
| uint16_t | ctl_temperature | Light CTL Temperature |
| uint16_t | target_ctl_temperature | Target Light CTL Temperature - Used in response path |
| uint16_t | ctl_delta_uv | Light CTL Delta UV |
| uint16_t | target_ctl_delta_uv | Target Light CTL Delta UV - Used in response path |
| uint8_t | tid | TID - Used in request path |
| uint8_t | transition_time | Transition Time - Used in request path. Used as remaining time in response path. |
| uint8_t | delay | Delay - Used in request path |

◆ rm_mesh_light_ctl_srv_temperature_range_info_t

| struct rm_mesh_light_ctl_srv_temperature_range_info_t | | |
|--|---------------------------|--------------------------------|
| Light CTL Temperature Range state determines the minimum and maximum color temperatures of tunable white light an element is capable of emitting | | |
| Data Fields | | |
| uint16_t | ctl_temperature_range_min | CTL Temperature Range Min |
| uint16_t | ctl_temperature_range_max | CTL Temperature Range Max |
| uint8_t | status | Status - Used in response path |

◆ rm_mesh_light_ctl_srv_extended_cfg_t

| struct rm_mesh_light_ctl_srv_extended_cfg_t | | |
|--|-------------------------------|---|
| BLE mesh light ctl extension for BLE mesh light ctl. | | |
| Data Fields | | |
| rm_ble_mesh_access_instance_t const * | p_temperature_access_instance | Pointer to access instance for temperature model. |

◆ rm_mesh_light_ctl_srv_instance_ctrl_t

| struct rm_mesh_light_ctl_srv_instance_ctrl_t | | |
|--|--|--|
| BLE mesh light ctl instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_LIGHT_CTL_SRV_Open() is called. | | |

Function Documentation

◆ RM_MESH_LIGHT_CTL_SRV_Open()

```
fsp_err_t RM_MESH_LIGHT_CTL_SRV_Open ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_ble_mesh_model_server_cfg_t const *const p_cfg )
```

API to initialize Light_Ctl Server model and to initialize Light_Ctl_Temperature Server model. This is to initialize Light_Ctl Server model and to register with Access layer. And this is to initialize Light_Ctl_Temperature Server model and to register with Access layer. Implements `rm_ble_mesh_model_server_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_LIGHT_CTL_SRV_Open(&g_mesh_light_ctl_srv0_ctrl,
&g_mesh_light_ctl_srv0_cfg);
```

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

◆ RM_MESH_LIGHT_CTL_SRV_Close()

```
fsp_err_t RM_MESH_LIGHT_CTL_SRV_Close ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl)
```

API to terminate Light_Ctl Server model. This is to terminate Light_Ctl Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_LIGHT_CTL_SRV_Close(&g_mesh_light_ctl_srv0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ RM_MESH_LIGHT_CTL_SRV_StateUpdate()

```
fsp_err_t RM_MESH_LIGHT_CTL_SRV_StateUpdate ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_ble_mesh_access_server_state_t const *const p_state )
```

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements `rm_ble_mesh_model_server_api_t::stateUpdate`.

Example:

```
/* Update server status. */
err = RM_MESH_LIGHT_CTL_SRV_StateUpdate(&g_mesh_light_ctl_srv0_ctrl, &state);
```

Return values

| | |
|--------------------------|-------------------------------------|
| FSP_SUCCESS | Updated server status successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_state is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_LIGHT_CTL_SRV_TemperatureServerStateUpdate()

```
fsp_err_t RM_MESH_LIGHT_CTL_SRV_TemperatureServerStateUpdate (
  rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_access_server_state_t const *const
  p_state )
```

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Parameters

| | | |
|------|---------|---|
| [in] | p_ctrl | rm_mesh_light_ctl_srv control block. |
| [in] | p_state | To send reply for a request or to inform change in state. |

Return values

| | |
|--------------------------|--------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_state is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

Bluetooth Low Energy Mesh Network Light Hsl Client (rm_mesh_light_hsl_clt)

p_parameter)
```

Detailed Description

Overview

Target Devices

The Bluetooth Low Energy Energy Mesh Network Light Hsl Client module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_light_hsl_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_light_hsl_clt_cfg.h:

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Configurations for Networking > Bluetooth Low Energy Mesh Network modules > BLE Mesh Model Light HSL Client (rm_mesh_light_hsl_clt)

This module can be added to the Stacks tab via New Stack > Networking > Bluetooth Low Energy Mesh Network modules > BLE Mesh Model Light HSL Client (rm_mesh_light_hsl_clt).

| Configuration | Options | Default | Description |
|--|-------------------------------|--------------------------|---|
| Interrupts > Callback Provided when Timeout Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh light HSL client ISR occurs |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_light_hsl_clt0 | Module name. |

Data Structures

```
struct rm_mesh_light_hsl_clt_instance_ctrl_t
```

Data Structure Documentation

◆ rm_mesh_light_hsl_clt_instance_ctrl_t

```
struct rm_mesh_light_hsl_clt_instance_ctrl_t
```

BLE mesh light hsl instance control block. DO NOT INITIALIZE. Initialization occurs when `RM_MESH_LIGHT_HSL_CLT_Open()` is called.

Function Documentation

◆ RM_MESH_LIGHT_HSL_CLT_Open()

```
fsp_err_t RM_MESH_LIGHT_HSL_CLT_Open ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
rm_ble_mesh_model_client_cfg_t const *const p_cfg )
```

Open Light_Hsl Client middleware. This is to initialize Light_Hsl Client model and to register with Access layer.

Implements `rm_ble_mesh_model_client_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_LIGHT_HSL_CLT_Open(&g_mesh_light_hsl_clt0_ctrl,
&g_mesh_light_hsl_clt0_cfg);
```

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

◆ **RM_MESH_LIGHT_HSL_CLT_Close()**

```
fsp_err_t RM_MESH_LIGHT_HSL_CLT_Close ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Close Light_Hsl Client middleware.

Implements `rm_ble_mesh_model_client_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_LIGHT_HSL_CLT_Close(&g_mesh_light_hsl_clt0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ **RM_MESH_LIGHT_HSL_CLT_GetModelHandle()**

```
fsp_err_t RM_MESH_LIGHT_HSL_CLT_GetModelHandle ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl, rm_ble_mesh_access_model_handle_t *const p_model_handle )
```

This is to get the handle of Light_Hsl client model.

Implements `rm_ble_mesh_model_client_api_t::getModelHandle`.

Example:

```
/* Get the handle of light hsl client model. */
err = RM_MESH_LIGHT_HSL_CLT_GetModelHandle(&g_mesh_light_hsl_clt0_ctrl,
&model_handle);
```

Return values

| | |
|-------------------------|---------------------------------------|
| FSP_SUCCESS | Got model handle successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_POINTER | The parameter p_model_handle is NULL. |

◆ RM_MESH_LIGHT_HSL_CLT_SetModelHandle()

```
fsp_err_t RM_MESH_LIGHT_HSL_CLT_SetModelHandle ( rm_ble_mesh_model_client_ctrl_t *const  
p_ctrl, rm_ble_mesh_access_model_handle_t model_handle )
```

DEPRECATED This is to set the handle of Light_Hsl client model.

Implements `rm_ble_mesh_model_client_api_t::setModelHandle`.

Return values

| | |
|-------------------|------------------------------------|
| FSP_SUCCESS | Changed model handle successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ RM_MESH_LIGHT_HSL_CLT_SendReliablePdu()

```
fsp_err_t RM_MESH_LIGHT_HSL_CLT_SendReliablePdu ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, uint32_t req_opcode, void const *const p_parameter, uint32_t rsp_opcode )
```

This is to initialize sending acknowledged commands.

Implements `rm_ble_mesh_model_client_api_t::sendReliablePdu`.

Example:

```
/* Initialize sending acknowledged commands. */
err = RM_MESH_LIGHT_HSL_CLT_SendReliablePdu(&g_mesh_light_hsl_clt0_ctrl,
req_opcode, p_parameter, rsp_opcode);
```

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_LIGHT_HSL_CLT_Get()**

```
fsp_err_t RM_MESH_LIGHT_HSL_CLT_Get ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

The Light HSL Get is an acknowledged message used to get the Light HSL Lightness, Light HSL Hue, and Light HSL Saturation states of an element. The response to the Light HSL Get message is a Light HSL Status message. There are no parameters for this message.

Parameters

| | | |
|------|--------|--------------------------------------|
| [in] | p_ctrl | rm_mesh_light_hsl_clt control block. |
|------|--------|--------------------------------------|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_LIGHT_HSL_CLT_Set()**

```
fsp_err_t RM_MESH_LIGHT_HSL_CLT_Set ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void
const *const p_parameter )
```

The Light HSL Set Unacknowledged is an unacknowledged message used to set the Light HSL Lightness state, Light HSL Hue state, and the Light HSL Saturation state of an element.

Parameters

| | | |
|------|-------------|--------------------------------------|
| [in] | p_ctrl | rm_mesh_light_hsl_clt control block. |
| [in] | p_parameter | Pointer to Light HSL Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_LIGHT_HSL_CLT_SetUnacknowledged()

```
fsp_err_t RM_MESH_LIGHT_HSL_CLT_SetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter )
```

The Light HSL Set is an acknowledged message used to set the Light HSL Lightness state, Light HSL Hue state, and the Light HSL Saturation state of an element. The response to the Light HSL Set message is a Light HSL Status message.

Parameters

| | | |
|------|-------------|--------------------------------------|
| [in] | p_ctrl | rm_mesh_light_hsl_clt control block. |
| [in] | p_parameter | Pointer to Light HSL Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_LIGHT_HSL_CLT_TargetGet()**

```
fsp_err_t RM_MESH_LIGHT_HSL_CLT_TargetGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Light HSL Target Get is an acknowledged message used to get the target Light HSL Lightness, Light HSL Hue, and Light HSL Saturation states of an element. The response to the Light HSL Target Get message is a Light HSL Target Status message. There are no parameters for this message.

Parameters

| | | |
|------|--------|--------------------------------------|
| [in] | p_ctrl | rm_mesh_light_hsl_clt control block. |
|------|--------|--------------------------------------|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_LIGHT_HSL_CLT_DefaultGet()

`fsp_err_t RM_MESH_LIGHT_HSL_CLT_DefaultGet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl)`

Light HSL Default Get is an acknowledged message used to get the Light Lightness Default, the Light HSL Hue Default, and Light HSL Saturation Default states of an element. The response to the Light HSL Default Get message is a Light HSL Default Status message. There are no parameters for this message.

Parameters

| | | |
|------|--------|--------------------------------------|
| [in] | p_ctrl | rm_mesh_light_hsl_clt control block. |
|------|--------|--------------------------------------|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_LIGHT_HSL_CLT_DefaultSet()

```
fsp_err_t RM_MESH_LIGHT_HSL_CLT_DefaultSet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

Light HSL Default Set is an acknowledged message used to set the Light Lightness Default, the Light HSL Hue Default, and Light HSL Saturation Default states of an element. The response to the Light HSL Default Set message is a Light HSL Default Status message.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_light_hsl_clt control block. |
| [in] | p_parameter | Pointer to Light HSL Default Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_LIGHT_HSL_CLT_DefaultSetUnacknowledged()

```
fsp_err_t RM_MESH_LIGHT_HSL_CLT_DefaultSetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

Light HSL Default Set Unacknowledged is an unacknowledged message used to set the Light Lightness Default, the Light HSL Hue Default, and Light HSL Saturation Default states of an element.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_light_hsl_clt control block. |
| [in] | p_parameter | Pointer to Light HSL Default Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_LIGHT_HSL_CLT_RangeGet()**

```
fsp_err_t RM_MESH_LIGHT_HSL_CLT_RangeGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

The Light HSL Range Get is an acknowledged message used to get the Light HSL Hue Range and Light HSL Saturation Range states of an element. The response to the Light HSL Range Get message is a Light HSL Range Status message. There are no parameters for this message.

Parameters

| | | |
|------|--------|--------------------------------------|
| [in] | p_ctrl | rm_mesh_light_hsl_clt control block. |
|------|--------|--------------------------------------|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_LIGHT_HSL_CLT_RangeSet()

```
fsp_err_t RM_MESH_LIGHT_HSL_CLT_RangeSet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

Light HSL Range Set is an acknowledged message used to set the Light HSL Hue Range and Light HSL Saturation Range states of an element. The response to the Light HSL Range Set message is a Light HSL Range Status message.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_light_hsl_clt control block. |
| [in] | p_parameter | Pointer to Light HSL Range Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_LIGHT_HSL_CLT_RangeSetUnacknowledged()

```
fsp_err_t RM_MESH_LIGHT_HSL_CLT_RangeSetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

Light HSL Range Set Unacknowledged is an unacknowledged message used to set the Light HSL Hue Range and Light HSL Saturation Range states of an element.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_light_hsl_clt control block. |
| [in] | p_parameter | Pointer to Light HSL Range Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_LIGHT_HSL_CLT_HueGet()**

```
fsp_err_t RM_MESH_LIGHT_HSL_CLT_HueGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

The Light HSL Hue Get is an acknowledged message used to get the Light HSL Hue state of an element. The response to the Light HSL Hue Get message is a Light HSL Hue Status message. There are no parameters for this message.

Parameters

| | | |
|------|--------|--------------------------------------|
| [in] | p_ctrl | rm_mesh_light_hsl_clt control block. |
|------|--------|--------------------------------------|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_LIGHT_HSL_CLT_HueSet()

```
fsp_err_t RM_MESH_LIGHT_HSL_CLT_HueSet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void
const *const p_parameter )
```

The Light HSL Hue Set is an acknowledged message used to set the target Light HSL Hue state of an element. The response to the Light HSL Hue Set message is a Light HSL Hue Status message.

Parameters

| | | |
|------|-------------|---------------------------------------|
| [in] | p_ctrl | rm_mesh_light_hsl_clt control block. |
| [in] | p_parameter | Pointer to Light HSL Hue Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_LIGHT_HSL_CLT_HueSetUnacknowledged()

```
fsp_err_t RM_MESH_LIGHT_HSL_CLT_HueSetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

The Light HSL Hue Set Unacknowledged is an unacknowledged message used to set the target Light HSL Hue state of an element.

Parameters

| | | |
|------|-------------|---------------------------------------|
| [in] | p_ctrl | rm_mesh_light_hsl_clt control block. |
| [in] | p_parameter | Pointer to Light HSL Hue Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_LIGHT_HSL_CLT_SaturationGet()**

```
fsp_err_t RM_MESH_LIGHT_HSL_CLT_SaturationGet ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl)
```

The Light HSL Saturation Get is an acknowledged message used to get the Light HSL Saturation state of an element. The response to the Light HSL Saturation Get message is a Light HSL Saturation Status message. There are no parameters for this message.

Parameters

| | | |
|------|--------|--------------------------------------|
| [in] | p_ctrl | rm_mesh_light_hsl_clt control block. |
|------|--------|--------------------------------------|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_LIGHT_HSL_CLT_SaturationSet()

```
fsp_err_t RM_MESH_LIGHT_HSL_CLT_SaturationSet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

The Light HSL Saturation Set is an acknowledged message used to set the target Light HSL Saturation state of an element. The response to the Light HSL Saturation Set message is a Light HSL Saturation Status message.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_light_hsl_clt control block. |
| [in] | p_parameter | Pointer to Light HSL Saturation Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_LIGHT_HSL_CLT_SaturationSetUnacknowledged()

```
fsp_err_t RM_MESH_LIGHT_HSL_CLT_SaturationSetUnacknowledged (
rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter )
```

The Light HSL Saturation Set Unacknowledged is an unacknowledged message used to set the target Light HSL Saturation state of an element.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_light_hsl_clt control block. |
| [in] | p_parameter | Pointer to Light HSL Saturation Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

```

Detailed Description

Overview

Target Devices

The Bluetooth Low Energy Energy Mesh Network Light Hsl Server module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_light_hsl_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_light_hsl_srv_cfg.h:

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Configurations for Networking > Bluetooth Low Energy Mesh Network modules > BLE Mesh Model Light HSL Server (rm_mesh_light_hsl_srv)

This module can be added to the Stacks tab via New Stack > Networking > Bluetooth Low Energy Mesh Network modules > BLE Mesh Model Light HSL Server (rm_mesh_light_hsl_srv).

| Configuration | Options | Default | Description |
|---|-------------------------------|---------------------------|---|
| Interrupts > Callback Provided when Timeout Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh light HSL server ISR occurs |
| Interrupts > Callback Provided when an Timeout ISR Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh light HSL server timeout ISR occurs |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_light_hsl_sr v0 | Module name. |

Data Structure Documentation

◆ rm_mesh_light_hsl_srv_info_t

| struct rm_mesh_light_hsl_srv_info_t | | |
|--|------------------------|--|
| Light HSL state is a composite state that includes the Light HSL Lighness, the Light HSL Hue and the Light HSL Saturation states | | |
| Data Fields | | |
| uint16_t | hsl_lightness | The perceived lightness of a light emitted by the element |
| uint16_t | target_hsl_lightness | Target Perceived lightness - used in the response path |
| uint16_t | hsl_hue | The 16-bit value representing the hue |
| uint16_t | target_hsl_hue | Target hue - used in the response path |
| uint16_t | hsl_saturation | The saturation of a color light |
| uint16_t | target_hsl_saturation | Target saturation - used in the response path |
| uint8_t | tid | TID - Used in request path |
| uint8_t | transition_time | Transition Time - Used in request path. Used as remaining time in response path. |
| uint8_t | delay | Delay - Used in request path |
| uint16_t | transition_time_handle | Transition Timer Handle |

◆ rm_mesh_light_hsl_srv_target_info_t

| struct rm_mesh_light_hsl_srv_target_info_t | | |
|--|--|--|
| | | |

Light HSL Target state is a composite state that includes the Light HSL Lighness, the Light HSL Hue and the Light HSL Saturation states

| Data Fields | | |
|-------------|----------------|---|
| uint16_t | hsl_lightness | The perceived lightness of a light emitted by the element |
| uint16_t | hsl_hue | The 16-bit value representing the hue |
| uint16_t | hsl_saturation | The saturation of a color light |

◆ rm_mesh_light_hsl_srv_default_info_t

struct rm_mesh_light_hsl_srv_default_info_t

Light HSL Default state is a composite state that includes the Light HSL Lighness, the Light HSL Hue and the Light HSL Saturation states

| Data Fields | | |
|-------------|----------------|---|
| uint16_t | hsl_lightness | The perceived lightness of a light emitted by the element |
| uint16_t | hsl_hue | The 16-bit value representing the hue |
| uint16_t | hsl_saturation | The saturation of a color light |

◆ rm_mesh_light_hsl_srv_hue_info_t

struct rm_mesh_light_hsl_srv_hue_info_t

Light HSL Hue

| Data Fields | | |
|-------------|---------|---------------------------------------|
| uint16_t | hsl_hue | The 16-bit value representing the hue |

◆ rm_mesh_light_hsl_srv_saturation_info_t

struct rm_mesh_light_hsl_srv_saturation_info_t

Light HSL Saturation

| Data Fields | | |
|-------------|----------------|---------------------------------|
| uint16_t | hsl_saturation | The saturation of a color light |

◆ rm_mesh_light_hsl_srv_range_info_t

struct rm_mesh_light_hsl_srv_range_info_t

Light HSL Range state is a composite state that includes Minimum and Maximum of the Light HSL Hue and the Light HSL Saturation states

| Data Fields | | |
|-------------|---------------|---|
| uint16_t | hue_range_min | The value of the Hue Range Min field of the Light HSL Hue |

| | | Range state |
|----------|----------------------|---|
| uint16_t | hue_range_max | The value of the Hue Range Max field of the Light HSL Hue Range state |
| uint16_t | saturation_range_min | The value of the Saturation Range Min field of the Light HSL Saturation Range state |
| uint16_t | saturation_range_max | The value of the Saturation Range Max field of the Light HSL Saturation Range state |
| uint8_t | status | Status - Used only in response path |

◆ rm_mesh_light_hsl_srv_extended_cfg_t

| struct rm_mesh_light_hsl_srv_extended_cfg_t | | |
|--|------------------------------|--|
| BLE mesh light hsl extension for BLE mesh light hsl. | | |
| Data Fields | | |
| rm_ble_mesh_access_instance_t const * | p_hue_access_instance | Pointer to access instance for hue model. |
| rm_ble_mesh_access_instance_t const * | p_saturation_access_instance | Pointer to access instance for saturation model. |

◆ rm_mesh_light_hsl_srv_instance_ctrl_t

| struct rm_mesh_light_hsl_srv_instance_ctrl_t |
|--|
| BLE mesh light hsl instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_LIGHT_HSL_SRV_Open() is called. |

Function Documentation

◆ RM_MESH_LIGHT_HSL_SRV_Open()

```
fsp_err_t RM_MESH_LIGHT_HSL_SRV_Open ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_ble_mesh_model_server_cfg_t const *const p_cfg )
```

API to initialize Light_Hsl Server/Light_Hsl_Hue Server/Light_Hsl_Saturation Server model.

1. This is to initialize Light_Hsl Server model and to register with Access layer.
2. This is to initialize Light_Hsl_Hue Server model and to register with Access layer.
3. This is to initialize Light_Hsl_Saturation Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_LIGHT_HSL_SRV_Open(&g_mesh_light_hsl_srv0_ctrl,
&g_mesh_light_hsl_srv0_cfg);
```

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

◆ RM_MESH_LIGHT_HSL_SRV_Close()

```
fsp_err_t RM_MESH_LIGHT_HSL_SRV_Close ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl)
```

API to terminate Light_Hsl Server model. This is to terminate Light_Hsl Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_LIGHT_HSL_SRV_Close(&g_mesh_light_hsl_srv0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ RM_MESH_LIGHT_HSL_SRV_StateUpdate()

```
fsp_err_t RM_MESH_LIGHT_HSL_SRV_StateUpdate ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_ble_mesh_access_server_state_t const *const p_state )
```

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements `rm_ble_mesh_model_server_api_t::stateUpdate`.

Example:

```
/* Update server status. */
err = RM_MESH_LIGHT_HSL_SRV_StateUpdate(&g_mesh_light_hsl_srv0_ctrl, &state);
```

Return values

| | |
|--------------------------|-------------------------------------|
| FSP_SUCCESS | Updated server status successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_state is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_LIGHT_HSL_SRV_HueServerStateUpdate()**

```
fsp_err_t RM_MESH_LIGHT_HSL_SRV_HueServerStateUpdate ( rm_ble_mesh_model_server_ctrl_t
*const p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state )
```

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Parameters

| | | |
|------|---------|---|
| [in] | p_ctrl | rm_mesh_light_hsl_srv control block. |
| [in] | p_state | To send reply for a request or to inform change in state. |

Return values

| | |
|--------------------------|--------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_state is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_LIGHT_HSL_SRV_SaturationServerStateUpdate()

```
fsp_err_t RM_MESH_LIGHT_HSL_SRV_SaturationServerStateUpdate (
rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_access_server_state_t const *const
p_state )
```

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Parameters

| | | |
|------|---------|---|
| [in] | p_ctrl | rm_mesh_light_hsl_srv control block. |
| [in] | p_state | To send reply for a request or to inform change in state. |

Return values

| | |
|--------------------------|--------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_state is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

- RA4W1

Configuration

Build Time Configurations for rm_mesh_light_lightness_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_light_lightness_clt_cfg.h:

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Configurations for Networking > Bluetooth Low Energy Mesh Network modules > BLE Mesh Model Light Lightness Client (rm_mesh_light_lightness_clt)

This module can be added to the Stacks tab via New Stack > Networking > Bluetooth Low Energy Mesh Network modules > BLE Mesh Model Light Lightness Client (rm_mesh_light_lightness_clt).

| Configuration | Options | Default | Description |
|--|-------------------------------|--------------------------------|---|
| Interrupts > Callback Provided when Timeout Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh light lightness client ISR occurs |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_light_lightness_clt0 | Module name. |

Data Structures

```
struct rm_mesh_light_lightness_clt_instance_ctrl_t
```

Data Structure Documentation

◆ rm_mesh_light_lightness_clt_instance_ctrl_t

```
struct rm_mesh_light_lightness_clt_instance_ctrl_t
```

BLE mesh light lightness instance control block. DO NOT INITIALIZE. Initialization occurs when `RM_MESH_LIGHT_LIGHTNESS_CLT_Open()` is called.

Function Documentation

◆ `RM_MESH_LIGHT_LIGHTNESS_CLT_Open()`

```
fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_Open ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
rm_ble_mesh_model_client_cfg_t const *const p_cfg )
```

Open Light_Lightness Client middleware. This is to initialize Light_Lightness Client model and to register with Access layer.

Implements `rm_ble_mesh_model_client_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_LIGHT_LIGHTNESS_CLT_Open(&g_mesh_light_lightness_clt0_ctrl,
&g_mesh_light_lightness_clt0_cfg);
```

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

◆ **RM_MESH_LIGHT_LIGHTNESS_CLT_Close()**

```
fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_Close ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Close Light_Lightness Client middleware.

Implements `rm_ble_mesh_model_client_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_LIGHT_LIGHTNESS_CLT_Close(&g_mesh_light_lightness_clt0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ **RM_MESH_LIGHT_LIGHTNESS_CLT_GetModelHandle()**

```
fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_GetModelHandle ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, rm_ble_mesh_access_model_handle_t *const p_model_handle )
```

This is to get the handle of Light_Lightness client model.

Implements `rm_ble_mesh_model_client_api_t::getModelHandle`.

Example:

```
/* Get the handle of light lightness client model. */
err =
RM_MESH_LIGHT_LIGHTNESS_CLT_GetModelHandle(&g_mesh_light_lightness_clt0_ctrl,
&model_handle);
```

Return values

| | |
|-------------------------|---------------------------------------|
| FSP_SUCCESS | Got model handle successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_POINTER | The parameter p_model_handle is NULL. |

◆ RM_MESH_LIGHT_LIGHTNESS_CLT_SetModelHandle()

```
fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_SetModelHandle ( rm_ble_mesh_model_client_ctrl_t  
*const p_ctrl, rm_ble_mesh_access_model_handle_t model_handle )
```

DEPRECATED This is to set the handle of Light_Lightness client model.

Implements `rm_ble_mesh_model_client_api_t::setModelHandle()`.

Return values

| | |
|-------------------|------------------------------------|
| FSP_SUCCESS | Changed model handle successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ RM_MESH_LIGHT_LIGHTNESS_CLT_SendReliablePdu()

```
fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_SendReliablePdu ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, uint32_t req_opcode, void const *const p_parameter, uint32_t rsp_opcode )
```

This is to initialize sending acknowledged commands.

Implements `rm_ble_mesh_model_client_api_t::sendReliablePdu`.

Example:

```
/* Initialize sending acknowledged commands. */
err =
RM_MESH_LIGHT_LIGHTNESS_CLT_SendReliablePdu(&g_mesh_light_lightness_clt0_ctrl,
                                             req_opcode,
                                             p_parameter,
                                             rsp_opcode);
```

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_LIGHT_LIGHTNESS_CLT_Get()**

```
fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_Get ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Light Lightness Get is an acknowledged message used to get the Light Lightness Actual state of an element. The response to the Light Lightness Get message is a Light Lightn

Parameters

| | | |
|------|--------|--|
| [in] | p_ctrl | rm_mesh_light_lightness_clt control block. |
|------|--------|--|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_LIGHT_LIGHTNESS_CLT_Set()

```
fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_Set ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

The Light Lightness Set is an acknowledged message used to set the Light Lightness Actual state of an element. The response to the Light Lightness Set message is a Light Lightness Status message.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_light_lightness_clt control block. |
| [in] | p_parameter | Pointer to Light Lightness Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_LIGHT_LIGHTNESS_CLT_SetUnacknowledged()

```
fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_SetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

The Light Lightness Set Unacknowledged is an unacknowledged message used to set the Light Lightness Actual state of an element.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_light_lightness_clt control block. |
| [in] | p_parameter | Pointer to Light Lightness Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_LIGHT_LIGHTNESS_CLT_LinearGet()

```
fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_LinearGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Light Lightness Linear Get is an acknowledged message used to get the Light Lightness Linear state of an element. The response to the Light Lightness Linear Get message is a Light Lightness Linear Status message. There are no parameters for this message.

Parameters

| | | |
|------|--------|--|
| [in] | p_ctrl | rm_mesh_light_lightness_clt control block. |
|------|--------|--|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_LIGHT_LIGHTNESS_CLT_LinearSet()

```
fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_LinearSet ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, void const *const p_parameter )
```

The Light Lightness Linear Set is an acknowledged message used to set the Light Lightness Linear state of an element. The response to the Light Lightness Linear Set message is a Light Lightness Linear Status message.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_light_lightness_clt control block. |
| [in] | p_parameter | Pointer to Light Lightness Linear Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_LIGHT_LIGHTNESS_CLT_LinearSetUnacknowledged()

```
fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_LinearSetUnacknowledged (
rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter )
```

The Light Lightness Linear Set Unacknowledged is an unacknowledged message used to set the Light Lightness Linear state of an element.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_light_lightness_clt control block. |
| [in] | p_parameter | Pointer to Light Lightness Linear Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_LIGHT_LIGHTNESS_CLT_LastGet()**

```
fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_LastGet ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl)
```

Light Lightness Last Get is an acknowledged message used to get the Light Lightness Last state of an element. The response to the Light Lightness Last Get message is a Light Lightness Last Status message. There are no parameters for this message.

Parameters

| | | |
|------|--------|--|
| [in] | p_ctrl | rm_mesh_light_lightness_clt control block. |
|------|--------|--|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_LIGHT_LIGHTNESS_CLT_DefaultGet()**

```
fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_DefaultGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Light Lightness Default Get is an acknowledged message used to get the Light Lightness Default state of an element. The response to the Light Lightness Default Get message is a Light Lightness Default Status message. There are no parameters for this message.

Parameters

| | | |
|------|--------|--|
| [in] | p_ctrl | rm_mesh_light_lightness_clt control block. |
|------|--------|--|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_LIGHT_LIGHTNESS_CLT_DefaultSet()

```
fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_DefaultSet ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, void const *const p_parameter )
```

The Light Lightness Default Set is an acknowledged message used to set the Light Lightness Default state of an element. The response to the Light Lightness Default Set message is a Light Lightness Default Status message.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_light_lightness_clt control block. |
| [in] | p_parameter | Pointer to Light Lightness Default Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_LIGHT_LIGHTNESS_CLT_DefaultSetUnacknowledged()

```
fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_DefaultSetUnacknowledged (
rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter )
```

The Light Lightness Default Set Unacknowledged is an unacknowledged message used to set the Light Lightness Default state of an element.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_light_lightness_clt control block. |
| [in] | p_parameter | Pointer to Light Lightness Default Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_LIGHT_LIGHTNESS_CLT_RangeGet()**

```
fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_RangeGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

The Light Lightness Range Get is an acknowledged message used to get the Light Lightness Range state of an element. The response to the Light Lightness Range Get message is a Light Lightness Range Status message. There are no parameters for this message.

Parameters

| | | |
|------|--------|--|
| [in] | p_ctrl | rm_mesh_light_lightness_clt control block. |
|------|--------|--|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_LIGHT_LIGHTNESS_CLT_RangeSet()**

```
fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_RangeSet ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, void const *const p_parameter )
```

Light Lightness Range Set is an acknowledged message used to set the Light Lightness Range state of an element. The response to the Light Lightness Range Get message is a Light Lightness Range Status message.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_light_lightness_clt control block. |
| [in] | p_parameter | Pointer to Light Lightness Range Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_LIGHT_LIGHTNESS_CLT_RangeSetUnacknowledged()

```
fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_RangeSetUnacknowledged (
  rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter )
```

Light Lightness Range Set Unacknowledged is an unacknowledged message used to set the Light Lightness Range state of an element.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_light_lightness_clt control block. |
| [in] | p_parameter | Pointer to Light Lightness Range Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

Bluetooth Low Energy Mesh Network Light Lightness Server (rm_mesh_light_lightness_srv)

```

Detailed Description

Overview

Target Devices

The Bluetooth Low Energy Energy Mesh Network Light Lightness Server module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_light_lightness_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_light_lightness_srv_cfg.h:

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Configurations for Networking > Bluetooth Low Energy Mesh Network modules > BLE Mesh Model Light Lightness Server (rm_mesh_light_lightness_srv)

This module can be added to the Stacks tab via New Stack > Networking > Bluetooth Low Energy Mesh Network modules > BLE Mesh Model Light Lightness Server (rm_mesh_light_lightness_srv).

| Configuration | Options | Default | Description |
|---|-------------------------------|--------------------------------|---|
| Interrupts > Callback Provided when Timeout Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh light lightness server ISR occurs |
| Interrupts > Callback Provided when an Timeout ISR Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh light lightness server timeout ISR occurs |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_light_lightness_srv0 | Module name. |

Data Structure Documentation

◆ rm_mesh_light_lightness_srv_linear_info_t

| struct rm_mesh_light_lightness_srv_linear_info_t | | |
|--|------------------|--|
| Light Lightness Linear state represents the lightness of a light on a linear scale | | |
| Data Fields | | |
| uint16_t | lightness_linear | Light Lightness Linear |
| uint16_t | lightness_target | Light Lightness Target - Used in response path. |
| uint8_t | tid | TID - Used in request path |
| uint8_t | transition_time | Transition Time - Used in request path. Used as remaining time in response path. |
| uint8_t | delay | Delay - Used in request path |

◆ rm_mesh_light_lightness_srv_actual_info_t

| struct rm_mesh_light_lightness_srv_actual_info_t | | |
|--|------------------|--|
| Light Lightness Actual state represents the lightness of a light on a perceptually uniform lightness scale | | |
| Data Fields | | |
| uint16_t | lightness_actual | Light Lightness Actual |
| uint16_t | lightness_target | Light Lightness Target - Used in response path. |
| uint8_t | tid | TID - Used in request path |
| uint8_t | transition_time | Transition Time - Used in request path. Used as remaining time in response path. |
| uint8_t | delay | Delay - Used in request path |

| | | |
|----------|------------------------|-------------------------|
| uint16_t | transition_time_handle | Transition Timer Handle |
|----------|------------------------|-------------------------|

◆ rm_mesh_light_lightness_srv_last_info_t

| | | |
|--|----------------|----------------------|
| struct rm_mesh_light_lightness_srv_last_info_t | | |
| Light Lightness Last state represents the lightness of a light on a perceptually uniform lightness scale | | |
| Data Fields | | |
| uint16_t | lightness_last | Light Lightness Last |

◆ rm_mesh_light_lightness_srv_default_info_t

| | | |
|---|-------------------|-------------------------|
| struct rm_mesh_light_lightness_srv_default_info_t | | |
| Light Lightness Default state is a value ranging from 0x0000 to 0xFFFF, representing a default lightness level for the Light Lightness Actual state | | |
| Data Fields | | |
| uint16_t | lightness_default | Light Lightness Default |

◆ rm_mesh_light_lightness_srv_range_info_t

| | | |
|--|---------------------|---------------------------|
| struct rm_mesh_light_lightness_srv_range_info_t | | |
| Light Lightness Range state determines the minimum and maximum lightness of an element | | |
| Data Fields | | |
| uint16_t | lightness_range_min | Light Lightness Range Min |
| uint16_t | lightness_range_max | Light Lightness Range Max |

◆ rm_mesh_light_lightness_srv_info_t

| | | |
|---|-------------------------|--|
| struct rm_mesh_light_lightness_srv_info_t | | |
| Light Lightness state is a composite state that includes the Light Lightness Linear, the Light Lightness Actual, the Light Lightness Last, and the Light Lightness Default states | | |
| Data Fields | | |
| rm_mesh_light_lightness_srv_linear_info_t | light_lightness_linear | Light Lightness Linear state represents the lightness of a light on a linear scale |
| rm_mesh_light_lightness_srv_actual_info_t | light_lightness_actual | Light Lightness Actual state represents the lightness of a light on a perceptually uniform lightness scale |
| rm_mesh_light_lightness_srv_last_info_t | light_lightness_last | Light Lightness Last state represents the lightness of a light on a perceptually uniform lightness scale |
| rm_mesh_light_lightness_srv_default_info_t | light_lightness_default | Light Lightness Default state is a value ranging from 0x0000 to 0xFFFF, representing a default |

| | | |
|--|-----------------------|--|
| | | lightness level for the Light Lightness Actual state |
| rm_mesh_light_lightness_srv_range_info_t | light_lightness_range | Light Lightness Range state. |
| uint8_t | range_status | Status field used only for the Range Status |

◆ [rm_mesh_light_lightness_srv_instance_ctrl_t](#)

```
struct rm_mesh_light_lightness_srv_instance_ctrl_t
```

BLE mesh light lightness instance control block. DO NOT INITIALIZE. Initialization occurs when [RM_MESH_LIGHT_LIGHTNESS_SRV_Open\(\)](#) is called.

Function Documentation

◆ [RM_MESH_LIGHT_LIGHTNESS_SRV_Open\(\)](#)

```
fsp_err_t RM_MESH_LIGHT_LIGHTNESS_SRV_Open ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_ble_mesh_model_server_cfg_t const *const p_cfg )
```

API to initialize Light_Lightness Server model and to initialize Light_Lightness_Setup Server model. This is to initialize Light_Lightness Server model and to register with Access layer. And this is to initialize Light_Lightness_Setup Server model and to register with Access layer. Implements [rm_ble_mesh_model_server_api_t::open](#).

Example:

```
/* Open the module. */
err = RM_MESH_LIGHT_LIGHTNESS_SRV_Open(&g_mesh_light_lightness_srv0_ctrl,
&g_mesh_light_lightness_srv0_cfg);
```

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

◆ RM_MESH_LIGHT_LIGHTNESS_SRV_Close()

```
fsp_err_t RM_MESH_LIGHT_LIGHTNESS_SRV_Close ( rm_ble_mesh_model_server_ctrl_t *const  
p_ctrl)
```

API to terminate Light_Lightness Server model. This is to terminate Light_Lightness Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::close`.

Example:

```
/* Close the module. */  
err = RM_MESH_LIGHT_LIGHTNESS_SRV_Close(&g_mesh_light_lightness_srv0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ RM_MESH_LIGHT_LIGHTNESS_SRV_StateUpdate()

```
fsp_err_t RM_MESH_LIGHT_LIGHTNESS_SRV_StateUpdate ( rm_ble_mesh_model_server_ctrl_t
*const p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state )
```

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements `rm_ble_mesh_model_server_api_t::stateUpdate`.

Example:

```
/* Update server status. */
err = RM_MESH_LIGHT_LIGHTNESS_SRV_StateUpdate(&g_mesh_light_lightness_srv0_ctrl,
&state);
```

Return values

| | |
|--------------------------|-------------------------------------|
| FSP_SUCCESS | Updated server status successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_state is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_LIGHT_LIGHTNESS_SRV_SetupServerStateUpdate()

```
fsp_err_t RM_MESH_LIGHT_LIGHTNESS_SRV_SetupServerStateUpdate (
  rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_access_server_state_t const *const
  p_state )
```

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Parameters

| | | |
|------|---------|---|
| [in] | p_ctrl | rm_mesh_light_lightness_srv control block. |
| [in] | p_state | To send reply for a request or to inform change in state. |

Return values

| | |
|--------------------------|--------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_state is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

p_parameter)
```

Detailed Description

Overview

Target Devices

The Bluetooth Low Energy Energy Mesh Network Light Location Client module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_light_lc_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_light_lc_clt_cfg.h:

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Configurations for Networking > Bluetooth Low Energy Mesh Network modules > BLE Mesh Model Light Lightness Controller Client (rm_mesh_light_lc_clt)

This module can be added to the Stacks tab via New Stack > Networking > Bluetooth Low Energy Mesh Network modules > BLE Mesh Model Light Lightness Controller Client (rm_mesh_light_lc_clt).

| Configuration | Options | Default | Description |
|--|-------------------------------|--------------------------|--|
| Interrupts > Callback Provided when Timeout Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh light lightness controller client ISR occurs |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_light_lc_clt_0 | Module name. |

Data Structures

```
struct rm_mesh_light_lc_clt_instance_ctrl_t
```

Data Structure Documentation

◆ rm_mesh_light_lc_clt_instance_ctrl_t

```
struct rm_mesh_light_lc_clt_instance_ctrl_t
```

BLE mesh light lc instance control block. DO NOT INITIALIZE. Initialization occurs when [RM_MESH_LIGHT_LC_CLT_Open\(\)](#) is called.

Function Documentation

◆ RM_MESH_LIGHT_LC_CLT_Open()

```
fsp_err_t RM_MESH_LIGHT_LC_CLT_Open ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
rm_ble_mesh_model_client_cfg_t const *const p_cfg )
```

Open Light_Lc Client middleware. This is to initialize Light_Lc Client model and to register with Access layer.

Implements `rm_ble_mesh_model_client_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_LIGHT_LC_CLT_Open(&g_mesh_light_lc_clt0_ctrl,
&g_mesh_light_lc_clt0_cfg);
```

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

◆ RM_MESH_LIGHT_LC_CLT_Close()

```
fsp_err_t RM_MESH_LIGHT_LC_CLT_Close ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Close Light_Lc Client middleware.

Implements `rm_ble_mesh_model_client_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_LIGHT_LC_CLT_Close(&g_mesh_light_lc_clt0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ **RM_MESH_LIGHT_LC_CLT_GetModelHandle()**

```
fsp_err_t RM_MESH_LIGHT_LC_CLT_GetModelHandle ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, rm_ble_mesh_access_model_handle_t *const p_model_handle )
```

This is to get the handle of Light_Lc client model.

Implements `rm_ble_mesh_model_client_api_t::getModelHandle`.

Example:

```
/* Get the handle of light lc client model. */
err = RM_MESH_LIGHT_LC_CLT_GetModelHandle(&g_mesh_light_lc_clt0_ctrl,
&model_handle);
```

Return values

| | |
|-------------------------|---------------------------------------|
| FSP_SUCCESS | Got model handle successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_POINTER | The parameter p_model_handle is NULL. |

◆ **RM_MESH_LIGHT_LC_CLT_SetModelHandle()**

```
fsp_err_t RM_MESH_LIGHT_LC_CLT_SetModelHandle ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, rm_ble_mesh_access_model_handle_t model_handle )
```

DEPRECATED This is to set the handle of Light_Lc client model.

Implements `rm_ble_mesh_model_client_api_t::setModelHandle`.

Return values

| | |
|-------------------|------------------------------------|
| FSP_SUCCESS | Changed model handle successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ RM_MESH_LIGHT_LC_CLT_SendReliablePdu()

```
fsp_err_t RM_MESH_LIGHT_LC_CLT_SendReliablePdu ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, uint32_t req_opcode, void const *const p_parameter, uint32_t rsp_opcode )
```

This is to initialize sending acknowledged commands.

Implements `rm_ble_mesh_model_client_api_t::sendReliablePdu`.

Example:

```
/* Initialize sending acknowledged commands. */
err = RM_MESH_LIGHT_LC_CLT_SendReliablePdu(&g_mesh_light_lc_clt0_ctrl,
req_opcode, p_parameter, rsp_opcode);
```

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_LIGHT_LC_CLT_ModeGet()**

```
fsp_err_t RM_MESH_LIGHT_LC_CLT_ModeGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Light LC Mode Get is an acknowledged message used to get the Light LC Mode state of an element. The response to the Light LC Mode Get message is a Light LC Mode Status message. There are no parameters for this message.

Parameters

| | | |
|------|--------|-------------------------------------|
| [in] | p_ctrl | rm_mesh_light_lc_clt control block. |
|------|--------|-------------------------------------|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_LIGHT_LC_CLT_ModeSet()**

```
fsp_err_t RM_MESH_LIGHT_LC_CLT_ModeSet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void
const *const p_parameter )
```

The Light LC Mode Set is an acknowledged message used to set the Light LC Mode state of an element. The response to the Light LC Mode Set message is a Light LC Mode Status message.

Parameters

| | | |
|------|-------------|---------------------------------------|
| [in] | p_ctrl | rm_mesh_light_lc_clt control block. |
| [in] | p_parameter | Pointer to Light LC Mode Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_LIGHT_LC_CLT_ModeSetUnacknowledged()

```
fsp_err_t RM_MESH_LIGHT_LC_CLT_ModeSetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

The Light LC Mode Set Unacknowledged is an unacknowledged message used to set the Light LC Mode state of an element.

Parameters

| | | |
|------|-------------|---------------------------------------|
| [in] | p_ctrl | rm_mesh_light_lc_clt control block. |
| [in] | p_parameter | Pointer to Light LC Mode Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_LIGHT_LC_CLT_OmGet()**

```
fsp_err_t RM_MESH_LIGHT_LC_CLT_OmGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Light LC OM Get is an acknowledged message used to get the Light LC Occupancy Mode state of an element. The response to the Light LC OM Get message is a Light LC OM Status message. There are no parameters for this message.

Parameters

| | | |
|------|--------|-------------------------------------|
| [in] | p_ctrl | rm_mesh_light_lc_clt control block. |
|------|--------|-------------------------------------|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_LIGHT_LC_CLT_OmSet()**

```
fsp_err_t RM_MESH_LIGHT_LC_CLT_OmSet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void
const *const p_parameter )
```

The Light LC OM Set is an acknowledged message used to set the Light LC Occupancy Mode state of an element. The response to the Light LC OM Set message is a Light LC OM Status message.

Parameters

| | | |
|------|-------------|-------------------------------------|
| [in] | p_ctrl | rm_mesh_light_lc_clt control block. |
| [in] | p_parameter | Pointer to Light LC OM Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_LIGHT_LC_CLT_OmSetUnacknowledged()

```
fsp_err_t RM_MESH_LIGHT_LC_CLT_OmSetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

The Light LC OM Set Unacknowledged is an unacknowledged message used to set the Light LC Occupancy Mode state of an element.

Parameters

| | | |
|------|-------------|-------------------------------------|
| [in] | p_ctrl | rm_mesh_light_lc_clt control block. |
| [in] | p_parameter | Pointer to Light LC OM Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_LIGHT_LC_CLT_LightOnOffGet()**

```
fsp_err_t RM_MESH_LIGHT_LC_CLT_LightOnOffGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Light LC Light OnOff Get is an acknowledged message used to get the Light LC Light OnOff state of an element. The response to the Light LC Light OnOff Get message is a Light LC Light OnOff Status message. There are no parameters for this message.

Parameters

| | | |
|------|--------|-------------------------------------|
| [in] | p_ctrl | rm_mesh_light_lc_clt control block. |
|------|--------|-------------------------------------|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_LIGHT_LC_CLT_LightOnOffSet()

```
fsp_err_t RM_MESH_LIGHT_LC_CLT_LightOnOffSet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

The Light LC Light OnOff Set is an acknowledged message used to set the Light LC Light OnOff state of an element. The response to the Light LC Light OnOff Set message is a Light LC Light OnOff Status message.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_light_lc_clt control block. |
| [in] | p_parameter | Pointer to Light LC Light OnOff Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_LIGHT_LC_CLT_LightOnOffSetUnacknowledged()

```
fsp_err_t RM_MESH_LIGHT_LC_CLT_LightOnOffSetUnacknowledged (
rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter )
```

The Light LC Light OnOff Set Unacknowledged is an unacknowledged message used to set the Light LC Light OnOff state of an element.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_light_lc_clt control block. |
| [in] | p_parameter | Pointer to Light LC Light OnOff Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_LIGHT_LC_CLT_PropertyGet()

```
fsp_err_t RM_MESH_LIGHT_LC_CLT_PropertyGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

Light LC Property Get is an acknowledged message used to get the Light LC Property state of an element. The response to the Light LC Property Get message is a Light LC Property Status message.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_light_lc_clt control block. |
| [in] | p_parameter | Pointer to Light LC Property Get message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_LIGHT_LC_CLT_PropertySet()

```
fsp_err_t RM_MESH_LIGHT_LC_CLT_PropertySet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

The Light LC Property Set is an acknowledged message used to set the Light LC Property state of an element. The response to the Light LC Property Set message is a Light LC Property Status message.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_light_lc_clt control block. |
| [in] | p_parameter | Pointer to Light LC Property Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_LIGHT_LC_CLT_PropertySetUnacknowledged()

```
fsp_err_t RM_MESH_LIGHT_LC_CLT_PropertySetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

The Light LC Property Set Unacknowledged is an unacknowledged message used to set the Light LC Property state of an element.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_light_lc_clt control block. |
| [in] | p_parameter | Pointer to Light LC Property Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

Detailed Description

Overview

Target Devices

The Bluetooth Low Energy Energy Mesh Network Light Location Server module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_light_lc_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_light_lc_srv_cfg.h:

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Configurations for Networking > Bluetooth Low Energy Mesh Network modules > BLE Mesh Model Light Lightness Controller Server (rm_mesh_light_lc_srv)

This module can be added to the Stacks tab via New Stack > Networking > Bluetooth Low Energy Mesh Network modules > BLE Mesh Model Light Lightness Controller Server (rm_mesh_light_lc_srv).

| Configuration | Options | Default | Description |
|-----------------------|----------------------|---------|-------------------|
| Interrupts > Callback | Name Must Be a Valid | NULL | Callback provided |

| | | | |
|---|-------------------------------|-----------------------------|--|
| Provided when Timeout Occurs | C Symbol | | when mesh light lightness controller server ISR occurs |
| Interrupts > Callback Provided when an Timeout ISR Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh light lightness controller server timeout ISR occurs |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_light_lc_srv 0 | Module name. |

| struct rm_mesh_light_lc_srv_property_info_t | | |
| Light LC Property state | | |
| Data Fields | | |
| uint16_t | property_id | Property ID identifying a Light LC Property |
| uint8_t * | property_value | Raw value for the Light LC Property |
| uint16_t | property_value_len | |

◆ rm_mesh_light_lc_srv_extended_callback_args_t

| | | |
|--|-------------------|---|
| struct rm_mesh_light_lc_srv_extended_callback_args_t | | |
| Light LC Property state | | |
| Data Fields | | |
| rm_ble_mesh_access_model_handle_t * | p_handle | Access model handle. |
| rm_ble_mesh_light_lc_srv_event_t | event_type | Application events defined for Light LC Server Model. |
| uint8_t * | p_event_data | Event data. |
| uint16_t | event_data_length | Event data length. |

◆ rm_mesh_light_lc_srv_instance_ctrl_t

| | | |
|--|--|--|
| struct rm_mesh_light_lc_srv_instance_ctrl_t | | |
| BLE mesh light lc instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_LIGHT_LC_SRV_Open() is called. | | |

Enumeration Type Documentation

◆ **rm_ble_mesh_light_lc_srv_event_t**

| enum <code>rm_ble_mesh_light_lc_srv_event_t</code> | |
|---|---------------------------------------|
| Light LC light event | |
| Enumerator | |
| <code>RM_MESH_LIGHT_LC_SRV_LIGHT_EVENT_OFF</code> | Light LC Server Event Off. |
| <code>RM_MESH_LIGHT_LC_SRV_LIGHT_EVENT_STANDBY</code> | Light LC Server Event Standby. |
| <code>RM_MESH_LIGHT_LC_SRV_LIGHT_EVENT_FADE_ON</code> | Light LC Server Event Fade On. |
| <code>RM_MESH_LIGHT_LC_SRV_LIGHT_EVENT_RUN</code> | Light LC Server Event Run. |
| <code>RM_MESH_LIGHT_LC_SRV_LIGHT_EVENT_FADE</code> | Light LC Server Event Fade. |
| <code>RM_MESH_LIGHT_LC_SRV_LIGHT_EVENT_PROLONG</code> | Light LC Server Event Prolong. |
| <code>RM_MESH_LIGHT_LC_SRV_LIGHT_EVENT_FADE_STANDBY_AUTO</code> | Light LC Server Event Standby Auto. |
| <code>RM_MESH_LIGHT_LC_SRV_LIGHT_EVENT_FADE_STANDBY_MANUAL</code> | Light LC Server Event Standby Manual. |

◆ **rm_ble_mesh_light_lc_srv_state_t**

| enum <code>rm_ble_mesh_light_lc_srv_state_t</code> | |
|---|---------------------------------------|
| Light LC state | |
| Enumerator | |
| <code>RM_MESH_LIGHT_LC_SRV_STATE_OFF</code> | Light LC Server State Off. |
| <code>RM_MESH_LIGHT_LC_SRV_STATE_STANDBY</code> | Light LC Server State Standby. |
| <code>RM_MESH_LIGHT_LC_SRV_STATE_FADE_ON</code> | Light LC Server State Fade On. |
| <code>RM_MESH_LIGHT_LC_SRV_STATE_RUN</code> | Light LC Server State Run. |
| <code>RM_MESH_LIGHT_LC_SRV_STATE_FADE</code> | Light LC Server State Fade. |
| <code>RM_MESH_LIGHT_LC_SRV_STATE_PROLONG</code> | Light LC Server State Prolong. |
| <code>RM_MESH_LIGHT_LC_SRV_STATE_FADE_STANDBY_AUTO</code> | Light LC Server State Standby Auto. |
| <code>RM_MESH_LIGHT_LC_SRV_STATE_FADE_STANDBY_MANUAL</code> | Light LC Server State Standby Manual. |

◆ **rm_mesh_light_lc_srv_light_state_t**

| | |
|--|------------------|
| enum <code>rm_mesh_light_lc_srv_light_state_t</code> | |
| Light LC light state | |
| Enumerator | |
| <code>RM_MESH_LIGHT_LC_SRV_LIGHT_STATE_OFF</code> | Light state Off. |
| <code>RM_MESH_LIGHT_LC_SRV_LIGHT_STATE_ON</code> | Light state ON. |

Function Documentation◆ **RM_MESH_LIGHT_LC_SRV_Open()**

```
fsp_err_t RM_MESH_LIGHT_LC_SRV_Open ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_ble_mesh_model_server_cfg_t const *const p_cfg )
```

API to initialize Light_Lc Server model. This is to initialize Light_Lc Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_LIGHT_LC_SRV_Open(&g_mesh_light_lc_srv0_ctrl,
&g_mesh_light_lc_srv0_cfg);
```

Return values

| | |
|-----------------------------------|--|
| <code>FSP_SUCCESS</code> | Model opened successfully. |
| <code>FSP_ERR_ASSERTION</code> | Pointer to control block or configuration structure is NULL. |
| <code>FSP_ERR_ALREADY_OPEN</code> | Model is already open. |
| <code>FSP_ERR_NOT_FOUND</code> | The number of models has exceeded the limit. |
| <code>FSP_ERR_ABORTED</code> | Model initialization is failed. |

◆ RM_MESH_LIGHT_LC_SRV_Close()

```
fsp_err_t RM_MESH_LIGHT_LC_SRV_Close ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl)
```

API to terminate Light_Lc Server model. This is to terminate Light_Lc Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::close`.

Example:

```
/* Close the module. */  
err = RM_MESH_LIGHT_LC_SRV_Close(&g_mesh_light_lc_srv0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ RM_MESH_LIGHT_LC_SRV_StateUpdate()

```
fsp_err_t RM_MESH_LIGHT_LC_SRV_StateUpdate ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_ble_mesh_access_server_state_t const *const p_state )
```

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements `rm_ble_mesh_model_server_api_t::stateUpdate`.

Example:

```
/* Update server status. */
err = RM_MESH_LIGHT_LC_SRV_StateUpdate(&g_mesh_light_lc_srv0_ctrl, &state);
```

Return values

| | |
|--------------------------|-------------------------------------|
| FSP_SUCCESS | Updated server status successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_state is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_LIGHT_LC_SRV_SetTimeProperty()

```
fsp_err_t RM_MESH_LIGHT_LC_SRV_SetTimeProperty ( rm_ble_mesh_model_server_ctrl_t *const
p_ctrl, rm_ble_mesh_model_server_device_property_t property, uint32_t time_in_ms )
```

API to set Light LC Sever Specific Time Properties. This is to update the Light LC Module with any Light Control Time Properties values. Typically these LC Time properties will be needed to be updated or informed to the Light LC Module during Power-Up, Scene Recall/Restore related scenario or when ever the Local application desires to enforce an update in these device properties values. Currently this interface handles only Time related Device Properties of Light LC Module like:
 RM_BLE_MESH_MODEL_SERVER_DEVICE_PROPERTY_LIGHT_CONTROL_TIME_OCCUPANCY_DELAY
 RM_BLE_MESH_MODEL_SERVER_DEVICE_PROPERTY_LIGHT_CONTROL_TIME_FADE_ON
 RM_BLE_MESH_MODEL_SERVER_DEVICE_PROPERTY_LIGHT_CONTROL_TIME_RUN_ON
 RM_BLE_MESH_MODEL_SERVER_DEVICE_PROPERTY_LIGHT_CONTROL_TIME_FADE
 RM_BLE_MESH_MODEL_SERVER_DEVICE_PROPERTY_LIGHT_CONTROL_TIME_PROLONG
 RM_BLE_MESH_MODEL_SERVER_DEVICE_PROPERTY_LIGHT_CONTROL_TIME_FADE_STANDBY_AUTO
 RM_BLE_MESH_MODEL_SERVER_DEVICE_PROPERTY_LIGHT_CONTROL_TIME_FADE_STANDBY_MANU
 AL

Parameters

| | | |
|------|------------|--|
| [in] | p_ctrl | Pointer to control structure. |
| [in] | property | LC Server Device Property ID |
| [in] | time_in_ms | Related Device Property Value time in milliseconds |

Example:

```
/* Set Light LC Sever Specific Time Properties. */
err = RM_MESH_LIGHT_LC_SRV_SetTimeProperty(&g_mesh_light_lc_srv0_ctrl, property,
time_in_ms);
```

Return values

| | |
|--------------------------|--|
| FSP_SUCCESS | Set the Light Control Time Properties values successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

◆ RM_MESH_LIGHT_LC_SRV_SetScenario()

```
fsp_err_t RM_MESH_LIGHT_LC_SRV_SetScenario ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_mesh_light_lc_srv_scenario_t const *const p_scenario )
```

API to locally trigger the Light LC Server state machine from the application. This typically is used in Power-Up or Scene Recall/Restore Scenario where the Application could trigger the Light LC Server from any desired LC State.

Example:

```
/* Trigger to Recall/Restore the scenario. */
err = RM_MESH_LIGHT_LC_SRV_SetScenario(&g_mesh_light_lc_srv0_ctrl, &scenario);
```

Parameters

| | | |
|------|------------|---|
| [in] | p_ctrl | Pointer to control structure. |
| [in] | p_scenario | Pointer to rm_mesh_light_lc_srv_scenario_t where Light LC Server State Informations are present |

Return values

| | |
|--------------------------|-----------------------------------|
| FSP_SUCCESS | Updated scenario successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_scenario is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

◆ RM_MESH_LIGHT_LC_SRV_GetCurrentScenario()

```
fsp_err_t RM_MESH_LIGHT_LC_SRV_GetCurrentScenario ( rm_ble_mesh_model_server_ctrl_t *const
p_ctrl, rm_mesh_light_lc_srv_scenario_t *const p_scenario )
```

API to fetch the Light LC Server state machine related information from the Light LC Server Module. This typically is used in Power-Up or Scene Recall/Restore Scenario where the Application uses this to fetch and persistently store the Light LC State related details.

Example:

```
/* Fetch the current scenario. */
err = RM_MESH_LIGHT_LC_SRV_GetCurrentScenario(&g_mesh_light_lc_srv0_ctrl,
&scenario);
```

Parameters

| | | |
|-------|------------|---|
| [in] | p_ctrl | Pointer to control structure. |
| [out] | p_scenario | Pointer to rm_mesh_light_lc_srv_scenario_t where Light LC Server State Informations are present |

Return values

| | |
|-------------------------|-----------------------------------|
| FSP_SUCCESS | Fetch information successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_scenario is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ RM_MESH_LIGHT_LC_SRV_ReportOccupancy()

```
fsp_err_t RM_MESH_LIGHT_LC_SRV_ReportOccupancy ( rm_ble_mesh_model_server_ctrl_t *const
p_ctrl)
```

API to report any occupancy to Light LC Server Model.

Example:

```
/* Reports any occupancy. */
err = RM_MESH_LIGHT_LC_SRV_ReportOccupancy(&g_mesh_light_lc_srv0_ctrl);
```

Parameters

| | | |
|------|--------|-------------------------------|
| [in] | p_ctrl | Pointer to control structure. |
|------|--------|-------------------------------|

Return values

| | |
|-------------------|-------------------------------------|
| FSP_SUCCESS | Updated server status successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ RM_MESH_LIGHT_LC_SRV_ReportLightOnOff()

```
fsp_err_t RM_MESH_LIGHT_LC_SRV_ReportLightOnOff ( rm_ble_mesh_model_server_ctrl_t *const
p_ctrl, rm_mesh_light_lc_srv_light_state_t state )
```

API to report any Light ON or OFF to Light LC Server Model. There could be many triggering factors to this Light related ON/OFF events from the upper layer. This API could be used for the following scenarios

1. Manual/Physical trigger of Light ON/OFF
2. State Binding with Generic ON/OFF
3. Trigger of Light ON/OFF due to Ambient Light Sensor values

Example:

```
/* Reports any Light ON or OFF. */
err = RM_MESH_LIGHT_LC_SRV_ReportLightOnOff(&g_mesh_light_lc_srv0_ctrl, state);
```

Parameters

| | | |
|------|--------|---|
| [in] | p_ctrl | Pointer to control structure. |
| [in] | state | Desired state value of Light LC ON/OFF. |

Return values

| | |
|-------------------|-------------------------------------|
| FSP_SUCCESS | Updated server status successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

Bluetooth Low Energy Mesh Network Light Xyl Client (rm_mesh_light_xyl_clt)

Modules » Networking » Bluetooth Low Energy Mesh Network Modules

Functions

```
fsp_err_t RM_MESH_LIGHT_XYL_CLT_Open (rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, rm_ble_mesh_model_client_cfg_t const *const p_cfg)
```

```
fsp_err_t RM_MESH_LIGHT_XYL_CLT_Close (rm_ble_mesh_model_client_ctrl_t

Detailed Description

Overview

Target Devices

The Bluetooth Low Energy Energy Mesh Network Light Xyl Client module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_light_xyl_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_light_xyl_clt_cfg.h:

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Configurations for Networking > Bluetooth Low Energy Mesh Network modules > BLE Mesh Model Light XYL Client (rm_mesh_light_xyl_clt)

This module can be added to the Stacks tab via New Stack > Networking > Bluetooth Low Energy Mesh Network modules > BLE Mesh Model Light XYL Client (rm_mesh_light_xyl_clt).

| Configuration | Options | Default | Description |
|--|-------------------------------|--------------------------|---|
| Interrupts > Callback Provided when Timeout Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh light XYL client ISR occurs |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_light_xyl_clt0 | Module name. |

Data Structures

```
struct rm_mesh_light_xyl_clt_instance_ctrl_t
```

Data Structure Documentation

◆ rm_mesh_light_xyl_clt_instance_ctrl_t

```
struct rm_mesh_light_xyl_clt_instance_ctrl_t
```

BLE mesh light xyl instance control block. DO NOT INITIALIZE. Initialization occurs when [RM_MESH_LIGHT_XYL_CLT_Open\(\)](#) is called.

Function Documentation

◆ **RM_MESH_LIGHT_XYL_CLT_Open()**

```
fsp_err_t RM_MESH_LIGHT_XYL_CLT_Open ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
rm_ble_mesh_model_client_cfg_t const *const p_cfg )
```

Open Light_Xyl Client middleware. This is to initialize Light_Xyl Client model and to register with Access layer.

Implements `rm_ble_mesh_model_client_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_LIGHT_XYL_CLT_Open(&g_mesh_light_xyl_clt0_ctrl,
&g_mesh_light_xyl_clt0_cfg);
```

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

◆ **RM_MESH_LIGHT_XYL_CLT_Close()**

```
fsp_err_t RM_MESH_LIGHT_XYL_CLT_Close ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Close Light_Xyl Client middleware.

Implements `rm_ble_mesh_model_client_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_LIGHT_XYL_CLT_Close(&g_mesh_light_xyl_clt0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ **RM_MESH_LIGHT_XYL_CLT_GetModelHandle()**

```
fsp_err_t RM_MESH_LIGHT_XYL_CLT_GetModelHandle ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, rm_ble_mesh_access_model_handle_t *const p_model_handle )
```

This is to get the handle of Light_Xyl client model.

Implements `rm_ble_mesh_model_client_api_t::getModelHandle`.

Example:

```
/* Get the handle of light xyl client model. */
err = RM_MESH_LIGHT_XYL_CLT_GetModelHandle(&g_mesh_light_xyl_clt0_ctrl,
&model_handle);
```

Return values

| | |
|-------------------------|---------------------------------------|
| FSP_SUCCESS | Got model handle successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_POINTER | The parameter p_model_handle is NULL. |

◆ **RM_MESH_LIGHT_XYL_CLT_SetModelHandle()**

```
fsp_err_t RM_MESH_LIGHT_XYL_CLT_SetModelHandle ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, rm_ble_mesh_access_model_handle_t model_handle )
```

DEPRECATED This is to set the handle of Light_Xyl client model.

Implements `rm_ble_mesh_model_client_api_t::setModelHandle`.

Return values

| | |
|-------------------|------------------------------------|
| FSP_SUCCESS | Changed model handle successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ RM_MESH_LIGHT_XYL_CLT_SendReliablePdu()

```
fsp_err_t RM_MESH_LIGHT_XYL_CLT_SendReliablePdu ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, uint32_t req_opcode, void const *const p_parameter, uint32_t rsp_opcode )
```

This is to initialize sending acknowledged commands.

Implements `rm_ble_mesh_model_client_api_t::sendReliablePdu`.

Example:

```
/* Initialize sending acknowledged commands. */
err = RM_MESH_LIGHT_XYL_CLT_SendReliablePdu(&g_mesh_light_xyl_clt0_ctrl,
req_opcode, p_parameter, rsp_opcode);
```

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_LIGHT_XYL_CLT_Get()**

```
fsp_err_t RM_MESH_LIGHT_XYL_CLT_Get ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

The Light xyL Get is an acknowledged message used to get the Light xyL Lightness, Light xyL x, and Light xyL y states of an element. Upon receiving a Light xyL Get message, the element shall respond with a Light xyL Status message. The response to the Light xyL Get message is a Light xyL Status message. There are no parameters for this message.

Parameters

| | | |
|------|--------|--------------------------------------|
| [in] | p_ctrl | rm_mesh_light_xyl_clt control block. |
|------|--------|--------------------------------------|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_LIGHT_XYL_CLT_Set()

```
fsp_err_t RM_MESH_LIGHT_XYL_CLT_Set ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter )
```

The Light xyL Set is an acknowledged message used to set the Light xyL Lightness, Light xyL x state, and the Light xyL y states of an element. The response to the Light xyL Set message is a Light xyL Status message.

Parameters

| | | |
|------|-------------|--------------------------------------|
| [in] | p_ctrl | rm_mesh_light_xyl_clt control block. |
| [in] | p_parameter | Pointer to Light xyL Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_LIGHT_XYL_CLT_SetUnacknowledged()

```
fsp_err_t RM_MESH_LIGHT_XYL_CLT_SetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, void const *const p_parameter )
```

The Light xyl Set Unacknowledged is an unacknowledged message used to set the Light xyl Lightness, Light xyl x, and the Light xyl y states of an element.

Parameters

| | | |
|------|-------------|--------------------------------------|
| [in] | p_ctrl | rm_mesh_light_xyl_clt control block. |
| [in] | p_parameter | Pointer to Light xyl Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_LIGHT_XYL_CLT_TargetGet()

`fsp_err_t RM_MESH_LIGHT_XYL_CLT_TargetGet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl)`

The Light xyL Target Get is an acknowledged message used to get the target Light xyL Lightness, Light xyL x, and Light xyL y states of an element. The response to the Light xyL Target Get message is a Light xyL Target Status message. There are no parameters for this message.

Parameters

| | | |
|------|--------|--------------------------------------|
| [in] | p_ctrl | rm_mesh_light_xyl_clt control block. |
|------|--------|--------------------------------------|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_LIGHT_XYL_CLT_DefaultGet()

`fsp_err_t RM_MESH_LIGHT_XYL_CLT_DefaultGet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl)`

Light xyl Default Get is an acknowledged message used to get the Light Lightness Default, the Light xyl x Default, and Light xyl y Default states of an element. The response to the Light xyl Default Get message is a Light xyl Default Status message. There are no parameters for this message.

Parameters

| | | |
|------|--------|--------------------------------------|
| [in] | p_ctrl | rm_mesh_light_xyl_clt control block. |
|------|--------|--------------------------------------|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_LIGHT_XYL_CLT_DefaultSet()

```
fsp_err_t RM_MESH_LIGHT_XYL_CLT_DefaultSet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

Light xyl Default Set is an acknowledged message used to set the Light Lightness Default, the Light xyl x Default, and Light xyl y Default states of an element. The response to the Light xyl Default Set message is a Light xyl Default Status message.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_light_xyl_clt control block. |
| [in] | p_parameter | Pointer to Light HSL Default Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_LIGHT_XYL_CLT_DefaultSetUnacknowledged()

```
fsp_err_t RM_MESH_LIGHT_XYL_CLT_DefaultSetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

Light xyl Default Set Unacknowledged is an unacknowledged message used to set the Light Lightness Default, the Light xyl x Default, and Light xyl y Default states of an element.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_light_xyl_clt control block. |
| [in] | p_parameter | Pointer to Light HSL Default Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_LIGHT_XYL_CLT_RangeGet()**

```
fsp_err_t RM_MESH_LIGHT_XYL_CLT_RangeGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

The Light xyL Range Get is an acknowledged message used to get the Light xyL x Range and Light xyL y Range states of an element. The response to the Light xyL Range Get message is a Light xyL Range Status message. There are no parameters for this message.

Parameters

| | | |
|------|--------|--------------------------------------|
| [in] | p_ctrl | rm_mesh_light_xyl_clt control block. |
|------|--------|--------------------------------------|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_LIGHT_XYL_CLT_RangeSet()**

```
fsp_err_t RM_MESH_LIGHT_XYL_CLT_RangeSet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

Light xyl Range Set is an acknowledged message used to set the Light xyl x Range and Light xyl y Range states of an element. The response to the Light xyl Range Set message is a Light xyl Range Status message.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_light_xyl_clt control block. |
| [in] | p_parameter | Pointer to Light xyl Range Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_LIGHT_XYL_CLT_RangeSetUnacknowledged()

`fsp_err_t RM_MESH_LIGHT_XYL_CLT_RangeSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)`

Light xyl Range Set Unacknowledged is an unacknowledged message used to set the Light xyl x Range and Light xyl y Range states of an element.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_light_xyl_clt control block. |
| [in] | p_parameter | Pointer to Light xyl Range Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

|---|---------------|---|
| Light xyL target state is a composite state that includes the xyL Lightness, the Light xyL x and the Light xyL y states | | |
| Data Fields | | |
| uint16_t | xyl_lightness | The perceived lightness of a light emitted by the element |
| uint16_t | xyl_x | The 16-bit value representing the x coordinate of a CIE1931 color light |
| uint16_t | xyl_y | The 16-bit value representing the y coordinate of a CIE1931 |

color light

◆ **rm_mesh_light_xyl_srv_default_info_t**

struct rm_mesh_light_xyl_srv_default_info_t

Light xyL default state is a composite state that includes the xyL Lightness, the Light xyL x and the Light xyL y states

Data Fields

| | | |
|----------|---------------|---|
| uint16_t | xyl_lightness | The perceived lightness of a light emitted by the element |
| uint16_t | xyl_x | The 16-bit value representing the x coordinate of a CIE1931 color light |
| uint16_t | xyl_y | The 16-bit value representing the y coordinate of a CIE1931 color light |

◆ **rm_mesh_light_xyl_srv_range_info_t**

struct rm_mesh_light_xyl_srv_range_info_t

Light xyL Range state determines the minimum and maximum values of the Light xyL x and syL y state of an element

Data Fields

| | | |
|----------|-----------------|--|
| uint16_t | xyl_x_range_min | The minimum value of a Light xyL x state of an element |
| uint16_t | xyl_x_range_max | The maximum value of a Light xyL x state of an element |
| uint16_t | xyl_y_range_min | The minimum value of a Light xyL y state of an element |
| uint16_t | xyl_y_range_max | The maximum value of a Light xyL y state of an element |
| uint8_t | status | Status - Used in the response path |

◆ **rm_mesh_light_xyl_srv_instance_ctrl_t**

struct rm_mesh_light_xyl_srv_instance_ctrl_t

BLE mesh light xyl instance control block. DO NOT INITIALIZE. Initialization occurs when [RM_MESH_LIGHT_XYL_SRV_Open\(\)](#) is called.**Function Documentation**

◆ RM_MESH_LIGHT_XYL_SRV_Open()

```
fsp_err_t RM_MESH_LIGHT_XYL_SRV_Open ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_ble_mesh_model_server_cfg_t const *const p_cfg )
```

API to initialize Light_Xyl Server model. This is to initialize Light_Xyl Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_LIGHT_XYL_SRV_Open(&g_mesh_light_xyl_srv0_ctrl,
&g_mesh_light_xyl_srv0_cfg);
```

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

◆ RM_MESH_LIGHT_XYL_SRV_Close()

```
fsp_err_t RM_MESH_LIGHT_XYL_SRV_Close ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl)
```

API to terminate Light_Xyl Server model. This is to terminate Light_Xyl Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_LIGHT_XYL_SRV_Close(&g_mesh_light_xyl_srv0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ RM_MESH_LIGHT_XYL_SRV_StateUpdate()

```
fsp_err_t RM_MESH_LIGHT_XYL_SRV_StateUpdate ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_ble_mesh_access_server_state_t const *const p_state )
```

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements `rm_ble_mesh_model_server_api_t::stateUpdate`.

Example:

```
/* Update server status. */
err = RM_MESH_LIGHT_XYL_SRV_StateUpdate(&g_mesh_light_xyl_srv0_ctrl, &state);
```

Return values

| | |
|--------------------------|-------------------------------------|
| FSP_SUCCESS | Updated server status successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_state is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

Detailed Description

Overview

Target Devices

The Bluetooth Low Energy Energy Mesh Network Scene Client module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for `rm_mesh_scene_clt`

The following build time configurations are defined in fsp_cfg/rm_mesh_scene_clt_cfg.h:

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Configurations for Networking > Bluetooth Low Energy Mesh Network modules > BLE Mesh Model Scene Client (rm_mesh_scene_clt)

This module can be added to the Stacks tab via New Stack > Networking > Bluetooth Low Energy Mesh Network modules > BLE Mesh Model Scene Client (rm_mesh_scene_clt).

| Configuration | Options | Default | Description |
|--|-------------------------------|----------------------|---|
| Interrupts > Callback Provided when Timeout Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh scene client ISR occurs |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_scene_clt0 | Module name. |

Data Structures

```
struct rm_mesh_scene_clt_instance_ctrl_t
```

Data Structure Documentation

◆ rm_mesh_scene_clt_instance_ctrl_t

```
struct rm_mesh_scene_clt_instance_ctrl_t
```

BLE mesh scene instance control block. DO NOT INITIALIZE. Initialization occurs when [RM_MESH_SCENE_CLT_Open\(\)](#) is called.

Function Documentation

◆ RM_MESH_SCENE_CLT_Open()

```
fsp_err_t RM_MESH_SCENE_CLT_Open ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
rm_ble_mesh_model_client_cfg_t const *const p_cfg )
```

open Scene Client middleware. This is to initialize Scene Client model and to register with Access layer.

Implements `rm_ble_mesh_model_client_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_SCENE_CLT_Open(&g_mesh_scene_clt0_ctrl, &g_mesh_scene_clt0_cfg);
```

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

◆ RM_MESH_SCENE_CLT_Close()

```
fsp_err_t RM_MESH_SCENE_CLT_Close ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Close Scene Client middleware.

Implements `rm_ble_mesh_model_client_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_SCENE_CLT_Close(&g_mesh_scene_clt0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ RM_MESH_SCENE_CLT_GetModelHandle()

```
fsp_err_t RM_MESH_SCENE_CLT_GetModelHandle ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
rm_ble_mesh_access_model_handle_t *const p_model_handle )
```

This is to get the handle of Scene client model.

Implements `rm_ble_mesh_model_client_api_t::getModelHandle`.

Example:

```
/* Get the handle of scene client model. */
err = RM_MESH_SCENE_CLT_GetModelHandle(&g_mesh_scene_clt0_ctrl, &model_handle);
```

Return values

| | |
|-------------------------|---------------------------------------|
| FSP_SUCCESS | Got model handle successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_POINTER | The parameter p_model_handle is NULL. |

◆ RM_MESH_SCENE_CLT_SetModelHandle()

```
fsp_err_t RM_MESH_SCENE_CLT_SetModelHandle ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
rm_ble_mesh_access_model_handle_t model_handle )
```

DEPRECATED This is to set the handle of Scene client model.

Implements `rm_ble_mesh_model_client_api_t::setModelHandle`.

Return values

| | |
|-------------------|------------------------------------|
| FSP_SUCCESS | Changed model handle successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ RM_MESH_SCENE_CLT_SendReliablePdu()

```
fsp_err_t RM_MESH_SCENE_CLT_SendReliablePdu ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
uint32_t req_opcode, void const *const p_parameter, uint32_t rsp_opcode )
```

This is to initialize sending acknowledged commands.

Implements `rm_ble_mesh_model_client_api_t::sendReliablePdu`.

Example:

```
/* Initialize sending acknowledged commands. */
err = RM_MESH_SCENE_CLT_SendReliablePdu(&g_mesh_scene_clt0_ctrl, req_opcode,
p_parameter, rsp_opcode);
```

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_SCENE_CLT_Get()**

```
fsp_err_t RM_MESH_SCENE_CLT_Get ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Scene Get is an acknowledged message used to get the current status of a currently active scene of an element. The response to the Scene Get message is a Scene Status message. There are no parameters for this message.

Parameters

| | | |
|------|--------|----------------------------------|
| [in] | p_ctrl | rm_mesh_scene_clt control block. |
|------|--------|----------------------------------|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_SCENE_CLT_Recall()

```
fsp_err_t RM_MESH_SCENE_CLT_Recall ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter )
```

Scene Recall is an acknowledged message that is used to recall the current state of an element from a previously stored scene. The response to the Scene Recall message is a Scene Status message.

Parameters

| | | |
|------|-------------|----------------------------------|
| [in] | p_ctrl | rm_mesh_scene_clt control block. |
| [in] | p_parameter | Pointer to Scene Recall message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_SCENE_CLT_RecallUnacknowledged()

`fsp_err_t RM_MESH_SCENE_CLT_RecallUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)`

Scene Recall Unacknowledged is an unacknowledged message used to recall the current state of an element from a previously stored Scene.

Parameters

| | | |
|------|-------------|----------------------------------|
| [in] | p_ctrl | rm_mesh_scene_clt control block. |
| [in] | p_parameter | Pointer to Scene Recall message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_SCENE_CLT_RegisterGet()**

```
fsp_err_t RM_MESH_SCENE_CLT_RegisterGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Scene Register Get is an acknowledged message used to get the current status of the Scene Register of an element. The response to the Scene Register Get message is a Scene Register Status message. There are no parameters for this message.

Parameters

| | | |
|------|--------|----------------------------------|
| [in] | p_ctrl | rm_mesh_scene_clt control block. |
|------|--------|----------------------------------|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_SCENE_CLT_Store()**

```
fsp_err_t RM_MESH_SCENE_CLT_Store ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter )
```

Scene Store is an acknowledged message used to store the current state of an element as a Scene, which can be recalled later. The response to the Scene Store message is a Scene Register Status message.

Parameters

| | | |
|------|-------------|----------------------------------|
| [in] | p_ctrl | rm_mesh_scene_clt control block. |
| [in] | p_parameter | Pointer to Scene Store message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_SCENE_CLT_StoreUnacknowledged()

```
fsp_err_t RM_MESH_SCENE_CLT_StoreUnacknowledged ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, void const *const p_parameter )
```

Scene Store Unacknowledged is an unacknowledged message used to store the current state of an element as a Scene, which can be recalled later.

Parameters

| | | |
|------|-------------|----------------------------------|
| [in] | p_ctrl | rm_mesh_scene_clt control block. |
| [in] | p_parameter | Pointer to Scene Store message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_SCENE_CLT_Delete()**

```
fsp_err_t RM_MESH_SCENE_CLT_Delete ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter )
```

Scene Delete is an acknowledged message used to delete a Scene from the Scene Register state of an element. The response to the Scene Delete message is a Scene Register Status message.

Parameters

| | | |
|------|-------------|------------------------------------|
| [in] | p_ctrl | rm_mesh_scene_clt control block. |
| [in] | p_parameter | Pointer to Scene Delete parameter. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_SCENE_CLT_DeleteUnacknowledged()

```
fsp_err_t RM_MESH_SCENE_CLT_DeleteUnacknowledged ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, void const *const p_parameter )
```

Scene Delete Unacknowledged is an unacknowledged message used to delete a scene from the Scene Register state of an element.

Parameters

| | | |
|------|-------------|------------------------------------|
| [in] | p_ctrl | rm_mesh_scene_clt control block. |
| [in] | p_parameter | Pointer to Scene Delete parameter. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

Bluetooth Low Energy Mesh Network Scene Server (rm_mesh_scene_srv)

```

Detailed Description

Overview

Target Devices

The Bluetooth Low Energy Energy Mesh Network Scene Server module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_scene_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_scene_srv_cfg.h:

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Configurations for Networking > Bluetooth Low Energy Mesh Network modules > BLE Mesh Model Scene Server (rm_mesh_scene_srv)

This module can be added to the Stacks tab via New Stack > Networking > Bluetooth Low Energy Mesh Network modules > BLE Mesh Model Scene Server (rm_mesh_scene_srv).

| Configuration | Options | Default | Description |
|---|-------------------------------|----------------------|---|
| Interrupts > Callback Provided when Timeout Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh scene server ISR occurs |
| Interrupts > Callback Provided when an Timeout ISR Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh scene server timeout ISR occurs |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_scene_srv0 | Module name. |
| Model Handle | Invalid Model Handle | 0 | Select model handle. |
| Setup Server Handle | Invalid Setup Server Handle | 0 | Select setup server handle. |

Data Structures

```
struct rm_mesh_scene_srv_number_info_t
```

```
struct rm_mesh_scene_srv_status_info_t
```

```
struct rm_mesh_scene_srv_register_status_info_t
```

```
struct rm_mesh_scene_srv_ext_tid_and_transition_info_t
```

```
struct rm_mesh_scene_srv_instance_ctrl_t
```

Data Structure Documentation

◆ rm_mesh_scene_srv_number_info_t

| | | |
|--|--------|--------------------------------|
| struct rm_mesh_scene_srv_number_info_t | | |
| The state to identify a scene | | |
| Data Fields | | |
| uint16_t | number | The number to identify a scene |

◆ rm_mesh_scene_srv_status_info_t

| | | |
|--|----------------|----------------------------------|
| struct rm_mesh_scene_srv_status_info_t | | |
| The current status of a currently active scene | | |
| Data Fields | | |
| uint8_t | status_code | Status Code |
| uint16_t | current_scene | Scene Number of a current scene. |
| uint16_t | target_scene | Scene Number of a target scene. |
| uint8_t | remaining_time | |

◆ rm_mesh_scene_srv_register_status_info_t

| | | |
|---|---------------|---|
| struct rm_mesh_scene_srv_register_status_info_t | | |
| The current status of scene register | | |
| Data Fields | | |
| uint8_t | status_code | Status Code |
| uint16_t | current_scene | Scene Number of a current scene. |
| uint16_t * | scenes | A list of scenes stored within an element |
| uint16_t | scenes_count | |

◆ rm_mesh_scene_srv_ext_tid_and_transition_info_t

| | | |
|---|--|--|
| struct rm_mesh_scene_srv_ext_tid_and_transition_info_t | | |
| TID and Transition is a structure which contains Transaction ID (TID) as mandatory field. Other two fields, Transition Time and Delay are optional. | | |

TID field is a transaction identifier indicating whether the message is a new message or a retransmission of a previously sent message.

If present, the Transition Time field identifies the time that an element will take to transition to the target state from the present state.

The Delay field shall be present when the Transition Time field is present. It identifies the message execution delay, representing a time interval between receiving the message by a model and executing the associated model behaviors.

◆ rm_mesh_scene_srv_instance_ctrl_t

```
struct rm_mesh_scene_srv_instance_ctrl_t
```

BLE mesh scene instance control block. DO NOT INITIALIZE. Initialization occurs when `RM_MESH_SCENE_SRV_Open()` is called.

Function Documentation

◆ RM_MESH_SCENE_SRV_Open()

```
fsp_err_t RM_MESH_SCENE_SRV_Open ( rm_ble_mesh_scene_server_ctrl_t *const p_ctrl,
rm_ble_mesh_scene_server_cfg_t const *const p_cfg )
```

API to initialize Scene Server model. This is to initialize Scene Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_SCENE_SRV_Open(&g_mesh_scene_srv0_ctrl, &g_mesh_scene_srv0_cfg);
```

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

◆ RM_MESH_SCENE_SRV_Close()

```
fsp_err_t RM_MESH_SCENE_SRV_Close ( rm_ble_mesh_scene_server_ctrl_t *const p_ctrl)
```

API to terminate Scene Server model. This is to terminate Scene Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::close`.

Example:

```
/* Close the module. */  
err = RM_MESH_SCENE_SRV_Close(&g_mesh_scene_srv0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ RM_MESH_SCENE_SRV_StateUpdate()

```
fsp_err_t RM_MESH_SCENE_SRV_StateUpdate ( rm_ble_mesh_scene_server_ctrl_t *const p_ctrl,
rm_ble_mesh_access_server_state_t const *const p_state )
```

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements `rm_ble_mesh_model_server_api_t::stateUpdate`.

Example:

```
/* Update server status. */
err = RM_MESH_SCENE_SRV_StateUpdate(&g_mesh_scene_srv0_ctrl, &state);
```

Return values

| | |
|--------------------------|-------------------------------------|
| FSP_SUCCESS | Updated server status successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_state is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

Bluetooth Low Energy Mesh Network Scheduler Client (rm_mesh_scheduler_clt)

Modules » Networking » Bluetooth Low Energy Mesh Network Modules

Functions

```
fsp_err_t RM_MESH_SCHEDULER_CLT_Open (rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, rm_ble_mesh_model_client_cfg_t const *const p_cfg)

(rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const
p_parameter)
```

```
fsp_err_t RM_MESH_SCHEDULER_CLT_ActionSetUnacknowledged
(rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const
p_parameter)
```

Detailed Description

Overview

Target Devices

The Bluetooth Low Energy Energy Mesh Network Scheduler Client module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_scheduler_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_scheduler_clt_cfg.h:

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Configurations for Networking > Bluetooth Low Energy Mesh Network modules > BLE Mesh Model Scheduler Client (rm_mesh_scheduler_clt)

This module can be added to the Stacks tab via New Stack > Networking > Bluetooth Low Energy Mesh Network modules > BLE Mesh Model Scheduler Client (rm_mesh_scheduler_clt).

| | | | |
|--|--|--|--|
| | | | |
|--|--|--|--|

| Configuration | Options | Default | Description |
|--|-------------------------------|--------------------------|---|
| Interrupts > Callback Provided when Timeout Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh scheduler client ISR occurs |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_scheduler_clt0 | Module name. |

Data Structures

```
struct rm_mesh_scheduler_clt_instance_ctrl_t
```

Data Structure Documentation

◆ rm_mesh_scheduler_clt_instance_ctrl_t

```
struct rm_mesh_scheduler_clt_instance_ctrl_t
```

BLE mesh scheduler instance control block. DO NOT INITIALIZE. Initialization occurs when `RM_MESH_SCHEDULER_CLT_Open()` is called.

Function Documentation

◆ RM_MESH_SCHEDULER_CLT_Open()

```
fsp_err_t RM_MESH_SCHEDULER_CLT_Open ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
rm_ble_mesh_model_client_cfg_t const *const p_cfg )
```

Open Scheduler Client middleware. This is to initialize Scheduler Client model and to register with Access layer.

Implements `rm_ble_mesh_model_client_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_SCHEDULER_CLT_Open(&g_mesh_scheduler_clt0_ctrl,
&g_mesh_scheduler_clt0_cfg);
```

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

◆ RM_MESH_SCHEDULER_CLT_Close()

```
fsp_err_t RM_MESH_SCHEDULER_CLT_Close ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Close Scheduler Client middleware.

Implements `rm_ble_mesh_model_client_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_SCHEDULER_CLT_Close(&g_mesh_scheduler_clt0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ RM_MESH_SCHEDULER_CLT_GetModelHandle()

```
fsp_err_t RM_MESH_SCHEDULER_CLT_GetModelHandle ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl, rm_ble_mesh_access_model_handle_t *const p_model_handle )
```

This is to get the handle of Scheduler client model.

Implements `rm_ble_mesh_model_client_api_t::getModelHandle`.

Example:

```
/* Get the handle of scheduler client model. */
err = RM_MESH_SCHEDULER_CLT_GetModelHandle(&g_mesh_scheduler_clt0_ctrl,
&model_handle);
```

Return values

| | |
|-------------------------|---------------------------------------|
| FSP_SUCCESS | Got model handle successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_POINTER | The parameter p_model_handle is NULL. |

◆ RM_MESH_SCHEDULER_CLT_SetModelHandle()

```
fsp_err_t RM_MESH_SCHEDULER_CLT_SetModelHandle ( rm_ble_mesh_model_client_ctrl_t *const  
p_ctrl, rm_ble_mesh_access_model_handle_t model_handle )
```

DEPRECATED This is to set the handle of Scheduler client model.

Implements `rm_ble_mesh_model_client_api_t::setModelHandle`.

Return values

| | |
|-------------------|------------------------------------|
| FSP_SUCCESS | Changed model handle successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ RM_MESH_SCHEDULER_CLT_SendReliablePdu()

```
fsp_err_t RM_MESH_SCHEDULER_CLT_SendReliablePdu ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, uint32_t req_opcode, void const *const p_parameter, uint32_t rsp_opcode )
```

This is to initialize sending acknowledged commands.

Implements `rm_ble_mesh_model_client_api_t::sendReliablePdu`.

Example:

```
/* Initialize sending acknowledged commands. */
err = RM_MESH_SCHEDULER_CLT_SendReliablePdu(&g_mesh_scheduler_clt0_ctrl,
req_opcode, p_parameter, rsp_opcode);
```

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_SCHEDULER_CLT_Get()**

```
fsp_err_t RM_MESH_SCHEDULER_CLT_Get ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Scheduler Get is an acknowledged message used to get the current Schedule Register state of an element. The response to the Scheduler Get message is a Scheduler Status message. There are no parameters for this message.

Parameters

| | | |
|------|--------|--------------------------------------|
| [in] | p_ctrl | rm_mesh_scheduler_clt control block. |
|------|--------|--------------------------------------|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_SCHEDULER_CLT_ActionGet()

```
fsp_err_t RM_MESH_SCHEDULER_CLT_ActionGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

Scheduler Action Get is an acknowledged message used to report the action defined by the entry of the Schedule Register state of an element, identified by the Index field. The response to the Scheduler Action Get message is a Scheduler Action Status message.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_scheduler_clt control block. |
| [in] | p_parameter | Pointer to Scheduler Action Get message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_SCHEDULER_CLT_ActionSet()

```
fsp_err_t RM_MESH_SCHEDULER_CLT_ActionSet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

Scheduler Action Set is an acknowledged message used to set the entry of the Schedule Register state of an element, identified by the Index field. The response to the Scheduler Action Set message is a Scheduler Action Status message.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_scheduler_clt control block. |
| [in] | p_parameter | Pointer to Scheduler Action Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_SCHEDULER_CLT_ActionSetUnacknowledged()

```
fsp_err_t RM_MESH_SCHEDULER_CLT_ActionSetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

Scheduler Action Set Unacknowledged is an unacknowledged message used to set the entry of the Schedule Register state of an element, identified by the Index field.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_scheduler_clt control block. |
| [in] | p_parameter | Pointer to Scheduler Action Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

Bluetooth Low Energy Mesh Network Scheduler Server (rm_mesh_scheduler_srv)

Modules » Networking » Bluetooth Low Energy Mesh Network Modules

Functions

```
fsp_err_t RM_MESH_SCHEDULER_SRV_Open (rm_ble_mesh_model_server_ctrl_t
*const p_ctrl, rm_ble_mesh_model_server_cfg_t const *const p_cfg)
```

```
fsp_err_t RM_MESH_SCHEDULER_SRV_Close
(rm_ble_mesh_model_server_ctrl_t *const p_ctrl)
```

```
fsp_err_t RM_MESH_SCHEDULER_SRV_StateUpdate
```

```
(rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_ble_mesh_access_server_state_t const *const p_state)
```

Detailed Description

Overview

Target Devices

The Bluetooth Low Energy Energy Mesh Network Scheduler Server module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_scheduler_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_scheduler_srv_cfg.h:

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Configurations for Networking > Bluetooth Low Energy Mesh Network modules > BLE Mesh Model Scheduler Server (rm_mesh_scheduler_srv)

This module can be added to the Stacks tab via New Stack > Networking > Bluetooth Low Energy Mesh Network modules > BLE Mesh Model Scheduler Server (rm_mesh_scheduler_srv).

| Configuration | Options | Default | Description |
|---|-------------------------------|--------------------------|---|
| Interrupts > Callback Provided when Timeout Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh scheduler server ISR occurs |
| Interrupts > Callback Provided when an Timeout ISR Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh scheduler server timeout ISR occurs |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_scheduler_srv0 | Module name. |

Data Structures

```
struct rm_mesh_scheduler_srv_schedules_info_t
```

```
struct rm_mesh_scheduler_srv_entry_index_info_t
```

```
struct rm_mesh_scheduler_srv_entry_info_t
```

```
struct rm_mesh_scheduler_srv_instance_ctrl_t
```

Data Structure Documentation

◆ rm_mesh_scheduler_srv_schedules_info_t

| | | |
|--|-----------|---|
| struct rm_mesh_scheduler_srv_schedules_info_t | | |
| The current Schedule Register state of an element. | | |
| Data Fields | | |
| uint16_t | schedules | Bit field indicating defined Actions in the Schedule Register |

◆ rm_mesh_scheduler_srv_entry_index_info_t

| | | |
|---|-------|--------------------------------------|
| struct rm_mesh_scheduler_srv_entry_index_info_t | | |
| The entry index of the Schedule Register state | | |
| Data Fields | | |
| uint8_t | index | Index of the Schedule Register entry |

◆ rm_mesh_scheduler_srv_entry_info_t

| | | |
|---|-----------------|--|
| struct rm_mesh_scheduler_srv_entry_info_t | | |
| The entry of the Schedule Register state | | |
| Data Fields | | |
| uint8_t | index | Index of the Schedule Register entry |
| uint8_t | year | Scheduled year for the action |
| uint16_t | month | Scheduled month for the action |
| uint8_t | day | Scheduled day of the month for the action |
| uint8_t | hour | Scheduled hour for the action |
| uint8_t | minute | Scheduled minute for the action |
| uint8_t | second | Scheduled second for the action |
| uint8_t | dayofweek | Schedule days of the week for the action |
| uint8_t | action | Action to be performed at the scheduled time |
| uint8_t | transition_time | Transition time for this action |
| uint16_t | scene_number | Scene number to be used for some actions |

◆ **rm_mesh_scheduler_srv_instance_ctrl_t**

```
struct rm_mesh_scheduler_srv_instance_ctrl_t
```

BLE mesh scheduler instance control block. DO NOT INITIALIZE. Initialization occurs when `RM_MESH_SCHEDULER_SRV_Open()` is called.

Function Documentation◆ **RM_MESH_SCHEDULER_SRV_Open()**

```
fsp_err_t RM_MESH_SCHEDULER_SRV_Open ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_ble_mesh_model_server_cfg_t const *const p_cfg )
```

API to initialize Scheduler Server model. This is to initialize Scheduler Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_SCHEDULER_SRV_Open(&g_mesh_scheduler_srv0_ctrl,
&g_mesh_scheduler_srv0_cfg);
```

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

◆ RM_MESH_SCHEDULER_SRV_Close()

```
fsp_err_t RM_MESH_SCHEDULER_SRV_Close ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl)
```

API to terminate Scheduler Server model. This is to terminate Scheduler Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::close`.

Example:

```
/* Close the module. */  
err = RM_MESH_SCHEDULER_SRV_Close(&g_mesh_scheduler_srv0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ RM_MESH_SCHEDULER_SRV_StateUpdate()

```
fsp_err_t RM_MESH_SCHEDULER_SRV_StateUpdate ( rm_ble_mesh_model_server_ctrl_t *const
p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state )
```

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements `rm_ble_mesh_model_server_api_t::stateUpdate`.

Example:

```
/* Update server status. */
err = RM_MESH_SCHEDULER_SRV_StateUpdate(&g_mesh_scheduler_srv0_ctrl, &state);
```

Return values

| | |
|--------------------------|-------------------------------------|
| FSP_SUCCESS | Updated server status successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_state is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

Bluetooth Low Energy Mesh Network Sensor Client (rm_mesh_sensor_clt)

Modules » Networking » Bluetooth Low Energy Mesh Network Modules

Functions

```
fsp_err_t RM_MESH_SENSOR_CLT_Open (rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, rm_ble_mesh_model_client_cfg_t const *const p_cfg)
```

```
fsp_err_t RM_MESH_SENSOR_CLT_Close (rm_ble_mesh_model_client_ctrl_t

Detailed Description

Overview

Target Devices

The Bluetooth Low Energy Energy Mesh Network Sensor Client module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_sensor_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_sensor_clt_cfg.h:

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Configurations for Networking > Bluetooth Low Energy Mesh Network modules > BLE Mesh Model Sensor Client (rm_mesh_sensor_clt)

This module can be added to the Stacks tab via New Stack > Networking > Bluetooth Low Energy Mesh Network modules > BLE Mesh Model Sensor Client (rm_mesh_sensor_clt).

| Configuration | Options | Default | Description |
|--|-------------------------------|-----------------------|--|
| Interrupts > Callback Provided when Timeout Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh sensor client ISR occurs |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_sensor_clt0 | Module name. |

Data Structures

```
struct rm\_mesh\_sensor\_clt\_instance\_ctrl\_t
```

Data Structure Documentation

◆ rm_mesh_sensor_clt_instance_ctrl_t

```
struct rm_mesh_sensor_clt_instance_ctrl_t
```

BLE mesh sensor instance control block. DO NOT INITIALIZE. Initialization occurs when [RM_MESH_SENSOR_CLT_Open\(\)](#) is called.

Function Documentation

◆ RM_MESH_SENSOR_CLT_Open()

```
fsp_err_t RM_MESH_SENSOR_CLT_Open ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
rm_ble_mesh_model_client_cfg_t const *const p_cfg )
```

Open Sensor Client middleware. This is to initialize Sensor Client model and to register with Access layer.

Implements `rm_ble_mesh_model_client_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_SENSOR_CLT_Open(&g_mesh_sensor_clt0_ctrl, &g_mesh_sensor_clt0_cfg);
```

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

◆ RM_MESH_SENSOR_CLT_Close()

```
fsp_err_t RM_MESH_SENSOR_CLT_Close ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Close Sensor Client middleware.

Implements `rm_ble_mesh_model_client_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_SENSOR_CLT_Close(&g_mesh_sensor_clt0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ **RM_MESH_SENSOR_CLT_GetModelHandle()**

```
fsp_err_t RM_MESH_SENSOR_CLT_GetModelHandle ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
rm_ble_mesh_access_model_handle_t *const p_model_handle )
```

This is to get the handle of Sensor client model.

Implements `rm_ble_mesh_model_client_api_t::getModelHandle`.

Example:

```
/* Get the handle of sensor client model. */
err = RM_MESH_SENSOR_CLT_GetModelHandle(&g_mesh_sensor_clt0_ctrl, &model_handle);
```

Return values

| | |
|-------------------------|---------------------------------------|
| FSP_SUCCESS | Got model handle successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_POINTER | The parameter p_model_handle is NULL. |

◆ **RM_MESH_SENSOR_CLT_SetModelHandle()**

```
fsp_err_t RM_MESH_SENSOR_CLT_SetModelHandle ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
rm_ble_mesh_access_model_handle_t model_handle )
```

DEPRECATED This is to set the handle of Sensor client model.

Implements `rm_ble_mesh_model_client_api_t::setModelHandle`.

Return values

| | |
|-------------------|------------------------------------|
| FSP_SUCCESS | Changed model handle successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ RM_MESH_SENSOR_CLT_SendReliablePdu()

```
fsp_err_t RM_MESH_SENSOR_CLT_SendReliablePdu ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, uint32_t req_opcode, void const *const p_parameter, uint32_t rsp_opcode )
```

This is to initialize sending acknowledged commands.

Implements `rm_ble_mesh_model_client_api_t::sendReliablePdu`.

Example:

```
/* Initialize sending acknowledged commands. */
err = RM_MESH_SENSOR_CLT_SendReliablePdu(&g_mesh_sensor_clt0_ctrl, req_opcode,
p_parameter, rsp_opcode);
```

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_SENSOR_CLT_DescriptorGet()**

```
fsp_err_t RM_MESH_SENSOR_CLT_DescriptorGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

Sensor Descriptor Get is an acknowledged message used to get the Sensor Descriptor state of all sensors within an element. The response to a Sensor Descriptor Get message is a Sensor Descriptor Status message.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_sensor_clt control block. |
| [in] | p_parameter | Pointer to Sensor Descriptor Get message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_SENSOR_CLT_Get()**

```
fsp_err_t RM_MESH_SENSOR_CLT_Get ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter )
```

Sensor Get is an acknowledged message used to get the Sensor Data state. The response to the Sensor Get message is a Sensor Status message.

Parameters

| | | |
|------|-------------|-----------------------------------|
| [in] | p_ctrl | rm_mesh_sensor_clt control block. |
| [in] | p_parameter | Pointer to Sensor Get message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_SENSOR_CLT_ColumnGet()**

```
fsp_err_t RM_MESH_SENSOR_CLT_ColumnGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void
const *const p_parameter )
```

Sensor Column Get is an acknowledged message used to get the Sensor Series Column state. The response to the Sensor Column Get message is a Sensor Column Status message

Parameters

| | | |
|------|-------------|---------------------------------------|
| [in] | p_ctrl | rm_mesh_sensor_clt control block. |
| [in] | p_parameter | Pointer to Sensor Column Get message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_SENSOR_CLT_SeriesGet()

```
fsp_err_t RM_MESH_SENSOR_CLT_SeriesGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void
const *const p_parameter )
```

Sensor Series Get is an acknowledged message used to get a sequence of the Sensor Series Column states. The response to the Sensor Series Get message is a Sensor Series Status message.

Parameters

| | | |
|------|-------------|---------------------------------------|
| [in] | p_ctrl | rm_mesh_sensor_clt control block. |
| [in] | p_parameter | Pointer to Sensor Series Get message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_SENSOR_CLT_CadenceGet()**

```
fsp_err_t RM_MESH_SENSOR_CLT_CadenceGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

Sensor Cadence Get is an acknowledged message used to get the Sensor Cadence state of an element. The response to the Sensor Cadence Get message is a Sensor Cadence Status message.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_sensor_clt control block. |
| [in] | p_parameter | Pointer to Sensor Cadence Get message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_SENSOR_CLT_CadenceSet()

```
fsp_err_t RM_MESH_SENSOR_CLT_CadenceSet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

Sensor Cadence Set is an acknowledged message used to set the Sensor Cadence state of an element. The response to the Sensor Cadence Set message is a Sensor Cadence Status message.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_sensor_clt control block. |
| [in] | p_parameter | Pointer to Sensor Cadence Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_SENSOR_CLT_CadenceSetUnacknowledged()

```
fsp_err_t RM_MESH_SENSOR_CLT_CadenceSetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

Sensor Cadence Set Unacknowledged is an unacknowledged message used to set the Sensor Cadence state of an element.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_sensor_clt control block. |
| [in] | p_parameter | Pointer to Sensor Cadence Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_SENSOR_CLT_SettingsGet()

```
fsp_err_t RM_MESH_SENSOR_CLT_SettingsGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

Sensor Settings Get is an acknowledged message used to get the list of Sensor Setting states of an element. The response to the Sensor Settings Get message is a Sensor Settings Status message

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_sensor_clt control block. |
| [in] | p_parameter | Pointer to Sensor Settings Get message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_SENSOR_CLT_SettingGet()

```
fsp_err_t RM_MESH_SENSOR_CLT_SettingGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void
const *const p_parameter )
```

Sensor Setting Get is an acknowledged message used to get the Sensor Setting state of an element. The response to the Sensor Setting Get message is a Sensor Setting Status message.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_sensor_clt control block. |
| [in] | p_parameter | Pointer to Sensor Settings Get message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_SENSOR_CLT_SettingSet()

```
fsp_err_t RM_MESH_SENSOR_CLT_SettingSet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void
const *const p_parameter )
```

Sensor Setting Set is an acknowledged message used to set the Sensor Setting state of an element. The response to the Sensor Setting Set message is a Sensor Setting Status message.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_sensor_clt control block. |
| [in] | p_parameter | Pointer to Sensor Settings Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_SENSOR_CLT_SettingSetUnacknowledged()

```
fsp_err_t RM_MESH_SENSOR_CLT_SettingSetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

Sensor Setting Set Unacknowledged is an unacknowledged message used to set the Sensor Setting state of an element.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_sensor_clt control block. |
| [in] | p_parameter | Pointer to Sensor Settings Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

Data Structure Documentation

◆ rm_mesh_sensor_srv_descriptor_info_t

```
struct rm_mesh_sensor_srv_descriptor_info_t
```

Sensor Descriptor state represents the attributes describing the sensor data

Data Fields

| | | |
|----------|---------------------------|--|
| uint16_t | sensor_property_id | Sensor Property ID field is a 2-octet value referencing a device property that describes the meaning and the format of data reported by a sensor |
| uint16_t | sensor_positive_tolerance | Sensor Positive Tolerance field is a 12-bit value representing the magnitude of a possible positive error associated with the measurements that the sensor is reporting |
| uint16_t | sensor_negative_tolerance | Sensor Negative Tolerance field is a 12-bit value representing the magnitude of a possible negative error associated with the measurements that the sensor is reporting |
| uint8_t | sensor_sampling_function | Sensor Sampling Function field specifies the averaging operation or type of sampling function applied to the measured value |
| uint8_t | sensor_measurement_period | Sensor Measurement Period field specifies a uint8 value n that represents the averaging time span, accumulation time, or measurement period in seconds over which the measurement is taken |
| uint8_t | sensor_update_interval | measurement reported by a sensor is internally refreshed at the frequency indicated in the Sensor Update Interval field |

| | | |
|---------|--------|--|
| uint8_t | status | Status - used in response to indicate if other fields to be included |
|---------|--------|--|

◆ rm_mesh_sensor_srv_settings_info_t

| | | |
|---|----------------------------|--|
| struct rm_mesh_sensor_srv_settings_info_t | | |
| Sensor Settings state controls parameters of a sensor | | |
| Data Fields | | |
| uint16_t | sensor_property_id | Property ID of a sensor |
| uint16_t * | setting_property_ids | Property ID of a setting within a sensor |
| uint16_t | setting_property_ids_count | |

◆ rm_mesh_sensor_srv_setting_info_t

| | | |
|--|----------------------------|--|
| struct rm_mesh_sensor_srv_setting_info_t | | |
| Sensor Setting state controls parameters of a sensor | | |
| Data Fields | | |
| uint16_t | sensor_property_id | Property ID of a sensor |
| uint16_t | sensor_setting_property_id | Property ID of a setting within a sensor |
| uint8_t | sensor_setting_access | Read/Write access rights for the setting |
| uint8_t * | sensor_setting_raw | Raw value of a setting within a sensor |
| uint16_t | sensor_setting_raw_len | |
| uint8_t | status | |

◆ rm_mesh_sensor_srv_cadence_info_t

| | | |
|---|-------------------------------|--|
| struct rm_mesh_sensor_srv_cadence_info_t | | |
| Sensor Cadence state controls the cadence of sensor reports | | |
| Data Fields | | |
| uint16_t | sensor_property_id | Property ID of a sensor |
| uint8_t | fast_cadence_period_divisor | Divisor for the Publish Period |
| uint8_t | status_trigger_type | Defines the unit and format of the Status Trigger Delta fields |
| uint8_t * | status_trigger_delta_down | Delta down value that triggers a status message |
| uint16_t | status_trigger_delta_down_len | |
| uint8_t * | status_trigger_delta_up | Delta up value that triggers a |

| | | |
|-----------|-----------------------------|--|
| | | status message |
| uint16_t | status_trigger_delta_up_len | |
| uint8_t | status_min_interval | Minimum interval between two consecutive Status messages APPLICATION NOTE: The Current Sensor Server Model implementation does not inherently check for the time interval between two consecutive status messages. The application layer which manages the data for the Sensor Server Model holds the responsibility for interleaving consecutive status messages with the configured Minimum time interval for statuses. |
| uint8_t * | fast_cadence_low | Low value for the fast cadence range |
| uint16_t | fast_cadence_low_len | |
| uint8_t * | fast_cadence_high | High value for the fast cadence range |
| uint16_t | fast_cadence_high_len | |
| uint8_t | status | Status - used in response path |

◆ rm_mesh_sensor_srv_data_info_t

| | | |
|--|-----------------|---|
| struct rm_mesh_sensor_srv_data_info_t | | |
| The Sensor Data state is a sequence of one or more pairs of Sensor Property ID and Raw Value fields, with each Raw Value field size and representation defined by the characteristics referenced by the Sensor Property ID | | |
| Data Fields | | |
| uint16_t | property_id_1 | ID of the 1st device property of the sensor |
| uint8_t * | raw_value_1 | Raw Value field with a size and representation defined by the 1st device property |
| uint16_t | raw_value_1_len | |
| uint16_t | property_id_2 | ID of the 2nd device property of the sensor |
| uint8_t * | raw_value_2 | Raw Value field with a size and representation defined by the 2nd device property |
| uint16_t | raw_value_2_len | |
| uint16_t | property_id_n | ID of the nth device property of |

| | | |
|-----------|-----------------|---|
| | | the sensor |
| uint8_t * | raw_value_n | Raw Value field with a size and representation defined by the nth device property |
| uint16_t | raw_value_n_len | |
| uint8_t | status | Status - used in response path |

◆ rm_mesh_sensor_srv_series_column_info_t

| | | |
|--|-------------------------|--|
| struct rm_mesh_sensor_srv_series_column_info_t | | |
| Values measured by sensors may be organized as arrays (and represented as series of columns, such as histograms) | | |
| Data Fields | | |
| uint16_t | sensor_property_id | Property describing the data series of the sensor |
| uint8_t * | sensor_raw_value_x | Raw value representing the left corner of a column on the X axis |
| uint16_t | sensor_raw_value_x_len | |
| uint8_t * | sensor_column_width | Raw value representing the width of the column |
| uint16_t | sensor_column_width_len | |
| uint8_t * | sensor_raw_value_y | Raw value representing the height of the column on the Y axis |
| uint16_t | sensor_raw_value_y_len | |
| uint8_t | status | Status - used in response path |

◆ rm_mesh_sensor_srv_instance_ctrl_t

| | |
|--|--|
| struct rm_mesh_sensor_srv_instance_ctrl_t | |
| BLE mesh sensor instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_SENSOR_SRV_Open() is called. | |

Function Documentation

◆ RM_MESH_SENSOR_SRV_Open()

```
fsp_err_t RM_MESH_SENSOR_SRV_Open ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_ble_mesh_model_server_cfg_t const *const p_cfg )
```

API to initialize Sensor Server model and to initialize Sensor_Setup Server model. This is to initialize Sensor Server model and to register with Access layer. And this is to initialize Sensor_Setup Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_SENSOR_SRV_Open(&g_mesh_sensor_srv0_ctrl, &g_mesh_sensor_srv0_cfg);
```

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

◆ RM_MESH_SENSOR_SRV_Close()

```
fsp_err_t RM_MESH_SENSOR_SRV_Close ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl)
```

API to terminate Sensor Server model. This is to terminate Sensor Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_SENSOR_SRV_Close(&g_mesh_sensor_srv0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ RM_MESH_SENSOR_SRV_StateUpdate()

```
fsp_err_t RM_MESH_SENSOR_SRV_StateUpdate ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_ble_mesh_access_server_state_t const *const p_state )
```

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements `rm_ble_mesh_model_server_api_t::stateUpdate`.

Example:

```
/* Update server status. */
err = RM_MESH_SENSOR_SRV_StateUpdate(&g_mesh_sensor_srv0_ctrl, &state);
```

Return values

| | |
|--------------------------|-------------------------------------|
| FSP_SUCCESS | Updated server status successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_state is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_SENSOR_SRV_SetupServerStateUpdate()

```
fsp_err_t RM_MESH_SENSOR_SRV_SetupServerStateUpdate ( rm_ble_mesh_model_server_ctrl_t
*const p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state )
```

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Parameters

| | | |
|------|---------|---|
| [in] | p_ctrl | rm_mesh_sensor_srv control block. |
| [in] | p_state | To send reply for a request or to inform change in state. |

Return values

| | |
|--------------------------|--------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_state is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

*const p_ctrl, void const *const p_parameter)
```

Detailed Description

Overview

Target Devices

The Bluetooth Low Energy Energy Mesh Network Time Client module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_time_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_time_clt_cfg.h:

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Configurations for Networking > Bluetooth Low Energy Mesh Network modules > BLE Mesh Model Time Client (rm_mesh_time_clt)

This module can be added to the Stacks tab via New Stack > Networking > Bluetooth Low Energy Mesh Network modules > BLE Mesh Model Time Client (rm_mesh_time_clt).

| Configuration | Options | Default | Description |
|--|-------------------------------|---------------------|--|
| Interrupts > Callback Provided when Timeout Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh time client ISR occurs |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_time_clt0 | Module name. |

Data Structures

```
struct rm\_mesh\_time\_clt\_instance\_ctrl\_t
```

Data Structure Documentation

◆ [rm_mesh_time_clt_instance_ctrl_t](#)

```
struct rm\_mesh\_time\_clt\_instance\_ctrl\_t
```

BLE mesh time instance control block. DO NOT INITIALIZE. Initialization occurs when [RM_MESH_TIME_CLT_Open\(\)](#) is called.

Function Documentation

◆ RM_MESH_TIME_CLT_Open()

```
fsp_err_t RM_MESH_TIME_CLT_Open ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
rm_ble_mesh_model_client_cfg_t const *const p_cfg )
```

Open Time Client middleware. This is to initialize Time Client model and to register with Access layer.

Implements `rm_ble_mesh_model_client_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_TIME_CLT_Open(&g_mesh_time_clt0_ctrl, &g_mesh_time_clt0_cfg);
```

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

◆ RM_MESH_TIME_CLT_Close()

```
fsp_err_t RM_MESH_TIME_CLT_Close ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Close Time Client middleware.

Implements `rm_ble_mesh_model_client_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_TIME_CLT_Close(&g_mesh_time_clt0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ RM_MESH_TIME_CLT_GetModelHandle()

```
fsp_err_t RM_MESH_TIME_CLT_GetModelHandle ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
rm_ble_mesh_access_model_handle_t *const p_model_handle )
```

This is to get the handle of Time client model.

Implements `rm_ble_mesh_model_client_api_t::getModelHandle`.

Example:

```
/* Get the handle of time client model. */
err = RM_MESH_TIME_CLT_GetModelHandle(&g_mesh_time_clt0_ctrl, &model_handle);
```

Return values

| | |
|-------------------------|---------------------------------------|
| FSP_SUCCESS | Got model handle successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_POINTER | The parameter p_model_handle is NULL. |

◆ RM_MESH_TIME_CLT_SetModelHandle()

```
fsp_err_t RM_MESH_TIME_CLT_SetModelHandle ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
rm_ble_mesh_access_model_handle_t model_handle )
```

DEPRECATED This is to set the handle of Time client model.

Implements `rm_ble_mesh_model_client_api_t::setModelHandle`.

Return values

| | |
|-------------------|------------------------------------|
| FSP_SUCCESS | Changed model handle successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ RM_MESH_TIME_CLT_SendReliablePdu()

```
fsp_err_t RM_MESH_TIME_CLT_SendReliablePdu ( rm_ble_mesh_model_client_ctrl_t*const p_ctrl,
uint32_t req_opcode, void const*const p_parameter, uint32_t rsp_opcode )
```

This is to initialize sending acknowledged commands.

Implements `rm_ble_mesh_model_client_api_t::sendReliablePdu`.

Example:

```
/* Initialize sending acknowledged commands. */
err = RM_MESH_TIME_CLT_SendReliablePdu(&g_mesh_time_clt0_ctrl, req_opcode,
p_parameter, rsp_opcode);
```

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_TIME_CLT_Get()**

```
fsp_err_t RM_MESH_TIME_CLT_Get ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Time Get is a message used to get the Time state of neighbor nodes. The response to the Time Get message is a Time Status message. There are no parameters for this message.

Parameters

| | | |
|------|--------|---------------------------------|
| [in] | p_ctrl | rm_mesh_time_clt control block. |
|------|--------|---------------------------------|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_TIME_CLT_Set()**

```
fsp_err_t RM_MESH_TIME_CLT_Set ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter )
```

Time Set is an acknowledged message used to set the Time state of an element. The response to the Time Set message is a Time Status message.

Parameters

| | | |
|------|-------------|---------------------------------|
| [in] | p_ctrl | rm_mesh_time_clt control block. |
| [in] | p_parameter | Pointer to Time Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_TIME_CLT_ZoneGet()**

```
fsp_err_t RM_MESH_TIME_CLT_ZoneGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Time Zone Get is an acknowledged message used to get the Time Zone Offset Current state, the Time Zone Offset New state, and the TAI of Zone Change state. The response to the Time Zone Get message is a Time Zone Status message. There are no parameters for this message.

Parameters

| | | |
|------|--------|---------------------------------|
| [in] | p_ctrl | rm_mesh_time_clt control block. |
|------|--------|---------------------------------|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_TIME_CLT_ZoneSet()**

```
fsp_err_t RM_MESH_TIME_CLT_ZoneSet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter )
```

Time Zone Set is an acknowledged message used to set the Time Zone Offset New state and the TAI of Zone Change state.

Parameters

| | | |
|------|-------------|-----------------------------------|
| [in] | p_ctrl | rm_mesh_time_clt control block. |
| [in] | p_parameter | Pointer to Time Zone Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_TIME_CLT_TaiUtcDeltaGet()**

```
fsp_err_t RM_MESH_TIME_CLT_TaiUtcDeltaGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

TAI-UTC Delta Get is an acknowledged message used to get the TAI-UTC Delta Current state, the TAI-UTC Delta New state, and the TAI of Delta Change state. The response to the TAI-UTC Delta Get message is a TAI-UTC Delta Status message. There are no parameters for this message.

Parameters

| | | |
|------|--------|---------------------------------|
| [in] | p_ctrl | rm_mesh_time_clt control block. |
|------|--------|---------------------------------|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_TIME_CLT_TaiUtcDeltaSet()**

```
fsp_err_t RM_MESH_TIME_CLT_TaiUtcDeltaSet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void
const *const p_parameter )
```

TAI-UTC Delta Set is an acknowledged message used to set the TAI-UTC Delta New state and the TAI of Delta Change state.

Parameters

| | | |
|------|-------------|---------------------------------------|
| [in] | p_ctrl | rm_mesh_time_clt control block. |
| [in] | p_parameter | Pointer to TAI-UTC Delta Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_TIME_CLT_RoleGet()**

```
fsp_err_t RM_MESH_TIME_CLT_RoleGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Time Role Get is an acknowledged message used to get the Time Role state of an element. The response to the Time Role Get message is a Time Role Status message. There are no parameters for this message.

Parameters

| | | |
|------|--------|--------------------------------|
| [in] | p_ctrl | rm_mesh_time_ct control block. |
|------|--------|--------------------------------|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_TIME_CLT_RoleSet()

```
fsp_err_t RM_MESH_TIME_CLT_RoleSet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter )
```

Time Role Set is an acknowledged message used to set the Time Role state of an element. The response to the Time Role Set message is a Time Role Status message.

Parameters

| | | |
|------|-------------|-----------------------------------|
| [in] | p_ctrl | rm_mesh_time_clt control block. |
| [in] | p_parameter | Pointer to Time Role Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

Bluetooth Low Energy Mesh Network Time Server (rm_mesh_time_srv)

Modules » Networking » Bluetooth Low Energy Mesh Network Modules

Functions

Data Structure Documentation

◆ rm_mesh_time_srv_info_t

| struct rm_mesh_time_srv_info_t | | |
|--|------------------|--|
| Mesh defines times based on International Atomic Time (TAI). The base representation of times is the number of seconds after 00:00:00 TAI on 2000-01-01 (that is, 1999-12-31T23:59:28 UTC) | | |
| Data Fields | | |
| uint8_t | tai_seconds[5] | Current TAI time in seconds since the epoch. |
| uint8_t | subsecond | The sub-second time in units of 1/256s. |
| uint8_t | uncertainty | Estimated uncertainty in 10-millisecond steps. |
| uint8_t | time_authority | 0 = No Time Authority. The element does not have a trusted OOB source of time, such as GPS or NTP. 1 = Time Authority. The element has a trusted OOB source of time, such as GPS or NTP or a battery-backed, properly initialized RTC. |
| uint16_t | tai_utc_delta | Current difference between TAI and UTC in seconds |
| uint8_t | time_zone_offset | The local time zone offset in 15-minute increments |

◆ rm_mesh_time_srv_zone_info_t

| struct rm_mesh_time_srv_zone_info_t | | |
|-------------------------------------|--------------------------|---|
| Time Zone | | |
| Data Fields | | |
| uint8_t | time_zone_offset_current | Current local time zone offset. Meaningful only in 'Time Zone Status' response. |
| uint8_t | time_zone_offset_new | Upcoming local time zone offset. |
| uint8_t | tai_of_zone_change[5] | Absolute TAI time when the Time Zone Offset will change from Current to New. |

◆ rm_mesh_time_srv_tai_utc_delta_info_t

| struct rm_mesh_time_srv_tai_utc_delta_info_t | | |
|--|--|--|
| TAI-UTC Delta | | |

| Data Fields | | |
|-------------|------------------------|--|
| uint16_t | tai_utc_delta_current | Current difference between TAI and UTC in seconds. Meaningful only in 'TAI-UTC Delta Status' response. |
| uint16_t | tai_utc_delta_new | Upcoming difference between TAI and UTC in seconds. |
| uint8_t | padding | Always 0b0. Other values are Prohibited. |
| uint8_t | tai_of_delta_change[5] | TAI Seconds time of the upcoming TAI-UTC Delta change |

◆ rm_mesh_time_srv_role_info_t

| struct rm_mesh_time_srv_role_info_t | | |
|-------------------------------------|------|-----------|
| The Time Role state of an element | | |
| Data Fields | | |
| uint8_t | role | Time Role |

◆ rm_mesh_time_srv_instance_ctrl_t

| | | |
|--|--|--|
| struct rm_mesh_time_srv_instance_ctrl_t | | |
| BLE mesh time instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_TIME_SRV_Open() is called. | | |

Function Documentation

◆ RM_MESH_TIME_SRV_Open()

```
fsp_err_t RM_MESH_TIME_SRV_Open ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_ble_mesh_model_server_cfg_t const *const p_cfg )
```

API to initialize Time Server model. This is to initialize Time Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_TIME_SRV_Open(&g_mesh_time_srv0_ctrl, &g_mesh_time_srv0_cfg);
```

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

◆ RM_MESH_TIME_SRV_Close()

```
fsp_err_t RM_MESH_TIME_SRV_Close ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl)
```

API to terminate Time Server model. This is to terminate Time Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_TIME_SRV_Close(&g_mesh_time_srv0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ RM_MESH_TIME_SRV_StateUpdate()

```
fsp_err_t RM_MESH_TIME_SRV_StateUpdate ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_ble_mesh_access_server_state_t const *const p_state )
```

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements `rm_ble_mesh_model_server_api_t::stateUpdate`.

Example:

```
/* Update server status. */
err = RM_MESH_TIME_SRV_StateUpdate(&g_mesh_time_srv0_ctrl, &state);
```

Return values

| | |
|--------------------------|-------------------------------------|
| FSP_SUCCESS | Updated server status successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_state is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

5.2.12.12 Cellular Comm Interface on UART (rm_cellular_comm_uart_aws)

 (CellularCommInterfaceHandle_t commInterfaceHandle)

void [comm_uart_aws_callback](#) (uart_callback_args_t *p_args)

Detailed Description

Middleware implementing the AWS Cellular Comm Interface for the FSP UART API.

Overview

See AWS documentation for how the Cellular Comm Interface works:

https://www.freertos.org/Documentation/api-ref/cellular/cellular_porting.html#cellular_porting_comm_if

Configuration

Note

Using DTC with UART is recommended to reduce the number of interrupts in the system.

Build Time Configurations for rm_cellular_comm_uart_aws

The following build time configurations are defined in fsp_cfg/middleware/rm_cellular_comm_uart_aws_cfg.h:

| Configuration | Options | Default | Description |
|-----------------------|--|---------------|--|
| Parameter Checking | <ul style="list-style-type: none"> Default (BSP) Enabled Disabled | Default (BSP) | Selects if code for parameter checking is to be included in the build. |
| Receive Buffer | Size should be greater than zero | 256 | Temporary buffer for received bytes. When read function is called remaining bytes will be read directly into buffer specified by read function argument. |
| Receive Transfer Size | Size should be greater than zero | 512 | The comm interface will break down UART reads into smaller read requests based on this number. For instance if |

this is set to 512 bytes then the interface will request 512 bytes at a time until the requested length is met or timeout. This is helpful for making use of DTC without having a long timeout period. AWS Cellular Interface Common->Comm Interface Receive Timeout is the timeout used for individual reads and should set accordingly based on this setting.

Configurations for Networking > Cellular Comm Interface on UART (rm_cellular_comm_uart_aws)

| Configuration | Options | Default | Description |
|---------------|-------------------------------|--------------------------|--------------|
| Name | Name must be a valid C symbol | g_rm_cellular_comm_uart0 | Module name. |

Function Documentation

◆ RM_CELLULAR_COMM_UART_AWS_Open()

```
CellularCommInterfaceError_t RM_CELLULAR_COMM_UART_AWS_Open (
    rm_cellular_comm_uart_aws_instance_ctrl_t * p_instance_ctrl,
    CellularCommInterfaceReceiveCallback_t receive_callback, void * pUserData )
```

Implements open for CellularCommInterface_t

Parameters

| | | |
|------|------------------|--|
| [in] | receive_callback | Callback to call upon receiving data |
| [in] | pUserData | Pointer to user data to be passed through callback |
| [in] | p_instance_ctrl | Pointer to a rm_cellular_comm_uart_aws_instance_ctrl_t |

Return values

| | |
|----------------------------------|-----------------------------|
| IOT_COMM_INTERFACE_SUCCESS | Open succeeded |
| IOT_COMM_INTERFACE_BAD_PARAMETER | Bad parameter was passed in |
| IOT_COMM_INTERFACE_FAILURE | General failure |
| IOT_COMM_INTERFACE_DRIVER_ERROR | Lower level failure |

◆ **RM_CELLULAR_COMM_UART_AWS_Send()**

```
CellularCommInterfaceError_t RM_CELLULAR_COMM_UART_AWS_Send (
CellularCommInterfaceHandle_t commInterfaceHandle, const uint8_t* pData, uint32_t
dataLength, uint32_t timeoutMilliseconds, uint32_t* pDataSentLength )
```

Implements send for CellularCommInterface_t. This function will block the calling thread until data is sent.

Parameters

| | | |
|------|---------------------|--|
| [in] | commInterfaceHandle | CellularCommInterfaceHandle_t assigned in open |
| [in] | pData | Pointer to data to send |
| [in] | dataLength | Length of data to send |
| [in] | timeoutMilliseconds | Timeout in MS to wait for data to send |
| [in] | pDataSentLength | Actual length of data sent |

Return values

| | |
|----------------------------------|-----------------------------|
| IOT_COMM_INTERFACE_SUCCESS | Send succeeded |
| IOT_COMM_INTERFACE_BAD_PARAMETER | Bad parameter was passed in |
| IOT_COMM_INTERFACE_FAILURE | General failure |
| IOT_COMM_INTERFACE_DRIVER_ERROR | Lower level failure |
| IOT_COMM_INTERFACE_TIMEOUT | Send operation timed out |

◆ **RM_CELLULAR_COMM_UART_AWS_Receive()**

```
CellularCommInterfaceError_t RM_CELLULAR_COMM_UART_AWS_Receive (
CellularCommInterfaceHandle_t commInterfaceHandle, uint8_t* pBuffer, uint32_t bufferSize,
uint32_t timeoutMilliseconds, uint32_t* pDataReceivedLength )
```

Implements receive for CellularCommInterface_t. This function will block the calling thread until data is received.

Parameters

| | | |
|------|---------------------|--|
| [in] | commInterfaceHandle | CellularCommInterfaceHandle_t assigned in open |
| [in] | pBuffer | Pointer to buffer to receive to |
| [in] | bufferLength | Length of buffer |
| [in] | timeoutMilliseconds | Timeout in MS to wait for data reception |
| [in] | pDataReceivedLength | Actual length of data received |

Return values

| | |
|----------------------------------|-----------------------------|
| IOT_COMM_INTERFACE_SUCCESS | Receive succeeded |
| IOT_COMM_INTERFACE_BAD_PARAMETER | Bad parameter was passed in |
| IOT_COMM_INTERFACE_FAILURE | General failure |
| IOT_COMM_INTERFACE_DRIVER_ERROR | Lower level failure |

◆ **RM_CELLULAR_COMM_UART_AWS_Close()**

```
CellularCommInterfaceError_t RM_CELLULAR_COMM_UART_AWS_Close (
CellularCommInterfaceHandle_t commInterfaceHandle)
```

Implements close for CellularCommInterface_t

Parameters

| | | |
|------|---------------------|--|
| [in] | commInterfaceHandle | CellularCommInterfaceHandle_t assigned in open |
|------|---------------------|--|

Return values

| | |
|----------------------------------|-----------------------------|
| IOT_COMM_INTERFACE_SUCCESS | Close succeeded |
| IOT_COMM_INTERFACE_BAD_PARAMETER | Bad parameter was passed in |
| IOT_COMM_INTERFACE_FAILURE | General failure |

◆ **comm_uart_aws_callback()**

```
void comm_uart_aws_callback ( uart_callback_args_t * p_args)
```

Callback for UART driver

Parameters

| | | |
|------|--------|------------------------------------|
| [in] | p_args | Arguments from UART RX/TX callback |
|------|--------|------------------------------------|

5.2.12.13 Ethernet (r_ether)

Modules » [Networking](#)

Functions

`fsp_err_t` [R_ETHER_Open](#) (`ether_ctrl_t *const p_ctrl`, `ether_cfg_t const *const p_cfg`)

After ETHERC, EDMAC and PHY-LSI are reset in software, an auto negotiation of PHY-LSI is begun. Afterwards, the link signal change interrupt is permitted. Implements [ether_api_t::open](#). [More...](#)

`fsp_err_t` [R_ETHER_Close](#) (`ether_ctrl_t *const p_ctrl`)

Disables interrupts. Removes power and releases hardware lock. Implements [ether_api_t::close](#). [More...](#)

`fsp_err_t` [R_ETHER_BufferRelease](#) (`ether_ctrl_t *const p_ctrl`)

Move to the next buffer in the circular receive buffer list. Implements [ether_api_t::bufferRelease](#). [More...](#)

`fsp_err_t` [R_ETHER_RxBufferUpdate](#) (`ether_ctrl_t *const p_ctrl`, `void *const p_buffer`)

Change the buffer pointer of the current rx buffer descriptor. Implements [ether_api_t::rxBufferUpdate](#). [More...](#)

`fsp_err_t` [R_ETHER_LinkProcess](#) (`ether_ctrl_t *const p_ctrl`)

The Link up processing, the Link down processing, and the magic packet detection processing are executed. Implements [ether_api_t::linkProcess](#). [More...](#)

`fsp_err_t` [R_ETHER_WakeOnLANEnable](#) (`ether_ctrl_t *const p_ctrl`)

The setting of ETHERC is changed from normal sending and receiving mode to magic packet detection mode. Implements [ether_api_t::wakeOnLANEnable](#). [More...](#)

`fsp_err_t` [R_ETHER_Read](#) (`ether_ctrl_t *const p_ctrl`, `void *const p_buffer`, `uint32_t *const length_bytes`)

Receive Ethernet frame. Receives data to the location specified by the pointer to the receive buffer. In zero copy mode, the address of the receive buffer is returned. In non zero copy mode, the received data in the internal buffer is copied to the pointer passed by the argument. Implements [ether_api_t::read](#). [More...](#)

`fsp_err_t` [R_ETHER_Write](#) (`ether_ctrl_t *const p_ctrl`, `void *const p_buffer`, `uint32_t const frame_length`)

Transmit Ethernet frame. Transmits data from the location specified by the pointer to the transmit buffer, with the data size equal to the specified frame length. In the non zero copy mode, transmits data after being copied to the internal buffer. Implements [ether_api_t::write](#). [More...](#)

`fsp_err_t` [R_ETHER_TxStatusGet](#) (`ether_ctrl_t *const p_ctrl`, `void *const p_buffer_address`)

`fsp_err_t` [R_ETHER_CallbackSet](#) (`ether_ctrl_t *const p_api_ctrl`, `void(*p_callback)(ether_callback_args_t*)`, `void const *const p_context`, `ether_callback_args_t *const p_callback_memory`)

Detailed Description

Driver for the Ethernet peripheral on RA MCUs. This module implements the [Ethernet Interface](#).

Overview

This module performs Ethernet frame transmission and reception using an Ethernet controller and an Ethernet DMA controller.

Features

The Ethernet module supports the following features:

- Transmit/receive processing
- Optional zero-copy buffering
- Callback function with returned event code
- Magic packet detection mode support
- Auto negotiation support
- Flow control support

- Multicast filtering support
- Broadcast filtering support
- Promiscuous mode support

Configuration

Build Time Configurations for r_ether

The following build time configurations are defined in fsp_cfg/r_ether_cfg.h:

| Configuration | Options | Default | Description |
|-----------------------------|--|---------------|--|
| Parameter Checking | <ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| ET0_LINKSTA Pin Status Flag | <ul style="list-style-type: none"> • Fall -> Rise • Rise -> Fall | Fall -> Rise | Specify the polarity of the link signal output by the PHY-LSI. When 0 is specified, link-up and link-down correspond respectively to the fall and rise of the LINKSTA signal. When 1 is specified, link-up and link-down correspond respectively to the rise and fall of the LINKSTA signal. |
| Link Signal Change Flag | <ul style="list-style-type: none"> • Unused • Used | Unused | Use LINKSTA signal for detect link status changes 0 = unused (use PHY-LSI status register) 1 = use (use LINKSTA signal) |

Configurations for Networking > Ethernet (r_ether)

This module can be added to the Stacks tab via New Stack > Networking > Ethernet (r_ether). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

| Configuration | Options | Default | Description |
|--------------------------|---|-------------------|-----------------------------------|
| General > Name | Name must be a valid C symbol | g_ether0 | Module name. |
| General > Channel | 0 | 0 | Select the ether channel number. |
| General > MAC address | Must be a valid MAC address | 00:11:22:33:44:55 | MAC address of this channel. |
| General > Zero-copy Mode | <ul style="list-style-type: none"> • Disable • Enable | Disable | Enable or disable zero-copy mode. |

| | | | |
|--------------------------------------|---|---------|---|
| General > Flow control functionality | <ul style="list-style-type: none"> • Disable • Enable | Disable | Enable or disable flow control. |
| Filters > Multicast Mode | <ul style="list-style-type: none"> • Disable • Enable | Enable | Enable or disable multicast frame reception. |
| Filters > Promiscuous Mode | <ul style="list-style-type: none"> • Disable • Enable | Disable | Enable this option to receive packets addressed to other NICs. |
| Filters > Broadcast filter | Must be a valid non-negative integer with maximum configurable value of 65535. | 0 | Limit of the number of broadcast frames received continuously |
| Buffers > Number of TX buffer | Must be an integer from 1 to 8 | 1 | Number of transmit buffers |
| Buffers > Number of RX buffer | Must be an integer from 1 to 8 | 1 | Number of receive buffers |
| Buffers > Allocate RX buffer | <ul style="list-style-type: none"> • Disable • Enable | Enable | Allocates the RX buffer when generating the configuration structure |
| Buffers > Buffer size | Must be at least 1514 which is the maximum Ethernet frame size. | 1514 | Size of Ethernet buffer |
| Buffers > Padding size | <ul style="list-style-type: none"> • Disable • 1 Byte • 2 Bytes • 3 Bytes | Disable | The padding size that is automatically inserted into the received packets |
| Buffers > Padding offset | Must be less than 64 bytes. | 0 | The offset into a receive buffer to insert padding bytes. |
| Interrupts > Interrupt priority | MCU Specific Options | | Select the EDMAC interrupt priority. |
| Interrupts > Callback | Name must be a valid C symbol | NULL | Callback provided when an ISR occurs |

Interrupt Configuration

The first [R_ETHER_Open](#) function call sets EINT interrupts. The user could provide callback function which would be invoked when EINT interrupt handler has been completed. The callback arguments will contain information about a channel number, the ETHERC and EDMAC status, the event code, and a pointer to the user defined context.

Callback Configuration

The user could provide callback function which would be invoked when either a magic packet or a link signal change is detected. When the callback function is called, a variable in which the channel

number for which the detection occurred and a constant shown in Table 2.4 are stored is passed as an argument. If the value of this argument is to be used outside the callback function, its value should be copied into, for example, a global variable.

Clock Configuration

The clock for this module is derived from the following peripheral clock for each MCU group:

| MCU Group | Peripheral Clock |
|-----------|------------------|
| RA4E2 | PCLKA |
| RA4T1 | PCLKA |
| RA6E1 | PCLKA |
| RA6E2 | PCLKA |
| RA6M2 | PCLKA |
| RA6M3 | PCLKA |
| RA6M4 | PCLKA |
| RA6M5 | PCLKA |
| RA6T3 | PCLKA |

Note

1. When using *ETHERC*, the *PCLKA* frequency is in the range $12.5 \text{ MHz} \leq PCLKA \leq 120 \text{ MHz}$.
2. When using *ETHERC*, $PCLKA = ICLK$.

Pin Configuration

To use the Ethernet module, input/output signals of the peripheral function have to be allocated to pins with the multi-function pin controller (MPC). Please perform the pin setting before calling the [R_ETHER_Open](#) function.

Usage Notes

Ethernet Frame Format

The Ethernet module supports the Ethernet II/IEEE 802.3 frame format.

Frame Format for Data Transmission and Reception

Figure 221: Frame Format Image

The preamble and SFD signal the start of an Ethernet frame. The FCS contains the CRC of the

Ethernet frame and is calculated on the transmitting side. When data is received the CRC value of the frame is calculated in hardware, and the Ethernet frame is discarded if the values do not match. When the hardware determines that the data is normal, the valid range of receive data is: (transmission destination address) + (transmission source address) + (length/type) + (data).

PAUSE Frame Format

Figure 222: Pause Frame Format Image

The transmission destination address is specified as 01:80:C2:00:00:01 (a multicast address reserved for PAUSE frames). At the start of the payload the length/type is specified as 0x8808 and the operation code as 0x0001. The pause duration in the payload is specified by the value of the automatic PAUSE (AP) bits in the automatic PAUSE frame setting register (APR), or the manual PAUSE time setting (MP) bits in the manual PAUSE frame setting register (MPR).

Magic Packet Frame Format

Figure 223: Magic Packet Frame Format Image

In a Magic Packet, the value FF:FF:FF:FF:FF:FF followed by the transmission destination address repeated 16 times is inserted somewhere in the Ethernet frame data.

Limitations

Memory alignment limitation for Ethernet buffer

The Ethernet Driver has several alignment constraints:

- 16-byte alignment for the descriptor
- 32-byte aligned read buffer for `R_ETHER_RxBufferUpdate` when zero copy mode is enabled

Functional limitations in TrustZone Security Extensions

The Ethernet Driver has several security constraints:

| MCU | Has Security Extension | Support Flat project | Support TrustZone project | |
|-------|------------------------|----------------------|---------------------------|------------|
| | | | Secure | Non-Secure |
| RA6M2 | - | X | - | - |
| RA6M3 | - | X | - | - |
| RA6M4 | - *1 | X | - | X |

RA6M5

- *1

X

-

X

*Note**1. ETHERC/EDMAC is always Non-secure peripheral in this MCU.*

Examples

ETHER Basic Example

This is a basic example of minimal use of the ETHER in an application.

*Note**In this example zero-copy mode is disabled and there are no restrictions on buffer alignment.*

Data Structure Documentation

◆ **ether_instance_descriptor_t**

struct ether_instance_descriptor_t

EDMAC descriptor as defined in the hardware manual. Structure must be packed at 1 byte.

◆ **ether_extended_cfg_t**

struct ether_extended_cfg_t

ETHER extension configures the buffer descriptor for ETHER.

Data Fields

| | | |
|---|----------------------------------|----------------------------------|
| ether_instance_descriptor_t * | p_rx_descriptors | Receive descriptor buffer pool. |
| ether_instance_descriptor_t * | p_tx_descriptors | Transmit descriptor buffer pool. |

◆ **ether_instance_ctrl_t**

struct ether_instance_ctrl_t

ETHER control block. DO NOT INITIALIZE. Initialization occurs when [ether_api_t::open](#) is called.

Data Fields

| | | |
|---|---------------------------------|--|
| uint32_t | open | Used to determine if the channel is configured. |
| ether_cfg_t const * | p_ether_cfg | Pointer to initial configurations. |
| ether_instance_descriptor_t * | p_rx_descriptor | Pointer to the currently referenced transmit descriptor. |
| ether_instance_descriptor_t * | p_tx_descriptor | Pointer to the currently referenced receive descriptor. |
| void * | p_reg_etherc | Base register of ethernet controller for this channel. |

| | |
|---|--|
| void * | p_reg_edmac |
| | Base register of EDMA controller for this channel. |
| ether_previous_link_status_t | previous_link_status |
| | Previous link status. |
| ether_link_change_t | link_change |
| | status of link change |
| ether_magic_packet_t | magic_packet |
| | status of magic packet detection |
| ether_link_establish_status_t | link_establish_status |
| | Current Link status. |

Enumeration Type Documentation

◆ ether_previous_link_status_t

| | |
|---|-------------------------------|
| enum ether_previous_link_status_t | |
| Enumerator | |
| ETHER_PREVIOUS_LINK_STATUS_DOWN | Previous link status is down. |
| ETHER_PREVIOUS_LINK_STATUS_UP | Previous link status is up. |

◆ ether_link_change_t

| enum ether_link_change_t | |
|-----------------------------|------------------------------|
| Enumerator | |
| ETHER_LINK_CHANGE_NO_CHANGE | Link status is no change. |
| ETHER_LINK_CHANGE_LINK_DOWN | Link status changes to down. |
| ETHER_LINK_CHANGE_LINK_UP | Link status changes to up. |

◆ ether_magic_packet_t

| enum ether_magic_packet_t | |
|---------------------------------|-------------------------------|
| Enumerator | |
| ETHER_MAGIC_PACKET_NOT_DETECTED | Magic packet is not detected. |
| ETHER_MAGIC_PACKET_DETECTED | Magic packet is detected. |

◆ ether_link_establish_status_t

| enum ether_link_establish_status_t | |
|------------------------------------|--------------------------------|
| Enumerator | |
| ETHER_LINK_ESTABLISH_STATUS_DOWN | Link establish status is down. |
| ETHER_LINK_ESTABLISH_STATUS_UP | Link establish status is up. |

Function Documentation

◆ **R_ETHER_Open()**

```
fsp_err_t R_ETHER_Open ( ether_ctrl_t *const p_ctrl, ether_cfg_t const *const p_cfg )
```

After ETHERC, EDMAC and PHY-LSI are reset in software, an auto negotiation of PHY-LSI is begun. Afterwards, the link signal change interrupt is permitted. Implements [ether_api_t::open](#).

Return values

| | |
|---------------------------------------|--|
| FSP_SUCCESS | Channel opened successfully. |
| FSP_ERR_ASSERTION | Pointer to ETHER control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Control block has already been opened or channel is being used by another instance. Call close() then open() to reconfigure. |
| FSP_ERR_ETHER_ERROR_PHY_COMMUNICATION | Initialization of PHY-LSI failed. |
| FSP_ERR_INVALID_CHANNEL | Invalid channel number is given. |
| FSP_ERR_INVALID_POINTER | Pointer to extend config structure or MAC address is NULL. |
| FSP_ERR_INVALID_ARGUMENT | Interrupt is not enabled. |
| FSP_ERR_ETHER_PHY_ERROR_LINK | Initialization of PHY-LSI failed. |

◆ **R_ETHER_Close()**

```
fsp_err_t R_ETHER_Close ( ether_ctrl_t *const p_ctrl)
```

Disables interrupts. Removes power and releases hardware lock. Implements [ether_api_t::close](#).

Return values

| | |
|-------------------|---|
| FSP_SUCCESS | Channel successfully closed. |
| FSP_ERR_ASSERTION | Pointer to ETHER control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened |

◆ **R_ETHER_BufferRelease()**

```
fsp_err_t R_ETHER_BufferRelease ( ether_ctrl_t *const p_ctrl)
```

Move to the next buffer in the circular receive buffer list. Implements `ether_api_t::bufferRelease`.

Return values

| | |
|---------------------------------------|---|
| FSP_SUCCESS | Processing completed successfully. |
| FSP_ERR_ASSERTION | Pointer to ETHER control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened |
| FSP_ERR_ETHER_ERROR_LINK | Auto-negotiation is not completed, and reception is not enabled. |
| FSP_ERR_ETHER_ERROR_MAGIC_PACKET_MODE | As a Magic Packet is being detected, transmission and reception is not enabled. |

◆ **R_ETHER_RxBufferUpdate()**

```
fsp_err_t R_ETHER_RxBufferUpdate ( ether_ctrl_t *const p_ctrl, void *const p_buffer )
```

Change the buffer pointer of the current rx buffer descriptor. Implements `ether_api_t::rxBufferUpdate`.

Return values

| | |
|-------------------------------------|--|
| FSP_SUCCESS | Processing completed successfully. |
| FSP_ERR_ASSERTION | A pointer argument is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_INVALID_POINTER | The pointer of buffer is NULL or not aligned on a 32-bit boundary. |
| FSP_ERR_INVALID_MODE | Driver is configured to non zero copy mode. |
| FSP_ERR_ETHER_RECEIVE_BUFFER_ACTIVE | All descriptor is active. |

◆ **R_ETHER_LinkProcess()**

```
fsp_err_t R_ETHER_LinkProcess ( ether_ctrl_t *const p_ctrl)
```

The Link up processing, the Link down processing, and the magic packet detection processing are executed. Implements [ether_api_t::linkProcess](#).

Return values

| | |
|---------------------------------------|--|
| FSP_SUCCESS | Link is up. |
| FSP_ERR_ASSERTION | Pointer to ETHER control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_ETHER_ERROR_LINK | Link is down. |
| FSP_ERR_ETHER_ERROR_PHY_COMMUNICATION | When reopening the PHY interface initialization of the PHY-LSI failed. |
| FSP_ERR_ALREADY_OPEN | When reopening the PHY interface it was already opened. |
| FSP_ERR_INVALID_CHANNEL | When reopening the PHY interface an invalid channel was passed. |
| FSP_ERR_INVALID_POINTER | When reopening the PHY interface the MAC address pointer was NULL. |
| FSP_ERR_INVALID_ARGUMENT | When reopening the PHY interface the interrupt was not enabled. |
| FSP_ERR_ETHER_PHY_ERROR_LINK | Initialization of the PHY-LSI failed. |

◆ **R_ETHER_WakeOnLANEnable()**

```
fsp_err_t R_ETHER_WakeOnLANEnable ( ether_ctrl_t *const p_ctrl)
```

The setting of ETHERC is changed from normal sending and receiving mode to magic packet detection mode. Implements [ether_api_t::wakeOnLANEnable](#).

Return values

| | |
|------------------------------|--|
| FSP_SUCCESS | Processing completed successfully. |
| FSP_ERR_ASSERTION | Pointer to ETHER control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_ETHER_ERROR_LINK | Auto-negotiation is not completed, and reception is not enabled. |
| FSP_ERR_ETHER_PHY_ERROR_LINK | Initialization of PHY-LSI failed. |

◆ **R_ETHER_Read()**

```
fsp_err_t R_ETHER_Read ( ether_ctrl_t *const p_ctrl, void *const p_buffer, uint32_t *const length_bytes )
```

Receive Ethernet frame. Receives data to the location specified by the pointer to the receive buffer. In zero copy mode, the address of the receive buffer is returned. In non zero copy mode, the received data in the internal buffer is copied to the pointer passed by the argument. Implements [ether_api_t::read](#).

Return values

| | |
|---------------------------------------|---|
| FSP_SUCCESS | Processing completed successfully. |
| FSP_ERR_ASSERTION | Pointer to ETHER control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_ETHER_ERROR_NO_DATA | There is no data in receive buffer. |
| FSP_ERR_ETHER_ERROR_LINK | Auto-negotiation is not completed, and reception is not enabled. |
| FSP_ERR_ETHER_ERROR_MAGIC_PACKET_MODE | As a Magic Packet is being detected, transmission and reception is not enabled. |
| FSP_ERR_ETHER_ERROR_FILTERING | Multicast Frame filter is enable, and Multicast Address Frame is received. |
| FSP_ERR_INVALID_POINTER | Value of the pointer is NULL. |

◆ **R_ETHER_Write()**

```
fsp_err_t R_ETHER_Write ( ether_ctrl_t *const p_ctrl, void *const p_buffer, uint32_t const
frame_length )
```

Transmit Ethernet frame. Transmits data from the location specified by the pointer to the transmit buffer, with the data size equal to the specified frame length. In the non zero copy mode, transmits data after being copied to the internal buffer. Implements `ether_api_t::write`.

Return values

| | |
|--|---|
| FSP_SUCCESS | Processing completed successfully. |
| FSP_ERR_ASSERTION | Pointer to ETHER control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_ETHER_ERROR_LINK | Auto-negotiation is not completed, and reception is not enabled. |
| FSP_ERR_ETHER_ERROR_MAGIC_PACKET_MODE | As a Magic Packet is being detected, transmission and reception is not enabled. |
| FSP_ERR_ETHER_ERROR_TRANSMIT_BUFFER_FULL | Transmit buffer is not empty. |
| FSP_ERR_INVALID_POINTER | Value of the pointer is NULL. |
| FSP_ERR_INVALID_ARGUMENT | Value of the send frame size is out of range. |

◆ **R_ETHER_TxStatusGet()**

```
fsp_err_t R_ETHER_TxStatusGet ( ether_ctrl_t *const p_ctrl, void *const p_buffer_address )
```

Provides status of Ethernet driver in the user provided pointer. Implements `ether_api_t::txStatusGet`.

Return values

| | |
|-------------------------|--|
| FSP_SUCCESS | Transmit buffer address is stored in provided p_buffer_address. |
| FSP_ERR_ASSERTION | Pointer to ETHER control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_INVALID_POINTER | p_status is NULL. |
| FSP_ERR_NOT_FOUND | Transmit buffer address has been overwritten in transmit descriptor. |

◆ **R_ETHER_CallbackSet()**

```
fsp_err_t R_ETHER_CallbackSet ( ether_ctrl_t *const p_api_ctrl, void(*) (ether_callback_args_t *)
p_callback, void const *const p_context, ether_callback_args_t *const p_callback_memory )
```

Updates the user callback with the option to provide memory for the callback argument structure. Implements `ether_api_t::callbackSet`.

Return values

| | |
|----------------------------|--|
| FSP_SUCCESS | Callback updated successfully. |
| FSP_ERR_ASSERTION | A required pointer is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_NO_CALLBACK_MEMORY | <code>p_callback</code> is non-secure and <code>p_callback_memory</code> is either secure or NULL. |

5.2.12.14 Ethernet (r_ether_phy)

Modules » Networking

Functions

```
fsp_err_t R_ETHER_PHY_Open (ether_phy_ctrl_t *const p_ctrl, ether_phy_cfg_t
const *const p_cfg)
```

Resets Ethernet PHY device. Implements `ether_phy_api_t::open`.
More...

```
fsp_err_t R_ETHER_PHY_Close (ether_phy_ctrl_t *const p_ctrl)
```

Close Ethernet PHY device. Implements `ether_phy_api_t::close`.
More...

```
fsp_err_t R_ETHER_PHY_StartAutoNegotiate (ether_phy_ctrl_t *const p_ctrl)
```

Starts auto-negotiate. Implements `ether_phy_api_t::startAutoNegotiate`. More...

```
fsp_err_t R_ETHER_PHY_LinkPartnerAbilityGet (ether_phy_ctrl_t *const p_ctrl,
uint32_t *const p_line_speed_duplex, uint32_t *const p_local_pause,
uint32_t *const p_partner_pause)
```

Reports the other side's physical capability. Implements `ether_phy_api_t::linkPartnerAbilityGet`. More...

`fsp_err_t R_ETHER_PHY_LinkStatusGet (ether_phy_ctrl_t *const p_ctrl)`

Returns the status of the physical link. Implements `ether_phy_api_t::linkStatusGet`. [More...](#)

Detailed Description

The Ethernet PHY module (`r_ether_phy`) provides an API for standard Ethernet PHY communications applications that use the ETHERC peripheral. It implements the [Ethernet PHY Interface](#).

Overview

The Ethernet PHY module is used to setup and manage an external Ethernet PHY device for use with the on-chip Ethernet Controller (ETHERC) peripheral. It performs auto-negotiation to determine the optimal connection parameters between link partners. Once initialized the connection between the external PHY and the onboard controller is automatically managed in hardware.

Features

The Ethernet PHY module supports the following features:

- Auto negotiation support
- Flow control support
- Link status check support

Configuration

Build Time Configurations for `r_ether_phy`

The following build time configurations are defined in `fsp_cfg/r_ether_phy_cfg.h`:

| Configuration | Options | Default | Description |
|------------------------|---|---------------|---|
| Parameter Checking | <ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| Select PHY(DEPRECATED) | <ul style="list-style-type: none"> • Default • Other • KSZ8091RNB • KSZ8041 • DP83620 • ICS1894 | Default | Config -> Select PHY is deprecated. Enable support for a PHY in the Config section and select it with Module -> PHY LSI type. Set Select PHY to Default to hide this message. |
| KSZ8091RNZ Target | <ul style="list-style-type: none"> • Disabled • Enabled | Disabled | Select whether to use KSZ8091RNB Phy LSI or not. |
| KSZ8041 Target | <ul style="list-style-type: none"> • Disabled • Enabled | Disabled | Select whether to use KSZ8041 Phy LSI or |

not.

| | | | |
|-----------------|--|----------|--|
| DP83620 Target | <ul style="list-style-type: none"> • Disabled • Enabled | Disabled | Select whether to use DP83620 Phy LSI or not. |
| ICS1894 Target | <ul style="list-style-type: none"> • Disabled • Enabled | Disabled | Select whether to use ICS1894 Phy LSI or not. |
| Reference Clock | <ul style="list-style-type: none"> • Default • Enabled • Disabled | Default | Select whether to use the RMIi reference clock. Selecting 'Default' will automatically choose the correct option when using a Renesas development board. |

Configurations for Networking > Ethernet (r_ether_phy)

This module can be added to the Stacks tab via New Stack > Networking > Ethernet (r_ether_phy). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

| Configuration | Options | Default | Description |
|------------------------------------|---|---------------|--|
| Name | Name must be a valid C symbol | g_ether_phy0 | Module name. |
| Channel | <ul style="list-style-type: none"> • 0 • 1 | 0 | Select the Ethernet controller channel number. |
| PHY-LSI Address | Specify a value between 0 and 31. | 0 | Specify the address of the PHY-LSI used. |
| PHY-LSI Reset Completion Timeout | Specify a value between 0x1 and 0xFFFFFFFF. | 0x00020000 | Specify the number of times to read the PHY-LSI control register while waiting for reset completion. This value should be adjusted experimentally based on the PHY-LSI used. |
| Select MII type | <ul style="list-style-type: none"> • MII • RMIi | RMIi | Specify whether to use MII or RMIi. |
| Phy LSI type | <ul style="list-style-type: none"> • Kit Component • DEFAULT • KSZ8091RNB • KSZ8041 • DP83620 • ICS1894 | Kit Component | Select the Phy LSI target. Selecting 'Kit Component' will automatically choose the correct option when using a Renesas development board. |
| MII/RMIi Register Access Wait-time | Specify a value between 0x1 and | 8 | Specify the bit timing for MII/RMIi register |

0x7FFFFFFF.

accesses during PHY initialization. This value should be adjusted experimentally based on the PHY-LSI used.

Flow Control

- Disable
- Enable

Disable

Select whether to enable or disable flow control.

Usage Notes

Note

See the [example](#) below for details on how to initialize the Ethernet PHY module.

Accessing the MII and RMII Registers

Use the PIR register to access the MII and RMII registers in the PHY-LSI. Serial data in the MII and RMII management frame format is transmitted and received through the ET0_MDC and ET0_MDIO pins controlled by software.

MII and RMII management frame format

The below table lists the MII and RMII management frame formats.

| Access type | MII and RMII management frame | | | | | | | | |
|----------------|-------------------------------|----|----|-------|-------|----|------------------------------|------|--|
| Item | PRE | ST | OP | PHYAD | REGAD | TA | DATA | IDLE | |
| Number of bits | 32 | 2 | 2 | 5 | 5 | 2 | 16 | 1 | |
| Read | 1...1 | 01 | 10 | 00001 | RRRRR | Z0 | DDDDD DDDDD DDDDD D | Z | |
| Write | 1...1 | 01 | 01 | 00001 | RRRRR | 10 | DDDDD DDDDD DDDDD D | Z | |

Note

- PRE (preamble): Send 32 consecutive 1s.
- ST (start of frame): Send 01b.
- OP (operation code): Send 10b for read or 01b for write.
- PHYAD (PHY address): Up to 32 PHY-LSIs can be connected to one MAC. PHY-LSIs are selected with these 5 bits. When the PHY-LSI address is 1, send 00001b.
- REGAD (register address): One register is selected from up to 32 registers in the PHY-LSI. When the register address is 1, send 00001b.
- TA (turnaround): Use 2-bit turnaround time to avoid contention between the register address and data during a read operation.
Send 10b during a write operation. Release the bus for 1 bit during a read operation (Z is output).

(This is indicated as Z0 because 0 is output from the PHY-LSI on the next clock cycle.)

- DATA (data): 16-bit data. Sequentially send or receive starting from the MSB.

- IDLE (IDLE condition): Wait time before inputting the next MII or RMII management format. Release the bus during a write

operation (Z is output). No control is required, because a bus was already released during a read operation.

Limitations

- The r_ether_phy module may need to be customized for PHY devices other than the ones currently supported. Use the existing code as a starting point for creating a custom implementation. Supported PHY devices are as follows.
 - KSZ8091RNB
 - KSZ8041
 - DP83620
 - ICS1894

Examples

ETHER PHY Basic Example

This is a basic example of minimal use of the ETHER PHY in an application.

```
void ether_phy_basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;

    g_ether_phy0_ctrl.open    = 0U;
    g_ether_phy0_cfg.channel = 0;

    /* Initializes the module. */
    err = R_ETHER_PHY_Open(&g_ether_phy0_ctrl, &g_ether_phy0_cfg);

    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);

    /* Start auto negotiation. */
    err = R_ETHER_PHY_StartAutoNegotiate(&g_ether_phy0_ctrl);
    assert(FSP_SUCCESS == err);

    /* Polling until link is established. */
    while (FSP_SUCCESS != R_ETHER_PHY_LinkStatusGet(&g_ether_phy0_ctrl))
    {
        /* Do nothing */
    }

    /* Get link partner ability from phy interface. */
    err = R_ETHER_PHY_LinkPartnerAbilityGet(&g_ether_phy0_ctrl,
                                             &g_ether_phy0_line_speed_duplex,
```

```

        &g_ether_phy0_local_pause,
        &g_ether_phy0_partner_pause);

    assert(FSP_SUCCESS == err);
/* Check current link status. */
    err = R_ETHER_PHY_LinkStatusGet(&g_ether_phy0_ctrl);
    assert(FSP_SUCCESS == err);
}

```

Data Structures

```
struct ether_phy_instance_ctrl_t
```

Data Structure Documentation

◆ ether_phy_instance_ctrl_t

| struct ether_phy_instance_ctrl_t | | |
|--|-----------------|---|
| ETHER PHY control block. DO NOT INITIALIZE. Initialization occurs when <code>ether_phy_api_t::open</code> is called. | | |
| Data Fields | | |
| uint32_t | open | Used to determine if the channel is configured. |
| ether_phy_cfg_t const * | p_ether_phy_cfg | Pointer to initial configurations. |
| volatile uint32_t * | p_reg_pir | Pointer to ETHERC peripheral registers. |
| uint32_t | local_advertise | Capabilities bitmap for local advertising. |

Function Documentation

◆ **R_ETHER_PHY_Open()**

```
fsp_err_t R_ETHER_PHY_Open ( ether_phy_ctrl_t *const p_ctrl, ether_phy_cfg_t const *const p_cfg )
```

Resets Ethernet PHY device. Implements `ether_phy_api_t::open`.

Return values

| | |
|-------------------------|--|
| FSP_SUCCESS | Channel opened successfully. |
| FSP_ERR_ASSERTION | Pointer to ETHER_PHY control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Control block has already been opened or channel is being used by another instance. Call close() then open() to reconfigure. |
| FSP_ERR_INVALID_CHANNEL | Invalid channel number is given. |
| FSP_ERR_INVALID_POINTER | Pointer to p_cfg is NULL. |
| FSP_ERR_TIMEOUT | PHY-LSI Reset wait timeout. |

◆ **R_ETHER_PHY_Close()**

```
fsp_err_t R_ETHER_PHY_Close ( ether_phy_ctrl_t *const p_ctrl)
```

Close Ethernet PHY device. Implements `ether_phy_api_t::close`.

Return values

| | |
|-------------------|---|
| FSP_SUCCESS | Channel successfully closed. |
| FSP_ERR_ASSERTION | Pointer to ETHER_PHY control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened |

◆ **R_ETHER_PHY_StartAutoNegotiate()**

```
fsp_err_t R_ETHER_PHY_StartAutoNegotiate ( ether_phy_ctrl_t *const p_ctrl)
```

Starts auto-negotiate. Implements `ether_phy_api_t::startAutoNegotiate`.

Return values

| | |
|-------------------|---|
| FSP_SUCCESS | ETHER_PHY successfully starts auto-negotiate. |
| FSP_ERR_ASSERTION | Pointer to ETHER_PHY control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened |

◆ R_ETHER_PHY_LinkPartnerAbilityGet()

```
fsp_err_t R_ETHER_PHY_LinkPartnerAbilityGet ( ether_phy_ctrl_t *const p_ctrl, uint32_t *const p_line_speed_duplex, uint32_t *const p_local_pause, uint32_t *const p_partner_pause )
```

Reports the other side's physical capability. Implements [ether_phy_api_t::linkPartnerAbilityGet](#).

Return values

| | |
|------------------------------|--|
| FSP_SUCCESS | ETHER_PHY successfully get link partner ability. |
| FSP_ERR_ASSERTION | Pointer to ETHER_PHY control block is NULL. |
| FSP_ERR_INVALID_POINTER | Pointer to arguments are NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened |
| FSP_ERR_ETHER_PHY_ERROR_LINK | PHY-LSI is not link up. |
| FSP_ERR_ETHER_PHY_NOT_READY | The auto-negotiation isn't completed |

◆ R_ETHER_PHY_LinkStatusGet()

```
fsp_err_t R_ETHER_PHY_LinkStatusGet ( ether_phy_ctrl_t *const p_ctrl)
```

Returns the status of the physical link. Implements [ether_phy_api_t::linkStatusGet](#).

Return values

| | |
|------------------------------|--|
| FSP_SUCCESS | ETHER_PHY successfully get link partner ability. |
| FSP_ERR_ASSERTION | Pointer to ETHER_PHY control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened |
| FSP_ERR_ETHER_PHY_ERROR_LINK | PHY-LSI is not link up. |

5.2.12.15 FreeRTOS+TCP Wrapper to r_ether (rm_freertos_plus_tcp)

[Modules](#) » [Networking](#)

Middleware for using TCP on RA MCUs.

Overview

FreeRTOS Plus TCP is a TCP stack created for use with FreeRTOS.

This module provides the NetworkInterface required to use FreeRTOS Plus TCP with the [Ethernet \(r_ether\)](#) driver.

Please refer to the [FreeRTOS Plus TCP documentation](#) for further details.

Configuration

Build Time Configurations for FreeRTOS_Plus_TCP

The following build time configurations are defined in aws/FreeRTOSIPConfig.h:

| Configuration | Options | Default | Description |
|------------------------------|---|--------------------------|--|
| Print debug messages | <ul style="list-style-type: none"> Disable Enable | Disable | If ipconfigHAS_DEBUG_PRINTF is set to 1 then FreeRTOS_debug_printf should be defined to the function used to print out the debugging messages. |
| Print info messages | <ul style="list-style-type: none"> Disable Enable | Disable | Set to 1 to print out non debugging messages, for example the output of the FreeRTOS_netstat() command, and ping replies. If ipconfigHAS_PRINTF is set to 1 then FreeRTOS_printf should be set to the function used to print out the messages. |
| Byte order of the target MCU | pdFREERTOS_LITTLE_ENDIAN | pdFREERTOS_LITTLE_ENDIAN | Define the byte order of the target MCU |
| IP/TCP/UDP checksums | <ul style="list-style-type: none"> Disable Enable | Enable | If the network card/driver includes checksum offloading (IP/TCP/UDP checksums) then set ipconfigDRIVER_INCLUDE_RX_IP_CHECKSUM to 1 to prevent the software stack repeating the checksum calculations. |
| Receive Block Time | Value must be a non-negative integer | 10000 | Amount of time FreeRTOS_recv() will block for. The timeouts can be set per socket, using setsockopt(). |

| | | | |
|--|---|------------------------------|--|
| Send Block Time | Value must be a non-negative integer | 10000 | Amount of time FreeRTOS_send() will block for. The timeouts can be set per socket, using setsockopt(). |
| DNS caching | <ul style="list-style-type: none"> • Disable • Enable | Enable | DNS caching |
| DNS Request Attempts | Value must be an integer | 2 | When a cache is present, ipconfigDNS_REQUEST_ATTEMPTS can be kept low and also DNS may use small timeouts. |
| IP stack task priority | Only symbols, numbers and arithmetic operators are valid. | configMAX_PRIORITIES - 2 | Set the priority of the task that executes the IP stack. |
| Stack size in words (not bytes) | Only symbols, numbers and arithmetic operators are valid. | configMINIMAL_STACK_SIZE * 5 | The size, in words (not bytes), of the stack allocated to the FreeRTOS+TCP stack. |
| Network Events call vApplicationIPNetworkEventHook | <ul style="list-style-type: none"> • Disable • Enable | Enable | vApplicationIPNetworkEventHook is called when the network connects or disconnects. |
| Max UDP send block time | Only symbols, numbers and arithmetic operators are valid. | 15000 / portTICK_PERIOD_MS | Max UDP send block time |
| Use DHCP | <ul style="list-style-type: none"> • Disable • Enable | Enable | If ipconfigUSE_DHCP is 1 then FreeRTOS+TCP will attempt to retrieve an IP address, netmask, DNS server address and gateway address from a DHCP server. |
| DHCP Register Hostname | <ul style="list-style-type: none"> • Disable • Enable | Enable | Register hostname when using DHCP |
| DHCP Uses Unicast | <ul style="list-style-type: none"> • Disable • Enable | Enable | DHCP uses unicast. |
| DHCP Send Discover After Auto IP | <ul style="list-style-type: none"> • Disable • Enable | Disable | DHCP Send Discover After Auto IP |
| DHCP callback function | <ul style="list-style-type: none"> • Disable • Enable | Disable | Provide an implementation of the DHCP callback function (xApplicationDHCPHook) |

| | | | |
|---|---|---|--|
| Interval between transmissions | Only symbols, numbers and arithmetic operators are valid. | 120000 / portTICK_PERIOD_MS | When ipconfigUSE_DHCP is set to 1, DHCP requests will be sent out at increasing time intervals until either a reply is received from a DHCP server and accepted, or the interval between transmissions reaches ipconfigMAXIMUM_DISCOVER_TX_PERIOD. |
| ARP Cache Entries | Value must be an integer | 6 | The maximum number of entries that can exist in the ARP table at any one time |
| ARP Request Retransmissions | Value must be an integer | 5 | ARP requests that do not result in an ARP response will be re-transmitted a maximum of ipconfigMAX_ARP_RETRANSMISSIONS times before the ARP request is aborted. |
| Maximum time before ARP table entry becomes stale | Value must be an integer | 150 | The maximum time between an entry in the ARP table being created or refreshed and the entry being removed because it is stale |
| Use string for IP Address | <ul style="list-style-type: none"> • Disable • Enable | Enable | Take an IP in decimal dot format (for example, "192.168.0.1") as its parameter FreeRTOS_inet_addr_quick() takes an IP address as four separate numerical octets (for example, 192, 168, 0, 1) as its parameters |
| Total number of available network buffers | Value must be an integer | 10 | Define the total number of network buffer that are available to the IP stack |
| Set the maximum number of events | Only symbols, numbers and arithmetic operators are valid. | ipconfigNUM_NETWORK_BUFFER_DESCRIPTOR + 5 | Set the maximum number of events that can be queued for |

| | | | |
|--|---|---------|--|
| Enable FreeRTOS_sendto() without calling Bind | <ul style="list-style-type: none"> • Enable • Disable | Disable | <p>processing at any one time. The event queue must be a minimum of 5 greater than the total number of network buffers</p> <p>Set to 1 then calling FreeRTOS_sendto() on a socket that has not yet been bound will result in the IP stack automatically binding the socket to a port number from the range socketAUTO_PORT_ALL OCATION_START_NUMB ER to 0xffff. If ipconfigALLOW_SOCKET_SEND_ WITHOUT_BIND is set to 0 then calling FreeRTOS_sendto() on a socket that has not yet been bound will result in the send operation being aborted.</p> |
| TTL values for UDP packets | Value must be an integer | 128 | Define the Time To Live (TTL) values used in outgoing UDP packets |
| TTL values for TCP packets | Value must be an integer | 128 | Defines the Time To Live (TTL) values used in outgoing TCP packets |
| Use TCP and all its features | <ul style="list-style-type: none"> • Disable • Enable | Enable | Use TCP and all its features |
| Let TCP use windowing mechanism | <ul style="list-style-type: none"> • Disable • Enable | Disable | Let TCP use windowing mechanism |
| Maximum number of bytes the payload of a network frame can contain | Value must be an integer | 1500 | Maximum number of bytes the payload of a network frame can contain |
| Basic DNS client or resolver | <ul style="list-style-type: none"> • Disable • Enable | Enable | Set ipconfigUSE_DNS to 1 to include a basic DNS client/resolver. DNS is used through the FreeRTOS_gethostbyname() API function. |
| Reply to incoming ICMP echo (ping) requests | <ul style="list-style-type: none"> • Disable • Enable | Enable | If ipconfigREPLY_TO_INCOMING_PINGS is set to 1 then the IP stack |

| | | | |
|--|---|---------|---|
| | | | will generate replies to incoming ICMP echo (ping) requests. |
| FreeRTOS_SendPingRequest() is available | <ul style="list-style-type: none"> • Disable • Enable | Disable | If ipconfigSUPPORT_OUTGOING_PINGS is set to 1 then the FreeRTOS_SendPingRequest() API function is available. |
| FreeRTOS_select() (and associated) API function is available | <ul style="list-style-type: none"> • Disable • Enable | Disable | If ipconfigSUPPORT_SELECT_FUNCTION is set to 1 then the FreeRTOS_select() (and associated) API function is available |
| Filter out non Ethernet II frames. | <ul style="list-style-type: none"> • Disable • Enable | Enable | If ipconfigFILTER_OUT_NON_ETHERNET_II_FRAMES is set to 1 then Ethernet frames that are not in Ethernet II format will be dropped. This option is included for potential future IP stack developments |
| Responsibility of the Ethernet interface to filter out packets | <ul style="list-style-type: none"> • Disable • Enable | Disable | If ipconfigETHERNET_DRIVER_FILTERS_FRAME_TYPES is set to 1 then it is the responsibility of the Ethernet interface to filter out packets that are of no interest. |
| Send RST packets, when receive unknown packets. | <ul style="list-style-type: none"> • Disable • Enable | Enable | TCP will not send RST packets in reply to TCP unknown or out-of-order packets |
| Access 32-bit fields in the IP packets | Value must be an integer | 2 | To access 32-bit fields in the IP packets with 32-bit memory instructions, all packets will be stored 32-bit-aligned, plus 16-bits. This has to do with the contents of the IP-packets: all 32-bit fields are 32-bit-aligned, plus 16-bit |
| Size of the pool of TCP window descriptors | Value must be an integer | 240 | Define the size of the pool of TCP window descriptors |
| Size of Rx buffer for TCP sockets | Value must be an integer | 3000 | Define the size of Rx buffer for TCP sockets |

| | | | |
|--|---|---------|---|
| Size of Tx buffer for TCP sockets | Value must be an integer | 3000 | Define the size of Tx buffer for TCP sockets |
| TCP keep-alive | <ul style="list-style-type: none"> • Disable • Enable | Enable | TCP keep-alive is available or not |
| TCP keep-alive interval | Value must be an integer | 120 | TCP keep-alive interval in second |
| The socket semaphore to unblock the MQTT task (USER_SEMAPHORE) | <ul style="list-style-type: none"> • Disable • Enable | Disable | The socket semaphore is used to unblock the MQTT task |
| The socket semaphore to unblock the MQTT task (WAKE_CALLBACK) | <ul style="list-style-type: none"> • Disable • Enable | Enable | The socket semaphore is used to unblock the MQTT task |
| The socket semaphore to unblock the MQTT task (USE_CALLBACKS) | <ul style="list-style-type: none"> • Disable • Enable | Disable | The socket semaphore is used to unblock the MQTT task |
| The socket semaphore to unblock the MQTT task (TX_DRIVER) | <ul style="list-style-type: none"> • Disable • Enable | Disable | The socket semaphore is used to unblock the MQTT task |
| The socket semaphore to unblock the MQTT task (RX_DRIVER) | <ul style="list-style-type: none"> • Disable • Enable | Disable | The socket semaphore is used to unblock the MQTT task |
| Possible optimisation for expert users | <ul style="list-style-type: none"> • Disable • Enable | Disable | Possible optimisation for expert users - requires network driver support. It is useful when there is high network traffic. If non-zero value then instead of passing received packets into the IP task one at a time the network interface can chain received packets together and pass them into the IP task in one go. If set to 0 then only one buffer will be sent at a time. |

Usage Notes

In order to use the NetworkInterface implementation provided by Renesas for RA devices:

- Configure an r_ether instance and provide a pointer to the instance of the NetworkInterface as follows:

```
/* Reference used by the NetworkInterface to access the ethernet instance. */
```

```
extern ether_instance_t const * gp_freertos_ether;

...

/* Make it reference the configured ether instance. */
ether_instance_t const * gp_freertos_ether = &g_ether_instance;
```

- Follow the TCP stack initialization procedure as described here: [FreeRTOS+TCP Networking Tutorial: Initializing the TCP/IP Stack](#)

Note

The MAC address passed to `FreeRTOS_IPInit` must match the MAC address configured in the `r_ether` instance. `g_ether_instance` must have `vEtherISRcallback` configured as the callback. The `xApplicationGetRandomNumber` and `ulApplicationGetNextSequenceNumber` functions should be implemented in systems using `FreeRTOS Plus TCP without Secure Sockets`. To connect to a server using an IP address the macro `ipconfigINCLUDE_FULL_INET_ADDR` must be set to 1.

Limitations

- Zero-copy is not currently supported by the `NetworkInterface`.

5.2.12.16 GTL BLE Abstraction (rm_ble_abs_gtl)

[Modules](#) » [Networking](#)

Middleware for the Bluetooth peripheral on RA MCUs. This module implements the [BLE ABS Interface](#).

Overview

This module provides BLE GAP functionality that complies with the Bluetooth Core Specification version 5.0 specified by the Bluetooth SIG. This module is configured via the [QE for BLE](#). QE for BLE provides standard and custom services defined by the user.

The module supports the Renesas Electronics DA14531 Bluetooth® Low Energy 5 Module. The `rm_ble_abs_gtl` driver interfaces with the DA14531 module over UART.

Features

The Bluetooth Low Energy Abstraction module with GTL supports the following features:

- Common functionality
 - Open/Close the BLE protocol stack.
- The following GAP Role support
 - Peripheral: The device that accepts a connection request from Central and establishes a connection.
- GAP functionality
 - Initialize the Host stack.

- Setting address.
 - Start/Stop Advertising.
 - Connect/Disconnect a link.
- GATT Common functionality
 - Get MTU Size.
- GATT Server functionality
 - Initialization of GATT Server.
 - Loading of Profile definition.
 - Notification of characteristics modification.
 - Read/Write of GATT Profile from host.

Configuration

Pin Configuration

Pins used by the BLE driver to control the DA14531 module:

- Reset Pin : Active low reset line for DA14531 module
- [UART Interface](#) : RX/TX Pins

Usage Notes

When using a public BD address the address pre-programmed into the DA14531 will be used and can't be overridden.

A random address can be set by calling the `R_BLE_VS_SetBdAddr` function before the `R_BLE_GAP_Init` function is called.

Ensure the BSP heap size is set to at least 2K bytes.

When using FreeRTOS ensure the heap 4 size is set to a minimum of 2K bytes.

This middleware module is compatible with GTL binary version 6.0.18 and later. You must ensure that the DA14531 Module (or PMOD) you are using contains this version (or later) firmware. Instructions detailing how to upgrade the firmware in a DA14531 Module can be found here:

https://lpccs-docs.renesas.com/US159-DA14531EVZ_Firmware_Upgrade/index.html

The GTL binary file can be downloaded using the tool described in the above instructions, or by using the following link:

<https://www.renesas.com/us/en/document/swo/fsp-gtl-binary-us159-da14531evz-pmod-programming?r=1564826>

Limitations

Developers should be aware of the following limitations when using the BLE_ABS:

Following a power on reset, the `R_BLE_VS_GetRand` function always returns the same number. Subsequent calls to this function produce random numbers.

Service and characteristic write callback functions, created when using the QE Tool are not supported

Currently supported rm_ble_abs_gtl interface functions:

- RM_BLE_ABS_Open
- RM_BLE_ABS_Close
- RM_BLE_ABS_StartLegacyAdvertising

Currently supported r_ble_api interface functions:

- R_BLE_Open
- R_BLE_Close
- R_BLE_Execute
- R_BLE_IsTaskFree
- R_BLE_GetVersion
- R_BLE_GAP_Init
- R_BLE_GAP_Terminate
- R_BLE_GAP_UpdConn
- R_BLE_GAP_SetDataLen
- R_BLE_GAP_Disconnect
- R_BLE_GAP_GetVerInfo
- R_BLE_GAP_ReadRssi
- R_BLE_GAP_ReadChMap
- R_BLE_GAP_SetAdvParam
- R_BLE_GAP_SetAdvSresData
- R_BLE_GAP_StartAdv
- R_BLE_GAP_StopAdv
- R_BLE_GAP_GetRemainAdvBufSize
- R_BLE_GAP_GetRemDevInfo
- R_BLE_GATTS_SetDbInst
- R_BLE_GATT_GetMtu
- R_BLE_GATTS_RegisterCb
- R_BLE_GATTS_DeregisterCb
- R_BLE_GATTS_Notification
- R_BLE_GATTS_Indication
- R_BLE_GATTS_GetAttr
- R_BLE_GATTS_SetAttr
- R_BLE_GATTC_RegisterCb
- R_BLE_GATTC_DeregisterCb
- R_BLE_GATTC_ReqExMtu
- R_BLE_GATTC_DiscAllPrimServ
- R_BLE_GATTC_DiscIncServ
- R_BLE_GATTC_ReadChar
- R_BLE_GATTC_WriteCharWithoutRsp
- R_BLE_GATTC_SignedWriteChar
- R_BLE_GATTC_WriteChar
- R_BLE_GATTC_WriteLongChar
- R_BLE_GATTC_ExecWrite
- R_BLE_VS_Init
- R_BLE_VS_GetBdAddr
- R_BLE_VS_SetBdAddr
- R_BLE_VS_GetRand

Currently supported callback events:

- BLE_GAP_EVENT_STACK_ON
- BLE_GAP_EVENT_STACK_OFF

- BLE_GAP_EVENT_CONN_IND
- BLE_GAP_EVENT_DISCONN_IND
- BLE_GAP_EVENT_DATA_LEN_CHG
- BLE_GAP_EVENT_CONN_PARAM_UPD_COMP
- BLE_GAP_EVENT_ADV_ON
- BLE_GAP_EVENT_ADV_OFF
- BLE_GAP_EVENT_SET_DATA_LEN_COMP
- BLE_GAP_EVENT_LOC_VER_INFO
- BLE_GAP_EVENT_RSSI_RD_COMP
- BLE_GAP_EVENT_CH_MAP_RD_COMP
- BLE_GAP_EVENT_GET_REM_DEV_INFO
- BLE_GATTS_EVENT_WRITE_RSP_COMP
- BLE_GATTS_EVENT_HDL_VAL_CNF
- BLE_GATTS_EVENT_DB_ACCESS_IND
- BLE_GATTC_EVENT_EX_MTU_RSP
- BLE_GATTC_EVENT_PRIM_SERV_16_DISC_IND
- BLE_GATTC_EVENT_PRIM_SERV_128_DISC_IND
- BLE_GATTC_EVENT_ALL_PRIM_SERV_DISC_COMP

Examples

BLE_ABS_GTL Basic Example

This is a basic example of minimal use of the BLE_ABS_GTL in an application.

```
/* The callback is called when peripheral event occurs. */
void gap_peripheral_cb (uint16_t type, ble_status_t result, st_ble_evt_data_t *
p_data)
{
    FSP_PARAMETER_NOT_USED(result);
    FSP_PARAMETER_NOT_USED(p_data);
    switch (type)
    {
        case BLE_GAP_EVENT_STACK_ON:
            {
                g_ble_event_flag = g_ble_event_flag | BLE_ABS_EVENT_FLAG_STACK_ON;
            }
            break;
        case BLE_GAP_EVENT_ADV_ON:
            {
                st_ble_gap_adv_set_evt_t * p_gap_adv_set_evt_param = (st_ble_gap_adv_set_evt_t *)
p_data->p_param;

5.2.12.17 NetX Duo Ethernet Driver (rm_netxduo_ether)

[Modules](#) » [Networking](#)

Overview

This module provides a NetX Duo driver that is implemented using the [Ethernet Interface](#).

Please refer to the [NetXDuo documentation](#) for further details.

Features

- Packet Types Supported
 - ARP
 - IPv4
 - IPv6
- Link status callback
- Configurable IP MTU

Configuration

Configurations for Networking > NetX Duo Ethernet Driver (rm_netxduo_ether)

| Configuration | Options | Default | Description |
|---------------|---|-------------------|--------------|
| Name | Name must be a valid C symbol | g_netxduo_ether_0 | Module name. |
| IP MTU | Value must be in the range [576, 1500] bytes. | 1500 | IP MTU |

Usage Notes

Calculating the Packet Size for an IP instance

In order to ensure that there is enough space to store an entire Ethernet frame, the packet pool used

for receiving packets must have a payload size that is 32 bytes larger than the configured `ether_cfg_t::ether_buffer_size`. The extra 32 bytes is needed in order to ensure that the allocated packets are properly aligned to 32 bytes.

`ether_cfg_t::ether_buffer_size` is calculated from the IP MTU using the following formula:

$$\text{ceil}((\text{rm_netxduo_ether_cfg_t::mtu} + \text{Ethernet Header (14)} + \text{Padding Bytes (2)}) / 32) * 32$$

Examples

Basic Example

This is a basic example of minimal use of the NetX Duo Ether Driver in an application.

```
#define NETXDUO_EXAMPLE_IP_STACK_SIZE (2048U)
#define NETXDUO_EXAMPLE_ARP_CACHE_SIZE (2048U)
#define NETXDUO_EXAMPLE_PACKET_SIZE (1568U)
#define NETXDUO_EXAMPLE_PACKET_NUM (100U)
#define NETXDUO_EXAMPLE_PACKET_POOL_SIZE ((sizeof(NX_PACKET) +
NETXDUO_EXAMPLE_PACKET_SIZE) * \
    NETXDUO_EXAMPLE_PACKET_NUM)
#define NETXDUO_EXAMPLE_MAC_ADDRESS_MSW (0)
#define NETXDUO_EXAMPLE_MAC_ADDRESS_LSW (0)

static NX_IP g_ip;
static NX_PACKET_POOL g_packet_pool;
static uint8_t g_ip_stack_memory[NETXDUO_EXAMPLE_IP_STACK_SIZE]
BSP_ALIGN_VARIABLE(4);
static uint8_t g_packet_pool_memory[NETXDUO_EXAMPLE_PACKET_POOL_SIZE]
BSP_ALIGN_VARIABLE(4);
static uint8_t g_ip_arp_cache_memory[NETXDUO_EXAMPLE_ARP_CACHE_SIZE]
BSP_ALIGN_VARIABLE(4);
static void rm_netxduo_ether0 (NX_IP_DRIVER * driver_req_ptr)
{
    /* Pass the driver request and ethernet driver configuration to the NetX Duo Ether
Driver. */
    rm_netxduo_ether(driver_req_ptr, &g_netxduo_ether_instance);
}
void rm_netxduo_ether_example ()
{
```

```
    UINT status;

    nx_system_initialize();

    /* Create a packet pool for the IP instance. */
    status = nx_packet_pool_create(&g_packet_pool,
    "Packet Pool",
                                NETXDUEXAMPLE_PACKET_SIZE,
                                &g_packet_pool_memory[0],
                                NETXDUEXAMPLE_PACKET_POOL_SIZE);

    assert(NX_SUCCESS == status);

    /* Create an IP instance using the rm_netxduo_ether driver and packet pool instance.
    */
    status = nx_ip_create(&g_ip,
    "IP Instance",
                                IP_ADDRESS(192, 168, 1, 2),
                                IP_ADDRESS(255, 255, 255, 0),
                                &g_packet_pool,
                                rm_netxduo_ether0,
                                &g_ip_stack_memory[0],
                                sizeof(g_ip_stack_memory),
                                0);

    assert(NX_SUCCESS == status);

    /* Enable all modules that are required by the application. */
    status = nx_arp_enable(&g_ip, g_ip_arp_cache_memory, sizeof
(g_ip_arp_cache_memory));

    assert(NX_SUCCESS == status);
    status = nx_tcp_enable(&g_ip);
    assert(NX_SUCCESS == status);
    status = nx_icmp_enable(&g_ip);
    assert(NX_SUCCESS == status);
}
```

Changing MAC address Example

This is an example of changing the MAC address after an IP instance has already been created.

```
void rm_netxduo_ether_change_mac_address_example ()
{
    ULONG driver_status;
    UINT status;
    /* Disable the link. */
    status = nx_ip_driver_interface_direct_command(&g_ip, NX_LINK_DISABLE, 0,
&driver_status);
    assert(NX_SUCCESS == status);
    /* Update the MAC address. */
    status = nx_ip_interface_physical_address_set(&g_ip,
                                                0,
                                                NETXDUEXAMPLE_MAC_ADDRESS_MSW,
                                                NETXDUEXAMPLE_MAC_ADDRESS_LSW,
                                                NX_TRUE);
    assert(NX_SUCCESS == status);
    /* Re-enable the link. */
    status = nx_ip_driver_interface_direct_command(&g_ip, NX_LINK_ENABLE, 0,
&driver_status);
    assert(NX_SUCCESS == status);
}
```

5.2.12.18 NetX Duo WiFi Driver (rm_netxduo_wifi)

[Modules](#) » [Networking](#)

Overview

This module provides a NetX Duo driver that is implemented using the rm_wifi_onchip_silex driver.

Please refer to the [NetXDuo documentation](#) for further details.

Features

- Packet Types Supported
 - TCP/IPv4
 - UDP
- Configurable IP MTU

Configuration

Build Time Configurations for rm_netxduo_wifi

The following build time configurations are defined in fsp_cfg/middleware/rm_netxduo_wifi_cfg.h:

| Configuration | Options | Default | Description |
|----------------|---|---------|-------------|
| IP MTU (bytes) | Value must be in the range [576, 1500] bytes. | 1500 | IP MTU |

Usage Notes

Connecting to a Wireless Network

NetX Duo does not support connecting to a wireless network directly and instead the driver functions should be called directly to establish a connection.

- `rm_wifi_onchip_silex_open()` should be called to initialize the WiFi module driver.
- `rm_wifi_onchip_silex_scan()` should be used to scan for access points.
- `rm_wifi_onchip_silex_connect()` should be used before opening a NetX IP instance in order to connect it to a network.
- `rm_wifi_onchip_silex_network_info_get()` should be used after an access point connection has been established to get DHCP acquired IP address, subnet mask, and gateway.

Unsupported NetX Duo Features

These features are currently not supported due to lack of support in the `rm_wifi_onchip_silex` driver or in the WiFi module hardware/firmware:

- IPv6 functionality
- TCP/UDP server mode
- ARP is handled directly by the WiFi module
- DHCP is always enabled on module by the `rm_wifi_onchip_silex` driver, thus the software DHCP stack is unsupported.
- The source port will not be used when binding a TCP or UDP socket. Applications should set the source port to `NX_ANY_PORT`.

On Module Alternatives

Instead of using NetX Duo Software Addons the following features can be performed directly on the WiFi module by calling the appropriate function instead if desired:

- DNS: The user can preform a DNS lookup by calling `rm_wifi_onchip_silex_dns_query`.
- ICMP: The user can perform a ping by calling `rm_wifi_onchip_silex_ping`.
- SNTP: The WiFi module has multiple public APIs for time related functions:
 - `RM_WIFI_ONCHIP_SILEX_EpochTimeGet`
 - `RM_WIFI_ONCHIP_SILEX_LocalTimeGet`
 - `RM_WIFI_ONCHIP_SILEX_SntpEnableSet`
 - `RM_WIFI_ONCHIP_SILEX_SntpServerIpAddressSet`
 - `RM_WIFI_ONCHIP_SILEX_SntpTimeZoneSet`

Examples

Basic Example

This is a basic example of minimal use of the NetX Duo WiFi Driver in an application.

```
#define NETXDUEXAMPLE_IP_STACK_SIZE (2048U)
#define NETXDUEXAMPLE_ARP_CACHE_SIZE (2048U)

    assert(NX_SUCCESS == status);

    /* Start the TLS Session using the connected TCP socket. This function will
    * ascertain from the TCP socket state that this is a TLS Client session. */
    status = nx_secure_tls_session_start(&tls_session, p_socket, NX_WAIT_FOREVER);
    assert(NX_SUCCESS == status);
}
```

UDP Example

This is a basic example of connecting a UDP socket.

```
#define NETXDUEXAMPLE_TESTS_SOCKET_TIMEOUT (3000)
#define NETXDUEXAMPLE_TESTS_UDP_TX_PORT (5000)
```

```
#define NETXDUIO_TESTS_SERVER_IP (0xC0A80064)

void rm_netxduo_wifi_udp_example (void)
{
    NX_UDP_SOCKET udp_client_socket;
    /* IP Address of the remote socket. */
    NXD_ADDRESS g_ip_address = NETXDUIO_TESTS_SERVER_IP;
    /* Create the socket. */
    nx_udp_socket_create(&g_ip, &udp_client_socket, "Socket 0", NX_IP_NORMAL,
NX_FRAGMENT_OKAY, 0, 5);
    /* Bind to the UDP port. */
    nx_udp_socket_bind(&udp_client_socket, NETXDUIO_TESTS_UDP_TX_PORT,
TX_WAIT_FOREVER);
    NX_PACKET * p_nx_packet = NX_NULL;
    /* Allocate a packet for message data */
    nx_packet_allocate(&g_packet_pool0, &p_nx_packet, NX_UDP_PACKET,
NETXDUIO_TESTS_SOCKET_TIMEOUT)
    /* Append message data to packet */
    nx_packet_data_append(&p_nx_packet, "Hello World", 12, &g_packet_pool0,
NX_WAIT_FOREVER);
    /* Send UDP message to server */
    nx_udp_socket_send(&udp_client_socket, &p_nx_packet, &g_ip_address,
NETXDUIO_TESTS_UDP_TX_PORT);
    NX_PACKET * p_nx_packet_recv;
    /* Receive any response from UDP server */
    nx_udp_socket_receive(&udp_client_socket, &p_nx_packet_recv,
NETXDUIO_TESTS_SOCKET_TIMEOUT);
    /* Unbind and delete the udp socket. */
    nx_udp_socket_unbind(&udp_client_socket);
    nx_udp_socket_delete(&udp_client_socket);
}
```

Detailed Description

MQTT client implementation using the DA16XXX WiFi module on RA MCUs.

Overview

This Middleware module supplies an implementation for the MQTT Client on the DA16XXX module. The network stack is run on the DA16XXX and this module inherits and extends the core functionality from the DA16XXX WiFi driver. The DA16XXX MQTT module only supports FreeRTOS currently (Microsoft Azure support expected in future release).

The DA16XXX module supports the following modules:

- DA16200

Refer to [WiFi Onchip DA16XXX Driver using r_sci_uart \(rm_wifi_onchip_da16xxx\)](#).

Features

The MQTT Onchip da16xxx Middleware driver supplies these features:

- Supports connect/disconnect to an MQTT broker via hostname, port, and user credentials

- Supports unsecure and secure connection via TLS encryption
- Supports the MQTT subscribe/publish model for multiple topics
- Supports other optional configurations such as MQTT v3.1.1, Quality-of-service (QoS) level, TLS cipher suites, and ALPNs

Configuration

Build Time Configurations for rm_mqtt_onchip_da16xxx

The following build time configurations are defined in fsp_cfg/rm_mqtt_onchip_da16xxx_cfg.h:

| Configuration | Options | Default | Description |
|------------------------|--|---------------|---|
| Parameter Checking | <ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| Size of MQTT RX buffer | Must be an integer greater than 0 | 512 | Size in bytes of the MQTT buffer used for receiving subscribed data. Must be an integer greater than 0. |
| Size of MQTT TX buffer | Must be an integer greater than 200 and less than 2064 | 512 | Size in bytes of the MQTT buffer used for sending commands and publishing data. Maximum publishing length is 2063 bytes |

Refer to [WiFi Onchip DA16XXX Driver using r_sci_uart \(rm_wifi_onchip_da16xxx\)](#).

Note: This module provides the basic configurations in the FSP Configurator required to connect to an MQTT broker such as credential information (user, password, client key, etc.), publish/subscribe topics, and optional configurations as required. The user can then copy these configurations to a new structure if they want to connect to a new endpoint/make changes to the configurations dynamically.

Interrupt Configuration

Refer to [UART \(r_sci_uart\)](#). `R_SCI_UART_Open()` is called by [WiFi Onchip DA16XXX Driver using r_sci_uart \(rm_wifi_onchip_da16xxx\)](#).

Clock Configuration

Refer to [UART \(r_sci_uart\)](#).

Pin Configuration

Refer to [UART \(r_sci_uart\)](#). `R_SCI_UART_Open()` is called by [WiFi Onchip DA16XXX Driver using r_sci_uart \(rm_wifi_onchip_da16xxx\)](#)

Usage Notes

Refer to [WiFi Onchip DA16XXX Driver using r_sci_uart \(rm_wifi_onchip_da16xxx\)](#).

- When the user intends to use secure TLS in their application, they need to provide certificates (root certificate authority, client certificate, and private key) in a header file
- The user must provide certificate macro names in the FSP Configurator properties, as well as the name of the header file (to link the module, certificates, and header together)
- If the user provides these credentials in the Configurator, they must create a new header file in their /src/ folder with the same name as they provided in the Configurator properties. When the code is generated, a build error will occur if the header file is not created
- If only using username and password, these fields can be left blank (default), and a header file does not need to be created

Limitations

Refer to [WiFi Onchip DA16XXX Driver using r_sci_uart \(rm_wifi_onchip_da16xxx\)](#).

- This module is not a standalone module - ensure that the WiFi module APIs are invoked first to configure the DA16XXX module and connect to an Access Point before using the MQTT module
- Ensure that DA16XXX SDK version v3.2.6 or later is being used, where the default buffer size for incoming TLS is 6KB and outgoing TLS is 4KB. Using earlier versions may result in failure to connect to an MQTT broker with TLS (unless buffer size settings are altered manually)
- For publish/subscribe topics, a separate QoS level cannot be set per topic - only one QoS level can be set which applies to all messages
- Currently the module only supports unsecured MQTT with username/password or secure MQTT/TLS with certificates (root CA, client certificate, and private key). The module does not accept username/password with certificates.

Examples

Basic Example

This is a basic example of minimal use of MQTT Middleware in an application.

```
void mqtt_onchip_basic_example (void)
{
    WIFIReturnCode_t wifi_err;
    fsp_err_t        mqtt_err;

    /* Setup Access Point connection parameters */
    WIFINetworkParams_t net_params =
    {
        .ucChannel           = 0,
        .xPassword.xWPA.cPassphrase = "password",
        .ucSSID              = "access_point_ssid",
        .xPassword.xWPA.ucLength = 8,
        .ucSSIDLength       = 17,
        .xSecurity           = eWiFiSecurityWPA2,
    }
}
```

```
};

/* Open connection to the Wifi Module */
wifi_err = WIFI_On();
assert(eWiFiSuccess == wifi_err);

/* Connect to the Access Point */
wifi_err = WIFI_ConnectAP(&net_params);
assert(eWiFiSuccess == wifi_err);

/* Initialize the MQTT Client connection */
mqtt_err = RM_MQTT_DA16XXX_Open(&g_rm_mqtt_onchip_da16xxx_instance,
&g_mqtt_onchip_da16xxx_cfg);
assert(FSP_SUCCESS == mqtt_err);

/* Subscribe to MQTT topics to be received */
mqtt_err = RM_MQTT_DA16XXX_Subscribe(&g_rm_mqtt_onchip_da16xxx_instance,
subTopics, 1);
assert(FSP_SUCCESS == mqtt_err);

/* Connect to the MQTT Broker */
mqtt_err = RM_MQTT_DA16XXX_Connect(&g_rm_mqtt_onchip_da16xxx_instance,
CONNECT_TIMEOUT);
assert(FSP_SUCCESS == mqtt_err);

/* Publish data to the MQTT Broker */
mqtt_err = RM_MQTT_DA16XXX_Publish(&g_rm_mqtt_onchip_da16xxx_instance,
&pubTopics[0]);
assert(FSP_SUCCESS == mqtt_err);

/* Loop to receive data from the MQTT Broker */
do
{
    RM_MQTT_DA16XXX_Receive(&g_rm_mqtt_onchip_da16xxx_instance,
&g_mqtt_onchip_da16xxx_cfg);
    R_BSP_SoftwareDelay(CONNECT_TIMEOUT, BSP_DELAY_UNITS_MILLISECONDS);
} while (cb_flag == 0);

/* Disconnect from the MQTT Broker */
mqtt_err = RM_MQTT_DA16XXX_Disconnect(&g_rm_mqtt_onchip_da16xxx_instance);
assert(FSP_SUCCESS == mqtt_err);

/* Close the MQTT Client module */
```

```
mqtt_err = RM_MQTT_DA16XXX_Close(&g_rm_mqtt_onchip_da16xxx_instance);  
assert(FSP_SUCCESS == mqtt_err);  
}
```

Data Structure Documentation

◆ mqtt_onchip_da16xxx_sub_info_t

| struct mqtt_onchip_da16xxx_sub_info_t | | |
|---------------------------------------|---------------------|--------------------------------------|
| MQTT SUBSCRIBE packet parameters | | |
| Data Fields | | |
| mqtt_onchip_da16xxx_qos_t | qos | Quality of Service for subscription. |
| const char * | p_topic_filter | Topic filter to subscribe to. |
| uint16_t | topic_filter_length | Length of subscription topic filter. |

◆ mqtt_onchip_da16xxx_pub_info_t

| struct mqtt_onchip_da16xxx_pub_info_t | | |
|---------------------------------------|-------------------|---|
| MQTT PUBLISH packet parameters | | |
| Data Fields | | |
| mqtt_onchip_da16xxx_qos_t | qos | Quality of Service for subscription. |
| const char * | p_topic_name | Topic name on which the message is published. |
| uint16_t | topic_name_Length | Length of topic name. |
| const char * | p_payload | Message payload. |
| uint32_t | payload_length | Message payload length. |

◆ mqtt_onchip_da16xxx_callback_args_t

| struct mqtt_onchip_da16xxx_callback_args_t | | |
|--|---------|--|
| MQTT Packet info structure to be passed to user callback | | |
| Data Fields | | |
| uint8_t * | p_data | Payload received from subscribed MQTT topic. |
| const char * | p_topic | Topic to which the message |

| | | |
|--------------|-------------|-----------------------------|
| | | payload belongs to. |
| uint32_t | data_length | Length of the MQTT payload. |
| void const * | p_context | Placeholder for user data. |

◆ mqtt_onchip_da16xxx_cfg_t

| | |
|----------------------------------|---|
| struct mqtt_onchip_da16xxx_cfg_t | |
| MQTT Configuration | |
| Data Fields | |
| const uint8_t | use_mqtt_v311 |
| | Flag to use MQTT v3.1.1. |
| const uint16_t | rx_timeout |
| | MQTT Rx timeout in milliseconds. |
| const uint16_t | tx_timeout |
| | MQTT Tx timeout in milliseconds. |
| void(* | p_callback)(mqtt_onchip_da16xxx_callback_args_t *p_args) |
| | Location of user callback. |
| void const * | p_context |
| | Placeholder for user data. Passed to the user callback in mqtt_onchip_da16xxx_callback_args_t . |
| uint8_t | clean_session |
| | Whether to establish a new, clean session or resume a previous session. |
| uint8_t | alpn_count |
| | ALPN Protocols count. Max value is 3. |

| | |
|----------------|--|
| const char * | p_alpns [MQTT_ONCHIP_DA16XXX_MAX_ALPN] |
| | ALPN Protocols. |
| uint8_t | tls_cipher_count |
| | TLS Cipher suites count. Max value is 17. |
| uint16_t | keep_alive_seconds |
| | MQTT keep alive period. |
| const char * | p_client_identifier |
| | MQTT Client identifier. Must be unique per client. |
| uint16_t | client_identifier_length |
| | Length of the client identifier. |
| const char * | p_host_name |
| | MQTT endpoint host name. |
| const uint16_t | mqtt_port |
| | MQTT Port number. |
| const char * | p_mqtt_user_name |
| | MQTT user name. Set to NULL if not used. |
| uint16_t | user_name_length |
| | Length of MQTT user name. Set to 0 if not used. |
| const char * | p_mqtt_password |

| | |
|--------------|--|
| | MQTT password. Set to NULL if not used. |
| uint16_t | password_length |
| | Length of MQTT password. Set to 0 if not used. |
| const char * | p_root_ca |
| | String representing a trusted server root certificate. |
| uint32_t | root_ca_size |
| | Size associated with root CA Certificate. |
| const char * | p_client_cert |
| | String representing a Client certificate. |
| uint32_t | client_cert_size |
| | Size associated with Client certificate. |
| const char * | p_client_private_key |
| | String representing Client Private Key. |
| uint32_t | private_key_size |
| | Size associated with Client Private Key. |
| const char * | p_will_topic |
| | String representing Will Topic. |
| const char * | p_will_msg |
| | String representing Will Message. |

| | |
|---|--|
| | |
| const char * | p_sni_name |
| | Server Name Indication. |
| | |
| mqtt_onchip_da16xxx_qos_t | will_qos_level |
| | Will Topic QoS level. |
| | |
| mqtt_onchip_da16xxx_tls_cipher_suites_t | p_tls_cipher_suites [MQTT_ONCHIP_DA16XXX_TLS_CIPHER_MAX_CNT] |
| | TLS Cipher suites supported. |
| | |

◆ [mqtt_onchip_da16xxx_instance_ctrl_t](#)

| | | |
|--|--|--|
| struct mqtt_onchip_da16xxx_instance_ctrl_t | | |
| MQTT_ONCHIP_DA16XXX private control block. DO NOT MODIFY. | | |
| Data Fields | | |
| uint8_t | cmd_tx_buff[MQTT_ONCHIP_DA16XXX_CFG_CMD_TX_BUF_SIZE] | Command send buffer. |
| uint8_t | cmd_rx_buff[MQTT_ONCHIP_DA16XXX_CFG_CMD_RX_BUF_SIZE] | Command receive buffer. |
| uint32_t | open | Flag to indicate if MQTT has been opened. |
| bool | is_mqtt_connected | Flag to track MQTT connection status. |
| mqtt_onchip_da16xxx_cfg_t const * | p_cfg | Pointer to p_cfg for MQTT. |

Enumeration Type Documentation

◆ **mqtt_onchip_da16xxx_qos_t**

| | |
|--------------------------------------|-------------------------|
| enum mqtt_onchip_da16xxx_qos_t | |
| MQTT Quality-of-service (QoS) levels | |
| Enumerator | |
| MQTT_ONCHIP_DA16XXX_QOS_0 | Delivery at most once. |
| MQTT_ONCHIP_DA16XXX_QOS_1 | Delivery at least once. |
| MQTT_ONCHIP_DA16XXX_QOS_2 | Delivery exactly once. |

◆ mqtt_onchip_da16xxx_tls_cipher_suites_t

| enum mqtt_onchip_da16xxx_tls_cipher_suites_t | |
|--|---|
| MQTT TLS Cipher Suites | |
| Enumerator | |
| TLS_ECDHE_RSA_WITH_AES_128_CBC_SHA | TLS_ECDHE_RSA_WITH_AES_128_CBC_SHA protocol. |
| TLS_ECDHE_RSA_WITH_AES_256_CBC_SHA | TLS_ECDHE_RSA_WITH_AES_256_CBC_SHA protocol. |
| TLS_ECDHE_RSA_WITH_AES_128_CBC_SHA256 | TLS_ECDHE_RSA_WITH_AES_128_CBC_SHA256 protocol. |

| TLS_ECDHE_ECDSA_WITH_AES_256_GCM_SHA384 | TLS_ECDHE_ECDSA_WITH_AES_256_GCM_SHA384 protocol. |

Function Documentation

◆ **RM_MQTT_DA16XXX_Open()**

```
fsp_err_t RM_MQTT_DA16XXX_Open ( mqtt_onchip_da16xxx_instance_ctrl_t * p_ctrl,
mqtt_onchip_da16xxx_cfg_t const *const p_cfg )
```

Initialize the DA16XXX on-chip MQTT Client service.

Parameters

| | | |
|------|--------|--|
| [in] | p_ctrl | Pointer to MQTT Client instance control structure. |
| [in] | p_cfg | Pointer to MQTT Client configuration structure. |

Return values

| | |
|--------------------------|---|
| FSP_SUCCESS | Function completed successfully. |
| FSP_ERR_WIFI_FAILED | Error occurred with command to Wifi module. |
| FSP_ERR_ASSERTION | The p_cfg instance is NULL. |
| FSP_ERR_INVALID_ARGUMENT | Data size is too large or NULL. |
| FSP_ERR_ALREADY_OPEN | The instance has already been opened. |

◆ **RM_MQTT_DA16XXX_Disconnect()**

```
fsp_err_t RM_MQTT_DA16XXX_Disconnect ( mqtt_onchip_da16xxx_instance_ctrl_t * p_ctrl)
```

Disconnect from DA16XXX MQTT Client service.

Parameters

| | | |
|------|--------|--|
| [in] | p_ctrl | Pointer to MQTT Client instance control structure. |
|------|--------|--|

Return values

| | |
|---------------------|--|
| FSP_SUCCESS | Function completed successfully. |
| FSP_ERR_WIFI_FAILED | Error occurred with command to Wifi module. |
| FSP_ERR_ASSERTION | The p_ctrl instance is NULL. |
| FSP_ERR_NOT_OPEN | The instance has not been opened or the client is not connected. |

◆ **RM_MQTT_DA16XXX_Connect()**

```
fsp_err_t RM_MQTT_DA16XXX_Connect ( mqtt_onchip_da16xxx_instance_ctrl_t * p_ctrl, uint32_t
timeout_ms )
```

Configure and connect the DA16XXX MQTT Client service.

Parameters

| | | |
|------|------------|--|
| [in] | p_ctrl | Pointer to MQTT Client instance control structure. |
| [in] | timeout_ms | Timeout in milliseconds. |

Return values

| | |
|----------------------|---|
| FSP_SUCCESS | Function completed successfully. |
| FSP_ERR_WIFI_FAILED | Error occurred with command to Wifi module. |
| FSP_ERR_ASSERTION | The p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | The instance has not been opened. |
| FSP_ERR_IN_USE | The MQTT client is already connected. |
| FSP_ERR_INVALID_DATA | Response does not contain Connect status. |

◆ **RM_MQTT_DA16XXX_Publish()**

```
fsp_err_t RM_MQTT_DA16XXX_Publish ( mqtt_onchip_da16xxx_instance_ctrl_t * p_ctrl,
mqtt_onchip_da16xxx_pub_info_t *const p_pub_info )
```

Publish a message for a given MQTT topic.

Parameters

| | | |
|------|------------|--|
| [in] | p_ctrl | Pointer to MQTT Client instance control structure. |
| [in] | p_pub_info | MQTT Publish packet parameters. |

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Function completed successfully. |
| FSP_ERR_WIFI_FAILED | Error occurred with command to Wifi module. |
| FSP_ERR_ASSERTION | The p_ctrl, p_pub_info is NULL. |
| FSP_ERR_NOT_OPEN | The instance has not been opened or the client is not connected. |
| FSP_ERR_INVALID_DATA | Data size is too large. |

◆ **RM_MQTT_DA16XXX_Subscribe()**

```
fsp_err_t RM_MQTT_DA16XXX_Subscribe ( mqtt_onchip_da16xxx_instance_ctrl_t* p_ctrl,
mqtt_onchip_da16xxx_sub_info_t*const p_sub_info, size_t subscription_count )
```

Subscribe to DA16XXX MQTT topics.

Parameters

| | | |
|------|--------------------|--|
| [in] | p_ctrl | Pointer to MQTT Client instance control structure. |
| [in] | p_sub_info | List of MQTT subscription info. |
| [in] | subscription_count | Number of topics to subscribe to. |

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Function completed successfully. |
| FSP_ERR_WIFI_FAILED | Error occurred with command to Wifi module. |
| FSP_ERR_ASSERTION | The p_ctrl, p_sub_info is NULL or subscription_count is 0. |
| FSP_ERR_NOT_OPEN | The instance has not been opened. |
| FSP_ERR_INVALID_DATA | Data size is too large. |

◆ **RM_MQTT_DA16XXX_UnSubscribe()**

```
fsp_err_t RM_MQTT_DA16XXX_UnSubscribe ( mqtt_onchip_da16xxx_instance_ctrl_t * p_ctrl,
mqtt_onchip_da16xxx_sub_info_t *const p_sub_info )
```

Unsubscribe from DA16XXX MQTT topics.

Parameters

| | | |
|------|------------|--|
| [in] | p_ctrl | Pointer to MQTT Client instance control structure. |
| [in] | p_sub_info | List of MQTT subscription info. |

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Function completed successfully. |
| FSP_ERR_WIFI_FAILED | Error occurred with command to Wifi module. |
| FSP_ERR_ASSERTION | The p_ctrl, p_sub_info is NULL. |
| FSP_ERR_NOT_OPEN | The instance has not been opened or the client is not connected. |
| FSP_ERR_INVALID_DATA | Data size is too large. |

◆ **RM_MQTT_DA16XXX_Receive()**

```
fsp_err_t RM_MQTT_DA16XXX_Receive ( mqtt_onchip_da16xxx_instance_ctrl_t * p_ctrl,
mqtt_onchip_da16xxx_cfg_t const *const p_cfg )
```

Receive data subscribed to on DA16XXX MQTT Client service.

Parameters

| | | |
|------|--------|--|
| [in] | p_ctrl | Pointer to MQTT Client instance control structure. |
| [in] | p_cfg | Pointer to MQTT Client configuration structure. |

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Function completed successfully. |
| FSP_ERR_ASSERTION | The p_ctrl, p_textstring, p_ip_addr is NULL. |
| FSP_ERR_NOT_OPEN | The instance has not been opened or the client is not connected. |
| FSP_ERR_INVALID_DATA | Receive function did not receive valid publish data. |

◆ **RM_MQTT_DA16XXX_Close()**

```
fsp_err_t RM_MQTT_DA16XXX_Close ( mqtt_onchip_da16xxx_instance_ctrl_t * p_ctrl)
```

Close the DA16XXX MQTT Client service.

Parameters

| | | |
|------|--------|--|
| [in] | p_ctrl | Pointer to MQTT Client instance control structure. |
|------|--------|--|

Detailed Description

Driver for the PTP peripheral on RA MCUs. This module implements the [PTP Interface](#).

Overview

PTP allows for multiple devices on a network to synchronize their clocks with very high precision. The PTP peripheral generates and processes PTP messages automatically. In slave mode, it also corrects the local time in order to adjust for any offset from the master clock time.

Features

- Ordinary clock
 - Master mode
 - Slave mode
- Peer-to-peer
- End-to-end
- Frame formats
 - Ethernet II frames
 - IEEE802.3 + LLC + SNAP frames
 - IPv4 + UDP
- Clock correction modes
 - Mode 1: Add the offsetFromMaster value to the local time whenever it is updated.
 - Mode 2: Calculate a clock gradient and continuously adjust the local time in order to minimize the offsetFromMaster value.

Configuration

Build Time Configurations for r_ptp

The following build time configurations are defined in fsp_cfg/r_ptp_cfg.h:

| Configuration | Options | Default | Description |
|--------------------|--|---------------|---|
| Parameter Checking | <ul style="list-style-type: none"> Default (BSP) Enabled Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

Configurations for Networking > PTP (r_ptp)

This module can be added to the Stacks tab via New Stack > Networking > PTP (r_ptp).

| Configuration | Options | Default | Description |
|--|------------------------------------|-------------------|--|
| Clock Properties > Priority 1 | Value must in the range [0,255]. | 128 | Priority1 field advertised in generated announce packets. |
| Clock Properties > Class | Value must in the range [0,255]. | 248 | Class field advertised in generated announce packets. |
| Clock Properties > Accuracy | Value must in the range [0,255]. | 0xFE | Accuracy field advertised in generated announce packets. |
| Clock Properties > Variance | Value must in the range [0,65535]. | 0xFFFF | Variance field advertised in generated announce packets. |
| Clock Properties > Priority 2 | Value must in the range [0,255]. | 128 | Priority2 field advertised in generated announce packets. |
| Clock Properties > Time Source | Value must in the range [0,255]. | 160 | Time Source field advertised in generated announce packets. |
| Ethernet > Multicast Filter MAC address | Must be a valid MAC address | 01:1B:19:00:00:00 | In Multicast Filtered mode, only multicast addresses that match this address are received by the ETHERC EDMAC. |
| Ethernet > Primary Destination MAC address | Must be a valid MAC address | 01:1B:19:00:00:00 | The destination MAC address for primary PTP messages. |
| Ethernet > PDelay Destination MAC address | Must be a valid MAC address | 01:80:C2:00:00:0E | The destination MAC address for PDelay messages. |
| IP > Primary Destination IP address | Must be a valid IP address | 224.0.1.129 | The destination IPv4 address for primary |

messages.

| | | | |
|--|------------------------------------|--------------------|--|
| IP > PDelay Destination IP address | Must be a valid IP address | 224.0.0.107 | The destination IPv4 address for PDelay messages. |
| IP > Event Message TOS | Value must in the range [0,255]. | 0 | The IP packet TOS for event messages. |
| IP > General Message TOS | Value must in the range [0,255]. | 0 | The IP packet TOS for general messages. |
| IP > Primary Message TTL | Value must in the range [0,255]. | 1 | The IP packet TTL for primary messages. |
| IP > PDelay Message TTL | Value must in the range [0,255]. | 1 | The IP packet TTL for p_delay messages. |
| IP > Event Port | Value must in the range [0,65535]. | 319 | The UDP port for event messages. |
| IP > General Port | Value must in the range [0,65535]. | 320 | The UDP port for general messages. |
| Synchronization Detection > Threshold (Nanoseconds) | Value must be greater than 0. | 1000000 | The minimum offsetFromMaster value required in order to synchronize with the master clock. |
| Synchronization Detection > Count | Value must in the range [0,15]. | 5 | The number of times the calculated offsetFromMaster value must be less than the threshold in order to synchronize with the master clock. |
| Synchronization Lost Detection > Threshold (Nanoseconds) | Value must be greater than 0. | 10000000 | The minimum offsetFromMaster value required in order to lose synchronization with the master clock. |
| Synchronization Lost Detection > Count | Value must in the range [0,15]. | 5 | The number of times the calculated offsetFromMaster value must be greater than the threshold in order to lose synchronization with the master. |
| Interrupts > Callback | Name must be a valid C symbol | ptp0_user_callback | Called when a STCA/SYNFP event occurs, a PTP message is received, or if a Pulse Timer event occurs. |
| Interrupts > MINT Interrupt priority | MCU Specific Options | | Select the EPTPC MINT interrupt priority. |

| | | | |
|---|--|-------------|--|
| Interrupts > Pulse Timer Interrupt priority | MCU Specific Options | | Select the EPTPC IPLS priority. |
| Name | Name must be a valid C symbol | g_ptp0 | Module name. |
| Ethernet PHY Interface Type | <ul style="list-style-type: none"> • MII • RMII | RMII | The interface type used to communicate with the Ethernet PHY. |
| Frame Filter | <ul style="list-style-type: none"> • Extended Promiscuous Mode • Unicast and Multicast • Unicast and Multicast Filtered • Unicast | Unicast | Selects how packets are filtered based on their destination MAC address. Packets that pass the filter are transferred to the ETHERC EDMAC. |
| Frame Format | <ul style="list-style-type: none"> • Ethernet II • Ethernet II IPv4 UDP • IEEE802.3 LLC SNAP • IEEE802.3 LLC SNAP IPv4 UDP | Ethernet II | The format of the frames that encapsulate the PTP messages. |
| Clock Domain | Value must in the range [0,255]. | 0 | The PTP clock will only respond to clocks in its domain. |
| Clock Domain Filter | <ul style="list-style-type: none"> • Enable • Disable | Enable | Filter out PTP messages from other clock domains. |
| Buffer Size | Value must in the range [64,1536]. | 1536 | The maximum Ethernet packet size that can be transmitted or received by the application from the EDMAC. |
| Number of transmit buffers | Value must in the range [1,16]. | 4 | The number of transmit buffers in the packet queue. |
| Number of receive buffers | Value must in the range [1,16]. | 4 | The number of receive buffers in the packet queue. |
| Announce message interval. | MCU Specific Options | | The period of time between generated announce messages. |
| Sync message interval. | MCU Specific Options | | The period of time between generated sync messages. |

| | | | |
|-----------------------------|--|-------------------------|--|
| Delay_req message interval. | MCU Specific Options | | The period of time between generated delay_req messages. |
| Message timeout | Value must be greater than 0. | 4000 | The time in milliseconds needed to generate timeout events after not receiving a sync or delay_resp message. |
| Clock Source | <ul style="list-style-type: none"> • PCLKA / 1 • PCLKA / 2 • PCLKA / 3 • PCLKA / 4 • PCLKA / 5 • PCLKA / 6 • REF50CK0 | PCLKA / 6 | The STCA clock source must be 20Mhz, 25Mhz, 50Mhz, or 100Mhz. When REF50CK0 is selected, the STCA frequency is 25Mhz. |
| Clock Correction Mode | <ul style="list-style-type: none"> • Clock Correction Mode 1 • Clock Correction Mode 2 | Clock Correction Mode 1 | Clock correction mode 1 corrects the local clock using the current offsetFromMaster value. Clock correction mode 2 calculates a clock gradient in order to continuously correct the local clock. |
| Gradient Worst10 Interval | Value must in the range [0,255]. | 32 | The number of sync messages to use when calculating the worst10 gradient values (Only applies to clock correction mode 2). |

Clock Configuration

The STCA input clock can be the following clock sources:

- PCLKA / 1
- PCLKA / 2
- PCLKA / 3
- PCLKA / 4
- PCLKA / 5
- PCLKA / 6
- REF50CK0

The STCA input clock is restricted to the following frequencies:

- 20 Mhz
- 25 Mhz
- 50 Mhz
- 100 Mhz

When REF50CK0 is selected, the input clock frequency is 25 Mhz.

Pin Configuration

The PTP module requires the [Ethernet \(r_ether\)](#) instance in order to initialize the Ethernet PHY. This means that the ETHERC pins must be configured.

Usage Notes

PTP Port State

The current PTP port state determines which messages need to be generated and processed by the PTP peripheral. It is the application's responsibility to determine what the current state of the PTP port should be.

The following messages can be generated by the PTP peripheral:

- Announce
- Sync
- Delay_req
- Delay_resp
- PDelay_req
- PDelay_resp

The following messages can be processed by the PTP peripheral:

- Sync
- Follow_up
- Delay_req
- Delay_resp
- PDelay_req
- PDelay_resp
- PDelay_resp_follow_up

The application must receive the following messages in order to determine the current state of its PTP port:

- Announce
- Management
- Signaling

The following messages can only be sent manually:

- Management
- Signaling

The PTP API defines the following states:

| State | Generated Messages | Processed Messages | Received Messages |
|---------------|-------------------------------------|---|---------------------------------|
| Disabled | N/A | N/A | N/A |
| Passive | N/A | N/A | Announce, Signaling, Management |
| E2E/P2P Slave | Delay_req/(PDelay_req, PDelay_resp) | Sync, Follow_up, Delay_resp/(PDelay_req | Announce, Signaling, Management |

E2E/P2P Master Announce, Sync, delay_req/(PDelay_req, Announce, Signaling,
 Delay_resp/(PDelay_req PDelay_resp) Management
 , PDelay_resp)

Pulse Timers

Pulse Timers are configurable timers used to generate interrupts and ELC events. Each pulse timer has a configurable start time, pulse, and period. At the start of each timer period, a rising edge occurs. After the pulse time has elapsed, a falling edge occurs. ELC events and IRQs can be generated on rising and/or falling edges for each Pulse Timer. There are two types of interrupts generated by each Pulse Timer; MINT and IPLS.

MINT Interrupts

MINT IRQs are only generated on the rising edge of a Pulse Timer channel. The callback will provide the channel number of the pulse timer that caused the interrupt.

IPLS Interrupts

Each Pulse Timer channel can be configured as a source for generating IPLS IRQs. All of the pulse timers that are selected as IPLS sources are OR'd together and rising and falling edge IRQs can be generated from the resulting signal. Below is an example of a resulting signal from two IPLS sources. Unlike MINT interrupts, IPLS interrupts do not provide any information about which Pulse Timer caused the IRQ because the IRQs from all the Pulse Timers are OR'd together.

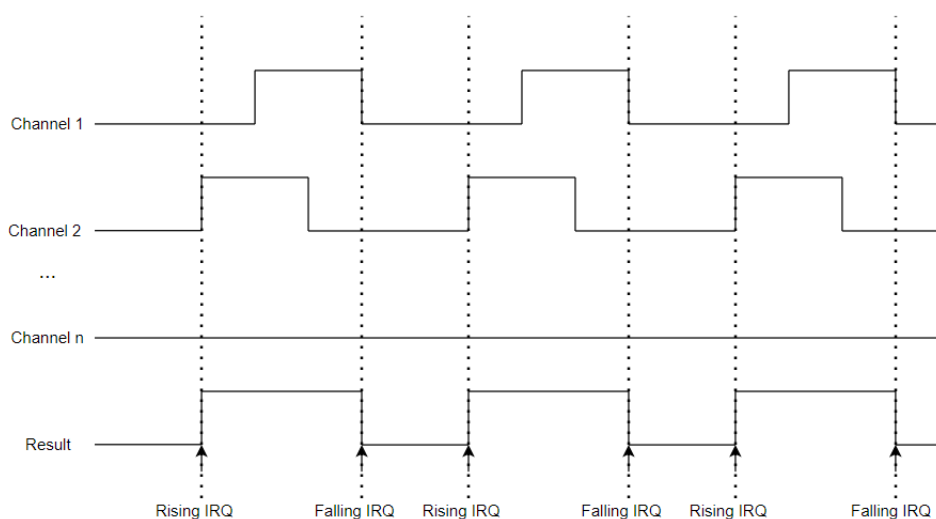

Figure 224: IPLS IRQ Generation

Ethernet Frame Filter

The PTP driver can filter Ethernet frames that are received by [Ethernet \(r_ether\)](#). There are four different filtering modes:

- Extended Promiscuous - All Ethernet frames are received by [Ethernet \(r_ether\)](#).
- Unicast and Multicast - All Unicast frames destined for the PTP and Multicast frames are received by [Ethernet \(r_ether\)](#).
- Unicast and Multicast Filtered - All Unicast frames destined for the PTP are received by

Ethernet (r_ether). All multicast frames that match `ptp_synfp_cfg_t::p_multicast_addr_filter` are received by Ethernet (r_ether).

- Unicast - Only Unicast frames destined for the PTP are received by Ethernet (r_ether).

Limitations

Developers should be aware of the following limitations when using the PTP:

- PTP will not automatically initialize Ethernet (r_ether). This provides flexibility by allowing PTP to be used alongside 3rd party IP stacks (Eg. [FreeRTOS+TCP Wrapper to r_ether \(rm_freertos_plus_tcp\)](#)), however this means the application must execute the Ethernet (r_ether) link process in order to use PTP.
- The driver will not detect announce message timeouts. This functionality must be handled by the application.
- When IP + UDP frame format is selected, the driver will not automatically join the multicast group. This must be done by the application.
- In order to call PTP API functions from ISRs, the MINT and IPLS interrupt priorities must be configured to be lower than `BSP_CFG_IRQ_MASK_LEVEL_FOR_CRITICAL_SECTION`. This is to guarantee that PTP register accesses are atomic.

Examples

Slave Mode

This is a basic example of minimal use of PTP in slave mode.

```
volatile bool g_first_announce_message_received = false;
volatile bool g_sync_acquired = false;
void slave_mode_basic_example (void)
{
    /* The PTP Instance must be opened before R_ETHER is opened. */
    fsp_err_t err = R_PTP_Open(&g_ptp_ctrl, &g_ptp_cfg);
    assert(FSP_SUCCESS == err);
    /* Configure the PTP MAC address. */
    err = R_PTP_MacAddrSet(&g_ptp_ctrl, g_ptp_mac_address);
    assert(FSP_SUCCESS == err);
    /* Configure the PTP Local Clock ID (Usually generated from MAC address). */
    err = R_PTP_LocalClockIdSet(&g_ptp_ctrl, g_ptp_clock_id);
    assert(FSP_SUCCESS == err);
    /* Open the r_ether_api instance. */
    err = R_ETHER_Open(&g_ether_ctrl, &g_ether_cfg);
    assert(FSP_SUCCESS == err);
    /* Wait for the link to be established. */
    do
```

```
{
    err = R_ETHER_LinkProcess(&g_ether_ctrl);
} while (FSP_SUCCESS != err);
/* Set the PTP instance to passive state and listen for announce message. */
err = R_PTP_PortStateSet(&g_ptp_ctrl, PTP_PORT_STATE_PASSIVE);
assert(FSP_SUCCESS == err);
/* Wait for the first announce message (This will provide the master clock ID). */
uint32_t timeout = EXAMPLE_TIMEOUT;
while (!g_first_announce_message_received && --timeout)
{
R_BSP_SoftwareDelay(1, BSP_DELAY_UNITS_SECONDS);
}
assert(0U != timeout);
/* When a master clock is found, change to the slave state to start synchronizing
 * the local clock to the master clock. */
err = R_PTP_PortStateSet(&g_ptp_ctrl, PTP_PORT_STATE_E2E_SLAVE);
assert(FSP_SUCCESS == err);
/* Wait for local clock to be synchronized with the master clock. */
timeout = EXAMPLE_TIMEOUT;
while (!g_sync_acquired && --timeout)
{
R_BSP_SoftwareDelay(1, BSP_DELAY_UNITS_SECONDS);
}
assert(0U != timeout);
/* The local clock is now synchronized with the grand master clock. */
}
/* Callback called whenever a PTP event occurs. */
void g_ptp_slave_callback_example (ptp_callback_args_t * p_args)
{
switch (p_args->event)
{
case PTP_EVENT_SYNC_ACQUIRED:
{
/* The offsetFromMaster value is now within the configured threshold to be
```

```
* synchronized with the master clock.
*/

    g_sync_acquired = true;
break;
}
case PTP_EVENT_MESSAGE_RECEIVED:
{
static ptp_message_t g_current_master_announce_message;
switch (p_args->p_message->header.message_type)
{
case PTP_MESSAGE_TYPE_ANNOUNCE:
{
        int8_t comparison = 0;
if (!g_first_announce_message_received)
{
/* If this is the first announce packet, immediately switch to this master clock. */
        comparison = 1;
        g_first_announce_message_received = true;
}
else
{
/*
 * Run the "Best Master Clock Algorithm" to determine if the clock defined in this
announce
 * packet is better than the current master clock.
 */
fsp_err_t err = R_PTP_BestMasterClock(&g_current_master_announce_message,
                                        p_args->p_message,
                                        &comparison);

        assert(FSP_SUCCESS == err);
}
if (1 == comparison)
{
/* Save the message as the new master announce message. */
```

```
        g_current_master_announce_message = *p_args->p_message;
/* Set the master clock ID and sourcePortID in the PTP instance so that it
 * synchronizes with the new best master clock.
 */
fsp_err_t err = R_PTP_MasterClockIdSet(&g_ptp_ctrl,
                                        g_current_master_annou
nce_message.header.clock_id,
                                        g_current_master_annou
nce_message.header.source_port_id);
    assert(FSP_SUCCESS == err);
    }
break;
    }
default:
    {
break;
    }
}
break;
    }
default:
    {
break;
    }
}
}
```

Master Mode

This is a basic example of minimal use of PTP in master mode.

```
#define PTP_EXAMPLE_CURRENT_UTC_OFFSET (37)
void master_mode_basic_example (void)
{
/* The PTP Instance must be opened before R_ETHER is opened. */
```

```
fsp_err_t err = R_PTP_Open(&g_ptp_ctrl, &g_ptp_cfg);
    assert(FSP_SUCCESS == err);
/* Configure the PTP MAC address. */
    err = R_PTP_MacAddrSet(&g_ptp_ctrl, g_ptp_mac_address);
    assert(FSP_SUCCESS == err);
/* Configure the PTP Local Clock ID (Usually generated from MAC address). */
    err = R_PTP_LocalClockIdSet(&g_ptp_ctrl, g_ptp_clock_id);
    assert(FSP_SUCCESS == err);
/* Get the current time from an external time source (Eg. RTC). */
ptp_time_t current_time;
    get_current_time_example(&current_time);
/* Set the PTP local time to the current time. */
    err = R_PTP_LocalClockValueSet(&g_ptp_ctrl, &current_time);
    assert(FSP_SUCCESS == err);
/* Set the currentUtcOffset field in announce messages. */
    err = R_PTP_CurrentUtcOffsetSet(&g_ptp_ctrl, PTP_EXAMPLE_CURRENT_UTC_OFFSET);
    assert(FSP_SUCCESS == err);
/* Set message flags in announce messages to indicate that the current UTC offset is
valid and that the PTP timescale is used. */
ptp_message_flags_t flags;
    flags.value = 0;
    flags.value_b.currentUtcOffsetValid = 1;
    flags.value_b.ptpTimescale          = 1;
    err = R_PTP_MessageFlagsSet(&g_ptp_ctrl, PTP_MESSAGE_TYPE_ANNOUNCE, flags);
    assert(FSP_SUCCESS == err);
/* Open the r_ether_api instance. */
    err = R_ETHER_Open(&g_ether_ctrl, &g_ether_cfg);
    assert(FSP_SUCCESS == err);
/* Wait for the link to be established. */
do
{
    err = R_ETHER_LinkProcess(&g_ether_ctrl);
} while (FSP_SUCCESS != err);
/* Set the PTP instance to passive state and listen for announce message. */
```

```
err = R_PTP_PortStateSet(&g_ptp_ctrl, PTP_PORT_STATE_E2E_MASTER);
assert(FSP_SUCCESS == err);
/*
 * The master clock is now operational and will automatically generate announce and
sync messages
 * as well as respond to delay_req messages.
 */
}
```

Send PTP Messages

This is a basic example of how to send PTP messages.

```
#define PTP_MANAGEMENT_ACTION_GET (0U)
#define PTP_TLV_TYPE_MANAGEMENT (1U)
#define PTP_TLV_MANAGEMENT_ID_CLOCK_DESCRIPTION (1U)
static uint32_t g_transmit_complete = 0U;
void send_message_example (void)
{
    static ptp_message_t message;
    static uint8_t      p_tlv_data[6];
    memset(&message, 0, sizeof(ptp_message_t));
    /* Fill in the required fields for the message header (Note that appropriate fields
will be endian swapped). */
    message.header.message_type = PTP_MESSAGE_TYPE_MANAGEMENT;
    message.header.version      = 2;
    /* The message length is the total number of bytes in the PTP message (Including the
message header). */
    message.header.message_length = (uint16_t) (sizeof(ptp_message_header_t) +
sizeof(ptp_message_management_t) +
sizeof(p_tlv_data));
    memcpy(message.header.clock_id, g_ptp_clock_id, sizeof(g_ptp_clock_id));
    message.header.control_field = PTP_CTRL_FIELD_MANAGEMENT;
    /* Fill in the required fields for the management message. */
    memcpy(message.management.target_clock_id, g_target_clock_id, sizeof
```

```
(g_target_clock_id));

    message.management.target_port_id      = 1;
    message.management.starting_boundary_hops = 1;
    message.management.boundary_hops      = 1;

◆ R_PTP_Open()

```
fsp_err_t R_PTP_Open ( ptp_ctrl_t *const p_ctrl, ptp_cfg_t const *const p_cfg )
```

This function initializes PTP. Implements [ptp_api_t::open](#).

This function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Configures the peripheral registers according to the configuration.
- Initialize the control structure for use in other [PTP Interface](#) functions.

Return values

| | |
|----------------------|---|
| FSP_SUCCESS | The instance has been successfully configured. |
| FSP_ERR_ALREADY_OPEN | Instance was already initialized. |
| FSP_ERR_NOT_OPEN | The EDMAC instance was not opened correctly. |
| FSP_ERR_ASSERTION | An invalid argument was given in the configuration structure. |

◆ R_PTP_MacAddrSet()

```
fsp_err_t R_PTP_MacAddrSet ( ptp_ctrl_t *const p_ctrl, uint8_t const *const p_mac_addr )
```

This function sets the MAC address for the PTP instance. Implements `ptp_api_t::macAddrSet`.

Note

This function may only be called while the PTP instance is in `ptp_port_state_t::PTP_PORT_STATE_DISABLE`.

Return values

| | |
|----------------------|---|
| FSP_SUCCESS | The MAC address has been set. |
| FSP_ERR_NOT_OPEN | The instance has not been opened. |
| FSP_ERR_ASSERTION | An argument was NULL |
| FSP_ERR_INVALID_MODE | The instance is not in the correct state. |

◆ R_PTP_IpAddrSet()

```
fsp_err_t R_PTP_IpAddrSet ( ptp_ctrl_t *const p_ctrl, uint32_t ip_addr )
```

This function sets the IP address for the PTP instance. Implements `ptp_api_t::ipAddrSet`.

Note

This function may only be called while the PTP instance is in `ptp_port_state_t::PTP_PORT_STATE_DISABLE`.

Return values

| | |
|----------------------|---|
| FSP_SUCCESS | The IP address has been set. |
| FSP_ERR_NOT_OPEN | The instance has not been opened. |
| FSP_ERR_ASSERTION | An argument was NULL. |
| FSP_ERR_INVALID_MODE | The configured <code>ptp_synfp_cfg_t::frame_format</code> is not configured to use IP packets, or the instance is not in the correct state. |

◆ **R_PTP_LocalClockIdSet()**

```
fsp_err_t R_PTP_LocalClockIdSet ( ptp_ctrl_t *const p_ctrl, uint8_t const *const p_clock_id )
```

This function sets the local clock ID for the PTP instance. Implements `ptp_api_t::localClockIdSet`.

Note

This function may only be called while the PTP instance is in `ptp_port_state_t::PTP_PORT_STATE_DISABLE`. Typically the clock ID is derived from the MAC address (E.g. {b1,b2,b3,0xFF,0xFE,b4,b5,b6}).

Return values

| | |
|----------------------|---|
| FSP_SUCCESS | The local clock ID has been set. |
| FSP_ERR_NOT_OPEN | The instance has not been opened. |
| FSP_ERR_ASSERTION | An argument was NULL |
| FSP_ERR_INVALID_MODE | The instance is not in the correct state. |

◆ **R_PTP_MasterClockIdSet()**

```
fsp_err_t R_PTP_MasterClockIdSet ( ptp_ctrl_t *const p_ctrl, uint8_t const *const p_clock_id, uint16_t port_id )
```

This function sets the master clock ID and port ID that the local clock will synchronize with. Implements `ptp_api_t::masterClockIdSet`.

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | The master clock ID and port ID have been set. |
| FSP_ERR_NOT_OPEN | The instance has not been opened. |
| FSP_ERR_ASSERTION | An argument was NULL |

◆ **R_PTP_MessageFlagsSet()**

```
fsp_err_t R_PTP_MessageFlagsSet ( ptp_ctrl_t *const p_ctrl, ptp_message_type_t message_type, ptp_message_flags_t flags )
```

This function sets the flags field for the given message type. Implements `ptp_api_t::messageFlagsSet`.

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | The master clock ID and port ID have been set. |
| FSP_ERR_NOT_OPEN | The instance has not been opened. |
| FSP_ERR_ASSERTION | An argument was NULL or invalid. |

◆ **R_PTP_CurrentUtcOffsetSet()**

```
fsp_err_t R_PTP_CurrentUtcOffsetSet ( ptp_ctrl_t *const p_ctrl, uint16_t offset )
```

This function sets the currentUtcOffset value in announce messages. [ptp_api_t::currentUtcOffsetSet](#)

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | The currentUtcOffset has been updated. |
| FSP_ERR_NOT_OPEN | The instance has not been opened. |
| FSP_ERR_ASSERTION | An argument was NULL or invalid. |

◆ **R_PTP_PortStateSet()**

```
fsp_err_t R_PTP_PortStateSet ( ptp_ctrl_t *const p_ctrl, uint32_t state )
```

This function changes the current state of the PTP instance. Implements [ptp_api_t::portStateSet](#).

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | The instance will transition to the new state. |
| FSP_ERR_NOT_OPEN | The instance has not been opened. |
| FSP_ERR_ASSERTION | An argument was NULL |

◆ **R_PTP_MessageSend()**

```
fsp_err_t R_PTP_MessageSend ( ptp_ctrl_t *const p_ctrl, ptp_message_t const *const p_message,
uint8_t const *const p_tlv_data, uint16_t tlv_data_size )
```

This function sends a PTP message. [ptp_api_t::messageSend](#).

Return values

| | |
|--|---|
| FSP_SUCCESS | The packet has been written to the transmit descriptor. |
| FSP_ERR_NOT_OPEN | The instance has not been opened. |
| FSP_ERR_ASSERTION | An argument was NULL or invalid. |
| FSP_ERR_ETHER_ERROR_TRANSMIT_BUFFER_FULL | There is no space for the packet in the transmit queue. |

◆ **R_PTP_LocalClockValueSet()**

```
fsp_err_t R_PTP_LocalClockValueSet ( ptp_ctrl_t *const p_ctrl, ptp_time_t *const p_time )
```

This function sets the local clock value. Implements `ptp_api_t::localClockValueSet`.

Return values

| | |
|-------------------|-------------------------------------|
| FSP_SUCCESS | The local clock value has been set. |
| FSP_ERR_NOT_OPEN | The instance has not been opened. |
| FSP_ERR_ASSERTION | An argument was NULL or invalid. |

◆ **R_PTP_LocalClockValueGet()**

```
fsp_err_t R_PTP_LocalClockValueGet ( ptp_ctrl_t *const p_ctrl, ptp_time_t *const p_time )
```

This function gets the local clock value. Implements `ptp_api_t::localClockValueGet`.

Return values

| | |
|-------------------|---|
| FSP_SUCCESS | The local clock value has been written in <code>p_time</code> . |
| FSP_ERR_NOT_OPEN | The instance has not been opened. |
| FSP_ERR_ASSERTION | An argument was NULL |

◆ **R_PTP_PulseTimerCommonConfig()**

```
fsp_err_t R_PTP_PulseTimerCommonConfig ( ptp_ctrl_t *const p_ctrl,
ptp_pulse_timer_common_cfg_t *const p_timer_cfg )
```

This function configures IPLS IRQ settings that are common to all pulse timer channels. Implements `ptp_api_t::pulseTimerCommonConfig`.

Return values

| | |
|-------------------|-----------------------------------|
| FSP_SUCCESS | The pulse timer has been enabled. |
| FSP_ERR_NOT_OPEN | The instance has not been opened. |
| FSP_ERR_ASSERTION | An argument was NULL or invalid. |

◆ **R_PTP_PulseTimerEnable()**

```
fsp_err_t R_PTP_PulseTimerEnable ( ptp_ctrl_t *const p_ctrl, uint32_t channel,
ptp_pulse_timer_cfg_t *const p_timer_cfg )
```

This function enables a pulse timer channel. Implements `ptp_api_t::pulseTimerEnable`.

Return values

| | |
|-------------------|-----------------------------------|
| FSP_SUCCESS | The pulse timer has been enabled. |
| FSP_ERR_NOT_OPEN | The instance has not been opened. |
| FSP_ERR_ASSERTION | An argument was NULL or invalid. |

◆ **R_PTP_PulseTimerDisable()**

```
fsp_err_t R_PTP_PulseTimerDisable ( ptp_ctrl_t *const p_ctrl, uint32_t channel )
```

This function disables a pulse timer channel. Implements `ptp_api_t::pulseTimerDisable`.

Return values

| | |
|-------------------|------------------------------------|
| FSP_SUCCESS | The pulse timer has been disabled. |
| FSP_ERR_NOT_OPEN | The instance has not been opened. |
| FSP_ERR_ASSERTION | An argument was NULL or invalid. |

◆ **R_PTP_Close()**

```
fsp_err_t R_PTP_Close ( ptp_ctrl_t *const p_ctrl)
```

Disable the PTP instance. Implements `ptp_api_t::close`.

Return values

| | |
|-------------------|------------------------------------|
| FSP_SUCCESS | The pulse timer has been disabled. |
| FSP_ERR_NOT_OPEN | The instance has not been opened. |
| FSP_ERR_ASSERTION | An argument was NULL or invalid. |

◆ R_PTP_BestMasterClock()

```
fsp_err_t R_PTP_BestMasterClock ( ptp_message_t const *const p_announce1, ptp_message_t const
*const p_announce2, int8_t *const p_comparison )
```

This function compares two clocks to determine which one is the better master clock.

p_comparison:

- Set to -1 if p_announce1 defines the best master clock.
- Set to 1 if p_announce2 defines the best master clock.
- Set to 0 if p_announce1 and p_announce2 define the same clock.

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | The valid result has been written to p_use_announce_clock. |
| FSP_ERR_ASSERTION | An argument was NULL. |

5.2.12.21 SPP BLE Abstraction (rm_ble_abs_spp)

Modules » [Networking](#)

Middleware for the Bluetooth peripheral on RA MCUs. This module implements the [BLE ABS Interface](#).

Overview

This module provides BLE GAP functionality that complies with the Bluetooth Core Specification version 5.0 specified by the Bluetooth SIG. This module is configured via the [QE for BLE](#). QE for BLE provides standard and custom services defined by the user.

The module supports the Renesas Electronics RYZ012 Bluetooth® Low Energy 5 Module. The rm_ble_abs_spp driver interfaces with the RYZ012 module over UART or SPI.

Features

The Bluetooth Low Energy Abstraction module with SPP supports the following features:

- Common functionality
 - Open/Close the BLE protocol stack.
 - Setting Transmit Power Level.
- The following GAP Role support
 - Peripheral: The device that accepts a connection request from Central and establishes a connection.
- GAP functionality
 - Initialize the Host stack.
 - Setting address.
 - Start/Stop Advertising.

- Connect/Disconnect a link.
- GATT Common functionality
 - Get MTU Size.
- GATT Server functionality
 - Initialization of GATT Server.
 - Loading of Profile definition.
 - Notification of characteristics modification.
 - Read/Write of GATT Profile from host.
- Selectable Communication Interfaces
 - [SPI Interface](#)
 - [UART Interface](#)

Target Devices

The Bluetooth Low Energy Abstraction module supports the following devices.

- RA6 line of devices using the RYZ012 module
- RA4 Line of devices using the RYZ012 module

Configuration

Build Time Configurations for rm_ble_abs_spp

The following build time configurations are defined in fsp_cfg/rm_ble_abs_spp_cfg.h:

| Configuration | Options | Default | Description |
|----------------------------|--|---------------|--|
| Parameter Checking | <ul style="list-style-type: none"> • Default (BSP) • Enable • Disable | Default (BSP) | Specify whether to include code for API parameter checking. |
| Reset Port | Refer to the RA Configuration tool for available options. | 03 | Specify the module reset pin port for the MCU. |
| Reset Pin | Refer to the RA Configuration tool for available options. | 10 | Specify the module reset pin for the MCU. |
| UART/SPI Select Port (PB5) | Refer to the RA Configuration tool for available options. | 03 | Specify the module PB5 (UART/SPI select) port for the MCU. |
| UART/SPI Select Pin (PB5) | Refer to the RA Configuration tool for available options. | 11 | Specify the module PB5 (UART/SPI select) pin for the MCU. |
| SPI Software SSL Port | Refer to the RA Configuration tool for available options. | Disabled | Specify the port to use for controlling SSL using the ioport module. |
| SPI Software SSL Pin | Refer to the RA Configuration tool for available options. | Disabled | Specify the pin to use for controlling SSL using the ioport module. |

| | | | |
|-------------------------------|---|------|---|
| Transmit Power Level (in dBm) | Refer to the RA Configuration tool for available options. | 4.57 | Specify the module transmit power in dBm. |
|-------------------------------|---|------|---|

Configurations for Networking > SPP BLE Abstraction (rm_ble_abs_spp)

This module can be added to the Stacks tab via New Stack > Networking > SPP BLE Abstraction (rm_ble_abs_spp).

| Configuration | Options | Default | Description |
|--|-------------------------------|-----------------------|--|
| General > Name | Name must be a valid C symbol | g_ble_abs0 | Module name. |
| General > GAP callback | Name must be a valid C symbol | gap_cb | If QE is used, set to "gap_cb". |
| General > Vendor specific callback | Name must be a valid C symbol | vs_cb | If QE is used, set to "vs_cb". |
| General > GATT server callback parameter | Name must be a valid C symbol | gs_abs_gatts_cb_param | If QE is used, set to "gs_abs_gattc_cb_param". |
| General > GATT server callback number | Must be a valid number | 2 | The number of GATT Server callback functions. |
| General > GATT client callback parameter | Name must be a valid C symbol | gs_abs_gattc_cb_param | Set GATT client callback parameter. If QE is used, set to "gs_abs_gattc_cb_param". |
| General > GATT client callback number | Must be a valid number | 2 | The number of GATT Server callback functions. |

Pin Configuration

Pins used by the BLE driver to control the RYZ012 module:

- Reset Pin : Active low reset line for RYZ012 module
- UART/SPI Select Pin : Allows selection between UART or SPI for module communication. UART is selected with output low and SPI with output high.
- [UART Interface](#) : RX/TX Pins
- [SPI Interface](#) : MOSI/MISO/SCK/SSL Pins
 - Data Ready Pin : When the [SPI Interface](#) is selected as the communication interface, the Data Ready pin is asserted in order to notify the MCU that there is data ready to be read.
 - Software SSL Pin : Can be optionally configured in order to drive the SSL Pin using software instead of hardware¹.

Note

1. The software SSL Pin is required when using the [SPI \(r_sci_spi\)](#) driver.
2. When using software SSL, the pin must be configured as "Output mode (Initial High)" in the pin configuration editor in addition to being configured in the "stacks" tab.

Usage Notes

Limitations

Developers should be aware of the following limitations when using the BLE_ABS:

Currently supported `rm_ble_abs_spp` interface functions:

- `RM_BLE_ABS_Open`
- `RM_BLE_ABS_Close`
- `RM_BLE_ABS_StartLegacyAdvertising`

Currently supported `r_ble_spp_api` interface functions:

- `R_BLE_Open`
- `R_BLE_Close`
- `R_BLE_SetEvent`
- `R_BLE_GAP_Init`
- `R_BLE_GAP_StopAdv`
- `R_BLE_GAP_SetAdvSresData`
- `R_BLE_GAP_StartAdv`
- `R_BLE_GAP_SetAdvParam`
- `R_BLE_GATT_GetMtu`
- `R_BLE_GATTS_SetDbInst`
- `R_BLE_GATTS_Init`
- `R_BLE_GATTS_GetAttr`
- `R_BLE_GATTS_SetAttr`
- `R_BLE_GATTS_Notification`
- `R_BLE_GATTS_Indication`
- `R_BLE_GATTS_RegisterCb`
- `R_BLE_GATTC_Init`
- `R_BLE_GATTC_RegisterCb`
- `R_BLE_VS_SetBdAddr`
- `R_BLE_VS_SetTxPower`

Currently supported callback events:

- `BLE_GAP_EVENT_CONN_IND`
- `BLE_GAP_EVENT_DISCONN_IND`
- `BLE_GAP_EVENT_ADV_ON`
- `BLE_GAP_EVENT_ADV_OFF`
- `BLE_GATTC_EVENT_CONN_IND`
- `BLE_GATTS_EVENT_CONN_IND`
- `BLE_GATTC_EVENT_DISCONN_IND`
- `BLE_GATTS_EVENT_DISCONN_IND`
- `BLE_GATTS_EVENT_WRITE_RSP_COMP`

Transmit Power

Specific Operational Use Conditions for RYZ012 BLE module:

Please consult the laws and regulations of the region(s) in which the device will be used to verify the information below before using this device.

North America (FCC) The module must not be operated at power levels above 10.0 dBm. Host devices that need higher output power may not be marketed without prior re-certification.

Europe (RED) The module must not be operated at power levels above 8.4 dBm. Host devices that need higher output power may not be marketed in regions covered by RED regulation without prior re-certification.

Japan (MIC) The module must be operated at power level 4.5 dBm. Host devices that need to change output power may not be marketed without prior re-certification.

The current default level used in the e² studio Configurator is 4.57 dBm for the transmit power level.

Examples

BLE_ABS_SPP Basic Example

This is a basic example of minimal use of the BLE_ABS_SPP in an application.

```
/* The callback is called when peripheral event occurs. */
void gap_peripheral_cb (uint16_t type, ble_status_t result, st_ble_evt_data_t *
p_data)
{
    FSP_PARAMETER_NOT_USED(result);
    FSP_PARAMETER_NOT_USED(p_data);

    switch (type)
    {
        case BLE_GAP_EVENT_STACK_ON:
            {
                g_ble_event_flag = g_ble_event_flag | BLE_ABS_EVENT_FLAG_STACK_ON;
                break;
            }
        case BLE_GAP_EVENT_ADV_ON:
            {
                st_ble_gap_adv_set_evt_t * p_gap_adv_set_evt_param = (st_ble_gap_adv_set_evt_t *)
p_data->p_param;

                g_advertising_handle = p_gap_adv_set_evt_param->adv_hdl;
                g_ble_event_flag |= BLE_ABS_EVENT_FLAG_ADV_ON;
                break;
            }
        case BLE_GAP_EVENT_ADV_OFF:
            {
                g_ble_event_flag |= BLE_ABS_EVENT_FLAG_ADV_OFF;
            }
    }
}
```

```
break;
    }
case BLE_GAP_EVENT_CONN_IND:
    {
        g_ble_event_flag |= BLE_ABS_EVENT_FLAG_CONN_IND;
break;
    }
    {
/* Do nothing. */
break;
    }
default:
break;
    }
}
```

```
#define BLE_ABS_EVENT_FLAG_STACK_ON (0x01 << 0)

}
```

BLE_ABS_SPP Firmware Update Example

This is a basic example of performing a firmware update.

```
void ble_abs_firmware_update_example (void)
{
    fsp_err_t err = FSP_SUCCESS;
    /* Open the module. */
    err = RM_BLE_ABS_Open(&g_ble_abs0_ctrl, &g_ble_abs0_cfg);
    assert(FSP_SUCCESS == err);
    /* Complete the firmware update (This function blocks until the procedure has
    completed). */
    ble_status_t status = R_BLE_VS_UpdateModuleFirmware(g_firmware_image,
    g_firmware_image_size);
    assert(BLE_SUCCESS == status);
    /* Close the module. */
    err = RM_BLE_ABS_Close(&g_ble_abs0_ctrl);
    assert(FSP_SUCCESS == err);
    /* The RYZ012 is now using the updated firmware. Call open to re-initialize the
    module using the new firmware. */
}
```

BLE_ABS_SPP Firmware Update Asynchronous Example

This is an example of performing a firmware update using the asynchronous API.

```
volatile uint32_t g_firmware_update_complete = 0;
void vs_cb (uint16_t type, ble_status_t result, st_ble_vs_evt_data_t * p_data)
{
    FSP_PARAMETER_NOT_USED(p_data);
    if (BLE_SUCCESS != result)
    {
        /* Stop the firmware update process if there was an error. */
        return;
    }
}
```

```
static uint16_t index = 0;
switch (type)
{
/* The response to the START_FW_UPDATE command was received (Fall through to send
the next data frame). */
case BLE_VS_EVENT_START_FW_UPDATE_COMP:
/* The response to the SEND_FW_DATA command was received. */
case BLE_VS_EVENT_SEND_FW_DATA_COMP:
{
if (BLE_VS_EVENT_START_FW_UPDATE_COMP == index)
{
index = 0;
}
uint16_t length = 0;
uint8_t * p_firmware_data = NULL;
/*
* Get next firmware data frame.
* Note that app_data_frame_get() is an application defined function.
*/
app_data_frame_get(index, &p_firmware_data, &length);
if (length > 0)
{
/* Send the firmware data frame. */
R_BLE_VS_SendFirmwareData(index, length, p_firmware_data);
index++;
}
else
{
/* The previously completed data frame was the last data frame. Send the firmware
update end command. */
R_BLE_VS_EndFirmwareUpdate(index - 1);
}
break;
}
```

```
/* The response to the END_FW_UPDATE command was received. */
case BLE_VS_EVENT_END_FW_UPDATE_COMP:
    {
        /* After the BLE_VS_EVENT_END_FW_UPDATE_COMP command is sent, send the restart
command. */

Detailed Description

Wifi and Socket implementation using the da16xxx WiFi module on RA MCUs.

Overview

This Middleware module supplies an implementation for the [FreeRTOS WiFi interface](#) using the DA16XXX module. The DA16XXX Wi-Fi module only supports FreeRTOS currently (Microsoft Azure support expected in future release).

DA16XXX is a low power Wi-Fi networking SoC that delivers a dramatic breakthrough in battery life even for devices that are continuously connected to the Wi-Fi network. The module comes readily equipped with radio certification for Japan, North America and Europe. More information about this module can be found at the [DA16XXX Web Site](#)

The DA16XXX module supports the following modules:

- DA16200
- DA16600 (currently Wi-Fi features only)

Features

The WiFi Onchip da16xxx Middleware driver supplies these features:

- Supports connect/disconnect to a b/g/n (2.4GHz) WiFi Access Point using Open, WPA, and WPA2 security. Encryption types can be either TKIP, or CCMP(AES).
- Supports retrieval of the module device MAC address.
- Once connected you can acquire the assigned module device IP.
- Supports a WiFi network scan capability to get a list of local Access Points.
- Supports a Ping function to test network connectivity.
- Supports a DNS Query call to retrieve the IPv4 address of a supplied URL.
- Supports TCP client sockets.
- Drive supports 1 UART for interfacing with the DA16XXX module.

Configuration

Build Time Configurations for rm_wifi_onchip_da16200

The following build time configurations are defined in fsp_cfg/rm_wifi_onchip_da16xxx_cfg.h:

| Configuration | Options | Default | Description |
|---|--|---------------|---|
| Parameter Checking | <ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| Enable DA16600 Support | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | Enabled if using the DA16600 module |
| Number of supported socket instances (not used with on-chip APIs) | 1 | 1 | Enable number of socket instances |
| Size of RX buffer for socket (not used with on-chip APIs) | Manual Entry | 8192 | |
| Size of TX buffer for CMD Port | Manual Entry | 1500 | |
| Size of RX buffer for CMD Port | Manual Entry | 3000 | |
| Semaphore maximum timeout | Manual Entry | 10000 | |
| Number of retries for AT commands | Manual Entry | 10 | |
| Module Reset Port | Refer to the RA Configuration tool for available options. | 06 | Specify the module reset pin port for the MCU. |

| | | | |
|--------------------|---|----------|---|
| Module Reset Pin | Refer to the RA Configuration tool for available options. | 03 | Specify the module reset pin for the MCU. |
| Enable SNTP Client | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | Should the SNTP client of the module be enabled |

Configurations for Networking > WiFi Onchip DA16xxx Driver using r_sci_uart (rm_wifi_onchip_da16xxx)

| Configuration | Options | Default | Description |
|---|---|---------|-------------------------------|
| Country code in ISO 3166-1 alpha-2 standard | Manual Entry | US | |
| SNTP server IPv4 address | Must be a valid IPv4 address | 0.0.0.0 | |
| SNTP Timezone UTC Offset in Hours | Refer to the RA Configuration tool for available options. | 0 | Value in hours from 12 to -12 |

Note: It is suggested that when using the da16xxx Module that DTC and FIFO are enabled in the UART configuration to facilitate a more reliable data transfer between module and MCU.

Note: If you wish to use flow control then you must enable flow control in the RA Configuration editor. This can be found in the UART setting. It is advantageous to use flow control all the time since it allows the hardware to gate the flow of data across the serial bus. Without hardware flow control for faster data rate you will most likely see an overflow condition between MCU and the module device.

Note: Higher baud rates are supported in the RA Configuration editor and should be changed in the first UART configuration. There is no need to change the second UART baud rate since it is only used as an AT command channel.

Note: It is a good idea to also enable the FIFO in the UART configuration settings if you plan to use higher baud rates.

Interrupt Configuration

Refer to [UART \(r_sci_uart\)](#). `R_SCI_UART_Open()` is called by [WiFi Onchip DA16XXX Driver using r_sci_uart \(rm_wifi_onchip_da16xxx\)](#).

Clock Configuration

Refer to [UART \(r_sci_uart\)](#).

Pin Configuration

Refer to [UART \(r_sci_uart\)](#). `R_SCI_UART_Open()` is called by [WiFi Onchip DA16XXX Driver using r_sci_uart \(rm_wifi_onchip_da16xxx\)](#)

Usage Notes

- When the DA16XXX Wi-Fi configures the UART baud rate on the DA16XXX module based on the user settings in the UART driver configuration properties, the UART Baud rate settings will be stored in the NVM memory of the DA16XXX. After reboot, the DA16XXX comes up with the previously updated UART baud rate settings.
- When using the DA16600 Pmod module, make sure that the SDK has been updated to the latest version that supports AT commands. The default SDK that comes from the factory doesn't support the AT command interface, which will cause the `WIFI_On()` API to fail. This is not required for the DA16200 Pmod module.

Limitations

- WiFi AP connections do not currently support WEP security.
- The default UART baud rate supported by v3.2.1 Wi-Fi SDK is 115200 and v3.2.4 Wi-Fi SDK is 230400. User needs to explicitly configure the default UART baud settings in the UART driver configurator properties based on the version of Wi-Fi SDK used in their testing.
- In v3.2.1 Wi-Fi SDK, the daylight savings time setting is disabled by default. The user needs to mandatorily set the following parameters such as `minutes = 0`, daylight savings to disable when calling `RM_WIFI_ONCHIP_DA16XXX_SntpTimeZoneSet()` API.
- Network connection parameters SSID and Passphrase for the Access Point can not contain any commas. This is a current limitation of the da16xxx module firmware. The `rm_wifi_onchip_da16xxx_connect()` function will return an error if a comma is detected.
- Wi-Fi AP Scanning is currently limited to max of 10 Access Points.

Examples

Basic Example

This is a basic example of minimal use of WiFi Middleware in an application.

```
void wifi_onchip_basic_example (void)
{
    WIFIReturnCode_t wifi_err;
    /* Setup Access Point connection parameters */
    WIFINetworkParams_t net_params =
    {
        .ucChannel                = 0,
        .xPassword.xWPA.cPassphrase = "password",
        .ucSSID                    = "access_point_ssid",
        .xPassword.xWPA.ucLength  = 8,
        .ucSSIDLength              = 17,
        .xSecurity                  = eWiFiSecurityWPA2,
    };
    memset(scan_data, 0, sizeof(WIFI_ScanResult_t) * MAX_WIFI_SCAN_RESULTS);
    memset(g_socket_recv_buffer, 0, sizeof(uint8_t) * SX_WIFI_SOCKET_RX_BUFFER_SIZE);
    /* Open connection to the Wifi Module */
}
```

```
wifi_err = WIFI_On();
assert(eWiFiSuccess == wifi_err);
/* Connect to the Access Point */
wifi_err = WIFI_ConnectAP(&net_params);
assert(eWiFiSuccess == wifi_err);
/* Get address assigned by AP */
WIFIIPConfiguration_t ipInfo;
wifi_err = WIFI_GetIPInfo(&ipInfo);
assert(eWiFiSuccess == wifi_err);
/* Ping an address accessible on the network */
uint8_t ip_address[4] = {216, 58, 194, 174}; // NOLINT
const uint16_t ping_count = 3;
const uint32_t intervalMS = 100;
wifi_err = WIFI_Ping(&ip_address[0], ping_count, intervalMS);
assert(eWiFiSuccess == wifi_err);
/* Scan the local Wifi network for other APs */
wifi_err = WIFI_Scan(&scan_data[0], MAX_WIFI_SCAN_RESULTS);
assert(eWiFiSuccess == wifi_err);
/* Shutdown the WIFI */
WIFI_Off();
}
```

SNTP example

An example of using Simple Network Time Protocol (SNTP) on WiFi in an application.

```
#define RM_WIFI_ONCHIP_DA16XXX_TEMP_BUFFER_SIZE (64)
/*
 * Example of the use of SNTP with Wifi. Example gets the epoch time and local
 * system time strings. It is also demonstrated how the user will need to disconnect
 * from the access point to make changes to the SNTP configuration during runtime.
 *
 * Function assumes that the SNTP has been enabled and configured with proper
 * SNTP server address. For brevity error checking has not been implemented.
 */
```

```
*/
void wifi_onchip_sntp_example (void)
{
    /* Setup Access Point connection parameters */
    WIFINetworkParams_t net_params =
    {
        .ucSSID                = "access_point_ssid",
        .ucSSIDLength          = 17,
        .xPassword.xWPA.cPassphrase = "password",
        .xPassword.xWPA.ucLength  = 8,
        .ucChannel              = 0,
        .xSecurity               = eWiFiSecurityWPA2
    };

    uint8_t local_time[RM_WIFI_ONCHIP_DA16XXX_TEMP_BUFFER_SIZE];
    time_t current_sys_time = 0;

    // SNTP IP address
    uint8_t ip_address_sntp_server_valid[4] = {216, 239, 35, 0}; // NOLINT : Static
IP address

    memset(local_time, 0, sizeof(local_time));

    /* Open connection to the Wifi Module */
    WIFI_On();

    /* Connect to the Access Point */
    WIFI_ConnectAP(&net_params);

    /* Get the local time string */
    RM_WIFI_ONCHIP_DA16XXX_LocalTimeGet((uint8_t *) local_time, sizeof(local_time));

    /* Disconnect from the access point to make changes to the SNTP configuration */
    WIFI_Disconnect();

    /* Change the IP address of the server */
    RM_WIFI_ONCHIP_DA16XXX_SntpServerIpAddressSet((uint8_t *)
ip_address_sntp_server_valid);

    /* Change the timezone to PST with daylight saving enabled */
    RM_WIFI_ONCHIP_DA16XXX_SntpTimeZoneSet(-8, 0,
WIFI_ONCHIP_DA16XXX_SNTP_DAYLIGHT_SAVINGS_DISABLE);

    /* Connect back to the access point */
}
```

```

WIFI_ConnectAP(&net_params);

/* Get the local time string in format [DayOfWeek Month DayOfMonth Year
Hour:Minute:Second] */
RM_WIFI_ONCHIP_DA16XXX_LocalTimeGet((uint8_t *) local_time, sizeof(local_time));

/* Disconnect from the Access Point and shutdown the WIFI module*/
WIFI_Disconnect();

WIFI_Off();
}

```

Set the SNTP Client Server IP Address

Parameters

| | | |
|------|-------------------------------|--|
| [in] | <code>p_server_ip_addr</code> | Pointer to IP address of SNTP server in byte array format. |
|------|-------------------------------|--|

Return values

| | |
|----------------------------------|--|
| <code>FSP_SUCCESS</code> | Successfully set the value. |
| <code>FSP_ERR_WIFI_FAILED</code> | Error occurred with command to Wifi module. |
| <code>FSP_ERR_NOT_OPEN</code> | Module is not open. |
| <code>FSP_ERR_ASSERTION</code> | The parameter <code>p_server_ip_addr</code> is NULL. |

Update the SNTP Server IP Address

◆ **RM_WIFI_ONCHIP_DA16XXX_SntpEnableSet()**

```
fsp_err_t RM_WIFI_ONCHIP_DA16XXX_SntpEnableSet ( wifi_onchip_da16xxx_sntp_enable_t enable )
```

Set the SNTP Client to Enable or Disable

Parameters

| | | |
|------|--------|---|
| [in] | enable | Flag to indicate enable/disable for SNTP support. |
|------|--------|---|

Return values

| | |
|---------------------|---|
| FSP_SUCCESS | Successfully set the value. |
| FSP_ERR_WIFI_FAILED | Error occurred with command to Wifi module. |
| FSP_ERR_NOT_OPEN | Module is not open. |

Enable or Disable the SNTP Client Service

◆ **RM_WIFI_ONCHIP_DA16XXX_SntpTimeZoneSet()**

```
fsp_err_t RM_WIFI_ONCHIP_DA16XXX_SntpTimeZoneSet ( int utc_offset_in_hours, uint32_t minutes, wifi_onchip_da16xxx_sntp_daylight_savings_enable_t daylightSavingsEnable )
```

Set the SNTP Client Timezone

Parameters

| | | |
|------|-----------------------|---|
| [in] | utc_offset_in_hours | Timezone in UTC offset in hours |
| [in] | minutes | Number of minutes used for timezone offset from GMT. |
| [in] | daylightSavingsEnable | Enable/Disable daylight saving in the timezone calculation. |

Return values

| | |
|--------------------------|---|
| FSP_SUCCESS | Successfully set the value. |
| FSP_ERR_WIFI_FAILED | Error occurred with command to Wifi module. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Parameter passed into function was invalid. |

Update the SNTP Timezone

◆ **RM_WIFI_ONCHIP_DA16XXX_LocalTimeGet()**

```
fsp_err_t RM_WIFI_ONCHIP_DA16XXX_LocalTimeGet ( uint8_t * p_local_time, uint32_t size_string )
```

Get the current local time based on current timezone in a string . Exp: YYYY-MM-DD,HOUR:MIN:SECS

Parameters

| | | |
|-------|--------------|--|
| [out] | p_local_time | Returns local time in string format. |
| [in] | size_string | Size of p_local_time string buffer.The size of this string needs to be at least 25 bytes |

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Successfully returned the local time string. |
| FSP_ERR_ASSERTION | The parameter local_time or p_instance_ctrl is NULL. |
| FSP_ERR_WIFI_FAILED | Error occurred with command to Wifi module. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_SIZE | String size value passed in exceeds maximum. |

Get the current local time based on current timezone in a string format

Detailed Description

Wifi and Socket implementation using the Silex SX-ULPGN WiFi module on RA MCUs.

Overview

This Middleware module supplies an implementation for the [FreeRTOS WiFi interface](#) using the Silex SX-ULPGN module.

You can find specifics about the WiFi and Secure Socket interface APIs supported by this module at these web sites: [Wifi API](#).

The SX-ULPGN is a low-power, compact IEEE 802.11b/g/n 2.4GHz 1x1 Wireless LAN module equipped with the Qualcomm® QCA4010 Wireless SOC. The module comes readily equipped with radio certification for Japan, North America and Europe. More information about this module can be found at the [Silex Web Site](#)

Features

The WiFi Onchip Silex Middleware driver supplies these features:

- Supports connect/disconnect to a b/g/n (2.4GHz) WiFi Access Point using Open, WPA, and WPA2 security. Encryption types can be either TKIP, or CCMP(AES).
- Supports retrieval of the module device MAC address.
- Once connected you can acquire the assigned module device IP.
- Supports a WiFi network scan capability to get a list of local Access Points.
- Supports a Ping function to test network connectivity.
- Supports a DNS Query call to retrieve the IPv4 address of a supplied URL.
- Supports both TCP and UDP client sockets.
- Drive supports 1 or 2 UARTs for interfacing with the SX-ULPGN module. The second UART is considered optional.

Configuration

Build Time Configurations for rm_wifi_onchip_silex

The following build time configurations are defined in fsp_cfg/rm_wifi_onchip_silex_cfg.h:

| Configuration | Options | Default | Description |
|--------------------------------------|--|---------------|---|
| Parameter Checking | <ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| Number of supported socket instances | Refer to the RA Configuration tool for available options. | 1 | Enable number of socket instances |
| Size of RX buffer for socket | Manual Entry | 4096 | |
| Size of TX buffer for | Manual Entry | 1500 | |

CMD Port

| | | | |
|-----------------------------------|---|----------|---|
| Size of RX buffer for CMD Port | Manual Entry | 3000 | |
| Semaphore maximum timeout | Manual Entry | 10000 | |
| Number of retries for AT commands | Manual Entry | 10 | |
| Module Reset Port | Refer to the RA Configuration tool for available options. | 06 | Specify the module reset pin port for the MCU. |
| Module Reset Pin | Refer to the RA Configuration tool for available options. | 03 | Specify the module reset pin for the MCU. |
| Enable SNTP Client | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | Should the SNTP client of the module be enabled |

Configurations for Networking > WiFi Onchip Silex Driver using r_sci_uart (rm_wifi_onchip_silex)

| Configuration | Options | Default | Description |
|---------------------------------------|---|----------|--|
| SNTP server IPv4 address | Must be a valid IPv4 address | 0.0.0.0 | |
| SNTP Timezone Offset from UTC Hours | Must be between 12 and -12 hours | 0 | Value in hours from 12 to -12 |
| SNTP Timezone Offset from UTC Minutes | Must be between 0 and 59 minutes | 0 | Value in minutes from 0 to 59 |
| Use Daylight Savings Time | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | Specify if daytime savings should be used for local time calculation |

Note: It is suggested that when using the Silex Module that DTC and FIFO are enabled in the UART configuration to facilitate a more reliable data transfer between module and MCU.

Note: If you wish to use flow control then you must enable flow control in the RA Configuration editor. This can be found in the UART setting. It is advantageous to use flow control all the time since it allows the hardware to gate the flow of data across the serial bus. Without hardware flow control for faster data rate you will most likely see an overflow condition between MCU and the module device.

Note: Higher baud rates are supported in the RA Configuration editor and should be changed in the first UART configuration. There is no need to change the second UART baud rate since it is only used as an AT command channel.

Note: It is a good idea to also enable the FIFO in the UART configuration settings if you plan to use higher baud rates.

Interrupt Configuration

Refer to [UART \(r_sci_uart\)](#). `R_SCI_UART_Open()` is called by WiFi Onchip Silex Driver using `r_sci_uart (rm_wifi_onchip_silex)`.

Clock Configuration

Refer to [UART \(r_sci_uart\)](#).

Pin Configuration

Refer to [UART \(r_sci_uart\)](#). `R_SCI_UART_Open()` is called by WiFi Onchip Silex Driver using `r_sci_uart (rm_wifi_onchip_silex)`

Usage Notes

Limitations

- WiFi AP connections do not currently support WEP security.
- When operating with a single UART only single socket connections are possible. To support multiple sockets two UART channels must be connected to the module. When using the Renesas-provided SX-ULPGN PMOD board the second UART channel is on pins 9 and 10 of the PMOD header.
- Network connection parameters SSID and Passphrase for the Access Point can not contain any commas. This is a current limitation of the Silex module firmware. The `rm_wifi_onchip_silex_connect()` function will return an error if a comma is detected.
- When operating with a single UART and there is an active socket connection you cannot call `WIFI_Scan()`, `WIFI_Ping()`, `WIFI_GetMAC()`, or `WIFI_GetIPInfo()`. Calling one of these function will return an error code in this situation. These commands are blocked in the one UART case during an active socket connection because they could cause data loss. To avoid this limitation please configure the hardware to use both UARTs.
- The Silex WiFi modules SNTP support requires all configuration changes to made when the WiFi is disconnected from an Access Point. This is a limitation of the Silex module firmware. If changes to the default SNTP settings are required then the application will have to close the current AP connection, make the necessary SNTP changes, and then re-establish the original connection.

Examples

Basic Example

This is a basic example of minimal use of WiFi Middleware in an application.

```
void wifi_onchip_basic_example (void)
{
    WIFIReturnCode_t wifi_err;

    /* Setup Access Point connection parameters */
    WIFINetworkParams_t net_params =
    {
        .ucChannel                = 0,
        .xPassword.xWPA.cPassphrase = "password",
    }
}
```

```

        .ucSSID                                = "access_point_ssid",
        .xPassword.xWPA.ucLength = 8,
        .ucSSIDLength                       = 17,
        .xSecurity                           = eWiFiSecurityWPA2,
    };
    memset(scan_data, 0, sizeof(WIFI_ScanResult_t) * MAX_WIFI_SCAN_RESULTS);
    memset(g_socket_recv_buffer, 0, sizeof(uint8_t) * SX_WIFI_SOCKET_RX_BUFFER_SIZE);
/* Open connection to the Wifi Module */
    wifi_err = WIFI_On();
    assert(eWiFiSuccess == wifi_err);
/* Connect to the Access Point */
    wifi_err = WIFI_ConnectAP(&net_params);
    assert(eWiFiSuccess == wifi_err);
/* Get address assigned by AP */
WIFI_IPConfiguration_t ipInfo;
    wifi_err = WIFI_GetIPInfo(&ipInfo);
    assert(eWiFiSuccess == wifi_err);
/* Ping an address accessible on the network */
    uint8_t      ip_address[4] = {216, 58, 194, 174}; // NOLINT
const uint16_t ping_count      = 3;
const uint32_t intervalMS     = 100;

    wifi_err = WIFI_Ping(&ip_address[0], ping_count, intervalMS);
    assert(eWiFiSuccess == wifi_err);
/* Scan the local Wifi network for other APs */
    wifi_err = WIFI_Scan(&scan_data[0], MAX_WIFI_SCAN_RESULTS);
    assert(eWiFiSuccess == wifi_err);
/* Shutdown the WIFI */
WIFI_Off();
}

```

SNTP example

An example of using Simple Network Time Protocol (SNTP) on WiFi in an application.

```
#define RM_WIFI_ONCHIP_SILEX_TEMP_BUFFER_SIZE (64)
```

```
/*
 * Example of the use of SNTP with Wifi. Example gets the epoch time and local
 * system time strings. It is also demonstrated how the user will need to disconnect
 * from the access point to make changes to the SNTP configuration during runtime.
 *
 * Function assumes that the SNTP has been enabled and configured with proper
 * SNTP server address. For brevity error checking has not been implemented.
 */
void wifi_onchip_sntp_example (void)
{
    /* Setup Access Point connection parameters */
    WIFINetworkParams_t net_params =
    {
        .ucSSID                = "access_point_ssid",
        .ucSSIDLength          = 17,
        .xPassword.xWPA.cPassphrase = "password",
        .xPassword.xWPA.ucLength   = 8,
        .ucChannel              = 0,
        .xSecurity               = eWiFiSecurityWPA2
    };

    uint8_t local_time[RM_WIFI_ONCHIP_SILEX_TEMP_BUFFER_SIZE];
    time_t current_sys_time = 0;

    // SNTP IP address
    uint8_t ip_address_sntp_server_valid[4] = {216, 239, 35, 0}; // NOLINT : Static
IP address
    memset(local_time, 0, sizeof(local_time));

    /* Open connection to the Wifi Module */
    WIFI_On();

    /* Connect to the Access Point */
    WIFI_ConnectAP(&net_params);

    /* Get the Epoch time in seconds since Jan 1, 1970 UTC */
    RM_WIFI_ONCHIP_SILEX_EpochTimeGet(&current_sys_time);

    /* Get the local time string */
}
```

```

RM_WIFI_ONCHIP_SILEX_LocalTimeGet((uint8_t *) local_time, sizeof(local_time));
/* Disconnect from the access point to make changes to the SNTP configuration */
WIFI_Disconnect();
/* Change the IP address of the server */
RM_WIFI_ONCHIP_SILEX_SntpServerIpAddressSet((uint8_t *)
ip_address_sntp_server_valid);
/* Change the timezone to PST with daylight saving enabled */
RM_WIFI_ONCHIP_SILEX_SntpTimeZoneSet(-7, 0,
WIFI_ONCHIP_SILEX_SNTP_DAYLIGHT_SAVINGS_ENABLE);
/* Connect back to the access point */
WIFI_ConnectAP(&net_params);
/* Get the Epoch time in seconds since Jan 1, 1970 UTC */
RM_WIFI_ONCHIP_SILEX_EpochTimeGet(&current_sys_time);
/* Get the local time string in format [DayOfWeek Month DayOfMonth Year
Hour:Minute:Second] */
RM_WIFI_ONCHIP_SILEX_LocalTimeGet((uint8_t *) local_time, sizeof(local_time));
/* Disconnect from the Access Point and shutdown the WIFI module*/
WIFI_Disconnect();
WIFI_Off();
}

```

Function Documentation

◆ **RM_WIFI_ONCHIP_SILEX_EpochTimeGet()**

fsp_err_t RM_WIFI_ONCHIP_SILEX_EpochTimeGet (time_t * p_utc_time)

This will retrieve time info from an NTP server at the address entered via an during configuration. If the server isn't set or the client isn't enabled, then it will return an error. The date/time is retrieved as the number of seconds since 00:00:00 UTC January 1, 1970

Parameters

| | | |
|-------|------------|------------------------------------|
| [out] | p_utc_time | Returns the epoch time in seconds. |
|-------|------------|------------------------------------|

Return values

| | |
|---------------------|---|
| FSP_SUCCESS | Successfully retrieved the system time from module. |
| FSP_ERR_ASSERTION | The parameter utc_time or p_instance_ctrl is NULL. |
| FSP_ERR_WIFI_FAILED | Error occurred with command to Wifi module. |
| FSP_ERR_NOT_OPEN | Module is not open. |

Get the current system time as the number of seconds since epoch 1970-01-01 00:00:00 UTC

◆ **RM_WIFI_ONCHIP_SILEX_LocalTimeGet()**

```
fsp_err_t RM_WIFI_ONCHIP_SILEX_LocalTimeGet ( uint8_t * p_local_time, uint32_t size_string )
```

Get the current local time based on current timezone in a string . Exp: Wed Oct 15 1975 07:06:00

Parameters

| | | |
|-------|--------------|--|
| [out] | p_local_time | Returns local time in string format. |
| [in] | size_string | Size of p_local_time string buffer.The size of this string needs to be at least 25 bytes |

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Successfully returned the local time string. |
| FSP_ERR_ASSERTION | The parameter local_time or p_instance_ctrl is NULL. |
| FSP_ERR_WIFI_FAILED | Error occurred with command to Wifi module. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_SIZE | String size value passed in exceeds maximum. |

Get the current local time based on current timezone in a string format

◆ **RM_WIFI_ONCHIP_SILEX_SntpEnableSet()**

```
fsp_err_t RM_WIFI_ONCHIP_SILEX_SntpEnableSet ( wifi_onchip_silex_sntp_enable_t enable)
```

Set the SNTP Client to Enable or Disable

Parameters

| | | |
|------|--------|--|
| [in] | enable | Can be set to enable/disable for SNTP support. |
|------|--------|--|

Return values

| | |
|---------------------|---|
| FSP_SUCCESS | Successfully set the value. |
| FSP_ERR_WIFI_FAILED | Error occurred with command to Wifi module. |
| FSP_ERR_NOT_OPEN | Module is not open. |

Enable or Disable the SNTP Client Service

◆ **RM_WIFI_ONCHIP_SILEX_SntpServerIpAddressSet()**

fsp_err_t RM_WIFI_ONCHIP_SILEX_SntpServerIpAddressSet (uint8_t * p_ip_address)

Set the SNTP Client Server IP Address

Parameters

| | | |
|------|--------------|--|
| [in] | p_ip_address | Pointer to IP address of SNTP server in byte array format. |
|------|--------------|--|

Return values

| | |
|---------------------|--|
| FSP_SUCCESS | Successfully set the value. |
| FSP_ERR_ASSERTION | The parameter p_ip_address or p_instance_ctrl is NULL. |
| FSP_ERR_WIFI_FAILED | Error occurred with command to Wifi module. |
| FSP_ERR_NOT_OPEN | Module is not open. |

Update the SNTP Server IP Address

◆ RM_WIFI_ONCHIP_SILEX_SntpTimeZoneSet()

```
fsp_err_t RM_WIFI_ONCHIP_SILEX_SntpTimeZoneSet ( int32_t hours, uint32_t minutes,
wifi_onchip_silex_sntp_daylight_savings_enable_t daylightSavingsEnable )
```

Set the SNTP Client Timezone

Parameters

| | | |
|------|-----------------------|---|
| [in] | hours | Number of hours (+/-) used for timezone offset from GMT. |
| [in] | minutes | Number of minutes used for timezone offset from GMT. |
| [in] | daylightSavingsEnable | Enable/Disable daylight saving in the timezone calculation. |

Return values

| | |
|--------------------------|---|
| FSP_SUCCESS | Successfully set the value. |
| FSP_ERR_WIFI_FAILED | Error occurred with command to Wifi module. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Parameter passed into function was invalid. |

Update the SNTP Timezone

5.2.13 Power

Modules

Detailed Description

Power Modules.

Modules

Low Power Modes (r_lpm)

Driver for the LPM peripheral on RA MCUs. This module implements the [Low Power Modes Interface](#).

5.2.13.1 Low Power Modes (r_lpm)

Modules » Power

Functions

fsp_err_t R_LPM_Open (lpm_ctrl_t *const p_api_ctrl, lpm_cfg_t const *const p_cfg)

fsp_err_t R_LPM_LowPowerReconfigure (lpm_ctrl_t *const p_api_ctrl, lpm_cfg_t const *const p_cfg)

fsp_err_t R_LPM_LowPowerModeEnter (lpm_ctrl_t *const p_api_ctrl)

fsp_err_t R_LPM_IoKeepClear (lpm_ctrl_t *const p_api_ctrl)

fsp_err_t R_LPM_Close (lpm_ctrl_t *const p_api_ctrl)

Detailed Description

Driver for the LPM peripheral on RA MCUs. This module implements the [Low Power Modes Interface](#).

Overview

The low power modes driver is used to configure and place the device into the desired low power mode. Various sources can be configured to wake from standby, request snooze mode, end snooze mode or end deep standby mode.

Features

The LPM HAL module has the following key features:

- Supports the following low power modes:
 - Deep Software Standby mode (On supported MCUs)
 - Deep Sleep (On supported MCUs)
 - Software Standby mode
 - Sleep mode
 - Snooze mode (On supported MCUs)
- Supports reducing power consumption when in deep software standby mode through internal power supply control and by resetting the states of I/O ports.
- Supports disabling and enabling the MCU's other hardware peripherals

Configuration

Build Time Configurations for r_lpm

The following build time configurations are defined in fsp_cfg/r_lpm_cfg.h:

| Configuration | Options | Default | Description |
|--------------------|-----------------|---------------|----------------------|
| Parameter Checking | • Default (BSP) | Default (BSP) | If selected code for |

| | | | |
|---------------|---|----------|--|
| | <ul style="list-style-type: none"> • Enabled • Disabled | | parameter checking is included in the build. |
| Standby Limit | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | If enabled, standby configuration only applies in R_LPM_LowPowerModeEnter. Otherwise, standby configuration applies to any WFI call. |

Configurations for Power > Low Power Modes (r_lpm)

This module can be added to the Stacks tab via New Stack > Power > Low Power Modes (r_lpm). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

| Configuration | Options | Default | Description |
|---|-------------------------------|---------|--|
| General > Name | Name must be a valid C symbol | g_lpm0 | Module name. |
| General > Low Power Mode | MCU Specific Options | | Power mode to be entered. |
| General > Output port state in standby and deep standby | MCU Specific Options | | Select the state of output pins during standby. Applies to address output, data output, and other bus control output pins. |
| Deep Sleep and Standby Options > Snooze Options (Not available on every MCU) > Snooze Request Source | MCU Specific Options | | Select the event that will enter snooze. |
| Deep Sleep and Standby Options > Snooze Options (Not available on every MCU) > Snooze End Sources | MCU Specific Options | | Enable wake from snooze from these sources. |
| Deep Sleep and Standby Options > Snooze Options (Not available on every MCU) > DTC state in Snooze Mode | MCU Specific Options | | Enable wake from snooze from this source. |
| Deep Sleep and Standby Options > Snooze Options (Not available on every MCU) > Snooze Cancel | MCU Specific Options | | Select an interrupt source to cancel snooze. |

Source

| | | |
|--|----------------------|--|
| Deep Sleep and Standby Options > Wake Sources | MCU Specific Options | Enable wake from deep sleep and standby from these Sources. |
| RAM Retention Control (Not available on every MCU) > RAM retention in Standby mode | MCU Specific Options | Select the memory regions that are retained in standby mode. |
| RAM Retention Control (Not available on every MCU) > TCM retention in Deep Sleep and Standby modes | MCU Specific Options | Select if Tightly Coupled Memory (TCM) is retained in deep sleep and standby modes. |
| RAM Retention Control (Not available on every MCU) > Standby RAM retention in Standby and Deep Standby modes | MCU Specific Options | Select if Standby RAM is retained in standby and deep standby modes. |
| Oscillator LDO Control (Not available on every MCU) > PLL1 LDO State in standby mode | MCU Specific Options | Select the state PLL1 LDO state in standby mode. |
| Oscillator LDO Control (Not available on every MCU) > PLL2 LDO State in standby mode | MCU Specific Options | Select the state PLL2 LDO state in standby mode. |
| Oscillator LDO Control (Not available on every MCU) > HOCO LDO State in standby mode | MCU Specific Options | Select the state HOCO LDO state in standby mode. |
| Deep Standby Options > I/O Port Retention | MCU Specific Options | Select the state of the IO Pins after exiting deep standby mode. |
| Deep Standby Options > Power-Supply Control | MCU Specific Options | Select the state of the internal power supply in deep standby mode. |
| Deep Standby Options > Cancel Sources | MCU Specific Options | Enable wake from deep standby using these sources. |
| Deep Standby Options > Cancel Edges | MCU Specific Options | Falling edge trigger is default. Select sources to enable wake from deep standby with rising edge. |

Clock Configuration

This module does not have any selectable clock sources.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Sleep Mode

At power on, by default sleep is set as the low-power mode. Sleep mode is the most convenient low-power mode available, as it does not require any special configuration (other than configuring and enabling a suitable interrupt or event to wake the MCU from sleep) to return to normal program-execution mode. The states of the SRAM, the processor registers, and the hardware peripherals are all maintained in sleep mode, and the time needed to enter and wake from sleep is minimal. Any interrupt causes the MCU device to wake from sleep mode, including the SysTick interrupt used by the RTOS scheduler.

Deep Sleep Mode

Deep sleep mode is similar to sleep mode with the exception that DTC and DMAC are stopped, access to TCM memory is not available, and only a subset of interrupts are available for waking the CPU.

Software Standby Mode

In software-standby mode, the CPU, as well as most of the on-chip peripheral functions and all of the internal oscillators, are stopped. The contents of the CPU internal registers and SRAM data, the states of on-chip peripheral functions, and I/O Ports are all retained. Software-standby mode allows significant reduction in power consumption, because most of the oscillators are stopped in this mode. Like sleep mode, standby mode requires an interrupt or event be configured and enabled to wake up.

Snooze Mode

Snooze mode can be used with some MCU peripherals to execute basic tasks while keeping the MCU in a low-power state. Many core peripherals and all clocks can be selected to run during Snooze, allowing for more flexible low-power configuration than Software Standby mode. To enable Snooze, select "Software Standby mode with Snooze mode enabled" for the "Low Power Mode" configuration option. Snooze mode settings (including entry/exit sources) are available under "Standby Options".

Deep Software Standby Mode

The MCU always wakes from Deep Software Standby Mode by going through reset, either by the negation of the reset pin or by one of the wakeup sources configurable in the "Deep Standby Options" configuration group.

The Reset Status Registers can be used to determine if the reset occurred after coming out of deep software standby. For example, R_SYSTEM->RSTSR0_b.DPSRSTF is set to 1 after a deep software standby reset.

I/O Port Retention can be enabled to maintain I/O port configuration across a deep software standby

reset. Retention can be cancelled through the [R_LPM_IoKeepClear](#) API.

Limitations

Developers should be aware of the following limitations when using the LPM:

- Flash stop (code flash disable) is not supported. See the section "Flash Operation Control Register (FLSTOP)" of the RA2/RA4 Family Hardware User's Manual.
- Reduced SRAM retention area in software standby mode is not supported. See the section "Power Save Memory Control Register (PSMCR)" of the RA4 Hardware User's Manual.
- Only one Snooze Request Source can be used at a time.
- When using Snooze mode with SCI0 RXD as the snooze source the system clock must be HOCO and the MOCO, Main Oscillator and PLL clocks must be turned off.
- If the main oscillator or PLL with main oscillator source is used for the system clock, the wake time from standby mode can be affected by the Main Oscillator Wait Time Setting in the MOSCWTCR register. This register setting is available to be changed through the Main Oscillator Wait Time setting in the CGC module properties. See the "Wakeup Timing and Duration" table in Electrical Characteristics for more information.
- When using the DC-DC regulator (where available), the MCU will temporarily switch to the LDO if Software Standby or Snooze is requested and back again when it is cancelled. Switching to the LDO incurs a 60 microsecond critical section wherein all interrupts AND peripherals are stopped. Switching back to DCDC from the LDO incurs an additional 22 microsecond critical section (peripherals running).

Examples

LPM Sleep Example

This is a basic example of minimal use of the LPM in an application. The LPM instance is opened and the configured low-power mode is entered.

```
void r_lpm_sleep (void)
{
    fsp_err_t err = R_LPM_Open(&g_lpm_ctrl, &g_lpm_cfg_sleep);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    err = R_LPM_LowPowerModeEnter(&g_lpm_ctrl);
    assert(FSP_SUCCESS == err);
}
```

LPM Deep Software Standby Example

```
void r_lpm_deep_software_standby (void)
{
    fsp_err_t err;
    /* Check the Deep Software Standby Reset Flag. If it is set, then the MCU is exiting
```

```
* Deep Software Standby mode. */
if (1U == R_SYSTEM->RSTSR0_b.DPSRSTF)
{
/* Clear the IOKEEP bit to allow I/O Port use.
* Note that this function should be called before opening the LPM driver. */
    err = R_LPM_IoKeepClear(&g_lpm_ctrl);
    assert(FSP_SUCCESS == err);
}
err = R_LPM_Open(&g_lpm_ctrl, &g_lpm_cfg_deep_software_standby);
/* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
/* Add user code here. */
/* Reconfigure the module to set the IOKEEP bit before entering deep software
standby. */
    err = R_LPM_LowPowerReconfigure(&g_lpm_ctrl, &g_lpm_cfg_deep_software_standby);
    assert(FSP_SUCCESS == err);
    err = R_LPM_LowPowerModeEnter(&g_lpm_ctrl);
/* Code after R_LPM_LowPowerModeEnter when using Deep Software Standby never be
executed.
* Deep software standby exits by resetting the MCU. */
    assert(FSP_SUCCESS == err);
}
```

Data Structures

struct [lpm_instance_ctrl_t](#)

Data Structure Documentation

◆ [lpm_instance_ctrl_t](#)

struct [lpm_instance_ctrl_t](#)

LPM private control block. DO NOT MODIFY. Initialization occurs when [R_LPM_Open\(\)](#) is called.

Function Documentation

◆ **R_LPM_Open()**

```
fsp_err_t R_LPM_Open ( lpm_ctrl_t *const p_api_ctrl, lpm_cfg_t const *const p_cfg )
```

Perform any necessary initialization

Return values

| | |
|--------------------------|---|
| FSP_SUCCESS | LPM instance opened |
| FSP_ERR_ASSERTION | Null Pointer |
| FSP_ERR_ALREADY_OPEN | LPM instance is already open |
| FSP_ERR_UNSUPPORTED | This MCU does not support Deep Software Standby |
| FSP_ERR_INVALID_ARGUMENT | One of the following: <ul style="list-style-type: none"> • Invalid snooze entry source • Invalid snooze end sources |
| FSP_ERR_INVALID_MODE | One of the following: <ul style="list-style-type: none"> • Invalid low power mode • Invalid DTC option for snooze mode • Invalid deep standby end sources • Invalid deep standby end sources edges • Invalid power supply option for deep standby • Invalid IO port option for deep standby • Invalid output port state setting for standby or deep standby • Invalid sources for wake from standby mode • Invalid power supply option for standby • Invalid IO port option for standby • Invalid standby end sources • Invalid standby end sources edges |

◆ R_LPM_LowPowerReconfigure()

```
fsp_err_t R_LPM_LowPowerReconfigure ( lpm_ctrl_t *const p_api_ctrl, lpm_cfg_t const *const p_cfg )
```

Configure a low power mode

NOTE: This function does not enter the low power mode, it only configures parameters of the mode. Execution of the WFI instruction is what causes the low power mode to be entered.

Return values

| | |
|--------------------------|---|
| FSP_SUCCESS | Low power mode successfully applied |
| FSP_ERR_ASSERTION | Null Pointer |
| FSP_ERR_NOT_OPEN | LPM instance is not open |
| FSP_ERR_UNSUPPORTED | This MCU does not support Deep Software Standby |
| FSP_ERR_INVALID_ARGUMENT | One of the following: <ul style="list-style-type: none"> Invalid snooze entry source Invalid snooze end sources |
| FSP_ERR_INVALID_MODE | One of the following: <ul style="list-style-type: none"> Invalid low power mode Invalid DTC option for snooze mode Invalid deep standby end sources Invalid deep standby end sources edges Invalid power supply option for deep standby Invalid IO port option for deep standby Invalid output port state setting for standby or deep standby Invalid sources for wake from standby mode Invalid power supply option for standby Invalid IO port option for standby Invalid standby end sources Invalid standby end sources edges |

◆ **R_LPM_LowPowerModeEnter()**

```
fsp_err_t R_LPM_LowPowerModeEnter ( lpm_ctrl_t *const p_api_ctrl)
```

Enter low power mode (sleep/deep sleep/standby/deep standby) using WFI macro.

Function will return after waking from low power mode.

Return values

| | |
|----------------------|---|
| FSP_SUCCESS | Successful. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | LPM instance is not open |
| FSP_ERR_INVALID_MODE | One of the following: <ul style="list-style-type: none"> • HOCO was not system clock when using snooze mode with SCIO/RXD0. • HOCO was not stable when using snooze mode with SCIO/RXD0. • MOCO was running when using snooze mode with SCIO/RXD0. • MAIN OSCILLATOR was running when using snooze mode with SCIO/RXD0. • PLL was running when using snooze mode with SCIO/RXD0. • Unable to disable oscillator stop detect when using standby or deep standby. |

◆ **R_LPM_IoKeepClear()**

```
fsp_err_t R_LPM_IoKeepClear ( lpm_ctrl_t *const p_api_ctrl)
```

Clear the IOKEEP bit after deep software standby

Return values

| | |
|---------------------|--|
| FSP_SUCCESS | DPSBYCR_b.IOKEEP bit cleared Successfully. |
| FSP_ERR_UNSUPPORTED | Deep standby mode not supported on this MCU. |

◆ **R_LPM_Close()**

```
fsp_err_t R_LPM_Close ( lpm_ctrl_t *const p_api_ctrl)
```

Close the LPM Instance

Return values

| | |
|-------------------|--------------------------|
| FSP_SUCCESS | LPM driver closed |
| FSP_ERR_NOT_OPEN | LPM instance is not open |
| FSP_ERR_ASSERTION | Null Pointer |

5.2.14 RTOS

Modules

Detailed Description

RTOS Modules.

Modules

[Azure RTOS ThreadX Port \(rm_threadx_port\)](#)

ThreadX port for RA MCUs.

[FreeRTOS Port \(rm_freertos_port\)](#)

FreeRTOS port for RA MCUs.

5.2.14.1 Azure RTOS ThreadX Port (rm_threadx_port)

Modules » RTOS

ThreadX port for RA MCUs.

Overview*Note*

The ThreadX Port does not provide any interfaces to the user. Consult the ThreadX documentation at <https://docs.microsoft.com/en-us/azure/rtos/threadx/> for further information.

Features

The RA ThreadX port supports the following features:

- Standard ThreadX configurations
- Hardware stack monitor

Configuration

Build Time Configurations for ThreadX

The following build time configurations are defined in fsp_cfg/azure/tx/tx_user.h:

| Configuration | Options | Default | Description |
|----------------------------|---|---------|--|
| General > Custom tx_user.h | Manual Entry | | Add a path to your custom tx_user.h file. It can be used to override some or all of the configurations defined here, and to define additional configurations. |
| General > Error Checking | <ul style="list-style-type: none"> • Enabled • Disabled | Enabled | The ThreadX basic API error checking can be bypassed by compiling with the symbol TX_DISABLE_ERROR_CHECKING defined. |
| General > Max Priorities | Value must be a multiple of 32 and in range 32 to 1024 or empty | 32 | Define the priority levels for ThreadX. Legal values range from 32 to 1024 and MUST be evenly divisible by 32. |
| General > Minimum Stack | Value must be greater than 0 or empty | 200 | Define the minimum stack for a ThreadX thread on this processor. If the size supplied during thread creation is less than this value, the thread create call will return an error. |
| General > Stack Filling | <ul style="list-style-type: none"> • Enabled • Disabled | Enabled | Determine if stack filling is enabled. By default, ThreadX stack filling is enabled, which places an 0xEF pattern in each byte of each thread's stack. This is used by debuggers |

| | | | |
|--|---|----------|--|
| General > Preemption Threshold | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | <p>with ThreadX-awareness and by the ThreadX run-time stack checking feature.</p> <p>Determine if preemption-threshold should be disabled. By default, preemption-threshold is disabled. If the application does not use preemption-threshold, it may be disabled to reduce code size and improve performance.</p> |
| General > Notify Callbacks | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | <p>Determine if the notify callback option should be disabled. By default, notify callbacks are disabled. If the application does not use notify callbacks, they may be disabled to reduce code size and improve performance.</p> |
| General > Inline Thread Resume Suspend | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | <p>Determine if the tx_thread_resume and tx_thread_suspend services should have their internal code in-line. This results in a larger image, but improves the performance of the thread resume and suspend services.</p> |
| General > Not Interruptable | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | <p>Determine if the internal ThreadX code is non-interruptable. This results in smaller code size and less processing overhead, but increases the interrupt lockout time.</p> |
| General > IAR Library Support | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | <p>Enable IAR library support (IAR compiler only). When IAR Library Support is Enabled, enable the linker option <code>--threaded_lib</code>. In the IAR IDE, this can be</p> |

| | | | |
|---------------------------------|---|----------|--|
| | | | enabled in Project > Options > General Options > Library Configuration > Enable thread support in library. |
| General > BSD Support | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | Defines TX_THREAD_EXTENSION_1 to bsd_err_no in order to support NXD BSD. |
| General > FileX Pointer | <ul style="list-style-type: none"> • Enabled • Disabled | Enabled | Determine if there is a FileX pointer in the thread control block. By default, the pointer is there for legacy/backwards compatibility. The pointer must also be there for applications using FileX. Disable this to save space in the thread control block. |
| Timer > Timer Ticks Per Second | Value must be greater than 0 or empty | 100 | Define the number of times the system timer runs per second. Default is 100 ticks per second, which results in a tick every 10ms. |
| Timer > Timer Thread Stack Size | Value must be greater than 0 or empty | 1024 | Define the system timer thread's default stack size and priority. These are only applicable if TX_TIMER_PROCESS_IN_ISR is disabled. |
| Timer > Timer Thread Priority | Value must be greater than 0 or empty | 0 | Define the system timer thread's default stack size and priority. These are only applicable if TX_TIMER_PROCESS_IN_ISR is disabled. |
| Timer > Timer Process In ISR | <ul style="list-style-type: none"> • Enabled • Disabled | Enabled | Determine if timer expirations (application timers, timeouts, and tx_thread_sleep calls should be processed within the a system timer thread or directly in the timer ISR. When disabled, the timer |

thread is used. When enabled, timer expiration processing is done directly from the timer ISR, thereby eliminating the timer thread control block, stack, and context switching to activate it.

| | | | |
|---|---|-------------------|--|
| Timer > Reactivate Inline | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | Determine if in-line timer reactivation should be used within the timer expiration processing. By default, this is disabled and a function call is used. When enabled, reactivating is performed in-line resulting in faster timer processing but slightly larger code size. |
| Timer > Timer | <ul style="list-style-type: none"> • Enabled • Disabled | Enabled | Determine if no timer processing is required. This option will help eliminate the timer processing when not needed. |
| Trace > Event Trace | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | Determine if the trace event logging code should be enabled. This causes slight increases in code size and overhead, but provides the ability to generate system trace information which is available for viewing in TraceX. |
| Trace > Trace Buffer Name | Name must be a valid C symbol | g_tx_trace_buffer | Name of trace buffer symbol, only used if Event Trace is enabled. |
| Trace > Memory section for Trace Buffer | Manual Entry | .bss | Specify the memory section where the Trace Buffer will be allocated, only used if Event Trace is enabled. To view TraceX data, export this buffer as raw binary data to a file (.trx extension recommended) and |

| | | | | |
|--|---|----------|--|--|
| | | | | open it with Microsoft Azure RTOS TraceX. |
| Trace > Trace Buffer Size | Value must be greater than 0 | 65536 | | Trace buffer size in bytes, only used if Event Trace is enabled |
| Trace > Trace Buffer Number of Registries | Value must be greater than 0 | 30 | | Number of registries available to TraceX, only used if Event Trace is enabled |
| Performance > Block Pool Performance Info | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | | When enabled, ThreadX gathers block pool performance information. |
| Performance > Byte Pool Performance Info | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | | When enabled, ThreadX gathers byte pool performance information. |
| Performance > Event Flags Performance Info | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | | When enabled, ThreadX gathers event flags performance information. |
| Performance > Mutex Performance Info | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | | When enabled, ThreadX gathers mutex performance information. |
| Performance > Queue Performance Info | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | | When enabled, ThreadX gathers queue performance information. |
| Performance > Semaphore Performance Info | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | | When enabled, ThreadX gathers semaphore performance information. |
| Performance > Thread Performance Info | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | | When enabled, ThreadX gathers thread performance information. |
| Performance > Timer Performance Info | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | | When enabled, ThreadX gathers timer performance information. |
| RA > Hardware Thread Stack Monitoring | MCU Specific Options | | | Use RA Hardware Stack Monitors to monitor thread stacks for overflow. Not available on MCUs that support PSPLIM. |

Interrupts > SysTick
Interrupt Priority

MCU Specific Options

Select the SysTick interrupt priority.

Interrupts > Maximum
Interrupt Priority

MCU Specific Options

The maximum priority (lowest numerical value) an interrupt can have and use scheduler services. Interrupts with higher priority can interrupt most scheduler critical sections. Setting this to Priority 0 (highest) disables this feature. This feature is not available on MCUs that do not have the BASEPRI register.

Clock Configuration

The ThreadX port uses the SysTick timer as the system clock. The timer rate is configured in the ThreadX component under General > Timer Ticks Per Second.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Interrupt Priorities

When no threads are ready to run, the ThreadX port spins in the PendSV_Handler, which is fixed at the lowest interrupt priority. The MCU does not service any other interrupts of the lowest priority while no threads are ready to run.

To get around this limitation, the application can create an idle thread that is always ready to run. If the idle thread enters a lower power mode, make sure all interrupts that are required to resume the scheduler can wake the MCU in the configured power mode. If the application expects to wake after a certain number of ticks, the idle thread should not enter standby mode because the SysTick cannot wake the MCU from standby mode. See [Low Power Modes \(r_lpm\)](#) for more information regarding low power modes.

Warning

Do not attempt to wake a thread from an interrupt with the lowest available interrupt priority unless the application has created an idle thread.

Hardware Stack Monitor

The hardware stack monitor generates an NMI if the PSP goes out of the memory area for the stack allocated for the current thread. A callback can be registered using [R_BSP_GroupIrqWrite\(\)](#) to be called whenever a stack overflow or underflow of the PSP for a particular thread is detected.

Low Power Modes

The idle processing executes WFI() when no thread is ready to run. If the MCU is configured to enter software standby mode or deep software standby mode when the idle processing executes WFI(), the RA ThreadX port changes the low power mode to sleep mode so the idle processing can wake from SysTick. The low power mode settings are restored when the MCU wakes from sleep mode.

TrustZone Integration

When using an RTOS in a TrustZone project, Arm recommends keeping the RTOS in the non-secure project. Tasks may call non-secure callable functions if the thread has allocated a secure context (using tx_thread_secure_stack_allocate).

The secure context can be freed by deleting the thread or calling tx_thread_secure_stack_free.

Examples

Stack Monitor Example

This is an example of using the stack monitor in an application.

```
#if BSP_FEATURE_BSP_HAS_SP_MON
void stack_monitor_callback(bsp_grp_irq_t irq);
void stack_monitor_callback (bsp_grp_irq_t irq)
{
    FSP_PARAMETER_NOT_USED(irq);
    if (1U == R_MPU_SPMON->SP[0].CTL_b.ERROR)
    {
        /* Handle main stack monitor error here. */
    }
    if (1U == R_MPU_SPMON->SP[1].CTL_b.ERROR)
    {
        /* Handle process stack monitor error here. */
    }
}
void rm_threadx_port_stack_monitor_example (void)
{
    /* Register a callback to be called when the stack goes outside the allocated stack
area. */
    R_BSP_GroupIrqWrite(BSP_GRP_IRQ_MPU_STACK, stack_monitor_callback);
}
#else
/* Allocate stack space to return from UsageFault. */
```

```
uint32_t g_stack_overflow_exception_stack[8] BSP_ALIGN_VARIABLE(BSP_STACK_ALIGNMENT)
BSP_PLACE_IN_SECTION(
    BSP_SECTION_STACK);

/* MCUs that do not have an SPMON stack monitor use PSPLIM to detect stack overflows.
When a stack overflow error
* occurs, the UsageFault_Handler fires if it has been enabled. */
void UsageFault_Handler (void)
{
    register uint32_t cfsr = SCB->CFSR;
    if (cfsr & SCB_CFSR_STKOF_Msk)
    {
        /* Update PSP and PSPLIM to point to an exception stack frame allocated for stack
overflows. */
        register uint32_t * p_exception_stack_frame = (uint32_t *)
(&g_stack_overflow_exception_stack);
        __set_PSP((uint32_t) p_exception_stack_frame);
        __set_PSPLIM((uint32_t) p_exception_stack_frame);
        /* Clear XPSR, only set T-bit. */
        p_exception_stack_frame[7] = 1U << 24;
        /* Set PC to stack overflow error while loop. When execution returns from the
UsageFault, it will go to the
* stack_overflow_error_occurred function. It cannot return to the location where
the fault occurred because
* the MCU does not save the exception stack frame to the stack when a stack
overflow error occurs. */
        p_exception_stack_frame[6] = (uint32_t) stack_overflow_error_occurred;
    }
    /* Clear flags. */
    SCB->CFSR = cfsr;
}

/* This function is called from UsageFault_Handler after a stack overflow occurs. */
void stack_overflow_error_occurred (void)
{
    /* When recovering from a stack overflow, move the thread to a while(1) loop. */

```

```
while (1)
{
/* Do nothing. */
}
}

void rm_threadx_port_stack_monitor_example (void)
{
/* Enable usage fault. */
SCB->SHCSR |= SCB_SHCSR_USGFAULTENA_Msk;
}
#endif
```

TrustZone Example

This is an example of calling `tx_thread_secure_stack_allocate` before calling any non-secure callable functions in a thread.

```
extern TX_THREAD * _tx_thread_current_ptr;

void rm_threadx_port_trustzone_thread_example (void)
{
/* When ThreadX is used in a non-secure TrustZone application,
tx_thread_secure_stack_allocate must be called prior
* to calling any non-secure callable function in a thread. The first parameter is a
pointer to the thread control block.
* This function can be called when the thread is created or in the thread before an
non-secure callable function is
* called. The second parameter is unused in the FSP implementation. */
UINT status = tx_thread_secure_stack_allocate(_tx_thread_current_ptr, 0);
assert(TX_SUCCESS == status);
rm_threadx_port_nsc_function();
}
```

5.2.14.2 FreeRTOS Port (rm_freertos_port)

[Modules](#) » [RTOS](#)

FreeRTOS port for RA MCUs.

Overview

Note

The FreeRTOS Port does not provide any interfaces to the user. Consult the FreeRTOS documentation at <https://www.freertos.org/Documentation> for further information.

Features

The RA FreeRTOS port supports the following features:

- Standard FreeRTOS configurations
- Hardware stack monitor

Configuration

Note

The FreeRTOS Port and libraries use printf by default when logging is enabled. printf requires a heap (BSP Tab -> Properties -> RA Common -> Heap size (bytes)).

Build Time Configurations for all

The following build time configurations are defined in aws/FreeRTOSConfig.h:

| Configuration | Options | Default | Description |
|---|---|----------|---|
| General > Custom FreeRTOSConfig.h | Manual Entry | | Add a path to your custom FreeRTOSConfig.h file. It can be used to override some or all of the configurations defined here, and to define additional configurations. |
| General > Use Preemption | <ul style="list-style-type: none"> • Enabled • Disabled | Enabled | Set to Enabled to use the preemptive RTOS scheduler, or Disabled to use the cooperative RTOS scheduler. |
| General > Use Port Optimised Task Selection | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | Some FreeRTOS ports have two methods of selecting the next task to execute - a generic method, and a method that is specific to that port. The Generic method: Is used when Use Port Optimized Task Selection is set to 0, or |

when a port specific method is not implemented.
 Can be used with all FreeRTOS ports.
 Is completely written in C, making it less efficient than a port specific method.
 Does not impose a limit on the maximum number of available priorities.

A port specific method:
 Is not available for all ports.
 Is used when Use Port Optimized Task Selection is Enabled.
 Relies on one or more architecture specific assembly instructions (typically a Count Leading Zeros [CLZ] or equivalent instruction) so can only be used with the architecture for which it was specifically written.
 Is more efficient than the generic method.
 Typically imposes a limit of 32 on the maximum number of available priorities.

Set Use Tickless Idle to Enabled to use the low power tickless mode, or Disabled to keep the tick interrupt running at all times. Low power tickless implementations are not provided for all FreeRTOS ports.

Enter the frequency in Hz at which the internal clock that drives the peripheral used to generate the tick interrupt will be executing - this is normally the same

General > Use Tickless Idle

- Enabled
- Disabled

Disabled

General > Cpu Clock Hz

Manual Entry

SystemCoreClock

clock that drives the internal CPU clock. This value is required in order to correctly configure timer peripherals.

The frequency of the RTOS tick interrupt. The tick interrupt is used to measure time. Therefore a higher tick frequency means time can be measured to a higher resolution. However, a high tick frequency also means that the RTOS kernel will use more CPU time so be less efficient. The RTOS demo applications all use a tick rate of 1000Hz. This is used to test the RTOS kernel and is higher than would normally be required.

More than one task can share the same priority. The RTOS scheduler will share processor time between tasks of the same priority by switching between the tasks during each RTOS tick. A high tick rate frequency will therefore also have the effect of reducing the 'time slice' given to each task.

The number of priorities available to the application tasks. Any number of tasks can share the same priority. Each available priority consumes RAM within the RTOS kernel so this value should not be set any higher than actually required by

General > Tick Rate Hz Must be an integer and 1000
greater than 0

General > Max Must be an integer and 5
Priorities greater than 0

| | | | |
|------------------------------|---------------------------------------|----------|---|
| General > Minimal Stack Size | Must be an integer and greater than 0 | 128 | <p>your application.</p> <p>The size of the stack used by the idle task. Generally this should not be reduced from the value set in the FreeRTOSConfig.h file provided with the demo application for the port you are using. Like the stack size parameter to the xTaskCreate() and xTaskCreateStatic() functions, the stack size is specified in words, not bytes. If each item placed on the stack is 32-bits, then a stack size of 100 means 400 bytes (each 32-bit stack item consuming 4 bytes).</p> |
| General > Max Task Name Len | Must be an integer and greater than 0 | 16 | <p>The maximum permissible length of the descriptive name given to a task when the task is created. The length is specified in the number of characters including the NULL termination byte.</p> |
| General > Use 16-bit Ticks | Disabled | Disabled | <p>Time is measured in 'ticks' - which is the number of times the tick interrupt has executed since the RTOS kernel was started. The tick count is held in a variable of type TickType_t. Defining configUSE_16_BIT_TICKS as 1 causes TickType_t to be defined (typedef'ed) as an unsigned 16bit type. Defining configUSE_16_BIT_TICKS as 0 causes TickType_t to be defined (typedef'ed) as</p> |

an unsigned 32bit type.

Using a 16-bit type will greatly improve performance on 8- and 16-bit architectures, but limits the maximum specifiable time period to 65535 'ticks'. Therefore, assuming a tick frequency of 250Hz, the maximum time a task can delay or block when a 16bit counter is used is 262 seconds, compared to 17179869 seconds when using a 32-bit counter.

This parameter controls the behaviour of tasks at the idle priority. It only has an effect if:

The preemptive scheduler is being used.

The application creates tasks that run at the idle priority.

If Use Time Slicing is Enabled then tasks that share the same priority will time slice. If none of the tasks get preempted then it might be assumed that each task at a given priority will be allocated an equal amount of processing time - and if the priority is above the idle priority then this is indeed the case.

When tasks share the idle priority the behaviour can be slightly different. If Idle Should Yield is Enabled then the idle task will yield immediately if any other task at the idle priority is ready to

General > Idle Should Yield

- Enabled
- Disabled

Enabled

run. This ensures the minimum amount of time is spent in the idle task when application tasks are available for scheduling. This behaviour can however have undesirable effects (depending on the needs of your application) as depicted below:

The diagram above shows the execution pattern of four tasks that are all running at the idle priority. Tasks A, B and C are application tasks. Task I is the idle task. A context switch occurs with regular period at times T0, T1, ..., T6. When the idle task yields task A starts to execute - but the idle task has already consumed some of the current time slice. This results in task I and task A effectively sharing the same time slice. The application tasks B and C therefore get more processing time than the application task A.

This situation can be avoided by:

If appropriate, using an idle hook in place of separate tasks at the idle priority.
Creating all application tasks at a priority greater than the idle priority.
Setting Idle Should Yield to Disabled.
Setting Idle Should Yield to Disabled

prevents the idle task from yielding processing time until the end of its time slice. This ensure all tasks at the idle priority are allocated an equal amount of processing time (if none of the tasks get pre-empted) - but at the cost of a greater proportion of the total processing time being allocated to the idle task.

Setting Use Task Notifications to Enabled will include direct to task notification functionality and its associated API in the build.

Setting Use Task Notifications to Disabled will exclude direct to task notification functionality and its associated API from the build.

Each task consumes 8 additional bytes of RAM when direct to task notifications are included in the build.

Set to Enabled to include mutex functionality in the build, or Disabled to omit mutex functionality from the build. Readers should familiarise themselves with the differences between mutexes and binary semaphores in relation to the FreeRTOS functionality.

Set to Enabled to include recursive mutex functionality in

General > Use Task Notifications

- Enabled
- Disabled

Enabled

General > Use Mutexes

|-----------------------------------|---|----------|---|
| General > Use Counting Semaphores | <ul style="list-style-type: none"> • Enabled • Disabled | Enabled | <p>the build, or Disabled to omit recursive mutex functionality from the build.</p> |
| General > Queue Registry Size | Must be an integer and greater than 0 | 10 | <p>Set to Enabled to include counting semaphore functionality in the build, or Disabled to omit counting semaphore functionality from the build.</p> <p>The queue registry has two purposes, both of which are associated with RTOS kernel aware debugging: It allows a textual name to be associated with a queue for easy queue identification within a debugging GUI. It contains the information required by a debugger to locate each registered queue and semaphore. The queue registry has no purpose unless you are using a RTOS kernel aware debugger. Registry Size defines the maximum number of queues and semaphores that can be registered. Only those queues and semaphores that you want to view using a RTOS kernel aware debugger need be registered. See the API reference documentation for <code>vQueueAddToRegistry()</code> and <code>vQueueUnregisterQueue()</code> for more information.</p> |
| General > Use Queue Sets | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | <p>Set to Enabled to include queue set</p> |

| | | | |
|--------------------------------|---|----------|--|
| General > Use Time Slicing | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | <p>functionality (the ability to block, or pend, on multiple queues and semaphores), or Disabled to omit queue set functionality.</p> <p>If Use Time Slicing is Enabled, FreeRTOS uses prioritised preemptive scheduling with time slicing. That means the RTOS scheduler will always run the highest priority task that is in the Ready state, and will switch between tasks of equal priority on every RTOS tick interrupt. If Use Time Slicing is Disabled then the RTOS scheduler will still run the highest priority task that is in the Ready state, but will not switch between tasks of equal priority just because a tick interrupt has occurred.</p> |
| General > Use Newlib Reentrant | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | <p>If Use Newlib Reentrant is Enabled then a newlib reent structure will be allocated for each created task. Note Newlib support has been included by popular demand, but is not used by the FreeRTOS maintainers themselves. FreeRTOS is not responsible for resulting newlib operation. User must be familiar with newlib and must provide system-wide implementations of the necessary stubs. Be warned that (at the time of writing) the current newlib design implements a system-wide malloc() that must</p> |

| | | | |
|--|---|----------|---|
| General > Enable Backward Compatibility | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | <p>be provided with locks.</p> <p>The FreeRTOS.h header file includes a set of #define macros that map the names of data types used in versions of FreeRTOS prior to version 8.0.0 to the names used in FreeRTOS version 8.0.0. The macros allow application code to update the version of FreeRTOS they are built against from a pre 8.0.0 version to a post 8.0.0 version without modification. Setting Enable Backward Compatibility to Disabled in FreeRTOSConfig.h excludes the macros from the build, and in so doing allowing validation that no pre version 8.0.0 names are being used.</p> |
| General > Num Thread Local Storage Pointers | Must be an integer and greater than 0 | 5 | Sets the number of indexes in each task's thread local storage array. |
| General > Stack Depth Type | Manual Entry | uint32_t | Sets the type used to specify the stack depth in calls to xTaskCreate(), and various other places stack sizes are used (for example, when returning the stack high water mark). Older versions of FreeRTOS specified stack sizes using variables of type UBaseType_t, but that was found to be too restrictive on 8-bit microcontrollers. Stack Depth Type removes that restriction by enabling application developers to specify |

General > Message
Buffer Length Type

Manual Entry

size_t

the type to use.

FreeRTOS Message buffers use variables of type Message Buffer Length Type to store the length of each message. If Message Buffer Length Type is not defined then it will default to size_t. If the messages stored in a message buffer will never be larger than 255 bytes then defining Message Buffer Length Type to uint8_t will save 3 bytes per message on a 32-bit microcontroller. Likewise if the messages stored in a message buffer will never be larger than 65535 bytes then defining Message Buffer Length Type to uint16_t will save 2 bytes per message on a 32-bit microcontroller.

General > Library Max
Syscall Interrupt
Priority

MCU Specific Options

The highest interrupt priority that can be used by any interrupt service routine that makes calls to interrupt safe FreeRTOS API functions. **DO NOT CALL INTERRUPT SAFE FREERTOS API FUNCTIONS FROM ANY INTERRUPT THAT HAS A HIGHER PRIORITY THAN THIS!** (higher priorities are lower numeric values)

Below is explanation for macros that are set based on this value from FreeRTOS website.

In the RA port, configKE
RNEL_INTERRUPT_PRIO

RITY is not used and the kernel runs at the lowest priority.

Note in the following discussion that only API functions that end in "FromISR" can be called from within an interrupt service routine.

`configMAX_SYSCALL_INTERRUPT_PRIORITY` sets the highest interrupt priority from which interrupt safe FreeRTOS API functions can be called.

A full interrupt nesting model is achieved by setting `configMAX_SYSCALL_INTERRUPT_PRIORITY` above (that is, at a higher priority level) than `configKERNEL_INTERRUPT_PRIORITY`. This means the FreeRTOS kernel does not completely disable interrupts, even inside critical sections. Further, this is achieved without the disadvantages of a segmented kernel architecture.

Interrupts that do not call API functions can execute at priorities above `configMAX_SYSCALL_INTERRUPT_PRIORITY` and therefore never be delayed by the RTOS kernel execution.

A special note for Arm Cortex-M users: Please read the page dedicated to interrupt priority settings on Arm Cortex-M devices. As a minimum, remember

that Arm Cortex-M cores use numerically low priority numbers to represent HIGH priority interrupts, which can seem counter-intuitive and is easy to forget! If you wish to assign an interrupt a low priority do NOT assign it a priority of 0 (or other low numeric value) as this can result in the interrupt actually having the highest priority in the system - and therefore potentially make your system crash if this priority is above configMAX_SYSCALL_INTERRUPT_PRIORITY.

The lowest priority on a Arm Cortex-M core is in fact 255 - however different Arm Cortex-M vendors implement a different number of priority bits and supply library functions that expect priorities to be specified in different ways. For example, on the RA6M3 the lowest priority you can specify is 15 - and the highest priority you can specify is 0.

The semantics of the configASSERT() macro are the same as the standard C assert() macro. An assertion is triggered if the parameter passed into configASSERT() is zero. configASSERT() is called throughout the FreeRTOS source files to check how the application is using FreeRTOS. It is highly recommended to

General > Assert

Manual Entry

assert(x)

develop FreeRTOS applications with `configASSERT()` defined.

The example definition (shown at the top of the file and replicated below) calls `vAssertCalled()`, passing in the file name and line number of the triggering `configASSERT()` call (`__FILE__` and `__LINE__` are standard macros provided by most compilers). This is just for demonstration as `vAssertCalled()` is not a FreeRTOS function, `configASSERT()` can be defined to take whatever action the application writer deems appropriate.

It is normal to define `configASSERT()` in such a way that it will prevent the application from executing any further. This is for two reasons; stopping the application at the point of the assertion allows the cause of the assertion to be debugged, and executing past a triggered assertion will probably result in a crash anyway.

Note defining `configASSERT()` will increase both the application code size and execution time. When the application is stable the additional overhead can be removed by simply commenting out the `configASSERT()`

definition in
FreeRTOSConfig.h.

```
/* Define
configASSERT() to call
vAssertCalled() if the
assertion fails. The
assertion
has failed if the value
of the parameter
passed into
configASSERT() equals
zero. */
```

```
#define configASSERT(
( x ) ) if( ( x ) == 0 )
vAssertCalled( __FILE__,
__LINE__ )
```

If running FreeRTOS under the control of a debugger, then configASSERT() can be defined to just disable interrupts and sit in a loop, as demonstrated below. That will have the effect of stopping the code on the line that failed the assert test - pausing the debugger will then immediately take you to the offending line so you can see why it failed.

```
/* Define
configASSERT() to
disable interrupts and
sit in a loop. */
#define configASSERT(
( x ) ) if( ( x ) == 0 ) { t
askDISABLE_INTERRUPTS(); for( ;; ); }
```

Include Application Defined Privileged Functions is only used by FreeRTOS MPU. If Include Application Defined Privileged Functions is Enabled then the application writer must provide a header file called "application_defined_privileged"

General > Include
Application Defined
Privileged Functions

- Enabled
 - Disabled
- Disabled

ed_functions.h", in which functions the application writer needs to execute in privileged mode can be implemented. Note that, despite having a .h extension, the header file should contain the implementation of the C functions, not just the functions' prototypes.

Functions implemented in "application_defined_privileged_functions.h" must save and restore the processor's privilege state using the prvRaisePrivilege() function and portRESET_PRIVILEGE() macro respectively. For example, if a library provided print function accesses RAM that is outside of the control of the application writer, and therefore cannot be allocated to a memory protected user mode task, then the print function can be encapsulated in a privileged function using the following code:

```
void MPU_debug_printf(
const char *pcMessage
)
{
/* State the privilege
level of the processor
when the function was
called. */
BaseType_t
xRunningPrivileged =
prvRaisePrivilege();

/* Call the library
function, which now
has access to all RAM.
```

```

*/
debug_printf(
pcMessage );

/* Reset the processor
privilege level to its
original value. */
portRESET_PRIVILEGE(
xRunningPrivileged );
}

```

This technique should only be use during development, and not deployment, as it circumvents the memory protection.

Set to Enabled if you wish to use an idle hook, or Disabled to omit an idle hook.

The kernel uses a call to `pvPortMalloc()` to allocate memory from the heap each time a task, queue or semaphore is created. The official FreeRTOS download includes four sample memory allocation schemes for this purpose. The schemes are implemented in the `heap_1.c`, `heap_2.c`, `heap_3.c`, `heap_4.c` and `heap_5.c` source files respectively. Use Malloc Failed Hook is only relevant when one of these three sample schemes is being used. The `malloc()` failed hook function is a hook (or callback) function that, if defined and configured, will be called if `pvPortMalloc()` ever returns `NULL`. `NULL` will be returned only if there is insufficient FreeRTOS heap memory remaining for the requested allocation to

Hooks > Use Idle Hook

- Enabled
- Disabled

Enabled

Hooks > Use Malloc
Failed Hook

- Enabled
- Disabled

Disabled

succeed.

If Use Malloc Failed Hook is Enabled then the application must define a malloc() failed hook function. If Use Malloc Failed Hook is set to Disabled then the malloc() failed hook function will not be called, even if one is defined. Malloc() failed hook functions must have the name and prototype shown below.

```
void vApplicationMallocFailedHook( void );
```

If Use Timers and Use Daemon Task Startup Hook are both Enabled then the application must define a hook function that has the exact name and prototype as shown below. The hook function will be called exactly once when the RTOS daemon task (also known as the timer service task) executes for the first time. Any application initialisation code that needs the RTOS to be running can be placed in the hook function.

```
void vApplicationDaemonTaskStartupHook( void );
```

Set to Enabled if you wish to use a tick hook, or Disabled to omit a tick hook.

The stack overflow detection page describes the use of this parameter. This is not recommended for RA MCUs with

Hooks > Use Daemon Task Startup Hook

- Enabled
- Disabled

Disabled

Hooks > Use Tick Hook

- Enabled

*pulTimerTaskStackSiz
e = configTIMER_TASK_
STACK_DEPTH;
}
```

Examples of the callback functions that must be provided by the application to supply the RAM used by the Idle and Timer Service tasks if Support Static Allocation is Enabled.

See the Static Vs Dynamic Memory Allocation page for more information.

If Support Dynamic

Memory Allocation >

• Enabled

Disabled

Support Dynamic Allocation

- Disabled

Allocation is Enabled then RTOS objects can be created using RAM that is automatically allocated from the FreeRTOS heap. If Support Dynamic Allocation is set to 0 then RTOS objects can only be created using RAM provided by the application writer.

See the Static Vs Dynamic Memory Allocation page for more information.

Memory Allocation > Total Heap Size

Must be an integer and greater than 0 1024

The total amount of RAM available in the FreeRTOS heap. This value will only be used if Support Dynamic Allocation is Enabled and the application makes use of one of the sample memory allocation schemes provided in the FreeRTOS source code download. See the memory configuration section for further details.

Memory Allocation > Application Allocated Heap

- Enabled
 - Disabled
- Disabled

By default the FreeRTOS heap is declared by FreeRTOS and placed in memory by the linker. Setting Application Allocated Heap to Enabled allows the heap to instead be declared by the application writer, which allows the application writer to place the heap wherever they like in memory. If heap_1.c, heap_2.c or heap_4.c is used, and Application Allocated Heap is Enabled, then the application writer must provide a uint8_t

array with the exact name and dimension as shown below. The array will be used as the FreeRTOS heap. How the array is placed at a specific memory location is dependent on the compiler being used - refer to your compiler's documentation.

```
uint8_t ucHeap[
configTOTAL_HEAP_SIZE
];
```

Clock Configuration

The FreeRTOS port uses the SysTick timer as the system clock. The timer rate is configured in the FreeRTOS component under General > Tick Rate Hz.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Hardware Stack Monitor (PSPLIM)

A UsageFault is generated if PSP goes out of the memory area for the stack allocated for the current task. If UsageFault is not enabled, it is escalated to HardFault.

Hardware Stack Monitor (SPMON)

The hardware stack monitor generates an NMI if the PSP goes out of the memory area for the stack allocated for the current task. A callback can be registered using [R_BSP_GroupIrqWrite\(\)](#) to be called whenever a stack overflow or underflow of the PSP for a particular thread is detected.

Stack Monitor Underflow Detection

By default the hardware stack monitor only checks for overflow of the process stack. To check for underflow define `configRECORD_STACK_HIGH_ADDRESS` as 1 on the command line.

Low Power Modes

When FreeRTOS is configured to use tickless idle, the idle task executes `WFI()` when no task is ready to run. If the MCU is configured to enter software standby mode or deep software standby mode when the idle task executes `WFI()`, the RA FreeRTOS port changes the low power mode to sleep mode so the idle task can wake from SysTick. The low power mode settings are restored when the MCU wakes from sleep mode.

TrustZone Integration

When using an RTOS in a TrustZone project, Arm recommends keeping the RTOS in the non-secure project. Tasks may call non-secure callable functions if the task has allocated a secure context (using `portALLOCATE_SECURE_CONTEXT`).

The secure context can be freed by deleting the thread or using the `portCLEAN_UP_TCB(pxTCB)` macro.

Examples

Stack Monitor Example

This is an example of using the stack monitor in an application.

```
#if BSP_FEATURE_BSP_HAS_SP_MON
void stack_monitor_callback (bsp_grp_irq_t irq)
{
    FSP_PARAMETER_NOT_USED(irq);
    if (1U == R_MPU_SPMON->SP[0].CTL_b.ERROR)
    {
        /* Handle main stack monitor error here. */
    }
    if (1U == R_MPU_SPMON->SP[1].CTL_b.ERROR)
    {
        /* Handle process stack monitor error here. */
    }
}
void rm_freertos_port_stack_monitor_example (void)
{
    /* Register a callback to be called when the stack goes outside the allocated stack
area. */
    R_BSP_GroupIrqWrite(BSP_GRP_IRQ_MPU_STACK, stack_monitor_callback);
}
#else
/* Allocate stack space to return from UsageFault. */
uint32_t g_stack_overflow_exception_stack[8] BSP_ALIGN_VARIABLE(BSP_STACK_ALIGNMENT)
BSP_PLACE_IN_SECTION(
    BSP_SECTION_STACK);
/* MCUs that do not have an SPMON stack monitor use PSPLIM to detect stack overflows.
When a stack overflow error
* occurs, the UsageFault_Handler fires if it has been enabled. */
void UsageFault_Handler (void)
{
    register uint32_t cfsr = SCB->CFSR;
    if (cfsr & SCB_CFSR_STKOF_Msk)
    {
```

```
/* Update PSP and PSPLIM to point to an exception stack frame allocated for stack
overflows. */
register uint32_t * p_exception_stack_frame = (uint32_t *)
(&g_stack_overflow_exception_stack);
    __set_PSP((uint32_t) p_exception_stack_frame);
    __set_PSPLIM((uint32_t) p_exception_stack_frame);
/* Clear XPSR, only set T-bit. */
    p_exception_stack_frame[7] = 1U << 24;
/* Set PC to stack overflow error while loop. When execution returns from the
UsageFault, it will go to the
    * stack_overflow_error_occurred function. It cannot return to the location where
the fault occurred because
    * the MCU does not save the exception stack frame to the stack when a stack
overflow error occurs. */
    p_exception_stack_frame[6] = (uint32_t) stack_overflow_error_occurred;
}
/* Clear flags. */
    SCB->CFSR = cfsr;
}
/* This function is called from UsageFault_Handler after a stack overflow occurs. */
void stack_overflow_error_occurred (void)
{
    /* When recovering from a stack overflow, move the task to a while(1) loop. */
    while (1)
    {
        /* Do nothing. */
    }
}
void rm_freertos_port_stack_monitor_example (void)
{
    /* Enable usage fault. */
    SCB->SHCSR |= SCB_SHCSR_USGFAULTENA_Msk;
}
#endif
```

TrustZone Example

This is an example of calling `portALLOCATE_SECURE_CONTEXT` before calling any non-secure callable functions in a task.

```
void rm_freertos_port_trustzone_task_example (void)
{
    /* When FreeRTOS is used in a non-secure TrustZone application,
portALLOCATE_SECURE_CONTEXT must be called prior
    * to calling any non-secure callable function in a task. The parameter is unused in
the FSP implementation. */
    portALLOCATE_SECURE_CONTEXT(0);
    rm_freertos_port_nsc_function();
}
```

5.2.15 Security

Modules

Detailed Description

Security Modules.

Modules

[AWS Device Provisioning](#)

AWS Device Provisioning example software.

[Azure RTOS NetX Crypto HW Acceleration \(rm_netx_secure_crypto\)](#)

Hardware acceleration for the Netx Crypto implementation of the Microsoft Azure RTOS NetX Crypto API.

[Mbed Crypto H/W Acceleration \(rm_psa_crypto\)](#)

Hardware acceleration for the mbedCrypto implementation of the Arm PSA Crypto API.

[SCE Protected Mode](#)

Driver for the Secure Crypto Engine (SCE9) on RA MCUs.

[Secure Crypto Engine \(r_sce_protected_cavp\)](#)

Driver for the CAVP Certified Secure Crypto Engine (SCE) on RA MCUs.

[Secure Key Injection \(r_sce_key_injection\)](#)

Driver for the Secure Key Injection on RA MCUs.

[TinyCrypt H/W Acceleration \(rm_tinycrypt_port\)](#)

AES128 Hardware acceleration for TinyCrypt on the RA2 family.

5.2.15.1 AWS Device Provisioning

[Modules](#) » [Security](#)

AWS Device Provisioning example software.

Overview

Terminology

The terminology defined below will be used in the following sections.

| Term | Description |
|---------------------|--|
| Service Provider | Entity that provides the cloud infrastructure and associated services, for example, AWS/Azure. |
| Device Manufacturer | Entity that provides the MCU, for example, Renesas. |
| OEM | Entity that uses the MCU to create a product. |
| Customer | End user of OEM product. |

Device ID

For systems that intend to use Public Key Certificate (PKC), the Device ID is in the form of a key pair (RSA or ECC). A PKC comprises of a **public key**, metadata, and finally a signature over all that. This signature is generated by the entity that issues the certificate and is known as a CA (Certificate Authority). The most common format for a public certificate is the [X.509 format](#) which is typically PEM (base 64) encoded such that the certificate is human-readable. It can also be DER encoded which is binary encoding and thus not human readable. The **public key** portion of the Device ID is

used for the Device Certificate.

Provisioning

Device Provisioning refers to the process by which a service provider links a certificate to a Device ID and thus a device. Depending on the provisioning model, an existing certificate from the device may be used or a new one will be issued at this stage. Provisioning (also referred to as Registration) occurs with respect to a particular service provider, for example, AWS or Azure. It is necessary that the certificate is issued by the service provider or a CA known to those providers. When a device is provisioned with AWS for example, the AWS IoT service associates the Device ID (and thus the device) with a specific certificate. The certificate will be programmed into the device and for all future transactions with AWS, the certificate will be used as the means of identifying the device. The public and private key are also stored on the MCU.

Provisioning Models

Provisioning services vary between [service providers](#). There are essentially three general provisioning models.

1. Provisioning happens on the production line. This requires the provisioning Infrastructure to be present on the production line. This is the most secure model, but is expensive.
2. Devices are programmed with a shared credential that is linked into the code at build time and the provisioning occurs when a customer uses the device for the first time. The shared credential and a unique device serial number are used to uniquely identify the device during the provisioning process. So long as the product only has the shared credential, it will only operate with limited (as defined by certificate policy) functionality. Once the provisioning is done, then the device will be fully functional. This is the most common use case for consumer products where no sensitive information is being transmitted. AWS provides an [example](#) of this model.
3. Devices have no identity programmed in the factory; provisioning occurs through some other device like a smartphone which is already trusted by the service provider.

In all these cases, the Device Identity

1. Is unique to the device
2. Must have restricted access within the device
3. Can be used to issue more than one certificate and the certificates themselves have to be updatable in the field.

AWS uses the PKCS11 API to erase, store and retrieve certificates. These PKCS11 functions (Write, Read and Erase) are separated out into a Physical Abstraction Layer (PAL) which the OEM/Device Manufacturer is expected to implement for the type of memory that they intend to use. The internal `rm_aws_pkcs11_pal_littlefs` module implements these requirements on RA MCU data flash.

AWS Provisioning Example

AWS provides an **example** implementation to support device provisioning. This implementation uses the PKCS11 API to store device credentials into the PKCS11 defined memory. The implementation (`aws_dev_mode_key_provisioning.c`) exposes two functions:

1. `vDevModeKeyProvisioning()`
2. `vAlternateKeyProvisioning()`

Both of these functions require that the device credentials be provided in PEM format. Using either of

these example functions as is in production is not recommended; but `vAlternateKeyProvisioning()` provides more flexibility because of the ability to provide credentials as arguments.

Credentials can be created as follows: [*Create your own CA](#) and use that to generate the device certificate. This CA will have to be registered with the service provider with which the product will be used, for example [Register your CA with AWS](#).

- [Use AWS](#) to generate the device certificate.

Examples

Basic Example

This is a basic example of provisioning a device using the AWS demo implementation.

```
#define keyCLIENT_CERTIFICATE_PEM \

}

```

Limitations

The provisioning code is an example provided by AWS. It must be modified to meet product requirements.

5.2.15.2 Azure RTOS NetX Crypto HW Acceleration (rm_netx_secure_crypto)

[Modules](#) » [Security](#)

Detailed Description

Hardware acceleration for the Netx Crypto implementation of the Microsoft Azure RTOS NetX Crypto API.

Overview

Please refer to the [NetXDuo - NetX Crypto documentation](#) for further details.

HW Overview

| Crypto Peripheral version | Devices |
|---------------------------|----------------------------|
| SCE9 | RA6M4, RA4M3, RA4M2, RA6M5 |
| SCE7 | RA6M3, RA6M2, RA6M1, RA6T1 |
| SCE5 | RA4W1, RA4M1 |
| SCE5B | RA6T2 |
| AES Engine | RA2A1, RA2E1, RA2E2, RA2L1 |

Note

NetX Crypto hardware acceleration is unsupported on 'SCE5' and 'AES Engine' crypto peripherals listed above.

Features

This module provides SCE9 hardware support for the following NetX Crypto operations

- SHA256 calculation
- SHA224 calculation
- MAC Operations
 - HMAC with SHA224
 - HMAC with SHA256
- AES
 - Keybits - 128, 192, 256
 - Encryption and Decryption.
 - Chaining Modes: CBC, CTR, GCM mode

| AES Chaining Mode | HW Acceleration |
|-------------------|--|
| CBC | Fully accelerated |
| CTR | Fully accelerated |
| GCM | Encrypt - Fully accelerated; Decrypt - Only GHASH and block cipher unit is HW accelerated |
| CCM | Only block cipher unit is HW accelerated |

- Random number generation
- ECC
 - ECDSA: Supported Curves - SECP384R1, SECP256R1.
 - ECDH: Supported Curves - SECP384R1, SECP256R1.
- RSA
 - Signature Generation - RSA 2048 (Plain or Wrapped private) key. (This can be used for decryption)
 - Signature Verification - RSA 2048, RSA 3072 and RSA 4096 keys. (This can be used for encryption)
 - Supported encoding scheme: PKCS1V15

This module provides SCE7 hardware support for the following NetX Crypto operations

- SHA256 calculation
- SHA224 calculation
- AES
 - Keybits - 128, 192, 256
 - Encryption and Decryption.
 - Chaining Modes: CBC, CTR, GCM mode

| AES Chaining Mode | HW Acceleration |
|-------------------|--|
| CBC | Fully accelerated |
| CTR | Fully accelerated |
| GCM | Only block cipher unit is HW accelerated |

- CCM
 - ECC
 - ECDSA: Supported Curves - SECP384R1, SECP256R1.
 - ECDH: Supported Curves - SECP384R1, SECP256R1.
- RSA
 - Signature Generation - RSA 2048 (Plain or Wrapped private) key. (This can be used for decryption)
 - Signature Verification - RSA 2048. (This can be used for encryption)
 - Supported encoding scheme: PKCS1V15

Only block cipher unit is HW accelerated

Configuration

Build Time Configurations for rm_netx_secure_crypto_sw_port

The following build time configurations are defined in fsp_cfg/middleware/rm_netx_secure_crypto_cfg.h:

| Configuration | Options | Default | Description |
|---------------------------------|--|----------------------------|--------------------------------------|
| Standalone Usage | <ul style="list-style-type: none"> • Use Standalone Crypto Only • Use with TLS | Use Standalone Crypto Only | Defines NX_CRYPTO_STANDALONE_ENABLE. |
| Maximum RSA Modulus size (bits) | <ul style="list-style-type: none"> • 1024 • 2048 • 3072 • 4096 | 4096 | |

Build Time Configurations for rm_netx_secure_crypto

The following build time configurations are defined in fsp_cfg/middleware/rm_netx_secure_crypto_cfg.h:

| Configuration | Options | Default | Description |
|---|--------------------------|---------|--|
| Hardware Acceleration > Hash > SHA256/224 | MCU Specific Options | | Enables NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_SHA256_ALT. |
| Hardware Acceleration > Cipher > AES | MCU Specific Options | | Enables NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_AES_ALT |
| Hardware Acceleration > Public Key Cryptography (PKC) > ECC > ECC | MCU Specific Options | | Enables NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_ECC_ALT |
| Hardware Acceleration > Public Key Cryptography (PKC) > ECC > ECDSA Scratch Buffer Size (Bytes) | Value must be an integer | 3016 | Sets value of NX_CRYPT_TO_ECDSA_SCRATCH_BUFFER_SIZE |
| Hardware Acceleration | Value must be an | 2464 | Sets value of NX_CRYPT |

| | | | |
|---|--|----------------------------|---|
| > Public Key Cryptography (PKC) > ECC > ECDH Scratch Buffer Size (Bytes) | integer | | TO_ECDH_SCRATCH_BUFFER_SIZE |
| Hardware Acceleration > Public Key Cryptography (PKC) > RSA > RSA | MCU Specific Options | | Enables/Disables RSA HW support |
| Hardware Acceleration > Public Key Cryptography (PKC) > RSA > RSA 2048 (HW) | MCU Specific Options | | Enables NETX_SECURE_CRYPTONX_CRYPTOMETHODS_RSA_2048_ALT to allow HW support |
| Hardware Acceleration > Public Key Cryptography (PKC) > RSA > RSA 3072 Verify/Encryption (HW) | MCU Specific Options | | Enables NETX_SECURE_CRYPTONX_CRYPTOMETHODS_RSA_3072_ALT to allow HW support |
| Hardware Acceleration > Public Key Cryptography (PKC) > RSA > RSA 4096 Verify/Encryption (HW) | MCU Specific Options | | Enables RSA NETX_SECURE_CRYPTONX_CRYPTOMETHODS_RSA_4096_ALT to allow HW support |
| Hardware Acceleration > Public Key Cryptography (PKC) > RSA > RSA Scratch Buffer Size (Bytes) | MCU Specific Options | | Sets value of NX_CRYPTORSA_SCRATCH_BUFFER_SIZE |
| Hardware Acceleration > TRNG | <ul style="list-style-type: none"> • Enabled • Disabled | Enabled | Enables NETX_SECURE_CRYPTONX_CRYPTOMETHODS_TRNG_ALT. |
| Standalone Usage | <ul style="list-style-type: none"> • Use Standalone Crypto Only • Use with TLS | Use Standalone Crypto Only | Defines NX_CRYPTOSTANDALONE_ENABLE. |

Random Number Generator Configuration

To enable hardware acceleration for the TRNG, the macro `NETX_SECURE_CRYPTONX_CRYPTOMETHODS_TRNG_ALT` must be defined in the configuration file. By default TRNG is enabled which can be disabled using the RA Configuration editor.

Once enabled 'rand' function will be mapped to HW TRNG; the 'srand' function is not supported, any calls to this function will have no effect. Functionality to re-seed the HW TRNG is not supported by the existing implementation.

If disabled, both 'rand' and 'srand' will be mapped to the C Standard Library. This would require setting up the heap as 'rand' implementation calls 'malloc'.

SHA256 Configuration

To enable hardware acceleration for the SHA256/224 calculation, the macro `NETX_SECURE_CRYPTONX_CRYPTOMETHODS_SHA256_ALT` must be defined in the configuration

file. By default SHA256 is enabled which can be disabled using the RA Configuration editor.

AES Configuration

To enable hardware acceleration for the AES128/192/256 operation, the macro `NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_AES_ALT` must be defined in the configuration file. By default AES is enabled which can be disabled using the RA Configuration editor.

ECC Configuration

To enable hardware acceleration for the ECDSA and ECDH for curves SECP384R1 and SECP256R1, the macro `NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_ECC_ALT` must be defined in the configuration file. By default ECC operations are enabled which can be disabled using the RA Configuration editor.

RSA Configuration

To enable hardware acceleration for the RSA Encrypt/Decrypt (or Sign/Verify) operation(s), the macro(s) below must be defined in the configuration file:

| Configuration Macro | Feature / Operation |
|--|---|
| <code>NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_RSA_2048_ALT</code> | Signature Generation / Signature Verification (Encryption / Decryption) |
| <code>NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_RSA_3072_ALT</code> | Signature Verification (Encryption Only) |
| <code>NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_RSA_4096_ALT</code> | Signature Verification (Encryption Only) |

By default RSA 2048 is enabled which can be disabled using the RA Configuration editor.

RSA software implementation is completely disabled when any of the above macros are enabled.

Usage Notes

Memory Alignment

Use 32bit aligned buffer pointers as arguments to APIs for best performance.

Hardware Initialization

`_nx_crypto_initialize()` must be invoked before using the NetX Crypto APIs to ensure that the SCE peripheral is initialized.

Memory Usage

Sufficient memory must be allocated to be used as 'crypto_metadata' for the chosen crypto operation(s). Refer [Azure RTOS NetX Crypto API description](#) for recommended 'crypto_metadata_size' based on selected crypto operations. Sufficient amount of memory must be allocated for the thread stack to support low level crypto operations when using this module in the standalone mode or through NetX Secure (TLS). A minimum stack of 0x1000 is required to use ECC and RSA. This is either the main stack in a bare metal application or the specific thread stack for an RTOS based application.

AES Usage

GCM mode

The first byte of the IV must indicate the length of the subsequent IV. For example if the IV is {0x00, 0x00, 0x00}, then the IV pointer passed to the `_nx_crypto_method_aes_operation` must store the IV as {0x03, 0x00, 0x00, 0x00}. Refer to the example code for actual usage.

CTR mode

For CTR mode the IV pointer must be as defined in [Using Advanced Encryption Standard \(AES\) Counter Mode With IPsec Encapsulating Security Payload \(ESP\)](#) under 'Figure 2. Counter Block Format'. The IV must be 8 bytes in length. The Nonce field in the reference above must be 4 bytes and should be passed to `_nx_crypto_method_aes_operation` through the key pointer stored after the actual AES key. For Example, if the AES 128-bit Plain Key is {0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00} and the Nonce is {0x01, 0x07, 0xBD, 0xFD}, the key passed to the `_nx_crypto_method_aes_operation` during Encryption/Decryption should be set as {0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x01, 0x07, 0xBD, 0xFD}. This format would also be valid for Wrapped keys where the Nonce is appended at the end of the actual Wrapped key. Refer to the example code for actual usage.

The 'Block Counter' field in the above reference is fixed to {0x00, 0x00, 0x00, 0x01} at the beginning and increments internally after every subsequent AES block is processed. Test vectors that have the initial Block Counter not set to {0x00, 0x00, 0x00, 0x01} cannot be used in this implementation.

ECC Usage

ECC operations include ECDH and ECDSA. As a part of ECDSA operation the input message can be hashed before signing or verification, or the message digest can be provided directly. ECC Scratch buffer size can be optionally reduced as supported ECC computations are now done by the HW. This is controlled by `NX_CRYPT0_ECDSA_SCRATCH_BUFFER_SIZE` and `NX_CRYPT0_ECDH_SCRATCH_BUFFER_SIZE` macros for ECDSA and ECDH respectively.

| Operation | Key Format |
|--|---|
| ECDSA Signature | Plain private key; Wrapped private key |
| ECDSA Signature-Verify | Uncompressed public key |
| Key Generation using ECDSA operation API | Wrapped private key; Uncompressed public key |
| ECDH private key import | Plain private key; Wrapped private key (Allows for Uncompressed and Formatted public key) |
| ECDH public key export | Uncompressed public key |
| ECDH setup | Uncompressed public key |
| ECDH shared secret calculate | Uncompressed public key |
| Key Generation using ECDH operation API | Wrapped private key; Uncompressed public key |

Note:

- Uncompressed public key is of the form (0x04 || Qx || Qy). Refer Section 2.2. Subject Public Key under [RFC5480](#)
- Formatted public key is of the form (Key Info (4 bytes) || Qx || Qy || Key Info (16 bytes)).

This is the key which is used internally by SCE peripheral.

RSA Usage

Wrapped Key Usage

To use the NetX Crypto stack with wrapped private keys (for signature generation/decryption), a dummy pointer (non-NULL) should be passed to the 'key' parameter during `_nx_crypto_method_rsa_init` API call. However, the 'key_size_in_bits' parameter should be equal to the intended RSA modulus length in bits. The actual wrapped key must be passed as the 'key' parameter to the `_nx_crypto_method_rsa_operation` API call with its length in bits passed through the 'key_size_in_bits' parameter.

For PKCS1V15 operation 'key' and 'key_size_in_bits' parameters of `_nx_crypto_method_pkcs1_v1_5_init` are unused. These can be passed as NULL and 0 respectively. The actual wrapped key must be passed as the 'key' parameter to the `_nx_crypto_method_pkcs1_v1_5_operation` API call and the intended modulus length in bits must be passed through the 'key_size_in_bits' parameter.

Limitations

- Only little endian mode is supported.
- RSA CRT keys are not supported.
- ECJPAKE related operations are unsupported for NIST 224, 256 and 384 bit curves when HW ECC is enabled.

Examples

Initialization Example

This example shows how to initialize the HW crypto engine. This step must be performed before any crypto algorithm is used.

```
/* Setup the platform; initialize the SCE and the TRNG */
err = nx_crypto_initialize();
assert(NX_CRYPTOSUCCESS == err);
```

Hash Example

This is an example on calculating the SHA256 hash using the NetX Crypto API.

```
extern NX_CRYPTOMETHOD crypto_method_sha256;
const uint8_t NIST_SHA256ShortMsgLen200[] =
{
    0x2e, 0x7e, 0xa8, 0x4d, 0xa4, 0xbc, 0x4d, 0x7c, 0xfb, 0x46, 0x3e, 0x3f, 0x2c,
    0x86, 0x47, 0x05,
    0x7a, 0xff, 0xf3, 0xfb, 0xec, 0xec, 0xa1, 0xd2, 00
```

```
};  
  
const uint8_t NIST_SHA256ShortMsgLen200_expected[] =  
{  
    0x76, 0xe3, 0xac, 0xbc, 0x71, 0x88, 0x36, 0xf2, 0xdf, 0x8a, 0xd2, 0xd0, 0xd2,  
    0xd7, 0x6f, 0x0c,  
    0xfa, 0x5f, 0xea, 0x09, 0x86, 0xbe, 0x91, 0x8f, 0x10, 0xbc, 0xee, 0x73, 0x0d,  
    0xf4, 0x41, 0xb9  
};  
  
void netx_secure_crypto_sha256_example (void)  
{  
    size_t    actual_hash_len = RM_NETX_SECURE_CRYPTTO_EXAMPLE_SHA256_HASH_SIZE_BYTES;

ECDH Example

This is an example on using the NetX Crypto API to generate a shared secret using ECDH. A shared secret is computed using known public key (from peer) and generated private key. Another shared secret is computed using the generated public key and known private key (imported to mimic peer). Both the shared secrets are checked to be the same.

```
extern NX_CRYPT_METHOD crypto_method_ecdh;
/*Private key 59137e38152350b195c9718d39673d519838055ad908dd4757152fd8255c09bf */

5.2.15.3 Mbed Crypto H/W Acceleration (rm_psa_crypto)

[Modules](#) » [Security](#)

Functions

int `mbedtls_platform_setup` (`mbedtls_platform_context *ctx`)

void `mbedtls_platform_teardown` (`mbedtls_platform_context *ctx`)

`fsp_err_t` `RM_PSA_CRYPTO_TRNG_Read` (`uint8_t *const p_rngbuf`, `uint32_t num_req_bytes`, `uint32_t *p_num_gen_bytes`)

Reads requested length of random data from the TRNG. Generate nbytes of random bytes and store them in `p_rngbuf` buffer. [More...](#)

Detailed Description

Hardware acceleration for the mbedCrypto implementation of the Arm PSA Crypto API.

Overview

Note

The PSA Crypto module does not provide any interfaces to the user. This release uses the mbedTLS version 3.4.0 which conforms to the PSA Crypto API 1.0 specification. Consult the Arm documentation at <https://armmbed.github.io/mbed-crypto/psa/#application-programming-interface> for further information. FSP 3.0 onward adopts a change by Arm where mbedCrypto has been integrated back to MbedTLS and the term mbedCrypto has been deprecated. The mbedCrypto term in FSP now refers to the crypto portion of the MbedTLS module.

HW Overview

| Crypto Peripheral version | Devices |
|---------------------------|--|
| SCE9 | RA6M4, RA4M3, RA4M2, RA6M5 |
| SCE7 | RA6M3, RA6M2, RA6M1, RA6T1 |
| SCE5 | RA4W1, RA4M1 |
| SCE5B | RA6T2 |
| AES Engine | RA2A1, RA2E1, RA2E2, RA2L1 |
| TRNG | RA4E1, RA4E2, RA4T1, RA6E1, RA6E2, RA6T3 |

Features

The PSA_Crypto module provides hardware support for the following PSA Crypto operations

- SHA256 calculation
- SHA224 calculation
 - MAC Operations
- AES
 - Keybits - 128, 192, 256
 - Plain-Text Key Generation
 - Wrapped Key Generation
 - Encryption and Decryption with no padding and with PKCS7 padding.
 - CBC, CTR, CCM , XTS and GCM modes

- MAC operations
- Export and Import of Plaintext and Wrapped keys
- ECC
 - Curves:
 - SECP256R1
 - SECP256K1
 - Brainpool256R1
 - SECP384R1
 - Brainpool384R1
 - Plain-Text Key Generation (Unavailable on SCE9)
 - Wrapped Key Generation
 - Signing and Verification
 - Export and Import of Plaintext keys
 - Export and Import of Wrapped keys generated by PSA.
 - ECDH Support
- RSA
 - Keybits - 2048. Verification only for 3072 and 4096 bits
 - Plain-Text Key Generation (Unavailable on SCE9)
 - Wrapped Key Generation
 - Signature Generation
 - Verification
 - Encryption and Decryption with PKCS1V15 and OAEP padding
 - Export and Import of Plaintext keys
 - Export and Import of Wrapped keys generated by PSA.
- Random number generation
- Persistent Key Storage

Configuration

Build Time Configurations for mbedCrypto

The following build time configurations are defined in arm/mbedtls/config.h:

| Configuration | Options | Default | Description |
|--|----------------------|---------|--|
| Hardware Acceleration > Key Format > AES | MCU Specific Options | | Select AES key formats used |
| Hardware Acceleration > Key Format > ECC | MCU Specific Options | | Select ECC key formats used |
| Hardware Acceleration > Key Format > RSA | MCU Specific Options | | Select RSA key formats used |
| Hardware Acceleration > Hash > SHA256/224 | MCU Specific Options | | Defines MBEDTLS_SHA256_ALT and MBEDTLS_SHA256_PROCESS_ALT. |
| Hardware Acceleration > Cipher > AES | MCU Specific Options | | Defines MBEDTLS_AES_ALT, MBEDTLS_AES_SETKEY_ENC_ALT, MBEDTLS_AES_SETKEY_DEC_ALT, MBEDTLS_AES_ENCRYPT_ALT and MBEDTLS_AES_D |

| | | | |
|--|--|----------|---|
| Hardware Acceleration > Public Key Cryptography (PKC) > ECC | MCU Specific Options | | ECRYPT_ALT |
| Hardware Acceleration > Public Key Cryptography (PKC) > ECC | MCU Specific Options | | Defines MBEDTLS_ECP_ALT |
| Hardware Acceleration > Public Key Cryptography (PKC) > ECDSA | MCU Specific Options | | Defines MBEDTLS_ECDSA_SIGN_ALT and MBEDTLS_ECDSA_VERIFY_ALT |
| Hardware Acceleration > Public Key Cryptography (PKC) > ECDH | MCU Specific Options | | Defines MBEDTLS_ECDH_ALT |
| Hardware Acceleration > Public Key Cryptography (PKC) > RSA | MCU Specific Options | | Defines MBEDTLS_RSA_ALT. |
| Hardware Acceleration > Public Key Cryptography (PKC) > RSA 3072 Verify | MCU Specific Options | | Enables RSA 3072 Verify. |
| Hardware Acceleration > Public Key Cryptography (PKC) > RSA 4096 Verify | MCU Specific Options | | Enables RSA 4096 Verify. |
| Hardware Acceleration > TRNG | Enabled | Enabled | Defines MBEDTLS_ENTROPY_HARDWARE_ALT. |
| Hardware Acceleration > Crypto Engine Initialization | Enabled | Enabled | MBEDTLS_PLATFORM_SETUP_TEARDOWN_ALT |
| Platform > Alternate > MBEDTLS_PLATFORM_SETBUF_ALT | <ul style="list-style-type: none"> Define Undefine | Undefine | MBEDTLS_PLATFORM_SETBUF_ALT |
| Platform > Alternate > MBEDTLS_PLATFORM_EXIT_ALT | <ul style="list-style-type: none"> Define Undefine | Undefine | MBEDTLS_PLATFORM_EXIT_ALT |

SHA256 Configuration

To enable hardware acceleration for the SHA256/224 calculation, the macro `MBEDTLS_SHA256_ALT` and `MBEDTLS_SHA256_PROCESS_ALT` must be defined in the configuration file. By default SHA256 is enabled. SHA256 can be disabled, but SHA512 then needs to be enabled (software version) because the PSA implementation uses it for the entropy accumulator. This can be done using the RA Configuration editor.

AES Configuration

To enable hardware acceleration for the AES128/256 operation, the macro MBEDTLS_AES_SETKEY_ENC_ALT, MBEDTLS_AES_SETKEY_DEC_ALT, MBEDTLS_AES_ENCRYPT_ALT and MBEDTLS_AES_DECRYPT_ALT must be defined in the configuration file. By default AES is enabled. AES cannot be disabled because the PSA implementation requires it for the CTR_DRBG random number generator. This can be done using the RA Configuration editor.

Note

Only AES XTS 128 is currently supported. RA2 devices support acceleration for ECB part alone, while other devices support full AES XTS hardware acceleration.

ECC Configuration

To enable hardware acceleration for the ECC Key Generation operation, the macro MBEDTLS_ECP_ALT must be defined in the configuration file. For ECDSA, the macros MBEDTLS_ECDSA_SIGN_ALT and MBEDTLS_ECDSA_VERIFY_ALT must be defined. By default ECC, ECDSA and ECDHE are enabled. To disable ECC, undefine MBEDTLS_ECP_C, MBEDTLS_ECDSA_C and MBEDTLS_ECDH_C. This can be done using the RA Configuration editor.

RSA Configuration

To enable hardware acceleration for the RSA2048 operation, the macro MBEDTLS_RSA_ALT must be defined in the configuration file. By default RSA is enabled. To disable RSA, undefine MBEDTLS_RSA_C, MBEDTLS_PK_C, MBEDTLS_PK_PARSE_C, MBEDTLS_PK_WRITE_C. This can be done using the RA Configuration editor.

Wrapped Key Usage

To use the Secure Crypto Engine to generate and use wrapped keys, use PSA_KEY_TYPE_AES_WRAPPED or PSA_KEY_TYPE_ECC_KEY_PAIR_WRAPPED(curve) or PSA_KEY_TYPE_RSA_KEY_PAIR when setting the key type attribute. Setting the key's type attribute using this value will cause the SCE to use wrapped key mode for all operations related to that key. The user can use the export functionality to save the wrapped keys to user ROM and import it later for usage. This mode requires that Wrapped Key functionality for the algorithm is enabled in the project configuration.

Note

On the SCE9 devices, only the RSA public key can be exported. A file system must be used to store the internally generated private key.

Persistent Key Storage

Persistent key storage can be enabled by defining MBEDTLS_FS_IO, MBEDTLS_PSA_CRYPTOSTORAGE_C, and MBEDTLS_PSA_ITS_FILE_C. The key lifetime must also be specified as PSA_KEY_LIFETIME_PERSISTENT. A lower level storage module must be added in the RA Configuration editor and initialized in the code before generating persistent keys. Persistent storage supports the use of plaintext and vendor keys. Refer to the lower level storage module documentation for information on how it should be initialized. To generate a persistent key the key must be assigned a unique id prior to calling generate using the psa_set_key_id api.

```
if (PSA_KEY_LIFETIME_IS_PERSISTENT(lifetime))  
{
```

```
/* Set the id to a positive integer. */
    psa_set_key_id(&attributes, (psa_key_id_t) 5);
}
```

Platform Configuration

To run the mbedCrypto implementation of the PSA Crypto API on the MCU, the macro `MBEDTLS_PLATFORM_SETUP_TEARDOWN_ALT` must be defined in the configuration file. This enables code that will initialize the SCE. Parameter checking (General|`MBEDTLS_CHECK_PARAMS`) is enabled by default. To reduce code size, disable parameter checking.

Random Number Configuration

To run the mbedCrypto implementation of the PSA Crypto API on the MCU, the macro `MBEDTLS_ENTROPY_HARDWARE_ALT` must be defined in the configuration file. This enables using the TRNG as an entropy source. None of the other cryptographic operations (even in software only mode) will work without this feature.

Usage Notes

Hardware Initialization

`mbedtls_platform_setup()` must be invoked before using the PSA Crypto API to ensure that the SCE peripheral is initialized.

Memory Usage

In general, depending on the mbedCrypto features being used a heap size of 0x1000 to 0x5000 bytes is required. The total allocated heap should be the **sum** of the heap requirements of the individual algorithms:

| Algorithm | Required Heap (bytes) |
|--------------|-----------------------|
| SHA256/224 | None |
| AES | 0x200 |
| Hardware ECC | 0x400 |
| Software ECC | 0x1800 |
| RSA | 0x1500 |

A minimum stack of 0x1000 is required where the module is used. This is either the main stack in a bare metal application or the task stack of the task used for crypto operations.

Limitations

- Only little endian mode is supported.

Stdio Buffering

The `MBEDTLS_PLATFORM_SETBUF_MACRO` was introduced in mbedTLS 3.2.1 to prevent stdio read/write functions from buffering stream data to reduce the likelihood of key leakage by setting the buffer argument in `setbuf()` to `NULL`. FSP uses a `dummy_setbuf()` function in `rm_psa_crypto.c` to prevent build errors; since FSP uses LittleFS by default (where the usage of a buffer is mandatory) this function does not perform any action. Setting the cache size in LittleFS to the minimum supported by the Data Flash (4) can minimize but not remove the likelihood of key data leakage. The dummy function can be replaced with a user-defined function by defining a different value for `MBEDTLS_PLATFORM_SETBUF_MACRO_value` in the FSP configurator.

SCE9 Usage

The SCE9 is used in Compatibility Mode for mbedCrypto acceleration. The crypto capabilities in this mode on the SCE9 are different which results in the below usage limitations with mbedCrypto:

- The module includes **both** wrapped and plaintext keys code irrespective of whether the application requires it.
- Plaintext key generation is not supported for RSA and ECC; only wrapped keys can be generated.
- If ECDH is used, only wrapped key will be generated on SCE9 and will not return an error even if the user context is somehow set for plain key. This may be relevant only if the `psa_key_agreement()` function with plaintext key on SCE9 is attempted.

Note

For a detailed description of the different SCE9 operating modes, refer to Application Note R11AN0498.

Using PSA Crypto with TrustZone

Unlike FSP drivers, PSA Crypto cannot be configured as Non-secure callable in the RA Configurator for a secure project. The reason for this is that in order to achieve the security objective of controlling access to protected keys, both the PSA Crypto code as well as the keys must be placed in the secure region. Since the PSA Crypto API requires access to the keys directly during initialization and later via a key handle, allowing non-secure code to use the API by making it Non-secure callable will require the keys to be stored in non-secure memory.

This section will provide a short explanation of how to add PSA Crypto to a secure project and have it usable by the non-secure project without exposing the keys. In this example the secure project will contain an RSA private key and the non-secure project is expected to be able to perform sign and verify operations using that key.

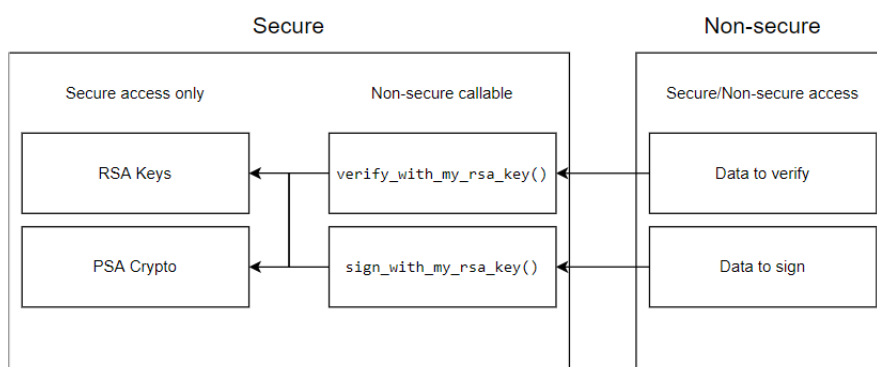

Figure 225: PSA Crypto Non-secure callable example

- Secure project

- During secure project boot-up, `psa_crypto_init()` is called.
 - The RSA private key is programmed into secure flash either at the factory or by calling `psa_generate_key()` in persistent mode. Note that the data-flash area used by the LittleFS will have to be in the secure region if the key is generated as a persistent.
 - `psa_import_key()/psa_open_key()` are called with the resultant handle held in secure RAM.
 - The Non-secure callable section contains the following **user-defined** functions
 - `verify_with_my_rsa_key(input_signature, input_hash, verification_result)`
 - The implementation of this function in secure region will call `psa_verify_hash()` and return the result via `verification_result`.
 - `sign_with_my_rsa_key(input_hash, output_signature)`
 - The implementation of this function in secure region will call `psa_sign_hash()` and return the signature via `output_signature`.
-
- Non-secure project
 - Calls `verify_with_my_rsa_key()` to verify a signature. The implementation will use the public key that is present in the secure project.
 - Calls `sign_with_my_rsa_key()` to generate a signature. The implementation will use the private key that is present on the secure project.

For more details on how to add user-code to the Non-secure callable region refer to the "Security Design with Arm TrustZone - IP Protection (R11AN0467EU0100)" Application Note.

Examples

Hash Example

This is an example on calculating the SHA256 hash using the PSA Crypto API.

```
const uint8_t NIST_SHA256ShortMsgLen200[] =
{
    0x2e, 0x7e, 0xa8, 0x4d, 0xa4, 0xbc, 0x4d, 0x7c, 0xfb, 0x46, 0x3e, 0x3f, 0x2c,
    0x86, 0x47, 0x05,
    0x7a, 0xff, 0xf3, 0xfb, 0xec, 0xec, 0xa1, 0xd2, 00
};
const uint8_t NIST_SHA256ShortMsgLen200_expected[] =
{
    0x76, 0xe3, 0xac, 0xbc, 0x71, 0x88, 0x36, 0xf2, 0xdf, 0x8a, 0xd2, 0xd0, 0xd2,
    0xd7, 0x6f, 0x0c,
    0xfa, 0x5f, 0xea, 0x09, 0x86, 0xbe, 0x91, 0x8f, 0x10, 0xbc, 0xee, 0x73, 0x0d,
    0xf4, 0x41, 0xb9
};
```

```

```

CMAC Example

This is an example on using the PSA Crypto API to generate an AES256 key, followed by generation and verification of MAC for random data of known length.

```
if (PSA_SUCCESS != psa_generate_random(input, sizeof(input)))
{
/* Random number generation failure */
    debugger_break();
}
else if (PSA_SUCCESS != psa_generate_key(&attributes, &key_handle))
{
/* Key generation failure */
    debugger_break();
}
/* Steps to generate the MAC */
else if (PSA_SUCCESS != psa_mac_sign_setup(&operation, key_handle, alg))
{
/* MAC Sign setup failed */
    debugger_break();
}
else if (PSA_SUCCESS != psa_mac_update(&operation, input, input_size))
{
/* MAC update failed */
    debugger_break();
}
else if (PSA_SUCCESS != psa_mac_sign_finish(&operation, AES_CMAC_mac, sizeof
(AES_CMAC_mac), &mac_ret))
{
/* MAC Sign operation failed */
    debugger_break();
}
else
{
/* All the operations succeeded for MAC generation */
}
```

```
/* Steps to verify the generated MAC */
if (PSA_SUCCESS != psa_mac_verify_setup(&verify_operation, key_handle, alg))
{
/* MAC verification setup failure */
    debugger_break();
}
else if (PSA_SUCCESS != psa_mac_update(&verify_operation, input, input_size))
{
/* MAC update failure */
    debugger_break();
}
else if (PSA_SUCCESS != psa_mac_verify_finish(&verify_operation, AES_CMAC_mac,
mac_ret))
{
/* MAC verification failed */
    debugger_break();
}
else
{
/* All the operations succeeded for MAC verification */
}
}
```

ECC Example

This is an example on using the PSA Crypto API to generate an ECC-P256R1 key, signing and verifying data after hashing it first using SHA256.

Note

Unlike RSA, ECDSA does not have any padding schemes. Thus the hash argument for the ECC sign operation MUST have a size larger than or equal to the curve size; i.e. for PSA_ECC_CURVE_SECP256R1 the payload size must be at least 256/8 bytes. nist.fips.186-4: " A hash function that provides a lower security strength than the security strength associated with the bit length of 'n' ordinarily should not be used, since this would reduce the security strength of the digital signature process to a level no greater than that provided by the hash function."

```
#define ECC_256_BIT_LENGTH 256
#define ECC_256_EXPORTED_SIZE 500
uint8_t exportedECC_SECP256R1Key[ECC_256_EXPORTED_SIZE];
size_t exportedECC_SECP256R1Keylength = 0;
```

```
void psa_ecc256R1_example (void)
{
/* This example generates an ECC-P256R1 keypair, performs signing and verification
operations.

* It then exports the generated key into ASN1 DER format to a RAM array which can
then be programmed to flash.

* It then re-imports that key, and performs signing and verification operations. */
unsigned char      payload[] = "ASYMMETRIC_INPUT_FOR_SIGN.....";

RSA Example

This is an example on using the PSA Crypto API to generate an RSA2048 key, encrypting and decrypting multi-block data and using PKCS7 padding.

```

#define RSA_2048_BIT_LENGTH 2048
#define RSA_2048_EXPORTED_SIZE 1210
/* The RSA 2048 key pair export in der format is roughly as follows
 * RSA private keys:
 * RSAPrivateKey ::= SEQUENCE { ----- 1 + 3
 * version Version, ----- 1 + 1 + 1
 * modulus INTEGER, ----- n ----- 1 + 3 + 256 + 1
 * publicExponent INTEGER, ----- e ----- 1 + 4
 * privateExponent INTEGER, ----- d ----- 1 + 3 + 256 (276
for Wrapped)
 * prime1 INTEGER, ----- p ----- 1 + 3 + (256 / 2)
 * prime2 INTEGER, ----- q ----- 1 + 3 + (256 / 2)
 * exponent1 INTEGER, ----- d mod (p-1) ----- 1 + 2 + (256 / 2) (4 for
Wrapped)
 * exponent2 INTEGER, ----- d mod (q-1) ----- 1 + 2 + (256 / 2) (4 for
Wrapped)
 * coefficient INTEGER, ----- (inverse of q) mod p - 1 + 2 + (256 / 2) (4
for Wrapped)
 * otherPrimeInfos OtherPrimeInfos OPTIONAL ----- 0 (not
supported)
 * }
 */

Function Documentation

◆ **mbedtls_platform_setup()**

```
int mbedtls_platform_setup ( mbedtls_platform_context * ctx)
```

This function initializes the SCE and the TRNG. It **must** be invoked before the crypto library can be used. This implementation is used if MBEDTLS_PLATFORM_SETUP_TEARDOWN_ALT is defined.

Example:

```
mbedtls_platform_context ctx = {0};

/* Setup the platform; initialize the SCE and the TRNG */
if (PSA_SUCCESS != mbedtls_platform_setup(&ctx))
```

Return values

| | |
|--------------------------------------|--------------------------------|
| 0 | Initialization was successful. |
| MBEDTLS_ERR_PLATFORM_HW_ACCEL_FAILED | SCE Initialization error. |

◆ **mbedtls_platform_teardown()**

```
void mbedtls_platform_teardown ( mbedtls_platform_context * ctx)
```

This implementation is used if MBEDTLS_PLATFORM_SETUP_TEARDOWN_ALT is defined. It is intended to de-initialize any items that were initialized in the `mbedtls_platform_setup()` function, but currently is only a placeholder function.

Example:

```
/* De-initialize the platform. This is currently a placeholder function which does
not do anything. */
mbedtls_platform_teardown(&ctx);
```

Return values

| | |
|-----|--|
| N/A | |
|-----|--|

◆ RM_PSA_CRYPTO_TRNG_Read()

```
fsp_err_t RM_PSA_CRYPTO_TRNG_Read ( uint8_t *const p_rngbuf, uint32_t num_req_bytes,
uint32_t * p_num_gen_bytes )
```

Reads requested length of random data from the TRNG. Generate nbytes of random bytes and store them in p_rngbuf buffer.

Return values

| | |
|------------------------|-------------------------------------|
| FSP_SUCCESS | Random number generation successful |
| FSP_ERR_ASSERTION | NULL input parameter(s). |
| FSP_ERR_CRYPTO_UNKNOWN | An unknown error occurred. |

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- s_generate_16byte_random_data

5.2.15.4 SCE Protected Mode

Detailed Description

Driver for the Secure Crypto Engine (SCE9) on RA MCUs.

Overview

This module provides SCE functions in protected mode.

Note

For a detailed description of the different SCE9 operating modes, refer to Application Note R11AN0498.

HW Overview

| Crypto Peripheral version | Devices |
|---------------------------|----------------------------|
| SCE9 (Protected mode) | RA4M2, RA4M3, RA6M4, RA6M5 |

Features

The SCE module supports for the following features.

- Cryptography
 - Symmetric Encryption/Decryption
 - AES

- ECB 128/256bit
 - CBC 128/256bit
 - GCM 128/256bit
 - CCM 128/256bit
 - Asymmetric Encryption/Decryption
 - RSA
 - RSAES-PKCS1-V1_5 1024/2048bit
 - RSAES-PKCS1-V1_5 3072/4096bit (Encryption only)
 - RSASSA-PKCS1-V1_5 1024/2048bit
 - RSASSA-PKCS1-V1_5 3072/4096bit (Verification only)
 - ECC
 - ECDSA secp192r1/secp224r1/secp256r1/secp384r1
 - ECDH secp256r1
 - Hash Functions
 - SHA-2
 - SHA-256
- Message Authentication Code
 - HMAC-SHA256bit
 - AES-CMAC 128/256bit
- Key Support
 - AES 128/256bit
 - AES Key Wrap/Key Unwrap 128/256bit
 - RSA 1024/2048bit
 - RSA 3072/4096bit (public key only)
 - ECC secp192r1/secp224r1/secp256r1/secp384r1
 - HMAC-SHA256bit
- TRNG
- TLS
 - SSL / TLS support function (TLS1.2 compliant)

Configuration

Clock Configuration

This module does not require a specific clock configuration.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Getting Started: Creating a SCE Protected Mode Project

Start by creating a new project in e² studio or RASC. On the Stacks tab, add New > Security > SCE Protected Mode. For information on how to install and update secure keys, refer to the Application Note R11AN0496.

Reducing initialization time

The SCE initialization sequence can be modified to support a smaller subset of features and allow for a shorter initialization period. This is particularly useful in cases where startup time is important and the cryptographic features that are required are known in advance. The current fast boot configuration option supports the cryptographic primitives required by MCUBoot including:

- RSA 3K/4K signature verification
- ECC P256 signature verification
- SHA224/256 and GHASH calculation

Limitations

Usage of R_SCE_ECDSA_secp384r1_SignatureGenerate/Verify

The SCE does not support SHA-384 in hardware, so the APIs listed below require the user to create a SHA-384 function for signature generation and verification. To use the APIs listed below, enable SCE_USER_SHA_384_ENABLED on RA Smart Configurator and prepare a function called SCE_USER_SHA_384_FUNCTION. The interface of SCE_USER_SHA_384_FUNCTION, which is called by the following APIs, is described below.

- R_SCE_ECDSA_secp384r1_SignatureGenerate()
- R_SCE_ECDSA_secp384r1_SignatureVerify()

SCE_USER_SHA_384_FUNCTION()

```
uint32_t SCE_USER_SHA_384_FUNCTION(uint8_t *message, uint8_t* digest, uint32_t
message_length)
```

SHA-384 hash calculation is performed for an area extending the number of bytes specified by the argument message_length from the address specified by the argument message. The calculation result should be stored at the address specified by the argument digest.

Parameters

| | |
|----------------|---|
| message | [in] Start address of message |
| digest | [in,out] address for storing hash calculation result (48 bytes) |
| message_length | [in] Effective byte count of message |

Return values

| | |
|--------|---------------------------------|
| 0 | Hash value stored successfully. |
| others | Storing of hash value failed. |

Examples

AES Example

This is an example of AES-256 encryption and decryption.

```
static uint8_t plain[BLOCK * 2] =
{
    0x52, 0x65, 0x6e, 0x65, 0x73, 0x61, 0x73, 0x20, 0x45, 0x6c, 0x65, 0x63, 0x74,
```

```
0x72, 0x6f, 0x6e,  
    0x69, 0x63, 0x73, 0x20, 0x43, 0x6f, 0x72, 0x70, 0x6f, 0x72, 0x61, 0x74, 0x69,  
0x6f, 0x6e, 0x00  
};  
void r_sce_example_aes ()  
{  
    sce_aes_handle_t      handle;  
    sce_aes_wrapped_key_t wrapped_key;  
    uint8_t               cipher_calculated[32] = {0};  
    uint8_t               plain_calculated[32] = {0};  
    uint32_t              dummy;  
    /* SCE power on */  
    R_SCE_Open(&sce_ctrl, &sce_cfg);  
    /* Generate a random key */  
    R_SCE_AES256_WrappedKeyGenerate(&wrapped_key);  
    /* Encrypt a plain text */  
    R_SCE_AES256ECB_EncryptInit(&handle, &wrapped_key);  
    R_SCE_AES256ECB_EncryptUpdate(&handle, plain, cipher_calculated, BLOCK * 2);  
    R_SCE_AES256ECB_EncryptFinal(&handle, cipher_calculated, &dummy);  
    /* Decrypt a cipher text using same key as Encryption */  
    R_SCE_AES256ECB_DecryptInit(&handle, &wrapped_key);  
    R_SCE_AES256ECB_DecryptUpdate(&handle, cipher_calculated, plain_calculated, BLOCK *  
2);  
    R_SCE_AES256ECB_DecryptFinal(&handle, plain_calculated, &dummy);  
    /* SCE power off */  
    R_SCE_Close(&sce_ctrl);  
    /* Compare plain and plain_calculated */  
    if (memcmp(plain, plain_calculated, BLOCK * 2))  
    {  
        while (1)  
        {  
            /* plain and plain_calculated are different (incorrect) */  
        }  
    }  
}
```

```
else
{
while (1)
{
/* plain and plain_calculated are the same (correct) */
}
}
}
```

ECC Example

This is an example of ECC secp-256 signature generate and verify.

```
uint8_t ecc256_data_msg[] =
{
's', 'a', 'm', 'p', 'l', 'e'
};
void r_sce_example_ecc ()
{
sce_ecc_wrapped_pair_key_t wrapped_pair_key;
sce_ecdsa_byte_data_t message_hash =
{
0
};
sce_ecdsa_byte_data_t signature;
uint8_t out_data[HW_SCE_ECDSA_DATA_BYTE_SIZE];
fsp_err_t return_code;
message_hash.data_length = sizeof(ecc256_data_msg);
message_hash.pdata = (uint8_t *) ecc256_data_msg;
signature.pdata = out_data;
/* SCE power on */
R_SCE_Open(&sce_ctrl, &sce_cfg);
/* Generate a random pair key */
R_SCE_ECC_secp256r1_WrappedKeyPairGenerate(&wrapped_pair_key);
/* Generate a Signature */
```

```
R_SCE_ECDSA_secp256r1_SignatureGenerate(&message_hash, &signature,
&wrapped_pair_key.priv_key);
/* Verify Signature and Public wrapped key */
return_code = R_SCE_ECDSA_secp256r1_SignatureVerify(&signature, &message_hash,
&wrapped_pair_key.pub_key);
/* SCE power off */
R_SCE_Close(&sce_ctrl);
if (FSP_SUCCESS != return_code)
{
while (1)
{
/* Verify Fail */
}
}
else
{
while (1)
{
/* Verify Success */
}
}
}
```

RSA Example

This is an example of RSA-2048 encryption and decryption.

```
uint8_t rsa_msg[256] =
{
0x00, 0x01, 0x02, 0x03, 0x04, 0x05, 0x06, 0x07, 0x08, 0x09, 0x0a, 0x0b, 0x0c,
0x0d, 0x0e, 0x0f,
0x10, 0x11, 0x12, 0x13, 0x14, 0x15, 0x16, 0x17, 0x18, 0x19, 0x1a, 0x1b, 0x1c,

Data Structures

struct [sce_instance_ctrl_t](#)

Data Structure Documentation

◆ [sce_instance_ctrl_t](#)

struct [sce_instance_ctrl_t](#)

SCE private control block. DO NOT MODIFY. Initialization occurs when [R_SCE_Open\(\)](#) is called.

Function Documentation

◆ R_SCE_Open()

```
fsp_err_t R_SCE_Open ( sce_ctrl_t *const p_ctrl, sce_cfg_t const *const p_cfg )
```

Enables use of SCE functionality.

Parameters

| | | |
|------|--------|---|
| [in] | p_ctrl | Pointer to control structure. |
| [in] | p_cfg | Pointer to pin configuration structure. |

Return values

| | |
|-------------------------------------|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTOSCE_FAIL | The error-detection self-test failed to terminate normally. |
| FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTOSCE_RETRY | Indicates that an entropy evaluation failure occurred. Run the function again. |

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes.

Note

The valid pre-run state is SCE disabled. The pre-run state is SCE Disabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_Close()

```
fsp_err_t R_SCE_Close ( sce_ctrl_t *const p_ctrl )
```

Stops supply of power to the SCE.

Parameters

| | | |
|------|--------|-------------------------------|
| [in] | p_ctrl | Pointer to control structure. |
|------|--------|-------------------------------|

Return values

| | |
|-------------|--------------------|
| FSP_SUCCESS | Normal termination |
|-------------|--------------------|

Note

The pre-run state is any state. After the function runs the state transitions to SCE Disabled State.

◆ R_SCE_SoftwareReset()

fsp_err_t R_SCE_SoftwareReset (void)

Software reset to SCE.

Reverts the state to the SCE initial state.

Return values

| | |
|-------------|--------------------|
| FSP_SUCCESS | Normal termination |
|-------------|--------------------|

Note

The pre-run state is any state. After the function runs the state transitions to SCE Disabled State.

◆ R_SCE_AES128_WrappedKeyGenerate()

fsp_err_t R_SCE_AES128_WrappedKeyGenerate (sce_aes_wrapped_key_t * wrapped_key)

This API outputs 128-bit AES wrapped key from a random number.

This API generates a wrapped key from a random number in the SCE. Accordingly, user key input is unnecessary. By encrypting data using the wrapped key is output by this API, dead copying of data can be prevented.

Parameters

| | | |
|----------|-------------|-------------------------|
| [in,out] | wrapped_key | 128-bit AES wrapped key |
|----------|-------------|-------------------------|

Return values

| | |
|-------------------------------------|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Disabled State.

◆ R_SCE_AES256_WrappedKeyGenerate()

```
fsp_err_t R_SCE_AES256_WrappedKeyGenerate ( sce_aes_wrapped_key_t * wrapped_key)
```

This API outputs 256-bit AES wrapped key from a random number.

This API generates a wrapped key from a random number in the SCE. Accordingly, user key input is unnecessary. By encrypting data using the wrapped key is output by this API, dead copying of data can be prevented.

Parameters

| | | |
|----------|-------------|-------------------------|
| [in,out] | wrapped_key | 256-bit AES wrapped key |
|----------|-------------|-------------------------|

Return values

| | |
|-------------------------------------|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Disabled State.

◆ R_SCE_RSA1024_WrappedKeyPairGenerate()

```
fsp_err_t R_SCE_RSA1024_WrappedKeyPairGenerate ( sce_rsa1024_wrapped_pair_key_t *
wrapped_pair_key)
```

This API outputs a wrapped key pair for a 1024-bit RSA public key and private key pair. These keys are generated from a random value produced internally by the SCE. Consequently, there is no need to input a user key. Dead copying of data can be prevented by encrypting the data using the wrapped key output by this API. A public wrapped key is generated by wrapped_pair_key->pub_key, and a private wrapped key is generated by wrapped_pair_key->priv_key. As the public key exponent, only 0x00010001 is generated.

Parameters

| | | |
|----------|------------------|---|
| [in,out] | wrapped_pair_key | User key index for RSA 1024-bit public key and private key pair |
|----------|------------------|---|

Return values

| | |
|---------------------------------------|---|
| FSP_SUCCESS | Normal end |
| FSP_ERR_CRYPTTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTTO_SCE_FAIL | An internal error occurred. Key generation failed. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSA2048_WrappedKeyPairGenerate()

```
fsp_err_t R_SCE_RSA2048_WrappedKeyPairGenerate ( sce_rsa2048_wrapped_pair_key_t *
wrapped_pair_key)
```

This API outputs a wrapped key pair for a 2048-bit RSA public key and private key pair. These keys are generated from a random value produced internally by the SCE. Consequently, there is no need to input a user key. Dead copying of data can be prevented by encrypting the data using the wrapped key output by this API. A public wrapped key is generated by wrapped_pair_key->pub_key, and a private wrapped key is generated by wrapped_pair_key->priv_key. As the public key exponent, only 0x00010001 is generated.

Parameters

| | | |
|----------|------------------|---|
| [in,out] | wrapped_pair_key | User key index for RSA 2048-bit public key and private key pair |
|----------|------------------|---|

Return values

| | |
|---------------------------------------|---|
| FSP_SUCCESS | Normal end |
| FSP_ERR_CRYPTTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTTO_SCE_FAIL | An internal error occurred. Key generation failed. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp192r1_WrappedKeyPairGenerate()

```
fsp_err_t R_SCE_ECC_secp192r1_WrappedKeyPairGenerate ( sce_ecc_wrapped_pair_key_t *
wrapped_pair_key)
```

This is an API for outputting a wrapped key pair for secp192r1 public key and private key pair. These keys are generated from a random number value internally within the SCE. There is therefore no need to input user keys. It is possible to prevent dead copying of data by using the wrapped key output by this API to encrypt the data. The public key index is generated in wrapped_pair_key->pub_key, and the private key index is generated in wrapped_pair_key->priv_key.

Parameters

| | | |
|----------|------------------|--|
| [in,out] | wrapped_pair_key | Wrapped pair key for secp192r1 public key and private key pair |
|----------|------------------|--|

Return values

| | |
|---------------------------------------|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTTO_SCE_FAIL | An internal error occurred. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp224r1_WrappedKeyPairGenerate()

`fsp_err_t R_SCE_ECC_secp224r1_WrappedKeyPairGenerate (sce_ecc_wrapped_pair_key_t * wrapped_pair_key)`

This is an API for outputting a wrapped key pair for secp224r1 public key and private key pair. These keys are generated from a random number value internally within the SCE. There is therefore no need to input user keys. It is possible to prevent dead copying of data by using the wrapped key output by this API to encrypt the data. The public key index is generated in `wrapped_pair_key->pub_key`, and the private key index is generated in `wrapped_pair_key->priv_key`.

Parameters

| | | |
|----------|-------------------------------|--|
| [in,out] | <code>wrapped_pair_key</code> | Wrapped pair key for secp224r1 public key and private key pair |
|----------|-------------------------------|--|

Return values

| | |
|---------------------------------------|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTTO_SCE_FAIL | An internal error occurred. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp256r1_WrappedKeyPairGenerate()

`fsp_err_t R_SCE_ECC_secp256r1_WrappedKeyPairGenerate (sce_ecc_wrapped_pair_key_t * wrapped_pair_key)`

This is an API for outputting a wrapped key pair for secp256r1 public key and private key pair. These keys are generated from a random number value internally within the SCE. There is therefore no need to input user keys. It is possible to prevent dead copying of data by using the wrapped key output by this API to encrypt the data. The public key index is generated in `wrapped_pair_key->pub_key`, and the private key index is generated in `wrapped_pair_key->priv_key`.

Parameters

| | | |
|----------|-------------------------------|--|
| [in,out] | <code>wrapped_pair_key</code> | Wrapped pair key for secp256r1 public key and private key pair |
|----------|-------------------------------|--|

Return values

| | |
|---------------------------------------|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTTO_SCE_FAIL | An internal error occurred. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp384r1_WrappedKeyPairGenerate()

```
fsp_err_t R_SCE_ECC_secp384r1_WrappedKeyPairGenerate ( sce_ecc_wrapped_pair_key_t *
wrapped_pair_key)
```

This is an API for outputting a wrapped key pair for secp384r1 public key and private key pair. These keys are generated from a random number value internally within the SCE. There is therefore no need to input user keys. It is possible to prevent dead copying of data by using the wrapped key output by this API to encrypt the data. The public key index is generated in wrapped_pair_key->pub_key, and the private key index is generated in wrapped_pair_key->priv_key.

Parameters

| | | |
|----------|------------------|--|
| [in,out] | wrapped_pair_key | Wrapped pair key for secp384r1 public key and private key pair |
|----------|------------------|--|

Return values

| | |
|-------------------------------------|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTOSCE_FAIL | An internal error occurred. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RandomNumberGenerate()

```
fsp_err_t R_SCE_RandomNumberGenerate ( uint32_t * random)
```

This API can generate 4 words random number.

Parameters

| | | |
|----------|--------|---------------------------------------|
| [in,out] | random | Stores 4words (16 bytes) random data. |
|----------|--------|---------------------------------------|

Return values

| | |
|-------------------------------------|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128_EncryptedKeyWrap()

```
fsp_err_t R_SCE_AES128_EncryptedKeyWrap ( uint8_t* initial_vector, uint8_t* encrypted_key,
sce_key_update_key_t* key_update_key, sce_aes_wrapped_key_t* wrapped_key )
```

This API wraps 128-bit AES key within the user routine.

Parameters

| | | |
|----------|----------------|---|
| [in] | initial_vector | Initialization vector when generating encrypted_key |
| [in] | encrypted_key | User key encrypted and MAC appended |
| [in] | key_update_key | Key update keyring |
| [in,out] | wrapped_key | 128-bit AES wrapped key |

Return values

| | |
|-------------------------------------|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTOSCE_FAIL | An internal error occurred. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256_EncryptedKeyWrap()

```
fsp_err_t R_SCE_AES256_EncryptedKeyWrap ( uint8_t* initial_vector, uint8_t* encrypted_key,
sce_key_update_key_t* key_update_key, sce_aes_wrapped_key_t* wrapped_key )
```

This API wraps 256-bit AES key within the user routine.

Parameters

| | | |
|----------|----------------|---|
| [in] | initial_vector | Initialization vector when generating encrypted_key |
| [in] | encrypted_key | User key encrypted and MAC appended |
| [in] | key_update_key | Key update keyring |
| [in,out] | wrapped_key | 256-bit AES wrapped key |

Return values

| | |
|-------------------------------------|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTOSCE_FAIL | An internal error occurred. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128_RFC3394KeyWrap()

```
fsp_err_t R_SCE_AES128_RFC3394KeyWrap ( sce_aes_wrapped_key_t* master_key, uint32_t
target_key_type, sce_aes_wrapped_key_t* target_key, uint32_t* rfc3394_wrapped_key )
```

This API wraps 128-bit AES key within the user routine.

Parameters

| | | |
|-------|---------------------|--------------------------------|
| [in] | master_key | AES-128 key used for wrapping. |
| [in] | target_key_type | Selects key to be wrapped. |
| [in] | target_key | Key to be wrapped. |
| [out] | rfc3394_wrapped_key | Wrapped key. |

Return values

| | |
|---------------------------------------|--|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_CRYPTTO_SCE_RESOURCE_CONFLICT | Resource conflict. |
| FSP_ERR_CRYPTTO_SCE_KEY_SET_FAIL | Input illegal user Key Generation Information. |
| FSP_ERR_CRYPTTO_SCE_FAIL | Internal error occurred. |

◆ R_SCE_AES256_RFC3394KeyWrap()

```
fsp_err_t R_SCE_AES256_RFC3394KeyWrap ( sce_aes_wrapped_key_t* master_key, uint32_t
target_key_type, sce_aes_wrapped_key_t* target_key, uint32_t* rfc3394_wrapped_key )
```

This API wraps 256-bit AES key within the user routine.

Parameters

| | | |
|-------|---------------------|--------------------------------|
| [in] | master_key | AES-256 key used for wrapping. |
| [in] | target_key_type | Selects key to be wrapped. |
| [in] | target_key | Key to be wrapped. |
| [out] | rfc3394_wrapped_key | Wrapped key. |

Return values

| | |
|---------------------------------------|--|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_CRYPTTO_SCE_RESOURCE_CONFLICT | Resource conflict. |
| FSP_ERR_CRYPTTO_SCE_KEY_SET_FAIL | Input illegal user Key Generation Information. |
| FSP_ERR_CRYPTTO_SCE_FAIL | Internal error occurred. |

◆ **R_SCE_AES128_RFC3394KeyUnwrap()**

```
fsp_err_t R_SCE_AES128_RFC3394KeyUnwrap ( sce_aes_wrapped_key_t * master_key, uint32_t
target_key_type, uint32_t * rfc3394_wrapped_key, sce_aes_wrapped_key_t * target_key )
```

This API unwraps 128-bit AES key within the user routine.

Parameters

| | | |
|-------|---------------------|----------------------------------|
| [in] | master_key | AES-128 key used for unwrapping. |
| [in] | target_key_type | Selects key to be unwrapped. |
| [in] | rfc3394_wrapped_key | Wrapped key. |
| [out] | target_key | Key to be unwrapped. |

Return values

| | |
|--------------------------------------|--|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_CRYPT0_SCE_RESOURCE_CONFLICT | Resource conflict. |
| FSP_ERR_CRYPT0_SCE_KEY_SET_FAIL | Input illegal user Key Generation Information. |
| FSP_ERR_CRYPT0_SCE_FAIL | Internal error occurred. |

◆ R_SCE_AES256_RFC3394KeyUnwrap()

```
fsp_err_t R_SCE_AES256_RFC3394KeyUnwrap ( sce_aes_wrapped_key_t * master_key, uint32_t
target_key_type, uint32_t * rfc3394_wrapped_key, sce_aes_wrapped_key_t * target_key )
```

This API unwraps 256-bit AES key within the user routine.

Parameters

| | | |
|-------|---------------------|----------------------------------|
| [in] | master_key | AES-256 key used for unwrapping. |
| [in] | target_key_type | Selects key to be unwrapped. |
| [in] | rfc3394_wrapped_key | Wrapped key. |
| [out] | target_key | Key to be unwrapped. |

Return values

| | |
|-------------------------------------|--|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT | Resource conflict. |
| FSP_ERR_CRYPTOSCE_KEY_SET_FAIL | Input illegal user Key Generation Information. |
| FSP_ERR_CRYPTOSCE_FAIL | Internal error occurred. |

◆ R_SCE_SHA256HMAC_EncryptedKeyWrap()

```
fsp_err_t R_SCE_SHA256HMAC_EncryptedKeyWrap ( uint8_t* initial_vector, uint8_t*
encrypted_key, sce_key_update_key_t* key_update_key, sce_hmac_sha_wrapped_key_t*
wrapped_key )
```

This API wraps HMAC-SHA256 key within the user routine.

Parameters

| | | |
|----------|----------------|---|
| [in] | initial_vector | Initialization vector when generating encrypted_key |
| [in] | encrypted_key | User key encrypted and MAC appended |
| [in] | key_update_key | Key update keyring |
| [in,out] | wrapped_key | HMAC-SHA256 wrapped key |

Return values

| | |
|-------------------------------------|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTOSCE_FAIL | An internal error occurred. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSA1024_EncryptedPublicKeyWrap()

```
fsp_err_t R_SCE_RSA1024_EncryptedPublicKeyWrap ( uint8_t * initial_vector, uint8_t *
encrypted_key, sce_key_update_key_t * key_update_key, sce_rsa1024_public_wrapped_key_t *
wrapped_key )
```

This API wraps 1024-bit RSA public key within the user routine.

Parameters

| | | |
|----------|----------------|---|
| [in] | initial_vector | Initialization vector when generating encrypted_key |
| [in] | encrypted_key | User key encrypted and MAC appended |
| [in] | key_update_key | Key update keyring |
| [in,out] | wrapped_key | 1024-bit RSA public wrapped key |

Return values

| | |
|---------------------------------------|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTTO_SCE_FAIL | An internal error occurred. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ **R_SCE_RSA1024_EncryptedPrivateKeyWrap()**

```
fsp_err_t R_SCE_RSA1024_EncryptedPrivateKeyWrap ( uint8_t* initial_vector, uint8_t*
encrypted_key, sce_key_update_key_t* key_update_key, sce_rsa1024_private_wrapped_key_t*
wrapped_key )
```

This API wraps 1024-bit RSA private key within the user routine.

Parameters

| | | |
|----------|----------------|---|
| [in] | initial_vector | Initialization vector when generating encrypted_key |
| [in] | encrypted_key | User key encrypted and MAC appended |
| [in] | key_update_key | Key update keyring |
| [in,out] | wrapped_key | 1024-bit RSA private wrapped key |

Return values

| | |
|-------------------------------------|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTOSCE_FAIL | An internal error occurred. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ **R_SCE_RSA2048_EncryptedPublicKeyWrap()**

```
fsp_err_t R_SCE_RSA2048_EncryptedPublicKeyWrap ( uint8_t * initial_vector, uint8_t *
encrypted_key, sce_key_update_key_t * key_update_key, sce_rsa2048_public_wrapped_key_t *
wrapped_key )
```

This API wraps 2048-bit RSA public key within the user routine.

Parameters

| | | |
|----------|----------------|---|
| [in] | initial_vector | Initialization vector when generating encrypted_key |
| [in] | encrypted_key | User key encrypted and MAC appended |
| [in] | key_update_key | Key update keyring |
| [in,out] | wrapped_key | 1024-bit RSA public wrapped key |

Return values

| | |
|-------------------------------------|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTOSCE_FAIL | An internal error occurred. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ **R_SCE_RSA2048_EncryptedPrivateKeyWrap()**

```
fsp_err_t R_SCE_RSA2048_EncryptedPrivateKeyWrap ( uint8_t* initial_vector, uint8_t*
encrypted_key, sce_key_update_key_t* key_update_key, sce_rsa2048_private_wrapped_key_t*
wrapped_key )
```

This API wraps 2048-bit RSA private key within the user routine.

Parameters

| | | |
|----------|----------------|---|
| [in] | initial_vector | Initialization vector when generating encrypted_key |
| [in] | encrypted_key | User key encrypted and MAC appended |
| [in] | key_update_key | Key update keyring |
| [in,out] | wrapped_key | 2048-bit RSA private wrapped key |

Return values

| | |
|-------------------------------------|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTOSCE_FAIL | An internal error occurred. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ **R_SCE_RSA3072_EncryptedPublicKeyWrap()**

```
fsp_err_t R_SCE_RSA3072_EncryptedPublicKeyWrap ( uint8_t * initial_vector, uint8_t *
encrypted_key, sce_key_update_key_t * key_update_key, sce_rsa3072_public_wrapped_key_t *
wrapped_key )
```

This API wraps 3072-bit RSA public key within the user routine.

Parameters

| | | |
|----------|----------------|---|
| [in] | initial_vector | Initialization vector when generating encrypted_key |
| [in] | encrypted_key | User key encrypted and MAC appended |
| [in] | key_update_key | Key update keyring |
| [in,out] | wrapped_key | 3072-bit RSA public wrapped key |

Return values

| | |
|-------------------------------------|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTOSCE_FAIL | An internal error occurred. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ **R_SCE_RSA4096_EncryptedPublicKeyWrap()**

```
fsp_err_t R_SCE_RSA4096_EncryptedPublicKeyWrap ( uint8_t * initial_vector, uint8_t *
encrypted_key, sce_key_update_key_t * key_update_key, sce_rsa4096_public_wrapped_key_t *
wrapped_key )
```

This API wraps 4096-bit RSA public key within the user routine.

Parameters

| | | |
|----------|----------------|---|
| [in] | initial_vector | Initialization vector when generating encrypted_key |
| [in] | encrypted_key | User key encrypted and MAC appended |
| [in] | key_update_key | Key update keyring |
| [in,out] | wrapped_key | 1024-bit RSA public wrapped key |

Return values

| | |
|-------------------------------------|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTOSCE_FAIL | An internal error occurred. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp192r1_EncryptedPublicKeyWrap()

```
fsp_err_t R_SCE_ECC_secp192r1_EncryptedPublicKeyWrap ( uint8_t * initial_vector, uint8_t *
encrypted_key, sce_key_update_key_t * key_update_key, sce_ecc_public_wrapped_key_t *
wrapped_key )
```

This API wraps secp192r1 public key within the user routine.

Parameters

| | | |
|----------|----------------|---|
| [in] | initial_vector | Initialization vector when generating encrypted_key |
| [in] | encrypted_key | User key encrypted and MAC appended |
| [in] | key_update_key | Key update keyring |
| [in,out] | wrapped_key | secp192r1 public wrapped key |

Return values

| | |
|-------------------------------------|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTOSCE_FAIL | An internal error occurred. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp224r1_EncryptedPublicKeyWrap()

```
fsp_err_t R_SCE_ECC_secp224r1_EncryptedPublicKeyWrap ( uint8_t * initial_vector, uint8_t *
encrypted_key, sce_key_update_key_t * key_update_key, sce_ecc_public_wrapped_key_t *
wrapped_key )
```

This API wraps secp224r1 public key within the user routine.

Parameters

| | | |
|----------|----------------|---|
| [in] | initial_vector | Initialization vector when generating encrypted_key |
| [in] | encrypted_key | User key encrypted and MAC appended |
| [in] | key_update_key | Key update keyring |
| [in,out] | wrapped_key | secp224r1 public wrapped key |

Return values

| | |
|-------------------------------------|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTOSCE_FAIL | An internal error occurred. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp256r1_EncryptedPublicKeyWrap()

```
fsp_err_t R_SCE_ECC_secp256r1_EncryptedPublicKeyWrap ( uint8_t * initial_vector, uint8_t *
encrypted_key, sce_key_update_key_t * key_update_key, sce_ecc_public_wrapped_key_t *
wrapped_key )
```

This API wraps secp256r1 public key within the user routine.

Parameters

| | | |
|----------|----------------|---|
| [in] | initial_vector | Initialization vector when generating encrypted_key |
| [in] | encrypted_key | User key encrypted and MAC appended |
| [in] | key_update_key | Key update keyring |
| [in,out] | wrapped_key | secp256r1 public wrapped key |

Return values

| | |
|---------------------------------------|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTTO_SCE_FAIL | An internal error occurred. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ **R_SCE_ECC_secp384r1_EncryptedPublicKeyWrap()**

```
fsp_err_t R_SCE_ECC_secp384r1_EncryptedPublicKeyWrap ( uint8_t * initial_vector, uint8_t *
encrypted_key, sce_key_update_key_t * key_update_key, sce_ecc_public_wrapped_key_t *
wrapped_key )
```

This API wraps secp384r1 public key within the user routine.

Parameters

| | | |
|----------|----------------|---|
| [in] | initial_vector | Initialization vector when generating encrypted_key |
| [in] | encrypted_key | User key encrypted and MAC appended |
| [in] | key_update_key | Key update keyring |
| [in,out] | wrapped_key | secp384r1 public wrapped key |

Return values

| | |
|-------------------------------------|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTOSCE_FAIL | An internal error occurred. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp192r1_EncryptedPrivateKeyWrap()

```
fsp_err_t R_SCE_ECC_secp192r1_EncryptedPrivateKeyWrap ( uint8_t * initial_vector, uint8_t *
encrypted_key, sce_key_update_key_t * key_update_key, sce_ecc_private_wrapped_key_t *
wrapped_key )
```

This API wraps secp192r1 private key within the user routine.

Parameters

| | | |
|----------|----------------|---|
| [in] | initial_vector | Initialization vector when generating encrypted_key |
| [in] | encrypted_key | User key encrypted and MAC appended |
| [in] | key_update_key | Key update keyring |
| [in,out] | wrapped_key | secp192r1 private wrapped key |

Return values

| | |
|-------------------------------------|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTOSCE_FAIL | An internal error occurred. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp224r1_EncryptedPrivateKeyWrap()

```
fsp_err_t R_SCE_ECC_secp224r1_EncryptedPrivateKeyWrap ( uint8_t * initial_vector, uint8_t *
encrypted_key, sce_key_update_key_t * key_update_key, sce_ecc_private_wrapped_key_t *
wrapped_key )
```

This API wraps secp224r1 private key within the user routine.

Parameters

| | | |
|----------|----------------|---|
| [in] | initial_vector | Initialization vector when generating encrypted_key |
| [in] | encrypted_key | User key encrypted and MAC appended |
| [in] | key_update_key | Key update keyring |
| [in,out] | wrapped_key | secp224r1 private wrapped key |

Return values

| | |
|-------------------------------------|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTOSCE_FAIL | An internal error occurred. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp256r1_EncryptedPrivateKeyWrap()

```
fsp_err_t R_SCE_ECC_secp256r1_EncryptedPrivateKeyWrap ( uint8_t * initial_vector, uint8_t *
encrypted_key, sce_key_update_key_t * key_update_key, sce_ecc_private_wrapped_key_t *
wrapped_key )
```

This API wraps secp256r1 private key within the user routine.

Parameters

| | | |
|----------|----------------|---|
| [in] | initial_vector | Initialization vector when generating encrypted_key |
| [in] | encrypted_key | User key encrypted and MAC appended |
| [in] | key_update_key | Key update keyring |
| [in,out] | wrapped_key | secp256r1 private wrapped key |

Return values

| | |
|-------------------------------------|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTOSCE_FAIL | An internal error occurred. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp384r1_EncryptedPrivateKeyWrap()

```
fsp_err_t R_SCE_ECC_secp384r1_EncryptedPrivateKeyWrap ( uint8_t * initial_vector, uint8_t *
encrypted_key, sce_key_update_key_t * key_update_key, sce_ecc_private_wrapped_key_t *
wrapped_key )
```

This API wraps secp384r1 private key within the user routine.

Parameters

| | | |
|----------|----------------|---|
| [in] | initial_vector | Initialization vector when generating encrypted_key |
| [in] | encrypted_key | User key encrypted and MAC appended |
| [in] | key_update_key | Key update keyring |
| [in,out] | wrapped_key | secp384r1 private wrapped key |

Return values

| | |
|-------------------------------------|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTOSCE_FAIL | An internal error occurred. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ **R_SCE_AES128ECB_EncryptInit()**

```
fsp_err_t R_SCE_AES128ECB_EncryptInit ( sce_aes_handle_t * handle, sce_aes_wrapped_key_t * wrapped_key )
```

The `R_SCE_AES128ECB_EncryptInit()` function performs preparations for the execution of an AES calculation, and writes the result to the first argument, `handle`. The value of `handle` is used as an argument in the subsequent `R_SCE_AES128ECB_EncryptUpdate()` function and `R_SCE_AES128ECB_EncryptFinal()` function.

Parameters

| | | |
|----------|--------------------------|-------------------------|
| [in,out] | <code>handle</code> | AES handler (work area) |
| [in] | <code>wrapped_key</code> | 128-bit AES wrapped key |

Return values

| | |
|-------------------------------------|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTOSCE_KEY_SET_FAIL | Input illegal wrapped key. |
| FSP_ERR_CRYPTOSCE_FAIL | Internal error occurred. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128ECB_EncryptUpdate()

```
fsp_err_t R_SCE_AES128ECB_EncryptUpdate ( sce_aes_handle_t * handle, uint8_t * plain, uint8_t * cipher, uint32_t plain_length )
```

The `R_SCE_AES128ECB_EncryptUpdate()` function encrypts the second argument, `plain`, utilizing the key index stored in the handle specified in the first argument, `handle`, and writes the ongoing status to this first argument. In addition, it writes the encryption result to the third argument, `cipher`. After plaintext input is completed, call `R_SCE_AES128ECB_EncryptFinal()`.

Specify areas for `plain` and `cipher` that do not overlap. For `plain` and `cipher`, specify RAM addresses that are multiples of 4.

Parameters

| | | |
|----------|--------------|--|
| [in,out] | handle | AES handler (work area) |
| [in] | plain | plaintext data area |
| [in,out] | cipher | ciphertext data area |
| [in,out] | plain_length | plaintext data length (must be a multiple of 16) |

Return values

| | |
|-------------------------------------|---------------------------------|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTOSCE_PARAMETER | Input data is illegal. |
| FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION | An invalid function was called. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ **R_SCE_AES128ECB_EncryptFinal()**

```
fsp_err_t R_SCE_AES128ECB_EncryptFinal ( sce_aes_handle_t * handle, uint8_t * cipher, uint32_t * cipher_length )
```

Using the handle specified in the first argument, handle, the [R_SCE_AES128ECB_EncryptFinal\(\)](#) function writes the calculation result to the second argument, cipher, and writes the length of the calculation result to the third argument, cipher_length. The original intent was for a portion of the encryption result that was not a multiple of 16 bytes to be written to the second argument. However, as a result of the restriction that only multiples of 16 can be input to the Update function, nothing is ever written to cipher, and 0 is always written to cipher_length. The arguments cipher and cipher_length are provided for compatibility in anticipation of the time when this restriction is lifted.

Parameters

| | | |
|----------|---------------|--|
| [in,out] | handle | AES handler (work area) |
| [in,out] | cipher | ciphertext data area (nothing ever written here) |
| [in,out] | cipher_length | ciphertext data length (0 always written here) |

Return values

| | |
|---------------------------------------|---------------------------------|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTTO_SCE_FAIL | An internal error occurred. |
| FSP_ERR_CRYPTTO_SCE_PARAMETER | Input data is illegal. |
| FSP_ERR_CRYPTTO_SCE_PROHIBIT_FUNCTION | An invalid function was called. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128ECB_DecryptInit()

```
fsp_err_t R_SCE_AES128ECB_DecryptInit ( sce_aes_handle_t * handle, sce_aes_wrapped_key_t * wrapped_key )
```

The `R_SCE_AES128ECB_DecryptInit()` function performs preparations for the execution of an AES calculation, and writes the result to the first argument, `handle`. The value of `handle` is used as an argument in the subsequent `R_SCE_AES128ECB_DecryptUpdate()` function and `R_SCE_AES128ECB_DecryptFinal()` function.

Parameters

| | | |
|----------|--------------------------|-------------------------|
| [in,out] | <code>handle</code> | AES handler (work area) |
| [in] | <code>wrapped_key</code> | 128-bit AES wrapped key |

Return values

| | |
|-------------------------------------|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTOSCE_KEY_SET_FAIL | Input illegal wrapped key. |
| FSP_ERR_CRYPTOSCE_FAIL | Internal error occurred. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ **R_SCE_AES128ECB_DecryptUpdate()**

```
fsp_err_t R_SCE_AES128ECB_DecryptUpdate ( sce_aes_handle_t * handle, uint8_t * cipher, uint8_t * plain, uint32_t cipher_length )
```

The **R_SCE_AES128ECB_DecryptUpdate()** function decrypts the second argument, cipher, utilizing the key index stored in the handle specified in the first argument, handle, and writes the ongoing status to this first argument. In addition, it writes the decryption result to the third argument, plain. After plaintext input is completed, call **R_SCE_AES128ECB_DecryptFinal()**.

Specify areas for plain and cipher that do not overlap. For plain and cipher, specify RAM addresses that are multiples of 4.

Parameters

| | | |
|----------|---------------|---|
| [in,out] | handle | AES handler (work area) |
| [in] | cipher | ciphertext data area |
| [in,out] | plain | plaintext data area |
| [in,out] | cipher_length | ciphertext data length (must be a multiple of 16) |

Return values

| | |
|---------------------------------------|---------------------------------|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTTO_SCE_PARAMETER | Input data is illegal. |
| FSP_ERR_CRYPTTO_SCE_PROHIBIT_FUNCTION | An invalid function was called. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ **R_SCE_AES128ECB_DecryptFinal()**

```
fsp_err_t R_SCE_AES128ECB_DecryptFinal ( sce_aes_handle_t * handle, uint8_t * plain, uint32_t * plain_length )
```

Using the handle specified in the first argument, handle, the [R_SCE_AES128ECB_DecryptFinal\(\)](#) function writes the calculation result to the second argument, plain, and writes the length of the calculation result to the third argument, plain_length. The original intent was for a portion of the decryption result that was not a multiple of 16 bytes to be written to the second argument. However, as a result of the restriction that only multiples of 16 can be input to the Update function, nothing is ever written to plain, and 0 is always written to plain_length. The arguments plain and plain_length are provided for compatibility in anticipation of the time when this restriction is lifted.

Parameters

| | | |
|----------|--------------|---|
| [in,out] | handle | AES handler (work area) |
| [in,out] | plain | plaintext data area (nothing ever written here) |
| [in,out] | plain_length | plaintext data length (0 always written here) |

Return values

| | |
|-------------------------------------|---------------------------------|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTOSCE_FAIL | An internal error occurred. |
| FSP_ERR_CRYPTOSCE_PARAMETER | Input data is illegal. |
| FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION | An invalid function was called. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ **R_SCE_AES256ECB_EncryptInit()**

```
fsp_err_t R_SCE_AES256ECB_EncryptInit ( sce_aes_handle_t * handle, sce_aes_wrapped_key_t * wrapped_key )
```

The `R_SCE_AES256ECB_EncryptInit()` function performs preparations for the execution of an AES calculation, and writes the result to the first argument, `handle`. The value of `handle` is used as an argument in the subsequent `R_SCE_AES256ECB_EncryptUpdate()` function and `R_SCE_AES256ECB_EncryptFinal()` function.

Parameters

| | | |
|----------|--------------------------|-------------------------|
| [in,out] | <code>handle</code> | AES handler (work area) |
| [in] | <code>wrapped_key</code> | 128-bit AES wrapped key |

Return values

| | |
|-------------------------------------|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTOSCE_KEY_SET_FAIL | Input illegal wrapped key. |
| FSP_ERR_CRYPTOSCE_FAIL | Internal error occurred. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256ECB_EncryptUpdate()

```
fsp_err_t R_SCE_AES256ECB_EncryptUpdate ( sce_aes_handle_t * handle, uint8_t * plain, uint8_t * cipher, uint32_t plain_length )
```

The `R_SCE_AES256ECB_EncryptUpdate()` function encrypts the second argument, `plain`, utilizing the key index stored in the handle specified in the first argument, `handle`, and writes the ongoing status to this first argument. In addition, it writes the encryption result to the third argument, `cipher`. After plaintext input is completed, call `R_SCE_AES256ECB_EncryptFinal()`.

Specify areas for `plain` and `cipher` that do not overlap. For `plain` and `cipher`, specify RAM addresses that are multiples of 4.

Parameters

| | | |
|----------|---------------------------|--|
| [in,out] | <code>handle</code> | AES handler (work area) |
| [in] | <code>plain</code> | plaintext data area |
| [in,out] | <code>cipher</code> | ciphertext data area |
| [in,out] | <code>plain_length</code> | plaintext data length (must be a multiple of 16) |

Return values

| | |
|---------------------------------------|---------------------------------|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTTO_SCE_PARAMETER | Input data is illegal. |
| FSP_ERR_CRYPTTO_SCE_PROHIBIT_FUNCTION | An invalid function was called. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ **R_SCE_AES256ECB_EncryptFinal()**

```
fsp_err_t R_SCE_AES256ECB_EncryptFinal ( sce_aes_handle_t * handle, uint8_t * cipher, uint32_t * cipher_length )
```

Using the handle specified in the first argument, handle, the [R_SCE_AES256ECB_EncryptFinal\(\)](#) function writes the calculation result to the second argument, cipher, and writes the length of the calculation result to the third argument, cipher_length. The original intent was for a portion of the encryption result that was not a multiple of 16 bytes to be written to the second argument. However, as a result of the restriction that only multiples of 16 can be input to the Update function, nothing is ever written to cipher, and 0 is always written to cipher_length. The arguments cipher and cipher_length are provided for compatibility in anticipation of the time when this restriction is lifted.

Parameters

| | | |
|----------|---------------|--|
| [in,out] | handle | AES handler (work area) |
| [in,out] | cipher | ciphertext data area (nothing ever written here) |
| [in,out] | cipher_length | ciphertext data length (0 always written here) |

Return values

| | |
|---------------------------------------|---------------------------------|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTTO_SCE_FAIL | An internal error occurred. |
| FSP_ERR_CRYPTTO_SCE_PARAMETER | Input data is illegal. |
| FSP_ERR_CRYPTTO_SCE_PROHIBIT_FUNCTION | An invalid function was called. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256ECB_DecryptInit()

```
fsp_err_t R_SCE_AES256ECB_DecryptInit ( sce_aes_handle_t * handle, sce_aes_wrapped_key_t * wrapped_key )
```

The `R_SCE_AES128ECB_DecryptInit()` function performs preparations for the execution of an AES calculation, and writes the result to the first argument, `handle`. The value of `handle` is used as an argument in the subsequent `R_SCE_AES128ECB_DecryptUpdate()` function and `R_SCE_AES128ECB_DecryptFinal()` function.

Parameters

| | | |
|----------|--------------------------|-------------------------|
| [in,out] | <code>handle</code> | AES handler (work area) |
| [in] | <code>wrapped_key</code> | 128-bit AES wrapped key |

Return values

| | |
|-------------------------------------|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTOSCE_KEY_SET_FAIL | Input illegal wrapped key. |
| FSP_ERR_CRYPTOSCE_FAIL | Internal error occurred. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256ECB_DecryptUpdate()

```
fsp_err_t R_SCE_AES256ECB_DecryptUpdate ( sce_aes_handle_t * handle, uint8_t * cipher, uint8_t * plain, uint32_t cipher_length )
```

The `R_SCE_AES256ECB_DecryptUpdate()` function decrypts the second argument, `cipher`, utilizing the key index stored in the handle specified in the first argument, `handle`, and writes the ongoing status to this first argument. In addition, it writes the decryption result to the third argument, `plain`. After plaintext input is completed, call `R_SCE_AES256ECB_DecryptFinal()`.

Specify areas for `plain` and `cipher` that do not overlap. For `plain` and `cipher`, specify RAM addresses that are multiples of 4.

Parameters

| | | |
|----------|---------------|---|
| [in,out] | handle | AES handler (work area) |
| [in] | cipher | ciphertext data area |
| [in,out] | plain | plaintext data area |
| [in,out] | cipher_length | ciphertext data length (must be a multiple of 16) |

Return values

| | |
|---------------------------------------|---------------------------------|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTTO_SCE_PARAMETER | Input data is illegal. |
| FSP_ERR_CRYPTTO_SCE_PROHIBIT_FUNCTION | An invalid function was called. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ **R_SCE_AES256ECB_DecryptFinal()**

```
fsp_err_t R_SCE_AES256ECB_DecryptFinal ( sce_aes_handle_t * handle, uint8_t * plain, uint32_t * plain_length )
```

Using the handle specified in the first argument, handle, the [R_SCE_AES256ECB_DecryptFinal\(\)](#) function writes the calculation result to the second argument, plain, and writes the length of the calculation result to the third argument, plain_length. The original intent was for a portion of the decryption result that was not a multiple of 16 bytes to be written to the second argument. However, as a result of the restriction that only multiples of 16 can be input to the Update function, nothing is ever written to plain, and 0 is always written to plain_length. The arguments plain and plain_length are provided for compatibility in anticipation of the time when this restriction is lifted.

Parameters

| | | |
|----------|--------------|---|
| [in,out] | handle | AES handler (work area) |
| [in,out] | plain | plaintext data area (nothing ever written here) |
| [in,out] | plain_length | plaintext data length (0 always written here) |

Return values

| | |
|-------------------------------------|---------------------------------|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTOSCE_FAIL | An internal error occurred. |
| FSP_ERR_CRYPTOSCE_PARAMETER | Input data is illegal. |
| FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION | An invalid function was called. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CBC_EncryptInit()

```
fsp_err_t R_SCE_AES128CBC_EncryptInit ( sce_aes_handle_t * handle, sce_aes_wrapped_key_t * wrapped_key, uint8_t * initial_vector )
```

The R_SCE_AES128CBC_EncryptInit() function performs preparations for the execution of an AES calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R_SCE_AES128CBC_EncryptUpdate() function and R_SCE_AES128CBC_EncryptFinal() function.

Parameters

| | | |
|----------|----------------|-------------------------------------|
| [in,out] | handle | AES handler (work area) |
| [in] | wrapped_key | 128-bit AES wrapped key |
| [in] | initial_vector | initialization vector area (16byte) |

Return values

| | |
|-------------------------------------|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTOSCE_KEY_SET_FAIL | Input illegal wrapped key. |
| FSP_ERR_CRYPTOSCE_FAIL | Internal error occurred. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CBC_EncryptUpdate()

```
fsp_err_t R_SCE_AES128CBC_EncryptUpdate ( sce_aes_handle_t * handle, uint8_t * plain, uint8_t * cipher, uint32_t plain_length )
```

The `R_SCE_AES128CBC_EncryptUpdate()` function encrypts the second argument, `plain`, utilizing the key index stored in the handle specified in the first argument, `handle`, and writes the ongoing status to this first argument. In addition, it writes the encryption result to the third argument, `cipher`. After plaintext input is completed, call `R_SCE_AES128CBC_EncryptFinal()`.

Specify areas for `plain` and `cipher` that do not overlap. For `plain` and `cipher`, specify RAM addresses that are multiples of 4.

Parameters

| | | |
|----------|---------------------------|--|
| [in,out] | <code>handle</code> | AES handler (work area) |
| [in] | <code>plain</code> | plaintext data area |
| [in,out] | <code>cipher</code> | ciphertext data area |
| [in,out] | <code>plain_length</code> | plaintext data length (must be a multiple of 16) |

Return values

| | |
|--|---------------------------------|
| <code>FSP_SUCCESS</code> | Normal termination |
| <code>FSP_ERR_CRYPT_SCE_PARAMETER</code> | Input data is illegal. |
| <code>FSP_ERR_CRYPT_SCE_PROHIBIT_FUNCTION</code> | An invalid function was called. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ **R_SCE_AES128CBC_EncryptFinal()**

```
fsp_err_t R_SCE_AES128CBC_EncryptFinal ( sce_aes_handle_t * handle, uint8_t * cipher, uint32_t * cipher_length )
```

Using the handle specified in the first argument, handle, the [R_SCE_AES128CBC_EncryptFinal\(\)](#) function writes the calculation result to the second argument, cipher, and writes the length of the calculation result to the third argument, cipher_length. The original intent was for a portion of the encryption result that was not a multiple of 16 bytes to be written to the second argument. However, as a result of the restriction that only multiples of 16 can be input to the Update function, nothing is ever written to cipher, and 0 is always written to cipher_length. The arguments cipher and cipher_length are provided for compatibility in anticipation of the time when this restriction is lifted.

Parameters

| | | |
|----------|---------------|--|
| [in,out] | handle | AES handler (work area) |
| [in,out] | cipher | ciphertext data area (nothing ever written here) |
| [in,out] | cipher_length | ciphertext data length (0 always written here) |

Return values

| | |
|---------------------------------------|---------------------------------|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTTO_SCE_FAIL | An internal error occurred. |
| FSP_ERR_CRYPTTO_SCE_PARAMETER | Input data is illegal. |
| FSP_ERR_CRYPTTO_SCE_PROHIBIT_FUNCTION | An invalid function was called. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CBC_DecryptInit()

```
fsp_err_t R_SCE_AES128CBC_DecryptInit ( sce_aes_handle_t * handle, sce_aes_wrapped_key_t * wrapped_key, uint8_t * initial_vector )
```

The R_SCE_AES128CBC_DecryptInit() function performs preparations for the execution of an AES calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R_SCE_AES128CBC_DecryptUpdate() function and R_SCE_AES128CBC_DecryptFinal() function.

Parameters

| | | |
|----------|----------------|-------------------------------------|
| [in,out] | handle | AES handler (work area) |
| [in] | wrapped_key | 128-bit AES wrapped key |
| [in] | initial_vector | initialization vector area (16byte) |

Return values

| | |
|-------------------------------------|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTOSCE_KEY_SET_FAIL | Input illegal wrapped key. |
| FSP_ERR_CRYPTOSCE_FAIL | Internal error occurred. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CBC_DecryptUpdate()

```
fsp_err_t R_SCE_AES128CBC_DecryptUpdate ( sce_aes_handle_t* handle, uint8_t* cipher, uint8_t* plain, uint32_t cipher_length )
```

The `R_SCE_AES128CBC_DecryptUpdate()` function decrypts the second argument, `cipher`, utilizing the key index stored in the handle specified in the first argument, `handle`, and writes the ongoing status to this first argument. In addition, it writes the decryption result to the third argument, `plain`. After plaintext input is completed, call `R_SCE_AES128CBC_DecryptFinal()`.

Specify areas for `plain` and `cipher` that do not overlap. For `plain` and `cipher`, specify RAM addresses that are multiples of 4.

Parameters

| | | |
|----------|---------------|---|
| [in,out] | handle | AES handler (work area) |
| [in] | cipher | ciphertext data area |
| [in,out] | plain | plaintext data area |
| [in,out] | cipher_length | ciphertext data length (must be a multiple of 16) |

Return values

| | |
|---------------------------------------|---------------------------------|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTTO_SCE_PARAMETER | Input data is illegal. |
| FSP_ERR_CRYPTTO_SCE_PROHIBIT_FUNCTION | An invalid function was called. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ **R_SCE_AES128CBC_DecryptFinal()**

```
fsp_err_t R_SCE_AES128CBC_DecryptFinal ( sce_aes_handle_t * handle, uint8_t * plain, uint32_t * plain_length )
```

Using the handle specified in the first argument, handle, the [R_SCE_AES128CBC_DecryptFinal\(\)](#) function writes the calculation result to the second argument, plain, and writes the length of the calculation result to the third argument, plain_length. The original intent was for a portion of the decryption result that was not a multiple of 16 bytes to be written to the second argument. However, as a result of the restriction that only multiples of 16 can be input to the Update function, nothing is ever written to plain, and 0 is always written to plain_length. The arguments plain and plain_length are provided for compatibility in anticipation of the time when this restriction is lifted.

Parameters

| | | |
|----------|--------------|---|
| [in,out] | handle | AES handler (work area) |
| [in,out] | plain | plaintext data area (nothing ever written here) |
| [in,out] | plain_length | plaintext data length (0 always written here) |

Return values

| | |
|-------------------------------------|---------------------------------|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTOSCE_FAIL | An internal error occurred. |
| FSP_ERR_CRYPTOSCE_PARAMETER | Input data is illegal. |
| FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION | An invalid function was called. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CBC_EncryptInit()

```
fsp_err_t R_SCE_AES256CBC_EncryptInit ( sce_aes_handle_t* handle, sce_aes_wrapped_key_t* wrapped_key, uint8_t* initial_vector )
```

The R_SCE_AES256CBC_EncryptInit() function performs preparations for the execution of an AES calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R_SCE_AES256CBC_EncryptUpdate() function and R_SCE_AES256CBC_EncryptFinal() function.

Parameters

| | | |
|----------|----------------|------------------------------|
| [in,out] | handle | AES handler (work area) |
| [in] | wrapped_key | 256-bit AES wrapped key |
| [in] | initial_vector | initial vector area (16byte) |

Return values

| | |
|---------------------------------------|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTTO_SCE_KEY_SET_FAIL | Input illegal wrapped key. |
| FSP_ERR_CRYPTTO_SCE_FAIL | Internal error occurred. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ **R_SCE_AES256CBC_EncryptUpdate()**

```
fsp_err_t R_SCE_AES256CBC_EncryptUpdate ( sce_aes_handle_t * handle, uint8_t * plain, uint8_t *
cipher, uint32_t plain_length )
```

The `R_SCE_AES256CBC_EncryptUpdate()` function encrypts the second argument, `plain`, utilizing the key index stored in the `handle` specified in the first argument, `handle`, and writes the ongoing status to this first argument. In addition, it writes the encryption result to the third argument, `cipher`. After plaintext input is completed, call `R_SCE_AES256CBC_EncryptFinal()`.

Specify areas for `plain` and `cipher` that do not overlap. For `plain` and `cipher`, specify RAM addresses that are multiples of 4.

Parameters

| | | |
|----------|---------------------------|--|
| [in,out] | <code>handle</code> | AES handler (work area) |
| [in] | <code>plain</code> | plaintext data area |
| [in,out] | <code>cipher</code> | ciphertext data area |
| [in,out] | <code>plain_length</code> | plaintext data length (must be a multiple of 16) |

Return values

| | |
|--|---------------------------------|
| <code>FSP_SUCCESS</code> | Normal termination |
| <code>FSP_ERR_CRYPTTO_SCE_PARAMETER</code> | Input data is illegal. |
| <code>FSP_ERR_CRYPTTO_SCE_PROHIBIT_FUNCTION</code> | An invalid function was called. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ **R_SCE_AES256CBC_EncryptFinal()**

```
fsp_err_t R_SCE_AES256CBC_EncryptFinal ( sce_aes_handle_t * handle, uint8_t * cipher, uint32_t * cipher_length )
```

Using the handle specified in the first argument, handle, the **R_SCE_AES256CBC_EncryptFinal()** function writes the calculation result to the second argument, cipher, and writes the length of the calculation result to the third argument, cipher_length. The original intent was for a portion of the encryption result that was not a multiple of 16 bytes to be written to the second argument. However, as a result of the restriction that only multiples of 16 can be input to the Update function, nothing is ever written to cipher, and 0 is always written to cipher_length. The arguments cipher and cipher_length are provided for compatibility in anticipation of the time when this restriction is lifted.

Parameters

| | | |
|----------|---------------|--|
| [in,out] | handle | AES handler (work area) |
| [in,out] | cipher | ciphertext data area (nothing ever written here) |
| [in,out] | cipher_length | ciphertext data length (0 always written here) |

Return values

| | |
|---------------------------------------|---------------------------------|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTTO_SCE_FAIL | An internal error occurred. |
| FSP_ERR_CRYPTTO_SCE_PARAMETER | Input data is illegal. |
| FSP_ERR_CRYPTTO_SCE_PROHIBIT_FUNCTION | An invalid function was called. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CBC_DecryptInit()

```
fsp_err_t R_SCE_AES256CBC_DecryptInit ( sce_aes_handle_t * handle, sce_aes_wrapped_key_t * wrapped_key, uint8_t * initial_vector )
```

The R_SCE_AES256CBC_DecryptInit() function performs preparations for the execution of an AES calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R_SCE_AES256CBC_DecryptUpdate() function and R_SCE_AES256CBC_DecryptFinal() function.

Parameters

| | | |
|----------|----------------|-------------------------------------|
| [in,out] | handle | AES handler (work area) |
| [in] | wrapped_key | 256-bit AES wrapped key |
| [in] | initial_vector | initialization vector area (16byte) |

Return values

| | |
|-------------------------------------|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTOSCE_KEY_SET_FAIL | Input illegal wrapped key. |
| FSP_ERR_CRYPTOSCE_FAIL | Internal error occurred. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CBC_DecryptUpdate()

```
fsp_err_t R_SCE_AES256CBC_DecryptUpdate ( sce_aes_handle_t* handle, uint8_t* cipher, uint8_t* plain, uint32_t cipher_length )
```

The `R_SCE_AES256CBC_DecryptUpdate()` function decrypts the second argument, `cipher`, utilizing the key index stored in the `handle` specified in the first argument, `handle`, and writes the ongoing status to this first argument. In addition, it writes the decryption result to the third argument, `plain`. After plaintext input is completed, call `R_SCE_AES256CBC_DecryptFinal()`.

Specify areas for `plain` and `cipher` that do not overlap. For `plain` and `cipher`, specify RAM addresses that are multiples of 4.

Parameters

| | | |
|----------|----------------------------|---|
| [in,out] | <code>handle</code> | AES handler (work area) |
| [in] | <code>cipher</code> | ciphertext data area |
| [in,out] | <code>plain</code> | plaintext data area |
| [in,out] | <code>cipher_length</code> | ciphertext data length (must be a multiple of 16) |

Return values

| | |
|---------------------------------------|---------------------------------|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTTO_SCE_PARAMETER | Input data is illegal. |
| FSP_ERR_CRYPTTO_SCE_PROHIBIT_FUNCTION | An invalid function was called. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ **R_SCE_AES256CBC_DecryptFinal()**

```
fsp_err_t R_SCE_AES256CBC_DecryptFinal ( sce_aes_handle_t * handle, uint8_t * plain, uint32_t * plain_length )
```

Using the handle specified in the first argument, handle, the [R_SCE_AES256CBC_DecryptFinal\(\)](#) function writes the calculation result to the second argument, plain, and writes the length of the calculation result to the third argument, plain_length. The original intent was for a portion of the decryption result that was not a multiple of 16 bytes to be written to the second argument. However, as a result of the restriction that only multiples of 16 can be input to the Update function, nothing is ever written to plain, and 0 is always written to plain_length. The arguments plain and plain_length are provided for compatibility in anticipation of the time when this restriction is lifted.

Parameters

| | | |
|----------|--------------|---|
| [in,out] | handle | AES handler (work area) |
| [in,out] | plain | plaintext data area (nothing ever written here) |
| [in,out] | plain_length | plaintext data length (0 always written here) |

Return values

| | |
|-------------------------------------|---------------------------------|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTOSCE_FAIL | An internal error occurred. |
| FSP_ERR_CRYPTOSCE_PARAMETER | Input data is illegal. |
| FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION | An invalid function was called. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128GCM_EncryptInit()

```
fsp_err_t R_SCE_AES128GCM_EncryptInit ( sce_gcm_handle_t * handle, sce_aes_wrapped_key_t *
wrapped_key, uint8_t * initial_vector, uint32_t initial_vector_length )
```

The R_SCE_AES128GCM_EncryptInit() function performs preparations for the execution of an GCM calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R_SCE_AES128GCM_EncryptUpdate() function and R_SCE_AES128GCM_EncryptFinal() function.

Parameters

| | | |
|----------|-----------------------|---|
| [in,out] | handle | AES-GCM handler (work area) |
| [in] | wrapped_key | 128-bit AES wrapped key |
| [in] | initial_vector | initialization vector area (initial_vector_length byte) |
| [in] | initial_vector_length | initialization vector length (1 or more bytes) |

Return values

| | |
|---------------------------------------|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTTO_SCE_KEY_SET_FAIL | Invalid wrapped key was input. |
| FSP_ERR_CRYPTTO_SCE_PARAMETER | Input data is illegal. |
| FSP_ERR_CRYPTTO_SCE_FAIL | An internal error occurred. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128GCM_EncryptUpdate()

```
fsp_err_t R_SCE_AES128GCM_EncryptUpdate ( sce_gcm_handle_t * handle, uint8_t * plain, uint8_t * cipher, uint32_t plain_data_length, uint8_t * aad, uint32_t aad_length )
```

The `R_SCE_AES128GCM_EncryptUpdate()` function encrypts the plaintext specified in the second argument, `plain`, in GCM mode using the values specified for `wrapped_key` and `initial_vector` in `R_SCE_AES128GCM_EncryptInit()`, along with the additional authentication data specified in the fifth argument, `aad`. Inside this function, the data that is input by the user is buffered until the input values of `aad` and `plain` exceed 16 bytes. After the input data from `plain` reaches 16 bytes or more, the encryption result is output to the ciphertext data area specified in the third argument, `cipher`. The lengths of the `plain` and `aad` data to input are respectively specified in the fourth argument, `plain_data_length`, and the sixth argument, `aad_length`. For these, specify not the total byte count for the `aad` and `plain` input data, but rather the data length to input when the user calls this function. If the input values `plain` and `aad` are not divisible by 16 bytes, they will be padded inside the function. First process the data that is input from `aad`, and then process the data that is input from `plain`. If `aad` data is input after starting to input `plain` data, an error will occur. If `aad` data and `plain` data are input to this function at the same time, the `aad` data will be processed, and then the function will transition to the `plain` data input state.

Specify areas for `plain` and `cipher` that do not overlap. For `plain`, `cipher`, `initial_vector`, and `aad`, specify RAM addresses that are multiples of 4

Parameters

| | | |
|----------|-------------------|---|
| [in,out] | handle | AES-GCM handler (work area) |
| [in] | plain | plaintext data area |
| [in,out] | cipher | ciphertext data area |
| [in] | plain_data_length | plaintext data length (0 or more bytes) |
| [in] | aad | additional authentication data (aad_length byte) |
| [in] | aad_length | additional authentication data length (0 or more bytes) |

Return values

| | |
|-------------------------------------|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTOSCE_PARAMETER | After the data from <code>plain</code> was input, an invalid handle was input from <code>aad</code> . |
| FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION | An invalid function was called. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128GCM_EncryptFinal()

```
fsp_err_t R_SCE_AES128GCM_EncryptFinal ( sce_gcm_handle_t * handle, uint8_t * cipher, uint32_t * cipher_data_length, uint8_t * atag )
```

If there is 16-byte fractional data indicated by the total data length of the value of plain that was input by R_SCE_AES128GCM_EncryptUpdate (), the R_SCE_AES128GCM_EncryptFinal() function will output the result of encrypting that fractional data to the ciphertext data area specified in the second argument, cipher. Here, the portion that does not reach 16 bytes will be padded with zeros. The authentication tag is output to the fourth argument, atag. For cipher and atag, specify RAM addresses that are multiples of 4.

Parameters

| | | |
|----------|--------------------|--|
| [in,out] | handle | AES-GCM handler (work area) |
| [in,out] | cipher | ciphertext data area (cipher_data_length byte) |
| [in,out] | cipher_data_length | ciphertext data length (0 always written here) |
| [in,out] | atag | authentication tag area |

Return values

| | |
|-------------------------------------|---------------------------------|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTOSCE_FAIL | An internal error occurred. |
| FSP_ERR_CRYPTOSCE_PARAMETER | An invalid handle was input. |
| FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION | An invalid function was called. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128GCM_DecryptInit()

```
fsp_err_t R_SCE_AES128GCM_DecryptInit ( sce_gcm_handle_t * handle, sce_aes_wrapped_key_t *
wrapped_key, uint8_t * initial_vector, uint32_t initial_vector_length )
```

The R_SCE_AES128GCM_DecryptInit() function performs preparations for the execution of an GCM calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R_SCE_AES128GCM_DecryptUpdate() function and R_SCE_AES128GCM_DecryptFinal() function.

Parameters

| | | |
|----------|-----------------------|---|
| [in,out] | handle | AES-GCM handler (work area) |
| [in] | wrapped_key | 128-bit AES wrapped key |
| [in] | initial_vector | initialization vector area (initial_vector_length byte) |
| [in] | initial_vector_length | initialization vector length (1 or more bytes) |

Return values

| | |
|-------------------------------------|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTOSCE_KEY_SET_FAIL | Invalid wrapped key was input. |
| FSP_ERR_CRYPTOSCE_PARAMETER | Input data is illegal. |
| FSP_ERR_CRYPTOSCE_FAIL | An internal error occurred. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128GCM_DecryptUpdate()

```
fsp_err_t R_SCE_AES128GCM_DecryptUpdate ( sce_gcm_handle_t* handle, uint8_t* cipher,
uint8_t* plain, uint32_t cipher_data_length, uint8_t* aad, uint32_t aad_length )
```

The `R_SCE_AES128GCM_DecryptUpdate()` function decrypts the ciphertext specified in the second argument, `cipher`, in GCM mode using the values specified for `wrapped_key` and `initial_vector` in `R_SCE_AES128GCM_DecryptInit()`, along with the additional authentication data specified in the fifth argument, `aad`. Inside this function, the data that is input by the user is buffered until the input values of `aad` and `plain` exceed 16 bytes. After the input data from `cipher` reaches 16 bytes or more, the decryption result is output to the plaintext data area specified in the third argument, `plain`. The lengths of the `cipher` and `aad` data to input are respectively specified in the fourth argument, `cipher_data_length`, and the sixth argument, `aad_length`. For these, specify not the total byte count for the `aad` and `cipher` input data, but rather the data length to input when the user calls this function. If the input values `cipher` and `aad` are not divisible by 16 bytes, they will be padded inside the function. First process the data that is input from `aad`, and then process the data that is input from `cipher`. If `aad` data is input after starting to input `cipher` data, an error will occur. If `aad` data and `cipher` data are input to this function at the same time, the `aad` data will be processed, and then the function will transition to the `cipher` data input state. Specify areas for `plain` and `cipher` that do not overlap. For `plain`, `cipher`, `stage`, `initial_vector`, and `aad`, specify RAM addresses that are multiples of 4.

Parameters

| | | |
|----------|--------------------|---|
| [in,out] | handle | AES-GCM handler (work area) |
| [in,out] | cipher | ciphertext data area |
| [in] | plain | plaintext data area |
| [in] | cipher_data_length | ciphertext data length (0 or more bytes) |
| [in] | aad | additional authentication data (aad_length byte) |
| [in] | aad_length | additional authentication data length (0 or more bytes) |

Return values

| | |
|---------------------------------------|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTTO_SCE_PARAMETER | After the data from <code>plain</code> was input, an invalid handle was input from <code>aad</code> . |
| FSP_ERR_CRYPTTO_SCE_PROHIBIT_FUNCTION | An invalid function was called. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ **R_SCE_AES128GCM_DecryptFinal()**

```
fsp_err_t R_SCE_AES128GCM_DecryptFinal ( sce_gcm_handle_t* handle, uint8_t* plain, uint32_t* plain_data_length, uint8_t* atag, uint32_t atag_length )
```

The `R_SCE_AES128GCM_DecryptFinal()` function decrypts, in GCM mode, the fractional ciphertext specified by `R_SCE_AES128GCM_DecryptUpdate()` that does not reach 16 bytes, and ends GCM decryption. The encryption data and authentication tag are respectively output to the plaintext data area specified in the second argument, `plain`, and the authentication tag area specified in the fourth argument, `atag`. The decoded data length is output to the third argument, `plain_data_length`. If authentication fails, the return value will be `TSIP_ERR_AUTHENTICATION`. For the fourth argument, `atag`, input 16 bytes or less. If it is less than 16 bytes, it will be padded with zeros inside the function. For `plain` and `atag`, specify RAM addresses that are multiples of 4.

Parameters

| | | |
|----------|-------------------|--|
| [in,out] | handle | AES-GCM handler (work area) |
| [in,out] | plain | plaintext data area (cipher_data_length byte) |
| [in,out] | plain_data_length | plaintext data length (0 always written here) |
| [in,out] | atag | authentication tag area (atag_length byte) |
| [in] | atag_length | authentication tag length (4,8,12,13,14,15,16 bytes) |

Return values

| | |
|-------------------------------------|---------------------------------|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTOSCE_FAIL | An internal error occurred. |
| FSP_ERR_CRYPTOSCE_AUTHENTICATION | Authentication failed |
| FSP_ERR_CRYPTOSCE_PARAMETER | Input data is illegal. |
| FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION | An invalid function was called. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256GCM_EncryptInit()

```
fsp_err_t R_SCE_AES256GCM_EncryptInit ( sce_gcm_handle_t * handle, sce_aes_wrapped_key_t *
wrapped_key, uint8_t * initial_vector, uint32_t initial_vector_length )
```

The R_SCE_AES256GCM_EncryptInit() function performs preparations for the execution of an GCM calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R_SCE_AES256GCM_EncryptUpdate() function and R_SCE_AES256GCM_EncryptFinal() function.

Parameters

| | | |
|----------|-----------------------|---|
| [in,out] | handle | AES-GCM handler (work area) |
| [in] | wrapped_key | 256-bit AES wrapped key |
| [in] | initial_vector | initialization vector area (initial_vector_length byte) |
| [in] | initial_vector_length | initialization vector length (1 or more bytes) |

Return values

| | |
|-------------------------------------|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTOSCE_KEY_SET_FAIL | Invalid wrapped key was input. |
| FSP_ERR_CRYPTOSCE_PARAMETER | Input data is illegal. |
| FSP_ERR_CRYPTOSCE_FAIL | An internal error occurred. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256GCM_EncryptUpdate()

```
fsp_err_t R_SCE_AES256GCM_EncryptUpdate ( sce_gcm_handle_t * handle, uint8_t * plain, uint8_t * cipher, uint32_t plain_data_length, uint8_t * aad, uint32_t aad_length )
```

The `R_SCE_AES256GCM_EncryptUpdate()` function encrypts the plaintext specified in the second argument, `plain`, in GCM mode using the values specified for `wrapped_key` and `initial_vector` in `R_SCE_AES256GCM_EncryptInit()`, along with the additional authentication data specified in the fifth argument, `aad`. Inside this function, the data that is input by the user is buffered until the input values of `aad` and `plain` exceed 16 bytes. After the input data from `plain` reaches 16 bytes or more, the encryption result is output to the ciphertext data area specified in the third argument, `cipher`. The lengths of the `plain` and `aad` data to input are respectively specified in the fourth argument, `plain_data_length`, and the sixth argument, `aad_length`. For these, specify not the total byte count for the `aad` and `plain` input data, but rather the data length to input when the user calls this function. If the input values `plain` and `aad` are not divisible by 16 bytes, they will be padded inside the function. First process the data that is input from `aad`, and then process the data that is input from `plain`. If `aad` data is input after starting to input `plain` data, an error will occur. If `aad` data and `plain` data are input to this function at the same time, the `aad` data will be processed, and then the function will transition to the `plain` data input state.

Specify areas for `plain` and `cipher` that do not overlap. For `plain`, `cipher`, `initial_vector`, and `aad`, specify RAM addresses that are multiples of 4

Parameters

| | | |
|----------|-------------------|---|
| [in,out] | handle | AES-GCM handler (work area) |
| [in] | plain | plaintext data area |
| [in,out] | cipher | ciphertext data area |
| [in] | plain_data_length | plaintext data length (0 or more bytes) |
| [in] | aad | additional authentication data (aad_length byte) |
| [in] | aad_length | additional authentication data length (0 or more bytes) |

Return values

| | |
|-------------------------------------|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTOSCE_PARAMETER | After the data from <code>plain</code> was input, an invalid handle was input from <code>aad</code> . |
| FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION | An invalid function was called. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256GCM_EncryptFinal()

```
fsp_err_t R_SCE_AES256GCM_EncryptFinal ( sce_gcm_handle_t * handle, uint8_t * cipher, uint32_t * cipher_data_length, uint8_t * atag )
```

If there is 16-byte fractional data indicated by the total data length of the value of plain that was input by R_SCE_AES256GCM_EncryptUpdate (), the R_SCE_AES256GCM_EncryptFinal() function will output the result of encrypting that fractional data to the ciphertext data area specified in the second argument, cipher. Here, the portion that does not reach 16 bytes will be padded with zeros. The authentication tag is output to the fourth argument, atag. For cipher and atag, specify RAM addresses that are multiples of 4.

Parameters

| | | |
|----------|--------------------|--|
| [in,out] | handle | AES-GCM handler (work area) |
| [in,out] | cipher | ciphertext data area (cipher_data_length byte) |
| [in,out] | cipher_data_length | ciphertext data length (0 always written here) |
| [in,out] | atag | authentication tag area |

Return values

| | |
|---------------------------------------|---------------------------------|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTTO_SCE_FAIL | An internal error occurred. |
| FSP_ERR_CRYPTTO_SCE_PARAMETER | An invalid handle was input. |
| FSP_ERR_CRYPTTO_SCE_PROHIBIT_FUNCTION | An invalid function was called. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256GCM_DecryptInit()

```
fsp_err_t R_SCE_AES256GCM_DecryptInit ( sce_gcm_handle_t * handle, sce_aes_wrapped_key_t * wrapped_key, uint8_t * initial_vector, uint32_t initial_vector_length )
```

The `R_SCE_AES256GCM_DecryptInit()` function performs preparations for the execution of an GCM calculation, and writes the result to the first argument, `handle`. The value of `handle` is used as an argument in the subsequent `R_SCE_AES256GCM_DecryptUpdate()` function and `R_SCE_AES256GCM_DecryptFinal()` function.

Parameters

| | | |
|----------|------------------------------------|---|
| [in,out] | <code>handle</code> | AES-GCM handler (work area) |
| [in] | <code>wrapped_key</code> | 256-bit AES wrapped key |
| [in] | <code>initial_vector</code> | initialization vector area (<code>initial_vector_length</code> byte) |
| [in] | <code>initial_vector_length</code> | initialization vector length (1 or more bytes) |

Return values

| | |
|---------------------------------------|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTTO_SCE_KEY_SET_FAIL | Invalid wrapped key was input. |
| FSP_ERR_CRYPTTO_SCE_PARAMETER | Input data is illegal. |
| FSP_ERR_CRYPTTO_SCE_FAIL | An internal error occurred. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256GCM_DecryptUpdate()

```
fsp_err_t R_SCE_AES256GCM_DecryptUpdate ( sce_gcm_handle_t* handle, uint8_t* cipher,
uint8_t* plain, uint32_t cipher_data_length, uint8_t* aad, uint32_t aad_length )
```

The `R_SCE_AES256GCM_DecryptUpdate()` function decrypts the ciphertext specified in the second argument, `cipher`, in GCM mode using the values specified for `wrapped_key` and `initial_vector` in `R_SCE_AES256GCM_DecryptInit()`, along with the additional authentication data specified in the fifth argument, `aad`. Inside this function, the data that is input by the user is buffered until the input values of `aad` and `plain` exceed 16 bytes. After the input data from `cipher` reaches 16 bytes or more, the decryption result is output to the plaintext data area specified in the third argument, `plain`. The lengths of the cipher and `aad` data to input are respectively specified in the fourth argument, `cipher_data_length`, and the sixth argument, `aad_length`. For these, specify not the total byte count for the `aad` and cipher input data, but rather the data length to input when the user calls this function. If the input values `cipher` and `aad` are not divisible by 16 bytes, they will be padded inside the function. First process the data that is input from `aad`, and then process the data that is input from `cipher`. If `aad` data is input after starting to input cipher data, an error will occur. If `aad` data and cipher data are input to this function at the same time, the `aad` data will be processed, and then the function will transition to the cipher data input state. Specify areas for `plain` and `cipher` that do not overlap. For `plain`, `cipher`, `stage`, `initial_vector`, and `aad`, specify RAM addresses that are multiples of 4.

Parameters

| | | |
|----------|--------------------|---|
| [in,out] | handle | AES-GCM handler (work area) |
| [in,out] | cipher | ciphertext data area |
| [in] | plain | plaintext data area |
| [in] | cipher_data_length | ciphertext data length (0 or more bytes) |
| [in] | aad | additional authentication data (aad_length byte) |
| [in] | aad_length | additional authentication data length (0 or more bytes) |

Return values

| | |
|-------------------------------------|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTOSCE_PARAMETER | After the data from <code>plain</code> was input, an invalid handle was input from <code>aad</code> . |
| FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION | An invalid function was called. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256GCM_DecryptFinal()

```
fsp_err_t R_SCE_AES256GCM_DecryptFinal ( sce_gcm_handle_t* handle, uint8_t* plain, uint32_t* plain_data_length, uint8_t* atag, uint32_t atag_length )
```

The `R_SCE_AES256GCM_DecryptFinal()` function decrypts, in GCM mode, the fractional ciphertext specified by `R_SCE_AES256GCM_DecryptUpdate()` that does not reach 16 bytes, and ends GCM decryption. The encryption data and authentication tag are respectively output to the plaintext data area specified in the second argument, `plain`, and the authentication tag area specified in the fourth argument, `atag`. The decoded data length is output to the third argument, `plain_data_length`. If authentication fails, the return value will be `TSIP_ERR_AUTHENTICATION`. For the fourth argument, `atag`, input 16 bytes or less. If it is less than 16 bytes, it will be padded with zeros inside the function. For `plain` and `atag`, specify RAM addresses that are multiples of 4.

Parameters

| | | |
|----------|-------------------|--|
| [in,out] | handle | AES-GCM handler (work area) |
| [in,out] | plain | plaintext data area (cipher_data_length byte) |
| [in,out] | plain_data_length | plaintext data length (0 always written here) |
| [in,out] | atag | authentication tag area (atag_length byte) |
| [in] | atag_length | authentication tag length (4,8,12,13,14,15,16 bytes) |

Return values

| | |
|---------------------------------------|---------------------------------|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTTO_SCE_FAIL | An internal error occurred. |
| FSP_ERR_CRYPTTO_SCE_AUTHENTICATION | Authentication failed |
| FSP_ERR_CRYPTTO_SCE_PARAMETER | Input data is illegal. |
| FSP_ERR_CRYPTTO_SCE_PROHIBIT_FUNCTION | An invalid function was called. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CCM_EncryptInit()

```
fsp_err_t R_SCE_AES128CCM_EncryptInit ( sce_ccm_handle_t* handle, sce_aes_wrapped_key_t* wrapped_key, uint8_t* nonce, uint32_t nonce_length, uint8_t* adata, uint8_t a_length, uint32_t payload_length, uint32_t mac_length )
```

The R_SCE_AES128CCM_EncryptInit() function prepares to perform CCM computation and writes the result to the first argument, handle. The succeeding functions R_SCE_AES128CCM_EncryptUpdate() and R_SCE_AES128CCM_EncryptFinal() use handle as an argument.

Parameters

| | | |
|----------|----------------|--|
| [in,out] | handle | AES-CCM handler (work area) |
| [in] | wrapped_key | 128-bit AES wrapped key |
| [in] | nonce | Nonce |
| [in] | nonce_length | Nonce data length (7 to 13 bytes) |
| [in] | adata | additional authentication data |
| [in] | a_length | additional authentication data length (0 to 110 bytes) |
| [in] | payload_length | Payload length (any number of bytes) |
| [in] | mac_length | MAC length (4, 6, 8, 10, 12, 14, or 16 bytes) |

Return values

| | |
|-------------------------------------|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTOSCE_KEY_SET_FAIL | Invalid wrapped key was input. |
| FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTOSCE_FAIL | An internal error occurred. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CCM_EncryptUpdate()

```
fsp_err_t R_SCE_AES128CCM_EncryptUpdate ( sce_ccm_handle_t * handle, uint8_t * plain, uint8_t * cipher, uint32_t plain_length )
```

The `R_SCE_AES128CCM_EncryptUpdate()` function encrypts the plaintext specified in the second argument, `plain`, in CCM mode using the values specified by `wrapped_key`, `nonce`, and `adata` in `R_SCE_AES128CCM_EncryptInit()`. This function buffers internally the data input by the user until the input value of `plain` exceeds 16 bytes. Once the amount of `plain` input data is 16 bytes or greater, the encrypted result is output to `cipher`, which is specified in the third argument. Use `payload_length` in `R_SCE_AES128CCM_EncryptInit()` to specify the total data length of `plain` that will be input. Use `plain_length` in this function to specify the data length to be input when the user calls this function. If the input value of `plain` is less than 16 bytes, the function performs padding internally.

Ensure that the areas allocated to `plain` and `cipher` do not overlap. Also, specify RAM addresses that are multiples of 4 for `plain` and `cipher`.

Parameters

| | | |
|----------|--------------|-----------------------------|
| [in,out] | handle | AES-CCM handler (work area) |
| [in] | plain | plaintext data area |
| [in,out] | cipher | ciphertext data area |
| [in] | plain_length | plaintext data length |

Return values

| | |
|-------------------------------------|---------------------------------|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION | An invalid function was called. |
| FSP_ERR_CRYPTOSCE_PARAMETER | An invalid handle was input. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CCM_EncryptFinal()

```
fsp_err_t R_SCE_AES128CCM_EncryptFinal ( sce_ccm_handle_t * handle, uint8_t * cipher, uint32_t
* cipher_length, uint8_t * mac, uint32_t mac_length )
```

If the data length of plain input in `R_SCE_AES128CCM_EncryptUpdate()` results in leftover data after 16 bytes, the `R_SCE_AES128CCM_EncryptFinal()` function outputs the leftover encrypted data to `cipher`, which is specified in the second argument. The MAC value is output to the fourth argument, `mac`. Set the fifth argument, `mac_length` to the same value as that specified for the argument `mac_length` in `Aes128CcmEncryptInit()`. Also, specify RAM addresses that are multiples of 4 for `cipher` and `mac`.

Parameters

| | | |
|----------|---------------|---|
| [in,out] | handle | AES-CCM handler (work area) |
| [in,out] | cipher | ciphertext data area |
| [in,out] | cipher_length | ciphertext data length |
| [in,out] | mac | MAC area |
| [in] | mac_length | MAC length (4, 6, 8, 10, 12, 14, or 16 bytes) |

Return values

| | |
|-------------------------------------|---------------------------------|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPT_SCE_PROHIBIT_FUNCTION | An invalid function was called. |
| FSP_ERR_CRYPT_SCE_PARAMETER | Input data is illegal. |
| FSP_ERR_CRYPT_SCE_FAIL | An internal error occurred. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CCM_DecryptInit()

```
fsp_err_t R_SCE_AES128CCM_DecryptInit ( sce_ccm_handle_t * handle, sce_aes_wrapped_key_t * wrapped_key, uint8_t * nonce, uint32_t nonce_length, uint8_t * adata, uint8_t a_length, uint32_t payload_length, uint32_t mac_length )
```

The `R_SCE_AES128CCM_DecryptInit()` function prepares to perform CCM computation and writes the result to the first argument, `handle`. The succeeding functions `R_SCE_AES128CCM_DecryptUpdate()` and `R_SCE_AES128CCM_DecryptFinal()` use `handle` as an argument.

Parameters

| | | |
|----------|----------------|--|
| [in,out] | handle | AES-CCM handler (work area) |
| [in] | wrapped_key | 128-bit AES wrapped key |
| [in] | nonce | Nonce |
| [in] | nonce_length | Nonce data length (7 to 13 bytes) |
| [in] | adata | additional authentication data |
| [in] | a_length | additional authentication data length (0 to 110 bytes) |
| [in] | payload_length | Payload length (any number of bytes) |
| [in] | mac_length | MAC length (4, 6, 8, 10, 12, 14, or 16 bytes) |

Return values

| | |
|-------------------------------------|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTOSCE_KEY_SET_FAIL | Invalid wrapped key was input. |
| FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTOSCE_FAIL | An internal error occurred. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CCM_DecryptUpdate()

```
fsp_err_t R_SCE_AES128CCM_DecryptUpdate ( sce_ccm_handle_t * handle, uint8_t * cipher,
uint8_t * plain, uint32_t cipher_length )
```

The `R_SCE_AES128CCM_DecryptUpdate()` function decrypts the ciphertext specified by the second argument, `cipher`, in CCM mode using the values specified by `wrapped_key`, `nonce`, and `adata` in `R_SCE_AES128CCM_DecryptInit()`. This function buffers internally the data input by the user until the input value of `cipher` exceeds 16 bytes. Once the amount of `cipher` input data is 16 bytes or greater, the decrypted result is output to `plain`, which is specified in the third argument. Use `payload_length` in `R_SCE_AES128CCM_DecryptInit()` to specify the total data length of `cipher` that will be input. Use `cipher_length` in this function to specify the data length to be input when the user calls this function. If the input value of `cipher` is less than 16 bytes, the function performs padding internally.

Ensure that the areas allocated to `cipher` and `plain` do not overlap. Also, specify RAM addresses that are multiples of 4 for `cipher` and `plain`.

Parameters

| | | |
|----------|---------------|-----------------------------|
| [in,out] | handle | AES-CCM handler (work area) |
| [in] | cipher | ciphertext data area |
| [in,out] | plain | plaintext data area |
| [in] | cipher_length | ciphertext data length |

Return values

| | |
|--------------------------------------|---------------------------------|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION | An invalid function was called. |
| FSP_ERR_CRYPTO_SCE_PARAMETER | An invalid handle was input. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ **R_SCE_AES128CCM_DecryptFinal()**

```
fsp_err_t R_SCE_AES128CCM_DecryptFinal ( sce_ccm_handle_t * handle, uint8_t * plain, uint32_t * plain_length, uint8_t * mac, uint32_t mac_length )
```

If the data length of cipher input in [R_SCE_AES128GCM_DecryptUpdate\(\)](#) results in leftover data after 16 bytes, the [R_SCE_AES128GCM_DecryptFinal\(\)](#) function outputs the leftover decrypted data to cipher, which is specified in the second argument. In addition, the function verifies the fourth argument, mac. Set the fifth argument, mac_length, to the same value as that specified for the argument mac_length in [Aes128CcmDecryptInit\(\)](#).

Parameters

| | | |
|----------|--------------|---|
| [in,out] | handle | AES-CCM handler (work area) |
| [in,out] | plain | plaintext data area |
| [in,out] | plain_length | plaintext data length |
| [in] | mac | MAC area |
| [in] | mac_length | MAC length (4, 6, 8, 10, 12, 14, or 16 bytes) |

Return values

| | |
|-------------------------------------|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION | An invalid function was called. |
| FSP_ERR_CRYPTOSCE_PARAMETER | Input data is illegal. |
| FSP_ERR_CRYPTOSCE_FAIL | Internal error, or authentication failed. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CCM_EncryptInit()

```
fsp_err_t R_SCE_AES256CCM_EncryptInit ( sce_ccm_handle_t* handle, sce_aes_wrapped_key_t* wrapped_key, uint8_t* nonce, uint32_t nonce_length, uint8_t* adata, uint8_t a_length, uint32_t payload_length, uint32_t mac_length )
```

The R_SCE_AES256CCM_EncryptInit() function prepares to perform CCM computation and writes the result to the first argument, handle. The succeeding functions R_SCE_AES256CCM_EncryptUpdate() and R_SCE_AES256CCM_EncryptFinal() use handle as an argument.

Parameters

| | | |
|----------|----------------|--|
| [in,out] | handle | AES-CCM handler (work area) |
| [in] | wrapped_key | 256-bit AES wrapped key |
| [in] | nonce | Nonce |
| [in] | nonce_length | Nonce data length (7 to 13 bytes) |
| [in] | adata | additional authentication data |
| [in] | a_length | additional authentication data length (0 to 110 bytes) |
| [in] | payload_length | Payload length (any number of bytes) |
| [in] | mac_length | MAC length (4, 6, 8, 10, 12, 14, or 16 bytes) |

Return values

| | |
|-------------------------------------|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTOSCE_KEY_SET_FAIL | Invalid wrapped key was input. |
| FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTOSCE_FAIL | An internal error occurred. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CCM_EncryptUpdate()

```
fsp_err_t R_SCE_AES256CCM_EncryptUpdate ( sce_ccm_handle_t * handle, uint8_t * plain, uint8_t * cipher, uint32_t plain_length )
```

The `R_SCE_AES256CCM_EncryptUpdate()` function encrypts the plaintext specified in the second argument, `plain`, in CCM mode using the values specified by `wrapped_key`, `nonce`, and `adata` in `R_SCE_AES256CCM_EncryptInit()`. This function buffers internally the data input by the user until the input value of `plain` exceeds 16 bytes. Once the amount of `plain` input data is 16 bytes or greater, the encrypted result is output to `cipher`, which is specified in the third argument. Use `payload_length` in `R_SCE_AES256CCM_EncryptInit()` to specify the total data length of `plain` that will be input. Use `plain_length` in this function to specify the data length to be input when the user calls this function. If the input value of `plain` is less than 16 bytes, the function performs padding internally.

Ensure that the areas allocated to `plain` and `cipher` do not overlap. Also, specify RAM addresses that are multiples of 4 for `plain` and `cipher`.

Parameters

| | | |
|----------|---------------------------|-----------------------------|
| [in,out] | <code>handle</code> | AES-CCM handler (work area) |
| [in] | <code>plain</code> | plaintext data area |
| [in,out] | <code>cipher</code> | ciphertext data area |
| [in] | <code>plain_length</code> | plaintext data length |

Return values

| | |
|---|---------------------------------|
| <code>FSP_SUCCESS</code> | Normal termination |
| <code>FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION</code> | An invalid function was called. |
| <code>FSP_ERR_CRYPTO_SCE_PARAMETER</code> | An invalid handle was input. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CCM_EncryptFinal()

```
fsp_err_t R_SCE_AES256CCM_EncryptFinal ( sce_ccm_handle_t * handle, uint8_t * cipher, uint32_t
* cipher_length, uint8_t * mac, uint32_t mac_length )
```

If the data length of plain input in `R_SCE_AES256CCM_EncryptUpdate()` results in leftover data after 16 bytes, the `R_SCE_AES256CCM_EncryptFinal()` function outputs the leftover encrypted data to `cipher`, which is specified in the second argument. The MAC value is output to the fourth argument, `mac`. Set the fifth argument, `mac_length` to the same value as that specified for the argument `mac_length` in `Aes256CcmEncryptInit()`. Also, specify RAM addresses that are multiples of 4 for `cipher` and `mac`.

Parameters

| | | |
|----------|---------------|---|
| [in,out] | handle | AES-CCM handler (work area) |
| [in,out] | cipher | ciphertext data area |
| [in,out] | cipher_length | ciphertext data length |
| [in,out] | mac | MAC area |
| [in] | mac_length | MAC length (4, 6, 8, 10, 12, 14, or 16 bytes) |

Return values

| | |
|-------------------------------------|---------------------------------|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION | An invalid function was called. |
| FSP_ERR_CRYPTOSCE_PARAMETER | Input data is illegal. |
| FSP_ERR_CRYPTOSCE_FAIL | An internal error occurred. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CCM_DecryptInit()

```
fsp_err_t R_SCE_AES256CCM_DecryptInit ( sce_ccm_handle_t * handle, sce_aes_wrapped_key_t *
wrapped_key, uint8_t * nonce, uint32_t nonce_length, uint8_t * adata, uint8_t a_length, uint32_t
payload_length, uint32_t mac_length )
```

The `R_SCE_AES256CCM_DecryptInit()` function prepares to perform CCM computation and writes the result to the first argument, `handle`. The succeeding functions `R_SCE_AES256CCM_DecryptUpdate()` and `R_SCE_AES256CCM_DecryptFinal()` use `handle` as an argument.

Parameters

| | | |
|----------|----------------|--|
| [in,out] | handle | AES-CCM handler (work area) |
| [in] | wrapped_key | 256-bit AES wrapped key |
| [in] | nonce | Nonce |
| [in] | nonce_length | Nonce data length (7 to 13 bytes) |
| [in] | adata | additional authentication data |
| [in] | a_length | additional authentication data length (0 to 110 bytes) |
| [in] | payload_length | Payload length (any number of bytes) |
| [in] | mac_length | MAC length (4, 6, 8, 10, 12, 14, or 16 bytes) |

Return values

| | |
|-------------------------------------|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTOSCE_KEY_SET_FAIL | Invalid wrapped key was input. |
| FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTOSCE_FAIL | An internal error occurred. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CCM_DecryptUpdate()

```
fsp_err_t R_SCE_AES256CCM_DecryptUpdate ( sce_ccm_handle_t * handle, uint8_t * cipher,
uint8_t * plain, uint32_t cipher_length )
```

The `R_SCE_AES256CCM_DecryptUpdate()` function decrypts the ciphertext specified by the second argument, `cipher`, in CCM mode using the values specified by `wrapped_key`, `nonce`, and `adata` in `R_SCE_AES256CCM_DecryptInit()`. This function buffers internally the data input by the user until the input value of `cipher` exceeds 16 bytes. Once the amount of `cipher` input data is 16 bytes or greater, the decrypted result is output to `plain`, which is specified in the third argument. Use `payload_length` in `R_SCE_AES256CCM_DecryptInit()` to specify the total data length of `cipher` that will be input. Use `cipher_length` in this function to specify the data length to be input when the user calls this function. If the input value of `cipher` is less than 16 bytes, the function performs padding internally.

Ensure that the areas allocated to `cipher` and `plain` do not overlap. Also, specify RAM addresses that are multiples of 4 for `cipher` and `plain`.

Parameters

| | | |
|----------|---------------|-----------------------------|
| [in,out] | handle | AES-CCM handler (work area) |
| [in] | cipher | ciphertext data area |
| [in,out] | plain | plaintext data area |
| [in] | cipher_length | ciphertext data length |

Return values

| | |
|--------------------------------------|---------------------------------|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION | An invalid function was called. |
| FSP_ERR_CRYPTO_SCE_PARAMETER | An invalid handle was input. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ **R_SCE_AES256CCM_DecryptFinal()**

```
fsp_err_t R_SCE_AES256CCM_DecryptFinal ( sce_ccm_handle_t * handle, uint8_t * plain, uint32_t * plain_length, uint8_t * mac, uint32_t mac_length )
```

If the data length of cipher input in [R_SCE_AES256GCM_DecryptUpdate\(\)](#) results in leftover data after 16 bytes, the [R_SCE_AES256GCM_DecryptFinal\(\)](#) function outputs the leftover decrypted data to cipher, which is specified in the second argument. In addition, the function verifies the fourth argument, mac. Set the fifth argument, mac_length, to the same value as that specified for the argument mac_length in [Aes256CcmDecryptInit\(\)](#).

Parameters

| | | |
|----------|--------------|---|
| [in,out] | handle | AES-CCM handler (work area) |
| [in,out] | plain | plaintext data area |
| [in,out] | plain_length | plaintext data length |
| [in] | mac | MAC area |
| [in] | mac_length | MAC length (4, 6, 8, 10, 12, 14, or 16 bytes) |

Return values

| | |
|-------------------------------------|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION | An invalid function was called. |
| FSP_ERR_CRYPTOSCE_PARAMETER | Input data is illegal. |
| FSP_ERR_CRYPTOSCE_FAIL | Internal error, or authentication failed. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ **R_SCE_AES128CMAC_GenerateInit()**

```
fsp_err_t R_SCE_AES128CMAC_GenerateInit ( sce_cmac_handle_t * handle, sce_aes_wrapped_key_t * wrapped_key )
```

The `R_SCE_AES128CMAC_GenerateInit()` function performs preparations for the execution of an CMAC calculation, and writes the result to the first argument, `handle`. The value of `handle` is used as an argument in the subsequent `R_SCE_AES128CMAC_GenerateUpdate()` function and `R_SCE_AES128CMAC_GenerateFinal()` function.

Parameters

| | | |
|----------|--------------------------|------------------------------|
| [in,out] | <code>handle</code> | AES-CMAC handler (work area) |
| [in] | <code>wrapped_key</code> | 128-bit AES wrapped key |

Return values

| | |
|-------------------------------------|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTOSCE_KEY_SET_FAIL | Invalid wrapped key was input. |
| FSP_ERR_CRYPTOSCE_FAIL | Internal error occurred. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CMAC_GenerateUpdate()

```
fsp_err_t R_SCE_AES128CMAC_GenerateUpdate ( sce_cmact_handle_t * handle, uint8_t * message,
uint32_t message_length )
```

The `R_SCE_AES128CMAC_GenerateUpdate()` function performs MAC value generation based on the message specified in the second argument, `message`, using the value specified for `wrapped_key` in `R_SCE_AES128CMAC_GenerateInit()`. Inside this function, the data that is input by the user is buffered until the input value of `message` exceeds 16 bytes. The length of the message data to input is specified in the third argument, `message_len`. For these, input not the total byte count for message input data, but rather the message data length to input when the user calls this function. If the input value, `message`, is not a multiple of 16 bytes, it will be padded within the function. For `message`, specify a RAM address that are multiples of 4.

Parameters

| | | |
|----------|----------------|---|
| [in,out] | handle | AES-CMAC handler (work area) |
| [in] | message | message data area (message_length byte) |
| [in] | message_length | message data length (0 or more bytes) |

Return values

| | |
|-------------------------------------|---------------------------------|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTOSCE_PARAMETER | An invalid handle was input. |
| FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION | An invalid function was called. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CMAC_GenerateFinal()

```
fsp_err_t R_SCE_AES128CMAC_GenerateFinal ( sce_cmac_handle_t* handle, uint8_t* mac )
```

The R_SCE_AES128CMAC_GenerateFinal() function outputs the MAC value to the MAC data area specified in the second argument, mac, and ends CMAC mode.

Parameters

| | | |
|----------|--------|------------------------------|
| [in,out] | handle | AES-CMAC handler (work area) |
| [in,out] | mac | MAC data area (16byte) |

Return values

| | |
|-------------------------------------|---------------------------------|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTOSCE_FAIL | An internal error occurred. |
| FSP_ERR_CRYPTOSCE_PARAMETER | An invalid handle was input. |
| FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION | An invalid function was called. |
| FSP_ERR_CRYPTOSCE_AUTHENTICATION | Not used. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CMAC_VerifyInit()

```
fsp_err_t R_SCE_AES128CMAC_VerifyInit ( sce_cmac_handle_t * handle, sce_aes_wrapped_key_t * wrapped_key )
```

The `R_SCE_AES128CMAC_VerifyInit()` function performs preparations for the execution of a CMAC calculation, and writes the result to the first argument, `handle`. The value of `handle` is used as an argument in the subsequent `R_SCE_AES128CMAC_VerifyUpdate()` function and `R_SCE_AES128CMAC_VerifyFinal()` function.

Parameters

| | | |
|----------|--------------------------|------------------------------|
| [in,out] | <code>handle</code> | AES-CMAC handler (work area) |
| [in] | <code>wrapped_key</code> | 128-bit AES wrapped key |

Return values

| | |
|-------------------------------------|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTOSCE_KEY_SET_FAIL | Invalid wrapped key was input. |
| FSP_ERR_CRYPTOSCE_FAIL | Internal error occurred. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ **R_SCE_AES128CMAC_VerifyUpdate()**

```
fsp_err_t R_SCE_AES128CMAC_VerifyUpdate ( sce_cmact_handle_t * handle, uint8_t * message,
uint32_t message_length )
```

The **R_SCE_AES128CMAC_VerifyUpdate()** function performs MAC value generation based on the message specified in the second argument, `message`, using the value specified for `wrapped_key` in **R_SCE_AES128CMAC_VerifyInit()**. Inside this function, the data that is input by the user is buffered until the input value of `message` exceeds 16 bytes. The length of the message data to input is specified in the third argument, `message_len`. For these, input not the total byte count for message input data, but rather the message data length to input when the user calls this function. If the input value, `message`, is not a multiple of 16 bytes, it will be padded within the function. For `message`, specify a RAM address that are multiples of 4.

Parameters

| | | |
|----------|-----------------------------|---|
| [in,out] | <code>handle</code> | AES-CMAC handler (work area) |
| [in] | <code>message</code> | message data area (<code>message_length</code> byte) |
| [in] | <code>message_length</code> | message data length (0 or more bytes) |

Return values

| | |
|-------------------------------------|---------------------------------|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPT_SCE_PARAMETER | An invalid handle was input. |
| FSP_ERR_CRYPT_SCE_PROHIBIT_FUNCTION | An invalid function was called. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CMAC_VerifyFinal()

```
fsp_err_t R_SCE_AES128CMAC_VerifyFinal ( sce_cmact_handle_t* handle, uint8_t* mac, uint32_t mac_length )
```

The `R_SCE_AES128CMAC_VerifyFinal()` function inputs the MAC value in the MAC data area specified in the second argument, `mac`, and verifies the MAC value. If authentication fails, the return value will be `TSIP_ERR_AUTHENTICATION`. If the MAC value is less than 16 bytes, it will be padded with zeros inside the function.

Parameters

| | | |
|----------|------------|---------------------------------|
| [in,out] | handle | AES-CMAC handler (work area) |
| [in,out] | mac | MAC data area (mac_length byte) |
| [in,out] | mac_length | MAC data length (2 to 16 bytes) |

Return values

| | |
|-------------------------------------|---------------------------------|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTOSCE_FAIL | An internal error occurred. |
| FSP_ERR_CRYPTOSCE_AUTHENTICATION | Authentication failed |
| FSP_ERR_CRYPTOSCE_PARAMETER | An invalid handle was input. |
| FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION | An invalid function was called. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CMAC_GenerateInit()

```
fsp_err_t R_SCE_AES256CMAC_GenerateInit ( sce_cmac_handle_t * handle, sce_aes_wrapped_key_t * wrapped_key )
```

The `R_SCE_AES256CMAC_GenerateInit()` function performs preparations for the execution of an CMAC calculation, and writes the result to the first argument, `handle`. The value of `handle` is used as an argument in the subsequent `R_SCE_AES256CMAC_GenerateUpdate()` function and `R_SCE_AES256CMAC_GenerateFinal()` function.

Parameters

| | | |
|----------|-------------|------------------------------|
| [in,out] | handle | AES-CMAC handler (work area) |
| [in] | wrapped_key | 256-bit AES wrapped key |

Return values

| | |
|-------------------------------------|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTOSCE_KEY_SET_FAIL | Invalid wrapped key was input. |
| FSP_ERR_CRYPTOSCE_FAIL | Internal error occurred. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CMAC_GenerateUpdate()

```
fsp_err_t R_SCE_AES256CMAC_GenerateUpdate ( sce_cmact_handle_t* handle, uint8_t* message,
uint32_t message_length )
```

The `R_SCE_AES256CMAC_GenerateUpdate()` function performs MAC value generation based on the message specified in the second argument, `message`, using the value specified for `wrapped_key` in `R_SCE_AES256CMAC_GenerateInit()`. Inside this function, the data that is input by the user is buffered until the input value of `message` exceeds 16 bytes. The length of the message data to input is specified in the third argument, `message_len`. For these, input not the total byte count for message input data, but rather the message data length to input when the user calls this function. If the input value, `message`, is not a multiple of 16 bytes, it will be padded within the function. For `message`, specify a RAM address that are multiples of 4.

Parameters

| | | |
|----------|----------------|---|
| [in,out] | handle | AES-CMAC handler (work area) |
| [in] | message | message data area (message_length byte) |
| [in] | message_length | message data length (0 or more bytes) |

Return values

| | |
|-------------------------------------|---------------------------------|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTOSCE_PARAMETER | An invalid handle was input. |
| FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION | An invalid function was called. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ **R_SCE_AES256CMAC_GenerateFinal()**

```
fsp_err_t R_SCE_AES256CMAC_GenerateFinal ( sce_cmac_handle_t* handle, uint8_t* mac )
```

The `R_SCE_AES256CMAC_GenerateFinal()` function outputs the MAC value to the MAC data area specified in the second argument, `mac`, and ends CMAC mode.

Parameters

| | | |
|----------|--------|------------------------------|
| [in,out] | handle | AES-CMAC handler (work area) |
| [in,out] | mac | MAC data area (16byte) |

Return values

| | |
|---------------------------------------|---------------------------------|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTTO_SCE_FAIL | An internal error occurred. |
| FSP_ERR_CRYPTTO_SCE_PARAMETER | An invalid handle was input. |
| FSP_ERR_CRYPTTO_SCE_PROHIBIT_FUNCTION | An invalid function was called. |
| FSP_ERR_CRYPTTO_SCE_AUTHENTICATION | Not used. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CMAC_VerifyInit()

```
fsp_err_t R_SCE_AES256CMAC_VerifyInit ( sce_cmec_handle_t * handle, sce_aes_wrapped_key_t * wrapped_key )
```

The `R_SCE_AES256CMAC_VerifyInit()` function performs preparations for the execution of a CMAC calculation, and writes the result to the first argument, `handle`. The value of `handle` is used as an argument in the subsequent `R_SCE_AES256CMAC_VerifyUpdate()` function and `R_SCE_AES256CMAC_VerifyFinal()` function.

Parameters

| | | |
|----------|-------------|------------------------------|
| [in,out] | handle | AES-CMAC handler (work area) |
| [in] | wrapped_key | 256-bit AES wrapped key |

Return values

| | |
|-------------------------------------|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTOSCE_KEY_SET_FAIL | Invalid wrapped key was input. |
| FSP_ERR_CRYPTOSCE_FAIL | Internal error occurred. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ **R_SCE_AES256CMAC_VerifyUpdate()**

```
fsp_err_t R_SCE_AES256CMAC_VerifyUpdate ( sce_cmact_handle_t * handle, uint8_t * message,
uint32_t message_length )
```

The **R_SCE_AES256CMAC_VerifyUpdate()** function performs MAC value generation based on the message specified in the second argument, `message`, using the value specified for `wrapped_key` in **R_SCE_AES256CMAC_VerifyInit()**. Inside this function, the data that is input by the user is buffered until the input value of `message` exceeds 16 bytes. The length of the message data to input is specified in the third argument, `message_len`. For these, input not the total byte count for message input data, but rather the message data length to input when the user calls this function. If the input value, `message`, is not a multiple of 16 bytes, it will be padded within the function. For `message`, specify a RAM address that are multiples of 4.

Parameters

| | | |
|----------|----------------|---|
| [in,out] | handle | AES-CMAC handler (work area) |
| [in] | message | message data area (message_length byte) |
| [in] | message_length | message data length (0 or more bytes) |

Return values

| | |
|-------------------------------------|---------------------------------|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTOSCE_PARAMETER | An invalid handle was input. |
| FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION | An invalid function was called. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CMAC_VerifyFinal()

```
fsp_err_t R_SCE_AES256CMAC_VerifyFinal ( sce_cmac_handle_t* handle, uint8_t* mac, uint32_t mac_length )
```

The `R_SCE_AES256CMAC_VerifyFinal()` function inputs the MAC value in the MAC data area specified in the second argument, `mac`, and verifies the MAC value. If authentication fails, the return value will be `TSIP_ERR_AUTHENTICATION`. If the MAC value is less than 16 bytes, it will be padded with zeros inside the function.

Parameters

| | | |
|----------|------------|---------------------------------|
| [in,out] | handle | AES-CMAC handler (work area) |
| [in,out] | mac | MAC data area (mac_length byte) |
| [in,out] | mac_length | MAC data length (2 to 16 bytes) |

Return values

| | |
|-------------------------------------|---------------------------------|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTOSCE_FAIL | An internal error occurred. |
| FSP_ERR_CRYPTOSCE_AUTHENTICATION | Authentication failed |
| FSP_ERR_CRYPTOSCE_PARAMETER | An invalid handle was input. |
| FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION | An invalid function was called. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_SHA256_Init()

```
fsp_err_t R_SCE_SHA256_Init ( sce_sha_md5_handle_t* handle)
```

The `R_SCE_SHA256_Init()` function performs preparations for the execution of an SHA-256 hash calculation, and writes the result to the first argument, `handle`. The value of `handle` is used as an argument in the subsequent `R_SCE_SHA256_Update()` function and `R_SCE_SHA256_Final()` function.

Parameters

| | | |
|----------|--------|-------------------------|
| [in,out] | handle | SHA handler (work area) |
|----------|--------|-------------------------|

Return values

| | |
|-------------|--------------------|
| FSP_SUCCESS | Normal termination |
|-------------|--------------------|

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_SHA256_Update()

```
fsp_err_t R_SCE_SHA256_Update ( sce_sha_md5_handle_t * handle, uint8_t * message, uint32_t message_length )
```

The R_SCE_SHA256_Update() function calculates a hash value based on the second argument, message, and the third argument, message_length, and writes the ongoing status to the first argument, handle. After message input is completed, call R_SCE_SHA256_Final().

Parameters

| | | |
|----------|----------------|-------------------------|
| [in,out] | handle | SHA handler (work area) |
| [in] | message | message data area |
| [in] | message_length | message data length |

Return values

| | |
|-------------------------------------|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTOSCE_PARAMETER | An invalid handle was input. |
| FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION | An invalid function was called. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_SHA256_Final()

```
fsp_err_t R_SCE_SHA256_Final ( sce_sha_md5_handle_t * handle, uint8_t * digest, uint32_t *
digest_length )
```

Using the handle specified in the first argument, handle, the R_SCE_SHA256_Final() function writes the calculation result to the second argument, digest, and writes the length of the calculation result to the third argument, digest_length.

Parameters

| | | |
|----------|---------------|----------------------------|
| [in,out] | handle | SHA handler (work area) |
| [in,out] | digest | hasha data area |
| [in,out] | digest_length | hash data length (32bytes) |

Return values

| | |
|-------------------------------------|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTOSCE_PARAMETER | An invalid handle was input. |
| FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION | An invalid function was called. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ **R_SCE_SHA256HMAC_GenerateInit()**

```
fsp_err_t R_SCE_SHA256HMAC_GenerateInit ( sce_hmac_sha_handle_t* handle,
sce_hmac_sha_wrapped_key_t* wrapped_key )
```

The `R_SCE_SHA256HMAC_GenerateInit()` function uses the second argument `wrapped_key` to prepare for execution of SHA256-HMAC calculation, then writes the result to the first argument `handle`. The argument `handle` is used by the subsequent `R_SCE_SHA256HMAC_GenerateUpdate()` function or `R_SCE_SHA256HMAC_GenerateFinal()` function.

Parameters

| | | |
|----------|-------------|------------------------------|
| [in,out] | handle | SHA-HMAC handler (work area) |
| [in] | wrapped_key | MAC wrapped key |

Return values

| | |
|-------------------------------------|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTOSCE_KEY_SET_FAIL | An invalid MAC wrapped key was input. |
| FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_SHA256HMAC_GenerateUpdate()

```
fsp_err_t R_SCE_SHA256HMAC_GenerateUpdate ( sce_hmac_sha_handle_t* handle, uint8_t* message, uint32_t message_length )
```

The `R_SCE_SHA256HMAC_GenerateUpdate()` function uses the handle specified by the first argument `handle`, calculates a hash value from the second argument `message` and third argument `message_length`, then writes the intermediate result to the first argument `handle`. After message input finishes, call the `R_SCE_SHA256HMAC_GenerateFinal()` function.

Parameters

| | | |
|----------|----------------|-----------------------------|
| [in,out] | handle | SHA-HMAC handle (work area) |
| [in] | message | Message area |
| [in] | message_length | Message length |

Return values

| | |
|-------------------------------------|---------------------------------|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTOSCE_PARAMETER | An invalid handle was input. |
| FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION | An invalid function was called. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_SHA256HMAC_GenerateFinal()

```
fsp_err_t R_SCE_SHA256HMAC_GenerateFinal ( sce_hmac_sha_handle_t* handle, uint8_t* mac )
```

The `R_SCE_SHA256HMAC_GenerateFinal()` function uses the handle specified by the first argument `handle` and writes the calculation result to the second argument `mac`.

Parameters

| | | |
|----------|--------|-----------------------------|
| [in,out] | handle | SHA-HMAC handle (work area) |
| [in,out] | mac | HMAC area (32 bytes) |

Return values

| | |
|-------------------------------------|---------------------------------|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTOSCE_FAIL | An internal error occurred. |
| FSP_ERR_CRYPTOSCE_PARAMETER | An invalid handle was input. |
| FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION | An invalid function was called. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_SHA256HMAC_VerifyInit()

```
fsp_err_t R_SCE_SHA256HMAC_VerifyInit ( sce_hmac_sha_handle_t* handle,
sce_hmac_sha_wrapped_key_t* wrapped_key )
```

The R_SCE_SHA256HMAC_VerifyInit() function uses the second argument wrapped_key to prepare for execution of SHA256-HMAC calculation, then writes the result to the first argument handle. The argument handle is used by the subsequent R_SCE_SHA256HMAC_VerifyUpdate() function or R_SCE_SHA256HMAC_VerifyFinal() function.

Parameters

| | | |
|----------|-------------|------------------------------|
| [in,out] | handle | SHA-HMAC handler (work area) |
| [in] | wrapped_key | MAC wrapped key |

Return values

| | |
|-------------------------------------|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTOSCE_KEY_SET_FAIL | An invalid MAC wrapped key was input. |
| FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ **R_SCE_SHA256HMAC_VerifyUpdate()**

```
fsp_err_t R_SCE_SHA256HMAC_VerifyUpdate ( sce_hmac_sha_handle_t * handle, uint8_t *
message, uint32_t message_length )
```

The `R_SCE_SHA256HMAC_VerifyUpdate()` function uses the handle specified by the first argument `handle`, calculates a hash value from the second argument `message` and third argument `message_length`, then writes the intermediate result to the first argument `handle`. After message input finishes, call the `R_SCE_SHA256HMAC_VerifyFinal()` function.

Parameters

| | | |
|----------|----------------|-----------------------------|
| [in,out] | handle | SHA-HMAC handle (work area) |
| [in] | message | Message area |
| [in] | message_length | Message length |

Return values

| | |
|-------------------------------------|---------------------------------|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTOSCE_PARAMETER | An invalid handle was input. |
| FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION | An invalid function was called. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ **R_SCE_SHA256HMAC_VerifyFinal()**

```
fsp_err_t R_SCE_SHA256HMAC_VerifyFinal ( sce_hmac_sha_handle_t* handle, uint8_t* mac,
uint32_t mac_length )
```

The [R_SCE_SHA256HMAC_VerifyFinal\(\)](#) function uses the handle specified by the first argument handle and verifies the mac value from the second argument mac and third argument mac_length. Input a value in bytes from 4 to 32 as mac_length.

Parameters

| | | |
|----------|------------|-----------------------------|
| [in,out] | handle | SHA-HMAC handle (work area) |
| [in] | mac | HMAC area |
| [in] | mac_length | HMAC length |

Return values

| | |
|-------------------------------------|---------------------------------|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTOSCE_FAIL | An internal error occurred. |
| FSP_ERR_CRYPTOSCE_PARAMETER | An invalid handle was input. |
| FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION | An invalid function was called. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ **R_SCE_RSASSA_PKCS1024_SignatureGenerate()**

```
fsp_err_t R_SCE_RSASSA_PKCS1024_SignatureGenerate ( sce_rsa_byte_data_t* message_hash,
sce_rsa_byte_data_t* signature, sce_rsa1024_private_wrapped_key_t* wrapped_key, uint8_t
hash_type )
```

The [R_SCE_RSASSA_PKCS1024_SignatureGenerate\(\)](#) function generates, in accordance with RSASSA-PKCS1-V1_5, a signature from the message text or hash value that is input in the first argument, message_hash, using the private wrapped key input to the third argument, wrapped_key, and writes the signature text to the second argument, signature. When a message is specified in the first argument, message_hash->data_type, a hash value is calculated for the message as specified by the fourth argument, hash_type. When specifying a hash value in the first argument, message_hash->data_type, a hash value calculated with a hash algorithm as specified by the fourth argument, hash_type, must be input to message_hash->pdata.

Parameters

| | | |
|------|--------------|--|
| [in] | message_hash | Message or hash value to which to attach signature <ul style="list-style-type: none"> message_hash->pdata : Specifies pointer to array storing the message or hash value |
|------|--------------|--|

| | | | |
|----------|-------------|--|--|
| | | | <ul style="list-style-type: none"> message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash value: 1) |
| [in,out] | signature | | Signature text storage destination information <ul style="list-style-type: none"> signature->pdata : Specifies pointer to array storing the signature text signature->data_length : data length |
| [in] | wrapped_key | | Inputs the 1024-bit RSA private wrapped key. |
| [in] | hash_type | | Only HW_SCE_RSA_HASH_SHA256 is supported |

Return values

| | |
|-------------------------------------|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTOSCE_KEY_SET_FAIL | Invalid wrapped key was input. |
| FSP_ERR_CRYPTOSCE_PARAMETER | Input data is invalid. |
| FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION | An invalid function was called. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ **R_SCE_RSASSA_PKCS1024_SignatureVerify()**

```
fsp_err_t R_SCE_RSASSA_PKCS1024_SignatureVerify ( sce_rsa_byte_data_t * signature,
sce_rsa_byte_data_t * message_hash, sce_rsa1024_public_wrapped_key_t * wrapped_key, uint8_t
hash_type )
```

The **R_SCE_RSASSA_PKCS1024_SignatureVerify()** function verifies, in accordance with RSASSA-PKCS1-V1_5, the signature text input to the first argument *signature*, and the message text or hash value input to the second argument, *message_hash*, using the public wrapped key input to the third argument, *wrapped_key*. When a message is specified in the second argument, *message_hash->data_type*, a hash value is calculated using the public wrapped key input to the third argument, *wrapped_key*, and as specified by the fourth argument, *hash_type*. When specifying a hash value in the second argument, *message_hash->data_type*, a hash value calculated with a hash algorithm as specified by the fourth argument, *hash_type*, must be input to *message_hash->pdata*.

Parameters

| | | |
|------|--------------|--|
| [in] | signature | Signature text information to verify <ul style="list-style-type: none"> signature->pdata : Specifies pointer to array storing the signature text signature->data_length : Specifies effective data length of the array |
| [in] | message_hash | Message text or hash value to verify <ul style="list-style-type: none"> message_hash->pdata : Specifies pointer to array storing the message or hash value message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash value: 1) |
| [in] | wrapped_key | Inputs the 1024-bit RSA public wrapped key. |
| [in] | hash_type | Only |

HW_SCE_RSA_HASH_SHA256 is supported

Return values

| | |
|-------------------------------------|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTOSCE_KEY_SET_FAIL | Invalid wrapped key was input. |
| FSP_ERR_CRYPTOSCE_AUTHENTICATION | Authentication failed |
| FSP_ERR_CRYPTOSCE_PARAMETER | Input data is invalid. |
| FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION | An invalid function was called. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSASSA_PKCS2048_SignatureGenerate()

```
fsp_err_t R_SCE_RSASSA_PKCS2048_SignatureGenerate ( sce_rsa_byte_data_t* message_hash,
sce_rsa_byte_data_t* signature, sce_rsa2048_private_wrapped_key_t* wrapped_key, uint8_t
hash_type )
```

The `R_SCE_RSASSA_PKCS2048_SignatureGenerate()` function generates, in accordance with RSASSA-PKCS1-V1_5, a signature from the message text or hash value that is input in the first argument, `message_hash`, using the private wrapped key input to the third argument, `wrapped_key`, and writes the signature text to the second argument, `signature`. When a message is specified in the first argument, `message_hash->data_type`, a hash value is calculated for the message as specified by the fourth argument, `hash_type`. When specifying a hash value in the first argument, `message_hash->data_type`, a hash value calculated with a hash algorithm as specified by the fourth argument, `hash_type`, must be input to `message_hash->pdata`.

Parameters

| | | |
|------|--------------|---|
| [in] | message_hash | <p>Message or hash value to which to attach signature</p> <ul style="list-style-type: none"> • <code>message_hash->pdata</code> : Specifies pointer to array storing the message or hash value • <code>message_hash->data_length</code> : Specifies effective data length of the array (Specify only when Message is selected) • <code>message_hash->data_type</code> : Selects the |
|------|--------------|---|

| | | |
|----------|-------------|---|
| | | data type of message_hash (Message: 0 Hash value: 1) |
| [in,out] | signature | Signature text storage destination information <ul style="list-style-type: none"> signature->pdata : Specifies pointer to array storing the signature text signature->data_length : data length |
| [in] | wrapped_key | Inputs the 2048-bit RSA private wrapped key. |
| [in] | hash_type | Only HW_SCE_RSA_HASH_SHA256 is supported |

Return values

| | |
|-------------------------------------|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTOSCE_KEY_SET_FAIL | Invalid wrapped key was input. |
| FSP_ERR_CRYPTOSCE_PARAMETER | Input data is invalid. |
| FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION | An invalid function was called. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSASSA_PKCS2048_SignatureVerify()

```
fsp_err_t R_SCE_RSASSA_PKCS2048_SignatureVerify ( sce_rsa_byte_data_t * signature,
sce_rsa_byte_data_t * message_hash, sce_rsa2048_public_wrapped_key_t * wrapped_key, uint8_t
hash_type )
```

The `R_SCE_RSASSA_PKCS2048_SignatureVerify()` function verifies, in accordance with RSASSA-PKCS1-V1_5, the signature text input to the first argument `signature`, and the message text or hash value input to the second argument, `message_hash`, using the public wrapped key input to the third argument, `wrapped_key`. When a message is specified in the second argument, `message_hash->data_type`, a hash value is calculated using the public wrapped key input to the third argument, `wrapped_key`, and as specified by the fourth argument, `hash_type`. When specifying a hash value in the second argument, `message_hash->data_type`, a hash value calculated with a hash algorithm as specified by the fourth argument, `hash_type`, must be input to `message_hash->pdata`.

Parameters

| | | |
|------|--------------|--|
| [in] | signature | Signature text information to verify <ul style="list-style-type: none"> signature->pdata : Specifies pointer to array storing the signature text signature->data_length : Specifies effective data length of the array |
| [in] | message_hash | Message text or hash value to verify <ul style="list-style-type: none"> message_hash->pdata : Specifies pointer to array storing the message or hash value message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash value: 1) |
| [in] | wrapped_key | Inputs the 1024-bit RSA public wrapped key. |
| [in] | hash_type | Only |

| | | |
|--|--|-------------------------------------|
| | | HW_SCE_RSA_HASH_SHA256 is supported |
|--|--|-------------------------------------|

Return values

| | |
|--------------------------------------|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL | Invalid wrapped key was input. |
| FSP_ERR_CRYPTO_SCE_AUTHENTICATION | Authentication failed |
| FSP_ERR_CRYPTO_SCE_PARAMETER | Input data is invalid. |
| FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION | An invalid function was called. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSASSA_PKCS3072_SignatureVerify()

```
fsp_err_t R_SCE_RSASSA_PKCS3072_SignatureVerify ( sce_rsa_byte_data_t * signature,
sce_rsa_byte_data_t * message_hash, sce_rsa3072_public_wrapped_key_t * wrapped_key, uint8_t
hash_type )
```

The `R_SCE_RSASSA_PKCS3072_SignatureVerify()` function verifies, in accordance with RSASSA-PKCS1-V1_5, the signature text input to the first argument `signature`, and the message text or hash value input to the second argument, `message_hash`, using the public wrapped key input to the third argument, `wrapped_key`. When a message is specified in the second argument, `message_hash->data_type`, a hash value is calculated using the public wrapped key input to the third argument, `wrapped_key`, and as specified by the fourth argument, `hash_type`. When specifying a hash value in the second argument, `message_hash->data_type`, a hash value calculated with a hash algorithm as specified by the fourth argument, `hash_type`, must be input to `message_hash->pdata`.

Parameters

| | | |
|------|--------------|--|
| [in] | signature | Signature text information to verify <ul style="list-style-type: none"> signature->pdata : Specifies pointer to array storing the signature text signature->data_length : Specifies effective data length of the array |
| [in] | message_hash | Message text or hash value to verify <ul style="list-style-type: none"> message_hash->pdata |

| | | | |
|------|-------------|--|---|
| | | | <p>ta : Specifies pointer to array storing the message or hash value</p> <ul style="list-style-type: none"> message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash value: 1) |
| [in] | wrapped_key | | Inputs the 3072-bit RSA public wrapped key. |
| [in] | hash_type | | Only HW_SCE_RSA_HASH_SHA256 is supported |

Return values

| | |
|-------------------------------------|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTOSCE_KEY_SET_FAIL | Invalid wrapped key was input. |
| FSP_ERR_CRYPTOSCE_AUTHENTICATION | Authentication failed |
| FSP_ERR_CRYPTOSCE_PARAMETER | Input data is invalid. |
| FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION | An invalid function was called. |
| FSP_ERR_CRYPTOSCE_FAIL | An internal error occurred. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSASSA_PKCS4096_SignatureVerify()

```
fsp_err_t R_SCE_RSASSA_PKCS4096_SignatureVerify ( sce_rsa_byte_data_t * signature,
sce_rsa_byte_data_t * message_hash, sce_rsa4096_public_wrapped_key_t * wrapped_key, uint8_t
hash_type )
```

The `R_SCE_RSASSA_PKCS4096_SignatureVerify()` function verifies, in accordance with RSASSA-PKCS1-V1_5, the signature text input to the first argument `signature`, and the message text or hash value input to the second argument, `message_hash`, using the public wrapped key input to the third argument, `wrapped_key`. When a message is specified in the second argument, `message_hash->data_type`, a hash value is calculated using the public wrapped key input to the third argument, `wrapped_key`, and as specified by the fourth argument, `hash_type`. When specifying a hash value in the second argument, `message_hash->data_type`, a hash value calculated with a hash algorithm as specified by the fourth argument, `hash_type`, must be input to `message_hash->pdata`.

Parameters

| | | |
|------|--------------|--|
| [in] | signature | Signature text information to verify <ul style="list-style-type: none"> signature->pdata : Specifies pointer to array storing the signature text signature->data_length : Specifies effective data length of the array |
| [in] | message_hash | Message text or hash value to verify <ul style="list-style-type: none"> message_hash->pdata : Specifies pointer to array storing the message or hash value message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash value: 1) |
| [in] | wrapped_key | Inputs the 1024-bit RSA public wrapped key. |
| [in] | hash_type | Only |

| | | |
|--|--|-------------------------------------|
| | | HW_SCE_RSA_HASH_SHA256 is supported |
|--|--|-------------------------------------|

Return values

| | |
|-------------------------------------|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTOSCE_KEY_SET_FAIL | Invalid wrapped key was input. |
| FSP_ERR_CRYPTOSCE_AUTHENTICATION | Authentication failed |
| FSP_ERR_CRYPTOSCE_PARAMETER | Input data is invalid. |
| FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION | An invalid function was called. |
| FSP_ERR_CRYPTOSCE_FAIL | An internal error occurred. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSAES_PKCS1024_Encrypt()

```
fsp_err_t R_SCE_RSAES_PKCS1024_Encrypt ( sce_rsa_byte_data_t* plain, sce_rsa_byte_data_t*
cipher, sce_rsa1024_public_wrapped_key_t* wrapped_key )
```

The R_SCE_RSAES_PKCS1024_Encrypt() function RSA-encrypts the plaintext input to the first argument, plain, according to RSAES-PKCS1-V1_5. It writes the encryption result to the second argument, cipher.

Parameters

| | | |
|----------|-------------|--|
| [in] | plain | plaintext <ul style="list-style-type: none"> plain->pdata : Specifies pointer to array containing plaintext. plain->data_length : Specifies valid data length of plaintext array. data size <= public key n size - 11 |
| [in,out] | cipher | ciphertext <ul style="list-style-type: none"> cipher->pdata : Specifies pointer to array containing ciphertext. cipher->data_length : Inputs ciphertext buffer size. Outputs valid data length after encryption (public key n size). |
| [in] | wrapped_key | Inputs the 1024-bit RSA public wrapped key. |

Return values

| | |
|-------------------------------------|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTOSCE_KEY_SET_FAIL | Incorrect wrapped key was input. |
| FSP_ERR_CRYPTOSCE_PARAMETER | Input data is illegal. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSAES_PKCS1024_Decrypt()

```
fsp_err_t R_SCE_RSAES_PKCS1024_Decrypt ( sce_rsa_byte_data_t* cipher, sce_rsa_byte_data_t*
plain, sce_rsa1024_private_wrapped_key_t* wrapped_key )
```

The R_SCE_RSAES_PKCS1024_Decrypt() function RSA-decrypts the ciphertext input to the first argument, cipher, according to RSAES-PKCS1-V1_5. It writes the decryption result to the second argument, plain.

Parameters

| | | |
|----------|-------------|--|
| [in] | cipher | ciphertext <ul style="list-style-type: none"> • cipher->pdata : Specifies pointer to array containing ciphertext. • cipher->data_length : Inputs ciphertext buffer size. Outputs valid data length after encryption (public key n size). |
| [in,out] | plain | plaintext <ul style="list-style-type: none"> • plain->pdata : Specifies pointer to array containing plaintext. • plain->data_length : Inputs plaintext buffer size. The following size is required. Plaintext buffer size >= public key n size -11. Outputs valid data length after decryption (public key n size). |
| [in] | wrapped_key | Inputs the 1024-bit RSA private wrapped key. |

Return values

| | |
|-------------------------------------|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTOSCE_KEY_SET_FAIL | Incorrect wrapped key was input. |
| FSP_ERR_CRYPTOSCE_PARAMETER | Input data is illegal. |

| | |
|-------------------------|-----------------------------|
| FSP_ERR_CRYPT0_SCE_FAIL | An internal error occurred. |
|-------------------------|-----------------------------|

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSAES_PKCS2048_Encrypt()

```
fsp_err_t R_SCE_RSAES_PKCS2048_Encrypt ( sce_rsa_byte_data_t* plain, sce_rsa_byte_data_t*
cipher, sce_rsa2048_public_wrapped_key_t* wrapped_key )
```

The R_SCE_RSAES_PKCS2048_Encrypt() function RSA-encrypts the plaintext input to the first argument, plain, according to RSAES-PKCS1-V1_5. It writes the encryption result to the second argument, cipher.

Parameters

| | | |
|----------|-------------|--|
| [in] | plain | plaintext <ul style="list-style-type: none"> plain->pdata : Specifies pointer to array containing plaintext. plain->data_length : Specifies valid data length of plaintext array. data size <= public key n size - 11 |
| [in,out] | cipher | ciphertext <ul style="list-style-type: none"> cipher->pdata : Specifies pointer to array containing ciphertext. cipher->data_length : Inputs ciphertext buffer size. Outputs valid data length after encryption (public key n size). |
| [in] | wrapped_key | Inputs the 2048-bit RSA public wrapped key. |

Return values

| | |
|-------------------------------------|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTOSCE_KEY_SET_FAIL | Incorrect wrapped key was input. |
| FSP_ERR_CRYPTOSCE_PARAMETER | Input data is illegal. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSAES_PKCS2048_Decrypt()

```
fsp_err_t R_SCE_RSAES_PKCS2048_Decrypt ( sce_rsa_byte_data_t* cipher, sce_rsa_byte_data_t*
plain, sce_rsa2048_private_wrapped_key_t* wrapped_key )
```

The R_SCE_RSAES_PKCS2048_Decrypt() function RSA-decrypts the ciphertext input to the first argument, cipher, according to RSAES-PKCS1-V1_5. It writes the decryption result to the second argument, plain.

Parameters

| | | |
|----------|-------------|--|
| [in] | cipher | ciphertext <ul style="list-style-type: none"> • cipher->pdata : Specifies pointer to array containing ciphertext. • cipher->data_length : Inputs ciphertext buffer size. Outputs valid data length after encryption (public key n size). |
| [in,out] | plain | plaintext <ul style="list-style-type: none"> • plain->pdata : Specifies pointer to array containing plaintext. • plain->data_length : Inputs plaintext buffer size. The following size is required. Plaintext buffer size >= public key n size -11. Outputs valid data length after decryption (public key n size). |
| [in] | wrapped_key | Inputs the 1024-bit RSA private wrapped key. |

Return values

| | |
|-------------------------------------|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTOSCE_KEY_SET_FAIL | Incorrect wrapped key was input. |
| FSP_ERR_CRYPTOSCE_PARAMETER | Input data is illegal. |

| | |
|-------------------------|-----------------------------|
| FSP_ERR_CRYPT0_SCE_FAIL | An internal error occurred. |
|-------------------------|-----------------------------|

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSAES_PKCS3072_Encrypt()

```
fsp_err_t R_SCE_RSAES_PKCS3072_Encrypt ( sce_rsa_byte_data_t* plain, sce_rsa_byte_data_t*
cipher, sce_rsa3072_public_wrapped_key_t* wrapped_key )
```

The R_SCE_RSAES_PKCS3072_Encrypt() function RSA-encrypts the plaintext input to the first argument, plain, according to RSAES-PKCS1-V1_5. It writes the encryption result to the second argument, cipher.

Parameters

| | | |
|----------|-------------|--|
| [in] | plain | plaintext <ul style="list-style-type: none"> plain->pdata : Specifies pointer to array containing plaintext. plain->data_length : Specifies valid data length of plaintext array. data size <= public key n size - 11 |
| [in,out] | cipher | ciphertext <ul style="list-style-type: none"> cipher->pdata : Specifies pointer to array containing ciphertext. cipher->data_length : Inputs ciphertext buffer size. Outputs valid data length after encryption (public key n size). |
| [in] | wrapped_key | Inputs the 3072-bit RSA public wrapped key. |

Return values

| | |
|---------------------------------------|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTTO_SCE_KEY_SET_FAIL | Incorrect wrapped key was input. |
| FSP_ERR_CRYPTTO_SCE_PARAMETER | Input data is illegal. |
| FSP_ERR_CRYPTTO_SCE_FAIL | An internal error occurred. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSAES_PKCS4096_Encrypt()

```
fsp_err_t R_SCE_RSAES_PKCS4096_Encrypt ( sce_rsa_byte_data_t* plain, sce_rsa_byte_data_t*
cipher, sce_rsa4096_public_wrapped_key_t* wrapped_key )
```

The R_SCE_RSAES_PKCS4096_Encrypt() function RSA-encrypts the plaintext input to the first argument, plain, according to RSAES-PKCS1-V1_5. It writes the encryption result to the second argument, cipher.

Parameters

| | | |
|----------|-------------|--|
| [in] | plain | plaintext <ul style="list-style-type: none"> plain->pdata : Specifies pointer to array containing plaintext. plain->data_length : Specifies valid data length of plaintext array. data size <= public key n size - 11 |
| [in,out] | cipher | ciphertext <ul style="list-style-type: none"> cipher->pdata : Specifies pointer to array containing ciphertext. cipher->data_length : Inputs ciphertext buffer size. Outputs valid data length after encryption (public key n size). |
| [in] | wrapped_key | Inputs the 4096-bit RSA public wrapped key. |

Return values

| | |
|-------------------------------------|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTOSCE_KEY_SET_FAIL | Incorrect wrapped key was input. |
| FSP_ERR_CRYPTOSCE_PARAMETER | Input data is illegal. |
| FSP_ERR_CRYPTOSCE_FAIL | An internal error occurred. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECDSA_secp192r1_SignatureGenerate()

```
fsp_err_t R_SCE_ECDSA_secp192r1_SignatureGenerate ( sce_ecdsa_byte_data_t* message_hash,
sce_ecdsa_byte_data_t* signature, sce_ecc_private_wrapped_key_t* wrapped_key )
```

When a message is specified in the first argument, message_hash->data_type, a SHA-256 hash of the message text input as the first argument, message_hash->pdata, is calculated, and the signature text is written to the second argument, signature, in accordance with secp192r1 using the private wrapped key input as the third argument, wrapped_key.

When a hash value is specified in the first argument, message_hash->data_type, the signature text for the first 24 bytes of the SHA-256 hash value input to the first argument, message_hash->pdata, is written to the second argument, signature, in accordance with secp192r1 using the private wrapped key input as the third argument, wrapped_key.

Parameters

| | | |
|----------|--------------|---|
| [in] | message_hash | <p>Message or hash value to which to attach signature</p> <ul style="list-style-type: none"> message_hash->pdata : Specifies pointer to array storing the message or hash value message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash value: 1) |
| [in,out] | signature | <p>Signature text storage destination information</p> <ul style="list-style-type: none"> signature->pdata : Specifies pointer to array storing signature text The signature format is "0 padding (64 bits) signature r (192 bits) 0 padding (64 bits) signature s (192 bits)". signature->data_length : Data length (byte units) |

| | | |
|------|-------------|---|
| [in] | wrapped_key | Input wrapped key of secp192r1 private key. |
|------|-------------|---|

Return values

| | |
|-------------------------------------|--|
| FSP_SUCCESS | Normal end |
| FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource required by the processing is in use by other processing. |
| FSP_ERR_CRYPTOSCE_KEY_SET_FAIL | Invalid wrapped key was input. |
| FSP_ERR_CRYPTOSCE_FAIL | An internal error occurred. |
| FSP_ERR_CRYPTOSCE_PARAMETER | Input data is invalid. |
| FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION | An invalid function was called. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECDSA_secp224r1_SignatureGenerate()

```
fsp_err_t R_SCE_ECDSA_secp224r1_SignatureGenerate ( sce_ecdsa_byte_data_t* message_hash,
sce_ecdsa_byte_data_t* signature, sce_ecc_private_wrapped_key_t* wrapped_key )
```

When a message is specified in the first argument, message_hash->data_type, a SHA-256 hash of the message text input as the first argument, message_hash->pdata, is calculated, and the signature text is written to the second argument, signature, in accordance with secp224r1 using the private wrapped key input as the third argument, wrapped_key.

When a hash value is specified in the first argument, message_hash->data_type, the signature text for the first 28 bytes of the SHA-256 hash value input to the first argument, message_hash->pdata, is written to the second argument, signature, in accordance with secp224r1 using the private wrapped key input as the third argument, wrapped_key.

Parameters

| | | |
|------|--------------|--|
| [in] | message_hash | <p>Message or hash value to which to attach signature</p> <ul style="list-style-type: none"> message_hash->pdata : Specifies pointer to array storing the message or hash value message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) message_hash->data_type : Selects the data type of message_hash |
|------|--------------|--|

| | | |
|----------|-------------|--|
| | | (Message: 0 Hash value: 1) |
| [in,out] | signature | Signature text storage destination information <ul style="list-style-type: none"> signature->pdata : Specifies pointer to array storing signature text The signature format is "0 padding (32 bits) signature r (224 bits) 0 padding (32 bits) signature s (224 bits)". signature->data_length : Data length (byte units) |
| [in] | wrapped_key | Input wrapped key of secp224r1 private key. |

Return values

| | |
|-------------------------------------|--|
| FSP_SUCCESS | Normal end |
| FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource required by the processing is in use by other processing. |
| FSP_ERR_CRYPTOSCE_KEY_SET_FAIL | Invalid wrapped key was input. |
| FSP_ERR_CRYPTOSCE_FAIL | An internal error occurred. |
| FSP_ERR_CRYPTOSCE_PARAMETER | Input data is invalid. |
| FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION | An invalid function was called. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECDSA_secp256r1_SignatureGenerate()

```
fsp_err_t R_SCE_ECDSA_secp256r1_SignatureGenerate ( sce_ecdsa_byte_data_t* message_hash,
sce_ecdsa_byte_data_t* signature, sce_ecc_private_wrapped_key_t* wrapped_key )
```

When a message is specified in the first argument, message_hash->data_type, a SHA-256 hash of the message text input as the first argument, message_hash->pdata, is calculated, and the signature text is written to the second argument, signature, in accordance with secp256r1 using the private wrapped key input as the third argument, wrapped_key.

When a hash value is specified in the first argument, message_hash->data_type, the signature text for the first 32 bytes of the SHA-256 hash value input to the first argument, message_hash->pdata, is written to the second argument, signature, in accordance with secp256r1 using the private wrapped key input as the third argument, wrapped_key.

Parameters

| | | |
|----------|--------------|---|
| [in] | message_hash | <p>Message or hash value to which to attach signature</p> <ul style="list-style-type: none"> message_hash->pdata : Specifies pointer to array storing the message or hash value message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash value: 1) |
| [in,out] | signature | <p>Signature text storage destination information</p> <ul style="list-style-type: none"> signature->pdata : Specifies pointer to array storing signature text The signature format is "signature r (256 bits) signature s (256 bits)". signature->data_length : Data length (byte units) |
| [in] | wrapped_key | Input wrapped key of secp256r1 private key. |

Return values

| | |
|-------------------------------------|--|
| FSP_SUCCESS | Normal end |
| FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource required by the processing is in use by other processing. |
| FSP_ERR_CRYPTOSCE_KEY_SET_FAIL | Invalid wrapped key was input. |
| FSP_ERR_CRYPTOSCE_FAIL | An internal error occurred. |
| FSP_ERR_CRYPTOSCE_PARAMETER | Input data is invalid. |
| FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION | An invalid function was called. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECDSA_secp384r1_SignatureGenerate()

```
fsp_err_t R_SCE_ECDSA_secp384r1_SignatureGenerate ( sce_ecdsa_byte_data_t* message_hash,
sce_ecdsa_byte_data_t* signature, sce_ecc_private_wrapped_key_t* wrapped_key )
```

When a message is specified in the first argument, message_hash->data_type, a SHA-384 hash of the message text input as the first argument, message_hash->pdata, is calculated, and the signature text is written to the second argument, signature, in accordance with secp384r1 using the private wrapped key input as the third argument, wrapped_key.

To use message input, prepare a user-defined function for SHA384.

When a hash value is specified in the first argument, message_hash->data_type, the signature text for the first 48 bytes of the SHA-384 hash value input to the first argument, message_hash->pdata, is written to the second argument, signature, in accordance with secp384r1 using the private wrapped key input as the third argument, wrapped_key.

Parameters

| | | |
|------|--------------|---|
| [in] | message_hash | <p>Message or hash value to which to attach signature</p> <ul style="list-style-type: none"> message_hash->pdata : Specifies pointer to array storing the message or hash value message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash |
|------|--------------|---|

| | | |
|----------|-------------|--|
| | | value: 1) |
| [in,out] | signature | Signature text storage destination information <ul style="list-style-type: none"> signature->pdata : Specifies pointer to array storing signature text The signature format is "signature r (384 bits) signature s (384 bits)". signature->data_length : Data length (byte units) |
| [in] | wrapped_key | Input wrapped key of secp384r1 private key. |

Return values

| | |
|-------------------------------------|--|
| FSP_SUCCESS | Normal end |
| FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource required by the processing is in use by other processing. |
| FSP_ERR_CRYPTOSCE_KEY_SET_FAIL | Invalid wrapped key was input. |
| FSP_ERR_CRYPTOSCE_FAIL | An internal error occurred. |
| FSP_ERR_CRYPTOSCE_PARAMETER | Input data is invalid. |
| FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION | An invalid function was called. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECDSA_secp192r1_SignatureVerify()

```
fsp_err_t R_SCE_ECDSA_secp192r1_SignatureVerify ( sce_ecdsa_byte_data_t* signature,
sce_ecdsa_byte_data_t* message_hash, sce_ecc_public_wrapped_key_t* wrapped_key )
```

When a message is specified in the second argument, message_hash->data_type, a SHA-256 hash of the message text input as the second argument, message_hash->pdata, is calculated, and the signature text input to the first argument, signature, is validated in accordance with secp192r1 using the public wrapped key input as the third argument, wrapped_key.

When a hash value is specified in the second argument, message_hash->data_type, the signature text for the first 24 bytes of the SHA-256 hash value input to the second argument, message_hash->pdata, input to the first argument, signature, is validated in accordance with secp192r1 using the public wrapped key input as the third argument, wrapped_key.

Parameters

| | | |
|----------|--------------|--|
| [in] | signature | Signature text information to be verified <ul style="list-style-type: none"> signature->pdata : Specifies pointer to array storing signature text The signature format is "0 padding (64 bits) signature r (192 bits) 0 padding (64 bits) signature s (192 bits)". signature->data_length : Specifies the data length (byte units) (nonuse) |
| [in,out] | message_hash | Message or hash value to be verified <ul style="list-style-type: none"> message_hash->pdata : Specifies pointer to array storing the message or hash value message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash value: 1) |

| | | |
|------|-------------|--|
| [in] | wrapped_key | Input wrapped key of secp192r1 public key. |
|------|-------------|--|

Return values

| | |
|-------------------------------------|--|
| FSP_SUCCESS | Normal end |
| FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource required by the processing is in use by other processing. |
| FSP_ERR_CRYPTOSCE_KEY_SET_FAIL | Invalid wrapped key was input. |
| FSP_ERR_CRYPTOSCE_FAIL | An internal error occurred or signature verification failed. |
| FSP_ERR_CRYPTOSCE_PARAMETER | Input data is invalid. |
| FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION | An invalid function was called. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECDSA_secp224r1_SignatureVerify()

```
fsp_err_t R_SCE_ECDSA_secp224r1_SignatureVerify ( sce_ecdsa_byte_data_t * signature,
sce_ecdsa_byte_data_t * message_hash, sce_ecc_public_wrapped_key_t * wrapped_key )
```

When a message is specified in the second argument, message_hash->data_type, a SHA-256 hash of the message text input as the second argument, message_hash->pdata, is calculated, and the signature text input to the first argument, signature, is validated in accordance with secp224r1 using the public wrapped key input as the third argument, wrapped_key.

When a hash value is specified in the second argument, message_hash->data_type, the signature text for the first 28 bytes of the SHA-256 hash value input to the second argument, message_hash->pdata, input to the first argument, signature, is validated in accordance with secp224r1 using the public wrapped key input as the third argument, wrapped_key.

Parameters

| | | |
|------|-----------|--|
| [in] | signature | Signature text information to be verified <ul style="list-style-type: none"> signature->pdata : Specifies pointer to array storing signature text The signature format is "0 padding (32 bits) signature r (224 bits) 0 padding (32 bits) signature s (224 bits)". signature->data_length : Specifies the data length (byte units) (nonuse) |
|------|-----------|--|

| | | |
|----------|--------------|--|
| [in,out] | message_hash | <p>Message or hash value to be verified</p> <ul style="list-style-type: none"> • message_hash->data : Specifies pointer to array storing the message or hash value • message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) • message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash value: 1) |
| [in] | wrapped_key | Input wrapped key of secp224r1 public key. |

Return values

| | |
|---------------------------------------|--|
| FSP_SUCCESS | Normal end |
| FSP_ERR_CRYPTTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource required by the processing is in use by other processing. |
| FSP_ERR_CRYPTTO_SCE_KEY_SET_FAIL | Invalid wrapped key was input. |
| FSP_ERR_CRYPTTO_SCE_FAIL | An internal error occurred or signature verification failed. |
| FSP_ERR_CRYPTTO_SCE_PARAMETER | Input data is invalid. |
| FSP_ERR_CRYPTTO_SCE_PROHIBIT_FUNCTION | An invalid function was called. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECDSA_secp256r1_SignatureVerify()

```
fsp_err_t R_SCE_ECDSA_secp256r1_SignatureVerify ( sce_ecdsa_byte_data_t* signature,
sce_ecdsa_byte_data_t* message_hash, sce_ecc_public_wrapped_key_t* wrapped_key )
```

When a message is specified in the second argument, message_hash->data_type, a SHA-256 hash of the message text input as the second argument, message_hash->pdata, is calculated, and the signature text input to the first argument, signature, is validated in accordance with secp256r1 using the public wrapped key input as the third argument, wrapped_key.

When a hash value is specified in the second argument, message_hash->data_type, the signature text for the first 32 bytes of the SHA-256 hash value input to the second argument, message_hash->pdata, input to the first argument, signature, is validated in accordance with secp256r1 using the public wrapped key input as the third argument, wrapped_key.

Parameters

| | | |
|----------|--------------|--|
| [in] | signature | Signature text information to be verified <ul style="list-style-type: none"> signature->pdata : Specifies pointer to array storing signature text The signature format is "signature r (256 bits) signature s (256 bits)". signature->data_length : Specifies the data length (byte units) (nonuse) |
| [in,out] | message_hash | Message or hash value to be verified <ul style="list-style-type: none"> message_hash->pdata : Specifies pointer to array storing the message or hash value message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash value: 1) |
| [in] | wrapped_key | Input wrapped key of |

secp256r1 public key.

Return values

| | |
|--------------------------------------|--|
| FSP_SUCCESS | Normal end |
| FSP_ERR_CRYPT0_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource required by the processing is in use by other processing. |
| FSP_ERR_CRYPT0_SCE_KEY_SET_FAIL | Invalid wrapped key was input. |
| FSP_ERR_CRYPT0_SCE_FAIL | An internal error occurred or signature verification failed. |
| FSP_ERR_CRYPT0_SCE_PARAMETER | Input data is invalid. |
| FSP_ERR_CRYPT0_SCE_PROHIBIT_FUNCTION | An invalid function was called. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECDSA_secp384r1_SignatureVerify()

```
fsp_err_t R_SCE_ECDSA_secp384r1_SignatureVerify ( sce_ecdsa_byte_data_t* signature,
sce_ecdsa_byte_data_t* message_hash, sce_ecc_public_wrapped_key_t* wrapped_key )
```

When a message is specified in the second argument, message_hash->data_type, a SHA-256 hash of the message text input as the second argument, message_hash->pdata, is calculated, and the signature text input to the first argument, signature, is validated in accordance with secp384r1 using the public wrapped key input as the third argument, wrapped_key.

To use message input, prepare a user-defined function for SHA384.

When a hash value is specified in the second argument, message_hash->data_type, the signature text for the first 48 bytes of the SHA-256 hash value input to the second argument, message_hash->pdata, input to the first argument, signature, is validated in accordance with secp384r1 using the public wrapped key input as the third argument, wrapped_key.

Parameters

| | | |
|------|-----------|--|
| [in] | signature | Signature text information to be verified <ul style="list-style-type: none"> signature->pdata : Specifies pointer to array storing signature text The signature format is "signature r (384 bits) signature s (384 bits)". signature->data_length : Specifies the data length (byte units) (nonuse) |
|------|-----------|--|

| | | |
|----------|--------------|--|
| [in,out] | message_hash | <p>Message or hash value to be verified</p> <ul style="list-style-type: none"> message_hash->data : Specifies pointer to array storing the message or hash value message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash value: 1) |
| [in] | wrapped_key | Input wrapped key of secp384r1 public key. |

Return values

| | |
|-------------------------------------|--|
| FSP_SUCCESS | Normal end |
| FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource required by the processing is in use by other processing. |
| FSP_ERR_CRYPTOSCE_KEY_SET_FAIL | Invalid wrapped key was input. |
| FSP_ERR_CRYPTOSCE_FAIL | An internal error occurred or signature verification failed. |
| FSP_ERR_CRYPTOSCE_PARAMETER | Input data is invalid. |
| FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION | An invalid function was called. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECDH_secp256r1_Init()

```
fsp_err_t R_SCE_ECDH_secp256r1_Init ( sce_ecdh_handle_t * handle, uint32_t key_type, uint32_t use_key_id )
```

The R_SCE_ECDH_secp256r1_Init() function prepares to perform ECDH key exchange computation and writes the result to the first argument, handle. The succeeding functions R_SCE_ECDH_secp256r1_PublicKeySign(), R_SCE_ECDH_secp256r1_PublicKeyVerify(), R_SCE_ECDH_secp256r1_SharedSecretCalculate(), and R_SCE_ECDH_secp256r1_KeyDerivation() use handle as an argument.

Use the second argument, key_type, to select the type of ECDH key exchange. When ECDHE is selected, the R_SCE_ECDH_secp256r1_PublicKeySign() function uses the SCE's random number generation functionality to generate an secp256r1 key pair. When ECDH is selected, keys installed beforehand are used for key exchange.

Input 1 as the third argument, use_key_id, to use key_id when key exchange is performed. key_id is for applications conforming to the DLMS/COSEM standard for smart meters.

Parameters

| | | |
|----------|------------|--|
| [in,out] | handle | ECDH handler (work area) |
| [in] | key_type | Key exchange type (0: ECDHE, 1: ECDH, 2:ECDH(AES-GCM-128 with IV)) |
| [in] | use_key_id | 0: key_id not used, 1: key_id used |

Return values

| | |
|-----------------------------|------------------------|
| FSP_SUCCESS | Normal end |
| FSP_ERR_CRYPT_SCE_PARAMETER | Input data is invalid. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECDH_secp256r1_PublicKeySign()

```
fsp_err_t R_SCE_ECDH_secp256r1_PublicKeySign ( sce_ecdh_handle_t * handle,
sce_ecc_public_wrapped_key_t * ecc_public_wrapped_key, sce_ecc_private_wrapped_key_t *
ecc_private_wrapped_key, uint8_t * public_key, sce_ecdsa_byte_data_t * signature,
sce_ecc_private_wrapped_key_t * wrapped_key )
```

The `R_SCE_ECDH_secp256r1_PublicKeySign()` function calculates a signature for a public key user wrapped key used for ECDH key exchange.

If ECDHE is specified by the `key_type` argument of the `R_SCE_ECDH_secp256r1_Init()` function, the SCE's random number generation functionality is used to generate an secp256r1 key pair. The public key is output to `public_key` and the private key is output to `wrapped_key`.

If ECDH is specified by the `key_type` argument of the `R_SCE_ECDH_secp256r1_Init()` function, the public key input as `ecc_public_wrapped_key` is output to `public_key` and nothing is output to `wrapped_key`.

The succeeding function `R_SCE_ECDH_secp256r1_SharedSecretCalculate()` uses the first argument, `handle`, as an argument. `R_SCE_ECDH_secp256r1_SharedSecretCalculate()` function uses `wrapped_key` as input to calculate Z.

Parameters

| | | |
|----------|-------------------------|---|
| [in,out] | handle | ECDH handler (work area) When using <code>key_id</code> , input <code>handle->key_id</code> after running <code>R_SCE_ECDH_secp256r1_Init()</code> . |
| [in] | ecc_public_wrapped_key | For ECDHE, input a null pointer. For ECDH, input the wrapped key of a secp256r1 public key. |
| [in] | ecc_private_wrapped_key | secp256r1 private key for signature generation |
| [in,out] | public_key | User secp256r1 public key (512-bit) for key exchange. When using <code>key_id</code> , <code>key_id</code> (8-bit) public key (512-bit) 0 padding (24-bit) |
| [in,out] | signature | Signature text storage destination information <ul style="list-style-type: none"> signature->pdata : Specifies pointer to array storing signature text. The signature format is "signature r (256 bits) signature s (256 bits)" signature->data_leng |

| | | |
|----------|-------------|---|
| | | th : Data length (in byte units) |
| [in,out] | wrapped_key | For ECDHE, a private wrapped key generated from a random number. Not output for ECDH. |

Return values

| | |
|-------------------------------------|--|
| FSP_SUCCESS | Normal end |
| FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource required by the processing is in use by other processing. |
| FSP_ERR_CRYPTOSCE_KEY_SET_FAIL | Invalid wrapped key was input. |
| FSP_ERR_CRYPTOSCE_FAIL | An internal error occurred. |
| FSP_ERR_CRYPTOSCE_PARAMETER | An invalid handle was input. |
| FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION | An invalid function was called. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECDH_secp256r1_PublicKeyVerify()

```
fsp_err_t R_SCE_ECDH_secp256r1_PublicKeyVerify ( sce_ecdh_handle_t* handle,
sce_ecc_public_wrapped_key_t* ecc_public_wrapped_key, uint8_t* public_key_data,
sce_ecdsa_byte_data_t* signature, sce_ecc_public_wrapped_key_t* wrapped_key )
```

The R_SCE_ECDH_secp256r1_PublicKeyVerify() function verifies the signature of the secp256r1 public key of the other ECDH key exchange party. If the signature is correct, it outputs the public wrapped key to the fifth argument. The first argument, handle, is used as an argument in the subsequent function R_SCE_ECDH_secp256r1_SharedSecretCalculate().

R_SCE_ECDH_secp256r1_SharedSecretCalculate() uses wrapped_key as input to calculate Z.

Parameters

| | | |
|----------|------------------------|---|
| [in,out] | handle | ECDH handler (work area) |
| [in] | ecc_public_wrapped_key | Public wrapped key area for signature verification |
| [in] | public_key_data | secp256r1 public key (512-bit). When key_id is used: key_id (8-bit) public key (512-bit) |
| [in] | signature | ECDSA secp256r1 signature of ecc_public_wrapped_key |
| [in,out] | wrapped_key | wrapped key of ecc_public_wrapped_key |

Return values

| | |
|-------------------------------------|--|
| FSP_SUCCESS | Normal end |
| FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource required by the processing is in use by other processing. |
| FSP_ERR_CRYPTOSCE_KEY_SET_FAIL | Invalid wrapped key was input. |
| FSP_ERR_CRYPTOSCE_FAIL | An internal error occurred or signature verification failed. |
| FSP_ERR_CRYPTOSCE_PARAMETER | An invalid handle was input. |
| FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION | An invalid function was called. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECDH_secp256r1_PublicKeyReadWithoutSignature()

```
fsp_err_t R_SCE_ECDH_secp256r1_PublicKeyReadWithoutSignature ( sce_ecdh_handle_t* handle,
uint8_t* public_key_data, sce_ecc_public_wrapped_key_t* wrapped_key )
```

The R_SCE_ECDH_secp256r1_PublicKeyReadWithoutSignature() function reads the secp256r1 public key of the other ECDH key exchange party and outputs the public wrapped key to the third argument. The first argument, handle, is used as an argument in the subsequent function R_SCE_ECDH_secp256r1_SharedSecretCalculate(). R_SCE_ECDH_secp256r1_SharedSecretCalculate() uses wrapped_key as input to calculate Z. This API does not verify signature of public_key_data, please protect this data by upper layer software.

Parameters

| | | |
|----------|-----------------|---|
| [in,out] | handle | ECDH handler (work area) |
| [in] | public_key_data | secp256r1 public key (512-bit). When key_id is used: key_id (8-bit) public key (512-bit) |
| [in,out] | wrapped_key | wrapped key of public_key_data |

Return values

| | |
|-------------------------------------|--|
| FSP_SUCCESS | Normal end |
| FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource required by the processing is in use by other processing. |
| FSP_ERR_CRYPTOSCE_PARAMETER | An invalid handle was input. |
| FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION | An invalid function was called. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State. Please note that this is slightly contrary to the protected mode policy as it omits signature verification.

◆ R_SCE_ECDH_secp256r1_SharedSecretCalculate()

```
fsp_err_t R_SCE_ECDH_secp256r1_SharedSecretCalculate ( sce_ecdh_handle_t* handle,
sce_ecc_public_wrapped_key_t* ecc_public_wrapped_key, sce_ecc_private_wrapped_key_t*
ecc_private_wrapped_key, sce_ecdh_wrapped_key_t* shared_secret_wrapped_key )
```

The `R_SCE_ECDH_secp256r1_SharedSecretCalculate()` function uses the ECDH key exchange algorithm to output the wrapped key of the shared secret Z derived from the public key of the other key exchange party and your own private key. Input as the second argument, `ecc_public_wrapped_key`, the public wrapped key whose signature was verified by `R_SCE_ECDH_secp256r1_PublicKeyVerify()`. When `key_type` of `R_SCE_ECDH_secp256r1_Init()` is 0, input as the third argument, `ecc_private_wrapped_key`, the private wrapped key generated from a random number by `R_SCE_ECDH_secp256r1_PublicKeySign()`, and when `key_type` is other than 0, input the private wrapped key that forms a pair with the second argument of `R_SCE_ECDH_secp256r1_PublicKeySign()`. The subsequent `R_SCE_ECDH_secp256r1_KeyDerivation()` function uses `shared_secret_wrapped_key` as key material for outputting the wrapped key.

Parameters

| | | |
|----------|---------------------------|--|
| [in,out] | handle | ECDH handler (work area) |
| [in] | ecc_public_wrapped_key | Public wrapped key whose signature was verified by <code>R_SCE_ECDH_secp256r1_PublicKeyVerify()</code> |
| [in] | ecc_private_wrapped_key | Private wrapped key |
| [in,out] | shared_secret_wrapped_key | Wrapped key of shared secret Z calculated by ECDH key exchange |

Return values

| | |
|-------------------------------------|--|
| FSP_SUCCESS | Normal end |
| FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource required by the processing is in use by other processing. |
| FSP_ERR_CRYPTOSCE_KEY_SET_FAIL | Invalid wrapped key was input. |
| FSP_ERR_CRYPTOSCE_FAIL | An internal error occurred. |
| FSP_ERR_CRYPTOSCE_PARAMETER | An invalid handle was input. |
| FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION | An invalid function was called. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECDH_secp256r1_KeyDerivation()

```
fsp_err_t R_SCE_ECDH_secp256r1_KeyDerivation ( sce_ecdh_handle_t * handle,
sce_ecdh_wrapped_key_t * shared_secret_wrapped_key, uint32_t key_type, uint32_t kdf_type,
uint8_t * other_info, uint32_t other_info_length, sce_hmac_sha_wrapped_key_t *
salt_wrapped_key, sce_aes_wrapped_key_t * wrapped_key )
```

The `R_SCE_ECDH_secp256r1_KeyDerivation()` function uses the shared secret "Z (shared_secret_index)" calculated by the `R_SCE_ECDH_secp256r1_SharedSecretCalculate()` function as the key material to derive the wrapped key specified by the third argument, `key_type`. The key derivation algorithm is one-step key derivation as defined in NIST SP800-56C. Either SHA-256 or SHA-256 HMAC is specified by the fourth argument, `kdf_type`. When SHA-256 HMAC is specified, the wrapped key output by the `R_SCE_SHA256HMAC_EncryptedKeyWrap()` function is specified as the seventh argument, `salt_wrapped_key`. Enter a fixed value for deriving a key shared with the key exchange partner in the fifth argument, `other_info`. A wrapped key corresponding to `key_type` is output as the eighth argument, `wrapped_key`. The correspondences between the types of derived wrapped_key and the functions with which they can be used as listed below.

- AES-128: All AES-128 Init functions
- AES-256: All AES-256 Init functions
- SHA256-HMAC: `R_SCE_SHA256HMAC_GenerateInit()` function and `R_SCE_SHA256HMAC_VerifyInit()` function

Parameters

| | | |
|----------|---------------------------|---|
| [in,out] | handle | ECDH handler (work area) |
| [in] | shared_secret_wrapped_key | Z wrapped key calculated by <code>R_SCE_ECDH_secp256r1_SharedSecretCalculate</code> |
| [in] | key_type | Derived key type (0: AES-128, 1: AES-256, 2:SHA256-HMAC, 3: AES-GCM-128 with IV) |
| [in] | kdf_type | Algorithm used for key derivation calculation (0: SHA-256, 1:SHA256-HMAC) |
| [in] | other_info | Additional data used for key derivation calculation: AlgorithmID PartyUInfo PartyVInfo |
| [in] | other_info_length | Data length of other_info (up to 147 byte units) |
| [in] | salt_wrapped_key | Salt wrapped key (Input NULL when <code>kdf_type</code> is 0.) |
| [in,out] | wrapped_key | Wrapped key corresponding to <code>key_type</code> . When the value of <code>key_type</code> is 2, an SHA256-HMAC wrapped key is output. <code>wrapped_key</code> can be specified by casting the start address of the area |

| | | |
|--|--|--|
| | | reserved beforehand by the <code>sce_hmac_sha_wrapped_key_t</code> type with the <code>(sce_aes_wrapped_key_t*)</code> type. |
|--|--|--|

Return values

| | |
|---------------------------------------|--|
| FSP_SUCCESS | Normal end |
| FSP_ERR_CRYPTTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource required by the processing is in use by other processing. |
| FSP_ERR_CRYPTTO_SCE_KEY_SET_FAIL | Invalid wrapped key was input. |
| FSP_ERR_CRYPTTO_SCE_PARAMETER | An invalid handle was input. |
| FSP_ERR_CRYPTTO_SCE_FAIL | Internal error occurred. |
| FSP_ERR_CRYPTTO_SCE_PROHIBIT_FUNCTION | An invalid function was called. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_TLS_RootCertificateRSA2048PublicKeyInstall()

```
fsp_err_t R_SCE_TLS_RootCertificateRSA2048PublicKeyInstall ( uint8_t *
encrypted_provisioning_key, uint8_t * initial_vector, uint8_t * encrypted_key,
sce_tls_ca_certification_public_wrapped_key_t * wrapped_key )
```

Generate TLS RSA Public key index data

Parameters

| | | |
|-------|----------------------------|--|
| [in] | encrypted_provisioning_key | the provisioning key includes encrypted CBC/CBC-MAC key for user key |
| [in] | initial_vector | the initial_vector for user key CBC encrypt |
| [in] | encrypted_key | the user key encrypted with AES128-ECB mode |
| [out] | wrapped_key | the user Key Generation Information (141 words) of RSA2048 bit |

Return values

| | |
|-------------------------------------|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTOSCE_FAIL | An internal error occurred. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_TLS_ECC_secp256r1_EphemeralWrappedKeyPairGenerate()

```
fsp_err_t R_SCE_TLS_ECC_secp256r1_EphemeralWrappedKeyPairGenerate (
sce_tls_p256_ecc_wrapped_key_t* tls_p256_ecc_wrapped_key, uint8_t*
ephemeral_ecdh_public_key )
```

Generate TLS ECC key pair

Parameters

| | | |
|------|---------------------------|----------------------------|
| [in] | tls_p256_ecc_wrapped_key | P256 ECC key index for TLS |
| [in] | ephemeral_ecdh_public_key | ephemeral ECDH public key |

Return values

| | |
|-------------------------------------|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTOSCE_FAIL | An internal error occurred. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_TLS_RootCertificateVerify()

```
fsp_err_t R_SCE_TLS_RootCertificateVerify ( uint32_t public_key_type, uint8_t* certificate,
uint32_t certificate_length, uint32_t public_key_n_start_position, uint32_t
public_key_n_end_position, uint32_t public_key_e_start_position, uint32_t
public_key_e_end_position, uint8_t* signature, uint32_t* encrypted_root_public_key )
```

Verify root CA certificate.

Parameters

| | | |
|-------|-----------------------------|---------------------------------|
| [in] | public_key_type | key type |
| [in] | certificate | certificates. |
| [in] | certificate_length | byte size of certificates. |
| [in] | public_key_n_start_position | start position of public key n. |
| [in] | public_key_n_end_position | end position of public key n. |
| [in] | public_key_e_start_position | start position of public key e. |
| [in] | public_key_e_end_position | end position of public key e. |
| [in] | signature | signature for certificates. |
| [out] | encrypted_root_public_key | public key for RSA 2048bit. |

Return values

| | |
|-------------------------------------|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTOSCE_FAIL | An internal error occurred. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_TLS_CertificateVerify()

```
fsp_err_t R_SCE_TLS_CertificateVerify ( uint32_t public_key_type, uint32_t *
encrypted_input_public_key, uint8_t * certificate, uint32_t certificate_length, uint8_t * signature,
uint32_t public_key_n_start_position, uint32_t public_key_n_end_position, uint32_t
public_key_e_start_position, uint32_t public_key_e_end_position, uint32_t *
encrypted_output_public_key )
```

Verify server certificate and intermediate certificate.

Parameters

| | | |
|-------|-----------------------------|---------------------------------|
| [in] | public_key_type | key type |
| [in] | encrypted_input_public_key | public key. |
| [in] | certificate | certificates. |
| [in] | certificate_length | byte size of certificates. |
| [in] | signature | signature for certificates. |
| [in] | public_key_n_start_position | start position of public key n. |
| [in] | public_key_n_end_position | end position of public key n. |
| [in] | public_key_e_start_position | start position of public key e. |
| [in] | public_key_e_end_position | end position of public key e. |
| [out] | encrypted_output_public_key | public key for RSA 2048bit. |

Return values

| | |
|-------------------------------------|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTOSCE_FAIL | An internal error occurred. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_TLS_PreMasterSecretEncryptWithRSA2048()

`fsp_err_t R_SCE_TLS_PreMasterSecretEncryptWithRSA2048 (uint32_t * encrypted_public_key, uint32_t * sce_pre_master_secret, uint8_t * encrypted_pre_master_secret)`

Output the result encrypted pre-master secret with RSA 2048bit

Parameters

| | | |
|-------|-----------------------------|--|
| [in] | encrypted_public_key | public key data. |
| [in] | sce_pre_master_secret | pre-master secret value. |
| [out] | encrypted_pre_master_secret | the value encrypted pre-master secret. |

Return values

| | |
|-------------------------------------|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTOSCE_FAIL | An internal error occurred. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_TLS_PreMasterSecretGenerateForRSA2048()

`fsp_err_t R_SCE_TLS_PreMasterSecretGenerateForRSA2048 (uint32_t * sce_pre_master_secret)`

Generate encrypted pre-master secret.

Parameters

| | | |
|-------|-----------------------|----------------------------------|
| [out] | sce_pre_master_secret | pre-master secret value for SCE. |
|-------|-----------------------|----------------------------------|

Return values

| | |
|-------------------------------------|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_TLS_MasterSecretGenerate()

```
fsp_err_t R_SCE_TLS_MasterSecretGenerate ( uint32_t select_cipher_suite, uint32_t *
sce_pre_master_secret, uint8_t * client_random, uint8_t * server_random, uint32_t *
sce_master_secret )
```

Generate encrypted master secret.

Parameters

| | | |
|-------|-----------------------|---|
| [in] | select_cipher_suite | cipher suite type |
| [in] | sce_pre_master_secret | pre-master secret value for SCE. |
| [in] | client_random | random value reported ClientHello. |
| [in] | server_random | random value reported ServerHello. |
| [out] | sce_master_secret | master secret value with SCE-specific conversion. |

Return values

| | |
|--------------------------------------|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTO_SCE_FAIL | An internal error occurred. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

Generate encrypted master secret.

Parameters

| | | |
|-------|-----------------------|------------------------------------|
| [in] | select_cipher_suite | cipher suite type |
| [in] | sce_pre_master_secret | pre-master secret value for SCE. |
| [in] | client_random | random value reported ClientHello. |
| [in] | server_random | random value reported ServerHello. |
| [out] | sce_master_secret | master secret value for SCE. |

Return values

| | |
|--------------------------------------|--|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a |

| | |
|-------------------------|--|
| T | hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTO_SCE_FAIL | An internal error occurred. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_TLS_SessionKeyGenerate()

```
fsp_err_t R_SCE_TLS_SessionKeyGenerate ( uint32_t select_cipher_suite, uint32_t*
sce_master_secret, uint8_t* client_random, uint8_t* server_random, uint8_t* nonce_explicit,
sce_hmac_sha_wrapped_key_t* client_mac_wrapped_key, sce_hmac_sha_wrapped_key_t*
server_mac_wrapped_key, sce_aes_wrapped_key_t* client_crypto_wrapped_key,
sce_aes_wrapped_key_t* server_crypto_wrapped_key, uint8_t* client_initial_vector, uint8_t*
server_initial_vector )
```

Output various key information.

Parameters

| | | |
|-------|---------------------------|--|
| [in] | select_cipher_suite | Key suite information number. |
| [in] | sce_master_secret | master secret value. |
| [in] | client_random | random value reported ClientHello. |
| [in] | server_random | random value reported ServerHello. |
| [in] | nonce_explicit | nonce value |
| [out] | client_mac_wrapped_key | the mac key during communication from client to server. |
| [out] | server_mac_wrapped_key | the mac key during communication from server to client. |
| [out] | client_crypto_wrapped_key | the crypto key during communication from client to server. |
| [out] | server_crypto_wrapped_key | the crypto key during communication from server to client. |
| [in] | client_initial_vector | not use. |
| [in] | server_initial_vector | not use. |

Return values

| | |
|-------------|--------------------|
| FSP_SUCCESS | Normal termination |
|-------------|--------------------|

| | |
|-------------------------------------|---|
| FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTOSCE_FAIL | An internal error occurred. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_TLS_VerifyDataGenerate()

```
fsp_err_t R_SCE_TLS_VerifyDataGenerate ( uint32_t select_verify_data, uint32_t *
sce_master_secret, uint8_t * hand_shake_hash, uint8_t * verify_data )
```

Generate verify data.

Parameters

| | | |
|-------|--------------------|---|
| [in] | select_verify_data | Select Client/Server data. |
| [in] | sce_master_secret | master secret data. |
| [in] | hand_shake_hash | TLS hand shake message SHA256 HASH value. |
| [out] | verify_data | verify data. |

Return values

| | |
|-------------------------------------|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTOSCE_FAIL | An internal error occurred. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_TLS_ServerKeyExchangeVerify()

```
fsp_err_t R_SCE_TLS_ServerKeyExchangeVerify ( uint32_t public_key_type, uint8_t *
client_random, uint8_t * server_random, uint8_t * server_ephemeral_ecdh_public_key, uint8_t *
server_key_exchange_signature, uint32_t * encrypted_public_key, uint32_t *
encrypted_ephemeral_ecdh_public_key )
```

Retrives ECDH public key.

Parameters

| | | |
|-------|-------------------------------------|--|
| [in] | public_key_type | key type |
| [in] | client_random | random value reported ClientHello. |
| [in] | server_random | random value reported ServerHello. |
| [in] | server_ephemeral_ecdh_public_key | Ephemeral ECDH public key from Server. |
| [in] | server_key_exchange_signature | Server Key Exchange signature. |
| [in] | encrypted_public_key | encrypted public key. |
| [out] | encrypted_ephemeral_ecdh_public_key | encrypted Ephemeral ECDH public key. |

Return values

| | |
|-------------------------------------|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTOSCE_FAIL | An internal error occurred. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_TLS_PreMasterSecretGenerateForECC_secp256r1()

```
fsp_err_t R_SCE_TLS_PreMasterSecretGenerateForECC_secp256r1 ( uint32_t *
encrypted_public_key, sce_tls_p256_ecc_wrapped_key_t * tls_p256_ecc_wrapped_key, uint32_t *
sce_pre_master_secret )
```

Generate encrypted pre-master secret.

Parameters

| | | |
|-------|--------------------------|--|
| [in] | encrypted_public_key | encrypted public key |
| [in] | tls_p256_ecc_wrapped_key | P-256 ECC key index. |
| [out] | sce_pre_master_secret | encrypted pre-master secret value for SCE. |

Return values

| | |
|-------------------------------------|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTOSCE_FAIL | An internal error occurred. |

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

5.2.15.5 Secure Crypto Engine (r_sce_protected_cavp)

Modules » Security

Driver for the CAVP Certified Secure Crypto Engine (SCE) on RA MCUs.

Version

v1.0.0

The version that appears on the Components tab of the FSP Configuration editor is v1.0.0+fsp.<fsp_version>. The <fsp_version> metadata reflects tooling support files only and does not indicate any changes to the CAVP certified code. See [Module Versioning](#) for more information about component versioning in FSP.

Functions

The user documentation for the functions in this module.

- [SCE Protected Mode](#)

Overview

This module provides SCE CAVP Certified functions.

HW Overview

Obtained device certification with RA6M4.

| Crypto Peripheral version | Devices |
|---------------------------|----------------------------|
| SCE9 (Protected mode) | RA4M2, RA4M3, RA6M4, RA6M5 |

Features

The SCE module supports for the following features.

- Cryptography
 - Symmetric Encryption/Decryption
 - AES
 - ECB 128/256bit
 - CBC 128/256bit
 - GCM 128/256bit
 - CCM 128/256bit
 - Asymmetric Encryption/Decryption
 - RSA
 - RSAES-PKCS1-V1_5 1024/2048bit
 - RSAES-PKCS1-V1_5 3072/4096bit (Encryption only)
 - RSASSA-PKCS1-V1_5 1024/2048bit
 - RSASSA-PKCS1-V1_5 3072/4096bit (Verification only)
 - ECC
 - ECDSA secp192r1/secp224r1/secp256r1/secp384r1
 - ECDH secp256r1
 - Hash Functions
 - SHA-2
 - SHA-256
- Message Authentication Code
 - HMAC-SHA256bit
 - AES-CMAC 128/256bit
- Key Support
 - AES 128/256bit
 - RSA 1024/2048bit
 - RSA 3072/4096bit (public key only)
 - ECC secp192r1/secp224r1/secp256r1/secp384r1
 - HMAC-SHA256bit
- TRNG
- TLS
 - SSL / TLS support function (TLS1.2 compliant)

Configuration

Clock Configuration

This module does not require a specific clock configuration.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Getting Started: Creating a SCE Protected Mode Project

Start by creating a new project in e² studio or RASC. On the Stacks tab, add New > Security > SCE Protected Mode(CAVP Certified). For information on how to install and update secure keys, refer to the Application Note R11AN0496.

Limitations

Usage of R_SCE_ECDSA_secp384r1_SignatureGenerate/Verify

The SCE does not support SHA-384 in hardware, so the APIs listed below require the user to create a SHA-384 function for signature generation and verification. To use the APIs listed below, enable SCE_USER_SHA_384_ENABLED on RA Smart Configurator and prepare a function called SCE_USER_SHA_384_FUNCTION. The interface of SCE_USER_SHA_384_FUNCTION, which is called by the following APIs, is described below.

- [R_SCE_ECDSA_secp384r1_SignatureGenerate\(\)](#)
- [R_SCE_ECDSA_secp384r1_SignatureVerify\(\)](#)

SCE_USER_SHA_384_FUNCTION()

```
uint32_t SCE_USER_SHA_384_FUNCTION(uint8_t * message, uint8_t * digest, uint32_t message_length)
```

SHA-384 hash calculation is performed for an area extending the number of bytes specified by the argument message_length from the address specified by the argument message. The calculation result should be stored at the address specified by the argument digest.

Parameters

| | |
|----------------|---|
| message | [in] Start address of message |
| digest | [in,out] address for storing hash calculation result (48 bytes) |
| message_length | [in] Effective byte count of message |

Return values

| | |
|--------|---------------------------------|
| 0 | Hash value stored successfully. |
| others | Storing of hash value failed. |

Examples

AES Example

This is an example of AES-256 encryption and decryption.

```
#include <string.h>
#include "r_sce.h"
#define BLOCK 16
void r_sce_example_aes();
sce_instance_ctrl_t sce_ctrl;
sce_cfg_t sce_cfg =
{
    .lifecycle = SCE_SSD
};
static uint8_t plain[BLOCK * 2] =
{
    0x52, 0x65, 0x6e, 0x65, 0x73, 0x61, 0x73, 0x20, 0x45, 0x6c, 0x65, 0x63, 0x74,
    0x72, 0x6f, 0x6e,
    0x69, 0x63, 0x73, 0x20, 0x43, 0x6f, 0x72, 0x70, 0x6f, 0x72, 0x61, 0x74, 0x69,
    0x6f, 0x6e, 0x00
};
void r_sce_example_aes ()
{

Detailed Description

Driver for the Secure Key Injection on RA MCUs.

Overview

This module provides SCE functions in PSA Crypto.

HW Overview

| Crypto Peripheral version | Devices |
|---------------------------|----------------------------|
| SCE9 | RA6M5, RA6M4, RA4M3, RA4M2 |
| SCE7 | RA6M3, RA6M2, RA6M1, RA6T1 |
| SCE5 | RA4W1, RA4M1 |
| SCE5B | RA6T2 |

Features

The SCE Key Injection Module has two types of APIs, InitialKeyWrap and EncryptedKeyWrap. The available APIs differ depending on used SCE. Please refer to the following for details.

- Key Support

- AES 128/256bit

| Crypto Peripheral version | 128 bit | 192 bit | 256 bit |
|---------------------------|---------------------|---------------------|---------------------|
| SCE9 | InitialKeyWrap Only | InitialKeyWrap Only | InitialKeyWrap Only |
| SCE7 | Support | Support | Support |
| SCE5 | Support | No support | Support |
| SCE5B | InitialKeyWrap Only | No support | InitialKeyWrap Only |

- RSA 2048/3072/4096bit

| Crypto Peripheral version | 2048 bit | 3072 bit (public) | 4096 bit (public) |
|---------------------------|----------|-------------------|-------------------|
|---------------------------|----------|-------------------|-------------------|

| | | | |
|-------|---------------------|---------------------|---------------------|
| SCE9 | InitialKeyWrap Only | InitialKeyWrap Only | InitialKeyWrap Only |
| SCE7 | Support | No support | No support |
| SCE5 | No support | No support | No support |
| SCE5B | No support | No support | No support |

◦ ECC secp256r1/secp256k1/secp384r1

| Crypto Peripheral version | secp256r1 | secp256k1 | secp384r1 | secp256r1 Brainpool | secp384r1 Brainpool |
|---------------------------|---------------------|---------------------|---------------------|---------------------|---------------------|
| SCE9 | InitialKeyWrap Only | InitialKeyWrap Only | InitialKeyWrap Only | InitialKeyWrap Only | InitialKeyWrap Only |
| SCE7 | Support | Support | Support | Support | Support |
| SCE5 | No support | No support | No support | No support | No support |
| SCE5B | No support | No support | No support | No support | No support |

Configuration

Clock Configuration

This module does not require a specific clock configuration.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Module activation

SCE Key Injection for PSA Crypto Module is off by default. To use it, please On the Stacks tab, add New > Security > MbedTLS or MbedTLS (Crypto Only), Add Requires SCE Driver > New > (*1), Add Key Injection for RSA Crypto (Optional) > New > Key Injection for RSA Crypto for PSA Crypto Module after adding MbedTLS. For information on how to import and update secure keys, refer to the Application Note R11AN0496.

(*1)

| Crypto Peripheral version | String displayed in the Stacks tab |
|---------------------------|------------------------------------|
| SCE9 | SCE Compatibility Mode |
| SCE7 | SCE7 |
| SCE5 | SCE5 |
| SCE5B | SCE5B |

Hardware Initialization

Please refer to Hardware Initialization in [Mbed Crypto H/W Acceleration \(rm_psa_crypto\)](#).

Function Documentation

◆ R_SCE_AES128_InitialKeyWrap()

```
fsp_err_t R_SCE_AES128_InitialKeyWrap ( const uint8_t *const key_type, const uint8_t *const wrapped_user_factory_programming_key, const uint8_t *const initial_vector, const uint8_t *const encrypted_key, sce_aes_wrapped_key_t *const wrapped_key )
```

This API generates 128-bit AES key within the user routine.

Parameters

| | | |
|----------|--------------------------------------|---|
| [in] | key_type | Selection key type when generating wrapped key (0: for encrypted key, 1: for plain key) |
| [in] | wrapped_user_factory_programming_key | Wrapped user factory programming key by the Renesas Key Wrap Service. When key_type is 1 as plain key, this is not required and any value can be specified. |
| [in] | initial_vector | Initialization vector when generating encrypted_key. When key_type is 1 as plain key, this is not required and any value can be specified. |
| [in] | encrypted_key | Encrypted user key and MAC appended |
| [in,out] | wrapped_key | 128-bit AES wrapped key |

Return values

| | |
|---------------------|---------------------|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_UNSUPPORTED | API not supported. |

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES192_InitialKeyWrap()

```
fsp_err_t R_SCE_AES192_InitialKeyWrap ( const uint8_t *const key_type, const uint8_t *const wrapped_user_factory_programming_key, const uint8_t *const initial_vector, const uint8_t *const encrypted_key, sce_aes_wrapped_key_t *const wrapped_key )
```

This API generates 192-bit AES key within the user routine.

Parameters

| | | |
|----------|--------------------------------------|---|
| [in] | key_type | Selection key type when generating wrapped key (0: for encrypted key, 1: for plain key) |
| [in] | wrapped_user_factory_programming_key | Wrapped user factory programming key by the Renesas Key Wrap Service. When key_type is 1 as plain key, this is not required and any value can be specified. |
| [in] | initial_vector | Initialization vector when generating encrypted_key. When key_type is 1 as plain key, this is not required and any value can be specified. |
| [in] | encrypted_key | Encrypted user key and MAC appended |
| [in,out] | wrapped_key | 192-bit AES wrapped key |

Return values

| | |
|---------------------|---------------------|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_UNSUPPORTED | API not supported. |

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTOSCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256_InitialKeyWrap()

```
fsp_err_t R_SCE_AES256_InitialKeyWrap ( const uint8_t *const key_type, const uint8_t *const wrapped_user_factory_programming_key, const uint8_t *const initial_vector, const uint8_t *const encrypted_key, sce_aes_wrapped_key_t *const wrapped_key )
```

This API generates 256-bit AES key within the user routine.

Parameters

| | | |
|----------|--------------------------------------|---|
| [in] | key_type | Selection key type when generating wrapped key (0: for encrypted key, 1: for plain key) |
| [in] | wrapped_user_factory_programming_key | Wrapped user factory programming key by the Renesas Key Wrap Service. When key_type is 1 as plain key, this is not required and any value can be specified. |
| [in] | initial_vector | Initialization vector when generating encrypted_key. When key_type is 1 as plain key, this is not required and any value can be specified. |
| [in] | encrypted_key | Encrypted user key and MAC appended |
| [in,out] | wrapped_key | 256-bit AES wrapped key |

Return values

| | |
|---------------------|---------------------|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_UNSUPPORTED | API not supported. |

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTOSCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_KeyUpdateKeyWrap()

```
fsp_err_t R_SCE_KeyUpdateKeyWrap ( const uint8_t *const
wrapped_user_factory_programming_key, const uint8_t *const initial_vector, const uint8_t *const
encrypted_key, sce_key_update_key_t *const key_update_key )
```

This API generates a key update key which is used for functions of the key updating.

Parameters

| | | |
|----------|--------------------------------------|---|
| [in] | wrapped_user_factory_programming_key | Wrapped user factory programming key by the Renesas Key Wrap Service. When key_type is 1 as plain key, this is not required and any value can be specified. |
| [in] | initial_vector | Initialization vector when generating encrypted_key. When key_type is 1 as plain key, this is not required and any value can be specified. |
| [in] | encrypted_key | Encrypted user key and MAC appended |
| [in,out] | key_update_key | Key update key |

Return values

| | |
|---------------------|---------------------|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_UNSUPPORTED | API not supported. |

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128_EncryptedKeyWrap()

```
fsp_err_t R_SCE_AES128_EncryptedKeyWrap ( const uint8_t *const initial_vector, const uint8_t
*const encrypted_key, const sce_key_update_key_t *const key_update_key,
sce_aes_wrapped_key_t *const wrapped_key )
```

This API wraps 128-bit AES key within the user routine.

Parameters

| | | |
|----------|----------------|---|
| [in] | initial_vector | Initialization vector when generating encrypted_key |
| [in] | encrypted_key | User key encrypted and MAC appended |
| [in] | key_update_key | Key update keyring |
| [in,out] | wrapped_key | 128-bit AES wrapped key |

Return values

| | |
|---------------------|---------------------|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_UNSUPPORTED | API not supported. |

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES192_EncryptedKeyWrap()

```
fsp_err_t R_SCE_AES192_EncryptedKeyWrap ( const uint8_t *const initial_vector, const uint8_t
*const encrypted_key, const sce_key_update_key_t *const key_update_key,
sce_aes_wrapped_key_t *const wrapped_key )
```

This API wraps 192-bit AES key within the user routine.

Parameters

| | | |
|----------|----------------|---|
| [in] | initial_vector | Initialization vector when generating encrypted_key |
| [in] | encrypted_key | User key encrypted and MAC appended |
| [in] | key_update_key | Key update keyring |
| [in,out] | wrapped_key | 192-bit AES wrapped key |

Return values

| | |
|---------------------|---------------------|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_UNSUPPORTED | API not supported. |

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256_EncryptedKeyWrap()

```
fsp_err_t R_SCE_AES256_EncryptedKeyWrap ( const uint8_t *const initial_vector, const uint8_t
*const encrypted_key, const sce_key_update_key_t *const key_update_key,
sce_aes_wrapped_key_t *const wrapped_key )
```

This API wraps 256-bit AES key within the user routine.

Parameters

| | | |
|----------|----------------|---|
| [in] | initial_vector | Initialization vector when generating encrypted_key |
| [in] | encrypted_key | User key encrypted and MAC appended |
| [in] | key_update_key | Key update keyring |
| [in,out] | wrapped_key | 256-bit AES wrapped key |

Return values

| | |
|---------------------|---------------------|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_UNSUPPORTED | API not supported. |

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSA2048_InitialPublicKeyWrap()

```
fsp_err_t R_SCE_RSA2048_InitialPublicKeyWrap ( const uint8_t *const key_type, const uint8_t
*const wrapped_user_factory_programming_key, const uint8_t *const initial_vector, const uint8_t
*const encrypted_key, sce_rsa2048_public_wrapped_key_t *const wrapped_key )
```

This API generates 2048-bit RSA key within the user routine.

Parameters

| | | |
|----------|--------------------------------------|---|
| [in] | key_type | Selection key type when generating wrapped key (0: for encrypted key, 1: for plain key) |
| [in] | wrapped_user_factory_programming_key | Wrapped user factory programming key by the Renesas Key Wrap Service. When key_type is 1 as plain key, this is not required and any value can be specified. |
| [in] | initial_vector | Initialization vector when generating encrypted_key. When key_type is 1 as plain key, this is not required and any value can be specified. |
| [in] | encrypted_key | Encrypted user key and MAC appended |
| [in,out] | wrapped_key | 2048-bit RSA wrapped key |

Return values

| | |
|---------------------|---------------------|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_UNSUPPORTED | API not supported. |

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTOSCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSA3072_InitialPublicKeyWrap()

```
fsp_err_t R_SCE_RSA3072_InitialPublicKeyWrap ( const uint8_t *const key_type, const uint8_t
*const wrapped_user_factory_programming_key, const uint8_t *const initial_vector, const uint8_t
*const encrypted_key, sce_rsa3072_public_wrapped_key_t *const wrapped_key )
```

This API generates 3072-bit RSA key within the user routine.

Parameters

| | | |
|----------|--------------------------------------|---|
| [in] | key_type | Selection key type when generating wrapped key (0: for encrypted key, 1: for plain key) |
| [in] | wrapped_user_factory_programming_key | Wrapped user factory programming key by the Renesas Key Wrap Service. When key_type is 1 as plain key, this is not required and any value can be specified. |
| [in] | initial_vector | Initialization vector when generating encrypted_key. When key_type is 1 as plain key, this is not required and any value can be specified. |
| [in] | encrypted_key | Encrypted user key and MAC appended |
| [in,out] | wrapped_key | 3072-bit RSA wrapped key |

Return values

| | |
|---------------------|---------------------|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_UNSUPPORTED | API not supported. |

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTOSCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSA4096_InitialPublicKeyWrap()

```
fsp_err_t R_SCE_RSA4096_InitialPublicKeyWrap ( const uint8_t *const key_type, const uint8_t
*const wrapped_user_factory_programming_key, const uint8_t *const initial_vector, const uint8_t
*const encrypted_key, sce_rsa4096_public_wrapped_key_t *const wrapped_key )
```

This API generates 4096-bit RSA key within the user routine.

Parameters

| | | |
|----------|--------------------------------------|---|
| [in] | key_type | Selection key type when generating wrapped key (0: for encrypted key, 1: for plain key) |
| [in] | wrapped_user_factory_programming_key | Wrapped user factory programming key by the Renesas Key Wrap Service. When key_type is 1 as plain key, this is not required and any value can be specified. |
| [in] | initial_vector | Initialization vector when generating encrypted_key. When key_type is 1 as plain key, this is not required and any value can be specified. |
| [in] | encrypted_key | Encrypted user key and MAC appended |
| [in,out] | wrapped_key | 4096-bit RSA wrapped key |

Return values

| | |
|---------------------|---------------------|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_UNSUPPORTED | API not supported. |

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTOSCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSA2048_InitialPrivateKeyWrap()

```
fsp_err_t R_SCE_RSA2048_InitialPrivateKeyWrap ( const uint8_t *const key_type, const uint8_t
*const wrapped_user_factory_programming_key, const uint8_t *const initial_vector, const uint8_t
*const encrypted_key, sce_rsa2048_private_wrapped_key_t *const wrapped_key )
```

This API generates 2048-bit RSA key within the user routine.

Parameters

| | | |
|----------|--------------------------------------|---|
| [in] | key_type | Selection key type when generating wrapped key (0: for encrypted key, 1: for plain key) |
| [in] | wrapped_user_factory_programming_key | Wrapped user factory programming key by the Renesas Key Wrap Service. When key_type is 1 as plain key, this is not required and any value can be specified. |
| [in] | initial_vector | Initialization vector when generating encrypted_key. When key_type is 1 as plain key, this is not required and any value can be specified. |
| [in] | encrypted_key | Encrypted user key and MAC appended |
| [in,out] | wrapped_key | 2048-bit RSA wrapped key |

Return values

| | |
|---------------------|---------------------|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_UNSUPPORTED | API not supported. |

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSA2048_EncryptedPublicKeyWrap()

```
fsp_err_t R_SCE_RSA2048_EncryptedPublicKeyWrap ( const uint8_t *const initial_vector, const
uint8_t *const encrypted_key, const sce_key_update_key_t *const key_update_key,
sce_rsa2048_public_wrapped_key_t *const wrapped_key )
```

This API wraps 2048-bit RSA key within the user routine.

Parameters

| | | |
|----------|----------------|---|
| [in] | initial_vector | Initialization vector when generating encrypted_key |
| [in] | encrypted_key | User key encrypted and MAC appended |
| [in] | key_update_key | Key update keyring |
| [in,out] | wrapped_key | 2048-bit RSA wrapped key |

Return values

| | |
|---------------------|---------------------|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_UNSUPPORTED | API not supported. |

Returns

- If an error occurs, the return value will be as follows.
- FSP_ERR_CRYPTTO_SCE_FAIL Internal I/O buffer is not empty.
 - FSP_ERR_CRYPTTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSA2048_EncryptedPrivateKeyWrap()

```
fsp_err_t R_SCE_RSA2048_EncryptedPrivateKeyWrap ( const uint8_t *const initial_vector, const
uint8_t *const encrypted_key, const sce_key_update_key_t *const key_update_key,
sce_rsa2048_private_wrapped_key_t *const wrapped_key )
```

This API wraps 2048-bit RSA key within the user routine.

Parameters

| | | |
|----------|----------------|---|
| [in] | initial_vector | Initialization vector when generating encrypted_key |
| [in] | encrypted_key | User key encrypted and MAC appended |
| [in] | key_update_key | Key update keyring |
| [in,out] | wrapped_key | 2048-bit RSA wrapped key |

Return values

| | |
|---------------------|---------------------|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_UNSUPPORTED | API not supported. |

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp256r1_InitialPublicKeyWrap()

```
fsp_err_t R_SCE_ECC_secp256r1_InitialPublicKeyWrap ( const uint8_t *const key_type, const uint8_t
*const wrapped_user_factory_programming_key, const uint8_t *const initial_vector, const uint8_t
*const encrypted_key, sce_ecc_public_wrapped_key_t *const wrapped_key )
```

This API generates 256-bit ECC key within the user routine.

Parameters

| | | |
|----------|--------------------------------------|---|
| [in] | key_type | Selection key type when generating wrapped key (0: for encrypted key, 1: for plain key) |
| [in] | wrapped_user_factory_programming_key | Wrapped user factory programming key by the Renesas Key Wrap Service. When key_type is 1 as plain key, this is not required and any value can be specified. |
| [in] | initial_vector | Initialization vector when generating encrypted_key. When key_type is 1 as plain key, this is not required and any value can be specified. |
| [in] | encrypted_key | Encrypted user key and MAC appended |
| [in,out] | wrapped_key | 256-bit ECC wrapped key |

Return values

| | |
|---------------------|---------------------|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_UNSUPPORTED | API not supported. |

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTOSCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp256k1_InitialPublicKeyWrap()

```
fsp_err_t R_SCE_ECC_secp256k1_InitialPublicKeyWrap ( const uint8_t *const key_type, const
uint8_t *const wrapped_user_factory_programming_key, const uint8_t *const initial_vector, const
uint8_t *const encrypted_key, sce_ecc_public_wrapped_key_t *const wrapped_key )
```

This API generates 256-bit ECC key within the user routine.

Parameters

| | | |
|----------|--------------------------------------|---|
| [in] | key_type | Selection key type when generating wrapped key (0: for encrypted key, 1: for plain key) |
| [in] | wrapped_user_factory_programming_key | Wrapped user factory programming key by the Renesas Key Wrap Service. When key_type is 1 as plain key, this is not required and any value can be specified. |
| [in] | initial_vector | Initialization vector when generating encrypted_key. When key_type is 1 as plain key, this is not required and any value can be specified. |
| [in] | encrypted_key | Encrypted user key and MAC appended |
| [in,out] | wrapped_key | 256-bit ECC wrapped key |

Return values

| | |
|---------------------|---------------------|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_UNSUPPORTED | API not supported. |

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp384r1_InitialPublicKeyWrap()

```
fsp_err_t R_SCE_ECC_secp384r1_InitialPublicKeyWrap ( const uint8_t *const key_type, const uint8_t
*const wrapped_user_factory_programming_key, const uint8_t *const initial_vector, const uint8_t
*const encrypted_key, sce_ecc_public_wrapped_key_t *const wrapped_key )
```

This API generates 384-bit ECC key within the user routine.

Parameters

| | | |
|----------|--------------------------------------|---|
| [in] | key_type | Selection key type when generating wrapped key (0: for encrypted key, 1: for plain key) |
| [in] | wrapped_user_factory_programming_key | Wrapped user factory programming key by the Renesas Key Wrap Service. When key_type is 1 as plain key, this is not required and any value can be specified. |
| [in] | initial_vector | Initialization vector when generating encrypted_key. When key_type is 1 as plain key, this is not required and any value can be specified. |
| [in] | encrypted_key | Encrypted user key and MAC appended |
| [in,out] | wrapped_key | 364-bit ECC wrapped key |

Return values

| | |
|---------------------|---------------------|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_UNSUPPORTED | API not supported. |

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTOSCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp256r1_InitialPrivateKeyWrap()

```
fsp_err_t R_SCE_ECC_secp256r1_InitialPrivateKeyWrap ( const uint8_t *const key_type, const
uint8_t *const wrapped_user_factory_programming_key, const uint8_t *const initial_vector, const
uint8_t *const encrypted_key, sce_ecc_private_wrapped_key_t *const wrapped_key )
```

This API generates 256-bit ECC key within the user routine.

Parameters

| | | |
|----------|--------------------------------------|---|
| [in] | key_type | Selection key type when generating wrapped key (0: for encrypted key, 1: for plain key) |
| [in] | wrapped_user_factory_programming_key | Wrapped user factory programming key by the Renesas Key Wrap Service. When key_type is 1 as plain key, this is not required and any value can be specified. |
| [in] | initial_vector | Initialization vector when generating encrypted_key. When key_type is 1 as plain key, this is not required and any value can be specified. |
| [in] | encrypted_key | Encrypted user key and MAC appended |
| [in,out] | wrapped_key | 256-bit ECC wrapped key |

Return values

| | |
|---------------------|---------------------|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_UNSUPPORTED | API not supported. |

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPT0_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPT0_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp256k1_InitialPrivateKeyWrap()

```
fsp_err_t R_SCE_ECC_secp256k1_InitialPrivateKeyWrap ( const uint8_t *const key_type, const
uint8_t *const wrapped_user_factory_programming_key, const uint8_t *const initial_vector, const
uint8_t *const encrypted_key, sce_ecc_private_wrapped_key_t *const wrapped_key )
```

This API generates 256-bit ECC key within the user routine.

Parameters

| | | |
|----------|--------------------------------------|---|
| [in] | key_type | Selection key type when generating wrapped key (0: for encrypted key, 1: for plain key) |
| [in] | wrapped_user_factory_programming_key | Wrapped user factory programming key by the Renesas Key Wrap Service. When key_type is 1 as plain key, this is not required and any value can be specified. |
| [in] | initial_vector | Initialization vector when generating encrypted_key. When key_type is 1 as plain key, this is not required and any value can be specified. |
| [in] | encrypted_key | Encrypted user key and MAC appended |
| [in,out] | wrapped_key | 256-bit ECC wrapped key |

Return values

| | |
|---------------------|---------------------|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_UNSUPPORTED | API not supported. |

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp384r1_InitialPrivateKeyWrap()

```
fsp_err_t R_SCE_ECC_secp384r1_InitialPrivateKeyWrap ( const uint8_t *const key_type, const
uint8_t *const wrapped_user_factory_programming_key, const uint8_t *const initial_vector, const
uint8_t *const encrypted_key, sce_ecc_private_wrapped_key_t *const wrapped_key )
```

This API generates 384-bit ECC key within the user routine.

Parameters

| | | |
|----------|--------------------------------------|---|
| [in] | key_type | Selection key type when generating wrapped key (0: for encrypted key, 1: for plain key) |
| [in] | wrapped_user_factory_programming_key | Wrapped user factory programming key by the Renesas Key Wrap Service. When key_type is 1 as plain key, this is not required and any value can be specified. |
| [in] | initial_vector | Initialization vector when generating encrypted_key. When key_type is 1 as plain key, this is not required and any value can be specified. |
| [in] | encrypted_key | Encrypted user key and MAC appended |
| [in,out] | wrapped_key | 384-bit ECC wrapped key |

Return values

| | |
|---------------------|---------------------|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_UNSUPPORTED | API not supported. |

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTOSCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp256r1_EncryptedPublicKeyWrap()

```
fsp_err_t R_SCE_ECC_secp256r1_EncryptedPublicKeyWrap ( const uint8_t *const initial_vector,
const uint8_t *const encrypted_key, const sce_key_update_key_t *const key_update_key,
sce_ecc_public_wrapped_key_t *const wrapped_key )
```

This API wraps 256-bit ECC key within the user routine.

Parameters

| | | |
|----------|----------------|---|
| [in] | initial_vector | Initialization vector when generating encrypted_key |
| [in] | encrypted_key | User key encrypted and MAC appended |
| [in] | key_update_key | Key update keyring |
| [in,out] | wrapped_key | 256-bit ECC wrapped key |

Return values

| | |
|---------------------|---------------------|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_UNSUPPORTED | API not supported. |

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp256k1_EncryptedPublicKeyWrap()

```
fsp_err_t R_SCE_ECC_secp256k1_EncryptedPublicKeyWrap ( const uint8_t *const initial_vector,
const uint8_t *const encrypted_key, const sce_key_update_key_t *const key_update_key,
sce_ecc_public_wrapped_key_t *const wrapped_key )
```

This API wraps 256-bit ECC key within the user routine.

Parameters

| | | |
|----------|----------------|---|
| [in] | initial_vector | Initialization vector when generating encrypted_key |
| [in] | encrypted_key | User key encrypted and MAC appended |
| [in] | key_update_key | Key update keyring |
| [in,out] | wrapped_key | 256-bit ECC wrapped key |

Return values

| | |
|---------------------|---------------------|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_UNSUPPORTED | API not supported. |

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp384r1_EncryptedPublicKeyWrap()

```
fsp_err_t R_SCE_ECC_secp384r1_EncryptedPublicKeyWrap ( const uint8_t *const initial_vector,
const uint8_t *const encrypted_key, const sce_key_update_key_t *const key_update_key,
sce_ecc_public_wrapped_key_t *const wrapped_key )
```

This API wraps 384-bit ECC key within the user routine.

Parameters

| | | |
|----------|----------------|---|
| [in] | initial_vector | Initialization vector when generating encrypted_key |
| [in] | encrypted_key | User key encrypted and MAC appended |
| [in] | key_update_key | Key update keyring |
| [in,out] | wrapped_key | 384-bit ECC wrapped key |

Return values

| | |
|---------------------|---------------------|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_UNSUPPORTED | API not supported. |

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp256r1_EncryptedPrivateKeyWrap()

```
fsp_err_t R_SCE_ECC_secp256r1_EncryptedPrivateKeyWrap ( const uint8_t *const initial_vector,
const uint8_t *const encrypted_key, const sce_key_update_key_t *const key_update_key,
sce_ecc_private_wrapped_key_t *const wrapped_key )
```

This API wraps 256-bit ECC key within the user routine.

Parameters

| | | |
|----------|----------------|---|
| [in] | initial_vector | Initialization vector when generating encrypted_key |
| [in] | encrypted_key | User key encrypted and MAC appended |
| [in] | key_update_key | Key update keyring |
| [in,out] | wrapped_key | 256-bit ECC wrapped key |

Return values

| | |
|---------------------|---------------------|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_UNSUPPORTED | API not supported. |

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp256k1_EncryptedPrivateKeyWrap()

```
fsp_err_t R_SCE_ECC_secp256k1_EncryptedPrivateKeyWrap ( const uint8_t *const initial_vector,
const uint8_t *const encrypted_key, const sce_key_update_key_t *const key_update_key,
sce_ecc_private_wrapped_key_t *const wrapped_key )
```

This API wraps 256-bit ECC key within the user routine.

Parameters

| | | |
|----------|----------------|---|
| [in] | initial_vector | Initialization vector when generating encrypted_key |
| [in] | encrypted_key | User key encrypted and MAC appended |
| [in] | key_update_key | Key update keyring |
| [in,out] | wrapped_key | 256-bit ECC wrapped key |

Return values

| | |
|---------------------|---------------------|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_UNSUPPORTED | API not supported. |

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp384r1_EncryptedPrivateKeyWrap()

```
fsp_err_t R_SCE_ECC_secp384r1_EncryptedPrivateKeyWrap ( const uint8_t *const initial_vector,
const uint8_t *const encrypted_key, const sce_key_update_key_t *const key_update_key,
sce_ecc_private_wrapped_key_t *const wrapped_key )
```

This API wraps 384-bit ECC key within the user routine.

Parameters

| | | |
|----------|----------------|---|
| [in] | initial_vector | Initialization vector when generating encrypted_key |
| [in] | encrypted_key | User key encrypted and MAC appended |
| [in] | key_update_key | Key update keyring |
| [in,out] | wrapped_key | 384-bit ECC wrapped key |

Return values

| | |
|---------------------|---------------------|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_UNSUPPORTED | API not supported. |

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_brainpoolP256r1_InitialPublicKeyWrap()

```
fsp_err_t R_SCE_ECC_brainpoolP256r1_InitialPublicKeyWrap ( const uint8_t *const key_type, const
uint8_t *const wrapped_user_factory_programming_key, const uint8_t *const initial_vector, const
uint8_t *const encrypted_key, sce_ecc_public_wrapped_key_t *const wrapped_key )
```

This API generates 256-bit Brainpool ECC key within the user routine.

Parameters

| | | |
|----------|--------------------------------------|---|
| [in] | key_type | Selection key type when generating wrapped key (0: for encrypted key, 1: for plain key) |
| [in] | wrapped_user_factory_programming_key | Wrapped user factory programming key by the Renesas Key Wrap Service. When key_type is 1 as plain key, this is not required and any value can be specified. |
| [in] | initial_vector | Initialization vector when generating encrypted_key. When key_type is 1 as plain key, this is not required and any value can be specified. |
| [in] | encrypted_key | Encrypted user key and MAC appended |
| [in,out] | wrapped_key | 256-bit ECC wrapped key |

Return values

| | |
|---------------------|---------------------|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_UNSUPPORTED | API not supported. |

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_brainpoolP256r1_InitialPrivateKeyWrap()

```
fsp_err_t R_SCE_ECC_brainpoolP256r1_InitialPrivateKeyWrap ( const uint8_t *const key_type, const
uint8_t *const wrapped_user_factory_programming_key, const uint8_t *const initial_vector, const
uint8_t *const encrypted_key, sce_ecc_private_wrapped_key_t *const wrapped_key )
```

This API generates 256-bit Brainpool ECC key within the user routine.

Parameters

| | | |
|----------|--------------------------------------|---|
| [in] | key_type | Selection key type when generating wrapped key (0: for encrypted key, 1: for plain key) |
| [in] | wrapped_user_factory_programming_key | Wrapped user factory programming key by the Renesas Key Wrap Service. When key_type is 1 as plain key, this is not required and any value can be specified. |
| [in] | initial_vector | Initialization vector when generating encrypted_key. When key_type is 1 as plain key, this is not required and any value can be specified. |
| [in] | encrypted_key | Encrypted user key and MAC appended |
| [in,out] | wrapped_key | 256-bit ECC wrapped key |

Return values

| | |
|---------------------|---------------------|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_UNSUPPORTED | API not supported. |

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTOSCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_brainpoolP384r1_InitialPublicKeyWrap()

```
fsp_err_t R_SCE_ECC_brainpoolP384r1_InitialPublicKeyWrap ( const uint8_t *const key_type, const
uint8_t *const wrapped_user_factory_programming_key, const uint8_t *const initial_vector, const
uint8_t *const encrypted_key, sce_ecc_public_wrapped_key_t *const wrapped_key )
```

This API generates 384-bit Brainpool ECC key within the user routine.

Parameters

| | | |
|----------|--------------------------------------|---|
| [in] | key_type | Selection key type when generating wrapped key (0: for encrypted key, 1: for plain key) |
| [in] | wrapped_user_factory_programming_key | Wrapped user factory programming key by the Renesas Key Wrap Service. When key_type is 1 as plain key, this is not required and any value can be specified. |
| [in] | initial_vector | Initialization vector when generating encrypted_key. When key_type is 1 as plain key, this is not required and any value can be specified. |
| [in] | encrypted_key | Encrypted user key and MAC appended |
| [in,out] | wrapped_key | 364-bit ECC wrapped key |

Return values

| | |
|---------------------|---------------------|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_UNSUPPORTED | API not supported. |

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTOSCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_brainpoolP384r1_InitialPrivateKeyWrap()

```
fsp_err_t R_SCE_ECC_brainpoolP384r1_InitialPrivateKeyWrap ( const uint8_t *const key_type, const
uint8_t *const wrapped_user_factory_programming_key, const uint8_t *const initial_vector, const
uint8_t *const encrypted_key, sce_ecc_private_wrapped_key_t *const wrapped_key )
```

This API generates 384-bit Brainpool ECC key within the user routine.

Parameters

| | | |
|----------|--------------------------------------|---|
| [in] | key_type | Selection key type when generating wrapped key (0: for encrypted key, 1: for plain key) |
| [in] | wrapped_user_factory_programming_key | Wrapped user factory programming key by the Renesas Key Wrap Service. When key_type is 1 as plain key, this is not required and any value can be specified. |
| [in] | initial_vector | Initialization vector when generating encrypted_key. When key_type is 1 as plain key, this is not required and any value can be specified. |
| [in] | encrypted_key | Encrypted user key and MAC appended |
| [in,out] | wrapped_key | 384-bit ECC wrapped key |

Return values

| | |
|---------------------|---------------------|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_UNSUPPORTED | API not supported. |

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTOSCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_brainpoolP256r1_EncryptedPublicKeyWrap()

```
fsp_err_t R_SCE_ECC_brainpoolP256r1_EncryptedPublicKeyWrap ( const uint8_t *const
initial_vector, const uint8_t *const encrypted_key, const sce_key_update_key_t *const
key_update_key, sce_ecc_public_wrapped_key_t *const wrapped_key )
```

This API wraps 256-bit Brainpool ECC key within the user routine.

Parameters

| | | |
|----------|----------------|---|
| [in] | initial_vector | Initialization vector when generating encrypted_key |
| [in] | encrypted_key | User key encrypted and MAC appended |
| [in] | key_update_key | Key update keyring |
| [in,out] | wrapped_key | 256-bit ECC wrapped key |

Return values

| | |
|---------------------|---------------------|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_UNSUPPORTED | API not supported. |

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_brainpoolP256r1_EncryptedPrivateKeyWrap()

```
fsp_err_t R_SCE_ECC_brainpoolP256r1_EncryptedPrivateKeyWrap ( const uint8_t *const
initial_vector, const uint8_t *const encrypted_key, const sce_key_update_key_t *const
key_update_key, sce_ecc_private_wrapped_key_t *const wrapped_key )
```

This API wraps 256-bit Brainpool ECC key within the user routine.

Parameters

| | | |
|----------|----------------|---|
| [in] | initial_vector | Initialization vector when generating encrypted_key |
| [in] | encrypted_key | User key encrypted and MAC appended |
| [in] | key_update_key | Key update keyring |
| [in,out] | wrapped_key | 256-bit ECC wrapped key |

Return values

| | |
|---------------------|---------------------|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_UNSUPPORTED | API not supported. |

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_brainpoolP384r1_EncryptedPublicKeyWrap()

```
fsp_err_t R_SCE_ECC_brainpoolP384r1_EncryptedPublicKeyWrap ( const uint8_t *const
initial_vector, const uint8_t *const encrypted_key, const sce_key_update_key_t *const
key_update_key, sce_ecc_public_wrapped_key_t *const wrapped_key )
```

This API wraps 384-bit Brainpool ECC key within the user routine.

Parameters

| | | |
|----------|----------------|---|
| [in] | initial_vector | Initialization vector when generating encrypted_key |
| [in] | encrypted_key | User key encrypted and MAC appended |
| [in] | key_update_key | Key update keyring |
| [in,out] | wrapped_key | 384-bit ECC wrapped key |

Return values

| | |
|---------------------|---------------------|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_UNSUPPORTED | API not supported. |

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_brainpoolP384r1_EncryptedPrivateKeyWrap()

```
fsp_err_t R_SCE_ECC_brainpoolP384r1_EncryptedPrivateKeyWrap ( const uint8_t *const
initial_vector, const uint8_t *const encrypted_key, const sce_key_update_key_t *const
key_update_key, sce_ecc_private_wrapped_key_t *const wrapped_key )
```

This API wraps 384-bit Brainpool ECC key within the user routine.

Parameters

| | | |
|----------|----------------|---|
| [in] | initial_vector | Initialization vector when generating encrypted_key |
| [in] | encrypted_key | User key encrypted and MAC appended |
| [in] | key_update_key | Key update keyring |
| [in,out] | wrapped_key | 384-bit ECC wrapped key |

Return values

| | |
|---------------------|---------------------|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_UNSUPPORTED | API not supported. |

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTOSCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

5.2.15.7 TinyCrypt H/W Acceleration (rm_tinycrypt_port)

Modules » Security

Functions

fsp_err_t RM_TINCRYPT_PORT_Init ()

fsp_err_t RM_TINCRYPT_PORT_TRNG_Read (uint8_t *const p_rngbuf, uint32_t num_req_bytes)

Reads requested length of random data from the TRNG. Generate num_req_bytes of random bytes and store them in p_rngbuf buffer. [More...](#)

int default_CSPRNG (uint8_t *dest, unsigned int size)

Implements the Cryptographically Secure Pseudo-Random Number Generator function required by TinyCrypt. [More...](#)

Detailed Description

AES128 Hardware acceleration for TinyCrypt on the RA2 family.

Overview

Note

The TinyCrypt port module does not provide any interfaces to the user. Consult the documentation at <https://github.com/intel/tinycrypt/blob/master/documentation/tinycrypt.rst> for further information.

TinyCrypt is designed as a small footprint software crypto implementation to be used on resource constrained devices. The software only module is available in FSP on all RA devices. Hardware acceleration for AES-128 is provided only for the RA2 family. This release uses TinyCrypt v0.2.8.

Hardware Overview

| Crypto Peripheral version | Devices |
|---------------------------|---------------------|
| AES Engine | RA2A1, RA2E1, RA2L1 |

Features

For features supported by the software-only version, refer to the TinyCrypt documentation.

The TinyCrypt port module provides hardware support for the following operations

- AES
 - Keybits - 128
 - ECB, CBC, CTR, CCM, GCM and CMAC modes -TRNG

Configuration

Build Time Configurations for TinyCrypt_Acceleration

The following build time configurations are defined in fsp_cfg/rm_tinycrypt_port_cfg.h:

| Configuration | Options | Default | Description |
|--------------------|--|---------------|---|
| Parameter Checking | <ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| GCM Support | MCU Specific Options | | AES-GCM with complete HW/SW support |

AES Configuration

To enable hardware acceleration for the AES128 operation, choose TinyCrypt (H/W Accelerated) from the stack options . This feature is only supported on the RA2 family.

Usage Notes

Hardware Initialization

Invoke `RM_TINCRYPT_PORT_Init ()` to initialize the hardware before using TinyCrypt if either hardware acceleration or the TRNG is to be used.

Random Number Generation

There are two Pseudo-random Number Generators (PRNG) provided in TinyCrypt

- CTR-PRNG which uses AES128 internally in its implementation. Enabling AES128 hardware acceleration will improve the performance of this module.
- HMAC-PRNG which uses SHA256 internally in its implementation.

Both these implementations will only be able to provide a random pseudo-random number sequence if they are seeded with truly random data. The TRNG module that is present in hardware and available in `rm_tinycrypt_port` must be used to seed these modules. When using CTR-PRNG or HMAC-PRNG, use the `RM_TINCRYPT_PORT_TRNG_Read()` function to obtain random data from the TRNG hardware and use that to seed the PRNG modules before invoking the pseudo-random number generation. If purely random data is sufficient for the application, then `RM_TINCRYPT_PORT_TRNG_Read()` can be used directly instead. The hardware TRNG implements the CTR_DRBG spec.

Default CSPRNG

The TinyCrypt ECC implementation requires a platform specific implementation of the `default_CSPRNG()` function. This function has been implemented using the hardware TRNG in the port to support software ECC usage. When using TinyCrypt in S/W mode, it is necessary to implement `default_CSPRNG()` if using ECC signature generation (ECDSA) or key derivation (ECDH).

AES-128 Usage

The AES ECB mode implementation is provided in `aes_encrypt.decrypt.c`. All the other modes of AES operation including CBC, CCN, CMAC and CTR use the ECB mode for the block operation. On the RA2, the ECB mode has been hardware accelerated which improves performance of the other modes as well. Additionally the CBC and CTR modes are also accelerated.

To use the different AES modes, first initialize the hardware (on the RA2) and then use the functions defined in the header file of each AES mode. Note that TinyCrypt does not provide any type of padding or buffering so the data provided to these modes should be multiples of AES block size.

Memory Usage

TinyCrypt does not use dynamic allocation so there is no heap requirement.

Limitations

Usage with RA4 and RA6 devices

TinyCrypt (S/W Only) can be used on RA4 and RA6 devices. However, since ECC signature generation (ECDSA) and key derivation (ECDH) requires a random number source, that operation is currently not supported on these devices when using TinyCrypt (S/W Only). In order to support those operations the function `default_CSPRNG()` must be implemented in the user code.

TinyCrypt

- No padding is supported; the user is expected to provide adequately padded data depending on the algorithm used.
- AES Key generation is not supported.
- Key encoding/decoding is not supported.

Using TinyCrypt with TrustZone

Unlike FSP drivers, TinyCrypt cannot be configured as Non-secure callable in the RA Configurator for a secure project. The reason for this is that in order to achieve the security objective of controlling access to protected keys, both the crypto code as well as the keys must be placed in the secure region. Since the tinyCrypt API requires access to the keys directly during initialization and later via a key handle, allowing non-secure code to use the API by making it Non-secure callable will require the keys to be stored in non-secure memory.

This limitation is identical to that for PSA Crypto. Refer to the documentation of that module on how to create a crypto Non-Secure Callable layer to be used in such situations.

Examples

AES-CBC Example

This is an example on using TinyCrypt to encrypt and decrypt data using an AES-128 key in CBC mode.

```
#define TC_INPUT_PLAINTEXT_SIZE 64U
#define TF_AES_IV_SIZE TC_AES_BLOCK_SIZE

Function Documentation

◆ **RM_TINCRYPT_PORT_Init()**

```
fsp_err_t RM_TINCRYPT_PORT_Init ( )
```

Initialize the SCE.

◆ **RM_TINCRYPT_PORT_TRNG_Read()**

```
fsp_err_t RM_TINCRYPT_PORT_TRNG_Read ( uint8_t *const p_rngbuf, uint32_t num_req_bytes )
```

Reads requested length of random data from the TRNG. Generate num_req_bytes of random bytes and store them in p_rngbuf buffer.

Return values

| | |
|-----------------------|-------------------------------------|
| FSP_SUCCESS | Random number generation successful |
| FSP_ERR_ASSERTION | NULL input parameter(s). |
| FSP_ERR_CRYPT_UNKNOWN | An unknown error occurred. |

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- HW_SCE_RNG_Read

◆ **default_CSPRNG()**

```
int default_CSPRNG ( uint8_t * dest, unsigned int size )
```

Implements the Cryptographically Secure Pseudo-Random Number Generator function required by TinyCrypt.

Return values

| | |
|------------------|-------------------------------------|
| TC_CRYPT_SUCCESS | Random number generation successful |
| TC_CRYPT_FAIL | Random number generation failed. |

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- RM_TINCRYPT_PORT_TRNG_Read

5.2.16 Sensor**Modules****Detailed Description**

Sensor Modules.

Modules

[FS1015 Flow Sensor \(rm_fs1015\)](#)

Middleware to implement the FS1015 sensor interface. This module implements the [FSXXXX Middleware Interface](#).

[FS2012 Flow Sensor \(rm_fs2012\)](#)

Middleware to implement the FS2012 sensor interface. This module implements the [FSXXXX Middleware Interface](#).

[FS3000 Flow Sensor \(rm_fs3000\)](#)

Middleware to implement the FS3000 sensor interface. This module implements the [FSXXXX Middleware Interface](#).

[HS300X Temperature/Humidity Sensor \(rm_hs300x\)](#)

Middleware to implement the HS300X sensor interface. This module implements the [HS300X Middleware Interface](#).

[HS400X Temperature/Humidity Sensor \(rm_hs400x\)](#)

Middleware to implement the HS400X sensor interface. This module implements the [HS400X Middleware Interface](#).

[OB1203 Light/Proximity/PPG Sensor \(rm_ob1203\)](#)

Middleware to implement the OB1203 sensor interface. This module implements the [OB1203 Middleware Interface](#).

[ZMOD4XXX Gas Sensor \(rm_zmod4xxx\)](#)

Middleware to implement the ZMOD4XXX sensor interface. This module implements the [ZMOD4XXX Middleware Interface](#).

5.2.16.1 FS1015 Flow Sensor (rm_fs1015)

[Modules](#) » [Sensor](#)

Functions

`fsp_err_t RM_FS1015_Open (rm_fsxxxx_ctrl_t *const p_api_ctrl,`

```
rm_fsxxxx_cfg_t const *const p_cfg)
```

Opens and configures the FS1015 Middle module. Implements [rm_fsxxxx_api_t::open](#). [More...](#)

```
fsp_err_t RM_FS1015_Close (rm_fsxxxx_ctrl_t *const p_api_ctrl)
```

Disables specified FS1015 control block. Implements [rm_fsxxxx_api_t::close](#). [More...](#)

```
fsp_err_t RM_FS1015_Read (rm_fsxxxx_ctrl_t *const p_api_ctrl,
rm_fsxxxx_raw_data_t *const p_raw_data)
```

Reads ADC data from FS1015. Implements [rm_fsxxxx_api_t::read](#). [More...](#)

fsp_err_t RM_FS1015_DataCalculate (rm_fsxxxx_ctrl_t *const p_api_ctrl,
rm_fsxxxx_raw_data_t *const p_raw_data, rm_fsxxxx_data_t *const
p_fs1015_data)
```

Calculates flow [m/sec] from ADC data. Implements [rm_fsxxxx_api_t::dataCalculate](#). [More...](#)

Detailed Description

Middleware to implement the FS1015 sensor interface. This module implements the [FSXXXX Middleware Interface](#).

Overview

Features

The FS1015 sensor interface implementation has the following key features:

- Getting ADC data from the sensor
- Calculating flow value from ADC data

Configuration

Build Time Configurations for rm_fs1015

The following build time configurations are defined in `fsp_cfg/rm_fs1015_cfg.h`:

| Configuration | Options | Default | Description |
|--------------------|--|---------------|---|
| Parameter Checking | <ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

| | | | |
|-------------|-------------|-------------|----------------------------|
| Device Type | FS1015-1005 | FS1015-1005 | Select FS1015 device used. |
|-------------|-------------|-------------|----------------------------|

Configurations for Sensor > FS1015 Flow Sensor (rm_fs1015)

This module can be added to the Stacks tab via New Stack > Sensor > FS1015 Flow Sensor (rm_fs1015).

| Configuration | Options | Default | Description |
|---------------|-------------------------------|------------------|---|
| Name | Manual Entry | g_fs1015_sensor0 | Module name. |
| Callback | Name must be a valid C symbol | fs1015_callback | A user callback function can be provided. |

Pin Configuration

This module use SDA and SCL pins of I2C Master and SCI I2C.

Usage Notes

[FS1015 datasheet is here.](#)

If ADC data is invalid, it is needed to read ADC data from FS1015 again. The module only supports FS1015-1005.

If an RTOS is used, blocking and bus lock is available.

- If blocking of an I2C bus is required, it is necessary to create a semaphore for blocking.
- If bus lock is required, it is necessary to create a mutex for bus lock. Bus lock is only available when a semaphore for blocking is used.

Bus Initialization

The FS1015 interface expects a bus instance to be opened before opening any FS1015 device. The interface will handle switching between devices on the bus but will not open or close the bus instance. The user should open the bus with the appropriate [I2C Master Interface](#) open call.

Examples

Basic Example

This is a basic example of minimal use of FS1015 sensor implementation in an application.

```
void rm_fs1015_basic_example (void)
{
    fsp_err_t          err = FSP_SUCCESS;
    rm_fsxxxx_raw_data_t fs1015_raw_data;
    rm_fsxxxx_data_t   fs1015_data;
    uint8_t            calculated_flag = 0;
```

```
rm_comms_i2c_bus_extended_cfg_t * p_extend =
    (rm_comms_i2c_bus_extended_cfg_t *) g_fs1015_cfg.p_instance->p_cfg->p_extend;
i2c_master_instance_t * p_driver_instance = (i2c_master_instance_t *)
p_extend->p_driver_instance;

p_driver_instance->p_api->open(p_driver_instance->p_ctrl,
p_driver_instance->p_cfg);
#if BSP_CFG_RTOS
/* Create a semaphore for blocking if a semaphore is not NULL */
if (NULL != p_extend->p_blocking_semaphore)
{
#if BSP_CFG_RTOS == 1 // AzureOS
    tx_semaphore_create(p_extend->p_blocking_semaphore->p_semaphore_handle,
        p_extend->p_blocking_semaphore->p_semaphore_name,
        (ULONG) 0);
#elif BSP_CFG_RTOS == 2 // FreeRTOS
    *(p_extend->p_blocking_semaphore->p_semaphore_handle) =
        xSemaphoreCreateCountingStatic((UBaseType_t) 1,
            (UBaseType_t) 0,
p_extend->p_blocking_semaphore->p_semaphore_memory);
#endif
}

/* Create a recursive mutex for bus lock if a recursive mutex is not NULL */
if (NULL != p_extend->p_bus_recursive_mutex)
{
#if BSP_CFG_RTOS == 1 // AzureOS
    tx_mutex_create(p_extend->p_bus_recursive_mutex->p_mutex_handle,
        p_extend->p_bus_recursive_mutex->p_mutex_name,
        TX_INHERIT);
#elif BSP_CFG_RTOS == 2 // FreeRTOS
    *(p_extend->p_bus_recursive_mutex->p_mutex_handle) =
        xSemaphoreCreateRecursiveMutexStatic(p_extend->p_bus_recursive_mutex->p_m
utex_memory);
#endif
}
```

```
    }
#endif

    err = RM_FS1015_Open(&g_fs1015_ctrl, &g_fs1015_cfg);
/* Handle any errors. This function should be defined by the user. */
    handle_error(err);
while (true)

Function Documentation

◆ **RM_FS1015_Open()**

```
fsp_err_t RM_FS1015_Open ( rm_fsxxxx_ctrl_t *const p_api_ctrl, rm_fsxxxx_cfg_t const *const p_cfg )
```

Opens and configures the FS1015 Middle module. Implements `rm_fsxxxx_api_t::open`.

Example:

```
err = RM_FS1015_Open(&g_fs1015_ctrl, &g_fs1015_cfg);
```

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | FS1015 successfully configured. |
| FSP_ERR_ASSERTION | Null pointer, or one or more configuration options is invalid. |
| FSP_ERR_ALREADY_OPEN | Module is already open. This module can only be opened once. |

◆ **RM_FS1015_Close()**

```
fsp_err_t RM_FS1015_Close ( rm_fsxxxx_ctrl_t *const p_api_ctrl)
```

Disables specified FS1015 control block. Implements `rm_fsxxxx_api_t::close`.

Return values

| | |
|-------------------|-------------------------------------|
| FSP_SUCCESS | Successfully closed. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_FS1015_Read()**

```
fsp_err_t RM_FS1015_Read ( rm_fsxxxx_ctrl_t *const p_api_ctrl, rm_fsxxxx_raw_data_t *const p_raw_data )
```

Reads ADC data from FS1015. Implements `rm_fsxxxx_api_t::read`.

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | Successfully data decoded. |
| FSP_ERR_ASSERTION | Null pointer, or one or more configuration options is invalid. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_FS1015_DataCalculate()

```
fsp_err_t RM_FS1015_DataCalculate ( rm_fsxxxx_ctrl_t *const p_api_ctrl, rm_fsxxxx_raw_data_t
*const p_raw_data, rm_fsxxxx_data_t *const p_fs1015_data )
```

Calculates flow [m/sec] from ADC data. Implements `rm_fsxxxx_api_t::dataCalculate`.

Return values

| | |
|-----------------------------|--|
| FSP_SUCCESS | Successfully data decoded. |
| FSP_ERR_ASSERTION | Null pointer, or one or more configuration options is invalid. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_SENSOR_INVALID_DATA | Data is invalid. |

Calculates flow from ADC data. Unit of Gas flow is SLPM (Standard liter per minute) Unit of Liquid flow is SCCM (Standard cubic centimeter per minute) Implements `rm_fsxxxx_api_t::dataCalculate`. [More...](#)

Detailed Description

Middleware to implement the FS2012 sensor interface. This module implements the [FSXXXX Middleware Interface](#).

Overview

Features

The FS2012 sensor interface implementation has the following key features:

- Getting ADC data from the sensor
- Calculating flow value from ADC data

Configuration

Build Time Configurations for rm_fs2012

The following build time configurations are defined in fsp_cfg/rm_fs2012_cfg.h:

| Configuration | Options | Default | Description |
|--------------------|--|----------------|---|
| Parameter Checking | <ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| Device Type | <ul style="list-style-type: none"> • FS2012-1020-N G • FS2012-1100-N G | FS2012-1100-NG | Select FS2012 device type. |

Configurations for Sensor > FS2012 Flow Sensor (rm_fs2012)

This module can be added to the Stacks tab via New Stack > Sensor > FS2012 Flow Sensor (rm_fs2012).

| Configuration | Options | Default | Description |
|---------------|-------------------------------|------------------|---|
| Name | Manual Entry | g_fs2012_sensor0 | Module name. |
| Callback | Name must be a valid C symbol | fs2012_callback | A user callback function can be provided. |

Pin Configuration

This module uses SDA and SCL pins of I2C Master and SCI I2C.

Usage Notes

[FS2012 datasheet is here](#). The module only supports FS2012-1020-NG and FS2012-1100-NG.

If an RTOS is used, blocking and bus lock is available.

- If blocking of an I2C bus is required, it is necessary to create a semaphore for blocking.
- If bus lock is required, it is necessary to create a mutex for bus lock. Bus lock is only available when a semaphore for blocking is used.

Bus Initialization

The FS2012 interface expects a bus instance to be opened before opening any FS2012 device. The interface will handle switching between devices on the bus but will not open or close the bus instance. The user should open the bus with the appropriate [I2C Master Interface](#) open call.

Examples

Basic Example

This is a basic example of minimal use of FS2012 sensor implementation in an application.

```
void rm_fs2012_basic_example (void)
{
    fsp_err_t          err = FSP_SUCCESS;
    rm_fsxxxx_raw_data_t fs2012_raw_data;
    rm_fsxxxx_data_t   fs2012_data;
    /* Open the I2C bus if it is not already open. */
    rm_comms_i2c_bus_extended_cfg_t * p_extend =
        (rm_comms_i2c_bus_extended_cfg_t *) g_fs2012_cfg.p_instance->p_cfg->p_extend;
    i2c_master_instance_t * p_driver_instance = (i2c_master_instance_t *)
p_extend->p_driver_instance;
    p_driver_instance->p_api->open(p_driver_instance->p_ctrl,
p_driver_instance->p_cfg);
#ifdef BSP_CFG_RTOS
    /* Create a semaphore for blocking if a semaphore is not NULL */
    if (NULL != p_extend->p_blocking_semaphore)
    {
#ifdef BSP_CFG_RTOS == 1 // AzureOS
        tx_semaphore_create(p_extend->p_blocking_semaphore->p_semaphore_handle,
            p_extend->p_blocking_semaphore->p_semaphore_name,
            (ULONG) 0);
#elseif BSP_CFG_RTOS == 2 // FreeRTOS
        *(p_extend->p_blocking_semaphore->p_semaphore_handle) =
            xSemaphoreCreateCountingStatic((UBaseType_t) 1,
```

```
                                (UBaseType_t) 0,

p_extend->p_blocking_semaphore->p_semaphore_memory);

#endif

}

/* Create a recursive mutex for bus lock if a recursive mutex is not NULL */
if (NULL != p_extend->p_bus_recursive_mutex)
{
#ifdef BSP_CFG_RTOS == 1 // AzureOS
    tx_mutex_create(p_extend->p_bus_recursive_mutex->p_mutex_handle,
                    p_extend->p_bus_recursive_mutex->p_mutex_name,
                    TX_INHERIT);
#elif BSP_CFG_RTOS == 2 // FreeRTOS
    *(p_extend->p_bus_recursive_mutex->p_mutex_handle) =
        xSemaphoreCreateRecursiveMutexStatic(p_extend->p_bus_recursive_mutex->p_m
utex_memory);
#endif
}
#endif

err = RM_FS2012_Open(&g_fs2012_ctrl, &g_fs2012_cfg);
/* Handle any errors. This function should be defined by the user. */
handle_error(err);

while (true)
{
    g_flag = 0;

    /* Read ADC Data from FS2012 */
    RM_FS2012_Read(&g_fs2012_ctrl,
                  &fs2012_raw_data);

    while (0 == g_flag)
    {
        /* Wait callback */
    }

    /* Calculate Flow value from ADC data */
    RM_FS2012_DataCalculate(&g_fs2012_ctrl, &fs2012_raw_data, &fs2012_data);
```

```

/* FS2012 sample rate. See table 4 on the page 5 of the datasheet. */
/* Gas : 409.6ms, Liquid : 716.8ms */
R_BSP_SoftwareDelay(FS2012_GAS_SAMPLE_RATE, BSP_DELAY_UNITS_MICROSECONDS);
}
}

```

Detailed Description

Middleware to implement the FS3000 sensor interface. This module implements the [FSXXXX Middleware Interface](#).

Overview

Features

The FS3000 sensor interface implementation has the following key features:

- Getting ADC data from the sensor
- Calculating flow value from ADC data

Configuration

Build Time Configurations for rm_fs3000

The following build time configurations are defined in fsp_cfg/rm_fs3000_cfg.h:

| Configuration | Options | Default | Description |
|--------------------|--|---------------|---|
| Parameter Checking | <ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| Device Type | FS3000-1005 | FS3000-1005 | Select FS3000 device used. |

Configurations for Sensor > FS3000 Flow Sensor (rm_fs3000)

This module can be added to the Stacks tab via New Stack > Sensor > FS3000 Flow Sensor (rm_fs3000).

| Configuration | Options | Default | Description |
|---------------|-------------------------------|------------------|---|
| Name | Manual Entry | g_fs3000_sensor0 | Module name. |
| Callback | Name must be a valid C symbol | fs3000_callback | A user callback function can be provided. |

Pin Configuration

This module use SDA and SCL pins of I2C Master and SCI I2C.

Usage Notes

[FS3000 datasheet is here.](#)

If ADC data is invalid, it is needed to read ADC data from FS3000 again. The module only supports FS3000-1005.

If an RTOS is used, blocking and bus lock is available.

- If blocking of an I2C bus is required, it is necessary to create a semaphore for blocking.
- If bus lock is required, it is necessary to create a mutex for bus lock. Bus lock is only available when a semaphore for blocking is used.

Bus Initialization

The FS3000 interface expects a bus instance to be opened before opening any FS3000 device. The interface will handle switching between devices on the bus but will not open or close the bus instance. The user should open the bus with the appropriate [I2C Master Interface](#) open call.

Examples

Basic Example

This is a basic example of minimal use of FS3000 sensor implementation in an application.

```
void rm_fs3000_basic_example (void)
{

◆ `RM_FS3000_Open()`

```
fsp_err_t RM_FS3000_Open ( rm_fsxxxx_ctrl_t *const p_api_ctrl, rm_fsxxxx_cfg_t const *const p_cfg )
```

Opens and configures the FS3000 Middle module. Implements `rm_fsxxxx_api_t::open`.

Example:

```
err = RM_FS3000_Open(&g_fs3000_ctrl, &g_fs3000_cfg);
```

Return values

| | |
|-----------------------------------|--|
| <code>FSP_SUCCESS</code> | FS3000 successfully configured. |
| <code>FSP_ERR_ASSERTION</code> | Null pointer, or one or more configuration options is invalid. |
| <code>FSP_ERR_ALREADY_OPEN</code> | Module is already open. This module can only be opened once. |

◆ `RM_FS3000_Close()`

```
fsp_err_t RM_FS3000_Close ( rm_fsxxxx_ctrl_t *const p_api_ctrl)
```

Disables specified FS3000 control block. Implements `rm_fsxxxx_api_t::close`.

Return values

| | |
|--------------------------------|-------------------------------------|
| <code>FSP_SUCCESS</code> | Successfully closed. |
| <code>FSP_ERR_ASSERTION</code> | Null pointer passed as a parameter. |
| <code>FSP_ERR_NOT_OPEN</code> | Module is not open. |

◆ RM_FS3000_Read()

```
fsp_err_t RM_FS3000_Read ( rm_fsxxxx_ctrl_t *const p_api_ctrl, rm_fsxxxx_raw_data_t *const p_raw_data )
```

Reads ADC data from FS3000. Implements `rm_fsxxxx_api_t::read`.

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | Successfully data decoded. |
| FSP_ERR_ASSERTION | Null pointer, or one or more configuration options is invalid. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_FS3000_DataCalculate()

```
fsp_err_t RM_FS3000_DataCalculate ( rm_fsxxxx_ctrl_t *const p_api_ctrl, rm_fsxxxx_raw_data_t *const p_raw_data, rm_fsxxxx_data_t *const p_fs3000_data )
```

Calculates flow [m/sec] from ADC data. Implements `rm_fsxxxx_api_t::dataCalculate`.

Return values

| | |
|-----------------------------|--|
| FSP_SUCCESS | Successfully data decoded. |
| FSP_ERR_ASSERTION | Null pointer, or one or more configuration options is invalid. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_SENSOR_INVALID_DATA | Data is invalid. |

Modules » [Sensor](#)

Functions

```
fsp_err_t RM_HS300X_Open (rm_hs300x_ctrl_t *const p_api_ctrl, rm_hs300x_cfg_t const *const p_cfg)
```

Opens and configures the HS300X Middle module. Implements `rm_hs300x_api_t::open`. [More...](#)

```
fsp_err_t RM_HS300X_Close (rm_hs300x_ctrl_t *const p_api_ctrl)
```

Disables specified HS300X control block. Implements `rm_hs300x_api_t::close`. [More...](#)

`fsp_err_t RM_HS300X_MeasurementStart (rm_hs300x_ctrl_t *const p_api_ctrl)`

This function should be called when start a measurement and when measurement data is stale data. Sends the slave address to the hs300x and start a measurement. Implements `rm_hs300x_api_t::measurementStart`. [More...](#)

`fsp_err_t RM_HS300X_Read (rm_hs300x_ctrl_t *const p_api_ctrl, rm_hs300x_raw_data_t *const p_raw_data)`

Reads ADC data from HS300X. Implements `rm_hs300x_api_t::read`. [More...](#)

`fsp_err_t RM_HS300X_DataCalculate (rm_hs300x_ctrl_t *const p_api_ctrl, rm_hs300x_raw_data_t *const p_raw_data, rm_hs300x_data_t *const p_hs300x_data)`

Calculates humidity [RH] and temperature [Celsius] from ADC data. Implements `rm_hs300x_api_t::dataCalculate`. [More...](#)

`fsp_err_t RM_HS300X_ProgrammingModeEnter (rm_hs300x_ctrl_t *const p_api_ctrl)`

This function must be called within 10ms after applying power to the sensor. Sends the commands to enter the programming mode. After calling this function, please wait 120us. Implements `rm_hs300x_api_t::programmingModeEnter`. [More...](#)

`fsp_err_t RM_HS300X_ResolutionChange (rm_hs300x_ctrl_t *const p_api_ctrl, rm_hs300x_data_type_t const data_type, rm_hs300x_resolution_t const resolution)`

This function must be called after calling the `RM_HS300X_ProgrammingModeEnter` function. Changes the sensor resolution. This function blocks for 120 us software delay plus 9 bytes on the I2C bus. After calling this function, 14ms must be waited. Failure to comply with these times may result in data corruption and introduce errors in sensor measurements. Implements `rm_hs300x_api_t::resolutionChange`. [More...](#)

`fsp_err_t RM_HS300X_SensorIdGet (rm_hs300x_ctrl_t *const p_api_ctrl, uint32_t *const p_sensor_id)`

This function must be called after calling the `RM_HS300X_ProgrammingModeEnter` function. Gets the sensor ID. This function blocks for 240 us software delay plus 12 bytes on the I2C bus. Implements `rm_hs300x_api_t::sensorIdGet`. [More...](#)

`fsp_err_t RM_HS300X_ProgrammingModeExit (rm_hs300x_ctrl_t *const`

p_api_ctrl)

This function must be called after calling the RM_HS300X_ProgrammingModeEnter function. This function must be called to return to normal sensor operation and perform measurements. Sends the commands to exit the programming mode. Implements `rm_hs300x_api_t::programmingModeExit`. [More...](#)

Detailed Description

Middleware to implement the HS300X sensor interface. This module implements the [HS300X Middleware Interface](#).

Overview

Features

The HS300X sensor interface implementation has the following key features:

- Starting a measurement at any time
- Getting ADC data from the sensor
- Calculating humidity and temperature value from getting ADC data
- Changing the sensor resolution
- Getting the sensor ID

Configuration

Build Time Configurations for rm_hs300x

The following build time configurations are defined in `fsp_cfg/rm_hs300x_cfg.h`:

| Configuration | Options | Default | Description |
|--------------------|--|-------------------------------|---|
| Parameter Checking | <ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| Data type | <ul style="list-style-type: none"> • Both humidity and temperature • Humidity only | Both humidity and temperature | Select Getting humidity only and both humidity and temperature. |
| Programming Mode | <ul style="list-style-type: none"> • ON • OFF | OFF | If selected the programming mode can be entered. |

Configurations for Sensor > HS300X Temperature/Humidity Sensor (rm_hs300x)

This module can be added to the Stacks tab via `New Stack > Sensor > HS300X Temperature/Humidity Sensor (rm_hs300x)`.

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

| | | | |
|----------|-------------------------------|------------------|---|
| Name | Manual Entry | g_hs300x_sensor0 | Module name. |
| Callback | Name must be a valid C symbol | hs300x_callback | A user callback function can be provided. |

Pin Configuration

This module use SDA and SCL pins of I2C Master and SCI I2C.

Usage Notes

[HS300x datasheet is here.](#)

If ADC data is valid and calculating humidity and temperature is finished, it is needed to start a measurement again. If ADC data is invalid, it is needed to read ADC data from HS300x again.

If changing the sensor resolution and getting the sensor ID, RM_HS300X_ProgrammingModeEnter function must be called within 10ms after applying power to the sensor. Entering the programming mode takes 120us. Thresore, after calling RM_HS300X_ProgrammingModeEnter function, please wait 120us. After calling RM_HS300X_ResolutionChange function, 14ms must be waited because failure to comply with these times may result in data corruption and introduce errors in sensor measurements.

If an RTOS is used, blocking and bus lock is available.

- If blocking of an I2C bus is required, it is necessary to create a semaphore for blocking.
- If bus lock is required, it is necessary to create a mutex for bus lock. Bus lock is only available when a semaphore for blocking is used.

Bus Initialization

The HS300X interface expects a bus instance to be opened before opening any HS300X device. The interface will handle switching between devices on the bus but will not open or close the bus instance. The user should open the bus with the appropriate [I2C Master Interface](#) open call.

Examples

Basic Example

This is a basic example of minimal use of HS300X sensor implementation in an application.

```
void rm_hs300x_basic_example (void)
{
    fsp_err_t          err = FSP_SUCCESS;
    rm_hs300x_raw_data_t hs300x_raw_data;
    rm_hs300x_data_t   hs300x_data;
    uint8_t           calculated_flag = 0;
    /* Open the I2C bus if it is not already open. */
    rm_comms_i2c_bus_extended_cfg_t * p_extend =
        (rm_comms_i2c_bus_extended_cfg_t *) g_hs300x_cfg.p_instance->p_cfg->p_extend;
```

```
i2c_master_instance_t * p_driver_instance = (i2c_master_instance_t *)
p_extend->p_driver_instance;

    p_driver_instance->p_api->open(p_driver_instance->p_ctrl,
p_driver_instance->p_cfg);
#if BSP_CFG_RTOS
    /* Create a semaphore for blocking if a semaphore is not NULL */
    if (NULL != p_extend->p_blocking_semaphore)
    {
        #if BSP_CFG_RTOS == 1 // AzureOS
            tx_semaphore_create(p_extend->p_blocking_semaphore->p_semaphore_handle,
                p_extend->p_blocking_semaphore->p_semaphore_name,
                (ULONG) 0);
        #elif BSP_CFG_RTOS == 2 // FreeRTOS
            *(p_extend->p_blocking_semaphore->p_semaphore_handle) =
                xSemaphoreCreateCountingStatic((UBaseType_t) 1,
                    (UBaseType_t) 0,
p_extend->p_blocking_semaphore->p_semaphore_memory);
        #endif
    }

    /* Create a recursive mutex for bus lock if a recursive mutex is not NULL */
    if (NULL != p_extend->p_bus_recursive_mutex)
    {
        #if BSP_CFG_RTOS == 1 // AzureOS
            tx_mutex_create(p_extend->p_bus_recursive_mutex->p_mutex_handle,
                p_extend->p_bus_recursive_mutex->p_mutex_name,
                TX_INHERIT);
        #elif BSP_CFG_RTOS == 2 // FreeRTOS

Function Documentation

◆ **RM_HS300X_Open()**

```
fsp_err_t RM_HS300X_Open ( rm_hs300x_ctrl_t *const p_api_ctrl, rm_hs300x_cfg_t const *const p_cfg )
```

Opens and configures the HS300X Middle module. Implements `rm_hs300x_api_t::open`.

Example:

```
err = RM_HS300X_Open(&g_hs300x_ctrl, &g_hs300x_cfg);
```

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | HS300X successfully configured. |
| FSP_ERR_ASSERTION | Null pointer, or one or more configuration options is invalid. |
| FSP_ERR_ALREADY_OPEN | Module is already open. This module can only be opened once. |

◆ **RM_HS300X_Close()**

```
fsp_err_t RM_HS300X_Close ( rm_hs300x_ctrl_t *const p_api_ctrl)
```

Disables specified HS300X control block. Implements `rm_hs300x_api_t::close`.

Return values

| | |
|-------------------|-------------------------------------|
| FSP_SUCCESS | Successfully closed. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_HS300X_MeasurementStart()**

```
fsp_err_t RM_HS300X_MeasurementStart ( rm_hs300x_ctrl_t *const p_api_ctrl)
```

This function should be called when start a measurement and when measurement data is stale data. Sends the slave address to the hs300x and start a measurement. Implements `rm_hs300x_api_t::measurementStart`.

Return values

| | |
|-------------------|-------------------------------------|
| FSP_SUCCESS | Successfully started. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_HS300X_Read()**

```
fsp_err_t RM_HS300X_Read ( rm_hs300x_ctrl_t *const p_api_ctrl, rm_hs300x_raw_data_t *const p_raw_data )
```

Reads ADC data from HS300X. Implements `rm_hs300x_api_t::read`.

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | Successfully data decoded. |
| FSP_ERR_ASSERTION | Null pointer, or one or more configuration options is invalid. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_HS300X_DataCalculate()**

```
fsp_err_t RM_HS300X_DataCalculate ( rm_hs300x_ctrl_t *const p_api_ctrl, rm_hs300x_raw_data_t *const p_raw_data, rm_hs300x_data_t *const p_hs300x_data )
```

Calculates humidity [RH] and temperature [Celsius] from ADC data. Implements `rm_hs300x_api_t::dataCalculate`.

Return values

| | |
|-----------------------------|--|
| FSP_SUCCESS | Successfully data decoded. |
| FSP_ERR_ASSERTION | Null pointer, or one or more configuration options is invalid. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_SENSOR_INVALID_DATA | Data is invalid. |

◆ **RM_HS300X_ProgrammingModeEnter()**

```
fsp_err_t RM_HS300X_ProgrammingModeEnter ( rm_hs300x_ctrl_t *const p_api_ctrl)
```

This function must be called within 10ms after applying power to the sensor. Sends the commands to enter the programming mode. After calling this function, please wait 120us. Implements `rm_hs300x_api_t::programmingModeEnter`.

Return values

| | |
|---------------------|-------------------------------------|
| FSP_SUCCESS | Successfully started. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_UNSUPPORTED | Programming mode is not supported. |

◆ **RM_HS300X_ResolutionChange()**

```
fsp_err_t RM_HS300X_ResolutionChange ( rm_hs300x_ctrl_t *const p_api_ctrl,
rm_hs300x_data_type_t const data_type, rm_hs300x_resolution_t const resolution )
```

This function must be called after calling the RM_HS300X_ProgrammingModeEnter function. Changes the sensor resolution. This function blocks for 120 us software delay plus 9 bytes on the I2C bus. After calling this function, 14ms must be waited. Failure to comply with these times may result in data corruption and introduce errors in sensor measurements. Implements [rm_hs300x_api_t::resolutionChange](#).

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Successfully started. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_MODE | Module is not entering the programming mode. |
| FSP_ERR_ABORTED | Communication is aborted. |
| FSP_ERR_TIMEOUT | Communication is timeout. |
| FSP_ERR_UNSUPPORTED | Programming mode is not supported. |

◆ **RM_HS300X_SensorIdGet()**

```
fsp_err_t RM_HS300X_SensorIdGet ( rm_hs300x_ctrl_t *const p_api_ctrl, uint32_t *const
p_sensor_id )
```

This function must be called after calling the RM_HS300X_ProgrammingModeEnter function. Gets the sensor ID. This function blocks for 240 us software delay plus 12 bytes on the I2C bus. Implements [rm_hs300x_api_t::sensorIdGet](#).

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Successfully started. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_MODE | Module is not entering the programming mode. |
| FSP_ERR_ABORTED | Communication is aborted. |
| FSP_ERR_TIMEOUT | Communication is timeout. |
| FSP_ERR_UNSUPPORTED | Programming mode is not supported. |

◆ RM_HS300X_ProgrammingModeExit()

`fsp_err_t RM_HS300X_ProgrammingModeExit (rm_hs300x_ctrl_t *const p_api_ctrl)`

This function must be called after calling the `RM_HS300X_ProgrammingModeEnter` function. This function must be called to return to normal sensor operation and perform measurements. Sends the commands to exit the programming mode. Implements `rm_hs300x_api_t::programmingModeExit`.

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Successfully started. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_MODE | Module is not entering the programming mode. |
| FSP_ERR_UNSUPPORTED | Programming mode is not supported. |

5.2.16.5 HS400X Temperature/Humidity Sensor (rm_hs400x)

Modules » Sensor

Functions

`fsp_err_t RM_HS400X_Open (rm_hs400x_ctrl_t *const p_api_ctrl, rm_hs400x_cfg_t const *const p_cfg)`

Opens and configures the HS400X middleware module. Implements `rm_hs400x_api_t::open`. [More...](#)

`fsp_err_t RM_HS400X_Close (rm_hs400x_ctrl_t *const p_api_ctrl)`

Disables specified HS400X control block. Implements `rm_hs400x_api_t::close`. [More...](#)

`fsp_err_t RM_HS400X_MeasurementStart (rm_hs400x_ctrl_t *const p_api_ctrl)`

This function should be called when start one shot measurement. Sends the command of measurement to HS400X and start a measurement. This function supports No-Hold measurement and Periodic measurement only. If Hold measurement is enabled, please call `RM_HS400X_Read()` without calling this function. In Periodic measurement, if the periodic measurement has already run, `RM_HS400X_EVENT_ERROR` is received in callback because HS400x device replies with NACK. Implements `rm_hs400x_api_t::measurementStart`. [More...](#)

`fsp_err_t RM_HS400X_MeasurementStop (rm_hs400x_ctrl_t *const p_api_ctrl)`

Stop a periodic measurement. Sends the command of stopping periodic measurement to HS400X. This function supports periodic measurement only. If a periodic measurement is not running, `RM_HS400X_EVENT_ERROR` is received in callback because HS400x device replies with NACK. Implements `rm_hs400x_api_t::measurementStop`. [More...](#)

`fsp_err_t RM_HS400X_Read (rm_hs400x_ctrl_t *const p_api_ctrl, rm_hs400x_raw_data_t *const p_raw_data)`

Reads ADC data from HS400X. If Hold measurement is enabled, HS400X holds the SCL line low during the measurement and releases the SCL line when the measurement is complete. If No-Hold measurement is enabled and the measurement result is not ready, `RM_HS400X_EVENT_MEASUREMENT_NOT_COMPLETE` is received in callback. Implements `rm_hs400x_api_t::read`. [More...](#)

`fsp_err_t RM_HS400X_DataCalculate (rm_hs400x_ctrl_t *const p_api_ctrl, rm_hs400x_raw_data_t *const p_raw_data, rm_hs400x_data_t *const p_hs400x_data)`

Calculates temperature [Celsius] and humidity [RH] from ADC data. Implements `rm_hs400x_api_t::dataCalculate`. [More...](#)

Detailed Description

Middleware to implement the HS400X sensor interface. This module implements the [HS400X Middleware Interface](#).

Overview

Features

The HS400X sensor interface implementation has the following key features:

- Starting a measurement at any time
- Selecting one shot or a periodic measurement
- Getting ADC data from the sensor
- Calculating humidity and temperature value from getting ADC data

Limitations

Alert feature is not supported. It will be supported in the future.

Notifications

The minimum frequency for the SCL clock in Hold measurement is 200kHz. Please configure `I2C_MASTER_RATE_FAST` or `I2C_MASTER_RATE_FASTPLUS` to "Rate" in [I2C Master \(r_iic_master\)](#) or

I2C Master (r_sci_i2c).

Configuration

Build Time Configurations for rm_hs400x

The following build time configurations are defined in fsp_cfg/rm_hs400x_cfg.h:

| Configuration | Options | Default | Description |
|--------------------|---|-------------------------------|---|
| Parameter Checking | <ul style="list-style-type: none"> Default (BSP) Enabled Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| Measurement Type | <ul style="list-style-type: none"> Hold Measurement No-Hold Measurement Periodic Measurement | No-Hold Measurement | Select measurement type. |
| Data type | <ul style="list-style-type: none"> Both humidity and temperature Temperature only | Both humidity and temperature | Select getting temperature only or both humidity and temperature. |

Configurations for Sensor > HS400X Temperature/Humidity Sensor (rm_hs400x)

This module can be added to the Stacks tab via New Stack > Sensor > HS400X Temperature/Humidity Sensor (rm_hs400x).

| Configuration | Options | Default | Description |
|------------------------------------|---|---------------------------|---|
| Name | Manual Entry | g_hs400x_sensor0 | Module name. |
| Temperature Resolution | <ul style="list-style-type: none"> 8-bit 10-bit 12-bit 14-bit | 14-bit | Set resolution of temperature. |
| Humidity Resolution | <ul style="list-style-type: none"> 8-bit 10-bit 12-bit 14-bit | 14-bit | Set resolution of humidity. |
| Frequency for Periodic Measurement | <ul style="list-style-type: none"> 0.4Hz 1Hz 2Hz | 1Hz | Set frequency for periodic measurement. |
| Comms I2C Callback | Name must be a valid C symbol | hs400x_comms_i2c_callback | A user COMMS I2C callback function can be provided. |

Pin Configuration

This module use SDA and SCL pins of I2C Master and SCI I2C.

Usage Notes

[HS400x datasheet is here.](#)

This module supports three measurement type :

- Hold measurement
- No-Hold measurement
- Periodic measurement

Hold and no-hold measurements also support measuring temperature data only. However, a periodic measurement only supports measuring both humidity and temperature data.

Hold Measurement

A hold measurement sequence consists of the following steps.

1. Wake up the HS400x series sensor from sleep mode by sending its I2C address with a write bit, and initiate a measurement by sending the desired hold measurement command.
2. Change the direction of communication by sending a start bit, the HS400x I2C address, and a read bit. The SCL line is held low by the sensor during the measurement process, which prevents the master from initiating any communications with other slaves on the bus.
3. Once the requested measurement is completed by the HS400x series sensor, the SCL line is released and the chip waits for the SCL clock signal to send the results. The sensor will then transmit the requested measurement data on the bus for the master to capture.

No-Hold Measurement

A no-hold measurement sequence consists of the following steps.

1. Wake up the HS400x series sensor from sleep mode by sending its I2C address with a write bit, and initiate a measurement by sending the desired no-hold measurement command.
2. To read the result from the HS400x series sensor, the master has to send the chip its I2C address and a read bit. If the measurement is completed and the result is ready, the chip will send an ACK bit and starts to send the result over the bus. If the measurement is still in progress, the chip will send a NACK bit and the master will need to try to read the result again.

Periodic Measurement

The HS400x sensors can also be configured to measure at regular intervals without user intervention. In this mode, the user can read the latest relative humidity / temperature data by issuing a data fetch sequence, which consists of sending the HS400x I2C address with a read bit. The sensor will then send the latest measurement result over the I2C bus.

When the periodic measurement mode is active, the only commands the chip will respond to are the data fetch command, and a command to stop the periodic measurements. The command to stop periodic measurements is issued by sending the I2C address with a write bit, followed by the command 0x30. Sequence to Stop Periodic Measurements. Once the periodic measurements have been stopped, the chip returns to sleep and is ready to accept all valid I2C commands.

Bus Initialization

The HS400X interface expects a I2C bus instance to be opened before opening any I2C device. The interface will handle switching between devices on the bus but will not open or close the bus instance. The user should open the bus with the appropriate [I2C Master Interface](#) open call.

If an RTOS is used, blocking and bus lock is available.

- If blocking of an I2C bus is required, it is necessary to create a semaphore for blocking.
- If bus lock is required, it is necessary to create a mutex for bus lock. Bus lock is only available when a semaphore for blocking is used.

Initialization

Initialize with [RM_HS400X_Open\(\)](#).

From measurement start to data acquisition

After normal completion, start the each measurement.

Hold Measurement

In hold measurement, the HS400x series sensor holds the SCL line low during the measurement and releases the SCL line when the measurement is complete.

1. Call [RM_HS400X_Read\(\)](#). This function will start a measurement and read the ADC data.
2. Wait until `RM_HS400X_EVENT_SUCCESS` is received.
3. Call [RM_HS400X_DataCalculate\(\)](#). This function will calculate temperature and humidity data from the ADC data.

No-Hold Measurement

In no-hold measurement, the HS400x series sensor does not hold the SCL line low, and the master is free to initiate communication with other slaves while the chip is performing the measurement.

1. Call [RM_HS400X_MeasurementStart\(\)](#). This function will start a measurement.
2. Wait until `RM_HS400X_EVENT_SUCCESS` is received.
3. Call [RM_HS400X_Read\(\)](#). This function will read the ADC data.
4. If the measurement result is not ready, `RM_HS400X_EVENT_MEASUREMENT_NOT_COMPLETE` is received in callback. User should call [RM_HS400X_Read\(\)](#) again. If the measurement is completed, `RM_HS400X_EVENT_SUCCESS` is received in callback.
5. Wait until `RM_HS400X_EVENT_SUCCESS` is received.
6. Call [RM_HS400X_DataCalculate\(\)](#). This function will calculate temperature and humidity data from the ADC data.

Periodic Measurement

In periodic measurement, the HS400x sensors measure at regular intervals without user intervention. If a periodic measurement is running, the resolution and the frequency cannot be changed. please stop the periodic measurement with [RM_HS400X_MeasurementStop\(\)](#).

1. Call [RM_HS400X_MeasurementStart\(\)](#). This function will start a measurement. If the function is called once, a second call is not required.
2. Wait until `RM_HS400X_EVENT_SUCCESS` is received.
3. Wait for frequency for periodic measurement.
4. Call [RM_HS400X_Read\(\)](#). This function will read the ADC data.
5. Wait until `RM_HS400X_EVENT_SUCCESS` is received.
6. Call [RM_HS400X_DataCalculate\(\)](#). This function will calculate temperature and humidity data from the ADC data.

Examples

Basic Example

This is a basic examples of minimal use of HS400X sensor implementation in an application.

```
void rm_hs400x_basic_example (void)
{
    fsp_err_t          err = FSP_SUCCESS;
    rm_hs400x_raw_data_t hs400x_raw_data;
    rm_hs400x_data_t   hs400x_data;

    bool               measurement_complete = false;
    bool               calculated           = false;

Function Documentation

◆ **RM_HS400X_Open()**

```
fsp_err_t RM_HS400X_Open ( rm_hs400x_ctrl_t *const p_api_ctrl, rm_hs400x_cfg_t const *const p_cfg )
```

Opens and configures the HS400X middleware module. Implements `rm_hs400x_api_t::open`.

Example:

```
err = RM_HS400X_Open(&g_hs400x_ctrl, &g_hs400x_cfg);
```

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | HS400X successfully configured. |
| FSP_ERR_ASSERTION | Null pointer, or one or more configuration options is invalid. |
| FSP_ERR_ALREADY_OPEN | Module is already open. This module can only be opened once. |
| FSP_ERR_TIMEOUT | communication is timeout. |
| FSP_ERR_ABORTED | communication is aborted. |

◆ **RM_HS400X_Close()**

```
fsp_err_t RM_HS400X_Close ( rm_hs400x_ctrl_t *const p_api_ctrl)
```

Disables specified HS400X control block. Implements `rm_hs400x_api_t::close`.

Return values

| | |
|-------------------|-------------------------------------|
| FSP_SUCCESS | Successfully closed. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_HS400X_MeasurementStart()**

```
fsp_err_t RM_HS400X_MeasurementStart ( rm_hs400x_ctrl_t *const p_api_ctrl)
```

This function should be called when start one shot measurement. Sends the command of measurement to HS400X and start a measurement. This function supports No-Hold measurement and Periodic measurement only. If Hold measurement is enabled, please call [RM_HS400X_Read\(\)](#) without calling this function. In Periodic measurement, if the periodic measurement has already run, RM_HS400X_EVENT_ERROR is received in callback because HS400x device replies with NACK. Implements [rm_hs400x_api_t::measurementStart](#).

Return values

| | |
|---------------------|-------------------------------------|
| FSP_SUCCESS | Successfully started. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_TIMEOUT | communication is timeout. |
| FSP_ERR_ABORTED | communication is aborted. |
| FSP_ERR_UNSUPPORTED | Hold measurement is unsupported. |

◆ **RM_HS400X_MeasurementStop()**

```
fsp_err_t RM_HS400X_MeasurementStop ( rm_hs400x_ctrl_t *const p_api_ctrl)
```

Stop a periodic measurement. Sends the command of stopping periodic measurement to HS400X. This function supports periodic measurement only. If a periodic measurement is not running, RM_HS400X_EVENT_ERROR is received in callback because HS400x device replies with NACK. Implements [rm_hs400x_api_t::measurementStop](#).

Return values

| | |
|---------------------|---|
| FSP_SUCCESS | Successfully started. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_TIMEOUT | communication is timeout. |
| FSP_ERR_ABORTED | communication is aborted. |
| FSP_ERR_UNSUPPORTED | Hold and No-Hold measurement are unsupported. |

◆ RM_HS400X_Read()

```
fsp_err_t RM_HS400X_Read ( rm_hs400x_ctrl_t *const p_api_ctrl, rm_hs400x_raw_data_t *const p_raw_data )
```

Reads ADC data from HS400X. If Hold measurement is enabled, HS400X holds the SCL line low during the measurement and releases the SCL line when the measurement is complete. If No-Hold measurement is enabled and the measurement result is not ready, RM_HS400X_EVENT_MEASUREMENT_NOT_COMPLETE is received in callback. Implements [rm_hs400x_api_t::read](#).

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | Successfully data decoded. |
| FSP_ERR_ASSERTION | Null pointer, or one or more configuration options is invalid. |
| FSP_ERR_TIMEOUT | communication is timeout. |
| FSP_ERR_ABORTED | communication is aborted. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_HS400X_DataCalculate()

```
fsp_err_t RM_HS400X_DataCalculate ( rm_hs400x_ctrl_t *const p_api_ctrl, rm_hs400x_raw_data_t *const p_raw_data, rm_hs400x_data_t *const p_hs400x_data )
```

Calculates temperature [Celsius] and humidity [RH] from ADC data. Implements [rm_hs400x_api_t::dataCalculate](#).

Return values

| | |
|-----------------------------|--|
| FSP_SUCCESS | Successfully data decoded. |
| FSP_ERR_ASSERTION | Null pointer, or one or more configuration options is invalid. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_SENSOR_INVALID_DATA | Data is invalid. |

5.2.16.6 OB1203 Light/Proximity/PPG Sensor (rm_ob1203)

Modules » Sensor

Functions

```
fsp_err_t RM_OB1203_Open (rm_ob1203_ctrl_t *const p_api_ctrl, rm_ob1203_cfg_t const *const p_cfg)
```

Opens and configures the OB1203 Middle module. Implements [rm_ob1203_api_t::open](#). [More...](#)

`fsp_err_t` [RM_OB1203_Close](#) ([rm_ob1203_ctrl_t](#) *const [p_api_ctrl](#))

Disables specified OB1203 control block. Implements [rm_ob1203_api_t::close](#). [More...](#)

`fsp_err_t` [RM_OB1203_MeasurementStart](#) ([rm_ob1203_ctrl_t](#) *const [p_api_ctrl](#))

Start measurement. Implements [rm_ob1203_api_t::measurementStart](#). [More...](#)

`fsp_err_t` [RM_OB1203_MeasurementStop](#) ([rm_ob1203_ctrl_t](#) *const [p_api_ctrl](#))

Stop measurement. If device interrupt is enabled, interrupt bits are cleared after measurement stop. If PPG mode, FIFO information is also reset after measurement stop. In RTOS and Light/Proximity/Light Proximity mode, if device interrupt is enabled, blocks 2 bytes on the I2C bus. In RTOS and PPG mode, if device interrupt is enabled, blocks 6 bytes on the I2C bus. If device interrupt is disabled, blocks 4 bytes on the I2C bus. Implements [rm_ob1203_api_t::measurementStop](#). [More...](#)

`fsp_err_t` [RM_OB1203_LightRead](#) ([rm_ob1203_ctrl_t](#) *const [p_api_ctrl](#),
[rm_ob1203_raw_data_t](#) *const [p_raw_data](#),
[rm_ob1203_light_data_type_t](#) type)

Reads Light ADC data from OB1203 device. If device interrupt is enabled, interrupt bits are cleared after data read. In RTOS and Light mode, if device interrupt is enabled, blocks 2 bytes on the I2C bus. Implements [rm_ob1203_api_t::lightRead](#). [More...](#)

`fsp_err_t` [RM_OB1203_LightDataCalculate](#) ([rm_ob1203_ctrl_t](#) *const [p_api_ctrl](#),
[rm_ob1203_raw_data_t](#) *const [p_raw_data](#), [rm_ob1203_light_data_t](#) *const [p_ob1203_data](#))

Calculate light data from raw data. Implements [rm_ob1203_api_t::lightDataCalculate](#). [More...](#)

`fsp_err_t` [RM_OB1203_ProxRead](#) ([rm_ob1203_ctrl_t](#) *const [p_api_ctrl](#),
[rm_ob1203_raw_data_t](#) *const [p_raw_data](#))

Reads Proximity ADC data from OB1203 device. If device interrupt is enabled, interrupt bits are cleared after data read. In RTOS and Proximity mode, if device interrupt is enabled, blocks 2 bytes on the I2C bus. Implements [rm_ob1203_api_t::proxRead](#). [More...](#)

`fsp_err_t RM_OB1203_ProxDDataCalculate (rm_ob1203_ctrl_t *const p_api_ctrl, rm_ob1203_raw_data_t *const p_raw_data, rm_ob1203_prox_data_t *const p_ob1203_data)`

Calculate proximity data from raw data. Implements `rm_ob1203_api_t::proxDataCalculate`. [More...](#)

`fsp_err_t RM_OB1203_PpgRead (rm_ob1203_ctrl_t *const p_api_ctrl, rm_ob1203_raw_data_t *const p_raw_data, uint8_t const number_of_samples)`

Reads PPG ADC data from OB1203 device. One sample requires three bytes. 0 cannot set to the number of samples. Implements `rm_ob1203_api_t::ppgRead`. [More...](#)

`fsp_err_t RM_OB1203_PpgDataCalculate (rm_ob1203_ctrl_t *const p_api_ctrl, rm_ob1203_raw_data_t *const p_raw_data, rm_ob1203_ppg_data_t *const p_ob1203_data)`

Calculate PPG data from raw data. Implements `rm_ob1203_api_t::ppgDataCalculate`. [More...](#)

`fsp_err_t RM_OB1203_GainSet (rm_ob1203_ctrl_t *const p_api_ctrl, rm_ob1203_gain_t const gain)`

Set gain. This function should be called after calling `RM_OB1203_MeasurementStop()`. In RTOS and Light Proximity mode, blocks 2 bytes on the I2C bus. Implements `rm_ob1203_api_t::gainSet`. [More...](#)

`fsp_err_t RM_OB1203_LedCurrentSet (rm_ob1203_ctrl_t *const p_api_ctrl, rm_ob1203_led_current_t const led_current)`

Set currents. This function should be called after calling `RM_OB1203_MeasurementStop()`. Implements `rm_ob1203_api_t::ledCurrentSet`. [More...](#)

`fsp_err_t RM_OB1203_DeviceInterruptCfgSet (rm_ob1203_ctrl_t *const p_api_ctrl, rm_ob1203_device_interrupt_cfg_t const interrupt_cfg)`

Set device interrupt configurations. This function should be called after calling `RM_OB1203_MeasurementStop()`. Implements `rm_ob1203_api_t::deviceInterruptCfgSet`. [More...](#)

`fsp_err_t RM_OB1203_FifoInfoGet (rm_ob1203_ctrl_t *const p_api_ctrl, rm_ob1203_fifo_info_t *const p_fifo_info)`

Get FIFO information from OB1203 device. Implements `rm_ob1203_api_t::fifoInfoGet`. [More...](#)

```
fsp_err_t RM_OB1203_DeviceStatusGet (rm_ob1203_ctrl_t *const p_api_ctrl,
rm_ob1203_device_status_t *const p_status)
```

Get device status from OB1203 device. Clear all interrupt bits.
Implements `rm_ob1203_api_t::deviceStatusGet`. [More...](#)

Detailed Description

Middleware to implement the OB1203 sensor interface. This module implements the [OB1203 Middleware Interface](#).

Overview

This module provides APIs for configuring and controlling the OB1203 sensor operation modes. Supported OB1203 sensor operation modes are below.

- Light mode
- Proximity mode
- Light Proximity mode
- PPG mode

Features

The OB1203 sensor interface implementation has the following key features:

- Initialize the sensor for measurement
- Start and stop a measurement at any time
- Get the ADC data from the sensor
- Calculate the Light/Proximity/PPG values.
- Software reset

Configuration

Build Time Configurations for rm_ob1203

The following build time configurations are defined in `fsp_cfg/rm_ob1203_cfg.h`:

| Configuration | Options | Default | Description |
|--------------------|--|---------------|---|
| Parameter Checking | <ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

Configurations for Sensor > OB1203 Light/Proximity/PPG Sensor (rm_ob1203)

This module can be added to the Stacks tab via New Stack > Sensor > OB1203 Light/Proximity/PPG Sensor (rm_ob1203).

| Configuration | Options | Default | Description |
|---------------|--------------|------------------|--------------|
| Name | Manual Entry | g_ob1203_sensor0 | Module name. |

| | | | |
|-------------------------------|--------------------------------------|---------------------------|---|
| Semaphore Timeout (RTOS only) | Value must be a non-negative integer | 0xFFFFFFFF | Set timeout for blocking in using RTOS. |
| Comms I2C Callback | Name must be a valid C symbol | ob1203_comms_i2c_callback | A user COMMS I2C callback function can be provided. |
| IRQ Callback | Name must be a valid C symbol | ob1203_irq_callback | A user IRQ callback function can be provided. |

Configurations for Sensor > OB1203 Light mode (rm_ob1203)

| Configuration | Options | Default | Description |
|--|---|---|---|
| Operation Mode | <ul style="list-style-type: none"> LS mode CS mode | LS mode | Set operation mode. |
| Interrupt Type | <ul style="list-style-type: none"> Threshold Variation | Threshold | Set interrupt type. |
| Interrupt Source | <ul style="list-style-type: none"> Clear channel Green channel Red channel (CS mode only) Blue channel (CS mode only) | Clear channel | Set interrupt source. |
| The Number of Similar Consecutive Interrupt Events | Value must be a non-negative integer | 0x02 | The number of similar consecutive Light mode interrupt events that must occur before the interrupt is asserted (4bits). Min = 0x0 and Max = 0xF |
| Sleep after Interrupt | <ul style="list-style-type: none"> Enabled Disabled | Disabled | Set sleep after interrupt. |
| Gain | <ul style="list-style-type: none"> 1 3 6 | 3 | Set gain for detection range. |
| Resolution and Measurement Period | Refer to the RA Configuration tool for available options. | Resolution:18bit. Measurement Period:100ms | Set resolution and measurement period. |
| Upper Threshold | Value must be a non-negative integer | 0x00CCC | Set upper threshold value (20bits). Min = 0x00000 and Max = 0xFFFFF. |
| Lower Threshold | Value must be a non-negative integer | 0x00000 | Set lower threshold value (20bits). Min = 0x00000 and Max = 0xFFFFF. |
| Variance Threshold | <ul style="list-style-type: none"> +/- 8 counts +/- 16 counts +/- 32 counts | +/- 128 counts | Set variance threshold. New data varies by selected counts |

- +/- 64 counts
 - +/- 128 counts
 - +/- 256 counts
 - +/- 512 counts
 - +/- 1024 counts
- compared to previous result.

Configurations for Sensor > OB1203 Proximity mode (rm_ob1203)

| Configuration | Options | Default | Description |
|--|---|---|---|
| Interrupt Type | <ul style="list-style-type: none"> • Normal • Logic | Normal | Set interrupt type. |
| The Number of Similar Consecutive Interrupt Events | Value must be a non-negative integer | 0x02 | The number of similar consecutive Proximity mode interrupt events that must occur before the interrupt is asserted (4bits). Min = 0x0 and Max = 0xF |
| Sleep after Interrupt | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | Set sleep after interrupt. |
| Gain | <ul style="list-style-type: none"> • 1 • 1.5 • 2 • 4 | 1 | Set gain of ADC output and noise. |
| LED Current | Value must be a non-negative integer | 0x100 | Set Current for LED (10bits). Min = 0x000 and Max = 0x3FF |
| LED Order | <ul style="list-style-type: none"> • IR LED first, Red LED second • Red LED first, IR LED second | IR LED first, Red LED second | Set LED order. |
| LED Analog Cancellation | <ul style="list-style-type: none"> • Enabled (50% offset of the full-scale value) • Disabled | Disabled | Set analog cancellation level. |
| LED Digital Cancellation | Value must be a non-negative integer | 0x100 | Set digital cancellation level (16bits). Min = 0x0000 and Max = 0xFFFF |

Pin Configuration

This module uses I2C Master, SCI I2C and IRQ drivers. Therefore, this module uses SDA and SCL pins of I2C Master and SCI I2C and an IRQ pin.

Usage Notes

[OB1203 datasheet is here.](#)

The OB1203 has four operation modes.

Light mode

Light mode has two operation modes.

| | | | | | |
|--|--|--|--|--|--|
| | | | | | |
|--|--|--|--|--|--|

| Operation mode | Red | Green | Blue | Clear | Comp *1 |
|----------------|-----|-------|------|-------|---------|
| LS mode | | ✓ | | ✓ | ✓ |
| CS mode | ✓ | ✓ | ✓ | ✓ | ✓ |

*1 : Temperature compensation data

Light mode features are below.

- High lux accuracy over different light sources
- Absolute sensitivity: 0.06 lux to > 150000 lux
- Output resolution: 13 to 20 bits
- Three LS/CS gain modes: x1 to x6
- Highly linear output, 50Hz/60Hz light and fluorescent light flicker immunity
- Four parallel channels (red, green, blue, clear)
- Accurate Correlated Color Temperature (CCT)
- Accurate CIE 1931 XYZ (RGB) color measurement
- Very stable spectral response over angle of light incidence

Proximity mode

Proximity mode features are below.

- Integrated and trimmed LED source, driver, and photodetector
- Programmable pulsed LED up to 250mA output current
- High resolution (12 to 16 bits)
- Object movement detection (in/out)
- Ambient light suppression > 100klx sun light
- Crosstalk cancelation (analog and digital)

PPG mode

PPG mode has two operation modes.

| Operation mode | Discription |
|----------------|--|
| PPG1 mode | Only one LED is used. This mode allows determination of parameters related to heart rate with an appropriate algorithm |
| PPG2 mode | Two LED are used. Second LED is used as a transmitter. This mode supports further analysis, such as SpO2 and respiration rate determination. |

PPG mode features are below.

- SpO2 measurement behind visibly dark, IR transmissive ink
- Industry's smallest optical biosensor module
- Fully integrated and trimmed module, including two LEDs, 250mA maximum drive current, and photodetectors
- Output resolution PPG: 16 to 18 bits
- Data stored in 18-bit wide, 32-sample FIFO memory

- Integrated averaging function for higher signal-to-noise ratio(SNR) and data rate reduction
- Programmable measurement rate: up to 3200 samples per second
- High SNR

Light Proximity mode

Light mode and Proximity mode can be used in parallel.

Bus Initialization

The OB1203 interface expects a bus instance to be opened before opening any OB1203 device. The interface will handle switching between devices on the bus but will not open or close the bus instance. The user should open the bus with the appropriate [I2C Master Interface](#) open call.

If an RTOS is used, blocking and bus lock for I2C bus are available.

- If blocking of an I2C bus is required, it is necessary to create a semaphore for blocking.
- If bus lock is required, it is necessary to create a mutex for bus lock. Bus lock is only available when a semaphore for blocking is used.

Initialization

Initialize with [RM_OB1203_Open\(\)](#).

From measurement start to data acquisition

After normal completion, start the measurement with [RM_OB1203_MeasurementStart\(\)](#).

Light mode

If IRQ is enabled

1. Wait until `RM_OB1203_EVENT_THRESHOLD_CROSSED` is received via IRQ callback.
2. Call [RM_OB1203_LightRead\(\)](#). This function will read the ADC data and clear the interrupt bits.
3. Wait until `RM_OB1203_EVENT_SUCCESS` is received.
4. Call [RM_OB1203_LightDataCalculate\(\)](#). This function will calculate light data from the ADC data.

If IRQ is disabled

1. Wait for measurement period configured.
2. Call [RM_OB1203_LightRead\(\)](#). This function will read the ADC data.
3. Wait until `RM_OB1203_EVENT_SUCCESS` is received.
4. Call [RM_OB1203_LightDataCalculate\(\)](#). This function will calculate light data from the ADC data.

Proximity mode

If IRQ is enabled

1. Wait until `RM_OB1203_EVENT_THRESHOLD_CROSSED` or `RM_OB1203_EVENT_OBJECT_NEAR` is received via IRQ callback.
2. Call [RM_OB1203_ProxRead\(\)](#). This function will read the ADC data and clear the interrupt bits.

3. Wait until `RM_OB1203_EVENT_SUCCESS` is received.
4. Call `RM_OB1203_ProxDataCalculate()`. This function will calculate proximity data from the ADC data.

If IRQ is disabled

1. Wait for measurement period configured.
2. Call `RM_OB1203_ProxRead()`. This function will read the ADC data.
3. Wait until `RM_OB1203_EVENT_SUCCESS` is received.
4. Call `RM_OB1203_ProxDataCalculate()`. This function will calculate proximity data from the ADC data.

PPG mode

If IRQ is enabled

1. Wait until `RM_OB1203_EVENT_MEASUREMENT_COMPLETE` is received via IRQ callback.
2. Call `RM_OB1203_PpgRead()`. This function will read the ADC data and clear the interrupt bits. In PPG2 mode, the number of read FIFO samples must be even value because two samples is one pair.
3. Wait until `RM_OB1203_EVENT_SUCCESS` is received.
4. Call `RM_OB1203_PpgDataCalculate()`. This function will calculate PPG data from the ADC data.

If IRQ is disabled

1. Wait for measurement period configured.
2. Call `RM_OB1203_PpgRead()`. This function will read the ADC data. In PPG2 mode, the number of read FIFO samples must be even value because two samples is one pair.
3. Wait until `RM_OB1203_EVENT_SUCCESS` is received.
4. Call `RM_OB1203_PpgDataCalculate()`. This function will calculate PPG data from the ADC data.

Light Proximity mode

Combination of the above Light mode and Proximity mode.

Getting device status

Call `RM_OB1203_DeviceStatusGet()`. This function will get device status over I2C.

- If `power_on_reset_occur` is true, the part has had a power-up event, either because the part was turned on or because there was a power-supply voltage disturbance.
- If `light_interrupt_occur` is true, Light mode interrupt condition has occurred.
- If `light_measurement_complete` is true, Light mode measurement is complete.
- If `ts_measurement_complete` is true, TS measurement is complete.
- If `fifo_afull_interrupt_occur` is true, FIFO almost full interrupt condition has occurred.
- If `ppg_measurement_complete` is true, PPG mode measurement is complete.
- If `object_near` is true, an object is near.
- If `prox_interrupt_occur` is true, Proximity mode interrupt condition has occurred.
- If `prox_measurement_complete` is true, Proximity mode measurement is complete.

Clearing interrupt bits

If interrupt bits are needed to clear without calling `RM_OB1203_LightRead()`, `RM_OB1203_ProxRead()`

, [RM_OB1203_PpgRead\(\)](#) and [RM_OB1203_MeasurementStop\(\)](#), please call [RM_OB1203_DeviceStatusGet\(\)](#). Interrupt bits are reset by STATUS_0 and STATUS_1 registers read.

Sleep after interrupt

Sleep after interrupt is valid in Light mode and Proximity mode. If a sleep after interrupt bit are set, a measurement will be stopped after an interrupt occurs. After STATUS_0 and STATUS_1 registers are read, a measurement will be started. please call [RM_OB1203_DeviceStatusGet\(\)](#).

PPG FIFO

PPG FIFO data is stored in 18-bit wide, 32-sample FIFO memory.

The FIFO almost full interrupt is triggered when a certain number of free FIFO registers are remaining.

If FIFO informations (write index, read index, overflow counter, unread_samples) are got, Call [RM_OB1203_FifoInfoGet\(\)](#).

- write_index is the FIFO index where the next sample of PPG data will be written in the FIFO.
- read_index is the index of the next sample to be read from the FIFO_DATA register.
- overflow_counter is the number of old samples (up to 15) which are overwritten by new data. If the FIFO Rollover is enabled, the FIFO overflow counter counts.
- unread_samples is the number of unread FIFO samples, which can be calculated by write index and read index.

Reconfiguration

The interface supports the following APIs for reconfiguration.

| API | Discription |
|---|---|
| RM_OB1203_GainSet() | Set gain |
| RM_OB1203_LedCurrentSet() | Set LED currents. Proximity mode and Light Proximity mode: LED Current is 10bits. Min = 0x000 and Max = 0x3FF PPG mode: IR/Red LED currents are 10bits/9bits. Min = 0x000/0x000 and Max = 0x3FF/0x1FF |
| RM_OB1203_DeviceInterruptCfgSet() | Set interrupt configurations. |

Relationship between APIs and registers

The relationship between APIs and registers accessed by the API is below.

| API | Registers |
|--|---|
| RM_OB1203_MeasurementStart() | MAIN_CTRL_0 and MAIN_CTRL_1 |
| RM_OB1203_MeasurementStop() | MAIN_CTRL_0, MAIN_CTRL_1, STATUS_0, STATUS_1, FIFO_WR_PTR, FIFO_RD_PTR and FIFO_OVF_CNT |
| RM_OB1203_LightRead() | LS_CLEAR_DATA, LS_GREEN_DATA, LS_BULE_DATA, LS_RED_DATA, COMP_DATA, STATUS_0 and STATUS_1 |
| RM_OB1203_ProxRead() | PS_DATA, STATUS_0 and STATUS_1 |

| | |
|---|---|
| RM_OB1203_PpgRead() | FIFO_DATA |
| RM_OB1203_DeviceStatusGet() | STATUS_0 and STATUS_1 |
| RM_OB1203_GainSet() | LS_GAIN and PPG_PS_GAIN |
| RM_OB1203_LedCurrentSet() | PS_LED_CURR, PPG_IRLED_CURR and PPG_RLED_CURR |
| RM_OB1203_DeviceInterruptCfgSet() | INT_CFG_0, INT_CFG_1 and INT_PST |
| RM_OB1203_FifoInfoGet() | FIFO_WR_PTR, FIFO_RD_PTR and FIFO_OVF_CNT |

Notifications

The application note [R01AN6311] using this module has an algorithm for biometric data calculation. The algorithm has the constraint of sampling rate (default: 100 samples per second). Please refer to the application note [R36AN0001EU] and OB1203 sensor page

(<https://www.renesas.com/jp/en/products/sensor-products/biosensors/ob1203-heart-rate-blood-oxygen-concentration-pulse-oximetry-proximity-light-and-color-sensor>)

R01AN6311 : <https://www.renesas.com/document/apn/ob1203-sample-application-sample-code>

R36AN0001EU : <https://www.renesas.com/document/apn/ob1203-pulse-oximeter-algorithm-spo2-heart-rate-and-respiration-rate>

If multiple operation modes is used with a single OB1203 sensor device, rm_ob1203 modules need to be used while switching between operation modes because modules cannot work in parallel.

Therefore, a current rm_ob1203 module must be closed with [RM_OB1203_Close\(\)](#) before another rm_ob1203 module is opened with [RM_OB1203_Open\(\)](#).

Examples

Basic Example

These are basic examples of minimal use of OB1203 sensor implementation in an application.

Light mode
