Detailed Description

Driver for the Renesas Secure IP on RA MPUs. This module implements the RSIP Interface.

Overview

This module provides RSIP functions in protected mode.

HW Overview

Crypto Peripheral version	Devices
RSIP-E11A	RA4L1
RSIP-E51A	RA8M1, RA8D1, RA8T1

Features

The RSIP module supports for the following features.

- Cryptography
  - Symmetric Encryption/Decryption
    - AES
      - ECB 128/192/256bit

- CBC 128/192/256bit
- CTR 128/192/256bit
- GCM 128/192/256bit
- CCM 128/192/256bit
- XTS 128/256bit

- Asymmetric Encryption/Decryption
  - RSA
    - RSAES-PKCS1-V1_5 2048/3072/4096bit
    - RSAES-OAEP 2048/3072/4096bit
    - RSASSA-PKCS1-V1_5 2048/3072/4096bit
    - RSASSA-PSS 2048/3072/4096bit
  - ECC
    - ECDSA
      - secp256r1/secp384r1/secp521r1
      - secp256k1
      - brainpool P256r1/P384r1/P512r1
    - ECDH
      - secp256r1/secp384r1/secp521r1
- Hash Functions
  - SHA-2
    - SHA-224, 256, 384, 512, 512/224, 512/256
- RFC3394 Key Wrap/Unwrap

- Message Authentication Code
  - HMAC-SHA224/256/384/512bit
  - AES-CMAC 128/192/256bit
- Key Manage
  - Key Support
    - AES 128/192/256bit
    - RSA 2048/3072/4096bit
    - ECC
      - secp256r1/secp384r1/secp521r1
      - secp256k1
      - brainpool P256r1/P384r1/P512r1
    - HMAC-SHA224/256/384/512bit
- Random Number Generate

Supported algorithms

The following algorithms are available on each devices.

- RSIP-E11A: RA4L1
- RSIP-E51A: RA8M1, RA8D1, RA8T1

Symmetric Key

Key type (rsip_key_type_t)	RSIP-E11A	RSIP-E51A
RSIP_KEY_TYPE_AES_128	Supported	Supported
RSIP_KEY_TYPE_AES_192	Not Supported	Supported
RSIP_KEY_TYPE_AES_256	Supported	Supported
RSIP_KEY_TYPE_XTS_AES_128	Not Supported	Supported
RSIP_KEY_TYPE_XTS_AES_256	Not Supported	Supported

RSIP_KEY_TYPE_HMAC_SHA224	Supported	Supported
RSIP_KEY_TYPE_HMAC_SHA256	Supported	Supported
RSIP_KEY_TYPE_HMAC_SHA384	Not Supported	Supported
RSIP_KEY_TYPE_HMAC_SHA512	Not Supported	Supported

Asymmetric Key

Key pair type (rsip_key_pair_type_t)	Public key type (rsip_key_type_t)	Private key type (rsip_key_type_t)	RSIP-E11A	RSIP-E51A
RSIP_KEY_PAIR_TYPE_ECC_SECP256R1	RSIP_KEY_TYPE_ECC_SECP256R1_PUBLIC	RSIP_KEY_TYPE_ECC_SECP256R1_PRIVATE	Supported	Supported
RSIP_KEY_PAIR_TYPE_ECC_SECP384R1	RSIP_KEY_TYPE_ECC_SECP384R1_PUBLIC	RSIP_KEY_TYPE_ECC_SECP384R1_PRIVATE	Not Supported	Supported
RSIP_KEY_PAIR_TYPE_ECC_SECP521R1	RSIP_KEY_TYPE_ECC_SECP521R1_PUBLIC	RSIP_KEY_TYPE_ECC_SECP521R1_PRIVATE	Not Supported	Supported
RSIP_KEY_PAIR_TYPE_ECC_SECP256K1	RSIP_KEY_TYPE_ECC_SECP256K1_PUBLIC	RSIP_KEY_TYPE_ECC_SECP256K1_PRIVATE	Not Supported	Supported
RSIP_KEY_PAIR_TYPE_ECC_BRAINPOOLP256R1	RSIP_KEY_TYPE_ECC_BRAINPOOLP256R1_PUBLIC	RSIP_KEY_TYPE_ECC_BRAINPOOLP256R1_PRIVATE	Not Supported	Supported
RSIP_KEY_PAIR_TYPE_ECC_BRAINPOOLP384R1	RSIP_KEY_TYPE_ECC_BRAINPOOLP384R1_PUBLIC	RSIP_KEY_TYPE_ECC_BRAINPOOLP384R1_PRIVATE	Not Supported	Supported

RSIP_HASH_TYPE_SHA384	Not Supported	Supported
RSIP_HASH_TYPE_SHA512	Not Supported	Supported
RSIP_HASH_TYPE_SHA512_224	Not Supported	Supported
RSIP_HASH_TYPE_SHA512_256	Not Supported	Supported

Configuration

Build Time Configurations for r_rsip_e51a_protected

The following build time configurations are defined in fsp_cfg/r_rsip_cfg.h:

Configuration	Options	Default	Description

Selection of algorithms to enable			
AES-128	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
AES-192	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
AES-256	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
AES-ECB CBC CTR	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
XTS-AES-128	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This

			configuration is provided only for the functions for which it works effectively.
XTS-AES-256	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
XTS-AES	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
AES-GCM	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
AES-CCM	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
AES-CMAC	Enabled	Enabled	If the application uses only some of the algorithm in the function, the code size

			can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC SECP256R1	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC SECP384R1	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC SECP521R1	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC SECP256K1	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC	• Enabled	Enabled	If the application uses

BRAINPOOLP256R1	• Disabled		only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC BRAINPOOLP384R1	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC BRAINPOOLP512R1	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
RSA-2048	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
RSA-3072	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the

			functions for which it works effectively.
RSA-4096	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA-1	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA-224	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA-256	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA-384	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused

			algorithms. This configuration is provided only for the functions for which it works effectively.
SHA-512	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA-512_224	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA-512_256	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
HMAC_SHA1	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
HMAC_SHA224	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the

			function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
HMAC_SHA256	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
HMAC_SHA384	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
HMAC_SHA512	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Build Time Configurations for r_rsip_e11a_protected

The following build time configurations are defined in fsp_cfg/r_rsip_cfg.h:

Configuration	Options	Default	Description
Selection of algorithms to enable			

AES-128	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
AES-192	Disabled	config.driver.rsip.algorithms_enable.aes192.disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
AES-256	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
AES-ECB CBC CTR	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
XTS-AES-128	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is

			provided only for the functions for which it works effectively.
XTS-AES-256	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
XTS-AES	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
AES-GCM	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
AES-CCM	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
AES-CMAC	Enabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by

			disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC SECP256R1	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC SECP384R1	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC SECP521R1	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC SECP256K1	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC BRAINPOOLP256R1	Disabled	Disabled	If the application uses only some of the

			algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC BRAINPOOLP384R1	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC BRAINPOOLP512R1	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
RSA-2048	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.

HMAC_SHA224	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size

			can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
HMAC_SHA256	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
HMAC_SHA384	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
HMAC_SHA512	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Security > RSIP Protected Mode (r_rsip_protected)

This module can be added to the Stacks tab via New Stack > Security > RSIP Protected Mode (r_rsip_protected).

Configuration	Options	Default	Description
General			

Name	Name must be a valid C symbol	g_rsip	Module name.

Clock Configuration

This module does not require a specific clock configuration.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Getting Started: Creating a RSIP Protected Mode Project

Start by creating a new project in e² studio or RASC. On the Stacks tab, add New > Security > RSIP Protected Mode (r_rsip_protected).

State Transition

This driver has the following states.

State Name	Details
STATE_INITIAL	Driver is not open.
STATE_MAIN	Ready to Compute.
STATE_AES	Computing AES (unauthenticated cipher)
STATE_AES_AEAD	Computing AES (AEAD).
STATE_AES_MAC	Computing AES (MAC).
STATE_SHA	Computing SHA.
STATE_HMAC	Computing HMAC.
STATE_KDF_HMAC	Computing KDF HMAC.

There are two types of APIs provided by the RSIP driver for accelerating cryptographic operations: those that provide cryptographic operations in a single API and those that provide them in multiple APIs. In this document, the former is referred to as single-part operations and the latter as multi-part operations. Each corresponds to the following algorithms:

- Single-part operations: DRBG, Key management, ECC, RSA, SHA, HMAC
- Multi-part operations: AES, SHA, HMAC

Multi-part operations are APIs which split a single cryptographic operation into a sequence of separate steps (e.g. Init-Update-Finish). This enables fine control over the configuration of the cryptographic operation, and allows the message data to be processed in fragments instead of all at once.

Due to the above characteristics, it is necessary to manage the operational states in the multi-part operations.

Examples

AES cipher Example

This is an example of AES-CBC encryption/decryption.

```
void r_rsip_example_aes ()
{
 fsp_err_t            err;
 static const uint8_t plain[RSIP_PRV_BYTE_SIZE_AES_BLOCK * 2] BSP_ALIGN_VARIABLE(4) =
    {
       0x52, 0x65, 0x6e, 0x65, 0x73, 0x61, 0x73, 0x20, 0x45, 0x6c, 0x65, 0x63, 0x74,
0x72, 0x6f, 0x6e,
       0x69, 0x63, 0x73, 0x20, 0x43, 0x6f, 0x72, 0x70, 0x6f, 0x72, 0x61, 0x74, 0x69,
0x6f, 0x6e, 0x00
    };
    uint8_t iv[RSIP_PRV_BYTE_SIZE_AES_BLOCK] BSP_ALIGN_VARIABLE(4) = {0};
    uint8_t cipher_calculated[RSIP_PRV_BYTE_SIZE_AES_BLOCK * 2] BSP_ALIGN_VARIABLE(4)
= {0};
    uint8_t plain_calculated[RSIP_PRV_BYTE_SIZE_AES_BLOCK * 2] BSP_ALIGN_VARIABLE(4)
= {0};
 /* Prepare wrapped key data area */
    uint8_t              wrapped_key[RSIP_BYTE_SIZE_WRAPPED_KEY_AES_256]
BSP_ALIGN_VARIABLE(4);
 rsip_wrapped_key_t * p_wrapped_key = (rsip_wrapped_key_t *) wrapped_key;
 /* Initialize the driver */
    err = R_RSIP_Open(&g_rsip_ctrl, &g_rsip_cfg);
    assert(FSP_SUCCESS == err);
 /* Generate a aes 256-bit key */
    err = R_RSIP_KeyGenerate(&g_rsip_ctrl, RSIP_KEY_TYPE_AES_256, p_wrapped_key);
    assert(FSP_SUCCESS == err);
 /* Generate a nonce */
    err = R_RSIP_RandomNumberGenerate(&g_rsip_ctrl, iv);
    assert(FSP_SUCCESS == err);
 /* Encrypt a plaintext */
    err = R_RSIP_AES_Cipher_Init(&g_rsip_ctrl, RSIP_AES_CIPHER_MODE_CBC_ENC,
```

```
p_wrapped_key, iv);
    assert(FSP_SUCCESS == err);
    err = R_RSIP_AES_Cipher_Update(&g_rsip_ctrl, plain, cipher_calculated,
RSIP_PRV_BYTE_SIZE_AES_BLOCK * 2);
    assert(FSP_SUCCESS == err);
    err = R_RSIP_AES_Cipher_Finish(&g_rsip_ctrl);
    assert(FSP_SUCCESS == err);
 /* Decrypt a ciphertext using the same key */
    err = R_RSIP_AES_Cipher_Init(&g_rsip_ctrl, RSIP_AES_CIPHER_MODE_CBC_DEC,
p_wrapped_key, iv);
    assert(FSP_SUCCESS == err);
    err = R_RSIP_AES_Cipher_Update(&g_rsip_ctrl, cipher_calculated, plain_calculated,
RSIP_PRV_BYTE_SIZE_AES_BLOCK);
    assert(FSP_SUCCESS == err);
    err = R_RSIP_AES_Cipher_Update(&g_rsip_ctrl,
                                   cipher_calculated + RSIP_PRV_BYTE_SIZE_AES_BLOCK,
                                   plain_calculated + RSIP_PRV_BYTE_SIZE_AES_BLOCK,
                                   RSIP_PRV_BYTE_SIZE_AES_BLOCK);
    assert(FSP_SUCCESS == err);
    err = R_RSIP_AES_Cipher_Finish(&g_rsip_ctrl);
    assert(FSP_SUCCESS == err);
 /* Compare plain and plain_calculated */
    assert(0 == memcmp(plain, plain_calculated, RSIP_PRV_BYTE_SIZE_AES_BLOCK * 2));
 /* Close the driver */
    err = R_RSIP_Close(&g_rsip_ctrl);
    assert(FSP_SUCCESS == err);
}
```

AES-GCM Example

This is an example of AES-GCM encryption/decryption.

```
#define GCM_BLOCK_LEN (16)
#define GCM_TEXT_LEN (31)
#define GCM_NONCE_LEN (12)
```

```
#define GCM_AAD_LEN (8)
#define GCM_TAG_LEN (8)

```

```
    assert(FSP_SUCCESS == err);
}
```

AES-CMAC Example

This is an example of AES-CMAC signature/verification.

```
#define CMAC_MESSAGE_LEN (10)
#define CMAC_MAC_LEN (16)
void r_rsip_example_cmac ()
{
 fsp_err_t err;
 static const uint8_t message[CMAC_MESSAGE_LEN] BSP_ALIGN_VARIABLE(4) = {0xf0, 0x8f,
0x89, 0x08, 0x75, 0xe1, 0x39, 0x48, 0x04, 0x89};
    uint8_t mac[CMAC_MAC_LEN] BSP_ALIGN_VARIABLE(4) = {0};
 /* Prepare wrapped key data area */
    uint8_t             wrapped_key[RSIP_BYTE_SIZE_WRAPPED_KEY_AES_256]
BSP_ALIGN_VARIABLE(4);
 rsip_wrapped_key_t * p_wrapped_key = (rsip_wrapped_key_t *) wrapped_key;
 /* Initialize the driver */
    err = R_RSIP_Open(&g_rsip_ctrl, &g_rsip_cfg);
    assert(FSP_SUCCESS == err);
 /* Generate a aes 256-bit key */
    err = R_RSIP_KeyGenerate(&g_rsip_ctrl, RSIP_KEY_TYPE_AES_256, p_wrapped_key);
    assert(FSP_SUCCESS == err);
 /* CMAC initialize for encrypt */
    err = R_RSIP_AES_MAC_Init(&g_rsip_ctrl, RSIP_AES_MAC_MODE_CMAC, p_wrapped_key);
    assert(FSP_SUCCESS == err);
 /* Input message */
    err = R_RSIP_AES_MAC_Update(&g_rsip_ctrl, message, CMAC_MESSAGE_LEN);
    assert(FSP_SUCCESS == err);
 /* Output remaining text and generate a tag */
    err = R_RSIP_AES_MAC_SignFinish(&g_rsip_ctrl, mac);
    assert(FSP_SUCCESS == err);
 /* CMAC initialize for decrypt */
```

```
    err = R_RSIP_AES_MAC_Init(&g_rsip_ctrl, RSIP_AES_MAC_MODE_CMAC, p_wrapped_key);
    assert(FSP_SUCCESS == err);
 /* Input message */
    err = R_RSIP_AES_MAC_Update(&g_rsip_ctrl, message, CMAC_MESSAGE_LEN);
    assert(FSP_SUCCESS == err);
 /* Verify the tag */
    err = R_RSIP_AES_MAC_VerifyFinish(&g_rsip_ctrl, mac, CMAC_MAC_LEN);
    assert(FSP_SUCCESS == err);
 /* Close the driver */
    err = R_RSIP_Close(&g_rsip_ctrl);
    assert(FSP_SUCCESS == err);
}
```

ECC Example

This is an example of ECDSA signature generation/verification.

```
#define SECP256R1_KEY_SIZE (32)
void r_rsip_example_ecc ()
{
 fsp_err_t err;
 static const uint8_t message[] BSP_ALIGN_VARIABLE(4) = "sample";
    uint8_t hash[SECP256R1_KEY_SIZE] BSP_ALIGN_VARIABLE(4)          = {0};
    uint8_t signature[SECP256R1_KEY_SIZE * 2] BSP_ALIGN_VARIABLE(4) = {0};
 /* Prepare wrapped key data area */
    uint8_t
wrapped_public_key[RSIP_BYTE_SIZE_WRAPPED_KEY_ECC_SECP256R1_PUBLIC]
BSP_ALIGN_VARIABLE(4);
    uint8_t
wrapped_private_key[RSIP_BYTE_SIZE_WRAPPED_KEY_ECC_SECP256R1_PRIVATE]
BSP_ALIGN_VARIABLE(4);
 rsip_wrapped_key_t * p_wrapped_public_key = (rsip_wrapped_key_t *)
wrapped_public_key;
 rsip_wrapped_key_t * p_wrapped_private_key = (rsip_wrapped_key_t *)
wrapped_private_key;
```

```
 /* Initialize the driver */
    err = R_RSIP_Open(&g_rsip_ctrl, &g_rsip_cfg);
    assert(FSP_SUCCESS == err);
 /* Generate a key pair of secp256r1 */
    err = R_RSIP_KeyPairGenerate(&g_rsip_ctrl,
 RSIP_KEY_PAIR_TYPE_ECC_SECP256R1,
                                 p_wrapped_public_key,
                                 p_wrapped_private_key);
    assert(FSP_SUCCESS == err);
 /* Generate the message hash */
    err = R_RSIP_SHA_Compute(&g_rsip_ctrl, RSIP_HASH_TYPE_SHA256, message,
sizeof(message), hash);
    assert(FSP_SUCCESS == err);
 /* Generate the signature */
    err = R_RSIP_ECDSA_Sign(&g_rsip_ctrl, p_wrapped_private_key, hash, signature);
    assert(FSP_SUCCESS == err);
 /* Verify the signature*/
    err = R_RSIP_ECDSA_Verify(&g_rsip_ctrl, p_wrapped_public_key, hash, signature);
    assert(FSP_SUCCESS == err);
 /* Close the driver */
    err = R_RSIP_Close(&g_rsip_ctrl);
    assert(FSP_SUCCESS == err);
}
```

RSA Example

This is an example of RSA encryption/decryption (RSAES-OAEP) and RSA signature generation/verification (RSASSA-PSS).

```
#define SHA256_HASH_SIZE (32)
#define RSA_2048_KEY_SIZE (256)
void r_rsip_example_rsa ()
{
 fsp_err_t err;
 static const uint8_t message[] BSP_ALIGN_VARIABLE(4) = "sample";
```

```

    err = memcmp(hash_1, hash_2, HMAC_HASH_LEN);
    assert(FSP_SUCCESS == err);
}
```

Data Structures

struct	rsip_instance_ctrl_t

Data Structure Documentation

◆ rsip_instance_ctrl_t

struct rsip_instance_ctrl_t
RSIP private control block. DO NOT MODIFY. Initialization occurs when R_RSIP_Open() is called.

Function Documentation

◆ R_RSIP_Open()

fsp_err_t R_RSIP_Open (rsip_ctrl_t *const *p_ctrl*, rsip_cfg_t const *const *p_cfg*)

Enables use of Renesas Secure IP functionality.

Implements rsip_api_t::open.

State transition

This API can only be executed in **STATE_INITIAL**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_MAIN
Others	No change

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_ALREADY_OPEN	Module is already open.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Internal key value is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Hardware initialization is failed.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption or hardware fault is detected.

Note

This version does not have an optional feature to disable TRNG initialization.

◆ R_RSIP_Close()

fsp_err_t R_RSIP_Close (rsip_ctrl_t *const *p_ctrl*)

Disables use of Renesas Secure IP functionality.

Implements rsip_api_t::close.

State transition

This API can be executed in **except STATE_INITIAL**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_INITIAL
Others	No change

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_RandomNumberGenerate()

fsp_err_t R_RSIP_RandomNumberGenerate (rsip_ctrl_t *const *p_ctrl*, uint8_t *const *p_random*)

Generates a 128-bit random number.

Implements rsip_api_t::randomNumberGenerate.

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_KeyGenerate()

fsp_err_t R_RSIP_KeyGenerate (rsip_ctrl_t *const *p_ctrl*, rsip_key_type_t const *key_type*, rsip_wrapped_key_t *const *p_wrapped_key*)

Generates a wrapped symmetric key from a random number. In this API, user key input is unnecessary. By encrypting data using the wrapped key is output by this API, dead copying of data can be prevented.

Implements rsip_api_t::keyGenerate.

Conditions

Argument key_type must be one of the following:

- RSIP_KEY_TYPE_AES_128, RSIP_KEY_TYPE_AES_256
- RSIP_KEY_TYPE_XTS_AES_128, RSIP_KEY_TYPE_XTS_AES_256
- RSIP_KEY_TYPE_HMAC_SHA224, RSIP_KEY_TYPE_HMAC_SHA256, RSIP_KEY_TYPE_HMAC_SHA384, RSIP_KEY_TYPE_HMAC_SHA512

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_KeyPairGenerate()

fsp_err_t R_RSIP_KeyPairGenerate (rsip_ctrl_t *const *p_ctrl*, rsip_key_pair_type_t const *key_pair_type*, rsip_wrapped_key_t *const *p_wrapped_public_key*, rsip_wrapped_key_t *const *p_wrapped_private_key*)

Generates a wrapped asymmetric key pair from a random number. In this API, user key input is unnecessary. By encrypting data using the wrapped key is output by this API, dead copying of data can be prevented.

Implements rsip_api_t::keyPairGenerate.

Conditions

Argument key_pair_type must be one of the following:

- RSIP_KEY_PAIR_TYPE_ECC_SECP256R1, RSIP_KEY_PAIR_TYPE_ECC_SECP384R1, RSIP_KEY_PAIR_TYPE_ECC_SECP521R1,
- RSIP_KEY_PAIR_TYPE_ECC_SECP256K1,
- RSIP_KEY_PAIR_TYPE_ECC_BRAINPOOLP256R1, RSIP_KEY_PAIR_TYPE_ECC_BRAINPOOLP384R1, RSIP_KEY_PAIR_TYPE_ECC_BRAINPOOLP512R1,
- RSIP_KEY_PAIR_TYPE_RSA_2048, RSIP_KEY_PAIR_TYPE_RSA_3072, RSIP_KEY_PAIR_TYPE_RSA_4096

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

Section Supported Algorithms.

◆ R_RSIP_EncryptedKeyWrap()

fsp_err_t R_RSIP_EncryptedKeyWrap (rsip_ctrl_t *const *p_ctrl*, rsip_key_update_key_t const *const *p_key_update_key*, uint8_t const *const *p_initial_vector*, rsip_key_type_t const *key_type*, uint8_t const *const *p_encrypted_key*, rsip_wrapped_key_t *const *p_wrapped_key*)

Decrypts an encrypted user key with Key Update Key (KUK) and wrap it with the Hardware Unique Key (HUK).

Implements rsip_api_t::encryptedKeyWrap.

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_RFC3394_KeyWrap()

fsp_err_t R_RSIP_RFC3394_KeyWrap (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_kek*, rsip_wrapped_key_t const *const *p_wrapped_target_key*, uint8_t *const *p_rfc3394_wrapped_target_key*)

This function provides Key Wrap algorithm compliant with RFC3394. Using p_wrapped_kek to wrap p_wrapped_target_key, and output the result to p_rfc3394_wrapped_target_key.
Implements rsip_api_t::rfc3394_KeyWrap.

<Usage Precautions>

- Argument "p_wrapped_kek" only supports the following key type.

Key Type of p_wrapped_kek	Corresponding Parameter
AES-128	RSIP_KEY_TYPE_AES_128

AES-256	RSIP_KEY_TYPE_AES_256

- Argument "p_wrapped_target_key" only supports the following key type.

Key Type of p_wrapped_target_key	Corresponding Parameter
AES-128	RSIP_KEY_TYPE_AES_128
AES-256	RSIP_KEY_TYPE_AES_256

<Operational State>
This API can only be executed in the STATE_MAIN, and there are no state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_INVALID_ARGUMENT	Input key type or mode is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

This function provides Key Wrap algorithm compliant with RFC3394. Using p_wrapped_kek to wrap p_wrapped_target_key, and output the result to p_rfc3394_wrapped_target_key.
Implements rsip_api_t::rfc3394_KeyWrap.

<Usage Precautions>

- Argument "p_wrapped_kek" only supports the following key type.

Key Type of p_wrapp	Correspon ding

ed_kek	Parameter
AES-128	RSIP_KEY_TYPE_AES_128
AES-256	RSIP_KEY_TYPE_AES_256

- Argument "p_wrapped_target_key" only supports the following key type.

Key Type of p_wrapped_target_key	Corresponding Parameter
AES-128	RSIP_KEY_TYPE_AES_128
AES-256	RSIP_KEY_TYPE_AES_256

<Operational State>
This API can only be executed in the STATE_MAIN, and there are no state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_INVALID_ARGUMENT	Input key type or mode is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_RFC3394_KeyUnwrap()

fsp_err_t R_RSIP_RFC3394_KeyUnwrap (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_kek*, rsip_key_type_t const *key_type*, uint8_t const *const *p_rfc3394_wrapped_target_key*, rsip_wrapped_key_t *const *p_wrapped_target_key*)

This function provides Key Unwrap algorithm compliant with RFC3394. Using p_wrapped_kek to unwrap p_rfc3394_wrapped_target_key, and output the result to p_wrapped_target_key.
Implements rsip_api_t::rfc3394_KeyUnwrap.

<Usage Precautions>

- Argument "p_wrapped_kek" only supports the following key type.

Key Type of p_wrapped_kek	Corresponding Parameter
AES-128	RSIP_KEY_TYPE_AES_128
AES-256	RSIP_KEY_TYPE_AES_256

- Argument "key_type" represents the key type of p_rfc3394_wrapped_target_key, and only supports the following key type.

Key Type of p_rfc3394_wrapped_target_key	Corresponding Parameter
AES-128	RSIP_KEY_TYPE_AES_128
AES-256	RSIP_KEY_TYPE_AES_256

<Operational State>
This API can only be executed in the STATE_MAIN, and there are no state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_INVALID_ARGUMENT	Input key type or mode is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.

FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

This function provides Key Unwrap algorithm compliant with RFC3394. Using p_wrapped_kek to unwrap p_rfc3394_wrapped_target_key, and output the result to p_wrapped_target_key. Implements rsip_api_t::rfc3394_KeyUnwrap.

<Usage Precautions>

- Argument "p_wrapped_kek" only supports the following key type.

Key Type of p_wrapped_kek	Corresponding Parameter
AES-128	RSIP_KEY_TYPE_AES_128
AES-256	RSIP_KEY_TYPE_AES_256

- Argument "key_type" represents the key type of p_rfc3394_wrapped_target_key, and only supports the following key type.

Key Type of p_rfc3394_wrapped_target_key	Corresponding Parameter
AES-128	RSIP_KEY_TYPE_AES_128
AES-256	RSIP_KEY_TYPE_AES_256

<Operational State>
This API can only be executed in the STATE_MAIN, and there are no state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_INVALID_ARGUMENT	Input key type or mode is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_InjectedKeyImport()

fsp_err_t R_RSIP_InjectedKeyImport (rsip_key_type_t const *key_type*, uint8_t const *const *p_injected_key*, rsip_wrapped_key_t *const *p_wrapped_key*, uint32_t const *wrapped_key_buffer_length*)

Generates structure data "rsip_wrapped_key_t" from injected key value. Refer "Key Size Table" for supported key types.

Implements rsip_api_t::injectedKeyImport.

State transition

This API can be executed in **any state** including STATE_INITIAL, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_UNSUPPORTED	Selected key type is not supported.
FSP_ERR_INVALID_SIZE	Buffer length is too short.

See also

Section Supported Algorithms

Note

Injected key value is not validated in this API.

See also

Section Supported Algorithms.

◆ R_RSIP_PublicKeyExport()

fsp_err_t R_RSIP_PublicKeyExport (rsip_wrapped_key_t const *const *p_wrapped_public_key*, uint8_t *const *p_raw_public_key*)

Exports public key parameters from a wrapped key.

Implements rsip_api_t::publicKeyExport.

Relative position of each elements in p_raw_public_key is shown in below:

- ECC (RSIP_KEY_TYPE_ECC_*) : Qx placed first and Qy placed after that.

bit length	Qx	Qy
256	0	32
384	0	48
512	0	64
521	0	66

- RSA (RSIP_KEY_TYPE_RSA_*) : n placed first and e placed after that.

modulus	n	e
1024	0	128
2048	0	256
3072	0	384
4096	0	512

State transition

This API can be executed in **any state** including STATE_INITIAL, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.

See also

Section Supported Algorithms.

◆ R_RSIP_AES_Cipher_Init()

fsp_err_t R_RSIP_AES_Cipher_Init (rsip_ctrl_t *const *p_ctrl*, rsip_aes_cipher_mode_t const *mode*, rsip_wrapped_key_t const *const *p_wrapped_key*, uint8_t const *const *p_initial_vector*)

Starts AES cipher operation in confidentiality mode (ECB/CBC/CTR) or XTS mode.

Implements rsip_api_t::aesCipherInit.

Conditions

Key type of p_wrapped_key must be one of the following:

- RSIP_KEY_TYPE_AES_128, RSIP_KEY_TYPE_AES_192, RSIP_KEY_TYPE_AES_256
- RSIP_KEY_TYPE_XTS_AES_128, RSIP_KEY_TYPE_XTS_AES_256

Argument mode must be the following:

- AES key
  - RSIP_AES_CIPHER_MODE_ECB_ENC, RSIP_AES_CIPHER_MODE_ECB_DEC
  - RSIP_AES_CIPHER_MODE_CBC_ENC, RSIP_AES_CIPHER_MODE_CBC_DEC
  - RSIP_AES_CIPHER_MODE_CTR
- XTS-AES key
  - RSIP_AES_CIPHER_MODE_XTS_ENC, RSIP_AES_CIPHER_MODE_XTS_DEC

Argument p_initial_vector must be the following:

- [ECB] Not used
- [CBC] Raw initial vector
- [CTR] Raw nonce
- [XTS] Raw initial vector

State transition

This API can only be executed in **STATE_MAIN**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_AES
Others	No change

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_INVALID_ARGUMENT	Input key type or mode is illegal.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.

FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

See also

Section Supported Algorithms.

Starts AES cipher operation in confidentiality mode (ECB/CBC/CTR) or XTS mode.

Implements rsip_api_t::aesCipherInit.

Conditions

Key type of p_wrapped_key must be one of the following:

- RSIP_KEY_TYPE_AES_128, RSIP_KEY_TYPE_AES_256
- RSIP_KEY_TYPE_XTS_AES_128, RSIP_KEY_TYPE_XTS_AES_256

Argument mode must be the following:

- AES key
  - RSIP_AES_CIPHER_MODE_ECB_ENC, RSIP_AES_CIPHER_MODE_ECB_DEC
  - RSIP_AES_CIPHER_MODE_CBC_ENC, RSIP_AES_CIPHER_MODE_CBC_DEC
  - RSIP_AES_CIPHER_MODE_CTR
- XTS-AES key
  - RSIP_AES_CIPHER_MODE_XTS_ENC, RSIP_AES_CIPHER_MODE_XTS_DEC

Argument p_initial_vector must be the following:

- [ECB] Not used
- [CBC] Raw initial vector
- [CTR] Raw nonce
- [XTS] Raw initial vector

State transition

This API can only be executed in **STATE_MAIN**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_AES
Others	No change

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.

FSP_ERR_INVALID_ARGUMENT	Input key type or mode is illegal.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

See also

Section Supported Algorithms.

◆ R_RSIP_AES_Cipher_Update()

fsp_err_t R_RSIP_AES_Cipher_Update (rsip_ctrl_t *const *p_ctrl*, uint8_t const *const *p_input*, uint8_t *const *p_output*, uint32_t const *length*)

Encrypts plaintext or decrypts ciphertext.

Implements rsip_api_t::aesCipherUpdate.

Conditions

Argument length must be the following:

- [ECB][CBC][CTR] 0 or a multiple of 16.
- [XTS] 0 or greater than or equal to 16.

Output length

Output length to p_output is length.

State transition

This API can only be executed in **STATE_AES**, and does not cause any state transitions.

In XTS mode, if once an integer other than 0 or a multiple of 16 is input, this API can no longer be called.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_INVALID_SIZE	Input length is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Internal error.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_AES_Cipher_Finish()

fsp_err_t R_RSIP_AES_Cipher_Finish (rsip_ctrl_t *const *p_ctrl*)

Finishes AES operation.

Implements rsip_api_t::aesCipherFinish.

State transition

This API can only be executed in **STATE_AES**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_MAIN
FSP_ERR_ASSERTION	No change
FSP_ERR_NOT_OPEN	No change
FSP_ERR_INVALID_STATE	No change
Others	STATE_MAIN

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Internal error.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_AES_AEAD_Init()

fsp_err_t R_RSIP_AES_AEAD_Init (rsip_ctrl_t *const *p_ctrl*, rsip_aes_aead_mode_t *mode*, rsip_wrapped_key_t const *const *p_wrapped_key*, uint8_t const *const *p_nonce*, uint32_t const *nonce_length*)

Starts AES AEAD function.

Implements rsip_api_t::aesAeadInit.

Conditions

Key type of p_wrapped_key must be one of the following:

- RSIP_KEY_TYPE_AES_128
- RSIP_KEY_TYPE_AES_192

- RSIP_KEY_TYPE_AES_256

Argument mode accepts any member of enumeration rsip_aes_aead_mode_t.

Argument nonce_length must be the following:

- [GCM] Any length is accepted, but 12 bytes is generally recommended.
- [CCM] 7 to 13 bytes.

State transition

This API can only be executed in **STATE_MAIN**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_AES_AEAD
Others	No change

The next callable API functions in STATE_AES_AEAD are as below.

- [GCM] R_RSIP_AES_AEAD_AADUpdate(), R_RSIP_AES_AEAD_Update(), R_RSIP_AES_AEAD_Finish() (encryption), R_RSIP_AES_AEAD_Verify() (decryption)
- [CCM] R_RSIP_AES_AEAD_LengthsSet()

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_INVALID_SIZE	nonce_length is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_INVALID_ARGUMENT	Input key type is illegal.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

See also

Section Supported Algorithms.

Starts AES AEAD function.

Implements rsip_api_t::aesAeadInit.

Conditions

Key type of p_wrapped_key must be one of the following:

- RSIP_KEY_TYPE_AES_128
- RSIP_KEY_TYPE_AES_256

Argument mode accepts any member of enumeration rsip_aes_aead_mode_t.

Argument nonce_length must be the following:

- [GCM] Any length is accepted, but 12 bytes is generally recommended.
- [CCM] 7 to 13 bytes.

State transition

This API can only be executed in **STATE_MAIN**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_AES_AEAD
Others	No change

The next callable API functions in STATE_AES_AEAD are as below.

- [GCM] R_RSIP_AES_AEAD_AADUpdate(), R_RSIP_AES_AEAD_Update(), R_RSIP_AES_AEAD_Finish() (encryption), R_RSIP_AES_AEAD_Verify() (decryption)
- [CCM] R_RSIP_AES_AEAD_LengthsSet()

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_INVALID_SIZE	nonce_length is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_INVALID_ARGUMENT	Input key type is illegal.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

See also

Section Supported Algorithms.

◆ R_RSIP_AES_AEAD_LengthsSet()

fsp_err_t R_RSIP_AES_AEAD_LengthsSet (rsip_ctrl_t *const *p_ctrl*, uint32_t const *total_aad_length*, uint32_t const *total_text_length*, uint32_t const *tag_length*)

Sets text and tag lengths for CCM mode.

Implements rsip_api_t::aesAeadLengthsSet.

Conditions

Argument total_aad_length must be equal to the length of AAD and must be 110 or less.

Argument total_test_length must be equal to the length of the plaintext or ciphertext.

Argument tag_length must be 4, 6, 8, 10, 12, 14, or 16.

State transition

This API can only be executed in **STATE_AES_AEAD**, and does not cause any state transitions.

The next callable API functions in STATE_AES_AEAD are as below.

- [CCM] R_RSIP_AES_AEAD_AADUpdate()

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_SIZE	Input length is illegal.
FSP_ERR_INVALID_STATE	Internal state is illegal.

Note

In GCM mode, this API must NOT be called. If called, FSP_ERR_INVALID_STATE will be returned. AAD length and text length are indeterminate and output tag length is fixed to 16 bytes.

◆ R_RSIP_AES_AEAD_AADUpdate()

fsp_err_t R_RSIP_AES_AEAD_AADUpdate (rsip_ctrl_t *const *p_ctrl*, uint8_t const *const *p_aad*, uint32_t const *aad_length*)

Inputs Additional Authentication Data (AAD).

Implements rsip_api_t::aesAeadAadUpdate.

State transition

This API can only be executed in **STATE_AES_AEAD**, and does not cause any state transitions.

- [GCM] R_RSIP_AES_AEAD_AADUpdate(), R_RSIP_AES_AEAD_Update(), R_RSIP_AES_AEAD_Finish() (encryption), R_RSIP_AES_AEAD_Verify() (decryption)
- [CCM] R_RSIP_AES_AEAD_AADUpdate() (AAD input is not completed), R_RSIP_AES_AEAD_Update() (AAD input is completed)

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_INVALID_SIZE	aad_length is illegal.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.
FSP_ERR_CRYPTO_RSIP_FAIL	Internal error.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.

◆ R_RSIP_AES_AEAD_Update()

fsp_err_t R_RSIP_AES_AEAD_Update (rsip_ctrl_t *const *p_ctrl*, uint8_t const *const *p_input*, uint32_t const *input_length*, uint8_t *const *p_output*, uint32_t *const *p_output_length*)

Encrypts plaintext or decrypts ciphertext.

Implements rsip_api_t::aesAeadUpdate.

Output length

Output length to p_output (p_output_length) is calculated text that has not yet been output in multiple of 16 bytes.

State transition

This API can only be executed in **STATE_AES_AEAD**, and does not cause any state transitions.

- [GCM] R_RSIP_AES_AEAD_Update(), R_RSIP_AES_AEAD_Finish() (encryption), R_RSIP_AES_AEAD_Verify() (decryption)
- [CCM] R_RSIP_AES_AEAD_Update() (text input is not completed), R_RSIP_AES_AEAD_Finish() (text input is completed, encryption), R_RSIP_AES_AEAD_Verify() (text input is completed, decryption)

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_SIZE	Input length is illegal.
FSP_ERR_INVALID_STATE	Internal state is illegal.

Note

In GCM mode, if this API is skipped, GMAC will be calculated. For detailed usage, refer to example code.

◆ R_RSIP_AES_AEAD_Finish()

fsp_err_t R_RSIP_AES_AEAD_Finish (rsip_ctrl_t *const *p_ctrl*, uint8_t *const *p_output*, uint32_t *const *p_output_length*, uint8_t *const *p_tag*)

Finalizes an AES AEAD encryption.

Implements rsip_api_t::aesAeadFinish.

Output length

Output length to p_output (p_output_length) is the remaining calculated text length.

Output length to p_tag as below.

- [GCM] 16 bytes.
- [CCM] Input value as tag_length in R_RSIP_AES_AEAD_LengthsSet().

State transition

This API can only be executed in **STATE_AES_AEAD**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_MAIN
FSP_ERR_ASSERTION	No change
FSP_ERR_NOT_OPEN	No change
FSP_ERR_INVALID_STATE	No change
Others	STATE_MAIN

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Internal error.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_AES_AEAD_Verify()

fsp_err_t R_RSIP_AES_AEAD_Verify (rsip_ctrl_t *const *p_ctrl*, uint8_t *const *p_output*, uint32_t *const *p_output_length*, uint8_t const *const *p_tag*, uint32_t const *tag_length*)

Finalizes an AES AEAD decryption.

If there is 16-byte fractional data indicated by the total data length of the value of p_cipher that was input by R_RSIP_AES_GCM_DecryptUpdate(), this API will output the result of decrypting that fractional data to p_cipher. Here, the portion that does not reach 16 bytes will be padded with zeros.

Implements rsip_api_t::aesAeadVerify.

Conditions

Argument tag_length must be as below.

- [GCM] 1 to 16 bytes.
- [CCM] Input value as tag_length in R_RSIP_AES_AEAD_LengthsSet().

Output length

Output length to p_output (p_output_length) is the remaining calculated text length.

State transition

This API can only be executed in **STATE_AES_AEAD**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_MAIN
FSP_ERR_ASSERTION	No change
FSP_ERR_NOT_OPEN	No change
FSP_ERR_INVALID_STATE	No change
Others	STATE_MAIN

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_INVALID_SIZE	tag_length is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Internal error.
FSP_ERR_CRYPTO_RSIP_AUTHENTICATION	Authentication is failed.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_AES_MAC_Init()

fsp_err_t R_RSIP_AES_MAC_Init (rsip_ctrl_t *const *p_ctrl*, rsip_aes_mac_mode_t const *mode*, rsip_wrapped_key_t const *const p_wrapped_key*)

Starts an AES MAC operation.

Implements rsip_api_t::aesMacInit.

Conditions

Key type of p_wrapped_key must be one of the following:

- RSIP_KEY_TYPE_AES_128
- RSIP_KEY_TYPE_AES_192
- RSIP_KEY_TYPE_AES_256

Argument mode accepts any member of enumeration rsip_aes_aead_mode_t.

State transition

This API can only be executed in **STATE_MAIN**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_AES_MAC
Others	No change

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

Note

To calculate AES-GMAC, please use not R_RSIP_MAC_*() but R_RSIP_AEAD_*(). For detailed usage, refer to example code.

See also

Section Supported Algorithms.

Starts an AES MAC operation.

Implements rsip_api_t::aesMacInit.

Conditions

Key type of p_wrapped_key must be one of the following:

- RSIP_KEY_TYPE_AES_128
- RSIP_KEY_TYPE_AES_256

Argument mode accepts any member of enumeration rsip_aes_aead_mode_t.

State transition

This API can only be executed in **STATE_MAIN**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_AES_MAC
Others	No change

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

Note

To calculate AES-GMAC, please use not R_RSIP_MAC_*() but R_RSIP_AEAD_*(). For detailed usage, refer to example code.

Section Supported Algorithms.

◆ R_RSIP_AES_MAC_Update()

fsp_err_t R_RSIP_AES_MAC_Update (rsip_ctrl_t *const *p_ctrl*, uint8_t const *const *p_message*, uint32_t const *message_length*)

Inputs message.

Implements rsip_api_t::aesMacUpdate.

Inside this function, the data that is input by the user is buffered until the input value of p_message exceeds 16 bytes. If the input value, p_message, is not a multiple of 16 bytes, it will be padded within the function.

State transition

This API can only be executed in **STATE_AES_MAC**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.

◆ R_RSIP_AES_MAC_SignFinish()

fsp_err_t R_RSIP_AES_MAC_SignFinish (rsip_ctrl_t *const *p_ctrl*, uint8_t *const *p_mac*)

Outputs AES MAC.

Implements rsip_api_t::aesMacSignFinish.

Output length

Output length to p_mac is 16 bytes.

State transition

This API can only be executed in **STATE_AES_MAC**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_MAIN
FSP_ERR_ASSERTION	No change
FSP_ERR_NOT_OPEN	No change
FSP_ERR_INVALID_STATE	No change
Others	STATE_MAIN

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Internal error.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_AES_MAC_VerifyFinish()

fsp_err_t R_RSIP_AES_MAC_VerifyFinish (rsip_ctrl_t *const *p_ctrl*, uint8_t const *const *p_mac*, uint32_t const *mac_length*)

Verifies AES MAC.

Implements rsip_api_t::aesMacVerifyFinish.

Conditions

Argument mac_length must be as below.

- [CMAC] 2 to 16 bytes.

State transition

This API can only be executed in **STATE_AES_MAC**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_MAIN
FSP_ERR_ASSERTION	No change
FSP_ERR_NOT_OPEN	No change
FSP_ERR_INVALID_STATE	No change
Others	STATE_MAIN

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_INVALID_SIZE	mac_length is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Internal error.
FSP_ERR_CRYPTO_RSIP_AUTHENTICATION	Authentication is failed.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_ECDSA_Sign()

fsp_err_t R_RSIP_ECDSA_Sign (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_private_key*, uint8_t const *const *p_hash*, uint8_t *const *p_signature*)

Generates an ECDSA signature.

Implements rsip_api_t::ecdsaSign.

Conditions

Key type of p_wrapped_private_key must be one of the following:

- RSIP_KEY_TYPE_ECC_SECP256R1_PRIVATE
- RSIP_KEY_TYPE_ECC_SECP384R1_PRIVATE
- RSIP_KEY_TYPE_ECC_SECP521R1_PRIVATE
- RSIP_KEY_TYPE_ECC_SECP256K1_PRIVATE
- RSIP_KEY_TYPE_ECC_BRAINPOOLP256R1_PRIVATE
- RSIP_KEY_TYPE_ECC_BRAINPOOLP384R1_PRIVATE
- RSIP_KEY_TYPE_ECC_BRAINPOOLP512R1_PRIVATE

Message hash p_hash should be computed in advance. In the case of hash length is less than the key length, padding is required to make it the same as the key length.

For secp521r1 operation, the length of p_hash must be set to 64 bytes.

For secp521r1 operation, the length of the argument p_signature must be set as 132 byte. Since 521 bit is not a 8-bit multiple, zero padding is required and the data format is as follows:

Data Format for secp521r1 (132 byte)			
zero padding (7 bit)	signature r (521 bit)	zero padding (7 bit)	signature s (521 bit)

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	• Input parameter is illegal. • Signature generation is failed.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

See also

Section Supported Algorithms.

◆ R_RSIP_ECDSA_Verify()

fsp_err_t R_RSIP_ECDSA_Verify (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_public_key*, uint8_t const *const *p_hash*, uint8_t const *const *p_signature*)

Verifies an ECDSA signature.

Implements rsip_api_t::ecdsaVerify.

Conditions

Key type of p_wrapped_public_key must be one of the following:

- RSIP_KEY_TYPE_ECC_SECP256R1_PUBLIC
- RSIP_KEY_TYPE_ECC_SECP384R1_PUBLIC
- RSIP_KEY_TYPE_ECC_SECP521R1_PUBLIC
- RSIP_KEY_TYPE_ECC_SECP256K1_PUBLIC
- RSIP_KEY_TYPE_ECC_BRAINPOOLP256R1_PUBLIC
- RSIP_KEY_TYPE_ECC_BRAINPOOLP384R1_PUBLIC
- RSIP_KEY_TYPE_ECC_BRAINPOOLP512R1_PUBLIC

Message hash p_hash should be computed in advance. In the case of hash length is less than the key length, padding is required to make it the same as the key length.

For secp521r1 operation, the length of p_hash must be set to 64 bytes.

For secp521r1 operation, the length of the argument p_signature must be set as 132 byte. Since 521 bit is not a 8-bit multiple, zero padding is required and the data format is as follows:

Data Format for secp521r1 (132 byte)			
zero padding (7 bit)	signature r (521 bit)	zero padding (7 bit)	signature s (521 bit)

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	• Input parameter is illegal. • Signature verification is failed.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

See also

Section Supported Algorithms.

◆ R_RSIP_PKI_ECDSA_CertVerify()

fsp_err_t R_RSIP_PKI_ECDSA_CertVerify (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_public_key*, uint8_t const *const *p_hash*, uint8_t const *const *p_signature*)

Verifies a public key certificate with ECDSA.

Implements rsip_api_t::pkiEcdsaCertVerify.

Conditions

Key type of p_wrapped_public_key must be one of the following:

- RSIP_KEY_TYPE_ECC_SECP256R1_PUBLIC
- RSIP_KEY_TYPE_ECC_SECP384R1_PUBLIC
- RSIP_KEY_TYPE_ECC_SECP521R1_PUBLIC

Message hash p_hash should be computed in advance. In the case of hash length is less than the key length, padding is required to make it the same as the key length.

For secp521r1 operation, the length of p_hash must be set to 64 bytes.

For secp521r1 operation, the length of the argument p_signature must be set as 132 byte. Since 521 bit is not a 8-bit multiple, zero padding is required and the data format is as follows:

Data Format for secp521r1 (132 byte)			
zero padding (7 bit)	signature r (521 bit)	zero padding (7 bit)	signature s (521 bit)

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	• Input parameter is illegal. • Signature verification is failed.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_ECDH_KeyAgree()

fsp_err_t R_RSIP_ECDH_KeyAgree (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_private_key*, rsip_wrapped_key_t const *const *p_wrapped_public_key*, rsip_wrapped_secret_t *const *p_wrapped_secret*)

Computes ECDH secret with wrapped private key and wrapped public key.

Implements rsip_api_t::ecdhKeyAgree.

Conditions

Key type of p_wrapped_private_key and p_wrapped_public_key must be one of the following:

- RSIP_KEY_TYPE_ECC_SECP256R1_PUBLIC
- RSIP_KEY_TYPE_ECC_SECP384R1_PUBLIC
- RSIP_KEY_TYPE_ECC_SECP521R1_PUBLIC

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_ECDH_PlainKeyAgree()

fsp_err_t R_RSIP_ECDH_PlainKeyAgree (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_private_key*, uint8_t const *const *p_plain_public_key*, rsip_wrapped_secret_t *const *p_wrapped_secret*)

Computes ECDH secret with wrapped private key and plain public key.

Implements rsip_api_t::ecdhPlainKeyAgree.

Conditions

Key type of p_wrapped_private_key must be one of the following:

- RSIP_KEY_TYPE_ECC_SECP256R1_PUBLIC
- RSIP_KEY_TYPE_ECC_SECP384R1_PUBLIC
- RSIP_KEY_TYPE_ECC_SECP521R1_PUBLIC

For secp521r1 operation, the length of the argument p_plain_public_key must be set as 132 byte. Since 521 bit is not a 8-bit multiple, zero padding is required and the data format is as follows:

Data Format for secp521r1 (132 byte)			
zero padding (7 bit)	public_key Qx (521 bit)	zero padding (7 bit)	public_key Qy (521 bit)

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

Attention

Unauthenticated public key of Diffie–Hellman key exchange generally carry the risk of man-in-the-middle (MITM) attack. Please use R_RSIP_ECDH_KeyAgree() or implement signature verification whenever possible.

◆ R_RSIP_KDF_MACKeyImport()

fsp_err_t R_RSIP_KDF_MACKeyImport (rsip_ctrl_t *const *p_ctrl*, rsip_key_type_t const *key_type*, rsip_wrapped_mac_t const *const *p_wrapped_mac*, uint32_t const *key_length*, rsip_wrapped_key_t *const *p_wrapped_key*)

Converts wrapped data to wrapped HMAC key for KDF.

Implements rsip_api_t::kdfMacKeyImport.

Conditions

Argument key_type must be one of the following:

- RSIP_KEY_TYPE_HMAC_SHA256
- RSIP_KEY_TYPE_HMAC_SHA384
- RSIP_KEY_TYPE_HMAC_SHA512

The argument p_wrapped_mac must be input the result of R_RSIP_KDF_HMAC_SignFinish().

Argument kdf_data_length depends on key type.

- 32 to 64 (RSIP_KEY_TYPE_HMAC_SHA256)
- 48 to 64 (RSIP_KEY_TYPE_HMAC_SHA384)
- 64 (RSIP_KEY_TYPE_HMAC_SHA512)

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_INVALID_SIZE	Any length is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_KDF_ECDHSecretKeyImport()

fsp_err_t R_RSIP_KDF_ECDHSecretKeyImport (rsip_ctrl_t *const *p_ctrl*, rsip_key_type_t const *key_type*, rsip_wrapped_secret_t const *const *p_wrapped_secret*, rsip_wrapped_key_t *const *p_wrapped_key*)

Converts wrapped ECDH secret to wrapped HMAC key for KDF.

Implements rsip_api_t::kdfEcdhSecretKeyImport.

Conditions

Argument key_type must be one of the following:

- RSIP_KEY_TYPE_HMAC_SHA256
- RSIP_KEY_TYPE_HMAC_SHA384
- RSIP_KEY_TYPE_HMAC_SHA512

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_KDF_HMAC_Init()

fsp_err_t R_RSIP_KDF_HMAC_Init (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_key*)

Prepares a HMAC generation.

Implements rsip_api_t::kdfhmacInit.

Conditions

Argument p_wrapped_key must be one of the following:
- Output data p_wrapped_key from R_RSIP_KDF_ECDHSecretKeyImport().
- Key type of p_wrapped_key is RSIP_KEY_TYPE_HMAC_xxx.

State transition

This API can only be executed in **STATE_MAIN**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_KDF_HMAC
Others	No change

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.

◆ R_RSIP_KDF_HMAC_MACUpdate()

fsp_err_t R_RSIP_KDF_HMAC_MACUpdate (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_mac_t const *const *p_wrapped_mac*)

Inputs wrapped MAC as a message.

Implements rsip_api_t::kdfhmacMacUpdate.

Conditions

The argument p_wrapped_mac must be input the result of R_RSIP_KDF_HMAC_SignFinish().

State transition

This API can only be executed in **STATE_KDF_HMAC**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.

◆ R_RSIP_KDF_HMAC_ECDHSecretUpdate()

fsp_err_t R_RSIP_KDF_HMAC_ECDHSecretUpdate (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_secret_t const *const *p_wrapped_secret*)

Inputs wrapped ECDH secret as a message.

Implements rsip_api_t::kdfhmacEcdhSecretUpdate.

Conditions

The argument p_wrapped_secret must be input the result of R_RSIP_ECDH_KeyAgree() or R_RSIP_ECDH_PlainKeyAgree().

State transition

This API can only be executed in **STATE_KDF_HMAC**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_KDF_HMAC_Update()

fsp_err_t R_RSIP_KDF_HMAC_Update (rsip_ctrl_t *const *p_ctrl*, uint8_t const *const *p_message*, uint32_t const *message_length*)

Inputs message.

Implements rsip_api_t::kdfhmacUpdate.

State transition

This API can only be executed in **STATE_KDF_HMAC**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_KDF_HMAC_SignFinish()

fsp_err_t R_RSIP_KDF_HMAC_SignFinish (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_mac_t *const *p_wrapped_mac*)

Finalizes a HMAC generation.

Implements rsip_api_t::kdfhmacSignFinish.

State transition

This API can only be executed in **STATE_KDF_HMAC**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_MAIN
FSP_ERR_ASSERTION	No change
FSP_ERR_NOT_OPEN	No change
FSP_ERR_INVALID_STATE	No change
Others	STATE_MAIN

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_KDF_HMAC_Suspend()

fsp_err_t R_RSIP_KDF_HMAC_Suspend (rsip_ctrl_t *const *p_ctrl*, rsip_kdf_hmac_handle_t *const *p_handle*)

Suspends HMAC operation.

This API releases RSIP resource and outputs intermediate results. Therefore, it can be used in the following cases:

- Execute another cryptographic operations during inputting successive chunks of the message.
- Reuse intermediate results.

Implements rsip_api_t::kdfhmacSuspend.

State transition

This API can only be executed in **STATE_KDF_HMAC**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_MAIN
Others	No change

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_KDF_HMAC_Resume()

fsp_err_t R_RSIP_KDF_HMAC_Resume (rsip_ctrl_t *const *p_ctrl*, rsip_kdf_hmac_handle_t const *const *p_handle*)

Resumes HMAC operation suspended by R_RSIP_KDF_HMAC_Suspend().

Implements rsip_api_t::kdfhmacResume.

State transition

This API can only be executed in **STATE_MAIN**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_KDF_HMAC
Others	No change

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.

◆ R_RSIP_KDF_MACConcatenate()

fsp_err_t R_RSIP_KDF_MACConcatenate (rsip_wrapped_mac_t *const *p_wrapped_mac1*, rsip_wrapped_mac_t const *const *p_wrapped_mac2*, uint32_t const *wrapped_mac1_buffer_length*)

Concatenates two wrapped MACs.

MAC1 || MAC2 is output to p_wrapped_mac1.

Implements rsip_api_t::kdfMacConcatenate.

State transition

This API can be executed in **any state** including STATE_INITIAL, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_INVALID_SIZE	Any length is illegal.

◆ R_RSIP_KDF_DerivedKeyImport()

fsp_err_t R_RSIP_KDF_DerivedKeyImport (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_mac_t const *const *p_wrapped_mac*, rsip_key_type_t const *key_type*, uint32_t const *position*, rsip_wrapped_key_t *const *p_wrapped_key*)

Outputs a wrapped key from KDF output.

Implements rsip_api_t::kdfDerivedKeyImport.

Conditions

Argument p_wrapped_mac must be input the result of R_RSIP_KDF_HMAC_SignFinish() or R_RSIP_KDF_MACConcatenate(). Argument key_type must be one of the following:

- RSIP_KEY_TYPE_AES_128
- RSIP_KEY_TYPE_AES_256
- RSIP_KEY_TYPE_HMAC_SHA256
- RSIP_KEY_TYPE_HMAC_SHA384
- RSIP_KEY_TYPE_HMAC_SHA512

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_KDF_DerivedIVWrap()

fsp_err_t R_RSIP_KDF_DerivedIVWrap (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_mac_t const *const *p_wrapped_mac*, rsip_initial_vector_type_t const *initial_vector_type*, uint32_t const *position*, uint8_t const *const *p_tls_sequence_num*, uint8_t *const *p_wrapped_initial_vector*)

Outputs a initial vector from KDF output.

Implements rsip_api_t::kdfDerivedIvWrap.

Conditions

Argument p_wrapped_mac must be input the result of R_RSIP_KDF_HMAC_SignFinish() or R_RSIP_KDF_MACConcatenate(). Argument initial_vector_type must be one of the following:

- RSIP_INITIAL_VECTOR_TYPE_AES_16_BYTE

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_OTF_Init()

fsp_err_t R_RSIP_OTF_Init (rsip_ctrl_t *const *p_ctrl*, rsip_otf_channel_t const *channel*, rsip_wrapped_key_t *const *p_wrapped_key*, uint8_t const *const *p_seed*)

Initialize on-the-fly decryption on RSIP. Implements rsip_api_t::otfInit.

<Usage Precautions>

- Argument "channel" represents channel number to be used, and supports the features listed below.

Channel	Corresponding Parameter
CH-0	RSIP_OTF_CHANNEL_0
CH-1 (*)	RSIP_OTF_CHANNEL_1

(*) These features are not supported.

<Operational State>
This API can only be executed in the STATE_MAIN, and there are no state transitions.

Parameters

[in,out]	p_ctrl	Pointer to control block.
[in]	channel	Channel number.
[in]	p_wrapped_key	Pointer to wrapped AES key.
[in]	p_seed	Pointer to seed.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled or selected channel is invalid.
FSP_ERR_INVALID_ARGUMENT	Input key type is illegal.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

Attention

This function is only part of on-the-fly decryption activation process and intended to be called from a higher level FSP module. Even if a user calls this function directly, the feature will not be enabled. The number of channels for the channel parameter is dependent on the hardware. RA8x1 supports only one channel, and channel parameter must always be set to RSIP_OTF_CHANNEL_0.

Initialize on-the-fly decryption on RSIP. Implements rsip_api_t::otfInit.

<Usage Precautions>

- Argument "channel" represents channel number to be used, and supports the features listed below.

Channel	Corresponding Parameter
CH-0	RSIP_OTF_CHANNEL_0
CH-1 (*)	RSIP_OTF_CHANNEL_1

(*) These features are not supported.

<Operational State>
This API can only be executed in the STATE_MAIN, and there are no state transitions.

Parameters

[in,out]	p_ctrl	Pointer to control block.
[in]	channel	Channel number.
[in]	p_wrapped_key	Pointer to wrapped AES key.
[in]	p_seed	Pointer to seed.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled or selected channel is invalid.
FSP_ERR_INVALID_ARGUMENT	Input key type is illegal.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

Attention

This function is only part of on-the-fly decryption activation process and intended to be called from a higher level FSP module. Even if a user calls this function directly, the feature will not be enabled. The number of channels for the channel parameter is dependent on the hardware. RA8x1 supports only one channel, and channel parameter must always be set to RSIP_OTF_CHANNEL_0.

◆ R_RSIP_PKI_VerifiedCertInfoExport()

fsp_err_t R_RSIP_PKI_VerifiedCertInfoExport (rsip_ctrl_t *const *p_ctrl*, rsip_verified_cert_info_t *const *p_verified_cert_info*)

Exports verified certificate information stored in this driver.

The certificate is last called function R_RSIP_PKI_ECDSA_CertVerify(), R_RSIP_PKI_RSASSA_PKCS1_V1_5_CertVerify(), R_RSIP_PKI_RSASSA_PSS_CertVerify(), or R_RSIP_PKI_VerifiedCertInfoImport().

Implements rsip_api_t::pkiVerifiedCertInfoExport.

State transition

This API can be executed in **any state** including STATE_INITIAL, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.

◆ R_RSIP_PKI_VerifiedCertInfoImport()

fsp_err_t R_RSIP_PKI_VerifiedCertInfoImport (rsip_ctrl_t *const *p_ctrl*, rsip_verified_cert_info_t const *const *p_verified_cert_info*)

Imports verified certificate information.

Implements rsip_api_t::pkiVerifiedCertInfoImport.

State transition

This API can be executed in **any state** including STATE_INITIAL, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.

◆ R_RSIP_PKI_CertKeyImport()

fsp_err_t R_RSIP_PKI_CertKeyImport (rsip_ctrl_t *const *p_ctrl*, uint8_t const *const *p_cert*, uint32_t const *cert_length*, rsip_key_type_t const *key_type*, uint8_t const *const *p_key_param1*, uint32_t const *key_param1_length*, uint8_t const *const *p_key_param2*, uint32_t const *key_param2_length*, rsip_hash_type_t const *hash_function*, rsip_wrapped_key_t *const *p_wrapped_public_key*)

Wraps the public key in the verified public key certificate.

Implements rsip_api_t::pkiCertKeyImport.

Conditions

Argument key_type must be one of the following:

- RSIP_KEY_TYPE_ECC_SECP256R1_PUBLIC
- RSIP_KEY_TYPE_ECC_SECP384R1_PUBLIC
- RSIP_KEY_TYPE_ECC_SECP521R1_PUBLIC

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

Note

- *Argument p_cert must correspond to the signature of the last called function R_RSIP_PKI_ECDSA_CertVerify(), R_RSIP_PKI_RSASSA_PKCS1_V1_5_CertVerify(), or R_RSIP_PKI_RSASSA_PSS_CertVerify().*
- *For arguments p_key_param1 and p_key_param2, specify an address inside the certificate. Addresses outside the certificate are invalid.*

◆ R_RSIP_RSA_Encrypt()

fsp_err_t R_RSIP_RSA_Encrypt (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_public_key*, uint8_t const *const *p_plain*, uint8_t *const *p_cipher*)

Encrypts plaintext with raw RSA.

Implements rsip_api_t::rsaEncrypt.

Conditions

Key type of p_wrapped_public_key must be one of the following:
- RSIP_KEY_TYPE_RSA_2048_PUBLIC
- RSIP_KEY_TYPE_RSA_3072_PUBLIC
- RSIP_KEY_TYPE_RSA_4096_PUBLIC

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

Note

This API provides RSA low-level primitives (RSAEP/RSAVP1). It should be used in conjunction with any padding scheme.

See also

Section Supported Algorithms.

◆ R_RSIP_RSA_Decrypt()

fsp_err_t R_RSIP_RSA_Decrypt (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_private_key*, uint8_t const *const *p_cipher*, uint8_t *const *p_plain*)

Decrypts ciphertext with raw RSA.

Implements rsip_api_t::rsaDecrypt.

Conditions

Key type of p_wrapped_private_key must be one of the following:
- RSIP_KEY_TYPE_RSA_2048_PRIVATE
- RSIP_KEY_TYPE_RSA_3072_PRIVATE
- RSIP_KEY_TYPE_RSA_4096_PRIVATE

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

Note

This API provides RSA low-level primitives (RSADP/RSASP1). It should be used in conjunction with any padding scheme.

See also

Section Supported Algorithms.

◆ R_RSIP_RSAES_PKCS1_V1_5_Encrypt()

fsp_err_t R_RSIP_RSAES_PKCS1_V1_5_Encrypt (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_public_key*, uint8_t const *const *p_plain*, uint32_t const *plain_length*, uint8_t *const *p_cipher*)

Encrypts plaintext with RSAES-PKCS1-v1_5.

Implements rsip_api_t::rsaesPkcs1V15Encrypt.

Conditions

Key type of p_wrapped_public_key must be one of the following:

- RSIP_KEY_TYPE_RSA_2048_PUBLIC
- RSIP_KEY_TYPE_RSA_3072_PUBLIC
- RSIP_KEY_TYPE_RSA_4096_PUBLIC

mLen (plain_length) and k (modulus length) must meet the following condition.

- mLen <= k - 11

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_INVALID_SIZE	Any length is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

See also

Section Supported Algorithms.

◆ R_RSIP_RSAES_PKCS1_V1_5_Decrypt()

fsp_err_t R_RSIP_RSAES_PKCS1_V1_5_Decrypt (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_private_key*, uint8_t const *const *p_cipher*, uint8_t *const *p_plain*, uint32_t *const *p_plain_length*, uint32_t const *plain_buffer_length*)

Decrypts with RSAES-PKCS1-v1_5.

Implements rsip_api_t::rsaesPkcs1V15Decrypt.

Conditions

Key type of p_wrapped_private_key must be one of the following:

- RSIP_KEY_TYPE_RSA_2048_PRIVATE
- RSIP_KEY_TYPE_RSA_3072_PRIVATE
- RSIP_KEY_TYPE_RSA_4096_PRIVATE

plain_buffer_length must be greater than or equal to mLen(plaintext length).

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_INVALID_SIZE	Any length is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

Note

This API skips the ciphertext length checking at RFC8017 (PKCS#1 v2.2) Section 7.2.2 Step 1.

Section Supported Algorithms.

◆ R_RSIP_RSAES_OAEP_Encrypt()

fsp_err_t R_RSIP_RSAES_OAEP_Encrypt (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_public_key*, rsip_hash_type_t const *hash_function*, rsip_mgf_type_t const *mask_generation_function*, uint8_t const *const *p_label*, uint32_t const *label_length*, uint8_t const *const *p_plain*, uint32_t const *plain_length*, uint8_t *const *p_cipher*)

Encrypts plaintext with RSAES-OAEP.

Implements rsip_api_t::rsaesOaepEncrypt.

Conditions

Key type of p_wrapped_public_key must be one of the following:

- RSIP_KEY_TYPE_RSA_2048_PUBLIC
- RSIP_KEY_TYPE_RSA_3072_PUBLIC
- RSIP_KEY_TYPE_RSA_4096_PUBLIC

mLen (plain_length), hLen (hash length of hash_function), and k (modulus length) must meet the following condition.

- mLen <= k - 2 hLen - 2

Argument hash_function accepts any member of enumeration rsip_hash_type_t.

Argument mask_generation_function accepts any member of enumeration rsip_mgf_type_t.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_INVALID_SIZE	Any length is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

See also

Section Supported Algorithms.

◆ R_RSIP_RSAES_OAEP_Decrypt()

fsp_err_t R_RSIP_RSAES_OAEP_Decrypt (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_private_key*, rsip_hash_type_t const *hash_function*, rsip_mgf_type_t const *mask_generation_function*, uint8_t const *const *p_label*, uint32_t const *label_length*, uint8_t const *const *p_cipher*, uint8_t *const *p_plain*, uint32_t *const *p_plain_length*, uint32_t const *plain_buffer_length*)

Decrypts ciphertext with RSAES-OAEP.

Implements rsip_api_t::rsaesOaepDecrypt.

Conditions

Key type of p_wrapped_private_key must be one of the following:

- RSIP_KEY_TYPE_RSA_2048_PRIVATE
- RSIP_KEY_TYPE_RSA_3072_PRIVATE
- RSIP_KEY_TYPE_RSA_4096_PRIVATE

hLen (hash length of hash_function) and k (modulus length) must meet the following condition.

- k >= 2 hLen + 2

plain_buffer_length must be greater than or equal to mLen(plaintext length).

Argument hash_function accepts any member of enumeration rsip_hash_type_t.

Argument mask_generation_function accepts any member of enumeration rsip_mgf_type_t.

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_INVALID_SIZE	Any length is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

Note

This API skips the ciphertext length checking at RFC8017 (PKCS#1 v2.2) Section 7.1.2 Step 1.

Section Supported Algorithms.

◆ R_RSIP_RSASSA_PKCS1_V1_5_Sign()

fsp_err_t R_RSIP_RSASSA_PKCS1_V1_5_Sign (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_private_key*, rsip_hash_type_t const *hash_function*, uint8_t const *const *p_hash*, uint8_t *const *p_signature*)

Signs message with RSASSA-PKCS1-v1_5.

Implements rsip_api_t::rsassaPkcs1V15Sign.

Conditions

Key type of p_wrapped_private_key must be one of the following:

- RSIP_KEY_TYPE_RSA_2048_PRIVATE
- RSIP_KEY_TYPE_RSA_3072_PRIVATE
- RSIP_KEY_TYPE_RSA_4096_PRIVATE

Argument hash_function accepts any member of enumeration rsip_hash_type_t.

Message hash p_hash should be computed in advance with hash_function.

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_INVALID_SIZE	Any length is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

See also

Section Supported Algorithms.

◆ R_RSIP_RSASSA_PKCS1_V1_5_Verify()

fsp_err_t R_RSIP_RSASSA_PKCS1_V1_5_Verify (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_public_key*, rsip_hash_type_t const *hash_function*, uint8_t const *const *p_hash*, uint8_t const *const *p_signature*)

Verifies signature with RSASSA-PKCS1-v1_5.

Implements rsip_api_t::rsassaPkcs1V15Verify.

Conditions

Key type of p_wrapped_public_key must be one of the following:

- RSIP_KEY_TYPE_RSA_2048_PUBLIC
- RSIP_KEY_TYPE_RSA_3072_PUBLIC
- RSIP_KEY_TYPE_RSA_4096_PUBLIC

Argument hash_function accepts any member of enumeration rsip_hash_type_t.

Message hash p_hash should be computed in advance with hash_function.

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_INVALID_SIZE	Any length is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

Section Supported Algorithms.

◆ R_RSIP_RSASSA_PSS_Sign()

fsp_err_t R_RSIP_RSASSA_PSS_Sign (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_private_key*, rsip_hash_type_t const *hash_function*, rsip_mgf_type_t const *mask_generation_function*, uint32_t const *salt_length*, uint8_t const *const *p_hash*, uint8_t *const

p_signature)

Signs message with RSASSA-PSS.

Implements rsip_api_t::rsassaPssSign.

Conditions

Key type of p_wrapped_private_key must be one of the following:

- RSIP_KEY_TYPE_RSA_2048_PRIVATE
- RSIP_KEY_TYPE_RSA_3072_PRIVATE
- RSIP_KEY_TYPE_RSA_4096_PRIVATE

Argument hash_function accepts any member of enumeration rsip_hash_type_t.

Argument mask_generation_function accepts any member of enumeration rsip_mgf_type_t.

Message hash p_hash should be computed in advance with hash_function.

Salt length salt_length must be one of the following:

- Any member of enumeration rsip_rsa_salt_length_t
  - RSIP_RSA_SALT_LENGTH_AUTO
  - RSIP_RSA_SALT_LENGTH_HASH
  - RSIP_RSA_SALT_LENGTH_MAX
- Integers that satisfies the formula: sLen <= emLen - hLen - 2
  - sLen is salt_length
  - emLen is the same as modulus length
  - hLen is the hash length

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_INVALID_SIZE	Any length is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

Section Supported Algorithms.

◆ R_RSIP_RSASSA_PSS_Verify()

fsp_err_t R_RSIP_RSASSA_PSS_Verify (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_public_key*, rsip_hash_type_t const *hash_function*, rsip_mgf_type_t const *mask_generation_function*, uint32_t const *salt_length*, uint8_t const *const *p_hash*, uint8_t const *const *p_signature*)

Verifies signature with RSASSA-PSS. Implements rsip_api_t::rsassaPssVerify.

Conditions

Key type of p_wrapped_public_key must be one of the following:

- RSIP_KEY_TYPE_RSA_2048_PUBLIC
- RSIP_KEY_TYPE_RSA_3072_PUBLIC
- RSIP_KEY_TYPE_RSA_4096_PUBLIC

Argument hash_function accepts any member of enumeration rsip_hash_type_t.

Argument mask_generation_function accepts any member of enumeration rsip_mgf_type_t.

Message hash p_hash should be computed in advance with hash_function.

Salt length salt_length must be one of the following:

- Any member of enumeration rsip_rsa_salt_length_t
  - RSIP_RSA_SALT_LENGTH_AUTO
  - RSIP_RSA_SALT_LENGTH_HASH
  - RSIP_RSA_SALT_LENGTH_MAX
- Integers that satisfies the formula: sLen <= emLen - hLen - 2
  - sLen is salt_length
  - emLen is the same as modulus length
  - hLen is the hash length

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_INVALID_SIZE	Any length is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.

FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

See also
Section Supported Algorithms.

◆ R_RSIP_SHA_Compute()

fsp_err_t R_RSIP_SHA_Compute (rsip_ctrl_t *const *p_ctrl*, rsip_hash_type_t const *hash_type*, uint8_t const *const *p_message*, uint32_t const *message_length*, uint8_t *const *p_digest*)

Generates SHA message digest. (Total input message must be less than 2^64 bits.)

Implements rsip_api_t::shaCompute.

Conditions
See R_RSIP_SHA_Init().
Output length
See R_RSIP_SHA_Finish().
State transition
This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.
Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.

See also
Section Supported Algorithms.

◆ R_RSIP_SHA_Init()

fsp_err_t R_RSIP_SHA_Init (rsip_ctrl_t *const *p_ctrl*, rsip_hash_type_t const *hash_type*)

Starts SHA operation.

Implements rsip_api_t::shaInit.

Conditions

Argument hash_function accepts any member of enumeration rsip_hash_type_t.

State transition

This API can only be executed in **STATE_MAIN**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_SHA
Others	No change

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.

See also

Section Supported Algorithms.

◆ R_RSIP_SHA_Update()

fsp_err_t R_RSIP_SHA_Update (rsip_ctrl_t *const *p_ctrl*, uint8_t const *const *p_message*, uint32_t const *message_length*)

Inputs SHA message. (Total input message must be less than 2^64 bits.)

Implements rsip_api_t::shaUpdate.

State transition

This API can only be executed in **STATE_SHA**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_SHA_Finish()

fsp_err_t R_RSIP_SHA_Finish (rsip_ctrl_t *const *p_ctrl*, uint8_t *const *p_digest*)

Outputs SHA message digest.

Implements rsip_api_t::shaFinish.

Output length

Output length to p_digest depends on hash_function.

- 28 (RSIP_HASH_TYPE_SHA224)
- 32 (RSIP_HASH_TYPE_SHA256)
- 48 (RSIP_HASH_TYPE_SHA384)
- 64 (RSIP_HASH_TYPE_SHA512)

State transition

This API can only be executed in **STATE_SHA**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_MAIN
FSP_ERR_ASSERTION	No change
FSP_ERR_NOT_OPEN	No change
FSP_ERR_INVALID_STATE	No change
Others	STATE_MAIN

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_SHA_Suspend()

fsp_err_t R_RSIP_SHA_Suspend (rsip_ctrl_t *const *p_ctrl*, rsip_sha_handle_t *const *p_handle*)

Suspends SHA operation.

This API releases RSIP resource and outputs intermediate results. Therefore, it can be used in the following cases:

- Execute another cryptographic operations during inputting successive chunks of the message.
- Reuse intermediate results.

Implements rsip_api_t::shaSuspend.

State transition

This API can only be executed in **STATE_SHA**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_MAIN
Others	No change

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_SHA_Resume()

fsp_err_t R_RSIP_SHA_Resume (rsip_ctrl_t *const *p_ctrl*, rsip_sha_handle_t const *const *p_handle*)

Resumes SHA operation suspended by R_RSIP_SHA_Suspend().

Implements rsip_api_t::shaResume.

State transition

This API can only be executed in **STATE_MAIN**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_SHA
Others	No change

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.

◆ R_RSIP_HMAC_Compute()

fsp_err_t R_RSIP_HMAC_Compute (rsip_ctrl_t *const *p_ctrl*, const rsip_wrapped_key_t * *p_wrapped_key*, uint8_t const *const *p_message*, uint32_t const *message_length*, uint8_t *const *p_mac*)

Generates HMAC. (Total input message must be less than 2^64 bits.)

Implements rsip_api_t::hmacCompute.

Conditions

See R_RSIP_HMAC_Init().

Output length

See R_RSIP_HMAC_SignFinish().

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

Section Supported Algorithms.

◆ R_RSIP_HMAC_Verify()

fsp_err_t R_RSIP_HMAC_Verify (rsip_ctrl_t *const *p_ctrl*, const rsip_wrapped_key_t * *p_wrapped_key*, uint8_t const *const *p_message*, uint32_t const *message_length*, uint8_t const *const *p_mac*, uint32_t const *mac_length*)

Verifies HMAC. (Total input message must be less than 2^64 bits.)

Implements rsip_api_t::hmacVerify.

Conditions

See R_RSIP_HMAC_Init() and R_RSIP_HMAC_VerifyFinish().

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_INVALID_SIZE	mac_length is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	MAC verification is failed.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

See also

Section Supported Algorithms.

◆ R_RSIP_HMAC_Init()

fsp_err_t R_RSIP_HMAC_Init (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_key*)

Starts HMAC operation.

Implements rsip_api_t::hmacInit.

Conditions

Key type of p_wrapped_key must be one of the following:
- RSIP_KEY_TYPE_HMAC_SHA224
- RSIP_KEY_TYPE_HMAC_SHA256
- RSIP_KEY_TYPE_HMAC_SHA384
- RSIP_KEY_TYPE_HMAC_SHA512

State transition

This API can only be executed in **STATE_MAIN**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_HMAC
Others	No change

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key is illegal.

See also

Section Supported Algorithms.

◆ R_RSIP_HMAC_Update()

fsp_err_t R_RSIP_HMAC_Update (rsip_ctrl_t *const *p_ctrl*, uint8_t const *const *p_message*, uint32_t const *message_length*)

Inputs HMAC message. (Total input message must be less than 2^64 bits.)

Implements rsip_api_t::hmacUpdate.

State transition

This API can only be executed in **STATE_HMAC**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_HMAC_SignFinish()

fsp_err_t R_RSIP_HMAC_SignFinish (rsip_ctrl_t *const *p_ctrl*, uint8_t *const *p_mac*)

Outputs HMAC.

Implements rsip_api_t::hmacSignFinish.

Output length

Output length to p_mac depends on key type of p_wrapped_key.

- 28 (RSIP_KEY_TYPE_HMAC_SHA224)
- 32 (RSIP_KEY_TYPE_HMAC_SHA256)
- 48 (RSIP_KEY_TYPE_HMAC_SHA384)
- 64 (RSIP_KEY_TYPE_HMAC_SHA512)

State transition

This API can only be executed in **STATE_HMAC**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_MAIN
FSP_ERR_ASSERTION	No change
FSP_ERR_NOT_OPEN	No change
FSP_ERR_INVALID_STATE	No change
Others	STATE_MAIN

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_HMAC_VerifyFinish()

fsp_err_t R_RSIP_HMAC_VerifyFinish (rsip_ctrl_t *const *p_ctrl*, uint8_t const *const *p_mac*, uint32_t const *mac_length*)

Verifies HMAC.

Implements rsip_api_t::hmacVerifyFinish.

Conditions

Argument mac_length depends on key type of p_wrapped_key. Usually the longest length is recommended.

- 4 to 28 (RSIP_KEY_TYPE_HMAC_SHA224)
- 4 to 32 (RSIP_KEY_TYPE_HMAC_SHA256)
- 4 to 48 (RSIP_KEY_TYPE_HMAC_SHA384)
- 4 to 64 (RSIP_KEY_TYPE_HMAC_SHA512)

State transition

This API can only be executed in **STATE_HMAC**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_MAIN
FSP_ERR_ASSERTION	No change
FSP_ERR_NOT_OPEN	No change
FSP_ERR_INVALID_STATE	No change
FSP_ERR_INVALID_SIZE	No change
Others	STATE_MAIN

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_INVALID_SIZE	mac_length is illegal.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	MAC verification is failed.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_HMAC_Suspend()

fsp_err_t R_RSIP_HMAC_Suspend (rsip_ctrl_t *const *p_ctrl*, rsip_hmac_handle_t *const *p_handle*)

Suspends HMAC operation.

This API releases RSIP resource and outputs intermediate results. Therefore, it can be used in the following cases:

- Execute another cryptographic operations during inputting successive chunks of the message.
- Reuse intermediate results.

Implements rsip_api_t::hmacSuspend.

State transition

This API can only be executed in **STATE_HMAC**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_MAIN
Others	No change

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.
FSP_ERR_UNSUPPORTED	This API is not supported on this device.

◆ R_RSIP_HMAC_Resume()

fsp_err_t R_RSIP_HMAC_Resume (rsip_ctrl_t *const *p_ctrl*, rsip_hmac_handle_t const *const *p_handle*)

Resumes HMAC operation suspended by R_RSIP_HMAC_Suspend().

Implements rsip_api_t::hmacResume.

State transition

This API can only be executed in **STATE_MAIN**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_HMAC
Others	No change

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_UNSUPPORTED	This API is not supported on this device.

Detailed Description

Driver for the Secure Crypto Engine (SCE9) on RA MCUs.

Overview

This module provides SCE functions in protected mode.

Note

For a detailed description of the different SCE9 operating modes, refer to Application Note R11AN0498.

HW Overview

Crypto Peripheral version	Devices

SCE9 (Protected mode)	RA4M2, RA4M3, RA6M4, RA6M5

Features

The SCE module supports for the following features.

- Cryptography
  - Symmetric Encryption/Decryption
    - AES
      - ECB 128/256bit
      - CBC 128/256bit
      - GCM 128/256bit
      - CCM 128/256bit
  - Asymmetric Encryption/Decryption
    - RSA
      - RSAES-PKCS1-V1_5 1024/2048bit
      - RSAES-PKCS1-V1_5 3072/4096bit (Encryption only)
      - RSASSA-PKCS1-V1_5 1024/2048bit
      - RSASSA-PKCS1-V1_5 3072/4096bit (Verification only)
    - ECC
      - ECDSA secp192r1/secp224r1/secp256r1/secp384r1
      - ECDH secp256r1
  - Hash Functions
    - SHA-2
      - SHA-256
- Message Authentication Code
  - HMAC-SHA256bit
  - AES-CMAC 128/256bit
- Key Support
  - AES 128/256bit
  - AES Key Wrap/Key Unwrap 128/256bit
  - RSA 1024/2048bit
  - RSA 3072/4096bit (public key only)
  - ECC secp192r1/secp224r1/secp256r1/secp384r1
  - HMAC-SHA256bit
- TRNG
- TLS
  - SSL / TLS support function (TLS1.2 compliant)

Configuration

Clock Configuration

This module does not require a specific clock configuration.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Getting Started: Creating a SCE Protected Mode Project

Start by creating a new project in e² studio or RASC. On the Stacks tab, add New > Security > SCE

Protected Mode. For information on how to install and update secure keys, refer to the Application Note R11AN0496.

Reducing intialization time

The SCE intialization sequence can be modified to support a smaller subset of features and allow for a shorter intialization period. This is particularly useful in cases where startup time is important and the cryptographic features that are required are known in advance. The current fast boot configuration option supports the cryptographic primitives requried by MCUBoot including:

- RSA 3K/4K signature verification
- ECC P256 signature verification
- SHA224/256 and GHASH calcuation

Limitations

Usage of R_SCE_ECDSA_secp384r1_SignatureGenerate/Verify

The SCE does not support SHA-384 in hardware, so the APIs listed below require the user to create a SHA-384 function for signature generation and verification. To use the APIs listed below, enable SCE_USER_SHA_384_ENABLED on RA Smart Configurator and prepare a function called SCE_USER_SHA_384_FUNCTION. The interface of SCE_USER_SHA_384_FUNCTION, which is called by the following APIs, is described below.

- R_SCE_ECDSA_secp384r1_SignatureGenerate()
- R_SCE_ECDSA_secp384r1_SignatureVerify()

SCE_USER_SHA_384_FUNCTION()

```
uint32_t SCE_USER_SHA_384_FUNCTION(uint8_t *message, uint8_t* digest, uint32_t
message_length)
```

SHA-384 hash calculation is performed for an area extending the number of bytes specified by the argument message_length from the address specified by the argument message. The calculation result should be stored at the address specified by the argument digest.

Parameters

message	[in] Start address of message
digest	[in,out] address for storing hash calculation result (48 bytes)
message_length	[in] Effective byte count of message

Return values

0	Hash value stored successfully.
others	Storing of hash value failed.

Examples

AES Example

This is an example of AES-256 encryption and decryption.

```
static uint8_t plain[BLOCK * 2] =
{
    0x52, 0x65, 0x6e, 0x65, 0x73, 0x61, 0x73, 0x20, 0x45, 0x6c, 0x65, 0x63, 0x74,
0x72, 0x6f, 0x6e,
    0x69, 0x63, 0x73, 0x20, 0x43, 0x6f, 0x72, 0x70, 0x6f, 0x72, 0x61, 0x74, 0x69,
0x6f, 0x6e, 0x00
};
void r_sce_example_aes ()
{
 sce_aes_handle_t      handle;
 sce_aes_wrapped_key_t wrapped_key;
    uint8_t               cipher_calculated[32] = {0};
    uint8_t               plain_calculated[32] = {0};
    uint32_t             dummy;
 /* SCE power on */
 R_SCE_Open(&sce_ctrl, &sce_cfg);
 /* Generate a random key */
 R_SCE_AES256_WrappedKeyGenerate(&wrapped_key);
 /* Encrypt a plain text */
 R_SCE_AES256ECB_EncryptInit(&handle, &wrapped_key);
 R_SCE_AES256ECB_EncryptUpdate(&handle, plain, cipher_calculated, BLOCK * 2);
 R_SCE_AES256ECB_EncryptFinal(&handle, cipher_calculated, &dummy);
 /* Decrypt a cipher text using same key as Encryption */
 R_SCE_AES256ECB_DecryptInit(&handle, &wrapped_key);
 R_SCE_AES256ECB_DecryptUpdate(&handle, cipher_calculated, plain_calculated, BLOCK *
2);
 R_SCE_AES256ECB_DecryptFinal(&handle, plain_calculated, &dummy);
 /* SCE power off */
 R_SCE_Close(&sce_ctrl);
 /* Compare plain and plain_calculated */
 if (memcmp(plain, plain_calculated, BLOCK * 2))
    {
```

```
 while (1)
      {
 /* plain and plain_calculated are different (incorrect) */
       }
    }
 else
    {
 while (1)
      {
 /* plain and plain_calculated are the same (correct) */
       }
    }
}
```

ECC Example

This is an example of ECC secp-256 signature generate and verify.

```
uint8_t ecc256_data_msg[] =
{
 's', 'a', 'm', 'p', 'l', 'e'
};
void r_sce_example_ecc ()
{
 sce_ecc_wrapped_pair_key_t wrapped_pair_key;
 sce_ecdsa_byte_data_t      message_hash =
    {
       0
    };
 sce_ecdsa_byte_data_t signature;
    uint8_t               out_data[HW_SCE_ECDSA_DATA_BYTE_SIZE];
 fsp_err_t             return_code;
    message_hash.data_length = sizeof(ecc256_data_msg);
    message_hash.pdata       = (uint8_t *) ecc256_data_msg;
    signature.pdata          = out_data;
```

```
 /* SCE power on */
 R_SCE_Open(&sce_ctrl, &sce_cfg);
 /* Generate a random pair key */
 R_SCE_ECC_secp256r1_WrappedKeyPairGenerate(&wrapped_pair_key);
 /* Generate a Signature */
 R_SCE_ECDSA_secp256r1_SignatureGenerate(&message_hash, &signature,
&wrapped_pair_key.priv_key);
 /* Verify Signature and Public wrapped key */
    return_code = R_SCE_ECDSA_secp256r1_SignatureVerify(&signature, &message_hash,
&wrapped_pair_key.pub_key);
 /* SCE power off */
 R_SCE_Close(&sce_ctrl);
 if (FSP_SUCCESS != return_code)
    {
 while (1)
      {
 /* Verify Fail */
       }
    }
 else
    {
 while (1)
      {
 /* Verify Success */
       }
    }
}
```

RSA Example

This is an example of RSA-2048 encryption and decryption.

```
uint8_t rsa_msg[256] =
{
    0x00, 0x01, 0x02, 0x03, 0x04, 0x05, 0x06, 0x07, 0x08, 0x09, 0x0a, 0x0b, 0x0c,
```

```
0x0d, 0x0e, 0x0f,
    0x10, 0x11, 0x12, 0x13, 0x14, 0x15, 0x16, 0x17, 0x18, 0x19, 0x1a, 0x1b, 0x1c,

```

Data Structures

struct	sce_instance_ctrl_t

Data Structure Documentation

◆ sce_instance_ctrl_t

struct sce_instance_ctrl_t
SCE private control block. DO NOT MODIFY. Initialization occurs when R_SCE_Open() is called.

Function Documentation

◆ R_SCE_Open()

fsp_err_t R_SCE_Open (sce_ctrl_t *const *p_ctrl*, sce_cfg_t const *const *p_cfg*)

Enables use of SCE functionality.

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	p_cfg	Pointer to pin configuration structure.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_FAIL	The error-detection self-test failed to terminate normally.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_RETRY	Indicates that an entropy evaluation failure occurred. Run the function again.

Returns

See Common Error Codes or functions called by this function for other possible return codes.

Note

The valid pre-run state is SCE disabled. The pre-run state is SCE Disabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_Close()

fsp_err_t R_SCE_Close (sce_ctrl_t *const *p_ctrl*)

Stops supply of power to the SCE.

Parameters

[in]	p_ctrl	Pointer to control structure.

Return values

FSP_SUCCESS	Normal termination

Note

The pre-run state is any state. After the function runs the state transitions to SCE Disabled State.

◆ R_SCE_SoftwareReset()

fsp_err_t R_SCE_SoftwareReset (void)

Software reset to SCE.

Reverts the state to the SCE initial state.

Return values

FSP_SUCCESS	Normal termination

Note

The pre-run state is any state. After the function runs the state transitions to SCE Disabled State.

◆ R_SCE_AES128_WrappedKeyGenerate()

fsp_err_t R_SCE_AES128_WrappedKeyGenerate (sce_aes_wrapped_key_t * *wrapped_key*)

This API outputs 128-bit AES wrapped key from a random number.

This API generates a wrapped key from a random number in the SCE. Accordingly, user key input is unnecessary. By encrypting data using the wrapped key is output by this API, dead copying of data can be prevented.

Parameters

[in,out]	wrapped_key	128-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Disabled State.

◆ R_SCE_AES256_WrappedKeyGenerate()

fsp_err_t R_SCE_AES256_WrappedKeyGenerate (sce_aes_wrapped_key_t * *wrapped_key*)

This API outputs 256-bit AES wrapped key from a random number.

This API generates a wrapped key from a random number in the SCE. Accordingly, user key input is unnecessary. By encrypting data using the wrapped key is output by this API, dead copying of data can be prevented.

Parameters

[in,out]	wrapped_key	256-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Disabled State.

◆ R_SCE_RSA1024_WrappedKeyPairGenerate()

fsp_err_t R_SCE_RSA1024_WrappedKeyPairGenerate (sce_rsa1024_wrapped_pair_key_t * *wrapped_pair_key*)

This API outputs a wrapped key pair for a 1024-bit RSA public key and private key pair. These keys are generated from a random value produced internally by the SCE. Consequently, there is no need to input a user key. Dead copying of data can be prevented by encrypting the data using the wrapped key output by this API. A public wrapped key is generated by wrapped_pair_key->pub_key, and a private wrapped key is generated by wrapped_pair_key->priv_key. As the public key exponent, only 0x00010001 is generated.

Parameters

[in,out]	wrapped_pair_key	User key index for RSA 1024-bit public key and private key pair

Return values

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred. Key generation failed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSA2048_WrappedKeyPairGenerate()

fsp_err_t R_SCE_RSA2048_WrappedKeyPairGenerate (sce_rsa2048_wrapped_pair_key_t * *wrapped_pair_key*)

This API outputs a wrapped key pair for a 2048-bit RSA public key and private key pair. These keys are generated from a random value produced internally by the SCE. Consequently, there is no need to input a user key. Dead copying of data can be prevented by encrypting the data using the wrapped key output by this API. A public wrapped key is generated by wrapped_pair_key->pub_key, and a private wrapped key is generated by wrapped_pair_key->priv_key. As the public key exponent, only 0x00010001 is generated.

Parameters

[in,out]	wrapped_pair_key	User key index for RSA 2048-bit public key and private key pair

Return values

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred. Key generation failed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp192r1_WrappedKeyPairGenerate()

fsp_err_t R_SCE_ECC_secp192r1_WrappedKeyPairGenerate (sce_ecc_wrapped_pair_key_t * *wrapped_pair_key*)

This is an API for outputting a wrapped key pair for secp192r1 public key and private key pair. These keys are generated from a random number value internally within the SCE. There is therefore no need to input user keys. It is possible to prevent dead copying of data by using the wrapped key output by this API to encrypt the data. The public key index is generated in wrapped_pair_key->pub_key, and the private key index is generated in wrapped_pair_key->priv_key.

Parameters

[in,out]	wrapped_pair_key	Wrapped pair key for secp192r1 public key and private key pair

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp224r1_WrappedKeyPairGenerate()

fsp_err_t R_SCE_ECC_secp224r1_WrappedKeyPairGenerate (sce_ecc_wrapped_pair_key_t * *wrapped_pair_key*)

This is an API for outputting a wrapped key pair for secp224r1 public key and private key pair. These keys are generated from a random number value internally within the SCE. There is therefore no need to input user keys. It is possible to prevent dead copying of data by using the wrapped key output by this API to encrypt the data. The public key index is generated in wrapped_pair_key->pub_key, and the private key index is generated in wrapped_pair_key->priv_key.

Parameters

[in,out]	wrapped_pair_key	Wrapped pair key for secp224r1 public key and private key pair

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp256r1_WrappedKeyPairGenerate()

fsp_err_t R_SCE_ECC_secp256r1_WrappedKeyPairGenerate (sce_ecc_wrapped_pair_key_t * *wrapped_pair_key*)

This is an API for outputting a wrapped key pair for secp256r1 public key and private key pair. These keys are generated from a random number value internally within the SCE. There is therefore no need to input user keys. It is possible to prevent dead copying of data by using the wrapped key output by this API to encrypt the data. The public key index is generated in wrapped_pair_key->pub_key, and the private key index is generated in wrapped_pair_key->priv_key.

Parameters

[in,out]	wrapped_pair_key	Wrapped pair key for secp256r1 public key and private key pair

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp384r1_WrappedKeyPairGenerate()

fsp_err_t R_SCE_ECC_secp384r1_WrappedKeyPairGenerate (sce_ecc_wrapped_pair_key_t * *wrapped_pair_key*)

This is an API for outputting a wrapped key pair for secp384r1 public key and private key pair. These keys are generated from a random number value internally within the SCE. There is therefore no need to input user keys. It is possible to prevent dead copying of data by using the wrapped key output by this API to encrypt the data. The public key index is generated in wrapped_pair_key->pub_key, and the private key index is generated in wrapped_pair_key->priv_key.

Parameters

[in,out]	wrapped_pair_key	Wrapped pair key for secp384r1 public key and private key pair

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RandomNumberGenerate()

fsp_err_t R_SCE_RandomNumberGenerate (uint32_t * *random*)

This API can generate 4 words random number.

Parameters

[in,out]	random	Stores 4words (16 bytes) random data.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128_EncryptedKeyWrap()

fsp_err_t R_SCE_AES128_EncryptedKeyWrap (uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_aes_wrapped_key_t * *wrapped_key*)

This API wraps 128-bit AES key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	128-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256_EncryptedKeyWrap()

fsp_err_t R_SCE_AES256_EncryptedKeyWrap (uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_aes_wrapped_key_t * *wrapped_key*)

This API wraps 256-bit AES key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	256-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128_RFC3394KeyWrap()

fsp_err_t R_SCE_AES128_RFC3394KeyWrap (sce_aes_wrapped_key_t * *master_key*, uint32_t *target_key_type*, sce_aes_wrapped_key_t * *target_key*, uint32_t * *rfc3394_wrapped_key*)

This API wraps 128-bit AES key within the user routine.

Parameters

[in]	master_key	AES-128 key used for wrapping.
[in]	target_key_type	Selects key to be wrapped.
[in]	target_key	Key to be wrapped.
[out]	rfc3394_wrapped_key	Wrapped key.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	Resource conflict.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Input illegal user Key Generation Information.
FSP_ERR_CRYPTO_SCE_FAIL	Internal error occurred.

◆ R_SCE_AES256_RFC3394KeyWrap()

fsp_err_t R_SCE_AES256_RFC3394KeyWrap (sce_aes_wrapped_key_t * *master_key*, uint32_t *target_key_type*, sce_aes_wrapped_key_t * *target_key*, uint32_t * *rfc3394_wrapped_key*)

This API wraps 256-bit AES key within the user routine.

Parameters

[in]	master_key	AES-256 key used for wrapping.
[in]	target_key_type	Selects key to be wrapped.
[in]	target_key	Key to be wrapped.
[out]	rfc3394_wrapped_key	Wrapped key.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	Resource conflict.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Input illegal user Key Generation Information.
FSP_ERR_CRYPTO_SCE_FAIL	Internal error occurred.

◆ R_SCE_AES128_RFC3394KeyUnwrap()

fsp_err_t R_SCE_AES128_RFC3394KeyUnwrap (sce_aes_wrapped_key_t * *master_key*, uint32_t *target_key_type*, uint32_t * *rfc3394_wrapped_key*, sce_aes_wrapped_key_t * *target_key*)

This API unwraps 128-bit AES key within the user routine.

Parameters

[in]	master_key	AES-128 key used for unwrapping.
[in]	target_key_type	Selects key to be unwrapped.
[in]	rfc3394_wrapped_key	Wrapped key.
[out]	target_key	Key to be unwrapped.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	Resource conflict.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Input illegal user Key Generation Information.
FSP_ERR_CRYPTO_SCE_FAIL	Internal error occurred.

◆ R_SCE_AES256_RFC3394KeyUnwrap()

fsp_err_t R_SCE_AES256_RFC3394KeyUnwrap (sce_aes_wrapped_key_t * *master_key*, uint32_t *target_key_type*, uint32_t * *rfc3394_wrapped_key*, sce_aes_wrapped_key_t * *target_key*)

This API unwraps 256-bit AES key within the user routine.

Parameters

[in]	master_key	AES-256 key used for unwrapping.
[in]	target_key_type	Selects key to be unwrapped.
[in]	rfc3394_wrapped_key	Wrapped key.
[out]	target_key	Key to be unwrapped.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	Resource conflict.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Input illegal user Key Generation Information.
FSP_ERR_CRYPTO_SCE_FAIL	Internal error occurred.

◆ R_SCE_SHA256HMAC_EncryptedKeyWrap()

fsp_err_t R_SCE_SHA256HMAC_EncryptedKeyWrap (uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_hmac_sha_wrapped_key_t * *wrapped_key*)

This API wraps HMAC-SHA256 key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	HMAC-SHA256 wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSA1024_EncryptedPublicKeyWrap()

fsp_err_t R_SCE_RSA1024_EncryptedPublicKeyWrap (uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_rsa1024_public_wrapped_key_t * *wrapped_key*)

This API wraps 1024-bit RSA public key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	1024-bit RSA public wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSA1024_EncryptedPrivateKeyWrap()

fsp_err_t R_SCE_RSA1024_EncryptedPrivateKeyWrap (uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_rsa1024_private_wrapped_key_t * *wrapped_key*)

This API wraps 1024-bit RSA private key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	1024-bit RSA private wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSA2048_EncryptedPublicKeyWrap()

fsp_err_t R_SCE_RSA2048_EncryptedPublicKeyWrap (uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_rsa2048_public_wrapped_key_t * *wrapped_key*)

This API wraps 2048-bit RSA public key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	1024-bit RSA public wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSA2048_EncryptedPrivateKeyWrap()

fsp_err_t R_SCE_RSA2048_EncryptedPrivateKeyWrap (uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_rsa2048_private_wrapped_key_t * *wrapped_key*)

This API wraps 2048-bit RSA private key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	2048-bit RSA private wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSA3072_EncryptedPublicKeyWrap()

fsp_err_t R_SCE_RSA3072_EncryptedPublicKeyWrap (uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_rsa3072_public_wrapped_key_t * *wrapped_key*)

This API wraps 3072-bit RSA public key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	3072-bit RSA public wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSA4096_EncryptedPublicKeyWrap()

fsp_err_t R_SCE_RSA4096_EncryptedPublicKeyWrap (uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_rsa4096_public_wrapped_key_t * *wrapped_key*)

This API wraps 4096-bit RSA public key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	1024-bit RSA public wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp192r1_EncryptedPublicKeyWrap()

fsp_err_t R_SCE_ECC_secp192r1_EncryptedPublicKeyWrap (uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_ecc_public_wrapped_key_t * *wrapped_key*)

This API wraps secp192r1 public key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	secp192r1 public wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp224r1_EncryptedPublicKeyWrap()

fsp_err_t R_SCE_ECC_secp224r1_EncryptedPublicKeyWrap (uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_ecc_public_wrapped_key_t * *wrapped_key*)

This API wraps secp224r1 public key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	secp224r1 public wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp256r1_EncryptedPublicKeyWrap()

fsp_err_t R_SCE_ECC_secp256r1_EncryptedPublicKeyWrap (uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_ecc_public_wrapped_key_t * *wrapped_key*)

This API wraps secp256r1 public key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	secp256r1 public wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp384r1_EncryptedPublicKeyWrap()

fsp_err_t R_SCE_ECC_secp384r1_EncryptedPublicKeyWrap (uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_ecc_public_wrapped_key_t * *wrapped_key*)

This API wraps secp384r1 public key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	secp384r1 public wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp192r1_EncryptedPrivateKeyWrap()

fsp_err_t R_SCE_ECC_secp192r1_EncryptedPrivateKeyWrap (uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_ecc_private_wrapped_key_t * *wrapped_key*)

This API wraps secp192r1 private key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	secp192r1 private wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp224r1_EncryptedPrivateKeyWrap()

fsp_err_t R_SCE_ECC_secp224r1_EncryptedPrivateKeyWrap (uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_ecc_private_wrapped_key_t * *wrapped_key*)

This API wraps secp224r1 private key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	secp224r1 private wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp256r1_EncryptedPrivateKeyWrap()

fsp_err_t R_SCE_ECC_secp256r1_EncryptedPrivateKeyWrap (uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_ecc_private_wrapped_key_t * *wrapped_key*)

This API wraps secp256r1 private key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	secp256r1 private wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp384r1_EncryptedPrivateKeyWrap()

fsp_err_t R_SCE_ECC_secp384r1_EncryptedPrivateKeyWrap (uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_ecc_private_wrapped_key_t * *wrapped_key*)

This API wraps secp384r1 private key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	secp384r1 private wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128ECB_EncryptInit()

fsp_err_t R_SCE_AES128ECB_EncryptInit (sce_aes_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key*)

The R_SCE_AES128ECB_EncryptInit() function performs preparations for the execution of an AES calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R_SCE_AES128ECB_EncryptUpdate() function and R_SCE_AES128ECB_EncryptFinal() function.

Parameters

[in,out]	handle	AES handler (work area)
[in]	wrapped_key	128-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Input illegal wrapped key.
FSP_ERR_CRYPTO_SCE_FAIL	Internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128ECB_EncryptUpdate()

fsp_err_t R_SCE_AES128ECB_EncryptUpdate (sce_aes_handle_t * *handle*, uint8_t * *plain*, uint8_t * *cipher*, uint32_t *plain_length*)

The R_SCE_AES128ECB_EncryptUpdate() function encrypts the second argument, plain, utilizing the key index stored in the handle specified in the first argument, handle, and writes the ongoing status to this first argument. In addition, it writes the encryption result to the third argument, cipher. After plaintext input is completed, call R_SCE_AES128ECB_EncryptFinal().

Specify areas for plain and cipher that do not overlap. For plain and cipher, specify RAM addresses that are multiples of 4.

Parameters

[in,out]	handle	AES handler (work area)
[in]	plain	plaintext data area
[in,out]	cipher	ciphertext data area
[in,out]	plain_length	plaintext data length (must be a multiple of 16)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128ECB_EncryptFinal()

fsp_err_t R_SCE_AES128ECB_EncryptFinal (sce_aes_handle_t * *handle*, uint8_t * *cipher*, uint32_t * *cipher_length*)

Using the handle specified in the first argument, handle, the R_SCE_AES128ECB_EncryptFinal() function writes the calculation result to the second argument, cipher, and writes the length of the calculation result to the third argument, cipher_length. The original intent was for a portion of the encryption result that was not a multiple of 16 bytes to be written to the second argument. However, as a result of the restriction that only multiples of 16 can be input to the Update function, nothing is ever written to cipher, and 0 is always written to cipher_length. The arguments cipher and cipher_length are provided for compatibility in anticipation of the time when this restriction is lifted.

Parameters

[in,out]	handle	AES handler (work area)
[in,out]	cipher	ciphertext data area (nothing ever written here)
[in,out]	cipher_length	ciphertext data length (0 always written here)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128ECB_DecryptInit()

fsp_err_t R_SCE_AES128ECB_DecryptInit (sce_aes_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key*)

The R_SCE_AES128ECB_DecryptInit() function performs preparations for the execution of an AES calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R_SCE_AES128ECB_DecryptUpdate() function and R_SCE_AES128ECB_DecryptFinal() function.

Parameters

[in,out]	handle	AES handler (work area)
[in]	wrapped_key	128-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Input illegal wrapped key.
FSP_ERR_CRYPTO_SCE_FAIL	Internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128ECB_DecryptUpdate()

fsp_err_t R_SCE_AES128ECB_DecryptUpdate (sce_aes_handle_t * *handle*, uint8_t * *cipher*, uint8_t * *plain*, uint32_t *cipher_length*)

The R_SCE_AES128ECB_DecryptUpdate() function decrypts the second argument, cipher, utilizing the key index stored in the handle specified in the first argument, handle, and writes the ongoing status to this first argument. In addition, it writes the decryption result to the third argument, plain. After plaintext input is completed, call R_SCE_AES128ECB_DecryptFinal().

Specify areas for plain and cipher that do not overlap. For plain and cipher, specify RAM addresses that are multiples of 4.

Parameters

[in,out]	handle	AES handler (work area)
[in]	cipher	ciphertext data area
[in,out]	plain	plaintext data area
[in,out]	cipher_length	ciphertext data length (must be a multiple of 16)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128ECB_DecryptFinal()

fsp_err_t R_SCE_AES128ECB_DecryptFinal (sce_aes_handle_t * *handle*, uint8_t * *plain*, uint32_t * *plain_length*)

Using the handle specified in the first argument, handle, the R_SCE_AES128ECB_DecryptFinal() function writes the calculation result to the second argument, plain, and writes the length of the calculation result to the third argument, plain_length. The original intent was for a portion of the decryption result that was not a multiple of 16 bytes to be written to the second argument. However, as a result of the restriction that only multiples of 16 can be input to the Update function, nothing is ever written to plain, and 0 is always written to plain_length. The arguments plain and plain_length are provided for compatibility in anticipation of the time when this restriction is lifted.

Parameters

[in,out]	handle	AES handler (work area)
[in,out]	plain	plaintext data area (nothing ever written here)
[in,out]	plain_length	plaintext data length (0 always written here)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256ECB_EncryptInit()

fsp_err_t R_SCE_AES256ECB_EncryptInit (sce_aes_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key*)

The R_SCE_AES256ECB_EncryptInit() function performs preparations for the execution of an AES calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R_SCE_AES256ECB_EncryptUpdate() function and R_SCE_AES256ECB_EncryptFinal() function.

Parameters

[in,out]	handle	AES handler (work area)
[in]	wrapped_key	128-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Input illegal wrapped key.
FSP_ERR_CRYPTO_SCE_FAIL	Internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256ECB_EncryptUpdate()

fsp_err_t R_SCE_AES256ECB_EncryptUpdate (sce_aes_handle_t * *handle*, uint8_t * *plain*, uint8_t * *cipher*, uint32_t *plain_length*)

The R_SCE_AES256ECB_EncryptUpdate() function encrypts the second argument, plain, utilizing the key index stored in the handle specified in the first argument, handle, and writes the ongoing status to this first argument. In addition, it writes the encryption result to the third argument, cipher. After plaintext input is completed, call R_SCE_AES256ECB_EncryptFinal().

Specify areas for plain and cipher that do not overlap. For plain and cipher, specify RAM addresses that are multiples of 4.

Parameters

[in,out]	handle	AES handler (work area)
[in]	plain	plaintext data area
[in,out]	cipher	ciphertext data area
[in,out]	plain_length	plaintext data length (must be a multiple of 16)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256ECB_EncryptFinal()

fsp_err_t R_SCE_AES256ECB_EncryptFinal (sce_aes_handle_t * *handle*, uint8_t * *cipher*, uint32_t * *cipher_length*)

Using the handle specified in the first argument, handle, the R_SCE_AES256ECB_EncryptFinal() function writes the calculation result to the second argument, cipher, and writes the length of the calculation result to the third argument, cipher_length. The original intent was for a portion of the encryption result that was not a multiple of 16 bytes to be written to the second argument. However, as a result of the restriction that only multiples of 16 can be input to the Update function, nothing is ever written to cipher, and 0 is always written to cipher_length. The arguments cipher and cipher_length are provided for compatibility in anticipation of the time when this restriction is lifted.

Parameters

[in,out]	handle	AES handler (work area)
[in,out]	cipher	ciphertext data area (nothing ever written here)
[in,out]	cipher_length	ciphertext data length (0 always written here)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256ECB_DecryptInit()

fsp_err_t R_SCE_AES256ECB_DecryptInit (sce_aes_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key*)

The R_SCE_AES128ECB_DecryptInit() function performs preparations for the execution of an AES calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R_SCE_AES128ECB_DecryptUpdate() function and R_SCE_AES128ECB_DecryptFinal() function.

Parameters

[in,out]	handle	AES handler (work area)
[in]	wrapped_key	128-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Input illegal wrapped key.
FSP_ERR_CRYPTO_SCE_FAIL	Internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256ECB_DecryptUpdate()

fsp_err_t R_SCE_AES256ECB_DecryptUpdate (sce_aes_handle_t * *handle*, uint8_t * *cipher*, uint8_t * *plain*, uint32_t *cipher_length*)

The R_SCE_AES256ECB_DecryptUpdate() function decrypts the second argument, cipher, utilizing the key index stored in the handle specified in the first argument, handle, and writes the ongoing status to this first argument. In addition, it writes the decryption result to the third argument, plain. After plaintext input is completed, call R_SCE_AES256ECB_DecryptFinal().

Specify areas for plain and cipher that do not overlap. For plain and cipher, specify RAM addresses that are multiples of 4.

Parameters

[in,out]	handle	AES handler (work area)
[in]	cipher	ciphertext data area
[in,out]	plain	plaintext data area
[in,out]	cipher_length	ciphertext data length (must be a multiple of 16)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256ECB_DecryptFinal()

fsp_err_t R_SCE_AES256ECB_DecryptFinal (sce_aes_handle_t * *handle*, uint8_t * *plain*, uint32_t * *plain_length*)

Using the handle specified in the first argument, handle, the R_SCE_AES256ECB_DecryptFinal() function writes the calculation result to the second argument, plain, and writes the length of the calculation result to the third argument, plain_length. The original intent was for a portion of the decryption result that was not a multiple of 16 bytes to be written to the second argument. However, as a result of the restriction that only multiples of 16 can be input to the Update function, nothing is ever written to plain, and 0 is always written to plain_length. The arguments plain and plain_length are provided for compatibility in anticipation of the time when this restriction is lifted.

Parameters

[in,out]	handle	AES handler (work area)
[in,out]	plain	plaintext data area (nothing ever written here)
[in,out]	plain_length	plaintext data length (0 always written here)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CBC_EncryptInit()

fsp_err_t R_SCE_AES128CBC_EncryptInit (sce_aes_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key*, uint8_t * *initial_vector*)

The R_SCE_AES128CBC_EncryptInit() function performs preparations for the execution of an AES calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R_SCE_AES128CBC_EncryptUpdate() function and R_SCE_AES128CBC_EncryptFinal() function.

Parameters

[in,out]	handle	AES handler (work area)
[in]	wrapped_key	128-bit AES wrapped key
[in]	initial_vector	initialization vector area (16byte)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Input illegal wrapped key.
FSP_ERR_CRYPTO_SCE_FAIL	Internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CBC_EncryptUpdate()

fsp_err_t R_SCE_AES128CBC_EncryptUpdate (sce_aes_handle_t * *handle*, uint8_t * *plain*, uint8_t * *cipher*, uint32_t *plain_length*)

The R_SCE_AES128CBC_EncryptUpdate() function encrypts the second argument, plain, utilizing the key index stored in the handle specified in the first argument, handle, and writes the ongoing status to this first argument. In addition, it writes the encryption result to the third argument, cipher. After plaintext input is completed, call R_SCE_AES128CBC_EncryptFinal().

Specify areas for plain and cipher that do not overlap. For plain and cipher, specify RAM addresses that are multiples of 4.

Parameters

[in,out]	handle	AES handler (work area)
[in]	plain	plaintext data area
[in,out]	cipher	ciphertext data area
[in,out]	plain_length	plaintext data length (must be a multiple of 16)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CBC_EncryptFinal()

fsp_err_t R_SCE_AES128CBC_EncryptFinal (sce_aes_handle_t * *handle*, uint8_t * *cipher*, uint32_t * *cipher_length*)

Using the handle specified in the first argument, handle, the R_SCE_AES128CBC_EncryptFinal() function writes the calculation result to the second argument, cipher, and writes the length of the calculation result to the third argument, cipher_length. The original intent was for a portion of the encryption result that was not a multiple of 16 bytes to be written to the second argument. However, as a result of the restriction that only multiples of 16 can be input to the Update function, nothing is ever written to cipher, and 0 is always written to cipher_length. The arguments cipher and cipher_length are provided for compatibility in anticipation of the time when this restriction is lifted.

Parameters

[in,out]	handle	AES handler (work area)
[in,out]	cipher	ciphertext data area (nothing ever written here)
[in,out]	cipher_length	ciphertext data length (0 always written here)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CBC_DecryptInit()

fsp_err_t R_SCE_AES128CBC_DecryptInit (sce_aes_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key*, uint8_t * *initial_vector*)

The R_SCE_AES128CBC_DecryptInit() function performs preparations for the execution of an AES calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R_SCE_AES128CBC_DecryptUpdate() function and R_SCE_AES128CBC_DecryptFinal() function.

Parameters

[in,out]	handle	AES handler (work area)
[in]	wrapped_key	128-bit AES wrapped key
[in]	initial_vector	initialization vector area (16byte)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Input illegal wrapped key.
FSP_ERR_CRYPTO_SCE_FAIL	Internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CBC_DecryptUpdate()

fsp_err_t R_SCE_AES128CBC_DecryptUpdate (sce_aes_handle_t * *handle*, uint8_t * *cipher*, uint8_t * *plain*, uint32_t *cipher_length*)

The R_SCE_AES128CBC_DecryptUpdate() function decrypts the second argument, cipher, utilizing the key index stored in the handle specified in the first argument, handle, and writes the ongoing status to this first argument. In addition, it writes the decryption result to the third argument, plain. After plaintext input is completed, call R_SCE_AES128CBC_DecryptFinal().

Specify areas for plain and cipher that do not overlap. For plain and cipher, specify RAM addresses that are multiples of 4.

Parameters

[in,out]	handle	AES handler (work area)
[in]	cipher	ciphertext data area
[in,out]	plain	plaintext data area
[in,out]	cipher_length	ciphertext data length (must be a multiple of 16)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CBC_DecryptFinal()

fsp_err_t R_SCE_AES128CBC_DecryptFinal (sce_aes_handle_t * *handle*, uint8_t * *plain*, uint32_t * *plain_length*)

Using the handle specified in the first argument, handle, the R_SCE_AES128CBC_DecryptFinal() function writes the calculation result to the second argument, plain, and writes the length of the calculation result to the third argument, plain_length. The original intent was for a portion of the decryption result that was not a multiple of 16 bytes to be written to the second argument. However, as a result of the restriction that only multiples of 16 can be input to the Update function, nothing is ever written to plain, and 0 is always written to plain_length. The arguments plain and plain_length are provided for compatibility in anticipation of the time when this restriction is lifted.

Parameters

[in,out]	handle	AES handler (work area)
[in,out]	plain	plaintext data area (nothing ever written here)
[in,out]	plain_length	plaintext data length (0 always written here)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CBC_EncryptInit()

fsp_err_t R_SCE_AES256CBC_EncryptInit (sce_aes_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key*, uint8_t * *initial_vector*)

The R_SCE_AES256CBC_EncryptInit() function performs preparations for the execution of an AES calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R_SCE_AES256CBC_EncryptUpdate() function and R_SCE_AES256CBC_EncryptFinal() function.

Parameters

[in,out]	handle	AES handler (work area)
[in]	wrapped_key	256-bit AES wrapped key
[in]	initial_vector	initial vector area (16byte)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Input illegal wrapped key.
FSP_ERR_CRYPTO_SCE_FAIL	Internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CBC_EncryptUpdate()

fsp_err_t R_SCE_AES256CBC_EncryptUpdate (sce_aes_handle_t * *handle*, uint8_t * *plain*, uint8_t * *cipher*, uint32_t *plain_length*)

The R_SCE_AES256CBC_EncryptUpdate() function encrypts the second argument, plain, utilizing the key index stored in the handle specified in the first argument, handle, and writes the ongoing status to this first argument. In addition, it writes the encryption result to the third argument, cipher. After plaintext input is completed, call R_SCE_AES256CBC_EncryptFinal().

Specify areas for plain and cipher that do not overlap. For plain and cipher, specify RAM addresses that are multiples of 4.

Parameters

[in,out]	handle	AES handler (work area)
[in]	plain	plaintext data area
[in,out]	cipher	ciphertext data area
[in,out]	plain_length	plaintext data length (must be a multiple of 16)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CBC_EncryptFinal()

fsp_err_t R_SCE_AES256CBC_EncryptFinal (sce_aes_handle_t * *handle*, uint8_t * *cipher*, uint32_t * *cipher_length*)

Using the handle specified in the first argument, handle, the R_SCE_AES256CBC_EncryptFinal() function writes the calculation result to the second argument, cipher, and writes the length of the calculation result to the third argument, cipher_length. The original intent was for a portion of the encryption result that was not a multiple of 16 bytes to be written to the second argument. However, as a result of the restriction that only multiples of 16 can be input to the Update function, nothing is ever written to cipher, and 0 is always written to cipher_length. The arguments cipher and cipher_length are provided for compatibility in anticipation of the time when this restriction is lifted.

Parameters

[in,out]	handle	AES handler (work area)
[in,out]	cipher	ciphertext data area (nothing ever written here)
[in,out]	cipher_length	ciphertext data length (0 always written here)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CBC_DecryptInit()

fsp_err_t R_SCE_AES256CBC_DecryptInit (sce_aes_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key*, uint8_t * *initial_vector*)

The R_SCE_AES256CBC_DecryptInit() function performs preparations for the execution of an AES calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R_SCE_AES256CBC_DecryptUpdate() function and R_SCE_AES256CBC_DecryptFinal() function.

Parameters

[in,out]	handle	AES handler (work area)
[in]	wrapped_key	256-bit AES wrapped key
[in]	initial_vector	initialization vector area (16byte)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Input illegal wrapped key.
FSP_ERR_CRYPTO_SCE_FAIL	Internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CBC_DecryptUpdate()

fsp_err_t R_SCE_AES256CBC_DecryptUpdate (sce_aes_handle_t * *handle*, uint8_t * *cipher*, uint8_t * *plain*, uint32_t *cipher_length*)

The R_SCE_AES256CBC_DecryptUpdate() function decrypts the second argument, cipher, utilizing the key index stored in the handle specified in the first argument, handle, and writes the ongoing status to this first argument. In addition, it writes the decryption result to the third argument, plain. After plaintext input is completed, call R_SCE_AES256CBC_DecryptFinal().

Specify areas for plain and cipher that do not overlap. For plain and cipher, specify RAM addresses that are multiples of 4.

Parameters

[in,out]	handle	AES handler (work area)
[in]	cipher	ciphertext data area
[in,out]	plain	plaintext data area
[in,out]	cipher_length	ciphertext data length (must be a multiple of 16)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CBC_DecryptFinal()

fsp_err_t R_SCE_AES256CBC_DecryptFinal (sce_aes_handle_t * *handle*, uint8_t * *plain*, uint32_t * *plain_length*)

Using the handle specified in the first argument, handle, the R_SCE_AES256CBC_DecryptFinal() function writes the calculation result to the second argument, plain, and writes the length of the calculation result to the third argument, plain_length. The original intent was for a portion of the decryption result that was not a multiple of 16 bytes to be written to the second argument. However, as a result of the restriction that only multiples of 16 can be input to the Update function, nothing is ever written to plain, and 0 is always written to plain_length. The arguments plain and plain_length are provided for compatibility in anticipation of the time when this restriction is lifted.

Parameters

[in,out]	handle	AES handler (work area)
[in,out]	plain	plaintext data area (nothing ever written here)
[in,out]	plain_length	plaintext data length (0 always written here)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128GCM_EncryptInit()

fsp_err_t R_SCE_AES128GCM_EncryptInit (sce_gcm_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key*, uint8_t * *initial_vector*, uint32_t *initial_vector_length*)

The R_SCE_AES128GCM_EncryptInit() function performs preparations for the execution of an GCM calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R_SCE_AES128GCM_EncryptUpdate() function and R_SCE_AES128GCM_EncryptFinal() function.

Parameters

[in,out]	handle	AES-GCM handler (work area)
[in]	wrapped_key	128-bit AES wrapped key
[in]	initial_vector	initialization vector area (initial_vector_length byte)
[in]	initial_vector_length	initialization vector length (1 ore more bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128GCM_EncryptUpdate()

fsp_err_t R_SCE_AES128GCM_EncryptUpdate (sce_gcm_handle_t * *handle*, uint8_t * *plain*, uint8_t * *cipher*, uint32_t *plain_data_length*, uint8_t * *aad*, uint32_t *aad_length*)

The R_SCE_AES128GCM_EncryptUpdate() function encrypts the plaintext specified in the second argument, plain, in GCM mode using the values specified for wrapped_key and initial_vector in R_SCE_AES128GCM_EncryptInit(), along with the additional authentication data specified in the fifth argument, aad. Inside this function, the data that is input by the user is buffered until the input values of aad and plain exceed 16 bytes. After the input data from plain reaches 16 bytes or more, the encryption result is output to the ciphertext data area specified in the third argument, cipher. The lengths of the plain and aad data to input are respectively specified in the fourth argument, plain_data_length, and the sixth argument, aad_length. For these, specify not the total byte count for the aad and plain input data, but rather the data length to input when the user calls this function. If the input values plain and aad are not divisible by 16 bytes, they will be padded inside the function. First process the data that is input from aad, and then process the data that is input from plain. If aad data is input after starting to input plain data, an error will occur. If aad data and plain data are input to this function at the same time, the aad data will be processed, and then the function will transition to the plain data input state.

Specify areas for plain and cipher that do not overlap. For plain, cipher, initial_vector, and aad, specify RAM addresses that are multiples of 4

Parameters

[in,out]	handle	AES-GCM handler (work area)
[in]	plain	plaintext data area
[in,out]	cipher	ciphertext data area
[in]	plain_data_length	plaintext data length (0 or more bytes)
[in]	aad	additional authentication data (aad_length byte)
[in]	aad_length	additional authentication data length (0 or more bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_PARAMETER	After the data from plain was input, an invalid handle was input from aad.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128GCM_EncryptFinal()

fsp_err_t R_SCE_AES128GCM_EncryptFinal (sce_gcm_handle_t * *handle*, uint8_t * *cipher*, uint32_t * *cipher_data_length*, uint8_t * *atag*)

If there is 16-byte fractional data indicated by the total data length of the value of plain that was input by R_SCE_AES128GCM_EncryptUpdate (), the R_SCE_AES128GCM_EncryptFinal() function will output the result of encrypting that fractional data to the ciphertext data area specified in the second argument, cipher. Here, the portion that does not reach 16 bytes will be padded with zeros. The authentication tag is output to the fourth argument, atag. For cipher and atag, specify RAM addresses that are multiples of 4.

Parameters

[in,out]	handle	AES-GCM handler (work area)
[in,out]	cipher	ciphertext data area (cipher_data_length byte)
[in,out]	cipher_data_length	ciphertext data length (0 always written here)
[in,out]	atag	authentication tag area

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128GCM_DecryptInit()

fsp_err_t R_SCE_AES128GCM_DecryptInit (sce_gcm_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key*, uint8_t * *initial_vector*, uint32_t *initial_vector_length*)

The R_SCE_AES128GCM_DecryptInit() function performs preparations for the execution of an GCM calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R_SCE_AES128GCM_DecryptUpdate() function and R_SCE_AES128GCM_DecryptFinal() function.

Parameters

[in,out]	handle	AES-GCM handler (work area)
[in]	wrapped_key	128-bit AES wrapped key
[in]	initial_vector	initialization vector area (initial_vector_length byte)
[in]	initial_vector_length	initialization vector length (1 ore more bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128GCM_DecryptUpdate()

fsp_err_t R_SCE_AES128GCM_DecryptUpdate (sce_gcm_handle_t * *handle*, uint8_t * *cipher*, uint8_t * *plain*, uint32_t *cipher_data_length*, uint8_t * *aad*, uint32_t *aad_length*)

The R_SCE_AES128GCM_DecryptUpdate() function decrypts the ciphertext specified in the second argument, cipher, in GCM mode using the values specified for wrapped_key and initial_vector in R_SCE_AES128GCM_DecryptInit(), along with the additional authentication data specified in the fifth argument, aad. Inside this function, the data that is input by the user is buffered until the input values of aad and plain exceed 16 bytes. After the input data from cipher reaches 16 bytes or more, the decryption result is output to the plaintext data area specified in the third argument, plain. The lengths of the cipher and aad data to input are respectively specified in the fourth argument, cipher_data_length, and the sixth argument, aad_length. For these, specify not the total byte count for the aad and cipher input data, but rather the data length to input when the user calls this function. If the input values cipher and aad are not divisible by 16 bytes, they will be padded inside the function. First process the data that is input from aad, and then process the data that is input from cipher. If aad data is input after starting to input cipher data, an error will occur. If aad data and cipher data are input to this function at the same time, the aad data will be processed, and then the function will transition to the cipher data input state. Specify areas for plain and cipher that do not overlap. For plain, cipher, stage, initial_vector, and aad, specify RAM addresses that are multiples of 4.

Parameters

[in,out]	handle	AES-GCM handler (work area)
[in,out]	cipher	ciphertext data area
[in]	plain	plaintext data area
[in]	cipher_data_length	ciphertext data length (0 or more bytes)
[in]	aad	additional authentication data (aad_length byte)
[in]	aad_length	additional authentication data length (0 or more bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_PARAMETER	After the data from plain was input, an invalid handle was input from aad.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128GCM_DecryptFinal()

fsp_err_t R_SCE_AES128GCM_DecryptFinal (sce_gcm_handle_t * *handle*, uint8_t * *plain*, uint32_t * *plain_data_length*, uint8_t * *atag*, uint32_t *atag_length*)

The R_SCE_AES128GCM_DecryptFinal() function decrypts, in GCM mode, the fractional ciphertext specified by R_SCE_AES128GCM_DecryptUpdate() that does not reach 16 bytes, and ends GCM decryption. The encryption data and authentication tag are respectively output to the plaintext data area specified in the second argument, plain, and the authentication tag area specified in the fourth argument, atag. The decoded data length is output to the third argument, plain_data_length. If authentication fails, the return value will be TSIP_ERR_AUTHENTICATION. For the fourth argument, atag, input 16 bytes or less. If it is less than 16 bytes, it will be padded with zeros inside the function. For plain and atag, specify RAM addresses that are multiples of 4.

Parameters

[in,out]	handle	AES-GCM handler (work area)
[in,out]	plain	plaintext data area (cipher_data_length byte)
[in,out]	plain_data_length	plaintext data length (0 always written here)
[in,out]	atag	authentication tag area (atag_length byte)
[in]	atag_length	authentication tag length (4,8,12,13,14,15,16 bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_AUTHENTICATION	Authentication failed
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256GCM_EncryptInit()

fsp_err_t R_SCE_AES256GCM_EncryptInit (sce_gcm_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key*, uint8_t * *initial_vector*, uint32_t *initial_vector_length*)

The R_SCE_AES256GCM_EncryptInit() function performs preparations for the execution of an GCM calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R_SCE_AES256GCM_EncryptUpdate() function and R_SCE_AES256GCM_EncryptFinal() function.

Parameters

[in,out]	handle	AES-GCM handler (work area)
[in]	wrapped_key	256-bit AES wrapped key
[in]	initial_vector	initialization vector area (initial_vector_length byte)
[in]	initial_vector_length	initialization vector length (1 ore more bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256GCM_EncryptUpdate()

fsp_err_t R_SCE_AES256GCM_EncryptUpdate (sce_gcm_handle_t * *handle*, uint8_t * *plain*, uint8_t * *cipher*, uint32_t *plain_data_length*, uint8_t * *aad*, uint32_t *aad_length*)

The R_SCE_AES256GCM_EncryptUpdate() function encrypts the plaintext specified in the second argument, plain, in GCM mode using the values specified for wrapped_key and initial_vector in R_SCE_AES256GCM_EncryptInit(), along with the additional authentication data specified in the fifth argument, aad. Inside this function, the data that is input by the user is buffered until the input values of aad and plain exceed 16 bytes. After the input data from plain reaches 16 bytes or more, the encryption result is output to the ciphertext data area specified in the third argument, cipher. The lengths of the plain and aad data to input are respectively specified in the fourth argument, plain_data_length, and the sixth argument, aad_length. For these, specify not the total byte count for the aad and plain input data, but rather the data length to input when the user calls this function. If the input values plain and aad are not divisible by 16 bytes, they will be padded inside the function. First process the data that is input from aad, and then process the data that is input from plain. If aad data is input after starting to input plain data, an error will occur. If aad data and plain data are input to this function at the same time, the aad data will be processed, and then the function will transition to the plain data input state.

Specify areas for plain and cipher that do not overlap. For plain, cipher, initial_vector, and aad, specify RAM addresses that are multiples of 4

Parameters

[in,out]	handle	AES-GCM handler (work area)
[in]	plain	plaintext data area
[in,out]	cipher	ciphertext data area
[in]	plain_data_length	plaintext data length (0 or more bytes)
[in]	aad	additional authentication data (aad_length byte)
[in]	aad_length	additional authentication data length (0 or more bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_PARAMETER	After the data from plain was input, an invalid handle was input from aad.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256GCM_EncryptFinal()

fsp_err_t R_SCE_AES256GCM_EncryptFinal (sce_gcm_handle_t * *handle*, uint8_t * *cipher*, uint32_t * *cipher_data_length*, uint8_t * *atag*)

If there is 16-byte fractional data indicated by the total data length of the value of plain that was input by R_SCE_AES256GCM_EncryptUpdate (), the R_SCE_AES256GCM_EncryptFinal() function will output the result of encrypting that fractional data to the ciphertext data area specified in the second argument, cipher. Here, the portion that does not reach 16 bytes will be padded with zeros. The authentication tag is output to the fourth argument, atag. For cipher and atag, specify RAM addresses that are multiples of 4.

Parameters

[in,out]	handle	AES-GCM handler (work area)
[in,out]	cipher	ciphertext data area (cipher_data_length byte)
[in,out]	cipher_data_length	ciphertext data length (0 always written here)
[in,out]	atag	authentication tag area

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256GCM_DecryptInit()

fsp_err_t R_SCE_AES256GCM_DecryptInit (sce_gcm_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key*, uint8_t * *initial_vector*, uint32_t *initial_vector_length*)

The R_SCE_AES256GCM_DecryptInit() function performs preparations for the execution of an GCM calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R_SCE_AES256GCM_DecryptUpdate() function and R_SCE_AES256GCM_DecryptFinal() function.

Parameters

[in,out]	handle	AES-GCM handler (work area)
[in]	wrapped_key	256-bit AES wrapped key
[in]	initial_vector	initialization vector area (initial_vector_length byte)
[in]	initial_vector_length	initialization vector length (1 ore more bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256GCM_DecryptUpdate()

fsp_err_t R_SCE_AES256GCM_DecryptUpdate (sce_gcm_handle_t * *handle*, uint8_t * *cipher*, uint8_t * *plain*, uint32_t *cipher_data_length*, uint8_t * *aad*, uint32_t *aad_length*)

The R_SCE_AES256GCM_DecryptUpdate() function decrypts the ciphertext specified in the second argument, cipher, in GCM mode using the values specified for wrapped_key and initial_vector in R_SCE_AES256GCM_DecryptInit(), along with the additional authentication data specified in the fifth argument, aad. Inside this function, the data that is input by the user is buffered until the input values of aad and plain exceed 16 bytes. After the input data from cipher reaches 16 bytes or more, the decryption result is output to the plaintext data area specified in the third argument, plain. The lengths of the cipher and aad data to input are respectively specified in the fourth argument, cipher_data_length, and the sixth argument, aad_length. For these, specify not the total byte count for the aad and cipher input data, but rather the data length to input when the user calls this function. If the input values cipher and aad are not divisible by 16 bytes, they will be padded inside the function. First process the data that is input from aad, and then process the data that is input from cipher. If aad data is input after starting to input cipher data, an error will occur. If aad data and cipher data are input to this function at the same time, the aad data will be processed, and then the function will transition to the cipher data input state. Specify areas for plain and cipher that do not overlap. For plain, cipher, stage, initial_vector, and aad, specify RAM addresses that are multiples of 4.

Parameters

[in,out]	handle	AES-GCM handler (work area)
[in,out]	cipher	ciphertext data area
[in]	plain	plaintext data area
[in]	cipher_data_length	ciphertext data length (0 or more bytes)
[in]	aad	additional authentication data (aad_length byte)
[in]	aad_length	additional authentication data length (0 or more bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_PARAMETER	After the data from plain was input, an invalid handle was input from aad.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256GCM_DecryptFinal()

fsp_err_t R_SCE_AES256GCM_DecryptFinal (sce_gcm_handle_t * *handle*, uint8_t * *plain*, uint32_t * *plain_data_length*, uint8_t * *atag*, uint32_t *atag_length*)

The R_SCE_AES256GCM_DecryptFinal() function decrypts, in GCM mode, the fractional ciphertext specified by R_SCE_AES256GCM_DecryptUpdate() that does not reach 16 bytes, and ends GCM decryption. The encryption data and authentication tag are respectively output to the plaintext data area specified in the second argument, plain, and the authentication tag area specified in the fourth argument, atag. The decoded data length is output to the third argument, plain_data_length. If authentication fails, the return value will be TSIP_ERR_AUTHENTICATION. For the fourth argument, atag, input 16 bytes or less. If it is less than 16 bytes, it will be padded with zeros inside the function. For plain and atag, specify RAM addresses that are multiples of 4.

Parameters

[in,out]	handle	AES-GCM handler (work area)
[in,out]	plain	plaintext data area (cipher_data_length byte)
[in,out]	plain_data_length	plaintext data length (0 always written here)
[in,out]	atag	authentication tag area (atag_length byte)
[in]	atag_length	authentication tag length (4,8,12,13,14,15,16 bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_AUTHENTICATION	Authentication failed
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CCM_EncryptInit()

fsp_err_t R_SCE_AES128CCM_EncryptInit (sce_ccm_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key*, uint8_t * *nonce*, uint32_t *nonce_length*, uint8_t * *adata*, uint8_t *a_length*, uint32_t *payload_length*, uint32_t *mac_length*)

The R_SCE_AES128CCM_EncryptInit() function prepares to perform CCM computation and writes the result to the first argument, handle. The succeeding functions R_SCE_AES128CCM_EncryptUpdate() and R_SCE_AES128CCM_EncryptFinal() use handle as an argument.

Parameters

[in,out]	handle	AES-CCM handler (work area)
[in]	wrapped_key	128-bit AES wrapped key
[in]	nonce	Nonce
[in]	nonce_length	Nonce data length (7 to 13 bytes)
[in]	adata	additional authentication data
[in]	a_length	additional authentication data length (0 to 110 bytes)
[in]	payload_length	Payload length (any number of bytes)
[in]	mac_length	MAC length (4, 6, 8, 10, 12, 14, or 16 bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CCM_EncryptUpdate()

fsp_err_t R_SCE_AES128CCM_EncryptUpdate (sce_ccm_handle_t * *handle*, uint8_t * *plain*, uint8_t * *cipher*, uint32_t *plain_length*)

The R_SCE_AES128CCM_EncryptUpdate() function encrypts the plaintext specified in the second argument, plain, in CCM mode using the values specified by wrapped_key, nonce, and adata in R_SCE_AES128CCM_EncryptInit(). This function buffers internally the data input by the user until the input value of plain exceeds 16 bytes. Once the amount of plain input data is 16 bytes or greater, the encrypted result is output to cipher, which is specified in the third argument. Use payload_length in R_SCE_AES128CCM_EncryptInit() to specify the total data length of plain that will be input. Use plain_length in this function to specify the data length to be input when the user calls this function. If the input value of plain is less than 16 bytes, the function performs padding internally.

Ensure that the areas allocated to plain and cipher do not overlap. Also, specify RAM addresses that are multiples of 4 for plain and cipher.

Parameters

[in,out]	handle	AES-CCM handler (work area)
[in]	plain	plaintext data area
[in,out]	cipher	ciphertext data area
[in]	plain_length	plaintext data length

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CCM_EncryptFinal()

fsp_err_t R_SCE_AES128CCM_EncryptFinal (sce_ccm_handle_t * *handle*, uint8_t * *cipher*, uint32_t * *cipher_length*, uint8_t * *mac*, uint32_t *mac_length*)

If the data length of plain input in R_SCE_AES128CCM_EncryptUpdate() results in leftover data after 16 bytes, the R_SCE_AES128CCM_EncryptFinal() function outputs the leftover encrypted data to cipher, which is specified in the second argument. The MAC value is output to the fourth argument, mac. Set the fifth argument, mac_length to the same value as that specified for the argument mac_length in Aes128CcmEncryptInit(). Also, specify RAM addresses that are multiples of 4 for cipher and mac.

Parameters

[in,out]	handle	AES-CCM handler (work area)
[in,out]	cipher	ciphertext data area
[in,out]	cipher_length	ciphertext data length
[in,out]	mac	MAC area
[in]	mac_length	MAC length (4, 6, 8, 10, 12, 14, or 16 bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CCM_DecryptInit()

fsp_err_t R_SCE_AES128CCM_DecryptInit (sce_ccm_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key*, uint8_t * *nonce*, uint32_t *nonce_length*, uint8_t * *adata*, uint8_t *a_length*, uint32_t *payload_length*, uint32_t *mac_length*)

The R_SCE_AES128CCM_DecryptInit() function prepares to perform CCM computation and writes the result to the first argument, handle. The succeeding functions R_SCE_AES128CCM_DecryptUpdate() and R_SCE_AES128CCM_DecryptFinal() use handle as an argument.

Parameters

[in,out]	handle	AES-CCM handler (work area)
[in]	wrapped_key	128-bit AES wrapped key
[in]	nonce	Nonce
[in]	nonce_length	Nonce data length (7 to 13 bytes)
[in]	adata	additional authentication data
[in]	a_length	additional authentication data length (0 to 110 bytes)
[in]	payload_length	Payload length (any number of bytes)
[in]	mac_length	MAC length (4, 6, 8, 10, 12, 14, or 16 bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CCM_DecryptUpdate()

fsp_err_t R_SCE_AES128CCM_DecryptUpdate (sce_ccm_handle_t * *handle*, uint8_t * *cipher*, uint8_t * *plain*, uint32_t *cipher_length*)

The R_SCE_AES128CCM_DecryptUpdate() function decrypts the ciphertext specified by the second argument, cipher, in CCM mode using the values specified by wrapped_key, nonce, and adata in in R_SCE_AES128CCM_DecryptInit(). This function buffers internally the data input by the user until the input value of cipher exceeds 16 bytes. Once the amount of cipher input data is 16 bytes or greater, the decrypted result is output to plain, which is specified in the third argument. Use payload_length in R_SCE_AES128CCM_DecryptInit() to specify the total data length of cipher that will be input. Use cipher_length in this function to specify the data length to be input when the user calls this function. If the input value of cipher is less than 16 bytes, the function performs padding internally.

Ensure that the areas allocated to cipher and plain do not overlap. Also, specify RAM addresses that are multiples of 4 for cipher and plain.

Parameters

[in,out]	handle	AES-CCM handler (work area)
[in]	cipher	ciphertext data area
[in,out]	plain	plaintext data area
[in]	cipher_length	ciphertext data length

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CCM_DecryptFinal()

fsp_err_t R_SCE_AES128CCM_DecryptFinal (sce_ccm_handle_t * *handle*, uint8_t * *plain*, uint32_t * *plain_length*, uint8_t * *mac*, uint32_t *mac_length*)

If the data length of cipher input in R_SCE_AES128GCM_DecryptUpdate() results in leftover data after 16 bytes, the R_SCE_AES128GCM_DecryptFinal() function outputs the leftover decrypted data to cipher, which is specified in the second argument. In addition, the function verifies the fourth argument, mac. Set the fifth argument, mac_length, to the same value as that specified for the argument mac_length in Aes128CcmDecryptInit().

Parameters

[in,out]	handle	AES-CCM handler (work area)
[in,out]	plain	plaintext data area
[in,out]	plain_length	plaintext data length
[in]	mac	MAC area
[in]	mac_length	MAC length (4, 6, 8, 10, 12, 14, or 16 bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_FAIL	Internal error, or authentication failed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CCM_EncryptInit()

fsp_err_t R_SCE_AES256CCM_EncryptInit (sce_ccm_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key*, uint8_t * *nonce*, uint32_t *nonce_length*, uint8_t * *adata*, uint8_t *a_length*, uint32_t *payload_length*, uint32_t *mac_length*)

The R_SCE_AES256CCM_EncryptInit() function prepares to perform CCM computation and writes the result to the first argument, handle. The succeeding functions R_SCE_AES256CCM_EncryptUpdate() and R_SCE_AES256CCM_EncryptFinal() use handle as an argument.

Parameters

[in,out]	handle	AES-CCM handler (work area)
[in]	wrapped_key	256-bit AES wrapped key
[in]	nonce	Nonce
[in]	nonce_length	Nonce data length (7 to 13 bytes)
[in]	adata	additional authentication data
[in]	a_length	additional authentication data length (0 to 110 bytes)
[in]	payload_length	Payload length (any number of bytes)
[in]	mac_length	MAC length (4, 6, 8, 10, 12, 14, or 16 bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CCM_EncryptUpdate()

fsp_err_t R_SCE_AES256CCM_EncryptUpdate (sce_ccm_handle_t * *handle*, uint8_t * *plain*, uint8_t * *cipher*, uint32_t *plain_length*)

The R_SCE_AES256CCM_EncryptUpdate() function encrypts the plaintext specified in the second argument, plain, in CCM mode using the values specified by wrapped_key, nonce, and adata in R_SCE_AES256CCM_EncryptInit(). This function buffers internally the data input by the user until the input value of plain exceeds 16 bytes. Once the amount of plain input data is 16 bytes or greater, the encrypted result is output to cipher, which is specified in the third argument. Use payload_length in R_SCE_AES256CCM_EncryptInit() to specify the total data length of plain that will be input. Use plain_length in this function to specify the data length to be input when the user calls this function. If the input value of plain is less than 16 bytes, the function performs padding internally.

Ensure that the areas allocated to plain and cipher do not overlap. Also, specify RAM addresses that are multiples of 4 for plain and cipher.

Parameters

[in,out]	handle	AES-CCM handler (work area)
[in]	plain	plaintext data area
[in,out]	cipher	ciphertext data area
[in]	plain_length	plaintext data length

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CCM_EncryptFinal()

fsp_err_t R_SCE_AES256CCM_EncryptFinal (sce_ccm_handle_t * *handle*, uint8_t * *cipher*, uint32_t * *cipher_length*, uint8_t * *mac*, uint32_t *mac_length*)

If the data length of plain input in R_SCE_AES256CCM_EncryptUpdate() results in leftover data after 16 bytes, the R_SCE_AES256CCM_EncryptFinal() function outputs the leftover encrypted data to cipher, which is specified in the second argument. The MAC value is output to the fourth argument, mac. Set the fifth argument, mac_length to the same value as that specified for the argument mac_length in Aes256CcmEncryptInit(). Also, specify RAM addresses that are multiples of 4 for cipher and mac.

Parameters

[in,out]	handle	AES-CCM handler (work area)
[in,out]	cipher	ciphertext data area
[in,out]	cipher_length	ciphertext data length
[in,out]	mac	MAC area
[in]	mac_length	MAC length (4, 6, 8, 10, 12, 14, or 16 bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CCM_DecryptInit()

fsp_err_t R_SCE_AES256CCM_DecryptInit (sce_ccm_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key*, uint8_t * *nonce*, uint32_t *nonce_length*, uint8_t * *adata*, uint8_t *a_length*, uint32_t *payload_length*, uint32_t *mac_length*)

The R_SCE_AES256CCM_DecryptInit() function prepares to perform CCM computation and writes the result to the first argument, handle. The succeeding functions R_SCE_AES256CCM_DecryptUpdate() and R_SCE_AES256CCM_DecryptFinal() use handle as an argument.

Parameters

[in,out]	handle	AES-CCM handler (work area)
[in]	wrapped_key	256-bit AES wrapped key
[in]	nonce	Nonce
[in]	nonce_length	Nonce data length (7 to 13 bytes)
[in]	adata	additional authentication data
[in]	a_length	additional authentication data length (0 to 110 bytes)
[in]	payload_length	Payload length (any number of bytes)
[in]	mac_length	MAC length (4, 6, 8, 10, 12, 14, or 16 bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CCM_DecryptUpdate()

fsp_err_t R_SCE_AES256CCM_DecryptUpdate (sce_ccm_handle_t * *handle*, uint8_t * *cipher*, uint8_t * *plain*, uint32_t *cipher_length*)

The R_SCE_AES256CCM_DecryptUpdate() function decrypts the ciphertext specified by the second argument, cipher, in CCM mode using the values specified by wrapped_key, nonce, and adata in in R_SCE_AES256CCM_DecryptInit(). This function buffers internally the data input by the user until the input value of cipher exceeds 16 bytes. Once the amount of cipher input data is 16 bytes or greater, the decrypted result is output to plain, which is specified in the third argument. Use payload_length in R_SCE_AES256CCM_DecryptInit() to specify the total data length of cipher that will be input. Use cipher_length in this function to specify the data length to be input when the user calls this function. If the input value of cipher is less than 16 bytes, the function performs padding internally.

Ensure that the areas allocated to cipher and plain do not overlap. Also, specify RAM addresses that are multiples of 4 for cipher and plain.

Parameters

[in,out]	handle	AES-CCM handler (work area)
[in]	cipher	ciphertext data area
[in,out]	plain	plaintext data area
[in]	cipher_length	ciphertext data length

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CCM_DecryptFinal()

fsp_err_t R_SCE_AES256CCM_DecryptFinal (sce_ccm_handle_t * *handle*, uint8_t * *plain*, uint32_t * *plain_length*, uint8_t * *mac*, uint32_t *mac_length*)

If the data length of cipher input in R_SCE_AES256GCM_DecryptUpdate() results in leftover data after 16 bytes, the R_SCE_AES256GCM_DecryptFinal() function outputs the leftover decrypted data to cipher, which is specified in the second argument. In addition, the function verifies the fourth argument, mac. Set the fifth argument, mac_length, to the same value as that specified for the argument mac_length in Aes256CcmDecryptInit().

Parameters

[in,out]	handle	AES-CCM handler (work area)
[in,out]	plain	plaintext data area
[in,out]	plain_length	plaintext data length
[in]	mac	MAC area
[in]	mac_length	MAC length (4, 6, 8, 10, 12, 14, or 16 bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_FAIL	Internal error, or authentication failed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CMAC_GenerateInit()

fsp_err_t R_SCE_AES128CMAC_GenerateInit (sce_cmac_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key*)

The R_SCE_AES128CMAC_GenerateInit() function performs preparations for the execution of an CMAC calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R_SCE_AES128CMAC_GenerateUpdate() function and R_SCE_AES128CMAC_GenerateFinal() function.

Parameters

[in,out]	handle	AES-CMAC handler (work area)
[in]	wrapped_key	128-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_FAIL	Internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CMAC_GenerateUpdate()

fsp_err_t R_SCE_AES128CMAC_GenerateUpdate (sce_cmac_handle_t * *handle*, uint8_t * *message*, uint32_t *message_length*)

The R_SCE_AES128CMAC_GenerateUpdate() function performs MAC value generation based on the message specified in the second argument, message, using the value specified for wrapped_key in R_SCE_AES128CMAC_GenerateInit(). Inside this function, the data that is input by the user is buffered until the input value of message exceeds 16 bytes. The length of the message data to input is specified in the third argument, message_len. For these, input not the total byte count for message input data, but rather the message data length to input when the user calls this function. If the input value, message, is not a multiple of 16 bytes, it will be padded within the function. For message, specify a RAM address that are multiples of 4.

Parameters

[in,out]	handle	AES-CMAC handler (work area)
[in]	message	message data area (message_length byte)
[in]	message_length	message data length (0 or more bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CMAC_GenerateFinal()

fsp_err_t R_SCE_AES128CMAC_GenerateFinal (sce_cmac_handle_t * *handle*, uint8_t * *mac*)

The R_SCE_AES128CMAC_GenerateFinal() function outputs the MAC value to the MAC data area specified in the second argument, mac, and ends CMAC mode.

Parameters

[in,out]	handle	AES-CMAC handler (work area)
[in,out]	mac	MAC data area (16byte)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.
FSP_ERR_CRYPTO_SCE_AUTHENTICATION	Not used.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CMAC_VerifyInit()

fsp_err_t R_SCE_AES128CMAC_VerifyInit (sce_cmac_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key*)

The R_SCE_AES128CMAC_VerifyInit() function performs preparations for the execution of a CMAC calculation, and writes the result to the first argument, handle. The value of handle is used as an argumentin the subsequent R_SCE_AES128CMAC_VerifyUpdate() function and R_SCE_AES128CMAC_VerifyFinal() function.

Parameters

[in,out]	handle	AES-CMAC handler (work area)
[in]	wrapped_key	128-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_FAIL	Internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CMAC_VerifyUpdate()

fsp_err_t R_SCE_AES128CMAC_VerifyUpdate (sce_cmac_handle_t * *handle*, uint8_t * *message*, uint32_t *message_length*)

The R_SCE_AES128CMAC_VerifyUpdate() function performs MAC value generation based on the message specified in the second argument, message, using the value specified for wrapped_key in R_SCE_AES128CMAC_VerifyInit(). Inside this function, the data that is input by the user is buffered until the input value of message exceeds 16 bytes. The length of the message data to input is specified in the third argument, message_len. For these, input not the total byte count for message input data, but rather the message data length to input when the user calls this function. If the input value, message, is not a multiple of 16 bytes, it will be padded within the function. For message, specify a RAM address that are multiples of 4.

Parameters

[in,out]	handle	AES-CMAC handler (work area)
[in]	message	message data area (message_length byte)
[in]	message_length	message data length (0 or more bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CMAC_VerifyFinal()

fsp_err_t R_SCE_AES128CMAC_VerifyFinal (sce_cmac_handle_t * *handle*, uint8_t * *mac*, uint32_t *mac_length*)

The R_SCE_AES128CMAC_VerifyFinal() function inputs the MAC value in the MAC data area specified in the second argument, mac, and verifies the MAC value. If authentication fails, the return value will be TSIP_ERR_AUTHENTICATION. If the MAC value is less than 16 bytes, it will be padded with zeros inside the function.

Parameters

[in,out]	handle	AES-CMAC handler (work area)
[in,out]	mac	MAC data area (mac_length byte)
[in,out]	mac_length	MAC data length (2 to 16 bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_AUTHENTICATION	Authentication failed
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CMAC_GenerateInit()

fsp_err_t R_SCE_AES256CMAC_GenerateInit (sce_cmac_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key*)

The R_SCE_AES256CMAC_GenerateInit() function performs preparations for the execution of an CMAC calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R_SCE_AES256CMAC_GenerateUpdate() function and R_SCE_AES256CMAC_GenerateFinal() function.

Parameters

[in,out]	handle	AES-CMAC handler (work area)
[in]	wrapped_key	256-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_FAIL	Internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CMAC_GenerateUpdate()

fsp_err_t R_SCE_AES256CMAC_GenerateUpdate (sce_cmac_handle_t * *handle*, uint8_t * *message*, uint32_t *message_length*)

The R_SCE_AES256CMAC_GenerateUpdate() function performs MAC value generation based on the message specified in the second argument, message, using the value specified for wrapped_key in R_SCE_AES256CMAC_GenerateInit(). Inside this function, the data that is input by the user is buffered until the input value of message exceeds 16 bytes. The length of the message data to input is specified in the third argument, message_len. For these, input not the total byte count for message input data, but rather the message data length to input when the user calls this function. If the input value, message, is not a multiple of 16 bytes, it will be padded within the function. For message, specify a RAM address that are multiples of 4.

Parameters

[in,out]	handle	AES-CMAC handler (work area)
[in]	message	message data area (message_length byte)
[in]	message_length	message data length (0 or more bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CMAC_GenerateFinal()

fsp_err_t R_SCE_AES256CMAC_GenerateFinal (sce_cmac_handle_t * *handle*, uint8_t * *mac*)

The R_SCE_AES256CMAC_GenerateFinal() function outputs the MAC value to the MAC data area specified in the second argument, mac, and ends CMAC mode.

Parameters

[in,out]	handle	AES-CMAC handler (work area)
[in,out]	mac	MAC data area (16byte)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.
FSP_ERR_CRYPTO_SCE_AUTHENTICATION	Not used.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CMAC_VerifyInit()

fsp_err_t R_SCE_AES256CMAC_VerifyInit (sce_cmac_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key*)

The R_SCE_AES256CMAC_VerifyInit() function performs preparations for the execution of a CMAC calculation, and writes the result to the first argument, handle. The value of handle is used as an argumentin the subsequent R_SCE_AES256CMAC_VerifyUpdate() function and R_SCE_AES256CMAC_VerifyFinal() function.

Parameters

[in,out]	handle	AES-CMAC handler (work area)
[in]	wrapped_key	256-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_FAIL	Internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CMAC_VerifyUpdate()

fsp_err_t R_SCE_AES256CMAC_VerifyUpdate (sce_cmac_handle_t * *handle*, uint8_t * *message*, uint32_t *message_length*)

The R_SCE_AES256CMAC_VerifyUpdate() function performs MAC value generation based on the message specified in the second argument, message, using the value specified for wrapped_key in R_SCE_AES256CMAC_VerifyInit(). Inside this function, the data that is input by the user is buffered until the input value of message exceeds 16 bytes. The length of the message data to input is specified in the third argument, message_len. For these, input not the total byte count for message input data, but rather the message data length to input when the user calls this function. If the input value, message, is not a multiple of 16 bytes, it will be padded within the function. For message, specify a RAM address that are multiples of 4.

Parameters

[in,out]	handle	AES-CMAC handler (work area)
[in]	message	message data area (message_length byte)
[in]	message_length	message data length (0 or more bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CMAC_VerifyFinal()

fsp_err_t R_SCE_AES256CMAC_VerifyFinal (sce_cmac_handle_t * *handle*, uint8_t * *mac*, uint32_t *mac_length*)

The R_SCE_AES256CMAC_VerifyFinal() function inputs the MAC value in the MAC data area specified in the second argument, mac, and verifies the MAC value. If authentication fails, the return value will be TSIP_ERR_AUTHENTICATION. If the MAC value is less than 16 bytes, it will be padded with zeros inside the function.

Parameters

[in,out]	handle	AES-CMAC handler (work area)
[in,out]	mac	MAC data area (mac_length byte)
[in,out]	mac_length	MAC data length (2 to 16 bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_AUTHENTICATION	Authentication failed
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_SHA256_Init()

fsp_err_t R_SCE_SHA256_Init (sce_sha_md5_handle_t * *handle*)

The R_SCE_SHA256_Init() function performs preparations for the execution of an SHA-256 hash calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R_SCE_SHA256_Update() function and R_SCE_SHA256_Final() function.

Parameters

[in,out]	handle	SHA handler (work area)

Return values

FSP_SUCCESS	Normal termination

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_SHA256_Update()

fsp_err_t R_SCE_SHA256_Update (sce_sha_md5_handle_t * *handle*, uint8_t * *message*, uint32_t *message_length*)

The R_SCE_SHA256_Update() function calculates a hash value based on the second argument, message, and the third argument, message_length, and writes the ongoing status to the first argument, handle. After message input is completed, call R_SCE_SHA256_Final().

Parameters

[in,out]	handle	SHA handler (work area)
[in]	message	message data area
[in]	message_length	message data length

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_SHA256_Final()

fsp_err_t R_SCE_SHA256_Final (sce_sha_md5_handle_t * *handle*, uint8_t * *digest*, uint32_t * *digest_length*)

Using the handle specified in the first argument, handle, the R_SCE_SHA256_Final() function writes the calculation result to the second argument, digest, and writes the length of the calculation result to the third argument, digest_length.

Parameters

[in,out]	handle	SHA handler (work area)
[in,out]	digest	hasha data area
[in,out]	digest_length	hash data length (32bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_SHA256HMAC_GenerateInit()

fsp_err_t R_SCE_SHA256HMAC_GenerateInit (sce_hmac_sha_handle_t * *handle*, sce_hmac_sha_wrapped_key_t * *wrapped_key*)

The R_SCE_SHA256HMAC_GenerateInit() function uses the second argument wrapped_key to prepare for execution of SHA256-HMAC calculation, then writes the result to the first argument handle. The argument handle is used by the subsequent R_SCE_SHA256HMAC_GenerateUpdate() function or R_SCE_SHA256HMAC_GenerateFinal() function.

Parameters

[in,out]	handle	SHA-HMAC handler (work area)
[in]	wrapped_key	MAC wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	An invalid MAC wrapped key was input.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_SHA256HMAC_GenerateUpdate()

fsp_err_t R_SCE_SHA256HMAC_GenerateUpdate (sce_hmac_sha_handle_t * *handle*, uint8_t * *message*, uint32_t *message_length*)

The R_SCE_SHA256HMAC_GenerateUpdate() function uses the handle specified by the first argument handle, calculates a hash value from the second argument message and third argument message_length, then writes the intermediate result to the first argument handle. After message input finishes, call the R_SCE_SHA256HMAC_GenerateFinal() function.

Parameters

[in,out]	handle	SHA-HMAC handle (work area)
[in]	message	Message area
[in]	message_length	Message length

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_SHA256HMAC_GenerateFinal()

fsp_err_t R_SCE_SHA256HMAC_GenerateFinal (sce_hmac_sha_handle_t * *handle*, uint8_t * *mac*)

The R_SCE_SHA256HMAC_GenerateFinal() function uses the handle specified by the first argument handle and writes the calculation result to the second argument mac.

Parameters

[in,out]	handle	SHA-HMAC handle (work area)
[in,out]	mac	HMAC area (32 bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_SHA256HMAC_VerifyInit()

fsp_err_t R_SCE_SHA256HMAC_VerifyInit (sce_hmac_sha_handle_t * *handle*, sce_hmac_sha_wrapped_key_t * *wrapped_key*)

The R_SCE_SHA256HMAC_VerifyInit() function uses the second argument wrapped_key to prepare for execution of SHA256-HMAC calculation, then writes the result to the first argument handle. The argument handle is used by the subsequent R_SCE_SHA256HMAC_VerifyUpdate() function or R_SCE_SHA256HMAC_VerifyFinal() function.

Parameters

[in,out]	handle	SHA-HMAC handler (work area)
[in]	wrapped_key	MAC wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	An invalid MAC wrapped key was input.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_SHA256HMAC_VerifyUpdate()

fsp_err_t R_SCE_SHA256HMAC_VerifyUpdate (sce_hmac_sha_handle_t * *handle*, uint8_t * *message*, uint32_t *message_length*)

The R_SCE_SHA256HMAC_VerifyUpdate() function uses the handle specified by the first argument handle, calculates a hash value from the second argument message and third argument message_length, then writes the intermediate result to the first argument handle. After message input finishes, call the R_SCE_SHA256HMAC_VerifyFinal() function.

Parameters

[in,out]	handle	SHA-HMAC handle (work area)
[in]	message	Message area
[in]	message_length	Message length

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_SHA256HMAC_VerifyFinal()

fsp_err_t R_SCE_SHA256HMAC_VerifyFinal (sce_hmac_sha_handle_t * *handle*, uint8_t * *mac*, uint32_t *mac_length*)

The R_SCE_SHA256HMAC_VerifyFinal() function uses the handle specified by the first argument handle and verifies the mac value from the second argument mac and third argument mac_length. Input a value in bytes from 4 to 32 as mac_length.

Parameters

[in,out]	handle	SHA-HMAC handle (work area)
[in]	mac	HMAC area
[in]	mac_length	HMAC length

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSASSA_PKCS1024_SignatureGenerate()

fsp_err_t R_SCE_RSASSA_PKCS1024_SignatureGenerate (sce_rsa_byte_data_t * *message_hash*, sce_rsa_byte_data_t * *signature*, sce_rsa1024_private_wrapped_key_t * *wrapped_key*, uint8_t *hash_type*)

The R_SCE_RSASSA_PKCS1024_SignatureGenerate() function generates, in accordance with RSASSA-PKCS1-V1_5, a signature from the message text or hash value that is input in the first argument, message_hash, using the private wrapped key input to the third argument, wrapped_key, and writes the signature text to the second argument, signature. When a message is specified in the first argument, message_hash->data_type, a hash value is calculated for the message as specified by the fourth argument, hash_type. When specifying a hash value in the first argument, message_hash->data_type, a hash value calculated with a hash algorithm as specified by the fourth argument, hash_type, must be input to message_hash->pdata.

Parameters

[in]	message_hash	Message or hash value to which to attach signature • message_hash->pdata : Specifies pointer to array storing the message or hash value

		• message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) • message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash value: 1)
[in,out]	signature	Signature text storage destination information • signature->pdata : Specifies pointer to array storing the signature text • signature->data_length : data length
[in]	wrapped_key	Inputs the 1024-bit RSA private wrapped key.
[in]	hash_type	Only HW_SCE_RSA_HASH_SHA256 is supported

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSASSA_PKCS1024_SignatureVerify()

fsp_err_t R_SCE_RSASSA_PKCS1024_SignatureVerify (sce_rsa_byte_data_t * *signature*, sce_rsa_byte_data_t * *message_hash*, sce_rsa1024_public_wrapped_key_t * *wrapped_key*, uint8_t *hash_type*)

The R_SCE_RSASSA_PKCS1024_SignatureVerify() function verifies, in accordance with RSASSA-PKCS1-V1_5, the signature text input to the first argument signature, and the message text or hash value input to the second argument, message_hash, using the public wrapped key input to the third argument, wrapped_key. When a message is specified in the second argument, message_hash->data_type, a hash value is calculated using the public wrapped key input to the third argument, wrapped_key, and as specified by the fourth argument, hash_type. When specifying a hash value in the second argument, message_hash->data_type, a hash value calculated with a hash algorithm as specified by the fourth argument, hash_type, must be input to message_hash->pdata.

Parameters

[in]	signature	Signature text information to verify • signature->pdata : Specifies pointer to array storing the signature text • signature->data_length : Specifies effective data length of the array
[in]	message_hash	Message text or hash value to verify • message_hash->pdata : Specifies pointer to array storing the message or hash value • message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) • message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash value: 1)
[in]	wrapped_key	Inputs the 1024-bit RSA public wrapped key.
[in]	hash_type	Only

		HW_SCE_RSA_HASH_SHA256 is supported

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_AUTHENTICATION	Authentication failed
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSASSA_PKCS2048_SignatureGenerate()

fsp_err_t R_SCE_RSASSA_PKCS2048_SignatureGenerate (sce_rsa_byte_data_t * *message_hash*, sce_rsa_byte_data_t * *signature*, sce_rsa2048_private_wrapped_key_t * *wrapped_key*, uint8_t *hash_type*)

The R_SCE_RSASSA_PKCS2048_SignatureGenerate() function generates, in accordance with RSASSA-PKCS1-V1_5, a signature from the message text or hash value that is input in the first argument, message_hash, using the private wrapped key input to the third argument, wrapped_key, and writes the signature text to the second argument, signature. When a message is specified in the first argument, message_hash->data_type, a hash value is calculated for the message as specified by the fourth argument, hash_type. When specifying a hash value in the first argument, message_hash->data_type, a hash value calculated with a hash algorithm as specified by the fourth argument, hash_type, must be input to message_hash->pdata.

Parameters

[in]	message_hash	Message or hash value to which to attach signature • message_hash->pdata : Specifies pointer to array storing the message or hash value • message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) • message_hash->data_type : Selects the

		data type of message_hash (Message: 0 Hash value: 1)
[in,out]	signature	Signature text storage destination information • signature->pdata : Specifies pointer to array storing the signature text • signature->data_length : data length
[in]	wrapped_key	Inputs the 2048-bit RSA private wrapped key.
[in]	hash_type	Only HW_SCE_RSA_HASH_SHA256 is supported

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSASSA_PKCS2048_SignatureVerify()

fsp_err_t R_SCE_RSASSA_PKCS2048_SignatureVerify (sce_rsa_byte_data_t * *signature*, sce_rsa_byte_data_t * *message_hash*, sce_rsa2048_public_wrapped_key_t * *wrapped_key*, uint8_t *hash_type*)

The R_SCE_RSASSA_PKCS2048_SignatureVerify() function verifies, in accordance with RSASSA-PKCS1-V1_5, the signature text input to the first argument signature, and the message text or hash value input to the second argument, message_hash, using the public wrapped key input to the third argument, wrapped_key. When a message is specified in the second argument, message_hash->data_type, a hash value is calculated using the public wrapped key input to the third argument, wrapped_key, and as specified by the fourth argument, hash_type. When specifying a hash value in the second argument, message_hash->data_type, a hash value calculated with a hash algorithm as specified by the fourth argument, hash_type, must be input to message_hash->pdata.

Parameters

[in]	signature	Signature text information to verify • signature->pdata : Specifies pointer to array storing the signature text • signature->data_length : Specifies effective data length of the array
[in]	message_hash	Message text or hash value to verify • message_hash->pdata : Specifies pointer to array storing the message or hash value • message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) • message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash value: 1)
[in]	wrapped_key	Inputs the 1024-bit RSA public wrapped key.
[in]	hash_type	Only

		HW_SCE_RSA_HASH_SHA256 is supported

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_AUTHENTICATION	Authentication failed
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSASSA_PKCS3072_SignatureVerify()

fsp_err_t R_SCE_RSASSA_PKCS3072_SignatureVerify (sce_rsa_byte_data_t * *signature*, sce_rsa_byte_data_t * *message_hash*, sce_rsa3072_public_wrapped_key_t * *wrapped_key*, uint8_t *hash_type*)

The R_SCE_RSASSA_PKCS3072_SignatureVerify() function verifies, in accordance with RSASSA-PKCS1-V1_5, the signature text input to the first argument signature, and the message text or hash value input to the second argument, message_hash, using the public wrapped key input to the third argument, wrapped_key. When a message is specified in the second argument, message_hash->data_type, a hash value is calculated using the public wrapped key input to the third argument, wrapped_key, and as specified by the fourth argument, hash_type. When specifying a hash value in the second argument, message_hash->data_type, a hash value calculated with a hash algorithm as specified by the fourth argument, hash_type, must be input to message_hash->pdata.

Parameters

[in]	signature	Signature text information to verify • signature->pdata : Specifies pointer to array storing the signature text • signature->data_length : Specifies effective data length of the array
[in]	message_hash	Message text or hash value to verify • message_hash->pda

		ta : Specifies pointer to array storing the message or hash value • message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) • message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash value: 1)
[in]	wrapped_key	Inputs the 3072-bit RSA public wrapped key.
[in]	hash_type	Only HW_SCE_RSA_HASH_SHA256 is supported

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_AUTHENTICATION	Authentication failed
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSASSA_PKCS4096_SignatureVerify()

fsp_err_t R_SCE_RSASSA_PKCS4096_SignatureVerify (sce_rsa_byte_data_t * *signature*, sce_rsa_byte_data_t * *message_hash*, sce_rsa4096_public_wrapped_key_t * *wrapped_key*, uint8_t *hash_type*)

The R_SCE_RSASSA_PKCS4096_SignatureVerify() function verifies, in accordance with RSASSA-PKCS1-V1_5, the signature text input to the first argument signature, and the message text or hash value input to the second argument, message_hash, using the public wrapped key input to the third argument, wrapped_key. When a message is specified in the second argument, message_hash->data_type, a hash value is calculated using the public wrapped key input to the third argument, wrapped_key, and as specified by the fourth argument, hash_type. When specifying a hash value in the second argument, message_hash->data_type, a hash value calculated with a hash algorithm as specified by the fourth argument, hash_type, must be input to message_hash->pdata.

Parameters

[in]	signature	Signature text information to verify • signature->pdata : Specifies pointer to array storing the signature text • signature->data_length : Specifies effective data length of the array
[in]	message_hash	Message text or hash value to verify • message_hash->pdata : Specifies pointer to array storing the message or hash value • message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) • message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash value: 1)
[in]	wrapped_key	Inputs the 1024-bit RSA public wrapped key.
[in]	hash_type	Only

		HW_SCE_RSA_HASH_SHA256 is supported

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_AUTHENTICATION	Authentication failed
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSAES_PKCS1024_Encrypt()

fsp_err_t R_SCE_RSAES_PKCS1024_Encrypt (sce_rsa_byte_data_t * *plain*, sce_rsa_byte_data_t * *cipher*, sce_rsa1024_public_wrapped_key_t * *wrapped_key*)

The R_SCE_RSAES_PKCS1024_Encrypt() function RSA-encrypts the plaintext input to the first argument, plain, according to RSAES-PKCS1-V1_5. It writes the encryption result to the second argument, cipher.

Parameters

[in]	plain	plaintext • plain->pdata : Specifies pointer to array containing plaintext. • plain->data_length : Specifies valid data length of plaintext array. data size <= public key n size - 11
[in,out]	cipher	ciphertext • cipher->pdata : Specifies pointer to array containing ciphertext. • cipher->data_length : Inputs ciphertext buffer size. Outputs valid data length after encryption (public key n size).
[in]	wrapped_key	Inputs the 1024-bit RSA public wrapped key.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Incorrect wrapped key was input.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSAES_PKCS1024_Decrypt()

fsp_err_t R_SCE_RSAES_PKCS1024_Decrypt (sce_rsa_byte_data_t * *cipher*, sce_rsa_byte_data_t * *plain*, sce_rsa1024_private_wrapped_key_t * *wrapped_key*)

The R_SCE_RSAES_PKCS1024_Decrypt() function RSA-decrypts the ciphertext input to the first argument, cipher, according to RSAES-PKCS1-V1_5. It writes the decryption result to the second argument, plain.

Parameters

[in]	cipher	ciphertext • cipher->pdata : Specifies pointer to array containing ciphertext. • cipher->data_length : Inputs ciphertext buffer size. Outputs valid data length after encryption (public key n size).
[in,out]	plain	plaintext • plain->pdata : Specifies pointer to array containing plaintext. • plain->data_length : Inputs plaintext buffer size. The following size is required. Plaintext buffer size >= public key n size -11. Outputs valid data length after decryption (public key n size).
[in]	wrapped_key	Inputs the 1024-bit RSA private wrapped key.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Incorrect wrapped key was input.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.

FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSAES_PKCS2048_Encrypt()

fsp_err_t R_SCE_RSAES_PKCS2048_Encrypt (sce_rsa_byte_data_t * *plain*, sce_rsa_byte_data_t * *cipher*, sce_rsa2048_public_wrapped_key_t * *wrapped_key*)

The R_SCE_RSAES_PKCS2048_Encrypt() function RSA-encrypts the plaintext input to the first argument, plain, according to RSAES-PKCS1-V1_5. It writes the encryption result to the second argument, cipher.

Parameters

[in]	plain	plaintext • plain->pdata : Specifies pointer to array containing plaintext. • plain->data_length : Specifies valid data length of plaintext array. data size <= public key n size - 11
[in,out]	cipher	ciphertext • cipher->pdata : Specifies pointer to array containing ciphertext. • cipher->data_length : Inputs ciphertext buffer size. Outputs valid data length after encryption (public key n size).
[in]	wrapped_key	Inputs the 2048-bit RSA public wrapped key.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Incorrect wrapped key was input.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSAES_PKCS2048_Decrypt()

fsp_err_t R_SCE_RSAES_PKCS2048_Decrypt (sce_rsa_byte_data_t * *cipher*, sce_rsa_byte_data_t * *plain*, sce_rsa2048_private_wrapped_key_t * *wrapped_key*)

The R_SCE_RSAES_PKCS2048_Decrypt() function RSA-decrypts the ciphertext input to the first argument, cipher, according to RSAES-PKCS1-V1_5. It writes the decryption result to the second argument, plain.

Parameters

[in]	cipher	ciphertext • cipher->pdata : Specifies pointer to array containing ciphertext. • cipher->data_length : Inputs ciphertext buffer size. Outputs valid data length after encryption (public key n size).
[in,out]	plain	plaintext • plain->pdata : Specifies pointer to array containing plaintext. • plain->data_length : Inputs plaintext buffer size. The following size is required. Plaintext buffer size >= public key n size -11. Outputs valid data length after decryption (public key n size).
[in]	wrapped_key	Inputs the 1024-bit RSA private wrapped key.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Incorrect wrapped key was input.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.

FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSAES_PKCS3072_Encrypt()

fsp_err_t R_SCE_RSAES_PKCS3072_Encrypt (sce_rsa_byte_data_t * *plain*, sce_rsa_byte_data_t * *cipher*, sce_rsa3072_public_wrapped_key_t * *wrapped_key*)

The R_SCE_RSAES_PKCS3072_Encrypt() function RSA-encrypts the plaintext input to the first argument, plain, according to RSAES-PKCS1-V1_5. It writes the encryption result to the second argument, cipher.

Parameters

[in]	plain	plaintext • plain->pdata : Specifies pointer to array containing plaintext. • plain->data_length : Specifies valid data length of plaintext array. data size <= public key n size - 11
[in,out]	cipher	ciphertext • cipher->pdata : Specifies pointer to array containing ciphertext. • cipher->data_length : Inputs ciphertext buffer size. Outputs valid data length after encryption (public key n size).
[in]	wrapped_key	Inputs the 3072-bit RSA public wrapped key.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Incorrect wrapped key was input.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSAES_PKCS4096_Encrypt()

fsp_err_t R_SCE_RSAES_PKCS4096_Encrypt (sce_rsa_byte_data_t * *plain*, sce_rsa_byte_data_t * *cipher*, sce_rsa4096_public_wrapped_key_t * *wrapped_key*)

The R_SCE_RSAES_PKCS4096_Encrypt() function RSA-encrypts the plaintext input to the first argument, plain, according to RSAES-PKCS1-V1_5. It writes the encryption result to the second argument, cipher.

Parameters

[in]	plain	plaintext • plain->pdata : Specifies pointer to array containing plaintext. • plain->data_length : Specifies valid data length of plaintext array. data size <= public key n size - 11
[in,out]	cipher	ciphertext • cipher->pdata : Specifies pointer to array containing ciphertext. • cipher->data_length : Inputs ciphertext buffer size. Outputs valid data length after encryption (public key n size).
[in]	wrapped_key	Inputs the 4096-bit RSA public wrapped key.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Incorrect wrapped key was input.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECDSA_secp192r1_SignatureGenerate()

fsp_err_t R_SCE_ECDSA_secp192r1_SignatureGenerate (sce_ecdsa_byte_data_t * *message_hash*, sce_ecdsa_byte_data_t * *signature*, sce_ecc_private_wrapped_key_t * *wrapped_key*)

When a message is specified in the first argument, message_hash->data_type, a SHA-256 hash of the message text input as the first argument, message_hash->pdata, is calculated, and the signature text is written to the second argument, signature, in accordance with secp192r1 using the private wrapped key input as the third argument, wrapped_key.

When a hash value is specified in the first argument, message_hash->data_type, the signature text for the first 24 bytes of the SHA-256 hash value input to the first argument, message_hash->pdata, is written to the second argument, signature, in accordance with secp192r1 using the private wrapped key input as the third argument, wrapped_key.

Parameters

[in]	message_hash	Message or hash value to which to attach signature • message_hash->pdata : Specifies pointer to array storing the message or hash value • message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) • message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash value: 1)
[in,out]	signature	Signature text storage destination information • signature->pdata : Specifies pointer to array storing signature text The signature format is "0 padding (64 bits) || signature r (192 bits) || 0 padding (64 bits) || signature s (192 bits)". • signature->data_length : Data length (byte units)

[in]	wrapped_key	Input wrapped key of secp192r1 private key.

Return values

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECDSA_secp224r1_SignatureGenerate()

fsp_err_t R_SCE_ECDSA_secp224r1_SignatureGenerate (sce_ecdsa_byte_data_t * *message_hash*, sce_ecdsa_byte_data_t * *signature*, sce_ecc_private_wrapped_key_t * *wrapped_key*)

When a message is specified in the first argument, message_hash->data_type, a SHA-256 hash of the message text input as the first argument, message_hash->pdata, is calculated, and the signature text is written to the second argument, signature, in accordance with secp224r1 using the private wrapped key input as the third argument, wrapped_key.

When a hash value is specified in the first argument, message_hash->data_type, the signature text for the first 28 bytes of the SHA-256 hash value input to the first argument, message_hash->pdata, is written to the second argument, signature, in accordance with secp224r1 using the private wrapped key input as the third argument, wrapped_key.

Parameters

[in]	message_hash	Message or hash value to which to attach signature • message_hash->pdata : Specifies pointer to array storing the message or hash value • message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) • message_hash->data_type : Selects the data type of message_hash

		(Message: 0 Hash value: 1)
[in,out]	signature	Signature text storage destination information • signature->pdata : Specifies pointer to array storing signature text The signature format is "0 padding (32 bits) || signature r (224 bits) || 0 padding (32 bits) || signature s (224 bits)". • signature->data_length : Data length (byte units)
[in]	wrapped_key	Input wrapped key of secp224r1 private key.

Return values

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECDSA_secp256r1_SignatureGenerate()

fsp_err_t R_SCE_ECDSA_secp256r1_SignatureGenerate (sce_ecdsa_byte_data_t * *message_hash*, sce_ecdsa_byte_data_t * *signature*, sce_ecc_private_wrapped_key_t * *wrapped_key*)

When a message is specified in the first argument, message_hash->data_type, a SHA-256 hash of the message text input as the first argument, message_hash->pdata, is calculated, and the signature text is written to the second argument, signature, in accordance with secp256r1 using the private wrapped key input as the third argument, wrapped_key.

When a hash value is specified in the first argument, message_hash->data_type, the signature text for the first 32 bytes of the SHA-256 hash value input to the first argument, message_hash->pdata, is written to the second argument, signature, in accordance with secp256r1 using the private wrapped key input as the third argument, wrapped_key.

Parameters

[in]	message_hash	Message or hash value to which to attach signature • message_hash->pdata : Specifies pointer to array storing the message or hash value • message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) • message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash value: 1)
[in,out]	signature	Signature text storage destination information • signature->pdata : Specifies pointer to array storing signature text The signature format is "signature r (256 bits) || signature s (256 bits)". • signature->data_length : Data length (byte units)
[in]	wrapped_key	Input wrapped key of secp256r1 private key.

Return values

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECDSA_secp384r1_SignatureGenerate()

fsp_err_t R_SCE_ECDSA_secp384r1_SignatureGenerate (sce_ecdsa_byte_data_t * *message_hash*, sce_ecdsa_byte_data_t * *signature*, sce_ecc_private_wrapped_key_t * *wrapped_key*)

When a message is specified in the first argument, message_hash->data_type, a SHA-384 hash of the message text input as the first argument, message_hash->pdata, is calculated, and the signature text is written to the second argument, signature, in accordance with secp384r1 using the private wrapped key input as the third argument, wrapped_key.

To use message input, prepare a user-defined function for SHA384.

When a hash value is specified in the first argument, message_hash->data_type, the signature text for the first 48 bytes of the SHA-384 hash value input to the first argument, message_hash->pdata, is written to the second argument, signature, in accordance with secp384r1 using the private wrapped key input as the third argument, wrapped_key.

Parameters

[in]	message_hash	Message or hash value to which to attach signature • message_hash->pdata : Specifies pointer to array storing the message or hash value • message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) • message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash

		value: 1)
[in,out]	signature	Signature text storage destination information • signature->pdata : Specifies pointer to array storing signature text The signature format is "signature r (384 bits) || signature s (384 bits)". • signature->data_length : Data length (byte units)
[in]	wrapped_key	Input wrapped key of secp384r1 private key.

Return values

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECDSA_secp192r1_SignatureVerify()

fsp_err_t R_SCE_ECDSA_secp192r1_SignatureVerify (sce_ecdsa_byte_data_t * *signature*, sce_ecdsa_byte_data_t * *message_hash*, sce_ecc_public_wrapped_key_t * *wrapped_key*)

When a message is specified in the second argument, message_hash->data_type, a SHA-256 hash of the message text input as the second argument, message_hash->pdata, is calculated, and the signature text input to the first argument, signature, is validated in accordance with secp192r1 using the public wrapped key input as the third argument, wrapped_key.

When a hash value is specified in the second argument, message_hash->data_type, the signature text for the first 24 bytes of the SHA-256 hash value input to the second argument, message_hash->pdata, input to the first argument, signature, is validated in accordance with secp192r1 using the public wrapped key input as the third argument, wrapped_key.

Parameters

[in]	signature	Signature text information to be verified • signature->pdata : Specifies pointer to array storing signature text The signature format is "0 padding (64 bits) || signature r (192 bits) || 0 padding (64 bits) || signature s (192 bits)". • signature->data_length : Specifies the data length (byte units) (nonuse)
[in,out]	message_hash	Message or hash value to be verified • message_hash->pdata : Specifies pointer to array storing the message or hash value • message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) • message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash value: 1)

[in]	wrapped_key	Input wrapped key of secp192r1 public key.

Return values

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred or signature verification failed.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECDSA_secp224r1_SignatureVerify()

fsp_err_t R_SCE_ECDSA_secp224r1_SignatureVerify (sce_ecdsa_byte_data_t * *signature*, sce_ecdsa_byte_data_t * *message_hash*, sce_ecc_public_wrapped_key_t * *wrapped_key*)

When a message is specified in the second argument, message_hash->data_type, a SHA-256 hash of the message text input as the second argument, message_hash->pdata, is calculated, and the signature text input to the first argument, signature, is validated in accordance with secp224r1 using the public wrapped key input as the third argument, wrapped_key.

When a hash value is specified in the second argument, message_hash->data_type, the signature text for the first 28 bytes of the SHA-256 hash value input to the second argument, message_hash->pdata, input to the first argument, signature, is validated in accordance with secp224r1 using the public wrapped key input as the third argument, wrapped_key.

Parameters

[in]	signature	Signature text information to be verified • signature->pdata : Specifies pointer to array storing signature text The signature format is "0 padding (32 bits) || signature r (224 bits) || 0 padding (32 bits) || signature s (224 bits)". • signature->data_length : Specifies the data length (byte units) (nonuse)

[in,out]	message_hash	Message or hash value to be verified • message_hash->pdata : Specifies pointer to array storing the message or hash value • message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) • message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash value: 1)
[in]	wrapped_key	Input wrapped key of secp224r1 public key.

Return values

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred or signature verification failed.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECDSA_secp256r1_SignatureVerify()

fsp_err_t R_SCE_ECDSA_secp256r1_SignatureVerify (sce_ecdsa_byte_data_t * *signature*, sce_ecdsa_byte_data_t * *message_hash*, sce_ecc_public_wrapped_key_t * *wrapped_key*)

When a message is specified in the second argument, message_hash->data_type, a SHA-256 hash of the message text input as the second argument, message_hash->pdata, is calculated, and the signature text input to the first argument, signature, is validated in accordance with secp256r1 using the public wrapped key input as the third argument, wrapped_key.

When a hash value is specified in the second argument, message_hash->data_type, the signature text for the first 32 bytes of the SHA-256 hash value input to the second argument, message_hash->pdata, input to the first argument, signature, is validated in accordance with secp256r1 using the public wrapped key input as the third argument, wrapped_key.

Parameters

[in]	signature	Signature text information to be verified • signature->pdata : Specifies pointer to array storing signature text The signature format is "signature r (256 bits) || signature s (256 bits)". • signature->data_length : Specifies the data length (byte units) (nonuse)
[in,out]	message_hash	Message or hash value to be verified • message_hash->pdata : Specifies pointer to array storing the message or hash value • message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) • message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash value: 1)
[in]	wrapped_key	Input wrapped key of

		secp256r1 public key.

Return values

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred or signature verification failed.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECDSA_secp384r1_SignatureVerify()

fsp_err_t R_SCE_ECDSA_secp384r1_SignatureVerify (sce_ecdsa_byte_data_t * *signature*, sce_ecdsa_byte_data_t * *message_hash*, sce_ecc_public_wrapped_key_t * *wrapped_key*)

When a message is specified in the second argument, message_hash->data_type, a SHA-256 hash of the message text input as the second argument, message_hash->pdata, is calculated, and the signature text input to the first argument, signature, is validated in accordance with secp384r1 using the public wrapped key input as the third argument, wrapped_key.

To use message input, prepare a user-defined function for SHA384.

When a hash value is specified in the second argument, message_hash->data_type, the signature text for the first 48 bytes of the SHA-256 hash value input to the second argument, message_hash->pdata, input to the first argument, signature, is validated in accordance with secp384r1 using the public wrapped key input as the third argument, wrapped_key.

Parameters

[in]	signature	Signature text information to be verified • signature->pdata : Specifies pointer to array storing signature text The signature format is "signature r (384 bits) || signature s (384 bits)". • signature->data_length : Specifies the data length (byte units) (nonuse)

[in,out]	message_hash	Message or hash value to be verified • message_hash->pdata : Specifies pointer to array storing the message or hash value • message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) • message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash value: 1)
[in]	wrapped_key	Input wrapped key of secp384r1 public key.

Return values

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred or signature verification failed.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECDH_secp256r1_Init()

fsp_err_t R_SCE_ECDH_secp256r1_Init (sce_ecdh_handle_t * *handle*, uint32_t *key_type*, uint32_t *use_key_id*)

The R_SCE_ECDH_secp256r1_Init() function prepares to perform ECDH key exchange computation and writes the result to the first argument, handle. The succeeding functions R_SCE_ECDH_secp256r1_PublicKeySign(), R_SCE_ECDH_secp256r1_PublicKeyVerify(), R_SCE_ECDH_secp256r1_SharedSecretCalculate(), and R_SCE_ECDH_secp256r1_KeyDerivation() use handle as an argument.

Use the second argument, key_type, to select the type of ECDH key exchange. When ECDHE is selected, the R_SCE_ECDH_secp256r1_PublicKeySign() function uses the SCE's random number generation functionality to generate an secp256r1 key pair. When ECDH is selected, keys installed beforehand are used for key exchange.

Input 1 as the third argument, use_key_id, to use key_id when key exchange is performed. key_id is for applications conforming to the DLMS/COSEM standard for smart meters.

Parameters

[in,out]	handle	ECDH handler (work area)
[in]	key_type	Key exchange type (0: ECDHE, 1: ECDH, 2:ECDH(AES-GCM-128 with IV))
[in]	use_key_id	0: key_id not used, 1: key_id used

Return values

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is invalid.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECDH_secp256r1_PublicKeySign()

fsp_err_t R_SCE_ECDH_secp256r1_PublicKeySign (sce_ecdh_handle_t * *handle*, sce_ecc_public_wrapped_key_t * *ecc_public_wrapped_key*, sce_ecc_private_wrapped_key_t * *ecc_private_wrapped_key*, uint8_t * *public_key*, sce_ecdsa_byte_data_t * *signature*, sce_ecc_private_wrapped_key_t * *wrapped_key*)

The R_SCE_ECDH_secp256r1_PublicKeySign() function calculates a signature for a public key user wrapped key used for ECDH key exchange.

If ECDHE is specified by the key_type argument of the R_SCE_ECDH_secp256r1_Init() function, the SCE's random number generation functionality is used to generate an secp256r1 key pair. The public key is output to public_key and the private key is output to wrapped_key.

If ECDH is specified by the key_type argument of the R_SCE_ECDH_secp256r1_Init() function, the public key input as ecc_public_wrapped_key is output to public_key and nothing is output to wrapped_key.

The succeeding function R_SCE_ECDH_secp256r1_SharedSecretCalculate() uses the first argument, handle, as an argument. R_SCE_ECDH_secp256r1_SharedSecretCalculate() function uses wrapped_key as input to calculate Z.

Parameters

[in,out]	handle	ECDH handler (work area) When using key_id, input handle->key_id after running R_SCE_ECDH_secp256r1_Init().
[in]	ecc_public_wrapped_key	For ECDHE, input a null pointer. For ECDH, input the wrapped key of a secp256r1 public key.
[in]	ecc_private_wrapped_key	secp256r1 private key for signature generation
[in,out]	public_key	User secp256r1 public key (512-bit) for key exchange. When using key_id, key_id (8-bit) || public key (512-bit) || 0 padding (24-bit)
[in,out]	signature	Signature text storage destination information • signature->pdata : Specifies pointer to array storing signature text. The signature format is "signature r (256 bits) || signature s (256 bits)" • signature->data_leng

		th : Data length (in byte units)
[in,out]	wrapped_key	For ECDHE, a private wrapped key generated from a random number. Not output for ECDH.

Return values

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECDH_secp256r1_PublicKeyVerify()

fsp_err_t R_SCE_ECDH_secp256r1_PublicKeyVerify (sce_ecdh_handle_t * *handle*, sce_ecc_public_wrapped_key_t * *ecc_public_wrapped_key*, uint8_t * *public_key_data*, sce_ecdsa_byte_data_t * *signature*, sce_ecc_public_wrapped_key_t * *wrapped_key*)

The R_SCE_ECDH_secp256r1_PublicKeyVerify() function verifies the signature of the secp256r1 public key of the other ECDH key exchange party. If the signature is correct, it outputs the public wrapped key to the fifth argument. The first argument, handle, is used as an argument in the subsequent function R_SCE_ECDH_secp256r1_SharedSecretCalculate(). R_SCE_ECDH_secp256r1_SharedSecretCalculate() uses wrapped_key as input to calculate Z.

Parameters

[in,out]	handle	ECDH handler (work area)
[in]	ecc_public_wrapped_key	Public wrapped key area for signature verification
[in]	public_key_data	secp256r1 public key (512-bit). When key_id is used: key_id (8-bit) || public key (512-bit)
[in]	signature	ECDSA secp256r1 signature of ecc_public_wrapped_key
[in,out]	wrapped_key	wrapped key of ecc_public_wrapped_key

Return values

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred or signature verification failed.
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECDH_secp256r1_PublicKeyReadWithoutSignature()

fsp_err_t R_SCE_ECDH_secp256r1_PublicKeyReadWithoutSignature (sce_ecdh_handle_t * *handle*, uint8_t * *public_key_data*, sce_ecc_public_wrapped_key_t * *wrapped_key*)

The R_SCE_ECDH_secp256r1_PublicKeyReadWithoutSignature() function reads the secp256r1 public key of the other ECDH key exchange party and outputs the public wrapped key to the third argument. The first argument, handle, is used as an argument in the subsequent function R_SCE_ECDH_secp256r1_SharedSecretCalculate().
R_SCE_ECDH_secp256r1_SharedSecretCalculate() uses wrapped_key as input to calculate Z. This API does not verify signature of public_key_data, please protect this data by upper layer software.

Parameters

[in,out]	handle	ECDH handler (work area)
[in]	public_key_data	secp256r1 public key (512-bit). When key_id is used: key_id (8-bit) || public key (512-bit)
[in,out]	wrapped_key	wrapped key of public_key_data

Return values

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State. Please note that this is slightly contrary to the protected mode policy as it omits signature verification.

◆ R_SCE_ECDH_secp256r1_SharedSecretCalculate()

fsp_err_t R_SCE_ECDH_secp256r1_SharedSecretCalculate (sce_ecdh_handle_t * *handle*, sce_ecc_public_wrapped_key_t * *ecc_public_wrapped_key*, sce_ecc_private_wrapped_key_t * *ecc_private_wrapped_key*, sce_ecdh_wrapped_key_t * *shared_secret_wrapped_key*)

The R_SCE_ECDH_secp256r1_SharedSecretCalculate() function uses the ECDH key exchange algorithm to output the wrapped key of the shared secret Z derived from the public key of the other key exchange party and your own private key. Input as the second argument, ecc_public_wrapped_key, the public wrapped key whose signature was verified by R_SCE_ECDH_secp256r1_PublicKeyVerify(). When key_type of R_SCE_ECDH_secp256r1_Init() is 0, input as the third argument, ecc_private_wrapped_key, the private wrapped key generated from a random number by R_SCE_ECDH_secp256r1_PublicKeySign(), and when key_type is other than 0, input the private wrapped key that forms a pair with the second argument of R_SCE_ECDH_secp256r1_PublicKeySign(). The subsequent R_SCE_ECDH_secp256r1_KeyDerivation() function uses shared_secret_wrapped_key as key material for outputting the wrapped key.

Parameters

[in,out]	handle	ECDH handler (work area)
[in]	ecc_public_wrapped_key	Public wrapped key whose signature was verified by R_SCE_ECDH_secp256r1_PublicKeyVerify()
[in]	ecc_private_wrapped_key	Private wrapped key
[in,out]	shared_secret_wrapped_key	Wrapped key of shared secret Z calculated by ECDH key exchange

Return values

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECDH_secp256r1_KeyDerivation()

fsp_err_t R_SCE_ECDH_secp256r1_KeyDerivation (sce_ecdh_handle_t * *handle*, sce_ecdh_wrapped_key_t * *shared_secret_wrapped_key*, uint32_t *key_type*, uint32_t *kdf_type*, uint8_t * *other_info*, uint32_t *other_info_length*, sce_hmac_sha_wrapped_key_t * *salt_wrapped_key*, sce_aes_wrapped_key_t * *wrapped_key*)

The R_SCE_ECDH_secp256r1_KeyDerivation() function uses the shared secret "Z (shared_secret_index)" calculated by the R_SCE_ECDH_secp256r1_SharedSecretCalculate() function as the key material to derive the wrapped key specified by the third argument, key_type. The key derivation algorithm is one-step key derivation as defined in NIST SP800-56C. Either SHA-256 or SHA-256 HMAC is specified by the fourth argument, kdf_type. When SHA-256 HMAC is specified, the wrapped key output by the R_SCE_SHA256HMAC_EncryptedKeyWrap() function is specified as the seventh argument, salt_wrapped_key. Enter a fixed value for deriving a key shared with the key exchange partner in the fifth argument, other_info. A wrapped key corresponding to key_type is output as the eighth argument, wrapped_key. The correspondences between the types of derived wrapped_key and the functions with which they can be used as listed below.

- AES-128: All AES-128 Init functions
- AES-256: All AES-256 Init functions
- SHA256-HMAC: R_SCE_SHA256HMAC_GenerateInit() function and R_SCE_SHA256HMAC_VerifyInit() function

Parameters

[in,out]	handle	ECDH handler (work area)
[in]	shared_secret_wrapped_key	Z wrapped key calculated by R_SCE_ECDH_secp256r1_SharedSecretCalculate
[in]	key_type	Derived key type (0: AES-128, 1: AES-256, 2:SHA256-HMAC, 3: AES-GCM-128 with IV)
[in]	kdf_type	Algorithm used for key derivation calculation (0: SHA-256, 1:SHA256-HMAC)
[in]	other_info	Additional data used for key derivation calculation: AlgorithmID || PartyUInfo || PartyVInfo
[in]	other_info_length	Data length of other_info (up to 147 byte units)
[in]	salt_wrapped_key	Salt wrapped key (Input NULL when kdf_type is 0.)
[in,out]	wrapped_key	Wrapped key corresponding to key_type. When the value of key_type is 2, an SHA256-HMAC wrapped key is output. wrapped_key can be specified by casting the start address of the area

		reserved beforehand by the sce_hmac_sha_wrapped_key_t type with the (sce_aes_wrapped_key_t*) type.

Return values

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTO_SCE_FAIL	Internal error occurred.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_TLS_RootCertificateRSA2048PublicKeyInstall()

fsp_err_t R_SCE_TLS_RootCertificateRSA2048PublicKeyInstall (uint8_t * *encrypted_provisioning_key*, uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_tls_ca_certification_public_wrapped_key_t * *wrapped_key*)

Generate TLS RSA Public key index data

Parameters

[in]	encrypted_provisioning_key	the provisioning key includes encrypted CBC/CBC-MAC key for user key
[in]	initial_vector	the initial_vector for user key CBC encrypt
[in]	encrypted_key	the user key encrypted with AES128-ECB mode
[out]	wrapped_key	the user Key Generation Information (141 words) of RSA2048 bit

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_TLS_ECC_secp256r1_EphemeralWrappedKeyPairGenerate()

fsp_err_t R_SCE_TLS_ECC_secp256r1_EphemeralWrappedKeyPairGenerate (sce_tls_p256_ecc_wrapped_key_t * *tls_p256_ecc_wrapped_key*, uint8_t * *ephemeral_ecdh_public_key*)

Generate TLS ECC key pair

Parameters

[in]	tls_p256_ecc_wrapped_key	P256 ECC key index for TLS
[in]	ephemeral_ecdh_public_key	ephemeral ECDH public key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_TLS_RootCertificateVerify()

fsp_err_t R_SCE_TLS_RootCertificateVerify (uint32_t *public_key_type*, uint8_t * *certificate*, uint32_t *certificate_length*, uint32_t *public_key_n_start_position*, uint32_t *public_key_n_end_position*, uint32_t *public_key_e_start_position*, uint32_t *public_key_e_end_position*, uint8_t * *signature*, uint32_t * *encrypted_root_public_key*)

Verify root CA certificate.

Parameters

[in]	public_key_type	key type
[in]	certificate	certificates.
[in]	certificate_length	byte size of certificates.
[in]	public_key_n_start_position	start position of public key n.
[in]	public_key_n_end_position	end position of public key n.
[in]	public_key_e_start_position	start position of public key e.
[in]	public_key_e_end_position	end position of public key e.
[in]	signature	signature for certificates.
[out]	encrypted_root_public_key	public key for RSA 2048bit.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_TLS_CertificateVerify()

fsp_err_t R_SCE_TLS_CertificateVerify (uint32_t *public_key_type*, uint32_t * *encrypted_input_public_key*, uint8_t * *certificate*, uint32_t *certificate_length*, uint8_t * *signature*, uint32_t *public_key_n_start_position*, uint32_t *public_key_n_end_position*, uint32_t *public_key_e_start_position*, uint32_t *public_key_e_end_position*, uint32_t * *encrypted_output_public_key*)

Verify server certificate and intermediate certificate.

Parameters

[in]	public_key_type	key type
[in]	encrypted_input_public_key	public key.
[in]	certificate	certificates.
[in]	certificate_length	byte size of certificates.
[in]	signature	signature for certificates.
[in]	public_key_n_start_position	start position of public key n.
[in]	public_key_n_end_position	end position of public key n.
[in]	public_key_e_start_position	start position of public key e.
[in]	public_key_e_end_position	end position of public key e.
[out]	encrypted_output_public_key	public key for RSA 2048bit.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_TLS_PreMasterSecretEncryptWithRSA2048()

fsp_err_t R_SCE_TLS_PreMasterSecretEncryptWithRSA2048 (uint32_t * *encrypted_public_key*, uint32_t * *sce_pre_master_secret*, uint8_t * *encrypted_pre_master_secret*)

Output the result encrypted pre-master secret with RSA 2048bit

Parameters

[in]	encrypted_public_key	public key data.
[in]	sce_pre_master_secret	pre-master secret value.
[out]	encrypted_pre_master_secret	the value encrypted pre-master secret.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_TLS_PreMasterSecretGenerateForRSA2048()

fsp_err_t R_SCE_TLS_PreMasterSecretGenerateForRSA2048 (uint32_t * *sce_pre_master_secret*)

Generate encrypted pre-master secret.

Parameters

[out]	sce_pre_master_secret	pre-master secret value for SCE.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_TLS_MasterSecretGenerate()

fsp_err_t R_SCE_TLS_MasterSecretGenerate (uint32_t *select_cipher_suite*, uint32_t * *sce_pre_master_secret*, uint8_t * *client_random*, uint8_t * *server_random*, uint32_t * *sce_master_secret*)

Generate encrypted master secret.

Parameters

[in]	select_cipher_suite	cipher suite type
[in]	sce_pre_master_secret	pre-master secret value for SCE.
[in]	client_random	random value reported ClientHello.
[in]	server_random	random value reported ServerHello.
[out]	sce_master_secret	master secret value with SCE-specific conversion.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_TLS_SessionKeyGenerate()

fsp_err_t R_SCE_TLS_SessionKeyGenerate (uint32_t *select_cipher_suite*, uint32_t * *sce_master_secret*, uint8_t * *client_random*, uint8_t * *server_random*, uint8_t * *nonce_explicit*, sce_hmac_sha_wrapped_key_t * *client_mac_wrapped_key*, sce_hmac_sha_wrapped_key_t * *server_mac_wrapped_key*, sce_aes_wrapped_key_t * *client_crypto_wrapped_key*, sce_aes_wrapped_key_t * *server_crypto_wrapped_key*, uint8_t * *client_initial_vector*, uint8_t * *server_initial_vector*)

Output various key information.

Parameters

[in]	select_cipher_suite	Key suite information number.
[in]	sce_master_secret	master secret value.
[in]	client_random	random value reported ClientHello.
[in]	server_random	random value reported ServerHello.
[in]	nonce_explicit	nonce value
[out]	client_mac_wrapped_key	the mac key during communication from client to server.
[out]	server_mac_wrapped_key	the mac key during communication from server to client.
[out]	client_crypto_wrapped_key	the crypto key during communication from client to server.
[out]	server_crypto_wrapped_key	the crypto key during communication from server to client.
[in]	client_initial_vector	not use.
[in]	server_initial_vector	not use.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_TLS_VerifyDataGenerate()

fsp_err_t R_SCE_TLS_VerifyDataGenerate (uint32_t *select_verify_data*, uint32_t * *sce_master_secret*, uint8_t * *hand_shake_hash*, uint8_t * *verify_data*)

Generate verify data.

Parameters

[in]	select_verify_data	Select Client/Server data.
[in]	sce_master_secret	master secret data.
[in]	hand_shake_hash	TLS hand shake message SHA256 HASH value.
[out]	verify_data	verify data.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_TLS_ServerKeyExchangeVerify()

fsp_err_t R_SCE_TLS_ServerKeyExchangeVerify (uint32_t *public_key_type*, uint8_t * *client_random*, uint8_t * *server_random*, uint8_t * *server_ephemeral_ecdh_public_key*, uint8_t * *server_key_exchange_signature*, uint32_t * *encrypted_public_key*, uint32_t * *encrypted_ephemeral_ecdh_public_key*)

Retrives ECDH public key.

Parameters

[in]	public_key_type	key type
[in]	client_random	random value reported ClientHello.
[in]	server_random	random value reported ServerHello.
[in]	server_ephemeral_ecdh_public_key	Ephemeral ECDH public key from Server.
[in]	server_key_exchange_signature	Server Key Exchange sigunature.
[in]	encrypted_public_key	encrypted public key.
[out]	encrypted_ephemeral_ecdh_public_key	encrypted Ephemeral ECDH public key.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_TLS_PreMasterSecretGenerateForECC_secp256r1()

fsp_err_t R_SCE_TLS_PreMasterSecretGenerateForECC_secp256r1 (uint32_t * *encrypted_public_key*, sce_tls_p256_ecc_wrapped_key_t * *tls_p256_ecc_wrapped_key*, uint32_t * *sce_pre_master_secret*)

Generate encrypted pre-master secret.

Parameters

[in]	encrypted_public_key	encrypted public key
[in]	tls_p256_ecc_wrapped_key	P-256 ECC key index.
[out]	sce_pre_master_secret	encrypted pre-master secret value for SCE.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

7.2.15.7 Secure Crypto Engine (r_sce_protected_cavp)

Modules » Security

Driver for the CAVP Certified Secure Crypto Engine (SCE) on RA MCUs.

Version

v1.1.0

The version that appears on the Components tab of the FSP Configuration editor is v1.1.0+fsp.<fsp_version>. The <fsp_version> metadata reflects tooling support files only and does not indicate any changes to the CAVP certified code. See Module Versioning for more information about component versioning in FSP.

Functions

The user documentation for the functions in this module.

- SCE Protected Mode

Overview

This module provides SCE CAVP Certified functions.

HW Overview

SCE9 Protected Mode CAVP certification has been obtained using the RA6M4 as the target processor.

Crypto Peripheral version	Devices
SCE9 (Protected mode)	RA4M2, RA4M3, RA6M4, RA6M5

Features

The SCE module supports for the following features.

- Cryptography
  - Symmetric Encryption/Decryption
    - AES
      - ECB 128/256bit
      - CBC 128/256bit
      - GCM 128/256bit
      - CCM 128/256bit
  - Asymmetric Encryption/Decryption
    - RSA
      - RSAES-PKCS1-V1_5 1024/2048bit
      - RSAES-PKCS1-V1_5 3072/4096bit (Encryption only)
      - RSASSA-PKCS1-V1_5 1024/2048bit
      - RSASSA-PKCS1-V1_5 3072/4096bit (Verification only)
    - ECC
      - ECDSA secp192r1/secp224r1/secp256r1/secp384r1
      - ECDH secp256r1
  - Hash Functions
    - SHA-2
      - SHA-256
- Message Authentication Code
  - HMAC-SHA256bit
  - AES-CMAC 128/256bit
- Key Support
  - AES 128/256bit
  - AES Key Wrap/Key Unwrap 128/256bit
  - RSA 1024/2048bit
  - RSA 3072/4096bit (public key only)
  - ECC secp192r1/secp224r1/secp256r1/secp384r1
  - HMAC-SHA256bit
- TRNG
- TLS
  - SSL / TLS support function (TLS1.2 compliant)

Configuration

Clock Configuration

This module does not require a specific clock configuration.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Getting Started: Creating a SCE Protected Mode Project

Start by creating a new project in e² studio or RASC. On the Stacks tab, add New > Security > SCE Protected Mode(CAVP Certified). For information on how to install and update secure keys, refer to the Application Note R11AN0496.

Reducing intialization time

The SCE intialization sequence can be modified to support a smaller subset of features and allow for a shorter intialization period. This is particularly useful in cases where startup time is important and the cryptographic features that are required are known in advance. The current fast boot configuration option supports the cryptographic primitives requried by MCUBoot including:

- RSA 3K/4K signature verification
- ECC P256 signature verification
- SHA224/256 and GHASH calcuation

Limitations

Usage of R_SCE_ECDSA_secp384r1_SignatureGenerate/Verify

The SCE does not support SHA-384 in hardware, so the APIs listed below require the user to create a SHA-384 function for signature generation and verification. To use the APIs listed below, enable SCE_USER_SHA_384_ENABLED on RA Smart Configurator and prepare a function called SCE_USER_SHA_384_FUNCTION. The interface of SCE_USER_SHA_384_FUNCTION, which is called by the following APIs, is described below.

- R_SCE_ECDSA_secp384r1_SignatureGenerate()
- R_SCE_ECDSA_secp384r1_SignatureVerify()

SCE_USER_SHA_384_FUNCTION()

```
uint32_t SCE_USER_SHA_384_FUNCTION(uint8_t * message, uint8_t * digest, uint32_t
message_length)
```

SHA-384 hash calculation is performed for an area extending the number of bytes specified by the argument message_length from the address specified by the argument message. The calculation result should be stored at the address specified by the argument digest.

Parameters

message	[in] Start address of message

digest	[in,out] address for storing hash calculation result (48 bytes)
message_length	[in] Effective byte count of message

Return values

0	Hash value stored successfully.
others	Storing of hash value failed.

Examples

AES Example

This is an example of AES-256 encryption and decryption.

```
static uint8_t plain[BLOCK * 2] =
{
    0x52, 0x65, 0x6e, 0x65, 0x73, 0x61, 0x73, 0x20, 0x45, 0x6c, 0x65, 0x63, 0x74,
0x72, 0x6f, 0x6e,
    0x69, 0x63, 0x73, 0x20, 0x43, 0x6f, 0x72, 0x70, 0x6f, 0x72, 0x61, 0x74, 0x69,
0x6f, 0x6e, 0x00
};
void r_sce_example_aes ()
{
 sce_aes_handle_t      handle;
 sce_aes_wrapped_key_t wrapped_key;
    uint8_t               cipher_calculated[32] = {0};
    uint8_t               plain_calculated[32] = {0};
    uint32_t             dummy;
 /* SCE power on */
 R_SCE_Open(&sce_ctrl, &sce_cfg);
 /* Generate a random key */
 R_SCE_AES256_WrappedKeyGenerate(&wrapped_key);
 /* Encrypt a plain text */
 R_SCE_AES256ECB_EncryptInit(&handle, &wrapped_key);
 R_SCE_AES256ECB_EncryptUpdate(&handle, plain, cipher_calculated, BLOCK * 2);
 R_SCE_AES256ECB_EncryptFinal(&handle, cipher_calculated, &dummy);
```

```
 /* Decrypt a cipher text using same key as Encryption */
 R_SCE_AES256ECB_DecryptInit(&handle, &wrapped_key);
 R_SCE_AES256ECB_DecryptUpdate(&handle, cipher_calculated, plain_calculated, BLOCK *
2);
 R_SCE_AES256ECB_DecryptFinal(&handle, plain_calculated, &dummy);
 /* SCE power off */
 R_SCE_Close(&sce_ctrl);
 /* Compare plain and plain_calculated */
 if (memcmp(plain, plain_calculated, BLOCK * 2))
    {
 while (1)
      {
 /* plain and plain_calculated are different (incorrect) */
       }
    }
 else
    {
 while (1)
      {
 /* plain and plain_calculated are the same (correct) */
       }
    }
}
```

ECC Example

This is an example of ECC secp-256 signature generate and verify.

```
uint8_t ecc256_data_msg[] =
{
 's', 'a', 'm', 'p', 'l', 'e'
};

Detailed Description

Driver for the Secure Key Injection on RA MCUs.

Overview

This module provides RSIP functions in PSA Crypto.

HW Overview

Crypto Peripheral version	Devices
RSIP-E11A	RA4L1
RSIP-E51A	RA8M1, RA8D1, RA8T1

Features

The RSIP Key Injection Module has two types of APIs, InitialKeyWrap and EncryptedKeyWrap. The available APIs differ depending on used RSIP. Please refer to the following for details.

Key Support

AES Key Injection

Crypto Peripheral version	128 bit	192 bit	256 bit
RSIP-E11A	Support	No support	Support
RSIP-E51A	Support	Support	Support

AES XTS Key Injection

Crypto Peripheral version	128 bit XTS	256 bit XTS
RSIP-E11A	No support	No support
RSIP-E51A	Support	Support

RSA Key Injection

Crypto Peripheral version	2048 bit	3072 bit	4096 bit
RSIP-E11A	No support	No support	No support
RSIP-E51A	Support	Support	Support

ECC Key Injection

Crypto Peripheral version	secp256r1	secp384r1	secp521r1	secp256k1	brainpoolP256r1	brainpoolP384r1	brainpoolP512r1	Ed25519
RSIP-E11A	Private Key Wrap Only	No support	No support	Private Key Wrap Only	Private Key Wrap Only	No support	No support	No support
RSIP-E51A	Support	Support	Support	Support	Support	Support	Support	Support

HMAC Key Injection

Crypto Peripheral version	SHA224	SHA256	SHA384	SHA512	SHA512/224	SHA512/256
RSIP-E11A	Support	Support	No support	No support	No support	No support
RSIP-E51A	Support	Support	Support	Support	Support	Support

Configuration

Clock Configuration

This module does not require a specific clock configuration.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Module activation

RSIP Key Umport for PSA Crypto Module is off by default. To use it, please On the Stacks tab, add New > Security > MbedTLS or MbedTLS (Crypto Only), Add Requires RSIP Driver > New > (*1), Add Key Injection for RSA Crypto (Optional) > New > Key Injectin for RSA Crypto for PSA Crypto Module after adding MbedTLS. For information on how to injection and update secure keys, refer to the Application Note R11AN0496.

Hardware Initialization

Please refer to Hardware Initialization in Mbed Crypto H/W Acceleration (rm_psa_crypto).

Function Documentation

◆ R_RSIP_AES128_InitialKeyWrap()

fsp_err_t R_RSIP_AES128_InitialKeyWrap (rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const *p_wrapped_user_factory_programming_key*, uint8_t const *const *p_initial_vector*, uint8_t const *const *p_user_key*, rsip_aes_wrapped_key_t *const *p_wrapped_key*)

This API generates 128-bit AES key within the user routine.

Parameters

[in]	key_injection_type	Selection key injection type when generating wrapped key
[in]	p_wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified.
[in]	p_initial_vector	Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified.
[in]	p_user_key	User key. If key injection type is not plain, it is encrypted and MAC appended
[out]	p_wrapped_key	128-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.

Note

The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.

◆ R_RSIP_AES192_InitialKeyWrap()

fsp_err_t R_RSIP_AES192_InitialKeyWrap (rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const *const *p_wrapped_user_factory_programming_key*, uint8_t const *const *p_initial_vector*, uint8_t const *const *p_user_key*, rsip_aes_wrapped_key_t *const *p_wrapped_key*)

This API generates 192-bit AES key within the user routine.

Parameters

[in]	key_injection_type	Selection key injection type when generating wrapped key
[in]	p_wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified.
[in]	p_initial_vector	Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified.
[in]	p_user_key	User key. If key injection type is not plain, it is encrypted and MAC appended
[out]	p_wrapped_key	192-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.
- FSP_ERR_UNSUPPORTED This API is not supported on this device.

Note

The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.

◆ R_RSIP_AES256_InitialKeyWrap()

fsp_err_t R_RSIP_AES256_InitialKeyWrap (rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const *const *p_wrapped_user_factory_programming_key*, uint8_t const *const *const *p_initial_vector*, uint8_t const *const *const *p_user_key*, rsip_aes_wrapped_key_t *const *p_wrapped_key*)

This API generates 256-bit AES key within the user routine.

Parameters

[in]	key_injection_type	Selection key injection type when generating wrapped key
[in]	p_wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified.
[in]	p_initial_vector	Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified.
[in]	p_user_key	User key. If key injection type is not plain, it is encrypted and MAC appended
[out]	p_wrapped_key	256-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.

Note

The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.

◆ R_RSIP_AES128_XTS_InitialKeyWrap()

fsp_err_t R_RSIP_AES128_XTS_InitialKeyWrap (rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const p_wrapped_user_factory_programming_key*, uint8_t const *const p_initial_vector*, uint8_t const *const p_user_key*, rsip_aes_wrapped_key_t *const *p_wrapped_key*)

This API generates 128-bit AES-XTS key within the user routine.

Parameters

[in]	key_injection_type	Selection key injection type when generating wrapped key
[in]	p_wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified.
[in]	p_initial_vector	Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified.
[in]	p_user_key	User key. If key injection type is not plain, it is encrypted and MAC appended
[out]	p_wrapped_key	128-bit AES-XTS wrapped key

Return values

FSP_SUCCESS	Normal termination.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.
- FSP_ERR_UNSUPPORTED This API is not supported on this device.

Note

The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.

◆ R_RSIP_AES256_XTS_InitialKeyWrap()

fsp_err_t R_RSIP_AES256_XTS_InitialKeyWrap (rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const *const *p_wrapped_user_factory_programming_key*, uint8_t const *const *p_initial_vector*, uint8_t const *const *p_user_key*, rsip_aes_wrapped_key_t *const *p_wrapped_key*)

This API generates 256-bit AES-XTS key within the user routine.

Parameters

[in]	key_injection_type	Selection key injection type when generating wrapped key
[in]	p_wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified.
[in]	p_initial_vector	Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified.
[in]	p_user_key	User key. If key injection type is not plain, it is encrypted and MAC appended
[out]	p_wrapped_key	256-bit AES-XTS wrapped key

Return values

FSP_SUCCESS	Normal termination.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.
- FSP_ERR_UNSUPPORTED This API is not supported on this device.

Note

The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.

◆ R_RSIP_RSA2048_InitialPublicKeyWrap()

fsp_err_t R_RSIP_RSA2048_InitialPublicKeyWrap (rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const *p_wrapped_user_factory_programming_key*, uint8_t const *const *p_initial_vector*, uint8_t const *const *p_user_key*, rsip_rsa2048_public_wrapped_key_t *const *p_wrapped_key*)

This API generates 2048-bit RSA public key within the user routine.

Parameters

[in]	key_injection_type	Selection key injection type when generating wrapped key
[in]	p_wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified.
[in]	p_initial_vector	Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified.
[in]	p_user_key	User key. If key injection type is not plain, it is encrypted and MAC appended
[out]	p_wrapped_key	2048-bit RSA wrapped public key

Return values

FSP_SUCCESS	Normal termination.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.
- FSP_ERR_UNSUPPORTED This API is not supported on this device.

Note

The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.

◆ R_RSIP_RSA2048_InitialPrivateKeyWrap()

fsp_err_t R_RSIP_RSA2048_InitialPrivateKeyWrap (rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const *p_wrapped_user_factory_programming_key*, uint8_t const *const *p_initial_vector*, uint8_t const *const *p_user_key*, rsip_rsa2048_private_wrapped_key_t *const *p_wrapped_key*)

This API generates 2048-bit RSA private key within the user routine.

Parameters

[in]	key_injection_type	Selection key injection type when generating wrapped key
[in]	p_wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified.
[in]	p_initial_vector	Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified.
[in]	p_user_key	User key. If key injection type is not plain, it is encrypted and MAC appended
[out]	p_wrapped_key	2048-bit RSA wrapped private key

Return values

FSP_SUCCESS	Normal termination.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.
- FSP_ERR_UNSUPPORTED This API is not supported on this device.

Note

The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.

◆ R_RSIP_RSA3072_InitialPublicKeyWrap()

fsp_err_t R_RSIP_RSA3072_InitialPublicKeyWrap (rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const *p_wrapped_user_factory_programming_key*, uint8_t const *const *p_initial_vector*, uint8_t const *const *p_user_key*, rsip_rsa3072_public_wrapped_key_t *const *p_wrapped_key*)

This API generates 3072-bit RSA public key within the user routine.

Parameters

[in]	key_injection_type	Selection key injection type when generating wrapped key
[in]	p_wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified.
[in]	p_initial_vector	Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified.
[in]	p_user_key	User key. If key injection type is not plain, it is encrypted and MAC appended
[out]	p_wrapped_key	3072-bit RSA wrapped public key

Return values

FSP_SUCCESS	Normal termination.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.
- FSP_ERR_UNSUPPORTED This API is not supported on this device.

Note

The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.

◆ R_RSIP_RSA3072_InitialPrivateKeyWrap()

fsp_err_t R_RSIP_RSA3072_InitialPrivateKeyWrap (rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const *p_wrapped_user_factory_programming_key*, uint8_t const *const *p_initial_vector*, uint8_t const *const *p_user_key*, rsip_rsa3072_private_wrapped_key_t *const *p_wrapped_key*)

This API generates 3072-bit RSA private key within the user routine.

Parameters

[in]	key_injection_type	Selection key injection type when generating wrapped key
[in]	p_wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified.
[in]	p_initial_vector	Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified.
[in]	p_user_key	User key. If key injection type is not plain, it is encrypted and MAC appended
[out]	p_wrapped_key	3072-bit RSA wrapped private key

Return values

FSP_SUCCESS	Normal termination.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.
- FSP_ERR_UNSUPPORTED This API is not supported on this device.

Note

The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.

◆ R_RSIP_RSA4096_InitialPublicKeyWrap()

fsp_err_t R_RSIP_RSA4096_InitialPublicKeyWrap (rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const *p_wrapped_user_factory_programming_key*, uint8_t const *const *p_initial_vector*, uint8_t const *const *p_user_key*, rsip_rsa4096_public_wrapped_key_t *const *p_wrapped_key*)

This API generates 4096-bit RSA public key within the user routine.

Parameters

[in]	key_injection_type	Selection key injection type when generating wrapped key
[in]	p_wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified.
[in]	p_initial_vector	Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified.
[in]	p_user_key	User key. If key injection type is not plain, it is encrypted and MAC appended
[out]	p_wrapped_key	4096-bit RSA wrapped public key

Return values

FSP_SUCCESS	Normal termination.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.
- FSP_ERR_UNSUPPORTED This API is not supported on this device.

Note

The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.

◆ R_RSIP_RSA4096_InitialPrivateKeyWrap()

fsp_err_t R_RSIP_RSA4096_InitialPrivateKeyWrap (rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const *p_wrapped_user_factory_programming_key*, uint8_t const *const *p_initial_vector*, uint8_t const *const *p_user_key*, rsip_rsa4096_private_wrapped_key_t *const *p_wrapped_key*)

This API generates 4096-bit RSA private key within the user routine.

Parameters

[in]	key_injection_type	Selection key injection type when generating wrapped key
[in]	p_wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified.
[in]	p_initial_vector	Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified.
[in]	p_user_key	User key. If key injection type is not plain, it is encrypted and MAC appended
[out]	p_wrapped_key	4096-bit RSA wrapped private key

Return values

FSP_SUCCESS	Normal termination.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.
- FSP_ERR_UNSUPPORTED This API is not supported on this device.

Note

The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.

◆ R_RSIP_ECC_secp256r1_InitialPublicKeyWrap()

fsp_err_t R_RSIP_ECC_secp256r1_InitialPublicKeyWrap (rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const *p_wrapped_user_factory_programming_key*, uint8_t const *const *p_initial_vector*, uint8_t const *const *p_user_key*, rsip_ecc_public_wrapped_key_t *const *p_wrapped_key*)

This API generates 256-bit ECC public key within the user routine.

Parameters

[in]	key_injection_type	Selection key injection type when generating wrapped key
[in]	p_wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified.
[in]	p_initial_vector	Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified.
[in]	p_user_key	User key. If key injection type is not plain, it is encrypted and MAC appended
[out]	p_wrapped_key	256-bit ECC wrapped public key

Return values

FSP_SUCCESS	Normal termination.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.
- FSP_ERR_UNSUPPORTED This API is not supported on this device.

Note

The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.

◆ R_RSIP_ECC_secp256r1_InitialPrivateKeyWrap()

fsp_err_t R_RSIP_ECC_secp256r1_InitialPrivateKeyWrap (rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const *p_wrapped_user_factory_programming_key*, uint8_t const *const *p_initial_vector*, uint8_t const *const *p_user_key*, rsip_ecc_private_wrapped_key_t *const *p_wrapped_key*)

This API generates 256-bit ECC private key within the user routine.

Parameters

[in]	key_injection_type	Selection key injection type when generating wrapped key
[in]	p_wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified.
[in]	p_initial_vector	Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified.
[in]	p_user_key	User key. If key injection type is not plain, it is encrypted and MAC appended
[out]	p_wrapped_key	256-bit ECC wrapped private key

Return values

FSP_SUCCESS	Normal termination.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.

Note

The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.

◆ R_RSIP_ECC_secp384r1_InitialPublicKeyWrap()

fsp_err_t R_RSIP_ECC_secp384r1_InitialPublicKeyWrap (rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const *const *p_wrapped_user_factory_programming_key*, uint8_t const *const *const *p_initial_vector*, uint8_t const *const *const *p_user_key*, rsip_ecc_public_wrapped_key_t *const *p_wrapped_key*)

This API generates 384-bit ECC public key within the user routine.

Parameters

[in]	key_injection_type	Selection key injection type when generating wrapped key
[in]	p_wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified.
[in]	p_initial_vector	Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified.
[in]	p_user_key	User key. If key injection type is not plain, it is encrypted and MAC appended
[out]	p_wrapped_key	384-bit ECC wrapped public key

Return values

FSP_SUCCESS	Normal termination.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.
- FSP_ERR_UNSUPPORTED This API is not supported on this device.

Note

The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.

◆ R_RSIP_ECC_secp384r1_InitialPrivateKeyWrap()

fsp_err_t R_RSIP_ECC_secp384r1_InitialPrivateKeyWrap (rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const *p_wrapped_user_factory_programming_key*, uint8_t const *const *p_initial_vector*, uint8_t const *const *p_user_key*, rsip_ecc_private_wrapped_key_t *const *p_wrapped_key*)

This API generates 384-bit ECC private key within the user routine.

Parameters

[in]	key_injection_type	Selection key injection type when generating wrapped key
[in]	p_wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified.
[in]	p_initial_vector	Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified.
[in]	p_user_key	User key. If key injection type is not plain, it is encrypted and MAC appended
[out]	p_wrapped_key	384-bit ECC wrapped private key

Return values

FSP_SUCCESS	Normal termination.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.
- FSP_ERR_UNSUPPORTED This API is not supported on this device.

Note

The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.

◆ R_RSIP_ECC_secp521r1_InitialPublicKeyWrap()

fsp_err_t R_RSIP_ECC_secp521r1_InitialPublicKeyWrap (rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const *p_wrapped_user_factory_programming_key*, uint8_t const *const *p_initial_vector*, uint8_t const *const *p_user_key*, rsip_ecc_public_wrapped_key_t *const *p_wrapped_key*)

This API generates 521-bit ECC public key within the user routine.

Parameters

[in]	key_injection_type	Selection key injection type when generating wrapped key
[in]	p_wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified.
[in]	p_initial_vector	Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified.
[in]	p_user_key	User key. If key injection type is not plain, it is encrypted and MAC appended
[out]	p_wrapped_key	521-bit ECC wrapped public key

Return values

FSP_SUCCESS	Normal termination.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.
- FSP_ERR_UNSUPPORTED This API is not supported on this device.

Note

The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.

◆ R_RSIP_ECC_secp521r1_InitialPrivateKeyWrap()

fsp_err_t R_RSIP_ECC_secp521r1_InitialPrivateKeyWrap (rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const *p_wrapped_user_factory_programming_key*, uint8_t const *const *p_initial_vector*, uint8_t const *const *p_user_key*, rsip_ecc_private_wrapped_key_t *const *p_wrapped_key*)

This API generates 521-bit ECC private key within the user routine.

Parameters

[in]	key_injection_type	Selection key injection type when generating wrapped key
[in]	p_wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified.
[in]	p_initial_vector	Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified.
[in]	p_user_key	User key. If key injection type is not plain, it is encrypted and MAC appended
[out]	p_wrapped_key	521-bit ECC wrapped private key

Return values

FSP_SUCCESS	Normal termination.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.
- FSP_ERR_UNSUPPORTED This API is not supported on this device.

Note

The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.

◆ R_RSIP_ECC_secp256k1_InitialPublicKeyWrap()

fsp_err_t R_RSIP_ECC_secp256k1_InitialPublicKeyWrap (rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const *p_wrapped_user_factory_programming_key*, uint8_t const *const *p_initial_vector*, uint8_t const *const *p_user_key*, rsip_ecc_public_wrapped_key_t *const *p_wrapped_key*)

This API generates 256-bit ECC public key within the user routine.

Parameters

[in]	key_injection_type	Selection key injection type when generating wrapped key
[in]	p_wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified.
[in]	p_initial_vector	Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified.
[in]	p_user_key	User key. If key injection type is not plain, it is encrypted and MAC appended
[out]	p_wrapped_key	256-bit ECC wrapped public key

Return values

FSP_SUCCESS	Normal termination.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.
- FSP_ERR_UNSUPPORTED This API is not supported on this device.

Note

The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.

◆ R_RSIP_ECC_secp256k1_InitialPrivateKeyWrap()

fsp_err_t R_RSIP_ECC_secp256k1_InitialPrivateKeyWrap (rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const *p_wrapped_user_factory_programming_key*, uint8_t const *const *p_initial_vector*, uint8_t const *const *p_user_key*, rsip_ecc_private_wrapped_key_t *const *p_wrapped_key*)

This API generates 256-bit ECC private key within the user routine.

Parameters

[in]	key_injection_type	Selection key injection type when generating wrapped key
[in]	p_wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified.
[in]	p_initial_vector	Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified.
[in]	p_user_key	User key. If key injection type is not plain, it is encrypted and MAC appended
[out]	p_wrapped_key	256-bit ECC wrapped private key

Return values

FSP_SUCCESS	Normal termination.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.
- FSP_ERR_UNSUPPORTED This API is not supported on this device.

Note

The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.

◆ R_RSIP_ECC_brainpoolP256r1_InitialPublicKeyWrap()

fsp_err_t R_RSIP_ECC_brainpoolP256r1_InitialPublicKeyWrap (rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const *p_wrapped_user_factory_programming_key*, uint8_t const *const *p_initial_vector*, uint8_t const *const *p_user_key*, rsip_ecc_public_wrapped_key_t *const *p_wrapped_key*)

This API generates 256-bit brainpool ECC public key within the user routine.

Parameters

[in]	key_injection_type	Selection key injection type when generating wrapped key
[in]	p_wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified.
[in]	p_initial_vector	Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified.
[in]	p_user_key	User key. If key injection type is not plain, it is encrypted and MAC appended
[out]	p_wrapped_key	256-bit ECC wrapped public key

Return values

FSP_SUCCESS	Normal termination.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.
- FSP_ERR_UNSUPPORTED This API is not supported on this device.

Note

The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.

◆ R_RSIP_ECC_brainpoolP256r1_InitialPrivateKeyWrap()

fsp_err_t R_RSIP_ECC_brainpoolP256r1_InitialPrivateKeyWrap (rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const *p_wrapped_user_factory_programming_key*, uint8_t const *const *p_initial_vector*, uint8_t const *const *p_user_key*, rsip_ecc_private_wrapped_key_t *const *p_wrapped_key*)

This API generates 256-bit brainpool ECC private key within the user routine.

Parameters

[in]	key_injection_type	Selection key injection type when generating wrapped key
[in]	p_wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified.
[in]	p_initial_vector	Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified.

[out]	p_wrapped_key	512-bit ECC wrapped private key

Return values

FSP_SUCCESS	Normal termination.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.
- FSP_ERR_UNSUPPORTED This API is not supported on this device.

Note

The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.

◆ R_RSIP_ECC_Ed25519_InitialPublicKeyWrap()

fsp_err_t R_RSIP_ECC_Ed25519_InitialPublicKeyWrap (rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const *p_wrapped_user_factory_programming_key*, uint8_t const *const *p_initial_vector*, uint8_t const *const *p_user_key*, rsip_ecc_public_wrapped_key_t *const *p_wrapped_key*)

This API generates 256-bit Edwards curve ECC public key within the user routine.

Parameters

[in]	key_injection_type	Selection key injection type when generating wrapped key
[in]	p_wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified.
[in]	p_initial_vector	Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified.
[in]	p_user_key	User key. If key injection type is not plain, it is encrypted and MAC appended
[out]	p_wrapped_key	256-bit ECC wrapped public key

Return values

FSP_SUCCESS	Normal termination.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.
- FSP_ERR_UNSUPPORTED This API is not supported on this device.

Note

The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.

◆ R_RSIP_ECC_Ed25519_InitialPrivateKeyWrap()

fsp_err_t R_RSIP_ECC_Ed25519_InitialPrivateKeyWrap (rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const *const *p_wrapped_user_factory_programming_key*, uint8_t const *const *const *p_initial_vector*, uint8_t const *const *const *p_user_key*, rsip_ecc_private_wrapped_key_t *const *p_wrapped_key*)

This API generates 256-bit Edwards curve ECC private key within the user routine.

Parameters

[in]	key_injection_type	Selection key injection type when generating wrapped key
[in]	p_wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified.
[in]	p_initial_vector	Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified.
[in]	p_user_key	User key. If key injection type is not plain, it is encrypted and MAC appended
[out]	p_wrapped_key	256-bit ECC wrapped private key

Return values

FSP_SUCCESS	Normal termination.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.
- FSP_ERR_UNSUPPORTED This API is not supported on this device.

Note

The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.

◆ R_RSIP_HMAC_SHA224_InitialKeyWrap()

fsp_err_t R_RSIP_HMAC_SHA224_InitialKeyWrap (rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const *const *p_wrapped_user_factory_programming_key*, uint8_t const *const *const *p_initial_vector*, uint8_t const *const *const *p_user_key*, rsip_hmac_sha_wrapped_key_t *const *p_wrapped_key*)

This API generates 224-bit HMAC-SHA key within the user routine.

Parameters

[in]	key_injection_type	Selection key injection type when generating wrapped key
[in]	p_wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified.
[in]	p_initial_vector	Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified.
[in]	p_user_key	User key. If key injection type is not plain, it is encrypted and MAC appended
[out]	p_wrapped_key	224-bit HMAC-SHA wrapped key

Return values

FSP_SUCCESS	Normal termination.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.

Note

The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.

◆ R_RSIP_HMAC_SHA256_InitialKeyWrap()

fsp_err_t R_RSIP_HMAC_SHA256_InitialKeyWrap (rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const *const *p_wrapped_user_factory_programming_key*, uint8_t const *const *const *p_initial_vector*, uint8_t const *const *const *p_user_key*, rsip_hmac_sha_wrapped_key_t *const *p_wrapped_key*)

This API generates 256-bit HMAC-SHA key within the user routine.

Parameters

[in]	key_injection_type	Selection key injection type when generating wrapped key
[in]	p_wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified.
[in]	p_initial_vector	Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified.
[in]	p_user_key	User key. If key injection type is not plain, it is encrypted and MAC appended
[out]	p_wrapped_key	256-bit HMAC-SHA wrapped key

Return values

FSP_SUCCESS	Normal termination.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.

Note

The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.

◆ R_RSIP_HMAC_SHA384_InitialKeyWrap()

fsp_err_t R_RSIP_HMAC_SHA384_InitialKeyWrap (rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const *const *p_wrapped_user_factory_programming_key*, uint8_t const *const *const *p_initial_vector*, uint8_t const *const *const *p_user_key*, rsip_hmac_sha_wrapped_key_t *const *p_wrapped_key*)

This API generates 384-bit HMAC-SHA key within the user routine.

Parameters

[in]	key_injection_type	Selection key injection type when generating wrapped key
[in]	p_wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified.
[in]	p_initial_vector	Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified.
[in]	p_user_key	User key. If key injection type is not plain, it is encrypted and MAC appended
[out]	p_wrapped_key	384-bit HMAC-SHA wrapped key

Return values

FSP_SUCCESS	Normal termination.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.
- FSP_ERR_UNSUPPORTED This API is not supported on this device.

Note

The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.

◆ R_RSIP_HMAC_SHA512_InitialKeyWrap()

fsp_err_t R_RSIP_HMAC_SHA512_InitialKeyWrap (rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const p_wrapped_user_factory_programming_key*, uint8_t const *const p_initial_vector*, uint8_t const *const p_user_key*, rsip_hmac_sha_wrapped_key_t *const *p_wrapped_key*)

This API generates 512-bit HMAC-SHA key within the user routine.

Parameters

[in]	key_injection_type	Selection key injection type when generating wrapped key
[in]	p_wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified.
[in]	p_initial_vector	Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified.
[in]	p_user_key	User key. If key injection type is not plain, it is encrypted and MAC appended
[out]	p_wrapped_key	512-bit HMAC-SHA wrapped key

Return values

FSP_SUCCESS	Normal termination.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.
- FSP_ERR_UNSUPPORTED This API is not supported on this device.

Note

The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.

◆ R_RSIP_HMAC_SHA512_224_InitialKeyWrap()

fsp_err_t R_RSIP_HMAC_SHA512_224_InitialKeyWrap (rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const *const *p_wrapped_user_factory_programming_key*, uint8_t const *const *const *p_initial_vector*, uint8_t const *const *const *p_user_key*, rsip_hmac_sha_wrapped_key_t *const *p_wrapped_key*)

This API generates 512/224-bit HMAC-SHA key within the user routine.

Parameters

[in]	key_injection_type	Selection key injection type when generating wrapped key
[in]	p_wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified.
[in]	p_initial_vector	Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified.
[in]	p_user_key	User key. If key injection type is not plain, it is encrypted and MAC appended
[out]	p_wrapped_key	512/224-bit HMAC-SHA wrapped key

Return values

FSP_SUCCESS	Normal termination.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.
- FSP_ERR_UNSUPPORTED This API is not supported on this device.

Note

The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.

◆ R_RSIP_HMAC_SHA512_256_InitialKeyWrap()

fsp_err_t R_RSIP_HMAC_SHA512_256_InitialKeyWrap (rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const *p_wrapped_user_factory_programming_key*, uint8_t const *const *p_initial_vector*, uint8_t const *const *p_user_key*, rsip_hmac_sha_wrapped_key_t *const *p_wrapped_key*)

This API generates 512/256-bit HMAC-SHA key within the user routine.

Parameters

[in]	key_injection_type	Selection key injection type when generating wrapped key
[in]	p_wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified.
[in]	p_initial_vector	Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified.
[in]	p_user_key	User key. If key injection type is not plain, it is encrypted and MAC appended
[out]	p_wrapped_key	512/256-bit HMAC-SHA wrapped key

Return values

FSP_SUCCESS	Normal termination.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.
- FSP_ERR_UNSUPPORTED This API is not supported on this device.

Note

The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.

Detailed Description

Driver for the Secure Key Injection on RA MCUs.

Overview

This module provides SCE functions in PSA Crypto.

HW Overview

Crypto Peripheral version	Devices
SCE9	RA6M5, RA6M4, RA4M3, RA4M2
SCE7	RA6M3, RA6M2, RA6M1, RA6T1
SCE5	RA4W1, RA4M1
SCE5B	RA6T2

Features

The SCE Key Injection Module has two types of APIs, InitialKeyWrap and EncryptedKeyWrap. The available APIs differ depending on used SCE. Please refer to the following for details.

- Key Support
  - AES 128/256bit

Crypto Peripheral version	128 bit	192 bit	256 bit
SCE9	InitialKeyWrap Only	InitialKeyWrap Only	InitialKeyWrap Only

SCE7	Support	Support	Support
SCE5	Support	No support	Support
SCE5B	InitialKeyWrap Only	No support	InitialKeyWrap Only

- RSA 2048/3072/4096bit

Crypto Peripheral version	2048 bit	3072 bit (public)	4096 bit (public)
SCE9	InitialKeyWrap Only	InitialKeyWrap Only	InitialKeyWrap Only
SCE7	Support	No support	No support
SCE5	No support	No support	No support
SCE5B	No support	No support	No support

- ECC secp256r1/secp256k1/secp384r1

Crypto Peripheral version	secp256r1	secp256k1	secp384r1	secp256r1 Brainpool	secp384r1 Brainpool
SCE9	InitialKeyWrap Only	InitialKeyWrap Only	InitialKeyWrap Only	InitialKeyWrap Only	InitialKeyWrap Only
SCE7	Support	Support	Support	Support	Support
SCE5	No support	No support	No support	No support	No support
SCE5B	No support	No support	No support	No support	No support

Configuration

Clock Configuration

This module does not require a specific clock configuration.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Module activation

SCE Key Injection for PSA Crypto Module is off by default. To use it, please On the Stacks tab, add New > Security > MbedTLS or MbedTLS (Crypto Only), Add Requires SCE Driver > New > (*1), Add Key Injection for RSA Crypto (Optional) > New > Key Injection for RSA Crypto for PSA Crypto Module after adding MbedTLS. For information on how to import and update secure keys, refer to the Application Note R11AN0496.
(*1)

Crypto Peripheral version	String displayed in the Stacks tab
SCE9	SCE Compatibility Mode
SCE7	SCE7
SCE5	SCE5
SCE5B	SCE5B

Hardware Initialization

Please refer to Hardware Initialization in Mbed Crypto H/W Acceleration (rm_psa_crypto).

Function Documentation

◆ R_SCE_AES128_InitialKeyWrap()

fsp_err_t R_SCE_AES128_InitialKeyWrap (const uint8_t *const *key_type*, const uint8_t *const *wrapped_user_factory_programming_key*, const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, sce_aes_wrapped_key_t *const *wrapped_key*)

This API generates 128-bit AES key within the user routine.

Parameters

[in]	key_type	Selection key type when generating wrapped key (0: for encrypted key, 1: for plain key)
[in]	wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	initial_vector	Initialization vector when generating encrypted_key. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	encrypted_key	Encrypted user key and MAC appended
[in,out]	wrapped_key	128-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES192_InitialKeyWrap()

fsp_err_t R_SCE_AES192_InitialKeyWrap (const uint8_t *const *key_type*, const uint8_t *const *wrapped_user_factory_programming_key*, const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, sce_aes_wrapped_key_t *const *wrapped_key*)

This API generates 192-bit AES key within the user routine.

Parameters

[in]	key_type	Selection key type when generating wrapped key (0: for encrypted key, 1: for plain key)
[in]	wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	initial_vector	Initialization vector when generating encrypted_key. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	encrypted_key	Encrypted user key and MAC appended
[in,out]	wrapped_key	192-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256_InitialKeyWrap()

fsp_err_t R_SCE_AES256_InitialKeyWrap (const uint8_t *const *key_type*, const uint8_t *const *wrapped_user_factory_programming_key*, const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, sce_aes_wrapped_key_t *const *wrapped_key*)

This API generates 256-bit AES key within the user routine.

Parameters

[in]	key_type	Selection key type when generating wrapped key (0: for encrypted key, 1: for plain key)
[in]	wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	initial_vector	Initialization vector when generating encrypted_key. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	encrypted_key	Encrypted user key and MAC appended
[in,out]	wrapped_key	256-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_KeyUpdateKeyWrap()

fsp_err_t R_SCE_KeyUpdateKeyWrap (const uint8_t *const *wrapped_user_factory_programming_key*, const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, sce_key_update_key_t *const *key_update_key*)

This API generates a key update key which is used for functions of the key updating.

Parameters

[in]	wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	initial_vector	Initialization vector when generating encrypted_key. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	encrypted_key	Encrypted user key and MAC appended
[in,out]	key_update_key	Key update key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128_EncryptedKeyWrap()

fsp_err_t R_SCE_AES128_EncryptedKeyWrap (const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, const sce_key_update_key_t *const *key_update_key*, sce_aes_wrapped_key_t *const *wrapped_key*)

This API wraps 128-bit AES key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	128-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES192_EncryptedKeyWrap()

fsp_err_t R_SCE_AES192_EncryptedKeyWrap (const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, const sce_key_update_key_t *const *key_update_key*, sce_aes_wrapped_key_t *const *wrapped_key*)

This API wraps 192-bit AES key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	192-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256_EncryptedKeyWrap()

fsp_err_t R_SCE_AES256_EncryptedKeyWrap (const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, const sce_key_update_key_t *const *key_update_key*, sce_aes_wrapped_key_t *const *wrapped_key*)

This API wraps 256-bit AES key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	256-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSA2048_InitialPublicKeyWrap()

fsp_err_t R_SCE_RSA2048_InitialPublicKeyWrap (const uint8_t *const *key_type*, const uint8_t *const *wrapped_user_factory_programming_key*, const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, sce_rsa2048_public_wrapped_key_t *const *wrapped_key*)

This API generates 2048-bit RSA key within the user routine.

Parameters

[in]	key_type	Selection key type when generating wrapped key (0: for encrypted key, 1: for plain key)
[in]	wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	initial_vector	Initialization vector when generating encrypted_key. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	encrypted_key	Encrypted user key and MAC appended
[in,out]	wrapped_key	2048-bit RSA wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSA3072_InitialPublicKeyWrap()

fsp_err_t R_SCE_RSA3072_InitialPublicKeyWrap (const uint8_t *const *key_type*, const uint8_t *const *wrapped_user_factory_programming_key*, const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, sce_rsa3072_public_wrapped_key_t *const *wrapped_key*)

This API generates 3072-bit RSA key within the user routine.

Parameters

[in]	key_type	Selection key type when generating wrapped key (0: for encrypted key, 1: for plain key)
[in]	wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	initial_vector	Initialization vector when generating encrypted_key. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	encrypted_key	Encrypted user key and MAC appended
[in,out]	wrapped_key	3072-bit RSA wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSA4096_InitialPublicKeyWrap()

fsp_err_t R_SCE_RSA4096_InitialPublicKeyWrap (const uint8_t *const *key_type*, const uint8_t *const *wrapped_user_factory_programming_key*, const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, sce_rsa4096_public_wrapped_key_t *const *wrapped_key*)

This API generates 4096-bit RSA key within the user routine.

Parameters

[in]	key_type	Selection key type when generating wrapped key (0: for encrypted key, 1: for plain key)
[in]	wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	initial_vector	Initialization vector when generating encrypted_key. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	encrypted_key	Encrypted user key and MAC appended
[in,out]	wrapped_key	4096-bit RSA wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSA2048_InitialPrivateKeyWrap()

fsp_err_t R_SCE_RSA2048_InitialPrivateKeyWrap (const uint8_t *const *key_type*, const uint8_t *const *wrapped_user_factory_programming_key*, const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, sce_rsa2048_private_wrapped_key_t *const *wrapped_key*)

This API generates 2048-bit RSA key within the user routine.

Parameters

[in]	key_type	Selection key type when generating wrapped key (0: for encrypted key, 1: for plain key)
[in]	wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	initial_vector	Initialization vector when generating encrypted_key. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	encrypted_key	Encrypted user key and MAC appended
[in,out]	wrapped_key	2048-bit RSA wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSA2048_EncryptedPublicKeyWrap()

fsp_err_t R_SCE_RSA2048_EncryptedPublicKeyWrap (const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, const sce_key_update_key_t *const *key_update_key*, sce_rsa2048_public_wrapped_key_t *const *wrapped_key*)

This API wraps 2048-bit RSA key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	2048-bit RSA wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSA2048_EncryptedPrivateKeyWrap()

fsp_err_t R_SCE_RSA2048_EncryptedPrivateKeyWrap (const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, const sce_key_update_key_t *const *key_update_key*, sce_rsa2048_private_wrapped_key_t *const *wrapped_key*)

This API wraps 2048-bit RSA key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	2048-bit RSA wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp256r1_InitialPublicKeyWrap()

fsp_err_t R_SCE_ECC_secp256r1_InitialPublicKeyWrap (const uint8_t *const *key_type*, const uint8_t *const *wrapped_user_factory_programming_key*, const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, sce_ecc_public_wrapped_key_t *const *wrapped_key*)

This API generates 256-bit ECC key within the user routine.

Parameters

[in]	key_type	Selection key type when generating wrapped key (0: for encrypted key, 1: for plain key)
[in]	wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	initial_vector	Initialization vector when generating encrypted_key. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	encrypted_key	Encrypted user key and MAC appended
[in,out]	wrapped_key	256-bit ECC wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp256k1_InitialPublicKeyWrap()

fsp_err_t R_SCE_ECC_secp256k1_InitialPublicKeyWrap (const uint8_t *const *key_type*, const uint8_t *const *wrapped_user_factory_programming_key*, const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, sce_ecc_public_wrapped_key_t *const *wrapped_key*)

This API generates 256-bit ECC key within the user routine.

Parameters

[in]	key_type	Selection key type when generating wrapped key (0: for encrypted key, 1: for plain key)
[in]	wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	initial_vector	Initialization vector when generating encrypted_key. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	encrypted_key	Encrypted user key and MAC appended
[in,out]	wrapped_key	256-bit ECC wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp384r1_InitialPublicKeyWrap()

fsp_err_t R_SCE_ECC_secp384r1_InitialPublicKeyWrap (const uint8_t *const *key_type*, const uint8_t *const *wrapped_user_factory_programming_key*, const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, sce_ecc_public_wrapped_key_t *const *wrapped_key*)

This API generates 384-bit ECC key within the user routine.

Parameters

[in]	key_type	Selection key type when generating wrapped key (0: for encrypted key, 1: for plain key)
[in]	wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	initial_vector	Initialization vector when generating encrypted_key. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	encrypted_key	Encrypted user key and MAC appended
[in,out]	wrapped_key	364-bit ECC wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp256r1_InitialPrivateKeyWrap()

fsp_err_t R_SCE_ECC_secp256r1_InitialPrivateKeyWrap (const uint8_t *const *key_type*, const uint8_t *const *wrapped_user_factory_programming_key*, const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, sce_ecc_private_wrapped_key_t *const *wrapped_key*)

This API generates 256-bit ECC key within the user routine.

Parameters

[in]	key_type	Selection key type when generating wrapped key (0: for encrypted key, 1: for plain key)
[in]	wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	initial_vector	Initialization vector when generating encrypted_key. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	encrypted_key	Encrypted user key and MAC appended
[in,out]	wrapped_key	256-bit ECC wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp256k1_InitialPrivateKeyWrap()

fsp_err_t R_SCE_ECC_secp256k1_InitialPrivateKeyWrap (const uint8_t *const *key_type*, const uint8_t *const *wrapped_user_factory_programming_key*, const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, sce_ecc_private_wrapped_key_t *const *wrapped_key*)

This API generates 256-bit ECC key within the user routine.

Parameters

[in]	key_type	Selection key type when generating wrapped key (0: for encrypted key, 1: for plain key)
[in]	wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	initial_vector	Initialization vector when generating encrypted_key. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	encrypted_key	Encrypted user key and MAC appended
[in,out]	wrapped_key	256-bit ECC wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp384r1_InitialPrivateKeyWrap()

fsp_err_t R_SCE_ECC_secp384r1_InitialPrivateKeyWrap (const uint8_t *const *key_type*, const uint8_t *const *wrapped_user_factory_programming_key*, const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, sce_ecc_private_wrapped_key_t *const *wrapped_key*)

This API generates 384-bit ECC key within the user routine.

Parameters

[in]	key_type	Selection key type when generating wrapped key (0: for encrypted key, 1: for plain key)
[in]	wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	initial_vector	Initialization vector when generating encrypted_key. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	encrypted_key	Encrypted user key and MAC appended
[in,out]	wrapped_key	384-bit ECC wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp256r1_EncryptedPublicKeyWrap()

fsp_err_t R_SCE_ECC_secp256r1_EncryptedPublicKeyWrap (const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, const sce_key_update_key_t *const *key_update_key*, sce_ecc_public_wrapped_key_t *const *wrapped_key*)

This API wraps 256-bit ECC key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	256-bit ECC wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp256k1_EncryptedPublicKeyWrap()

fsp_err_t R_SCE_ECC_secp256k1_EncryptedPublicKeyWrap (const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, const sce_key_update_key_t *const *key_update_key*, sce_ecc_public_wrapped_key_t *const *wrapped_key*)

This API wraps 256-bit ECC key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	256-bit ECC wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp384r1_EncryptedPublicKeyWrap()

fsp_err_t R_SCE_ECC_secp384r1_EncryptedPublicKeyWrap (const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, const sce_key_update_key_t *const *key_update_key*, sce_ecc_public_wrapped_key_t *const *wrapped_key*)

This API wraps 384-bit ECC key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	384-bit ECC wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp256r1_EncryptedPrivateKeyWrap()

fsp_err_t R_SCE_ECC_secp256r1_EncryptedPrivateKeyWrap (const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, const sce_key_update_key_t *const *key_update_key*, sce_ecc_private_wrapped_key_t *const *wrapped_key*)

This API wraps 256-bit ECC key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	256-bit ECC wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp256k1_EncryptedPrivateKeyWrap()

fsp_err_t R_SCE_ECC_secp256k1_EncryptedPrivateKeyWrap (const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, const sce_key_update_key_t *const *key_update_key*, sce_ecc_private_wrapped_key_t *const *wrapped_key*)

This API wraps 256-bit ECC key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	256-bit ECC wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp384r1_EncryptedPrivateKeyWrap()

fsp_err_t R_SCE_ECC_secp384r1_EncryptedPrivateKeyWrap (const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, const sce_key_update_key_t *const *key_update_key*, sce_ecc_private_wrapped_key_t *const *wrapped_key*)

This API wraps 384-bit ECC key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	384-bit ECC wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_brainpoolP256r1_InitialPublicKeyWrap()

fsp_err_t R_SCE_ECC_brainpoolP256r1_InitialPublicKeyWrap (const uint8_t *const *key_type*, const uint8_t *const *wrapped_user_factory_programming_key*, const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, sce_ecc_public_wrapped_key_t *const *wrapped_key*)

This API generates 256-bit Brainpool ECC key within the user routine.

Parameters

[in]	key_type	Selection key type when generating wrapped key (0: for encrypted key, 1: for plain key)
[in]	wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	initial_vector	Initialization vector when generating encrypted_key. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	encrypted_key	Encrypted user key and MAC appended
[in,out]	wrapped_key	256-bit ECC wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_brainpoolP256r1_InitialPrivateKeyWrap()

fsp_err_t R_SCE_ECC_brainpoolP256r1_InitialPrivateKeyWrap (const uint8_t *const *key_type*, const uint8_t *const *wrapped_user_factory_programming_key*, const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, sce_ecc_private_wrapped_key_t *const *wrapped_key*)

This API generates 256-bit Brainpool ECC key within the user routine.

Parameters

[in]	key_type	Selection key type when generating wrapped key (0: for encrypted key, 1: for plain key)
[in]	wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	initial_vector	Initialization vector when generating encrypted_key. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	encrypted_key	Encrypted user key and MAC appended
[in,out]	wrapped_key	256-bit ECC wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_brainpoolP384r1_InitialPublicKeyWrap()

fsp_err_t R_SCE_ECC_brainpoolP384r1_InitialPublicKeyWrap (const uint8_t *const *key_type*, const uint8_t *const *wrapped_user_factory_programming_key*, const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, sce_ecc_public_wrapped_key_t *const *wrapped_key*)

This API generates 384-bit Brainpool ECC key within the user routine.

Parameters

[in]	key_type	Selection key type when generating wrapped key (0: for encrypted key, 1: for plain key)
[in]	wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	initial_vector	Initialization vector when generating encrypted_key. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	encrypted_key	Encrypted user key and MAC appended
[in,out]	wrapped_key	364-bit ECC wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_brainpoolP384r1_InitialPrivateKeyWrap()

fsp_err_t R_SCE_ECC_brainpoolP384r1_InitialPrivateKeyWrap (const uint8_t *const *key_type*, const uint8_t *const *wrapped_user_factory_programming_key*, const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, sce_ecc_private_wrapped_key_t *const *wrapped_key*)

This API generates 384-bit Brainpool ECC key within the user routine.

Parameters

[in]	key_type	Selection key type when generating wrapped key (0: for encrypted key, 1: for plain key)
[in]	wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	initial_vector	Initialization vector when generating encrypted_key. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	encrypted_key	Encrypted user key and MAC appended
[in,out]	wrapped_key	384-bit ECC wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_brainpoolP256r1_EncryptedPublicKeyWrap()

fsp_err_t R_SCE_ECC_brainpoolP256r1_EncryptedPublicKeyWrap (const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, const sce_key_update_key_t *const *key_update_key*, sce_ecc_public_wrapped_key_t *const *wrapped_key*)

This API wraps 256-bit Brainpool ECC key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	256-bit ECC wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_brainpoolP256r1_EncryptedPrivateKeyWrap()

fsp_err_t R_SCE_ECC_brainpoolP256r1_EncryptedPrivateKeyWrap (const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, const sce_key_update_key_t *const *key_update_key*, sce_ecc_private_wrapped_key_t *const *wrapped_key*)

This API wraps 256-bit Brainpool ECC key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	256-bit ECC wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_brainpoolP384r1_EncryptedPublicKeyWrap()

fsp_err_t R_SCE_ECC_brainpoolP384r1_EncryptedPublicKeyWrap (const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, const sce_key_update_key_t *const *key_update_key*, sce_ecc_public_wrapped_key_t *const *wrapped_key*)

This API wraps 384-bit Brainpool ECC key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	384-bit ECC wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_brainpoolP384r1_EncryptedPrivateKeyWrap()

fsp_err_t R_SCE_ECC_brainpoolP384r1_EncryptedPrivateKeyWrap (const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, const sce_key_update_key_t *const *key_update_key*, sce_ecc_private_wrapped_key_t *const *wrapped_key*)

This API wraps 384-bit Brainpool ECC key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	384-bit ECC wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.
- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

7.2.15.10 TinyCrypt H/W Acceleration (rm_tinycrypt_port)

fsp_err_t	RM_TINCYRYPT_PORT_Init ()
fsp_err_t	RM_TINCYRYPT_PORT_TRNG_Read (uint8_t *const p_rngbuf, uint32_t num_req_bytes) Reads requested length of random data from the TRNG. Generate num_req_bytes of random bytes and store them in p_rngbuf buffer. More...
int	default_CSPRNG (uint8_t *dest, unsigned int size) Implements the Cryptographically Secure Pseudo-Random Number Generator function required byt TinyCrypt. More...

Detailed Description

AES128 Hardware acceleration for TinyCrypt on the RA2 family.

Overview

Note

The TinyCrypt port module does not provide any interfaces to the user. Consult the documentation at https://github.com/intel/tinycrypt/blob/master/documentation/tinycrypt.rst for further information.

TinyCrypt is designed as a small footprint software crypto implementation to be used on resource constrained devices. The software only module is available in FSP on all RA devices. Hardware acceleration for AES-128 is provided only for the RA2 family. This release uses TinyCrypt v0.2.8.

Hardware Overview

Crypto Peripheral version	Devices
AES Engine	RA2A1, RA2E1, RA2L1

Features

For features supported by the software-only version, refer to the TinyCrypt documentation.

The TinyCrypt port module provides hardware support for the following operations

- AES
  - Keybits - 128, 192, 256
  - ECB, CBC, CTR, CCM, GCM and CMAC modes -TRNG

Configuration

Build Time Configurations for TinyCrypt_Acceleration

The following build time configurations are defined in fsp_cfg/rm_tinycrypt_port_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

AES Configuration

To enable hardware acceleration for the AES128 operation, choose TinyCrypt (H/W Accelerated) from the stack options . This feature is only supported on the RA2 family.

Usage Notes

Hardware Initialization

Invoke RM_TINCYRYPT_PORT_Init () to initialize the hardware before using Tinycrypt if either

hardware acceleration or the TRNG is to be used.

Random Number Generation

There are two Pseudo-random Number Generators (PRNG) provided in TinyCrypt

- CTR-PRNG which uses AES128 internally in its implementation. Enabling AES128 hardware acceleration will improve the performance of this module.
- HMAC-PRNG which uses SHA256 internally in its implementation.

Both these implementations will only be able to provide a random pseudo-random number sequence if they are seeded with truly random data. The TRNG module that is present in hardware and available in rm_tinycrypt_port must be used to seed these modules. When using CTR-PRNG or HMAC-PRNG, use the RM_TINCYRYPT_PORT_TRNG_Read() function to obtain random data from the TRNG hardware and use that to seed the PRNG modules before invoking the pseudo-random number generation. If purely random data is sufficient for the application, then RM_TINCYRYPT_PORT_TRNG_Read() can be used directly instead. The hardware TRNG implements the CTR_DRBG spec.

Default CSPRNG

The TinyCrypt ECC implementation requires a platform specific implementation of the default_CSPRNG() function. This function has been implemented using the hardware TRNG in the port to support software ECC usage. When using TinyCrypt in S/W mode, it is necessary to implement default_CSPRNG() if using ECC signature generation (ECDSA) or key derivation (ECDH).

AES-128 Usage

The AES ECB mode implementation is provided in aes_encrypt.decrypt.c. All the other modes of AES operation including CBC, CCN, CMAC and CTR use the ECB mode for the block operation. On the RA2, the ECB mode has been hardware accelerated which improves performance of the other modes as well. Additionally the CBC and CTR modes are also accelerated.

To use the different AES modes, first initialize the hardware (on the RA2) and then use the functions defined in the header file of each AES mode. Note that TinyCrypt does not provide any type of padding or buffering so the data provided to these modes should be multiples of AES block size.

Usage with RA2A2

On the RA2A2, the TinyCrypt API has been expanded to support GCM mode operation. Key lengths of 128, 192 and 256 are supported. GCM mode operation is not supported on other MCUs in hardware or software in the TinyCrypt API.

Memory Usage

TinyCrypt does not use dynamic allocation so there is no heap requirement.

Limitations

Usage with RA4 and RA6 devices

TinyCrypt (S/W Only) can be used on RA4 and RA6 devices. However, since ECC signature generation (ECDSA) and key derivation (ECDH) requires a random number source, that operation is currently not supported on these devices when using TinyCrypt (S/W Only). In order to support those operations the function default_CSPRNG() must be implemented in the user code.

TinyCrypt

- No padding is supported; the user is expected to provide adequately padded data depending on the algorithm used.
- AES Key generation is not supported.
- Key encoding/decoding is not supported.

Using TinyCrypt with TrustZone

Unlike FSP drivers, TinyCrypt cannot be configured as Non-secure callable in the RA Configurator for a secure project. The reason for this is that in order to achieve the security objective of controlling access to protected keys, both the crypto code as well as the keys must be placed in the secure region. Since the tinyCrypt API requires access to the keys directly during initialization and later via a key handle, allowing non-secure code to use the API by making it Non-secure callable will require the keys to be stored in non-secure memory.

This limitation is identical to that for PSA Crypto. Refer to the documentation of that module on how to create a crypto Non-Secure Callable layer to be used in such situations.

Examples

AES-CBC Example

This is an example on using TinyCrypt to encrypt and decrypt data using an AES-128 key in CBC mode.

```
#define TC_INPUT_PLAINTEXT_SIZE 64U
#define TF_AES_IV_SIZE TC_AES_BLOCK_SIZE
#define TC_OUTPUT_CIPHERTEXT_SIZE (TC_INPUT_PLAINTEXT_SIZE + TF_AES_IV_SIZE)
/*

Function Documentation

◆ RM_TINCYRYPT_PORT_Init()

fsp_err_t RM_TINCYRYPT_PORT_Init ( )
Initialize the SCE.

◆ RM_TINCYRYPT_PORT_TRNG_Read()

fsp_err_t RM_TINCYRYPT_PORT_TRNG_Read (uint8_t *const *p_rngbuf*, uint32_t *num_req_bytes*)
Reads requested length of random data from the TRNG. Generate num_req_bytes of random bytes and store them in p_rngbuf buffer.

Return values

FSP_SUCCESS	Random number generation successful
FSP_ERR_ASSERTION	NULL input parameter(s).
FSP_ERR_CRYPTO_UNKNOWN	An unknown error occurred.

Returns

See Common Error Codes or functions called by this function for other possible return codes.

◆ default_CSPRNG()

int default_CSPRNG (uint8_t * *dest*, unsigned int *size*)
Implements the Cryptographically Secure Pseudo-Random Number Generator function required byt TinyCrypt.

Return values

TC_CRYPTO_SUCCESS	Random number generation successful
TC_CRYPTO_FAIL	Random number generation failed.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- RM_TINCYRYPT_PORT_TRNG_Read

7.2.16 Sensor

Modules

Detailed Description

Sensor Modules.

Modules

	FS1015 Flow Sensor (rm_fs1015) [Deprecated] Middleware to implement the FS1015 sensor interface. This module implements the FSXXXX Middleware Interface.
	FS2012 Flow Sensor (rm_fs2012) [Deprecated] Middleware to implement the FS2012 sensor interface. This module implements the FSXXXX Middleware Interface.
	FS3000 Flow Sensor (rm_fs3000) Middleware to implement the FS3000 sensor interface. This module implements the FSXXXX Middleware Interface.
	HS300X Temperature/Humidity Sensor (rm_hs300x) Middleware to implement the HS300X sensor interface. This module implements the HS300X Middleware Interface.
	HS400X Temperature/Humidity Sensor (rm_hs400x) Middleware to implement the HS400X sensor interface. This module implements the HS400X Middleware Interface.
	OB1203 Light/Proximity/PPG Sensor (rm_ob1203) [Deprecated] Middleware to implement the OB1203 sensor interface. This module implements the OB1203 Middleware Interface.
	RRH46410 Gas Sensor Module (rm_rrh46410) Middleware to implement the RRH46410 sensor module interface. This module implements the ZMOD4XXX Middleware Interface.
	RRH47000 NDIR CO2 Sensor Module (rm_rrh47000) Middleware to implement the RRH47000 sensor module interface. This module implements the SENSOR Middleware Interface.
	RRH62000 All-in-one Air Quality Module (rm_rrh62000) Middleware to implement the RRH62000 sensor module interface. This module implements the SENSOR Middleware Interface.

	ZMOD4XXX Gas Sensor (rm_zmod4xxx) Middleware to implement the ZMOD4XXX sensor interface. This module implements the ZMOD4XXX Middleware Interface.

Detailed Description

Middleware to implement the FS1015 sensor interface. This module implements the FSXXXX Middleware Interface.

Overview

FS1015 is EOL.

Features

The FS1015 sensor interface implementation has the following key features:

- Getting ADC data from the sensor
- Calculating flow value from ADC data

Limitations

- I2C Master (r_sau_i2c) is not supported. FS1015 needs clock stretching, but is not supported by SAU I2C.

Configuration

Build Time Configurations for rm_fs1015

The following build time configurations are defined in fsp_cfg/rm_fs1015_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
Device Type	FS1015-1005	FS1015-1005	Select FS1015 device used.

Configurations for Sensor > FS1015 Flow Sensor (rm_fs1015) [Deprecated]

This module can be added to the Stacks tab via New Stack > Sensor > FS1015 Flow Sensor (rm_fs1015) [Deprecated].

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_fs1015_sensor0	Module name.
Callback	Name must be a valid C symbol	fs1015_callback	A user callback function can be provided.

Pin Configuration

This module use SDA and SCL pins of I2C Master and SCI I2C.

Usage Notes

FS1015 datasheet is here.
If ADC data is invalid, it is needed to read ADC data from FS1015 again. The module only supports FS1015-1005.

If an RTOS is used, blocking and bus lock is available.

- If blocking of an I2C bus is required, it is necessary to create a semaphore for blocking.
- If bus lock is required, it is necessary to create a mutex for bus lock. Bus lock is only available when a semaphore for blocking is used.

Bus Initialization

The FS1015 interface expects a bus instance to be opened before opening any FS1015 device. The interface will handle switching between devices on the bus but will not open or close the bus instance. The user should open the bus with the appropriate I2C Master Interface open call.

Examples

Basic Example

This is a basic example of minimal use of FS1015 sensor implementation in an application.

```
void rm_fs1015_basic_example (void)
{
 fsp_err_t            err = FSP_SUCCESS;
 rm_fsxxxx_raw_data_t fs1015_raw_data;

Data Structure Documentation

◆ rm_fs1015_instance_ctrl_t

struct rm_fs1015_instance_ctrl_t	
FS1015 Control Block	
Data Fields	
uint32_t	open
	Open flag.
rm_fsxxxx_cfg_t const *	p_cfg
	Pointer to FS1015 Configuration.
rm_comms_instance_t const *	p_comms_i2c_instance
	Pointer of I2C Communications Middleware instance structure.

void const *	p_context
	Pointer to the user-provided context.

Function Documentation

◆ RM_FS1015_Open()

fsp_err_t RM_FS1015_Open (rm_fsxxxx_ctrl_t *const *p_api_ctrl*, rm_fsxxxx_cfg_t const *const *p_cfg*)

Opens and configures the FS1015 Middle module. Implements rm_fsxxxx_api_t::open.

Example:

```
    err = RM_FS1015_Open(&g_fs1015_ctrl, &g_fs1015_cfg);
```

Return values

FSP_SUCCESS	FS1015 successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.

◆ RM_FS1015_Close()

fsp_err_t RM_FS1015_Close (rm_fsxxxx_ctrl_t *const *p_api_ctrl*)

Disables specified FS1015 control block. Implements rm_fsxxxx_api_t::close.

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_FS1015_Read()

fsp_err_t RM_FS1015_Read (rm_fsxxxx_ctrl_t *const *p_api_ctrl*, rm_fsxxxx_raw_data_t *const *p_raw_data*)

Reads ADC data from FS1015. Implements rm_fsxxxx_api_t::read.

Return values

FSP_SUCCESS	Successfully data decoded.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_FS1015_DataCalculate()

fsp_err_t RM_FS1015_DataCalculate (rm_fsxxxx_ctrl_t *const *p_api_ctrl*, rm_fsxxxx_raw_data_t *const *p_raw_data*, rm_fsxxxx_data_t *const *p_fs1015_data*)

Calculates flow [m/sec] from ADC data. Implements rm_fsxxxx_api_t::dataCalculate.

Return values

FSP_SUCCESS	Successfully data decoded.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_SENSOR_INVALID_DATA	Data is invalid.

Data Structures

struct	rm_fs3000_instance_ctrl_t

Data Structure Documentation

◆ rm_fs3000_instance_ctrl_t

struct rm_fs3000_instance_ctrl_t	
FS3000 Control Block	
Data Fields	
uint32_t	open
	Open flag.
rm_fsxxxx_cfg_t const *	p_cfg
	Pointer to FS3000 Configuration.
rm_comms_instance_t const *	p_comms_i2c_instance
	Pointer of I2C Communications Middleware instance structure.
void const *	p_context
	Pointer to the user-provided context.

Function Documentation

◆ RM_FS3000_Open()

fsp_err_t RM_FS3000_Open (rm_fsxxxx_ctrl_t *const *p_api_ctrl*, rm_fsxxxx_cfg_t const *const *p_cfg*)

Opens and configures the FS3000 Middle module. Implements rm_fsxxxx_api_t::open.

Example:

```
    err = RM_FS3000_Open(&g_fs3000_ctrl, &g_fs3000_cfg);
```

Return values

FSP_SUCCESS	FS3000 successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.

◆ RM_FS3000_Close()

fsp_err_t RM_FS3000_Close (rm_fsxxxx_ctrl_t *const *p_api_ctrl*)

Disables specified FS3000 control block. Implements rm_fsxxxx_api_t::close.

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_FS3000_Read()

fsp_err_t RM_FS3000_Read (rm_fsxxxx_ctrl_t *const *p_api_ctrl*, rm_fsxxxx_raw_data_t *const *p_raw_data*)

Reads ADC data from FS3000. Implements rm_fsxxxx_api_t::read.

Return values

FSP_SUCCESS	Successfully data decoded.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_FS3000_DataCalculate()

fsp_err_t RM_FS3000_DataCalculate (rm_fsxxxx_ctrl_t *const *p_api_ctrl*, rm_fsxxxx_raw_data_t *const *p_raw_data*, rm_fsxxxx_data_t *const *p_fs3000_data*)
Calculates flow [m/sec] from ADC data. Implements rm_fsxxxx_api_t::dataCalculate.

Return values

FSP_SUCCESS	Successfully data decoded.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_SENSOR_INVALID_DATA	Data is invalid.

Detailed Description

Middleware to implement the HS300X sensor interface. This module implements the HS300X Middleware Interface.

Overview

Features

The HS300X sensor interface implementation has the following key features:

- Starting a measurement at any time
- Getting ADC data from the sensor
- Calculating humidity and temperature value from getting ADC data
- Changing the sensor resolution
- Getting the sensor ID

Configuration

Build Time Configurations for rm_hs300x

The following build time configurations are defined in fsp_cfg/rm_hs300x_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
Data type	• Both humidity and temperature • Humidity only	Both humidity and temperature	Select Getting humidity only and both humidity and temperature.
Programming Mode	• ON • OFF	OFF	If selected the programming mode can be entered.

Configurations for Sensor > HS300X Temperature/Humidity Sensor (rm_hs300x)

This module can be added to the Stacks tab via New Stack > Sensor > HS300X Temperature/Humidity Sensor (rm_hs300x).

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_hs300x_sensor0	Module name.
Callback	Name must be a valid C symbol	hs300x_callback	A user callback function can be provided.

Pin Configuration

This module use SDA and SCL pins of I2C Master and SCI I2C.

Usage Notes

HS300x datasheet is here.
If ADC data is valid and calculating humidity and temperature is finished, it is needed to start a

measurement again. If ADC data is invalid, it is needed to read ADC data from HS300x again.

If changing the sensor resolution and getting the sensor ID, RM_HS300X_ProgrammingModeEnter function must be called within 10ms after applying power to the sensor. Entering the programming mode takes 120us. Thresore, after calling RM_HS300X_ProgrammingModeEnter function, please wait 120us. After calling RM_HS300X_ResolutionChange function, 14ms must be waited because failure to comply with these times may result in data corruption and introduce errors in sensor measurements.

If an RTOS is used, blocking and bus lock is available.

- If blocking of an I2C bus is required, it is necessary to create a semaphore for blocking.
- If bus lock is required, it is necessary to create a mutex for bus lock. Bus lock is only available when a semaphore for blocking is used.

Bus Initialization

The HS300X interface expects a bus instance to be opened before opening any HS300X device. The interface will handle switching between devices on the bus but will not open or close the bus instance. The user should open the bus with the appropriate I2C Master Interface open call.

Examples

Basic Example

This is a basic example of minimal use of HS300X sensor implementation in an application.

```
void rm_hs300x_basic_example (void)
{
 fsp_err_t            err = FSP_SUCCESS;
 rm_hs300x_raw_data_t hs300x_raw_data;
 rm_hs300x_data_t    hs300x_data;
    uint8_t             calculated_flag = 0;
 /* Open the I2C bus if it is not already open. */
    rm_comms_i2c_bus_extended_cfg_t * p_extend =
       (rm_comms_i2c_bus_extended_cfg_t *) g_hs300x_cfg.p_instance->p_cfg->p_extend;
 i2c_master_instance_t * p_driver_instance = (i2c_master_instance_t *)
p_extend->p_driver_instance;
    p_driver_instance->p_api->open(p_driver_instance->p_ctrl,
p_driver_instance->p_cfg);
#if BSP_CFG_RTOS
 /* Create a semaphore for blocking if a semaphore is not NULL */
 if (NULL != p_extend->p_blocking_semaphore)
    {
 #if BSP_CFG_RTOS == 1 // AzureOS
```

```
      tx_semaphore_create(p_extend->p_blocking_semaphore->p_semaphore_handle,
                          p_extend->p_blocking_semaphore->p_semaphore_name,
                          (ULONG) 0);
 #elif BSP_CFG_RTOS == 2 // FreeRTOS
      *(p_extend->p_blocking_semaphore->p_semaphore_handle) =

Function Documentation

◆ RM_HS300X_Open()

fsp_err_t RM_HS300X_Open (rm_hs300x_ctrl_t *const *p_api_ctrl*, rm_hs300x_cfg_t const *const *p_cfg*)

Opens and configures the HS300X Middle module. Implements rm_hs300x_api_t::open.

Example:

```
    err = RM_HS300X_Open(&g_hs300x_ctrl, &g_hs300x_cfg);
```

Return values

FSP_SUCCESS	HS300X successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.

◆ RM_HS300X_Close()

fsp_err_t RM_HS300X_Close (rm_hs300x_ctrl_t *const *p_api_ctrl*)

Disables specified HS300X control block. Implements rm_hs300x_api_t::close.

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_HS300X_MeasurementStart()

fsp_err_t RM_HS300X_MeasurementStart (rm_hs300x_ctrl_t *const *p_api_ctrl*)

This function should be called when start a measurement and when measurement data is stale data. Sends the slave address to the hs300x and start a measurement. Implements rm_hs300x_api_t::measurementStart.

Return values

FSP_SUCCESS	Successfully started.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_HS300X_Read()

fsp_err_t RM_HS300X_Read (rm_hs300x_ctrl_t *const *p_api_ctrl*, rm_hs300x_raw_data_t *const *p_raw_data*)

Reads ADC data from HS300X. Implements rm_hs300x_api_t::read.

Return values

FSP_SUCCESS	Successfully data decoded.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_HS300X_DataCalculate()

fsp_err_t RM_HS300X_DataCalculate (rm_hs300x_ctrl_t *const *p_api_ctrl*, rm_hs300x_raw_data_t *const *p_raw_data*, rm_hs300x_data_t *const *p_hs300x_data*)

Calculates humidity [RH] and temperature [Celsius] from ADC data. Implements rm_hs300x_api_t::dataCalculate.

Return values

FSP_SUCCESS	Successfully data decoded.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_SENSOR_INVALID_DATA	Data is invalid.

◆ RM_HS300X_ProgrammingModeEnter()

fsp_err_t RM_HS300X_ProgrammingModeEnter (rm_hs300x_ctrl_t *const *p_api_ctrl*)

This function must be called within 10ms after applying power to the sensor. Sends the commands to enter the programming mode. After calling this function, please wait 120us. Implements rm_hs300x_api_t::programmingModeEnter.

Return values

FSP_SUCCESS	Successfully started.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_UNSUPPORTED	Programming mode is not supported.

◆ RM_HS300X_ResolutionChange()

fsp_err_t RM_HS300X_ResolutionChange (rm_hs300x_ctrl_t *const *p_api_ctrl*, rm_hs300x_data_type_t const *data_type*, rm_hs300x_resolution_t const *resolution*)

This function must be called after calling the RM_HS300X_ProgrammingModeEnter function. Changes the sensor resolution. This function blocks for 120 us software delay plus 9 bytes on the I2C bus. After calling this function, 14ms must be waited. Failure to comply with these times may result in data corruption and introduce errors in sensor measurements. Implements rm_hs300x_api_t::resolutionChange.

Return values

FSP_SUCCESS	Successfully started.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_MODE	Module is not entering the programming mode.
FSP_ERR_ABORTED	Communication is aborted.
FSP_ERR_TIMEOUT	Communication is timeout.
FSP_ERR_UNSUPPORTED	Programming mode is not supported.

◆ RM_HS300X_SensorIdGet()

fsp_err_t RM_HS300X_SensorIdGet (rm_hs300x_ctrl_t *const *p_api_ctrl*, uint32_t *const *p_sensor_id*)

This function must be called after calling the RM_HS300X_ProgrammingModeEnter function. Gets the sensor ID. This function blocks for 240 us software delay plus 12 bytes on the I2C bus. Implements rm_hs300x_api_t::sensorIdGet.

Return values

FSP_SUCCESS	Successfully started.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_MODE	Module is not entering the programming mode.
FSP_ERR_ABORTED	Communication is aborted.
FSP_ERR_TIMEOUT	Communication is timeout.
FSP_ERR_UNSUPPORTED	Programming mode is not supported.

◆ RM_HS300X_ProgrammingModeExit()

fsp_err_t RM_HS300X_ProgrammingModeExit (rm_hs300x_ctrl_t *const *p_api_ctrl*)
This function must be called after calling the RM_HS300X_ProgrammingModeEnter function. This function must be called to return to normal sensor operation and perform measurements. Sends the commands to exit the programming mode. Implements rm_hs300x_api_t::programmingModeExit. **Return values** FSP_SUCCESS — Successfully started. FSP_ERR_ASSERTION — Null pointer passed as a parameter. FSP_ERR_NOT_OPEN — Module is not open. FSP_ERR_INVALID_MODE — Module is not entering the programming mode. FSP_ERR_UNSUPPORTED — Programming mode is not supported.

Modules » Sensor

Functions

fsp_err_t	RM_HS400X_Open (rm_hs400x_ctrl_t *const p_api_ctrl, rm_hs400x_cfg_t const *const p_cfg) Opens and configures the HS400X middleware module. Implements rm_hs400x_api_t::open. More...
fsp_err_t	RM_HS400X_Close (rm_hs400x_ctrl_t *const p_api_ctrl) Disables specified HS400X control block. Implements rm_hs400x_api_t::close. More...
fsp_err_t	RM_HS400X_MeasurementStart (rm_hs400x_ctrl_t *const p_api_ctrl) This function should be called when start one shot measurement. Sends the command of measurement to HS400X and start a measurement. This function supports No-Hold measurement and Periodic measurement only. If Hold measurement is enabled, please call RM_HS400X_Read() without calling this function. In Periodic measurement, if the periodic measurement has already run, RM_HS400X_EVENT_ERROR is received in callback because HS400x device replies with NACK. Implements rm_hs400x_api_t::measurementStart. More...

fsp_err_t	RM_HS400X_MeasurementStop (rm_hs400x_ctrl_t *const p_api_ctrl) Stop a periodic measurement. Sends the command of stopping periodic measurement to HS400X. This function supports periodic measurement only. If a periodic measurement is not running, RM_HS400X_EVENT_ERROR is received in callback because HS400x device replies with NACK. Implements rm_hs400x_api_t::measurementStop. More...
fsp_err_t	RM_HS400X_Read (rm_hs400x_ctrl_t *const p_api_ctrl, rm_hs400x_raw_data_t *const p_raw_data) Reads ADC data from HS400X. If Hold measurement is enabled, HS400X holds the SCL line low during the measurement and releases the SCL line when the measurement is complete. If No-Hold measurement is enabled and the measurement result is not ready, RM_HS400X_EVENT_MEASUREMENT_NOT_COMPLETE is received in callback. Implements rm_hs400x_api_t::read. More...
fsp_err_t	RM_HS400X_DataCalculate (rm_hs400x_ctrl_t *const p_api_ctrl, rm_hs400x_raw_data_t *const p_raw_data, rm_hs400x_data_t *const p_hs400x_data) Calculates temperature [Celsius] and humidity [RH] from ADC data. Implements rm_hs400x_api_t::dataCalculate. More...

Detailed Description

Middleware to implement the HS400X sensor interface. This module implements the HS400X Middleware Interface.

Overview

Features

The HS400X sensor interface implementation has the following key features:

- Starting a measurement at any time
- Selecting one shot or a periodic measurement
- Getting ADC data from the sensor
- Calculating humidity and temperature value from getting ADC data

Limitations

- Alert feature is not supported. It will be supported in the future.
- I2C Master (r_sau_i2c) is not supported in Hold measurement. Hold measurement needs clock stretching, but is not supported by SAU I2C.

Notifications

The minimum frequency for the SCL clock in Hold measurement is 200kHz. Please configure I2C_MASTER_RATE_FAST or I2C_MASTER_RATE_FASTPLUS to "Rate" in I2C Master (r_iic_master) or I2C Master (r_sci_i2c).

Configuration

Build Time Configurations for rm_hs400x

The following build time configurations are defined in fsp_cfg/rm_hs400x_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
Measurement Type	• Hold Measurement • No-Hold Measurement • Periodic Measurement	No-Hold Measurement	Select measurement type.
Data type	• Both humidity and temperature • Temperature only	Both humidity and temperature	Select getting temperature only or both humidity and temperature.

Configurations for Sensor > HS400X Temperature/Humidity Sensor (rm_hs400x)

This module can be added to the Stacks tab via New Stack > Sensor > HS400X Temperature/Humidity Sensor (rm_hs400x).

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_hs400x_sensor0	Module name.
Temperature Resolution	• 8-bit • 10-bit • 12-bit • 14-bit	14-bit	Set resolution of temperature.
Humidity Resolution	• 8-bit • 10-bit • 12-bit • 14-bit	14-bit	Set resolution of humidity.
Frequency for Periodic Measurement	• 0.4Hz • 1Hz • 2Hz	1Hz	Set frequency for periodic measurement.
Comms I2C Callback	Name must be a valid C symbol	hs400x_comms_i2c_callback	A user COMMS I2C callback function can be provided.

Pin Configuration

This module use SDA and SCL pins of I2C Master and SCI I2C.

Usage Notes

HS400x datasheet is here.
This module supports three measurement type :

- Hold measurement
- No-Hold measurement
- Periodic measurement

Hold and no-hold measurements also support measuring temperature data only. However, a periodic measurement only supports measuring both humidity and temperature data.

Hold Measurement

A hold measurement sequence consists of the following steps.

1. Wake up the HS400x series sensor from sleep mode by sending its I2C address with a write bit, and initiate a measurement by sending the desired hold measurement command.
2. Change the direction of communication by sending a start bit, the HS400x I2C address, and a read bit. The SCL line is held low by the sensor during the measurement process, which prevents the master from initiating any communications with other slaves on the bus.
3. Once the requested measurement is completed by the HS400x series sensor, the SCL line is released and the chip waits for the SCL clock signal to send the results. The sensor will then transmit the requested measurement data on the bus for the master to capture.

No-Hold Measurement

A no-hold measurement sequence consists of the following steps.

1. Wake up the HS400x series sensor from sleep mode by sending its I2C address with a write bit, and initiate a measurement by sending the desired no-hold measurement command.
2. To read the result from the HS400x series sensor, the master has to send the chip its I2C address and a read bit. If the measurement is completed and the result is ready, the chip will send an ACK bit and starts to send the result over the bus. If the measurement is still in progress, the chip will send a NACK bit and the master will need to try to read the result again.

Periodic Measurement

The HS400x sensors can also be configured to measure at regular intervals without user intervention. In this mode, the user can read the latest relative humidity / temperature data by issuing a data fetch sequence, which consists of sending the HS400x I2C address with a read bit. The sensor will then send the latest measurement result over the I2C bus.
When the periodic measurement mode is active, the only commands the chip will respond to are the data fetch command, and a command to stop the periodic measurements. The command to stop periodic measurements is issued by sending the I2C address with a write bit, followed by the command 0x30. Sequence to Stop Periodic Measurements. Once the periodic measurements have been stopped, the chip returns to sleep and is ready to accept all valid I2C commands.

Bus Initialization

The HS400X interface expects a I2C bus instance to be opened before opening any I2C device. The interface will handle switching between devices on the bus but will not open or close the bus instance. The user should open the bus with the appropriate I2C Master Interface open call.

If an RTOS is used, blocking and bus lock is available.

- If blocking of an I2C bus is required, it is necessary to create a semaphore for blocking.
- If bus lock is required, it is necessary to create a mutex for bus lock. Bus lock is only available when a semaphore for blocking is used.

Initialization

Initialize with RM_HS400X_Open().

From measurement start to data acquisition

After normal completion, start the each measurement.

Hold Measurement

In hold measurement, the HS400x series sensor holds the SCL line low during the measurement and releases the SCL line when the measurement is complete.

1. Call RM_HS400X_Read(). This function will start a measurement and read the ADC data.
2. Wait until RM_HS400X_EVENT_SUCCESS is received.
3. Call RM_HS400X_DataCalculate(). This function will calculate temperature and humidity data from the ADC data.

No-Hold Measurement

In no-hold measurement, the HS400x series sensor does not hold the SCL line low, and the master is free to initiate communication with other slaves while the chip is performing the measurement.

1. Call RM_HS400X_MeasurementStart(). This function will start a measurement.
2. Wait until RM_HS400X_EVENT_SUCCESS is received.
3. Call RM_HS400X_Read(). This function will read the ADC data.
4. If the measurement result is not ready, RM_HS400X_EVENT_MEASUREMENT_NOT_COMPLETE is received in callback. User should call RM_HS400X_Read() again. If the measurement is completed, RM_HS400X_EVENT_SUCCESS is received in callback.
5. Wait until RM_HS400X_EVENT_SUCCESS is received.
6. Call RM_HS400X_DataCalculate(). This function will calculate temperature and humidity data from the ADC data.

Periodic Measurement

In periodic measurement, the HS400x sensors measure at regular intervals without user intervention. If a periodic measurement is running, the resolution and the frequency cannot be changed. please stop the periodic measurement with RM_HS400X_MeasurementStop().

1. Call RM_HS400X_MeasurementStart(). This function will start a measurement. If the function is called once, a second call is not required.
2. Wait until RM_HS400X_EVENT_SUCCESS is received.
3. Wait for frequency for periodic measurement.
4. Call RM_HS400X_Read(). This function will read the ADC data.

5. Wait until RM_HS400X_EVENT_SUCCESS is received.
6. Call RM_HS400X_DataCalculate(). This function will calculate temperature and humidity data from the ADC data.

Examples

Basic Example

This is a basic examples of minimal use of HS400X sensor implementation in an application.

```

	Flag for stop of periodic measurement.
volatile bool	no_hold_measurement_read
	Flag for data read of No-Hold measurement.
uint8_t	write_buf [18]
	Buffer for data write.
void(*	p_comms_callback)(rm_hs400x_callback_args_t *p_args)
	I2C Communications callback.

Function Documentation

◆ RM_HS400X_Open()

fsp_err_t RM_HS400X_Open (rm_hs400x_ctrl_t *const *p_api_ctrl*, rm_hs400x_cfg_t const *const *p_cfg*)

Opens and configures the HS400X middleware module. Implements rm_hs400x_api_t::open.

Example:

```
err = RM_HS400X_Open(&g_hs400x_ctrl, &g_hs400x_cfg);
```

Return values

FSP_SUCCESS	HS400X successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.
FSP_ERR_TIMEOUT	communication is timeout.
FSP_ERR_ABORTED	communication is aborted.

◆ RM_HS400X_Close()

fsp_err_t RM_HS400X_Close (rm_hs400x_ctrl_t *const *p_api_ctrl*)

Disables specified HS400X control block. Implements rm_hs400x_api_t::close.

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_HS400X_MeasurementStart()

fsp_err_t RM_HS400X_MeasurementStart (rm_hs400x_ctrl_t *const *p_api_ctrl*)

This function should be called when start one shot measurement. Sends the command of measurement to HS400X and start a measurement. This function supports No-Hold measurement and Periodic measurement only. If Hold measurement is enabled, please call RM_HS400X_Read() without calling this function. In Periodic measurement, if the periodic measurement has already run, RM_HS400X_EVENT_ERROR is received in callback because HS400x device replies with NACK. Implements rm_hs400x_api_t::measurementStart.

Return values

FSP_SUCCESS	Successfully started.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_TIMEOUT	communication is timeout.
FSP_ERR_ABORTED	communication is aborted.
FSP_ERR_UNSUPPORTED	Hold measurement is unsupported.

◆ RM_HS400X_MeasurementStop()

fsp_err_t RM_HS400X_MeasurementStop (rm_hs400x_ctrl_t *const *p_api_ctrl*)

Stop a periodic measurement. Sends the command of stopping periodic measurement to HS400X. This function supports periodic measurement only. If a periodic measurement is not running, RM_HS400X_EVENT_ERROR is received in callback because HS400x device replies with NACK. Implements rm_hs400x_api_t::measurementStop.

Return values

FSP_SUCCESS	Successfully started.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_TIMEOUT	communication is timeout.
FSP_ERR_ABORTED	communication is aborted.
FSP_ERR_UNSUPPORTED	Hold and No-Hold measurement are unsupported.

◆ RM_HS400X_Read()

fsp_err_t RM_HS400X_Read (rm_hs400x_ctrl_t *const *p_api_ctrl*, rm_hs400x_raw_data_t *const *p_raw_data*)

Reads ADC data from HS400X. If Hold measurement is enabled, HS400X holds the SCL line low during the measurement and releases the SCL line when the measurement is complete. If No-Hold measurement is enabled and the measurement result is not ready, RM_HS400X_EVENT_MEASUREMENT_NOT_COMPLETE is received in callback. Implements rm_hs400x_api_t::read.

Return values

FSP_SUCCESS	Successfully data decoded.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_TIMEOUT	communication is timeout.
FSP_ERR_ABORTED	communication is aborted.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_HS400X_DataCalculate()

fsp_err_t RM_HS400X_DataCalculate (rm_hs400x_ctrl_t *const *p_api_ctrl*, rm_hs400x_raw_data_t *const *p_raw_data*, rm_hs400x_data_t *const *p_hs400x_data*)

Calculates temperature [Celsius] and humidity [RH] from ADC data. Implements rm_hs400x_api_t::dataCalculate.

Return values

FSP_SUCCESS	Successfully data decoded.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_SENSOR_INVALID_DATA	Data is invalid.

Detailed Description

Middleware to implement the OB1203 sensor interface. This module implements the OB1203 Middleware Interface.

Overview

OB1203 is EOL.

This module provides APIs for configuring and controlling the OB1203 sensor operation modes. Supported OB1203 sensor operation modes are below.

- Light mode
- Proximity mode
- Light Proximity mode
- PPG mode

Features

The OB1203 sensor interface implementation has the following key features:

- Initialize the sensor for measurement
- Start and stop a measurement at any time
- Get the ADC data from the sensor
- Calculate the Light/Proximity/PPG values.
- Software reset

Configuration

Build Time Configurations for rm_ob1203

The following build time configurations are defined in fsp_cfg/rm_ob1203_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Sensor > OB1203 Light/Proximity/PPG Sensor (rm_ob1203) [Deprecated]

This module can be added to the Stacks tab via New Stack > Sensor > OB1203 Light/Proximity/PPG Sensor (rm_ob1203) [Deprecated].

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_ob1203_sensor0	Module name.
Semaphore Timeout (RTOS only)	Value must be a non-negative integer	0xFFFFFFFF	Set timeout for blocking in using RTOS.
Comms I2C Callback	Name must be a valid C symbol	ob1203_comms_i2c_callback	A user COMMS I2C callback function can be provided.
IRQ Callback	Name must be a valid C symbol	ob1203_irq_callback	A user IRQ callback function can be provided.

Configurations for Sensor > OB1203 Light mode (rm_ob1203)

Configuration	Options	Default	Description
Operation Mode	• LS mode • CS mode	LS mode	Set operation mode.
Interrupt Type	• Threshold • Variation	Threshold	Set interrupt type.
Interrupt Source	• Clear channel • Green channel • Red channel (CS mode only) • Blue channel (CS mode only)	Clear channel	Set interrupt source.
The Number of Similar Consecutive Interrupt Events	Value must be a non-negative integer	0x02	The number of similar consecutive Light mode interrupt events that must occur before the interrupt is asserted (4bits). Min = 0x0 and Max = 0xF
Sleep after Interrupt	• Enabled • Disabled	Disabled	Set sleep after interrupt.
Gain	• 1 • 3 • 6	3	Set gain for detection range.
Resolution and Measurement Period	Refer to the RA Configuration tool for available options.	Resolution:18bit. Measurement Period:100ms	Set resolution and measurement period.
Upper Threshold	Value must be a non-negative integer	0x00CCC	Set upper threshold value (20bits). Min = 0x00000 and Max = 0xFFFFF.
Lower Threshold	Value must be a non-negative integer	0x00000	Set lower threshold value (20bits). Min = 0x00000 and Max =

			0xFFFFF.
Variance Threshold	• +/- 8 counts • +/- 16 counts • +/- 32 counts • +/- 64 counts • +/- 128 counts • +/- 256 counts • +/- 512 counts • +/- 1024 counts	+/- 128 counts	Set variance threshold. New data varies by selected counts compared to previous result.

Configurations for Sensor > OB1203 Proximity mode (rm_ob1203)

Configuration	Options	Default	Description
Interrupt Type	• Normal • Logic	Normal	Set interrupt type.
The Number of Similar Consecutive Interrupt Events	Value must be a non-negative integer	0x02	The number of similar consecutive Proximity mode interrupt events that must occur before the interrupt is asserted (4bits). Min = 0x0 and Max = 0xF
Sleep after Interrupt	• Enabled • Disabled	Disabled	Set sleep after interrupt.
Gain	• 1 • 1.5 • 2 • 4	1	Set gain of ADC output and noise.
LED Current	Value must be a non-negative integer	0x100	Set Current for LED (10bits). Min = 0x000 and Max = 0x3FF
LED Order	• IR LED first, Red LED second • Red LED first, IR LED second	IR LED first, Red LED second	Set LED order.
LED Analog Cancellation	• Enabled (50% offset of the full-scale value) • Disabled	Disabled	Set analog cancellation level.
LED Digital Cancellation	Value must be a non-negative integer	0x100	Set digital cancellation level (16bits). Min = 0x0000 and Max = 0xFFFF
Number of LED pulses	• 1 pulse • 2 pulses • 4 pulses • 8 pulses • 16 pulses • 32 pulses	8 pulses	Set number of LED pulses.

Pulse Width and Measurement Period	Refer to the RA Configuration tool for available options.	Pulse width:42us. Measurement Period:100ms	Set pulse width and measurement period.
Moving Average	• Enabled • Disabled	Disabled	Set moving average.
Hysteresis	Value must be a non-negative integer	0x00	Set hysteresis level (7bits). Min = 0x00 and Max = 0x7F.
Upper Threshold	Value must be a non-negative integer	0x0600	Set upper threshold value (16bits). Min = 0x0000 and Max = 0xFFFF.
Lower Threshold	Value must be a non-negative integer	0x0000	Set lower threshold value (16bits). Min = 0x0000 and Max = 0xFFFF.

Configurations for Sensor > OB1203 PPG mode (rm_ob1203)

Configuration	Options	Default	Description
Operation Mode	• PPG1 mode • PPG2 mode	PPG2 mode	Set operation mode.
Interrupt Type	• Data • FIFO Almost Full	Data	Set interrupt type.
Gain	• 1 • 1.5 • 2 • 4	1	Set gain of ADC output and noise.
IR LED Current	Value must be a non-negative integer	0x366	Set Current for IR LED (10bits). Min = 0x000 and Max = 0x3FF
Red LED Current	Value must be a non-negative integer	0x1B3	Set Current for Red LED (9bits). Min = 0x000 and Max = 0x1FF
Power Save Mode	• Enabled • Disabled	Disabled	Set power save mode.
LED Order	• IR LED first, Red LED second • Red LED first, IR LED second	IR LED first, Red LED second	Set LED order.
IR LED Analog Cancellation	• Enabled (50% offset of the full-scale value) • Disabled	Disabled	Set analog cancellation level.
Red LED Analog Cancellation	• Enabled (50% offset of the full-	Disabled	Set analog cancellation level.

	scale value) • Disabled		
Number of Averaged PPG Samples	• 1 (No averaging) • 2 consecutives samples are averaged • 4 consecutives samples are averaged • 8 consecutives samples are averaged • 16 consecutives samples are averaged • 32 consecutives samples are averaged	8 consecutives samples are averaged	Set number of averaged for PPG samples.
Pulse Width and Measurement Period	Refer to the RA Configuration tool for available options.	Pulse width:130us. Measurement Period:1.25ms	Set pulse width and measurement period.
FIFO Rollover	• Enabled • Disabled	Enabled	Set FIFO rollover.
FIFO Almost Full Value	Value must be a non-negative integer	0x0C	Set the number of empty FIFO words when the FIFO almost full interrupt is issued (4bits). Min = 0x0 and Max = 0xF. In PPG2 Mode, only even values must be used.

Configurations for Sensor > OB1203 Light Proximity mode (rm_ob1203)

Configuration	Options	Default	Description
General			
Device Interrupt	• Light mode • Proximity mode	Light mode	Select an operation mode using device interrupt.
Light mode			
Operation Mode	• LS mode • CS mode	LS mode	Set operation mode.
Interrupt Type	• Threshold • Variation	Threshold	Set interrupt type.
Interrupt Source	• Clear channel • Green channel • Red channel (CS mode only)	Clear channel	Set interrupt source.

	• Blue channel (CS mode only)		
The Number of Similar Consecutive Interrupt Events	Value must be a non-negative integer	0x02	The number of similar consecutive Light mode interrupt events that must occur before the interrupt is asserted (4bits). Min = 0x0 and Max = 0xF
Sleep after Interrupt	• Enabled • Disabled	Disabled	Set sleep after interrupt.
Gain	• 1 • 3 • 6	3	Set gain for detection range.
Resolution and Measurement Period	Refer to the RA Configuration tool for available options.	Resolution:18bit. Measurement Period:100ms	Set resolution and measurement period.
Upper Threshold	Value must be a non-negative integer	0x00CCC	Set upper threshold value (20bits). Min = 0x00000 and Max = 0xFFFFF.
Lower Threshold	Value must be a non-negative integer	0x00000	Set lower threshold value (20bits). Min = 0x00000 and Max = 0xFFFFF.
Variance Threshold	• +/- 8 counts • +/- 16 counts • +/- 32 counts • +/- 64 counts • +/- 128 counts • +/- 256 counts • +/- 512 counts • +/- 1024 counts	+/- 128 counts	Set variance threshold. New data varies by selected counts compared to previous result.
Proximity mode			
Interrupt Type	• Normal • Logic	Normal	Set interrupt type.
The Number of Similar Consecutive Interrupt Events	Value must be a non-negative integer	0x02	The number of similar consecutive Proximity mode interrupt events that must occur before the interrupt is asserted (4bits). Min = 0x0 and Max = 0xF
Sleep after Interrupt	• Enabled • Disabled	Disabled	Set sleep after interrupt.
Gain	• 1 • 1.5	1	Set gain of ADC output and noise.

	• 2 • 4		
LED Current	Value must be a non-negative integer	0x100	Set Current for LED (10bits). Min = 0x000 and Max = 0x3FF
LED Order	• IR LED first, Red LED second • Red LED first, IR LED second	IR LED first, Red LED second	Set LED order.
LED Analog Cancellation	• Enabled (50% offset of the full-scale value) • Disabled	Disabled	Set analog cancellation level.
LED Digital Cancellation	Value must be a non-negative integer	0x100	Set digital cancellation level (16bits). Min = 0x0000 and Max = 0xFFFF
Number of LED pulses	• 1 pulse • 2 pulses • 4 pulses • 8 pulses • 16 pulses • 32 pulses	8 pulses	Set number of LED pulses.
Pulse Width and Measurement Period	Refer to the RA Configuration tool for available options.	Pulse width:42us. Measurement Period:100ms	Set pulse width and measurement period.
Moving Average	• Enabled • Disabled	Disabled	Set moving average.
Hysteresis	Value must be a non-negative integer	0x00	Set hysteresis level (7bits). Min = 0x00 and Max = 0x7F.
Upper Threshold	Value must be a non-negative integer	0x0600	Set upper threshold value (16bits). Min = 0x0000 and Max = 0xFFFF.
Lower Threshold	Value must be a non-negative integer	0x0000	Set lower threshold value (16bits). Min = 0x0000 and Max = 0xFFFF.

Pin Configuration

This module uses I2C Master, SCI I2C and IRQ drivers. Therefore, this module uses SDA and SCL pins of I2C Master and SCI I2C and an IRQ pin.

Usage Notes

OB1203 datasheet is here.

The OB1203 has four operation modes.

Light mode

Light mode has two operation modes.

Operation mode	Red	Green	Blue	Clear	Comp *1
LS mode		✓		✓	✓
CS mode	✓	✓	✓	✓	✓

*1 : Temperature compensation data

Light mode features are below.

- High lux accuracy over different light sources
- Absolute sensitivity: 0.06 lux to > 150000 lux
- Output resolution: 13 to 20 bits
- Three LS/CS gain modes: x1 to x6
- Highly linear output, 50Hz/60Hz light and fluorescent light flicker immunity
- Four parallel channels (red, green, blue, clear)
- Accurate Correlated Color Temperature (CCT)
- Accurate CIE 1931 XYZ (RGB) color measurement
- Very stable spectral response over angle of light incidence

Proximity mode

Proximity mode features are below.

- Integrated and trimmed LED source, driver, and photodetector
- Programmable pulsed LED up to 250mA output current
- High resolution (12 to 16 bits)
- Object movement detection (in/out)
- Ambient light suppression > 100klx sun light
- Crosstalk cancelation (analog and digital)

PPG mode

PPG mode has two operation modes.

Operation mode	Discription
PPG1 mode	Only one LED is used. This mode allows determination of parameters related to heart rate with an appropriate algorithm
PPG2 mode	Two LED are used. Second LED is used as a transmitter. This mode supports further analysis, such as SpO2 and respiration rate determination.

PPG mode features are below.

- SpO2 measurement behind visibly dark, IR transmissive ink
- Industry's smallest optical biosensor module
- Fully integrated and trimmed module, including two LEDs, 250mA maximum drive current, and photodetectors
- Output resolution PPG: 16 to 18 bits
- Data stored in 18-bit wide, 32-sample FIFO memory
- Integrated averaging function for higher signal-to-noise ratio(SNR) and data rate reduction
- Programmable measurement rate: up to 3200 samples per second
- High SNR

Light Proximity mode

Light mode and Proximity mode can be used in parallel.

Bus Initialization

The OB1203 interface expects a bus instance to be opened before opening any OB1203 device. The interface will handle switching between devices on the bus but will not open or close the bus instance. The user should open the bus with the appropriate I2C Master Interface open call.

If an RTOS is used, blocking and bus lock for I2C bus are available.

- If blocking of an I2C bus is required, it is necessary to create a semaphore for blocking.
- If bus lock is required, it is necessary to create a mutex for bus lock. Bus lock is only available when a semaphore for blocking is used.

Initialization

Initialize with RM_OB1203_Open().

From measurement start to data acquisition

After normal completion, start the measurement with RM_OB1203_MeasurementStart().

Light mode

If IRQ is enabled

1. Wait until RM_OB1203_EVENT_THRESHOLD_CROSSED is received via IRQ callback.
2. Call RM_OB1203_LightRead(). This function will read the ADC data and clear the interrupt bits.
3. Wait until RM_OB1203_EVENT_SUCCESS is received.
4. Call RM_OB1203_LightDataCalculate(). This function will calculate light data from the ADC data.

If IRQ is disabled

1. Wait for measurement period configured.
2. Call RM_OB1203_LightRead(). This function will read the ADC data.
3. Wait until RM_OB1203_EVENT_SUCCESS is received.
4. Call RM_OB1203_LightDataCalculate(). This function will calculate light data from the ADC data.

Proximity mode

If IRQ is enabled

1. Wait until RM_OB1203_EVENT_THRESHOLD_CROSSED or RM_OB1203_EVENT_OBJECT_NEAR is received via IRQ callback.
2. Call RM_OB1203_ProxRead(). This function will read the ADC data and clear the interrupt bits.
3. Wait until RM_OB1203_EVENT_SUCCESS is received.
4. Call RM_OB1203_ProxDataCalculate(). This function will calculate proximity data from the ADC data.

If IRQ is disabled

1. Wait for measurement period configured.
2. Call RM_OB1203_ProxRead(). This function will read the ADC data.
3. Wait until RM_OB1203_EVENT_SUCCESS is received.
4. Call RM_OB1203_ProxDataCalculate(). This function will calculate proximity data from the ADC data.

PPG mode

If IRQ is enabled

1. Wait until RM_OB1203_EVENT_MEASUREMENT_COMPLETE is received via IRQ callback.
2. Call RM_OB1203_PpgRead(). This function will read the ADC data and clear the interrupt bits. In PPG2 mode, the number of read FIFO samples must be even value because two samples is one pair.
3. Wait until RM_OB1203_EVENT_SUCCESS is received.
4. Call RM_OB1203_PpgDataCalculate(). This function will calculate PPG data from the ADC data.

If IRQ is disabled

1. Wait for measurement period configured.
2. Call RM_OB1203_PpgRead(). This function will read the ADC data. In PPG2 mode, the number of read FIFO samples must be even value because two samples is one pair.
3. Wait until RM_OB1203_EVENT_SUCCESS is received.
4. Call RM_OB1203_PpgDataCalculate(). This function will calculate PPG data from the ADC data.

Light Proximity mode

Combination of the above Light mode and Proximity mode.

Getting device status

Call RM_OB1203_DeviceStatusGet(). This function will get device status over I2C.

- If power_on_reset_occur is true, the part has had a power-up event, either because the part was turned on or because there was a power-supply voltage disturbance.
- If light_interrupt_occur is true, Light mode interrupt condition has occurred.
- If light_measurement_complete is true, Light mode measurement is complete.
- If ts_measurement_complete is true, TS measurement is complete.
- If fifo_afull_interrupt_occur is true, FIFO almost full interrupt condition has occurred.

- If ppg_measurement_complete is true, PPG mode measurement is complete.
- If object_near is true, an object is near.
- If prox_interrupt_occur is true, Proximity mode interrupt condition has occurred.
- If prox_measurement_complete is true, Proximity mode measurement is complete.

Clearing interrupt bits

If interrupt bits are needed to clear without calling RM_OB1203_LightRead(), RM_OB1203_ProxRead() , RM_OB1203_PpgRead() and RM_OB1203_MeasurementStop(), please call RM_OB1203_DeviceStatusGet(). Interrupt bits are reset by STATUS_0 and STATUS_1 registers read.

Sleep after interrupt

Sleep after interrupt is valid in Light mode and Proximity mode. If a sleep after interrupt bit are set, a measurement will be stopped after an interrupt occurs. After STATUS_0 and STATUS_1 registers are read, a measurement will be started. please call RM_OB1203_DeviceStatusGet().

PPG FIFO

PPG FIFO data is stored in 18-bit wide, 32-sample FIFO memory.
The FIFO almost full interrupt is triggered when a certain number of free FIFO registers are remaining.
If FIFO informations (write index, read index, overflow counter, unread_samples) are got, Call RM_OB1203_FifoInfoGet().

- write_index is the FIFO index where the next sample of PPG data will be written in the FIFO.
- read_index is the index of the next sample to be read from the FIFO_DATA register.
- overflow_counter is the number of old samples (up to 15) which are overwritten by new data. If the FIFO Rollover is enabled, the FIFO overflow counter counts.
- unread_samples is the number of unread FIFO samples, which can be calculated by write index and read index.

Reconfiguration

The interface supports the following APIs for reconfiguration.

API	Discription
RM_OB1203_GainSet()	Set gain
RM_OB1203_LedCurrentSet()	Set LED currents. Proximity mode and Light Proximity mode: LED Current is 10bits. Min = 0x000 and Max = 0x3FF PPG mode: IR/Red LED currents are 10bits/9bits. Min = 0x000/0x000 and Max = 0x3FF/0x1FF
RM_OB1203_DeviceInterruptCfgSet()	Set interrupt configurations.

Relationship between APIs and registers

The relationship between APIs and registers accessed by the API is below.

API	Registers
RM_OB1203_MeasurementStart()	MAIN_CTRL_0 and MAIN_CTRL_1

RM_OB1203_MeasurementStop()	MAIN_CTRL_0, MAIN_CTRL_1 , STATUS_0, STATUS_1, FIFO_WR_PTR, FIFO_RD_PTR and FIFO_OVF_CNT
RM_OB1203_LightRead()	LS_CLEAR_DATA, LS_GREEN_DATA, LS_BULE_DATA, LS_RED_DATA, COMP_DATA, STATUS_0 and STATUS_1
RM_OB1203_ProxRead()	PS_DATA, STATUS_0 and STATUS_1
RM_OB1203_PpgRead()	FIFO_DATA
RM_OB1203_DeviceStatusGet()	STATUS_0 and STATUS_1
RM_OB1203_GainSet()	LS_GAIN and PPG_PS_GAIN
RM_OB1203_LedCurrentSet()	PS_LED_CURR, PPG_IRLED_CURR and PPG_RLED_CURR
RM_OB1203_DeviceInterruptCfgSet()	INT_CFG_0, INT_CFG_1 and INT_PST
RM_OB1203_FifoInfoGet()	FIFO_WR_PTR, FIFO_RD_PTR and FIFO_OVF_CNT

Notifications

The application note [R01AN6311] using this module has an algorithm for biometric data calculation. The algorithm has the constraint of sampling rate (default: 100 samples per second). Please refer to the application note [R36AN0001EU] and OB1203 sensor page (https://www.renesas.com/jp/en/products/sensor-products/biosensors/ob1203-heart-rate-blood-oxygen-concentration-pulse-oximetry-proximity-light-and-color-sensor)
R01AN6311 : https://www.renesas.com/document/apn/ob1203-sample-application-sample-code
R36AN0001EU : https://www.renesas.com/document/apn/ob1203-pulse-oximeter-algorithm-spo2-heart-rate-and-respiration-rate

If multiple operation modes is used with a single OB1203 sensor device, rm_ob1203 modules need to be used while switching between operation modes because modules cannot work in parallel. Threfore, a current rm_ob1203 module must be closed with RM_OB1203_Close() before another rm_ob1203 module is opened with RM_OB1203_Open().

Examples

Basic Example

These are basic examples of minimal use of OB1203 sensor implementation in an application.

Light mode

```

Data Structure Documentation

◆ rm_ob1203_init_process_params_t

struct rm_ob1203_init_process_params_t		
OB1203 initialization process block		
Data Fields		
volatile bool	communication_finished	Communication flag for blocking.
volatile rm_ob1203_event_t	event	Callback event.

◆ rm_ob1203_mode_extended_cfg_t

struct rm_ob1203_mode_extended_cfg_t		
OB1203 mode extended configuration		
Data Fields		
rm_ob1203_api_t const *	p_api	Pointer to APIs.
rm_ob1203_operation_mode_t	mode_irq	Operation mode using IRQ.
rm_ob1203_ppg_prox_gain_t	ppg_prox_gain	Proximity gain range.
rm_ob1203_led_order_t	led_order	LED order.
rm_ob1203_light_sensor_mode_t	light_sensor_mode	LS or CS sensor mode.
rm_ob1203_light_interrupt_type	light_interrupt_type	Light mode interrupt type.

_t		
rm_ob1203_light_interrupt_source_t	light_interrupt_source	Light mode interrupt source.
uint8_t	light_interrupt_persist	The number of similar consecutive Light mode interrupt events that must occur before the interrupt is asserted (4bits).
rm_ob1203_sleep_after_interrupt_t	light_sleep	Sleep after an interrupt.
rm_ob1203_light_gain_t	light_gain	Light gain range.
uint32_t	light_upper_threshold	Upper threshold for interrupt.
uint32_t	light_lower_threshold	Lower threshold for interrupt.
rm_ob1203_variance_threshold_t	light_variance_threshold	variance threshold for interrupt.
rm_ob1203_light_resolution_meas_period_t	light_resolution_period	Resolution and measurement period.
rm_ob1203_light_data_type_t	light_data_type	Light data type.
rm_ob1203_sleep_after_interrupt_t	prox_sleep	Sleep after an interrupt.
rm_ob1203_prox_interrupt_type_t	prox_interrupt_type	Proximity mode interrupt type.
uint8_t	prox_interrupt_persist	The number of similar consecutive Proximity mode interrupt events that must occur before the interrupt is asserted (4bits).
uint16_t	prox_led_current	Proximity LED current.
rm_ob1203_analog_cancellation_t	prox_ana_can	Analog cancellation.
uint16_t	prox_dig_can	Digital cancellation.
rm_ob1203_number_led_pulses_t	prox_num_led_pulses	Number of LED pulses.
uint16_t	prox_upper_threshold	Upper threshold for interrupt.
uint16_t	prox_lower_threshold	Lower threshold for interrupt.
rm_ob1203_prox_pulse_width_meas_period_t	prox_width_period	Proximity pulse width and measurement period.

rm_ob1203_ppg_sensor_mode_t	ppg_sensor_mode	PPG1 or PPG2 sensor mode.

rm_ob1203_ppg_interrupt_type_t	ppg_interrupt_type	PPG mode interrupt type.
uint16_t	ppg_ir_led_current	PPG IR LED current.
uint16_t	ppg_red_led_current	PPG Red LED current.
rm_ob1203_power_save_mode_t	ppg_power_save_mode	PPG power save mode.
rm_ob1203_analog_cancellation_t	ppg_ir_led_ana_can	IR LED analog cancellations.
rm_ob1203_analog_cancellation_t	ppg_red_led_ana_can	Red LED analog cancellations.
rm_ob1203_number_averaged_samples_t	ppg_num_averaged_samples	Number of averaged PPG samples.
rm_ob1203_ppg_pulse_width_meas_period_t	ppg_width_period	PPG pulse width and measurement period.
rm_ob1203_fifo_rollover_t	ppg_fifo_rollover	FIFO rollover enable.
uint8_t	ppg_fifo_empty_num	the number of empty FIFO words when the FIFO almost full interrupt is issued. In PPG2 Mode only even values should be used. (4 bits)
uint8_t	ppg_number_of_samples	Number of PPG samples.

◆ rm_ob1203_instance_ctrl_t

struct rm_ob1203_instance_ctrl_t	
OB1203 Control Block	
Data Fields	
rm_ob1203_semaphore_t const *	p_semaphore
	The semaphore to wait for callback. This is used for another data read/write after a communication.
uint32_t	open
	Open flag.
rm_ob1203_cfg_t const *	p_cfg
	Pointer to OB1203 Configuration.

uint8_t	buf [8]
	Buffer for I2C communications.
rm_ob1203_init_process_params_t	init_process_params
	For the initialization process.
uint8_t	register_address
	Register address to access.
volatile rm_ob1203_device_status_t *	p_device_status
	Pointer to device status.
volatile rm_ob1203_fifo_info_t *	p_fifo_info
	Pointer to FIFO information structure.
volatile bool	fifo_reset
	Flag for FIFO reset for PPG mode.
volatile bool	prox_gain_update
	Flag for gain update for Proximity mode.
volatile bool	interrupt_bits_clear
	Flag for clearing interrupt bits.
rm_comms_instance_t const *	p_comms_i2c_instance
	Pointer of I2C Communications Middleware instance structure.

rm_ob1203_mode_extended_cfg_t *	p_mode
	Pointer of OB1203 operation mode extended configuration.
void const *	p_irq_instance
	Pointer to IRQ instance.
void const *	p_context
	Pointer to the user-provided context.
void(*	p_comms_callback)(rm_ob1203_callback_args_t *p_args)
	I2C Communications callback.
void(*	p_irq_callback)(rm_ob1203_callback_args_t *p_args)
	IRQ callback.

Function Documentation

◆ RM_OB1203_Open()

fsp_err_t RM_OB1203_Open (rm_ob1203_ctrl_t *const *p_api_ctrl*, rm_ob1203_cfg_t const *const *p_cfg*)

Opens and configures the OB1203 Middle module. Implements rm_ob1203_api_t::open.

Example:

```
    err = RM_OB1203_Open(&g_ob1203_ctrl, &g_ob1203_cfg);
```

Return values

FSP_SUCCESS	OB1203 successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.
FSP_ERR_TIMEOUT	Communication is timeout.
FSP_ERR_ABORTED	Communication is aborted.

◆ RM_OB1203_Close()

fsp_err_t RM_OB1203_Close (rm_ob1203_ctrl_t *const *p_api_ctrl*)

Disables specified OB1203 control block. Implements rm_ob1203_api_t::close.

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_OB1203_MeasurementStart()

fsp_err_t RM_OB1203_MeasurementStart (rm_ob1203_ctrl_t *const *p_api_ctrl*)

Start measurement. Implements rm_ob1203_api_t::measurementStart.

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.

◆ RM_OB1203_MeasurementStop()

fsp_err_t RM_OB1203_MeasurementStop (rm_ob1203_ctrl_t *const *p_api_ctrl*)

Stop measurement. If device interrupt is enabled, interrupt bits are cleared after measurement stop. If PPG mode, FIFO information is also reset after measurement stop. In RTOS and Light/Proximity/Light Proximity mode, if device interrupt is enabled, blocks 2 bytes on the I2C bus. In RTOS and PPG mode, if device interrupt is enabled, blocks 6 bytes on the I2C bus. If device interrupt is disabled, blocks 4 bytes on the I2C bus. Implements rm_ob1203_api_t::measurementStop.

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.

◆ RM_OB1203_LightRead()

fsp_err_t RM_OB1203_LightRead (rm_ob1203_ctrl_t *const *p_api_ctrl*, rm_ob1203_raw_data_t *const *p_raw_data*, rm_ob1203_light_data_type_t *type*)

Reads Light ADC data from OB1203 device. If device interrupt is enabled, interrupt bits are cleared after data read. In RTOS and Light mode, if device interrupt is enabled, blocks 2 bytes on the I2C bus. Implements rm_ob1203_api_t::lightRead.

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.

◆ RM_OB1203_LightDataCalculate()

fsp_err_t RM_OB1203_LightDataCalculate (rm_ob1203_ctrl_t *const *p_api_ctrl*, rm_ob1203_raw_data_t *const *p_raw_data*, rm_ob1203_light_data_t *const *p_ob1203_data*)

Calculate light data from raw data. Implements rm_ob1203_api_t::lightDataCalculate.

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.

◆ RM_OB1203_ProxRead()

fsp_err_t RM_OB1203_ProxRead (rm_ob1203_ctrl_t *const *p_api_ctrl*, rm_ob1203_raw_data_t *const *p_raw_data*)

Reads Proximity ADC data from OB1203 device. If device interrupt is enabled, interrupt bits are cleared after data read. In RTOS and Proximity mode, if device interrupt is enabled, blocks 2 bytes on the I2C bus. Implements rm_ob1203_api_t::proxRead.

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.

◆ RM_OB1203_ProxDataCalculate()

fsp_err_t RM_OB1203_ProxDataCalculate (rm_ob1203_ctrl_t *const *p_api_ctrl*, rm_ob1203_raw_data_t *const *p_raw_data*, rm_ob1203_prox_data_t *const *p_ob1203_data*)

Calculate proximity data from raw data. Implements rm_ob1203_api_t::proxDataCalculate.

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.

◆ RM_OB1203_PpgRead()

fsp_err_t RM_OB1203_PpgRead (rm_ob1203_ctrl_t *const *p_api_ctrl*, rm_ob1203_raw_data_t *const *p_raw_data*, uint8_t const *number_of_samples*)

Reads PPG ADC data from OB1203 device. One sample requires three bytes. 0 cannot set to the number of samples. Implements rm_ob1203_api_t::ppgRead.

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.

◆ RM_OB1203_PpgDataCalculate()

fsp_err_t RM_OB1203_PpgDataCalculate (rm_ob1203_ctrl_t *const *p_api_ctrl*, rm_ob1203_raw_data_t *const *p_raw_data*, rm_ob1203_ppg_data_t *const *p_ob1203_data*)

Calculate PPG data from raw data. Implements rm_ob1203_api_t::ppgDataCalculate.

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.

◆ RM_OB1203_GainSet()

fsp_err_t RM_OB1203_GainSet (rm_ob1203_ctrl_t *const *p_api_ctrl*, rm_ob1203_gain_t const *gain*)

Set gain. This function should be called after calling RM_OB1203_MeasurementStop(). In RTOS and Light Proximity mode, blocks 2 bytes on the I2C bus. Implements rm_ob1203_api_t::gainSet.

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.

◆ RM_OB1203_LedCurrentSet()

fsp_err_t RM_OB1203_LedCurrentSet (rm_ob1203_ctrl_t *const *p_api_ctrl*, rm_ob1203_led_current_t const *led_current*)

Set currents. This function should be called after calling RM_OB1203_MeasurementStop(). Implements rm_ob1203_api_t::ledCurrentSet.

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.

◆ RM_OB1203_DeviceInterruptCfgSet()

fsp_err_t RM_OB1203_DeviceInterruptCfgSet (rm_ob1203_ctrl_t *const *p_api_ctrl*, rm_ob1203_device_interrupt_cfg_t const *interrupt_cfg*)

Set device interrupt configurations. This function should be called after calling RM_OB1203_MeasurementStop(). Implements rm_ob1203_api_t::deviceInterruptCfgSet.

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.

◆ RM_OB1203_FifoInfoGet()

fsp_err_t RM_OB1203_FifoInfoGet (rm_ob1203_ctrl_t *const *p_api_ctrl*, rm_ob1203_fifo_info_t *const *p_fifo_info*)

Get FIFO information from OB1203 device. Implements rm_ob1203_api_t::fifoInfoGet.

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.

◆ RM_OB1203_DeviceStatusGet()

fsp_err_t RM_OB1203_DeviceStatusGet (rm_ob1203_ctrl_t *const *p_api_ctrl*, rm_ob1203_device_status_t *const *p_status*)

Get device status from OB1203 device. Clear all interrupt bits. Implements rm_ob1203_api_t::deviceStatusGet.

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.
FSP_ERR_TIMEOUT	Communication is timeout.
FSP_ERR_ABORTED	Communication is aborted.

7.2.16.7 RRH46410 Gas Sensor Module (rm_rrh46410)

Modules » Sensor

Functions

fsp_err_t	RM_RRH46410_Open (rm_zmod4xxx_ctrl_t *const p_api_ctrl, rm_zmod4xxx_cfg_t const *const p_cfg) Opens and configures the RRH46410 sensor module. Implements rm_zmod4xxx_api_t::open. More...
fsp_err_t	RM_RRH46410_Close (rm_zmod4xxx_ctrl_t *const p_api_ctrl) This function should be called when close the sensor module. Implements rm_zmod4xxx_api_t::close. More...
fsp_err_t	RM_RRH46410_MeasurementStart (rm_zmod4xxx_ctrl_t *const p_api_ctrl) This function should be called when start a measurement. Implements rm_zmod4xxx_api_t::measurementStart. More...
fsp_err_t	RM_RRH46410_MeasurementStop (rm_zmod4xxx_ctrl_t *const p_api_ctrl) This function should be called when stop a measurement. Implements rm_zmod4xxx_api_t::measurementStop. More...
fsp_err_t	RM_RRH46410_Read (rm_zmod4xxx_ctrl_t *const p_api_ctrl, rm_zmod4xxx_raw_data_t *const p_raw_data) This function should be called to get measurement results after measurement finishes. To check measurement status either polling or busy/interrupt pin can be used. Implements rm_zmod4xxx_api_t::read. More...
fsp_err_t	RM_RRH46410_Iaq2ndGenDataCalculate (rm_zmod4xxx_ctrl_t *const p_api_ctrl, rm_zmod4xxx_raw_data_t *const p_raw_data, rm_zmod4xxx_iaq_2nd_data_t *const p_rrh46410_data) This function should be called when calculating gas data from measurement results. Implements rm_zmod4xxx_api_t::iaq2ndGenDataCalculate. More...
fsp_err_t	RM_RRH46410_PbaqDataCalculate (rm_zmod4xxx_ctrl_t *const p_api_ctrl, rm_zmod4xxx_raw_data_t *const p_raw_data, rm_zmod4xxx_pbaq_data_t *const p_rrh46410_data)

	This function should be called when calculating gas data from measurement results. Implements rm_zmod4xxx_api_t::pbaqDataCalculate. More...
fsp_err_t	RM_RRH46410_TemperatureAndHumiditySet (rm_zmod4xxx_ctrl_t *const p_api_ctrl, float temperature, float humidity) This function should be called before Read. Humidity measurements are needed for ambient compensation. temperature is not supported. Implements rm_zmod4xxx_api_t::temperatureAndHumiditySet. More...

Detailed Description

Middleware to implement the RRH46410 sensor module interface. This module implements the ZMOD4XXX Middleware Interface.

Overview

This module provides an API for configuring and controlling the RRH46410 sensor module (ZMOD4410 + MCU).

I2C communication with the RRH46410 sensor module is realized by connecting with the rm_comms_i2c module.

Features

The RRH46410 sensor interface implementation has the following key features:

- Initialize the sensor for measurement
- Start a measurement at any time
- Input current humidity for best performance.
- Receive status for wait until the measurement is done. This will also be signaled by an interrupt
- Get the measruement results from the sensor module
- Different from ZMOD sensors, no libraries are needed.

Configuration

Build Time Configurations for rm_rrh46410

The following build time configurations are defined in fsp_cfg/rm_rrh46410_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
Operation Mode	• IAQ 2nd Gen and Rel IAQ	IAQ 2nd Gen and Rel IAQ	Select operation mode.

- IAQ 2nd Gen ULP and Rel IAQ ULP
- Public Building AQ Standard (PBAQ)

Configurations for Sensor > RRH46410 Gas Sensor Module (rm_rrh46410)

This module can be added to the Stacks tab via New Stack > Sensor > RRH46410 Gas Sensor Module (rm_rrh46410).

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_rrh46410_sensor0	Module name.
Comms I2C Callback	Name must be a valid C symbol	rrh46410_comms_i2c_callback	A user COMMS I2C callback function can be provided.
IRQ Callback	Name must be a valid C symbol	rrh46410_irq_callback	A user IRQ callback function can be provided.

Pin Configuration

This module use SDA and SCL pins of I2C Master, SCI I2C and IICA Master.

Usage Notes

RRH46410 datasheet is here.
The RRH46410 has three modes of operation.
The RRH46410 will respond to TVOC immediately upon start-up; however, a conditioning period of 48 hours followed by a sensor module restart in an ambient environment is recommended to improve stability and obtain maximum performance.
Best results are achieved with continuous operation because the module algorithm can learn about the environment over time.

Operation mode	Description	Data
IAQ 2nd Generation and Relative IAQ	Using AI for improved ppm TVOC, IAQ and eCO2 functionality (recommended for new designs). Lightweight algorithm reacts to air quality changes and outputs a relative IAQ	IAQ, TVOC[mg/m^3], EtOH[ppm], eCO2[ppm], Rel IAQ
IAQ 2nd Generation Ultra Low Power and Relative IAQ Ultra Low Power	Using AI for improved ppm TVOC, IAQ and eCO2 functionality. Lightweight algorithm reacts to air quality changes and outputs a relative IAQ. This operation mode offers a much lower power	IAQ, TVOC[mg/m^3], EtOH[ppm], eCO2[ppm], Rel IAQ

	consumption.	
Public Building AQ Standard (PBAQ)	For highly accurate and consistent sensor readings to fulfill public building standards.	TVOC[mg/m^3], EtOH[ppm]

If an RTOS is used, blocking and bus lock is available.

- If blocking of an I2C bus is required, it is necessary to create a semaphore for blocking.
- If bus lock is required, it is necessary to create a mutex for bus lock. Bus lock is only available when a semaphore for blocking is used.

Limitations

- I2C Master (r_sau_i2c) is not supported. RRH46410 needs clock stretching, but is not supported by SAU I2C.
- The following commands are currently not supported.
  - Get Product ID
  - Get Tracking Number
  - Set Operation Mode -> Sensor cleaning
  - Config GPIO
  - Get GPIO
  - Set GPIO
  - Clear GPIO
  - Read Flash Shadow
  - Write Flash Shadow
  - Write Flash
  - Reset

Notifications

- The RRH46410 sensor module needs a reset before operation; please input a reset signal to the RES_N pin (active low).
- The RRH46410 sensor module needs some time (e.g. 1s) for self initialization after power-on and reset.

Bus Initialization

The RRH46410 interface expects a bus instance to be opened before opening any RRH46410 device. The interface will handle switching between devices on the bus but will not open or close the bus instance. The user should open the bus with the appropriate I2C Master Interface open call.

Initialization

Initialize with RM_RRH46410_Open().

From measurement start to data acquisition

After normal completion, start the measurement with RM_RRH46410_MeasurementStart(). An endless loop continuously checks the status of the RRH46410 sensor module and reads its data. The measurement results are subsequently processed, and the air quality values are calculated.

If IRQ is enabled

1. Wait until RM_ZMOD4XXX_EVENT_MEASUREMENT_COMPLETE is received via IRQ callback.

2. Call RM_RRH46410_Read(). This function will read the measurement results.
3. Wait until RM_ZMOD4XXX_EVENT_MEASUREMENT_COMPLETE is received.
4. Call the DataCalculate API according to the mode.

If IRQ is disabled

1. Call RM_RRH46410_Read(). This function will read the measurement results.
2. If RM_ZMOD4XXX_EVENT_MEASUREMENT_NOT_COMPLETE is received in callback, user should wait some time and then call RM_RRH46410_Read() again.
3. Wait until RM_ZMOD4XXX_EVENT_MEASUREMENT_COMPLETE is received.
4. Call the DataCalculate API according to the mode.

Examples

Basic Example

These are basic examples of minimal use of RRH46410 sensor implementation in an application.

IAQ 2nd Gen.

```
void rm_rrh46410_iaq_2nd_gen_basic_example (void)
{
 fsp_err_t                  err = FSP_SUCCESS;

Function Documentation

◆ RM_RRH46410_Open()

fsp_err_t RM_RRH46410_Open (rm_zmod4xxx_ctrl_t *const *p_api_ctrl*, rm_zmod4xxx_cfg_t const *const *p_cfg*)

Opens and configures the RRH46410 sensor module. Implements rm_zmod4xxx_api_t::open.

Return values

FSP_SUCCESS	RRH46410 successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.
FSP_ERR_TIMEOUT	Communication is timeout.
FSP_ERR_ABORTED	Communication is aborted.

◆ RM_RRH46410_Close()

fsp_err_t RM_RRH46410_Close (rm_zmod4xxx_ctrl_t *const *p_api_ctrl*)

This function should be called when close the sensor module. Implements rm_zmod4xxx_api_t::close.

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_RRH46410_MeasurementStart()

fsp_err_t RM_RRH46410_MeasurementStart (rm_zmod4xxx_ctrl_t *const *p_api_ctrl*)

This function should be called when start a measurement. Implements rm_zmod4xxx_api_t::measurementStart.

Return values

FSP_SUCCESS	Successfully started.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.
FSP_ERR_TIMEOUT	Communication is timeout.
FSP_ERR_ABORTED	Communication is aborted.

◆ RM_RRH46410_MeasurementStop()

fsp_err_t RM_RRH46410_MeasurementStop (rm_zmod4xxx_ctrl_t *const *p_api_ctrl*)

This function should be called when stop a measurement. Implements rm_zmod4xxx_api_t::measurementStop.

Return values

FSP_SUCCESS	Successfully stopped.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.
FSP_ERR_TIMEOUT	Communication is timeout.
FSP_ERR_ABORTED	Communication is aborted.

◆ RM_RRH46410_Read()

fsp_err_t RM_RRH46410_Read (rm_zmod4xxx_ctrl_t *const *p_api_ctrl*, rm_zmod4xxx_raw_data_t *const *p_raw_data*)

This function should be called to get measurement results after measurement finishes. To check measurement status either polling or busy/interrupt pin can be used. Implements rm_zmod4xxx_api_t::read.

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.
FSP_ERR_TIMEOUT	Communication is timeout.
FSP_ERR_ABORTED	Communication is aborted.

◆ RM_RRH46410_Iaq2ndGenDataCalculate()

fsp_err_t RM_RRH46410_Iaq2ndGenDataCalculate (rm_zmod4xxx_ctrl_t *const *p_api_ctrl*, rm_zmod4xxx_raw_data_t *const *p_raw_data*, rm_zmod4xxx_iaq_2nd_data_t *const *p_rrh46410_data*)

This function should be called when calculating gas data from measurement results. Implements rm_zmod4xxx_api_t::iaq2ndGenDataCalculate.

Return values

FSP_SUCCESS	Successfully gas data is calculated.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.
FSP_ERR_UNSUPPORTED	Unsupported operation mode.
FSP_ERR_SENSOR_MEASUREMENT_NOT_FINISHED	Measurement is not finished.

◆ RM_RRH46410_PbaqDataCalculate()

fsp_err_t RM_RRH46410_PbaqDataCalculate (rm_zmod4xxx_ctrl_t *const *p_api_ctrl*, rm_zmod4xxx_raw_data_t *const *p_raw_data*, rm_zmod4xxx_pbaq_data_t *const *p_rrh46410_data*)

This function should be called when calculating gas data from measurement results. Implements rm_zmod4xxx_api_t::pbaqDataCalculate.

Return values

FSP_SUCCESS	Successfully gas data is calculated.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.
FSP_ERR_UNSUPPORTED	Unsupported operation mode.
FSP_ERR_SENSOR_MEASUREMENT_NOT_FINISHED	Measurement is not finished.

◆ RM_RRH46410_TemperatureAndHumiditySet()

fsp_err_t RM_RRH46410_TemperatureAndHumiditySet (rm_zmod4xxx_ctrl_t *const *p_api_ctrl*, float *temperature*, float *humidity*)
This function should be called before Read. Humidity measurements are needed for ambient compensation. temperature is not supported. Implements rm_zmod4xxx_api_t::temperatureAndHumiditySet.

Return values

FSP_SUCCESS	Successfully humidity is set.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.

Detailed Description

Middleware to implement the RRH47000 sensor module interface. This module implements the SENSOR Middleware Interface.

Overview

This module provides an API for configuring and controlling the RRH47000 sensor module.

I2C communication with the RRH47000 sensor module is realized by connecting with the rm_comms_i2c module.

Features

The RRH47000 sensor interface implementation has the following key features:

- Initialize the sensor for measurement
- Get the measruement results from the sensor module

Configuration

Build Time Configurations for rm_rrh47000

The following build time configurations are defined in fsp_cfg/rm_rrh47000_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Sensor > RRH47000 NDIR CO2 Sensor Module (rm_rrh47000)

This module can be added to the Stacks tab via New Stack > Sensor > RRH47000 NDIR CO2 Sensor Module (rm_rrh47000).

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_rrh47000_sensor0	Module name.
Automatic Baseline Correction (ABC)	• Enable all • Enable only ABC • Enable only fast ABC • Disable all	Enable all	Set Automatic Baseline Correction (ABC).
Correction cycle period [days]	Value must be 1 or more	7	Set correction cycle period. Min = 1 and Max = 30.
CO2 baseline value [ppm]	Value must be 400 or more	400	Set CO2 baseline value. Min = 400 and Max = 1500.
Comms I2C Callback	Name must be a valid C symbol	rrh47000_comms_i2c_callback	A user COMMS I2C callback function can be provided.

Pin Configuration

This module use SDA and SCL pins of I2C Master, SCI I2C and IICA Master.

Usage Notes

RRH47000 datasheet is here.
The RRH47000 sensor module uses nondispersive infrared (NDIR) technology to accurately measure CO2 in a compact package size while ensuring competitive pricing. An integrated relative humidity and temperature sensor enables calibration and compensation of the NDIR sensor for precise operation in different environments. Sensors for carbon dioxide (CO2, not estimated), humidity (RH), and temperature (T), are combined in a single package.
If an RTOS is used, blocking and bus lock is available.

- If blocking of an I2C bus is required, it is necessary to create a semaphore for blocking.
- If bus lock is required, it is necessary to create a mutex for bus lock. Bus lock is only available when a semaphore for blocking is used.

Notifications

- This module supports I2C only (not support UART).
- The RRH47000 sensor module needs a minimum of 3 seconds to initiate communication via I²C after power-on.
- The RRH47000 sensor module supports a clock frequency ranging from 10kHz to 100kHz.

Limitations

- I2C Master (r_sau_i2c) is not supported. RRH47000 needs clock stretching, but is not supported by SAU I2C.
- The following commands are currently not supported.
  - Start CO2 Correction
  - Get Serial Number

Bus Initialization

The RRH47000 interface expects a bus instance to be opened before opening any RRH47000 device. The interface will handle switching between devices on the bus but will not open or close the bus instance. The user should open the bus with the appropriate I2C Master Interface open call.

Initialization

Initialize with RM_RRH47000_Open().

From measurement start to data acquisition

An endless loop continuously checks the status of the RRH47000 sensor module and reads its data. The measurement results are subsequently processed, and the air quality values are calculated.

1. Call RM_RRH47000_Read() and read the measurement data.
2. Wait until RM_AIR_SENSOR_EVENT_SUCCESS is received.
3. Call RM_RRH47000_DataCalculate().

Examples

Basic Example

These are basic examples of minimal use of RRH47000 sensor implementation in an application.

```
void rm_rrh47000_basic_example (void)
{
 fsp_err_t                err = FSP_SUCCESS;
 rm_air_sensor_raw_data_t raw_data;
 rm_air_sensor_data_t     rrh47000_data;
 bool calculated = false;
 /* Open the I2C bus if it is not already open. */
    rm_comms_i2c_bus_extended_cfg_t * p_extend =
       (rm_comms_i2c_bus_extended_cfg_t *)
g_rrh47000_cfg.p_comms_instance->p_cfg->p_extend;
 i2c_master_instance_t * p_driver_instance = (i2c_master_instance_t *)
p_extend->p_driver_instance;
    p_driver_instance->p_api->open(p_driver_instance->p_ctrl,
p_driver_instance->p_cfg);
```

```
#if BSP_CFG_RTOS
 /* Create a semaphore for blocking if a semaphore is not NULL */
 if (NULL != p_extend->p_blocking_semaphore)
    {
 #if BSP_CFG_RTOS == 1 // AzureOS
       tx_semaphore_create(p_extend->p_blocking_semaphore->p_semaphore_handle,
                           p_extend->p_blocking_semaphore->p_semaphore_name,
                           (ULONG) 0);
 #elif BSP_CFG_RTOS == 2 // FreeRTOS
       *(p_extend->p_blocking_semaphore->p_semaphore_handle) =
            xSemaphoreCreateCountingStatic((UBaseType_t) 1,
                                           (UBaseType_t) 0,

p_extend->p_blocking_semaphore->p_semaphore_memory);
 #endif
    }
 /* Create a recursive mutex for bus lock if a recursive mutex is not NULL */
 if (NULL != p_extend->p_bus_recursive_mutex)
    {
 #if BSP_CFG_RTOS == 1 // AzureOS
       tx_mutex_create(p_extend->p_bus_recursive_mutex->p_mutex_handle,

	Pointer of configuration block.
rm_comms_instance_t const *	p_comms_i2c_instance
	Pointer of I2C Communications Middleware instance structure.
void const *	p_context
	Pointer to the user-provided context.
void(*	p_comms_callback)(rm_air_sensor_callback_args_t *p_args)
	I2C Communications callback.

Enumeration Type Documentation

◆ rm_rrh47000_abc_t

enum rm_rrh47000_abc_t	
RRH47000 Automatic Baseline Correction (ABC) setting.	
Enumerator	
RM_RRH47000_ABC_ENABLE_ALL	Enable all.
RM_RRH47000_ABC_ENABLE_ONLY_ABC	Enable only ABC (automatic baseline correction)
RM_RRH47000_ABC_ENABLE_ONLY_FAST_ABC	Enable only fast ABC (fast automatic baseline correction)
RM_RRH47000_ABC_DISABLE_ALL	Disable all.

Function Documentation

◆ RM_RRH47000_Open()

fsp_err_t RM_RRH47000_Open (rm_air_sensor_ctrl_t *const *p_api_ctrl*, rm_air_sensor_cfg_t const *const *p_cfg*)

Opens and configures the RRH47000 sensor module. Implements rm_air_sensor_api_t::open.

Return values

FSP_SUCCESS	RRH47000 successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.
FSP_ERR_INVALID_DATA	Checksum error occurs.

◆ RM_RRH47000_Close()

fsp_err_t RM_RRH47000_Close (rm_air_sensor_ctrl_t *const *p_api_ctrl*)

This function should be called when close the sensor module. Implements rm_air_sensor_api_t::close.

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_RRH47000_Read()

fsp_err_t RM_RRH47000_Read (rm_air_sensor_ctrl_t *const *p_api_ctrl*, rm_air_sensor_raw_data_t *const *p_raw_data*)

This function should be called to get measurement results after measurement finishes. Implements rm_air_sensor_api_t::read.

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.
FSP_ERR_TIMEOUT	Communication is timeout.
FSP_ERR_ABORTED	Communication is aborted.

◆ RM_RRH47000_DataCalculate()

fsp_err_t RM_RRH47000_DataCalculate (rm_air_sensor_ctrl_t *const *p_api_ctrl*, const rm_air_sensor_raw_data_t *const *p_raw_data*, rm_air_sensor_data_t *const *p_rrh47000_data*)

This function should be called when calculating gas data from measurement results. Implements rm_air_sensor_api_t::dataCalculate.

Return values

FSP_SUCCESS	Successfully gas data is calculated.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.
FSP_ERR_SENSOR_INVALID_DATA	Checksum error occurs.

◆ RM_RRH47000_FirmwareVersionGet()

fsp_err_t RM_RRH47000_FirmwareVersionGet (rm_air_sensor_ctrl_t *const *p_api_ctrl*, rm_air_sensor_version_t *const *p_version*)

This function should be called to get firmware version. Firmware version will be set "ascii_code" of p_version. Implements rm_air_sensor_api_t::firmwareVersionGet.

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.
FSP_ERR_INVALID_POINTER	Pointer is NULL.
FSP_ERR_TIMEOUT	Communication is timeout.
FSP_ERR_ABORTED	Communication is aborted.

◆ RM_RRH47000_StatusCheck()

fsp_err_t RM_RRH47000_StatusCheck (rm_air_sensor_ctrl_t *const *p_api_ctrl*)

StatusCheck API is unsupported. Implements rm_air_sensor_api_t::statusCheck.

Return values

FSP_ERR_UNSUPPORTED	Unsupported.

◆ RM_RRH47000_AlgorithmVersionGet()

fsp_err_t RM_RRH47000_AlgorithmVersionGet (rm_air_sensor_ctrl_t *const *p_api_ctrl*, rm_air_sensor_version_t *const *p_version*)

AlgorithmVersionGet API is unsupported. Implements rm_air_sensor_api_t::statusCheck.

Return values

FSP_ERR_UNSUPPORTED	Unsupported.

7.2.16.9 RRH62000 All-in-one Air Quality Module (rm_rrh62000)

Modules » Sensor

Detailed Description

Middleware to implement the RRH62000 sensor module interface. This module implements the SENSOR Middleware Interface.

Overview

This module provides an API for configuring and controlling the RRH62000 sensor module.

I2C communication with the RRH62000 sensor module is realized by connecting with the rm_comms_i2c module.

Features

The RRH62000 sensor interface implementation has the following key features:

- Initialize the sensor for measurement
- Receive status for wait until the measurement is done.
- Get the measruement results from the sensor module

Configuration

Build Time Configurations for rm_rrh62000

The following build time configurations are defined in fsp_cfg/rm_rrh62000_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Sensor > RRH62000 All-in-one Air Quality Module (rm_rrh62000)

This module can be added to the Stacks tab via New Stack > Sensor > RRH62000 All-in-one Air Quality Module (rm_rrh62000).

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_rrh62000_sensor0	Module name.
Number of moving average [times]	Value must be 1 or more	10	Set number of moving average. Min = 1 and Max = 60.
Fan speed control [%]	Value must be 60 or more	86	Set fan speed control. Min = 60 and Max = 100.
Comms I2C Callback	Name must be a valid C symbol	rrh62000_comms_i2c_callback	A user COMMS I2C callback function can be provided.

Pin Configuration

This module use SDA and SCL pins of I2C Master, SCI I2C and IICA Master.

Usage Notes

RRH62000 datasheet is here.
When using the sensor for the first time, allow up to 48 hours for re-hydration of the humidity sensor in ambient air and for TVOC sensor conditioning. This will allow the module to take optimal readings.
The RRH62000 is an integrated sensor module for the measurement of critical air quality parameters. Sensors for particulate matter (PM), total volatile organic compounds (TVOC), estimation of carbon dioxide (eCO2) optional nitrogen dioxide (NO2), optional ozone (O3), humidity (RH), and temperature (T), are combined in a single package.
If an RTOS is used, blocking and bus lock is available.

- If blocking of an I2C bus is required, it is necessary to create a semaphore for blocking.
- If bus lock is required, it is necessary to create a mutex for bus lock. Bus lock is only available when a semaphore for blocking is used.

Notifications

- After turning on the module for the first time, the sensor will automatically start in ZMOD sensor cleaning mode for 1 minute. Do not cut power to the sensor during this period.
- Interval time needs to be at least 1s after power-on or reset.
- I2C-master access interval for RRH62000 must be longer than 1s.
- This module supports I2C only (not support UART).

Limitations

- I2C Master (r_sau_i2c) is not supported. RRH62000 needs clock stretching, but is not supported by SAU I2C.
- The following commands are currently not supported.
    - SLEEP
    - CLEAN
    - TINTC_H
    - TINTC_L
    - TCLEAN
    - RMOX
    - UID

Bus Initialization

The RRH62000 interface expects a bus instance to be opened before opening any RRH62000 device. The interface will handle switching between devices on the bus but will not open or close the bus instance. The user should open the bus with the appropriate I2C Master Interface open call.

Initialization

Initialize with RM_RRH62000_Open().

From measurement start to data acquisition

An endless loop continuously checks the status of the RRH62000 sensor module and reads its data. The measurement results are subsequently processed, and the air quality values are calculated.

1. Call RM_RRH62000_StatusCheck(). This function will execute a status check over I2C.

2. If RM_AIR_SENSOR_EVENT_MEASUREMENT_NOT_COMPLETE is received in callback, user should wait some time (min=1s) and then call RM_RRH62000_StatusCheck() again.
3. Wait until RM_AIR_SENSOR_EVENT_MEASUREMENT_COMPLETE is received.
4. Call RM_RRH62000_Read() and read the measurement data.
5. Wait until RM_AIR_SENSOR_EVENT_SUCCESS is received.
6. Call RM_RRH62000_DataCalculate().

Examples

Basic Example

These are basic examples of minimal use of RRH62000 sensor implementation in an application.

```
void rm_rrh62000_basic_example (void)
{
 fsp_err_t                err = FSP_SUCCESS;
 rm_air_sensor_raw_data_t raw_data;
 rm_air_sensor_data_t     rrh62000_data;
 /* Open the I2C bus if it is not already open. */
    rm_comms_i2c_bus_extended_cfg_t * p_extend =
       (rm_comms_i2c_bus_extended_cfg_t *)
g_rrh62000_cfg.p_comms_instance->p_cfg->p_extend;
 i2c_master_instance_t * p_driver_instance = (i2c_master_instance_t *)
p_extend->p_driver_instance;
    p_driver_instance->p_api->open(p_driver_instance->p_ctrl,
p_driver_instance->p_cfg);
#if BSP_CFG_RTOS
 /* Create a semaphore for blocking if a semaphore is not NULL */
 if (NULL != p_extend->p_blocking_semaphore)
    {
 #if BSP_CFG_RTOS == 1 // AzureOS
       tx_semaphore_create(p_extend->p_blocking_semaphore->p_semaphore_handle,
                           p_extend->p_blocking_semaphore->p_semaphore_name,
                           (ULONG) 0);
 #elif BSP_CFG_RTOS == 2 // FreeRTOS
       *(p_extend->p_blocking_semaphore->p_semaphore_handle) =
            xSemaphoreCreateCountingStatic((UBaseType_t) 1,
                                           (UBaseType_t) 0,
```

```
p_extend->p_blocking_semaphore->p_semaphore_memory);
 #endif
    }
 /* Create a recursive mutex for bus lock if a recursive mutex is not NULL */
 if (NULL != p_extend->p_bus_recursive_mutex)
    {

Data Structures

struct	rm_rrh62000_init_process_params_t
struct	rm_rrh62000_status_params_t
struct	rm_rrh62000_instance_ctrl_t

Data Structure Documentation

◆ rm_rrh62000_init_process_params_t

struct rm_rrh62000_init_process_params_t		
RRH62000 initialization process block		
Data Fields		
volatile bool	communication_finished	Communication flag for blocking.
volatile rm_air_sensor_event_t	event	Callback event.

◆ rm_rrh62000_status_params_t

struct rm_rrh62000_status_params_t		
RRH62000 status parameters block		
Data Fields		
uint8_t	value	Value to check measurement complete.

volatile bool	flag	Flag to identify StatusCheck API and other APIs in callback.

◆ rm_rrh62000_instance_ctrl_t

struct rm_rrh62000_instance_ctrl_t	
RRH62000 control block	
Data Fields	
uint32_t	open
	Open flag.
uint8_t	write_buf [2]
	Write buffer for I2C communications.
uint8_t	read_buf [2]
	Read buffer for I2C communications.
uint8_t *	p_read_data
	Pointer to read data. This is used for checking error code and checksum in callback.
uint8_t	read_bytes
	Read bytes. This is used for checking error code and checksum in callback.
volatile rm_air_sensor_event_t	event
	Callback event.
rm_rrh62000_status_params_t	status
	Status parameter for arriving new measurement results.

rm_rrh62000_status_params_t	cleaning_status
	Status parameter for ZMOD cleaning.
rm_rrh62000_init_process_params_t	init_process_params
	For the initialization process.
rm_air_sensor_cfg_t const *	p_cfg
	Pointer of configuration block.
rm_comms_instance_t const *	p_comms_i2c_instance
	Pointer of I2C Communications Middleware instance structure.
void const *	p_context
	Pointer to the user-provided context.
void(*	p_comms_callback)(rm_air_sensor_callback_args_t *p_args)
	I2C Communications callback.

Function Documentation

◆ RM_RRH62000_Open()

fsp_err_t RM_RRH62000_Open (rm_air_sensor_ctrl_t *const *p_api_ctrl*, rm_air_sensor_cfg_t const *const *p_cfg*)

Opens and configures the RRH62000 sensor module. If ZMOD cleaning is not complete, this function will take at least 1 minute. Implements rm_air_sensor_api_t::open.

Return values

FSP_SUCCESS	RRH62000 successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.
FSP_ERR_NOT_INITIALIZED	ZMOD cleaning is not complete.

◆ RM_RRH62000_Close()

fsp_err_t RM_RRH62000_Close (rm_air_sensor_ctrl_t *const *p_api_ctrl*)

This function should be called when close the sensor module. Implements rm_air_sensor_api_t::close.

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_RRH62000_StatusCheck()

fsp_err_t RM_RRH62000_StatusCheck (rm_air_sensor_ctrl_t *const *p_api_ctrl*)

This function should be called when polling is used. It reads the status of sensor. Implements rm_air_sensor_api_t::statusCheck.

Return values

FSP_SUCCESS	Successfully started.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.
FSP_ERR_TIMEOUT	communication is timeout.
FSP_ERR_ABORTED	communication is aborted.

◆ RM_RRH62000_Read()

fsp_err_t RM_RRH62000_Read (rm_air_sensor_ctrl_t *const *p_api_ctrl*, rm_air_sensor_raw_data_t *const *p_raw_data*)

This function should be called to get measurement results after measurement finishes. To check measurement status either polling or busy/interrupt pin can be used. Implements rm_air_sensor_api_t::read.

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.
FSP_ERR_TIMEOUT	Communication is timeout.
FSP_ERR_ABORTED	Communication is aborted.

◆ RM_RRH62000_DataCalculate()

fsp_err_t RM_RRH62000_DataCalculate (rm_air_sensor_ctrl_t *const *p_api_ctrl*, const rm_air_sensor_raw_data_t *const *p_raw_data*, rm_air_sensor_data_t *const *p_rrh62000_data*)

This function should be called when calculating gas data from measurement results. Implements rm_air_sensor_api_t::dataCalculate.

Return values

FSP_SUCCESS	Successfully gas data is calculated.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.

◆ RM_RRH62000_FirmwareVersionGet()

fsp_err_t RM_RRH62000_FirmwareVersionGet (rm_air_sensor_ctrl_t *const *p_api_ctrl*, rm_air_sensor_version_t *const *p_version*)

This function should be called to get firmware version. Firmware version does not use "patch" of p_version. Implements rm_air_sensor_api_t::firmwareVersionGet.

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.
FSP_ERR_TIMEOUT	Communication is timeout.
FSP_ERR_ABORTED	Communication is aborted.

◆ RM_RRH62000_AlgorithmVersionGet()

fsp_err_t RM_RRH62000_AlgorithmVersionGet (rm_air_sensor_ctrl_t *const *p_api_ctrl*, rm_air_sensor_version_t *const *p_version*)

This function should be called to get algorithm version. Implements rm_air_sensor_api_t::algorithmVersionGet.

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.
FSP_ERR_TIMEOUT	Communication is timeout.
FSP_ERR_ABORTED	Communication is aborted.

This function should be called before Read and DataCalculate. Check for unexpected reset occurs or getting unvalid ADC data. Implements rm_zmod4xxx_api_t::deviceErrorCheck. More...

Detailed Description

Middleware to implement the ZMOD4XXX sensor interface. This module implements the ZMOD4XXX Middleware Interface.

Overview

The following measurement modes are EOL.

- ZMOD4410 Odor
- ZMOD4510 OAQ 1st Generation

This module provides an API for configuring and controlling the ZMOD4XXX sensor. Supported ZMOD4XXX sensors are below.

- ZMOD4410
- ZMOD4450
- ZMOD4510

I2C communication with the ZMOD4XXX sensor is realized by connecting with the rm_comms_i2c module.

Features

The ZMOD4XXX sensor interface implementation has the following key features:

- Initialize the sensor for measurement
- Start a measurement at any time
- Read status register for wait until the measurement is done. This will also be signaled by an interrupt
- Get the ADC data from the sensor
- Input the ADC data and acquire the air quality values by calculation in the library.

Configuration

Build Time Configurations for rm_zmod4xxx

The following build time configurations are defined in fsp_cfg/rm_zmod4xxx_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Sensor > ZMOD4XXX Gas Sensor (rm_zmod4xxx)

This module can be added to the Stacks tab via New Stack > Sensor > ZMOD4XXX Gas Sensor (rm_zmod4xxx).

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_zmod4xxx_sensor0	Module name.
Comms I2C Callback	Name must be a valid C symbol	zmod4xxx_comms_i2c_callback	A user COMMS I2C callback function can be provided.
IRQ Callback	Name must be a valid C symbol	zmod4xxx_irq_callback	A user IRQ callback function can be provided.

Pin Configuration

This module use SDA and SCL pins of I2C Master and SCI I2C.

Usage Notes

ZMOD4410 datasheet is here.
The ZMOD4410 has five modes of operation.
The ZMOD4410 will respond to TVOC immediately upon start-up; however, a conditioning period of 48 hours followed by a sensor module restart in an ambient environment is recommended to improve stability and obtain maximum performance.

Best results are achieved with continuous operation because the module algorithm can learn about the environment over time.

Method	Description
IAQ 1st Generation Continuous	Measurement of UBA levels for IAQ and eCO2, provides continuous data
IAQ 1st Generation Low Power	Measurement of UBA levels for IAQ and eCO2, fixed sampling interval of 6 seconds
IAQ 2nd Generation	Using AI for improved ppm TVOC, IAQ and eCO2 functionality (recommended for new designs)
IAQ 2nd Generation Ultra Low Power	Using AI for improved ppm TVOC, IAQ and eCO2 functionality. This method offers a much lower power consumption
Relative IAQ	Lightweight algorithm reacts to air quality changes and outputs a relative IAQ
Relative IAQ Ultra Low Power	Lightweight algorithm reacts to air quality changes and outputs a relative IAQ. This method offers a much lower power consumption
Public Building AQ Standard (PBAQ)	For highly accurate and consistent sensor readings to fulfill public building standards.
Odor	Control signal based on Air Quality Changes
Sulfur-based Odor Discrimination	The odors in "sulfur" (sulfur based) and "acceptable" (organic based) and shows an intensity level of the smell

ZMOD4450 datasheet is here.
The ZMOD4450 has one modes of operation.
The response time for a gas stimulation is always within a few seconds, depending on the gas and its concentration. An active or direct airflow onto the sensor module is not necessary since diffusion of ambient gas does not limit the sensor module response time. The ZMOD4450 will respond to typical refrigeration gases immediate upon start-up; however, a conditioning period of 48 hours in a refrigeration environment is recommended to improve stability and get maximum performance, as the module algorithm is able to learn about the refrigeration environment over time.

Method	Description
RAQ	Control signal based on Refrigerator Air Quality Changes

ZMOD4510 datasheet is here.
The ZMOD4510 has two modes of operation.
The ZMOD4510 in OAQ 1st Gen operation will respond to typical outdoor gases after a warm-up time of 60 min, consisting of 20 min for stabilization and 40 min for baseline finding.
For OAQ 2nd Gen operation a response to ozone will be seen after a warmup time of 30 min.
For NO2 O3 operation a response to nitrogen_dioxide and ozone will be seen after a warmup time of 5 min.
In all operation modes a conditioning period of 48 hours followed by a sensor module restart in an ambient environment is recommended to improve stability and obtain maximum performance.

Method	Description
OAQ 1st Generation	Measurement of Air Quality
OAQ 2nd Generation	Selective Ozone featuring Ultra-Low Power
NO2 O3	Selective nitrogen dioxide and ozone firmware

A library corresponding to each of these modes is required. By setting in RA Configuration, the library will be generated in the ra/fsp/lib/rm_zmod4xxx folder of your project.

If an RTOS is used, blocking and bus lock is available.

- If blocking of an I2C bus is required, it is necessary to create a semaphore for blocking.
- If bus lock is required, it is necessary to create a mutex for bus lock. Bus lock is only available when a semaphore for blocking is used.

Notifications

The ZMOD4xxx sensor needs a reset before operation; please input a reset signal to the RES_N pin (active low).

Program flow for OAQ 2nd gen is changed in FSP v4.0.0. Please refer to the programming manual [R36US0004EU] and the application note[R01AN5899].
R01AN5899 : https://www.renesas.com/document/apn/zmod4xxx-sample-application
R36US0004EU : https://www.renesas.com/document/mat/zmod4510-programming-manual-read-me

Bus Initialization

The ZMOD4XXX interface expects a bus instance to be opened before opening any ZMOD4XXX device. The interface will handle switching between devices on the bus but will not open or close the bus instance. The user should open the bus with the appropriate I2C Master Interface open call.

Initialization

Initialize with RM_ZMOD4XXX_Open(). One channel of timer is required to measure the waiting time at initialization.

From measurement start to data acquisition

After normal completion, start the measurement with RM_ZMOD4XXX_MeasurementStart(). An endless loop continuously checks the status of the ZMOD4XXX sensor and reads its data. The raw data is subsequently processed, and the air quality values are calculated.

If IRQ is enabled

1. Call RM_ZMOD4XXX_MeasurementStart().
2. Wait until RM_ZMOD4XXX_EVENT_MEASUREMENT_COMPLETE is received via IRQ callback.
3. Call RM_ZMOD4XXX_Read(). This function will read the ADC data.
4. Wait until RM_ZMOD4XXX_EVENT_SUCCESS is received.
5. Call the DataCalculate API according to the mode.

If IRQ is disabled

1. Call RM_ZMOD4XXX_MeasurementStart().
2. Wait until RM_ZMOD4XXX_EVENT_SUCCESS is received.
3. Call RM_ZMOD4XXX_StatusCheck(). This function will execute a status check over I2C.
4. If RM_ZMOD4XXX_EVENT_MEASUREMENT_NOT_COMPLETE is received in callback, user should wait some time and then call RM_ZMOD4XXX_StatusCheck() again.
5. Wait until RM_ZMOD4XXX_EVENT_MEASUREMENT_COMPLETE is received.
6. Call RM_ZMOD4XXX_Read() and read the ADC data.
7. Wait until RM_ZMOD4XXX_EVENT_SUCCESS is received.
8. Call the DataCalculate API according to the mode.

Checking device error for IAQ 2nd Gen.

1. Call RM_ZMOD4XXX_DeviceErrorCheck(). This function will execute a device error check over I2C.
2. If any device error occurs, RM_ZMOD4XXX_EVENT_DEV_ERR_POWER_ON_RESET or RM_ZMOD4XXX_EVENT_DEV_ERR_ACCESS_CONFLICT are received in callback. If no device error, RM_ZMOD4XXX_EVENT_SUCCESS is received in callback.

Examples

Basic Example

These are basic examples of minimal use of ZMOD4XXX sensor implementation in an application.

IAQ 1st Gen. Continuous mode

```
void rm_zmod4xxx_iaq_1st_gen_continuous_basic_example (void)

Data Structures

struct	rm_zmod4xxx_init_process_params_t
struct	rm_zmod4xxx_instance_ctrl_t

Enumerations

enum	rm_zmod4xxx_lib_type_t

Data Structure Documentation

◆ rm_zmod4xxx_init_process_params_t

struct rm_zmod4xxx_init_process_params_t		
ZMOD4XXX initialization process block		
Data Fields		
volatile uint32_t	delay_ms	Delay milliseconds.
volatile bool	communication_finished	Communication flag for blocking.
volatile bool	measurement_finished	IRQ flag.
volatile rm_zmod4xxx_event_t	event	Callback event.

◆ rm_zmod4xxx_instance_ctrl_t

struct rm_zmod4xxx_instance_ctrl_t	
ZMOD4XXX control block	
Data Fields	
uint32_t	open
	Open flag.
uint8_t	buf [RM_ZMOD4XXX_MAX_I2C_BUF_SIZE]
	Buffer for I2C communications.
uint8_t	register_address
	Register address to access.
rm_zmod4xxx_status_params_t	status
	Status parameter.
volatile bool	dev_err_check
	Flag for checking device error.
volatile rm_zmod4xxx_event_t	event

	Callback event.
rm_zmod4xxx_init_process_params_t	init_process_params
	For the initialization process.
rm_zmod4xxx_cfg_t const *	p_cfg
	Pointer of configuration block.
rm_comms_instance_t const *	p_comms_i2c_instance
	Pointer of I2C Communications Middleware instance structure.
rm_zmod4xxx_lib_extended_cfg_t *	p_zmod4xxx_lib
	Pointer of ZMOD4XXX Lib extended configuration.
void const *	p_irq_instance
	Pointer to IRQ instance.
void const *	p_context
	Pointer to the user-provided context.
void(*	p_comms_callback)(rm_zmod4xxx_callback_args_t *p_args)
	I2C Communications callback.
void(*	p_irq_callback)(rm_zmod4xxx_callback_args_t *p_args)
	IRQ callback.

Enumeration Type Documentation

◆ rm_zmod4xxx_lib_type_t

enum rm_zmod4xxx_lib_type_t
ZMOD4XXX Library type

Function Documentation

◆ RM_ZMOD4XXX_Open()

fsp_err_t RM_ZMOD4XXX_Open (rm_zmod4xxx_ctrl_t *const *p_api_ctrl*, rm_zmod4xxx_cfg_t const *const *p_cfg*)
This function should be called when start a measurement and when measurement data is stale data. Sends the slave address to the zmod4xxx and start a measurement. Implements rm_zmod4xxx_api_t::open. **Return values** FSP_SUCCESS — Successfully started. FSP_ERR_ASSERTION — Null pointer passed as a parameter. FSP_ERR_ALREADY_OPEN — Module is already open. FSP_ERR_UNSUPPORTED — Unsupport product ID. FSP_ERR_TIMEOUT — communication is timeout. FSP_ERR_ABORTED — communication is aborted.

◆ RM_ZMOD4XXX_Close()

fsp_err_t RM_ZMOD4XXX_Close (rm_zmod4xxx_ctrl_t *const *p_api_ctrl*)
This function should be called when close the sensor. Implements rm_zmod4xxx_api_t::close. **Return values** FSP_SUCCESS — Successfully closed. FSP_ERR_ASSERTION — Null pointer passed as a parameter. FSP_ERR_NOT_OPEN — Module is not open.

◆ RM_ZMOD4XXX_MeasurementStart()

fsp_err_t RM_ZMOD4XXX_MeasurementStart (rm_zmod4xxx_ctrl_t *const *p_api_ctrl*)

This function should be called when start a measurement. Implements rm_zmod4xxx_api_t::measurementStart.

Return values

FSP_SUCCESS	Successfully started.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.
FSP_ERR_TIMEOUT	communication is timeout.
FSP_ERR_ABORTED	communication is aborted.

◆ RM_ZMOD4XXX_MeasurementStop()

fsp_err_t RM_ZMOD4XXX_MeasurementStop (rm_zmod4xxx_ctrl_t *const *p_api_ctrl*)

This function should be called when stop a measurement. Implements rm_zmod4xxx_api_t::measurementStop.

Return values

FSP_SUCCESS	Successfully started.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.
FSP_ERR_TIMEOUT	communication is timeout.
FSP_ERR_ABORTED	communication is aborted.

◆ RM_ZMOD4XXX_StatusCheck()

fsp_err_t RM_ZMOD4XXX_StatusCheck (rm_zmod4xxx_ctrl_t *const *p_api_ctrl*)

This function should be called when polling is used. It reads the status of sensor. Implements rm_zmod4xxx_api_t::statusCheck.

Return values

FSP_SUCCESS	Successfully started.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.
FSP_ERR_TIMEOUT	communication is timeout.
FSP_ERR_ABORTED	communication is aborted.

◆ RM_ZMOD4XXX_Read()

fsp_err_t RM_ZMOD4XXX_Read (rm_zmod4xxx_ctrl_t *const *p_api_ctrl*, rm_zmod4xxx_raw_data_t *const *p_raw_data*)

This function should be called when measurement finishes. To check measurement status either polling or busy/interrupt pin can be used. Implements rm_zmod4xxx_api_t::read.

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.
FSP_ERR_TIMEOUT	Communication is timeout.
FSP_ERR_ABORTED	Communication is aborted.
FSP_ERR_SENSOR_MEASUREMENT_NOT_FINISHED	Measurement is not finished.

◆ RM_ZMOD4XXX_Iaq1stGenDataCalculate()

fsp_err_t RM_ZMOD4XXX_Iaq1stGenDataCalculate (rm_zmod4xxx_ctrl_t *const *p_api_ctrl*, rm_zmod4xxx_raw_data_t *const *p_raw_data*, rm_zmod4xxx_iaq_1st_data_t *const *p_zmod4xxx_data*)

This function should be called when measurement finishes. To check measurement status either polling or busy/interrupt pin can be used. Implements rm_zmod4xxx_api_t::iaq1stGenDataCalculate .

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.

◆ RM_ZMOD4XXX_Iaq2ndGenDataCalculate()

fsp_err_t RM_ZMOD4XXX_Iaq2ndGenDataCalculate (rm_zmod4xxx_ctrl_t *const *p_api_ctrl*, rm_zmod4xxx_raw_data_t *const *p_raw_data*, rm_zmod4xxx_iaq_2nd_data_t *const *p_zmod4xxx_data*)

This function should be called when measurement finishes. To check measurement status either polling or busy/interrupt pin can be used. Implements rm_zmod4xxx_api_t::iaq2ndGenDataCalculate.

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.

◆ RM_ZMOD4XXX_OdorDataCalculate()

fsp_err_t RM_ZMOD4XXX_OdorDataCalculate (rm_zmod4xxx_ctrl_t *const *p_api_ctrl*, rm_zmod4xxx_raw_data_t *const *p_raw_data*, rm_zmod4xxx_odor_data_t *const *p_zmod4xxx_data*)

This function should be called when measurement finishes. To check measurement status either polling or busy/interrupt pin can be used. Implements rm_zmod4xxx_api_t::odorDataCalculate.

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.

◆ RM_ZMOD4XXX_SulfurOdorDataCalculate()

fsp_err_t RM_ZMOD4XXX_SulfurOdorDataCalculate (rm_zmod4xxx_ctrl_t *const *p_api_ctrl*, rm_zmod4xxx_raw_data_t *const *p_raw_data*, rm_zmod4xxx_sulfur_odor_data_t *const *p_zmod4xxx_data*)

This function should be called when measurement finishes. To check measurement status either polling or busy/interrupt pin can be used. Implements rm_zmod4xxx_api_t::sulfurOdorDataCalculate.

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.

◆ RM_ZMOD4XXX_Oaq1stGenDataCalculate()

fsp_err_t RM_ZMOD4XXX_Oaq1stGenDataCalculate (rm_zmod4xxx_ctrl_t *const *p_api_ctrl*, rm_zmod4xxx_raw_data_t *const *p_raw_data*, rm_zmod4xxx_oaq_1st_data_t *const *p_zmod4xxx_data*)

This function should be called when measurement finishes. To check measurement status either polling or busy/interrupt pin can be used. Implements rm_zmod4xxx_api_t::oaq1stGenDataCalculate.

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.

◆ RM_ZMOD4XXX_Oaq2ndGenDataCalculate()

fsp_err_t RM_ZMOD4XXX_Oaq2ndGenDataCalculate (rm_zmod4xxx_ctrl_t *const *p_api_ctrl*, rm_zmod4xxx_raw_data_t *const *p_raw_data*, rm_zmod4xxx_oaq_2nd_data_t *const *p_zmod4xxx_data*)

This function should be called when measurement finishes. To check measurement status either polling or busy/interrupt pin can be used. Implements rm_zmod4xxx_api_t::oaq2ndGenDataCalculate.

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.

◆ RM_ZMOD4XXX_RaqDataCalculate()

fsp_err_t RM_ZMOD4XXX_RaqDataCalculate (rm_zmod4xxx_ctrl_t *const *p_api_ctrl*, rm_zmod4xxx_raw_data_t *const *p_raw_data*, rm_zmod4xxx_raq_data_t *const *p_zmod4xxx_data*)

This function should be called when measurement finishes. To check measurement status either polling or busy/interrupt pin can be used. Implements rm_zmod4xxx_api_t::raqDataCalculate.

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.

◆ RM_ZMOD4XXX_RellaqDataCalculate()

fsp_err_t RM_ZMOD4XXX_RellaqDataCalculate (rm_zmod4xxx_ctrl_t *const *p_api_ctrl*, rm_zmod4xxx_raw_data_t *const *p_raw_data*, rm_zmod4xxx_rel_iaq_data_t *const *p_zmod4xxx_data*)

This function should be called when measurement finishes. To check measurement status either polling or busy/interrupt pin can be used. Implements rm_zmod4xxx_api_t::rellaqDataCalculate.

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.

◆ RM_ZMOD4XXX_PbaqDataCalculate()

fsp_err_t RM_ZMOD4XXX_PbaqDataCalculate (rm_zmod4xxx_ctrl_t *const *p_api_ctrl*, rm_zmod4xxx_raw_data_t *const *p_raw_data*, rm_zmod4xxx_pbaq_data_t *const *p_zmod4xxx_data*)

This function should be called when measurement finishes. To check measurement status either polling or busy/interrupt pin can be used. Implements rm_zmod4xxx_api_t::pbaqDataCalculate.

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.

◆ RM_ZMOD4XXX_No2O3DataCalculate()

fsp_err_t RM_ZMOD4XXX_No2O3DataCalculate (rm_zmod4xxx_ctrl_t *const *p_api_ctrl*, rm_zmod4xxx_raw_data_t *const *p_raw_data*, rm_zmod4xxx_no2_o3_data_t *const *p_zmod4xxx_data*)

This function should be called when measurement finishes. To check measurement status either polling or busy/interrupt pin can be used. Implements rm_zmod4xxx_api_t::no2O3DataCalculate.

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter or library internal error occured.
FSP_ERR_NOT_OPEN	Module is not opened configured.
FSP_ERR_SENSOR_IN_STABILIZATION	Module is stabilizing.
FSP_ERR_SENSOR_INVALID_DATA	Sensor probably damaged. Algorithm results may be incorrect.

◆ RM_ZMOD4XXX_TemperatureAndHumiditySet()

fsp_err_t RM_ZMOD4XXX_TemperatureAndHumiditySet (rm_zmod4xxx_ctrl_t *const *p_api_ctrl*, float *temperature*, float *humidity*)

This function is valid only for OAQ_2nd_Gen and IAQ_2nd_Gen_ULP. This function should be called before DataCalculate. Humidity and temperature measurements are needed for ambient compensation. Implements rm_zmod4xxx_api_t::temperatureAndHumiditySet.

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.

◆ RM_ZMOD4XXX_DeviceErrorCheck()

fsp_err_t RM_ZMOD4XXX_DeviceErrorCheck (rm_zmod4xxx_ctrl_t *const *p_api_ctrl*)
This function is valid only for IAQ_2nd_Gen and IAQ_2nd_Gen_ULP. This function should be called before Read and DataCalculate. Check for unexpected reset occurs or getting unvalid ADC data. Implements rm_zmod4xxx_api_t::deviceErrorCheck.

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.
FSP_ERR_TIMEOUT	communication is timeout.
FSP_ERR_ABORTED	communication is aborted.

7.2.17 Storage

Modules

Detailed Description

Storage Modules.

Modules

	Block Media Custom Implementation (rm_block_media_user) Middleware that implements a block media interface on the media of your choice. This module implements the Block Media Interface.
	Block Media RAM (rm_block_media_ram) Middleware that implements a block media interface on RAM. This module implements the Block Media Interface.
	Block Media SD/MMC (rm_block_media_sdmmc) Middleware to implement the block media interface on SD cards. This module implements the Block Media Interface.
	Block Media SPI Flash (rm_block_media_spi) Middleware to implement the block media interface on SPI flash

	memory. This module implements the Block Media Interface.
	Block Media USB (rm_block_media_usb) Middleware to implement the block media interface on USB mass storage devices. This module implements the Block Media Interface.
	FileX I/O (rm_filex_block_media) Middleware for the Azure RTOS FileX File System control using Block Media on RA MCUs.
	FileX I/O (rm_filex_levelx_nor) Middleware for the Azure RTOS FileX File System control using LevelX NOR on RA MCUs.
	Flash (r_flash_hp) Driver for the flash memory on RA high-performance MCUs. This module implements the Flash Interface.
	Flash (r_flash_lp) Driver for the flash memory on RA low-power MCUs. This module implements the Flash Interface.
	FreeRTOS+FAT Port for RA (rm_freertos_plus_fat) Middleware for the FAT File System control on RA MCUs.
	LevelX NOR Port (rm_levelx_nor_spi) Middleware for using Azure RTOS LevelX on NOR SPI memory.
	LittleFS on Flash (rm_littlefs_flash) Middleware for the LittleFS File System control on RA MCUs.
	LittleFS on SPI Flash (rm_littlefs_spi_flash) Middleware for the LittleFS File System control on RA MCUs using external SPI Flash.
	OSPI Flash (r_ospi)

	Driver for the OSPI peripheral on RA MCUs. This module implements the SPI Flash Interface.
	OSPI Flash (r_ospi_b) Driver for the OSPI_B peripheral on RA MCUs. This module implements the SPI Flash Interface.
	QSPI (r_qspi) Driver for the QSPI peripheral on RA MCUs. This module implements the SPI Flash Interface.
	SD/MMC (r_sdhi) Driver for the SD/MMC Host Interface (SDHI) peripheral on RA MCUs. This module implements the SD/MMC Interface.
	Virtual EEPROM on Flash (rm_vee_flash) Virtual EEPROM on RA MCUs. This module implements the Virtual EEPROM Interface.

7.2.17.1 Block Media Custom Implementation (rm_block_media_user)

Modules » Storage

Middleware that implements a block media interface on the media of your choice. This module implements the Block Media Interface.

Overview

Features

This module is for using Block media with user-selected media.

Configuration

Block Media User has no output config settings.
The user is required to create the config settings etc. in the application.
The figure below is an example of the config definition when the user media in USB PMSC is RAM.

```
const rm_block_media_api_t g_rm_block_media_on_user_media =

{
```

```
    .open      = RM_BLOCK_MEDIA_RAM_Open,
    .mediaInit = RM_BLOCK_MEDIA_RAM_MediaInit,
    .read      = RM_BLOCK_MEDIA_RAM_Read,
    .write    = RM_BLOCK_MEDIA_RAM_Write,
    .erase    = RM_BLOCK_MEDIA_RAM_Erase,
    .infoGet   = RM_BLOCK_MEDIA_RAM_InfoGet,
    .statusGet = RM_BLOCK_MEDIA_RAM_StatusGet,
    .close    = RM_BLOCK_MEDIA_RAM_Close,
};
extern void r_usb_pmsc_block_media_event_callback(rm_block_media_callback_args_t *
p_args);
const rm_block_media_cfg_t g_rm_block_media0_cfg =
{.p_extend = NULL, .p_callback = r_usb_pmsc_block_media_event_callback, .p_context =
NULL, };
rm_block_media_instance_t g_rm_block_media0 =
{.p_api = &g_rm_block_media_on_user_media, .p_ctrl = NULL, .p_cfg =
&g_rm_block_media0_cfg, };
```

Note

If you use block_media_user, you need to create a function that matches the media you are using.
In the above example, this is the function with RM_BLOCK_MEDIA_.
Register the created function in rm_block_media_api_t.
The registered rm_block_media_api_t is registered in p_api, which is a member of rm_block_media_instance_t.

Clock Configuration

This module has no required clock configurations.

Pin Configuration

This module does not use I/O pins.

Examples

Basic Example

Please refer to USB PMSC (r_usb_pmsc) for the PMSC application given as an example.

7.2.17.2 Block Media RAM (rm_block_media_ram)

Modules » Storage

Functions

fsp_err_t	RM_BLOCK_MEDIA_RAM_Open (rm_block_media_ctrl_t *const p_ctrl, rm_block_media_cfg_t const *const p_cfg)
fsp_err_t	RM_BLOCK_MEDIA_RAM_MediaInit (rm_block_media_ctrl_t *const p_ctrl)
fsp_err_t	RM_BLOCK_MEDIA_RAM_Read (rm_block_media_ctrl_t *const p_ctrl, uint8_t *const p_dest_address, uint32_t const block_address, uint32_t const num_blocks)
fsp_err_t	RM_BLOCK_MEDIA_RAM_Write (rm_block_media_ctrl_t *const p_ctrl, uint8_t const *const p_src_address, uint32_t const block_address, uint32_t const num_blocks)
fsp_err_t	RM_BLOCK_MEDIA_RAM_Erase (rm_block_media_ctrl_t *const p_ctrl, uint32_t const block_address, uint32_t const num_blocks)
fsp_err_t	RM_BLOCK_MEDIA_RAM_StatusGet (rm_block_media_ctrl_t *const p_api_ctrl, rm_block_media_status_t *const p_status)
fsp_err_t	RM_BLOCK_MEDIA_RAM_InfoGet (rm_block_media_ctrl_t *const p_ctrl, rm_block_media_info_t *const p_info)
fsp_err_t	RM_BLOCK_MEDIA_RAM_Close (rm_block_media_ctrl_t *const p_ctrl)

Detailed Description

Middleware that implements a block media interface on RAM. This module implements the Block Media Interface.

Overview

Features

- This module is for using RAM as a media area.
- Supports using any read/write section of the address space as the media area.

Note

When using an external RAM as the media area (like SDRAM or OctaRAM), it must be initialized before calling RM_BLOCK_MEDIA_RAM_Open().
When using PMSC driver in combination with this module, the API of this module is called from the PMSC driver.

Configuration

Build Time Configurations for rm_block_media_ram

The following build time configurations are defined in fsp_cfg/rm_block_media_ram_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
RAM Media Size	Please enter the RAM media size.	65536	Enter a RAM media size of 20K bytes or more.
Memory Storage Section	Manual Entry	.bss	This is the section of memory that will be used for the backing storage. Must be a valid Linker section. ('.bss', '.sdram', '.OSPI_DEVICE_0_RAM', etc). For AC6 preface any section with '.bss' e.g. '.bss.sdram'

Configurations for Storage > Block Media RAM Implementation (rm_block_media_ram)

This module can be added to the Stacks tab via New Stack > Storage > Block Media RAM Implementation (rm_block_media_ram).

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_rm_block_media0	Module name.
Callback	Name must be a valid C symbol	NULL	A user callback function can be provided. If this callback function is provided, it will be called when a card is inserted or removed.

Note

Specify RAM media size of 20 Kbytes or more. This module cannot be used with an MCU that cannot allocate at least 20 Kbytes of RAM as media area.
When using AC6 it is recommended to start section names with ".bss" (ex. ".bss.sdram") to prevent unnecessarily large binaries. This tells AC6 to create ZI sections rather than initialized sections.

Clock Configuration

This module has no required clock configurations.

Pin Configuration

This module does not use I/O pins.

Function Documentation

◆ RM_BLOCK_MEDIA_RAM_Open()

fsp_err_t RM_BLOCK_MEDIA_RAM_Open (rm_block_media_ctrl_t *const *p_ctrl*, rm_block_media_cfg_t const *const *p_cfg*)

Opens the module.

Implements rm_block_media_api_t::open().

Return values

FSP_SUCCESS	Module is available and is now open.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_ALREADY_OPEN	Module has already been opened with this instance of the control structure.

Returns

See Common Error Codes or functions called by this function for other possible return codes.

◆ RM_BLOCK_MEDIA_RAM_MediaInit()

fsp_err_t RM_BLOCK_MEDIA_RAM_MediaInit (rm_block_media_ctrl_t *const *p_ctrl*)

Initializes the RAM media area.

Implements rm_block_media_api_t::mediaInit().

Return values

FSP_SUCCESS	Module is initialized and ready to access the memory device.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.

Returns

See Common Error Codes or functions called by this function for other possible return codes.

◆ RM_BLOCK_MEDIA_RAM_Read()

fsp_err_t RM_BLOCK_MEDIA_RAM_Read (rm_block_media_ctrl_t *const *p_ctrl*, uint8_t *const *p_dest_address*, uint32_t const *block_address*, uint32_t const *num_blocks*)

Reads data from RAM media.

Implements rm_block_media_api_t::read().

This function blocks until the data is read into the destination buffer.

Return values

FSP_SUCCESS	Data read successfully.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_INITIALIZED	Module has not been initialized.

Returns

See Common Error Codes or functions called by this function for other possible return codes.

◆ RM_BLOCK_MEDIA_RAM_Write()

fsp_err_t RM_BLOCK_MEDIA_RAM_Write (rm_block_media_ctrl_t *const *p_ctrl*, uint8_t const *const *p_src_address*, uint32_t const *block_address*, uint32_t const *num_blocks*)

Writes data to RAM media.

Implements rm_block_media_api_t::write().

This function blocks until the write operation completes.

Return values

FSP_SUCCESS	Write finished successfully.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_INITIALIZED	Module has not been initialized.

Returns

See Common Error Codes or functions called by this function for other possible return codes.

◆ RM_BLOCK_MEDIA_RAM_Erase()

fsp_err_t RM_BLOCK_MEDIA_RAM_Erase (rm_block_media_ctrl_t *const *p_ctrl*, uint32_t const *block_address*, uint32_t const *num_blocks*)

Erases sectors of RAM media.

Implements rm_block_media_api_t::erase().

This function blocks until erase is complete.

Return values

FSP_SUCCESS	Erase operation requested.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_INITIALIZED	Module has not been initialized.

Returns

See Common Error Codes or functions called by this function for other possible return codes.

◆ RM_BLOCK_MEDIA_RAM_StatusGet()

fsp_err_t RM_BLOCK_MEDIA_RAM_StatusGet (rm_block_media_ctrl_t *const *p_api_ctrl*, rm_block_media_status_t *const *p_status*)

Provides driver status.

Implements rm_block_media_api_t::statusGet().

Return values

FSP_SUCCESS	Status stored in p_status.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLOCK_MEDIA_RAM_InfoGet()

fsp_err_t RM_BLOCK_MEDIA_RAM_InfoGet (rm_block_media_ctrl_t *const *p_ctrl*, rm_block_media_info_t *const *p_info*)

Retrieves module information.

Implements rm_block_media_api_t::infoGet().

Return values

FSP_SUCCESS	Erase operation requested.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLOCK_MEDIA_RAM_Close()

fsp_err_t RM_BLOCK_MEDIA_RAM_Close (rm_block_media_ctrl_t *const *p_ctrl*)

Closes the module.

Implements rm_block_media_api_t::close().

Return values

FSP_SUCCESS	Successful close.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.

Detailed Description

Middleware to implement the block media interface on SD cards. This module implements the Block Media Interface.

Overview

Features

The SD/MMC implementation of the block media interface has the following key features:

- Reading, writing, and erasing data from an SD card
- Callback called when card insertion or removal is detected
- Provides media information such as sector size and total number of sectors.

Configuration

Build Time Configurations for rm_block_media_sdmmc

The following build time configurations are defined in driver/rm_block_media_sdmmc_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Storage > Block Media SD/MMC (rm_block_media_sdmmc)

This module can be added to the Stacks tab via New Stack > Storage > Block Media SD/MMC (rm_block_media_sdmmc). Non-secure callable guard functions can be generated for this module by

right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_rm_block_media0	Module name.
Callback	Name must be a valid C symbol	NULL	A user callback function can be provided. If this callback function is provided, it will be called when a card is inserted or removed.

Clock Configuration

This module has no required clock configurations.

Pin Configuration

This module does not use I/O pins.

Examples

Basic Example

This is a basic example of minimal use of the SD/MMC block media implementation in an application.

```
#define RM_BLOCK_MEDIA_SDMMC_BLOCK_SIZE (512)
uint8_t g_dest[RM_BLOCK_MEDIA_SDMMC_BLOCK_SIZE] BSP_ALIGN_VARIABLE(4);
uint8_t g_src[RM_BLOCK_MEDIA_SDMMC_BLOCK_SIZE] BSP_ALIGN_VARIABLE(4);
uint32_t g_transfer_complete = 0;
void rm_block_media_sdmmc_basic_example (void)
{
 /* Initialize g_src to known data */
 for (uint32_t i = 0; i < RM_BLOCK_MEDIA_SDMMC_BLOCK_SIZE; i++)
    {
       g_src[i] = (uint8_t) ('A' + (i % 26));
    }
 /* Open the RM_BLOCK_MEDIA_SDMMC driver. */
 fsp_err_t err = RM_BLOCK_MEDIA_SDMMC_Open(&g_rm_block_media0_ctrl,
&g_rm_block_media0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
```

```
 /* A device shall be ready to accept the first command within 1ms from detecting VDD
min. Reference section 6.4.1.1
  * "Power Up Time of Card" in the SD Physical Layer Simplified Specification Version
6.00. */
 R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
 /* Initialize the SD card. This should not be done until the card is plugged in for
SD devices. */
    err = RM_BLOCK_MEDIA_SDMMC_MediaInit(&g_rm_block_media0_ctrl);
    assert(FSP_SUCCESS == err);
 /* Write a block of data to sector 3 of an SD card. */
    err = RM_BLOCK_MEDIA_SDMMC_Write(&g_rm_block_media0_ctrl, g_src, 3, 1);
    assert(FSP_SUCCESS == err);
 /* Read a block of data from sector 3 of an SD card. */
    err = RM_BLOCK_MEDIA_SDMMC_Read(&g_rm_block_media0_ctrl, g_dest, 3, 1);
    assert(FSP_SUCCESS == err);
}
```

Function Documentation

◆ RM_BLOCK_MEDIA_SDMMC_Open()

fsp_err_t RM_BLOCK_MEDIA_SDMMC_Open (rm_block_media_ctrl_t *const *p_ctrl*, rm_block_media_cfg_t const *const *p_cfg*)

Opens the module.

Implements rm_block_media_api_t::open().

Return values

FSP_SUCCESS	Module is available and is now open.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_ALREADY_OPEN	Module has already been opened with this instance of the control structure.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- sdmmc_api_t::open

◆ RM_BLOCK_MEDIA_SDMMC_MediaInit()

fsp_err_t RM_BLOCK_MEDIA_SDMMC_MediaInit (rm_block_media_ctrl_t *const *p_ctrl*)

Initializes the SD or eMMC device. This procedure requires several sequential commands. This function blocks until all identification and configuration commands are complete.

Implements rm_block_media_api_t::mediaInit().

Return values

FSP_SUCCESS	Module is initialized and ready to access the memory device.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:
- sdmmc_api_t::mediaInit

◆ RM_BLOCK_MEDIA_SDMMC_Read()

fsp_err_t RM_BLOCK_MEDIA_SDMMC_Read (rm_block_media_ctrl_t *const *p_ctrl*, uint8_t *const *p_dest_address*, uint32_t const *block_address*, uint32_t const *num_blocks*)

Reads data from an SD or eMMC device. Up to 0x10000 sectors can be read at a time. Implements rm_block_media_api_t::read().

Return values

FSP_SUCCESS	Data read successfully.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_INITIALIZED	Module has not been initialized.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:
- sdmmc_api_t::read

◆ RM_BLOCK_MEDIA_SDMMC_Write()

fsp_err_t RM_BLOCK_MEDIA_SDMMC_Write (rm_block_media_ctrl_t *const *p_ctrl*, uint8_t const *const *p_src_address*, uint32_t const *block_address*, uint32_t const *num_blocks*)

Writes data to an SD or eMMC device. Up to 0x10000 sectors can be written at a time. Implements rm_block_media_api_t::write().

Return values

FSP_SUCCESS	Write finished successfully.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_INITIALIZED	Module has not been initialized.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- sdmmc_api_t::write

◆ RM_BLOCK_MEDIA_SDMMC_Erase()

fsp_err_t RM_BLOCK_MEDIA_SDMMC_Erase (rm_block_media_ctrl_t *const *p_ctrl*, uint32_t const *block_address*, uint32_t const *num_blocks*)

Erases sectors of an SD card or eMMC device. Implements rm_block_media_api_t::erase().

Return values

FSP_SUCCESS	Erase operation requested.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_INITIALIZED	Module has not been initialized.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- sdmmc_api_t::erase
- sdmmc_api_t::statusGet

◆ RM_BLOCK_MEDIA_SDMMC_CallbackSet()

fsp_err_t RM_BLOCK_MEDIA_SDMMC_CallbackSet (rm_block_media_ctrl_t *const *p_ctrl*, void(*)(rm_block_media_callback_args_t *) *p_callback*, void const *const *p_context*, rm_block_media_callback_args_t *const *p_callback_memory*)

Updates the user callback with the option to provide memory for the callback argument structure. Implements rm_block_media_api_t::callbackSet.

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

◆ RM_BLOCK_MEDIA_SDMMC_StatusGet()

fsp_err_t RM_BLOCK_MEDIA_SDMMC_StatusGet (rm_block_media_ctrl_t *const *p_api_ctrl*, rm_block_media_status_t *const *p_status*)

Provides driver status. Implements rm_block_media_api_t::statusGet().

Return values

FSP_SUCCESS	Status stored in p_status.
FSP_ERR_ASSERTION	NULL pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLOCK_MEDIA_SDMMC_InfoGet()

fsp_err_t RM_BLOCK_MEDIA_SDMMC_InfoGet (rm_block_media_ctrl_t *const *p_ctrl*, rm_block_media_info_t *const *p_info*)

Retrieves module information. Implements rm_block_media_api_t::infoGet().

Return values

FSP_SUCCESS	Erase operation requested.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_INITIALIZED	Module has not been initialized.

◆ RM_BLOCK_MEDIA_SDMMC_Close()

fsp_err_t RM_BLOCK_MEDIA_SDMMC_Close (rm_block_media_ctrl_t *const *p_ctrl*)
Closes an open SD/MMC device. Implements rm_block_media_api_t::close().

Return values

FSP_SUCCESS	Successful close.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.

7.2.17.4 Block Media SPI Flash (rm_block_media_spi)

Modules » Storage

Functions

fsp_err_t	RM_BLOCK_MEDIA_SPI_Open (rm_block_media_ctrl_t *const p_ctrl, rm_block_media_cfg_t const *const p_cfg)

fsp_err_t	RM_BLOCK_MEDIA_SPI_MediaInit (rm_block_media_ctrl_t *const p_ctrl)
fsp_err_t	RM_BLOCK_MEDIA_SPI_Read (rm_block_media_ctrl_t *const p_ctrl, uint8_t *const p_dest, uint32_t const start_block, uint32_t const num_blocks)
fsp_err_t	RM_BLOCK_MEDIA_SPI_StatusGet (rm_block_media_ctrl_t *const p_ctrl, rm_block_media_status_t *const p_status)
fsp_err_t	RM_BLOCK_MEDIA_SPI_Write (rm_block_media_ctrl_t *const p_ctrl, uint8_t const *const p_src, uint32_t const start_block, uint32_t const num_blocks)
fsp_err_t	RM_BLOCK_MEDIA_SPI_CallbackSet (rm_block_media_ctrl_t *const p_ctrl, void(*p_callback)(rm_block_media_callback_args_t *), void const *const p_context, rm_block_media_callback_args_t *const p_callback_memory)
fsp_err_t	RM_BLOCK_MEDIA_SPI_Close (rm_block_media_ctrl_t *const p_ctrl)
fsp_err_t	RM_BLOCK_MEDIA_SPI_Erase (rm_block_media_ctrl_t *const p_ctrl, uint32_t const start_block, uint32_t const num_blocks)

Detailed Description

Middleware to implement the block media interface on SPI flash memory. This module implements the Block Media Interface.

Overview

Features

The SPI implementation of the block media interface has the following key features:

- Reading, writing, and erasing data from SPI flash memory
- Provides media information such as sector size and total number of sectors.

Note

By default, Block Media SPI Read, Write, and Erase are blocking operations. Non-blocking operation may be achieved by yielding control within the optional callback function.

Configuration

Build Time Configurations for rm_block_media_spi

The following build time configurations are defined in driver/rm_block_media_spi_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected, code for parameter checking is included in the build

Configurations for Storage > Block Media SPI Flash (rm_block_media_spi)

This module can be added to the Stacks tab via New Stack > Storage > Block Media SPI Flash (rm_block_media_spi).

Configuration	Options	Default	Description
Module Instance Name	Name must be a valid C symbol	g_rm_block_media0	Module name
Block size (bytes)	Manual Entry	4096	Specify the size of a block in bytes.
Block count	Minimum block count is 1, maximum is defined by hardware and software design.	8192	Number of blocks available for use by this driver instance.
Base Address	Manual Entry	0	Base address offset (bytes) for instance memory region.
Callback Function	Name must be a valid C symbol	NULL	A user callback function can be

provided. If this callback is provided, it will be called after the completion of Read, Write, and Erase operations, or anytime these functions are waiting on hardware.

Clock Configuration

This module has no required clock configurations.

Pin Configuration

This module does not use I/O pins.

Limitations

Developers should be aware of the following limitations when using RM_BLOCK_MEDIA_SPI:

- Getting and setting Block Protection or Advanced Sector Protection modes is not supported.
- Addressing QSPI memory address ranges greater than 64 MB (one bank) is not supported.

Examples

Basic Example

This is a basic example of minimal use of the SPI block media implementation in an application.

```
#define RM_BLOCK_MEDIA_SPI_BLOCK_SIZE (256U)
uint8_t g_dest[RM_BLOCK_MEDIA_SPI_BLOCK_SIZE] BSP_ALIGN_VARIABLE(4);
uint8_t g_src[RM_BLOCK_MEDIA_SPI_BLOCK_SIZE] BSP_ALIGN_VARIABLE(4);
void rm_block_media_spi_basic_example (void)
{
 /* Initialize g_src to known data */
 for (uint32_t i = 0; i < RM_BLOCK_MEDIA_SPI_BLOCK_SIZE; i++)
    {
       g_src[i] = (uint8_t) ('A' + (i % 26));
    }
 /* Open the RM_BLOCK_MEDIA_SPI driver. */
 fsp_err_t err = RM_BLOCK_MEDIA_SPI_Open(&g_rm_block_media0_ctrl,
&g_rm_block_media0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
```

```
 /* Initialize the SPI flash memory. */
    err = RM_BLOCK_MEDIA_SPI_MediaInit(&g_rm_block_media0_ctrl);
    assert(FSP_SUCCESS == err);
 /* Write a block of data to block 3 of the SPI flash memory. */
    err = RM_BLOCK_MEDIA_SPI_Write(&g_rm_block_media0_ctrl, g_src, 3, 1);
    assert(FSP_SUCCESS == err);
 /* Read a block of data from block 3 of the SPI flash memory. */
    err = RM_BLOCK_MEDIA_SPI_Read(&g_rm_block_media0_ctrl, g_dest, 3, 1);
    assert(FSP_SUCCESS == err);
}
```

Non-Blocking Example

This is a basic example of using the optional SPI callback to impliment non-blocking operation.

```
#define RM_BLOCK_MEDIA_EXAMPLE_DEVICE_BLOCK_COUNT 0x1000
void rm_block_media_spi_non_blocking_example (void)
{
 /* Initialize g_src to known data */
 for (uint32_t i = 0; i < RM_BLOCK_MEDIA_SPI_BLOCK_SIZE; i++)
    {
       g_src[i] = (uint8_t) ('A' + (i % 26));
    }
 /* Open the RM_BLOCK_MEDIA_SPI driver. This enables the card detection interrupt. */
 fsp_err_t err = RM_BLOCK_MEDIA_SPI_Open(&g_rm_block_media0_ctrl,
&g_rm_block_media0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Initialize the Block Media SPI driver. */
    err = RM_BLOCK_MEDIA_SPI_MediaInit(&g_rm_block_media0_ctrl);
    assert(FSP_SUCCESS == err);
 /* Erase a large quantity of data from SPI Flash Memory */
    err = RM_BLOCK_MEDIA_SPI_Erase(&g_rm_block_media0_ctrl, 0,
RM_BLOCK_MEDIA_EXAMPLE_DEVICE_BLOCK_COUNT);
    assert(FSP_SUCCESS == err);
```

```
}
/* The optional callback is invoked for Read, Write, and Erase operations, whenever
the operation completes or has
 * been blocked by the lower level SPI driver busy indication.
 */
void rm_block_media_spi_example_callback (rm_block_media_callback_args_t * p_args)
{
 if (RM_BLOCK_MEDIA_EVENT_OPERATION_COMPLETE == p_args->event)
    {
 /* Process operation complete. */
    }
 else if (RM_BLOCK_MEDIA_EVENT_POLL_STATUS == p_args->event)
    {
 rm_block_media_status_t status;
 rm_block_media_ctrl_t * p_ctrl = (rm_block_media_ctrl_t *) p_args->p_context;
 fsp_err_t err = RM_BLOCK_MEDIA_SPI_StatusGet(p_ctrl, &status);
      assert(FSP_SUCCESS == err);
 if (true == status.busy)
      {
 /* Run waiting tasks */
            vTaskSuspend(xTaskGetCurrentTaskHandle());
      }
    }
 else
    {
       assert(RM_BLOCK_MEDIA_EVENT_ERROR == p_args->event);
 /* Process Read, Write, or Erase error. */
    }
}
```

Function Documentation

◆ RM_BLOCK_MEDIA_SPI_Open()

fsp_err_t RM_BLOCK_MEDIA_SPI_Open (rm_block_media_ctrl_t *const *p_ctrl*, rm_block_media_cfg_t const *const *p_cfg*)

Parameter checking and Acquires mutex, then handles driver initialization at the HAL SPI layer and marking the open flag in control block.

Implements rm_block_media_api_t::open.

Return values

FSP_SUCCESS	Block media for SPI framework is successfully opened.
FSP_ERR_ASSERTION	One of the input parameters or their data references may be null.
FSP_ERR_ALREADY_OPEN	The channel specified has already been opened. See HAL driver for other possible causes.

Returns

See Common Error Codes or HAL driver for other possible return codes or causes. This function calls
- spi_flash_api_t::open

◆ RM_BLOCK_MEDIA_SPI_InfoGet()

fsp_err_t RM_BLOCK_MEDIA_SPI_InfoGet (rm_block_media_ctrl_t *const *p_ctrl*, rm_block_media_info_t *const *p_info*)

Retrieves module information.

Implements rm_block_media_api_t::infoGet.

Return values

FSP_SUCCESS	Erase operation requested.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_INITIALIZED	Module has not been initialized.

◆ RM_BLOCK_MEDIA_SPI_MediaInit()

fsp_err_t RM_BLOCK_MEDIA_SPI_MediaInit (rm_block_media_ctrl_t *const *p_ctrl*)

Initializes the Block Media SPI Flash device.

Implements rm_block_media_api_t::mediaInit.

Return values

FSP_SUCCESS	Module is initialized and ready to access the memory device.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLOCK_MEDIA_SPI_Read()

fsp_err_t RM_BLOCK_MEDIA_SPI_Read (rm_block_media_ctrl_t *const *p_ctrl*, uint8_t *const *p_dest*, uint32_t const *start_block*, uint32_t const *num_blocks*)

Reads a number of blocks from spi flash memory. By default, this is a function is blocking. Non-blocking operation may be achieved by yielding control within the optional callback function.

Implements rm_block_media_api_t::read.

Return values

FSP_SUCCESS	SPI data read successfully
FSP_ERR_ASSERTION	p_ctrl or p_dest is NULL, or num_blocks is zero
FSP_ERR_NOT_OPEN	Block Media SPI module is not yet open
FSP_ERR_INVALID_ADDRESS	Invalid address range for read operation
FSP_ERR_NOT_INITIALIZED	Block Media SPI module is not yet initialized

◆ RM_BLOCK_MEDIA_SPI_StatusGet()

fsp_err_t RM_BLOCK_MEDIA_SPI_StatusGet (rm_block_media_ctrl_t *const *p_ctrl*, rm_block_media_status_t *const *p_status*)

Provides driver status.

Implements rm_block_media_api_t::statusGet.

Return values

FSP_SUCCESS	Status stored in p_status.
FSP_ERR_ASSERTION	NULL pointer.
FSP_ERR_NOT_OPEN	Module is not open.

Returns

See Common Error Codes or HAL driver for other possible return codes or causes. This function calls
- spi_flash_api_t::statusGet

◆ RM_BLOCK_MEDIA_SPI_Write()

fsp_err_t RM_BLOCK_MEDIA_SPI_Write (rm_block_media_ctrl_t *const *p_ctrl*, uint8_t const *const *p_src*, uint32_t const *start_block*, uint32_t const *num_blocks*)

Writes provided data to a number of blocks of spi flash memory. By default, this is a function is blocking. Non-blocking operation may be achieved by yielding control within the optional callback function.

Implements rm_block_media_api_t::write.

Return values

FSP_SUCCESS	Flash write finished successfully.
FSP_ERR_ASSERTION	p_ctrl or p_src is NULL. Or num_blocks is zero.
FSP_ERR_NOT_OPEN	Block media SPI Framework module is not yet initialized.
FSP_ERR_INVALID_ADDRESS	Invalid address range
FSP_ERR_NOT_INITIALIZED	Block Media SPI module is not yet initialized

Returns

See Common Error Codes or HAL driver for other possible return codes or causes. This function calls
- spi_flash_api_t::write

◆ RM_BLOCK_MEDIA_SPI_CallbackSet()

fsp_err_t RM_BLOCK_MEDIA_SPI_CallbackSet (rm_block_media_ctrl_t *const *p_ctrl*, void(*)(rm_block_media_callback_args_t *) *p_callback*, void const *const *p_context*, rm_block_media_callback_args_t *const *p_callback_memory*)

Updates the user callback with the option to provide memory for the callback argument structure. API not supported.

Implements rm_block_media_api_t::callbackSet.

Return values

FSP_ERR_UNSUPPORTED	API not supported by RM_BLOCK_MEDIA_SPI.

◆ RM_BLOCK_MEDIA_SPI_Close()

fsp_err_t RM_BLOCK_MEDIA_SPI_Close (rm_block_media_ctrl_t *const *p_ctrl*)

Closes the Block Media SPI device. Implements rm_block_media_api_t::close.

Return values

FSP_SUCCESS	Successful close.
FSP_ERR_ASSERTION	One of the following parameters may be null: p_ctrl.
FSP_ERR_NOT_OPEN	Block media SPI Framework module is not yet initialized.

Returns

See Common Error Codes or HAL driver for other possible return codes or causes. This function calls

- spi_flash_api_t::close

◆ RM_BLOCK_MEDIA_SPI_Erase()

fsp_err_t RM_BLOCK_MEDIA_SPI_Erase (rm_block_media_ctrl_t *const *p_ctrl*, uint32_t const *start_block*, uint32_t const *num_blocks*)

This function erases blocks of the SPI device. By default, this is a function is blocking. Non-blocking operation may be achieved by yielding control within the optional callback function.

Implements rm_block_media_api_t::erase.

Return values

FSP_SUCCESS	Erase operation requested.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_INITIALIZED	Module has not been initialized.
FSP_ERR_INVALID_ADDRESS	Invalid address range

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- spi_flash_api_t::erase
- spi_flash_api_t::statusGet

fsp_err_t	RM_BLOCK_MEDIA_USB_Close (rm_block_media_ctrl_t *const p_ctrl)

Detailed Description

Middleware to implement the block media interface on USB mass storage devices. This module implements the Block Media Interface.

Overview

Features

The USB implementation of the block media interface has the following key features:

- Reading, writing, and erasing data from a USB mass storage device
- Callback called when device insertion or removal is detected
- Provides media information such as sector size and total number of sectors.

Configuration

Build Time Configurations for rm_block_media_usb

The following build time configurations are defined in driver/rm_block_media_usb_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Storage > Block Media USB (rm_block_media_usb)

This module can be added to the Stacks tab via New Stack > Storage > Block Media USB (rm_block_media_usb). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_rm_block_media0	Module name.
Callback	Name must be a valid C symbol	NULL	A user callback function can be

			provided. If this callback function is provided, it will be called when a device is attached or removed.
Pointer to user context	Name must be a valid C symbol	NULL	A user context can be provided. If this context is provided, it will be passed to callback function when a device is attached or removed.

Note

RM_BLOCK_MEDIA_USB_MediaInit function must be called after receiving the insert event notification.

Clock Configuration

This module has no required clock configurations.

Pin Configuration

This module does not use I/O pins.

Examples

Basic Example

This is a basic example of minimal use of the USB mass storage block media implementation in an application.

```
#define RM_BLOCK_MEDIA_USB_BLOCK_SIZE (512)
volatile bool g_usb_inserted = false;
uint8_t       g_dest[RM_BLOCK_MEDIA_USB_BLOCK_SIZE] BSP_ALIGN_VARIABLE(4);
uint8_t       g_src[RM_BLOCK_MEDIA_USB_BLOCK_SIZE] BSP_ALIGN_VARIABLE(4);
void rm_block_media_usb_basic_example (void)
{
 /* Initialize g_src to known data */
 for (uint32_t i = 0; i < RM_BLOCK_MEDIA_USB_BLOCK_SIZE; i++)
    {
       g_src[i] = (uint8_t) ('A' + (i % 26));
    }
 /* Open the RM_BLOCK_MEDIA_USB driver. */
 fsp_err_t err = RM_BLOCK_MEDIA_USB_Open(&g_rm_block_media0_ctrl,
&g_rm_block_media0_cfg);
```

```
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 while (!g_usb_inserted)
    {
 /* Wait for a card insertion interrupt. */
    }
 /* Initialize the mass storage device. This should not be done until the device is
plugged in and initialized. */
    err = RM_BLOCK_MEDIA_USB_MediaInit(&g_rm_block_media0_ctrl);
    assert(FSP_SUCCESS == err);
 /* Write a block of data to sector 3 of an USB mass storage device. */
    err = RM_BLOCK_MEDIA_USB_Write(&g_rm_block_media0_ctrl, g_src, 3, 1);
    assert(FSP_SUCCESS == err);
 /* Read a block of data from sector 3 of an USB mass storage device. */
    err = RM_BLOCK_MEDIA_USB_Read(&g_rm_block_media0_ctrl, g_dest, 3, 1);
    assert(FSP_SUCCESS == err);
}
```

Device Insertion

This is an example of using a callback to determine when a mass storage device is plugged in and enumerated.

```
/* The callback is called when a media insertion event occurs. */
void rm_block_media_usb_media_insertion_example_callback
(rm_block_media_callback_args_t * p_args)
{
 if (RM_BLOCK_MEDIA_EVENT_MEDIA_INSERTED == p_args->event)
    {
       g_usb_inserted = true;
    }
 if (RM_BLOCK_MEDIA_EVENT_MEDIA_REMOVED == p_args->event)
    {
       g_usb_inserted = false;
    }
```

```
}
```

Function Documentation

◆ RM_BLOCK_MEDIA_USB_Open()

fsp_err_t RM_BLOCK_MEDIA_USB_Open (rm_block_media_ctrl_t *const *p_ctrl*,
rm_block_media_cfg_t const *const *p_cfg*)

Opens the module.

Implements rm_block_media_api_t::open().

Return values

FSP_SUCCESS	Module is available and is now open.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_ALREADY_OPEN	Module has already been opened with this instance of the control structure.

Returns

See Common Error Codes or functions called by this function for other possible return codes.

◆ RM_BLOCK_MEDIA_USB_MediaInit()

fsp_err_t RM_BLOCK_MEDIA_USB_MediaInit (rm_block_media_ctrl_t *const *p_ctrl*)

Initializes the USB device.

Implements rm_block_media_api_t::mediaInit().

Return values

FSP_SUCCESS	Module is initialized and ready to access the memory device.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLOCK_MEDIA_USB_Read()

fsp_err_t RM_BLOCK_MEDIA_USB_Read (rm_block_media_ctrl_t *const *p_ctrl*, uint8_t *const *p_dest_address*, uint32_t const *block_address*, uint32_t const *num_blocks*)

Reads data from an USB device. Implements rm_block_media_api_t::read().

This function blocks until the data is read into the destination buffer.

Return values

FSP_SUCCESS	Data read successfully.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_INITIALIZED	Module has not been initialized.
FSP_ERR_USB_FAILED	The message could not received completed successfully.

Returns

See Common Error Codes or functions called by this function for other possible return codes.

◆ RM_BLOCK_MEDIA_USB_Write()

fsp_err_t RM_BLOCK_MEDIA_USB_Write (rm_block_media_ctrl_t *const *p_ctrl*, uint8_t const *const *p_src_address*, uint32_t const *block_address*, uint32_t const *num_blocks*)

Writes data to an USB device. Implements rm_block_media_api_t::write().

This function blocks until the write operation completes.

Return values

FSP_SUCCESS	Write finished successfully.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_INITIALIZED	Module has not been initialized.
FSP_ERR_USB_FAILED	The message could not received completed successfully.

Returns

See Common Error Codes or functions called by this function for other possible return codes.

◆ RM_BLOCK_MEDIA_USB_Erase()

fsp_err_t RM_BLOCK_MEDIA_USB_Erase (rm_block_media_ctrl_t *const *p_ctrl*, uint32_t const *block_address*, uint32_t const *num_blocks*)

Erases sectors of an USB device. Implements rm_block_media_api_t::erase().

This function blocks until erase is complete.

Return values

FSP_SUCCESS	Erase operation requested.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_INITIALIZED	Module has not been initialized.

Returns

See Common Error Codes or functions called by this function for other possible return codes.

◆ RM_BLOCK_MEDIA_USB_CallbackSet()

fsp_err_t RM_BLOCK_MEDIA_USB_CallbackSet (rm_block_media_ctrl_t *const *p_api_ctrl*, void(*)(rm_block_media_callback_args_t *) *p_callback*, void const *const *p_context*, rm_block_media_callback_args_t *const *p_callback_memory*)

Updates the user callback with the option to provide memory for the callback argument structure. Implements rm_block_media_api_t::callbackSet.

Note

This function is currently unsupported for Block Media over USB.

Return values

FSP_ERR_UNSUPPORTED	CallbackSet is not currently supported for Block Media over USB.

◆ RM_BLOCK_MEDIA_USB_StatusGet()

fsp_err_t RM_BLOCK_MEDIA_USB_StatusGet (rm_block_media_ctrl_t *const *p_api_ctrl*, rm_block_media_status_t *const *p_status*)

Provides driver status. Implements rm_block_media_api_t::statusGet().

Return values

FSP_SUCCESS	Status stored in p_status.
FSP_ERR_ASSERTION	NULL pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_INITIALIZED	Module has not been initialized.

Returns

See Common Error Codes or functions called by this function for other possible return codes.

◆ RM_BLOCK_MEDIA_USB_InfoGet()

fsp_err_t RM_BLOCK_MEDIA_USB_InfoGet (rm_block_media_ctrl_t *const *p_ctrl*, rm_block_media_info_t *const *p_info*)

Retrieves module information. Implements rm_block_media_api_t::infoGet().

Return values

FSP_SUCCESS	Erase operation requested.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_INITIALIZED	Module has not been initialized.

◆ RM_BLOCK_MEDIA_USB_Close()

fsp_err_t RM_BLOCK_MEDIA_USB_Close (rm_block_media_ctrl_t *const *p_ctrl*)

Closes an open USB device. Implements rm_block_media_api_t::close().

Return values

FSP_SUCCESS	Successful close.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.

Detailed Description

Middleware for the Azure RTOS FileX File System control using Block Media on RA MCUs.

Overview

This module provides the hardware port layer for FileX file system. After initializing this module, refer to the FileX API reference to use the file system: https://docs.microsoft.com/en-us/azure/rtos/filex/

Features

The FileX Block Media module supports the following features:

- Callbacks for insertion and removal for removable devices.
- ThreadX is typically required for FileX. To use FileX without ThreadX FX_STANDALONE_ENABLE must be defined.
- Unless FX_SINGLE_THREAD or FX_STANDALONE_ENABLE are defined, all FileX operations are thread safe.

Configuration

Build Time Configurations for rm_filex_block_media

The following build time configurations are defined in fsp_cfg/middleware/rm_filex_block_media_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	Selects if code for parameter checking is to be included in the build.

Configurations for Storage > FileX I/O (rm_filex_block_media)

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_rm_filex_block_media_0	Module name.
Callback	Name must be a valid C symbol	g_rm_filex_block_media_0_callback	A user callback function can be provided. If this callback function is provided, it will be called when media is inserted or removed. It will also be called during operations by the lower level block media as a way for the user to provide their desired waiting functionality.
Partition Number	• 0 • 1 • 2 • 3	0	The partition to use for partitioned media. This partition will only be used if a Master Boot Record with partition table exists at block 0 of the media, otherwise the FileX FAT boot record should exist or be formatted to block 0.

Build Time Configurations for fx

The following build time configurations are defined in fsp_cfg/azure/fx/fx_user.h:

Configuration	Options	Default	Description
Common			
Max Long Name Len	Value must be an integer greater than or equal to 13 and less than or equal to 256, or empty		Specifies the maximum file name size for FileX. If left blank the default value is 256. Legal values range between 13 and 256.
Max Last Name Len	Value must be an integer greater than or equal to 13 and less than or equal to 256, or empty		This value defines the maximum file name length, which includes full path name. If left blank the default value is 256. Legal values range between 13 and 256.

Max Sector Cache	Value must be an integer greater than 0 and power of 2 or empty		Specifies the maximum number of logical sectors that can be cached by FileX. The actual number of sectors that can be cached is lesser of this constant and how many sectors can fit in the amount of memory supplied at fx_media_open. The default value if left blank is 256. All values must be a power of 2.
Fat Map Size	Value must be an integer greater than 0 or empty		Specifies the number of sectors that can be represented in the FAT update map. The default value if left blank is 256. Larger values help reduce unneeded updates of secondary FAT sectors.
Max Fat Cache	Value must be an integer greater than 0 and power of 2 or empty		Specifies the number of entries in the internal FAT cache. The default value if left blank is 16. All values must be a power of 2.
Threading			
Update Rate (Seconds)	Value must be an integer greater than 0 or empty		Specifies rate at which system time in FileX is adjusted. Default value if left blank is 10, specifying that the FileX system time is updated every 10 seconds.
No Timer	• Enabled • Disabled (default)	Disabled (default)	Eliminates the ThreadX timer setup to update the FileX system time and date. Doing so causes default time and date to be placed on all file operations.
Single Thread	• Enabled • Disabled (default)	Disabled (default)	Eliminates ThreadX protection logic from the FileX source. It should be used if FileX is being used only from

			one thread.
Standalone	• Enabled • Disabled (default)	Disabled (default)	Enables FileX to be used in standalone mode (without Azure RTOS).
Extra Features			
Don't Update Open Files	• Enabled • Disabled (default)	Disabled (default)	When enabled, FileX does not update already opened files.
Media Search Cache	• Enabled (default) • Disabled	Enabled (default)	When disabled, the file search cache optimization is disabled.
Direct Data Read Cache Fill	• Enabled (default) • Disabled	Enabled (default)	When disabled, the direct read sector update of cache is disabled.
Media Statistics	• Enabled (default) • Disabled	Enabled (default)	When disabled, gathering of media statistics is disabled.
Single Open Legacy	• Enabled • Disabled (default)	Disabled (default)	When enabled, legacy single open logic for the same file is enabled.
Rename Path Inherit	• Enabled • Disabled (default)	Disabled (default)	When enabled, renaming inherits path information.
No Local Path	• Enabled • Disabled (default)	Disabled (default)	When enabled, removes local path logic from FileX, resulting in smaller code size.
64-bit LBA	• Enabled • Disabled (default)	Disabled (default)	When enabled, 64-bits sector addresses are used in I/O driver.
Cache	• Enabled (default) • Disabled	Enabled (default)	Enables or disables the cache, default is enabled.
File Close	• Enabled (default) • Disabled	Enabled (default)	Enables or disables file close, default is enabled.
Fast Close	• Enabled (default) • Disabled	Enabled (default)	Enables or disables fast open, default is enabled.
Force Memory Operation	• Enabled (default)	Enabled (default)	Enables or disables force memory

	• Disabled		operation, default is enabled.
Build Options	• Enabled (default) • Disabled	Enabled (default)	Enables or disables build options, default is enabled.
One Line Function	• Enabled (default) • Disabled	Enabled (default)	Enables or disables one line function, default is enabled.
FAT Entry Refresh	• Enabled (default) • Disabled	Enabled (default)	Enables or disables FAT entry refresh, default is enabled.
Consecutive Detect	• Enabled (default) • Disabled	Enabled (default)	Enables or disables consecutive detect, default is enabled.
Enable exFAT	• Enabled • Disabled (default)	Disabled (default)	Enables exFAT support in FileX.
Fault Tolerant			
Fault Tolerant Service	• Enabled • Disabled (default)	Disabled (default)	When enabled, enables the FileX Fault Tolerant Module. Enabling Fault Tolerant automatically defines the symbol FX_FAULT_TOLERANT and FX_FAULT_TOLERANT_DATA.
Fault Tolerant Data	• Enabled • Disabled (default)	Disabled (default)	When enabled, FileX immediately passes all file data write requests to the media's driver. This potentially decreases performance, but helps limit lost file data. Note that enabling this feature does not automatically enable FileX Fault Tolerant Module, which should be enabled separately.
Fault Tolerant	• Enabled • Disabled (default)	Disabled (default)	When enabled, FileX immediately passes write requests of all system sectors (boot, FAT, and directory sectors) to the media's driver. This potentially decreases performance, but helps

			limit corruption to lost clusters. Note that enabling this feature does not automatically enable FileX Fault Tolerant Module, which should be enabled separately.
Fault Tolerant Boot Index	Value must be an integer greater than or equal to 116 and less than or equal to 119		Defines byte offset in the boot sector where the cluster for the fault tolerant log is. By default if left blank this value is 116. This field takes 4 bytes. Bytes 116 through 119 are chosen because they are marked as reserved by FAT 12/16/32/exFAT specification.
Error Checking	• Enabled (default) • Disabled	Enabled (default)	

Configurations for Storage > Azure RTOS FileX on Block Media

This module can be added to the Stacks tab via New Stack > Storage > Azure RTOS FileX on Block Media.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_fx_media0	Symbol used for media_ptr parameter in FileX APIs
Volume Name	Name must be a maximum of 11 characters	Volume 1	Volume name string, which is a maximum of 11 characters.
Number of FATs	Number of FATs must be an integer greater than 0	1	Number of FATs in the media. The minimal value is 1 for the primary FAT. Values greater than 1 result in additional FAT copies being maintained at run-time.
Directory Entries	Number of Directory Entries must be an integer greater than 0	256	Number of directory entries in the root directory.
Hidden Sectors	Number of Hidden Sectors must be an	0	Number of sectors hidden before this

	integer		media's boot sector. If using media formatted with multiple partitions this number should correspond to the starting block number for the desired partition.
Total Sectors	Total Sectors must be an integer greater than 0	65536	Total number of sectors in the media. When using a Renesas provided block media implementation, total sectors can be fetched by the infoGet from the block media API. Any removable media must be inserted and initialized first to retrieve this info.
Bytes per Sector	Bytes per Sector must be multiple of 32	512	Number of bytes per sector, which is typically 512. FileX requires this to be a multiple of 32. When using a Renesas provided block media implementation, bytes per sector can be fetched by the infoGet from the block media API. Any removable media must be inserted and initialized first to retrieve this info.
Sectors per Cluster	Sectors per Cluster must be an integer greater than 0	1	Number of sectors in each cluster. The cluster is the minimum allocation unit in a FAT file system.
Volume Serial Number (exFAT only)	Volume Serial Number must be an integer greater than 0	12345	Serial number to be used for this volume. exFAT only.
Boundary Unit (exFAT only)	Boundary unit must be an integer greater than 0	128	Physical data area alignment size, in number of sectors. exFAT only.
Working media memory size	Memory size must be an integer greater than or equal to the size of one sector	512	Memory allocated for file system. Memory size must be an integer greater than or equal

to the size of one sector.

Usage Notes

Pending during Read/Write

The FileX Block Media driver provides a number of events in the user callback to handle waiting or pending while it is doing blocking operations. The events received in the callback will differ depending on the lower level block media driver in use.

If the lower level block media driver is rm_block_media_spi (SPI blocks on read/write operations):

- The user will receive RM_BLOCK_MEDIA_EVENT_POLL_STATUS in the user callback while the lower level driver is polling for the read/write operation to be complete. The user can choose to do a thread sleep or software delay upon receiving this event in the callback.
- Once the operation is complete no other callbacks will be received.

If the lower level block media driver is rm_block_media_sdmmc (SDMMC is interrupt based, the FileX Block Media driver will still block while waiting for interrupts from SDMMC):

- The user will receive RM_BLOCK_MEDIA_EVENT_WAIT in the user callback when the FileX Block Media driver begins waiting for an interrupt event from SDMMC. This is sent from a thread context. The user can choose to pend on a semaphore, sleep the thread, or do a software delay upon receiving this event in the callback. The FileX Block Media driver thread will block until an interrupt is received.
- Once an SDMMC interrupt is received the user will receive RM_BLOCK_MEDIA_EVENT_WAIT_END in the user callback. This is sent from an interrupt context. The user can choose to give a semaphore on this event or do nothing.
- If SDMMC is busy on a long erase after receiving the interrupt the FileX Block Media driver will send RM_BLOCK_MEDIA_EVENT_POLL_STATUS to the user callback and proceed to do a blocking poll on SDMMC status. The user can choose to do a thread sleep or software delay upon receiving this event in the callback. This event will not be received by the user on typical operations by FileX.

Partitioned Media

When using fx_format to format a partition the number of hidden sectors should match the starting block number of the partition and the total number of sectors should be equal to the number of sectors in the partition.

Unused User Callback Events

Certain events are defined in rm_block_media_event_t but not returned by the FileX Block Media user callback:

- RM_BLOCK_MEDIA_EVENT_OPERATION_COMPLETE: This event is handled internally and operation success is indicated by FileX API calls returning FX_SUCCESS.
- RM_BLOCK_MEDIA_EVENT_ERROR: This event is handled internally and operation failure will be indicated by an error return code from FileX API calls.

Erasing Flash Memory Prior to Usage

The area of the flash memory being used for the FileX instance should be erased using the lower

level flash API prior to usage. Otherwise, FileX open operation may fail when fx_media_open( ) is called.

Examples

Basic Example

This is a basic example of FileX Block Media in an application.

```
#define RM_FILEX_BLOCK_MEDIA_EXAMPLE_FILE_NAME "TEST_FILE.txt"
#define RM_FILEX_BLOCK_MEDIA_EXAMPLE_BUFFER_SIZE_BYTES (10240)
#define RM_FILEX_BLOCK_MEDIA_EXAMPLE_PARTITION_NUMBER (0)
#define RM_FILEX_BLOCK_MEDIA_EXAMPLE_BLOCK_SIZE (512)
#define RM_FILEX_BLOCK_MEDIA_EXAMPLE_NUM_DIRECTORY_ENTRIES (128)
#define RM_FILEX_BLOCK_MEDIA_EXAMPLE_NUM_FATS (1)
#define RM_FILEX_BLOCK_MEDIA_EXAMPLE_HIDDEN_SECTORS (0)
#define RM_FILEX_BLOCK_MEDIA_EXAMPLE_TOTAL_SECTORS (1073741824)
#define RM_FILEX_BLOCK_MEDIA_EXAMPLE_SECTOR_SIZE (512)
#define RM_FILEX_BLOCK_MEDIA_EXAMPLE_SECTORS_PER_CLUSTER (1)
#define RM_FILEX_BLOCK_MEDIA_EXAMPLE_NUM_HEADS (1)
#define RM_FILEX_BLOCK_MEDIA_EXAMPLE_SECTORS_PER_TRACK (1)
extern rm_filex_block_media_instance_t g_filex_block_media0;
extern rm_filex_block_media_instance_ctrl_t g_filex_block_media0_ctrl;
extern rm_filex_block_media_cfg_t g_filex_block_media0_cfg;
extern FX_MEDIA g_fx_media0;
extern uint8_t g_fx_media0_memory[RM_FILEX_BLOCK_MEDIA_EXAMPLE_BLOCK_SIZE];
extern uint8_t g_file_data[RM_FILEX_BLOCK_MEDIA_EXAMPLE_BUFFER_SIZE_BYTES];
extern uint8_t g_read_buffer[RM_FILEX_BLOCK_MEDIA_EXAMPLE_BUFFER_SIZE_BYTES];
void rm_filex_block_media_example (void)
{
 /* Open media driver.*/
 fsp_err_t err = RM_FILEX_BLOCK_MEDIA_Open(&g_filex_block_media0_ctrl,
&g_filex_block_media0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Initialize FileX */
    fx_system_initialize();
```

```
 /* Open the media. If the media is removable, it must be inserted before calling
  * fx_media_open. This assumes the disk is already partitioned and formatted. */
    UINT fx_err = fx_media_open(&g_fx_media0,
 "filex_example_media",
 RM_FILEX_BLOCK_MEDIA_BlockDriver,
                              &g_filex_block_media0,
                              g_fx_media0_memory,
 sizeof(g_fx_media0_memory));
    handle_fx_error(fx_err);
 /* Create a file */
    fx_err = fx_file_create(&g_fx_media0, RM_FILEX_BLOCK_MEDIA_EXAMPLE_FILE_NAME);
    handle_fx_error(fx_err);
 /* Open source file for writing. */
    FX_FILE sourceFile;
    fx_err = fx_file_open(&g_fx_media0, &sourceFile,
RM_FILEX_BLOCK_MEDIA_EXAMPLE_FILE_NAME, FX_OPEN_FOR_WRITE);
    handle_fx_error(fx_err);
 /* Write file data. */
    fx_err = fx_file_write(&sourceFile, g_file_data, sizeof(g_file_data));
    handle_fx_error(fx_err);
 /* Close the file. */
    fx_err = fx_file_close(&sourceFile);
    handle_fx_error(fx_err);
 /* Open the source file in read mode. */
    fx_err = fx_file_open(&g_fx_media0, &sourceFile,
RM_FILEX_BLOCK_MEDIA_EXAMPLE_FILE_NAME, FX_OPEN_FOR_READ);
    handle_fx_error(fx_err);
 /* Read file data. */
    ULONG actual_size_read;
    fx_err = fx_file_read(&sourceFile, g_read_buffer, sizeof(g_file_data),
&actual_size_read);
    handle_fx_error(fx_err);
    assert(sizeof(g_file_data) == actual_size_read);
 /* Close the file. */
```

```
    fx_err = fx_file_close(&sourceFile);
    handle_fx_error(fx_err);
 /* Verify the file data read matches the file written. */
    assert(0U == memcmp(g_file_data, g_read_buffer, sizeof(g_file_data)));
 /* Close the Media */
    fx_err = fx_media_close(&g_fx_media0);
    handle_fx_error(fx_err);
}
```

Format Example

This shows how to partition and format a disk if it is not already partitioned and formatted.

```
void rm_filex_block_media_format_example (void)
{
 /* Open media driver.*/
 fsp_err_t err = RM_FILEX_BLOCK_MEDIA_Open(&g_filex_block_media0_ctrl,
&g_filex_block_media0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Format the media */
    UINT fx_err =
fx_media_format(&g_fx_media0,                                    // Pointer to
FileX media control block.
 RM_FILEX_BLOCK_MEDIA_BlockDriver,                  // Driver entry
                                &g_filex_block_media0, // Pointer to Block Media
Driver
                                g_fx_media0_memory, // Media buffer pointer
 sizeof(g_fx_media0_memory),                        // Media buffer size
 "EXAMPLE_VOLUME",                                 // Volume Name
                                 RM_FILEX_BLOCK_MEDIA_EXAMPLE_NUM_FATS,
// Number of FATs
                                 RM_FILEX_BLOCK_MEDIA_EXAMPLE_NUM_DIRECTORY_ENTRIES,
// Directory Entries
                                 RM_FILEX_BLOCK_MEDIA_EXAMPLE_HIDDEN_SECTORS,
```

```
// Hidden sectors

RM_FILEX_BLOCK_MEDIA_EXAMPLE_TOTAL_SECTORS,         // Total sectors
                                  RM_FILEX_BLOCK_MEDIA_EXAMPLE_SECTOR_SIZE,
// Sector size

RM_FILEX_BLOCK_MEDIA_EXAMPLE_SECTORS_PER_CLUSTER,   // Sectors per cluster
                                  RM_FILEX_BLOCK_MEDIA_EXAMPLE_NUM_HEADS,
// Heads
                                  RM_FILEX_BLOCK_MEDIA_EXAMPLE_SECTORS_PER_TRACK);
// Sectors per track
    handle_fx_error(fx_err);
}
```

Callback Pend Example

This shows how to use the I/O driver callback with ThreadX in order to wait/pend for operations to complete.

```
TX_SEMAPHORE g_operation_wait_semaphore;
/* Callback called by FileX block media I/O driver needs to pend on operation. */
void rm_filex_block_media_test_callback_pend (rm_filex_block_media_callback_args_t *
p_args)
{
 if (p_args->event & RM_BLOCK_MEDIA_EVENT_WAIT)
    {
 /* Interrupt has not happened for operation, get semaphore to wait for it. This will
be called from the FileX I/O driver thread. */
       tx_semaphore_get(&g_operation_wait_semaphore, TX_WAIT_FOREVER);
    }
 if (p_args->event & RM_BLOCK_MEDIA_EVENT_WAIT_END)
    {
 /* Interrupt has occurred for operation, post semaphore so that wait will end. This
will be called from an interrupt context. */
       tx_semaphore_put(&g_operation_wait_semaphore);
```

```
    }
 if (p_args->event & RM_BLOCK_MEDIA_EVENT_POLL_STATUS)
    {
 /* Interrupt has been received from block media device but operation is still
ongoing. The FileX I/O driver will wait on the driver busy status.
  * This event can be used to put the thread to sleep while waiting. This will be
called from the FileX I/O driver thread. */
       tx_thread_sleep(1);
    }
}
void rm_filex_block_media_callback_pend_example (void)
{
 /* Create semaphore for driver use */
    tx_semaphore_create(&g_operation_wait_semaphore, "operation_wait_semaphore", 0);
 /* Open media driver.*/
 fsp_err_t err = RM_FILEX_BLOCK_MEDIA_Open(&g_filex_block_media0_ctrl,
&g_filex_block_media0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Format the media */
    UINT fx_err =
fx_media_format(&g_fx_media0,                                    // Pointer to
FileX media control block.
 RM_FILEX_BLOCK_MEDIA_BlockDriver,                  // Driver entry
                                &g_filex_block_media0, // Pointer to Block Media
Driver
                                g_fx_media0_memory, // Media buffer pointer
 sizeof(g_fx_media0_memory),                        // Media buffer size
 "EXAMPLE_VOLUME",                                 // Volume Name
                                 RM_FILEX_BLOCK_MEDIA_EXAMPLE_NUM_FATS,
// Number of FATs
                                 RM_FILEX_BLOCK_MEDIA_EXAMPLE_NUM_DIRECTORY_ENTRIES,
// Directory Entries
                                 RM_FILEX_BLOCK_MEDIA_EXAMPLE_HIDDEN_SECTORS,
```

```
// Hidden sectors

RM_FILEX_BLOCK_MEDIA_EXAMPLE_TOTAL_SECTORS,         // Total sectors
                                  RM_FILEX_BLOCK_MEDIA_EXAMPLE_SECTOR_SIZE,
// Sector size

RM_FILEX_BLOCK_MEDIA_EXAMPLE_SECTORS_PER_CLUSTER,   // Sectors per cluster
                                  RM_FILEX_BLOCK_MEDIA_EXAMPLE_NUM_HEADS,
// Heads
                                  RM_FILEX_BLOCK_MEDIA_EXAMPLE_SECTORS_PER_TRACK);
// Sectors per track
    handle_fx_error(fx_err);
}
```

Media Insertion Example

This shows how to use the callback to wait for media insertion.

```
volatile uint32_t g_rm_filex_block_media_insertion_events = 0;
volatile uint32_t g_rm_filex_block_media_removal_events = 0;
/* Callback called by media driver when a removable device is inserted or removed. */
void rm_filex_block_media_test_callback (rm_filex_block_media_callback_args_t *
p_args)
{
 if (p_args->event & RM_BLOCK_MEDIA_EVENT_MEDIA_INSERTED)
    {
       g_rm_filex_block_media_insertion_events++;
    }
 if (p_args->event & RM_BLOCK_MEDIA_EVENT_MEDIA_REMOVED)
    {
       g_rm_filex_block_media_removal_events++;
    }
}
void rm_filex_block_media_media_insertion_example (void)
{
```

```
 /* Open media driver.*/
 fsp_err_t err = RM_FILEX_BLOCK_MEDIA_Open(&g_filex_block_media0_ctrl,
&g_filex_block_media0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Wait for media insertion. */
 while (0U == g_rm_filex_block_media_insertion_events)
    {
 /* Wait for media insertion. */
    }
 /* Open the media. If the media is removable, it must be inserted before calling
  * fx_media_open. This assumes the disk is already partitioned and formatted. */
    UINT fx_err = fx_media_open(&g_fx_media0,
 "filex_example_media",
 RM_FILEX_BLOCK_MEDIA_BlockDriver,
                             &g_filex_block_media0,
                             g_fx_media0_memory,
 sizeof(g_fx_media0_memory));
    handle_fx_error(fx_err);
}
```

Using FileX with Custom Block Media Implementations

When using a Custom Block Media implementation with rm_filex_block_media the custom implementation must call rm_filex_block_media_memory_callback upon the completion of a read/write operation. This callback should be called with an event of RM_BLOCK_MEDIA_EVENT_OPERATION_COMPLETE and p_context of rm_filex_block_media_instance_ctrl_t *. The following example shows how this should be done in the context of a demo RAM block media read function.

```
#define EXAMPLE_BLOCK_MEDIA_RAM_START_ADDR (0x20004AFE)
#define EXAMPLE_BLOCK_MEDIA_RAM_BLOCK_SIZE_BYTES (512)
/* Example implementation of rm_block_media_api_t::read(), user should define custom
block media RAM implementation. */
fsp_err_t RM_BLOCK_MEDIA_CUSTOM_RAM_Read (rm_block_media_ctrl_t * const p_ctrl,
                                          uint8_t * const
               p_dest_address,
```

```
                                       uint32_t const
block_address,
                                       uint32_t const                num_blocks)
{
 FSP_PARAMETER_NOT_USED(p_ctrl);
    memcpy(p_dest_address,
          (void *) (EXAMPLE_BLOCK_MEDIA_RAM_START_ADDR + (block_address *
EXAMPLE_BLOCK_MEDIA_RAM_BLOCK_SIZE_BYTES)),
          (EXAMPLE_BLOCK_MEDIA_RAM_BLOCK_SIZE_BYTES * num_blocks));
 /* Notify FileX port of operation complete through calling the callback, this is
required for custom block media/FileX port integration */
 rm_block_media_callback_args_t args;
    args.event    = RM_BLOCK_MEDIA_EVENT_OPERATION_COMPLETE;
    args.p_context = (void *) &g_filex_block_media0_ctrl;
    rm_filex_block_media_memory_callback(&args);
 return FSP_SUCCESS;
}
```

Data Structures

struct	rm_filex_block_media_instance_ctrl_t

Data Structure Documentation

◆ rm_filex_block_media_instance_ctrl_t

struct rm_filex_block_media_instance_ctrl_t
Common macro for FSP header files. There is also a corresponding FSP_FOOTER macro at the end of this file. FileX block media private control block. DO NOT MODIFY. Initialization occurs when RM_FILEX_BLOCK_MEDIA_Open is called.

Function Documentation

◆ RM_FILEX_BLOCK_MEDIA_Open()

fsp_err_t RM_FILEX_BLOCK_MEDIA_Open (rm_filex_block_media_ctrl_t *const *p_ctrl*, rm_filex_block_media_cfg_t const *const *p_cfg*)

The file system relies on the media to be formatted prior to creating directories and files The sector size and sector count will change depending on the media type and size.

The File Allocation Table (FAT) starts after the reserved sectors in the media. The FAT area is basically an array of 12-bit, 16-bit, or 32-bit entries that determine if that cluster is allocated or part of a chain of clusters comprising a subdirectory or a file. The size of each FAT entry is determined by the number of clusters that need to be represented. If the number of clusters (derived from the total sectors divided by the sectors per cluster) is less than 4,086, 12-bit FAT entries are used. If the total number of clusters is greater than 4,086 and less than or equal to 65,525, 16-bit FAT entries are used. Otherwise, if the total number of clusters is greater than 65,525, 32-bit FAT entries are used. Initializes callback and configuration for FileX Block Media interface. Call this before calling any FileX functions.

Implements rm_filex_block_media_api_t::open().

Return values

FSP_SUCCESS	Success.
FSP_ERR_ASSERTION	An input parameter was invalid.
FSP_ERR_ALREADY_OPEN	Module is already open.

Returns

See Common Error Codes or functions called by this function for other possible return codes.

◆ RM_FILEX_BLOCK_MEDIA_Close()

fsp_err_t RM_FILEX_BLOCK_MEDIA_Close (rm_filex_block_media_ctrl_t *const *p_ctrl*)

Closes media device.

Implements rm_filex_block_media_api_t::close().

Return values

FSP_SUCCESS	Media device closed.
FSP_ERR_ASSERTION	An input parameter was invalid.
FSP_ERR_NOT_OPEN	Module not open.

Returns

See Common Error Codes or functions called by this function for other possible return codes.

◆ RM_FILEX_BLOCK_MEDIA_BlockDriver()

void RM_FILEX_BLOCK_MEDIA_BlockDriver (FX_MEDIA * *p_fx_media*)

Access Block Media device functions open, close, read, write and control.

The RM_FILEX_BLOCK_MEDIA_BlockDriver function is called from the FileX file system driver and issues requests to a Block Media device through the FSP Block Media Interface. Uses block media driver for accesses.

Parameters

[in,out]	p_fx_media	FileX media control block. All information about each open media device are maintained in the FX_MEDIA data type. The I/O driver communicates the success or failure of the request through the fx_media_driver_status member of FX_MEDIA (p_fx_media->fx_media_driver_status). Possible values are documented in the FileX User Guide.

Return values

None	

Returns

Nothing, but updates FileX media control block.

7.2.17.7 FileX I/O (rm_filex_levelx_nor)

Modules » Storage

Functions

void	RM_FILEX_LEVELX_NOR_DeviceDriver (FX_MEDIA *p_fx_media) Access LevelX NOR device functions open, close, read, write and control. More...

Detailed Description

Middleware for the Azure RTOS FileX File System control using LevelX NOR on RA MCUs.

Overview

This module provides the hardware port layer for FileX file system. After initializing this module, refer to the FileX API reference to use the file system: https://docs.microsoft.com/en-us/azure/rtos/filex/

Features

The FileX LevelX NOR module supports the following features:

- ThreadX is typically required for FileX. To use FileX without ThreadX FX_STANDALONE_ENABLE must be defined.
- Unless FX_SINGLE_THREAD or FX_STANDALONE_ENABLE are defined, all FileX operations are thread safe.

Configuration

Build Time Configurations for rm_filex_levelx_nor

The following build time configurations are defined in fsp_cfg/middleware/rm_filex_levelx_nor_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	Selects if code for parameter checking is to be included in the build.

Configurations for Storage > FileX I/O (rm_filex_levelx_nor)

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_rm_filex_levelx_nor0	Module name.
Callback	Name must be a valid C symbol	g_rm_filex_levelx_nor_0_callback	A user callback function can be provided. If this callback function is provided, it will be called during operations by the lower level block media as a way for the user to provide their desired waiting functionality.
LevelX NOR Name (String)	Manual Entry	g_rm_filex_levelx_nor_0	String name to be input into LevelX API.

Build Time Configurations for fx

The following build time configurations are defined in fsp_cfg/azure/fx/fx_user.h:

Configuration	Options	Default	Description
Common			
Max Long Name Len	Value must be an		Specifies the maximum

	integer greater than or equal to 13 and less than or equal to 256, or empty	file name size for FileX. If left blank the default value is 256. Legal values range between 13 and 256.
Max Last Name Len	Value must be an integer greater than or equal to 13 and less than or equal to 256, or empty	This value defines the maximum file name length, which includes full path name. If left blank the default value is 256. Legal values range between 13 and 256.
Max Sector Cache	Value must be an integer greater than 0 and power of 2 or empty	Specifies the maximum number of logical sectors that can be cached by FileX. The actual number of sectors that can be cached is lesser of this constant and how many sectors can fit in the amount of memory supplied at fx_media_open. The default value if left blank is 256. All values must be a power of 2.
Fat Map Size	Value must be an integer greater than 0 or empty	Specifies the number of sectors that can be represented in the FAT update map. The default value if left blank is 256. Larger values help reduce unneeded updates of secondary FAT sectors.
Max Fat Cache	Value must be an integer greater than 0 and power of 2 or empty	Specifies the number of entries in the internal FAT cache. The default value if left blank is 16. All values must be a power of 2.
Threading		
Update Rate (Seconds)	Value must be an integer greater than 0 or empty	Specifies rate at which system time in FileX is adjusted. Default value if left blank is 10, specifying that the FileX system time is updated every 10

			seconds.
No Timer	• Enabled • Disabled (default)	Disabled (default)	Eliminates the ThreadX timer setup to update the FileX system time and date. Doing so causes default time and date to be placed on all file operations.
Single Thread	• Enabled • Disabled (default)	Disabled (default)	Eliminates ThreadX protection logic from the FileX source. It should be used if FileX is being used only from one thread.
Standalone	• Enabled • Disabled (default)	Disabled (default)	Enables FileX to be used in standalone mode (without Azure RTOS).
Extra Features			
Don't Update Open Files	• Enabled • Disabled (default)	Disabled (default)	When enabled, FileX does not update already opened files.
Media Search Cache	• Enabled (default) • Disabled	Enabled (default)	When disabled, the file search cache optimization is disabled.
Direct Data Read Cache Fill	• Enabled (default) • Disabled	Enabled (default)	When disabled, the direct read sector update of cache is disabled.
Media Statistics	• Enabled (default) • Disabled	Enabled (default)	When disabled, gathering of media statistics is disabled.
Single Open Legacy	• Enabled • Disabled (default)	Disabled (default)	When enabled, legacy single open logic for the same file is enabled.
Rename Path Inherit	• Enabled • Disabled (default)	Disabled (default)	When enabled, renaming inherits path information.
No Local Path	• Enabled • Disabled (default)	Disabled (default)	When enabled, removes local path logic from FileX, resulting in smaller code size.
64-bit LBA	• Enabled • Disabled	Disabled (default)	When enabled, 64-bits sector addresses are

	(default)		used in I/O driver.
Cache	• Enabled (default) • Disabled	Enabled (default)	Enables or disables the cache, default is enabled.
File Close	• Enabled (default) • Disabled	Enabled (default)	Enables or disables file close, default is enabled.
Fast Close	• Enabled (default) • Disabled	Enabled (default)	Enables or disables fast open, default is enabled.
Force Memory Operation	• Enabled (default) • Disabled	Enabled (default)	Enables or disables force memory operation, default is enabled.
Build Options	• Enabled (default) • Disabled	Enabled (default)	Enables or disables build options, default is enabled.
One Line Function	• Enabled (default) • Disabled	Enabled (default)	Enables or disables one line function, default is enabled.
FAT Entry Refresh	• Enabled (default) • Disabled	Enabled (default)	Enables or disables FAT entry refresh, default is enabled.
Consecutive Detect	• Enabled (default) • Disabled	Enabled (default)	Enables or disables consecutive detect, default is enabled.
Enable exFAT	• Enabled • Disabled (default)	Disabled (default)	Enables exFAT support in FileX.
Fault Tolerant			
Fault Tolerant Service	• Enabled • Disabled (default)	Disabled (default)	When enabled, enables the FileX Fault Tolerant Module. Enabling Fault Tolerant automatically defines the symbol FX_FAULT_TOLERANT and FX_FAULT_TOLERANT_DATA.
Fault Tolerant Data	• Enabled • Disabled (default)	Disabled (default)	When enabled, FileX immediately passes all file data write requests to the media's driver. This potentially decreases performance, but helps limit lost file data. Note that enabling this

			feature does not automatically enable FileX Fault Tolerant Module, which should be enabled separately.
Fault Tolerant	• Enabled • Disabled (default)	Disabled (default)	When enabled, FileX immediately passes write requests of all system sectors (boot, FAT, and directory sectors) to the media's driver. This potentially decreases performance, but helps limit corruption to lost clusters. Note that enabling this feature does not automatically enable FileX Fault Tolerant Module, which should be enabled separately.
Fault Tolerant Boot Index	Value must be an integer greater than or equal to 116 and less than or equal to 119		Defines byte offset in the boot sector where the cluster for the fault tolerant log is. By default if left blank this value is 116. This field takes 4 bytes. Bytes 116 through 119 are chosen because they are marked as reserved by FAT 12/16/32/exFAT specification.
Error Checking	• Enabled (default) • Disabled	Enabled (default)	

Configurations for Storage > Azure RTOS FileX on LevelX NOR

This module can be added to the Stacks tab via New Stack > Storage > Azure RTOS FileX on LevelX NOR.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_fx_media0	Symbol used for media_ptr parameter in FileX APIs
Volume Name	Name must be a maximum of 11 characters	Volume 1	Volume name string, which is a maximum of 11 characters.

Number of FATs	Number of FATs must be an integer greater than 0	1	Number of FATs in the media. The minimal value is 1 for the primary FAT. Values greater than 1 result in additional FAT copies being maintained at run-time.
Directory Entries	Number of Directory Entries must be an integer greater than 0	256	Number of directory entries in the root directory.
Hidden Sectors	Number of Hidden Sectors must be an integer	0	Number of sectors hidden before this media's boot sector. If using media formatted with multiple partitions this number should correspond to the starting block number for the desired partition.
Total Sectors	Total Sectors must be an integer greater than 0	57337	Total number of sectors in the media. When using a Renesas provided block media implementation, total sectors can be fetched by the infoGet from the block media API. Any removable media must be inserted and initialized first to retrieve this info.
Sectors per Cluster	Sectors per Cluster must be an integer greater than 0	1	Number of sectors in each cluster. The cluster is the minimum allocation unit in a FAT file system.
Volume Serial Number (exFAT only)	Volume Serial Number must be an integer greater than 0	12345	Serial number to be used for this volume. exFAT only.
Boundary Unit (exFAT only)	Boundary unit must be an integer greater than 0	128	Physical data area alignment size, in number of sectors. exFAT only.
Working media memory size	Memory size must be an integer greater than or equal to the size of one sector	512	Memory allocated for file system. Memory size must be an integer greater than or equal to the size of one sector.

Usage Notes

Pending during Write/Erase

If the underlying LevelX NOR driver performs a blocking operation that requires waiting to complete (such as a long write/erase on NOR SPI), a callback can be provided to provide a way to wait with an OS-specific thread wait. This callback will also pass up block erase events.

Partitioned Media

Partitioned media is not supported directly by the FileX LevelX NOR port.

Examples

Basic Example

This is a basic example of FileX Block Media in an application.

```
#define RM_FILEX_LEVELX_NOR_EXAMPLE_FILE_NAME "TEST_FILE.txt"
#define RM_FILEX_LEVELX_NOR_EXAMPLE_BUFFER_SIZE_BYTES (10240)
#define RM_FILEX_LEVELX_NOR_EXAMPLE_PARTITION_NUMBER (0)
#define RM_FILEX_LEVELX_NOR_EXAMPLE_BLOCK_SIZE (512)
#define RM_FILEX_LEVELX_NOR_EXAMPLE_NUM_DIRECTORY_ENTRIES (128)
#define RM_FILEX_LEVELX_NOR_EXAMPLE_NUM_FATS (1)
#define RM_FILEX_LEVELX_NOR_EXAMPLE_HIDDEN_SECTORS (0)
#define RM_FILEX_LEVELX_NOR_EXAMPLE_TOTAL_SECTORS (512)
#define RM_FILEX_LEVELX_NOR_EXAMPLE_SECTOR_SIZE (512)
#define RM_FILEX_LEVELX_NOR_EXAMPLE_SECTORS_PER_CLUSTER (1)
#define RM_FILEX_LEVELX_NOR_EXAMPLE_NUM_HEADS (1)
#define RM_FILEX_LEVELX_NOR_EXAMPLE_SECTORS_PER_TRACK (1)
extern rm_filex_levelx_nor_instance_t g_filex_levelx_nor0;
extern rm_filex_levelx_nor_instance_ctrl_t g_filex_levelx_nor0_ctrl;
extern rm_filex_levelx_nor_cfg_t g_filex_levelx_nor0_cfg;
extern FX_MEDIA g_fx_media0;
extern uint8_t g_fx_media0_memory[RM_FILEX_LEVELX_NOR_EXAMPLE_BLOCK_SIZE];
extern uint8_t g_file_data[RM_FILEX_LEVELX_NOR_EXAMPLE_BUFFER_SIZE_BYTES];
extern uint8_t g_read_buffer[RM_FILEX_LEVELX_NOR_EXAMPLE_BUFFER_SIZE_BYTES];
void rm_filex_levelx_nor_example (void)
{
 /* Initialize FileX */
```

```
    fx_system_initialize();
 /* Initialize LevelX */
    lx_nor_flash_initialize();
 /* Open the media. This assumes the flash is already formatted. */
    UINT fx_err = fx_media_open(&g_fx_media0,
 "filex_example_media",
 RM_FILEX_LEVELX_NOR_DeviceDriver,
                             &g_filex_levelx_nor0,
                             g_fx_media0_memory,
 sizeof(g_fx_media0_memory));

    handle_fx_error(fx_err);
 /* Open source file for writing. */
    FX_FILE sourceFile;
    fx_err = fx_file_open(&g_fx_media0, &sourceFile,
RM_FILEX_LEVELX_NOR_EXAMPLE_FILE_NAME, FX_OPEN_FOR_WRITE);
    handle_fx_error(fx_err);
 /* Write file data. */
    fx_err = fx_file_write(&sourceFile, g_file_data, sizeof(g_file_data));
    handle_fx_error(fx_err);
 /* Close the file. */
    fx_err = fx_file_close(&sourceFile);
    handle_fx_error(fx_err);
 /* Open the source file in read mode. */
    fx_err = fx_file_open(&g_fx_media0, &sourceFile,
RM_FILEX_LEVELX_NOR_EXAMPLE_FILE_NAME, FX_OPEN_FOR_READ);
    handle_fx_error(fx_err);
 /* Read file data. */
    ULONG actual_size_read;
    fx_err = fx_file_read(&sourceFile, g_read_buffer, sizeof(g_file_data),
&actual_size_read);
    handle_fx_error(fx_err);
```

```
    assert(sizeof(g_file_data) == actual_size_read);
 /* Close the file. */
    fx_err = fx_file_close(&sourceFile);
    handle_fx_error(fx_err);
 /* Verify the file data read matches the file written. */
    assert(0U == memcmp(g_file_data, g_read_buffer, sizeof(g_file_data)));
 /* Close the Media */
    fx_err = fx_media_close(&g_fx_media0);
    handle_fx_error(fx_err);
}
```

Format Example

This shows how to partition and format a disk if it is not already partitioned and formatted.

```
extern rm_levelx_nor_spi_cfg_t g_levelx_nor_spi0_cfg;
#define RM_FILEX_LEVELX_NOR_EXAMPLE_SPI_SECTOR_SIZE (4096)
void rm_filex_levelx_nor_format_example (void)
{
 spi_flash_instance_t * p_spi_flash_instance = (spi_flash_instance_t *)
g_levelx_nor_spi0_cfg.p_lower_lvl;
 spi_flash_status_t    status;
 /* Erase flash prior to usage */
 fsp_err_t err = p_spi_flash_instance->p_api->open(p_spi_flash_instance->p_ctrl,
p_spi_flash_instance->p_cfg);
    assert(FSP_SUCCESS == err);
 for (uint32_t i = g_levelx_nor_spi0_cfg.address_offset;
         i < g_levelx_nor_spi0_cfg.size;
         i += RM_FILEX_LEVELX_NOR_EXAMPLE_SPI_SECTOR_SIZE)
    {
       err = p_spi_flash_instance->p_api->erase(p_spi_flash_instance->p_ctrl,
                                                (uint8_t *)
g_levelx_nor_spi0_cfg.base_address + i,

RM_FILEX_LEVELX_NOR_EXAMPLE_SPI_SECTOR_SIZE);
```

```
     assert(FSP_SUCCESS == err);
      status.write_in_progress = true;
 while (status.write_in_progress)
     {
           err =
p_spi_flash_instance->p_api->statusGet(p_spi_flash_instance->p_ctrl, &status);
     assert(FSP_SUCCESS == err);
      }
   }
   err = p_spi_flash_instance->p_api->close(p_spi_flash_instance->p_ctrl);
   assert(FSP_SUCCESS == err);
 /* Format the media */
   UINT fx_err = fx_media_format(&g_fx_media0,
// Pointer to FileX media control block.
 RM_FILEX_LEVELX_NOR_DeviceDriver,                  // Driver entry
                                &g_filex_levelx_nor0, // Pointer to Block Media
Driver
                                g_fx_media0_memory, // Media buffer pointer
 sizeof(g_fx_media0_memory),                        // Media buffer size
 "EXAMPLE_VOLUME",                                  // Volume Name
                                 RM_FILEX_LEVELX_NOR_EXAMPLE_NUM_FATS,
// Number of FATs
                                 RM_FILEX_LEVELX_NOR_EXAMPLE_NUM_DIRECTORY_ENTRIES,
// Directory Entries
                                 RM_FILEX_LEVELX_NOR_EXAMPLE_HIDDEN_SECTORS,
// Hidden sectors

RM_FILEX_LEVELX_NOR_EXAMPLE_TOTAL_SECTORS,         // Total sectors
                                 RM_FILEX_LEVELX_NOR_EXAMPLE_SECTOR_SIZE,
// Sector size

RM_FILEX_LEVELX_NOR_EXAMPLE_SECTORS_PER_CLUSTER,   // Sectors per cluster
                                 RM_FILEX_LEVELX_NOR_EXAMPLE_NUM_HEADS,
// Heads
```

```
                                    RM_FILEX_LEVELX_NOR_EXAMPLE_SECTORS_PER_TRACK);
// Sectors per track
    handle_fx_error(fx_err);
}
```

Callback Wait Example

This shows how to use the I/O driver callback with ThreadX in order to wait for operations to complete.

```
/* Callback called by FileX block media I/O driver needs to wait on operation. */
void rm_filex_levelx_nor_test_callback_wait (rm_filex_levelx_nor_callback_args_t *
p_args)
{
 if (p_args->event & RM_FILEX_LEVELX_NOR_EVENT_BUSY)
    {
 /* Put the thread to sleep while waiting for operation to complete. */
       tx_thread_sleep(1);
    }
}
void rm_filex_levelx_nor_callback_wait_example (void)
{
 /* Format the media */
    UINT fx_err = fx_media_format(&g_fx_media0,
// Pointer to FileX media control block.
 RM_FILEX_LEVELX_NOR_DeviceDriver,                  // Driver entry
                                &g_filex_levelx_nor0, // Pointer to Block Media
Driver
                                g_fx_media0_memory, // Media buffer pointer
 sizeof(g_fx_media0_memory),                        // Media buffer size
 "EXAMPLE_VOLUME",                                  // Volume Name
                                 RM_FILEX_LEVELX_NOR_EXAMPLE_NUM_FATS,
// Number of FATs
                                 RM_FILEX_LEVELX_NOR_EXAMPLE_NUM_DIRECTORY_ENTRIES,
// Directory Entries
```

```
                                    RM_FILEX_LEVELX_NOR_EXAMPLE_HIDDEN_SECTORS,
// Hidden sectors

RM_FILEX_LEVELX_NOR_EXAMPLE_TOTAL_SECTORS,          // Total sectors
                                    RM_FILEX_LEVELX_NOR_EXAMPLE_SECTOR_SIZE,
// Sector size

RM_FILEX_LEVELX_NOR_EXAMPLE_SECTORS_PER_CLUSTER,    // Sectors per cluster
                                    RM_FILEX_LEVELX_NOR_EXAMPLE_NUM_HEADS,
// Heads
                                    RM_FILEX_LEVELX_NOR_EXAMPLE_SECTORS_PER_TRACK);
// Sectors per track
    handle_fx_error(fx_err);
}
```

Data Structures

struct	rm_filex_levelx_nor_callback_args_t
struct	rm_filex_levelx_nor_cfg_t
struct	rm_filex_levelx_nor_instance_ctrl_t
struct	rm_filex_levelx_nor_instance_t

Macros

#define	VOID

Enumerations

enum	rm_filex_levelx_nor_event_t

Data Structure Documentation

◆ rm_filex_levelx_nor_callback_args_t

struct rm_filex_levelx_nor_callback_args_t		
Callback function parameter data		
Data Fields		
rm_filex_levelx_nor_event_t	event	The event can be used to identify what caused the callback.

void const *	p_context	Placeholder for user data.

◆ rm_filex_levelx_nor_cfg_t

struct rm_filex_levelx_nor_cfg_t	
FileX LevelX configuration	
Data Fields	
UINT(*	nor_driver_initialize)(LX_NOR_FLASH *)
	Pointer to the initialization function.
LX_NOR_FLASH *	p_nor_flash
	NOR Flash instance.
CHAR *	p_nor_flash_name
	NOR Flash instance name.
fsp_err_t(*	close)()
	Pointer to underlying driver close.
void(*	p_callback)(rm_filex_levelx_nor_callback_args_t *p_args)
	Pointer to callback function.
void const *	p_context
	Placeholder for user data.

◆ rm_filex_levelx_nor_instance_ctrl_t

struct rm_filex_levelx_nor_instance_ctrl_t		
FileX block media private control block. DO NOT MODIFY. Initialization occurs when RM_FILEX_LEVELX_NOR_Open is called.		
Data Fields		
rm_filex_levelx_nor_cfg_t const *	p_cfg	Pointer to instance configuration.

◆ rm_filex_levelx_nor_instance_t

struct rm_filex_levelx_nor_instance_t		
This structure encompasses everything that is needed to use an instance of this interface.		
Data Fields		
rm_filex_levelx_nor_instance_ctrl_t *	p_ctrl	Pointer to the control structure for this instance.
rm_filex_levelx_nor_cfg_t const *	p_cfg	Pointer to the configuration structure for this instance.

Macro Definition Documentation

◆ VOID

#define VOID
Common macro for FSP header files. There is also a corresponding FSP_FOOTER macro at the end of this file.

Enumeration Type Documentation

◆ rm_filex_levelx_nor_event_t

enum rm_filex_levelx_nor_event_t	
Options for the callback events.	
Enumerator	
RM_FILEX_LEVELX_NOR_EVENT_BUSY	Pending operation, user can define their own wait functionality.

Function Documentation

◆ RM_FILEX_LEVELX_NOR_DeviceDriver()

void RM_FILEX_LEVELX_NOR_DeviceDriver (FX_MEDIA * *p_fx_media*)

Access LevelX NOR device functions open, close, read, write and control.

The RM_FILEX_LEVELX_NOR_DeviceDriver function is called from the FileX file system driver and issues requests to a LevelX NOR device through the LevelX API.

Parameters

[in,out]	p_fx_media	FileX media control block. All information about each open media device are maintained in the FX_MEDIA data type. The I/O driver communicates the success or failure of the request through the fx_media_driver_status member of FX_MEDIA (p_fx_media->fx_media_driver_status). Possible values are documented in the FileX User Guide.

Return values

None	

Returns

Nothing, but updates FileX media control block.

7.2.17.8 Flash (r_flash_hp)

Detailed Description

Driver for the flash memory on RA high-performance MCUs. This module implements the Flash Interface.

Overview

The Flash HAL module APIs allow an application to write, erase and blank check both the data and

ROM flash areas that reside within the MCU. The amount of flash memory available varies across MCU parts.

Features

The R_FLASH_HP module has the following key features:

- Blocking and non-blocking erasing, writing and blank-checking of data flash.
- Blocking erasing, writing and blank-checking of code flash.
- Callback functions for completion of non-blocking data flash operations.
- Access window (write protection) for ROM Flash, allowing only specified areas of code flash to be erased or written.
- Boot block-swapping.
- ID code programming support.
- Anti-rollback counter support (select MCUs).
- Blocking writing of user lockable data flash option setting memory area (select MCUs).

Configuration

Build Time Configurations for r_flash_hp

The following build time configurations are defined in fsp_cfg/r_flash_hp_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
Code Flash Programming Enable	• Enabled • Disabled	Disabled	Controls whether or not code-flash programming is enabled. Disabling reduces the amount of ROM and RAM used by the API.
Data Flash Programming Enable	• Enabled • Disabled	Enabled	Controls whether or not data-flash programming is enabled. Disabling reduces the amount of ROM used by the API.

Configurations for Storage > Flash (r_flash_hp)

This module can be added to the Stacks tab via New Stack > Storage > Flash (r_flash_hp). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_flash0	Module name.
Data Flash Background	• Enabled	Enabled	Enabling allows Flash

Operation	• Disabled		API calls that reference data-flash to return immediately, with the operation continuing in the background.
Callback	Name must be a valid C symbol	NULL	A user callback function can be specified. Callback function called when a Data Flash Background Operation completes or errors.
Flash Ready Interrupt Priority	MCU Specific Options		Select the flash ready interrupt priority.
Flash Error Interrupt Priority	MCU Specific Options		Select the flash error interrupt priority.

Clock Configuration

Flash uses FCLK as the clock source depending on the MCU. When writing and erasing the clock source must be at least 4 MHz.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Warning

It is highly recommended that the developer reviews sections 5 and 6 of the Flash Memory section of the target MCUs Hardware User's Manual prior to using the r_flash_hp module. In particular, understanding ID Code and Access Window functionality can help avoid unrecoverable flash scenarios.

Data Flash Background Operation (BGO) Precautions

When using the data flash BGO (Background Operation) mode, you can still access the user ROM, RAM and external memory. You must ensure that the data flash is not accessed during a data flash operation. This includes interrupts that may access the data flash.

Data flash BGO is not supported during anti-rollback counter operations or writes to the user lockable area.

Code Flash Precautions

Code flash cannot be accessed while writing, erasing or blank checking code flash. Code flash cannot be accessed while modifying the access window, selecting the startup area or setting the ID code. In order to support modifying code flash all supporting code must reside in RAM. This is only done when code flash programming is enabled. BGO mode is not supported for code flash, so a code flash operation will not return before the operation has completed. By default, the vector table resides in the code flash. If an interrupt occurs during the code flash operation, then code flash will be accessed to fetch the interrupt's starting address and an error will occur. The simplest work-around is to disable interrupts during code flash operations. Another option is to copy the vector table to

RAM, update the VTOR (Vector Table Offset Register) accordingly and ensure that any interrupt service routines execute out of RAM. Similarly, you must insure that if in a multi-threaded environment, threads running from code flash cannot become active while a code flash operation is in progress.

Flash Clock (FCLK)

The flash clock source is the clock used by the Flash peripheral in performing all Flash operations. As part of the flash_api_t::open function the Flash clock source is checked will return FSP_ERR_FCLK if it is invalid. Once the Flash API has been opened, if the flash clock source frequency is changed, the flash_api_t::updateFlashClockFreq API function must be called to inform the API of the change. Failure to do so could result in flash operation failures and possibly damage the part.

Anti Rollback Counter

Anti-rollback counters are available on select MCUs and can be used to prevent or limit firmware downgrade. The counters can only be incremented and never decremented or reset, even with an external programming tool.

Note

The OEM bootloader anti-rollback counter is protected by the security engine and cannot be incremented past the version number specified in the code certificate. This counter works with the First Stage Bootloader (FSBL) set to enabled. For more information, read the 'Secure Boot' section in the 'Security Features' chapter of the user manual of the target MCU and refer to Application Note R11AN0774.

Anti-Rollback Counter Configuration Setting

When anti-rollback counters are used for one or more non-secure applications, the Anti-Rollback Counter Configuration Setting for ARC_NSEC (ARCCS) must be configured as either a single line (1xn bits) or multi-line counter (mxn bits). Single line is suitable when there is only one non-secure application using the anti-rollback counter. Multi-line is suitable when there are multiple non-secure applications. Before the counter is configured, it can't be used.

This configuration setting is permanent and must be performed with an external programming tool such as Renesas Flash Programmer (RFP). It cannot be configured in e2 studio.

The secure application and OEM bootloader anti-rollback counters do not require any initial configuration.

Anti-Rollback Counter Lock Setting

Select MCUs have the ability to permanently lock the anti-rollback counters using the Anti-Rollback Counter Lock Setting (ARCLS). It cannot be set with e2 studio, but if needed, it can be configured with an external programming tool such as Renesas Flash Programmer (RFP). **Once the lock protection is applied to a counter, the counter value can never be incremented again.** It is still possible to read the value of a locked counter.

Anti-Rollback Counter Recovery from Power Loss or other Counter Increment Error

If an error is returned by R_FLASH_HP_AntiRollbackCounterIncrement or power loss occurs during increment command processing, a successful call to R_FLASH_HP_AntiRollbackCounterRefresh is required before reading or incrementing the counter again. Otherwise, the counter flash may be in an invalid state.

User Lockable Area

The user lockable area of the data flash configuration area neither requires nor supports erase before rewriting.

Locked sections of the user lockable area cannot be rewritten.

If lockable area is available on the MCU, start address, end address, and write size can be read at runtime in the second element of the data flash block information array (p_info->data_flash.p_block_array[1]) returned by R_FLASH_HP_InfoGet.

Interrupts

Enable the flash ready interrupt only if you plan to use the data flash BGO. In this mode, the application can initiate a data flash operation and then be asynchronously notified of its completion, or an error, using a user supplied-callback function. The callback function is passed a structure containing event information that indicates the source of the callback event (for example, flash_api_t::FLASH_EVENT_ERASE_COMPLETE) When the FLASH FRDYI interrupt is enabled, the corresponding ISR will be defined in the flash driver. The ISR will call a user-callback function if one was registered with the flash_api_t::open API.

Note

The Flash HP supports an additional flash-error interrupt and if the BGO mode is enabled for the FLASH HP then both the Flash Ready Interrupt and Flash Error Interrupts must be enabled (assigned a priority).

Viewing flash contents in e2 studio

By default, the contents of data flash and code flash are cached by e^2 studio. This means that during a debug session, modifications to these memory regions will not be observed by e^2 studio. When debugging applications using e^2 studio, disable the "Allow caching of flash contents" option in the debug configuration in order to view modified flash contents (Debug Configuration > Debugger > Debug Tool Settings > Allow caching of flash contents).

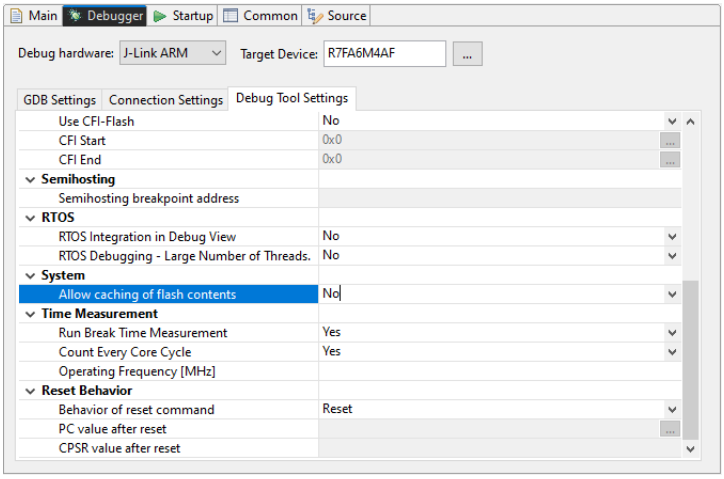

Figure 299: Debug Configuration

Limitations

- Write operations must be aligned on page boundaries and must be a multiple of the page boundary size.
- Erase operations will erase the entire block the provided address resides in.
- Data flash is better suited for storing data as it can be erased and written to while code is

still executing from code flash. Data flash is also guaranteed for a larger number of reprogramming/erasure cycles than code flash.
- Read values of erased data flash blocks are not guaranteed to be 0xFF. Blank check should be used to determine if memory has been erased but not yet programmed.
- Runtime locking of the user lockable area is not currently supported. The area can be locked by an external programming tool. Do not write to locked areas of user lockable area.

Examples

High-Performance Flash Basic Example

This is a basic example of erasing and writing to data flash and code flash.

```
#define FLASH_DF_BLOCK_0 0x40100000U /* 64 B: 0x40100000 - 0x4010003F */
#define FLASH_CF_BLOCK_8 0x00010000  /* 32 KB: 0x00010000 - 0x00017FFF */
#define FLASH_DATA_BLOCK_SIZE (1024)
#define FLASH_HP_EXAMPLE_WRITE_SIZE 32
uint8_t       g_dest[TRANSFER_LENGTH];
uint8_t       g_src[TRANSFER_LENGTH];
flash_result_t blank_check_result;
void r_flash_hp_basic_example (void)
{
 /* Initialize p_src to known data */
 for (uint32_t i = 0; i < TRANSFER_LENGTH; i++)
    {
       g_src[i] = (uint8_t) ('A' + (i % 26));
    }
 /* Open the flash hp instance. */
 fsp_err_t err = R_FLASH_HP_Open(&g_flash_ctrl, &g_flash_cfg);
    assert(FSP_SUCCESS == err);
 /* Erase 1 block of data flash starting at block 0. */
    err = R_FLASH_HP_Erase(&g_flash_ctrl, FLASH_DF_BLOCK_0, 1);
    assert(FSP_SUCCESS == err);
 /* Check if block 0 is erased. */
    err = R_FLASH_HP_BlankCheck(&g_flash_ctrl, FLASH_DF_BLOCK_0,
FLASH_DATA_BLOCK_SIZE, &blank_check_result);
    assert(FSP_SUCCESS == err);
 /* Verify the previously erased area is blank */
    assert(FLASH_RESULT_BLANK == blank_check_result);
```

```
 /* Write 32 bytes to the first block of data flash. */
    err = R_FLASH_HP_Write(&g_flash_ctrl, (uint32_t) g_src, FLASH_DF_BLOCK_0,
FLASH_HP_EXAMPLE_WRITE_SIZE);
    assert(FSP_SUCCESS == err);
    assert(0 == memcmp(g_src, (uint8_t *) FLASH_DF_BLOCK_0,
FLASH_HP_EXAMPLE_WRITE_SIZE));
 /* Disable interrupts to prevent vector table access while code flash is in P/E
mode. */
    __disable_irq();
 /* Erase 1 block of code flash starting at block 10. */
    err = R_FLASH_HP_Erase(&g_flash_ctrl, FLASH_CF_BLOCK_8, 1);
    assert(FSP_SUCCESS == err);
 /* Write 32 bytes to the first block of data flash. */
    err = R_FLASH_HP_Write(&g_flash_ctrl, (uint32_t) g_src, FLASH_CF_BLOCK_8,
FLASH_HP_EXAMPLE_WRITE_SIZE);
    assert(FSP_SUCCESS == err);
 /* Enable interrupts after code flash operations are complete. */
    __enable_irq();
    assert(0 == memcmp(g_src, (uint8_t *) FLASH_CF_BLOCK_8,
FLASH_HP_EXAMPLE_WRITE_SIZE));
}
```

High-Performance Flash Advanced Example

This example demonstrates using BGO to do non-blocking operations on the data flash.

```
bool interrupt_called;
flash_event_t flash_event;
static flash_cfg_t g_flash_bgo_example_cfg =
{
    .p_callback    = flash_callback,
    .p_context      = 0,
    .p_extend       = NULL,
    .data_flash_bgo = true,
    .ipl            = 5,
```

```
    .irq            = BSP_VECTOR_FLASH_HP_FRDYI_ISR,
};
void r_flash_hp_bgo_example (void)
{
 /* Initialize p_src to known data */
 for (uint32_t i = 0; i < TRANSFER_LENGTH; i++)
    {
       g_src[i] = (uint8_t) ('A' + (i % 26));
    }
 /* Open the flash hp instance. */
 fsp_err_t err = R_FLASH_HP_Open(&g_flash_ctrl, &g_flash_bgo_example_cfg);
 /* Handle any errors. */
    assert(FSP_SUCCESS == err);
    interrupt_called = false;
 /* Erase 1 block of data flash starting at block 0. */
    err = R_FLASH_HP_Erase(&g_flash_ctrl, FLASH_DF_BLOCK_0, 1);
    assert(FSP_SUCCESS == err);
 while (!interrupt_called)
    {
       ;
    }
    assert(FLASH_EVENT_ERASE_COMPLETE == flash_event);
    interrupt_called = false;
 /* Write 32 bytes to the first block of data flash. */
    err = R_FLASH_HP_Write(&g_flash_ctrl, (uint32_t) g_src, FLASH_DF_BLOCK_0,
FLASH_HP_EXAMPLE_WRITE_SIZE);
    assert(FSP_SUCCESS == err);
 flash_status_t status;
 /* Wait until the current flash operation completes. */
 do
    {
       err = R_FLASH_HP_StatusGet(&g_flash_ctrl, &status);
    } while ((FSP_SUCCESS == err) && (FLASH_STATUS_BUSY == status));
 /* If the interrupt wasn't called process the error. */
```

```
    assert(interrupt_called);
 /* If the event wasn't a write complete process the error. */
    assert(FLASH_EVENT_WRITE_COMPLETE == flash_event);
 /* Verify the data was written correctly. */
    assert(0 == memcmp(g_src, (uint8_t *) FLASH_DF_BLOCK_0,
FLASH_HP_EXAMPLE_WRITE_SIZE));
}
void flash_callback (flash_callback_args_t * p_args)
{
    interrupt_called = true;
    flash_event      = p_args->event;
}
```

High-Performance Flash Bank Swap Example

This example demonstrates swapping which flash bank is located at address 0. This feature is only on select MCUs.

```
void r_flash_hp_bankswap_example (void)
{
 /* Open the flash hp instance. */
 fsp_err_t err = R_FLASH_HP_Open(&g_flash_ctrl, &g_flash_cfg);
 /* Handle any errors. */
    assert(FSP_SUCCESS == err);
 /* Write the new application starting at 0x00200000. */
 /* Swap the block at address 0 with the one at 0x00200000 after the next restart.
  * The application at 0x00200000 must be written there by application code. */
    err = R_FLASH_HP_BankSwap(&g_flash_ctrl);
 /* Handle any errors. */
    assert(FSP_SUCCESS == err);
 /* Handle any pre-reset operations here */
 /* Reset the MCU to swap to the other bank */
    __NVIC_SystemReset();
}
```

High-Performance Anti-Rollback Counter Basic Example

This example demonstrates basic usage of the anti-rollback counter functions.

```
void r_flash_hp_anti_rollback_counter_example (void)
{
 /* Open the flash hp instance. */
 fsp_err_t err = R_FLASH_HP_Open(&g_flash_ctrl, &g_flash_cfg);
 /* Handle any errors. */
    assert(FSP_SUCCESS == err);
    uint32_t current_count;
 /* Read the current counter value for the secure application */
    err = R_FLASH_HP_AntiRollbackCounterRead(&g_flash_ctrl, FLASH_ARC_SEC,
&current_count);
    assert(FSP_SUCCESS == err);
 /* Read the current counter value for the OEM bootloader */
    err = R_FLASH_HP_AntiRollbackCounterRead(&g_flash_ctrl, FLASH_ARC_OEMBL,
&current_count);
    assert(FSP_SUCCESS == err);
 /* Read the current counter value for the non-secure application if counter is
configured as 1xn bits */
    err = R_FLASH_HP_AntiRollbackCounterRead(&g_flash_ctrl, FLASH_ARC_NSEC_0,
&current_count); // NSEC App
    assert(FSP_SUCCESS == err);
 /* Read the current counter value for 4 non-secure applications if counter is
configured as mxn bits */
    err = R_FLASH_HP_AntiRollbackCounterRead(&g_flash_ctrl, FLASH_ARC_NSEC_0,
&current_count); // NSEC App 0
    err |= R_FLASH_HP_AntiRollbackCounterRead(&g_flash_ctrl, FLASH_ARC_NSEC_1,
&current_count); // NSEC App 1
    err |= R_FLASH_HP_AntiRollbackCounterRead(&g_flash_ctrl, FLASH_ARC_NSEC_2,
&current_count); // NSEC App 2
    err |= R_FLASH_HP_AntiRollbackCounterRead(&g_flash_ctrl, FLASH_ARC_NSEC_3,
&current_count); // NSEC App 3
    assert(FSP_SUCCESS == err);
 /* Increment the counter value for the secure application. Caution: The increment
```

```
cannot be reversed. */
    err = R_FLASH_HP_AntiRollbackCounterIncrement(&g_flash_ctrl, FLASH_ARC_SEC);
 /* If error occurred during increment, refresh the counter flash to ensure a valid
state */
 if (FSP_SUCCESS != err)
    {
       err = R_FLASH_HP_AntiRollbackCounterRefresh(&g_flash_ctrl, FLASH_ARC_SEC);
      assert(FSP_SUCCESS == err);
    }
    assert(FSP_SUCCESS == err);
}
```

High-Performance User Lockable Area Basic Example

This example demonstrates writing the user lockable area.

```
void r_flash_hp_user_lockable_area_example (void)
{
 /* Open the flash hp instance. */
 fsp_err_t err = R_FLASH_HP_Open(&g_flash_ctrl, &g_flash_cfg);
    assert(FSP_SUCCESS == err);
 flash_info_t flash_info;
    err = R_FLASH_HP_InfoGet(&g_flash_ctrl, &flash_info);
    assert(FSP_SUCCESS == err);
    assert(flash_info.data_flash.num_regions >= 2);
 flash_block_info_t const * const p_user_area_info =
&flash_info.data_flash.p_block_array[1];
 /* Select initial value to write to the lockable area */
    uint32_t update_complete_flag = 0;
 /* Set parameters for writing update_complete_flag to start of lockable area */
    uint32_t const flash_address    = p_user_area_info->block_section_st_addr;
    uint32_t const write_size_bytes = sizeof(update_complete_flag);
 /* Ensure write size is a multiple of the programming size */
    uint32_t const programming_size_bytes = p_user_area_info->block_size_write;
    assert(write_size_bytes % programming_size_bytes == 0);
```

```
 /* Write data to the beginning of User Lockable Area 0 */
    err = R_FLASH_HP_UserLockableAreaWrite(&g_flash_ctrl,
                                           (uint32_t) &update_complete_flag,
                                           flash_address,
                                           write_size_bytes);
    assert(FSP_SUCCESS == err);
 /* Confirm the data was written */
    assert(0 == memcmp(&update_complete_flag, (uint8_t *) flash_address,
write_size_bytes));
 /* Select new value to write to the lockable area */
    update_complete_flag = 1;
 /* Write new data to the beginning of User Lockable Area 0 */
    err = R_FLASH_HP_UserLockableAreaWrite(&g_flash_ctrl,
                                           (uint32_t) &update_complete_flag,
                                           flash_address,
                                           write_size_bytes);
    assert(FSP_SUCCESS == err);
 /* Confirm the data was written */
    assert(0 == memcmp(&update_complete_flag, (uint8_t *) flash_address,
write_size_bytes));
}
```

Data Structures

struct	flash_hp_instance_ctrl_t

Enumerations

enum	flash_bgo_operation_t

Data Structure Documentation

◆ flash_hp_instance_ctrl_t

struct flash_hp_instance_ctrl_t	
Flash HP instance control block. DO NOT INITIALIZE.	
Data Fields	
uint32_t	opened
	To check whether api has been opened or not.

flash_bgo_operation_t	current_operation
	Operation in progress, for example, FLASH_OPERATION_CF_ERASE.

Enumeration Type Documentation

◆ flash_bgo_operation_t

enum flash_bgo_operation_t

Possible Flash operation states

Function Documentation

◆ R_FLASH_HP_Open()

fsp_err_t R_FLASH_HP_Open (flash_ctrl_t *const *p_api_ctrl*, flash_cfg_t const *const *p_cfg*)

Initializes the high performance flash peripheral. Implements flash_api_t::open.

The Open function initializes the Flash.

Example:

```
/* Open the flash hp instance. */
fsp_err_t err = R_FLASH_HP_Open(&g_flash_ctrl, &g_flash_cfg);
```

Return values

FSP_SUCCESS	Initialization was successful and timer has started.
FSP_ERR_ALREADY_OPEN	The flash control block is already open.
FSP_ERR_ASSERTION	NULL provided for p_ctrl or p_cfg.
FSP_ERR_IRQ_BSP_DISABLED	Caller is requesting BGO but the Flash interrupts are not enabled.
FSP_ERR_FCLK	FCLK must be a minimum of 4 MHz for Flash operations.

◆ R_FLASH_HP_Write()

fsp_err_t R_FLASH_HP_Write (flash_ctrl_t *const *p_api_ctrl*, uint32_t const *src_address*, uint32_t *flash_address*, uint32_t const *num_bytes*)

Writes to the specified Code or Data Flash memory area. Implements flash_api_t::write.

Example:

```
/* Write 32 bytes to the first block of data flash. */
   err = R_FLASH_HP_Write(&g_flash_ctrl, (uint32_t) g_src, FLASH_DF_BLOCK_0,
FLASH_HP_EXAMPLE_WRITE_SIZE);
```

Return values

FSP_SUCCESS	Operation successful. If BGO is enabled this means the operation was started successfully.
FSP_ERR_IN_USE	The Flash peripheral is busy with a prior on-going transaction.
FSP_ERR_NOT_OPEN	The Flash API is not Open.
FSP_ERR_CMD_LOCKED	FCU is in locked state, typically as a result of attempting to Write an area that is protected by an Access Window.
FSP_ERR_WRITE_FAILED	Status is indicating a Programming error for the requested operation. This may be returned if the requested Flash area is not blank.
FSP_ERR_TIMEOUT	Timed out waiting for FCU operation to complete.
FSP_ERR_INVALID_SIZE	Number of bytes provided was not a multiple of the programming size or exceeded the maximum range.
FSP_ERR_INVALID_ADDRESS	Invalid address was input or address not on programming boundary.
FSP_ERR_ASSERTION	NULL provided for p_ctrl.
FSP_ERR_PE_FAILURE	Failed to enter or exit P/E mode.

◆ R_FLASH_HP_Erase()

fsp_err_t R_FLASH_HP_Erase (flash_ctrl_t *const *p_api_ctrl*, uint32_t const *address*, uint32_t const *num_blocks*)

Erases the specified Code or Data Flash blocks. Implements flash_api_t::erase by the block_erase_address.

Note

Code flash may contain blocks of different sizes. When erasing code flash it is important to take this into consideration to prevent erasing a larger address space than desired.

Example:

```
/* Erase 1 block of data flash starting at block 0. */
   err = R_FLASH_HP_Erase(&g_flash_ctrl, FLASH_DF_BLOCK_0, 1);
```

Return values

FSP_SUCCESS	Successful open.
FSP_ERR_INVALID_BLOCKS	Invalid number of blocks specified
FSP_ERR_INVALID_ADDRESS	Invalid address specified. If the address is in code flash then code flash programming must be enabled.
FSP_ERR_IN_USE	Other flash operation in progress, or API not initialized
FSP_ERR_CMD_LOCKED	FCU is in locked state, typically as a result of attempting to Erase an area that is protected by an Access Window.
FSP_ERR_ASSERTION	NULL provided for p_ctrl
FSP_ERR_NOT_OPEN	The Flash API is not Open.
FSP_ERR_ERASE_FAILED	Status is indicating a Erase error.
FSP_ERR_TIMEOUT	Timed out waiting for the FCU to become ready.
FSP_ERR_PE_FAILURE	Failed to enter or exit P/E mode.

◆ R_FLASH_HP_BlankCheck()

fsp_err_t R_FLASH_HP_BlankCheck (flash_ctrl_t *const *p_api_ctrl*, uint32_t const *address*, uint32_t *num_bytes*, flash_result_t * *p_blank_check_result*)

Performs a blank check on the specified address area. Implements flash_api_t::blankCheck.

Example:

```
/* Check if block 0 is erased. */
   err = R_FLASH_HP_BlankCheck(&g_flash_ctrl, FLASH_DF_BLOCK_0,
FLASH_DATA_BLOCK_SIZE, &blank_check_result);
   assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Blank check operation completed with result in p_blank_check_result, or blank check started and in-progess (BGO mode).
FSP_ERR_INVALID_ADDRESS	Invalid data flash address was input.
FSP_ERR_INVALID_SIZE	'num_bytes' was either too large or not aligned for the CF/DF boundary size.
FSP_ERR_IN_USE	Other flash operation in progress or API not initialized.
FSP_ERR_ASSERTION	NULL provided for p_ctrl.
FSP_ERR_CMD_LOCKED	FCU is in locked state, typically as a result of attempting to Erase an area that is protected by an Access Window.
FSP_ERR_NOT_OPEN	The Flash API is not Open.
FSP_ERR_TIMEOUT	Timed out waiting for the FCU to become ready.
FSP_ERR_PE_FAILURE	Failed to enter or exit P/E mode.
FSP_ERR_BLANK_CHECK_FAILED	Blank check operation failed.

◆ R_FLASH_HP_StatusGet()

fsp_err_t R_FLASH_HP_StatusGet (flash_ctrl_t *const *p_api_ctrl*, flash_status_t *const *p_status*)

Query the FLASH peripheral for its status. Implements flash_api_t::statusGet.

Example:

```
flash_status_t status;
/* Wait until the current flash operation completes. */
do
   {
      err = R_FLASH_HP_StatusGet(&g_flash_ctrl, &status);
   } while ((FSP_SUCCESS == err) && (FLASH_STATUS_BUSY == status));
```

Return values

FSP_SUCCESS	FLASH peripheral is ready to use.
FSP_ERR_ASSERTION	NULL provided for p_ctrl.
FSP_ERR_NOT_OPEN	The Flash API is not Open.

◆ R_FLASH_HP_IdCodeSet()

fsp_err_t R_FLASH_HP_IdCodeSet (flash_ctrl_t *const *p_api_ctrl*, uint8_t const *const *p_id_code*, flash_id_code_mode_t *mode*)

Implements flash_api_t::idCodeSet.

Return values

FSP_SUCCESS	ID Code successfully configured.
FSP_ERR_IN_USE	FLASH peripheral is busy with a prior operation.
FSP_ERR_ASSERTION	NULL provided for p_ctrl.
FSP_ERR_UNSUPPORTED	Code Flash Programming is not enabled.
FSP_ERR_NOT_OPEN	Flash API has not yet been opened.
FSP_ERR_PE_FAILURE	Failed to enter or exit Code Flash P/E mode.
FSP_ERR_TIMEOUT	Timed out waiting for the FCU to become ready.
FSP_ERR_WRITE_FAILED	Status is indicating a Programming error for the requested operation.
FSP_ERR_CMD_LOCKED	FCU is in locked state, typically as a result of having received an illegal command.

◆ R_FLASH_HP_AccessWindowSet()

fsp_err_t R_FLASH_HP_AccessWindowSet (flash_ctrl_t *const *p_api_ctrl*, uint32_t const *start_addr*, uint32_t const *end_addr*)

Configure an access window for the Code Flash memory using the provided start and end address. An access window defines a contiguous area in Code Flash for which programming/erase is enabled. This area is on block boundaries. The block containing start_addr is the first block. The block containing end_addr is the last block. The access window then becomes first block –> last block inclusive. Anything outside this range of Code Flash is then write protected.

Note

If the start address and end address are set to the same value, then the access window is effectively removed. This accomplishes the same functionality as R_FLASH_HP_AccessWindowClear().

Implements flash_api_t::accessWindowSet.

Return values

FSP_SUCCESS	Access window successfully configured.
FSP_ERR_INVALID_ADDRESS	Invalid settings for start_addr and/or end_addr.
FSP_ERR_IN_USE	FLASH peripheral is busy with a prior operation.
FSP_ERR_ASSERTION	NULL provided for p_ctrl.
FSP_ERR_UNSUPPORTED	Code Flash Programming is not enabled.
FSP_ERR_NOT_OPEN	Flash API has not yet been opened.
FSP_ERR_PE_FAILURE	Failed to enter or exit Code Flash P/E mode.
FSP_ERR_TIMEOUT	Timed out waiting for the FCU to become ready.
FSP_ERR_WRITE_FAILED	Status is indicating a Programming error for the requested operation.
FSP_ERR_CMD_LOCKED	FCU is in locked state, typically as a result of having received an illegal command.

◆ R_FLASH_HP_AccessWindowClear()

fsp_err_t R_FLASH_HP_AccessWindowClear (flash_ctrl_t *const *p_api_ctrl*)

Remove any access window that is currently configured in the Code Flash. Subsequent to this call all Code Flash is writable. Implements flash_api_t::accessWindowClear.

Return values

FSP_SUCCESS	Access window successfully removed.
FSP_ERR_IN_USE	FLASH peripheral is busy with a prior operation.
FSP_ERR_ASSERTION	NULL provided for p_ctrl.
FSP_ERR_UNSUPPORTED	Code Flash Programming is not enabled.
FSP_ERR_NOT_OPEN	Flash API has not yet been opened.
FSP_ERR_PE_FAILURE	Failed to enter or exit Code Flash P/E mode.
FSP_ERR_TIMEOUT	Timed out waiting for the FCU to become ready.
FSP_ERR_WRITE_FAILED	Status is indicating a Programming error for the requested operation.
FSP_ERR_CMD_LOCKED	FCU is in locked state, typically as a result of having received an illegal command.

◆ R_FLASH_HP_Reset()

fsp_err_t R_FLASH_HP_Reset (flash_ctrl_t *const *p_api_ctrl*)

Reset the FLASH peripheral. Implements flash_api_t::reset.

No attempt is made to check if the flash is busy before executing the reset since the assumption is that a reset will terminate any existing operation.

Return values

FSP_SUCCESS	Flash circuit successfully reset.
FSP_ERR_ASSERTION	NULL provided for p_ctrl.
FSP_ERR_NOT_OPEN	The control block is not open.
FSP_ERR_PE_FAILURE	Failed to enter or exit P/E mode.
FSP_ERR_TIMEOUT	Timed out waiting for the FCU to become ready.
FSP_ERR_CMD_LOCKED	FCU is in locked state, typically as a result of having received an illegal command.

◆ R_FLASH_HP_StartUpAreaSelect()

fsp_err_t R_FLASH_HP_StartUpAreaSelect (flash_ctrl_t *const *p_api_ctrl*, flash_startup_area_swap_t *swap_type*, bool *is_temporary*)

Selects which block, Default (Block 0) or Alternate (Block 1), is used as the startup area block. The provided parameters determine which block will become the active startup block and whether that action will be immediate (but temporary), or permanent subsequent to the next reset. Doing a temporary switch might appear to have limited usefulness. If there is an access window in place such that Block 0 is write protected, then one could do a temporary switch, update the block and switch them back without having to touch the access window. Implements flash_api_t::startupAreaSelect.

Return values

FSP_SUCCESS	Start-up area successfully toggled.
FSP_ERR_IN_USE	FLASH peripheral is busy with a prior operation.
FSP_ERR_ASSERTION	NULL provided for p_ctrl.
FSP_ERR_NOT_OPEN	The control block is not open.
FSP_ERR_UNSUPPORTED	Code Flash Programming is not enabled.
FSP_ERR_PE_FAILURE	Failed to enter or exit Code Flash P/E mode.
FSP_ERR_TIMEOUT	Timed out waiting for the FCU to become ready.
FSP_ERR_WRITE_FAILED	Status is indicating a Programming error for the requested operation.
FSP_ERR_CMD_LOCKED	FCU is in locked state, typically as a result of having received an illegal command.

◆ R_FLASH_HP_BankSwap()

fsp_err_t R_FLASH_HP_BankSwap (flash_ctrl_t *const *p_api_ctrl*)

Swaps the flash bank located at address 0x00000000 and address 0x00200000. This can only be done when in dual bank mode. Dual bank mode can be enabled in the FSP Configuration Tool under BSP Properties. After a bank swap is done the MCU will need to be reset for the changes to take place. flash_api_t::bankSwap.

Return values

FSP_SUCCESS	Start-up area successfully toggled.
FSP_ERR_IN_USE	FLASH peripheral is busy with a prior operation.
FSP_ERR_ASSERTION	NULL provided for p_ctrl.
FSP_ERR_NOT_OPEN	The control block is not open.
FSP_ERR_UNSUPPORTED	Code Flash Programming is not enabled.
FSP_ERR_PE_FAILURE	Failed to enter or exit Code Flash P/E mode.
FSP_ERR_TIMEOUT	Timed out waiting for the FCU to become ready.
FSP_ERR_INVALID_MODE	Cannot switch banks while flash is in Linear mode.
FSP_ERR_WRITE_FAILED	Flash write operation failed.
FSP_ERR_CMD_LOCKED	FCU is in locked state, typically as a result of having received an illegal command.

◆ R_FLASH_HP_UpdateFlashClockFreq()

fsp_err_t R_FLASH_HP_UpdateFlashClockFreq (flash_ctrl_t *const *p_api_ctrl*)

Indicate to the already open Flash API that the FCLK has changed. Implements flash_api_t::updateFlashClockFreq.

This could be the case if the application has changed the system clock, and therefore the FCLK. Failure to call this function subsequent to changing the FCLK could result in damage to the flash macro.

Return values

FSP_SUCCESS	Start-up area successfully toggled.
FSP_ERR_IN_USE	Flash is busy with an on-going operation.
FSP_ERR_ASSERTION	NULL provided for p_ctrl
FSP_ERR_NOT_OPEN	Flash API has not yet been opened.
FSP_ERR_FCLK	FCLK is not within the acceptable range.

◆ R_FLASH_HP_InfoGet()

fsp_err_t R_FLASH_HP_InfoGet (flash_ctrl_t *const *p_api_ctrl*, flash_info_t *const *p_info*)

Returns the information about the flash regions. Implements flash_api_t::infoGet.

Return values

FSP_SUCCESS	Successful retrieved the request information.
FSP_ERR_NOT_OPEN	The control block is not open.
FSP_ERR_ASSERTION	NULL provided for p_ctrl or p_info.

◆ R_FLASH_HP_Close()

fsp_err_t R_FLASH_HP_Close (flash_ctrl_t *const *p_api_ctrl*)

Releases any resources that were allocated by the Open() or any subsequent Flash operations. Implements flash_api_t::close.

Return values

FSP_SUCCESS	Successful close.
FSP_ERR_NOT_OPEN	The control block is not open.
FSP_ERR_ASSERTION	NULL provided for p_ctrl or p_cfg.

◆ R_FLASH_HP_CallbackSet()

fsp_err_t R_FLASH_HP_CallbackSet (flash_ctrl_t *const *p_api_ctrl*, void(*)(flash_callback_args_t *) *p_callback*, void const *const *p_context*, flash_callback_args_t *const *p_callback_memory*)

Updates the user callback with the option to provide memory for the callback argument structure. Implements flash_api_t::callbackSet.

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

◆ R_FLASH_HP_AntiRollbackCounterIncrement()

fsp_err_t R_FLASH_HP_AntiRollbackCounterIncrement (flash_ctrl_t *const *p_api_ctrl*, flash_arc_t *counter*)

Increments the selected anti-rollback counter.

Warning

If this function returns an error code other than FSP_SUCCESS, or power loss occurs during a call to this function, call R_FLASH_HP_AntiRollbackCounterRefresh to ensure the counter flash is in a valid state following the error.

Note

The counter is read internally before increment.

Implements flash_api_t::antiRollbackCounterIncrement

Return values

FSP_SUCCESS	Counter incremented successfully
FSP_ERR_NOT_OPEN	The control block is not open.
FSP_ERR_ASSERTION	NULL provided for p_api_ctrl
FSP_ERR_NOT_ENABLED	The specified counter has not been configured (configuration is only required for ARC_NSEC)
FSP_ERR_OVERFLOW	The counter cannot be incremented because it is already at its max value
FSP_ERR_PE_FAILURE	Failed to enter or exit Data Flash P/E mode.
FSP_ERR_TIMEOUT	Timed out waiting for the FCU to become ready.
FSP_ERR_CMD_LOCKED	FCU is in locked state, typically as a result of having received an illegal command
FSP_ERR_UNSUPPORTED	Data flash programming is not enabled or selected anti-rollback counter is not supported on this MCU

◆ R_FLASH_HP_AntiRollbackCounterRefresh()

fsp_err_t R_FLASH_HP_AntiRollbackCounterRefresh (flash_ctrl_t *const *p_api_ctrl*, flash_arc_t *counter*)

Refreshes the selected anti-rollback counter flash area to ensure the flash is in a valid state even if an error occured during counter increment processing.

This function must be called if errors or power failure occured during counter increment.

Power failure can be detected by the application code by management of user-defined non-voltile flags during counter increment.

Until a refresh completes successfully, the value of the anti-rollback counter cannot be guaranteed and should not be read.

Implements flash_api_t::antiRollbackCounterRefresh

Return values

FSP_SUCCESS	Counter refreshed successfully
FSP_ERR_NOT_OPEN	The control block is not open.
FSP_ERR_ASSERTION	NULL provided for p_ctrl
FSP_ERR_NOT_ENABLED	The specified counter has not been configured (configuration is only required for ARC_NSEC)
FSP_ERR_PE_FAILURE	Failed to enter or exit Data Flash P/E mode.
FSP_ERR_TIMEOUT	Timed out waiting for the FCU to become ready.
FSP_ERR_CMD_LOCKED	FCU is in locked state, typically as a result of having received an illegal command
FSP_ERR_UNSUPPORTED	Data flash programming is not enabled or Anti-Rollback counter is not supported on this MCU

◆ R_FLASH_HP_AntiRollbackCounterRead()

fsp_err_t R_FLASH_HP_AntiRollbackCounterRead (flash_ctrl_t *const *p_api_ctrl*, flash_arc_t *counter*, uint32_t *const *p_count*)

Reads the selected anti-rollback counter and returns the number of counter bits set.

Implements flash_api_t::antiRollbackCounterRead

Return values

FSP_SUCCESS	Counter read successfully into p_count
FSP_ERR_NOT_OPEN	The control block is not open.
FSP_ERR_ASSERTION	NULL provided for p_api_ctrl or p_count
FSP_ERR_NOT_ENABLED	The specified counter has not been configured (configuration is only required for ARC_NSEC)
FSP_ERR_PE_FAILURE	Failed to enter or exit Data Flash P/E mode.
FSP_ERR_TIMEOUT	Timed out waiting for the FCU to become ready.
FSP_ERR_CMD_LOCKED	FCU is in locked state, typically as a result of having received an illegal command
FSP_ERR_UNSUPPORTED	Data flash programming is not enabled or Anti-Rollback counter is not supported on this MCU

◆ R_FLASH_HP_UserLockableAreaWrite()

fsp_err_t R_FLASH_HP_UserLockableAreaWrite (flash_ctrl_t *const *p_api_ctrl*, uint32_t const *src_address*, uint32_t *flash_address*, uint32_t const *num_bytes*)

Write to the user lockable area in flash

Implements flash_api_t::userLockableAreaWrite

Note

BGO is not supported for user lockable area flash operations.

Return values

FSP_SUCCESS	Operation successful.
FSP_ERR_IN_USE	The Flash peripheral is busy with a prior on-going transaction.
FSP_ERR_NOT_OPEN	The Flash API is not Open.
FSP_ERR_CMD_LOCKED	FCU is in locked state, typically as a result of attempting to Write an area that is protected by an Access Window.
FSP_ERR_WRITE_FAILED	Status is indicating a Programming error for the requested operation.
FSP_ERR_TIMEOUT	Timed out waiting for FCU operation to complete.
FSP_ERR_INVALID_SIZE	Number of bytes provided was not a multiple of the programming size or exceeded the maximum range.
FSP_ERR_INVALID_ADDRESS	Invalid address was input or address not on programming boundary.
FSP_ERR_ASSERTION	NULL provided for p_ctrl.
FSP_ERR_PE_FAILURE	Failed to enter or exit P/E mode.

Detailed Description

Driver for the flash memory on RA low-power MCUs. This module implements the Flash Interface.

Overview

The Flash HAL module APIs allow an application to write, erase and blank check both the data and code flash areas that reside within the MCU. The amount of flash memory available varies across MCU parts.

Features

The Low-Power Flash HAL module has the following key features:

- Blocking and non-blocking erasing, writing and blank-checking of data flash.
- Blocking erasing, writing and blank checking of code flash.
- Callback functions for completion of non-blocking data flash operations.
- Access window (write protection) for code flash, allowing only specified areas of code flash to be erased or written.
- Boot block-swapping.
- ID code programming support.

Configuration

Build Time Configurations for r_flash_lp

The following build time configurations are defined in fsp_cfg/r_flash_lp_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
Code Flash Programming	• Enabled • Disabled	Disabled	Controls whether or not code-flash programming is enabled. Disabling reduces the amount of ROM and RAM used by the API.
Code Flash Background Operation Support With Bank Programming	MCU Specific Options		Enables execution from the startup code flash bank while programming the other code flash bank.
Data Flash Programming	• Enabled • Disabled	Enabled	Controls whether or not data-flash programming is enabled. Disabling reduces the amount of ROM used by the API.
Data Flash Background Operation Support	• Enabled • Disabled	Enabled	Controls whether or not Data Flash Background

		Operation support is included in the build. Disabling reduces the amount of ROM used by the API.
Instant Bank Swap (No Reset Required)	MCU Specific Options	Calls to R_FLASH_LP_BankSwap will immediately swap banks without requiring a reset.

Configurations for Storage > Flash (r_flash_lp)

This module can be added to the Stacks tab via New Stack > Storage > Flash (r_flash_lp).

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_flash0	Module name.
Data Flash Background Operation	• Enabled • Disabled	Enabled	Enabling allows Flash API calls that reference data-flash to return immediately, with the operation continuing in the background.
Callback	Name must be a valid C symbol	NULL	A user callback function can be specified. Callback function called when a Data Flash Background Operation completes or errors.
Flash Ready Interrupt Priority	MCU Specific Options		Select the flash ready interrupt priority.

Clock Configuration

Flash either uses FCLK or ICLK as the clock source depending on the MCU. When writing and erasing the clock source must be at least 4 MHz.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Warning

It is highly recommended that the developer reviews sections 5 and 6 of the Flash Memory section of the target MCUs Hardware User's Manual prior to using the r_flash_lp module. In particular, understanding ID Code and Access Window functionality can help avoid unrecoverable flash scenarios.

Data Flash Background Operation (BGO) Precautions

When using the data flash BGO, the code flash, RAM and external memory can still be accessed. You must ensure that the data flash is not accessed during a data flash operation. This includes interrupts that may access the data flash.

Code Flash Precautions

Modifying code flash has limitations requiring some of the flash code to reside in RAM. The use of Bank Programming can limit these requirements but some still exist.

Code flash cannot be accessed while writing, erasing or blank checking code flash unless Bank Programming is supported. Code flash cannot be accessed while modifying the access window, selecting the startup area or setting the ID code. In order to support modifying code flash or flash settings all supporting code must reside in RAM. This is only done when code flash programming is enabled.

When Bank Programming is disabled or not supported a code flash write, erase or blank check operation will not return before the operation has completed.

By default, the vector table resides in the code flash. If an interrupt occurs during the code flash operation other thank a Bank Programming operation, then code flash will be accessed to fetch the interrupt's starting address and an error will occur. The simplest work-around is to disable interrupts during code flash operations. Another option is to copy the vector table to RAM, update the VTOR (Vector Table Offset Register) accordingly and ensure that any interrupt service routines execute out of RAM. Similarly, you must ensure that if in a multi-threaded environment, threads running from code flash cannot become active while a code flash operation is in progress.

Bank Programming Precautions

Bank programming is supported on select MCUs. When enabled Bank1 can be programmed while executing out of Bank0, decreasing the RAM used by the flash driver. When this mode is enabled only Bank1 can be modified.

Flash Clock Source

The flash clock source is the clock used by the Flash peripheral in performing all Flash operations. As part of the flash_api_t::open function the Flash clock source is checked will return FSP_ERR_FCLK if it is invalid. Once the Flash API has been opened, if the flash clock source frequency is changed, the flash_api_t::updateFlashClockFreq API function must be called to inform the API of the change. Failure to do so could result in flash operation failures and possibly damage the part.

Interrupts

Enable the flash ready interrupt only if you plan to use the data flash BGO. In this mode, the application can initiate a data flash operation and then be asynchronously notified of its completion, or an error, using a user supplied-callback function. The callback function is passed a structure containing event information that indicates the source of the callback event (for example, flash_api_t::FLASH_EVENT_ERASE_COMPLETE) When the FLASH FRDYI interrupt is enabled, the corresponding ISR will be defined in the flash driver. The ISR will call a user-callback function if one was registered with the flash_api_t::open API.

Note

The Flash HP supports an additional flash-error interrupt and if the BGO mode is enabled for the FLASH HP then both the Flash Ready Interrupt and Flash Error Interrupts must be enabled (assigned a priority).

Viewing flash contents in e2 studio

By default, the contents of data flash and code flash are cached by e^2 studio. This means that during a debug session, modifications to these memory regions will not be observed by e^2 studio. When debugging applications using e^2 studio, disable the "Allow caching of flash contents" option in the debug configuration in order to view modified flash contents (Debug Configuration > Debugger > Debug Tool Settings > Allow caching of flash contents).

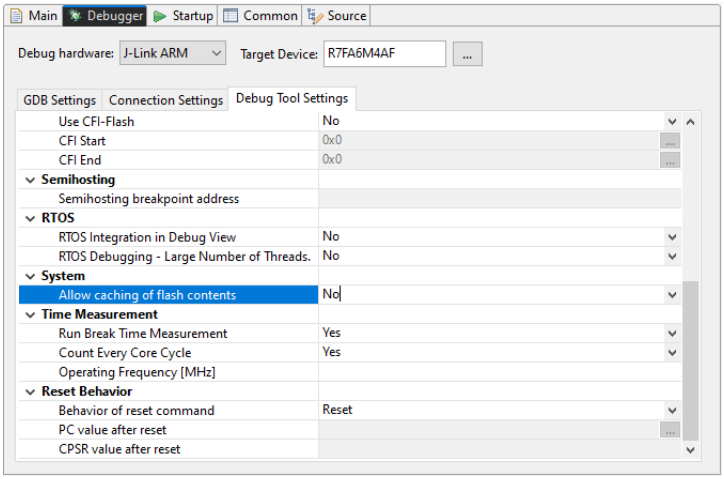

Figure 300: Debug Configuration

Limitations

- Write operations must be aligned on page boundaries and must be a multiple of the page boundary size.
- Erase operations will erase the entire block the provided address resides in.
- Data flash is better suited for storing data as it can be erased and written to while code is still executing from code flash. Data flash is also guaranteed for a larger number of reprogramming/erasure cycles than code flash.
- Read values of erased blocks are not guaranteed to be 0xFF. Blank check should be used to determine if memory has been erased but not yet programmed.

Examples

Low-Power Flash Basic Example

This is a basic example of erasing and writing to data flash and code flash.

```
#define FLASH_DF_BLOCK_0 0x40100000U /* 1 KB: 0x40100000 - 0x401003FF */
#define FLASH_CF_BLOCK_10 0x00005000  /* 2 KB: 0x00005000 - 0x000057FF */
#define FLASH_DATA_BLOCK_SIZE (1024)
#define FLASH_LP_EXAMPLE_WRITE_SIZE 32
uint8_t       g_dest[TRANSFER_LENGTH];
uint8_t       g_src[TRANSFER_LENGTH];
flash_result_t blank_check_result;
```

```
void R_FLASH_LP_basic_example (void)
{
 /* Initialize p_src to known data */
 for (uint32_t i = 0; i < TRANSFER_LENGTH; i++)
    {
       g_src[i] = (uint8_t) ('A' + (i % 26));
    }
 /* Open the flash lp instance. */
 fsp_err_t err = R_FLASH_LP_Open(&g_flash_ctrl, &g_flash_cfg);
    assert(FSP_SUCCESS == err);
 /* Erase 1 block of data flash starting at block 0. */
    err = R_FLASH_LP_Erase(&g_flash_ctrl, FLASH_DF_BLOCK_0, 1);
    assert(FSP_SUCCESS == err);
 /* Check if block 0 is erased. */
    err = R_FLASH_LP_BlankCheck(&g_flash_ctrl, FLASH_DF_BLOCK_0,
FLASH_DATA_BLOCK_SIZE, &blank_check_result);
    assert(FSP_SUCCESS == err);
 /* Verify the previously erased area is blank */
    assert(FLASH_RESULT_BLANK == blank_check_result);
 /* Write 32 bytes to the first block of data flash. */
    err = R_FLASH_LP_Write(&g_flash_ctrl, (uint32_t) g_src, FLASH_DF_BLOCK_0,
FLASH_LP_EXAMPLE_WRITE_SIZE);
    assert(FSP_SUCCESS == err);
    assert(0 == memcmp(g_src, (uint8_t *) FLASH_DF_BLOCK_0,
FLASH_LP_EXAMPLE_WRITE_SIZE));
 /* Disable interrupts to prevent vector table access while code flash is in P/E
mode. */
    __disable_irq();
 /* Erase 1 block of code flash starting at block 10. */
    err = R_FLASH_LP_Erase(&g_flash_ctrl, FLASH_CF_BLOCK_10, 1);
    assert(FSP_SUCCESS == err);
 /* Write 32 bytes to the first block of data flash. */
    err = R_FLASH_LP_Write(&g_flash_ctrl, (uint32_t) g_src, FLASH_CF_BLOCK_10,
FLASH_LP_EXAMPLE_WRITE_SIZE);
```

```
    assert(FSP_SUCCESS == err);
 /* Enable interrupts after code flash operations are complete. */
    __enable_irq();
    assert(0 == memcmp(g_src, (uint8_t *) FLASH_CF_BLOCK_10,
FLASH_LP_EXAMPLE_WRITE_SIZE));
}
```

Low-Power Flash Advanced Example

This example demonstrates using BGO to do non-blocking operations on the data flash.

```
bool interrupt_called;
flash_event_t flash_event;
static flash_cfg_t g_flash_bgo_example_cfg =
{
    .p_callback    = flash_callback,
    .p_context      = 0,
    .p_extend       = NULL,
    .data_flash_bgo = true,
    .ipl            = 5,
    .irq            = BSP_VECTOR_FLASH_LP_FRDYI_ISR,
};
void R_FLASH_LP_bgo_example (void)
{
 /* Initialize p_src to known data */
 for (uint32_t i = 0; i < TRANSFER_LENGTH; i++)
    {
       g_src[i] = (uint8_t) ('A' + (i % 26));
    }
 /* Open the flash lp instance. */
 fsp_err_t err = R_FLASH_LP_Open(&g_flash_ctrl, &g_flash_bgo_example_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    interrupt_called = false;
 /* Erase 1 block of data flash starting at block 0. */
```

```
    err = R_FLASH_LP_Erase(&g_flash_ctrl, FLASH_DF_BLOCK_0, 1);
    assert(FSP_SUCCESS == err);
 while (!interrupt_called)
    {
       ;
    }
    assert(FLASH_EVENT_ERASE_COMPLETE == flash_event);
    interrupt_called = false;
 /* Write 32 bytes to the first block of data flash. */
    err = R_FLASH_LP_Write(&g_flash_ctrl, (uint32_t) g_src, FLASH_DF_BLOCK_0,
FLASH_LP_EXAMPLE_WRITE_SIZE);
    assert(FSP_SUCCESS == err);
 flash_status_t status;
 /* Wait until the current flash operation completes. */
 do
    {
       err = R_FLASH_LP_StatusGet(&g_flash_ctrl, &status);
    } while ((FSP_SUCCESS == err) && (FLASH_STATUS_BUSY == status));
 /* If the interrupt wasn't called process the error. */
    assert(interrupt_called);
 /* If the event wasn't a write complete process the error. */
    assert(FLASH_EVENT_WRITE_COMPLETE == flash_event);
 /* Verify the data was written correctly. */
    assert(0 == memcmp(g_src, (uint8_t *) FLASH_DF_BLOCK_0,
FLASH_LP_EXAMPLE_WRITE_SIZE));
 /* When Bank Programming is enabled the code flash P/E operations are also non
blocking. */
    interrupt_called = false;
 /* Erase the first block of the flash bank not configured as the startup bank. */
    err = R_FLASH_LP_Erase(&g_flash_ctrl, (BSP_FEATURE_FLASH_CODE_FLASH_START +
BSP_ROM_SIZE_BYTES) / 2, 1);
    assert(FSP_SUCCESS == err);
 while (!interrupt_called)
    {
```

```
        ;
    }
    assert(FLASH_EVENT_ERASE_COMPLETE == flash_event);
}
void flash_callback (flash_callback_args_t * p_args)
{
    interrupt_called = true;
    flash_event      = p_args->event;
}
```

Low-Power Flash Bank Swap Example

This example demonstrates swapping which flash bank is located at address 0. This feature is only on select MCUs.

```
void R_FLASH_LP_bankswap_example (void)
{
 /* Open the flash lp instance. */
 fsp_err_t err = R_FLASH_LP_Open(&g_flash_ctrl, &g_flash_cfg);
 /* Handle any errors. */
    assert(FSP_SUCCESS == err);
 /* Write the new application starting at 0x0004_0000. */
 /* Swap the bank at address 0 with the one at 0x0004_0000 after the next restart.
  * The application at 0x0004_0000 must be written there by application code. */
    err = R_FLASH_LP_BankSwap(&g_flash_ctrl);
 /* When using Instant Bank Swap the MCU will now have the banks swapped. */
 /* Handle any errors. */
    assert(FSP_SUCCESS == err);
 /* Handle any pre-reset operations here */
 /* When using Bank Swap with Reset the MCU must be reset to swap to the other bank
*/
    __NVIC_SystemReset();
}
```

Data Structures

struct	flash_lp_instance_ctrl_t

Data Structure Documentation

◆ flash_lp_instance_ctrl_t

struct flash_lp_instance_ctrl_t
Flash instance control block. DO NOT INITIALIZE. Initialization occurs when R_FLASH_LP_Open() is called.

Function Documentation

◆ R_FLASH_LP_Open()

fsp_err_t R_FLASH_LP_Open (flash_ctrl_t *const *p_api_ctrl*, flash_cfg_t const *const *p_cfg*)

Initialize the Low Power flash peripheral. Implements flash_api_t::open.

The Open function initializes the Flash.

This function must be called once prior to calling any other FLASH API functions. If a user supplied callback function is supplied, then the Flash Ready interrupt will be configured to call the users callback routine with an Event type describing the source of the interrupt for Data Flash operations.

Example:

```
/* Open the flash lp instance. */
fsp_err_t err = R_FLASH_LP_Open(&g_flash_ctrl, &g_flash_cfg);
```

Note

Providing a callback function in the supplied p_cfg->callback field automatically configures the Flash for Data Flash to operate in non-blocking background operation (BGO) mode.

Return values

FSP_SUCCESS	Initialization was successful and timer has started.
FSP_ERR_ASSERTION	NULL provided for p_ctrl, p_cfg or p_callback if BGO is enabled.
FSP_ERR_IRQ_BSP_DISABLED	Caller is requesting BGO but the Flash interrupts are not enabled.
FSP_ERR_FCLK	FCLK must be a minimum of 4 MHz for Flash operations.
FSP_ERR_ALREADY_OPEN	Flash Open() has already been called.
FSP_ERR_TIMEOUT	Failed to exit P/E mode after configuring flash.
FSP_ERR_INVALID_STATE	The system is not running from the required clock or the required clock is not running and stable.

◆ R_FLASH_LP_Write()

fsp_err_t R_FLASH_LP_Write (flash_ctrl_t *const *p_api_ctrl*, uint32_t const *src_address*, uint32_t *flash_address*, uint32_t const *num_bytes*)

Write to the specified Code or Data Flash memory area. Implements flash_api_t::write.

Example:

```
/* Write 32 bytes to the first block of data flash. */
   err = R_FLASH_LP_Write(&g_flash_ctrl, (uint32_t) g_src, FLASH_DF_BLOCK_0,
FLASH_LP_EXAMPLE_WRITE_SIZE);
```

Return values

FSP_SUCCESS	Operation successful. If BGO is enabled this means the operation was started successfully.
FSP_ERR_IN_USE	The Flash peripheral is busy with a prior on-going transaction.
FSP_ERR_NOT_OPEN	The Flash API is not Open.
FSP_ERR_WRITE_FAILED	Status is indicating a Programming error for the requested operation. This may be returned if the requested Flash area is not blank.
FSP_ERR_TIMEOUT	Timed out waiting for FCU operation to complete.
FSP_ERR_INVALID_SIZE	Number of bytes provided was not a multiple of the programming size or exceeded the maximum range.
FSP_ERR_INVALID_ADDRESS	Invalid address was input or address not on programming boundary.
FSP_ERR_ASSERTION	NULL provided for p_ctrl.

◆ R_FLASH_LP_Erase()

fsp_err_t R_FLASH_LP_Erase (flash_ctrl_t *const *p_api_ctrl*, uint32_t const *address*, uint32_t const *num_blocks*)

Erase the specified Code or Data Flash blocks. Implements flash_api_t::erase.

Example:

```
/* Erase 1 block of data flash starting at block 0. */
   err = R_FLASH_LP_Erase(&g_flash_ctrl, FLASH_DF_BLOCK_0, 1);
```

Return values

FSP_SUCCESS	Successful open.
FSP_ERR_INVALID_BLOCKS	Invalid number of blocks specified
FSP_ERR_INVALID_ADDRESS	Invalid address specified
FSP_ERR_IN_USE	Other flash operation in progress, or API not initialized
FSP_ERR_ASSERTION	NULL provided for p_ctrl
FSP_ERR_NOT_OPEN	The Flash API is not Open.
FSP_ERR_TIMEOUT	Timed out waiting for FCU to be ready.
FSP_ERR_ERASE_FAILED	Status is indicating a Erase error.

◆ R_FLASH_LP_BlankCheck()

fsp_err_t R_FLASH_LP_BlankCheck (flash_ctrl_t *const *p_api_ctrl*, uint32_t const *address*, uint32_t *num_bytes*, flash_result_t * *p_blank_check_result*)

Perform a blank check on the specified address area. Implements flash_api_t::blankCheck.

Example:

```
/* Check if block 0 is erased. */
   err = R_FLASH_LP_BlankCheck(&g_flash_ctrl, FLASH_DF_BLOCK_0,
FLASH_DATA_BLOCK_SIZE, &blank_check_result);
   assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Blankcheck operation completed with result in p_blank_check_result, or blankcheck started and in-progess (BGO mode).
FSP_ERR_INVALID_ADDRESS	Invalid data flash address was input
FSP_ERR_INVALID_SIZE	'num_bytes' was either too large or not aligned for the CF/DF boundary size.
FSP_ERR_IN_USE	Flash is busy with an on-going operation.
FSP_ERR_ASSERTION	NULL provided for p_ctrl
FSP_ERR_NOT_OPEN	Flash API has not yet been opened.
FSP_ERR_TIMEOUT	Timed out waiting for the FCU to become ready.
FSP_ERR_BLANK_CHECK_FAILED	An error occurred during blank checking.

◆ R_FLASH_LP_StatusGet()

fsp_err_t R_FLASH_LP_StatusGet (flash_ctrl_t *const *p_api_ctrl*, flash_status_t *const *p_status*)

Query the FLASH for its status. Implements flash_api_t::statusGet.

Example:

```
flash_status_t status;
/* Wait until the current flash operation completes. */
do
   {
      err = R_FLASH_LP_StatusGet(&g_flash_ctrl, &status);
   } while ((FSP_SUCCESS == err) && (FLASH_STATUS_BUSY == status));
```

Return values

FSP_SUCCESS	Flash is ready and available to accept commands.
FSP_ERR_ASSERTION	NULL provided for p_ctrl
FSP_ERR_NOT_OPEN	Flash API has not yet been opened.

◆ R_FLASH_LP_AccessWindowSet()

fsp_err_t R_FLASH_LP_AccessWindowSet (flash_ctrl_t *const *p_api_ctrl*, uint32_t const *start_addr*, uint32_t const *end_addr*)

Configure an access window for the Code Flash memory. Implements flash_api_t::accessWindowSet .

An access window defines a contiguous area in Code Flash for which programming/erase is enabled. This area is on block boundaries. The block containing start_addr is the first block. The block containing end_addr is the last block. The access window then becomes first block (inclusive) –> last block (exclusive). Anything outside this range of Code Flash is then write protected. As an example, if you wanted to place an accesswindow on Code Flash Blocks 0 and 1, such that only those two blocks were writable, you would need to specify (address in block 0, address in block 2) as the respective start and end address.

Note

If the start address and end address are set to the same value, then the access window is effectively removed. This accomplishes the same functionality as R_FLASH_LP_AccessWindowClear().

The invalid address and programming boundaries supported and enforced by this function are dependent on the MCU in use as well as the part package size. Please see the User manual and/or requirements document for additional information.

Parameters

	p_api_ctrl	The p api control
[in]	start_addr	The start address
[in]	end_addr	The end address

Return values

FSP_SUCCESS	Access window successfully configured.
FSP_ERR_INVALID_ADDRESS	Invalid settings for start_addr and/or end_addr.
FSP_ERR_IN_USE	FLASH peripheral is busy with a prior operation.
FSP_ERR_ASSERTION	NULL provided for p_ctrl.
FSP_ERR_UNSUPPORTED	Code Flash Programming is not enabled.
FSP_ERR_NOT_OPEN	Flash API has not yet been opened.
FSP_ERR_TIMEOUT	Timed out waiting for the FCU to become ready.
FSP_ERR_WRITE_FAILED	Status is indicating a Programming error for the requested operation.

◆ R_FLASH_LP_AccessWindowClear()

fsp_err_t R_FLASH_LP_AccessWindowClear (flash_ctrl_t *const *p_api_ctrl*)

Remove any access window that is configured in the Code Flash. Implements flash_api_t::accessWindowClear. On successful return from this call all Code Flash is writable.

Return values

FSP_SUCCESS	Access window successfully removed.
FSP_ERR_IN_USE	FLASH peripheral is busy with a prior operation.
FSP_ERR_ASSERTION	NULL provided for p_ctrl.
FSP_ERR_UNSUPPORTED	Code Flash Programming is not enabled.
FSP_ERR_NOT_OPEN	Flash API has not yet been opened.
FSP_ERR_TIMEOUT	Timed out waiting for the FCU to become ready.
FSP_ERR_WRITE_FAILED	Status is indicating a Programming error for the requested operation.

◆ R_FLASH_LP_IdCodeSet()

fsp_err_t R_FLASH_LP_IdCodeSet (flash_ctrl_t *const *p_api_ctrl*, uint8_t const *const *p_id_code*, flash_id_code_mode_t *mode*)

Write the ID code provided to the id code registers. Implements flash_api_t::idCodeSet.

Return values

FSP_SUCCESS	ID code successfully configured.
FSP_ERR_IN_USE	FLASH peripheral is busy with a prior operation.
FSP_ERR_ASSERTION	NULL provided for p_ctrl.
FSP_ERR_UNSUPPORTED	Code Flash Programming is not enabled.
FSP_ERR_NOT_OPEN	Flash API has not yet been opened.
FSP_ERR_TIMEOUT	Timed out waiting for completion of extra command.
FSP_ERR_WRITE_FAILED	Status is indicating a Programming error for the requested operation.

◆ R_FLASH_LP_Reset()

fsp_err_t R_FLASH_LP_Reset (flash_ctrl_t *const *p_api_ctrl*)

Reset the FLASH peripheral. Implements flash_api_t::reset.

No attempt is made to check if the flash is busy before executing the reset since the assumption is that a reset will terminate any existing operation.

Return values

FSP_SUCCESS	Flash circuit successfully reset.
FSP_ERR_ASSERTION	NULL provided for p_ctrl
FSP_ERR_NOT_OPEN	Flash API has not yet been opened.

◆ R_FLASH_LP_StartUpAreaSelect()

fsp_err_t R_FLASH_LP_StartUpAreaSelect (flash_ctrl_t *const *p_api_ctrl*, flash_startup_area_swap_t *swap_type*, bool *is_temporary*)

Select which block is used as the startup area block. Implements flash_api_t::startupAreaSelect.

Selects which block - Default (Block 0) or Alternate (Block 1) is used as the startup area block. The provided parameters determine which block will become the active startup block and whether that action will be immediate (but temporary), or permanent subsequent to the next reset. Doing a temporary switch might appear to have limited usefulness. If there is an access window in place such that Block 0 is write protected, then one could do a temporary switch, update the block and switch them back without having to touch the access window.

Return values

FSP_SUCCESS	Start-up area successfully toggled.
FSP_ERR_IN_USE	Flash is busy with an on-going operation.
FSP_ERR_ASSERTION	NULL provided for p_ctrl
FSP_ERR_NOT_OPEN	Flash API has not yet been opened.
FSP_ERR_WRITE_FAILED	Status is indicating a Programming error for the requested operation.
FSP_ERR_TIMEOUT	Timed out waiting for the FCU to become ready.
FSP_ERR_UNSUPPORTED	Code Flash Programming is not enabled. Cannot set FLASH_STARTUP_AREA_BTFLG when the temporary flag is false.

◆ R_FLASH_LP_BankSwap()

fsp_err_t R_FLASH_LP_BankSwap (flash_ctrl_t *const *p_api_ctrl*)

Swap the Code Flash bank to update new program. Implement flash_api_t::bankSwap.

Swap the flash bank located at address 0x00000000 and address 0x00040000. After a bank swap is done the MCU will need to be reset for the changes to take place unless instant swap is enabled.

To use this API, Code Flash Programming in the FSP Configuration Tool under Stack Properties must be enabled.

Note

This function only available on MCUs which support bank swap feature.
When active bank is bank 1, startup program protection function is invalid.

Parameters

[in]	p_api_ctrl	The api control instance.

Return values

FSP_SUCCESS	Banks were swapped.
FSP_ERR_UNSUPPORTED	Module does not support Bank Swap.
FSP_ERR_ASSERTION	NULL provided for p_ctrl.
FSP_ERR_NOT_OPEN	The control block is not open.
FSP_ERR_IN_USE	Extra area is being used by other command.

◆ R_FLASH_LP_UpdateFlashClockFreq()

fsp_err_t R_FLASH_LP_UpdateFlashClockFreq (flash_ctrl_t *const *p_api_ctrl*)

Indicate to the already open Flash API that the FCLK has changed. Implements flash_api_t::updateFlashClockFreq.

This could be the case if the application has changed the system clock, and therefore the FCLK. Failure to call this function subsequent to changing the FCLK could result in damage to the flash macro.

Return values

FSP_SUCCESS	Start-up area successfully toggled.
FSP_ERR_IN_USE	Flash is busy with an on-going operation.
FSP_ERR_FCLK	Invalid flash clock source frequency.
FSP_ERR_ASSERTION	NULL provided for p_ctrl
FSP_ERR_NOT_OPEN	Flash API has not yet been opened.
FSP_ERR_TIMEOUT	Timed out waiting for the FCU to become ready.

◆ R_FLASH_LP_InfoGet()

fsp_err_t R_FLASH_LP_InfoGet (flash_ctrl_t *const *p_api_ctrl*, flash_info_t *const *p_info*)

Returns the information about the flash regions. Implements flash_api_t::infoGet.

Return values

FSP_SUCCESS	Successful retrieved the request information.
FSP_ERR_ASSERTION	NULL provided for p_ctrl or p_info.
FSP_ERR_NOT_OPEN	The flash is not open.

◆ R_FLASH_LP_Close()

fsp_err_t R_FLASH_LP_Close (flash_ctrl_t *const *p_api_ctrl*)

Release any resources that were allocated by the Flash API. Implements flash_api_t::close.

Return values

FSP_SUCCESS	Successful close.
FSP_ERR_ASSERTION	NULL provided for p_ctrl or p_cfg.
FSP_ERR_NOT_OPEN	Flash API has not yet been opened.
FSP_ERR_IN_USE	The flash is currently in P/E mode.

◆ R_FLASH_LP_CallbackSet()

fsp_err_t R_FLASH_LP_CallbackSet (flash_ctrl_t *const *p_api_ctrl*, void(*)(flash_callback_args_t *) *p_callback*, void const *const *p_context*, flash_callback_args_t *const *p_callback_memory*)

Stub function Implements flash_api_t::callbackSet.

Return values

FSP_ERR_UNSUPPORTED	Function has not been implemented.

◆ R_FLASH_LP_AntiRollbackCounterIncrement()

fsp_err_t R_FLASH_LP_AntiRollbackCounterIncrement (flash_ctrl_t *const *p_api_ctrl*, flash_arc_t *counter*)

Stub function Implements flash_api_t::antiRollbackCounterIncrement.

Return values

FSP_ERR_UNSUPPORTED	Function has not been implemented.

◆ R_FLASH_LP_AntiRollbackCounterRefresh()

fsp_err_t R_FLASH_LP_AntiRollbackCounterRefresh (flash_ctrl_t *const *p_api_ctrl*, flash_arc_t *counter*)

Stub function Implements flash_api_t::antiRollbackCounterRefresh.

Return values

FSP_ERR_UNSUPPORTED	Function has not been implemented.

◆ R_FLASH_LP_AntiRollbackCounterRead()

fsp_err_t R_FLASH_LP_AntiRollbackCounterRead (flash_ctrl_t *const *p_api_ctrl*, flash_arc_t *counter*, uint32_t *const *p_count*)

Stub function Implements flash_api_t::antiRollbackCounterRead.

Return values

FSP_ERR_UNSUPPORTED	Function has not been implemented.

◆ R_FLASH_LP_UserLockableAreaWrite()

fsp_err_t R_FLASH_LP_UserLockableAreaWrite (flash_ctrl_t *const *p_api_ctrl*, uint32_t const *src_address*, uint32_t *flash_address*, uint32_t const *num_bytes*)

Stub function Implements flash_api_t::userLockableAreaWrite.

Return values

FSP_ERR_UNSUPPORTED	Function has not been implemented.

Detailed Description

Middleware for the FAT File System control on RA MCUs.

Overview

This module provides the hardware port layer for FreeRTOS+FAT file system. After initializing this module, refer to the FreeRTOS+FAT API reference to use the file system: https://www.freertos.org/FreeRTOS-Plus/FreeRTOS_Plus_FAT/index.html

Features

The FreeRTOS+FAT port module supports the following features:

- Callbacks for insertion and removal for removable devices.
- Helper function to initialize FF_Disk_t
- Blocking read and write port functions that use FreeRTOS task notification to pend if FreeRTOS is used
- FreeRTOS is optional

Configuration

Build Time Configurations for rm_freertos_plus_fat

The following build time configurations are defined in fsp_cfg/middleware/rm_freertos_plus_fat_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Storage > FreeRTOS+FAT Port for RA (rm_freertos_plus_fat)

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_rm_freertos_plus_fat0	Module name.
Total Number of Sectors	Must be a non-negative integer	31293440	Enter the total number of sectors on the device. If this is not known, update rm_freertos_plus_fat_disk_cfg_t::num_blocks after calling RM_FREERTOS_PLUS_FAT_MediaInit().
Sector Size (bytes)	Must be a power of 2 multiple of 512	512	Select the sector size. Must match the underlying media sector size and at least 512. If this is not known, update rm_freertos_plus_fat_disk_cfg_t::num_blocks after calling RM_FREERTOS_PLUS_FAT_MediaInit().
Cache Size (bytes)	Must be a power of 2 multiple of 512	1024	Select the cache size. Must be a multiple of the sector size and at least 2 times the sector size.
Partition Number	Must be a non-negative integer	0	Select the partition number for this disk.
Callback	Name must be a valid C symbol	NULL	A user callback function can be provided. If this callback function is provided, it will be called when a card is inserted or removed.

Usage Notes

Pending during Read/Write

If the underlying driver supports non-blocking operations, the FreeRTOS+FAT port pends the active

FreeRTOS task during read and write operations so other tasks can run in the background.

If FreeRTOS is not used, the FreeRTOS+FAT port spins in a while loop waiting for read and write operations to complete.

FreeRTOS+FAT without FreeRTOS

To use FreeRTOS+FAT without FreeRTOS, copy FreeRTOSConfigMinimal.h to one of your project's include paths and rename it FreeRTOSConfig.h.

Also, update the Malloc function to malloc and the Free function to free in the Common configurations.

Examples

Basic Example

This is a basic example of FreeRTOS+FAT in an application.

```
#define RM_FREERTOS_PLUS_FAT_EXAMPLE_FILE_NAME "TEST_FILE.txt"
#define RM_FREERTOS_PLUS_FAT_EXAMPLE_BUFFER_SIZE_BYTES (10240)
#define RM_FREERTOS_PLUS_FAT_EXAMPLE_PARTITION_NUMBER (0)
extern rm_freertos_plus_fat_instance_ctrl_t g_freertos_plus_fat0_ctrl;
extern const rm_freertos_plus_fat_cfg_t g_freertos_plus_fat0_cfg;
extern rm_freertos_plus_fat_disk_cfg_t g_rm_freertos_plus_fat_disk_cfg;
extern uint8_t g_file_data[RM_FREERTOS_PLUS_FAT_EXAMPLE_BUFFER_SIZE_BYTES];
extern uint8_t g_read_buffer[RM_FREERTOS_PLUS_FAT_EXAMPLE_BUFFER_SIZE_BYTES];
void rm_freertos_plus_fat_example (void)
{
 /* Open media driver.*/
 fsp_err_t err = RM_FREERTOS_PLUS_FAT_Open(&g_freertos_plus_fat0_ctrl,
&g_freertos_plus_fat0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Initialize the media and the disk. If the media is removable, it must be inserted
before calling
  * RM_FREERTOS_PLUS_FAT_MediaInit. */
    err = RM_FREERTOS_PLUS_FAT_MediaInit(&g_freertos_plus_fat0_ctrl,
&g_rm_freertos_plus_fat_disk_cfg.device);
    assert(FSP_SUCCESS == err);
 /* Initialize one disk for each partition used in the application. */
```

```
    FF_Disk_t disk;
    err = RM_FREERTOS_PLUS_FAT_DiskInit(&g_freertos_plus_fat0_ctrl,
&g_rm_freertos_plus_fat_disk_cfg, &disk);
    assert(FSP_SUCCESS == err);
 /* Mount each disk. This assumes the disk is already partitioned and formatted. */
    FF_Error_t ff_err = FF_Mount(&disk,
RM_FREERTOS_PLUS_FAT_EXAMPLE_PARTITION_NUMBER);
    handle_ff_error(ff_err);
 /* Add the disk to the file system. */
    FF_FS_Add("/", &disk);
 /* Open a source file for writing. */
    FF_FILE * pxSourceFile = ff_fopen((const char *)
RM_FREERTOS_PLUS_FAT_EXAMPLE_FILE_NAME, "w");
    assert(NULL != pxSourceFile);
 /* Write file data. */
 size_t size_return = ff_fwrite(g_file_data, sizeof(g_file_data), 1, pxSourceFile);
    assert(1 == size_return);
 /* Close the file. */
 int close_err = ff_fclose(pxSourceFile);
    assert(0 == close_err);
 /* Open the source file in read mode. */
    pxSourceFile = ff_fopen((const char *) RM_FREERTOS_PLUS_FAT_EXAMPLE_FILE_NAME,
"r");
    assert(NULL != pxSourceFile);
 /* Read file data. */
    size_return = ff_fread(g_read_buffer, sizeof(g_file_data), 1, pxSourceFile);
    assert(1 == size_return);
 /* Close the file. */
    close_err = ff_fclose(pxSourceFile);
    assert(0 == close_err);
 /* Verify the file data read matches the file written. */
    assert(0U == memcmp(g_file_data, g_read_buffer, sizeof(g_file_data)));
}
```

Format Example

This shows how to partition and format a disk if it is not already partitioned and formatted.

```
void rm_freertos_plus_fat_format_example (void)
{
 /* Open media driver.*/
 fsp_err_t err = RM_FREERTOS_PLUS_FAT_Open(&g_freertos_plus_fat0_ctrl,
&g_freertos_plus_fat0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Initialize the media and the disk. If the media is removable, it must be inserted
before calling
  * RM_FREERTOS_PLUS_FAT_MediaInit. */
    err = RM_FREERTOS_PLUS_FAT_MediaInit(&g_freertos_plus_fat0_ctrl,
&g_rm_freertos_plus_fat_disk_cfg.device);
    assert(FSP_SUCCESS == err);
 /* Initialize one disk for each partition used in the application. */
    FF_Disk_t disk;
    err = RM_FREERTOS_PLUS_FAT_DiskInit(&g_freertos_plus_fat0_ctrl,
&g_rm_freertos_plus_fat_disk_cfg, &disk);
    assert(FSP_SUCCESS == err);
 /* Try to mount the disk. If the disk is not formatted, mount will fail. */
    FF_Error_t ff_err = FF_Mount(&disk,
RM_FREERTOS_PLUS_FAT_EXAMPLE_PARTITION_NUMBER);
 if (FF_isERR((uint32_t) ff_err))
    {
 /* The disk is likely not formatted. Partition and format the disk, then mount
again. */
       FF_PartitionParameters_t partition_params;
       partition_params.ulSectorCount   =
g_rm_freertos_plus_fat_disk_cfg.device.sector_count;
       partition_params.ulHiddenSectors = 1;
       partition_params.ulInterSpace    = 0;
       memset(partition_params.xSizes, 0, sizeof(partition_params.xSizes));
       partition_params.xSizes[RM_FREERTOS_PLUS_FAT_EXAMPLE_PARTITION_NUMBER] =
```

```
            (BaseType_t) partition_params.ulSectorCount - 1;
       partition_params.xPrimaryCount = 1;
       partition_params.eSizeType    = eSizeIsSectors;
       ff_err = FF_Partition(&disk, &partition_params);
      handle_ff_error(ff_err);
       ff_err = FF_Format(&disk, RM_FREERTOS_PLUS_FAT_EXAMPLE_PARTITION_NUMBER,
pdFALSE, pdFALSE);
      handle_ff_error(ff_err);
       ff_err = FF_Mount(&disk, RM_FREERTOS_PLUS_FAT_EXAMPLE_PARTITION_NUMBER);
      handle_ff_error(ff_err);
    }
}
```

Media Insertion Example

This shows how to use the callback to wait for media insertion.

```
#if 2 == BSP_CFG_RTOS
static EventGroupHandle_t xUSBEventGroupHandle = NULL;
#else
volatile uint32_t g_rm_freertos_plus_fat_insertion_events = 0;
volatile uint32_t g_rm_freertos_plus_fat_removal_events = 0;
#endif
/* Callback called by media driver when a removable device is inserted or removed. */
void rm_freertos_plus_fat_test_callback (rm_freertos_plus_fat_callback_args_t *
p_args)
{
#if 2 == BSP_CFG_RTOS
 /* Post an event if FreeRTOS is available. */
    BaseType_t xHigherPriorityTaskWoken = pdFALSE;
    xEventGroupSetBitsFromISR(xUSBEventGroupHandle, p_args->event,
&xHigherPriorityTaskWoken);
    portYIELD_FROM_ISR(xHigherPriorityTaskWoken);
#else
 /* If FreeRTOS is not used, set a global flag. */
```

```
 if (p_args->event & RM_FREERTOS_PLUS_FAT_EVENT_MEDIA_INSERTED)
    {
       g_rm_freertos_plus_fat_insertion_events++;
    }
 if (p_args->event & RM_FREERTOS_PLUS_FAT_EVENT_MEDIA_REMOVED)
    {
       g_rm_freertos_plus_fat_removal_events++;
    }
#endif
}
void rm_freertos_plus_fat_media_insertion_example (void)
{
#if 2 == BSP_CFG_RTOS
 /* Create event flags if FreeRTOS is used. */
    xUSBEventGroupHandle = xEventGroupCreate();
    TEST_ASSERT_NOT_EQUAL(NULL, xUSBEventGroupHandle);
#endif
 /* Open media driver.*/
 fsp_err_t err = RM_FREERTOS_PLUS_FAT_Open(&g_freertos_plus_fat0_ctrl,
&g_freertos_plus_fat0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Wait for media insertion. */
#if 2 == BSP_CFG_RTOS
    EventBits_t xEventGroupValue = xEventGroupWaitBits(xUSBEventGroupHandle,
 RM_FREERTOS_PLUS_FAT_EVENT_MEDIA_INSERTED,
                                                       pdTRUE,
                                                       pdFALSE,
                                                       portMAX_DELAY);
    assert(RM_FREERTOS_PLUS_FAT_EVENT_MEDIA_INSERTED ==
          (RM_FREERTOS_PLUS_FAT_EVENT_MEDIA_INSERTED & xEventGroupValue));
#else
 while (0U == g_rm_freertos_plus_fat_insertion_events)
    {
```

```
 /* Wait for media insertion. */
    }
#endif
 /* Initialize the media and the disk. If the media is removable, it must be inserted
before calling
  * RM_FREERTOS_PLUS_FAT_MediaInit. */
    err = RM_FREERTOS_PLUS_FAT_MediaInit(&g_freertos_plus_fat0_ctrl,
&g_rm_freertos_plus_fat_disk_cfg.device);
    assert(FSP_SUCCESS == err);
 /* Initialize one disk for each partition used in the application. */
    FF_Disk_t disk;
    err = RM_FREERTOS_PLUS_FAT_DiskInit(&g_freertos_plus_fat0_ctrl,
&g_rm_freertos_plus_fat_disk_cfg, &disk);
    assert(FSP_SUCCESS == err);
}
```

Media Insertion Example for USB

This shows how to use the callback to read and write to USB media.

```
void rm_freertos_plus_fat_usb_example (void)
{
#if 2 == BSP_CFG_RTOS
 /* Create event flags if FreeRTOS is used. */
    xUSBEventGroupHandle = xEventGroupCreate();
#endif
 /* Open media driver.*/
 fsp_err_t err = RM_FREERTOS_PLUS_FAT_Open(&g_freertos_plus_fat0_ctrl,
&g_freertos_plus_fat0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Wait for the USB media to be attached. */
#if 2 == BSP_CFG_RTOS
    EventBits_t xEventGroupValue = xEventGroupWaitBits(xUSBEventGroupHandle,
 RM_FREERTOS_PLUS_FAT_EVENT_MEDIA_INSERTED,
```

```
                                                    pdTRUE,
                                                    pdFALSE,
                                                    portMAX_DELAY);
    assert(RM_FREERTOS_PLUS_FAT_EVENT_MEDIA_INSERTED ==
          (RM_FREERTOS_PLUS_FAT_EVENT_MEDIA_INSERTED & xEventGroupValue));
#else
 while (0U == g_rm_freertos_plus_fat_insertion_events)
    {
 /* Wait for the USB media to be attached. */
    }
#endif
 /* Initialize the media and the disk. If the media is removable, it must be inserted
before calling
  * RM_FREERTOS_PLUS_FAT_MediaInit. */
    err = RM_FREERTOS_PLUS_FAT_MediaInit(&g_freertos_plus_fat0_ctrl,
&g_rm_freertos_plus_fat_disk_cfg.device);
    assert(FSP_SUCCESS == err);
 /* Initialize one disk for each partition used in the application. */
    FF_Disk_t disk;
    err = RM_FREERTOS_PLUS_FAT_DiskInit(&g_freertos_plus_fat0_ctrl,
&g_rm_freertos_plus_fat_disk_cfg, &disk);
    assert(FSP_SUCCESS == err);
 /* Mount each disk. This assumes the disk is already partitioned and formatted. */
    FF_Error_t ff_err = FF_Mount(&disk,
RM_FREERTOS_PLUS_FAT_EXAMPLE_PARTITION_NUMBER);
    handle_ff_error(ff_err);
 /* Add the disk to the file system. */
    FF_FS_Add("/", &disk);
 /* Open a source file for writing. */
    FF_FILE * pxSourceFile = ff_fopen((const char *)
RM_FREERTOS_PLUS_FAT_EXAMPLE_FILE_NAME, "w");
    assert(NULL != pxSourceFile);
 /* Write file data. */
 size_t size_return = ff_fwrite(g_file_data, sizeof(g_file_data), 1, pxSourceFile);
```

```
    assert(1 == size_return);
 /* Close the file. */
 int close_err = ff_fclose(pxSourceFile);
    assert(0 == close_err);
 /* Open the source file in read mode. */
    pxSourceFile = ff_fopen((const char *) RM_FREERTOS_PLUS_FAT_EXAMPLE_FILE_NAME,

    assert(NULL != pxSourceFile);
 /* Read file data. */
    size_return = ff_fread(g_read_buffer, sizeof(g_file_data), 1, pxSourceFile);
    assert(1 == size_return);
 /* Close the file. */
    close_err = ff_fclose(pxSourceFile);
    assert(0 == close_err);
 /* Verify the file data read matches the file written. */
    assert(0U == memcmp(g_file_data, g_read_buffer, sizeof(g_file_data)));
}
```

Data Structures

struct	rm_freertos_plus_fat_instance_ctrl_t

Data Structure Documentation

◆ rm_freertos_plus_fat_instance_ctrl_t

struct rm_freertos_plus_fat_instance_ctrl_t
FreeRTOS plus FAT private control block. DO NOT MODIFY. Initialization occurs when RM_FREERTOS_PLUS_FAT_Open is called.

Function Documentation

◆ RM_FREERTOS_PLUS_FAT_Open()

fsp_err_t RM_FREERTOS_PLUS_FAT_Open (rm_freertos_plus_fat_ctrl_t *const *p_ctrl*, rm_freertos_plus_fat_cfg_t const *const *p_cfg*)

Initializes lower layer media device.

Implements rm_freertos_plus_fat_api_t::open().

Return values

FSP_SUCCESS	Success.
FSP_ERR_ASSERTION	An input parameter was invalid.
FSP_ERR_ALREADY_OPEN	Module is already open.
FSP_ERR_OUT_OF_MEMORY	Not enough memory to create semaphore.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:
- rm_block_media_api_t::open

◆ RM_FREERTOS_PLUS_FAT_MediaInit()

fsp_err_t RM_FREERTOS_PLUS_FAT_MediaInit (rm_freertos_plus_fat_ctrl_t *const *p_ctrl*, rm_freertos_plus_fat_device_t *const *p_device*)

Initializes the media device. This function blocks until all identification and configuration commands are complete.

Implements rm_freertos_plus_fat_api_t::mediaInit().

Return values

FSP_SUCCESS	Module is initialized and ready to access the memory device.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module has not been initialized.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:
- rm_block_media_api_t::mediaInit
- rm_block_media_api_t::infoGet

◆ RM_FREERTOS_PLUS_FAT_DiskInit()

fsp_err_t RM_FREERTOS_PLUS_FAT_DiskInit (rm_freertos_plus_fat_ctrl_t *const *p_ctrl*, rm_freertos_plus_fat_disk_cfg_t const *const *p_disk_cfg*, FF_Disk_t *const *p_disk*)

Initializes a FreeRTOS+FAT disk structure. This function calls FF_CreateIOManger.

Implements rm_freertos_plus_fat_api_t::diskInit().

Return values

FSP_SUCCESS	Module is initialized and ready to access the memory device.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module has not been initialized.
FSP_ERR_INTERNAL	Call to FF_CreateIOManger failed.

◆ RM_FREERTOS_PLUS_FAT_DiskDeinit()

fsp_err_t RM_FREERTOS_PLUS_FAT_DiskDeinit (rm_freertos_plus_fat_ctrl_t *const *p_ctrl*, FF_Disk_t *const *p_disk*)

Deinitializes a FreeRTOS+FAT disk structure. This function calls FF_DeleteIOManger.

Implements rm_freertos_plus_fat_api_t::diskDeinit().

Return values

FSP_SUCCESS	Module is initialized and ready to access the memory device.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module has not been initialized.

◆ RM_FREERTOS_PLUS_FAT_InfoGet()

fsp_err_t RM_FREERTOS_PLUS_FAT_InfoGet (rm_freertos_plus_fat_ctrl_t *const *p_ctrl*, FF_Disk_t *const *p_disk*, rm_freertos_plus_fat_info_t *const *p_info*)

Get partition information. This function can only be called after rm_freertos_plus_fat_api_t::diskInit() .

Implements rm_freertos_plus_fat_api_t::infoGet().

Return values

FSP_SUCCESS	Information stored in p_info.
FSP_ERR_ASSERTION	An input parameter was invalid.
FSP_ERR_NOT_OPEN	Module not open.
FSP_ERR_NOT_FOUND	The value of p_iomanager is NULL.

◆ RM_FREERTOS_PLUS_FAT_Close()

fsp_err_t RM_FREERTOS_PLUS_FAT_Close (rm_freertos_plus_fat_ctrl_t *const *p_ctrl*)

Closes media device.

Implements rm_freertos_plus_fat_api_t::close().

Return values

FSP_SUCCESS	Media device closed.
FSP_ERR_ASSERTION	An input parameter was invalid.
FSP_ERR_NOT_OPEN	Module not open.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:
- rm_block_media_api_t::close

Detailed Description

Middleware for using Azure RTOS LevelX on NOR SPI memory.

Overview

This module provides the hardware port layer for LevelX on NOR SPI flash memory. Setup for this module is done solely through calling LevelX APIs. Please refer to the LevelX API reference: https://docs.microsoft.com/en-us/azure/rtos/levelx/

Configuration

Build Time Configurations for rm_levelx_nor_spi

The following build time configurations are defined in fsp_cfg/middleware/rm_levelx_nor_spi_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	Selects if code for parameter checking is to be included in the

			build.
Page Buffer Size (bytes)	Size should be greater than zero	256	When direct read is enabled in LevelX a situation can occur where the driver has to write to SPI memory with the source locaiton also being within the SPI memory address range. In this situation the driver needs a buffer that is at least the same size as a page in order to temporarily store data to write out.

Configurations for Storage > LevelX NOR Port (rm_levelx_nor_spi)

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_rm_levelx_nor_spi0	Module name.
Memory Start Adress Offset (bytes)	Offset should be greater than or equal to zero	0	Enter the starting offset to use in the SPI memory. The starting address for LevelX memory will be the SPI memory base address plus this offset.
Memory Size (bytes)	Size should be greater than zero	33554432	Enter the size that the LevelX Memory should be. This can be smaller than the SPI memory size in order to use a subset of SPI memory.
Poll Status Count	Poll Status Count should be greater than or equal to zero	0xFFFFFFFF	Number of times to poll for operation complete status for blocking memory operations.

Build Time Configurations for lx

The following build time configurations are defined in fsp_cfg/azure/lx/lx_user.h:

Configuration	Options	Default	Description
NOR			
Direct Read	• Enabled (default) • Disabled	Enabled (default)	When enabled, this option bypasses the NOR flash driver read routine in favor or

			reading the NOR memory directly, resulting in a significant performance increase.
Free Sector Data Verify	• Enabled • Disabled (default)	Disabled (default)	When enabled, this causes the LevelX NOR instance open logic to verify free NOR sectors are all ones.
Extended Cache	• Enabled (default) • Disabled	Enabled (default)	Enables the extended NOR cache.
Extended Cache Size	Manual Entry		If not set this value defaults to 8, which represents a maximum of 8 sectors that can be cached in a NOR instance.
Sector Mapping Cache Size	Value must be greater than or equal to 8 and a power of 2, or empty		If not set this value defaults to 16 and defines the logical sector mapping cache size. Large values improve performance, but cost memory. The minimum size is 8 and all values must be a power of 2.
NAND			
Sector Mapping Cache Size	Value must be greater than or equal to 8 and a power of 2, or empty		If not set this value defaults to 128 and defines the logical sector mapping cache size. Large values improve performance, but cost memory. The minimum size is 8 and all values must be a power of 2.
Flash Direct Mapping Cache	• Enabled • Disabled (default)	Disabled (default)	When enabled, this creates a direct mapping cache, such that there are no cache misses. It also required that LX_NAND_SECTOR_MAPPING_CACHE_SIZE represents the exact number of total pages in your flash device.

Thread Safe	• Enabled • Disabled (default)	Disabled (default)	When enabled, this makes LevelX thread-safe by using a ThreadX mutex object throughout the API.
Standalone Mode	• Enabled • Disabled (default)	Disabled (default)	When enabled, allows LevelX to be used in standalone mode (without Azure RTOS).

Usage Notes

Pending during Erase/Write

The LevelX NOR SPI driver is blocking on all SPI operations and will poll device status for operation completion on Writes and Erases. A callback can be provided by the user to wait with an OS-specific thread wait in these instances.

Closing the driver

When lx_nor_flash_close is called to close the LevelX instance it does not call any services within the LevelX NOR SPI driver to close out the driver instance. The user should call the generated close function (i.e. g_rm_levelx_nor_spi0_close) in order to close out the driver instance.

Erasing Flash Memory Prior to Usage

The area of the flash memory being used for the LevelX instance should be erased using the lower level flash API prior to usage. Otherwise, LevelX API may fail on lx_nor_flash_open due to any areas in flash memory that have been written/set.

Examples

Basic Example

This is a basic example of using the LevelX NOR SPI driver with the LevelX API in an application.

```
#define RM_LEVELX_NOR_SPI_EXAMPLE_SECTOR_SIZE (512)
#define RM_LEVELX_NOR_SPI_EXAMPLE_BUFFER_FILL_VALUE (0xA5)
#define RM_LEVELX_NOR_SPI_EXAMPLE_SPI_SECTOR_SIZE (4096)
extern rm_levelx_nor_spi_instance_ctrl_t g_levelx_nor_spi0_ctrl;
extern rm_levelx_nor_spi_cfg_t g_levelx_nor_spi0_cfg;
extern LX_NOR_FLASH g_lx_nor_flash0;
void rm_levelx_nor_spi_example (void)
{
    uint8_t               read_buffer[RM_LEVELX_NOR_SPI_EXAMPLE_SECTOR_SIZE];
    uint8_t               write_buffer[RM_LEVELX_NOR_SPI_EXAMPLE_SECTOR_SIZE];
```

```
 spi_flash_instance_t * p_spi_flash_instance = (spi_flash_instance_t *)
g_levelx_nor_spi0_cfg.p_lower_lvl;
 spi_flash_status_t    status;
    memset(write_buffer, RM_LEVELX_NOR_SPI_EXAMPLE_BUFFER_FILL_VALUE, sizeof
(write_buffer));
 /* Erase flash prior to usage */
 fsp_err_t err = p_spi_flash_instance->p_api->open(p_spi_flash_instance->p_ctrl,
p_spi_flash_instance->p_cfg);
    assert(FSP_SUCCESS == err);
 for (uint32_t i = g_levelx_nor_spi0_cfg.address_offset;
         i < g_levelx_nor_spi0_cfg.size;
         i += RM_LEVELX_NOR_SPI_EXAMPLE_SPI_SECTOR_SIZE)
    {
       err = p_spi_flash_instance->p_api->erase(p_spi_flash_instance->p_ctrl,
                                                (uint8_t *)
g_levelx_nor_spi0_cfg.base_address + i,

RM_LEVELX_NOR_SPI_EXAMPLE_SPI_SECTOR_SIZE);
      assert(FSP_SUCCESS == err);
       status.write_in_progress = true;
 while (status.write_in_progress)
      {
           err =
p_spi_flash_instance->p_api->statusGet(p_spi_flash_instance->p_ctrl, &status);
      assert(FSP_SUCCESS == err);
       }
    }
    err = p_spi_flash_instance->p_api->close(p_spi_flash_instance->p_ctrl);
    assert(FSP_SUCCESS == err);
 /* Initialize LevelX */
    lx_nor_flash_initialize();
    UINT lx_err = lx_nor_flash_open(&g_lx_nor_flash0, "LX_NOR_SPI_EXAMPLE",
g_levelx_nor_spi0_initialize);
    handle_lx_error(lx_err);
```

```
 /* Write test value to sector 0 then read back to verify */
    lx_err = lx_nor_flash_sector_write(&g_lx_nor_flash0, 0, write_buffer);
    handle_lx_error(lx_err);
    lx_err = lx_nor_flash_sector_read(&g_lx_nor_flash0, 0, read_buffer);
    handle_lx_error(lx_err);
    assert(0 == memcmp(read_buffer, write_buffer, sizeof(read_buffer)));
}
```

Callback Wait Example

This shows how to use the LevelX NOR SPI driver callback with ThreadX in order to wait for operations to complete.

```
/* Callback called by LevelX NOR SPI driver needs to wait on operation. */
void rm_levelx_nor_spi_callback_wait_example (rm_levelx_nor_spi_callback_args_t *
p_args)
{
 if (p_args->event & RM_LEVELX_NOR_SPI_EVENT_BUSY)
    {
 /* Put the thread to sleep while waiting for operation to complete. */
       tx_thread_sleep(1);
    }
}
```

Data Structures

struct	rm_levelx_nor_spi_callback_args_t
struct	rm_levelx_nor_spi_cfg_t
struct	rm_levelx_nor_spi_instance_ctrl_t

Enumerations

enum	rm_levelx_nor_spi_event_t

Data Structure Documentation

◆ rm_levelx_nor_spi_callback_args_t

struct rm_levelx_nor_spi_callback_args_t
RM_LEVELX_NOR_SPI callback arguments definitions

Data Fields		
rm_levelx_nor_spi_event_t	event	LevelX NOR driver callback event.
void const *	p_context	Placeholder for user data.

◆ rm_levelx_nor_spi_cfg_t

struct rm_levelx_nor_spi_cfg_t	
SF_EL_LX_NOR Config Block Type	
Data Fields	
spi_flash_instance_t const *	p_lower_lvl
	Lower level memory pointer.
LX_NOR_FLASH *	p_lx_nor_flash
	Pointer to the LevelX nor flash instance.
uint32_t	base_address
	Base address of memory mapped region.
uint32_t	address_offset
	Offset to use subset of available flash size if desired.
uint32_t	size
	Size of the partitioned region.
uint32_t	poll_status_count
	Number of times to poll for operation complete status before returning an error.
void const *	p_context
	Placeholder for user data. Passed to the user callback.

void(*	p_callback)(rm_levelx_nor_spi_callback_args_t *p_args)
	Callback function.

◆ rm_levelx_nor_spi_instance_ctrl_t

struct rm_levelx_nor_spi_instance_ctrl_t		
SF_EL_LX_NOR Control Block Type		
Data Fields		
rm_levelx_nor_spi_cfg_t const *	p_cfg	Pointer to instance configuration.
uint32_t	start_address	Start address of partition to use within memory mapped region.
uint32_t	minimum_erase_size	Minimum erase size of SPI memory.
uint8_t	page_buffer[RM_LEVELX_NOR_SPI_CFG_BUFFER_SIZE]	Page buffer for situations when writing to SPI memory from a source within SPI memory.
uint32_t	open	Used to determine if module is initialized.

Enumeration Type Documentation

◆ rm_levelx_nor_spi_event_t

enum rm_levelx_nor_spi_event_t	
Common macro for FSP header files. There is also a corresponding FSP_FOOTER macro at the end of this file. Options for the callback events.	
Enumerator	
RM_LEVELX_NOR_SPI_EVENT_BUSY	Pending operation, user can define their own wait functionality.

Function Documentation

◆ RM_LEVELX_NOR_SPI_Open()

fsp_err_t RM_LEVELX_NOR_SPI_Open (rm_levelx_nor_spi_instance_ctrl_t *const *p_ctrl*, rm_levelx_nor_spi_cfg_t const *const *p_cfg*)

Initializes LevelX NOR SPI port read/write and control.

Calls lower level SPI memory functions.

Parameters

[in,out]	p_ctrl	Control block for the LevelX NOR SPI instance.
[in,out]	p_cfg	Configuration for LevelX NOR SPI port.

Return values

FSP_SUCCESS	LevelX NOR driver is successfully opened.
FSP_ERR_ASSERTION	p_ctrl or p_cfg is NULL.
FSP_ERR_ALREADY_OPEN	Driver is already in OPEN state.

Returns

See Common_Error_Codes or lower level drivers for other possible return codes. This function calls

- spi_flash_api_t:open

◆ RM_LEVELX_NOR_SPI_Read()

fsp_err_t RM_LEVELX_NOR_SPI_Read (rm_levelx_nor_spi_instance_ctrl_t *const *p_ctrl*, ULONG *const *p_flash_addr*, ULONG *const *p_dest*, ULONG *word_count*)

LevelX NOR driver "read sector" service.

This is responsible for reading a specific sector in a specific block of the NOR flash. All error checking and correcting logic is the responsibility of this service.

Parameters

[in]	p_ctrl	Control block for the LevelX NOR SPI instance.
[in]	p_flash_addr	Specifies the address of a logical sector within a NOR flash block of memory.
[in,out]	p_dest	Specifies where to place the sector contents.
[in]	word_count	Specifies how many 32-bit words to read.

Return values

FSP_SUCCESS	LevelX NOR flash sector read successful.
FSP_ERR_ASSERTION	p_ctrl, p_flash_addr or p_dest is NULL.
FSP_ERR_NOT_OPEN	Driver not in OPEN state for reading.

Returns

See Common_Error_Codes or lower level drivers for other possible return codes.

◆ RM_LEVELX_NOR_SPI_Write()

fsp_err_t RM_LEVELX_NOR_SPI_Write (rm_levelx_nor_spi_instance_ctrl_t *const *p_ctrl*, ULONG *const *p_flash_addr*, ULONG *const *p_src*, ULONG *word_count*)

LevelX NOR driver "write sector" service.

This is responsible for writing a specific sector into a block of the NOR flash. All error checking is the responsibility of the this service.

Parameters

[in]	p_ctrl	Control block for the LevelX NOR SPI instance.
[in,out]	p_flash_addr	Specifies the address of a logical sector within a NOR flash block of memory.
[in]	p_src	Specifies the source of the write.
[in]	word_count	Specifies how many 32-bit words to write.

Return values

FSP_SUCCESS	LevelX NOR flash sector write successful.
FSP_ERR_ASSERTION	p_ctrl, p_flash_addr or p_src is NULL.
FSP_ERR_NOT_OPEN	Driver not in OPEN state for writing.
FSP_ERR_TIMEOUT	Timeout occurred while waiting for operation to complete.
FSP_ERR_WRITE_FAILED	Verification of Write operation failed.
FSP_ERR_INVALID_ADDRESS	Write address or size falls outside of flash memory range.

Returns

See Common_Error_Codes or lower level drivers for other possible return codes. This function calls

- spi_flash_api_t:write

◆ RM_LEVELX_NOR_SPI_BlockErase()

fsp_err_t RM_LEVELX_NOR_SPI_BlockErase (rm_levelx_nor_spi_instance_ctrl_t *const *p_ctrl*, ULONG *block*, ULONG *erase_count*)

LevelX NOR driver "block erase" service.

This is responsible for erasing the specified block of the NOR flash.

Parameters

[in]	p_ctrl	Control block for the LevelX NOR SPI instance.
[in]	block	Specifies which NOR block to erase.
[in]	erase_count	Provided for diagnostic purposes(currently unused).

Return values

FSP_SUCCESS	LevelX NOR flash block erase successful.
FSP_ERR_ASSERTION	p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Driver not in OPEN state for erasing.
FSP_ERR_TIMEOUT	Timeout occurred while waiting for operation to complete.

Returns

See Common_Error_Codes or lower level drivers for other possible return codes. This function calls

- spi_flash_api_t:erase

◆ RM_LEVELX_NOR_SPI_BlockErasedVerify()

fsp_err_t RM_LEVELX_NOR_SPI_BlockErasedVerify (rm_levelx_nor_spi_instance_ctrl_t *const *p_ctrl*, ULONG *block*)

LevelX NOR driver "block erased verify" service.

This is responsible for verifying the specified block of the NOR flash is erased.

Parameters

[in]	p_ctrl	Control block for the LevelX NOR SPI instance.
[in]	block	Specifies which block to verify that it is erased.

Return values

FSP_SUCCESS	LevelX flash block erase verification successful.
FSP_ERR_ASSERTION	p_ctrl or lower level driver is NULL.
FSP_ERR_NOT_OPEN	Driver not in OPEN state for verifying.
FSP_ERR_NOT_ERASED	The block is not erased properly.

Returns

See Common_Error_Codes or lower level drivers for other possible return codes.

◆ RM_LEVELX_NOR_SPI_Close()

fsp_err_t RM_LEVELX_NOR_SPI_Close (rm_levelx_nor_spi_instance_ctrl_t *const *p_ctrl*)

LevelX NOR driver close service.

This is responsible for closing the driver properly.

Parameters

[in]	p_ctrl	Control block for the LevelX NOR SPI instance.

Return values

FSP_SUCCESS	LevelX flash is available and is now open for read, write, and control access.
FSP_ERR_ASSERTION	p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Driver not in OPEN state for closing.

Returns

See Common_Error_Codes or lower level drivers for other possible return codes. This function calls

- spi_flash_api_t:close

7.2.17.12 LittleFS on Flash (rm_littlefs_flash)

Modules » Storage

Functions

fsp_err_t	RM_LITTLEFS_FLASH_Open (rm_littlefs_ctrl_t *const p_ctrl, rm_littlefs_cfg_t const *const p_cfg)
fsp_err_t	RM_LITTLEFS_FLASH_Close (rm_littlefs_ctrl_t *const p_ctrl)

Detailed Description

Middleware for the LittleFS File System control on RA MCUs.

Overview

This module provides the hardware port layer for the LittleFS file system. After initializing this module, refer to the LittleFS documentation to use the file system:
https://github.com/ARMmbed/littlefs

Configuration

Build Time Configurations for rm_littlefs_flash

The following build time configurations are defined in fsp_cfg/rm_littlefs_flash_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Storage > LittleFS on Flash (rm_littlefs_flash)

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_rm_littlefs0	Module name.
Read Size	Must be a non-negative integer	1	Minimum size of a block read. All read operations will be a multiple of this value.
Program Size	Must be a non-negative integer	4	Minimum size of a block program. All program operations will be a multiple of this value.

Block Size (bytes)	Must be a multiple of 64	128	Size of an erasable block. This does not impact RAM consumption and may be larger than the physical erase size. However, non-inlined files take up at minimum one block. Must be a multiple of the read and program sizes.
Block Count	Manual Entry	(BSP_DATA_FLASH_SIZE_BYTES/128)	Number of erasable blocks on the device.
Block Cycles	Must be an integer	1024	Number of erase cycles before LittleFS evicts metadata logs and moves the metadata to another block. Suggested values are in the range 100-1000, with large values having better performance at the cost of less consistent wear distribution. Set to -1 to disable block-level wear-leveling.
Cache Size	Must be a non-negative integer	64	Size of block caches. Each cache buffers a portion of a block in RAM. The LittleFS needs a read cache, a program cache, and one additional cache per file. Larger caches can improve performance by storing more data and reducing the number of disk accesses. Must be a multiple of the read and program sizes, and a factor of the block size.
Lookahead Size	Must be a non-negative multiple of 8	16	Size of the lookahead buffer in bytes. A larger lookahead buffer increases the number of blocks found during an allocation pass. The lookahead buffer is

			stored as a compact bitmap, so each byte of RAM can track 8 blocks. Must be a multiple of 8.

Common LittleFS Configuration

Build Time Configurations for LittleFS

The following build time configurations are defined in arm/littlefs/lfs_util.h:

Configuration	Options	Default	Description
Custom lfs_util.h	Manual Entry		Add a path to your custom lfs_util.h file. It can be used to override some or all of the configurations defined here, and to define additional configurations.
Thread Safe	• Enabled • Disabled	Disabled	Enables thread safety in LittleFS.
Read Only	• Enabled • Disabled	Disabled	Enables Read Only mode in LittleFS.
Use Malloc	• Enabled • Disabled	Enabled	Configures the use of malloc by LittleFS.
Use Assert	• Enabled • Disabled	Enabled	Configures the use of assert by LittleFS.
Debug Messages	• Enabled • Disabled	Disabled	Configures debug messages.
Warning Messages	• Enabled • Disabled	Disabled	Configures warning messages.
Error Messages	• Enabled • Disabled	Disabled	Configures error messages.
Trace Messages	• Enabled • Disabled	Disabled	Configures trace messages.
Intrinsics	• Enabled • Disabled	Enabled	Configures intrinsic functions such as __builtin_clz.
Instance Name for STDIO wrapper	Name must be a valid C symbol	g_rm_littlefs0	The rm_littlefs instance name to use with the STDIO wrapper.

Usage Notes

Blocking Read/Write/Erase

The LittleFS port blocks on Read/Write/Erase calls until the operation has completed.

Memory Constraints

The block size defined in the LittleFS configuration must be a multiple of the data flash erase size of the MCU. It must be greater than 104 bytes which is the minimum block size of a LittleFS block. For information about data flash erase sizes refer to the "Specifications of the code flash memory and data flash memory" table of the "Flash Memory" chapter's "Overview" section.

Examples

Basic Example

This is a basic example of LittleFS on Flash in an application.

```
extern const rm_littlefs_cfg_t g_rm_littlefs_flash0_cfg;
#ifdef LFS_NO_MALLOC
static uint8_t g_file_buffer[LFS_CACHE_SIZE];
static struct lfs_file_config g_file_cfg =
{
    .buffer = g_file_buffer
};
#endif
void rm_littlefs_example (void)
{
    uint8_t    buffer[30];
    lfs_file_t file;
 /* Open LittleFS Flash port.*/
 fsp_err_t err = RM_LITTLEFS_FLASH_Open(&g_rm_littlefs_flash0_ctrl,
&g_rm_littlefs_flash0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Format the filesystem. */
 int lfs_err = lfs_format(&g_rm_littlefs_flash0_lfs, &g_rm_littlefs_flash0_lfs_cfg);
    handle_lfs_error(lfs_err);
 /* Mount the filesystem. */
    lfs_err = lfs_mount(&g_rm_littlefs_flash0_lfs, &g_rm_littlefs_flash0_lfs_cfg);
    handle_lfs_error(lfs_err);
 /* Create a breakfast directory. */
```

```
    lfs_err = lfs_mkdir(&g_rm_littlefs_flash0_lfs, "breakfast");
    handle_lfs_error(lfs_err);
 /* Create a file toast in the breakfast directory. */
 const char * path = "breakfast/toast";
#ifdef LFS_NO_MALLOC
 /**********************************************************************************
**********************************
  * By default LittleFS uses malloc to allocate buffers. This can be disabled in the
RA Configuration editor.
  * Buffers will be generated from the configuration for the read, program and
lookahead buffers.
  * When opening a file a unique buffer must be passed in for use as a file buffer.
  * The buffer size must be equal to the cache size.
  **********************************************************************************
**********************************/
    lfs_err = lfs_file_opencfg(&g_rm_littlefs_flash0_lfs,
                               &file,
                               path,
                               LFS_O_WRONLY | LFS_O_CREAT | LFS_O_APPEND,
                               &g_file_cfg);
    handle_lfs_error(lfs_err);
#else
    lfs_err = lfs_file_open(&g_rm_littlefs_flash0_lfs, &file, path, LFS_O_WRONLY |
LFS_O_CREAT | LFS_O_APPEND);
    handle_lfs_error(lfs_err);
#endif
 const char * contents = "butter";
    lfs_size_t   len      = strlen(contents);
 /* Apply butter to toast 10 times. */
 for (uint32_t i = 0; i < 10; i++)
    {
       lfs_err = lfs_file_write(&g_rm_littlefs_flash0_lfs, &file, contents, len);
 if (lfs_err < 0)
     {
```

```
      handle_lfs_error(lfs_err);
       }
   }
 /* Close the file. */
   lfs_err = lfs_file_close(&g_rm_littlefs_flash0_lfs, &file);
   handle_lfs_error(lfs_err);
 /* Unmount the filesystem. */
   lfs_err = lfs_unmount(&g_rm_littlefs_flash0_lfs);
   handle_lfs_error(lfs_err);
 /* Remount the filesystem. */
   lfs_err = lfs_mount(&g_rm_littlefs_flash0_lfs, &g_rm_littlefs_flash0_lfs_cfg);
   handle_lfs_error(lfs_err);
 /* Open breakfast/toast. */
#ifdef LFS_NO_MALLOC
   lfs_err = lfs_file_opencfg(&g_rm_littlefs_flash0_lfs, &file, path, LFS_O_RDONLY,
&g_file_cfg);
   handle_lfs_error(lfs_err);
#else
   lfs_err = lfs_file_open(&g_rm_littlefs_flash0_lfs, &file, path, LFS_O_RDONLY);
   handle_lfs_error(lfs_err);
#endif
   handle_lfs_error(lfs_err);
 /* Verify the toast is buttered the correct amount. */
 for (uint32_t i = 0; i < 10; i++)
   {
      lfs_err = lfs_file_read(&g_rm_littlefs_flash0_lfs, &file, buffer, len);
 if (lfs_err < 0)
     {
     handle_lfs_error(lfs_err);
      }
      assert(0 == memcmp(buffer, contents, len));
   }
 /* Close the file. */
   lfs_err = lfs_file_close(&g_rm_littlefs_flash0_lfs, &file);
```

```
    handle_lfs_error(lfs_err);
}
```

Function Documentation

◆ RM_LITTLEFS_FLASH_Open()

fsp_err_t RM_LITTLEFS_FLASH_Open (rm_littlefs_ctrl_t *const *p_ctrl*, rm_littlefs_cfg_t const *const *p_cfg*)

Opens the driver and initializes lower layer driver.

Implements rm_littlefs_api_t::open().

Return values

FSP_SUCCESS	Success.
FSP_ERR_ASSERTION	An input parameter was invalid.
FSP_ERR_ALREADY_OPEN	Module is already open.
FSP_ERR_INVALID_SIZE	The provided block size is invalid.
FSP_ERR_INVALID_ARGUMENT	Flash BGO mode must be disabled.
FSP_ERR_INTERNAL	Failed to create the semaphore.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- flash_api_t::open

◆ RM_LITTLEFS_FLASH_Close()

fsp_err_t RM_LITTLEFS_FLASH_Close (rm_littlefs_ctrl_t *const *p_ctrl*)

Closes the lower level driver.

Implements rm_littlefs_api_t::close().

Return values

FSP_SUCCESS	Media device closed.
FSP_ERR_ASSERTION	An input parameter was invalid.
FSP_ERR_NOT_OPEN	Module not open.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- flash_api_t::close

7.2.17.13 LittleFS on SPI Flash (rm_littlefs_spi_flash)

Modules » Storage

Functions

fsp_err_t	RM_LITTLEFS_SPI_FLASH_Open (rm_littlefs_ctrl_t *const p_ctrl, rm_littlefs_cfg_t const *const p_cfg)
fsp_err_t	RM_LITTLEFS_SPI_FLASH_Close (rm_littlefs_ctrl_t *const p_ctrl)

Detailed Description

Middleware for the LittleFS File System control on RA MCUs using external SPI Flash.

Overview

This module provides the hardware port layer for the LittleFS file system. After initializing this module, refer to the LittleFS documentation to use the file system:
https://github.com/ARMmbed/littlefs

Configuration

Build Time Configurations for rm_littlefs_spi_flash

The following build time configurations are defined in fsp_cfg/rm_littlefs_spi_flash_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Storage > LittleFS on SPI Flash (rm_littlefs_spi_flash)

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_rm_littlefs0	Module name.
Delay Callback	Manual Entry	g_rm_littlefs_spi_flash0_callback	Optional delay callback for custom delay while waiting for the flash erase/write operation to complete.
Read Size	Must be a non-negative integer	1	Minimum size of a block read. All read operations will be a multiple of this value.
Program Size	Must be a non-negative integer	4	Minimum size of a block program. All

			program operations will be a multiple of this value.
Block Size (bytes)	Must be a multiple of 64	4096	Size of an erasable block. This does not impact RAM consumption and may be larger than the physical erase size. However, non-inlined files take up at minimum one block. Must be a multiple of the read and program sizes.
Block Cycles	Must be an integer	1024	Number of erase cycles before LittleFS evicts metadata logs and moves the metadata to another block. Suggested values are in the range 100-1000, with large values having better performance at the cost of less consistent wear distribution. Set to -1 to disable block-level wear-leveling.
Cache Size	Must be a non-negative integer	64	Size of block caches. Each cache buffers a portion of a block in RAM. The LittleFS needs a read cache, a program cache, and one additional cache per file. Larger caches can improve performance by storing more data and reducing the number of disk accesses. Must be a multiple of the read and program sizes, and a factor of the block size.
Lookahead Size	Must be a non-negative multiple of 8	16	Size of the lookahead buffer in bytes. A larger lookahead buffer increases the number of blocks found during an allocation pass. The

			lookahead buffer is stored as a compact bitmap, so each byte of RAM can track 8 blocks. Must be a multiple of 8.
Memory Start Adress Offset (bytes)	Offset should be greater than or equal to zero	0	Enter the starting offset to use in the SPI memory. The starting address for LittleFS memory will be the SPI memory base address plus this offset.
Memory Size (bytes)	Size should be greater than zero	33554432	Enter the size that the LittleFS Memory should be. This can be smaller than the SPI memory size in order to use a subset of SPI memory.
Poll Status Count	Poll Status Count should be greater than or equal to zero	0xFFFFFFFF	Number of times to poll for operation complete status for blocking memory operations.

Common LittleFS Configuration

Build Time Configurations for LittleFS

The following build time configurations are defined in arm/littlefs/lfs_util.h:

Configuration	Options	Default	Description
Custom lfs_util.h	Manual Entry		Add a path to your custom lfs_util.h file. It can be used to override some or all of the configurations defined here, and to define additional configurations.
Thread Safe	• Enabled • Disabled	Disabled	Enables thread safety in LittleFS.
Read Only	• Enabled • Disabled	Disabled	Enables Read Only mode in LittleFS.
Use Malloc	• Enabled • Disabled	Enabled	Configures the use of malloc by LittleFS.
Use Assert	• Enabled • Disabled	Enabled	Configures the use of assert by LittleFS.
Debug Messages	• Enabled • Disabled	Disabled	Configures debug messages.

Warning Messages	• Enabled • Disabled	Disabled	Configures warning messages.
Error Messages	• Enabled • Disabled	Disabled	Configures error messages.
Trace Messages	• Enabled • Disabled	Disabled	Configures trace messages.
Intrinsics	• Enabled • Disabled	Enabled	Configures intrinsic functions such as __builtin_clz.
Instance Name for STDIO wrapper	Name must be a valid C symbol	g_rm_littlefs0	The rm_littlefs instance name to use with the STDIO wrapper.

Usage Notes

Blocking Read/Write/Erase

The LittleFS port blocks on Read/Write/Erase calls until the operation has completed.

Memory Constraints

The block size defined in the LittleFS configuration must be a multiple of the sector erase size of the SPI Flash. It must be greater than 104 bytes which is the minimum block size of a LittleFS block.

Examples

Basic Example

This is a basic example of LittleFS on Flash in an application.

```
extern const rm_littlefs_cfg_t g_rm_littlefs_spi_flash0_cfg;
#ifdef LFS_NO_MALLOC
static uint8_t g_file_buffer[LFS_CACHE_SIZE];
static struct lfs_file_config g_file_cfg =
{
    .buffer = g_file_buffer
};
#endif
void rm_littlefs_example (void)
{
    uint8_t    buffer[30];
    lfs_file_t file;
 /* Open LittleFS Flash port.*/
```

```
 fsp_err_t err = RM_LITTLEFS_SPI_FLASH_Open(&g_rm_littlefs_spi_flash0_ctrl,
&g_rm_littlefs_spi_flash0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Format the filesystem. */
 int lfs_err = lfs_format(&g_rm_littlefs_spi_flash0_lfs,
&g_rm_littlefs_spi_flash0_lfs_cfg);
    handle_lfs_error(lfs_err);
 /* Mount the filesystem. */
    lfs_err = lfs_mount(&g_rm_littlefs_spi_flash0_lfs,
&g_rm_littlefs_spi_flash0_lfs_cfg);
    handle_lfs_error(lfs_err);
 /* Create a breakfast directory. */
    lfs_err = lfs_mkdir(&g_rm_littlefs_spi_flash0_lfs, "breakfast");
    handle_lfs_error(lfs_err);
 /* Create a file toast in the breakfast directory. */
 const char * path = "breakfast/toast";
#ifdef LFS_NO_MALLOC
 /**********************************************************************************
**********************************
  * By default LittleFS uses malloc to allocate buffers. This can be disabled in the
RA Configuration editor.
  * Buffers will be generated from the configuration for the read, program and
lookahead buffers.
  * When opening a file a unique buffer must be passed in for use as a file buffer.
  * The buffer size must be equal to the cache size.
  **********************************************************************************
**********************************/
    lfs_err = lfs_file_opencfg(&g_rm_littlefs_spi_flash0_lfs,
                               &file,
                               path,
                               LFS_O_WRONLY | LFS_O_CREAT | LFS_O_APPEND,
                               &g_file_cfg);
    handle_lfs_error(lfs_err);
```

```
#else
    lfs_err = lfs_file_open(&g_rm_littlefs_spi_flash0_lfs, &file, path, LFS_O_WRONLY
| LFS_O_CREAT | LFS_O_APPEND);
    handle_lfs_error(lfs_err);
#endif
 const char * contents = "butter";
    lfs_size_t   len      = strlen(contents);
 /* Apply butter to toast 10 times. */
 for (uint32_t i = 0; i < 10; i++)
    {
       lfs_err = lfs_file_write(&g_rm_littlefs_spi_flash0_lfs, &file, contents, len);
 if (lfs_err < 0)
      {
      handle_lfs_error(lfs_err);
       }
    }
 /* Close the file. */
    lfs_err = lfs_file_close(&g_rm_littlefs_spi_flash0_lfs, &file);
    handle_lfs_error(lfs_err);
 /* Unmount the filesystem. */
    lfs_err = lfs_unmount(&g_rm_littlefs_spi_flash0_lfs);
    handle_lfs_error(lfs_err);
 /* Remount the filesystem. */
    lfs_err = lfs_mount(&g_rm_littlefs_spi_flash0_lfs,
&g_rm_littlefs_spi_flash0_lfs_cfg);
    handle_lfs_error(lfs_err);
 /* Open breakfast/toast. */
#ifdef LFS_NO_MALLOC
    lfs_err = lfs_file_opencfg(&g_rm_littlefs_spi_flash0_lfs, &file, path,
LFS_O_RDONLY, &g_file_cfg);
    handle_lfs_error(lfs_err);
#else
    lfs_err = lfs_file_open(&g_rm_littlefs_spi_flash0_lfs, &file, path,
LFS_O_RDONLY);
```

```
    handle_lfs_error(lfs_err);
#endif
    handle_lfs_error(lfs_err);
 /* Verify the toast is buttered the correct amount. */
 for (uint32_t i = 0; i < 10; i++)
    {
       lfs_err = lfs_file_read(&g_rm_littlefs_spi_flash0_lfs, &file, buffer, len);
 if (lfs_err < 0)
      {
      handle_lfs_error(lfs_err);
       }
       assert(0 == memcmp(buffer, contents, len));
    }
 /* Close the file. */
    lfs_err = lfs_file_close(&g_rm_littlefs_spi_flash0_lfs, &file);
    handle_lfs_error(lfs_err);
}
```

Function Documentation

◆ RM_LITTLEFS_SPI_FLASH_Open()

fsp_err_t RM_LITTLEFS_SPI_FLASH_Open (rm_littlefs_ctrl_t *const *p_ctrl*, rm_littlefs_cfg_t const *const *p_cfg*)

Opens the driver and initializes lower layer driver.

Implements rm_littlefs_api_t::open().

Return values

FSP_SUCCESS	Success.
FSP_ERR_ASSERTION	An input parameter was invalid.
FSP_ERR_ALREADY_OPEN	Module is already open.
FSP_ERR_INVALID_SIZE	The provided block size is invalid.
FSP_ERR_INVALID_ARGUMENT	Flash BGO mode must be disabled.
FSP_ERR_INTERNAL	Failed to create the semaphore.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:
- spi_flash_api_t::open

◆ RM_LITTLEFS_SPI_FLASH_Close()

fsp_err_t RM_LITTLEFS_SPI_FLASH_Close (rm_littlefs_ctrl_t *const *p_ctrl*)

Closes the lower level driver.

Implements rm_littlefs_api_t::close().

Return values

FSP_SUCCESS	Media device closed.
FSP_ERR_ASSERTION	An input parameter was invalid.
FSP_ERR_NOT_OPEN	Module not open.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:
- spi_flash_api_t::close

7.2.17.14 OSPI Flash (r_ospi)

Detailed Description

Driver for the OSPI peripheral on RA MCUs. This module implements the SPI Flash Interface.

Overview

The OSPI peripheral interfaces with an external OctaFlash and/or OctaRAM chip(s) to perform data I/O Operations. When both OctaFlash and OctaRAM devices are interfaced, they must be connected to their own chip-select lines. The devices cannot share a single chip-select line.

Features

The OSPI driver has the following key features to support the **OctaFlash** device:

- Perform data I/O Operation in both SPI and OPI modes

- Can be configured with OctaFlash device on either of the 2 channels
- Memory mapped read access to the OctaFlash
- Programming the OctaFlash device using single continuous write
- Erasing the OctaFlash device
- Sending device specific commands and reading back responses
- Entering and exiting XIP (Single Continuous Read) mode
- 3 byte addressing for SPI
- 4 byte addressing for SPI and OPI
- Auto-calibration for OPI mode (SOPI and DOPI)

The OSPI driver has the following key features to support the **OctaRAM** device:

- Perform data I/O Operation in DOPI mode
- Can be configured with OctaRAM device on either of the 2 channels
- Memory mapped read amd write access to the OctaRAM using single continuous mode
- Sending device specific commands and reading back responses
- Auto-calibration for DOPI mode
- Uninitialized global variables or buffers can be allocated in the OSPI RAM address space.

Additional build-time features:

- Optional (build-time) DMAC support for data transmission when used with OctaFlash.

Note

For OctaFlash, use of DMAC for data transmission is strongly recommended. Without the use of DMAC, due to the high-speed hardware design of the OSPI peripheral, data transmission can be sensitive to timing variance, which could cause software-based memory-mapped operations to fail unexpectedly.

Configuration

OSPI Flash:

Build Time Configurations for r_ospi

The following build time configurations are defined in driver/r_ospi_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
DMAC Support	• Enable • Disable	Disable	Enable DMAC support for the OSPI module.

Configurations for Storage > OSPI Flash (r_ospi)

This module can be added to the Stacks tab via New Stack > Storage > OSPI Flash (r_ospi).

Configuration	Options	Default	Description
General			
General > Single Continuous Mode			
Read Idle Time	Must be an integer	100	Specify the read idle

	greater than 0 with maximum configurable value of 127		time.
Write Idle Time	Must be an integer greater than 0 with maximum configurable value of 127	100	Specify the write idle time.
Name	Name must be a valid C symbol	g_ospi0	Module name.
Channel	Channel should be 0 or 1	0	Specify the OSPI chip select line to use.
Flash Size	Must be an integer greater than 0 with maximum configurable value of 0x3FFFFFFF	0x04000000	Specify the OctaFlash size in bytes.
SPI Protocol	• SPI • Single data rate OPI • Dual data rate OPI	SPI	Select the initial SPI protocol. SPI protocol can be changed on the OctaFlash using R_OSPI_DirectTransfer( ).
Address Bytes	• 3 • 4	4	Select the number of address bytes.
OPI Mode			
OPI Mode > Auto-Calibration			
Data latching delay	Must be a valid non-negative integer with maximum configurable value of 0xFF	0x80	Set this to 0 to enable auto-calibration. 0x80 is the default value calculated at 3.3V and 25°C
Auto-Calibration Address	Must be a valid non-negative integer with maximum configurable value of 0xFFFFFFFF	0x00	Set the address of the read/write destination to be performed for auto-calibration.
OPI Mode > Command Definitions			
Page Program Command	Must be a 16-bit OSPI Page Program Command under OPI Mode|Command Definitions	0x12ED	The command to program a page in OPI mode.
Read Command	Must be a 16-bit OSPI Read Command under OPI Mode|Command Definitions	0xEC13	The command to read in SOPI mode (8READ).
Dual Read Command	Must be a 16-bit OSPI Dual Read Command	0xEE11	The command to read in DOPI mode (8DTRD).

	under OPI Mode|Command Definitions		
Write Enable Command	Must be a 16-bit OSPI Write Enable Command under OPI Mode|Command Definitions	0x06F9	The command to enable write in OPI mode.
Status Command	Must be a 16-bit OSPI Status Command under OPI Mode|Command Definitions	0x05FA	The command to query the status of a write or erase command in OPI mode.
OPI Mode > OM_DQS Enable Counter			
SOPI	Must be an integer between 0 and 255	9	OM_DQS enable counter for memory access. Setting for SOPI mode.
DOPI	Must be an integer between 0 and 255	6	OM_DQS enable counter for memory access. Setting for DOPI mode.
Command Length Bytes	Must be an integer between 1 and 2	2	Command length in bytes
Memory Read Dummy Cycles	Must be an integer between 0 and 255	10	Memory read dummy cycles
Status Read Dummy Cycles	Must be an integer between 0 and 255	4	Status read dummy cycles
DOPI Byte Order	• Byte0, Byte1, Byte2, Byte3 • Byte1, Byte0, Byte3, Byte2	Byte0, Byte1, Byte2, Byte3	Byte order on the external bus
SPI Mode			
SPI Mode > Command Definitions			
Page Program Command	Must be a 8-bit OSPI Page Program Command under SPI Mode|Command Definitions	0x12	The command to program a page in SPI mode.
Read Command	Must be a 8-bit OSPI Read Command under SPI Mode|Command Definitions	0x13	The command to read in SPI mode.
Write Enable Command	Must be a 16-bit OSPI Write Enable Command under SPI Mode|Command	0x06	The command to enable write in SPI mode.

	Definitions		
Status Command	Must be a 16-bit OSPI Status Command under SPI Mode|Command Definitions	0x05	The command to query the status of a write or erase command in SPI mode.
Common Command Definitions			
Sector Erase Command	Must be a value greater than or equal to 0	0x21DE	The command to erase a sector. Set Sector Erase Size to 0 if unused.
Block Erase Command	Must be a value greater than or equal to 0	0xDC23	The command to erase a block. Set Block Erase Size to 0 if unused.
Chip Erase Command	Must be a value greater than or equal to 0	0xC738	The command to erase the entire chip. Set Chip Erase Command to 0 if unused.
Write Status Bit	Must be an integer between 0 and 7	0	Which bit contains the write in progress status returned from the Write Status Command.
Write Enable Bit	Must be an integer between 0 and 7	1	Which bit contains the write enable status returned from the Write Enable Command.
Sector Erase Size	Must be an integer greater than or equal to 0	4096	The sector erase size. Set Sector Erase Size to 0 if Sector Erase is not supported.
Block Erase Size	Must be an integer greater than or equal to 0	65536	The block erase size. Set Block Erase Size to 0 if Block Erase is not supported.
Chip Select Timing Setting			
Memory Mapped Read Command Interval	• 2 • 5 • 7 • 9 • 11 • 13 • 15 • 17	2	Memory mapped read command execution interval setting in OCTACLK units
Memory Mapped Write Command Interval	• 2 • 5	2	Memory mapped write command execution

	• 7 • 9 • 11 • 13 • 15 • 17		interval setting in OCTACLK units
Command Interval	• 2 • 5 • 7 • 9 • 11 • 13 • 15 • 17	2	Command execution interval setting in OCTACLK units
Memory Mapped Read Pull-up Timing	• 5 SPI/SOPI • 6 SPI/SOPI • 7 SPI/SOPI, 6.5 DOPI • 8 SPI/SOPI, 7.5 DOPI • 9 SPI/SOPI, 8.5 DOPI	5 SPI/SOPI	Memory mapped read signal pull-up timing setting in OCTACLK units
Memory Mapped Write Pull-up Timing	• 2 SPI/SOPI, 1.5 DOPI • 3 SPI/SOPI, 2.5 DOPI • 4 SPI/SOPI, 3.5 DOPI • 5 SPI/SOPI, 4.5 DOPI • 6 SPI/SOPI, 5.5 DOPI • 7 SPI/SOPI, 6.5 DOPI • 8 SPI/SOPI, 7.5 DOPI • 9 SPI/SOPI, 8.5 DOPI	2 SPI/SOPI, 1.5 DOPI	Memory mapped write signal pull-up timing setting in OCTACLK units
Pull-up Timing	• 5 SPI/SOPI • 6 SPI/SOPI • 7 SPI/SOPI, 6.5 DOPI • 8 SPI/SOPI, 7.5 DOPI • 9 SPI/SOPI, 8.5 DOPI	5 SPI/SOPI	Signal pull-up timing setting in OCTACLK units
Memory Mapped Read Pull-down Timing	• 3 SPI/SOPI, 2.5 DOPI • 4 SPI/SOPI, 3.5 DOPI • 5 SPI/SOPI, 4.5 DOPI	3 SPI/SOPI, 2.5 DOPI	Memory mapped read signal pull-down timing setting in OCTACLK units

Memory Mapped Write Pull-down Timing	• 3 SPI/SOPI, 2.5 DOPI • 4 SPI/SOPI, 3.5 DOPI • 5 SPI/SOPI, 4.5 DOPI	3 SPI/SOPI, 2.5 DOPI	Memory mapped write signal pull-down timing setting in OCTACLK units
Pull-down Timing	• 3 SPI/SOPI, 2.5 DOPI • 4 SPI/SOPI, 3.5 DOPI • 5 SPI/SOPI, 4.5 DOPI	3 SPI/SOPI, 2.5 DOPI	Signal pull-down timing setting in OCTACLK units

Note

The user is expected to modify the command definitions based on the OctaFlash chip and SPI communication mode. The default mode is SPI mode and default erase commands are set for OPI mode based on Macronix OctaFlash MX25LM51245G.

OSPI RAM:

Build Time Configurations for r_ospi

The following build time configurations are defined in driver/r_ospi_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
DMAC Support	• Enable • Disable	Disable	Enable DMAC support for the OSPI module.

Configurations for Storage > OSPI RAM (r_ospi)

This module can be added to the Stacks tab via New Stack > Storage > OSPI RAM (r_ospi).

Configuration	Options	Default	Description
General			
General > Single Continuous Mode			
Read Idle Time	Must be an integer greater than 0 with maximum configurable value of 127	127	Specify the read idle time.
Write Idle Time	Must be an integer greater than 0 with maximum configurable value of 127	127	Specify the write idle time.
Name	Name must be a valid C symbol	g_ospi_ram0	Module name.
Channel	Channel should be 0 or	0	Specify the OSPI chip

	1 [Channel 0 recommended]		select line to use.
RAM Size	Must be an integer greater than 0 with maximum configurable value of 0x00800000	0x00800000	Specify the OctaRam size in bytes.
SPI Protocol	Dual data rate OPI	Dual data rate OPI	Select the initial SPI protocol. OctaRAM only supports DOPI mode.
Address Bytes	4	4	Select the number of address bytes. OctaRAM only supports 4 byte addresses in DOPI mode.
Auto-Calibration			
Data latching delay	Must be a valid non-negative integer with maximum configurable value of 0xFF	0x80	Set this to 0 to enable auto-calibration. 0x80 is the default value calculated at 3.3V and 25°C
Auto-Calibration Address	Must be a valid non-negative integer with maximum configurable value of 0xFFFFFFFF	0x00	Set the address of the read/write destination to be performed for auto-calibration.
Command Definitions			
Memory Read Command	Must be a 16-bit OSPI Dual Read Command under Command Definitions	0xA000	The command to read in DOPI mode.
Memory Write Command	Must be a 16-bit OSPI Write Command under Command Definitions	0x2000	The command to write in DOPI mode.
OM_DQS Enable Counter			
DOPI	Must be an integer between 0 and 255	3	OM_DQS enable counter for memory access. Setting for DOPI mode.
Chip Select Timing Setting			
Memory Mapped Read Command Interval	• 2 • 5 • 7 • 9 • 11 • 13 • 15 • 17	2	Memory mapped read command execution interval setting in OCTACLK units

Memory Mapped Write Command Interval	• 2 • 5 • 7 • 9 • 11 • 13 • 15 • 17	2	Memory mapped write command execution interval setting in OCTACLK units
Command Interval	• 2 • 5 • 7 • 9 • 11 • 13 • 15 • 17	2	Command execution interval setting in OCTACLK units
Memory Mapped Read Pull-up Timing	• 6.5 DOPI • 7.5 DOPI • 8.5 DOPI	6.5 DOPI	Memory mapped read signal pull-up timing setting in OCTACLK units
Memory Mapped Write Pull-up Timing	• 1.5 DOPI • 2.5 DOPI • 3.5 DOPI • 4.5 DOPI • 5.5 DOPI • 6.5 DOPI • 7.5 DOPI • 8.5 DOPI	1.5 DOPI	Memory mapped write signal pull-up timing setting in OCTACLK units
Pull-up Timing	• 6.5 DOPI • 7.5 DOPI • 8.5 DOPI	6.5 DOPI	Signal pull-up timing setting in OCTACLK units
Memory Mapped Read Pull-down Timing	• 2.5 DOPI • 3.5 DOPI • 4.5 DOPI	2.5 DOPI	Memory mapped read signal pull-down timing setting in OCTACLK units
Memory Mapped Write Pull-down Timing	• 2.5 DOPI • 3.5 DOPI • 4.5 DOPI	2.5 DOPI	Memory mapped write signal pull-down timing setting in OCTACLK units
Pull-down Timing	• 2.5 DOPI • 3.5 DOPI • 4.5 DOPI	2.5 DOPI	Signal pull-down timing setting in OCTACLK units
Command Length Bytes	Must be an integer between 1 and 2	2	Command length in bytes
Memory Read Dummy Cycles	Must be an integer between 0 and 255	4	Memory read dummy cycles
Memory Write Dummy Cycles	Must be an integer between 0 and 255	4	Memory write dummy cycles

DOPI Byte Order	• Byte0, Byte1, Byte2, Byte3 • Byte1, Byte0, Byte3, Byte2	Byte1, Byte0, Byte3, Byte2	Byte order on the external bus
Chip Select Maximum Low Time (us)	Must be an integer between 0 to 511	4	Chip Select Maximum Low Time (tCSM).

Clock Configuration

PCLKA is the Octal-SPI bus interface, and PCLKB is used to set OSPI registers.

The signals to the OSPI device are derived from OCTASPICLK. The OMSCLK signal is OCTASPICLK / 2. Data can be output at the OCTASPICLK rate if SPI Protocol is set to Dual Data Rate OPI.

The PCLKB, PCLKA, and OCTASPICLK frequencies can be set on the **Clocks** tab of the RA Configuration editor.

Pin Configuration

The following pins are available to connect to an external OSPI device:

- OMSCLK: OSPI clock output (OCTASPICLK / 2)
- OMDQS: OSPI data strobe signal
- OMCS0: OSPI device 0 select
- OMCS1: OSPI device 1 select
- OMSIO0: Data 0 I/O
- OMSIO1: Data 1 I/O
- OMSIO2: Data 2 I/O
- OMSIO3: Data 3 I/O
- OMSIO4: Data 4 I/O
- OMSIO5: Data 5 I/O
- OMSIO6: Data 6 I/O
- OMSIO7: Data 7 I/O

Note

Data pins must be configured with IOPORT_CFG_DRIVE_HS_HIGH.
Chip Select pins should be configured with at least IOPORT_CFG_DRIVE_MEDIUM.

Usage Notes

Usage Notes for OctaFlash support

Enabling DMAC

DMAC data transmission support is configurable for OSPI Flash and is disabled from the build by default. Use of a high-priority (low channel number) DMAC for data transmission is strongly recommended.

For further details on DMAC please refer Transfer (r_dmac).

OSPI Memory Mapped Access

After R_OSPI_Open() completes successfully, the OctaFlash device contents are mapped to address 0x68000000 (channel 0) or 0x70000000 (channel 1) based on the channel configured and can be

read like on-chip flash. Channel 0 supports 128 MB while Channel 1 supports 256 MB of address space.

Auto-calibration

Auto-calibration procedure is triggered automatically when the 'Data latching delay' field in the configurator properties is set to 0. The user application is responsible for setting the appropriate preamble pattern before calling R_OSPI_Open() with SOPI/DOPI mode or changing the SPI protocol to SOPI/DOPI using R_OSPI_SpiProtocolSet() API. The appropriate preamble pattern can be written to the desired address using the R_OSPI_Write() API while in the SPI mode (recommended). Ensure that the same address is passed through the configurator. If the OctaFlash chip is already in SOPI/DOPI mode, the preamble pattern must be programmed using the debugger before calling R_OSPI_Open().

Chip Select Latencies

Chip select latencies can be set through the configurator. The default settings support SOPI and SPI at minimum latency. In case the driver is opened in SPI mode and will be switched to DOPI mode later using R_OSPI_SpiProtocolSet(), please select latencies required for DOPI before calling R_OSPI_Open().

OctaFlash Commands

- Set the erase commands based on intended mode of operation (SPI or OPI). These commands cannot be changed during run-time.
- Read, Write and Status commands for both SPI and OPI are configured allowing switching between the modes at run-time.

Usage Notes for OctaRAM support

OSPI Memory Mapped Access

After R_OSPI_Open() completes successfully, the OctaRAM device contents are mapped to address 0x68000000 (channel 0) or 0x70000000 (channel 1) based on the channel configured and can be written to or read from like on-chip RAM. Channel 0 and 1 support 8 MB of address space.

Auto-calibration

Since the OctaRAM only supports DOPI mode, the driver allows the user to call R_OSPI_Open() without performing the auto-calibration procedure automatically when 'Data latching delay' field is set to 0 in the configurator properties. This is done so that the user can write the appropriate preamble pattern to the desired address using memory mapped writes while in DOPI mode. Ensure that the same address is passed through the configurator. R_OSPI_AutoCalibrate() should be then called to perform auto-calibration.

Chip Select Latencies

Chip select latencies can be set through the configurator. The default settings support DOPI at minimum latency.

Limitations

Developers should be aware of the following limitations when using the OSPI driver:

OctaFlash

- Single continuous read in SPI mode is not supported by the peripheral. The maximum amount of data that can be read using a single read command is 4-bytes (When doing a 32-bit access).
- Fast Reads would be slower than regular reads as the SPI mode cannot be operated with an OMSCLK greater than 50MHz.

Examples

OSPI Flash:

Basic Example

This is a basic example of minimal use of the OSPI in an application with OctaFlash.

```
#define OSPI_EXAMPLE_DATA_LENGTH (1024)
uint8_t g_dest[OSPI_EXAMPLE_DATA_LENGTH];
/* Place data in the .ospi_flash section to flash it during programming. */
const uint8_t g_src[OSPI_EXAMPLE_DATA_LENGTH] BSP_PLACE_IN_SECTION(".ospi_flash") =
"ABCDEFGHIJKLMNOPQRSTUVWXYZ";
/* Place code in the .code_in_ospi section to flash it during programming. */
void r_ospi_example_function(void) BSP_PLACE_IN_SECTION(".code_in_ospi")
__attribute__((noinline));
void r_ospi_example_function (void)
{
 /* Add code here. */
}
void r_ospi_basic_example (void)
{
 /* Open the OSPI instancee */
 fsp_err_t err = R_OSPI_Open(&g_ospi0_ctrl, &g_ospi0_cfg);
    assert(FSP_SUCCESS == err);
 /* (Optional) Change SPI to DOPI mode */
    r_ospi_example_spi_to_dopi();
 /* After R_OSPI_Open() and any required device specific intiialization, data can be
read directly from the OSPI flash. */
    memcpy(&g_dest[0], &g_src[0], OSPI_EXAMPLE_DATA_LENGTH);
 /* After R_OSPI_Open() and any required device specific intiialization, functions in
the OSPI flash can be called. */
    r_ospi_example_function();
```

```
}
```

Reading Status Register Example (R_OSPI_DirectTransfer)

This is an example of using R_OSPI_DirectWrite followed by R_OSPI_DirectRead to send the read status register command and read back the status register from the device.

```
#define OSPI_COMMAND_READ_STATUS_REGISTER (0x05U)
void r_ospi_direct_example (void)
{
 spi_flash_direct_transfer_t ospi_test_direct_transfer =
    {
       .command       = OSPI_TEST_READ_STATUS_COMMAND_SPI_MODE,
       .address       = 0U,
       .data          = 0U,
       .command_length = 1U,
       .address_length = 0U,
       .data_length    = 0U,
       .dummy_cycles   = 0U
    };
 /* Open the OSPI instance. */
 fsp_err_t err = R_OSPI_Open(&g_ospi0_ctrl, &g_ospi0_cfg);
    assert(FSP_SUCCESS == err);
 /* Write Enable */
    err = R_OSPI_DirectTransfer(&g_ospi0_ctrl, &ospi_test_direct_transfer,
SPI_FLASH_DIRECT_TRANSFER_DIR_WRITE);
    assert(FSP_SUCCESS == err);
 /* Read Status Register */
    ospi_test_direct_transfer.command    = OSPI_TEST_READ_STATUS_COMMAND_SPI_MODE;
    ospi_test_direct_transfer.data_length = 1U;
    err = R_OSPI_DirectTransfer(&g_ospi0_ctrl, &ospi_test_direct_transfer,
SPI_FLASH_DIRECT_TRANSFER_DIR_READ);
    assert(FSP_SUCCESS == err);
 /* Check if Write Enable is set */
 if (OSPI_WEN_BIT_MASK != (ospi_test_direct_transfer.data & OSPI_WEN_BIT_MASK))
```

```
    {
       __BKPT(0);
    }
}
```

Auto-calibration Example (R_OSPI_DirectTransfer, R_OSPI_Write, R_OSPI_SpiProtocolSet)

This is an example of using R_OSPI_SpiProtocolSet to change the operating mode from SPI to SOPI and allow the driver to initiate auto-calibration.

```
#define OSPI_DOPI_PREAMBLE_PATTERN_LENGTH_BYTES (16U)
#define OSPI_EXAMPLE_PREAMBLE_ADDRESS (0x68000000U) /* Device connected to CS0 */
const uint8_t g_preamble_bytes[OSPI_DOPI_PREAMBLE_PATTERN_LENGTH_BYTES] =
{
    0x00, 0x00, 0xFF, 0xFF, 0xFF, 0x00, 0x08, 0x00, 0x00, 0xF7, 0xFF, 0x00, 0x08,
0xF7, 0x00, 0xF7
};
void ospi_example_wait_until_wip (void)
{
 fsp_err_t          err = FSP_SUCCESS;
 spi_flash_status_t status;
    status.write_in_progress = true;
    uint32_t timeout = UINT32_MAX;
 while ((status.write_in_progress) && (--timeout))
    {
       err = R_OSPI_StatusGet(&g_ospi0_ctrl, &status);
      assert(FSP_SUCCESS == err);
    }
 if (0 == timeout)
    {
      assert(FSP_SUCCESS == err);
    }
}
void r_ospi_auto_calibrate_example (void)
{
```

```
 /* Open the OSPI instance. */
 /* Set data_latch_delay_clocks to 0x0 to enable auto-calibration */
 fsp_err_t err = R_OSPI_Open(&g_ospi0_ctrl, &g_ospi0_cfg);
    assert(FSP_SUCCESS == err);
    uint8_t * preamble_pattern_addr = (uint8_t *) OSPI_EXAMPLE_PREAMBLE_ADDRESS;
    err = R_OSPI_Write(&g_ospi0_ctrl, g_preamble_bytes, preamble_pattern_addr,
OSPI_EXAMPLE_PREAMBLE_ADDRESS);
    assert(FSP_SUCCESS == err);
 /* Wait until write has been completed */
    ospi_example_wait_until_wip();
 /* Change from SPI to DOPI mode */
    r_ospi_example_spi_to_dopi();
}
```

Octaclk Update Example (R_OSPI_SpiProtocolSet)

This is an example of using R_BSP_OctaclkUpdate to change the Octal-SPI clock frequency during run time. The OCTACLK frequency must be updated before calling the R_OSPI_SpiProtocolSet with appropriate clock source and divider settings required to be set for the new SPI protocol mode. Ensure that the clock source selected is started.

```
static void ospi_example_change_omclk (void)
{
 /* Ensure clock source (PLL2 in this example) is running before changing the OCTACLK
frequency */
    bsp_octaclk_settings_t octaclk_settings;
    octaclk_settings.source_clock = BSP_CLOCKS_CLOCK_PLL2;
    octaclk_settings.divider      = BSP_CLOCKS_OCTACLK_DIV_2;
    R_BSP_OctaclkUpdate(&octaclk_settings);
}
```

OSPI Data and IAR

When using the IAR compiler, OSPI data must be const qualified to be downloaded by the debugger.

OSPI RAM:

Basic Example

This is a basic example of minimal use of the OSPI in an application with OctaRAM.

```
#define OSPI_RAM_EXAMPLE_DATA_LENGTH (1024)
uint8_t g_dest[OSPI_RAM_EXAMPLE_DATA_LENGTH];
/* Place uninitialized data buffers in the ospi_device_0_no_load section.
 * Use ospi_device_1_no_load section if the OctaRAM is configured on channel 1.
 */
uint8_t g_src_1[OSPI_RAM_EXAMPLE_DATA_LENGTH]
BSP_PLACE_IN_SECTION(".ospi_device_0_no_load");
uint8_t g_src_2[OSPI_RAM_EXAMPLE_DATA_LENGTH]
BSP_PLACE_IN_SECTION(".ospi_device_0_no_load");
void r_ospi_ram_basic_example (void)
{
 /* Open the OSPI instancee.
  * Ensure valid setting of the 'Data latching delay' field in the configurator.
  * To successfully perform OSPI RAM reads this value must not be 0.
  */
 fsp_err_t err = R_OSPI_Open(&g_ospi_ram0_ctrl, &g_ospi_ram0_cfg);
    assert(FSP_SUCCESS == err);
 /* After R_OSPI_Open() and any required device specific intiialization, data can be
read from or written to directly from the OSPI RAM. */
    memcpy(&g_dest[0], &g_src_1[0], OSPI_RAM_EXAMPLE_DATA_LENGTH);
    memcpy(&g_src_2[0], &g_src_1[0], OSPI_RAM_EXAMPLE_DATA_LENGTH);
}
```

Auto-calibration Example (R_OSPI_DirectTransfer, R_OSPI_AutoCalibrate)

This is an example of using R_OSPI_AutoCalibrate to calibrate OSPI peripheral to read data from the OctaRAM device.

```
#define OSPI_RAM_EXAMPLE_PREAMBLE_ADDRESS (0x68000000U) /* Device connected to CS0 */
#define OSPI_RAM_EXAMPLE_OCTARAM_CR_LATENCY_COUNTER_MASK (0x00F0U)
#define OSPI_RAM_EXAMPLE_OCTARAM_CR_LATENCY_COUNTER_POS (4U)
#define OSPI_RAM_EXAMPLE_OCTARAM_100MHZ_4CLOCKS_CR_SETTING (1U)
void r_ospi_ram_auto_calibrate_example (void)
{
```

```
 /* Open the OSPI instancee */
 fsp_err_t err = R_OSPI_Open(&g_ospi_ram0_ctrl, &g_ospi_ram0_cfg);
    assert(FSP_SUCCESS == err);
 /* OctaRAM Configuration Register (cr) read and write command definition */
 spi_flash_direct_transfer_t read_cr =
    {
       .command       = 0xC000U,    // NOLINT(readability-magic-numbers)
       .address       = 0x00040000U, // NOLINT(readability-magic-numbers)
       .data          = 0U,
       .command_length = 2U,
       .address_length = 4U,
       .data_length    = 2U,
 /* Dummy Cycles set to the default value specified in the OctaRAM device
Configuration Register */
       .dummy_cycles   = 5U
    };
 spi_flash_direct_transfer_t write_cr =
    {
       .command       = 0x4000U,    // NOLINT(readability-magic-numbers)
       .address       = 0x00040000U, // NOLINT(readability-magic-numbers)
       .data          = 0U,
       .command_length = 2U,
       .address_length = 4U,
       .data_length    = 2U,
       .dummy_cycles   = 0U
    };
 /* Read OctaRAM device Configuration Register */
    err = R_OSPI_DirectTransfer(&g_ospi_ram0_ctrl, &read_cr,
SPI_FLASH_DIRECT_TRANSFER_DIR_READ);
    assert(FSP_SUCCESS == err);
    uint16_t config_reg = (uint16_t) (((uint16_t) (read_cr.data) &
~OSPI_RAM_EXAMPLE_OCTARAM_CR_LATENCY_COUNTER_MASK) |
                                      ((uint16_t)
(OSPI_RAM_EXAMPLE_OCTARAM_100MHZ_4CLOCKS_CR_SETTING <<
```

```
                                                    OSPI_RAM_EXAMPLE_OCTARAM_CR_LATENC
Y_COUNTER_POS) &
                                          OSPI_RAM_EXAMPLE_OCTARAM_CR_LATENCY_COUNTER_MA
SK));
 /* Write Configuration Register */
    write_cr.data = (uint32_t) config_reg;
    err          = R_OSPI_DirectTransfer(&g_ospi_ram0_ctrl, &write_cr,
SPI_FLASH_DIRECT_TRANSFER_DIR_WRITE);
    assert(FSP_SUCCESS == err);
    read_cr.data = 0;
 /* Set Dummy Clocks to value configured above (4 Clocks) */
    read_cr.dummy_cycles = 4U;
 /* Read Configuration Register */
    err = R_OSPI_DirectTransfer(&g_ospi_ram0_ctrl, &read_cr,
SPI_FLASH_DIRECT_TRANSFER_DIR_READ);
    assert(FSP_SUCCESS == err);
 /* Confirm the intended Configuration Register value */
    assert(config_reg == (uint16_t) (read_cr.data & UINT16_MAX));
 volatile uint32_t * ram_addr = (uint32_t *) OSPI_RAM_EXAMPLE_PREAMBLE_ADDRESS;
 /* Write the auto-calibration preamble pattern for DOPI mode as specified by the
Hardware Manual */
    ram_addr[0] = 0xFFFF0000;          // NOLINT(readability-magic-numbers)
    ram_addr[1] = 0x0800FF00;          // NOLINT(readability-magic-numbers)
    ram_addr[2] = 0xFF0000F7;          // NOLINT(readability-magic-numbers)
    ram_addr[3] = 0x00F708F7;          // NOLINT(readability-magic-numbers)
    err = R_OSPI_AutoCalibrate(&g_ospi_ram0_ctrl);
    assert(FSP_SUCCESS == err);
 /* After Auto-calibration data can be read from or written to directly from the OSPI
RAM. */
    memcpy(&g_dest[0], &g_src_1[0], OSPI_RAM_EXAMPLE_DATA_LENGTH);
    memcpy(&g_src_2[0], &g_src_1[0], OSPI_RAM_EXAMPLE_DATA_LENGTH);
}
```

OSPI_DOPI_BYTE_ORDER_0123	DOPI byte order byte 0, byte 1, byte 2, byte 3.
OSPI_DOPI_BYTE_ORDER_1032	DOPI byte order byte 1, byte 0, byte 3, byte 2.

Function Documentation

◆ R_OSPI_Open()

fsp_err_t R_OSPI_Open (spi_flash_ctrl_t *const *p_ctrl*, spi_flash_cfg_t const *const *p_cfg*)

Open the OSPI driver module. After the driver is open, the OSPI can be accessed like internal flash memory.

Implements spi_flash_api_t::open.

Example:

```
/* Open the OSPI instancee */
fsp_err_t err = R_OSPI_Open(&g_ospi0_ctrl, &g_ospi0_cfg);
```

Return values

FSP_SUCCESS	Configuration was successful.
FSP_ERR_ASSERTION	The parameter p_ctrl or p_cfg is NULL.
FSP_ERR_ALREADY_OPEN	Driver has already been opened with the same p_ctrl.
FSP_ERR_CALIBRATE_FAILED	Failed to perform auto-calibrate.
FSP_ERR_INVALID_ARGUMENT	Attempting to open the driver with an invalid SPI protocol for OctaRAM.

◆ R_OSPI_DirectWrite()

fsp_err_t R_OSPI_DirectWrite (spi_flash_ctrl_t *const *p_ctrl*, uint8_t const *const *p_src*, uint32_t const *bytes*, bool const *read_after_write*)

Writes raw data directly to the OctaFlash. API not supported. Use R_OSPI_DirectTransfer

Implements spi_flash_api_t::directWrite.

Return values

FSP_ERR_UNSUPPORTED	API not supported by OSPI.

◆ R_OSPI_DirectRead()

fsp_err_t R_OSPI_DirectRead (spi_flash_ctrl_t *const *p_ctrl*, uint8_t *const *p_dest*, uint32_t const *bytes*)

Reads raw data directly from the OctaFlash. API not supported. Use R_OSPI_DirectTransfer.

Implements spi_flash_api_t::directRead.

Return values

FSP_ERR_UNSUPPORTED	API not supported by OSPI.

◆ R_OSPI_DirectTransfer()

fsp_err_t R_OSPI_DirectTransfer (spi_flash_ctrl_t *const *p_ctrl*, spi_flash_direct_transfer_t *const *p_transfer*, spi_flash_direct_transfer_dir_t *direction*)

Read/Write raw data directly with the OctaFlash/OctaRAM device.

Implements spi_flash_api_t::directTransfer.

Example:

```
/* Write Enable */
   err = R_OSPI_DirectTransfer(&g_ospi0_ctrl, &ospi_test_direct_transfer,
SPI_FLASH_DIRECT_TRANSFER_DIR_WRITE);
   assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	The flash was programmed successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.

◆ R_OSPI_XipEnter()

fsp_err_t R_OSPI_XipEnter (spi_flash_ctrl_t *const *p_ctrl*)

Enters Single Continuous Read/Write mode.

Implements spi_flash_api_t::xipEnter.

Return values

FSP_SUCCESS	The flash was programmed successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.
FSP_ERR_UNSUPPORTED	API not supported by OSPI - OctaRAM.

◆ R_OSPI_XipExit()

fsp_err_t R_OSPI_XipExit (spi_flash_ctrl_t *const *p_ctrl*)

Exits XIP (execute in place) mode.

Implements spi_flash_api_t::xipExit.

Return values

FSP_SUCCESS	The flash was programmed successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.
FSP_ERR_UNSUPPORTED	API not supported by OSPI - OctaRAM.

◆ R_OSPI_Write()

fsp_err_t R_OSPI_Write (spi_flash_ctrl_t *const *p_ctrl*, uint8_t const *const *p_src*, uint8_t *const *p_dest*, uint32_t *byte_count*)

Program a page of data to the flash.

Implements spi_flash_api_t::write.

Example:

```
    err = R_OSPI_Write(&g_ospi0_ctrl, g_preamble_bytes, preamble_pattern_addr,
OSPI_EXAMPLE_PREAMBLE_ADDRESS);
    assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	The flash was programmed successfully.
FSP_ERR_ASSERTION	p_instance_ctrl, p_dest or p_src is NULL, or byte_count crosses a page boundary.
FSP_ERR_NOT_OPEN	Driver is not opened.
FSP_ERR_DEVICE_BUSY	Another Write/Erase transaction is in progress.
FSP_ERR_INVALID_SIZE	Write operation crosses page-boundary.
FSP_ERR_UNSUPPORTED	API not supported by OSPI - OctaRAM.
FSP_ERR_WRITE_FAILED	The write enable bit was not set.

◆ R_OSPI_Erase()

fsp_err_t R_OSPI_Erase (spi_flash_ctrl_t *const *p_ctrl*, uint8_t *const *p_device_address*, uint32_t *byte_count*)

Erase a block or sector of flash. The byte_count must exactly match one of the erase sizes defined in spi_flash_cfg_t. For chip erase, byte_count must be SPI_FLASH_ERASE_SIZE_CHIP_ERASE.

Implements spi_flash_api_t::erase.

Return values

FSP_SUCCESS	The command to erase the flash was executed successfully.
FSP_ERR_ASSERTION	p_instance_ctrl or p_device_address is NULL, byte_count doesn't match an erase size defined in spi_flash_cfg_t, or byte_count is set to 0.
FSP_ERR_NOT_OPEN	Driver is not opened.
FSP_ERR_DEVICE_BUSY	The device is busy.
FSP_ERR_UNSUPPORTED	API not supported by OSPI - OctaRAM.
FSP_ERR_WRITE_FAILED	The write enable bit was not set.

◆ R_OSPI_StatusGet()

fsp_err_t R_OSPI_StatusGet (spi_flash_ctrl_t *const *p_ctrl*, spi_flash_status_t *const *p_status*)

Gets the write or erase status of the flash.

Implements spi_flash_api_t::statusGet.

Example:

```
      err = R_OSPI_StatusGet(&g_ospi0_ctrl, &status);
     assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	The write status is in p_status.
FSP_ERR_ASSERTION	p_instance_ctrl or p_status is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.
FSP_ERR_UNSUPPORTED	API not supported by OSPI - OctaRAM.

◆ R_OSPI_BankSet()

fsp_err_t R_OSPI_BankSet (spi_flash_ctrl_t *const *p_ctrl*, uint32_t *bank*)

Selects the bank to access.

Implements spi_flash_api_t::bankSet.

Return values

FSP_ERR_UNSUPPORTED	API not supported by OSPI.

◆ R_OSPI_SpiProtocolSet()

fsp_err_t R_OSPI_SpiProtocolSet (spi_flash_ctrl_t *const *p_ctrl*, spi_flash_protocol_t *spi_protocol*)

Sets the SPI protocol.

Implements spi_flash_api_t::spiProtocolSet.

Return values

FSP_SUCCESS	SPI protocol updated on MCU peripheral.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.
FSP_ERR_CALIBRATE_FAILED	Failed to perform auto-calibrate.
FSP_ERR_INVALID_ARGUMENT	Attempting to set an invalid SPI protocol for OctaRAM.

◆ R_OSPI_AutoCalibrate()

fsp_err_t R_OSPI_AutoCalibrate (spi_flash_ctrl_t *const *p_ctrl*)

Auto-calibrate the OctaRAM device using the preamble pattern.

Note

The preamble pattern must be written to the configured address before calling this API. Implements spi_flash_api_t::autoCalibrate.

Return values

FSP_SUCCESS	SPI protocol updated on MCU peripheral.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.
FSP_ERR_CALIBRATE_FAILED	Failed to perform auto-calibrate.
FSP_ERR_UNSUPPORTED	API not supported by OSPI - OctaFlash.

◆ R_OSPI_Close()

fsp_err_t R_OSPI_Close (spi_flash_ctrl_t *const *p_ctrl*)
Close the OSPI driver module. Implements spi_flash_api_t::close. **Return values** FSP_SUCCESS — Configuration was successful. FSP_ERR_ASSERTION — p_instance_ctrl is NULL. FSP_ERR_NOT_OPEN — Driver is not opened.

Detailed Description

Driver for the OSPI_B peripheral on RA MCUs. This module implements the SPI Flash Interface.

Overview

The OSPI_B peripheral supports xSPI (or OSPI) compatible external memory devices, and it interfaces with these devices to perform data I/O Operations. The OSPI_B peripheral does not support addressable devices, so all connected memory devices must be connected to an individual chip-select pin. Please note that this document will reference the xSPI protocol to which OSPI is a subset. The OSPI_B peripheral is compatible with a variety of xSPI protocol operating modes.

Features

The OSPI_B driver has the following key features to support the **xSPI** device:

- Perform data I/O Operation
- Direct memory-mapped access to the xSPI device memory up to 256 MB.
- Can be configured with xSPI devices on either of the 2 channels
- Programming the xSPI device using combination write (up to 64 bytes)
- Erasing the xSPI device
- Sending device specific commands and reading back responses of up to 8 bytes
- 3 byte addressing
- 4 byte addressing
- Auto-calibration
- Decryption-on-the-fly

Additional build-time features:

- Optional (build-time) DMAC support for data transmission when used with OSPI_B.
- Optional (build-time) XiP support for entering/exiting XiP mode of the target device.
- Optional (build-time) Data-strobe (DS) auto-calibration support for target devices using the DS signal.
- Optional (build-time) Decryption on the fly (DOTF)

Note

For OSPI_B, use of DMAC for data transmission is strongly recommended. Without the use of DMAC, due to the high-speed hardware design of the OSPI peripheral, data transmission can be sensitive to timing variance, which could cause software-based memory-mapped operations to fail unexpectedly.

Configuration

OSPI_B Flash:

Build Time Configurations for r_ospi_b

The following build time configurations are defined in fsp_cfg/r_ospi_b_cfg.h:

Configuration	Options	Default	Description
Memory-mapping Support			
Prefetch Function	• Enable • Disable	Enable	Enable prefetch function on memory-mapped reads.
Combination Function	Refer to the RA Configuration tool for available options.	64 Byte	Enable combination function on memory-mapped writes.
XiP Support	• Enable • Disable	Disable	Enable the use of XiP enter and exit codes.
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
DMAC Support	• Enable • Disable	Disable	Enable DMAC support for the OSPI module.
Autocalibration Support	• Enable • Disable	Disable	Enable DS autocalibration for dual-data-rate modes.
DOTF Support	• Enable (Protected Mode) • Enable (Compatibility Mode) • Disable	Disable	Enable DOTF support for the OSPI module.

Configurations for Storage > OSPI Flash (r_ospi_b)

This module can be added to the Stacks tab via New Stack > Storage > OSPI Flash (r_ospi_b).

Configuration	Options	Default	Description
General			
Name	Name must be a valid C symbol	g_ospi0	Module name.
Unit	MCU Specific Options		Specify the OSPI peripheral to use.
Channel	• CS0 • CS1	CS1	Specify the OSPI chip select line to use.
Initial Protocol Mode	• SPI (1S-1S-1S) • DSPI (1S-2S-2S) • DSPI (2S-2S-2S)	SPI (1S-1S-1S)	Select the initial protocol mode of the xSPI target device.

	• QSPI (1S-4S-4S) • QSPI (4S-4S-4S) • QSPI (4S-4D-4D) • Dual data rate OPI (8D-8D-8D)		Please see the documentation for examples of changing the protocol mode.
Initial Address Bytes	• 3 • 4	4	Select the number of address bytes.
Write Status Bit	Must be an integer between 0 and 7	0	Which bit contains the write in progress status returned from the Write Status Command.
Write Enable Bit	Must be an integer between 0 and 7	1	Which bit contains the write enable status returned from the Write Enable Command.
Sector Erase Size	Must be an integer greater than or equal to 0 and less than 4294967296	4096	The sector erase size. Set Sector Erase Size to 0 if Sector Erase is not supported.
Block Erase Size	Must be an integer greater than or equal to 0 and less than 4294967296	262144	The block erase size. Set Block Erase Size to 0 if Block Erase is not supported.
Command Set Table	Must be a vaild C symbol		Specify the custom command set table (ospi_b_xspi_command_set_t[]) to use. If provided, all properties for High-speed Mode will be ignored.
Command Set Table Length	Length must be an integer greater than or equal to zero.	0	Length of the custom command set table.
Defaults			
Defaults > Command Definitions			
Page Program Command	Must be a 8-bit OSPI Page Program Command under SPI Mode|Command Definitions	0x12	Default command to program a page.
Read Command	Must be a 8-bit OSPI Read Command under SPI Mode|Command Definitions	0x13	Default command to read.

Write Enable Command	Must be a 16-bit OSPI Write Enable Command under SPI Mode|Command Definitions	0x06	Default command to enable write.
Status Command	Must be a 16-bit OSPI Status Command under SPI Mode|Command Definitions	0x05	Default command to query the status of a write or erase command.
Defaults > Erase Command Definitions			
Sector Erase Command	Must be an integer between 0x01 and 0xFFFF, inclusive.	0x2121	Default command to erase a sector. The lowwer byte will be used for 1-byte commands. Set to 0 if unused.
Block Erase Command	Must be an integer between 0x01 and 0xFFFF, inclusive.	0xDCDC	Default command to erase a block. The lowwer byte will be used for 1-byte commands. Set to 0 if unused.
Chip Erase Command	Must be an integer between 0x01 and 0xFFFF, inclusive.	0x6060	Default command to erase the entire chip. The lowwer byte will be used for 1-byte commands. Set to 0 if unused.
Defaults > Dummy Cycles			
Memory Read Dummy Cycles	Must be an integer between 0 and 31	0	Default memory read dummy cycles
Status Read Dummy Cycles	Must be an integer between 0 and 31	0	Default status read dummy cycles
High-speed Mode			
High-speed Mode > Auto-Calibration			
Data latching delay	Must be a valid non-negative integer with maximum configurable value of 0x1F	0x08	If auto-calibration support is enabled, set this to 0 to trigger auto-calibration when appropriate.
Auto-Calibration Address	Must be a valid non-negative integer with maximum configurable value of 0xFFFFFFFF	0x00	Set the address of the read/write destination to be performed for auto-calibration.
High-speed Mode > Command Definitions			
Page Program	Must be a 16-bit OSPI	0x1212	The command to

Command	Page Program Command under High-speed Mode|Command Definitions		program a page in OPI mode.
Dual Read Command	Must be a 16-bit OSPI Dual Read Command under High-speed Mode|Command Definitions	0xEEEE	The command to read in High-speed mode (8DTRD).
Write Enable Command	Must be a 16-bit OSPI Write Enable Command under High-speed Mode|Command Definitions	0x0606	The command to enable write in OPI mode. Set to 0 to ignore.
Status Command	Must be a 16-bit OSPI Status Command under High-speed Mode|Command Definitions	0x0505	The command to query the status of a write or erase command in OPI mode. Set to 0 to ignore.
Sector Erase Command	Must be an integer between 0x01 and 0xFFFF, inclusive.	0	The command to erase a sector for high-speed mode. Set to 0 if unused.
Block Erase Command	Must be an integer between 0x01 and 0xFFFF, inclusive.	0	The command to erase a block for high-speed mode. Set to 0 if unused.
Chip Erase Command	Must be an integer between 0x01 and 0xFFFF, inclusive.	0	The command to erase the entire chip for high-speed mode. Set to 0 if unused.
Protocol	• SPI (1S-1S-1S) • DSPI (1S-2S-2S) • DSPI (2S-2S-2S) • QSPI (1S-4S-4S) • QSPI (4S-4S-4S) • QSPI (4S-4D-4D) • Dual data rate OPI (8D-8D-8D)	Dual data rate OPI (8D-8D-8D)	Select the High-Speed xSPI protocol.
Command Length Bytes	• 1 • 2	2	Command length in bytes
Memory Read Dummy Cycles	Must be an integer between 0 and 31	20	Memory read dummy cycles
Status Read Dummy Cycles	Must be an integer between 0 and 31	3	Status read dummy cycles

Chip Select Timing Setting

Command Interval	Refer to the RA Configuration tool for available options.	2	Command execution interval setting in OCTACLK units
Pull-up Timing	• No Extension • 1 Cycle	No Extension	Signal pull-up timing (CS asserting extention) setting in OCTACLK units
Pull-down Timing	• No Extension • 1 Cycle	No Extension	Signal pull-down timing (CS negating extention) setting in OCTACLK units
XiP Mode			
XiP Enter Code	Must be an integer between 0 and 255	0	XiP enter code.
XiP Exit Code	Must be an integer between 0 and 255	0	XiP exit code.
DOTF			
Name	Name must be a valid C symbol	g_ospi_dotf	DOTF Configuration name.
AES Key	Name must be a valid C symbol	g_ospi_dotf_key	Name of Key variable.
AES IV	Name must be a valid C symbol	g_ospi_dotf_iv	Name of IV variable
AES Key Length	MCU Specific Options		Select AES key length
Key Format	MCU Specific Options		Select key format
Decryption start address	Value must be an integer between 0x80000000 and 0x9FFFFFFF	0x90000000	OSPI decryption start address
Decryption end address	Value must be an integer between 0x80000000 and 0x9FFFFFFF	0x90001FFF	OSPI decryption end address

Note

The user is expected to modify the command definitions based on the xSPI chip and SPI communication mode. The default mode is SPI mode and default erase commands are set for DOPI mode based on Infineon S28HS256.

Clock Configuration

PCLKA is the Octal-SPI bus interface, and PCLKB is used to set OSPI registers.

The signals to the xSPI target device are derived from OCTASPICLK. The OMSCLK signal is OCTASPICLK / 2. Data can be output at the OCTASPICLK rate if protocol mode is set to a Dual Data Rate mode (8D-8D-8D or 4S-4D-4D).

The PCLKB, PCLKA, and OCTASPICLK frequencies can be set on the **Clocks** tab of the RA Configuration editor.

Pin Configuration

The following pins are available to connect to an external OSPI device:

- OMSCLK: OSPI clock output (OCTASPICLK / 2)
- OMDQS: OSPI data strobe signal
- OMCS0: OSPI device 0 select
- OMCS1: OSPI device 1 select
- OMSIO0: Data 0 I/O
- OMSIO1: Data 1 I/O
- OMSIO2: Data 2 I/O
- OMSIO3: Data 3 I/O
- OMSIO4: Data 4 I/O
- OMSIO5: Data 5 I/O
- OMSIO6: Data 6 I/O
- OMSIO7: Data 7 I/O

Note

Data pins must be configured with IOPORT_CFG_DRIVE_HS_HIGH.
Chip Select pins should be configured with at least IOPORT_CFG_DRIVE_MEDIUM.

Usage Notes

Usage Notes for xSPI support

After R_OSPI_B_Open() completes successfully, the xSPI device contents are mapped to address 0x80000000 (bank CS0) or 0x90000000 (bank CS1) and can be read like on-chip flash. Bank CS0 is only accessible from OSPI_B channel/slave 0 and likewise, bank CS1 is only accessible from OSPI_B channel/slave 1. Bank CS0 and CS1 support up to 256 MB of address space each.

Auto-calibration

If support is enabled, auto-calibration procedures are triggered automatically when the 'Data latching delay' field in the configurator properties is set to 0. The user application is responsible for setting the appropriate preamble pattern before calling R_OSPI_B_Open() when using a data strobe (DS) mode or changing the SPI protocol to a DS mode using the R_OSPI_B_SpiProtocolSet() API. The appropriate preamble pattern can be written to the desired address using the R_OSPI_B_Write() API while in simple SPI mode (recommended), or a non-DS mode. Ensure that the same address is passed through the configurator. If the xSPI device is already in a DS mode, the preamble pattern must be programmed using the debugger before calling R_OSPI_B_Open().

The preamble pattern is expected to be { 0x00, 0x00, 0xFF, 0xFF, 0xFF, 0x00, 0x08, 0x00, 0x00, 0xF7, 0xFF, 0x00, 0x08, 0xF7, 0x00, 0xF7 }.

Chip Select Latencies

Chip select latencies can be set through the configurator. The default settings support SPI at minimum latency. In case the driver is opened in SPI mode and will be switched to DOPI mode later using R_OSPI_B_SpiProtocolSet(), please select latencies required for DOPI before calling R_OSPI_B_Open().

XiP Support

OSPI_B supports eXecute in Place (XiP) modes of operation. This can be used for read-only memory-mapped accesses to reduce overall read latency by skipping the command sequence in the xSPI transaction. Separate XiP enter and exit codes may be specified for either attached target device. Upon calling R_OSPI_B_XipEnter(), the associated memory region for the target device is switched to read-only mode and the enter code sent to the device. Calling R_OSPI_B_XipExit() will transmit the exit code and transition the memory region back to read-write access.

Only one flash device should be used after entering XiP mode. Once entered, XiP codes will be transmitted to all attached devices.

xSPI Commands

Command sets and erase commands may be specified individually for each supported protocol mode. By default, the configurator only supports an alternative command set for DOPI (8D-8D-8D) mode. The command sets cannot be changed during run-time. The appropriate command set will be selected when changing protocol modes. If a command set is not found, it defaults to the SPI command set.

If custom DOPI erase commands are not specified, ensure the erase commands are the appropriate 2-byte DOPI commands. The lower byte will be used for 1-byte command protocols.

DOTF Support

Decryption-On-The-Fly is configurable for OSPI Flash and is disabled from the build by default.

Supported Key Formats

- When the Compatibility Mode stack is added for the crypto engine, the user can provide either a wrapped or plaintext AES key to the DOTF module.
- When the Protected Mode stack is used, only wrapped keys are supported.

When configuring the DOTF options, make sure that the key format is specified.

Note

For a detailed description of the Crypto Engine operating modes, refer to Application Note R11AN0498.

Using the DOTF feature requires first creating the encrypted blob on the PC and then configuring the DOTF module with the appropriate parameters to allow decryption of the blob once it is programmed into OSPI. Use the Security Key Management Tool (https://www.renesas.com/us/en/software-tool/security-key-management-tool) to create the encrypted blob. Example: To encrypt a 4096 byte area in a input srec file from 0x90000000 to 0x90000FFF using a 128 AES encryption key "FFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF" and iv "00000000000000000000000000000000" use SKMT with the following arguments: skmt.exe /encdotf /keytype "AES-128" /enckey "FFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF" /nonce "00000000000000000000000000000000" /startaddr "90000000" /endaddr "90000FFF" /prg "input.srec" /incplain /output "encrypted_output.srec"

The values for key, iv and decryption area start and end addresses that were used to create the blob using SKMT must be set in the DOTF configuration in FSP.

Make sure that the Key and IV passed into DOTF configuration are 4 byte aligned. This can be done using a compiler alignment attribute as shown below: uint8_t aes_key[] **attribute**((aligned(4))) = { 0x00, 0x01, 0x02, 0x03, 0x04, 0x05, 0x06, 0x07, 0x08, 0x09, 0x0a, 0x0b, 0x0c, 0x0d, 0x0e, 0x0f,

0x10, 0x11, 0x12, 0x13, 0x14, 0x15, 0x16, 0x17, 0x18, 0x19, 0x1a, 0x1b, 0x1c, 0x1d, 0x1e, 0x1f };

Limitations

Developers should be aware of the following limitations when using the OSPI_B driver:

OSPI_B

- Prefetch and combination support for memory-mapped access is applied globally to all slave devices.
- Combination writes are limited to a maximum of 64 bytes. The user should verify the write has completed before attempting to write more bytes.
- Writing to the memory-mapped regions with the CPU is restricted to 64-bit accesses with 8-byte destination alignments. This restriction is not applicable to other bus masters (e.g. DTC or DMAC).
- When using Arm LLVM ensure any read-only (const) data used with R_OSPI_B_Write() is word (4-byte) aligned if the DMAC is not being used. If parameter checking is enabled, the source pointer alignment will be verified for calls to R_OSPI_B_Write().
- Take care to restrict concurrent accesses of the OSPI memory area. Collisions on the bus can occur if other bus masters attempt to write to the OSPI memory area while another master is reading the OSPI memory area.
- When using 8D-8D-8D mode, care should be taken to access on even-aligned addresses. Problems may occur if odd address alignment is used. This restriction applies to all bus masters using OSPI_B.
- DOTF: AES-192 is not supported when the Protected Mode stack is used.
- When using the IAR compiler, OSPI data must be const qualified to be downloaded by the debugger.

Examples

OSPI Flash:

The following definitions are used across various example snippets below.

```
#define OSPI_B_COMMAND_WRITE_ENABLE_SPI_MODE (0x06U)
#define OSPI_B_COMMAND_WRITE_DISABLE_SPI_MODE (0x04U)
#define OSPI_B_COMMAND_READ_STATUS_SPI_MODE (0x05U)
#define OSPI_B_COMMAND_READ_REGISTER_SPI_MODE (0x65U)
#define OSPI_B_COMMAND_READ_QSPI_MODE (0x0BU)
#define OSPI_B_COMMAND_PROGRAM_QSPI_MODE (0x12U)
#define OSPI_B_COMMAND_WRITE_ENABLE_QSPI_MODE (0x06U)
#define OSPI_B_COMMAND_STATUS_QSPI_MODE (0x05U)
#define OSPI_B_COMMAND_BLOCK_ERASE_DOPI_MODE (0x21DEU)
#define OSPI_B_COMMAND_SECTOR_ERASE_DOPI_MODE (0xDC23U)
#define OSPI_B_COMMAND_CHIP_ERASE_DOPI_MODE (0x609FU)
#define OSPI_B_COMMAND_READ_DOPI_MODE (0xEE11U)
#define OSPI_B_COMMAND_PROGRAM_DOPI_MODE (0x12EDU)
```

```
#define OSPI_B_COMMAND_WRITE_ENABLE_DOPI_MODE (0x06F9U)
#define OSPI_B_COMMAND_STATUS_DOPI_MODE (0x05FAU)
#define OSPI_B_WEN_BIT_MASK (0x02U)
#define OSPI_B_WIP_BIT_MASK (0x01U)
#define OSPI_B_BLOCK_ERASE_SIZE (4096U)
#define OSPI_B_SECTOR_ERASE_SIZE (262144U)
#define OSPI_B_EXAMPLE_DESTINATION_ADDRESS ((void *) 0x90000000U) /* Device on CS1 */
```

```
static void ospi_b_change_mode (spi_flash_protocol_t new_protocol)
{
 /* Step 1. Identify current device configuration and reconfigure as needed... */
 /* Step 2. Update clocks... */
 /* Step 3. Transition driver to the new protocol. */
 fsp_err_t err = R_OSPI_B_SpiProtocolSet(&g_ospi0_ctrl, new_protocol);
    assert(FSP_SUCCESS == err);
 /* Step 4. Verify mode change... */
}
```

Basic Example

This is a basic example of minimal use of the OSPI in an application with OctaFlash.

```
#define OSPI_B_EXAMPLE_DATA_LENGTH (1024)
uint8_t g_dest[OSPI_B_EXAMPLE_DATA_LENGTH];
/* Place data in the .ospi_flash section to flash it during programming. */
const uint8_t g_src[OSPI_B_EXAMPLE_DATA_LENGTH] BSP_PLACE_IN_SECTION(".ospi_flash") =
"ABCDEFGHIJKLMNOPQRSTUVWXYZ";
/* Place code in the .code_in_ospi section to flash it during programming. */
void r_ospi_b_example_function(void) BSP_PLACE_IN_SECTION(".code_in_ospi")
__attribute__((noinline));
void r_ospi_b_example_function (void)
{
 /* Add code here. */
}
void r_ospi_b_basic_example (void)
```

```
{
 /* Open the OSPI instance. */
 fsp_err_t err = R_OSPI_B_Open(&g_ospi0_ctrl, &g_ospi0_cfg);
    assert(FSP_SUCCESS == err);
 /* (Optional) Change SPI to DOPI mode */
    ospi_b_change_mode(SPI_FLASH_PROTOCOL_8D_8D_8D);
 /* After R_OSPI_B_Open() and any required device specific initialization, data can
be read directly from the OSPI flash. */
    memcpy(&g_dest[0], &g_src[0], OSPI_B_EXAMPLE_DATA_LENGTH);
 /* After R_OSPI_B_Open() and any required device specific initialization, functions
in the OSPI flash can be called. */
    r_ospi_b_example_function();
}
```

Reading Status Register Example (R_OSPI_B_DirectTransfer)

This is an example of using R_OSPI_B_DirectWrite followed by R_OSPI_B_DirectRead to send the read status register command and read back the status register from the device.

```
#define OSPI_B_COMMAND_READ_STATUS_REGISTER (0x05U)
void r_ospi_b_direct_example (void)
{
 spi_flash_direct_transfer_t ospi_b_test_direct_transfer =
    {
       .command       = OSPI_B_COMMAND_READ_STATUS_SPI_MODE,
       .address       = 0U,
       .data          = 0U,
       .command_length = 1U,
       .address_length = 0U,
       .data_length    = 0U,
       .dummy_cycles   = 0U
    };
 /* Open the OSPI instance. */
 fsp_err_t err = R_OSPI_B_Open(&g_ospi0_ctrl, &g_ospi0_cfg);
    assert(FSP_SUCCESS == err);
```

```
 /* Write Enable */
    err = R_OSPI_B_DirectTransfer(&g_ospi0_ctrl, &ospi_b_test_direct_transfer,
SPI_FLASH_DIRECT_TRANSFER_DIR_WRITE);
    assert(FSP_SUCCESS == err);
 /* Read Status Register */
    ospi_b_test_direct_transfer.command    = OSPI_B_COMMAND_READ_STATUS_SPI_MODE;
    ospi_b_test_direct_transfer.data_length = 1U;
    err = R_OSPI_B_DirectTransfer(&g_ospi0_ctrl, &ospi_b_test_direct_transfer,
SPI_FLASH_DIRECT_TRANSFER_DIR_READ);
    assert(FSP_SUCCESS == err);
 /* Check if Write Enable is set */
 if (OSPI_B_WEN_BIT_MASK != (ospi_b_test_direct_transfer.data & OSPI_B_WEN_BIT_MASK))
    {
       __BKPT(0);
    }
}
```

Auto-calibration Example (R_OSPI_B_DirectTransfer, R_OSPI_B_Write, R_OSPI_B_SpiProtocolSet)

This is an example of using R_OSPI_B_SpiProtocolSet to change the operating mode from SPI to DOPI and allow the driver to initiate auto-calibration.

```
#define OSPI_B_DOPI_PREAMBLE_PATTERN_LENGTH_BYTES (16U)
#define OSPI_B_EXAMPLE_PREAMBLE_ADDRESS (0x90000000U) /* Device connected to CS1 */
const uint8_t g_preamble_bytes[OSPI_B_DOPI_PREAMBLE_PATTERN_LENGTH_BYTES] =
{
    0x00, 0x00, 0xFF, 0xFF, 0xFF, 0x00, 0x08, 0x00, 0x00, 0xF7, 0xFF, 0x00, 0x08,
0xF7, 0x00, 0xF7
};
static void ospi_b_wait_until_wip (void)
{
 fsp_err_t          err = FSP_SUCCESS;
 spi_flash_status_t status;
    status.write_in_progress = true;
    uint32_t timeout = UINT32_MAX;
```

```
 while ((status.write_in_progress) && (--timeout))
    {
       err = R_OSPI_B_StatusGet(&g_ospi0_ctrl, &status);
      assert(FSP_SUCCESS == err);
    }
 if (0 == timeout)
    {
      assert(FSP_SUCCESS == err);
    }
}
void r_ospi_b_auto_calibrate_example (void)
{
 /* Open the OSPI instance. */
 /* Set data_latch_delay_clocks to 0x0 to enable auto-calibration */
 fsp_err_t err = R_OSPI_B_Open(&g_ospi0_ctrl, &g_ospi0_cfg);
    assert(FSP_SUCCESS == err);
    uint8_t * preamble_pattern_addr = (uint8_t *) OSPI_B_EXAMPLE_PREAMBLE_ADDRESS;
    err = R_OSPI_B_Write(&g_ospi0_ctrl, g_preamble_bytes, preamble_pattern_addr,
OSPI_B_EXAMPLE_PREAMBLE_ADDRESS);
    assert(FSP_SUCCESS == err);
 /* Wait until write has been completed */
    ospi_b_wait_until_wip();
 /* Change from SPI to DOPI mode */
    ospi_b_change_mode(SPI_FLASH_PROTOCOL_8D_8D_8D);
}
```

OctaclkUpdate Example (R_OSPI_B_SpiProtocolSet)

This is an example of using R_BSP_OctaclkUpdate to change the Octal-SPI clock frequency during run time. The OCTACLK frequency must be updated before calling the R_OSPI_B_SpiProtocolSet with appropriate clock source and divider settings required to be set for the new SPI protocol mode. Ensure that the clock source selected is started.

```
/*
 * Changes the OCTACLK divider; assumes PLL2 is being used as the source for OCTACLK.
 * @param divider New clock divider to switch to.
```

```
 */
static void ospi_b_change_omclk (bsp_clocks_octaclk_div_t divider)
{
 /* Ensure clock source (PLL2 in this example) is running before changing the OCTACLK
frequency */
    bsp_octaclk_settings_t octaclk_settings;
    octaclk_settings.source_clock = BSP_CLOCKS_CLOCK_PLL2;
    octaclk_settings.divider      = divider;
    R_BSP_OctaclkUpdate(&octaclk_settings);
}
```

Using a Custom xSPI Command Set Example

This is an example of using custom command sets for 8D-8D-8D and 4S-4S-4S protocol modes.

```
/* Custom two-byte erase commands. */
spi_flash_erase_command_t g_2B_erase_commands[] =
{
    {.command = OSPI_B_COMMAND_BLOCK_ERASE_DOPI_MODE, .size = OSPI_B_BLOCK_ERASE_SIZE
},
    {.command = OSPI_B_COMMAND_SECTOR_ERASE_DOPI_MODE, .size =
OSPI_B_SECTOR_ERASE_SIZE     },
    {.command = OSPI_B_COMMAND_CHIP_ERASE_DOPI_MODE, .size =
SPI_FLASH_ERASE_SIZE_CHIP_ERASE},
};
ospi_b_table_t g_2B_erase_table =
{
    .p_table = g_2B_erase_commands,
    .length = (uint8_t) (sizeof(g_2B_erase_commands) / sizeof
(g_2B_erase_commands[0])),
};
/* Custom command sets. */
ospi_b_xspi_command_set_t g_command_sets[] =
{
 /* 8D-8D-8D example with inverted lower command byte. */
```

```
    {
        .protocol             = SPI_FLASH_PROTOCOL_8D_8D_8D,
        .command_bytes       = OSPI_B_COMMAND_BYTES_2,
        .read_command         = OSPI_B_COMMAND_READ_DOPI_MODE,
        .page_program_command = OSPI_B_COMMAND_PROGRAM_DOPI_MODE,
        .write_enable_command = OSPI_B_COMMAND_WRITE_ENABLE_DOPI_MODE,
        .status_command       = OSPI_B_COMMAND_STATUS_DOPI_MODE,
        .read_dummy_cycles    = 20U,
        .program_dummy_cycles = 0U,
        .status_dummy_cycles = 3U,
        .p_erase_commands    = &g_2B_erase_table
    },
 /* 4S-4S-4S example with different .read_command and dummy cycles. */
    {
        .protocol             = SPI_FLASH_PROTOCOL_4S_4S_4S,
        .command_bytes       = OSPI_B_COMMAND_BYTES_1,
        .read_command         = OSPI_B_COMMAND_READ_QSPI_MODE,
        .page_program_command = OSPI_B_COMMAND_PROGRAM_QSPI_MODE,

Data Structure Documentation

◆ ospi_b_table_t

struct ospi_b_table_t		
Simple array length table structure.		
Data Fields		
void *	p_table	Pointer to the table array.
uint8_t	length	Number of entries in the table.

◆ ospi_b_timing_setting_t

struct ospi_b_timing_setting_t		
Memory mapped timing		
Data Fields		
ospi_b_command_interval_clocks_t	command_to_command_interval	Interval between 2 consecutive commands.
ospi_b_command_cs_pullup_clocks_t	cs_pullup_lag	Duration to de-assert CS line after the last command.
ospi_b_command_cs_pulldown_clocks_t	cs_pulldown_lead	Duration to assert CS line before the first command.

◆ ospi_b_xspi_command_set_t

struct ospi_b_xspi_command_set_t

Command set used for a protocol mode other than normal (1S-1S-1S) SPI.		
Data Fields		
spi_flash_protocol_t	protocol	Protocol mode associated with this command set.
ospi_b_command_bytes_t	command_bytes	Number of command bytes for each command code.
uint16_t	read_command	Read command.
uint16_t	page_program_command	Page program/write command.
uint16_t	write_enable_command	Command to enable write or erase, set to 0x00 to ignore.
uint16_t	status_command	Command to read the write status, set to 0x00 to ignore.
uint8_t	read_dummy_cycles	Dummy cycles to be inserted for read commands.
uint8_t	program_dummy_cycles	Dummy cycles to be inserted for page program commands.
uint8_t	status_dummy_cycles	Dummy cycles to be inserted for status read commands.
ospi_b_table_t const *	p_erase_commands	List of all erase commands and associated sizes.

◆ ospi_b_dotf_cfg_t

struct ospi_b_dotf_cfg_t
This structure is used to hold all the DOTF related configuration.

◆ ospi_b_extended_cfg_t

struct ospi_b_extended_cfg_t		
OSPI_B Extended configuration.		
Data Fields		
uint8_t	ospi_b_unit	The OSPI_B unit corresponding to the selected channel.
ospi_b_device_number_t	channel	Device number to be used for memory device.
ospi_b_timing_setting_t const *	p_timing_settings	Memory-mapped timing settings.
ospi_b_table_t const *	p_xspi_command_set	Additional protocol command sets; if additional protocol commands set are not used set this to NULL.
uint8_t *	p_autocalibration_preamble_pat	OctaFlash memory address

	tern_addr	holding the preamble pattern.
uint8_t	data_latch_delay_clocks	Specify delay between OM_DQS and OM_DQS Strobe. Set to 0 to auto-calibrate. Typical value is 0x80.
transfer_instance_t const *	p_lower_lvl_transfer	DMA Transfer instance used for data transmission.
uint8_t	read_dummy_cycles	Dummy cycles to be inserted for read commands.
uint8_t	program_dummy_cycles	Dummy cycles to be inserted for page program commands.
uint8_t	status_dummy_cycles	Dummy cycles to be inserted for status read commands.

◆ ospi_b_instance_ctrl_t

struct ospi_b_instance_ctrl_t		
Instance control block. DO NOT INITIALIZE. Initialization occurs when spi_flash_api_t::open is called		
Data Fields		
spi_flash_cfg_t const *	p_cfg	Pointer to initial configuration.
uint32_t	open	Whether or not driver is open.
spi_flash_protocol_t	spi_protocol	Current OSPI protocol selected.
ospi_b_device_number_t	channel	Device number to be used for memory device.
ospi_b_xspi_command_set_t const *	p_cmd_set	Command set for the active protocol mode.
R_XSPI0_Type *	p_reg	Address for the OSPI peripheral associated with this channel.

Enumeration Type Documentation

◆ ospi_b_device_number_t

enum ospi_b_device_number_t	
OSPI Flash chip select	
Enumerator	
OSPI_B_DEVICE_NUMBER_0	Device connected to Chip-Select 0.
OSPI_B_DEVICE_NUMBER_1	Device connected to Chip-Select 1.

◆ ospi_b_command_bytes_t

enum ospi_b_command_bytes_t	
OSPI flash number of command code bytes.	
Enumerator	
OSPI_B_COMMAND_BYTES_1	Command codes are 1 byte long.
OSPI_B_COMMAND_BYTES_2	Command codes are 2 bytes long.

◆ ospi_b_command_interval_clocks_t

enum ospi_b_command_interval_clocks_t	
OSPI frame to frame interval	
Enumerator	
OSPI_B_COMMAND_INTERVAL_CLOCKS_1	1 interval clocks
OSPI_B_COMMAND_INTERVAL_CLOCKS_2	2 interval clocks
OSPI_B_COMMAND_INTERVAL_CLOCKS_3	3 interval clocks
OSPI_B_COMMAND_INTERVAL_CLOCKS_4	4 interval clocks
OSPI_B_COMMAND_INTERVAL_CLOCKS_5	5 interval clocks
OSPI_B_COMMAND_INTERVAL_CLOCKS_6	6 interval clocks
OSPI_B_COMMAND_INTERVAL_CLOCKS_7	7 interval clocks
OSPI_B_COMMAND_INTERVAL_CLOCKS_8	8 interval clocks
OSPI_B_COMMAND_INTERVAL_CLOCKS_9	9 interval clocks
OSPI_B_COMMAND_INTERVAL_CLOCKS_10	10 interval clocks
OSPI_B_COMMAND_INTERVAL_CLOCKS_11	11 interval clocks
OSPI_B_COMMAND_INTERVAL_CLOCKS_12	12 interval clocks
OSPI_B_COMMAND_INTERVAL_CLOCKS_13	13 interval clocks
OSPI_B_COMMAND_INTERVAL_CLOCKS_14	14 interval clocks
OSPI_B_COMMAND_INTERVAL_CLOCKS_15	15 interval clocks
OSPI_B_COMMAND_INTERVAL_CLOCKS_16	16 interval clocks

◆ ospi_b_command_cs_pullup_clocks_t

enum ospi_b_command_cs_pullup_clocks_t	
OSPI chip select de-assertion duration	
Enumerator	
OSPI_B_COMMAND_CS_PULLUP_CLOCKS_NO_EXTENSION	CS asserting No extension.
OSPI_B_COMMAND_CS_PULLUP_CLOCKS_1	CS asserting Extend 1 cycle.

◆ ospi_b_command_cs_pulldown_clocks_t

enum ospi_b_command_cs_pulldown_clocks_t	
OSPI chip select assertion duration	
Enumerator	
OSPI_B_COMMAND_CS_PULLDOWN_CLOCKS_NO_EXTENSION	CS negating No extension.
OSPI_B_COMMAND_CS_PULLDOWN_CLOCKS_1	CS negating Extend 1 cycle.

◆ ospi_b_prefetch_function_t

enum ospi_b_prefetch_function_t	
Prefetch function settings	
Enumerator	
OSPI_B_PREFETCH_FUNCTION_DISABLE	Prefetch function disable.
OSPI_B_PREFETCH_FUNCTION_ENABLE	Prefetch function enable.

◆ ospi_b_combination_function_t

enum ospi_b_combination_function_t	
Combination function settings	
Enumerator	
OSPI_B_COMBINATION_FUNCTION_DISABLE	Combination function disable.
OSPI_B_COMBINATION_FUNCTION_4BYTE	Combine up to 4 bytes.
OSPI_B_COMBINATION_FUNCTION_8BYTE	Combine up to 8 bytes.
OSPI_B_COMBINATION_FUNCTION_12BYTE	Combine up to 12 bytes.
OSPI_B_COMBINATION_FUNCTION_16BYTE	Combine up to 16 bytes.
OSPI_B_COMBINATION_FUNCTION_20BYTE	Combine up to 20 bytes.
OSPI_B_COMBINATION_FUNCTION_24BYTE	Combine up to 24 bytes.
OSPI_B_COMBINATION_FUNCTION_28BYTE	Combine up to 28 bytes.
OSPI_B_COMBINATION_FUNCTION_32BYTE	Combine up to 32 bytes.
OSPI_B_COMBINATION_FUNCTION_36BYTE	Combine up to 36 bytes.
OSPI_B_COMBINATION_FUNCTION_40BYTE	Combine up to 40 bytes.
OSPI_B_COMBINATION_FUNCTION_44BYTE	Combine up to 44 bytes.
OSPI_B_COMBINATION_FUNCTION_48BYTE	Combine up to 48 bytes.
OSPI_B_COMBINATION_FUNCTION_52BYTE	Combine up to 52 bytes.
OSPI_B_COMBINATION_FUNCTION_56BYTE	Combine up to 56 bytes.
OSPI_B_COMBINATION_FUNCTION_60BYTE	Combine up to 60 bytes.
OSPI_B_COMBINATION_FUNCTION_64BYTE	Combine up to 64 bytes.
OSPI_B_COMBINATION_FUNCTION_2BYTE	Combine up to 2 bytes.

◆ ospi_b_dotf_aes_key_length_words_t

enum ospi_b_dotf_aes_key_length_words_t
OSPI DOTF AES Key Lengths.

◆ ospi_b_dotf_aes_key_type_t

enum ospi_b_dotf_aes_key_type_t
PSPI DOTF AES Type.

◆ ospi_b_dotf_key_format_t

enum ospi_b_dotf_key_format_t
OSPI DOTF key Type.

Function Documentation

◆ R_OSPI_B_Open()

fsp_err_t R_OSPI_B_Open (spi_flash_ctrl_t *const *p_ctrl*, spi_flash_cfg_t const *const *p_cfg*)
Open the xSPI device. After the driver is open, the xSPI device can be accessed like internal flash memory. Implements spi_flash_api_t::open. **Return values** FSP_SUCCESS — Configuration was successful. FSP_ERR_ASSERTION — The parameter p_ctrl or p_cfg is NULL. FSP_ERR_ALREADY_OPEN — Driver has already been opened with the same p_ctrl. FSP_ERR_CALIBRATE_FAILED — Failed to perform auto-calibrate.

◆ R_OSPI_B_DirectWrite()

fsp_err_t R_OSPI_B_DirectWrite (spi_flash_ctrl_t * *p_ctrl*, uint8_t const *const *p_src*, uint32_t const *bytes*, bool const *read_after_write*)

Writes raw data directly to the OctaFlash. API not supported. Use R_OSPI_B_DirectTransfer

Implements spi_flash_api_t::directWrite.

Return values

FSP_ERR_UNSUPPORTED	API not supported by OSPI.

◆ R_OSPI_B_DirectRead()

fsp_err_t R_OSPI_B_DirectRead (spi_flash_ctrl_t * *p_ctrl*, uint8_t *const *p_dest*, uint32_t const *bytes*)

Reads raw data directly from the OctaFlash. API not supported. Use R_OSPI_B_DirectTransfer.

Implements spi_flash_api_t::directRead.

Return values

FSP_ERR_UNSUPPORTED	API not supported by OSPI.

◆ R_OSPI_B_DirectTransfer()

fsp_err_t R_OSPI_B_DirectTransfer (spi_flash_ctrl_t * *p_ctrl*, spi_flash_direct_transfer_t *const *p_transfer*, spi_flash_direct_transfer_dir_t *direction*)

Read/Write raw data directly with the OctaFlash.

Implements spi_flash_api_t::directTransfer.

Return values

FSP_SUCCESS	The flash was programmed successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.

◆ R_OSPI_B_XipEnter()

fsp_err_t R_OSPI_B_XipEnter (spi_flash_ctrl_t * *p_ctrl*)

Enters XIP (execute in place) mode.

Implements spi_flash_api_t::xipEnter.

Return values

FSP_SUCCESS	XiP mode was entered successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.
FSP_ERR_UNSUPPORTED	XiP support is not enabled.

◆ R_OSPI_B_XipExit()

fsp_err_t R_OSPI_B_XipExit (spi_flash_ctrl_t * *p_ctrl*)

Exits XIP (execute in place) mode.

Implements spi_flash_api_t::xipExit.

Return values

FSP_SUCCESS	XiP mode was entered successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.
FSP_ERR_UNSUPPORTED	XiP support is not enabled.

◆ R_OSPI_B_Write()

fsp_err_t R_OSPI_B_Write (spi_flash_ctrl_t * *p_ctrl*, uint8_t const *const *p_src*, uint8_t *const *p_dest*, uint32_t *byte_count*)

Program a page of data to the flash.

Implements spi_flash_api_t::write.

Return values

FSP_SUCCESS	The flash was programmed successfully.
FSP_ERR_ASSERTION	p_instance_ctrl, p_dest or p_src is NULL, or byte_count crosses a page boundary.
FSP_ERR_NOT_OPEN	Driver is not opened.
FSP_ERR_INVALID_SIZE	Insufficient space remaining in page or write length is not a multiple of CPU access size when not using the DMAC.
FSP_ERR_DEVICE_BUSY	Another Write/Erase transaction is in progress.
FSP_ERR_WRITE_FAILED	Write operation failed.
FSP_ERR_INVALID_ADDRESS	Destination or source is not aligned to CPU access alignment when not using the DMAC.

◆ R_OSPI_B_Erase()

fsp_err_t R_OSPI_B_Erase (spi_flash_ctrl_t * *p_ctrl*, uint8_t *const *p_device_address*, uint32_t *byte_count*)

Erase a block or sector of flash. The byte_count must exactly match one of the erase sizes defined in spi_flash_cfg_t. For chip erase, byte_count must be SPI_FLASH_ERASE_SIZE_CHIP_ERASE.

Implements spi_flash_api_t::erase.

Return values

FSP_SUCCESS	The command to erase the flash was executed successfully.
FSP_ERR_ASSERTION	p_instance_ctrl or p_device_address is NULL, byte_count doesn't match an erase size defined in spi_flash_cfg_t, or byte_count is set to 0.
FSP_ERR_NOT_OPEN	Driver is not opened.
FSP_ERR_DEVICE_BUSY	The device is busy.
FSP_ERR_WRITE_FAILED	Write operation failed.

◆ R_OSPI_B_StatusGet()

fsp_err_t R_OSPI_B_StatusGet (spi_flash_ctrl_t * *p_ctrl*, spi_flash_status_t *const *p_status*)

Gets the write or erase status of the flash.

Implements spi_flash_api_t::statusGet.

Return values

FSP_SUCCESS	The write status is in p_status.
FSP_ERR_ASSERTION	p_instance_ctrl or p_status is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.

◆ R_OSPI_B_BankSet()

fsp_err_t R_OSPI_B_BankSet (spi_flash_ctrl_t * *p_ctrl*, uint32_t *bank*)

Selects the bank to access. Use ospi_b_bank_select_t as the bank value.

Implements spi_flash_api_t::bankSet.

Return values

FSP_ERR_UNSUPPORTED	This function is unsupported.

◆ R_OSPI_B_SpiProtocolSet()

fsp_err_t R_OSPI_B_SpiProtocolSet (spi_flash_ctrl_t * *p_ctrl*, spi_flash_protocol_t *spi_protocol*)

Sets the SPI protocol.

Implements spi_flash_api_t::spiProtocolSet.

Return values

FSP_SUCCESS	SPI protocol updated on MPU peripheral.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.
FSP_ERR_CALIBRATE_FAILED	Failed to perform auto-calibrate.

◆ R_OSPI_B_Close()

fsp_err_t R_OSPI_B_Close (spi_flash_ctrl_t * *p_ctrl*)

Close the OSPI driver module.

Implements spi_flash_api_t::close.

Return values

FSP_SUCCESS	Configuration was successful.
FSP_ERR_ASSERTION	p_instance_ctrl is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.

◆ R_OSPI_B_AutoCalibrate()

fsp_err_t R_OSPI_B_AutoCalibrate (spi_flash_ctrl_t *const *p_ctrl*)

AutoCalibrate the OSPI_B DS signal.

Implements spi_flash_api_t::autoCalibrate.

Return values

FSP_SUCCESS	Autocalibration completed successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.
FSP_ERR_UNSUPPORTED	Autocalibration support is not enabled.
FSP_ERR_CALIBRATE_FAILED	Failed to perform auto-calibrate.

◆ R_OSPI_B_DOTF_Configure()

fsp_err_t R_OSPI_B_DOTF_Configure (spi_flash_ctrl_t *const *p_ctrl*, ospi_b_dotf_cfg_t *const *p_dotf_cfg*)

Configure DOTF

Parameters

[in]	p_ctrl	Pointer to OSPI specific control structure
[in]	p_dotf_cfg	Pointer to DOTF configuration structure

Return values

FSP_SUCCESS	DOTF enabled successfully
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Key initialization failed.
FSP_ERR_CRYPTO_SCE_FAIL	Key wrapping failed.
FSP_ERR_INVALID_ARGUMENT	Invalid key type argument.
FSP_ERR_UNSUPPORTED	DOTF support is not enabled

7.2.17.16 QSPI (r_qspi)

fsp_err_t	R_QSPI_BankSet (spi_flash_ctrl_t *p_ctrl, uint32_t bank)
fsp_err_t	R_QSPI_SpiProtocolSet (spi_flash_ctrl_t *p_ctrl, spi_flash_protocol_t spi_protocol)
fsp_err_t	R_QSPI_AutoCalibrate (spi_flash_ctrl_t *p_ctrl)
fsp_err_t	R_QSPI_Close (spi_flash_ctrl_t *p_ctrl)

Detailed Description

Driver for the QSPI peripheral on RA MCUs. This module implements the SPI Flash Interface.

Overview

Features

The QSPI driver has the following key features:

- Memory mapped read access to the QSPI flash
- Programming the QSPI flash device
- Erasing the QSPI flash device
- Sending device specific commands and reading back responses
- Entering and exiting QPI mode
- Entering and exiting XIP mode
- 3 or 4 byte addressing

Configuration

Build Time Configurations for r_qspi

The following build time configurations are defined in driver/r_qspi_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
Support Multiple Line Program in Extended SPI Mode	• Enabled • Disabled	Disabled	If selected code for programming on multiple lines in extended SPI mode is

included in the build.

Configurations for Storage > QSPI (r_qspi)

This module can be added to the Stacks tab via New Stack > Storage > QSPI (r_qspi).

Configuration	Options	Default	Description
General			
Name	Name must be a valid C symbol	g_qspi0	Module name.
SPI Protocol	• Extended SPI • QPI	Extended SPI	Select the initial SPI protocol. SPI protocol can be changed in R_QSPI_Direct().
Address Bytes	• 3 • 4 • 4 with 4-byte read code	3	Select the number of address bytes. Selecting '4 with 4-byte read code' converts the default read code determined in Read Mode to the 4-byte version. If 4-byte mode is selected without using 4-byte commands, the application must issue the EN4B command using R_QSPI_Direct().
Read Mode	• Standard Read • Fast Read • Fast Read Dual Output • Fast Read Dual I/O • Fast Read Quad Output • Fast Read Quad I/O	Fast Read Quad I/O	Select the read mode for memory mapped access.
Dummy Clocks for Fast Read	Refer to the RA Configuration tool for available options.	Default	Select the number of dummy clocks for fast read operations. Default is 6 clocks for Fast Read Quad I/O, 4 clocks for Fast Read Dual I/O, and 8 clocks for other fast read instructions including Fast Read Quad Output, Fast Read Dual Output, and Fast Read

Page Size Bytes	Must be an integer greater than 0	256	The maximum number of bytes allowed for a single write.
Command Definitions			
Page Program Command	Must be an 8-bit QSPI Page Program Command under Command Definitions	0x02	The command to program a page. If 'Support Multiple Line Program in Extended SPI Mode' is Enabled, this command must use the same number of data lines as the selected read mode.
Page Program Address Lines	• 1 • 2 • 4	1	Select the number of lines to use for the address bytes during write operations. This can be determined by referencing the datasheet for the external QSPI. It should either be 1 or match the number of data lines used for memory mapped fast read operations.
Write Enable Command	Must be an 8-bit QSPI Write Enable Command under Command Definitions	0x06	The command to enable write.
Status Command	Must be an 8-bit QSPI Status Command under Command Definitions	0x05	The command to query the status of a write or erase command.
Write Status Bit	Must be an integer between 0 and 7	0	Which bit contains the write in progress status returned from the Write Status Command.
Sector Erase Command	Must be an 8-bit QSPI Sector Erase Command under Command Definitions	0x20	The command to erase a sector. Set Sector Erase Size to 0 if unused.
Sector Erase Size	Must be an integer greater than or equal to 0	4096	The sector erase size. Set Sector Erase Size to 0 if Sector Erase is not supported.
Block Erase Command	Must be an 8-bit QSPI Block Erase Command under Command	0xD8	The command to erase a block. Set Block Erase Size to 0 if

	Definitions		unused.
Block Erase Size	Must be an integer greater than or equal to 0	65536	The block erase size. Set Block Erase Size to 0 if Block Erase is not supported.
Block Erase 32KB Command	Must be an 8-bit QSPI Block Erase 32KB Command under Command Definitions	0x52	The command to erase a 32KB block. Set Block Erase Size to 0 if unused.
Block Erase 32KB Size	Must be an integer greater than or equal to 0	32768	The block erase 32KB size. Set Block Erase 32KB Size to 0 if Block Erase 32KB is not supported.
Chip Erase Command	Must be an 8-bit QSPI Chip Erase Command under Command Definitions	0xC7	The command to erase the entire chip. Set Chip Erase Command to 0 if unused.
XIP Enter M7-M0	Must be an 8-bit QSPI XIP Enter M7-M0 command under Command Definitions	0x20	How to set M7-M0 to enter XIP mode.
XIP Exit M7-M0	Must be an 8-bit QSPI XIP Exit M7-M0 command under Command Definitions	0xFF	How to set M7-M0 exit XIP mode.
Bus Timing			
QSPKCLK Divisor	MCU Specific Options		Select the divisor to apply to PCLK to get QSPCLK.
Minimum QSSL Deselect Cycles	Refer to the RA Configuration tool for available options.	4 QSPCLK	Define the minimum number of QSPCLK cycles for QSSL to remain high beween operations.

Clock Configuration

The QSPI clock is derived from PCLKA.

Pin Configuration

The following pins are available to connect to an external QSPI device:

- QSPCLK: QSPI clock output
- QSSL: QSPI slave select
- QIO0: Data 0 I/O
- QIO1: Data 1 I/O
- QIO2: Data 2 I/O

- QIO3: Data 3 I/O

Note

It is recommended to configure the pins with IOPORT_CFG_DRIVE_HIGH.

Usage Notes

QSPI Memory Mapped Access

After R_QSPI_Open() completes successfully, the QSPI flash device contents are mapped to address 0x60000000 and can be read like on-chip flash.

Limitations

Developers should be aware of the following limitations when using the QSPI driver:

- Only P305-P310 are currently supported by the J-Link driver to flash the QSPI.
- The default J-Link downloader requires the device to be in extended SPI mode (not QPI mode).

Examples

Basic Example

This is a basic example of minimal use of the QSPI in an application.

```
#define QSPI_EXAMPLE_DATA_LENGTH (1024)
uint8_t g_dest[QSPI_EXAMPLE_DATA_LENGTH];
/* Place data in the .qspi_flash section to flash it during programming. */
const uint8_t g_src[QSPI_EXAMPLE_DATA_LENGTH] BSP_PLACE_IN_SECTION(".qspi_flash") =
"ABCDEFGHIJKLMNOPQRSTUVWXYZ";
/* Place code in the .code_in_qspi section to flash it during programming. */
void r_qspi_example_function(void) BSP_PLACE_IN_SECTION(".code_in_qspi")
__attribute__((noinline));
void r_qspi_example_function (void)
{
 /* Add code here. */
}
void r_qspi_basic_example (void)
{
 /* Open the QSPI instance. */
 fsp_err_t err = R_QSPI_Open(&g_qspi0_ctrl, &g_qspi0_cfg);
    assert(FSP_SUCCESS == err);
```

```
 /* (Optional) Send device specific initialization commands. */
    r_qspi_example_init();
 /* After R_QSPI_Open() and any required device specific intiialization, data can be
read directly from the QSPI flash. */
    memcpy(&g_dest[0], &g_src[0], QSPI_EXAMPLE_DATA_LENGTH);
 /* After R_QSPI_Open() and any required device specific intiialization, functions in
the QSPI flash can be called. */
    r_qspi_example_function();
}
```

Initialization Command Structure Example

This is an example of the types of commands that can be used to initialize the QSPI.

```
#define QSPI_COMMAND_WRITE_ENABLE (0x06U)
#define QSPI_COMMAND_WRITE_STATUS_REGISTER (0x01U)
#define QSPI_COMMAND_ENTER_QPI_MODE (0x38U)
#define QSPI_EXAMPLE_STATUS_REGISTER_1 (0x40)
#define QSPI_EXAMPLE_STATUS_REGISTER_2 (0x00)
static void r_qspi_example_init (void)
{
 /* Write status registers */
 /* Write one byte to enable writing to the status register, then deassert QSSL. */
    uint8_t   data[4];
 fsp_err_t err;
    data[0] = QSPI_COMMAND_WRITE_ENABLE;
    err    = R_QSPI_DirectWrite(&g_qspi0_ctrl, &data[0], 1, false);
    assert(FSP_SUCCESS == err);
 /* Write 3 bytes, including the write status register command followed by values for
both status registers. In the
  * status registers, set QE to 1 and other bits to their default setting. After all
data is written, deassert the
  * QSSL line. */
    data[0] = QSPI_COMMAND_WRITE_STATUS_REGISTER;
    data[1] = QSPI_EXAMPLE_STATUS_REGISTER_1;
```

```
    data[2] = QSPI_EXAMPLE_STATUS_REGISTER_2;
    err    = R_QSPI_DirectWrite(&g_qspi0_ctrl, &data[0], 3, false);
    assert(FSP_SUCCESS == err);
 /* Wait for status register to update. */
 spi_flash_status_t status;
 do
    {
       (void) R_QSPI_StatusGet(&g_qspi0_ctrl, &status);
    } while (true == status.write_in_progress);
 /* Write one byte to enter QSPI mode, then deassert QSSL. After entering QPI mode on
the device, change the SPI
  * protocol to QPI mode on the MCU peripheral. */
    data[0] = QSPI_COMMAND_ENTER_QPI_MODE;
    err    = R_QSPI_DirectWrite(&g_qspi0_ctrl, &data[0], 1, false);
    assert(FSP_SUCCESS == err);
    (void) R_QSPI_SpiProtocolSet(&g_qspi0_ctrl, SPI_FLASH_PROTOCOL_QPI);
}
```

Reading Status Register Example (R_QSPI_DirectWrite, R_QSPI_DirectRead)

This is an example of using R_QSPI_DirectWrite followed by R_QSPI_DirectRead to send the read status register command and read back the status register from the device.

```
#define QSPI_COMMAND_READ_STATUS_REGISTER (0x05U)
void r_qspi_direct_example (void)
{
 /* Read a status register. */
 /* Write one byte to read the status register. Do not deassert QSSL. */
    uint8_t   data;
 fsp_err_t err;
    data = QSPI_COMMAND_READ_STATUS_REGISTER;
    err = R_QSPI_DirectWrite(&g_qspi0_ctrl, &data, 1, true);
    assert(FSP_SUCCESS == err);
 /* Read one byte. After all data is read, deassert the QSSL line. */
    err = R_QSPI_DirectRead(&g_qspi0_ctrl, &data, 1);
```

```
    assert(FSP_SUCCESS == err);
 /* Status register contents are available in variable 'data'. */
}
```

Querying Device Size Example (R_QSPI_DirectWrite, R_QSPI_DirectRead)

This is an example of using R_QSPI_DirectWrite followed by R_QSPI_DirectRead to query the device size.

```
#define QSPI_EXAMPLE_COMMAND_READ_ID (0x9F)
#define QSPI_EXAMPLE_COMMAND_READ_SFDP (0x5A)
void r_qspi_size_example (void)
{
 /* Many QSPI devices support more than one way to query the device size. Consult the
datasheet for your
  * QSPI device to determine which of these methods are supported (if any). */
    uint32_t device_size_bytes;
 fsp_err_t err;
#ifdef QSPI_EXAMPLE_COMMAND_READ_ID
 /* This example shows how to get the device size by reading the manufacturer ID. */
    uint8_t data[4];
    data[0] = QSPI_EXAMPLE_COMMAND_READ_ID;
    err    = R_QSPI_DirectWrite(&g_qspi0_ctrl, &data[0], 1, true);
    assert(FSP_SUCCESS == err);
 /* Read 3 bytes. The third byte often represents the size of the QSPI, where the
size of the QSPI = 2 ^ N. */
    err = R_QSPI_DirectRead(&g_qspi0_ctrl, &data[0], 3);
    assert(FSP_SUCCESS == err);
    device_size_bytes = 1U << data[2];
 FSP_PARAMETER_NOT_USED(device_size_bytes);
#endif
#ifdef QSPI_EXAMPLE_COMMAND_READ_SFDP
 /* Read the JEDEC SFDP header to locate the JEDEC flash parameters table. Reference
JESD216 "Serial Flash
  * Discoverable Parameters (SFDP)". */
```

```
 /* Send the standard 0x5A command followed by 3 address bytes (SFDP header is at
address 0). */
    uint8_t buffer[16];
    memset(&buffer[0], 0, sizeof(buffer));
    buffer[0] = QSPI_EXAMPLE_COMMAND_READ_SFDP;
    err       = R_QSPI_DirectWrite(&g_qspi0_ctrl, &buffer[0], 4, true);
    assert(FSP_SUCCESS == err);
 /* Read out 16 bytes (1 dummy byte followed by 15 data bytes). */
    err = R_QSPI_DirectRead(&g_qspi0_ctrl, &buffer[0], 16);
    assert(FSP_SUCCESS == err);
 /* Read the JEDEC flash parameters to locate the memory size. */
 /* Send the standard 0x5A command followed by 3 address bytes (located in big endian
order at offset 0xC-0xE).
  * These bytes are accessed at 0xD-0xF because the first byte read is a dummy byte.
*/
    buffer[0] = QSPI_EXAMPLE_COMMAND_READ_SFDP;
    buffer[1] = buffer[0xF];
    buffer[2] = buffer[0xE];
    buffer[3] = buffer[0xD];
    err       = R_QSPI_DirectWrite(&g_qspi0_ctrl, &buffer[0], 4, true);
    assert(FSP_SUCCESS == err);
 /* Read out 9 bytes (1 dummy byte followed by 8 data bytes). */
    err = R_QSPI_DirectRead(&g_qspi0_ctrl, &buffer[0], 9);
    assert(FSP_SUCCESS == err);
 /* Read the memory density (located in big endian order at offset 0x4-0x7). These
bytes are accessed at 0x5-0x8
  * because the first byte read is a dummy byte. */
    uint32_t memory_density = (uint32_t) ((buffer[8] << 24) | (buffer[7] << 16) |
(buffer[6] << 8) | buffer[5]);
 if ((1U << 31) & memory_density)
    {
 /* For densities 4 gigabits and above, bit-31 is set to 1b. The field 30:0 defines
'N' where the density is
  * computed as 2^N bits (N must be >= 32). This code subtracts 3 from N to divide by
```

```
8 to get the size in
  * bytes instead of bits. */
       device_size_bytes = 1U << ((memory_density & ~(1U << 31)) - 3U);
    }
 else
    {
 /* For densities 2 gigabits or less, bit-31 is set to 0b. The field 30:0 defines the
size in bits. This
  * code divides the memory density by 8 to get the size in bytes instead of bits. */
       device_size_bytes = (memory_density / 8) + 1;
    }
 FSP_PARAMETER_NOT_USED(device_size_bytes);
#endif
}
```

Function Documentation

◆ R_QSPI_Open()

fsp_err_t R_QSPI_Open (spi_flash_ctrl_t * *p_ctrl*, spi_flash_cfg_t const *const *p_cfg*)

Open the QSPI driver module. After the driver is open, the QSPI can be accessed like internal flash memory starting at address 0x60000000.

Implements spi_flash_api_t::open.

Return values

FSP_SUCCESS	Configuration was successful.
FSP_ERR_ASSERTION	The parameter p_instance_ctrl or p_cfg is NULL.
FSP_ERR_ALREADY_OPEN	Driver has already been opened with the same p_instance_ctrl.

◆ R_QSPI_DirectWrite()

fsp_err_t R_QSPI_DirectWrite (spi_flash_ctrl_t * *p_ctrl*, uint8_t const *const *p_src*, uint32_t const *bytes*, bool const *read_after_write*)

Writes raw data directly to the QSPI.

Implements spi_flash_api_t::directWrite.

Return values

FSP_SUCCESS	The flash was programmed successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.
FSP_ERR_INVALID_MODE	This function can't be called when XIP mode is enabled.
FSP_ERR_DEVICE_BUSY	The device is busy.

◆ R_QSPI_DirectRead()

fsp_err_t R_QSPI_DirectRead (spi_flash_ctrl_t * *p_ctrl*, uint8_t *const *p_dest*, uint32_t const *bytes*)

Reads raw data directly from the QSPI. This API can only be called after R_QSPI_DirectWrite with read_after_write set to true.

Implements spi_flash_api_t::directRead.

Return values

FSP_SUCCESS	The flash was programmed successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.
FSP_ERR_INVALID_MODE	This function must be called after R_QSPI_DirectWrite with read_after_write set to true.

◆ R_QSPI_DirectTransfer()

fsp_err_t R_QSPI_DirectTransfer (spi_flash_ctrl_t * *p_ctrl*, spi_flash_direct_transfer_t *const *p_transfer*, spi_flash_direct_transfer_dir_t *direction*)

Read/Write raw data directly with the OctaFlash/OctaRAM device. Unsupported by QSPI.

Implements spi_flash_api_t::directTransfer.

Return values

FSP_ERR_UNSUPPORTED	API not supported by QSPI.

◆ R_QSPI_XipEnter()

fsp_err_t R_QSPI_XipEnter (spi_flash_ctrl_t * *p_ctrl*)

Enters XIP (execute in place) mode.

Implements spi_flash_api_t::xipEnter.

Return values

FSP_SUCCESS	The flash was programmed successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.

◆ R_QSPI_XipExit()

fsp_err_t R_QSPI_XipExit (spi_flash_ctrl_t * *p_ctrl*)

Exits XIP (execute in place) mode.

Implements spi_flash_api_t::xipExit.

Return values

FSP_SUCCESS	The flash was programmed successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.

◆ R_QSPI_Write()

fsp_err_t R_QSPI_Write (spi_flash_ctrl_t * *p_ctrl*, uint8_t const *const *p_src*, uint8_t *const *p_dest*, uint32_t *byte_count*)

Program a page of data to the flash.

Implements spi_flash_api_t::write.

Return values

FSP_SUCCESS	The flash was programmed successfully.
FSP_ERR_ASSERTION	p_instance_ctrl, p_dest or p_src is NULL, or byte_count crosses a page boundary.
FSP_ERR_NOT_OPEN	Driver is not opened.
FSP_ERR_INVALID_MODE	This function can't be called when XIP mode is enabled.
FSP_ERR_DEVICE_BUSY	The device is busy.

◆ R_QSPI_Erase()

fsp_err_t R_QSPI_Erase (spi_flash_ctrl_t * *p_ctrl*, uint8_t *const *p_device_address*, uint32_t *byte_count*)

Erase a block or sector of flash. The byte_count must exactly match one of the erase sizes defined in spi_flash_cfg_t. For chip erase, byte_count must be SPI_FLASH_ERASE_SIZE_CHIP_ERASE.

Implements spi_flash_api_t::erase.

Return values

FSP_SUCCESS	The command to erase the flash was executed successfully.
FSP_ERR_ASSERTION	p_instance_ctrl or p_device_address is NULL, or byte_count doesn't match an erase size defined in spi_flash_cfg_t, or device is in XIP mode.
FSP_ERR_NOT_OPEN	Driver is not opened.
FSP_ERR_INVALID_MODE	This function can't be called when XIP mode is enabled.
FSP_ERR_DEVICE_BUSY	The device is busy.

◆ R_QSPI_StatusGet()

fsp_err_t R_QSPI_StatusGet (spi_flash_ctrl_t * *p_ctrl*, spi_flash_status_t *const *p_status*)

Gets the write or erase status of the flash.

Implements spi_flash_api_t::statusGet.

Return values

FSP_SUCCESS	The write status is in p_status.
FSP_ERR_ASSERTION	p_instance_ctrl or p_status is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.
FSP_ERR_INVALID_MODE	This function can't be called when XIP mode is enabled.

◆ R_QSPI_BankSet()

fsp_err_t R_QSPI_BankSet (spi_flash_ctrl_t * *p_ctrl*, uint32_t *bank*)

Selects the bank to access. A bank is a 64MB sliding access window into the QSPI device flash memory space. To access chip address 0x4000000, select bank 1, then read from internal flash address 0x60000000. To access chip address 0x8001000, select bank 2, then read from internal flash address 0x60001000.

This function is not required for memory devices less than or equal to 512 Mb (64MB).

Implements spi_flash_api_t::bankSet.

Return values

FSP_SUCCESS	Bank successfully selected.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.

◆ R_QSPI_SpiProtocolSet()

fsp_err_t R_QSPI_SpiProtocolSet (spi_flash_ctrl_t * *p_ctrl*, spi_flash_protocol_t *spi_protocol*)

Sets the SPI protocol.

Implements spi_flash_api_t::spiProtocolSet.

Return values

FSP_SUCCESS	SPI protocol updated on MCU peripheral.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.
FSP_ERR_INVALID_ARGUMENT	Invalid SPI protocol requested.

◆ R_QSPI_AutoCalibrate()

fsp_err_t R_QSPI_AutoCalibrate (spi_flash_ctrl_t * *p_ctrl*)

Auto-calibrate the OctaRAM device using the preamble pattern. Unsupported by QSPI. Implements spi_flash_api_t::autoCalibrate.

Return values

FSP_ERR_UNSUPPORTED	API not supported by QSPI

◆ R_QSPI_Close()

fsp_err_t R_QSPI_Close (spi_flash_ctrl_t * *p_ctrl*)

Close the QSPI driver module.

Implements spi_flash_api_t::close.

Return values

FSP_SUCCESS	Configuration was successful.
FSP_ERR_ASSERTION	p_instance_ctrl is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.

7.2.17.17 SD/MMC (r_sdhi)

Detailed Description

Driver for the SD/MMC Host Interface (SDHI) peripheral on RA MCUs. This module implements the SD/MMC Interface.

Overview

Features

- Supports the following memory devices: SDSC (SD Standard Capacity), SDHC (SD High Capacity), SDXC (SD Extended Capacity) and eMMC (embedded Multi Media Card)
    - Supports reading, writing and erasing SD memory devices
    - Supports 1, 4 or 8-bit data bus (8-bit bus is supported for eMMC only)
    - Supports detection of device write protection (SD cards only)
    - Supports high speed mode
- Automatically configures the clock to the maximum clock rate supported by both host (MCU) and device
- Supports hardware acceleration using DMAC or DTC
- Supports callback notification when an operation completes or an error occurs

Configuration

Build Time Configurations for r_sdhi

The following build time configurations are defined in fsp_cfg/r_sdhi_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
Unaligned Access Support	• Disabled • Enabled	Enabled	If enabled, code for supporting buffers that are not aligned on a 4-byte boundary is included in the build. Only disable this if all buffers passed to the driver are 4-byte aligned.
SD Support	• Disabled • Enabled	Enabled	If selected code for SD card support is included in the build.
eMMC Support	• Disabled • Enabled	Disabled	If selected code for eMMC device support is included in the build.

Configurations for Storage > SD/MMC (r_sdhi)

This module can be added to the Stacks tab via New Stack > Storage > SD/MMC (r_sdhi). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_sdmmc0	Module name.

Channel	Value must be a non-negative integer	0	Select the channel.
Bus Width	MCU Specific Options		Select the bus width.
Card Detection	• Not Used • CD Pin	CD Pin	Select the card detection method.
Write Protection	• Not Used • WP Pin	WP Pin	Select whether or not to use the write protect pin. Select Not Used if the MCU or device does not have a write protect pin.
Callback	Name must be a valid C symbol	NULL	A user callback function can be provided. If this callback function is provided, it will be called from the interrupt service routine (ISR).
Access Interrupt Priority	MCU Specific Options		Select the access interrupt priority.
Card Interrupt Priority	MCU Specific Options		Select the card interrupt priority.
DTC Interrupt Priority	MCU Specific Options		Select the DTC interrupt priority.

Interrupt Configurations:

The following interrupts are required to use the r_sdhi module:

Using SD/MMC with DTC:

- Access Interrupt
- DTC Interrupt

Using SD/MMC with DMAC:

- Access Interrupt
- DMAC Interrupt (in DMAC instance)

The Card interrupt is optional and only available on MCU packages that have the SDnCD pin (n = channel number).

Clock Configuration

The SDMMC MCU peripheral (SDHI) uses the PCLKA for its clock source. The SDMMC driver selects the optimal built-in divider based on the PCLKA frequency and the maximum clock rate allowed by the device obtained at media initialization.

Pin Configuration

The SDMMC driver supports the following pins (n = channel number):

- SDnCLK
- SDnCMD
- SDnDAT0
- SDnDAT1
- SDnDAT2
- SDnDAT3
- SDnDAT4 (not available on all MCUs)
- SDnDAT5 (not available on all MCUs)
- SDnDAT6 (not available on all MCUs)
- SDnDAT7 (not available on all MCUs)
- SDnCD (not available on all MCUs)
- SDnWP

The drive capacity for each pin should be set to "Medium" or "High" for most hardware designs. This can be configured in the **Pins** tab of the RA Configuration editor by selecting the pin under Pin Selection -> Ports.

Usage Notes

Card Detection

When Card Detection is configured to "CD Pin" in the RA Configuration editor, interrupt flags are cleared and card detection is enabled during R_SDHI_Open().

R_SDHI_StatusGet() can be called to retrieve the current status of the card (including whether a card is present). If the Card Interrupt Priority is enabled, a callback is called when a card is inserted or removed.

If a card is removed and reinserted, R_SDHI_MediaInit() must be called before reading from the card or writing to the card.

Note

R_SDHI_StatusGet() should be used to initially determine the card state after opening the interface.

DMA Request Interrupt Priority

When data transfers are not 4-byte aligned or not a multiple of 4 bytes, a software copy of the block size (up to 512 bytes) is done in the DMA Request interrupt. This blocks all other interrupts that are a lower or equal priority to the access interrupt until the software copy is complete.

Timing Notes for R_SDHI_MediaInit

The R_SDHI_MediaInit() API completes the entire device identification and configuration process. This involves several command-response cycles at a bus width of 1 bit and a bus speed of 400 kHz or less.

Limitations

Developers should be aware of the following limitations when using the SDHI:

Blocking Calls

The following functions block execution until the response is received for at least one command:

- R_SDHI_MediaInit
- R_SDHI_Erase

Once the function returns the status of the operation can be determined via R_SDHI_StatusGet or through receipt of a callback.

Note

Due to the variability in clocking configurations it is recommended to determine blocking delays experimentally on the target system.

Data Alignment and Size

Data transfers should be 4-byte aligned and a multiple of 4 bytes in size whenever possible. This recommendation applies to the read(), write(), readIoExt(), and writeIoExt() APIs. When data transfers are 4-byte aligned and a multiple of 4-bytes, the r_sdhi driver is zero copy and takes full advantage of hardware acceleration by the DMAC or DTC. When data transfers are not 4-byte aligned or not a multiple of 4 bytes an extra CPU interrupt is required for each block transferred and a software copy is used to move data to the destination buffer.

Examples

Basic Example

This is a basic example of minimal use of the r_sdhi in an application.

```
uint8_t g_dest[SDHI_MAX_BLOCK_SIZE] BSP_ALIGN_VARIABLE(4);
uint8_t g_src[SDHI_MAX_BLOCK_SIZE] BSP_ALIGN_VARIABLE(4);
uint32_t g_transfer_complete = 0;
void r_sdhi_basic_example (void)
{
 /* Initialize g_src to known data */
 for (uint32_t i = 0; i < SDHI_MAX_BLOCK_SIZE; i++)
    {
       g_src[i] = (uint8_t) ('A' + (i % 26));
    }
 /* Open the SDHI driver. */
 fsp_err_t err = R_SDHI_Open(&g_sdmmc0_ctrl, &g_sdmmc0_cfg);
    assert(FSP_SUCCESS == err);
 /* A device shall be ready to accept the first command within 1ms from detecting VDD
min. Reference section 6.4.1.1
  * "Power Up Time of Card" in the SD Physical Layer Simplified Specification Version
6.00. */
```

```
 R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
 /* Initialize the SD card. This should not be done until the card is plugged in for
SD devices. */
    err = R_SDHI_MediaInit(&g_sdmmc0_ctrl, NULL);
    assert(FSP_SUCCESS == err);
    err = R_SDHI_Write(&g_sdmmc0_ctrl, g_src, 3, 1);
    assert(FSP_SUCCESS == err);
 while (!g_transfer_complete)
    {
 /* Wait for transfer. */
    }
    err = R_SDHI_Read(&g_sdmmc0_ctrl, g_dest, 3, 1);
    assert(FSP_SUCCESS == err);
 while (!g_transfer_complete)
    {
 /* Wait for transfer. */
    }
}
/* The callback is called when a transfer completes. */
void r_sdhi_example_callback (sdmmc_callback_args_t * p_args)
{
 if (SDMMC_EVENT_TRANSFER_COMPLETE == p_args->event)
    {
       g_transfer_complete = 1;
    }
}
```

Card Detection Example

This is an example of using SDHI when the card may not be plugged in. The card detection interrupt must be enabled to use this example.

```
bool g_card_inserted = false;
void r_sdhi_card_detect_example (void)
{
```

```
/* Open the SDHI driver. This enables the card detection interrupt. */
fsp_err_t err = R_SDHI_Open(&g_sdmmc0_ctrl, &g_sdmmc0_cfg);
/* Handle any errors. This function should be defined by the user. */
   assert(FSP_SUCCESS == err);
/* Check if card is inserted. */
sdmmc_status_t status;
   err = R_SDHI_StatusGet(&g_sdmmc0_ctrl, &status);
   assert(FSP_SUCCESS == err);
if (!status.card_inserted)
   {
while (!g_card_inserted)
     {
/* Wait for a card insertion interrupt. */
     }
   }
/* A device shall be ready to accept the first command within 1ms from detecting VDD
min. Reference section 6.4.1.1
  * "Power Up Time of Card" in the SD Physical Layer Simplified Specification Version
6.00. */
R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
/* Initialize the SD card after card insertion is detected. */
   err = R_SDHI_MediaInit(&g_sdmmc0_ctrl, NULL);
   assert(FSP_SUCCESS == err);
}
/* The callback is called when a card detection event occurs if the card detection
interrupt is enabled. */
void r_sdhi_card_detect_example_callback (sdmmc_callback_args_t * p_args)
{
if (SDMMC_EVENT_CARD_INSERTED == p_args->event)
   {
      g_card_inserted = true;
   }
if (SDMMC_EVENT_CARD_REMOVED == p_args->event)
   {
```

```
        g_card_inserted = false;
    }
}
```

Function Documentation

◆ R_SDHI_Open()

fsp_err_t R_SDHI_Open (sdmmc_ctrl_t *const *p_api_ctrl*, sdmmc_cfg_t const *const *p_cfg*)

Opens the driver. Resets SDHI, and enables card detection interrupts if card detection is enabled. R_SDHI_MediaInit must be called after this function before any other functions can be used.

Implements sdmmc_api_t::open().

Example:

```
/* Open the SDHI driver. */
fsp_err_t err = R_SDHI_Open(&g_sdmmc0_ctrl, &g_sdmmc0_cfg);
```

Return values

FSP_SUCCESS	Module is now open.
FSP_ERR_ASSERTION	Null Pointer or block size is not in the valid range of 1-512. Block size must be 512 bytes for SD cards and eMMC devices.
FSP_ERR_ALREADY_OPEN	Driver has already been opened with this instance of the control structure.
FSP_ERR_IRQ_BSP_DISABLED	Access interrupt is not enabled.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	Requested channel does not exist on this MCU.

◆ R_SDHI_MediaInit()

fsp_err_t R_SDHI_MediaInit (sdmmc_ctrl_t *const *p_api_ctrl*, sdmmc_device_t *const *p_device*)

Initializes the SDHI hardware and completes identification and configuration for the SD or eMMC device. This procedure requires several sequential commands. This function blocks until all identification and configuration commands are complete.

Implements sdmmc_api_t::mediaInit().

Example:

```
 /* A device shall be ready to accept the first command within 1ms from detecting VDD
min. Reference section 6.4.1.1
  * "Power Up Time of Card" in the SD Physical Layer Simplified Specification Version
6.00. */
 R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
 /* Initialize the SD card. This should not be done until the card is plugged in for
SD devices. */
    err = R_SDHI_MediaInit(&g_sdmmc0_ctrl, NULL);
```

Return values

FSP_SUCCESS	Module is now ready for read/write access.
FSP_ERR_ASSERTION	Null Pointer or block size is not in the valid range of 1-512. Block size must be 512 bytes for SD cards and eMMC devices.
FSP_ERR_NOT_OPEN	Driver has not been initialized.
FSP_ERR_CARD_INIT_FAILED	Device was not identified as an SD card or eMMC device.
FSP_ERR_RESPONSE	Device responded with an error.
FSP_ERR_TIMEOUT	Device did not respond.
FSP_ERR_DEVICE_BUSY	Device is holding DAT0 low (device is busy) or another operation is ongoing.

◆ R_SDHI_Read()

fsp_err_t R_SDHI_Read (sdmmc_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_dest*, uint32_t const *start_sector*, uint32_t const *sector_count*)

Reads data from an SD or eMMC device. Up to 0x10000 sectors can be read at a time. Implements sdmmc_api_t::read().

A callback with the event SDMMC_EVENT_TRANSFER_COMPLETE is called when the read data is available.

Example:

```
err = R_SDHI_Read(&g_sdmmc0_ctrl, g_dest, 3, 1);
```

Return values

FSP_SUCCESS	Data read successfully.
FSP_ERR_ASSERTION	NULL pointer.
FSP_ERR_NOT_OPEN	Driver has not been initialized.
FSP_ERR_CARD_NOT_INITIALIZED	Card was unplugged.
FSP_ERR_DEVICE_BUSY	Driver is busy with a previous operation.

◆ R_SDHI_Write()

fsp_err_t R_SDHI_Write (sdmmc_ctrl_t *const *p_api_ctrl*, uint8_t const *const *p_source*, uint32_t const *start_sector*, uint32_t const *sector_count*)

Writes data to an SD or eMMC device. Up to 0x10000 sectors can be written at a time. Implements sdmmc_api_t::write().

A callback with the event SDMMC_EVENT_TRANSFER_COMPLETE is called when the all data has been written and the device is no longer holding DAT0 low to indicate it is busy.

Example:

```
err = R_SDHI_Write(&g_sdmmc0_ctrl, g_src, 3, 1);
```

Return values

FSP_SUCCESS	Card write finished successfully.
FSP_ERR_ASSERTION	Handle or Source address is NULL.
FSP_ERR_NOT_OPEN	Driver has not been initialized.
FSP_ERR_CARD_NOT_INITIALIZED	Card was unplugged.
FSP_ERR_DEVICE_BUSY	Driver is busy with a previous operation.
FSP_ERR_CARD_WRITE_PROTECTED	SD card is Write Protected.
FSP_ERR_WRITE_FAILED	Write operation failed.

◆ R_SDHI_ReadIo()

fsp_err_t R_SDHI_ReadIo (sdmmc_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_data*, uint32_t const *function*, uint32_t const *address*)

The Read function reads a one byte register from an SDIO card. Implements sdmmc_api_t::readIo().

Note

This function is not supported.

Return values

FSP_ERR_UNSUPPORTED	SDIO is not supported.

◆ R_SDHI_WriteIo()

fsp_err_t R_SDHI_WriteIo (sdmmc_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_data*, uint32_t const *function*, uint32_t const *address*, sdmmc_io_write_mode_t const *read_after_write*)

Writes a one byte register to an SDIO card. Implements sdmmc_api_t::writeIo().

Note

This function is not supported.

Return values

FSP_ERR_UNSUPPORTED	SDIO is not supported.

◆ R_SDHI_ReadIoExt()

fsp_err_t R_SDHI_ReadIoExt (sdmmc_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_dest*, uint32_t const *function*, uint32_t const *address*, uint32_t *const *count*, sdmmc_io_transfer_mode_t *transfer_mode*, sdmmc_io_address_mode_t *address_mode*)

Reads data from an SDIO card function. Implements sdmmc_api_t::readIoExt().

Note

This function is not supported.

Return values

FSP_ERR_UNSUPPORTED	SDIO is not supported.

◆ R_SDHI_WriteIoExt()

fsp_err_t R_SDHI_WriteIoExt (sdmmc_ctrl_t *const *p_api_ctrl*, uint8_t const *const *p_source*, uint32_t const *function*, uint32_t const *address*, uint32_t const *count*, sdmmc_io_transfer_mode_t *transfer_mode*, sdmmc_io_address_mode_t *address_mode*)

Writes data to an SDIO card function. Implements sdmmc_api_t::writeIoExt().

Note

This function is not supported.

Return values

FSP_ERR_UNSUPPORTED	SDIO is not supported.

◆ R_SDHI_IoIntEnable()

fsp_err_t R_SDHI_IoIntEnable (sdmmc_ctrl_t *const *p_api_ctrl*, bool *enable*)

Enables or disables the SDIO Interrupt. Implements sdmmc_api_t::ioIntEnable().

Note

This function is not supported.

Return values

FSP_ERR_UNSUPPORTED	SDIO is not supported.

◆ R_SDHI_StatusGet()

fsp_err_t R_SDHI_StatusGet (sdmmc_ctrl_t *const *p_api_ctrl*, sdmmc_status_t *const *p_status*)

Provides driver status. Implements sdmmc_api_t::statusGet().

Return values

FSP_SUCCESS	Status stored in p_status.
FSP_ERR_ASSERTION	NULL pointer.
FSP_ERR_NOT_OPEN	Driver has not been initialized.

◆ R_SDHI_Erase()

fsp_err_t R_SDHI_Erase (sdmmc_ctrl_t *const *p_api_ctrl*, uint32_t const *start_sector*, uint32_t const *sector_count*)

Erases sectors of an SD card or eMMC device. Implements sdmmc_api_t::erase().

This function blocks until the erase command is sent. Poll the status to determine when erase is complete.

Return values

FSP_SUCCESS	Erase operation requested.
FSP_ERR_ASSERTION	A required pointer is NULL or an argument is invalid.
FSP_ERR_NOT_OPEN	Driver has not been initialized.
FSP_ERR_CARD_NOT_INITIALIZED	Card was unplugged.
FSP_ERR_CARD_WRITE_PROTECTED	SD card is Write Protected.
FSP_ERR_RESPONSE	Device responded with an error.
FSP_ERR_TIMEOUT	Device did not respond.
FSP_ERR_DEVICE_BUSY	Device is holding DAT0 low (device is busy) or another operation is ongoing.

◆ R_SDHI_CallbackSet()

fsp_err_t R_SDHI_CallbackSet (sdmmc_ctrl_t *const *p_api_ctrl*, void(*)(sdmmc_callback_args_t *) *p_callback*, void const *const *p_context*, sdmmc_callback_args_t *const *p_callback_memory*)

Updates the user callback with the option to provide memory for the callback argument structure. Implements sdmmc_api_t::callbackSet.

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

◆ R_SDHI_Close()

fsp_err_t R_SDHI_Close (sdmmc_ctrl_t *const *p_api_ctrl*)
Closes an open SD/MMC device. Implements sdmmc_api_t::close().

Return values

FSP_SUCCESS	Successful close.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Driver has not been initialized.

7.2.17.18 Virtual EEPROM on Flash (rm_vee_flash)

fsp_err_t	RM_VEE_FLASH_StatusGet (rm_vee_ctrl_t *const p_api_ctrl, rm_vee_status_t *const p_status)

fsp_err_t RM_VEE_FLASH_Close (rm_vee_ctrl_t *const p_api_ctrl)

Detailed Description

Virtual EEPROM on RA MCUs. This module implements the Virtual EEPROM Interface.

Overview

This VEE module emulates basic EEPROM capabilities. Support is provided for reading and writing both common records and reference data (originally programmed during product assembly or test). A count of the number of segments erased throughout the lifetime of the application is maintained and can be accessed at any time. Wear leveling is handled automatically by the driver.

Features

- Writing and reading user defined records of any length to data flash.
- Wear leveling is handled automatically.
- Reference data such as calibration data programmed at assembly or test time is preserved.
- Reference data can be updated at run time.
- Fault resilient design.

Data Flash Segmentation

Wear leveling is handled by changing the location in the data flash where a record is stored every time that it is updated. This change in physical location of the record is transparent to the user. Any time an update for a specific record ID is written, it is written to the next unused location in data flash and its location is stored in RAM for quick look-up later. When required, only the most recent version of these records is automatically copied to the next blank segment in data flash. The data flash area is divided into a number of equal-size segments. There is only one segment active at a time. A segment contains two areas- the record area (which is the vast majority of the segment) and the reference data area which contains optional data typically programmed during assembly or final test. Records and updated reference data are written to this segment until one of the two areas becomes full. The record area must be able to hold at least one of every record ID possible and still have space left over for record updates.

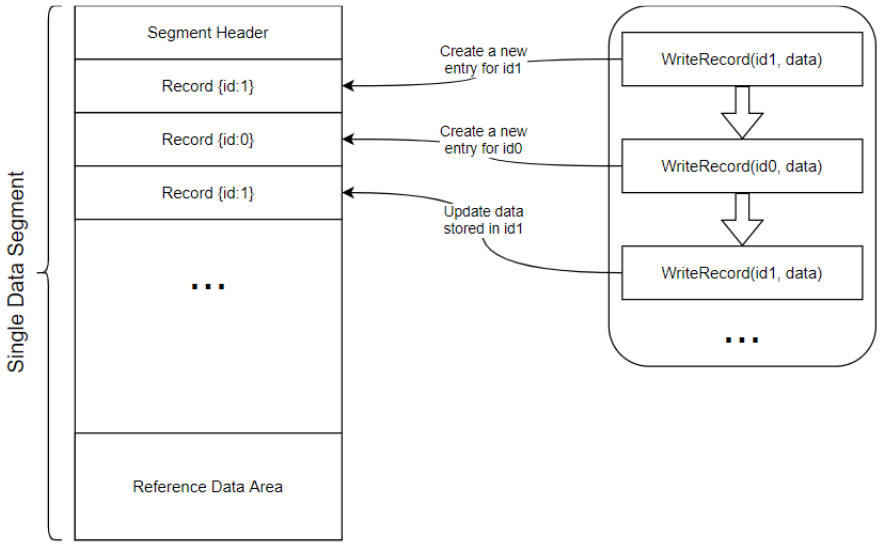

Figure 301: Segment Data Format

When a segment does not have sufficient space for additional records or updated reference data, a Refresh occurs. This process copies the most recent record for each ID as well as the latest version of reference data (if any) to the next segment. The very first time VEE runs on an MCU, it marks the last segment as active whether there is reference data configured or not. The end of VEE data flash area is used to provide an easily identified physical flash address that can be used while programming reference data without requiring Virtual EEPROM middleware.

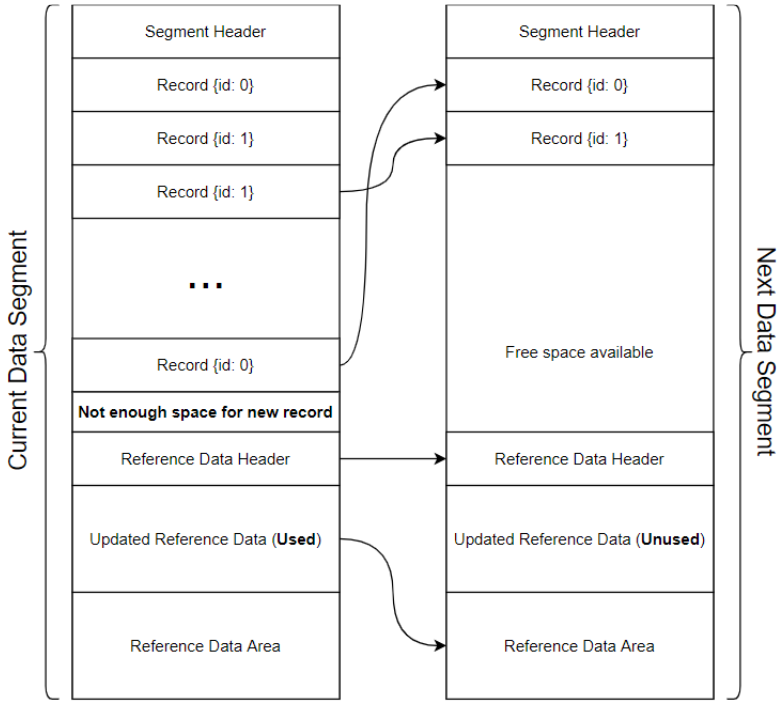

Figure 302: Refresh Operation

Record Format

Each record begins with a header that contains the record size, followed by the data, and the trailer.

The trailer contains a validation code which is used for internal purposes only and is not a 16-bit CRC or ECC value. If that level of error checking is desired, the user should include that in the record data passed to the driver. Padding is added between the end of user data and the trailer to ensure the trailer is aligned properly.

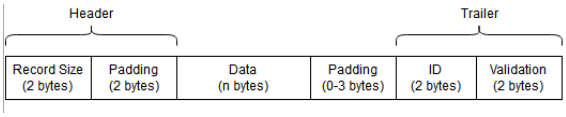

Figure 303: Record Format

Reference Data Area

VEE can be configured for the presence of reference data. The original programmed reference data must be located at the end of the VEE data flash area. An area of equal size is reserved below this in case updated reference data becomes available later. Below that is a header which indicates whether the update area has been written to.

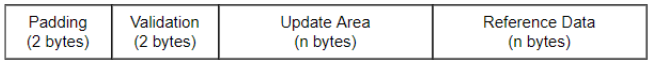

Figure 304: Reference Data Area Format

Just as with records, the validation code is used for internal purposes only and is not a 16-bit CRC or ECC value. If that level of error checking is desired, the user should include that in the updated reference data passed to the driver.

Fault Tolerance

The Virtual EEPROM has a fault tolerant design. If for any reason an operation fails before it is completed the next time the module is opened a refresh will occur. Any corrupted data will be discarded.

Configuration

Build Time Configurations for rm_vee_flash

The following build time configurations are defined in fsp_cfg/rm_vee_flash_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
Reference Data Support	• Enabled • Disabled	Disabled	Support writing reference data to the end of the segment.
Refresh Buffer Size	Value must be an integer greater than 0 and a multiple of 4 bytes.	32	The size of the internal buffer used to copying data from one flash segment to another

			during a refresh operation. This is required because data flash to data flash transfers are not supported by the hardware.

Configurations for Storage > Virtual EEPROM on Flash (rm_vee_flash)

This module can be added to the Stacks tab via New Stack > Storage > Virtual EEPROM on Flash (rm_vee_flash). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_vee0	Module name.
Record Max ID	Value must be an integer.	16	Set this value to the highest record ID in use.
Number of Segments	Value must be an integer.	2	Set value to number of segments desired in data flash (minimum 2). The fewer the segments, the fewer refreshes occur, but the longer refreshes take to complete (erase time).
Start Address	Manual Entry	BSP_FEATURE_FLASH_DATA_FLASH_START	Start address of the flash area used by Virtual EEPROM.
Total Size	Manual Entry	BSP_DATA_FLASH_SIZE_BYTES	The total size (In bytes) of the flash area used by Virtual EEPROM.
Reference Data Size	Value must be an integer.	0	The size of the reference area (In bytes) used by Virtual EEPROM.
Callback	Name must be a valid C symbol	vee_callback	A user callback function can be provided. If this callback function is provided, it will be called from the flash interrupt service routine (ISR).

Clock Configuration

There is no clock configuration for the RM_VEE_FLASH module.

Pin Configuration

This module does not use I/O pins.

Usage Notes

A refresh buffer is required to copy data between segments. Data flash cannot be simultaneously read from and written to. Data will be temporarily copied into RAM during refresh operations.

Examples

Basic Example

This is a basic example of minimal use of the RM_VEE_FLASH module in an application.

```
volatile bool callback_called = false;
/* Record ID to use for storing pressure data. */
#define ID_PRESSURE (0U)
/* Example data structure. */
typedef struct st_pressure
{
    uint32_t timestamp;
    uint16_t low;
    uint16_t average;
    uint16_t high;
} pressure_t;
void rm_vee_example ()
{
 /* Open the Virtual EEPROM Module. */
 fsp_err_t err = RM_VEE_FLASH_Open(&g_vee_ctrl, &g_vee_cfg);
 if (FSP_SUCCESS != err)
    {
       error_handler();
    }
 /* Read pressure data from external sensor. */
    pressure_t pressure_data;
    get_pressure_data(&pressure_data);
 /* Write the pressure data to a Virtual EEPROM Record. */
```

```
    err = RM_VEE_FLASH_RecordWrite(&g_vee_ctrl, ID_PRESSURE, (uint8_t *)
&pressure_data, sizeof(pressure_t));
 if (FSP_SUCCESS != err)
    {
       error_handler();
    }
 /* Wait for the Virtual EEPROM callback to indicate it finished writing data. */
 while (false == callback_called)
    {
       ;
    }
 /* Get a pointer to the record that is stored in data flash. */
    uint32_t    length;
    pressure_t * p_pressure_data;
    err = RM_VEE_FLASH_RecordPtrGet(&g_vee_ctrl, ID_PRESSURE, (uint8_t **)
&p_pressure_data, &length);
 if (FSP_SUCCESS != err)
    {
       error_handler();
    }
 /* Close the Virtual EEPROM Module. */
    err = RM_VEE_FLASH_Close(&g_vee_ctrl);
 if (FSP_SUCCESS != err)
    {
       error_handler();
    }
}
void rm_vee_tests_callback (rm_vee_callback_args_t * p_args)
{
    callback_called = true;
 FSP_PARAMETER_NOT_USED(p_args);
}
```

Data Structures

struct	rm_vee_flash_cfg_t

struct rm_vee_flash_instance_ctrl_t

Data Structure Documentation

◆ rm_vee_flash_cfg_t

struct rm_vee_flash_cfg_t		
User configuration structure, used in open function		
Data Fields		
flash_instance_t const *	p_flash	Pointer to a flash instance.

◆ rm_vee_flash_instance_ctrl_t

struct rm_vee_flash_instance_ctrl_t
Instance control block. This is private to the FSP and should not be used or modified by the application.

Function Documentation

◆ RM_VEE_FLASH_Open()

fsp_err_t RM_VEE_FLASH_Open (rm_vee_ctrl_t *const *p_api_ctrl*, rm_vee_cfg_t const *const *p_cfg*)

Open the RM_VEE_FLASH driver module

Implements rm_vee_api_t::open

Initializes the driver's internal structures and opens the Flash driver. The Flash driver must be closed prior to opening VEE. The error code FSP_SUCCESS_RECOVERY indicates that VEE detected corrupted data; most likely due to a power loss during a data flash write or erase. In these cases, an automatic internal Refresh is performed and the partially written data is lost.

Return values

FSP_SUCCESS	Successful. FSP_SUCCESS_RECOVERY changed to FSP_SUCCESS
FSP_ERR_ASSERTION	An input parameter is NULL.
FSP_ERR_ALREADY_OPEN	This function has already been called.
FSP_ERR_PE_FAILURE	This error indicates that a flash programming, erase, or blankcheck operation has failed in hardware.
FSP_ERR_TIMEOUT	Interrupts disabled outside of VEE
FSP_ERR_NOT_INITIALIZED	Corruption found. A refresh is required.
FSP_ERR_INVALID_ARGUMENT	The supplied configuration is invalid.

◆ RM_VEE_FLASH_RecordWrite()

fsp_err_t RM_VEE_FLASH_RecordWrite (rm_vee_ctrl_t *const *p_api_ctrl*, uint32_t const *rec_id*, uint8_t const *const *p_rec_data*, uint32_t const *num_bytes*)

Writes a record to data flash.

Implements rm_vee_api_t::recordWrite

This function writes num_bytes of data pointed to by p_rec_data to data flash. This function returns immediately after starting the flash write. BE SURE NOT TO MODIFY the data buffer contents until after the write completes. This includes exiting the calling function when the data buffer is a local variable (stack may be used by another function and corrupt the data buffer contents).

Return values

FSP_SUCCESS	Write started successfully.
FSP_ERR_NOT_OPEN	The module has not been opened.
FSP_ERR_ASSERTION	An input parameter is NULL.
FSP_ERR_INVALID_ARGUMENT	An argument contains an illegal value.
FSP_ERR_INVALID_MODE	The operation cannot be started in the current mode.
FSP_ERR_IN_USE	Last API call still executing.
FSP_ERR_PE_FAILURE	This error indicates that a flash programming, erase, or blankcheck operation has failed in hardware.
FSP_ERR_TIMEOUT	Flash write timed out (Should not be possible when flash bgo is used).
FSP_ERR_NOT_INITIALIZED	Corruption found. A refresh is required.

◆ RM_VEE_FLASH_RefDataWrite()

fsp_err_t RM_VEE_FLASH_RefDataWrite (rm_vee_ctrl_t *const *p_api_ctrl*, uint8_t const *const *p_ref_data*)

Writes new Reference data to the reference update area.

Implements rm_vee_api_t::refDataWrite

This function writes VEE_CFG_REF_DATA_SIZE bytes pointed to by p_ref_data to data flash. This function returns immediately after starting the flash write. BE SURE NOT TO MODIFY the data buffer contents until after the write completes.

Return values

FSP_SUCCESS	Write started successfully.
FSP_ERR_NOT_OPEN	The module has not been opened.
FSP_ERR_IN_USE	Last API call still executing.
FSP_ERR_ASSERTION	An input parameter is NULL.
FSP_ERR_INVALID_MODE	The operation cannot be started in the current mode.
FSP_ERR_PE_FAILURE	This error indicates that a flash programming, erase, or blankcheck operation has failed in hardware.
FSP_ERR_TIMEOUT	Flash write timed out (Should not be possible when flash bgo is used).
FSP_ERR_UNSUPPORTED	Reference data is not supported in the current configuration.
FSP_ERR_NOT_INITIALIZED	Corruption found. A refresh is required.

◆ RM_VEE_FLASH_RecordPtrGet()

fsp_err_t RM_VEE_FLASH_RecordPtrGet (rm_vee_ctrl_t *const *p_api_ctrl*, uint32_t const *rec_id*, uint8_t **const *pp_rec_data*, uint32_t *const *p_num_bytes*)

Gets a pointer to the most recent record data.

Implements rm_vee_api_t::recordPtrGet

This function sets the argument pointer to the most recent version of the record data in flash. Flash cannot be accessed for reading and writing at the same time. Therefore, reading the data at p_ref_data must be completed prior to initiating any type of Flash write.

Return values

FSP_SUCCESS	Successful.
FSP_ERR_NOT_OPEN	The module has not been opened.
FSP_ERR_IN_USE	Last API call still executing.
FSP_ERR_ASSERTION	p_ref_data is NULL.
FSP_ERR_INVALID_ARGUMENT	Record data not configured.
FSP_ERR_NOT_FOUND	The record associated with the requested ID could not be found.

◆ RM_VEE_FLASH_RefDataPtrGet()

fsp_err_t RM_VEE_FLASH_RefDataPtrGet (rm_vee_ctrl_t *const *p_api_ctrl*, uint8_t **const *pp_ref_data*)

Gets a pointer to the most recent reference data.

Implements rm_vee_api_t::recordPtrGet

This function sets the argument pointer to the most recent version of the reference data in flash. Flash cannot be accessed for reading and writing at the same time.

Return values

FSP_SUCCESS	Successful.
FSP_ERR_NOT_OPEN	The module has not been opened.
FSP_ERR_IN_USE	Last API call still executing.
FSP_ERR_ASSERTION	An input parameter is NULL.
FSP_ERR_UNSUPPORTED	Reference data is not supported in the current configuration.
FSP_ERR_NOT_FOUND	No reference data was found.

◆ RM_VEE_FLASH_Refresh()

fsp_err_t RM_VEE_FLASH_Refresh (rm_vee_ctrl_t *const *p_api_ctrl*)

Manually start a refresh operation

Implements rm_vee_api_t::refresh

This function is used to start a segment Refresh at any time. The Refresh process by default occurs automatically when no more record or reference data space is available and a Write is requested. However, the app may desire to force a refresh when it knows it is running low on space and large amounts of data are about to be recorded.

Return values

FSP_SUCCESS	Successful.
FSP_ERR_NOT_OPEN	The module has not been opened.
FSP_ERR_ASSERTION	An input parameter is NULL.
FSP_ERR_IN_USE	Last API call still executing.
FSP_ERR_PE_FAILURE	This error indicates that a flash programming, erase, or blankcheck operation has failed in hardware.
FSP_ERR_INVALID_MODE	The operation cannot be started in the current mode.
FSP_ERR_TIMEOUT	Flash write timed out (Should not be possible when flash bgo is used).
FSP_ERR_NOT_INITIALIZED	Corruption found. A refresh is required.

◆ RM_VEE_FLASH_Format()

fsp_err_t RM_VEE_FLASH_Format (rm_vee_ctrl_t *const *p_api_ctrl*, uint8_t const *const *p_ref_data*)

Start a manual format operation.

Implements rm_vee_api_t::format

Return values

FSP_SUCCESS	Successful.
FSP_ERR_NOT_OPEN	The module has not been opened.
FSP_ERR_IN_USE	Last API call still executing.
FSP_ERR_PE_FAILURE	This error indicates that a flash programming, erase, or blankcheck operation has failed
FSP_ERR_ASSERTION	An input parameter is NULL.
FSP_ERR_TIMEOUT	Flash write timed out (Should not be possible when flash bgo is used).
FSP_ERR_NOT_INITIALIZED	Corruption found. A refresh is required.

◆ RM_VEE_FLASH_CallbackSet()

fsp_err_t RM_VEE_FLASH_CallbackSet (rm_vee_ctrl_t *const *p_api_ctrl*, void(*)(rm_vee_callback_args_t *) *p_callback*, void const *const *p_context*, rm_vee_callback_args_t *const *p_callback_memory*)

Updates the user callback with the option to provide memory for the callback argument structure.

Implements rm_vee_api_t::callbackSet.

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

◆ RM_VEE_FLASH_StatusGet()

fsp_err_t RM_VEE_FLASH_StatusGet (rm_vee_ctrl_t *const *p_api_ctrl*, rm_vee_status_t *const *p_status*)

Get the current status of the driver.

Implements rm_vee_api_t::statusGet

This command is typically used to verify that the last Write or Refresh command has completed before attempting to perform another API call.

Return values

FSP_SUCCESS	Successful.
FSP_ERR_NOT_OPEN	The module has not been opened.
FSP_ERR_ASSERTION	An input parameter is NULL.

◆ RM_VEE_FLASH_Close()

fsp_err_t RM_VEE_FLASH_Close (rm_vee_ctrl_t *const *p_api_ctrl*)

Closes the Flash driver and VEE driver.

Implements rm_vee_api_t::close

Return values

FSP_SUCCESS	Successful.
FSP_ERR_NOT_OPEN	The module has not been opened.
FSP_ERR_ASSERTION	An input parameter is NULL.

7.2.18 System

Modules

Detailed Description

System Modules.

Modules

Clock Generation Circuit (r_cgc)

Driver for the CGC peripheral on RA MCUs. This module implements the CGC Interface.

	Event Link Controller (r_elc) Driver for the ELC peripheral on RA MCUs. This module implements the ELC Interface.
	I/O Port (r_ioport) Driver for the I/O Ports peripheral on RA MCUs. This module implements the I/O Port Interface.

7.2.18.1 Clock Generation Circuit (r_cgc)

fsp_err_t	R_CGC_Close (cgc_ctrl_t *const p_ctrl)

Detailed Description

Driver for the CGC peripheral on RA MCUs. This module implements the CGC Interface.

Note

> ***This module is not required for the initial clock configuration. Initial clock settings are configurable on the **Clocks** tab of the RA Configuration editor. The initial clock settings are applied by the BSP during the startup process before main.***

Overview

Features

The CGC module supports runtime modifications of clock settings. Key features include the following:

- Supports changing the system clock source to any of the following options (provided they are supported on the MCU):
  - High-speed on-chip oscillator (HOCO)
  - Middle-speed on-chip oscillator (MOCO)
  - Low-speed on-chip oscillator (LOCO)
  - Main oscillator (external resonator or external clock input frequency)
  - Sub-clock oscillator (external resonator)
  - PLL/PLL2 (not available on all MCUs)
- When the system core clock frequency changes, the following things are updated:
  - The CMSIS standard global variable SystemCoreClock is updated to reflect the new clock frequency.
  - Wait states for ROM and RAM are adjusted to the minimum supported value for the new clock frequency.
  - The operating power control mode is updated to the minimum supported value for the new clock settings.
- Supports starting or stopping any of the system clock sources
- Supports changing dividers for the internal clocks
- Supports the oscillation stop detection feature

Internal Clocks

The RA microcontrollers have up to seven internal clocks. Not all internal clocks exist on all MCUs. Each clock domain has its own divider that can be updated in R_CGC_SystemClockSet(). The dividers are subject to constraints described in the footnote of the table "Specifications of the Clock Generation Circuit for the internal clocks" in the hardware manual.

The internal clocks include:

- System clock (ICLK): core clock used for CPU, flash, internal SRAM, DTC, and DMAC
- PCLKA/PCLKB/PCLKC/PCLKD: Peripheral clocks, refer to the table "Specifications of the Clock Generation Circuit for the internal clocks" in the hardware manual to see which peripherals are controlled by which clocks.
- FCLK: Clock source for reading data flash and for programming/erasure of both code and data flash.
- BCLK: External bus clock

Configuration

Note

*The initial clock settings are configurable on the **Clocks** tab of the RA Configuration editor.*
There is a configuration to enable the HOCO on reset in the OFS1 settings on the BSP tab.
The following clock related settings are configurable in the RA Common section on the BSP tab:
- *Main Oscillator Wait Time*
- *Main Oscillator Clock Source (external oscillator or crystal/resonator)*
- *Subclock Populated*
- *Subclock Drive*
- *Subclock Stabilization Time (ms)*

The default stabilization times are determined based on development boards provided by Renesas, but are generally valid for most designs. Depending on the target board hardware configuration and requirements these values may need to be adjusted for reliability or startup speed.

Build Time Configurations for r_cgc

The following build time configurations are defined in fsp_cfg/r_cgc_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for System > Clock Generation Circuit (r_cgc)

This module can be added to the Stacks tab via New Stack > System > Clock Generation Circuit (r_cgc). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Sub Clock Oscillation Stop Detection Settings			
Enable sub clock oscillator stop detection via the SOSC_STOP interrupt	• Enabled • Disabled	Disabled	Oscillation Stop Detection for Sub Clock enabled.
Sub Clock Oscillation Stop Detection Time	Manual Entry	0	These bits specify the oscillation stop detection time. It is detected that oscillation has stopped when oscillation has been stopped for (A-2) to (A+1) clock cycles, where A refers to the time specified by these bits. Oscillation stop detection time = Low-speed on-chip oscillator clock (LOCO) cycle x ((value of OSDCCMP) + 1).
Sub Clock Oscillation Stop Detection	MCU Specific Options		[Optional] Select the interrupt priority for

Interrupt Priority			the Sub Clock Oscillation Stop Detection interrupt.
Main Oscillation Stop Detection Settings			
Enable main clock oscillator stop detection via the MOSC_STOP interrupt	• Enabled • Disabled	Disabled	Oscillation Stop Detection for Main Clock enabled.
Main Oscillation Stop Detection Time	Manual Entry	0	These bits specify the oscillation stop detection time. It is detected that oscillation has stopped when oscillation has been stopped for (A - 2) to (A + 1) clock cycles, where A refers to the time specified by these bits. Oscillation stop detection time = High speed on-chip oscillator clock (HOCO) cycle x ((value of OSDCCMP) + 1).
Main Oscillation Stop Detection Interrupt Priority	MCU Specific Options		[Optional] Select the interrupt priority for the Main Oscillation Stop Detection interrupt.
Oscillator Stop Detection Settings			
Clock Switch Enable for Oscillation Stop Detected of SDADCCLK	• Enabled • Disabled	Disabled	The OSTDCSE bit specifies the source clock of the 24-bit Sigma-delta A/D Converter Clock switched to HOCO when oscillation stop detected.
Name	Name must be a valid C symbol	g_cgc0	Module name.
Enable main oscillator stop detection via the NMI interrupt	• Enabled • Disabled	Enabled	Oscillation Stop Detection for System Clock enabled.
Oscillation Stop Detection Callback	Name must be a valid C symbol	NULL	A user callback function must be provided if oscillation stop detection for System Clock/Main Oscillation/Sub Clock

	Oscillation is used. If this callback function is provided, it is called from the NMI handler if the main oscillator stops.

Clock Configuration

This module is used to configure the system clocks. There are no module specific clock configurations required to use it.

Pin Configuration

The CGC module controls the output of the CLOCKOUT signal.

If an external oscillator is used the XTAL and EXTAL pins must be configured accordingly. When running from an on chip oscillator there is no requirement for the main clock external oscillator. In this case, the XTAL and EXTAL pins can be set to a different function in the RA Configuration editor.

The functionality of the subclock external oscillator pins XCIN and XCOUT is fixed.

Usage Notes

Oscillation Stop Detection

CGC driver supports following oscillation stop detection function.

NMI Interrupt

The CGC driver uses the NMI for oscillation stop detection of the main oscillator after R_CGC_OscStopDetectEnable is called. The NMI is enabled by default. No special configuration is required. When the NMI is triggered, the callback function registered during R_CGC_Open() is called.

Main Oscillator Stop Detection Interrupt

A main clock oscillation stop detection interrupt (MOSTD_STOP) is generated when the Oscillation Stop Detection for Main Clock is enabled. The main oscillation stop detection interrupt is a maskable interrupt. When the MOSTD_STOP is triggered, the callback function registered during R_CGC_Open() is called.

Subclk Oscillator Stop Detection Interrupt

A sub clock oscillation stop detection interrupt (SOSC_STOP) is generated when the Oscillation Stop Detection for Sub Clock is enabled. The sub clock oscillation stop detection interrupt is a maskable interrupt. When the SOSC_STOP is triggered, the callback function registered during R_CGC_Open() is called.

ADC Clock Switching

When Clock Switch Enable for Oscillation Stop Detected is set.

- When MOSC stop is detected when MOSC is selected for SDADCCLK, SDADCCLK is switched to HOCO.
- When SOSC stop is detected when PLL is selected for SDADCCLK, SDADCCLK is switched to

HOCO.

Starting or Stopping the Subclock

If the Subclock Populated property is set to Populated on the BSP configuration tab, then the subclock is started in the BSP startup routine. Otherwise, it is stopped in the BSP startup routine. Starting and stopping the subclock at runtime is not recommended since the stabilization requirements typically negate the negligible power savings.

The application is responsible for ensuring required clocks are started and stable before accessing MCU peripheral registers.

Warning

The subclock can take up to several seconds to stabilize. RA startup code does not wait for subclock stabilization unless the subclock is the main clock source. In this case the default wait time is 1000ms (1 second). When running AGT or RTC off the subclock, the application must ensure the subclock is stable before starting operation. Because there is no hardware stabilization status bit for the subclock R_CGC_ClockCheck cannot be used to optimize this wait.

Changing the subclock state during R_CGC_ClocksCfg() is not supported.

Low Power Operation

If "Use Low Voltage Mode" is enabled in the BSP MCU specific properties (not available on all MCUs), the MCU is always in low voltage mode and no other power modes are considered. The following conditions must be met for the MCU to run in low voltage mode:

- Requires HOCO to be running, so HOCO cannot be stopped in low voltage mode
- Requires PLL to be stopped, so PLL APIs are not available in low voltage mode
- Requires ICLK <= 4 MHz
- If oscillation stop detection is used, dividers of 1 or 2 cannot be used for any clock

If "Use Low Voltage Mode" is not enabled, the MCU applies the lowest power mode by searching through the following list in order and applying the first power mode that is supported under the current conditions:

- Subosc-speed mode (lowest power)
  - Requires system clock to be LOCO or subclock
  - Requires MOCO, HOCO, main oscillator, and PLL (if present) to be stopped
  - Requires ICLK and FCLK dividers to be 1
- Low-speed mode
  - Requires PLL to be stopped
  - Requires ICLK <= 1 MHz
  - If oscillation stop detection is used, dividers of 1, 2, 4, or 8 cannot be used for any clock
- Middle-speed mode (not supported on all MCUs)
  - Requires ICLK <= 8 MHz
- High-speed mode
  - Default mode if no other operating mode is supported

Refer to the section "Function for Lower Operating Power Consumption" in the "Low Power Modes" chapter of the hardware manual for MCU specific information about operating power control modes.

Note

The DCDC regulator (if present) is only available in Middle- and High-speed modes. The BSP will automatically switch between DCDC and LDO when switching between compatible and incompatible modes if the DCDC regulator is in use. Switching to the LDO incurs a 60 microsecond critical section wherein all interrupts AND peripherals are stopped. Switching back to DCDC from the LDO incurs an additional 22 microsecond critical section (peripherals running).

When low voltage mode is not used, the following functions adjust the operating power control mode to ensure it remains within the hardware specification and to ensure the MCU is running at the optimal operating power control mode:

- R_CGC_ClockStart()
- R_CGC_ClockStop()
- R_CGC_SystemClockSet()
- R_CGC_OscStopDetectEnable()
- R_CGC_OscStopDetectDisable()

Note

FSP APIs, including these APIs, are not thread safe. These APIs and any other user code that modifies the operating power control mode must not be allowed to interrupt each other. Proper care must be taken during application design if these APIs are used in threads or interrupts to ensure this constraint is met.

No action is required by the user of these APIs. This section is provided for informational purposes only.

Examples

Basic Example

This is a basic example of minimal use of the CGC in an application.

```
void cgc_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the CGC module. */
    err = R_CGC_Open(&g_cgc0_ctrl, &g_cgc0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Change the system clock to LOCO for power saving. */
 /* Start the LOCO. */
    err = R_CGC_ClockStart(&g_cgc0_ctrl, CGC_CLOCK_LOCO, NULL);
    assert(FSP_SUCCESS == err);
 /* Wait for the LOCO stabilization wait time.
  *
  * NOTE: The MOCO, LOCO and subclock do not have stabilization status bits, so any
stabilization time must be
```

```
  * performed via a software wait when starting these oscillators. For all other
oscillators, R_CGC_ClockCheck can
  * be used to verify stabilization status.
  */
 R_BSP_SoftwareDelay(BSP_FEATURE_CGC_LOCO_STABILIZATION_MAX_US,
BSP_DELAY_UNITS_MICROSECONDS);
 /* Set divisors. Divisors for clocks that don't exist on the MCU are ignored. */
 cgc_divider_cfg_t dividers =
    {

    assert(FSP_SUCCESS == err);
}
```

Configuring Multiple Clocks

This example demonstrates switching to a new source clock and stopping the previous source clock in a single function call using R_CGC_ClocksCfg().

```
void cgc_clocks_cfg_example (void)
```

```
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the CGC module. */
    err = R_CGC_Open(&g_cgc0_ctrl, &g_cgc0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Change the system clock to PLL running from the main oscillator. */
 /* Assuming the system clock is MOCO, switch to HOCO. */
 cgc_clocks_cfg_t clocks_cfg;
    clocks_cfg.system_clock                     = CGC_CLOCK_PLL;
    clocks_cfg.pll_state                        = CGC_CLOCK_CHANGE_NONE;
    clocks_cfg.pll_cfg.source_clock             = CGC_CLOCK_MAIN_OSC; // unused
    clocks_cfg.pll_cfg.multiplier               = CGC_PLL_MUL_10_0;   // unused
    clocks_cfg.pll_cfg.divider                  = CGC_PLL_DIV_2;      // unused
    clocks_cfg.divider_cfg.sckdivcr_b.iclk_div = CGC_SYS_CLOCK_DIV_1;
    clocks_cfg.divider_cfg.sckdivcr_b.pclka_div = CGC_SYS_CLOCK_DIV_4;
    clocks_cfg.divider_cfg.sckdivcr_b.pclkb_div = CGC_SYS_CLOCK_DIV_4;
    clocks_cfg.divider_cfg.sckdivcr_b.pclkc_div = CGC_SYS_CLOCK_DIV_4;
    clocks_cfg.divider_cfg.sckdivcr_b.pclkd_div = CGC_SYS_CLOCK_DIV_4;
    clocks_cfg.divider_cfg.sckdivcr_b.bclk_div = CGC_SYS_CLOCK_DIV_4;
    clocks_cfg.divider_cfg.sckdivcr_b.fclk_div = CGC_SYS_CLOCK_DIV_4;
    clocks_cfg.mainosc_state                    = CGC_CLOCK_CHANGE_NONE;

 /* (Optional) Reenable oscillation stop detection after waking from low power mode.
*/
    err = R_CGC_OscStopDetectEnable(&g_cgc0_ctrl);
    assert(FSP_SUCCESS == err);
}
```

Data Structures

struct	cgc_instance_ctrl_t

Data Structure Documentation

◆ cgc_instance_ctrl_t

struct cgc_instance_ctrl_t	
CGC private control block. DO NOT MODIFY. Initialization occurs when R_CGC_Open() is called.	
Data Fields	
void const *	p_context

Field Documentation

◆ p_context

void const* cgc_instance_ctrl_t::p_context
Placeholder for user data. Passed to the user callback in cgc_callback_args_t.

Function Documentation

◆ R_CGC_Open()

fsp_err_t R_CGC_Open (cgc_ctrl_t *const *p_ctrl*, cgc_cfg_t const *const *p_cfg*)

Initialize the CGC API. Implements cgc_api_t::open.

Example:

```
/* Initializes the CGC module. */
   err = R_CGC_Open(&g_cgc0_ctrl, &g_cgc0_cfg);
```

Return values

FSP_SUCCESS	CGC successfully initialized.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_ALREADY_OPEN	Module is already open.

◆ R_CGC_ClocksCfg()

fsp_err_t R_CGC_ClocksCfg (cgc_ctrl_t *const *p_ctrl*, cgc_clocks_cfg_t const *const *p_clock_cfg*)

Reconfigures all main system clocks. This API can be used for any of the following purposes:

- start or stop clocks
- change the system clock source
- configure the PLL/PLL2 multiplication and division ratios when starting the PLL
- configure the division ratios when starting the HOCO/MOCO/MOSC
- change the system dividers

If the requested system clock source has a stabilization flag, this function blocks waiting for the stabilization flag of the requested system clock source to be set. If the requested system clock source was just started and it has no stabilization flag, this function blocks for the stabilization time required by the requested system clock source according to the Electrical Characteristics section of the hardware manual. If the requested system clock source has no stabilization flag and it is already running, it is assumed to be stable and this function will not block. If the requested system clock is the subclock, the subclock must be stable prior to calling this function.

The internal dividers (cgc_clocks_cfg_t::divider_cfg) are subject to constraints described in footnotes of the hardware manual table detailing specifications for the clock generation circuit for the internal clocks for the MCU. For example:

- RA6M3: see footnotes of Table 9.2 "Specifications of the clock generation circuit for the internal clocks" in the RA6M3 manual R01UH0886EJ0100
- RA2A1: see footnotes of Table 9.2 "Clock generation circuit specifications for the internal clocks" in the RA2A1 manual R01UH0888EJ0100

Do not attempt to stop the requested clock source or the source of a PLL if the PLL will be running after this operation completes.

Implements cgc_api_t::clocksCfg.

Example:

```
/* Assuming the system clock is MOCO, switch to HOCO. */
```

```
cgc_clocks_cfg_t clocks_cfg;
   clocks_cfg.system_clock                      = CGC_CLOCK_PLL;
   clocks_cfg.pll_state                         = CGC_CLOCK_CHANGE_NONE;
   clocks_cfg.pll_cfg.source_clock              = CGC_CLOCK_MAIN_OSC; // unused
   clocks_cfg.pll_cfg.multiplier                = CGC_PLL_MUL_10_0;   // unused
   clocks_cfg.pll_cfg.divider                   = CGC_PLL_DIV_2;      // unused
   clocks_cfg.divider_cfg.sckdivcr_b.iclk_div = CGC_SYS_CLOCK_DIV_1;
   clocks_cfg.divider_cfg.sckdivcr_b.pclka_div = CGC_SYS_CLOCK_DIV_4;
   clocks_cfg.divider_cfg.sckdivcr_b.pclkb_div = CGC_SYS_CLOCK_DIV_4;
   clocks_cfg.divider_cfg.sckdivcr_b.pclkc_div = CGC_SYS_CLOCK_DIV_4;
   clocks_cfg.divider_cfg.sckdivcr_b.pclkd_div = CGC_SYS_CLOCK_DIV_4;
   clocks_cfg.divider_cfg.sckdivcr_b.bclk_div = CGC_SYS_CLOCK_DIV_4;
   clocks_cfg.divider_cfg.sckdivcr_b.fclk_div = CGC_SYS_CLOCK_DIV_4;
   clocks_cfg.mainosc_state                     = CGC_CLOCK_CHANGE_NONE;
   clocks_cfg.hoco_state                        = CGC_CLOCK_CHANGE_START;
   clocks_cfg.moco_state                        = CGC_CLOCK_CHANGE_STOP;
   clocks_cfg.loco_state                        = CGC_CLOCK_CHANGE_NONE;
   err = R_CGC_ClocksCfg(&g_cgc0_ctrl, &clocks_cfg);
   assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Clock configuration applied successfully.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_IN_USE	Attempt to stop the current system clock or the PLL source clock.
FSP_ERR_CLOCK_ACTIVE	PLL configuration cannot be changed while PLL is running.
FSP_ERR_OSC_STOP_DET_ENABLED	PLL multiplier must be less than 20 if oscillation stop detect is enabled and the input frequency is less than 12.5 MHz.
FSP_ERR_NOT_STABILIZED	PLL clock source is not stable.
FSP_ERR_PLL_SRC_INACTIVE	PLL clock source is not running.
FSP_ERR_INVALID_STATE	The subclock must be running before activating HOCO with FLL.

◆ R_CGC_ClockStart()

fsp_err_t R_CGC_ClockStart (cgc_ctrl_t *const *p_ctrl*, cgc_clock_t *clock_source*, cgc_pll_cfg_t const *const *p_pll_cfg*)

Start the specified clock if it is not currently active. The PLL configuration cannot be changed while the PLL is running. Implements cgc_api_t::clockStart.

The PLL source clock must be operating and stable prior to starting the PLL.

Example:

```
/* Start the LOCO. */
   err = R_CGC_ClockStart(&g_cgc0_ctrl, CGC_CLOCK_LOCO, NULL);
   assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Clock initialized successfully.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_STABILIZED	The clock source is not stabilized after being turned off or PLL clock source is not stable.
FSP_ERR_PLL_SRC_INACTIVE	PLL clock source is not running.
FSP_ERR_CLOCK_ACTIVE	PLL configuration cannot be changed while PLL is running.
FSP_ERR_OSC_STOP_DET_ENABLED	PLL multiplier must be less than 20 if oscillation stop detect is enabled and the input frequency is less than 12.5 MHz.
FSP_ERR_INVALID_STATE	The subclock must be running before activating HOCO with FLL.

◆ R_CGC_ClockStop()

fsp_err_t R_CGC_ClockStop (cgc_ctrl_t *const *p_ctrl*, cgc_clock_t *clock_source*)

Stop the specified clock if it is active. Implements cgc_api_t::clockStop.

Do not attempt to stop the current system clock source. Do not attempt to stop the source clock of a PLL if the PLL is running.

Return values

FSP_SUCCESS	Clock stopped successfully.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_IN_USE	Attempt to stop the current system clock or the PLL source clock.
FSP_ERR_OSC_STOP_DET_ENABLED	Attempt to stop MOCO when Oscillation stop is enabled.
FSP_ERR_NOT_STABILIZED	Clock not stabilized after starting.

◆ R_CGC_SystemClockSet()

fsp_err_t R_CGC_SystemClockSet (cgc_ctrl_t *const *p_ctrl*, cgc_clock_t *clock_source*, cgc_divider_cfg_t const *const *p_divider_cfg*)

Set the specified clock as the system clock and configure the internal dividers for ICLK, PCLKA, PCLKB, PCLKC, PCLKD, BCLK, and FCLK. Implements cgc_api_t::systemClockSet.

The requested clock source must be running and stable prior to calling this function. The internal dividers are subject to constraints described in the hardware manual table "Specifications of the Clock Generation Circuit for the internal clocks".

The internal dividers (p_divider_cfg) are subject to constraints described in footnotes of the hardware manual table detailing specifications for the clock generation circuit for the internal clocks for the MCU. For example:

- RA6M3: see footnotes of Table 9.2 "Specifications of the clock generation circuit for the internal clocks" in the RA6M3 manual R01UH0886EJ0100
- RA2A1: see footnotes of Table 9.2 "Clock generation circuit specifications for the internal clocks" in the RA2A1 manual R01UH0888EJ0100

This function also updates the RAM and ROM wait states, the operating power control mode, and the SystemCoreClock CMSIS global variable.

Example:

```
/* Set divisors. Divisors for clocks that don't exist on the MCU are ignored. */
cgc_divider_cfg_t dividers =
   {
```

```
 /* PCLKB is not used in this application, so select the maximum divisor for lowest
power. */
       .sckdivcr_b.pclkb_div = CGC_SYS_CLOCK_DIV_64,
 /* PCLKD is not used in this application, so select the maximum divisor for lowest
power. */
       .sckdivcr_b.pclkd_div = CGC_SYS_CLOCK_DIV_64,
 /* ICLK is the MCU clock, allow it to run as fast as the LOCO is capable. */
       .sckdivcr_b.iclk_div = CGC_SYS_CLOCK_DIV_1,
 /* These clocks do not exist on some devices. If any clocks don't exist, set the
divider to 1. */
       .sckdivcr_b.pclka_div = CGC_SYS_CLOCK_DIV_1,
       .sckdivcr_b.pclkc_div = CGC_SYS_CLOCK_DIV_1,
       .sckdivcr_b.fclk_div = CGC_SYS_CLOCK_DIV_1,
       .sckdivcr_b.bclk_div = CGC_SYS_CLOCK_DIV_1,
    };
 /* Switch the system clock to LOCO. */
    err = R_CGC_SystemClockSet(&g_cgc0_ctrl, CGC_CLOCK_LOCO, &dividers);
    assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Operation performed successfully.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_CLOCK_INACTIVE	The specified clock source is inactive.
FSP_ERR_NOT_STABILIZED	The clock source has not stabilized

◆ R_CGC_SystemClockGet()

fsp_err_t R_CGC_SystemClockGet (cgc_ctrl_t *const *p_ctrl*, cgc_clock_t *const *p_clock_source*, cgc_divider_cfg_t *const *p_divider_cfg*)

Return the current system clock source and configuration. Implements cgc_api_t::systemClockGet.

Return values

FSP_SUCCESS	Parameters returned successfully.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Module is not open.

◆ R_CGC_ClockCheck()

fsp_err_t R_CGC_ClockCheck (cgc_ctrl_t *const *p_ctrl*, cgc_clock_t *clock_source*)

Check the specified clock for stability. Implements cgc_api_t::clockCheck.

Return values

FSP_SUCCESS	Clock is running and stable.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_STABILIZED	Clock not stabilized.
FSP_ERR_CLOCK_INACTIVE	Clock not turned on.

◆ R_CGC_OscStopDetectEnable()

fsp_err_t R_CGC_OscStopDetectEnable (cgc_ctrl_t *const *p_ctrl*)

Enable the oscillation stop detection for the main clock. Implements cgc_api_t::oscStopDetectEnable.

The MCU will automatically switch the system clock to MOCO when a stop is detected if Main Clock is the system clock. If the system clock is the PLL, then the clock source will not be changed and the PLL free running frequency will be the system clock frequency.

Example:

```
/* Enable oscillation stop detection. The main oscillator must be running at this
point. */
    err = R_CGC_OscStopDetectEnable(&g_cgc0_ctrl);
    assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Operation performed successfully.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_LOW_VOLTAGE_MODE	Settings not allowed in low voltage mode.
FSP_ERR_UNSUPPORTED	Function not supported.

◆ R_CGC_OscStopDetectDisable()

fsp_err_t R_CGC_OscStopDetectDisable (cgc_ctrl_t *const *p_ctrl*)

Disable the oscillation stop detection for the main clock. Implements cgc_api_t::oscStopDetectDisable.

Example:

```
/* (Optional) Oscillation stop detection must be disabled before entering any low
power mode. */
    err = R_CGC_OscStopDetectDisable(&g_cgc0_ctrl);
    assert(FSP_SUCCESS == err);
    __WFI();
```

Return values

FSP_SUCCESS	Operation performed successfully.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_OSC_STOP_DETECTED	The Oscillation stop detect status flag is set. Under this condition it is not possible to disable the Oscillation stop detection function.
FSP_ERR_UNSUPPORTED	Function not supported.

◆ R_CGC_OscStopStatusClear()

fsp_err_t R_CGC_OscStopStatusClear (cgc_ctrl_t *const *p_ctrl*)

Clear the Oscillation Stop Detection Status register. This register is not cleared automatically if the stopped clock is restarted. Implements cgc_api_t::oscStopStatusClear.

After clearing the status, oscillation stop detection is no longer enabled.

This register cannot be cleared while the main oscillator is the system clock or the PLL source clock.

Example:

```
/* (Optional) Clear the error flag. Only clear this flag after switching the MCU clock source away from the main
 * oscillator and if the main oscillator is stable again. */
  err = R_CGC_OscStopStatusClear(&g_cgc0_ctrl);
  assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Operation performed successfully.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_CLOCK_INACTIVE	Main oscillator must be running to clear the oscillation stop detection flag.
FSP_ERR_OSC_STOP_CLOCK_ACTIVE	The Oscillation Detect Status flag cannot be cleared if the Main Osc or PLL is set as the system clock. Change the system clock before attempting to clear this bit.
FSP_ERR_INVALID_HW_CONDITION	Oscillation stop status was not cleared. Check preconditions and try again.
FSP_ERR_UNSUPPORTED	Function not supported.

◆ R_CGC_CallbackSet()

fsp_err_t R_CGC_CallbackSet (cgc_ctrl_t *const *p_api_ctrl*, void(*)(cgc_callback_args_t *) *p_callback*, void const *const *p_context*, cgc_callback_args_t *const *p_callback_memory*)

Updates the user callback and has option of providing memory for callback structure. Implements cgc_api_t::callbackSet

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.
FSP_ERR_UNSUPPORTED	Function not supported.

◆ R_CGC_Close()

fsp_err_t R_CGC_Close (cgc_ctrl_t *const *p_ctrl*)

Closes the CGC module. Implements cgc_api_t::close.

Return values

FSP_SUCCESS	The module is successfully closed.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Module is not open.

Detailed Description

Driver for the ELC peripheral on RA MCUs. This module implements the ELC Interface.

Overview

The event link controller (ELC) uses the event requests generated by various peripheral modules as source signals to connect (link) them to different modules, allowing direct cooperation between the modules without central processing unit (CPU) intervention. The conceptual diagram below illustrates a potential setup where a pin interrupt triggers a timer which later triggers an ADC conversion and CTSU scan, while at the same time a serial communication interrupt automatically starts a data transfer. These tasks would be automatically handled without the need for polling or interrupt management.

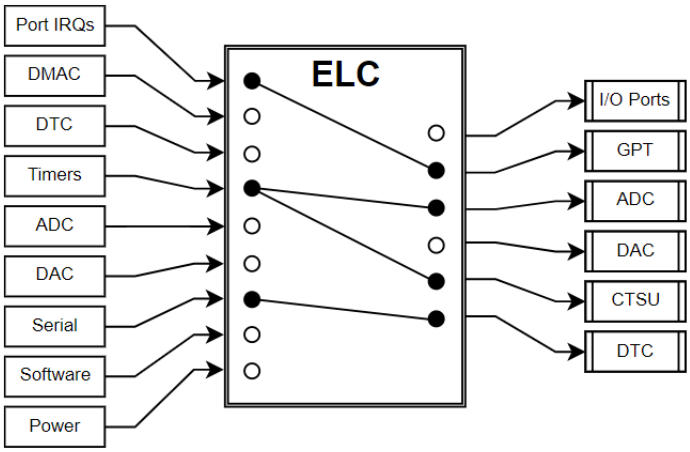

Figure 305: Event Link Controller Conceptual Diagram

In essence, the ELC is an array of multiplexers to route a wide variety of interrupt signals to a subset of peripheral functions. Events are linked by setting the multiplexer for the desired function to the desired signal (through R_ELC_LinkSet). The diagram below illustrates one peripheral output of the ELC. In this example, a conversion start is triggered for ADC0 Group A when the GPT0 counter overflows:

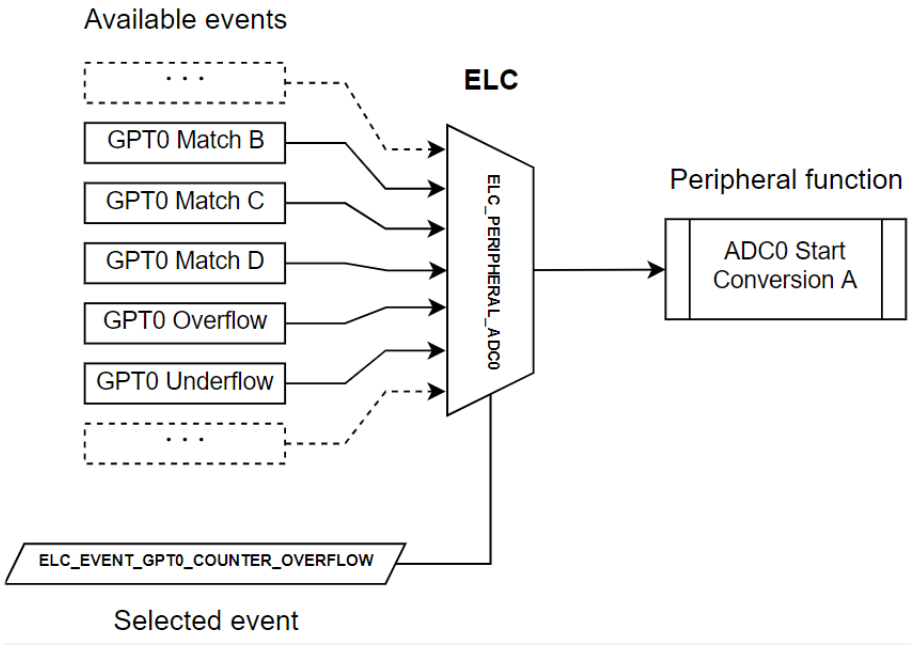

Figure 306: ELC Example

Features

The ELC HAL module can perform the following functions:

- Initialize the ELC to a pre-defined set of links
- Create an event link between two blocks
- Break an event link between two blocks
- Generate one of two software events that interrupt the CPU
- Globally enable or disable event links

A variety of functions can be activated via events, including:

- General-purpose timer (GPT) control
- ADC and DAC conversion start
- Synchronized I/O port output (ports 1-4 only)
- Capacitive touch unit (CTSU) measurement activation

Note

The available sources and peripherals may differ between devices. A full list of selectable peripherals and events is available in the User's Manual for your device.
Some peripherals have specific settings related to ELC event generation and/or reception. Details on how to enable event functionality for each peripheral are located in the usage notes for the related module(s) as well as in the User's Manual for your device.

Configuration

Note

Event links will be automatically generated based on the selections made in module properties. To view the currently linked events check the Event Links tab in the RA Configuration editor.
Calling R_ELC_Open followed by R_ELC_Enable will automatically link all events shown in the Event Links tab.

To manually link an event to a peripheral at runtime perform the following steps:

1. Configure the operation of the destination peripheral (including any configuration necessary to receive events)
2. Use R_ELC_LinkSet to set the desired event link to the peripheral
3. Use R_ELC_Enable to enable transmission of event signals
4. Configure the signaling module to output the desired event (typically an interrupt)

To disable the event, either use R_ELC_LinkBreak to clear the link for a specific event or R_ELC_Disable to globally disable event linking.

Note

The ELC module needs no pin, clocking or interrupt configuration; it is merely a mechanism to connect signals between peripherals. However, when linking I/O Ports via the ELC the relevant I/O pins need to be configured as inputs or outputs.

Build Time Configurations for r_elc

The following build time configurations are defined in fsp_cfg/r_elc_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for System > Event Link Controller (r_elc)

This module can be added to the Stacks tab via New Stack > System > Event Link Controller (r_elc). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	ELC instance name must be g_elc to match elc_cfg_t data structure created in elc_data.c	g_elc	Module name. Fixed to g_elc.

Usage Notes

Limitations

Developers should be aware of the following limitations when using the ELC:

- To link events it is necessary for the ELC and the related modules to be enabled. The ELC cannot operate if the related modules are in the module stop state or the MCU is in a low power consumption mode for which the module is stopped.
- If two modules are linked across clock domains there may be a 1 to 2 cycle delay between event signaling and reception. The delay timing is based on the frequency of the slowest clock.

Examples

Basic Example

Below is a basic example of minimal use of event linking in an application.

```
/* This struct is automatically generated based on the events configured by
peripherals in the RA Configuration editor. */
static const elc_cfg_t g_elc_cfg =
{
#if (BSP_CFG_MCU_PART_SERIES == 0)
    .link[ELC_PERIPHERAL_TAU01]   = ELC_EVENT_ICU_IRQ0,
    .link[ELC_PERIPHERAL_IOPORT1] = ELC_EVENT_TAU0_TMI01
#else
    .link[ELC_PERIPHERAL_GPT_A]   = ELC_EVENT_ICU_IRQ0,
    .link[ELC_PERIPHERAL_IOPORT1] = ELC_EVENT_GPT4_COUNTER_OVERFLOW
#endif
};
void elc_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the software and sets the links defined in the control structure. */
    err = R_ELC_Open(&g_elc_ctrl, &g_elc_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Create or modify a link between a peripheral function and an event source. */
#if (BSP_CFG_MCU_PART_SERIES == 0)
    err = R_ELC_LinkSet(&g_elc_ctrl, ELC_PERIPHERAL_AD, ELC_EVENT_TAU0_TMI01);
#else
    err = R_ELC_LinkSet(&g_elc_ctrl, ELC_PERIPHERAL_ADC0,
ELC_EVENT_GPT4_COUNTER_OVERFLOW);
#endif
    assert(FSP_SUCCESS == err);
 /* Globally enable event linking in the ELC. */
    err = R_ELC_Enable(&g_elc_ctrl);
    assert(FSP_SUCCESS == err);
}
```

Software-Generated Events

This example demonstrates how to use a software-generated event to signal a peripheral. This can be useful when the desired event source is not supported by the ELC hardware.

```
/* Interrupt handler for peripheral event not supported by the ELC */
void peripheral_isr (void)
{
 fsp_err_t err;
 /* Generate an event signal through software to the linked peripheral. */
    err = R_ELC_SoftwareEventGenerate(&g_elc_ctrl, ELC_SOFTWARE_EVENT_0);
    assert(FSP_SUCCESS == err);
}
void elc_software_event (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Open the module. */
    err = R_ELC_Open(&g_elc_ctrl, &g_elc_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Link ADC0 conversion start to software event 0. */
#if (BSP_CFG_MCU_PART_SERIES == 0)
    err = R_ELC_LinkSet(&g_elc_ctrl, ELC_PERIPHERAL_AD,
ELC_EVENT_ELC_SOFTWARE_EVENT_0);
#else
    err = R_ELC_LinkSet(&g_elc_ctrl, ELC_PERIPHERAL_ADC0,
ELC_EVENT_ELC_SOFTWARE_EVENT_0);
#endif
    assert(FSP_SUCCESS == err);
 while (true)
    {
 /* Application code here. */
    }
}
```

Data Structures

struct	elc_instance_ctrl_t

Data Structure Documentation

◆ elc_instance_ctrl_t

struct elc_instance_ctrl_t
ELC private control block. DO NOT MODIFY. Initialization occurs when R_ELC_Open() is called.

Function Documentation

◆ R_ELC_Open()

fsp_err_t R_ELC_Open (elc_ctrl_t *const *p_ctrl*, elc_cfg_t const *const *p_cfg*)

Initialize all the links in the Event Link Controller. Implements elc_api_t::open

The configuration structure passed in to this function includes links for every event source included in the ELC and sets them all at once. To set or clear an individual link use R_ELC_LinkSet and R_ELC_LinkBreak respectively.

Example:

```
/* Initializes the software and sets the links defined in the control structure. */
   err = R_ELC_Open(&g_elc_ctrl, &g_elc_cfg);
```

Return values

FSP_SUCCESS	Initialization was successful
FSP_ERR_ASSERTION	p_ctrl or p_cfg was NULL
FSP_ERR_ALREADY_OPEN	The module is currently open

◆ R_ELC_Close()

fsp_err_t R_ELC_Close (elc_ctrl_t *const *p_ctrl*)

Globally disable ELC linking. Implements elc_api_t::close

Return values

FSP_SUCCESS	The ELC was successfully disabled
FSP_ERR_ASSERTION	p_ctrl was NULL
FSP_ERR_NOT_OPEN	The module has not been opened

◆ R_ELC_SoftwareEventGenerate()

fsp_err_t R_ELC_SoftwareEventGenerate (elc_ctrl_t *const *p_ctrl*, elc_software_event_t *event_number*)

Generate a software event in the Event Link Controller. Implements elc_api_t::softwareEventGenerate

Example:

```
/* Generate an event signal through software to the linked peripheral. */
   err = R_ELC_SoftwareEventGenerate(&g_elc_ctrl, ELC_SOFTWARE_EVENT_0);
   assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Initialization was successful
FSP_ERR_ASSERTION	Invalid event number or p_ctrl was NULL
FSP_ERR_NOT_OPEN	The module has not been opened

◆ R_ELC_LinkSet()

fsp_err_t R_ELC_LinkSet (elc_ctrl_t *const *p_ctrl*, elc_peripheral_t *peripheral*, elc_event_t *signal*)

Create a single event link. Implements elc_api_t::linkSet

Example:

```
 /* Create or modify a link between a peripheral function and an event source. */
#if (BSP_CFG_MCU_PART_SERIES == 0)
    err = R_ELC_LinkSet(&g_elc_ctrl, ELC_PERIPHERAL_AD, ELC_EVENT_TAU0_TMI01);
#else
    err = R_ELC_LinkSet(&g_elc_ctrl, ELC_PERIPHERAL_ADC0,
ELC_EVENT_GPT4_COUNTER_OVERFLOW);
#endif
    assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Initialization was successful
FSP_ERR_ASSERTION	p_ctrl was NULL
FSP_ERR_NOT_OPEN	The module has not been opened

◆ R_ELC_LinkBreak()

fsp_err_t R_ELC_LinkBreak (elc_ctrl_t *const *p_ctrl*, elc_peripheral_t *peripheral*)

Break an event link. Implements elc_api_t::linkBreak

Return values

FSP_SUCCESS	Event link broken
FSP_ERR_ASSERTION	p_ctrl was NULL
FSP_ERR_NOT_OPEN	The module has not been opened

◆ R_ELC_Enable()

fsp_err_t R_ELC_Enable (elc_ctrl_t *const *p_ctrl*)

Enable the operation of the Event Link Controller. Implements elc_api_t::enable

Return values

FSP_SUCCESS	ELC enabled.
FSP_ERR_ASSERTION	p_ctrl was NULL
FSP_ERR_NOT_OPEN	The module has not been opened

◆ R_ELC_Disable()

fsp_err_t R_ELC_Disable (elc_ctrl_t *const *p_ctrl*)

Disable the operation of the Event Link Controller. Implements elc_api_t::disable

Return values

FSP_SUCCESS	ELC disabled.
FSP_ERR_ASSERTION	p_ctrl was NULL
FSP_ERR_NOT_OPEN	The module has not been opened

fsp_err_t	R_IOPORT_PinWrite (ioport_ctrl_t *const p_ctrl, bsp_io_port_pin_t pin, bsp_io_level_t level)
fsp_err_t	R_IOPORT_PortDirectionSet (ioport_ctrl_t *const p_ctrl, bsp_io_port_t port, ioport_size_t direction_values, ioport_size_t mask)
fsp_err_t	R_IOPORT_PortEventInputRead (ioport_ctrl_t *const p_ctrl, bsp_io_port_t port, ioport_size_t *p_event_data)
fsp_err_t	R_IOPORT_PinEventInputRead (ioport_ctrl_t *const p_ctrl, bsp_io_port_pin_t pin, bsp_io_level_t *p_pin_event)
fsp_err_t	R_IOPORT_PortEventOutputWrite (ioport_ctrl_t *const p_ctrl, bsp_io_port_t port, ioport_size_t event_data, ioport_size_t mask_value)
fsp_err_t	R_IOPORT_PinEventOutputWrite (ioport_ctrl_t *const p_ctrl, bsp_io_port_pin_t pin, bsp_io_level_t pin_value)

Detailed Description

Driver for the I/O Ports peripheral on RA MCUs. This module implements the I/O Port Interface.

Overview

The I/O port pins operate as general I/O port pins, I/O pins for peripheral modules, interrupt input pins, analog I/O, port group function for the ELC, or bus control pins.

Features

The IOPORT HAL module can configure the following pin settings:

- Pin direction
- Default output state
- Pull-up
- NMOS/PMOS
- Drive strength
- Event edge trigger (falling, rising or both)
- Whether the pin is to be used as an IRQ pin
- Whether the pin is to be used as an analog pin
- Peripheral connection

The module also provides the following functionality:

- Read/write GPIO pins/ports
- Sets event output data
- Reads event input data

Configuration

The I/O PORT HAL module must be configured by the user for the desired operation. The operating state of an I/O pin can be set via the RA Configuration tool. When the project is built a pin configuration file is created. The BSP will automatically configure the MCU IO ports accordingly at startup using the same API functions mentioned in this document.

Build Time Configurations for r_ioport

The following build time configurations are defined in fsp_cfg/r_ioport_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for System > I/O Port (r_ioport)

This module can be added to the Stacks tab via New Stack > System > I/O Port (r_ioport).

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_ioport	Module name.
1st Port ELC Trigger Source	MCU Specific Options		ELC source that will trigger the 1st port
2nd Port ELC Trigger Source	MCU Specific Options		ELC source that will trigger the 2nd port
3rd Port ELC Trigger Source	MCU Specific Options		ELC source that will trigger the 3rd port
4th Port ELC Trigger Source	MCU Specific Options		ELC source that will trigger the 4th port
Pin Configuration Name	Name must be a valid	g_bsp_pin_cfg	Name for pin

C symbol	configuration structure

Clock Configuration

The I/O PORT HAL module does not require a specific clock configuration.

Pin Configuration

The IOPORT module is used for configuring pins.

Usage Notes

Port Group Function for ELC

Depending on pin configuration, the IOPORT module can perform automatic reads and writes on 4 ports (RA2 and RA0 series support 2 ports only, see the table of ELC triggers below) on receipt of an ELC event.

ELC triggers	RA6T2	RA2XX, RA0XX	All others
1st Port	Port B	Port 1	Port 1
2nd Port	Port C	Port 2	Port 2
3rd Port	Port D	NA	Port 3
4th Port	Port E	NA	Port 4

When an event is received by a port, the state of the input pins on the port is saved in a hardware register. Simultaneously, the state of output pins on the port is set or cleared based on settings configured by the user. The functions R_IOPORT_PinEventInputRead and R_IOPORT_PortEventInputRead allow reading the last event input state of a pin or port, and event-triggered pin output can be configured through R_IOPORT_PinEventOutputWrite and R_IOPORT_PortEventOutputWrite.

In addition, each pin on these ports can be configured to trigger an ELC event on rising, falling or both edges. This event can be used to activate other modules when the pin changes state.

Note

The number of ELC-aware ports vary across MCUs. Refer to the Hardware User's Manual for your device for more details.

Examples

Basic Example

This is a basic example of minimal use of the IOPORT in an application.

```
void basic_example ()
{
 bsp_io_level_t readLevel;
 fsp_err_t      err;
```

```
 /* Initialize the IOPORT module and configure the pins
  * Note: The default pin configuration name in the RA Configuration tool is
g_bsp_pin_cfg */
    err = R_IOPORT_Open(&g_ioport_ctrl, &g_bsp_pin_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Call R_IOPORT_PinsCfg if the configuration was not part of initial configurations
made in open */
    err = R_IOPORT_PinsCfg(&g_ioport_ctrl, &g_runtime_pin_cfg);
    assert(FSP_SUCCESS == err);
 /* Set Pin 00 of Port 06 to High */
    err = R_IOPORT_PinWrite(&g_ioport_ctrl, BSP_IO_PORT_06_PIN_00, BSP_IO_LEVEL_HIGH
);
    assert(FSP_SUCCESS == err);
 /* Read Pin 00 of Port 06*/
    err = R_IOPORT_PinRead(&g_ioport_ctrl, BSP_IO_PORT_06_PIN_00, &readLevel);
    assert(FSP_SUCCESS == err);
}
```

Blinky Example

This example uses IOPORT to configure and toggle a pin to blink an LED.

```
void blinky_example ()
{
 fsp_err_t err;
 /* Initialize the IOPORT module and configure the pins */
    err = R_IOPORT_Open(&g_ioport_ctrl, &g_bsp_pin_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Configure Pin as output
  * Call the R_IOPORT_PinCfg if the configuration was not part of initial
configurations made in open */
    err = R_IOPORT_PinCfg(&g_ioport_ctrl, BSP_IO_PORT_06_PIN_00,
IOPORT_CFG_PORT_DIRECTION_OUTPUT);
```

```
   assert(FSP_SUCCESS == err);
 bsp_io_level_t level = BSP_IO_LEVEL_LOW;
 while (1)
   {
 /* Determine the next state of the LEDs */
 if (BSP_IO_LEVEL_LOW == level)
     {
           level = BSP_IO_LEVEL_HIGH;
      }
 else
     {
           level = BSP_IO_LEVEL_LOW;
      }
 /* Update LED on RA6M3-PK */
      err = R_IOPORT_PinWrite(&g_ioport_ctrl, BSP_IO_PORT_06_PIN_00, level);
     assert(FSP_SUCCESS == err);
 /* Delay */
 R_BSP_SoftwareDelay(100, BSP_DELAY_UNITS_MILLISECONDS); // NOLINT
   }
}
```

ELC Example

This is an example of using IOPORT with ELC events. The ELC event system allows the captured data to be stored when it occurs and then read back at a later time.

```
static elc_instance_ctrl_t g_elc_ctrl;
static elc_cfg_t g_elc_cfg;
void ioport_elc_example ()
{
 bsp_io_level_t eventValue;
 fsp_err_t      err;
 /* Initializes the software and sets the links defined in the control structure. */
   err = R_ELC_Open(&g_elc_ctrl, &g_elc_cfg);
 /* Handle any errors. This function should be defined by the user. */
```

```
    assert(FSP_SUCCESS == err);
 /* Create or modify a link between a peripheral function and an event source. */
    err = R_ELC_LinkSet(&g_elc_ctrl, (elc_peripheral_t) ELC_PERIPHERAL_IOPORT2,
ELC_EVENT_ELC_SOFTWARE_EVENT_0);
    assert(FSP_SUCCESS == err);
 /* Globally enable event linking in the ELC. */
    err = R_ELC_Enable(&g_elc_ctrl);
    assert(FSP_SUCCESS == err);
 /* Initialize the IOPORT module and configure the pins */
    err = R_IOPORT_Open(&g_ioport_ctrl, &g_bsp_pin_cfg);
    assert(FSP_SUCCESS == err);
 /* Call the R_IOPORT_PinCfg if the configuration was not part of initial
configurations made in open */
    err = R_IOPORT_PinCfg(&g_ioport_ctrl, BSP_IO_PORT_02_PIN_00,
IOPORT_CFG_PORT_DIRECTION_INPUT);
    assert(FSP_SUCCESS == err);
 /* Generate an event signal through software to the linked peripheral. */
    err = R_ELC_SoftwareEventGenerate(&g_elc_ctrl, ELC_SOFTWARE_EVENT_0);
    assert(FSP_SUCCESS == err);
 /* Read Pin Event Input. The data(BSP_IO_LEVEL_HIGH/ BSP_IO_LEVEL_LOW) from
BSP_IO_PORT_02_PIN_00 is read into the
  * EIDR bit */
    err = R_IOPORT_PinEventInputRead(&g_ioport_ctrl, BSP_IO_PORT_02_PIN_00,
&eventValue);
    assert(FSP_SUCCESS == err);
}
```

IOPORT_PORT_14_PIN_15	IO port 14 pin 15.

◆ ioport_peripheral_t

enum ioport_peripheral_t	
Superset of all peripheral functions.	
Enumerator	
IOPORT_PERIPHERAL_IO	Pin will functions as an IO pin
IOPORT_PERIPHERAL_DEBUG	Pin will function as a DEBUG pin
IOPORT_PERIPHERAL_AGT	Pin will function as an AGT peripheral pin
IOPORT_PERIPHERAL_AGTW	Pin will function as an AGT peripheral pin
IOPORT_PERIPHERAL_AGT1	Pin will function as an AGT peripheral pin
IOPORT_PERIPHERAL_GPT0	Pin will function as a GPT peripheral pin
IOPORT_PERIPHERAL_GPT1	Pin will function as a GPT peripheral pin
IOPORT_PERIPHERAL_SCI0_2_4_6_8	Pin will function as an SCI peripheral pin
IOPORT_PERIPHERAL_SCI1_3_5_7_9	Pin will function as an SCI peripheral pin
IOPORT_PERIPHERAL_SPI	Pin will function as a SPI peripheral pin
IOPORT_PERIPHERAL_IIC	Pin will function as a IIC peripheral pin
IOPORT_PERIPHERAL_KEY	Pin will function as a KEY peripheral pin

IOPORT_PERIPHERAL_CLKOUT_COMP_RTC	Pin will function as a clock/comparator/RTC peripheral pin
IOPORT_PERIPHERAL_CAC_AD	Pin will function as a CAC/ADC peripheral pin
IOPORT_PERIPHERAL_BUS	Pin will function as a BUS peripheral pin
IOPORT_PERIPHERAL_CTSU	Pin will function as a CTSU peripheral pin
IOPORT_PERIPHERAL_ACMPHS	Pin will function as a CMPHS peripheral pin
IOPORT_PERIPHERAL_LCDC	Pin will function as a segment LCD peripheral pin
IOPORT_PERIPHERAL_DE_SCI0_2_4_6_8	Pin will function as an SCI peripheral DEn pin
IOPORT_PERIPHERAL_DE_SCI1_3_5_7_9	Pin will function as an SCI DEn peripheral pin
IOPORT_PERIPHERAL_DALI	Pin will function as a DALI peripheral pin
IOPORT_PERIPHERAL_CEU	Pin will function as a CEU peripheral pin
IOPORT_PERIPHERAL_CAN	Pin will function as a CAN peripheral pin
IOPORT_PERIPHERAL_QSPI	Pin will function as a QSPI peripheral pin
IOPORT_PERIPHERAL_SSI	Pin will function as an SSI peripheral pin
IOPORT_PERIPHERAL_USB_FS	Pin will function as a USB full speed peripheral pin
IOPORT_PERIPHERAL_USB_HS	Pin will function as a USB high speed peripheral pin
IOPORT_PERIPHERAL_GPT2	Pin will function as a GPT peripheral pin
IOPORT_PERIPHERAL_SDHI_MMC	Pin will function as an SD/MMC peripheral pin
IOPORT_PERIPHERAL_GPT3	Pin will function as a GPT peripheral pin
IOPORT_PERIPHERAL_ETHER_MII	Pin will function as an Ethernet MMI peripheral pin
IOPORT_PERIPHERAL_GPT4	Pin will function as a GPT peripheral pin
IOPORT_PERIPHERAL_ETHER_RMII	Pin will function as an Ethernet RMMI peripheral pin
IOPORT_PERIPHERAL_PDC	Pin will function as a PDC peripheral pin

IOPORT_PERIPHERAL_LCD_GRAPHICS	Pin will function as a graphics LCD peripheral pin
IOPORT_PERIPHERAL_CAC	Pin will function as a CAC peripheral pin
IOPORT_PERIPHERAL_TRACE	Pin will function as a debug trace peripheral pin
IOPORT_PERIPHERAL_OSPI	Pin will function as a OSPI peripheral pin
IOPORT_PERIPHERAL_CEC	Pin will function as a CEC peripheral pin
IOPORT_PERIPHERAL_PGAOUT0	Pin will function as a PGAOUT peripheral pin
IOPORT_PERIPHERAL_PGAOUT1	Pin will function as a PGAOUT peripheral pin
IOPORT_PERIPHERAL_ULPT	Pin will function as a ULPT peripheral pin
IOPORT_PERIPHERAL_MIPI	Pin will function as a MIPI DSI peripheral pin
IOPORT_PERIPHERAL_UARTA	Pin will function as an UARTA peripheral pin

◆ ioport_cfg_options_t

enum ioport_cfg_options_t	
Options to configure pin functions	
Enumerator	
IOPORT_CFG_PORT_DIRECTION_INPUT	Sets the pin direction to input (default)
IOPORT_CFG_PORT_DIRECTION_OUTPUT	Sets the pin direction to output.
IOPORT_CFG_PORT_OUTPUT_LOW	Sets the pin level to low.
IOPORT_CFG_PORT_OUTPUT_HIGH	Sets the pin level to high.
IOPORT_CFG_PULLUP_ENABLE	Enables the pin's internal pull-up.
IOPORT_CFG_PIM_TTL	Enables the pin's input mode.
IOPORT_CFG_NMOS_ENABLE	Enables the pin's NMOS open-drain output.
IOPORT_CFG_IRQ_ENABLE	Sets pin as an IRQ pin.
IOPORT_CFG_ANALOG_ENABLE	Enables pin to operate as an analog pin.

IOPORT_CFG_PERIPHERAL_PIN	Enables pin to operate as a peripheral pin.
IOPORT_CFG_PORT_DIRECTION_INPUT	Sets the pin direction to input (default)
IOPORT_CFG_PORT_DIRECTION_OUTPUT	Sets the pin direction to output.
IOPORT_CFG_PORT_OUTPUT_LOW	Sets the pin level to low.
IOPORT_CFG_PORT_OUTPUT_HIGH	Sets the pin level to high.
IOPORT_CFG_PULLUP_ENABLE	Enables the pin's internal pull-up.
IOPORT_CFG_PIM_TTL	Enables the pin's input mode.
IOPORT_CFG_NMOS_ENABLE	Enables the pin's NMOS open-drain output.
IOPORT_CFG_PMOS_ENABLE	Enables the pin's PMOS open-drain ouput.
IOPORT_CFG_DRIVE_MID	Sets pin drive output to medium.
IOPORT_CFG_DRIVE_HS_HIGH	Sets pin drive output to high along with supporting high speed.
IOPORT_CFG_DRIVE_MID_IIC	Sets pin to drive output needed for IIC on a 20mA port.
IOPORT_CFG_DRIVE_HIGH	Sets pin drive output to high.
IOPORT_CFG_EVENT_RISING_EDGE	Sets pin event trigger to rising edge.
IOPORT_CFG_EVENT_FALLING_EDGE	Sets pin event trigger to falling edge.
IOPORT_CFG_EVENT_BOTH_EDGES	Sets pin event trigger to both edges.
IOPORT_CFG_IRQ_ENABLE	Sets pin as an IRQ pin.
IOPORT_CFG_ANALOG_ENABLE	Enables pin to operate as an analog pin.
IOPORT_CFG_PERIPHERAL_PIN	Enables pin to operate as a peripheral pin.

Function Documentation

◆ R_IOPORT_Open()

fsp_err_t R_IOPORT_Open (ioport_ctrl_t *const *p_ctrl*, const ioport_cfg_t * *p_cfg*)

Initializes internal driver data, then calls pin configuration function to configure pins.

Return values

FSP_SUCCESS	Pin configuration data written to PFS register(s)
FSP_ERR_ASSERTION	NULL pointer
FSP_ERR_ALREADY_OPEN	Module is already open.

◆ R_IOPORT_Close()

fsp_err_t R_IOPORT_Close (ioport_ctrl_t *const *p_ctrl*)

Resets IOPORT registers. Implements ioport_api_t::close

Return values

FSP_SUCCESS	The IOPORT was successfully uninitialized
FSP_ERR_ASSERTION	p_ctrl was NULL
FSP_ERR_NOT_OPEN	The module has not been opened

◆ R_IOPORT_PinsCfg()

fsp_err_t R_IOPORT_PinsCfg (ioport_ctrl_t *const *p_ctrl*, const ioport_cfg_t * *p_cfg*)

Configures the functions of multiple pins by loading configuration data into pin PFS registers. Implements ioport_api_t::pinsCfg.

This function initializes the supplied list of PmnPFS registers with the supplied values. This data can be generated by the Pins tab of the RA Configuration editor or manually by the developer. Different pin configurations can be loaded for different situations such as low power modes and testing.

Return values

FSP_SUCCESS	Pin configuration data written to PFS register(s)
FSP_ERR_NOT_OPEN	The module has not been opened
FSP_ERR_ASSERTION	NULL pointer

◆ R_IOPORT_PinCfg()

fsp_err_t R_IOPORT_PinCfg (ioport_ctrl_t *const *p_ctrl*, bsp_io_port_pin_t *pin*, uint32_t *cfg*)

Configures the settings of a pin. Implements ioport_api_t::pinCfg.

Return values

FSP_SUCCESS	Pin configured
FSP_ERR_NOT_OPEN	The module has not been opened
FSP_ERR_ASSERTION	NULL pointer

Note

This function is re-entrant for different pins. This function will change the configuration of the pin with the new configuration. For example it is not possible with this function to change the drive strength of a pin while leaving all the other pin settings unchanged. To achieve this the original settings with the required change will need to be written using this function.

◆ R_IOPORT_PinRead()

fsp_err_t R_IOPORT_PinRead (ioport_ctrl_t *const *p_ctrl*, bsp_io_port_pin_t *pin*, bsp_io_level_t * *p_pin_value*)

Reads the level on a pin. Implements ioport_api_t::pinRead.

Return values

FSP_SUCCESS	Pin read
FSP_ERR_ASSERTION	NULL pointer
FSP_ERR_NOT_OPEN	The module has not been opened

Note

This function is re-entrant for different pins.

◆ R_IOPORT_PortRead()

fsp_err_t R_IOPORT_PortRead (ioport_ctrl_t *const *p_ctrl*, bsp_io_port_t *port*, ioport_size_t * *p_port_value*)

Reads the value on an IO port. Implements ioport_api_t::portRead.

The specified port will be read, and the levels for all the pins will be returned. Each bit in the returned value corresponds to a pin on the port. For example, bit 7 corresponds to pin 7, bit 6 to pin 6, and so on.

Return values

FSP_SUCCESS	Port read
FSP_ERR_ASSERTION	NULL pointer
FSP_ERR_NOT_OPEN	The module has not been opened

Note

This function is re-entrant for different ports.

◆ R_IOPORT_PortWrite()

fsp_err_t R_IOPORT_PortWrite (ioport_ctrl_t *const *p_ctrl*, bsp_io_port_t *port*, ioport_size_t *value*, ioport_size_t *mask*)

Writes to multiple pins on a port. Implements ioport_api_t::portWrite.

The input value will be written to the specified port. Each bit in the value parameter corresponds to a bit on the port. For example, bit 7 corresponds to pin 7, bit 6 to pin 6, and so on. Each bit in the mask parameter corresponds to a pin on the port.

Only the bits with the corresponding bit in the mask value set will be updated. For example, value = 0xFFFF, mask = 0x0003 results in only bits 0 and 1 being updated.

Return values

FSP_SUCCESS	Port written to
FSP_ERR_INVALID_ARGUMENT	The port and/or mask not valid
FSP_ERR_NOT_OPEN	The module has not been opened
FSP_ERR_ASSERTION	NULL pointer

Note

This function is re-entrant for different ports. This function makes use of the PCNTR3 register to atomically modify the levels on the specified pins on a port.

◆ R_IOPORT_PinWrite()

fsp_err_t R_IOPORT_PinWrite (ioport_ctrl_t *const *p_ctrl*, bsp_io_port_pin_t *pin*, bsp_io_level_t *level*)

Sets a pin's output either high or low. Implements ioport_api_t::pinWrite.

Return values

FSP_SUCCESS	Pin written to
FSP_ERR_INVALID_ARGUMENT	The pin and/or level not valid
FSP_ERR_NOT_OPEN	The module has not been opened
FSP_ERR_ASSERTION	NULL pointer

Note

This function is re-entrant for different pins. This function makes use of the PCNTR3 register to atomically modify the level on the specified pin on a port.

◆ R_IOPORT_PortDirectionSet()

fsp_err_t R_IOPORT_PortDirectionSet (ioport_ctrl_t *const *p_ctrl*, bsp_io_port_t *port*, ioport_size_t *direction_values*, ioport_size_t *mask*)

Sets the direction of individual pins on a port. Implements ioport_api_t::portDirectionSet().

Multiple pins on a port can be set to inputs or outputs at once. Each bit in the mask parameter corresponds to a pin on the port. For example, bit 7 corresponds to pin 7, bit 6 to pin 6, and so on. If a bit is set to 1 then the corresponding pin will be changed to an input or an output as specified by the direction values. If a mask bit is set to 0 then the direction of the pin will not be changed.

Return values

FSP_SUCCESS	Port direction updated
FSP_ERR_INVALID_ARGUMENT	The port and/or mask not valid
FSP_ERR_NOT_OPEN	The module has not been opened
FSP_ERR_ASSERTION	NULL pointer

Note

This function is re-entrant for different ports.

◆ R_IOPORT_PortEventInputRead()

fsp_err_t R_IOPORT_PortEventInputRead (ioport_ctrl_t *const *p_ctrl*, bsp_io_port_t *port*, ioport_size_t * *p_event_data*)

Reads the value of the event input data. Implements ioport_api_t::portEventInputRead().

The event input data for the port will be read. Each bit in the returned value corresponds to a pin on the port. For example, bit 7 corresponds to pin 7, bit 6 to pin 6, and so on.

The port event data is captured in response to a trigger from the ELC. This function enables this data to be read. Using the event system allows the captured data to be stored when it occurs and then read back at a later time.

Return values

FSP_SUCCESS	Port read
FSP_ERR_INVALID_ARGUMENT	Port not a valid ELC port
FSP_ERR_ASSERTION	NULL pointer
FSP_ERR_NOT_OPEN	The module has not been opened
FSP_ERR_UNSUPPORTED	Function not supported.

Note

This function is re-entrant for different ports.

◆ R_IOPORT_PinEventInputRead()

fsp_err_t R_IOPORT_PinEventInputRead (ioport_ctrl_t *const *p_ctrl*, bsp_io_port_pin_t *pin*, bsp_io_level_t * *p_pin_event*)

Reads the value of the event input data of a specific pin. Implements ioport_api_t::pinEventInputRead.

The pin event data is captured in response to a trigger from the ELC. This function enables this data to be read. Using the event system allows the captured data to be stored when it occurs and then read back at a later time.

Return values

FSP_SUCCESS	Pin read
FSP_ERR_ASSERTION	NULL pointer
FSP_ERR_NOT_OPEN	The module has not been opened
FSP_ERR_INVALID_ARGUMENT	Port is not valid ELC PORT.
FSP_ERR_UNSUPPORTED	Function not supported.

Note

This function is re-entrant.

◆ R_IOPORT_PortEventOutputWrite()

fsp_err_t R_IOPORT_PortEventOutputWrite (ioport_ctrl_t *const *p_ctrl*, bsp_io_port_t *port*, ioport_size_t *event_data*, ioport_size_t *mask_value*)

This function writes the set and reset event output data for a port. Implements ioport_api_t::portEventOutputWrite.

Using the event system enables a port state to be stored by this function in advance of being output on the port. The output to the port will occur when the ELC event occurs.

The input value will be written to the specified port when an ELC event configured for that port occurs. Each bit in the value parameter corresponds to a bit on the port. For example, bit 7 corresponds to pin 7, bit 6 to pin 6, and so on. Each bit in the mask parameter corresponds to a pin on the port.

Return values

FSP_SUCCESS	Port event data written
FSP_ERR_INVALID_ARGUMENT	Port or Mask not valid
FSP_ERR_NOT_OPEN	The module has not been opened
FSP_ERR_ASSERTION	NULL pointer

Note

This function is re-entrant for different ports.

◆ R_IOPORT_PinEventOutputWrite()

fsp_err_t R_IOPORT_PinEventOutputWrite (ioport_ctrl_t *const *p_ctrl*, bsp_io_port_pin_t *pin*, bsp_io_level_t *pin_value*)

This function writes the event output data value to a pin. Implements ioport_api_t::pinEventOutputWrite.

Using the event system enables a pin state to be stored by this function in advance of being output on the pin. The output to the pin will occur when the ELC event occurs.

Return values

FSP_SUCCESS	Pin event data written
FSP_ERR_INVALID_ARGUMENT	Port or Pin or value not valid
FSP_ERR_NOT_OPEN	The module has not been opened
FSP_ERR_ASSERTION	NULL pointer

Note

This function is re-entrant for different ports.

7.2.19 Timers

Modules

Detailed Description

Timers Modules.

Modules

	Independent Channel, 16-bit and 8-bit timer (r_tau) Driver for the TAU peripheral on RA MCUs. This module implements the Timer Interface.
	Port Output Enable for GPT (r_poeg) Driver for the POEG peripheral on RA MCUs. This module implements the POEG Interface.
	Realtime Clock (r_rtc) Driver for the RTC peripheral on RA MCUs. This module implements the RTC Interface.
	Realtime Clock (r_rtc_c) Driver for the RTC peripheral on RA MCUs. This module implements the RTC Interface.
	Three-Phase PWM (r_gpt_three_phase) Driver for 3-phase motor control using the GPT peripheral on RA MCUs. This module implements the Three-Phase Interface.
	Timer, 32-bit Interval Timer (r_tml) Driver for the TML peripherals on RA MCUs. This module implements the Timer Interface.
	Timer, General PWM (r_gpt) Driver for the GPT32 and GPT16 peripherals on RA MCUs. This module implements the Timer Interface.
	Timer, Low-Power (r_agt) Driver for the AGT and AGTW peripheral on RA MCUs. This module

	implements the Timer Interface.
	Timer, Simultaneous Channel (r_tau_pwm) Driver for the TAU_PWM peripheral on RA MCUs. This module implements the Timer Interface.
	Timer, Ultra Low-Power (r_ulpt) Driver for the ULPT peripheral on RA MCUs. This module implements the Timer Interface.

7.2.19.1 Independent Channel, 16-bit and 8-bit timer (r_tau)

fsp_err_t	R_TAU_LinMeasurementFuncSwitch (timer_ctrl_t *const p_ctrl, tau_function_t func)

Detailed Description

Driver for the TAU peripheral on RA MCUs. This module implements the Timer Interface.

Overview

Features

The TAU module has the following features:

- Supports Function Interval Timer, Square Wave Output, External Event Counter, Divider Function, Input Pulse Interval Measurement, Delay Counter, Input Signal High- or Low-Level Width Measurement.
- Configurable clock source and external sources input to TImn
- Configurable period (counts per timer cycle).
- Supports operation clocks: CK00, CK01, CK02, and CK03.
- Supports noise filter on input source.
- Supports 16-bit and 8-bit timers.
- Supports the runtime reconfiguration of the period.
- Signal can be output to a pin.
- Supports counting based on an external signal to TImn
- Supports measuring pulse width or pulse period.
- APIs are provided to start, stop, and reset the counter.
- APIs are provided to get the current period, source clock frequency, and count direction.
- APIs are provided to get the current timer status and counter value. Below table illustrates the channels and their corresponding supported features.

Channel	Interval Timer	Square Wave Output	External Event Counter	Divider	Input Pulse Interval Measurement	Delay Counter	Measure High-Low Level Pulse Width	8-bit timer operation	Operation clocks	Input signals	Output signals
TAU00	✓	✓	✓	✓	✓	✓	✓		CK00, CK01	TI00, ELC	TO00
TAU01	✓	✓	✓		✓	✓	✓	✓	CK00, CK01, CK02, CK03	TI01, ELC	TO01
TAU02	✓	✓	✓		✓	✓	✓		CK00, CK01	TI02	TO02
TAU03	✓	✓	✓		✓	✓	✓	✓	CK00,	TI03	TO03

							CK01, CK02, CK03		
TAU04	✓	✓	✓		✓	✓	✓	CK00, CK01	TI04	TO04
TAU05	✓	✓	✓		✓	✓	✓	CK00, CK01	TI05, MOCO, LOCO, FSUB	TO05
TAU06	✓	✓	✓		✓	✓	✓	CK00, CK01	TI06	TO06
TAU07	✓	✓	✓		✓	✓	✓	CK00, CK01	TI07, RXD2	TO07

Configuration

Build Time Configurations for r_tau

The following build time configurations are defined in fsp_cfg/r_tau_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
Interrupt Support	• Disabled • Enabled	Enabled	Enable support for interrupts
Pin Output Support	• Disabled • Enabled	Disabled	Enable output for either square wave or divider output
Pin Input Support	• Disabled • Enabled	Disabled	Enable input for pulse width measurement, level width measurement, pulse/edge counting or divider functions.
Extra Input Mode Support	• Disabled • Enabled	Disabled	Enable support for event counting, system clock count sources and input noise filtering when Pin Input Support is enabled.
8-Bit Mode Support	• Disabled • Enabled	Disabled	Enable support for 8-bit timer modes (only available on channels 1 and 3).

Configurations for Timers > Timer, Independent Channel, 16-bit and 8-bit Timer Operation (r_tau)

This module can be added to the Stacks tab via New Stack > Timers > Timer, Independent Channel, 16-bit and 8-bit Timer Operation (r_tau).

Configuration	Options	Default	Description
General			
Name	Name must be a valid C symbol	g_timer0	Module name.
Channel	Channel number must be a non-negative integer	0	Physical hardware channel.
Function	• Interval Timer • Square Wave Output • External Event Counter • Divider • Input Pulse Interval Measurement • Measure Low Level Pulse Width • Measure High Level Pulse Width • Delay Counter	Interval Timer	Function selection. Note: The calculation of the input pulse function and the high-low level pulse width measurement function is implemented using interrupts. ISR's must be enabled for these functions even if callback is unused.
Bit Timer Mode	• 16-bit timer • Higher 8-bit timer • Lower 8-bit timer • Higher and Lower 8-bit timer	16-bit timer	Specify the 16 or 8-bit timer mode
Operation Clock	• CK00 • CK01 • CK02 • CK03	CK00	Specify the selection of operation clock
Period	Value must be a non-negative integer	0x10000	Specify the timer period based on the selected units. When the unit is set to 'Raw Counts', setting the period to 0x10000 results in the maximum period at the lowest

			divisor (fastest timer tick). When Pulse width measurement or high-low level pulse width measurement is enabled, this period is always generated as zero.. The period should be set maximally 0x100 when lower 8-bit mode or higher and lower 8-bit mode is enabled. When 'Input->Trigger Edge' is set to 'Trigger Edge Rising' or 'Trigger Edge Falling', this period can be maximally set to 0x20000 when using the divider function. If the requested period cannot be achieved, the settings with the largest possible period, that does not exceed the requested period, are used. The theoretical calculated period is printed in a comment in the timer_cfg_t structure.
Period Unit	• Raw Counts • Nanoseconds • Microseconds • Milliseconds • Seconds • Hertz • Kilohertz	Raw Counts	Unit of the period specified above
Period (Higher 8-bit timer)	Value must be a non-negative integer	0x100	Specify the higher 8-bit timer period based on the selected unit. When the unit is set to 'Raw Counts', setting the period to 0x100 results in the maximum period at the lowest divisor (fastest timer tick). This setting is only applicable in interval timer function with higher 8bit mode

			or higher and lower 8bit mode. If the requested period cannot be achieved, the settings with the largest possible period that is less than or equal to the requested period are used. The theoretical calculated period is printed in a comment in the tau_extended_cfg_t structure.
Period Unit (Higher 8-bit timer)	• Raw Counts • Nanoseconds • Microseconds • Milliseconds • Seconds • Hertz • Kilohertz	Raw Counts	Unit of the period specified above
Input			
Input Source	MCU Specific Options		Input source, applies in input pulse width measurement function, high-low level pulse width measurement function, external event count function, and divider function.
Trigger Edge	• Trigger Edge Rising • Trigger Edge Falling • Trigger Edge Both	Trigger Edge Rising	Select the trigger edge. Applies in input pulse width measurement function, high-low level pulse width measurement function, external event count function, and divider function.
Input Filter	• Disabled • Enabled	Disabled	Input filter, applies in input pulse width measurement function, high-low level pulse width measurement function, external event count function, and divider function.
Output			
Initial Output	• Disabled • Start Level High	Disabled	Initial output, applies in divider function and

	• Start Level Low		square wave.
Interrupts			
Setting of starting count and interrupt	• Timer interrupt is not generated when counting is started/Start trigger is invalid during counting operation. • Timer interrupt is generated when counting is started/Start trigger is valid during counting operation.	Timer interrupt is not generated when counting is started/Start trigger is invalid during counting operation.	Specify OPIRQ bit setting
Callback	Name must be a valid C symbol	NULL	A user callback function. If this callback function is provided, it is called from the interrupt service routine (ISR) each time the timer period elapses.
Interrupt Priority	MCU Specific Options		Timer interrupt priority.
Higher 8-bit Interrupt Priority	MCU Specific Options		Timer higher 8-bit interrupt priority.

Clock Configuration

The TAU clock is based on the peripheral module clock (PCLKB) which is equal to the system clock (ICLK).

Each TAU channel has certain operation clocks selections, these can be set with the **General>Operation Clock** property in the module configuration. When the operation clock of a channel is set to CK00, CK01, CK02, or CK03, the TAU module provides divisor values for each of those clocks. These divisors may be set in the **Clocks** tab. As such, setting a divisor in the **Clocks** tab affects all TAU channels that use that CK0x clock as an input. Adjusting these settings determines the frequency range achievable by a TAU channel. If a desired frequency is not achievable, the divider in the **Clocks** tab may be adjusted. The clock dividers cannot be adjusted at runtime.

Pin Configuration

This module should use the TOmn pins as output pins for Square Wave Output, Divider Function

For input source, the input signal must be applied to External Event Counter, Divider, Input Pulse Interval Measurement, Delay Counter, and Measure High-Low Level Pulse Width Function

Timer Period

The RA Configuration editor will automatically calculate the period count value based on the selected period time, units, operation clock (set by **General>Operation Clock** property in the module configuration), and clock divisor value (set in **Clocks** tab).

When the selected unit is "Raw counts", the maximum and minimum allowed period setting varies depending on the selected clock source:

Clock divisor	Minimum period (counts)	Maximum period (counts)
ICLK/1	0x00002	0x10000
All other divisors	0x00001	0x10000

Note

If ICLK (undivided) is selected as the operation clock (CK00, CK01) and TDR0n is set to 0x0000 (n = 0 to 7), interrupt requests output from timer array units cannot be used. For this reason When Clock Source is ICLK, Minimum period (counts) is 0x00002

Clock divisor	Minimum Higher 8-bit period (counts)	Maximum Higher 8-bit period (counts)
All divisors	0x001	0x100

Note

Though the TAU is a 16-bit timer, because the period interrupt occurs when the counter underflow, setting the period register to 0 results in an effective period of 1 count. For this reason all user-provided raw count values reflect the actual number of period counts (not the raw register values).

Usage Notes

Interval Timer Function

This function can be used as a reference timer to generate TAU0_TMI0n (timer interrupt) at fixed intervals. The interrupt generation period can be calculated by the following expression.

- Generation period of TAU0_TMI0n (timer interrupt) = Period of count clock × (Set value of TDR0n + 1)

The Interval Timer Function can operate as the higher/lower 8-bits mode.

When "Interrupts > Setting of starting count and interrupt" is "Timer interrupt is generated when counting is started/Start trigger is valid during counting operation.", an interrupt is generated immediately after R_TAU_Start() function is called and timer output also changed.

Square Wave Output Function

This function can use TO0n to perform a toggle operation as soon as TAU0_TMI0n has been generated, and outputs a square wave with a duty factor of 50%.

The period and frequency for outputting a square wave from TO0n can be calculated by the following expressions.

- Period of square wave output from TO0n = Period of count clock × (Set value of TDR0n + 1) × 2

- Frequency of square wave output from TO0n = Frequency of count clock / {(Set value of TDR0n + 1) × 2}

The Square Wave Output Function can operate as the lower 8-bits mode.

When "Interrupts > Setting of starting count and interrupt" is "Timer interrupt is generated when counting is started/Start trigger is valid during counting operation.", an interrupt is generated immediately after R_TAU_Start() function is called and output pin is also changed.

External Event Counter Function

The timer array unit can be used as an external event counter that counts the number of times the valid input edge (external event) is detected in the TI0n pin. When a specified count value is reached, the event counter generates an interrupt. The specified number of counts can be calculated by the following expression.

- Specified number of counts = Set value of TDR0n + 1

Instead of using the TI0n pin input, a channel specified for the External Event Counter Function can also use the signal as "Middle-speed on-chip oscillator (MOCO)", "Low-speed on-chip oscillator (LOCO)", "Subsystem clock (FSUB)", and ELC event which selected in **Input>Input Source** property as its input source to drive counting.

The External Event Counter Function can operate as the lower 8-bits mode.

Delay Counter Function

It is possible to start counting down when the valid edge of the TI0n pin input is detected (an external event), and then generate TAU0_TMI0n (a timer interrupt) after any specified interval. The interrupt generation period can be calculated by the following expression. Generation period of TAU0_TMI0n (timer interrupt) = Period of count clock × (Set value of TDR0n + 1)

Instead of using the TI0n pin input, a channel specified for the Delay Counter Function can also use the signal as "Middle-speed on-chip oscillator (MOCO)", "Low-speed on-chip oscillator (LOCO)", "Subsystem clock (FSUB)", and ELC event which selected in **Input>Input Source** property as its input source to drive counting.

The Delay Counter Function can operate as the lower 8-bits mode.

When "Interrupts > Setting of starting count and interrupt" is "Timer interrupt is generated when counting is started/Start trigger is valid during counting operation.", a start trigger is valid during counting operation.

Divider Function

The timer array unit can be used as a frequency divider that divides a clock input to the TI00 pin and outputs the result from the TO00 pin. The divided clock frequency output from TO00 can be calculated by the following expression. When rising edge/falling edge is selected:

- Divided clock frequency = Input clock frequency / {(Set value of TDR00 + 1) × 2} When both edges are selected:
- Divided clock frequency ≈ Input clock frequency / (Set value of TDR00 + 1)

When "Interrupts > Setting of starting count and interrupt" is "Timer interrupt is generated when counting is started/Start trigger is valid during counting operation.", an interrupt is generated

immediately after first input signal is detected and output pin is also changed.

Input Pulse Interval Measurement Function

The count value can be captured at the TI0n valid edge and the interval of the pulse input to TI0n can be measured. The pulse interval can be calculated by the following expression.

- TI0n input pulse interval = Period of count clock × ((0x10000 × TSR0n.OVF) + (Captured value of TDR0n + 1))

Instead of using the TI0n pin input, a channel specified for the Input Pulse Interval Measurement can also use the signal as "Middle-speed on-chip oscillator (MOCO)", "Low-speed on-chip oscillator (LOCO)", "Subsystem clock (FSUB)", "Input signal of the RXD2 pin", and ELC event which selected in **Input>Input Source** property as its input source to drive counting.

High-Low Level Pulse Width Measurement

By starting counting at one edge of the TI0n pin input and capturing the number of counts at another edge, the signal width (high-level width or low-level width) of TI0n can be measured. The signal width of TI0n can be calculated by the following expression.

- Signal width of TI0n input = Period of count clock × ((0x10000 × TSR0n.OVF) + (Captured value of TDR0n + 1))

Instead of using the TI0n pin input, a channel specified for the High-Low Level Pulse Width Function can also use the signal as "Middle-speed on-chip oscillator (MOCO)", "Low-speed on-chip oscillator (LOCO)", "Subsystem clock (FSUB)", "Input signal of the RXD2 pin", and ELC event which selected in **Input>Input Source** property as its input source to drive counting.

Triggering ELC Events with TAU

The TAU timer can trigger the start of other peripherals. The Event Link Controller (r_elc) guide provides a list of all available peripherals.

Limitations

- When using pin input a delay of 2 TAU input clocks (ICLK/CK0*) is required between R_TAU_Open() and R_TAU_Start(). When using the noise filter, a delay of 4 clocks is required instead. See in hardware manual: TAU > Timer Input (TI0n) Control > Cautions on Channel Input Operation.
- When using High-Low Level Pulse Width Measurement function, the counter can not be reset by invoking R_TAU_Reset().

Examples

TAU Basic Example

This is a basic example of minimal use of the TAU in an application.

```
void tau_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
```

```
 /* Initializes the module. */
    err = R_TAU_Open(&g_timer0_ctrl, &g_timer0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Start the timer. */
    (void) R_TAU_Start(&g_timer0_ctrl);
}
```

TAU Callback Example

This is an example of a timer callback.

```
/* Example callback called when timer expires. */
uint32_t g_counter_underflow = 0U;
void timer_callback (timer_callback_args_t * p_args)
{
 if (TIMER_EVENT_CYCLE_END == p_args->event)
    {
 /* Add application code to be called periodically here. */
       g_counter_underflow++;
    }
 if (TIMER_EVENT_HIGHER_8BIT_CYCLE_END == p_args->event)
    {
 /* Add application code to be called periodically here. */
    }
}
```

TAU 16-bit or 8-bit mode Example

To use the TAU as 16-bit or 8-bit mode, select Bit Mode Timer.

```
void tau_counter_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
```

```
    err = R_TAU_Open(&g_timer0_ctrl, &g_timer0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Start the timer. */
    (void) R_TAU_Start(&g_timer0_ctrl);
 /* (Optional) Stop the timer. */
    (void) R_TAU_Stop(&g_timer0_ctrl);
 /* Read the current counter value. Counter value is in status.counter. */
 timer_status_t status;
    (void) R_TAU_StatusGet(&g_timer0_ctrl, &status);
}
```

```
void tau_higher_8bit_counter_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = R_TAU_Open(&g_timer0_ctrl, &g_timer0_higher_8bit_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Start the timer. */
    (void) R_TAU_Start(&g_timer0_ctrl);
 /* (Optional) Stop the timer. */
    (void) R_TAU_Stop(&g_timer0_ctrl);
 /* Read the current counter value. Counter value is in status.counter. */
 timer_status_t status;
    (void) R_TAU_StatusGet(&g_timer0_ctrl, &status);
}
```

TAU Input Capture Example

This is an example of using the TAU to capture pulse width or pulse period measurements.

```
/* Example callback called when a capture occurs. */
uint32_t g_captured_time = 0U;
void timer_capture_callback (timer_callback_args_t * p_args)
```

```
{
 if (TIMER_EVENT_CAPTURE_EDGE == p_args->event)
    {
 /* Process capture from TAUIO. */
       g_captured_time = p_args->capture;
    }
}
void tau_input_capture_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = R_TAU_Open(&g_timer_input_capture_ctrl, &g_timer_input_capture_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Enable captures. Captured values arrive in the interrupt. */
    (void) R_TAU_Enable(&g_timer_input_capture_ctrl);
 /* (Optional) Disable captures. */
    (void) R_TAU_Disable(&g_timer_input_capture_ctrl);
}
```

TAU Period Update Example

This is an example of updating the period.

```
#define TAU_EXAMPLE_MSEC_PER_SEC (1000)
#define TAU_EXAMPLE_DESIRED_PERIOD_MSEC (20)
/* This example shows how to calculate a new period value at runtime. */
void tau_period_calculation_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = R_TAU_Open(&g_timer0_ctrl, &g_timer0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Start the timer. */
```

```
    (void) R_TAU_Start(&g_timer0_ctrl);
 /* Get operation clock frequency
  * - Use the R_TAU_InfoGet function (it accounts for the clock source and divider of
operation clock ).
  */
 timer_info_t info;
    (void) R_TAU_InfoGet(&g_timer0_ctrl, &info);
    uint32_t timer_freq_hz = info.clock_frequency;
 /* Calculate the desired period based on the current clock. Note that this
calculation could overflow if the
  * desired period is larger than UINT32_MAX / iclk_freq_hz. A cast to uint32_t is
used to prevent this. */
    uint32_t period_counts =
       (uint32_t) ((timer_freq_hz * TAU_EXAMPLE_DESIRED_PERIOD_MSEC) /
TAU_EXAMPLE_MSEC_PER_SEC);
 /* Set the calculated period. This will return an error if parameter checking is
enabled and the calculated
  * period is larger than UINT16_MAX. */
    err = R_TAU_PeriodSet(&g_timer0_ctrl, period_counts);
    assert(FSP_SUCCESS == err);
}
```

TAU Square Wave Output Function Example

This is an example of configuration for Square Wave Output Function.

```
/* This example shows how configure squarewave output function. */
void tau_squarewave_output_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initialize the timers. */
    err = R_TAU_Open(&g_timer_squarewave_ctrl, &g_timer_squarewave_cfg);
    assert(FSP_SUCCESS == err);
 /* Start the timer. */
    (void) R_TAU_Start(&g_timer_squarewave_ctrl);
```

```
 /* Read the current counter value. Counter value is in status.counter. */
 timer_status_t status;
    (void) R_TAU_StatusGet(&g_timer_squarewave_ctrl, &status);
}
```

TAU External Event Counter Function Example

This is an example of configuration for External Event Counter Function.

```
/* This example shows how to configure the external event counter function. */
void tau_external_event_counter_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initialize the timers. */
    err = R_TAU_Open(&g_timer_external_event_ctrl, &g_timer_external_event_cfg);
    assert(FSP_SUCCESS == err);
 /* Enable external event counter */
    (void) R_TAU_Enable(&g_timer_external_event_ctrl);
 /* Read the current counter value. Counter value is in status.counter. */
 timer_status_t status;
    (void) R_TAU_StatusGet(&g_timer_external_event_ctrl, &status);
}
```

TAU Divider Function Example

This is an example of configuration for Divider Function.

```
/* This example shows how configure divider function. */
void tau_divider_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initialize the timers. */
    err = R_TAU_Open(&g_timer_divider_ctrl, &g_timer_divider_cfg);
    assert(FSP_SUCCESS == err);
 /* Start the divider. */
    (void) R_TAU_Start(&g_timer_divider_ctrl);
```

```
 /* Read the current counter value. Counter value is in status.counter. */
 timer_status_t status;
    (void) R_TAU_StatusGet(&g_timer_divider_ctrl, &status);
}
```

TAU Delay Counter Function Example

This is an example of configuration for Delay Counter Function.

```
/* This example shows how configure delay counter function. */
void tau_delay_counter_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initialize the timers. */
    err = R_TAU_Open(&g_timer_delay_counter_ctrl, &g_timer_delay_counter_cfg);
    assert(FSP_SUCCESS == err);
 /* Start Delay Counter. */
    (void) R_TAU_Enable(&g_timer_delay_counter_ctrl);
 /* Read the current counter value. Counter value is in status.counter. */
 timer_status_t status;
    (void) R_TAU_StatusGet(&g_timer_delay_counter_ctrl, &status);
}
```

enum	tau_input_noise_filter_t

Data Structure Documentation

◆ tau_instance_ctrl_t

struct tau_instance_ctrl_t
Channel control block. DO NOT INITIALIZE. Initialization occurs when timer_api_t::open is called.

◆ tau_extended_cfg_t

struct tau_extended_cfg_t		
Optional TAU extension data structure.		
Data Fields		
tau_interrupt_opirq_bit_t	opirq: 1	Setting of starting count and interrupt.
tau_function_t	tau_func	Setting of Function for TAU.
tau_bit_mode_t	bit_mode	Setting of 16-bit timer or 8-bit timer.
tau_pin_output_cfg_t	initial_output	Setting of Function for TAU.
tau_input_source_t	input_source	
tau_input_noise_filter_t	tau_filter	Input filter for TAU.
tau_trigger_edge_t	trigger_edge	Trigger edge to start pulse period measurement or count external event.
tau_operation_ck_t	operation_clock	
uint16_t	period_higher_8bit_counts	Period in raw higher 8 bit timer counts.
uint8_t	higher_8bit_cycle_end_ipl	Cycle higher 8-bit end interrupt priority.
IRQn_Type	higher_8bit_cycle_end_irq	Cycle higher 8-bit end interrupt.

Enumeration Type Documentation

◆ tau_function_t

enum tau_function_t	
Timer function	
Enumerator	
TAU_FUNCTION_INTERVAL	Interval Timer Function.
TAU_FUNCTION_SQUARE_WAVE	Square Wave Function.
TAU_FUNCTION_EXTERNAL_EVENT_COUNT	External Event Count Function.
TAU_FUNCTION_DIVIDER	Divider Function.
TAU_FUNCTION_INPUT_PULSE_INTERVAL_MEASUREMENT	Input Pulse Interval Function.
TAU_FUNCTION_LOW_LEVEL_WIDTH_MEASUREMENT	Low Level Width Measure Function.
TAU_FUNCTION_HIGH_LEVEL_WIDTH_MEASUREMENT	High Level Width Measure Function.
TAU_FUNCTION_DELAY_COUNT	Delay Count Function.

◆ tau_bit_mode_t

enum tau_bit_mode_t	
Timer bit mode	
Enumerator	
TAU_BIT_MODE_16BIT	16-Bit Timer Mode
TAU_BIT_MODE_HIGHER_8BIT	Higher 8-bit Timer Mode.
TAU_BIT_MODE_LOWER_8BIT	Lower 8-bit Timer Mode.
TAU_BIT_MODE_HIGHER_LOWER_8BIT	Lower and Higher 8-bit Timer Mode.

◆ tau_operation_ck_t

enum tau_operation_ck_t
Timer operation clock.

◆ tau_trigger_edge_t

enum tau_trigger_edge_t	
Trigger edge for pulse period measurement mode, high-low measurement, divider, delay counter and event counting mode.	
Enumerator	
TAU_TRIGGER_EDGE_FALLING	Measurement starts or events are counted on falling edge.
TAU_TRIGGER_EDGE_RISING	Measurement starts or events are counted on rising edge.
TAU_TRIGGER_EDGE_BOTH	Events are counted on both edges (pulse period mode and high-low measurement)

◆ tau_interrupt_opirq_bit_t

enum tau_interrupt_opirq_bit_t
Interrupt and starting Count Mode

◆ tau_input_source_t

enum tau_input_source_t	
Input source	
Enumerator	
TAU_INPUT_SOURCE_TI_PIN	Timer Input Source is input pin.
TAU_INPUT_SOURCE_ELC	ELC Timer Input Source.
TAU_INPUT_SOURCE_RXD2_PIN	Timer Input Source is RXD2 pin.
TAU_INPUT_SOURCE_MOCO	Timer Input Source is MOCO.
TAU_INPUT_SOURCE_LOCO	Timer Input Source is LOCO.
TAU_INPUT_SOURCE_FSUB	Timer Input Source is FSUB.
TAU_INPUT_SOURCE_NONE	No Timer Input Source.

◆ tau_pin_output_cfg_t

enum tau_pin_output_cfg_t	
Level of TAU pin	
Enumerator	
TAU_PIN_OUTPUT_CFG_START_LEVEL_LOW	Pin level low.
TAU_PIN_OUTPUT_CFG_START_LEVEL_HIGH	Pin level high.
TAU_PIN_OUTPUT_CFG_DISABLED	Not used as output pin.

◆ tau_input_noise_filter_t

enum tau_input_noise_filter_t	
Input filter, applies TAU in high-low measurement, pulse width measurement, delay counter, divider, or event counter mode.	
Enumerator	
TAU_INPUT_NOISE_FILTER_DISABLE	Disable noise filter.
TAU_INPUT_NOISE_FILTER_ENABLE	Enable noise filter.

Function Documentation

◆ R_TAU_Open()

fsp_err_t R_TAU_Open (timer_ctrl_t *const *p_ctrl*, timer_cfg_t const *const *p_cfg*)

Initializes the timer module and applies configurations. Implements timer_api_t::open.

The TAU implementation of the general timer can accept a tau_extended_cfg_t extension parameter.

Example:

```
/* Initializes the module. */
   err = R_TAU_Open(&g_timer0_ctrl, &g_timer0_cfg);
```

Return values

FSP_SUCCESS	Initialization was successful and timer has started.
FSP_ERR_ASSERTION	A required input pointer is NULL or the period is not in the valid range
FSP_ERR_ALREADY_OPEN	Module is already open.
FSP_ERR_INVALID_CHANNEL	The channel does not support this feature.
FSP_ERR_IRQ_BSP_DISABLED	Timer_cfg_t::p_callback is not NULL, but ISR is not enabled. ISR must be enabled to use callback
FSP_ERR_INVALID_MODE	Invalid configuration for p_extend.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	The channel requested in the p_cfg parameter is not available on this device.

◆ R_TAU_Stop()

fsp_err_t R_TAU_Stop (timer_ctrl_t *const *p_ctrl*)

Stops timer. Implements timer_api_t::stop.

Example:

```
/* (Optional) Stop the timer. */
   (void) R_TAU_Stop(&g_timer0_ctrl);
```

Return values

FSP_SUCCESS	Timer successfully stopped.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ R_TAU_Start()

fsp_err_t R_TAU_Start (timer_ctrl_t *const *p_ctrl*)

Starts timer. Implements timer_api_t::start.

Example:

```
/* Start the timer. */
   (void) R_TAU_Start(&g_timer0_ctrl);
```

Return values

FSP_SUCCESS	Timer successfully started.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ R_TAU_Reset()

fsp_err_t R_TAU_Reset (timer_ctrl_t *const *p_ctrl*)

Resets the counter value to the period minus one. Input Pulse Function is reset counter value to 0. Implements timer_api_t::reset.

Note

This function can not reset the counter when counter is stopped, and function High/Low Measurement Function is used.

Return values

FSP_SUCCESS	The counter value written successfully.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ R_TAU_Enable()

fsp_err_t R_TAU_Enable (timer_ctrl_t *const *p_ctrl*)

Enables external event triggers that start, stop, clear, or capture the counter. Implements timer_api_t::enable.

Example:

```
/* Enable captures. Captured values arrive in the interrupt. */
   (void) R_TAU_Enable(&g_timer_input_capture_ctrl);
```

Return values

FSP_SUCCESS	External events successfully enabled.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ R_TAU_Disable()

fsp_err_t R_TAU_Disable (timer_ctrl_t *const *p_ctrl*)

Disables external event triggers that start, stop, clear, or capture the counter. Implements timer_api_t::disable.

Note

The timer could be running after R_TAU_Disable(). To ensure it is stopped, call R_TAU_Stop().

Example:

```
/* (Optional) Disable captures. */
   (void) R_TAU_Disable(&g_timer_input_capture_ctrl);
```

Return values

FSP_SUCCESS	External events successfully disabled.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ R_TAU_PeriodSet()

fsp_err_t R_TAU_PeriodSet (timer_ctrl_t *const *p_ctrl*, uint32_t const *period_counts*)

Sets period value provided. If the timer is running, the period will be updated after the next counter underflow. If the timer is stopped, this function resets the counter and updates the period. This Function is not supported for Input pulse Function, High-Low Measurement Function. Implements timer_api_t::periodSet.

Note

if timer mode is Lower and Higher 8-bit Timer Mode, the last 8 bits are the lower 8-bits of the timer, and the subsequent 8 bits are the higher 8-bits of the timer

Example:

```
/* Get operation clock frequency
 * - Use the R_TAU_InfoGet function (it accounts for the clock source and divider of operation clock ).
 */
timer_info_t info;
   (void) R_TAU_InfoGet(&g_timer0_ctrl, &info);
   uint32_t timer_freq_hz = info.clock_frequency;
/* Calculate the desired period based on the current clock. Note that this calculation could overflow if the
 * desired period is larger than UINT32_MAX / iclk_freq_hz. A cast to uint32_t is used to prevent this. */
   uint32_t period_counts =
      (uint32_t) ((timer_freq_hz * TAU_EXAMPLE_DESIRED_PERIOD_MSEC) / TAU_EXAMPLE_MSEC_PER_SEC);
/* Set the calculated period. This will return an error if parameter checking is enabled and the calculated
 * period is larger than UINT16_MAX. */
   err = R_TAU_PeriodSet(&g_timer0_ctrl, period_counts);
   assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Period value written successfully.
FSP_ERR_ASSERTION	p_ctrl was NULL or period is invalid range.
FSP_ERR_NOT_OPEN	The instance is not opened.
FSP_ERR_UNSUPPORTED	Unsupported for Input pulse Function, High-Low Measurement Function

◆ R_TAU_CompareMatchSet()

fsp_err_t R_TAU_CompareMatchSet (timer_ctrl_t *const *p_ctrl*, uint32_t const *compare_match_value*, timer_compare_match_t const *match_channel*)

Placeholder for unsupported compareMatch function. Implements timer_api_t::compareMatchSet.

Return values

FSP_ERR_UNSUPPORTED	TAU compare match is not supported.

◆ R_TAU_DutyCycleSet()

fsp_err_t R_TAU_DutyCycleSet (timer_ctrl_t *const *p_ctrl*, uint32_t const *duty_cycle_counts*, uint32_t const *pin*)

timer_api_t::dutyCycleSet is not supported on the R_TAU Independent channels.

Return values

FSP_ERR_UNSUPPORTED	Function not supported in this implementation.

◆ R_TAU_InfoGet()

fsp_err_t R_TAU_InfoGet (timer_ctrl_t *const *p_ctrl*, timer_info_t *const *p_info*)

Get timer information and store it in provided pointer p_info. Implements timer_api_t::infoGet.

Example:

```
timer_info_t info;
   (void) R_TAU_InfoGet(&g_timer0_ctrl, &info);
   uint32_t timer_freq_hz = info.clock_frequency;
```

Return values

FSP_SUCCESS	Period, count direction, frequency, and ELC event written to caller's structure successfully.
FSP_ERR_ASSERTION	p_ctrl or p_info was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ R_TAU_StatusGet()

fsp_err_t R_TAU_StatusGet (timer_ctrl_t *const *p_ctrl*, timer_status_t *const *p_status*)

Get current timer status and store it in provided pointer p_status. Implements timer_api_t::statusGet.

Example:

```
/* Read the current counter value. Counter value is in status.counter. */
timer_status_t status;
   (void) R_TAU_StatusGet(&g_timer0_ctrl, &status);
```

Return values

FSP_SUCCESS	Current timer state and counter value set successfully.
FSP_ERR_ASSERTION	p_ctrl or p_status was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ R_TAU_CallbackSet()

fsp_err_t R_TAU_CallbackSet (timer_ctrl_t *const *p_api_ctrl*, void(*)(timer_callback_args_t *) *p_callback*, void const *const *p_context*, timer_callback_args_t *const *p_callback_memory*)

Updates the user callback. Implements timer_api_t::callbackSet.

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.

◆ R_TAU_Close()

fsp_err_t R_TAU_Close (timer_ctrl_t *const *p_ctrl*)

Stops counter, disables output pins, and clears internal driver data. Implements timer_api_t::close.

Return values

FSP_SUCCESS	Successful close.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ R_TAU_LinMeasurementFuncSwitch()

fsp_err_t R_TAU_LinMeasurementFuncSwitch (timer_ctrl_t *const *p_ctrl*, tau_function_t *func*)

This function is provided for the SAU LIN driver to support switching between low level measurement and input pulse measurement functions during LIN reception. It is not intended to be called directly by application code.

Parameters

[in]	p_ctrl	Pointer to TAU control structure
[in]	func	Measurement functions (TAU_FUNCTION_LOW_LEVEL_WIDTH_MEASUREMENT, TAU_FUNCTION_INPUT_PULSE_INTERVAL_MEASUREMENT)

Return values

FSP_SUCCESS	Switching was successful and measurement has started.
FSP_ERR_ASSERTION	A required input pointer is NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.
FSP_ERR_INVALID_ARGUMENT	Invalid input function.

7.2.19.2 Port Output Enable for GPT (r_poeg)

Modules » Timers

Functions

fsp_err_t	R_POEG_Open (poeg_ctrl_t *const p_ctrl, poeg_cfg_t const *const p_cfg)
fsp_err_t	R_POEG_OutputDisable (poeg_ctrl_t *const p_ctrl)
fsp_err_t	R_POEG_Reset (poeg_ctrl_t *const p_ctrl)
fsp_err_t	R_POEG_StatusGet (poeg_ctrl_t *const p_ctrl, poeg_status_t *const p_status)
fsp_err_t	R_POEG_CallbackSet (poeg_ctrl_t *const p_ctrl, void(*p_callback)(poeg_callback_args_t *), void const *const p_context, poeg_callback_args_t *const p_callback_memory)
fsp_err_t	R_POEG_Close (poeg_ctrl_t *const p_ctrl)

Detailed Description

Driver for the POEG peripheral on RA MCUs. This module implements the POEG Interface.

Overview

The POEG module can be used to configure events to disable GPT GTIOC output pins.

Features

The POEG module has the following features:

- Supports disabling GPT output pins based on GTETRG input pin level.
- Supports disabling GPT output pins based on comparator crossing events (configurable in the Comparator, High-Speed (r_acmphs) driver).
- Supports disabling GPT output pins when GTIOC pins are the same level (configurable in the Timer, General PWM (r_gpt) driver).
- Supports disabling GPT output pins when main oscillator stop is detected.
- Supports disabling GPT output pins by software API.
- Supports notifying the application when GPT output pins are disabled by POEG.
- Supports resetting POEG status.

Configuration

Build Time Configurations for r_poeg

The following build time configurations are defined in fsp_cfg/r_poeg_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Timers > Port Output Enable for GPT (r_poeg)

This module can be added to the Stacks tab via New Stack > Timers > Port Output Enable for GPT (r_poeg). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
General			
Name	Name must be a valid C symbol	g_poeg0	Module name.
Channel	Must be a valid POEG channel	0	Specify the hardware channel.
Trigger	MCU Specific Options		Select the trigger

			sources that will enable POEG. Software disable is always supported. This configuration can only be set once after reset. It cannot be modified after the initial setting.
Input			
GTETRG Polarity	• Active High • Active Low	Active High	Select the polarity of the GTETRG pin. Only applicable if GTETRG pin is selected under Trigger.
GTETRG Noise Filter	• Disabled • PCLKB/1 • PCLKB/8 • PCLKB/32 • PCLKB/128	Disabled	Configure the noise filter for the GTETRG pin. Only applicable if GTETRG pin is selected under Trigger.
Interrupts			
Callback	Name must be a valid C symbol	NULL	A user callback function can be specified here. If this callback function is provided, it will be called from the interrupt service routine (ISR) when GPT output pins are disabled by POEG.
Interrupt Priority	MCU Specific Options		Select the POEG interrupt priority.

Clock Configuration

The POEG clock is based on the PCLKB frequency.

Pin Configuration

This module can use GTETRGA, GTETRGB, GTETRGC, or GTETRGD as an input signal to disable GPT output pins.

Usage Notes

POEG GTETRG Pin and Channel

The POEG channel number corresponds to the GTETRG input pin that can be used with the channel. GTETRGA must be used with POEG channel 0, GTETRGB must be used with POEG channel 1, etc.

Limitations

The user should be aware of the following limitations when using POEG:

- The POEG trigger source can only be set once per channel. Modifying the POEG trigger source after it is set is not allowed by the hardware.
- The POEG cannot be disabled using this API. The interrupt is disabled in R_POEG_Close(), but the POEG will still disable the GPT output pins if a trigger is detected even if the module is closed.

Examples

POEG Basic Example

This is a basic example of minimal use of the POEG in an application.

```
void poeg_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the POEG. */
    err = R_POEG_Open(&g_poeg0_ctrl, &g_poeg0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
}
```

POEG Callback Example

This is an example of a using the POEG callback to restore GPT output operation.

```
/* Example callback called when POEG disables GPT output pins. */
void poeg_callback (poeg_callback_args_t * p_args)
{
 FSP_PARAMETER_NOT_USED(p_args);
 /* (Optional) Determine the cause of the POEG event. */
 poeg_status_t status;
    (void) R_POEG_StatusGet(&g_poeg0_ctrl, &status);
 /* Correct the cause of the POEG event before resetting POEG. */
 /* Reset the POEG before exiting the callback. */
    (void) R_POEG_Reset(&g_poeg0_ctrl);
 /* Wait for the status to clear after reset before exiting the callback to ensure
the interrupt does not fire
  * again. */
```

```
do
   {
     (void) R_POEG_StatusGet(&g_poeg0_ctrl, &status);
   } while (POEG_STATE_NO_DISABLE_REQUEST != status.state);
 /* Alternatively, if the POEG cannot be reset, disable the POEG interrupt to prevent
it from firing continuously.
  * Update the 0 in the macro below to match the POEG channel number. */
   NVIC_DisableIRQ(VECTOR_NUMBER_POEG0_EVENT);
}
```

Data Structures

struct	poeg_instance_ctrl_t

Data Structure Documentation

◆ poeg_instance_ctrl_t

struct poeg_instance_ctrl_t
Channel control block. DO NOT INITIALIZE. Initialization occurs when poeg_api_t::open is called.

Function Documentation

◆ R_POEG_Open()

fsp_err_t R_POEG_Open (poeg_ctrl_t *const *p_ctrl*, poeg_cfg_t const *const *p_cfg*)

Initializes the POEG module and applies configurations. Implements poeg_api_t::open.

Note

The poeg_cfg_t::trigger setting can only be configured once after reset. Reopening with a different trigger configuration is not possible.

Example:

```
/* Initializes the POEG. */
   err = R_POEG_Open(&g_poeg0_ctrl, &g_poeg0_cfg);
```

Return values

FSP_SUCCESS	Initialization was successful.
FSP_ERR_ASSERTION	A required input pointer is NULL or the source divider is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open.
FSP_ERR_IRQ_BSP_DISABLED	poeg_cfg_t::p_callback is not NULL, but ISR is not enabled. ISR must be enabled to use callback.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	The channel requested in the p_cfg parameter is not available on this device.

◆ R_POEG_OutputDisable()

fsp_err_t R_POEG_OutputDisable (poeg_ctrl_t *const *p_ctrl*)

Disables GPT output pins. Implements poeg_api_t::outputDisable.

Return values

FSP_SUCCESS	GPT output pins successfully disabled.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ R_POEG_Reset()

fsp_err_t R_POEG_Reset (poeg_ctrl_t *const *p_ctrl*)

Resets status flags. Implements poeg_api_t::reset.

Note

Status flags are only reset if the original POEG trigger is resolved. Check the status using R_POEG_StatusGet after calling this function to verify the status is cleared.

Example:

```
/* Correct the cause of the POEG event before resetting POEG. */
/* Reset the POEG before exiting the callback. */
   (void) R_POEG_Reset(&g_poeg0_ctrl);
/* Wait for the status to clear after reset before exiting the callback to ensure
the interrupt does not fire
 * again. */
do
   {
     (void) R_POEG_StatusGet(&g_poeg0_ctrl, &status);
   } while (POEG_STATE_NO_DISABLE_REQUEST != status.state);
```

Return values

FSP_SUCCESS	Function attempted to clear status flags.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ R_POEG_StatusGet()

fsp_err_t R_POEG_StatusGet (poeg_ctrl_t *const *p_ctrl*, poeg_status_t *const *p_status*)

Get current POEG status and store it in provided pointer p_status. Implements poeg_api_t::statusGet.

Example:

```
/* (Optional) Determine the cause of the POEG event. */
poeg_status_t status;
   (void) R_POEG_StatusGet(&g_poeg0_ctrl, &status);
```

Return values

FSP_SUCCESS	Current POEG state stored successfully.
FSP_ERR_ASSERTION	p_ctrl or p_status was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ R_POEG_CallbackSet()

fsp_err_t R_POEG_CallbackSet (poeg_ctrl_t *const *p_ctrl*, void(*)(poeg_callback_args_t *) *p_callback*, void const *const *p_context*, poeg_callback_args_t *const *p_callback_memory*)

Updates the user callback with the option to provide memory for the callback argument structure. Implements poeg_api_t::callbackSet.

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

◆ R_POEG_Close()

fsp_err_t R_POEG_Close (poeg_ctrl_t *const *p_ctrl*)

Disables POEG interrupt. Implements poeg_api_t::close.

Note

This function does not disable the POEG.

Return values

FSP_SUCCESS	Successful close.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

fsp_err_t	R_RTC_CallbackSet (rtc_ctrl_t *const p_ctrl,

	void(*p_callback)(rtc_callback_args_t *), void const *const p_context, rtc_callback_args_t *const p_callback_memory)
fsp_err_t	R_RTC_TimeCaptureSet (rtc_ctrl_t *const p_ctrl, rtc_time_capture_t *const p_time_capture)
fsp_err_t	R_RTC_TimeCaptureGet (rtc_ctrl_t *const p_ctrl, rtc_time_capture_t *const p_time_capture)

Detailed Description

Driver for the RTC peripheral on RA MCUs. This module implements the RTC Interface.

Overview

The RTC HAL module configures the RTC module and controls clock, calendar and alarm functions. A callback can be used to respond to the alarm and periodic interrupt.

Features

- RTC time and date get and set.
- RTC time and date alarm get and set.
- RTC alarm and periodic event notification.
- RTC time capture.

The RTC HAL module supports three different interrupt types:

- An alarm interrupt generated on a match of any combination of year, month, day, day of the week, hour, minute or second
- A periodic interrupt generated every 2, 1, 1/2, 1/4, 1/8, 1/16, 1/32, 1/64, 1/128, or 1/256 second(s)
- A carry interrupt is used internally when reading time from the RTC calender to get accurant time readings.
  Note
  See section "23.3.5 Reading 64-Hz Counter and Time" of the RA6M3 manual R01UH0886EJ0100 for more details.
  A user-defined callback function can be registered (in the rtc_api_t::open API call) and will be called from the interrupt service routine (ISR) for alarm and periodic interrupt. When called, it is passed a pointer to a structure (rtc_callback_args_t) that holds a user-defined context pointer and an indication of which type of interrupt was fired.

Date and Time validation

"Parameter Checking" needs to be enabled if date and time validation is required for calendarTimeSet and calendarAlarmSet APIs. If "Parameter Checking" is enabled, the 'day of the week' field is automatically calculated and updated by the driver for the provided date. When using the calendarAlarmSet API, only the fields which have their corresponding match flag set are written to the registers. Other register fields are reset to default value.

Sub-Clock error adjustment (Time Error Adjustment Function)

The time error adjustment function is used to correct errors, running fast or slow, in the time caused

by variation in the precision of oscillation by the sub-clock oscillator. Because 32,768 cycles of the sub-clock oscillator constitute 1 second of operation when the sub-clock oscillator is selected, the clock runs fast if the sub-clock frequency is high and slow if the sub-clock frequency is low. The time error adjustment functions include:

- Automatic adjustment
- Adjustment by software

The error adjustment is reset every time RTC is reconfigured or time is set.

Note

RTC driver configurations do not do error adjustment internally while initiliazing the driver. Application must make calls to the error adjustment api's for desired adjustment. See section 26.3.8 "Time Error Adjustment Function" of the RA6M3 manual R01UH0886EJ0100) for more details on this feature

Configuration

Build Time Configurations for r_rtc

The following build time configurations are defined in fsp_cfg/r_rtc_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
Set Source Clock in Open	• Enabled • Disabled	Enabled	If enabled RTC source clock is initialized in R_RTC_Open. If disabled, R_RTC_ClockSourceSet must be called to set the RTC source clock. Disable if user wants to control the setting of RTC source clock after warm start.

Configurations for Timers > Realtime Clock (r_rtc)

This module can be added to the Stacks tab via New Stack > Timers > Realtime Clock (r_rtc). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_rtc0	Module name.
Clock Source	MCU Specific Options		Select the RTC clock source.
Frequency Comparision Value (LOCO)	Value must be a positive integer between 7 and 511	255	Frequency comparison value when using LOCO

Automatic Adjustment Mode	• Enabled • Disabled	Enabled	Enable/ Disable the Error Adjustment mode
Automatic Adjustment Period	• 10 Seconds • 1 Minute • NONE	10 Seconds	Select the Error Adjustment Period for Automatic Adjustment
Adjustment Type (Plus-Minus)	• NONE • Addition • Subtraction	NONE	Select the Error Adjustment type
Error Adjustment Value	Value must be a positive integer less than equal to 63	0	Specify the Adjustment Value (the number of sub-clock cycles) from the prescaler
Callback	Name must be a valid C symbol	NULL	A user callback function can be provided. If this callback function is provided, it will be called from the interrupt service routine (ISR).
Alarm Interrupt Priority	MCU Specific Options		Select the alarm interrupt priority.
Period Interrupt Priority	MCU Specific Options		Select the period interrupt priority.
Carry Interrupt Priority	MCU Specific Options		Select the carry interrupt priority.

Note

See 23.2.20 Frequency Register (RFRH/RFRL) of the RA6M3 manual R01UH0886EJ0100) for more details

Interrupt Configuration

To activate interrupts for the RTC module, the desired interrupts must be enabled, The underlying implementation will be expected to handle any interrupts it can support and notify higher layers via callback.

Clock Configuration

The RTC HAL module can use the following clock sources:

- LOCO (Low Speed On-Chip Oscillator) with less accuracy
- Sub-clock oscillator with increased accuracy

Users have to select the right source for their application. LOCO is the default during configuration when it is available.

Pin Configuration

This module does not use I/O pins.

Usage Notes

System Initialization

- RTC driver does not start the sub-clock. The application is responsible for ensuring required clocks are started and stable before accessing MCU peripheral registers.

Warning

The subclock can take seconds to stabilize. The RA startup code does not wait for subclock stabilization unless the subclock is the main clock source. When running AGT or RTC off the subclock, the application must ensure the subclock is stable before starting operation.

- Carry interrupt priority must be set to avoid incorrect time returned from calendarTimeGet API during roll-over.
- Even when only running in Periodic Interrupt mode R_RTC_CalendarTimeSet must be called successfully to start the RTC.
- In case of warm start or a hard reset (when VBATT powers RTC in case of power loss), user might not want to reinitialize the clock source after reset. In this case, disable the Set Source Clock in Open property for RTC and call R_RTC_ClockSourceSet() only when RTC clock source needs to be set. Application should check for the reset type and should accordingly call the R_RTC_ClockSourceSet().

Limitations

Developers should be aware of the following limitations when using the RTC:

- R_RTC operates in 24-hour mode.
- Binary-count mode is not supported.
- The R_RTC_CalendarTimeGet() cannot be used from an interrupt that has higher priority than the carry interrupt. Also, it must not be called with interrupts disabled globally, as this API internally uses carry interrupt for its processing. API may return incorrect time if this is done.
- Time capture input pins should be configured prior to opening RTC.
- When multiple events are detected, the capture time for the first event is retained. Time capture value must be got and reset status bit for the next capture when having event input.

VRTC-Domain

VRTC-domain provides power supply to SOSC and RTC on devices with IRTC:

- In case VRTC-domain is invalid, SOSC and RTC will be in undetermined state. Any operation related to RTC and sub-clock should be avoided.
- When VRTC-domain becomes valid again, application is responsible to reinitialize SOSC and RTC. Sub-clock initialization can be done by calling R_BSP_SubclockInitialize().
- BSP provides R_BSP_SubclockStatusGet() to check the status of VRTC domain. But, it is recommended to use LVD to monitor VRTC domain change. Please refer to Low/Programmable Voltage Detection (r_lvd) module for more details.

Time Capture

The RTC is capable of storing the month, day, hour, minute and second when detecting an edge of a signal on a time capture event input pin. On RA parts up to three capture channels can be configured.

- Use R_RTC_TimeCaptureSet to configure the detection source and noise filter for each capture channel.
- Use R_RTC_TimeCaptureGet to check the latest capture. If no capture has been triggered the function will return FSP_ERR_INVALID_STATE.
- Even when the supply of power from the VCC power supply pin is stopped and VRTC power is being supplied, the time capture function of the time capture event input pins (RTCICn) can be used.

Examples

RTC Basic Example

This is a basic example of minimal use of the RTC in an application.

```
/* rtc_time_t is an alias for the C Standard time.h struct 'tm' */
rtc_time_t set_time =
{
    .tm_sec = 10,
    .tm_min = 11,
    .tm_hour = 12,
    .tm_mday = 6,
    .tm_wday = 3,
    .tm_mon = 11,
    .tm_year = YEARS_SINCE_1900,
};
rtc_time_t get_time;
void rtc_example ()
{
 fsp_err_t err = FSP_SUCCESS;
 /* Open the RTC module */
    err = R_RTC_Open(&g_rtc0_ctrl, &g_rtc0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Set the RTC clock source. Can be skipped if "Set Source Clock in Open" property
is enabled. */
 R_RTC_ClockSourceSet(&g_rtc0_ctrl);
 /* Set the calendar time */
 R_RTC_CalendarTimeSet(&g_rtc0_ctrl, &set_time);
 /* Get the calendar time */
```

```
 R_RTC_CalendarTimeGet(&g_rtc0_ctrl, &get_time);
}
```

RTC Clock Source Set Example

This is an example of how to handle call to set the RTC clock.

```
void rtc_clock_source_set_example ()
{
 fsp_err_t err = FSP_SUCCESS;
 /* Open the RTC module*/
    err = R_RTC_Open(&g_rtc0_ctrl, &g_rtc0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* This condition can differ based on use case. */
 if (R_SYSTEM->RSTSR0 == 1)
    {
 /* Set the RTC clock source. Can be skipped if "Set Source Clock in Open" property
is enabled. */
 R_RTC_ClockSourceSet(&g_rtc0_ctrl);
    }
 /* R_RTC_CalendarTimeSet must be called at least once to start the RTC */
 R_RTC_CalendarTimeSet(&g_rtc0_ctrl, &set_time);
 /* Set the periodic interrupt rate to 1 second */
 R_RTC_PeriodicIrqRateSet(&g_rtc0_ctrl, RTC_PERIODIC_IRQ_SELECT_1_SECOND);
 /* Wait for the periodic interrupt */
 while (1)
    {
 /* Wait for interrupt */
    }
}
```

RTC Periodic interrupt example

This is an example of periodic interrupt in RTC.

```
```

```
void rtc_periodic_irq_example ()
{
 fsp_err_t err = FSP_SUCCESS;
 /* Open the RTC module*/
    err = R_RTC_Open(&g_rtc0_ctrl, &g_rtc0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Set the RTC clock source. Can be skipped if "Set Source Clock in Open" property
is enabled. */
 R_RTC_ClockSourceSet(&g_rtc0_ctrl);
 /* R_RTC_CalendarTimeSet must be called at least once to start the RTC */
 R_RTC_CalendarTimeSet(&g_rtc0_ctrl, &set_time);
 /* Set the periodic interrupt rate to 1 second */
 R_RTC_PeriodicIrqRateSet(&g_rtc0_ctrl, RTC_PERIODIC_IRQ_SELECT_1_SECOND);
 /* Wait for the periodic interrupt */
 while (1)
    {
 /* Wait for interrupt */
    }
}
```

RTC Alarm interrupt example

This is an example of alarm interrupt in RTC.

```
void rtc_alarm_irq_example ()
{
 fsp_err_t err = FSP_SUCCESS;
 /*Open the RTC module*/
    err = R_RTC_Open(&g_rtc0_ctrl, &g_rtc0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Set the RTC clock source. Can be skipped if "Set Source Clock in Open" property
is enabled. */
 R_RTC_ClockSourceSet(&g_rtc0_ctrl);
```

```
 R_RTC_CalendarTimeSet(&g_rtc0_ctrl, &set_time1.time);
 R_RTC_CalendarAlarmSet(&g_rtc0_ctrl, &set_time1);
 /* Wait for the Alarm interrupt */
 while (1)
    {
 /* Wait for interrupt */
    }
}
```

RTC Error Adjustment example

This is an example of modifying error adjustment in RTC.

```
void rtc_erroradj_example ()
{
 fsp_err_t err = FSP_SUCCESS;
 /*Open the RTC module*/
 R_RTC_Open(&g_rtc0_ctrl, &g_rtc1_cfg);
 /* Set the RTC clock source. Can be skipped if "Set Source Clock in Open" property
is enabled. */
 R_RTC_ClockSourceSet(&g_rtc0_ctrl);
 R_RTC_CalendarTimeSet(&g_rtc0_ctrl, &set_time1.time);
 /* Modify Error Adjustment after RTC is running */
    err = R_RTC_ErrorAdjustmentSet(&g_rtc0_ctrl, &err_cfg2);
    assert(FSP_SUCCESS == err);
}
```

RTC with VRTC-domain example

This is an example of calling RTC API on devices with VRTC-domain.

```
#if BSP_FEATURE_RTC_IS_IRTC
void rtc_vrtc_domain_checking_example ()
{
 fsp_err_t       err       = FSP_SUCCESS;
 static uint32_t rtc_opened = 0;
```

```
 while (1)
    {
       err = R_BSP_SubclockStatusGet();
 if (FSP_SUCCESS != err)
     {
 /* RTC API should not be called. */
 /* Try to initialize SOSC. */
           err = R_BSP_SubclockInitialize();
 if (FSP_SUCCESS == err)
     {
 /* Delay for sub-clock oscillation stabilization time */
 R_BSP_SoftwareDelay(BSP_CLOCK_CFG_SUBCLOCK_STABILIZATION_MS,
BSP_DELAY_UNITS_MILLISECONDS);
     }
     }
 else
     {
 /* VRTC-domain reset will not initialize RTC registers. */
 if (0 == rtc_opened)
     {
               err       = R_RTC_Open(&g_rtc0_ctrl, &g_rtc0_cfg);
               rtc_opened = (FSP_SUCCESS == err) ? 1 : 0;
     }
 /* Other RTC API can be called if needed. */
     }
    }
}
#endif
```

RTC Time Capture example

This is an example of calling Time Capture API on RTC with Independent Power Supply.

```
void rtc_irtc_time_capture_example ()
{
```

```
 fsp_err_t err = FSP_SUCCESS;
 /* Open the RTC module*/
    err = R_RTC_Open(&g_rtc0_ctrl, &g_rtc1_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Configure a GPIO pin to trigger the Time Capture pin */
 R_BSP_PinCfg(RTC_TIME_CAPTURE_TRIGGER_CHANNEL_0, (uint32_t) BSP_IO_DIRECTION_OUTPUT
);
 /* Preset trigger pin */
 R_BSP_PinWrite(RTC_TIME_CAPTURE_TRIGGER_CHANNEL_0, BSP_IO_LEVEL_LOW);
 R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
 /* Set the RTC clock source. Can be skipped if "Set Source Clock in Open" property
is enabled. */
 R_RTC_ClockSourceSet(&g_rtc0_ctrl);
 /* R_RTC_CalendarTimeSet must be called at least once to start the RTC */
 R_RTC_CalendarTimeSet(&g_rtc0_ctrl, &set_time);
 /* Set time capture configuration for the provided channel when RTC is running */
    err = R_RTC_TimeCaptureSet(&g_rtc0_ctrl, &g_rtc_time_capture);
    assert(FSP_SUCCESS == err);
 /* Update trigger pin */
 R_BSP_PinWrite(RTC_TIME_CAPTURE_TRIGGER_CHANNEL_0, BSP_IO_LEVEL_HIGH);
 R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
 /* Get the time capture for the provided channel */
    err = R_RTC_TimeCaptureGet(&g_rtc0_ctrl, &g_rtc_time_capture);
    assert(FSP_SUCCESS == err);
}
```

Data Structures

struct	rtc_extended_cfg_t
struct	rtc_instance_ctrl_t

Data Structure Documentation

◆ rtc_extended_cfg_t

struct rtc_extended_cfg_t

RTC extend configuration		
Data Fields		
uint8_t	alarm1_ipl	Alarm 1 interrupt priority.
IRQn_Type	alarm1_irq	Alarm 1 interrupt vector.

◆ rtc_instance_ctrl_t

struct rtc_instance_ctrl_t	
Channel control block. DO NOT INITIALIZE. Initialization occurs when rtc_api_t::open is called	
Data Fields	
uint32_t	open
	Whether or not driver is open.
const rtc_cfg_t *	p_cfg
	Pointer to initial configurations.
volatile bool	carry_isr_triggered
	Was the carry isr triggered.

Function Documentation

◆ R_RTC_Open()

fsp_err_t R_RTC_Open (rtc_ctrl_t *const *p_ctrl*, rtc_cfg_t const *const *p_cfg*)

Opens and configures the RTC driver module. Implements rtc_api_t::open. Configuration includes clock source, and interrupt callback function.

Example:

```
/* Open the RTC module */
   err = R_RTC_Open(&g_rtc0_ctrl, &g_rtc0_cfg);
```

Return values

FSP_SUCCESS	Initialization was successful and RTC has started.
FSP_ERR_ASSERTION	Invalid p_ctrl or p_cfg pointer.
FSP_ERR_ALREADY_OPEN	Module is already open.
FSP_ERR_INVALID_ARGUMENT	Invalid time parameter field.

◆ R_RTC_Close()

fsp_err_t R_RTC_Close (rtc_ctrl_t *const *p_ctrl*)

Close the RTC driver. Implements rtc_api_t::close

Return values

FSP_SUCCESS	De-Initialization was successful and RTC driver closed.
FSP_ERR_ASSERTION	Invalid p_ctrl.
FSP_ERR_NOT_OPEN	Driver not open already for close.

◆ R_RTC_ClockSourceSet()

fsp_err_t R_RTC_ClockSourceSet (rtc_ctrl_t *const *p_ctrl*)

Sets the RTC clock source. Implements rtc_api_t::clockSourceSet.

Example:

```
/* This condition can differ based on use case. */
if (R_SYSTEM->RSTSR0 == 1)
   {
/* Set the RTC clock source. Can be skipped if "Set Source Clock in Open" property
is enabled. */
R_RTC_ClockSourceSet(&g_rtc0_ctrl);
   }
```

Return values

FSP_SUCCESS	Initialization was successful and RTC has started.
FSP_ERR_ASSERTION	Invalid p_ctrl or p_cfg pointer.
FSP_ERR_NOT_OPEN	Driver is not opened.
FSP_ERR_INVALID_ARGUMENT	Invalid clock source.

◆ R_RTC_CalendarTimeSet()

fsp_err_t R_RTC_CalendarTimeSet (rtc_ctrl_t *const *p_ctrl*, rtc_time_t *const *p_time*)

Set the calendar time.

Implements rtc_api_t::calendarTimeSet.

Return values

FSP_SUCCESS	Calendar time set operation was successful.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Driver not open already for operation.
FSP_ERR_INVALID_ARGUMENT	Invalid time parameter field.

◆ R_RTC_CalendarTimeGet()

fsp_err_t R_RTC_CalendarTimeGet (rtc_ctrl_t *const *p_ctrl*, rtc_time_t *const *p_time*)

Get the calendar time.

Warning

Do not call this function from a critical section or from an interrupt with higher priority than the carry interrupt, or the time returned may be inaccurate.

Implements rtc_api_t::calendarTimeGet

Return values

FSP_SUCCESS	Calendar time get operation was successful.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Driver not open already for operation.
FSP_ERR_IRQ_BSP_DISABLED	User IRQ parameter not valid

◆ R_RTC_CalendarAlarmSet()

fsp_err_t R_RTC_CalendarAlarmSet (rtc_ctrl_t *const *p_ctrl*, rtc_alarm_time_t *const *p_alarm*)

Set the calendar alarm time.

Implements rtc_api_t::calendarAlarmSet.

Precondition

The calendar counter must be running before the alarm can be set.

Return values

FSP_SUCCESS	Calendar alarm time set operation was successful.
FSP_ERR_INVALID_ARGUMENT	Invalid time parameter field.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Driver not open already for operation.
FSP_ERR_IRQ_BSP_DISABLED	User IRQ parameter not valid

◆ R_RTC_CalendarAlarmGet()

fsp_err_t R_RTC_CalendarAlarmGet (rtc_ctrl_t *const *p_ctrl*, rtc_alarm_time_t *const *p_alarm*)

Get the calendar alarm time.

Implements rtc_api_t::calendarAlarmGet

Return values

FSP_SUCCESS	Calendar alarm time get operation was successful.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Driver not open already for operation.

◆ R_RTC_PeriodicIrqRateSet()

fsp_err_t R_RTC_PeriodicIrqRateSet (rtc_ctrl_t *const *p_ctrl*, rtc_periodic_irq_select_t const *rate*)

Set the periodic interrupt rate and enable periodic interrupt.

Implements rtc_api_t::periodicIrqRateSet

Note

To start the RTC R_RTC_CalendarTimeSet must be called at least once.

Example:

```
/* Set the periodic interrupt rate to 1 second */
R_RTC_PeriodicIrqRateSet(&g_rtc0_ctrl, RTC_PERIODIC_IRQ_SELECT_1_SECOND);
```

Return values

FSP_SUCCESS	The periodic interrupt rate was successfully set.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Driver not open already for operation.
FSP_ERR_IRQ_BSP_DISABLED	User IRQ parameter not valid

◆ R_RTC_InfoGet()

fsp_err_t R_RTC_InfoGet (rtc_ctrl_t *const *p_ctrl*, rtc_info_t *const *p_rtc_info*)

Set RTC clock source and running status information ad store it in provided pointer p_rtc_info

Implements rtc_api_t::infoGet

Return values

FSP_SUCCESS	Get information Successful.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Driver not open already for operation.

◆ R_RTC_ErrorAdjustmentSet()

fsp_err_t R_RTC_ErrorAdjustmentSet (rtc_ctrl_t *const *p_ctrl*, rtc_error_adjustment_cfg_t const *const *err_adj_cfg*)

This function sets time error adjustment

Implements rtc_api_t::errorAdjustmentSet

Return values

FSP_SUCCESS	Time error adjustment successful.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Driver not open for operation.
FSP_ERR_UNSUPPORTED	The clock source is not sub-clock.
FSP_ERR_INVALID_ARGUMENT	Invalid error adjustment value.

◆ R_RTC_CallbackSet()

fsp_err_t R_RTC_CallbackSet (rtc_ctrl_t *const *p_ctrl*, void(*)(rtc_callback_args_t *) *p_callback*, void const *const *p_context*, rtc_callback_args_t *const *p_callback_memory*)

Updates the user callback and has option of providing memory for callback structure. Implements rtc_api_t::callbackSet

Return values

FSP_SUCCESS	Baud rate was successfully changed.
FSP_ERR_ASSERTION	Pointer to RTC control block is NULL or the RTC is not configured to use the internal clock.
FSP_ERR_NOT_OPEN	The control block has not been opened
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

◆ R_RTC_TimeCaptureSet()

fsp_err_t R_RTC_TimeCaptureSet (rtc_ctrl_t *const *p_ctrl*, rtc_time_capture_t *const *p_time_capture*)

Set time capture configuration for the provided channel.

Implements rtc_api_t::timeCaptureSet

Note

Updating capture settings requires significant software delay. Timing considerations should be carefully considered when calling this function.

Return values

FSP_SUCCESS	Setting for Time capture was successful.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Driver not open already for operation.
FSP_ERR_INVALID_CHANNEL	Invalid input channel set.
FSP_ERR_UNSUPPORTED	Hardware not support this feature.

◆ R_RTC_TimeCaptureGet()

fsp_err_t R_RTC_TimeCaptureGet (rtc_ctrl_t *const *p_ctrl*, rtc_time_capture_t *const *p_time_capture*)

Get time capture value of the provided channel.

Implements rtc_api_t::timeCaptureGet

Return values

FSP_SUCCESS	Get time capture successful.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Driver not open already for operation.
FSP_ERR_INVALID_CHANNEL	Invalid input channel get.
FSP_ERR_INVALID_STATE	Invalid operation state.
FSP_ERR_UNSUPPORTED	Hardware not support this feature.

fsp_err_t	R_RTC_C_TimeCaptureSet (rtc_ctrl_t *const p_ctrl, rtc_time_capture_t *const p_time_capture)
fsp_err_t	R_RTC_C_TimeCaptureGet (rtc_ctrl_t *const p_ctrl, rtc_time_capture_t *const p_time_capture)

Detailed Description

Driver for the RTC peripheral on RA MCUs. This module implements the RTC Interface.

Overview

The RTC HAL module configures the RTC module and controls clock, calendar and alarm functions. A callback can be used to respond to the alarm and periodic interrupt.

Features

- RTC_C time and date get and set.
- RTC_C time and date alarm get and set.
- RTC_C alarm and periodic event notification.

The RTC HAL module supports two different interrupt types:

- An alarm interrupt generated on a match of any combination of minute, hour and day of the week.
- A periodic interrupt generated every 1 month, 1 day, 1 hour, 1 minute, 1 second and 1/2 second.

A user-defined callback function can be registered (in the rtc_api_t::open API call) and will be called from the interrupt service routine (ISR) for alarm and periodic interrupt. When called, it is passed a pointer to a structure (rtc_callback_args_t) that holds a user-defined context pointer and an indication of which type of interrupt was fired.

Date and Time validation

"Parameter Checking" needs to be enabled if date and time validation is required for calendarTimeSet and calendarAlarmSet APIs. When using the calendarAlarmSet API, minute, hour and day of the week are written to the related registers.

Sub-Clock error adjustment (Time Error Adjustment Function)

The time error adjustment function is used to correct errors, running fast or slow, in the time caused by variation in the precision of oscillation by the sub-clock oscillator. Because 32,768 cycles of the sub-clock oscillator constitute 1 second of operation when the sub-clock oscillator is selected, the

clock runs fast if the sub-clock frequency is high and slow if the sub-clock frequency is low.

The error adjustment is reset every time RTC is reconfigured or time is set.

Note

RTC driver configurations do not do error adjustment internally while initializing the driver. Application must make calls to the error adjustment api's for desired adjustment.

Configuration

Build Time Configurations for r_rtc_c

The following build time configurations are defined in fsp_cfg/r_rtc_c_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Timers > Realtime Clock (r_rtc_c)

This module can be added to the Stacks tab via New Stack > Timers > Realtime Clock (r_rtc_c).

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_rtc0	Module name.
Operation clock	• FSXP • SOSC/256 (128 Hz)	FSXP	Select the RTC operation clock. If using 'SOSC/256' as the source for RTCCLK, the FSXP source cannot be LOCO in Clock tab.
Callback	Name must be a valid C symbol	NULL	A user callback function can be provided. If this callback function is provided, it will be called from the interrupt service routine (ISR).
Interrupt Priority	MCU Specific Options		Select the period or alarm interrupt priority.

Interrupt Configuration

To activate interrupts for the RTC module, the desired interrupts must be enabled, The underlying implementation will be expected to handle any interrupts it can support and notify higher layers via callback.

Clock Configuration

The RTC HAL module can use the following clock sources(setting in clock page):

- Sub-Clock: SOSC (32.768 kHz)
- SOSC/256 (128 Hz)
- LOCO (32.768 kHz)

Users have to select the right source for their application. Sub-Clock is the default during configuration when it is available.

Pin Configuration

This module does not use I/O pins.

Usage Notes

System Initialization

- RTC driver does not start the sub-clock. The application is responsible for ensuring required clocks are started and stable before accessing MCU peripheral registers.

Warning
: The subclock can take seconds to stabilize. The RA startup code does not wait for subclock stabilization unless the subclock is the main clock source. When running AGT or RTC off the subclock, the application must ensure the subclock is stable before starting operation.

- Even when only running in Periodic Interrupt mode R_RTC_C_CalendarTimeSet must be called successfully to start the RTC.

Limitations

Developers should be aware of the following limitations when using the RTC_C:

- R_RTC_C operates in 24-hour mode.
- If using 'SOSC/256' as the source for RTC operation clock, the FSXP source cannot be LOCO in Clock tab.
- Time error correction function can only proceed when the setting of the RTCC0.RTC128EN bit is 0.
- Alarm clock interrupt can work under LOCO clock source, but it is unstable. Please use alarm clock interrupt function under other clocks.

Examples

RTC Basic Example

This is a basic example of minimal use of the RTC_C in an application.

```
/* rtc_time_t is an alias for the C Standard time.h struct 'tm' */
rtc_time_t set_time =
{
    .tm_sec = 10,
```

```
    .tm_min = 11,
    .tm_hour = 12,
    .tm_mday = 6,
    .tm_wday = 3,
    .tm_mon = 11,
    .tm_year = YEARS_SINCE_1900,
};
rtc_time_t get_time;
void rtc_c_example ()
{
 fsp_err_t err = FSP_SUCCESS;
 /* Open the RTC module */
    err = R_RTC_C_Open(&g_rtc0_ctrl, &g_rtc0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Set the calendar time */
 R_RTC_C_CalendarTimeSet(&g_rtc0_ctrl, &set_time);
 /* Get the calendar time */
 R_RTC_C_CalendarTimeGet(&g_rtc0_ctrl, &get_time);
}
```

RTC Calendar Time Set example

This is an example of setting calendar time in RTC_C.

Warning

The weekday must be set correctly even when parameter checking is disabled.

```
/* rtc_time_t is an alias for the C Standard time.h struct 'tm' */
rtc_time_t set_calendar_time =
{
    .tm_sec = 10,
    .tm_min = 11,
    .tm_hour = 12,
    .tm_mday = 6,
 /* tm_wday value must be set correctly */
```

```
    .tm_wday = 5,
    .tm_mon = 11,
    .tm_year = YEARS_SINCE_1900,
};
void rtc_c_calendar_time_set_example ()
{
 fsp_err_t err = FSP_SUCCESS;
 /* Open the RTC module */
    err = R_RTC_C_Open(&g_rtc0_ctrl, &g_rtc0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Set the calendar time and date */
    err = R_RTC_C_CalendarTimeSet(&g_rtc0_ctrl, &set_calendar_time);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
}
```

RTC Periodic interrupt example

This is an example of periodic interrupt in RTC.

```
void rtc_c_periodic_irq_example ()
{
 fsp_err_t err = FSP_SUCCESS;
 /* Open the RTC module*/
    err = R_RTC_C_Open(&g_rtc0_ctrl, &g_rtc0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* R_RTC_C_CalendarTimeSet must be called at least once to start the RTC */
 R_RTC_C_CalendarTimeSet(&g_rtc0_ctrl, &set_time);
 /* Set the periodic interrupt rate to 1 second */
 R_RTC_C_PeriodicIrqRateSet(&g_rtc0_ctrl, RTC_PERIODIC_IRQ_SELECT_1_SECOND);
 /* Wait for the periodic interrupt */
 while (1)
    {
```

```
 /* Wait for interrupt */
    }
}
```

RTC Alarm interrupt example

This is an example of alarm interrupt in RTC.

```
void rtc_c_alarm_irq_example ()
{
 fsp_err_t err = FSP_SUCCESS;
 /*Open the RTC module*/
    err = R_RTC_C_Open(&g_rtc0_ctrl, &g_rtc0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 R_RTC_C_CalendarTimeSet(&g_rtc0_ctrl, &set_time);
 R_RTC_C_CalendarAlarmSet(&g_rtc0_ctrl, &set_time1);
 /* Wait for the Alarm interrupt */
 while (1)
    {
 /* Wait for interrupt */
    }
}
```

RTC Error Adjustment example

This is an example of modifying error adjustment in RTC.

```
void rtc_c_erroradj_example ()
{
 fsp_err_t err = FSP_SUCCESS;
 /*Open the RTC module*/
 R_RTC_C_Open(&g_rtc0_ctrl, &g_rtc1_cfg);
 R_RTC_C_CalendarTimeSet(&g_rtc0_ctrl, &set_time);
 /* Modify Error Adjustment after RTC is running */
    err = R_RTC_C_ErrorAdjustmentSet(&g_rtc0_ctrl, &err_cfg2);
```

```
    assert(FSP_SUCCESS == err);
}
```

Data Structures

struct	rtc_c_extended_cfg
struct	rtc_c_instance_ctrl_t

Enumerations

enum	rtc_c_subclock_division_t

Data Structure Documentation

◆ rtc_c_extended_cfg

struct rtc_c_extended_cfg		
RTC extended configuration		
Data Fields		
rtc_c_subclock_division_t	clock_source_div	The sub clock division value.

◆ rtc_c_instance_ctrl_t

struct rtc_c_instance_ctrl_t	
Channel control block. DO NOT INITIALIZE. Initialization occurs when rtc_api_t::open is called	
Data Fields	
uint32_t	open
	Whether or not driver is open.
const rtc_cfg_t *	p_cfg
	Pointer to initial configurations.

Enumeration Type Documentation

◆ rtc_c_subclock_division_t

enum rtc_c_subclock_division_t	
RTC sub_clock division	
Enumerator	
RTC_CLOCK_SOURCE_SUBCLOCK_DIV_BY_1	Using sub_clock for rct_c clock.
RTC_CLOCK_SOURCE_SUBCLOCK_DIV_BY_256	Using (sub_clock / 256) for rct_c clock.

Function Documentation

◆ R_RTC_C_Open()

fsp_err_t R_RTC_C_Open (rtc_ctrl_t *const *p_ctrl*, rtc_cfg_t const *const *p_cfg*)

Opens and configures the RTC driver module. Implements rtc_api_t::open. Configuration includes clock source, and interrupt callback function.

R_RTC_Open should be called to manipulate the RTC instead of setting register directly.

Example:

```
/* Open the RTC module */
   err = R_RTC_C_Open(&g_rtc0_ctrl, &g_rtc0_cfg);
```

Return values

FSP_SUCCESS	Initialization was successful and RTC has started.
FSP_ERR_UNSUPPORTED	Invalid clock source.
FSP_ERR_ALREADY_OPEN	Module is already open.
FSP_ERR_INVALID_MODE	Subsystem clock should use SOSC before setting realtime clock to SOSC/256.
FSP_ERR_ASSERTION	Invalid time parameter field.

◆ R_RTC_C_Close()

fsp_err_t R_RTC_C_Close (rtc_ctrl_t *const *p_ctrl*)

Close the RTC driver. Implements rtc_api_t::close

Return values

FSP_SUCCESS	De-Initialization was successful and RTC driver closed.
FSP_ERR_ASSERTION	Invalid p_ctrl.
FSP_ERR_NOT_OPEN	Driver not open already for close.

◆ R_RTC_C_ClockSourceSet()

fsp_err_t R_RTC_C_ClockSourceSet (rtc_ctrl_t *const *p_ctrl*)

Setting clock source is not supported on the RTC_C.

Return values

FSP_ERR_UNSUPPORTED	Please set clock source in clock page.

◆ R_RTC_C_CalendarTimeSet()

fsp_err_t R_RTC_C_CalendarTimeSet (rtc_ctrl_t *const *p_ctrl*, rtc_time_t *const *p_time*)

Set the calendar time.

Implements rtc_api_t::calendarTimeSet.

Return values

FSP_SUCCESS	Calendar time set operation was successful.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Driver not open already for operation.
FSP_ERR_INVALID_ARGUMENT	Invalid parameter field.

◆ R_RTC_C_CalendarTimeGet()

fsp_err_t R_RTC_C_CalendarTimeGet (rtc_ctrl_t *const *p_ctrl*, rtc_time_t *const *p_time*)

Get the calendar time.

Warning

Do not call this function from a critical section or from an interrupt with higher priority than the carry interrupt, or the time returned may be inaccurate.

Implements rtc_api_t::calendarTimeGet

Return values

FSP_SUCCESS	Calendar time get operation was successful.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Driver not open already for operation.

◆ R_RTC_C_CalendarAlarmSet()

fsp_err_t R_RTC_C_CalendarAlarmSet (rtc_ctrl_t *const *p_ctrl*, rtc_alarm_time_t *const *p_alarm*)

Set the calendar alarm time. For the p_alarm, only minutes, hours and weekdays are valid. Minutes 0 to 59. Hours 0 to 23. Weekdays 0 to 127.

Implements rtc_api_t::calendarAlarmSet.

Precondition

The calendar counter must be running before the alarm can be set.

Return values

FSP_SUCCESS	Calendar alarm time set operation was successful.
FSP_ERR_INVALID_ARGUMENT	Invalid time parameter field.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Driver not open already for operation.
FSP_ERR_IRQ_BSP_DISABLED	Interrupt must be enabled to use the alarm.

◆ R_RTC_C_CalendarAlarmGet()

fsp_err_t R_RTC_C_CalendarAlarmGet (rtc_ctrl_t *const *p_ctrl*, rtc_alarm_time_t *const *p_alarm*)

Get the calendar alarm time. For the p_alarm, only minutes, hours and weekdays will be got.

Implements rtc_api_t::calendarAlarmGet

Return values

FSP_SUCCESS	Calendar alarm time get operation was successful.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Driver not open already for operation.

◆ R_RTC_C_PeriodicIrqRateSet()

fsp_err_t R_RTC_C_PeriodicIrqRateSet (rtc_ctrl_t *const *p_ctrl*, rtc_periodic_irq_select_t const *rate*)

Set the periodic interrupt rate and enable periodic interrupt.

Implements rtc_api_t::periodicIrqRateSet

Note

To start the RTC R_RTC_C_CalendarTimeSet must be called at least once.

Example:

```
/* Set the periodic interrupt rate to 1 second */
R_RTC_C_PeriodicIrqRateSet(&g_rtc0_ctrl, RTC_PERIODIC_IRQ_SELECT_1_SECOND);
```

Return values

FSP_SUCCESS	The periodic interrupt rate was successfully set.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Driver not open already for operation.
FSP_ERR_IRQ_BSP_DISABLED	User IRQ parameter not valid

◆ R_RTC_C_InfoGet()

fsp_err_t R_RTC_C_InfoGet (rtc_ctrl_t *const *p_ctrl*, rtc_info_t *const *p_rtc_info*)

Get RTC_C running status information ad store it in provided pointer p_rtc_info

Implements rtc_api_t::infoGet

Return values

FSP_SUCCESS	Get information Successful.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Realtime clock module is stopped.

◆ R_RTC_C_ErrorAdjustmentSet()

fsp_err_t R_RTC_C_ErrorAdjustmentSet (rtc_ctrl_t *const *p_ctrl*, rtc_error_adjustment_cfg_t const *const *err_adj_cfg*)

This function sets time error adjustment

Implements rtc_api_t::errorAdjustmentSet

Return values

FSP_SUCCESS	Time error adjustment successful.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Driver not open for operation.
FSP_ERR_INVALID_ARGUMENT	Not under sub-clock or invalid error adjustment value.

◆ R_RTC_C_CallbackSet()

fsp_err_t R_RTC_C_CallbackSet (rtc_ctrl_t *const *p_ctrl*, void(*)(rtc_callback_args_t *) *p_callback*, void const *const *p_context*, rtc_callback_args_t *const *p_callback_memory*)

Updates the user callback and has option of providing memory for callback structure. Implements rtc_api_t::callbackSet

Return values

FSP_SUCCESS	Baud rate was successfully changed.
FSP_ERR_ASSERTION	Pointer to RTC control block is NULL or the RTC is not configured to use the internal clock.
FSP_ERR_NOT_OPEN	The control block has not been opened

◆ R_RTC_C_TimeCaptureSet()

fsp_err_t R_RTC_C_TimeCaptureSet (rtc_ctrl_t *const *p_ctrl*, rtc_time_capture_t *const *p_time_capture*)

Capture is not supported on the RTC_C.

Return values

FSP_ERR_UNSUPPORTED	Function not supported in this implementation.

◆ R_RTC_C_TimeCaptureGet()

fsp_err_t R_RTC_C_TimeCaptureGet (rtc_ctrl_t *const *p_ctrl*, rtc_time_capture_t *const *p_time_capture*)

Capture is not supported on the RTC_C.

Return values

FSP_ERR_UNSUPPORTED	Function not supported in this implementation.

7.2.19.5 Three-Phase PWM (r_gpt_three_phase)

fsp_err_t	R_GPT_THREE_PHASE_Start (three_phase_ctrl_t *const p_ctrl)
fsp_err_t	R_GPT_THREE_PHASE_Reset (three_phase_ctrl_t *const p_ctrl)
fsp_err_t	R_GPT_THREE_PHASE_DutyCycleSet (three_phase_ctrl_t *const p_ctrl, three_phase_duty_cycle_t *const p_duty_cycle)
fsp_err_t	R_GPT_THREE_PHASE_CallbackSet (three_phase_ctrl_t *const p_ctrl, void(*p_callback)(timer_callback_args_t *), void const *const p_context, timer_callback_args_t *const p_callback_memory)
fsp_err_t	R_GPT_THREE_PHASE_Close (three_phase_ctrl_t *const p_ctrl)

Detailed Description

Driver for 3-phase motor control using the GPT peripheral on RA MCUs. This module implements the Three-Phase Interface.

Overview

The General PWM Timer (GPT) Three-Phase driver provides basic functionality for synchronously starting and stopping three PWM channels for use in 3-phase motor control applications. A function is additionally provided to allow setting duty cycle values for all three channels, optionally with double-buffering.

Features

The GPT Three-Phase driver provides the following functions:

- Synchronize configuration of three GPT channels
- Synchronously start, stop and reset all three GPT channels
- Set duty cycle on all three channels with one function

Configuration

Build Time Configurations for r_gpt_three_phase

The following build time configurations are defined in fsp_cfg/r_gpt_three_phase_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Timers > Three-Phase PWM (r_gpt_three_phase)

This module can be added to the Stacks tab via New Stack > Timers > Three-Phase PWM (r_gpt_three_phase). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
General			
Name	Name must be a valid C symbol	g_three_phase0	Module name.
Mode	• Triangle-Wave Symmetric PWM • Triangle-Wave Asymmetric PWM • Triangle-Wave Asymmetric PWM (Mode 3)	Triangle-Wave Symmetric PWM	Mode selection. Triangle-Wave Symmetric PWM: Generates symmetric PWM waveforms with duty cycle determined by compare match set during a crest interrupt and updated at the next trough. Triangle-Wave Asymmetric PWM: Generates asymmetric PWM waveforms with duty cycle determined by compare match set during a crest/trough interrupt and updated at the next trough/crest.
Period	Value must be a non-negative integer less than or equal to 0x40000000000	15	Specify the timer period in units selected below. Setting the period to 0x100000000 raw counts results in the maximum period. Set the period to 0x100000000 raw counts for a free running timer or an input capture configuration. The period can be set up to 0x40000000000, which will use a divider of 1024 with the maximum period. If the requested period cannot be achieved, the settings with the largest possible period

			that is less than or equal to the requested period are used. The theoretical calculated period is printed in a comment in the generated timer_cfg_t structures for each timer.
Period Unit	• Raw Counts • Nanoseconds • Microseconds • Milliseconds • Seconds • Hertz • Kilohertz	Kilohertz	Unit of the period specified above
GPT U-Channel	Value must be an integer greater than or equal to 0	0	Specify the GPT channel for U signal output.
GPT V-Channel	Value must be an integer greater than or equal to 0	1	Specify the GPT channel for V signal output.
GPT W-Channel	Value must be an integer greater than or equal to 0	2	Specify the GPT channel for W signal output.
Callback Channel	• U-Channel • V-Channel • W-Channel	U-Channel	Specify the GPT channel to set a callback for when using R_GPT_THREE_PHASE_CallbackSet.
Buffer Mode	• Single Buffer • Double Buffer	Single Buffer	When Double Buffer is selected the 'duty_buffer' array in three_phase_duty_cycle_t is used as a buffer for the 'duty' array. This allows setting the duty cycle for the next two crest/trough events in asymmetric mode with only one call to R_GPT_THREE_PHASE_DutyCycleSet.
GTIOCA Stop Level	• Pin Level Low • Pin Level High	Pin Level Low	Select the behavior of the output pin when the timer is stopped.
GTIOCB Stop Level	• Pin Level Low • Pin Level High	Pin Level Low	Select the behavior of the output pin when the timer is stopped.

Extra Features

Extra Features > Dead Time

Dead Time Count Up (Raw Counts)	Must be a valid non-negative integer with a maximum configurable value of 4294967295 (0xffffffff).	0	Select the dead time to apply during up counting. This value also applies during down counting for the GPT32 and GPT16 variants.
Dead Time Count Down (Raw Counts) (GPTE/GPTEH only)	Must be a valid non-negative integer with a maximum configurable value of 4294967295 (0xffffffff).	0	Select the dead time to apply during down counting. This value only applies to the GPT32E and GPT32EH variants.

Clock Configuration

Please refer to the Timer, General PWM (r_gpt) section for more information.

Pin Configuration

Please refer to the Timer, General PWM (r_gpt) section for more information.

Usage Notes

Warning

Be sure the GTIOCA/B stop level and dead time values are set appropriately for your application before attempting to drive a motor. Failure to do so may result in damage to the motor drive circuitry and/or the motor itself if the timer is stopped by software.

Initial Setup

The following should be configured once the GPT Three-Phase module has been added to a project:

1. Set "Pin Output Support" in one of the GPT submodules to "Enabled with Extra Features"
2. Configure common settings in the GPT Three-Phase module properties
3. Set the crest and trough interrupt priority and callback function in **one** of the three GPT submodules (if desired)
4. Set the "Extra Features -> Output Disable" settings in each GPT submodule as needed for your application

Note

Because all three modules are operated synchronously with the same period interrupts only need to be enabled in one of the three GPT modules.

Buffer Modes

There are two buffering modes available for duty cycle values - single- and double-buffered. In single buffer mode only the values specified in the duty array element of three_phase_duty_cycle_t are used by R_GPT_THREE_PHASE_DutyCycleSet. At the next trough or crest event the output duty cycle will be internally updated to the set values.

In double buffer mode the duty_buffer array values are used as buffer values for the duty elements. Once passed to R_GPT_THREE_PHASE_DutyCycleSet, the next trough or crest event will update the output duty cycle to the values specified in duty as before. However, at the following crest or trough event the output duty cycle will be updated to the values in duty_buffer. This allows the duty cycle for both sides of an asymmetric PWM waveform to be set at only one trough or crest event per period instead of at every event.

Examples

GPT Three-Phase Basic Example

This is a basic example of minimal use of the GPT Three-Phase module in an application. The duty cycle is updated at every timer trough with the previously loaded buffer value, then the duty cycle buffer is reloaded in the trough interrupt callback.

```
void gpt_callback (timer_callback_args_t * p_args)
{
 fsp_err_t                err;
 three_phase_duty_cycle_t duty_cycle;
 if (TIMER_EVENT_TROUGH == p_args->event)
    {
 /* Update duty cycle values (example) */
       duty_cycle.duty[THREE_PHASE_CHANNEL_U] =
get_duty_counts(THREE_PHASE_CHANNEL_U);
       duty_cycle.duty[THREE_PHASE_CHANNEL_V] =
get_duty_counts(THREE_PHASE_CHANNEL_V);
       duty_cycle.duty[THREE_PHASE_CHANNEL_W] =
get_duty_counts(THREE_PHASE_CHANNEL_W);
 /* Update duty cycle values */
       err = R_GPT_THREE_PHASE_DutyCycleSet(&g_gpt_three_phase_ctrl, &duty_cycle);
       assert(FSP_SUCCESS == err);
    }
 else
    {
 /* Handle crest event. */
    }
}
void gpt_three_phase_basic_example (void)
{
```

```
fsp_err_t err = FSP_SUCCESS;
/* Initializes the module. */
   err = R_GPT_THREE_PHASE_Open(&g_gpt_three_phase_ctrl, &g_gpt_three_phase_cfg);
/* Handle any errors. This function should be defined by the user. */
   assert(FSP_SUCCESS == err);
/* Start the timer. */
   (void) R_GPT_THREE_PHASE_Start(&g_gpt_three_phase_ctrl);
}
```

Data Structures

struct	gpt_three_phase_instance_ctrl_t

Data Structure Documentation

◆ gpt_three_phase_instance_ctrl_t

struct gpt_three_phase_instance_ctrl_t
Channel control block. DO NOT INITIALIZE. Initialization occurs when three_phase_api_t::open is called.

Function Documentation

◆ R_GPT_THREE_PHASE_Open()

fsp_err_t R_GPT_THREE_PHASE_Open (three_phase_ctrl_t *const *p_ctrl*, three_phase_cfg_t const *const *p_cfg*)

Initializes the 3-phase timer module (and associated timers) and applies configurations. Implements three_phase_api_t::open.

Example:

```
/* Initializes the module. */
   err = R_GPT_THREE_PHASE_Open(&g_gpt_three_phase_ctrl, &g_gpt_three_phase_cfg);
```

Return values

FSP_SUCCESS	Initialization was successful.
FSP_ERR_ASSERTION	A required input pointer is NULL.
FSP_ERR_ALREADY_OPEN	Module is already open.

◆ R_GPT_THREE_PHASE_Stop()

fsp_err_t R_GPT_THREE_PHASE_Stop (three_phase_ctrl_t *const *p_ctrl*)

Stops all timers synchronously. Implements three_phase_api_t::stop.

Return values

FSP_SUCCESS	Timers successfully stopped.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ R_GPT_THREE_PHASE_Start()

fsp_err_t R_GPT_THREE_PHASE_Start (three_phase_ctrl_t *const *p_ctrl*)

Starts all timers synchronously. Implements three_phase_api_t::start.

Example:

```
/* Start the timer. */
   (void) R_GPT_THREE_PHASE_Start(&g_gpt_three_phase_ctrl);
```

Return values

FSP_SUCCESS	Timers successfully started.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ R_GPT_THREE_PHASE_Reset()

fsp_err_t R_GPT_THREE_PHASE_Reset (three_phase_ctrl_t *const *p_ctrl*)

Resets the counter values to 0. Implements three_phase_api_t::reset.

Return values

FSP_SUCCESS	Counters were reset successfully.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ R_GPT_THREE_PHASE_DutyCycleSet()

fsp_err_t R_GPT_THREE_PHASE_DutyCycleSet (three_phase_ctrl_t *const *p_ctrl*, three_phase_duty_cycle_t *const *p_duty_cycle*)

Sets duty cycle for all three timers. Implements three_phase_api_t::dutyCycleSet.

In symmetric PWM mode duty cycle values are reflected after the next trough. In asymmetric PWM mode values are reflected at the next trough OR crest, whichever comes first.

When double-buffering is enabled the values in three_phase_duty_cycle_t::duty_buffer are set to the double-buffer registers. When values are reflected the first time the single buffer values (three_phase_duty_cycle_t::duty) are used. On the second reflection the duty_buffer values are used. In asymmetric PWM mode this enables both count-up and count-down PWM values to be set at trough (or crest) exclusively.

Note

It is recommended to call this function in a high-priority callback to ensure that it is not interrupted and that no GPT events occur during setting that would result in a duty cycle buffer load operation.

Example:

```
/* Update duty cycle values */
      err = R_GPT_THREE_PHASE_DutyCycleSet(&g_gpt_three_phase_ctrl, &duty_cycle);
      assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Duty cycle updated successfully.
FSP_ERR_ASSERTION	p_ctrl was NULL
FSP_ERR_NOT_OPEN	The instance is not opened.
FSP_ERR_INVALID_ARGUMENT	One or more duty cycle count values was outside the range 0..(period - 1).

◆ R_GPT_THREE_PHASE_CallbackSet()

fsp_err_t R_GPT_THREE_PHASE_CallbackSet (three_phase_ctrl_t *const *p_ctrl*, void(*)(timer_callback_args_t *) *p_callback*, void const *const *p_context*, timer_callback_args_t *const *p_callback_memory*)

Updates the user callback for the GPT U-channel with the option to provide memory for the callback argument structure. Implements three_phase_api_t::callbackSet.

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.

◆ R_GPT_THREE_PHASE_Close()

fsp_err_t R_GPT_THREE_PHASE_Close (three_phase_ctrl_t *const *p_ctrl*)
Stops counters, disables output pins, and clears internal driver data. Implements three_phase_api_t::close. **Return values** FSP_SUCCESS — Successful close. FSP_ERR_ASSERTION — p_ctrl was NULL. FSP_ERR_NOT_OPEN — The instance is not opened.

fsp_err_t	R_TML_CallbackSet (timer_ctrl_t *const p_api_ctrl, void(*p_callback)(timer_callback_args_t *), void const *const p_context, timer_callback_args_t *const p_callback_memory)
fsp_err_t	R_TML_Close (timer_ctrl_t *const p_ctrl)

Detailed Description

Driver for the TML peripherals on RA MCUs. This module implements the Timer Interface.

Overview

The TML module can be used to count or count input events. TML operates with the HOCO, MOCO, MOSC, LOCO/SOSC clock or the event input from the ELC, which is asynchronous to CPU operation.

Features

The TML module has the following features:

- Supports 8-bit counter mode: 4 independent channels (Channel 0,Channel 1,Channel 2 and Channel 3).
- Supports 16-bit counter mode: 2 independent channels (Channel 0 and Channel 2).
- Supports 32-bit counter mode: 1 channel (channel 0).
- Supports 16-bit capture mode: 1 channel (channel 0).
- Supports count source of HOCO, MOCO, MOSC, LOCO/SOSC clock or ELC events.
- Configurable period (counts per timer cycle).
- Supports runtime reconfiguration of period.
- Supports capture-start by external sources from ELC events.
- APIs are provided to start, stop, and reset the counter.
- APIs are provided to get the current period, source clock frequency, and count direction.
- APIs are provided to get the current timer status.

Selecting a Timer

RA MCUs have different timer peripherals: the General PWM Timer (GPT), the 32-bit Interval Timer (TML), Timer Array Unit (TAU), and the Asynchronous General Purpose Timer (AGT). Some MCUs have multiple timer modules. When selecting between them, consider these factors:

	GPT	TML	AGT	TAU
Low Power Modes	The GPT can operate in sleep mode.	The TML can operate in all low power modes.	The AGT can operate in all low power modes.	The TAU can not operate in all low power modes.
Available Channels	The number of GPT channels is device specific. Currently supported MCUs have at least 7 GPT channels.	Currently supported MCUs have 4 TML channels.	Currently supported MCUs have 2 AGT channels.	Currently supported MCUs have 8 TAU channels.
Timer Resolution	Currently	The TML timers	The AGT timers	The TAU timers

	supported MCUs have at least one 32-bit GPT timer.	are 32-bit/16-bit/8-bit timers.	are 16-bit timers.	are 16-bit/8-bit timers.
Clock Source	The GPT runs off PCLKD with a configurable divider up to 1024. It can also be configured to count ELC events or external pulses.	The TML runs off MOSC, LOCO/SOSC, HOCO, MOCO with a configurable divider up to 128 or ELC events.	The AGT runs off PCLKB, LOCO, or subclock.	The TAU runs off PCLK with a configurable divider up to 32768

Configuration

Build Time Configurations for r_tml

The following build time configurations are defined in fsp_cfg/r_tml_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
Critical Section Guarding	• Enabled • Disabled	Disabled	Enable critical section guarding around peripheral configuration updates. This should be enabled if multiple instances of the R_TML module are being used.
16-bit Capture Mode Support	• Disabled • Enabled	Disabled	Controls whether 16-bit capture mode support is included in the build. This setting applies globally to all r_tml_instances. If 16-bit capture mode is not used by any instance, disable this setting to reduce ROM usage.
Enable Single Channel	• Disabled • Enabled	Disabled	Enable single channel to reduce code size. Assumes channel 0.
Interrupt Support	• Disabled • Enabled	Disabled	Enable support for interrupts.

Configurations for Timers > 32-bit Interval Timer (r_tml)

This module can be added to the Stacks tab via New Stack > Timers > 32-bit Interval Timer (r_tml).

Configuration	Options	Default	Description
General			
Name	Name must be a valid C symbol	g_timer0	Module name.
Mode	• 8-bit Counter Mode • 16-bit Counter Mode • 32-bit Counter Mode • 16-bit Capture Mode	16-bit Counter Mode	Selection of Operating mode.
Channel Selection	Channel number must exist on this MCU	0	Specify the hardware channel.
ELC event	MCU Specific Options		Select the elc event.
Counter Mode Settings			
Period	Value must be positive integer	0x10000	Specify the timer period in units selected below. Set the period to 0x100 (8-bit) or 0x10000 (16-bit) or 0x100000000 (32-bit) raw counts for a free running timer. Since the maxmimum divider is 128... the raw counts period can be set up to the (max count+1)*128. [0x8000 (8-bit) or 0x800000 (16-bit), or 0x8000000000 (32-bit)].
Period Unit	• Raw Counts • Nanoseconds • Microseconds • Milliseconds • Seconds • Hertz • Kilohertz	Raw Counts	Unit of the period specified above. When the Counter Clock Source is the ELC, only Raw Counts can be selected here.
Capture Mode Settings			
Capture Mode Settings > 16-Bit Counter Input Settings (when Capture source = Interrupt on compare match with ITLCMP01)			
Period	Value must be positive	0x10000	Specify the timer

	integer		period in units selected below. Set the period to 0x10000 raw counts in the maximum period of 16-bit capture.
Period Unit	• Raw Counts • Nanoseconds • Microseconds • Milliseconds • Seconds • Hertz • Kilohertz	Raw Counts	Unit of the period specified above. When the Capture Clock Source is the ELC, only Raw Counts can be selected here.
Capture Trigger	MCU Specific Options		Selection of capture trigger.
Capture Clock Divider	• fITL0 • fITL0/2 • fITL0/4 • fITL0/8 • fITL0/16 • fITL0/32 • fITL0/64 • fITL0/128	fITL0	Configure FDIV0 for the counter clock in 16-bit Capture Mode.
Counter Status	• Retained after the completion of capturing • Cleared after the completion of capturing	Retained after the completion of capturing	Selection of the 16-bit counter (ITL000 + ITL001) clearing after capturing.
Interrupt			
Callback function	Name must be a valid C symbol	NULL	A user callback function can be provided here. If this callback function is provided, it is called from the interrupt service routine (ISR) each time the IRQn triggers
Priority	MCU Specific Options		Select the interrupt priority.

Clock Configuration

The TML operating clock is based on the HOCO, MOCO, MOSC, or LOCO/SOSC. The operating frequency will be based on the source chosen and the divider selected. You can set the clock frequencies using the **Clocks** tab of the RA Configuration editor or change the clock divider for the capture mode channel by **Capture Mode Settings->Capture Clock Divider**.

Note

The TML channels may be alternatively configured to use an event input from the ELC as a count clock in case no frequency/duration can be input, only "Raw Counts".

Pin Configuration

Usage Notes

Maximum Period

In capture mode, the clock divider for the capture channel has to be selected in **Capture Mode Settings->Capture Clock Divider**. If ITLCMP01 is the capture trigger input, the clock divider for channels 2 + 3 is not available.

When no capture mode is active, the RA Configuration editor will automatically calculate the period count value and source clock divider based on the selected period time, units and clock speed.

When the selected period unit is "Raw counts", the maximum period setting is 0x8000000000/0x800000/0x8000 on a 32-bit/16-bit/8-bit timer. This will configure the timer with the maximum period and a count clock divisor of 128.

Note

When an event input from ELC is used as an operation clock, the automatic calculation of the period count value and source clock divider is not available.

Updating Period

The period is updated after calling R_TML_PeriodSet().

Note

The period is only updated when the counter is stopped.
When using the API to set the period counts, the maximum timer_cfg_t::period_counts for 8-bit and 16-bit modes are 0x100 and 0x10000, respectively. To set the the maximum count for 32-bit mode, set the timer_cfg_t::period_counts to 0 (as 0x10000000 is outside the 32-bit range).
In the 16-bit capture mode, if the interrupt on compare match with ITLCMP01 is used as trigger source, the period counts of the 16-bit timer channels 2 + 3 can be changed at run-time.

Capture mode

When the 16-bit capture mode is to be used for channels 0 and 1, the counter value is stored in interval timer capture register 00 (ITLCAP00) in response to the selected capture trigger.

Note

*When Channels 0 and 1 are in capture mode, Channels 2 and 3 can be used to trigger the capture when ITLCMP01 is the capture trigger. In this case the counter setup for Channels 2 and 3 are in **Capture Mode Settings->16-Bit Counter Input Settings**. If ITLCMP01 is not the capture trigger input, Channels 2 and 3 may be setup as an independent instance of 16-bit Counter channel.*
When a capture trigger is generated when the timer is not running, the previous counter value of the capture channel is still copied to the Interval Timer Capture Register (ITLCAP00).
*The **Common->16-bit Capture Mode Support** property in the module configuration must be enabled to use the capture operation.*

Controlling TML with ELC Events

The TML timer can be configured to start count down or trigger capture when an ELC event occurs.

Note

The configurable ELC TML sources are shared by all TML channels.
The event links for the ELC must be configured outside this module.

Triggering ELC Events with TML

The TML timer can trigger the start of other peripherals. The Event Link Controller (r_elc) guide provides a list of all available peripherals.

Examples

TML Basic Example

This is a basic example of minimal use of the TML in an application.

```
void tml_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = R_TML_Open(&g_timer0_ctrl, &g_timer0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Start the timer. */
    (void) R_TML_Start(&g_timer0_ctrl);
}
```

TML Callback Example

This is an example of a timer callback.

```
/* Example callback called when timer expires. */
void timer_callback (timer_callback_args_t * p_args)
{
 if (TIMER_EVENT_CYCLE_END == p_args->event)
    {
 /* Add application code to be called periodically here. */
    }
}
```

TML Counter Example

This is an example of 8/16/32-bit Counter.

```
void tml_counter_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = R_TML_Open(&g_timer0_ctrl, &g_timer0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Start the timer. */
    (void) R_TML_Start(&g_timer0_ctrl);
 /* Read the current state. Counter value is in status.state. */
 timer_status_t status;
    (void) R_TML_StatusGet(&g_timer0_ctrl, &status);
 /* (Optional) Enable the mask for the interrupt flag. */
    (void) R_TML_Disable(&g_timer0_ctrl);
 /* (Optional) Disable the mask to use the interrupt. */
    (void) R_TML_Enable(&g_timer0_ctrl);
 /* (Optional) Stop the timer. */
    (void) R_TML_Stop(&g_timer0_ctrl);
}
```

TML Capture Example

This is an example of using the TML to capture the counter value of configured channel.

```
/* Example callback called when a capture occurs. */
uint64_t g_captured_time    = 0U;
uint32_t g_capture_overflows = 0U;
void timer_capture_callback (timer_callback_args_t * p_args)
{
 if (TIMER_EVENT_CAPTURE_EDGE == p_args->event)
    {
 /* (Optional) Get the current period if not known. */
 timer_info_t info;
```

```
       (void) R_TML_InfoGet(&g_timer0_ctrl, &info);
       uint32_t period = info.period_counts;
       g_captured_time    = (period * g_capture_overflows) + p_args->capture;
       g_capture_overflows = 0U;
    }
 if (TIMER_EVENT_CYCLE_END == p_args->event)
    {
 /* An overflow occurred during capture. This must be accounted for at the
application layer. */
       g_capture_overflows++;
    }
}
void tml_capture_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = R_TML_Open(&g_timer0_ctrl, &g_timer0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* There are 4 ways to trigger the capture:
  * - Use software trigger by set the ITLCC0.CAPR bit to 1 directly after call start
  * - Use ELC event and wait for valid input
  * - Use LOCO/SOSC clock and wait for valid edge
  * - Use interrupt on compare match with ITLCPM01
  *
  * This example uses the last option.
  */
    (void) R_TML_Start(&g_timer0_ctrl);
}
```

TML Period Update Example

This an example of updating the period.

```
#define TML_EXAMPLE_MSEC_PER_SEC (1000)
```

```
#define TML_EXAMPLE_DESIRED_PERIOD_MSEC (20)
/* This example shows how to calculate a new period value at runtime. */
void tml_period_calculation_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = R_TML_Open(&g_timer0_ctrl, &g_timer0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Get the source clock frequency (in Hz) */
 timer_info_t info;
    (void) R_TML_InfoGet(&g_timer0_ctrl, &info);
    uint32_t timer_freq_hz = info.clock_frequency;
 /* Calculate the desired period based on the current clock. Note that this
calculation could overflow if the
  * desired period is larger than UINT32_MAX. A cast to uint64_t is used to prevent
this. */
    uint32_t period_counts =
       (uint32_t) (((uint64_t) timer_freq_hz * TML_EXAMPLE_DESIRED_PERIOD_MSEC) /
TML_EXAMPLE_MSEC_PER_SEC);
 /* Set the calculated period. */
    err = R_TML_PeriodSet(&g_timer0_ctrl, period_counts);
    assert(FSP_SUCCESS == err);
 /* Start the timer. */
    (void) R_TML_Start(&g_timer0_ctrl);
}
```

Data Structures

struct	tml_extended_cfg_t
struct	tml_instance_ctrl_t

Enumerations

enum	tml_clock_t
enum	tml_capture_trigger_t

enum	tml_counter_status_t

Data Structure Documentation

◆ tml_extended_cfg_t

struct tml_extended_cfg_t		
User configuration structure, used in open function		
Data Fields		
tml_capture_trigger_t	capture_trigger	Select the capture source for capture channel.
tml_counter_status_t	counter_status	Status of 16-bit counter (ITL000 + ITL001) after completion of capturing.

◆ tml_instance_ctrl_t

struct tml_instance_ctrl_t	
TML instance control block.	
Data Fields	
uint32_t	open
	Used to determine if the channel is configured.
const timer_cfg_t *	p_cfg
	Pointer to the configuration block.
uint8_t	channel_mask
	Mask value of channel used.
void(*	p_callback)(timer_callback_args_t *)
	Pointer to callback that is called when a timer event occurs.
void const *	p_context
	Pointer to context to be passed into callback function.

Enumeration Type Documentation

◆ tml_clock_t

enum tml_clock_t	
Enumeration for TML FITL0, FITL1 clock source	
Enumerator	
TML_CLOCK_HOCO	HOCO.
TML_CLOCK_MOCO	MOCO.
TML_CLOCK_MOSC	MOSC.
TML_CLOCK_LOCO_SOSC	SOSC.
TML_CLOCK_ELC_EVENT	Event input from the ELC.

◆ tml_capture_trigger_t

enum tml_capture_trigger_t	
Enumeration for TML FITL2 capture trigger source	
Enumerator	
TML_CAPTURE_TRIGGER_SOFTWARE	Software trigger.
TML_CAPTURE_TRIGGER_ITLCMP01	Interrupt on compare match with ITLCMP01.
TML_CAPTURE_TRIGGER_LOCO_SOSC	LOCO/SOSC (rising edge)
TML_CAPTURE_TRIGGER_EVENT_ELC	Event input from ELC (rising edge)

◆ tml_counter_status_t

enum tml_counter_status_t	
Enumeration for status of 16-bit counter (ITL000 + ITL001) after completion of capturing	
Enumerator	
TML_COUNTER_STATUS_RETAINED_AFTER_CAPTURING	16-bit counter (ITL000 + ITL001) is retained after the completion of capturing
TML_COUNTER_STATUS_CLEARED_AFTER_CAPTURING	16-bit counter (ITL000 + ITL001) is cleared after the completion of capturing

Function Documentation

◆ R_TML_Open()

fsp_err_t R_TML_Open (timer_ctrl_t *const *p_ctrl*, timer_cfg_t const *const *p_cfg*)

Initializes the timer module and applies configurations. Implements timer_api_t::open.

TML hardware does not support one-shot functionality natively. If one shot mode is desired, the user code should stop the timer after the timer expires the first time in an ISR after the requested period has elapsed.

The TML implementation of the general timer can accept a tml_extended_cfg_t extension parameter.

Example:

```
/* Initializes the module. */
   err = R_TML_Open(&g_timer0_ctrl, &g_timer0_cfg);
```

Return values

FSP_SUCCESS	Initialization was successful and timer has started.
FSP_ERR_ASSERTION	A required input pointer is NULL or the source divider is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open.
FSP_ERR_IRQ_BSP_DISABLED	timer_cfg_t::p_callback is not NULL, but ISR is not enabled. ISR must be enabled to use one-shot mode or callback.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	The channel requested in the p_cfg parameter is not available on this device.
FSP_ERR_INVALID_CHANNEL	Selected channel is invalid
FSP_ERR_INVALID_MODE	The mode requested in the p_cfg parameter is incorrect. It must be the same for all instances.
FSP_ERR_IN_USE	Channel is running

◆ R_TML_Stop()

fsp_err_t R_TML_Stop (timer_ctrl_t *const *p_ctrl*)

Stops the counter and disable the capture. Implements timer_api_t::stop.

Example:

```
/* (Optional) Stop the timer. */
   (void) R_TML_Stop(&g_timer0_ctrl);
```

Return values

FSP_SUCCESS	Timer successfully stopped.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	The channel requested in the p_cfg parameter is not available on this device.

◆ R_TML_Start()

fsp_err_t R_TML_Start (timer_ctrl_t *const *p_ctrl*)

Starts the counter and enable the capture. Implements timer_api_t::start.

Example:

```
/* Start the timer. */
   (void) R_TML_Start(&g_timer0_ctrl);
```

Return values

FSP_SUCCESS	Timer successfully started.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	The channel requested in the p_cfg parameter is not available on this device.

◆ R_TML_Reset()

fsp_err_t R_TML_Reset (timer_ctrl_t *const *p_ctrl*)

Resets the counter value to 0. Implements timer_api_t::reset.

Return values

FSP_SUCCESS	Counter value written successfully.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	The channel requested in the p_cfg parameter is not available on this device.

◆ R_TML_Enable()

fsp_err_t R_TML_Enable (timer_ctrl_t *const *p_ctrl*)

Enable the interrupt generation from the selected channel timer_api_t::enable.

Example:

```
/* (Optional) Disable the mask to use the interrupt. */
   (void) R_TML_Enable(&g_timer0_ctrl);
```

Return values

FSP_SUCCESS	External events successfully enabled.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	The channel requested in the p_cfg parameter is not available on this device.

◆ R_TML_Disable()

fsp_err_t R_TML_Disable (timer_ctrl_t *const *p_ctrl*)

Disable the interrupt generation for this timer. Implements timer_api_t::disable.

Note

The timer could be stop after R_TML_Disable().

Example:

```
/* (Optional) Enable the mask for the interrupt flag. */
   (void) R_TML_Disable(&g_timer0_ctrl);
```

Return values

FSP_SUCCESS	External events successfully disabled.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	The channel requested in the p_cfg parameter is not available on this device.

◆ R_TML_PeriodSet()

fsp_err_t R_TML_PeriodSet (timer_ctrl_t *const *p_ctrl*, uint32_t const *period_counts*)

Sets period value provided. Only set this value when all timers are stop. Implements timer_api_t::periodSet.

Example:

```
/* Get the source clock frequency (in Hz) */
timer_info_t info;
   (void) R_TML_InfoGet(&g_timer0_ctrl, &info);
   uint32_t timer_freq_hz = info.clock_frequency;
/* Calculate the desired period based on the current clock. Note that this calculation could overflow if the
 * desired period is larger than UINT32_MAX. A cast to uint64_t is used to prevent this. */
   uint32_t period_counts =
      (uint32_t) (((uint64_t) timer_freq_hz * TML_EXAMPLE_DESIRED_PERIOD_MSEC) / TML_EXAMPLE_MSEC_PER_SEC);
/* Set the calculated period. */
   err = R_TML_PeriodSet(&g_timer0_ctrl, period_counts);
   assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Period value written successfully.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.
FSP_ERR_IN_USE	Channel is running

◆ R_TML_DutyCycleSet()

fsp_err_t R_TML_DutyCycleSet (timer_ctrl_t *const *p_ctrl*, uint32_t const *duty_cycle_counts*, uint32_t const *pin*)

timer_api_t::dutyCycleSet is not supported on the TML.

Return values

FSP_ERR_UNSUPPORTED	Function not supported in this implementation.

◆ R_TML_CompareMatchSet()

fsp_err_t R_TML_CompareMatchSet (timer_ctrl_t *const *p_ctrl*, uint32_t const *compare_match_value*, timer_compare_match_t const *match_channel*)

timer_api_t::compareMatchSet is not supported on the TML.

Return values

FSP_ERR_UNSUPPORTED	Function not supported in this implementation.

◆ R_TML_InfoGet()

fsp_err_t R_TML_InfoGet (timer_ctrl_t *const *p_ctrl*, timer_info_t *const *p_info*)

Get timer configuration information and store it in provided pointer p_info. Implements timer_api_t::infoGet.

Example:

```
/* (Optional) Get the current period if not known. */
timer_info_t info;
      (void) R_TML_InfoGet(&g_timer0_ctrl, &info);
      uint32_t period = info.period_counts;
```

Return values

FSP_SUCCESS	Period, count direction, frequency, and ELC event written to caller's structure successfully.
FSP_ERR_ASSERTION	p_ctrl or p_info was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ R_TML_StatusGet()

fsp_err_t R_TML_StatusGet (timer_ctrl_t *const *p_ctrl*, timer_status_t *const *p_status*)

Get current timer status and store it in provided pointer p_status. Implements timer_api_t::statusGet.

Example:

```
/* Read the current state. Counter value is in status.state. */
timer_status_t status;
   (void) R_TML_StatusGet(&g_timer0_ctrl, &status);
```

Return values

FSP_SUCCESS	Current timer state and counter value set successfully.
FSP_ERR_ASSERTION	p_ctrl or p_status was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	The channel requested in the p_cfg parameter is not available on this device.

◆ R_TML_CallbackSet()

fsp_err_t R_TML_CallbackSet (timer_ctrl_t *const *p_api_ctrl*, void(*)(timer_callback_args_t *) *p_callback*, void const *const *p_context*, timer_callback_args_t *const *p_callback_memory*)

Updates the user callback with the option to provide memory for the callback argument structure. Implements timer_api_t::callbackSet.

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.

◆ R_TML_Close()

fsp_err_t R_TML_Close (timer_ctrl_t *const *p_ctrl*)
Stops counter, disables output pins, and clears internal driver data. Implements timer_api_t::close. **Return values** FSP_SUCCESS — Successful close. FSP_ERR_ASSERTION — p_ctrl was NULL. FSP_ERR_NOT_OPEN — The instance is not opened. FSP_ERR_IP_CHANNEL_NOT_PRESENT — The channel requested in the p_cfg parameter is not available on this device. FSP_ERR_IN_USE — Channel is running

Detailed Description

Driver for the GPT32 and GPT16 peripherals on RA MCUs. This module implements the Timer Interface.

Overview

The GPT module can be used to count events, measure external input signals, generate a periodic interrupt, or output a periodic or PWM signal to a GTIOC pin.

This module supports the GPT peripherals GPT32EH, GPT32E, GPT32, and GPT16. GPT16 is a 16-bit timer. The other peripherals (GPT32EH, GPT32E, and GPT32) are 32-bit timers. The 32-bit timers are all treated the same in this module from the API perspective.

Features

The GPT module has the following features:

- Supports periodic mode, one-shot mode, and PWM mode.
- Supports count source of PCLK, GTETRG pins, GTIOC pins, or ELC events.
- Supports debounce filter on GTIOC pins.
- Signal can be output to a pin.
- Configurable period (counts per timer cycle).
- Configurable duty cycle in PWM mode.
- Supports runtime reconfiguration of period.

- Supports runtime reconfiguration of duty cycle in PWM mode.
- Supports runtime reconfiguration of compare match value.
- APIs are provided to start, stop, and reset the counter.
- APIs are provided to get the current period, source clock frequency, and count direction.
- APIs are provided to get the current timer status and counter value.
- Supports start, stop, clear, count up, count down, and capture by external sources from GTETRG pins, GTIOC pins, or ELC events.
- Supports symmetric and asymmetric PWM waveform generation.
- Supports One shot synchronous pulse waveform generation.
- Supports automatic addition of dead time.
- Supports generating ELC events to start an ADC scan at a compare match value (see Event Link Controller (r_elc)) and updating the compare match value.
- Supports linking with a POEG channel to automatically disable GPT output when an error condition is detected.
- Supports setting the counter value while the timer is stopped.
- Supports enabling and disabling output pins.
- Supports skipping up to seven overflow/underflow (crest/trough) interrupts at a time
- Supports generating custom PWM waveforms by configuring the pin's output level at each compare match and cycle end.

Selecting a Timer

RA MCUs have two timer peripherals: the General PWM Timer (GPT) and the Asynchronous General Purpose Timer (AGT). When selecting between them, consider these factors:

	GPT	AGT
Low Power Modes	The GPT can operate in sleep mode.	The AGT can operate in all low power modes.
Available Channels	The number of GPT channels is device specific. All currently supported MCUs have at least 7 GPT channels.	All MCUs have 2 AGT channels.
Timer Resolution	All MCUs have at least one 32-bit GPT timer.	The AGT timers are 16-bit timers.
Clock Source	The GPT runs off PCLKD with a configurable divider up to 1024. It can also be configured to count ELC events or external pulses.	The AGT runs off PCLKB, LOCO, or subclock.

Configuration

Build Time Configurations for r_gpt

The following build time configurations are defined in fsp_cfg/r_gpt_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled	Default (BSP)	If selected code for parameter checking is

	• Disabled		included in the build.
Pin Output Support	• Disabled • Enabled • Enabled with Extra Features	Disabled	Enables or disables support for outputting PWM waveforms on GTIOCx pins. The "Enabled with Extra Features" option enables support for Triangle wave modes and also enables the features located in the "Extra Features" section of each module instance.
Write Protect Enable	• Enabled • Disabled	Disabled	If selected write protection is applied to all GPT channels.

Configurations for Timers > Timer, General PWM (r_gpt)

This module can be added to the Stacks tab via New Stack > Timers > Timer, General PWM (r_gpt). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
General			
General > Compare Match			
General > Compare Match > Compare Match A			
Status	• Enabled • Disabled	Disabled	
Compare match value	Value must be a non-negative integer less than or equal to 0x40000000000	0	Specify the compare match A value in units that selected in Period Unit section.
General > Compare Match > Compare Match B			
Status	• Enabled • Disabled	Disabled	
Compare match value	Value must be a non-negative integer less than or equal to 0x40000000000	0	Specify the compare match B value in units that selected in Period Unit section.
Name	Name must be a valid C symbol	g_timer0	Module name.
Channel	Enter the supported Channel number	0	Specify the hardware channel.
Mode	• Periodic	Periodic	Mode selection.

		• One-Shot • One-Shot Pulse • Saw-wave PWM • Triangle-wave PWM (symmetric, Mode 1) • Triangle-wave PWM (asymmetric, Mode 2) • Triangle-wave PWM (asymmetric, Mode 3)	Periodic: Generates periodic interrupts or square waves. One-shot: Generate a single interrupt or a pulse wave. Note: One-shot mode is implemented in software. ISRs must be enabled for one-shot even if callback is unused. One-Shot Pulse: Counter performs saw-wave operation with fixed buffer operation. Saw-wave PWM: Generates basic saw-wave PWM waveforms. Triangle-wave PWM (symmetric, Mode 1): Generates symmetric PWM waveforms with duty cycle determined by compare match set with 32-bit transfer during a crest event and updated at the next trough with single or double buffer operation. Triangle-wave PWM (asymmetric, Mode 2): Generates asymmetric PWM waveforms with duty cycle determined by compare match set with 32-bit transfer during a crest/trough event and updated at the next trough/crest. Triangle-wave PWM (asymmetric, Mode 3): Generates PWM waveforms with duty cycle determined by compare match set with 64-bit transfer during a crest interrupt and updated at the next trough with fixed buffer operation.
Period	Value must be a non-negative integer less	0x10000	Specify the timer period in units selected

	than or equal to 0x40000000000		below. Set the period to 0x100000000 (32-bit) or 0x10000 (16-bit) raw counts for a free running timer or an input capture configuration. The period can be set up to 0x40000000000 (32-bit) or 0x4000000 (16-bit) which will use a divider of 1024 with the maximum period. If the requested period cannot be achieved, the settings with the largest possible period that is less than or equal to the requested period are used. The theoretical calculated period is printed in a comment in the generated timer_cfg_t structure.
Period Unit	• Raw Counts • Nanoseconds • Microseconds • Milliseconds • Seconds • Hertz • Kilohertz	Raw Counts	Unit of the period specified above
Output			
Output > Custom Waveform			
Output > Custom Waveform > GTIOA			
Initial Output Level	• Pin Level Low • Pin Level High	Pin Level Low	Set the initial output level of GTIOCxA.
Cycle End Output Level	• Pin Level Retain • Pin Level Low • Pin Level High • Pin Level Toggle	Pin Level Retain	Set the output level of GTIOCxA at cycle end.
Compare Match Output Level	• Pin Level Retain • Pin Level Low • Pin Level High • Pin Level Toggle	Pin Level Retain	Set the output level of GTIOCxA at compare match.
Retain Output Level at Count Stop	• Disabled • Enabled	Disabled	Retain the current GTIOxA output level

			when counting is stopped.
Output > Custom Waveform > GTIOB			
Initial Output Level	• Pin Level Low • Pin Level High	Pin Level Low	Set the initial output level of GTIOCxB.
Cycle End Output Level	• Pin Level Retain • Pin Level Low • Pin Level High • Pin Level Toggle	Pin Level Retain	Set the output level of GTIOCxB at cycle end.
Compare Match Output Level	• Pin Level Retain • Pin Level Low • Pin Level High • Pin Level Toggle	Pin Level Retain	Set the output level of GTIOCxB at compare match.
Retain Output Level at Count Stop	• Disabled • Enabled	Disabled	Retain the current GTIOxB output level when counting is stopped.
Custom Waveform Enable	• Disabled • Enabled	Disabled	Enable custom waveform configuration.
Duty Cycle Percent (only applicable in PWM mode)	Value must be between 0 and 100	50	Specify the timer duty cycle percent. Only used in PWM mode.
GTIOCA Output Enabled	• True • False	False	Enable the output of GTIOCA on a pin.
GTIOCA Stop Level	• Pin Level Low • Pin Level High	Pin Level Low	Select the behavior of the output pin when the timer is stopped.
GTIOCB Output Enabled	• True • False	False	Enable the output of GTIOCB on a pin.
GTIOCB Stop Level	• Pin Level Low • Pin Level High	Pin Level Low	Select the behavior of the output pin when the timer is stopped.
Input			
Count Up Source	MCU Specific Options		Select external source that will increment the counter. If any count up source is selected, the timer will count the external sources only. It will not count PCLKD cycles.
Count Down Source	MCU Specific Options		Select external source that will decrement the

			counter. If any count down source is selected, the timer will count the external sources only. It will not count PCLKD cycles.
Start Source	MCU Specific Options		Select external source that will start the timer. For pulse width measurement, set the Start Source and the Clear Source to the trigger edge (the edge to start the measurement), and set the Stop Source and Capture Source (either A or B) to the opposite edge (the edge to stop the measurement). For pulse period measurement, set the Start Source, the Clear Source, and the Capture Source (either A or B) to the trigger edge (the edge to start the measurement).
Stop Source	MCU Specific Options		Select external source that will stop the timer.
Clear Source	MCU Specific Options		Select external source that will clear the timer.
Capture A Source	MCU Specific Options		Select external source that will trigger a capture A event.
Capture B Source	MCU Specific Options		Select external source that will trigger a capture B event.
Noise Filter A Sampling Clock Select	• No Filter • Filter PCLKD / 1 • Filter PCLKD / 4 • Filter PCLKD / 16 • Filter PCLKD / 64	No Filter	Select the input filter for GTIOCA.
Noise Filter B Sampling Clock Select	• No Filter • Filter PCLKD / 1 • Filter PCLKD / 4	No Filter	Select the input filter for GTIOCB.

	• Filter PCLKD / 16 • Filter PCLKD / 64		
Interrupts			
Callback	Name must be a valid C symbol	NULL	A user callback function can be specified here. If this callback function is provided, it will be called from the interrupt service routine (ISR) each time the timer period elapses
Overflow/Crest Interrupt Priority	MCU Specific Options		Select the overflow interrupt priority. This is the crest interrupt for triangle-wave PWM.
Capture/Compare match A Interrupt Priority	MCU Specific Options		Select the interrupt priority for Capture/Compare match A.
Capture/Compare match B Interrupt Priority	MCU Specific Options		Select the interrupt priority for Capture/Compare match B.
Underflow/Trough Interrupt Priority	MCU Specific Options		Select the interrupt priority for the trough interrupt (triangle-wave PWM only).
Extra Features			
Extra Features > Output Disable			
POEG Link	MCU Specific Options		Select which POEG to link this GPT channel to.
Output Disable POEG Trigger	• Dead Time Error • GTIOCA and GTIOCB High Level • GTIOCA and GTIOCB Low Level		Select which errors send an output disable trigger to POEG. Dead time error is only available GPT channels that have GTINTAD.GRPDTE.
GTIOCA Disable Setting	• Disable Prohibited • Set Hi Z • Level Low	Disable Prohibited	Select the disable setting for GTIOCA.

	• Level High		
GTIOCB Disable Setting	• Disable Prohibited • Set Hi Z • Level Low • Level High	Disable Prohibited	Select the disable setting for GTIOCB.
Extra Features > ADC Trigger			
Start Event Trigger (Channels with GTINTAD only)	• Trigger Event A/D Converter Start Request A During Up Counting • Trigger Event A/D Converter Start Request A During Down Counting • Trigger Event A/D Converter Start Request B During Up Counting • Trigger Event A/D Converter Start Request B During Down Counting		Select which A/D converter start request interrupts to generate and at which point in the cycle to generate them.
ADC A Compare Match (Raw Counts)	Must be a valid non-negative integer with a maximum configurable value of 4294967295 (0xffffffff).	0	Select the compare match value that generates a GPTn AD TRIG A event.
ADC B Compare Match (Raw Counts)	Must be a valid non-negative integer with a maximum configurable value of 4294967295 (0xffffffff).	0	Select the compare match value that generates a GPTn AD TRIG B event.
Extra Features > Dead Time (Value range varies with Channel)			
Dead Time Count Up (Raw Counts)	Must be a valid non-negative integer with a maximum configurable value of 4294967295 (0xffffffff).	0	Select the dead time to apply during up counting. This value also applies during down counting for channels that do not have GTDVD. The dead time count up value can be set up to 0xffffffff (32-bit) or 0xffff (16-bit).
Dead Time Count Down	Must be a valid non-	0	Select the dead time to

(Raw Counts) (Channels with GTDVD only)	negative integer with a maximum configurable value of 4294967295 (0xffffffff).		apply during down counting. The dead time count down value can be set up to 0xffffffff (32-bit) or 0xffff (16-bit).
Extra Features > Interrupt Skipping (Channels with GTITC only)			
Interrupt to Count	• None • Overflow and Underflow (sawtooth) • Crest (triangle) • Trough (triangle)	None	Select the count source for interrupt skipping. The interrupt skip counter increments after each source event. All crest/overflow and trough/underflow interrupts are skipped when the interrupt skip counter is non-zero.
Interrupt Skip Count	• 0 • 1 • 2 • 3 • 4 • 5 • 6 • 7	0	Select the number of interrupts to skip.
Skip ADC Events	• None • ADC A Compare Match • ADC B Compare Match • ADC A and B Compare Match	None	Select ADC events to suppress when the interrupt skip count is not zero.
Extra Features	• Enabled • Disabled	Disabled	Select whether to enable extra features on this channel.

Clock Configuration

The GPT clock is based on the PCLKD frequency. You can set the PCLKD frequency using the **Clocks** tab of the RA Configuration editor or by using the CGC Interface at run-time.

Pin Configuration

This module can use GTETRGA, GTETRGB, GTETRGC, GTETRGD, GTIOCA and GTIOCB pins as count sources.

This module can use GTIOCA and GTIOCB pins as output pins for periodic or PWM signals.

This module can use GTIOCA and GTIOCB as input pins to measure input signals.

Usage Notes

Maximum Period

The RA Configuration editor will automatically calculate the period count value and source clock divider based on the selected period time, units and clock speed.

When the selected period unit is "Raw counts", the maximum period setting is 0x40000000000 on a 32-bit timer or 0x4000000 on a 16-bit timer. This will configure the timer with the maximum period and a count clock divisor of 1024.

Note

16-bit channels inherently have a reduced maximum period compared to 32-bit channels. When setting period values of hundreds of milliseconds or more on 16-bit channels be sure to check the generated output to confirm the actual configured value as it will clip much earlier than 32-bit channels. In general, it is recommended to use a lower-power timer like AGT or RTC if long hardware delays are required.

Updating Period and Duty Cycle

The period and duty cycle are updated after the next counter overflow after calling R_GPT_PeriodSet() or R_GPT_DutyCycleSet(). To force them to update before the next counter overflow, call R_GPT_Reset() while the counter is running.

Note

When manually changing the timer period counts the maximum value for a 32-bit GPT is 0x100000000. This number overflows the 32-bit value for timer_cfg_t::period_counts. To configure the timer for the maximum period, set timer_cfg_t::period_counts to 0.

One-Shot Mode

The GPT timer does not support one-shot mode natively. One-shot mode is achieved by stopping the timer in the interrupt service routine before the callback is called. If the interrupt is not serviced before the timer period expires again, the timer generates more than one event. The callback is only called once in this case, but multiple events may be generated if the timer is linked to the Transfer (r_dtc).

One-Shot Mode Output

The output waveform in one-shot mode is one PCLKD cycle less than the configured period. The configured period must be at least 2 counts to generate an output pulse.

Examples of one-shot signals that can be generated by this module are shown below:

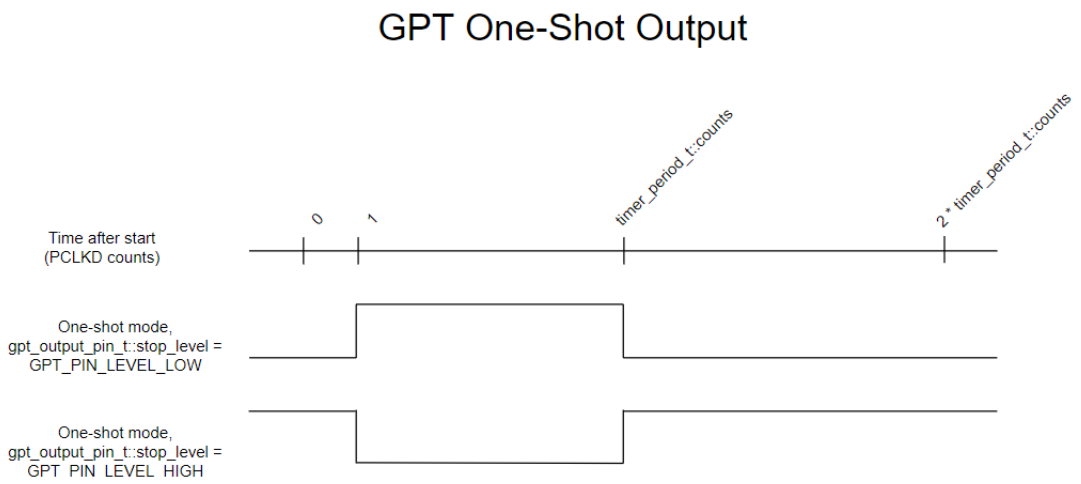

Figure 307: GPT One-Shot Output

One-Shot Pulse Mode

The one-shot pulse mode is an asymmetric PWM mode that provides more control over the rising and falling edges of the output. The user provides a period and initial output level and controls the signal by specifying compare match values for the leading and trailing edges each period.

Note

Despite its name, the One-Shot Pulse Mode operates continuously and does not stop after the first period.

One-Shot Pulse Mode Output

Examples of PWM signals that can be generated by this module are shown below. The leading and trailing edge match values can be modified using R_GPT_DutyCycleSet() in the overflow interrupt.

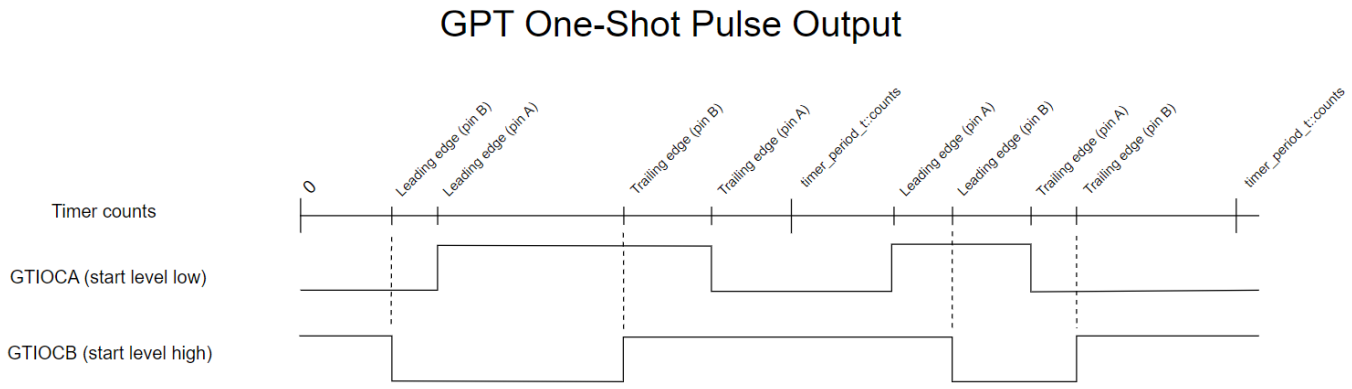

Figure 308: GPT One-Shot Pulse Output (without dead time)

If dead time is enabled only match values for GTIOCnA need to be set; the match values for GTIOCnB will be automatically configured in hardware.

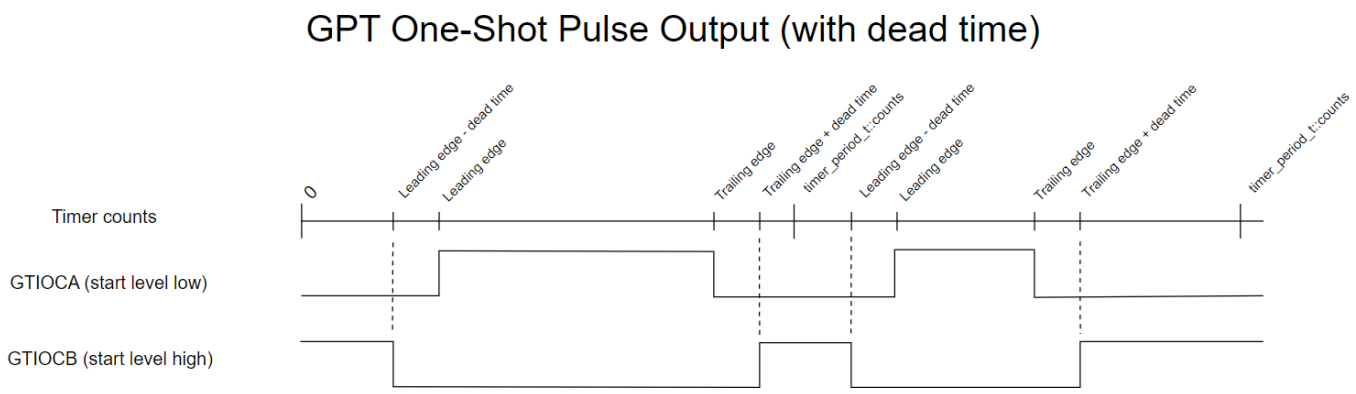

Figure 309: GPT One-Shot Pulse Output (with dead time)

Periodic Output

The GTIOC pin toggles twice each time the timer expires in periodic mode. This is achieved by defining a PWM wave at a 50 percent duty cycle so that the period of the resulting square wave (from rising edge to rising edge) matches the period of the GPT timer. Since the periodic output is actually a PWM output, the time at the stop level is one cycle shorter than the time opposite the stop level for odd period values.

Examples of periodic signals that can be generated by this module are shown below:

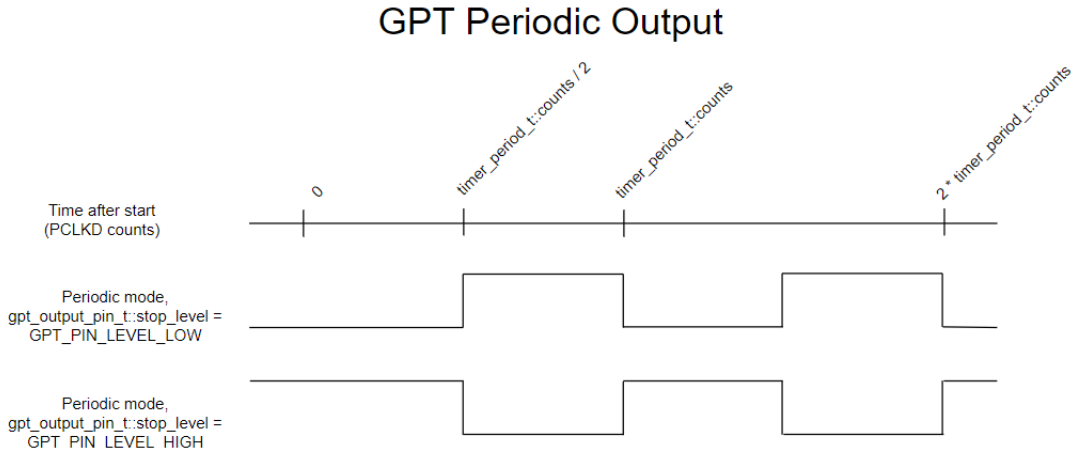

Figure 310: GPT Periodic Output

PWM Output

The PWM output signal is high at the beginning of the cycle and low at the end of the cycle.

Examples of PWM signals that can be generated by this module are shown below:

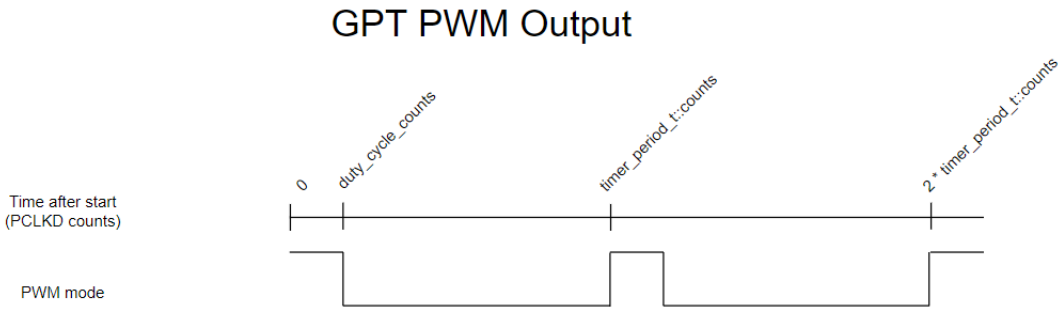

Figure 311: GPT PWM Output

Triangle-Wave PWM Output

Examples of PWM signals that can be generated by this module are shown below. The duty_cycle_counts can be modified using R_GPT_DutyCycleSet() in the crest interrupt and updated at the following trough for symmetric PWM or modified in both the crest/trough interrupts and updated at the following trough/crest for asymmetric PWM.

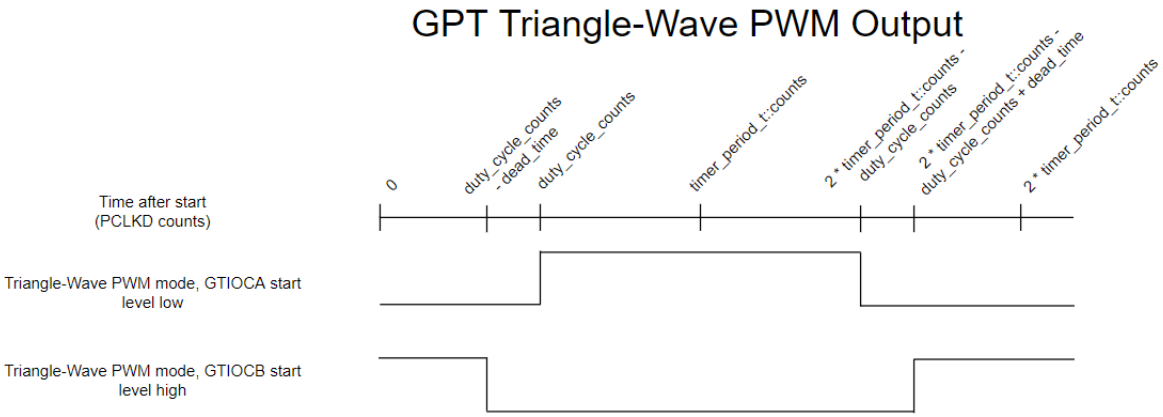

Figure 312: GPT Triangle-Wave PWM Output

PWM Output Delay Circuit

On select MCUs, an additional PWM output delay circuit can be configured in order to fine tune the rising and falling edge delays in increments of 1/32 times the period of the GPT core clock. The PWM output delay function must be configured prior to initializing the GPT channels using R_GPT_PwmOutputDelayInitialize.

Note

1. In Saw-wave PWM mode, the output delay setting cannot be changed while the capture compare setting (GTCCRn) is greater than or equal the period setting (GTPR) - 2.
2. In Triangle PWM modes, the output delay setting cannot be changed while the counter is counting down, and the capture compare setting (GTCCRn) is less than or equal to 2.
3. When the PWM Output Delay Circuit is enabled, the PWM signal is delayed by 3 GPT core clock cycles.
4. When the GPTCLK is used as the GPT core clock, the following delay is required between writes to the rising or falling edge output delay setting for a given pin: Write_Interval[ns] = Period_of_PCLKA [ns] × 6 + Period_of_GPTCLK [ns] × 4).

Event Counting

Event counting can be done by selecting up or down counting sources from GTETRG pins, ELC events, or GTIOC pins. In event counting mode, the GPT counter is not affected by PCLKD.

Note

In event counting mode, the application must call R_GPT_Start() to enable event counting. The counter will not change after calling R_GPT_Start() until an event occurs.

Pulse Measurement

If the capture edge occurs before the start edge in pulse measurement, the first capture is invalid (0).

Controlling GPT with GTETRG Edges

The GPT timer can be configured to stop, start, clear, count up, or count down when a GTETRG rising or falling edge occurs.

Note

The GTETRG pins are shared by all GPT channels.
GTETRG pins require POEG to be on (example code for this is provided in GPT Free Running Counter Example).
If input filtering is required on the GTETRG pins, that must also be handled outside this module.

Controlling GPT with ELC Events

The GPT timer can be configured to stop, start, clear, count up, or count down when an ELC event occurs.

Note

The configurable ELC GPT sources are shared by all GPT channels.
The event links for the ELC must be configured outside this module.

Triggering ELC Events with GPT

The GPT timer can trigger the start of other peripherals. The Event Link Controller (r_elc) guide provides a list of all available peripherals.

Enabling External Sources for Start, Stop, Clear, or Capture

R_GPT_Enable() must be called when external sources are used for start, stop, clear, or capture.

Interrupt Skipping

When an interrupt skipping source is selected a hardware counter will increment each time the selected event occurs. Each interrupt past the first (up to the specified skip count) will be suppressed. If ADC events are selected for skipping they will also be suppressed except during the timer period leading to the selected interrupt skipping event (see below diagram).

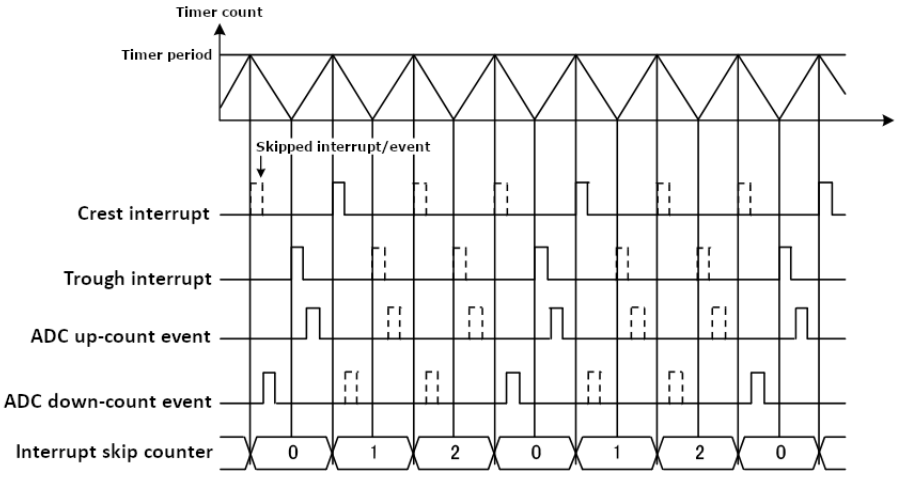

Figure 313: Crest interrupt skipping in triangle-wave PWM modes (skip count 2)

Complementary Output

By using the Custom Waveform option the output pins can be made to output complementary waveforms. To ensure these waveforms stay in sync, the duty cycle for both pins can be set simultaneously by calling R_GPT_DutyCycleSet once with a pin parameter of GPT_IO_PIN_GTIOCA_AND_GTIOCB.

Note

The pin level for 0% and 100% duty cycle is determined by the Cycle End Output Level in normal PWM mode and the Initial Output Level in triangle PWM modes. 100% duty will output the configured level and 0% will output the opposite. Do not use Pin Level Toggle or Pin Level Retain for the Cycle End Output Level if normal PWM waveforms are desired.

Examples

GPT Basic Example

This is a basic example of minimal use of the GPT in an application.

```
void gpt_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = R_GPT_Open(&g_timer0_ctrl, &g_timer0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Start the timer. */
    (void) R_GPT_Start(&g_timer0_ctrl);
}
```

GPT Callback Example

This is an example of a timer callback.

```
/* Example callback called when timer expires. */
void timer_callback (timer_callback_args_t * p_args)
{
 if (TIMER_EVENT_CYCLE_END == p_args->event)
    {
 /* Add application code to be called periodically here. */
    }
}
```

GPT Free Running Counter Example

To use the GPT as a free running counter, select periodic mode and set the the Period to 0xFFFFFFFF for a 32-bit timer or 0xFFFF for a 16-bit timer.

```
void gpt_counter_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* (Optional) If event count mode is used to count edges on a GTETRG pin, POEG must
be started to use GTETRG.
  * Reference Note 1 of Table 23.2 "GPT functions" in the RA6M3 manual
R01UH0886EJ0100. */
 R_BSP_MODULE_START(FSP_IP_POEG, 0U);
 /* Initializes the module. */
    err = R_GPT_Open(&g_timer0_ctrl, &g_timer0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Start the timer. */
    (void) R_GPT_Start(&g_timer0_ctrl);
 /* (Optional) Stop the timer. */
    (void) R_GPT_Stop(&g_timer0_ctrl);
```

```
 /* Read the current counter value. Counter value is in status.counter. */
 timer_status_t status;
    (void) R_GPT_StatusGet(&g_timer0_ctrl, &status);
}
```

GPT Input Capture Example

This is an example of using the GPT to capture pulse width or pulse period measurements.

```
/* Example callback called when a capture occurs. */
uint64_t g_captured_time    = 0U;
uint32_t g_capture_overflows = 0U;
void timer_capture_callback (timer_callback_args_t * p_args)
{
 if ((TIMER_EVENT_CAPTURE_A == p_args->event) || (TIMER_EVENT_CAPTURE_B ==
p_args->event))
    {
 /* (Optional) Get the current period if not known. */
 timer_info_t info;
       (void) R_GPT_InfoGet(&g_timer0_ctrl, &info);
       uint64_t period = info.period_counts;
 /* The maximum period is one more than the maximum 32-bit number, but will be
reflected as 0 in
  * timer_info_t::period_counts. */
 if (0U == period)
      {
            period = UINT32_MAX + 1U;
      }
       g_captured_time    = (period * g_capture_overflows) + p_args->capture;
       g_capture_overflows = 0U;
    }
 if (TIMER_EVENT_CYCLE_END == p_args->event)
    {
 /* An overflow occurred during capture. This must be accounted for at the
application layer. */
```

```
       g_capture_overflows++;
    }
}
void gpt_capture_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = R_GPT_Open(&g_timer0_ctrl, &g_timer0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Enable captures. Captured values arrive in the interrupt. */
    (void) R_GPT_Enable(&g_timer0_ctrl);
 /* (Optional) Disable captures. */
    (void) R_GPT_Disable(&g_timer0_ctrl);
}
```

GPT Period Update Example

This an example of updating the period.

```
#define GPT_EXAMPLE_MSEC_PER_SEC (1000)
#define GPT_EXAMPLE_DESIRED_PERIOD_MSEC (20)
/* This example shows how to calculate a new period value at runtime. */
void gpt_period_calculation_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = R_GPT_Open(&g_timer0_ctrl, &g_timer0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Start the timer. */
    (void) R_GPT_Start(&g_timer0_ctrl);
 /* Get the source clock frequency (in Hz). There are 3 ways to do this in FSP:
  * - If the PCLKD frequency has not changed since reset, the source clock frequency
is
```

```
  * BSP_STARTUP_PCLKD_HZ >> timer_cfg_t::source_div
  * - Use the R_GPT_InfoGet function (it accounts for the divider).
  * - Calculate the current PCLKD frequency using
R_FSP_SystemClockHzGet(FSP_PRIV_CLOCK_PCLKD) and right shift
  * by timer_cfg_t::source_div.
  *
  * This example uses the 3rd option (R_FSP_SystemClockHzGet).
  */
    uint32_t pclkd_freq_hz = R_FSP_SystemClockHzGet(FSP_PRIV_CLOCK_PCLKD) >>
g_timer0_cfg.source_div;
 /* Calculate the desired period based on the current clock. Note that this
calculation could overflow if the
  * desired period is larger than UINT32_MAX / pclkd_freq_hz. A cast to uint64_t is
used to prevent this. */
    uint32_t period_counts =
       (uint32_t) (((uint64_t) pclkd_freq_hz * GPT_EXAMPLE_DESIRED_PERIOD_MSEC) /
GPT_EXAMPLE_MSEC_PER_SEC);
 /* Set the calculated period. */
    err = R_GPT_PeriodSet(&g_timer0_ctrl, period_counts);
    assert(FSP_SUCCESS == err);
}
```

GPT Duty Cycle Update Example

This an example of updating the duty cycle.

```
#define GPT_EXAMPLE_DESIRED_DUTY_CYCLE_PERCENT (25)
#define GPT_EXAMPLE_MAX_PERCENT (100)
/* This example shows how to calculate a new duty cycle value at runtime. */
void gpt_duty_cycle_calculation_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = R_GPT_Open(&g_timer0_ctrl, &g_timer0_cfg);

Data Structure Documentation

◆ gpt_output_pin_t

struct gpt_output_pin_t		
Configurations for output pins.		
Data Fields		
bool	output_enabled	Set to true to enable output, false to disable output.
gpt_pin_level_t	stop_level	Select a stop level from gpt_pin_level_t.

◆ gpt_gtior_setting_t

struct gpt_gtior_setting_t
Custom GTIOR settings used for configuring GTIOCxA and GTIOCxB pins.

◆ gpt_instance_ctrl_t

struct gpt_instance_ctrl_t
Channel control block. DO NOT INITIALIZE. Initialization occurs when timer_api_t::open is called.

◆ gpt_extended_pwm_cfg_t

struct gpt_extended_pwm_cfg_t		
GPT extension for advanced PWM features.		
Data Fields		
uint8_t	trough_ipl	Trough interrupt priority.
IRQn_Type	trough_irq	Trough interrupt.
gpt_poeg_link_t	poeg_link	Select which POEG channel controls output disable for this GPT channel.
gpt_output_disable_t	output_disable	Select which trigger sources request output disable from POEG.
gpt_adc_trigger_t	adc_trigger	Select trigger sources to start A/D conversion.

uint32_t	dead_time_count_up	Set a dead time value for counting up.
uint32_t	dead_time_count_down	Set a dead time value for counting down (available on GPT32E and GPT32EH only)
uint32_t	adc_a_compare_match	Select the compare match value used to trigger an A/D conversion start request using ELC_EVENT_GPT<channel>_AD_TRIG_A.
uint32_t	adc_b_compare_match	Select the compare match value used to trigger an A/D conversion start request using ELC_EVENT_GPT<channel>_AD_TRIG_B.
gpt_interrupt_skip_source_t	interrupt_skip_source	Interrupt source to count for interrupt skipping.
gpt_interrupt_skip_count_t	interrupt_skip_count	Number of interrupts to skip between events.
gpt_interrupt_skip_adc_t	interrupt_skip_adc	ADC events to skip when interrupt skipping is enabled.
gpt_gtioc_disable_t	gtioca_disable_setting	Select how to configure GTIOCA when output is disabled.
gpt_gtioc_disable_t	gtiocb_disable_setting	Select how to configure GTIOCB when output is disabled.

◆ gpt_extended_cfg_t

struct gpt_extended_cfg_t		
GPT extension configures the output pins for GPT.		
Data Fields		
gpt_output_pin_t	gtioca	Configuration for GPT I/O pin A.
gpt_output_pin_t	gtiocb	Configuration for GPT I/O pin B.
gpt_source_t	start_source	Event sources that trigger the timer to start.
gpt_source_t	stop_source	Event sources that trigger the timer to stop.
gpt_source_t	clear_source	Event sources that trigger the timer to clear.
gpt_source_t	capture_a_source	Event sources that trigger capture of GTIOCA.
gpt_source_t	capture_b_source	Event sources that trigger capture of GTIOCB.
gpt_source_t	count_up_source	Event sources that trigger a

		single up count. If GPT_SOURCE_NONE is selected for both count_up_source and count_down_source, then the timer count source is PCLK.
gpt_source_t	count_down_source	Event sources that trigger a single down count. If GPT_SOURCE_NONE is selected for both count_up_source and count_down_source, then the timer count source is PCLK.
gpt_capture_filter_t	capture_filter_gtioca	
gpt_capture_filter_t	capture_filter_gtiocb	
uint8_t	capture_a_ipl	Capture A interrupt priority.
uint8_t	capture_b_ipl	Capture B interrupt priority.
IRQn_Type	capture_a_irq	Capture A interrupt.
IRQn_Type	capture_b_irq	Capture B interrupt.
uint32_t	compare_match_value[2]	Storing compare match value for channels.
uint8_t	compare_match_status	Storing the compare match register status.
gpt_extended_pwm_cfg_t const *	p_pwm_cfg	Advanced PWM features, optional.
gpt_gtior_setting_t	gtior_setting	Custom GTIOR settings used for configuring GTIOCxA and GTIOCxB pins.

Enumeration Type Documentation

◆ gpt_io_pin_t

enum gpt_io_pin_t	
Input/Output pins, used to select which duty cycle to update in R_GPT_DutyCycleSet().	
Enumerator	
GPT_IO_PIN_GTIOCA	GTIOCA.
GPT_IO_PIN_GTIOCB	GTIOCB.
GPT_IO_PIN_GTIOCA_AND_GTIOCB	GTIOCA and GTIOCB.
GPT_IO_PIN_TROUGH	Used in R_GPT_DutyCycleSet when Triangle-wave PWM Mode 3 is selected.
GPT_IO_PIN_CREST	Used in R_GPT_DutyCycleSet when Triangle-wave PWM Mode 3 is selected.
GPT_IO_PIN_ONE_SHOT_LEADING_EDGE	Used in R_GPT_DutyCycleSet to set GTCCRC and GTCCRE registers when One-Shot Pulse mode is selected.
GPT_IO_PIN_ONE_SHOT_TRAILING_EDGE	Used in R_GPT_DutyCycleSet to set GTCCRD and GTCCRF registers when One-Shot Pulse mode is selected.

◆ gpt_buffer_force_push

enum gpt_buffer_force_push	
Forced buffer push operation used in One-Sot Pulse mode with R_GPT_DutyCycleSet().	
Enumerator	
GPT_BUFFER_FORCE_PUSH	Used in R_GPT_DutyCycleSet to force push the data from GTCCRn registers to temporary buffer A or B when One-Shot Pulse mode is selected.

◆ gpt_pin_level_t

enum gpt_pin_level_t	
Level of GPT pin	
Enumerator	
GPT_PIN_LEVEL_LOW	Pin level low.
GPT_PIN_LEVEL_HIGH	Pin level high.

◆ gpt_source_t

enum gpt_source_t	
Sources can be used to start the timer, stop the timer, count up, or count down. These enumerations represent a bitmask. Multiple sources can be ORed together.	
Enumerator	
GPT_SOURCE_NONE	No active event sources.
GPT_SOURCE_GTETRGA_RISING	Action performed on GTETRGA rising edge.
GPT_SOURCE_GTETRGA_FALLING	Action performed on GTETRGA falling edge.
GPT_SOURCE_GTETRGB_RISING	Action performed on GTETRGB rising edge.
GPT_SOURCE_GTETRGB_FALLING	Action performed on GTETRGB falling edge.
GPT_SOURCE_GTETRGC_RISING	Action performed on GTETRGC rising edge.
GPT_SOURCE_GTETRGC_FALLING	Action performed on GTETRGC falling edge.
GPT_SOURCE_GTETRGD_RISING	Action performed on GTETRGB rising edge.
GPT_SOURCE_GTETRGD_FALLING	Action performed on GTETRGB falling edge.
GPT_SOURCE_GTIOCA_RISING_WHILE_GTIOCB_LOW	Action performed when GTIOCA input rises while GTIOCB is low.
GPT_SOURCE_GTIOCA_RISING_WHILE_GTIOCB_HIGH	Action performed when GTIOCA input rises while GTIOCB is high.
GPT_SOURCE_GTIOCA_FALLING_WHILE_GTIOCB_LOW	Action performed when GTIOCA input falls while GTIOCB is low.
GPT_SOURCE_GTIOCA_FALLING_WHILE_GTIOCB_HIGH	Action performed when GTIOCA input falls while GTIOCB is high.

GPT_SOURCE_GTIOCB_RISING_WHILE_GTIOCA_LOW	Action performed when GTIOCB input rises while GTIOCA is low.
GPT_SOURCE_GTIOCB_RISING_WHILE_GTIOCA_HIGH	Action performed when GTIOCB input rises while GTIOCA is high.
GPT_SOURCE_GTIOCB_FALLING_WHILE_GTIOCA_LOW	Action performed when GTIOCB input falls while GTIOCA is low.
GPT_SOURCE_GTIOCB_FALLING_WHILE_GTIOCA_HIGH	Action performed when GTIOCB input falls while GTIOCA is high.
GPT_SOURCE_GPT_A	Action performed on ELC GPTA event.
GPT_SOURCE_GPT_B	Action performed on ELC GPTB event.
GPT_SOURCE_GPT_C	Action performed on ELC GPTC event.
GPT_SOURCE_GPT_D	Action performed on ELC GPTD event.
GPT_SOURCE_GPT_E	Action performed on ELC GPTE event.
GPT_SOURCE_GPT_F	Action performed on ELC GPTF event.
GPT_SOURCE_GPT_G	Action performed on ELC GPTG event.
GPT_SOURCE_GPT_H	Action performed on ELC GPTH event.

◆ gpt_capture_filter_t

enum gpt_capture_filter_t	
Input capture signal noise filter (debounce) setting. Only available for input signals GTIOCxA and GTIOCxB. The noise filter samples the external signal at intervals of the PCLK divided by one of the values. When 3 consecutive samples are at the same level (high or low), then that level is passed on as the observed state of the signal. See "Noise Filter Function" in the hardware manual, GPT section.	
Enumerator	
GPT_CAPTURE_FILTER_NONE	None - no filtering.
GPT_CAPTURE_FILTER_PCLKD_DIV_1	PCLK/1 - fast sampling.
GPT_CAPTURE_FILTER_PCLKD_DIV_4	PCLK/4.
GPT_CAPTURE_FILTER_PCLKD_DIV_16	PCLK/16.
GPT_CAPTURE_FILTER_PCLKD_DIV_64	PCLK/64 - slow sampling.

◆ gpt_adc_trigger_t

enum gpt_adc_trigger_t	
Trigger options to start A/D conversion.	
Enumerator	
GPT_ADC_TRIGGER_NONE	None - no output disable request.
GPT_ADC_TRIGGER_UP_COUNT_START_ADC_A	Request A/D conversion from ADC unit 0 at up counting compare match of gpt_extended_pwm_cfg_t::adc_a_compare_match.
GPT_ADC_TRIGGER_DOWN_COUNT_START_ADC_A	Request A/D conversion from ADC unit 0 at down counting compare match of gpt_extended_pwm_cfg_t::adc_a_compare_match.
GPT_ADC_TRIGGER_UP_COUNT_START_ADC_B	Request A/D conversion from ADC unit 1 at up counting compare match of gpt_extended_pwm_cfg_t::adc_b_compare_match.
GPT_ADC_TRIGGER_DOWN_COUNT_START_ADC_B	Request A/D conversion from ADC unit 1 at down counting compare match of gpt_extended_pwm_cfg_t::adc_b_compare_match.

◆ gpt_poeg_link_t

enum gpt_poeg_link_t	
POEG channel to link to this channel.	
Enumerator	
GPT_POEG_LINK_POEG0	Link this GPT channel to POEG channel 0 (GTETRGA)
GPT_POEG_LINK_POEG1	Link this GPT channel to POEG channel 1 (GTETRGB)
GPT_POEG_LINK_POEG2	Link this GPT channel to POEG channel 2 (GTETRGC)
GPT_POEG_LINK_POEG3	Link this GPT channel to POEG channel 3 (GTETRGD)

◆ gpt_output_disable_t

enum gpt_output_disable_t	
Select trigger to send output disable request to POEG.	
Enumerator	
GPT_OUTPUT_DISABLE_NONE	None - no output disable request.
GPT_OUTPUT_DISABLE_DEAD_TIME_ERROR	Request output disable if a dead time error occurs.
GPT_OUTPUT_DISABLE_GTIOCA_GTIOCB_HIGH	Request output disable if GTIOCA and GTIOCB are high at the same time.
GPT_OUTPUT_DISABLE_GTIOCA_GTIOCB_LOW	Request output disable if GTIOCA and GTIOCB are low at the same time.

◆ gpt_gtioc_disable_t

enum gpt_gtioc_disable_t	
Disable level options for GTIOC pins.	
Enumerator	
GPT_GTIOC_DISABLE_PROHIBITED	Do not allow output disable.
GPT_GTIOC_DISABLE_SET_HI_Z	Set GTIOC to high impedance when output is disabled.
GPT_GTIOC_DISABLE_LEVEL_LOW	Set GTIOC level low when output is disabled.
GPT_GTIOC_DISABLE_LEVEL_HIGH	Set GTIOC level high when output is disabled.

◆ gpt_adc_compare_match_t

enum gpt_adc_compare_match_t	
Trigger options to start A/D conversion.	
Enumerator	
GPT_ADC_COMPARE_MATCH_ADC_A	Set A/D conversion start request value for GPT A/D converter start request A.
GPT_ADC_COMPARE_MATCH_ADC_B	Set A/D conversion start request value for GPT A/D converter start request B.

◆ gpt_interrupt_skip_source_t

enum gpt_interrupt_skip_source_t	
Interrupt skipping modes	
Enumerator	
GPT_INTERRUPT_SKIP_SOURCE_NONE	Do not skip interrupts.
GPT_INTERRUPT_SKIP_SOURCE_OVERFLOW_UNDERFLOW	Count and skip overflow and underflow interrupts.
GPT_INTERRUPT_SKIP_SOURCE_CREST	Count crest interrupts for interrupt skipping. Skip the number of crest and trough interrupts configured in gpt_interrupt_skip_count_t. When the interrupt does fire, the trough interrupt fires before the crest interrupt.
GPT_INTERRUPT_SKIP_SOURCE_TROUGH	Count trough interrupts for interrupt skipping. Skip the number of crest and trough interrupts configured in gpt_interrupt_skip_count_t. When the interrupt does fire, the crest interrupt fires before the trough interrupt.

◆ gpt_interrupt_skip_count_t

enum gpt_interrupt_skip_count_t	
Number of interrupts to skip between events	
Enumerator	
GPT_INTERRUPT_SKIP_COUNT_0	Do not skip interrupts.
GPT_INTERRUPT_SKIP_COUNT_1	Skip one interrupt.
GPT_INTERRUPT_SKIP_COUNT_2	Skip two interrupts.
GPT_INTERRUPT_SKIP_COUNT_3	Skip three interrupts.
GPT_INTERRUPT_SKIP_COUNT_4	Skip four interrupts.
GPT_INTERRUPT_SKIP_COUNT_5	Skip five interrupts.
GPT_INTERRUPT_SKIP_COUNT_6	Skip six interrupts.
GPT_INTERRUPT_SKIP_COUNT_7	Skip seven interrupts.

◆ gpt_interrupt_skip_adc_t

enum gpt_interrupt_skip_adc_t	
ADC events to skip during interrupt skipping	
Enumerator	
GPT_INTERRUPT_SKIP_ADC_NONE	Do not skip ADC events.
GPT_INTERRUPT_SKIP_ADC_A	Skip ADC A events.
GPT_INTERRUPT_SKIP_ADC_B	Skip ADC B events.
GPT_INTERRUPT_SKIP_ADC_A_AND_B	Skip ADC A and B events.

◆ gpt_pwm_output_delay_setting_t

enum gpt_pwm_output_delay_setting_t	
Delay setting for the PWM Delay Generation Circuit (PDG).	
Enumerator	
GPT_PWM_OUTPUT_DELAY_SETTING_0_32	Delay is not applied.
GPT_PWM_OUTPUT_DELAY_SETTING_1_32	Delay of 1 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_2_32	Delay of 2 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_3_32	Delay of 3 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_4_32	Delay of 4 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_5_32	Delay of 5 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_6_32	Delay of 6 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_7_32	Delay of 7 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_8_32	Delay of 8 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_9_32	Delay of 9 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_10_32	Delay of 10 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_11_32	Delay of 11 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_12_32	Delay of 12 / 32 GTCLK period applied.

GPT_PWM_OUTPUT_DELAY_SETTING_13_32	Delay of 13 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_14_32	Delay of 14 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_15_32	Delay of 15 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_16_32	Delay of 16 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_17_32	Delay of 17 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_18_32	Delay of 18 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_19_32	Delay of 19 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_20_32	Delay of 20 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_21_32	Delay of 21 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_22_32	Delay of 22 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_23_32	Delay of 23 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_24_32	Delay of 24 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_25_32	Delay of 25 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_26_32	Delay of 26 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_27_32	Delay of 27 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_28_32	Delay of 28 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_29_32	Delay of 29 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_30_32	Delay of 30 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_31_32	Delay of 31 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_BYPASS	Bypass the PWM Output Delay Circuit.

◆ gpt_pwm_output_delay_edge_t

enum gpt_pwm_output_delay_edge_t	
Select which PWM Output Delay setting to apply.	
Enumerator	
GPT_PWM_OUTPUT_DELAY_EDGE_RISING	Configure the PWM Output Delay setting for rising edge.
GPT_PWM_OUTPUT_DELAY_EDGE_FALLING	Configure the PWM Output Delay setting for falling edge.

Function Documentation

◆ R_GPT_Open()

fsp_err_t R_GPT_Open (timer_ctrl_t *const *p_ctrl*, timer_cfg_t const *const *p_cfg*)

Initializes the timer module and applies configurations. Implements timer_api_t::open.

GPT hardware does not support one-shot functionality natively. When using one-shot mode, the timer will be stopped in an ISR after the requested period has elapsed.

The GPT implementation of the general timer can accept a gpt_extended_cfg_t extension parameter.

Example:

```
/* Initializes the module. */
   err = R_GPT_Open(&g_timer0_ctrl, &g_timer0_cfg);
```

Return values

FSP_SUCCESS	Initialization was successful and timer has started.
FSP_ERR_ASSERTION	A required input pointer is NULL or the source divider is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open.
FSP_ERR_IRQ_BSP_DISABLED	timer_cfg_t::mode is TIMER_MODE_ONE_SHOT or timer_cfg_t::p_callback is not NULL, but ISR is not enabled. ISR must be enabled to use one-shot mode or callback.
FSP_ERR_INVALID_MODE	Triangle wave PWM is only supported if GPT_CFG_OUTPUT_SUPPORT_ENABLE is 2. Selected channel does not support external count sources. External and event count sources not are available in this mode.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	The channel requested in the p_cfg parameter is not available on this device.

◆ R_GPT_Stop()

fsp_err_t R_GPT_Stop (timer_ctrl_t *const *p_ctrl*)

Stops timer. Implements timer_api_t::stop.

Example:

```
/* (Optional) Stop the timer. */
   (void) R_GPT_Stop(&g_timer0_ctrl);
```

Return values

FSP_SUCCESS	Timer successfully stopped.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ R_GPT_Start()

fsp_err_t R_GPT_Start (timer_ctrl_t *const *p_ctrl*)

Starts timer. Implements timer_api_t::start.

Example:

```
/* Start the timer. */
   (void) R_GPT_Start(&g_timer0_ctrl);
```

Return values

FSP_SUCCESS	Timer successfully started.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ R_GPT_Reset()

fsp_err_t R_GPT_Reset (timer_ctrl_t *const *p_ctrl*)

Resets the counter value to 0. Implements timer_api_t::reset.

Note

This function also updates to the new period if no counter overflow has occurred since the last call to R_GPT_PeriodSet().

Return values

FSP_SUCCESS	Counter value written successfully.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ R_GPT_Enable()

fsp_err_t R_GPT_Enable (timer_ctrl_t *const *p_ctrl*)

Enables external event triggers that start, stop, clear, or capture the counter. Implements timer_api_t::enable.

Example:

```
/* Enable captures. Captured values arrive in the interrupt. */
   (void) R_GPT_Enable(&g_timer0_ctrl);
```

Return values

FSP_SUCCESS	External events successfully enabled.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ R_GPT_Disable()

fsp_err_t R_GPT_Disable (timer_ctrl_t *const *p_ctrl*)

Disables external event triggers that start, stop, clear, or capture the counter. Implements timer_api_t::disable.

Note

The timer could be running after R_GPT_Disable(). To ensure it is stopped, call R_GPT_Stop().

Example:

```
/* (Optional) Disable captures. */
   (void) R_GPT_Disable(&g_timer0_ctrl);
```

Return values

FSP_SUCCESS	External events successfully disabled.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ R_GPT_PeriodSet()

fsp_err_t R_GPT_PeriodSet (timer_ctrl_t *const *p_ctrl*, uint32_t const *period_counts*)

Sets period value provided. If the timer is running, the period will be updated after the next counter overflow. If the timer is stopped, this function resets the counter and updates the period. Implements timer_api_t::periodSet.

Warning

If periodic output is used, the duty cycle buffer registers are updated after the period buffer register. If this function is called while the timer is running and a GPT overflow occurs during processing, the duty cycle will not be the desired 50% duty cycle until the counter overflow after processing completes.

Example:

```
 /* Get the source clock frequency (in Hz). There are 3 ways to do this in FSP:
  * - If the PCLKD frequency has not changed since reset, the source clock frequency
is
  * BSP_STARTUP_PCLKD_HZ >> timer_cfg_t::source_div
  * - Use the R_GPT_InfoGet function (it accounts for the divider).
  * - Calculate the current PCLKD frequency using
R_FSP_SystemClockHzGet(FSP_PRIV_CLOCK_PCLKD) and right shift
  * by timer_cfg_t::source_div.
  *
```

```
  * This example uses the 3rd option (R_FSP_SystemClockHzGet).
  */
    uint32_t pclkd_freq_hz = R_FSP_SystemClockHzGet(FSP_PRIV_CLOCK_PCLKD) >>
g_timer0_cfg.source_div;
 /* Calculate the desired period based on the current clock. Note that this
calculation could overflow if the
  * desired period is larger than UINT32_MAX / pclkd_freq_hz. A cast to uint64_t is
used to prevent this. */
    uint32_t period_counts =
       (uint32_t) (((uint64_t) pclkd_freq_hz * GPT_EXAMPLE_DESIRED_PERIOD_MSEC) /
GPT_EXAMPLE_MSEC_PER_SEC);
 /* Set the calculated period. */
    err = R_GPT_PeriodSet(&g_timer0_ctrl, period_counts);
    assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Period value written successfully.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ R_GPT_DutyCycleSet()

fsp_err_t R_GPT_DutyCycleSet (timer_ctrl_t *const *p_ctrl*, uint32_t const *duty_cycle_counts*, uint32_t const *pin*)

Sets duty cycle on requested pin. Implements timer_api_t::dutyCycleSet.

Duty cycle is updated in the buffer register. The updated duty cycle is reflected after the next cycle end (counter overflow).

Example:

```
 /* Get the current period setting. */
 timer_info_t info;
    (void) R_GPT_InfoGet(&g_timer0_ctrl, &info);
    uint32_t current_period_counts = info.period_counts;
 /* Calculate the desired duty cycle based on the current period. Note that if the
period could be larger than
  * UINT32_MAX / 100, this calculation could overflow. A cast to uint64_t is used to
```

```
prevent this. The cast is
  * not required for 16-bit timers. */
    uint32_t duty_cycle_counts =
       (uint32_t) (((uint64_t) current_period_counts *
GPT_EXAMPLE_DESIRED_DUTY_CYCLE_PERCENT) /
                   GPT_EXAMPLE_MAX_PERCENT);
 /* Set the calculated duty cycle. */
    err = R_GPT_DutyCycleSet(&g_timer0_ctrl, duty_cycle_counts, GPT_IO_PIN_GTIOCB);
    assert(FSP_SUCCESS == err);
```

Parameters

[in]	p_ctrl	Pointer to instance control block.
[in]	duty_cycle_counts	Duty cycle to set in counts.
[in]	pin	Use gpt_io_pin_t to select GPT_IO_PIN_GTIOCA or GPT_IO_PIN_GTIOCB

Return values

FSP_SUCCESS	Duty cycle updated successfully.
FSP_ERR_ASSERTION	p_ctrl was NULL or the pin is not one of gpt_io_pin_t
FSP_ERR_NOT_OPEN	The instance is not opened.
FSP_ERR_INVALID_ARGUMENT	Duty cycle is larger than period.
FSP_ERR_INVALID_MODE	GPT_IO_PIN_TROUGH, and GPT_IO_PIN_CREST settings are invalid in the this mode.
FSP_ERR_UNSUPPORTED	GPT_CFG_OUTPUT_SUPPORT_ENABLE is 0.

◆ R_GPT_CompareMatchSet()

fsp_err_t R_GPT_CompareMatchSet (timer_ctrl_t *const *p_ctrl*, uint32_t const *compare_match_value*, timer_compare_match_t const *match_channel*)

Set value for compare match feature. Implements timer_api_t::compareMatchSet.

Note

This API should be used when timer is stop counting. And shall not be used along with PWM operation.

Example:

```
 /* Set the compare match value (GPT_COMPARE_MATCH_EXAMPLE_VALUE). This value must be
less than or equal to period value. */
    err = R_GPT_CompareMatchSet(&g_timer0_ctrl, GPT_COMPARE_MATCH_EXAMPLE_VALUE,
TIMER_COMPARE_MATCH_A);
    assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Set the compare match value successfully.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.
FSP_ERR_NOT_ENABLED	Requested compare channel is disabled.

◆ R_GPT_InfoGet()

fsp_err_t R_GPT_InfoGet (timer_ctrl_t *const *p_ctrl*, timer_info_t *const *p_info*)

Get timer information and store it in provided pointer p_info. Implements timer_api_t::infoGet.

Example:

```
/* (Optional) Get the current period if not known. */
timer_info_t info;
      (void) R_GPT_InfoGet(&g_timer0_ctrl, &info);
      uint64_t period = info.period_counts;
/* The maximum period is one more than the maximum 32-bit number, but will be
reflected as 0 in
 * timer_info_t::period_counts. */
if (0U == period)
    {
          period = UINT32_MAX + 1U;
    }
```

Return values

FSP_SUCCESS	Period, count direction, frequency, and ELC event written to caller's structure successfully.
FSP_ERR_ASSERTION	p_ctrl or p_info was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ R_GPT_StatusGet()

fsp_err_t R_GPT_StatusGet (timer_ctrl_t *const *p_ctrl*, timer_status_t *const *p_status*)

Get current timer status and store it in provided pointer p_status. Implements timer_api_t::statusGet.

Example:

```
/* Read the current counter value. Counter value is in status.counter. */
timer_status_t status;
   (void) R_GPT_StatusGet(&g_timer0_ctrl, &status);
```

Return values

FSP_SUCCESS	Current timer state and counter value set successfully.
FSP_ERR_ASSERTION	p_ctrl or p_status was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ R_GPT_CounterSet()

fsp_err_t R_GPT_CounterSet (timer_ctrl_t *const *p_ctrl*, uint32_t *counter*)

Set counter value.

Note

Do not call this API while the counter is counting. The counter value can only be updated while the counter is stopped.

Return values

FSP_SUCCESS	Counter value updated.
FSP_ERR_ASSERTION	p_ctrl or p_status was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.
FSP_ERR_IN_USE	The timer is running. Stop the timer before calling this function.

◆ R_GPT_OutputEnable()

fsp_err_t R_GPT_OutputEnable (timer_ctrl_t *const *p_ctrl*, gpt_io_pin_t *pin*)

Enable output for GTIOCA and/or GTIOCB.

Return values

FSP_SUCCESS	Output is enabled.
FSP_ERR_ASSERTION	p_ctrl or p_status was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ R_GPT_OutputDisable()

fsp_err_t R_GPT_OutputDisable (timer_ctrl_t *const *p_ctrl*, gpt_io_pin_t *pin*)

Disable output for GTIOCA and/or GTIOCB.

Return values

FSP_SUCCESS	Output is disabled.
FSP_ERR_ASSERTION	p_ctrl or p_status was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ R_GPT_AdcTriggerSet()

fsp_err_t R_GPT_AdcTriggerSet (timer_ctrl_t *const *p_ctrl*, gpt_adc_compare_match_t *which_compare_match*, uint32_t *compare_match_value*)

Set A/D converter start request compare match value.

Return values

FSP_SUCCESS	Counter value updated.
FSP_ERR_ASSERTION	p_ctrl or p_status was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ R_GPT_PwmOutputDelaySet()

fsp_err_t R_GPT_PwmOutputDelaySet (timer_ctrl_t *const *p_ctrl*, gpt_pwm_output_delay_edge_t *edge*, gpt_pwm_output_delay_setting_t *delay_setting*, uint32_t const *pin*)

Set the Output Delay setting for the PWM output pin.

Return values

FSP_SUCCESS	The output delay was set.
FSP_ERR_ASSERTION	An input parameter was invalid.
FSP_ERR_NOT_OPEN	The instance is not opened.
FSP_ERR_INVALID_CHANNEL	The channel does not support this feature.
FSP_ERR_NOT_INITIALIZED	The PWM Output Delay Circuit has not been initialized.
FSP_ERR_INVALID_STATE	The PWM Output Delay setting cannot be updated in the current state.
FSP_ERR_UNSUPPORTED	This feature is not supported on this MCU.

◆ R_GPT_CallbackSet()

fsp_err_t R_GPT_CallbackSet (timer_ctrl_t *const *p_api_ctrl*, void(*)(timer_callback_args_t *) *p_callback*, void const *const *p_context*, timer_callback_args_t *const *p_callback_memory*)

Updates the user callback with the option to provide memory for the callback argument structure. Implements timer_api_t::callbackSet.

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

◆ R_GPT_Close()

fsp_err_t R_GPT_Close (timer_ctrl_t *const *p_ctrl*)

Stops counter, disables output pins, and clears internal driver data. Implements timer_api_t::close.

Return values

FSP_SUCCESS	Successful close.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ R_GPT_PwmOutputDelayInitialize()

fsp_err_t R_GPT_PwmOutputDelayInitialize ( )

Initialize the PWM Delay Generation Circuit (PDG). This function must be called before calling R_GPT_PwmOutputDelaySet.

Note

This function will delay for 20 microseconds.

Return values

FSP_SUCCESS	Initialization sequence completed successfully.
FSP_ERR_INVALID_STATE	The source clock frequnecy is out of the required range for the PDG.
FSP_ERR_UNSUPPORTED	This feature is not supported.

Detailed Description

Driver for the AGT and AGTW peripheral on RA MCUs. This module implements the Timer Interface.

Overview

Features

The AGT module has the following features:

- Supports 16- and 32-bit timers via the AGT and AGTW peripherals, respectively.
- Supports periodic mode, one-shot mode, and PWM mode.
- Signal can be output to a pin.
- Configurable period (counts per timer cycle).
- Configurable duty cycle in PWM mode.
- Configurable clock source, including PCLKB, LOCO, SUBCLK, and external sources input to AGTIO.
- Supports runtime reconfiguration of period.
- Supports runtime reconfiguration of duty cycle in PWM mode.
- Supports counting based on an external clock input to AGTIO.
- Supports debounce filter on AGTIO pins.
- Supports measuring pulse width or pulse period.
- APIs are provided to start, stop, and reset the counter.
- APIs are provided to get the current period, source clock frequency, and count direction.
- APIs are provided to get the current timer status and counter value.

Selecting a Timer

RA MCUs have two timer peripherals: the General PWM Timer (GPT) and the Asynchronous General Purpose Timer (AGT). When selecting between them, consider these factors:

	GPT	AGT
Low Power Modes	The GPT can operate in sleep mode.	The AGT can operate in all low power modes (when count source is LOCO or subclock).
Available Channels	The number of GPT channels is device specific. All currently supported MCUs have at least 7 GPT channels.	All MCUs have at least 2 AGT channels.
Timer Resolution	All MCUs have at least one 32-bit GPT timer.	The AGT timers can be 16-bit or 32-bit timers.
Clock Source	The GPT runs off PCLKD with a configurable divider up to 1024. It can also be configured to count ELC events or external pulses.	The AGT runs off PCLKB, LOCO, or subclock with a configurable divider up to 8 for PCLKB or up to 128 for LOCO or subclock.

Configuration

Build Time Configurations for r_agt

The following build time configurations are defined in fsp_cfg/r_agt_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
Pin Output Support	• Disabled • Enabled	Disabled	If selected code for outputting a waveform to a pin is included in the build.
Pin Input Support	• Disabled • Enabled	Disabled	Enable input support to use pulse width measurement mode, pulse period measurement mode, or input from P402, P403, P404, or AGTIO.

Configurations for Timers > Timer, Low-Power (r_agt)

This module can be added to the Stacks tab via New Stack > Timers > Timer, Low-Power (r_agt). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
General			
Name	Name must be a valid C symbol	g_timer0	Module name.
Counter Bit Width	MCU Specific Options		Counter register bit width (16-bit or 32-bit))
Channel	Channel number must be a non-negative integer	0	Physical hardware channel.
Mode	• Periodic • One-Shot • PWM	Periodic	Mode selection. Note: One-shot mode is implemented in software. ISR's must be enabled for one shot even if callback is unused.
Period	Value must be non-negative	0x10000	Specify the timer period based on the selected unit. When the unit is set to 'Raw Counts', setting the period to 0x100000000 (32-bit) or 0x10000 (16-bit) results in the maximum period at the lowest divisor (fastest timer tick). Set the period to 0x100000000 (32-bit) or 0x10000 (16-bit) for a free running timer, pulse width measurement or pulse period measurement. Setting the period higher will automatically select a higher divider; the period can be set up to 0x800000000 (32-bit) or 0x80000 (16-bit) when counting from PCLKB or 0x8000000000 (32-bit) or 0x800000 (16-bit) when counting from LOCO/subclock, which will use a divider of 8 or 128 respectively with the maximum

			period. If the requested period cannot be achieved, the settings with the largest possible period that is less than or equal to the requested period are used. The theoretical calculated period is printed in a comment in the timer_cfg_t structure.
Period Unit	• Raw Counts • Nanoseconds • Microseconds • Milliseconds • Seconds • Hertz • Kilohertz	Raw Counts	Unit of the period specified above
Count Source	MCU Specific Options		AGT counter clock source. NOTE: The divisor is calculated automatically based on the selected period. See agt_clock_t documentation for details.
Output			
Duty Cycle Percent (only applicable in PWM mode)	Value must be between 0 and 100	50	Specify the timer duty cycle percent. Only used in PWM mode.
AGTOA Output	• Disabled • Start Level Low • Start Level High	Disabled	Configure AGTOA output.
AGTOB Output	• Disabled • Start Level Low • Start Level High	Disabled	Configure AGTOB output.
AGTO Output	• Disabled • Start Level Low • Start Level High	Disabled	Configure AGTO output.
Input			
Measurement Mode	• Measure Disabled • Measure Low Level Pulse Width • Measure High Level Pulse	Measure Disabled	Select if the AGT should be used to measure pulse width or pulse period. In high level pulse width measurement mode, the AGT counts when

	Width • Measure Pulse Period		AGTIO is high and starts counting immediately in the middle of a pulse if AGTIO is high when R_AGT_Start() is called. In low level pulse width measurement mode, the AGT counts when AGTIO is low and could start counting in the middle of a pulse if AGTIO is low when R_AGT_Start() is called.
Input Filter	• No Filter • Filter sampled at PCLKB • Filter sampled at PCLKB / 8 • Filter sampled at PCLKB / 32	No Filter	Input filter, applies AGTIO in pulse period measurement, pulse width measurement, or event counter mode. The filter requires the signal to be at the same level for 3 successive reads at the specified filter frequency.
Enable Pin	• Enable Pin Not Used • Enable Pin Active Low • Enable Pin Active High	Enable Pin Not Used	Select active edge for the AGTEE pin if used. Only applies if the count source is P402, P403 or AGTIO.
Trigger Edge	• Trigger Edge Rising • Trigger Edge Falling • Trigger Edge Both	Trigger Edge Rising	Select the trigger edge. Applies if measurement mode is pulse period, or if the count source is P402, P403, or AGTIO. Do not select Trigger Edge Both with pulse period measurement.
Interrupts			
Callback	Name must be a valid C symbol	NULL	A user callback function. If this callback function is provided, it is called from the interrupt service routine (ISR) each time the timer period elapses.
Underflow Interrupt Priority	MCU Specific Options		Timer interrupt priority.

When using the AGT module on devices with both AGT and AGTW peripherals, the channel numbers used with the AGT driver are combined between both peripherals; AGTW channels are listed first followed by AGT. For example, on the RA2A2 there are 2 AGTW channels and 8 AGT channels. These correspond to channels 0-1 for AGTW0-AGTW1 and 2-9 for AGT0-AGT7.

Clock Configuration

The AGT clock is based on the PCLKB, LOCO, or Subclock frequency. You can set the clock frequency using the **Clocks** tab of the RA Configuration editor or by using the CGC Interface at run-time.

Pin Configuration

This module can use the AGTOA and AGTOB pins as output pins for periodic, one-shot, or PWM signals.

For input capture, the input signal must be applied to the AGTIOn pin.

For event counting, the AGTEEn enable pin is optional.

Timer Period

The RA Configuration editor will automatically calculate the period count value and source clock divider based on the selected period time, units, and clock speed.

When the selected unit is "Raw counts", the maximum allowed period setting varies depending on the selected clock source:

Clock source	16-bit Timer Maximum period (counts)	32-bit Timer Maximum period (counts)
LOCO/Subclock	0x800000	0x8000000000
PCLKB	0x80000	0x800000000
All other sources	0x10000	0x100000000

Note

The period interrupt occurs when the counter underflows, setting the period register to 0 results in an effective period of 1 count. For this reason all user-provided raw count values reflect the actual number of period counts (not the raw register values).
When using a 32-bit channel (AGTW), a special period count value of 0 is used to obtain an actual period register value of 0xFFFFFFFF.

Usage Notes

Starting and Stopping the AGT

After starting or stopping the timer, AGT registers cannot be accessed until the AGT state is updated after 3 AGTCLK cycles. If another AGT function is called before the 3 AGTCLK period elapses, the function spins waiting for the AGT state to update. The required wait time after starting or stopping the timer can be determined using the frequency of AGTCLK, which is derived from timer_cfg_t::source_div and agt_extended_cfg_t::count_source.

The application is responsible for ensuring required clocks are started and stable before accessing MCU peripheral registers.

Warning

The subclock can take seconds to stabilize. The RA startup code does not wait for subclock stabilization unless the subclock is the main clock source. When running AGT or RTC off the subclock, the application must ensure the subclock is stable before starting operation.

Low Power Modes

The AGT1 (channel 1 only) can be used to enter snooze mode or to wake the MCU from snooze, software standby, or deep software standby modes when a counter underflow occurs. The compare match A and B events can also be used to wake from software standby or snooze modes.

One-Shot Mode

The AGT timer does not support one-shot mode natively. One-shot mode is achieved by stopping the timer in the interrupt service routine before the callback is called. If the interrupt is not serviced before the timer period expires again, the timer generates more than one event. The callback is only called once in this case, but multiple events may be generated if the timer is linked to the Transfer (r_dtc).

One-Shot Mode Output

The output waveform in one-shot mode is one AGT clock cycle less than the configured period. The configured period must be at least 2 counts to generate an output pulse.

Examples of one-shot signals that can be generated by this module are shown below:

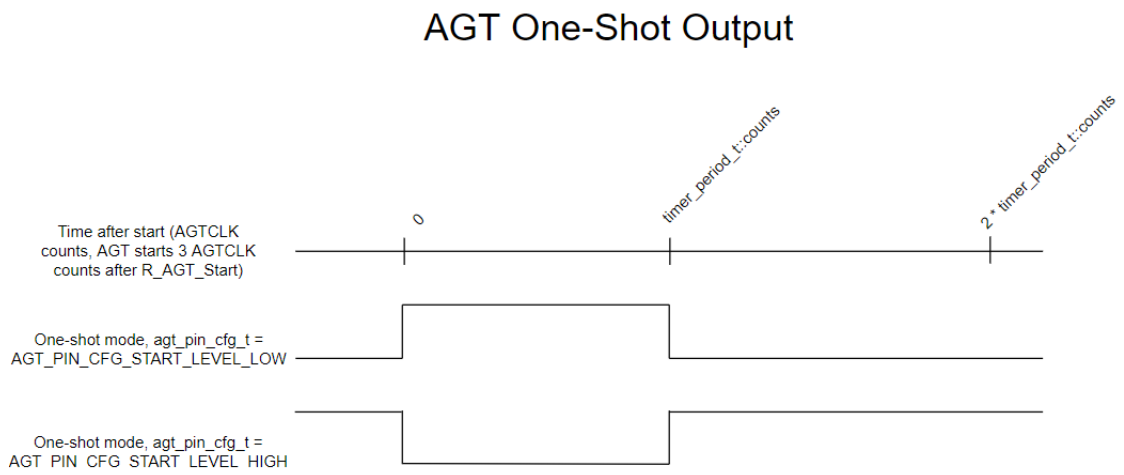

Figure 314: AGT One-Shot Output

Periodic Output

The AGTOA or AGTOB pin toggles twice each time the timer expires in periodic mode. This is achieved by defining a PWM wave at a 50 percent duty cycle so that the period of the resulting square (from rising edge to rising edge) matches the period of the AGT timer. Since the periodic output is actually a PWM output, the time at the stop level is one cycle shorter than the time opposite the stop level for odd period values.

Examples of periodic signals that can be generated by this module are shown below:

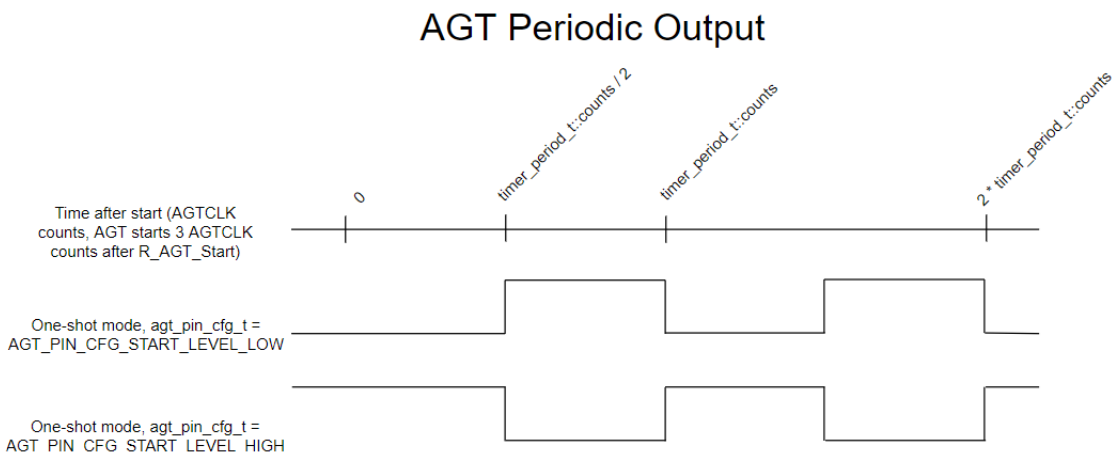

Figure 315: AGT Periodic Output

PWM Output

This module does not support in phase PWM output. The PWM output signal is low at the beginning of the cycle and high at the end of the cycle.

Examples of PWM signals that can be generated by this module are shown below:

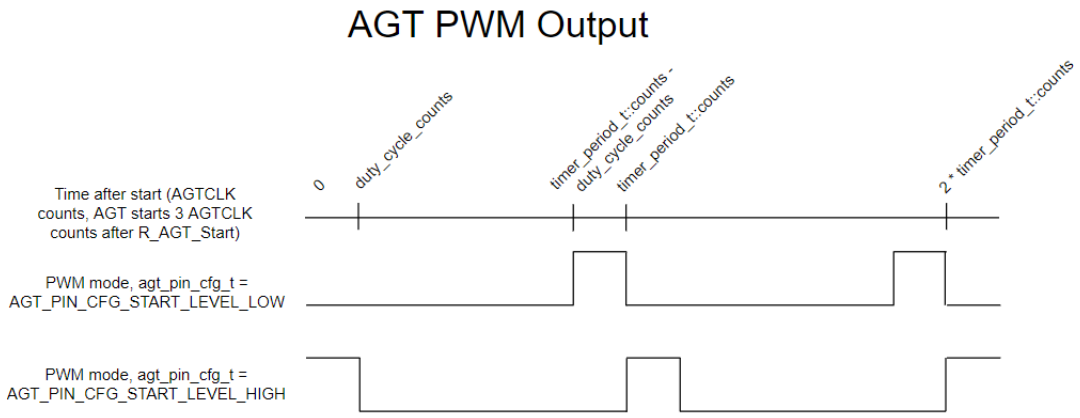

Figure 316: AGT PWM Output

Triggering ELC Events with AGT

The AGT timer can trigger the start of other peripherals. The Event Link Controller (r_elc) guide provides a list of all available peripherals.

Examples

AGT Basic Example

This is a basic example of minimal use of the AGT in an application.

```
void agt_basic_example (void)
```

```
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = R_AGT_Open(&g_timer0_ctrl, &g_timer0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Start the timer. */
    (void) R_AGT_Start(&g_timer0_ctrl);
}
```

AGT Callback Example

This is an example of a timer callback.

```
/* Example callback called when timer expires. */
void timer_callback (timer_callback_args_t * p_args)
{
 if (TIMER_EVENT_CYCLE_END == p_args->event)
    {
 /* Add application code to be called periodically here. */
    }
}
```

AGT Free Running Counter Example

To use the AGT as a free running counter, select periodic mode and set the the Period to 0xFFFFFFFF for a 32-bit timer or 0xFFFF for a 16-bit timer.

```
void agt_counter_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = R_AGT_Open(&g_timer0_ctrl, &g_timer0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
```

```
 /* Start the timer. */
    (void) R_AGT_Start(&g_timer0_ctrl);
 /* (Optional) Stop the timer. */
    (void) R_AGT_Stop(&g_timer0_ctrl);
 /* Read the current counter value. Counter value is in status.counter. */
 timer_status_t status;
    (void) R_AGT_StatusGet(&g_timer0_ctrl, &status);
}
```

AGT Input Capture Example

This is an example of using the AGT to capture pulse width or pulse period measurements.

```
/* Example callback called when a capture occurs. */
uint64_t g_captured_time    = 0U;
uint32_t g_capture_overflows = 0U;
void timer_capture_callback (timer_callback_args_t * p_args)
{
 if (TIMER_EVENT_CAPTURE_A == p_args->event)
    {
 /* (Optional) Get the current period if not known. */
 timer_info_t info;
       (void) R_AGT_InfoGet(&g_timer0_ctrl, &info);
       uint32_t period = info.period_counts;
 /* Process capture from AGTIO. */
       g_captured_time    = ((uint64_t) period * g_capture_overflows) +
p_args->capture;
       g_capture_overflows = 0U;
    }
 if (TIMER_EVENT_CYCLE_END == p_args->event)
    {
 /* An overflow occurred during capture. This must be accounted for at the
application layer. */
       g_capture_overflows++;
    }
```

```
}
void agt_capture_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = R_AGT_Open(&g_timer0_ctrl, &g_timer0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Enable captures. Captured values arrive in the interrupt. */
    (void) R_AGT_Enable(&g_timer0_ctrl);
 /* (Optional) Disable captures. */
    (void) R_AGT_Disable(&g_timer0_ctrl);
}
```

AGT Period Update Example

This an example of updating the period.

```
#define AGT_EXAMPLE_MSEC_PER_SEC (1000)
#define AGT_EXAMPLE_DESIRED_PERIOD_MSEC (20)
/* This example shows how to calculate a new period value at runtime. */
void agt_period_calculation_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = R_AGT_Open(&g_timer0_ctrl, &g_timer0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Start the timer. */
    (void) R_AGT_Start(&g_timer0_ctrl);
 /* Get the source clock frequency (in Hz). There are several ways to do this in FSP:
  * - If LOCO or subclock is chosen in agt_extended_cfg_t::clock_source
  * - The source clock frequency is BSP_LOCO_HZ >> timer_cfg_t::source_div
  * - If PCLKB is chosen in agt_extended_cfg_t::clock_source and the PCLKB frequency
has not changed since reset,
```

```
  * - The source clock frequency is BSP_STARTUP_PCLKB_HZ >> timer_cfg_t::source_div
  * - Use the R_AGT_InfoGet function (it accounts for the clock source and divider).
  * - Calculate the current PCLKB frequency using
R_FSP_SystemClockHzGet(FSP_PRIV_CLOCK_PCLKB) and right shift
  * by timer_cfg_t::source_div.
  *
  * This example uses the last option (R_FSP_SystemClockHzGet).
  */
    uint32_t timer_freq_hz = R_FSP_SystemClockHzGet(FSP_PRIV_CLOCK_PCLKB) >>
g_timer0_cfg.source_div;
 /* Calculate the desired period based on the current clock. Note that this
calculation could overflow if the
  * desired period is larger than UINT32_MAX / pclkb_freq_hz. A cast to uint64_t is
used to prevent this. */
    uint32_t period_counts =
       (uint32_t) (((uint64_t) timer_freq_hz * AGT_EXAMPLE_DESIRED_PERIOD_MSEC) /
AGT_EXAMPLE_MSEC_PER_SEC);
 /* Set the calculated period. This will return an error if parameter checking is
enabled and the calculated
  * period is larger than UINT16_MAX. */
    err = R_AGT_PeriodSet(&g_timer0_ctrl, period_counts);
    assert(FSP_SUCCESS == err);
}
```

AGT Duty Cycle Update Example

This an example of updating the duty cycle.

```
#define AGT_EXAMPLE_DESIRED_DUTY_CYCLE_PERCENT (25)
#define AGT_EXAMPLE_MAX_PERCENT (100)
/* This example shows how to calculate a new duty cycle value at runtime. */
void agt_duty_cycle_calculation_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
```

```
    err = R_AGT_Open(&g_timer0_ctrl, &g_timer0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Start the timer. */
    (void) R_AGT_Start(&g_timer0_ctrl);
 /* Get the current period setting. */
 timer_info_t info;
    (void) R_AGT_InfoGet(&g_timer0_ctrl, &info);
    uint32_t current_period_counts = info.period_counts;
 /* Calculate the desired duty cycle based on the current period. */
    uint32_t duty_cycle_counts = (current_period_counts *
AGT_EXAMPLE_DESIRED_DUTY_CYCLE_PERCENT) /
                                 AGT_EXAMPLE_MAX_PERCENT;
 /* Set the calculated duty cycle. */
    err = R_AGT_DutyCycleSet(&g_timer0_ctrl, duty_cycle_counts, AGT_OUTPUT_PIN_AGTOA
);
    assert(FSP_SUCCESS == err);
}
```

AGT Cascaded Timers Example

This an example of using underflow from an even AGT channel as the count source for the next channel (in this case, AGT0 and AGT1).

```
/* This example shows how use cascaded timers. The count source for AGT channel 1 is
set to AGT0 underflow. */
void agt_cascaded_timers_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initialize the timers in any order. */
    err = R_AGT_Open(&g_timer_channel0_ctrl, &g_timer_channel0_cfg);
    assert(FSP_SUCCESS == err);
    err = R_AGT_Open(&g_timer_channel1_ctrl, &g_timer_channel1_cfg);
    assert(FSP_SUCCESS == err);
 /* Start AGT channel 1 first. */
```

```
    (void) R_AGT_Start(&g_timer_channel1_ctrl);
    (void) R_AGT_Start(&g_timer_channel0_ctrl);
 /* (Optional) Stop AGT channel 0 first. */
    (void) R_AGT_Stop(&g_timer_channel0_ctrl);
    (void) R_AGT_Stop(&g_timer_channel1_ctrl);
 /* Read the current counter value. Counter value is in status.counter. */
 timer_status_t status;
    (void) R_AGT_StatusGet(&g_timer_channel1_ctrl, &status);
}
```

Data Structures

struct	agt_instance_ctrl_t
struct	agt_extended_cfg_t

Enumerations

enum	agt_clock_t
enum	agt_measure_t
enum	agt_agtio_filter_t
enum	agt_enable_pin_t
enum	agt_trigger_edge_t
enum	agt_output_pin_t
enum	agt_pin_cfg_t
enum	agt_counter_bit_width_t

Data Structure Documentation

◆ agt_instance_ctrl_t

struct agt_instance_ctrl_t
Channel control block. DO NOT INITIALIZE. Initialization occurs when timer_api_t::open is called.

◆ agt_extended_cfg_t

struct agt_extended_cfg_t
Optional AGT extension data structure.

Data Fields		
agt_clock_t	count_source	AGT channel clock source. Valid values are: AGT_CLOCK_PCLKB, AGT_CLOCK_LOCO, AGT_CLOCK_FSUB.
union agt_extended_cfg_t	__unnamed__	
agt_pin_cfg_t	agto: 3	Configure AGTO pin. *Note* *AGTIO polarity is opposite AGTO*
agt_measure_t	measurement_mode	Measurement mode.
agt_agtio_filter_t	agtio_filter	Input filter for AGTIO.
agt_enable_pin_t	enable_pin	Enable pin (event counting only)
agt_trigger_edge_t	trigger_edge	Trigger edge to start pulse period measurement or count external event.
agt_counter_bit_width_t	counter_bit_width	Counter bit width.

Enumeration Type Documentation

◆ agt_clock_t

enum agt_clock_t	
Count source	
Enumerator	
AGT_CLOCK_PCLKB	PCLKB count source, division by 1, 2, or 8 allowed.
AGT_CLOCK_LOCO	LOCO count source, division by 1, 2, 4, 8, 16, 32, 64, or 128 allowed.
AGT_CLOCK_AGT_UNDERFLOW	Underflow event signal from next lowest AGT channel, division must be 1.
AGT_CLOCK_SUBCLOCK	Subclock count source, division by 1, 2, 4, 8, 16, 32, 64, or 128 allowed.
AGT_CLOCK_P402	Counts events on P402, events are counted in deep software standby mode.
AGT_CLOCK_P403	Counts events on P403, events are counted in deep software standby mode.
AGT_CLOCK_P404	Counts events on P404, events are counted in deep software standby mode.
AGT_CLOCK_AGTIO	Counts events on AGTIOn, events are not counted in software standby modes.

◆ agt_measure_t

enum agt_measure_t	
Enable pin for event counting mode.	
Enumerator	
AGT_MEASURE_DISABLED	AGT used as a counter.
AGT_MEASURE_PULSE_WIDTH_LOW_LEVEL	AGT used to measure low level pulse width.
AGT_MEASURE_PULSE_WIDTH_HIGH_LEVEL	AGT used to measure high level pulse width.
AGT_MEASURE_PULSE_PERIOD	AGT used to measure pulse period.

◆ agt_agtio_filter_t

enum agt_agtio_filter_t	
Input filter, applies AGTIO in pulse period measurement, pulse width measurement, or event counter mode. The filter requires the signal to be at the same level for 3 successive reads at the specified filter frequency.	
Enumerator	
AGT_AGTIO_FILTER_NONE	No filter.
AGT_AGTIO_FILTER_PCLKB	Filter at PCLKB.
AGT_AGTIO_FILTER_PCLKB_DIV_8	Filter at PCLKB / 8.
AGT_AGTIO_FILTER_PCLKB_DIV_32	Filter at PCLKB / 32.

◆ agt_enable_pin_t

enum agt_enable_pin_t	
Enable pin for event counting mode.	
Enumerator	
AGT_ENABLE_PIN_NOT_USED	AGTEE/AGTWEE is not used.
AGT_ENABLE_PIN_ACTIVE_LOW	Events are only counted when AGTEE/AGTWEE is low.
AGT_ENABLE_PIN_ACTIVE_HIGH	Events are only counted when AGTEE/AGTWEE is high.

◆ agt_trigger_edge_t

enum agt_trigger_edge_t	
Trigger edge for pulse period measurement mode and event counting mode.	
Enumerator	
AGT_TRIGGER_EDGE_RISING	Measurement starts or events are counted on rising edge.
AGT_TRIGGER_EDGE_FALLING	Measurement starts or events are counted on falling edge.
AGT_TRIGGER_EDGE_BOTH	Events are counted on both edges (n/a for pulse period mode)

◆ agt_output_pin_t

enum agt_output_pin_t	
Output pins, used to select which duty cycle to update in R_AGT_DutyCycleSet().	
Enumerator	
AGT_OUTPUT_PIN_AGTOA	AGTOA.
AGT_OUTPUT_PIN_AGTOB	AGTOB.

◆ agt_pin_cfg_t

enum agt_pin_cfg_t	
Level of AGT pin	
Enumerator	
AGT_PIN_CFG_DISABLED	Not used as output pin.
AGT_PIN_CFG_START_LEVEL_LOW	Pin level low.
AGT_PIN_CFG_START_LEVEL_HIGH	Pin level high.

◆ agt_counter_bit_width_t

enum agt_counter_bit_width_t	
Counter type to determine regsiter size	
Enumerator	
AGT_COUNTER_BIT_WIDTH_DEFAULT	Legacy.
AGT_COUNTER_BIT_WIDTH_16	AGT.
AGT_COUNTER_BIT_WIDTH_32	AGTW.

Function Documentation

◆ R_AGT_Open()

fsp_err_t R_AGT_Open (timer_ctrl_t *const *p_ctrl*, timer_cfg_t const *const *p_cfg*)

Initializes the AGT module instance. Implements timer_api_t::open.

The AGT hardware does not support one-shot functionality natively. The one-shot feature is therefore implemented in the AGT HAL layer. For a timer configured as a one-shot timer, the timer is stopped upon the first timer expiration.

The AGT implementation of the general timer can accept an optional agt_extended_cfg_t extension parameter. For AGT, the extension specifies the clock to be used as timer source and the output pin configurations. If the extension parameter is not specified (NULL), the default clock PCLKB is used and the output pins are disabled.

Example:

```
/* Initializes the module. */
   err = R_AGT_Open(&g_timer0_ctrl, &g_timer0_cfg);
```

Return values

FSP_SUCCESS	Initialization was successful and timer has started.
FSP_ERR_ASSERTION	A required input pointer is NULL or the period is not in the valid range of 1 to 0xFFFF.
FSP_ERR_ALREADY_OPEN	R_AGT_Open has already been called for this p_ctrl.
FSP_ERR_IRQ_BSP_DISABLED	A required interrupt has not been enabled in the vector table.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	Requested channel number is not available on AGT.

◆ R_AGT_Start()

fsp_err_t R_AGT_Start (timer_ctrl_t *const *p_ctrl*)

Starts timer. Implements timer_api_t::start.

Example:

```
/* Start the timer. */
   (void) R_AGT_Start(&g_timer0_ctrl);
```

Return values

FSP_SUCCESS	Timer started.
FSP_ERR_ASSERTION	p_ctrl is null.
FSP_ERR_NOT_OPEN	The instance control structure is not opened.

◆ R_AGT_Stop()

fsp_err_t R_AGT_Stop (timer_ctrl_t *const *p_ctrl*)

Stops the timer. Implements timer_api_t::stop.

Example:

```
/* (Optional) Stop the timer. */
   (void) R_AGT_Stop(&g_timer0_ctrl);
```

Return values

FSP_SUCCESS	Timer stopped.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance control structure is not opened.

◆ R_AGT_Reset()

fsp_err_t R_AGT_Reset (timer_ctrl_t *const *p_ctrl*)

Resets the counter value to the period minus one. Implements timer_api_t::reset.

Return values

FSP_SUCCESS	Counter reset.
FSP_ERR_ASSERTION	p_ctrl is NULL
FSP_ERR_NOT_OPEN	The instance control structure is not opened.

◆ R_AGT_Enable()

fsp_err_t R_AGT_Enable (timer_ctrl_t *const *p_ctrl*)

Enables external event triggers that start, stop, clear, or capture the counter. Implements timer_api_t::enable.

Example:

```
/* Enable captures. Captured values arrive in the interrupt. */
   (void) R_AGT_Enable(&g_timer0_ctrl);
```

Return values

FSP_SUCCESS	External events successfully enabled.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ R_AGT_Disable()

fsp_err_t R_AGT_Disable (timer_ctrl_t *const *p_ctrl*)

Disables external event triggers that start, stop, clear, or capture the counter. Implements timer_api_t::disable.

Example:

```
/* (Optional) Disable captures. */
   (void) R_AGT_Disable(&g_timer0_ctrl);
```

Return values

FSP_SUCCESS	External events successfully disabled.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ R_AGT_PeriodSet()

fsp_err_t R_AGT_PeriodSet (timer_ctrl_t *const *p_ctrl*, uint32_t const *period_counts*)

Updates period. The new period is updated immediately and the counter is reset to the maximum value. Implements timer_api_t::periodSet.

Warning

If periodic output is used, the duty cycle buffer registers are updated after the period buffer register. If this function is called while the timer is running and an AGT underflow occurs during processing, the duty cycle will not be the desired 50% duty cycle until the counter underflow after processing completes.
Stop the timer before calling this function if one-shot output is used.

Example:

```
/* Get the source clock frequency (in Hz). There are several ways to do this in FSP:
 * - If LOCO or subclock is chosen in agt_extended_cfg_t::clock_source
 * - The source clock frequency is BSP_LOCO_HZ >> timer_cfg_t::source_div
 * - If PCLKB is chosen in agt_extended_cfg_t::clock_source and the PCLKB frequency
has not changed since reset,
 * - The source clock frequency is BSP_STARTUP_PCLKB_HZ >> timer_cfg_t::source_div
 * - Use the R_AGT_InfoGet function (it accounts for the clock source and divider).
 * - Calculate the current PCLKB frequency using
R_FSP_SystemClockHzGet(FSP_PRIV_CLOCK_PCLKB) and right shift
 * by timer_cfg_t::source_div.
 *
```

```
  * This example uses the last option (R_FSP_SystemClockHzGet).
  */
    uint32_t timer_freq_hz = R_FSP_SystemClockHzGet(FSP_PRIV_CLOCK_PCLKB) >>
g_timer0_cfg.source_div;
 /* Calculate the desired period based on the current clock. Note that this
calculation could overflow if the
  * desired period is larger than UINT32_MAX / pclkb_freq_hz. A cast to uint64_t is
used to prevent this. */
    uint32_t period_counts =
       (uint32_t) (((uint64_t) timer_freq_hz * AGT_EXAMPLE_DESIRED_PERIOD_MSEC) /
AGT_EXAMPLE_MSEC_PER_SEC);
 /* Set the calculated period. This will return an error if parameter checking is
enabled and the calculated
  * period is larger than UINT16_MAX. */
    err = R_AGT_PeriodSet(&g_timer0_ctrl, period_counts);
    assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Period value updated.
FSP_ERR_ASSERTION	A required pointer was NULL, or the period was not in the valid range of 1 to 0xFFFF.
FSP_ERR_NOT_OPEN	The instance control structure is not opened.

◆ R_AGT_DutyCycleSet()

fsp_err_t R_AGT_DutyCycleSet (timer_ctrl_t *const *p_ctrl*, uint32_t const *duty_cycle_counts*, uint32_t const *pin*)

Updates duty cycle. If the timer is counting, the new duty cycle is reflected after the next counter underflow. Implements timer_api_t::dutyCycleSet.

Example:

```
/* Get the current period setting. */
timer_info_t info;
   (void) R_AGT_InfoGet(&g_timer0_ctrl, &info);
   uint32_t current_period_counts = info.period_counts;
/* Calculate the desired duty cycle based on the current period. */
   uint32_t duty_cycle_counts = (current_period_counts *
AGT_EXAMPLE_DESIRED_DUTY_CYCLE_PERCENT) /
                                AGT_EXAMPLE_MAX_PERCENT;
/* Set the calculated duty cycle. */
   err = R_AGT_DutyCycleSet(&g_timer0_ctrl, duty_cycle_counts, AGT_OUTPUT_PIN_AGTOA
);
   assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Duty cycle updated.
FSP_ERR_ASSERTION	A required pointer was NULL, or the pin was not AGT_AGTO_AGTOA or AGT_AGTO_AGTOB.
FSP_ERR_INVALID_ARGUMENT	Duty cycle was not in the valid range of 0 to period (counts) - 1
FSP_ERR_NOT_OPEN	The instance control structure is not opened.
FSP_ERR_UNSUPPORTED	AGT_CFG_OUTPUT_SUPPORT_ENABLE is 0.

◆ R_AGT_CompareMatchSet()

fsp_err_t R_AGT_CompareMatchSet (timer_ctrl_t *const *p_ctrl*, uint32_t const *compare_match_value*, timer_compare_match_t const *match_channel*)

Placeholder for unsupported compareMatch function. Implements timer_api_t::compareMatchSet.

Return values

FSP_ERR_UNSUPPORTED	AGT compare match is not supported.

◆ R_AGT_InfoGet()

fsp_err_t R_AGT_InfoGet (timer_ctrl_t *const *p_ctrl*, timer_info_t *const *p_info*)

Gets timer information and store it in provided pointer p_info. Implements timer_api_t::infoGet.

Example:

```
/* (Optional) Get the current period if not known. */
timer_info_t info;
      (void) R_AGT_InfoGet(&g_timer0_ctrl, &info);
      uint32_t period = info.period_counts;
```

Return values

FSP_SUCCESS	Period, count direction, and frequency stored in p_info.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The instance control structure is not opened.

◆ R_AGT_StatusGet()

fsp_err_t R_AGT_StatusGet (timer_ctrl_t *const *p_ctrl*, timer_status_t *const *p_status*)

Retrieves the current state and counter value stores them in p_status. Implements timer_api_t::statusGet.

Example:

```
/* Read the current counter value. Counter value is in status.counter. */
timer_status_t status;
   (void) R_AGT_StatusGet(&g_timer0_ctrl, &status);
```

Return values

FSP_SUCCESS	Current status and counter value provided in p_status.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The instance control structure is not opened.

◆ R_AGT_CallbackSet()

fsp_err_t R_AGT_CallbackSet (timer_ctrl_t *const *p_api_ctrl*, void(*)(timer_callback_args_t *) *p_callback*, void const *const *p_context*, timer_callback_args_t *const *p_callback_memory*)

Updates the user callback with the option to provide memory for the callback argument structure. Implements timer_api_t::callbackSet.

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

◆ R_AGT_Close()

fsp_err_t R_AGT_Close (timer_ctrl_t *const *p_ctrl*)
Stops counter, disables interrupts, disables output pins, and clears internal driver data. Implements timer_api_t::close. **Return values** FSP_SUCCESS — Timer closed. FSP_ERR_ASSERTION — p_ctrl is NULL. FSP_ERR_NOT_OPEN — The instance control structure is not opened.

fsp_err_t	R_TAU_PWM_CallbackSet (timer_ctrl_t *const p_api_ctrl, void(*p_callback)(timer_callback_args_t *), void const *const p_context, timer_callback_args_t *const p_callback_memory)
fsp_err_t	R_TAU_PWM_Close (timer_ctrl_t *const p_ctrl)

Detailed Description

Driver for the TAU_PWM peripheral on RA MCUs. This module implements the Timer Interface.

Overview

Features

The TAU_PWM module has the following features:

- Supports simultaneous channel operation functions: one-shot pulse output, PWM output and multiple PWM output.
- Configurable clock source (CK00, CK01).
- Build-time configuration of clock divider
- Configurable period (counts per timer cycle).
- Configurable trigger source (TImn input) for one-shot pulse output
- Supports noise filter on input source in one-shot pulse output mode (always enabled)
- Supports runtime reconfiguration of period/delay, pulse width or duty cycle percent.
- Signal can be output to a pin.
- APIs are provided to start, stop, and reset the counter.
- APIs are provided to get the current period, source clock frequency, and count direction.
- APIs are provided to get the current timer status and counter value.
- Build-time availabilty of multi-slave mode for PWM outputs

Configuration

Build Time Configurations for r_tau_pwm

The following build time configurations are defined in fsp_cfg/r_tau_pwm_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
One-shot Pulse Output Mode Support	• Disabled • Enabled	Disabled	Controls whether one-shot pulse output mode support is included in the build. This setting applies globally to all r_tau_pwm_instances. If one shot mode is not used by any instance, disable this setting to

			reduce ROM usage.
PWM Output Mode Support	• Disabled • Enabled	Enabled	Controls whether PWM mode support is included in the build. This setting applies globally to all r_tau_pwm_instances. If PWM mode is not used by any instance, disable this setting to reduce ROM usage.
Multi-Slave	• Disabled • Enabled	Disabled	Enable support for multiple slaves

Configurations for Timers > Timer, Simultaneous Channel Operation (r_tau_pwm)

This module can be added to the Stacks tab via New Stack > Timers > Timer, Simultaneous Channel Operation (r_tau_pwm).

Configuration	Options	Default	Description
General			
Name	Name must be a valid C symbol	g_timer0	Module name.
Operation Clock	• CK00 • CK01	CK00	Select the operation clock
Mode	• One-shot pulse output • PWM output	PWM output	Mode selection.
Master Channel	Channel number must be even.	0	Select the TAU master channel. When two or more master channels are to be used, slave channels with a master channel between them may not be set.
Period	Value must be a non-negative integer	0x10000	Specify the timer period based on the selected unit. In One-shot pulse output mode this value corresponds to the delay time. When the unit is set to 'Raw Counts', setting the period to 0x10000/0x10001 results in the maximum period for PWM Output function/One-shot pulse output function

			at the lowest divisor (fastest timer tick). The theoretical calculated period is printed in a comment in the timer_cfg_t structure.
Period Unit	• Raw Counts • Nanoseconds • Microseconds • Milliseconds • Seconds • Hertz • Kilohertz	Raw Counts	Unit of the period specified above
Input (One-shot pulse)			
Trigger Source	MCU Specific Options		Select the trigger source for master channel.
Detect Edge	• Falling Edge • Rising Edge • Both Edges	Falling Edge	Select the detect edge.
Interrupts			
Callback	Name must be a valid C symbol	NULL	A user callback function can be provided. If provided, the callback function is called from the interrupt service routine (ISR) each time the timer period elapses in PWM mode, and when the timer delay elapses in one-shot mode. If the optional slave channel interrupt is enabled, the callback is also called when the signal switches state during the PWM cycle in PWM mode, and when the pulse output is complete in one-shot mode.
Interrupt Priority	MCU Specific Options		Timer interrupt priority.

Configurations for Timers > TAU PWM Channel Configuration (r_tau_pwm)

Configuration	Options	Default	Description
General			

Channel	Value must be between 0 and 7.	1	Specify the slave channel.
Output			
Output Level	• Start Level Low • Start Level High	Start Level Low	Output level of TAU slave channel.
Output Polarity	• Active-high • Active-low	Active-high	Output polarity of TAU slave channel.
One-Shot Pulse Width	Value must be a non-negative integer	0xffff	Specify the pulse width based on the selected unit. When the unit is set to 'Raw Counts', setting the period to 0xffff results in the maximum period at the lowest divisor (fastest timer tick).
One-Shot Pulse Width Unit	• Raw Counts • Nanoseconds • Microseconds • Milliseconds • Seconds • Hertz • Kilohertz	Raw Counts	Unit of the period specified above
PWM Duty Cycle Percent	Value must be a non-negative integer between 0 and 100	50	Specify the duty cycle percent for output pulse of slave channel.
Interrupts			
Interrupt Priority	MCU Specific Options		Timer interrupt priority.

Clock Configuration

The TAU PWM clock is based on the peripheral module clock (PCLKB) which is equal to the system clock (ICLK).

Each TAU PWM channel has certain operation clocks selections, these can be set with the **General>Operation Clock** property in the module configuration. When the operation clock of a channel is set to CK00, or CK01, the TAU_PWM module provides divisor values for each of those clocks. These divisors may be set in the **Clocks** tab. As such, setting a divisor in the **Clocks** tab affects all TAU PWM and TAU channels that use that CK0x clock as an input. Adjusting these settings determines the frequency range achievable by a TAU_PWM channel. If a desired frequency is not achievable, the divider in the **Clocks** tab may be adjusted. The clock dividers cannot be adjusted at runtime.

Pin Configuration

This module can use the TOmn pins as output pins for One-shot and PWM signals.

This module can use the TImn pin as the input pin for One-shot signals.

Timer Period And Duty Cycle

The RA Configuration editor will automatically calculate the period/pulse width/duty cycle percent based on the selected period time, units, clock source, clock divider and mode.

When the selected unit is "Raw counts", the maximum and minimum allowed period/pulse width/duty cycle setting are presented by the following tables:

In One-shot pulse output mode:

Clock divider	Minimum period (counts)	Maximum period (counts)	Minimum pulse width (counts)	Maximum pulse width (counts)
PCLK/1	0x00003	0x10001	0x0001	0xffff
PCLK/2 to PCLK/32768	0x00002	0x10000	0x0000	0xffff

In PWM output mode:

Clock divider	Minimum period (counts)	Maximum period (counts)	Minimum duty cycle (%)	Maximum duty cycle (%)
PCLK/1	0x00002	0x10001	0	100
PCLK/2 to PCLK/32768	0x00001	0x10000	0	100

Note

If PCLK (undivided) is selected as the operation clock (CK00, CK01) and TDR0n is set to 0x0000 (n = 0 to 7), interrupt requests output from timer array units cannot be used. So, when PCLK is undivided, the minimum period must be plus one.
Because the period interrupt occurs when the counter underflows, setting the period register to 0 results in an effective period of 1 count. For this reason, all user-provided raw count values reflect the actual number of period counts (not the raw register values).

Usage Notes

Updating Period and Duty Cycle

The period and duty cycle are updated after the next counter underflow after calling R_TAU_PWM_PeriodSet() or R_TAU_PWM_DutyCycleSet().

One-Shot Pulse Output Mode

By using two channels as a set, a one-shot pulse having any delay pulse width can be generated from the signal input to the TI0n pin.

The delay time is counted by the master channel, and the pulse width is counted by the slave channel.

PWM Output

Two channels can be used as a set to generate a pulse of any period and duty factor (duty cycle). By extending the PWM function and using multiple slave channels, many PWM waveforms with different

duty values can be output.

When multiple slaves are to be connected to a single master, the build time option for multiple slaves needs to be set.

Note

When two or more master channels are to be used, slave channels with a master channel between them may not be set. For example, if channels 0 and 4 are set as master channels, channels 1 to 3 can be set as the slave channels of master channel 0, channels 5 to 7 cannot be set as the slave channels of master channel 0.

The period is counted by the master channel, and the duty cycle is counted by the slave channel.

Controlling TAU_PWM with ELC Events

The TAU_PWM timer can be configured to trigger the timer counter when an ELC event occurs.

Note

Triggering the timer using ELC events is supported only when master channel is set to 0 and mode is set to One-shot pulse output.
The event links for the ELC must be configured outside this module.

Triggering ELC Events with TAU_PWM

The TAU_PWM timer can trigger the start of other peripherals. The Event Link Controller (r_elc) guide provides a list of all available peripherals.

Note

Only event signals from channel 00 to 03 are available.

Limitations

- None

Examples

TAU_PWM Basic Example

This is a basic example of minimal use of the TAU PWM (in PWM Output mode) in an application.

```
void tau_pwm_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = R_TAU_PWM_Open(&g_timer0_ctrl, &g_timer0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Start the timer. */
    (void) R_TAU_PWM_Start(&g_timer0_ctrl);
```

```
}
```

TAU_PWM Callback Example

This is an example of a timer callback.

Note

The callback function always called after the period time (in PWM output mode) or delay time (in One-shot pulse output mode) has expired. Additionally, it can be optionally called after the duty cycle (in PWM output mode) or pulse width (in One-shot pulse output mode) has expired by enabling the slave channel's interrupt.

```
uint32_t g_timer_master_cycle_end_counter = 0;
uint32_t g_timer_slave_cycle_end_counter = 0;
/* Example callback called when timer expires. */
void timer_callback (timer_callback_args_t * p_args)
{
 if (TIMER_EVENT_MASTER_CYCLE_END == p_args->event)
    {
       g_timer_master_cycle_end_counter++;
    }
 if (TIMER_EVENT_SLAVE_CYCLE_END == p_args->event)
    {
       g_timer_slave_cycle_end_counter++;
    }
}
```

TAU_PWM One-Shot Pulse Output Mode Example

TAU_PWM One-Shot Pulse Output Mode Example - Software Trigger

This example demonstrates the configuration and use of One-shot pulse output mode with TAU_PWM timer when using the software trigger.

```
void tau_pwm_one_shot_software_trigger_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = R_TAU_PWM_Open(&g_timer0_ctrl, &g_timer0_one_shot_software_cfg);
```

```
/* Handle any errors. This function should be defined by the user. */
   assert(FSP_SUCCESS == err);
/* Enable triggering (including by software). */
   (void) R_TAU_PWM_Enable(&g_timer0_ctrl);
   g_timer_master_cycle_end_counter = 0;
   g_timer_slave_cycle_end_counter = 0;
   (void) R_TAU_PWM_Start(&g_timer0_ctrl);
   uint32_t timeout = TIMER_TEST_WAVEFORM_TIMEOUT;
while (((timeout--) > 0) && (0 == g_timer_slave_cycle_end_counter))
   {
/* Wait for one shot pulse output to complete */
   }
/* Ensure exactly one slave interrupt and one master interrupt have occurred. */
   assert(1 == g_timer_master_cycle_end_counter);
   assert(1 == g_timer_slave_cycle_end_counter);
   g_timer_master_cycle_end_counter = 0;
   g_timer_slave_cycle_end_counter = 0;
/* Start trigger by software. */
   (void) R_TAU_PWM_Start(&g_timer0_ctrl);
   timeout = TIMER_TEST_WAVEFORM_TIMEOUT;
while (((timeout--) > 0) && (0 == g_timer_slave_cycle_end_counter))
   {
/* Wait for one shot pulse output to complete */
   }
/* Ensure exactly one slave interrupt and one master interrupt have occurred. */
   assert(1 == g_timer_master_cycle_end_counter);
   assert(1 == g_timer_slave_cycle_end_counter);
/* Stop timer and disable the software trigger. */
   (void) R_TAU_PWM_Stop(&g_timer0_ctrl);
/* Read the current counter value. Counter value is in status.counter. */
timer_status_t status;
   (void) R_TAU_PWM_StatusGet(&g_timer0_ctrl, &status);
}
```

TAU_PWM One-Shot Pulse Output Mode Example - Pin Input Trigger

This example demonstrates the configuration and use of One-shot pulse output mode with TAU_PWM timer when using an external pin input trigger.

```
void tau_pwm_one_shot_pin_input_trigger_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = R_TAU_PWM_Open(&g_timer0_ctrl, &g_timer0_one_shot_input_pin_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Enable the input trigger. */
    (void) R_TAU_PWM_Enable(&g_timer0_ctrl);
    (void) R_TAU_PWM_Start(&g_timer0_ctrl);
 /* Wait for trigger source from the input pin */
 /* Disable the input trigger. */
    (void) R_TAU_PWM_Stop(&g_timer0_ctrl);
 /* Read the current counter value. Counter value is in status.counter. */
 timer_status_t status;
    (void) R_TAU_PWM_StatusGet(&g_timer0_ctrl, &status);
}
```

TAU_PWM PWM Output Mode Example

This example demonstrates the configuration and use of PWM output mode with TAU_PWM timer.

```
void tau_pwm_multiple_pwm_output_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = R_TAU_PWM_Open(&g_timer0_ctrl, &g_timer0_pwm_output_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Start the timer. */
    (void) R_TAU_PWM_Start(&g_timer0_ctrl);
 /* (Optional) Stop the timer. */
```

```
    (void) R_TAU_PWM_Stop(&g_timer0_ctrl);
 /* Read the current counter value. Counter value is in status.counter. */
 timer_status_t status;
    (void) R_TAU_PWM_StatusGet(&g_timer0_ctrl, &status);
}
```

TAU_PWM Period Update Example

This an example of updating the period.

```
#define TAU_PWM_EXAMPLE_MSEC_PER_SEC (1000)
#define TAU_PWM_EXAMPLE_DESIRED_PERIOD_MSEC (20)
/* This example shows how to calculate a new period value at runtime. */
void tau_pwm_period_calculation_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = R_TAU_PWM_Open(&g_timer0_ctrl, &g_timer0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Start the timer. */
    (void) R_TAU_PWM_Start(&g_timer0_ctrl);
 /* Get the source clock frequency (in Hz) */
 timer_info_t info;
    (void) R_TAU_PWM_InfoGet(&g_timer0_ctrl, &info);
    uint32_t timer_freq_hz = info.clock_frequency;
 /* Calculate the desired period based on the current clock. Note that this
calculation could overflow if the
  * desired period is larger than UINT32_MAX. A cast to uint32_t is used to prevent
this. */
    uint32_t period_counts =
       (uint32_t) ((timer_freq_hz * TAU_PWM_EXAMPLE_DESIRED_PERIOD_MSEC) /
TAU_PWM_EXAMPLE_MSEC_PER_SEC);
 /* Set the calculated period. This will return an error if parameter checking is
enabled and the calculated
```

```
  * period is larger than UINT16_MAX. */
    err = R_TAU_PWM_PeriodSet(&g_timer0_ctrl, period_counts);
    assert(FSP_SUCCESS == err);
}
```

TAU_PWM Duty Cycle Update Example

This an example of updating the duty cycle.

```
#define TAU_PWM_EXAMPLE_MSEC_PER_SEC (1000)
#define TAU_PWM_EXAMPLE_DESIRED_PERIOD_MSEC (20)
/* This example shows how to calculate a new period value at runtime. */
void tau_pwm_period_calculation_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = R_TAU_PWM_Open(&g_timer0_ctrl, &g_timer0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Start the timer. */
    (void) R_TAU_PWM_Start(&g_timer0_ctrl);
 /* Get the source clock frequency (in Hz) */
 timer_info_t info;
    (void) R_TAU_PWM_InfoGet(&g_timer0_ctrl, &info);
    uint32_t timer_freq_hz = info.clock_frequency;
 /* Calculate the desired period based on the current clock. Note that this
calculation could overflow if the
  * desired period is larger than UINT32_MAX. A cast to uint32_t is used to prevent
this. */
    uint32_t period_counts =
       (uint32_t) ((timer_freq_hz * TAU_PWM_EXAMPLE_DESIRED_PERIOD_MSEC) /
TAU_PWM_EXAMPLE_MSEC_PER_SEC);
 /* Set the calculated period. This will return an error if parameter checking is
enabled and the calculated
  * period is larger than UINT16_MAX. */
```

```
    err = R_TAU_PWM_PeriodSet(&g_timer0_ctrl, period_counts);
    assert(FSP_SUCCESS == err);
}
```

ELC Example

This is an example of using TAU_PWM with ELC events.

```
/* This example shows how to use ELC event to trigger the timer counters. */
void tau_pwm_elc_event_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = R_TAU_PWM_Open(&g_timer0_ctrl, &g_timer0_elc_event_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Enable the elc event trigger. */
    (void) R_TAU_PWM_Enable(&g_timer0_ctrl);
    (void) R_TAU_PWM_Start(&g_timer0_ctrl);
 /* Wait for ELC event */
 /* Disable the elc event trigger. */
    (void) R_TAU_PWM_Stop(&g_timer0_ctrl);
 /* Read the current counter value. Counter value is in status.counter. */
 timer_status_t status;
    (void) R_TAU_PWM_StatusGet(&g_timer0_ctrl, &status);
}
```

Data Structures

struct	tau_pwm_channel_cfg_t
struct	tau_pwm_extended_cfg_t
struct	tau_pwm_instance_ctrl_t

Enumerations

enum	tau_pwm_operation_clock_t
enum	tau_pwm_source_t

enum	tau_pwm_detect_edge_t
enum	tau_pwm_output_level_t
enum	tau_pwm_output_polarity_t
enum	tau_pwm_io_pin_t

Data Structure Documentation

◆ tau_pwm_channel_cfg_t

struct tau_pwm_channel_cfg_t		
TAU_PWM per channel configuration.		
Data Fields		
uint8_t	channel	Slave Channel Number (1..7)
uint16_t	duty_cycle_counts	One-shot: Pulse_width_counts; PWM: Duty_cycle_counts.
tau_pwm_output_level_t	output_level	Setting of output level for TAU.
tau_pwm_output_polarity_t	output_polarity	Setting of output polarity for TAU.
uint8_t	cycle_end_ipl	TAU slave channel IPL.
IRQn_Type	cycle_end_irq	TAU slave channel IRQ.

◆ tau_pwm_extended_cfg_t

struct tau_pwm_extended_cfg_t		
Extended configuration structure for TAU_PWM		
Data Fields		
tau_pwm_operation_clock_t	operation_clock	Setting of operation clock for master and slave channels.
tau_pwm_source_t	trigger_source	Trigger source for master channel.
tau_pwm_detect_edge_t	detect_edge	Trigger edge to start pulse period measurement.
tau_pwm_channel_cfg_t const *	p_slave_channel_cfgs[TAU_PWM_MAX_NUM_SLAVE_CHANNELS]	Configuration for each slave channel, at least 1 slave channel is required.

◆ tau_pwm_instance_ctrl_t

struct tau_pwm_instance_ctrl_t
Channel control block. DO NOT INITIALIZE. Initialization occurs when timer_api_t::open is called.

Enumeration Type Documentation

◆ tau_pwm_operation_clock_t

enum tau_pwm_operation_clock_t	
Operation clock.	
Enumerator	
TAU_PWM_OPERATION_CLOCK_CK00	Operation Clock CK00.
TAU_PWM_OPERATION_CLOCK_CK01	Operation CLock CK01.

◆ tau_pwm_source_t

enum tau_pwm_source_t	
Trigger Source	
Enumerator	
TAU_PWM_SOURCE_PIN_INPUT	Use TI0n pin input as trigger source.
TAU_PWM_SOURCE_ELC_EVENT	Use ELC events as trigger source.

◆ tau_pwm_detect_edge_t

enum tau_pwm_detect_edge_t	
TI0n pin input edge	
Enumerator	
TAU_PWM_DETECT_EDGE_FALLING	Detects falling edge.
TAU_PWM_DETECT_EDGE_RISING	Detects rising edge.
TAU_PWM_DETECT_EDGES_BOTH	Detects both edges.

◆ tau_pwm_output_level_t

enum tau_pwm_output_level_t	
Level of TAU pin	
Enumerator	
TAU_PWM_OUTPUT_LEVEL_LOW	Pin level low.
TAU_PWM_OUTPUT_LEVEL_HIGH	Pin level high.

◆ tau_pwm_output_polarity_t

enum tau_pwm_output_polarity_t	
Timer output polarity	
Enumerator	
TAU_PWM_OUTPUT_POLARITY_ACTIVE_HIGH	Positive logic output (active-high)
TAU_PWM_OUTPUT_POLARITY_ACTIVE_LOW	Negative logic output (active-low)

◆ tau_pwm_io_pin_t

enum tau_pwm_io_pin_t	
Input/Output pins, used to select which duty cycle to update in R_TAU_PWM_DutyCycleSet().	
Enumerator	
TAU_PWM_IO_PIN_CHANNEL_0	I/O pin of channel 0.
TAU_PWM_IO_PIN_CHANNEL_1	I/O pin of channel 1.
TAU_PWM_IO_PIN_CHANNEL_2	I/O pin of channel 2.
TAU_PWM_IO_PIN_CHANNEL_3	I/O pin of channel 3.
TAU_PWM_IO_PIN_CHANNEL_4	I/O pin of channel 4.
TAU_PWM_IO_PIN_CHANNEL_5	I/O pin of channel 5.
TAU_PWM_IO_PIN_CHANNEL_6	I/O pin of channel 6.
TAU_PWM_IO_PIN_CHANNEL_7	I/O pin of channel 7.

Function Documentation

◆ R_TAU_PWM_Open()

fsp_err_t R_TAU_PWM_Open (timer_ctrl_t *const *p_ctrl*, timer_cfg_t const *const *p_cfg*)

Initializes the timer module and applies configurations. Implements timer_api_t::open.

The TAU_PWM implementation of the timer requires a tau_pwm_extended_cfg_t extension parameter.

Example:

```
/* Initializes the module. */
   err = R_TAU_PWM_Open(&g_timer0_ctrl, &g_timer0_cfg);
```

Return values

FSP_SUCCESS	Initialization was successful
FSP_ERR_ASSERTION	A required input pointer is NULL, the source divider/period/duty cycle counts or number of slave channels is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open.
FSP_ERR_IRQ_BSP_DISABLED	ISR of master channel must be enabled
FSP_ERR_INVALID_MODE	Invalid configuration option provided for selected timer mode
FSP_ERR_INVALID_CHANNEL	The master/slave channel selected is not available on this device, slave channel number must be greater than master channel number.

◆ R_TAU_PWM_Stop()

fsp_err_t R_TAU_PWM_Stop (timer_ctrl_t *const *p_ctrl*)

Stops timer. Implements timer_api_t::stop.

Example:

```
/* (Optional) Stop the timer. */
   (void) R_TAU_PWM_Stop(&g_timer0_ctrl);
```

Return values

FSP_SUCCESS	Timer successfully stopped.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ R_TAU_PWM_Start()

fsp_err_t R_TAU_PWM_Start (timer_ctrl_t *const *p_ctrl*)

Starts timer (pwm mode) or triggers the one-shot pulse output by software (one-shot mode). Implements timer_api_t::start.

Note

In one-shot mode, this function is supported only after the timer has been placed into the start trigger detection wait state by calling timer_api_t::enable

Example:

```
/* Start the timer. */
   (void) R_TAU_PWM_Start(&g_timer0_ctrl);
```

Return values

FSP_SUCCESS	Timer successfully started.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.
FSP_ERR_NOT_ENABLED	In One-shot mode, timer must be enabled first.

◆ R_TAU_PWM_Reset()

fsp_err_t R_TAU_PWM_Reset (timer_ctrl_t *const *p_ctrl*)

Resets the counter value to the current period and duty cycle. Implements timer_api_t::reset.

Note

If the timer is stopped when calling this function, the timer counter is not reset. The counter will be reset one cycle after the timer is next started (or restarted), since it takes one cycle to reload the initial count when starting the timer.

Return values

FSP_SUCCESS	Counter value written successfully.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ R_TAU_PWM_Enable()

fsp_err_t R_TAU_PWM_Enable (timer_ctrl_t *const *p_ctrl*)

Enables external event inputs that can start the counter and enables the software trigger. After a successful call to this function, the timer is placed into the trigger detection wait state. Implements timer_api_t::enable.

Example:

```
/* Enable triggering (including by software). */
   (void) R_TAU_PWM_Enable(&g_timer0_ctrl);
```

Return values

FSP_SUCCESS	External events successfully enabled.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.
FSP_ERR_INVALID_MODE	The mode is invalid, only called in TIMER_MODE_ONE_SHOT mode.
FSP_ERR_UNSUPPORTED	Unsupported when one shot mode support is disabled

◆ R_TAU_PWM_PeriodSet()

fsp_err_t R_TAU_PWM_PeriodSet (timer_ctrl_t *const *p_ctrl*, uint32_t const *period_counts*)

Sets period value provided. If the timer is running, the period will be updated after the next counter underflow. If the timer is stopped, this function resets the counter and updates the period. Implements timer_api_t::periodSet.

Example:

```
/* Get the source clock frequency (in Hz) */
timer_info_t info;
   (void) R_TAU_PWM_InfoGet(&g_timer0_ctrl, &info);
   uint32_t timer_freq_hz = info.clock_frequency;
/* Calculate the desired period based on the current clock. Note that this
calculation could overflow if the
  * desired period is larger than UINT32_MAX. A cast to uint32_t is used to prevent
this. */
   uint32_t period_counts =
      (uint32_t) ((timer_freq_hz * TAU_PWM_EXAMPLE_DESIRED_PERIOD_MSEC) /
TAU_PWM_EXAMPLE_MSEC_PER_SEC);
/* Set the calculated period. This will return an error if parameter checking is
enabled and the calculated
  * period is larger than UINT16_MAX. */
   err = R_TAU_PWM_PeriodSet(&g_timer0_ctrl, period_counts);
   assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Period value written successfully.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.
FSP_ERR_INVALID_ARGUMENT	Period counts is out of range.

◆ R_TAU_PWM_CompareMatchSet()

fsp_err_t R_TAU_PWM_CompareMatchSet (timer_ctrl_t *const *p_ctrl*, uint32_t const *compare_match_value*, timer_compare_match_t const *match_channel*)

Placeholder for unsupported compareMatch function. Implements timer_api_t::compareMatchSet.

Return values

FSP_ERR_UNSUPPORTED	TAU PWM compare match is not supported.

◆ R_TAU_PWM_DutyCycleSet()

fsp_err_t R_TAU_PWM_DutyCycleSet (timer_ctrl_t *const *p_ctrl*, uint32_t const *duty_cycle_counts*, uint32_t const *pin*)

Sets duty cycle on requested pin. Implements timer_api_t::dutyCycleSet.

Duty cycle is updated in the timer data register. The updated duty cycle is reflected after the next cycle end (counter underflow).

Example:

```
/* Get the current period setting. */
timer_info_t info;
   (void) R_TAU_PWM_InfoGet(&g_timer0_ctrl, &info);
   uint32_t current_period_counts = info.period_counts;
/* Calculate the desired duty cycle based on the current period. */
   uint16_t duty_cycle_counts = (uint16_t) ((current_period_counts *
TAU_PWM_EXAMPLE_DESIRED_DUTY_CYCLE_PERCENT) /
                                          TAU_PWM_EXAMPLE_MAX_PERCENT);
/* Set the calculated duty cycle. */
   err = R_TAU_PWM_DutyCycleSet(&g_timer0_ctrl, duty_cycle_counts, 1);
   assert(FSP_SUCCESS == err);
```

Parameters

[in]	p_ctrl	Pointer to instance control block.
[in]	duty_cycle_counts	Duty cycle to set in counts.
[in]	pin	Use tau_pwm_io_pin_t to select the target slave channel

Return values

FSP_SUCCESS	Duty cycle updated successfully.
FSP_ERR_ASSERTION	p_ctrl was NULL or the pin is not one of tau_pwm_io_pin_t.
FSP_ERR_NOT_OPEN	The instance is not opened.
FSP_ERR_INVALID_ARGUMENT	Duty cycle is out of range or larger than period.

◆ R_TAU_PWM_InfoGet()

fsp_err_t R_TAU_PWM_InfoGet (timer_ctrl_t *const *p_ctrl*, timer_info_t *const *p_info*)

Get timer information and store it in provided pointer p_info. Implements timer_api_t::infoGet.

Example:

```
/* Get the current period setting. */
timer_info_t info;
   (void) R_TAU_PWM_InfoGet(&g_timer0_ctrl, &info);
   uint32_t current_period_counts = info.period_counts;
```

Return values

FSP_SUCCESS	Period, count direction, frequency written to caller's structure successfully
FSP_ERR_ASSERTION	p_ctrl or p_info was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ R_TAU_PWM_StatusGet()

fsp_err_t R_TAU_PWM_StatusGet (timer_ctrl_t *const *p_ctrl*, timer_status_t *const *p_status*)

Retrieves the current timer state and master channel counter value and stores them in provided pointer p_status. Implements timer_api_t::statusGet.

Example:

```
/* Read the current counter value. Counter value is in status.counter. */
timer_status_t status;
   (void) R_TAU_PWM_StatusGet(&g_timer0_ctrl, &status);
```

Return values

FSP_SUCCESS	Current timer state and counter value retrieved successfully.
FSP_ERR_ASSERTION	p_ctrl or p_status was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ R_TAU_PWM_CallbackSet()

fsp_err_t R_TAU_PWM_CallbackSet (timer_ctrl_t *const *p_api_ctrl*, void(*)(timer_callback_args_t *) *p_callback*, void const *const *p_context*, timer_callback_args_t *const *p_callback_memory*)

Updates the user callback with the option to provide memory for the callback argument structure. Implements timer_api_t::callbackSet.

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	p_ctrl or p_callback was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ R_TAU_PWM_Close()

fsp_err_t R_TAU_PWM_Close (timer_ctrl_t *const *p_ctrl*)

Stops counter, disables output pins, and clears internal driver data. Implements timer_api_t::close.

Return values

FSP_SUCCESS	Successful close.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

7.2.19.10 Timer, Ultra Low-Power (r_ulpt)

fsp_err_t	R_ULPT_StatusGet (timer_ctrl_t *const p_ctrl, timer_status_t *const p_status)
fsp_err_t	R_ULPT_CallbackSet (timer_ctrl_t *const p_api_ctrl, void(*p_callback)(timer_callback_args_t *), void const *const p_context, timer_callback_args_t *const p_callback_memory)
fsp_err_t	R_ULPT_Close (timer_ctrl_t *const p_ctrl)

Detailed Description

Driver for the ULPT peripheral on RA MCUs. This module implements the Timer Interface.

Overview

Features

The ULPT module has the following features:

- Supports periodic mode, one-shot mode, and PWM mode.
- Signal can be output to a pin.
- Configurable period (counts per timer cycle).
- Configurable duty cycle in PWM mode.
- Configurable clock source, LOCO, SUBCLK, and external sources input to ULPTEVIn.
- Supports runtime reconfiguration of period.
- Supports runtime reconfiguration of duty cycle in PWM mode.
- Supports counting based on an external clock input to ULPTEVIn.
- Supports debounce filter on ULPTEVIn pins.
- APIs are provided to start, stop, and reset the counter.
- APIs are provided to get the current period, source clock frequency, and count direction.
- APIs are provided to get the current timer status and counter value.

Selecting a Timer

RA MCUs can have multiple timer peripherals: the General PWM Timer (GPT) and the Asynchronous General Purpose Timer, and the Ultra Low Power Timer (ULPT). When selecting between them, consider these factors:

	GPT	AGT	ULPT

Low Power Modes	The GPT can operate in sleep mode.	The AGT can operate in all low power modes (when count source is LOCO or subclock).	The ULPT can operate in all low power up to DSTBYs (when count source is LOCO or subclock).
Available Channels	The number of GPT channels is device specific. All currently supported MCUs have at least 7 GPT channels.	All MCUs have 2 AGT channels.	The number of ULPT channels is device specific, 2 is common.
Timer Resolution	All MCUs have at least one 32-bit GPT timer.	The AGT timers are 16-bit timers.	The ULPT timers are 32-bit timers.
Clock Source	The GPT runs off PCLKD with a configurable divider up to 1024. It can also be configured to count ELC events or external pulses.	The AGT runs off PCLKB, LOCO, or subclock with a configurable divider up to 8 for PCLKB or up to 128 for LOCO or subclock.	The ULPT runs off PCLKB. LOCO, or subclock are count sources with a configurable divider up to 128.

Configuration

Build Time Configurations for r_ulpt

The following build time configurations are defined in fsp_cfg/r_ulpt_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
Pin Output Support	• Disabled • Enabled	Disabled	If selected code for outputting a waveform to a pin is included in the build.
Pin Input Support	• Disabled • Enabled (Required when Count Source is EVI on any channel)	Disabled	Enable input support to use ULPTEVin as count source

Configurations for Timers > Timer, Ultra-Low-Power (r_ulpt)

This module can be added to the Stacks tab via New Stack > Timers > Timer, Ultra-Low-Power (r_ulpt). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
General			
Name	Name must be a valid C symbol	g_timer0	Module name.
Channel	Channel number does not exist	0	Physical hardware channel.
Mode	• Periodic • One-Shot • PWM	Periodic	Mode selection. Note: One-shot mode is implemented in software. ISR's must be enabled for one shot even if callback is unused.
Period	Value must be non-negative	0x10000	Specify the timer period based on the selected unit. When the unit is set to 'Raw Counts', setting the period to 0x10000 results in the maximum period at the lowest divisor (fastest timer tick). Set the period to 0x10000 for a free running timer, pulse width measurement or pulse period measurement. Setting the period higher will automatically select a higher divider; the period can be set up to 0x80000 when counting from PCLKB or 0x800000 when counting from LOCO/subclock, which will use a divider of 8 or 128 respectively with the maximum period. If the requested period cannot be achieved, the settings with the largest possible period that is less than or equal to the requested period are used. The theoretical calculated period is printed in a

			comment in the timer_cfg_t structure.
Period Unit	• Raw Counts • Nanoseconds • Microseconds • Milliseconds • Seconds • Hertz • Kilohertz	Raw Counts	Unit of the period specified above
Count Source	• LOCO • SUBCLOCK • EVI (Requires Pin Input Support-Enabled)	LOCO	ULPT count source. NOTE: The divisor is calculated automatically based on the selected period. See ulpt_count_source_t documentation for details.
Output			
Duty Cycle Percent (only applicable in PWM mode)	Value must be between 0 and 100	50	Specify the timer duty cycle percent. Only used in PWM mode.
ULPTOA Output	• Disabled • Start Level Low • Start Level High	Disabled	Configure Match ULPTOA output.
ULPTOB Output	• Disabled • Start Level Low • Start Level High	Disabled	Configure Match ULPTOB output.
ULPTO Output	• Disabled • Start Level Low • Start Level High	Disabled	Configure Pulse ULPTO output.
Input			
Input Filter	• No Filter • Filter sampled at PCLKB • Filter sampled at PCLKB / 8 • Filter sampled at PCLKB / 32	No Filter	ULPTEVIn filter. Only applies if the count source is ULPTEVIn, event counter mode. The filter requires the signal to be at the same level for 3 successive reads at the specified filter frequency.
Enable Pin	• Enable Function Ignored • Enable Function Low • Enable Function High • Enable Function	Enable Function Ignored	ULPTEEn enable edge. Only applies if the count source is ULPTEVIn, event counter mode

	Start • Enable Function Restart		
Trigger Edge	• Trigger Edge Rising • Trigger Edge Falling • Trigger Edge Both	Trigger Edge Rising	ULPTEVIn trigger edge. Applies Only applies if the count source is ULPTEVIn, event counter mode.
Event Edge	• Event Edge Rising • Event Edge Falling • Event Edge Both	Event Edge Rising	Select the ULPTEVin edge. Applies if count input is ULPTEVin.
Interrupts			
Callback	Name must be a valid C symbol	NULL	A user callback function. If this callback function is provided, it is called from the interrupt service routine (ISR) each time the timer period elapses.
Underflow Interrupt Priority	MCU Specific Options		Timer interrupt priority.

Clock Configuration

The ULPT subsystem is driven by the PCLKB, but countdown is driven LOCO, Subclock, or event input. You can set the clock frequency using the **Clocks** tab of the RA Configuration editor or by using the CGC Interface at run-time.

Pin Configuration

This module can use the ULPTO, ULPTOA and ULPTOB pins as output pins for periodic, one-shot, or PWM signals.

For event counting, the input clocking signal must be applied to the ULPTEVIn pin.

Timer Period

The RA Configuration editor will automatically calculate the period count value and source clock divider based on the selected period time, units, and clock speed.

When the selected unit is "Raw counts", the maximum allowed period setting varies depending on the selected clock source:

Clock source	Maximum period (counts)
LOCO/Subclock	0xFFFFFFFF

All other sources	0xFFFFFFFF

Note

Though the ULPT is a 32-bit timer, because the period interrupt occurs when the counter underflows, setting the period register to 0 results in an effective period of 1 count. For this reason all user-provided raw count values reflect the actual number of period counts (not the raw register values).

Usage Notes

Starting and Stopping the ULPT

After starting or stopping the timer, ULPT registers cannot be accessed until the ULPT state is updated after 3 ULPTCLK cycles. If another ULPT function is called before the 3 ULPTCLK period elapses, the function spins waiting for the ULPT state to update. The required wait time after starting or stopping the timer can be determined using the frequency of ULPTCLK, which is derived from timer_cfg_t::source_div and ulpt_extended_cfg_t::count_source.

The application is responsible for ensuring required clocks are started and stable before accessing MCU peripheral registers.

Warning

The subclock can take seconds to stabilize. The RA startup code does not wait for subclock stabilization unless the subclock is the main clock source. When running ULPT or RTC off the subclock, the application must ensure the subclock is stable before starting operation.

Low Power Modes

The ULPT can be used to enter snooze mode or to wake the MCU from snooze, software standby, or deep software standby modes when a counter underflow occurs. The compare match A and B events can also be used to wake from software standby or snooze modes.

One-Shot Mode

The ULPT timer does support one-shot mode natively. The interrupt with put the module in the stop state. The callback is only called once in this case. If needed the timer needs to be re-started via the driver call.

Periodic Output

The ULPTO toggles each time the counter underflows.

Examples of periodic signals that can be generated by this module are shown below:

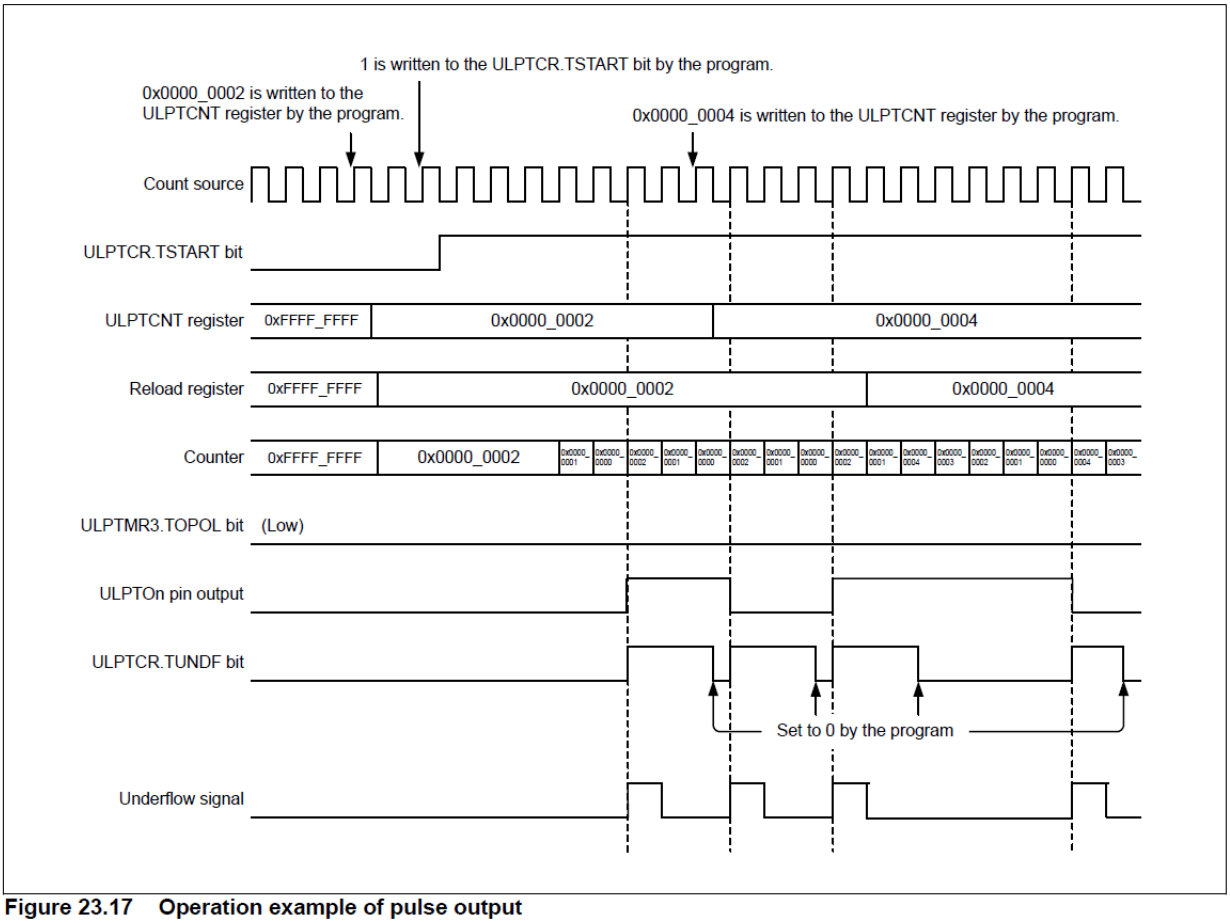

Figure 23.17 Operation example of pulse output

Figure 317: ULPT Periodic Output

PWM Output

The ULPTOA or ULPTOB pin toggles each time the compare match timer matches the down counter. It also toggles once the underflow occurs in periodic mode. for example setting the ULPT counter to 0x1000, and compare match A to half (0x800) will created a 50% duty cycle output on ULPTOA. Setting ULPTB to a quarter of that (0x400) will create a 25% duty cycle wave. Since the periodic output is actually a PWM output, the time at the stop level is one cycle shorter than the time opposite the stop level for odd period values.

Examples of periodic signals that can be generated by this module are shown below:

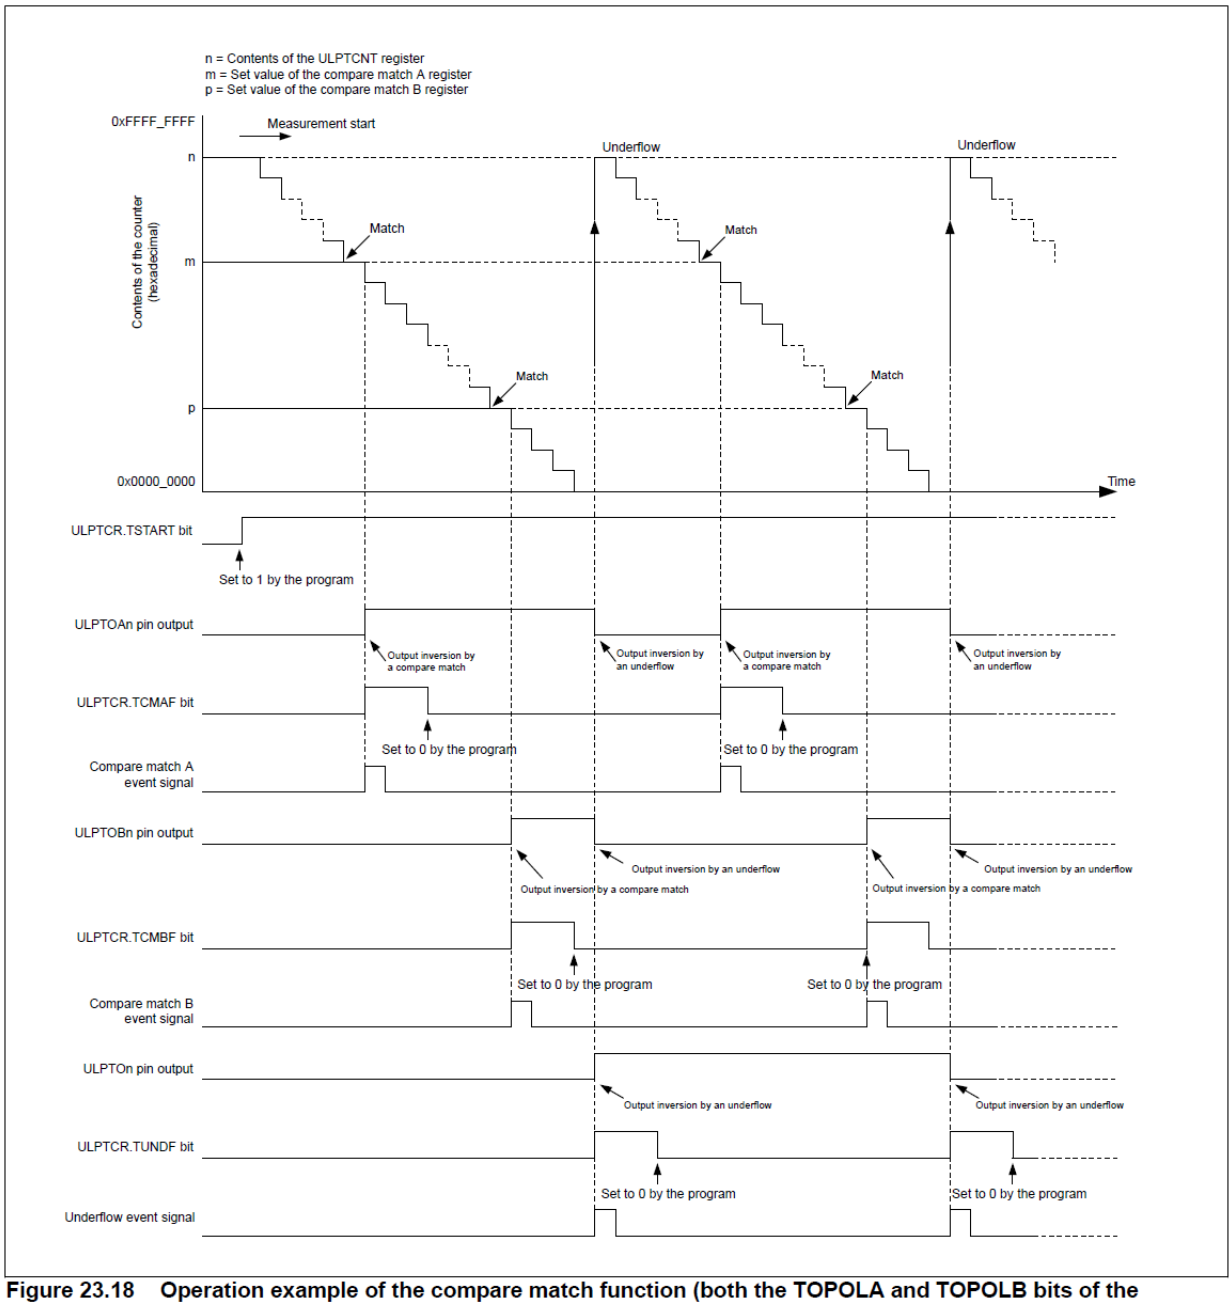

Figure 23.18 Operation example of the compare match function (both the TOPOLA and TOPOLB bits of the ULPTCMSR register are set to 0)

Figure 318: ULPT Periodic Output

Triggering ELC Events with ULPT

The ULPT timer can trigger the start of other peripherals. The Event Link Controller (r_elc) guide provides a list of all available peripherals.

Examples

ULPT Basic Example

This is a basic example of minimal use of the ULPT in an application.

```
void ulpt_basic_example (void)
{
 fsp_err_t      err = FSP_SUCCESS;
 timer_status_t status;
 /* Initializes the module. */
    err = R_ULPT_Open(&g_timer0_ctrl, &g_timer0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Start the timer. */
    (void) R_ULPT_Start(&g_timer0_ctrl);
 /* Read the current counter value. Counter value is in status.counter. */
    (void) R_ULPT_StatusGet(&g_timer0_ctrl, &status);
}
```

ULPT Callback Example

This is an example of a timer callback.

```
/* Example callback called when timer expires. */
void timer_callback (timer_callback_args_t * p_args)
{
 if (TIMER_EVENT_CYCLE_END == p_args->event)
    {
 /* Add application code to be called periodically here. */
    }
}
```

ULPT Free Running Counter Example

To use the ULPT as a free running counter, select periodic mode and set the the Period to 0xFFFFFFFF.

```
void ulpt_counter_example (void)
{
 fsp_err_t      err = FSP_SUCCESS;
```

```
 timer_status_t status;
 /* Initializes the module. */
    err = R_ULPT_Open(&g_timer0_ctrl, &g_timer0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Start the timer. */
    (void) R_ULPT_Start(&g_timer0_ctrl);
 /* (Optional) Stop the timer. This will set the counter back to max */
    (void) R_ULPT_Stop(&g_timer0_ctrl);
 /* Read the current counter value. Counter value is in status.counter. */
    (void) R_ULPT_StatusGet(&g_timer0_ctrl, &status);
}
```

ULPT Period Update Example

This an example of updating the period.

```
#define ULPT_EXAMPLE_MSEC_PER_SEC (1000)
#define ULPT_EXAMPLE_DESIRED_PERIOD_MSEC (20)
/* This example shows how to calculate a new period value at runtime. */
void ulpt_period_calculation_example (void)
{
 fsp_err_t    err = FSP_SUCCESS;
 timer_info_t ulptInfo;
    uint32_t    timer_freq_hz = 0;
 /* Initializes the module. */
    err = R_ULPT_Open(&g_timer0_ctrl, &g_timer0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Start the timer. */
    (void) R_ULPT_Start(&g_timer0_ctrl);
    err = R_ULPT_Enable(&g_timer0_ctrl);
    assert(FSP_SUCCESS == err);
 /* Get the source clock frequency (in Hz).
  * - Use the R_ULPT_InfoGet function (it accounts for the clock source and divider).
```

```
*/
 if (R_ULPT_InfoGet(&g_timer0_ctrl, &ulptInfo) == FSP_SUCCESS)
    {
       timer_freq_hz = ulptInfo.clock_frequency;
    }
 /* Calculate the desired period based on the current clock. Note that this
calculation could overflow if the
  * desired period is larger than UINT32_MAX / pclkb_freq_hz. A cast to uint64_t is
used to prevent this. */
    uint32_t period_counts =
       (uint32_t) (((uint64_t) timer_freq_hz * ULPT_EXAMPLE_DESIRED_PERIOD_MSEC) /
ULPT_EXAMPLE_MSEC_PER_SEC);
 /* Set the calculated period. This will return an error if parameter checking is
enabled and the calculated
  * period is larger than UINT16_MAX. */
    err = R_ULPT_PeriodSet(&g_timer0_ctrl, period_counts);
    assert(FSP_SUCCESS == err);
    err = R_ULPT_Disable(&g_timer0_ctrl);
    assert(FSP_SUCCESS == err);
}
```

ULPT Duty Cycle Update Example

This an example of updating the duty cycle.

```
#define ULPT_EXAMPLE_DESIRED_DUTY_CYCLE_PERCENT (25)
#define ULPT_EXAMPLE_MAX_PERCENT (100)
/* This example shows how to calculate a new duty cycle value at runtime. */
void ulpt_duty_cycle_calculation_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = R_ULPT_Open(&g_timer0_ctrl, &g_timer0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
```

```
 /* Start the timer. */
    (void) R_ULPT_Start(&g_timer0_ctrl);
 /* Get the current period setting. */
 timer_info_t info;
    (void) R_ULPT_InfoGet(&g_timer0_ctrl, &info);
    uint32_t current_period_counts = info.period_counts;
 /* Calculate the desired duty cycle based on the current period. */
    uint32_t duty_cycle_counts = (current_period_counts *
ULPT_EXAMPLE_DESIRED_DUTY_CYCLE_PERCENT) /
                                 ULPT_EXAMPLE_MAX_PERCENT;
 /* Set the calculated duty cycle. */
    err = R_ULPT_DutyCycleSet(&g_timer0_ctrl, duty_cycle_counts,
ULPT_OUTPUT_PIN_ULPTOA);
    assert(FSP_SUCCESS == err);
}
```

◆ ulpt_instance_ctrl_t

struct ulpt_instance_ctrl_t
Channel control block. DO NOT INITIALIZE. Initialization occurs when timer_api_t::open is called.

◆ ulpt_extended_cfg_t

struct ulpt_extended_cfg_t		
Optional ULPT extension data structure.		
Data Fields		
ulpt_clock_t	count_source	ULPT channel clock source.
ulpt_ulptevi_filter_t	ulptevi_filter	Input filter for ULTPEVI.
ulpt_enable_function_t	enable_function	Counter function when ULPTEE is valid.
ulpt_trigger_edge_t	trigger_edge	Enable trigger edge (start and restart functions only).
ulpt_event_pin_t	event_pin	Event pin (event counting only).
ulpt_pulse_pin_cfg_t	ulpto	Pulse output pin.
union ulpt_extended_cfg_t	__unnamed__	

Enumeration Type Documentation

◆ ulpt_clock_t

enum ulpt_clock_t	
Count source.	
Enumerator	
ULPT_CLOCK_LOCO	LOCO count source, division by 1, 2, 4, 8, 16, 32, 64, 128.
ULPT_CLOCK_SUBCLOCK	Subclock count source, division by 1, 2, 4, 8, 16, 32, 64, 128.
ULPT_CLOCK_ULPTEVI	Counts external events on ULPTEVI.

◆ ulpt_enable_function_t

enum ulpt_enable_function_t	
Counter mode for event enable.	
Enumerator	
ULPT_ENABLE_FUNCTION_IGNORED	Always count external events, ignore ULPTEE.
ULPT_ENABLE_FUNCTION_ENABLE_LOW	Event counting is enabled while ULPTEE is low (event counting only).
ULPT_ENABLE_FUNCTION_ENABLE_HIGH	Event counting is enabled while ULPTEE is high (event counting only).
ULPT_ENABLE_FUNCTION_START	Counting is started after ULPTEE.
ULPT_ENABLE_FUNCTION_RESTART	Counting is restarted after ULPTEE.

◆ ulpt_trigger_edge_t

enum ulpt_trigger_edge_t	
Enable signal trigger edge for start and restart functions.	
Enumerator	
ULPT_TRIGGER_EDGE_RISING	Timer enable function occurs on the rising edge of ULPTEE.
ULPT_TRIGGER_EDGE_FALLING	Timer enable function occurs on the falling edge of ULPTEE.
ULPT_TRIGGER_EDGE_BOTH	Timer enable function occurs on any edge of ULPTEE.

◆ ulpt_event_pin_t

enum ulpt_event_pin_t	
Event signal pin.	
Enumerator	
ULPT_EVENT_PIN_RISING	Event count occurs on the rising edge.
ULPT_EVENT_PIN_FALLING	Event count occurs on the falling edge.
ULPT_EVENT_PIN_BOTH	Event count occurs on both edges.

◆ ulpt_output_pin_t

enum ulpt_output_pin_t	
Output pins, used to select which duty cycle to update in R_ULPT_DutyCycleSet().	
Enumerator	
ULPT_OUTPUT_PIN_ULPTOA	Compare match A output.
ULPT_OUTPUT_PIN_ULPTOB	Compare match B output.

◆ ulpt_pulse_pin_cfg_t

enum ulpt_pulse_pin_cfg_t	
ULPTO pulse output pin.	
Enumerator	
ULPT_PULSE_PIN_CFG_DISABLED	Output pin disabled.
ULPT_PULSE_PIN_CFG_ENABLED_START_LEVEL_LOW	Output pin Enabled Start Low.
ULPT_PULSE_PIN_CFG_ENABLED_START_LEVEL_HIGH	Output pin enabled Start Hig.

◆ ulpt_match_pin_cfg_t

enum ulpt_match_pin_cfg_t	
ULPT match output pin.	
Enumerator	
ULPT_MATCH_PIN_CFG_DISABLED	Match output disabled.
ULPT_MATCH_PIN_CFG_START_LEVEL_LOW	Match output enabled, starts low.
ULPT_MATCH_PIN_CFG_START_LEVEL_HIGH	Match output enabled, starts high.

◆ ulpt_ulptevi_filter_t

enum ulpt_ulptevi_filter_t	
Input filter, applied to ULPTEVI in event counter mode. The filter requires the signal to be at the same level for 3 successive reads at the specified filter frequency.	
Enumerator	
ULPT_ULPTEVI_FILTER_NONE	No filter.
ULPT_ULPTEVI_FILTER_PCLKB	Filter at PCLKB.
ULPT_ULPTEVI_FILTER_PCLKB_DIV_8	Filter at PCLKB / 8.
ULPT_ULPTEVI_FILTER_PCLKB_DIV_32	Filter at PCLKB / 32.

Function Documentation

◆ R_ULPT_Open()

fsp_err_t R_ULPT_Open (timer_ctrl_t *const *p_ctrl*, timer_cfg_t const *const *p_cfg*)

Initializes the ULPT module instance. Implements timer_api_t::open.

The ULPT implementation of the general timer can accept an optional ulpt_extended_cfg_t extension parameter. For ULPT, the extension specifies the clock to be used as timer source and the output pin configurations. If the extension parameter is not specified (NULL), the default clock LOCO is used and the output pins are disabled.

Example:

```
/* Initializes the module. */
   err = R_ULPT_Open(&g_timer0_ctrl, &g_timer0_cfg);
```

Return values

FSP_SUCCESS	Initialization was successful and timer has started.
FSP_ERR_ASSERTION	A required input pointer is NULL or the period is not in the valid range of 1 to 0xFFFF.
FSP_ERR_ALREADY_OPEN	R_ULPT_Open has already been called for this p_ctrl.
FSP_ERR_IRQ_BSP_DISABLED	A required interrupt has not been enabled in the vector table.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	Requested channel number is not available on ULPT.

◆ R_ULPT_Start()

fsp_err_t R_ULPT_Start (timer_ctrl_t *const *p_ctrl*)

Starts timer. Implements timer_api_t::start.

Example:

```
/* Start the timer. */
   (void) R_ULPT_Start(&g_timer0_ctrl);
```

Return values

FSP_SUCCESS	Timer started.
FSP_ERR_ASSERTION	p_ctrl is null.
FSP_ERR_NOT_OPEN	The instance control structure is not opened.

◆ R_ULPT_Stop()

fsp_err_t R_ULPT_Stop (timer_ctrl_t *const *p_ctrl*)

Stops the timer. Implements timer_api_t::stop.

Example:

```
/* (Optional) Stop the timer. This will set the counter back to max */
   (void) R_ULPT_Stop(&g_timer0_ctrl);
```

Return values

FSP_SUCCESS	Timer stopped.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance control structure is not opened.

◆ R_ULPT_Reset()

fsp_err_t R_ULPT_Reset (timer_ctrl_t *const *p_ctrl*)

Resets the counter value to the period minus one. Implements timer_api_t::reset.

Return values

FSP_SUCCESS	Counter reset.
FSP_ERR_ASSERTION	p_ctrl is NULL
FSP_ERR_NOT_OPEN	The instance control structure is not opened.

◆ R_ULPT_Enable()

fsp_err_t R_ULPT_Enable (timer_ctrl_t *const *p_ctrl*)

Enables external event triggers that start, stop, clear, or capture the counter. Implements timer_api_t::enable.

Example:

```
err = R_ULPT_Enable(&g_timer0_ctrl);
assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	External events successfully enabled.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ R_ULPT_Disable()

fsp_err_t R_ULPT_Disable (timer_ctrl_t *const *p_ctrl*)

Disables external event triggers that start, stop, clear, or capture the counter. Implements timer_api_t::disable.

Example:

```
err = R_ULPT_Disable(&g_timer0_ctrl);
assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	External events successfully disabled.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ R_ULPT_PeriodSet()

fsp_err_t R_ULPT_PeriodSet (timer_ctrl_t *const *p_ctrl*, uint32_t const *period_counts*)

Updates period. The new period is updated immediately and the counter is reset to the maximum value. Implements timer_api_t::periodSet.

Warning

If periodic output is used, the duty cycle buffer registers are updated after the period buffer register. If this function is called while the timer is running and an AGT underflow occurs during processing, the duty cycle will not be the desired 50% duty cycle until the counter underflow after processing completes.
Stop the timer before calling this function if one-shot output is used.

Example:

```
/* Set the calculated period. This will return an error if parameter checking is
enabled and the calculated
 * period is larger than UINT16_MAX. */
  err = R_ULPT_PeriodSet(&g_timer0_ctrl, period_counts);
  assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Period value updated.
FSP_ERR_ASSERTION	A required pointer was NULL, or the period was not in the valid range of 1 to 0xFFFF.
FSP_ERR_NOT_OPEN	The instance control structure is not opened.

◆ R_ULPT_DutyCycleSet()

fsp_err_t R_ULPT_DutyCycleSet (timer_ctrl_t *const *p_ctrl*, uint32_t const *duty_cycle_counts*, uint32_t const *pin*)

Updates duty cycle. If the timer is counting, the new duty cycle is reflected after the next counter underflow. Implements timer_api_t::dutyCycleSet.

Example:

```
/* Set the calculated duty cycle. */
   err = R_ULPT_DutyCycleSet(&g_timer0_ctrl, duty_cycle_counts,
ULPT_OUTPUT_PIN_ULPTOA);
   assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Duty cycle updated.
FSP_ERR_ASSERTION	A required pointer was NULL, or the pin was not ULPT_ULPTO_ULPTOA or ULPT_ULPTO_ULPTOB.
FSP_ERR_INVALID_ARGUMENT	Duty cycle was not in the valid range of 0 to period (counts) - 1
FSP_ERR_NOT_OPEN	The instance control structure is not opened.
FSP_ERR_UNSUPPORTED	ULPT_CFG_OUTPUT_SUPPORT_ENABLE is 0.

◆ R_ULPT_CompareMatchSet()

fsp_err_t R_ULPT_CompareMatchSet (timer_ctrl_t *const *p_ctrl*, uint32_t const *compare_match_value*, timer_compare_match_t const *match_channel*)

Placeholder for unsupported compareMatch function. Implements timer_api_t::compareMatchSet.

Return values

FSP_ERR_UNSUPPORTED	ULPT compare match is not supported.

◆ R_ULPT_InfoGet()

fsp_err_t R_ULPT_InfoGet (timer_ctrl_t *const *p_ctrl*, timer_info_t *const *p_info*)

Gets timer information and store it in provided pointer p_info. Implements timer_api_t::infoGet.

Example:

```
/* Get the source clock frequency (in Hz).
 * - Use the R_ULPT_InfoGet function (it accounts for the clock source and divider).
*/
if (R_ULPT_InfoGet(&g_timer0_ctrl, &ulptInfo) == FSP_SUCCESS)
   {
      timer_freq_hz = ulptInfo.clock_frequency;
   }
```

Return values

FSP_SUCCESS	Period, count direction, and frequency stored in p_info.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The instance control structure is not opened.

◆ R_ULPT_StatusGet()

fsp_err_t R_ULPT_StatusGet (timer_ctrl_t *const *p_ctrl*, timer_status_t *const *p_status*)

Retrieves the current state and counter value stores them in p_status. Implements timer_api_t::statusGet.

Example:

```
/* Read the current counter value. Counter value is in status.counter. */
   (void) R_ULPT_StatusGet(&g_timer0_ctrl, &status);
```

Return values

FSP_SUCCESS	Current status and counter value provided in p_status.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The instance control structure is not opened.

◆ R_ULPT_CallbackSet()

fsp_err_t R_ULPT_CallbackSet (timer_ctrl_t *const *p_api_ctrl*, void(*)(timer_callback_args_t *) *p_callback*, void const *const *p_context*, timer_callback_args_t *const *p_callback_memory*)

Updates the user callback with the option to provide memory for the callback argument structure. Implements timer_api_t::callbackSet.

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

◆ R_ULPT_Close()

fsp_err_t R_ULPT_Close (timer_ctrl_t *const *p_ctrl*)

Stops counter, disables interrupts, disables output pins, and clears internal driver data. Implements timer_api_t::close.

Return values

FSP_SUCCESS	Timer closed.
FSP_ERR_ASSERTION	p_ctrl is NULL.
FSP_ERR_NOT_OPEN	The instance control structure is not opened.

7.2.20 Transfer

Modules

Detailed Description

Transfer Modules.

Modules

	Transfer (r_dmac) Driver for the DMAC peripheral on RA MCUs. This module implements

fsp_err_t	R_DMAC_CallbackSet (transfer_ctrl_t *const p_api_ctrl, void(*p_callback)(dmac_callback_args_t *), void const *const p_context, dmac_callback_args_t *const p_callback_memory)
fsp_err_t	R_DMAC_Close (transfer_ctrl_t *const p_api_ctrl)

Detailed Description

Driver for the DMAC peripheral on RA MCUs. This module implements the Transfer Interface.

Overview

The Direct Memory Access Controller (DMAC) transfers data from one memory location to another without using the CPU.

Features

- Supports multiple transfer modes
  - Normal transfer
  - Repeat transfer
  - Block transfer
  - Repeat-Block transfer (Not available on all MCUs)
- Address increment, decrement, fixed, or offset modes
- Triggered by ELC events
  - Some exceptions apply, see the Event table in the Event Numbers section of the Interrupt Controller Unit chapter of the hardware manual
- Supports 1, 2, and 4 byte data units

Configuration

Build Time Configurations for r_dmac

The following build time configurations are defined in fsp_cfg/r_dmac_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Transfer > Transfer (r_dmac)

This module can be added to the Stacks tab via New Stack > Transfer > Transfer (r_dmac).

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_transfer0	Module name.
Channel	Value must be a non-negative integer	0	Specify the hardware channel.
Mode	MCU Specific Options		Select the transfer mode. Normal: One transfer per activation, transfer ends after Number of Transfers; Repeat: One transfer per activation, Repeat Area address reset after Number of Transfers, transfer ends after Number of

			Blocks; Block: Number of Blocks per activation, Repeat Area address reset after Number of Transfers, transfer ends after Number of Blocks.
Transfer Size	• 1 Byte • 2 Bytes • 4 Bytes	2 Bytes	Select the transfer size.
Destination Address Mode	• Fixed • Offset addition • Incremented • Decremented	Fixed	Select the address mode for the destination.
Source Address Mode	• Fixed • Offset addition • Incremented • Decremented	Fixed	Select the address mode for the source.
Repeat Area (Unused in Normal Mode)	• Destination • Source	Source	Select the repeat area. Either the source or destination address resets to its initial value after completing Number of Transfers in Repeat or Block mode.
Number of Transfers	Value must be a non-negative integer	1	Specify the number of transfers for repeat and normal mode or block size for repeat-block transfer mode.
Number of Blocks (Valid only in Repeat,Block or Repeat-Block Mode)	Value must be a non-negative integer	0	Specify the number of blocks to transfer in Repeat,Block or Repeat-Block mode.
Activation Source	MCU Specific Options		Select the DMAC transfer start event. If no ELC event is chosen then software start can be used.
Callback	Name must be a valid C symbol	NULL	A user callback that is called at the end of the transfer.
Transfer End Interrupt Priority	MCU Specific Options		Select the transfer end interrupt priority.
Interrupt Frequency	• Interrupt after all transfers have completed • Interrupt after each block, or	Interrupt after all transfers have completed	Select to have interrupt after each transfer or after last transfer.

	repeat size is transfered		
Offset value (Valid only when address mode is \'Offset\')	Value must be a 24 bit signed integer.	1	Offset value is added to the address after each transfer.
Source Buffer Size	Value must be a non-negative integer with a maximum configurable value of 65535.	1	Specify the size of whole source buffer (valid only for Repeat-Block transfer mode with source address update mode other than offset addition).

Clock Configuration

The DMAC peripheral module uses ICLK as the clock source. The ICLK frequency is set by using the **Clocks** tab of the RA Configuration editor prior to a build, or by using the CGC module at run-time.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Source and Destination Configuration

R_DMAC_Reset() API function should be called to set the source and destination before starting transfer operation.

Transfer Modes

The DMAC Module supports three modes of operation.

- **Normal Mode** - In normal mode, a single data unit is transfered every time the configured ELC event is received by the DMAC channel. A data unit can be 1-byte, 2-bytes, or 4-bytes. The source and destination addresses can be fixed, increment, decrement, or add an offset to the next data unit after each transfer. A 16-bit counter decrements after each transfer. When the counter reaches 0, transfers will no longer be triggered by the ELC event and the CPU can be interrupted to signal that all transfers have finished.
- **Repeat Mode** - Repeat mode works the same way as normal mode, however the length is limited to an integer in the range[1,1024]. When the transfer counter reaches 0, the counter is reset to its configured value, the repeat area (source or destination address) resets to its starting address and the block count remaining will decrement by 1. When the block count reaches 0, transfers will no longer be triggered by the ELC event and the CPU may be interrupted to signal that all transfers have finished.
- **Block Mode** - In block mode, the amount of data units transfered by each interrupt can be set to an integer in the range [1,1024]. The number of blocks to transfer can also be configured to a 16-bit number. After each block transfer the repeat area (source or destination address) will reset to the original address and the other address will be incremented or decremented to the next block.
- **Repeat-Block Mode** - In repeat-block mode, the amount of data units transfered by each interrupt can be set to an integer in the range [1,1024]. The number of blocks to transfer can be configured to a 16 bit number. If the destination address mode is offset mode,

maximum configurable number of blocks is 0xFFFF for block size(length) of one with data transfer size as byte,0x7FFF for block size of one with data transfer size as half word and 0x3FFF for block size of one with data size as word. After each block transfer the source address and the destination address will be incremented or decremented to the next block address. In case of offset address mode for source address, the source address size is the total size of source buffer after which the source area is rolled over, block size can be smaller than the source buffer size.For source address mode as offset mode, the maximum configurable source buffer size is 0xFFFF for transfer data size of a byte,0x7FFF for transfer data size of half word and 0x3FFF for transfer data size of word. Repeat-block mode can be used to implement single ring buffer to multiple ring buffer transfer type design.

Selecting the DTC or DMAC

The Transfer API is implemented by both DTC and the DMAC so that applications can switch between the DTC and the DMAC. When selecting between them, consider these factors:

	DTC	DMAC
Repeat Mode	• Repeats forever • Max repeat size is 256 x 4 bytes	• Configurable number of repeats • Max repeat size is 1024 x 4 bytes
Block Mode	• Max block size is 256 x 4 bytes	• Max block size is 1024 x 4 bytes
Channels	• One instance per interrupt	• MCU specific (8 channels or less)
Chained Transfers	• Supported	• Not Supported
Software Trigger	• Must use the software ELC event	• Has support for software trigger without using software ELC event • Supports TRANSFER_START_MODE_SINGLE and TRANSFER_START_MODE_REPEAT
Offset Address Mode	• Not supported	• Supported

Interrupts

The DTC and DMAC interrupts behave differently. The DTC uses the configured IELSR event IRQ as the interrupt source whereas each DMAC channel has its own IRQ.

The transfer_info_t::irq setting also behaves a little differently depending on which mode is selected.

Normal Mode

	DTC	DMAC
TRANSFER_IRQ_EACH	Interrupt after each transfer	N/A
TRANSFER_IRQ_END	Interrupt after last transfer	Interrupt after last transfer

Repeat Mode

	DTC	DMAC
TRANSFER_IRQ_EACH	Interrupt after each transfer	Interrupt after each repeat
TRANSFER_IRQ_END	Interrupt after each repeat	Interrupt after last transfer

Block Mode

	DTC	DMAC
TRANSFER_IRQ_EACH	Interrupt after each block	Interrupt after each block
TRANSFER_IRQ_END	Interrupt after last block	Interrupt after last block

Repeat-block Mode

	DTC	DMAC
TRANSFER_IRQ_EACH	N/A	N/A
TRANSFER_IRQ_END	N/A	Interrupt after last block

Additional Considerations

- The DTC requires a moderate amount of RAM (one transfer_info_t struct per open instance + DTC_VECTOR_TABLE_SIZE).
- The DTC stores transfer information in RAM and writes back to RAM after each transfer whereas the DMAC stores all transfer information in registers.
- When transfers are configured for more than one activation source, the DTC must fetch the transfer info from RAM on each interrupt. This can cause a higher latency between transfers.

Offset Address Mode

When the source or destination mode is configured to offset mode, a configurable offset is added to the source or destination pointer after each transfer. The offset is a signed 24 bit number.

Examples

Basic Example

This is a basic example of minimal use of the DMAC in an application. In this case, one or more events have been routed to the DMAC for handling so it only needs to be enabled to start accepting transfers.

```
void dmac_minimal_example (void)
{
 /* Open the transfer instance with initial configuration. */
 fsp_err_t err = R_DMAC_Open(&g_transfer_ctrl, &g_transfer_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Enable the DMAC so that it responds to transfer requests. */
```

```
    err = R_DMAC_Enable(&g_transfer_ctrl);
    assert(FSP_SUCCESS == err);
}
```

CRC32 Example

In this example the DMAC is used to feed the CRC peripheral to perform a CRC32 operation.

```
volatile bool g_transfer_complete = false;
void dmac_callback (dmac_callback_args_t * cb_data)
{
 FSP_PARAMETER_NOT_USED(cb_data);
    g_transfer_complete = true;
}
void dmac_crc_example (void)
{
    uint8_t p_src[TRANSFER_LENGTH];
 /* Initialize p_src to [ABC..OP] */
 for (uint32_t i = 0; i < TRANSFER_LENGTH; i++)
    {
       p_src[i] = (uint8_t) ('A' + (i % 26));
    }
 /* Set transfer source address to p_src */
    g_transfer_cfg.p_info->p_src = (void *) p_src;
 /* Set transfer destination address to the CRC data input register */
    g_transfer_cfg.p_info->p_dest = (void *) &R_CRC->CRCDIR;
 /* Open the transfer instance with initial configuration. */
 fsp_err_t err = R_DMAC_Open(&g_transfer_ctrl, &g_transfer_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Enable DMAC transfers. */
    (void) R_DMAC_Enable(&g_transfer_ctrl);
 /* Open the CRC module. */
    err = R_CRC_Open(&g_crc_ctrl, &g_crc_cfg);
    assert(FSP_SUCCESS == err);
```

```
/* Clear the transfer complete flag. */
   g_transfer_complete = false;
/* Trigger the transfer using software. */
   err = R_DMAC_SoftwareStart(&g_transfer_ctrl, TRANSFER_START_MODE_SINGLE);
   assert(FSP_SUCCESS == err);
while (!g_transfer_complete)
   {
/* Wait for transfer complete interrupt */
   }
/* Get CRC result and perform final XOR. */
   uint32_t crc32;
   (void) R_CRC_CalculatedValueGet(&g_crc_ctrl, &crc32);
   crc32 ^= CRC32_FINAL_XOR_VALUE;
/* Verify that the CRC32 is calculated correctly. */
/* CRC32("ABCD...NOP") = 0xE0E8FF4D. */
const uint32_t expected_crc32 = 0xE0E8FF4D;
if (expected_crc32 != crc32)
   {
/* Handle any CRC errors. This function should be defined by the user. */
      handle_crc_error();
   }
}
```

Data Structures

Data Structure Documentation

◆ dmac_instance_ctrl_t

struct dmac_instance_ctrl_t
Control block used by driver. DO NOT INITIALIZE - this structure will be initialized in transfer_api_t::open.

◆ dmac_extended_cfg_t

struct dmac_extended_cfg_t	
DMAC transfer configuration extension. This extension is required.	
Data Fields	
uint8_t	channel
	Channel number, does not apply to all HAL drivers.
IRQn_Type	irq
	DMAC interrupt number.
uint8_t	ipl
	DMAC interrupt priority.
int32_t	offset
	Offset value used with transfer_addr_mode_t::TRANSFER_ADDR_MODE_OFFSET.
uint16_t	src_buffer_size
elc_event_t	activation_source
void(*	p_callback)(dmac_callback_args_t *cb_data)
void const *	p_context

Field Documentation

◆ src_buffer_size

uint16_t dmac_extended_cfg_t::src_buffer_size

Source ring buffer size for TRANSFER_MODE_REPEAT_BLOCK.

◆ activation_source

elc_event_t dmac_extended_cfg_t::activation_source

Select which event will trigger the transfer.

Note

Select ELC_EVENT_NONE for software activation in order to use softwareStart and softwareStart to trigger transfers.

◆ p_callback

void(* dmac_extended_cfg_t::p_callback) (dmac_callback_args_t *cb_data)

Callback for transfer end interrupt.

◆ p_context

void const* dmac_extended_cfg_t::p_context

Placeholder for user data. Passed to the user p_callback in transfer_callback_args_t.

Macro Definition Documentation

◆ DMAC_MAX_NORMAL_TRANSFER_LENGTH

#define DMAC_MAX_NORMAL_TRANSFER_LENGTH

Max configurable number of transfers in TRANSFER_MODE_NORMAL.

◆ DMAC_MAX_REPEAT_TRANSFER_LENGTH

#define DMAC_MAX_REPEAT_TRANSFER_LENGTH

Max number of transfers per repeat for TRANSFER_MODE_REPEAT.

◆ DMAC_MAX_BLOCK_TRANSFER_LENGTH

#define DMAC_MAX_BLOCK_TRANSFER_LENGTH

Max number of transfers per block in TRANSFER_MODE_BLOCK

◆ DMAC_MAX_REPEAT_COUNT

#define DMAC_MAX_REPEAT_COUNT
Max configurable number of repeats to trasnfer in TRANSFER_MODE_REPEAT

◆ DMAC_MAX_BLOCK_COUNT

#define DMAC_MAX_BLOCK_COUNT
Max configurable number of blocks to transfer in TRANSFER_MODE_BLOCK

Function Documentation

◆ R_DMAC_Open()

fsp_err_t R_DMAC_Open (transfer_ctrl_t *const *p_api_ctrl*, transfer_cfg_t const *const *p_cfg*)

Configure a DMAC channel.

Return values

FSP_SUCCESS	Successful open.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	The configured channel is invalid.
FSP_ERR_IRQ_BSP_DISABLED	The IRQ associated with the activation source is not enabled in the BSP.
FSP_ERR_ALREADY_OPEN	The control structure is already opened.

◆ R_DMAC_Reconfigure()

fsp_err_t R_DMAC_Reconfigure (transfer_ctrl_t *const *p_api_ctrl*, transfer_info_t * *p_info*)

Reconfigure the transfer with new transfer info.

Return values

FSP_SUCCESS	Transfer is configured and will start when trigger occurs.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_ENABLED	DMAC is not enabled. The current configuration must not be valid.
FSP_ERR_NOT_OPEN	Handle is not initialized. Call R_DMAC_Open to initialize the control block.

◆ R_DMAC_Reset()

fsp_err_t R_DMAC_Reset (transfer_ctrl_t *const *p_api_ctrl*, void const *volatile *p_src*, void *volatile *p_dest*, uint16_t const *num_transfers*)

Reset transfer source, destination, and number of transfers.

Return values

FSP_SUCCESS	Transfer reset successfully.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_ENABLED	DMAC is not enabled. The current configuration must not be valid.
FSP_ERR_NOT_OPEN	Handle is not initialized. Call R_DMAC_Open to initialize the control block.

◆ R_DMAC_SoftwareStart()

fsp_err_t R_DMAC_SoftwareStart (transfer_ctrl_t *const *p_api_ctrl*, transfer_start_mode_t *mode*)

If the mode is TRANSFER_START_MODE_SINGLE initiate a single transfer with software. If the mode is TRANSFER_START_MODE_REPEAT continue triggering transfers until all of the transfers are completed.

Return values

FSP_SUCCESS	Transfer started written successfully.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Handle is not initialized. Call R_DMAC_Open to initialize the control block.
FSP_ERR_UNSUPPORTED	Handle was not configured for software activation.

◆ R_DMAC_SoftwareStop()

fsp_err_t R_DMAC_SoftwareStop (transfer_ctrl_t *const *p_api_ctrl*)

Stop software transfers if they were started with TRANSFER_START_MODE_REPEAT.

Return values

FSP_SUCCESS	Transfer stopped written successfully.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Handle is not initialized. Call R_DMAC_Open to initialize the control block.

◆ R_DMAC_Enable()

fsp_err_t R_DMAC_Enable (transfer_ctrl_t *const *p_api_ctrl*)

Enable transfers for the configured activation source.

Return values

FSP_SUCCESS	Counter value written successfully.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Handle is not initialized. Call R_DMAC_Open to initialize the control block.

◆ R_DMAC_Disable()

fsp_err_t R_DMAC_Disable (transfer_ctrl_t *const *p_api_ctrl*)

Disable transfers so that they are no longer triggered by the activation source.

Return values

FSP_SUCCESS	Counter value written successfully.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Handle is not initialized. Call R_DMAC_Open to initialize the control block.

◆ R_DMAC_InfoGet()

fsp_err_t R_DMAC_InfoGet (transfer_ctrl_t *const *p_api_ctrl*, transfer_properties_t *const *p_info*)

Set driver specific information in provided pointer.

Return values

FSP_SUCCESS	Information has been written to p_info.
FSP_ERR_NOT_OPEN	Handle is not initialized. Call R_DMAC_Open to initialize the control block.
FSP_ERR_ASSERTION	An input parameter is invalid.

◆ R_DMAC_Reload()

fsp_err_t R_DMAC_Reload (transfer_ctrl_t *const *p_api_ctrl*, void const * *p_src*, void * *p_dest*, uint32_t const *num_transfers*)

To update next transfer information without interruption during transfer.

Return values

FSP_ERR_UNSUPPORTED	This feature is not supported.

◆ R_DMAC_CallbackSet()

fsp_err_t R_DMAC_CallbackSet (transfer_ctrl_t *const *p_api_ctrl*, void(*)(dmac_callback_args_t *) *p_callback*, void const *const *p_context*, dmac_callback_args_t *const *p_callback_memory*)

Updates the user callback with the option to provide memory for the callback argument structure.

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.

◆ R_DMAC_Close()

fsp_err_t R_DMAC_Close (transfer_ctrl_t *const *p_api_ctrl*)
Disable transfer and clean up internal data. Implements transfer_api_t::close. **Return values** FSP_SUCCESS — Successful close. FSP_ERR_ASSERTION — An input parameter is invalid. FSP_ERR_NOT_OPEN — Handle is not initialized. Call R_DMAC_Open to initialize the control block.

7.2.20.2 Transfer (r_dtc)

fsp_err_t R_DTC_Close (transfer_ctrl_t *const p_api_ctrl)

Detailed Description

Driver for the DTC peripheral on RA MCUs. This module implements the Transfer Interface.

Overview

The Data Transfer Controller (DTC) transfers data from one memory location to another without using the CPU.

The DTC uses a RAM based vector table. Each entry in the vector table corresponds to an entry in the ISR vector table. When the DTC is triggered by an interrupt, it reads the DTC vector table, fetches the transfer information, and then executes the transfer. After the transfer is executed, the DTC writes the updated transfer info back to the location pointed to by the DTC vector table.

Features

- Supports multiple transfer modes
  - Normal transfer
  - Repeat transfer
  - Block transfer
- Chain transfers
- Address increment, decrement or fixed modes
- Can be triggered by any event that has reserved a slot in the interrupt vector table.
  - Some exceptions apply, see the Event table in the Event Numbers section of the Interrupt Controller Unit chapter of the hardware manual
- Supports 1, 2, and 4 byte data units

Configuration

Build Time Configurations for r_dtc

The following build time configurations are defined in fsp_cfg/r_dtc_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
Linker section to keep DTC vector table	Manual Entry	.fsp_dtc_vector_table	Section to place the DTC vector table.

Configurations for Transfer > Transfer (r_dtc)

This module can be added to the Stacks tab via New Stack > Transfer > Transfer (r_dtc).

Configuration	Options	Default	Description
Name	Name must be a valid	g_transfer0	Module name.

	C symbol		
Mode	• Normal • Repeat • Block	Normal	Select the transfer mode. Normal: One transfer per activation, transfer ends after Number of Transfers. Repeat: One transfer per activation, Repeat Area address reset after Number of Transfers, transfer repeats until stopped. Block: Number of Blocks per activation, Repeat Area address reset after Number of Transfers, transfer ends after Number of Blocks.
Transfer Size	• 1 Byte • 2 Bytes • 4 Bytes	2 Bytes	Select the transfer size.
Destination Address Mode	• Fixed • Incremented • Decremented	Fixed	Select the address mode for the destination.
Source Address Mode	• Fixed • Incremented • Decremented	Fixed	Select the address mode for the source.
Repeat Area (Unused in Normal Mode)	• Destination • Source	Source	Select the repeat area. Either the source or destination address resets to its initial value after completing Number of Transfers in Repeat or Block mode.
Interrupt Frequency	• After all transfers have completed • After each transfer	After all transfers have completed	Select to have interrupt after each transfer or after last transfer.
Number of Transfers	Value must be a non-negative integer	0	Specify the number of transfers.
Number of Blocks (Valid only in Block Mode)	Must be a valid non-negative integer with a maximum configurable value of 65536. Applicable only in Block Mode.	0	Specify the number of blocks to transfer in Block mode.

Number of Transfer Descriptors	Value must be a non-negative integer	1	Specify the number of transfer descriptors. Users have to initialize descriptors if its value is greater than 1.
Activation Source	MCU Specific Options		Select the DTC transfer start event.

Clock Configuration

The DTC peripheral module uses ICLK as the clock source. The ICLK frequency is set by using the **Clocks** tab of the RA Configuration editor prior to a build or by using the CGC module at runtime.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Source and Destination Configuration

R_DTC_Reset() API function should be called to set the Source and Destination address before starting the transfer operation.

Transfer Modes

The DTC Module supports three modes of operation.

- **Normal Mode** - In normal mode, a single data unit is transfered every time an interrupt is received by the DTC. A data unit can be 1-byte, 2-bytes, or 4-bytes. The source and destination addresses can be fixed, increment or decrement to the next data unit after each transfer. A 16-bit counter (length) decrements after each transfer. When the counter reaches 0, transfers will no longer be triggered by the interrupt source and the CPU can be interrupted to signal that all transfers have finished.
- **Repeat Mode** - Repeat mode works the same way as normal mode, however the length is limited to an integer in the range[1,256]. When the tranfer counter reaches 0, the counter is reset to its configured value and the repeat area (source or destination address) resets to its starting address and transfers will still be triggered by the interrupt.
- **Block Mode** - In block mode, the amount of data units transfered by each interrupt can be set to an integer in the range [1,256]. The number of blocks to transfer can also be configured to a 16-bit number. After each block transfer the repeat area (source or destination address) will reset to the original address and the other address will be incremented or decremented to the next block.

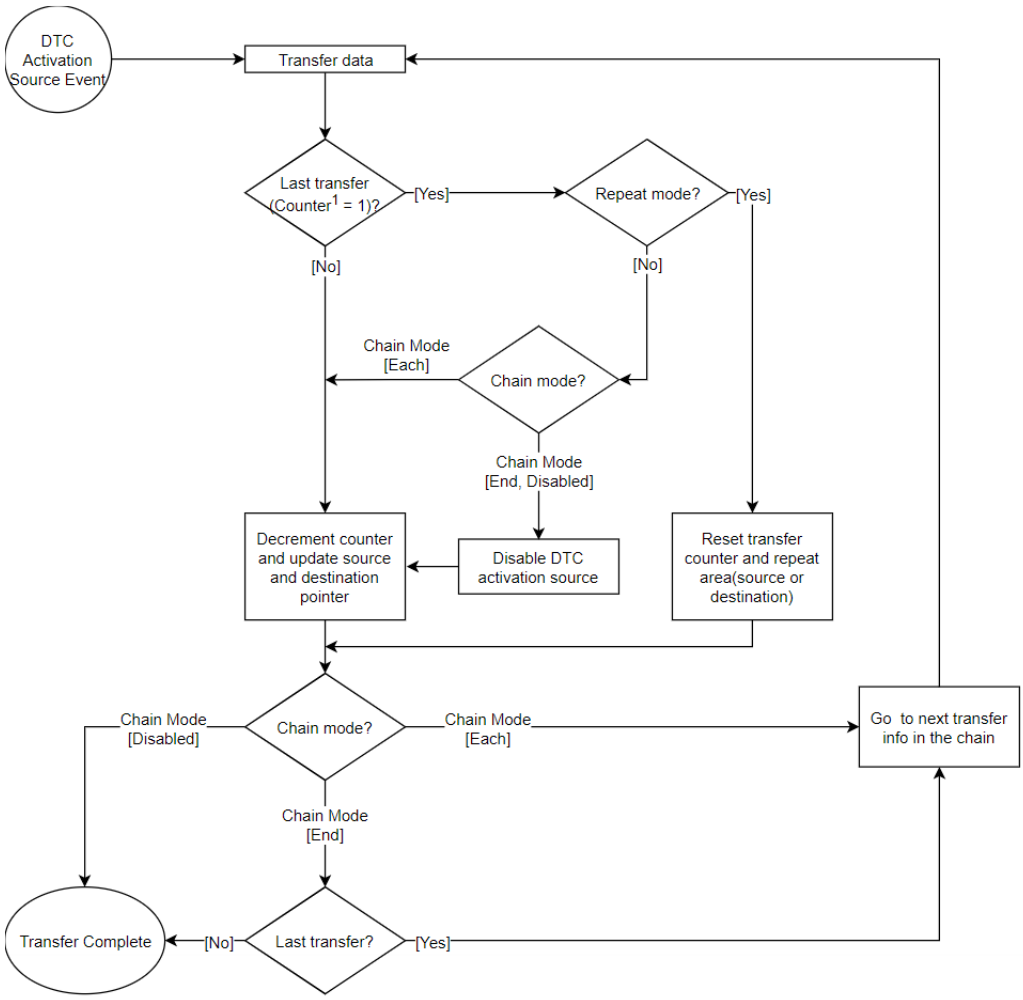
Note

The source and destination address of the transfer must be aligned to the configured data unit.

Chaining Transfers

Multiple transfers can be configured for the same interrupt source by specifying an array of transfer_info_t structs instead of just passing a pointer to one. In this configuration, every transfer_info_t struct must be configured for a chain mode except for the last one. There are two types of chain mode; CHAIN_MODE_EACH and CHAIN_MODE_END. If a transfer is configured in

CHAIN_MODE_EACH then it triggers the next transfer in the chain after it completes each transfer. If a transfer is configured in CHAIN_MODE_END then it triggers the next transfer in the chain after it completes its last transfer.



1. **Counter** refers to transfer_info_t::**length** in normal and repeat mode and transfer_info_t::**num_blocks** in block mode.

Figure 319: DTC Transfer Flowchart

Selecting the DTC or DMAC

The Transfer API is implemented by both DTC and the DMAC so that applications can switch between the DTC and the DMAC. When selecting between them, consider these factors:

	DTC	DMAC
Repeat Mode	• Repeats forever • Max repeat size is 256 x 4 bytes	• Configurable number of repeats • Max repeat size is 1024 x 4 bytes
Block Mode	• Max block size is 256 x 4 bytes	• Max block size is 1024 x 4 bytes
Channels	• One instance per interrupt	• MCU specific (8 channels or less)

Chained Transfers	• Supported	• Not Supported
Software Trigger	• Must use the software ELC event	• Has support for software trigger without using software ELC event • Supports TRANSFER_START_MODE_SINGLE and TRANSFER_START_MODE_REPEAT
Offset Address Mode	• Not supported	• Supported

Additional Considerations

- The DTC requires a moderate amount of RAM (one transfer_info_t struct per open instance + DTC_VECTOR_TABLE_SIZE).
- The DTC stores transfer information in RAM and writes back to RAM after each transfer whereas the DMAC stores all transfer information in registers.
- When transfers are configured for more than one activation source, the DTC must fetch the transfer info from RAM on each interrupt. This can cause a higher latency between transfers.
- The DTC interrupts the CPU using the activation source's IRQ. Each DMAC channel has its own IRQ.
- The necessary alignment of the transfer_info_t structs depends on the underlying MCU. The DTC_TRANSFER_INFO_ALIGNMENT macro is supplied to align the structs as necessary.

Interrupts

The DTC and DMAC interrupts behave differently. The DTC uses the configured event IRQ as the interrupt source whereas each DMAC channel has its own IRQ.

The transfer_info_t::irq setting also behaves a little differently depending on which mode is selected.

- **Normal Mode**

	DTC	DMAC
TRANSFER_IRQ_EACH	Interrupt after each transfer	N/A
TRANSFER_IRQ_END	Interrupt after last transfer	Interrupt after last transfer

- **Repeat Mode**

	DTC	DMAC
TRANSFER_IRQ_EACH	Interrupt after each transfer	Interrupt after each repeat
TRANSFER_IRQ_END	Interrupt after each repeat	Interrupt after last transfer

- **Block Mode**

	DTC	DMAC
TRANSFER_IRQ_EACH	Interrupt after each block	Interrupt after each block
TRANSFER_IRQ_END	Interrupt after last block	Interrupt after last block

Note

DTC_VECTOR_TABLE_SIZE = (ICU_NVIC_IRQ_SOURCES x 4) Bytes

Peripheral Interrupts and DTC

When an interrupt is configured to trigger DTC transfers, the peripheral ISR will trigger on the following conditions:

- Each transfer completed (transfer_info_t::irq = TRANSFER_IRQ_EACH)
- Last transfer completed (transfer_info_t::irq = TRANSFER_IRQ_END)

For example, if SCI1_RXI is configured to trigger DTC transfers and a SCI1_RXI event occurs, the interrupt will not fire until the DTC transfer is completed. If the DTC transfer_info_t::irq is configured to only interrupt on the last transfer, then no RXI interrupts will occur until the last transfer is completed.

Note

1. The DTC activation source must be enabled in the NVIC in order to trigger DTC transfers (Modules that are designed to integrate the R_DTC module will automatically handle this).
2. The DTC prioritizes activation sources by granting the smaller interrupt vector numbers higher priority. The priority of interrupts to the CPU is determined by the NVIC priority.

Low Power Modes

DTCST must be set to 0 before transitioning to any of the following:

- Module-stop state
- Software Standby mode without Snooze mode transition
- Deep Software Standby mode

Note

1. R_LPM Module stops the DTC before entering deep software standby mode and software standby without snooze mode transition.
2. For more information see 18.9 and 18.10 in the RA6M3 manual R01UH0886EJ0100.

Limitations

Developers should be aware of the following limitations when using the DTC:

- If the DTC is configured to service many different activation sources, the system could run in to performance issues due to memory contention. To address this issue, it is reccomended that the DTC vector table and transfer information be moved to their own dedicated memory area (Ex: SRAM0, SRAM1, SRAMHS). This allows memory accesses from different BUS Masters (CPU, DTC, DMAC, EDMAC and Graphics IPs) to occur in parallel.

Examples

Basic Example

This is a basic example of minimal use of the DTC in an application.

```
void dtc_minimal_example (void)

{
```

```
/* Open the transfer instance with initial configuration. */
fsp_err_t err = R_DTC_Open(&g_transfer_ctrl, &g_transfer_cfg);
/* Handle any errors. This function should be defined by the user. */
   assert(FSP_SUCCESS == err);
/* Enable the DTC to handle incoming transfer requests. */
   err = R_DTC_Enable(&g_transfer_ctrl);
   assert(FSP_SUCCESS == err);
}
```

Data Structures

struct	dtc_extended_cfg_t
struct	dtc_instance_ctrl_t

Macros

#define	DTC_MAX_NORMAL_TRANSFER_LENGTH
#define	DTC_MAX_REPEAT_TRANSFER_LENGTH
#define	DTC_MAX_BLOCK_TRANSFER_LENGTH
#define	DTC_MAX_BLOCK_COUNT
#define	DTC_TRANSFER_INFO_ALIGNMENT

Data Structure Documentation

◆ dtc_extended_cfg_t

struct dtc_extended_cfg_t		
DTC transfer configuration extension. This extension is required.		
Data Fields		
IRQn_Type	activation_source	Select which IRQ will trigger the transfer.

◆ dtc_instance_ctrl_t

struct dtc_instance_ctrl_t
Control block used by driver. DO NOT INITIALIZE - this structure will be initialized in transfer_api_t::open.

Macro Definition Documentation

◆ DTC_MAX_NORMAL_TRANSFER_LENGTH

#define DTC_MAX_NORMAL_TRANSFER_LENGTH
Max configurable number of transfers in NORMAL MODE

◆ DTC_MAX_REPEAT_TRANSFER_LENGTH

#define DTC_MAX_REPEAT_TRANSFER_LENGTH
Max number of transfers per repeat for REPEAT MODE

◆ DTC_MAX_BLOCK_TRANSFER_LENGTH

#define DTC_MAX_BLOCK_TRANSFER_LENGTH
Max number of transfers per block in BLOCK MODE

◆ DTC_MAX_BLOCK_COUNT

#define DTC_MAX_BLOCK_COUNT
Max configurable number of blocks to transfer in BLOCK MODE

◆ DTC_TRANSFER_INFO_ALIGNMENT

#define DTC_TRANSFER_INFO_ALIGNMENT
Alignment required for transfer_info_t structures.

Function Documentation

◆ R_DTC_Open()

fsp_err_t R_DTC_Open (transfer_ctrl_t *const *p_api_ctrl*, transfer_cfg_t const *const *p_cfg*)

Configure the vector table if it hasn't been configured, enable the Module and copy the pointer to the transfer info into the DTC vector table. Implements transfer_api_t::open.

Example:

```
/* Open the transfer instance with initial configuration. */
fsp_err_t err = R_DTC_Open(&g_transfer_ctrl, &g_transfer_cfg);
```

Return values

FSP_SUCCESS	Successful open. Transfer transfer info pointer copied to DTC Vector table. Module started. DTC vector table configured.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_UNSUPPORTED	Address Mode Offset is selected.
FSP_ERR_ALREADY_OPEN	The control structure is already opened.
FSP_ERR_IN_USE	The index for this IRQ in the DTC vector table is already configured.
FSP_ERR_IRQ_BSP_DISABLED	The IRQ associated with the activation source is not enabled in the BSP.

◆ R_DTC_Reconfigure()

fsp_err_t R_DTC_Reconfigure (transfer_ctrl_t *const *p_api_ctrl*, transfer_info_t * *p_info*)

Copy pointer to transfer info into the DTC vector table and enable transfer in ICU. Implements transfer_api_t::reconfigure.

Return values

FSP_SUCCESS	Transfer is configured and will start when trigger occurs.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Handle is not initialized. Call R_DTC_Open to initialize the control block.
FSP_ERR_NOT_ENABLED	Transfer source address is NULL or is not aligned correctly. Transfer destination address is NULL or is not aligned correctly.

Note

p_info must persist until all transfers are completed.

◆ R_DTC_Reset()

fsp_err_t R_DTC_Reset (transfer_ctrl_t *const *p_api_ctrl*, void const *volatile *p_src*, void *volatile *p_dest*, uint16_t const *num_transfers*)

Reset transfer source, destination, and number of transfers. Implements transfer_api_t::reset.

Return values

FSP_SUCCESS	Transfer reset successfully (transfers are enabled).
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Handle is not initialized. Call R_DTC_Open to initialize the control block.
FSP_ERR_NOT_ENABLED	Transfer source address is NULL or is not aligned correctly. Transfer destination address is NULL or is not aligned correctly.

◆ R_DTC_SoftwareStart()

fsp_err_t R_DTC_SoftwareStart (transfer_ctrl_t *const *p_api_ctrl*, transfer_start_mode_t *mode*)

Placeholder for unsupported softwareStart function. Implements transfer_api_t::softwareStart.

Return values

FSP_ERR_UNSUPPORTED	DTC software start is not supported.

◆ R_DTC_SoftwareStop()

fsp_err_t R_DTC_SoftwareStop (transfer_ctrl_t *const *p_api_ctrl*)

Placeholder for unsupported softwareStop function. Implements transfer_api_t::softwareStop.

Return values

FSP_ERR_UNSUPPORTED	DTC software stop is not supported.

◆ R_DTC_Enable()

fsp_err_t R_DTC_Enable (transfer_ctrl_t *const *p_api_ctrl*)

Enable transfers on this activation source. Implements transfer_api_t::enable.

Example:

```
/* Enable the DTC to handle incoming transfer requests. */
   err = R_DTC_Enable(&g_transfer_ctrl);
   assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Transfers will be triggered by the activation source
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_UNSUPPORTED	Address Mode Offset is selected.
FSP_ERR_NOT_OPEN	Handle is not initialized. Call R_DTC_Open to initialize the control block.

◆ R_DTC_Disable()

fsp_err_t R_DTC_Disable (transfer_ctrl_t *const *p_api_ctrl*)

Disable transfer on this activation source. Implements transfer_api_t::disable.

Return values

FSP_SUCCESS	Transfers will not occur on activation events.
FSP_ERR_NOT_OPEN	Handle is not initialized. Call R_DTC_Open to initialize the control block.
FSP_ERR_ASSERTION	An input parameter is invalid.

◆ R_DTC_InfoGet()

fsp_err_t R_DTC_InfoGet (transfer_ctrl_t *const *p_api_ctrl*, transfer_properties_t *const *p_properties*)

Provides information about this transfer. Implements transfer_api_t::infoGet.

Return values

FSP_SUCCESS	p_info updated with current instance information.
FSP_ERR_NOT_OPEN	Handle is not initialized. Call R_DTC_Open to initialize the control block.
FSP_ERR_ASSERTION	An input parameter is invalid.

◆ R_DTC_Reload()

fsp_err_t R_DTC_Reload (transfer_ctrl_t *const *p_api_ctrl*, void const * *p_src*, void * *p_dest*, uint32_t const *num_transfers*)

To update next transfer information without interruption during transfer.

Return values

FSP_ERR_UNSUPPORTED	This feature is not supported.

◆ R_DTC_CallbackSet()

fsp_err_t R_DTC_CallbackSet (transfer_ctrl_t *const *p_api_ctrl*, void(*)(transfer_callback_args_t *) *p_callback*, void const *const *p_context*, transfer_callback_args_t *const *p_callback_memory*)

Placeholder for unsupported callbackset function. Implements transfer_api_t::callbackSet.

Return values

FSP_ERR_UNSUPPORTED	DTC does not support direct callbacks.

◆ **R_DTC_Close()**

fsp_err_t R_DTC_Close (transfer_ctrl_t *const *p_api_ctrl*)
Disables DTC activation in the ICU, then clears transfer data from the DTC vector table. Implements transfer_api_t::close. **Return values** FSP_SUCCESS — Successful close. FSP_ERR_ASSERTION — An input parameter is invalid. FSP_ERR_NOT_OPEN — Handle is not initialized. Call R_DTC_Open to initialize the control block.

7.2.21 TrustZone

Modules

Detailed Description

Arm TrustZone Modules.

Modules

Arm TrustZone Context RA Port (rm_tz_context)	RTOS Context Management for RA MCUs.

7.2.21.1 Arm TrustZone Context RA Port (rm_tz_context)

Modules » TrustZone

RTOS Context Management for RA MCUs.

Overview

Add this module to a secure TrustZone project to allow the associated non-secure project to use an RTOS. It is used by an RTOS port for RA MCUs (for example, the FreeRTOS Port (rm_freertos_port), which is automatically added to RA projects when FreeRTOS is selected during project creation).

Note

The RTOS Context Management module does not provide any interfaces to the user. To use this module to port an

RTOS, consult the Arm documentation at https://arm-software.github.io/CMSIS_5/Core/html/group__context__trustzone__functions.html for further information.

Configuration

Build Time Configurations for rm_tz_context

The following build time configurations are defined in fsp_cfg/rm_tz_context_cfg.h:

Configuration	Options	Default	Description
Process Stack Slots	Value must be a non-negative integer greater than 0	8	The maximum number of threads that can allocate a secure context. For applications using FreeRTOS, the Idle task requires 1 context as well.
Process Stack Size	Value must be a non-negative multiple of 8	256	The maximum stack size of all non-secure callable functions.

Clock Configuration

This module does not use peripheral clocks.

Pin Configuration

This module does not use I/O pins.

Usage Notes

TrustZone Integration

When using an RTOS in a TrustZone project, Arm recommends keeping the RTOS in the non-secure project. Tasks may call non-secure callable functions if the task has allocated a secure context. To allocate a secure context, reference the documentation for the RTOS port used. For example, reference TrustZone Integration when FreeRTOS is used.

Sealing the Process Stack

This module seals each process stack by placing the value 0xFEF5EDA5 above the stack top. For more information, refer to section 3.5 "Sealing a Stack" in "Secure software guidelines for ARMv8-M": https://developer.arm.com/documentation/100720/0300.

7.3 Interfaces

Detailed Description

FSP interfaces provide APIs for common functionality. They can be implemented by one or more modules. Modules can use other modules as dependencies using this interface layer.

Modules

	Analog Analog Interfaces.
	AI AI Interfaces.
	Audio Audio Interfaces.
	CapTouch CapTouch Interfaces.
	Connectivity Connectivity Interfaces.
	DSP DSP Interfaces.
	Graphics Graphics Interfaces.
	Input Input Interfaces.
	Monitoring Monitoring Interfaces.
	Motor Motor Interfaces.

	Networking Networking Interfaces.
	Power Power Interfaces.
	Security Security Interfaces.
	Sensor Sensor Interfaces.
	Storage Storage Interfaces.
	System System Interfaces.
	Timers Timers Interfaces.
	Transfer Transfer Interfaces.

7.3.1 Analog
Interfaces

Detailed Description

Analog Interfaces.

Modules

	ADC Interface

	Interface for A/D Converters.
	Comparator Interface Interface for comparators.
	DAC Interface Interface for D/A converters.
	OPAMP Interface Interface for Operational Amplifiers.

7.3.1.1 ADC Interface

Interfaces » Analog

Detailed Description

Interface for A/D Converters.

Summary

The ADC interface provides standard ADC functionality including one-shot mode (single scan), continuous scan and group scan. It also allows configuration of hardware and software triggers for starting scans. After each conversion an interrupt can be triggered, and if a callback function is provided, the call back is invoked with the appropriate event information.

Data Structure Documentation

◆ adc_status_t

struct adc_status_t		
ADC status.		
Data Fields		
adc_state_t	state	Current state.

◆ adc_callback_args_t

struct adc_callback_args_t		
ADC callback arguments definitions		
Data Fields		
uint16_t	unit	ADC device in use.
adc_event_t	event	ADC callback event.
void const *	p_context	Placeholder for user data.
adc_channel_t	channel	Channel of conversion result.
uint64_t	channel_mask	Channel mask for conversion result. Only valid for r_adc_b and r_sdadc_b.
adc_group_mask_t	group_mask	Group Mask.

◆ adc_info_t

struct adc_info_t		
ADC Information Structure for Transfer Interface		
Data Fields		
__I void *	p_address	The address to start reading the data from.
uint32_t	length	The total number of transfers to read.
transfer_size_t	transfer_size	The size of each transfer.
elc_peripheral_t	elc_peripheral	Name of the peripheral in the ELC list.
elc_event_t	elc_event	Name of the ELC event for the peripheral.
uint32_t	calibration_data	Temperature sensor calibration data (0xFFFFFFFF if unsupported) for reference voltage.
int16_t	slope_microvolts	Temperature sensor slope in microvolts/degrees C.

◆ adc_cfg_t

struct adc_cfg_t	
ADC general configuration	
Data Fields	
uint16_t	unit
	ADC unit to be used.
adc_mode_t	mode
	ADC operation mode.
adc_resolution_t	resolution
	ADC resolution.
adc_alignment_t	alignment
	Specify left or right alignment; ignored if addition used.

adc_trigger_t	trigger
	Default and Group A trigger source.
IRQn_Type	scan_end_irq
	Scan end IRQ number.
IRQn_Type	scan_end_b_irq
	Scan end group B IRQ number.
IRQn_Type	scan_end_c_irq
	Scan end group C IRQ number.
uint8_t	scan_end_ipl
	Scan end interrupt priority.
uint8_t	scan_end_b_ipl
	Scan end group B interrupt priority.
uint8_t	scan_end_c_ipl
	Scan end group C interrupt priority.
void(*	p_callback)(adc_callback_args_t *p_args)
	Callback function; set to NULL for none.
void const *	p_context
	Placeholder for user data. Passed to the user callback in adc_callback_args_t.

void const *	p_extend
	Extension parameter for hardware specific settings.

◆ adc_api_t

struct adc_api_t	
ADC functions implemented at the HAL layer will follow this API.	
Data Fields	
fsp_err_t(*	open)(adc_ctrl_t *const p_ctrl, adc_cfg_t const *const p_cfg)
fsp_err_t(*	scanCfg)(adc_ctrl_t *const p_ctrl, void const *const p_extend)

fsp_err_t(*	close)(adc_ctrl_t *const p_ctrl)

fsp_err_t(*	infoGet)(adc_ctrl_t *const p_ctrl, adc_info_t *const p_adc_info)

Field Documentation

◆ open

fsp_err_t(* adc_api_t::open) (adc_ctrl_t *const p_ctrl, adc_cfg_t const *const p_cfg)

Initialize ADC Unit; apply power, set the operational mode, trigger sources, interrupt priority, and configurations common to all channels and sensors.

Precondition

Configure peripheral clocks, ADC pins and IRQs prior to calling this function.

Parameters

[in]	p_ctrl	Pointer to control handle structure
[in]	p_cfg	Pointer to configuration structure

◆ scanCfg

fsp_err_t(* adc_api_t::scanCfg) (adc_ctrl_t *const p_ctrl, void const *const p_extend)

Configure the scan including the channels, groups, and scan triggers to be used for the unit that was initialized in the open call. Some configurations are not supported for all implementations. See implementation for details.

Parameters

[in]	p_ctrl	Pointer to control handle structure
[in]	p_extend	See implementation for details

◆ scanStart

fsp_err_t(* adc_api_t::scanStart) (adc_ctrl_t *const p_ctrl)

Start the scan (in case of a software trigger), or enable the hardware trigger.

Parameters

[in]	p_ctrl	Pointer to control handle structure

◆ scanGroupStart

fsp_err_t(* adc_api_t::scanGroupStart) (adc_ctrl_t *p_ctrl, adc_group_mask_t group_mask)

Start the scan group (in case of a software trigger), or enable the hardware trigger.

Parameters

[in]	p_ctrl	Pointer to control handle structure
[in]	group_mask	Mask of groups to start

◆ scanStop

fsp_err_t(* adc_api_t::scanStop) (adc_ctrl_t *const p_ctrl)

Stop the ADC scan (in case of a software trigger), or disable the hardware trigger.

Parameters

[in]	p_ctrl	Pointer to control handle structure

◆ scanStatusGet

fsp_err_t(* adc_api_t::scanStatusGet) (adc_ctrl_t *const p_ctrl, adc_status_t *p_status)

Check scan status.

Parameters

[in]	p_ctrl	Pointer to control handle structure
[out]	p_status	Pointer to store current status in

◆ read

fsp_err_t(* adc_api_t::read) (adc_ctrl_t *const p_ctrl, adc_channel_t const reg_id, uint16_t *const p_data)

Read ADC conversion result.

Parameters

[in]	p_ctrl	Pointer to control handle structure
[in]	reg_id	ADC channel to read (see enumeration adc_channel_t)
[in]	p_data	Pointer to variable to load value into.

◆ read32

fsp_err_t(* adc_api_t::read32) (adc_ctrl_t *const p_ctrl, adc_channel_t const reg_id, uint32_t *const p_data)

Read ADC conversion result into a 32-bit word.

Parameters

[in]	p_ctrl	Pointer to control handle structure
[in]	reg_id	ADC channel to read (see enumeration adc_channel_t)
[in]	p_data	Pointer to variable to load value into.

◆ calibrate

fsp_err_t(* adc_api_t::calibrate) (adc_ctrl_t *const p_ctrl, void const *p_extend)

Calibrate ADC or associated PGA (programmable gain amplifier). The driver may require implementation specific arguments to the p_extend input. Not supported for all implementations. See implementation for details.

Parameters

[in]	p_ctrl	Pointer to control handle structure
[in]	p_extend	Pointer to implementation specific arguments

◆ offsetSet

fsp_err_t(* adc_api_t::offsetSet) (adc_ctrl_t *const p_ctrl, adc_channel_t const reg_id, int32_t const offset)

Set offset for input PGA configured for differential input. Not supported for all implementations. See implementation for details.

Parameters

[in]	p_ctrl	Pointer to control handle structure
[in]	reg_id	ADC channel to read (see enumeration adc_channel_t)
[in]	offset	See implementation for details.

◆ callbackSet

fsp_err_t(* adc_api_t::callbackSet) (adc_ctrl_t *const p_ctrl, void(*p_callback)(adc_callback_args_t *), void const *const p_context, adc_callback_args_t *const p_callback_memory)

Specify callback function and optional context pointer and working memory pointer.

Parameters

[in]	p_ctrl	Pointer to the ADC control block.
[in]	p_callback	Callback function
[in]	p_context	Pointer to send to callback function
[in]	p_working_memory	Pointer to volatile memory where callback structure can be allocated. Callback arguments allocated here are only valid during the callback.

◆ close

fsp_err_t(* adc_api_t::close) (adc_ctrl_t *const p_ctrl)

Close the specified ADC unit by ending any scan in progress, disabling interrupts, and removing power to the specified A/D unit.

Parameters

[in]	p_ctrl	Pointer to control handle structure

◆ infoGet

fsp_err_t(* adc_api_t::infoGet) (adc_ctrl_t *const p_ctrl, adc_info_t *const p_adc_info)

Return the ADC data register address of the first (lowest number) channel and the total number of bytes to be read in order for the DTC/DMAC to read the conversion results of all configured channels. Return the temperature sensor calibration and slope data.

Parameters

[in]	p_ctrl	Pointer to control handle structure
[out]	p_adc_info	Pointer to ADC information structure

◆ adc_instance_t

struct adc_instance_t

This structure encompasses everything that is needed to use an instance of this interface.

Data Fields		
adc_ctrl_t *	p_ctrl	Pointer to the control structure for this instance.
adc_cfg_t const *	p_cfg	Pointer to the configuration structure for this instance.
void const *	p_channel_cfg	Pointer to the channel configuration structure for this instance.
adc_api_t const *	p_api	Pointer to the API structure for this instance.

Typedef Documentation

◆ adc_ctrl_t

typedef void adc_ctrl_t

ADC control block. Allocate using driver instance control structure from driver instance header file.

Enumeration Type Documentation

◆ adc_mode_t

enum adc_mode_t

ADC operation mode definitions

Enumerator	
ADC_MODE_SINGLE_SCAN	Single scan - one or more channels.
ADC_MODE_GROUP_SCAN	Two trigger sources to trigger scan for two groups which contain one or more channels.
ADC_MODE_CONTINUOUS_SCAN	Continuous scan - one or more channels.

◆ adc_resolution_t

enum adc_resolution_t	
ADC data resolution definitions	
Enumerator	
ADC_RESOLUTION_10_BIT	10 bit resolution
ADC_RESOLUTION_8_BIT	8 bit resolution
ADC_RESOLUTION_12_BIT	12 bit resolution
ADC_RESOLUTION_12_BIT	12 bit resolution
ADC_RESOLUTION_10_BIT	10 bit resolution
ADC_RESOLUTION_8_BIT	8 bit resolution
ADC_RESOLUTION_14_BIT	14 bit resolution
ADC_RESOLUTION_16_BIT	16 bit resolution
ADC_RESOLUTION_24_BIT	24 bit resolution

◆ adc_alignment_t

enum adc_alignment_t	
ADC data alignment definitions	
Enumerator	
ADC_ALIGNMENT_RIGHT	Data alignment right.
ADC_ALIGNMENT_LEFT	Data alignment left.

◆ adc_trigger_t

enum adc_trigger_t	
ADC trigger mode definitions	
Enumerator	
ADC_TRIGGER_SOFTWARE	Software trigger; not for group modes.
ADC_TRIGGER_SYNC_ELC	Synchronous trigger via ELC.
ADC_TRIGGER_ASYNC_EXTERNAL	External asynchronous trigger; not for group modes.

◆ adc_event_t

enum adc_event_t	
ADC callback event definitions	
Enumerator	
ADC_EVENT_SCAN_COMPLETE	Normal/Group A scan complete.
ADC_EVENT_SCAN_COMPLETE_GROUP_B	Group B scan complete.
ADC_EVENT_SCAN_COMPLETE_GROUP_C	Group C scan complete.
ADC_EVENT_CALIBRATION_COMPLETE	Calibration complete.
ADC_EVENT_CONVERSION_COMPLETE	Conversion complete.
ADC_EVENT_CALIBRATION_REQUEST	Calibration requested.
ADC_EVENT_CONVERSION_ERROR	Scan error.
ADC_EVENT_OVERFLOW	Overflow occurred.
ADC_EVENT_LIMIT_CLIP	Limiter clipping occurred.
ADC_EVENT_FIFO_READ_REQUEST	FIFO read requested.
ADC_EVENT_FIFO_OVERFLOW	FIFO overflow occurred.
ADC_EVENT_WINDOW_COMPARE_A	Window A comparison condition met.
ADC_EVENT_WINDOW_COMPARE_B	Window B comparison condition met.
ADC_EVENT_ZERO_CROSS_DETECTION	Zero-cross detection interrupt.
ADC_EVENT_CAPTURE_A	Capture A conversion complete.
ADC_EVENT_CAPTURE_B	Capture B conversion complete.

◆ adc_channel_t

enum adc_channel_t	
ADC channels	
Enumerator	
ADC_CHANNEL_0	Channel 0 for select mode or channel 0 to 3 for scan mode.
ADC_CHANNEL_1	Channel 1 for select mode or channel 1 to 4 for scan mode.
ADC_CHANNEL_2	Channel 2 for select mode or channel 2 to 5 for scan mode.
ADC_CHANNEL_3	Channel 3 for select mode or channel 3 to 6 for scan mode.
ADC_CHANNEL_4	Channel 4 for select mode or channel 4 to 7 for scan mode.
ADC_CHANNEL_5	Channel 5 for select mode.
ADC_CHANNEL_6	Channel 6 for select mode.
ADC_CHANNEL_7	Channel 7 for select mode.
ADC_CHANNEL_21	Channel 21 for select mode.
ADC_CHANNEL_22	Channel 22 for select mode.
ADC_CHANNEL_TEMPERATURE	Temperature sensor output voltage for select mode.
ADC_CHANNEL_VOLT	Internal reference voltage for select mode.
ADC_CHANNEL_POSITIVE_SIDE_VREF	Select positive reference voltage as target conversion.
ADC_CHANNEL_NEGATIVE_SIDE_VREF	Select negative reference voltage as target conversion.
ADC_CHANNEL_0	ADC channel 0.
ADC_CHANNEL_1	ADC channel 1.
ADC_CHANNEL_2	ADC channel 2.

ADC_CHANNEL_3	ADC channel 3.
ADC_CHANNEL_4	ADC channel 4.
ADC_CHANNEL_5	ADC channel 5.
ADC_CHANNEL_6	ADC channel 6.
ADC_CHANNEL_7	ADC channel 7.
ADC_CHANNEL_8	ADC channel 8.
ADC_CHANNEL_9	ADC channel 9.
ADC_CHANNEL_10	ADC channel 10.
ADC_CHANNEL_11	ADC channel 11.
ADC_CHANNEL_12	ADC channel 12.
ADC_CHANNEL_13	ADC channel 13.
ADC_CHANNEL_14	ADC channel 14.
ADC_CHANNEL_15	ADC channel 15.
ADC_CHANNEL_16	ADC channel 16.
ADC_CHANNEL_17	ADC channel 17.
ADC_CHANNEL_18	ADC channel 18.
ADC_CHANNEL_19	ADC channel 19.
ADC_CHANNEL_20	ADC channel 20.
ADC_CHANNEL_21	ADC channel 21.
ADC_CHANNEL_22	ADC channel 22.
ADC_CHANNEL_23	ADC channel 23.
ADC_CHANNEL_24	ADC channel 24.
ADC_CHANNEL_25	ADC channel 25.
ADC_CHANNEL_26	ADC channel 26.

ADC_CHANNEL_27	ADC channel 27.
ADC_CHANNEL_28	ADC channel 28.
ADC_CHANNEL_SELF_DIAGNOSIS	Self-Diagnosis channel.
ADC_CHANNEL_TEMPERATURE	Temperature sensor output.
ADC_CHANNEL_VOLT	Internal reference voltage.
ADC_CHANNEL_DA0	D/A Converter Channel 0.
ADC_CHANNEL_DA1	D/A Converter Channel 1.
ADC_CHANNEL_DA2	D/A Converter Channel 2.
ADC_CHANNEL_DA3	D/A Converter Channel 3.
ADC_CHANNEL_FIRST_INTERNAL	Highest physical channel.
ADC_CHANNEL_LAST_INTERNAL	First internal channel.
ADC_CHANNEL_0	ADC channel 0.
ADC_CHANNEL_1	ADC channel 1.
ADC_CHANNEL_2	ADC channel 2.
ADC_CHANNEL_3	ADC channel 3.
ADC_CHANNEL_4	ADC channel 4.
ADC_CHANNEL_5	ADC channel 5.
ADC_CHANNEL_6	ADC channel 6.
ADC_CHANNEL_7	ADC channel 7.
ADC_CHANNEL_8	ADC channel 8.
ADC_CHANNEL_9	ADC channel 9.
ADC_CHANNEL_10	ADC channel 10.
ADC_CHANNEL_11	ADC channel 11.
ADC_CHANNEL_12	ADC channel 12.

ADC_CHANNEL_13	ADC channel 13.
ADC_CHANNEL_14	ADC channel 14.
ADC_CHANNEL_15	ADC channel 15.
ADC_CHANNEL_16	ADC channel 16.
ADC_CHANNEL_17	ADC channel 17.
ADC_CHANNEL_18	ADC channel 18.
ADC_CHANNEL_19	ADC channel 19.
ADC_CHANNEL_20	ADC channel 20.
ADC_CHANNEL_21	ADC channel 21.
ADC_CHANNEL_22	ADC channel 22.
ADC_CHANNEL_23	ADC channel 23.
ADC_CHANNEL_24	ADC channel 24.
ADC_CHANNEL_25	ADC channel 25.
ADC_CHANNEL_26	ADC channel 26.
ADC_CHANNEL_27	ADC channel 27.
ADC_CHANNEL_28	ADC channel 28.
ADC_CHANNEL_DUPLEX_A	Data duplexing register A.
ADC_CHANNEL_DUPLEX_B	Data duplexing register B.
ADC_CHANNEL_DUPLEX	Data duplexing register.
ADC_CHANNEL_TEMPERATURE	Temperature sensor output.
ADC_CHANNEL_VOLT	Internal reference voltage.

◆ adc_group_id_t

enum adc_group_id_t	
Enumerator	
ADC_GROUP_ID_0	Group ID 0.
ADC_GROUP_ID_1	Group ID 1.
ADC_GROUP_ID_2	Group ID 2.
ADC_GROUP_ID_3	Group ID 3.
ADC_GROUP_ID_4	Group ID 4.
ADC_GROUP_ID_5	Group ID 5.
ADC_GROUP_ID_6	Group ID 6.
ADC_GROUP_ID_7	Group ID 7.
ADC_GROUP_ID_8	Group ID 8.

◆ adc_group_mask_t

enum adc_group_mask_t	
Enumerator	
ADC_GROUP_MASK_NONE	Group Mask Unknown or None.
ADC_GROUP_MASK_0	Group Mask 0.
ADC_GROUP_MASK_1	Group Mask 1.
ADC_GROUP_MASK_2	Group Mask 2.
ADC_GROUP_MASK_3	Group Mask 3.
ADC_GROUP_MASK_4	Group Mask 4.
ADC_GROUP_MASK_5	Group Mask 5.
ADC_GROUP_MASK_6	Group Mask 6.
ADC_GROUP_MASK_7	Group Mask 7.
ADC_GROUP_MASK_8	Group Mask 8.
ADC_GROUP_MASK_ALL	All Groups.

◆ adc_state_t

enum adc_state_t	
ADC states.	
Enumerator	
ADC_STATE_IDLE	ADC is idle.
ADC_STATE_SCAN_IN_PROGRESS	ADC scan in progress.
ADC_STATE_CALIBRATION_IN_PROGRESS	ADC calibration in progress - Not used by all ADC instances.

7.3.1.2 Comparator Interface

Interfaces » Analog

Detailed Description

Interface for comparators.

Summary

The comparator interface provides standard comparator functionality, including generating an event when the comparator result changes.

Data Structures

struct	comparator_info_t
struct	comparator_status_t
struct	comparator_callback_args_t
struct	comparator_cfg_t
struct	comparator_api_t
struct	comparator_instance_t

Typedefs

typedef void	comparator_ctrl_t

Enumerations

enum	comparator_mode_t
enum	comparator_trigger_t
enum	comparator_polarity_invert_t
enum	comparator_pin_output_t
enum	comparator_filter_t
enum	comparator_state_t

Data Structure Documentation

◆ comparator_info_t

struct comparator_info_t
Comparator information.
Data Fields

uint32_t	min_stabilization_wait_us	Minimum stabilization wait time in microseconds.

◆ comparator_status_t

struct comparator_status_t		
Comparator status.		
Data Fields		
comparator_state_t	state	Current comparator state.

◆ comparator_callback_args_t

struct comparator_callback_args_t		
Callback function parameter data		
Data Fields		
void const *	p_context	Placeholder for user data. Set in comparator_api_t::open function in comparator_cfg_t.
uint32_t	channel	The physical hardware channel that caused the interrupt.

◆ comparator_cfg_t

struct comparator_cfg_t	
User configuration structure, used in open function	
Data Fields	
uint8_t	channel
	Hardware channel used.
comparator_mode_t	mode
	Normal or window mode.
comparator_trigger_t	trigger
	Trigger setting.
comparator_filter_t	filter
	Digital filter clock divisor setting.

comparator_polarity_invert_t	invert
	Whether to invert output.
comparator_pin_output_t	pin_output
	Whether to include output on output pin.
uint8_t	vref_select
	Internal Vref Select.
uint8_t	ipl
	Interrupt priority.
IRQn_Type	irq
	NVIC interrupt number.
void(*	p_callback)(comparator_callback_args_t *p_args)
void const *	p_context
void const *	p_extend
	Comparator hardware dependent configuration.

Field Documentation

◆ p_callback

void(* comparator_cfg_t::p_callback) (comparator_callback_args_t *p_args)

Callback called when comparator event occurs.

◆ p_context

void const* comparator_cfg_t::p_context
Placeholder for user data. Passed to the user callback in comparator_callback_args_t.

◆ comparator_api_t

struct comparator_api_t	
Comparator functions implemented at the HAL layer will follow this API.	
Data Fields	
fsp_err_t(*	open)(comparator_ctrl_t *const p_ctrl, comparator_cfg_t const *const p_cfg)
fsp_err_t(*	outputEnable)(comparator_ctrl_t *const p_ctrl)
fsp_err_t(*	infoGet)(comparator_ctrl_t *const p_ctrl, comparator_info_t *const p_info)
fsp_err_t(*	statusGet)(comparator_ctrl_t *const p_ctrl, comparator_status_t *const p_status)
fsp_err_t(*	close)(comparator_ctrl_t *const p_ctrl)

Field Documentation

◆ open

fsp_err_t(* comparator_api_t::open) (comparator_ctrl_t *const p_ctrl, comparator_cfg_t const *const p_cfg)
Initialize the comparator.

Parameters

[in]	p_ctrl	Pointer to instance control block
[in]	p_cfg	Pointer to configuration

◆ outputEnable

fsp_err_t(* comparator_api_t::outputEnable) (comparator_ctrl_t *const p_ctrl)

Start the comparator.

Parameters

[in]	p_ctrl	Pointer to instance control block

◆ infoGet

fsp_err_t(* comparator_api_t::infoGet) (comparator_ctrl_t *const p_ctrl, comparator_info_t *const p_info)

Provide information such as the recommended minimum stabilization wait time.

Parameters

[in]	p_ctrl	Pointer to instance control block
[out]	p_info	Comparator information stored here

◆ statusGet

fsp_err_t(* comparator_api_t::statusGet) (comparator_ctrl_t *const p_ctrl, comparator_status_t *const p_status)

Provide current comparator status.

Parameters

[in]	p_ctrl	Pointer to instance control block
[out]	p_status	Status stored here

◆ close

fsp_err_t(* comparator_api_t::close) (comparator_ctrl_t *const p_ctrl)

Stop the comparator.

Parameters

[in]	p_ctrl	Pointer to instance control block

◆ comparator_instance_t

struct comparator_instance_t

This structure encompasses everything that is needed to use an instance of this interface.

Data Fields		
comparator_ctrl_t *	p_ctrl	Pointer to the control structure for this instance.
comparator_cfg_t const *	p_cfg	Pointer to the configuration structure for this instance.
comparator_api_t const *	p_api	Pointer to the API structure for this instance.

Typedef Documentation

◆ comparator_ctrl_t

typedef void comparator_ctrl_t

Includes board and MCU related header files. Comparator control block. Allocate an instance specific control block to pass into the comparator API calls.

Enumeration Type Documentation

◆ comparator_mode_t

enum comparator_mode_t

Select whether to invert the polarity of the comparator output.

Enumerator	
COMPARATOR_MODE_NORMAL	Normal mode.
COMPARATOR_MODE_WINDOW	Window mode, not supported by all implementations.

◆ comparator_trigger_t

enum comparator_trigger_t

Trigger type: rising edge, falling edge, both edges, low level.

Enumerator	
COMPARATOR_TRIGGER_RISING	Rising edge trigger.
COMPARATOR_TRIGGER_FALLING	Falling edge trigger.
COMPARATOR_TRIGGER_BOTH_EDGE	Both edges trigger.

◆ comparator_polarity_invert_t

enum comparator_polarity_invert_t	
Select whether to invert the polarity of the comparator output.	
Enumerator	
COMPARATOR_POLARITY_INVERT_OFF	Do not invert polarity.
COMPARATOR_POLARITY_INVERT_ON	Invert polarity.

◆ comparator_pin_output_t

enum comparator_pin_output_t	
Select whether to include the comparator output on the output pin.	
Enumerator	
COMPARATOR_PIN_OUTPUT_OFF	Do not include comparator output on output pin.
COMPARATOR_PIN_OUTPUT_ON	Include comparator output on output pin.

◆ comparator_filter_t

enum comparator_filter_t	
Comparator digital filtering sample clock divisor settings.	
Enumerator	
COMPARATOR_FILTER_OFF	Disable debounce filter.
COMPARATOR_FILTER_1	Filter using PCLK divided by 1, not supported by all implementations.
COMPARATOR_FILTER_8	Filter using PCLK divided by 8.
COMPARATOR_FILTER_16	Filter using PCLK divided by 16, not supported by all implementations.
COMPARATOR_FILTER_32	Filter using PCLK divided by 32.

◆ comparator_state_t

enum comparator_state_t	
Current comparator state.	
Enumerator	
COMPARATOR_STATE_OUTPUT_LOW	VCMP < VREF if polarity is not inverted, VCMP > VREF if inverted.
COMPARATOR_STATE_OUTPUT_HIGH	VCMP > VREF if polarity is not inverted, VCMP < VREF if inverted.
COMPARATOR_STATE_OUTPUT_DISABLED	comparator_api_t::outputEnable() has not been called

7.3.1.3 DAC Interface

Interfaces » Analog

Detailed Description

Interface for D/A converters.

Summary

The DAC interface provides standard Digital/Analog Converter functionality. A DAC application writes digital sample data to the device and generates analog output on the DAC output pin.

Data Structures

struct	dac_info_t
struct	dac_cfg_t
struct	dac_api_t
struct	dac_instance_t

Typedefs

typedef void	dac_ctrl_t

Enumerations

enum	dac_data_format_t

Data Structure Documentation

◆ dac_info_t

struct dac_info_t		
DAC information structure to store various information for a DAC		
Data Fields		
uint8_t	bit_width	Resolution of the DAC.

◆ dac_cfg_t

struct dac_cfg_t		
DAC Open API configuration parameter		
Data Fields		
uint8_t	channel	ID associated with this DAC channel.
bool	ad_da_synchronized	AD/DA synchronization.
void const *	p_extend	

◆ dac_api_t

struct dac_api_t	
DAC driver structure. General DAC functions implemented at the HAL layer follow this API.	
Data Fields	
fsp_err_t(*	open)(dac_ctrl_t *const p_ctrl, dac_cfg_t const *const p_cfg)
fsp_err_t(*	close)(dac_ctrl_t *const p_ctrl)
fsp_err_t(*	write)(dac_ctrl_t *const p_ctrl, uint16_t value)
fsp_err_t(*	start)(dac_ctrl_t *const p_ctrl)
fsp_err_t(*	stop)(dac_ctrl_t *const p_ctrl)

Field Documentation

◆ open

fsp_err_t(* dac_api_t::open) (dac_ctrl_t *const p_ctrl, dac_cfg_t const *const p_cfg)

Initial configuration.

Parameters

[in]	p_ctrl	Pointer to control block. Must be declared by user. Elements set here.
[in]	p_cfg	Pointer to configuration structure. All elements of this structure must be set by user.

◆ close

fsp_err_t(* dac_api_t::close) (dac_ctrl_t *const p_ctrl)

Close the D/A Converter.

Parameters

[in]	p_ctrl	Control block set in dac_api_t::open call for this timer.

◆ write

fsp_err_t(* dac_api_t::write) (dac_ctrl_t *const p_ctrl, uint16_t value)

Write sample value to the D/A Converter.

Parameters

[in]	p_ctrl	Control block set in dac_api_t::open call for this timer.
[in]	value	Sample value to be written to the D/A Converter.

◆ start

fsp_err_t(* dac_api_t::start) (dac_ctrl_t *const p_ctrl)

Start the D/A Converter if it has not been started yet.

Parameters

[in]	p_ctrl	Control block set in dac_api_t::open call for this timer.

◆ stop

fsp_err_t(* dac_api_t::stop) (dac_ctrl_t *const p_ctrl)

Stop the D/A Converter if the converter is running.

Parameters

[in]	p_ctrl	Control block set in dac_api_t::open call for this timer.

◆ dac_instance_t

struct dac_instance_t		
This structure encompasses everything that is needed to use an instance of this interface.		
Data Fields		
dac_ctrl_t *	p_ctrl	Pointer to the control structure for this instance.
dac_cfg_t const *	p_cfg	Pointer to the configuration structure for this instance.
dac_api_t const *	p_api	Pointer to the API structure for this instance.

Typedef Documentation

◆ dac_ctrl_t

typedef void dac_ctrl_t
DAC control block. Allocate an instance specific control block to pass into the DAC API calls.

Enumeration Type Documentation

◆ dac_data_format_t

enum dac_data_format_t	
DAC Open API data format settings.	
Enumerator	
DAC_DATA_FORMAT_FLUSH_RIGHT	LSB of data is flush to the right leaving the top 4 bits unused.
DAC_DATA_FORMAT_FLUSH_LEFT	MSB of data is flush to the left leaving the bottom 4 bits unused.

7.3.1.4 OPAMP Interface

Interfaces » Analog

Detailed Description

Interface for Operational Amplifiers.

Summary

The OPAMP interface provides standard operational amplifier functionality, including starting and stopping the amplifier.

Data Structures

struct	opamp_trim_args_t
struct	opamp_info_t
struct	opamp_status_t
struct	opamp_cfg_t
struct	opamp_api_t
struct	opamp_instance_t

Typedefs

typedef void	opamp_ctrl_t

Enumerations

enum	opamp_trim_cmd_t

enum	opamp_trim_input_t

Data Structure Documentation

◆ opamp_trim_args_t

struct opamp_trim_args_t		
OPAMP trim arguments.		
Data Fields		
uint8_t	channel	Channel.
opamp_trim_input_t	input	Which input of the channel above.

◆ opamp_info_t

struct opamp_info_t		
OPAMP information.		
Data Fields		
uint32_t	min_stabilization_wait_us	Minimum stabilization wait time in microseconds.

◆ opamp_status_t

struct opamp_status_t		
OPAMP status.		
Data Fields		
uint32_t	operating_channel_mask	Bitmask of channels currently operating.

◆ opamp_cfg_t

struct opamp_cfg_t		
OPAMP general configuration.		
Data Fields		
void const *	p_extend	Extension parameter for hardware specific settings.

◆ opamp_api_t

struct opamp_api_t	
OPAMP functions implemented at the HAL layer will follow this API.	
Data Fields	
fsp_err_t(*	open)(opamp_ctrl_t *const p_ctrl, opamp_cfg_t const *const p_cfg)

fsp_err_t(*	start)(opamp_ctrl_t *const p_ctrl, uint32_t const channel_mask)
fsp_err_t(*	stop)(opamp_ctrl_t *const p_ctrl, uint32_t const channel_mask)
fsp_err_t(*	trim)(opamp_ctrl_t *const p_ctrl, opamp_trim_cmd_t const cmd, opamp_trim_args_t const *const p_args)
fsp_err_t(*	infoGet)(opamp_ctrl_t *const p_ctrl, opamp_info_t *const p_info)
fsp_err_t(*	statusGet)(opamp_ctrl_t *const p_ctrl, opamp_status_t *const p_status)
fsp_err_t(*	close)(opamp_ctrl_t *const p_ctrl)

Field Documentation

◆ open

fsp_err_t(* opamp_api_t::open) (opamp_ctrl_t *const p_ctrl, opamp_cfg_t const *const p_cfg)

Initialize the operational amplifier.

Parameters

[in]	p_ctrl	Pointer to instance control block
[in]	p_cfg	Pointer to configuration

◆ start

fsp_err_t(* opamp_api_t::start) (opamp_ctrl_t *const p_ctrl, uint32_t const channel_mask)

Start the op-amp(s).

Parameters

[in]	p_ctrl	Pointer to instance control block
[in]	channel_mask	Bitmask of channels to start

◆ stop

fsp_err_t(* opamp_api_t::stop) (opamp_ctrl_t *const p_ctrl, uint32_t const channel_mask)

Stop the op-amp(s).

Parameters

[in]	p_ctrl	Pointer to instance control block
[in]	channel_mask	Bitmask of channels to stop

◆ trim

fsp_err_t(* opamp_api_t::trim) (opamp_ctrl_t *const p_ctrl, opamp_trim_cmd_t const cmd, opamp_trim_args_t const *const p_args)

Trim the op-amp(s). Not supported on all MCUs. See implementation for procedure details.

Parameters

[in]	p_ctrl	Pointer to instance control block
[in]	cmd	Trim command
[in]	p_args	Pointer to arguments for the command

◆ infoGet

fsp_err_t(* opamp_api_t::infoGet) (opamp_ctrl_t *const p_ctrl, opamp_info_t *const p_info)

Provide information such as the recommended minimum stabilization wait time.

Parameters

[in]	p_ctrl	Pointer to instance control block
[out]	p_info	OPAMP information stored here

◆ statusGet

fsp_err_t(* opamp_api_t::statusGet) (opamp_ctrl_t *const p_ctrl, opamp_status_t *const p_status)

Provide status of each op-amp channel.

Parameters

[in]	p_ctrl	Pointer to instance control block
[out]	p_status	Status stored here

◆ close

fsp_err_t(* opamp_api_t::close) (opamp_ctrl_t *const p_ctrl)

Close the specified OPAMP unit by ending any scan in progress, disabling interrupts, and removing power to the specified A/D unit.

Parameters

[in]	p_ctrl	Pointer to instance control block

◆ opamp_instance_t

struct opamp_instance_t		
This structure encompasses everything that is needed to use an instance of this interface.		
Data Fields		
opamp_ctrl_t *	p_ctrl	Pointer to the control structure for this instance.
opamp_cfg_t const *	p_cfg	Pointer to the configuration structure for this instance.
opamp_api_t const *	p_api	Pointer to the API structure for this instance.

Typedef Documentation

◆ opamp_ctrl_t

typedef void opamp_ctrl_t
OPAMP control block. Allocate using driver instance control structure from driver instance header file.

Enumeration Type Documentation

◆ opamp_trim_cmd_t

enum opamp_trim_cmd_t	
Includes board and MCU related header files. Trim command.	
Enumerator	
OPAMP_TRIM_CMD_START	Initialize trim state machine.
OPAMP_TRIM_CMD_NEXT_STEP	Move to next step in state machine.
OPAMP_TRIM_CMD_CLEAR_BIT	Clear trim bit.

◆ opamp_trim_input_t

enum opamp_trim_input_t	
Trim input.	
Enumerator	
OPAMP_TRIM_INPUT_PCH	Trim non-inverting (+) input.
OPAMP_TRIM_INPUT_NCH	Trim inverting (-) input.

7.3.2 AI

Interfaces

Detailed Description

7.3.2.1 Data Collector Interface

Interfaces » AI

Detailed Description

Interface for RAI Data Collector.

Summary

The rai data collector interface provides functionality to collect data from differnet channels using snapshot mode, data feed mode or mixed mode.

Data Structures

struct	rai_data_collector_error_callback_args_t
struct	rai_data_collector_frame_buffer_t
struct	rai_data_collector_callback_args_t
struct	rai_data_collector_snapshot_cfg_t
struct	rai_data_collector_data_feed_cfg_t
struct	rai_data_collector_cfg_t
struct	rai_data_collector_api_t
struct	rai_data_collector_instance_t

Typedefs

typedef void	rai_data_collector_ctrl_t

Enumerations

enum	rai_data_collector_data_type_t
enum	rai_data_collector_error_event_t

Data Structure Documentation

◆ **rai_data_collector_error_callback_args_t**

struct rai_data_collector_error_callback_args_t		
Error callback function parameter		
Data Fields		
uint8_t	instance_id	Instance ID.

rai_data_collector_error_event_t	event	Error event.

◆ rai_data_collector_frame_buffer_t

struct rai_data_collector_frame_buffer_t		
Frame buffer structure		
Data Fields		
void *	p_buf	Pointer to data buffer.
rai_data_collector_data_type_t	data_type	Data samples in the buffer.

◆ rai_data_collector_callback_args_t

struct rai_data_collector_callback_args_t		
Data ready callback function parameter		
Data Fields		
uint8_t	frames	Number of frame buffers.
uint8_t	instance_id	Instance id.
uint32_t	frame_buf_len	Frame buffers shall have the same amount of data sample.
rai_data_collector_frame_buffer_t const *	p_frame_buf	Array of frame buffers.
void const *	p_context	Pointer to the user-provided context.

◆ rai_data_collector_snapshot_cfg_t

struct rai_data_collector_snapshot_cfg_t		
Snapshot mode configuration		
Data Fields		
uint8_t	channels	Total snapshot mode channels.
uint16_t	transfer_len	DTC transfer length.
timer_instance_t const *	p_timer	Pointer to timer instance.
transfer_instance_t const *	p_transfer	Pointer to DTC instance.

◆ rai_data_collector_data_feed_cfg_t

struct rai_data_collector_data_feed_cfg_t		
Data feed mode configuration		
Data Fields		
uint8_t	channels	Total data feed mode channels.

◆ rai_data_collector_cfg_t

struct rai_data_collector_cfg_t	
RAI Data Collector general configuration	
Data Fields	
uint32_t	channels: 8
	Total number of channels.
uint32_t	instance_id: 8
	Instance id.
uint32_t	virt_channels: 8
	Virtual channels.
uint32_t	reserved: 8
	Reserved.
uint32_t	channel_ready_mask
	Bitmask of configured channels.
uint32_t	required_frame_len
	Length of each frame buffer.
rai_data_collector_snapshot_cfg_t const *	p_snapshot_cfg
	Pointer to snapshot mode configuration structure.
rai_data_collector_data_feed_cfg_t const *	p_data_feed_cfg
	Pointer to data feed mode configuration structure.
void *	p_extend

	Pointer to extended configuration structure.
void(*	p_callback)(rai_data_collector_callback_args_t const *p_args)
	Pointer to the callback function when data is collected.
void(*	p_error_callback)(rai_data_collector_error_callback_args_t const *p_args)
	Pointer to the callback function when there is an error.
void const *	p_context
	Pointer to the user-provided context.

◆ rai_data_collector_api_t

struct rai_data_collector_api_t	
RAI Data Collector interface API.	
Data Fields	
fsp_err_t(*	open)(rai_data_collector_ctrl_t *const p_ctrl, rai_data_collector_cfg_t const *const p_cfg)
fsp_err_t(*	snapshotChannelRegister)(rai_data_collector_ctrl_t *const p_ctrl, uint8_t channel, void const *p_src)
fsp_err_t(*	bufferRelease)(rai_data_collector_ctrl_t *const p_ctrl)
fsp_err_t(*	bufferReset)(rai_data_collector_ctrl_t *const p_ctrl)
fsp_err_t(*	snapshotStart)(rai_data_collector_ctrl_t *const p_ctrl)
fsp_err_t(*	snapshotStop)(rai_data_collector_ctrl_t *const p_ctrl)
fsp_err_t(*	channelBufferGet)(rai_data_collector_ctrl_t *const p_ctrl, uint8_t channel, void **pp_buf)

fsp_err_t(*	channelWrite)(rai_data_collector_ctrl_t *const p_ctrl, uint8_t channel, const void *p_buf, uint32_t len)
fsp_err_t(*	close)(rai_data_collector_ctrl_t *const p_ctrl)

Field Documentation

◆ open

fsp_err_t(* rai_data_collector_api_t::open) (rai_data_collector_ctrl_t *const p_ctrl, rai_data_collector_cfg_t const *const p_cfg)

Initialize Data Collector module instance.

Note

To reopen after calling this function, call rai_data_collector_api_t::close first.

Parameters

[in]	p_ctrl	Pointer to control handle structure
[in]	p_cfg	Pointer to configuration structure

◆ snapshotChannelRegister

fsp_err_t(* rai_data_collector_api_t::snapshotChannelRegister) (rai_data_collector_ctrl_t *const p_ctrl, uint8_t channel, void const *p_src)

Config transfer source address for snapshot mode channel

Parameters

[in]	p_ctrl	Pointer to control handle structure
[in]	p_src	Pointer to transfer source address

◆ bufferRelease

fsp_err_t(* rai_data_collector_api_t::bufferRelease) (rai_data_collector_ctrl_t *const p_ctrl)

Release frame buffers by upper modules

Parameters

[in]	p_ctrl	Pointer to control handle structure
[in]	channel	Which snapshot mode channel
[in]	p_src	Chanenl source buffer address

◆ bufferReset

fsp_err_t(* rai_data_collector_api_t::bufferReset) (rai_data_collector_ctrl_t *const p_ctrl)

Reset internal buffers

Parameters

[in]	p_ctrl	Pointer to control handle structure

◆ snapshotStart

fsp_err_t(* rai_data_collector_api_t::snapshotStart) (rai_data_collector_ctrl_t *const p_ctrl)

Starts snapshot mode.

Parameters

[in]	p_ctrl	Pointer to control handle structure

◆ snapshotStop

fsp_err_t(* rai_data_collector_api_t::snapshotStop) (rai_data_collector_ctrl_t *const p_ctrl)

Stops snapshot mode.

Parameters

[in]	p_ctrl	Pointer to control handle structure

◆ channelBufferGet

fsp_err_t(* rai_data_collector_api_t::channelBufferGet) (rai_data_collector_ctrl_t *const p_ctrl, uint8_t channel, void **pp_buf)

Get the PING or PONG buffer address for data transfer. For data feed mode only.

Parameters

[in]	p_ctrl	Pointer to control handle structure
[in]	channel	Which data feed mode channel
[out]	pp_buf	Returned buffer address

◆ channelWrite

fsp_err_t(* rai_data_collector_api_t::channelWrite) (rai_data_collector_ctrl_t *const p_ctrl, uint8_t channel, const void *p_buf, uint32_t len)

Write data to frame buffer using CPU copy. For data feed mode only.

Parameters

[in]	p_ctrl	Pointer to control handle structure
[in]	channel	Which data feed mode channel
[in]	p_buf	Data buffer
[in]	len	Length of data buffer in data samples

◆ close

fsp_err_t(* rai_data_collector_api_t::close) (rai_data_collector_ctrl_t *const p_ctrl)

Close the specified Data Collector module instance.

Parameters

[in]	p_ctrl	Pointer to control handle structure

◆ rai_data_collector_instance_t

struct rai_data_collector_instance_t

This structure encompasses everything that is needed to use an instance of this interface.

Data Fields

rai_data_collector_ctrl_t *	p_ctrl	Pointer to the control structure

		for this instance.
rai_data_collector_cfg_t const *	p_cfg	Pointer to the configuration structure for this instance.
rai_data_collector_api_t const *	p_api	Pointer to the API structure for this instance.

Typedef Documentation

◆ rai_data_collector_ctrl_t

typedef void rai_data_collector_ctrl_t
Data Collector control block. Allocate an instance specific control block to pass into the Data Collector API calls.

Enumeration Type Documentation

◆ rai_data_collector_data_type_t

enum rai_data_collector_data_type_t	
Data types	
Enumerator	
RAI_DATA_COLLECTOR_DATA_TYPE_INT8_T	Signed 8-bit.
RAI_DATA_COLLECTOR_DATA_TYPE_UINT8_T	Unsigned 8-bit.
RAI_DATA_COLLECTOR_DATA_TYPE_INT16_T	Signed 16-bit.
RAI_DATA_COLLECTOR_DATA_TYPE_UINT16_T	Unsigned 16-bit.
RAI_DATA_COLLECTOR_DATA_TYPE_INT32_T	Signed 32-bit.
RAI_DATA_COLLECTOR_DATA_TYPE_UINT32_T	Unsigned 32-bit.
RAI_DATA_COLLECTOR_DATA_TYPE_FLOAT	Float.
RAI_DATA_COLLECTOR_DATA_TYPE_DOUBLE	Double.

◆ rai_data_collector_error_event_t

enum rai_data_collector_error_event_t
Data Collector module error events

7.3.2.2 Data Shipper Interface

Interfaces » AI

Detailed Description

Interface for RAI Data Shipper.

Summary

The rai data shipper interface provides multiple communication methods.

Data Structures

struct	rai_data_shipper_callback_args_t
struct	rai_data_shipper_write_params_t
struct	rai_data_shipper_cfg_t
struct	rai_data_shipper_api_t
struct	rai_data_shipper_instance_t

Typedefs

typedef void	rai_data_shipper_ctrl_t

Data Structure Documentation

◆ **rai_data_shipper_callback_args_t**

struct rai_data_shipper_callback_args_t		
Callback function parameter structure		
Data Fields		
rm_comms_event_t	result	Whether data is sent successfully or not.
void const *	p_context	Pointer to the user-provided context.
uint8_t	instance	Data collector instance ID.

◆ **rai_data_shipper_write_params_t**

struct rai_data_shipper_write_params_t
Data Shipper write funciton parameter structure
Data Fields

uint16_t	events	Events.
uint16_t	diagnostic_data_len	Diagnostic data length.
uint8_t *	p_diagnostic_data	Pointer to diagnostic data.
rai_data_collector_callback_args_t *	p_sensor_data	Pointer to sensor data info.

◆ rai_data_shipper_cfg_t

struct rai_data_shipper_cfg_t	
RAI Data Shipper general configuration	
Data Fields	
uint8_t	divider
	Send data on every (divider + 1) requests in case the interface bandwidth is not sufficient.
crc_instance_t const *	p_crc
	Pointer to CRC instance.
rm_comms_instance_t const *	p_comms
	Pointer to COMMS API instance.
void const *	p_context
	Pointer to the user-provided context.
void(*	p_callback)(rai_data_shipper_callback_args_t *p_args)
	Pointer to the callback function on data sent or error.

◆ rai_data_shipper_api_t

struct rai_data_shipper_api_t	
RAI Data Shipper interface API.	
Data Fields	
fsp_err_t(*	open)(rai_data_shipper_ctrl_t *const p_ctrl, rai_data_shipper_cfg_t const *const p_cfg)

fsp_err_t(*	read)(rai_data_shipper_ctrl_t *const p_ctrl, void *const p_buf, uint32_t *const buf_len)
fsp_err_t(*	write)(rai_data_shipper_ctrl_t *const p_ctrl, rai_data_shipper_write_params_t const *p_write_params)
fsp_err_t(*	close)(rai_data_shipper_ctrl_t *const p_ctrl)

Field Documentation

◆ open

fsp_err_t(* rai_data_shipper_api_t::open) (rai_data_shipper_ctrl_t *const p_ctrl, rai_data_shipper_cfg_t const *const p_cfg)

Initialize Data Shipper module instance.

Note

To reopen after calling this function, call rai_data_shipper_api_t::close first.

Parameters

[in]	p_ctrl	Pointer to control handle structure
[in]	p_cfg	Pointer to configuration structure

◆ read

fsp_err_t(* rai_data_shipper_api_t::read) (rai_data_shipper_ctrl_t *const p_ctrl, void *const p_buf, uint32_t *const buf_len)

Read data.

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	p_buf	Pointer to the location to store read data.
[in]	buf_len	Number of bytes to read.

◆ write

fsp_err_t(* rai_data_shipper_api_t::write) (rai_data_shipper_ctrl_t *const p_ctrl, rai_data_shipper_write_params_t const *p_write_params)

Write data.

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	write_params	Pointer to write parameters structure

◆ close

fsp_err_t(* rai_data_shipper_api_t::close) (rai_data_shipper_ctrl_t *const p_ctrl)

Close the specified Data Shipper module instance.

Parameters

[in]	p_ctrl	Pointer to control handle structure

◆ rai_data_shipper_instance_t

struct rai_data_shipper_instance_t		
This structure encompasses everything that is needed to use an instance of this interface.		
Data Fields		
rai_data_shipper_ctrl_t *	p_ctrl	Pointer to the control structure for this instance.
rai_data_shipper_cfg_t const *	p_cfg	Pointer to the configuration structure for this instance.
rai_data_shipper_api_t const *	p_api	Pointer to the API structure for this instance.

Typedef Documentation

◆ rai_data_shipper_ctrl_t

typedef void rai_data_shipper_ctrl_t

Data Shipper control block. Allocate an instance specific control block to pass into the Data Shipper API calls.

7.3.3 Audio

Interfaces

Detailed Description

Audio Interfaces.

Modules

	ADPCM Decoder Interface Interface for ADPCM decoder.
	AUDIO PLAYBACK Interface Interface for the Audio Playback.

7.3.3.1 ADPCM Decoder Interface

Interfaces » Audio

Detailed Description

Interface for ADPCM decoder.

Summary

The ADPCM decoder interface provides functionality to decode the 4bit ADPCM data to 16bit PCM output.

Data Structures

struct	adpcm_decoder_cfg_t
struct	adpcm_decoder_api_t
struct	adpcm_decoder_instance_t

Typedefs

typedef void	adpcm_decoder_ctrl_t

Data Structure Documentation

◆ adpcm_decoder_cfg_t

struct adpcm_decoder_cfg_t

Audio Decoder general configuration

◆ adpcm_decoder_api_t

struct adpcm_decoder_api_t

Audio Decoder interface API.

Data Fields

fsp_err_t(*	open)(adpcm_decoder_ctrl_t *const p_ctrl, adpcm_decoder_cfg_t const *const p_cfg)
fsp_err_t(*	decode)(adpcm_decoder_ctrl_t *const p_ctrl, void const *p_src, void *p_dest, uint32_t src_len_bytes)
fsp_err_t(*	reset)(adpcm_decoder_ctrl_t *const p_ctrl)
fsp_err_t(*	close)(adpcm_decoder_ctrl_t *const p_ctrl)

Field Documentation

◆ open

fsp_err_t(* adpcm_decoder_api_t::open) (adpcm_decoder_ctrl_t *const p_ctrl, adpcm_decoder_cfg_t const *const p_cfg)

Initialize Audio Decoder device.

Note

To reconfigure after calling this function, call adpcm_decoder_api_t::close first.

Parameters

[in]	p_ctrl	Pointer to control handle structure
[in]	p_cfg	Pointer to configuration structure

◆ decode

fsp_err_t(* adpcm_decoder_api_t::decode) (adpcm_decoder_ctrl_t *const p_ctrl, void const *p_src, void *p_dest, uint32_t src_len_bytes)

Decodes the compressed data and stores it in output buffer.

Parameters

[in]	p_ctrl	Pointer to control handle structure
[in]	p_src	Pointer to a source data buffer from which data will be picked up for decode operation. The argument must not be NULL.
[out]	p_dest	Pointer to the location to store the decoded data.
[in]	p_dest	Number of bytes to be decoded.

◆ reset

fsp_err_t(* adpcm_decoder_api_t::reset) (adpcm_decoder_ctrl_t *const p_ctrl)

Resets the ADPCM driver.

Parameters

[in]	p_ctrl	Pointer to control handle structure

◆ close

fsp_err_t(* adpcm_decoder_api_t::close) (adpcm_decoder_ctrl_t *const p_ctrl)

Close the specified Audio decoder modules.

Parameters

[in]	p_ctrl	Pointer to control handle structure

◆ adpcm_decoder_instance_t

struct adpcm_decoder_instance_t

This structure encompasses everything that is needed to use an instance of this interface.

Data Fields		
adpcm_decoder_ctrl_t *	p_ctrl	Pointer to the control structure for this instance.

adpcm_decoder_cfg_t const *	p_cfg	Pointer to the configuration structure for this instance.
adpcm_decoder_api_t const *	p_api	Pointer to the API structure for this instance.

Typedef Documentation

◆ adpcm_decoder_ctrl_t

typedef void adpcm_decoder_ctrl_t
Audio Decoder control block. Allocate an instance specific control block to pass into the Audio Decoder API calls.

7.3.3.2 AUDIO PLAYBACK Interface

Interfaces » Audio

Detailed Description

Interface for the Audio Playback.

Defines the API and data structures for the Audio Playback implementation.

Summary

This module provides common interface for Audio Playback.

Data Structures

struct	audio_playback_callback_args_t
struct	audio_playback_cfg_t
struct	audio_playback_api_t
struct	audio_playback_instance_t

Typedefs

typedef void	audio_playback_ctrl_t

Enumerations

enum	audio_playback_event_t

Data Structure Documentation

◆ audio_playback_callback_args_t

struct audio_playback_callback_args_t		
Callback function parameter data		
Data Fields		
void *	p_context	Placeholder for user data.
audio_playback_event_t	event	Event that triggered the callback.

◆ audio_playback_cfg_t

struct audio_playback_cfg_t	
Audio Playback configuration parameters.	
Data Fields	
void const *	p_extend
	Hardware dependent configuration.
void(*	p_callback)(audio_playback_callback_args_t *p_args)
void *	p_context

Field Documentation

◆ p_callback

void(* audio_playback_cfg_t::p_callback) (audio_playback_callback_args_t *p_args)
Callback called when play is complete.

◆ p_context

void* audio_playback_cfg_t::p_context
Placeholder for user data. Passed to the user callback in audio_playback_callback_args_t.

◆ audio_playback_api_t

struct audio_playback_api_t	
Audio Playback functions implemented by the Audio Playback drivers will follow this API.	
Data Fields	
fsp_err_t(*	open)(audio_playback_ctrl_t *const p_ctrl, audio_playback_cfg_t const *const p_cfg)

fsp_err_t(*	start)(audio_playback_ctrl_t *const p_ctrl)
fsp_err_t(*	stop)(audio_playback_ctrl_t *const p_ctrl)
fsp_err_t(*	play)(audio_playback_ctrl_t *const p_ctrl, void const *const p_buffer, uint32_t length)
fsp_err_t(*	close)(audio_playback_ctrl_t *const p_ctrl)

Field Documentation

◆ open

fsp_err_t(* audio_playback_api_t::open) (audio_playback_ctrl_t *const p_ctrl, audio_playback_cfg_t const *const p_cfg)

Open a audio playback module.

Parameters

[in]	p_ctrl	Pointer to memory allocated for control block.
[in]	p_cfg	Pointer to the hardware configurations.

◆ start

fsp_err_t(* audio_playback_api_t::start) (audio_playback_ctrl_t *const p_ctrl)

Start audio playback hardware.

Parameters

[in]	p_ctrl	Pointer to control block.

◆ stop

fsp_err_t(* audio_playback_api_t::stop) (audio_playback_ctrl_t *const p_ctrl)

Stop audio playback hardware.

Parameters

[in]	p_ctrl	Pointer to control block.

◆ play

fsp_err_t(* audio_playback_api_t::play) (audio_playback_ctrl_t *const p_ctrl, void const *const p_buffer, uint32_t length)

Play audio buffer.

Parameters

[in]	p_ctrl	Pointer to control block.
[in]	p_buffer	Pointer to buffer with PCM samples to play. Data must be scaled for audio playback hardware.
[in]	length	Length of data in p_buffer.

◆ close

fsp_err_t(* audio_playback_api_t::close) (audio_playback_ctrl_t *const p_ctrl)

Close the audio driver.

Parameters

[in]	p_ctrl	Pointer to control block initialized in audio_playback_api_t::open.

◆ audio_playback_instance_t

struct audio_playback_instance_t		
This structure encompasses everything that is needed to use an instance of this interface.		
Data Fields		
audio_playback_ctrl_t *	p_ctrl	Pointer to the control structure for this instance.
audio_playback_cfg_t const *	p_cfg	Pointer to the configuration structure for this instance.
audio_playback_api_t const *	p_api	Pointer to the API structure for this instance.

Typedef Documentation

◆ audio_playback_ctrl_t

typedef void audio_playback_ctrl_t
Audio Playback control block. Allocate an instance specific control block to pass into the AUDIO_PLAYBACK API calls.

Enumeration Type Documentation

◆ audio_playback_event_t

enum audio_playback_event_t	
Callback event types.	
Enumerator	
AUDIO_PLAYBACK_EVENT_PLAYBACK_COMPLETE	Audio playback complete event.

7.3.4 CapTouch

Interfaces

Detailed Description

CapTouch Interfaces.

Modules

	CTSU Interface Interface for Capacitive Touch Sensing Unit (CTSU) functions.
	Touch Middleware Interface Interface for Touch Middleware functions.

7.3.4.1 CTSU Interface

Interfaces » CapTouch

Detailed Description

Interface for Capacitive Touch Sensing Unit (CTSU) functions.

Summary

The CTSU interface provides CTSU functionality.

Data Structures

struct	ctsu_callback_args_t
struct	ctsu_element_cfg_t
struct	ctsu_auto_button_cfg_t
struct	ctsu_cfg_t
struct	ctsu_api_t
struct	ctsu_instance_t

Typedefs

typedef void	ctsu_ctrl_t

Enumerations

enum	ctsu_event_t
enum	ctsu_cap_t
enum	ctsu_txvsel_t
enum	ctsu_txvsel2_t
enum	ctsu_atune1_t
enum	ctsu_atune12_t
enum	ctsu_md_t
enum	ctsu_posel_t
enum	ctsu_ssdiv_t
enum	ctsu_specific_data_type_t

Data Structure Documentation

◆ ctsu_callback_args_t

struct ctsu_callback_args_t		
Callback function parameter data		
Data Fields		
ctsu_event_t	event	The event can be used to identify what caused the callback.

void const *	p_context	Placeholder for user data. Set in ctsu_api_t::open function in ctsu_cfg_t.

◆ ctsu_element_cfg_t

struct ctsu_element_cfg_t		
CTSU Configuration parameters. Element Configuration		
Data Fields		
ctsu_ssdiv_t	ssdiv	CTSU Spectrum Diffusion Frequency Division Setting (CTSU Only)
uint16_t	so	CTSU Sensor Offset Adjustment.
uint8_t	snum	CTSU Measurement Count Setting.
uint8_t	sdpa	CTSU Base Clock Setting.

◆ ctsu_auto_button_cfg_t

struct ctsu_auto_button_cfg_t		
Configuration of each automatic judgement button		
Data Fields		
uint8_t	elem_index	Element number used by this button for automatic judgement.
uint16_t	threshold	Touch/non-touch judgement threshold for automatic judgement.
uint16_t	hysteresis	Threshold hysteresis for chattering prevention for automatic judgement.

◆ ctsu_cfg_t

struct ctsu_cfg_t	
User configuration structure, used in open function	
Data Fields	
ctsu_cap_t	cap
	CTSU Scan Start Trigger Select.
ctsu_txvsel_t	txvsel
	CTSU Transmission Power Supply Select.

ctsu_txvsel2_t	txvsel2
	CTSU Transmission Power Supply Select 2 (CTSU2 Only)
ctsu_atune1_t	atune1
	CTSU Power Supply Capacity Adjustment (CTSU Only)
ctsu_atune12_t	atune12
	CTSU Power Supply Capacity Adjustment (CTSU2 Only)
ctsu_md_t	md
	CTSU Measurement Mode Select.
ctsu_posel_t	posel
	CTSU Non-Measured Channel Output Select (CTSU2 Only)
uint8_t	tsod
	TS all terminal output control for multi electrode scan.
uint8_t	mec_ts
	TS number used when using the MEC function.
uint8_t	mec_shield_ts
	TS number of active shield used when using MEC function.
uint8_t	tlot
	Number of consecutive judgements exceeding the threshold L for automatic judgement.

uint8_t	thot
	Number of consecutive judgements exceeding the threshold H for automatic judgement.
uint8_t	jc
	Judgement condition for automatic judgement.
uint8_t	ajmmat
	Measured value moving average number of times for automatic judgement.
uint8_t	ajbmat
	Average number of baselines for automatic judgement.
uint8_t	mtucfen
	Mutual capacity operation for automatic judgement.
uint8_t	ajfen
	Automatic judgement function enabled for automatic judgement.
uint8_t	autojudge_monitor_num
	Method number for QE monitor for automatic judgement.
uint8_t	majirimd
	JMM or VMM for automatic judgement.
uint8_t	ctsuchac0
	TS00-TS07 enable mask.

uint8_t	ctsuchac1
	TS08-TS15 enable mask.
uint8_t	ctsuchac2
	TS16-TS23 enable mask.
uint8_t	ctsuchac3
	TS24-TS31 enable mask.
uint8_t	ctsuchac4
	TS32-TS39 enable mask.
uint8_t	ctsuchtrc0
	TS00-TS07 mutual-tx mask.
uint8_t	ctsuchtrc1
	TS08-TS15 mutual-tx mask.
uint8_t	ctsuchtrc2
	TS16-TS23 mutual-tx mask.
uint8_t	ctsuchtrc3
	TS24-TS31 mutual-tx mask.
uint8_t	ctsuchtrc4
	TS32-TS39 mutual-tx mask.

ctsu_element_cfg_t const *	p_elements
	Pointer to elements configuration array.
uint8_t	num_rx
	Number of receive terminals.
uint8_t	num_tx
	Number of transmit terminals.
uint16_t	num_moving_average
	Number of moving average for measurement data.
bool	tunning_enable
	Initial offset tuning flag.
void(*	p_callback)(ctsu_callback_args_t *p_args)
	Callback provided when CTSUFN ISR occurs.
transfer_instance_t const *	p_transfer_tx
	DTC instance for transmit at CTSUWR. Set to NULL if unused.
transfer_instance_t const *	p_transfer_rx
	DTC instance for receive at CTSURD. Set to NULL if unused.
adc_instance_t const *	p_adc_instance
	ADC instance for temperature correction.
IRQn_Type	write_irq

	CTSU_CTSUWR interrupt vector.
IRQn_Type	read_irq
	CTSU_CTSURD interrupt vector.
IRQn_Type	end_irq
	CTSU_CTSUFN interrupt vector.
void const *	p_context
	User defined context passed into callback function.
void const *	p_extend
	Pointer to extended configuration by instance of interface.
uint16_t	tuning_self_target_value
	Target self value for initial offset tuning.
uint16_t	tuning_mutual_target_value
	Target mutual value for initial offset tuning.
ctsu_auto_button_cfg_t const *	p_ctsu_auto_buttons
	Pointer to array of automatic judgement button configuration.
uint8_t	majority_mode
	Software majority mode selection.

◆ ctsu_api_t

struct ctsu_api_t

Functions implemented at the HAL layer will follow this API.

Data Fields

fsp_err_t(*	open)(ctsu_ctrl_t *const p_ctrl, ctsu_cfg_t const *const p_cfg)
fsp_err_t(*	scanStart)(ctsu_ctrl_t *const p_ctrl)
fsp_err_t(*	dataGet)(ctsu_ctrl_t *const p_ctrl, uint16_t *p_data)
fsp_err_t(*	scanStop)(ctsu_ctrl_t *const p_ctrl)
fsp_err_t(*	diagnosis)(ctsu_ctrl_t *const p_ctrl)
fsp_err_t(*	callbackSet)(ctsu_ctrl_t *const p_ctrl, void(*p_callback)(ctsu_callback_args_t *), void const *const p_context, ctsu_callback_args_t *const p_callback_memory)
fsp_err_t(*	close)(ctsu_ctrl_t *const p_ctrl)
fsp_err_t(*	specificDataGet)(ctsu_ctrl_t *const p_ctrl, uint16_t *p_specific_data, ctsu_specific_data_type_t specific_data_type)
fsp_err_t(*	dataInsert)(ctsu_ctrl_t *const p_ctrl, uint16_t *p_insert_data)
fsp_err_t(*	autoJudgementDataGet)(ctsu_ctrl_t *const p_ctrl, uint64_t *p_button_status)
fsp_err_t(*	offsetTuning)(ctsu_ctrl_t *const p_ctrl)

Field Documentation

◆ open

fsp_err_t(* ctsu_api_t::open) (ctsu_ctrl_t *const p_ctrl, ctsu_cfg_t const *const p_cfg)

Open driver.

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	p_cfg	Pointer to pin configuration structure.

◆ scanStart

fsp_err_t(* ctsu_api_t::scanStart) (ctsu_ctrl_t *const p_ctrl)

Scan start.

Parameters

[in]	p_ctrl	Pointer to control structure.

◆ dataGet

fsp_err_t(* ctsu_api_t::dataGet) (ctsu_ctrl_t *const p_ctrl, uint16_t *p_data)

Data get.

Parameters

[in]	p_ctrl	Pointer to control structure.
[out]	p_data	Pointer to get data array.

◆ scanStop

fsp_err_t(* ctsu_api_t::scanStop) (ctsu_ctrl_t *const p_ctrl)

ScanStop.

Parameters

[in]	p_ctrl	Pointer to control structure.

◆ diagnosis

fsp_err_t(* ctsu_api_t::diagnosis) (ctsu_ctrl_t *const p_ctrl)

Diagnosis.

Parameters

[in]	p_ctrl	Pointer to control structure.

◆ callbackSet

fsp_err_t(* ctsu_api_t::callbackSet) (ctsu_ctrl_t *const p_ctrl, void(*p_callback)(ctsu_callback_args_t *), void const *const p_context, ctsu_callback_args_t *const p_callback_memory)

Specify callback function and optional context pointer and working memory pointer.

Parameters

[in]	p_ctrl	Pointer to the CTSU control block.
[in]	p_callback	Callback function
[in]	p_context	Pointer to send to callback function
[in]	p_working_memory	Pointer to volatile memory where callback structure can be allocated. Callback arguments allocated here are only valid during the callback.

◆ close

fsp_err_t(* ctsu_api_t::close) (ctsu_ctrl_t *const p_ctrl)

Close driver.

Parameters

[in]	p_ctrl	Pointer to control structure.

◆ specificDataGet

fsp_err_t(* ctsu_api_t::specificDataGet) (ctsu_ctrl_t *const p_ctrl, uint16_t *p_specific_data, ctsu_specific_data_type_t specific_data_type)

Specific Data get.

Parameters

[in]	p_ctrl	Pointer to control structure.
[out]	p_specific_data	Pointer to get specific data array.
[in]	specific_data_type	Specific data type

◆ dataInsert

fsp_err_t(* ctsu_api_t::dataInsert) (ctsu_ctrl_t *const p_ctrl, uint16_t *p_insert_data)

Data Insert.

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	p_insert_data	Pointer to insert data.

◆ autoJudgementDataGet

fsp_err_t(* ctsu_api_t::autoJudgementDataGet) (ctsu_ctrl_t *const p_ctrl, uint64_t *p_button_status)

Initialize automatic judgement and get button status.

Parameters

[in]	p_ctrl	Pointer to control structure.
[out]	p_button_status	Pointer to get button status array.

◆ offsetTuning

fsp_err_t(* ctsu_api_t::offsetTuning) (ctsu_ctrl_t *const p_ctrl)

Adjust the offset value to tune the sensor.

Parameters

[in]	p_ctrl	Pointer to control structure.

◆ ctsu_instance_t

struct ctsu_instance_t

This structure encompasses everything that is needed to use an instance of this interface.

Data Fields

ctsu_ctrl_t *	p_ctrl	Pointer to the control structure for this instance.
ctsu_cfg_t const *	p_cfg	Pointer to the configuration structure for this instance.
ctsu_api_t const *	p_api	Pointer to the API structure for this instance.

Typedef Documentation

◆ ctsu_ctrl_t

typedef void ctsu_ctrl_t
CTSU Control block. Allocate an instance specific control block to pass into the API calls.

Enumeration Type Documentation

◆ ctsu_event_t

enum ctsu_event_t	
CTSU Events for callback function	
Enumerator	
CTSU_EVENT_SCAN_COMPLETE	Normal end.
CTSU_EVENT_OVERFLOW	Sensor counter overflow (CTSUST.CTSUSOVF set)
CTSU_EVENT_ICOMP	Abnormal TSCAP voltage (CTSUERRS.CTSUICOMP set)
CTSU_EVENT_ICOMP1	Abnormal sensor current (CTSUSR.ICOMP1 set)

◆ ctsu_cap_t

enum ctsu_cap_t	
CTSU Scan Start Trigger Select	
Enumerator	
CTSU_CAP_SOFTWARE	Scan start by software trigger.
CTSU_CAP_EXTERNAL	Scan start by external trigger.

◆ ctsu_txvsel_t

enum ctsu_txvsel_t	
CTSU Transmission Power Supply Select	
Enumerator	
CTSU_TXVSEL_VCC	VCC selected.
CTSU_TXVSEL_INTERNAL_POWER	Internal logic power supply selected.

◆ ctsu_txvsel2_t

enum ctsu_txvsel2_t	
CTSU Transmission Power Supply Select 2 (CTSU2 Only)	
Enumerator	
CTSU_TXVSEL_MODE	Follow TXVSEL setting.
CTSU_TXVSEL_VCC_PRIVATE	VCC private selected.

◆ ctsu_atune1_t

enum ctsu_atune1_t	
CTSU Power Supply Capacity Adjustment (CTSU Only)	
Enumerator	
CTSU_ATUNE1_NORMAL	Normal output (40uA)
CTSU_ATUNE1_HIGH	High-current output (80uA)

◆ ctsu_atune12_t

enum ctsu_atune12_t	
CTSU Power Supply Capacity Adjustment (CTSU2 Only)	
Enumerator	
CTSU_ATUNE12_80UA	High-current output (80uA)
CTSU_ATUNE12_40UA	Normal output (40uA)
CTSU_ATUNE12_20UA	Low-current output (20uA)
CTSU_ATUNE12_160UA	Very high-current output (160uA)

◆ ctsu_md_t

enum ctsu_md_t	
CTSU Measurement Mode Select	
Enumerator	
CTSU_MODE_SELF_MULTI_SCAN	Self-capacitance multi scan mode.
CTSU_MODE_MUTUAL_FULL_SCAN	Mutual capacitance full scan mode.
CTSU_MODE_MUTUAL_CFC_SCAN	Mutual capacitance cfc scan mode (CTSU2 Only)
CTSU_MODE_CURRENT_SCAN	Current scan mode (CTSU2 Only)
CTSU_MODE_CORRECTION_SCAN	Correction scan mode (CTSU2 Only)
CTSU_MODE_DIAGNOSIS_SCAN	Diagnosis scan mode.

◆ ctsu_posel_t

enum ctsu_posel_t	
CTSU Non-Measured Channel Output Select (CTSU2 Only)	
Enumerator	
CTSU_POSEL_LOW_GPIO	Output low through GPIO.
CTSU_POSEL_HI_Z	Hi-Z.
CTSU_POSEL_LOW	Setting prohibited.
CTSU_POSEL_SAME_PULSE	Same phase pulse output as transmission channel through the power setting by the TXVSEL[1:0] bits.

◆ ctsu_ssdiv_t

enum ctsu_ssdiv_t	
CTSU Spectrum Diffusion Frequency Division Setting (CTSU Only)	
Enumerator	
CTSU_SSDIV_4000	4.00 <= Base clock frequency (MHz)
CTSU_SSDIV_2000	2.00 <= Base clock frequency (MHz) < 4.00
CTSU_SSDIV_1330	1.33 <= Base clock frequency (MHz) < 2.00
CTSU_SSDIV_1000	1.00 <= Base clock frequency (MHz) < 1.33
CTSU_SSDIV_0800	0.80 <= Base clock frequency (MHz) < 1.00
CTSU_SSDIV_0670	0.67 <= Base clock frequency (MHz) < 0.80
CTSU_SSDIV_0570	0.57 <= Base clock frequency (MHz) < 0.67
CTSU_SSDIV_0500	0.50 <= Base clock frequency (MHz) < 0.57
CTSU_SSDIV_0440	0.44 <= Base clock frequency (MHz) < 0.50
CTSU_SSDIV_0400	0.40 <= Base clock frequency (MHz) < 0.44
CTSU_SSDIV_0360	0.36 <= Base clock frequency (MHz) < 0.40
CTSU_SSDIV_0330	0.33 <= Base clock frequency (MHz) < 0.36
CTSU_SSDIV_0310	0.31 <= Base clock frequency (MHz) < 0.33
CTSU_SSDIV_0290	0.29 <= Base clock frequency (MHz) < 0.31
CTSU_SSDIV_0270	0.27 <= Base clock frequency (MHz) < 0.29
CTSU_SSDIV_0000	0.00 <= Base clock frequency (MHz) < 0.27

◆ ctsu_specific_data_type_t

enum ctsu_specific_data_type_t
CTSU select data type for slect data get

7.3.4.2 Touch Middleware Interface

Interfaces » CapTouch

Detailed Description

Interface for Touch Middleware functions.

Summary

The TOUCH interface provides TOUCH functionality.

Data Structures

struct	touch_button_cfg_t
struct	touch_slider_cfg_t
struct	touch_wheel_cfg_t
struct	touch_pad_cfg_t
struct	touch_cfg_t
struct	touch_sensitivity_info_t
struct	touch_api_t
struct	touch_instance_t

Macros

#define	TOUCH_COUNT_MAX Value of Maximum count.
#define	TOUCH_OFF_VALUE Value of Non-touch.

Typedefs

typedef void	touch_ctrl_t
typedef struct st_ctsu_callback_args	touch_callback_args_t

Data Structure Documentation

◆ touch_button_cfg_t

struct touch_button_cfg_t		
Configuration of each button		
Data Fields		
uint8_t	elem_index	Element number used by this button.
uint16_t	threshold	Touch/non-touch judgment threshold.
uint16_t	hysteresis	Threshold hysteresis for chattering prevention.

◆ touch_slider_cfg_t

struct touch_slider_cfg_t		
Configuration of each slider		
Data Fields		
uint8_t const *	p_elem_index	Element number array used by this slider.
uint8_t	num_elements	Number of elements used by this slider.
uint16_t	threshold	Position calculation start threshold value.

◆ touch_wheel_cfg_t

struct touch_wheel_cfg_t		
Configuration of each wheel		
Data Fields		
uint8_t const *	p_elem_index	Element number array used by this wheel.
uint8_t	num_elements	Number of elements used by this wheel.
uint16_t	threshold	Position calculation start threshold value.

◆ touch_pad_cfg_t

struct touch_pad_cfg_t		
Configuration of each pads		
Data Fields		
uint8_t const *	p_elem_index_rx	RX of element number arrays used by this pad.

uint8_t const *	p_elem_index_tx	TX of element number arrays used by this pad.
uint8_t	num_elements	Number of elements used by this pad.
uint16_t	threshold	Coordinate calculation threshold value.
uint16_t	rx_pixel	rx coordinate resolution
uint16_t	tx_pixel	tx coordinate resolution
uint8_t	max_touch	Maximum number of touch judgments used by the pad.
uint8_t	num_drift	Number of pad drift.

◆ touch_cfg_t

struct touch_cfg_t		
User configuration structure, used in open function		
Data Fields		
touch_button_cfg_t const *	p_buttons	Pointer to array of button configuration.
touch_slider_cfg_t const *	p_sliders	Pointer to array of slider configuration.
touch_wheel_cfg_t const *	p_wheels	Pointer to array of wheel configuration.
touch_pad_cfg_t const *	p_pad	Pointer of pad configuration.
uint8_t	num_buttons	Number of buttons.
uint8_t	num_sliders	Number of sliders.
uint8_t	num_wheels	Number of wheels.
uint8_t	on_freq	The cumulative number of determinations of ON.
uint8_t	off_freq	The cumulative number of determinations of OFF.
uint16_t	drift_freq	Base value drift frequency. [0 : no use].
uint16_t	cancel_freq	Maximum continuous ON. [0 : no use].
uint8_t	number	Configuration number for QE monitor.
ctsu_instance_t const *	p_ctsu_instance	Pointer to CTSU instance.
uart_instance_t const *	p_uart_instance	Pointer to UART instance.
void const *	p_context	User defined context passed into callback function.

void const *	p_extend	Pointer to extended configuration by instance of interface.

◆ touch_sensitivity_info_t

struct touch_sensitivity_info_t		
Configuration of each touch sensitivity information		
Data Fields		
uint16_t *	p_touch_sensitivity_ratio	Pointer to sensitivity ratio array.
uint16_t	old_threshold_ratio	Old threshold ratio.
uint16_t	new_threshold_ratio	New threshold ratio.
uint8_t	new_hysteresis_ratio	New hysteresis ratio.

◆ touch_api_t

struct touch_api_t	
Functions implemented at the HAL layer will follow this API.	
Data Fields	
fsp_err_t(*	open)(touch_ctrl_t *const p_ctrl, touch_cfg_t const *const p_cfg)
fsp_err_t(*	scanStart)(touch_ctrl_t *const p_ctrl)
fsp_err_t(*	dataGet)(touch_ctrl_t *const p_ctrl, uint64_t *p_button_status, uint16_t *p_slider_position, uint16_t *p_wheel_position)
fsp_err_t(*	scanStop)(ctsu_ctrl_t *const p_ctrl)
fsp_err_t(*	padDataGet)(touch_ctrl_t *const p_ctrl, uint16_t *p_pad_rx_coordinate, uint16_t *p_pad_tx_coordinate, uint8_t *p_pad_num_touch)
fsp_err_t(*	callbackSet)(touch_ctrl_t *const p_ctrl, void(*p_callback)(touch_callback_args_t *), void const *const p_context, touch_callback_args_t *const p_callback_memory)
fsp_err_t(*	close)(touch_ctrl_t *const p_ctrl)
fsp_err_t(*	sensitivityRatioGet)(touch_ctrl_t *const p_ctrl, touch_sensitivity_info_t *p_touch_sensitivity_info)

fsp_err_t(*	thresholdAdjust)(touch_ctrl_t *const p_ctrl, touch_sensitivity_info_t *p_touch_sensitivity_info)
fsp_err_t(*	driftControl)(touch_ctrl_t *const p_ctrl, uint16_t input_drift_freq)

Field Documentation

◆ open

fsp_err_t(* touch_api_t::open) (touch_ctrl_t *const p_ctrl, touch_cfg_t const *const p_cfg)

Open driver.

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	p_cfg	Pointer to pin configuration structure.

◆ scanStart

fsp_err_t(* touch_api_t::scanStart) (touch_ctrl_t *const p_ctrl)

Scan start.

Parameters

[in]	p_ctrl	Pointer to control structure.

◆ dataGet

fsp_err_t(* touch_api_t::dataGet) (touch_ctrl_t *const p_ctrl, uint64_t *p_button_status, uint16_t *p_slider_position, uint16_t *p_wheel_position)

Data get.

Parameters

[in]	p_ctrl	Pointer to control structure.
[out]	p_button_status	Pointer to get data bitmap.
[out]	p_slider_position	Pointer to get data array.
[out]	p_wheel_position	Pointer to get data array.

◆ scanStop

fsp_err_t(* touch_api_t::scanStop) (ctsu_ctrl_t *const p_ctrl)

ScanStop.

Parameters

[in]	p_ctrl	Pointer to control structure.

◆ padDataGet

fsp_err_t(* touch_api_t::padDataGet) (touch_ctrl_t *const p_ctrl, uint16_t *p_pad_rx_coordinate, uint16_t *p_pad_tx_coordinate, uint8_t *p_pad_num_touch)

pad data get.

Parameters

[in]	p_ctrl	Pointer to control structure.
[out]	p_pad_rx_coordinate	Pointer to get coordinate of receiver side.
[out]	p_pad_tx_coordinate	Pointer to get coordinate of transmitter side.
[out]	p_pad_num_touch	Pointer to get touch count.

◆ callbackSet

fsp_err_t(* touch_api_t::callbackSet) (touch_ctrl_t *const p_ctrl, void(*p_callback)(touch_callback_args_t *), void const *const p_context, touch_callback_args_t *const p_callback_memory)

Specify callback function and optional context pointer and working memory pointer.

Parameters

[in]	p_ctrl	Pointer to the CTSU control block.
[in]	p_callback	Callback function
[in]	p_context	Pointer to send to callback function
[in]	p_working_memory	Pointer to volatile memory where callback structure can be allocated. Callback arguments allocated here are only valid during the callback.

◆ close

fsp_err_t(* touch_api_t::close) (touch_ctrl_t *const p_ctrl)

Close driver.

Parameters

[in]	p_ctrl	Pointer to control structure.

◆ sensitivityRatioGet

fsp_err_t(* touch_api_t::sensitivityRatioGet) (touch_ctrl_t *const p_ctrl, touch_sensitivity_info_t *p_touch_sensitivity_info)

Sensitivity ratio get.

Parameters

[in]	p_ctrl	Pointer to control structure.
[in,out]	p_touch_sensitivity_info	Pointer to touch sensitivity structure.

◆ thresholdAdjust

fsp_err_t(* touch_api_t::thresholdAdjust) (touch_ctrl_t *const p_ctrl, touch_sensitivity_info_t *p_touch_sensitivity_info)

Threshold adjust.

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	p_touch_sensitivity_info	Pointer to touch sensitivity structure.

◆ driftControl

fsp_err_t(* touch_api_t::driftControl) (touch_ctrl_t *const p_ctrl, uint16_t input_drift_freq)

Drift control.

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	input_drift_freq	Drift frequency value.

◆ touch_instance_t

struct touch_instance_t

This structure encompasses everything that is needed to use an instance of this interface.

Data Fields		
touch_ctrl_t *	p_ctrl	Pointer to the control structure for this instance.
touch_cfg_t const *	p_cfg	Pointer to the configuration structure for this instance.
touch_api_t const *	p_api	Pointer to the API structure for this instance.

Typedef Documentation

◆ touch_ctrl_t

typedef void touch_ctrl_t
Control block. Allocate an instance specific control block to pass into the API calls.

◆ touch_callback_args_t

typedef struct st_ctsu_callback_args touch_callback_args_t
Callback function parameter data

7.3.5 Connectivity

Interfaces

Detailed Description

Connectivity Interfaces.

Modules

	CAN Interface Interface for CAN peripheral.
	CEC Interface Interface for CEC peripheral.
	Communicatons Middleware Interface Interface for Communications Middleware functions.

	I2C Master Interface Interface for I2C master communication.
	I2C Slave Interface Interface for I2C slave communication.
	I2S Interface Interface for I2S audio communication.
	I3C Interface Interface for I3C.
	LIN Interface Interface for LIN communications.
	SMCI Interface Interface for SMCI communications.
	SPI Interface Interface for SPI communications.
	UART Interface Interface for UART communications.
	USB HCDC Interface Interface for USB HCDC functions.
	USB HHID Interface Interface for USB HHID functions.
	USB HMSC Interface Interface for USB HMSC functions.
	USB Interface

	Interface for USB functions.
	USB PCDC Interface Interface for USB PCDC functions.
	USB PHID Interface Interface for USB PHID functions.
	USB PMSC Interface Interface for USB PMSC functions.
	USB PPRN Interface Interface for USB PPRN functions.

7.3.5.1 CAN Interface

Interfaces » Connectivity

Detailed Description

Interface for CAN peripheral.

Summary

The CAN interface provides common APIs for CAN HAL drivers. CAN interface supports following features.

- Full-duplex CAN communication
- Generic CAN parameter setting
- Interrupt driven transmit/receive processing
- Callback function support with returning event code
- Hardware resource locking during a transaction

Data Structures

struct	can_info_t
struct	can_bit_timing_cfg_t
struct	can_frame_t

struct	can_callback_args_t
struct	can_cfg_t
struct	can_api_t
struct	can_instance_t

Typedefs

typedef void	can_ctrl_t

Enumerations

enum	can_event_t
enum	can_operation_mode_t
enum	can_test_mode_t
enum	can_id_mode_t
enum	can_frame_type_t

Data Structure Documentation

◆ can_info_t

struct can_info_t		
CAN status info		
Data Fields		
uint32_t	status	Useful information from the CAN status register.
uint32_t	rx_mb_status	RX Message Buffer New Data flags.
uint32_t	rx_fifo_status	RX FIFO Empty flags.
uint8_t	error_count_transmit	Transmit error count.
uint8_t	error_count_receive	Receive error count.
uint32_t	error_code	Error code, cleared after reading.

◆ can_bit_timing_cfg_t

struct can_bit_timing_cfg_t
CAN bit rate configuration.
Data Fields

uint32_t	baud_rate_prescaler	Baud rate prescaler. Valid values: 1 - 1024.
uint32_t	time_segment_1	Time segment 1 control.
uint32_t	time_segment_2	Time segment 2 control.
uint32_t	synchronization_jump_width	Synchronization jump width.

◆ can_frame_t

struct can_frame_t		
CAN data Frame		
Data Fields		
uint32_t	id	CAN ID.
can_id_mode_t	id_mode	Standard or Extended ID (IDE).
can_frame_type_t	type	Frame type (RTR).
uint8_t	data_length_code	CAN Data Length Code (DLC).
uint32_t	options	Implementation-specific options.
uint8_t	data[CAN_DATA_BUFFER_LENGTH]	CAN data.

◆ can_callback_args_t

struct can_callback_args_t		
CAN callback parameter definition		
Data Fields		
uint32_t	channel	Device channel number.
can_event_t	event	Event code.
uint32_t	error	Error code.
union can_callback_args_t	__unnamed__	
void const *	p_context	Context provided to user during callback.
can_frame_t	frame	Received frame data.

◆ can_cfg_t

struct can_cfg_t	
CAN Configuration	
Data Fields	
uint32_t	channel
	CAN channel.

can_bit_timing_cfg_t *	p_bit_timing
	CAN bit timing.
void(*	p_callback)(can_callback_args_t *p_args)
	Pointer to callback function.
void const *	p_context
	User defined callback context.
void const *	p_extend
	CAN hardware dependent configuration.
uint8_t	ipl
	Error/Transmit/Receive interrupt priority.
IRQn_Type	error_irq
	Error IRQ number.
IRQn_Type	rx_irq
	Receive IRQ number.
IRQn_Type	tx_irq
	Transmit IRQ number.

◆ can_api_t

struct can_api_t
Shared Interface definition for CAN

Data Fields

fsp_err_t(*	open)(can_ctrl_t *const p_ctrl, can_cfg_t const *const p_cfg)
fsp_err_t(*	write)(can_ctrl_t *const p_ctrl, uint32_t buffer_number, can_frame_t *const p_frame)
fsp_err_t(*	read)(can_ctrl_t *const p_ctrl, uint32_t buffer_number, can_frame_t *const p_frame)
fsp_err_t(*	close)(can_ctrl_t *const p_ctrl)
fsp_err_t(*	modeTransition)(can_ctrl_t *const p_ctrl, can_operation_mode_t operation_mode, can_test_mode_t test_mode)
fsp_err_t(*	infoGet)(can_ctrl_t *const p_ctrl, can_info_t *const p_info)
fsp_err_t(*	callbackSet)(can_ctrl_t *const p_ctrl, void(*p_callback)(can_callback_args_t *), void const *const p_context, can_callback_args_t *const p_callback_memory)

Field Documentation

◆ open

fsp_err_t(* can_api_t::open) (can_ctrl_t *const p_ctrl, can_cfg_t const *const p_cfg)

Open function for CAN device

Parameters

[in,out]	p_ctrl	Pointer to the CAN control block. Must be declared by user. Value set here.
[in]	p_cfg	Pointer to CAN configuration structure. All elements of this structure must be set by user.

◆ write

fsp_err_t(* can_api_t::write) (can_ctrl_t *const p_ctrl, uint32_t buffer_number, can_frame_t *const p_frame)

Write function for CAN device

Parameters

[in]	p_ctrl	Pointer to the CAN control block.
[in]	buffer	Buffer number (mailbox or message buffer) to write to.
[in]	p_frame	Pointer for frame of CAN ID, DLC, data and frame type to write.

◆ read

fsp_err_t(* can_api_t::read) (can_ctrl_t *const p_ctrl, uint32_t buffer_number, can_frame_t *const p_frame)

Read function for CAN device

Parameters

[in]	p_ctrl	Pointer to the CAN control block.
[in]	buffer	Message buffer (number) to read from.
[in]	p_frame	Pointer to store the CAN ID, DLC, data and frame type.

◆ close

fsp_err_t(* can_api_t::close) (can_ctrl_t *const p_ctrl)

Close function for CAN device

Parameters

[in]	p_ctrl	Pointer to the CAN control block.

◆ modeTransition

fsp_err_t(* can_api_t::modeTransition) (can_ctrl_t *const p_ctrl, can_operation_mode_t operation_mode, can_test_mode_t test_mode)

Mode Transition function for CAN device

Parameters

[in]	p_ctrl	Pointer to the CAN control block.
[in]	operation_mode	Destination CAN operation state.
[in]	test_mode	Destination CAN test state.

◆ infoGet

fsp_err_t(* can_api_t::infoGet) (can_ctrl_t *const p_ctrl, can_info_t *const p_info)

Get CAN channel info.

Parameters

[in]	p_ctrl	Handle for channel (pointer to channel control block)
[out]	p_info	Memory address to return channel specific data to.

◆ callbackSet

fsp_err_t(* can_api_t::callbackSet) (can_ctrl_t *const p_ctrl, void(*p_callback)(can_callback_args_t *), void const *const p_context, can_callback_args_t *const p_callback_memory)

Specify callback function and optional context pointer and working memory pointer.

Parameters

[in]	p_ctrl	Control block set in can_api_t::open call.
[in]	p_callback	Callback function to register
[in]	p_context	Pointer to send to callback function
[in]	p_working_memory	Pointer to volatile memory where callback structure can be allocated. Callback arguments allocated here are only valid during the callback.

◆ can_instance_t

struct can_instance_t		
This structure encompasses everything that is needed to use an instance of this interface.		
Data Fields		
can_ctrl_t *	p_ctrl	Pointer to the control structure for this instance.
can_cfg_t const *	p_cfg	Pointer to the configuration structure for this instance.
can_api_t const *	p_api	Pointer to the API structure for this instance.

Typedef Documentation

◆ can_ctrl_t

typedef void can_ctrl_t
CAN control block. Allocate an instance specific control block to pass into the CAN API calls.

Enumeration Type Documentation

◆ can_event_t

enum can_event_t	
CAN event codes	
Enumerator	
CAN_EVENT_ERR_WARNING	Error Warning event.
CAN_EVENT_ERR_PASSIVE	Error Passive event.
CAN_EVENT_ERR_BUS_OFF	Bus Off event.
CAN_EVENT_BUS_RECOVERY	Bus Off Recovery event.
CAN_EVENT_MAILBOX_MESSAGE_LOST	Mailbox has been overrun.
CAN_EVENT_ERR_BUS_LOCK	Bus lock detected (32 consecutive dominant bits).
CAN_EVENT_ERR_CHANNEL	Channel error has occurred.
CAN_EVENT_TX_ABORTED	Transmit abort event.
CAN_EVENT_RX_COMPLETE	Receive complete event.
CAN_EVENT_TX_COMPLETE	Transmit complete event.
CAN_EVENT_ERR_GLOBAL	Global error has occurred.
CAN_EVENT_TX_FIFO_EMPTY	Transmit FIFO is empty.
CAN_EVENT_FIFO_MESSAGE_LOST	Receive FIFO overrun.

◆ can_operation_mode_t

enum can_operation_mode_t	
CAN Operation modes	
Enumerator	
CAN_OPERATION_MODE_NORMAL	CAN Normal Operation Mode.
CAN_OPERATION_MODE_RESET	CAN Reset Operation Mode.
CAN_OPERATION_MODE_HALT	CAN Halt Operation Mode.
CAN_OPERATION_MODE_SLEEP	CAN Sleep Operation Mode.

◆ can_test_mode_t

enum can_test_mode_t	
CAN Test modes	
Enumerator	
CAN_TEST_MODE_DISABLED	CAN Test Mode Disabled.
CAN_TEST_MODE_LISTEN	CAN Test Listen Mode.
CAN_TEST_MODE_LOOPBACK_EXTERNAL	CAN Test External Loopback Mode.
CAN_TEST_MODE_LOOPBACK_INTERNAL	CAN Test Internal Loopback Mode.
CAN_TEST_MODE_INTERNAL_BUS	CANFD Internal CAN Bus Communication Test Mode.

◆ can_id_mode_t

enum can_id_mode_t	
CAN ID modes	
Enumerator	
CAN_ID_MODE_STANDARD	Standard IDs of 11 bits used.
CAN_ID_MODE_EXTENDED	Extended IDs of 29 bits used.

◆ can_frame_type_t

enum can_frame_type_t	
CAN frame types	
Enumerator	
CAN_FRAME_TYPE_DATA	Data frame.
CAN_FRAME_TYPE_REMOTE	Remote frame.

7.3.5.2 CEC Interface

Interfaces » Connectivity

Detailed Description

Interface for CEC peripheral.

Summary

The CEC interface provides common APIs for CEC HAL drivers and supports the following features:

- Opening and closing the CEC module.
- Allocation for full range of local address settings (TV, Recording Device, Playback Device, etc.)
- Supports a user-callback function (required), invoked when transmit, receive, or error interrupts are received.

Data Structures

union	cec_message_t
struct	cec_callback_args_t
struct	cec_cfg_t
struct	cec_api_t
struct	cec_instance_t

Typedefs

typedef void	cec_ctrl_t

Enumerations

enum	cec_addr_t
enum	cec_clock_source_t
enum	cec_state_t
enum	cec_error_t
enum	cec_event_t

Data Structure Documentation

◆ cec_message_t

union cec_message_t		
CEC message		
Data Fields		
struct cec_message_t	__unnamed__	
uint8_t	raw_data[CEC_DATA_BUFFER_LENGTH+2 *sizeof(uint8_t)]	Contiguous raw data.

◆ cec_callback_args_t

struct cec_callback_args_t		
CEC callback parameter definition		
Data Fields		
cec_event_t	event	Event code.
void const *	p_context	Context provided to user during callback.
bool	addr_match	Local addresss matches message destination.
uint8_t	data_byte	Received data byte (INTDA)
cec_status_t	status	CEC Module status data.
cec_error_t	errors	Error code bitfield.

◆ cec_cfg_t

struct cec_cfg_t	
CEC Configuration	
Data Fields	
cec_timing_t const *	bit_timing_cfg
	CEC Bit Timing Configuration.

uint16_t	rx_data_sample_time
	Receive Data Sample Time Setting.
uint16_t	rx_data_bit_reference_width
	Receive Data Bit Reference Width.
void(*	p_callback)(cec_callback_args_t *p_args)
	Pointer to callback function.
void const *	p_context
	User defined callback context.
uint8_t	ipl
	Error/Data/Message interrupt priority level.
IRQn_Type	error_irq
	Error IRQ number.
IRQn_Type	data_irq
	Data IRQ number.
IRQn_Type	msg_irq
	Communication Complete IRQ number.
void *	p_extend
	Pointer to extended configuration structure.

◆ cec_api_t

struct cec_api_t	
Shared Interface definition for CEC	
Data Fields	
fsp_err_t(*	open)(cec_ctrl_t *const p_ctrl, cec_cfg_t const *const p_cfg)
fsp_err_t(*	mediaInit)(cec_ctrl_t *const p_ctrl, cec_addr_t local_address)
fsp_err_t(*	write)(cec_ctrl_t *const p_ctrl, cec_message_t const *const p_message, uint32_t message_size)
fsp_err_t(*	close)(cec_ctrl_t *const p_ctrl)
fsp_err_t(*	statusGet)(cec_ctrl_t *const p_ctrl, cec_status_t *const p_status)
fsp_err_t(*	callbackSet)(cec_ctrl_t *const p_ctrl, void(*p_callback)(cec_callback_args_t *), void const *const p_context, cec_callback_args_t *const p_callback_memory)

Field Documentation

◆ open

fsp_err_t(* cec_api_t::open) (cec_ctrl_t *const p_ctrl, cec_cfg_t const *const p_cfg)

Open function for CEC device

Parameters

[in,out]	p_ctrl	Pointer to the CEC control block. Must be declared by user. Value set here.
[in]	p_cfg	Pointer to CEC configuration structure. All elements of this structure must be set by user.

◆ mediaInit

fsp_err_t(* cec_api_t::mediaInit) (cec_ctrl_t *const p_ctrl, cec_addr_t local_address)

Initializes the CEC device. May be called any time after the CEC module has been opened. This API blocks until the device initialization procedure is complete.

Parameters

[in]	p_ctrl	Pointer to CEC instance control block.
[out]	local_address	Desired Logical address for local device.

◆ write

fsp_err_t(* cec_api_t::write) (cec_ctrl_t *const p_ctrl, cec_message_t const *const p_message, uint32_t message_size)

Write function for CEC device

Parameters

[in]	p_ctrl	Pointer to CEC instance control block
[in]	p_message	Message data
[in]	message_size	Total size of entire message

◆ close

fsp_err_t(* cec_api_t::close) (cec_ctrl_t *const p_ctrl)

Close function for CEC device

Parameters

[in]	p_ctrl	Pointer to CEC instance control block
[out]	p_message	Message data

◆ statusGet

fsp_err_t(* cec_api_t::statusGet) (cec_ctrl_t *const p_ctrl, cec_status_t *const p_status)

Get CEC channel info.

Parameters

[in]	p_ctrl	Pointer to CEC instance control block
[out]	p_status	Memory address to return channel specific data to.

◆ callbackSet

fsp_err_t(* cec_api_t::callbackSet) (cec_ctrl_t *const p_ctrl, void(*p_callback)(cec_callback_args_t *), void const *const p_context, cec_callback_args_t *const p_callback_memory)

Specify callback function, optional context pointer and working memory pointer.

Parameters

[in]	p_ctrl	Control block set in cec_api_t::open call.
[in]	p_callback	Callback function to register
[in]	p_context	Pointer to send to callback function
[in]	p_callback_memory	Pointer to volatile memory where callback structure cec be allocated. Callback arguments allocated here are only valid during the callback.

◆ cec_instance_t

struct cec_instance_t

This structure encompasses everything that is needed to use an instance of this interface.

Data Fields

cec_ctrl_t *	p_ctrl	Pointer to the control structure for this instance.
cec_cfg_t const *	p_cfg	Pointer to the configuration structure for this instance.
cec_api_t const *	p_api	Pointer to the API structure for this instance.

Typedef Documentation

◆ cec_ctrl_t

typedef void cec_ctrl_t
CEC control block. Allocate an instance specific control block to pass into the CEC API calls.

Enumeration Type Documentation

◆ cec_addr_t

enum cec_addr_t	
CEC Addresses	
Enumerator	
CEC_ADDR_TV	CEC Address for TV.
CEC_ADDR_RECORDING_DEVICE_1	CEC Address for Recording Device 1.
CEC_ADDR_RECORDING_DEVICE_2	CEC Address for Recording Devide 2.
CEC_ADDR_TUNER_1	CEC Address for Tuner 1.
CEC_ADDR_PLAYBACK_DEVICE_1	CEC Address for Playback Device 1.
CEC_ADDR_AUDIO_SYSTEM	CEC Address for Audio System.
CEC_ADDR_TUNER_2	CEC Address for Tuner 2.
CEC_ADDR_TUNER_3	CEC Address for Tuner 3.
CEC_ADDR_PLAYBACK_DEVICE_2	CEC Address for Playback Device 2.
CEC_ADDR_RECORDING_DEVICE_3	CEC Address for Recording Device 3.
CEC_ADDR_TUNER_4	CEC Address for Tuner 4.
CEC_ADDR_PLAYBACK_DEVICE_3	CEC Address for Playback Device 3.
CEC_ADDR_SPECIFIC_USE	CEC Address for Specific Use.
CEC_ADDR_UNREGISTERED	CEC Address for Unregistered Devices.
CEC_ADDR_BROADCAST	CEC Broadcast message.

◆ cec_clock_source_t

enum cec_clock_source_t	
CEC Source Clock	
Enumerator	
CEC_CLOCK_SOURCE_PCLKB_DIV_32	PCLKB / 32 is the source of the CEC Clock.
CEC_CLOCK_SOURCE_PCLKB_DIV_64	PCLKB / 64 is the source of the CEC Clock.
CEC_CLOCK_SOURCE_PCLKB_DIV_128	PCLKB / 128 is the source of the CEC Clock.
CEC_CLOCK_SOURCE_PCLKB_DIV_256	PCLKB / 256 is the source of the CEC Clock.
CEC_CLOCK_SOURCE_PCLKB_DIV_512	PCLKB / 512 is the source of the CEC Clock.
CEC_CLOCK_SOURCE_PCLKB_DIV_1024	PCLKB / 1024 is the source of the CEC Clock.
CEC_CLOCK_SOURCE_CECCLK	CECCLK is the source of the CEC Clock.
CEC_CLOCK_SOURCE_CECCLK_DIV_256	CECCLK / 256 is the source of the CEC Clock.

◆ cec_state_t

enum cec_state_t	
CEC State	
Enumerator	
CEC_STATE_UNINIT	Module requires initialization.
CEC_STATE_READY	Module ready for operation.
CEC_STATE_TX_ACTIVE	Transmit in progress, either direct or broadcast.
CEC_STATE_RX_ACTIVE	Receive in progress, either direct or broadcast.
CEC_STATE_BUSY	CEC Signal Free Time has not yet elapsed.

◆ cec_error_t

enum cec_error_t	
CEC Error Code	
Enumerator	
CEC_ERROR_NONE	No errors currently active.
CEC_ERROR_OERR	Overrun error.
CEC_ERROR_UERR	Unterrun Error.
CEC_ERROR_ACKERR	ACK Error.
CEC_ERROR_TERR	Timing Error.
CEC_ERROR_TXERR	Transmission Error.
CEC_ERROR_AERR	Bus arbitration Loss.
CEC_ERROR_BLERR	Bus lock error.
CEC_ERROR_ADDR	Address allocation error.

◆ cec_event_t

enum cec_event_t	
CEC event codes	
Enumerator	
CEC_EVENT_RX_DATA	Receive Data byte event.
CEC_EVENT_RX_COMPLETE	Receive complete event.
CEC_EVENT_TX_COMPLETE	Transmit complete event.
CEC_EVENT_READY	CEC Address allocated and module is now ready.
CEC_EVENT_ERR	Error has occurred.

7.3.5.3 Communicatons Middleware Interface

Interfaces » Connectivity

Detailed Description

Interface for Communications Middleware functions.

Summary

The Communications interface provides multiple communications functionality.

Data Structures

struct	rm_comms_write_read_params_t
struct	rm_comms_callback_args_t
struct	rm_comms_cfg_t
struct	rm_comms_api_t
struct	rm_comms_instance_t

Typedefs

typedef void	rm_comms_ctrl_t

Enumerations

enum	rm_comms_event_t

Data Structure Documentation

◆ rm_comms_write_read_params_t

struct rm_comms_write_read_params_t
Struct to pack params for writeRead

◆ rm_comms_callback_args_t

struct rm_comms_callback_args_t
Communications middleware callback parameter definition

◆ rm_comms_cfg_t

struct rm_comms_cfg_t
Communications middleware configuration block
Data Fields

uint32_t	semaphore_timeout
	Timeout for read/write.
void const *	p_extend
	Pointer to extended configuration by instance of interface.
void const *	p_lower_level_cfg
	Pointer to lower level driver configuration structure.
void const *	p_context
	Pointer to the user-provided context.
void(*	p_callback)(rm_comms_callback_args_t *p_args)
	Pointer to callback function, mostly used if using non-blocking functionality.

◆ rm_comms_api_t

struct rm_comms_api_t	
COMM APIs	
Data Fields	
fsp_err_t(*	open)(rm_comms_ctrl_t *const p_ctrl, rm_comms_cfg_t const *const p_cfg)
fsp_err_t(*	close)(rm_comms_ctrl_t *const p_ctrl)
fsp_err_t(*	read)(rm_comms_ctrl_t *const p_ctrl, uint8_t *const p_dest, uint32_t const bytes)
fsp_err_t(*	write)(rm_comms_ctrl_t *const p_ctrl, uint8_t *const p_src, uint32_t const bytes)
fsp_err_t(*	writeRead)(rm_comms_ctrl_t *const p_ctrl,

	rm_comms_write_read_params_t write_read_params)
fsp_err_t(*	callbackSet)(rm_comms_ctrl_t *const p_ctrl, void(*p_callback)(rm_comms_callback_args_t *), void const *const p_context)

Field Documentation

◆ open

fsp_err_t(* rm_comms_api_t::open) (rm_comms_ctrl_t *const p_ctrl, rm_comms_cfg_t const *const p_cfg)

Open driver.

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	p_cfg	Pointer to configuration structure.

◆ close

fsp_err_t(* rm_comms_api_t::close) (rm_comms_ctrl_t *const p_ctrl)

Close driver.

Parameters

[in]	p_ctrl	Pointer to control structure.

◆ read

fsp_err_t(* rm_comms_api_t::read) (rm_comms_ctrl_t *const p_ctrl, uint8_t *const p_dest, uint32_t const bytes)

Read data.

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	p_dest	Pointer to the location to store read data.
[in]	bytes	Number of bytes to read.

◆ write

fsp_err_t(* rm_comms_api_t::write) (rm_comms_ctrl_t *const p_ctrl, uint8_t *const p_src, uint32_t const bytes)

Write data.

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	p_src	Pointer to the location to get write data from.
[in]	bytes	Number of bytes to write.

◆ writeRead

fsp_err_t(* rm_comms_api_t::writeRead) (rm_comms_ctrl_t *const p_ctrl, rm_comms_write_read_params_t write_read_params)

Write bytes over comms followed by a read, will have a struct for params.

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	write_read_params	Parameters structure.

◆ callbackSet

fsp_err_t(* rm_comms_api_t::callbackSet) (rm_comms_ctrl_t *const p_ctrl, void(*p_callback)(rm_comms_callback_args_t *), void const *const p_context)

Specify callback function and optional context pointer.

Parameters

[in]	p_ctrl	Pointer to the control block.
[in]	p_callback	Callback function
[in]	p_context	Pointer to send to callback function

◆ rm_comms_instance_t

struct rm_comms_instance_t

This structure encompasses everything that is needed to use an instance of this interface.

Typedef Documentation

◆ rm_comms_ctrl_t

typedef void rm_comms_ctrl_t
Communications control block. Allocate an instance specific control block to pass into the Communications API calls.

Enumeration Type Documentation

◆ rm_comms_event_t

enum rm_comms_event_t
Event in the callback function

7.3.5.4 I2C Master Interface

Interfaces » Connectivity

Detailed Description

Interface for I2C master communication.

Summary

The I2C master interface provides a common API for I2C HAL drivers. The I2C master interface supports:

- Interrupt driven transmit/receive processing
- Callback function support which can return an event code

Data Structures

struct	i2c_master_callback_args_t
struct	i2c_master_status_t
struct	i2c_master_cfg_t
struct	i2c_master_api_t
struct	i2c_master_instance_t

Typedefs

typedef void	i2c_master_ctrl_t

Enumerations

enum	i2c_master_rate_t
enum	i2c_master_addr_mode_t
enum	i2c_master_event_t

Data Structure Documentation

◆ i2c_master_callback_args_t

struct i2c_master_callback_args_t		
I2C callback parameter definition		
Data Fields		
void const *	p_context	Pointer to user-provided context.
i2c_master_event_t	event	Event code.

◆ i2c_master_status_t

struct i2c_master_status_t		
I2C status indicators		
Data Fields		
bool	open	True if driver is open.

◆ i2c_master_cfg_t

struct i2c_master_cfg_t	
I2C configuration block	
Data Fields	
uint8_t	channel
	Identifier recognizable by implementation. More...
i2c_master_rate_t	rate
	Device's maximum clock rate from enum i2c_rate_t.
uint32_t	slave
	The address of the slave device.
i2c_master_addr_mode_t	addr_mode

	Indicates how slave fields should be interpreted.
uint8_t	ipl
	Interrupt priority level. Same for RXI, TXI, TEI and ERI.
IRQn_Type	rxi_irq
	Receive IRQ number.
IRQn_Type	txi_irq
	Transmit IRQ number.
IRQn_Type	tei_irq
	Transmit end IRQ number.
IRQn_Type	eri_irq
	Error IRQ number.
transfer_instance_t const *	p_transfer_tx
	Transfer instance for I2C transmit. Set to NULL if unused. More...
transfer_instance_t const *	p_transfer_rx
	Transfer instance for I2C receive. Set to NULL if unused.
void(*	p_callback)(i2c_master_callback_args_t *p_args)
	Pointer to callback function. More...
void const *	p_context
	Pointer to the user-provided context.

void const *	p_extend
	Any configuration data needed by the hardware. More...

Field Documentation

◆ channel

uint8_t i2c_master_cfg_t::channel

Identifier recognizable by implementation.

Generic configuration

◆ p_transfer_tx

transfer_instance_t const* i2c_master_cfg_t::p_transfer_tx

Transfer instance for I2C transmit. Set to NULL if unused.

Transfer API support

◆ p_callback

void(* i2c_master_cfg_t::p_callback) (i2c_master_callback_args_t *p_args)

Pointer to callback function.

Parameters to control software behavior

◆ p_extend

void const* i2c_master_cfg_t::p_extend

Any configuration data needed by the hardware.

Implementation-specific configuration

◆ i2c_master_api_t

struct i2c_master_api_t

Interface definition for I2C access as master

Data Fields

fsp_err_t(*	open)(i2c_master_ctrl_t *const p_ctrl, i2c_master_cfg_t const *const p_cfg)
fsp_err_t(*	read)(i2c_master_ctrl_t *const p_ctrl, uint8_t *const p_dest, uint32_t const bytes, bool const restart)
fsp_err_t(*	write)(i2c_master_ctrl_t *const p_ctrl, uint8_t *const p_src, uint32_t

	const bytes, bool const restart)
fsp_err_t(*	abort)(i2c_master_ctrl_t *const p_ctrl)
fsp_err_t(*	slaveAddressSet)(i2c_master_ctrl_t *const p_ctrl, uint32_t const slave, i2c_master_addr_mode_t const addr_mode)
fsp_err_t(*	callbackSet)(i2c_master_ctrl_t *const p_ctrl, void(*p_callback)(i2c_master_callback_args_t *), void const *const p_context, i2c_master_callback_args_t *const p_callback_memory)
fsp_err_t(*	statusGet)(i2c_master_ctrl_t *const p_ctrl, i2c_master_status_t *p_status)
fsp_err_t(*	close)(i2c_master_ctrl_t *const p_ctrl)

Field Documentation

◆ open

fsp_err_t(* i2c_master_api_t::open) (i2c_master_ctrl_t *const p_ctrl, i2c_master_cfg_t const *const p_cfg)

Opens the I2C Master driver and initializes the hardware.

Parameters

[in]	p_ctrl	Pointer to control block. Must be declared by user. Elements are set here.
[in]	p_cfg	Pointer to configuration structure.

◆ read

fsp_err_t(* i2c_master_api_t::read) (i2c_master_ctrl_t *const p_ctrl, uint8_t *const p_dest, uint32_t const bytes, bool const restart)

Performs a read operation on an I2C Master device.

Parameters

[in]	p_ctrl	Pointer to control block set in i2c_master_api_t::open call.
[in]	p_dest	Pointer to the location to store read data.
[in]	bytes	Number of bytes to read.
[in]	restart	Specify if the restart condition should be issued after reading.

◆ write

fsp_err_t(* i2c_master_api_t::write) (i2c_master_ctrl_t *const p_ctrl, uint8_t *const p_src, uint32_t const bytes, bool const restart)

Performs a write operation on an I2C Master device.

Parameters

[in]	p_ctrl	Pointer to control block set in i2c_master_api_t::open call.
[in]	p_src	Pointer to the location to get write data from.
[in]	bytes	Number of bytes to write.
[in]	restart	Specify if the restart condition should be issued after writing.

◆ abort

fsp_err_t(* i2c_master_api_t::abort) (i2c_master_ctrl_t *const p_ctrl)

Performs a reset of the peripheral.

Parameters

[in]	p_ctrl	Pointer to control block set in i2c_master_api_t::open call.

◆ slaveAddressSet

fsp_err_t(* i2c_master_api_t::slaveAddressSet) (i2c_master_ctrl_t *const p_ctrl, uint32_t const slave, i2c_master_addr_mode_t const addr_mode)

Sets address of the slave device without reconfiguring the bus.

Parameters

[in]	p_ctrl	Pointer to control block set in i2c_master_api_t::open call.
[in]	slave_address	Address of the slave device.
[in]	address_mode	Addressing mode.

◆ callbackSet

fsp_err_t(* i2c_master_api_t::callbackSet) (i2c_master_ctrl_t *const p_ctrl, void(*p_callback)(i2c_master_callback_args_t *), void const *const p_context, i2c_master_callback_args_t *const p_callback_memory)

Specify callback function and optional context pointer and working memory pointer.

Parameters

[in]	p_ctrl	Pointer to the IIC Master control block.
[in]	p_callback	Callback function
[in]	p_context	Pointer to send to callback function
[in]	p_working_memory	Pointer to volatile memory where callback structure can be allocated. Callback arguments allocated here are only valid during the callback.

◆ statusGet

fsp_err_t(* i2c_master_api_t::statusGet) (i2c_master_ctrl_t *const p_ctrl, i2c_master_status_t *p_status)

Gets the status of the configured I2C device.

Parameters

[in]	p_ctrl	Pointer to the IIC Master control block.
[out]	p_status	Pointer to store current status.

◆ close

fsp_err_t(* i2c_master_api_t::close) (i2c_master_ctrl_t *const p_ctrl)

Closes the driver and releases the I2C Master device.

Parameters

[in]	p_ctrl	Pointer to control block set in i2c_master_api_t::open call.

◆ i2c_master_instance_t

struct i2c_master_instance_t		
This structure encompasses everything that is needed to use an instance of this interface.		
Data Fields		
i2c_master_ctrl_t *	p_ctrl	Pointer to the control structure for this instance.
i2c_master_cfg_t const *	p_cfg	Pointer to the configuration structure for this instance.
i2c_master_api_t const *	p_api	Pointer to the API structure for this instance.

Typedef Documentation

◆ i2c_master_ctrl_t

typedef void i2c_master_ctrl_t
I2C control block. Allocate an instance specific control block to pass into the I2C API calls.

Enumeration Type Documentation

◆ i2c_master_rate_t

enum i2c_master_rate_t	
Communication speed options	
Enumerator	
I2C_MASTER_RATE_STANDARD	100 kHz
I2C_MASTER_RATE_FAST	400 kHz
I2C_MASTER_RATE_FASTPLUS	1 MHz
I2C_MASTER_RATE_HIGHSPEED	3.4 MHz

◆ i2c_master_addr_mode_t

enum i2c_master_addr_mode_t	
Addressing mode options	
Enumerator	
I2C_MASTER_ADDR_MODE_7BIT	Use 7-bit addressing mode.
I2C_MASTER_ADDR_MODE_10BIT	Use 10-bit addressing mode.

◆ i2c_master_event_t

enum i2c_master_event_t	
Callback events	
Enumerator	
I2C_MASTER_EVENT_ABORTED	A transfer was aborted.
I2C_MASTER_EVENT_RX_COMPLETE	A receive operation was completed successfully.
I2C_MASTER_EVENT_TX_COMPLETE	A transmit operation was completed successfully.
I2C_MASTER_EVENT_START	I2C sent a start condition.
I2C_MASTER_EVENT_BYTE_ACK	I2C finished sending/receiving 1 data byte.

7.3.5.5 I2C Slave Interface

Interfaces » Connectivity

Detailed Description

Interface for I2C slave communication.

Summary

The I2C slave interface provides a common API for I2C HAL drivers. The I2C slave interface supports:

- Interrupt driven transmit/receive processing
- Callback function support which returns a event codes

Data Structures

struct	i2c_slave_callback_args_t
struct	i2c_slave_cfg_t
struct	i2c_slave_api_t
struct	i2c_slave_instance_t

Typedefs

typedef void	i2c_slave_ctrl_t

Enumerations

enum	i2c_slave_rate_t
enum	i2c_slave_addr_mode_t
enum	i2c_slave_event_t

Data Structure Documentation

◆ **i2c_slave_callback_args_t**

struct i2c_slave_callback_args_t		
I2C callback parameter definition		
Data Fields		
void const *	p_context	Pointer to user-provided context.
uint32_t	bytes	Number of received/transmitted bytes in buffer.

i2c_slave_event_t	event	Event code.

◆ i2c_slave_cfg_t

struct i2c_slave_cfg_t	
I2C configuration block	
Data Fields	
uint8_t	channel
	Identifier recognizable by implementation. More...
i2c_slave_rate_t	rate
	Device's maximum clock rate from enum i2c_rate_t.
uint16_t	slave
	The address of the slave device.
i2c_slave_addr_mode_t	addr_mode
	Indicates how slave fields should be interpreted.
bool	general_call_enable
	Allow a General call from master.
IRQn_Type	rxi_irq
	Receive IRQ number.
IRQn_Type	txi_irq
	Transmit IRQ number.
IRQn_Type	tei_irq
	Transmit end IRQ number.

IRQn_Type	eri_irq
	Error IRQ number.
uint8_t	ipl
	Interrupt priority level for receive, transmit, and transmit end interrupts.
uint8_t	eri_ipl
	Interrupt priority level for error interrupt.
bool	clock_stretching_enable
	Low Hold SCL during reception for the period between the 9th and the 1st clock cycle.
transfer_instance_t const *	p_transfer_tx
	DTC instance for I2C transmit.Set to NULL if unused. More...
transfer_instance_t const *	p_transfer_rx
	DTC instance for I2C receive. Set to NULL if unused.
void(*	p_callback)(i2c_slave_callback_args_t *p_args)
	Pointer to callback function. More...
void const *	p_context
	Pointer to the user-provided context.
void const *	p_extend
	Any configuration data needed by the hardware. More...

Field Documentation

◆ channel

uint8_t i2c_slave_cfg_t::channel

Identifier recognizable by implementation.

Generic configuration

◆ p_transfer_tx

transfer_instance_t const* i2c_slave_cfg_t::p_transfer_tx

DTC instance for I2C transmit.Set to NULL if unused.

DTC support

◆ p_callback

void(* i2c_slave_cfg_t::p_callback) (i2c_slave_callback_args_t *p_args)

Pointer to callback function.

Parameters to control software behavior

◆ p_extend

void const* i2c_slave_cfg_t::p_extend

Any configuration data needed by the hardware.

Implementation-specific configuration

◆ i2c_slave_api_t

struct i2c_slave_api_t

Interface definition for I2C access as slave

Data Fields

fsp_err_t(*	open)(i2c_slave_ctrl_t *const p_ctrl, i2c_slave_cfg_t const *const p_cfg)
fsp_err_t(*	read)(i2c_slave_ctrl_t *const p_ctrl, uint8_t *const p_dest, uint32_t const bytes)
fsp_err_t(*	write)(i2c_slave_ctrl_t *const p_ctrl, uint8_t *const p_src, uint32_t const bytes)
fsp_err_t(*	callbackSet)(i2c_slave_ctrl_t *const p_ctrl, void(*p_callback)(i2c_slave_callback_args_t *), void const *const

	p_context, i2c_slave_callback_args_t *const p_callback_memory)
fsp_err_t(*	close)(i2c_slave_ctrl_t *const p_ctrl)

Field Documentation

◆ open

fsp_err_t(* i2c_slave_api_t::open) (i2c_slave_ctrl_t *const p_ctrl, i2c_slave_cfg_t const *const p_cfg)

Opens the I2C Slave driver and initializes the hardware.

Parameters

[in]	p_ctrl	Pointer to control block. Must be declared by user. Elements are set here.
[in]	p_cfg	Pointer to configuration structure.

◆ read

fsp_err_t(* i2c_slave_api_t::read) (i2c_slave_ctrl_t *const p_ctrl, uint8_t *const p_dest, uint32_t const bytes)

Performs a read operation on an I2C Slave device.

Parameters

[in]	p_ctrl	Pointer to control block set in i2c_slave_api_t::open call.
[in]	p_dest	Pointer to the location to store read data.
[in]	bytes	Number of bytes to read.

◆ write

fsp_err_t(* i2c_slave_api_t::write) (i2c_slave_ctrl_t *const p_ctrl, uint8_t *const p_src, uint32_t const bytes)

Performs a write operation on an I2C Slave device.

Parameters

[in]	p_ctrl	Pointer to control block set in i2c_slave_api_t::open call.
[in]	p_src	Pointer to the location to get write data from.
[in]	bytes	Number of bytes to write.

◆ callbackSet

fsp_err_t(* i2c_slave_api_t::callbackSet) (i2c_slave_ctrl_t *const p_ctrl, void(*p_callback)(i2c_slave_callback_args_t *), void const *const p_context, i2c_slave_callback_args_t *const p_callback_memory)

Specify callback function and optional context pointer and working memory pointer.

Parameters

[in]	p_ctrl	Pointer to the IIC Slave control block.
[in]	p_callback	Callback function
[in]	p_context	Pointer to send to callback function
[in]	p_working_memory	Pointer to volatile memory where callback structure can be allocated. Callback arguments allocated here are only valid during the callback.

◆ close

fsp_err_t(* i2c_slave_api_t::close) (i2c_slave_ctrl_t *const p_ctrl)

Closes the driver and releases the I2C Slave device.

Parameters

[in]	p_ctrl	Pointer to control block set in i2c_slave_api_t::open call.

◆ i2c_slave_instance_t

struct i2c_slave_instance_t

This structure encompasses everything that is needed to use an instance of this interface.		
Data Fields		
i2c_slave_ctrl_t *	p_ctrl	Pointer to the control structure for this instance.
i2c_slave_cfg_t const *	p_cfg	Pointer to the configuration structure for this instance.
i2c_slave_api_t const *	p_api	Pointer to the API structure for this instance.

Typedef Documentation

◆ i2c_slave_ctrl_t

typedef void i2c_slave_ctrl_t
I2C control block. Allocate an instance specific control block to pass into the I2C API calls.

Enumeration Type Documentation

◆ i2c_slave_rate_t

enum i2c_slave_rate_t	
Communication speed options	
Enumerator	
I2C_SLAVE_RATE_STANDARD	100 kHz
I2C_SLAVE_RATE_FAST	400 kHz
I2C_SLAVE_RATE_FASTPLUS	1 MHz
I2C_SLAVE_RATE_HIGHSPEED	3.4 MHz

◆ i2c_slave_addr_mode_t

enum i2c_slave_addr_mode_t	
Addressing mode options	
Enumerator	
I2C_SLAVE_ADDR_MODE_7BIT	Use 7-bit addressing mode.
I2C_SLAVE_ADDR_MODE_10BIT	Use 10-bit addressing mode.

◆ i2c_slave_event_t

enum i2c_slave_event_t	
Callback events	
Enumerator	
I2C_SLAVE_EVENT_ABORTED	A transfer was aborted.
I2C_SLAVE_EVENT_RX_COMPLETE	A receive operation was completed successfully.
I2C_SLAVE_EVENT_TX_COMPLETE	A transmit operation was completed successfully.
I2C_SLAVE_EVENT_RX_REQUEST	A read operation expected from slave. Detected a write from master.
I2C_SLAVE_EVENT_TX_REQUEST	A write operation expected from slave. Detected a read from master.
I2C_SLAVE_EVENT_RX_MORE_REQUEST	A read operation expected from slave. Master sends out more data than configured to be read in slave.
I2C_SLAVE_EVENT_TX_MORE_REQUEST	A write operation expected from slave. Master requests more data than configured to be written by slave.
I2C_SLAVE_EVENT_GENERAL_CALL	General Call address received from Master. Detected a write from master.

7.3.5.6 I2S Interface

Interfaces » Connectivity

Detailed Description

Interface for I2S audio communication.

Summary

The I2S (Inter-IC Sound) interface provides APIs and definitions for I2S audio communication.

Data Structures

struct	i2s_callback_args_t
struct	i2s_status_t
struct	i2s_cfg_t
struct	i2s_api_t
struct	i2s_instance_t

Typedefs

typedef void	i2s_ctrl_t

Enumerations

enum	i2s_pcm_width_t
enum	i2s_word_length_t
enum	i2s_event_t
enum	i2s_mode_t
enum	i2s_mute_t
enum	i2s_ws_continue_t
enum	i2s_state_t

Data Structure Documentation

◆ i2s_callback_args_t

struct i2s_callback_args_t		
Callback function parameter data		
Data Fields		
void const *	p_context	Placeholder for user data. Set in i2s_api_t::open function in i2s_cfg_t.
i2s_event_t	event	The event can be used to identify what caused the callback (overflow or error).

◆ i2s_status_t

struct i2s_status_t
I2S status.

Data Fields		
i2s_state_t	state	Current I2S state.

◆ i2s_cfg_t

struct i2s_cfg_t	
User configuration structure, used in open function	
Data Fields	
uint32_t	channel
i2s_pcm_width_t	pcm_width
	Audio PCM data width.
i2s_word_length_t	word_length
	Audio word length, bits must be >= i2s_cfg_t::pcm_width bits.
i2s_ws_continue_t	ws_continue
	Whether to continue WS transmission during idle state.
i2s_mode_t	operating_mode
	Master or slave mode.
transfer_instance_t const *	p_transfer_tx
transfer_instance_t const *	p_transfer_rx
void(*	p_callback)(i2s_callback_args_t *p_args)
void const *	p_context
void const *	p_extend
	Extension parameter for hardware specific settings.

uint8_t	rxi_ipl
	Receive interrupt priority.
uint8_t	txi_ipl
	Transmit interrupt priority.
uint8_t	idle_err_ipl
	Idle/Error interrupt priority.
IRQn_Type	txi_irq
	Transmit IRQ number.
IRQn_Type	rxi_irq
	Receive IRQ number.
IRQn_Type	int_irq
	Idle/Error IRQ number.

Field Documentation

◆ channel

uint32_t i2s_cfg_t::channel

Select a channel corresponding to the channel number of the hardware.

◆ p_transfer_tx

transfer_instance_t const* i2s_cfg_t::p_transfer_tx

To use DMA for transmitting link a Transfer instance here. Set to NULL if unused.

◆ p_transfer_rx

transfer_instance_t const* i2s_cfg_t::p_transfer_rx

To use DMA for receiving link a Transfer instance here. Set to NULL if unused.

◆ p_callback

void(* i2s_cfg_t::p_callback) (i2s_callback_args_t *p_args)

Callback provided when an I2S ISR occurs. Set to NULL for no CPU interrupt.

◆ p_context

void const* i2s_cfg_t::p_context

Placeholder for user data. Passed to the user callback in i2s_callback_args_t.

◆ i2s_api_t

struct i2s_api_t

I2S functions implemented at the HAL layer will follow this API.

Data Fields

fsp_err_t(*	open)(i2s_ctrl_t *const p_ctrl, i2s_cfg_t const *const p_cfg)
fsp_err_t(*	stop)(i2s_ctrl_t *const p_ctrl)
fsp_err_t(*	mute)(i2s_ctrl_t *const p_ctrl, i2s_mute_t const mute_enable)
fsp_err_t(*	write)(i2s_ctrl_t *const p_ctrl, void const *const p_src, uint32_t const bytes)
fsp_err_t(*	read)(i2s_ctrl_t *const p_ctrl, void *const p_dest, uint32_t const bytes)
fsp_err_t(*	writeRead)(i2s_ctrl_t *const p_ctrl, void const *const p_src, void *const p_dest, uint32_t const bytes)
fsp_err_t(*	statusGet)(i2s_ctrl_t *const p_ctrl, i2s_status_t *const p_status)
fsp_err_t(*	close)(i2s_ctrl_t *const p_ctrl)
fsp_err_t(*	callbackSet)(i2s_ctrl_t *const p_ctrl, void(*p_callback)(i2s_callback_args_t *), void const *const p_context,

	i2s_callback_args_t *const p_callback_memory)

Field Documentation

◆ open

fsp_err_t(* i2s_api_t::open) (i2s_ctrl_t *const p_ctrl, i2s_cfg_t const *const p_cfg)

Initial configuration.

Precondition

Peripheral clocks and any required output pins should be configured prior to calling this function.

Note

To reconfigure after calling this function, call i2s_api_t::close first.

Parameters

[in]	p_ctrl	Pointer to control block. Must be declared by user. Elements set here.
[in]	p_cfg	Pointer to configuration structure. All elements of this structure must be set by user.

◆ stop

fsp_err_t(* i2s_api_t::stop) (i2s_ctrl_t *const p_ctrl)

Stop communication. Communication is stopped when callback is called with I2S_EVENT_IDLE.

Parameters

[in]	p_ctrl	Control block set in i2s_api_t::open call for this instance.

◆ mute

fsp_err_t(* i2s_api_t::mute) (i2s_ctrl_t *const p_ctrl, i2s_mute_t const mute_enable)

Enable or disable mute.

Parameters

[in]	p_ctrl	Control block set in i2s_api_t::open call for this instance.
[in]	mute_enable	Whether to enable or disable mute.

◆ write

fsp_err_t(* i2s_api_t::write) (i2s_ctrl_t *const p_ctrl, void const *const p_src, uint32_t const bytes)

Write I2S data. All transmit data is queued when callback is called with I2S_EVENT_TX_EMPTY. Transmission is complete when callback is called with I2S_EVENT_IDLE.

Parameters

[in]	p_ctrl	Control block set in i2s_api_t::open call for this instance.
[in]	p_src	Buffer of PCM samples. Must be 4 byte aligned.
[in]	bytes	Number of bytes in the buffer. Recommended requesting a multiple of 8 bytes. If not a multiple of 8, padding 0s will be added to transmission to make it a multiple of 8.

◆ read

fsp_err_t(* i2s_api_t::read) (i2s_ctrl_t *const p_ctrl, void *const p_dest, uint32_t const bytes)

Read I2S data. Reception is complete when callback is called with I2S_EVENT_RX_EMPTY.

Parameters

[in]	p_ctrl	Control block set in i2s_api_t::open call for this instance.
[in]	p_dest	Buffer to store PCM samples. Must be 4 byte aligned.
[in]	bytes	Number of bytes in the buffer. Recommended requesting a multiple of 8 bytes. If not a multiple of 8, receive will stop at the multiple of 8 below requested bytes.

writeRead

fsp_err_t(* i2s_api_t::writeRead) (i2s_ctrl_t *const p_ctrl, void const *const p_src, void *const p_dest, uint32_t const bytes)

Simultaneously write and read I2S data. Transmission and reception are complete when callback is called with I2S_EVENT_IDLE.

Parameters

[in]	p_ctrl	Control block set in i2s_api_t::open call for this instance.
[in]	p_src	Buffer of PCM samples. Must be 4 byte aligned.
[in]	p_dest	Buffer to store PCM samples. Must be 4 byte aligned.
[in]	bytes	Number of bytes in the buffers. Recommended requesting a multiple of 8 bytes. If not a multiple of 8, padding 0s will be added to transmission to make it a multiple of 8, and receive will stop at the multiple of 8 below requested bytes.

statusGet

fsp_err_t(* i2s_api_t::statusGet) (i2s_ctrl_t *const p_ctrl, i2s_status_t *const p_status)

Get current status and store it in provided pointer p_status.

Parameters

[in]	p_ctrl	Control block set in i2s_api_t::open call for this instance.
[out]	p_status	Current status of the driver.

close

fsp_err_t(* i2s_api_t::close) (i2s_ctrl_t *const p_ctrl)

Allows driver to be reconfigured and may reduce power consumption.

Parameters

[in]	p_ctrl	Control block set in i2s_api_t::open call for this instance.

◆ callbackSet

fsp_err_t(* i2s_api_t::callbackSet) (i2s_ctrl_t *const p_ctrl, void(*p_callback)(i2s_callback_args_t *), void const *const p_context, i2s_callback_args_t *const p_callback_memory)

Specify callback function and optional context pointer and working memory pointer.

Parameters

[in]	p_ctrl	Pointer to the I2S control block.
[in]	p_callback	Callback function
[in]	p_context	Pointer to send to callback function
[in]	p_working_memory	Pointer to volatile memory where callback structure can be allocated. Callback arguments allocated here are only valid during the callback.

◆ i2s_instance_t

struct i2s_instance_t		
This structure encompasses everything that is needed to use an instance of this interface.		
Data Fields		
i2s_ctrl_t *	p_ctrl	Pointer to the control structure for this instance.
i2s_cfg_t const *	p_cfg	Pointer to the configuration structure for this instance.
i2s_api_t const *	p_api	Pointer to the API structure for this instance.

Typedef Documentation

◆ i2s_ctrl_t

typedef void i2s_ctrl_t
I2S control block. Allocate an instance specific control block to pass into the I2S API calls.

Enumeration Type Documentation

◆ i2s_pcm_width_t

enum i2s_pcm_width_t	
Audio PCM width	
Enumerator	
I2S_PCM_WIDTH_8_BITS	Using 8-bit PCM.
I2S_PCM_WIDTH_16_BITS	Using 16-bit PCM.
I2S_PCM_WIDTH_18_BITS	Using 18-bit PCM.
I2S_PCM_WIDTH_20_BITS	Using 20-bit PCM.
I2S_PCM_WIDTH_22_BITS	Using 22-bit PCM.
I2S_PCM_WIDTH_24_BITS	Using 24-bit PCM.
I2S_PCM_WIDTH_32_BITS	Using 32-bit PCM.

◆ i2s_word_length_t

enum i2s_word_length_t	
Audio system word length.	
Enumerator	
I2S_WORD_LENGTH_8_BITS	Using 8-bit system word length.
I2S_WORD_LENGTH_16_BITS	Using 16-bit system word length.
I2S_WORD_LENGTH_24_BITS	Using 24-bit system word length.
I2S_WORD_LENGTH_32_BITS	Using 32-bit system word length.
I2S_WORD_LENGTH_48_BITS	Using 48-bit system word length.
I2S_WORD_LENGTH_64_BITS	Using 64-bit system word length.
I2S_WORD_LENGTH_128_BITS	Using 128-bit system word length.
I2S_WORD_LENGTH_256_BITS	Using 256-bit system word length.

◆ i2s_event_t

enum i2s_event_t	
Events that can trigger a callback function	
Enumerator	
I2S_EVENT_IDLE	Communication is idle.
I2S_EVENT_TX_EMPTY	Transmit buffer is below FIFO trigger level.
I2S_EVENT_RX_FULL	Receive buffer is above FIFO trigger level.

◆ i2s_mode_t

enum i2s_mode_t	
I2S communication mode	
Enumerator	
I2S_MODE_SLAVE	Slave mode.
I2S_MODE_MASTER	Master mode.

◆ i2s_mute_t

enum i2s_mute_t	
Mute audio samples.	
Enumerator	
I2S_MUTE_OFF	Disable mute.
I2S_MUTE_ON	Enable mute.

◆ i2s_ws_continue_t

enum i2s_ws_continue_t	
Whether to continue WS (word select line) transmission during idle state.	
Enumerator	
I2S_WS_CONTINUE_ON	Enable WS continue mode.
I2S_WS_CONTINUE_OFF	Disable WS continue mode.

◆ i2s_state_t

enum i2s_state_t	
Possible status values returned by i2s_api_t::statusGet.	
Enumerator	
I2S_STATE_IN_USE	I2S is in use.
I2S_STATE_STOPPED	I2S is stopped.

7.3.5.7 I3C Interface

Interfaces » Connectivity

Detailed Description

Interface for I3C.

Summary

The I3C interface provides APIs and definitions for I3C communication.

Data Structures

struct	i3c_device_status_t
struct	i3c_slave_info_t
struct	i3c_device_table_cfg_t
struct	i3c_device_cfg_t
struct	i3c_command_descriptor_t
struct	i3c_callback_args_t
struct	i3c_cfg_t
struct	i3c_api_t
struct	i3c_instance_t

Typedefs

typedef void	i3c_ctrl_t

Enumerations

enum	i3c_common_command_code_t
enum	i3c_event_t
enum	i3c_device_type_t
enum	i3c_device_protocol_t
enum	i3c_address_assignment_mode_t
enum	i3c_ibi_type_t

Data Structure Documentation

◆ i3c_device_status_t

struct i3c_device_status_t		
The current status of the slave device (See GETSTATUS in the MIPI I3C Specification v1.0).		
Data Fields		
uint8_t	pending_interrupt	Contains the interrupt number of any pending interrupt, or 0 if no interrupts are pending.
uint8_t	vendor_status	Reserved for vendor-specific meaning.

◆ i3c_slave_info_t

struct i3c_slave_info_t		
Device characteristics that define the I3C capabilities of a slave.		
Data Fields		
uint8_t	pid[6]	Provisional ID.
union i3c_slave_info_t	__unnamed__	
uint8_t	dcr	Device Characteristics Register.

◆ i3c_device_table_cfg_t

struct i3c_device_table_cfg_t		
Structure for configuring an entry in the device table when the driver is in master mode (See i3c_api_t::masterDeviceTableSet).		
Data Fields		
uint8_t	static_address	I3C Static address / I2C address for this device.
uint8_t	dynamic_address	Dynamic address for the

		device. This address will be assigned during Dynamic Address Assignment.
i3c_device_protocol_t	device_protocol	The protocol used to communicate with this device (I3C / I2C Legacy).
bool	ibi_accept	Accept or reject IBI requests from this device.
bool	master_request_accept	Accept mastership requests from this device.
bool	ibi_payload	IBI requests from this device have a data payload. Note: When the device is configured using ENTDAA, the ibi_payload will automatically be updated based on the value of BCR.

◆ i3c_device_cfg_t

struct i3c_device_cfg_t		
Structure for configuring a slave address when the driver is in slave mode (See i3c_api_t::deviceCfgSet).		
Data Fields		
uint8_t	static_address	I3C Static address / I2C address for this device.
uint8_t	dynamic_address	Dynamic address for this device. Note that the dynamic address will automatically be updated when ENTDAA is completed.
i3c_slave_info_t	slave_info	PID, BCR, and DCR registers for the device (Slave mode only).

◆ i3c_command_descriptor_t

struct i3c_command_descriptor_t		
Descriptor for completing CCC/HDR transfers.		
Data Fields		
uint8_t	command_code	Common Command Code / HDR Command Code for the transfer.
uint8_t *	p_buffer	Buffer for reading or writing data.
uint32_t	length	Length of the data portion of the command.

bool	restart	If true, issue a repeated-start after the transfer is completed.
bool	rnw	Set to true if the command type is Direct Get.

◆ i3c_callback_args_t

struct i3c_callback_args_t		
Arguments that are passed to the user callback when an event occurs.		
Data Fields		
i3c_event_t	event	The type of event that has occurred.
uint32_t	event_status	Status flags associated with the event.
uint32_t	transfer_size	Number of bytes transferred.
i3c_slave_info_t const *	p_slave_info	A pointer to the Characteristics Registers read during ENTDAA.
uint8_t	dynamic_address	The dynamic address that was assigned to the slave during ENTDAA.
i3c_ibi_type_t	ibi_type	The type of IBI that has been received.
uint8_t	ibi_address	The address of the device that sent the IBI.
uint8_t	command_code	The command code of the received command.
void const *	p_context	User defined context.

◆ i3c_cfg_t

struct i3c_cfg_t	
User configuration structure, used in open function	
Data Fields	
uint32_t	channel
i3c_device_type_t	device_type
transfer_instance_t const *	p_transfer_tx
	Transfer instance for I3C transmit. Set to NULL if unused. More...

transfer_instance_t const *	p_transfer_rx
	Transfer instance for I3C receive. Set to NULL if unused.
void(*	p_callback)(i3c_callback_args_t const *const p_args)
void const *	p_context
	Pointer to the user-provided context.
void const *	p_extend

Field Documentation

◆ channel

uint32_t i3c_cfg_t::channel

Select a channel corresponding to the channel number of the hardware.

◆ device_type

i3c_device_type_t i3c_cfg_t::device_type

The type of device.

◆ p_transfer_tx

transfer_instance_t const* i3c_cfg_t::p_transfer_tx

Transfer instance for I3C transmit. Set to NULL if unused.

Transfer API support.

◆ p_callback

void(* i3c_cfg_t::p_callback) (i3c_callback_args_t const *const p_args)

Pointer to the user callback.

◆ p_extend

void const* i3c_cfg_t::p_extend

Pointer to extended configuration.

◆ i3c_api_t

struct i3c_api_t

I3C functions implemented at the HAL layer will follow this API.

Data Fields	
fsp_err_t(*	open)(i3c_ctrl_t *const p_ctrl, i3c_cfg_t const *const p_cfg)
fsp_err_t(*	enable)(i3c_ctrl_t *const p_ctrl)
fsp_err_t(*	deviceCfgSet)(i3c_ctrl_t *const p_ctrl, i3c_device_cfg_t const *const p_device_cfg)
fsp_err_t(*	masterDeviceTableSet)(i3c_ctrl_t *const p_ctrl, uint32_t device_index, i3c_device_table_cfg_t const *const p_device_table_cfg)
fsp_err_t(*	deviceSelect)(i3c_ctrl_t *const p_ctrl, uint32_t device_index, uint32_t bitrate_mode)
fsp_err_t(*	dynamicAddressAssignmentStart)(i3c_ctrl_t *const p_ctrl, i3c_address_assignment_mode_t address_assignment_mode, uint32_t starting_device_index, uint32_t device_count)
fsp_err_t(*	slaveStatusSet)(i3c_ctrl_t *const p_ctrl, i3c_device_status_t device_status)
fsp_err_t(*	commandSend)(i3c_ctrl_t *const p_ctrl, i3c_command_descriptor_t const *const p_command_descriptor)
fsp_err_t(*	write)(i3c_ctrl_t *const p_ctrl, uint8_t const *const p_data, uint32_t length, bool restart)
fsp_err_t(*	read)(i3c_ctrl_t *const p_ctrl, uint8_t *const p_data, uint32_t length, bool restart)
fsp_err_t(*	ibiWrite)(i3c_ctrl_t *const p_ctrl, i3c_ibi_type_t ibi_type, uint8_t const *const p_data, uint32_t length)
fsp_err_t(*	ibiRead)(i3c_ctrl_t *const p_ctrl, uint8_t *const p_data, uint32_t length)
fsp_err_t(*	close)(i3c_ctrl_t *const p_ctrl)

Field Documentation

◆ open

fsp_err_t(* i3c_api_t::open) (i3c_ctrl_t *const p_ctrl, i3c_cfg_t const *const p_cfg)

Initial configuration.

Parameters

[in]	p_ctrl	Pointer to control block. Must be declared by user. Elements set here.
[in]	p_cfg	Pointer to configuration structure. All elements of this structure must be set by user.

◆ enable

fsp_err_t(* i3c_api_t::enable) (i3c_ctrl_t *const p_ctrl)

Enable the I3C device.

Parameters

[in]	p_ctrl	Control block set in i3c_api_t::open call for this instance.

◆ deviceCfgSet

fsp_err_t(* i3c_api_t::deviceCfgSet) (i3c_ctrl_t *const p_ctrl, i3c_device_cfg_t const *const p_device_cfg)

Set the configuration of this device.

Parameters

[in]	p_ctrl	Control block set in i3c_api_t::open call for this instance.
[in]	p_device_cfg	Pointer to device configuration.

◆ masterDeviceTableSet

fsp_err_t(* i3c_api_t::masterDeviceTableSet) (i3c_ctrl_t *const p_ctrl, uint32_t device_index, i3c_device_table_cfg_t const *const p_device_table_cfg)

Set the configuration for the device at the given index in the device table. The configuration will be used by transfers when it is selected by deviceSelect.

Note: This function is not used in slave mode.

Parameters

[in]	p_ctrl	Control block set in i3c_api_t::open call for this instance.
[in]	device_index	Index into the device table.
[in]	p_device_table_cfg	Pointer to the table settings for the entry in the master device table.

◆ deviceSelect

fsp_err_t(* i3c_api_t::deviceSelect) (i3c_ctrl_t *const p_ctrl, uint32_t device_index, uint32_t bitrate_mode)

In master mode, select the device for the next transfer.

Note: This function is not used in slave mode.

Parameters

[in]	p_ctrl	Control block set in i3c_api_t::open call for this instance.
[in]	device_index	Index into the device table.
[in]	bitrate_setting	The bitrate settings for the selected device.

◆ dynamicAddressAssignmentStart

fsp_err_t(* i3c_api_t::dynamicAddressAssignmentStart) (i3c_ctrl_t *const p_ctrl, i3c_address_assignment_mode_t address_assignment_mode, uint32_t starting_device_index, uint32_t device_count)

Start Dynamic Address Assignment by sending either the ENTDAA or SETDASA command See i3c_address_assignment_mode_t for more information.

Note: This function is not used in slave mode.

Parameters

[in]	p_ctrl	Control block set in i3c_api_t::open call for this instance.
[in]	address_assignment_mode	The command to use for Dynamic Address Assignment.
[in]	starting_device_index	The device index that will be used to assign the first device during Dynamic Address Assignment.
[in]	device_count	The number of devices to assign (Only used with I3C_ADDRESS_ASSIGNMENT_MODE_ENTDAA).

◆ slaveStatusSet

fsp_err_t(* i3c_api_t::slaveStatusSet) (i3c_ctrl_t *const p_ctrl, i3c_device_status_t device_status)

Set the status returned to the master in response to a GETSTATUS command.

Note: This function is not used in master mode.

Parameters

[in]	p_ctrl	Control block set in i3c_api_t::open call for this instance.
[in]	device_status	New status settings for responding to the GETSTATUS command code.

◆ commandSend

fsp_err_t(* i3c_api_t::commandSend) (i3c_ctrl_t *const p_ctrl, i3c_command_descriptor_t const *const p_command_descriptor)

Send a read/write/broadcast CCC or HDR command.

Note: This function is not used in slave mode.

Parameters

[in]	p_ctrl	Control block set in i3c_api_t::open call for this instance.
[in]	p_command_descriptor	A descriptor for executing the command.

◆ write

fsp_err_t(* i3c_api_t::write) (i3c_ctrl_t *const p_ctrl, uint8_t const *const p_data, uint32_t length, bool restart)

In master mode: Start a write transfer. When the transfer is completed send a stop condition or a repeated-start. In slave mode: Set the write buffer and configure the number of bytes that will be transferred before the the transfer is ended by the slave via the 'T' bit or by the master issueing a stop condition.

Parameters

[in]	p_ctrl	Control block set in i3c_api_t::open call for this instance.
[in]	p_data	Pointer to a buffer to write.
[in]	length	Number of bytes to transfer.
[in]	restart	If true, issue a repeated-start after the transfer is completed (Master only).

◆ read

fsp_err_t(* i3c_api_t::read) (i3c_ctrl_t *const p_ctrl, uint8_t *const p_data, uint32_t length, bool restart)

In master mode: Start a read transfer. When the transfer is completed, send a stop condition or a repeated-start. In slave mode: Set the read buffer for storing data read during the transfer. When the buffer is full, the application will receive a callback requesting a new read buffer. If no buffer is provided by the application, the driver will discard any remaining bytes read during the transfer.

Parameters

[in]	p_ctrl	Control block set in i3c_api_t::open call for this instance.
[in]	p_data	Pointer to a buffer to store the bytes read during the transfer.
[in]	length	Number of bytes to transfer.
[in]	restart	If true, issue a repeated-start after the transfer is completed (Master only).

◆ ibiWrite

fsp_err_t(* i3c_api_t::ibiWrite) (i3c_ctrl_t *const p_ctrl, i3c_ibi_type_t ibi_type, uint8_t const *const p_data, uint32_t length)

Initiate an IBI write operation.

Note: This function is not used in master mode.

Parameters

[in]	p_ctrl	Control block set in i3c_api_t::open call for this instance.
[in]	ibi_type	The type of In-Band Interrupt.
[in]	p_data	Pointer to a buffer to start the bytes read during the transfer.
[in]	length	Number of bytes to transfer.

◆ ibiRead

fsp_err_t(* i3c_api_t::ibiRead) (i3c_ctrl_t *const p_ctrl, uint8_t *const p_data, uint32_t length)

Set the read buffer for storing received IBI data (This function is not used in slave mode).

Parameters

[in]	p_ctrl	Control block set in i3c_api_t::open call for this instance.
[in]	p_data	Pointer to a buffer to store the bytes read during the transfer.
[in]	length	Number of bytes to transfer.

◆ close

fsp_err_t(* i3c_api_t::close) (i3c_ctrl_t *const p_ctrl)

Allows driver to be reconfigured and may reduce power consumption.

Parameters

[in]	p_ctrl	Control block set in i3c_api_t::open call for this instance.

◆ i3c_instance_t

struct i3c_instance_t		
This structure encompasses everything that is needed to use an instance of this interface.		
Data Fields		
i3c_ctrl_t *	p_ctrl	Pointer to the control structure for this instance.
i3c_cfg_t const *	p_cfg	Pointer to the configuration structure for this instance.
i3c_api_t const *	p_api	Pointer to the API structure for this instance.

Typedef Documentation

◆ i3c_ctrl_t

typedef void i3c_ctrl_t
I3C control block. Allocate an instance specific control block to pass into the I3C API calls.

Enumeration Type Documentation

◆ i3c_common_command_code_t

enum i3c_common_command_code_t	
Common Command Codes defined by MIPI I3C Specification v1.1.	
Enumerator	
I3C_CCC_BROADCAST_ENEC	Enable Slave initiated events.
I3C_CCC_BROADCAST_DISEC	Disable Slave initiated events.
I3C_CCC_BROADCAST_ENTAS0	Enter Activity State 0.
I3C_CCC_BROADCAST_ENTAS1	Enter Activity State 1.
I3C_CCC_BROADCAST_ENTAS2	Enter Activity State 2.
I3C_CCC_BROADCAST_ENTAS3	Enter Activity State 3.
I3C_CCC_BROADCAST_RSTDAA	Reset Dynamic Address Assignment.
I3C_CCC_BROADCAST_ENTDAA	Enter Dynamic Address Assignment.
I3C_CCC_BROADCAST_DEFSVLS	Define List of Slaves.
I3C_CCC_BROADCAST_SETMWL	Set Max Write Length.
I3C_CCC_BROADCAST_SETMRL	Set Max Read Length.
I3C_CCC_BROADCAST_ENTTM	Enter Test Mode.
I3C_CCC_BROADCAST_SETBUSCON	Set BUS Context.
I3C_CCC_BROADCAST_ENDXFER	Data Transfer Ending Procedure Control.
I3C_CCC_BROADCAST_ENTHDR0	Enter HDR Mode 0.
I3C_CCC_BROADCAST_ENTHDR1	Enter HDR Mode 1.
I3C_CCC_BROADCAST_ENTHDR2	Enter HDR Mode 2.
I3C_CCC_BROADCAST_ENTHDR3	Enter HDR Mode 3.
I3C_CCC_BROADCAST_ENTHDR4	Enter HDR Mode 4 (Reserved for future definition).
I3C_CCC_BROADCAST_ENTHDR5	Enter HDR Mode 5 (Reserved for future definition).

I3C_CCC_BROADCAST_ENTHDR6	Enter HDR Mode 6 (Reserved for future definition).
I3C_CCC_BROADCAST_ENTHDR7	Enter HDR Mode 7 (Reserved for future definition).
I3C_CCC_BROADCAST_SETXTIME	Set Exchange Timing Info.
I3C_CCC_BROADCAST_SETAASA	Set All Addresses to Static Address.
I3C_CCC_BROADCAST_RSTACT	Slave Reset Action.
I3C_CCC_BROADCAST_DEFGRPA	Define List of Group Address.
I3C_CCC_BROADCAST_RSTGRPA	Reset Group Address.
I3C_CCC_BROADCAST_MLANE	Multi-Lane Data Transfer Control.
I3C_CCC_DIRECT_ENEC	Enable Slave initiated events.
I3C_CCC_DIRECT_DISEC	Disable Slave initiated events.
I3C_CCC_DIRECT_ENTAS0	Enter Activity State 0.
I3C_CCC_DIRECT_ENTAS1	Enter Activity State 1.
I3C_CCC_DIRECT_ENTAS2	Enter Activity State 2.
I3C_CCC_DIRECT_ENTAS3	Enter Activity State 3.
I3C_CCC_DIRECT_RSTDAA	Reset Dynamic Address Assignment (DEPRECATED v1.0).
I3C_CCC_DIRECT_SETDASA	Set Dynamic Address from Static Address.
I3C_CCC_DIRECT_SETNEWDA	Set New Dynamic Address.
I3C_CCC_DIRECT_SETMWL	Set Max Write Length.
I3C_CCC_DIRECT_SETMRL	Set Max Read Length.
I3C_CCC_DIRECT_GETMWL	Get Max Write Length.
I3C_CCC_DIRECT_GETMRL	Get Max Read Length.
I3C_CCC_DIRECT_GETPID	Get Provisional ID.
I3C_CCC_DIRECT_GETBCR	Get Bus Characteristic Register.

I3C_CCC_DIRECT_GETDCR	Get Device Characteristic Register.
I3C_CCC_DIRECT_GETSTATUS	Get Device Status.
I3C_CCC_DIRECT_GETACCMST	Get Accept Mastership.
I3C_CCC_DIRECT_ENDXFER	Data Transfer Ending Procedure Control.
I3C_CCC_DIRECT_SETBRGTGT	Set Bridge Targets.
I3C_CCC_DIRECT_GETMXDS	Get Max Data Speed.
I3C_CCC_DIRECT_GETHDRCAP	Get HDR Capability.
I3C_CCC_DIRECT_SETROUTE	Set Route.
I3C_CCC_DIRECT_D2DXFER	Device to Device(s) Tunneling Control.
I3C_CCC_DIRECT_SETXTIME	Set Exchange Timing Information.
I3C_CCC_DIRECT_GETXTIME	Get Exchange Timing Information.
I3C_CCC_DIRECT_RSTACT	Reset Slave Action.
I3C_CCC_DIRECT_SETGRPA	Set Group Address.
I3C_CCC_DIRECT_RSTGRPA	Reset Group Address.
I3C_CCC_DIRECT_MLANE	Multi-Lane Data Transfer Control.

◆ i3c_event_t

enum i3c_event_t	
I3C Events that result in a callback.	
Enumerator	
I3C_EVENT_ENTDAA_ADDRESS_PHASE	Events that only occur in Master mode. A Slave device has finished writing its PID, BCR, and DCR. This information is provided in i3c_callback_args_t::p_slave_info.
I3C_EVENT_IBI_READ_COMPLETE	An IBI has successfully been read.
I3C_EVENT_IBI_READ_BUFFER_FULL	There is no more space in the IBI read buffer. The application may provide another buffer by calling i3c_api_t::ibiRead.
I3C_EVENT_READ_BUFFER_FULL	Events that only occur in Slave mode. There is no more space in the read buffer. The application may provide another buffer by calling i3c_api_t::read.
I3C_EVENT_IBI_WRITE_COMPLETE	A IBI was written successfully.
I3C_EVENT_HDR_EXIT_PATTERN_DETECTED	The HDR exit pattern was detected on the bus.
I3C_EVENT_ADDRESS_ASSIGNMENT_COMPLETE	Dynamic Address Assignment has completed. Events that are common to Master and Slave mode.
I3C_EVENT_COMMAND_COMPLETE	A command was completed.
I3C_EVENT_WRITE_COMPLETE	A write transfer has completed.
I3C_EVENT_READ_COMPLETE	A read transfer has completed.
I3C_EVENT_TIMEOUT_DETECTED	SCL is stuck at the logic high or logic low level during a transfer.
I3C_EVENT_INTERNAL_ERROR	An internal error occurred.
I3C_EVENT_SDA_WRITE_COMPLETE	An SDA (Short Data Argument) write transfer has completed.

◆ i3c_device_type_t

enum i3c_device_type_t	
The type of device.	
Enumerator	
I3C_DEVICE_TYPE_MAIN_MASTER	The main master starts in master mode and is responsible for configuring the bus.
I3C_DEVICE_TYPE_SLAVE	A slave device listens to the bus for relevant I3C Commands (CCCs) sent by the current master, and responds accordingly. Slave devices may also initiate In-band interrupts and Hot-Join requests.

◆ i3c_device_protocol_t

enum i3c_device_protocol_t	
Identifies the protocol for transferring data with the device on the bus.	
Enumerator	
I3C_DEVICE_PROTOCOL_I2C	Transfers will use legacy I2C protocol with open-drain output at a reduced baudrate.
I3C_DEVICE_PROTOCOL_I3C	Transfers will use I3C SDR mode.

◆ i3c_address_assignment_mode_t

enum i3c_address_assignment_mode_t	
Address Assignment Mode.	
Enumerator	
I3C_ADDRESS_ASSIGNMENT_MODE_ENTDAA	Send the ENTDAA command to enter Dynamic Address Assignment mode and assign dynamic addresses in order, starting with the starting device index. The procedure is completed after the specified number of devices have been configured. The callback will be called after the PID, DCR, and BCR registers have been read for each device.

◆ i3c_ibi_type_t

enum i3c_ibi_type_t	
The type of In-Band Interrupt.	
Enumerator	
I3C_IBI_TYPE_INTERRUPT	Application specific In-Band Interrupt for notifying the master when an event occurs.
I3C_IBI_TYPE_HOT_JOIN	Request the master to perform the Dynamic Address Assignment process.
I3C_IBI_TYPE_MASTERSHIP_REQUEST	Request the master to give up control of the bus.

7.3.5.8 LIN Interface

Interfaces » Connectivity

Detailed Description

Interface for LIN communications.

Summary

The LIN interface provides common APIs for LIN HAL drivers. The LIN interface supports the following features:

- Half-duplex master or slave LIN communication
- Interrupt driven transmit/receive processing
- Callback function with returned event code and data
- Checksum generation and validation (standard or enhanced)
- Bus Sleep and Wakeup

Data Structures

struct	lin_transfer_params_t
struct	lin_callback_args_t
struct	lin_cfg_t
struct	lin_api_t
struct	lin_instance_t

Typedefs

typedef void	lin_ctrl_t

Enumerations

enum	lin_mode_t
enum	lin_checksum_type_t
enum	lin_event_t

Data Structure Documentation

◆ lin_transfer_params_t

struct lin_transfer_params_t		
LIN Transfer Parameters		
Data Fields		
uint8_t	id	The unprotected frame ID associated with the information frame transfer.
uint8_t *	p_information	Pointer to rx or tx buffer associated with the information frame transfer.
uint8_t	num_bytes	Length of buffer pointed to by p_information, in bytes.
lin_checksum_type_t	checksum_type	Checksum type to use for checksum generation (when writing frame) or validation (when reading frame). See lin_checksum_type_t.

◆ lin_callback_args_t

struct lin_callback_args_t		
LIN Callback Arguments		
Data Fields		
uint32_t	channel	Channel number.
lin_event_t	event	Event code.
uint8_t	bytes_received	Valid for the following events: • LIN_EVENT_RX_INFORMATION_FRAME_COMPLETE • LIN_EVENT_ERR_FRAMING • LIN_EVENT_ERR_INVALI

		D_CHECKSUM Contains the number of information bytes received for an information frame reception.
uint8_t	pid	For LIN slave: Contains the most recently received protected identifier For LIN master: Contains the most recently transmitted protected identifier.
uint8_t	checksum	Received checksum. Valid for the following events: • LIN_EVENT_RX_INFORMATION_FRAME_COMPLETE • LIN_EVENT_ERR_INVALID_CHECKSUM.
void const *	p_context	Context provided to user during callback.

◆ lin_cfg_t

struct lin_cfg_t	
LIN configuration block	
Data Fields	
uint8_t	channel
	Select a channel corresponding to the channel number of the hardware.
lin_mode_t	mode
	Driver mode (master or slave)
void(*	p_callback)(lin_callback_args_t *p_args)
	Pointer to callback function.
void const *	p_context
	User defined context passed into callback function.

void const *	p_extend
	LIN hardware dependent configuration.

◆ lin_api_t

struct lin_api_t	
Interface definition for LIN	
Data Fields	
fsp_err_t(*	open)(lin_ctrl_t *const p_ctrl, lin_cfg_t const *const p_cfg)
fsp_err_t(*	startFrameWrite)(lin_ctrl_t *const p_ctrl, uint8_t const id)
fsp_err_t(*	informationFrameWrite)(lin_ctrl_t *const p_ctrl, const lin_transfer_params_t *const p_transfer_params)
fsp_err_t(*	informationFrameRead)(lin_ctrl_t *const p_ctrl, lin_transfer_params_t *const p_transfer_params)
fsp_err_t(*	communicationAbort)(lin_ctrl_t *const p_ctrl)
fsp_err_t(*	callbackSet)(lin_ctrl_t *const p_ctrl, void(*p_callback)(lin_callback_args_t *), void const *const p_context, lin_callback_args_t *const p_callback_memory)
fsp_err_t(*	wakeupSend)(lin_ctrl_t *const p_ctrl)
fsp_err_t(*	sleepEnter)(lin_ctrl_t *const p_ctrl)
fsp_err_t(*	sleepExit)(lin_ctrl_t *const p_ctrl)
fsp_err_t(*	close)(lin_ctrl_t *const p_ctrl)

Field Documentation

◆ open

fsp_err_t(* lin_api_t::open) (lin_ctrl_t *const p_ctrl, lin_cfg_t const *const p_cfg)

Open LIN device. Transmission and reception of LIN frames is enabled upon successful return from this function.

Parameters

[in,out]	p_ctrl	Pointer to the LIN control block. Must be declared by user. Value set here.
[in]	p_cfg	Pointer to LIN configuration structure. All elements of this structure must be set by user.

◆ startFrameWrite

fsp_err_t(* lin_api_t::startFrameWrite) (lin_ctrl_t *const p_ctrl, uint8_t const id)

Begin non-blocking transmission of the LIN start frame. The start frame consists of the break pattern, sync word, and protected frame identifier (PID). The unprotected identifier should be supplied. The driver will compute the PID.

When the start frame has been transmitted, the callback is called with event LIN_EVENT_TX_START_FRAME_COMPLETE.

Parameters

[in,out]	p_ctrl	Pointer to the LIN control block.
[in]	id	Unprotected frame identifier

◆ informationFrameWrite

fsp_err_t(* lin_api_t::informationFrameWrite) (lin_ctrl_t *const p_ctrl, const lin_transfer_params_t *const p_transfer_params)

Begin non-blocking transmission of the LIN information frame.

The write buffer is used until the write is complete. When the write completes successfully (all bytes are fully transmitted on the wire) the callback is called with event LIN_EVENT_TX_INFORMATION_FRAME_COMPLETE.

Parameters

[in,out]	p_ctrl	Pointer to the LIN control block.
[in]	p_transfer_params	Pointer to parameters required for the write transaction.

◆ informationFrameRead

fsp_err_t(* lin_api_t::informationFrameRead) (lin_ctrl_t *const p_ctrl, lin_transfer_params_t *const p_transfer_params)

Begin non-blocking read of information frame bytes.

When a read completes successfully, the callback is called with event LIN_EVENT_RX_INFORMATION_FRAME_COMPLETE.

Parameters

[in]	p_ctrl	Pointer to the LIN control block for the channel.
[in]	p_transfer_params	Pointer to parameters required for the read transaction.

◆ communicationAbort

fsp_err_t(* lin_api_t::communicationAbort) (lin_ctrl_t *const p_ctrl)

Abort ongoing transfer.

Parameters

[in]	p_ctrl	Pointer to the LIN control block.

◆ callbackSet

fsp_err_t(* lin_api_t::callbackSet) (lin_ctrl_t *const p_ctrl, void(*p_callback)(lin_callback_args_t *), void const *const p_context, lin_callback_args_t *const p_callback_memory)

Specify callback function and optional context pointer and working memory pointer.

Parameters

[in]	p_ctrl	Pointer to the LIN control block.
[in]	p_callback	Callback function
[in]	p_context	Pointer to send to callback function
[in]	p_working_memory	Pointer to volatile memory where callback structure can be allocated. Callback arguments allocated here are only valid during the callback.

◆ wakeupSend

fsp_err_t(* lin_api_t::wakeupSend) (lin_ctrl_t *const p_ctrl)

Send wakeup signal for LIN device.

Parameters

[in]	p_ctrl	Pointer to the LIN control block.

◆ sleepEnter

fsp_err_t(* lin_api_t::sleepEnter) (lin_ctrl_t *const p_ctrl)

Place the LIN node in bus sleep mode.

Parameters

[in]	p_ctrl	Pointer to the LIN control block.

◆ sleepExit

fsp_err_t(* lin_api_t::sleepExit) (lin_ctrl_t *const p_ctrl)

Exit the bus sleep mode for LIN device.

Parameters

[in]	p_ctrl	Pointer to the LIN control block.

◆ close

fsp_err_t(* lin_api_t::close) (lin_ctrl_t *const p_ctrl)

Close LIN device.

Parameters

[in]	p_ctrl	Pointer to the LIN control block.

◆ lin_instance_t

struct lin_instance_t

This structure encompasses everything that is needed to use an instance of this interface.

Data Fields

lin_ctrl_t *	p_ctrl	Pointer to the control structure for this instance.

lin_cfg_t const *	p_cfg	Pointer to the configuration structure for this instance.
lin_api_t const *	p_api	Pointer to the API structure for this instance.

Typedef Documentation

◆ lin_ctrl_t

typedef void lin_ctrl_t
LIN control block. Allocate an instance specific control block to pass into the LIN API calls.

Enumeration Type Documentation

◆ lin_mode_t

enum lin_mode_t	
LIN driver mode	
Enumerator	
LIN_MODE_SLAVE	Slave mode.
LIN_MODE_MASTER	Master mode.

◆ lin_checksum_type_t

enum lin_checksum_type_t	
LIN checksum type	
Enumerator	
LIN_CHECKSUM_TYPE_CLASSIC	8 bit LIN classic checksum over information bytes only
LIN_CHECKSUM_TYPE_ENHANCED	8 bit LIN enhanced checksum over information bytes and PID
LIN_CHECKSUM_TYPE_NONE	Skip driver checksum generation/validation.

◆ lin_event_t

enum lin_event_t	
LIN Event codes	
Enumerator	
LIN_EVENT_NONE	No event present.
LIN_EVENT_RX_START_FRAME_COMPLETE	Start frame received event.
LIN_EVENT_RX_INFORMATION_FRAME_COMPLETE	Information frame received event.
LIN_EVENT_TX_START_FRAME_COMPLETE	Start frame transmission complete event.
LIN_EVENT_TX_INFORMATION_FRAME_COMPLETE	Information transmission complete event.
LIN_EVENT_ERR_INVALID_CHECKSUM	Information frame received successfully, but checksum was invalid.
LIN_EVENT_TX_WAKEUP_COMPLETE	Transmit wake up complete event.
LIN_EVENT_RX_WAKEUP_COMPLETE	Receive wake up complete event.
LIN_EVENT_ERR_BUS_COLLISION_DETECTED	Bus collision detection event.
LIN_EVENT_ERR_COUNTER_OVERFLOW	Counter overflow event.
LIN_EVENT_ERR_OVERRUN	Overrun error event.
LIN_EVENT_ERR_PARITY	Parity error event (start frame only, LIN information is sent without parity)
LIN_EVENT_ERR_FRAMING	Framing error event.

7.3.5.9 SMCI Interface

Interfaces » Connectivity

Detailed Description

Interface for SMCI communications.

Summary

The SMCI interface provides common APIs for SMCI HAL drivers. The SMCI interface supports the following features:

- Interrupt driven transmit/receive processing
- Callback function with returned event code
- Runtime baud-rate change (baud = 1/ETU)
- Hardware resource locking during a transaction

Data Structures

struct	smci_status_t
struct	smci_transfer_mode_t
struct	smci_speed_params_t
struct	smci_callback_args_t
struct	smci_cfg_t
struct	smci_api_t
struct	smci_instance_t

Typedefs

typedef void	smci_ctrl_t

Enumerations

enum	smci_state_t
enum	smci_event_t
enum	smci_convention_type_t
enum	smci_clock_conversion_integer_t
enum	smci_baudrate_adjustment_integer_t
enum	smci_protocol_type_t

Data Structure Documentation

◆ smci_status_t

struct smci_status_t		
SMCI driver specific information		
Data Fields		
smci_state_t	smci_state	State ot the smci state

		machine.
uint32_t	bytes_recvd	Bytes read into receive buffer since read was called.

◆ smci_transfer_mode_t

struct smci_transfer_mode_t		
SMCI Transfer Mode settings		
Data Fields		
smci_protocol_type_t	protocol	Protocol (Normal t=0, or Block t=1)
smci_convention_type_t	convention	Convention Direct or Inverse.
bool	gsm_mode	True=GMS Mode, false=Normal.

◆ smci_speed_params_t

struct smci_speed_params_t		
SMCI settings that are used as inputs to register setting calculations		
Data Fields		
uint32_t	baudrate	Bits per second requested, 1/ETU.
smci_baudrate_adjustment_integer_t	di	Referred to as D in ISO spec (from Table 8 in ISO7816-3 3rd Edition)
smci_clock_conversion_integer_t	fi	Index of in ISO spec (from Table 8 in ISO7816-3 3rd Edition)

◆ smci_callback_args_t

struct smci_callback_args_t		
SMCI Callback parameter definition		
Data Fields		
uint32_t	channel	Device channel number.
smci_event_t	event	Event code.
uint8_t	data	Data Byte to process. Contains the next character received for the events SMCI_EVENT_RX_CHAR, SMCI_EVENT_ERR_PARITY, SMCI_EVENT_ERR_LOW_SIGNAL, or SMCI_EVENT_ERR_OVERRUN. Otherwise unused.
void const *	p_context	Context provided to user during

		callback.

◆ smci_cfg_t

struct smci_cfg_t	
Configuration Structure for SMCI	
Data Fields	
uint8_t	channel
	Channel number of the hardware.
uint8_t	rxi_ipl
	Receive interrupt priority.
uint8_t	txi_ipl
	Transmit interrupt priority.
uint8_t	eri_ipl
	Error interrupt priority.
IRQn_Type	rxi_irq
	Receive interrupt IRQ number.
IRQn_Type	txi_irq
	Transmit interrupt IRQ number.
IRQn_Type	eri_irq
	Error interrupt IRQ number.
void(*	p_callback)(smci_callback_args_t *p_args)
	Pointer to callback function.

void const *	p_context
	User defined context passed into callback function.
void const *	p_extend
	SMCI hardware dependent configuration.

◆ smci_api_t

struct smci_api_t	
Shared Interface definition for SMCI	
Data Fields	
fsp_err_t(*	open)(smci_ctrl_t *const p_ctrl, smci_cfg_t const *const p_cfg)
fsp_err_t(*	read)(smci_ctrl_t *const p_ctrl, uint8_t *const p_dest, uint32_t const bytes)
fsp_err_t(*	write)(smci_ctrl_t *const p_ctrl, uint8_t const *const p_src, uint32_t const bytes)
fsp_err_t(*	transferModeSet)(smci_ctrl_t *const p_ctrl, smci_transfer_mode_t const *const p_transfer_mode_params)
fsp_err_t(*	baudSet)(smci_ctrl_t *const p_ctrl, void const *const p_baud_setting)
fsp_err_t(*	statusGet)(smci_ctrl_t *const p_ctrl, smci_status_t *const p_status)
fsp_err_t(*	clockControl)(smci_ctrl_t *const p_ctrl, bool clock_enable)
fsp_err_t(*	callbackSet)(smci_ctrl_t *const p_ctrl, void(*p_callback)(smci_callback_args_t *), void const *const p_context, smci_callback_args_t *const p_callback_memory)
fsp_err_t(*	close)(smci_ctrl_t *const p_ctrl)

Field Documentation

◆ open

fsp_err_t(* smci_api_t::open) (smci_ctrl_t *const p_ctrl, smci_cfg_t const *const p_cfg)

Open Smart Card Interface Mode (SMCI)

Parameters

[in,out]	p_ctrl	Pointer to the SMCI control block. Must be declared by user. Value set here.
[in]	smci_cfg_t	Pointer to SMCI configuration structure. All elements of this structure must be set by user.

◆ read

fsp_err_t(* smci_api_t::read) (smci_ctrl_t *const p_ctrl, uint8_t *const p_dest, uint32_t const bytes)

Read from Smart Card device. The read buffer is used until the read is complete. When a transfer is complete, the callback is called with event SMCI_EVENT_RX_COMPLETE. Bytes received outside an active transfer are received in the callback function with event SMCI_EVENT_RX_CHAR.

Parameters

[in]	p_ctrl	Pointer to the SMCI control block for the channel.
[in]	p_dest	Destination address to read data from.
[in]	bytes	Read data length.

◆ write

fsp_err_t(* smci_api_t::write) (smci_ctrl_t *const p_ctrl, uint8_t const *const p_src, uint32_t const bytes)

Write to Smart Card device. The write buffer is used until write is complete. Do not overwrite write buffer contents until the write is finished. When the write is complete (all bytes are fully transmitted on the wire), the callback called with event SMCI_EVENT_TX_COMPLETE.

Parameters

[in]	p_ctrl	Pointer to the SMCI control block.
[in]	p_src	Source address to write data to.
[in]	bytes	Write data length.

◆ transferModeSet

fsp_err_t(* smci_api_t::transferModeSet) (smci_ctrl_t *const p_ctrl, smci_transfer_mode_t const *const p_transfer_mode_params)

Change the peripheral settings based on provided transfer mode and data convention type

Parameters

[in]	p_ctrl	Pointer to the SMCI control block.
[in]	p_transfer_mode_params	Pointer to SMCI setting like protocol, convention, and gsm_mode

◆ baudSet

fsp_err_t(* smci_api_t::baudSet) (smci_ctrl_t *const p_ctrl, void const *const p_baud_setting)

Change baud rate.

Warning

Calling this API aborts any in-progress transmission and disables reception until the new baud settings have been applied.

Parameters

[in]	p_ctrl	Pointer to the SMCI control block.
[in]	p_baud_setting	Pointer to module specific setting for configuring baud rate.

◆ statusGet

fsp_err_t(* smci_api_t::statusGet) (smci_ctrl_t *const p_ctrl, smci_status_t *const p_status)

Get the driver specific information.

Parameters

[in]	p_ctrl	Pointer to the SMCI control block.
[out]	p_status	State info for the driver.

◆ clockControl

fsp_err_t(* smci_api_t::clockControl) (smci_ctrl_t *const p_ctrl, bool clock_enable)

Enable or disable the SMCI clock to control the start of the activation or de-activation

Parameters

[in]	p_ctrl	Pointer to the SMCI control block.
[in]	clock_enable	True: enables clock output, False disables it

◆ callbackSet

fsp_err_t(* smci_api_t::callbackSet) (smci_ctrl_t *const p_ctrl, void(*p_callback)(smci_callback_args_t *), void const *const p_context, smci_callback_args_t *const p_callback_memory)

Specify callback function and optional context pointer and callback memory pointer.

Parameters

[in]	p_ctrl	Pointer to the SMCI control block.
[in]	p_callback	Callback function
[in]	p_context	Pointer to send to callback function
[in]	p_callback_memory	Pointer to volatile memory where callback structure can be allocated. Callback arguments allocated here are only valid during the callback.

◆ close

fsp_err_t(* smci_api_t::close) (smci_ctrl_t *const p_ctrl)

Close SMCI device.

Parameters

[in]	p_ctrl	Pointer to the SMCI control block.

◆ smci_instance_t

struct smci_instance_t

This structure encompasses everything that is needed to use an instance of this interface.

Data Fields		
smci_ctrl_t *	p_ctrl	Pointer to the control structure for this instance.
smci_cfg_t const *	p_cfg	Pointer to the configuration structure for this instance.
smci_api_t const *	p_api	Pointer to the API structure for this instance.

Typedef Documentation

◆ smci_ctrl_t

typedef void smci_ctrl_t
Smart Card Interface control block. Allocate an instance specific control block to pass into the SMCI API calls.

Enumeration Type Documentation

◆ smci_state_t

enum smci_state_t	
Enumerator	
SMCI_STATE_IDLE_CLOCK_OFF	SMCI idle state with no clock output.
SMCI_STATE_TX_RX_IDLE	SMCI is in idle state, clock is active.
SMCI_STATE_TX_PROGRESSING	Transmission is in progress.
SMCI_STATE_RX_PROGRESSING	Reception is in progress.

◆ smci_event_t

enum smci_event_t	
SMCI Event codes	
Enumerator	
SMCI_EVENT_RX_COMPLETE	Receive complete event.
SMCI_EVENT_TX_COMPLETE	Transmit complete event.
SMCI_EVENT_RX_CHAR	Character transfer is completed.
SMCI_EVENT_ERR_PARITY	Parity error event.
SMCI_EVENT_ERR_LOW_SIGNAL	Low error signal response occurred event.
SMCI_EVENT_ERR_OVERRUN	Overrun error event.

◆ smci_convention_type_t

enum smci_convention_type_t	
Enumerator	
SMCI_CONVENTION_TYPE_DIRECT	Direct convention type (LSB First, High=1)
SMCI_CONVENTION_TYPE_INVERSE	Inverse convention type (MSB First, Low=1)

◆ smci_clock_conversion_integer_t

enum smci_clock_conversion_integer_t	
Enumerator	
SMCI_CLOCK_CONVERSION_INTEGER_372_4	372 base cycles for 1-bit period, max freq = 4Mhz
SMCI_CLOCK_CONVERSION_INTEGER_372_5	372 base cycles for 1-bit period, max freq = 5Mhz
SMCI_CLOCK_CONVERSION_INTEGER_558_6	558 base cycles for 1-bit period, max freq = 6Mhz
SMCI_CLOCK_CONVERSION_INTEGER_744_8	744 base cycles for 1-bit period, max freq = 8Mhz
SMCI_CLOCK_CONVERSION_INTEGER_1116_12	

	1116 base cycles for 1-bit period, max freq = 12Mhz
SMCI_CLOCK_CONVERSION_INTEGER_1488_16	1488 base cycles for 1-bit period, max freq = 16Mhz
SMCI_CLOCK_CONVERSION_INTEGER_1860_20	1860 base cycles for 1-bit period, max freq = 20Mhz
SMCI_CLOCK_CONVERSION_INTEGER_UNSUPPORTED7	Unsupported Clock Cycles.
SMCI_CLOCK_CONVERSION_INTEGER_UNSUPPORTED8	Unsupported Clock Cycles.
SMCI_CLOCK_CONVERSION_INTEGER_512_5	512 base cycles for 1-bit period, max freq = 5Mhz
SMCI_CLOCK_CONVERSION_INTEGER_768_75	768 base cycles for 1-bit period, max freq = 7.5Mhz
SMCI_CLOCK_CONVERSION_INTEGER_1024_10	1024 base cycles for 1-bit period, max freq = 10Mhz
SMCI_CLOCK_CONVERSION_INTEGER_1536_15	1536 base cycles for 1-bit period, max freq = 15Mhz
SMCI_CLOCK_CONVERSION_INTEGER_2048_20	2048 base cycles for 1-bit period, max freq = 20Mhz
SMCI_CLOCK_CONVERSION_INTEGER_UNSUPPORTED14	Unsupported Clock Cycles.
SMCI_CLOCK_CONVERSION_INTEGER_UNSUPPORTED15	Unsupported Clock Cycles.

◆ smci_baudrate_adjustment_integer_t

enum smci_baudrate_adjustment_integer_t	
Enumerator	
SMCI_BAUDRATE_ADJUSTMENT_INTEGER_RFU0	RESERVED.
SMCI_BAUDRATE_ADJUSTMENT_INTEGER_1	Di=1.
SMCI_BAUDRATE_ADJUSTMENT_INTEGER_2	Di=2.
SMCI_BAUDRATE_ADJUSTMENT_INTEGER_4	Di=4.
SMCI_BAUDRATE_ADJUSTMENT_INTEGER_8	Di=8.
SMCI_BAUDRATE_ADJUSTMENT_INTEGER_16	Di=16.
SMCI_BAUDRATE_ADJUSTMENT_INTEGER_32	Di=32.
SMCI_BAUDRATE_ADJUSTMENT_INTEGER_64	Di=64.
SMCI_BAUDRATE_ADJUSTMENT_INTEGER_12	Di=12.
SMCI_BAUDRATE_ADJUSTMENT_INTEGER_20	Di=20.
SMCI_BAUDRATE_ADJUSTMENT_INTEGER_RFU10	RESERVED.
SMCI_BAUDRATE_ADJUSTMENT_INTEGER_RFU11	RESERVED.
SMCI_BAUDRATE_ADJUSTMENT_INTEGER_RFU12	RESERVED.
SMCI_BAUDRATE_ADJUSTMENT_INTEGER_RFU13	RESERVED.
SMCI_BAUDRATE_ADJUSTMENT_INTEGER_RFU14	RESERVED.
SMCI_BAUDRATE_ADJUSTMENT_INTEGER_RFU15	RESERVED.

◆ smci_protocol_type_t

enum smci_protocol_type_t	
SMCI Protocol Type according to ISO7816-3	
Enumerator	
SMCI_PROTOCOL_TYPE_T0	Normal mode operation (Protocol T = 0)
SMCI_PROTOCOL_TYPE_T1	Block transfer mode operation (Protocol T = 1)

7.3.5.10 SPI Interface

Interfaces » Connectivity

Detailed Description

Interface for SPI communications.

Summary

Provides a common interface for communication using the SPI Protocol.

Data Structures

struct	spi_callback_args_t
struct	spi_write_read_guard_args_t
struct	spi_cfg_t
struct	spi_api_t
struct	spi_instance_t

Typedefs

typedef void	spi_ctrl_t

Enumerations

enum	spi_bit_width_t
enum	spi_mode_t
enum	spi_clk_phase_t

enum	spi_clk_polarity_t
enum	spi_mode_fault_t
enum	spi_bit_order_t
enum	spi_event_t

Data Structure Documentation

◆ spi_callback_args_t

struct spi_callback_args_t		
Common callback parameter definition		
Data Fields		
uint32_t	channel	Device channel number.
spi_event_t	event	Event code.
void const *	p_context	Context provided to user during callback.

◆ spi_write_read_guard_args_t

struct spi_write_read_guard_args_t
Non-secure arguments for write-read guard function

◆ spi_cfg_t

struct spi_cfg_t	
SPI interface configuration	
Data Fields	
uint8_t	channel
	Channel number to be used.
IRQn_Type	rxi_irq
	Receive Buffer Full IRQ number.
IRQn_Type	txi_irq
	Transmit Buffer Empty IRQ number.

IRQn_Type	tei_irq
	Transfer Complete IRQ number.
IRQn_Type	eri_irq
	Error IRQ number.
uint8_t	rxi_ipl
	Receive Interrupt priority.
uint8_t	txi_ipl
	Transmit Interrupt priority.
uint8_t	tei_ipl
	Transfer Complete Interrupt priority.
uint8_t	eri_ipl
	Error Interrupt priority.
spi_mode_t	operating_mode
	Select master or slave operating mode.
spi_clk_phase_t	clk_phase
	Data sampling on odd or even clock edge.
spi_clk_polarity_t	clk_polarity
	Clock level when idle.
spi_mode_fault_t	mode_fault

	Mode fault error (master/slave conflict) flag.
spi_bit_order_t	bit_order
	Select to transmit MSB/LSB first.
transfer_instance_t const *	p_transfer_tx
	To use SPI DTC/DMAC write transfer, link a transfer instance here. Set to NULL if unused.
transfer_instance_t const *	p_transfer_rx
	To use SPI DTC/DMAC read transfer, link a transfer instance here. Set to NULL if unused.
void(*	p_callback)(spi_callback_args_t *p_args)
	Pointer to user callback function.
void const *	p_context
	User defined context passed to callback function.
void const *	p_extend
	Extended SPI hardware dependent configuration.

◆ **spi_api_t**

struct spi_api_t	
Shared Interface definition for SPI	
Data Fields	
fsp_err_t(*	open)(spi_ctrl_t *p_ctrl, spi_cfg_t const *const p_cfg)
fsp_err_t(*	read)(spi_ctrl_t *const p_ctrl, void *p_dest, uint32_t const length, spi_bit_width_t const bit_width)

fsp_err_t(*	write)(spi_ctrl_t *const p_ctrl, void const *p_src, uint32_t const length, spi_bit_width_t const bit_width)
fsp_err_t(*	writeRead)(spi_ctrl_t *const p_ctrl, void const *p_src, void *p_dest, uint32_t const length, spi_bit_width_t const bit_width)
fsp_err_t(*	callbackSet)(spi_ctrl_t *const p_ctrl, void(*p_callback)(spi_callback_args_t *), void const *const p_context, spi_callback_args_t *const p_callback_memory)
fsp_err_t(*	close)(spi_ctrl_t *const p_ctrl)

Field Documentation

◆ open

fsp_err_t(* spi_api_t::open) (spi_ctrl_t *p_ctrl, spi_cfg_t const *const p_cfg)

Initialize a channel for SPI communication mode.

Parameters

[in,out]	p_ctrl	Pointer to user-provided storage for the control block.
[in]	p_cfg	Pointer to SPI configuration structure.

◆ read

fsp_err_t(* spi_api_t::read) (spi_ctrl_t *const p_ctrl, void *p_dest, uint32_t const length, spi_bit_width_t const bit_width)

Receive data from a SPI device.

Parameters

[in]	p_ctrl	Pointer to the control block for the channel.
[out]	p_dest	Pointer to destination buffer into which data will be copied that is received from a SPI device. It is the responsibility of the caller to ensure that adequate space is available to hold the requested data count.
[in]	length	Number of units of data to be transferred (unit size specified by the bit_width).
[in]	bit_width	Data bit width to be transferred.

◆ write

fsp_err_t(* spi_api_t::write) (spi_ctrl_t *const p_ctrl, void const *p_src, uint32_t const length, spi_bit_width_t const bit_width)

Transmit data to a SPI device.

Parameters

[in]	p_ctrl	Pointer to the control block for the channel.
[in]	p_src	Pointer to a source data buffer from which data will be transmitted to a SPI device. The argument must not be NULL.
[in]	length	Number of units of data to be transferred (unit size specified by the bit_width).
[in]	bit_width	Data bit width to be transferred.

◆ writeRead

fsp_err_t(* spi_api_t::writeRead) (spi_ctrl_t *const p_ctrl, void const *p_src, void *p_dest, uint32_t const length, spi_bit_width_t const bit_width)

Simultaneously transmit data to a SPI device while receiving data from a SPI device (full duplex).

Parameters

[in]	p_ctrl	Pointer to the control block for the channel.
[in]	p_src	Pointer to a source data buffer from which data will be transmitted to a SPI device. The argument must not be NULL.
[out]	p_dest	Pointer to destination buffer into which data will be copied that is received from a SPI device. It is the responsibility of the caller to ensure that adequate space is available to hold the requested data count. The argument must not be NULL.
[in]	length	Number of units of data to be transferred (unit size specified by the bit_width).
[in]	bit_width	Data bit width to be transferred.

◆ callbackSet

fsp_err_t(* spi_api_t::callbackSet) (spi_ctrl_t *const p_ctrl, void(*p_callback)(spi_callback_args_t *), void const *const p_context, spi_callback_args_t *const p_callback_memory)

Specify callback function and optional context pointer and working memory pointer.

Parameters

[in]	p_ctrl	Pointer to the SPI control block.
[in]	p_callback	Callback function
[in]	p_context	Pointer to send to callback function
[in]	p_working_memory	Pointer to volatile memory where callback structure can be allocated. Callback arguments allocated here are only valid during the callback.

◆ close

fsp_err_t(* spi_api_t::close) (spi_ctrl_t *const p_ctrl)

Remove power to the SPI channel designated by the handle and disable the associated interrupts.

Parameters

[in]	p_ctrl	Pointer to the control block for the channel.

◆ spi_instance_t

struct spi_instance_t		
This structure encompasses everything that is needed to use an instance of this interface.		
Data Fields		
spi_ctrl_t *	p_ctrl	Pointer to the control structure for this instance.
spi_cfg_t const *	p_cfg	Pointer to the configuration structure for this instance.
spi_api_t const *	p_api	Pointer to the API structure for this instance.

Typedef Documentation

◆ spi_ctrl_t

typedef void spi_ctrl_t
SPI control block. Allocate an instance specific control block to pass into the SPI API calls.

Enumeration Type Documentation

◆ spi_bit_width_t

enum spi_bit_width_t	
Data bit width	
Enumerator	
SPI_BIT_WIDTH_4_BITS	Data bit width is 4 bits.
SPI_BIT_WIDTH_5_BITS	Data bit width is 5 bits.
SPI_BIT_WIDTH_6_BITS	Data bit width is 6 bits.
SPI_BIT_WIDTH_7_BITS	Data bit width is 7 bits.
SPI_BIT_WIDTH_8_BITS	Data bit width is 8 bits.
SPI_BIT_WIDTH_9_BITS	Data bit width is 9 bits.
SPI_BIT_WIDTH_10_BITS	Data bit width is 10 bits.
SPI_BIT_WIDTH_11_BITS	Data bit width is 11 bits.
SPI_BIT_WIDTH_12_BITS	Data bit width is 12 bits.
SPI_BIT_WIDTH_13_BITS	Data bit width is 13 bits.
SPI_BIT_WIDTH_14_BITS	Data bit width is 14 bits.
SPI_BIT_WIDTH_15_BITS	Data bit width is 15 bits.
SPI_BIT_WIDTH_16_BITS	Data bit width is 16 bits.
SPI_BIT_WIDTH_17_BITS	Data bit width is 17 bits.
SPI_BIT_WIDTH_18_BITS	Data bit width is 18 bits.
SPI_BIT_WIDTH_19_BITS	Data bit width is 19 bits.
SPI_BIT_WIDTH_20_BITS	Data bit width is 20 bits.

SPI_BIT_WIDTH_21_BITS	Data bit width is 21 bits.
SPI_BIT_WIDTH_22_BITS	Data bit width is 22 bits.
SPI_BIT_WIDTH_23_BITS	Data bit width is 23 bits.
SPI_BIT_WIDTH_24_BITS	Data bit width is 24 bits.
SPI_BIT_WIDTH_25_BITS	Data bit width is 25 bits.
SPI_BIT_WIDTH_26_BITS	Data bit width is 26 bits.
SPI_BIT_WIDTH_27_BITS	Data bit width is 27 bits.
SPI_BIT_WIDTH_28_BITS	Data bit width is 28 bits.
SPI_BIT_WIDTH_29_BITS	Data bit width is 29 bits.
SPI_BIT_WIDTH_30_BITS	Data bit width is 30 bits.
SPI_BIT_WIDTH_31_BITS	Data bit width is 31 bits.
SPI_BIT_WIDTH_32_BITS	Data bit width is 32 bits.

◆ spi_mode_t

enum spi_mode_t	
Master or slave operating mode	
Enumerator	
SPI_MODE_MASTER	Channel operates as SPI master.
SPI_MODE_SLAVE	Channel operates as SPI slave.

◆ spi_clk_phase_t

enum spi_clk_phase_t	
Clock phase	
Enumerator	
SPI_CLK_PHASE_EDGE_ODD	0: Data sampling on odd edge, data variation on even edge
SPI_CLK_PHASE_EDGE_EVEN	1: Data variation on odd edge, data sampling on even edge

◆ spi_clk_polarity_t

enum spi_clk_polarity_t	
Clock polarity	
Enumerator	
SPI_CLK_POLARITY_LOW	0: Clock polarity is low when idle
SPI_CLK_POLARITY_HIGH	1: Clock polarity is high when idle

◆ spi_mode_fault_t

enum spi_mode_fault_t	
Mode fault error flag. This error occurs when the device is setup as a master, but the SSLA line does not seem to be controlled by the master. This usually happens when the connecting device is also acting as master. A similar situation can also happen when configured as a slave.	
Enumerator	
SPI_MODE_FAULT_ERROR_ENABLE	Mode fault error flag on.
SPI_MODE_FAULT_ERROR_DISABLE	Mode fault error flag off.

◆ spi_bit_order_t

enum spi_bit_order_t	
Bit order	
Enumerator	
SPI_BIT_ORDER_MSB_FIRST	Send MSB first in transmission.
SPI_BIT_ORDER_LSB_FIRST	Send LSB first in transmission.

◆ spi_event_t

enum spi_event_t	
SPI events	
Enumerator	
SPI_EVENT_TRANSFER_COMPLETE	The data transfer was completed.
SPI_EVENT_TRANSFER_ABORTED	The data transfer was aborted.
SPI_EVENT_ERR_MODE_FAULT	Mode fault error.
SPI_EVENT_ERR_READ_OVERFLOW	Read overflow error.
SPI_EVENT_ERR_PARITY	Parity error.
SPI_EVENT_ERR_OVERRUN	Overrun error.
SPI_EVENT_ERR_FRAMING	Framing error.
SPI_EVENT_ERR_MODE_UNDERRUN	Underrun error.

7.3.5.11 UART Interface

Interfaces » Connectivity

Detailed Description

Interface for UART communications.

Summary

The UART interface provides common APIs for UART HAL drivers. The UART interface supports the following features:

- Full-duplex UART communication
- Interrupt driven transmit/receive processing
- Callback function with returned event code
- Runtime baud-rate change
- Hardware resource locking during a transaction
- CTS/RTS hardware flow control support (with an associated IOPORT pin)

Data Structures

struct	uart_info_t
struct	uart_callback_args_t
struct	uart_cfg_t
struct	uart_api_t
struct	uart_instance_t

Typedefs

typedef void	uart_ctrl_t

Enumerations

enum	uart_event_t
enum	uart_data_bits_t
enum	uart_parity_t
enum	uart_stop_bits_t
enum	uart_dir_t

Data Structure Documentation

◆ uart_info_t

struct uart_info_t		
UART driver specific information		
Data Fields		
uint32_t	write_bytes_max	Maximum bytes that can be written at this time. Only applies if uart_cfg_t::p_transfer_tx is not NULL.

uint32_t	read_bytes_max	Maximum bytes that are available to read at one time. Only applies if uart_cfg_t::p_transfer_rx is not NULL.

◆ uart_callback_args_t

struct uart_callback_args_t		
UART Callback parameter definition		
Data Fields		
uint32_t	channel	Device channel number.
uart_event_t	event	Event code.
uint32_t	data	Contains the next character received for the events UART_EVENT_RX_CHAR, UART_EVENT_ERR_PARITY, UART_EVENT_ERR_FRAMING, or UART_EVENT_ERR_OVERFLOW. Otherwise unused.
void const *	p_context	Context provided to user during callback.

◆ uart_cfg_t

struct uart_cfg_t	
UART Configuration	
Data Fields	
uint8_t	channel
	Select a channel corresponding to the channel number of the hardware.
uart_data_bits_t	data_bits
	Data bit length (8 or 7 or 9)
uart_parity_t	parity
	Parity type (none or odd or even)
uart_stop_bits_t	stop_bits
	Stop bit length (1 or 2)

uint8_t	rxi_ipl
	Receive interrupt priority.
IRQn_Type	rxi_irq
	Receive interrupt IRQ number.
uint8_t	txi_ipl
	Transmit interrupt priority.
IRQn_Type	txi_irq
	Transmit interrupt IRQ number.
uint8_t	tei_ipl
	Transmit end interrupt priority.
IRQn_Type	tei_irq
	Transmit end interrupt IRQ number.
uint8_t	eri_ipl
	Error interrupt priority.
IRQn_Type	eri_irq
	Error interrupt IRQ number.
transfer_instance_t const *	p_transfer_rx
transfer_instance_t const *	p_transfer_tx

void(*	p_callback)(uart_callback_args_t *p_args)
	Pointer to callback function.
void const *	p_context
	User defined context passed into callback function.
void const *	p_extend
	UART hardware dependent configuration.

Field Documentation

◆ p_transfer_rx

transfer_instance_t const* uart_cfg_t::p_transfer_rx

Optional transfer instance used to receive multiple bytes without interrupts. Set to NULL if unused. If NULL, the number of bytes allowed in the read API is limited to one byte at a time.

◆ p_transfer_tx

transfer_instance_t const* uart_cfg_t::p_transfer_tx

Optional transfer instance used to send multiple bytes without interrupts. Set to NULL if unused. If NULL, the number of bytes allowed in the write APIs is limited to one byte at a time.

◆ uart_api_t

struct uart_api_t

Shared Interface definition for UART

Data Fields

fsp_err_t(*	open)(uart_ctrl_t *const p_ctrl, uart_cfg_t const *const p_cfg)
fsp_err_t(*	read)(uart_ctrl_t *const p_ctrl, uint8_t *const p_dest, uint32_t const bytes)
fsp_err_t(*	write)(uart_ctrl_t *const p_ctrl, uint8_t const *const p_src, uint32_t const bytes)
fsp_err_t(*	baudSet)(uart_ctrl_t *const p_ctrl, void const *const p_baudrate_info)

fsp_err_t(*	infoGet)(uart_ctrl_t *const p_ctrl, uart_info_t *const p_info)
fsp_err_t(*	communicationAbort)(uart_ctrl_t *const p_ctrl, uart_dir_t communication_to_abort)
fsp_err_t(*	callbackSet)(uart_ctrl_t *const p_ctrl, void(*p_callback)(uart_callback_args_t *), void const *const p_context, uart_callback_args_t *const p_callback_memory)
fsp_err_t(*	close)(uart_ctrl_t *const p_ctrl)
fsp_err_t(*	readStop)(uart_ctrl_t *const p_ctrl, uint32_t *remaining_bytes)

Field Documentation

◆ open

fsp_err_t(* uart_api_t::open) (uart_ctrl_t *const p_ctrl, uart_cfg_t const *const p_cfg)

Open UART device.

Parameters

[in,out]	p_ctrl	Pointer to the UART control block. Must be declared by user. Value set here.
[in]	uart_cfg_t	Pointer to UART configuration structure. All elements of this structure must be set by user.

◆ read

fsp_err_t(* uart_api_t::read) (uart_ctrl_t *const p_ctrl, uint8_t *const p_dest, uint32_t const bytes)

Read from UART device. The read buffer is used until the read is complete. When a transfer is complete, the callback is called with event UART_EVENT_RX_COMPLETE. Bytes received outside an active transfer are received in the callback function with event UART_EVENT_RX_CHAR. The maximum transfer size is reported by infoGet().

Parameters

[in]	p_ctrl	Pointer to the UART control block for the channel.
[in]	p_dest	Destination address to read data from.
[in]	bytes	Read data length.

◆ write

fsp_err_t(* uart_api_t::write) (uart_ctrl_t *const p_ctrl, uint8_t const *const p_src, uint32_t const bytes)

Write to UART device. The write buffer is used until write is complete. Do not overwrite write buffer contents until the write is finished. When the write is complete (all bytes are fully transmitted on the wire), the callback called with event UART_EVENT_TX_COMPLETE. The maximum transfer size is reported by infoGet().

Parameters

[in]	p_ctrl	Pointer to the UART control block.
[in]	p_src	Source address to write data to.
[in]	bytes	Write data length.

◆ baudSet

fsp_err_t(* uart_api_t::baudSet) (uart_ctrl_t *const p_ctrl, void const *const p_baudrate_info)

Change baud rate.

Warning

Calling this API aborts any in-progress transmission and disables reception until the new baud settings have been applied.

Parameters

[in]	p_ctrl	Pointer to the UART control block.
[in]	p_baudrate_info	Pointer to module specific information for configuring baud rate.

◆ infoGet

fsp_err_t(* uart_api_t::infoGet) (uart_ctrl_t *const p_ctrl, uart_info_t *const p_info)

Get the driver specific information.

Parameters

[in]	p_ctrl	Pointer to the UART control block.
[out]	p_info	Pointer to UART information structure.

◆ communicationAbort

fsp_err_t(* uart_api_t::communicationAbort) (uart_ctrl_t *const p_ctrl, uart_dir_t communication_to_abort)

Abort ongoing transfer.

Parameters

[in]	p_ctrl	Pointer to the UART control block.
[in]	communication_to_abort	Type of abort request.

◆ callbackSet

fsp_err_t(* uart_api_t::callbackSet) (uart_ctrl_t *const p_ctrl, void(*p_callback)(uart_callback_args_t *), void const *const p_context, uart_callback_args_t *const p_callback_memory)

Specify callback function and optional context pointer and working memory pointer.

Parameters

[in]	p_ctrl	Pointer to the UART control block.
[in]	p_callback	Callback function
[in]	p_context	Pointer to send to callback function
[in]	p_working_memory	Pointer to volatile memory where callback structure can be allocated. Callback arguments allocated here are only valid during the callback.

◆ close

fsp_err_t(* uart_api_t::close) (uart_ctrl_t *const p_ctrl)

Close UART device.

Parameters

[in]	p_ctrl	Pointer to the UART control block.

◆ readStop

fsp_err_t(* uart_api_t::readStop) (uart_ctrl_t *const p_ctrl, uint32_t *remaining_bytes)

Stop ongoing read and return the number of bytes remaining in the read.

Parameters

[in]	p_ctrl	Pointer to the UART control block.
[in,out]	remaining_bytes	Pointer to location to store remaining bytes for read.

◆ uart_instance_t

struct uart_instance_t

This structure encompasses everything that is needed to use an instance of this interface.

Data Fields

uart_ctrl_t *	p_ctrl	Pointer to the control structure for this instance.
uart_cfg_t const *	p_cfg	Pointer to the configuration structure for this instance.
uart_api_t const *	p_api	Pointer to the API structure for this instance.

Typedef Documentation

◆ uart_ctrl_t

typedef void uart_ctrl_t
UART control block. Allocate an instance specific control block to pass into the UART API calls.

Enumeration Type Documentation

◆ uart_event_t

enum uart_event_t	
UART Event codes	
Enumerator	
UART_EVENT_RX_COMPLETE	Receive complete event.
UART_EVENT_TX_COMPLETE	Transmit complete event.
UART_EVENT_RX_CHAR	Character received.
UART_EVENT_ERR_PARITY	Parity error event.
UART_EVENT_ERR_FRAMING	Mode fault error event.
UART_EVENT_ERR_OVERFLOW	FIFO Overflow error event.
UART_EVENT_BREAK_DETECT	Break detect error event.
UART_EVENT_TX_DATA_EMPTY	Last byte is transmitting, ready for more data.

◆ uart_data_bits_t

enum uart_data_bits_t	
UART Data bit length definition	
Enumerator	
UART_DATA_BITS_5	Data bits 5-bit.
UART_DATA_BITS_9	Data bits 9-bit.
UART_DATA_BITS_7	Data bits 7-bit.
UART_DATA_BITS_8	Data bits 8-bit.
UART_DATA_BITS_5	Data bits 5-bit.
UART_DATA_BITS_9	Data bits 9-bit.
UART_DATA_BITS_7	Data bits 7-bit.
UART_DATA_BITS_8	Data bits 8-bit.
UART_DATA_BITS_9	Data bits 9-bit.
UART_DATA_BITS_8	Data bits 8-bit.
UART_DATA_BITS_7	Data bits 7-bit.

◆ uart_parity_t

enum uart_parity_t	
UART Parity definition	
Enumerator	
UART_PARITY_OFF	No parity.
UART_PARITY_ZERO	Zero parity.
UART_PARITY_EVEN	Even parity.
UART_PARITY_ODD	Odd parity.

◆ uart_stop_bits_t

enum uart_stop_bits_t	
UART Stop bits definition	
Enumerator	
UART_STOP_BITS_1	Stop bit 1-bit.
UART_STOP_BITS_2	Stop bits 2-bit.

◆ uart_dir_t

enum uart_dir_t	
UART transaction definition	
Enumerator	
UART_DIR_RX_TX	Both RX and TX.
UART_DIR_RX	Only RX.
UART_DIR_TX	Only TX.

7.3.5.12 USB HCDC Interface

Interfaces » Connectivity

Detailed Description

Interface for USB HCDC functions.

Summary

The USB HCDC interface provides USB HCDC functionality.

Data Structures

struct	usb_hcdc_encapsulated_t
struct	usb_hcdc_abstractstate_t
struct	usb_hcdc_countrysetting_t

union	usb_hcdc_commfeature_t
struct	usb_hcdc_linecoding_t
struct	usb_hcdc_controllinestate_t
struct	usb_hcdc_serialstate_t
struct	usb_hcdc_breakduration_t
struct	usb_hcdc_device_info_t
struct	usb_hcdc_api_t
struct	usb_hcdc_instance_t

Enumerations

enum	usb_hcdc_data_bit_t
enum	usb_hcdc_stop_bit_t
enum	usb_hcdc_parity_bit_t
enum	usb_hcdc_line_speed_t
enum	usb_hcdc_feature_selector_t

Data Structure Documentation

◆ usb_hcdc_encapsulated_t

struct usb_hcdc_encapsulated_t		
Encapsulated data		
Data Fields		
uint8_t *	p_data	Protocol dependent data.
uint16_t	wlength	Data length in bytes.

◆ usb_hcdc_abstractstate_t

struct usb_hcdc_abstractstate_t		
Abstract Control Model (ACM) settings bitmap		
Data Fields		
uint16_t	bis: 1	Idle enable.
uint16_t	bdms: 1	Data multiplexing enable.
uint16_t	rsv: 14	Reserved.

◆ usb_hcdc_countrysetting_t

struct usb_hcdc_countrysetting_t		
Country code data		
Data Fields		
uint16_t	country_code	Country code.

◆ usb_hcdc_commfeature_t

union usb_hcdc_commfeature_t		
Feature setting data		
Data Fields		
usb_hcdc_abstractstate_t	abstract_state	ACM settings bitmap.
usb_hcdc_countrysetting_t	country_setting	Country code.

◆ usb_hcdc_linecoding_t

struct usb_hcdc_linecoding_t		
Virtual UART configuration (line coding)		
Data Fields		
usb_hcdc_line_speed_t	dwdte_rate	Data terminal rate in bits per second.
usb_hcdc_stop_bit_t	bchar_format	Stop bits.
usb_hcdc_parity_bit_t	bparity_type	Parity.
usb_hcdc_data_bit_t	bdata_bits	Data bits.
uint8_t	rsv	Reserved.

◆ usb_hcdc_controllinestate_t

struct usb_hcdc_controllinestate_t		
Virtual UART control signal bitmap		
Data Fields		
uint16_t	bdtr: 1	DTR.
uint16_t	brts: 1	RTS.
uint16_t	rsv: 14	Reserved.

◆ usb_hcdc_serialstate_t

struct usb_hcdc_serialstate_t		
Virtual UART state bitmap		
Data Fields		
uint16_t	brx_carrier: 1	DCD signal.

uint16_t	btx_carrier: 1	DSR signal.
uint16_t	bbreak: 1	Break detection status.
uint16_t	bring_signal: 1	Ring signal.
uint16_t	bframing: 1	Framing error.
uint16_t	bparity: 1	Parity error.
uint16_t	bover_run: 1	Over Run error.
uint16_t	rsv: 9	Reserved.

◆ usb_hcdc_breakduration_t

struct usb_hcdc_breakduration_t		
Break duration data		
Data Fields		
uint16_t	wtime_ms	Duration of Break.

◆ usb_hcdc_device_info_t

struct usb_hcdc_device_info_t		
Break duration data		
Data Fields		
uint16_t	vendor_id	Vendor ID.
uint16_t	product_id	Product ID.
uint8_t	subclass	Subclass code.

◆ usb_hcdc_api_t

struct usb_hcdc_api_t	
USB HCDC functions implemented at the HAL layer will follow this API.	
Data Fields	
fsp_err_t(*	controlDataRead)(usb_ctrl_t *const p_api_ctrl, uint8_t *p_buf, uint32_t size, uint8_t device_address)
fsp_err_t(*	deviceRegister)(usb_ctrl_t *const p_api_ctrl, uint16_t vendor_id, uint16_t product_id)
fsp_err_t(*	infoGet)(usb_ctrl_t *const p_api_ctrl, usb_hcdc_device_info_t *p_info, uint8_t device_address)

Field Documentation

◆ controlDataRead

fsp_err_t(* usb_hcdc_api_t::controlDataRead) (usb_ctrl_t *const p_api_ctrl, uint8_t *p_buf, uint32_t size, uint8_t device_address)

Read Control Data (CDC Interrupt IN data)

Parameters

[in]	p_api_ctrl	Pointer to control structure.
[in]	p_buf	Pointer to area that stores read data.
[in]	size	Read request size.
[in]	device_address	Device address.

◆ deviceRegister

fsp_err_t(* usb_hcdc_api_t::deviceRegister) (usb_ctrl_t *const p_api_ctrl, uint16_t vendor_id, uint16_t product_id)

Register the specified vendor class device in the device table.

Parameters

[in]	p_api_ctrl	Pointer to control structure.
[in]	vendor_id	Vendor ID.
[in]	product_id	Product ID.

◆ infoGet

fsp_err_t(* usb_hcdc_api_t::infoGet) (usb_ctrl_t *const p_api_ctrl, usb_hcdc_device_info_t *p_info, uint8_t device_address)

Get connected device information.

Parameters

[in]	p_api_ctrl	Pointer to control structure.
[in]	p_info	Pointer to store CDC device information.
[in]	device_address	Device address.

◆ usb_hcdc_instance_t

struct usb_hcdc_instance_t

This structure encompasses everything that is needed to use an instance of this interface.

Data Fields		
usb_ctrl_t *	p_ctrl	Pointer to the control structure

		for this instance.
usb_cfg_t const *	p_cfg	Pointer to the configuration structure for this instance.
usb_hcdc_api_t const *	p_api	Pointer to the API structure for this instance.

Enumeration Type Documentation

◆ usb_hcdc_data_bit_t

enum usb_hcdc_data_bit_t	
Virtual UART data length	
Enumerator	
USB_HCDC_DATA_BIT_7	7 bits
USB_HCDC_DATA_BIT_8	8 bits

◆ usb_hcdc_stop_bit_t

enum usb_hcdc_stop_bit_t	
Virtual UART stop bit length	
Enumerator	
USB_HCDC_STOP_BIT_1	1 bit
USB_HCDC_STOP_BIT_15	1.5 bits
USB_HCDC_STOP_BIT_2	2 bits

◆ usb_hcdc_parity_bit_t

enum usb_hcdc_parity_bit_t	
Virtual UART parity bit setting	
Enumerator	
USB_HCDC_PARITY_BIT_NONE	No parity bit.
USB_HCDC_PARITY_BIT_ODD	Odd parity.
USB_HCDC_PARITY_BIT_EVEN	Even parity.

◆ usb_hcdc_line_speed_t

enum usb_hcdc_line_speed_t
Virtual UART bitrate

◆ usb_hcdc_feature_selector_t

enum usb_hcdc_feature_selector_t
Feature Selector

7.3.5.13 USB HHID Interface

Interfaces » Connectivity

Detailed Description

Interface for USB HHID functions.

Summary

The USB HHID interface provides USB HHID functionality.

Data Structures

struct	usb_hhid_api_t
struct	usb_hhid_instance_t

Macros

#define	USB_HID_OTHER Other.
#define	USB_HID_KEYBOARD Keyboard.
#define	USB_HID_MOUSE Mouse.
#define	USB_HID_IN

	In Transfer.
#define	USB_HID_OUT Out Transfer.

Data Structure Documentation

◆ usb_hhid_api_t

struct usb_hhid_api_t	
USB HHID functions implemented at the HAL layer will follow this API.	
Data Fields	
fsp_err_t(*	typeGet)(usb_ctrl_t *const p_ctrl, uint8_t *p_type, uint8_t device_address)
fsp_err_t(*	maxPacketSizeGet)(usb_ctrl_t *const p_ctrl, uint16_t *p_size, uint8_t direction, uint8_t device_address)

Field Documentation

◆ typeGet

fsp_err_t(* usb_hhid_api_t::typeGet) (usb_ctrl_t *const p_ctrl, uint8_t *p_type, uint8_t device_address)

Get HID protocol.(USB Mouse/USB Keyboard/Other Type.)

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	p_type	Pointer to store HID protocol value.
[in]	device_address	Device Address.

◆ maxPacketSizeGet

fsp_err_t(* usb_hhid_api_t::maxPacketSizeGet) (usb_ctrl_t *const p_ctrl, uint16_t *p_size, uint8_t direction, uint8_t device_address)

Obtains max packet size for the connected HID device. The max packet size is set to the area. Set the direction (USB_HID_IN/USB_HID_OUT).

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	p_size	Pointer to the area to store the max package size.
[in]	direction	Transfer direction.
[in]	device_address	Device Address.

◆ usb_hhid_instance_t

struct usb_hhid_instance_t		
This structure encompasses everything that is needed to use an instance of this interface.		
Data Fields		
usb_ctrl_t *	p_ctrl	Pointer to the control structure for this instance.
usb_cfg_t const *	p_cfg	Pointer to the configuration structure for this instance.
usb_hhid_api_t const *	p_api	Pointer to the API structure for this instance.

7.3.5.14 USB HMSC Interface

Interfaces » Connectivity

Detailed Description

Interface for USB HMSC functions.

Summary

The USB HMSC interface provides USB HMSC functionality.

Data Structures

struct	usb_hmsc_api_t

Enumerations

enum	usb_atapi_t
enum	usb_csw_result_t

Data Structure Documentation

◆ usb_hmsc_api_t

struct usb_hmsc_api_t

USB HMSC functions implemented at the HAL layer will follow this API.

Data Fields

fsp_err_t(*	storageCommand)(usb_ctrl_t *const p_ctrl, uint8_t *buf, uint8_t command, uint8_t destination)
fsp_err_t(*	driveNumberGet)(usb_ctrl_t *const p_ctrl, uint8_t *p_drive, uint8_t destination)
fsp_err_t(*	storageReadSector)(uint16_t drive_number, uint8_t *const buff, uint32_t sector_number, uint16_t sector_count)
fsp_err_t(*	storageWriteSector)(uint16_t drive_number, uint8_t const *const buff, uint32_t sector_number, uint16_t sector_count)
fsp_err_t(*	semaphoreGet)(void)
fsp_err_t(*	semaphoreRelease)(void)

Field Documentation

◆ storageCommand

fsp_err_t(* usb_hmsc_api_t::storageCommand) (usb_ctrl_t *const p_ctrl, uint8_t *buf, uint8_t command, uint8_t destination)

Processing for MassStorage(ATAPI) command.

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	*buf	Pointer to the buffer area to store the transfer data.
[in]	command	ATAPI command.
[in]	destination	Represents a device address.

◆ driveNumberGet

fsp_err_t(* usb_hmsc_api_t::driveNumberGet) (usb_ctrl_t *const p_ctrl, uint8_t *p_drive, uint8_t destination)

Get number of Storage drive.

Parameters

[in]	p_ctrl	Pointer to control structure.
[out]	p_drive	Store address for Drive No.
[in]	destination	Represents a device address.

◆ storageReadSector

fsp_err_t(* usb_hmsc_api_t::storageReadSector) (uint16_t drive_number, uint8_t *const buff, uint32_t sector_number, uint16_t sector_count)

Read sector information.

Parameters

[in]	drive_number	Drive number.
[out]	*buff	Pointer to the buffer area to store the transfer data.
[in]	sector_number	The sector number to start with.
[in]	sector_count	Transmit with the sector size of the number of times.

◆ storageWriteSector

fsp_err_t(* usb_hmsc_api_t::storageWriteSector) (uint16_t drive_number, uint8_t const *const buff, uint32_t sector_number, uint16_t sector_count)

Write sector information.

Parameters

[in]	drive_number	Drive number.
[in]	*buff	Pointer to the buffer area to store the transfer data.
[in]	sector_number	The sector number to start with.
[in]	sector_count	Transmit with the sector size of the number of times.

◆ semaphoreGet

fsp_err_t(* usb_hmsc_api_t::semaphoreGet) (void)

Get Semaphore.

◆ semaphoreRelease

fsp_err_t(* usb_hmsc_api_t::semaphoreRelease) (void)

Release Semaphore.

Enumeration Type Documentation

◆ usb_atapi_t

enum usb_atapi_t	
ATAPI commands	
Enumerator	
USB_ATAPI_TEST_UNIT_READY	Test Unit Ready.
USB_ATAPI_REQUEST_SENSE	Request Sense.
USB_ATAPI_FORMAT_UNIT	Format Unit.
USB_ATAPI_INQUIRY	Inquiry.
USB_ATAPI_MODE_SELECT6	Mode Select6.
USB_ATAPI_MODE_SENSE6	Mode Sense6.
USB_ATAPI_START_STOP_UNIT	Start Stop Unit.
USB_ATAPI_PREVENT_ALLOW	Prevent Allow.
USB_ATAPI_READ_FORMAT_CAPACITY	Read Format Capacity.
USB_ATAPI_READ_CAPACITY	Read Capacity.
USB_ATAPI_READ10	Read10.
USB_ATAPI_WRITE10	Write10.
USB_ATAPI_SEEK	Seek.
USB_ATAPI_WRITE_AND_VERIFY	Write and Verify.
USB_ATAPI_VERIFY10	Verify10.
USB_ATAPI_MODE_SELECT10	Mode Select10.
USB_ATAPI_MODE_SENSE10	Mode Sense10.

◆ usb_csw_result_t

enum usb_csw_result_t	
Command Status Wrapper (CSW)	
Enumerator	
USB_CSW_RESULT_SUCCESS	CSW was successful.
USB_CSW_RESULT_FAIL	CSW failed.
USB_CSW_RESULT_PHASE	CSW has phase error.

7.3.5.15 USB Interface

Interfaces » Connectivity

Detailed Description

Interface for USB functions.

Summary

The USB interface provides USB functionality.

Data Structures

struct	usb_cfg_t
struct	usb_api_t
struct	usb_instance_t

Macros

#define	USB_BREQUEST b15-8
#define	USB_GET_STATUS USB Standard request Get Status.

Data Structure Documentation

◆ usb_cfg_t

struct usb_cfg_t		
USB configuration.		
Data Fields		
usb_mode_t	usb_mode	USB_MODE_HOST/USB_MODE_PERI.
usb_speed_t	usb_speed	USB speed (USB_HS/USB_FS/USB_LS)
uint8_t	module_number	USB module number (USB_IP0/USB_IP1)
usb_class_t	type	USB device class etc.
usb_descriptor_t *	p_usb_reg	Pointer to the usb_decriptor_t structure area.
usb_compliance_cb_t *	usb_complience_cb	
IRQn_Type	irq	USBI dedicated interrupt number storage variable.
IRQn_Type	irq_r	USBR dedicated interrupt number storage variable.
IRQn_Type	irq_d0	FS D0FIFO dedicated interrupt number storage variable.
IRQn_Type	irq_d1	FS D1FIFO dedicated interrupt number storage variable.
IRQn_Type	hsirq	USBIR dedicated interrupt number storage variable.
IRQn_Type	irq_typec	USB Type-C IR dedicated interrupt number storage variable.
IRQn_Type	hsirq_d0	HS D0FIFO dedicated interrupt number storage variable.
IRQn_Type	hsirq_d1	HS D1FIFO dedicated interrupt number storage variable.
uint8_t	ipl	Variable to store the interrupt priority of USBI.
uint8_t	ipl_r	Variable to store the interrupt priority of USBR.
uint8_t	ipl_d0	Variable to store the interrupt priority of FS D0FIFO.
uint8_t	ipl_d1	Variable to store the interrupt priority of FS D1FIFO.

uint8_t	hsipl	Variable to store the interrupt priority of USBIR.
uint8_t	ipl_typec	Variable to store the interrupt priority of USB Type-C IR.
uint8_t	hsipl_d0	Variable to store the interrupt priority of HS D0FIFO.
uint8_t	hsipl_d1	Variable to store the interrupt priority of HS D1FIFO.
usb_callback_t *	p_usb_apl_callback	Application Callback.
void const *	p_context	Other Context.
const transfer_instance_t *	p_transfer_tx	Send context.
const transfer_instance_t *	p_transfer_rx	Receive context.
void const *	p_extend	Pointer to extended configuration by instance of interface.

◆ usb_api_t

struct usb_api_t	
Functions implemented at the HAL layer will follow this API.	
Data Fields	
fsp_err_t(*	open)(usb_ctrl_t *const p_ctrl, usb_cfg_t const *const p_cfg)
fsp_err_t(*	close)(usb_ctrl_t *const p_ctrl)
fsp_err_t(*	read)(usb_ctrl_t *const p_ctrl, uint8_t *p_buf, uint32_t size, uint8_t destination)
fsp_err_t(*	write)(usb_ctrl_t *const p_ctrl, uint8_t const *const p_buf, uint32_t size, uint8_t destination)
fsp_err_t(*	stop)(usb_ctrl_t *const p_ctrl, usb_transfer_t direction, uint8_t destination)
fsp_err_t(*	suspend)(usb_ctrl_t *const p_ctrl)
fsp_err_t(*	resume)(usb_ctrl_t *const p_ctrl)
fsp_err_t(*	vbusSet)(usb_ctrl_t *const p_ctrl, uint16_t state)

Field Documentation

◆ open

fsp_err_t(* usb_api_t::open) (usb_ctrl_t *const p_ctrl, usb_cfg_t const *const p_cfg)

Start the USB module

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	p_cfg	Pointer to configuration structure.

◆ close

fsp_err_t(* usb_api_t::close) (usb_ctrl_t *const p_ctrl)

Stop the USB module

Parameters

[in]	p_ctrl	Pointer to control structure.

◆ read

fsp_err_t(* usb_api_t::read) (usb_ctrl_t *const p_ctrl, uint8_t *p_buf, uint32_t size, uint8_t destination)

Request USB data read

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	p_buf	Pointer to area that stores read data.
[in]	size	Read request size.
[in]	destination	In Host mode, it represents the device address, and in Peripheral mode, it represents the device class.

◆ write

fsp_err_t(* usb_api_t::write) (usb_ctrl_t *const p_ctrl, uint8_t const *const p_buf, uint32_t size, uint8_t destination)

Request USB data write

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	p_buf	Pointer to area that stores write data.
[in]	size	Read request size.
[in]	destination	In Host mode, it represents the device address, and in Peripheral mode, it represents the device class.

◆ stop

fsp_err_t(* usb_api_t::stop) (usb_ctrl_t *const p_ctrl, usb_transfer_t direction, uint8_t destination)

Stop USB data read/write processing

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	direction	Receive (USB_TRANSFER_READ) or send (USB_TRANSFER_WRITE).
[in]	destination	In Host mode, it represents the device address, and in Peripheral mode, it represents the device class.

◆ suspend

fsp_err_t(* usb_api_t::suspend) (usb_ctrl_t *const p_ctrl)

Request suspend

Parameters

[in]	p_ctrl	Pointer to control structure.

◆ resume

fsp_err_t(* usb_api_t::resume) (usb_ctrl_t *const p_ctrl)

Request resume

Parameters

[in]	p_ctrl	Pointer to control structure.

◆ vbusSet

fsp_err_t(* usb_api_t::vbusSet) (usb_ctrl_t *const p_ctrl, uint16_t state)

Sets VBUS supply start/stop.

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	state	VBUS supply start/stop specification

◆ infoGet

fsp_err_t(* usb_api_t::infoGet) (usb_ctrl_t *const p_ctrl, usb_info_t *p_info, uint8_t destination)

Get information on USB device.

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	p_info	Pointer to usb_info_t structure area.
[in]	destination	Device address for Host.

◆ pipeRead

fsp_err_t(* usb_api_t::pipeRead) (usb_ctrl_t *const p_ctrl, uint8_t *p_buf, uint32_t size, uint8_t pipe_number)

Request data read from specified pipe

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	p_buf	Pointer to area that stores read data.
[in]	size	Read request size.
[in]	pipe_number	Pipe Number.

◆ pipeWrite

fsp_err_t(* usb_api_t::pipeWrite) (usb_ctrl_t *const p_ctrl, uint8_t *p_buf, uint32_t size, uint8_t pipe_number)

Request data write to specified pipe

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	p_buf	Pointer to area that stores write data.
[in]	size	Read request size.
[in]	pipe_number	Pipe Number.

◆ pipeStop

fsp_err_t(* usb_api_t::pipeStop) (usb_ctrl_t *const p_ctrl, uint8_t pipe_number)

Stop USB data read/write processing to specified pipe

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	pipe_number	Pipe Number.

◆ usedPipesGet

fsp_err_t(* usb_api_t::usedPipesGet) (usb_ctrl_t *const p_ctrl, uint16_t *p_pipe, uint8_t destination)

Get pipe number

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	p_pipe	Pointer to area that stores the selected pipe number (bit map information).
[in]	destination	Device address for Host.

◆ pipeInfoGet

fsp_err_t(* usb_api_t::pipeInfoGet) (usb_ctrl_t *const p_ctrl, usb_pipe_t *p_info, uint8_t pipe_number)

Get pipe information

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	p_info	Pointer to usb_pipe_t structure area.
[in]	pipe_number	Pipe Number.

◆ eventGet

fsp_err_t(* usb_api_t::eventGet) (usb_ctrl_t *const p_ctrl, usb_status_t *event)

Return USB-related completed events (OS less only)

Parameters

[in]	p_ctrl	Pointer to control structure.
[out]	event	Pointer to event.

◆ callback

fsp_err_t(* usb_api_t::callback) (usb_callback_t *p_callback)

Register a callback function to be called upon completion of a USB related event. (RTOS only)

Parameters

[in]	p_callback	Pointer to Callback function.

◆ pullUp

fsp_err_t(* usb_api_t::pullUp) (usb_ctrl_t *const p_ctrl, uint8_t state)

Pull-up enable/disable setting of D+/D- line.

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	state	Pull-up enable/disable setting.

◆ hostControlTransfer

fsp_err_t(* usb_api_t::hostControlTransfer) (usb_ctrl_t *const p_ctrl, usb_setup_t *p_setup, uint8_t *p_buf, uint8_t device_address)

Performs settings and transmission processing when transmitting a setup packet.

Parameters

[in]	p_ctrl	USB control structure.
[in]	p_setup	Setup packet information.
[in]	p_buf	Transfer area information.
[in]	device_address	Device address information.

◆ periControlDataGet

fsp_err_t(* usb_api_t::periControlDataGet) (usb_ctrl_t *const p_ctrl, uint8_t *p_buf, uint32_t size)

Receives data sent by control transfer.

Parameters

[in]	p_ctrl	USB control structure.
[in]	p_buf	Data reception area information.
[in]	size	Data reception size information.

◆ periControlDataSet

fsp_err_t(* usb_api_t::periControlDataSet) (usb_ctrl_t *const p_ctrl, uint8_t *p_buf, uint32_t size)

Performs transfer processing for control transfer.

Parameters

[in]	p_ctrl	USB control structure.
[in]	p_buf	Area information for data transfer.
[in]	size	Transfer size information.

◆ periControlStatusSet

fsp_err_t(* usb_api_t::periControlStatusSet) (usb_ctrl_t *const p_ctrl, usb_setup_status_t status)

Set the response to the setup packet.

Parameters

[in]	p_ctrl	USB control structure.
[in]	status	USB port startup information.

◆ remoteWakeup

fsp_err_t(* usb_api_t::remoteWakeup) (usb_ctrl_t *const p_ctrl)

Sends a remote wake-up signal to the connected Host.

Parameters

[in]	p_ctrl	USB control structure.

◆ driverActivate

fsp_err_t(* usb_api_t::driverActivate) (usb_ctrl_t *const p_api_ctrl)

Activate USB Driver

Parameters

[in]	p_api_ctrl	USB control structure.

◆ callbackMemorySet

fsp_err_t(* usb_api_t::callbackMemorySet) (usb_ctrl_t *const p_api_ctrl, usb_callback_args_t *p_callback_memory)

Set callback memory to USB driver.

Parameters

[in]	p_api_ctrl	USB control structure.
[in]	p_callback_memory	Pointer to store USB event information.

◆ moduleNumberGet

fsp_err_t(* usb_api_t::moduleNumberGet) (usb_ctrl_t *const p_ctrl, uint8_t *module_number)

This API gets the module number.

Parameters

[in]	p_ctrl	USB control structure.
[out]	module_number	Module number to get.

◆ classTypeGet

fsp_err_t(* usb_api_t::classTypeGet) (usb_ctrl_t *const p_ctrl, usb_class_t *class_type)

This API gets the module number.

Parameters

[in]	p_ctrl	USB control structure.
[out]	class_type	Class type to get.

◆ deviceAddressGet

fsp_err_t(* usb_api_t::deviceAddressGet) (usb_ctrl_t *const p_ctrl, uint8_t *device_address)

This API gets the device address.

Parameters

[in]	p_ctrl	USB control structure.
[out]	device_address	Device address to get.

◆ pipeNumberGet

fsp_err_t(* usb_api_t::pipeNumberGet) (usb_ctrl_t *const p_ctrl, uint8_t *pipe_number)

This API gets the pipe number.

Parameters

[in]	p_ctrl	USB control structure.
[out]	pipe_number	Pipe number to get.

◆ deviceStateGet

fsp_err_t(* usb_api_t::deviceStateGet) (usb_ctrl_t *const p_ctrl, uint16_t *state)

This API gets the state of the device.

Parameters

[in]	p_ctrl	USB control structure.
[out]	state	Device state to get.

◆ dataSizeGet

fsp_err_t(* usb_api_t::dataSizeGet) (usb_ctrl_t *const p_ctrl, uint32_t *data_size)

This API gets the data size.

Parameters

[in]	p_ctrl	USB control structure.
[out]	data_size	Data size to get.

◆ setupGet

fsp_err_t(* usb_api_t::setupGet) (usb_ctrl_t *const p_ctrl, usb_setup_t *setup)

This API gets the setup type.

Parameters

[in]	p_ctrl	USB control structure.
[out]	setup	Setup type to get.

◆ otgCallbackSet

fsp_err_t(* usb_api_t::otgCallbackSet) (usb_ctrl_t *const p_ctrl, usb_otg_callback_t *p_callback)

This API sets the callback function for OTG.

Parameters

[in]	p_ctrl	USB control structure.
[in]	p_callback	Pointer to the callback function for OTG.

◆ otgSRP

fsp_err_t(* usb_api_t::otgSRP) (usb_ctrl_t *const p_ctrl)

This API starts SRP processing for OTG.

Parameters

[in]	p_ctrl	USB control structure.

◆ typecInfoGet

fsp_err_t(* usb_api_t::typecInfoGet) (usb_ctrl_t *const p_ctrl, usb_typec_info_t *p_info)

Get information on USB Type-C Connection.

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	p_info	Pointer to usb_typec_info_t structure area.

◆ usb_instance_t

struct usb_instance_t		
This structure encompasses everything that is needed to use an instance of this interface.		
Data Fields		
usb_ctrl_t *	p_ctrl	Pointer to the control structure for this instance.
usb_cfg_t const *	p_cfg	Pointer to the configuration structure for this instance.
usb_api_t const *	p_api	Pointer to the API structure for this instance.

Typedef Documentation

◆ usb_ctrl_t

typedef void usb_ctrl_t
USB control block. Allocate an instance specific control block to pass into the USB API calls.

Enumeration Type Documentation

◆ usb_speed_t

enum usb_speed_t	
USB speed type	
Enumerator	
USB_SPEED_LS	Low speed operation.
USB_SPEED_FS	Full speed operation.
USB_SPEED_HS	Hi speed operation.

◆ usb_setup_status_t

enum usb_setup_status_t	
USB request result	
Enumerator	
USB_SETUP_STATUS_ACK	ACK response.
USB_SETUP_STATUS_STALL	STALL response.

◆ usb_status_t

enum usb_status_t	
USB driver status	
Enumerator	
USB_STATUS_POWERED	Powered State.
USB_STATUS_DEFAULT	Default State.
USB_STATUS_ADDRESS	Address State.
USB_STATUS_CONFIGURED	Configured State.
USB_STATUS_SUSPEND	Suspend State.
USB_STATUS_RESUME	Resume State.
USB_STATUS_DETACH	Detach State.
USB_STATUS_REQUEST	Request State.
USB_STATUS_REQUEST_COMPLETE	Request Complete State.
USB_STATUS_READ_COMPLETE	Read Complete State.
USB_STATUS_WRITE_COMPLETE	Write Complete State.
USB_STATUS_BC	battery Charge State
USB_STATUS_OVERCURRENT	Over Current state.
USB_STATUS_NOT_SUPPORT	Device Not Support.
USB_STATUS_NONE	None Status.
USB_STATUS_MSC_CMD_COMPLETE	MSC_CMD Complete.

◆ usb_class_t

enum usb_class_t	
USB class type	
Enumerator	
USB_CLASS_PCDC	PCDC Class.

USB_CLASS_PCDCC	PCDCC Class.
USB_CLASS_PCDC2	PCDC2 Class.
USB_CLASS_PCDCC2	PCDCC2 Class.
USB_CLASS_PHID	PHID Class.
USB_CLASS_PHID2	PHID2 Class.
USB_CLASS_PAUD	PAUD Class.
USB_CLASS_PPRN	PPRN Class.
USB_CLASS_DFU	DFU Class.
USB_CLASS_PVND	PVND Class.
USB_CLASS_HCDC	HCDC Class.
USB_CLASS_HCDCC	HCDCC Class.
USB_CLASS_HHID	HHID Class.
USB_CLASS_HVND	HVND Class.
USB_CLASS_HMSC	HMSC Class.
USB_CLASS_PMSC	PMSC Class.
USB_CLASS_HPRN	HPRN Class.
USB_CLASS_HUVC	HUVC Class.
USB_CLASS_HAUD	HAUD Class.
USB_CLASS_REQUEST	USB Class Request.
USB_CLASS_HUB	HUB Class.
USB_CLASS_END	USB Class End Code.

◆ usb_bcport_t

enum usb_bcport_t	
USB battery charging type	
Enumerator	
USB_BCPORT_SDP	SDP port settings.
USB_BCPORT_CDP	CDP port settings.
USB_BCPORT_DCP	DCP port settings.

◆ usb_onoff_t

enum usb_onoff_t	
USB status	
Enumerator	
USB_OFF	USB Off State.
USB_ON	USB On State.

◆ usb_transfer_t

enum usb_transfer_t	
USB read/write type	
Enumerator	
USB_TRANSFER_READ	Data Receive communication.
USB_TRANSFER_WRITE	Data transmission communication.

◆ usb_transfer_type_t

enum usb_transfer_type_t	
USB transfer type	
Enumerator	
USB_TRANSFER_TYPE_BULK	Bulk communication.
USB_TRANSFER_TYPE_INT	Interrupt communication.
USB_TRANSFER_TYPE_ISO	Isochronous communication.

◆ usb_mode_t

enum usb_mode_t	
Enumerator	
USB_MODE_HOST	Host mode.
USB_MODE_PERI	Peripheral mode.

◆ usb_compliancetest_status_t

enum usb_compliancetest_status_t	
Enumerator	
USB_COMPLIANCETEST_ATTACH	Device Attach Detection.
USB_COMPLIANCETEST_DETACH	Device Detach Detection.
USB_COMPLIANCETEST_TPL	TPL device connect.
USB_COMPLIANCETEST_NOTTPL	Not TPL device connect.
USB_COMPLIANCETEST_HUB	USB Hub connect.
USB_COMPLIANCETEST_OVRC	Over current.
USB_COMPLIANCETEST_NORES	Response Time out for Control Read Transfer.
USB_COMPLIANCETEST_SETUP_ERR	Setup Transaction Error.

◆ usb_typec_mode_t

enum usb_typec_mode_t	
USB TypeC operation_mode	
Enumerator	
USB_TYPEC_MODE_SINK	Sink Only Mode.
USB_TYPEC_MODE_USB20_ONLY_SINK	USB 2.0 Only Sink Mode.

◆ usb_typec_plug_t

enum usb_typec_plug_t	
USB TypeC Connection of Plug Orientation	
Enumerator	
USB_TYPEC_PLUG_CC1_CONNECTED	CC1 connected.
USB_TYPEC_PLUG_CC2_CONNECTED	CC2 connected.

◆ usb_typec_connection_status_t

enum usb_typec_connection_status_t	
USB TypeC Status of Connection State Machine	
Enumerator	
USB_TYPEC_CONNECTION_STATUS_DISABLED	Disabled.
USB_TYPEC_CONNECTION_STATUS_UNATTACHED	Unattached.SNK.
USB_TYPEC_CONNECTION_STATUS_ATTACHED_WAIT	AttachedWait.SNK.
USB_TYPEC_CONNECTION_STATUS_ATTACHED	Attached.SNK.
USB_TYPEC_CONNECTION_STATUS_ATTACHED_POWER_DEFAULT	Attached.SNK (PowerDefault.SNK)
USB_TYPEC_CONNECTION_STATUS_ATTACHED_POWER_15	Attached.SNK (Power1.5.SNK)
USB_TYPEC_CONNECTION_STATUS_ATTACHED_POWER_30	Attached.SNK (Power3.0.SNK)

◆ usb_typec_vbus_status_t

enum usb_typec_vbus_status_t	
USB TypeC VBUS status	
Enumerator	
USB_TYPEC_VBUS_STATUS_OFF	VBUS Off State.
USB_TYPEC_VBUS_STATUS_ON	VBUS On State.

7.3.5.16 USB PCDC Interface

Interfaces » Connectivity

Detailed Description

Interface for USB PCDC functions.

Summary

The USB PCDC interface provides USB PCDC functionality.

Data Structures

struct	usb_serial_state_bitmap_t
union	usb_sci_serialstate_t
struct	usb_pcdc_linecoding_t
struct	usb_pcdc_ctrllinestate_t

Macros

#define	USB_PCDC_SET_LINE_CODING Set Line Coding.
#define	USB_PCDC_GET_LINE_CODING Get Line Coding.
#define	USB_PCDC_SET_CONTROL_LINE_STATE Control Line State.

#define	USB_PCDC_SERIAL_STATE Serial State Code.
#define	USB_PCDC_SETUP_TBL_BSIZE Setup packet table size (uint16_t * 5)

Data Structure Documentation

◆ usb_serial_state_bitmap_t

struct usb_serial_state_bitmap_t		
Virtual UART signal state		
Data Fields		
uint16_t	b_rx_carrier: 1	DCD signal.
uint16_t	b_tx_carrier: 1	DSR signal.
uint16_t	b_break: 1	Break signal.
uint16_t	b_ring_signal: 1	Ring signal.
uint16_t	b_framing: 1	Framing error.
uint16_t	b_parity: 1	Parity error.
uint16_t	b_over_run: 1	Overrun error.
uint16_t	rsv: 9	Reserved.

◆ usb_sci_serialstate_t

union usb_sci_serialstate_t		
Class Notification Serial State		
Data Fields		
uint32_t	word	Word Access.
usb_serial_state_bitmap_t	bit	Bit Access.

◆ usb_pcdc_linecoding_t

struct usb_pcdc_linecoding_t		
Virtual UART communication settings		
Data Fields		
uint32_t	dw_dte_rate	Bitrate.
uint8_t	b_char_format	Stop bits.
uint8_t	b_parity_type	Parity.

uint8_t	b_data_bits	Data bits.
uint8_t	rsv	Reserved.

◆ **usb_pcdc_ctrllinestate_t**

struct usb_pcdc_ctrllinestate_t		
Virtual UART control line state		
Data Fields		
uint16_t	bdtr: 1	DTR.
uint16_t	brts: 1	RTS.
uint16_t	rsv: 14	Reserved.

7.3.5.17 USB PHID Interface

Interfaces » Connectivity

Detailed Description

Interface for USB PHID functions.

Summary

The USB interface provides USB functionality.

7.3.5.18 USB PMSC Interface

Interfaces » Connectivity

Detailed Description

Interface for USB PMSC functions.

Summary

The USB PMSC interface provides USB PMSC functionality.

Macros

#define	USB_MASS_STORAGE_RESET Mass storage reset request code.

#define	USB_GET_MAX_LUN Get max logical unit number request code.

7.3.5.19 USB PPRN Interface

Interfaces » Connectivity

Detailed Description

Interface for USB PPRN functions.

Summary

The USB PPRN interface provides USB PPRN functionality.

Macros

#define	USB_PPRN_GET_DEVICE_ID Get Device ID.
#define	USB_PRPN_GET_PORT_STATUS Get Port Status.
#define	USB_PPRN_SOFT_RESET Soft Reset.
#define	USB_PPRN_PORT_STATUS_PAPER_EMPTY 1: Paper Empty, 0: Paper Not Empty
#define	USB_PPRN_PORT_STATUS_SELECT 1: Selected, 0: Not Selected
#define	USB_PPRN_PORT_STATUS_NOT_ERROR 1: No Error, 0; Error

7.3.6 DSP

Interfaces

Detailed Description

DSP Interfaces.

Modules

	IIR Interface Interface for IIR filter functionality.

7.3.6.1 IIR Interface

Interfaces » DSP

Detailed Description

Interface for IIR filter functionality.

Summary

The IIR interface allows access to the IIRFA peripheral for hardware acceleration of direct form 2 transposed biquad IIR filters.

Data Structures

struct	iir_filter_coeffs_t
struct	iir_filter_state_t
struct	iir_filter_cfg_t
struct	iir_status_t
struct	iir_cfg_t
struct	iir_api_t
struct	iirfa_instance_t

Typedefs

typedef void	iir_ctrl_t

Data Structure Documentation

◆ iir_filter_coeffs_t

struct iir_filter_coeffs_t		
Filter stage coefficient data		
Data Fields		
float	b0	Coefficient B0.
float	b1	Coefficient B1.
float	b2	Coefficient B2.
float	a1	Coefficient A0.
float	a2	Coefficient A1.

◆ iir_filter_state_t

struct iir_filter_state_t		
Filter stage state data		
Data Fields		
float	d0	State variable D0.
float	d1	State variable D1.

◆ iir_filter_cfg_t

struct iir_filter_cfg_t		
Filter configuration		
Data Fields		
iir_filter_coeffs_t *	p_filter_coeffs	Filter coefficients.
iir_filter_state_t *	p_filter_state	Filter state data.
uint8_t	stage_base	Hardware stage to start from.
uint8_t	stage_num	Number of filter stages to use.

◆ iir_status_t

struct iir_status_t
Filter state register status

◆ iir_cfg_t

struct iir_cfg_t		
IIRFA API configuration parameter		
Data Fields		

void const *	p_extend	
uint8_t	channel	IIRFA channel to use.

◆ iir_api_t

struct iir_api_t	
IIR driver structure. IIR functions implemented at the HAL layer follow this API.	
Data Fields	
fsp_err_t(*	open)(iir_ctrl_t *const p_ctrl, iir_cfg_t const *const p_cfg)
fsp_err_t(*	close)(iir_ctrl_t *const p_ctrl)
fsp_err_t(*	configure)(iir_ctrl_t *const p_ctrl, iir_filter_cfg_t const *const p_filter_cfg)
fsp_err_t(*	filter)(iir_ctrl_t *const p_ctrl, float const *p_data_in, float *p_data_out, uint16_t const num_samples)
fsp_err_t(*	statusGet)(iir_ctrl_t *const p_ctrl, iir_status_t *const p_status)

Field Documentation

◆ open

fsp_err_t(* iir_api_t::open) (iir_ctrl_t *const p_ctrl, iir_cfg_t const *const p_cfg)

Initial configuration.

Parameters

[in]	p_ctrl	Pointer to control block. Must be declared by user. Elements set here.
[in]	p_cfg	Pointer to configuration structure. All elements of this structure must be set by user.

◆ close

fsp_err_t(* iir_api_t::close) (iir_ctrl_t *const p_ctrl)

Close the IIRFA channel.

Parameters

[in]	p_ctrl	Control block set in iir_api_t::open.

◆ configure

fsp_err_t(* iir_api_t::configure) (iir_ctrl_t *const p_ctrl, iir_filter_cfg_t const *const p_filter_cfg)

Configure filter coefficients and state variables.

Parameters

[in]	p_ctrl	Control block set in iir_api_t::open.
[in]	p_filter_cfg	Pointer to filter configuration to write.

◆ filter

fsp_err_t(* iir_api_t::filter) (iir_ctrl_t *const p_ctrl, float const *p_data_in, float *p_data_out, uint16_t const num_samples)

Filter the specified data.

Parameters

[in]	p_ctrl	Control block set in iir_api_t::open.
[in]	p_data_in	Pointer to float input data.
[in]	p_data_out	Pointer to float output buffer.
[in]	num_samples	Number of samples to process.

◆ statusGet

fsp_err_t(* iir_api_t::statusGet) (iir_ctrl_t *const p_ctrl, iir_status_t *const p_status)
Retrieve current status (including state registers). **Parameters** [in] p_ctrl — Control block set in iir_api_t::open. [in] p_status — Pointer to status struct.

◆ iirfa_instance_t

struct iirfa_instance_t		
This structure encompasses everything that is needed to use an instance of this interface.		
Data Fields		
iir_ctrl_t *	p_ctrl	Pointer to the control structure for this instance.
iir_cfg_t const *	p_cfg	Pointer to the configuration structure for this instance.
iir_api_t const *	p_api	Pointer to the API structure for this instance.

Typedef Documentation

◆ iir_ctrl_t

typedef void iir_ctrl_t
IIR control block. Allocate an instance specific control block to pass into the DAC API calls.

7.3.7 Graphics

Interfaces

Detailed Description

Graphics Interfaces.

Modules

CAPTURE Interface	Interface for CAPTURE functions.

	Display Interface Interface for LCD panel displays.
	JPEG Codec Interface Interface for JPEG functions.
	MIPI DSI Interface Interface for MIPI DSI communications.
	SLCDC Interface Interface for Segment LCD controllers.

7.3.7.1 CAPTURE Interface

Interfaces » Graphics

Detailed Description

Interface for CAPTURE functions.

Summary

The CAPTURE interface provides the functionality for capturing an image from an image sensor/camera. When a capture is complete a capture complete interrupt is triggered.

Data Structures

struct	capture_status_t
struct	capture_callback_args_t
struct	capture_cfg_t
struct	capture_api_t
struct	capture_instance_t

Typedefs

typedef uint32_t	capture_event_t

typedef void	capture_ctrl_t

Enumerations

enum	capture_state_t

Data Structure Documentation

◆ capture_status_t

struct capture_status_t		
CAPTURE status		
Data Fields		
capture_state_t	state	Current state.
uint32_t *	p_buffer	Pointer to active buffer.
uint32_t	data_size	Size of data written to provided buffer.

◆ capture_callback_args_t

struct capture_callback_args_t		
CAPTURE callback function parameter data		
Data Fields		
capture_event_t	event	Event causing the callback.
uint8_t *	p_buffer	Pointer to buffer that contains captured data.
void const *	p_context	Placeholder for user data. Set in capture_api_t::open function in capture_cfg_t.

◆ capture_cfg_t

struct capture_cfg_t	
CAPTURE configuration parameters.	
Data Fields	
uint16_t	x_capture_start_pixel
	Horizontal position to start capture.
uint16_t	x_capture_pixels
	Number of horizontal pixels to capture.

uint16_t	y_capture_start_pixel
	Vertical position to start capture.
uint16_t	y_capture_pixels
	Number of vertical lines/pixels to capture.
uint8_t	bytes_per_pixel
	Number of bytes per pixel.
void(*	p_callback)(capture_callback_args_t *p_args)
	Callback provided when a CAPTURE transfer ISR occurs.
void const *	p_context
	User defined context passed to callback function.
void const *	p_extend
	Extension parameter for hardware specific settings.

◆ capture_api_t

struct capture_api_t	
CAPTURE functions implemented at the HAL layer will follow this API.	
Data Fields	
fsp_err_t(*	open)(capture_ctrl_t *const p_ctrl, capture_cfg_t const *const p_cfg)
fsp_err_t(*	close)(capture_ctrl_t *const p_ctrl)
fsp_err_t(*	captureStart)(capture_ctrl_t *const p_ctrl, uint8_t *const p_buffer)
fsp_err_t(*	callbackSet)(capture_ctrl_t *const p_ctrl, void(*p_callback)(capture_callback_args_t *), void const *const

	p_context, capture_callback_args_t *const p_callback_memory)
fsp_err_t(*	statusGet)(capture_ctrl_t *const p_ctrl, capture_status_t *p_status)

Field Documentation

◆ open

fsp_err_t(* capture_api_t::open) (capture_ctrl_t *const p_ctrl, capture_cfg_t const *const p_cfg)

Initial configuration.

Note

To reconfigure after calling this function, call capture_api_t::close first.

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	p_cfg	Pointer to pin configuration structure.

◆ close

fsp_err_t(* capture_api_t::close) (capture_ctrl_t *const p_ctrl)

Closes the driver and allows reconfiguration. May reduce power consumption.

Parameters

[in]	p_ctrl	Pointer to control structure.

◆ captureStart

fsp_err_t(* capture_api_t::captureStart) (capture_ctrl_t *const p_ctrl, uint8_t *const p_buffer)

Start a capture.

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	p_buffer	New pointer to store captured image data.

◆ callbackSet

fsp_err_t(* capture_api_t::callbackSet) (capture_ctrl_t *const p_ctrl, void(*p_callback)(capture_callback_args_t *), void const *const p_context, capture_callback_args_t *const p_callback_memory)

Specify callback function and optional context pointer and working memory pointer.

Parameters

[in]	p_ctrl	Pointer to the CAPTURE control block.
[in]	p_callback	Callback function
[in]	p_context	Pointer to send to callback function
[in]	p_working_memory	Pointer to volatile memory where callback structure can be allocated. Callback arguments allocated here are only valid during the callback.

◆ statusGet

fsp_err_t(* capture_api_t::statusGet) (capture_ctrl_t *const p_ctrl, capture_status_t *p_status)

Check scan status.

Parameters

[in]	p_ctrl	Pointer to control handle structure
[out]	p_status	Pointer to store current status in

◆ capture_instance_t

struct capture_instance_t

This structure encompasses everything that is needed to use an instance of this interface.

Data Fields

capture_ctrl_t *	p_ctrl	Pointer to the control structure for this instance.
capture_cfg_t const *	p_cfg	Pointer to the configuration structure for this instance.
capture_api_t const *	p_api	Pointer to the API structure for this instance.

Typedef Documentation

◆ capture_event_t

typedef uint32_t capture_event_t
CAPTURE callback event ID - see implimentation for details

◆ capture_ctrl_t

typedef void capture_ctrl_t
CAPTURE control block. Allocate an instance specific control block to pass into the CAPTURE API calls.

Enumeration Type Documentation

◆ capture_state_t

enum capture_state_t	
CAPTURE states.	
Enumerator	
CAPTURE_STATE_IDLE	CAPTURE is idle.
CAPTURE_STATE_IN_PROGRESS	CAPTURE capture in progress.
CAPTURE_STATE_BUSY	CAPTURE reset in progress.

7.3.7.2 Display Interface

Interfaces » Graphics

Detailed Description

Interface for LCD panel displays.

Summary

The display interface provides standard display functionality:

- Signal timing configuration for LCD panels with RGB interface.
- Dot clock source selection (internal or external) and frequency divider.
- Blending of multiple graphics layers on the background screen.
- Color correction (brightness/configuration/gamma correction).
- Interrupts and callback function.

Data Structures

struct	display_timing_t
struct	display_color_t
struct	display_coordinate_t
struct	display_brightness_t
struct	display_contrast_t
struct	display_correction_t
struct	gamma_correction_t
struct	display_gamma_correction_t
struct	display_clut_t
struct	display_colorkeying_cfg_t
struct	display_colorkeying_layer_t
struct	display_input_cfg_t
struct	display_output_cfg_t
struct	display_layer_t
struct	display_callback_args_t
struct	display_cfg_t
struct	display_runtime_cfg_t
struct	display_clut_cfg_t
struct	display_status_t
struct	display_api_t
struct	display_instance_t

Typedefs

typedef void	display_ctrl_t

Enumerations

enum	display_frame_layer_t
enum	display_state_t
enum	display_event_t
enum	display_in_format_t
enum	display_out_format_t
enum	display_endian_t
enum	display_color_order_t
enum	display_signal_polarity_t
enum	display_sync_edge_t
enum	display_fade_control_t
enum	display_fade_status_t
enum	display_color_keying_t
enum	display_data_swap_t

Data Structure Documentation

◆ display_timing_t

struct display_timing_t		
Display signal timing setting		
Data Fields		
uint16_t	total_cyc	Total cycles in one line or total lines in one frame.
uint16_t	display_cyc	Active video cycles or lines.
uint16_t	back_porch	Back porch cycles or lines.
uint16_t	sync_width	Sync signal asserting width.
display_signal_polarity_t	sync_polarity	Sync signal polarity.

◆ display_color_t

struct display_color_t
RGB Color setting

◆ display_coordinate_t

struct display_coordinate_t		
Contrast (gain) correction setting		
Data Fields		
int16_t	x	Coordinate X, this allows to set signed value.
int16_t	y	Coordinate Y, this allows to set signed value.

◆ display_brightness_t

struct display_brightness_t		
Brightness (DC) correction setting		
Data Fields		
bool	enable	Brightness Correction On/Off.
uint16_t	r	Brightness (DC) adjustment for R channel.
uint16_t	g	Brightness (DC) adjustment for G channel.
uint16_t	b	Brightness (DC) adjustment for B channel.

◆ display_contrast_t

struct display_contrast_t		
Contrast (gain) correction setting		
Data Fields		
bool	enable	Contrast Correction On/Off.
uint8_t	r	Contrast (gain) adjustment for R channel.
uint8_t	g	Contrast (gain) adjustment for G channel.
uint8_t	b	Contrast (gain) adjustment for B channel.

◆ display_correction_t

struct display_correction_t		
Color correction setting		
Data Fields		
display_brightness_t	brightness	Brightness.
display_contrast_t	contrast	Contrast.

◆ gamma_correction_t

struct gamma_correction_t		
Gamma correction setting for each color		
Data Fields		
bool	enable	Gamma Correction On/Off.
uint16_t *	gain	Gain adjustment.
uint16_t *	threshold	Start threshold.

◆ display_gamma_correction_t

struct display_gamma_correction_t		
Gamma correction setting		
Data Fields		
gamma_correction_t	r	Gamma correction for R channel.
gamma_correction_t	g	Gamma correction for G channel.
gamma_correction_t	b	Gamma correction for B channel.

◆ display_clut_t

struct display_clut_t		
CLUT setting		
Data Fields		
uint32_t	color_num	The number of colors in CLUT.
const uint32_t *	p_clut	Address of the area storing the CLUT data (in ARGB8888 format)

◆ display_colorkeying_cfg_t

struct display_colorkeying_cfg_t		
Color Keying setting		
Data Fields		
display_color_t	src_color	Source color.
display_color_t	dst_color	Destination color.
display_color_keying_t	enable_ckey	Select enable or disable.

◆ display_colorkeying_layer_t

struct display_colorkeying_layer_t
Color Keying layer setting

◆ display_input_cfg_t

struct display_input_cfg_t		
Graphics plane input configuration structure		
Data Fields		
uint32_t *	p_base	Base address to the frame buffer.
uint16_t	hsize	Horizontal pixel size in a line.
uint16_t	vsize	Vertical pixel size in a frame.
uint32_t	hstride	Memory stride (bytes) in a line.
display_in_format_t	format	Input format setting.
bool	line_descending_enable	Line descending enable.
bool	lines_repeat_enable	Line repeat enable.
uint16_t	lines_repeat_times	Expected number of line repeating.

◆ display_output_cfg_t

struct display_output_cfg_t		
Display output configuration structure		
Data Fields		
display_timing_t	htiming	Horizontal display cycle setting.
display_timing_t	vtiming	Vertical display cycle setting.
display_out_format_t	format	Output format setting.
display_endian_t	endian	Bit order of output data.
display_color_order_t	color_order	Color order in pixel.
display_signal_polarity_t	data_enable_polarity	Data Enable signal polarity.
display_sync_edge_t	sync_edge	Signal sync edge selection.
display_color_t	bg_color	Background color.
display_brightness_t	brightness	Brightness setting.
display_contrast_t	contrast	Contrast setting.
display_gamma_correction_t *	p_gamma_correction	Pointer to gamma correction setting.
bool	dithering_on	Dithering on/off.

◆ display_layer_t

struct display_layer_t
Graphics layer blend setup parameter structure

Data Fields		
display_coordinate_t	coordinate	Blending location (starting point of image)
display_color_t	bg_color	Color outside region.
display_fade_control_t	fade_control	Layer fade-in/out control on/off.
uint8_t	fade_speed	Layer fade-in/out frame rate.

◆ display_callback_args_t

struct display_callback_args_t		
Display callback parameter definition		
Data Fields		
display_event_t	event	Event code.
void const *	p_context	Context provided to user during callback.

◆ display_cfg_t

struct display_cfg_t	
Display main configuration structure	
Data Fields	
display_input_cfg_t	input [2]
	Graphics input frame setting. More...
display_output_cfg_t	output
	Graphics output frame setting.
display_layer_t	layer [2]
	Graphics layer blend setting.
uint8_t	line_detect_ipl
	Line detect interrupt priority.
uint8_t	underflow_1_ipl
	Underflow 1 interrupt priority.

uint8_t	underflow_2_ipl
	Underflow 2 interrupt priority.
IRQn_Type	line_detect_irq
	Line detect interrupt vector.
IRQn_Type	underflow_1_irq
	Underflow 1 interrupt vector.
IRQn_Type	underflow_2_irq
	Underflow 2 interrupt vector.
void(*	p_callback)(display_callback_args_t *p_args)
	Pointer to callback function. More...
void const *	p_context
	User defined context passed into callback function.
void const *	p_extend
	Display hardware dependent configuration. More...

Field Documentation

◆ input

display_input_cfg_t display_cfg_t::input[2]

Graphics input frame setting.

Generic configuration for display devices

◆ p_callback

void(* display_cfg_t::p_callback) (display_callback_args_t *p_args)
Pointer to callback function. Configuration for display event processing

◆ p_extend

void const* display_cfg_t::p_extend
Display hardware dependent configuration. Pointer to display peripheral specific configuration

◆ display_runtime_cfg_t

struct display_runtime_cfg_t		
Display main configuration structure		
Data Fields		
display_input_cfg_t	input	Graphics input frame setting. Generic configuration for display devices
display_layer_t	layer	Graphics layer alpha blending setting.

◆ display_clut_cfg_t

struct display_clut_cfg_t		
Display CLUT configuration structure		
Data Fields		
uint32_t *	p_base	Pointer to CLUT source data.
uint16_t	start	Beginning of CLUT entry to be updated.
uint16_t	size	Size of CLUT entry to be updated.

◆ display_status_t

struct display_status_t		
Display Status		
Data Fields		
display_state_t	state	Status of display module.
display_fade_status_t	fade_status[DISPLAY_FRAME_LAYER_2+1]	Status of fade-in/fade-out status.

◆ display_api_t

struct display_api_t	
Shared Interface definition for display peripheral	
Data Fields	
fsp_err_t(*	open)(display_ctrl_t *const p_ctrl, display_cfg_t const *const p_cfg)
fsp_err_t(*	close)(display_ctrl_t *const p_ctrl)
fsp_err_t(*	start)(display_ctrl_t *const p_ctrl)
fsp_err_t(*	stop)(display_ctrl_t *const p_ctrl)
fsp_err_t(*	layerChange)(display_ctrl_t const *const p_ctrl, display_runtime_cfg_t const *const p_cfg, display_frame_layer_t frame)
fsp_err_t(*	bufferChange)(display_ctrl_t const *const p_ctrl, uint8_t *const framebuffer, display_frame_layer_t frame)
fsp_err_t(*	correction)(display_ctrl_t const *const p_ctrl, display_correction_t const *const p_param)
fsp_err_t(*	clut)(display_ctrl_t const *const p_ctrl, display_clut_cfg_t const *const p_clut_cfg, display_frame_layer_t layer)
fsp_err_t(*	clutEdit)(display_ctrl_t const *const p_ctrl, display_frame_layer_t layer, uint8_t index, uint32_t color)
fsp_err_t(*	colorKeySet)(display_ctrl_t const *const p_ctrl, display_colorkeying_layer_t key_cfg, display_frame_layer_t layer)
fsp_err_t(*	statusGet)(display_ctrl_t const *const p_ctrl, display_status_t *const p_status)

Field Documentation

◆ open

fsp_err_t(* display_api_t::open) (display_ctrl_t *const p_ctrl, display_cfg_t const *const p_cfg)

Open display device.

Parameters

[in,out]	p_ctrl	Pointer to display interface control block. Must be declared by user. Value set here.
[in]	p_cfg	Pointer to display configuration structure. All elements of this structure must be set by user.

◆ close

fsp_err_t(* display_api_t::close) (display_ctrl_t *const p_ctrl)

Close display device.

Parameters

[in]	p_ctrl	Pointer to display interface control block.

◆ start

fsp_err_t(* display_api_t::start) (display_ctrl_t *const p_ctrl)

Display start.

Parameters

[in]	p_ctrl	Pointer to display interface control block.

◆ stop

fsp_err_t(* display_api_t::stop) (display_ctrl_t *const p_ctrl)

Display stop.

Parameters

[in]	p_ctrl	Pointer to display interface control block.

◆ layerChange

fsp_err_t(* display_api_t::layerChange) (display_ctrl_t const *const p_ctrl, display_runtime_cfg_t const *const p_cfg, display_frame_layer_t frame)

Change layer parameters at runtime.

Parameters

[in]	p_ctrl	Pointer to display interface control block.
[in]	p_cfg	Pointer to run-time layer configuration structure.
[in]	frame	Number of graphic frames.

◆ bufferChange

fsp_err_t(* display_api_t::bufferChange) (display_ctrl_t const *const p_ctrl, uint8_t *const framebuffer, display_frame_layer_t frame)

Change layer framebuffer pointer.

Parameters

[in]	p_ctrl	Pointer to display interface control block.
[in]	framebuffer	Pointer to desired framebuffer.
[in]	frame	Number of graphic frames.

◆ correction

fsp_err_t(* display_api_t::correction) (display_ctrl_t const *const p_ctrl, display_correction_t const *const p_param)

Color correction.

Parameters

[in]	p_ctrl	Pointer to display interface control block.
[in]	param	Pointer to color correction configuration structure.

◆ clut

fsp_err_t(* display_api_t::clut) (display_ctrl_t const *const p_ctrl, display_clut_cfg_t const *const p_clut_cfg, display_frame_layer_t layer)

Set CLUT for display device.

Parameters

[in]	p_ctrl	Pointer to display interface control block.
[in]	p_clut_cfg	Pointer to CLUT configuration structure.
[in]	layer	Layer number corresponding to the CLUT.

◆ clutEdit

fsp_err_t(* display_api_t::clutEdit) (display_ctrl_t const *const p_ctrl, display_frame_layer_t layer, uint8_t index, uint32_t color)

Set CLUT element for display device.

Parameters

[in]	p_ctrl	Pointer to display interface control block.
[in]	layer	Layer number corresponding to the CLUT.
[in]	index	CLUT element index.
[in]	color	Desired CLUT index color.

◆ colorKeySet

fsp_err_t(* display_api_t::colorKeySet) (display_ctrl_t const *const p_ctrl, display_colorkeying_layer_t key_cfg, display_frame_layer_t layer)

Configure color keying.

Parameters

[in]	p_ctrl	Pointer to display interface control block.
[in]	key_cfg	Pointer to color keying configuration.
[in]	layer	Layer to apply color keying.

◆ statusGet

fsp_err_t(* display_api_t::statusGet) (display_ctrl_t const *const p_ctrl, display_status_t *const p_status)

Get status for display device.

Parameters

[in]	p_ctrl	Pointer to display interface control block.
[in]	status	Pointer to display interface status structure.

◆ display_instance_t

struct display_instance_t		
This structure encompasses everything that is needed to use an instance of this interface.		
Data Fields		
display_ctrl_t *	p_ctrl	Pointer to the control structure for this instance.
display_cfg_t const *	p_cfg	Pointer to the configuration structure for this instance.
display_api_t const *	p_api	Pointer to the API structure for this instance.

Typedef Documentation

◆ display_ctrl_t

typedef void display_ctrl_t
Display control block. Allocate an instance specific control block to pass into the display API calls.Display control block

Enumeration Type Documentation

◆ display_frame_layer_t

enum display_frame_layer_t	
Display frame number	
Enumerator	
DISPLAY_FRAME_LAYER_1	Frame layer 1.
DISPLAY_FRAME_LAYER_2	Frame layer 2.

◆ display_state_t

enum display_state_t	
Display interface operation state	
Enumerator	
DISPLAY_STATE_CLOSED	Display closed.
DISPLAY_STATE_OPENED	Display opened.
DISPLAY_STATE_DISPLAYING	Displaying.

◆ display_event_t

enum display_event_t	
Display event codes	
Enumerator	
DISPLAY_EVENT_GR1_UNDERFLOW	Graphics frame1 underflow occurs.
DISPLAY_EVENT_GR2_UNDERFLOW	Graphics frame2 underflow occurs.
DISPLAY_EVENT_LINE_DETECTION	Designated line is processed.
DISPLAY_EVENT_FRAME_END	Frame end is processed.

◆ display_in_format_t

enum display_in_format_t	
Input format setting	
Enumerator	
DISPLAY_IN_FORMAT_32BITS_ARGB8888	ARGB8888, 32 bits.
DISPLAY_IN_FORMAT_32BITS_RGB888	RGB888, 32 bits.
DISPLAY_IN_FORMAT_16BITS_RGB565	RGB565, 16 bits.
DISPLAY_IN_FORMAT_16BITS_ARGB1555	ARGB1555, 16 bits.
DISPLAY_IN_FORMAT_16BITS_ARGB4444	ARGB4444, 16 bits.
DISPLAY_IN_FORMAT_CLUT8	CLUT8.
DISPLAY_IN_FORMAT_CLUT4	CLUT4.
DISPLAY_IN_FORMAT_CLUT1	CLUT1.

◆ display_out_format_t

enum display_out_format_t	
Output format setting	
Enumerator	
DISPLAY_OUT_FORMAT_24BITS_RGB888	RGB888, 24 bits.
DISPLAY_OUT_FORMAT_18BITS_RGB666	RGB666, 18 bits.
DISPLAY_OUT_FORMAT_16BITS_RGB565	RGB565, 16 bits.
DISPLAY_OUT_FORMAT_8BITS_SERIAL	SERIAL, 8 bits.

◆ display_endian_t

enum display_endian_t	
Data endian select	
Enumerator	
DISPLAY_ENDIAN_LITTLE	Little-endian.
DISPLAY_ENDIAN_BIG	Big-endian.

◆ display_color_order_t

enum display_color_order_t	
RGB color order select	
Enumerator	
DISPLAY_COLOR_ORDER_RGB	Color order RGB.
DISPLAY_COLOR_ORDER_BGR	Color order BGR.

◆ display_signal_polarity_t

enum display_signal_polarity_t	
Polarity of a signal select	
Enumerator	
DISPLAY_SIGNAL_POLARITY_LOACTIVE	Low active signal.
DISPLAY_SIGNAL_POLARITY_HIACTIVE	High active signal.

◆ display_sync_edge_t

enum display_sync_edge_t	
Signal synchronization edge select	
Enumerator	
DISPLAY_SIGNAL_SYNC_EDGE_RISING	Signal is synchronized to rising edge.
DISPLAY_SIGNAL_SYNC_EDGE_FALLING	Signal is synchronized to falling edge.

◆ display_fade_control_t

enum display_fade_control_t	
Fading control	
Enumerator	
DISPLAY_FADE_CONTROL_NONE	Applying no fading control.
DISPLAY_FADE_CONTROL_FADEIN	Applying fade-in control.
DISPLAY_FADE_CONTROL_FADEOUT	Applying fade-out control.

◆ display_fade_status_t

enum display_fade_status_t	
Fading status	
Enumerator	
DISPLAY_FADE_STATUS_NOT_UNDERWAY	Fade-in/fade-out is not in progress.
DISPLAY_FADE_STATUS_FADING_UNDERWAY	Fade-in or fade-out is in progress.
DISPLAY_FADE_STATUS_PENDING	Fade-in/fade-out is configured but not yet started.

◆ display_color_keying_t

enum display_color_keying_t	
Color Keying enable or disable	
Enumerator	
DISPLAY_COLOR_KEYING_DISABLE	Color keying disable.
DISPLAY_COLOR_KEYING_ENABLE	Color keying enable.

◆ display_data_swap_t

enum display_data_swap_t
Data swap settings

7.3.7.3 JPEG Codec Interface

Interfaces » Graphics

Detailed Description

Interface for JPEG functions.

Data Structures

struct	jpeg_encode_image_size_t
struct	jpeg_callback_args_t
struct	jpeg_cfg_t
struct	jpeg_api_t
struct	jpeg_instance_t

Typedefs

typedef void	jpeg_ctrl_t

Enumerations

enum	jpeg_color_space_t
enum	jpeg_data_order_t
enum	jpeg_status_t
enum	jpeg_decode_pixel_format_t
enum	jpeg_decode_subsample_t

Data Structure Documentation

◆ **jpeg_encode_image_size_t**

struct jpeg_encode_image_size_t		
Image parameter structure		
Data Fields		
uint16_t	horizontal_stride_pixels	Horizontal stride.
uint16_t	horizontal_resolution	Horizontal Resolution in pixels.
uint16_t	vertical_resolution	Vertical Resolution in pixels.

◆ jpeg_callback_args_t

struct jpeg_callback_args_t		
Callback status structure		
Data Fields		
jpeg_status_t	status	JPEG status.
uint32_t	image_size	JPEG image size.
void const *	p_context	Pointer to user-provided context.

◆ jpeg_cfg_t

struct jpeg_cfg_t	
User configuration structure, used in open function.	
Data Fields	
IRQn_Type	jedi_irq
	Data transfer interrupt IRQ number.
IRQn_Type	jdti_irq
	Decompression interrupt IRQ number.
uint8_t	jdti_ipl
	Data transfer interrupt priority.
uint8_t	jedi_ipl
	Decompression interrupt priority.
jpeg_mode_t	default_mode
	Mode to use at startup.
jpeg_data_order_t	decode_input_data_order
	Input data stream byte order.

jpeg_data_order_t	decode_output_data_order
	Output data stream byte order.
jpeg_decode_pixel_format_t	pixel_format
	Pixel format.
uint8_t	alpha_value
	Alpha value to be applied to decoded pixel data. Only valid for ARGB8888 format.
void(*	p_decode_callback)(jpeg_callback_args_t *p_args)
	User-supplied callback functions.
void const *	p_decode_context
	Placeholder for user data. Passed to user callback in jpeg_callback_args_t.
jpeg_data_order_t	encode_input_data_order
	Input data stream byte order.
jpeg_data_order_t	encode_output_data_order
	Output data stream byte order.
uint16_t	dri_marker
	DRI Marker setting (0 = No DRI or RST marker)
uint16_t	horizontal_resolution
	Horizontal resolution of input image.

uint16_t	vertical_resolution
	Vertical resolution of input image.
uint16_t	horizontal_stride_pixels
	Horizontal stride of input image.
uint8_t const *	p_quant_luma_table
	Luma quantization table.
uint8_t const *	p_quant_chroma_table
	Chroma quantization table.
uint8_t const *	p_huffman_luma_ac_table
	Huffman AC table for luma.
uint8_t const *	p_huffman_luma_dc_table
	Huffman DC table for luma.
uint8_t const *	p_huffman_chroma_ac_table
	Huffman AC table for chroma.
uint8_t const *	p_huffman_chroma_dc_table
	Huffman DC table for chroma.
void(*	p_encode_callback)(jpeg_callback_args_t *p_args)
	User-supplied callback functions.
void const *	p_encode_context

	Placeholder for user data. Passed to user callback in jpeg_callback_args_t.

◆ jpeg_api_t

struct jpeg_api_t	
JPEG functions implemented at the HAL layer will follow this API.	
Data Fields	
fsp_err_t(*	open)(jpeg_ctrl_t *const p_ctrl, jpeg_cfg_t const *const p_cfg)
fsp_err_t(*	inputBufferSet)(jpeg_ctrl_t *const p_ctrl, void *p_buffer, uint32_t buffer_size)
fsp_err_t(*	outputBufferSet)(jpeg_ctrl_t *const p_ctrl, void *p_buffer, uint32_t buffer_size)
fsp_err_t(*	statusGet)(jpeg_ctrl_t *const p_ctrl, jpeg_status_t *const p_status)
fsp_err_t(*	close)(jpeg_ctrl_t *const p_ctrl)
fsp_err_t(*	horizontalStrideSet)(jpeg_ctrl_t *const p_ctrl, uint32_t horizontal_stride)
fsp_err_t(*	pixelFormatGet)(jpeg_ctrl_t *const p_ctrl, jpeg_color_space_t *const p_color_space)
fsp_err_t(*	imageSubsampleSet)(jpeg_ctrl_t *const p_ctrl, jpeg_decode_subsample_t horizontal_subsample, jpeg_decode_subsample_t vertical_subsample)

fsp_err_t(*	imageSizeGet)(jpeg_ctrl_t *const p_ctrl, uint16_t *p_horizontal_size, uint16_t *p_vertical_size)
fsp_err_t(*	imageSizeSet)(jpeg_ctrl_t *const p_ctrl, jpeg_encode_image_size_t *p_image_size)

fsp_err_t(*	modeSet)(jpeg_ctrl_t *const p_ctrl, jpeg_mode_t mode)

Field Documentation

◆ open

fsp_err_t(* jpeg_api_t::open) (jpeg_ctrl_t *const p_ctrl, jpeg_cfg_t const *const p_cfg)

Initial configuration

Precondition

none

Parameters

[in,out]	p_ctrl	Pointer to control block. Must be declared by user. Elements set here.
[in]	p_cfg	Pointer to configuration structure. All elements of this structure must be set by user.

◆ inputBufferSet

fsp_err_t(* jpeg_api_t::inputBufferSet) (jpeg_ctrl_t *const p_ctrl, void *p_buffer, uint32_t buffer_size)

Assign input data buffer to JPEG codec.

Precondition

the JPEG codec module must have been opened properly.

Note

The buffer starting address must be 8-byte aligned.

Parameters

[in]	p_ctrl	Control block set in jpeg_api_t::open call.
[in]	p_buffer	Pointer to the input buffer space
[in]	buffer_size	Size of the input buffer

◆ outputBufferSet

fsp_err_t(* jpeg_api_t::outputBufferSet) (jpeg_ctrl_t *const p_ctrl, void *p_buffer, uint32_t buffer_size)

Assign output buffer to JPEG codec for storing output data.

Precondition

The JPEG codec module must have been opened properly.

Note

The buffer starting address must be 8-byte aligned. For the decoding process, the HLD driver automatically computes the number of lines of the image to decoded so the output data fits into the given space. If the supplied output buffer is not able to hold the entire frame, the application should call the Output Full Callback function so it can be notified when additional buffer space is needed.

Parameters

[in]	p_ctrl	Control block set in jpeg_api_t::open call.
[in]	p_buffer	Pointer to the output buffer space
[in]	buffer_size	Size of the output buffer

◆ statusGet

fsp_err_t(* jpeg_api_t::statusGet) (jpeg_ctrl_t *const p_ctrl, jpeg_status_t *const p_status)

Retrieve current status of the JPEG codec module.

Precondition

the JPEG codec module must have been opened properly.

Parameters

[in]	p_ctrl	Control block set in jpeg_api_t::open call.
[out]	p_status	JPEG module status

◆ close

fsp_err_t(* jpeg_api_t::close) (jpeg_ctrl_t *const p_ctrl)

Cancel an outstanding operation.

Precondition

the JPEG codec module must have been opened properly.

Note

If the encoding or the decoding operation is finished without errors, the HLD driver automatically closes the device. In this case, application does not need to explicitly close the JPEG device.

Parameters

[in]	p_ctrl	Control block set in jpeg_api_t::open call.

◆ horizontalStrideSet

fsp_err_t(* jpeg_api_t::horizontalStrideSet) (jpeg_ctrl_t *const p_ctrl, uint32_t horizontal_stride)

Configure the horizontal stride value.

Precondition

The JPEG codec module must have been opened properly.

Parameters

[in]	p_ctrl	Control block set in jpeg_api_t::open call.
[in]	horizontal_stride	Horizontal stride value to be used for the decoded image data.
[in]	buffer_size	Size of the output buffer

◆ pixelFormatGet

fsp_err_t(* jpeg_api_t::pixelFormatGet) (jpeg_ctrl_t *const p_ctrl, jpeg_color_space_t *const p_color_space)

Get the input pixel format.

Precondition

the JPEG codec module must have been opened properly.

Parameters

[in]	p_ctrl	Control block set in jpeg_api_t::open call.
[out]	p_color_space	JPEG input format.

◆ imageSubsampleSet

fsp_err_t(* jpeg_api_t::imageSubsampleSet) (jpeg_ctrl_t *const p_ctrl, jpeg_decode_subsample_t horizontal_subsample, jpeg_decode_subsample_t vertical_subsample)

Configure the horizontal and vertical subsample settings.

Precondition

The JPEG codec module must have been opened properly.

Parameters

[in]	p_ctrl	Control block set in jpeg_api_t::open call.
[in]	horizontal_subsample	Horizontal subsample value
[in]	vertical_subsample	Vertical subsample value

◆ linesDecodedGet

fsp_err_t(* jpeg_api_t::linesDecodedGet) (jpeg_ctrl_t *const p_ctrl, uint32_t *const p_lines)

Return the number of lines decoded into the output buffer.

Precondition

the JPEG codec module must have been opened properly.

Parameters

[in]	p_ctrl	Control block set in jpeg_api_t::open call.
[out]	p_lines	Number of lines decoded

◆ imageSizeGet

fsp_err_t(* jpeg_api_t::imageSizeGet) (jpeg_ctrl_t *const p_ctrl, uint16_t *p_horizontal_size, uint16_t *p_vertical_size)

Retrieve image size during decoding operation.

Precondition

the JPEG codec module must have been opened properly.

Note

If the encoding or the decoding operation is finished without errors, the HLD driver automatically closes the device. In this case, application does not need to explicitly close the JPEG device.

Parameters

[in]	p_ctrl	Control block set in jpeg_api_t::open call.
[out]	p_horizontal_size	Image horizontal size, in number of pixels.
[out]	p_vertical_size	Image vertical size, in number of pixels.

◆ imageSizeSet

fsp_err_t(* jpeg_api_t::imageSizeSet) (jpeg_ctrl_t *const p_ctrl, jpeg_encode_image_size_t *p_image_size)

Set image parameters to JPEG Codec

Precondition

The JPEG codec module must have been opened properly.

Parameters

[in,out]	p_ctrl	Pointer to control block. Must be declared by user. Elements set here.
[in]	p_image_size	Pointer to the RAW image parameters

◆ modeSet

fsp_err_t(* jpeg_api_t::modeSet) (jpeg_ctrl_t *const p_ctrl, jpeg_mode_t mode)

Switch between encode and decode mode or vice-versa.

Precondition

The JPEG codec module must have been opened properly. The JPEG Codec can only perform one operation at a time and requires different configuration for encode and decode. This function facilitates easy switching between the two modes in case both are needed in an application.

Parameters

[in]	p_ctrl	Control block set in jpeg_api_t::open call.
[in]	mode	Mode to switch to

◆ jpeg_instance_t

struct jpeg_instance_t		
This structure encompasses everything that is needed to use an instance of this interface.		
Data Fields		
jpeg_ctrl_t *	p_ctrl	Pointer to the control structure for this instance.
jpeg_cfg_t const *	p_cfg	Pointer to the configuration structure for this instance.
jpeg_api_t const *	p_api	Pointer to the API structure for this instance.

Typedef Documentation

◆ jpeg_ctrl_t

typedef void jpeg_ctrl_t
JPEG decode control block. Allocate an instance specific control block to pass into the JPEG decode API calls.

Enumeration Type Documentation

◆ jpeg_color_space_t

enum jpeg_color_space_t	
Configuration for this module Image color space definitions	
Enumerator	
JPEG_COLOR_SPACE_YCBCR444	Color Space YCbCr 444.
JPEG_COLOR_SPACE_YCBCR422	Color Space YCbCr 422.
JPEG_COLOR_SPACE_YCBCR420	Color Space YCbCr 420.
JPEG_COLOR_SPACE_YCBCR411	Color Space YCbCr 411.

◆ jpeg_data_order_t

enum jpeg_data_order_t	
Multi-byte Data Format	
Enumerator	
JPEG_DATA_ORDER_NORMAL	(1)(2)(3)(4)(5)(6)(7)(8) Normal byte order
JPEG_DATA_ORDER_BYTE_SWAP	(2)(1)(4)(3)(6)(5)(8)(7) Byte Swap
JPEG_DATA_ORDER_WORD_SWAP	(3)(4)(1)(2)(7)(8)(5)(6) Word Swap
JPEG_DATA_ORDER_WORD_BYTE_SWAP	(4)(3)(2)(1)(8)(7)(6)(5) Word-Byte Swap
JPEG_DATA_ORDER_LONGWORD_SWAP	(5)(6)(7)(8)(1)(2)(3)(4) Longword Swap
JPEG_DATA_ORDER_LONGWORD_BYTE_SWAP	(6)(5)(8)(7)(2)(1)(4)(3) Longword Byte Swap
JPEG_DATA_ORDER_LONGWORD_WORD_SWAP	(7)(8)(5)(6)(3)(4)(1)(2) Longword Word Swap
JPEG_DATA_ORDER_LONGWORD_WORD_BYTE_SWAP	(8)(7)(6)(5)(4)(3)(2)(1) Longword Word Byte Swap

◆ jpeg_status_t

enum jpeg_status_t	
JPEG HLD driver internal status information. The driver can simultaneously be in more than any one status at the same time. Parse the status bit-fields using the definitions in this enum to determine driver status	
Enumerator	
JPEG_STATUS_NONE	JPEG codec module is not initialized.
JPEG_STATUS_IDLE	JPEG Codec module is open but not running.
JPEG_STATUS_RUNNING	JPEG Codec is running.
JPEG_STATUS_HEADER_PROCESSING	JPEG Codec module is reading the JPEG header information.
JPEG_STATUS_INPUT_PAUSE	JPEG Codec paused waiting for more input data.
JPEG_STATUS_OUTPUT_PAUSE	JPEG Codec paused after it decoded the number of lines specified by user.
JPEG_STATUS_IMAGE_SIZE_READY	JPEG decoding operation obtained image size, and paused.
JPEG_STATUS_ERROR	JPEG Codec module encountered an error.
JPEG_STATUS_OPERATION_COMPLETE	JPEG Codec has completed the operation.

◆ jpeg_decode_pixel_format_t

enum jpeg_decode_pixel_format_t	
Pixel Data Format	
Enumerator	
JPEG_DECODE_PIXEL_FORMAT_ARGB8888	Pixel Data ARGB8888 format.
JPEG_DECODE_PIXEL_FORMAT_RGB565	Pixel Data RGB565 format.

◆ jpeg_decode_subsample_t

enum jpeg_decode_subsample_t	
Data type for horizontal and vertical subsample settings. This setting applies only to the decoding operation.	
Enumerator	
JPEG_DECODE_OUTPUT_NO_SUBSAMPLE	No subsample. The image is decoded with no reduction in size.
JPEG_DECODE_OUTPUT_SUBSAMPLE_HALF	The output image size is reduced by half.
JPEG_DECODE_OUTPUT_SUBSAMPLE_ONE_QUARTER	The output image size is reduced to one-quarter.
JPEG_DECODE_OUTPUT_SUBSAMPLE_ONE_EIGHTH	The output image size is reduced to one-eighth.

7.3.7.4 MIPI DSI Interface

Interfaces » Graphics

Detailed Description

Interface for MIPI DSI communications.

Summary

The MIPI DSI interface provides functionality involved with driving display panels over MIPI.

Data Structures

struct	mipi_dsi_cmd_t
union	mipi_dsi_ack_err_status_t
struct	mipi_dsi_status_t
struct	mipi_dsi_callback_args_t
struct	mipi_dsi_timing_t
struct	mipi_dsi_cfg_t
struct	mipi_dsi_api_t

struct	mipi_dsi_instance_t

Typedefs

typedef __PACKED_STRUCT	st_mipi_dsi_result Data of received packet header. More...
typedef void	mipi_dsi_ctrl_t

Enumerations

enum	mipi_dsi_cmd_id_t
enum	mipi_dsi_dcs_id_t
enum	mipi_dsi_video_data_t
enum	mipi_dsi_ack_err_t
enum	mipi_dsi_vc_t

enum	mipi_dsi_phy_status_t
enum	mipi_dsi_link_status_t
enum	mipi_dsi_lane_t

Variables

mipi_dsi_cmd_id_t	cmd_id Data type.
uint8_t	virtual_channel_id Virtual channel ID.

uint8_t	long_packet Sort packet (0) or Long packet (1)
uint8_t	rx_success Response packet or ack trigger received.
uint8_t	timeout Fatal timeout error.
uint8_t	rx_fail Expected receive not done.
uint8_t	rx_data_fail Receive packet data fail.
uint8_t	rx_correctable_error Correctable error detected.
uint8_t	rx_ack_err Rx acknowledge and error report packet received.
uint8_t	info_overwrite This information was overwritten.

Data Structure Documentation

◆ mipi_dsi_cmd_t

struct mipi_dsi_cmd_t		
MIPI DSI Command		
Data Fields		
uint8_t	channel	Virtual Channel ID.
mipi_dsi_cmd_id_t	cmd_id	Message ID.
mipi_dsi_cmd_flag_t	flags	Flags controlling this message transition.

uint16_t	tx_len	Transmit buffer size.
const uint8_t *	p_tx_buffer	Transmit buffer pointer.
const uint8_t *	p_rx_buffer	Receive buffer pointer.

◆ mipi_dsi_ack_err_status_t

union mipi_dsi_ack_err_status_t		
MIPI DSI Acknowledge and Error status type		
Data Fields		
	__PACKED_STRUCT	Error report bits.
mipi_dsi_vc_t	virtual_channel: 4	Virtual Channel ID.
uint32_t	__pad0__: 12	
uint32_t	bits	

◆ mipi_dsi_status_t

struct mipi_dsi_status_t		
MIPI DSI status type		
Data Fields		
mipi_dsi_link_status_t	link_status	Link status.
mipi_dsi_ack_err_status_t	ack_err_latest	Latest Acknowledge and Error Report Packet Latest Info.
mipi_dsi_ack_err_status_t	ack_err_accumulated	Accumulated Acknowledge and Error Report Packet Latest Info.

◆ mipi_dsi_callback_args_t

struct mipi_dsi_callback_args_t		
MIPI DSI callback parameter definition		
Data Fields		
mipi_dsi_event_t	event	Event code.
union mipi_dsi_callback_args_t	__unnamed__	
mipi_dsi_receive_result_t *	p_result	Receive result pointer.
void const *	p_context	Context provided to user during callback.

◆ mipi_dsi_timing_t

struct mipi_dsi_timing_t		
MIPI DSI transition timing		
Data Fields		
uint32_t	clock_stop_time	Clock stop time.

uint32_t	clock_beforehand_time	Clock beforehand time.
uint32_t	clock_keep_time	Clock Keep time.
uint32_t	go_lp_and_back	Go LP and Back time.

◆ mipi_dsi_cfg_t

struct mipi_dsi_cfg_t	
MIPI DSI main configuration structure	
Data Fields	
mipi_phy_instance_t const *	p_mipi_phy_instance
	Pointer to mipi physical layer instance.
mipi_dsi_timing_t const *	p_timing
	Pointer to MIPI DSI timing configuration.
bool	hsa_no_lp
	Suppress the transition to LP during HSA period and keep HS.
bool	hbp_no_lp
	Suppress the transition to LP during HBP period and keep HS.
bool	hfp_no_lp
	Suppress the transition to LP during HFP period and keep HS.
uint8_t	num_lanes
	Number of MIPI lanes to use.
uint8_t	ulps_wakeup_period
	ULPS wakeup period.
uint8_t	continuous_clock

	Always run HS clock on/off.
uint32_t	hs_tx_timeout
	HS-Tx Timeout value.
uint32_t	lp_rx_timeout
	LP-Rx host processor timeout.
uint32_t	turnaround_timeout
	Turnaround Acknowledge Timeout.
uint32_t	bta_timeout
	Peripheral Response Timeout.
uint32_t	lprw_timeout
	LP Read and Write Timeouts.
uint32_t	hsrw_timeout
	HS Read and Write Timeouts.
uint32_t	max_return_packet_size
	Maximum return packet size.
bool	ecc_enable
	ECC Check enable.
mipi_dsi_vc_t	crc_check_mask
	Virtual channel CRC check enable.

bool	scramble_enable
	Scramble on/off.
bool	tearing_detect
	External tearing effect detection mode (0:rising, 1:falling edge)
bool	eotp_enable
	End of Transmit Packet (EoTP) on/off.
bool	sync_pulse
	Enable for Non-Burst Mode with Sync Pulse sequence.
mipi_dsi_video_data_t	data_type
	Video mode data type: 16-bit RGB, 18-bit RGB, 24-bit RGB.
uint8_t	virtual_channel_id
	Video mode virtual channel to use (from 0x0 to 0x3)
uint32_t	vertical_sync_lines
	Number of vertical sync active lines.
bool	vertical_sync_polarity
	V-Sync Polarity.
uint32_t	vertical_active_lines
	Number of vertical active lines.

uint32_t	vertical_back_porch
	Vertical back porch.
uint32_t	vertical_front_porch
	Vertical front porch.
uint32_t	horizontal_sync_lines
	Number of horizontal sync active lines.
bool	horizontal_sync_polarity
	H-Sync Polarity.
uint32_t	horizontal_active_lines
	Number of horizontal active lines.
uint32_t	horizontal_back_porch
	Horizontal back porch.
uint32_t	horizontal_front_porch
	Horizontal front porch.
void(*	p_callback)(mipi_dsi_callback_args_t *p_args)
	Pointer to callback function. More...
void const *	p_context
	User defined context passed into callback function.
void const *	p_extend

	MIPI hardware dependent configuration. More...

Field Documentation

◆ p_callback

void(* mipi_dsi_cfg_t::p_callback) (mipi_dsi_callback_args_t *p_args)
Pointer to callback function. Callback configuration

◆ p_extend

void const* mipi_dsi_cfg_t::p_extend
MIPI hardware dependent configuration. Pointer to display peripheral specific configuration

◆ mipi_dsi_api_t

struct mipi_dsi_api_t	
Shared Interface definition for MIPI DSI peripheral	
Data Fields	
fsp_err_t(*	open)(mipi_dsi_ctrl_t *const p_ctrl, mipi_dsi_cfg_t const *const p_cfg)
fsp_err_t(*	close)(mipi_dsi_ctrl_t *const p_ctrl)
fsp_err_t(*	start)(mipi_dsi_ctrl_t *const p_ctrl)
fsp_err_t(*	stop)(mipi_dsi_ctrl_t *const p_ctrl)
fsp_err_t(*	ulpsEnter)(mipi_dsi_ctrl_t *const p_ctrl, mipi_dsi_lane_t lane)
fsp_err_t(*	ulpsExit)(mipi_dsi_ctrl_t *const p_ctrl, mipi_dsi_lane_t lane)
fsp_err_t(*	command)(mipi_dsi_ctrl_t *const p_api_ctrl, mipi_dsi_cmd_t *p_cmd)
fsp_err_t(*	statusGet)(mipi_dsi_ctrl_t *const p_ctrl, mipi_dsi_status_t *p_status)

Field Documentation

◆ open

fsp_err_t(* mipi_dsi_api_t::open) (mipi_dsi_ctrl_t *const p_ctrl, mipi_dsi_cfg_t const *const p_cfg)

Open MIPI DSI device.

Parameters

[in,out]	p_ctrl	Pointer to MIPI DSI interface control block. Must be declared by user. Value set here.
[in]	p_cfg	Pointer to MIPI DSI configuration structure. All elements of this structure must be set by user.

◆ close

fsp_err_t(* mipi_dsi_api_t::close) (mipi_dsi_ctrl_t *const p_ctrl)

Close MIPI DSI device.

Parameters

[in]	p_ctrl	Pointer to MIPI DSI interface control block.

◆ start

fsp_err_t(* mipi_dsi_api_t::start) (mipi_dsi_ctrl_t *const p_ctrl)

Start pixel data output.

Parameters

[in]	p_ctrl	Pointer to MIPI DSI interface control block.

◆ stop

fsp_err_t(* mipi_dsi_api_t::stop) (mipi_dsi_ctrl_t *const p_ctrl)

Stop pixel data output.

Parameters

[in]	p_ctrl	Pointer to MIPI DSI interface control block.

◆ ulpsEnter

fsp_err_t(* mipi_dsi_api_t::ulpsEnter) (mipi_dsi_ctrl_t *const p_ctrl, mipi_dsi_lane_t lane)

Enter Ultra-low Power State (ULPS).

Parameters

[in]	p_ctrl	Pointer to MIPI DSI interface control block.
[in]	lane	Physical lane(s) to transition into ULPS

◆ ulpsExit

fsp_err_t(* mipi_dsi_api_t::ulpsExit) (mipi_dsi_ctrl_t *const p_ctrl, mipi_dsi_lane_t lane)

Exit Ultra-low Power State (ULPS).

Parameters

[in]	p_ctrl	Pointer to MIPI DSI interface control block.
[in]	lane	Physical lane(s) to transition from ULPS

◆ command

fsp_err_t(* mipi_dsi_api_t::command) (mipi_dsi_ctrl_t *const p_api_ctrl, mipi_dsi_cmd_t *p_cmd)

Send a command to the display.

Parameters

[in]	p_ctrl	Pointer to MIPI DSI interface control block.
[in]	p_cmd	Pointer to a command structure

◆ statusGet

fsp_err_t(* mipi_dsi_api_t::statusGet) (mipi_dsi_ctrl_t *const p_ctrl, mipi_dsi_status_t *p_status)

Get status of MIPI link.

Parameters

[in]	p_ctrl	Pointer to MIPI DSI interface control block.
[in]	p_status	Pointer to MIPI DSI interface status structure.

◆ mipi_dsi_instance_t

struct mipi_dsi_instance_t		
This structure encompasses everything that is needed to use an instance of this interface.		
Data Fields		
mipi_dsi_ctrl_t *	p_ctrl	Pointer to the control structure for this instance.
mipi_dsi_cfg_t const *	p_cfg	Pointer to the configuration structure for this instance.
mipi_dsi_api_t const *	p_api	Pointer to the API structure for this instance.

Typedef Documentation

◆ st_mipi_dsi_result

typedef __PACKED_STRUCT st_mipi_dsi_result
Data of received packet header. MIPI DSI Result

◆ mipi_dsi_ctrl_t

typedef void mipi_dsi_ctrl_t
MIPI DSI control block. Allocate an instance specific control block to pass into the MIPI DSI API calls.

Enumeration Type Documentation

◆ mipi_dsi_cmd_id_t

enum mipi_dsi_cmd_id_t	
MIPI DSI packet Data Type (commands) - See MIPI specification for additional information	
Enumerator	
MIPI_DSI_CMD_ID_V_SYNC_START	(Short) Sync Event, V Sync Start
MIPI_DSI_CMD_ID_V_SYNC_END	(Short) Sync Event, V Sync End
MIPI_DSI_CMD_ID_H_SYNC_START	(Short) Sync Event, H Sync Start
MIPI_DSI_CMD_ID_H_SYNC_END	(Short) Sync Event, H Sync End
MIPI_DSI_CMD_ID_COMPRESSION_MODE	(Short) Compression Mode Command
MIPI_DSI_CMD_ID_END_OF_TRANSMISSION	(Short) End of Transmission packet (EoTp)
MIPI_DSI_CMD_ID_COLOR_MODE_OFF	(Short) Color Mode (CM) Off Command
MIPI_DSI_CMD_ID_COLOR_MODE_ON	(Short) Color Mode (CM) On Command
MIPI_DSI_CMD_ID_SHUTDOWN_PERIPHERAL	(Short) Shut Down Peripheral Command
MIPI_DSI_CMD_ID_TURN_ON_PERIPHERAL	(Short) Turn On Peripheral Command
MIPI_DSI_CMD_ID_GENERIC_SHORT_WRITE_0_PARAM	(Short) Generic Short WRITE, no parameters
MIPI_DSI_CMD_ID_GENERIC_SHORT_WRITE_1_PARAM	(Short) Generic Short WRITE, 1 parameter
MIPI_DSI_CMD_ID_GENERIC_SHORT_WRITE_2_PARAM	(Short) Generic Short WRITE, 2 parameters
MIPI_DSI_CMD_ID_GENERIC_READ_REQUEST_0_PARAM	(Short) Generic READ, no parameters
MIPI_DSI_CMD_ID_GENERIC_READ_REQUEST_1_PARAM	(Short) Generic READ, 1 parameter
MIPI_DSI_CMD_ID_GENERIC_READ_REQUEST_2_PARAM	(Short) Generic READ, 2 parameters
MIPI_DSI_CMD_ID_DCS_SHORT_WRITE_0_PARAM	(Short) DCS Short WRITE, no parameters
MIPI_DSI_CMD_ID_DCS_SHORT_WRITE_1_PARAM	(Short) DCS Short WRITE, 1 parameter
MIPI_DSI_CMD_ID_DCS_READ	(Short) DCS READ, no parameters
MIPI_DSI_CMD_ID_EXECUTE_QUEUE	(Short) Execute Queue

MIPI_DSI_CMD_ID_SET_MAXIMUM_RETURN_PACKET_SIZE	(Short) Set Maximum Return Packet Size
MIPI_DSI_CMD_ID_NULL_PACKET	(Long) Null Packet, no data
MIPI_DSI_CMD_ID_BLANKING_PACKET	(Long) Blanking Packet, no data
MIPI_DSI_CMD_ID_GENERIC_LONG_WRITE	(Long) Generic Long Write
MIPI_DSI_CMD_ID_DCS_LONG_WRITE	(Long) DCS Long Write/write_LUT Command Packet
MIPI_DSI_CMD_ID_PICTURE_PARAMETER_SET	(Long) Picture Parameter Set
MIPI_DSI_CMD_ID_COMPRESSED_PIXEL_STREAM	(Long) Compressed Pixel Stream
MIPI_DSI_CMD_ID_LOOSELY_PACKED_PIXEL_STREAM_YCBCR20	(Long) Loosely Packed Pixel Stream, 20-bit YCbCr, 4:2:2 Format
MIPI_DSI_CMD_ID_PACKED_PIXEL_STREAM_YCBCR24	(Long) Packed Pixel Stream, 24-bit YCbCr, 4:2:2 Format
MIPI_DSI_CMD_ID_PACKED_PIXEL_STREAM_YCBCR16	(Long) Packed Pixel Stream, 16-bit YCbCr, 4:2:2 Format
MIPI_DSI_CMD_ID_PACKED_PIXEL_STREAM_30	(Long) Packed Pixel Stream, 30-bit RGB, 10-10-10 Format
MIPI_DSI_CMD_ID_PACKED_PIXEL_STREAM_36	(Long) Packed Pixel Stream, 36-bit RGB, 12-12-12 Format
MIPI_DSI_CMD_ID_PACKED_PIXEL_STREAM_YCBCR12	(Long) Packed Pixel Stream, 12-bit YCbCr, 4:2:0 Format
MIPI_DSI_CMD_ID_PACKED_PIXEL_STREAM_16	(Long) Packed Pixel Stream, 16-bit RGB, 5-6-5 Format
MIPI_DSI_CMD_ID_PACKED_PIXEL_STREAM_18	(Long) Packed Pixel Stream, 18-bit RGB, 6-6-6 Format
MIPI_DSI_CMD_ID_LOOSELY_PACKED_PIXEL_STREAM_18	(Long) Loosely Packed Pixel Stream, 18-bit RGB, 6-6-6 Format
MIPI_DSI_CMD_ID_PACKED_PIXEL_STREAM_24	(Long) Packed Pixel Stream, 24-bit RGB, 8-8-8 Format

◆ mipi_dsi_dcs_id_t

enum mipi_dsi_dcs_id_t	
MIPI DCS ID types - See MIPI DCS specification for additional information	
Enumerator	
MIPI_DSI_DCS_ID_ENTER_IDLE_MODE	Enter idle mode.
MIPI_DSI_DCS_ID_ENTER_INVERT_MODE	Displayed image colors inverted.
MIPI_DSI_DCS_ID_ENTER_NORMAL_MODE	Whole display area used for image.
MIPI_DSI_DCS_ID_ENTER_PARTIAL_MODE	Part of display area used for image.
MIPI_DSI_DCS_ID_ENTER_SLEEP_MODE	Power off the display panel.
MIPI_DSI_DCS_ID_EXIT_IDLE_MODE	Full color depth used.
MIPI_DSI_DCS_ID_EXIT_INVERT_MODE	Displayed image colors not inverted.
MIPI_DSI_DCS_ID_EXIT_SLEEP_MODE	Power on the display panel.
MIPI_DSI_DCS_ID_GET_3D_CONTROL	Get display module 3D mode.
MIPI_DSI_DCS_ID_GET_ADDRESS_MODE	Get data order for transfers from host to the display device.
MIPI_DSI_DCS_ID_GET_BLUE_CHANNEL	Get blue component of pixel at 0,0.
MIPI_DSI_DCS_ID_GET_CABC_MIN_BRIGHTNESS	Get current minimum brightness level of the active CABC mode.
MIPI_DSI_DCS_ID_GET_COMPRESSION_MODE	Get current compression mode.
MIPI_DSI_DCS_ID_GET_CONTROL_DISPLAY	Get control display mode.
MIPI_DSI_DCS_ID_GET_DIAGNOSTIC_RESULT	Get peripheral self-diagnostic result.
MIPI_DSI_DCS_ID_GET_DISPLAY_BRIGHTNESS	Get current display brightness level.
MIPI_DSI_DCS_ID_GET_DISPLAY_MODE	Get current display mode from the peripheral.
MIPI_DSI_DCS_ID_GET_DSI_MODE	Get DSI operation mode.
MIPI_DSI_DCS_ID_GET_ERROR_COUNT_ON_DSI	Get number of corrupted packets on DSI.
MIPI_DSI_DCS_ID_GET_GREEN_CHANNEL	Get green component of pixel at 0,0.

MIPI_DSI_DCS_ID_GET_IMAGE_CHECKSUM_CT	Returns checksum of frame of color-transformed pixel data.
MIPI_DSI_DCS_ID_GET_IMAGE_CHECKSUM_RGB	Returns checksum of frame of RGB pixel data.
MIPI_DSI_DCS_ID_GET_PIXEL_FORMAT	Get current pixel format.
MIPI_DSI_DCS_ID_GET_POWER_MODE	Get current power mode.
MIPI_DSI_DCS_ID_GET_POWER_SAVE	Get current power-save mode.
MIPI_DSI_DCS_ID_GET_RED_CHANNEL	Get red component of pixel at 0,0.
MIPI_DSI_DCS_ID_GET_SCANLINE	Get current scanline.
MIPI_DSI_DCS_ID_GET_SIGNAL_MODE	Get display module signaling mode.
MIPI_DSI_DCS_ID_NOP	No operation.
MIPI_DSI_DCS_ID_READ_ACMD	Perform read access to the ACMD registers.
MIPI_DSI_DCS_ID_READ_DDB_CONTINUE	Continue reading the DDB from the last read location.
MIPI_DSI_DCS_ID_READ_DDB_START	Read the DDB from the provided location.
MIPI_DSI_DCS_ID_READ_DSE_MAILBOX	Read access to the registers of the DSE read or write control mailbox.
MIPI_DSI_DCS_ID_READ_MEMORY_CONTINUE	Read image data from peripheral, continuing after last read.
MIPI_DSI_DCS_ID_READ_MEMORY_START	Read image data from the peripheral to the host.
MIPI_DSI_DCS_ID_READ_PPS_CONTINUE	Continue reading the specified length of PPS data.
MIPI_DSI_DCS_ID_READ_PPS_START	Read PPS data.
MIPI_DSI_DCS_ID_SET_3D_CONTROL	3D is used on the display panel
MIPI_DSI_DCS_ID_SET_ADDRESS_MODE	Set data order for transfers from host to peripheral.
MIPI_DSI_DCS_ID_SET_ARP_OFF	Disable ARP.
MIPI_DSI_DCS_ID_SET_ARP_ON	Enable ARP and set T2 timer.

MIPI_DSI_DCS_ID_SET_CABC_MIN_BRIGHTNESS	Set minimum brightness level for CABC mode.
MIPI_DSI_DCS_ID_SET_COLUMN_ADDRESS	Set column extent.
MIPI_DSI_DCS_ID_SET_DISPLAY_BRIGHTNESS	Set display brightness level.
MIPI_DSI_DCS_ID_SET_DISPLAY_OFF	Blank the display device.
MIPI_DSI_DCS_ID_SET_DISPLAY_ON	Show image on display device.
MIPI_DSI_DCS_ID_SET_DSI_MODE	Set DSI operation mode.
MIPI_DSI_DCS_ID_SET_GAMMA_CURVE	Select gamma curve used by display.
MIPI_DSI_DCS_ID_SET_PAGE_ADDRESS	Set page extent.
MIPI_DSI_DCS_ID_SET_PARTIAL_COLUMNS	Define the number of columns in the partial display area.
MIPI_DSI_DCS_ID_SET_PARTIAL_ROWS	Define the number of rows in the partial display area.
MIPI_DSI_DCS_ID_SET_PIXEL_FORMAT	Define how many bits per pixel are used.
MIPI_DSI_DCS_ID_SET_SCROLL_AREA	Define vertical scrolling and fixed area.
MIPI_DSI_DCS_ID_SET_SCROLL_START	Define vertical scrolling starting point.
MIPI_DSI_DCS_ID_SET_TEAR_OFF	Sync information not sent from the display module to the host.
MIPI_DSI_DCS_ID_SET_TEAR_ON	Sync information is sent from the display module to the host.
MIPI_DSI_DCS_ID_SET_TEAR_SCANLINE	Sync information is sent from display to the host when display refresh reaches profivided scan line.
MIPI_DSI_DCS_ID_SET_VSYNC_TIMING	Set VSYNC timing to the specified length of PPS data.
MIPI_DSI_DCS_ID_SOFT_RESET	Software reset.
MIPI_DSI_DCS_ID_WRITE_ACMD	Write access to ACMD registers.
MIPI_DSI_DCS_ID_WRITE_CONTROL_DISPLAY	Write control mode of display brightness.
MIPI_DSI_DCS_ID_WRITE_DSE_MAILBOX	Write registers of DSE read or write control mailbox.

MIPI_DSI_DCS_ID_WRITE_LUT	Fill peripheral look-up table with provided data.
MIPI_DSI_DCS_ID_WRITE_MEMORY_CONTINUE	Continue image information transfer from last address.
MIPI_DSI_DCS_ID_WRITE_MEMORY_START	Transfer image information from host to peripheral.
MIPI_DSI_DCS_ID_WRITE_POWER_SAVE	Writes power save mode.

◆ mipi_dsi_video_data_t

enum mipi_dsi_video_data_t	
MIPI DSI Video Data type	
Enumerator	
MIPI_DSI_VIDEO_DATA_16RGB_PIXEL_STREAM	16-bit RGB Packed Pixel Stream
MIPI_DSI_VIDEO_DATA_18RGB_PIXEL_STREAM	18-bit RGB Packed Pixel Stream
MIPI_DSI_VIDEO_DATA_18RGB_LOOSELY_PIXEL_STREAM	18-bit RGB Loosely Packed Pixel Stream
MIPI_DSI_VIDEO_DATA_24RGB_PIXEL_STREAM	24-bit RGB Packed Pixel Stream

◆ mipi_dsi_ack_err_t

enum mipi_dsi_ack_err_t	
MIPI DSI Acknowledge and Error type	
Enumerator	
MIPI_DSI_ACK_ERR_NONE	No Errors.
MIPI_DSI_ACK_ERR_SOT_ERROR	SoT Error.
MIPI_DSI_ACK_ERR_SOT_SYNC_ERROR	SoT Sync Error.
MIPI_DSI_ACK_ERR_EOT_SYNC_ERROR	EoT Sync Error.
MIPI_DSI_ACK_ERR_ESCAPE_ENTRY_ERROR	Escape Mode Entry Error.
MIPI_DSI_ACK_ERR_LOW_POWER_SYNC_ERROR	Low-Power Transmit Sync Error.
MIPI_DSI_ACK_ERR_PERIPHERAL_TIMEOUT_ERRO R	Peripheral Timeout Error.
MIPI_DSI_ACK_ERR_FALSE_CONTROL_ERROR	False Control Error.
MIPI_DSI_ACK_ERR_CONTENTION_DETECTED	Contention Detected Error.
MIPI_DSI_ACK_ERR_ECC_SINGLE	ECC Error, single-bit.
MIPI_DSI_ACK_ERR_ECC_MULTI	ECC Error, multi-bit.
MIPI_DSI_ACK_ERR_CKSM_ERROR	Checksum Error (Long packet only)
MIPI_DSI_ACK_ERR_DSI_DATA_ERROR	DSI Data Type Not Recognized.
MIPI_DSI_ACK_ERR_DSI_VC_ID_ERROR	DSI VC ID Invalid.
MIPI_DSI_ACK_ERR_INVALID_TX_LEN	Invalid Transmission Length.
MIPI_DSI_ACK_ERR_DSI_PROTOCOL_VIOLATION	DSI Protocol Violation.

◆ mipi_dsi_vc_t

enum mipi_dsi_vc_t	
Enumerator	
MIPI_DSI_VC_NONE	No channels selected.
MIPI_DSI_VC_0	Virtual channel 0.
MIPI_DSI_VC_1	Virtual channel 1.
MIPI_DSI_VC_2	Virtual channel 2.
MIPI_DSI_VC_3	Virtual channel 3.

◆ mipi_dsi_cmd_flag_t

enum mipi_dsi_cmd_flag_t	
MIPI DSI Message Flags	
Enumerator	
MIPI_DSI_CMD_FLAG_NONE	No flags.
MIPI_DSI_CMD_FLAG_BTA	Assert bus turnaround at end of transfer.
MIPI_DSI_CMD_FLAG_BTA_READ	Assert bus turnaround followed by read request (No WRITE request before BTA)
MIPI_DSI_CMD_FLAG_BTA_NO_WRITE	Immediately assert bus turnaround (No WRITE request before BTA)
MIPI_DSI_CMD_FLAG_AUX_OPERATION	Execute auxiliary operation command.
MIPI_DSI_CMD_FLAG_ACT_CODE_RESET_TRIGGER	Send action code reset trigger message.
MIPI_DSI_CMD_FLAG_ACT_CODE_INITIAL_SKEW_CAL	Send action code initial skew calibration message.
MIPI_DSI_CMD_FLAG_ACT_CODE_PERIODIC_SKEW_CAL	Send action code periodic skew message.
MIPI_DSI_CMD_FLAG_ACT_CODE_NO_OPERATION	Send action code NOOP message.
MIPI_DSI_CMD_FLAG_LOW_POWER	Transmit in low-power mode.

◆ mipi_dsi_event_t

enum mipi_dsi_event_t	
MIPI DSI event codes	
Enumerator	
MIPI_DSI_EVENT_SEQUENCE_0	Sequence 0 event (Low-Power)
MIPI_DSI_EVENT_SEQUENCE_1	Sequence 1 event (High-Speed)
MIPI_DSI_EVENT_VIDEO	Video event.
MIPI_DSI_EVENT_RECEIVE	Receive event.
MIPI_DSI_EVENT_FATAL	Fatal event.
MIPI_DSI_EVENT_PHY	Physical layer event.
MIPI_DSI_EVENT_POST_OPEN	Interface has been opened. Perform post-open application processing.
MIPI_DSI_EVENT_PRE_START	Video is about to start. Perform pre-video application processing.

◆ mipi_dsi_sequence_status_t

enum mipi_dsi_sequence_status_t	
MIPI DSI Sequence status	
Enumerator	
MIPI_DSI_SEQUENCE_STATUS_NONE	Sequence status not set.
MIPI_DSI_SEQUENCE_STATUS_RUNNING	Sequence operation in progress.
MIPI_DSI_SEQUENCE_STATUS_ACTIONS_FINISHED	All descriptor actions finished.
MIPI_DSI_SEQUENCE_STATUS_DESCRIPTORS_FINISHED	All descriptors finished.
MIPI_DSI_SEQUENCE_STATUS_DESCRIPTOR_ABORT	Descriptor abort interrupt.
MIPI_DSI_SEQUENCE_STATUS_SIZE_ERROR	Packet size error.
MIPI_DSI_SEQUENCE_STATUS_TX_INTERNAL_BUS_ERROR	Tx internal bus error.
MIPI_DSI_SEQUENCE_STATUS_RX_FATAL_ERROR	Receive fatal error.
MIPI_DSI_SEQUENCE_STATUS_RX_FAIL	Receive fail.
MIPI_DSI_SEQUENCE_STATUS_RX_PACKET_DATA_FAIL	Receive packet data fail.
MIPI_DSI_SEQUENCE_STATUS_RX_CORRECTABLE_ERROR	Receive correctable error.
MIPI_DSI_SEQUENCE_STATUS_RX_ACK_AND_ERROR	Receive acknowledge and error report.

◆ mipi_dsi_video_status_t

enum mipi_dsi_video_status_t	
MIPI DSI video status errors	
Enumerator	
MIPI_DSI_VIDEO_STATUS_NONE	Video status not set.
MIPI_DSI_VIDEO_STATUS_START	Video started event.
MIPI_DSI_VIDEO_STATUS_STOP	Video stopped event.
MIPI_DSI_VIDEO_STATUS_RUNNING	Video running status.
MIPI_DSI_VIDEO_STATUS_READY	Video ready event.
MIPI_DSI_VIDEO_STATUS_TIMING_ERROR	Video timing error event.
MIPI_DSI_VIDEO_STATUS_UNDERFLOW	Video buffer underflow event.
MIPI_DSI_VIDEO_STATUS_OVERFLOW	Video buffer overflow event.

◆ mipi_dsi_receive_status_t

enum mipi_dsi_receive_status_t	
MIPI DSI receive status errors	
Enumerator	
MIPI_DSI_RECEIVE_STATUS_NONE	Receive status not set.
MIPI_DSI_RECEIVE_STATUS_BTA_REQUEST_END	Receive BTA request end.
MIPI_DSI_RECEIVE_STATUS_LP_RX_HOST_TIMEOUT	Receive low power receive timeout.
MIPI_DSI_RECEIVE_STATUS_BTA_ACK_TIMEOUT	Receive BTA ack timeout.
MIPI_DSI_RECEIVE_STATUS_RESPONSE_PACKET	Receive response.
MIPI_DSI_RECEIVE_STATUS_EOTP	Receive end of transmission packet.
MIPI_DSI_RECEIVE_STATUS_TEARING_TRIGGER	Receive tearing trigger.
MIPI_DSI_RECEIVE_STATUS_ACK_TRIGGER	Receive ack trigger.
MIPI_DSI_RECEIVE_STATUS_TEARING_DETECT	Receive tearing detect.

MIPI_DSI_RECEIVE_STATUS_MALFORM_ERROR	Receive malform error.
MIPI_DSI_RECEIVE_STATUS_ECC_MULTI	Receive ecc multi-bit error.
MIPI_DSI_RECEIVE_STATUS_UNEXPECTED_PACKET	Receive unexpected packet.
MIPI_DSI_RECEIVE_STATUS_WORD_COUNT	Receive word count.
MIPI_DSI_RECEIVE_STATUS_CRC	Receive crc error.
MIPI_DSI_RECEIVE_STATUS_INTERNAL_BUS	Receive internal bus error.
MIPI_DSI_RECEIVE_STATUS_BUFFER_OVERFLOW	Receive buffer overflow.
MIPI_DSI_RECEIVE_STATUS_TIMEOUT	Receive timeout.
MIPI_DSI_RECEIVE_STATUS_NO_RESPONSE	Receive no response.
MIPI_DSI_RECEIVE_STATUS_PACKET_SIZE	Receive packet size error.
MIPI_DSI_RECEIVE_STATUS_ECC_SINGLE	Receive ecc single bit error.
MIPI_DSI_RECEIVE_STATUS_ACK_AND_ERROR	Receive ack and error.

◆ mipi_dsi_fatal_status_t

enum mipi_dsi_fatal_status_t	
MIPI DSI fatal status errors	
Enumerator	
MIPI_DSI_FATAL_STATUS_NONE	Fatal status not set.
MIPI_DSI_FATAL_STATUS_HS_TX_TIMEOUT	Fatal high speed transmit timeout.
MIPI_DSI_FATAL_STATUS_LP_RX_TIMEOUT	Fatal low power receive timeout.
MIPI_DSI_FATAL_STATUS_BTA_ACK_TIMEOUT	Fatal BTA ack timeout.
MIPI_DSI_FATAL_STATUS_ESCAPE_ENTRY_ERROR	Fatal escape mode entry error.
MIPI_DSI_FATAL_STATUS_LPDT_SYNC_ERROR	Fatal low power data transmission synchronization error.
MIPI_DSI_FATAL_STATUS_CTRL_ERROR	Fatal control error.
MIPI_DSI_FATAL_STATUS_LP0_CONTENTION_DETECT	Fatal lane 0 low power contention detect.
MIPI_DSI_FATAL_STATUS_LP1_CONTENTION_DETECT	Fatal lane 1 low power contention detect.
MIPI_DSI_FATAL_STATUS_LP0_CONTENTION	Fatal lane 0 low power contention status.
MIPI_DSI_FATAL_STATUS_LP1_CONTENTION	Fatal lane 1 low power contention status.

◆ mipi_dsi_phy_status_t

enum mipi_dsi_phy_status_t	
MIPI DSI physical lane status	
Enumerator	
MIPI_DSI_PHY_STATUS_NONE	Physical lane status not set.
MIPI_DSI_PHY_STATUS_ULP_NOT_ACTIVE	Physical lane ULP not active.
MIPI_DSI_PHY_STATUS_CLOCK_LANE_STOP	Clock lane in stopped state.
MIPI_DSI_PHY_STATUS_DATA_LANE0_LP_RX	Data lane low power receive mode.
MIPI_DSI_PHY_STATUS_DATA_LANE0_ULP_RX	Data lane ultra low power receive mode.

MIPI_DSI_PHY_STATUS_DATA_LANE0_NOT_ULP	Data lane 0 not in ULP mode.
MIPI_DSI_PHY_STATUS_DATA_LANE1_NOT_ULP	Data lane 1 not in ULP mode.
MIPI_DSI_PHY_STATUS_DATA_LANE2_NOT_ULP	Data lane 2 not in ULP mode.
MIPI_DSI_PHY_STATUS_DATA_LANE3_NOT_ULP	Data lane 3 not in ULP mode.
MIPI_DSI_PHY_STATUS_DATA_LANE0_STOP	Data lane 0 stop state.
MIPI_DSI_PHY_STATUS_DATA_LANE1_STOP	Data lane 1 stop state.
MIPI_DSI_PHY_STATUS_DATA_LANE2_STOP	Data lane 2 stop state.
MIPI_DSI_PHY_STATUS_DATA_LANE3_STOP	Data lane 3 stop state.
MIPI_DSI_PHY_STATUS_DATA_LANE0_RX_TO_TX	Data lane Rx to Tx transition event.
MIPI_DSI_PHY_STATUS_DATA_LANE0_TX_TO_RX	Data lane Tx to Rx transition event.
MIPI_DSI_PHY_STATUS_DATA_LANE0_RX_STATE	Data lane Rx active state.
MIPI_DSI_PHY_STATUS_CLOCK_ULPS_ENTER	Clock lane ULPS enter event.
MIPI_DSI_PHY_STATUS_CLOCK_ULPS_EXIT	Clock lane ULPS exit event.
MIPI_DSI_PHY_STATUS_CLOCK_LP_TO_HS	Clock lane LP to HS transition event.
MIPI_DSI_PHY_STATUS_CLOCK_HS_TO_LP	Clock lane HS to LP transition event.
MIPI_DSI_PHY_STATUS_DATA_LANE_ULPS_ENTER	Data lane ULPS enter event.
MIPI_DSI_PHY_STATUS_DATA_LANE_ULPS_EXIT	Data lane ULPS exit event.

◆ mipi_dsi_link_status_t

enum mipi_dsi_link_status_t	
MIPI DSI link status bits	
Enumerator	
MIPI_DSI_LINK_STATUS_IDLE	Link idle or uninitialized.
MIPI_DSI_LINK_STATUS_CH0_RUNNING	Channel 0 running.
MIPI_DSI_LINK_STATUS_CH1_RUNNING	Channel 1 running.
MIPI_DSI_LINK_STATUS_VIDEO_RUNNING	Video output running.
MIPI_DSI_LINK_STATUS_HP_MODE_BUSY	HP operation busy.
MIPI_DSI_LINK_STATUS_LP_MODE_BUSY	LP operation busy.

◆ mipi_dsi_lane_t

enum mipi_dsi_lane_t	
MIPI DSI Lane Type	
Enumerator	
MIPI_DSI_LANE_CLOCK	Clock Lanes.
MIPI_DSI_LANE_DATA_ALL	All Data Lanes.

7.3.7.5 SLCDC Interface

Interfaces » Graphics

Detailed Description

Interface for Segment LCD controllers.

Data Structures

struct	slcdc_cfg_t
struct	slcdc_api_t

struct	slcdc_instance_t

Typedefs

typedef void	slcdc_ctrl_t

Enumerations

enum	slcdc_bias_method_t
enum	slcdc_time_slice_t
enum	slcdc_waveform_t
enum	slcdc_drive_volt_gen_t
enum	slcdc_ref_volt_sel_t
enum	slcdc_display_area_control_blink_t
enum	slcdc_display_area_t
enum	slcdc_contrast_t
enum	slcdc_display_on_off_t
enum	slcdc_display_enable_disable_t
enum	slcdc_display_clock_t
enum	slcdc_clk_div_t

Data Structure Documentation

◆ slcdc_cfg_t

struct slcdc_cfg_t		
SLCDC configuration block		
Data Fields		
slcdc_display_clock_t	slcdc_clock	LCD clock source (LCDSCKSEL)
slcdc_clk_div_t	slcdc_clock_setting	LCD clock setting (LCDC0)
slcdc_bias_method_t	bias_method	LCD display bias method select (LBAS bit)
slcdc_time_slice_t	time_slice	Time slice of LCD display select (LDTY bit)
slcdc_waveform_t	waveform	LCD display waveform select (LWAVE bit)

slcdc_drive_volt_gen_t	drive_volt_gen	LCD Drive Voltage Generator Select (MDSET bit)
slcdc_contrast_t	contrast	LCD Boost Level (contrast setting)
slcdc_ref_volt_sel_t	ref_volt_sel	LCD reference voltage selection (MDSET2 bit)

◆ slcdc_api_t

struct slcdc_api_t	
SLCDC functions implemented at the HAL layer will follow this API.	
Data Fields	
fsp_err_t(*	open)(slcdc_ctrl_t *const p_ctrl, slcdc_cfg_t const *const p_cfg)
fsp_err_t(*	write)(slcdc_ctrl_t *const p_ctrl, uint8_t const start_segment, uint8_t const *p_data, uint8_t const segment_count)
fsp_err_t(*	modify)(slcdc_ctrl_t *const p_ctrl, uint8_t const segment, uint8_t const data_mask, uint8_t const data)
fsp_err_t(*	start)(slcdc_ctrl_t *const p_ctrl)
fsp_err_t(*	stop)(slcdc_ctrl_t *const p_ctrl)
fsp_err_t(*	setContrast)(slcdc_ctrl_t *const p_ctrl, slcdc_contrast_t const contrast)
fsp_err_t(*	setDisplayArea)(slcdc_ctrl_t *const p_ctrl, slcdc_display_area_t const display_area)
fsp_err_t(*	close)(slcdc_ctrl_t *const p_ctrl)

Field Documentation

◆ open

fsp_err_t(* slcdc_api_t::open) (slcdc_ctrl_t *const p_ctrl, slcdc_cfg_t const *const p_cfg)

Open SLCDC.

Parameters

[in,out]	p_ctrl	Pointer to display interface control block. Must be declared by user.
[in]	p_cfg	Pointer to display configuration structure. All elements of this structure must be set by the user.

◆ write

fsp_err_t(* slcdc_api_t::write) (slcdc_ctrl_t *const p_ctrl, uint8_t const start_segment, uint8_t const *p_data, uint8_t const segment_count)

Write data to the SLCDC segment data array. Specifies the initial display data. Except when using 8-time slice mode, store values in the lower 4 bits when writing to the A-pattern area and in the upper 4 bits when writing to the B-pattern area.

Parameters

[in]	p_ctrl	Pointer to display interface control block.
[in]	start_segment	Specify the start segment number to be written.
[in]	p_data	Pointer to the display data to be written to the specified segments.
[in]	segment_count	Number of segments to be written.

◆ modify

fsp_err_t(* slcdc_api_t::modify) (slcdc_ctrl_t *const p_ctrl, uint8_t const segment, uint8_t const data_mask, uint8_t const data)

Rewrite data in the SLCDC segment data array. Rewrites the LCD display data in 1-bit units. If a bit is not specified for rewriting, the value stored in the bit is held as it is.

Parameters

[in]	p_ctrl	Pointer to display interface control block.
[in]	segment	The segment to be written.
[in]	data_mask	Mask the data being displayed. Set 0 to the bit to be rewritten and set 1 to the other bits. Multiple bits can be rewritten.
[in]	data	Specify display data to rewrite to the specified segment.

◆ start

fsp_err_t(* slcdc_api_t::start) (slcdc_ctrl_t *const p_ctrl)

Enable display signal output. Displays the segment data on the LCD.

Parameters

[in]	p_ctrl	Pointer to display interface control block.

◆ stop

fsp_err_t(* slcdc_api_t::stop) (slcdc_ctrl_t *const p_ctrl)

Disable display signal output. Stops displaying data on the LCD.

Parameters

[in]	p_ctrl	Pointer to display interface control block.

◆ setContrast

fsp_err_t(* slcdc_api_t::setContrast) (slcdc_ctrl_t *const p_ctrl, slcdc_contrast_t const contrast)

Set the display contrast. This function can be used only when the internal voltage boosting method is used for drive voltage generation.

Parameters

[in]	p_ctrl	Pointer to display interface control block.

◆ setDisplayArea

fsp_err_t(* slcdc_api_t::setDisplayArea) (slcdc_ctrl_t *const p_ctrl, slcdc_display_area_t const display_area)

Set LCD display area. This function sets a specified display area, A-pattern or B-pattern. This function can be used to 'blink' the display between A-pattern and B-pattern area data.

When using blinking, the RTC is required to operate before this function is executed. To configure the RTC, follow the steps below. 1) Open RTC 2) Set Periodic IRQ 3) Start RTC counter 4) Enable IRQ, RTC_EVENT_PERIODIC_IRQ Refer to the User's Manual for the detailed procedure.

Parameters

[in]	p_ctrl	Pointer to display interface control block.
[in]	display_area	Display area to be used, A-pattern or B-pattern area.

◆ close

fsp_err_t(* slcdc_api_t::close) (slcdc_ctrl_t *const p_ctrl)

Close SLCDC.

Parameters

[in]	p_ctrl	Pointer to display interface control block.

◆ slcdc_instance_t

struct slcdc_instance_t

This structure encompasses everything that is needed to use an instance of this interface.

Data Fields		
slcdc_ctrl_t *	p_ctrl	Pointer to the control structure for this instance.
slcdc_cfg_t const *	p_cfg	Pointer to the configuration structure for this instance.

slcdc_api_t const *	p_api	Pointer to the API structure for this instance.

Typedef Documentation

◆ slcdc_ctrl_t

typedef void slcdc_ctrl_t
SLCDC control block. Allocate an instance specific control block to pass into the SLCDC API calls.SLCDC control block

Enumeration Type Documentation

◆ slcdc_bias_method_t

enum slcdc_bias_method_t	
LCD display bias method.	
Enumerator	
SLCDC_BIAS_2	1/2 bias method
SLCDC_BIAS_3	1/3 bias method
SLCDC_BIAS_4	1/4 bias method

◆ slcdc_time_slice_t

enum slcdc_time_slice_t	
Time slice of LCD display.	
Enumerator	
SLCDC_STATIC	Static.
SLCDC_SLICE_2	2-time slice
SLCDC_SLICE_3	3-time slice
SLCDC_SLICE_4	4-time slice
SLCDC_SLICE_6	6-time slice
SLCDC_SLICE_8	8-time slice

◆ slcdc_waveform_t

enum slcdc_waveform_t	
LCD display waveform select.	
Enumerator	
SLCDC_WAVE_A	Waveform A.
SLCDC_WAVE_B	Waveform B.

◆ slcdc_drive_volt_gen_t

enum slcdc_drive_volt_gen_t	
LCD Drive Voltage Generator Select.	
Enumerator	
SLCDC_VOLT_EXTERNAL	External resistance division method.
SLCDC_VOLT_INTERNAL	Internal voltage boosting method.
SLCDC_VOLT_CAPACITOR	Capacitor split method.

◆ slcdc_ref_volt_sel_t

enum slcdc_ref_volt_sel_t	
LCD Reference Voltage Selection.	
Enumerator	
SLCDC_REF_INTERNAL_VL1_CAPACITOR_VCC_EXTERNAL	Select VL1 reference for internal voltage or VCC reference for capacitor split or external division. Select VL2 reference for internal voltage or VL4 reference for capacitor split

◆ slcdc_display_area_control_blink_t

enum slcdc_display_area_control_blink_t	
Display Data Area Control	
Enumerator	
SLCDC_NOT_BLINKING	Display either A-pattern or B-pattern data.
SLCDC_BLINKING	Alternately display A-pattern and B-pattern data.

◆ slcdc_display_area_t

enum slcdc_display_area_t	
Display Area data	
Enumerator	
SLCDC_DISP_A	Display A-pattern data.
SLCDC_DISP_B	Display B-pattern data.
SLCDC_DISP_BLINK	Blink between A- and B-pattern.

◆ slcdc_contrast_t

enum slcdc_contrast_t	
LCD Boost Level (contrast) settings	
Enumerator	
SLCDC_CONTRAST_0	Contrast level 0.
SLCDC_CONTRAST_1	Contrast level 1.
SLCDC_CONTRAST_2	Contrast level 2.
SLCDC_CONTRAST_3	Contrast level 3.
SLCDC_CONTRAST_4	Contrast level 4.
SLCDC_CONTRAST_5	Contrast level 5.
SLCDC_CONTRAST_6	Contrast level 6.

SLCDC_CONTRAST_7	Contrast level 7.
SLCDC_CONTRAST_8	Contrast level 8.
SLCDC_CONTRAST_9	Contrast level 9.
SLCDC_CONTRAST_10	Contrast level 10.
SLCDC_CONTRAST_11	Contrast level 11.
SLCDC_CONTRAST_12	Contrast level 12.
SLCDC_CONTRAST_13	Contrast level 13.
SLCDC_CONTRAST_14	Contrast level 14.
SLCDC_CONTRAST_15	Contrast level 15.
SLCDC_CONTRAST_16	Contrast level 16.
SLCDC_CONTRAST_17	Contrast level 17.
SLCDC_CONTRAST_18	Contrast level 18.
SLCDC_CONTRAST_19	Contrast level 19.
SLCDC_CONTRAST_20	Contrast level 20.
SLCDC_CONTRAST_21	Contrast level 21.
SLCDC_CONTRAST_22	Contrast level 22.

◆ slcdc_display_on_off_t

enum slcdc_display_on_off_t	
LCD Display Enable/Disable	
Enumerator	
SLCDC_DISP_OFF	Display off.
SLCDC_DISP_ON	Display on.

◆ slcdc_display_enable_disable_t

enum slcdc_display_enable_disable_t	
LCD Display output enable	
Enumerator	
SLCDC_DISP_DISABLE	Output ground level to segment/common pins.
SLCDC_DISP_ENABLE	Output enable.

◆ slcdc_display_clock_t

enum slcdc_display_clock_t	
LCD Display clock selection	
Enumerator	
SLCDC_CLOCK_LOCO	Display clock source LOCO.
SLCDC_CLOCK_SOSC	Display clock source SOSC.
SLCDC_CLOCK_MOSC	Display clock source MOSC.
SLCDC_CLOCK_MOCO	Display clock source MOCO.
SLCDC_CLOCK_HOCO	Display clock source HOCO.

◆ slcdc_clk_div_t

enum slcdc_clk_div_t	
LCD clock settings	
Enumerator	
SLCDC_CLK_DIVISOR_LOCO_4	LOCO Clock/4.
SLCDC_CLK_DIVISOR_LOCO_8	LOCO Clock/8.
SLCDC_CLK_DIVISOR_LOCO_16	LOCO Clock/16.
SLCDC_CLK_DIVISOR_LOCO_32	LOCO Clock/32.
SLCDC_CLK_DIVISOR_LOCO_64	LOCO Clock/64.
SLCDC_CLK_DIVISOR_LOCO_128	LOCO Clock/128.

SLCDC_CLK_DIVISOR_LOCO_256	LOCO Clock/256.

SLCDC_CLK_DIVISOR_HOCO_1048576	HOCO Clock/1048576.

7.3.8 Input

Interfaces

Detailed Description

Input Interfaces.

Modules

External IRQ Interface

Interface for detecting external interrupts.

	Key Matrix Interface Interface for key matrix functions.

7.3.8.1 External IRQ Interface

Interfaces » Input

Detailed Description

Interface for detecting external interrupts.

Summary

The External IRQ Interface is for configuring interrupts to fire when a trigger condition is detected on an external IRQ pin.

Data Structures

struct	external_irq_callback_args_t
struct	external_irq_cfg_t
struct	external_irq_api_t
struct	external_irq_instance_t

Typedefs

typedef void	external_irq_ctrl_t

Enumerations

enum	external_irq_trigger_t
enum	external_irq_clock_source_div_t

Data Structure Documentation

◆ **external_irq_callback_args_t**

struct external_irq_callback_args_t		
Callback function parameter data		
Data Fields		
void const *	p_context	Placeholder for user data. Set in external_irq_api_t::open

		function in external_irq_cfg_t.
uint32_t	channel	The physical hardware channel that caused the interrupt.

◆ external_irq_cfg_t

struct external_irq_cfg_t	
User configuration structure, used in open function	
Data Fields	
uint8_t	channel
	Hardware channel used.
uint8_t	ipl
	Interrupt priority.
IRQn_Type	irq
	Interrupt number assigned to this instance.
external_irq_trigger_t	trigger
	Trigger setting.
external_irq_clock_source_div_t	clock_source_div
	Digital filter clock divisor setting.
bool	filter_enable
	Digital filter enable/disable setting.
void(*	p_callback)(external_irq_callback_args_t *p_args)
void const *	p_context
void const *	p_extend

	External IRQ hardware dependent configuration.

Field Documentation

◆ p_callback

void(* external_irq_cfg_t::p_callback) (external_irq_callback_args_t *p_args)

Callback provided external input trigger occurs.

◆ p_context

void const* external_irq_cfg_t::p_context

Placeholder for user data. Passed to the user callback in external_irq_callback_args_t.

◆ external_irq_api_t

struct external_irq_api_t

External interrupt driver structure. External interrupt functions implemented at the HAL layer will follow this API.

Data Fields

fsp_err_t(*	open)(external_irq_ctrl_t *const p_ctrl, external_irq_cfg_t const *const p_cfg)
fsp_err_t(*	enable)(external_irq_ctrl_t *const p_ctrl)
fsp_err_t(*	disable)(external_irq_ctrl_t *const p_ctrl)
fsp_err_t(*	callbackSet)(external_irq_ctrl_t *const p_ctrl, void(*p_callback)(external_irq_callback_args_t *), void const *const p_context, external_irq_callback_args_t *const p_callback_memory)
fsp_err_t(*	close)(external_irq_ctrl_t *const p_ctrl)

Field Documentation

◆ open

fsp_err_t(* external_irq_api_t::open) (external_irq_ctrl_t *const p_ctrl, external_irq_cfg_t const *const p_cfg)

Initial configuration.

Parameters

[out]	p_ctrl	Pointer to control block. Must be declared by user. Value set here.
[in]	p_cfg	Pointer to configuration structure. All elements of the structure must be set by user.

◆ enable

fsp_err_t(* external_irq_api_t::enable) (external_irq_ctrl_t *const p_ctrl)

Enable callback when an external trigger condition occurs.

Parameters

[in]	p_ctrl	Control block set in Open call for this external interrupt.

◆ disable

fsp_err_t(* external_irq_api_t::disable) (external_irq_ctrl_t *const p_ctrl)

Disable callback when external trigger condition occurs.

Parameters

[in]	p_ctrl	Control block set in Open call for this external interrupt.

◆ callbackSet

fsp_err_t(* external_irq_api_t::callbackSet) (external_irq_ctrl_t *const p_ctrl, void(*p_callback)(external_irq_callback_args_t *), void const *const p_context, external_irq_callback_args_t *const p_callback_memory)

Specify callback function and optional context pointer and working memory pointer.

Parameters

[in]	p_ctrl	Pointer to the External IRQ control block.
[in]	p_callback	Callback function
[in]	p_context	Pointer to send to callback function
[in]	p_working_memory	Pointer to volatile memory where callback structure can be allocated. Callback arguments allocated here are only valid during the callback.

◆ close

fsp_err_t(* external_irq_api_t::close) (external_irq_ctrl_t *const p_ctrl)

Allow driver to be reconfigured. May reduce power consumption.

Parameters

[in]	p_ctrl	Control block set in Open call for this external interrupt.

◆ external_irq_instance_t

struct external_irq_instance_t

This structure encompasses everything that is needed to use an instance of this interface.

Data Fields

external_irq_ctrl_t *	p_ctrl	Pointer to the control structure for this instance.
external_irq_cfg_t const *	p_cfg	Pointer to the configuration structure for this instance.
external_irq_api_t const *	p_api	Pointer to the API structure for this instance.

Typedef Documentation

◆ external_irq_ctrl_t

typedef void external_irq_ctrl_t
External IRQ control block. Allocate an instance specific control block to pass into the external IRQ API calls.

Enumeration Type Documentation

◆ external_irq_trigger_t

enum external_irq_trigger_t	
Condition that will trigger an interrupt when detected.	
Enumerator	
EXTERNAL_IRQ_TRIG_FALLING	Falling edge trigger.
EXTERNAL_IRQ_TRIG_RISING	Rising edge trigger.
EXTERNAL_IRQ_TRIG_BOTH_EDGE	Both edges trigger.
EXTERNAL_IRQ_TRIG_LEVEL_LOW	Low level trigger.
EXTERNAL_IRQ_TRIG_LEVEL_HIGH	High level trigger.

◆ external_irq_clock_source_div_t

enum external_irq_clock_source_div_t	
External IRQ input pin digital filtering sample clock divisor settings. The digital filter rejects trigger conditions that are shorter than 3 periods of the filter clock.	
Enumerator	
EXTERNAL_IRQ_CLOCK_SOURCE_DIV_1	Filter using clock source divided by 1.
EXTERNAL_IRQ_CLOCK_SOURCE_DIV_8	Filter using clock source divided by 8.
EXTERNAL_IRQ_CLOCK_SOURCE_DIV_32	Filter using clock source divided by 32.
EXTERNAL_IRQ_CLOCK_SOURCE_DIV_64	Filter using clock source divided by 64.

7.3.8.2 Key Matrix Interface

Interfaces » Input

Detailed Description

Interface for key matrix functions.

Summary

The KEYMATRIX interface provides standard Key Matrix functionality including event generation on a rising or falling edge for one or more channels at the same time. The generated event indicates all channels that are active in that instant via a bit mask. This allows the interface to be used with a matrix configuration or a one-to-one hardware implementation that is triggered on either a rising or a falling edge.

Data Structures

struct	keymatrix_callback_args_t
struct	keymatrix_cfg_t
struct	keymatrix_api_t
struct	keymatrix_instance_t

Typedefs

typedef void	keymatrix_ctrl_t

Enumerations

enum	keymatrix_trigger_t

Data Structure Documentation

◆ keymatrix_callback_args_t

struct keymatrix_callback_args_t		
Callback function parameter data		
Data Fields		
void const *	p_context	Holder for user data. Set in keymatrix_api_t::open function in keymatrix_cfg_t.
uint32_t	channel_mask	Bit vector representing the physical hardware channel(s) that caused the interrupt.

◆ keymatrix_cfg_t

struct keymatrix_cfg_t	
User configuration structure, used in open function	
Data Fields	

uint32_t	channel_mask
	Key Input channel(s). Bit mask of channels to open.
keymatrix_trigger_t	trigger
	Key Input trigger setting.
uint8_t	ipl
	Interrupt priority level.
IRQn_Type	irq
	NVIC IRQ number.
void(*	p_callback)(keymatrix_callback_args_t *p_args)
	Callback for key interrupt ISR.
void const *	p_context
	Holder for user data. Passed to callback in keymatrix_user_cb_data_t.
void const *	p_extend
	Extension parameter for hardware specific settings.

◆ keymatrix_api_t

struct keymatrix_api_t	
Key Matrix driver structure. Key Matrix functions implemented at the HAL layer will use this API.	
Data Fields	
fsp_err_t(*	open)(keymatrix_ctrl_t *const p_ctrl, keymatrix_cfg_t const *const p_cfg)
fsp_err_t(*	enable)(keymatrix_ctrl_t *const p_ctrl)

fsp_err_t(*	disable)(keymatrix_ctrl_t *const p_ctrl)
fsp_err_t(*	close)(keymatrix_ctrl_t *const p_ctrl)

Field Documentation

◆ open

fsp_err_t(* keymatrix_api_t::open) (keymatrix_ctrl_t *const p_ctrl, keymatrix_cfg_t const *const p_cfg)

Initial configuration.

Parameters

[out]	p_ctrl	Pointer to control block. Must be declared by user. Value set in this function.
[in]	p_cfg	Pointer to configuration structure. All elements of the structure must be set by user.

◆ enable

fsp_err_t(* keymatrix_api_t::enable) (keymatrix_ctrl_t *const p_ctrl)

Enable Key interrupt

Parameters

[in]	p_ctrl	Control block pointer set in Open call for this Key interrupt.

◆ disable

fsp_err_t(* keymatrix_api_t::disable) (keymatrix_ctrl_t *const p_ctrl)

Disable Key interrupt.

Parameters

[in]	p_ctrl	Control block pointer set in Open call for this Key interrupt.

◆ close

fsp_err_t(* keymatrix_api_t::close) (keymatrix_ctrl_t *const p_ctrl)
Allow driver to be reconfigured. May reduce power consumption. **Parameters** [in] p_ctrl — Control block pointer set in Open call for this Key interrupt.

◆ keymatrix_instance_t

struct keymatrix_instance_t		
This structure encompasses everything that is needed to use an instance of this interface.		
Data Fields		
keymatrix_ctrl_t *	p_ctrl	Pointer to the control structure for this instance.
keymatrix_cfg_t const *	p_cfg	Pointer to the configuration structure for this instance.
keymatrix_api_t const *	p_api	Pointer to the API structure for this instance.

Typedef Documentation

◆ keymatrix_ctrl_t

typedef void keymatrix_ctrl_t
Key matrix control block. Allocate an instance specific control block to pass into the key matrix API calls.

Enumeration Type Documentation

◆ keymatrix_trigger_t

enum keymatrix_trigger_t	
Trigger type: rising edge, falling edge	
Enumerator	
KEYMATRIX_TRIG_FALLING	Falling edge trigger.
KEYMATRIX_TRIG_RISING	Rising edge trigger.

7.3.9 Monitoring

Interfaces

Detailed Description

Monitoring Interfaces.

Modules

CAC Interface	Interface for clock frequency accuracy measurements.
CRC Interface	Interface for cyclic redundancy checking.
DOC Interface	Interface for the Data Operation Circuit.
Low Voltage Detection Interface	Interface for Low Voltage Detection.
WDT Interface	Interface for watch dog timer functions.

7.3.9.1 CAC Interface

Interfaces » Monitoring

Detailed Description

Interface for clock frequency accuracy measurements.

Summary

The interface for the clock frequency accuracy measurement circuit (CAC) peripheral is used to check a system clock frequency with a reference clock signal by counting the number of pulses of the clock to be measured.

Data Structures

struct	cac_ref_clock_config_t
struct	cac_meas_clock_config_t
struct	cac_callback_args_t
struct	cac_cfg_t
struct	cac_api_t
struct	cac_instance_t

Typedefs

typedef void	cac_ctrl_t

Enumerations

enum	cac_event_t
enum	cac_clock_type_t
enum	cac_clock_source_t
enum	cac_ref_divider_t
enum	cac_ref_digfilter_t
enum	cac_ref_edge_t
enum	cac_meas_divider_t

Data Structure Documentation

◆ cac_ref_clock_config_t

struct cac_ref_clock_config_t		
Structure defining the settings that apply to reference clock configuration.		
Data Fields		
cac_ref_divider_t	divider	Divider specification for the Reference clock.
cac_clock_source_t	clock	Clock source for the Reference clock.
cac_ref_digfilter_t	digfilter	Digital filter selection for the CACREF ext clock.
cac_ref_edge_t	edge	Edge detection for the

		Reference clock.

◆ cac_meas_clock_config_t

struct cac_meas_clock_config_t		
Structure defining the settings that apply to measurement clock configuration.		
Data Fields		
cac_meas_divider_t	divider	Divider specification for the Measurement clock.
cac_clock_source_t	clock	Clock source for the Measurement clock.

◆ cac_callback_args_t

struct cac_callback_args_t		
Callback function parameter data		
Data Fields		
cac_event_t	event	The event can be used to identify what caused the callback.
void const *	p_context	Value provided in configuration structure.

◆ cac_cfg_t

struct cac_cfg_t	
CAC Configuration	
Data Fields	
cac_ref_clock_config_t	cac_ref_clock
	Reference clock specific settings.
cac_meas_clock_config_t	cac_meas_clock
	Measurement clock specific settings.
uint16_t	cac_upper_limit
	The upper limit counter threshold.
uint16_t	cac_lower_limit
	The lower limit counter threshold.

IRQn_Type	mendi_irq
	Measurement End IRQ number.
IRQn_Type	ovfi_irq
	Measurement Overflow IRQ number.
IRQn_Type	ferri_irq
	Frequency Error IRQ number.
uint8_t	mendi_ipl
	Measurement end interrupt priority.
uint8_t	ovfi_ipl
	Overflow interrupt priority.
uint8_t	ferri_ipl
	Frequency error interrupt priority.
void(*	p_callback)(cac_callback_args_t *p_args)
	Callback provided when a CAC interrupt ISR occurs.
void const *	p_context
	Passed to user callback in cac_callback_args_t.
void const *	p_extend
	CAC hardware dependent configuration */.

◆ cac_api_t

struct cac_api_t	
CAC functions implemented at the HAL layer API	
Data Fields	
fsp_err_t(*	open)(cac_ctrl_t *const p_ctrl, cac_cfg_t const *const p_cfg)
fsp_err_t(*	startMeasurement)(cac_ctrl_t *const p_ctrl)
fsp_err_t(*	stopMeasurement)(cac_ctrl_t *const p_ctrl)
fsp_err_t(*	read)(cac_ctrl_t *const p_ctrl, uint32_t *const p_counter)
fsp_err_t(*	callbackSet)(cac_ctrl_t *const p_ctrl, void(*p_callback)(cac_callback_args_t *), void const *const p_context, cac_callback_args_t *const p_callback_memory)
fsp_err_t(*	close)(cac_ctrl_t *const p_ctrl)

Field Documentation

◆ open

fsp_err_t(* cac_api_t::open) (cac_ctrl_t *const p_ctrl, cac_cfg_t const *const p_cfg)

Open function for CAC device.

Parameters

[out]	p_ctrl	Pointer to CAC device control. Must be declared by user.
[in]	cac_cfg_t	Pointer to CAC configuration structure.

◆ startMeasurement

fsp_err_t(* cac_api_t::startMeasurement) (cac_ctrl_t *const p_ctrl)

Begin a measurement for the CAC peripheral.

Parameters

[in]	p_ctrl	Pointer to CAC device control.

◆ stopMeasurement

fsp_err_t(* cac_api_t::stopMeasurement) (cac_ctrl_t *const p_ctrl)

End a measurement for the CAC peripheral.

Parameters

[in]	p_ctrl	Pointer to CAC device control.

◆ read

fsp_err_t(* cac_api_t::read) (cac_ctrl_t *const p_ctrl, uint32_t *const p_counter)

Read function for CAC peripheral.

Parameters

[in]	p_ctrl	Control for the CAC device context.
[in]	p_counter	Pointer to variable in which to store the current CACNTBR register contents.

◆ callbackSet

fsp_err_t(* cac_api_t::callbackSet) (cac_ctrl_t *const p_ctrl, void(*p_callback)(cac_callback_args_t *), void const *const p_context, cac_callback_args_t *const p_callback_memory)

Specify callback function and optional context pointer and working memory pointer.

Parameters

[in]	p_ctrl	Control block set in cac_api_t::open call
[in]	p_callback	Callback function to register
[in]	p_context	Pointer to send to callback function
[in]	p_working_memory	Pointer to volatile memory where callback structure can be allocated. Callback arguments allocated here are only valid during the callback.

◆ close

fsp_err_t(* cac_api_t::close) (cac_ctrl_t *const p_ctrl)

Close function for CAC device.

Parameters

[in]	p_ctrl	Pointer to CAC device control.

◆ cac_instance_t

struct cac_instance_t		
This structure encompasses everything that is needed to use an instance of this interface.		
Data Fields		
cac_ctrl_t *	p_ctrl	Pointer to the control structure for this instance.
cac_cfg_t const *	p_cfg	Pointer to the configuration structure for this instance.
cac_api_t const *	p_api	Pointer to the API structure for this instance.

Typedef Documentation

◆ cac_ctrl_t

typedef void cac_ctrl_t
CAC control block. Allocate an instance specific control block to pass into the CAC API calls.

Enumeration Type Documentation

◆ cac_event_t

enum cac_event_t	
Event types returned by the ISR callback when used in CAC interrupt mode	
Enumerator	
CAC_EVENT_FREQUENCY_ERROR	Frequency error.
CAC_EVENT_MEASUREMENT_COMPLETE	Measurement complete.
CAC_EVENT_COUNTER_OVERFLOW	Counter overflow.

◆ cac_clock_type_t

enum cac_clock_type_t	
Enumeration of the two possible clocks.	
Enumerator	
CAC_CLOCK_MEASURED	Measurement clock.
CAC_CLOCK_REFERENCE	Reference clock.

◆ cac_clock_source_t

enum cac_clock_source_t	
Enumeration of the possible clock sources for both the reference and measurement clocks.	
Enumerator	
CAC_CLOCK_SOURCE_MAIN_OSC	Main clock oscillator.
CAC_CLOCK_SOURCE_SUBCLOCK	Sub-clock.
CAC_CLOCK_SOURCE_HOCO	HOCO (High speed on chip oscillator)
CAC_CLOCK_SOURCE_MOCO	MOCO (Middle speed on chip oscillator)
CAC_CLOCK_SOURCE_LOCO	LOCO (Low speed on chip oscillator)
CAC_CLOCK_SOURCE_PCLKB	PCLKB (Peripheral Clock B)
CAC_CLOCK_SOURCE_IWDT	IWDT-dedicated on-chip oscillator.
CAC_CLOCK_SOURCE_EXTERNAL	Externally supplied measurement clock on CACREF pin.

◆ cac_ref_divider_t

enum cac_ref_divider_t	
Enumeration of available dividers for the reference clock.	
Enumerator	
CAC_REF_DIV_32	Reference clock divided by 32.
CAC_REF_DIV_128	Reference clock divided by 128.
CAC_REF_DIV_1024	Reference clock divided by 1024.
CAC_REF_DIV_8192	Reference clock divided by 8192.

◆ cac_ref_digfilter_t

enum cac_ref_digfilter_t	
Enumeration of available digital filter settings for an external reference clock.	
Enumerator	
CAC_REF_DIGITAL_FILTER_OFF	No digital filter on the CACREF pin for reference clock.
CAC_REF_DIGITAL_FILTER_1	Sampling clock for digital filter = measuring frequency.
CAC_REF_DIGITAL_FILTER_4	Sampling clock for digital filter = measuring frequency/4.
CAC_REF_DIGITAL_FILTER_16	Sampling clock for digital filter = measuring frequency/16.

◆ cac_ref_edge_t

enum cac_ref_edge_t	
Enumeration of available edge detect settings for the reference clock.	
Enumerator	
CAC_REF_EDGE_RISE	Rising edge detect for the Reference clock.
CAC_REF_EDGE_FALL	Falling edge detect for the Reference clock.
CAC_REF_EDGE_BOTH	Both Rising and Falling edges detect for the Reference clock.

◆ cac_meas_divider_t

enum cac_meas_divider_t	
Enumeration of available dividers for the measurement clock	
Enumerator	
CAC_MEAS_DIV_1	Measurement clock divided by 1.
CAC_MEAS_DIV_4	Measurement clock divided by 4.
CAC_MEAS_DIV_8	Measurement clock divided by 8.
CAC_MEAS_DIV_32	Measurement clock divided by 32.

7.3.9.2 CRC Interface

Interfaces » Monitoring

Detailed Description

Interface for cyclic redundancy checking.

Summary

The CRC (Cyclic Redundancy Check) calculator generates CRC codes using five different polynomials including 8 bit, 16 bit, and 32 bit variations. Calculation can be performed by sending data to the block using the CPU or by snooping on read or write activity on one of SCI channels.

Data Structures

struct	crc_input_t
struct	crc_cfg_t
struct	crc_api_t
struct	crc_instance_t

Typedefs

typedef void	crc_ctrl_t

Enumerations

enum	crc_polynomial_t

enum	crc_bit_order_t
enum	crc_snoop_direction_t

Data Structure Documentation

◆ crc_input_t

struct crc_input_t		
Structure for CRC inputs		
Data Fields		
uint32_t	num_bytes	Length of input buffer. It must be 4-byte aligned when a 32-bit CRC polynomial function is used.
uint32_t	crc_seed	CRC seed value.
const void *	p_input_buffer	Pointer to input buffer.

◆ crc_cfg_t

struct crc_cfg_t		
User configuration structure, used in open function		
Data Fields		
uint8_t	channel	Channel number.
crc_polynomial_t	polynomial	CRC Generating Polynomial Switching (GPS)
crc_bit_order_t	bit_order	CRC Calculation Switching (LMS)
uint32_t	snoop_address	Register Snoop Address (CRCSA)
void const *	p_extend	CRC Hardware Dependent Configuration.

◆ crc_api_t

struct crc_api_t	
CRC driver structure. General CRC functions implemented at the HAL layer will follow this API.	
Data Fields	
fsp_err_t(*	open)(crc_ctrl_t *const p_ctrl, crc_cfg_t const *const p_cfg)
fsp_err_t(*	close)(crc_ctrl_t *const p_ctrl)

fsp_err_t(*	crcResultGet)(crc_ctrl_t *const p_ctrl, uint32_t *crc_result)
fsp_err_t(*	snoopEnable)(crc_ctrl_t *const p_ctrl, uint32_t crc_seed)
fsp_err_t(*	snoopDisable)(crc_ctrl_t *const p_ctrl)
fsp_err_t(*	calculate)(crc_ctrl_t *const p_ctrl, crc_input_t *const p_crc_input, uint32_t *p_crc_result)

Field Documentation

◆ open

fsp_err_t(* crc_api_t::open) (crc_ctrl_t *const p_ctrl, crc_cfg_t const *const p_cfg)

Open the CRC driver module.

Parameters

[in]	p_ctrl	Pointer to CRC device handle.
[in]	p_cfg	Pointer to a configuration structure.

◆ close

fsp_err_t(* crc_api_t::close) (crc_ctrl_t *const p_ctrl)

Close the CRC module driver

Parameters

[in]	p_ctrl	Pointer to CRC device handle

Return values

FSP_SUCCESS	Configuration was successful.

◆ crcResultGet

fsp_err_t(* crc_api_t::crcResultGet) (crc_ctrl_t *const p_ctrl, uint32_t *crc_result)

Return the current calculated value.

Parameters

[in]	p_ctrl	Pointer to CRC device handle.
[out]	crc_result	The calculated value from the last CRC calculation.

◆ snoopEnable

fsp_err_t(* crc_api_t::snoopEnable) (crc_ctrl_t *const p_ctrl, uint32_t crc_seed)

Configure and Enable snooping.

Parameters

[in]	p_ctrl	Pointer to CRC device handle.
[in]	crc_seed	CRC seed.

◆ snoopDisable

fsp_err_t(* crc_api_t::snoopDisable) (crc_ctrl_t *const p_ctrl)

Disable snooping.

Parameters

[in]	p_ctrl	Pointer to CRC device handle.

◆ calculate

fsp_err_t(* crc_api_t::calculate) (crc_ctrl_t *const p_ctrl, crc_input_t *const p_crc_input, uint32_t *p_crc_result)

Perform a CRC calculation on a block of data.

Parameters

[in]	p_ctrl	Pointer to CRC device handle.
[in]	p_crc_input	A pointer to structure for CRC inputs
[out]	crc_result	The calculated value of the CRC calculation.

◆ crc_instance_t

struct crc_instance_t		
This structure encompasses everything that is needed to use an instance of this interface.		
Data Fields		
crc_ctrl_t *	p_ctrl	Pointer to the control structure for this instance.
crc_cfg_t const *	p_cfg	Pointer to the configuration structure for this instance.
crc_api_t const *	p_api	Pointer to the API structure for this instance.

Typedef Documentation

◆ crc_ctrl_t

typedef void crc_ctrl_t
CRC control block. Allocate an instance specific control block to pass into the CRC API calls.

Enumeration Type Documentation

◆ crc_polynomial_t

enum crc_polynomial_t	
CRC Generating Polynomial Switching (GPS).	
Enumerator	
CRC_POLYNOMIAL_CRC_8	8-bit CRC-8 (X^8 + X^2 + X + 1)
CRC_POLYNOMIAL_CRC_16	16-bit CRC-16 (X^16 + X^15 + X^2 + 1)
CRC_POLYNOMIAL_CRC_CCITT	16-bit CRC-CCITT (X^16 + X^12 + X^5 + 1)
CRC_POLYNOMIAL_CRC_32	32-bit CRC-32 (X^32 + X^26 + X^23 + X^22 + X^16 + X^12 + X^11 + X^10 + X^8 + X^7 + X^5 + X^4 + X^2 + X + 1)
CRC_POLYNOMIAL_CRC_32C	32-bit CRC-32C (X^32 + X^28 + X^27 + X^26 + X^25 + X^23 + X^22 + X^20 + X^19 + X^18 + X^14 + X^13 + X^11 + X^10 + X^9 + X^8 + X^6 + 1)

◆ crc_bit_order_t

enum crc_bit_order_t	
CRC Calculation Switching (LMS)	
Enumerator	
CRC_BIT_ORDER_LMS_LSB	Generates CRC for LSB first communication.
CRC_BIT_ORDER_LMS_MSB	Generates CRC for MSB first communication.

◆ crc_snoop_direction_t

enum crc_snoop_direction_t	
Snoop-On-Write/Read Switch (CRCSWR)	
Enumerator	
CRC_SNOOP_DIRECTION_RECEIVE	Snoop-on-read.
CRC_SNOOP_DIRECTION_TRANSMIT	Snoop-on-write.

7.3.9.3 DOC Interface

Interfaces » Monitoring

Detailed Description

Interface for the Data Operation Circuit.

Defines the API and data structures for the DOC implementation of the Data Operation Circuit (DOC) interface.

Summary

This module implements the DOC_API using the Data Operation Circuit (DOC).

Data Structures

struct	doc_callback_args_t
struct	doc_cfg_t
struct	doc_api_t

struct	doc_instance_t

Typedefs

typedef void	doc_ctrl_t

Enumerations

enum	doc_event_t
enum	doc_bit_width_t

Data Structure Documentation

◆ doc_callback_args_t

struct doc_callback_args_t		
Callback function parameter data.		
Data Fields		
void const *	p_context	Set in doc_api_t::open function in doc_cfg_t. Placeholder for user data.

◆ doc_cfg_t

struct doc_cfg_t	
User configuration structure, used in the open function.	
Data Fields	
doc_event_t	event
	Select enumerated value from doc_event_t.
doc_bit_width_t	bit_width
	The bit width of operations.
uint32_t	doc_data
uint32_t	doc_data_extra
uint8_t	ipl
	DOC interrupt priority.

IRQn_Type	irq
	Interrupt number assigned to this instance.
void(*	p_callback)(doc_callback_args_t *p_args)
void const *	p_context

Field Documentation

◆ doc_data

uint32_t doc_cfg_t::doc_data

Initial/Reference data for addition, subtraction, and comparison operations.

- In Addition and Subtraction mode, this value sets the initial value of the operations.
- In Comparison match, mismatch, lower, and upper modes, this value is compared with data that is written.
- In Comparison inside window and outside window modes, this value is used as the lower bound for comparisons.

◆ doc_data_extra

uint32_t doc_cfg_t::doc_data_extra

Additional reference data for use in Window Comparison operations.

- In Comparison inside window and outside window modes, this value is used as the upper bound for comparisons.

◆ p_callback

void(* doc_cfg_t::p_callback) (doc_callback_args_t *p_args)

Callback provided when a DOC ISR occurs.

◆ p_context

void const* doc_cfg_t::p_context

Placeholder for user data. Passed to the user callback in doc_callback_args_t.

◆ doc_api_t

struct doc_api_t

Data Operation Circuit (DOC) API structure. DOC functions implemented at the HAL layer will follow this API.

Data Fields

fsp_err_t(*	open)(doc_ctrl_t *const p_ctrl, doc_cfg_t const *const p_cfg)
fsp_err_t(*	close)(doc_ctrl_t *const p_ctrl)
fsp_err_t(*	read)(doc_ctrl_t *const p_ctrl, uint32_t *p_result)
fsp_err_t(*	write)(doc_ctrl_t *const p_ctrl, uint32_t data)
fsp_err_t(*	callbackSet)(doc_ctrl_t *const p_ctrl, void(*p_callback)(doc_callback_args_t *), void const *const p_context, doc_callback_args_t *const p_callback_memory)

Field Documentation

◆ open

fsp_err_t(* doc_api_t::open) (doc_ctrl_t *const p_ctrl, doc_cfg_t const *const p_cfg)

Initial configuration.

Parameters

[in]	p_ctrl	Pointer to control block. Must be declared by user. Elements set here.
[in]	p_cfg	Pointer to configuration structure. All elements of this structure must be set by user.

◆ close

fsp_err_t(* doc_api_t::close) (doc_ctrl_t *const p_ctrl)

Allow the driver to be reconfigured. Will reduce power consumption.

Parameters

[in]	p_ctrl	Control block set in doc_api_t::open call.

◆ read

fsp_err_t(* doc_api_t::read) (doc_ctrl_t *const p_ctrl, uint32_t *p_result)

Gets the result of addition/subtraction operations and stores it in the provided pointer p_result.

Parameters

[in]	p_ctrl	Control block set in doc_api_t::open call.
[in]	p_result	The result of the DOC operation.

◆ write

fsp_err_t(* doc_api_t::write) (doc_ctrl_t *const p_ctrl, uint32_t data)

Write to the DODIR register.

Parameters

[in]	p_ctrl	Control block set in doc_api_t::open call.
[in]	data	data to be written to DOC DODIR register.

◆ callbackSet

fsp_err_t(* doc_api_t::callbackSet) (doc_ctrl_t *const p_ctrl, void(*p_callback)(doc_callback_args_t *), void const *const p_context, doc_callback_args_t *const p_callback_memory)

Specify callback function and optional context pointer and working memory pointer.

Parameters

[in]	p_ctrl	Pointer to the DOC control block.
[in]	p_callback	Callback function
[in]	p_context	Pointer to send to callback function
[in]	p_working_memory	Pointer to volatile memory where callback structure can be allocated. Callback arguments allocated here are only valid during the callback.

◆ doc_instance_t

struct doc_instance_t

This structure encompasses everything that is needed to use an instance of this interface.

Data Fields		
doc_ctrl_t *	p_ctrl	Pointer to the control structure for this instance.
doc_cfg_t const *	p_cfg	Pointer to the configuration structure for this instance.
doc_api_t const *	p_api	Pointer to the API structure for this instance.

Typedef Documentation

◆ doc_ctrl_t

typedef void doc_ctrl_t

DOC control block. Allocate an instance specific control block to pass into the DOC API calls.

Enumeration Type Documentation

◆ doc_event_t

enum doc_event_t	
Event that can trigger a callback function.	
Enumerator	
DOC_EVENT_COMPARISON_MISMATCH	The data is not equal to the reference data setting.
DOC_EVENT_ADDITION	Addition resulted in a value greater than the max for the configured bit width.
DOC_EVENT_SUBTRACTION	Subtraction resulted in a value less than 0.
DOC_EVENT_COMPARISON_MATCH	The data is equal to the reference data settting.
DOC_EVENT_COMPARISON_LOWER	The data is less than the reference data setting.
DOC_EVENT_COMPARISON_UPPER	The data is greater than the reference data setting.
DOC_EVENT_COMPARISON_INSIDE_WINDOW	The data is between the two reference data settings.
DOC_EVENT_COMPARISON_OUTSIDE_WINDOW	The data is outside the two reference data setttings.

◆ doc_bit_width_t

enum doc_bit_width_t	
The bit width used during operations.	
Enumerator	
DOC_BIT_WIDTH_16	Operations are 16-bit.
DOC_BIT_WIDTH_32	Operations are 32-bit.

7.3.9.4 Low Voltage Detection Interface

Interfaces » Monitoring

Detailed Description

Interface for Low Voltage Detection.

Summary

The LVD driver provides functions for configuring the LVD voltage monitors and detectors.

Data Structures

struct	lvd_status_t
struct	lvd_callback_args_t
struct	lvd_cfg_t
struct	lvd_api_t
struct	lvd_instance_t

Typedefs

typedef void	lvd_ctrl_t

Enumerations

enum	lvd_threshold_t
enum	lvd_response_t
enum	lvd_voltage_slope_t
enum	lvd_sample_clock_t
enum	lvd_negation_delay_t
enum	lvd_threshold_crossing_t
enum	lvd_current_state_t

Data Structure Documentation

◆ lvd_status_t

struct lvd_status_t		
Current state of a voltage monitor.		
Data Fields		
lvd_threshold_crossing_t	crossing_detected	Threshold crossing detection (latched)

lvd_current_state_t	current_state	Instantaneous status of monitored voltage (above or below threshold)

◆ lvd_callback_args_t

struct lvd_callback_args_t		
LVD callback parameter definition		
Data Fields		
uint32_t	monitor_number	Monitor number.
lvd_current_state_t	current_state	Current state of the voltage monitor.
void const *	p_context	Placeholder for user data.

◆ lvd_cfg_t

struct lvd_cfg_t	
LVD configuration structure	
Data Fields	
uint32_t	monitor_number
lvd_threshold_t	voltage_threshold
lvd_response_t	detection_response
lvd_voltage_slope_t	voltage_slope
lvd_negation_delay_t	negation_delay
lvd_sample_clock_t	sample_clock_divisor
IRQn_Type	irq
uint8_t	monitor_ipl
void(*	p_callback)(lvd_callback_args_t *p_args)
void const *	p_context

void const *	p_extend

Field Documentation

◆ monitor_number

uint32_t lvd_cfg_t::monitor_number

Monitor number, 1, 2, ...

◆ voltage_threshold

lvd_threshold_t lvd_cfg_t::voltage_threshold

Threshold for out of range voltage detection

◆ detection_response

lvd_response_t lvd_cfg_t::detection_response

Response on detecting a threshold crossing

◆ voltage_slope

lvd_voltage_slope_t lvd_cfg_t::voltage_slope

Direction of voltage crossing that will trigger a detection (Rising Edge, Falling Edge, Both).

◆ negation_delay

lvd_negation_delay_t lvd_cfg_t::negation_delay

Negation of LVD signal follows reset or voltage in range

◆ sample_clock_divisor

lvd_sample_clock_t lvd_cfg_t::sample_clock_divisor

Sample clock divider, use LVD_SAMPLE_CLOCK_DISABLED to disable digital filtering

◆ irq

IRQn_Type lvd_cfg_t::irq

Interrupt number.

◆ monitor_ipl

uint8_t lvd_cfg_t::monitor_ipl

Interrupt priority level.

◆ p_callback

void(* lvd_cfg_t::p_callback) (lvd_callback_args_t *p_args)
User function to be called from interrupt

◆ p_context

void const* lvd_cfg_t::p_context
Placeholder for user data. Passed to the user callback in

◆ p_extend

void const* lvd_cfg_t::p_extend
Extension parameter for hardware specific settings

◆ lvd_api_t

struct lvd_api_t	
LVD driver API structure. LVD driver functions implemented at the HAL layer will adhere to this API.	
Data Fields	
fsp_err_t(*	open)(lvd_ctrl_t *const p_ctrl, lvd_cfg_t const *const p_cfg)
fsp_err_t(*	statusGet)(lvd_ctrl_t *const p_ctrl, lvd_status_t *p_lvd_status)
fsp_err_t(*	statusClear)(lvd_ctrl_t *const p_ctrl)
fsp_err_t(*	callbackSet)(lvd_ctrl_t *const p_ctrl, void(*p_callback)(lvd_callback_args_t *), void const *const p_context, lvd_callback_args_t *const p_callback_memory)
fsp_err_t(*	close)(lvd_ctrl_t *const p_ctrl)

Field Documentation

◆ open

fsp_err_t(* lvd_api_t::open) (lvd_ctrl_t *const p_ctrl, lvd_cfg_t const *const p_cfg)

Initializes a low voltage detection driver according to the passed-in configuration structure.

Parameters

[in]	p_ctrl	Pointer to control structure for the driver instance
[in]	p_cfg	Pointer to the configuration structure for the driver instance

◆ statusGet

fsp_err_t(* lvd_api_t::statusGet) (lvd_ctrl_t *const p_ctrl, lvd_status_t *p_lvd_status)

Get the current state of the monitor, (threshold crossing detected, voltage currently above or below threshold). Must be used if the peripheral was initialized with lvd_response_t set to LVD_RESPONSE_NONE.

Parameters

[in]	p_ctrl	Pointer to the control structure for the driver instance
[in,out]	p_lvd_status	Pointer to a lvd_status_t structure

◆ statusClear

fsp_err_t(* lvd_api_t::statusClear) (lvd_ctrl_t *const p_ctrl)

Clears the latched status of the monitor. Must be used if the peripheral was initialized with lvd_response_t set to LVD_RESPONSE_NONE.

Parameters

[in]	p_ctrl	Pointer to the control structure for the driver instance

◆ callbackSet

fsp_err_t(* lvd_api_t::callbackSet) (lvd_ctrl_t *const p_ctrl, void(*p_callback)(lvd_callback_args_t *), void const *const p_context, lvd_callback_args_t *const p_callback_memory)

Specify callback function and optional context pointer and working memory pointer.

Parameters

[in]	p_ctrl	Pointer to the LVD control block.
[in]	p_callback	Callback function
[in]	p_context	Pointer to send to callback function
[in]	p_working_memory	Pointer to volatile memory where callback structure can be allocated. Callback arguments allocated here are only valid during the callback.

◆ close

fsp_err_t(* lvd_api_t::close) (lvd_ctrl_t *const p_ctrl)

Disables the LVD peripheral. Closes the driver instance.

Parameters

[in]	p_ctrl	Pointer to the control structure for the driver instance

◆ lvd_instance_t

struct lvd_instance_t		
This structure encompasses everything that is needed to use an instance of this interface.		
Data Fields		
lvd_ctrl_t *	p_ctrl	Pointer to the control structure for this instance.
lvd_cfg_t const *	p_cfg	Pointer to the configuration structure for this interface instance.
lvd_api_t const *	p_api	Pointer to the API structure for this interface instance.

Typedef Documentation

◆ lvd_ctrl_t

typedef void lvd_ctrl_t
LVD control block. Allocate an instance specific control block to pass into the LVD API calls.

Enumeration Type Documentation

◆ lvd_threshold_t

enum lvd_threshold_t	
Register definitions, common services, and error codes. Voltage detection level The thresholds supported by each MCU are in the MCU User's Manual as well as in the r_lvd module description on the stack tab of the RA project.	
Enumerator	
LVD_THRESHOLD_MONITOR_1_LEVEL_4_08V	4.08V
LVD_THRESHOLD_MONITOR_1_LEVEL_3_88V	3.88V
LVD_THRESHOLD_MONITOR_1_LEVEL_3_67V	3.67V
LVD_THRESHOLD_MONITOR_1_LEVEL_3_47V	3.47V
LVD_THRESHOLD_MONITOR_1_LEVEL_3_27V	3.27V
LVD_THRESHOLD_MONITOR_1_LEVEL_3_06V	3.06V
LVD_THRESHOLD_MONITOR_1_LEVEL_2_91V	2.91V
LVD_THRESHOLD_MONITOR_1_LEVEL_2_76V	2.76V
LVD_THRESHOLD_MONITOR_1_LEVEL_2_60V	2.60V
LVD_THRESHOLD_MONITOR_1_LEVEL_2_45V	2.45V
LVD_THRESHOLD_MONITOR_1_LEVEL_2_35V	2.35V
LVD_THRESHOLD_MONITOR_1_LEVEL_2_25V	2.25V
LVD_THRESHOLD_MONITOR_1_LEVEL_2_15V	2.15V
LVD_THRESHOLD_MONITOR_1_LEVEL_2_04V	2.04V
LVD_THRESHOLD_MONITOR_1_LEVEL_1_94V	1.94V
LVD_THRESHOLD_MONITOR_1_LEVEL_1_84V	1.84V

LVD_THRESHOLD_MONITOR_1_LEVEL_1_74V	1.74V
LVD_THRESHOLD_MONITOR_1_LEVEL_1_63V	1.63V
LVD_THRESHOLD_MONITOR_1_LEVEL_3_10V	3.10V
LVD_THRESHOLD_MONITOR_1_LEVEL_3_00V	3.00V
LVD_THRESHOLD_MONITOR_1_LEVEL_2_90V	2.90V
LVD_THRESHOLD_MONITOR_1_LEVEL_2_79V	2.79V
LVD_THRESHOLD_MONITOR_1_LEVEL_2_68V	2.68V
LVD_THRESHOLD_MONITOR_1_LEVEL_2_58V	2.58V
LVD_THRESHOLD_MONITOR_1_LEVEL_2_48V	2.48V
LVD_THRESHOLD_MONITOR_1_LEVEL_2_20V	2.20V
LVD_THRESHOLD_MONITOR_1_LEVEL_1_96V	1.96V
LVD_THRESHOLD_MONITOR_1_LEVEL_1_86V	1.86V
LVD_THRESHOLD_MONITOR_1_LEVEL_1_75V	1.75V
LVD_THRESHOLD_MONITOR_1_LEVEL_1_65V	1.65V
LVD_THRESHOLD_MONITOR_2_LEVEL_3_13V	3.13V
LVD_THRESHOLD_MONITOR_2_LEVEL_2_92V	2.92V
LVD_THRESHOLD_MONITOR_2_LEVEL_2_71V	2.71V
LVD_THRESHOLD_MONITOR_2_LEVEL_2_50V	2.50V
LVD_THRESHOLD_MONITOR_2_LEVEL_2_30V	2.30V
LVD_THRESHOLD_MONITOR_2_LEVEL_2_09V	2.09V
LVD_THRESHOLD_MONITOR_2_LEVEL_1_88V	1.88V
LVD_THRESHOLD_MONITOR_2_LEVEL_1_67V	1.67V
LVD_THRESHOLD_MONITOR_1_LEVEL_4_29V	4.29V
LVD_THRESHOLD_MONITOR_1_LEVEL_4_16V	4.16V

LVD_THRESHOLD_MONITOR_1_LEVEL_4_14V	4.14V
LVD_THRESHOLD_MONITOR_1_LEVEL_4_03V	4.03V
LVD_THRESHOLD_MONITOR_1_LEVEL_4_02V	4.02V
LVD_THRESHOLD_MONITOR_1_LEVEL_3_86V	3.86V
LVD_THRESHOLD_MONITOR_1_LEVEL_3_84V	3.84V
LVD_THRESHOLD_MONITOR_1_LEVEL_3_10V	3.10V
LVD_THRESHOLD_MONITOR_1_LEVEL_3_00V	3.00V
LVD_THRESHOLD_MONITOR_1_LEVEL_2_90V	2.90V
LVD_THRESHOLD_MONITOR_1_LEVEL_2_79V	2.79V
LVD_THRESHOLD_MONITOR_1_LEVEL_2_68V	2.68V
LVD_THRESHOLD_MONITOR_1_LEVEL_2_58V	2.58V
LVD_THRESHOLD_MONITOR_1_LEVEL_2_48V	2.48V
LVD_THRESHOLD_MONITOR_1_LEVEL_2_20V	2.20V
LVD_THRESHOLD_MONITOR_1_LEVEL_1_96V	1.96V
LVD_THRESHOLD_MONITOR_1_LEVEL_1_86V	1.86V
LVD_THRESHOLD_MONITOR_1_LEVEL_1_75V	1.75V
LVD_THRESHOLD_MONITOR_1_LEVEL_1_65V	1.65V
LVD_THRESHOLD_MONITOR_1_LEVEL_2_99V	2.99V
LVD_THRESHOLD_MONITOR_1_LEVEL_2_92V	2.92V
LVD_THRESHOLD_MONITOR_1_LEVEL_2_85V	2.85V
LVD_THRESHOLD_MONITOR_2_LEVEL_4_31V	4.31V
LVD_THRESHOLD_MONITOR_2_LEVEL_4_29V	4.29V
LVD_THRESHOLD_MONITOR_2_LEVEL_4_17V	4.17V
LVD_THRESHOLD_MONITOR_2_LEVEL_4_14V	4.14V

LVD_THRESHOLD_MONITOR_2_LEVEL_4_03V	4.03V
LVD_THRESHOLD_MONITOR_2_LEVEL_4_02V	4.02V
LVD_THRESHOLD_MONITOR_2_LEVEL_3_84V	3.84V
LVD_THRESHOLD_MONITOR_2_LEVEL_2_99V	2.99V
LVD_THRESHOLD_MONITOR_2_LEVEL_2_92V	2.92V
LVD_THRESHOLD_MONITOR_2_LEVEL_2_85V	2.85V
LVD_THRESHOLD_EXLVDVBAT_LEVEL_3_1V	3.1V
LVD_THRESHOLD_EXLVDVBAT_LEVEL_2_9V	2.9V
LVD_THRESHOLD_EXLVDVBAT_LEVEL_2_8V	2.8V
LVD_THRESHOLD_EXLVDVBAT_LEVEL_2_7V	2.7V
LVD_THRESHOLD_EXLVDVBAT_LEVEL_2_6V	2.6V
LVD_THRESHOLD_EXLVDVBAT_LEVEL_2_4V	2.4V
LVD_THRESHOLD_EXLVDVBAT_LEVEL_2_2V	2.2V
LVD_THRESHOLD_LVDVRTC_LEVEL_2_8V	2.8V
LVD_THRESHOLD_LVDVRTC_LEVEL_2_6V	2.6V
LVD_THRESHOLD_LVDVRTC_LEVEL_2_4V	2.4V
LVD_THRESHOLD_LVDVRTC_LEVEL_2_2V	2.2V

◆ lvd_response_t

enum lvd_response_t	
Response types for handling threshold crossing event.	
Enumerator	
LVD_RESPONSE_NMI	Non-maskable interrupt.
LVD_RESPONSE_INTERRUPT	Maskable interrupt.
LVD_RESPONSE_RESET	Reset on VCC-fall.
LVD_RESPONSE_RESET_ON_RISING	Reset on VCC-rise.
LVD_RESPONSE_NONE	No response, status must be requested via statusGet function.

◆ lvd_voltage_slope_t

enum lvd_voltage_slope_t	
The direction from which VCC must cross the threshold to trigger a detection (rising, falling, or both).	
Enumerator	
LVD_VOLTAGE_SLOPE_RISING	When VCC >= Vdet2 (rise) is detected.
LVD_VOLTAGE_SLOPE_FALLING	When VCC < Vdet2 (drop) is detected.
LVD_VOLTAGE_SLOPE_BOTH	When drop and rise are detected.

◆ lvd_sample_clock_t

enum lvd_sample_clock_t	
Sample clock divider, use LVD_SAMPLE_CLOCK_DISABLED to disable digital filtering	
Enumerator	
LVD_SAMPLE_CLOCK_LOCO_DIV_2	Digital filter sample clock is LOCO divided by 2.
LVD_SAMPLE_CLOCK_LOCO_DIV_4	Digital filter sample clock is LOCO divided by 4.
LVD_SAMPLE_CLOCK_LOCO_DIV_8	Digital filter sample clock is LOCO divided by 8.
LVD_SAMPLE_CLOCK_LOCO_DIV_16	Digital filter sample clock is LOCO divided by 16.
LVD_SAMPLE_CLOCK_DISABLED	Digital filter is disabled.

◆ lvd_negation_delay_t

enum lvd_negation_delay_t	
Negation delay of LVD reset signal follows reset or voltage in range	
Enumerator	
LVD_NEGATION_DELAY_FROM_VOLTAGE	Negation follows a stabilization time (tLVDn) after VCC > Vdet1 is detected. If a transition to software standby or deep software standby is to be made, the only possible value for the RN bit is LVD_NEGATION_DELAY_FROM_VOLTAGE
LVD_NEGATION_DELAY_FROM_RESET	Negation follows a stabilization time (tLVDn) after assertion of the LVDn reset. If a transition to software standby or deep software standby is to be made, the only possible value for the RN bit is LVD_NEGATION_DELAY_FROM_VOLTAGE

◆ lvd_threshold_crossing_t

enum lvd_threshold_crossing_t	
Threshold crossing detection (latched)	
Enumerator	
LVD_THRESHOLD_CROSSING_NOT_DETECTED	Threshold crossing has not been detected.
LVD_THRESHOLD_CROSSING_DETECTED	Threshold crossing has been detected.

◆ lvd_current_state_t

enum lvd_current_state_t	
Instantaneous status of VCC (above or below threshold)	
Enumerator	
LVD_CURRENT_STATE_BELOW_THRESHOLD	VCC < threshold.
LVD_CURRENT_STATE_ABOVE_THRESHOLD	VCC >= threshold or monitor is disabled.

7.3.9.5 WDT Interface

Interfaces » Monitoring

Detailed Description

Interface for watch dog timer functions.

Summary

The WDT interface for the Watchdog Timer (WDT) peripheral provides watchdog functionality including resetting the device or generating an interrupt.

Data Structures

struct	wdt_callback_args_t
struct	wdt_timeout_values_t
struct	wdt_cfg_t
struct	wdt_api_t
struct	wdt_instance_t

Typedefs

typedef void	wdt_ctrl_t

Enumerations

enum	wdt_timeout_t
enum	wdt_clock_division_t
enum	wdt_window_start_t
enum	wdt_window_end_t
enum	wdt_reset_control_t
enum	wdt_stop_control_t
enum	wdt_status_t

Data Structure Documentation

◆ wdt_callback_args_t

struct wdt_callback_args_t
Callback function parameter data
Data Fields

void const *	p_context	Placeholder for user data. Set in wdt_api_t::open function in wdt_cfg_t.

◆ wdt_timeout_values_t

struct wdt_timeout_values_t		
WDT timeout data. Used to return frequency of WDT clock and timeout period		
Data Fields		
uint32_t	clock_frequency_hz	Frequency of watchdog clock after divider.
uint32_t	timeout_clocks	Timeout period in units of watchdog clock ticks.

◆ wdt_cfg_t

struct wdt_cfg_t	
WDT configuration parameters.	
Data Fields	
wdt_timeout_t	timeout
	Timeout period.
wdt_clock_division_t	clock_division
	Clock divider.
wdt_window_start_t	window_start
	Refresh permitted window start position.
wdt_window_end_t	window_end
	Refresh permitted window end position.
wdt_reset_control_t	reset_control
	Select NMI/IRQ or reset generated on underflow.
wdt_stop_control_t	stop_control
	Select whether counter operates in sleep mode.

void(*	p_callback)(wdt_callback_args_t *p_args)
	Callback provided when a WDT ISR occurs.
void const *	p_context
void const *	p_extend
	Placeholder for user extension.

Field Documentation

◆ p_context

void const* wdt_cfg_t::p_context
Placeholder for user data. Passed to the user callback in wdt_callback_args_t.

◆ wdt_api_t

struct wdt_api_t	
WDT functions implemented at the HAL layer will follow this API.	
Data Fields	
fsp_err_t(*	open)(wdt_ctrl_t *const p_ctrl, wdt_cfg_t const *const p_cfg)
fsp_err_t(*	refresh)(wdt_ctrl_t *const p_ctrl)
fsp_err_t(*	statusGet)(wdt_ctrl_t *const p_ctrl, wdt_status_t *const p_status)
fsp_err_t(*	statusClear)(wdt_ctrl_t *const p_ctrl, const wdt_status_t status)
fsp_err_t(*	counterGet)(wdt_ctrl_t *const p_ctrl, uint32_t *const p_count)
fsp_err_t(*	timeoutGet)(wdt_ctrl_t *const p_ctrl, wdt_timeout_values_t *const p_timeout)
fsp_err_t(*	callbackSet)(wdt_ctrl_t *const p_ctrl, void(*p_callback)(wdt_callback_args_t *), void const *const p_context, wdt_callback_args_t *const p_callback_memory)

Field Documentation

◆ open

fsp_err_t(* wdt_api_t::open) (wdt_ctrl_t *const p_ctrl, wdt_cfg_t const *const p_cfg)

Initialize the WDT in register start mode. In auto-start mode (Supported devices only) with NMI output it registers the NMI callback.

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	p_cfg	Pointer to pin configuration structure.

◆ refresh

fsp_err_t(* wdt_api_t::refresh) (wdt_ctrl_t *const p_ctrl)

Refresh the watchdog timer.

Parameters

[in]	p_ctrl	Pointer to control structure.

◆ statusGet

fsp_err_t(* wdt_api_t::statusGet) (wdt_ctrl_t *const p_ctrl, wdt_status_t *const p_status)

Read the status of the WDT.

Parameters

[in]	p_ctrl	Pointer to control structure.
[out]	p_status	Pointer to variable to return status information through.

◆ statusClear

fsp_err_t(* wdt_api_t::statusClear) (wdt_ctrl_t *const p_ctrl, const wdt_status_t status)

Clear the status flags of the WDT.

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	status	Status condition(s) to clear.

◆ counterGet

fsp_err_t(* wdt_api_t::counterGet) (wdt_ctrl_t *const p_ctrl, uint32_t *const p_count)

Read the current WDT counter value.

Parameters

[in]	p_ctrl	Pointer to control structure.
[out]	p_count	Pointer to variable to return current WDT counter value.

◆ timeoutGet

fsp_err_t(* wdt_api_t::timeoutGet) (wdt_ctrl_t *const p_ctrl, wdt_timeout_values_t *const p_timeout)

Read the watchdog timeout values.

Parameters

[in]	p_ctrl	Pointer to control structure.
[out]	p_timeout	Pointer to structure to return timeout values.

◆ callbackSet

fsp_err_t(* wdt_api_t::callbackSet) (wdt_ctrl_t *const p_ctrl, void(*p_callback)(wdt_callback_args_t *), void const *const p_context, wdt_callback_args_t *const p_callback_memory)

Specify callback function and optional context pointer and working memory pointer.

Parameters

[in]	p_ctrl	Pointer to the WDT control block.
[in]	p_callback	Callback function
[in]	p_context	Pointer to send to callback function
[in]	p_callback_memory	Pointer to volatile memory where callback structure can be allocated. Callback arguments allocated here are only valid during the callback.

◆ wdt_instance_t

struct wdt_instance_t

This structure encompasses everything that is needed to use an instance of this interface.

Data Fields

wdt_ctrl_t *	p_ctrl	Pointer to the control structure for this instance.
wdt_cfg_t const *	p_cfg	Pointer to the configuration structure for this instance.
wdt_api_t const *	p_api	Pointer to the API structure for this instance.

Typedef Documentation

◆ wdt_ctrl_t

typedef void wdt_ctrl_t
WDT control block. Allocate an instance specific control block to pass into the WDT API calls.

Enumeration Type Documentation

◆ wdt_timeout_t

enum wdt_timeout_t	
WDT time-out periods.	
Enumerator	
WDT_TIMEOUT_128	128 clock cycles
WDT_TIMEOUT_512	512 clock cycles
WDT_TIMEOUT_1024	1024 clock cycles
WDT_TIMEOUT_2048	2048 clock cycles
WDT_TIMEOUT_4096	4096 clock cycles
WDT_TIMEOUT_8192	8192 clock cycles
WDT_TIMEOUT_16384	16384 clock cycles

◆ wdt_clock_division_t

enum wdt_clock_division_t	
WDT clock division ratio.	
Enumerator	
WDT_CLOCK_DIVISION_1	CLK/1.
WDT_CLOCK_DIVISION_4	CLK/4.
WDT_CLOCK_DIVISION_16	CLK/16.
WDT_CLOCK_DIVISION_32	CLK/32.
WDT_CLOCK_DIVISION_64	CLK/64.
WDT_CLOCK_DIVISION_128	CLK/128.
WDT_CLOCK_DIVISION_256	CLK/256.
WDT_CLOCK_DIVISION_512	CLK/512.
WDT_CLOCK_DIVISION_2048	CLK/2048.
WDT_CLOCK_DIVISION_8192	CLK/8192.

◆ wdt_window_start_t

enum wdt_window_start_t	
WDT refresh permitted period window start position.	
Enumerator	
WDT_WINDOW_START_25	Start position = 25%.
WDT_WINDOW_START_50	Start position = 50%.
WDT_WINDOW_START_75	Start position = 75%.
WDT_WINDOW_START_100	Start position = 100%.

◆ wdt_window_end_t

enum wdt_window_end_t	
WDT refresh permitted period window end position.	
Enumerator	
WDT_WINDOW_END_75	End position = 75%.
WDT_WINDOW_END_50	End position = 50%.
WDT_WINDOW_END_25	End position = 25%.
WDT_WINDOW_END_0	End position = 0%.

◆ wdt_reset_control_t

enum wdt_reset_control_t	
WDT Counter underflow and refresh error control.	
Enumerator	
WDT_RESET_CONTROL_NMI	NMI/IRQ request when counter underflows.
WDT_RESET_CONTROL_RESET	Reset request when counter underflows.

◆ wdt_stop_control_t

enum wdt_stop_control_t	
WDT Counter operation in sleep mode.	
Enumerator	
WDT_STOP_CONTROL_DISABLE	Count will not stop when device enters sleep mode.
WDT_STOP_CONTROL_ENABLE	Count will automatically stop when device enters sleep mode.

◆ wdt_status_t

enum wdt_status_t	
WDT status	
Enumerator	
WDT_STATUS_NO_ERROR	No status flags set.
WDT_STATUS_UNDERFLOW	Underflow flag set.
WDT_STATUS_REFRESH_ERROR	Refresh error flag set. Refresh outside of permitted window.
WDT_STATUS_UNDERFLOW_AND_REFRESH_ERROR	Underflow and refresh error flags set.
WDT_STATUS_OVERFLOW	Overflow flag set.

7.3.10 Motor

Interfaces

Detailed Description

Motor Interfaces.

Modules

	Motor 120-Degree Control Interface Interface for motor 120 control functions.
	Motor 120-Degree Driver Interface Interface for motor driver functions.
	Motor Inertia Estimate Interface Interface for Motor inertia estimate functions.
	Motor Interface Interface for Motor functions.

	Motor Return Origin Function Interface Interface for Motor return origin functions.
	Motor angle Interface Interface for motor angle and speed calculation functions.
	Motor current Interface Interface for motor current functions.
	Motor driver Interface Interface for motor driver functions.
	Motor position Interface Interface for motor position functions.
	Motor speed Interface Interface for motor speed functions.

7.3.10.1 Motor 120-Degree Control Interface

Interfaces » Motor

Detailed Description

Interface for motor 120 control functions.

Summary

The motor 120 control interface for speed calculation and setting, fixed cycle processing

Data Structures

struct	motor_120_control_callback_args_t
struct	motor_120_control_motor_parameter_t
struct	motor_120_control_cfg_t

struct	motor_120_control_api_t
struct	motor_120_control_instance_t

Typedefs

typedef void	motor_120_control_ctrl_t

Enumerations

enum	motor_120_control_event_t
enum	motor_120_conduction_type_t
enum	motor_120_control_status_t
enum	motor_120_control_run_mode_t
enum	motor_120_control_rotation_direction_t
enum	motor_120_control_wait_stop_flag_t
enum	motor_120_control_timeout_error_flag_t
enum	motor_120_control_pattern_error_flag_t
enum	motor_120_control_speed_ref_t
enum	motor_120_control_voltage_ref_t

Data Structure Documentation

◆ motor_120_control_callback_args_t

struct motor_120_control_callback_args_t		
Callback function parameter data		
Data Fields		
motor_120_control_event_t	event	Event trigger.
void const *	p_context	Placeholder for user data.

◆ motor_120_control_motor_parameter_t

struct motor_120_control_motor_parameter_t		
Motor parameter for motor 120 control		
Data Fields		
uint32_t	u4_motor_pp	Pole pairs.
float	f4_motor_r	Resistance (ohm)

float	f4_motor_ld	Inductance for d-axis (H)
float	f4_motor_lq	Inductance for q-axis (H)
float	f4_motor_m	Magnet flux (Wb)
float	f4_motor_j	Rotor inertia (kgm^2)

◆ motor_120_control_cfg_t

struct motor_120_control_cfg_t	
Configuration parameters.	
Data Fields	
motor_120_conduction_type_t	conduction_type
	0:First 60 degree PWM, 1:Complementary first 60 degree PWM
uint32_t	u4_timeout_cnt
	Undetected time.
float	f4_max_drive_v
	Max output voltage (V)
float	f4_min_drive_v
	Min output voltage (V)
uint32_t	u4_speed_pi_decimation
	Speed PI control decimation counter.
uint32_t	u4_free_run_timer_freq
	Speed calc free run timer frequency (MHz)
float	f4_speed_lpf_k
	Speed LPF parameter.

float	f4_limit_speed_change
	Speed ref change limit.
float	f4_pi_ctrl_kp
	PI control error.
float	f4_pi_ctrl_ki
	PI control buffer of integral term.
float	f4_pi_ctrl_ilimit
	PI control limit of integral term.
motor_120_control_motor_parameter_t	motor_param
	Motor parameter.
void(*	p_callback)(motor_120_control_callback_args_t *p_args)
	Callback function.
void const *	p_context
	Placeholder for user data.
void const *	p_extend
	Extended configurations.

◆ motor_120_control_api_t

struct motor_120_control_api_t
Functions implemented at the HAL layer will follow these APIs.

Data Fields	
fsp_err_t(*	open)(motor_120_control_ctrl_t *const p_ctrl, motor_120_control_cfg_t const *const p_cfg)
fsp_err_t(*	close)(motor_120_control_ctrl_t *const p_ctrl)
fsp_err_t(*	run)(motor_120_control_ctrl_t *const p_ctrl)
fsp_err_t(*	stop)(motor_120_control_ctrl_t *const p_ctrl)
fsp_err_t(*	reset)(motor_120_control_ctrl_t *const p_ctrl)
fsp_err_t(*	speedSet)(motor_120_control_ctrl_t *const p_ctrl, float const speed_rpm)
fsp_err_t(*	speedGet)(motor_120_control_ctrl_t *const p_ctrl, float *const p_speed_rpm)
fsp_err_t(*	currentGet)(motor_120_control_ctrl_t *const p_ctrl, motor_120_driver_current_status_t *const p_current_status)
fsp_err_t(*	waitStopFlagGet)(motor_120_control_ctrl_t *const p_ctrl, motor_120_control_wait_stop_flag_t *const p_flag)
fsp_err_t(*	timeoutErrorFlagGet)(motor_120_control_ctrl_t *const p_ctrl, motor_120_control_timeout_error_flag_t *const p_timeout_error_flag)
fsp_err_t(*	patternErrorFlagGet)(motor_120_control_ctrl_t *const p_ctrl, motor_120_control_pattern_error_flag_t *const p_pattern_error_flag)
fsp_err_t(*	voltageRefGet)(motor_120_control_ctrl_t *const p_ctrl, motor_120_control_voltage_ref_t *const p_voltage_ref)
fsp_err_t(*	parameterUpdate)(motor_120_control_ctrl_t *const p_ctrl, motor_120_control_cfg_t const *const p_cfg)

Field Documentation

◆ open

fsp_err_t(* motor_120_control_api_t::open) (motor_120_control_ctrl_t *const p_ctrl, motor_120_control_cfg_t const *const p_cfg)

Initialize the motor 120 control module.

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	p_cfg	Pointer to configuration structure.

◆ close

fsp_err_t(* motor_120_control_api_t::close) (motor_120_control_ctrl_t *const p_ctrl)

Close the motor 120 control module

Parameters

[in]	p_ctrl	Pointer to control structure.

◆ run

fsp_err_t(* motor_120_control_api_t::run) (motor_120_control_ctrl_t *const p_ctrl)

Run the motor 120 control module

Parameters

[in]	p_ctrl	Pointer to control structure.

◆ stop

fsp_err_t(* motor_120_control_api_t::stop) (motor_120_control_ctrl_t *const p_ctrl)

Stop the motor 120 control module

Parameters

[in]	p_ctrl	Pointer to control structure.

◆ reset

fsp_err_t(* motor_120_control_api_t::reset) (motor_120_control_ctrl_t *const p_ctrl)

Reset variables of the motor 120 control module

Parameters

[in]	p_ctrl	Pointer to control structure.

◆ speedSet

fsp_err_t(* motor_120_control_api_t::speedSet) (motor_120_control_ctrl_t *const p_ctrl, float const speed_rpm)

Set speed[rpm]

Parameters

[in]	p_ctrl	Pointer to control structure.
[out]	speed_rpm	Pointer to get speed data[rpm]

◆ speedGet

fsp_err_t(* motor_120_control_api_t::speedGet) (motor_120_control_ctrl_t *const p_ctrl, float *const p_speed_rpm)

Get speed.

Parameters

[in]	p_ctrl	Pointer to control structure.
[out]	p_speed_rpm	Pointer to get speed data[rpm]

◆ currentGet

fsp_err_t(* motor_120_control_api_t::currentGet) (motor_120_control_ctrl_t *const p_ctrl, motor_120_driver_current_status_t *const p_current_status)

Get phase current, Vdc and Va_max data.

Parameters

[in]	p_ctrl	Pointer to control structure.
[out]	p_current_status	Pointer to get data structure.

◆ waitStopFlagGet

fsp_err_t(* motor_120_control_api_t::waitStopFlagGet) (motor_120_control_ctrl_t *const p_ctrl, motor_120_control_wait_stop_flag_t *const p_flag)

Get wait stop flag.

Parameters

[in]	p_ctrl	Pointer to control structure.
[out]	p_flag	Pointer to wait stop flag

◆ timeoutErrorFlagGet

fsp_err_t(* motor_120_control_api_t::timeoutErrorFlagGet) (motor_120_control_ctrl_t *const p_ctrl, motor_120_control_timeout_error_flag_t *const p_timeout_error_flag)

Get timerout error flag.

Parameters

[in]	p_ctrl	Pointer to control structure.
[out]	p_timeout_error_flag	Pointer to timeout error flag

◆ patternErrorFlagGet

fsp_err_t(* motor_120_control_api_t::patternErrorFlagGet) (motor_120_control_ctrl_t *const p_ctrl, motor_120_control_pattern_error_flag_t *const p_pattern_error_flag)

Get pattern error flag.

Parameters

[in]	p_ctrl	Pointer to control structure.
[out]	p_pattern_error_flag	Pointer to pattern error flag

◆ voltageRefGet

fsp_err_t(* motor_120_control_api_t::voltageRefGet) (motor_120_control_ctrl_t *const p_ctrl, motor_120_control_voltage_ref_t *const p_voltage_ref)

Get voltage ref.

Parameters

[in]	p_ctrl	Pointer to control structure.
[out]	p_voltage_ref	Pointer to flag voltage ref

◆ parameterUpdate

fsp_err_t(* motor_120_control_api_t::parameterUpdate) (motor_120_control_ctrl_t *const p_ctrl, motor_120_control_cfg_t const *const p_cfg)

Update configuration parameters for the calculation in the motor 120 control module

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	p_cfg	Pointer to configuration structure include update parameters.

◆ motor_120_control_instance_t

struct motor_120_control_instance_t		
This structure encompasses everything that is needed to use an instance of this interface.		
Data Fields		
motor_120_control_ctrl_t *	p_ctrl	Pointer to the control structure for this instance.
motor_120_control_cfg_t const *	p_cfg	Pointer to the configuration structure for this instance.
motor_120_control_api_t const *	p_api	Pointer to the API structure for this instance.

Typedef Documentation

◆ motor_120_control_ctrl_t

typedef void motor_120_control_ctrl_t
Control block. Allocate an instance specific control block to pass into the API calls.

Enumeration Type Documentation

◆ motor_120_control_event_t

enum motor_120_control_event_t	
Events that can trigger a callback function	
Enumerator	
MOTOR_120_CONTROL_EVENT_ADC_FORWARD	Event before motor 120 driver process.
MOTOR_120_CONTROL_EVENT_ADC_BACKWARD	Event after motor 120 driver process.
MOTOR_120_CONTROL_EVENT_CYCLE_FORWARD	Before cyclic process of speed control.
MOTOR_120_CONTROL_EVENT_CYCLE_BACKWARD	After cyclic process of speed control.

◆ motor_120_conduction_type_t

enum motor_120_conduction_type_t	
Enumerator	
MOTOR_120_CONDUCTION_TYPE_FIRST60	First 60 degree PWM.
MOTOR_120_CONDUCTION_TYPE_COMPLEMENTARY	Complementary first 60 degree PWM.

◆ motor_120_control_status_t

enum motor_120_control_status_t	
120 control status	
Enumerator	
MOTOR_120_CONTROL_STATUS_INACTIVE	120 control status inactive
MOTOR_120_CONTROL_STATUS_ACTIVE	120 control status active

◆ motor_120_control_run_mode_t

enum motor_120_control_run_mode_t	
Run mode	
Enumerator	
MOTOR_120_CONTROL_RUN_MODE_INIT	Run mode init.
MOTOR_120_CONTROL_RUN_MODE_BOOT	Run mode boot.
MOTOR_120_CONTROL_RUN_MODE_DRIVE	Run mode drive.

◆ motor_120_control_rotation_direction_t

enum motor_120_control_rotation_direction_t	
Rotation direction	
Enumerator	
MOTOR_120_CONTROL_ROTATION_DIRECTION_CW	Clockwise.
MOTOR_120_CONTROL_ROTATION_DIRECTION_CCW	Counter clockwise.
MOTOR_120_CONTROL_ROTATION_DIRECTION_MAX	Max value.

◆ motor_120_control_wait_stop_flag_t

enum motor_120_control_wait_stop_flag_t	
Flag for waiting for motor stop	
Enumerator	
MOTOR_120_CONTROL_WAIT_STOP_FLAG_CLEAR	Wait stop flag clear.
MOTOR_120_CONTROL_WAIT_STOP_FLAG_SET	Wait stop flag set.

◆ motor_120_control_timeout_error_flag_t

enum motor_120_control_timeout_error_flag_t	
Flag for timeout error status	
Enumerator	
MOTOR_120_CONTROL_TIMEOUT_ERROR_FLAG_CLEAR	Timeout error flag clear.
MOTOR_120_CONTROL_TIMEOUT_ERROR_FLAG_SET	Timeout error flag set.

◆ motor_120_control_pattern_error_flag_t

enum motor_120_control_pattern_error_flag_t	
Flag for pattern error status	
Enumerator	
MOTOR_120_CONTROL_PATTERN_ERROR_FLAG_CLEAR	Pattern error flag clear.
MOTOR_120_CONTROL_PATTERN_ERROR_FLAG_SET	Pattern error flag set.

◆ motor_120_control_speed_ref_t

enum motor_120_control_speed_ref_t	
Speed reference status	
Enumerator	
MOTOR_120_CONTROL_SPEED_REF_ZERO_CONST	Speed reference zero const.
MOTOR_120_CONTROL_SPEED_REF_OPENLOOP_1	Speed reference openloop 1.
MOTOR_120_CONTROL_SPEED_REF_OPENLOOP_2	Speed reference openloop 2.
MOTOR_120_CONTROL_SPEED_REF_OPENLOOP_3	Speed reference openloop 3.
MOTOR_120_CONTROL_SPEED_REF_CHANGE	Speed reference change.

◆ motor_120_control_voltage_ref_t

enum motor_120_control_voltage_ref_t	
Voltage reference status	
Enumerator	
MOTOR_120_CONTROL_VOLTAGE_REF_ZERO_CONST	Voltage reference zero const.
MOTOR_120_CONTROL_VOLTAGE_REF_UP	Voltage reference up.
MOTOR_120_CONTROL_VOLTAGE_REF_CONST	Voltage reference const.
MOTOR_120_CONTROL_VOLTAGE_REF_OPENLOOP	Voltage reference opneloop.
MOTOR_120_CONTROL_VOLTAGE_REF_PI_OUTPUT	Voltage reference pi output.

7.3.10.2 Motor 120-Degree Driver Interface

Interfaces » Motor

Detailed Description

Interface for motor driver functions.

Summary

The MOTOR_120_DRIVER interface for setting the PWM modulation duty

Data Structures

struct	motor_120_driver_callback_args_t
struct	motor_120_driver_current_status_t
struct	motor_120_driver_cfg_t
struct	motor_120_driver_api_t
struct	motor_120_driver_instance_t

Typedefs

typedef void	motor_120_driver_ctrl_t

Enumerations

enum	motor_120_driver_event_t
enum	motor_120_driver_flag_offset_calc_t
enum	motor_120_driver_phase_pattern_t

Data Structure Documentation

◆ motor_120_driver_callback_args_t

struct motor_120_driver_callback_args_t		
Callback function parameter data		
Data Fields		
motor_120_driver_event_t	event	Event trigger.
void const *	p_context	Placeholder for user data.

◆ motor_120_driver_current_status_t

struct motor_120_driver_current_status_t		
Current data get structure		
Data Fields		
float	iu	U phase current (A)
float	iv	V phase current (A)
float	iw	W phase current (A)

float	vdc	Main line voltage (V)
float	vu	U phase voltage (V)
float	vv	V phase voltage (V)
float	vw	W phase voltage (V)

◆ motor_120_driver_cfg_t

struct motor_120_driver_cfg_t	
Configuration parameters.	
Data Fields	
void(*	p_callback)(motor_120_driver_callback_args_t *p_args)
	Callback function.
void const *	p_context
	Placeholder for user data.
void const *	p_extend
	Placeholder for user extension.

◆ motor_120_driver_api_t

struct motor_120_driver_api_t	
Functions implemented at the HAL layer will follow these APIs.	
Data Fields	
fsp_err_t(*	open)(motor_120_driver_ctrl_t *const p_ctrl, motor_120_driver_cfg_t const *const p_cfg)
fsp_err_t(*	close)(motor_120_driver_ctrl_t *const p_ctrl)
fsp_err_t(*	run)(motor_120_driver_ctrl_t *const p_ctrl)
fsp_err_t(*	stop)(motor_120_driver_ctrl_t *const p_ctrl)
fsp_err_t(*	reset)(motor_120_driver_ctrl_t *const p_ctrl)

fsp_err_t(*	phaseVoltageSet)(motor_120_driver_ctrl_t *const p_ctrl, float const u_voltage, float const v_voltage, float const w_voltage)
fsp_err_t(*	phasePatternSet)(motor_120_driver_ctrl_t *const p_ctrl, motor_120_driver_phase_pattern_t const pattern)
fsp_err_t(*	currentGet)(motor_120_driver_ctrl_t *const p_ctrl, motor_120_driver_current_status_t *const p_current_status)
fsp_err_t(*	currentOffsetCalc)(motor_120_driver_ctrl_t *const p_ctrl)
fsp_err_t(*	flagCurrentOffsetGet)(motor_120_driver_ctrl_t *const p_ctrl, motor_120_driver_flag_offset_calc_t *const p_flag_offset)
fsp_err_t(*	parameterUpdate)(motor_120_driver_ctrl_t *const p_ctrl, motor_120_driver_cfg_t const *const p_cfg)

Field Documentation

◆ open

fsp_err_t(* motor_120_driver_api_t::open) (motor_120_driver_ctrl_t *const p_ctrl, motor_120_driver_cfg_t const *const p_cfg)

Initialize the motor 120 driver module.

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	p_cfg	Pointer to configuration structure.

◆ close

fsp_err_t(* motor_120_driver_api_t::close) (motor_120_driver_ctrl_t *const p_ctrl)

Close the motor 120 driver module

Parameters

[in]	p_ctrl	Pointer to control structure.

◆ run

fsp_err_t(* motor_120_driver_api_t::run) (motor_120_driver_ctrl_t *const p_ctrl)

Run the motor 120 driver module

Parameters

[in]	p_ctrl	Pointer to control structure.

◆ stop

fsp_err_t(* motor_120_driver_api_t::stop) (motor_120_driver_ctrl_t *const p_ctrl)

Stop the motor 120 driver module

Parameters

[in]	p_ctrl	Pointer to control structure.

◆ reset

fsp_err_t(* motor_120_driver_api_t::reset) (motor_120_driver_ctrl_t *const p_ctrl)

Reset variables of the motor 120 driver module

Parameters

[in]	p_ctrl	Pointer to control structure.

◆ phaseVoltageSet

fsp_err_t(* motor_120_driver_api_t::phaseVoltageSet) (motor_120_driver_ctrl_t *const p_ctrl, float const u_voltage, float const v_voltage, float const w_voltage)

Set (Input) phase voltage data into the motor 120 driver module

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	u_voltage	U phase voltage [V]
[in]	v_voltage	V phase voltage [V]
[in]	w_voltage	W phase voltage [V]

◆ phasePatternSet

fsp_err_t(* motor_120_driver_api_t::phasePatternSet) (motor_120_driver_ctrl_t *const p_ctrl, motor_120_driver_phase_pattern_t const pattern)

Set phase voltage pattern the motor 120 driver module

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	pattern	Voltage pattern

◆ currentGet

fsp_err_t(* motor_120_driver_api_t::currentGet) (motor_120_driver_ctrl_t *const p_ctrl, motor_120_driver_current_status_t *const p_current_status)

Get phase current, Vdc and Va_max data from the motor 120 driver module

Parameters

[in]	p_ctrl	Pointer to control structure.
[out]	p_current_status	Pointer to get data structure.

◆ currentOffsetCalc

fsp_err_t(* motor_120_driver_api_t::currentOffsetCalc) (motor_120_driver_ctrl_t *const p_ctrl)

current offset detection from the motor 120 driver module

Parameters

[in]	p_ctrl	Pointer to control structure.

◆ flagCurrentOffsetGet

fsp_err_t(* motor_120_driver_api_t::flagCurrentOffsetGet) (motor_120_driver_ctrl_t *const p_ctrl, motor_120_driver_flag_offset_calc_t *const p_flag_offset)

Get the flag of finish current offset detection from the motor 120 driver module

Parameters

[in]	p_ctrl	Pointer to control structure.
[out]	p_flag_offset	Flag of finish current offset detection

◆ parameterUpdate

fsp_err_t(* motor_120_driver_api_t::parameterUpdate) (motor_120_driver_ctrl_t *const p_ctrl, motor_120_driver_cfg_t const *const p_cfg)
Update configuration parameters for the calculation in the motor 120 driver module

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	p_cfg	Pointer to configuration structure include update parameters.

◆ motor_120_driver_instance_t

struct motor_120_driver_instance_t		
This structure encompasses everything that is needed to use an instance of this interface.		
Data Fields		
motor_120_driver_ctrl_t *	p_ctrl	Pointer to the control structure for this instance.
motor_120_driver_cfg_t const *	p_cfg	Pointer to the configuration structure for this instance.
motor_120_driver_api_t const *	p_api	Pointer to the API structure for this instance.

Typedef Documentation

◆ motor_120_driver_ctrl_t

typedef void motor_120_driver_ctrl_t
Control block. Allocate an instance specific control block to pass into the API calls.

Enumeration Type Documentation

◆ motor_120_driver_event_t

enum motor_120_driver_event_t	
Events that can trigger a callback function	
Enumerator	
MOTOR_120_DRIVER_EVENT_FORWARD	Event before motor 120 driver process (before current control timing)
MOTOR_120_DRIVER_EVENT_120_CONTROL	Event 120 detection.
MOTOR_120_DRIVER_EVENT_BACKWARD	Event after motor 120 driver process (after PWM duty setting)

◆ motor_120_driver_flag_offset_calc_t

enum motor_120_driver_flag_offset_calc_t	
The flag represents that the offset measurement is finished	
Enumerator	
MOTOR_120_DRIVER_FLAG_OFFSET_CALC_CLEAR	Offset calculation not finished.
MOTOR_120_DRIVER_FLAG_OFFSET_CALC_OFF_FINISH	Off voltage offset calculation finished.
MOTOR_120_DRIVER_FLAG_OFFSET_CALC_ALL_FINISH	All offset calculation finished.

◆ motor_120_driver_phase_pattern_t

enum motor_120_driver_phase_pattern_t	
Phase voltage pattern	
Enumerator	
MOTOR_120_DRIVER_PHASE_PATTERN_ERROR	Phase voltage pattern error.
MOTOR_120_DRIVER_PHASE_PATTERN_UP_PWM_VN_ON	Up(PWM) to Vn(on)
MOTOR_120_DRIVER_PHASE_PATTERN_UP_PWM_WN_ON	Up(PWM) to Wn(on)
MOTOR_120_DRIVER_PHASE_PATTERN_VP_PWM_UN_ON	Vp(PWM) to Un(on)
MOTOR_120_DRIVER_PHASE_PATTERN_VP_PWM_WN_ON	Vp(PWM) to Wn(on)

MOTOR_120_DRIVER_PHASE_PATTERN_WP_PWM_UN_ON	Wp(PWM) to Un(on)
MOTOR_120_DRIVER_PHASE_PATTERN_WP_PWM_VN_ON	Wp(PWM) to Vn(on)
MOTOR_120_DRIVER_PHASE_PATTERN_UP_ON_VN_PWM	Up(on) to Vn(PWM)
MOTOR_120_DRIVER_PHASE_PATTERN_UP_ON_WN_PWM	Up(on) to Wn(PWM)
MOTOR_120_DRIVER_PHASE_PATTERN_VP_ON_UN_PWM	Vp(on) to Un(PWM)
MOTOR_120_DRIVER_PHASE_PATTERN_VP_ON_WN_PWM	Vp(on) to Wn(PWM)
MOTOR_120_DRIVER_PHASE_PATTERN_WP_ON_UN_PWM	Wp(on) to Un(PWM)
MOTOR_120_DRIVER_PHASE_PATTERN_WP_ON_VN_PWM	Wp(on) to Vn(PWM)
MOTOR_120_DRIVER_PHASE_PATTERN_U_PWM_VN_ON	U(PWM) to Vn(on)
MOTOR_120_DRIVER_PHASE_PATTERN_U_PWM_WN_ON	U(PWM) to Wn(on)
MOTOR_120_DRIVER_PHASE_PATTERN_V_PWM_UN_ON	V(PWM) to Un(on)
MOTOR_120_DRIVER_PHASE_PATTERN_V_PWM_WN_ON	V(PWM) to Wn(on)
MOTOR_120_DRIVER_PHASE_PATTERN_W_PWM_UN_ON	W(PWM) to Un(on)
MOTOR_120_DRIVER_PHASE_PATTERN_W_PWM_VN_ON	W(PWM) to Vn(on)
MOTOR_120_DRIVER_PHASE_PATTERN_UP_ON_V_PWM	Up(on) to V(PWM)
MOTOR_120_DRIVER_PHASE_PATTERN_UP_ON_W_PWM	Up(on) to W(PWM)
MOTOR_120_DRIVER_PHASE_PATTERN_VP_ON_U_PWM	Vp(on) to U(PWM)
MOTOR_120_DRIVER_PHASE_PATTERN_VP_ON_W_PWM	Vp(on) to W(PWM)
MOTOR_120_DRIVER_PHASE_PATTERN_WP_ON_U_PWM	Wp(on) to U(PWM)
MOTOR_120_DRIVER_PHASE_PATTERN_WP_ON_V_PWM	Wp(on) to V(PWM)

7.3.10.3 Motor Inertia Estimate Interface

Interfaces » Motor

Detailed Description

Interface for Motor inertia estimate functions.

Summary

The Motor interface provides Motor inertia estimate functionality.

Data Structures

struct	motor_inertia_estimate_info_t
struct	motor_inertia_estimate_cfg_t
struct	motor_inertia_estimate_api_t
struct	motor_inertia_estimate_instance_t

Typedefs

typedef void	motor_inertia_estimate_ctrl_t

Data Structure Documentation

◆ **motor_inertia_estimate_info_t**

struct motor_inertia_estimate_info_t		
Interface data structure		
Data Fields		
int16_t	s2_position_reference_degree	Position reference [degree].
motor_inertia_estimate_mode_t	mode	Internal mode of inertia estimation.
float	f_estimated_inertia	Estimated inertia data.

◆ **motor_inertia_estimate_cfg_t**

struct motor_inertia_estimate_cfg_t		
Configuration parameters.		
Data Fields		
void const *	p_context	
void const *	p_extend	Placeholder for user extension.

◆ motor_inertia_estimate_api_t

struct motor_inertia_estimate_api_t	
Functions implemented at the HAL layer will follow this API.	
Data Fields	
fsp_err_t(*	open)(motor_inertia_estimate_ctrl_t *const p_ctrl, motor_inertia_estimate_cfg_t const *const p_cfg)
fsp_err_t(*	close)(motor_inertia_estimate_ctrl_t *const p_ctrl)
fsp_err_t(*	start)(motor_inertia_estimate_ctrl_t *const p_ctrl)
fsp_err_t(*	stop)(motor_inertia_estimate_ctrl_t *const p_ctrl)
fsp_err_t(*	reset)(motor_inertia_estimate_ctrl_t *const p_ctrl)
fsp_err_t(*	infoGet)(motor_inertia_estimate_ctrl_t *const p_ctrl, motor_inertia_estimate_info_t *const p_info)
fsp_err_t(*	dataSet)(motor_inertia_estimate_ctrl_t *const p_ctrl, motor_inertia_estimate_set_data_t *const p_set_data)
fsp_err_t(*	speedCyclic)(motor_inertia_estimate_ctrl_t *const p_ctrl)
fsp_err_t(*	currentCyclic)(motor_inertia_estimate_ctrl_t *const p_ctrl)
fsp_err_t(*	parameterUpdate)(motor_inertia_estimate_ctrl_t *const p_ctrl, motor_inertia_estimate_cfg_t const *p_cfg)

Field Documentation

◆ open

fsp_err_t(* motor_inertia_estimate_api_t::open) (motor_inertia_estimate_ctrl_t *const p_ctrl, motor_inertia_estimate_cfg_t const *const p_cfg)

Open driver.

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	p_cfg	Pointer to configuration structure.

◆ close

fsp_err_t(* motor_inertia_estimate_api_t::close) (motor_inertia_estimate_ctrl_t *const p_ctrl)

Close driver.

Parameters

[in]	p_ctrl	Pointer to control structure.

◆ start

fsp_err_t(* motor_inertia_estimate_api_t::start) (motor_inertia_estimate_ctrl_t *const p_ctrl)

Start the function.

Parameters

[in]	p_ctrl	Pointer to control structure.

◆ stop

fsp_err_t(* motor_inertia_estimate_api_t::stop) (motor_inertia_estimate_ctrl_t *const p_ctrl)

Stop(same as cancel) the function.

Parameters

[in]	p_ctrl	Pointer to control structure.

◆ reset

fsp_err_t(* motor_inertia_estimate_api_t::reset) (motor_inertia_estimate_ctrl_t *const p_ctrl)

Reset the function. (recover from error state)

Parameters

[in]	p_ctrl	Pointer to control structure.

◆ infoGet

fsp_err_t(* motor_inertia_estimate_api_t::infoGet) (motor_inertia_estimate_ctrl_t *const p_ctrl, motor_inertia_estimate_info_t *const p_info)

Get information from the function (to set speed & position control)

Parameters

[in]	p_ctrl	Pointer to control structure.
[out]	p_info	Pointer to information

◆ dataSet

fsp_err_t(* motor_inertia_estimate_api_t::dataSet) (motor_inertia_estimate_ctrl_t *const p_ctrl, motor_inertia_estimate_set_data_t *const p_set_data)

Set the data to the function (from speed, position and current control)

Parameters

[in]	p_ctrl	Pointer to control structure.
[out]	p_set_data	Pointer to set the data

◆ speedCyclic

fsp_err_t(* motor_inertia_estimate_api_t::speedCyclic) (motor_inertia_estimate_ctrl_t *const p_ctrl)

Speed cyclic process of the function

Parameters

[in]	p_ctrl	Pointer to control structure.

◆ currentCyclic

fsp_err_t(* motor_inertia_estimate_api_t::currentCyclic) (motor_inertia_estimate_ctrl_t *const p_ctrl)

Current cyclic process of the function

Parameters

[in]	p_ctrl	Pointer to control structure.

◆ parameterUpdate

fsp_err_t(* motor_inertia_estimate_api_t::parameterUpdate) (motor_inertia_estimate_ctrl_t *const p_ctrl, motor_inertia_estimate_cfg_t const *p_cfg)

Update parameters for the function.

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	p_cfg	Pointer to configuration structure include update parameters.

◆ motor_inertia_estimate_instance_t

struct motor_inertia_estimate_instance_t		
This structure encompasses everything that is needed to use an instance of this interface.		
Data Fields		
motor_inertia_estimate_ctrl_t *	p_ctrl	Pointer to the control structure for this instance.
motor_inertia_estimate_cfg_t const *	p_cfg	Pointer to the configuration structure for this instance.
motor_inertia_estimate_api_t const *	p_api	Pointer to the API structure for this instance.

Typedef Documentation

◆ motor_inertia_estimate_ctrl_t

typedef void motor_inertia_estimate_ctrl_t
Motor inertia estimate block. Allocate an instance specific control block to pass into the API calls.

7.3.10.4 Motor Interface

Interfaces » Motor

Detailed Description

Interface for Motor functions.

Summary

The Motor interface provides Motor functionality.

Data Structures

struct	motor_callback_args_t
struct	motor_cfg_t
struct	motor_api_t
struct	motor_instance_t

Typedefs

typedef void	motor_ctrl_t

Enumerations

enum	motor_error_t
enum	motor_callback_event_t
enum	motor_wait_stop_flag_t
enum	motor_function_select_t

Data Structure Documentation

◆ motor_callback_args_t

struct motor_callback_args_t		
callback function parameter data		
Data Fields		
void const *	p_context	Placeholder for user data.
motor_callback_event_t	event	

◆ motor_cfg_t

struct motor_cfg_t	
Configuration parameters.	
Data Fields	
motor_speed_instance_t const *	p_motor_speed_instance
	Speed Instance.
motor_current_instance_t const *	p_motor_current_instance

	Current Instance.
void(*	p_callback)(motor_callback_args_t *p_args)
void const *	p_extend
	Placeholder for user extension.

Field Documentation

◆ p_callback

void(* motor_cfg_t::p_callback) (motor_callback_args_t *p_args)
Placeholder for user data. Passed to the user callback in motor_callback_args_t.

◆ motor_api_t

struct motor_api_t
Functions implemented at the HAL layer will follow this API.
Data Fields

fsp_err_t(*	open)(motor_ctrl_t *const p_ctrl, motor_cfg_t const *const p_cfg)
fsp_err_t(*	close)(motor_ctrl_t *const p_ctrl)
fsp_err_t(*	run)(motor_ctrl_t *const p_ctrl)
fsp_err_t(*	stop)(motor_ctrl_t *const p_ctrl)
fsp_err_t(*	reset)(motor_ctrl_t *const p_ctrl)
fsp_err_t(*	errorSet)(motor_ctrl_t *const p_ctrl, motor_error_t const error)
fsp_err_t(*	speedSet)(motor_ctrl_t *const p_ctrl, float const speed_rpm)
fsp_err_t(*	positionSet)(motor_ctrl_t *const p_ctrl, motor_speed_position_data_t const *const p_position)

fsp_err_t(*	statusGet)(motor_ctrl_t *const p_ctrl, uint8_t *const p_status)
fsp_err_t(*	angleGet)(motor_ctrl_t *const p_ctrl, float *const p_angle_rad)
fsp_err_t(*	speedGet)(motor_ctrl_t *const p_ctrl, float *const p_speed_rpm)
fsp_err_t(*	waitStopFlagGet)(motor_ctrl_t *const p_ctrl, motor_wait_stop_flag_t *const p_flag)
fsp_err_t(*	errorCheck)(motor_ctrl_t *const p_ctrl, uint16_t *const p_error)
fsp_err_t(*	functionSelect)(motor_ctrl_t *const p_ctrl, motor_function_select_t const function)

Field Documentation

◆ open

fsp_err_t(* motor_api_t::open) (motor_ctrl_t *const p_ctrl, motor_cfg_t const *const p_cfg)

Open driver.

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	p_cfg	Pointer to configuration structure.

◆ close

fsp_err_t(* motor_api_t::close) (motor_ctrl_t *const p_ctrl)

Close driver.

Parameters

[in]	p_ctrl	Pointer to control structure.

◆ run

fsp_err_t(* motor_api_t::run) (motor_ctrl_t *const p_ctrl)

Run the motor. (Start the motor rotation.)

Parameters

[in]	p_ctrl	Pointer to control structure.

◆ stop

fsp_err_t(* motor_api_t::stop) (motor_ctrl_t *const p_ctrl)

Stop the motor. (Stop the motor rotation.)

Parameters

[in]	p_ctrl	Pointer to control structure.

◆ reset

fsp_err_t(* motor_api_t::reset) (motor_ctrl_t *const p_ctrl)

Reset the motor control. (Recover from the error status.)

Parameters

[in]	p_ctrl	Pointer to control structure.

◆ errorSet

fsp_err_t(* motor_api_t::errorSet) (motor_ctrl_t *const p_ctrl, motor_error_t const error)

Set Error Information.

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	error	Happend error code

◆ speedSet

fsp_err_t(* motor_api_t::speedSet) (motor_ctrl_t *const p_ctrl, float const speed_rpm)

Set rotation speed.

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	speed_rpm	Required rotation speed [rpm]

◆ positionSet

fsp_err_t(* motor_api_t::positionSet) (motor_ctrl_t *const p_ctrl, motor_speed_position_data_t const *const p_position)

Set reference position.

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	p_position	Pointer to set required data

◆ statusGet

fsp_err_t(* motor_api_t::statusGet) (motor_ctrl_t *const p_ctrl, uint8_t *const p_status)

Get the motor control status.

Parameters

[in]	p_ctrl	Pointer to control structure.
[out]	p_status	Pointer to get the motor control status

◆ angleGet

fsp_err_t(* motor_api_t::angleGet) (motor_ctrl_t *const p_ctrl, float *const p_angle_rad)

Get the rotor angle.

Parameters

[in]	p_ctrl	Pointer to control structure.
[out]	p_angle_rad	Pointer to get the rotor angle [rad]

◆ speedGet

fsp_err_t(* motor_api_t::speedGet) (motor_ctrl_t *const p_ctrl, float *const p_speed_rpm)

Get the rotation speed.

Parameters

[in]	p_ctrl	Pointer to control structure.
[out]	p_speed_rpm	Pointer to get the rotation speed [rpm]

◆ waitStopFlagGet

fsp_err_t(* motor_api_t::waitStopFlagGet) (motor_ctrl_t *const p_ctrl, motor_wait_stop_flag_t *const p_flag)

Get wait stop flag.

Parameters

[in]	p_ctrl	Pointer to control structure.
[out]	p_flag	Pointer to wait stop flag

◆ errorCheck

fsp_err_t(* motor_api_t::errorCheck) (motor_ctrl_t *const p_ctrl, uint16_t *const p_error)

Check the error occurrence

Parameters

[in]	p_ctrl	Pointer to control structure.
[out]	p_error	Pointer to get occured error

◆ functionSelect

fsp_err_t(* motor_api_t::functionSelect) (motor_ctrl_t *const p_ctrl, motor_function_select_t const function)

FunctionSelect.

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	function	Selected function

◆ motor_instance_t

struct motor_instance_t		
This structure encompasses everything that is needed to use an instance of this interface.		
Data Fields		
motor_ctrl_t *	p_ctrl	Pointer to the control structure for this instance.
motor_cfg_t const *	p_cfg	Pointer to the configuration structure for this instance.
motor_api_t const *	p_api	Pointer to the API structure for this instance.

Typedef Documentation

◆ motor_ctrl_t

typedef void motor_ctrl_t
Motor Control block. Allocate an instance specific control block to pass into the API calls.

Enumeration Type Documentation

◆ motor_error_t

enum motor_error_t
Error information

◆ motor_callback_event_t

enum motor_callback_event_t	
Events that can trigger a callback function	
Enumerator	
MOTOR_CALLBACK_EVENT_SPEED_FORWARD	Event forward speed control.
MOTOR_CALLBACK_EVENT_SPEED_BACKWARD	Event backward speed control.
MOTOR_CALLBACK_EVENT_CURRENT_FORWARD	Event forward current control.
MOTOR_CALLBACK_EVENT_CURRENT_BACKWARD	Event backward current control.
MOTOR_CALLBACK_EVENT_ADC_FORWARD	Event before motor 120 driver process.
MOTOR_CALLBACK_EVENT_ADC_BACKWARD	Event after motor 120 driver process.
MOTOR_CALLBACK_EVENT_CYCLE_FORWARD	Before cyclic process of speed control.
MOTOR_CALLBACK_EVENT_CYCLE_BACKWARD	After cyclic process of speed control.

◆ motor_wait_stop_flag_t

enum motor_wait_stop_flag_t	
Flag for waiting for motor stop	
Enumerator	
MOTOR_WAIT_STOP_FLAG_CLEAR	Wait stop flag clear.
MOTOR_WAIT_STOP_FLAG_SET	Wait stop flag set.

◆ motor_function_select_t

enum motor_function_select_t	
Function select	
Enumerator	
MOTOR_FUNCTION_SELECT_NONE	No function selected.
MOTOR_FUNCTION_SELECT_INERTIA_ESTIMATE	Inertia estimation.
MOTOR_FUNCTION_SELECT_RETURN_ORIGIN	Return origin position.

7.3.10.5 Motor Return Origin Function Interface

Interfaces » Motor

Detailed Description

Interface for Motor return origin functions.

Summary

The Motor interface provides Motor return origin functionality.

Data Structures

struct	motor_return_origin_info_t
struct	motor_return_origin_cfg_t
struct	motor_return_origin_api_t

struct	motor_return_origin_instance_t

Typedefs

typedef void	motor_return_origin_ctrl_t

Enumerations

enum	motor_return_origin_mode_t

Data Structure Documentation

◆ motor_return_origin_info_t

struct motor_return_origin_info_t		
Interface data structure		
Data Fields		
float	f_position_reference_degree	Position reference [degree].
motor_return_origin_state_t	state	
float	f_result_angle	Result angle position.

◆ motor_return_origin_cfg_t

struct motor_return_origin_cfg_t		
Configuration parameters.		
Data Fields		
motor_return_origin_mode_t	mode	
void const *	p_context	
void const *	p_extend	Placeholder for user extension.

◆ motor_return_origin_api_t

struct motor_return_origin_api_t	
Functions implemented at the HAL layer will follow this API.	
Data Fields	
fsp_err_t(*	open)(motor_return_origin_ctrl_t *const p_ctrl, motor_return_origin_cfg_t const *const p_cfg)
fsp_err_t(*	close)(motor_return_origin_ctrl_t *const p_ctrl)
fsp_err_t(*	start)(motor_return_origin_ctrl_t *const p_ctrl)
fsp_err_t(*	stop)(motor_return_origin_ctrl_t *const p_ctrl)

fsp_err_t(*	reset)(motor_return_origin_ctrl_t *const p_ctrl)
fsp_err_t(*	infoGet)(motor_return_origin_ctrl_t *const p_ctrl, motor_return_origin_info_t *const p_info)
fsp_err_t(*	dataSet)(motor_return_origin_ctrl_t *const p_ctrl, motor_return_origin_set_data_t *const p_set_data)
fsp_err_t(*	speedCyclic)(motor_return_origin_ctrl_t *const p_ctrl)
fsp_err_t(*	parameterUpdate)(motor_return_origin_ctrl_t *const p_ctrl, motor_return_origin_cfg_t const *p_cfg)

Field Documentation

◆ open

fsp_err_t(* motor_return_origin_api_t::open) (motor_return_origin_ctrl_t *const p_ctrl, motor_return_origin_cfg_t const *const p_cfg)

Open driver.

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	p_cfg	Pointer to configuration structure.

◆ close

fsp_err_t(* motor_return_origin_api_t::close) (motor_return_origin_ctrl_t *const p_ctrl)

Close driver.

Parameters

[in]	p_ctrl	Pointer to control structure.

◆ start

fsp_err_t(* motor_return_origin_api_t::start) (motor_return_origin_ctrl_t *const p_ctrl)

Start the function.

Parameters

[in]	p_ctrl	Pointer to control structure.

◆ stop

fsp_err_t(* motor_return_origin_api_t::stop) (motor_return_origin_ctrl_t *const p_ctrl)

Stop the function. (Cancel the function works.)

Parameters

[in]	p_ctrl	Pointer to control structure.

◆ reset

fsp_err_t(* motor_return_origin_api_t::reset) (motor_return_origin_ctrl_t *const p_ctrl)

Reset the function. (Initialize the function.)

Parameters

[in]	p_ctrl	Pointer to control structure.

◆ infoGet

fsp_err_t(* motor_return_origin_api_t::infoGet) (motor_return_origin_ctrl_t *const p_ctrl, motor_return_origin_info_t *const p_info)

Get the function information.

Parameters

[in]	p_ctrl	Pointer to control structure.
[out]	p_info	Pointer to info

◆ dataSet

fsp_err_t(* motor_return_origin_api_t::dataSet) (motor_return_origin_ctrl_t *const p_ctrl, motor_return_origin_set_data_t *const p_set_data)

Set the data to the function

Parameters

[in]	p_ctrl	Pointer to control structure.
[out]	p_set_data	Pointer to set the data

◆ speedCyclic

fsp_err_t(* motor_return_origin_api_t::speedCyclic) (motor_return_origin_ctrl_t *const p_ctrl)

Speed cyclic process of the function

Parameters

[in]	p_ctrl	Pointer to control structure.

◆ parameterUpdate

fsp_err_t(* motor_return_origin_api_t::parameterUpdate) (motor_return_origin_ctrl_t *const p_ctrl, motor_return_origin_cfg_t const *p_cfg)

Update parameters for the function.

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	p_cfg	Pointer to configuration structure include update parameters.

◆ motor_return_origin_instance_t

struct motor_return_origin_instance_t		
This structure encompasses everything that is needed to use an instance of this interface.		
Data Fields		
motor_return_origin_ctrl_t *	p_ctrl	Pointer to the control structure for this instance.
motor_return_origin_cfg_t const *	p_cfg	Pointer to the configuration structure for this instance.
motor_return_origin_api_t const *	p_api	Pointer to the API structure for this instance.

Typedef Documentation

◆ motor_return_origin_ctrl_t

typedef void motor_return_origin_ctrl_t
Motor return origin function block. Allocate an instance specific control block to pass into the API calls.

Enumeration Type Documentation

◆ motor_return_origin_mode_t

enum motor_return_origin_mode_t	
Selection type of return origin function	
Enumerator	
MOTOR_RETURN_ORIGIN_MODE_PUSH	Return origin position with pushing.
MOTOR_RETURN_ORIGIN_MODE_SENSOR	Return origin position with origin sensor.
MOTOR_RETURN_ORIGIN_MODE_2_SENSOR	Return origin position with 2 sensors.
MOTOR_RETURN_ORIGIN_MODE_3_SENSOR	Return origin position with 3 sensors.

7.3.10.6 Motor angle Interface

Interfaces » Motor

Detailed Description

Interface for motor angle and speed calculation functions.

Summary

The Motor angle interface calculates the rotor angle and rotational speed from other data.

Data Structures

struct	motor_angle_cfg_t
struct	motor_angle_current_t
struct	motor_angle_voltage_reference_t
struct	motor_angle_ad_data_t

struct	motor_angle_encoder_info_t
struct	motor_angle_api_t
struct	motor_angle_instance_t

Typedefs

typedef void	motor_angle_ctrl_t

Enumerations

enum	motor_sense_encoder_angle_adjust_t
enum	motor_angle_open_loop_t
enum	motor_angle_error_t

Data Structure Documentation

◆ motor_angle_cfg_t

struct motor_angle_cfg_t
Configuration parameters.

◆ motor_angle_current_t

struct motor_angle_current_t		
Interface structure		
Data Fields		
float	id	d-axis current
float	iq	q-axis current

◆ motor_angle_voltage_reference_t

struct motor_angle_voltage_reference_t		
Motor angle voltage reference		
Data Fields		
float	vd	d-axis voltage reference
float	vq	q-axis voltage reference

◆ motor_angle_ad_data_t

struct motor_angle_ad_data_t
A/D conversion data
Data Fields

float	sin_ad_data	sin A/D data of induction sensor
float	cos_ad_data	cos A/D data of induction sensor

◆ motor_angle_encoder_info_t

struct motor_angle_encoder_info_t		
Motor angle encoder adjustment info		
Data Fields		
motor_sense_encoder_angle_adjust_t	e_adjust_status	Encoder Adjustment Status.
uint8_t	u1_adjust_count_full	Adjustment count became full.
motor_angle_open_loop_t	e_open_loop_status	Openloop status.
float	f_openloop_speed	Openloop speed.
float	f_openloop_id_ref	Openloop d-axis current.

◆ motor_angle_api_t

struct motor_angle_api_t	
Functions implemented as application interface will follow these APIs.	
Data Fields	
fsp_err_t(*	open)(motor_angle_ctrl_t *const p_ctrl, motor_angle_cfg_t const *const p_cfg)
fsp_err_t(*	close)(motor_angle_ctrl_t *const p_ctrl)
fsp_err_t(*	reset)(motor_angle_ctrl_t *const p_ctrl)
fsp_err_t(*	currentSet)(motor_angle_ctrl_t *const p_ctrl, motor_angle_current_t *const p_st_current, motor_angle_voltage_reference_t *const p_st_voltage)
fsp_err_t(*	speedSet)(motor_angle_ctrl_t *const p_ctrl, float const speed_ctrl, float const damp_speed)
fsp_err_t(*	flagPiCtrlSet)(motor_angle_ctrl_t *const p_ctrl, uint32_t const flag_pi)
fsp_err_t(*	internalCalculate)(motor_angle_ctrl_t *const p_ctrl)

fsp_err_t(*	angleSpeedGet)(motor_angle_ctrl_t *const p_ctrl, float *const p_angle, float *const p_speed, float *const p_phase_err)
fsp_err_t(*	angleAdjust)(motor_angle_ctrl_t *const p_ctrl)
fsp_err_t(*	encoderCyclic)(motor_angle_ctrl_t *const p_ctrl)
fsp_err_t(*	cyclicProcess)(motor_angle_ctrl_t *const p_ctrl)
fsp_err_t(*	sensorDataSet)(motor_angle_ctrl_t *const p_ctrl, motor_angle_ad_data_t *const p_ad_data)
fsp_err_t(*	estimatedComponentGet)(motor_angle_ctrl_t *const p_ctrl, float *const p_ed, float *const p_eq)
fsp_err_t(*	infoGet)(motor_angle_ctrl_t *const p_ctrl, motor_angle_encoder_info_t *const p_info)
fsp_err_t(*	parameterUpdate)(motor_angle_ctrl_t *const p_ctrl, motor_angle_cfg_t const *p_cfg)

Field Documentation

◆ open

fsp_err_t(* motor_angle_api_t::open) (motor_angle_ctrl_t *const p_ctrl, motor_angle_cfg_t const *const p_cfg)

Initialize the Motor_Angle.

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	p_cfg	Pointer to configuration structure.

◆ close

fsp_err_t(* motor_angle_api_t::close) (motor_angle_ctrl_t *const p_ctrl)

Close (Finish) the Motor_Angle.

Parameters

[in]	p_ctrl	Pointer to control structure.

◆ reset

fsp_err_t(* motor_angle_api_t::reset) (motor_angle_ctrl_t *const p_ctrl)

Reset the Motor_Angle.

Parameters

[in]	p_ctrl	Pointer to control structure.

◆ currentSet

fsp_err_t(* motor_angle_api_t::currentSet) (motor_angle_ctrl_t *const p_ctrl, motor_angle_current_t *const p_st_current, motor_angle_voltage_reference_t *const p_st_voltage)

Set (Input) Current & Voltage Reference data into the Motor_Angle.

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	p_st_current	Pointer to current structure
[in]	p_st_voltage	Pointer to voltage Reference structure

◆ speedSet

fsp_err_t(* motor_angle_api_t::speedSet) (motor_angle_ctrl_t *const p_ctrl, float const speed_ctrl, float const damp_speed)

Set (Input) Speed Information into the Motor_Angle.

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	speed_ctrl	Control reference of rotational speed [rad/s]
[in]	damp_speed	Damping rotational speed [rad/s]

◆ flagPiCtrlSet

fsp_err_t(* motor_angle_api_t::flagPiCtrlSet) (motor_angle_ctrl_t *const p_ctrl, uint32_t const flag_pi)

Set the flag of PI Control runs.

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	flag_pi	The flag of PI control runs

◆ internalCalculate

fsp_err_t(* motor_angle_api_t::internalCalculate) (motor_angle_ctrl_t *const p_ctrl)

Calculate internal parameters of encoder process.

Parameters

[in]	p_ctrl	Pointer to control structure.

◆ angleSpeedGet

fsp_err_t(* motor_angle_api_t::angleSpeedGet) (motor_angle_ctrl_t *const p_ctrl, float *const p_angle, float *const p_speed, float *const p_phase_err)

Get rotor angle and rotational speed from the Motor_Angle.

Parameters

[in]	p_ctrl	Pointer to control structure.
[out]	p_angl	Memory address to get rotor angle data
[out]	p_speed	Memory address to get rotational speed data
[out]	p_phase_err	Memory address to get phase(angle) error data

◆ angleAdjust

fsp_err_t(* motor_angle_api_t::angleAdjust) (motor_angle_ctrl_t *const p_ctrl)

Angle Adjustment Process.

Parameters

[in]	p_ctrl	Pointer to control structure.

◆ encoderCyclic

fsp_err_t(* motor_angle_api_t::encoderCyclic) (motor_angle_ctrl_t *const p_ctrl)

DEPRECATED Encoder Cyclic Process.

Parameters

[in]	p_ctrl	Pointer to control structure.

◆ cyclicProcess

fsp_err_t(* motor_angle_api_t::cyclicProcess) (motor_angle_ctrl_t *const p_ctrl)

Cyclic Process. please

Parameters

[in]	p_ctrl	Pointer to control structure.

◆ sensorDataSet

fsp_err_t(* motor_angle_api_t::sensorDataSet) (motor_angle_ctrl_t *const p_ctrl, motor_angle_ad_data_t *const p_ad_data)

Set sensor A/D data into the Motor_Angle.

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	p_ad_data	Pointer to A/D conversion data

◆ estimatedComponentGet

fsp_err_t(* motor_angle_api_t::estimatedComponentGet) (motor_angle_ctrl_t *const p_ctrl, float *const p_ed, float *const p_eq)

Get estimated d/q-axis component from the Motor_Angle.

Parameters

[in]	p_ctrl	Pointer to control structure.
[out]	p_ed	Memory address to get estimated d-axis component
[out]	p_eq	Memory address to get estimated q-axis component

◆ infoGet

fsp_err_t(* motor_angle_api_t::infoGet) (motor_angle_ctrl_t *const p_ctrl, motor_angle_encoder_info_t *const p_info)

Get Encoder Calculate Information.

Parameters

[in]	p_ctrl	Pointer to control structure.
[out]	p_info	Memory address to get angle internal information

◆ parameterUpdate

fsp_err_t(* motor_angle_api_t::parameterUpdate) (motor_angle_ctrl_t *const p_ctrl, motor_angle_cfg_t const *p_cfg)

Update Parameters for the calculation in the Motor_Angle.

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	p_cfg	Pointer to configuration structure include update parameters.

◆ motor_angle_instance_t

struct motor_angle_instance_t		
This structure encompasses everything that is needed to use an instance of this interface.		
Data Fields		
motor_angle_ctrl_t *	p_ctrl	Pointer to the control structure for this instance.
motor_angle_cfg_t const *	p_cfg	Pointer to the configuration structure for this instance.
motor_angle_api_t const *	p_api	Pointer to the API structure for this instance.

Typedef Documentation

◆ motor_angle_ctrl_t

typedef void motor_angle_ctrl_t
Motor Angle Control block. Allocate an instance specific control block to pass into the API calls.

Enumeration Type Documentation

◆ motor_sense_encoder_angle_adjust_t

enum motor_sense_encoder_angle_adjust_t	
Enumerator	
MOTOR_SENSE_ENCODER_ANGLE_ADJUST_90_DEGREE	Roter Angle Adjustment to pull in 90degree.
MOTOR_SENSE_ENCODER_ANGLE_ADJUST_0_DEGREE	Roter Angle Adjustment to pull in 0degree.
MOTOR_SENSE_ENCODER_ANGLE_ADJUST_FINISH	Roter Angle Adjustment Finish.
MOTOR_SENSE_ENCODER_ANGLE_ADJUST_OPENLOOP	Roter Angle Adjustment Finish.

◆ motor_angle_open_loop_t

enum motor_angle_open_loop_t	
Enumerator	
MOTOR_ANGLE_OPEN_LOOP_INACTIVE	Openloop inactive.
MOTOR_ANGLE_OPEN_LOOP_ACTIVE	Openloop active.

◆ motor_angle_error_t

enum motor_angle_error_t	
Flag for induction correction error status	
Enumerator	
MOTOR_ANGLE_ERROR_NONE	No error happen.
MOTOR_ANGLE_ERROR_INDUCTION	Error happens in induction sensor correction process.

7.3.10.7 Motor current Interface

Interfaces » Motor

Detailed Description

Interface for motor current functions.

Summary

The Motor current interface for getting the PWM modulation duty from electric current and speed

Data Structures

struct	motor_current_output_t
struct	motor_current_input_current_t
struct	motor_current_input_voltage_t
struct	motor_current_get_voltage_t
struct	motor_current_cfg_t
struct	motor_current_api_t
struct	motor_current_instance_t

Typedefs

typedef void	motor_current_ctrl_t

Enumerations

enum	motor_current_event_t

Data Structure Documentation

◆ motor_current_output_t

struct motor_current_output_t		
Structure of interface to speed control Output parameters		
Data Fields		
float	f_id	D-axis current [A].
float	f_iq	Q-axis current [A].
float	f_vamax	
float	f_speed_rad	Speed value [rad/s].
float	f_speed_rpm	Speed value [rpm].
float	f_rotor_angle	Motor rotor angle [rad].
float	f_position_rad	Motor rotor position [rad].
float	f_ed	Estimated d-axis component[V] of flux due to the permanent magnet.
float	f_eq	Estimated q-axis component[V]

		of flux due to the permanent magnet.
float	f_phase_err_rad	Phase error [rad].
uint8_t	u1_flag_get_iref	Flag to set d/q-axis current reference.
uint8_t	u1_adjust_status	Angle adjustment satatus.
uint8_t	u1_adjust_count_full	Angle adjustment count full.
uint8_t	u1_openloop_status	Openloop status.
float	f_openloop_speed	Openloop speed.
float	f_openloop_id_ref	Openloop d-axis current.

◆ motor_current_input_current_t

struct motor_current_input_current_t		
Three-phase input current		
Data Fields		
float	iu	U phase current[A].
float	iv	V phase current[A].
float	iw	W phase current[A].

◆ motor_current_input_voltage_t

struct motor_current_input_voltage_t		
Input voltage		
Data Fields		
float	vdc	Main line voltage[V].
float	va_max	Maximum magnitude of voltage vector[V].

◆ motor_current_get_voltage_t

struct motor_current_get_voltage_t		
Struct to get motor current		
Data Fields		
float	u_voltage	U phase voltage[V].
float	v_voltage	V phase voltage[V].
float	w_voltage	W phase voltage[V].
float	vd_reference	d-axis voltage reference
float	vq_reference	q-axis voltage reference

◆ motor_current_cfg_t

struct motor_current_cfg_t
Configuration parameters.

◆ motor_current_api_t

struct motor_current_api_t	
Functions implemented at the Motor Current Module will follow these APIs.	
Data Fields	
fsp_err_t(*	open)(motor_current_ctrl_t *const p_ctrl, motor_current_cfg_t const *const p_cfg)
fsp_err_t(*	close)(motor_current_ctrl_t *const p_ctrl)
fsp_err_t(*	reset)(motor_current_ctrl_t *const p_ctrl)
fsp_err_t(*	run)(motor_current_ctrl_t *const p_ctrl)
fsp_err_t(*	parameterSet)(motor_current_ctrl_t *const p_ctrl, motor_current_input_t const *const p_st_input)
fsp_err_t(*	currentReferenceSet)(motor_current_ctrl_t *const p_ctrl, float const id_reference, float const iq_reference)
fsp_err_t(*	speedPhaseSet)(motor_current_ctrl_t *const p_ctrl, float const speed_rad, float const phase_rad)
fsp_err_t(*	currentSet)(motor_current_ctrl_t *const p_ctrl, motor_current_input_current_t const *const p_st_current, motor_current_input_voltage_t const *const p_st_voltage)
fsp_err_t(*	parameterGet)(motor_current_ctrl_t *const p_ctrl, motor_current_output_t *const p_st_output)
fsp_err_t(*	currentGet)(motor_current_ctrl_t *const p_ctrl, float *const p_id, float *const p_iq)
fsp_err_t(*	phaseVoltageGet)(motor_current_ctrl_t *const p_ctrl, motor_current_get_voltage_t *const p_voltage)

fsp_err_t(*	parameterUpdate)(motor_current_ctrl_t *const p_ctrl, motor_current_cfg_t const *const p_cfg)

Field Documentation

◆ open

fsp_err_t(* motor_current_api_t::open) (motor_current_ctrl_t *const p_ctrl, motor_current_cfg_t const *const p_cfg)

Initialize the motor current module.

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	p_cfg	Pointer to configuration structure.

◆ close

fsp_err_t(* motor_current_api_t::close) (motor_current_ctrl_t *const p_ctrl)

Close (Finish) the motor current module.

Parameters

[in]	p_ctrl	Pointer to control structure.

◆ reset

fsp_err_t(* motor_current_api_t::reset) (motor_current_ctrl_t *const p_ctrl)

Reset variables for the motor current module.

Parameters

[in]	p_ctrl	Pointer to control structure.

◆ run

fsp_err_t(* motor_current_api_t::run) (motor_current_ctrl_t *const p_ctrl)

Activate the motor current control.

Parameters

[in]	p_ctrl	Pointer to control structure.

◆ parameterSet

fsp_err_t(* motor_current_api_t::parameterSet) (motor_current_ctrl_t *const p_ctrl, motor_current_input_t const *const p_st_input)

Set (Input) parameters into the motor current module.

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	p_st_input	Pointer to input data structure(speed control output data)

◆ currentReferenceSet

fsp_err_t(* motor_current_api_t::currentReferenceSet) (motor_current_ctrl_t *const p_ctrl, float const id_reference, float const iq_reference)

Set (Input) Current reference into the motor current module.

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	id_reference	D-axis current reference [A]
[in]	iq_reference	Q-axis current reference [A]

◆ speedPhaseSet

fsp_err_t(* motor_current_api_t::speedPhaseSet) (motor_current_ctrl_t *const p_ctrl, float const speed_rad, float const phase_rad)

Set (Input) Speed & Phase data into the motor current module.

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	speed_rad	Rotational speed [rad/s]
[in]	phase_rad	Rotor phase [rad]

◆ currentSet

fsp_err_t(* motor_current_api_t::currentSet) (motor_current_ctrl_t *const p_ctrl, motor_current_input_current_t const *const p_st_current, motor_current_input_voltage_t const *const p_st_voltage)

Set (Input) Current data into the motor current module.

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	p_st_current	Pointer to input current structure
[in]	p_st_voltage	Pointer to input voltage structure

◆ parameterGet

fsp_err_t(* motor_current_api_t::parameterGet) (motor_current_ctrl_t *const p_ctrl, motor_current_output_t *const p_st_output)

Get (output) parameters from the motor current module

Parameters

[in]	p_ctrl	Pointer to control structure.
[out]	p_st_output	Pointer to output data structure(speed control input data)

◆ currentGet

fsp_err_t(* motor_current_api_t::currentGet) (motor_current_ctrl_t *const p_ctrl, float *const p_id, float *const p_iq)

Get d/q-axis current

Parameters

[in]	p_ctrl	Pointer to control structure.
[out]	p_id	Pointer to get d-axis current [A]
[out]	p_iq	Pointer to get q-axis current [A]

◆ phaseVoltageGet

fsp_err_t(* motor_current_api_t::phaseVoltageGet) (motor_current_ctrl_t *const p_ctrl, motor_current_get_voltage_t *const p_voltage)

Get phase output voltage

Parameters

[in]	p_ctrl	Pointer to control structure.
[out]	p_voltage	Pointer to get voltages

◆ parameterUpdate

fsp_err_t(* motor_current_api_t::parameterUpdate) (motor_current_ctrl_t *const p_ctrl, motor_current_cfg_t const *const p_cfg)

Update parameters for the calculation in the motor current control.

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	p_cfg	Pointer to configuration structure include update parameters.

◆ motor_current_instance_t

struct motor_current_instance_t		
This structure encompasses everything that is needed to use an instance of this interface.		
Data Fields		
motor_current_ctrl_t *	p_ctrl	Pointer to the control structure for this instance.
motor_current_cfg_t const *	p_cfg	Pointer to the configuration structure for this instance.
motor_current_api_t const *	p_api	Pointer to the API structure for this instance.

Typedef Documentation

◆ motor_current_ctrl_t

typedef void motor_current_ctrl_t
Control block. Allocate an instance specific control block to pass into the API calls.

Enumeration Type Documentation

◆ motor_current_event_t

enum motor_current_event_t	
Events that can trigger a callback function	
Enumerator	
MOTOR_CURRENT_EVENT_FORWARD	Event forward current control.
MOTOR_CURRENT_EVENT_DATA_SET	Event set speed control output data.
MOTOR_CURRENT_EVENT_BACKWARD	Event backward current control.

7.3.10.8 Motor driver Interface

Interfaces » Motor

Detailed Description

Interface for motor driver functions.

Summary

The Motor driver interface for setting the PWM modulation duty

Data Structures

struct	motor_driver_callback_args_t
struct	motor_driver_current_get_t
struct	motor_driver_cfg_t
struct	motor_driver_api_t
struct	motor_driver_instance_t

Typedefs

typedef void	motor_driver_ctrl_t

Enumerations

enum	motor_driver_event_t
enum	motor_driver_shunt_type_t

Data Structure Documentation

◆ motor_driver_callback_args_t

struct motor_driver_callback_args_t		
Callback function parameter data		
Data Fields		
motor_driver_event_t	event	Event trigger.
void const *	p_context	Placeholder for user data.

◆ motor_driver_current_get_t

struct motor_driver_current_get_t		
Current Data Get Structure		
Data Fields		
float	iu	U phase current [A].
float	iv	V phase current [A].
float	iw	W phase current [A].
float	vdc	Main Line Voltage [V].
float	va_max	maximum magnitude of voltage vector
float	sin_ad	Induction sensor sin signal.
float	cos_ad	Induction sensor cos signal.

◆ motor_driver_cfg_t

struct motor_driver_cfg_t	
Configuration parameters.	
Data Fields	
adc_channel_t	iu_ad_ch
	A/D Channel for U Phase Current.
adc_channel_t	iv_ad_ch
	A/D Channel for V Phase Current.
adc_channel_t	iw_ad_ch
	A/D Channel for W Phase Current.

adc_channel_t	vdc_ad_ch
	A/D Channel for Main Line Voltage.
adc_channel_t	sin_ad_ch
	A/D Channel for induction sensor sin signal.
adc_channel_t	cos_ad_ch
	A/D Channel for induction sensor cos signal.
motor_driver_shunt_type_t	shunt
	Selection of shunt type.
void const *	p_context
	Placeholder for user data.

◆ motor_driver_api_t

struct motor_driver_api_t	
Functions implemented at the HAL layer will follow these APIs.	
Data Fields	
fsp_err_t(*	open)(motor_driver_ctrl_t *const p_ctrl, motor_driver_cfg_t const *const p_cfg)
fsp_err_t(*	close)(motor_driver_ctrl_t *const p_ctrl)
fsp_err_t(*	reset)(motor_driver_ctrl_t *const p_ctrl)
fsp_err_t(*	phaseVoltageSet)(motor_driver_ctrl_t *const p_ctrl, float const u_voltage, float const v_voltage, float const w_voltage)
fsp_err_t(*	currentGet)(motor_driver_ctrl_t *const p_ctrl,

	motor_driver_current_get_t *const p_current_get)
fsp_err_t(*	flagCurrentOffsetGet)(motor_driver_ctrl_t *const p_ctrl, uint8_t *const p_flag_offset)
fsp_err_t(*	currentOffsetRestart)(motor_driver_ctrl_t *const p_ctrl)
fsp_err_t(*	parameterUpdate)(motor_driver_ctrl_t *const p_ctrl, motor_driver_cfg_t const *const p_cfg)

Field Documentation

◆ open

fsp_err_t(* motor_driver_api_t::open) (motor_driver_ctrl_t *const p_ctrl, motor_driver_cfg_t const *const p_cfg)

Initialize the Motor Driver Module.

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	p_cfg	Pointer to configuration structure.

◆ close

fsp_err_t(* motor_driver_api_t::close) (motor_driver_ctrl_t *const p_ctrl)

Close the Motor Driver Module

Parameters

[in]	p_ctrl	Pointer to control structure.

◆ reset

fsp_err_t(* motor_driver_api_t::reset) (motor_driver_ctrl_t *const p_ctrl)

Reset variables of the Motor Driver Module

Parameters

[in]	p_ctrl	Pointer to control structure.

◆ phaseVoltageSet

fsp_err_t(* motor_driver_api_t::phaseVoltageSet) (motor_driver_ctrl_t *const p_ctrl, float const u_voltage, float const v_voltage, float const w_voltage)

Set (Input) Phase Voltage data into the Motor Driver Module

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	u_voltage	U phase voltage [V]
[in]	v_voltage	V phase voltage [V]
[in]	w_voltage	W phase voltage [V]

◆ currentGet

fsp_err_t(* motor_driver_api_t::currentGet) (motor_driver_ctrl_t *const p_ctrl, motor_driver_current_get_t *const p_current_get)

Get Phase current, Vdc and Va_max data from the Motor Driver Module

Parameters

[in]	p_ctrl	Pointer to control structure.
[out]	p_current_get	Pointer to get data structure.

◆ flagCurrentOffsetGet

fsp_err_t(* motor_driver_api_t::flagCurrentOffsetGet) (motor_driver_ctrl_t *const p_ctrl, uint8_t *const p_flag_offset)

Get the flag of finish current offset detection from the Motor Driver Module

Parameters

[in]	p_ctrl	Pointer to control structure.
[out]	p_flag_offset	Flag of finish current offset detection

◆ currentOffsetRestart

fsp_err_t(* motor_driver_api_t::currentOffsetRestart) (motor_driver_ctrl_t *const p_ctrl)

Restart current offset detection

Parameters

[in]	p_ctrl	Pointer to control structure.

◆ parameterUpdate

fsp_err_t(* motor_driver_api_t::parameterUpdate) (motor_driver_ctrl_t *const p_ctrl, motor_driver_cfg_t const *const p_cfg)
Update Configuration Parameters for the calculation in the Motor Driver Module

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	p_cfg	Pointer to configuration structure include update parameters.

◆ motor_driver_instance_t

struct motor_driver_instance_t		
This structure encompasses everything that is needed to use an instance of this interface.		
Data Fields		
motor_driver_ctrl_t *	p_ctrl	Pointer to the control structure for this instance.
motor_driver_cfg_t const *	p_cfg	Pointer to the configuration structure for this instance.
motor_driver_api_t const *	p_api	Pointer to the API structure for this instance.

Typedef Documentation

◆ motor_driver_ctrl_t

typedef void motor_driver_ctrl_t
Control block. Allocate an instance specific control block to pass into the API calls.

Enumeration Type Documentation

◆ motor_driver_event_t

enum motor_driver_event_t	
Events that can trigger a callback function	
Enumerator	
MOTOR_DRIVER_EVENT_FORWARD	Event before Motor Driver Process (before Current Control timing)
MOTOR_DRIVER_EVENT_CURRENT	Event Current Control timing.
MOTOR_DRIVER_EVENT_BACKWARD	Event after Motor Driver Process (after PWM duty setting)

◆ motor_driver_shunt_type_t

enum motor_driver_shunt_type_t	
Selection of shunt type	
Enumerator	
MOTOR_DRIVER_SHUNT_TYPE_1_SHUNT	Only use U phase current.
MOTOR_DRIVER_SHUNT_TYPE_2_SHUNT	Use U and W phase current.
MOTOR_DRIVER_SHUNT_TYPE_3_SHUNT	Use all phase current.

7.3.10.9 Motor position Interface

Interfaces » Motor

Detailed Description

Interface for motor position functions.

Summary

The Motor position interface for getting the speed references from Encoder Sensor

Data Structures

struct	motor_position_info_t
struct	motor_position_cfg_t

struct	motor_position_api_t
struct	motor_position_instance_t

Typedefs

typedef void	motor_position_ctrl_t

Enumerations

enum	motor_position_ctrl_mode_t

Data Structure Documentation

◆ motor_position_info_t

struct motor_position_info_t		
Position information		
Data Fields		
uint8_t	u1_state_position_profile	Position control profile state.
int16_t	s2_position_degree	Position data [degree].

◆ motor_position_cfg_t

struct motor_position_cfg_t		
Configuration parameters.		
Data Fields		
void const *	p_context	Placeholder for user data.
void const *	p_extend	

◆ motor_position_api_t

struct motor_position_api_t	
Functions implemented at the HAL layer will follow these APIs.	
Data Fields	
fsp_err_t(*	open)(motor_position_ctrl_t *const p_ctrl, motor_position_cfg_t const *const p_cfg)
fsp_err_t(*	close)(motor_position_ctrl_t *const p_ctrl)
fsp_err_t(*	reset)(motor_position_ctrl_t *const p_ctrl)
fsp_err_t(*	positionGet)(motor_position_ctrl_t *const p_ctrl, int16_t *const p_position)

fsp_err_t(*	positionSet)(motor_position_ctrl_t *const p_ctrl, float const position_rad)
fsp_err_t(*	positionReferenceSet)(motor_position_ctrl_t *const p_ctrl, int16_t const position_reference_deg)
fsp_err_t(*	controlModeSet)(motor_position_ctrl_t *const p_ctrl, motor_position_ctrl_mode_t const mode)
fsp_err_t(*	positionControl)(motor_position_ctrl_t *const p_ctrl)
fsp_err_t(*	ipdSpeedPControl)(motor_position_ctrl_t *const p_ctrl, float const ref_speed_rad, float const speed_rad, float *const p_iq_ref)
fsp_err_t(*	speedReferencePControlGet)(motor_position_ctrl_t *const p_ctrl, float *const p_speed_ref)
fsp_err_t(*	speedReferenceIpdControlGet)(motor_position_ctrl_t *const p_ctrl, float const max_speed_rad, float *const p_speed_ref)
fsp_err_t(*	speedReferenceFeedforwardGet)(motor_position_ctrl_t *const p_ctrl, float *const p_speed_ref)
fsp_err_t(*	infoGet)(motor_position_ctrl_t *const p_ctrl, motor_position_info_t *const p_info)
fsp_err_t(*	parameterUpdate)(motor_position_ctrl_t *const p_ctrl, motor_position_cfg_t const *const p_cfg)

Field Documentation

◆ open

fsp_err_t(* motor_position_api_t::open) (motor_position_ctrl_t *const p_ctrl, motor_position_cfg_t const *const p_cfg)

Initialize the Motor Position Module.

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	p_cfg	Pointer to configuration structure.

◆ close

fsp_err_t(* motor_position_api_t::close) (motor_position_ctrl_t *const p_ctrl)

Close (Finish) the Motor Position Module.

Parameters

[in]	p_ctrl	Pointer to control structure.

◆ reset

fsp_err_t(* motor_position_api_t::reset) (motor_position_ctrl_t *const p_ctrl)

Reset(Stop) the Motor Position Module.

Parameters

[in]	p_ctrl	Pointer to control structure.

◆ positionGet

fsp_err_t(* motor_position_api_t::positionGet) (motor_position_ctrl_t *const p_ctrl, int16_t *const p_position)

Get Position data.

Parameters

[in]	p_ctrl	Pointer to control structure.
[out]	p_position	Pointer to get position data

◆ positionSet

fsp_err_t(* motor_position_api_t::positionSet) (motor_position_ctrl_t *const p_ctrl, float const position_rad)

Set Position data from Encoder.

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	position_rad	Position data [radian]

◆ positionReferenceSet

fsp_err_t(* motor_position_api_t::positionReferenceSet) (motor_position_ctrl_t *const p_ctrl, int16_t const position_reference_deg)

Set (Input) Position reference into the Motor Position Module.

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	position_refernce_deg	Position reference [degree]

◆ controlModeSet

fsp_err_t(* motor_position_api_t::controlModeSet) (motor_position_ctrl_t *const p_ctrl, motor_position_ctrl_mode_t const mode)

Set (Input) Position Control Mode.

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	mode	Position Control Mode

◆ positionControl

fsp_err_t(* motor_position_api_t::positionControl) (motor_position_ctrl_t *const p_ctrl)

Calculate internal position reference

Parameters

[in]	p_ctrl	Pointer to control structure.

◆ ipdSpeedPControl

fsp_err_t(* motor_position_api_t::ipdSpeedPControl) (motor_position_ctrl_t *const p_ctrl, float const ref_speed_rad, float const speed_rad, float *const p_iq_ref)

Calculate iq reference

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	ref_speed_rad	Speed Reference [rad/sec]
[in]	speed_rad	Current Speed [rad/sec]
[out]	p_iq_ref	Pointer to get iq reference

◆ speedReferencePControlGet

fsp_err_t(* motor_position_api_t::speedReferencePControlGet) (motor_position_ctrl_t *const p_ctrl, float *const p_speed_ref)

Get Speed Reference by P Control

Parameters

[in]	p_ctrl	Pointer to control structure.
[out]	p_speed_ref	Pointer to get speed reference

◆ speedReferenceIpdControlGet

fsp_err_t(* motor_position_api_t::speedReferenceIpdControlGet) (motor_position_ctrl_t *const p_ctrl, float const max_speed_rad, float *const p_speed_ref)

Get Speed Reference by IPD Control

Parameters

[in]	p_ctrl	Pointer to control structure.
[out]	p_speed_ref	Pointer to get speed reference

◆ speedReferenceFeedforwardGet

fsp_err_t(* motor_position_api_t::speedReferenceFeedforwardGet) (motor_position_ctrl_t *const p_ctrl, float *const p_speed_ref)

Get Speed Reference by Speed Feedforward

Parameters

[in]	p_ctrl	Pointer to control structure.
[out]	p_speed_ref	Pointer to get speed reference

◆ infoGet

fsp_err_t(* motor_position_api_t::infoGet) (motor_position_ctrl_t *const p_ctrl, motor_position_info_t *const p_info)

Get Position information.

Parameters

[in]	p_ctrl	Pointer to control structure.
[out]	p_info	Pointer to get information

◆ parameterUpdate

fsp_err_t(* motor_position_api_t::parameterUpdate) (motor_position_ctrl_t *const p_ctrl, motor_position_cfg_t const *const p_cfg)

Update Parameters for the calculation in the Motor Position Module.

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	p_cfg	Pointer to configuration structure include update parameters.

◆ motor_position_instance_t

struct motor_position_instance_t

This structure encompasses everything that is needed to use an instance of this interface.

Data Fields

motor_position_ctrl_t *	p_ctrl	Pointer to the control structure for this instance.
motor_position_cfg_t const *	p_cfg	Pointer to the configuration structure for this instance.
motor_position_api_t const *	p_api	Pointer to the API structure for

		this instance.

Typedef Documentation

◆ motor_position_ctrl_t

typedef void motor_position_ctrl_t
Control block. Allocate an instance specific control block to pass into the API calls.

Enumeration Type Documentation

◆ motor_position_ctrl_mode_t

enum motor_position_ctrl_mode_t
Position Control Mode

7.3.10.10 Motor speed Interface

Interfaces » Motor

Detailed Description

Interface for motor speed functions.

Summary

The Motor speed interface for getting the current references from electric current and rotational speed

Data Structures

struct	motor_speed_callback_args_t
struct	motor_speed_position_data_t
struct	motor_speed_cfg_t
struct	motor_speed_api_t
struct	motor_speed_instance_t

Typedefs

typedef void	motor_speed_ctrl_t

Enumerations

enum	motor_speed_event_t
enum	motor_speed_loop_mode_t
enum	motor_speed_step_t

Data Structure Documentation

◆ motor_speed_callback_args_t

struct motor_speed_callback_args_t		
Callback function parameter data		
Data Fields		
void const *	p_context	Placeholder for user data.
motor_speed_event_t	event	

◆ motor_speed_position_data_t

struct motor_speed_position_data_t		
Motor speed and position structure		
Data Fields		
motor_speed_step_t	e_step_mode	Select step mode.
motor_speed_loop_mode_t	e_loop_mode	Select control mode.
int16_t	position_reference_degree	Position reference [degree].

◆ motor_speed_cfg_t

struct motor_speed_cfg_t	
Configuration parameters.	
Data Fields	
motor_speed_input_t *	st_input
	Input data structure for automatic set.
motor_speed_output_t *	st_output
	Output data structure for automatic receive.
motor_position_instance_t const *	p_position_instance
	Position module instance.

void const *	p_context
	Placeholder for user data.

◆ motor_speed_api_t

struct motor_speed_api_t	
Functions implemented at the HAL layer will follow these APIs.	
Data Fields	
fsp_err_t(*	open)(motor_speed_ctrl_t *const p_ctrl, motor_speed_cfg_t const *const p_cfg)
fsp_err_t(*	close)(motor_speed_ctrl_t *const p_ctrl)
fsp_err_t(*	reset)(motor_speed_ctrl_t *const p_ctrl)
fsp_err_t(*	run)(motor_speed_ctrl_t *const p_ctrl)
fsp_err_t(*	speedReferenceSet)(motor_speed_ctrl_t *const p_ctrl, float const speed_reference_rpm)
fsp_err_t(*	positionReferenceSet)(motor_speed_ctrl_t *const p_ctrl, motor_speed_position_data_t const *const p_position_data)
fsp_err_t(*	parameterSet)(motor_speed_ctrl_t *const p_ctrl, motor_speed_input_t const *const p_st_input)
fsp_err_t(*	speedControl)(motor_speed_ctrl_t *const p_ctrl)
fsp_err_t(*	parameterGet)(motor_speed_ctrl_t *const p_ctrl, motor_speed_output_t *const p_st_output)
fsp_err_t(*	parameterUpdate)(motor_speed_ctrl_t *const p_ctrl, motor_speed_cfg_t const *const p_cfg)

Field Documentation

◆ open

fsp_err_t(* motor_speed_api_t::open) (motor_speed_ctrl_t *const p_ctrl, motor_speed_cfg_t const *const p_cfg)

Initialize the motor speed module.

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	p_cfg	Pointer to configuration structure.

◆ close

fsp_err_t(* motor_speed_api_t::close) (motor_speed_ctrl_t *const p_ctrl)

Close (Finish) the motor speed module.

Parameters

[in]	p_ctrl	Pointer to control structure.

◆ reset

fsp_err_t(* motor_speed_api_t::reset) (motor_speed_ctrl_t *const p_ctrl)

Reset(Stop) the motor speed module.

Parameters

[in]	p_ctrl	Pointer to control structure.

◆ run

fsp_err_t(* motor_speed_api_t::run) (motor_speed_ctrl_t *const p_ctrl)

Activate the motor speed control.

Parameters

[in]	p_ctrl	Pointer to control structure.

◆ speedReferenceSet

fsp_err_t(* motor_speed_api_t::speedReferenceSet) (motor_speed_ctrl_t *const p_ctrl, float const speed_reference_rpm)

Set (Input) speed reference into the motor speed module.

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	speed_refernce_rpm	Speed reference [rpm]

◆ positionReferenceSet

fsp_err_t(* motor_speed_api_t::positionReferenceSet) (motor_speed_ctrl_t *const p_ctrl, motor_speed_position_data_t const *const p_position_data)

Set (Input) position reference and control mode

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	p_position_data	Pointer to structure position data

◆ parameterSet

fsp_err_t(* motor_speed_api_t::parameterSet) (motor_speed_ctrl_t *const p_ctrl, motor_speed_input_t const *const p_st_input)

Set (Input) speed parameters into the motor speed module.

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	p_st_input	Pointer to structure to input parameters.

◆ speedControl

fsp_err_t(* motor_speed_api_t::speedControl) (motor_speed_ctrl_t *const p_ctrl)

Calculate current reference

Parameters

[in]	p_ctrl	Pointer to control structure.

◆ parameterGet

fsp_err_t(* motor_speed_api_t::parameterGet) (motor_speed_ctrl_t *const p_ctrl, motor_speed_output_t *const p_st_output)

Get speed control output parameters

Parameters

[in]	p_ctrl	Pointer to control structure.
[out]	p_st_output	Pointer to get speed control parameters

◆ parameterUpdate

fsp_err_t(* motor_speed_api_t::parameterUpdate) (motor_speed_ctrl_t *const p_ctrl, motor_speed_cfg_t const *const p_cfg)

Update Parameters for the calculation in the motor speed module.

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	p_cfg	Pointer to configuration structure include update parameters.

◆ motor_speed_instance_t

struct motor_speed_instance_t		
This structure encompasses everything that is needed to use an instance of this interface.		
Data Fields		
motor_speed_ctrl_t *	p_ctrl	Pointer to the control structure for this instance.
motor_speed_cfg_t const *	p_cfg	Pointer to the configuration structure for this instance.
motor_speed_api_t const *	p_api	Pointer to the API structure for this instance.

Typedef Documentation

◆ motor_speed_ctrl_t

typedef void motor_speed_ctrl_t
Control block. Allocate an instance specific control block to pass into the API calls.

Enumeration Type Documentation

◆ motor_speed_event_t

enum motor_speed_event_t	
Events that can trigger a callback function	
Enumerator	
MOTOR_SPEED_EVENT_FORWARD	Event forward speed control.
MOTOR_SPEED_EVENT_BACKWARD	Event backward speed control.
MOTOR_SPEED_EVENT_ENCODER_CYCLIC	Event encoder cyclic.
MOTOR_SPEED_EVENT_ENCODER_ADJUST	Event encoder adjust.

◆ motor_speed_loop_mode_t

enum motor_speed_loop_mode_t	
Enumerator	
MOTOR_SPEED_LOOP_MODE_SPEED	Speed control mode.
MOTOR_SPEED_LOOP_MODE_POSITION	Position control mode.

◆ motor_speed_step_t

enum motor_speed_step_t	
Enumerator	
MOTOR_SPEED_STEP_DISABLE	Position control works without step mode.
MOTOR_SPEED_STEP_ENABLE	Position control works with step mode.

7.3.11 Networking

Interfaces

Detailed Description

Networking Interfaces.

Modules

	BLE ABS Interface Interface for BLE Abstraction functions.
	BLE Interface Interface for Bluetooth Low Energy (BLE) functions.
	BLE Mesh Network Interfaces BLE Mesh Network Interfaces.
	DA16XXX AT Command Transport Layer Abstraction interface for DA16XXX AT Command functions.
	Ethernet Interface Interface for Ethernet functions.
	Ethernet PHY Interface Interface for Ethernet PHY functions.
	PTP Interface Interface for PTP functions.
	WiFi Interface Interface for common WiFi APIs.

7.3.11.1 BLE ABS Interface

Interfaces » Networking

Detailed Description

Interface for BLE Abstraction functions.

Summary

The BLE Abstraction (BLE ABS) interface provides an abstraction layer for various Renesas BLE hardware.

Data Structures

struct	ble_device_address_t
struct	ble_gap_connection_parameter_t
struct	ble_gap_connection_phy_parameter_t
struct	ble_gap_scan_phy_parameter_t
struct	ble_gap_scan_on_t
struct	ble_abs_callback_args_t
struct	ble_abs_pairing_parameter_t
struct	ble_abs_gatt_server_callback_set_t
struct	ble_abs_gatt_client_callback_set_t
struct	ble_abs_legacy_advertising_parameter_t
struct	ble_abs_extend_advertising_parameter_t
struct	ble_abs_non_connectable_advertising_parameter_t
struct	ble_abs_periodic_advertising_parameter_t

typedef void	ble_abs_ctrl_t

Enumerations

enum	ble_abs_advertising_filter_t
enum	ble_abs_local_bond_information_t
enum	ble_abs_remote_bond_information_t
enum	ble_abs_delete_non_volatile_area_t

Data Structure Documentation

◆ ble_device_address_t

struct ble_device_address_t		
st_ble_device_address is the type of bluetooth device address(BD_ADDR).		
Data Fields		
uint8_t	addr[BLE_BD_ADDR_LEN]	bluetooth device address.
uint8_t	type	the type of bluetooth device address.

◆ ble_gap_connection_parameter_t

struct ble_gap_connection_parameter_t		
ble_gap_connection_parameter_t is Connection parameters included in connection interval, slave latency, supervision timeout, ce length.		
Data Fields		
uint16_t	conn_intv_min	Minimum connection interval.
uint16_t	conn_intv_max	Maximum connection interval.
uint16_t	conn_latency	Slave latency.

uint16_t	sup_to	Supervision timeout.
uint16_t	min_ce_length	Minimum CE Length.
uint16_t	max_ce_length	Maximum CE Length.

◆ ble_gap_connection_phy_parameter_t

struct ble_gap_connection_phy_parameter_t		
ble_gap_connection_phy_parameter_t is Connection parameters per PHY.		
Data Fields		
uint16_t	scan_intv	Scan interval.
uint16_t	scan_window	Scan window.
ble_gap_connection_parameter_t *	p_conn_param	Connection interval, slave latency, supervision timeout, and CE length.

◆ ble_gap_scan_phy_parameter_t

struct ble_gap_scan_phy_parameter_t		
Scan parameters per scan PHY.		
Data Fields		
uint8_t	scan_type	Scan type.
uint16_t	scan_intv	Scan interval.
uint16_t	scan_window	Scan window.

◆ ble_gap_scan_on_t

struct ble_gap_scan_on_t		
Parameters configured when scanning starts.		
Data Fields		
uint8_t	proc_type	Procedure type.
uint8_t	filter_dups	Filter duplicates.
uint16_t	duration	Scan duration.
uint16_t	period	Scan period.

◆ ble_abs_callback_args_t

struct ble_abs_callback_args_t		
Callback function parameter data		
Data Fields		
uint32_t	channel	Select a channel corresponding to the channel number of the hardware.

ble_event_cb_t	ble_abs_event	The event can be used to identify what caused the callback.
void const *	p_context	Placeholder for user data. Set in ble_abs_api_t::open function in ble_abs_cfg_t.

◆ ble_abs_pairing_parameter_t

struct ble_abs_pairing_parameter_t		
st_ble_abs_pairing_parameter_t includes the pairing parameters.		
Data Fields		
uint8_t	io_capabilitie_local_device	IO capabilities of local device.
uint8_t	mitm_protection_policy	MITM protection policy.
uint8_t	secure_connection_only	Determine whether to accept only Secure Connections or not.
uint8_t	local_key_distribute	Type of keys to be distributed from local device.
uint8_t	remote_key_distribute	Type of keys which local device requests a remote device to distribute.
uint8_t	maximum_key_size	Maximum LTK size.
uint8_t	padding[2]	Reserved.

◆ ble_abs_gatt_server_callback_set_t

struct ble_abs_gatt_server_callback_set_t		
GATT Server callback function and the priority.		
Data Fields		
ble_gatt_server_application_callback_t	gatt_server_callback_function	GATT Server callback function.
uint8_t	gatt_server_callback_priority	The priority number of GATT Server callback function.

◆ ble_abs_gatt_client_callback_set_t

struct ble_abs_gatt_client_callback_set_t		
GATT Client callback function and the priority.		
Data Fields		
ble_gatt_client_application_callback_t	gatt_client_callback_function	GATT Client callback function.
uint8_t	gatt_client_callback_priority	The priority number of GATT Client callback function.

◆ ble_abs_legacy_advertising_parameter_t

struct ble_abs_legacy_advertising_parameter_t		
st_ble_abs_legacy_advertising_parameter_t is the parameters for legacy advertising.		
Data Fields		
ble_device_address_t *	p_peer_address	The remote device address. If the p_peer_address parameter is not NULL, Direct Connectable Advertising is performed to the remote address. If the p_peer_address parameter is NULL, Undirect Connectable Advertising is performed according to the advertising filter policy specified by the filter parameter.
uint8_t *	p_advertising_data	Advertising Data. If the p_advertising_data is specified as NULL, Advertising Data is not included in the advertising PDU.
uint8_t *	p_scan_response_data	Scan Response Data. If the p_scan_response_data is specified as NULL, Scan Response Data is not included in the advertising PDU.
uint32_t	fast_advertising_interval	Advertising with the fast_advertising_interval parameter continues for the period specified by the fast_advertising_period parameter. Time(ms) = fast_advertising_interval * 0.625. If the fast_advertising_period parameter is 0, this parameter is ignored. Valid range is 0x00000020 - 0x00FFFFFF.
uint32_t	slow_advertising_interval	After the elapse of the fast_advertising_period, advertising with the slow_advertising_interval parameter continues for the period specified by the slow_advertising_period parameter. Time(ms) =

		slow_advertising_interval * 0.625. Valid range is 0x00000020 - 0x00FFFFFF.
uint16_t	fast_advertising_period	The period which advertising with the fast_advertising_interval parameter continues for. Time = duration * 10ms. After the elapse of the fast_advertising_period, BLE_GAP_EVENT_ADV_OFF event notifies that the advertising has stopped. Valid range is 0x0000 - 0xFFFF. If the fast_advertising_period parameter is 0x0000, advertising with the fast_advertising_interval parameter is not performed.
uint16_t	slow_advertising_period	The period which advertising with the slow_advertising_interval parameter continues for. Time = duration * 10ms. After the elapse of the slow_advertising_period, BLE_GAP_EVENT_ADV_OFF event notifies that the advertising has stopped. Valid range is 0x0000 - 0xFFFF. If the slow_advertising_period parameter is 0x0000, the advertising continues.
uint16_t	advertising_data_length	Advertising data length(byte). Valid range is 0-31. If the advertising_data_length is 0, Advertising Data is not included in the advertising PDU.
uint16_t	scan_response_data_length	Scan response data length (in bytes). Scan Response Data(byte). Valid range is 0-31. If the scan_response_data_length is 0, Scan Response Data is not included in the advertising PDU.
uint8_t	advertising_channel_map	The channel map used for the advertising packet transmission. It is a bitwise OR of the following values.

		<table><tr><th>macro</th><th>description</th></tr><tr><td>BLE_GAP_ADV_CH_37(0x01)</td><td>Use 37 CH.</td></tr><tr><td>BLE_GAP_ADV_CH_38(0x02)</td><td>Use 38 CH.</td></tr><tr><td>BLE_GAP_ADV_CH_39(0x04)</td><td>Use 39 CH.</td></tr><tr><td>BLE_GAP_ADV_CH_ALL(0x07)</td><td>Use 37 - 39 CH.</td></tr></table>
uint8_t	advertising_filter_policy	Advertising filter policy. If the p_peer_address parameter is NULL, the advertising is performed according to the advertising filter policy. If the p_peer_address parameter is not NULL, this parameter is ignored. <table><tr><th>macro</th><th>description</th></tr><tr><td>BLE_ABS_ADVERTISING_FILTER_ALLOW_ANY(0x00)</td><td>Process scan and connection requests from all devices.</td></tr><tr><td>BLE_ABS_ADVERTISING_FILTER_ALLOW_WHITE_LIST(0x01)</td><td>Process scan and connection requests from only devices in the White List.</td></tr></table>
uint8_t	own_bluetooth_address_type	Own Bluetooth address type. Select one of the following. <table><tr><th>macro</th><th>description</th></tr><tr><td>BLE_GAP_ADDR_PUBLIC(0x00)</td><td>Public Address</td></tr><tr><td>BLE_GAP_ADDR_RPA_ID_PUBLIC(0x02)</td><td>Resolvable Private Address. If the IRK (Identity Resolving Key) of local</td></tr></table>

		device has not been registered in Resolving List, public address is used.
uint8_t	own_bluetooth_address[6]	Own Bluetooth address.
uint8_t	padding[3]	Reserved.

◆ ble_abs_extend_advertising_parameter_t

struct ble_abs_extend_advertising_parameter_t		
st_ble_abs_extend_advertising_parameter_t is the parameters for extended advertising.		
Data Fields		
ble_device_address_t *	p_peer_address	The remote device address. If the p_addr parameter is not NULL, Direct Connectable Advertising is performed to the remote address. If the p_addr parameter is NULL, Undirect Connectable Advertising is performed according to the advertising filter policy specified by the filter parameter.
uint8_t *	p_advertising_data	Advertising data. If p_adv_data is specified as NULL, advertising data is not set.
uint32_t	fast_advertising_interval	Advertising with the fast_advertising_interval parameter continues for the period specified by the fast_advertising_period parameter. Time(ms) = fast_advertising_interval * 0.625. If the fast_advertising_period parameter is 0, this parameter is ignored. Valid range is 0x00000020 - 0x00FFFFFF.
uint32_t	slow_advertising_interval	After the elapse of the fast_advertising_period, advertising with the slow_advertising_interval parameter continues for the period specified by the slow_advertising_period

<table>
<tr><td></td><td></td><td>parameter.
Time(ms) =
slow_advertising_interval *
0.625.
Valid range is 0x00000020 -
0x00FFFFFF.</td></tr>
<tr><td>uint16_t</td><td>fast_advertising_period</td><td>The period which advertising
with the
fast_advertising_interval
parameter continues for.
Time = duration * 10ms.
After the elapse of the
fast_advertising_period,
BLE_GAP_EVENT_ADV_OFF
event notifies that the
advertising has stopped.
Valid range is 0x0000 - 0xFFFF.
If the fast_advertising_period
parameter is 0x0000, the
fast_advertising_interval
parameter is ignored.</td></tr>
<tr><td>uint16_t</td><td>slow_advertising_period</td><td>The period which advertising
with the
slow_advertising_interval
parameter continues for.
Time = duration * 10ms.
After the elapse of the
slow_advertising_period,
BLE_GAP_EVENT_ADV_OFF
event notifies that the
advertising has stopped.
Valid range is 0x0000 - 0xFFFF.
If the slow_advertising_period
parameter is 0x0000, the
advertising continues.</td></tr>
<tr><td>uint16_t</td><td>advertising_data_length</td><td>Advertising data length (in
bytes).
Valid range is 0-229.
If the adv_data_length is 0,
Advertising Data is not included
in the advertising PDU.</td></tr>
<tr><td>uint8_t</td><td>advertising_channel_map</td><td>The channel map used for the
advertising packet
transmission.
It is a bitwise OR of the
following values.<table><tr><th>macro</th><th>description</th></tr><tr><td>BLE_GAP_ADV
_CH_37(0x01)</td><td>Use 37 CH.</td></tr><tr><td>BLE_GAP_ADV
_CH_38(0x02)</td><td>Use 38 CH.</td></tr></table></td></tr>
</table>

		BLE_GAP_ADV_CH_39(0x04) Use 39 CH. BLE_GAP_ADV_CH_ALL(0x07) Use 37 - 39 CH.
uint8_t	advertising_filter_policy	Advertising filter policy. If the p_peer_address parameter is NULL, the advertising is performed according to the advertising filter policy. If the p_peer_address parameter is not NULL, this parameter is ignored. macro / description: BLE_ABS_ADVERTISING_FILTER_ALLOW_ANY(0x00) Process scan and connection requests from all devices. BLE_ABS_ADVERTISING_FILTER_ALLOW_WHITE_LIST(0x01) Process scan and connection requests from only devices in the White List.
uint8_t	own_bluetooth_address_type	Own Bluetooth address type. Select one of the following. macro / description: BLE_GAP_ADDR_PUBLIC(0x00) Public Address BLE_GAP_ADDR_RPA_ID_PUBLIC(0x02) Resolvable Private Address. If the IRK (Identity Resolving Key) of local device has not been registered in Resolving List, public address is used.

<table>
<tr><td>uint8_t</td><td>own_bluetooth_address[6]</td><td>Own Bluetooth address.</td></tr>
<tr><td>uint8_t</td><td>primary_advertising_phy</td><td>Primary advertising PHY.
In this parameter, only 1M PHY and Coded PHY can be specified, and 2M PHY cannot be specified.
<table><tr><th>macro</th><th>description</th></tr><tr><td>BLE_GAP_ADV_PHY_1M(0x01)</td><td>Use 1M PHY as Primary Advertising PHY.
When the adv_prop_type field is Legacy Advertising PDU type, this field shall be set to BLE_GAP_ADV_PHY_1M.</td></tr><tr><td>BLE_GAP_ADV_PHY_CD(0x03)</td><td>Use Coded PHY as Primary Advertising PHY.
Coding scheme is configured by R_BLE_VS_SetCodingScheme().</td></tr></table></td></tr>
<tr><td>uint8_t</td><td>secondary_advertising_phy</td><td>Secondary advertising Phy.
Select one of the following.
<table><tr><th>macro</th><th>description</th></tr><tr><td>BLE_GAP_ADV_PHY_1M(0x01)</td><td>Use 1M PHY as Secondary Advertising PHY.</td></tr><tr><td>BLE_GAP_ADV_PHY_2M(0x02)</td><td>Use 2M PHY as Secondary Advertising PHY.</td></tr><tr><td>BLE_GAP_ADV_PHY_CD(0x03)</td><td>Use Coded PHY(S=8) as Secondary Advertising PHY.</td></tr></table></td></tr>
</table>

		Coding scheme is configured by R_BLE_VS_SetCodingScheme().
uint8_t	padding[3]	Reserved.

◆ ble_abs_non_connectable_advertising_parameter_t

struct ble_abs_non_connectable_advertising_parameter_t		
st_ble_abs_non_connectable_advertising_parameter_t is the parameters for non-connectable advertising.		
Data Fields		
ble_device_address_t *	p_peer_address	The remote device address. If the p_peer_address parameter is not NULL, Direct Connectable Advertising is performed to the remote address. If the p_peer_address parameter is NULL, Undirect Connectable Advertising is performed according to the advertising filter policy specified by the filter parameter.
uint8_t *	p_advertising_data	Advertising data. If p_adv_data is specified as NULL, advertising data is not set.
uint32_t	advertising_interval	Advertising with the advertising_interval parameter continues for the period specified by the duration parameter. Time(ms) = advertising_interval * 0.625. If the duration parameter is 0x0000, the advertising with the advertising_interval parameter continue. Valid range is 0x00000020 - 0x00FFFFFF.
uint16_t	advertising_duration	The period which advertising with the advertising_interval parameter continues for. Time = advertising_duration * 10ms. After the elapse of the advertising_duration, BLE_GAP_EVENT_ADV_OFF

		event notifies that the advertising has stopped. Valid range is 0x0000 - 0xFFFF. If the advertising_duration parameter is 0x0000, the advertising continues.
uint16_t	advertising_data_length	Advertising data length (in bytes). If the primary_advertising_phy parameter is BLE_ABS_ADVERTISING_PHY_LEGACY(0x00), the valid range is 0-31. If the primary_advertising_phy parameter is the other values, the valid range is 0-1650. If the advertising_data_length parameter is 0, Advertising Data is not included in the advertising PDU.
uint8_t	advertising_channel_map	The channel map used for the advertising packet transmission. It is a bitwise OR of the following values. macro: description BLE_GAP_ADV_CH_37(0x01): Use 37 CH. BLE_GAP_ADV_CH_38(0x02): Use 38 CH. BLE_GAP_ADV_CH_39(0x04): Use 39 CH. BLE_GAP_ADV_CH_ALL(0x07): Use 37 - 39 CH.
uint8_t	own_bluetooth_address_type	Own Bluetooth address type. Select one of the following. macro: description BLE_GAP_ADDR_PUBLIC(0x00): Public Address BLE_GAP_ADDR_RPA_ID_PUBLIC(0x02): Resolvable Private Address. If the IRK (Identity Resolving

<table>
<tr><td></td><td></td><td>Key) of local device has not been registered in Resolving List, public address is used.</td></tr>
<tr><td>uint8_t</td><td>own_bluetooth_address[6]</td><td>Own Bluetooth address.</td></tr>
<tr><td>uint8_t</td><td>primary_advertising_phy</td><td>Primary advertising PHY.
In this parameter, only 1M PHY and Coded PHY can be specified, and 2M PHY cannot be specified.
<table><tr><th>macro</th><th>description</th></tr><tr><td>BLE_ABS_ADVERTISING_PHY_LEGACY(0x00)</td><td>Use 1M PHY as Primary Advertising PHY for Non-Connectable Legacy Advertising. If Periodic Advertising is performed, this value shall not set to the adv_phy parameter.</td></tr><tr><td>BLE_GAP_ADV_PHY_1M(0x01)</td><td>Use 1M PHY as Primary Advertising PHY. When the adv_prop_type field is Legacy Advertising PDU type, this field shall be set to BLE_GAP_ADV_PHY_1M.</td></tr><tr><td>BLE_GAP_ADV_PHY_CD(0x03)</td><td>Use Coded PHY as Primary Advertising PHY. Coding scheme is</td></tr></table></td></tr>
</table>

		configured by R_BLE_VS_SetCodingScheme().
uint8_t	secondary_advertising_phy	Secondary advertising Phy. Select one of the following. macro: description BLE_GAP_ADV_PHY_1M(0x01): Use 1M PHY as Secondary Advertising PHY. BLE_GAP_ADV_PHY_2M(0x02): Use 2M PHY as Secondary Advertising PHY. BLE_GAP_ADV_PHY_CD(0x03): Use Coded PHY(S=8) as Secondary Advertising PHY. Coding scheme is configured by R_BLE_VS_SetCodingScheme().
uint8_t	padding[2]	Reserved.

◆ **ble_abs_periodic_advertising_parameter_t**

struct ble_abs_periodic_advertising_parameter_t		
st_ble_abs_periodic_advertising_parameter_t is the parameters for periodic advertising.		
Data Fields		
ble_abs_non_connectable_advertising_parameter_t	advertising_parameter	Advertising parameters.
uint8_t *	p_periodic_advertising_data	Periodic advertising data. If p_perd_adv_data is specified as NULL, periodic advertising data is not set.
uint16_t	periodic_advertising_interval	Periodic advertising interval. Time(ms) = periodic_advertising_interval * 1.25. Valid range is 0x0006 - 0xFFFF.
uint16_t	periodic_advertising_data_length	Periodic advertising data length (in bytes). Valid range is 0 - 1650.

		If the periodic_advertising_data_length is 0, Periodic Advertising Data is not included in the advertising PDU.

◆ ble_abs_scan_phy_parameter_t

struct ble_abs_scan_phy_parameter_t		
st_ble_abs_scan_phy_parameter_t is the phy parameters for scan.		
Data Fields		
uint16_t	fast_scan_interval	Fast scan interval. Interval(ms) = fast_scan_interval * 0.625. Valid range is 0x0004 - 0xFFFF.
uint16_t	slow_scan_interval	Slow Scan interval. Slow Scan interval(ms) = slow_scan_interval * 0.625. Valid range is 0x0004 - 0xFFFF.
uint16_t	fast_scan_window	Fast Scan window. Fast Scan window(ms) = fast_scan_window * 0.625. Valid range is 0x0004 - 0xFFFF.
uint16_t	slow_scan_window	Slow Scan window. Slow Scan window(ms) = slow_scan_window * 0.625. Valid range is 0x0004 - 0xFFFF.
uint8_t	scan_type	Scan type. macro: description BLE_GAP_SCAN_PASSIVE(0x00): Passive Scan. BLE_GAP_SCAN_ACTIVE(0x01): Active Scan.
uint8_t	padding[3]	Reserved.

◆ ble_abs_scan_parameter_t

struct ble_abs_scan_parameter_t		
st_ble_abs_scan_parameter_t is the parameters for scan.		
Data Fields		
ble_abs_scan_phy_parameter_t *	p_phy_parameter_1M	Scan parameters for receiving the advertising packets in 1M PHY. In case of not receiving the advertising packets in 1M PHY,

		this field is specified as NULL. p_phy_parameter_1M or p_phy_parameter_coded field shall be set to scan parameters.
ble_abs_scan_phy_parameter_t *	p_phy_parameter_coded	Scan parameters for receiving the advertising packets in Coded PHY. In case of not receiving the advertising packets in Coded PHY, this field is specified as NULL. p_phy_parameter_1M or p_phy_parameter_coded field shall be set to scan parameters.
uint8_t *	p_filter_data	Data for Advertising Data filtering. The p_filter_data parameter is used for the advertising data in single advertising report. The advertising data composed of multiple advertising reports is not filtered by this parameter. If the p_filter_data parameter is specified as NULL, the filtering is not done.
uint16_t	fast_scan_period	The period which scan with the fast scan interval/fast scan window continues for. Time(ms) = fast_scan_period * 10. Valid range is 0x0000 - 0xFFFF. If the fast_scan_period parameter is 0x0000, scan with the fast scan interval/fast scan window is not performed. After the elapse of the fast_scan_period, BLE_GAP_EVENT_SCAN_TO event notifies that the scan has stopped.
uint16_t	slow_scan_period	The period which scan with the slow scan interval/slow scan window continues for. Time = slow_scan_period * 10ms. Valid range is 0x0000 - 0xFFFF. If the slow_scan_period parameter is 0x0000, the scan continues. After the elapse of the slow_scan_period,

<table>
<tr><td></td><td></td><td>BLE_GAP_EVENT_SCAN_TO event notifies that the scan has stopped.</td></tr>
<tr><td>uint16_t</td><td>filter_data_length</td><td>The length of the data specified by the p_filter_data parameter. Valid range is 0x0000-0x0010. If the filter_data_length parameter is 0, the filtering is not done.</td></tr>
<tr><td>uint8_t</td><td>device_scan_filter_policy</td><td>Scan Filter Policy. Select one of the following.
Address type setting (Field [7:4])
<table>
<tr><th>macro</th><th>description</th></tr>
<tr><td>BLE_GAP_ADDR_PUBLIC(0x00)</td><td>Use Public Address.</td></tr>
<tr><td>BLE_GAP_ADDR_RAND(0x01)</td><td>Use Random Address.</td></tr>
<tr><td>BLE_GAP_ADDR_RPA_ID_PUBLIC(0x02)</td><td>If the IRK (Identity Resolving Key) of local device has been registered in Resolving list, use RPA. If not, use Public Address.</td></tr>
<tr><td>BLE_GAP_ADDR_RPA_ID_RANDOM(0x03)</td><td>If the IRK (Identity Resolving Key) of local device has been registered in Resolving list, use RPA. If not, use Random Address.</td></tr>
</table>
White list setting (Field [3:0])
<table>
<tr><th>macro</th><th>description</th></tr>
<tr><td>BLE_GAP_SCAN_ALLOW_ADV_ALL(0x00)</td><td>Accept all advertising and scan response</td></tr>
</table></td></tr>
</table>

				PDUs except directed advertising PDUs not addressed to local device.
			BLE_GAP_SCAN_ALLOW_ADV_WLST(0x01)	Accept only advertising and scan response PDUs from remote devices whose address is registered in the White List. Directed advertising PDUs which are not addressed to local device is ignored.
			BLE_GAP_SCAN_ALLOW_ADV_EXCEPT_DIRECTED(0x02)	Accept all advertising and scan response PDUs except directed advertising PDUs whose the target address is identity address but doesn't address local device. However directed advertising PDUs whose the target address is the local resolvable private address are accepted.
			BLE_GAP_SCAN_ALLOW_ADV_EXCEPT_DI	Accept all advertising and scan

		RECTED_WLST(0x03)	response PDUs. The following are excluded: Advertising and scan response PDUs where the advertiser's identity address is not in the White List. Directed advertising PDUs whose the target address is identity address but doesn't address local device. However directed advertising PDUs whose the target address is the local resolvable private address are accepted.
uint8_t	filter_duplicate	Filter duplicates. Maximum number of filtered devices is 8. The 9th and subsequent devices are not filtered by this parameter. macro / description BLE_GAP_SCAN_FILT_DUPLIC_DISABLE(0x00) — Duplicate filter disabled. BLE_GAP_SCAN_FILT_DUPLI — Duplicate filter enabled.	

		C_ENABLE(0x01) BLE_GAP_SCAN_FILT_DUPLIC_ENABLE_FOR_PERIOD(0x02)) Duplicate filtering enabled, reset for each scan period.
uint8_t	filter_ad_type	The AD type of the data specified by the p_filter_data parameter. The AD type identifier values are defined in Bluetooth SIG Assigned Number (https://www.bluetooth.com/specifications/assigned-numbers).
uint8_t	padding[3]	Padding.

◆ ble_abs_connection_phy_parameter_t

struct ble_abs_connection_phy_parameter_t		
st_ble_abs_connection_phy_parameter_t is the phy parameters for create connection.		
Data Fields		
uint16_t	connection_interval	Connection interval. Time(ms) = connection_interval * 1.25. Valid range is 0x0006 - 0x0C80.
uint16_t	connection_slave_latency	Slave latency. Valid range is 0x0000 - 0x01F3.
uint16_t	supervision_timeout	Supervision timeout. Time(ms) = supervision_timeout * 10. Valid range is 0x000A - 0x0C80.
uint8_t	padding[2]	Padding.

◆ ble_abs_connection_parameter_t

struct ble_abs_connection_parameter_t		
st_ble_abs_connection_parameter_t is the parameters for create connection.		
Data Fields		
ble_abs_connection_phy_parameter_t *	p_connection_phy_parameter_1M	Connection interval, slave latency, supervision timeout for 1M PHY. The p_connection_phy_parameter_1M is specified as NULL, a connection request is not sent with 1M PHY.

ble_abs_connection_phy_parameter_t *	p_connection_phy_parameter_2M	Connection interval, slave latency, supervision timeout for 2M PHY. The p_connection_phy_parameter_2M is specified as NULL, a connection request is not sent with 2M PHY.
ble_abs_connection_phy_parameter_t *	p_connection_phy_parameter_coded	Connection interval, slave latency, supervision timeout for Coded PHY. The p_connection_phy_parameter_coded is specified as NULL, a connection request is not sent with Coded PHY.
ble_device_address_t *	p_device_address	Address of the device to be connected. If the filter field is BLE_GAP_INIT_FILT_USE_WLST(0x01), this parameter is ignored and please fill p_device_address.addr with 0x00.
uint8_t	filter_parameter	The filter field specifies whether the White List is used or not, when connecting with a remote device. Address type setting (Field [7:4])

macro	description
BLE_GAP_ADDR_PUBLIC(0x00)	Use Public Address.
BLE_GAP_ADDR_RAND(0x01)	Use Random Address.
BLE_GAP_ADDR_RPA_ID_PUBLIC(0x02)	If the IRK (Identity Resolving Key) of local device has been registered in Resolving list, use RPA. If not, use Public Address.
BLE_GAP_ADDR_RPA_ID_RANDOM(0x03)	If the IRK (Identity Resolving

		Key) of local device has been registered in Resolving list, use RPA. If not, use Random Address. White list setting (Field [3:0]) macro / description BLE_GAP_INIT_FILT_USE_ADDR(0x00) — White List is not used. The remote device to be connected is specified by the p_addr field is used. BLE_GAP_INIT_FILT_USE_WLST(0x01) — White List is used. The remote device registered in White List is connected with local device. The p_addr field is ignored.
uint8_t	connection_timeout	The time(sec) to cancel the create connection request. Valid range is 0 <= connection_timeout <= 10. If the connection_timeout field is 0, the create connection request is not canceled.
uint8_t	padding[2]	Padding.

◆ ble_abs_cfg_t

struct ble_abs_cfg_t	
BLE ABS configuration parameters.	
Data Fields	
uint32_t	channel
	Select a channel corresponding to the channel number of the hardware. More...

ble_gap_application_callback_t	gap_callback
	GAP callback function.
ble_vendor_specific_application_callback_t	vendor_specific_callback
	Vendor Specific callback function.
ble_abs_gatt_server_callback_set_t *	p_gatt_server_callback_list
	GATT Server callback set.
uint8_t	gatt_server_callback_list_number
	The number of GATT Server callback functions.
ble_abs_gatt_client_callback_set_t *	p_gatt_client_callback_list
	GATT Client callback set.
uint8_t	gatt_client_callback_list_number
	The number of GATT Client callback functions.
ble_abs_pairing_parameter_t *	p_pairing_parameter
	Pairing parameters.
flash_instance_t const *	p_flash_instance
	Pointer to flash instance.
timer_instance_t const *	p_timer_instance

	Pointer to timer instance.
void(*	p_callback)(ble_abs_callback_args_t *p_args)
	Callback provided when a BLE ISR occurs.
void const *	p_context
	Placeholder for user data. Passed to the user callback in ble_abs_callback_args_t.
void const *	p_extend
	Placeholder for user extension.

Field Documentation

◆ channel

uint32_t ble_abs_cfg_t::channel
Select a channel corresponding to the channel number of the hardware. the parameters for initialization.

◆ ble_abs_api_t

struct ble_abs_api_t	
BLE ABS functions implemented at the HAL layer will follow this API.	
Data Fields	
fsp_err_t(*	open)(ble_abs_ctrl_t *const p_ctrl, ble_abs_cfg_t const *const p_cfg)
fsp_err_t(*	close)(ble_abs_ctrl_t *const p_ctrl)
fsp_err_t(*	reset)(ble_abs_ctrl_t *const p_ctrl, ble_event_cb_t init_callback)
fsp_err_t(*	startLegacyAdvertising)(ble_abs_ctrl_t *const p_ctrl, ble_abs_legacy_advertising_parameter_t const *const p_advertising_parameter)

fsp_err_t(*	startExtendedAdvertising)(ble_abs_ctrl_t *const p_ctrl, ble_abs_extend_advertising_parameter_t const *const p_advertising_parameter)
fsp_err_t(*	startNonConnectableAdvertising)(ble_abs_ctrl_t *const p_ctrl, ble_abs_non_connectable_advertising_parameter_t const *const p_advertising_parameter)
fsp_err_t(*	startPeriodicAdvertising)(ble_abs_ctrl_t *const p_ctrl, ble_abs_periodic_advertising_parameter_t const *const p_advertising_parameter)
fsp_err_t(*	startScanning)(ble_abs_ctrl_t *const p_ctrl, ble_abs_scan_parameter_t const *const p_scan_parameter)
fsp_err_t(*	createConnection)(ble_abs_ctrl_t *const p_ctrl, ble_abs_connection_parameter_t const *const p_connection_parameter)
fsp_err_t(*	setLocalPrivacy)(ble_abs_ctrl_t *const p_ctrl, uint8_t const *const p_lc_irk, uint8_t privacy_mode)
fsp_err_t(*	startAuthentication)(ble_abs_ctrl_t *const p_ctrl, uint16_t connection_handle)
fsp_err_t(*	deleteBondInformation)(ble_abs_ctrl_t *const p_ctrl, ble_abs_bond_information_parameter_t const *const p_bond_information_parameter)
fsp_err_t(*	importKeyInformation)(ble_abs_ctrl_t *const p_ctrl, ble_device_address_t *p_local_identity_address, uint8_t *p_local_irk, uint8_t *p_local_csrk)
fsp_err_t(*	exportKeyInformation)(ble_abs_ctrl_t *const p_ctrl, ble_device_address_t *p_local_identity_address, uint8_t *p_local_irk, uint8_t *p_local_csrk)

Field Documentation

◆ open

fsp_err_t(* ble_abs_api_t::open) (ble_abs_ctrl_t *const p_ctrl, ble_abs_cfg_t const *const p_cfg)

Initialize the BLE ABS in register start mode.

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	p_cfg	Pointer to pin configuration structure.

◆ close

fsp_err_t(* ble_abs_api_t::close) (ble_abs_ctrl_t *const p_ctrl)

Close the BLE ABS.

Parameters

[in]	p_ctrl	Pointer to control structure.

◆ reset

fsp_err_t(* ble_abs_api_t::reset) (ble_abs_ctrl_t *const p_ctrl, ble_event_cb_t init_callback)

Close the BLE ABS.

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	init_callback	callback function to initialize Host Stack.

◆ startLegacyAdvertising

fsp_err_t(* ble_abs_api_t::startLegacyAdvertising) (ble_abs_ctrl_t *const p_ctrl, ble_abs_legacy_advertising_parameter_t const *const p_advertising_parameter)

Start Legacy Connectable Advertising.

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	p_advertising_parameter	Pointer to Advertising parameters for Legacy Advertising.

◆ startExtendedAdvertising

fsp_err_t(* ble_abs_api_t::startExtendedAdvertising) (ble_abs_ctrl_t *const p_ctrl, ble_abs_extend_advertising_parameter_t const *const p_advertising_parameter)

Start Extended Connectable Advertising.

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	p_advertising_parameter	Pointer to Advertising parameters for extend Advertising.

◆ startNonConnectableAdvertising

fsp_err_t(* ble_abs_api_t::startNonConnectableAdvertising) (ble_abs_ctrl_t *const p_ctrl, ble_abs_non_connectable_advertising_parameter_t const *const p_advertising_parameter)

Start Non-Connectable Advertising.

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	p_advertising_parameter	Pointer to Advertising parameters for non-connectable Advertising.

◆ startPeriodicAdvertising

fsp_err_t(* ble_abs_api_t::startPeriodicAdvertising) (ble_abs_ctrl_t *const p_ctrl, ble_abs_periodic_advertising_parameter_t const *const p_advertising_parameter)

Start Periodic Advertising.

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	p_advertising_parameter	Pointer to Advertising parameters for periodic Advertising.

◆ startScanning

fsp_err_t(* ble_abs_api_t::startScanning) (ble_abs_ctrl_t *const p_ctrl, ble_abs_scan_parameter_t const *const p_scan_parameter)

Start scanning.

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	p_scan_parameter	Pointer to scan parameter.

◆ createConnection

fsp_err_t(* ble_abs_api_t::createConnection) (ble_abs_ctrl_t *const p_ctrl, ble_abs_connection_parameter_t const *const p_connection_parameter)

Request create connection.

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	p_connection_parameter	Pointer to connection parameter.

◆ setLocalPrivacy

fsp_err_t(* ble_abs_api_t::setLocalPrivacy) (ble_abs_ctrl_t *const p_ctrl, uint8_t const *const p_lc_irk, uint8_t privacy_mode)

Configure local device privacy.

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	p_lc_irk	Pointer to IRK (Identity Resolving Key) to be registered in the resolving list.
[in]	privacy_mode	privacy_mode privacy mode.

◆ startAuthentication

fsp_err_t(* ble_abs_api_t::startAuthentication) (ble_abs_ctrl_t *const p_ctrl, uint16_t connection_handle)

Start pairing or encryption.

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	connection_handle	Connection handle identifying the remote device.

◆ deleteBondInformation

fsp_err_t(* ble_abs_api_t::deleteBondInformation) (ble_abs_ctrl_t *const p_ctrl, ble_abs_bond_information_parameter_t const *const p_bond_information_parameter)

Delete bond information.

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	p_bond_information_parameter	Pointer to bond information parameter.

◆ importKeyInformation

fsp_err_t(* ble_abs_api_t::importKeyInformation) (ble_abs_ctrl_t *const p_ctrl, ble_device_address_t *p_local_identity_address, uint8_t *p_local_irk, uint8_t *p_local_csrk)

Import local identity address, keys information to local storage.

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	p_local_identity_address	Pointer to local identiry address.
[in]	uint8_t	p_local_irk Pointer to local IRK (Identity Resolving Key)
[in]	uint8_t	p_local_csrk Pointer to local CSRK

◆ exportKeyInformation

fsp_err_t(* ble_abs_api_t::exportKeyInformation) (ble_abs_ctrl_t *const p_ctrl, ble_device_address_t *p_local_identity_address, uint8_t *p_local_irk, uint8_t *p_local_csrk)
Export local identity address, keys information from local storage.

Parameters

[in]	p_ctrl	Pointer to control structure.
[out]	p_local_identity_address	Pointer to local identiry address.
[out]	uint8_t	p_local_irk Pointer to local IRK (Identity Resolving Key)
[out]	uint8_t	p_local_csrk Pointer to local CSRK

◆ ble_abs_instance_t

struct ble_abs_instance_t		
This structure encompasses everything that is needed to use an instance of this interface.		
Data Fields		
ble_abs_ctrl_t *	p_ctrl	Pointer to the control structure for this instance.
ble_abs_cfg_t const *	p_cfg	Pointer to the configuration structure for this instance.
ble_abs_api_t const *	p_api	Pointer to the API structure for this instance.

Typedef Documentation

◆ ble_gap_application_callback_t

typedef void(* ble_gap_application_callback_t) (uint16_t event_type, ble_status_t event_result, st_ble_evt_data_t *p_event_data)
ble_gap_application_callback_t is the GAP Event callback function type.

◆ ble_vendor_specific_application_callback_t

typedef void(* ble_vendor_specific_application_callback_t) (uint16_t event_type, ble_status_t event_result, st_ble_vs_evt_data_t *p_event_data)
ble_vendor_specific_application_callback_t is the Vendor Specific Event callback function type.

◆ ble_gatt_server_application_callback_t

typedef void(* ble_gatt_server_application_callback_t) (uint16_t event_type, ble_status_t event_result, st_ble_gatts_evt_data_t *p_event_data)
ble_gatt_server_application_callback_t is the GATT Server Event callback function type.

◆ ble_gatt_client_application_callback_t

typedef void(* ble_gatt_client_application_callback_t) (uint16_t event_type, ble_status_t event_result, st_ble_gattc_evt_data_t *p_event_data)
ble_gatt_client_application_callback_t is the GATT Server Event callback function type.

◆ ble_abs_delete_bond_application_callback_t

typedef void(* ble_abs_delete_bond_application_callback_t) (st_ble_dev_addr_t *p_addr)
ble_abs_delete_bond_application_callback_t is the delete bond information Event callback function type.

◆ ble_abs_ctrl_t

typedef void ble_abs_ctrl_t
BLE ABS control block. Allocate an instance specific control block to pass into the BLE ABS API calls.

Enumeration Type Documentation

◆ ble_abs_advertising_filter_t

enum ble_abs_advertising_filter_t	
Advertising Filter Policy	
Enumerator	
BLE_ABS_ADVERTISING_FILTER_ALLOW_ANY	Receive a connect request from all devices.
BLE_ABS_ADVERTISING_FILTER_ALLOW_WHITE_LIST	Receive a connect request from only the devices registered in White List.

◆ ble_abs_local_bond_information_t

enum ble_abs_local_bond_information_t	
Local keys delete policy	
Enumerator	
BLE_ABS_LOCAL_BOND_INFORMATION_NONE	Delete no local keys.
BLE_ABS_LOCAL_BOND_INFORMATION_ALL	Delete all local keys.

◆ ble_abs_remote_bond_information_t

enum ble_abs_remote_bond_information_t	
Remote keys delete policy	
Enumerator	
BLE_ABS_REMOTE_BOND_INFORMATION_NONE	Delete no remote device keys.
BLE_ABS_REMOTE_BOND_INFORMATION_SPECIFIED	Delete the keys specified by the device address.
BLE_ABS_REMOTE_BOND_INFORMATION_ALL	Delete all remote device keys.

◆ ble_abs_delete_non_volatile_area_t

enum ble_abs_delete_non_volatile_area_t	
Deletion policy for non-volatile memory	
Enumerator	
BLE_ABS_DELETE_NON_VOLATILE_AREA_DISABLE	Delete no keys stored in storage.
BLE_ABS_DELETE_NON_VOLATILE_AREA_ENABLE	Delete the keys stored in storage.

Detailed Description

Interface for Bluetooth Low Energy (BLE) functions.

Summary

The BLE interface for the Bluetooth Low Energy (BLE) peripheral provides BLE functionality.

Modules

GAP
ISO
GATT_COMMON
GATT_SERVER
GATT_CLIENT

	L2CAP
	VS

Macros

#define	BLE_VERSION_MAJOR
#define	BLE_VERSION_MINOR
#define	BLE_LIB_EXTENDED
#define	BLE_LIB_BALANCE
#define	BLE_LIB_COMPACT

Typedefs

typedef void(*	ble_event_cb_t) (void) ble_event_cb_t is the callback function type for R_BLE_SetEvent(). More...

Macro Definition Documentation

◆ BLE_VERSION_MAJOR

#define BLE_VERSION_MAJOR
BLE Module Major Version.

◆ BLE_VERSION_MINOR

#define BLE_VERSION_MINOR
BLE Module Minor Version.

◆ BLE_LIB_EXTENDED

#define BLE_LIB_EXTENDED
BLE Protocol Stack Library Extended type.

◆ BLE_LIB_BALANCE

#define BLE_LIB_BALANCE
BLE Protocol Stack Library Balance type.

◆ BLE_LIB_COMPACT

#define BLE_LIB_COMPACT
BLE Protocol Stack Library Compacy type.

Typedef Documentation

◆ ble_event_cb_t

ble_event_cb_t
ble_event_cb_t is the callback function type for R_BLE_SetEvent(). **Returns** none

Function Documentation

◆ R_BLE_Open()

ble_status_t R_BLE_Open (void)
Open the BLE protocol stack. This function should be called once before using the BLE protocol stack. **Return values** BLE_SUCCESS(0x0000) — Success

◆ R_BLE_Close()

ble_status_t R_BLE_Close (void)
Close the BLE protocol stack. This function should be called once to close the BLE protocol stack. **Return values** BLE_SUCCESS(0x0000) — Success

◆ R_BLE_Execute()

ble_status_t R_BLE_Execute (void)

Execute the BLE task.

This handles all the task queued in the BLE protocol stack internal task queue and return. This function should be called repeatedly in the main loop.

Return values

BLE_SUCCESS(0x0000)	Success

◆ R_BLE_IsTaskFree()

uint32_t R_BLE_IsTaskFree (void)

Check the BLE task queue is free or not.

This function returns the BLE task queue free status. When this function returns 0x0, call R_BLE_Execute() to execute the BLE task.

Return values

0x0	BLE task queue is not free
0x1	BLE task queue is free

◆ R_BLE_SetEvent()

ble_status_t R_BLE_SetEvent (ble_event_cb_t *cb*)

Set event.

This function add an event in the BLE protocol stack internal queue. The event is handled in R_BLE_Execute just like Bluetooth event. This function is intended to be called in hardware interrupt context. Even if calling this function with the same cb before the cb is invoked, only one event is registered. The maximum number of the events can be registered at a time is eight.

Parameters

cb	The callback for the event.

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_ALREADY_IN_PROGRESS(0x000A)	The event already registered with the callback.
BLE_ERR_CONTEXT_FULL(0x000B)	No free slot for the event.

◆ R_BLE_GetVersion()

uint32_t R_BLE_GetVersion (void)

Get the BLE FIT module version.

This function returns the BLE FIT module version.
The major version(BLE_VERSION_MAJOR) is contained in the two most significant bytes, and the minor version(BLE_VERSION_MINOR) occupies the remaining two bytes.

Return values

BLE_VERSION_MAJOR | BLE_VERSION_MINOR	

◆ R_BLE_GetLibType()

uint32_t R_BLE_GetLibType (void)

Get the type of BLE protocol stack library.

This function returns the type of BLE protocol stack library.

Return values

BLE_LIB_EXTENDED(0x00)	Extended
BLE_LIB_BALANCE(0x01)	Balance
BLE_LIB_COMPACT(0x02)	Compact

GAP

Functions

ble_status_t	R_BLE_GAP_Init (ble_gap_app_cb_t gap_cb) Initialize the Host Stack. More...
ble_status_t	R_BLE_GAP_Terminate (void) Terminate the Host Stack. More...
ble_status_t	R_BLE_GAP_UpdConn (uint16_t conn_hdl, uint8_t mode, uint16_t accept, st_ble_gap_conn_param_t *p_conn_updt_param) Update the connection parameters. More...

ble_status_t	R_BLE_GAP_SetDataLen (uint16_t conn_hdl, uint16_t tx_octets, uint16_t tx_time) Update the packet size and the packet transmit time. More...
ble_status_t	R_BLE_GAP_Disconnect (uint16_t conn_hdl, uint8_t reason) Disconnect the link. More...
ble_status_t	R_BLE_GAP_SetPhy (uint16_t conn_hdl, st_ble_gap_set_phy_param_t *p_phy_param) Set the phy for connection. More...
ble_status_t	R_BLE_GAP_SetDefPhy (st_ble_gap_set_def_phy_param_t *p_def_phy_param) Set the default phy which allows remote device to change. More...
ble_status_t	R_BLE_GAP_SetPrivMode (st_ble_dev_addr_t *p_addr, uint8_t *p_privacy_mode, uint8_t device_num) Set the privacy mode. More...
ble_status_t	R_BLE_GAP_ConfWhiteList (uint8_t op_code, st_ble_dev_addr_t *p_addr, uint8_t device_num) Set White List. More...
ble_status_t	R_BLE_GAP_GetVerInfo (void) Get the version number of the Controller and the host stack. More...
ble_status_t	R_BLE_GAP_ReadPhy (uint16_t conn_hdl) Get the phy settings. More...
ble_status_t	R_BLE_GAP_ConfRslvList (uint8_t op_code, st_ble_dev_addr_t *p_addr, st_ble_gap_rslv_list_key_set_t *p_peer_irk, uint8_t device_num) Set Resolving List. More...
ble_status_t	R_BLE_GAP_EnableRpa (uint8_t enable) Enable/Disable address resolution and generation of a resolvable

	private address. More...
ble_status_t	R_BLE_GAP_SetRpaTo (uint16_t rpa_timeout) Set the update time of resolvable private address. More...
ble_status_t	R_BLE_GAP_ReadRpa (st_ble_dev_addr_t *p_addr) Get the resolvable private address of local device. More...
ble_status_t	R_BLE_GAP_ReadRssi (uint16_t conn_hdl) Get RSSI. More...
ble_status_t	R_BLE_GAP_ReadChMap (uint16_t conn_hdl) Get the Channel Map. More...
ble_status_t	R_BLE_GAP_SetRandAddr (uint8_t *p_random_addr) Set a random address. More...
ble_status_t	R_BLE_GAP_SetAdvParam (st_ble_gap_adv_param_t *p_adv_param) Set advertising parameters. More...
ble_status_t	R_BLE_GAP_SetAdvSresData (st_ble_gap_adv_data_t *p_adv_srsp_data) Set advertising data/scan response data/periodic advertising data. More...
ble_status_t	R_BLE_GAP_StartAdv (uint8_t adv_hdl, uint16_t duration, uint8_t max_extd_adv_evts) Start advertising. More...
ble_status_t	R_BLE_GAP_StopAdv (uint8_t adv_hdl) Stop advertising. More...
ble_status_t	R_BLE_GAP_SetPerdAdvParam (st_ble_gap_perd_adv_param_t *p_perd_adv_param) Set periodic advertising parameters. More...

ble_status_t	R_BLE_GAP_StartPerdAdv (uint8_t adv_hdl) Start periodic advertising. More...
ble_status_t	R_BLE_GAP_StopPerdAdv (uint8_t adv_hdl) Stop periodic advertising. More...
ble_status_t	R_BLE_GAP_GetRemainAdvBufSize (uint16_t *p_remain_adv_data_size, uint16_t *p_remain_perd_adv_data_size) Get buffer size for advertising data/scan response data/periodic advertising data in the Controller. More...
ble_status_t	R_BLE_GAP_RemoveAdvSet (uint8_t op_code, uint8_t adv_hdl) Delete advertising set. More...
ble_status_t	R_BLE_GAP_CreateConn (st_ble_gap_create_conn_param_t *p_param) Request for a link establishment. More...
ble_status_t	R_BLE_GAP_CancelCreateConn (void) Cancel the request for a link establishment. More...
ble_status_t	R_BLE_GAP_SetChMap (uint8_t *p_channel_map) Set the Channel Map. More...
ble_status_t	R_BLE_GAP_StartScan (st_ble_gap_scan_param_t *p_scan_param, st_ble_gap_scan_on_t *p_scan_enable) Set scan parameter and start scan. More...
ble_status_t	R_BLE_GAP_StopScan (void) Stop scan. More...
ble_status_t	R_BLE_GAP_CreateSync (st_ble_dev_addr_t *p_addr, uint8_t adv_sid, uint16_t skip, uint16_t sync_to) Request for a periodic sync establishment. More...

ble_status_t	R_BLE_GAP_CancelCreateSync (void) Cancel the request for a periodic sync establishment. More...
ble_status_t	R_BLE_GAP_TerminateSync (uint16_t sync_hdl) Terminate the periodic sync. More...
ble_status_t	R_BLE_GAP_ConfPerdAdvList (uint8_t op_code, st_ble_dev_addr_t *p_addr, uint8_t *p_adv_sid_set, uint8_t device_num) Set Periodic Advertiser List. More...
ble_status_t	R_BLE_GAP_AuthorizeDev (uint16_t conn_hdl, uint8_t author_flag) Authorize a remote device. More...
ble_status_t	R_BLE_GAP_GetRemDevInfo (uint16_t conn_hdl) Get the information about remote device. More...
ble_status_t	R_BLE_GAP_SetPairingParams (st_ble_gap_pairing_param_t *p_pair_param) Set the parameters using pairing. More...
ble_status_t	R_BLE_GAP_SetLocIdInfo (st_ble_dev_addr_t *p_lc_id_addr, uint8_t *p_lc_irk) Set the IRK and the identity address distributed to a remote device. More...
ble_status_t	R_BLE_GAP_SetLocCsrk (uint8_t *p_local_csrk) Set the CSRK distributed to a remote device. More...
ble_status_t	R_BLE_GAP_StartPairing (uint16_t conn_hdl) Start pairing. More...
ble_status_t	R_BLE_GAP_ReplyPairing (uint16_t conn_hdl, uint8_t response) Reply the pairing request from a remote device. More...
ble_status_t	R_BLE_GAP_StartEnc (uint16_t conn_hdl)

	Encryption the link. More...
ble_status_t	R_BLE_GAP_ReplyPasskeyEntry (uint16_t conn_hdl, uint32_t passkey, uint8_t response) Reply the passkey entry request. More...
ble_status_t	R_BLE_GAP_ReplyNumComp (uint16_t conn_hdl, uint8_t response) Reply the numeric comparison request. More...
ble_status_t	R_BLE_GAP_NotifyKeyPress (uint16_t conn_hdl, uint8_t key_press) Notify the input key type which a remote device inputs in the passkey entry. More...
ble_status_t	R_BLE_GAP_GetDevSecInfo (uint16_t conn_hdl, st_ble_gap_auth_info_t *p_sec_info) Get the security information about the remote device. More...
ble_status_t	R_BLE_GAP_ReplyExKeyInfoReq (uint16_t conn_hdl) Distribute the keys of local device. More...
ble_status_t	R_BLE_GAP_SetRemOobData (st_ble_dev_addr_t *p_addr, uint8_t oob_data_flag, st_ble_gap_oob_data_t *p_oob) Set the oob data from a remote device. More...
ble_status_t	R_BLE_GAP_CreateScOobData (void) Create data for oob in secure connection. More...
ble_status_t	R_BLE_GAP_SetBondInfo (st_ble_gap_bond_info_t *p_bond_info, uint8_t device_num, uint8_t *p_set_num) Set the bonding information stored in non-volatile memory to the host stack. More...
void	R_BLE_GAP_DeleteBondInfo (int32_t local, int32_t remote, st_ble_dev_addr_t *p_addr, ble_gap_del_bond_cb_t gap_del_bond_cb) This function deletes the bonding information in Host Stack. When a function for deleting the bonding information stored in non-volatile area is registered by the gap_del_bond_cb parameter, it is deleted as well as the bonding information in Host Stack. More...

ble_status_t	R_BLE_GAP_ReplyLtkReq (uint16_t conn_hdl, uint16_t ediv, uint8_t *p_peer_rand, uint8_t response) Reply the LTK request from a remote device. More...
ble_status_t	R_BLE_GAP_SetCteConnlessParam (st_ble_gap_cte_connless_t *p_cte_param) Set the parameters for the transmission of Constant Tone Extensions in any periodic advertising. More...
ble_status_t	R_BLE_GAP_EnableCteConnless (uint16_t adv_hdl, uint8_t enable) Enable or disable Constant Tone Extensions in periodic advertising identified by the adv_hdl. More...
ble_status_t	R_BLE_GAP_StartCteConnlessRecv (st_ble_gap_cte_connless_recv_t *p_cte_recv) Enable sampling received Constant Tone Extension fields. More...
ble_status_t	R_BLE_GAP_StopCteConnlessRecv (uint16_t sync_hdl) Disable sampling received Constant Tone Extension fields. More...
ble_status_t	R_BLE_GAP_SetCteConnParam (st_ble_gap_cte_conn_t *p_cte_param) Set the parameters for the transmission of Constant Tone Extensions in ACL link. More...
ble_status_t	R_BLE_GAP_EnableCteConnRsp (uint16_t conn_hdl, uint8_t enable) Enable or disable Constant Tone Extensions Transmission in ACL link by conn_hdl. More...
ble_status_t	R_BLE_GAP_SetCteConnRecvParam (st_ble_gap_cte_conn_rx_param_t *p_cte_param) Set the parameters for the receiving of Constant Tone Extensions in ACL link. and start sampling. More...
ble_status_t	R_BLE_GAP_StopCteConnRecvSampling (uint16_t conn_hdl) Stop sampling of Constant Tone Extensions on the specified connection. More...

ble_status_t	R_BLE_GAP_StartCteConnReq (st_ble_gap_cte_conn_req_t *p_req) Set the parameters and start sending request of Constant Tone Extensions in ACL link to peer. More...
ble_status_t	R_BLE_GAP_StopCteConnReq (uint16_t handle) Stop sending request of Constant Tone Extensions in ACL link to peer. More...
ble_status_t	R_BLE_GAP_SetDefaultSubrate (st_ble_gap_subrate_param_t *p_subrate_param) Set the initial values for the acceptable parameters for subrating requests,. More...
ble_status_t	R_BLE_GAP_RequestSubrate (uint16_t conn_hdl, st_ble_gap_subrate_param_t *p_subrate_param) Request a change to the subrating factor other parameters applied to an existing connection using the Connection Subrate Update procedure. More...
ble_status_t	R_BLE_GAP_StartPerdAdvSetInfoTransfer (uint16_t adv_hdl, uint16_t conn_hdl, uint16_t service_data) This function starts Periodic advertising adv set info transfer to the connection. More...
ble_status_t	R_BLE_GAP_StartPerdAdvSyncTransfer (uint16_t sync_hdl, uint16_t conn_hdl, uint16_t service_data) This function starts Periodic advertising sync transfer. More...
ble_status_t	R_BLE_GAP_SetPerdAdvSyncTransferParam (uint16_t conn_hdl, st_ble_gap_past_param_t *p_past_param) This function starts to accept Periodic advertising sync transfer from the connection. More...
ble_status_t	R_BLE_GAP_SetDefPerdAdvSyncTransferParam (st_ble_gap_past_param_t *p_past_param) This function set the default parameter of Periodic advertising sync transfer for all subsequent connection. It does not affect any existing connection. More...

ble_status_t	R_BLE_GAP_ReadAntennaInfo (void) This function read the switching rates, the sampling rates, the number of antennae, and the maximum length of a transmitted Constant Tone Extension. More...
ble_status_t	R_BLE_GAP_ReceiverTest (st_ble_gap_recv_test_param_t *p_rx_test_param) Start a test where the DUT receives test reference packets at a fixed interval. The tester generates the test reference packets. More...
ble_status_t	R_BLE_GAP_TransmitterTest (st_ble_gap_trans_test_param_t *p_tx_test_param) Start a test where the DUT generates test reference packets at a fixed interval. The Controller shall transmit at the power level indicated by the TX_Power_Level parameter. More...
ble_status_t	R_BLE_GAP_ModifySleepClockAccuracy (uint8_t act) request that the Controller changes its sleep clock accuracy for testing purposes. It should not be used under other circumstances. More...
ble_status_t	R_BLE_GAP_ReadRemoteTransmitPowerLevel (uint16_t conn_hdl, uint8_t phy) Read the transmit power level used by the remote device. More...
ble_status_t	R_BLE_GAP_SetPathLossReportingParam (st_ble_gap_set_path_loss_rpt_param_t *p_loss_rpt_param) Set the path loss threshold reporting parameters for the ACL connection identified. More...
ble_status_t	R_BLE_GAP_SetPathLossReportingEnable (uint16_t conn_hdl, uint8_t enable) Enable or disable path loss reporting for the ACL connection. More...
ble_status_t	R_BLE_GAP_SetTransmitPowerReportingEnable (uint16_t conn_hdl, uint8_t local_enable, uint8_t remote_enable) Enable or disable the transmit power level changing report. More...
ble_status_t	R_BLE_GAP_SetDataRelatedAddrChanges (uint8_t adv_hdl, uint8_t change_reason)

	Specifies circumstances when the Controller shall refresh any Resolvable Private Address. More...
ble_status_t	R_BLE_GAP_TestEnd (void) Stop any test which is in progress. The Num_Packets for a transmitter test shall be reported as 0x0000. The Num_Packets is an unsigned number and contains the number of received packets. More...
ble_status_t	R_BLE_GAP_ReqPeerSCA (uint16_t conn_hdl) Read the Sleep Clock Accuracy (SCA) of the peer device. More...
ble_status_t	R_BLE_GAP_EnhancedReadTxPowerLevel (uint16_t conn_hdl, uint8_t phy) Read the current and maximum transmit power levels of the local Controller on the ACL connection identified by the Connection_Handle parameter and the PHY indicated by the PHY parameter. More...
ble_status_t	R_BLE_GAP_SetHostFeat (uint8_t bit_number, uint8_t bit_value) Set or clear a bit controlled by the Host in the Link Layer FeatureSet stored in the Controller. More...

Detailed Description

(end addtogroup BLE_API)

Data Structures

struct	st_ble_evt_data_t st_ble_evt_data_t is the type of the data notified in a GAP Event. More...
struct	st_ble_dev_addr_t st_ble_dev_addr_t is the type of bluetooth device address(BD_ADDR). More...
struct	st_ble_gap_ext_adv_param_t Advertising parameters. More...

struct	st_ble_gap_adv_data_t Advertising data/scan response data/periodic advertising data. More...
struct	st_ble_gap_perd_adv_param_t Periodic advertising parameter. More...
struct	st_ble_gap_scan_phy_param_t Scan parameters per scan PHY. More...
struct	st_ble_gap_ext_scan_param_t Scan parameters. More...
struct	st_ble_gap_scan_on_t Parameters configured when scanning starts. More...
struct	st_ble_gap_conn_param_t Connection parameters included in connection interval, slave latency, supervision timeout, ce length. More...
struct	st_ble_gap_conn_phy_param_t Connection parameters per PHY. More...
struct	st_ble_gap_create_conn_param_t Connection parameters used in R_BLE_GAP_CreateConn(). More...
struct	st_ble_gap_rslv_list_key_set_t IRK of a remote device and IRK type of local device used in R_BLE_GAP_ConfRslvList(). More...
struct	st_ble_gap_set_phy_param_t PHY configuration parameters used in R_BLE_GAP_SetPhy(). More...
struct	st_ble_gap_set_def_phy_param_t

	PHY preferences which allows a remote device to set used in R_BLE_GAP_SetDefPhy(). More...
struct	st_ble_gap_auth_info_t Pairing parameters required from a remote device or information about keys distributed from a remote device. More...
struct	st_ble_gap_key_dist_t Keys distributed from a remote device. More...
struct	st_ble_gap_key_ex_param_t This structure includes the distributed keys and negotiated LTK size. More...
struct	st_ble_gap_pairing_param_t Pairing parameters used in R_BLE_GAP_SetPairingParams(). More...
struct	st_ble_gap_oob_data_t Oob data received from the remote device. This is used in R_BLE_GAP_SetRemOobData(). More...
struct	st_ble_gap_cte_antenna_info_t This is the parameters used in R_BLE_GAP_GetAntennaInfo(). More...
struct	st_ble_gap_recv_test_param_t This is the parameters used in R_BLE_GAP_ReceiverTest() More...
struct	st_ble_gap_trans_test_param_t This is the parameters used in R_BLE_GAP_TransmitterTest(). More...
struct	st_ble_gap_set_path_loss_rpt_param_t This is the parameters used in R_BLE_GAP_SetPathLossReportingParam(). More...
struct	st_ble_gap_cte_connless_t connectionless CTE param More...

struct	st_ble_gap_cte_conn_t connection CTE param More...
struct	st_ble_gap_cte_connless_recv_t connectionless CTE receive param More...
struct	st_ble_gap_cte_conn_rx_param_t connection CTE receive param More...
struct	st_ble_gap_cte_conn_req_t connection CTE request More...
struct	st_ble_gap_subrate_param_t subrating param More...
struct	st_ble_gap_ver_num_t Version number of host stack. More...
struct	st_ble_gap_loc_ver_info_t Version number of Controller. More...
struct	st_ble_gap_loc_dev_info_evt_t Version information of local device. More...
struct	st_ble_gap_hw_err_evt_t Hardware error that is notified from Controller. More...
struct	st_ble_gap_cmd_err_evt_t HCI Command error. More...
struct	st_ble_gap_adv_rept_t Advertising Report. More...

struct	st_ble_gap_ext_adv_rept_t Extended Advertising Report. More...
struct	st_ble_gap_perd_adv_rept_t Periodic Advertising Report. More...
struct	st_ble_gap_adv_rept_evt_t Advertising report. More...
union	st_ble_gap_adv_rept_evt_t.param Advertising Report. More...
struct	st_ble_gap_adv_set_evt_t Advertising handle. More...
struct	st_ble_gap_adv_off_evt_t Information about the advertising set which stops advertising. More...
struct	st_ble_gap_adv_data_evt_t This structure notifies that advertising data has been set to Controller by R_BLE_GAP_SetAdvSresData(). More...
struct	st_ble_gap_rem_adv_set_evt_t This structure notifies that an advertising set has been removed. More...
struct	st_ble_gap_conn_evt_t This structure notifies that a link has been established. More...
struct	st_ble_gap_disconn_evt_t This structure notifies that a link has been disconnected. More...
struct	st_ble_gap_rd_ch_map_evt_t This structure notifies that Channel Map has been retrieved by

	R_BLE_GAP_ReadChMap(). More...
struct	st_ble_gap_rd_rssi_evt_t This structure notifies that RSSI has been retrieved by R_BLE_GAP_ReadRssi(). More...
struct	st_ble_gap_dev_info_evt_t This structure notifies that information about remote device has been retrieved by R_BLE_GAP_GetRemDevInfo(). More...
struct	st_ble_gap_conn_upd_evt_t This structure notifies that connection parameters has been updated. More...
struct	st_ble_gap_conn_upd_req_evt_t This structure notifies that a request for connection parameters update has been received. More...
struct	st_ble_gap_conn_hdl_evt_t This structure notifies that a GAP Event that includes only connection handle has occurred. More...
struct	st_ble_gap_data_len_chg_evt_t This structure notifies that the packet data length has been updated. More...
struct	st_ble_gap_rd_rpa_evt_t This structure notifies that the local resolvable private address has been retrieved by R_BLE_GAP_ReadRpa(). More...
struct	st_ble_gap_phy_upd_evt_t This structure notifies that PHY for a connection has been updated. More...
struct	st_ble_gap_phy_rd_evt_t This structure notifies that the PHY settings has been retrieved by R_BLE_GAP_ReadPhy(). More...

struct	st_ble_gap_scan_req_recv_evt_t This structure notifies that a Scan Request packet has been received from a Scanner. More...
struct	st_ble_gap_sync_est_evt_t This structure notifies that a Periodic sync has been established. More...
struct	st_ble_gap_sync_hdl_evt_t This structure notifies that a GAP Event that includes only sync handle has occurred. More...
struct	st_ble_gap_white_list_conf_evt_t This structure notifies that White List has been configured. More...
struct	st_ble_gap_rslv_list_conf_evt_t This structure notifies that Resolving List has been configured. More...
struct	st_ble_gap_perd_list_conf_evt_t This structure notifies that Periodic Advertiser List has been configured. More...
struct	st_ble_gap_set_priv_mode_evt_t This structure notifies that Privacy Mode has been configured. More...
struct	st_ble_gap_pairing_req_evt_t This structure notifies that a pairing request from a remote device has been received. More...
struct	st_ble_gap_passkey_display_evt_t This structure notifies that a request for Passkey display in pairing has been received. More...
struct	st_ble_gap_num_comp_evt_t

	This structure notifies that a request for Numeric Comparison in pairing has been received. More...
struct	st_ble_gap_key_press_ntf_evt_t This structure notifies that the remote device has input a key in Passkey Entry. More...
struct	st_ble_gap_pairing_info_evt_t This structure notifies that the pairing has completed. More...
struct	st_ble_gap_enc_chg_evt_t This structure notifies that the encryption status of a link has been changed. More...
struct	st_ble_gap_peer_key_info_evt_t This structure notifies that the remote device has distributed the keys. More...
struct	st_ble_gap_ltk_req_evt_t This structure notifies that a LTK request from a remote device has been received. More...
struct	st_ble_gap_ltk_rsp_evt_t This structure notifies that local device has replied to the LTK request from the remote device. More...
struct	st_ble_gap_sc_oob_data_evt_t This structure notifies that OOB data for Secure Connections has been generated by R_BLE_GAP_CreateScOobData(). More...
struct	st_ble_gap_bond_info_t Bonding information used in R_BLE_GAP_SetBondInfo(). More...
struct	st_cte_iq_sample_t CTE IQ sample data. More...

struct	st_ble_gap_cte_connless_rept_t connectionless CTE data report More...
struct	st_ble_gap_cte_conn_rept_t connection CTE data report More...
struct	st_ble_subrate_upd_t subrating update event More...
struct	st_ble_gap_past_est_evt_t This structure notifies that. More...
struct	st_ble_gap_tx_power_reporting_evt_t This structure notifies that. More...
struct	st_ble_gap_pass_loss_thr_evt_t This structure notifies that a path loss report has been received. More...
struct	st_ble_gap_req_peer_sca_evt_t This structure notifies that a SCA request to a remote device has been completed. More...
struct	st_ble_gap_dtm_test_end_evt_t report of dtm transmit/receive test end More...
struct	st_ble_gap_enhanced_read_tx_power_level_evt_t Power level report of remove device. More...

#define	BLE_GAP_SC_PROC_OBS Observation Procedure.
#define	BLE_GAP_LIST_ADD_DEV Add the device to the list.
#define	BLE_GAP_LIST_REM_DEV Delete the device from the list.
#define	BLE_GAP_LIST_CLR Clear the list.
#define	BLE_GAP_WHITE_LIST_MAX_ENTRY The maximum entry number of White List.
#define	BLE_GAP_RSLV_LIST_MAX_ENTRY The maximum entry number of Resolving List.
#define	BLE_GAP_PERD_LIST_MAX_ENTRY The maximum entry number of Periodic Advertiser List.
#define	BLE_GAP_RPA_DISABLED

	Disable RPA generation/resolution.
#define	BLE_GAP_RPA_ENABLED Enable RPA generation/resolution.
#define	BLE_GAP_RL_LOC_KEY_ALL_ZERO All-zero IRK.
#define	BLE_GAP_RL_LOC_KEY_REGISTERED The IRK registered by R_BLE_GAP_SetLocIdInfo().
#define	BLE_MAX_NO_OF_ADV_SETS_SUPPORTED The maximum number of advertising set for the Abstraction API.
#define	BLE_GAP_LEGACY_PROP_ADV_IND Connectable and scannable undirected Legacy Advertising Packet.
#define	BLE_GAP_LEGACY_PROP_ADV_DIRECT_IND Connectable directed (low duty cycle) Legacy Advertising Packet.
#define	BLE_GAP_LEGACY_PROP_ADV_HDC_DIRECT_IND Connectable directed (high duty cycle) Legacy Advertising Packet.
#define	BLE_GAP_LEGACY_PROP_ADV_SCAN_IND Scannable undirected Legacy Advertising Packet.
#define	BLE_GAP_LEGACY_PROP_ADV_NONCONN_IND Non-connectable and non-scannable undirected Legacy Advertising Packet.
#define	BLE_GAP_EXT_PROP_ADV_CONN_NOSCAN_UNDIRECT Connectable and non-scannable undirected Extended Advertising Packet.

#define	BLE_GAP_EXT_PROP_ADV_CONN_NOSCAN_DIRECT Connectable and non-scannable directed (low duty cycle) Extended Advertising Packet.
#define	BLE_GAP_EXT_PROP_ADV_CONN_NOSCAN_HDC_DIRECT Connectable and non-scannable directed (high duty cycle) Extended Advertising Packet.
#define	BLE_GAP_EXT_PROP_ADV_NOCONN_SCAN_UNDIRECT Non-connectable and scannable undirected Extended Advertising Packet.
#define	BLE_GAP_EXT_PROP_ADV_NOCONN_SCAN_DIRECT Non-connectable and scannable directed (low duty cycle) Extended Advertising Packet.
#define	BLE_GAP_EXT_PROP_ADV_NOCONN_SCAN_HDC_DIRECT Non-connectable and scannable directed (high duty cycle) Extended Advertising Packet.
#define	BLE_GAP_EXT_PROP_ADV_NOCONN_NOSCAN_UNDIRECT Non-connectable and non-scannable undirected Extended Advertising Packet.
#define	BLE_GAP_EXT_PROP_ADV_NOCONN_NOSCAN_DIRECT Non-connectable and non-scannable directed (low duty cycle) Extended Advertising Packet.
#define	BLE_GAP_EXT_PROP_ADV_NOCONN_NOSCAN_HDC_DIRECT Non-connectable and non-scannable directed (high duty cycle) Extended Advertising Packet.
#define	BLE_GAP_EXT_PROP_ADV_ANONYMOUS Omit the advertiser address from Extended Advertising Packet.
#define	BLE_GAP_EXT_PROP_ADV_INCLUDE_TX_POWER Indicate that the advertising data includes TX Power.

#define	BLE_GAP_ADV_ALLOW_SCAN_ANY_CONN_ANY Process scan and connection requests from all devices.
#define	BLE_GAP_ADV_ALLOW_SCAN_WLST_CONN_ANY Process connection requests from all devices and scan requests from only devices that are in the White List.
#define	BLE_GAP_ADV_ALLOW_SCAN_ANY_CONN_WLST Process scan requests from all devices and connection requests from only devices that are in the White List.
#define	BLE_GAP_ADV_ALLOW_SCAN_WLST_CONN_WLST Process scan and connection requests from only devices in the White List.
#define	BLE_GAP_ADV_PHY_1M Use 1M PHY.
#define	BLE_GAP_ADV_PHY_2M Use 2M PHY.
#define	BLE_GAP_ADV_PHY_CD Use Coded PHY.
#define	BLE_GAP_SCAN_REQ_NTF_DISABLE Disable Scan Request Notification.
#define	BLE_GAP_SCAN_REQ_NTF_ENABLE Enable Scan Request Notification.
#define	BLE_GAP_PERD_PROP_TX_POWER Indicate that periodic advertising data includes Tx Power.
#define	BLE_GAP_INVALID_ADV_HDL

	Invalid advertising handle.
#define	BLE_GAP_SET_PHYS_HOST_PREF_1M Use 1M PHY.
#define	BLE_GAP_SET_PHYS_HOST_PREF_2M Use 2M PHY.
#define	BLE_GAP_SET_PHYS_HOST_PREF_CD Use Coded PHY.
#define	BLE_GAP_SET_PHYS_OP_HOST_NO_PREF No preferred coding.
#define	BLE_GAP_SET_PHYS_OP_HOST_PREF_S_2 Use S=2 coding.
#define	BLE_GAP_SET_PHYS_OP_HOST_PREF_S_8 Use S=8 coding.
#define	BLE_GAP_CONN_UPD_MODE_REQ Request for updating the connection parameters.
#define	BLE_GAP_CONN_UPD_MODE_RSP Reply a connection parameter update request.
#define	BLE_GAP_CONN_UPD_ACCEPT Accept the update request.
#define	BLE_GAP_CONN_UPD_REJECT Reject the update request.
#define	BLE_GAP_CH_MAP_SIZE The size of channel map.

#define	BLE_GAP_INVALID_CONN_HDL Invalid Connection handle.
#define	BLE_GAP_NOT_USE_CONN_HDL This macro indicates that connection handle is not used.
#define	BLE_GAP_INIT_CONN_HDL Initial Connection handle.
#define	BLE_GAP_PAIRING_ACCEPT Accept a request regarding pairing.
#define	BLE_GAP_PAIRING_REJECT Reject a request regarding pairing.
#define	BLE_GAP_LTK_REQ_ACCEPT Reply for the LTK request.
#define	BLE_GAP_LTK_REQ_DENY Reject the LTK request.
#define	BLE_GAP_LESC_PASSKEY_ENTRY_STARTED Notify that passkey entry started.
#define	BLE_GAP_LESC_PASSKEY_DIGIT_ENTERED Notify that passkey digit entered.
#define	BLE_GAP_LESC_PASSKEY_DIGIT_ERASED Notify that passkey digit erased.
#define	BLE_GAP_LESC_PASSKEY_CLEARED Notify that passkey cleared.

#define	BLE_GAP_LESC_PASSKEY_ENTRY_COMPLETED Notify that passkey entry completed.
#define	BLE_GAP_SEC_MITM_BEST_EFFORT MITM Protection not required.
#define	BLE_GAP_SEC_MITM_STRICT MITM Protection required.
#define	BLE_GAP_KEY_DIST_ENCKEY LTK.
#define	BLE_GAP_KEY_DIST_IDKEY IRK and Identity Address.
#define	BLE_GAP_KEY_DIST_SIGNKEY CSRK.
#define	BLE_GAP_ID_ADDR_SIZE The size of identity address.
#define	BLE_GAP_IRK_SIZE The size of IRK.
#define	BLE_GAP_CSRK_SIZE The size of CSRK.
#define	BLE_GAP_LTK_SIZE The size of LTK.
#define	BLE_GAP_EDIV_SIZE The size of EDIV.
#define	BLE_GAP_RAND_64_BIT_SIZE

	The size of Rand.
#define	BLE_GAP_UNAUTH_PAIRING Unauthenticated pairing.
#define	BLE_GAP_AUTH_PAIRING Authenticated pairing.
#define	BLE_GAP_LEGACY_PAIRING Legacy pairing.
#define	BLE_GAP_LESC_PAIRING Secure Connections.
#define	BLE_GAP_BONDING_NONE The device doesn't support Bonding.
#define	BLE_GAP_BONDING The device supports Bonding.
#define	BLE_GAP_IOCAP_DISPLAY_ONLY Display Only iocapability. More...
#define	BLE_GAP_IOCAP_DISPLAY_YESNO Display Yes/No iocapability. More...
#define	BLE_GAP_IOCAP_KEYBOARD_ONLY Keyboard Only iocapability. More...
#define	BLE_GAP_IOCAP_NOINPUT_NOOUTPUT No Input No Output iocapability. More...
#define	BLE_GAP_IOCAP_KEYBOARD_DISPLAY Keyboard Display iocapability. More...

#define	BLE_GAP_OOB_DATA_NOT_PRESENT Reply that No OOB data has been received when pairing.
#define	BLE_GAP_OOB_DATA_PRESENT Reply that the OOB data has been received when pairing.
#define	BLE_GAP_SC_BEST_EFFORT Accept Legacy pairing and Secure Connections.
#define	BLE_GAP_SC_STRICT Accept only Secure Connections.
#define	BLE_GAP_SC_KEY_PRESS_NTF_NOT_SPRT Not support for Key Press Notification.
#define	BLE_GAP_SC_KEY_PRESS_NTF_SPRT Support for Key Press Notification.
#define	BLE_GAP_LEGACY_OOB_SIZE The size of Temporary Key for OOB in legacy pairing.
#define	BLE_GAP_OOB_CONFIRM_VAL_SIZE The size of Confirmation Value for OOB in Secure Connections.
#define	BLE_GAP_OOB_RANDOM_VAL_SIZE The size of Rand for OOB in Secure Connections.
#define	BLE_GAP_SEC_DEL_LOC_NONE Delete no local keys.
#define	BLE_GAP_SEC_DEL_LOC_IRK Delete local IRK.

#define	BLE_GAP_SEC_DEL_LOC_CSRK Delete local CSRK.
#define	BLE_GAP_SEC_DEL_LOC_ALL Delete all local keys.
#define	BLE_GAP_SEC_DEL_REM_NONE Delete no remote device keys.
#define	BLE_GAP_SEC_DEL_REM_SA Delete a key specified by the p_addr parameter.
#define	BLE_GAP_SEC_DEL_REM_NOT_CONN Delete keys of not connected remote devices.
#define	BLE_GAP_SEC_DEL_REM_ALL Delete all remote device keys.
#define	BLE_GAP_CTE_DISABLED Disable CTE transmission or receive.
#define	BLE_GAP_CTE_ENABLED Enable CTE transmission or receive.
#define	BLE_GAP_CTE_MAX_ANTENNA Max antenna number.
#define	BLE_GAP_CTE_TYPE_AOA CTE type AoA.
#define	BLE_GAP_CTE_TYPE_AOD_1US CTE type AoD with slot of 1 us.
#define	BLE_GAP_CTE_TYPE_AOD_2US

	CTE type AoD with slot of 2 us.

Typedefs

typedef void(*	ble_gap_app_cb_t) (uint16_t event_type, ble_status_t event_result, st_ble_evt_data_t *p_event_data) ble_gap_app_cb_t is the GAP Event callback function type. More...
typedef void(*	ble_gap_del_bond_cb_t) (st_ble_dev_addr_t *p_addr) ble_gap_del_bond_cb_t is the type of the callback function for delete bonding information stored in non-volatile area. This type is used in R_BLE_GAP_DeleteBondInfo(). More...
typedef st_ble_gap_ext_adv_param_t	st_ble_gap_adv_param_t Advertising parameters. More...
typedef st_ble_gap_ext_scan_param_t	st_ble_gap_scan_param_t Scan parameters. More...

Enumerations

enum	e_ble_gap_evt_t GAP Event Identifier. More...

Data Structure Documentation

◆ st_ble_evt_data_t

struct st_ble_evt_data_t		
st_ble_evt_data_t is the type of the data notified in a GAP Event.		
Data Fields		
uint16_t	param_len	The size of GAP Event parameters.
void *	p_param	GAP Event parameters. This parameter differs in each GAP Event.

◆ st_ble_dev_addr_t

struct st_ble_dev_addr_t		
st_ble_dev_addr_t is the type of bluetooth device address(BD_ADDR). ***Note*** *The BD address setting format is little endian.* *If the address is "AA:BB:CC:DD:EE:FF", set the byte array in the order {0xFF, 0xEE, 0xDD, 0xCC, 0xBB, 0xAA}.*		
Data Fields		
uint8_t	addr[BLE_BD_ADDR_LEN]	BD_ADDR.
uint8_t	type	Bluetooth address type. macro: description BLE_GAP_ADDR_PUBLIC(0x00): Public Address. BLE_GAP_ADDR_RAND(0x01): Random Address.

◆ st_ble_gap_ext_adv_param_t

struct st_ble_gap_ext_adv_param_t		
Advertising parameters.		
Data Fields		
uint8_t	adv_hdl	Advertising handle identifying the advertising set to be set the advertising parameters. Valid range is 0x00 - 0x03. In the first advertising parameters setting, the advertising set specified by adv_hdl is generated. The Advertising Set ID(Advertising SID) of the advertising set is same as adv_hdl.
uint16_t	adv_prop_type	Advertising packet type. Legacy advertising PDU type, or bitwise or of Extended advertising PDU type and Extended advertising option. category / macro / description Legacy Advertising PDU: BLE_GAP_LEGACY_PROP_A: Connectable and scannabl

			type	DV_IND(0x0013)	e undirected Legacy Advertising Packet
				BLE_GAP_LEGACY_PROP_ADV_DIRECT_IND(0x0015)	Connectable directed (low duty cycle) Legacy Advertising Packet
				BLE_GAP_LEGACY_PROP_ADV_HDC_DIRECT_IND(0x001D)	Connectable directed (high duty cycle) Legacy Advertising Packet
				BLE_GAP_LEGACY_PROP_ADV_SCAN_IND(0x0012)	Scannable undirected Legacy Advertising Packet
				BLE_GAP_LEGACY_PROP_ADV_NONCONN_IND(0x0010)	Non-connectable and non-scannable undirected Legacy Advertising Packet
			Extended Advertising PDU type	BLE_GAP_EXT_PROP_ADV_CONN_NOSCAN_UNDIRECT(0x0001)	Connectable and non-scannable undirected Extended Advertising Packet
				BLE_GAP_EXT_PROP_ADV_CONN_N	Connectable and non-scannable

			OSCAN_DIRECT(0x0005)	directed (low duty cycle) Extended Advertising Packet
			BLE_GAP_EXT_PROP_ADV_CONN_NOSCAN_HDC_DIRECT(0x000D)	Connectable and non-scannable directed (high duty cycle) Extended Advertising Packet
			BLE_GAP_EXT_PROP_ADV_NOCONN_SCAN_UNDIRECT(0x0002)	Non-connectable and scannable undirected Extended Advertising Packet
			BLE_GAP_EXT_PROP_ADV_NOCONN_SCAN_DIRECT(0x0006)	Non-connectable and scannable directed (low duty cycle) Extended Advertising Packet
			BLE_GAP_EXT_PROP_ADV_NOCONN_SCAN_HDC_DIRECT(0x000E)	Non-connectable and scannable directed (high duty cycle) Extended Advertising

					Packet
				BLE_GAP_EXT_PROP_ADV_NOCONN_NOSCAN_UNDIRECT(0x0000)	Non-connectable and non-scannable undirected Extended Advertising Packet
				BLE_GAP_EXT_PROP_ADV_NOCONN_NOSCAN_DIRECT(0x0004)	Non-connectable and non-scannable directed (low duty cycle) Extended Advertising Packet
				BLE_GAP_EXT_PROP_ADV_NOCONN_NOSCAN_HDC_DIRECT(0x000C)	Non-connectable and non-scannable directed (high duty cycle) Extended Advertising Packet
			Extended Advertising Option	BLE_GAP_EXT_PROP_ADV_ANONYMOUS(0x0020)	Omit the advertiser address from Extended Advertising Packet.
				BLE_GAP_EXT_PROP_ADV_INCLUDE_TX_POWER(0x0	Indicate that the advertising data includes TX

<table>
<tr><td></td><td></td><td>040) Power.</td></tr>
