- Full-duplex transmission and reception (writeRead) may experience RX overflows at very high bitrates when using DTC or DMAC. In this case, use half-duplex (write and read) functions.

## Examples

### Basic Example

This is a basic example of minimal use of the SPI in an application.

```
static volatile bool g_transfer_complete = false;
```

```
void spi_basic_example (void)
{
    uint8_t tx_buffer[TRANSFER_SIZE];
    uint8_t rx_buffer[TRANSFER_SIZE];
 fsp_err_t err = FSP_SUCCESS;
 /* Initialize the SPI module. */
    err = R_SPI_B_Open(&g_spi_ctrl, &g_spi_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Start a write/read transfer */
    err = R_SPI_B_WriteRead(&g_spi_ctrl, tx_buffer, rx_buffer, TRANSFER_SIZE,
SPI_BIT_WIDTH_8_BITS);
    assert(FSP_SUCCESS == err);
 /* Wait for SPI_EVENT_TRANSFER_COMPLETE callback event. */
 while (false == g_transfer_complete)
    {
       ;
    }
}
static void r_spi_callback (spi_callback_args_t * p_args)
{
 if (SPI_EVENT_TRANSFER_COMPLETE == p_args->event)
    {
       g_transfer_complete = true;
    }
}
```

### Driving Software Slave Select Line

This is an example of communicating with multiple slave devices by asserting SSL in software.

```
void spi_software_ssl_example (void)
{
    uint8_t tx_buffer[TRANSFER_SIZE];
    uint8_t rx_buffer[TRANSFER_SIZE];
```

```
/* Configure Slave Select Line 1 */
R_BSP_PinWrite(SLAVE_SELECT_LINE_1, BSP_IO_LEVEL_HIGH);
/* Configure Slave Select Line 2 */
R_BSP_PinWrite(SLAVE_SELECT_LINE_2, BSP_IO_LEVEL_HIGH);
fsp_err_t err = FSP_SUCCESS;
/* Initialize the SPI module. */
   err = R_SPI_B_Open(&g_spi_ctrl, &g_spi_cfg);
/* Handle any errors. This function should be defined by the user. */
   assert(FSP_SUCCESS == err);
/* Assert Slave Select Line 1 */
R_BSP_PinWrite(SLAVE_SELECT_LINE_1, BSP_IO_LEVEL_LOW);
/* Start a write/read transfer */
   g_transfer_complete = false;
   err                 = R_SPI_B_WriteRead(&g_spi_ctrl, tx_buffer, rx_buffer,
TRANSFER_SIZE, SPI_BIT_WIDTH_8_BITS);
   assert(FSP_SUCCESS == err);
/* Wait for SPI_EVENT_TRANSFER_COMPLETE callback event. */
while (false == g_transfer_complete)
   {
      ;
   }
/* De-assert Slave Select Line 1 */
R_BSP_PinWrite(SLAVE_SELECT_LINE_1, BSP_IO_LEVEL_HIGH);
/* Wait for minimum time required between transfers. */
R_BSP_SoftwareDelay(SSL_NEXT_ACCESS_DELAY, BSP_DELAY_UNITS_MICROSECONDS);
/* Assert Slave Select Line 2 */
R_BSP_PinWrite(SLAVE_SELECT_LINE_2, BSP_IO_LEVEL_LOW);
/* Start a write/read transfer */
   g_transfer_complete = false;
   err                 = R_SPI_B_WriteRead(&g_spi_ctrl, tx_buffer, rx_buffer,
TRANSFER_SIZE, SPI_BIT_WIDTH_8_BITS);
   assert(FSP_SUCCESS == err);
/* Wait for SPI_EVENT_TRANSFER_COMPLETE callback event. */
while (false == g_transfer_complete)
```

```
    {
        ;
    }
 /* De-assert Slave Select Line 2 */
 R_BSP_PinWrite(SLAVE_SELECT_LINE_2, BSP_IO_LEVEL_HIGH);
}
```

### Configuring the SPI Clock Divider Registers

This example demonstrates how to set the SPI clock divisors at runtime.

```
void spi_bitrate_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
    g_spi_cfg.p_extend = &g_spi_extended_cfg;
 /* Configure SPI Clock divider to achieve largest bitrate less than or equal to the
desired bitrate. */
    err = R_SPI_B_CalculateBitrate(BITRATE, SPI_B_CLOCK_SOURCE_SCISPICLK,
&(g_spi_extended_cfg.spck_div));
    assert(FSP_SUCCESS == err);
 /* Initialize the SPI module. */
    err = R_SPI_B_Open(&g_spi_ctrl, &g_spi_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
}
```

### Data Structures

| | |
|---|---|
| struct | rspck_div_setting_t |
| struct | spi_b_extended_cfg_t |
| struct | spi_b_instance_ctrl_t |

### Enumerations

| | |

| enum | spi_b_delay_count_t |
| enum | spi_b_clock_source_t |

## Data Structure Documentation

### ◆ rspck_div_setting_t

| struct rspck_div_setting_t | | |
|---|---|---|
| SPI Clock Divider settings. | | |
| Data Fields | | |
| uint8_t | spbr | SPBR register setting. |
| uint8_t | brdv: 2 | BRDV setting in SPCMD0. |

### ◆ spi_b_extended_cfg_t

| struct spi_b_extended_cfg_t | | |
|---|---|---|
| Extended SPI interface configuration | | |
| Data Fields | | |
| spi_b_ssl_mode_t | spi_clksyn | Select SPI or Clock Synchronous mode operation. |
| spi_b_communication_t | spi_comm | Select full-duplex or transmit-only communication. |
| spi_b_ssl_polarity_t | ssl_polarity | Select SSLn signal polarity. |
| spi_b_ssl_select_t | ssl_select | Select which slave to use: 0-SSL0, 1-SSL1, 2-SSL2, 3-SSL3. |
| spi_b_mosi_idle_value_fixing_t | mosi_idle | Select MOSI idle fixed value and selection. |
| spi_b_parity_t | parity | Select parity and enable/disable parity. |
| spi_b_byte_swap_t | byte_swap | Select byte swap mode. |
| spi_b_clock_source_t | clock_source | Communication clock source (TCLK). |
| rspck_div_setting_t | spck_div | Register values for configuring the SPI Clock Divider. |

| | | |
|---|---|---|
| spi_b_delay_count_t | spck_delay | SPI Clock Delay Register Setting. |
| spi_b_delay_count_t | ssl_negation_delay | SPI Slave Select Negation Delay Register Setting. |
| spi_b_delay_count_t | next_access_delay | SPI Next-Access Delay Register Setting. |

### ◆ spi_b_instance_ctrl_t

| struct spi_b_instance_ctrl_t | |
|---|---|
| Channel control block. DO NOT INITIALIZE. Initialization occurs when spi_api_t::open is called. | |
| **Data Fields** | |
| uint32_t | open |
| | Indicates whether the open() API has been successfully called. |
| | |
| spi_cfg_t const * | p_cfg |
| | Pointer to instance configuration. |
| | |
| R_SPI_B0_Type * | p_regs |
| | Base register for this channel. |
| | |
| void const * | p_tx_data |
| | Buffer to transmit. |
| | |
| void * | p_rx_data |
| | Buffer to receive. |
| | |
| uint32_t | tx_count |
| | Number of Data Frames to transfer (8-bit, 16-bit, 32-bit) |
| | |
| uint32_t | rx_count |
| | Number of Data Frames to transfer (8-bit, 16-bit, 32-bit) |

| | |
|---|---|
| | |
| uint32_t | count |
| | Number of Data Frames to transfer (8-bit, 16-bit, 32-bit) |
| | |
| spi_bit_width_t | bit_width |
| | Bits per Data frame (8-bit, 16-bit, 32-bit) |
| | |

### Enumeration Type Documentation

#### ◆ spi_b_ssl_mode_t

| enum spi_b_ssl_mode_t | |
|---|---|
| 3-Wire or 4-Wire mode. | |
| Enumerator | |
| SPI_B_SSL_MODE_SPI | SPI operation (4-wire method) |
| SPI_B_SSL_MODE_CLK_SYN | Clock Synchronous operation (3-wire method) |

#### ◆ spi_b_communication_t

| enum spi_b_communication_t | |
|---|---|
| Transmit Only (Half Duplex), or Full Duplex. | |
| Enumerator | |
| SPI_B_COMMUNICATION_FULL_DUPLEX | Full-Duplex synchronous serial communication. |
| SPI_B_COMMUNICATION_TRANSMIT_ONLY | Transit only serial communication. |

### ◆ spi_b_ssl_polarity_t

| enum spi_b_ssl_polarity_t | |
|---|---|
| Slave Select Polarity. | |
| Enumerator | |
| SPI_B_SSLP_LOW | SSLP signal polarity active low. |
| SPI_B_SSLP_HIGH | SSLP signal polarity active high. |

### ◆ spi_b_ssl_select_t

| enum spi_b_ssl_select_t | |
|---|---|
| The Slave Select Line | |
| Enumerator | |
| SPI_B_SSL_SELECT_SSL0 | Select SSL0. |
| SPI_B_SSL_SELECT_SSL1 | Select SSL1. |
| SPI_B_SSL_SELECT_SSL2 | Select SSL2. |
| SPI_B_SSL_SELECT_SSL3 | Select SSL3. |

### ◆ spi_b_mosi_idle_value_fixing_t

| enum spi_b_mosi_idle_value_fixing_t | |
|---|---|
| MOSI Idle Behavior. | |
| Enumerator | |
| SPI_B_MOSI_IDLE_VALUE_FIXING_DISABLE | MOSI output value=value set in MOIFV bit. |
| SPI_B_MOSI_IDLE_VALUE_FIXING_LOW | MOSIn level low during MOSI idling. |
| SPI_B_MOSI_IDLE_VALUE_FIXING_HIGH | MOSIn level high during MOSI idling. |

### ◆ spi_b_parity_t

| enum spi_b_parity_t | |
|---|---|
| Parity Mode | |
| Enumerator | |
| SPI_B_PARITY_MODE_DISABLE | Disable parity. |
| SPI_B_PARITY_MODE_ODD | Select even parity. |
| SPI_B_PARITY_MODE_EVEN | Select odd parity. |

### ◆ spi_b_byte_swap_t

| enum spi_b_byte_swap_t | |
|---|---|
| Byte Swapping Enable/Disable. | |
| Enumerator | |
| SPI_B_BYTE_SWAP_DISABLE | Disable Byte swapping for 16/32-Bit transfers. |
| SPI_B_BYTE_SWAP_ENABLE | Enable Byte swapping for 16/32-Bit transfers. |

### ◆ spi_b_delay_count_t

| enum spi_b_delay_count_t | |
|---|---|
| Delay count for SPI delay settings. | |
| Enumerator | |
| SPI_B_DELAY_COUNT_1 | Set RSPCK delay count to 1 RSPCK. |
| SPI_B_DELAY_COUNT_2 | Set RSPCK delay count to 2 RSPCK. |
| SPI_B_DELAY_COUNT_3 | Set RSPCK delay count to 3 RSPCK. |
| SPI_B_DELAY_COUNT_4 | Set RSPCK delay count to 4 RSPCK. |
| SPI_B_DELAY_COUNT_5 | Set RSPCK delay count to 5 RSPCK. |
| SPI_B_DELAY_COUNT_6 | Set RSPCK delay count to 6 RSPCK. |
| SPI_B_DELAY_COUNT_7 | Set RSPCK delay count to 7 RSPCK. |
| SPI_B_DELAY_COUNT_8 | Set RSPCK delay count to 8 RSPCK. |

### ◆ spi_b_clock_source_t

| enum spi_b_clock_source_t |
|---|
| SPI communication clock source. |

## Function Documentation

### ◆ R_SPI_B_Open()

fsp_err_t R_SPI_B_Open ( spi_ctrl_t * *p_api_ctrl*, spi_cfg_t const *const *p_cfg* )

This functions initializes a channel for SPI communication mode. Implements spi_api_t::open.

This function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Configures the peripheral registers according to the configuration.
- Initialize the control structure for use in other SPI Interface functions.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Channel initialized successfully. |
| FSP_ERR_ALREADY_OPEN | Instance was already initialized. |
| FSP_ERR_ASSERTION | An invalid argument was given in the configuration structure. |
| FSP_ERR_UNSUPPORTED | A requested setting is not possible on this device with the current build configuration. |
| FSP_ERR_IP_CHANNEL_NOT_PRESENT | The channel number is invalid. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes. This function calls: transfer_api_t::open

***Note***

*This function is reentrant.*

### ◆ R_SPI_B_Read()

fsp_err_t R_SPI_B_Read ( spi_ctrl_t *const *p_api_ctrl*, void * *p_dest*, uint32_t const *length*, spi_bit_width_t const *bit_width* )

This function receives data from a SPI device. Implements spi_api_t::read.

The function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Sets up the instance to complete a SPI read operation.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Read operation successfully completed. |
| FSP_ERR_ASSERTION | NULL pointer to control or destination parameters or transfer length is zero. |
| FSP_ERR_NOT_OPEN | The channel has not been opened. Open channel first. |
| FSP_ERR_IN_USE | A transfer is already in progress. |

### ◆ R_SPI_B_Write()

fsp_err_t R_SPI_B_Write ( spi_ctrl_t *const *p_api_ctrl*, void const * *p_src*, uint32_t const *length*, spi_bit_width_t const *bit_width* )

This function transmits data to a SPI device using the TX Only Communications Operation Mode. Implements spi_api_t::write.

The function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Sets up the instance to complete a SPI write operation.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Write operation successfully completed. |
| FSP_ERR_ASSERTION | NULL pointer to control or source parameters or transfer length is zero. |
| FSP_ERR_NOT_OPEN | The channel has not been opened. Open the channel first. |
| FSP_ERR_IN_USE | A transfer is already in progress. |

### ◆ R_SPI_B_WriteRead()

fsp_err_t R_SPI_B_WriteRead ( spi_ctrl_t *const *p_api_ctrl*, void const * *p_src*, void * *p_dest*, uint32_t const *length*, spi_bit_width_t const *bit_width* )

This function simultaneously transmits and receive data. Implements spi_api_t::writeRead.

The function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Sets up the instance to complete a SPI writeRead operation.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Write operation successfully completed. |
| FSP_ERR_ASSERTION | NULL pointer to control, source or destination parameters or transfer length is zero. |
| FSP_ERR_NOT_OPEN | The channel has not been opened. Open the channel first. |
| FSP_ERR_IN_USE | A transfer is already in progress. |

### ◆ R_SPI_B_CallbackSet()

fsp_err_t R_SPI_B_CallbackSet ( spi_ctrl_t *const *p_api_ctrl*, void(*)(spi_callback_args_t *) *p_callback*, void *const *p_context*, spi_callback_args_t *const *p_callback_memory* )

Updates the user callback and has option of providing memory for callback structure. Implements spi_api_t::callbackSet

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Callback updated successfully. |
| FSP_ERR_ASSERTION | A required pointer is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_NO_CALLBACK_MEMORY | p_callback is non-secure and p_callback_memory is either secure or NULL. |

### ◆ R_SPI_B_Close()

fsp_err_t R_SPI_B_Close ( spi_ctrl_t *const *p_api_ctrl*)

This function manages the closing of a channel by the following task. Implements spi_api_t::close.

Disables SPI operations by disabling the SPI bus.

- Disables the SPI peripheral.
- Disables all the associated interrupts.
- Update control structure so it will not work with SPI Interface functions.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Channel successfully closed. |
| FSP_ERR_ASSERTION | A required pointer argument is NULL. |
| FSP_ERR_NOT_OPEN | The channel has not been opened. Open the channel first. |

### ◆ R_SPI_B_CalculateBitrate()

fsp_err_t R_SPI_B_CalculateBitrate ( uint32_t *bitrate*, spi_b_clock_source_t *clock_source*, rspck_div_setting_t * *spck_div* )

Calculates the SPBR register value and the BRDV bits for a desired bitrate. If the desired bitrate is faster than the maximum bitrate, than the bitrate is set to the maximum bitrate. If the desired bitrate is slower than the minimum bitrate, than an error is returned.

**Parameters**

| | | |
|---|---|---|
| [in] | bitrate | Desired bitrate |
| [in] | clock_source | SPI communication clock source to be used |
| [out] | spck_div | Memory location to store bitrate register settings. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Valid spbr and brdv values were calculated |
| FSP_ERR_UNSUPPORTED | Bitrate is not achievable |

### Detailed Description

Middleware to implement a generic communications interface over SPI. This module implements the Communications Middleware Interface.

# Overview

The RM_COMMS_SPI module implements COMMS API for SPI interface.

### Features

The implementation of the SPI communications interface has the following key features:

- Read data from SPI bus
- Write data to SPI bus
- Simultaneously read from and write to SPI bus
- Support slave select and multiple slaves

# Configuration

### Build Time Configurations for rm_comms_spi

The following build time configurations are defined in fsp_cfg/rm_comms_spi_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP) | Default (BSP) | If selected code for |

| | | | |
|---|---|---|---|
| | • Enabled<br>• Disabled | | parameter checking is included in the build. |
| Auto Slave Select | • Enabled<br>• Disabled | Disabled | if selected slave select pin will be configured by module instance. |

**Configurations for Connectivity > SPI Shared Bus (rm_comms_spi)**

This module can be added to the Stacks tab via New Stack > Connectivity > SPI Shared Bus (rm_comms_spi).

| Configuration | Options | Default | Description |
|---|---|---|---|
| Name | Name must be a valid C symbol | g_comms_spi_bus0 | Module name. |
| Bus Timeout | Value must be a non-negative integer less than or equal to 0xFFFFFFFF | 0xFFFFFFFF | Set timeout for locking bus in using RTOS. |
| Semaphore for Blocking (RTOS only) | • Unuse<br>• Use | Use | Set Semaphore for blocking in using RTOS. |
| Recursive Mutex for Bus (RTOS only) | • Unuse<br>• Use | Use | Set Mutex for locking bus in using RTOS. |

**Configurations for Connectivity > SPI Communication Device (rm_comms_spi)**

This module can be added to the Stacks tab via New Stack > Connectivity > SPI Communication Device (rm_comms_spi).

| Configuration | Options | Default | Description |
|---|---|---|---|
| Name | Name must be a valid C symbol | g_comms_spi_device0 | Module name. |
| SSL Port Number | Refer to the RA Configuration tool for available options. | Disabled | GPIO output port number to select slave device. |
| SSL Pin Number | Refer to the RA Configuration tool for available options. | Disabled | GPIO output pin number to select slave device. |
| SSL Next Access Delay (Microseconds) | Value must be a non-negative integer | 1 | SSL next access delay. |
| Slave Select Polarity | • Active Low<br>• Active High | Active Low | Select the slave select active level. |
| Semaphore Timeout (RTOS only) | Value must be a non-negative integer less than or equal to 0xFFFFFFFF | 0xFFFFFFFF | Set timeout for blocking in using RTOS. |
| Callback | Name must be a valid C symbol | NULL | A user callback function can be |

provided.

### Pin Configuration

A GPIO can be configured for slave select.

## Usage Notes

If an RTOS is used, blocking and bus lock is available via SPI shared bus. Bus lock is only available when blocking is used.

### Limitations

- Only 8-bit data width is supported
- RM_COMMS_API are not reentrant in non blocking mode
- When in blocking mode, RM_COMMS_SPI_Write(), RM_COMMS_SPI_Read() and RM_COMMS_SPI_WriteRead() cannot be called in callback.
- COMMS SPI devices on the same SPI bus must sit on the same SPI shared bus.

## Examples

### Basic Example

This is a basic example of minimal use of SPI communications implementation in an application.

```
void rm_comms_spi_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
    err = RM_COMMS_SPI_Open(&g_comms_spi_ctrl, &g_comms_spi_cfg);
 if (FSP_SUCCESS != err)
    {
 /* Handle any errors. */
    }
 while (true)
    {
 /* Send data. */
       g_error    = 0;
       g_completed = 0;
       err = RM_COMMS_SPI_Write(&g_comms_spi_ctrl, g_tx_buf, TX_BUF_LEN);
 if (FSP_SUCCESS != err)
     {
 /* Handle any errors. */
     }
```

```
 while ((0 == g_completed) && (0 == g_error))
      {
 /* Wait callback */
      }
 /* Receive data. */
       g_error    = 0;
       g_completed = 0;
 /* Wait for minimum time required between transfers. */
 R_BSP_SoftwareDelay(SSL_NEXT_ACCESS_DELAY, BSP_DELAY_UNITS_MICROSECONDS);
       err = RM_COMMS_SPI_Read(&g_comms_spi_ctrl, g_rx_buf, RX_BUF_LEN);
 if (FSP_SUCCESS != err)
      {
 /* Handle any errors.*/
      }
 while ((0 == g_completed) && (0 == g_error))
      {
 /* Wait callback */
      }
    }
}
static void rm_comms_user_callback (rm_comms_callback_args_t * p_args)
{
 if (p_args->event == RM_COMMS_EVENT_OPERATION_COMPLETE)
    {
       g_completed = 1;
    }
 else
    {
       g_error = 1;
    }
}
```

### Data Structures

| | |
|---|---|
| struct | rm_comms_spi_instance_ctrl_t |

## Data Structure Documentation

### ◆ rm_comms_spi_instance_ctrl_t

| struct rm_comms_spi_instance_ctrl_t | |
|---|---|
| Communications middleware control structure. | |
| **Data Fields** | |
| uint32_t | open |
| | Open flag. |
| | |
| rm_comms_cfg_t const * | p_cfg |
| | Middleware configuration. |
| | |
| rm_comms_spi_bus_extended_cfg_t * | p_bus |
| | Pointer to extended configuration structure. |
| | |
| rm_comms_spi_device_extended_cfg_t * | p_device |
| | Pointer to device specific settings (lower level configuration structure) |
| | |
| void(* | p_callback )(rm_comms_callback_args_t *p_args) |
| | Pointer to callback that is called when a spi_event_t occurs. |
| | |
| void * | p_context |
| | Pointer to context passed into callback function. |
| | |

## Function Documentation

### ◆ RM_COMMS_SPI_Open()

fsp_err_t RM_COMMS_SPI_Open ( rm_comms_ctrl_t *const *p_api_ctrl*, rm_comms_cfg_t const *const *p_cfg* )

Opens and configures the SPI Comms module. Implements rm_comms_api_t::open.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | SPI Comms module successfully configured. |
| FSP_ERR_ASSERTION | Null pointer, or one or more configuration options is invalid. |
| FSP_ERR_ALREADY_OPEN | Module is already open. This module can only be opened once. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes.

### ◆ RM_COMMS_SPI_Close()

fsp_err_t RM_COMMS_SPI_Close ( rm_comms_ctrl_t *const *p_api_ctrl*)

Disables specified SPI Comms module. Implements rm_comms_api_t::close.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully closed. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not open. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes.

### ◆ RM_COMMS_SPI_CallbackSet()

fsp_err_t RM_COMMS_SPI_CallbackSet ( rm_comms_ctrl_t *const *p_api_ctrl*, void(*)(rm_comms_callback_args_t *) *p_callback*, void *const *p_context* )

Updates the SPI Comms callback. Implements rm_comms_api_t::callbackSet.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully set. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_COMMS_SPI_Read()

fsp_err_t RM_COMMS_SPI_Read ( rm_comms_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_dest*, uint32_t const *bytes* )

Performs a read from the SPI bus. Implements rm_comms_api_t::read.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully data decoded. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not open. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes.

### ◆ RM_COMMS_SPI_Write()

fsp_err_t RM_COMMS_SPI_Write ( rm_comms_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_src*, uint32_t const *bytes* )

Performs a write to the SPI bus. Implements rm_comms_api_t::write.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully writing data . |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not open. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes.

### ◆ RM_COMMS_SPI_WriteRead()

fsp_err_t RM_COMMS_SPI_WriteRead ( rm_comms_ctrl_t *const *p_api_ctrl*, rm_comms_write_read_params_t const *write_read_params* )

Performs simultaneous read and write. Implements rm_comms_api_t::writeRead..

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Transfer was started successfully. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Read bytes and write bytes are not the same. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes.

### Detailed Description

UART driver for the SAU peripheral on RA MCUs. This module implements the UART Interface.

# Overview

### Features

The SAU UART module supports the following features:

- Full-duplex UART communication
- Interrupt-driven data transmission and reception
- Invoking the user-callback function with an event code (RX/TX complete, TX data empty, RX char, error, etc)
- Baud-rate change at run-time
- Integration with the DTC transfer module
- Abort in-progress read/write operations

# Configuration

### Build Time Configurations for r_sau_uart

The following build time configurations are defined in fsp_cfg/r_sau_uart_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| Critical Section Guarding | • Enabled<br>• Disabled | Disabled | Enable critical section guarding around peripheral configuration updates. This should be enabled if the R_SAU_I2C module is being used simultaneously with |

| | | | |
|---|---|---|---|
| | | | this module. |
| DTC Support | • Enable<br>• Disable | Disable | Enable DTC support for the SAU_UART module. |
| Enable Single Channel | MCU Specific Options | | Enable single channel to reduce code size if only channel 0, 1, or 2 is needed. |
| Enable Fixed Baudrate | • Enable<br>• Disable | Enable | Disable baudrate calculation and setter functions to reduce code size. |

**Configurations for Connectivity > UART (r_sau_uart)**

This module can be added to the Stacks tab via New Stack > Connectivity > UART (r_sau_uart).

| Configuration | Options | Default | Description |
|---|---|---|---|
| General | | | |
| Name | Name must be a valid C symbol | g_uart0 | Module name. |
| Channel | Value must be a non-negative integer | 0 | Select the UART channel. |
| Data Bits | • 7 bits<br>• 8 bits<br>• 9 bits | 8 bits | Select the number of bits per word. |
| Parity | • None<br>• Zero<br>• Odd<br>• Even | None | Select the parity mode. |
| Stop Bits | • 1 bit<br>• 2 bits | 1 bit | Select the number of stop bits. In receive, 2 bit is not available. |
| Bit Order | • LSB First<br>• MSB First | LSB First | Select of data transfer sequence. |
| Baud | | | |
| Baud Rate | Value must be an integer greater than 0 | 115200 | Enter the desired baud rate.<br><br>If the requested baud rate cannot be achieved, adjust the operation clock frequency until the baud rate is achievable. The calculated baud rate is printed in a comment |

| | | | |
|---|---|---|---|
| | | | in the generated sau_uart_baudrate_setting_t structure. |
| Extra | | | |
| Operation Clock | • CKm0<br>• CKm1 | CKm0 | Select the operation clock. Use the Clocks tab to set the operation clock divider. |
| Tx Signal Level | • Standard<br>• Inverted | Standard | Select the level of transmitted signal. |
| Interrupts | | | |
| Callback | Name must be a valid C symbol | NULL | A user callback function can be provided. If this callback function is provided, it will be called from the interrupt service routine (ISR). |
| Transmit End Interrupt Priority | MCU Specific Options | | Select the transmit end interrupt priority. |
| Receive End Interrupt Priority | MCU Specific Options | | Select the receive end interrupt priority. |
| Error Interrupt Priority | MCU Specific Options | | Select the error interrupt priority. |

### Clock Configuration

The SAU clock uses the system clock (ICLK) as its clock source.

A prescaler is applied to the ICLK in order to produce the operation clock frequency. The operation clock is used to generate the desired transfer period of the SAU module.

SAU operation clocks are shared among all channels within a SAU unit. Check the Hardware User's Manual for your MCU for available units and channels. SAU operation clock dividers are configurable in the Clocks tab.

The operation clock dividers are named SAU CKmn where m is the SAU unit, and n is the operation clock. For example, SAU CK01 applies to all SAU0 instances using CK1 as the operation clock (m=0, n=1).

### Pin Configuration

This module uses TXD and RXD to communicate to external devices.

# Usage Notes

### 9-bit data transfers

- p_src: the address for the send data buffer. p_src in R_SAU_UART_Write must be aligned on a 16-bit boundary. (the data order in buffer: the lower 8-bits of the first number, the highest 1-bit of the first number, the lower 8-bits of the second number, the highest 1-bit of the second number, etc)
- byte: the size of send data buffer.

**Selecting Operation Clock Frequency**

The relationship between operation clock frequency and bitrate is: bitrate = f_mck / [ 2 * (SDRmn.STCLK + 1) ] where:

- SDRmn.STCLK is an integer in the range [2, 127] for SAU UART
- f_mck is the operation clock (SAU CKmn) frequency

By plugging in the minimum and maximum SDRmn.STCLK values, the range of bitrates for a given operation clock frequency can be obtained.

Note that due to STCLK being set as discrete integers, the actual bitrate may not be exact. The actual bitrate and percent errors can be calculated by the formulas:

```
actual_bitrate = f_mck / [ 2 * (SDRmn.STCLK + 1) ]
percent_error = 100 * abs [(actual_bitrate - expected_bitrate) / expected_bitrate]
```

Using the fastest possible operation clock for the desired bitrate will result in the lowest deviation from the requested baud rate. Set the CKmn operation clock divider in the Clocks tab to select the desired operation clock frequency.

**Example of Selecting Operation Clock Frequency**

Suppose an example application with a 32MHz ICLK requires:

- 1 SAU0 UART0 instance running at 1000 bps
- 1 SAU0 UART1 instance running at 115200 bps

The following operation clocks could be used:

```
# Operation clock frequency of 250 kHz with 32 Mhz ICLK (32MHz/128=250 kHz)
bitrate_min = 250e3 / [ 2 * (127 + 1) ] = ~976 bps
bitrate_max = 250e3 / [ 2 * (2 + 1) ] = ~41,666 bps
# Operation clock frequency of 16 MHz with 32 MHz ICLK (32MHz/2=16 MHz)
bitrate_min = 16e6 / [ 2 * (127 + 1) ] = ~62,500 bps
bitrate_max = 16e6 / [ 2 * (2 + 1) ] = ~2,666,666 bps
```

An operation clock of 250 kHz works for UART0 because 1000 is in the range [976, 41.6k]. An operation clock of 16 MHz works for UART1 because 115200 is in the range [62.5k, 2.6M].

Applying the settings:

- Select CK0 for UART0 and CK1 for UART1 using the SAU UART "Extra > Operation Clock" property
- Set CK00 Div to /128 for SAU0, CK0 (UART0) in the Clocks tab
- Set CK01 Div to /2 for for SAU0, CK1 (UART1) in the Clocks tab

### Runtime Baud Rate Change

In order to change the baud rate at runtime, "Common > Enable Fixed Baudrate" must be set to "Disabled" in the module properties.

If changing the baud rate is required at runtime, use a unique operation clock for each SAU instance. This is required because R_SAU_UART_BaudSet may change the operation clock divider. Since the operation clocks are shared between SAU channels on each SAU unit, changing a shared operation clock of one instance will cause an incorrect bitrate to be generated on the other instance(s).

If the system clock frequency is changed at runtime, this setting should be disabled, as the baud rate settings will need to be updated after the system clock change.

### Limitations

- Reception is still enabled after uart_api_t::communicationAbort API is called. Any characters received after abort and before the next call to read will arrive via the callback function with event UART_EVENT_RX_CHAR.
- If 9-bit data length is specified at R_SAU_UART_Open call, p_src in R_SAU_UART_Write must be aligned on a 16-bit boundary.
- When multiple channels on the same SAU unit need to be used, and one is configured as UART, then critical section property needs to be enabled.

### DTC Limitations

- DTC support is available for reception, but labeled as [Not recommended]. This is because the UART bytes are received asynchronously. Bytes can be received between calls to R_SAU_UART_Read(). The logic required to combine bytes received through R_SAU_UART_Read() (UART_EVENT_RX_COMPLETE) and bytes received between calls (UART_EVENT_RX_CHAR) is complex. Reception length may also be unknown, and the driver will not issue an interrupt unless the entire DTC buffer is filled.
- Transfer size must be less than or equal to 64K bytes if DTC interface is used for transfer. uart_api_t::infoGet API can be used to get the max transfer size allowed.
- When using 9-bit reception with DTC, clear the upper 7 bits of data before processing the read data. The upper 7 bits contain status flags that are part of the register used to read data in 9-bit mode.

# Examples

### SAU UART Example

```
uint8_t g_dest[TRANSFER_LENGTH];

uint8_t g_src[TRANSFER_LENGTH];

uint8_t g_out_of_band_received[TRANSFER_LENGTH];

uint32_t g_transfer_complete = 0;
```

```
uint32_t g_receive_complete = 0;
uint32_t g_out_of_band_index = 0;
void r_sau_uart_basic_example (void)
{
 /* Initialize p_src to known data */
 for (uint32_t i = 0; i < TRANSFER_LENGTH; i++)
    {
       g_src[i] = (uint8_t) ('A' + (i % 26));
    }
 /* Open the transfer instance with initial configuration. */
 fsp_err_t err = R_SAU_UART_Open(&g_uart0_ctrl, &g_uart0_cfg);
    assert(FSP_SUCCESS == err);
    err = R_SAU_UART_Read(&g_uart0_ctrl, g_dest, TRANSFER_LENGTH);
    assert(FSP_SUCCESS == err);
    err = R_SAU_UART_Write(&g_uart0_ctrl, g_src, TRANSFER_LENGTH);
    assert(FSP_SUCCESS == err);
 while (!g_transfer_complete)
    {
    }
 while (!g_receive_complete)
    {
    }
}
void example_callback (uart_callback_args_t * p_args)
{
 /* Handle the UART event */
 switch (p_args->event)
    {
 /* Received a character */
 case UART_EVENT_RX_CHAR:
      {
 /* Only put the next character in the receive buffer if there is space for it */
 if (sizeof(g_out_of_band_received) > g_out_of_band_index)
      {
```

```
 /* Write either the next one or two bytes depending on the receive data size */
 if (UART_DATA_BITS_8 >= g_uart0_cfg.data_bits)
      {
                  g_out_of_band_received[g_out_of_band_index++] = (uint8_t)
p_args->data;
      }
 else
      {
                  uint16_t * p_dest = (uint16_t *)
&g_out_of_band_received[g_out_of_band_index];
                  *p_dest             = (uint16_t) p_args->data;
                  g_out_of_band_index += 2;
      }
      }
 break;
      }
 /* Receive complete */
 case UART_EVENT_RX_COMPLETE:
      {
            g_receive_complete = 1;
 break;
      }
 /* Transmit complete */
 case UART_EVENT_TX_COMPLETE:
      {
            g_transfer_complete = 1;
 break;
      }
 default:
      {
      }
    }
}
```

### SAU UART Baud Set Example

```
#define SAU_UART_BAUDRATE_19200 (19200)
#define SAU_UART_BAUDRATE_ERROR_PERCENT_5 (5000)
void r_sau_uart_baud_example (void)
{
    sau_uart_baudrate_setting_t baud_setting;
    uint32_t baud_rate = SAU_UART_BAUDRATE_19200;
 fsp_err_t err = R_SAU_UART_BaudCalculate(&g_uart0_ctrl, baud_rate, &baud_setting);
    assert(FSP_SUCCESS == err);
    err = R_SAU_UART_BaudSet(&g_uart0_ctrl, (void *) &baud_setting);
    assert(FSP_SUCCESS == err);
}
```

### ◆ sau_operation_clock_t

| enum sau_operation_clock_t | |
|---|---|
| UART operation clock selection definition | |
| Enumerator | |
| SAU_UART_OPERATION_CLOCK_CK0 | Operating clock use CK0. |
| SAU_UART_OPERATION_CLOCK_CK1 | Operating clock use CK1. |

### ◆ sau_uart_signal_level_t

| enum sau_uart_signal_level_t | |
|---|---|
| UART data signal level definition | |
| Enumerator | |
| SAU_UART_SIGNAL_LEVEL_STANDARD | Uart data signal level standard. |
| SAU_UART_SIGNAL_LEVEL_INVERTED | Uart data signal level inverted. |

## Function Documentation

### ◆ R_SAU_UART_Open()

fsp_err_t R_SAU_UART_Open ( uart_ctrl_t *const *p_api_ctrl*, uart_cfg_t const *const *p_cfg* )

Configures the UART driver based on the input configurations. If reception is enabled at compile time, reception is enabled at the end of this function. Implements uart_api_t::open

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Channel opened successfully. |
| FSP_ERR_ASSERTION | Pointer to UART control block or configuration structure is NULL. |
| FSP_ERR_IP_CHANNEL_NOT_PRESENT | The requested channel does not exist on this MCU. |
| FSP_ERR_INVALID_ARGUMENT | Flow control is enabled but flow control pin is not defined or selected channel does not support "Hardware CTS and Hardware RTS" flow control. |
| FSP_ERR_ALREADY_OPEN | Control block has already been opened or channel is being used by another instance. Call close() then open() to reconfigure. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- transfer_api_t::open

### ◆ R_SAU_UART_Close()

fsp_err_t R_SAU_UART_Close ( uart_ctrl_t *const *p_api_ctrl*)

Aborts any in progress transfers. Disables interrupts, receiver, and transmitter. Closes lower level transfer drivers if used. Removes power. Implements uart_api_t::close

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Channel successfully closed. |
| FSP_ERR_ASSERTION | Pointer to UART control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened |

### ◆ R_SAU_UART_Read()

fsp_err_t R_SAU_UART_Read ( uart_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_dest*, uint32_t const *bytes* )

Receives user specified number of bytes into destination buffer pointer. Implements uart_api_t::read

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Data reception successfully ends. |
| FSP_ERR_ASSERTION | Pointer to UART control block is NULL. Number of transfers outside the max or min boundary when transfer instance used |
| FSP_ERR_INVALID_ARGUMENT | Destination address or data size is not valid for 9-bit mode. |
| FSP_ERR_NOT_OPEN | The control block has not been opened |
| FSP_ERR_IN_USE | A previous read operation is still in progress. |
| FSP_ERR_UNSUPPORTED | current operation mode is transmission only. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- transfer_api_t::reset

***Note***

*If 9-bit data length is specified at R_SAU_UART_Open call, p_dest must be aligned 16-bit boundary.*

### ◆ R_SAU_UART_Write()

fsp_err_t R_SAU_UART_Write ( uart_ctrl_t *const *p_api_ctrl*, uint8_t const *const *p_src*, uint32_t const *bytes* )

Transmits user specified number of bytes from the source buffer pointer. Implements uart_api_t::write

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Data transmission finished successfully. |
| FSP_ERR_ASSERTION | Pointer to UART control block is NULL. Number of transfers outside the max or min boundary when transfer instance used |
| FSP_ERR_INVALID_ARGUMENT | Source address or data size is not valid for 9-bit mode. |
| FSP_ERR_NOT_OPEN | The control block has not been opened |
| FSP_ERR_IN_USE | A UART transmission is in progress |
| FSP_ERR_UNSUPPORTED | SAU_UART_CFG_TX_ENABLE is set to 0 |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- transfer_api_t::reset

***Note***

*If 9-bit data length is specified at R_SAU_UART_Open call, p_src must be aligned on a 16-bit boundary.*

### ◆ R_SAU_UART_BaudSet()

fsp_err_t R_SAU_UART_BaudSet ( uart_ctrl_t *const *p_api_ctrl*, void const *const *p_baud_setting* )

Updates the baud rate using the clock selected in Open. p_baud_setting is a pointer to a sau_uart_baudrate_setting_t structure. Implements uart_api_t::baudSet

**Warning**

This terminates any in-progress transmission.
This function may change the operation clock frequency. Select a unique operation clock for each SAU instance if using this function.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Baud rate was successfully changed. |
| FSP_ERR_ASSERTION | Pointer p_ctrl is NULL |
| FSP_ERR_INVALID_ARGUMENT | p_api_ctrl is empty. |
| FSP_ERR_NOT_OPEN | The control block has not been opened |
| FSP_ERR_UNSUPPORTED | Fixed baud rate is enabled |

### ◆ R_SAU_UART_CallbackSet()

fsp_err_t R_SAU_UART_CallbackSet ( uart_ctrl_t *const *p_api_ctrl*, void(*)(uart_callback_args_t *) *p_callback*, void *const *p_context*, uart_callback_args_t *const *p_callback_memory* )

Updates the user callback for callback structure. Implements uart_api_t::callbackSet

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Callback updated successfully. |
| FSP_ERR_ASSERTION | Pointer p_ctrl is NULL or p_callback_memory is not NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |

### ◆ R_SAU_UART_InfoGet()

fsp_err_t R_SAU_UART_InfoGet ( uart_ctrl_t *const *p_api_ctrl*, uart_info_t *const *p_info* )

Provides the driver information, including the maximum number of bytes that can be received or transmitted at a time. Implements uart_api_t::infoGet

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Information stored in provided p_info. |
| FSP_ERR_INVALID_ARGUMENT | Pointer to UART control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened |

### ◆ R_SAU_UART_Abort()

fsp_err_t R_SAU_UART_Abort ( uart_ctrl_t *const *p_api_ctrl*, uart_dir_t *communication_to_abort* )

Provides API to abort ongoing transfer. Transmission is aborted after the current character is transmitted. Reception is still enabled after abort(). Any characters received after abort() and before the transfer is reset in the next call to read(), will arrive via the callback function with event UART_EVENT_RX_CHAR. Implements uart_api_t::communicationAbort

**Return values**

| | |
|---|---|
| FSP_SUCCESS | UART transaction aborted successfully. |
| FSP_ERR_ASSERTION | Pointer to UART control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_UNSUPPORTED | The requested Abort direction is unsupported. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- transfer_api_t::disable

### ◆ R_SAU_UART_ReadStop()

fsp_err_t R_SAU_UART_ReadStop ( uart_ctrl_t *const *p_api_ctrl*, uint32_t * *remaining_bytes* )

Provides API to abort ongoing read. Reception is still enabled after abort(). Any characters received after abort() and before the transfer is reset in the next call to read(), will arrive via the callback function with event UART_EVENT_RX_CHAR. Implements uart_api_t::readStop

**Return values**

| | |
|---|---|
| FSP_SUCCESS | UART transaction aborted successfully. |
| FSP_ERR_ASSERTION | Pointer to UART control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_UNSUPPORTED | The requested Abort direction is unsupported. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- transfer_api_t::disable

### ◆ R_SAU_UART_BaudCalculate()

fsp_err_t R_SAU_UART_BaudCalculate ( sau_uart_instance_ctrl_t *const *p_ctrl*, uint32_t *baudrate*, sau_uart_baudrate_setting_t *const *p_baud_setting* )

Calculates baud rate register settings (SDR.STCLK) for the specified SAU unit.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | Pointer to the SAU UART control block. |
| [in] | baudrate | Baud rate [bps]. For example, 19200, 57600, 115200, etc. |
| [out] | p_baud_setting | Baud setting information stored here if successful |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Baud rate is successfully calculated |
| FSP_ERR_UNSUPPORTED | Fixed baudrate is being used |
| FSP_ERR_ASSERTION | Null pointer |
| FSP_ERR_INVALID_ARGUMENT | Baud rate is not achievable with selected operation clock frequency |

### ◆ R_SAU_UART_ReceiveSuspend()

fsp_err_t R_SAU_UART_ReceiveSuspend ( uart_ctrl_t *const *p_api_ctrl*)

Suspend Reception

**Return values**

| | |
|---|---|
| FSP_ERR_UNSUPPORTED | Functionality not supported by this driver instance |

### ◆ R_SAU_UART_ReceiveResume()

fsp_err_t R_SAU_UART_ReceiveResume ( uart_ctrl_t *const *p_api_ctrl*)

Resume Reception

**Return values**

| | |

#### Detailed Description

Driver for the SCI peripheral on RA MCUs. This module implements the UART Interface.

# Overview

#### Features

The SCI UART module supports the following features:

- Full-duplex UART communication
- Interrupt-driven data transmission and reception
- Invoking the user-callback function with an event code (RX/TX complete, TX data empty, RX char, error, etc)
- Baud-rate change at run-time
- Bit rate modulation and noise cancellation
- CTS/RTS hardware flow control (with an associated pin)
- RS-485 Half Duplex driver support with external RS-485 transceiver
- Integration with the DTC transfer module
- Abort in-progress read/write operations
- FIFO support on supported channels

# Configuration

### Build Time Configurations for r_sci_b_uart

The following build time configurations are defined in fsp_cfg/r_sci_b_uart_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| FIFO Support | • Enable<br>• Disable | Disable | Enable FIFO support for the SCI_UART module. |
| DTC Support | • Enable<br>• Disable | Disable | Enable DTC support for the SCI_UART module. |
| Flow Control Support | • Enable<br>• Disable | Disable | Enable RS232 and RS-485 flow control support using a user provided pin. |

### Configurations for Connectivity > UART (r_sci_b_uart)

This module can be added to the Stacks tab via New Stack > Connectivity > UART (r_sci_b_uart). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

| Configuration | Options | Default | Description |
|---|---|---|---|
| General | | | |
| Name | Name must be a valid C symbol | g_uart0 | Module name. |
| Channel | Value must be a non-negative integer | 0 | Select the SCI channel. |
| Data Bits | • 8bits<br>• 7bits<br>• 9bits | 8bits | Select the number of bits per word. |

| | | | |
|---|---|---|---|
| Parity | • None<br>• Odd<br>• Even | None | Select the parity mode. |
| Stop Bits | • 1bit<br>• 2bits | 1bit | Select the number of stop bits. |
| Baud | | | |
| Baud Rate | Value must be an integer greater than 0 | 115200 | Enter the desired baud rate.<br><br>If the requested baud rate cannot be achieved, the settings with the smallest percent error are used. The theoretical calculated baud rate and percent error are printed in a comment in the generated sci_b_baud_setting_t structure. |
| Baud Rate Modulation | • Disabled<br>• Enabled | Disabled | Enabling baud rate modulation reduces the percent error of the actual baud rate with respect to the requested baud rate. It does this by modulating the number of cycles per clock, so some bits are slightly longer than others. |
| Max Error (%) | Must be a valid non-negative integer with a maximum configurable value of 100 | 5 | Maximum percent error allowed during baud calculation. This is used by the algorithm to determine whether or not to consider using less accurate alternative register settings.<br><br>NOTE: The baud calculation does not show an error in the tool if this percent error was not achieved. The calculated percent error is recorded in a comment in the generated sci_b_baud_setting_t |

| | | | |
|---|---|---|---|
| | | | structure. |
| Flow Control | | | |
| CTS/RTS Selection | MCU Specific Options | | Select either CTS or RTS function on the CTSn_RTSn pin of SCI channel n or select CTS function on CTSn pin and RTS function on CTSn_RTSn pin of SCI channel n (Available on selected MCUs and channels). |
| Software RTS Port | Refer to the RA Configuration tool for available options. | Disabled | Specify the flow control pin port for the MCU. |
| Software RTS Pin | Refer to the RA Configuration tool for available options. | Disabled | Specify the flow control pin for the MCU. |
| Extra | | | |
| Extra > RS-485 | | | |
| DE Pin | • Disable<br>• Enable | Disable | Enable or disable the DE pin for use in RS-485 half-duplex mode. |
| DE Pin Polarity | • Active Low<br>• Active High | Active High | Select the polarity of the DE pin. |
| DE Pin Assertion Time | Must be a valid integer greater than 0 and less than or equal to 31. | 1 | Configure the time between assertion of the DE pin and the start of a write transfer. The time is specified in multiples of the SCI base clock period. |
| DE Pin Negation Time | Must be a valid integer greater than 0 and less than or equal to 31. | 1 | Configure the time between the end of a write transfer and the negation of the DE pin. The time is specified in multiples of the SCI base clock period. |
| Clock Source | • Internal Clock<br>• Internal Clock With Output on SCK<br>• External Clock 8x baud rate<br>• External Clock | Internal Clock | Selection of the clock source to be used in the baud-rate clock generator. When internal clock is used the baud rate can be output on the SCK pin. |

| | | | |
|---|---|---|---|
| | 16x baud rate | | |
| Start bit detection | • Falling Edge<br>• Low Level | Falling Edge | Start bit detected as falling edge or low level. |
| Noise Filter | • Enable<br>• Disable | Disable | Enable the digital noise filter on RXDn pin. The digital noise filter block in SCI consists of two-stage flipflop circuits. |
| Receive FIFO Trigger Level | Refer to the RA Configuration tool for available options. | Max | Unused if the channel has no FIFO or if DTC is used for reception. Set to One to get a callback immediately when each byte is received. Set to Max to get a callback when FIFO is full or after 15 bit times with no data (fewer interrupts). |
| Interrupts | | | |
| Callback | Name must be a valid C symbol | NULL | A user callback function can be provided. If this callback function is provided, it will be called from the interrupt service routine (ISR). |
| Receive Interrupt Priority | MCU Specific Options | | Select the receive interrupt priority. |
| Transmit Data Empty Interrupt Priority | MCU Specific Options | | Select the transmit interrupt priority. |
| Transmit End Interrupt Priority | MCU Specific Options | | Select the transmit end interrupt priority. |
| Error Interrupt Priority | MCU Specific Options | | Select the error interrupt priority. |

### Clock Configuration

The clock for this module is derived from the following peripheral clock for each MCU group:

| MCU Group | Peripheral Clock |
|---|---|
| RA6T2 | SCISPICLK |
| RA8D1 | SCICLK |
| RA8D2 | SCICLK |

| | |
|---|---|
| RA8E1 | SCICLK |
| RA8E2 | SCICLK |
| RA8M1 | SCICLK |
| RA8M2 | SCICLK |
| RA8P1 | SCICLK |
| RA8T1 | SCICLK |
| RA8T2 | SCICLK |

The clock source for the baud-rate clock generator can be selected from the internal clock, the external clock times 8 or the external clock times 16. The external clock is supplied to the SCK pin.

### Pin Configuration

This module uses TXD and RXD to communicate to external devices. CTS or RTS can be controlled by the hardware. CTS or RTS or both (CTS and RTS) can be controlled by the hardware When the internal clock is the source for the baud-rate generator the SCK pin can be used to output a clock with the same frequency as the bit rate.

## Usage Notes

- When configured for Hardware CTS and Software RTS the configured flow control pin will be used for RTS. The pin will be set high inside of the receive ISR while data is being read. It will be set low when all data is read.
- When configured for Hardware CTS and Hardware RTS the CSTn_RTSn pin will be used for RTS function and the CTSn pin will be used for CTS function on channel n.
- The driver will follow correct hardware flow control function when CTSn_RTSn pin is connected to CTSn pin when "Hardware CTS and Hardware RTS" flow control is selected. The data will still be transferred when CTSn_RTSn and CTSn are disconnected as the CTSn pin is internally pulled low on the hardware when CTSn pin is configured as a peripheral pin for SCI module. Do not configure CTSn pin if the hardware flow control is not desired.

### Limitations

- Reception is still enabled after uart_api_t::communicationAbort API is called. Any characters received after abort and before the next call to read will arrive via the callback function with event UART_EVENT_RX_CHAR.

### DTC Limitations

- DTC support is available for reception, but labeled as [Not recommended]. This is because the UART bytes are received asynchronously. Bytes can be received between calls to R_SCI_B_UART_Read(). The logic required to combine bytes received through R_SCI_B_UART_Read() (UART_EVENT_RX_COMPLETE) and bytes received between calls (UART_EVENT_RX_CHAR) is complex. Reception length may also be unknown, and the driver will not issue an interrupt unless the entire DTC buffer is filled.
- Transfer size must be less than or equal to 64K bytes if DTC interface is used for transfer. uart_api_t::infoGet API can be used to get the max transfer size allowed.
- When using 9-bit reception with DTC, clear the upper 7 bits of data before processing the read data. The upper 7 bits contain status flags that are part of the register used to read data in 9-bit mode.

# Examples

### SCI UART Example

```
uint8_t g_dest[TRANSFER_LENGTH];
uint8_t g_src[TRANSFER_LENGTH];
uint8_t g_out_of_band_received[TRANSFER_LENGTH];
uint32_t g_transfer_complete = 0;
uint32_t g_receive_complete = 0;
uint32_t g_out_of_band_index = 0;
void r_sci_b_uart_basic_example (void)
{
 /* Initialize p_src to known data */
 for (uint32_t i = 0; i < TRANSFER_LENGTH; i++)
    {
       g_src[i] = (uint8_t) ('A' + (i % 26));
    }
 /* Open the transfer instance with initial configuration. */
 fsp_err_t err = R_SCI_B_UART_Open(&g_uart0_ctrl, &g_uart0_cfg);
    assert(FSP_SUCCESS == err);
    err = R_SCI_B_UART_Read(&g_uart0_ctrl, g_dest, TRANSFER_LENGTH);
    assert(FSP_SUCCESS == err);
    err = R_SCI_B_UART_Write(&g_uart0_ctrl, g_src, TRANSFER_LENGTH);
    assert(FSP_SUCCESS == err);
 while (!g_transfer_complete)
    {
    }
 while (!g_receive_complete)
    {
    }
}
void example_callback (uart_callback_args_t * p_args)
{
 /* Handle the UART event */
 switch (p_args->event)
    {
```

```
 /* Received a character */
 case UART_EVENT_RX_CHAR:
      {
 /* Only put the next character in the receive buffer if there is space for it */
 if (sizeof(g_out_of_band_received) > g_out_of_band_index)
      {
 /* Write either the next one or two bytes depending on the receive data size */
 if (UART_DATA_BITS_8 >= g_uart0_cfg.data_bits)
      {
                  g_out_of_band_received[g_out_of_band_index++] = (uint8_t)
p_args->data;
      }
 else
      {
                  uint16_t * p_dest = (uint16_t *)
&g_out_of_band_received[g_out_of_band_index];
                  *p_dest             = (uint16_t) p_args->data;
                  g_out_of_band_index += 2;
      }
      }
 break;
      }
 /* Receive complete */
 case UART_EVENT_RX_COMPLETE:
      {
            g_receive_complete = 1;
 break;
      }
 /* Transmit complete */
 case UART_EVENT_TX_COMPLETE:
      {
            g_transfer_complete = 1;
 break;
      }
```

```
 default:
      {
      }
    }
}
```

### SCI UART Baud Set Example

```
#define SCI_B_UART_BAUDRATE_19200 (19200)
#define SCI_B_UART_BAUDRATE_ERROR_PERCENT_5 (5000)
void r_sci_b_uart_baud_example (void)
{
 sci_b_baud_setting_t baud_setting;
    uint32_t             baud_rate                = SCI_B_UART_BAUDRATE_19200;
 bool                enable_bitrate_modulation = false;
    uint32_t             error_rate_x_1000         =
SCI_B_UART_BAUDRATE_ERROR_PERCENT_5;
 fsp_err_t err = R_SCI_B_UART_BaudCalculate(baud_rate, enable_bitrate_modulation,
error_rate_x_1000, &baud_setting);
    assert(FSP_SUCCESS == err);
    err = R_SCI_B_UART_BaudSet(&g_uart0_ctrl, (void *) &baud_setting);
    assert(FSP_SUCCESS == err);
}
```

## Data Structure Documentation

### ◆ sci_b_uart_instance_ctrl_t

| struct sci_b_uart_instance_ctrl_t |
|---|
| UART instance control block. |

### ◆ sci_b_baud_setting_t

| struct sci_b_baud_setting_t |
|---|
| Register settings to achieve a desired baud rate and modulation duty. |

### ◆ sci_b_uart_rs485_setting_t

| struct sci_b_uart_rs485_setting_t | | |
|---|---|---|
| Configuration settings for controlling the DE signal for RS-485. | | |
| Data Fields | | |
| sci_b_uart_rs485_enable_t | enable | Enable the DE signal. |
| sci_b_uart_rs485_de_polarity_t | polarity | DE signal polarity. |
| uint8_t | assertion_time: 5 | Time in baseclock units after assertion of the DE signal and before the start of the write transfer. |
| uint8_t | negation_time: 5 | Time in baseclock units after the end of a write transfer and before the DE signal is negated. |

### ◆ sci_b_uart_extended_cfg_t

| struct sci_b_uart_extended_cfg_t | | |
|---|---|---|
| UART on SCI device Configuration | | |
| Data Fields | | |
| sci_b_clk_src_t | clock | The source clock for the baud-rate generator. If internal optionally output baud rate on SCK. |

| | | |
|---|---|---|
| sci_b_uart_start_bit_detect_t | rx_edge_start | Start reception on falling edge. |
| sci_b_uart_noise_cancellation_t | noise_cancel | Noise cancellation setting. |
| sci_b_baud_setting_t * | p_baud_setting | Register settings for a desired baud rate. |
| sci_b_uart_rx_fifo_trigger_t | rx_fifo_trigger | Receive FIFO trigger level, unused if channel has no FIFO or if DTC is used. |
| bsp_io_port_pin_t | flow_control_pin | UART Driver Enable pin. |
| sci_b_uart_flow_control_t | flow_control | CTS/RTS function of the SSn pin. |
| sci_b_uart_rs485_setting_t | rs485_setting | RS-485 settings. |

## Enumeration Type Documentation

### ◆ sci_b_clk_src_t

| enum sci_b_clk_src_t | |
|---|---|
| Enumeration for SCI clock source | |
| Enumerator | |
| SCI_B_UART_CLOCK_INT | Use internal clock for baud generation. |
| SCI_B_UART_CLOCK_INT_WITH_BAUDRATE_OUTPUT | Use internal clock for baud generation and output on SCK. |
| SCI_B_UART_CLOCK_EXT8X | Use external clock 8x baud rate. |
| SCI_B_UART_CLOCK_EXT16X | Use external clock 16x baud rate. |

### ◆ sci_b_uart_flow_control_t

| enum sci_b_uart_flow_control_t | |
|---|---|
| UART flow control mode definition | |
| Enumerator | |
| SCI_B_UART_FLOW_CONTROL_RTS | Use CTSn_RTSn pin for RTS. |
| SCI_B_UART_FLOW_CONTROL_CTS | Use CTSn_RTSn pin for CTS. |
| SCI_B_UART_FLOW_CONTROL_HARDWARE_CTSRTS | Use CTSn pin for CTS, CTSn_RTSn pin for RTS. |
| SCI_B_UART_FLOW_CONTROL_CTSRTS | Use SCI pin for CTS, external pin for RTS. |

### ◆ sci_b_uart_rx_fifo_trigger_t

| enum sci_b_uart_rx_fifo_trigger_t | |
|---|---|
| Receive FIFO trigger configuration. | |
| Enumerator | |
| SCI_B_UART_RX_FIFO_TRIGGER_1 | Callback after each byte is received without buffering. |
| SCI_B_UART_RX_FIFO_TRIGGER_2 | Callback when FIFO having 2 bytes. |
| SCI_B_UART_RX_FIFO_TRIGGER_3 | Callback when FIFO having 3 bytes. |
| SCI_B_UART_RX_FIFO_TRIGGER_4 | Callback when FIFO having 4 bytes. |
| SCI_B_UART_RX_FIFO_TRIGGER_5 | Callback when FIFO having 5 bytes. |
| SCI_B_UART_RX_FIFO_TRIGGER_6 | Callback when FIFO having 6 bytes. |
| SCI_B_UART_RX_FIFO_TRIGGER_7 | Callback when FIFO having 7 bytes. |
| SCI_B_UART_RX_FIFO_TRIGGER_8 | Callback when FIFO having 8 bytes. |
| SCI_B_UART_RX_FIFO_TRIGGER_9 | Callback when FIFO having 9 bytes. |
| SCI_B_UART_RX_FIFO_TRIGGER_10 | Callback when FIFO having 10 bytes. |
| SCI_B_UART_RX_FIFO_TRIGGER_11 | Callback when FIFO having 11 bytes. |
| SCI_B_UART_RX_FIFO_TRIGGER_12 | Callback when FIFO having 12 bytes. |
| SCI_B_UART_RX_FIFO_TRIGGER_13 | Callback when FIFO having 13 bytes. |
| SCI_B_UART_RX_FIFO_TRIGGER_14 | Callback when FIFO having 14 bytes. |
| SCI_B_UART_RX_FIFO_TRIGGER_MAX | Callback when FIFO is full or after 15 bit times with no data (fewer interrupts) |

### ◆ sci_b_uart_start_bit_detect_t

| enum sci_b_uart_start_bit_detect_t | |
|---|---|
| Asynchronous Start Bit Edge Detection configuration. | |
| Enumerator | |
| SCI_B_UART_START_BIT_LOW_LEVEL | Detect low level on RXDn pin as start bit. |
| SCI_B_UART_START_BIT_FALLING_EDGE | Detect falling level on RXDn pin as start bit. |

### ◆ sci_b_uart_noise_cancellation_t

| enum sci_b_uart_noise_cancellation_t | |
|---|---|
| Noise cancellation configuration. | |
| Enumerator | |
| SCI_B_UART_NOISE_CANCELLATION_DISABLE | Disable noise cancellation. |
| SCI_B_UART_NOISE_CANCELLATION_ENABLE | Enable noise cancellation. |

### ◆ sci_b_uart_rs485_enable_t

| enum sci_b_uart_rs485_enable_t | |
|---|---|
| RS-485 Enable/Disable. | |
| Enumerator | |
| SCI_B_UART_RS485_DISABLE | RS-485 disabled. |
| SCI_B_UART_RS485_ENABLE | RS-485 enabled. |

### ◆ sci_b_uart_rs485_de_polarity_t

| enum sci_b_uart_rs485_de_polarity_t | |
|---|---|
| The polarity of the RS-485 DE signal. | |
| Enumerator | |
| SCI_B_UART_RS485_DE_POLARITY_HIGH | The DE signal is high when a write transfer is in progress. |
| SCI_B_UART_RS485_DE_POLARITY_LOW | The DE signal is low when a write transfer is in progress. |

## Function Documentation

### ◆ R_SCI_B_UART_Open()

fsp_err_t R_SCI_B_UART_Open ( uart_ctrl_t *const *p_api_ctrl*, uart_cfg_t const *const *p_cfg* )

Configures the UART driver based on the input configurations. If reception is enabled at compile time, reception is enabled at the end of this function. Implements uart_api_t::open

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Channel opened successfully. |
| FSP_ERR_ASSERTION | Pointer to UART control block or configuration structure is NULL. |
| FSP_ERR_IP_CHANNEL_NOT_PRESENT | The requested channel does not exist on this MCU. |
| FSP_ERR_INVALID_ARGUMENT | Flow control is enabled but flow control pin is not defined. |
| FSP_ERR_ALREADY_OPEN | Control block has already been opened or channel is being used by another instance. Call close() then open() to reconfigure. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- transfer_api_t::open

### ◆ R_SCI_B_UART_Close()

fsp_err_t R_SCI_B_UART_Close ( uart_ctrl_t *const *p_api_ctrl*)

Aborts any in progress transfers. Disables interrupts, receiver, and transmitter. Closes lower level transfer drivers if used. Removes power. Implements uart_api_t::close

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Channel successfully closed. |
| FSP_ERR_ASSERTION | Pointer to UART control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened |

### ◆ R_SCI_B_UART_Read()

fsp_err_t R_SCI_B_UART_Read ( uart_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_dest*, uint32_t const *bytes* )

Receives user specified number of bytes into destination buffer pointer. Implements uart_api_t::read

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Data reception successfully ends. |
| FSP_ERR_ASSERTION | Pointer to UART control block is NULL. Number of transfers outside the max or min boundary when transfer instance used |
| FSP_ERR_INVALID_ARGUMENT | Destination address or data size is not valid for 9-bit mode. |
| FSP_ERR_NOT_OPEN | The control block has not been opened |
| FSP_ERR_IN_USE | A previous read operation is still in progress. |
| FSP_ERR_UNSUPPORTED | SCI_B_UART_CFG_RX_ENABLE is set to 0 |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- transfer_api_t::reset

***Note***

*If 9-bit data length is specified at R_SCI_B_UART_Open call, p_dest must be aligned 16-bit boundary.*

### ◆ R_SCI_B_UART_Write()

fsp_err_t R_SCI_B_UART_Write ( uart_ctrl_t *const *p_api_ctrl*, uint8_t const *const *p_src*, uint32_t const *bytes* )

Transmits user specified number of bytes from the source buffer pointer. Implements uart_api_t::write

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Data transmission finished successfully. |
| FSP_ERR_ASSERTION | Pointer to UART control block is NULL. Number of transfers outside the max or min boundary when transfer instance used |
| FSP_ERR_INVALID_ARGUMENT | Source address or data size is not valid for 9-bit mode. |
| FSP_ERR_NOT_OPEN | The control block has not been opened |
| FSP_ERR_IN_USE | A UART transmission is in progress |
| FSP_ERR_UNSUPPORTED | SCI_B_UART_CFG_TX_ENABLE is set to 0 |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- transfer_api_t::reset

***Note***

*If 9-bit data length is specified at R_SCI_B_UART_Open call, p_src must be aligned on a 16-bit boundary.*

### ◆ R_SCI_B_UART_CallbackSet()

fsp_err_t R_SCI_B_UART_CallbackSet ( uart_ctrl_t *const *p_api_ctrl*, void(*)(uart_callback_args_t *) *p_callback*, void *const *p_context*, uart_callback_args_t *const *p_callback_memory* )

Updates the user callback and has option of providing memory for callback structure. Implements uart_api_t::callbackSet

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Callback updated successfully. |
| FSP_ERR_ASSERTION | A required pointer is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_NO_CALLBACK_MEMORY | p_callback is non-secure and p_callback_memory is either secure or NULL. |

### ◆ R_SCI_B_UART_BaudSet()

fsp_err_t R_SCI_B_UART_BaudSet ( uart_ctrl_t *const *p_api_ctrl*, void const *const *p_baud_setting* )

Updates the baud rate using the clock selected in Open. p_baud_setting is a pointer to a sci_b_baud_setting_t structure. Implements uart_api_t::baudSet

**Warning**

This terminates any in-progress transmission.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Baud rate was successfully changed. |
| FSP_ERR_ASSERTION | Pointer to UART control block is NULL or the UART is not configured to use the internal clock. |
| FSP_ERR_NOT_OPEN | The control block has not been opened |

### ◆ R_SCI_B_UART_InfoGet()

fsp_err_t R_SCI_B_UART_InfoGet ( uart_ctrl_t *const *p_api_ctrl*, uart_info_t *const *p_info* )

Provides the driver information, including the maximum number of bytes that can be received or transmitted at a time. Implements uart_api_t::infoGet

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Information stored in provided p_info. |
| FSP_ERR_ASSERTION | Pointer to UART control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened |

### ◆ R_SCI_B_UART_Abort()

fsp_err_t R_SCI_B_UART_Abort ( uart_ctrl_t *const *p_api_ctrl*, uart_dir_t *communication_to_abort* )

Provides API to abort ongoing transfer. Transmission is aborted after the current character is transmitted. Reception is still enabled after abort(). Any characters received after abort() and before the transfer is reset in the next call to read(), will arrive via the callback function with event UART_EVENT_RX_CHAR. Implements uart_api_t::communicationAbort

**Return values**

| | |
|---|---|
| FSP_SUCCESS | UART transaction aborted successfully. |
| FSP_ERR_ASSERTION | Pointer to UART control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_UNSUPPORTED | The requested Abort direction is unsupported. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- transfer_api_t::disable

### ◆ R_SCI_B_UART_ReadStop()

fsp_err_t R_SCI_B_UART_ReadStop ( uart_ctrl_t *const *p_api_ctrl*, uint32_t * *remaining_bytes* )

Provides API to abort ongoing read. Reception is still enabled after abort(). Any characters received after abort() and before the transfer is reset in the next call to read(), will arrive via the callback function with event UART_EVENT_RX_CHAR. Implements uart_api_t::readStop

**Return values**

| | |
|---|---|
| FSP_SUCCESS | UART transaction aborted successfully. |
| FSP_ERR_ASSERTION | Pointer to UART control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_UNSUPPORTED | The requested Abort direction is unsupported. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- transfer_api_t::disable

### ◆ R_SCI_B_UART_BaudCalculate()

fsp_err_t R_SCI_B_UART_BaudCalculate ( uint32_t *baudrate*, bool *bitrate_modulation*, uint32_t *baud_rate_error_x_1000*, sci_b_baud_setting_t *const *p_baud_setting* )

Calculates baud rate register settings. Evaluates and determines the best possible settings set to the baud rate related registers.

**Parameters**

| | | |
|---|---|---|
| [in] | baudrate | Baud rate [bps]. For example, 19200, 57600, 115200, etc. |
| [in] | bitrate_modulation | Enable bitrate modulation |
| [in] | baud_rate_error_x_1000 | Max baud rate error. At most <baud_rate_percent_error> x 1000 required for module to function. Absolute max baud_rate_error is 15000 (15%). |
| [out] | p_baud_setting | Baud setting information stored here if successful |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Baud rate is set successfully |
| FSP_ERR_ASSERTION | Null pointer |
| FSP_ERR_INVALID_ARGUMENT | Baud rate is '0', error in calculated baud rate is larger than requested max error, or requested max error in baud rate is larger than 15%. |

### ◆ R_SCI_B_UART_ReceiveSuspend()

fsp_err_t R_SCI_B_UART_ReceiveSuspend ( uart_ctrl_t *const *p_api_ctrl*)

Suspend Reception

**Return values**

| | |
|---|---|
| FSP_ERR_UNSUPPORTED | Functionality not supported by this driver instance |

### ◆ R_SCI_B_UART_ReceiveResume()

| fsp_err_t R_SCI_B_UART_ReceiveResume ( uart_ctrl_t *const *p_api_ctrl*) |
|---|
| Resume Reception<br><br>**Return values**<br>FSP_ERR_UNSUPPORTED — Functionality not supported by this driver instance |

### Detailed Description

Driver for the SCI peripheral on RA MCUs. This module implements the UART Interface.

# Overview

### Features

The SCI UART module supports the following features:

- Full-duplex UART communication
- Interrupt-driven data transmission and reception
- Invoking the user-callback function with an event code (RX/TX complete, TX data empty, RX char, error, etc)
- Baud-rate change at run-time
- Bit rate modulation and noise cancellation
- CTS/RTS hardware flow control (with an associated pin)
- RS-485 Half Duplex driver support with external RS-485 transceiver
- Integration with the DTC transfer module
- Abort in-progress read/write operations
- FIFO support on supported channels
- IrDA is supported on devices that have IrDA interface

# Configuration

### Build Time Configurations for r_sci_uart

The following build time configurations are defined in fsp_cfg/r_sci_uart_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| FIFO Support | • Enable<br>• Disable | Disable | Enable FIFO support for the SCI_UART module. |
| DTC Support | • Enable<br>• Disable | Disable | Enable DTC support for the SCI_UART module. |
| Flow Control Support | • Enable<br>• Disable | Disable | Enable RS232 and RS-485 flow control support using a user provided pin. |
| RS-485 Support | • Enable<br>• Disable | Disable | Enable support for controlling the RS-485 DE pin. |

| | | | |
|---|---|---|---|
| IrDA Support | • Enabled<br>• Disabled | Disabled | Enable support for IrDA pulse encoding/decoding. |

**Configurations for Connectivity > UART (r_sci_uart)**

This module can be added to the Stacks tab via New Stack > Connectivity > UART (r_sci_uart). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

| Configuration | Options | Default | Description |
|---|---|---|---|
| General | | | |
| Name | Name must be a valid C symbol | g_uart0 | Module name. |
| Channel | Value must be a non-negative integer | 0 | Select the SCI channel. |
| Data Bits | • 8bits<br>• 7bits<br>• 9bits | 8bits | Select the number of bits per word. |
| Parity | • None<br>• Odd<br>• Even | None | Select the parity mode. |
| Stop Bits | • 1bit<br>• 2bits | 1bit | Select the number of stop bits. |
| Baud | | | |
| Baud Rate | Value must be an integer greater than 0 | 115200 | Enter the desired baud rate.<br><br>If the requested baud rate cannot be achieved, the settings with the smallest percent error are used. The theoretical calculated baud rate and percent error are printed in a comment in the generated baud_setting_t structure.<br><br>For RA4 and RA6 MCUs, refer the datasheet to calculate baud rate considering the SEMR.ABCSE bit restriction. |
| Baud Rate Modulation | • Disabled<br>• Enabled | Disabled | Enabling baud rate modulation reduces the |

| | | | |
|---|---|---|---|
| | | | percent error of the actual baud rate with respect to the requested baud rate. It does this by modulating the number of cycles per clock, so some bits are slightly longer than others. |
| Max Error (%) | Must be a valid non-negative integer with a maximum configurable value of 100 | 5 | Maximum percent error allowed during baud calculation. This is used by the algorithm to determine whether or not to consider using less accurate alternative register settings.<br><br>NOTE: The baud calculation does not show an error in the tool if this percent error was not achieved. The calculated percent error is recorded in a comment in the generated baud_setting_t structure. |
| Flow Control | | | |
| CTS/RTS Selection | MCU Specific Options | | Select either CTS or RTS function on the CTSn_RTSn pin of SCI channel n or select CTS function on CTSn pin and RTS function on CTSn_RTSn pin of SCI channel n (Available on selected MCUs and channels). |
| Software RTS Port | Refer to the RA Configuration tool for available options. | Disabled | Specify the flow control pin port for the MCU. |
| Software RTS Pin | Refer to the RA Configuration tool for available options. | Disabled | Specify the flow control pin for the MCU. |
| Extra | | | |
| Extra > IrDA | | | |
| Enable | • Disabled | Disabled | Enable IrDA on this |

| | | | |
|---|---|---|---|
| | • Enabled | | channel. |
| RXD Polarity Switching | • Normal<br>• Inverted | Normal | IRRXD Pulse polarity (Normal: High Pulse=0) and (Inverted: Low Pulse=0).. |
| TXD Polarity Switching | • Normal<br>• Inverted | Normal | IRTXD Pulse polarity (Normal: High Pulse 0) and (Inverted: Low Pulse=0). |
| Extra > RS-485 | | | |
| DE Pin | • Disable<br>• Enable | Disable | Enable or disable the DE pin for use in RS-485 half-duplex mode. |
| DE Pin Polarity | • Active Low<br>• Active High | Active High | Select the polarity of the DE pin. |
| DE Port Number | Refer to the RA Configuration tool for available options. | Disabled | GPIO output port number to use for generating the DE signal. |
| DE Pin Number | Refer to the RA Configuration tool for available options. | Disabled | GPIO output pin number to use for generating the DE signal. |
| Clock Source | • Internal Clock<br>• Internal Clock With Output on SCK<br>• External Clock 8x baud rate<br>• External Clock 16x baud rate | Internal Clock | Selection of the clock source to be used in the baud-rate clock generator. When internal clock is used the baud rate can be output on the SCK pin. |
| Start bit detection | • Falling Edge<br>• Low Level | Falling Edge | Start bit detected as falling edge or low level. |
| Noise Filter | • Enable<br>• Disable | Disable | Enable the digital noise filter on RXDn pin. The digital noise filter block in SCI consists of two-stage flipflop circuits. |
| Receive FIFO Trigger Level | Refer to the RA Configuration tool for available options. | Max | Unused if the channel has no FIFO or if DTC is used for reception. Set to One to get a callback immediately when each byte is received. Set to Max to get a callback when |

| | | | |
|---|---|---|---|
| | | | FIFO is full or after 15 bit times with no data (fewer interrupts). |
| Interrupts | | | |
| Callback | Name must be a valid C symbol | NULL | A user callback function can be provided. If this callback function is provided, it will be called from the interrupt service routine (ISR). |
| Receive Interrupt Priority | MCU Specific Options | | Select the receive interrupt priority. |
| Transmit Data Empty Interrupt Priority | MCU Specific Options | | Select the transmit interrupt priority. |
| Transmit End Interrupt Priority | MCU Specific Options | | Select the transmit end interrupt priority. |
| Error Interrupt Priority | MCU Specific Options | | Select the error interrupt priority. |

### Clock Configuration

The clock for this module is derived from the following peripheral clock for each MCU group:

| MCU Group | Peripheral Clock |
|---|---|
| RA2A1 | PCLKB |
| RA2A2 | PCLKB |
| RA2E1 | PCLKB |
| RA2E2 | PCLKB |
| RA2E3 | PCLKB |
| RA2L1 | PCLKB |
| RA2L2 | PCLKB |
| RA2T1 | PCLKB |
| RA4C1 | PCLKA |
| RA4E1 | PCLKA |
| RA4E2 | PCLKA |
| RA4L1 | PCLKA |
| RA4M1 | PCLKA |
| RA4M2 | PCLKA |

| | |
|---|---|
| RA4M3 | PCLKA |
| RA4T1 | PCLKA |
| RA4W1 | PCLKA |
| RA6E1 | PCLKA |
| RA6E2 | PCLKA |
| RA6M1 | PCLKA |
| RA6M2 | PCLKA |
| RA6M3 | PCLKA |
| RA6M4 | PCLKA |
| RA6M5 | PCLKA |
| RA6T1 | PCLKA |
| RA6T3 | PCLKA |

The clock source for the baud-rate clock generator can be selected from the internal clock, the external clock times 8 or the external clock times 16. The external clock is supplied to the SCK pin.

### Pin Configuration

This module uses TXD and RXD to communicate to external devices. CTS or RTS or both (CTS and RTS) can be controlled by the hardware. Some MCUs support hardware flow control for both CTS and RTS on some channels. Some MCUs and channels support hardware flow control for either CTS or RTS but not both. If both are desired a GPIO pin can be used for RTS. When the internal clock is the source for the baud-rate generator the SCK pin can be used to output a clock with the same frequency as the bit rate.

# Usage Notes

- When configured for Hardware CTS and Software RTS the configured flow control pin will be used for RTS. The pin will be set high inside of the receive ISR while data is being read. It will be set low when all data is read.
- When configured for Hardware CTS and Hardware RTS the CSTn_RTSn pin will be used for RTS function and the CTSn pin will be used for CTS function on channel n.
- The driver will follow correct hardware flow control function when CTSn_RTSn pin is connected to CTSn pin when "Hardware CTS and Hardware RTS" flow control is selected. The data will still be transferred when CTSn_RTSn and CTSn are disconnected as the CTSn pin is internally pulled low on the hardware when CTSn pin is configured as a peripheral pin for SCI module. Do not configure CTSn pin if the hardware flow control is not desired.

### Limitations

- Reception is still enabled after uart_api_t::communicationAbort API is called. Any characters received after abort and before the next call to read will arrive via the callback function with event UART_EVENT_RX_CHAR.
- The R_SCI_UART_BaudCalculate() and R_SCI_UART_Open() APIs are used to obtain the baud rate register settings for a specific baudrate. On RA4 and RA6 MCU groups, there is a restriction on SEMR.ABSCE bit for certain channels (refer to 'SEMR : Serial Extended Mode' Register section of MCU User Manual). The API does not enforce this restriction and it may

return invalid settings.

### DTC Limitations

- DTC support is available for reception, but labeled as [Not recommended]. This is because the UART bytes are received asynchronously. Bytes can be received between calls to R_SCI_UART_Read(). The logic required to combine bytes received through R_SCI_UART_Read() (UART_EVENT_RX_COMPLETE) and bytes received between calls (UART_EVENT_RX_CHAR) is complex. Reception length may also be unknown, and the driver will not issue an interrupt unless the entire DTC buffer is filled.
- Transfer size must be less than or equal to 64K bytes if DTC interface is used for transfer. uart_api_t::infoGet API can be used to get the max transfer size allowed.
- When using 9-bit reception with DTC, clear the upper 7 bits of data before processing the read data. The upper 7 bits contain status flags that are part of the register used to read data in 9-bit mode.

### IrDA Limitations

- The IrDA interface works in cooperation with a particular SCI channel based on the IrDA standard 1.0.
- If optics placement yields the echo of transmitted data on the receiver, the application should disable the RX irq during transmission.
- R_SCI_UART_BaudCalculate shall not be called for IrDA baud rate calculation. The correct use is to create the baud rate by using the configurator. If run-time changes to baud rate are required, multiple instances of different baud rates should be created with the configurator.

## Examples

### SCI UART Example

```
uint8_t g_dest[TRANSFER_LENGTH];
uint8_t g_src[TRANSFER_LENGTH];
uint8_t g_out_of_band_received[TRANSFER_LENGTH];
uint32_t g_transfer_complete = 0;
uint32_t g_receive_complete = 0;
uint32_t g_out_of_band_index = 0;
void r_sci_uart_basic_example (void)
{
 /* Initialize p_src to known data */
 for (uint32_t i = 0; i < TRANSFER_LENGTH; i++)
    {
       g_src[i] = (uint8_t) ('A' + (i % 26));
    }
 /* Open the transfer instance with initial configuration. */
 fsp_err_t err = R_SCI_UART_Open(&g_uart0_ctrl, &g_uart0_cfg);
```

```
    assert(FSP_SUCCESS == err);
    err = R_SCI_UART_Read(&g_uart0_ctrl, g_dest, TRANSFER_LENGTH);
    assert(FSP_SUCCESS == err);
    err = R_SCI_UART_Write(&g_uart0_ctrl, g_src, TRANSFER_LENGTH);
    assert(FSP_SUCCESS == err);
 while (!g_transfer_complete)
    {
    }
 while (!g_receive_complete)
    {
    }
}
void example_callback (uart_callback_args_t * p_args)
{
 /* Handle the UART event */
 switch (p_args->event)
    {
 /* Received a character */
 case UART_EVENT_RX_CHAR:
     {
 /* Only put the next character in the receive buffer if there is space for it */
 if (sizeof(g_out_of_band_received) > g_out_of_band_index)
     {
 /* Write either the next one or two bytes depending on the receive data size */
 if (UART_DATA_BITS_8 >= g_uart0_cfg.data_bits)
     {
                 g_out_of_band_received[g_out_of_band_index++] = (uint8_t)
p_args->data;
     }
 else
     {
                 uint16_t * p_dest = (uint16_t *)
&g_out_of_band_received[g_out_of_band_index];
                 *p_dest             = (uint16_t) p_args->data;
```

```
                g_out_of_band_index += 2;
     }
     }
 break;
     }
 /* Receive complete */
 case UART_EVENT_RX_COMPLETE:
     {
           g_receive_complete = 1;
 break;
     }
 /* Transmit complete */
 case UART_EVENT_TX_COMPLETE:
     {
           g_transfer_complete = 1;
 break;
     }
 default:
     {
     }
   }
}
```

### SCI UART Baud Set Example

```
#define SCI_UART_BAUDRATE_19200 (19200)
#define SCI_UART_BAUDRATE_ERROR_PERCENT_5 (5000)
void r_sci_uart_baud_example (void)
{
 baud_setting_t baud_setting;
    uint32_t       baud_rate                = SCI_UART_BAUDRATE_19200;
 bool          enable_bitrate_modulation = false;
    uint32_t       error_rate_x_1000         = SCI_UART_BAUDRATE_ERROR_PERCENT_5;
 fsp_err_t err = R_SCI_UART_BaudCalculate(baud_rate, enable_bitrate_modulation,
error_rate_x_1000, &baud_setting);
```

```
    assert(FSP_SUCCESS == err);
    err = R_SCI_UART_BaudSet(&g_uart0_ctrl, (void *) &baud_setting);
    assert(FSP_SUCCESS == err);
}
```

| sci_uart_irda_setting_t | irda_setting | IrDA settings. |

## Enumeration Type Documentation

### ◆ sci_clk_src_t

| enum sci_clk_src_t | |
|---|---|
| Enumeration for SCI clock source | |
| Enumerator | |
| SCI_UART_CLOCK_INT | Use internal clock for baud generation. |
| SCI_UART_CLOCK_INT_WITH_BAUDRATE_OUTPUT | Use internal clock for baud generation and output on SCK. |
| SCI_UART_CLOCK_EXT8X | Use external clock 8x baud rate. |
| SCI_UART_CLOCK_EXT16X | Use external clock 16x baud rate. |

### ◆ sci_uart_flow_control_t

| enum sci_uart_flow_control_t | |
|---|---|
| UART flow control mode definition | |
| Enumerator | |
| SCI_UART_FLOW_CONTROL_RTS | Use SCI pin for RTS. |
| SCI_UART_FLOW_CONTROL_CTS | Use SCI pin for CTS. |
| SCI_UART_FLOW_CONTROL_CTSRTS | Use SCI pin for CTS, external pin for RTS. |
| SCI_UART_FLOW_CONTROL_HARDWARE_CTSRTS | Use CTSn_RTSn pin for RTS and CTSn pin for CTS. Available only for some channels on selected MCUs. See hardware manual for channel specific options. |

### ◆ sci_uart_rx_fifo_trigger_t

| enum sci_uart_rx_fifo_trigger_t | |
|---|---|
| Receive FIFO trigger configuration. | |
| Enumerator | |
| SCI_UART_RX_FIFO_TRIGGER_1 | Callback after each byte is received without buffering. |
| SCI_UART_RX_FIFO_TRIGGER_2 | Callback when FIFO having 2 bytes. |
| SCI_UART_RX_FIFO_TRIGGER_3 | Callback when FIFO having 3 bytes. |
| SCI_UART_RX_FIFO_TRIGGER_4 | Callback when FIFO having 4 bytes. |
| SCI_UART_RX_FIFO_TRIGGER_5 | Callback when FIFO having 5 bytes. |
| SCI_UART_RX_FIFO_TRIGGER_6 | Callback when FIFO having 6 bytes. |
| SCI_UART_RX_FIFO_TRIGGER_7 | Callback when FIFO having 7 bytes. |
| SCI_UART_RX_FIFO_TRIGGER_8 | Callback when FIFO having 8 bytes. |
| SCI_UART_RX_FIFO_TRIGGER_9 | Callback when FIFO having 9 bytes. |
| SCI_UART_RX_FIFO_TRIGGER_10 | Callback when FIFO having 10 bytes. |
| SCI_UART_RX_FIFO_TRIGGER_11 | Callback when FIFO having 11 bytes. |
| SCI_UART_RX_FIFO_TRIGGER_12 | Callback when FIFO having 12 bytes. |
| SCI_UART_RX_FIFO_TRIGGER_13 | Callback when FIFO having 13 bytes. |
| SCI_UART_RX_FIFO_TRIGGER_14 | Callback when FIFO having 14 bytes. |
| SCI_UART_RX_FIFO_TRIGGER_MAX | Callback when FIFO is full or after 15 bit times with no data (fewer interrupts) |

### ◆ sci_uart_start_bit_t

| enum sci_uart_start_bit_t | |
|---|---|
| Asynchronous Start Bit Edge Detection configuration. | |
| Enumerator | |
| SCI_UART_START_BIT_LOW_LEVEL | Detect low level on RXDn pin as start bit. |
| SCI_UART_START_BIT_FALLING_EDGE | Detect falling level on RXDn pin as start bit. |

### ◆ sci_uart_noise_cancellation_t

| enum sci_uart_noise_cancellation_t | |
|---|---|
| Noise cancellation configuration. | |
| Enumerator | |
| SCI_UART_NOISE_CANCELLATION_DISABLE | Disable noise cancellation. |
| SCI_UART_NOISE_CANCELLATION_ENABLE | Enable noise cancellation. |

### ◆ sci_uart_rs485_enable_t

| enum sci_uart_rs485_enable_t | |
|---|---|
| RS-485 Enable/Disable. | |
| Enumerator | |
| SCI_UART_RS485_DISABLE | RS-485 disabled. |
| SCI_UART_RS485_ENABLE | RS-485 enabled. |

### ◆ sci_uart_rs485_de_polarity_t

| enum sci_uart_rs485_de_polarity_t | |
|---|---|
| The polarity of the RS-485 DE signal. | |
| Enumerator | |
| SCI_UART_RS485_DE_POLARITY_HIGH | The DE signal is high when a write transfer is in progress. |
| SCI_UART_RS485_DE_POLARITY_LOW | The DE signal is low when a write transfer is in progress. |

### ◆ sci_uart_irda_enable_t

| enum sci_uart_irda_enable_t | |
|---|---|
| IrDA Enable/Disable. | |
| Enumerator | |
| SCI_UART_IRDA_DISABLED | IrDA disabled. |
| SCI_UART_IRDA_ENABLED | IrDA enabled. |

### ◆ sci_uart_irda_polarity_t

| enum sci_uart_irda_polarity_t | |
|---|---|
| IrDA Polarity Switching. | |
| Enumerator | |
| SCI_UART_IRDA_POLARITY_NORMAL | IrDA Tx/Rx polarity not inverted. |
| SCI_UART_IRDA_POLARITY_INVERTED | IrDA Tx/Rx polarity inverted. |

## Function Documentation

### ◆ R_SCI_UART_Open()

fsp_err_t R_SCI_UART_Open ( uart_ctrl_t *const *p_api_ctrl*, uart_cfg_t const *const *p_cfg* )

Configures the UART driver based on the input configurations. If reception is enabled at compile time, reception is enabled at the end of this function. Implements uart_api_t::open

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Channel opened successfully. |
| FSP_ERR_ASSERTION | Pointer to UART control block or configuration structure is NULL. |
| FSP_ERR_IP_CHANNEL_NOT_PRESENT | The requested channel does not exist on this MCU. |
| FSP_ERR_INVALID_ARGUMENT | Flow control is enabled but flow control pin is not defined or selected channel does not support "Hardware CTS and Hardware RTS" flow control. (or) restricted channel is selected. |
| FSP_ERR_ALREADY_OPEN | Control block has already been opened or channel is being used by another instance. Call close() then open() to reconfigure. |
| FSP_ERR_INVALID_CHANNEL | IrDA is requested for a channel that does not support IrDA. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- transfer_api_t::open

### ◆ R_SCI_UART_Close()

fsp_err_t R_SCI_UART_Close ( uart_ctrl_t *const *p_api_ctrl*)

Aborts any in progress transfers. Disables interrupts, receiver, and transmitter. Closes lower level transfer drivers if used. Removes power. Implements uart_api_t::close

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Channel successfully closed. |
| FSP_ERR_ASSERTION | Pointer to UART control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened |

### ◆ R_SCI_UART_Read()

fsp_err_t R_SCI_UART_Read ( uart_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_dest*, uint32_t const *bytes* )

Receives user specified number of bytes into destination buffer pointer. Implements uart_api_t::read

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Data reception successfully ends. |
| FSP_ERR_ASSERTION | Pointer to UART control block is NULL. Number of transfers outside the max or min boundary when transfer instance used |
| FSP_ERR_INVALID_ARGUMENT | Destination address or data size is not valid for 9-bit mode. |
| FSP_ERR_NOT_OPEN | The control block has not been opened |
| FSP_ERR_IN_USE | A previous read operation is still in progress. |
| FSP_ERR_UNSUPPORTED | SCI_UART_CFG_RX_ENABLE is set to 0 |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- transfer_api_t::reset

***Note***

*If 9-bit data length is specified at R_SCI_UART_Open call, p_dest must be aligned 16-bit boundary.*

### ◆ R_SCI_UART_Write()

fsp_err_t R_SCI_UART_Write ( uart_ctrl_t *const *p_api_ctrl*, uint8_t const *const *p_src*, uint32_t const *bytes* )

Transmits user specified number of bytes from the source buffer pointer. Implements uart_api_t::write

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Data transmission finished successfully. |
| FSP_ERR_ASSERTION | Pointer to UART control block is NULL. Number of transfers outside the max or min boundary when transfer instance used |
| FSP_ERR_INVALID_ARGUMENT | Source address or data size is not valid for 9-bit mode. |
| FSP_ERR_NOT_OPEN | The control block has not been opened |
| FSP_ERR_IN_USE | A UART transmission is in progress |
| FSP_ERR_UNSUPPORTED | SCI_UART_CFG_TX_ENABLE is set to 0 |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- transfer_api_t::reset

***Note***

*If 9-bit data length is specified at R_SCI_UART_Open call, p_src must be aligned on a 16-bit boundary.*

### ◆ R_SCI_UART_CallbackSet()

fsp_err_t R_SCI_UART_CallbackSet ( uart_ctrl_t *const *p_api_ctrl*, void(*)(uart_callback_args_t *) *p_callback*, void *const *p_context*, uart_callback_args_t *const *p_callback_memory* )

Updates the user callback and has option of providing memory for callback structure. Implements uart_api_t::callbackSet

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Callback updated successfully. |
| FSP_ERR_ASSERTION | A required pointer is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_NO_CALLBACK_MEMORY | p_callback is non-secure and p_callback_memory is either secure or NULL. |

### ◆ R_SCI_UART_BaudSet()

fsp_err_t R_SCI_UART_BaudSet ( uart_ctrl_t *const *p_api_ctrl*, void const *const *p_baud_setting* )

Updates the baud rate using the clock selected in Open. p_baud_setting is a pointer to a baud_setting_t structure. Implements uart_api_t::baudSet

**Warning**

This terminates any in-progress transmission.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Baud rate was successfully changed. |
| FSP_ERR_ASSERTION | Pointer to UART control block is NULL or the UART is not configured to use the internal clock. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_INVALID_ARGUMENT | Restricted channel is selected. |

### ◆ R_SCI_UART_InfoGet()

fsp_err_t R_SCI_UART_InfoGet ( uart_ctrl_t *const *p_api_ctrl*, uart_info_t *const *p_info* )

Provides the driver information, including the maximum number of bytes that can be received or transmitted at a time. Implements uart_api_t::infoGet

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Information stored in provided p_info. |
| FSP_ERR_ASSERTION | Pointer to UART control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened |

### ◆ R_SCI_UART_Abort()

fsp_err_t R_SCI_UART_Abort ( uart_ctrl_t *const *p_api_ctrl*, uart_dir_t *communication_to_abort* )

Provides API to abort ongoing transfer. Transmission is aborted after the current character is transmitted. Reception is still enabled after abort(). Any characters received after abort() and before the transfer is reset in the next call to read(), will arrive via the callback function with event UART_EVENT_RX_CHAR. Implements uart_api_t::communicationAbort

**Return values**

| | |
|---|---|
| FSP_SUCCESS | UART transaction aborted successfully. |
| FSP_ERR_ASSERTION | Pointer to UART control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_UNSUPPORTED | The requested Abort direction is unsupported. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- transfer_api_t::disable

### ◆ R_SCI_UART_ReadStop()

fsp_err_t R_SCI_UART_ReadStop ( uart_ctrl_t *const *p_api_ctrl*, uint32_t * *remaining_bytes* )

Provides API to abort ongoing read. Reception is still enabled after abort(). Any characters received after abort() and before the transfer is reset in the next call to read(), will arrive via the callback function with event UART_EVENT_RX_CHAR. Implements uart_api_t::readStop

**Return values**

| | |
|---|---|
| FSP_SUCCESS | UART transaction aborted successfully. |
| FSP_ERR_ASSERTION | Pointer to UART control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_UNSUPPORTED | The requested Abort direction is unsupported. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- transfer_api_t::disable

### ◆ R_SCI_UART_BaudCalculate()

fsp_err_t R_SCI_UART_BaudCalculate ( uint32_t *baudrate*, bool *bitrate_modulation*, uint32_t *baud_rate_error_x_1000*, baud_setting_t *const *p_baud_setting* )

Calculates baud rate register settings. Evaluates and determines the best possible settings set to the baud rate related registers.

***Note***

*For limitations of this API, refer to the 'Limitations' section of r_sci_uart module in FSP User Manual.*

**Parameters**

| | | |
|---|---|---|
| [in] | baudrate | Baud rate [bps]. For example, 19200, 57600, 115200, etc. |
| [in] | bitrate_modulation | Enable bitrate modulation |
| [in] | baud_rate_error_x_1000 | Max baud rate error. At most <baud_rate_percent_error> x 1000 required for module to function. Absolute max baud_rate_error is 15000 (15%). |
| [out] | p_baud_setting | Baud setting information stored here if successful |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Baud rate is set successfully |
| FSP_ERR_ASSERTION | Null pointer |
| FSP_ERR_INVALID_ARGUMENT | Baud rate is '0', error in calculated baud rate is larger than requested max error, or requested max error in baud rate is larger than 15%. |

### ◆ R_SCI_UART_ReceiveSuspend()

fsp_err_t R_SCI_UART_ReceiveSuspend ( uart_ctrl_t *const *p_api_ctrl*)

Suspend Reception

**Return values**

| | |
|---|---|
| FSP_ERR_UNSUPPORTED | Functionality not supported by this driver instance |

### ◆ R_SCI_UART_ReceiveResume()

| fsp_err_t R_SCI_UART_ReceiveResume ( uart_ctrl_t *const *p_api_ctrl*) |
|---|
| Resume Reception<br><br>**Return values**<br>FSP_ERR_UNSUPPORTED — Functionality not supported by this driver instance |

### Detailed Description

Driver for the UARTA peripheral on RA MCUs. This module implements the UART Interface.

# Overview

### Features

The UARTA module supports the following features:

- Full-duplex UART communication
- Interrupt-driven data transmission and reception
- Baud-rate change at run-time
- Integration with the DTC transfer module
- Abort in-progress read/write operations
- MSB or LSB first transfer selectable
- Inversion control of communication logic level provided
- Clock output function (Not available on all MCUs)

# Configuration

### Build Time Configurations for r_uarta

The following build time configurations are defined in fsp_cfg/r_uarta_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| DTC Support | MCU Specific Options | | Enable DTC support for the UARTA module. |
| Receive Error Interrupt Mode | • Disabled<br>• Enabled | Enabled | Selection receive interrupt mode . Disabled: The UARTA0_ERRI interrupt is generated when a reception error occurs. Enabled: The UARTA0_RXI interrupt is generated when a reception error occurs. |

### Configurations for Connectivity > UART (r_uarta)

This module can be added to the Stacks tab via New Stack > Connectivity > UART (r_uarta). Non-secure callable guard functions can be generated for this module by right clicking the module in the

RA Configuration tool and checking the "Non-secure Callable" box.

| Configuration | Options | Default | Description |
|---|---|---|---|
| General | | | |
| Name | Name must be a valid C symbol | g_uart0 | Module name. |
| Channel | Value must be a non-negative integer | 0 | Select the UARTA channel. |
| Data Bits | • 8bits<br>• 7bits<br>• 5bits | 8bits | Select the number of bits per word. |
| Parity | • None<br>• Zero<br>• Odd<br>• Even | None | Select the parity mode. |
| Stop Bits | • 1bit<br>• 2bits | 1bit | Select the number of stop bits.<br>Note: For the receive data, only the first 1 bit of the stop bits is checked regardless of the stop bit length. |
| Baud | | | |
| Baud Rate | Value must be an integer greater than 0 | 115200 | Enter the desired baud rate.<br><br>If the requested baud rate cannot be achieved, the settings with the smallest percent error are used. The theoretical calculated baud rate and percent error are printed in a comment in the generated baud_setting_t structure. |
| Extra | | | |
| Transfer Order | • LSB first<br>• MSB first | LSB first | Selection of the transmission/reception order. |
| Transfer level | • Positive logic<br>• Negative logic | Positive logic | Selection of the transmission/reception level. |
| Clock output | MCU Specific Options | | Enable Clock output |

| | | | |
|---|---|---|---|
| Interrupts | | | |
| Callback | Name must be a valid C symbol | NULL | A user callback function can be provided. If this callback function is provided, it will be called from the interrupt service routine (ISR). |
| Receive Interrupt Priority | MCU Specific Options | | Select the receive interrupt priority. |
| Transmit Interrupt Priority | MCU Specific Options | | Select the transmit interrupt priority. |
| Error Interrupt Priority | MCU Specific Options | | Select the error interrupt priority. |

### Clock Configuration

The baud-rate clock generator can be selected from the clock source MOSC, HOCO, MOCO, SOSC/LOCO.

### Pin Configuration

This module uses TXDA and RXDA pin to communicate to external devices.

# Usage Notes

### Limitations

- Reception is still enabled after uart_api_t::communicationAbort API is called. Any characters received after abort and before the next call to read will arrive via the callback function with event UART_EVENT_RX_CHAR.
- The UARTA module does not have CTS or RTS signals.
- UARTA 0ch and 1ch cannot be configured for secure and non-secure usage simultaneously.

### DTC Limitations

- DTC support is available for reception, but labeled as [Not recommended]. This is because the UART bytes are received asynchronously. Bytes can be received between calls to R_UARTA_Read(). The logic required to combine bytes received through R_UARTA_Read() (UART_EVENT_RX_COMPLETE) and bytes received between calls (UART_EVENT_RX_CHAR) is complex. Reception length may also be unknown, and the driver will not issue an interrupt unless the entire DTC buffer is filled.
- Transfer size must be less than or equal to 64K bytes if DTC interface is used for transfer. uart_api_t::infoGet API can be used to get the max transfer size allowed.

# Examples

### UARTA Example

```
uint8_t          g_dest[TRANSFER_LENGTH];
```

```
uint8_t          g_src[TRANSFER_LENGTH];
uint8_t          g_out_of_band_received[TRANSFER_LENGTH];
volatile uint32_t g_transfer_complete = 0;
volatile uint32_t g_receive_complete = 0;
uint32_t          g_out_of_band_index = 0;
void r_uarta_basic_example (void)
{
 /* Initialize p_src to known data */
 for (uint32_t i = 0; i < TRANSFER_LENGTH; i++)
    {
       g_src[i] = (uint8_t) ('A' + (i % 26));
    }
 /* Open the transfer instance with initial configuration. */
 fsp_err_t err = R_UARTA_Open(&g_uart0_ctrl, &g_uart0_cfg);
    assert(FSP_SUCCESS == err);
    err = R_UARTA_Read(&g_uart0_ctrl, g_dest, TRANSFER_LENGTH);
    assert(FSP_SUCCESS == err);
    err = R_UARTA_Write(&g_uart0_ctrl, g_src, TRANSFER_LENGTH);
    assert(FSP_SUCCESS == err);
 while (!g_transfer_complete)
    {
    }
 while (!g_receive_complete)
    {
    }
}
void example_callback (uart_callback_args_t * p_args)
{
 /* Handle the UART event */
 switch (p_args->event)
    {
 /* Received a character */
 case UART_EVENT_RX_CHAR:
      {
```

```
 /* Only put the next character in the receive buffer if there is space for it */
 if (sizeof(g_out_of_band_received) > g_out_of_band_index)
      {
 /* Write either the next one or two bytes depending on the receive data size */
 if (UART_DATA_BITS_8 >= g_uart0_cfg.data_bits)
      {
                  g_out_of_band_received[g_out_of_band_index++] = (uint8_t)
p_args->data;
      }
 else
      {
                  uint16_t * p_dest = (uint16_t *)
&g_out_of_band_received[g_out_of_band_index];
                  *p_dest             = (uint16_t) p_args->data;
                  g_out_of_band_index += 2;
      }
      }
 break;
      }
 /* Receive complete */
 case UART_EVENT_RX_COMPLETE:
      {
            g_receive_complete = 1;
 break;
      }
 /* Transmit complete */
 case UART_EVENT_TX_COMPLETE:
      {
            g_transfer_complete = 1;
 break;
      }
 default:
      {
      }
```

```
    }
}
```

### UARTA Baud Set Example

```
#define UARTA_BAUDRATE_19200 (19200)
#define UARTA_BAUDRATE_ERROR_PERCENT_4740 (4740)
void r_uarta_baud_example (void)
{
 uarta_baud_setting_t baud_setting;
    uint32_t             baud_rate         = UARTA_BAUDRATE_19200;
    uint32_t             error_rate_x_1000 = UARTA_BAUDRATE_ERROR_PERCENT_4740;
 uarta_clock_source_t clock_source      = UARTA_CLOCK_SOURCE_HOCO;
 fsp_err_t err = R_UARTA_BaudCalculate(baud_rate, error_rate_x_1000, clock_source,
&baud_setting);
    assert(FSP_SUCCESS == err);
    err = R_UARTA_BaudSet(&g_uart0_ctrl, (void *) &baud_setting);
    assert(FSP_SUCCESS == err);
}
```

|---|---|
| Transmission/reception level configuration. | |
| Enumerator | |
| UARTA_ALV_BIT_POSITIVE_LOGIC | Positive logic (wait state = high level, start bit = low level, stop bit = high level) |
| UARTA_ALV_BIT_NEGATIVE_LOGIC | Negative logic (wait state = low level, start bit = high level, stop bit = low level) |

## Function Documentation

### ◆ R_UARTA_Open()

fsp_err_t R_UARTA_Open ( uart_ctrl_t *const *p_api_ctrl*, uart_cfg_t const *const *p_cfg* )

Configures the UARTA driver based on the input configurations. If transmission/reception is enabled at compile time, transmission/reception is enabled at the end of this function. Implements uart_api_t::open

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Channel opened successfully. |
| FSP_ERR_ASSERTION | Pointer to UARTA control block or configuration structure is NULL. |
| FSP_ERR_IP_CHANNEL_NOT_PRESENT | The requested channel does not exist on this MCU. |
| FSP_ERR_INVALID_ARGUMENT | Invalid clock select (f_UTA0) and baudrate configuration. |
| FSP_ERR_ALREADY_OPEN | Control block has already been opened or channel is being used by another instance. Call close() then open() to reconfigure. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- transfer_api_t::open

### ◆ R_UARTA_Close()

fsp_err_t R_UARTA_Close ( uart_ctrl_t *const *p_api_ctrl*)

Aborts any in progress transfers. Disables interrupts, receiver, and transmitter. Closes lower level transfer drivers if used. Removes power. Implements uart_api_t::close

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Channel successfully closed. |
| FSP_ERR_ASSERTION | Pointer to UARTA control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened |

### ◆ R_UARTA_Read()

fsp_err_t R_UARTA_Read ( uart_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_dest*, uint32_t const *bytes* )

Receives user specified number of bytes into destination buffer pointer. Implements uart_api_t::read

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Data reception successfully ends. |
| FSP_ERR_ASSERTION | Pointer to UARTA control block is NULL. Number of transfers outside the max or min boundary when transfer instance used |
| FSP_ERR_NOT_OPEN | The control block has not been opened |
| FSP_ERR_IN_USE | A previous read operation is still in progress. |
| FSP_ERR_UNSUPPORTED | UARTA_CFG_RX_ENABLE is set to 0 |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- transfer_api_t::reset

### ◆ R_UARTA_Write()

fsp_err_t R_UARTA_Write ( uart_ctrl_t *const *p_api_ctrl*, uint8_t const *const *p_src*, uint32_t const *bytes* )

Transmits user specified number of bytes from the source buffer pointer. Implements uart_api_t::write

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Data transmission finished successfully. |
| FSP_ERR_ASSERTION | Pointer to UARTA control block is NULL. Number of transfers outside the max or min boundary when transfer instance used |
| FSP_ERR_NOT_OPEN | The control block has not been opened |
| FSP_ERR_IN_USE | A UARTA transmission is in progress |
| FSP_ERR_UNSUPPORTED | UART_CFG_TX_ENABLE is set to 0 |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- transfer_api_t::reset

### ◆ R_UARTA_CallbackSet()

fsp_err_t R_UARTA_CallbackSet ( uart_ctrl_t *const *p_api_ctrl*, void(*)(uart_callback_args_t *) *p_callback*, void *const *p_context*, uart_callback_args_t *const *p_callback_memory* )

Updates the user callback and has option of providing memory for callback structure. Implements uart_api_t::callbackSet

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Callback updated successfully. |
| FSP_ERR_ASSERTION | A required pointer is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_NO_CALLBACK_MEMORY | p_callback is non-secure and p_callback_memory is either secure or NULL. |

### ◆ R_UARTA_BaudSet()

fsp_err_t R_UARTA_BaudSet ( uart_ctrl_t *const *p_api_ctrl*, void const *const *p_baud_setting* )

Updates the baud rate using the clock selected in Open. p_baud_setting is a pointer to a uarta_baud_setting_t structure. Implements uart_api_t::baudSet

**Warning**

This terminates any in-progress transmission.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Baud rate was successfully changed. |
| FSP_ERR_ASSERTION | Pointer to UARTA control block is NULL or the UART is not configured to use the internal clock. |
| FSP_ERR_INVALID_ARGUMENT | Invalid clock select (f_UTA0) and baudrate configuration. |
| FSP_ERR_NOT_OPEN | The control block has not been opened |

### ◆ R_UARTA_InfoGet()

fsp_err_t R_UARTA_InfoGet ( uart_ctrl_t *const *p_api_ctrl*, uart_info_t *const *p_info* )

Provides the driver information, including the maximum number of bytes that can be received or transmitted at a time. Implements uart_api_t::infoGet

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Information stored in provided p_info. |
| FSP_ERR_ASSERTION | Pointer to UART control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened |

### ◆ R_UARTA_Abort()

fsp_err_t R_UARTA_Abort ( uart_ctrl_t *const *p_api_ctrl*, uart_dir_t *communication_to_abort* )

Provides API to abort ongoing transfer. Transmission is aborted after the current character is transmitted. Reception is still enabled after abort(). Any characters received after abort() and before the transfer is reset in the next call to read(), will arrive via the callback function with event UART_EVENT_RX_CHAR. Implements uart_api_t::communicationAbort

**Return values**

| | |
|---|---|
| FSP_SUCCESS | UARTA transaction aborted successfully. |
| FSP_ERR_ASSERTION | Pointer to UARTA control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_UNSUPPORTED | The requested Abort direction is unsupported. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes. This function calls: transfer_api_t::disable

### ◆ R_UARTA_ReadStop()

fsp_err_t R_UARTA_ReadStop ( uart_ctrl_t *const *p_api_ctrl*, uint32_t * *p_remaining_bytes* )

Provides API to abort ongoing read. Reception is still enabled after abort(). Any characters received after abort() and before the transfer is reset in the next call to read(), will arrive via the callback function with event UART_EVENT_RX_CHAR. Implements uart_api_t::readStop

**Return values**

| | |
|---|---|
| FSP_SUCCESS | UARTA transaction aborted successfully. |
| FSP_ERR_ASSERTION | Pointer to UARTA control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_UNSUPPORTED | The requested Abort direction is unsupported. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes. This function calls: transfer_api_t::disable

### ◆ R_UARTA_BaudCalculate()

fsp_err_t R_UARTA_BaudCalculate ( uint32_t *baudrate*, uint32_t *baud_rate_percent_error_x1000*, uarta_clock_source_t *clock_source*, uarta_baud_setting_t *const *p_baud_setting* )

Calculates baud rate register settings. Evaluates and determines the best possible settings set to the baud rate related registers.

**Parameters**

| | | |
|---|---|---|
| [in] | baudrate | Baud rate [bps]. For example, 19200, 57600, 115200, etc. |
| [in] | baud_rate_percent_error_x1000 | Max baud rate error. At most baud_rate_percent_error x 1000 required for module to function. Absolute max baud_rate_error is 4740 (4.74%). |
| [in] | clock_source | Clock Source. Required for module to generate baudrate. The clock sources can be select include UARTA_CLOCK_SOURCE_MOSC, UARTA_CLOCK_SOURCE_HOCO, UARTA_CLOCK_SOURCE_MOCO, UARTA_CLOCK_SOURCE_SOSC_LOCO. |
| [out] | p_baud_setting | Baud setting information stored here if successful |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Baud rate is set successfully |
| FSP_ERR_ASSERTION | Null pointer |
| FSP_ERR_INVALID_ARGUMENT | Argument is out of available range, baud rate is '0'. |
| FSP_ERR_INVALID_RATE | Baud rate error is outside the range or the baud rate could not be set given the current clock source. |

### ◆ R_UARTA_ReceiveSuspend()

| fsp_err_t R_UARTA_ReceiveSuspend ( uart_ctrl_t *const *p_api_ctrl*) |
|---|
| Suspend Reception<br><br>**Return values**<br>FSP_ERR_UNSUPPORTED — Functionality not supported by this driver instance |

### ◆ R_UARTA_ReceiveResume()

| fsp_err_t R_UARTA_ReceiveResume ( uart_ctrl_t *const *p_api_ctrl*) |
|---|
| Resume Reception<br><br>**Return values**<br>FSP_ERR_UNSUPPORTED — Functionality not supported by this driver instance |

## 5.2.6.32 UART Communication Device (rm_comms_uart)

### Detailed Description

Middleware to implement a generic communications interface over UART. This module implements the Communications Middleware Interface.

# Overview

The RM_COMMS_UART module implements COMMS API for UART interface.

### Features

The implementation of the UART communications interfacehas the following key features:

- Non-blocking API for bare metal
- Non-blocking and blocking API for RTOS

# Configuration

### Build Time Configurations for rm_comms_uart

The following build time configurations are defined in fsp_cfg/rm_comms_uart_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

### Configurations for Connectivity > UART Communication Device (rm_comms_uart)

This module can be added to the Stacks tab via New Stack > Connectivity > UART Communication Device (rm_comms_uart).

| Configuration | Options | Default | Description |
|---|---|---|---|
| RTOS | | | |
| Recursive Write Mutex | • Do Not Use<br>• Use | Use | Lock device for writing in using RTOS. |
| Recursive Read Mutex | • Do Not Use<br>• Use | Use | Lock device for reading in using RTOS. |
| Mutex Timeout | Value must be a non-negative integer | 0xFFFFFFFF | Timeout for recursive mutex operation in using RTOS. |
| Write Semaphore | • Do Not Use<br>• Use | Use | Block writing in using RTOS. |
| Read Semaphore | • Do Not Use<br>• Use | Use | Block reading in using RTOS. |
| Semaphore Timeout | Value must be a non-negative integer | 0xFFFFFFFF | Timeout for semaphore operation in using RTOS. |
| Name | Name must be a valid C symbol | g_comms_uart0 | Module name. |
| Callback | Name must be a valid C symbol | NULL | A user callback function can be provided. |

# Usage Notes

### Limitations

- RM_COMMS_API are not reentrant in non blocking mode
- When in blocking mode, RM_COMMS_UART_Write() and RM_COMMS_UART_Read() cannot be called in callback.
- RM_COMMS_UART_WriteRead API is not implemented

# Examples

### Basic Example

This is a basic example of minimal use of UART communications implementation in an application.

```
void rm_comms_uart_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
    err = RM_COMMS_UART_Open(&g_comms_uart_ctrl, &g_comms_uart_cfg);
 if (FSP_SUCCESS != err)
    {
```

```
 /* Handle any errors. */
    }
 while (true)
    {
 /* Send data. */
       g_err_flag = 0;
       g_tx_flag = 0;
       err       = RM_COMMS_UART_Write(&g_comms_uart_ctrl, g_tx_buf, TX_BUF_LEN);
 if (FSP_SUCCESS != err)
      {
 /* Handle any errors. */
      }
 while ((0 == g_tx_flag) && (0 == g_err_flag))
      {
 /* Wait callback */
      }
 /* Receive data. */
       g_err_flag = 0;
       g_rx_flag = 0;
       err       = RM_COMMS_UART_Read(&g_comms_uart_ctrl, g_rx_buf, RX_BUF_LEN);
 if (FSP_SUCCESS != err)
      {
 /* Handle any errors.*/
      }
 while ((0 == g_rx_flag) && (0 == g_err_flag))
      {
 /* Wait callback */
      }
    }
}
static void rm_comms_uart_callback (rm_comms_callback_args_t * p_args)
{
 if (p_args->event == RM_COMMS_EVENT_TX_OPERATION_COMPLETE)
    {
```

```
        g_tx_flag = 1;
    }
 else if (p_args->event == RM_COMMS_EVENT_RX_OPERATION_COMPLETE)
    {
        g_rx_flag = 1;
    }
 else
    {
        g_err_flag = 1;
    }
}
```

## Data Structures

| | |
|---|---|
| struct | rm_comms_uart_instance_ctrl_t |

## Data Structure Documentation

### ◆ rm_comms_uart_instance_ctrl_t

| struct rm_comms_uart_instance_ctrl_t | |
|---|---|
| Communications middleware control structure. | |
| **Data Fields** | |
| uint32_t | open |
| | Open flag. |
| | |
| rm_comms_cfg_t const * | p_cfg |
| | Middleware configuration. |
| | |
| rm_comms_uart_extended_cfg_t const * | p_extend |
| | Pointer to extended configuration structure. |
| | |
| void(* | p_callback )(rm_comms_callback_args_t *p_args) |
| | Pointer to callback that is called when a uart_event_t occurs. |

| | |
|---|---|
| void * | p_context |
| | Pointer to context passed into callback function. |

### Function Documentation

#### ◆ RM_COMMS_UART_Open()

fsp_err_t RM_COMMS_UART_Open ( rm_comms_ctrl_t *const *p_api_ctrl*, rm_comms_cfg_t const *const *p_cfg* )

Opens and configures the UART Comms module. Implements rm_comms_api_t::open.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | UART Comms module successfully configured. |
| FSP_ERR_ASSERTION | Null pointer, or one or more configuration options is invalid. |
| FSP_ERR_ALREADY_OPEN | Module is already open. This module can only be opened once. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes.

#### ◆ RM_COMMS_UART_Close()

fsp_err_t RM_COMMS_UART_Close ( rm_comms_ctrl_t *const *p_api_ctrl*)

Disables specified UART Comms module. Implements rm_comms_api_t::close.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully closed. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not open. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes.

### ◆ RM_COMMS_UART_CallbackSet()

fsp_err_t RM_COMMS_UART_CallbackSet ( rm_comms_ctrl_t *const *p_api_ctrl*, void(*)(rm_comms_callback_args_t *) *p_callback*, void *const *p_context* )

Updates the UART Comms callback. Implements rm_comms_api_t::callbackSet.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully set. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_COMMS_UART_Read()

fsp_err_t RM_COMMS_UART_Read ( rm_comms_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_dest*, uint32_t const *bytes* )

Performs a read from the UART device. Implements rm_comms_api_t::read.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully data decoded. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not open. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes.

### ◆ RM_COMMS_UART_Write()

fsp_err_t RM_COMMS_UART_Write ( rm_comms_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_src*, uint32_t const *bytes* )

Performs a write to the UART device. Implements rm_comms_api_t::write.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully writing data . |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not open. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes.

### ◆ RM_COMMS_UART_WriteRead()

fsp_err_t RM_COMMS_UART_WriteRead ( rm_comms_ctrl_t *const *p_api_ctrl*, rm_comms_write_read_params_t const *write_read_params* )

Performs a write to, then a read from the UART device. Implements rm_comms_api_t::writeRead.

**Return values**

| | |
|---|---|
| FSP_ERR_UNSUPPORTED | Not supported. |

## Detailed Description

Driver for the USB peripheral on RA MCUs. This module implements the USB Interface.

# Overview

The USB module operates in combination with the device class drivers provided by Renesas to form a complete USB stack.

### Features

The USB module has the following key features:

- USB Host mode
  - Enumerates Low/Full/High-speed devices (see note below)
  - Automatic transfer error determination and retry
- USB Peripheral mode
  - Supports USB1.1/2.0/3.0 hosts
- Automatic processing of device connect/disconnect, suspend/resume, and USB bus reset
- Up to 10 pipes
  - Control transfers supported on pipe 0
  - Data transfer on pipes 1 to 9 (Bulk or Interrupt)
- Functions with or without an RTOS

*Note*

*Supported speeds are dependent on the MCU.*

# Support Device Class

This driver supports the following device classes.

| Host/Peripheral | Device Class | BareMetal | FreeRTOS | AzureRTOS |
|---|---|---|---|---|
| Host | HCDC (ACM) | Yes | Yes | Yes |
| | HCDC (ECM) | – | Yes | – |
| | HHID | Yes | Yes | Yes |
| | HMSC | Yes | Yes | Yes |
| | HPRN | – | – | Yes |
| | HUVC | – | – | Yes |
| | HVND | Yes | Yes | – |
| | HAUD | Yes | Yes | Yes |
| | HCDC+HMSC (Composite) | – | Yes | – |
| Peripheral | PCDC | Yes | Yes | Yes |
| | PHID | Yes | Yes | Yes |
| | PMSC | Yes | Yes | Yes |
| | PPRN | Yes | Yes | Yes |
| | PAUD | Yes | Yes | Yes |
| | DFU | – | – | Yes |

| | | | | |
|---|---|---|---|---|
| | PVND | Yes | Yes | – |
| | PCDC+PMSC | Yes | Yes | Yes |
| | PHID+PMSC | Yes | Yes | – |
| | PCDC+PHID | Yes | Yes | – |
| | PCDC+PCDC | Yes | Yes | – |
| | PHID+PHID | Yes | Yes | – |
| | PCDC+PVND | Yes | Yes | – |
| Other | OTG (CDC) | – | – | Yes |
| | OTG (HID) | – | – | Yes |
| | OTG (MSC) | – | – | Yes |

# Configuration

### Build Time Configurations for r_usb_basic

The following build time configurations are defined in fsp_cfg/r_usb_basic_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| CL Only Mode | • Disabled<br>• Enabled | Disabled | To reduce power consumption, a classic-only mode where operation is only in accord with the USB 1.1 standard is selectable. |
| CPU Bus Access Wait Cycles | MCU Specific Options | | This setting controls the delay for consecutive USB peripheral register access. Set this value to a number of CPU cycles that is equivalent to 40.8ns or more. |
| Battery Charging | MCU Specific Options | | Specify whether or not to include battery charging functionality. |
| Power IC Shutdown Polarity | MCU Specific Options | | Select the polarity of the Shutdown signal on the power supply IC (if provided). |

| | | | |
|---|---|---|---|
| Dedicated Charging Port (DCP) Mode | MCU Specific Options | | When enabled, USB communication is disabled and the port is used for charging only. |
| Notifications for SET_INTERFACE/SET_FEATURE/CLEAR_FEATURE | • Disabled<br>• Enabled | Enabled | When enabled, the application will receive notifications for SET_INTERFACE, SET_FEATURE and CLEAR_FEATURE messages. |
| Double Buffering | • Disabled<br>• Enabled | Enabled | When enabled, the FIFOs for Pipes 1-5 are double-buffered. |
| Continuous Transfer Mode | MCU Specific Options | | Enable or disable continuous transfer mode. |
| LDO Regulator | MCU Specific Options | | Enable or disable LDO regulator. |
| DMA/DTC Support | MCU Specific Options | | Enable or disable DMA/DTC support for the USB module. |
| DMA/DTC Source Address | MCU Specific Options | | Set this to match the speed mode when DMA/DTC is enabled. Otherwise, set to 'DMA Disabled'/'DTC Disabled'. |
| DMA/DTC Destination Address | MCU Specific Options | | Set this to match the speed mode when DMA/DTC is enabled. Otherwise, set to 'DMA Disabled'/'DTC Disabled'. |
| USB Compliance Test mode | • Enabled<br>• Disabled | Disabled | Display the information required to take the compliance test. |
| USB TPL table name | Enter the TPL table name. | NULL | Enter the name of the TPL Table. |

**Configurations for Connectivity > USB (r_usb_basic)**

| Configuration | Options | Default | Description |
|---|---|---|---|
| Name | Name must be a valid C symbol | g_basic0 | Module name. |
| USB Mode | • Host mode<br>• Peri mode<br>• OTG mode | Host mode | Select the usb mode. |

| | | | |
|---|---|---|---|
| USB Speed | • Full Speed<br>• Hi Speed<br>• Low Speed | Full Speed | Select the USB speed. |
| USB Module Number | • USB_IP0 Port<br>• USB_IP1 Port | USB_IP0 Port | Specify the USB module number to be used. |
| USB Device Class | Refer to the RA Configuration tool for available options. | Peripheral Communications Device Class | Select the USB device class. |
| USB Descriptor | USB Descriptor must be a valid C symbol. | g_usb_descriptor | Enter the name of the descriptor to be used. For how to create a descriptor structure, refer to the Descriptor definition chapter in the usb_basic manual. Specify NULL when using the Host class. |
| USB Compliance Callback | Compliance Callback must be a valid C symbol. | NULL | Set the callback for compliance tests here. |
| USBFS Interrupt Priority | MCU Specific Options | | Select the interrupt priority used by the main USBFS ISR. |
| USBFS Resume Priority | MCU Specific Options | | Select the interrupt priority used by the USBFS Resume ISR. |
| USBFS D0FIFO Interrupt Priority | MCU Specific Options | | Select the interrupt priority used by the USBFS D0FIFO. |
| USBFS D1FIFO Interrupt Priority | MCU Specific Options | | Select the interrupt priority used by the USBFS D1FIFO. |
| USBHS Interrupt Priority | MCU Specific Options | | Select the interrupt priority used by the main USBHS ISR. |
| USBHS D0FIFO Interrupt Priority | MCU Specific Options | | Select the interrupt priority used by the USBHS D0FIFO ISR. |
| USBHS D1FIFO Interrupt Priority | MCU Specific Options | | Select the interrupt priority used by the USBHS D1FIFO ISR. |
| USB Callback | Enter the address of the function. | NULL | A user callback function can be defined here. |
| USB Callback Context | Enter the address of the context. | NULL | Set the callback context here. |

### Clock Configuration

The USB module uses PLL as the clock source. The PLL frequency can be set in the **Clocks** tab of the configuration editor or by using the CGC Interface at run-time.

*Note*

*When using HOCO as the PLL source on Cortex M33 parts the FLL function must be enabled for correct USB operation. Refer to the MCU Family -> Clocks group of the BSP properties in the RA configuration tool to adjust FLL settings.*

### Pin Configuration

In peripheral mode the USB_VBUS and/or USBHS_VBUS pins are used to detect the USB connection status (connected or disconnected) and should be connected to the USB VBUS signal.

*Note*

*USB_VBUS and USBHS_VBUS are 5V-tolerant pins.*

In host mode the USBHS_VBUSEN, USBHS_OVRCURA and USBHS_OVRCURB pins should be connected to the relevant pins of an external power supply IC, if available. These pins will be used to manage the USB VBUS supply.

### DMA Configuration

When using DMA with USB the following properties must be configured for each DMAC module:

| Config Name | Select Name | Description |
|---|---|---|
| Transfer Size | 2 Bytes<br>4 Bytes | In FS mode, select "2 Bytes"<br>In HS mode, select "4 Bytes" |
| Activation source | USBFS FIFO 0<br>USBFS FIFO 1<br>USBHS FIFO 0<br>USBHS FIFO 1 | USB FS Reception<br>USB FS Transmission<br>USB HS Reception<br>USB HS Transmission |

# Descriptor definition

In Peripheral mode, the usb_descriptor_t structure stores descriptor information including the device and configuration descriptors. The values set in this structure are sent to the USB host as part of enumeration.

```
typedef struct usb_descriptor
{
    uint8_t *p_device;    /* Pointer to device descriptor */
    uint8_t *p_config_f; /* Pointer to full-speed configuration descriptor */
    uint8_t *p_config_h; /* Pointer to high-speed configuration descriptor (HS only)
*/
    uint8_t *p_qualifier; /* Pointer to device qualifier descriptor (HS only) */
```

```
    uint8_t **pp_string; /* Pointer to string descriptor table */
    uint8_t num_string;   /* Number of strings in table */
} usb_descriptor_t;
```

*Note*

*Even in high-speed mode the full-speed configuration must be made available:*

```
/* Example USB FS descriptor struct */
usb_descriptor_t g_usb_descriptor =
{
    smp_device,
    smp_config_f,
    NULL,
    NULL,
    smp_str_table,
    3,
};
/* Example USB HS descriptor struct */
usb_descriptor_t g_usb_descriptor =
{
    smp_device,
    smp_config_f,
    smp_config_h,
    smp_qualifier,
    smp_str_table,
    3,
};
```

### String Descriptor

This USB driver requires string descriptors to be registered in the string descriptor table. Use the following format to define the elements:

```
/* String descriptor 0 is reserved for language ID information */
uint8_t str_descriptor_0[]
{
```

```
    0x04,      /* Length */
    0x03,      /* Descriptor type */
    0x09, 0x04 /* Language ID */
};
uint8_t str_descriptor_manufacturer[] =
{
    0x10,      /* Length */
    0x03,      /* Descriptor type */
 'R', 0x00,
 'E', 0x00,
 'N', 0x00,
 'E', 0x00,
 'S', 0x00,
 'A', 0x00,
 'S', 0x00
};
uint8_t str_descriptor_product[] =
{
    0x12,      /* Length */
    0x03,      /* Descriptor type */
 'C', 0x00,
 'D', 0x00,
 'C', 0x00,
 '_', 0x00,
 'D', 0x00,
 'E', 0x00,
 'M', 0x00,
 'O', 0x00
};
/* String descriptor table */
uint8_t * smp_str_table[] =
{
    str_descriptor_0,            /* Index: 0 */
    str_descriptor_manufacturer, /* Index: 1 */
```

```
    str_descriptor_product,      /* Index: 2 */
};
```

*Note*

*Set the string index values in the device/configuration descriptors (iManufacturer, iConfiguration etc.) to the index of the desired string in the string descriptor table. For example, in the table below, the manufacturer is described in* ***str_descriptor_manufacturer*** *and the value of iManufacturer in the device descriptor is* ***1****.*

### Other Descriptors

Refer to the Universal Serial Bus Revision 2.0 specification (http://www.usb.org/developers/docs/) for details on how to construct the device, configuration and qualifier descriptors.

# Usage Notes

### Program Structure

USB applications (whether using an RTOS or not) should be written as an event-handling loop. Either a callback function (RTOS only) or R_USB_EventGet should be used to provide event data to the application loop where a switch statement handles the event.

*Note*

*1.The USB_STATUS_CONFIGURED event should be confirmed before calling R_USB_Read or R_USB_Write.*
*2.When attaching or detaching USB cable, the suspend or resume event may be notified to the application program in USB peripheral mode. Please ignore these events since the notification of these events to the application program does not affect the operation.*
*3.USB applications always need to check the USB device status member(status) of usb_event_info_t control structure before proceeding to event-handling loop. If device status is success (FSP_SUCCESS) then only proceed with handling of received events.*

### Limitations

Developers should be aware of the following limitations when using the USB driver:

- In USB host mode, the module does not support suspend during data transfers. Execute suspend only after confirming that all transfers are complete.
- Multiconfigurations are not supported.
- This driver does not support CPU transfers using the D0FIFO/D1FIFO register.
- In USB host mode, this USB driver does not support the composite device other than "HMSC + HCDC (for FreeRTOS)".
- The user can not specify DMA transfer to USB IP0 and IP1 modules at the same time when using USB multi-port feature. USB multi-port function: Simultaneous operation feature of USB Host and Peripheral.
- In USB host mode, When using a USB High-speed module, enumeration may not start when the user slowly detach the USB cable and attach USB cable.

### Compliance Test

Please set as follows to the following items in RA configuration (r_usb_basic) when doing the compliance test.

1.USB Compliance Test mode Set "Enabled" in this item.

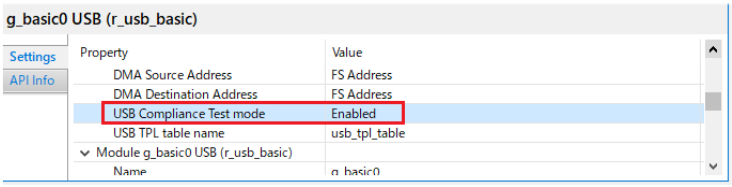

Figure 223: Compliance Test Setting

2.USB TPL table name. Set the start address of TPL(Target Peripheral List) defined in the application program.

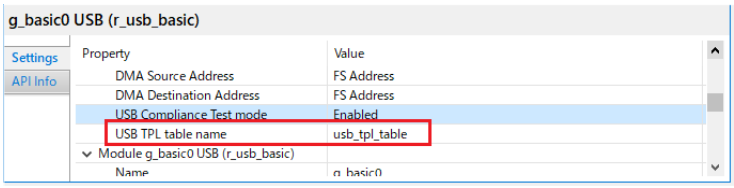

Figure 224: TPL Start Address Setting

Please refer to the following about how to define for TPL.
The following example is when two devices are set in TPL.

```
const uint16_t usb_tpl_table[] =
{
    2,                  /* Number of tpl */
    0,                  /* Reserved */
    0x0123, 0x4567,     /* Vendor ID, Product ID (1st device) */
    0x89ab, 0xcdef      /* Vendor ID, Product ID (2nd device) */
};
```

3.USB Compliance Callback Set the start address of the callback function defined in the application program.

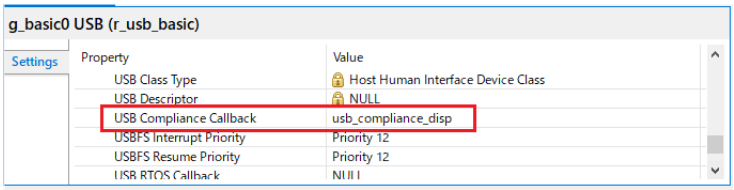

Figure 225: Compliance Callback Setting

The user needs to create this callback function by referring to the following.

```
void usb_compliance_disp (void * param)
{
    usb_compliance_t    *disp_data;
    uint8_t             print_data[32];
    disp_data = (usb_compliance_t*)param;
 switch(disp_data->status)
    {
 case USB_COMPLIANCETEST_ATTACH:            /* Device Attach Detection */
           display("\nATTACH \n");
 break;
 case USB_COMPLIANCETEST_DETACH:            /* Device Detach Detection */
           display("\nDETACH \n");
 break;
 case USB_COMPLIANCETEST_TPL:               /* TPL device connect */
           display("\nTPL PID:%04x VID:%04x \n",disp_data->pid, disp_data->vid);
 break;
 case USB_COMPLIANCETEST_NOTTPL:            /* Not TPL device connect */
           display("\nNOTPL PID:%04x VID:%04x \n",disp_data->pid, disp_data->vid);
 break;
 case USB_COMPLIANCETEST_HUB:               /* USB Hub connect */
           display("\nHub    \n");
 break;
 case USB_COMPLIANCETEST_OVRC:             /* over current */
 break;
 case USB_COMPLIANCETEST_NORES:             /* Response Time out for Control Read
Transfer */
           display("\nNOTRESP \n");
 break;
 case USB_COMPLIANCETEST_SETUP_ERR:         /* Setup Transaction Error */
 break;
 default:
 break;
    }
} /* End of function usb_compliance_disp() */
```

Please replace the display function described in the example with the display function created by the customer.

### Callback function for USB Peripheral

The user can get completed USB event using callback function in USB Peripheral for BareMetal.

- Please specify user callback function in the following item.

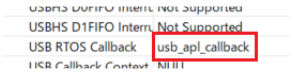

Figure 226: User Callback Function Setting

- Please call the *R_USB_DriverActivate* function using one of the following methods.
  - Infinite loop in user application program
  - Timer Interrupt (Add r_gpt module in user system)
- Please sepecify the area to store USB events to USB driver using *R_USB_CallbackMemorySet* function after calling *R_USB_Open* function.

```
usb_callback_args_t g_apl_usb_event_callback;
```

- Please allocate a buffer area such as a ring buffer to store USB event information in user application program.

```
#define BUFSIZE 10

usb_callback_args_t g_apl_usb_event_buffer[BUFSIZE];
```

- The USB driver calls the callback function when the USB event completes. USB event information is stored in the area indicated by the callback function argument.Copy the callback function argument to the ring buffer area or other area secured above.

```
g_apl_usb_event_buffer[g_apl_buffer_wp] = g_apl_usb_event_callback;

g_apl_buffer_wp++;

g_apl_buffer_wp %= BUFSIZE;
```

### TrustZone

1. The USB driver for FreeRTOS cannot be allocated in Secure region.
2. Please place the descriptor file in Secure region when using Non-Secure Callable.
3. The user callback function should be specified using the *R_USB_Callback* function after calling the *R_USB_Open* function when using Non-Secure Callable.
4. For Non-Secure region, please do USB clock setting when creating Secure project.
5. Please do USB pin setting when creating USB driver project.

### Support Composite Device

This driver for FreeRTOS supports the following compoiste device when this driver for FreeRTOS works in USB Host mode.

1. PCDC + PMSC

### How to Configuration

- Add HMSC and HCDC stack as follow.

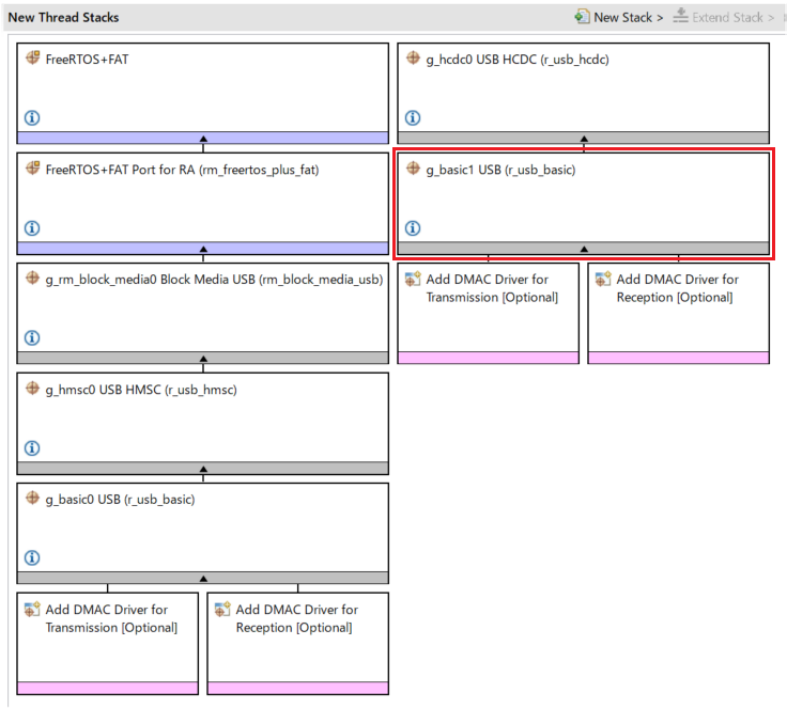

Figure 227: Add HMSC and HCDC Stack

- Delete the "g_basic1" instance manually since this instance is not used in composite device. (Refer to the red frame in the above figure.)

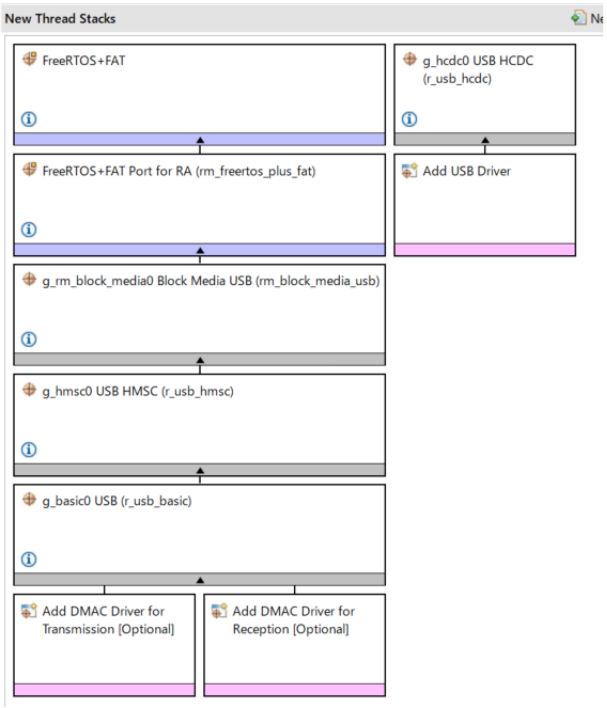

Figure 228: Delete g_basic1 instance

### Using Hub

- The user can use USB Hub when using the following device classes (Bare Metal + FreeRTOS):
    - Host Communication Device Class (HCDC)
    - Host Human Interface Device Class (HHID)
    - Host Mass Storage Class (HMSC)
- When configuring single-class host hub, be sure to enable hub support property in each class stack:

Figure 229: USB Hub CDC-CDC setting

#### Note

- For USB Hub usage with Azure RTOS, please refer to Azure RTOS USBX Port (rm_usbx_port).
- The followings are the limitation when using USB Hub:
    - The current USB driver does not support for multi-class host hub and DMA transfer.
    - The USB driver allocates USB PIPE9 for USB Hub.
    - For HCDC, the user cannot connect more than 2 CDC devices to USB Hub.
    - For HHID, the user cannot connect more than 3 HID devices to USB Hub.
    - For HMSC, the user cannot connect more than 4 MSC devices to USB Hub.
- Depending on the Hub used, it may be necessary to supply power to the Hub.
- For HHID Hub, do not connect two HID devices that support both Interrupt IN and Interrupt Out transfer.
- For HMSC Hub, HMSC driver may not work properly due to the combination of the Hub

device and USB stick.
- HVND and HCDC-ECM do not support USB Hub.

### UCLK setting

Enable UCLK in "Clocks" tab on e² studio when using the following MCU.

1. RA6M4

# Examples

### USB Basic Example

This is a basic example of minimal use of the USB in an application.

```
void usb_basic_example (void)
{
    usb_event_info_t event_info;
 usb_status_t    event;
    g_usb_on_usb.open(&g_basic0_ctrl, &g_basic0_cfg);
    memset(&event_info, 0, sizeof(usb_event_info_t));
 /* Loop back between PC(TerminalSoft) and USB MCU */
 while (1)
    {
       g_usb_on_usb.eventGet(&event_info, &event);
 switch (event)
     {
 case USB_STATUS_CONFIGURED:
               g_usb_on_usb.read(&g_basic0_ctrl, g_buf, DATA_LEN, USB_CLASS_PCDC);
 break;
 case USB_STATUS_WRITE_COMPLETE:
 if (FSP_SUCCESS == event_info.status)
     {
                g_usb_on_usb.read(&g_basic0_ctrl, g_buf, DATA_LEN, USB_CLASS_PCDC);
     }
 break;
 case USB_STATUS_READ_COMPLETE:
 if ((FSP_SUCCESS == event_info.status) || (FSP_ERR_USB_SIZE_SHORT ==
event_info.status))
```

```
      {
                  g_usb_on_usb.write(&g_basic0_ctrl, g_buf, event_info.data_size,
USB_CLASS_PCDC);
      }
 break;
 case USB_STATUS_REQUEST:   /* Receive Class Request */
 if (USB_PCDC_SET_LINE_CODING == (event_info.setup.request_type & USB_BREQUEST))
      {
                  g_usb_on_usb.periControlDataGet(&g_basic0_ctrl, (uint8_t *)
&g_line_coding, LINE_CODING_LENGTH);
      }
 else if (USB_PCDC_GET_LINE_CODING == (event_info.setup.request_type & USB_BREQUEST))
      {
                  g_usb_on_usb.periControlDataSet(&g_basic0_ctrl, (uint8_t *)
&g_line_coding, LINE_CODING_LENGTH);
      }
 else
      {
                  g_usb_on_usb.periControlStatusSet(&g_basic0_ctrl,
USB_SETUP_STATUS_ACK);
      }
 break;
 case USB_STATUS_SUSPEND:
 case USB_STATUS_DETACH:
 break;
 default:
 break;
      }
    }
} /* End of function usb_main() */
```

### USB Host Composite (CDC+MSC) Example

### Typedefs

| | |
|---|---|
| typedef usb_event_info_t | usb_instance_ctrl_t |

### Typedef Documentation

### ◆ usb_instance_ctrl_t

| typedef usb_event_info_t usb_instance_ctrl_t |
|---|
| USB private control block. DO NOT MODIFY. Initialization occurs when R_USB_Open is called. |

## Function Documentation

### ◆ R_USB_EventGet()

| fsp_err_t R_USB_EventGet ( usb_ctrl_t *const *p_api_ctrl*, usb_status_t * *event* ) |
|---|
| Obtains completed USB related events. (OS-less Only)<br><br>In USB host mode, the device address value of the USB device that completed an event is specified in the usb_ctrl_t structure member (address) specified by the event's argument. In USB peripheral mode, USB_NULL is specified in member (address). If this function is called in the RTOS execution environment, a failure is returned.<br><br>**Return values**<br><br>FSP_SUCCESS — Event Get Success.<br>FSP_ERR_USB_FAILED — If called in the RTOS environment, an error is returned.<br><br>***Note***<br>*Do not use the same variable as the first argument of R_USB_Open for the first argument.*<br>*Do not call this API in the interrupt function.* |

### ◆ R_USB_Callback()

| fsp_err_t R_USB_Callback ( usb_callback_t * *p_callback*) |
|---|
| Register a callback function to be called upon completion of a USB related event. (RTOS only)<br><br>This function registers a callback function to be called when a USB-related event has completed. If this function is called in the OS-less execution environment, a failure is returned.<br><br>**Return values**<br><br>FSP_SUCCESS — Successfully completed.<br>FSP_ERR_ASSERTION — Parameter is NULL error.<br><br>***Note***<br>*Do not call this API in the interrupt function.* |

### ◆ R_USB_Open()

fsp_err_t R_USB_Open ( usb_ctrl_t *const *p_api_ctrl*, usb_cfg_t const *const *p_cfg* )

Applies power to the USB module specified in the argument (p_ctrl).

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Success in open. |
| FSP_ERR_USB_BUSY | Specified USB module now in use. |
| FSP_ERR_ASSERTION | Parameter is NULL error. |
| FSP_ERR_USB_FAILED | The function could not be completed successfully. |
| FSP_ERR_USB_PARAMETER | Parameter error. |

***Note***

*Do not call this API in the following function.*
*(1). Interrupt function.*
*(2). Callback function ( for RTOS ).*

### ◆ R_USB_Close()

fsp_err_t R_USB_Close ( usb_ctrl_t *const *p_api_ctrl*)

Terminates power to the USB module specified in argument (p_ctrl). USB0 module stops when USB_IP0 is specified to the member (module), USB1 module stops when USB_IP1 is specified to the member (module).

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Success. |
| FSP_ERR_USB_FAILED | The function could not be completed successfully. |
| FSP_ERR_USB_NOT_OPEN | USB module is not open. |
| FSP_ERR_ASSERTION | Parameter is NULL error. |
| FSP_ERR_USB_PARAMETER | Parameter error. |

***Note***

*Do not call this API in the following function.*
*(1). Interrupt function.*
*(2). Callback function ( for RTOS ).*

### ◆ R_USB_Read()

fsp_err_t R_USB_Read ( usb_ctrl_t *const *p_api_ctrl*, uint8_t * *p_buf*, uint32_t *size*, uint8_t *destination* )

Bulk/Interrupt data transfer.

Requests USB data read (bulk/interrupt transfer). The read data is stored in the area specified by argument (p_buf). After data read is completed, confirm the operation by checking the return value (USB_STATUS_READ_COMPLETE) of the R_USB_GetEvent function. The received data size is set in member (size) of the usb_ctrl_t structure. To figure out the size of the data when a read is complete, check the return value (USB_STATUS_READ_COMPLETE) of the R_USB_GetEvent function, and then refer to the member (size) of the usb_crtl_t structure.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully completed (Data read request completed). |
| FSP_ERR_USB_FAILED | The function could not be completed successfully. |
| FSP_ERR_USB_BUSY | Data receive request already in process for USB device with same device address. |
| FSP_ERR_ASSERTION | Parameter is NULL error. |
| FSP_ERR_USB_PARAMETER | Parameter error. |

***Note***

*1. Do not call this API in the following function.*
*(1). Interrupt function.*
*(2). Callback function ( for RTOS ).*
*2. Allocate the following the storage area when using DMA transfer and specify the start address of the allocated storage area to the 2nd argument(p_buf).*
*(1). When using High-speed and enabling continuous transfer mode, allocate the storage area with a size that is a multiple of 2048.*
*(2). When using High-speed and disabling continuous transfer mode, allocate the storage area with a size that is a multiple of 512.*
*(3). When using Full-speed, allocate the storage area with a size that is a multiple of 64.*
*3. Specify the following address to the 2nd argument (p_buf) when using DMA transfer.*
*(1). When using High-speed module, specify start address of the buffer area aligned on 4-byte boundary.*
*(2). When using Full-speed module, specify start address of the buffer area aligned on 2-byte boundary.*

### ◆ R_USB_Write()

fsp_err_t R_USB_Write ( usb_ctrl_t *const *p_api_ctrl*, uint8_t const *const *p_buf*, uint32_t *size*, uint8_t *destination* )

Bulk/Interrupt data transfer.

Requests USB data write (bulk/interrupt transfer). Stores write data in area specified by argument (p_buf). Set the device class type in usb_ctrl_t structure member (type). Confirm after data write is completed by checking the return value (USB_STATUS_WRITE_COMPLETE) of the R_USB_GetEvent function. For sending a zero-length packet, please refer the following Note.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully completed. (Data write request completed) |
| FSP_ERR_USB_FAILED | The function could not be completed successfully. |
| FSP_ERR_USB_BUSY | Data write request already in process for USB device with same device address. |
| FSP_ERR_ASSERTION | Parameter is NULL error. |
| FSP_ERR_USB_PARAMETER | Parameter error. |

***Note***

*1. The user needs to send the zero-length packet(ZLP) since this USB driver does not send the ZLP automatically. When sending a ZLP, the user sets USB_NULL in the third argument (size) of R_USB_Write function as follow. e.g)*
*R_USB_Write (&g_basic0_ctrl, &g_buf, USB_NULL);*
*2. Specify the following address to the 2nd argument (p_buf) when using DMA transfer.*
*(1). When using High-speed module, specify start address of the buffer area aligned on 4-byte boundary.*
*(2). When using Full-speed module, specify start address of the buffer area aligned on 2-byte boundary.*
*3. Do not call this API in the following function.*
*(1). Interrupt function.*
*(2). Callback function ( for RTOS ).*

### ◆ R_USB_Stop()

fsp_err_t R_USB_Stop ( usb_ctrl_t *const *p_api_ctrl*, usb_transfer_t *direction*, uint8_t *destination* )

Requests a data read/write transfer be terminated when a data read/write transfer is being performed.

To stop a data read, set USB_TRANSFER_READ as the argument (type); to stop a data write, specify USB_WRITE as the argument (type).

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully completed. (stop completed) |
| FSP_ERR_USB_FAILED | The function could not be completed successfully. |
| FSP_ERR_ASSERTION | Parameter is NULL error. |
| FSP_ERR_USB_BUSY | Stop processing is called multiple times. |
| FSP_ERR_USB_PARAMETER | Parameter error. |

***Note***

*Do not call this API in the following function.*
*(1). Interrupt function.*
*(2). Callback function ( for RTOS ).*

### ◆ R_USB_Suspend()

fsp_err_t R_USB_Suspend ( usb_ctrl_t *const *p_api_ctrl*)

Sends a SUSPEND signal from the USB module assigned to the member (module) of the usb_crtl_t structure.

After the suspend request is completed, confirm the operation with the return value (USB_STATUS_SUSPEND) of the R_USB_EventGet function.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully completed. |
| FSP_ERR_USB_FAILED | The function could not be completed successfully. |
| FSP_ERR_USB_BUSY | During a suspend request to the specified USB module, or when the USB module is already in the suspended state. |
| FSP_ERR_ASSERTION | Parameter is NULL error. |
| FSP_ERR_USB_PARAMETER | Parameter error. |

***Note***

*Do not call this API in the following function.*
*(1). Interrupt function.*
*(2). Callback function ( for RTOS ).*

### ◆ R_USB_Resume()

fsp_err_t R_USB_Resume ( usb_ctrl_t *const *p_api_ctrl*)

Sends a RESUME signal from the USB module assigned to the member (module) of the usb_ctrl_tstructure.

After the resume request is completed, confirm the operation with the return value (USB_STATUS_RESUME) of the R_USB_EventGet function

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully completed. |
| FSP_ERR_USB_FAILED | The function could not be completed successfully. |
| FSP_ERR_USB_BUSY | Resume already requested for same device address. (USB host mode only) |
| FSP_ERR_USB_NOT_SUSPEND | USB device is not in the SUSPEND state. |
| FSP_ERR_ASSERTION | Parameter is NULL error. |
| FSP_ERR_USB_PARAMETER | Parameter error. |

***Note***

*Do not call this API in the following function.*
*(1). Interrupt function.*
*(2). Callback function ( for RTOS ).*

### ◆ R_USB_VbusSet()

fsp_err_t R_USB_VbusSet ( usb_ctrl_t *const *p_api_ctrl*, uint16_t *state* )

Specifies starting or stopping the VBUS supply.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successful completion. (VBUS supply start/stop completed) |
| FSP_ERR_USB_FAILED | The function could not be completed successfully. |
| FSP_ERR_ASSERTION | Parameter is NULL error. |
| FSP_ERR_USB_PARAMETER | Parameter error. |

***Note***

*Do not call this API in the following function.*
*(1). Interrupt function.*
*(2). Callback function ( for RTOS ).*

### ◆ R_USB_InfoGet()

fsp_err_t R_USB_InfoGet ( usb_ctrl_t *const *p_api_ctrl*, usb_info_t * *p_info*, uint8_t *destination* )

Obtains completed USB-related events.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successful completion. (VBUS supply start/stop completed) |
| FSP_ERR_ASSERTION | Parameter is NULL error. |
| FSP_ERR_USB_FAILED | The function could not be completed successfully. |
| FSP_ERR_USB_PARAMETER | Parameter error. |

### ◆ R_USB_PipeRead()

fsp_err_t R_USB_PipeRead ( usb_ctrl_t *const *p_api_ctrl*, uint8_t * *p_buf*, uint32_t *size*, uint8_t *pipe_number* )

Requests a data read (Bulk/Interrupt transfer) via the pipe specified in the argument.

The read data is stored in the area specified in the argument (p_buf). After the data read is completed, confirm the operation with the R_USB_GetEvent function return value(USB_STATUS_READ_COMPLETE). To figure out the size of the data when a read is complete, check the return value (USB_STATUS_READ_COMPLETE) of the R_USB_GetEvent function, and then refer to the member (size) of the usb_crtl_t structure.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully completed. |
| FSP_ERR_USB_BUSY | Specified pipe now handling data receive/send request. |
| FSP_ERR_USB_FAILED | The function could not be completed successfully. |
| FSP_ERR_ASSERTION | Parameter is NULL error. |
| FSP_ERR_USB_PARAMETER | Parameter error. |

***Note***

*1. Do not call this API in the following function.*
*(1). Interrupt function.*
*(2). Callback function ( for RTOS ).*
*2. Allocate the following the storage area when using DMA transfer and specify the start address of the allocated storage area to the 2nd argument(p_buf).*
*(1). When using High-speed and enabling continuous transfer mode, allocate the storage area with a size that is a multiple of 2048.*
*(2). When using High-speed and disabling continuous transfer mode, allocate the storage area with a size that is a multiple of 512.*
*(3). When using Full-speed, allocate the storage area with a size that is a multiple of 64.*
*3. Specify the following address to the 2nd argument (p_buf) when using DMA transfer.*
*(1). When using High-speed module, specify start address of the buffer area aligned on 4-byte boundary.*
*(2). When using Full-speed module, specify start address of the buffer area aligned on 2-byte boundary.*

### ◆ R_USB_PipeWrite()

fsp_err_t R_USB_PipeWrite ( usb_ctrl_t *const *p_api_ctrl*, uint8_t * *p_buf*, uint32_t *size*, uint8_t *pipe_number* )

Requests a data write (Bulk/Interrupt transfer).

The write data is stored in the area specified in the argument (p_buf). After data write is completed, confirm the operation with the return value (USB_STATUS_WRITE_COMPLETE) of the EventGet function. For sending a zero-length packet, please refer the following Note.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully completed. |
| FSP_ERR_USB_BUSY | Specified pipe now handling data receive/send request. |
| FSP_ERR_USB_FAILED | The function could not be completed successfully. |
| FSP_ERR_ASSERTION | Parameter is NULL error. |
| FSP_ERR_USB_PARAMETER | Parameter error. |

***Note***

*1. The user needs to send the zero-length packet(ZLP) since this USB driver does not send the ZLP automatically. When sending a ZLP, the user sets USB_NULL in the third argument (size) of R_USB_PipeWrite function as follow.*
*e.g)*
*R_USB_PipeWrite (&g_basic0_ctrl, &g_buf, USB_NULL, pipe_number);*
*2. Specify the following address to the 2nd argument (p_buf) when using DMA transfer.*
*(1). When using High-speed module, specify start address of the buffer area aligned on 4-byte boundary.*
*(2). When using Full-speed module, specify start address of the buffer area aligned on 2-byte boundary.*
*3. Do not call this API in the following function.*
*(1). Interrupt function.*
*(2). Callback function ( for RTOS ).*

### ◆ R_USB_PipeStop()

fsp_err_t R_USB_PipeStop ( usb_ctrl_t *const *p_api_ctrl*, uint8_t *pipe_number* )

Terminates a data read/write operation.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully completed. (Stop request completed) |
| FSP_ERR_USB_FAILED | The function could not be completed successfully. |
| FSP_ERR_ASSERTION | Parameter is NULL error. |
| FSP_ERR_USB_PARAMETER | Parameter error. |

***Note***

*Do not call this API in the following function.*
*(1). Interrupt function.*
*(2). Callback function ( for RTOS ).*

### ◆ R_USB_UsedPipesGet()

fsp_err_t R_USB_UsedPipesGet ( usb_ctrl_t *const *p_api_ctrl*, uint16_t * *p_pipe*, uint8_t *destination* )

Gets the selected pipe number (number of the pipe that has completed initialization) via bit map information.

The bit map information is stored in the area specified in argument (p_pipe). Based on the information (module member and address member) assigned to the usb_ctrl_t structure, obtains the PIPE information of that USB device.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully completed. |
| FSP_ERR_USB_FAILED | The function could not be completed successfully. |
| FSP_ERR_ASSERTION | Parameter is NULL error. |
| FSP_ERR_USB_PARAMETER | Parameter error. |

### ◆ R_USB_PipeInfoGet()

fsp_err_t R_USB_PipeInfoGet ( usb_ctrl_t *const *p_api_ctrl*, usb_pipe_t * *p_info*, uint8_t *pipe_number* )

Gets the following pipe information regarding the pipe specified in the argument (p_ctrl) member (pipe): endpoint number, transfer type, transfer direction and maximum packet size.

The obtained pipe information is stored in the area specified in the argument (p_info).

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully completed. |
| FSP_ERR_USB_FAILED | The function could not be completed successfully. |
| FSP_ERR_ASSERTION | Parameter is NULL error. |
| FSP_ERR_USB_PARAMETER | Parameter error. |

### ◆ R_USB_PullUp()

fsp_err_t R_USB_PullUp ( usb_ctrl_t *const *p_api_ctrl*, uint8_t *state* )

This API enables or disables pull-up of D+/D- line.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successful completion. (Pull-up enable/disable setting completed) |
| FSP_ERR_USB_FAILED | The function could not be completed successfully. |
| FSP_ERR_ASSERTION | Parameter is NULL error. |
| FSP_ERR_USB_PARAMETER | Parameter error. |

***Note***

*Do not call this API in the following function.*
*(1). Interrupt function.*
*(2). Callback function ( for RTOS ).*

### ◆ R_USB_HostControlTransfer()

fsp_err_t R_USB_HostControlTransfer ( usb_ctrl_t *const *p_api_ctrl*, usb_setup_t * *p_setup*, uint8_t * *p_buf*, uint8_t *device_address* )

Performs settings and transmission processing when transmitting a setup packet.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successful completion. |
| FSP_ERR_USB_FAILED | The function could not be completed successfully. |
| FSP_ERR_ASSERTION | Parameter is NULL error. |
| FSP_ERR_USB_PARAMETER | Parameter error. |
| FSP_ERR_USB_BUSY | Specified pipe now handling data receive/send request. |

***Note***

*Do not call this API in the following function.*
*(1). Interrupt function.*
*(2). Callback function ( for RTOS ).*

### ◆ R_USB_PeriControlDataGet()

fsp_err_t R_USB_PeriControlDataGet ( usb_ctrl_t *const *p_api_ctrl*, uint8_t * *p_buf*, uint32_t *size* )

Receives data sent by control transfer.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successful completion. |
| FSP_ERR_USB_FAILED | The function could not be completed successfully. |
| FSP_ERR_ASSERTION | Parameter is NULL error. |
| FSP_ERR_USB_BUSY | Specified pipe now handling data receive/send request. |
| FSP_ERR_USB_PARAMETER | Parameter error. |

***Note***

*Do not call this API in the following function.*
*(1). Interrupt function.*
*(2). Callback function ( for RTOS ).*

### ◆ R_USB_PeriControlDataSet()

fsp_err_t R_USB_PeriControlDataSet ( usb_ctrl_t *const *p_api_ctrl*, uint8_t * *p_buf*, uint32_t *size* )

Performs transfer processing for control transfer.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successful completion. |
| FSP_ERR_USB_FAILED | The function could not be completed successfully. |
| FSP_ERR_ASSERTION | Parameter is NULL error. |
| FSP_ERR_USB_BUSY | Specified pipe now handling data receive/send request. |
| FSP_ERR_USB_PARAMETER | Parameter error. |

***Note***

*Do not call this API in the following function.*
*(1). Interrupt function.*
*(2). Callback function ( for RTOS ).*

### ◆ R_USB_PeriControlStatusSet()

fsp_err_t R_USB_PeriControlStatusSet ( usb_ctrl_t *const *p_api_ctrl*, usb_setup_status_t *status* )

Set the response to the setup packet.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successful completion. |
| FSP_ERR_USB_FAILED | The function could not be completed successfully. |
| FSP_ERR_ASSERTION | Parameter is NULL error. |
| FSP_ERR_USB_PARAMETER | Parameter error. |

***Note***

*Do not call this API in the following function.*
*(1). Interrupt function.*
*(2). Callback function ( for RTOS ).*

### ◆ R_USB_RemoteWakeup()

| fsp_err_t R_USB_RemoteWakeup ( usb_ctrl_t *const *p_api_ctrl*) |
|---|

Sends a remote wake-up signal to the connected Host.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successful completion. |
| FSP_ERR_USB_FAILED | The function could not be completed successfully. |
| FSP_ERR_ASSERTION | Parameter is NULL error. |
| FSP_ERR_USB_NOT_SUSPEND | Device is not suspended. |
| FSP_ERR_USB_BUSY | The device is in resume operation. |

***Note***

*Do not call this API in the following function.*
*(1). Interrupt function.*
*(2). Callback function ( for RTOS ).*

### ◆ R_USB_DriverActivate()

| fsp_err_t R_USB_DriverActivate ( usb_ctrl_t *const *p_api_ctrl*) |
|---|

Activate USB Driver for USB Peripheral BareMetal.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successful completion. |
| FSP_ERR_USB_FAILED | The function could not be completed successfully. |
| FSP_ERR_ASSERTION | Parameter is NULL error. |

***Note***

*Call this API in the in the infinite loop of the application program or a timer interrupt.*

### ◆ R_USB_CallbackMemorySet()

fsp_err_t R_USB_CallbackMemorySet ( usb_ctrl_t *const *p_api_ctrl*, usb_callback_args_t * *p_callback_memory* )

Set callback memory to USB Driver for USB Peripheral BareMetal.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successful completion. |
| FSP_ERR_USB_FAILED | The function could not be completed successfully. |
| FSP_ERR_ASSERTION | Parameter is NULL error. |

***Note***

*Call this API after calling R_USB_Open function.*

### ◆ R_USB_ModuleNumberGet()

fsp_err_t R_USB_ModuleNumberGet ( usb_ctrl_t *const *p_api_ctrl*, uint8_t * *module_number* )

This API gets the module number.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successful completion. |

### ◆ R_USB_ClassTypeGet()

fsp_err_t R_USB_ClassTypeGet ( usb_ctrl_t *const *p_api_ctrl*, usb_class_t * *class_type* )

This API gets the class type.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successful completion. |

***Note***

*In Bare-Metal, In the Bare-Metal version, please specify the variable specified by the 1st argument of the R_USB_EventGet function to the 1st argument of this API.*
*In the FreeRTOS, please specify one of the following to the 1st argument of this API.*
*1. The 1st argument of the callback function specified in Conguration.*
*2. The start address of the area where the structure area of the 1st argument was copied.*

### ◆ R_USB_DeviceAddressGet()

fsp_err_t R_USB_DeviceAddressGet ( usb_ctrl_t *const *p_api_ctrl*, uint8_t * *device_address* )

This API gets the device address.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successful completion. |

***Note***

*In Bare-Metal, In the Bare-Metal version, please specify the variable specified by the 1st argument of the R_USB_EventGet function to the 1st argument of this API.*
*In the FreeRTOS, please specify one of the following to the 1st argument of this API.*
*1. The 1st argument of the callback function specified in Conguration.*
*2. The start address of the area where the structure area of the 1st argument was copied.*

### ◆ R_USB_PipeNumberGet()

fsp_err_t R_USB_PipeNumberGet ( usb_ctrl_t *const *p_api_ctrl*, uint8_t * *pipe_number* )

This API gets the pipe number.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successful completion. |

***Note***

*In Bare-Metal, In the Bare-Metal version, please specify the variable specified by the 1st argument of the R_USB_EventGet function to the 1st argument of this API.*
*In the FreeRTOS, please specify one of the following to the 1st argument of this API.*
*1. The 1st argument of the callback function specified in Conguration.*
*2. The start address of the area where the structure area of the 1st argument was copied.*

### ◆ R_USB_DeviceStateGet()

fsp_err_t R_USB_DeviceStateGet ( usb_ctrl_t *const *p_api_ctrl*, uint16_t * *state* )

This API gets the state of the device.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successful completion. |

***Note***

*In Bare-Metal, In the Bare-Metal version, please specify the variable specified by the 1st argument of the R_USB_EventGet function to the 1st argument of this API.*

#### 5.2.6.34 USB Composite (r_usb_composite)

Modules » Connectivity

#### Functions

Refer to USB (r_usb_basic) for the common API (r_usb_basic) to be called from the application.

# Overview

USB composite device works as a USB Peripheral by combining two peripheral device classes and r_usb_basic module.
This USB driver supports the following composite devices:

1. PCDC + PMSC
2. PCDC + PHID
3. PHID + PMSC
4. PCDC + PCDC
5. PHID + PHID
6. PCDC + PVND

# How to Configuration

The following shows FSP configuration procedure for USB composite device.

- Select [New Stack]->[USB]->[USB Composite]

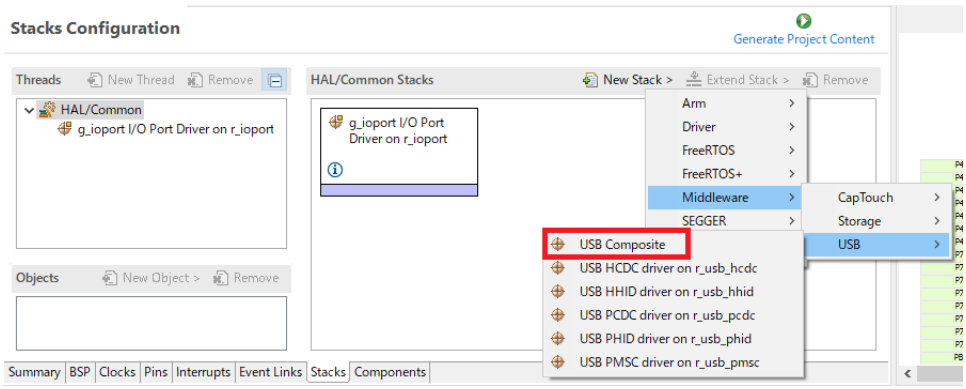

Figure 230: Select USB Composite

- The following is displayed when selecting [USB Composite].

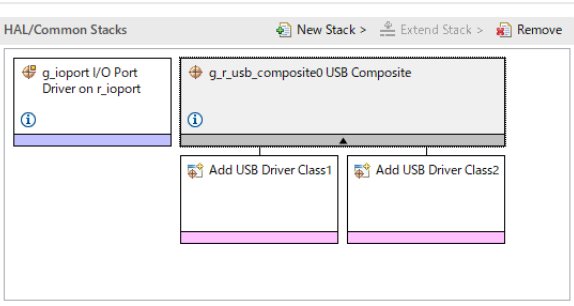

Figure 231: USB Composite Stack

- Select the supported 2 device classes as follows.

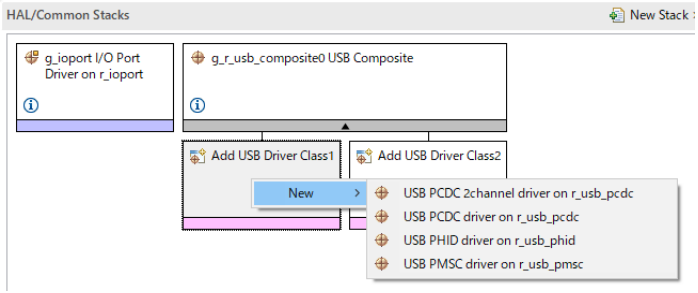

Figure 232: Select Device Classes

*Note*

1. *Be sure to select "USB PCDC driver on r_usb_pcdc" and "USB PCDC 2channel driver on r_usb_pcdc" when configurating for "PCDC + PCDC".*
2. *Be sure to select "USB PHID driver on r_usb_phid" and "USB PHID 2channel driver on r_usb_phid" when configurating for "PHID + PHID".*

- Select the supported 2 device classes as follows. The following is displayed when selecting

2 device classes.

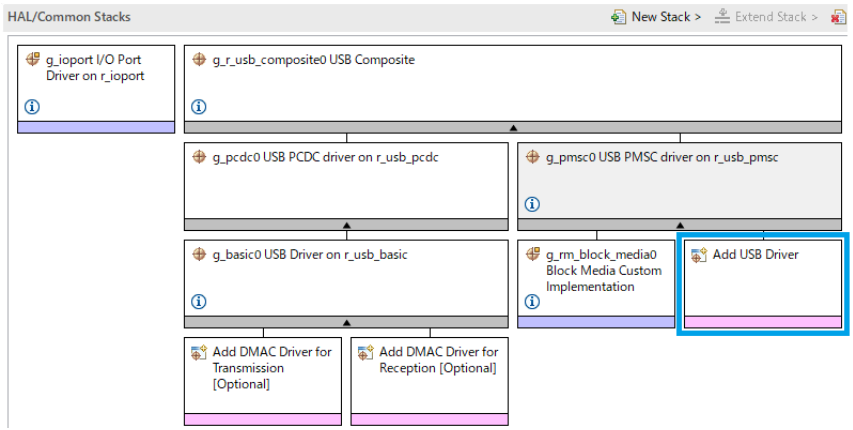

Figure 233: Delete USB Basic Instance

*Note*

1. *Delete the "g_basic1" instance manually since this instance is not used in composite device. (Refer to the blue frame in the above figure.)*
2. *The error is output when selecting the following device classes.*
    a. *PMSC + PMSC*

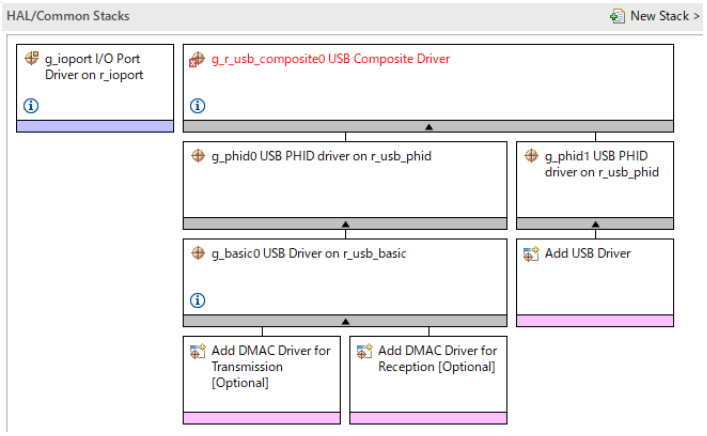

Figure 234: Device Class Selection Error

## Limitations

- The following composite device is not suppored when using RA2A1(MCU).
    - PMSC + PCDC
    - PCDC + PCDC

- If you use PMSC, make sure to use usb_basic module with PMSC.

  There is a risk that the information on the PMSC storage media cannot be registered normally in the "USB Callback Context".

**Notes**

Please determine by refer to the member "type" in "usb_event_info" structure when getting PCDC channel number which the write event is completed in PCDC + PCDC, PHID + PHID, etc.

# Descriptor

Templates for composite device descriptors can be found in ra/fsp/src/r_usb_composite folder. Also, please be sure to use your vendor ID.

1. r_usb_pcdc_pmsc_descriptor.c.template (for PCDC + PMSC)
2. r_usb_pcdc_phid_descriptor.c.template (for PCDC + PHID)
3. r_usb_phid_pmsc_descriptor.c.template (for PHID + PMSC)
4. r_usb_pcdc_pcdc_descriptor.c.template (for PCDC + PCDC)
5. r_usb_phid_phid_descriptor.c.template (for PHID + PHID)
6. r_usb_pcdc_pvnd_descriptor.c.template (for PCDC + PVND) and r_usb_pcdc_pvnd_descriptor.h.template (for PCDC + PVND)

# Examples

### USB COMPOSITE Example

- PCDC + PHID

### Detailed Description

This module provides a USB Peripheral Audio Device Class Driver (HAUD). It implements the USB HAUD Interface.

### Functions

Refer to USB (r_usb_basic) for the common API (r_usb_basic) to be called from the application.

### Detailed Description

# Overview

The r_usb_haud module combines with the r_usb_basic module to provide USB Host Audio Device Class (HAUD) driver.

### Features

The r_usb_haud module has the following key features:

- Data transfer to and from USB peripheral audio device.
- Transmissio Audio class request to USB peripheal audio device.
- Supports Audio 1.0

### Clock Configuration

Refer to the USB (r_usb_basic) module.

### Pin Configuration

Refer to the USB (r_usb_basic) module.

# Usage Notes

### Class Requests (Host to Peripheral)

This driver notifies the application when receiving the following class requests:

- Audio 1.0

| Request | Code | Description |
|---|---|---|
| SET_CUR | 0x01 | Current setting attribute |
| GET_CUR | 0x81 | Current setting attribute |

Note:

For details about each device class, please refer to Audio Class specification.

### Limitations

- This module must be incorporated into a project using r_usb_basic and does not provide any public APIs.
- Please ignore the suspend or resume event occurs when attaching or detaching the USB cable.

# Examples

### USB HAUD Example

1. Example code for Audio 1.0

```

## Function Documentation

### ◆ R_USB_HAUD_DeviceInfoGet()

fsp_err_t R_USB_HAUD_DeviceInfoGet ( usb_ctrl_t *const *p_api_ctrl*, usb_haud_device_info_t * *p_info*, uint8_t *device_address* )

Check audio version of connected device.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully completed. |
| FSP_ERR_USB_FAILED | The function could not be completed successfully. |
| FSP_ERR_ASSERTION | Parameter Null pointer error. |
| FSP_ERR_USB_PARAMETER | Parameter error. |

***Note***

*(1). Interrupt function.*
*(2). Callback function ( for RTOS ).*

### ◆ R_USB_HAUD_AlternateNumberGet()

fsp_err_t R_USB_HAUD_AlternateNumberGet ( usb_ctrl_t *const *p_api_ctrl*, usb_haud_sampling_t * *p_info*, uint8_t *direction*, uint8_t *device_address* )

Get the alternate number for SET_INTERFACE. (Audio 1.0 support only)

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully completed. |
| FSP_ERR_USB_FAILED | The function could not be completed successfully. |
| FSP_ERR_ASSERTION | Parameter Null pointer error. |
| FSP_ERR_USB_PARAMETER | Parameter error. |

***Note***

*(1). Interrupt function.*
*(2). Callback function ( for RTOS ).*

### ◆ R_USB_HAUD_PipeSet()

fsp_err_t R_USB_HAUD_PipeSet ( usb_ctrl_t *const *p_api_ctrl*, uint32_t *interface_number*, uint32_t *alternate_number*, uint8_t *device_address* )

Find the interface descriptor for streaming data transfer and configure the pipe.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully completed. |
| FSP_ERR_USB_FAILED | The function could not be completed successfully. |
| FSP_ERR_ASSERTION | Parameter Null pointer error. |
| FSP_ERR_USB_PARAMETER | Parameter error. |

## 5.2.6.36 USB HCDC (r_usb_hcdc)

Modules » Connectivity

### Functions

fsp_err_t R_USB_HCDC_ControlDataRead (usb_ctrl_t *const p_api_ctrl, uint8_t *p_buf, uint32_t size, uint8_t device_address)

Read Control Data.(CDC Interrupt IN data) More...

fsp_err_t R_USB_HCDC_SpecificDeviceRegister (usb_ctrl_t *const p_api_ctrl, uint16_t vendor_id, uint16_t product_id)

Register the specified vendor class device in the device table. More...

fsp_err_t R_USB_HCDC_DeviceInfoGet (usb_ctrl_t *const p_api_ctrl, usb_hcdc_device_info_t *p_info, uint8_t device_address)

Get the VID, PID and subclass code of the connected device. More...

### Detailed Description

This module provides a USB Host Communications Device Class (HCDC) driver. It implements the USB HCDC Interface.

### Functions

Refer to USB (r_usb_basic) for the common API (r_usb_basic) to be called from the application.

### Detailed Description

# Overview

The r_usb_hcdc module, when used in combination with the r_usb_basic module, operates as a USB Host Communications Device Class (HCDC) driver. The HCDC conforms to the PSTN device subclass abstract control model of the USB Communications Device Class (CDC) specification and enables communication with a CDC peripheral device.

### Features

The r_usb_hcdc module has the following key features:

- Checks for connected devices
- Implementation of communication line settings
- Acquisition of the communication line state
- Data transfer to and from a CDC peripheral device

# Configuration

### Build Time Configurations for r_usb_hcdc

The following build time configurations are defined in fsp_cfg/r_usb_hcdc_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Target Peripheral Device Class ID | • CDC class supported device<br>• Vendor class device | CDC class supported device | Specify the device class ID of the CDC device to be connected. |
| USB Hub Multi CDC | • Disabled<br>• Enabled | Disabled | Enable or disable HUB support for CDC-CDC. |

### Configurations for Connectivity > USB HCDC (r_usb_hcdc)

This module can be added to the Stacks tab via New Stack > Connectivity > USB HCDC (r_usb_hcdc).

| Configuration | Options | Default | Description |
|---|---|---|---|
| Name | Name must be a valid C symbol | g_hcdc0 | Module name. |

*Note*

*Refer to the USB (r_usb_basic) module for hardware configuration options.*

### Clock Configuration

Refer to the USB (r_usb_basic) module.

### Pin Configuration

Refer to the USB (r_usb_basic) module.

# Usage Notes

### Communications Device Class (CDC), PSTN and ACM

This software conforms to the Abstract Control Model (ACM) subclass of the Communications Device Class specification as defined in the "USB Communications Class Subclass Specification for PSTN Devices", Revision 1.2. The Abstract Control Model subclass is a technology that bridges the gap between USB devices and earlier modems (employing RS-232C connections) enabling use of application programs designed for older modems.

### Basic Functions

The main functions of HCDC are the following:

- Verify connected devices
- Make communication line settings
- Acquire the communication line state
- Transfer data to and from the CDC peripheral device

### Abstract Control Model Class Requests - Host to Device

This driver supports the following class requests:

| Request | Code | Description |
|---|---|---|
| SendEncapsulatedCommand | 0x00 | Transmits an AT command as defined by the protocol used by the device (normally 0 for USB). |
| GetEncapsulatedResponse | 0x01 | Requests a response to a command transmitted by SendEncapsulatedCommand. |
| SetCommFeature | 0x02 | Enables or disables features such as device-specific 2-byte code and country setting. |
| GetCommFeature | 0x03 | Acquires the enabled/disabled state of features such as device-specific 2-byte code and country setting. |
| ClearCommFeature | 0x04 | Restores the default enabled/disabled settings of features such as device-specific 2-byte code and country setting. |
| SetLineCoding | 0x20 | Makes communication line settings (communication speed, data length, parity bit, and stop bit length). |

| | | |
|---|---|---|
| GetLineCoding | 0x21 | Acquires the communication line setting state. |
| SetControlLineState | 0x22 | Makes communication line control signal (RTS, DTR) settings. |
| SendBreak | 0x23 | Transmits a break signal. |

*Note*

*For more information about Abstract Control Model requests, refer to Table 11 "Requests - Abstract Control Model" in the "USB Communications Class Subclass Specification for PSTN Devices", Revision 1.2.*

The expected data format for each command is shown below followed by dependent structures.

| bmRequestType | bRequest | wValue | wIndex | wLength | Data |
|---|---|---|---|---|---|
| 0x21 | SEND_ENCAPSULATED_COMMAND (0x00) | 0x0000 | 0x0000 | Data length | usb_hcdc_encapsulated_t |
| 0x21 | GET_ENCAPSULATED_RESPONSE (0x01) | 0x0000 | 0x0000 | Data length | usb_hcdc_encapsulated_t |
| 0x21 | SET_COMM_FEATURE (0x02) | usb_hcdc_feature_selector_t | 0x0000 | Data length | usb_hcdc_commfeature_t |
| 0x21 | GET_COMM_FEATURE (0x03) | usb_hcdc_feature_selector_t | 0x0000 | Data length | usb_hcdc_commfeature_t |
| 0x21 | CLEAR_COMM_FEATURE (0x04) | usb_hcdc_feature_selector_t | 0x0000 | Data length | None |
| 0x21 | SET_LINE_CODING (0x20) | 0x0000 | 0x0000 | 0x0000 | usb_hcdc_linecoding_t |
| 0xA1 | GET_LINE_CODING (0x21) | 0x0000 | 0x0000 | 0x0007 | usb_hcdc_linecoding_t |
| 0x21 | SET_CONTROL_LINE_STATE (0x22) | usb_hcdc_controllinestate_t | 0x0000 | 0x0000 | None |
| 0x21 | SEND_BREAK (0x23) | usb_hcdc_breakduration_t | 0x0000 | 0x0000 | None |

**ACM Notifications from Device to Host**

The following class notifications are supported:

| Notification | Code | Description |
|---|---|---|
| RESPONSE_AVAILABLE | 0x01 | Response to GET_ENCAPSULATED_RESPONSE |

| | | |
|---|---|---|
| SERIAL_STATE | 0x20 | Notification of serial line state |

The data types returned are as follows:

| bmRequestType | bRequest | wValue | wIndex | wLength | Data |
|---|---|---|---|---|---|
| 0xA1 | RESPONSE_AVAILABLE (0x01) | 0x0000 | 0x0000 | 0x0000 | None |
| 0xA1 | SERIAL_STATE (0x20) | 0x0000 | 0x0000 | 0x0002 | usb_hcdc_serialstate_t |

*Note*

*The host is notified with SERIAL_STATE whenever a change in the UART port state is detected.*

### Limitations

This driver is subject to the following limitations:

- Suspend is not supported when a data transfer is in progress. Confirm that data transfer has completed before executing suspend.
- Use of compound USB devices with CDC class support is not supported.
- This module must be incorporated into a project using r_usb_basic and does not provide any public APIs.
- This driver does not support Low-speed.
- This driver does not support simultaneous operation with the other device class.

# Examples

### USB HCDC Loopback Example

The main functions of the HCDC loopback example are as follows:

1. Virtual UART control settings are configured by transmitting the class request SET_LINE_CODING to the CDC device.
2. Sends receive (Bulk In transfer) requests to a CDC peripheral device and receives data.
3. Loops received data back to the peripheral by means of Bulk Out transfers.

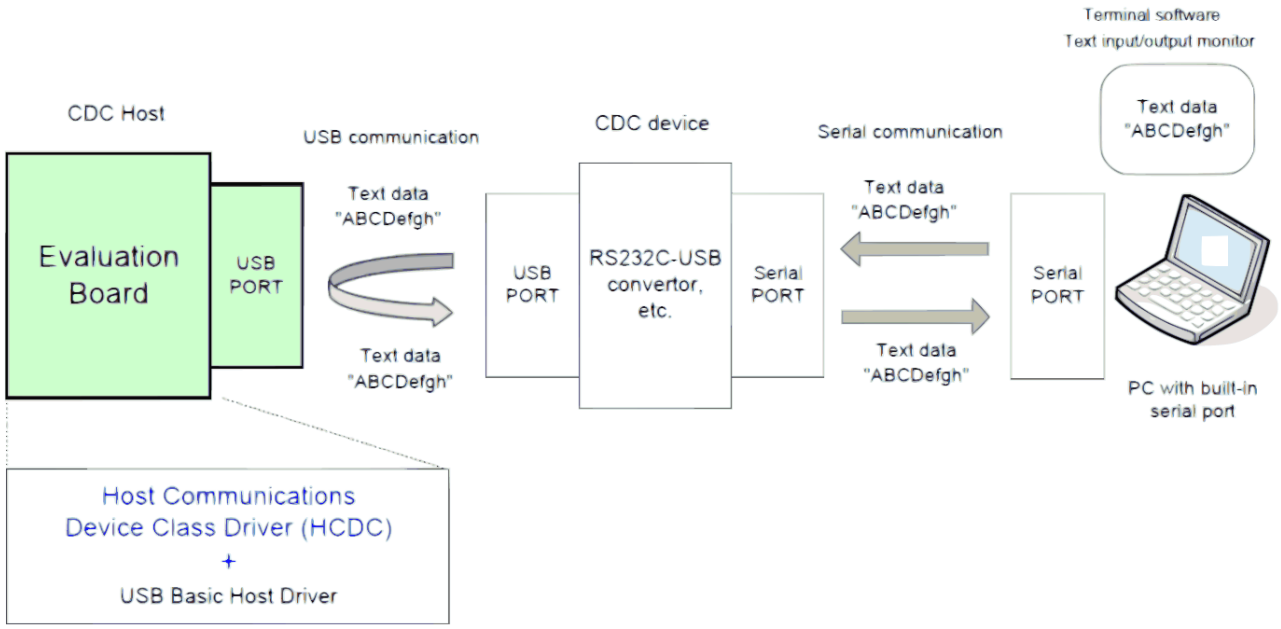

Figure 235: Data Transfer (Loopback)

The main loop performs loopback processing in which data received from a CDC peripheral device is transmitted unaltered back to the peripheral.

### Detailed Description

This module provides a USB Host Communications Device Class (HCDC-ECM) driver. It implements the USB HCDC_ECM (r_usb_hcdc_ecm).

### Functions

Refer to USB (r_usb_basic) for the common API (r_usb_basic) to be called from the application.

### Detailed Description

# Overview

The r_usb_hcdc_ecm module, when used in combination with the r_usb_basic and r_usb_hcdc modules, operates as a USB Host Communications Device Class (HCDC-ECM) driver. The HCDC-ECM conforms to subclass ethernet control model of the USB Communications Device Class (CDC) specification and enables communication with a CDC peripheral device.

### Features

The r_usb_hcdc_ecm module has the following key features:

- Checks for connected devices
- Data transfer to and from a CDC-ECM peripheral device

# Configuration

### Build Time Configurations for r_usb_hcdc_ecm

The following build time configurations are defined in fsp_cfg/r_usb_hcdc_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Target Peripheral Device Class ID | • CDC class supported device<br>• Vendor class device | CDC class supported device | Specify the device class ID of the CDC device to be connected. |

### Configurations for Connectivity > USB HCDC (r_usb_hcdc_ecm)

This module can be added to the Stacks tab via New Stack > Connectivity > USB HCDC (r_usb_hcdc_ecm).

| Configuration | Options | Default | Description |
|---|---|---|---|
| Interrupts | | | |
| Callback | Name must be a valid C symbol | NULL | A user callback function. If this callback function is provided, it is called from the interrupt service routine (ISR) each time a interrupt occurs. |
| Name | Name must be a valid C symbol | g_hcdc_ecm0 | Module name. |

*Note*

*Refer to the USB (r_usb_basic) module for hardware configuration options.*

### Clock Configuration

Refer to the USB (r_usb_basic) module.

### Pin Configuration

Refer to the USB (r_usb_basic) module.

# Usage Notes

### Basic Functions

The main functions of HCDC are the following:

- Verify connected devices
- Transfer data to and from the CDC-ECM peripheral device

### Class Request

This driver uses the following class request.

- SetEthernetPacketFilter

# Limitations

This driver has the following limitations:

### Dependencies

- This driver works on FreeRTOS and FreeRTOS Plus TCP.

### Requirements

- Please use a USB-LAN converter that supports the CDC-ECM class. If the USB-LAN converter does not support CDC-ECM class, this driver does not work properly.
- Please confirm with the manufacturer of using USB-LAN converter to see if it supports the CDC-ECM class.

### Constraints

This driver has the following constrains.

- Use of compound USB devices with CDC class support is not supported.
- This driver does not support Low-speed.
- This driver does not support simultaneous operation with the other device class.

# Operation Checking Converters

The following converters have been confirmed to work properly:

- UGREEN USB to Ethernet Adapter RJ45 (Manufacture: Ugreen Group Limited, Item model number: 50922)
- ELECOM USB to Ethernet Adapter EDC-GUA3V2-B (Manufacture: Elecom Co., Ltd, Item model number: EDC-GUA3V2-B)
- HP USB-C to RJ45 Adapter (Manufacture: Hewlett-Packard Company, Item model number: 7W66AA)

# Examples

### USB HCDC-ECM Example

The following is the porting layere example code for FreeRTOS Plus TCP

```

## Data Structures

| | |
|---|---|
| struct | usb_hcdc_ecm_instance_ctrl_t |

## Data Structure Documentation

### ◆ usb_hcdc_ecm_instance_ctrl_t

| struct usb_hcdc_ecm_instance_ctrl_t | |
|---|---|
| USB HCDC ECM control block. DO NOT INITIALIZE. Initialization occurs when ether_api_t::open is called. | |
| **Public Member Functions** | |
| uint8_t read_buffer [HCDC_ECM_READ_DATA_LEN] | __attribute__ ((__aligned__(4))) |
| | Buffer area for read data. |
| | |
| **Data Fields** | |
| uint32_t | open |
| | Used to determine if the channel is configured. |
| | |
| uint32_t | receive_size |
| | Received data size. |
| | |
| uint32_t | receive_status |
| | Status of receive result. |
| | |

## Function Documentation

### ◆ R_USB_HCDC_ECM_Open()

fsp_err_t R_USB_HCDC_ECM_Open ( ether_ctrl_t *const *p_ctrl*, ether_cfg_t const *const *p_cfg* )

After USB, CDC are reset in software.Implements ether_api_t::open.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Channel opened successfully. |
| FSP_ERR_USB_NOT_OPEN | USB module is not open.. |
| FSP_ERR_ALREADY_OPEN | RTOS internal error. |

### ◆ R_USB_HCDC_ECM_Close()

fsp_err_t R_USB_HCDC_ECM_Close ( ether_ctrl_t *const *p_ctrl*)

Disables interrupts. Removes power and releases hardware lock. Implements ether_api_t::close.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Channel successfully closed. |

### ◆ R_USB_HCDC_ECM_BufferRelease()

fsp_err_t R_USB_HCDC_ECM_BufferRelease ( ether_ctrl_t *const *p_ctrl*)

Move to the next buffer in the circular receive buffer list. Implements ether_api_t::bufferRelease.

**Return values**

| | |
|---|---|
| FSP_ERR_UNSUPPORTED | This function is not supported. |

### ◆ R_USB_HCDC_ECM_RxBufferUpdate()

fsp_err_t R_USB_HCDC_ECM_RxBufferUpdate ( ether_ctrl_t *const *p_ctrl*, void *const *p_buffer* )

Not support this function in HCDC-ECM. Implements ether_api_t::rxBufferUpdate.

**Return values**

| | |
|---|---|
| FSP_ERR_UNSUPPORTED | This function is not supported. |

### ◆ R_USB_HCDC_ECM_LinkProcess()

fsp_err_t R_USB_HCDC_ECM_LinkProcess ( ether_ctrl_t *const *p_ctrl*)

The Link up processing, the Link down processing, and the magic packet detection processing are executed. Implements ether_api_t::linkProcess.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Link is up. |
| FSP_ERR_USB_FAILED | Link is not up. |

### ◆ R_USB_HCDC_ECM_WakeOnLANEnable()

fsp_err_t R_USB_HCDC_ECM_WakeOnLANEnable ( ether_ctrl_t *const *p_ctrl*)

Not support this function in HCDC-ECM. Implements ether_api_t::wakeOnLANEnable.

**Return values**

| | |
|---|---|
| FSP_ERR_UNSUPPORTED | This function is not supported. |

### ◆ R_USB_HCDC_ECM_Read()

fsp_err_t R_USB_HCDC_ECM_Read ( ether_ctrl_t *const *p_ctrl*, void *const *p_buffer*, uint32_t *const *p_length_bytes* )

Receive USB data. Receives data to the location specified by the pointer to the receive buffer. Implements ether_api_t::read.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Processing completed successfully. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_INVALID_STATE | USB data read failure. |

### ◆ R_USB_HCDC_ECM_Write()

fsp_err_t R_USB_HCDC_ECM_Write ( ether_ctrl_t *const *p_ctrl*, void *const *p_buffer*, uint32_t const *length* )

Transmit USB data. Transmits data from the location specified by the pointer to the transmit buffer, with the data size equal to the specified frame length. Implements ether_api_t::write.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Processing completed successfully. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_INVALID_STATE | USB data write failure. |
| FSP_ERR_INVALID_ARGUMENT | Value of the send frame size is out of range. |

### ◆ R_USB_HCDC_ECM_TxStatusGet()

fsp_err_t R_USB_HCDC_ECM_TxStatusGet ( ether_ctrl_t *const *p_ctrl*, void *const *p_buffer_address* )

Not support this function in HCDC-ECM. Implements ether_api_t::txStatusGet.

**Return values**

| | |
|---|---|
| FSP_ERR_UNSUPPORTED | This function is not supported. |

### ◆ R_USB_HCDC_ECM_CallbackSet()

fsp_err_t R_USB_HCDC_ECM_CallbackSet ( ether_ctrl_t *const *p_api_ctrl*, void(*)(ether_callback_args_t *) *p_callback*, void *const *p_context*, ether_callback_args_t *const *p_callback_memory* )

Updates the user callback with the option to provide memory for the callback argument structure. Implements ether_api_t::callbackSet.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Callback updated successfully. |
| FSP_ERR_NO_CALLBACK_MEMORY | p_callback is non-secure and p_callback_memory is either secure or NULL. |

## 5.2.6.38 USB HHID (r_usb_hhid)

Modules » Connectivity

### Functions

fsp_err_t R_USB_HHID_TypeGet (usb_ctrl_t *const p_api_ctrl, uint8_t *p_type, uint8_t device_address)

Get HID protocol.(USB Mouse/USB Keyboard/Other Type.) More...

fsp_err_t R_USB_HHID_MaxPacketSizeGet (usb_ctrl_t *const p_api_ctrl, uint16_t *p_size, uint8_t direction, uint8_t device_address)

Obtains max packet size for the connected HID device. The max packet size is set to the area. Set the direction (USB_HID_IN/USB_HID_OUT). More...

### Detailed Description

This module provides a USB Host Human Interface Device Class Driver (HHID). It implements the USB HHID Interface.

# Overview

The r_usb_hhid module combines with the r_usb_basic module to provide a USB Host Human Interface Device Class (HHID) driver. The HHID driver conforms to the USB Human Interface Device class specifications and implements communication with a HID device.

### Features

The r_usb_hhid module has the following key features:

- Data communication with a connected HID device (USB mouse, keyboard etc.)
- Issuing of HID class requests to a connected HID device
- Supports Interrupt OUT transfer

# Configuration

### Build Time Configurations for r_usb_hhid

The following build time configurations are defined in fsp_cfg/r_usb_hhid_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| USB Hub Multi HID | • Disabled<br>• Enabled | Disabled | Enable or disable HUB support for HID-HID. |

### Configurations for Connectivity > USB HHID (r_usb_hhid)

This module can be added to the Stacks tab via New Stack > Connectivity > USB HHID (r_usb_hhid). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

| Configuration | Options | Default | Description |
|---|---|---|---|
| Name | Name must be a valid C symbol | g_hhid0 | Module name. |

### Clock Configuration

Refer to the USB (r_usb_basic) module.

### Pin Configuration

Refer to the USB (r_usb_basic) module.

# Usage Notes

*Note*

*This driver is not guaranteed to provide USB HID operation in all scenarios. The developer must verify correct operation when connected to the targeted USB peripherals.*

### Class Requests

The class requests supported by this driver are shown below:

| Request | Code | Description |
|---|---|---|
| USB_GET_REPORT | 0x01 | Receives a report from the HID device. |
| USB_SET_REPORT | 0x09 | Sends a report to the HID device. |
| USB_GET_IDLE | 0x02 | Receives a duration (time) from the HID device. |
| USB_SET_IDLE | 0x0A | Sends a duration (time) to the HID device. |
| USB_GET_PROTOCOL | 0x03 | Reads a protocol from the HID device. |
| USB_SET_PROTOCOL | 0x0B | Sends a protocol to the HID device. |
| USB_GET_REPORT_DESCRIPTOR | 0x06 | Requests a report descriptor. |
| USB_GET_HID_DESCRIPTOR | 0x06 | Requests a HID descriptor. |

### Data Format

The boot protocol data format of data received from the keyboard or mouse through interrupt-IN transfers is shown below:

| offset | Keyboard (8 Bytes) | Mouse (3 Bytes) |
|---|---|---|
| 0 (Top Byte) | Modifier keys | b0 : Button 1<br>b1 : Button 2<br>b2 : Button 3<br>b3-b7 : Reserved |
| +1 | Reserved | X displacement |
| +2 | Keycode 1 | Y displacement |
| +3 | Keycode 2 | - |
| +4 | Keycode 3 | - |
| +5 | Keycode 4 | - |
| +6 | Keycode 5 | - |
| +7 | Keycode 6 | - |

### Limitations

- The HID driver does not analyze the report descriptor. This driver determines the report format from the interface protocol.
- This driver does not support DMA transfers.
- This driver does not support High-speed.

- The transfer rates of Full-speed and Low-speed are the same when the max packet sizes of Full-speed and Low-speed are the same.
- This driver does not support simultaneous operation with the other device class.

# Examples

### USB HHID Example

The main functions of the application are as follows:

1. Performs enumeration and initialization of HID devices.
2. Transfers data to and from a connected HID device (mouse or keyboard). Data received from the device is read and discarded.
3. When an RTOS is used, the USB driver calls the callback (usb_apl_callback) in order to pass events to the main loop through a queue.

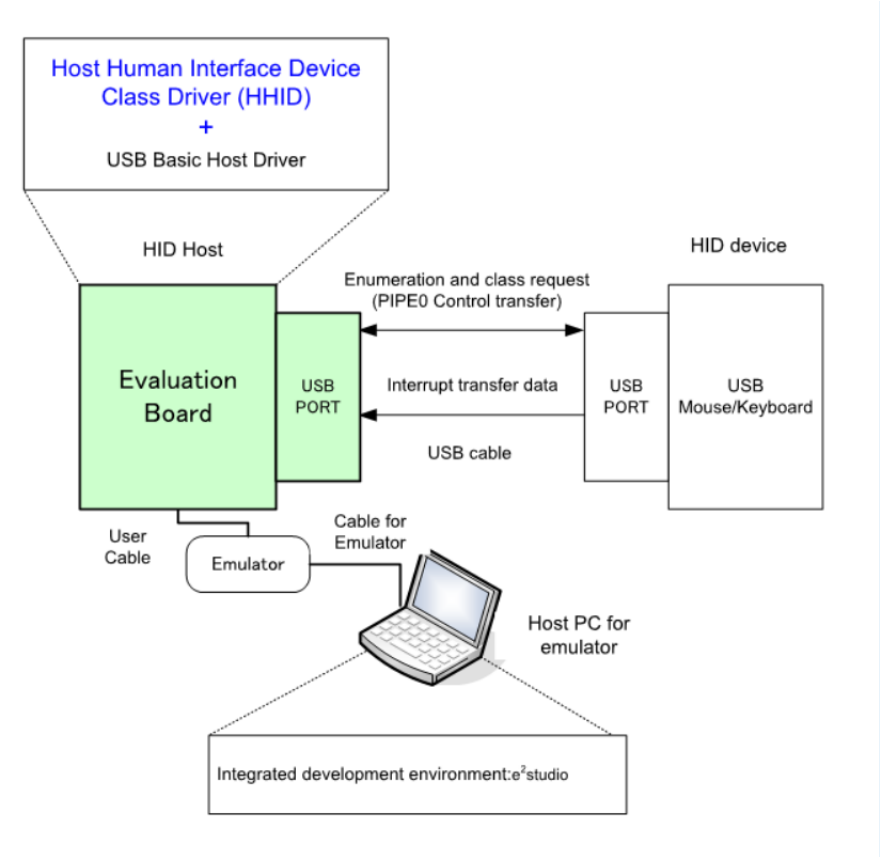

Figure 236: Example Operating Environment

### Application Processing (for RTOS)

The main loop performs processing to receive data from the HID device as part of the main routine. An overview of the processing performed by the loop is shown below.

1. When a USB-related event has completed, the USB driver calls the callback function (usb_apl_callback). In the callback function (usb_apl_callback), the application task (APL) is notified of the USB completion event using the real-time OS functionality.
2. In APL, information regarding the USB completion event was notified from the callback

function is retrieved using the real-time OS functionality.
3. If the USB completion event (the event member of the usb_ctrl_t structure) retrieved in step 2 above is USB_STATUS_CONFIGURED, APL sends the class request (SET_PROTOCOL) to the HID device.
4. If the USB completion event (the event member of the usb_ctrl_t structure) retrieved in step 2 above is USB_STATUS_REQUEST_COMPLETE, APL performs a data reception request to receive data transmitted from the HID device by calling the R_USB_Read function.
5. The above processing is repeated.

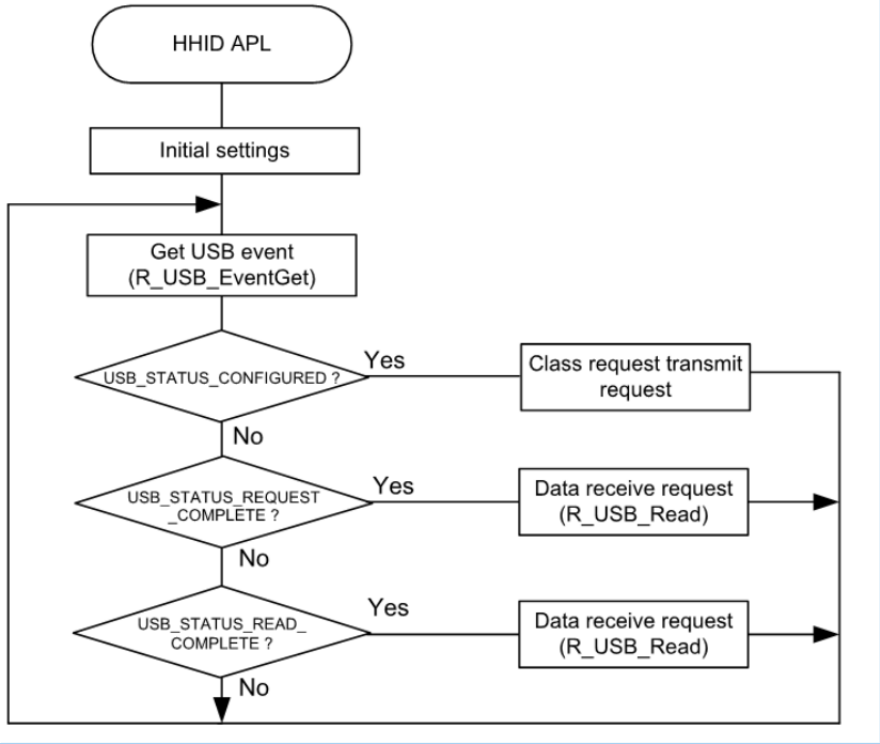

Figure 237: Main Loop (Normal mode)

### Application Processing (for Non-OS)

The main loop performs processing to receive data from the HID device as part of the main routine. An overview of the processing of the main loop is presented below.

1. When the R_USB_GetEvent function is called after an HID device attaches to the USB host and enumeration completes, USB_STATUS_CONFIGURED is set as the return value. When the APL confirms USB_STATUS_CONFIGURED, it calls the R_USB_Write function to request transmission of data to the HID device.
2. When the R_USB_GetEvent function is called after sending of class request SET_PROTOCOL to the HID device has completed, USB_STATUS_REQUEST_COMPLETE is set as the return value. When the APL confirms USB_STATUS_REQUEST_COMPLETE, it calls the R_USB_Read function to make a data receive request for data sent by the HID device.
3. When the R_USB_GetEvent function is called after reception of data from the HID device has completed, USB_STATUS_READ_COMPLETE is set as the return value. When the APL confirms USB_STATUS_READ_COMPLETE, it calls the R_USB_Read function to make a data receive request for data sent by the HID device.
4. The processing in step 3, above, is repeated.

## Function Documentation

### ◆ R_USB_HHID_TypeGet()

fsp_err_t R_USB_HHID_TypeGet ( usb_ctrl_t *const *p_api_ctrl*, uint8_t * *p_type*, uint8_t *device_address* )

Get HID protocol.(USB Mouse/USB Keyboard/Other Type.)

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Success. |
| FSP_ERR_USB_FAILED | The function could not be completed successfully. |
| FSP_ERR_ASSERTION | Parameter Null pointer error. |
| FSP_ERR_USB_PARAMETER | Parameter error. |

### ◆ R_USB_HHID_MaxPacketSizeGet()

fsp_err_t R_USB_HHID_MaxPacketSizeGet ( usb_ctrl_t *const *p_api_ctrl*, uint16_t * *p_size*, uint8_t *direction*, uint8_t *device_address* )

Obtains max packet size for the connected HID device. The max packet size is set to the area. Set the direction (USB_HID_IN/USB_HID_OUT).

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Success. |
| FSP_ERR_USB_FAILED | The function could not be completed successfully. |
| FSP_ERR_ASSERTION | Parameter Null pointer error. |
| FSP_ERR_USB_PARAMETER | Parameter error. |

### Detailed Description

This module provides a USB Host Mass Storage Class (HMSC) driver. It implements the USB HMSC Interface.

# Overview

The r_usb_hmsc module, when used in combination with the r_usb_basic module, operates as a USB Host Mass Storage Class (HMSC) driver. It is built on the USB Mass Storage Class Bulk-Only Transport (BOT) protocol. It is possible to communicate with BOT-compatible USB storage devices by combining this module with a file system and storage device driver.

*Note*

*This module should be used in combination with the FreeRTOS+FAT File System.*

### Features

The r_usb_hmsc module has the following key features:

- Checking of connected USB storage devices to determine whether or not operation is supported
- Storage command communication using the BOT protocol
- Support for SFF-8070i (ATAPI) USB mass storage subclass
- Sharing of a single pipe for IN/OUT directions or multiple devices
- Supports up to 4 connected USB storage devices

### Known Issues

- Users can not use TrustZone features that use Non-secure Callable.

### Class Requests

The class requests supported by this driver are shown below.

| Request | Description |
|---|---|
| GetMaxLun | Gets the maximum number of units that are supported. |
| MassStorageReset | Cancels a protocol error. |

### Storage Commands

This driver supports the following storage commands:

- TEST_UNIT_READY
- MODE_SELECT10
- MODE_SENSE10
- PREVENT_ALLOW
- READ_FORMAT_CAPACITY
- READ10
- WRITE10

# Configuration

### Build Time Configurations for r_usb_hmsc

The following build time configurations are defined in fsp_cfg/r_usb_hmsc_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| USB Hub Multi MSC | • Disabled<br>• Enabled | Disabled | Enable or disable HUB support for MSC-MSC. |

Refer to the USB (r_usb_basic) module.

### Clock Configuration

Refer to the USB (r_usb_basic) module.

### Pin Configuration

Refer to the USB (r_usb_basic) module.

# Usage Notes

Warning

Due to the wide variety of USB mass storage device implementations, this driver is not guaranteed to work with all devices. When implementing the driver it is important to verify correct operation with the mass storage devices that the end user is expected to use.

### Multi Port

This driver supports simultaneous operation with Peripheral Communication Device Class(PCDC). If the user are using MCU that supports 2 USB modules, such as RA6M3, the user can run HMSC on one USB module and PCDC on the other. This driver does not support simultaneous operation using device classes other than PCDC.

### For Bare Metal

1. To use FreeRTOS+FAT without FreeRTOS, copy FreeRTOSConfigMinimal.h to one of your project's include paths and rename it FreeRTOSConfig.h.
2. In RA configurator, enter the appropriate values in the Main stack size and Heap size fields. The figure below is an example of the RA6M3-EK board.

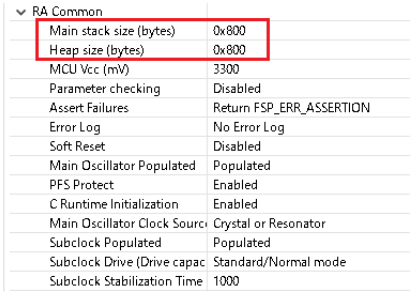

Figure 239: BSP Setting

1. In the Bare Metal version, specify "NULL" in the Callback item.

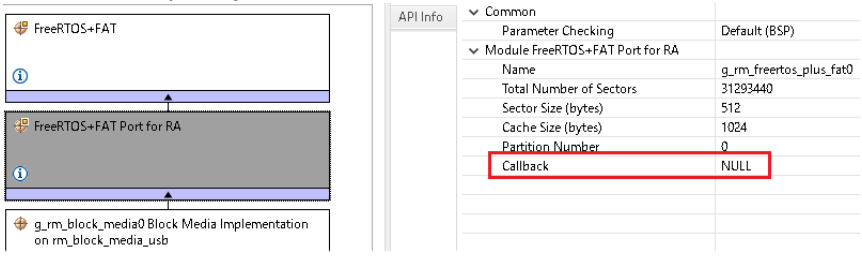

Figure 240: For Bare Metal Setting

### Limitations

1. Some MSC devices may be unable to connect because they are not recognized as storage devices.
2. MSC devices that return values of 1 or higher in response to the GetMaxLun command (mass storage class command) are not supported.
3. A maximum of 4 USB storage devices can be connected.
4. Only USB storage devices with a sector size of 512 bytes can be connected.
5. A device that does not respond to the READ_CAPACITY command operates as a device with a sector size of 512 bytes.
6. The continuous transfer mode cannot be used when using DMA.
7. This module must be incorporated into a project using r_usb_basic and does not provide any public APIs.
8. This driver does not support Low-speed.

# Examples

## USB HMSC Example

### Example Operating Environment

The following shows an example operating environment for the HMSC.

Refer to the associated instruction manuals for details on setting up the evaluation board and using the emulator, etc.

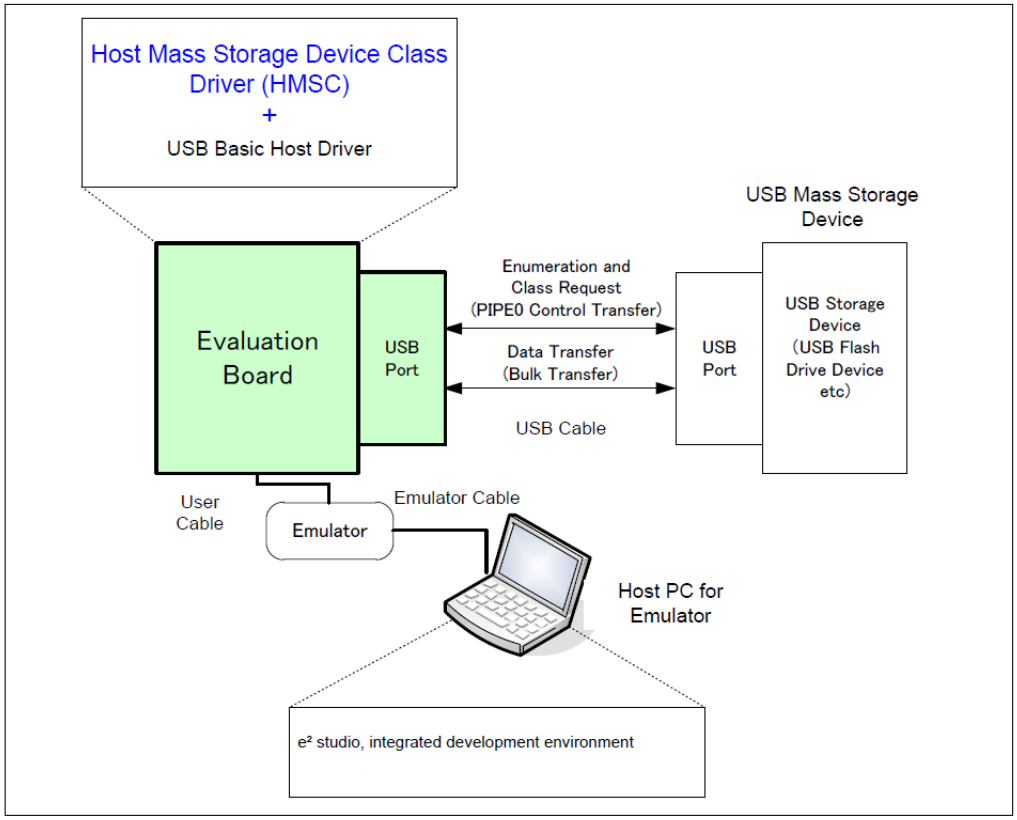

Figure 241: Example Operating Environment

### Application Specifications

The main functions of the application are as follows:

1. Performs enumeration and drive recognition processing on MSC devices.
2. After the above processsing finisihes, the application writes the file to the MSC device once.
3. After writing the above file, the APL repeatedly reads the file. It continues to read the file repeatedly until the switch is pressed again.

### Application Processing (for RTOS)

This application has two tasks. An overview of the processing in these two tasks is provided below.

#### usb_apl_task

1. After start up, MCU pin setting, USB controller initialization, and application program initialization are performed.

2. The MSC device is attached to the kit. When enumeration and drive recognition processing have completed, the USB driver calls the callback function (usb_apl_callback). In the callback function (usb_apl_callback), the application task is notified of the USB completion event using the FreeRTOS functionality.
3. In the application task, information regarding the USB completion event about which notification was received from the callback function is retrieved using the real-time OS functionality.
4. If the USB completion event (the event member of the usb_ctrl_t structure) retrieved in step 2 above is USB_STS_CONFIGURED then, based on the USB completion event, the MSC device is mounted and the file is written to the MSC device.
5. If the USB completion event (the event member of the usb_ctrl_t structure) retrieved in step 2 above is USB_STS_DETACH, the application initializes the variables for state management.

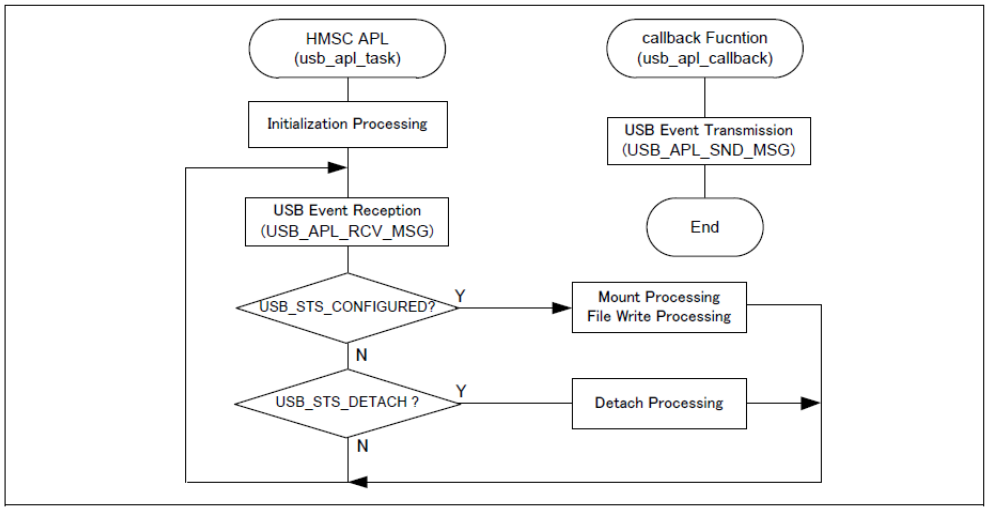

Figure 242: usb_apl_task

### file_read_task

Of the application tasks usb_apl_task and file_read_task, file_read_task is processed while usb_apl_task is in the wait state. This task performs file read processing on the file that was written to the MSC device.

**Example Code**

```

### Function Documentation

#### ◆ R_USB_HMSC_StorageCommand()

| fsp_err_t R_USB_HMSC_StorageCommand ( usb_ctrl_t *const *p_api_ctrl*, uint8_t * *buf*, uint8_t *command*, uint8_t *destination* ) |
|---|
| Processing for MassStorage(ATAPI) command. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Success. |
| FSP_ERR_USB_FAILED | The function could not be completed successfully. |
| FSP_ERR_ASSERTION | Parameter Null pointer error. |
| FSP_ERR_USB_PARAMETER | Parameter error. |

### ◆ R_USB_HMSC_DriveNumberGet()

fsp_err_t R_USB_HMSC_DriveNumberGet ( usb_ctrl_t *const *p_api_ctrl*, uint8_t * *p_drive*, uint8_t *destination* )

Get number of Storage drive.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Success. |
| FSP_ERR_USB_FAILED | The function could not be completed successfully. |
| FSP_ERR_ASSERTION | Parameter Null pointer error. |
| FSP_ERR_USB_PARAMETER | Parameter error. |

### ◆ R_USB_HMSC_StorageReadSector()

fsp_err_t R_USB_HMSC_StorageReadSector ( uint16_t *drive_number*, uint8_t *const *buff*, uint32_t *sector_number*, uint16_t *sector_count* )

Read sector information.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Success. |
| FSP_ERR_USB_FAILED | The function could not be completed successfully. |
| FSP_ERR_ASSERTION | Parameter Null pointer error. |
| FSP_ERR_USB_PARAMETER | Parameter error. |

***Note***

*The address specified in the argument buff must be 4-byte aligned.*

### ◆ R_USB_HMSC_StorageWriteSector()

fsp_err_t R_USB_HMSC_StorageWriteSector ( uint16_t *drive_number*, uint8_t const *const *buff*, uint32_t *sector_number*, uint16_t *sector_count* )

Write sector information.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Success. |
| FSP_ERR_USB_FAILED | The function could not be completed successfully. |
| FSP_ERR_ASSERTION | Parameter Null pointer error. |
| FSP_ERR_USB_PARAMETER | Parameter error. |

***Note***

*The address specified in the argument buff must be 4-byte aligned.*

### ◆ R_USB_HMSC_SemaphoreGet()

fsp_err_t R_USB_HMSC_SemaphoreGet ( void )

Get a semaphore. (RTOS only)

If this function is called in the OS less execution environment, a failure is returned.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Success. |
| FSP_ERR_USB_FAILED | The function could not be completed successfully. |

### ◆ R_USB_HMSC_SemaphoreRelease()

fsp_err_t R_USB_HMSC_SemaphoreRelease ( void )

Release a semaphore. (RTOS only)

If this function is called in the OS less execution environment, a failure is returned.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Success. |
| FSP_ERR_USB_FAILED | The function could not be completed successfully. |

### 5.2.6.40 USB Host Vendor class (r_usb_hvnd)

Modules » Connectivity

#### Functions

Refer to USB (r_usb_basic) for the common API (r_usb_basic) to be called from the application.

# Overview

USB Host Vendor class works by combining r_usb_basic module.

# How to Configuration

The following shows FSP configuration procedure for USB Host Vendor class.

- Select [New Stack]->[Middleware]->[USB]->[USB Host Vendor class driver on r_usb_hvnd].

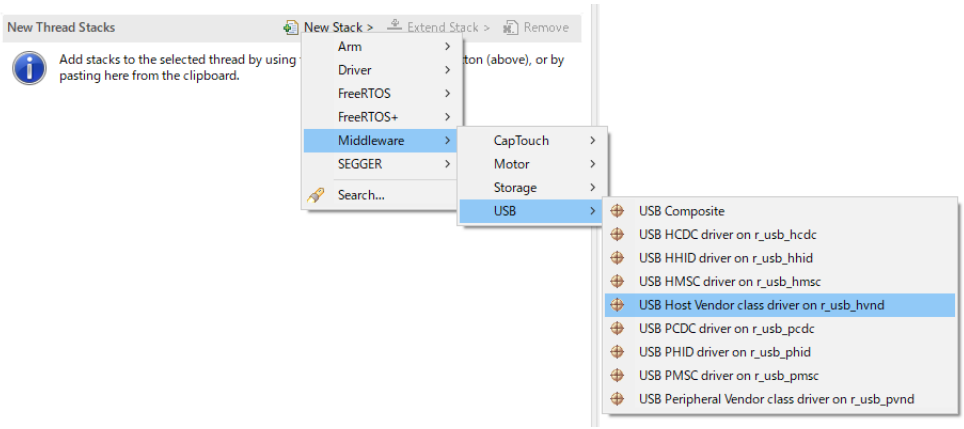

Figure 243: Select USB Host Vendor Class

- The following is displayed when selecting [USB Host Vendor class driver on r_usb_hvnd]. The user does not specify USB pipe number in Vendor class.

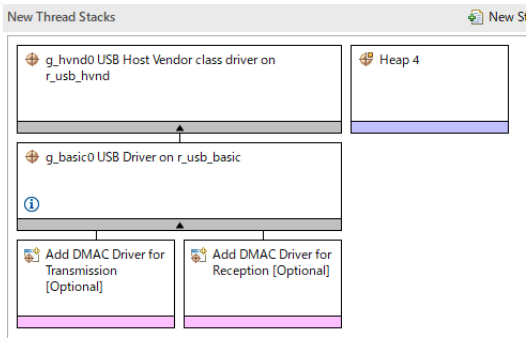

Figure 244: USB Host Vendor Class Stack

# API

Use the following APIs in Host Vendor class application program.

- For Data Transfer
  Use the following APIs for data transfer for Bulk transfer or Interrupt transfer.

  1. R_USB_PipeRead()
  2. R_USB_PipeWrite()
  3. R_USB_PipeStop()

- For Control Transfer
  Use the following API for the class request processing.

  1. R_USB_HostControlTransfer()

- For USB Pipe Information
  The USB driver allocates USB PIPE by analyzing the descriptor of USB device in Vendor class. Use the following APIs to get the allocated USB pipe information.

  1. R_USB_UsedPipesGet()
  2. R_USB_PipeInfoGet()

# USB PIPE Allocation

The USB driver allocates USB PIPE by analyzing the descriptor of USB device in Vendor class.
The USB PIPE related to the Endpoint Descriptor are allocated in order from USB PIPE1 according to the description order of the Endpoint Descriptor.

# Examples

This application program processes the following after the enumeration completes with USB device.

1. Getting USB Pipe Infomattion
2. Vendor Class Request Processing
3. Loopback processing of bulk transfer and interrupt transfer.

```
/***********************************************************************

### 5.2.6.41 USB PAUD (r_usb_paud)

Modules » Connectivity

This module provides a USB Peripheral Audio Device Class Driver (PAUD). It implements the USB PAUD Interface.

#### Functions

Refer to USB (r_usb_basic) for the common API (r_usb_basic) to be called from the application.

#### Detailed Description

# Overview

The r_usb_paud module combines with the r_usb_basic module to provide a USB Peripheral Audio Device Class (PAUD) driver.

### Features

The r_usb_paud module has the following key features:

- Data transfer to and from a USB host
- Response to Audio class requests
- Supports Audio 1.0 and Audio 2.0

### Clock Configuration

Refer to the USB (r_usb_basic) module.

### Pin Configuration

Refer to the USB (r_usb_basic) module.

## Usage Notes

### Class Requests (Host to Peripheral)

This driver notifies the application when receiving the following class requests:

- Audio 1.0

| Request | Code | Description |
|---|---|---|
| GET MIN | 0x82 | Minimum setting attribute |
| GET_MAX | 0x83 | Maximum setting attribute |
| GET_RES | 0x84 | Resolution attribute |
| SET_CUR | 0x01 | Current setting attribute |
| GET_CUR | 0x81 | Current setting attribute |

- Audio 2.0

| Request | Code | Description |
|---|---|---|
| CUR | 0x01 | Current setting attribute |
| RANGE | 0x02 | Range attribute |

Note:

For details about each device class, please refer to Audio Class specification.

### Limitations

- This module must be incorporated into a project using r_usb_basic and does not provide any public APIs.
- Please ignore the suspend or resume event occurs when attaching or detaching the USB

cable.

# Examples

### USB PAUD Example

1. Example code for Audio 1.0

```
#define A10_FU_ID_0 (5)
#define A10_FU_ID_1 (8)
#define A10_EP_ADDR_OUT (0x02)

#### 5.2.6.42 USB PCDC (r_usb_pcdc)

Modules » Connectivity

This module provides a USB Peripheral Communications Device Class Driver (PCDC). It implements the USB PCDC Interface.

**Functions**

Refer to USB (r_usb_basic) for the common API (r_usb_basic) to be called from the application.

**Detailed Description**

# Overview

The r_usb_pcdc module combines with the r_usb_basic module to provide a USB Peripheral Communications Device Class (PCDC) driver. The PCDC driver conforms to Abstract Control Model of the USB Communications Device Class (CDC) specification and enables communication with a CDC host device.

**Features**

The r_usb_pcdc module has the following key features:

- Data transfer to and from a USB host
- Response to CDC class requests
- Supports CDC notifications

# Configuration

**Build Time Configurations for r_usb_pcdc**

The following build time configurations are defined in fsp_cfg/r_usb_pcdc_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|

**Configurations for Connectivity > USB PCDC (r_usb_pcdc)**

This module can be added to the Stacks tab via New Stack > Connectivity > USB PCDC (r_usb_pcdc).

| Configuration | Options | Default | Description |
|---|---|---|---|
| Name | Name must be a valid C symbol | g_pcdc0 | Module name. |

*Note*

*Refer to the USB (r_usb_basic) module for hardware configuration options.*

### Clock Configuration

Refer to the USB (r_usb_basic) module.

### Pin Configuration

Refer to the USB (r_usb_basic) module.

# Usage Notes

### Abstract Control Model Overview

The Abstract Control Model subclass of CDC is a technology that bridges the gap between USB devices and earlier modems (employing RS-232C connections), enabling use of application programs designed for older modems.

### Class Requests (Host to Peripheral)

This driver notifies the application when receiving the following class requests:

| Request | Code | Description |
|---|---|---|
| SetLineCoding | 0x20 | Sets communication line settings (bitrate, data length, parity, and stop bit length) |
| GetLineCoding | 0x21 | Acquires the communication line setting state |
| SetControlLineState | 0x22 | Set communication line control signals (RTS, DTR) |

*Note*

*For details concerning the Abstract Control Model requests, refer to Table 11 "Requests - Abstract Control Model" in the "USB Communications Class Subclass Specification for PSTN Devices", Revision 1.2.*

### Data Format of Class Requests

The data format of supported class requests is described below:

| bmRequestType | bRequest | wValue | wIndex | wLength | Data |
|---|---|---|---|---|---|
| 0x21 | SET_LINE_CODING (0x20) | 0x0000 | 0x0000 | 0x0007 | usb_pcdc_linecoding_t |
| 0xA1 | GET_LINE_CODING (0x21) | 0x0000 | 0x0000 | 0x0007 | usb_pcdc_linecoding_t |
| 0x21 | SET_CONTROL_LINE_STATE (0x22) | usb_pcdc_ctrlinestate_t | 0x0000 | 0x0000 | None |

### Class Notifications (Peripheral to Host)

The following class notifications are supported:

| Notification | Code | Description |
|---|---|---|
| SERIAL_STATE | 0x20 | Notification of serial line state |

The data types returned are as follows:

| bmRequestType | bRequest | wValue | wIndex | wLength | Data |
|---|---|---|---|---|---|
| 0xA1 | SERIAL_STATE (0x20) | 0x0000 | 0x0000 | 0x0002 | usb_serial_state_bitmap_t |

*Note*

*The host is notified with SERIAL_STATE whenever a change in the UART port state is detected. This driver will automatically detect overrun, parity and framing errors. A state notification is performed when a transition from normal to error state is detected.*

### Virtual COM-port Usage

When connected to a PC the CDC device can be used as a virtual COM port. After enumeration, the CDC class requests GetLineCoding and SetControlLineState are executed by the target, and the CDC device is registered in Windows Device Manager as a virtual COM device.

Registering the CDC device as a virtual COM-port in Windows Device Manager enables data communication with the CDC device via a terminal app such as PuTTY. When changing settings of the serial port in the terminal application, the UART setting is propagated to the firmware via the class request SetLineCoding.

Data input (or file transmission) from the terminal app window is transmitted to the board using endpoint 2 (EP2); data from the board side is transmitted to the PC using EP1.

When the last packet of data received is the maximum packet size, and the terminal determines that there is continuous data, the received data may not be displayed in the terminal. If the received data is smaller than the maximum packet size, the data received up to that point is displayed in the terminal.

### Multi Port

This driver supports simultaneous operation with Host Mass Storage Class(HMSC). If the user are using MCU that supports 2 USB modules, such as RA6M3, the user can run PCDC on one USB module and HMSC on the other. This driver does not support simultaneous operation using device classes other than HMSC.

### Limitations

- This module must be incorporated into a project using r_usb_basic and does not provide any public APIs.
- This driver does not support Low-speed.
- Please ignore the suspend or resume event occurs when attaching or detaching the USB cable.

# Examples

## USB PCDC Loopback Example

The main functions of the PCDC loopback example are as follows:

1. Receives virtual UART configuration data from the host terminal
2. Loops all other received data back to the host terminal

### 5.2.6.43 USB PHID (r_usb_phid)

Modules » Connectivity

This module is USB Peripheral Human Interface Device Class Driver (PHID). It implements the USB PHID Interface.

#### Functions

Refer to USB (r_usb_basic) for the common API (r_usb_basic) to be called from the application.

#### Detailed Description

# Overview

The r_usb_phid module combines with the r_usb_basic module to provide a USB Peripheral Human Interface Device Class (PHID) driver. The PHID driver conforms to the USB Human Interface Device class specifications and implements communication with a HID host.

#### Features

The r_usb_phid module has the following functions:

- Data transfer to and from a USB host
- Response to HID class requests
- Response to function references from the HID host

*Note*

*This driver is not guaranteed to provide USB HID operation in all scenarios. The developer must verify correct operation when connected to the targeted USB hosts.*

# Configuration

### Build Time Configurations for r_usb_phid

The following build time configurations are defined in fsp_cfg/r_usb_phid_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|

### Configurations for Connectivity > USB PHID (r_usb_phid)

This module can be added to the Stacks tab via New Stack > Connectivity > USB PHID (r_usb_phid).

| Configuration | Options | Default | Description |
|---|---|---|---|
| Name | Name must be a valid C symbol | g_phid0 | Module name. |

### Clock Configuration

Refer to the USB (r_usb_basic) module.

### Pin Configuration

Refer to the USB (r_usb_basic) module.

# Usage Notes

### Class Requests (Host to Peripheral)

This driver notifies the application when receiving the following class requests:

| Request | Code | Description |
|---|---|---|
| Get_Report | 0x01 | Receives a report from the HID host |
| Set_Report | 0x09 | Sends a report to the HID host |
| Get_Idle | 0x02 | Receives a duration (time) from the HID host |
| Set_Idle | 0x0A | Sends a duration (time) to the HID host |
| Get_Protocol | 0x03 | Reads a protocol from the HID |

| | | |
|---|---|---|
| | | host |
| Set_Protocol | 0x0B | Sends a protocol to the HID host |
| Get_Descriptor | 0x06 | Transmits a report or HID descriptor |

The data format of supported class requests is described below:

| bmRequestType | bRequest | wValue | wIndex | wLength | Data |
|---|---|---|---|---|---|
| 0xA1 | GET_REPORT (0x01) | ReportType & ReportID | Interface | ReportLength | Report |
| 0x21 | SET_REPORT (0x09) | ReportType & ReportID | Interface | ReportLength | Report |
| 0xA1 | GET_IDLE (0x02) | 0 & ReportID | Interface | 1 | Idle rate |
| 0x21 | SET_IDLE (0x0A) | Duration & ReportID | Interface | 0 | Idle rate |
| 0xA1 | GET_PROTOCOL (0x03) | 0 | Interface | 0 | 0 (Boot) or 1 (Report) |
| 0x21 | SET_PROTOCOL (0x0B) | 0 (Boot) or 1 (Report) | Interface | 0 | Not applicable |

**Limitations**

- This driver does not support USB Hi-speed mode.
- This driver does not support USB Low-speed mode.
- This driver does not support DMA transfers.
- This driver does not support simultaneous operation with USB Host device class.
- Please ignore the suspend or resume event occurs when attaching or detaching the USB cable.

# Examples

# Descriptors

A template for PHID descriptors can be found in ra/fsp/src/r_usb_phid. Be sure to replace the vendor ID with your own.
Keyboard templates should be referred to r_usb_phid_descriptor_keyboard.c.template.
Mouse templates should be referred to r_usb_phid_descriptor_mouse.c.template.

### 5.2.6.44 USB PMSC (r_usb_pmsc)

Modules » Connectivity

This module provides a USB Peripheral Mass Storage Class (PMSC) driver. It implements the USB PMSC Interface.

#### Functions

Refer to USB (r_usb_basic) for the common API (r_usb_basic) to be called from the application.

#### Detailed Description

# Overview

The r_usb_pmsc module combines with the r_usb_basic module to provide USB Peripheral It operates as a Mass Storage class driver (hereinafter referred to as PMSC).
The USB peripheral mass storage class driver (PMSC) comprises a USB mass storage class bulk-only transport (BOT) protocol.
When combined with a USB peripheral control driver and media driver, it enables communication with a USB host as a BOT-compatible storage device.

#### Features

The r_usb_pmsc module has the following key features:

- Storage command control using the BOT protocol

- Supports only SFF-8070i (ATAPI) Interface Sub-Class
- Response to mass storage device class requests from a USB host

# Configuration

### Build Time Configurations for r_usb_pmsc

The following build time configurations are defined in fsp_cfg/r_usb_pmsc_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Vendor Information | Vendor Information must be 8 bytes long; pad with spaces if shorter. | Vendor | Specify the vendor information field (part of the Inquiry command response). |
| Product Information | Product Information must be 16 bytes long; pad with spaces if shorter. | Mass Storage | Specify the product information field (part of the Inquiry command response). |
| Product Revision Level | Product Revision Level must be 4 bytes long; pad with spaces if shorter. | 1.00 | Specify the product revision level field (part of the Inquiry command response). |
| Sector size | • 512<br>• 4096 | 512 | Specifies the sector size. |
| Number of Transfer Sectors | Please enter a number between 1 and 255. | 8 | Specify the maximum sector size to request with one data transfer. |

### Configurations for Connectivity > USB PMSC (r_usb_pmsc)

This module can be added to the Stacks tab via New Stack > Connectivity > USB PMSC (r_usb_pmsc).

| Configuration | Options | Default | Description |
|---|---|---|---|
| Name | Name must be a valid C symbol | g_pmsc0 | Module name. |

Refer to the USB (r_usb_basic) module for hardware configuration options.

### Clock Configuration

Refer to the USB (r_usb_basic) module.

### Pin Configuration

Refer to the USB (r_usb_basic) module.

# Usage Notes

### Class Requests

The class requests supported by this driver are shown below.

| Request | Code | Description |
|---|---|---|
| Bulk-Only Mass Storage Reset | 0xFF | Resets the connection interface to the mass storage device. |
| Get Max Logical Unit Number | 0xFE | Reports the logical numbers supported by the device. |

### Storage Commands

This driver supports the following storage commands.

| Command | Code | Description |
|---|---|---|
| TEST_UNIT_READY | 0x00 | Checks the state of the peripheral device. |
| REQUEST_SENSE | 0x03 | Gets the error information of the previous storage command execution result. |
| INQUIRY | 0x12 | Gets the parameter information of the logical unit. |
| READ_FORMAT_CAPACITY | 0x23 | Gets the formattable capacity. |
| READ_CAPACITY | 0x25 | Gets the capacity information of the logical unit. |
| READ10 | 0x28 | Reads data. |
| WRITE10 | 0x1A | Writes data. |
| MODE_SENSE10 | 0x5A | Gets the parameters of the logical unit. |

*Note*

*A STALL or FAIL error is sent to the host upon receipt of any command not listed in the above table.*

### BOT Protocol Overview

BOT (USB MSC Bulk-Only Transport) is a transfer protocol that encapsulates command, data, and status (results of commands) using only two endpoints (one bulk in and one bulk out). The ATAPI storage commands and the response status are embedded in a Command Block Wrapper (CBW) and a Command Status Wrapper (CSW). The below image shows an overview of how the BOT protocol progresses with command and status data flowing between USB host and peripheral.

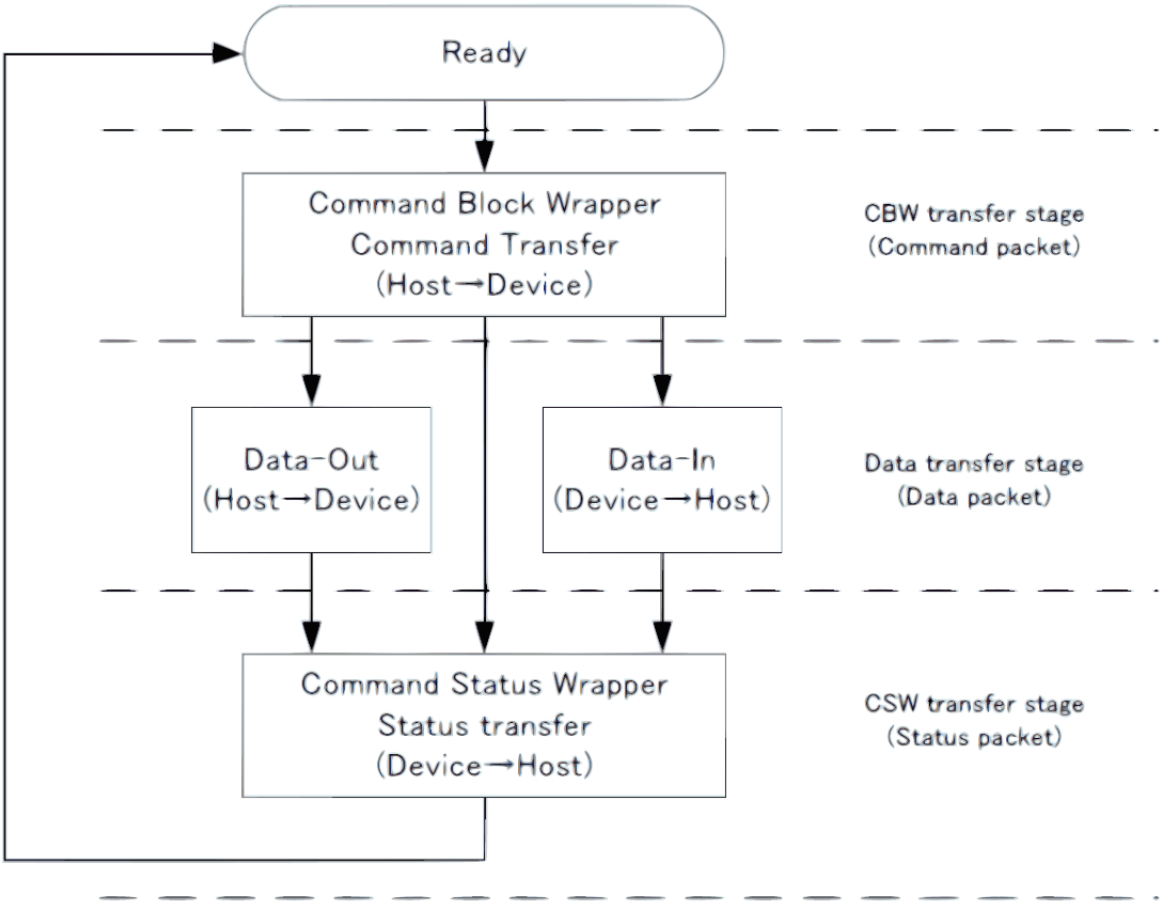

Figure 250: BOT protocol Overview

### Block Media Interface

PMSC implements a block media interface to enable access to higher-level modules. If the block media interface supports multiple media, users can select any media to access.

*Note*

*When the user develops the storage media driver, be sure to define the instance named "g_rm_block_media0".*

### Limitations

1. The driver always returns 0 in response to the GetMaxLun command.
2. The driver supports a sector size of 512 bytes only.
3. The only media currently supported by the block media interface is an SD card. The card must be inserted before initializing the driver.
4. When using DMA for Hi-Speed transfers continuous transfer mode must not be used in the USB Basic driver.
5. The storage area must be formatted before use.
6. When using the SD/MMC Block Media Implementation (rm_block_media_sdmmc), "Card Detection" must be set to "Not Used" in the SD/MMC Host Interface (r_sdhi) settings.
7. The driver does not support Low-speed.
8. This driver does not support simultaneous operation with USB Host device class.
9. Please ignore the suspend or resume event occurs when attaching or detaching the USB cable.

# Examples

### USB PMSC Example

In this example, when the evaluation board is connected to the host PC it is recognized as a removable disk and reading/writing files is possible. The FAT type is either FAT12, FAT16, or FAT32 depending on the size of the media used.

### 5.2.6.45 USB PPRN (r_usb_pprn)

Modules » Connectivity

This module is USB Peripheral Printer Device Class Driver (PPRN). It implements the USB PPRN Interface.

#### Functions

Refer to USB (r_usb_basic) for the common API (r_usb_basic) to be called from the application.

#### Detailed Description

# Overview

The r_usb_pprn module combines with the r_usb_basic module to provide a USB Peripheral Printer Device Class (PPRN) driver. The PPRN driver conforms to the USB Printer Device class specifications and implements communication with a printer host.

#### Features

The r_usb_pprn module has the following functions:

- Data transfer to and from a USB host
- Response to the printer class requests

- Response to function references from the printer host

*Note*

*This driver is not guaranteed to provide USB printer operation in all scenarios. The developer must verify correct operation when connected to the targeted USB hosts.*

# Configuration

### Build Time Configurations for r_usb_pprn

The following build time configurations are defined in fsp_cfg/r_usb_pprn_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|

### Configurations for Connectivity > USB PPRN (r_usb_pprn)

This module can be added to the Stacks tab via New Stack > Connectivity > USB PPRN (r_usb_pprn).

| Configuration | Options | Default | Description |
|---|---|---|---|
| Name | Name must be a valid C symbol | g_pprn0 | Module name. |

### Clock Configuration

Refer to the USB (r_usb_basic) module.

### Pin Configuration

Refer to the USB (r_usb_basic) module.

# Usage Notes

### Class Requests (Host to Peripheral)

This driver notifies the application when receiving the following class requests:

| Request | Code | Description |
|---|---|---|
| GET_DEVICE_ID | 0x00 | Get IEEE 1284 Device ID String |
| GET_PORT_STATUS | 0x01 | Get Printer's Status |
| SOFT_RESET | 0x02 | Flushes all buffers and resets the Bulk OUT and Bulk IN pipes |

The data format of supported class requests is described below:

| bmRequestType | bRequest | wValue | wIndex | wLength | Data |
|---|---|---|---|---|---|
| 0xA1 | GET_DEVICE_ID (0x00) | Config Index | Interface Alternate Setting | Maximum Length | 1284 Device ID String |

| | | | | | |
|---|---|---|---|---|---|
| 0xA1 | GET_PORT_STATUS (0x01) | 0 | Interface | 1 | Printer Status |
| 0x21 | SOFT_RESET (0x02) | 0 | Interface | 0 | None |

### Limitations

- This driver does not support USB Low-speed mode.
- This driver does not support simultaneous operation with USB Host device class.
- Please ignore the suspend or resume event occurs when attaching or detaching the USB cable.

### USB PPRN Example

This is a minimal example for implementing PPRN in bare metal and FreeRTOS application.

# Descriptors

A template for PPRN descriptors can be found in ra/fsp/src/r_usb_pprn folder. Be sure to replace the vendor ID with your own.

### 5.2.6.46 USB Peripheral Vendor class (r_usb_pvnd)

Modules » Connectivity

#### Functions

Refer to USB (r_usb_basic) for the common API (r_usb_basic) to be called from the application.

# Overview

USB Peripheral Vendor class works by combining r_usb_basic module.

# How to Configuration

The following shows FSP configuration procedure for USB Peripheral Vendor class.

- Select [New Stack]->[Middleware]->[USB]->[USB Peripheral Vendor class driver on r_usb_pvnd].

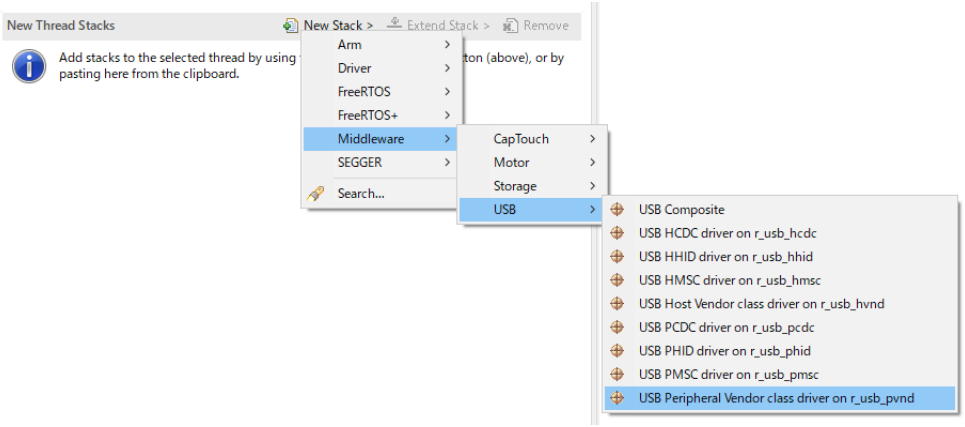

Figure 252: Select USB Peripheral Vendor Class

- The following is displayed when selecting [USB Peripheral Vendor class driver on r_usb_pvnd]. The user does not specify USB pipe number in Vendor class.

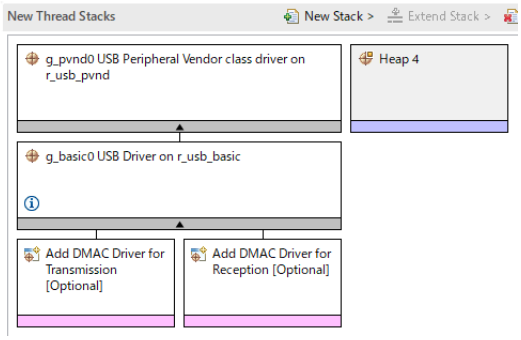

Figure 253: USB Peripheral Vendor Class Stack

# API

Use the following APIs in Peripheral Vendor class application program.

- For Data Transfer
  Use the following APIs for data transfer for Bulk transfer or Interrupt transfer.

  1. R_USB_PipeRead()
  2. R_USB_PipeWrite()
  3. R_USB_PipeStop()

- For Control Transfer
  Use the following API for the class request processing.

  1. R_USB_PeriControlDataGet()
  2. R_USB_PeriControlDataSet()
  3. R_USB_PeriControlStatusSet()

- For USB Pipe Information
  The USB driver allocates USB PIPE by analyzing the descriptor of USB device in Vendor class. Use the following APIs to get the allocated USB pipe information.

  1. R_USB_UsedPipesGet()
  2. R_USB_PipeInfoGet()

# USB PIPE Allocation

The USB driver allocates USB PIPE by analyzing the descriptor of USB device in Vendor class.
The USB PIPE related to the Endpoint Descriptor are allocated in order from USB PIPE1 according to the description order of the Endpoint Descriptor.
FSP driver pipe configuration behaviors for the PVND Class, when it is used with the Composite PCDC+PVND Class is mentioned below.

- In Composite PCDC+PVND class, PCDC class interface is placed next to the PVND class interface in descriptor file. PVND Class Pipe configurations are as follows.
  - FSP driver(PVND) allocates Pipes in order from USB PIPE1 according to the order of the endpoint in descriptor(Bulk transfer).
  - FSP driver(PVND) allocates Pipes in order(decremental order) from USB PIPE9 according to the order of the endpoint in descriptor(Interrupt transfer).
  - PCDC and PVND must always use different USB PIPEs.

For example:

- In the Composite PCDC+PVND class, if there are 3 number of bulk transfers endpoints and one Interrupt transfer endpoint in descriptor file for PVND class and for this configuration FSP driver configures USB PIPE1, USB PIPE2 and USB PIPE3 for bulk data transfer and USB PIPE9 for Interrupt data transfer.
- Since hardware support total 5 number of Bulk transfer pipe configuration. So, in this scenario, for the PCDC class we have configurable USB PCDC Stack property to select available Pipes(USB PIPE 4 and USB PIPE 5 for Bulk and USB PIPE 6 for Interrupt transfer) from USB PCDC Stack configurator.

# Limitaions

- Please ignore the suspend or resume event occurs when attaching or detaching the USB cable.

# Descriptor

Template for Vendor class descriptor can be found in ra/fsp/src/r_usb_pvnd folder. Also, please be sure to use your vendor ID.

# Examples

This application program processes the following after the enumeration completes with USB device.

1. Getting USB Pipe Infomattion
2. Vendor Class Request Processing
3. Loopback processing of bulk transfer and interrupt transfer.

### Detailed Description

Driver for the USB_TYPEC peripheral on RA MCUs. This module implements the USB TYPEC Interface.

# Overview

The r_usb_typec module is used in combination with r_usb_basic and other device class for USB communication and with the Type C module alone for Type-C charging.

### Features

The r_usb_typec module has the following key features:

- Detection of Source Connect/Disconnect (CC1/CC2 pin and USB_VBUS pin)
- Detection of Source Partner's Current Capability, Default USB, Type-C 1.5A, or Type-C 3.0A

# Usage Notes

### Basic Functions

The main functions of thie module are the following:

- Initialization and un-initialization of USB Type-C module.
- Getting of Type-C module information.

### Note

- Port Setting

If the user is using an MCU that supports the USB Type-C module and all of the following conditions are satisfied, please add code to control the port connected to External Rd immediately after calling the R_USB_TYPEC_Open function. (Because it is necessary to control External Rd after Internal Rd is turned ON.)

1. The USB operating mode is Device mode.
2. The power mode is BusPower. (External Rd is mounted on board)

```
R_USB_TYPEC_Open(&g_usbcc0_ctrl, &g_usbcc0_cfg);
R_IOPORT_PinCfg(&g_ioport_ctrl, BSP_IO_PORT_01_PIN_09, (uint32_t)
IOPORT_CFG_PORT_DIRECTION_OUTPUT | (uint32_t) IOPORT_CFG_PORT_OUTPUT_LOW);
```

- Debounce

Depending on the user board, the user may need code to debaunce the USB_VBUS pin.

# Examples

### USB Type-C Example

The following is example code for USB Type-C.

```
/*****************************************************************************
 * Function Name : usb_typec_apl_callback
 * Description : Callback function for Application program
 * Arguments : usb_typec_callback_args_t * p_typec_args : Callback function parameter
data.
 * Return value : none
 *****************************************************************************/

|---|---|
| struct | usb_typec_instance_ctrl_t |

## Data Structure Documentation

### ◆ usb_typec_instance_ctrl_t

| struct usb_typec_instance_ctrl_t | |
|---|---|
| USB TYPE-C control block. DO NOT INITIALIZE. Initialization occurs when usb_typec_api_t::open is called. | |
| **Data Fields** | |
| uint32_t | open |
| | Used to determine if the channel is configured. |
| | |
| usb_typec_cfg_t * | p_cfg |
| | Pointer to initial configurations. |
| | |
| uint32_t | module_number |
| | USB module number (USB_IP0/USB_IP1) |
| | |
| IRQn_Type | irq_typec_cci |
| | USBCC_CCI interrupt number storage variable. |
| | |
| IRQn_Type | irq_typec_ccs |
| | USBCC_CCS interrupt number storage variable. |
| | |
| uint32_t | ipl_typec_cci |
| | |

| | |
|---|---|
| | Variable to store the interrupt priority of USBCC_CCI. |
| | |
| uint32_t | ipl_typec_ccs |
| | Variable to store the interrupt priority of USBCC_CCS. |
| | |

### Function Documentation

#### ◆ R_USB_TYPEC_Open()

fsp_err_t R_USB_TYPEC_Open ( usb_typec_ctrl_t *const *p_ctrl*, usb_typec_cfg_t const *const *p_cfg* )

Initialize USB Type-C module and USB Type-C driver. Implements usb_typec_api_t::open.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Channel opened successfully. |
| FSP_ERR_NOT_OPEN | USB TYPEC module is not open. |
| FSP_ERR_ALREADY_OPEN | Control block has already been opened or channel is being used by another instance. Call close() then open() to reconfigure. |

#### ◆ R_USB_TYPEC_Close()

fsp_err_t R_USB_TYPEC_Close ( usb_typec_ctrl_t *const *p_ctrl*)

Uninitialize USB Type-C module and disable interrupts. Implements usb_typec_api_t::close.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Channel successfully closed. |
| FSP_ERR_NOT_OPEN | USB TYPEC module is not open. |

### ◆ R_USB_TYPEC_InfoGet()

fsp_err_t R_USB_TYPEC_InfoGet ( usb_typec_ctrl_t *const *p_ctrl*, usb_typec_info_t * *p_info* )

Get USB Type-C connect Information. Implements usb_typec_api_t::infoGet.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successful completion. |
| FSP_ERR_NOT_OPEN | USB TYPEC module is not open. |

### ◆ R_USB_TYPEC_LowPowerModeSet()

fsp_err_t R_USB_TYPEC_LowPowerModeSet ( usb_typec_ctrl_t *const *p_ctrl*, usb_typec_ccs_status_t *status* )

Set IRQ Mode for USB Type-C module by Low Power Mode. Implements usb_typec_api_t::lowPowerModeSet.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successful completion. |
| FSP_ERR_NOT_OPEN | USB TYPEC module is not open. |
| FSP_ERR_USB_PARAMETER | Parameter error. |

### Detailed Description

Middleware to implement a generic communications interface over USB_PCDC. This module implements the Communications Middleware Interface.

# Overview

The RM_COMMS_USB_PCDC module implements COMMS API for USB_PCDC interface.

### Features

The implementation of the USB_PCDC communications interfacehas the following key features:

- Non-blocking API for bare metal
- Non-blocking and blocking API for RTOS
- USB connection detection mode

# Configuration

### Build Time Configurations for rm_comms_usb_pcdc

The following build time configurations are defined in fsp_cfg/r_usb_pcdc_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

### Configurations for Connectivity > USB PCDC Communication Device (rm_comms_usb_pcdc)

This module can be added to the Stacks tab via New Stack > Connectivity > USB PCDC Communication Device (rm_comms_usb_pcdc).

| Configuration | Options | Default | Description |
|---|---|---|---|
| RTOS | | | |
| Recursive Write Mutex | • Do Not Use<br>• Use | Use | Lock device for writing in using RTOS. |
| Recursive Read Mutex | • Do Not Use<br>• Use | Use | Lock device for reading in using RTOS. |
| Mutex Timeout | Value must be a non-negative integer | 0xFFFFFFFF | Timeout for recursive mutex operation in using RTOS. |
| Write Semaphore | • Do Not Use<br>• Use | Use | Block writing in using RTOS. |
| Read Semaphore | • Do Not Use<br>• Use | Use | Block reading in using RTOS. |
| Semaphore Timeout | Value must be a non-negative integer | 0xFFFFFFFF | Timeout for semaphore operation in using RTOS. |
| Name | Name must be a valid C symbol | g_comms_usb_pcdc0 | Module name. |
| USB Connection Detection | • Disabled<br>• Baudrate Configuration<br>• Control Line State | Disabled | Enable it only when application wants to process the error of USB host tool not opened. |
| Callback | Name must be a valid C symbol | NULL | A user callback function can be provided. |

# Usage Notes

USB connection detection has two modes: Baudrate Configuration mode and Control Line State mode. The former depends on line coding request, and the latter relies on control line state request. When it is enabled, rm_comms_usb_pcdc_write API will return FSP_ERR_NOT_ENABLED when USB host tool is not opened. By default it is disabled.

### Limitations

- RM_COMMS_API are not reentrant in non blocking mode
- When in blocking mode, RM_COMMS_USB_PCDC_Write() and RM_COMMS_USB_PCDC_Read() cannot be called in callback.
- RM_COMMS_USB_PCDC_WriteRead API is not implemented
- USB connection detection could be platform specific when it is enabled. For Windows USB host, Baudrate configuration mode should be used.

## Examples

### Basic Example

This is a basic example of minimal use of USB_PCDC communications implementation in an application.

```
void rm_comms_usb_pcdc_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
    err = RM_COMMS_USB_PCDC_Open(&g_comms_usb_pcdc_ctrl, &g_comms_usb_pcdc_cfg);
 if (FSP_SUCCESS != err)
    {
 /* Handle any errors. */
    }
 while (true)
    {
 /* Send data. */
       g_err_flag = 0;
       g_tx_flag = 0;
       err       = RM_COMMS_USB_PCDC_Write(&g_comms_usb_pcdc_ctrl, g_tx_buf,
TX_BUF_LEN);
 if (FSP_SUCCESS != err)
     {
 /* Handle any errors. */
     }
 while ((0 == g_tx_flag) && (0 == g_err_flag))
     {
```

```
 /* Wait callback */
      }
 /* Receive data. */
       g_err_flag = 0;
       g_rx_flag = 0;
       err       = RM_COMMS_USB_PCDC_Read(&g_comms_usb_pcdc_ctrl, g_rx_buf,
RX_BUF_LEN);
 if (FSP_SUCCESS != err)
      {
 /* Handle any errors.*/
      }
 while ((0 == g_rx_flag) && (0 == g_err_flag))
      {
 /* Wait callback */
      }
    }
}
static void rm_comms_usb_pcdc_callback (rm_comms_callback_args_t * p_args)
{
 if (p_args->event == RM_COMMS_EVENT_TX_OPERATION_COMPLETE)
    {
       g_tx_flag = 1;
    }
 else if (p_args->event == RM_COMMS_EVENT_RX_OPERATION_COMPLETE)
    {
       g_rx_flag = 1;
    }
 else
    {
       g_err_flag = 1;
    }
}
```

# Descriptor

A template for PCDC descriptors can be found in ra/fsp/src/r_usb_pcdc/r_usb_pcdc_descriptor.c.template. Also, please be sure to use your vendor ID.

### Function Documentation

#### ◆ RM_COMMS_USB_PCDC_Open()

fsp_err_t RM_COMMS_USB_PCDC_Open ( rm_comms_ctrl_t *const *p_api_ctrl*, rm_comms_cfg_t const *const *p_cfg* )

Opens and configures the USB PCDC Comms module. Implements rm_comms_api_t::open.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | USB PCDC Comms module successfully configured. |
| FSP_ERR_ASSERTION | Null pointer, or one or more configuration options is invalid. |
| FSP_ERR_ALREADY_OPEN | Module is already open. This module can only be opened once. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes.

#### ◆ RM_COMMS_USB_PCDC_Close()

fsp_err_t RM_COMMS_USB_PCDC_Close ( rm_comms_ctrl_t *const *p_api_ctrl*)

Disables specified USB PCDC Comms module. Implements rm_comms_api_t::close.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully closed. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not open. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes.

### ◆ RM_COMMS_USB_PCDC_CallbackSet()

fsp_err_t RM_COMMS_USB_PCDC_CallbackSet ( rm_comms_ctrl_t *const *p_api_ctrl*, void(*)(rm_comms_callback_args_t *) *p_callback*, void *const *p_context* )

Updates the USB PCDC Comms callback. Implements rm_comms_api_t::callbackSet.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully set. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_COMMS_USB_PCDC_Read()

fsp_err_t RM_COMMS_USB_PCDC_Read ( rm_comms_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_dest*, uint32_t const *bytes* )

Performs a read from the USB PCDC device. Implements rm_comms_api_t::read.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully data decoded. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_NOT_ENABLED | USB device needs connecting from USB host to operate. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes.

### ◆ RM_COMMS_USB_PCDC_Write()

fsp_err_t RM_COMMS_USB_PCDC_Write ( rm_comms_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_src*, uint32_t const *bytes* )

Performs a write to the USB PCDC device. Implements rm_comms_api_t::write.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully writing data . |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_NOT_ENABLED | USB device needs connecting from USB host to operate. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes.

### ◆ RM_COMMS_USB_PCDC_WriteRead()

fsp_err_t RM_COMMS_USB_PCDC_WriteRead ( rm_comms_ctrl_t *const *p_api_ctrl*, rm_comms_write_read_params_t const *write_read_params* )

Performs a write to, then a read from the USB device. Implements rm_comms_api_t::writeRead.

**Return values**

| | |
|---|---|
| FSP_ERR_UNSUPPORTED | Not supported. |

### ◆ rm_comms_usb_pcdc_notify_application()

void rm_comms_usb_pcdc_notify_application ( rm_comms_usb_pcdc_instance_ctrl_t const * *p_ctrl*, rm_comms_event_t *event* )

(end addtogroup RM_COMMS_USB_PCDC)

## 5.2.7 DSP

Modules

### Detailed Description

DSP Modules.

**Modules**

| | |
|---|---|
| | CMSIS DSP H/W Acceleration (rm_cmsis_dsp)<br>Middleware to implement Arm CMSIS DSP by using 32-bit Multiply-Accumulator (MACL). |
| | IIR Filter Accelerator (r_iirfa)<br>Driver for the IIRFA peripheral on RA MCUs. This module implements the IIR Interface. |

### 5.2.7.1 CMSIS DSP H/W Acceleration (rm_cmsis_dsp)

Modules » DSP

Middleware to implement Arm CMSIS DSP by using 32-bit Multiply-Accumulator (MACL).

# Overview

The 32-bit Multiply-Accumulator (MACL) provides hardware acceleration for calculation of CMSIS DSP functions. After initializing this module, refer to the Arm documentation to use the file system: https://www.keil.com/pack/doc/CMSIS/DSP/html/index.html

**Features**

The MACL module supports the following features:

| No | MACL API | Feature |
|---|---|---|
| 1 | arm_mult_q31 | Q31 vector multiplication |
| 2 | arm_scale_q31 | Multiplies a Q31 vector by a scalar |
| 3 | arm_mat_mult_q31 | Q31 matrix multiplication |
| 4 | arm_mat_vec_mult_q31 | Q31 matrix and vector multiplication |
| 5 | arm_mat_scale_q31 | Q31 matrix scaling |
| 6 | arm_biquad_cascade_df1_q31 | Processing function for the Q31 Biquad cascade filter |
| 7 | arm_conv_partial_q31 | Partial convolution of Q31 sequences |
| 8 | arm_conv_q31 | Convolution of Q31 sequences |
| 9 | arm_correlate_q31 | Correlation of Q31 sequences |

| | | |
|---|---|---|
| 10 | arm_fir_decimate_q31 | Processing function for the Q31 FIR decimator |
| 11 | arm_fir_interpolate_q31 | Processing function for the Q31 FIR interpolator |
| 12 | arm_fir_q31 | Processing function for Q31 FIR filter |
| 13 | arm_fir_sparse_q31 | Processing function for the Q31 sparse FIR filter |
| 14 | arm_lms_norm_q31 | Processing function for Q31 normalized LMS filter |
| 15 | arm_lms_q31 | Processing function for Q31 LMS filter |

*Note*

*The MACL hardware acceleration when executing 5 APIs including arm_scale_q31, arm_mat_scale_q31, arm_correlate_q31, arm_fir_q31, and arm_lms_q31 with 1-element input on IAR compiler will not be better than ARM CMSIS software. The MACL hardware is useful when executing with larger amounts of input.*

# Configuration

### CMSIS DSP Acceleration Configuration

To enable hardware acceleration for Arm CMSIS DSP, the stack "Arm CMSIS6 DSP Acceleration" of CMSIS DSP must be filled with MACL (rm_cmsis_dsp). Otherwise the CMSIS DSP functions will perform the calculation by using software. This can be done at the Stack Configuration.

# Usage Notes

### Hardware Support

MACL module is required for using this middleware. Refer to the MCU hardware user's manual or datasheet to determine if it has MACL support.

# Examples

### Basic Example

About examples, how to use the CMSIS DSP APIs refer to the link: https://github.com/ARM-software/CMSIS-DSP/tree/main/Examples/ARM.

| __STATIC_INLINE float | R_IIRFA_SingleFilter (iir_ctrl_t *const p_api_ctrl, float data_in) |

### Detailed Description

Driver for the IIRFA peripheral on RA MCUs. This module implements the IIR Interface.

# Overview

The IIR Filter Accelerator (IIRFA) provides hardware acceleration for calculation of single-precision floating point direct form 2 biquad IIR filters. Up to 32 biquad stages can be configured at a time.

### Features

The IIRFA module supports the following features:

- Up to 16 different concurrent configurations/channels
- 32 biquad filter stages (shared between all channels)
- Runtime filter configuration
- ECC error detection for coefficient and delay data
    - 1-bit error correction, 2-bit error detection

# Configuration

### Build Time Configurations for r_iirfa

The following build time configurations are defined in fsp_cfg/r_iirfa_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| Polling Mode | • Enabled<br>• Disabled | Enabled | When enabled the IIRFA driver will poll for completion before reading the output register. This prevents |

| | | | |
|---|---|---|---|
| | | | IIRFA operations from delaying global interrupt processing at the cost of slower filter performance. |
| Software Loop Unroll Depth | Refer to the RA Configuration tool for available options. | 1 Sample | Select the number of samples to process for every loop. This setting generally only affects filters that use 1 biquad stage. |
| ECC Support | • Disabled<br>• Enabled<br>• Enabled (no writeback) | Enabled | Select whether to detect ECC errors. When set to 'Enabled (no writeback)' 1-bit ECC errors will not be corrected. |
| Rounding Mode | • Nearest<br>• Toward zero | Nearest | Select how to round calculation results. |

**Configurations for DSP > IIR Filter Accelerator (r_iirfa)**

This module can be added to the Stacks tab via New Stack > DSP > IIR Filter Accelerator (r_iirfa). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

| Configuration | Options | Default | Description |
|---|---|---|---|
| Name | Name must be a valid C symbol | g_iirfa0 | Module name. |
| Channel | Value must be an integer between 0 and 15 | 0 | Select the IIRFA channel. |

**Clock Configuration**

The clock source for the IIRFA peripheral is ICLK.

**Pin Configuration**

IIRFA does not have any pin connections.

**Filter Configuration**

Before using IIRFA to filter data the coefficients and state variables must be initialized. See the Filter Configuration example for how to initialize an iir_filter_cfg_t struct to pass to R_IIRFA_Configure.

*Note*

*There are 32 total biquad stages in the peripheral shared across all channels. Channels may not select the same stages, so it is important to choose iir_filter_cfg_t::stage_base and iir_filter_cfg_t::stage_num carefully to ensure no overlap.*

# Usage Notes

### Maximizing Performance

The optimum configuration for IIRFA is dependent on the application. It is recommended to consider the following in regards to your project to determine what settings may be ideal.

Regardless of configuration, each filter stage takes 2 ICLK cycles to process per sample and an additional 5 cycles to write state values back to registers. This means single-sample operations only take 2 cycles per stage while multi-sample operations take 7. Additional overhead cycles are required to load and store each sample. The following suggestions may improve performance:

- Either process more data at a time with R_IIRFA_Filter or only one sample at a time using R_IIRFA_SingleFilter
- Use the unrolled software loop option
    - Provide data in a multiple of the unroll depth
- Disable polling (see warning)

### Polling Mode

By default, the driver will poll a status flag for completion after writing input data to IIRFA. Disabling polling significantly improves performance when using a low number of stages, but may cause higher global interrupt latency during processing.

*Note*

*If only one stage is used it is recommended to disable polling as IIRFA will typically execute faster than code resulting in no wait cycles. If polling must be used with a one stage filter, please note that in some situations the Arm CMSIS DSP Library functions arm_biquad_cascade_df2T_init_f32 and arm_biquad_cascade_df2T_f32 may provide better performance. It up to the user to evaluate performance within their own project.*

Warning

When polling is disabled, filter operation works by writing a value to IIRCHnINP then immediately reading IIRCHnOUT. While this maximizes performance, the core will wait for output data to become available before continuing execution. **While execution waits for IIRCHnOUT no interrupts will be processed by the core.** The maximum wait time for a 32-stage filter may be up to approximately 64 ICLK cycles for single sample processing or 224 ICLK cycles for multi-sample processing (decreasing linearly with the number of stages used).

### Single Sample Processing

In applications such as motor control where each sample needs immediate processing, the inline function R_IIRFA_SingleFilter is provided. This function has no parameter checking, takes one sample, and returns a filtered sample. Polling is supported by this function (if configured).

### ECC Errors

If configured, R_IIRFA_Filter will return an error if a 1- or 2-bit ECC error has occurred.

1-bit errors are automatically corrected unless writeback is disabled. 2-bit errors cannot be automatically corrected. Reset the coefficient and filter data by calling R_IIRFA_Configure if a non-correctable ECC error is reported.

### Limitations

- A total of 32 stages may be configured at any one time across all channels.
- When polling is disabled core execution is halted while waiting for data to become available. (See warning)

# Examples

### Filter Configuration

Below is an example of how to initialize a filter configuration to pass to R_IIRFA_Configure.

```
#define FILTER_STAGE_NUM (2)
/* Biquad coefficients (4th order Butterworth 200Hz lowpass on 44.1KHz input) */
iir_filter_coeffs_t gp_iirfa0_filter_coeffs[FILTER_STAGE_NUM] =
{
    {
       .b0 = 1.000000000F,
       .b1 = 2.000000000F,
       .b2 = 1.000000000F,
       .a1 = -1.947914029F,
       .a2 = 0.948705125F,
    },
    {
       .b0 = 1.000000000F,
       .b1 = 2.000000000F,
       .b2 = 1.000000000F,
       .a1 = -1.977625722F,
       .a2 = 0.978428884F,
    },
};
/* Biquad state data (clear to start) */
iir_filter_state_t gp_iirfa0_filter_state[FILTER_STAGE_NUM] = {0};
/* Filter configuration */
iir_filter_cfg_t g_iirfa0_filter_cfg =
{
    .p_filter_coeffs = gp_iirfa0_filter_coeffs, // Pointer to filter coefficient
array
```

```
    .p_filter_state = gp_iirfa0_filter_state, // Pointer to filter state data array
    .stage_base      = 0,                     // Which hardware biquad stage to
start allocation from (0-31)
    .stage_num       = 2,                     // Number of stages to allocate
};
```

### Software Example

The following is a basic example of configuring and using a filter with IIRFA.

```
#define NUM_SAMPLES (128)
#define TWO_PI (2.0F * (float) M_PI)
float gp_data_in[NUM_SAMPLES];
float gp_data_out[NUM_SAMPLES];
void iirfa_filter_example (void)
{
 fsp_err_t err;
 /* Initialize the IIRFA module */
    err = R_IIRFA_Open(&g_iirfa0_ctrl, &g_iirfa0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Initialize filter coefficients and state variables */
    err = R_IIRFA_Configure(&g_iirfa0_ctrl, &g_iirfa0_filter_cfg);
    assert(FSP_SUCCESS == err);
 /* Get input data to be filtered */
    get_input_data(gp_data_in);
 /* Filter data */
    err = R_IIRFA_Filter(&g_iirfa0_ctrl, gp_data_in, gp_data_out, NUM_SAMPLES);
 /* R_IIRFA_Filter will return FSP_ERR_INVALID_RESULT when one or more calculations
results in infinity. */
 if (FSP_ERR_INVALID_RESULT == err)
    {
 /* Handle error */
    }
 else
```

```
    {
      assert(FSP_SUCCESS == err);
    }
}
```

| Prepare an IIR channel for filtering.<br><br>**Return values**<br>FSP_SUCCESS — The channel was successfully opened.<br>FSP_ERR_ASSERTION — One or both of the parameters was NULL.<br>FSP_ERR_IP_CHANNEL_NOT_PRESENT — An invalid channel was selected.<br>FSP_ERR_ALREADY_OPEN — The instance is already opened. |

### ◆ R_IIRFA_Filter()

fsp_err_t R_IIRFA_Filter ( iir_ctrl_t *const *p_api_ctrl*, float const * *p_data_in*, float * *p_data_out*, uint16_t const *num_samples* )

Start a filter operation on the specified data.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Data has been successfully filtered. |
| FSP_ERR_ASSERTION | One of the provided pointers is NULL. |
| FSP_ERR_NOT_OPEN | Instance is not open. |
| FSP_ERR_INVALID_ARGUMENT | num_samples is zero. |
| FSP_ERR_INVALID_RESULT | The result of one or more calculations was +/- infinity. |
| FSP_ERR_NOT_INITIALIZED | The filter is not configured. |
| FSP_ERR_IIRFA_ECC_1BIT | A 1-bit ECC error was detected. |
| FSP_ERR_IIRFA_ECC_2BIT | A 2-bit ECC error was detected. |

### ◆ R_IIRFA_Configure()

fsp_err_t R_IIRFA_Configure ( iir_ctrl_t *const *p_api_ctrl*, iir_filter_cfg_t const *const *p_filter_cfg* )

Configure filter coefficients and state values.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Configuration successful. |
| FSP_ERR_ASSERTION | p_api_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Instance is not open. |
| FSP_ERR_INVALID_ARGUMENT | Invalid filter stage selection. |
| FSP_ERR_IN_USE | One or more requested filter stages are currently in use. |

### ◆ R_IIRFA_StatusGet()

fsp_err_t R_IIRFA_StatusGet ( iir_ctrl_t *const *p_api_ctrl*, iir_status_t *const *p_status* )

Read the current filter state variables.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Information read successfully. |
| FSP_ERR_ASSERTION | p_api_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Instance is not open. |

### ◆ R_IIRFA_Close()

fsp_err_t R_IIRFA_Close ( iir_ctrl_t *const *p_api_ctrl*)

Stop filter operations and close the channel instance.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | The channel is successfully closed. |
| FSP_ERR_ASSERTION | p_api_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Instance is not open. |

### ◆ R_IIRFA_SingleFilter()

__STATIC_INLINE float R_IIRFA_SingleFilter ( iir_ctrl_t *const *p_api_ctrl*, float *data_in* )

Perform a single inline filter operation.

***Note***

*This function is intended to be used in performance-critical applications. As such, no parameter checking or error validation is provided.*

### 5.2.8.1 Azure RTOS GUIX Port (rm_guix_port)

Modules » Graphics

#### Functions

| | |
|---|---|
| UINT | rm_guix_port_hw_initialize (GX_DISPLAY *p_display) |

#### Detailed Description

# Overview

The Azure RTOS GUIX Port module provides the configuration and hardware acceleration support necessary for use of GUIX on RA products. The port provides full integration with the graphics peripherals (GLCDC, DRW and JPEG).

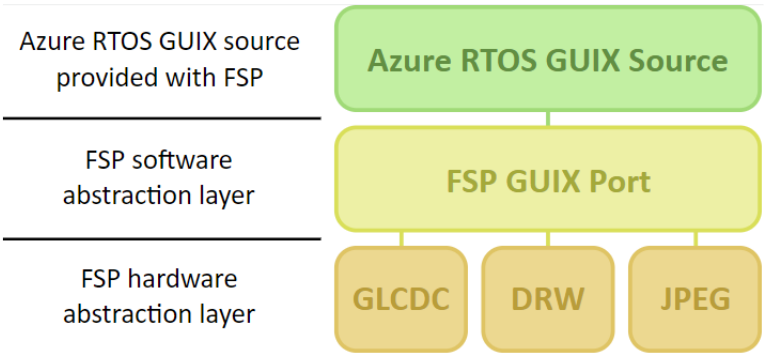

Figure 254: Azure RTOS GUIX Port Block Diagram

*Note*

*This port layer primarily enables hardware acceleration and background handling of many display operations and does not contain code intended to be directly called by the user. For information about how to use GUIX and GUIX Studio (including example code) please consult the Azure RTOS GUIX documentation.*

### Hardware Acceleration

The following functions are currently performed with hardware acceleration:

- DRW Engine (D/AVE 2D Port Interface (r_drw))
  - Drawing bitmaps
  - 8, 4 and 1bpp uncompressed and compressed (RLE) font rendering
  - Line and shape drawing
  - Anti-aliased operations
    - Circle stroke and fill
    - Polygon stroke and fill

        - Lines and arcs
- JPEG Codec (r_jpeg)
    - JPEG decoding
- Graphics LCD (r_glcdc)
    - Brightness, contrast and gamma correction
    - Pixel format conversion (framebuffer to LCD)

# Configuration

### Build Time Configurations for gx

The following build time configurations are defined in fsp_cfg/azure/gx/gx_user.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Hardware Acceleration | | | |
| JPEG Codec Support | MCU Specific Options | | Select whether or not to use the JPEG Codec for hardware acceleration. |
| DRW Engine Support | • Enabled<br>• Disabled | Enabled | Select whether or not to use the DRW Engine for hardware acceleration. |
| Max DRW Operations | Value must be a positive integer | 30 | Specifies the maximum number of DRW operations before flushing the display list. Reducing this value may reduce the peak heap used by the application but may reduce performance. |
| Internal Thread | | | |
| Stack Size | Value must be greater than zero | 4096 | GUIX internal thread stack size in bytes. Must be greater than zero. |
| Priority | Value must be between 0 to 31 | 30 | Priority of the GUIX Internal Thread. The value must be between 0 to 31. |
| Time Slice | Value must be in range 0 to 0xFFFFFFFF | 10 | Time Slice value of the GUIX Internal Thread. The value must be between 0 (TX_NO_TIME_SLICE) to 0xFFFFFFFF. |
| System Timer (ms) | Value must be greater | 20 | GUIX system timer |

| | | | |
|---|---|---|---|
| | than or equal to 10 | | period (GX_SYSTEM_TIMER_MS). This value will be internally converted to RTOS ticks and will be rounded down to the next smallest multiple of the RTOS tick period (1000 / TX_TIMER_TICKS_PER_SECOND). |
| Multithread Support | • Disabled<br>• Enabled | Enabled | Must be enabled if GUIX functions are called from multiple threads. Set to Disabled when calling GUIX from only one thread to reduce system overhead. |
| UTF8 Support | • Disabled<br>• Enabled | Enabled | Select whether to enable or disable support for UTF8 characters. |
| Event Queue Size | Value must be greater than zero | 48 | Maximum number of events in the GUIX event queue. |
| Enable GX_WIDGET User Data | • Enabled<br>• Disabled | Disabled | Set to Enabled to to use the gx_widget_user_data member in the GX_WIDGET structure. |

**Build Time Configurations for rm_guix_port**

The following build time configurations are defined in fsp_cfg/middleware/rm_guix_port_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| DRW Buffer Cache | • Enabled<br>• Disabled | Enabled | Enabling this option significantly improves DRW Engine performance. Set to Disabled only if Display underflow events are triggered under high graphics load. |

**Configurations for Graphics > Azure RTOS GUIX Port (rm_guix_port)**

| Configuration | Options | Default | Description |
|---|---|---|---|
| Display Rotation | | | |
| Screen Orientation | • None | None | Select the display |

| | | | |
|---|---|---|---|
| | • CW (90 degrees)<br>• FLIP (180 degrees)<br>• CCW (270 degrees) | | orientation specified in the GUIX Studio project. The Canvas Buffer must be enabled when rotating 180 degrees (FLIP). |
| Use Canvas Buffer | • Enabled<br>• Disabled | Disabled | When screen rotation is set to 180 degrees (FLIP), a canvas buffer must be used. The canvas buffer size will be the same as a frame buffer for the display module. |
| Canvas Buffer Memory Section | This property must be a valid section name | bss | Specify the memory section where the GUIX Canvas Buffer will be allocated. |
| JPEG Decoding | | | |
| Work Buffer Size | Must be a positive integer greater than 0 | 0xC800 | Specify the JPEG work buffer size in bytes. A larger buffer can reduce JPEG decode/draw times. The buffer will not be allocated if JPEG Codec support is disabled.<br><br>Unless you are sure of the subsampling used in and the size of the input JPEG images it is recommended to allocate at least 16 framebuffer lines of memory. |
| Buffer Memory Section | This property must be a valid section name | bss | Specify the memory section where the JPEG Work Buffer will be allocated. |
| Name | Name must be a valid C symbol | g_rm_guix_port0 | Module name. |
| Target Display Layer | • Graphics Layer 1<br>• Graphics Layer 2 | Graphics Layer 1 | Specify which graphics screen to inherit the buffer and display dimensions from. |
| Callback Function | Must be a valid C symbol | NULL | If a callback function is provided it will be called when Display events occur. |

### Hardware Configuration

No clocks or pins are directly required by this module. Please consult the submodules' documentation for their requirements.

## Usage Notes

### Getting Started

To get started with GUIX in an RA project the following must be performed:

1. In e² studio, open the RA Configuration editor for your GUIX project
2. Select or create a thread
3. Add GUIX to your project in the Stacks view by clicking **New Stack -> Azure RTOS -> GUIX**
4. Ensure the configuration options for GUIX and the port layer are set as necessary for your application
5. Set the properties for the GLCDC module to match the timing and memory requirements of your display panel
6. Set the input color format in the GLCDC module (Input -> Graphics Layer * -> General -> Color format) and the output color format in the JPEG Codec module if applicable (Decode -> Output color format) per your project specification
7. Click the BSP tab in the configuration editor and confirm the heap size in the Properties pane is sufficient (see Note below)
8. Click Generate Project Content to save and commit configuration changes
9. Drop the Quick Setup entry in Developer Assistance into the desired thread entry C file and update the items marked with TODO as necessary
10. Call the Quick Setup function from the thread entry function (or where desired)

At this point the project is now ready to build and run your GUIX Studio project. Please refer to the documentation for Azure RTOS GUIX and GUIX Studio for details on how to create and edit a GUI application.

*Note*

*It is recommended to start with 8K-32K of heap to begin development. Actual heap use is typically far lower than this but must be characterized by the developer.*

### Using Hardware Acceleration

In most cases there is no need to perform additional configuration to ensure the DRW Engine is used. However, there are some guidelines that should be followed:

- Avoid transparent pixelmaps in 8-bit display mode as they are rendered in software. In particular, ensure PNGs to be used in 8bpp GUIX Studio projects are saved without transparency data if no transparency is needed.
- The following items may require a large heap to draw successfully:
  - Polygons (more sides = more heap)
  - Filled arcs and ellipses (more framebuffer lines occupied = more heap)
  - gx_canvas_pixelmap_tile (more tiles = more heap)
- When using hardware acceleration, images used for tile fill of shapes must have dimensions that are a power of 2. This limitation does not apply to gx_canvas_pixelmap_tile as well as certain arc/ellipse fill functions as GUIX manually draws pixelmaps to fill these shapes (at the expense of heap space).

# Examples

### Basic Example

This is a basic example demonstrating how to get GUIX up and running given an existing GUIX Studio project. A template for this code is available in Developer Assistance for the GUIX Port module.

*Note*

*GUIX manages the GLCDC, DRW and JPEG Codec submodules internally; they do not need to be opened directly.*

```
GX_WINDOW_ROOT * p_window_root;
void guix_user_start (void)
{
 /* Initialize GUIX */
    gx_system_initialize();
 /* Configure GUIX Studio project main display and get a pointer to the root window
*/
    gx_studio_display_configure(MAIN_DISPLAY,
 rm_guix_port_hw_initialize,
                                MAIN_DISPLAY_LANGUAGE_ENGLISH,
                                MAIN_DISPLAY_THEME,
                                &p_window_root);
 /* Set pointer to the first buffer generated by the configuration
(rm_guix_port_canvas) */
    gx_canvas_memory_define(p_window_root->gx_window_root_canvas,
                            rm_guix_port_canvas,

p_window_root->gx_window_root_canvas->gx_canvas_memory_size);
 /* Create and show the root window in the GUIX Studio project */
    gx_studio_named_widget_create("root_widget_name", (GX_WIDGET *) p_window_root,
GX_NULL);
    gx_widget_show(p_window_root);
 /* Start GUIX */
    gx_system_start();
 /* GUIX will continue to run in its own thread */
}
```

## Data Structures

| | |
|---|---|
| struct | rm_guix_port_callback_args_t |

## Enumerations

| | |
|---|---|
| enum | rm_guix_port_device_t |
| enum | rm_guix_port_event_t |

## Data Structure Documentation

### ◆ rm_guix_port_callback_args_t

| struct rm_guix_port_callback_args_t | | |
|---|---|---|
| Callback arguments for the FSP GUIX Port | | |
| Data Fields | | |
| rm_guix_port_device_t | device | Device code. |
| rm_guix_port_event_t | event | Event code of the low level hardware. |
| uint32_t | error | Error code if RM_GUIX_PORT_EVENT_ERROR. |

## Enumeration Type Documentation

### ◆ rm_guix_port_device_t

| enum rm_guix_port_device_t | |
|---|---|
| Low level device code for the GUIX | |
| Enumerator | |
| RM_GUIX_PORT_DEVICE_NONE | Non hardware. |
| RM_GUIX_PORT_DEVICE_DISPLAY | Display device. |
| RM_GUIX_PORT_DEVICE_DRW | 2D Graphics Engine |
| RM_GUIX_PORT_DEVICE_JPEG | JPEG Codec. |

### ◆ rm_guix_port_event_t

| enum rm_guix_port_event_t | |
|---|---|
| Display event codes | |
| Enumerator | |
| RM_GUIX_PORT_EVENT_ERROR | Low level driver error occurs. |
| RM_GUIX_PORT_EVENT_DISPLAY_VSYNC | Display interface VSYNC. |
| RM_GUIX_PORT_EVENT_UNDERFLOW | Display interface underflow. |

## Function Documentation

### ◆ rm_guix_port_hw_initialize()

UINT rm_guix_port_hw_initialize ( GX_DISPLAY * *p_display*)

Callback function to be passed to gx_studio_display_configure in order to start hardware modules.

Example:

```
 /* Configure GUIX Studio project main display and get a pointer to the root window
*/
    gx_studio_display_configure(MAIN_DISPLAY,
 rm_guix_port_hw_initialize,
                                MAIN_DISPLAY_LANGUAGE_ENGLISH,
                                MAIN_DISPLAY_THEME,
                                &p_window_root);
```

***Note***

*This function should only be called by GUIX.*

**Return values**

| | |
|---|---|
| GX_SUCCESS | Device driver setup is successfully done. |
| GX_FAILURE | Device driver setup failed. |

### 5.2.8.2 Capture Engine Unit (r_ceu)

Modules » Graphics

## Functions

| | |
|---|---|
| fsp_err_t | R_CEU_Open (capture_ctrl_t *const p_ctrl, capture_cfg_t const *const p_cfg) |
| fsp_err_t | R_CEU_Close (capture_ctrl_t *const p_ctrl) |
| fsp_err_t | R_CEU_CaptureStart (capture_ctrl_t *const p_ctrl, uint8_t *const p_buffer) |
| fsp_err_t | R_CEU_CallbackSet (capture_ctrl_t *const p_ctrl, void(*p_callback)(capture_callback_args_t *), void *const p_context, capture_callback_args_t *const p_callback_memory) |
| fsp_err_t | R_CEU_StatusGet (capture_ctrl_t *const p_ctrl, capture_status_t *p_status) |

### Detailed Description

Driver for the CEU peripheral on RA MCUs. This module implements the CAPTURE Interface.

# Overview

The CEU peripheral supports interfacing with external cameras by accepting timing and data signals in order to capture incoming data. A callback is invoked for each V-Sync event, frame of data accepted, or when certain errors occur.

### Features

- Supports 8 or 16-bit camera bus
- Capture images up to 5 MP (2560x1920)
- Capture incoming data directly into a user defined memory location without the need for DTC/DMAC
- Capture specified size 'raw' image data using Data Synchronous Fetch mode (e.g. RGB565, YUV422, etc.)
- Capture binary image data using Data Enable fetch mode (e.g. JPEG)
- Perform basic timing signal validation

# Configuration

### Build Time Configurations for r_ceu

The following build time configurations are defined in fsp_cfg/r_ceu_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

### Configurations for Graphics > Capture Engine Unit (r_ceu)

This module can be added to the Stacks tab via New Stack > Graphics > Capture Engine Unit

(r_ceu). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

| Configuration | Options | Default | Description |
|---|---|---|---|
| General | | | |
| Name | Name must be a valid C symbol | g_ceu0 | Module name. |
| Input | | | |
| Input > Data Bus Specifications | | | |
| Data Bus Size | MCU Specific Options | | Data bus-width of CEU physical connection. |
| HSYNC Polarity | • High<br>• Low | High | Specify the active polarity of the HSYNC signal. |
| VSYNC Polarity | • High<br>• Low | High | Specify the active polarity of the VSYNC signal. |
| Input > Capture Specifications | | | |
| Input > Capture Specifications > Sample Points | | | |
| Data Sample Point | • Rising edge of the camera clock<br>• Falling edge of the camera clock | Rising edge of the camera clock | Specify the external camera clock transition state for fetching the image data (D15 to D0) from the external module. |
| H-Sync Sample Point | • Rising edge of the camera clock<br>• Falling edge of the camera clock | Rising edge of the camera clock | Specify the external camera clock transition state for capturing H-Sync from the external module. |
| V-Sync Sample Point | • Rising edge of the camera clock<br>• Falling edge of the camera clock | Rising edge of the camera clock | Specify the external camera clock transition state for capturing V-Sync from the external module. |
| Horizontal capture resolution | Value must be an integer. | 640 | Specify the number of horizontal pixels to capture. |
| Vertical capture resolution | Value must be an integer. | 480 | Specify the number of vertical pixels to capture. |
| Horizontal pixel offset | Value must be an integer. | 0 | Number of pixels from H-sync signal up to the |

| | | | |
|---|---|---|---|
| | | | start of a valid data period. |
| Vertical pixel offset | Value must be an integer. | 0 | Specify the vertical line to start capturing image data. |
| Capture Mode | • Data Synchronous Fetch<br>• Data Enable Fetch | Data Synchronous Fetch | Capture mode of incoming data. |
| Output | | | |
| Output > Buffer | | | |
| Data Enable Buffer Size | Value must be a positive integer. | 0 | Specify size of image region available for use by CEU data bus. (Only applicable to Data Enable Fetch capture mode) |
| Byte Swapping | • Swap 8-bit units<br>• Swap 16-bit units<br>• Swap 32-bit units | | Byte swapping configuration. Bytes may be swapped in 8-bit, 16-bit, or 32-bit units. |
| Burst Transfer Mode | • Transfer in 32-byte units<br>• Transfer in 64-byte units<br>• Transfer in 128-byte units<br>• Transfer in 256-byte units | Transfer in 256-byte units | Specify the unit for transferring data to the bus bridge module. |
| Interrupts | | | |
| Interrupts > Selectable CEU Events | | | |
| One-Frame Capture End Event | • Enabled<br>• Disabled | Enabled | Capturing one frame from an external module has finished. |
| Horizontal Sync Event | • Enabled<br>• Disabled | Disabled | Horizontal sync signal was input from an external module. |
| Vertical Sync Event | • Enabled<br>• Disabled | Enabled | Vertical sync signal was input from an external module. |
| CRAM Buffer Overflow Error | • Enabled<br>• Disabled | Enabled | Data overflowed in the CRAM write buffer. |
| H-Sync Validation Error | • Enabled<br>• Disabled | Disabled | The number of configured H-sync |

| | | | |
|---|---|---|---|
| | | | cycles is different than the H-sync cycles input from the external module. |
| V-Sync Validation Error | • Enabled<br>• Disabled | Disabled | The number of configured V-sync cycles is different than the V-sync cycles input from the external module. |
| V-Sync Error | • Enabled<br>• Disabled | Enabled | V-sync has been input while CEU holds data (insufficient vertical-sync front porch). |
| No H-Sync error | • Enabled<br>• Disabled | Enabled | No H-sync signal was input. |
| No V-Sync error | • Enabled<br>• Disabled | Enabled | No V-sync signal was input. |
| Callback | Name must be a valid C symbol. | g_ceu0_user_callback | A user callback function must be provided. This callback is invoked for every successful frame capture as well as other status or error conditions. |
| CEU Interrupt Priority | MCU Specific Options | | Select the CEU interrupt priority. |

### Clock Configuration

The CEU peripheral is clocked both from PCLKA and externally, from the camera module (VIO_CLK). The external input clock (VIO_CLK) should have a frequency at most the same as the CEU operating clock (PCLKA) frequency, with jitter on both sides included. The PCLKA frequency may be set using the **Clocks** tab of the RA Configuration editor or by using the CGC Interface at run-time.

*Note*

*At least 10 external clock cycles (VIO_CLK) must elapse after opening the CEU module, before starting a capture.*

### Pin Configuration

The VIO_CLK pin is a clock input to the MCU and should be connected to the clock output from the camera. The VIO_HD and VIO_VD pins must be connected to the horizontal and vertical sync signal output of the camera respectively. The VIO_D0 to VIO_D15 pins are the data bus input pins and should be connected to the relevant output pins of the camera. For 8-bit camera data bus VIO_D0 to VIO_D7 should be used.

*Note*

*Camera control and serial communication pins must be configured separately and are not controlled by this module.*

### Capture Resolution

- For Data Synchronous Fetch mode, capture size is calculated using the configured Horizontal Resolution, Vertical Resolution, and Bytes Per Pixel.
- For Data Enable Fetch mode, the capture size is controlled by the external module and is defined as a period from a VD rising edge to the VD falling edge. For this mode Horizontal Resolution and Vertical Resolution are not used. However, the maximum capture size is configured using the 'Data Enable Buffer Size' option, which is used to configure the maximum write 'Firewall Address' location.

*Note*

*For Data Enable Fetch mode, the external module must transmit data in 4-byte units.*

### Capture Offset

The blanking period from a horizontal or vertical sync signal differs among external modules. Therefore, the capture start location must be specified in terms of external cycles from the sync signal so that an image can be captured from the valid image area. Some external modules output a horizontal sync signal as a data enable signal. In this case, there is no blanking period so the configured offsets must be cleared to 0.

- The horizontal capture start location must be specified in terms of the number of pixels from a horizontal sync signal.
- The vertical capture start location must be specified in terms of the number of H-cycles from a vertical sync signal.

*Note*

*Capture offset is not used when Data Enable Fetch mode is configured.*

## Usage Notes

### Interrupt Configuration

- CEU V-sync, capture-end, and error interrupts are used by this module for reporting capture status and error events such as overrun, vertical line number setting and other capture errors.

*Note*

*If both a capture complete event and capture error event occur simultaneously, the capture complete event should be disregarded.*

### CEU Setup With External Camera

- Ensure that the memory pointed to by p_buffer is both valid and large enough to store a complete image.
- When Data Synchronous Fetch mode is configured, the amount of space required (in bytes) may be calculated as size (bytes) = image width (pixels) * image height (lines) * number of bytes per pixel.
- Ensure that the capture buffer address is 4-byte aligned and the buffer size is divisible by 32 bytes.

*Note*

*Any required configuration for external cameras must be performed by the application.*

# Examples

### Basic Example

This is a basic example of minimal use of the CEU in an application. This example shows how this driver can be used for capturing data from an external I/O device such as an image sensor.

```
bool g_ceu_capture_error;
bool g_ceu_capture_complete;
void ceu_minimal_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
    g_ceu_capture_error    = false;
    g_ceu_capture_complete = false;
    err = R_CEU_Open(&g_ceu0_ctrl, &g_ceu0_cfg);
    assert(FSP_SUCCESS == err);
    err = R_CEU_CaptureStart(&g_ceu0_ctrl, g_user_buffer);
    assert(FSP_SUCCESS == err);
 while (!g_ceu_capture_complete && !g_ceu_capture_error)
    {
 /* Wait for capture to complete. */
    }
/* Process image here if capture was successful. */
    err = R_CEU_Close(&g_ceu0_ctrl);
    assert(FSP_SUCCESS == err);
}
void ceu_callback (capture_callback_args_t * p_args)
{
 /* Multiple event flags may be set simultaneously */
 if (p_args->event & (uint32_t) ~(CEU_EVENT_HD | CEU_EVENT_VD | CEU_EVENT_FRAME_END))
    {
 /* Error processing should occur first. Application should not process complete
event if error occurred. */
       g_ceu_capture_error = true;
    }
 else
```

```
    {
 if (p_args->event & CEU_EVENT_VD)
      {
 /* Capture has started. Process V-Sync event. */
      }
 if (p_args->event & CEU_EVENT_FRAME_END)
      {
 /* Capture is complete and no error has occurred */
            g_ceu_capture_complete = true;
      }
    }
}
```

## Data Structures

## Data Structure Documentation

### ◆ ceu_byte_swapping_t

| struct ceu_byte_swapping_t |
|---|
| |

| Swap bits configuration | | |
|---|---|---|
| Data Fields | | |
| uint8_t | swap_8bit_units: 1 | Byte swapping in 8-bit units. |
| uint8_t | swap_16bit_units: 1 | Byte swapping in 16-bit units. |
| uint8_t | swap_32bit_units: 1 | Byte swapping in 32-bit units. |

### ◆ ceu_edge_info_t

| struct ceu_edge_info_t | | |
|---|---|---|
| Edge information for latching signals | | |
| Data Fields | | |
| uint8_t | dsel: 1 | Sets the edge for fetching the image data (D15 to D0) from an external module. |
| uint8_t | hdsel: 1 | Sets the edge for capturing hd from external module. |
| uint8_t | vdsel: 1 | Sets the edge for capturing vd from external module. |

### ◆ ceu_extended_cfg_t

| struct ceu_extended_cfg_t | | |
|---|---|---|
| Extended configuration structure for CEU. | | |
| Data Fields | | |
| ceu_capture_format_t | capture_format | Capture format for incoming data. |
| ceu_data_bus_size_t | data_bus_width | Size of camera data bus. |
| ceu_edge_info_t | edge_info | |
| ceu_hsync_polarity_t | hsync_polarity | Polarity of HSYNC input. |
| ceu_vsync_polarity_t | vsync_polarity | Polarity of VSYNC input. |
| uint32_t | image_area_size | Image capture size. Used when setting firewall address for Data Enable Fetch mode. |
| ceu_byte_swapping_t | byte_swapping | Controls byte swapping in 8-bit, 16-bit and 32-bit units. |
| ceu_burst_transfer_mode_t | burst_mode | Bus transfer data size. |
| uint32_t | interrupts_enabled | Enabled interrupt events bit mask. |
| uint8_t | ceu_ipl | PDC interrupt priority. |
| IRQn_Type | ceu_irq | PDC IRQ number. |

### ◆ ceu_instance_ctrl_t

| struct ceu_instance_ctrl_t |
| --- |
| CEU instance control block. DO NOT INITIALIZE. |

## Enumeration Type Documentation

### ◆ ceu_capture_mode_t

| enum ceu_capture_mode_t | |
| --- | --- |
| Capture mode | |
| Enumerator | |
| CEU_CAPTURE_MODE_SINGLE | Single image capture. |
| CEU_CAPTURE_MODE_CONTINUOUS | Continuous image capture. |

### ◆ ceu_data_bus_size_t

| enum ceu_data_bus_size_t | |
| --- | --- |
| Data bus width | |
| Enumerator | |
| CEU_DATA_BUS_SIZE_8_BIT | Data bus is 8-bit. |
| CEU_DATA_BUS_SIZE_16_BIT | Data bus is 16-bit. |

### ◆ ceu_hsync_polarity_t

| enum ceu_hsync_polarity_t | |
| --- | --- |
| Polarity of input HSYNC signal | |
| Enumerator | |
| CEU_HSYNC_POLARITY_HIGH | HSYNC signal is active high. |
| CEU_HSYNC_POLARITY_LOW | HSYNC signal is active low. |

### ◆ ceu_vsync_polarity_t

| enum ceu_vsync_polarity_t | |
|---|---|
| Polarity of input VSYNC signal | |
| Enumerator | |
| CEU_VSYNC_POLARITY_HIGH | VSYNC signal is active high. |
| CEU_VSYNC_POLARITY_LOW | VSYNC signal is active low. |

### ◆ ceu_burst_transfer_mode_t

| enum ceu_burst_transfer_mode_t | |
|---|---|
| Enumerator | |
| CEU_BURST_TRANSFER_MODE_X1 | Transferred to the bus in 32-byte units */. |
| CEU_BURST_TRANSFER_MODE_X2 | Transferred to the bus in 64-byte units */. |
| CEU_BURST_TRANSFER_MODE_X4 | Transferred to the bus in 128-byte units */. |
| CEU_BURST_TRANSFER_MODE_X8 | Transferred to the bus in 256-byte units */. |

### ◆ ceu_event_t

| enum ceu_event_t | |
|---|---|
| Enumerator | |
| CEU_EVENT_FRAME_END | Frame end event (CPE) |
| CEU_EVENT_HD | (Not Used) HD received (HD) |
| CEU_EVENT_VD | VD received (VD) |
| CEU_EVENT_CRAM_OVERFLOW | Data overflowed in the CRAM buffer (CDTOF) |
| CEU_EVENT_HD_MISMATCH | HD mismatch (IGHS) |
| CEU_EVENT_VD_MISMATCH | VD mismatch (IGVS) |
| CEU_EVENT_VD_ERROR | Invalid VD condition (VBP) |
| CEU_EVENT_FIREWALL | Data write address exceeds firewall (FWF) |
| CEU_EVENT_HD_MISSING | HD was expected but not input (NHD) |
| CEU_EVENT_VD_MISSING | VD was expected but not input (NVD) |

### ◆ ceu_capture_format_t

| enum ceu_capture_format_t | |
|---|---|
| Capture mode for CEU. | |
| Enumerator | |
| CEU_CAPTURE_FORMAT_DATA_SYNCHRONOUS | Raw formatted data. |
| CEU_CAPTURE_FORMAT_DATA_ENABLE | JPG formatted data. |

## Function Documentation

### ◆ R_CEU_Open()

fsp_err_t R_CEU_Open ( capture_ctrl_t *const *p_ctrl*, capture_cfg_t const *const *p_cfg* )

CEU module initialization.

Implements capture_api_t::open

The function provides initial configuration for the CEU module. Further initialization may be performed in capture_api_t::captureStart. This function should be called once prior to calling any other CEU API functions. After the CEU is opened the Open function should not be called again without first calling the Close function.

Example:

```
err = R_CEU_Open(&g_ceu0_ctrl, &g_ceu0_cfg);
assert(FSP_SUCCESS == err);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Initialization was successful. |
| FSP_ERR_ASSERTION | One or more parameters is NULL. |
| FSP_ERR_ALREADY_OPEN | Module is already open. |

### ◆ R_CEU_Close()

fsp_err_t R_CEU_Close ( capture_ctrl_t *const *p_ctrl*)

Stops and closes the transfer interface.

Implements capture_api_t::close

Stops any active captures, clears internal driver state-data, disables interrupts, and powers off the CEU peripheral.

Example:

```
err = R_CEU_Close(&g_ceu0_ctrl);
assert(FSP_SUCCESS == err);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Initialization was successful. |
| FSP_ERR_ASSERTION | One or more parameters is NULL. |
| FSP_ERR_NOT_OPEN | Open has not been successfully called. |

### ◆ R_CEU_CaptureStart()

fsp_err_t R_CEU_CaptureStart ( capture_ctrl_t *const *p_ctrl*, uint8_t *const *p_buffer* )

Starts a capture.

Implements capture_api_t::captureStart.

Sets up the interface to transfer data from the CEU into the specifiec buffer. Configures the CEU settings as previously set by the capture_api_t::open API. When a capture is complete the callback registered during capture_api_t::open API call or by capture_api_t::callbackSet API will be called.

Example:

```
err = R_CEU_CaptureStart(&g_ceu0_ctrl, g_user_buffer);
assert(FSP_SUCCESS == err);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Initialization was successful. |
| FSP_ERR_ASSERTION | One or more parameters is NULL. |
| FSP_ERR_NOT_OPEN | Open has not been successfully called. |
| FSP_ERR_INVALID_ADDRESS | Invalid buffer address alignment. |
| FSP_ERR_IN_USE | Capture is in progress. |
| FSP_ERR_INVALID_STATE | Capture is pending. |
| FSP_ERR_NOT_INITIALIZED | Callback function has not been set. |

### ◆ R_CEU_CallbackSet()

fsp_err_t R_CEU_CallbackSet ( capture_ctrl_t *const *p_ctrl*, void(*)(capture_callback_args_t *) *p_callback*, void *const *p_context*, capture_callback_args_t *const *p_callback_memory* )

Updates the user callback and has option of providing memory for callback structure.

Implements capture_api_t::callbackSet.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Initialization was successful. |
| FSP_ERR_ASSERTION | One or more parameters is NULL. |
| FSP_ERR_NOT_OPEN | Open has not been successfully called. |
| FSP_ERR_NO_CALLBACK_MEMORY | p_callback is non-secure and p_callback_memory is either secure or NULL. |

### ◆ R_CEU_StatusGet()

| fsp_err_t R_CEU_StatusGet ( capture_ctrl_t *const *p_ctrl*, capture_status_t * *p_status* ) |
|---|
| Provides the ceu operating status.<br>Implements capture_api_t::statusGet.<br><br>**Return values**<br>FSP_SUCCESS — Initialization was successful.<br>FSP_ERR_ASSERTION — One or more parameters is NULL.<br>FSP_ERR_NOT_OPEN — Open has not been successfully called. |

### 5.2.8.3 D/AVE 2D Port Interface (r_drw)

Modules » Graphics

Driver for the DRW peripheral on RA MCUs. This module is a port of D/AVE 2D.

# Overview

*Note*

***The D/AVE 2D Port Interface (D1 layer) is a HAL layer for the D/AVE D2 layer API and does not provide any interfaces to the user. Consult the TES Dave2D Driver Documentation for further information on using the D2 API.***

*For cross-platform compatibility purposes the D1 and D2 APIs are not bound by FSP coding guidelines for function names and general module functionality.*

# Configuration

### Build Time Configurations for r_drw

The following build time configurations are defined in fsp_cfg/r_drw_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Allow Indirect Mode | • Enabled<br>• Disabled | Enabled | Enable indirect mode to allow no-copy mode for d2_adddlist (see the TES Dave2D Driver Documentation for details). |
| Memory Allocation | • Default | Default | Set Memory Allocation |

| | | |
|---|---|---|
| | • Custom | to Default to use built-in dynamic memory allocation for the D2 heap. This will use an RTOS heap if configured; otherwise, standard C malloc and free will be used.<br>Set to Custom to define your own allocation scheme for the D2 heap. In this case, the developer will need to define the following functions:<br><br>void * d1_malloc(size_t size)<br>void d1_free(void * ptr) |

**Configurations for Graphics > D/AVE 2D Port Interface (r_drw)**

This module can be added to the Stacks tab via New Stack > Graphics > D/AVE 2D Port Interface (r_drw).

| Configuration | Options | Default | Description |
|---|---|---|---|
| D2 Device Handle Name | Name must be a valid C symbol | d2_handle0 | Set the name for the d2_device handle used when calling D2 layer functions. |
| DRW Interrupt Priority | MCU Specific Options | | Select the DRW_INT (display list completion) interrupt priority. |

**Heap Size**

The D1 port layer allows the D2 driver to allocate memory as needed. There are three ways the driver can accomplish this:

1. Allocate memory using the main heap
2. Allocate memory using a heap provided by an RTOS
3. Allocate memory via user-provided functions

When the "Memory Allocation" configuration option is set to "Default" the driver will use an RTOS implementation if available and the main heap otherwise. Setting the option to "Custom" allows the user to define their own scheme using the following prototypes:

```
void * d1_malloc(size_t size);

void d1_free(void * ptr);
```

Warning

If there is no RTOS-based allocation scheme the main heap will be used. Be sure that it is enabled by setting the "Heap size (bytes)" property under RA Common on the **BSP** tab of the RA Configuration editor.

*Note*

*It is recommended to add 32KB of additional heap space for the D2 driver until the actual usage can be determined in your application.*

### Interrupt

The D1 port includes one interrupt to handle various events like display list completion or bus error. This interrupt is managed internally by the D2 driver and no callback function is available.

## Usage Notes

### Limitations

Developers should be aware of the following limitations when using the DRW engine:

- The DRW module supports two additional interrupt types - bus error and render complete. These interrupts are not needed for D2 layer operation and thus are not supported.
- If the DRW module is stopped during rendering the render will continue once the module is started again. If this behavior is undesirable in your application it is recommended to call d2_flushframe before stopping the peripheral.
- The resolution and size limits for D/AVE 2D are as follows:

| Item | Limit (pixels) |
|---|---|
| Coordinate range | -2048 to 2047 (1:11:4 fixedpoint) |
| Object/primitive size | 1024 x 1024 (10:4 fixedpoint) |
| Framebuffer size | 2048 x 2048 |
| Texture size | 1024 x 1024 |
| Blit size | 2047 x 1024 |

### 5.2.8.4 Display Serial Interface (r_vin)

Modules » Graphics

#### Functions

| | |
|---|---|
| fsp_err_t | R_VIN_Open (capture_ctrl_t *const p_api_ctrl, capture_cfg_t const *const p_cfg) |
| fsp_err_t | R_VIN_Close (capture_ctrl_t *const p_api_ctrl) |
| fsp_err_t | R_VIN_CaptureStart (capture_ctrl_t *const p_api_ctrl, uint8_t *const p_buffer) |

| | |
|---|---|
| fsp_err_t | R_VIN_StatusGet (capture_ctrl_t *const p_api_ctrl, capture_status_t *p_status) |

### Detailed Description

Driver for the VIN peripheral on RA MCUs. This module implements the CAPTURE Interface.

# Overview

The VIN peripheral relies on the use of a Camera Serial Interface (CSI-2) Host, physical layer (D-PHY), and supporting sub-systems. Together, these form a high-speed graphics serial bus that formats and writes image data to memory according to the MIPI_CSI and R_VIN configurations.

### Features

The module has one video channel that can control the capture of data into a capture area of up to 4096 × 4096 pixels when scaling is off (2048 × 2048 pixels when scaling is on). It can also provide vertical and horizontal scaling of the data by up to three and two times, respectively.

For captured video data, the VIN provides a color space conversion function from YCbCr-422 to RGB or RGB to YCbCr-422 and a format conversion function from RGB to ARGB.

As the VIN internally generates a field signal, it can capture progressive data.

Supported Data Types:

| Image Format | Input Camera Format (MIPI CSI) | Output Memory Format |
|---|---|---|
| YCbCr-422 8-bit | Supported | Supported |
| YCbCr-422 10-bit | Supported | Supported |
| RGB-565 | | Supported |
| ARGB-1555 | | Supported |
| RGB-888 | Supported | |
| ARGB-8888 | | Supported |
| RAW8 | Supported | Supported |

# Configuration

### Build Time Configurations for r_vin

The following build time configurations are defined in fsp_cfg/r_vin_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

### Clock Configuration

AXI bus clock (aclk) runs on ICLK and is the main clock for VIN, processing one pixel per clock cycle. In the case of CSI-2, VIN processes the following depths with aclk, so select a clock that is higher than the transfer rate.

- RGB 888: depth = 24 bit
- YCbCr8bit: depth = 16 bit
- YCbCr10bit: depth = 20 bit
- RAW8: depth = 16 bit Example: When setting up for a 720 Mbps 2 lane MIPI CSI transfer rate, with YCbCr 8bit scaling bypass, aclk must be set to a frequency of 720*2/16 = 90 MHz or higher.

### Pin Configuration

VIN does not require pin configuration.

## Usage Notes

### Color Space Conversion

VIN may (optionally) be configured to convert between RGB and YCbCr data.

### RGB to YCbCr Conversion

Formulas are below for the conversion of RGB to YCbCr formats Y = ((C_RtoY × R + C_GtoY × G + C_BtoY × B) × 2 ^ YCLSFT) + Y_Addition Cb = ((C_RtoCb × R + C_GtoCb × G + C_BtoCb × B) × 2 ^ CBCLSFT) + Cb_Addition Cr = ((C_RtoCr × R + C_GtoCr × G + C_BtoCr × B) × 2 ^ CRCLSFT) + Cr_Addition

*Note : YCLSFT, CBCLSFT, and CRCLSFT values are all fixed to 10.*

### YCbCr to RGB Conversion

When enabled, YCbCr to RGB conversion is carried out according to the configured matrix coefficients. The color conversion input is extended to 12 bits by the data extension selection. See User Manual for additional information.

## Examples

### Basic Example

This is a basic example showing the minimum code required to initialize and start the VIN module.

```
void vin_minimal_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
    err = R_VIN_Open(&g_vin0_ctrl, &g_vin0_cfg);
    assert(FSP_SUCCESS == err);
```

```
    USER_CODE_camera_open();          // Prepare camera for capture
    err = R_VIN_CaptureStart(&g_vin0_ctrl, NULL);
    assert(FSP_SUCCESS == err);
    USER_CODE_camera_stream_on();      // Camera begin outputting image data
 capture_status_t capture_status;
    err = R_VIN_StatusGet(&g_vin0_ctrl, &capture_status);
    assert(FSP_SUCCESS == err);
    err = R_VIN_Close(&g_vin0_ctrl);
    assert(FSP_SUCCESS == err);
}
void vin0_callback (capture_callback_args_t * p_args)
{
 vin_event_t event            = (vin_event_t) p_args->event;
 vin_module_status_t    module_status    = (vin_module_status_t)
p_args->event_status;
 vin_interrupt_status_t interrupt_status = (vin_interrupt_status_t)
p_args->interrupt_status;
    switch (event)
    {
 case VIN_EVENT_NOTIFY:
     {
           USER_CODE_vin_process_notify(module_status, interrupt_status);
 if (interrupt_status.bits.frame_complete)
     {
 /* Capture Complete - Process data buffer pointer and index */
               USER_CODE_vin_process_completed_frame(p_args->p_buffer,
module_status.bits.latest_buffer);
           }
 break;
      }
 case VIN_EVENT_ERROR:
     {
 // Process Error based on interrupt and module status;
           USER_CODE_vin_process_error(module_status, interrupt_status);
```

```
 break;
       }
 default:
      {
 /* Do nothing */
 break;
       }
    }
}
void USER_CODE_camera_open (void)
{
 // Pre-transmission Camera Configuration
}
void USER_CODE_camera_stream_on (void)
{
 // Begin Streaming Image Data
}
void USER_CODE_vin_process_error (vin_module_status_t module_status,
vin_interrupt_status_t interrupt_status)
{
 FSP_PARAMETER_NOT_USED(module_status);
 FSP_PARAMETER_NOT_USED(interrupt_status);
 // Process Error
}
void USER_CODE_vin_process_notify (vin_module_status_t module_status,
vin_interrupt_status_t interrupt_status)
{
 FSP_PARAMETER_NOT_USED(module_status);
 FSP_PARAMETER_NOT_USED(interrupt_status);
 // Process Status Notification
}
void USER_CODE_vin_process_completed_frame (uint8_t * p_complete_frame, uint8_t
frame_idx)
{
```

```
 FSP_PARAMETER_NOT_USED(p_complete_frame);
 FSP_PARAMETER_NOT_USED(frame_idx);
 // Process Frame Data
}
```

| Enumerator | |
| VIN_DATA_TYPE_YUV422_8_BIT | Data Type YUV422 8-bit. |
| VIN_DATA_TYPE_YUV422_10_BIT | Data Type YUV422 10-bit. |
| VIN_DATA_TYPE_RGB888_BIT | Data Type RGB888. |
| VIN_DATA_TYPE_RAW8_BIT | Data Type RAW8. |

### ◆ vin_yuv444_conversion_mode_t

| enum vin_yuv444_conversion_mode_t | |
|---|---|
| VIN Input YUV444 Conversion Mode | |
| Enumerator | |
| VIN_YUV444_CONVERSION_MODE_DATA_EXTEND | The data of CbCr to be interpolated holds the data one pixel before. |
| VIN_YUV444_CONVERSION_MODE_INTERPOLATE | Generates CbCr data to be interpolated. |

### ◆ vin_pixel_data_clipping_t

| enum vin_pixel_data_clipping_t | |
|---|---|
| VIN Pixel Data Clipping | |
| Enumerator | |
| VIN_PIXEL_DATA_CLIPPING_DEFAULT | Default clipping mode. |
| VIN_PIXEL_DATA_CLIPPING_NIBBLE | Lower 4-bits clipping mode. |
| VIN_PIXEL_DATA_CLIPPING_DISABLED | Clipping mode disabled. |

### ◆ vin_conversion_mode_t

| enum vin_conversion_mode_t | |
|---|---|
| VIN Conversion Mode | |
| Enumerator | |
| VIN_CONVERSION_MODE_NONE | Data is not converted before output. |
| VIN_CONVERSION_MODE_RGB_TO_ARGB | RGB input Data is converted to ARGB before output. |
| VIN_CONVERSION_MODE_YC_SEPARATED | Y and CbCr data are separated before output. |

### ◆ vin_yc_transform_mode_t

| enum vin_yc_transform_mode_t | |
|---|---|
| VIN YC Transform Mode | |
| Enumerator | |
| VIN_YC_TRANSFORM_MODE_Y_CBCR | Y and CbCr data are transferred to memory. |
| VIN_YC_TRANSFORM_MODE_Y | Y data is transferred to memory as 8-bit data. |
| VIN_YC_TRANSFORM_MODE_Y10_CBCR | 10-bit Y data and 8-bit CbCr data are transferred to memory |
| VIN_YC_TRANSFORM_MODE_Y10 | 10-bit Y data is transferred to memory |

### ◆ vin_interpolation_mode_t

| enum vin_interpolation_mode_t | |
|---|---|
| VIN Interpolation Mode | |
| Enumerator | |
| VIN_INTERPOLATION_MODE_BILINEAR | Y and CbCr data are transferred to memory. |
| VIN_INTERPOLATION_MODE_NEIGHBOR | Y data is transferred to memory as 8-bit data. |

### ◆ vin_event_t

| enum vin_event_t | |
|---|---|
| VIN instance control block. Implements | |
| Enumerator | |
| VIN_EVENT_NONE | No Event. |
| VIN_EVENT_NOTIFY | Notification Event. |
| VIN_EVENT_ERROR | Error Event. |

## Function Documentation

### ◆ R_VIN_Open()

fsp_err_t R_VIN_Open ( capture_ctrl_t *const *p_api_ctrl*, capture_cfg_t const *const *p_cfg* )

Initialize the VIN peripheral.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | The channel was successfully opened. |
| FSP_ERR_ASSERTION | One or both of the parameters was NULL. |
| FSP_ERR_ALREADY_OPEN | The instance is already opened. |

### ◆ R_VIN_Close()

fsp_err_t R_VIN_Close ( capture_ctrl_t *const *p_api_ctrl*)

Close VIN and display data instances, disable interrupts, and power-off the module.

- NOTE: Application shall issue stop command to the peripheral and wait at least one full frame before calling CSI_Stop, after ensuring MIPI CSI reception is no longer active by checking data returned by MIPI_CSI GetStatus()

**Return values**

| | |
|---|---|
| FSP_SUCCESS | The channel is successfully closed. |
| FSP_ERR_ASSERTION | p_api_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Instance is not open. |

### ◆ R_VIN_CaptureStart()

fsp_err_t R_VIN_CaptureStart ( capture_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_buffer* )

Start video capture.

- NOTE: For best results, camera should not be transmitting data until after VIN capture start has been called.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Data is successfully written to the D/A Converter. |
| FSP_ERR_ASSERTION | p_api_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Instance is not open. |
| FSP_ERR_IN_USE | The physical interface is currently in use. |
| FSP_ERR_INVALID_STATE | VIN is already in video mode. |
| FSP_ERR_UNSUPPORTED | p_buffer parameter is not supported. |

### ◆ R_VIN_StatusGet()

| fsp_err_t R_VIN_StatusGet ( capture_ctrl_t *const *p_api_ctrl*, capture_status_t * *p_status* ) |
|---|
| Provide information about current VIN status.<br><br>**Return values**<br>FSP_SUCCESS — Information read successfully.<br>FSP_ERR_ASSERTION — p_api_ctrl is NULL.<br>FSP_ERR_NOT_OPEN — Instance is not open. |

## 5.2.8.5 Graphics LCD (r_glcdc)

Modules » Graphics

### Functions

| | |
|---|---|
| fsp_err_t | R_GLCDC_Open (display_ctrl_t *const p_api_ctrl, display_cfg_t const *const p_cfg) |
| fsp_err_t | R_GLCDC_Close (display_ctrl_t *const p_api_ctrl) |
| fsp_err_t | R_GLCDC_Start (display_ctrl_t *const p_api_ctrl) |
| fsp_err_t | R_GLCDC_Stop (display_ctrl_t *const p_api_ctrl) |
| fsp_err_t | R_GLCDC_LayerChange (display_ctrl_t const *const p_api_ctrl, display_runtime_cfg_t const *const p_cfg, display_frame_layer_t layer) |
| fsp_err_t | R_GLCDC_BufferChange (display_ctrl_t const *const p_api_ctrl, uint8_t *const framebuffer, display_frame_layer_t layer) |
| fsp_err_t | R_GLCDC_ColorCorrection (display_ctrl_t const *const p_api_ctrl, display_correction_t const *const p_correction) |
| fsp_err_t | R_GLCDC_ClutUpdate (display_ctrl_t const *const p_api_ctrl, display_clut_cfg_t const *const p_clut_cfg, display_frame_layer_t layer) |
| fsp_err_t | R_GLCDC_ClutEdit (display_ctrl_t const *const p_api_ctrl, display_frame_layer_t layer, uint8_t index, uint32_t color) |
| fsp_err_t | R_GLCDC_ColorKeySet (display_ctrl_t const *const p_api_ctrl, display_colorkeying_layer_t key_cfg, display_frame_layer_t layer) |

| | |
|---|---|
| fsp_err_t | R_GLCDC_StatusGet (display_ctrl_t const *const p_api_ctrl, display_status_t *const p_status) |

### Detailed Description

Driver for the GLCDC peripheral on RA MCUs. This module implements the Display Interface.

# Overview

The GLCDC is a multi-stage graphics output peripheral designed to automatically generate timing and data signals for LCD panels. As part of its internal pipeline the two internal graphics layers can be repositioned, alpha blended, color corrected, dithered and converted to and from a wide variety of pixel formats.

### Features

The following features are available:

| Feature | Options |
|---|---|
| Input color formats | ARGB8888, ARGB4444, ARGB1555, RGB888 (32-bit), RGB565, CLUT 8bpp, CLUT 4bpp, CLUT 1bpp |
| Output color formats | RGB888, RGB666, RGB565, Serial RGB888 (8-bit parallel) |
| Correction processes | Alpha blending, positioning, brightness and contrast, gamma correction, dithering |
| Timing signals | Dot clock, Vsync, Hsync, Vertical and horizontal data enable (DE) |
| Maximum resolution | Up to 2038 x 2043 pixels (dependent on sync signal width) |
| Maximum dot clock | 60MHz for serial RGB mode, 54MHz otherwise |
| Internal clock divisors | 1-9, 12, 16, 24, 32 |
| Interrupts | Line detect (Vblank), Layer 1 underflow, Layer 2 underflow |
| Other functions | Byte-order and endianness control, line repeat function |

# Configuration

### Build Time Configurations for r_glcdc

The following build time configurations are defined in fsp_cfg/r_glcdc_cfg.h:

| | | | |
|---|---|---|---|

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected, code for parameter checking is included in the build. |
| Color Correction | • On<br>• Off | Off | If selected, code to adjust brightness, contrast and gamma settings is included in the build. When disabled all color correction configuration options are ignored. |

**Configurations for Graphics > Graphics LCD (r_glcdc)**

This module can be added to the Stacks tab via New Stack > Graphics > Graphics LCD (r_glcdc).

| Configuration | Options | Default | Description |
|---|---|---|---|
| General | | | |
| Name | Name must be a valid C symbol | g_display0 | Module name. |
| Interrupts | | | |
| Callback Function | Name must be a valid C symbol | NULL | A user callback function can be defined here. |
| Line Detect Interrupt Priority | MCU Specific Options | | Select the line detect (Vsync) interrupt priority. |
| Underflow 1 Interrupt Priority | MCU Specific Options | | Select the underflow interrupt priority for layer 1. |
| Underflow 2 Interrupt Priority | MCU Specific Options | | Select the underflow interrupt priority for layer 2. |
| Input | | | |
| Input > Graphics Layer 1 | | | |
| Input > Graphics Layer 1 > General | | | |
| Enabled | • Yes<br>• No | Yes | Specify Used if the graphics layer 1 is used. If so a framebuffer will be automatically generated based on the specified height and horizontal stride. |

| | | | |
|---|---|---|---|
| Horizontal size | Value must be an integer from 16 to 2040 | 480 | Specify the number of horizontal pixels. |
| Vertical size | Value must be an integer from 16 to 2043 | 854 | Specify the number of vertical pixels. |
| Horizontal position | Must be a valid non-negative integer with a maximum configurable value of 4091 | 0 | Specify the horizontal offset in pixels of the graphics layer from the background layer. |
| Vertical position | Must be a valid non-negative integer with a maximum configurable value of 4094 | 0 | Specify the vertical offset in pixels of the graphics layer from the background layer. |
| Color format | • ARGB8888 (32-bit)<br>• RGB888 (32-bit)<br>• RGB565 (16-bit)<br>• ARGB1555 (16-bit)<br>• ARGB4444 (16-bit)<br>• CLUT8 (8-bit)<br>• CLUT4 (4-bit)<br>• CLUT1 (1-bit) | RGB565 (16-bit) | Specify the graphics layer Input format. If selecting CLUT formats, you must write the CLUT table data before starting output. |
| Line descending mode | • Enabled<br>• Disabled | Disabled | Select Used if the framebuffer starts from the bottom of the line. |
| Input > Graphics Layer 1 > Framebuffer | | | |
| Framebuffer name | This property must be a valid C symbol | fb_background | Specify the name for the framebuffer for Layer 1. |
| Number of framebuffers | Must be a valid non-negative integer | 2 | Number of framebuffers allocated for Graphics Layer 1. |
| Section for framebuffer allocation | Manual Entry | .sdram_noinit | Specify the section in which to allocate the framebuffer. |
| Input > Graphics Layer 1 > Line Repeat | | | |
| Enable | • On<br>• Off | Off | Select On if the display will be repeated from a smaller section of the framebuffer. |
| Repeat count | Must be a valid non-negative integer with a maximum configurable value of 65535 i.e | 0 | Specify the number of times the image is repeated. |

| | | | |
|---|---|---|---|
| | (vertical size) x (lines repeat times) must be equal to the panel vertical size | | |
| Input > Graphics Layer 1 > Fading | | | |
| Mode | • None<br>• Fade-in<br>• Fade-out | None | Select the fade method. |
| Speed | Value must be an integer from 0 to 255 | 0 | Specify the number of frames for the fading transition to complete. |
| Input > Graphics Layer 2 | | | |
| Input > Graphics Layer 2 > General | | | |
| Enabled | • Yes<br>• No | No | Specify Used if the graphics layer 2 is used. If so a framebuffer will be automatically generated based on the specified height and horizontal stride. |
| Horizontal size | Value must be be an integer from 16 to 2040 | 480 | Specify the number of horizontal pixels. |
| Vertical size | Value must be be an integer from 16 to 2043 | 854 | Specify the number of vertical pixels. |
| Horizontal position | Must be a valid non-negative integer with a maximum configurable value of 4091 | 0 | Specify the horizontal offset in pixels of the graphics layer from the background layer. |
| Vertical position | Must be a valid non-negative integer with a maximum configurable value of 4094 | 0 | Specify the vertical offset in pixels of the graphics layer from the background layer. |
| Color format | • ARGB8888 (32-bit)<br>• RGB888 (32-bit)<br>• RGB565 (16-bit)<br>• ARGB1555 (16-bit)<br>• ARGB4444 (16-bit)<br>• CLUT8 (8-bit)<br>• CLUT4 (4-bit)<br>• CLUT1 (1-bit) | RGB565 (16-bit) | Specify the graphics layer Input format. If selecting CLUT formats, you must write the CLUT table data before starting output. |
| Line descending mode | • Enabled | Disabled | Select Used if the |

| | | | |
|---|---|---|---|
| | • Disabled | | framebuffer starts from the bottom of the line. |
| Input > Graphics Layer 2 > Framebuffer | | | |
| Framebuffer name | This property must be a valid C symbol | fb_foreground | Specify the name for the framebuffer for Layer 2. |
| Number of framebuffers | Must be a valid non-negative integer | 2 | Number of framebuffers allocated for Graphics Layer 2. |
| Section for framebuffer allocation | Manual Entry | .sdram_noinit | Specify the section in which to allocate the framebuffer. |
| Input > Graphics Layer 2 > Line Repeat | | | |
| Enable | • On<br>• Off | Off | Select On if the display will be repeated from a smaller section of the framebuffer. |
| Repeat count | Must be a valid non-negative integer with a maximum configurable value of 65535 i.e (vertical size) x (lines repeat times) must be equal to the panel vertical size | 0 | Specify the number of times the image is repeated. |
| Input > Graphics Layer 2 > Fading | | | |
| Mode | • None<br>• Fade-in<br>• Fade-out | None | Select the fade method. |
| Speed | Value must be an integer from 0 to 255 | 0 | Specify the number of frames for the fading transition to complete. |
| Output | | | |
| Output > Timing | | | |
| Horizontal total cycles | Value must be an integer from 24 to 2047 | 559 | Specify the total cycles in a horizontal line. Set to the number of cycles defined in the data sheet of LCD panel sheet in your system |
| Horizontal active video cycles | Value must be an integer from 16 to 2040 | 480 | Specify the number of active video cycles in a horizontal line (including front and back porch). Set to the number of cycles |

| | | | |
|---|---|---|---|
| | | | defined in the data sheet of LCD panel sheet in your system. |
| Horizontal back porch cycles | Value must be an integer from 5 to 2029 | 5 | Specify the number of back porch cycles in a horizontal line. Back porch starts from the beginning of Hsync cycles, which means back porch cycles contain Hsync cycles. Set to the number of cycles defined in the data sheet of LCD panel sheet in your system. |
| Horizontal sync signal cycles | Value must be an integer from 0 to 2046 | 2 | Specify the number of Hsync signal assertion cycles. Set to the number of cycles defined in the data sheet of LCD panel sheet in your system. |
| Horizontal sync signal polarity | • Low active<br>• High active | Low active | Select the polarity of Hsync signal to match your system. |
| Vertical total lines | Value must be an integer from 20 to 2047 | 894 | Specify number of total lines in a frame (including front and back porch). |
| Vertical active video lines | Value must be an integer from 16 to 2043 | 854 | Specify the number of active video lines in a frame. |
| Vertical back porch lines | Value must be an integer from 3 to 2030 | 20 | Specify the number of back porch lines in a frame. Back porch starts from the beginning of Vsync lines, which means back porch lines contain Vsync lines. |
| Vertical sync signal lines | Value must be an integer from 0 to 2046 | 3 | Specify the Vsync signal assertion lines in a frame. |
| Vertical sync signal polarity | • Low active<br>• High active | Low active | Select the polarity of Vsync signal to match to your system. |
| Data Enable Signal Polarity | • Low active<br>• High active | High active | Select the polarity of Data Enable signal to |

| | | | |
|---|---|---|---|
| | | | match to your system. |
| Sync edge | • Rising edge<br>• Falling edge | Falling edge | Select the polarity of Sync signals to match to your system. |
| Output > Format | | | |
| Color format | • 24bits RGB888<br>• 18bits RGB666<br>• 16bits RGB565<br>• 8bits serial | 24bits RGB888 | Specify the graphics layer output format to match to your LCD panel. |
| Color order | • RGB<br>• BGR | RGB | Select data order for output signal to LCD panel. |
| Endian | • Little endian<br>• Big endian | Little endian | Select data endianness for output signal to LCD panel. |
| Output > Background | | | |
| Alpha | Value must be an integer from 0 to 255 | 255 | Alpha component of the background color. |
| Red | Value must be an integer from 0 to 255 | 0 | Red component of the background color. |
| Green | Value must be an integer from 0 to 255 | 0 | Green component of the background color. |
| Blue | Value must be an integer from 0 to 255 | 0 | Blue component of the background color. |
| CLUT | | | |
| Enabled | • Yes<br>• No | No | Specify Used if selecting CLUT formats for a graphics layer input format. If used, a buffer (CLUT_buffer) will be automatically generated based on the selected pixel width. |
| Size | Must be a valid non-negative integer with a maximum configurable value of 256 | 256 | Specify the number of entries for the CLUT source data buffer. Each entry consumes 4 bytes (1 word). |
| TCON | | | |
| Hsync pin select | • Not used<br>• LCD_TCON0<br>• LCD_TCON1<br>• LCD_TCON2<br>• LCD_TCON3 | LCD_TCON1 | Select the TCON pin used for the Hsync signal to match to your system. |

| | | | |
|---|---|---|---|
| Vsync pin select | • Not used<br>• LCD_TCON0<br>• LCD_TCON1<br>• LCD_TCON2<br>• LCD_TCON3 | LCD_TCON0 | Select TCON pin used for Vsync signal to match to your system. |
| Data enable (DE) pin select | • Not used<br>• LCD_TCON0<br>• LCD_TCON1<br>• LCD_TCON2<br>• LCD_TCON3 | LCD_TCON2 | Select TCON pin used for DataEnable signal to match to your system. |
| Panel clock source | • Internal clock (GLCDCLK)<br>• External clock (LCD_EXTCLK) | Internal clock (GLCDCLK) | Choose between an internal GLCDCLK generated from PCLKA or an external clock provided to the LCD_EXTCLK pin. |
| Panel clock division ratio | Refer to the RA Configuration tool for available options. | 1/8 | Select the clock source divider value. |
| Color Correction | | | |
| Color Correction > Brightness | | | |
| Enabled | • Yes<br>• No | No | Enable brightness color correction. |
| Red channel | Value must be an integer from 0 to 1023 | 512 | Red component of the brightness calibration. This value is divided by 512 to determine gain. |
| Green channel | Value must be an integer from 0 to 1023 | 512 | Green component of the brightness calibration. This value is divided by 512 to determine gain. |
| Blue channel | Value must be an integer from 0 to 1023 | 512 | Blue component of the brightness calibration. This value is divided by 512 to determine gain. |
| Color Correction > Contrast | | | |
| Enabled | • Yes<br>• No | No | Enable contrast color correction. |
| Red channel gain | Value must be an integer from 0 to 255 | 128 | Red component of the contrast calibration. This value is divided by 128 to determine gain. |
| Green channel gain | Value must be an integer from 0 to 255 | 128 | Green component of the contrast calibration. This value is divided by 128 to |

| | | | |
|---|---|---|---|
| | | | determine gain. |
| Blue channel gain | Value must be an integer from 0 to 255 | 128 | Blue component of the contrast calibration. This value is divided by 128 to determine gain. |
| Color Correction > Gamma | | | |
| Color Correction > Gamma > Tables | | | |
| Color Correction > Gamma > Tables > Red | | | |
| Color Correction > Gamma > Tables > Red > Gain | | | |
| 0 | Value must be an integer from 0 to 2047 | 1024 | Enter a gain value from 0 to 2047 (corresponding to gain of 0 and 1.999, respectively). |
| 1 | Value must be an integer from 0 to 2047 | 1024 | Enter a gain value from 0 to 2047 (corresponding to gain of 0 and 1.999, respectively). |
| 2 | Value must be an integer from 0 to 2047 | 1024 | Enter a gain value from 0 to 2047 (corresponding to gain of 0 and 1.999, respectively). |
| 3 | Value must be an integer from 0 to 2047 | 1024 | Enter a gain value from 0 to 2047 (corresponding to gain of 0 and 1.999, respectively). |
| 4 | Value must be an integer from 0 to 2047 | 1024 | Enter a gain value from 0 to 2047 (corresponding to gain of 0 and 1.999, respectively). |
| 5 | Value must be an integer from 0 to 2047 | 1024 | Enter a gain value from 0 to 2047 (corresponding to gain of 0 and 1.999, respectively). |
| 6 | Value must be an integer from 0 to 2047 | 1024 | Enter a gain value from 0 to 2047 (corresponding to gain of 0 and 1.999, respectively). |
| 7 | Value must be an integer from 0 to 2047 | 1024 | Enter a gain value from 0 to 2047 (corresponding to gain |

| | | | |
|---|---|---|---|
| | | | of 0 and 1.999, respectively). |
| 8 | Value must be an integer from 0 to 2047 | 1024 | Enter a gain value from 0 to 2047 (corresponding to gain of 0 and 1.999, respectively). |
| 9 | Value must be an integer from 0 to 2047 | 1024 | Enter a gain value from 0 to 2047 (corresponding to gain of 0 and 1.999, respectively). |
| 10 | Value must be an integer from 0 to 2047 | 1024 | Enter a gain value from 0 to 2047 (corresponding to gain of 0 and 1.999, respectively). |
| 11 | Value must be an integer from 0 to 2047 | 1024 | Enter a gain value from 0 to 2047 (corresponding to gain of 0 and 1.999, respectively). |
| 12 | Value must be an integer from 0 to 2047 | 1024 | Enter a gain value from 0 to 2047 (corresponding to gain of 0 and 1.999, respectively). |
| 13 | Value must be an integer from 0 to 2047 | 1024 | Enter a gain value from 0 to 2047 (corresponding to gain of 0 and 1.999, respectively). |
| 14 | Value must be an integer from 0 to 2047 | 1024 | Enter a gain value from 0 to 2047 (corresponding to gain of 0 and 1.999, respectively). |
| 15 | Value must be an integer from 0 to 2047 | 1024 | Enter a gain value from 0 to 2047 (corresponding to gain of 0 and 1.999, respectively). |
| Color Correction > Gamma > Tables > Red > Threshold | | | |
| 1 | Value must be an integer from 0 to 1023 | 64 | Enter a threshold value between the surrounding values less than or equal to 1023. |
| 2 | Value must be an | 128 | Enter a threshold value |

| | | | |
|---|---|---|---|
| | integer from 0 to 1023 | | between the surrounding values less than or equal to 1023. |
| 3 | Value must be an integer from 0 to 1023 | 192 | Enter a threshold value between the surrounding values less than or equal to 1023. |
| 4 | Value must be an integer from 0 to 1023 | 256 | Enter a threshold value between the surrounding values less than or equal to 1023. |
| 5 | Value must be an integer from 0 to 1023 | 320 | Enter a threshold value between the surrounding values less than or equal to 1023. |
| 6 | Value must be an integer from 0 to 1023 | 384 | Enter a threshold value between the surrounding values less than or equal to 1023. |
| 7 | Value must be an integer from 0 to 1023 | 448 | Enter a threshold value between the surrounding values less than or equal to 1023. |
| 8 | Value must be an integer from 0 to 1023 | 512 | Enter a threshold value between the surrounding values less than or equal to 1023. |
| 9 | Value must be an integer from 0 to 1023 | 576 | Enter a threshold value between the surrounding values less than or equal to 1023. |
| 10 | Value must be an integer from 0 to 1023 | 640 | Enter a threshold value between the surrounding values less than or equal to 1023. |
| 11 | Value must be an integer from 0 to 1023 | 704 | Enter a threshold value between the surrounding values less than or equal to 1023. |
| 12 | Value must be an integer from 0 to 1023 | 768 | Enter a threshold value between the surrounding values less than or equal to 1023. |
| 13 | Value must be an integer from 0 to 1023 | 832 | Enter a threshold value between the surrounding values less than or equal to 1023. |

| | | | |
|---|---|---|---|
| 14 | Value must be an integer from 0 to 1023 | 896 | Enter a threshold value between the surrounding values less than or equal to 1023. |
| 15 | Value must be an integer from 0 to 1023 | 960 | Enter a threshold value between the surrounding values less than or equal to 1023. |

Color Correction > Gamma > Tables > Green

Color Correction > Gamma > Tables > Green > Gain

| | | | |
|---|---|---|---|
| 0 | Value must be an integer from 0 to 2047 | 1024 | Enter a gain value from 0 to 2047 (corresponding to gain of 0 and 1.999, respectively). |
| 1 | Value must be an integer from 0 to 2047 | 1024 | Enter a gain value from 0 to 2047 (corresponding to gain of 0 and 1.999, respectively). |
| 2 | Value must be an integer from 0 to 2047 | 1024 | Enter a gain value from 0 to 2047 (corresponding to gain of 0 and 1.999, respectively). |
| 3 | Value must be an integer from 0 to 2047 | 1024 | Enter a gain value from 0 to 2047 (corresponding to gain of 0 and 1.999, respectively). |
| 4 | Value must be an integer from 0 to 2047 | 1024 | Enter a gain value from 0 to 2047 (corresponding to gain of 0 and 1.999, respectively). |
| 5 | Value must be an integer from 0 to 2047 | 1024 | Enter a gain value from 0 to 2047 (corresponding to gain of 0 and 1.999, respectively). |
| 6 | Value must be an integer from 0 to 2047 | 1024 | Enter a gain value from 0 to 2047 (corresponding to gain of 0 and 1.999, respectively). |
| 7 | Value must be an integer from 0 to 2047 | 1024 | Enter a gain value from 0 to 2047 (corresponding to gain |

| | | | |
|---|---|---|---|
| | | | of 0 and 1.999, respectively). |
| 8 | Value must be an integer from 0 to 2047 | 1024 | Enter a gain value from 0 to 2047 (corresponding to gain of 0 and 1.999, respectively). |
| 9 | Value must be an integer from 0 to 2047 | 1024 | Enter a gain value from 0 to 2047 (corresponding to gain of 0 and 1.999, respectively). |
| 10 | Value must be an integer from 0 to 2047 | 1024 | Enter a gain value from 0 to 2047 (corresponding to gain of 0 and 1.999, respectively). |
| 11 | Value must be an integer from 0 to 2047 | 1024 | Enter a gain value from 0 to 2047 (corresponding to gain of 0 and 1.999, respectively). |
| 12 | Value must be an integer from 0 to 2047 | 1024 | Enter a gain value from 0 to 2047 (corresponding to gain of 0 and 1.999, respectively). |
| 13 | Value must be an integer from 0 to 2047 | 1024 | Enter a gain value from 0 to 2047 (corresponding to gain of 0 and 1.999, respectively). |
| 14 | Value must be an integer from 0 to 2047 | 1024 | Enter a gain value from 0 to 2047 (corresponding to gain of 0 and 1.999, respectively). |
| 15 | Value must be an integer from 0 to 2047 | 1024 | Enter a gain value from 0 to 2047 (corresponding to gain of 0 and 1.999, respectively). |
| Color Correction > Gamma > Tables > Green > Threshold | | | |
| 1 | Value must be an integer from 0 to 1023 | 64 | Enter a threshold value between the surrounding values less than or equal to 1023. |
| 2 | Value must be an | 128 | Enter a threshold value |

| | | | |
|---|---|---|---|
| | integer from 0 to 1023 | | between the surrounding values less than or equal to 1023. |
| 3 | Value must be an integer from 0 to 1023 | 192 | Enter a threshold value between the surrounding values less than or equal to 1023. |
| 4 | Value must be an integer from 0 to 1023 | 256 | Enter a threshold value between the surrounding values less than or equal to 1023. |
| 5 | Value must be an integer from 0 to 1023 | 320 | Enter a threshold value between the surrounding values less than or equal to 1023. |
| 6 | Value must be an integer from 0 to 1023 | 384 | Enter a threshold value between the surrounding values less than or equal to 1023. |
| 7 | Value must be an integer from 0 to 1023 | 448 | Enter a threshold value between the surrounding values less than or equal to 1023. |
| 8 | Value must be an integer from 0 to 1023 | 512 | Enter a threshold value between the surrounding values less than or equal to 1023. |
| 9 | Value must be an integer from 0 to 1023 | 576 | Enter a threshold value between the surrounding values less than or equal to 1023. |
| 10 | Value must be an integer from 0 to 1023 | 640 | Enter a threshold value between the surrounding values less than or equal to 1023. |
| 11 | Value must be an integer from 0 to 1023 | 704 | Enter a threshold value between the surrounding values less than or equal to 1023. |
| 12 | Value must be an integer from 0 to 1023 | 768 | Enter a threshold value between the surrounding values less than or equal to 1023. |
| 13 | Value must be an integer from 0 to 1023 | 832 | Enter a threshold value between the surrounding values less than or equal to 1023. |

| | | | |
|---|---|---|---|
| 14 | Value must be an integer from 0 to 1023 | 896 | Enter a threshold value between the surrounding values less than or equal to 1023. |
| 15 | Value must be an integer from 0 to 1023 | 960 | Enter a threshold value between the surrounding values less than or equal to 1023. |

Color Correction > Gamma > Tables > Blue

Color Correction > Gamma > Tables > Blue > Gain

| | | | |
|---|---|---|---|
| 0 | Value must be an integer from 0 to 2047 | 1024 | Enter a gain value from 0 to 2047 (corresponding to gain of 0 and 1.999, respectively). |
| 1 | Value must be an integer from 0 to 2047 | 1024 | Enter a gain value from 0 to 2047 (corresponding to gain of 0 and 1.999, respectively). |
| 2 | Value must be an integer from 0 to 2047 | 1024 | Enter a gain value from 0 to 2047 (corresponding to gain of 0 and 1.999, respectively). |
| 3 | Value must be an integer from 0 to 2047 | 1024 | Enter a gain value from 0 to 2047 (corresponding to gain of 0 and 1.999, respectively). |
| 4 | Value must be an integer from 0 to 2047 | 1024 | Enter a gain value from 0 to 2047 (corresponding to gain of 0 and 1.999, respectively). |
| 5 | Value must be an integer from 0 to 2047 | 1024 | Enter a gain value from 0 to 2047 (corresponding to gain of 0 and 1.999, respectively). |
| 6 | Value must be an integer from 0 to 2047 | 1024 | Enter a gain value from 0 to 2047 (corresponding to gain of 0 and 1.999, respectively). |
| 7 | Value must be an integer from 0 to 2047 | 1024 | Enter a gain value from 0 to 2047 (corresponding to gain |

| | | | |
|---|---|---|---|
| | | | of 0 and 1.999, respectively). |
| 8 | Value must be an integer from 0 to 2047 | 1024 | Enter a gain value from 0 to 2047 (corresponding to gain of 0 and 1.999, respectively). |
| 9 | Value must be an integer from 0 to 2047 | 1024 | Enter a gain value from 0 to 2047 (corresponding to gain of 0 and 1.999, respectively). |
| 10 | Value must be an integer from 0 to 2047 | 1024 | Enter a gain value from 0 to 2047 (corresponding to gain of 0 and 1.999, respectively). |
| 11 | Value must be an integer from 0 to 2047 | 1024 | Enter a gain value from 0 to 2047 (corresponding to gain of 0 and 1.999, respectively). |
| 12 | Value must be an integer from 0 to 2047 | 1024 | Enter a gain value from 0 to 2047 (corresponding to gain of 0 and 1.999, respectively). |
| 13 | Value must be an integer from 0 to 2047 | 1024 | Enter a gain value from 0 to 2047 (corresponding to gain of 0 and 1.999, respectively). |

pattern.

### Clock Configuration

The peripheral clock for this module is PCLKA.

The dot clock is typically generated from the PLL with a maximum output frequency of 54 MHz in most pixel formats (60 MHz for serial RGB). Optionally, a clock signal can be provided to the LCD_EXTCLK pin for finer framerate control (60 MHz maximum input). With either clock source dividers of 1-9, 12, 16, 24 and 32 may be used. Clocks must be initialized and settled prior to starting this module.

### Pin Configuration

This module controls a variety of pins necessary for LCD data and timing signal output:

| Pin Name | Function | Notes |
|---|---|---|
| LCD_EXTCLK | External clock signal input | The maximum input clock frequency is 60MHz. |
| LCD_CLK | Dot clock output | The maximum output frequency is 54MHz (60MHz in serial RGB mode). |
| LCD_DATAn | Pixel data output lines | Pin assignment and color order is based on the output block configuration. See "Output Control for Data Format" in the GLCDC section of the relevant hardware manual for details. |
| LCD_TCONn | Panel timing signal output | These pins can be configured to output vertical and horizontal synchronization and data valid signals. |

*Note*

*There are two banks of pins listed for the GLCDC in the RA6M3 User's Manual (_A and _B). In most cases the _B bank will be used as _A conflicts with SDRAM pins. In either case, it is generally recommended to only use pins from only one bank at a time as this allows for superior signal routing both inside and outside the package. If _A and _B pins must be mixed be sure to note the timing precision penalty detailed in Table 60.33 in in the RA6M3 User's Manual.*

# Usage Notes

### Overview

The GLCDC peripheral is a combination of several sub-peripherals that form a pixel data processing pipeline. Each block passes pixel data to the next but otherwise they are disconnected from one another - in other words, changing timing block parameters does not affect the output generation block configuration and vice versa.

### Initial Configuration

During R_GLCDC_Open all configured parameters are set in the GLCDC peripheral fully preparing it for operation. Once opened, calling R_GLCDC_Start is typically all that is needed for basic operation. Background generation, timing and output parameters are not configurable at runtime, though layer control and color correction options can be altered.

### Framebuffer Allocation

The framebuffer should be allocated in the highest-speed region available without displacing the stack, heap and other program-critical structures. Regardless of the placement two rules must be followed to ensure correct operation of the GLCDC:

- The framebuffer must be aligned on a 64-byte boundary
- The horizontal stride of the buffer must be a multiple of 64 bytes

*Note*

*Framebuffers allocated through the RA Configuration tool automatically follow the alignment and size requirements.*

If your framebuffer will be placed in internal memory it is recommended to avoid any high-speed RAM regions as there is typically no speed advantage for doing so. In particular, it is important to ensure the framebuffer does not push the stack or any heaps outside of high-speed RAM areas to preserve CPU performance.

### Graphics Layers and Timing Parameters

The GLCDC synthesizes graphics data through two configurable graphics layers onto a background layer. The background is used as a solid-color canvas upon which to composite data from the graphics layers. The two graphics layers are blended on top of each other (Layer 2 above Layer 1) and overlaid on the background layer based on their individual configuration. The placement of the layers (as well as LCD timing parameters) are detailed in Figure 1. The colors of the dimensions indicate which element of the display_cfg_t struct is being referenced - for example, the width of the background layer would be [display_cfg].output.htiming.display_cyc as shown in the figure below.

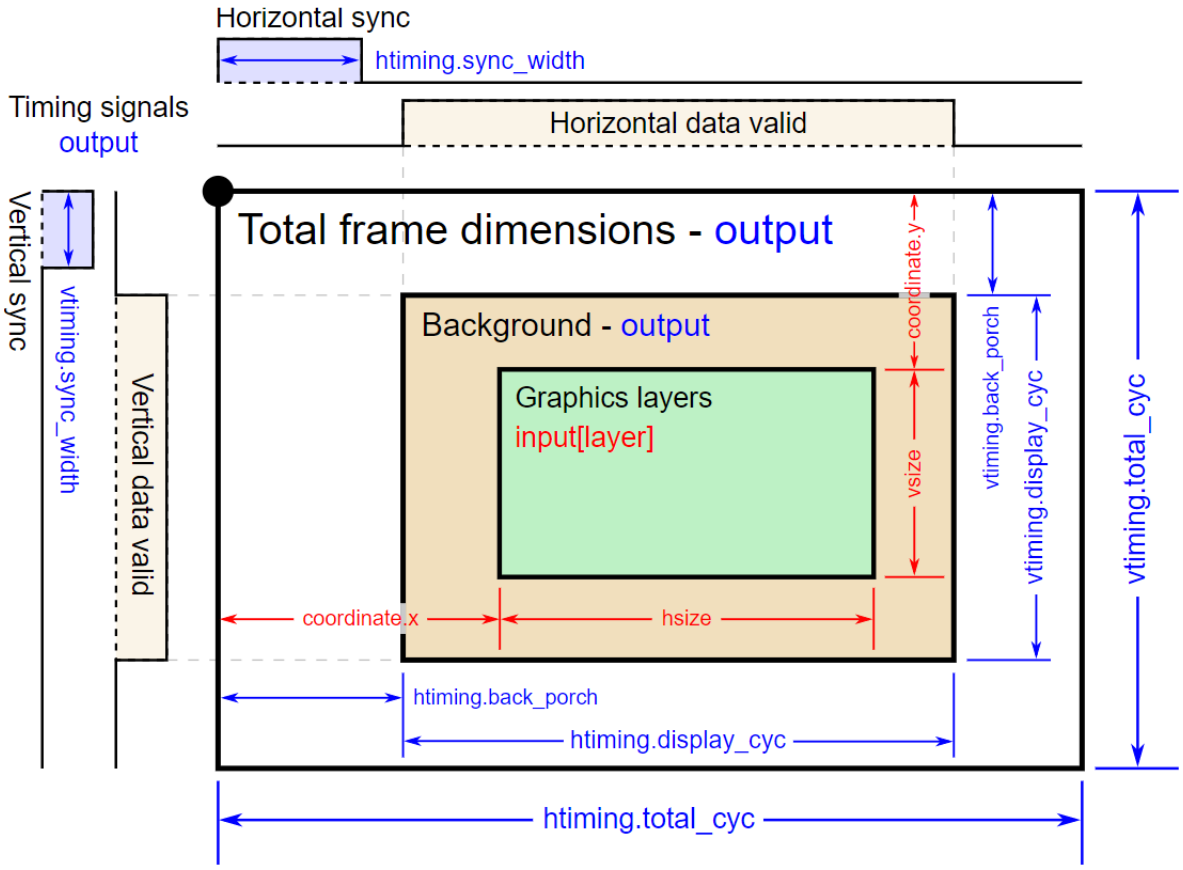

Figure 255: GLCDC layers and timing

*Note*

*The data enable signal (if configured) is the logical AND of the horizontal and vertical data valid signals. In the GLCDC layers and timing figure, only one graphics layer is shown for simplicity. Additionally, in most applications the graphics layer(s) will be the same dimensions as the background layer.*

### Runtime Configuration Options

*Note*

*All runtime configurations detailed below are also automatically configured during R_GLCDC_Open based on the options selected in the RA Configuration editor.*

### Blend processing

Control of layer positioning, alpha blending and fading is possible at runtime via R_GLCDC_LayerChange. This function takes a display_runtime_cfg_t parameter which contains the same input and layer elements as the display_cfg_t control block. Refer to the documentation for display_runtime_cfg_t as well as the Examples below to see what options are configurable.

### Brightness and contrast

Brightness and contrast correction can be controlled through R_GLCDC_ColorCorrection. The display_correction_t parameter is used to control enabling, disabling and gain values for both corrections as shown below:

```
display_correction_t correction;
/* Brightness values are 0-1023 with +512 offset being neutral */
   correction.brightness.r = 512;
   correction.brightness.g = 512;
   correction.brightness.b = 512;
/* Contrast values are 0-255 representing gain of 0-2 (128 is gain of 1) */
   correction.contrast.r = 128;
   correction.contrast.g = 128;
   correction.contrast.b = 128;
/* Brightness and contrast correction can be enabled or disabled independent of one
another */
   correction.brightness.enable = true;
   correction.contrast.enable   = true;
/* Enable correction */
R_GLCDC_ColorCorrection(&g_disp_ctrl, &correction);
```

### Color Look-Up Table (CLUT) Modes

The GLCDC supports 1-, 4- and 8-bit color look-up table (CLUT) formats for input pixel data. By using these modes the framebuffer size in memory can be reduced significantly, allowing even high-resolution displays to be buffered in on-chip SRAM. To enable CLUT modes for a layer the color format must be set to a CLUT mode (either at startup or through R_GLCDC_LayerChange) in addition to filling the CLUT as appropriate via R_GLCDC_ClutUpdate as shown below:

```
/* Basic 4-bit (16-color) CLUT definition */
   uint32_t clut_4[16] =
   {
      0xFF000000,                  // Black
      0xFFFFFFFF,                  // White
      0xFF0000FF,                  // Blue
      0xFF0080FF,                  // Turquoise
      0xFF00FFFF,                  // Cyan
      0xFF00FF80,                  // Mint Green
      0xFF00FF00,                  // Green
      0xFF80FF00,                  // Lime Green
      0xFFFFFF00,                  // Yellow
      0xFFFF8000,                  // Orange
```

```
      0xFFFF0000,                    // Red
      0xFFFF0080,                    // Pink
      0xFFFF00FF,                    // Magenta
      0xFF8000FF,                    // Purple
      0xFF808080,                    // Gray
      0x00000000                      // Transparent
   };
/* Define the CLUT configuration */
display_clut_cfg_t clut_cfg =
   {
      .start = 0,
      .size   = 16,
      .p_base = clut_4
   };
/* Update the CLUT in the GLCDC */
R_GLCDC_ClutUpdate(&g_disp_ctrl, &clut_cfg, DISPLAY_FRAME_LAYER_1);
```

*Note*

*If individual elements of the CLUT must be changed or if elements must be changed one at a time (for instance, when using emWin) it is recommended to use R_GLCDC_ClutEdit to avoid repeated memcpy operations.*

### Other Configuration Options

### Gamma correction

Gamma correction is performed based on a gain curved defined in the RA Configuration editor. Each point on the curve is defined by a threshold and a gain value - each gain value represents a multiplier from 0x-2x (set as 0-2047) that sets the Y-value of the slope of the gain curve, while each threshold interval sets the X-value respectively. For a more detailed explanation refer to Figure "Calculation of gamma correction value" and the related description above it in the GLCDC section of the relevant hardware manual.

When setting threshold values three rules must be followed:

- Each threshold value must be greater than the previous value
- Threshold values must be greater than zero and less than 1024
- Threshold values can equal the previous value only if they are 1023 (maximum)

*Note*

*Gamma correction can only be applied via R_GLCDC_Open.*

### Dithering

Dithering is a method of pixel blending that allows for smoother transitions between colors when

using a limited palette. A full description of dithering is outside the scope of this document. For more information on the pattern settings and how to configure them refer to the Figures "Configuration of dither correction block" and "Addition value selection method for 2x2 pattern dither" in the GLCDC section of the relevant hardware manual.

### Maximum Resolution

Though the GLCDC is capable of outputting resolutions in excess of HD, maximum clockspeeds and bus throughput limit what can be realistically achieved. Below is a table of maximum recommended widescreen resolutions at various input color depths **based on clock and bus limits at 60 FPS.**

| Device | 8bpp | 16bpp | 24/32bpp |
|---|---|---|---|
| RA6M3 | 960x540 (qHD) | 800x480 (WVGA) | 640x360 (nHD) |
| RA8 | 1920x1200 (WUXGA) | 1280x800 (WXGA) | 960x540 (qHD) |

*Note*

*The above values are estimated conservatively based on effective SDRAM bus throughput at a standard framerate. To calculate estimated maximum values for other situations the following equations can be used:*
*bytes per frame = (SDCLK speed (Hz) * SDRAM bus width / 8) / framerate*
*width = sqrt(16/9 * (bytes per frame) / (pixel bit depth / 8))*
*height = 9/16 * width*
*These equations provide values that are theoretically possible but may or may not be attainable depending on a number of other factors. It is the responsibility of the developer to test and confirm performance on each system to determine a suitable panel size for the application.*

Warning

The maximum resolution for GLCDC may exceed the limits for single texture or primitive rending operations with the DRW peripheral (D/AVE 2D). See the Limitations section in the DRW Usage Notes for details.

### Limitations

Developers should be aware of the following limitations when using the GLCDC API:

- Due to a limitation of the GLCDC hardware, if the horizontal back porch is less than the number of pixels in a graphics burst read (64 bytes) for a layer and the layer is positioned at a negative X-value then the layer X-position will be locked to the nearest 64-byte boundary, rounded toward zero.
- The GLCDC peripheral offers a chroma-key function that can be used to perform a green-screen-like color replacement. This functionality is not exposed through the GLCDC API. See the descriptions for GR1_AB7/GR2_AB7 through GR1_AB9/GR2_AB9 in the device's User's Manual for further details.
- Use of R_GLCDC_ClutUpdate and R_GLCDC_ClutEdit may not be mixed on the same frame.

## Examples

### Basic Example

This is a basic example showing the minimum code required to initialize and start the GLCDC module. If the entire display can be drawn within the vertical blanking period no further code may be necessary.

```
void glcdc_init (void)
{
 fsp_err_t err;
 // Open the GLCDC driver
    err = R_GLCDC_Open(&g_disp_ctrl, &g_disp_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 // Start display output
    err = R_GLCDC_Start(&g_disp_ctrl);
    assert(FSP_SUCCESS == err);
}
```

### Layer Transitions

This example demonstrates how to set up and execute both a sliding and fading layer transition. This is most useful in static image transition scenarios as switching between two actively-drawing graphics layers may require up to four framebuffers to eliminate tearing.

```
volatile uint32_t g_vsync_count = 0;
/* Callback function for GLCDC interrupts */
static void glcdc_callback (display_callback_args_t * p_args)
{
 if (p_args->event == DISPLAY_EVENT_LINE_DETECTION)
    {
       g_vsync_count++;
    }
}
/* Simple wait that returns 1 if no Vsync happened within the timeout period */
uint8_t vsync_wait (void)
{
    uint32_t timeout_timer = GLCDC_VSYNC_TIMEOUT;
    g_vsync_count = 0;
 while (!g_vsync_count && --timeout_timer)
    {
 /* Spin here until DISPLAY_EVENT_LINE_DETECTION callback or timeout */
    }
```

```
 return timeout_timer ? 0 : 1;
}
/* Initiate a fade on Layer 2
 *
 * Parameters:
 * direction True for fade in, false for fade out
 * speed number of frames over which to fade
 */
void glcdc_layer_transition_fade (display_runtime_cfg_t * disp_rt_cfg, bool
direction, uint16_t speed)
{
 fsp_err_t err;
 if (direction)
    {
 /* Set the runtime struct to the desired buffer */
       disp_rt_cfg->input.p_base       = (uint32_t *) g_framebuffer_1;
       disp_rt_cfg->layer.fade_control = DISPLAY_FADE_CONTROL_FADEIN;
    }
 else
    {
       disp_rt_cfg->layer.fade_control = DISPLAY_FADE_CONTROL_FADEOUT;
    }
 /* Ensure speed is at least 1 frame */
 if (!speed)
    {
       speed = 1;
    }
 /* Set the fade speed to the desired change in alpha per frame */
    disp_rt_cfg->layer.fade_speed = UINT8_MAX / speed;
 /* Initiate the fade (will start on the next Vsync) */
    err = R_GLCDC_LayerChange(&g_disp_ctrl, disp_rt_cfg, DISPLAY_FRAME_LAYER_2);
    assert(FSP_SUCCESS == err);
}
/* Slide Layer 1 out to the left while sliding Layer 2 in from the right */
```

```
void glcdc_layer_transition_sliding (display_runtime_cfg_t * disp_rt_cfg_in,
display_runtime_cfg_t * disp_rt_cfg_out)
{
 fsp_err_t err;
 /* Set the config for the incoming layer to be just out of bounds on the right side
*/
    disp_rt_cfg_in->input.p_base       = (uint32_t *) g_framebuffer_1;
    disp_rt_cfg_in->layer.coordinate.x = DISPLAY_WIDTH;
 /* Move layer 1 out and layer 2 in at a fixed rate of 4 pixels per frame */
 for (int32_t x = disp_rt_cfg_in->layer.coordinate.x; x >= 0; x -= 4)
    {
 /* Wait for a Vsync before starting */
       vsync_wait();
 /* Set the X-coordinate of both layers then update them */
       disp_rt_cfg_out->layer.coordinate.x = (int16_t) (x - DISPLAY_WIDTH);
       disp_rt_cfg_in->layer.coordinate.x = (int16_t) x;
       err = R_GLCDC_LayerChange(&g_disp_ctrl, disp_rt_cfg_out, DISPLAY_FRAME_LAYER_1
);
      assert(FSP_SUCCESS == err);
       err = R_GLCDC_LayerChange(&g_disp_ctrl, disp_rt_cfg_in, DISPLAY_FRAME_LAYER_2
);
      assert(FSP_SUCCESS == err);
    }
}
```

### Double-Buffering

Using a double-buffer allows one to be output to the LCD while the other is being drawn to memory, eliminating tearing and in some cases reducing bus load. The following is a basic example showing integration of the line detect (Vsync) interrupt to set the timing for buffer swapping and drawing.

```
/* User-defined function to draw the current display to a framebuffer */
void display_draw (uint8_t * framebuffer)
{
 FSP_PARAMETER_NOT_USED(framebuffer);
 /* Draw buffer here */
```

```
}
/* This function is an example of a basic double-buffered display thread */
void display_thread (void)
{
    uint8_t * p_framebuffer = NULL;
 fsp_err_t err;
 /* Initialize and start the R_GLCDC module */
    glcdc_init();
 while (1)
    {
 /* Swap the active framebuffer */
       p_framebuffer = (p_framebuffer == g_framebuffer_0) ? g_framebuffer_1 :
g_framebuffer_0;
 /* Draw the new framebuffer now */
       display_draw(p_framebuffer);
 /* Now that the framebuffer is ready, update the GLCDC buffer pointer on the next
Vsync */
       err = R_GLCDC_BufferChange(&g_disp_ctrl, p_framebuffer, DISPLAY_FRAME_LAYER_1
);
     assert(FSP_SUCCESS == err);
 /* Wait for a Vsync event */
       vsync_wait();
    }
}
```

| GLCDC_DITHERING_OUTPUT_FORMAT_RGB565 | Dithering output format RGB565. |

## Function Documentation

### ◆ R_GLCDC_Open()

fsp_err_t R_GLCDC_Open ( display_ctrl_t *const *p_api_ctrl*, display_cfg_t const *const *p_cfg* )

Open GLCDC module. Implements display_api_t::open.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Device was opened successfully. |
| FSP_ERR_ALREADY_OPEN | Device was already open. |
| FSP_ERR_ASSERTION | Pointer to the control block or the configuration structure is NULL. |
| FSP_ERR_CLOCK_GENERATION | Dot clock cannot be generated from clock source. |
| FSP_ERR_INVALID_TIMING_SETTING | Invalid panel timing parameter. |
| FSP_ERR_INVALID_LAYER_SETTING | Invalid layer setting found. |
| FSP_ERR_INVALID_ALIGNMENT | Input buffer alignment invalid. |
| FSP_ERR_INVALID_GAMMA_SETTING | Invalid gamma correction setting found |
| FSP_ERR_INVALID_BRIGHTNESS_SETTING | Invalid brightness correction setting found |

***Note***

*PCLKA must be supplied to Graphics LCD Controller (GLCDC) and GLCDC pins must be set in IOPORT before calling this API.*

### ◆ R_GLCDC_Close()

fsp_err_t R_GLCDC_Close ( display_ctrl_t *const *p_api_ctrl*)

Close GLCDC module. Implements display_api_t::close.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Device was closed successfully. |
| FSP_ERR_ASSERTION | Pointer to the control block is NULL. |
| FSP_ERR_NOT_OPEN | The function call is performed when the driver state is not equal to DISPLAY_STATE_CLOSED. |
| FSP_ERR_INVALID_UPDATE_TIMING | A function call is performed when the GLCDC is updating register values internally. |

***Note***

*This API can be called when the driver is not in DISPLAY_STATE_CLOSED state. It returns an error if the register update operation for the background screen generation block is being held.*

### ◆ R_GLCDC_Start()

fsp_err_t R_GLCDC_Start ( display_ctrl_t *const *p_api_ctrl*)

Start GLCDC module. Implements display_api_t::start.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Device was started successfully. |
| FSP_ERR_NOT_OPEN | GLCDC module has not been opened. |
| FSP_ERR_ASSERTION | Pointer to the control block is NULL. |

***Note***

*This API can be called when the driver is not in DISPLAY_STATE_OPENED status.*

### ◆ R_GLCDC_Stop()

fsp_err_t R_GLCDC_Stop ( display_ctrl_t *const *p_api_ctrl*)

Stop GLCDC module. Implements display_api_t::stop.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Device was stopped successfully |
| FSP_ERR_ASSERTION | Pointer to the control block is NULL |
| FSP_ERR_INVALID_MODE | Function call is performed when the driver state is not DISPLAY_STATE_DISPLAYING. |
| FSP_ERR_INVALID_UPDATE_TIMING | The function call is performed while the GLCDC is updating register values internally. |

***Note***

*This API can be called when the driver is in the DISPLAY_STATE_DISPLAYING state. It returns an error if the register update operation for the background screen generation blocks, the graphics data I/F blocks, or the output control block is being held.*

### ◆ R_GLCDC_LayerChange()

fsp_err_t R_GLCDC_LayerChange ( display_ctrl_t const *const *p_api_ctrl*, display_runtime_cfg_t const *const *p_cfg*, display_frame_layer_t *layer* )

Change layer parameters of GLCDC module at runtime. Implements display_api_t::layerChange.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Changed layer parameters of GLCDC module successfully. |
| FSP_ERR_ASSERTION | Pointer to the control block or the configuration structure is NULL. |
| FSP_ERR_INVALID_MODE | A function call is performed when the driver state is not DISPLAY_STATE_DISPLAYING. |
| FSP_ERR_INVALID_UPDATE_TIMING | A function call is performed while the GLCDC is updating register values internally. |

***Note***

*This API can be called when the driver is in DISPLAY_STATE_DISPLAYING state. It returns an error if the register update operation for the background screen generation blocks or the graphics data I/F block is being held.*

### ◆ R_GLCDC_BufferChange()

fsp_err_t R_GLCDC_BufferChange ( display_ctrl_t const *const *p_api_ctrl*, uint8_t *const *framebuffer*, display_frame_layer_t *layer* )

Change the framebuffer pointer for a layer. Implements display_api_t::bufferChange.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Changed layer parameters of GLCDC module successfully. |
| FSP_ERR_ASSERTION | Pointer to the control block is NULL. |
| FSP_ERR_INVALID_MODE | A function call is performed when the driver state is not DISPLAY_STATE_DISPLAYING. |
| FSP_ERR_INVALID_ALIGNMENT | The framebuffer pointer is not 64-byte aligned. |
| FSP_ERR_INVALID_UPDATE_TIMING | A function call is performed while the GLCDC is updating register values internally. |

***Note***

*This API can be called when the driver is in DISPLAY_STATE_OPENED state or higher. It returns an error if the register update operation for the background screen generation blocks or the graphics data I/F block is being held.*

### ◆ R_GLCDC_ColorCorrection()

fsp_err_t R_GLCDC_ColorCorrection ( display_ctrl_t const *const *p_api_ctrl*, display_correction_t const *const *p_correction* )

Perform color correction through the GLCDC module. Implements display_api_t::correction.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Color correction by GLCDC module was performed successfully. |
| FSP_ERR_ASSERTION | Pointer to the control block or the display correction structure is NULL. |
| FSP_ERR_INVALID_MODE | Function call is performed when the driver state is not DISPLAY_STATE_DISPLAYING. |
| FSP_ERR_INVALID_UPDATE_TIMING | A function call is performed while the GLCDC is updating registers internally. |
| FSP_ERR_UNSUPPORTED | Feature not supported with the current configuration. |
| FSP_ERR_INVALID_BRIGHTNESS_SETTING | Invalid brightness correction setting found |

***Note***

*This API can be called when the driver is in the DISPLAY_STATE_DISPLAYING state. It returns an error if the register update operation for the background screen generation blocks or the output control block is being held.*

### ◆ R_GLCDC_ClutUpdate()

fsp_err_t R_GLCDC_ClutUpdate ( display_ctrl_t const *const *p_api_ctrl*, display_clut_cfg_t const *const *p_clut_cfg*, display_frame_layer_t *layer* )

Write an entire color look-up table (CLUT) in the GLCDC module. Implements display_api_t::clut.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | CLUT written successfully. |
| FSP_ERR_ASSERTION | Pointer to the control block or CLUT source data is NULL. |
| FSP_ERR_INVALID_UPDATE_TIMING | R_GLCDC_ClutEdit was already used to edit the specified CLUT this frame. |
| FSP_ERR_INVALID_CLUT_ACCESS | Illegal CLUT entry or size is specified. |

***Note***

*This API can be called any time. The written data will be used after the next vertical sync event.*

### ◆ R_GLCDC_ClutEdit()

fsp_err_t R_GLCDC_ClutEdit ( display_ctrl_t const *const *p_api_ctrl*, display_frame_layer_t *layer*, uint8_t *index*, uint32_t *color* )

Update an element of a color look-up table (CLUT) in the GLCDC module. Implements display_api_t::clutEdit.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | CLUT element updated successfully. |
| FSP_ERR_ASSERTION | Pointer to the control block is NULL. |

***Note***

*This API can be called any time. The written data will be used after the next vertical sync event.*

### ◆ R_GLCDC_ColorKeySet()

fsp_err_t R_GLCDC_ColorKeySet ( display_ctrl_t const *const *p_api_ctrl*, display_colorkeying_layer_t *key_cfg*, display_frame_layer_t *layer* )

Configuring color key is not supported for GLCDC.

**Return values**

| | |
|---|---|
| FSP_ERR_UNSUPPORTED | |

### ◆ R_GLCDC_StatusGet()

fsp_err_t R_GLCDC_StatusGet ( display_ctrl_t const *const *p_api_ctrl*, display_status_t *const *p_status* )

Get status of GLCDC module. Implements display_api_t::statusGet.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Got status successfully. |
| FSP_ERR_ASSERTION | Pointer to the control block or the status structure is NULL. |

***Note***

*The GLCDC hardware starts the fading processing at the first Vsync after the previous LayerChange() call is held. Due to this behavior of the hardware, this API may not return DISPLAY_FADE_STATUS_FADING_UNDERWAY as the fading status, if it is called before the first Vsync after LayerChange() is called. In this case, the API returns DISPLAY_FADE_STATUS_PENDING, instead of DISPLAY_FADE_STATUS_NOT_UNDERWAY.*

### 5.2.8.6 JPEG Codec (r_jpeg)

Modules » Graphics

#### Functions

| | |
|---|---|
| fsp_err_t | R_JPEG_Open (jpeg_ctrl_t *const p_api_ctrl, jpeg_cfg_t const *const p_cfg) |

| fsp_err_t | R_JPEG_EncodeImageSizeSet (jpeg_ctrl_t *const p_api_ctrl, jpeg_encode_image_size_t *p_image_size) |
| fsp_err_t | R_JPEG_ModeSet (jpeg_ctrl_t *const p_api_ctrl, jpeg_mode_t mode) |
| fsp_err_t | R_JPEG_Close (jpeg_ctrl_t *p_api_ctrl) |
| fsp_err_t | R_JPEG_StatusGet (jpeg_ctrl_t *p_api_ctrl, jpeg_status_t *p_status) |

#### Detailed Description

Driver for the JPEG peripheral on RA MCUs. This module implements the JPEG Codec Interface.

# Overview

The JPEG Codec is a hardware block providing accelerated JPEG image encode and decode functionality independent of the CPU. Images can optionally be partially processed facilitating streaming applications.

### Features

The JPEG Codec provides a number of options useful in a variety of applications:

- Basic encoding and decoding
- Streaming input and/or output
- Decoding JPEGs of unknown size
- Shrink (sub-sample) an image during the decoding process
- Rearrange input and output byte order (byte, word and/or longword swap)
- JPEG error detection

The specifications for the codec are as follows:

| Feature | Options |
|---|---|
| Decompression input formats | Baseline JPEG Y'CbCr 4:4:4, 4:2:2, 4:2:0 and 4:1:1 |
| Decompression output formats | ARGB8888, RGB565 |
| Compression input formats | Raw Y'CbCr 4:2:2 only |
| Compression output formats | Baseline JPEG Y'CbCr 4:2:2 only |
| Byte reordering | Byte, halfword and/or word swapping on input and output |
| Interrupt sources | Image size acquired, input/output data pause, decode complete, error |
| Compatible image sizes | See Minimum Coded Unit (MCU) below |

# Configuration

### Build Time Configurations for r_jpeg

The following build time configurations are defined in fsp_cfg/r_jpeg_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected, code for parameter checking is included in the build. |
| Decode Support | • Enabled<br>• Disabled | Enabled | If selected, code for decoding JPEG images is included in the build. |
| Encode Support | • Enabled<br>• Disabled | Disabled | If selected, code for encoding JPEG images is included in the build. |

### Configurations for Graphics > JPEG Codec (r_jpeg)

This module can be added to the Stacks tab via New Stack > Graphics > JPEG Codec (r_jpeg).

| Configuration | Options | Default | Description |
|---|---|---|---|

| | | | |
|---|---|---|---|
| General | | | |
| Name | Name must be a valid C symbol | g_jpeg0 | Module name. |
| Default mode | • Decode<br>• Encode | Decode | Set the mode to use when calling R_JPEG_Open. This parameter is only used when both Encode and Decode support are enabled. |
| Decode | | | |
| Input byte order | MCU Specific Options | | Select the byte order of the input data for decoding. |
| Output byte order | MCU Specific Options | | Select the byte order of the output data for decoding. |
| Output color format | • ARGB8888 (32-bit)<br>• RGB565 (16-bit) | RGB565 (16-bit) | Select the output pixel format for decode operations. |
| Output alpha (ARGB8888 only) | Value must be an 8-bit integer (0-255) | 255 | Specify the alpha value to apply to each output pixel when ARGB8888 format is chosen. |
| Callback | Name must be a valid C symbol | NULL | If a callback function is provided it will be called from the interrupt service routine (ISR) each time a related IRQ triggers. |
| Encode | | | |
| Horizontal resolution | Value cannot be greater than 65535 and must be a non-negative integer divisible by 16 | 480 | Horizontal resolution of the raw image (in pixels). This value can be configured at runtime via R_JPEG_ImageSizeSet. |
| Vertical resolution | Value cannot be greater than 65535 and must be a non-negative integer divisible by 8 | 272 | Vertical resolution of the raw image. This value can be configured at runtime via R_JPEG_ImageSizeSet. |
| Horizontal stride | Value cannot be greater than 65535 and must be a non-negative integer | 480 | Horizontal stride of the raw image buffer (in pixels). This value can be configured at |

| | | | |
|---|---|---|---|
| | | | runtime via R_JPEG_ImageSizeSet. |
| Input byte order | MCU Specific Options | | Select the byte order of the input data for encoding. |
| Output byte order | MCU Specific Options | | Select the byte order of the output data for encoding. |
| Reset interval | Value cannot be greater than 65535 and must be a non-negative integer | 512 | Set the number of MCUs between RST markers. A value of 0 will disable DRI and RST marker output. |
| Quality factor | Value must be between 1 and 100 and must be an integer | 50 | Set the quality factor for encoding (1-100). Lower values produce smaller images at the cost of image quality. |
| Callback | Name must be a valid C symbol | NULL | If a callback function is provided it will be called from the interrupt service routine (ISR) each time a related IRQ triggers. |
| Interrupts | | | |
| Decode Process Interrupt Priority | MCU Specific Options | | Select the decompression interrupt priority. |
| Data Transfer Interrupt Priority | MCU Specific Options | | Select the data transfer interrupt priority. |

### Clock Configuration

The peripheral clock for this module is PCLKA. No clocks are provided by this module.

### Pin Configuration

This module does not have any input or output pin connections.

# Usage Notes

### Overview

The JPEG Codec contains both decode and encode hardware. While these two functions are largely independent in configuration only one can be used at a time.

To switch from decode to encode mode (or vice versa) use R_JPEG_ModeSet while the JPEG Codec is idle.

### Status

The status value (jpeg_status_t) provided by the callback and by R_JPEG_StatusGet is a bitfield that encompasses all potential status indication conditions. One or more statuses can be set simultaneously.

### Decoding Process

JPEG decoding can be performed in several ways depending on the application:

- To perform the simplest decode operation where all dimensions are known:
  - Set the input buffer, stride and output buffer then wait for a callback with status JPEG_STATUS_OPERATION_COMPLETE.
- To pause after decoding the JPEG header (in order to acquire image dimensions and secure an output buffer):
  - Call R_JPEG_InputBufferSet before setting the output buffer and wait for a callback with status JPEG_STATUS_IMAGE_SIZE_READY.
- To decode a partial JPEG image then pause until the next chunk is available:
  - Specify a size smaller than the full JPEG data when calling R_JPEG_InputBufferSet.
- To pause decoding once an output buffer is filled:
  - Specify a size smaller than the full decoded image when calling R_JPEG_OutputBufferSet.

The flowchart below illustrates the steps necessary to handle any decode operation. The statuses given in blue are part of jpeg_status_t with the JPEG_DECODE_STATUS prefix omitted.

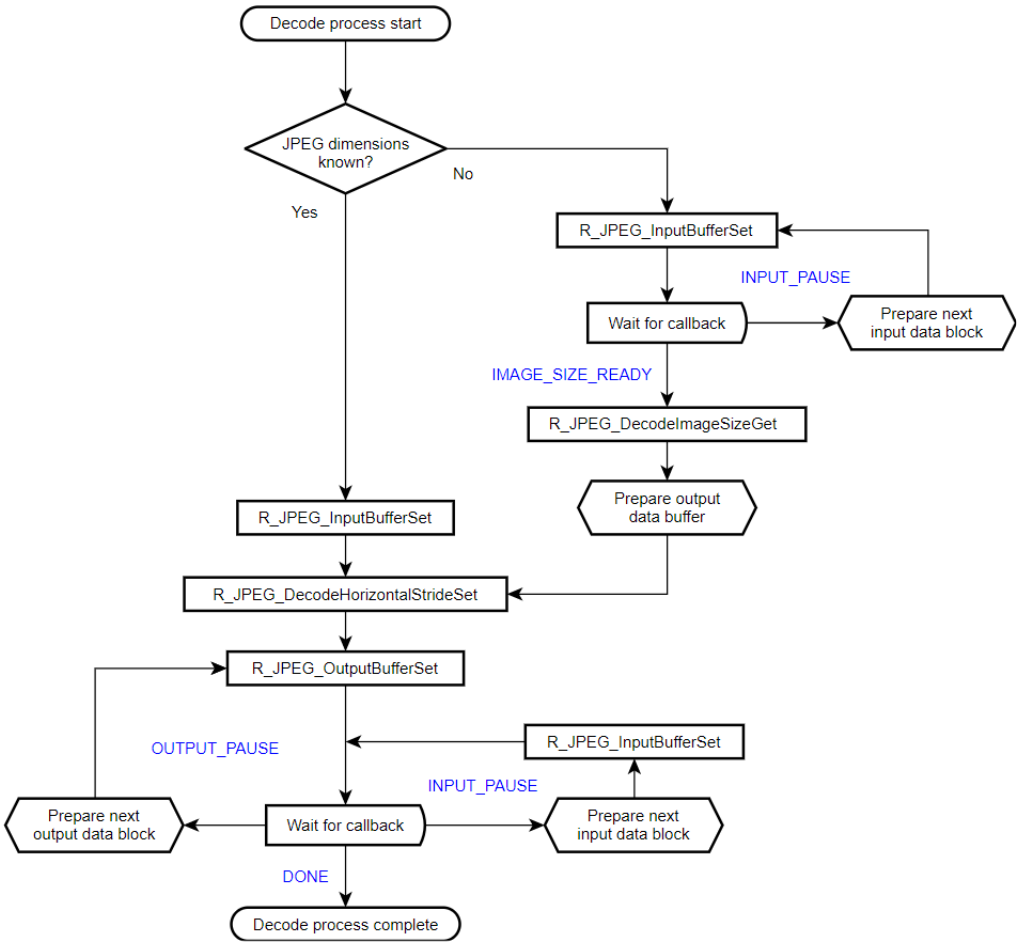

Figure 256: JPEG Decode Operational Flow

### Encoding Process

As compared to decoding, encoding is fairly straightforward. The only option available is to stream input data if desired. The flowchart below details the steps needed to compress an image.

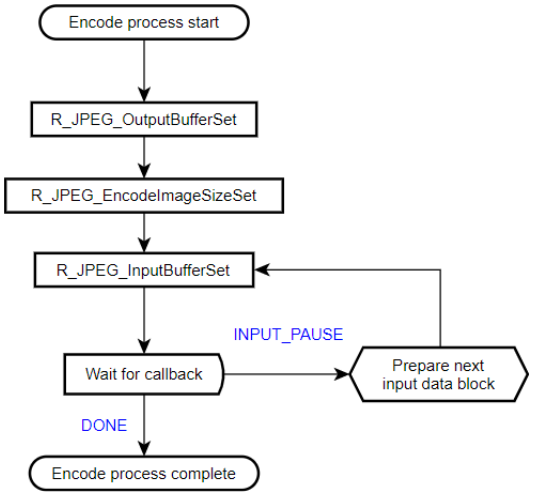

Figure 257: JPEG Encode Operational Flow

### Handling Failed Operations

If an encode or decode operation fails or times out while the codec is running, the peripheral must be reset before it is used again. To reset the JPEG Codec simply close and re-open the module by calling R_JPEG_Close followed by R_JPEG_Open.

### Limitations

Developers should be aware of the following limitations when using the JPEG API.

### Minimum Coded Unit (MCU)

The JPEG Codec can only correctly process images that are an even increment of minimum coded units (MCUs). In other words, depending on the format the width and height of an image to be encoded or decoded must be divisible by the following:

| Format | Horizontal | Vertical |
|---|---|---|
| Y'CbCr 4:4:4 | 8 pixels | 8 lines |
| Y'CbCr 4:2:2 | 16 pixels | 8 lines |
| Y'CbCr 4:1:1 | 32 pixels | 8 lines |
| Y'CbCr 4:2:0 | 16 pixels | 16 lines |

*Note*

*Because encoding is limited to Y'CbCr 4:2:2, raw pixel input data must always be in whole increments of 16x8 pixels.*

### Encoding Input Format

The encoding unit only supports Y'CbCr 4:2:2 input. Raw RGB888 data can be converted to this format as follows:

```
y =       (0.299000f * r) + (0.587000f * g) + (0.114000f * b);
cb = 128 - (0.168736f * r) - (0.331264f * g) + (0.500000f * b);
cr = 128 + (0.500000f * r) - (0.418688f * g) - (0.081312f * b);
```

While these equations are mathematically simple they do use the floating-point unit. To speed things up we can multiply the coefficients by 256 and divide the sum by 256...

```
y =       ((76.5440f * r) + (150.272f * g) + (29.1840f * b)) / 256;
cb = 128 - ((43.1964f * r) - (84.8036f * g) + (128.000f * b)) / 256;
cr = 128 + ((128.000f * r) - (107.184f * g) - (20.8159f * b)) / 256;
```

...which allows the formulas to be calculated entirely with shifts and addition (coefficients rounded to the nearest integer):

```
y =       (   (r << 6) + (r << 3) + (r << 2) + r
            + (g << 7) + (g << 4) + (g << 2) + (g << 1)
            + (b << 4) + (b << 3) + (b << 2) + b
           ) >> 8;
cb = 128 - (   (r << 5) + (r << 3) + (r << 1) + r
            + (g << 6) + (g << 4) + (g << 2) + g
            - (b << 7)
           ) >> 8;
cr = 128 + (   (r << 7)
            - (g << 6) - (g << 5) - (g << 3) - (g << 1) - g
            - (b << 4) - (b << 2) - b)
           ) >> 8;
```

To compose the final Y'CbCr 4:2:2 data the chroma of every two pixels must be averaged. **In addition, the JPEG Codec expects chrominance values to be in the range -127..127 instead of the standard 1..255.**

```
cb = (uint8_t) ((int8_t) ((cb0 + cb1 + 1) >> 1) - 128);
cr = (uint8_t) ((int8_t) ((cr0 + cr1 + 1) >> 1) - 128);
```

Finally, the below equation composes two 4:2:2 output pixels at a time with standard byte order (JPEG_DATA_ORDER_NORMAL):

```
   out = y0 + (cb << 8) + (y1 << 16) + (cr << 24);
```

*Note*

*RGB565 pixels must be upscaled to RGB888 before using the above formulas. Refer to the below example on Y'CbCr Conversion for implementation details.*

# Examples

### Basic Decode Example

This is a basic example showing the minimum code required to initialize the JPEG Codec and decode an image.

```
void jpeg_decode_basic (void)
{
 fsp_err_t err;
 /* Open JPEG Codec */
    err = R_JPEG_Open(&g_jpeg_ctrl, &g_jpeg_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Set input buffer */
    err = R_JPEG_InputBufferSet(&g_jpeg_ctrl, JPEG_PTR, JPEG_SIZE_BYTES);
    assert(FSP_SUCCESS == err);
 /* Set horizontal stride of output buffer */
    err = R_JPEG_DecodeHorizontalStrideSet(&g_jpeg_ctrl, JPEG_HSIZE);
    assert(FSP_SUCCESS == err);
 /* Set output buffer */
    err = R_JPEG_OutputBufferSet(&g_jpeg_ctrl, decode_buffer, sizeof(decode_buffer));
    assert(FSP_SUCCESS == err);
 /* Wait for decode completion */
 jpeg_status_t status = (jpeg_status_t) 0;
 while (!(status & (JPEG_STATUS_OPERATION_COMPLETE | JPEG_STATUS_ERROR)))
    {
```

```
       err = R_JPEG_StatusGet(&g_jpeg_ctrl, &status);
      assert(FSP_SUCCESS == err);
    }
}
```

### Streaming Input/Output Example

In this example JPEG data is read in 512-byte chunks. Decoding is paused when a chunk is read and once the JPEG header is decoded. The image is decoded 16 lines at a time.

*Note*

*Streaming is always bypassed when a given buffer's size encompasses the entire input or output image, respectively. Though this example decodes via smaller chunks the input and output data are still contiguous for ease of demonstration. Refer to the comments for further insight as to how to implement streaming with different JPEG/output buffer size combinations.*

```
#define JPEG_INPUT_SIZE_BYTES 512U
/* JPEG Codec status */
static volatile jpeg_status_t g_jpeg_status = JPEG_STATUS_NONE;
/* JPEG event flag */
static volatile uint8_t jpeg_event = 0;
/* Callback function for JPEG decode interrupts */
void jpeg_decode_callback (jpeg_callback_args_t * p_args)
{
 /* Get JPEG Codec status */
    g_jpeg_status = p_args->status;
 /* Set JPEG flag */
    jpeg_event = 1;
}
/* Simple wait that returns 1 if no event happened within the timeout period */
static uint8_t jpeg_event_wait (void)
{
    uint32_t timeout_timer = JPEG_EVENT_TIMEOUT;
 while (!jpeg_event && --timeout_timer)
    {
 /* Spin here until an event callback or timeout */
    }
    jpeg_event = 0;
```

```
 return timeout_timer ? 0 : 1;
}
/* Decode a JPEG image to a buffer using streaming input and output */
void jpeg_decode_streaming (void)
{
    uint8_t    * p_jpeg = (uint8_t *) JPEG_PTR;
 jpeg_status_t status = (jpeg_status_t) 0;
    uint8_t       timeout = 0;
 fsp_err_t    err;
 /* Number of input bytes to read at a time */
    uint32_t input_bytes = JPEG_INPUT_SIZE_BYTES;
 /* Open JPEG unit and start decode */
    err = R_JPEG_Open(&g_jpeg_ctrl, &g_jpeg_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 while (!(status & JPEG_STATUS_ERROR) && !timeout)
    {
 /* Set the input buffer to read `input_bytes` bytes at a time */
       err = R_JPEG_InputBufferSet(&g_jpeg_ctrl, p_jpeg, input_bytes);
     assert(FSP_SUCCESS == err);
 /* This delay is required for streaming input mode to function correctly.
  * (Without this delay the JPEG Codec will not correctly locate markers in the file
header.) */
 R_BSP_SoftwareDelay(10, BSP_DELAY_UNITS_MICROSECONDS);
 /* Wait for a callback */
       timeout = jpeg_event_wait();
 /* Get the status from the callback */
       status = g_jpeg_status;
 /* Break if the header has finished decoding */

 /* Set the new input buffer pointer */
         err = R_JPEG_InputBufferSet(&g_jpeg_ctrl, p_jpeg, input_bytes);
      assert(FSP_SUCCESS == err);
      }
    }
 /* Close driver to allow encode operations if needed */
    err = R_JPEG_Close(&g_jpeg_ctrl);
    assert(FSP_SUCCESS == err);
}
```

### Encode Example

This is a basic example showing the minimum code required to initialize the JPEG Codec and encode an image.

*Note*

*This example assumes image dimensions are provided in the configuration. If this is not the case, R_JPEG_EncodeImageSizeSet must be used to set the size before calling R_JPEG_InputBufferSet.*

```
void jpeg_encode_basic (void)
{
 fsp_err_t err;
 /* Open JPEG Codec */
    err = R_JPEG_Open(&g_jpeg_ctrl, &g_jpeg_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Set output buffer */
    err = R_JPEG_OutputBufferSet(&g_jpeg_ctrl, jpeg_buffer, sizeof(jpeg_buffer));
    assert(FSP_SUCCESS == err);
```

```
 /* Set input buffer */
    err = R_JPEG_InputBufferSet(&g_jpeg_ctrl, RAW_YCBCR_IMAGE_PTR, IMAGE_SIZE_BYTES);
    assert(FSP_SUCCESS == err);
 /* Wait for decode completion */
 jpeg_status_t status = (jpeg_status_t) 0;
 while (!(status & JPEG_STATUS_OPERATION_COMPLETE))
    {
       err = R_JPEG_StatusGet(&g_jpeg_ctrl, &status);
      assert(FSP_SUCCESS == err);
    }
}
```

### Streaming Encode Example

In this example the raw input data is provided in smaller chunks. This can help significantly reduce buffer size and improve throughput when streaming in raw data from an outside source.

```
/* Callback function for JPEG encode interrupts */
void jpeg_encode_callback (jpeg_callback_args_t * p_args)
{
 /* Get JPEG Codec status */
    g_jpeg_status = p_args->status;
 /* Set JPEG flag */
    jpeg_event = 1;
}
void jpeg_encode_streaming (void)
{
    uint8_t   timeout = 0;
    uint8_t * p_chunk = (uint8_t *) RAW_YCBCR_IMAGE_PTR;
 fsp_err_t err;
 /* Open JPEG Codec */
    err = R_JPEG_Open(&g_jpeg_ctrl, &g_jpeg_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Set output buffer */
```

```
   err = R_JPEG_OutputBufferSet(&g_jpeg_ctrl, jpeg_buffer, sizeof(jpeg_buffer));
   assert(FSP_SUCCESS == err);
/* Set the image size */
jpeg_encode_image_size_t image_size;
   image_size.horizontal_resolution    = X_RESOLUTION;
   image_size.vertical_resolution      = Y_RESOLUTION;
   image_size.horizontal_stride_pixels = H_STRIDE;
   err = R_JPEG_EncodeImageSizeSet(&g_jpeg_ctrl, &image_size);
   assert(FSP_SUCCESS == err);
/* Calculate the size of the input data chunk (16 lines in this example) */
   uint32_t chunk_size = H_STRIDE * 16U * YCBCR_BYTES_PER_PIXEL;
while (!timeout)
   {
/* Set the input buffer */
      err = R_JPEG_InputBufferSet(&g_jpeg_ctrl, p_chunk, chunk_size);
     assert(FSP_SUCCESS == err);
/* Wait for a callback */
      timeout = jpeg_event_wait();
if (g_jpeg_status & JPEG_STATUS_OPERATION_COMPLETE)
     {
/* Encode complete */
break;
     }
if (g_jpeg_status & JPEG_STATUS_INPUT_PAUSE)
     {
/* Load next block of input data here (if needed) */
           p_chunk += chunk_size;
     }
   }
}
```

### Y'CbCr Conversion

The below function is provided as a reference for how to convert RGB values to Y'CbCr for use with the JPEG Codec.

*Note*

*This function is only partially optimized for clarity. Further appllication-specific size- or speed-based optimizations should be considered when implementing in an actual project.*

```
#define RGB565_G_MASK 0x07E0
#define RGB565_B_MASK 0x001F
#define C_0 128
typedef enum e_pixel_format
{
    PIXEL_FORMAT_ARGB8888,
    PIXEL_FORMAT_RGB565
} pixel_format_t;
/* 5-bit to 8-bit LUT */

## Data Structures

| | |
|---|---|
| struct | jpeg_instance_ctrl_t |

## Data Structure Documentation

### ◆ jpeg_instance_ctrl_t

| struct jpeg_instance_ctrl_t | | |
|---|---|---|
| JPEG Codec module control block. DO NOT INITIALIZE. Initialization occurs when jpep_api_t::open is called. | | |
| Data Fields | | |
| uint32_t | open | JPEG Codec driver status. |
| jpeg_status_t | status | JPEG Codec operational status. |
| fsp_err_t | error_code | JPEG Codec error code (if any). |
| jpeg_mode_t | mode | Current mode (decode or encode). |
| uint32_t | horizontal_stride_bytes | Horizontal Stride settings. |

| | | |
|---|---|---|
| uint32_t | output_buffer_size | Output buffer size. |
| jpeg_cfg_t const * | p_cfg | JPEG Decode configuration struct. |
| void const * | p_extend | JPEG Codec hardware dependent configuration */. |
| jpeg_decode_pixel_format_t | pixel_format | Pixel format. |
| uint16_t | total_lines_decoded | Track the number of lines decoded so far. |
| jpeg_decode_subsample_t | horizontal_subsample | Horizontal sub-sample setting. |
| uint16_t | lines_to_encode | Number of lines to encode. |
| uint16_t | vertical_resolution | vertical size |
| uint16_t | total_lines_encoded | Number of lines encoded. |

## Function Documentation

### ◆ R_JPEG_Open()

fsp_err_t R_JPEG_Open ( jpeg_ctrl_t *const *p_api_ctrl*, jpeg_cfg_t const *const *p_cfg* )

Initialize the JPEG Codec module.

***Note***

*This function configures the JPEG Codec for operation and sets up the registers for data format and pixel format based on user-supplied configuration parameters. Interrupts are enabled to support callbacks.*

**Return values**

| | |
|---|---|
| FSP_SUCCESS | JPEG Codec module is properly configured and is ready to take input data. |
| FSP_ERR_ALREADY_OPEN | JPEG Codec is already open. |
| FSP_ERR_ASSERTION | Pointer to the control block or the configuration structure is NULL. |
| FSP_ERR_IRQ_BSP_DISABLED | JEDI interrupt does not have an IRQ number. |
| FSP_ERR_INVALID_ARGUMENT | (Encode only) Quality factor, horizontal resolution and/or vertical resolution are invalid. |
| FSP_ERR_INVALID_ALIGNMENT | (Encode only) The horizontal resolution (at 16bpp) is not divisible by 8 bytes. |

### ◆ R_JPEG_OutputBufferSet()

fsp_err_t R_JPEG_OutputBufferSet ( jpeg_ctrl_t * *p_api_ctrl*, void * *p_output_buffer*, uint32_t *output_buffer_size* )

Assign a buffer to the JPEG Codec for storing output data.

***Note***

*In Decode mode, the number of image lines to be decoded depends on the size of the buffer and the horizontal stride settings. Once the output buffer size is known, the horizontal stride value is known, and the input pixel format is known (the input pixel format is obtained by the JPEG decoder from the JPEG headers), the driver automatically computes the number of lines that can be decoded into the output buffer. After these lines are decoded, the JPEG engine pauses and a callback function is triggered, so the application is able to provide the next buffer for the JPEG module to resume the operation.*

The JPEG decoding operation automatically starts after both the input buffer and the output buffer are set and the output buffer is big enough to hold at least eight lines of decoded image data.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | The output buffer is properly assigned to JPEG codec device. |
| FSP_ERR_ASSERTION | Pointer to the control block or output_buffer is NULL or output_buffer_size is 0. |
| FSP_ERR_INVALID_ALIGNMENT | Buffer starting address is not 8-byte aligned. |
| FSP_ERR_NOT_OPEN | JPEG not opened. |
| FSP_ERR_JPEG_UNSUPPORTED_IMAGE_SIZE | The number of horizontal pixels exceeds horizontal memory stride. |
| FSP_ERR_JPEG_BUFFERSIZE_NOT_ENOUGH | Invalid buffer size. |
| FSP_ERR_IN_USE | The output buffer cannot be changed during codec operation. |

### ◆ R_JPEG_InputBufferSet()

fsp_err_t R_JPEG_InputBufferSet ( jpeg_ctrl_t *const *p_api_ctrl*, void * *p_data_buffer*, uint32_t *data_buffer_size* )

Assign an input data buffer to the JPEG codec for processing.

***Note***

*After the amount of data is processed, the JPEG driver triggers a callback function with the flag JPEG_PRV_OPERATION_INPUT_PAUSE set. The application supplies the next chunk of data to the driver so processing can resume.*
*The JPEG decoding operation automatically starts after both the input buffer and the output buffer are set, and the output buffer is big enough to hold at least one line of decoded image data.*

If zero is provided for the decode data buffer size the JPEG Codec will never pause for more input data and will continue to read until either an image has been fully decoded or an error condition occurs.

***Note***

*When encoding images the minimum data buffer size is 8 lines by 16 Y'CbCr 4:2:2 pixels (256 bytes). This corresponds to one minimum coded unit (MCU) of the resulting JPEG output.*

**Return values**

| | |
|---|---|
| FSP_SUCCESS | The input data buffer is properly assigned to JPEG Codec device. |
| FSP_ERR_ASSERTION | Pointer to the control block is NULL, or the pointer to the input_buffer is NULL, or the input_buffer_size is 0. |
| FSP_ERR_INVALID_ALIGNMENT | Buffer starting address is not 8-byte aligned. |
| FSP_ERR_NOT_OPEN | JPEG not opened. |
| FSP_ERR_IN_USE | The input buffer cannot be changed while the codec is running. |
| FSP_ERR_INVALID_CALL | In encode mode the output buffer must be set first. |
| FSP_ERR_JPEG_IMAGE_SIZE_ERROR | The buffer size is smaller than the minimum coded unit (MCU). |

### ◆ R_JPEG_DecodeLinesDecodedGet()

fsp_err_t R_JPEG_DecodeLinesDecodedGet ( jpeg_ctrl_t * *p_api_ctrl*, uint32_t * *p_lines* )

Returns the number of lines decoded into the output buffer.

***Note***

*Use this function to retrieve the number of image lines written to the output buffer after a partial decode operation. Combined with the horizontal stride settings and the output pixel format the application can compute the amount of data to read from the output buffer.*

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Line count successfully returned. |
| FSP_ERR_ASSERTION | Pointer to the control block or p_lines is NULL. |
| FSP_ERR_NOT_OPEN | JPEG not opened. |

### ◆ R_JPEG_DecodeImageSubsampleSet()

fsp_err_t R_JPEG_DecodeImageSubsampleSet ( jpeg_ctrl_t *const *p_api_ctrl*, jpeg_decode_subsample_t *horizontal_subsample*, jpeg_decode_subsample_t *vertical_subsample* )

Configure horizontal and vertical subsampling.

***Note***

*This function can be used to scale the output of decoded image data.*

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Horizontal subsample value is properly configured. |
| FSP_ERR_ASSERTION | Pointer to the control block is NULL. |
| FSP_ERR_NOT_OPEN | JPEG not opened. |

### ◆ R_JPEG_DecodeHorizontalStrideSet()

fsp_err_t R_JPEG_DecodeHorizontalStrideSet ( jpeg_ctrl_t * *p_api_ctrl*, uint32_t *horizontal_stride* )

Configure horizontal stride setting for decode operations.

***Note***

*If the image size is known prior to the open call and/or the output buffer stride is constant, pass the horizontal stride value in the jpeg_cfg_t structure. Otherwise, after the image size becomes available use this function to set the output buffer horizontal stride value.*

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Horizontal stride value is properly configured. |
| FSP_ERR_ASSERTION | Pointer to the control block is NULL. |
| FSP_ERR_INVALID_ALIGNMENT | Horizontal stride is zero or is not 8-byte aligned. |
| FSP_ERR_NOT_OPEN | JPEG not opened. |

### ◆ R_JPEG_DecodeImageSizeGet()

fsp_err_t R_JPEG_DecodeImageSizeGet ( jpeg_ctrl_t * *p_api_ctrl*, uint16_t * *p_horizontal_size*, uint16_t * *p_vertical_size* )

Obtain the size of an image being decoded.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | The image size is available and the horizontal and vertical values are stored in the memory pointed to by p_horizontal_size and p_vertical_size. |
| FSP_ERR_ASSERTION | Pointer to the control block is NULL and/or size is not ready. |
| FSP_ERR_NOT_OPEN | JPEG is not opened. |

### ◆ R_JPEG_DecodePixelFormatGet()

fsp_err_t R_JPEG_DecodePixelFormatGet ( jpeg_ctrl_t * *p_api_ctrl*, jpeg_color_space_t * *p_color_space* )

Get the color format of the JPEG being decoded.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | The color format was successfully retrieved. |
| FSP_ERR_ASSERTION | Pointer to the control block is NULL. |
| FSP_ERR_NOT_OPEN | JPEG is not opened. |

### ◆ R_JPEG_EncodeImageSizeSet()

fsp_err_t R_JPEG_EncodeImageSizeSet ( jpeg_ctrl_t *const *p_api_ctrl*, jpeg_encode_image_size_t * *p_image_size* )

Set the image dimensions for an encode operation.

***Note***

*Image dimensions must be set before setting the input buffer.*

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Image size was successfully written to the JPEG Codec. |
| FSP_ERR_ASSERTION | Pointer to the control block or p_image_size is NULL. |
| FSP_ERR_INVALID_ALIGNMENT | Horizontal stride is not 8-byte aligned. |
| FSP_ERR_INVALID_ARGUMENT | Horizontal or vertical resolution is invalid or zero. |
| FSP_ERR_NOT_OPEN | JPEG not opened. |
| FSP_ERR_IN_USE | Image parameters cannot be changed while the codec is running. |

### ◆ R_JPEG_ModeSet()

fsp_err_t R_JPEG_ModeSet ( jpeg_ctrl_t *const *p_api_ctrl*, jpeg_mode_t *mode* )

Switch between encode and decode mode (or vice-versa).

***Note***

*The codec must not be idle in order to switch modes.*

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Mode changed successfully. |
| FSP_ERR_ASSERTION | p_api_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_IN_USE | JPEG Codec is currently in use. |
| FSP_ERR_INVALID_ARGUMENT | (Encode only) Quality factor, horizontal resolution and/or vertical resolution are invalid. |
| FSP_ERR_INVALID_ALIGNMENT | (Encode only) The horizontal resolution (at 16bpp) is not divisible by 8 bytes. |

### ◆ R_JPEG_Close()

fsp_err_t R_JPEG_Close ( jpeg_ctrl_t * *p_api_ctrl*)

Cancel an outstanding JPEG codec operation and close the device.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | The JPEG unit is stopped and the driver is closed. |
| FSP_ERR_ASSERTION | Pointer to the control block is NULL. |
| FSP_ERR_NOT_OPEN | JPEG not opened. |

### ◆ R_JPEG_StatusGet()

| fsp_err_t R_JPEG_StatusGet ( jpeg_ctrl_t * *p_api_ctrl*, jpeg_status_t * *p_status* ) |
|---|
| Get the status of the JPEG codec. This function can also be used to poll the device. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | The status information is successfully retrieved. |
| FSP_ERR_ASSERTION | Pointer to the control block or p_status is NULL. |
| FSP_ERR_NOT_OPEN | JPEG is not opened. |

#### 5.2.8.7 LVGL Port (rm_lvgl_port)

Modules » Graphics

**Functions**

| | |
|---|---|
| fsp_err_t | RM_LVGL_PORT_Open (rm_lvgl_port_instance_ctrl_t *const p_instance_ctrl, rm_lvgl_port_cfg_t const *const p_cfg) |

**Detailed Description**

LVGL graphics library port for RA MCUs.

# Overview

The LVGL RA Port module provides the configuration necessary for use of the LVGL graphics library on RA products. The port provides integration for GLCDC into the LVGL display system, a time source for LVGL timer logic, and optional integration with FreeRTOS.

*Note*

*This port layer primarily enables hardware acceleration and background handling of many display operations and does not contain code intended to be directly called by the user. Please consult the LVGL Project Documentation for details on how to use LVGL in your project.*

### Hardware Acceleration

Hardware acceleration is optionally provided by DRW using a lightly modified fork of the upstream driver provided by the LVGL project. Most rendering operations are supported.

# Configuration

### Build Time Configurations for lvgl

The following build time configurations are defined in fsp_cfg/lvgl/lvgl/lv_conf.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| General | | | |
| Custom lv_conf.h | Manual Entry | | Add a path to your custom lv_conf.h file. It can be used to override some or all of the configurations defined here, and to define additional configurations. |
| LVGL | | | |
| LVGL > Display | | | |
| LV_COLOR_DEPTH | Value must equal 16 or 32. | 16 | Color depth. 16 or 32 supported. |
| LVGL > Memory | | | |
| LV_MEM_SIZE | Value must be an integer multiple of 1024 between 0x800 and 0xFFFFFFFF. | 0x10000 | Size of the memory available for `lv_malloc()` in bytes. |
| LV_DRAW_LAYER_SIMPLE_BUF_SIZE | Value must be an integer multiple of 1024 between 0x400 and 0xFFFFFFFF. | 0x6000 | Buffer size for simple layer chunks. |
| LV_DRAW_LAYER_MAX_MEMORY | Value must be an integer. | 0 | Limit the max allocated memory for simple and transformed layers.<br>0 for no limit.<br>Otherwise, should be greater than or equal to LV_DRAW_LAYER_SIMPLE_BUF_SIZE.<br>If transformed layers are used, it should be large enough for the largest widget (width x height x 4 area). |
| LV_DRAW_THREAD_STACK_SIZE | Value must be an integer multiple of 1024 between 0x400 and 0xFFFFFFFF. | 0x2000 | Stack size of the drawing thread in bytes. Only used when FreeRTOS integration is used. |
| LVGL > OS Integration | | | |
| LV_USE_OS | • LV_OS_NONE<br>• LV_OS_FREERTOS | LV_OS_FREERTOS | Select LVGL RTOS integration. |

| | | | |
|---|---|---|---|
| LV_DRAW_THREAD_PRIO | • LV_THREAD_PRIO_LOWEST<br>• LV_THREAD_PRIO_LOW<br>• LV_THREAD_PRIO_MID<br>• LV_THREAD_PRIO_HIGH<br>• LV_THREAD_PRIO_HIGHEST | LV_THREAD_PRIO_HIGH | Thread priority of the drawing task. |
| LVGL > Software Rendering | | | |
| LV_DRAW_SW_SUPPORT_RGB565 | • Enabled<br>• Disabled | Enabled | Enable software rendering support for the specified color format.<br>Disable to reduce code size.<br>Some formats may be used internally for some features. |
| LV_DRAW_SW_SUPPORT_RGB565_SWAPPED | • Enabled<br>• Disabled | Enabled | Enable software rendering support for the specified color format.<br>Disable to reduce code size.<br>Some formats may be used internally for some features. |
| LV_DRAW_SW_SUPPORT_RGB565A8 | • Enabled<br>• Disabled | Enabled | Enable software rendering support for the specified color format.<br>Disable to reduce code size.<br>Some formats may be used internally for some features. |
| LV_DRAW_SW_SUPPORT_RGB888 | • Enabled<br>• Disabled | Enabled | Enable software rendering support for the specified color format.<br>Disable to reduce code size.<br>Some formats may be used internally for some features. |
| LV_DRAW_SW_SUPPORT_XRGB8888 | • Enabled<br>• Disabled | Enabled | Enable software rendering support for the specified color format. |

| | | | |
|---|---|---|---|
| | | | Disable to reduce code size.<br>Some formats may be used internally for some features. |
| LV_DRAW_SW_SUPPORT_ARGB8888 | • Enabled<br>• Disabled | Enabled | Enable software rendering support for the specified color format.<br>Disable to reduce code size.<br>Some formats may be used internally for some features. |
| LV_DRAW_SW_SUPPORT_ARGB8888_PREMULTIPLIED | • Enabled<br>• Disabled | Enabled | Enable software rendering support for the specified color format.<br>Disable to reduce code size.<br>Some formats may be used internally for some features. |
| LV_DRAW_SW_SUPPORT_L8 | • Enabled<br>• Disabled | Enabled | Enable software rendering support for the specified color format.<br>Disable to reduce code size.<br>Some formats may be used internally for some features. |
| LV_DRAW_SW_SUPPORT_AL88 | • Enabled<br>• Disabled | Enabled | Enable software rendering support for the specified color format.<br>Disable to reduce code size.<br>Some formats may be used internally for some features. |
| LV_DRAW_SW_SUPPORT_A8 | • Enabled<br>• Disabled | Enabled | Enable software rendering support for the specified color format.<br>Disable to reduce code size.<br>Some formats may be used internally for some features. |
| LV_DRAW_SW_SUPPOR | • Enabled | Enabled | Enable software |

| | | | |
|---|---|---|---|
| T_I1 | • Disabled | | rendering support for the specified color format.<br>Disable to reduce code size.<br>Some formats may be used internally for some features. |
| LVGL > Hardware Rendering | | | |
| LV_USE_DRAW_DAVE2D | • Enabled<br>• Disabled | Enabled | Enable built-in DRW Engine support. |
| LVGL > Debug | | | |
| LV_ASSERT_HANDLER_INCLUDE | Manual Entry | <stdint.h> | Header file to include to support LV_ASSERT_HANDLER macro. |
| LV_ASSERT_HANDLER | Manual Entry | | Macro to execute when an LV_ASSERT occurs. |
| LVGL > Widgets | | | |
| LV_USE_OBJ_NAME | • Enabled<br>• Disabled | Disabled | Enable support for widget names. |
| LVGL > Input Devices | | | |
| LV_USE_GESTURE_RECOGNITION | • Enabled<br>• Disabled | Disabled | Enable support for multi-touch gesture recognition.<br>Requires floating point support. |
| LV_USE_IME_PINYIN | • Enabled<br>• Disabled | Disabled | Enable Pinyin input method. |
| LV_IME_PINYIN_USE_DEFAULT_DICT | • Enabled<br>• Disabled | Enabled | Use default thesaurus. |
| LV_IME_PINYIN_CAND_TEXT_NUM | Value must be positive. | 6 | Maximum number of displayed candidate panels. Adjust according to screen size. |
| LV_IME_PINYIN_USE_K9_MODE | • Enabled<br>• Disabled | Enabled | Use nine key (K9) input. |
| LV_IME_PINYIN_K9_CAND_TEXT_NUM | Value must be positive. | 3 | Maximum number of displayed candidate panels in K9 mode. Adjust according to screen size. |
| LVGL > Fonts | | | |
| LVGL > Fonts > Montserrat | | | |

| | | | |
|---|---|---|---|
| LV_FONT_MONTSERRAT_8 | • Enabled<br>• Disabled | Enabled | Enable built-in font (FontAwesome5, Montserrat) size 8. |
| LV_FONT_MONTSERRAT_10 | • Enabled<br>• Disabled | Enabled | Enable built-in font (FontAwesome5, Montserrat) size 10. |
| LV_FONT_MONTSERRAT_12 | • Enabled<br>• Disabled | Enabled | Enable built-in font (FontAwesome5, Montserrat) size 12. |
| LV_FONT_MONTSERRAT_14 | • Enabled<br>• Disabled | Enabled | Enable built-in font (FontAwesome5, Montserrat) size 14. |
| LV_FONT_MONTSERRAT_16 | • Enabled<br>• Disabled | Enabled | Enable built-in font (FontAwesome5, Montserrat) size 16. |
| LV_FONT_MONTSERRAT_18 | • Enabled<br>• Disabled | Enabled | Enable built-in font (FontAwesome5, Montserrat) size 18. |
| LV_FONT_MONTSERRAT_20 | • Enabled<br>• Disabled | Enabled | Enable built-in font (FontAwesome5, Montserrat) size 20. |
| LV_FONT_MONTSERRAT_22 | • Enabled<br>• Disabled | Enabled | Enable built-in font (FontAwesome5, Montserrat) size 22. |
| LV_FONT_MONTSERRAT_24 | • Enabled<br>• Disabled | Enabled | Enable built-in font (FontAwesome5, Montserrat) size 24. |
| LV_FONT_MONTSERRAT_26 | • Enabled<br>• Disabled | Enabled | Enable built-in font (FontAwesome5, Montserrat) size 26. |
| LV_FONT_MONTSERRAT_28 | • Enabled<br>• Disabled | Enabled | Enable built-in font (FontAwesome5, Montserrat) size 28. |
| LV_FONT_MONTSERRAT_30 | • Enabled<br>• Disabled | Enabled | Enable built-in font (FontAwesome5, Montserrat) size 30. |
| LV_FONT_MONTSERRAT_32 | • Enabled<br>• Disabled | Enabled | Enable built-in font (FontAwesome5, Montserrat) size 32. |
| LV_FONT_MONTSERRAT_34 | • Enabled<br>• Disabled | Enabled | Enable built-in font (FontAwesome5, Montserrat) size 34. |
| LV_FONT_MONTSERRAT_36 | • Enabled<br>• Disabled | Enabled | Enable built-in font (FontAwesome5, Montserrat) size 36. |

| | | | |
|---|---|---|---|
| LV_FONT_MONTSERRAT_38 | • Enabled<br>• Disabled | Enabled | Enable built-in font (FontAwesome5, Montserrat) size 38. |
| LV_FONT_MONTSERRAT_40 | • Enabled<br>• Disabled | Enabled | Enable built-in font (FontAwesome5, Montserrat) size 40. |
| LV_FONT_MONTSERRAT_42 | • Enabled<br>• Disabled | Enabled | Enable built-in font (FontAwesome5, Montserrat) size 42. |
| LV_FONT_MONTSERRAT_44 | • Enabled<br>• Disabled | Enabled | Enable built-in font (FontAwesome5, Montserrat) size 44. |
| LV_FONT_MONTSERRAT_46 | • Enabled<br>• Disabled | Enabled | Enable built-in font (FontAwesome5, Montserrat) size 46. |
| LV_FONT_MONTSERRAT_48 | • Enabled<br>• Disabled | Enabled | Enable built-in font (FontAwesome5, Montserrat) size 48. |
| LVGL > Fonts > DejaVu | | | |
| LV_FONT_DEJAVU_16_PERSIAN_HEBREW | • Enabled<br>• Disabled | Enabled | Enable built-in font DejaVu (Arabic, Hebrew, Persian) size 16. |
| LVGL > Fonts > SourceHanSansSC | | | |
| LV_FONT_SOURCE_HAN_SANS_SC_14_CJK | • Enabled<br>• Disabled | Enabled | Enable built-in font SourceHanSansSC size 14. |
| LV_FONT_SOURCE_HAN_SANS_SC_16_CJK | • Enabled<br>• Disabled | Enabled | Enable built-in font SourceHanSansSC size 16. |
| LVGL > Fonts > Unscii | | | |
| LV_FONT_UNSCII_8 | • Enabled<br>• Disabled | Enabled | Enable built-in font unscii-8 size 8. |
| LV_FONT_UNSCII_16 | • Enabled<br>• Disabled | Enabled | Enable built-in font unscii-8 size 16. |
| LV_FONT_DEFAULT | Name must be a valid C symbol. | lv_font_montserrat_14 | Set a default font for LVGL. Required. |
| LV_USE_FONT_PLACEHOLDER | • Enabled<br>• Disabled | Enabled | Draw a placeholder when a glyph is not found. |
| LV_USE_BIDI | • Enabled<br>• Disabled | Disabled | Enable bidirectional text. |
| LV_USE_ARABIC_PERSIAN_CHARS | • Enabled<br>• Disabled | Disabled | Enable Arabic and Persian language |

| | | | |
|---|---|---|---|
| | | | processing. |
| LV_USE_FONT_MANAGER | • Enabled<br>• Disabled | Disabled | Enable the font manager. |
| LV_FONT_MANAGER_NAME_MAX_LEN | Value must be positive. | 32 | Maximum font name length when font manager is enabled. |

**Build Time Configurations for rm_lvgl_port**

The following build time configurations are defined in fsp_cfg/middleware/rm_lvgl_port_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| Provide Tick Callback | • Enabled<br>• Disabled | Enabled | Enable the LVGL port driver to provide a tick callback to LVGL. |

**Configurations for Graphics > LVGL Port (rm_lvgl_port)**

| Configuration | Options | Default | Description |
|---|---|---|---|
| Name | Name must be a valid C symbol | g_rm_lvgl_port0 | Module name. |
| Target Display Layer | • Graphics Layer 1<br>• Graphics Layer 2 | Graphics Layer 1 | Specify which graphics screen to inherit the buffer and display dimensions from. |
| Callback Function | Must be a valid C symbol | NULL | If a callback function is provided it will be called when Display events occur. |

**Hardware Configuration**

No clocks or pins are directly required by this module. Please consult the GLCDC Usage Guide for its requirements here: Graphics LCD (r_glcdc)

**LVGL Configuration**

LVGL is configured via the use of a configuration header. The port layer provides configuration options within e2 Studio for commonly changed LVGL settings and autogenerates the required header files. It is also possible to provide a custom LVGL configuration header which overrides the LVGL configuration options set in e2 Studio, or configures options that are not exposed in the port layer in e2 Studio.

# Usage Notes

**Getting Started**

To get started with LVGL in an RA project the following must be performed:

1. In e2 studio, open the RA Configuration editor for your project
2. Add LVGL to your project in the Stacks view by clicking **New Stack -> Graphics -> LVGL**
    - If using FreeRTOS, first create a new thread and add the LVGL stack to it
3. Set the properties for the GLCDC module to match the timing and memory requirements of your display panel
4. Ensure interrupts on all modules are enabled:
    - GLCDC Vertical Position (GLCDC_VPOS) Interrupt
    - DRW Interrupt (if applicable)
5. Confirm stack size and global heap size are configured as needed
    - If using FreeRTOS, it is suggested to add the Heap_4 stack to provide memory allocation to DRW
    - Stack size must be adequate for the thread executing the LVGL timer handler loop
    - Stack size is configured per thread if FreeRTOS is used
    - Final heap and stack usage must be characterized
6. Ensure the configuration options for LVGL are set as necessary for your application
7. Confirm LVGL heap size is configured as needed
    - Final LVGL heap usage must be characterized
8. Confirm other LVGL memory parameters are configured as needed
    - Final memory usage for miscellaneous memory parameters must be characterized
9. Resolve any remaining constraints
10. Click Generate Project Content to save and commit configuration changes

At this point the project is now ready to build with LVGL. Please refer to the LVGL Project Documentation for details on how to use LVGL in your project, as well as LVGL demo and example code.

### Demos and Examples

The LVGL packed with FSP also includes the demos and examples directories that are in the LVGL project. To allow the demos to be included and built in a user project:

1. Create a custom LVGL configuration header, for example lv_conf_custom.h
2. Specify the header file name in the **General|Custom lv_conf.h** LVGL stack configuration property
3. Set the LV_BUILD_DEMOS macro to 1 in the custom header, to override the value set in the generated lv_conf.h
4. Set the desired LV_USE_DEMO_* macro to 1 in the the custom header, to enable the desired demo
5. Call the desired demo function prior to lv_timer_handler() to set up the demo

Including and building the examples in a user project are the same steps, but set the LV_BUILD_EXAMPLES macro to 1 in the custom header instead. No LV_USE_ macros should be required for the examples.

*Note*

*Not all upstream demos and examples material are available, so some demos or examples may not build or execute.*

### Libraries

The LVGL packed with FSP also includes the src/libs directory that is in the LVGL project. Only bin_decoder is a mandatory library used by LVGL. Other libraries are either first-party or third-party libraries available for use within LVGL.

*Note*

*The included libraries may not be applicable to an RA embedded context. The included libraries may not compile or function without further modification. Libraries like ThorVG require a C++ based FSP project. These libraries are included for convenience but are not validated or officially supported as part of the FSP LVGL integration. Not all libraries have been included.*

### Multi-thread Support

LVGL is not a thread safe library. Please refer to Tasks and threads for information on how to use LVGL in a multi-thread environment.

*Note*

*This includes both bare metal and FreeRTOS projects. RTOS support is optionally configured depending on whether FreeRTOS is used in the project.*

### Limitations

Developers should be aware of the following limitations when using LVGL with FSP:

- Compilers may produce different results at this time (v9.3.0). AC6 is known to produce different software rendering output when blending certain image formats with a 32-bit color depth. LLVM is known to create artifacts with LVGL image decoding and blending.
- The DRW upstream driver does not support all LVGL rendering features. Some unsupported features are horizontal gradients, dashed lines, and blitting of certain image formats. In some cases, the LVGL software renderer will act as a fallback renderer, such as when an unsupported image format is used.

---

## Examples

### Basic Example

This is a basic example demonstrating the initialization of LVGL and the port layer within a FreeRTOS thread entry function, then servicing LVGL timer logic in a loop.

*Note*

*The port layer manages the GLCDC submodule internally, while the LVGL project manages the DRW submodule; they do not need to be opened directly.*

```
void lvgl_thread_entry (void * pvParameters)
{
 FSP_PARAMETER_NOT_USED(pvParameters);
 fsp_err_t error;
 /* Initialize LVGL. */
    lv_init();
 /* TODO: Perform any initialization necessary for the physical display. */
 /* Initialize the LVGL port driver. */
    error = RM_LVGL_PORT_Open(&g_lvgl_port_ctrl, &g_lvgl_port_cfg);
```

```
 /* TODO: Handle fsp_err_t return values as required. */
    (void) error;
 /* TODO: Create an input device using LVGL. */
 /* TODO: Create a user defined UI using LVGL widgets. */
 /* For example, add a label to the LVGL active screen on the default display. */
    lv_obj_t * active_screen = lv_screen_active();
    lv_obj_set_style_text_color(active_screen, lv_color_black(), 0);
    lv_obj_set_style_bg_color(active_screen, lv_color_white(), 0);
    lv_obj_t * label_object = lv_label_create(active_screen);
    lv_label_set_text(label_object, "Hello World!");
 /* Call lv_timer_handler() to process LVGL timer tasks, which includes display
refresh. */
 while (1)
    {
       lv_timer_handler();
       vTaskDelay(1);
    }
}
```

*Note*

*For further example code please consult the LVGL Project Documentation.*

### Data Structures

| | |
|---|---|
| struct | rm_lvgl_port_callback_args_t |
| struct | rm_lvgl_port_cfg_t |
| struct | rm_lvgl_port_instance_ctrl_t |

### Enumerations

| | |
|---|---|
| enum | rm_lvgl_port_device_t |
| enum | rm_lvgl_port_event_t |

## Data Structure Documentation

### ◆ rm_lvgl_port_callback_args_t

struct rm_lvgl_port_callback_args_t

| Callback arguments for the FSP LVGL Port | | |
|---|---|---|
| Data Fields | | |
| rm_lvgl_port_device_t | device | Device code. |
| rm_lvgl_port_event_t | event | Event code of the low level hardware. |
| uint32_t | error | Error code if RM_LVGL_PORT_EVENT_ERROR. |

### ◆ rm_lvgl_port_cfg_t

| struct rm_lvgl_port_cfg_t |
|---|
| Configuration structure for the FSP LVGL Port |

### ◆ rm_lvgl_port_instance_ctrl_t

| struct rm_lvgl_port_instance_ctrl_t |
|---|
| Instance control block for LVGL Port |

## Enumeration Type Documentation

### ◆ rm_lvgl_port_device_t

| enum rm_lvgl_port_device_t | |
|---|---|
| Low level device code for the LVGL Port | |
| Enumerator | |
| RM_LVGL_PORT_DEVICE_NONE | Non hardware. |
| RM_LVGL_PORT_DEVICE_DISPLAY | Display device. |

### ◆ rm_lvgl_port_event_t

| enum rm_lvgl_port_event_t | |
|---|---|
| Display event codes | |
| Enumerator | |
| RM_LVGL_PORT_EVENT_DISPLAY_VPOS | Display interface VPOS. |
| RM_LVGL_PORT_EVENT_UNDERFLOW | Display interface underflow. |

## Function Documentation

### ◆ RM_LVGL_PORT_Open()

fsp_err_t RM_LVGL_PORT_Open ( rm_lvgl_port_instance_ctrl_t *const *p_instance_ctrl*, rm_lvgl_port_cfg_t const *const *p_cfg* )

Open the LVGL port driver module.

Example:

```
/* Initialize the LVGL port driver. */
   error = RM_LVGL_PORT_Open(&g_lvgl_port_ctrl, &g_lvgl_port_cfg);
/* TODO: Handle fsp_err_t return values as required. */
   (void) error;
```

***Note***

*This function should be called after the LVGL function lv_init() has been called.*

**Return values**

| | |
|---|---|
| FSP_SUCCESS | LVGL port successfully opened. |
| FSP_ERR_OUT_OF_MEMORY | Internal call to lv_display_create() failed to allocate memory for a display. |

See Common_Error_Codes for other possible return codes. This function calls R_GLCDC_Open(), R_GLCDC_Start(), and R_GLCDC_BufferChange().

## 5.2.8.8 MIPI Display Serial Interface (r_mipi_dsi)

Modules » Graphics

### Functions

| | |
|---|---|
| fsp_err_t | R_MIPI_DSI_Open (mipi_dsi_ctrl_t *const p_api_ctrl, mipi_dsi_cfg_t const *const p_cfg) |
| fsp_err_t | R_MIPI_DSI_Close (mipi_dsi_ctrl_t *const p_api_ctrl) |
| fsp_err_t | R_MIPI_DSI_Start (mipi_dsi_ctrl_t *const p_api_ctrl) |
| fsp_err_t | R_MIPI_DSI_Stop (mipi_dsi_ctrl_t *const p_api_ctrl) |
| fsp_err_t | R_MIPI_DSI_UlpsEnter (mipi_dsi_ctrl_t *const p_api_ctrl, mipi_dsi_lane_t lane) |
| fsp_err_t | R_MIPI_DSI_UlpsExit (mipi_dsi_ctrl_t *const p_api_ctrl, mipi_dsi_lane_t lane) |
| fsp_err_t | R_MIPI_DSI_Command (mipi_dsi_ctrl_t *const p_api_ctrl, mipi_dsi_cmd_t *p_cmd) |

| | |
|---|---|
| fsp_err_t | R_MIPI_DSI_StatusGet (mipi_dsi_ctrl_t *const p_api_ctrl, mipi_dsi_status_t *p_status) |

### Detailed Description

Driver for the MIPI DSI peripheral on RA MCUs. This module implements the Display Interface.

# Overview

The MIPI DSI peripheral consists of the Display Serial Interface (DSI-2) Host, physical layer (D-PHY), and supporting sub-systems. Together, these form a high-speed graphics serial bus that formats data from the GLCDC layer and sends it to an external display. The DSI-2 and D-Phy peripherals support MIPI Alliance for Display Serial Interface 2 Version 1.1 (with Errata 01) and MIPI Alliance Specification for D-PHY Version 2.1 (with Errata 01).

### Features

The following features are available:

| Feature | Options |
|---|---|
| Pixel formats | RGB888, RGB666, RGB565 |
| Number of lanes | Up to 2 |
| Maximum resolution | See GLCDC specifications |
| Maximum bandwidth | Up to 750 Mbps per high-speed lane |

Features:

- Supports up to 2 Lanes.
- Bidirectional LP mode transfer/receipt (LP-TX / LP-RX).
- Unidirectional High-Speed mode transfer (HS-TX).
- Data rates of up to 720 Mbps per lane.
- Ultra-Low-Power State (ULPS).
- Video input from GLCDC (RGB888, RGB666, RGB565).
- ECC/Checksum generation and verification for packets.
- Generation of scrambled packets.
- Automatic transition from HP to LP during blanking/porch periods.

# Configuration

### Build Time Configurations for r_mipi_dsi

The following build time configurations are defined in fsp_cfg/r_mipi_dsi_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

### Configurations for Graphics > MIPI Physical Layer (r_mipi_phy)

| Configuration | Options | Default | Description |
|---|---|---|---|
| General | | | |
| Name | Name must be a valid C symbol | g_mipi_phy0 | Module name. |
| Timing | | | |
| Timing > THSPREP | | | |
| ns | Value must be a number, greater than or equal to zero. | 40 | (Nanosecond portion) Duration of the data lane LP-00 state, immediately before entry to the HS-0 state (ns) |
| UI | Value must be a number, greater than or equal to zero. | 5 | (UI portion) Duration of the data lane LP-00 state, immediately before entry to the HS-0 state (UI) |
| Timing > THSSETT | | | |
| ns | Value must be a number, greater than or equal to zero. | 200 | (Nanosecond portion) Period over which a transition to the HS state is to be ignored after the TCLK-PREPARE period has begun in the data lane. (ns) |
| UI | Value must be a number, greater than or equal to zero. | 0 | (UI portion) Period over which a transition to the HS state is to be ignored after the TCLK-PREPARE period has begun in the data lane. (UI) |
| Timing > THSZERO | | | |
| ns | Value must be a number, greater than or equal to zero. | 140 | (Nanosecond portion) Specify the data lane zero time before sending data (ns). |
| UI | Value must be a number, greater than or equal to zero. | 10 | (UI portion) Specify the data lane zero time before sending data (UI). |
| Timing > THSTRAIL | | | |
| ns | Value must be a | 60 | (Nanosecond portion) |

| | | | |
|---|---|---|---|
| | number, greater than or equal to zero. | | Specify the data lane trail time before exiting HS mode (ns). |
| UI | Value must be a number, greater than or equal to zero. | 4 | (UI portion) Specify the data lane trail time before exiting HS mode (UI). |
| Timing > TCLKPOST | | | |
| ns | Value must be a number, greater than or equal to zero. | 60 | (Nanosecond portion) Specify the duration after HS data lane trail time elapses before stopping the clock lane (ns). |
| UI | Value must be a number, greater than or equal to zero. | 52 | (UI portion) Specify the duration after HS data lane trail time elapses before stopping the clock lane (UI). |
| Timing > TCLKPRE | | | |
| ns | Value must be a number, greater than or equal to zero. | 0 | (Nanosecond portion) Specify the time clock is active before transitioning data lane into HS mode (ns). |
| UI | Value must be a number, greater than or equal to zero. | 8 | (UI portion) Specify the time clock is active before transitioning data lane into HS mode (UI). |
| Timing > TCLKPREP | | | |

| Timing > TCLKTRL | | | |
| ns | Value must be a number, greater than or equal to zero. | 60 | (Nanosecond portion) Specify the time after clock lane stop before exiting HS mode (ns). |
| UI | Value must be a number, greater than or equal to zero. | 0 | (UI portion) Specify the time after clock lane stop before exiting HS mode (UI). |
| Timing > TCLKZERO | | | |
| ns | Value must be a number, greater than or equal to zero. | 230 | (Nanosecond portion) Specify the time clock lane is zero before starting in HS mode (ns). |

| | | | |
|---|---|---|---|
| UI | Value must be a number, greater than or equal to zero. | 0 | (UI portion) Specify the time clock lane is zero before starting in HS mode (UI) |
| Timing > THSEXIT | | | |
| ns | Value must be a number, greater than or equal to zero. | 100 | (Nanosecond portion) Specify the data lane HS mode exit time (ns). |
| UI | Value must be a number, greater than or equal to zero. | 0 | (UI portion) Specify the data lane HS mode exit time (UI) |
| LP Clock Divider | Value must be an integer. | 5 | Specify the MIPI PHY LP clock division ratio (Resulting frequency must be from 2-17 MHz) |
| TINIT (ns) | Value must be a number, greater than or equal to zero. | 600000 | Minimum duration of the TINIT state (ns) |
| DSI PLL Frequency (MHz) | Value must be between 160 MHz and 1440.0 MHz. | 1000.00 | Specify the MIPI PHY PLL frequency in MHz. |

**Configurations for Graphics > MIPI Display (r_mipi_dsi)**

| Configuration | Options | Default | Description |
|---|---|---|---|
| General | | | |
| Name | Name must be a valid C symbol | g_mipi_dsi0 | Module name. |
| Options | | | |
| LCD External Clock Hz | Value must be an integer. | 0 | Specify the GLCDC external clock frequency in Hz (Set to 0 when GLCDC clock source is set to Internal). |
| Data Scramble Enable | • Disable<br>• Enable | Disable | Data Scramble Enable. Do not enable unless peripheral has data scramble function. |
| EoTP Enable | • Disable<br>• Enable | Enable | Disable to support devices that do not support EoTP transmission. |
| ECC Check Enable | • Disable<br>• Enable | Enable | ECC Check support enable. |

| | | | |
|---|---|---|---|
| CRC Enable | • Virtual Channel 0<br>• Virtual Channel 1<br>• Virtual Channel 2<br>• Virtual Channel 3 | | |
| Maximum Return Packet Size | Value must be an integer. | 1 | Specify the maximum return packet size to be received in LP-RX mode. |
| External Tearing Effect Detection Sense Select | • Rising Edge<br>• Falling Edge | 1 | Specify the maximum return packet size to be received in LP-RX mode. |
| HS-TX Timeout Count (us) | Value must be an integer. | 0 | Set LP-RX Timeout (LRX-H_TO) value. (0 is disabled) |
| LP-RX Host Processor Timeout (us) | Value must be an integer. | 0 | Set LP-RX Timeout (LRX-H_TO) value. (0 is disabled) |
| Turnaround Acknowledge Timeout (us) | Value must be an integer. | 0 | Set Turnaround Acknowledge Timeout value. (0 is disabled) |
| Peripheral Response Timeout (us) | Value must be an integer. | 0 | Set Peripheral Response Timeout BTA value. (0 is disabled) |
| LP Write Response Timeout (us) | Value must be an integer. | 0 | Set Low Power Write Acknowledge Timeout value. (0 is disabled) |
| LP Read Response Timeout (us) | Value must be an integer. | 0 | Set Low Power Read Acknowledge Timeout value. (0 is disabled) |
| HS Write Response Timeout (us) | Value must be an integer. | 0 | Set High Speed Write Acknowledge Timeout value. (0 is disabled) |
| HS Read Response Timeout (us) | Value must be an integer. | 0 | Set High Speed Read Acknowledge Timeout value. (0 is disabled) |
| Low Power | | | |
| Ultra Low Power State Wakeup Period (us) | Value must be a positive integer or zero. | 1000 | Set ultra low power state wakeup period (us). |
| Clock Lane | | | |
| Continuous Mode | • Disable | Enable | Enable or disable |

| | | | |
|---|---|---|---|
| | • Enable | | continuous clock mode. |
| Data Lane | | | |
| Number of Data Lanes | Value must be an integer. | 2 | Specify the number of data lanes. Note: not all data lanes are capable of HS operation. See Usage Notes for additional information. |
| Video Mode | | | |
| Video Mode > Pixel Packet | | | |
| Sync Pulse | • HSE and VSE are not transmitted<br>• HSE and VSE are transmitted | HSE and VSE are not transmitted | Select if HSE and VSE are transmitted. Disable for Burst Mode sequence or Non-Burst Mode with Sync Events. |
| Virtual Channel ID | Value must be an integer. | 0 | Select the video mode virtual channel ID. |
| Delay Override (0 to disable) | Value must be an integer. | 0 | Override FSP calculated delay value (not recommended for most users). Delay for DSI Host between first data reception from display module until DSI output begins. (Unit: 32xUI). Set to 0 to use FSP calculated value (recommended). |
| Prevent LP Transition | • No LP during the HSA period<br>• No LP during the HBP period<br>• No LP during the HFP period | | Prevent LP transition during specified periods. |
| Interrupts | | | |
| dsi_seq0 Interrupt Priority | MCU Specific Options | | Select the Low-Power Sequence command operation interrupt priority. |
| dsi_seq1 Interrupt Priority | MCU Specific Options | | Select the High-Speed Sequence command operation interrupt priority. |
| dsi_vin1 Interrupt Priority | MCU Specific Options | | Select the Video Input interrupt priority. |
| dsi_rcv Interrupt | MCU Specific Options | | Select the Receive |

| | | | |
|---|---|---|---|
| Priority | | | interrupt priority. |
| dsi_ferr Interrupt Priority | MCU Specific Options | | Select the Fatal Error interrupt priority. |
| dsi_ppi Interrupt Priority | MCU Specific Options | | Select the PHY-Protocol Interface interrupt priority. |
| Receive Interrupt Enable | Refer to the RA Configuration tool for available options. | Multiple options are selected; refer to the RA Configuration tool for selected options. | Enable receive interrupts. |
| Fatal Error Interrupt Enable | • HS TX Timeout<br>• LP-RX Host Processor Timeout<br>• Turnaround Acknowledge Timeout<br>• Escape mode Entry Error<br>• LPDT Sync Error<br>• Control Error<br>• LP0 Contention Error<br>• LP1 Contention Error | • HS TX Timeout<br>• LP-RX Host Processor Timeout<br>• Turnaround Acknowledge Timeout<br>• Escape mode Entry Error<br>• LPDT Sync Error<br>• Control Error<br>• LP0 Contention Error<br>• LP1 Contention Error | Enable Fatal Error interrupts. |
| Physical Lane Interrupt Enable | • Data Lane-0 Rx to Tx Transition<br>• Data Lane-0 Tx to Rx Transition<br>• Clock Lane ULPS Enter<br>• Clock Lane ULPS Exit<br>• Clock Lane LP to HS Transition<br>• Clock Lane HS to LP Transition<br>• Data Lane ULPS Enter<br>• Data Lane ULPS Exit | | Enable Physical Lane interrupts. |
| Video Mode Interrupt Enable | • Video Mode Operation Start<br>• Video Mode Operation Stop<br>• Video Mode Operation Ready<br>• Timing Error<br>• Video Buffer Underflow Error | • Video Buffer Underflow Error<br>• Video Buffer Overflow Error | Enable Video Mode interrupts. |

| | | | |
|---|---|---|---|
| | • Video Buffer Overflow Error | | |
| Sequence Channel 0 Interrupt Enable | • All Actions Finish<br>• All Descriptors Finish<br>• Tx Internal Bus Error<br>• Receive Fatal Error<br>• Receive Fail<br>• Receive Packet Data Fail<br>• Receive Correctable Error Interrupt<br>• Receive Acknowledge and Error Report Packet | • All Actions Finish<br>• All Descriptors Finish<br>• Tx Internal Bus Error<br>• Receive Fatal Error<br>• Receive Fail<br>• Receive Packet Data Fail<br>• Receive Correctable Error Interrupt<br>• Receive Acknowledge and Error Report Packet | Enable Sequence Channel 0 interrupts. |
| Sequence Channel 1 Interrupt Enable | • All Actions Finish<br>• All Descriptors Finish<br>• Packet Size Error<br>• Tx Internal Bus Error<br>• Receive Fatal Error<br>• Receive Fail<br>• Receive Packet Data Fail<br>• Receive Correctable Error Interrupt<br>• Receive Acknowledge and Error Report Packet | • All Actions Finish<br>• All Descriptors Finish<br>• Packet Size Error<br>• Tx Internal Bus Error<br>• Receive Fatal Error<br>• Receive Fail<br>• Receive Packet Data Fail<br>• Receive Correctable Error Interrupt<br>• Receive Acknowledge and Error Report Packet | Enable Sequence Channel 1 interrupts. |
| Callback | Name must be a valid C symbol | mipi_dsi0_callback | A user callback function. If this callback function is provided it is called from the interrupt service routine (ISR) each time any interrupt occurs. |
| Callback Context | Name must be a valid C symbol | NULL | Pointer to the context structure to be passed through the callback argument. |

### Clock Configuration

The MIPI DSI D-PHY has a dedicated regulator (D-PHY LDO) and PLL (D-PHY PLL), which are managed by the driver. The D-PHY PLL frequency must be configured between 160 MHz and 1.44 GHz.

*Note*

*The D-PHY High-Speed data transmission rate is determined by the following formula: Line rate [Mbps] = fDPHYPLL [MHz] / 2*

### Pin Configuration

Communication to the external display occurs via one or more data lanes and one clock lane. Each of these lanes has dedicated pins. Lane 0 is capable of low-power data transfer and bidirectional communication with a display. Lane 1 is capable of low-power or high-speed data transfer to the external display. Additionally, an optional tearing effect connection (DSI_TE) may be used with this module.

## Usage Notes

### Display Data

The DSI-2 Host consumes data from the GLCDC module and prepares it for output via the D-PHY and connections to the display.

### MIPI DSI Operating Modes

MIPI DSI is capable of several operating modes: Non-Burst Mode with Sync Pulse, Non-Burst Mode with Sync Event, and Burst Mode. Each operational mode is achieved by configuring the peripheral with specific timimg and option settings.

Non-Burst Mode with Sync Pulse:

- GLCDC Video Clock bandwidth == MIPI Phy PLL bandwidth
- Sync Pulse is enabled (HSE and VSE are transmitted)

Non-Burst Mode with Sync Event:

- GLCDC Video Clock bandwidth == MIPI Phy PLL bandwidth
- Sync Pulse is disabled (HSE and VSE are not transmitted)

Burst Mode:

- GLCDC Video Clock bandwidth < MIPI Phy PLL bandwidth
- Sync Pulse is disabled (HSE and VSE are not transmitted)

For the purpose of this section:

- GLCDC Video Clock bandwidth is defined as: (Panel Clock MHz) * (Bits per pixel)
- MIPI Phy PLL bandwidth is defined as: (MIPI Phy PLL Clock MHz / 2) * (Number of MIPI data lanes) * 8 - (Configuration Dependent Transmission Overhead)

*Note*

*Consult the MIPI DSI Specification and the connected display's User Manual to calculate the desired bandwidth utilization. Additionally, especially with strict timing requirements, it is recommended to empirically validate the configuration and use the API to check for reported errors.*

### MIPI PHY Data Lanes

The DSI-2 Host supports two basic types of operations: Command Mode and Video Mode. While a data lane is in Low-Power (LP) operation, Command Mode may be used for bi-directional communication with a connected display using a pre-defined set of command descriptors.

*Note*

*GLCDC Video Clock bandwidth must not exceed Data Bus bandwidth or MIPI Phy PLL bandwidth.*

### MIPI PHY Timing Configuration

The MIPI DSI D-PHY configuration controls timing aspects of Low Power (LP) and High Speed (HS) communication. Configure these values to match specifications listed in the datasheet for the display.

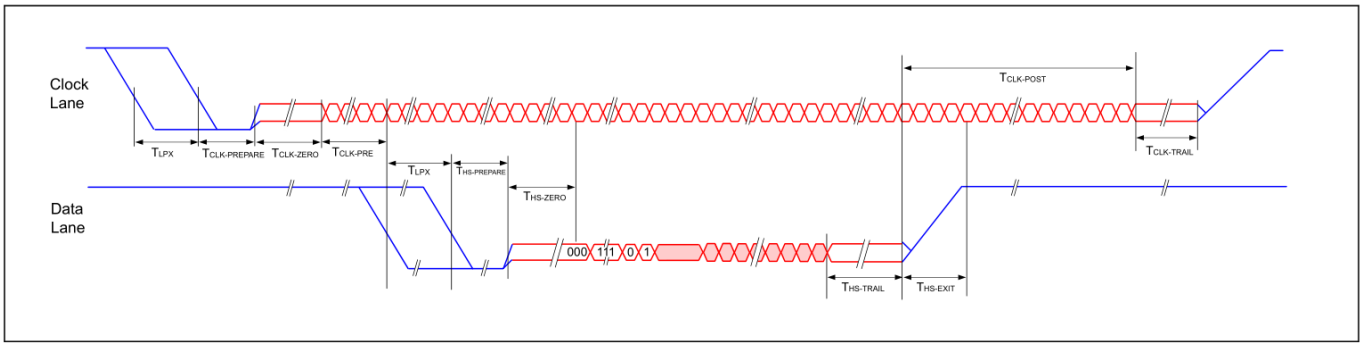

Figure 258: High-Speed data transmission in normal mode

### Command Mode Operation

Two internal channels may be used for command mode operations, available for all physical lane configurations. Channel-0 supports only LP mode (LP-TX, LP-RX), while Channel-1 supports LP mode (LP-TX, LP-RX) and HS mode (HS-TX).

There are two basic packet formats, short and long. Each format may be transmitted in high-speed or low-power modes. Packets may be followed by a Bus Turn-Around (BTA) request for reading information from the display. Once configured and started, video packets are transmitted automatically, until video output is stopped.

In addition to the full set of MIPI DSI commands, the application may trigger any of four special commands by setting flags in the message structure. These special commands are Reset Signal, Initial Skew Calibration, Periodic Skew Calibration, and No-Operation.

*Note*

*For peripherals with more than one lane, physical Lane 0 is used for all peripheral-to-processor transmissions. Other lanes are unidirectional, from the host processor to the peripheral.*

### Acknowledge and Error Reporting

The application is notified of Acknowledge and Error Reporting (AwER) via an optional receive interrupt event. The most recent and accumulated AwER data may be retrieved by calling R_MIPI_DSI_StatusGet(). The application may send a MIPI_DSI_CMD_FLAG_BTA_NO_WRITE message with tx size of zero to request AwER from the peripheral.

### Ultra-low Power State

Ultra-low Power State (ULPS) may be actived when HS and LP operations are not occurring. Clock and Data lanes may be transitioned into ULPS independently from each other.

### Limitations

Developers should be aware of the following limitations when using the MIPI DSI API:

- MIPI DSI must be closed before transitioning MCU into low-power modes.
- Data bus bandwidth limitations should be considered when setting GLCDC and MIPI DSI clock speeds.
- When the MIPI DSI is used, voltage of VCC and AVCC_MIPI pin must be same and 3V or larger(VCC=AVCC_MIPI≧3V)

### Interrupt Configuration

When enabled, Interrupts will invoke the configured callback function. Low-power and High-Speed command status should be determined by checking Sequence 0 and Sequence 1 events, respectively. See the DSI Error Handling section of the user manual for information about how to handle error events.

### MIPI DSI Setup with External Display

Especially for use with display middleware such as emWin or GUIX, the callback will be invoked with post-open and pre-video-start events. Depending on your hardware, it may be necessary to use these events to configure the display.

## Examples

### Basic Example

This is a basic example showing the minimum code required to initialize and start the MIPI DSI module.

```
void mipi_dsi_minimal_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
    err = R_MIPI_DSI_Open(&g_mipi_dsi0_ctrl, &g_mipi_dsi0_cfg);
    assert(FSP_SUCCESS == err);
 /* Application to perform display specific initialization. */
    uint8_t       cmd_tx_buffer[] = {0x30, 0x01}; // NOLINT(readability-magic-
numbers)
 mipi_dsi_cmd_t cmd             =
    {
       .channel    = 0,
       .cmd_id      = MIPI_CMD_ID_DCS_SHORT_WRITE_1_PARAM,
```

```
      .flags       = (mipi_dsi_cmd_flag_t) (MIPI_DSI_CMD_FLAG_LOW_POWER |
MIPI_DSI_CMD_FLAG_BTA_READ),
      .tx_len      = 1,
      .p_tx_buffer = cmd_tx_buffer,
   };
   err = R_MIPI_DSI_Command(&g_mipi_dsi0_ctrl, &cmd);
   assert(FSP_SUCCESS == err);
/* Wait for tx/rx complete before sending additional messages */
while (!message_tx_complete)
   {
      ;
   }
while (!message_rx_complete)
   {
      ;
   }
   err = R_MIPI_DSI_Start(&g_mipi_dsi0_ctrl);
   assert(FSP_SUCCESS == err);
/* Trigger status message from peripheral by sending LP BTA
 * NOTE: This is required for ack_err status data to be populated */
mipi_dsi_cmd_t read_cmd = {0};
   read_cmd.cmd_id = MIPI_CMD_ID_DCS_READ;
   read_cmd.flags |= MIPI_DSI_CMD_FLAG_BTA_NO_WRITE | MIPI_DSI_CMD_FLAG_LOW_POWER;
   message_rx_complete = false;
   err                 = R_MIPI_DSI_Command(&g_mipi_dsi0_ctrl, &read_cmd);
   assert(FSP_SUCCESS == err);
while (!message_rx_complete)
   {
      ;
   }
/* Read peripheral and local MIPI DSI status
 * Note: peripheral ack_err status is cleared each time it is read using StatusGet
*/
mipi_dsi_status_t status;
```

```
    err = R_MIPI_DSI_StatusGet(&g_mipi_dsi0_ctrl, &status);
    assert(FSP_SUCCESS == err);
    err = R_MIPI_DSI_Stop(&g_mipi_dsi0_ctrl);
    assert(FSP_SUCCESS == err);
    err = R_MIPI_DSI_UlpsEnter(&g_mipi_dsi0_ctrl, (mipi_dsi_lane_t)
(MIPI_DSI_LANE_CLOCK | MIPI_DSI_LANE_DATA_ALL));
    assert(FSP_SUCCESS == err);
    err = R_MIPI_DSI_UlpsExit(&g_mipi_dsi0_ctrl, (mipi_dsi_lane_t)
(MIPI_DSI_LANE_CLOCK | MIPI_DSI_LANE_DATA_ALL));
    assert(FSP_SUCCESS == err);
    err = R_MIPI_DSI_Close(&g_mipi_dsi0_ctrl);
    assert(FSP_SUCCESS == err);
}
void mipi_dsi0_callback (mipi_dsi_callback_args_t * p_args)
{
 switch (p_args->event)
    {
 case MIPI_DSI_EVENT_POST_OPEN:
     {
 /* Application to configure peripheral using necessary interface and commands */
           configure_dsi_peripheral();
 break;
     }
 case MIPI_DSI_EVENT_RECEIVE:
     {
 /* Application to perform receive processing */
           message_rx_complete = true;
 break;
     }
 case MIPI_DSI_EVENT_SEQUENCE_0:
     {
           message_tx_complete = (p_args->tx_status ==
MIPI_DSI_SEQUENCE_STATUS_DESCRIPTORS_FINISHED);
 break;
```

```
      }
 default:
      {
 break;
      }
    }
}
void configure_dsi_peripheral (void)
{
 /* Send necessary commands to configure LCD */
}
```

### Data Structures

| | |
|---|---|
| struct | mipi_dsi_irq_cfg_t |
| struct | mipi_dsi_extended_cfg_t |
| struct | mipi_dsi_instance_ctrl_t |

## Data Structure Documentation

### ◆ mipi_dsi_irq_cfg_t

| struct mipi_dsi_irq_cfg_t | | |
|---|---|---|
| MIPI DSI interrupt configuration | | |
| Data Fields | | |
| uint8_t | ipl | Interrupt priority. |
| IRQn_Type | irq | Interrupt vector number. |

### ◆ mipi_dsi_extended_cfg_t

| struct mipi_dsi_extended_cfg_t | | |
|---|---|---|
| Extended configuration structure for MIPI DSI. | | |
| Data Fields | | |
| mipi_dsi_irq_cfg_t | dsi_seq0 | Sequence 0 interrupt. |
| mipi_dsi_irq_cfg_t | dsi_seq1 | Sequence 1 interrupt. |
| mipi_dsi_irq_cfg_t | dsi_ferr | DSI Fatal Error interrupt. |
| mipi_dsi_irq_cfg_t | dsi_ppi | D-PHY PPI interrupt. |

| uint32_t | dsi_sqch0ie | Sequence Channel 0 interrupt enable configuration. |
| uint32_t | dsi_sqch1ie | Sequence Channel 1 interrupt enable configuration. |

### ◆ mipi_dsi_instance_ctrl_t

| struct mipi_dsi_instance_ctrl_t | |
|---|---|
| MIPI DSI instance control block. | |
| **Data Fields** | |
| uint32_t | open |
| | Interface is open. |
| | |
| bool | data_ulps_active |
| | Data lane ULPS status. |
| | |
| bool | clock_ulps_active |
| | Data lane ULPS status. |
| | |
| mipi_dsi_lane_t | ulps_status |
| | Ultra-low Power State active status. |
| | |
| mipi_dsi_cfg_t const * | p_cfg |
| | Pointer to configuration structure used to open the interface. |
| | |
| void(* | p_callback )(mipi_dsi_callback_args_t *) |

| | |
|---|---|
| | Pointer to callback that is called when an adc_event_t occurs. |
| | |
| void * | p_context |
| | Pointer to context to be passed into callback function. |
| | |
| mipi_dsi_callback_args_t * | p_callback_memory |
| | Pointer to non-secure memory that can be used to pass arguments to a callback in non-secure memory. |
| | |

### Function Documentation

#### ◆ R_MIPI_DSI_Open()

fsp_err_t R_MIPI_DSI_Open ( mipi_dsi_ctrl_t *const *p_api_ctrl*, mipi_dsi_cfg_t const *const *p_cfg* )

Initialize the MIPI DSI peripheral.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | The channel was successfully opened. |
| FSP_ERR_ASSERTION | One or both of the parameters was NULL. |
| FSP_ERR_ALREADY_OPEN | The instance is already opened. |
| FSP_ERR_INVALID_STATE | Display module must be opened before DSI. |

#### ◆ R_MIPI_DSI_Close()

fsp_err_t R_MIPI_DSI_Close ( mipi_dsi_ctrl_t *const *p_api_ctrl*)

Close MIPI DSI and display data instances, disable interrupts, and power-off the module.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | The channel is successfully closed. |
| FSP_ERR_ASSERTION | p_api_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Instance is not open. |
| FSP_ERR_IN_USE | Operation in progress and must be stopped before closing. |

### ◆ R_MIPI_DSI_Start()

fsp_err_t R_MIPI_DSI_Start ( mipi_dsi_ctrl_t *const *p_api_ctrl*)

Start video output. Initialize Video Output Registers Perform sequence steps 3 to 5 from "Start of Video Mode Operation" in the MIPI DSI section of the relevant hardware manual.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Data is successfully written to the D/A Converter. |
| FSP_ERR_ASSERTION | p_api_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Instance is not open. |
| FSP_ERR_IN_USE | The physical interface is currently in use. |
| FSP_ERR_INVALID_STATE | DSI is already in video mode. |

### ◆ R_MIPI_DSI_Stop()

fsp_err_t R_MIPI_DSI_Stop ( mipi_dsi_ctrl_t *const *p_api_ctrl*)

Stop video output.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Data is successfully written to the D/A Converter. |
| FSP_ERR_ASSERTION | p_api_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Instance is not open. |
| FSP_ERR_IN_USE | DSI cannot be closed while ULPS is active. |

### ◆ R_MIPI_DSI_UlpsEnter()

fsp_err_t R_MIPI_DSI_UlpsEnter ( mipi_dsi_ctrl_t *const *p_api_ctrl*, mipi_dsi_lane_t *lane* )

Enter Ultra-low Power State (ULPS).

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Information read successfully. |
| FSP_ERR_ASSERTION | p_api_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Instance is not open. |
| FSP_ERR_INVALID_MODE | Invalid mode for transition. |

### ◆ R_MIPI_DSI_UlpsExit()

fsp_err_t R_MIPI_DSI_UlpsExit ( mipi_dsi_ctrl_t *const *p_api_ctrl*, mipi_dsi_lane_t *lane* )

Exit Ultra-low Power State (ULPS).

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Information read successfully. |
| FSP_ERR_ASSERTION | p_api_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Instance is not open. |

### ◆ R_MIPI_DSI_Command()

fsp_err_t R_MIPI_DSI_Command ( mipi_dsi_ctrl_t *const *p_api_ctrl*, mipi_dsi_cmd_t * *p_cmd* )

Send a command to the peripheral device.

***Note***

*p_data will be used as either write data or a read buffer depending on the data id.*
*p_data memory must not be updated until sequence operation is complete if byte_count is greater than 16.*

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Command(s) queued successfully. |
| FSP_ERR_ASSERTION | p_api_ctrl is NULL. cmd_id specifies a long packet but p_data is NULL. |
| FSP_ERR_NOT_OPEN | Instance is not open. |
| FSP_ERR_IN_USE | The physical interface is currently in use or video mode is in operation. |
| FSP_ERR_INVALID_POINTER | Invalid pointer provided |
| FSP_ERR_INVALID_ARGUMENT | Invalid message configuration |

### ◆ R_MIPI_DSI_StatusGet()

fsp_err_t R_MIPI_DSI_StatusGet ( mipi_dsi_ctrl_t *const *p_api_ctrl*, mipi_dsi_status_t * *p_status* )

Provide information about current MIPI DSI status.

Note: Accumulated Acknowledge and Error (AwER) Status is cleared by calling this function. Latest AwER status is only set upon reception from peripheral.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Information read successfully. |
| FSP_ERR_ASSERTION | p_api_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Instance is not open. |

### Detailed Description

Driver for the PDC peripheral on RA MCUs. This module implements the CAPTURE Interface.

# Overview

The PDC peripheral supports interfacing with external cameras by accepting timing and data signals in order to capture incoming data. A callback is invoked every time a frame of data is accepted.

### Features

- Capture incoming data into a user defined buffer
- Data bytes per pixel can be configured
- Endianess of the incoming data can be specified
- Supports configuring capture width and height
- Supports configuring vertical and horizontal sync polarity
- Horizontal and Vertical position for image/data capture can be specified
- External clock to the camera module can be adjusted
- Choice between DMA and DTC to transfer out the captured data
- The specified user callback is invoked when a data frame is captured

# Configuration

### Build Time Configurations for r_pdc

The following build time configurations are defined in fsp_cfg/r_pdc_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

### Configurations for Graphics > Parallel Data Capture (r_pdc)

This module can be added to the Stacks tab via New Stack > Graphics > Parallel Data Capture (r_pdc).

| Configuration | Options | Default | Description |
|---|---|---|---|
| General | | | |
| Name | Name must be a valid C symbol | g_pdc0 | Module name. |
| Input | | | |
| Input > Signal polarity | | | |
| HSYNC | • High<br>• Low | High | Specify the active polarity of the HSYNC signal. |
| VSYNC | • High<br>• Low | High | Specify the active polarity of the VSYNC signal. |
| Input > Capture Specifications | | | |

| | | | |
|---|---|---|---|
| Number of pixels to capture horizontally | Value must be an integer greater than 0 | 640 | Specify the number of horizontal pixels to capture. |
| Number of lines to capture vertically | Value must be an integer greater than 0 | 480 | Specify the number of vertical pixels to capture. |
| Horizontal pixel to start capture from | Value must be an integer | 0 | Specify the horizontal pixel to start capturing image data from. Allows an image smaller than the native resolution of a camera to be captured. |
| Line to start capture from | Value must be an integer | 0 | Specify the vertical line to start capturing image data from. Allows an image smaller than the native resolution of a camera to be captured. |
| Bytes per pixel | Value must be an integer greater than 0 | 2 | Specify the number of bytes per pixel of the captured image data. |
| Clock divider | • CLK/2<br>• CLK/4<br>• CLK/6<br>• CLK/8<br>• CLK/10<br>• CLK/12<br>• CLK/14<br>• CLK/16 | CLK/2 | Specify the clock divider for clock frequency of the clock input PCKO to the PDC peripheral. |
| Endianess | • Little<br>• Big | Little | Specify the endianness of the captured image data. |
| Output | | | |
| Output > Buffer | | | |
| Number of image buffers | Value must be an integer greater than 0 | 1 | Specify the number of buffers to create. |
| Interrupts | | | |
| Callback | Name must be a valid C symbol | g_pdc_user_callback | A user callback function must be provided. This callback is invoked for every successful frame capture and any error conditions |
| PDC Interrupt Priority | MCU Specific Options | | Select the PDC |

| | | |
|---|---|---|
| | | interrupt priority. |
| DTC Interrupt Priority | MCU Specific Options | Select the DTC interrupt priority. |

### Clock Configuration

The PDC peripheral module uses the PCLKB as its clock source. The maximum clock to the camera module is PCLKB / 2.

### Pin Configuration

The PCKO pin is a clock output and should be connected to the clock input of the camera. The PIXCLK pin is a clock input and should be connected to the output pixel clock of the camera. Likewise, the HSYNC and VSYNC pins must be connected to the horizontal and vertical sync signals of the camera, respectively. The PIXD0-PIXD7 pins are the 8-bit data bus input and should be connected to the relevant output pins of the camera.

*Note*

*Camera control and serial communication pins must be configured separately and are not controlled by this module.*

## Usage Notes

### Interrupt Configuration

- PDC error interrupts are used by this module for reporting errors such as overrun, underrun, vertical line number setting and horizontal byte number setting errors.
- In addition to the PDC error interrupts, DMA or DTC interrupts are also used internally to perform data transfer from this peripheral to the specified image buffer.
- Receive data ready interrupt is used as activation source for DMA and DTC trigger.

### Enabling Transfer Modules

- An option to select between DMAC or DTC is provided with DMA as the default transfer choice.
- For further details on DMA please refer Transfer (r_dmac)
- For further details on DTC please refer Transfer (r_dtc)

### PDC setup with external camera

- Before configuring the external camera device the PDC Open API must be called in order to start clock output.
- Ensure that the memory pointed to by p_buffer is both valid and large enough to store a complete image.
- The amount of space required (in bytes) can be calculated as: size (bytes) = image width (pixels) * image height (lines) * number of bytes per pixel
- Ensure that the size above is divisible by and aligned to 32 bytes.

## Examples

### Basic Example

This is a basic example of minimal use of the PDC in an application. This example shows how this

driver can be used for capturing data from an external I/O device such as an image sensor.

```
void g_pdc_user_callback (capture_callback_args_t * p_args)
{
 if (PDC_EVENT_TRANSFER_COMPLETE == p_args->event)
    {
       g_capture_ready = true;
    }
}
void basic_example (void)
{
 fsp_err_t err;
 /* Initialize the PDC module */
    err = R_PDC_Open(&g_pdc0_ctrl, &g_pdc0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Initialize the camera module at this point. This implementation is camera vendor
specific. */
    camera_module_initialization();
 /* Initialize capture ready flag to false. This gets set to true in PDC callback
upon successful frame capture. */
    g_capture_ready = false;
    err = R_PDC_CaptureStart(&g_pdc0_ctrl, g_user_buffer);
    assert(FSP_SUCCESS == err);
    uint32_t timeout_ms = PDC_DELAY_MS;
 /* Since there is nothing else to do, block until Callback triggers*/
 while ((true != g_capture_ready) && timeout_ms)
    {
 R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
       timeout_ms--;;
    }
 if (0U == timeout_ms)
    {
       __BKPT(0);
    }
```

```
}
static void camera_module_initialization (void)
{
 /* Camera vendor specific initialization to be done here */
}
```

### Data Structures

| | |
|---|---|
| struct | pdc_extended_cfg_t |
| struct | pdc_instance_ctrl_t |

### Enumerations

| | |
|---|---|
| enum | pdc_event_t |
| enum | pdc_clock_division_t |
| enum | pdc_endian_t |
| enum | pdc_hsync_polarity_t |
| enum | pdc_vsync_polarity_t |

## Data Structure Documentation

### ◆ pdc_extended_cfg_t

| struct pdc_extended_cfg_t | | |
|---|---|---|
| Extended configuration structure for PDC. | | |
| Data Fields | | |
| pdc_clock_division_t | clock_division | Clock divider. |
| pdc_endian_t | endian | Endian of capture data. |
| pdc_hsync_polarity_t | hsync_polarity | Polarity of HSYNC input. |
| pdc_vsync_polarity_t | vsync_polarity | Polarity of VSYNC input. |
| uint8_t | pdc_ipl | PDC interrupt priority. |
| uint8_t | transfer_req_ipl | Transfer interrupt priority. |
| IRQn_Type | pdc_irq | PDC IRQ number. |
| IRQn_Type | transfer_req_irq | Transfer request IRQ number. |
| transfer_instance_t const * | p_lower_lvl_transfer | Pointer to the transfer instance the PDC should use. |

### ◆ pdc_instance_ctrl_t

| struct pdc_instance_ctrl_t |
| --- |
| PDC instance control block. DO NOT INITIALIZE. |

## Enumeration Type Documentation

### ◆ pdc_event_t

| enum pdc_event_t | |
| --- | --- |
| PDC events | |
| Enumerator | |
| PDC_EVENT_TRANSFER_COMPLETE | Complete frame transferred by DMAC/DTC. |
| PDC_EVENT_RX_DATA_READY | Receive data ready interrupt. |
| PDC_EVENT_FRAME_END | Frame end interrupt. |
| PDC_EVENT_ERR_OVERRUN | Overrun interrupt. |
| PDC_EVENT_ERR_UNDERRUN | Underrun interrupt. |
| PDC_EVENT_ERR_V_SET | Vertical line setting error interrupt. |
| PDC_EVENT_ERR_H_SET | Horizontal byte number setting error interrupt. |

### ◆ pdc_clock_division_t

| enum pdc_clock_division_t | |
|---|---|
| Clock divider applied to PDC clock to provide PCKO output frequency | |
| Enumerator | |
| PDC_CLOCK_DIVISION_2 | CLK / 2. |
| PDC_CLOCK_DIVISION_4 | CLK / 4. |
| PDC_CLOCK_DIVISION_6 | CLK / 6. |
| PDC_CLOCK_DIVISION_8 | CLK / 8. |
| PDC_CLOCK_DIVISION_10 | CLK / 10. |
| PDC_CLOCK_DIVISION_12 | CLK / 12. |
| PDC_CLOCK_DIVISION_14 | CLK / 14. |
| PDC_CLOCK_DIVISION_16 | CLK / 16. |

### ◆ pdc_endian_t

| enum pdc_endian_t | |
|---|---|
| Endian of captured data | |
| Enumerator | |
| PDC_ENDIAN_LITTLE | Data is in little endian format. |
| PDC_ENDIAN_BIG | Data is in big endian format. |

### ◆ pdc_hsync_polarity_t

| enum pdc_hsync_polarity_t | |
|---|---|
| Polarity of input HSYNC signal | |
| Enumerator | |
| PDC_HSYNC_POLARITY_HIGH | HSYNC signal is active high. |
| PDC_HSYNC_POLARITY_LOW | HSYNC signal is active low. |

### ◆ pdc_vsync_polarity_t

| enum pdc_vsync_polarity_t | |
|---|---|
| Polarity of input VSYNC signal | |
| Enumerator | |
| PDC_VSYNC_POLARITY_HIGH | VSYNC signal is active high. |
| PDC_VSYNC_POLARITY_LOW | VSYNC signal is active low. |

## Function Documentation

### ◆ R_PDC_Open()

fsp_err_t R_PDC_Open ( capture_ctrl_t *const *p_ctrl*, capture_cfg_t const *const *p_cfg* )

Powers on PDC, handles required initialization described in the hardware manual.

Implements capture_api_t::open.

The Open function provides initial configuration for the PDC module. It powers on the module and enables the PCLKO output and the PIXCLK input. Further initialization requires the PIXCLK input to be running in order to be able to reset the PDC as part of its initialization. This clock is input from a camera module and so the reset and further initialization is performed in capture_api_t::captureStart. This function should be called once prior to calling any other PDC API functions. After the PDC is opened the Open function should not be called again without first calling the Close function.

Example:

```
/* Initialize the PDC module */
   err = R_PDC_Open(&g_pdc0_ctrl, &g_pdc0_cfg);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Initialization was successful. |
| FSP_ERR_ASSERTION | One or more of the following parameters is NULL<br>1. p_cfg is NULL<br>2. p_api_ctrl is NULL<br>3. The pointer to the transfer interface in the p_cfg parameter is NULL<br>4. Callback parameter is NULL.<br>5. Invalid IRQ number assigned |
| FSP_ERR_INVALID_ARGUMENT | One or more of the following parameters is incorrect<br>1. bytes_per_pixel is zero<br>2. x_capture_pixels is zero<br>3. y_capture_pixels is zero<br>4. x_capture_start_pixel + x_capture_pixels is greater than 4095, OR<br>5. y_capture_start_pixel + y_capture_pixels is greater than 4095 |
| FSP_ERR_ALREADY_OPEN | Module is already open. |

### ◆ R_PDC_Close()

fsp_err_t R_PDC_Close ( capture_ctrl_t *const *p_ctrl*)

Stops and closes the transfer interface, disables and powers off the PDC, clears internal driver data and disables interrupts.

Implements capture_api_t::close.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successful close. |
| FSP_ERR_ASSERTION | p_api_ctrl is NULL |
| FSP_ERR_NOT_OPEN | Open has not been successfully called. |

### ◆ R_PDC_CaptureStart()

fsp_err_t R_PDC_CaptureStart ( capture_ctrl_t *const *p_ctrl*, uint8_t *const *p_buffer* )

Starts a capture. Enables interrupts.

Implements capture_api_t::captureStart.

Sets up the transfer interface to transfer data from the PDC into the specified buffer. Configures the PDC settings as previously set by the capture_api_t::open API. These settings are configured here as the PIXCLK input must be active for the PDC reset operation. When a capture is complete the callback registered during capture_api_t::open API call will be called.

Example:

```
err = R_PDC_CaptureStart(&g_pdc0_ctrl, g_user_buffer);
assert(FSP_SUCCESS == err);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Capture start successful. |
| FSP_ERR_ASSERTION | One or more of the following parameters is NULL<br>1. p_api_ctrl is NULL<br>2. p_buffer is NULL |
| FSP_ERR_NOT_OPEN | Open has not been successfully called. |
| FSP_ERR_IN_USE | PDC transfer is already in progress. |
| FSP_ERR_TIMEOUT | Reset operation timed out. |
| FSP_ERR_NOT_INITIALIZED | Callback function has not been set |

### ◆ R_PDC_StatusGet()

fsp_err_t R_PDC_StatusGet ( capture_ctrl_t *const *p_ctrl*, capture_status_t * *p_status* )

Provides the pdc operating status.

Implements capture_api_t::statusGet.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Initialization was successful. |
| FSP_ERR_ASSERTION | One or more parameters is NULL. |
| FSP_ERR_NOT_OPEN | Open has not been successfully called. |

### ◆ R_PDC_CallbackSet()

fsp_err_t R_PDC_CallbackSet ( capture_ctrl_t *const *p_ctrl*, void(*)(capture_callback_args_t *) *p_callback*, void *const *p_context*, capture_callback_args_t *const *p_callback_memory* )

Updates the user callback and has option of providing memory for callback structure.

Implements capture_api_t::callbackSet.

**Return values**

| | |
|---|---|
| FSP_ERR_UNSUPPORTED | This is just a stub at present |

#### 5.2.8.10 SEGGER emWin RA Port (rm_emwin_port)

Modules » Graphics

SEGGER emWin port for RA MCUs.

# Overview

The SEGGER emWin RA Port module provides the configuration and hardware acceleration support necessary for use of emWin on RA products. The port provides full integration with the graphics peripherals as well as FreeRTOS.

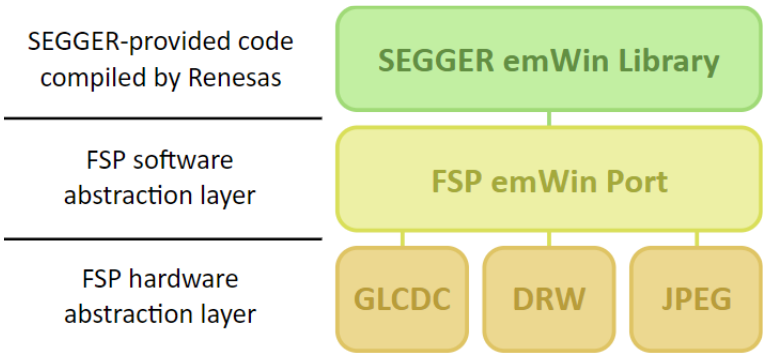

Figure 259: SEGGER emWin FSP Port Block Diagram (using RA6M3 as example)

*Note*

*This port layer primarily enables hardware acceleration and background handling of many display operations and does not contain code intended to be directly called by the user. Please consult the SEGGER emWin User Guide (UM03001) for details on how to use emWin in your project.*

### Hardware Acceleration

The following functions are currently performed with hardware acceleration:

- DRW Engine (r_drw)
  - Drawing bitmaps (ARGB8888 and RGB565)
  - 4bpp font rendering
  - Rectangle fill
  - Line and shape drawing
  - Anti-aliased operations
    - Circle stroke and fill
    - Polygon stroke and fill
    - Lines and arcs
- JPEG Codec (r_jpeg)
  - JPEG decoding
- Graphics LCD Controller (r_glcdc)
  - Brightness, contrast and gamma correction
  - Pixel format conversion (framebuffer to LCD)

## Configuration

### Build Time Configurations for rm_emwin_port

The following build time configurations are defined in fsp_cfg/rm_emwin_port_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Memory Allocation | | | |
| GUI Heap Size | Value must be a non-negative integer | 32768 | Set the size of the heap to be allocated for use exclusively by emWin. |
| Section for GUI Heap | Manual Entry | .ram_noinit | Specify the section in which to allocate the GUI heap. |

| | | | |
|---|---|---|---|
| Maximum Layers | Value must be a non-negative integer | 16 | Set the maximum number of available display layers in emWin.<br><br>This setting is not related to GLCDC Layer 1 or 2. |
| AA Font Conversion Buffer Size | Value must be a non-negative integer | 400 | Set the size of the conversion buffer for anti-aliased font glyphs. This should be set to the size (in bytes) of the largest AA character to be rendered. |
| LCD Settings | | | |
| Wait for Vertical Sync | • Enabled<br>• Disabled | Enabled | When enabled emWin will wait for a vertical sync event each time the display is updated. If an RTOS is used the thread will yield; otherwise each frame will block until Vsync.<br><br>WARNING: Disabling vertical sync will result in tearing. It is recommended to always leave this setting Enabled if an RTOS is used. |
| JPEG Decoding | | | |
| JPEG Decoding > General | | | |
| Input Alignment | • 8-byte aligned (faster)<br>• Unaligned (slower) | 8-byte aligned (faster) | Setting this option to 8-bit alignment can allow the hardware JPEG Codec to directly read JPEG data. This speeds up JPEG decoding operations and reduces RAM overhead, but all JPEG images must reside on an 8-byte boundary.<br><br>When this option is enabled the input buffer is not allocated. |

| | | | |
|---|---|---|---|
| Double-Buffer Output | • Enabled<br>• Disabled | Disabled | Enable this option to configure JPEG decoding operations to use a double-buffered output pipeline. This allows the JPEG to be rendered to the display at the same time as decoding at the cost of additional RAM usage.<br><br>Enabling this option automatically allocates double the output buffer size. |
| Error Timeout | Value must be a non-negative integer | 50 | Set the timeout for JPEG decoding operations (in RTOS ticks) in the event of a decode error. |
| JPEG Decoding > Buffers | | | |
| Input Buffer Size | Value must be a non-negative integer | 0x1000 | Set the size of the JPEG decode input buffer (in bytes). This buffer is used to ensure 8-byte alignment of input data. Specifying a size smaller than the size of the JPEG to decode will use additional interrupts to stream data in during the decoding process. |
| Output Buffer Size | Value must be a non-negative integer | 0x3C00 | Set the size of the JPEG decode output buffer (in bytes). An output buffer smaller than the size of a decoded image will use additional interrupts to stream the data into a framebuffer.<br><br>Unless you are sure of the subsampling used in and the size of the input JPEG images it is recommended to allocate at least 16 framebuffer lines of memory. |
| Section for Buffers | Manual Entry | .ram_noinit | Specify the section in |

which to allocate the JPEG work buffers.

### Hardware Configuration

No clocks or pins are directly required by this module. Please consult the submodules' documentation for their requirements.

### Library Configuration

emWin is provided as a pre-compiled library. To maximize compatibility the build-time options are configured as follows:

```
#define GUI_OS (1) // Context switch support enabled
#define GUI_MAXTASK (1) // One task supported by default (can be increased at runtime
via GUITASK_SetMaxTask())
#define GUI_NUM_LAYERS (3) // Up to three displays supported
#define GUI_SUPPORT_TOUCH (1) // Support touch screens
#define GUI_SUPPORT_MOUSE (1) // Support a mouse
#define GUI_SUPPORT_MEMDEV (1) // Memory devices available
#define GUI_WINSUPPORT (1) // Window manager available
#define GUI_SUPPORT_BIDI (1) // Bidirectional text enabled
#define GUI_DEBUG_LEVEL (2) // Parameter and consistency checks enabled (no logging)
```

All other options are left at the default settings in GUI_ConfDefaults.h.

## Usage Notes

### Getting Started

To get started with emWin in an RA project the following must be performed:

1. Open the RA Configuration editor for your project
2. Add emWin to your project in the Stacks view by clicking **New Stack -> SEGGER -> SEGGER emWin**
3. Ensure the configuration options for emWin are set as necessary for your application
4. Set the properties for the GLCDC module to match the timing and memory requirements of your display panel
5. Set the JPEG decode color depth to the desired value (if applicable)
6. Ensure interrupts on all modules are enabled:
    - GLCDC Vertical Position (Vpos) Interrupt
    - DRW Interrupt (if applicable)
    - JPEG Encode/Decode and Data Transfer Interrupts (if applicable)
7. Confirm stack and heap are configured as needed
    - When starting development a minimum stack of 0x1000 (4K) and heap of 0x4000 (16K) are recommended until actual usage can be characterized
8. Click Generate Project Content to save and commit configuration changes

At this point the project is now ready to build with emWin. Please refer to the SEGGER emWin User Guide (UM03001) as well as demo and sample code for details on how to create a GUI application.

### Using Hardware Acceleration

In most cases there is no need to perform additional configuration to ensure the DRW Engine is used. However, there are some guidelines that should be followed depending on the item in question:

- Bitmaps:
  - ARGB8888, RGB888 and RGB565 bitmaps require no additional settings.
- Anti-aliased shapes:
  - Anti-aliased lines, circles, polygons, polygon outlines and arcs are rendered with the DRW Engine.
- Anti-aliased (4bpp) fonts:
  - Set the text mode to GUI_TM_TRANS or create the relevant widget with WM_CF_HASTRANS set.
  - Ensure the "AA Font Conversion Buffer Size" configuration option is set to a size equal to or greater than the size (in bytes) of the largest glyph.
- 8bpp palletized images:
  - When creating these images ensure transparency is not enabled as the SEGGER method for this is not compatible with the DRW Engine.
- RLE-encoded images:
  - Hardware acceleration is not available for SEGGER's RLE format.
- JPEG images:
  - Align any user-declared JPEG data to an 8-byte boundary. If 8-byte alignment cannot be guaranteed disable the **JPEG Decoding -> General -> Input Alignment** option in the RA Configuration.

### Multi-thread Support

When the "Multi-thread Support" configuration is enabled, emWin can be called from multiple threads. This comes with advantages and disadvantages:

Advantages:

- High flexibility in development of applications
- Threads can pend and post on emWin events

Disadvantages:

- Slightly higher RAM/ROM use
- Large GUI projects can become difficult to debug

*Note*

*Multi-thread support is independent of RTOS support. RTOS support is managed internally and cannot be manually configured.*

### Limitations

Developers should be aware of the following limitations when using SEGGER emWin with FSP:

- Hardware acceleration is not available when using color modes lower than 16 bits.
- Hardware acceleration is not available for SEGGER's RLE image format.
- Rotated screen modes are not supported.
- Because emWin is provided as a pre-compiled library the build-time options are fixed. See

the Library Configuration section for the supplied configuration.

# Examples

### Basic Example

This is a basic example demonstrating a very simple emWin application. The screen is cleared to white and "Hello World!" is printed in the center.

*Note*

*emWin manages the GLCDC, DRW and JPEG Codec submodules internally; they do not need to be opened directly.*

```
#include "DIALOG.h"
#define COLOR_WHITE 0x00FFFFFFU
#define COLOR_BLACK 0x00000000U
#define GUI_DRAW_DELAY 100
static void _cbMain (WM_MESSAGE * pMsg)
{
    GUI_RECT Rect;
 switch (pMsg->MsgId)
    {
 case WM_CREATE:
      {
 break;
       }
 case WM_PAINT:
      {
 /* Clear background to white */
            GUI_SetBkColor(COLOR_WHITE);
            GUI_Clear();
 /* Draw "Hello World!" in black in the center */
            WM_GetClientRect(&Rect);
            GUI_SetColor(COLOR_BLACK);
            GUI_DispStringInRect("Hello World!", &Rect, GUI_TA_VCENTER |
GUI_TA_HCENTER);
 break;
```

```
      }
 default:
     {
          WM_DefaultProc(pMsg);
 break;
      }
   }
}
void emWinTask (void)
{
   int32_t xSize;
   int32_t ySize;
 /* Initialize emWin */
   GUI_Init();
 /* Get screen dimensions */
   xSize = LCD_GetXSize();
   ySize = LCD_GetYSize();
 /* Create main window */
   WM_CreateWindowAsChild(0, 0, xSize, ySize, WM_HBKWIN, WM_CF_SHOW, _cbMain, 0);
 /* Enter main drawing loop */
 while (1)
   {
      GUI_Delay(GUI_DRAW_DELAY);
   }
}
```

*Note*

*For further example code please consult SEGGER emWin documentation, which can be downloaded here, as well as the Quick Start Guide and example project(s) provided with your Evaluation Kit (if applicable).*

### Detailed Description

Driver for the SLCDC peripheral on RA MCUs. This module implements the SLCDC Interface.

# Overview

The segment LCD controller (SLCDC) utilizes two to four reference voltages to provide AC signals for driving traditional segment LCD panels. Depending on the LCD and MCU package, up to 272 segments can be driven. A built-in link to the RTC allows for up to 152 segments to switch between two patterns at regular intervals. An on-chip boost driver can be used to provide configurable reference voltages up to 5.25V allowing for simple contrast adjustment.

### Features

The SLCDC module can perform the following functions:

- Initialize, start and stop the SLCDC
- Set and modify the output pattern
- Blink between two patterns based on a periodic RTC interrupt signal
- Adjust display contrast (only when using internal voltage boosting)
- Select reference voltage mode: VL1 reference mode (1/3 or 1/4 Bias) and VL2 reference mode (1/3 Bias) can be selected at internal voltage boosting method, conventional VCC reference mode (1/3 Bias) and VL4 reference mode (1/3) Bias can be selected at capacitor split method

# Configuration

### Build Time Configurations for r_slcdc

The following build time configurations are defined in fsp_cfg/r_slcdc_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

**Configurations for Graphics > Segment LCD (r_slcdc)**

This module can be added to the Stacks tab via New Stack > Graphics > Segment LCD (r_slcdc).

| Configuration | Options | Default | Description |
|---|---|---|---|
| General | | | |
| Name | Name must be a valid C symbol | g_slcdc0 | Module Name |
| Clock | | | |
| Source | MCU Specific Options | | Select the clock source. |
| Divisor | MCU Specific Options | | Select the clock divisor. |
| Output | | | |
| Bias method | • 1/2 bias<br>• 1/3 bias<br>• 1/4 bias | 1/2 bias | Select the bias method. This determines the number of voltage levels used to create the waveforms. |
| Timeslice | MCU Specific Options | | Select the LCD time slice. The number of slices should match the number of common (COM) pins for your LCD panel. |
| Waveform | • Waveform A<br>• Waveform B | Waveform A | Select the LCD waveform. |
| Drive method | MCU Specific Options | | Select the LCD drive method. |
| Reference Voltage | MCU Specific Options | | Select the LCD reference voltage. |
| Default contrast (if available) | MCU Specific Options | | Select the default contrast level. |

**Valid Configurations**

Though there are many setting combinations only a limited subset are supported by the SLCDC peripheral hardware:

Boards have feature Select reference voltage mode (see relevant hardware manual for details)

| | | | | | | | |

### Clock Configuration

See relevant hardware manual: The SLCDC clock can be sourced from the main clock (MOSC), sub-clock (SOSC), HOCO, LOCO or MOCO. Dividers of 4 to 1024 are available for SOSC/LOCO and 256 to 1048576 are for MOSC/HOCO/MOCO. It is recommended to adjust the divisor such that the resulting clock provides a frame frequency of 32-128 Hz (some conditions have a frame frequency 24 to 128 Hz - see Table "Combinations of display waveform, time slices, bias method, and frame frequency" in the SLCDC section of the relevant hardware manual).

Others: The SLCDC clock can be sourced from the main clock (MOSC), sub-clock (SOSC), HOCO or LOCO. Dividers of 4 to 1024 are available for SOSC/LOCO and 256 to 524288 for MOSC/HOCO. It is recommended to adjust the divisor such that the resulting clock provides a frame frequency of 32-128 Hz.

*Note*

*Make sure your desired source clock is enabled and running before starting SLCDC output.*
*Do not set the segment LCD clock over 512 Hz when using internal boost or capacitor split modes.*

### Pin Configuration

This module controls a variety of pins necessary for segment LCD voltage generation and signal output:

| Pin Name | Function | Notes |
|---|---|---|
| SEGn | Segment data output | Connect these signals to the segment pins of the LCD. |
| COMn | Common signal output | Connect these signals to the common pins of the LCD. |
| VLn | Voltage reference | These pins should be connected to passive components based on the selected drive method (see "Supplying LCD Drive Voltages VL1, VL2, VL3, and VL4" in the SLCDC section of the relevant hardware manual). |
| CAPH, CAPL | Drive voltage generator capacitor | Connect a nonpolar 0.47uF capacitor across these pins when using internal boost or capacitor split modes. This pin is not needed when using resistance division. |

### Interrupt Configuration

The SLCDC provides no interrupt signals.

*Note*

*Blinking output timing is driven directly from the RTC periodic interrupt. Once the interrupt is enabled setting the display to SLCDC_DISP_BLINK will swap between A- and B-pattern each time it occurs. The ELC is not required for this functionality.*

# Usage Notes

### Limitations

Developers should be aware of the following limitations when using the SLCDC:

- Different packages provide different numbers of segment pins. Check the User's Manual for your device to confirm availability and mapping of segment signals.
- When using internal boost mode a delay of 5ms is required between calling R_SLCDC_Open and R_SLCDC_Start to allow the boost circuit to charge.

- When using the internal boost or capacitor split method do not set the segment LCD clock higher than 512 Hz.

# Examples

### Basic Example

Below is a basic example of minimal use of the SLCDC in an application. The SLCDC driver is initialized, output is started and a pattern is written to the segment registers.

```
void slcdc_init (void)
{
 fsp_err_t err;
 /* Open SLCDC driver */
    err = R_SLCDC_Open(&g_slcdc_ctrl, &g_slcdc_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* When using internal boost mode this delay is required to allow the boost circuit
to charge. See
  * "Segment LCD Source Clock Control Register (SLCDSCKCR)" description in SLCDC
section of the relevant
  * hardware manual for details. */
 R_BSP_SoftwareDelay(5, BSP_DELAY_UNITS_MILLISECONDS);
 /* Start SLCDC output */
    err = R_SLCDC_Start(&g_slcdc_ctrl);
    assert(FSP_SUCCESS == err);
 /* Write pattern to display */
    err = R_SLCDC_Write(&g_slcdc_ctrl, 0, segment_data, NUM_SEGMENTS);
    assert(FSP_SUCCESS == err);
}
```

*Note*

*While the SLCDC is running, pattern data is constantly being output. No latching or buffering is required when writing or reading segment data.*

### Blinking Output

This example demonstrates how to set up blinking output using the RTC periodic interrupt. In this example it is assumed that the SLCDC has already been started.

```
void slcdc_blink (void)
{
 fsp_err_t err;
 /* Open RTC and set time/date */
    err = R_RTC_Open(&r_rtc_ctrl, &r_rtc_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    err = R_RTC_CalendarTimeSet(&r_rtc_ctrl, &g_rtc_time);
    assert(FSP_SUCCESS == err);
 /* Set RTC periodic interrupt to 2 Hz (display blink cycle will be 1 Hz) */
    err = R_RTC_PeriodicIrqRateSet(&r_rtc_ctrl,
RTC_PERIODIC_IRQ_SELECT_1_DIV_BY_2_SECOND);
    assert(FSP_SUCCESS == err);
 /* Set display to blink */
    err = R_SLCDC_SetDisplayArea(&g_slcdc_ctrl, SLCDC_DISP_BLINK);
    assert(FSP_SUCCESS == err);
 /* Display will now continuously blink */
}
```

## Data Structures

| | |
|---|---|
| struct | slcdc_instance_ctrl_t |

## Data Structure Documentation

### ◆ slcdc_instance_ctrl_t

| struct slcdc_instance_ctrl_t |
|---|
| SLCDC control block. DO NOT INITIALIZE. Initialization occurs when slcdc_api_t::open is called |

## Function Documentation

### ◆ R_SLCDC_Open()

fsp_err_t R_SLCDC_Open ( slcdc_ctrl_t *const *p_ctrl*, slcdc_cfg_t const *const *p_cfg* )

Opens the SLCDC driver. Implements slcdc_api_t::open.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Device was opened successfully. |
| FSP_ERR_ASSERTION | Pointer to the control block or the configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Module is already open. |
| FSP_ERR_UNSUPPORTED | Invalid display mode. |

### ◆ R_SLCDC_Write()

fsp_err_t R_SLCDC_Write ( slcdc_ctrl_t *const *p_ctrl*, uint8_t const *start_segment*, uint8_t const * *p_data*, uint8_t const *segment_count* )

Writes a sequence of display data to the segment data registers. Implements slcdc_api_t::write.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Data was written successfully. |
| FSP_ERR_ASSERTION | Pointer to the control block or data is NULL. |
| FSP_ERR_INVALID_ARGUMENT | Segment index is (or will be) out of range. |
| FSP_ERR_NOT_OPEN | Device is not opened or initialized. |

### ◆ R_SLCDC_Modify()

fsp_err_t R_SLCDC_Modify ( slcdc_ctrl_t *const *p_ctrl*, uint8_t const *segment*, uint8_t const *data*, uint8_t const *data_mask* )

Modifies a single segment register based on a mask and the desired data. Implements slcdc_api_t::modify.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Device was opened successfully. |
| FSP_ERR_ASSERTION | Pointer to the control block structure is NULL. |
| FSP_ERR_INVALID_ARGUMENT | Invalid parameter in the argument. |
| FSP_ERR_NOT_OPEN | Device is not opened or initialized |

### ◆ R_SLCDC_Start()

fsp_err_t R_SLCDC_Start ( slcdc_ctrl_t *const *p_ctrl*)

Starts output of LCD signals. Implements slcdc_api_t::start.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | SLCDC timing, output, and voltage generation(if configured) activated |
| FSP_ERR_ASSERTION | Pointer to the control block structure is NULL. |
| FSP_ERR_NOT_OPEN | Device is not opened or initialized |

### ◆ R_SLCDC_Stop()

fsp_err_t R_SLCDC_Stop ( slcdc_ctrl_t *const *p_ctrl*)

Stops output of LCD signals. Implements slcdc_api_t::stop.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Device was opened successfully. |
| FSP_ERR_ASSERTION | Pointer to the control block structure is NULL. |
| FSP_ERR_NOT_OPEN | Device is not opened or initialized |

### ◆ R_SLCDC_SetContrast()

fsp_err_t R_SLCDC_SetContrast ( slcdc_ctrl_t *const *p_ctrl*, slcdc_contrast_t const *contrast* )

Sets contrast to the specified level. Implements slcdc_api_t::setContrast.

***Note***

*Contrast can be adjusted when the SLCDC is operating in internal boost mode only. The range of values is 0-5 when 1/4 bias setting is used and 0-15 otherwise. See "LCD Boost Level Control Register (VLCD)" description in the SLCDC section of the relevant hardware manual for voltage levels at each setting.*

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Device was opened successfully. |
| FSP_ERR_ASSERTION | Pointer to the control block structure is NULL. |
| FSP_ERR_NOT_OPEN | Device is not opened or initialized |
| FSP_ERR_UNSUPPORTED | Unsupported operation |

### ◆ R_SLCDC_SetDisplayArea()

fsp_err_t R_SLCDC_SetDisplayArea ( slcdc_ctrl_t *const *p_ctrl*, slcdc_display_area_t const *display_area* )

Sets output to Waveform A, Waveform B or blinking output. Implements slcdc_api_t::setDisplayArea.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Device was opened successfully. |
| FSP_ERR_ASSERTION | Pointer to the control block structure is NULL. |
| FSP_ERR_UNSUPPORTED | Pattern selection has no effect in 8-time-slice mode. |
| FSP_ERR_NOT_OPEN | Device is not opened or initialized. |

### ◆ R_SLCDC_Close()

fsp_err_t R_SLCDC_Close ( slcdc_ctrl_t *const *p_ctrl*)

Closes the SLCDC driver. Implements slcdc_api_t::close.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Device was closed successfully. |
| FSP_ERR_ASSERTION | Pointer to the control block structure is NULL. |
| FSP_ERR_NOT_OPEN | Device is not opened or initialized |

### 5.2.9.1 External IRQ (r_icu)

Modules » Input

**Functions**

| | |
|---|---|
| fsp_err_t | R_ICU_ExternalIrqOpen (external_irq_ctrl_t *const p_api_ctrl, external_irq_cfg_t const *const p_cfg) |
| fsp_err_t | R_ICU_ExternalIrqEnable (external_irq_ctrl_t *const p_api_ctrl) |
| fsp_err_t | R_ICU_ExternalIrqDisable (external_irq_ctrl_t *const p_api_ctrl) |
| fsp_err_t | R_ICU_ExternalIrqCallbackSet (external_irq_ctrl_t *const p_api_ctrl, void(*p_callback)(external_irq_callback_args_t *), void *const p_context, external_irq_callback_args_t *const p_callback_memory) |
| fsp_err_t | R_ICU_ExternalIrqClose (external_irq_ctrl_t *const p_api_ctrl) |

**Detailed Description**

Driver for the ICU peripheral on RA MCUs. This module implements the External IRQ Interface.

# Overview

The Interrupt Controller Unit (ICU) controls which event signals are linked to the NVIC, DTC, and DMAC modules. The R_ICU software module only implements the External IRQ Interface. The external_irq interface is for configuring interrupts to fire when a trigger condition is detected on an external IRQ pin.

*Note*

*Multiple instances are used when more than one external interrupt is needed. Configure each instance with different channels and properties as needed for the specific interrupt.*

**Features**

- Supports configuring interrupts for IRQ pins on the target MCUs
  - Enabling and disabling interrupt generation.
  - Configuring interrupt trigger on rising edge, falling edge, both edges, or low level signal.
  - Enabling and disabling the IRQ noise filter.
- Supports configuring a user callback function, which will be invoked by the HAL module

when an external pin interrupt is generated.

# Configuration

### Build Time Configurations for r_icu

The following build time configurations are defined in fsp_cfg/r_icu_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

### Configurations for Input > External IRQ (r_icu)

This module can be added to the Stacks tab via New Stack > Input > External IRQ (r_icu). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

| Configuration | Options | Default | Description |
|---|---|---|---|
| Name | Name must be a valid C symbol | g_external_irq0 | Module name. |
| Channel | Value must be a non-negative integer | 0 | Specify the hardware channel. |
| Trigger | MCU Specific Options | | Select the signal edge or state that triggers an interrupt. |
| Digital Filtering | MCU Specific Options | | Select if the digital noise filter should be enabled. |
| Filter Source | MCU Specific Options | | Select the clock source for digital filter (Only affected when the digital filter is enabled). |
| Digital Filtering Sample Clock (Only valid when Digital Filtering is Enabled) | MCU Specific Options | | Select the clock divider for the digital noise filter. |
| Callback | Name must be a valid C symbol | NULL | A user callback function can be provided here. If this callback function is provided, it is called from the interrupt service routine (ISR) each time the IRQn triggers |

| | | |
|---|---|---|
| Pin Interrupt Priority | MCU Specific Options | Select the PIN interrupt priority. |

### Clock Configuration

The ICU peripheral module doesn't require any specific clock settings.

*Note*

*The digital filter uses PCLKB as the clock source for sampling the IRQ pin.*

### Pin Configuration

The pin for the external interrupt channel must be configured as an input with IRQ Input Enabled.

### Limitation

Pin configuration does not show conflicts when same IRQ is used by multiple pins.

## Usage Notes

### Digital Filter

The digital filter is used to reject trigger conditions that are too short. The trigger condition must be longer than three periods of the filter clock. The filter clock frequency is determined by PCLKB and the external_irq_pclk_div_t setting.

MIN_PULSE_WIDTH = EXTERNAL_IRQ_PCLKB_DIV / PCLKB_FREQUENCY * 3

### DMAC/DTC

When using an External IRQ pin to trigger a DMAC/DTC transfer, the External IRQ pin must be opened before the transfer instance is opened.

## Examples

### Basic Example

This is a basic example of minimal use of the ICU in an application.

```
#define ICU_IRQN_PIN BSP_IO_PORT_02_PIN_06
#define ICU_IRQN 6
/* Called from icu_irq_isr */
void external_irq_callback (external_irq_callback_args_t * p_args)
{
    (void) p_args;
    g_external_irq_complete = 1;
}
void simple_example ()
```

```
{
 /* Example Configuration */
 external_irq_cfg_t icu_cfg =
    {
        .channel          = ICU_IRQN,
        .trigger          = EXTERNAL_IRQ_TRIG_RISING,
        .filter_enable    = false,
        .clock_source_div = EXTERNAL_IRQ_CLOCK_SOURCE_DIV_1,
        .p_callback       = external_irq_callback,
        .p_context       = 0,
        .ipl              = 0,
        .irq              = (IRQn_Type) 0,
    };
 /* Configure the external interrupt. */
 fsp_err_t err = R_ICU_ExternalIrqOpen(&g_icu_ctrl, &icu_cfg);
    assert(FSP_SUCCESS == err);
 /* Enable the external interrupt. */
 /* Enable not required when used with ELC or DMAC. */
    err = R_ICU_ExternalIrqEnable(&g_icu_ctrl);
    assert(FSP_SUCCESS == err);
 while (0 == g_external_irq_complete)
    {
 /* Wait for interrupt. */
    }
}
```

### Data Structures

| EXTERNAL_IRQ_DIGITAL_FILTER_LOCO | Digital filter using clock LOCO. |

## Function Documentation

### ◆ R_ICU_ExternalIrqOpen()

fsp_err_t R_ICU_ExternalIrqOpen ( external_irq_ctrl_t *const *p_api_ctrl*, external_irq_cfg_t const *const *p_cfg* )

Configure an IRQ input pin for use with the external interrupt interface. Implements external_irq_api_t::open.

The Open function is responsible for preparing an external IRQ pin for operation.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Open successful. |
| FSP_ERR_ASSERTION | One of the following is invalid:<br>• p_ctrl or p_cfg is NULL |
| FSP_ERR_ALREADY_OPEN | The channel specified has already been opened. No configurations were changed. Call the associated Close function to reconfigure the channel. |
| FSP_ERR_IP_CHANNEL_NOT_PRESENT | The channel requested in p_cfg is not available on the device selected in r_bsp_cfg.h. |
| FSP_ERR_INVALID_ARGUMENT | p_cfg->p_callback is not NULL, but ISR is not enabled. ISR must be enabled to use callback function. |
| FSP_ERR_UNSUPPORTED | An input argument is not supported by selected mode. |

***Note***

*This function is reentrant for different channels. It is not reentrant for the same channel.*

### ◆ R_ICU_ExternalIrqEnable()

fsp_err_t R_ICU_ExternalIrqEnable ( external_irq_ctrl_t *const *p_api_ctrl*)

Enable external interrupt for specified channel at NVIC. Implements external_irq_api_t::enable.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Interrupt Enabled successfully. |
| FSP_ERR_ASSERTION | The p_ctrl parameter was null. |
| FSP_ERR_NOT_OPEN | The channel is not opened. |
| FSP_ERR_IRQ_BSP_DISABLED | Requested IRQ is not defined in this system |

### ◆ R_ICU_ExternalIrqDisable()

fsp_err_t R_ICU_ExternalIrqDisable ( external_irq_ctrl_t *const *p_api_ctrl*)

Disable external interrupt for specified channel at NVIC. Implements external_irq_api_t::disable.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Interrupt disabled successfully. |
| FSP_ERR_ASSERTION | The p_ctrl parameter was null. |
| FSP_ERR_NOT_OPEN | The channel is not opened. |
| FSP_ERR_IRQ_BSP_DISABLED | Requested IRQ is not defined in this system |

### ◆ R_ICU_ExternalIrqCallbackSet()

fsp_err_t R_ICU_ExternalIrqCallbackSet ( external_irq_ctrl_t *const *p_api_ctrl*, void(*)(external_irq_callback_args_t *) *p_callback*, void *const *p_context*, external_irq_callback_args_t *const *p_callback_memory* )

Updates the user callback and has option of providing memory for callback structure. Implements external_irq_api_t::callbackSet

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Callback updated successfully. |
| FSP_ERR_ASSERTION | A required pointer is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_NO_CALLBACK_MEMORY | p_callback is non-secure and p_callback_memory is either secure or NULL. |

### ◆ R_ICU_ExternalIrqClose()

| fsp_err_t R_ICU_ExternalIrqClose ( external_irq_ctrl_t *const *p_api_ctrl*) |
|---|
| Close the external interrupt channel. Implements external_irq_api_t::close.<br><br>**Return values**<br>FSP_SUCCESS — Successfully closed.<br>FSP_ERR_ASSERTION — The parameter p_ctrl is NULL.<br>FSP_ERR_NOT_OPEN — The channel is not opened. |

## 5.2.9.2 Key Matrix (r_kint)

Modules » Input

### Functions

| | |
|---|---|
| fsp_err_t | R_KINT_Open (keymatrix_ctrl_t *const p_api_ctrl, keymatrix_cfg_t const *const p_cfg) |
| fsp_err_t | R_KINT_Close (keymatrix_ctrl_t *const p_api_ctrl) |
| fsp_err_t | R_KINT_Enable (keymatrix_ctrl_t *const p_api_ctrl) |
| fsp_err_t | R_KINT_Disable (keymatrix_ctrl_t *const p_api_ctrl) |

### Detailed Description

Driver for the KINT peripheral on RA MCUs. This module implements the Key Matrix Interface.

# Overview

The KINT module configures the Key Interrupt (KINT) peripheral to detect rising or falling edges on any of the KINT channels. When such an event is detected on any of the configured pins, the module generates an interrupt.

### Features

- Detect rising or falling edges on KINT channels
- Callback for notifying the application when edges are detected on the configured channels

# Configuration

### Build Time Configurations for r_kint

The following build time configurations are defined in fsp_cfg/r_kint_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

### Configurations for Input > Key Matrix (r_kint)

This module can be added to the Stacks tab via New Stack > Input > Key Matrix (r_kint).

| Configuration | Options | Default | Description |
|---|---|---|---|
| General | | | |
| Name | Name must be a valid C symbol | g_kint0 | Module name. |
| Input | | | |
| Key Interrupt Flag Mask | MCU Specific Options | | Select channels to enable. |
| Interrupts | | | |
| Trigger Type | • Falling Edge<br>• Rising Edge | Rising Edge | Specifies if the enabled channels detect a rising edge or a falling edge. NOTE: either all channels detecting a rising edge or all channels detecting a falling edge. |
| Callback | Name must be a valid C symbol | kint_callback | A user callback function can be provided. If this callback function is provided, it will be called from the interrupt service routine (ISR) each time the IRQ triggers. |
| Key Interrupt Priority | MCU Specific Options | | Select the key interrupt priority. |

### Clock Configuration

The KINT peripheral runs on PCLKB.

### Pin Configuration

The KRn pins are key switch matrix row input pins.

# Usage Notes

### Connecting a Switch Matrix

The KINT module is designed to scan the rows of a switch matrix where each row is connected to a number of columns through switches. A periodic timer (or other mechanism) sets one column pin high at a time. Any switches that are pressed on the driven column cause a rising (or falling) edge on the row pin (KRn) causing an interrupt.

*Note*

*In applications where multiple keys may be pressed at the same time it is recommended to put a diode inline with each switch to prevent ghosting.*

### Handling Multiple Pins

When an edge is detected on multiple pins at the same time, a single IRQ will be generated. A mask of all the pins that detected an edge will be passed to the callback.

# Examples

### Basic Example

This is a basic example of minimal use of the KINT in an application.

```
static volatile uint32_t g_channel_mask;
static volatile uint32_t g_kint_edge_detected = 0U;
/* Called from key_int_isr */
void r_kint_callback (keymatrix_callback_args_t * p_args)
{
    g_channel_mask       = p_args->channel_mask;
    g_kint_edge_detected = 1U;
}
void r_kint_example ()
{
 /* Configure the KINT. */
 fsp_err_t err = R_KINT_Open(&g_kint_ctrl, &g_kint_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Enable the KINT. */
    err = R_KINT_Enable(&g_kint_ctrl);
    assert(FSP_SUCCESS == err);
 while (0 == g_kint_edge_detected)
    {
```

```
 /* Wait for interrupt. */
    }
}
```

### Data Structures

| Channel instance control block. DO NOT INITIALIZE. Initialization occurs when keymatrix_api_t::open is called. |

## Function Documentation

### ◆ R_KINT_Open()

| fsp_err_t R_KINT_Open ( keymatrix_ctrl_t *const *p_api_ctrl*, keymatrix_cfg_t const *const *p_cfg* ) |
|---|
| Configure all the Key Input (KINT) channels and provides a handle for use with the rest of the KINT API functions. Implements keymatrix_api_t::open. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Initialization was successful. |
| FSP_ERR_ASSERTION | One of the following parameters may be NULL: p_cfg, or p_ctrl or the callback. |
| FSP_ERR_ALREADY_OPEN | The module has already been opened. |
| FSP_ERR_IP_CHANNEL_NOT_PRESENT | The channel mask is invalid. |

### ◆ R_KINT_Close()

| fsp_err_t R_KINT_Close ( keymatrix_ctrl_t *const *p_api_ctrl*) |
|---|
| Clear the KINT configuration and disable the KINT IRQ. Implements keymatrix_api_t::close. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successful close. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | The module is not opened. |

### ◆ R_KINT_Enable()

| fsp_err_t R_KINT_Enable ( keymatrix_ctrl_t *const *p_api_ctrl*) |
|---|
| This function enables interrupts for the KINT peripheral after clearing any pending requests. Implements keymatrix_api_t::enable. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Interrupt enabled successfully. |
| FSP_ERR_ASSERTION | The p_ctrl parameter was null. |
| FSP_ERR_NOT_OPEN | The peripheral is not opened. |

### ◆ R_KINT_Disable()

| fsp_err_t R_KINT_Disable ( keymatrix_ctrl_t *const *p_api_ctrl*) |
|---|
| This function disables interrupts for the KINT peripheral. Implements keymatrix_api_t::disable. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Interrupt disabled successfully. |
| FSP_ERR_ASSERTION | The p_ctrl parameter was null. |
| FSP_ERR_NOT_OPEN | The channel is not opened. |

**Detailed Description**

Driver for the CRC peripheral on RA MCUs. This module implements the CRC Interface.

# Overview

The CRC module provides a API to calculate 8, 16 and 32-bit CRC values on a block of data in memory or a stream of data over a Serial Communication Interface (SCI) channel using industry-standard polynomials.

**Features**

- CRC module supports the following 8 and 16 bit CRC polynomials which operates on 8-bit data in parallel
  - X^8+X^2+X+1 (CRC-8)
  - X^16+X^15+X^2+1 (CRC-16)
  - X^16+X^12+X^5+1 (CRC-CCITT)
- CRC module supports the following 32 bit CRC polynomials which operates on 32-bit data in parallel
  - X^32+X^26+X^23+X^22+X^16+X^12+X^11+X^10+X^8+X^7+X^5+X^4+X^2+X+ 1 (CRC-32)
  - X^32+ X^28+ X^27+ X^26+ X^25+ X^23+ X^22+ X^20+ X^19+ X^18+X^14+X^13+X^11+X^10+X^9+X^8+X^6+1 (CRC-32C)
- CRC module can calculate CRC with LSB first or MSB first bit order.

# Configuration

**Build Time Configurations for r_crc**

The following build time configurations are defined in fsp_cfg/r_crc_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

**Configurations for Monitoring > CRC (r_crc)**

This module can be added to the Stacks tab via New Stack > Monitoring > CRC (r_crc). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

| Configuration | Options | Default | Description |
|---|---|---|---|
| Name | Name must be a valid C symbol | g_crc0 | Module name. |
| CRC Polynomial | MCU Specific Options | | Select the CRC polynomial. |
| Bit Order | MCU Specific Options | | Select the CRC bit order. |
| Snoop Address | MCU Specific Options | | Select the SCI register address CRC snoop |

**Clock Configuration**

There is no clock configuration for the CRC module.

### Pin Configuration

This module does not use I/O pins.

# Usage Notes

### CRC Snoop

The CRC snoop function monitors reads from and writes to a specified I/O register address and performs CRC calculation on the data read from and written to the register address automatically. Instead of calling R_CRC_Calculate on a block of data, R_CRC_SnoopEnable is called to start monitoring reads/writes and R_CRC_CalculatedValueGet is used to obtain the current CRC.

*Note*

*Snoop mode is available for transmit/receive operations on SCI only.*

### Limitations

When using CRC32 polynomial functions the CRC module produces the same results as popular online CRC32 calculators, but it is important to remember a few important points.

- Online CRC32 calculators allow the input to be any number of bytes. The FSP CRC32 API function uses 32-bit words. This means the online calculations must be 'padded' to end on a 32-bit boundary.
- Online CRC32 calculators usually invert the output prior to presenting it as a result. It is up to the application program to include this step if needed.
- The seed value of 0xFFFFFFFF needs to be used by both the online calculator and the R_CRC module API (CRC32 polynomials)
- Make sure the bit orientation of the R_CRC CRC32 is set for LSB and that you have CRC32 selected and not CRC32C.
- Some online CRC tools XOR the final result with 0xFFFFFFFF.

# Examples

### Basic Example

This is a basic example of minimal use of the CRC module in an application.

```
void crc_example ()
{
    uint32_t length;
    uint32_t uint8_calculated_value;
    length = sizeof(g_data_8bit) / sizeof(g_data_8bit[0]);
 crc_input_t example_input =
    {
       .p_input_buffer = g_data_8bit,
       .num_bytes      = length,
```

```
      .crc_seed       = 0,
   };
 /* Open CRC module with 8 bit polynomial */
 R_CRC_Open(&crc_ctrl, &g_crc_test_cfg);
 /* 8-bit CRC calculation */
 R_CRC_Calculate(&crc_ctrl, &example_input, &uint8_calculated_value);
}
```

### Snoop Example

This example demonstrates CRC snoop operation.

```
void crc_snoop_example ()
{
 /* Open CRC module with 8 bit polynomial */
 R_CRC_Open(&crc_ctrl, &g_crc_test_cfg);
 /* Open SCI Driver */
 /* Configure Snoop address and enable snoop mode */
 R_CRC_SnoopEnable(&crc_ctrl, 0);
 /* Perfrom SCI read/Write operation depending on the SCI snoop address configure */
 /* Read CRC value */
 R_CRC_CalculatedValueGet(&crc_ctrl, &g_crc_buff);
}
```

## Data Structures

| | |
|---|---|
| struct | crc_instance_ctrl_t |

## Data Structure Documentation

### ◆ crc_instance_ctrl_t

| struct crc_instance_ctrl_t |
|---|
| Driver instance control structure. |

## Function Documentation

### ◆ R_CRC_Open()

fsp_err_t R_CRC_Open ( crc_ctrl_t *const *p_ctrl*, crc_cfg_t const *const *p_cfg* )

Open the CRC driver module

Implements crc_api_t::open

Open the CRC driver module and initialize the driver control block according to the passed-in configuration structure.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Configuration was successful. |
| FSP_ERR_ASSERTION | p_ctrl or p_cfg is NULL. |
| FSP_ERR_ALREADY_OPEN | Module already open |
| FSP_ERR_UNSUPPORTED | Hardware not support this feature. |

### ◆ R_CRC_Close()

fsp_err_t R_CRC_Close ( crc_ctrl_t *const *p_ctrl*)

Close the CRC module driver.

Implements crc_api_t::close

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Configuration was successful. |
| FSP_ERR_ASSERTION | p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | The driver is not opened. |

### ◆ R_CRC_Calculate()

fsp_err_t R_CRC_Calculate ( crc_ctrl_t *const *p_ctrl*, crc_input_t *const *p_crc_input*, uint32_t * *calculatedValue* )

Perform a CRC calculation on a block of 8-bit/32-bit (for 32-bit polynomial) data.

Implements crc_api_t::calculate

This function performs a CRC calculation on an array of 8-bit/32-bit (for 32-bit polynomial) values and returns an 8-bit/32-bit (for 32-bit polynomial) calculated value

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Calculation successful. |
| FSP_ERR_ASSERTION | Either p_ctrl, inputBuffer, or calculatedValue is NULL. |
| FSP_ERR_INVALID_ARGUMENT | length value is NULL, or not 4-byte aligned when 32-bit CRC polynomial function is configured. |
| FSP_ERR_NOT_OPEN | The driver is not opened. |

### ◆ R_CRC_CalculatedValueGet()

fsp_err_t R_CRC_CalculatedValueGet ( crc_ctrl_t *const *p_ctrl*, uint32_t * *calculatedValue* )

Return the current calculated value.

Implements crc_api_t::crcResultGet

CRC calculation operates on a running value. This function returns the current calculated value.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Return of calculated value successful. |
| FSP_ERR_ASSERTION | Either p_ctrl or calculatedValue is NULL. |
| FSP_ERR_NOT_OPEN | The driver is not opened. |

### ◆ R_CRC_SnoopEnable()

fsp_err_t R_CRC_SnoopEnable ( crc_ctrl_t *const *p_ctrl*, uint32_t *crc_seed* )

Configure the snoop channel and set the CRC seed.

Implements crc_api_t::snoopEnable

The CRC calculator can operate on reads and writes over any of the first ten SCI channels. For example, if set to channel 0, transmit, every byte written out SCI channel 0 is also sent to the CRC calculator as if the value was explicitly written directly to the CRC calculator.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Snoop configured successfully. |
| FSP_ERR_ASSERTION | Pointer to control structure is NULL |
| FSP_ERR_NOT_OPEN | The driver is not opened. |
| FSP_ERR_UNSUPPORTED | SNOOP operation is not supported. |

### ◆ R_CRC_SnoopDisable()

fsp_err_t R_CRC_SnoopDisable ( crc_ctrl_t *const *p_ctrl*)

Disable snooping.

Implements crc_api_t::snoopDisable

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Snoop disabled. |
| FSP_ERR_ASSERTION | p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | The driver is not opened. |
| FSP_ERR_UNSUPPORTED | SNOOP operation is not supported. |

## 5.2.10.2 Clock Accuracy Circuit (r_cac)

Modules » Monitoring

**Functions**

| | |
|---|---|
| fsp_err_t | R_CAC_Open (cac_ctrl_t *const p_ctrl, cac_cfg_t const *const p_cfg) |
| fsp_err_t | R_CAC_StartMeasurement (cac_ctrl_t *const p_ctrl) |
| fsp_err_t | R_CAC_StopMeasurement (cac_ctrl_t *const p_ctrl) |

| | |
|---|---|
| fsp_err_t | R_CAC_Read (cac_ctrl_t *const p_ctrl, uint32_t *const p_counter) |
| fsp_err_t | R_CAC_CallbackSet (cac_ctrl_t *const p_ctrl, void(*p_callback)(cac_callback_args_t *), void *const p_context, cac_callback_args_t *const p_callback_memory) |
| fsp_err_t | R_CAC_Close (cac_ctrl_t *const p_ctrl) |

### Detailed Description

Driver for the CAC peripheral on RA MCUs. This module implements the CAC Interface.

# Overview

The interface for the clock frequency accuracy measurement circuit (CAC) peripheral is used to check a system clock frequency with a reference clock signal by counting the number of measurement clock edges that occur between two edges of the reference clock.

### Features

- Supports clock frequency-measurement and monitoring based on a reference signal input
- Reference can be either an externally supplied clock source or an internal clock source
- An interrupt request may optionally be generated by a completed measurement, a detected frequency error, or a counter overflow.
- A digital filter is available for an externally supplied reference clock, and dividers are available for both internally supplied measurement and reference clocks.
- Edge-detection options for the reference clock are configurable as rising, falling, or both.

# Configuration

### Build Time Configurations for r_cac

The following build time configurations are defined in fsp_cfg/r_cac_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

### Configurations for Monitoring > Clock Accuracy Circuit (r_cac)

This module can be added to the Stacks tab via New Stack > Monitoring > Clock Accuracy Circuit (r_cac). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

| Configuration | Options | Default | Description |
|---|---|---|---|
| Name | Name must be a valid C symbol | g_cac0 | Module name. |

| | | | |
|---|---|---|---|
| Reference clock divider | • 32<br>• 128<br>• 1024<br>• 8192 | 32 | Reference clock divider. |
| Reference clock source | MCU Specific Options | | Reference clock source. |
| Reference clock digital filter | • Disabled<br>• Sampling clock =Measuring freq<br>• Sampling clock =Measuring freq/4<br>• Sampling clock =Measuring freq/16 | Disabled | Reference clock digital filter. |
| Reference clock edge detect | • Rising<br>• Falling<br>• Both | Rising | Reference clock edge detection. |
| Measurement clock divider | • 1<br>• 4<br>• 8<br>• 32 | 1 | Measurement clock divider. |
| Measurement clock source | MCU Specific Options | | Measurement clock source. |
| Upper Limit Threshold | Value must be a non-negative integer, between 0 to 65535 | 0 | Top end of allowable range for measurement completion. |
| Lower Limit Threshold | Value must be a non-negative integer, between 0 to 65535 | 0 | Bottom end of allowable range for measurement completion. |
| Frequency Error Interrupt Priority | MCU Specific Options | | CAC frequency error interrupt priority. |
| Measurement End Interrupt Priority | MCU Specific Options | | CAC measurement end interrupt priority. |
| Overflow Interrupt Priority | MCU Specific Options | | CAC overflow interrupt priority. |
| Callback | Name must be a valid C symbol | NULL | Function name for callback |

### Clock Configuration

The CAC measurement clock source can be configured as the following:

1. MAIN_OSC
2. SUBCLOCK
3. HOCO

4. MOCO
5. LOCO
6. PCLKB
7. IWDT

The CAC reference clock source can be configured as the following:

1. MAIN_OSC
2. SUBCLOCK
3. HOCO
4. MOCO
5. LOCO
6. PCLKB
7. IWDT
8. External Clock Source (CACREF)

### Pin Configuration

The CACREF pin can be configured to provide the reference clock for CAC measurements.

## Usage Notes

### Measurement Accuracy

The clock measurement result may be off by up to one pulse depending on the phase difference between the edge detection circuit, digital filter, and CACREF pin signal, if applicable.

### Frequency Error Interrupt

The frequency error interrupt is only triggered at the end of a CAC measurement. This means that there will be a measurement complete interrupt in addition to the frequency error interrupt.

## Examples

### Basic Example

This is a basic example of minimal use of the CAC in an application.

```
volatile uint32_t g_callback_complete;
void cac_basic_example ()
{
    g_callback_complete = 0;
 fsp_err_t err = R_CAC_Open(&g_cac_ctrl, &g_cac_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    (void) R_CAC_StartMeasurement(&g_cac_ctrl);
 /* Wait for measurement to complete. */
 while (0 == g_callback_complete)
```

```
    {
    }
    uint32_t value;
 /* Read the CAC measurement. */
    (void) R_CAC_Read(&g_cac_ctrl, &value);
}
/* Called when measurement is completed. */
static void r_cac_callback (cac_callback_args_t * p_args)
{
 if (CAC_EVENT_MEASUREMENT_COMPLETE == p_args->event)
    {
       g_callback_complete = 1U;
    }
}
```

### Data Structures

| | |
|---|---|
| struct | cac_instance_ctrl_t |

## Data Structure Documentation

### ◆ cac_instance_ctrl_t

| struct cac_instance_ctrl_t |
|---|
| CAC instance control block. DO NOT INITIALIZE. |

## Function Documentation

### ◆ R_CAC_Open()

| fsp_err_t R_CAC_Open ( cac_ctrl_t *const *p_ctrl*, cac_cfg_t const *const *p_cfg* ) |
|---|
| The Open function configures the CAC based on the provided user configuration settings. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | CAC is available and available for measurement(s). |
| FSP_ERR_ASSERTION | An argument is invalid. |
| FSP_ERR_ALREADY_OPEN | The CAC has already been opened. |

***Note***

*There is only a single CAC peripheral.*

### ◆ R_CAC_StartMeasurement()

fsp_err_t R_CAC_StartMeasurement ( cac_ctrl_t *const *p_ctrl*)

Start the CAC measurement process.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | CAC measurement started. |
| FSP_ERR_ASSERTION | NULL provided for p_instance_ctrl or p_cfg. |
| FSP_ERR_NOT_OPEN | R_CAC_Open() has not been successfully called. |

### ◆ R_CAC_StopMeasurement()

fsp_err_t R_CAC_StopMeasurement ( cac_ctrl_t *const *p_ctrl*)

Stop the CAC measurement process.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | CAC measuring has been stopped. |
| FSP_ERR_ASSERTION | NULL provided for p_instance_ctrl or p_cfg. |
| FSP_ERR_NOT_OPEN | R_CAC_Open() has not been successfully called. |

### ◆ R_CAC_Read()

fsp_err_t R_CAC_Read ( cac_ctrl_t *const *p_ctrl*, uint32_t *const *p_counter* )

Read and return the CAC status and counter registers.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | CAC read successful. |
| FSP_ERR_ASSERTION | An argument is NULL. |
| FSP_ERR_NOT_OPEN | R_CAC_Open() has not been successfully called. |

### ◆ R_CAC_CallbackSet()

fsp_err_t R_CAC_CallbackSet ( cac_ctrl_t *const *p_ctrl*, void(*)(cac_callback_args_t *) *p_callback*, void *const *p_context*, cac_callback_args_t *const *p_callback_memory* )

Updates the user callback with the option to provide memory for the callback argument structure. Implements cac_api_t::callbackSet.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Callback updated successfully. |
| FSP_ERR_ASSERTION | A required pointer is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_NO_CALLBACK_MEMORY | p_callback is non-secure and p_callback_memory is either secure or NULL. |

### ◆ R_CAC_Close()

fsp_err_t R_CAC_Close ( cac_ctrl_t *const *p_ctrl*)

Release any resources that were allocated by the Open() or any subsequent CAC operations.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successful close. |
| FSP_ERR_ASSERTION | NULL provided for p_instance_ctrl or p_cfg. |
| FSP_ERR_NOT_OPEN | R_CAC_Open() has not been successfully called. |

## 5.2.10.3 Data Operation Circuit (r_doc)

| fsp_err_t | R_DOC_Write (doc_ctrl_t *const p_api_ctrl, uint32_t data) |

| | |
|---|---|
| fsp_err_t | R_DOC_CallbackSet (doc_ctrl_t *const p_api_ctrl, void(*p_callback)(doc_callback_args_t *), void *const p_context, doc_callback_args_t *const p_callback_memory) |

### Detailed Description

Driver for the DOC peripheral on RA MCUs. This module implements the DOC Interface.

# Overview

### Features

The DOC HAL module peripheral is used to compare, add or subtract 16-bit or 32-bit[1] data and can detect the following events:

- Comparison Mode
  - Data is equal to the configured reference data setting.
  - Data is not equal to the configured reference data setting.
  - Data is less than the configured reference data setting[2].
  - Data is greater than the configured reference data setting[2].
  - Data is inside of a configurable pair of reference data settings[2].
  - Data is outside of a configurable pair of reference data settings[2].
- Addition Mode - Overflow of an addition operation
- Subtraction Mode - Underflow of a subtraction operation

A user-defined callback can be created to inform the CPU when any of above events occur.

*Note*

1. *Operating on 32-bit data is not supported on all MCUs.*
2. *This comparison mode is not supported on all MCUs.*

# Configuration

### Build Time Configurations for r_doc

The following build time configurations are defined in fsp_cfg/r_doc_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

### Build Time Configurations for r_doc

The following build time configurations are defined in fsp_cfg/r_doc_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled | Default (BSP) | If selected code for parameter checking is |

| | | | |
|---|---|---|---|
| | • Disabled | | included in the build. |

### Configurations for Monitoring > Data Operation Circuit (r_doc)

This module can be added to the Stacks tab via New Stack > Monitoring > Data Operation Circuit (r_doc). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

| Configuration | Options | Default | Description |
|---|---|---|---|
| Name | Name must be a valid C symbol | g_doc0 | Module name. |
| Event | MCU Specific Options | | Select the event that will trigger the DOC interrupt. |
| Bit Width | MCU Specific Options | | The bit width for DOC operations. |
| Reference/Initial Data | Value must be an integer greater than or equal to 0. | 0 | Enter Initial Value for Addition/Subtraction or enter reference value for comparison. |
| Additional Reference Data | Value must be an integer greater than or equal to 0. | 0 | Additional reference data used for Window Compare modes. |
| Callback | Name must be a valid C symbol | NULL | A user callback function must be provided. This will be called from the interrupt service routine (ISR) when the configured DOC event occurs. |
| DOC Interrupt Priority | MCU Specific Options | | Select the DOC interrupt priority. |

### Configurations for Monitoring > Data Operation Circuit (r_doc)

This module can be added to the Stacks tab via New Stack > Monitoring > Data Operation Circuit (r_doc). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

| Configuration | Options | Default | Description |
|---|---|---|---|
| Name | Name must be a valid C symbol | g_doc0 | Module name. |
| Event | MCU Specific Options | | Select the event that will trigger the DOC interrupt. |
| Bit Width | MCU Specific Options | | The bit width for DOC operations. |

| | | | |
|---|---|---|---|
| Reference/Initial Data | Value must be an integer greater than or equal to 0. | 0 | Enter Initial Value for Addition/Subtraction or enter reference value for comparison. |
| Additional Reference Data | Value must be an integer greater than or equal to 0. | 0 | Additional reference data used for Window Compare modes. |
| Callback | Name must be a valid C symbol | NULL | A user callback function must be provided. This will be called from the interrupt service routine (ISR) when the configured DOC event occurs. |
| DOC Interrupt Priority | MCU Specific Options | | Select the DOC interrupt priority. |

### Clock Configuration

The DOC HAL module does not require a specific clock configuration.

### Pin Configuration

The DOC HAL module does not require and specific pin configurations.

## Usage Notes

### DMAC/DTC Integration

DOC can be used with Transfer (r_dmac) or Transfer (r_dtc) to write to the input register without CPU intervention. DMAC is more useful for most DOC applications because it can be started directly from software. To write DOC input data with DTC/DMAC, set transfer_info_t::p_dest to R_DOC->DODIR.

## Examples

### Basic Example

This is a basic example of minimal use of the R_DOC in an application. This example shows how this driver can be used for continuous 16 bit addition operation while reading the result at every overflow event.

```
#define DOC_EXAMPLE_VALUE 0xF000

uint32_t g_callback_event_counter = 0;

/* This callback is called when DOC overflow event occurs. It is registered in

doc_cfg_t when R_DOC_Open is

 * called. */

void doc_callback (doc_callback_args_t * p_args)
```

```
{
 FSP_PARAMETER_NOT_USED(p_args);
    g_callback_event_counter++;
}
void basic_example (void)
{
 fsp_err_t err;
 /* Initialize the DOC module for addition with initial value specified in
doc_cfg_t::doc_data. */
    err = R_DOC_Open(&g_doc_ctrl, &g_doc_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Write data to the DOC Data Input Register and read the result of addition from
status register when an
  * interrupt occurs. */
 for (int i = 0; i < 5; i++)
    {
       err = R_DOC_Write(&g_doc_ctrl, DOC_EXAMPLE_VALUE);
      assert(FSP_SUCCESS == err);
 if (g_callback_event_counter >= 1)
      {
            uint32_t result;
 /* Read the result of the operation */
            err = R_DOC_Read(&g_doc_ctrl, &result);
      assert(FSP_SUCCESS == err);
       }
    }
}
```

### Function Documentation

### ◆ R_DOC_Open()

fsp_err_t R_DOC_Open ( doc_ctrl_t *const *p_api_ctrl*, doc_cfg_t const *const *p_cfg* )

Opens and configures the Data Operation Circuit (DOC) in comparison, addition or subtraction mode and sets initial data for addition or subtraction, or reference data for comparison.

Example:

```
/* Initialize the DOC module for addition with initial value specified in
doc_cfg_t::doc_data. */
    err = R_DOC_Open(&g_doc_ctrl, &g_doc_cfg);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | DOC successfully configured. |
| FSP_ERR_ALREADY_OPEN | Module already open. |
| FSP_ERR_ASSERTION | One or more pointers point to NULL or callback is NULL or the interrupt vector is invalid. |

### ◆ R_DOC_Close()

fsp_err_t R_DOC_Close ( doc_ctrl_t *const *p_api_ctrl*)

Closes the module driver. Enables module stop mode.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Module successfully closed. |
| FSP_ERR_NOT_OPEN | Driver not open. |
| FSP_ERR_ASSERTION | Pointer pointing to NULL. |

***Note***

*This function will disable the DOC interrupt in the NVIC.*

### ◆ R_DOC_Read()

fsp_err_t R_DOC_Read ( doc_ctrl_t *const *p_api_ctrl*, uint32_t * *p_result* )

Returns the result of addition/subtraction.

Example:

```
          uint32_t result;
/* Read the result of the operation */
          err = R_DOC_Read(&g_doc_ctrl, &result);
     assert(FSP_SUCCESS == err);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Status successfully read. |
| FSP_ERR_NOT_OPEN | Driver not open. |
| FSP_ERR_ASSERTION | One or more pointers point to NULL. |

### ◆ R_DOC_Write()

fsp_err_t R_DOC_Write ( doc_ctrl_t *const *p_api_ctrl*, uint32_t *data* )

Writes to the DODIR - DOC Input Register.

Example:

```
      err = R_DOC_Write(&g_doc_ctrl, DOC_EXAMPLE_VALUE);
     assert(FSP_SUCCESS == err);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Values successfully written to the registers. |
| FSP_ERR_NOT_OPEN | Driver not open. |
| FSP_ERR_ASSERTION | One or more pointers point to NULL. |

### ◆ R_DOC_CallbackSet()

fsp_err_t R_DOC_CallbackSet ( doc_ctrl_t *const *p_api_ctrl*, void(*)(doc_callback_args_t *) *p_callback*, void *const *p_context*, doc_callback_args_t *const *p_callback_memory* )

Updates the user callback and has option of providing memory for callback structure. Implements doc_api_t::callbackSet

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Callback updated successfully. |
| FSP_ERR_ASSERTION | A required pointer is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_NO_CALLBACK_MEMORY | p_callback is non-secure and p_callback_memory is either secure or NULL. |

## 5.2.10.4 Independent Watchdog (r_iwdt)

### Detailed Description

Driver for the IWDT peripheral on RA MCUs. This module implements the WDT Interface.

# Overview

The independent watchdog timer is used to recover from unexpected errors in an application. The timer must be refreshed periodically in the permitted count window by the application. If the count is allowed to underflow or refresh occurs outside of the valid refresh period, the IWDT resets the device or generates an NMI.

### Features

The IWDT HAL module has the following key features:

- When the IWDT underflows or is refreshed outside of the permitted refresh window, one of the following events can occur:
  - Resetting of the device
  - Generation of an NMI
- The WDT supports following modes:[1]
  - In auto start mode, the WDT begins counting at reset.
  - In register start mode, the WDT can be started from the application[1].

### Selecting a Watchdog

RA MCUs have two watchdog peripherals: the watchdog timer (WDT) and the independent watchdog timer (IWDT). When selecting between them, consider these factors:

| | WDT | IWDT |
|---|---|---|
| Start Mode | The WDT can be started from the application (register start mode) or configured by hardware to start automatically (auto start mode). | On most of MCUs, the IWDT can only be configured by hardware to start automatically[1]. |
| Clock Source | The WDT runs off a peripheral clock. | The IWDT has its own clock source which improves safety. |

*Note*

*1. Refer to the MCU hardware user's manual or datasheet to determine if IWDT supports register start mode.*

# Configuration

When using register start mode, configure the watchdog timer on the Stacks tab.

*Note*

*When using auto start mode, configurations on the **Stacks** tab are ignored. Configure the watchdog using the OFS settings on the BSP tab. These settings include the following:*

- *Start Mode*
- *Timeout Period*
- *Dedicated Clock Frequency Divisor*
- *Window End Position*
- *Window Start Position*
- *Reset Interrupt Request Select*
- *Stop Control*

*Review the OFS0 properties window to see additional details.*

### Build Time Configurations for r_iwdt

The following build time configurations are defined in fsp_cfg/r_iwdt_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| Register Start NMI Support | MCU Specific Options | | If enabled, code for NMI support in register start mode is included in the build. |

### Configurations for Monitoring > Independent Watchdog (r_iwdt)

This module can be added to the Stacks tab via New Stack > Monitoring > Independent Watchdog (r_iwdt). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

| Configuration | Options | Default | Description |
|---|---|---|---|
| Name | Name must be a valid C symbol | g_wdt0 | Module name. |
| Timeout | MCU Specific Options | | Select the independent watchdog timeout in cycles. |
| Clock Division Ratio | MCU Specific Options | | Select the independent watchdog clock divisor. |
| Window Start Position | MCU Specific Options | | Select the allowed independent watchdog refresh start point in %. |
| Window End Position | MCU Specific Options | | Select the allowed independent watchdog refresh end point in %. |
| Reset Control | MCU Specific Options | | Select what happens when the independent watchdog timer expires. |
| Stop Control | MCU Specific Options | | Select the independent watchdog state in low power mode. |
| NMI callback | Name must be a valid C symbol | NULL | A user callback function can be provided here. If this callback function is |

provided, it is called from the interrupt service routine (ISR) when the watchdog triggers.

### Clock Configuration

The IWDT clock is based on the IWDTCLK frequency. You can set the IWDTCLK frequency divider using the **BSP** tab of the RA Configuration editor.

### Pin Configuration

This module does not use I/O pins.

## Usage Notes

### NMI Interrupt

The independent watchdog timer uses the NMI, which is enabled by default. No special configuration is required. When the NMI is triggered, the callback function registered during open is called.

*Note*

*When using the IWDT in software start mode with NMI and the timer underflows, the IWDT status must be reset by calling R_IWDT_StatusClear before restarting the timer via R_IWDT_Refresh.*

### Period Calculation

The IWDT operates from IWDTCLK. With a IWDTCLK of 15000 Hz, the maximum time from the last refresh to device reset or NMI generation will be just below 35 seconds as detailed below.

IWDTCLK = 15000 Hz
Clock division ratio = IWDTCLK / 256
Timeout period = 2048 cycles
WDT clock frequency = 15000 Hz / 256 = 58.59 Hz
Cycle time = 1 / 58.59 Hz = 17.067 ms
Timeout = 17.067 ms x 2048 cycles = 34.95 seconds

### Limitations

Developers should be aware of the following limitations when using the IWDT:

- When using a J-Link debugger the IWDT counter does not count and therefore will not reset the device or generate an NMI. To enable the watchdog to count and generate a reset or NMI while debugging, add this line of code in the application:

```
/* (Optional) Enable the IWDT to count and generate NMI or reset when the
 * debugger is connected. */
  R_DEBUG->DBGSTOPCR_b.DBGSTOP_IWDT = 0;
```

- If the IWDT is configured to stop the counter in low power mode, then your application must restart the watchdog by calling R_IWDT_Refresh() after the MCU wakes from low power mode.

# Examples

### IWDT Basic Example

This is a basic example of minimal use of the IWDT in an application.

```
void iwdt_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* In auto start mode, the IWDT starts counting immediately when the MCU is powered
on. */
 /* Initializes the module. */
    err = R_IWDT_Open(&g_iwdt0_ctrl, &g_iwdt0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 while (true)
    {
 /* Application work here. */
 /* Refresh before the counter underflows to prevent reset or NMI based on the
setting. */
       (void) R_IWDT_Refresh(&g_iwdt0_ctrl);
    }
}
```

### IWDT Advanced Example

This example demonstrates using a start window and gives an example callback to handle an NMI generated by an underflow or refresh error.

```
#define IWDT_TIMEOUT_COUNTS (2048U)
#define IWDT_MAX_COUNTER (IWDT_TIMEOUT_COUNTS - 1U)
#define IWDT_START_WINDOW_75 ((IWDT_MAX_COUNTER * 3) / 4)
/* Example callback called when a watchdog NMI occurs. */
void iwdt_callback (wdt_callback_args_t * p_args)
{
 FSP_PARAMETER_NOT_USED(p_args);
 fsp_err_t err = FSP_SUCCESS;
```

```
 /* (Optional) Determine the source of the NMI. */
 wdt_status_t status = WDT_STATUS_NO_ERROR;
    err = R_IWDT_StatusGet(&g_iwdt0_ctrl, &status);
    assert(FSP_SUCCESS == err);
 /* (Optional) Log source of NMI and any other debug information. */
 /* (Optional) Clear the error flags. */
    err = R_IWDT_StatusClear(&g_iwdt0_ctrl, status);
    assert(FSP_SUCCESS == err);
 /* (Optional) Issue a software reset to reset the MCU. */
    __NVIC_SystemReset();
}
void iwdt_advanced_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* (Optional) Enable the IWDT to count and generate NMI or reset when the
  * debugger is connected. */
    R_DEBUG->DBGSTOPCR_b.DBGSTOP_IWDT = 0;
#if defined(R_SYSTEM_RSTSR1_IWDTRF_Msk)
 /* (Optional) Check if the IWDTRF flag is set to know if the system is
  * recovering from a IWDT reset. */
 if (R_SYSTEM->RSTSR1_b.IWDTRF)
    {
 /* Clear the flag. */
       R_SYSTEM->RSTSR1 = 0U;
    }
#endif
 /* Open the module. */
    err = R_IWDT_Open(&g_iwdt0_ctrl, &g_iwdt0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Initialize other application code. */
 /* Do not call R_IWDT_Refresh() in auto start mode unless the
  * counter is in the acceptable refresh window. */
    (void) R_IWDT_Refresh(&g_iwdt0_ctrl);
```

```
while (true)
   {
/* Application work here. */
/* (Optional) If there is a chance the application takes less time than
 * the start window, verify the IWDT counter is past the start window
 * before refreshing the IWDT. */
      uint32_t iwdt_counter = 0U;
do
     {
/* Read the current IWDT counter value. */
           err = R_IWDT_CounterGet(&g_iwdt0_ctrl, &iwdt_counter);
     assert(FSP_SUCCESS == err);
     } while (iwdt_counter >= IWDT_START_WINDOW_75);
/* Refresh before the counter underflows to prevent reset or NMI. */
      (void) R_IWDT_Refresh(&g_iwdt0_ctrl);
   }
}
```

## Data Structures

| | |
|---|---|
| struct | iwdt_instance_ctrl_t |

## Data Structure Documentation

### ◆ iwdt_instance_ctrl_t

| struct iwdt_instance_ctrl_t | |
|---|---|
| IWDT control block. DO NOT INITIALIZE. Initialization occurs when wdt_api_t::open is called. | |
| **Data Fields** | |
| uint32_t | wdt_open |
| | Indicates whether the open() API has been successfully called. |
| | |
| void * | p_context |
| | Placeholder for user data. Passed to the user callback in wdt_callback_args_t. |
| | |
| void(* | p_callback )(wdt_callback_args_t *p_args) |

| | |
|---|---|
| | Callback provided when a WDT NMI ISR occurs. |
| | |

### Function Documentation

#### ◆ R_IWDT_Open()

fsp_err_t R_IWDT_Open ( wdt_ctrl_t *const *p_api_ctrl*, wdt_cfg_t const *const *p_cfg* )

Register the IWDT NMI callback.

Example:

```
/* Initializes the module. */
   err = R_IWDT_Open(&g_iwdt0_ctrl, &g_iwdt0_cfg);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | IWDT successfully configured. |
| FSP_ERR_ASSERTION | Null Pointer. |
| FSP_ERR_NOT_ENABLED | An attempt to open the IWDT when the OFS0 register is not configured for auto-start mode. |
| FSP_ERR_ALREADY_OPEN | Module is already open. This module can only be opened once. |
| FSP_ERR_INVALID_STATE | The security state of the NMI and the module do not match. |

### ◆ R_IWDT_Refresh()

fsp_err_t R_IWDT_Refresh ( wdt_ctrl_t *const *p_api_ctrl*)

Refresh the Independent Watchdog Timer. If the refresh fails due to being performed outside of the permitted refresh period the device will either reset or trigger an NMI ISR to run.

Example:

```
/* Refresh before the counter underflows to prevent reset or NMI based on the
setting. */
      (void) R_IWDT_Refresh(&g_iwdt0_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | IWDT successfully refreshed. |
| FSP_ERR_ASSERTION | One or more parameters are NULL pointers. |
| FSP_ERR_NOT_OPEN | The driver has not been opened. Perform R_IWDT_Open() first. |

### ◆ R_IWDT_StatusGet()

fsp_err_t R_IWDT_StatusGet ( wdt_ctrl_t *const *p_api_ctrl*, wdt_status_t *const *p_status* )

Read the IWDT status flags.

Indicates both status and error conditions.

Example:

```
/* (Optional) Determine the source of the NMI. */
wdt_status_t status = WDT_STATUS_NO_ERROR;
   err = R_IWDT_StatusGet(&g_iwdt0_ctrl, &status);
   assert(FSP_SUCCESS == err);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | IWDT status successfully read. |
| FSP_ERR_ASSERTION | Null pointer as a parameter. |
| FSP_ERR_NOT_OPEN | The driver has not been opened. Perform R_IWDT_Open() first. |
| FSP_ERR_UNSUPPORTED | This function is only valid if the IWDT generates an NMI when an error occurs. |

***Note***

*When the IWDT is configured to output a reset on underflow or refresh error reading the status and error flags serves no purpose as they will always indicate that no underflow has occurred and there is no refresh error. Reading the status and error flags is only valid when interrupt request output is enabled.*

### ◆ R_IWDT_StatusClear()

fsp_err_t R_IWDT_StatusClear ( wdt_ctrl_t *const *p_api_ctrl*, const wdt_status_t *status* )

Clear the IWDT status and error flags. Implements wdt_api_t::statusClear.

Example:

```
/* (Optional) Clear the error flags. */
   err = R_IWDT_StatusClear(&g_iwdt0_ctrl, status);
   assert(FSP_SUCCESS == err);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | IWDT flag(s) successfully cleared. |
| FSP_ERR_ASSERTION | Null pointer as a parameter. |
| FSP_ERR_NOT_OPEN | The driver has not been opened. Perform R_IWDT_Open() first. |
| FSP_ERR_UNSUPPORTED | This function is only valid if the IWDT generates an NMI when an error occurs. |

***Note***

*When the IWDT is configured to output a reset on underflow or refresh error reading the status and error flags serves no purpose as they will always indicate that no underflow has occurred and there is no refresh error. Reading the status and error flags is only valid when interrupt request output is enabled.*

### ◆ R_IWDT_CounterGet()

fsp_err_t R_IWDT_CounterGet ( wdt_ctrl_t *const *p_api_ctrl*, uint32_t *const *p_count* )

Read the current count value of the IWDT. Implements wdt_api_t::counterGet.

Example:

```
/* Read the current IWDT counter value. */
           err = R_IWDT_CounterGet(&g_iwdt0_ctrl, &iwdt_counter);
     assert(FSP_SUCCESS == err);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | IWDT current count successfully read. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | The driver has not been opened. Perform R_IWDT_Open() first. |

### ◆ R_IWDT_TimeoutGet()

fsp_err_t R_IWDT_TimeoutGet ( wdt_ctrl_t *const *p_api_ctrl*, wdt_timeout_values_t *const *p_timeout* )

Read timeout information for the watchdog timer. Implements wdt_api_t::timeoutGet.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | IWDT timeout information retrieved successfully. |
| FSP_ERR_ASSERTION | One or more parameters are NULL pointers. |
| FSP_ERR_NOT_OPEN | The driver has not been opened. Perform R_IWDT_Open() first. |

### ◆ R_IWDT_CallbackSet()

fsp_err_t R_IWDT_CallbackSet ( wdt_ctrl_t *const *p_ctrl*, void(*)(wdt_callback_args_t *) *p_callback*, void *const *p_context*, wdt_callback_args_t *const *p_callback_memory* )

Updates the user callback and has option of providing memory for callback structure. Implements wdt_api_t::callbackSet

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Callback updated successfully. |
| FSP_ERR_ASSERTION | A required pointer is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_NO_CALLBACK_MEMORY | p_callback is non-secure and p_callback_memory is either secure or NULL. |

### Detailed Description

Driver for the LVD and PVD peripherals on RA MCUs. This module implements the Low Voltage Detection Interface.

*Note*

*In the below usage notes, "LVD" refers to both LVD and PVD.*

# Overview

The Low Voltage Detection module configures the voltage monitors to detect when a power supply pin or a voltage detector pin voltages crosses a specified threshold.

### Features

The LVD HAL module supports the following functions:

- Seven run-time configurable voltage monitors (Voltage Monitor 1, Voltage Monitor 2, Voltage Monitor 4, Voltage Monitor 5, LVD VBAT, LVD VRTC, EXLVD)
  - Configurable voltage threshold
  - Digital filter (Available on specific MCUs)
  - Support for both interrupt or polling
    - NMI or maskable interrupt can be configured (NMI support for Voltage Monitor 1 & Voltage Monitor 2 only).
  - Voltage monitor interrupt generation condition can be configured (rising, falling, or both edge event detection).
  - Support for resetting the MCU when $V_{CC}$ falls below/rises above configured threshold.
    **Note**: Voltage monitor availability is limited based on the selected MCU.

# Configuration

### Build Time Configurations for r_lvd

The following build time configurations are defined in fsp_cfg/r_lvd_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

### Configurations for Monitoring > Low/Programmable Voltage Detection (r_lvd)

This module can be added to the Stacks tab via New Stack > Monitoring > Low/Programmable Voltage Detection (r_lvd). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

| Configuration | Options | Default | Description |
|---|---|---|---|
| Name | Name must be a valid C symbol | g_lvd0 | Module name. |
| Monitor Number | MCU Specific Options | | Select the LVD monitor. |
| Digital Filter | MCU Specific Options | | Enable the digital filter and select the digital filter clock divider. |
| Voltage Threshold | MCU Specific Options | | Select the low voltage detection threshold. |
| Detection Response | MCU Specific Options | | Select what happens when the voltage crosses the threshold voltage. |
| Voltage Slope | MCU Specific Options | | Select interrupt generation on rising voltage, falling voltage or both. |
| Negation Delay | MCU Specific Options | | Negation of the monitor signal can either be delayed from the reset event or from voltage returning to normal range. |
| Monitor Interrupt Callback | Name must be a valid C symbol. | NULL | A user callback function can be provided. If this callback function is provided, it will be called from the interrupt service routine (ISR) each time the IRQ triggers. |
| LVD Monitor Interrupt Priority | MCU Specific Options | | Select the LVD Monitor interrupt priority. |

**Clock Configuration**

The LOCO clock must be enabled in order to use the digital filter.

**Pin Configuration**

To use LVD module, you need to switch pin function of EXLVDVBAT pin, VRTC pin, EXLVD pin to enable LVD function on this pin.

# Usage Notes

### Startup Edge Detection

If $V_{CC}$ is below the threshold prior to configuring the voltage monitor for falling edge detection, the monitor will immediately detect the a falling edge condition. If $V_{CC}$ is above the threshold prior to configuring the monitor for rising edge detection, the monitor will not detect a rising edge condition until $V_{CC}$ falls below the threshold and then rises above it again.

### Voltage Monitor 0

The LVD HAL module only supports configuring voltage monitor 1 and voltage monitor 2. Voltage monitor 0 can be configured by setting the appropriate bits in the OFS1 register. This means that voltage monitor 0 settings cannot be changed at runtime.

Voltage monitor 0 supports the following features

- Configurable Voltage Threshold ($V_{DET0}$)
- Reset the device when $V_{CC}$ falls below $V_{DET0}$

### Limitations

- The digital filter must be disabled when using voltage monitors in Software Standby or Deep Software Standby.
- Deep Software Standby mode is not possible if the voltage monitor is configured to reset the MCU.
- Reset generated by the VCC-rise detection is supported only on devices with PVD.
- On RA0, when LVD0 is used the detection voltage of LVD1 must be higher than LVD0's. See in hardware manual: LVD > Register Descriptions > LVD1CR.
- Voltage Monitor 4, Voltage Monitor 5 does not support interrupt feature.
- LVD Monitor 1 and LVD Monitor 2 must have the same security attribution. Either both monitors are used in the secure project, or both monitors are used in the non-secure project.

# Examples

### Basic Example

This is a basic example of minimal use of the LVD in an application.

```
void basic_example (void)
{
 fsp_err_t err = R_LVD_Open(&g_lvd_ctrl, &g_lvd_cfg);
    assert(FSP_SUCCESS == err);
 while (1)
    {
 lvd_status_t status;
       err = R_LVD_StatusGet(&g_lvd_ctrl, &status);
      assert(FSP_SUCCESS == err);
```

```
 if (LVD_THRESHOLD_CROSSING_DETECTED == status.crossing_detected)
      {
            err = R_LVD_StatusClear(&g_lvd_ctrl);
      assert(FSP_SUCCESS == err);
 /* Do something */
       }
    }
}
```

### Interrupt Example

This is a basic example of using a LVD instance that is configured to generate an interrupt.

```
void interrupt_example (void)
{
 fsp_err_t err = R_LVD_Open(&g_lvd_ctrl, &g_lvd_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 while (1)
    {
 /* Application Process */
 /* Application will be interrupted when Vcc crosses the configured threshold. */
    }
}
/* Called when Vcc crosses configured threshold. */
void lvd_callback (lvd_callback_args_t * p_args)
{
 if (LVD_CURRENT_STATE_BELOW_THRESHOLD == p_args->current_state)
    {
 /* Do Something */
    }
}
```

### Reset Example

This is a basic example of using a LVD instance that is configured to reset the MCU.

```
void reset_example (void)
{
 if (1U == R_SYSTEM->RSTSR0_b.LVD1RF)
    {
 /* The system is coming out of reset because Vcc crossed configured voltage
threshold. */
 /* Clear Voltage Monitor 1 Reset Detect Flag. */
       R_SYSTEM->RSTSR0_b.LVD1RF = 0;
    }
 fsp_err_t err = R_LVD_Open(&g_lvd_ctrl, &g_lvd_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 while (1)

## Data Structures

| | |
|---|---|
| struct | lvd_instance_ctrl_t |

## Data Structure Documentation

### ◆ lvd_instance_ctrl_t

| |
|---|
| struct lvd_instance_ctrl_t |
| LVD instance control structure |

## Function Documentation

### ◆ R_LVD_Open()

fsp_err_t R_LVD_Open ( lvd_ctrl_t *const *p_api_ctrl*, lvd_cfg_t const *const *p_cfg* )

Initializes a voltage monitor and detector according to the passed-in configuration structure.

**Parameters**

| | | |
|---|---|---|
| [in] | p_api_ctrl | Pointer to the control structure for the driver instance |
| [in] | p_cfg | Pointer to the configuration structure for the driver instance |

***Note***

*Digital filter is not to be used with standby modes.*
*Startup time can take on the order of milliseconds for some configurations.*

Example:

```
fsp_err_t err = R_LVD_Open(&g_lvd_ctrl, &g_lvd_cfg);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successful |
| FSP_ERR_ASSERTION | Requested configuration was invalid |
| FSP_ERR_ALREADY_OPEN | The instance was already opened |
| FSP_ERR_IN_USE | Another instance is already using the desired monitor |
| FSP_ERR_UNSUPPORTED | Digital filter was enabled on a device that does not support it |

### ◆ R_LVD_StatusGet()

fsp_err_t R_LVD_StatusGet ( lvd_ctrl_t *const *p_api_ctrl*, lvd_status_t * *p_lvd_status* )

Get the current state of the monitor (threshold crossing detected, voltage currently above or below threshold).

**Parameters**

| | | |
|---|---|---|
| [in] | p_api_ctrl | Pointer to the control structure for the driver instance |
| [out] | p_lvd_status | Pointer to status structure |

Example:

```
err = R_LVD_StatusGet(&g_lvd_ctrl, &status);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successful |
| FSP_ERR_ASSERTION | An argument was NULL |
| FSP_ERR_NOT_OPEN | Driver is not open |
| FSP_ERR_UNSUPPORTED | This monitor does not support status feature |

### ◆ R_LVD_StatusClear()

fsp_err_t R_LVD_StatusClear ( lvd_ctrl_t *const *p_api_ctrl*)

Clears the latched status of the monitor.

**Parameters**

| | | |
|---|---|---|
| [in] | p_api_ctrl | Pointer to the control structure for the driver instance |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successful |
| FSP_ERR_ASSERTION | An argument was NULL |
| FSP_ERR_NOT_OPEN | Driver is not open |
| FSP_ERR_UNSUPPORTED | This monitor does not support status feature |

### ◆ R_LVD_CallbackSet()

fsp_err_t R_LVD_CallbackSet ( lvd_ctrl_t *const *p_api_ctrl*, void(*)(lvd_callback_args_t *) *p_callback*, void *const *p_context*, lvd_callback_args_t *const *p_callback_memory* )

Updates the user callback and has option of providing memory for callback structure. Implements lvd_api_t::callbackSet

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Callback updated successfully. |
| FSP_ERR_ASSERTION | A required pointer is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_NO_CALLBACK_MEMORY | p_callback is non-secure and p_callback_memory is either secure or NULL. |

### ◆ R_LVD_Close()

fsp_err_t R_LVD_Close ( lvd_ctrl_t *const *p_api_ctrl*)

Disables the LVD peripheral. Closes the driver instance.

**Parameters**

| | | |
|---|---|---|
| [in] | p_api_ctrl | Pointer to the control block structure for the driver instance |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successful |
| FSP_ERR_ASSERTION | An argument was NULL |
| FSP_ERR_NOT_OPEN | Driver is not open |

## 5.2.10.6 Watchdog (r_wdt)

| fsp_err_t | R_WDT_CallbackSet (wdt_ctrl_t *const p_ctrl, void(*p_callback)(wdt_callback_args_t *), void *const p_context, wdt_callback_args_t *const p_callback_memory) |

### Detailed Description

Driver for the WDT peripheral on RA MCUs. This module implements the WDT Interface.

# Overview

The watchdog timer is used to recover from unexpected errors in an application. The watchdog timer must be refreshed periodically in the permitted count window by the application. If the count is allowed to underflow or refresh occurs outside of the valid refresh period, the WDT resets the device or generates an NMI.

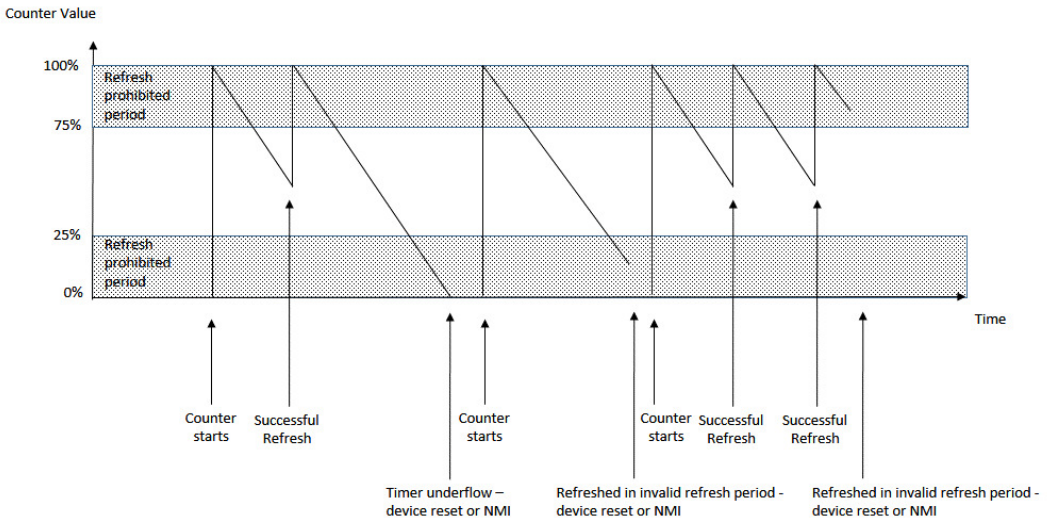

Figure 260: Watchdog Timer Operation Example

### Features

The WDT HAL module has the following key features:

- When the WDT underflows or is refreshed outside of the permitted refresh window, one of the following events can occur:
  - Resetting of the device
  - Generation of an NMI
- The WDT has two supported modes:
  - In auto start mode, the WDT begins counting at reset.
  - In register start mode, the WDT can be started from the application.

### Selecting a Watchdog

RA MCUs have two watchdog peripherals: the watchdog timer (WDT) and the independent watchdog timer (IWDT). When selecting between them, consider these factors:

| | WDT | IWDT |
|---|---|---|
| Start Mode | The WDT can be started from the application (register start mode) or configured by hardware to start automatically (auto start mode). | The IWDT can only be configured by hardware to start automatically. |
| Clock Source | The WDT runs off a peripheral clock. | The IWDT has its own clock source which improves safety. |

## Configuration

When using register start mode, configure the watchdog timer on the Stacks tab.

*Note*

*When using auto start mode, configurations on the **Stacks** tab are ignored. Configure the watchdog using the OFS settings on the BSP tab.*

### Build Time Configurations for r_wdt

The following build time configurations are defined in fsp_cfg/r_wdt_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| Register Start NMI Support | • Enabled<br>• Disabled | Disabled | If enabled, code for NMI support in register start mode is included in the build. |

### Configurations for Monitoring > Watchdog (r_wdt)

This module can be added to the Stacks tab via New Stack > Monitoring > Watchdog (r_wdt). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

| Configuration | Options | Default | Description |
|---|---|---|---|
| Name | Name must be a valid C symbol | g_wdt0 | Module name. |
| Timeout | • 1,024 Cycles<br>• 4,096 Cycles<br>• 8,192 Cycles<br>• 16,384 Cycles | 16,384 Cycles | Select the watchdog timeout in cycles. |
| Clock Division Ratio | • PCLK/4<br>• PCLK/64<br>• PCLK/128<br>• PCLK/512<br>• PCLK/2048<br>• PCLK/8192 | PCLK/8192 | Select the watchdog clock divisor. |
| Window Start Position | • 100 (Window Position Not Specified)<br>• 75<br>• 50<br>• 25 | 100 (Window Position Not Specified) | Select the allowed watchdog refresh start point in %. |
| Window End Position | • 0 (Window Position Not Specified)<br>• 25<br>• 50<br>• 75 | 0 (Window Position Not Specified) | Select the allowed watchdog refresh end point in %. |
| Reset Control | • Reset Output<br>• NMI Generated | Reset Output | Select what happens when the watchdog timer expires. |
| Stop Control | • WDT Count Enabled in Low Power Mode<br>• WDT Count Disabled in Low Power Mode | WDT Count Disabled in Low Power Mode | Select the watchdog state in low power mode. |
| NMI Callback | Name must be a valid C symbol | NULL | A user callback function must be provided if the WDT is configured to generate an NMI when the timer underflows or a refresh error occurs. If this callback function is provided, it will be called from the NMI handler each time the |

watchdog triggers.

### Clock Configuration

The WDT clock is based on the PCLKB frequency. You can set the PCLKB frequency using the **Clocks** tab of the RA Configuration editor or by using the CGC Interface at run-time. The maximum timeout period with PCLKB running at 60 MHz is approximately 2.2 seconds.

### Pin Configuration

This module does not use I/O pins.

## Usage Notes

### NMI Interrupt

The watchdog timer uses the NMI, which is enabled by default. No special configuration is required. When the NMI is triggered, the callback function registered during open is called.

*Note*

*When using the WDT in software start mode with NMI and the timer underflows, the WDT status must be reset by calling R_WDT_StatusClear before restarting the timer via R_WDT_Refresh.*

### Period Calculation

The WDT operates from PCLKB. With a PCLKB of 60 MHz, the maximum time from the last refresh to device reset or NMI generation will be just over 2.2 seconds as detailed below.

PLCKB = 60 MHz
Clock division ratio = PCLKB / 8192
Timeout period = 16384 cycles
WDT clock frequency = 60 MHz / 8192 = 7.324 kHz
Cycle time = 1 / 7.324 kHz = 136.53 us
Timeout = 136.53 us x 16384 cycles = 2.23 seconds

### Limitations

Developers should be aware of the following limitations when using the WDT:

- When using a J-Link debugger the WDT counter does not count and therefore will not reset the device or generate an NMI. To enable the watchdog to count and generate a reset or NMI while debugging, add this line of code in the application:

```
/* (Optional) Enable the WDT to count and generate NMI or reset when the
 * debugger is connected. */
  R_DEBUG->DBGSTOPCR_b.DBGSTOP_WDT = 0;
```

- If the WDT is configured to stop the counter in low power mode, then your application must restart the watchdog by calling R_WDT_Refresh() after the MCU wakes from low power mode.

## Examples

### WDT Basic Example

This is a basic example of minimal use of the WDT in an application.

```
void wdt_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* In auto start mode, the WDT starts counting immediately when the MCU is powered
on. */
 /* Initializes the module. */
    err = R_WDT_Open(&g_wdt0_ctrl, &g_wdt0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* In register start mode, start the watchdog by calling R_WDT_Refresh. */
    err = R_WDT_Refresh(&g_wdt0_ctrl);
    assert(FSP_SUCCESS == err);
 while (true)
    {
 /* Application work here. */
 /* Refresh before the counter underflows to prevent reset or NMI. */
      err = R_WDT_Refresh(&g_wdt0_ctrl);
      assert(FSP_SUCCESS == err);
    }
}
```

### WDT Advanced Example

This example demonstrates using a start window and gives an example callback to handle an NMI generated by an underflow or refresh error.

```
#define WDT_TIMEOUT_COUNTS (16384U)
#define WDT_MAX_COUNTER (WDT_TIMEOUT_COUNTS - 1U)
#define WDT_START_WINDOW_75 ((WDT_MAX_COUNTER * 3) / 4)
/* Example callback called when a watchdog NMI occurs. */
void wdt_callback (wdt_callback_args_t * p_args)
{
 FSP_PARAMETER_NOT_USED(p_args);
```

```
 fsp_err_t err = FSP_SUCCESS;
 /* (Optional) Determine the source of the NMI. */
 wdt_status_t status = WDT_STATUS_NO_ERROR;
    err = R_WDT_StatusGet(&g_wdt0_ctrl, &status);
    assert(FSP_SUCCESS == err);
 /* (Optional) Log source of NMI and any other debug information. */
 /* (Optional) Clear the error flags. */
    err = R_WDT_StatusClear(&g_wdt0_ctrl, status);
    assert(FSP_SUCCESS == err);
 /* (Register start mode) In register start mode, call R_WDT_Refresh() to
  * continue using the watchdog after an error. */
    err = R_WDT_Refresh(&g_wdt0_ctrl);
    assert(FSP_SUCCESS == err);
 /* (Optional) Issue a software reset to reset the MCU. */
    __NVIC_SystemReset();
}
void wdt_advanced_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* (Optional) Enable the WDT to count and generate NMI or reset when the
  * debugger is connected. */
    R_DEBUG->DBGSTOPCR_b.DBGSTOP_WDT = 0;
 /* (Optional) Check if the WDTRF flag is set to know if the system is
  * recovering from a WDT reset. */
 if (R_SYSTEM->RSTSR1_b.WDTRF)
    {
 /* Clear the flag. */
       R_SYSTEM->RSTSR1 = 0U;
    }
 /* Open the module. */
    err = R_WDT_Open(&g_wdt0_ctrl, &g_wdt0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Initialize other application code. */
```

```
/* (Register start mode) Call R_WDT_Refresh() to start the WDT in register
 * start mode. Do not call R_WDT_Refresh() in auto start mode unless the
 * counter is in the acceptable refresh window. */
   err = R_WDT_Refresh(&g_wdt0_ctrl);
   assert(FSP_SUCCESS == err);
while (true)
   {
/* Application work here. */
/* (Optional) If there is a chance the application takes less time than
 * the start window, verify the WDT counter is past the start window
 * before refreshing the WDT. */
      uint32_t wdt_counter = 0U;
do
     {
/* Read the current WDT counter value. */
           err = R_WDT_CounterGet(&g_wdt0_ctrl, &wdt_counter);
     assert(FSP_SUCCESS == err);
     } while (wdt_counter >= WDT_START_WINDOW_75);
/* Refresh before the counter underflows to prevent reset or NMI. */
     err = R_WDT_Refresh(&g_wdt0_ctrl);
     assert(FSP_SUCCESS == err);
   }
}
```

## Data Structures

| | |
|---|---|
| struct | wdt_instance_ctrl_t |

## Data Structure Documentation

### ◆ wdt_instance_ctrl_t

| struct wdt_instance_ctrl_t |
|---|
| WDT private control block. DO NOT MODIFY. Initialization occurs when R_WDT_Open() is called. |

## Function Documentation

### ◆ R_WDT_Open()

fsp_err_t R_WDT_Open ( wdt_ctrl_t *const *p_ctrl*, wdt_cfg_t const *const *p_cfg* )

Configure the WDT in register start mode. In auto-start_mode the NMI callback can be registered. Implements wdt_api_t::open.

This function should only be called once as WDT configuration registers can only be written to once so subsequent calls will have no effect.

Example:

```
/* Initializes the module. */
   err = R_WDT_Open(&g_wdt0_ctrl, &g_wdt0_cfg);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | WDT successfully configured. |
| FSP_ERR_ASSERTION | Null pointer, or one or more configuration options is invalid. |
| FSP_ERR_ALREADY_OPEN | Module is already open. This module can only be opened once. |
| FSP_ERR_INVALID_STATE | The security state of the NMI and the module do not match. |

***Note***

*In auto start mode the only valid configuration option is for registering the callback for the NMI ISR if NMI output has been selected.*

### ◆ R_WDT_TimeoutGet()

fsp_err_t R_WDT_TimeoutGet ( wdt_ctrl_t *const *p_ctrl*, wdt_timeout_values_t *const *p_timeout* )

Read timeout information for the watchdog timer. Implements wdt_api_t::timeoutGet.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | WDT timeout information retrieved successfully. |
| FSP_ERR_ASSERTION | Null Pointer. |
| FSP_ERR_NOT_OPEN | Instance control block is not initialized. |

### ◆ R_WDT_Refresh()

fsp_err_t R_WDT_Refresh ( wdt_ctrl_t *const *p_ctrl*)

Refresh the watchdog timer. Implements wdt_api_t::refresh.

In addition to refreshing the watchdog counter this function can be used to start the counter in register start mode.

Example:

```
/* Refresh before the counter underflows to prevent reset or NMI. */
     err = R_WDT_Refresh(&g_wdt0_ctrl);
     assert(FSP_SUCCESS == err);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | WDT successfully refreshed. |
| FSP_ERR_ASSERTION | p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Instance control block is not initialized. |

***Note***

*This function only returns FSP_SUCCESS. If the refresh fails due to being performed outside of the permitted refresh period the device will either reset or trigger an NMI ISR to run.*

### ◆ R_WDT_StatusGet()

fsp_err_t R_WDT_StatusGet ( wdt_ctrl_t *const *p_ctrl*, wdt_status_t *const *p_status* )

Read the WDT status flags. Implements wdt_api_t::statusGet.

Indicates both status and error conditions.

Example:

```
/* (Optional) Determine the source of the NMI. */
wdt_status_t status = WDT_STATUS_NO_ERROR;
   err = R_WDT_StatusGet(&g_wdt0_ctrl, &status);
   assert(FSP_SUCCESS == err);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | WDT status successfully read. |
| FSP_ERR_ASSERTION | Null pointer as a parameter. |
| FSP_ERR_NOT_OPEN | Instance control block is not initialized. |
| FSP_ERR_UNSUPPORTED | This function is only valid if the watchdog generates an NMI when an error occurs. |

***Note***

*When the WDT is configured to output a reset on underflow or refresh error reading the status and error flags serves no purpose as they will always indicate that no underflow has occurred and there is no refresh error. Reading the status and error flags is only valid when interrupt request output is enabled.*

### ◆ R_WDT_StatusClear()

fsp_err_t R_WDT_StatusClear ( wdt_ctrl_t *const *p_ctrl*, const wdt_status_t *status* )

Clear the WDT status and error flags. Implements wdt_api_t::statusClear.

Example:

```
/* (Optional) Clear the error flags. */
   err = R_WDT_StatusClear(&g_wdt0_ctrl, status);
   assert(FSP_SUCCESS == err);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | WDT flag(s) successfully cleared. |
| FSP_ERR_ASSERTION | Null pointer as a parameter. |
| FSP_ERR_NOT_OPEN | Instance control block is not initialized. |
| FSP_ERR_UNSUPPORTED | This function is only valid if the watchdog generates an NMI when an error occurs. |

***Note***

*When the WDT is configured to output a reset on underflow or refresh error reading the status and error flags serves no purpose as they will always indicate that no underflow has occurred and there is no refresh error. Reading the status and error flags is only valid when interrupt request output is enabled.*

### ◆ R_WDT_CounterGet()

fsp_err_t R_WDT_CounterGet ( wdt_ctrl_t *const *p_ctrl*, uint32_t *const *p_count* )

Read the current count value of the WDT. Implements wdt_api_t::counterGet.

Example:

```
/* Read the current WDT counter value. */
           err = R_WDT_CounterGet(&g_wdt0_ctrl, &wdt_counter);
     assert(FSP_SUCCESS == err);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | WDT current count successfully read. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Instance control block is not initialized. |

### ◆ R_WDT_CallbackSet()

fsp_err_t R_WDT_CallbackSet ( wdt_ctrl_t *const *p_ctrl*, void(*)(wdt_callback_args_t *) *p_callback*, void *const *p_context*, wdt_callback_args_t *const *p_callback_memory* )

Updates the user callback and has option of providing memory for callback structure. Implements wdt_api_t::callbackSet

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Callback updated successfully. |
| FSP_ERR_ASSERTION | A required pointer is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_NO_CALLBACK_MEMORY | p_callback is non-secure and p_callback_memory is either secure or NULL. |

### Detailed Description

Calculation process for the motor control on RA MCUs. This module implements the Motor 120-Degree Control Interface.

# Overview

The motor current is used to control the electric current of motor rotation in an application. This module should be called cyclically after the A/D conversion of electric current of each phase in an application. This module calculates each phase voltage with input current reference, electric current and rotor angle.

### Features

The motor 120 control sensorless module has below features.

- Calculate each phase(U/V/W) voltage.
- Decoupling control.
- Voltage error compensation.

# Configuration

### Build Time Configurations for rm_motor_120_control_sensorless

The following build time configurations are defined in fsp_cfg/rm_motor_120_control_sensorless_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

### Configurations for Motor > 120-degree conduction control sensorless (rm_motor_120_control_sensorless)

This module can be added to the Stacks tab via New Stack > Motor > 120-degree conduction control sensorless (rm_motor_120_control_sensorless).

| Configuration | Options | Default | Description |
|---|---|---|---|
| General | | | |
| Name | Name must be a valid C symbol | g_motor_120_control_sensorless0 | Module name. |
| Conduction type | • First 60 degree PWM<br>• Complementary First 60 degree PWM | First 60 degree PWM | Select conduction type |
| Stop BEMF | Must be a valid non-negative value. | 0.5 | Value of stop motor BEMF (U+V+W) |
| Timeout counts (msec) | Must be a valid integer. | 2000 | Undetected time |
| Maximum voltage for BOOT (V) | Must be a valid non-negative value. | 8.0 | Maximum output voltage for boot mode (V) |
| Maximum voltage (V) | Must be a valid non-negative value. | 20.0 | Maximum output voltage (V) |
| Minimum voltage (V) | Must be a valid non-negative value. | 3.0 | Minimum output voltage (V) |
| Carrier frequency (kHz) | Must be a valid non-negative value. | 20.0 | PWM carrier frequency (kHz) |
| Adjusting angle | Must be a valid non-negative value. | 0 | Adjusting angle |
| Speed PI decimation | Must be a valid integer. | 1 | Speed PI control decimation count |
| Free run timer frequency (MHz) | Must be a valid integer. | 120 | Freerun timer frequency (MHz) |
| Speed LPF K | Must be a valid non-negative value. | 1.0 | Speed LPF parameter |

| | | | |
|---|---|---|---|
| Step of speed change | Must be a valid non-negative value. | 0.2 | Speed reference change step |
| Boot reference voltage (V) | Must be a valid non-negative value. | 3.0 | Voltage reference for boot mode |
| Voltage lamping time | Must be a valid integer. | 128 | Voltage lamping time |
| Voltage constant adjust time | Must be a valid integer. | 64 | Voltage constant adjust time value (msec) |
| Open loop start speed (rpm) | Must be a valid integer value. | 150 | Open loop start speed (rpm) |
| Open loop mode2 speed (rpm) | Must be a valid integer value. | 185 | to mode2 change speed (rpm) |
| Open loop mode3 speed (rpm) | Must be a valid integer value. | 1000 | to mode3 change speed (rpm) |
| Open loop start voltage (V) | Must be a valid non-negative value. | 3.0 | start reference voltage (V) |
| Open loop mode1 speed rate | Must be a valid non-negative value. | 0.25 | increase rate of reference speed (rpm/control period) |
| Open loop mode2 voltage rate | Must be a valid non-negative value. | 0.00285 | increase rate of reference voltage (v/control period) |
| Open loop mode2 speed rate | Must be a valid non-negative value. | 0.71 | increase rate of reference speed (rpm/control period) |
| Open loop mode3 voltage rate | Must be a valid non-negative value. | 0.002 | increase rate of reference voltage (v/control period) |
| Open loop maximum voltage (V) | Must be a valid non-negative value. | 6.5 | openloop maximum voltage (V) |
| PI control KP | Must be a valid non-negative value. | 0.02 | PI control gain of proportional term |
| PI control KI | Must be a valid non-negative value. | 0.004 | PI control gain of integral term |
| PI control limit | Must be a valid non-negative value. | 24.0 | PI control limit of integral term |
| Motor Parameter | | | |
| Pole pairs | Must be a valid integer. | 2 | Pole pairs |
| Resistance (ohm) | Must be a valid non-negative value. | 6.447 | Resistance |
| Inductance of d-axis (H) | Must be a valid non-negative value. | 0.0045 | Inductance of d-axis |
| Inductance of q-axis | Must be a valid non- | 0.0045 | Inductance of q-axis |

| | | | |
|---|---|---|---|
| (H) | negative value. | | |
| Permanent magnetic flux (Wb) | Must be a valid non-negative value. | 0.02159 | Permanent magnetic flux |
| Motor Parameter > Rotor inertia (kgm^2) | Must be a valid non-negative value. | 1.8 | Rotor inertia |
| Interrupts | | | |
| Callback | Name must be a valid C symbol | NULL | callback function |

### Clock Configuration

This module doesn't depend on clock setting, because this module is a simple calculation process.

### Pin Configuration

This module does not use I/O pins.

## Usage Notes

### Limitations

- Set the period of current control with none-negative value.
- Set the reference voltage with none-negative value.

## Examples

### Basic Example

This is a basic example of minimal use of the motor 120 control sensorless in an application.

```
void motor_120_control_sensorless_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err =
RM_MOTOR_120_CONTROL_SENSORLESS_Open(g_motor_120_control_sensorless0.p_ctrl,
                                          g_motor_120_control_sensorless0.p_cfg);
    assert(FSP_SUCCESS == err);
 /* Set speed reference before motor run */
    (void)
RM_MOTOR_120_CONTROL_SENSORLESS_SpeedSet(g_motor_120_control_sensorless0.p_ctrl,

DEF_120_CONTROL_SENSORLESSHALL_TEST_OVSPD_LIM);
```

```
 /* Start motor rotation */
    (void)
RM_MOTOR_120_CONTROL_SENSORLESS_Run(g_motor_120_control_sensorless0.p_ctrl);
 /* Get current motor speed */
    (void)
RM_MOTOR_120_CONTROL_SENSORLESS_SpeedGet(g_motor_120_control_sensorless0.p_ctrl,
&smpl_speed);
 /* Get current */
    (void)
RM_MOTOR_120_CONTROL_SENSORLESS_CurrentGet(g_motor_120_control_sensorless0.p_ctrl,
&smpl_current_status);
 /* Get wait stop flag */
    (void)
RM_MOTOR_120_CONTROL_SENSORLESS_WaitStopFlagGet
(g_motor_120_control_sensorless0.p_ctrl,
                                                    &smpl_wait_stop_flag);
 /* Get timeout error flag */
    (void)
RM_MOTOR_120_CONTROL_SENSORLESS_TimeoutErrorFlagGet
(g_motor_120_control_sensorless0.p_ctrl,
                                                         &smpl_timeout_error_fl
ag);
 /* Get pattern error flag */
    (void)
RM_MOTOR_120_CONTROL_SENSORLESS_PatternErrorFlagGet
(g_motor_120_control_sensorless0.p_ctrl,
                                                         &smpl_pattern_error_fl
ag);
 /* Get voltage ref */
    (void)
RM_MOTOR_120_CONTROL_SENSORLESS_VoltageRefGet(g_motor_120_control_sensorless0.p_ctrl,
&smpl_voltage_ref);
    (void)
RM_MOTOR_120_CONTROL_SENSORLESS_ParameterUpdate
```

```
(g_motor_120_control_sensorless0.p_ctrl,

g_motor_120_control_sensorless0.p_cfg);
 /* Stop motor rotation */
    (void)
RM_MOTOR_120_CONTROL_SENSORLESS_Stop(g_motor_120_control_sensorless0.p_ctrl);
 /* Reset the process. */
    (void)
RM_MOTOR_120_CONTROL_SENSORLESS_Reset(g_motor_120_control_sensorless0.p_ctrl);
 /* Close the module. */
    (void)
RM_MOTOR_120_CONTROL_SENSORLESS_Close(g_motor_120_control_sensorless0.p_ctrl);
}
```

### Data Structures

| timer_instance_t const * | p_speed_calc_timer_instance | Speed calculate timer module. |

### ◆ motor_120_control_sensorless_instance_ctrl_t

| struct motor_120_control_sensorless_instance_ctrl_t | | |
|---|---|---|
| 120 control sensorless instance control block | | |
| Data Fields | | |
| uint32_t | open | Used to determine if the channel is configured. |
| motor_120_control_status_t | active | Flag to set active/inactive the motor 120 control. |
| motor_120_control_run_mode_t | run_mode | Drive mode. |
| motor_120_control_timeout_error_flag_t | timeout_error_flag | Timeout error status. |
| motor_120_control_pattern_error_flag_t | pattern_error_flag | Bemf pattern error status. |
| motor_120_control_rotation_direction_t | direction | Rotational direction (0:CW ,1:CCW) |
| float | f4_ol_pattern_set_calc | Counts to change timing of open loop pattern. |
| float | f4_speed_calc_base | Base counts to calculate |

| | | |
|---|---|---|
| | | rotation speed. |
| float | f_rpm2rad | Translate value to radian/second to rpm. |
| float | f4_v_ref | Voltage reference (output of speed PI control) |
| uint32_t | u4_pwm_duty | PWM duty. |
| float | f4_ref_speed_rad | Motor speed reference. |
| float | f4_ref_speed_rad_ctrl | Motor speed reference for speed PI control. |
| float | f4_speed_rad | Motor speed. |
| uint32_t | u4_cnt_speed_pi | Counter for period of speed PI control. |
| motor_120_control_wait_stop_flag_t | flag_wait_stop | Flag for waiting for motor stop. |
| float | f4_vn_ad | Neutral voltage. |
| uint32_t | u4_cnt_adj_v | Voltage lamping count adjustment. |
| motor_120_control_sensorless_draw_in_position_t | flag_draw_in | Status of draw in a initial position. |
| motor_120_driver_phase_pattern_t | v_pattern | Voltage pattern. |
| uint32_t | u4_v_pattern_num | Selecting pattern number for openloop drive. |
| uint32_t | u4_bemf_signal | Pattern of BEMF. |
| uint32_t | u4_pre_bemf_signal | Previous pattern of BEMF. |
| motor_120_control_sensorless_pattern_change_flag_t | flag_pattern_change | Pattern change flag. |
| motor_120_control_speed_ref_t | flag_speed_ref | Speed reference flag. |
| motor_120_control_voltage_ref_t | flag_voltage_ref | Voltage reference flag. |
| uint32_t | u4_ol_signal | Pattern of BEMF. |
| uint32_t | u4_ol_pattern_set | Openloop frequency. |
| uint32_t | u4_cnt_ol_pattern_set | Counter for openloop pattern change. |
| uint32_t | u4_cnt_timeout | Counter for timeout error. |
| uint32_t | u4_bemf_timer_cnt | Value of timer counter. |
| uint32_t | u4_pre_bemf_timer_cnt | Previous value of timer counter. |
| int32_t | s4_timer_cnt_ave | Counts for 360 degrees. |
| | | |

| | | |
|---|---|---|
| uint32_t | u4_timer_cnt_buf[MOTOR_120_CONTROL_SENSORLESS_TIMES] | Counts for 60 degrees. |
| uint32_t | u4_timer_cnt_num | Array element number before 360 degrees. |
| uint32_t | u4_cnt_carrier | Counter for carrier interrupt. |
| uint32_t | u4_pre_cnt_carrier | Previous carrier interrupt count. |
| uint32_t | u4_angle_shift_cnt | Shift degrees count. |
| float | f4_pi_ctrl_err | PI control error. |
| float | f4_pi_ctrl_refi | PI control buffer of integral term. |
| motor_120_control_cfg_t const * | p_cfg | Pointer of configuration structure. |
| timer_direction_t | timer_direction | Hold timer direction. |
| timer_callback_args_t | timer_args | For call timer callbackSet function. |

## Enumeration Type Documentation

### ◆ motor_120_control_sensorless_draw_in_position_t

| enum motor_120_control_sensorless_draw_in_position_t | |
|---|---|
| Draw in a initial position | |
| Enumerator | |
| MOTOR_120_CONTROL_SENSORLESS_DRAW_IN_POSITION_INIT | Initial parameter. |
| MOTOR_120_CONTROL_SENSORLESS_DRAW_IN_POSITION_1ST_TIME | Draw in a initial position of the 1st time. |
| MOTOR_120_CONTROL_SENSORLESS_DRAW_IN_POSITION_2ND_TIME | Draw in a initial position of the 2nd time. |

### ◆ motor_120_control_sensorless_pattern_change_flag_t

| enum motor_120_control_sensorless_pattern_change_flag_t | |
|---|---|
| Pattern change | |
| Enumerator | |
| MOTOR_120_CONTROL_SENSORLESS_PATTERN_CHANGE_FLAG_CLEAR | Initial parameter. |
| MOTOR_120_CONTROL_SENSORLESS_PATTERN_CHANGE_FLAG_SET | Voltage pattern change. |

## Function Documentation

### ◆ RM_MOTOR_120_CONTROL_SENSORLESS_Open()

fsp_err_t RM_MOTOR_120_CONTROL_SENSORLESS_Open ( motor_120_control_ctrl_t *const *p_ctrl*, motor_120_control_cfg_t const *const *p_cfg* )

Opens and configures the motor sensorless 120 detection module. Implements motor_120_control_api_t::open.

Example:

```
/* Initializes the module. */
   err =
RM_MOTOR_120_CONTROL_SENSORLESS_Open(g_motor_120_control_sensorless0.p_ctrl,
                                     g_motor_120_control_sensorless0.p_cfg);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Motor driver successfully configured. |
| FSP_ERR_ASSERTION | Null pointer, or one or more configuration options is invalid. |
| FSP_ERR_ALREADY_OPEN | Module is already open. This module can only be opened once. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter error. |

### ◆ RM_MOTOR_120_CONTROL_SENSORLESS_Close()

fsp_err_t RM_MOTOR_120_CONTROL_SENSORLESS_Close ( motor_120_control_ctrl_t *const *p_ctrl*)

Disables specified motor sensorless 120 detection module. Implements motor_120_control_api_t::close.

Example:

```
/* Close the module. */
   (void)
RM_MOTOR_120_CONTROL_SENSORLESS_Close(g_motor_120_control_sensorless0.p_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully closed. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_MOTOR_120_CONTROL_SENSORLESS_Run()

fsp_err_t RM_MOTOR_120_CONTROL_SENSORLESS_Run ( motor_120_control_ctrl_t *const *p_ctrl*)

Run motor (Start motor rotation). Implements motor_120_control_api_t::run.

Example:

```
/* Start motor rotation */
   (void)
RM_MOTOR_120_CONTROL_SENSORLESS_Run(g_motor_120_control_sensorless0.p_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_MOTOR_120_CONTROL_SENSORLESS_Stop()

fsp_err_t RM_MOTOR_120_CONTROL_SENSORLESS_Stop ( motor_120_control_ctrl_t *const *p_ctrl*)

Stop motor (Stop motor rotation). Implements motor_120_control_api_t::stop.

Example:

```
/* Stop motor rotation */
   (void)
RM_MOTOR_120_CONTROL_SENSORLESS_Stop(g_motor_120_control_sensorless0.p_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_MOTOR_120_CONTROL_SENSORLESS_Reset()

fsp_err_t RM_MOTOR_120_CONTROL_SENSORLESS_Reset ( motor_120_control_ctrl_t *const *p_ctrl*)

Reset variables of motor sensorless 120 detection module. Implements motor_120_control_api_t::reset.

Example:

```
/* Reset the process. */
   (void)
RM_MOTOR_120_CONTROL_SENSORLESS_Reset(g_motor_120_control_sensorless0.p_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully reset. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_MOTOR_120_CONTROL_SENSORLESS_SpeedSet()

fsp_err_t RM_MOTOR_120_CONTROL_SENSORLESS_SpeedSet ( motor_120_control_ctrl_t *const *p_ctrl*, float const *speed_rpm* )

Set speed[rpm]. Implements motor_120_control_api_t::speedSet.

Example:

```
/* Set speed reference before motor run */
   (void)
RM_MOTOR_120_CONTROL_SENSORLESS_SpeedSet(g_motor_120_control_sensorless0.p_ctrl,

DEF_120_CONTROL_SENSORLESSHALL_TEST_OVSPD_LIM);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_MOTOR_120_CONTROL_SENSORLESS_SpeedGet()

fsp_err_t RM_MOTOR_120_CONTROL_SENSORLESS_SpeedGet ( motor_120_control_ctrl_t *const *p_ctrl*, float *const *p_speed_rpm* )

Get speed. Implements motor_120_control_api_t::speedGet.

Example:

```
/* Get current motor speed */
   (void)
RM_MOTOR_120_CONTROL_SENSORLESS_SpeedGet(g_motor_120_control_sensorless0.p_ctrl,
&smpl_speed);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter error. |

### ◆ RM_MOTOR_120_CONTROL_SENSORLESS_CurrentGet()

fsp_err_t RM_MOTOR_120_CONTROL_SENSORLESS_CurrentGet ( motor_120_control_ctrl_t *const *p_ctrl*, motor_120_driver_current_status_t *const *p_current_status* )

Get current. Implements motor_120_control_api_t::currentGet.

Example:

```
/* Get current */
   (void)
RM_MOTOR_120_CONTROL_SENSORLESS_CurrentGet(g_motor_120_control_sensorless0.p_ctrl,
&smpl_current_status);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter error. |

### ◆ RM_MOTOR_120_CONTROL_SENSORLESS_WaitStopFlagGet()

fsp_err_t RM_MOTOR_120_CONTROL_SENSORLESS_WaitStopFlagGet ( motor_120_control_ctrl_t *const *p_ctrl*, motor_120_control_wait_stop_flag_t *const *p_flag* )

Get wait stop flag. Implements motor_120_control_api_t::waitStopFlagGet.

Example:

```
/* Get wait stop flag */
   (void)
RM_MOTOR_120_CONTROL_SENSORLESS_WaitStopFlagGet
(g_motor_120_control_sensorless0.p_ctrl,
                                                  &smpl_wait_stop_flag);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter error. |

### ◆ RM_MOTOR_120_CONTROL_SENSORLESS_TimeoutErrorFlagGet()

fsp_err_t RM_MOTOR_120_CONTROL_SENSORLESS_TimeoutErrorFlagGet ( motor_120_control_ctrl_t *const *p_ctrl*, motor_120_control_timeout_error_flag_t *const *p_timeout_error_flag* )

Get timeout error flag. Implements motor_120_control_api_t::timeoutErrorFlagGet.

Example:

```
 /* Get timeout error flag */
    (void)
RM_MOTOR_120_CONTROL_SENSORLESS_TimeoutErrorFlagGet
(g_motor_120_control_sensorless0.p_ctrl,
                                                    &smpl_timeout_error_fl
ag);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter error. |

### ◆ RM_MOTOR_120_CONTROL_SENSORLESS_PatternErrorFlagGet()

fsp_err_t RM_MOTOR_120_CONTROL_SENSORLESS_PatternErrorFlagGet ( motor_120_control_ctrl_t *const *p_ctrl*, motor_120_control_pattern_error_flag_t *const *p_pattern_error_flag* )

Get pattern error flag. Implements motor_120_control_api_t::patternErrorFlagGet.

Example:

```
/* Get pattern error flag */
   (void)
RM_MOTOR_120_CONTROL_SENSORLESS_PatternErrorFlagGet
(g_motor_120_control_sensorless0.p_ctrl,
                                                    &smpl_pattern_error_fl
ag);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter error. |

### ◆ RM_MOTOR_120_CONTROL_SENSORLESS_VoltageRefGet()

fsp_err_t RM_MOTOR_120_CONTROL_SENSORLESS_VoltageRefGet ( motor_120_control_ctrl_t *const *p_ctrl*, motor_120_control_voltage_ref_t *const *p_voltage_ref* )

Get voltage ref. Implements motor_120_control_api_t::voltageRefGet.

Example:

```
/* Get voltage ref */
   (void)
RM_MOTOR_120_CONTROL_SENSORLESS_VoltageRefGet(g_motor_120_control_sensorless0.p_ctrl,
&smpl_voltage_ref);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter error. |

### ◆ RM_MOTOR_120_CONTROL_SENSORLESS_ParameterUpdate()

fsp_err_t RM_MOTOR_120_CONTROL_SENSORLESS_ParameterUpdate ( motor_120_control_ctrl_t *const *p_ctrl*, motor_120_control_cfg_t const *const *p_cfg* )

Update the parameters of sensorless 120 detection module. Implements motor_120_control_api_t::parameterUpdate.

Example:

```
    (void)
RM_MOTOR_120_CONTROL_SENSORLESS_ParameterUpdate
(g_motor_120_control_sensorless0.p_ctrl,

g_motor_120_control_sensorless0.p_cfg);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully data was updated. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter error. |

### Detailed Description

Calculation process for the motor control on RA MCUs. This module implements the Motor 120-Degree Control Interface.

# Overview

The motor current is used to control the electric current of motor rotation in an application. This module should be called cyclically after the A/D conversion of electric current of each phase in an application. This module calculates each phase voltage with input current reference, electric current and rotor angle.

### Features

The motor 120 control hall module has below features.

- Calculate each phase(U/V/W) voltage.
- Decoupling control.
- Voltage error compensation.

# Configuration

### Build Time Configurations for rm_motor_120_control_hall

The following build time configurations are defined in fsp_cfg/rm_motor_120_control_hall_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

### Configurations for Motor > 120-degree conduction control with Hall sensors

**(rm_motor_120_control_hall)**

This module can be added to the Stacks tab via New Stack > Motor > 120-degree conduction control with Hall sensors (rm_motor_120_control_hall).

| Configuration | Options | Default | Description |
|---|---|---|---|
| General | | | |
| Name | Name must be a valid C symbol | g_motor_120_control_hall0 | Module name. |
| Conduction type | • First 60 degree PWM<br>• Complementary First 60 degree PWM | First 60 degree PWM | Select conduction type |
| Timeout counts (msec) | Must be a valid integer. | 200 | Counts to judge rotor unrotate |
| Maximum voltage (V) | Must be a valid non-negative value. | 20.0 | Maximum output voltage (V) |
| Minimum voltage (V) | Must be a valid non-negative value. | 3.0 | Minimum output voltage (V) |
| Speed PI decimation | Must be a valid integer. | 0 | Speed PI control decimation count |
| Freerun timer frequency (MHz) | Must be a valid integer. | 120 | Freerun timer frequency (MHz) |
| Speed LPF | Must be a valid non-negative value. | 1.0 | Speed LPF parameter |
| Step of speed reference change | Must be a valid non-negative value. | 0.2 | Speed ref change step |
| Start reference voltage (V) | Must be a valid non-negative value. | 5.8 | Reference voltage for boot mode (V) |
| Hall wait counts | Must be a valid integer. | 12 | Wait counts of hall interrupts to start speed calculation |
| Stop judge time | Must be a valid integer. | 1000 | Stop judge time |
| Minimum limit speed (rpm) | Must be a valid integer. | 550 | Minimum limit speed (rpm) (mechanical angle) |
| PI control KP | Must be a valid non-negative value. | 0.02 | PI control gain of proportional term |
| PI control KI | Must be a valid non-negative value. | 0.0005 | PI control gain of integral term |
| PI control limit | Must be a valid non-negative value. | 24.0 | PI control limit of integral term |

| | | | |
|---|---|---|---|
| Hall interrupt mask value | Must be a valid integer. | 15 | For limiting hall interrupt processing. Limited by the number of ADC interrupts |
| Motor Parameter | | | |
| Pole pairs | Must be a valid integer. | 2 | Pole pairs |
| Resistance (ohm) | Must be a valid non-negative value. | 6.447 | Resistance |
| Inductance of d-axis (H) | Must be a valid non-negative value. | 0.0045 | Inductance of d-axis |
| Inductance of q-axis (H) | Must be a valid non-negative value. | 0.0045 | Inductance of q-axis |
| Permanent magnetic flux (Wb) | Must be a valid non-negative value. | 0.02159 | Permanent magnetic flux |
| Motor Parameter > Rotor inertia (kgm^2) | Must be a valid non-negative value. | 1.8 | Rotor inertia |
| Interrupts | | | |
| Callback | Name must be a valid C symbol | NULL | Callback function |
| Hall sensor port U | Manual Entry | BSP_IO_PORT_04_PIN_11 | Hall sensor port U |
| Hall sensor port V | Manual Entry | BSP_IO_PORT_04_PIN_10 | Hall sensor port V |
| Hall sensor port W | Manual Entry | BSP_IO_PORT_04_PIN_09 | Hall sensor port W |

### Clock Configuration

This module doesn't depend on clock setting, because this module is a simple calculation process.

### Pin Configuration

Depend on included ICU module.

## Usage Notes

### Limitations

- Set the period of current control with none-negative value.
- Set the reference voltage with none-negative value.

## Examples

### Basic Example

This is a basic example of minimal use of the motor 120 control hall in an application.

```
void motor_120_control_hall_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = RM_MOTOR_120_CONTROL_HALL_Open(g_motor_120_control_hall0.p_ctrl,
g_motor_120_control_hall0.p_cfg);
    assert(FSP_SUCCESS == err);
 /* Set speed reference before motor run */
    (void) RM_MOTOR_120_CONTROL_HALL_SpeedSet(g_motor_120_control_hall0.p_ctrl,
DEF_120_CONTROL_HALL_TEST_SPEED_REF);
 /* Start motor rotation */
    (void) RM_MOTOR_120_CONTROL_HALL_Run(g_motor_120_control_hall0.p_ctrl);
 /* Get current motor speed */
    (void) RM_MOTOR_120_CONTROL_HALL_SpeedGet(g_motor_120_control_hall0.p_ctrl,
&smpl_speed);
 /* Get current */
    (void) RM_MOTOR_120_CONTROL_HALL_CurrentGet(g_motor_120_control_hall0.p_ctrl,
&smpl_current_status);
 /* Get wait stop flag */
    (void)
RM_MOTOR_120_CONTROL_HALL_WaitStopFlagGet(g_motor_120_control_hall0.p_ctrl,
&smpl_wait_stop_flag);
 /* Get timeout error flag */
    (void)
RM_MOTOR_120_CONTROL_HALL_TimeoutErrorFlagGet(g_motor_120_control_hall0.p_ctrl,
&smpl_timeout_error_flag);
 /* Get pattern error flag */
    (void)
RM_MOTOR_120_CONTROL_HALL_PatternErrorFlagGet(g_motor_120_control_hall0.p_ctrl,
&smpl_pattern_error_flag);
 /* Get voltage ref */
    (void) RM_MOTOR_120_CONTROL_HALL_VoltageRefGet(g_motor_120_control_hall0.p_ctrl,
&smpl_voltage_ref);
    (void)
```

```
RM_MOTOR_120_CONTROL_HALL_ParameterUpdate(g_motor_120_control_hall0.p_ctrl,
g_motor_120_control_hall0.p_cfg);
 /* Stop motor rotation */
    (void) RM_MOTOR_120_CONTROL_HALL_Stop(g_motor_120_control_hall0.p_ctrl);
 /* Reset the process. */
    (void) RM_MOTOR_120_CONTROL_HALL_Reset(g_motor_120_control_hall0.p_ctrl);
 /* Close the module. */
    (void) RM_MOTOR_120_CONTROL_HALL_Close(g_motor_120_control_hall0.p_ctrl);
}
```

## Data Structures

## Data Structure Documentation

### ◆ motor_120_control_hall_extended_cfg_t

| struct motor_120_control_hall_extended_cfg_t | | |
|---|---|---|
| Extended configurations for motor 120 control hall | | |
| Data Fields | | |
| bsp_io_port_pin_t | port_hall_sensor_u | Hall sensor port U. |
| bsp_io_port_pin_t | port_hall_sensor_v | Hall sensor port V. |
| bsp_io_port_pin_t | port_hall_sensor_w | Hall sensor port W. |
| float | f4_start_refv | Reference voltage for boot mode. |
| uint32_t | u4_hall_wait_cnt | Wait counts of hall interrupts for speed calculation. |
| uint32_t | u4_stop_judge_time | Stop judge time. |
| uint32_t | u4_min_speed_rpm | Minimum limit speed (rpm) (mechanical angle) |
| uint32_t | u4_hall_interrupt_mask_value | For limiting hall interrupt processing. Limited by the number of ADC interrupts. |
| motor_120_driver_instance_t const * | p_motor_120_driver_instance | Motor 120 driver access module. |
| timer_instance_t const * | p_speed_cyclic_timer_instance | Cyclic process of speed control timer module. |
| timer_instance_t const * | p_speed_calc_timer_instance | Speed calculate timer module. |

| | | |
|---|---|---|
| external_irq_instance_t const * | p_u_hall_irq_instance | U phase hall interrupt. |
| external_irq_instance_t const * | p_v_hall_irq_instance | V phase hall interrupt. |
| external_irq_instance_t const * | p_w_hall_irq_instance | W phase hall interrupt. |

### ◆ motor_120_control_hall_instance_ctrl_t

| struct motor_120_control_hall_instance_ctrl_t | | |
|---|---|---|
| 120 control hall instance control block | | |
| Data Fields | | |
| uint32_t | open | Used to determine if the channel is configured. |
| motor_120_control_status_t | active | Flag to set active/inactive the motor 120 control. |
| motor_120_control_run_mode_t | run_mode | Drive mode. |
| motor_120_control_timeout_error_flag_t | timeout_error_flag | Timeout error status. |
| motor_120_control_pattern_error_flag_t | pattern_error_flag | Hall pattern error status. |
| motor_120_control_rotation_direction_t | direction | Rotational direction (0:CW ,1:CCW) |
| float | f4_speed_calc_base | Base counts to calculate rotation speed. |
| float | f_rpm2rad | Translate value to radian/second to rpm. |
| float | f4_v_ref | Voltage reference (output of speed PI control) |
| float | f4_ref_speed_rad | Motor speed reference. |
| float | f4_ref_speed_rad_ctrl | Motor speed reference for speed PI control. |
| float | f4_speed_rad | Motor speed. |
| uint32_t | u4_cnt_speed_pi | Counter for period of speed PI control. |
| motor_120_control_wait_stop_flag_t | flag_wait_stop | Flag for waiting for motor stop. |
| uint32_t | u4_cnt_wait_stop | Counter for waiting motor stop. |
| motor_120_driver_phase_pattern_t | v_pattern | Voltage pattern. |
| motor_120_control_speed_ref_t | flag_speed_ref | Speed reference flag. |
| motor_120_control_voltage_ref_t | flag_voltage_ref | Voltage reference flag. |
| | | |

| | | |
|---|---|---|
| uint32_t | u4_cnt_timeout | Counter for timeout error. |
| uint32_t | u4_hall_timer_cnt | Value of timer counter. |
| uint32_t | u4_pre_hall_timer_cnt | Previous value of timer counter. |
| int32_t | s4_timer_cnt_ave | Counts for 360 degrees. |
| uint32_t | u4_timer_cnt_buf[MOTOR_120_CONTROL_HALL_TIMES] | Counts for 60 degrees. |
| uint32_t | u4_timer_cnt_num | Array element number before 360 degrees. |
| float | f4_pi_ctrl_err | PI control error. |
| float | f4_pi_ctrl_refi | PI control buffer of integral term. |
| uint32_t | u4_hall_intr_cnt | For start timing of speed calculation. |
| uint32_t | u4_adc_interrupt_cnt | Number of ADC interrupt processing. |
| motor_120_control_cfg_t const * | p_cfg | Pointer of configuration structure. |
| timer_direction_t | timer_direction | Hold timer direction. |
| external_irq_callback_args_t | hall_interrupt_args | For call IRQ callbackSet function. |
| timer_callback_args_t | timer_args | For call timer callbackSet function. |

### Function Documentation

### ◆ RM_MOTOR_120_CONTROL_HALL_Open()

fsp_err_t RM_MOTOR_120_CONTROL_HALL_Open ( motor_120_control_ctrl_t *const *p_ctrl*, motor_120_control_cfg_t const *const *p_cfg* )

Opens and configures the motor hall 120 detection module. Implements motor_120_control_api_t::open.

Example:

```
/* Initializes the module. */
   err = RM_MOTOR_120_CONTROL_HALL_Open(g_motor_120_control_hall0.p_ctrl,
g_motor_120_control_hall0.p_cfg);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Motor 120 driver successfully configured. |
| FSP_ERR_ASSERTION | Null pointer, or one or more configuration options is invalid. |
| FSP_ERR_ALREADY_OPEN | Module is already open. This module can only be opened once. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter error. |

### ◆ RM_MOTOR_120_CONTROL_HALL_Close()

fsp_err_t RM_MOTOR_120_CONTROL_HALL_Close ( motor_120_control_ctrl_t *const *p_ctrl*)

Disables specified motor hall 120 detection module. Implements motor_120_control_api_t::close.

Example:

```
/* Close the module. */
   (void) RM_MOTOR_120_CONTROL_HALL_Close(g_motor_120_control_hall0.p_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully closed. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_MOTOR_120_CONTROL_HALL_Run()

fsp_err_t RM_MOTOR_120_CONTROL_HALL_Run ( motor_120_control_ctrl_t *const *p_ctrl*)

Run motor (Start motor rotation). Implements motor_120_control_api_t::run.

Example:

```
/* Start motor rotation */
   (void) RM_MOTOR_120_CONTROL_HALL_Run(g_motor_120_control_hall0.p_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_MOTOR_120_CONTROL_HALL_Stop()

fsp_err_t RM_MOTOR_120_CONTROL_HALL_Stop ( motor_120_control_ctrl_t *const *p_ctrl*)

Stop motor (Stop motor rotation). Implements motor_120_control_api_t::stop.

Example:

```
/* Stop motor rotation */
   (void) RM_MOTOR_120_CONTROL_HALL_Stop(g_motor_120_control_hall0.p_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_MOTOR_120_CONTROL_HALL_Reset()

fsp_err_t RM_MOTOR_120_CONTROL_HALL_Reset ( motor_120_control_ctrl_t *const *p_ctrl*)

Reset variables of motor hall 120 detection module. Implements motor_120_control_api_t::reset.

Example:

```
/* Reset the process. */
   (void) RM_MOTOR_120_CONTROL_HALL_Reset(g_motor_120_control_hall0.p_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully reset. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_MOTOR_120_CONTROL_HALL_SpeedSet()

fsp_err_t RM_MOTOR_120_CONTROL_HALL_SpeedSet ( motor_120_control_ctrl_t *const *p_ctrl*, float const *speed_rpm* )

Set speed[rpm]. Implements motor_120_control_api_t::speedSet.

Example:

```
/* Set speed reference before motor run */
   (void) RM_MOTOR_120_CONTROL_HALL_SpeedSet(g_motor_120_control_hall0.p_ctrl,
DEF_120_CONTROL_HALL_TEST_SPEED_REF);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_MOTOR_120_CONTROL_HALL_SpeedGet()

fsp_err_t RM_MOTOR_120_CONTROL_HALL_SpeedGet ( motor_120_control_ctrl_t *const *p_ctrl*, float *const *p_speed_rpm* )

Get speed. Implements motor_120_control_api_t::speedGet.

Example:

```
/* Get current motor speed */
   (void) RM_MOTOR_120_CONTROL_HALL_SpeedGet(g_motor_120_control_hall0.p_ctrl,
&smpl_speed);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter error. |

### ◆ RM_MOTOR_120_CONTROL_HALL_CurrentGet()

fsp_err_t RM_MOTOR_120_CONTROL_HALL_CurrentGet ( motor_120_control_ctrl_t *const *p_ctrl*, motor_120_driver_current_status_t *const *p_current_status* )

Get current. Implements motor_120_control_api_t::currentGet.

Example:

```
/* Get current */
   (void) RM_MOTOR_120_CONTROL_HALL_CurrentGet(g_motor_120_control_hall0.p_ctrl,
&smpl_current_status);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter error. |

### ◆ RM_MOTOR_120_CONTROL_HALL_WaitStopFlagGet()

fsp_err_t RM_MOTOR_120_CONTROL_HALL_WaitStopFlagGet ( motor_120_control_ctrl_t *const *p_ctrl*, motor_120_control_wait_stop_flag_t *const *p_flag* )

Get wait stop flag. Implements motor_120_control_api_t::waitStopFlagGet.

Example:

```
/* Get wait stop flag */
   (void)
RM_MOTOR_120_CONTROL_HALL_WaitStopFlagGet(g_motor_120_control_hall0.p_ctrl,
&smpl_wait_stop_flag);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter error. |

### ◆ RM_MOTOR_120_CONTROL_HALL_TimeoutErrorFlagGet()

fsp_err_t RM_MOTOR_120_CONTROL_HALL_TimeoutErrorFlagGet ( motor_120_control_ctrl_t *const *p_ctrl*, motor_120_control_timeout_error_flag_t *const *p_timeout_error_flag* )

Get timeout error flag. Implements motor_120_control_api_t::timeoutErrorFlagGet.

Example:

```
/* Get timeout error flag */
   (void)
RM_MOTOR_120_CONTROL_HALL_TimeoutErrorFlagGet(g_motor_120_control_hall0.p_ctrl,
&smpl_timeout_error_flag);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter error. |

### ◆ RM_MOTOR_120_CONTROL_HALL_PatternErrorFlagGet()

fsp_err_t RM_MOTOR_120_CONTROL_HALL_PatternErrorFlagGet ( motor_120_control_ctrl_t *const *p_ctrl*, motor_120_control_pattern_error_flag_t *const *p_pattern_error_flag* )

Get pattern error flag. Implements motor_120_control_api_t::patternErrorFlagGet.

Example:

```
/* Get pattern error flag */
   (void)
RM_MOTOR_120_CONTROL_HALL_PatternErrorFlagGet(g_motor_120_control_hall0.p_ctrl,
&smpl_pattern_error_flag);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter error. |

### ◆ RM_MOTOR_120_CONTROL_HALL_VoltageRefGet()

fsp_err_t RM_MOTOR_120_CONTROL_HALL_VoltageRefGet ( motor_120_control_ctrl_t *const *p_ctrl*, motor_120_control_voltage_ref_t *const *p_voltage_ref* )

Get voltage ref. Implements motor_120_control_api_t::voltageRefGet.

Example:

```
/* Get voltage ref */
   (void) RM_MOTOR_120_CONTROL_HALL_VoltageRefGet(g_motor_120_control_hall0.p_ctrl,
&smpl_voltage_ref);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter error. |

### ◆ RM_MOTOR_120_CONTROL_HALL_ParameterUpdate()

fsp_err_t RM_MOTOR_120_CONTROL_HALL_ParameterUpdate ( motor_120_control_ctrl_t *const *p_ctrl*, motor_120_control_cfg_t const *const *p_cfg* )

Update the parameters of hall 120 detection module. Implements motor_120_control_api_t::parameterUpdate.

Example:

```
    (void)
RM_MOTOR_120_CONTROL_HALL_ParameterUpdate(g_motor_120_control_hall0.p_ctrl,
g_motor_120_control_hall0.p_cfg);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully data was updated. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter error. |

### Detailed Description

Calculation process for the motor control on RA MCUs. This module implements the Motor driver Interface.

# Overview

The motor driver module is used to translate phase voltage to PWM duty and output PWM, and detect phase current and main line voltage. This module should be called cyclically at included A/D Conversion finish interrupt.

### Features

The Motor Driver Module has below features.

- Calculate each phase(U/V/W) PWM duty according to reference and output PWM.
- Detect each phase current and main line voltage.
- Detect and correct A/D offset at phase current channel

# Configuration

### Build Time Configurations for rm_motor_driver

The following build time configurations are defined in fsp_cfg/rm_motor_driver_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| ADC_B Support | • Enabled<br>• Disabled | Disabled | Select ADC_B module support. |
| Shared ADC support | • Enabled<br>• Disabled | Disabled | Select Shared ADC support. |
| Supported Motor Number | Must be greater than 1. | 1 | |

### Configurations for Motor > ADC and PWM Modulation (rm_motor_driver)

This module can be added to the Stacks tab via New Stack > Motor > ADC and PWM Modulation (rm_motor_driver).

| Configuration | Options | Default | Description |
|---|---|---|---|
| General | | | |
| Name | Name must be a valid C symbol | g_motor_driver0 | Module name. |
| Shunt type | • 1 shunt<br>• 2 shunt<br>• 3 shunt | 2 shunt | Select shunt type |
| Modulation method | • SVPWM<br>• SPWM | SVPWM | Select PWM modulation method |
| PWM output port UP | Manual Entry | 0 | PWM output port UP |
| PWM output port UN | Manual Entry | 0 | PWM output port UN |
| PWM output port VP | Manual Entry | 0 | PWM output port VP |
| PWM output port VN | Manual Entry | 0 | PWM output port VN |
| PWM output port WP | Manual Entry | 0 | PWM output port WP |
| PWM output port WN | Manual Entry | 0 | PWM output port WN |
| PWM Timer Frequency (MHz) | Must be a valid integer. | 120 | GPT PWM timer frequency |
| PWM Carrier Period (Microseconds) | Must be a valid integer. | 50 | GPT PWM carrier period |
| Dead Time (Raw Counts) | Must be a valid integer. | 240 | GPT PWM dead time |
| Current Range (A) | Must be a valid value | 27.5F | Current range to measure(Maximum |

| | | | |
|---|---|---|---|
| | | | input current) |
| Voltage Range (V) | Must be a valid value | 111.0F | Voltage range to measure(Maximum input Main Line Voltage) |
| Counts for current offset measurement | Must be a valid integer. | 500 | How many times to measure current offset |
| A/D conversion channel for U Phase current | Value must be a supported channel number | 0 | Specify the A/D channel for U phase current (channel availability varies by MCU) |
| A/D conversion channel for W Phase current | Value must be a supported channel number | 2 | Specify the A/D channel for W phase current (channel availability varies by MCU) |
| A/D conversion channel for Main Line Voltage | Value must be a supported channel number | 5 | Specify the A/D channel for main line voltage (channel availability varies by MCU) |
| A/D conversion channel for V Phase current | Value must be a supported channel number | 1 | Specify the A/D channel for V phase current (channel availability varies by MCU) |
| A/D conversion channel for sin signal | Value must be a supported channel number | 27 | Specify the A/D channel for sin signal of induction sensor (channel availability varies by MCU) |
| A/D conversion channel for cos signal | Value must be a supported channel number | 28 | Specify the A/D channel for cos signal of induction sensor (channel availability varies by MCU) |
| Using ADC Scan Group | Value should be between 0 to 8 (valid only with ADC_B module) | 0 | For MCUs with ADC_B, select the scan group used. |
| A/D conversion unit for U Phase current | Must be a valid non-negative value. | 0 | Select the A/D conversion module for U phase current (only valid with adc module) |
| A/D conversion unit for W Phase current | Must be a valid non-negative value. | 0 | Select the A/D conversion module for W phase current (only |

| | | | |
|---|---|---|---|
| | | | valid with adc module) |
| A/D conversion unit for main line voltage | Must be a valid non-negative value. | 0 | Select the A/D conversion module for main line voltage (only valid with adc module) |
| A/D conversion unit for V Phase current | Must be a valid non-negative value. | 0 | Select the A/D conversion module for V phase current (only valid with adc module) |
| A/D conversion unit for sin signal | Must be a valid non-negative value. | 0 | Select the A/D conversion module for sin signal of induction sensor (only valid with adc module) |
| A/D conversion unit for cos signal | Must be a valid non-negative value. | 0 | Select the A/D conversion module for cos signal of induction sensor (only valid with adc module) |
| ADC interrupt module | • 1st<br>• 2nd | 1st | Select from which module ADC intterupt happens (only valid with adc module) |
| Adjustment value to current A/D | Must be a valid non-negative value. | 20.0 | Value to adjust 1shunt A/D double buffer |
| Minimum difference of PWM duty | Must be a valid non-negative value. | 300 | Minimum difference of PWM duty |
| Adjustment delay of A/D conversion | Must be a valid non-negative value. | 240 | Adjustment delay of A/D conversion |
| 1shunt interrupt phase | • PHASE_U<br>• PHASE_V<br>• PHASE_W | PHASE_U | Select the phase which occures ADC end interrupt. (Only valid with 1shunt) |
| Input Voltage (V) | Must be a valid value | 24.0F | Input voltage |
| Resolution of A/D conversion | Must be a valid Resolution of ADC. | 0xFFF | Resolution of A/D conversion |
| Offset of A/D conversion for current | Must be a valid non-negative value. | 0x745 | Offset of A/D conversion for current |
| Conversion level of A/D conversion for voltage | Must be a valid value | 0.66F | Conversion level of A/D conversion for voltage |
| GTIOCA Stop Level | • Pin Level Low<br>• Pin Level High | Pin Level High | Select the behavior of the output pin when the timer is stopped. |
| GTIOCB Stop Level | • Pin Level Low<br>• Pin Level High | Pin Level High | Select the behavior of the output pin when |

| | | | |
|---|---|---|---|
| | | | the timer is stopped. |
| Modulation | | | |
| Maximum Duty | Must be a valid value | 0.9375F | Maximum duty of PWM |
| Interrupts | | | |
| Callback | Name must be a valid C symbol | NULL | A user callback function. If this callback function is provided, it is called at A/D conversion finish interrupt. |

### Clock Configuration

Set used clock with included GPT timer.

### Pin Configuration

Depend on included GPT Three Phase Module and ADC Module.

## Usage Notes

When shared ADC instance is used, please perform below sequence.

1. Add (New) shared ADC instance.
2. Set configurations of below ADC module for your use.
3. Select "Common | Shared ADC support" to "Enabled".

### Limitations

Basically no limitation exists.

## Examples

### Basic Example

This is a basic example of minimal use of the Motor Driver in an application.

```
void motor_driver_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = RM_MOTOR_DRIVER_Open(&g_motor_driver0.p_ctrl, &g_motor_driver0.p_cfg);
    assert(FSP_SUCCESS == err);
 /* Basically run this module at cyclic interrupt (e.g. included GPT PWM Carrier
intterupt).
  * This implementation is an example. */
```

```
 // while (true)
    {
 /* Application work here. */
 /* Get electric current, main line voltage and maximum voltage component */
       (void) RM_MOTOR_DRIVER_CurrentGet(&g_motor_driver0.p_ctrl, &f_get_iu,
&f_get_iw, &f_get_vdc, &f_get_va_max);
 /* Get the flag of A/D convderted current offset */
       (void) RM_MOTOR_DRIVER_FlagCurrentOffsetGet(&g_motor_driver0.p_ctrl,
&u1_get_flg_offset);
 // Perform current control process here
 /* Set phase voltage */
       (void) RM_MOTOR_DRIVER_PhaseVoltageSet(&g_motor_driver0.p_ctrl, 1.0F, 1.0F,
1.0F);
       (void) RM_MOTOR_DRIVER_ParameterUpdate(&g_motor_driver0.p_ctrl,
&g_motor_driver0.p_cfg);
    }
    (void) RM_MOTOR_DRIVER_Reset(&g_motor_driver0.p_ctrl);
 //

    (void) RM_MOTOR_DRIVER_Close(&g_motor_driver0.p_ctrl);
}
```

## Data Structures

| MOTOR_DRIVER_MODULATION_METHOD_SVPWM | Space vector pulse-width-modulation. |

## Function Documentation

### ◆ RM_MOTOR_DRIVER_Open()

fsp_err_t RM_MOTOR_DRIVER_Open ( motor_driver_ctrl_t *const *p_ctrl*, motor_driver_cfg_t const *const *p_cfg* )

Opens and configures the Motor Driver module. Implements motor_driver_api_t::open.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Motor Driver successfully configured. |
| FSP_ERR_ASSERTION | Null pointer, or one or more configuration options is invalid. |
| FSP_ERR_ALREADY_OPEN | Module is already open. This module can only be opened once. |

### ◆ RM_MOTOR_DRIVER_Close()

fsp_err_t RM_MOTOR_DRIVER_Close ( motor_driver_ctrl_t *const *p_ctrl*)

Disables specified Motor Driver Module. Implements motor_driver_api_t::close.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully closed. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_MOTOR_DRIVER_Reset()

fsp_err_t RM_MOTOR_DRIVER_Reset ( motor_driver_ctrl_t *const *p_ctrl*)

Reset variables of Motor Driver Module. Implements motor_driver_api_t::reset.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully reset. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_MOTOR_DRIVER_PhaseVoltageSet()

fsp_err_t RM_MOTOR_DRIVER_PhaseVoltageSet ( motor_driver_ctrl_t *const *p_ctrl*, float const *u_voltage*, float const *v_voltage*, float const *w_voltage* )

Set Phase Voltage Data to calculate PWM duty. Implements motor_driver_api_t::phaseVoltageSet.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully data is set. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_MOTOR_DRIVER_CurrentGet()

fsp_err_t RM_MOTOR_DRIVER_CurrentGet ( motor_driver_ctrl_t *const *p_ctrl*, motor_driver_current_get_t *const *p_current_get* )

Get calculated phase Current, Vdc & Va_max data. Implements motor_driver_api_t::currentGet.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successful data get. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter error. |

### ◆ RM_MOTOR_DRIVER_FlagCurrentOffsetGet()

fsp_err_t RM_MOTOR_DRIVER_FlagCurrentOffsetGet ( motor_driver_ctrl_t *const *p_ctrl*, uint8_t *const *p_flag_offset* )

Get the flag of finish current offset detection. Implements motor_driver_api_t::flagCurrentOffsetGet .

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successful data get. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter error. |

### ◆ RM_MOTOR_DRIVER_CurrentOffsetRestart()

fsp_err_t RM_MOTOR_DRIVER_CurrentOffsetRestart ( motor_driver_ctrl_t *const *p_ctrl*)

Restart the current offset detection. Implements motor_driver_api_t::currentOffsetRestart.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully restarted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_MOTOR_DRIVER_ParameterUpdate()

fsp_err_t RM_MOTOR_DRIVER_ParameterUpdate ( motor_driver_ctrl_t *const *p_ctrl*, motor_driver_cfg_t const *const *p_cfg* )

Update the parameters of Driver Module. Implements motor_driver_api_t::parameterUpdate.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully data was updated. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### Detailed Description

Calculation process for the motor control on RA MCUs. This module implements the Motor 120-Degree Driver Interface.

# Overview

The motor 120 degree driver module is used to translate phase voltage to PWM duty and output PWM, and detect phase current, voltage and main line voltage. This module should be called cyclically at included A/D conversion finish interrupt.

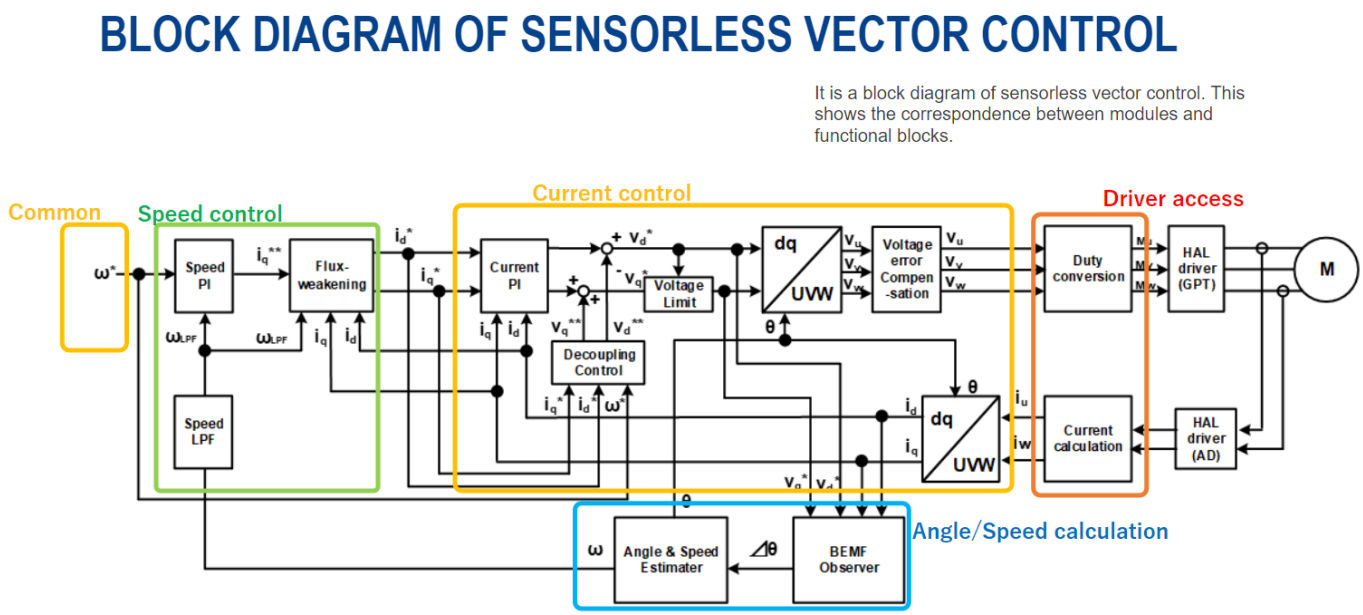

Figure 261: Image of Current Control Module(yellow block)

### Features

The motor 120 degree driver module has below features.

- Calculate each phase(U/V/W) PWM duty according to reference and output PWM.
- Detect each phase current, phase voltage and main line voltage.
- Detect and correct A/D offset at phase current and voltage channel

# Configuration

### Build Time Configurations for rm_motor_120_driver

The following build time configurations are defined in fsp_cfg/rm_motor_120_driver_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| ADC_B Support | • Enabled<br>• Disabled | Disabled | Select ADC_B module support. |
| Shared ADC support | • Enabled<br>• Disabled | Disabled | Select Shared ADC support. |
| Support Motor Number | Must be greater than 1. | 1 | |

**Configurations for Motor > ADC and PWM modulation (rm_motor_120_driver)**

This module can be added to the Stacks tab via New Stack > Motor > ADC and PWM modulation (rm_motor_120_driver).

| Configuration | Options | Default | Description |
|---|---|---|---|
| General | | | |

### Clock Configuration

Set used clock with included GPT timer.

### Pin Configuration

Depend on included GPT three phase module and ADC module.

## Usage Notes

### Limitations

Basically no limitation exists.

## Examples

### Basic Example

This is a basic example of minimal use of the Motor 120 degree driver in an application.

```
void motor_120_driver_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = RM_MOTOR_120_DRIVER_Open(&g_motor_120_driver0.p_ctrl,
&g_motor_120_driver0.p_cfg);
 /* Start PWM output */
```

```
    err = RM_MOTOR_120_DRIVER_Run(&g_motor_120_driver0.p_ctrl);
    assert(FSP_SUCCESS == err);
 /* Basically run this module at cyclic interrupt (e.g. included GPT PWM carrier
intterupt).
  * This implementation is an example. */
 // while (true)
    {
 /* Application work here. */
 /* Caclutarion of current offset */
       (void) RM_MOTOR_120_DRIVER_CurrentOffsetCalc(&g_motor_120_driver0.p_ctrl);
 /* Get electric current, main line voltage and maximum voltage component */
       (void) RM_MOTOR_120_DRIVER_CurrentGet(&g_motor_120_driver0.p_ctrl,
&g_current_status);
 /* Get the flag of A/D convderted current offset */
       (void) RM_MOTOR_120_DRIVER_FlagCurrentOffsetGet(&g_motor_120_driver0.p_ctrl,
&u1_get_flg_offset);
 // Perform current control process here
 /* Set phase voltage */
       (void) RM_MOTOR_120_DRIVER_PhaseVoltageSet(&g_motor_120_driver0.p_ctrl, 1.0F,
1.0F, 1.0F);

## Function Documentation

### ◆ RM_MOTOR_120_DRIVER_Open()

fsp_err_t RM_MOTOR_120_DRIVER_Open ( motor_120_driver_ctrl_t *const *p_ctrl*, motor_120_driver_cfg_t const *const *p_cfg* )

Opens and configures the motor 120 driver module. Implements motor_120_driver_api_t::open.

Example:

```
/* Initializes the module. */
   err = RM_MOTOR_120_DRIVER_Open(&g_motor_120_driver0.p_ctrl,
&g_motor_120_driver0.p_cfg);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Motor 120 driver successfully configured. |
| FSP_ERR_ASSERTION | Null pointer, or one or more configuration options is invalid. |
| FSP_ERR_ALREADY_OPEN | Module is already open. This module can only be opened once. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter error. |

### ◆ RM_MOTOR_120_DRIVER_Close()

fsp_err_t RM_MOTOR_120_DRIVER_Close ( motor_120_driver_ctrl_t *const *p_ctrl*)

Disables specified motor 120 driver module. Implements motor_120_driver_api_t::close.

Example:

```
   (void) RM_MOTOR_120_DRIVER_Close(&g_motor_120_driver0.p_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully closed. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_MOTOR_120_DRIVER_Run()

fsp_err_t RM_MOTOR_120_DRIVER_Run ( motor_120_driver_ctrl_t *const *p_ctrl*)

Run motor (Start motor rotation). Implements motor_120_driver_api_t::run.

Example:

```
/* Start PWM output */
   err = RM_MOTOR_120_DRIVER_Run(&g_motor_120_driver0.p_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_MOTOR_120_DRIVER_Stop()

fsp_err_t RM_MOTOR_120_DRIVER_Stop ( motor_120_driver_ctrl_t *const *p_ctrl*)

Stop motor (Stop motor rotation). Implements motor_120_driver_api_t::stop.

Example:

```
   (void) RM_MOTOR_120_DRIVER_Stop(&g_motor_120_driver0.p_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_MOTOR_120_DRIVER_Reset()

fsp_err_t RM_MOTOR_120_DRIVER_Reset ( motor_120_driver_ctrl_t *const *p_ctrl*)

Reset variables of motor 120 driver module. Implements motor_120_driver_api_t::reset.

Example:

```
   (void) RM_MOTOR_120_DRIVER_Reset(&g_motor_120_driver0.p_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully reset. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_MOTOR_120_DRIVER_PhaseVoltageSet()

fsp_err_t RM_MOTOR_120_DRIVER_PhaseVoltageSet ( motor_120_driver_ctrl_t *const *p_ctrl*, float const *u_voltage*, float const *v_voltage*, float const *w_voltage* )

Set phase voltage data to calculate PWM duty. Implements motor_120_driver_api_t::phaseVoltageSet.

Example:

```
 /* Set phase voltage */
      (void) RM_MOTOR_120_DRIVER_PhaseVoltageSet(&g_motor_120_driver0.p_ctrl, 1.0F,
1.0F, 1.0F);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully data is set. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_MOTOR_120_DRIVER_PhasePatternSet()

fsp_err_t RM_MOTOR_120_DRIVER_PhasePatternSet ( motor_120_driver_ctrl_t *const *p_ctrl*, motor_120_driver_phase_pattern_t const *pattern* )

Set phase voltage pattern. Implements motor_120_driver_api_t::phasePatternSet.

Example:

```
/* Set phase pattern */
      (void) RM_MOTOR_120_DRIVER_PhasePatternSet(&g_motor_120_driver0.p_ctrl,
MOTOR_120_DRIVER_API_VP_ON_WN_PWM);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully data is set. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_MOTOR_120_DRIVER_CurrentGet()

fsp_err_t RM_MOTOR_120_DRIVER_CurrentGet ( motor_120_driver_ctrl_t *const *p_ctrl*, motor_120_driver_current_status_t *const *p_current_status* )

Get calculated phase current, Vdc & Va_max data. Implements motor_120_driver_api_t::currentGet .

Example:

```
/* Get electric current, main line voltage and maximum voltage component */
      (void) RM_MOTOR_120_DRIVER_CurrentGet(&g_motor_120_driver0.p_ctrl,
&g_current_status);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successful data get. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter error. |

### ◆ RM_MOTOR_120_DRIVER_CurrentOffsetCalc()

fsp_err_t RM_MOTOR_120_DRIVER_CurrentOffsetCalc ( motor_120_driver_ctrl_t *const *p_ctrl*)

current offset detection. Implements motor_120_driver_api_t::currentOffsetCalc

Example:

```
/* Caclutarion of current offset */
      (void) RM_MOTOR_120_DRIVER_CurrentOffsetCalc(&g_motor_120_driver0.p_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successful data get. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter error. |

### ◆ RM_MOTOR_120_DRIVER_FlagCurrentOffsetGet()

fsp_err_t RM_MOTOR_120_DRIVER_FlagCurrentOffsetGet ( motor_120_driver_ctrl_t *const *p_ctrl*, motor_120_driver_flag_offset_calc_t *const *p_flag_offset* )

Get the flag of finish current offset detection. Implements motor_120_driver_api_t::flagCurrentOffsetGet.

Example:

```
/* Get the flag of A/D convderted current offset */
      (void) RM_MOTOR_120_DRIVER_FlagCurrentOffsetGet(&g_motor_120_driver0.p_ctrl,
&u1_get_flg_offset);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successful data get. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter error. |

### ◆ RM_MOTOR_120_DRIVER_ParameterUpdate()

| fsp_err_t RM_MOTOR_120_DRIVER_ParameterUpdate ( motor_120_driver_ctrl_t *const *p_ctrl*, motor_120_driver_cfg_t const *const *p_cfg* ) |
|---|
| Update the parameters of 120 driver module. Implements motor_120_driver_api_t::parameterUpdate.<br><br>Example:<br>`(void) RM_MOTOR_120_DRIVER_ParameterUpdate(&g_motor_120_driver0.p_ctrl, &g_motor_120_driver0.p_cfg);`<br><br>**Return values**<br>FSP_SUCCESS — Successfully data was updated.<br>FSP_ERR_ASSERTION — Null pointer.<br>FSP_ERR_NOT_OPEN — Module is not open.<br>FSP_ERR_INVALID_ARGUMENT — Input parameter error. |

### Detailed Description

Usual control of a SPM (Surface Permanent Magnet) motor on RA MCUs. This module implements the Motor 120 degree control (rm_motor_120_degree).

# Overview

The motor 120 degree control is used to control a motor rotation in an application. This module is implemented with using a SPM motor. User can start/stop motor rotation simply.

### Features

The motor 120 degree module has below features.

- Start/Stop a motor rotation
- Error detection (over current, over speed, over voltage, low voltage)

### Target Hardware

The below figure shows examples of target hardware of this Motor 120-degree Module.

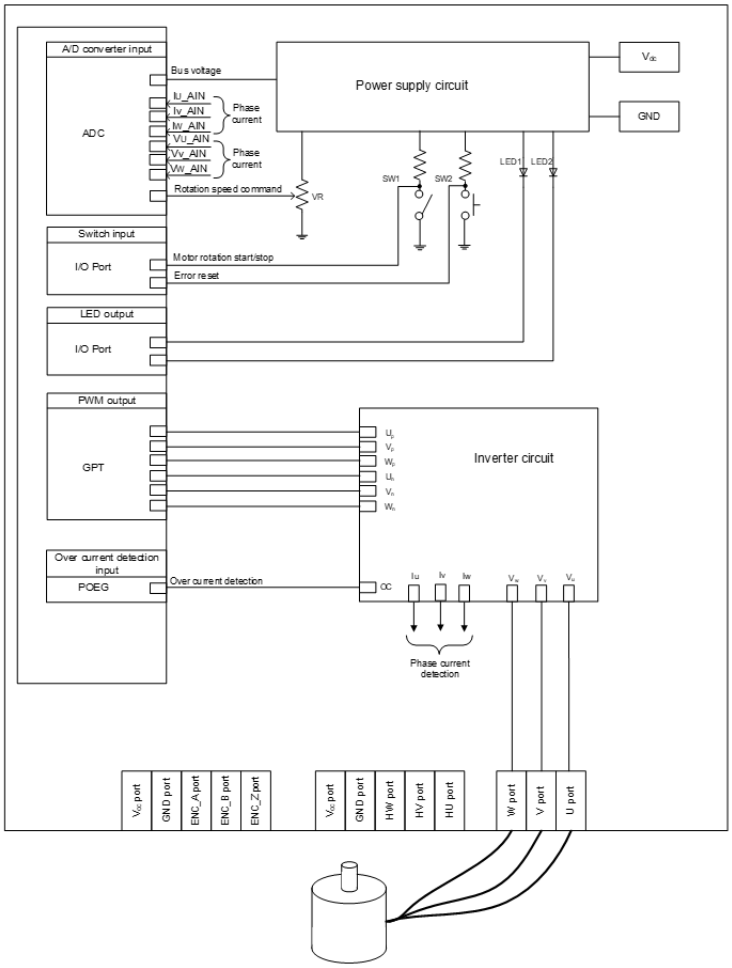

Figure 262: Example of target hardware of motor 120-degree sensorless

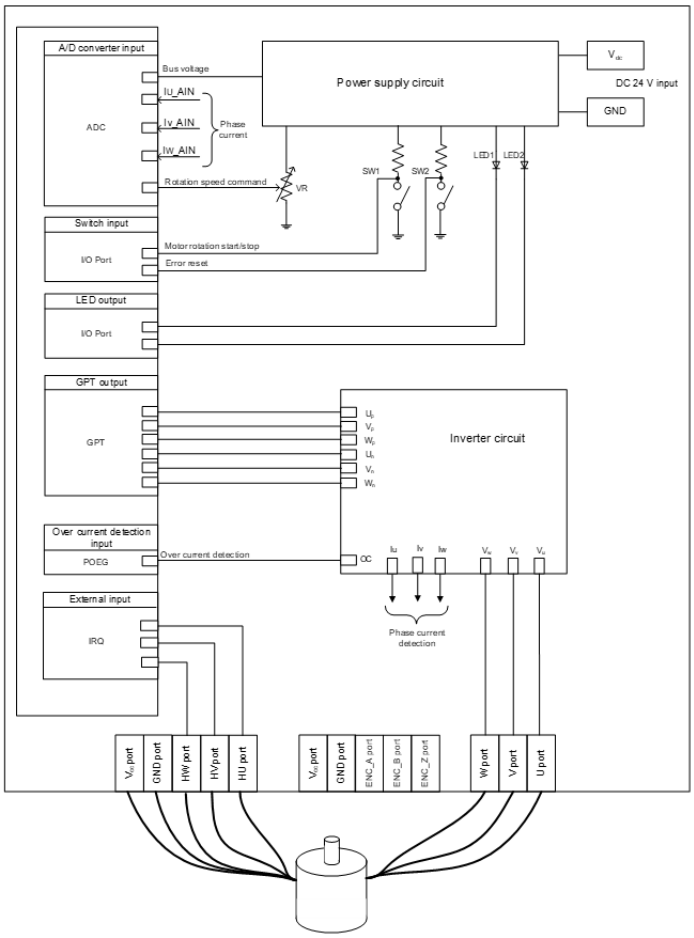

Figure 263: Example of target hardware of motor 120-degree with hall sensor

### Modulation

The modulation factor "m" is defined as follows.

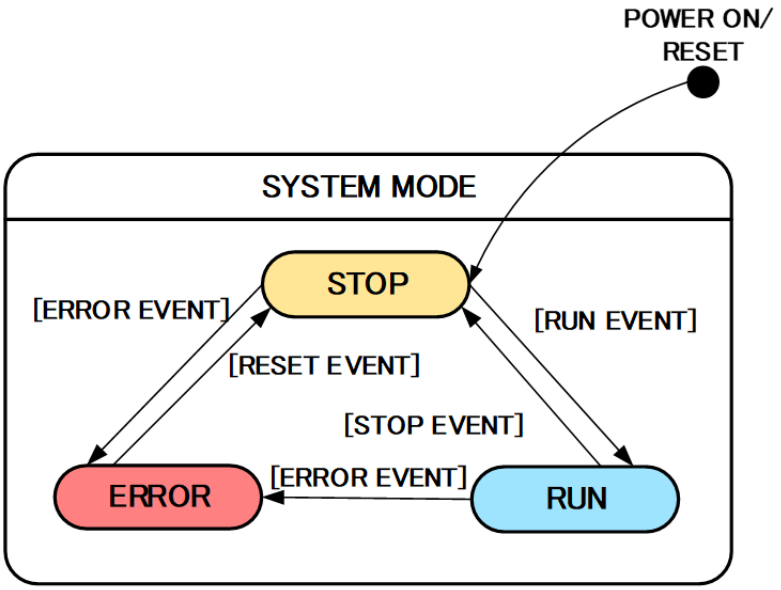
$$m = \frac{V}{E}$$

m : Modulation ratio  V : Reference voltage  E : Inverter input voltage

Figure 264: Modulation factor

### State transition

The below figure shows a state transition diagram. Internal state is managed by "SYSTEM MODE".



| | | MODE | | |
|---|---|---|---|---|
| | | STOP | RUN | ERROR |
| EVENT | STOP | STOP | STOP | ERROR |
| | RUN | RUN | RUN | ERROR |
| | ERROR | ERROR | ERROR | ERROR |
| | RESET | STOP | RUN | STOP |

Figure 265: State transition diagram

(1) SYSTEM MODE "SYSTEM MODE" indicates the operating states of the system. The state transits on occurrence of each event (EVENT). "SYSTEM MODE" has 3 states that are motor drive stop (INACTIVE), motor drive (ACTIVE), and abnormal condition (ERROR).

(2) EVENT When "EVENT" occurs in each "SYSTEM MODE", "SYSTEM MODE" changes as shown the table in above figure, according to that "EVENT". The occurrence factors of each event are shown below.

| EVENT name | Occurrence factor |
|---|---|
| STOP | by user operation |
| RUN | by user operation |
| ERROR | when the system detects an error |
| RESET | by user operation |

**Flowchart**

The below figures show flowcharts of motor 120-degree module.

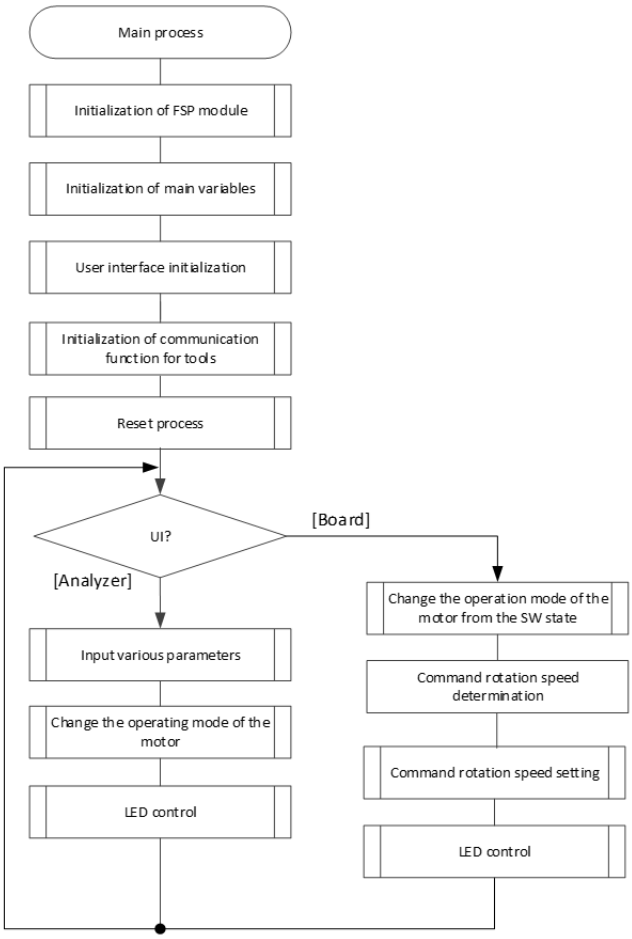


Figure 266: Main process

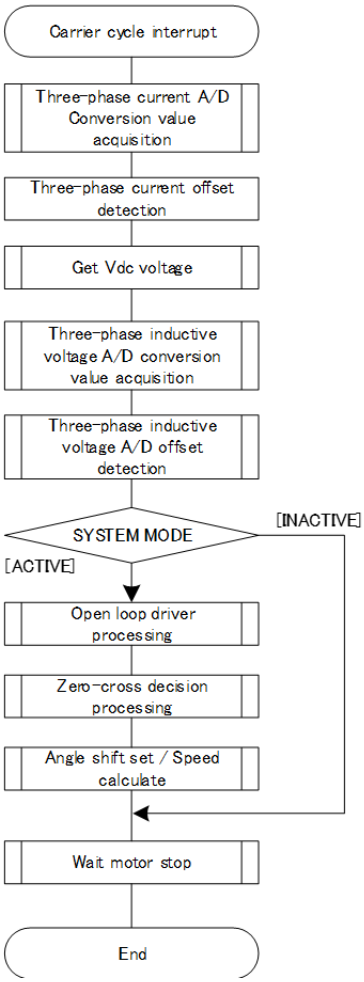

Figure 267: Current control process of 120-degree sensorless

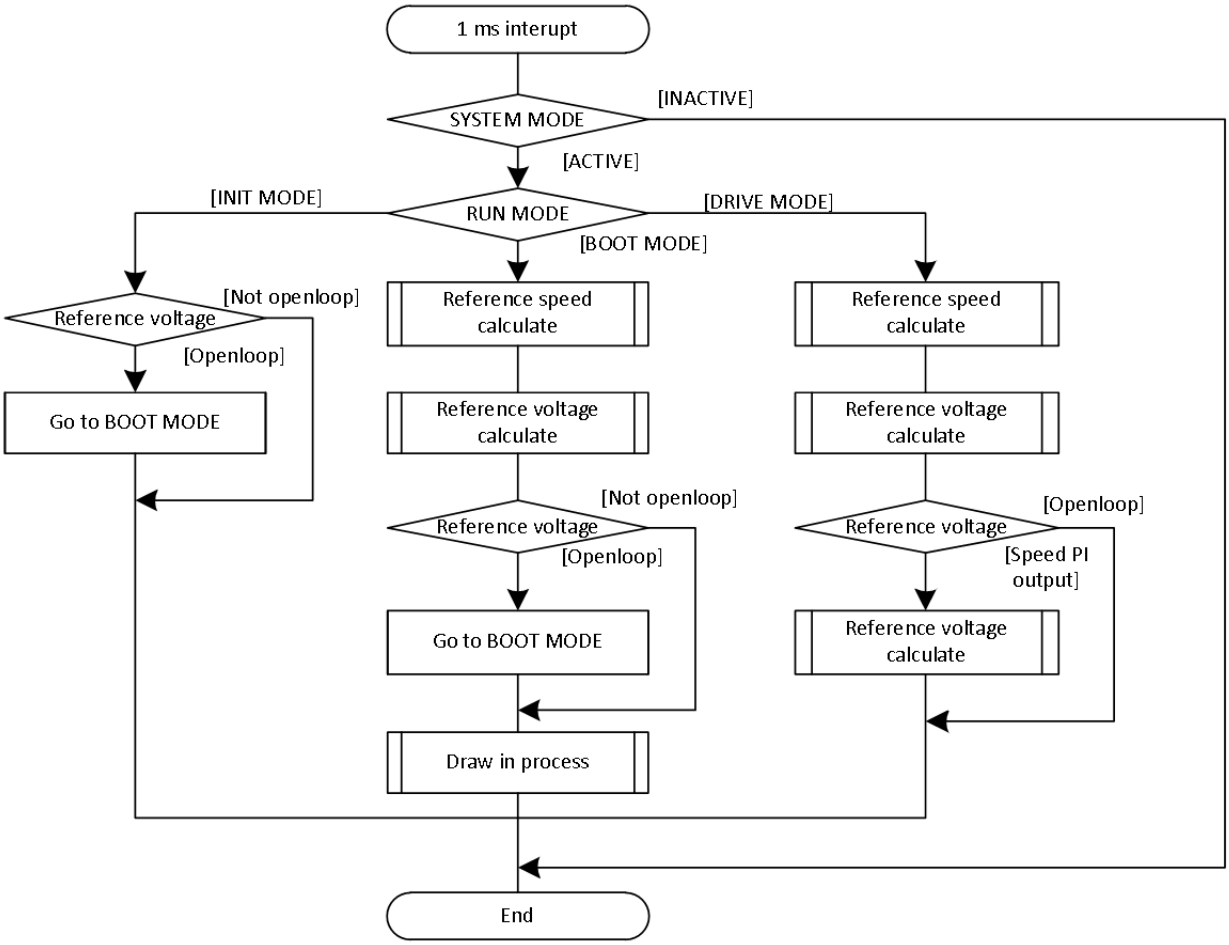

Figure 268: Speed control process of 120-degree sensorless

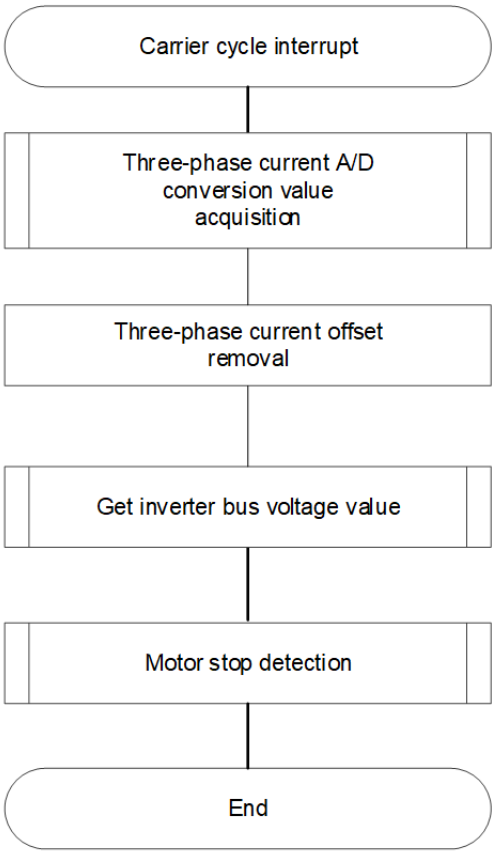

Figure 269: Current control process of 120-degree with hall sensor

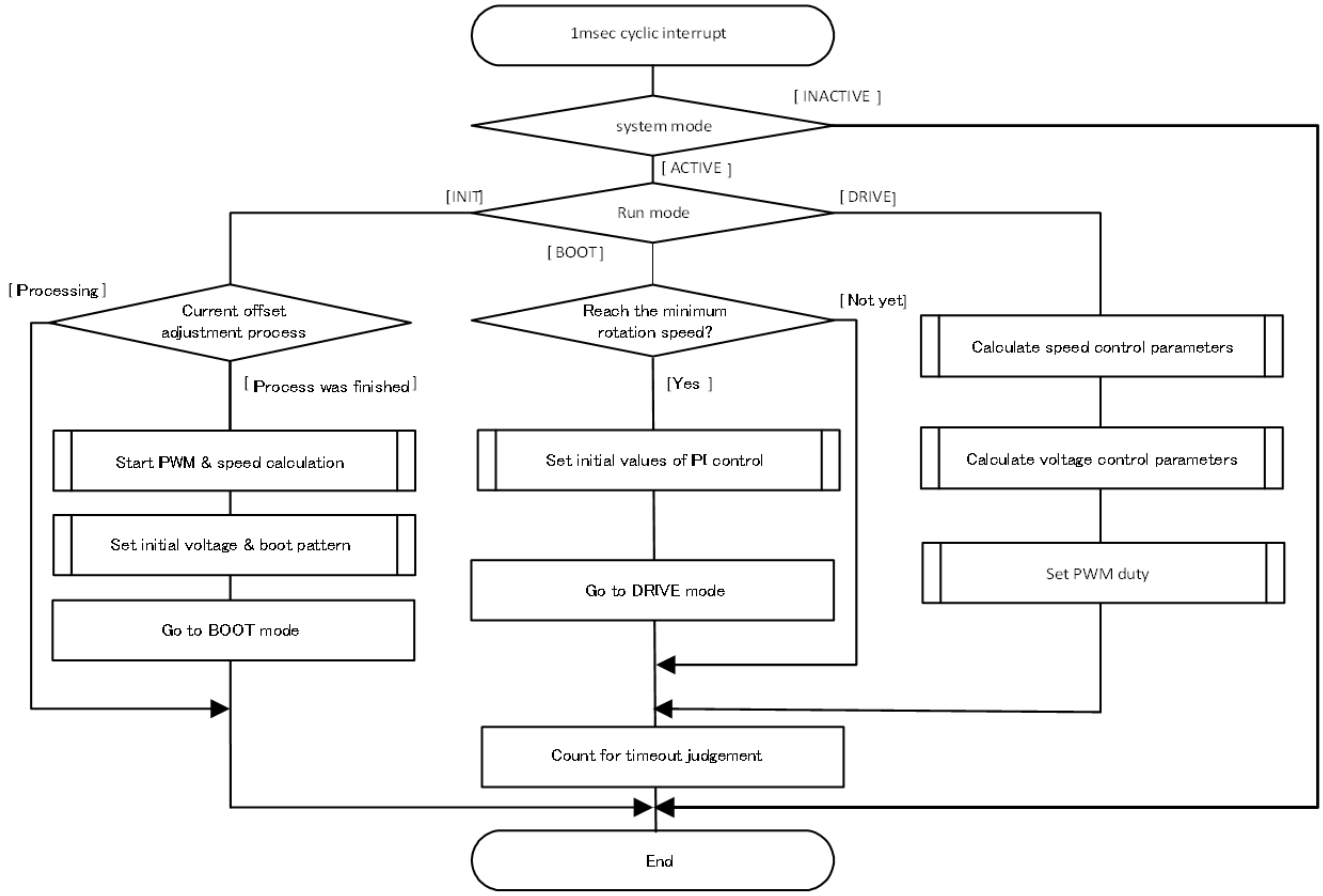

Figure 270: Speed control process of 120-degree with hall sensor

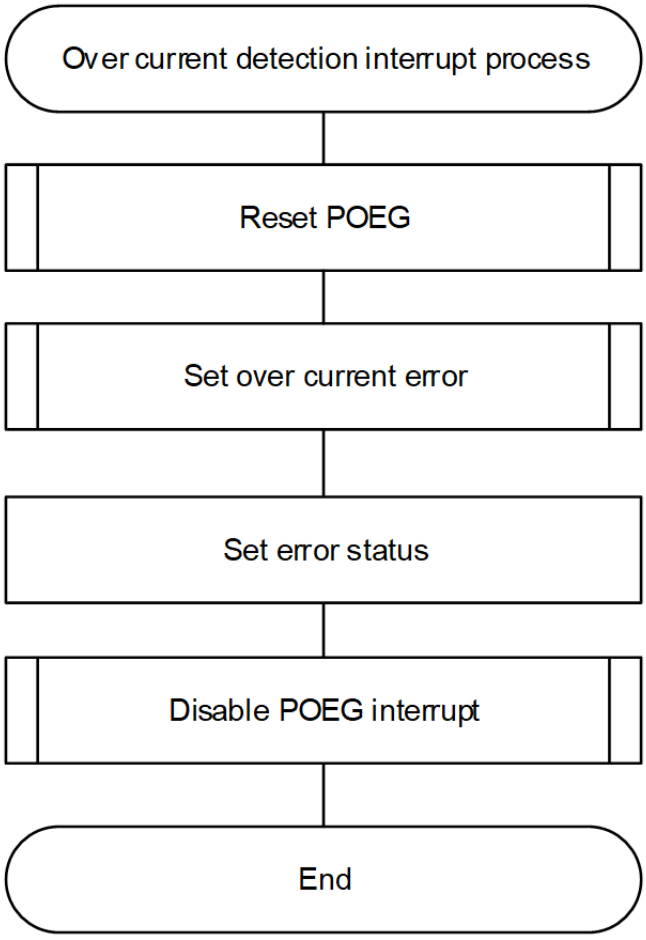

Figure 271: Over current detection interrupt process

# Configuration

### Build Time Configurations for rm_motor_120_degree

The following build time configurations are defined in fsp_cfg/rm_motor_120_degree_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

### Configurations for Motor > Motor 120 degree control (rm_motor_120_degree)

This module can be added to the Stacks tab via New Stack > Motor > Motor 120 degree control (rm_motor_120_degree).

| Configuration | Options | Default | Description |
|---|---|---|---|
| General | | | |

| | | | |
|---|---|---|---|
| Name | Name must be a valid C symbol | g_motor_120_degree0 | Module name. |
| Limit of over current (A) | Must be a valid value | 4.0 | Limit of over current.(Detection threshold) |
| Limit of over voltage (V) | Must be a valid value | 28.0 | Limit of over voltage.(Detection threshold) |
| Limit of over speed (rpm) | Must be a valid value | 3000.0 | Limit of over speed.(Detection threshold) |
| Limit of low voltage (V) | Must be a valid value | 14.0 | Limit of low voltage.(Detection threshold) |
| Interrupts | | | |
| Callback | Name must be a valid C symbol | NULL | A user callback function. |

### Clock Configuration

This module doesn't depend on clock setting, because this module is a simple status transition process.

### Pin Configuration

This module does not use I/O pins. Please set used pins on configuration of each hardware modules.

# Usage Notes

### Limitations

- Set the limit of electric current with non-negative value.
- Set the limit of input voltage with non-negative value.
- Set the limit of rotational speed with non-negative value.

# Examples

### Basic Example

This is a basic example of minimal use of the motor 120 degree in an application.

```
void motor_120_degree_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = RM_MOTOR_120_DEGREE_Open(g_motor_120_degree0.p_ctrl,
g_motor_120_degree0.p_cfg);
```

```
    assert(FSP_SUCCESS == err);
 /* Set speed reference before motor run */
    (void) RM_MOTOR_120_DEGREE_SpeedSet(g_motor_120_degree0.p_ctrl,
DEF_120_DEGREE_SPEED_REF);
 /* Start motor rotation */
    (void) RM_MOTOR_120_DEGREE_Run(g_motor_120_degree0.p_ctrl);
 /* Get current status */
    (void) RM_MOTOR_120_DEGREE_StatusGet(g_motor_120_degree0.p_ctrl, &smpl_status);
 /* Get current motor speed */
    (void) RM_MOTOR_120_DEGREE_SpeedGet(g_motor_120_degree0.p_ctrl, &smpl_speed);
 /* Get wait stop flag */
    (void) RM_MOTOR_120_DEGREE_WaitStopFlagGet(g_motor_120_degree0.p_ctrl,
&smpl_wait_stop_flag);
 /* Check error */
    (void) RM_MOTOR_120_DEGREE_ErrorCheck(g_motor_120_degree0.p_ctrl, &smpl_error);
 /* Stop motor rotation */
    (void) RM_MOTOR_120_DEGREE_Stop(g_motor_120_degree0.p_ctrl);
    (void) RM_MOTOR_120_DEGREE_ErrorSet(g_motor_120_degree0.p_ctrl,
MOTOR_ERROR_OVER_CURRENT_HW);
 /* Reset the process. */
    (void) RM_MOTOR_120_DEGREE_Reset(g_motor_120_degree0.p_ctrl);
 /* Close the module. */
    (void) RM_MOTOR_120_DEGREE_Close(g_motor_120_degree0.p_ctrl);
}
```

| MOTOR_120_DEGREE_CTRL_EVENT_RESET | Reset event. |

## Function Documentation

### ◆ RM_MOTOR_120_DEGREE_Open()

fsp_err_t RM_MOTOR_120_DEGREE_Open ( motor_ctrl_t *const *p_ctrl*, motor_cfg_t const *const *p_cfg* )

Configure the motor in register start mode. Implements motor_api_t::open.

Example:

```
/* Initializes the module. */
   err = RM_MOTOR_120_DEGREE_Open(g_motor_120_degree0.p_ctrl,
g_motor_120_degree0.p_cfg);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully configured. |
| FSP_ERR_ASSERTION | Null pointer, or one or more configuration options is invalid. |
| FSP_ERR_ALREADY_OPEN | Module is already open. This module can only be opened once. |

***Note***

*This function should only be called once as motor configuration registers can only be written to once so subsequent calls will have no effect.*

### ◆ RM_MOTOR_120_DEGREE_Close()

fsp_err_t RM_MOTOR_120_DEGREE_Close ( motor_ctrl_t *const *p_ctrl*)

Disables specified motor control block. Implements motor_api_t::close.

Example:

```
/* Close the module. */
   (void) RM_MOTOR_120_DEGREE_Close(g_motor_120_degree0.p_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully closed. |
| FSP_ERR_ASSERTION | p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

***Note***

### ◆ RM_MOTOR_120_DEGREE_Reset()

fsp_err_t RM_MOTOR_120_DEGREE_Reset ( motor_ctrl_t *const *p_ctrl*)

Reset motor control block. Implements motor_api_t::reset.

Example:

```
/* Reset the process. */
   (void) RM_MOTOR_120_DEGREE_Reset(g_motor_120_degree0.p_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

***Note***

### ◆ RM_MOTOR_120_DEGREE_Run()

fsp_err_t RM_MOTOR_120_DEGREE_Run ( motor_ctrl_t *const *p_ctrl*)

Run motor (Start motor rotation). Implements motor_api_t::run.

Example:

```
/* Start motor rotation */
   (void) RM_MOTOR_120_DEGREE_Run(g_motor_120_degree0.p_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully started. |
| FSP_ERR_ASSERTION | p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

***Note***

### ◆ RM_MOTOR_120_DEGREE_Stop()

fsp_err_t RM_MOTOR_120_DEGREE_Stop ( motor_ctrl_t *const *p_ctrl*)

Stop motor (Stop motor rotation). Implements motor_api_t::stop.

Example:

```
/* Stop motor rotation */
   (void) RM_MOTOR_120_DEGREE_Stop(g_motor_120_degree0.p_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully stopped. |
| FSP_ERR_ASSERTION | p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

***Note***

### ◆ RM_MOTOR_120_DEGREE_ErrorSet()

fsp_err_t RM_MOTOR_120_DEGREE_ErrorSet ( motor_ctrl_t *const *p_ctrl*, motor_error_t const *error* )

Set error information. Implements motor_api_t::errorSet.

Example:

```
    (void) RM_MOTOR_120_DEGREE_ErrorSet(g_motor_120_degree0.p_ctrl,
MOTOR_ERROR_OVER_CURRENT_HW);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully set error information. |
| FSP_ERR_ASSERTION | p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

***Note***

### ◆ RM_MOTOR_120_DEGREE_SpeedSet()

fsp_err_t RM_MOTOR_120_DEGREE_SpeedSet ( motor_ctrl_t *const *p_ctrl*, float const *speed_rpm* )

Set speed reference[rpm]. Implements motor_api_t::speedSet.

Example:

```
 /* Set speed reference before motor run */
    (void) RM_MOTOR_120_DEGREE_SpeedSet(g_motor_120_degree0.p_ctrl,
DEF_120_DEGREE_SPEED_REF);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully set speed reference. |
| FSP_ERR_ASSERTION | p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

***Note***

### ◆ RM_MOTOR_120_DEGREE_StatusGet()

fsp_err_t RM_MOTOR_120_DEGREE_StatusGet ( motor_ctrl_t *const *p_ctrl*, uint8_t *const *p_status* )

Get current control status. Implements motor_api_t::statusGet.

Example:

```
/* Get current status */
   (void) RM_MOTOR_120_DEGREE_StatusGet(g_motor_120_degree0.p_ctrl, &smpl_status);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully got current control status. |
| FSP_ERR_ASSERTION | p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_POINTER | Data received pointer is invalid. |

***Note***

### ◆ RM_MOTOR_120_DEGREE_SpeedGet()

fsp_err_t RM_MOTOR_120_DEGREE_SpeedGet ( motor_ctrl_t *const *p_ctrl*, float *const *p_speed_rpm* )

Get rotational speed. Implements motor_api_t::speedGet.

Example:

```
/* Get current motor speed */
   (void) RM_MOTOR_120_DEGREE_SpeedGet(g_motor_120_degree0.p_ctrl, &smpl_speed);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully got rotational speed. |
| FSP_ERR_ASSERTION | p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_POINTER | Data received pointer is invalid. |

***Note***

### ◆ RM_MOTOR_120_DEGREE_WaitStopFlagGet()

fsp_err_t RM_MOTOR_120_DEGREE_WaitStopFlagGet ( motor_ctrl_t *const *p_ctrl*, motor_wait_stop_flag_t *const *p_flag_wait_stop* )

Get wait stop flag. Implements motor_api_t::waitStopFlagGet.

Example:

```
/* Get wait stop flag */
   (void) RM_MOTOR_120_DEGREE_WaitStopFlagGet(g_motor_120_degree0.p_ctrl,
&smpl_wait_stop_flag);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully got wait stop flag. |
| FSP_ERR_ASSERTION | p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_POINTER | Data received pointer is invalid. |

***Note***

### ◆ RM_MOTOR_120_DEGREE_ErrorCheck()

fsp_err_t RM_MOTOR_120_DEGREE_ErrorCheck ( motor_ctrl_t *const *p_ctrl*, uint16_t *const *p_error* )

Check the occurunce of error. Implements motor_api_t::errorCheck.

Example:

```
/* Check error */
   (void) RM_MOTOR_120_DEGREE_ErrorCheck(g_motor_120_degree0.p_ctrl, &smpl_error);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully error checke process. |
| FSP_ERR_ASSERTION | p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_POINTER | Data received pointer is invalid. |

***Note***

### ◆ RM_MOTOR_120_DEGREE_PositionSet()

fsp_err_t RM_MOTOR_120_DEGREE_PositionSet ( motor_ctrl_t *const *p_ctrl*, motor_speed_position_data_t const *const *p_position* )

Set position reference. Implements motor_api_t::positionSet.

**Return values**

| | |
|---|---|
| FSP_ERR_UNSUPPORTED | Unsupported. |

***Note***

### ◆ RM_MOTOR_120_DEGREE_AngleGet()

fsp_err_t RM_MOTOR_120_DEGREE_AngleGet ( motor_ctrl_t *const *p_ctrl*, float *const *p_angle_rad* )

Set position reference. Implements motor_api_t::angleGet.

**Return values**

| | |
|---|---|
| FSP_ERR_UNSUPPORTED | Unsupported. |

***Note***

### ◆ RM_MOTOR_120_DEGREE_FunctionSelect()

fsp_err_t RM_MOTOR_120_DEGREE_FunctionSelect ( motor_ctrl_t *const *p_ctrl*, motor_function_select_t const *function* )

Select using function. Implements motor_api_t::functionSelect.

**Return values**

| | |
|---|---|
| FSP_ERR_UNSUPPORTED | Unsupported. |

***Note***

### Detailed Description

Calculation process for the motor control on RA MCUs. This module implements the Motor angle Interface.

# Overview

The motor angle and speed estimation module is used to calculate rotor angle and rotational speed

in an application. This module should be called cyclically after the A/D conversion of electric current of each phase in an application.

**Features**

The Motor Angle and Speed Estimation Module has below features.

- Calculate rotor angle [radian].
- Calculate rotational speed [radian/second].

# Configuration

**Build Time Configurations for rm_motor_estimate**

The following build time configurations are defined in fsp_cfg/rm_motor_estimate_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

**Configurations for Motor > Motor Angle and Speed Estimation (rm_motor_estimate)**

This module can be added to the Stacks tab via New Stack > Motor > Motor Angle and Speed Estimation (rm_motor_estimate).

| Configuration | Options | Default | Description |
|---|---|---|---|
| Motor Parameter | | | |
| Pole pairs | Must be a valid positive integer. | 2 | Pole pairs |
| Motor Parameter > Resistance[ohm] | Must be a valid value | 8.5F | Resistance |
| Motor Parameter > Inductance of d-axis[H] | Must be a valid value | 0.0045F | Inductance of d-axis |
| Motor Parameter > Inductance of q-axis[H] | Must be a valid value | 0.0045F | Inductance of q-axis |
| Motor Parameter > Permanent magnetic flux[Wb] | Must be a valid value | 0.02159F | Permanent magnetic flux |
| Motor Parameter > Rotor inertia[kgm^2] | Must be a valid value | 0.0000028F | Rotor inertia |
| Motor Parameter > Nominal current[Arms] | Must be a valid value | 1.67 | Nominal current |
| Name | Name must be a valid C symbol | g_motor_angle0 | Module name. |
| Openloop damping | • Disable<br>• Enable | Enable | Openloop damping functionally enable or |

| | | | |
|---|---|---|---|
| | | | disable |
| Natural frequency of BEMF observer | Must be a valid value | 1000.0F | Natural frequency of BEMF observer |
| Damping ratio of BEMF observer | Must be a valid value | 1.0F | Damping ratio of BEMF observer |
| Natural frequency of PLL Speed estimate loop | Must be a valid value | 20.0F | Natural frequency of PLL Speed estimate loop |
| Damping ratio of PLL Speed estimate loop | Must be a valid value | 1.0F | Damping ratio of PLL Speed estimate loop |
| Control period | Must be a valid value | 0.00005F | Control period |

### Clock Configuration

This module doesn't depend on clock setting, because this module is a simple calculation process.

### Pin Configuration

This module does not use I/O pins.

## Usage Notes

### Limitations

Developers should be aware of the following limitations when using the Motor Angle and Speed Estimation:

## Examples

### Basic Example

This is a basic example of minimal use of the Motor Angle and Speed Estimation in an application.

```
void motor_estimate_basic_example (void)
{
 fsp_err_t             err = FSP_SUCCESS;
 motor_angle_current_t smpl_current:
 motor_angle_voltage_reference_t smpl_voltage;
 /* Initializes the module. */
    err = RM_MOTOR_ESTIMATE_Open(&g_mtr_angle0_ctrl, &g_mtr_angle_set0_cfg);
    assert(FSP_SUCCESS == err);
 /* Basically run this module at A/D conversion finish interrupt.
  * This implementation is an example. */
 while (true)
```

```
    {
 /* Application work here. */
 /* Set PI Control Flag before get Angle/Speed and Estimated Component */
       (void) RM_MOTOR_ESTIMATE_FlagPiCtrlSet(&g_mtr_angle0_ctrl, 1U);
       smpl_current.id = 1.0F;
       smpl_current.iq = 1.0F;
       smpl_voltage.vd = 10.0F;
       smpl_voltage.vq = 10.0F;
 /* Set Current and Speed data before get Angle/Speed and Estimated Component */
       (void) RM_MOTOR_ESTIMATE_CurrentSet(&g_mtr_angle0_ctrl, smpl_current,
smpl_voltage);
 /* Set Internal Speed Reference & damping speed data before get Angle/Speed and
Estimated Component */
       (void) RM_MOTOR_ESTIMATE_SpeedSet(&g_mtr_angle0_ctrl, 104.27F, 10.0F);
 /* Get Angle/Speed data */
       (void) RM_MOTOR_ESTIMATE_AngleSpeedGet(&g_mtr_angle0_ctrl, &f_get_angle,
&f_get_speed, &f_get_phase_err);
 /* Get Estimated Component */
       (void) RM_MOTOR_ESTIMATE_EstimatedComponentGet(&g_mtr_angle0_ctrl, &f_get_ed,
&f_get_eq);
    }
}
```

### Function Documentation

### ◆ RM_MOTOR_ESTIMATE_Open()

fsp_err_t RM_MOTOR_ESTIMATE_Open ( motor_angle_ctrl_t *const *p_ctrl*, motor_angle_cfg_t const *const *p_cfg* )

Opens and configures the Angle Estimation module. Implements motor_angle_api_t::open.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | MTR_ANGL_EST successfully configured. |
| FSP_ERR_ASSERTION | Null pointer, or one or more configuration options is invalid. |
| FSP_ERR_ALREADY_OPEN | Module is already open. This module can only be opened once. |
| FSP_ERR_INVALID_ARGUMENT | Configuration parameter error. |

### ◆ RM_MOTOR_ESTIMATE_Close()

fsp_err_t RM_MOTOR_ESTIMATE_Close ( motor_angle_ctrl_t *const *p_ctrl*)

Disables specified Angle Estimation module. Implements motor_angle_api_t::close.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully closed. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_MOTOR_ESTIMATE_Reset()

fsp_err_t RM_MOTOR_ESTIMATE_Reset ( motor_angle_ctrl_t *const *p_ctrl*)

Reset variables of Angle Estimation module. Implements motor_angle_api_t::reset.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully reset. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_MOTOR_ESTIMATE_CurrentSet()

fsp_err_t RM_MOTOR_ESTIMATE_CurrentSet ( motor_angle_ctrl_t *const *p_ctrl*, motor_angle_current_t *const *p_st_current*, motor_angle_voltage_reference_t *const *p_st_voltage* )

Set d/q-axis Current Data & Voltage Reference. Implements motor_angle_api_t::currentSet.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully set. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_MOTOR_ESTIMATE_SpeedSet()

fsp_err_t RM_MOTOR_ESTIMATE_SpeedSet ( motor_angle_ctrl_t *const *p_ctrl*, float const *speed_ctrl*, float const *damp_speed* )

Set Speed Information. Implements motor_angle_api_t::speedSet.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully set. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_MOTOR_ESTIMATE_FlagPiCtrlSet()

fsp_err_t RM_MOTOR_ESTIMATE_FlagPiCtrlSet ( motor_angle_ctrl_t *const *p_ctrl*, uint32_t const *flag_pi* )

Set the flag of PI Control runs. Implements motor_angle_api_t::flagPiCtrlSet.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully set. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_MOTOR_ESTIMATE_AngleSpeedGet()

fsp_err_t RM_MOTOR_ESTIMATE_AngleSpeedGet ( motor_angle_ctrl_t *const *p_ctrl*, float *const *p_angle*, float *const *p_speed*, float *const *p_phase_err* )

Gets the current rotor's angle and rotation speed. Implements motor_angle_api_t::angleSpeedGet.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successful data get. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_MOTOR_ESTIMATE_EstimatedComponentGet()

fsp_err_t RM_MOTOR_ESTIMATE_EstimatedComponentGet ( motor_angle_ctrl_t *const *p_ctrl*, float *const *p_ed*, float *const *p_eq* )

Gets estimated d/q-axis component. Implements motor_angle_api_t::estimatedComponentGet.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully data gotten. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_MOTOR_ESTIMATE_ParameterUpdate()

fsp_err_t RM_MOTOR_ESTIMATE_ParameterUpdate ( motor_angle_ctrl_t *const *p_ctrl*, motor_angle_cfg_t const *const *p_cfg* )

Update the parameters of Angle&Speed Estimation. Implements motor_angle_api_t::parameterUpdate.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully data is update. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_MOTOR_ESTIMATE_InternalCalculate()

fsp_err_t RM_MOTOR_ESTIMATE_InternalCalculate ( motor_angle_ctrl_t *const *p_ctrl*)

Calculate internal parameters. Implements motor_angle_api_t::internalCalculate.

**Return values**

| | |
|---|---|
| FSP_ERR_UNSUPPORTED | Unsupported. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_MOTOR_ESTIMATE_AngleAdjust()

fsp_err_t RM_MOTOR_ESTIMATE_AngleAdjust ( motor_angle_ctrl_t *const *p_ctrl*)

Angle Adjustment Process. Implements motor_angle_api_t::angleAdjust.

**Return values**

| | |
|---|---|
| FSP_ERR_UNSUPPORTED | Unsupported. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_MOTOR_ESTIMATE_EncoderCyclic()

fsp_err_t RM_MOTOR_ESTIMATE_EncoderCyclic ( motor_angle_ctrl_t *const *p_ctrl*)

Encoder Cyclic Process (Call in cyclic timer). Implements motor_angle_api_t::encoderCyclic.

**Return values**

| | |
|---|---|
| FSP_ERR_UNSUPPORTED | Unsupported. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_MOTOR_ESTIMATE_InfoGet()

fsp_err_t RM_MOTOR_ESTIMATE_InfoGet ( motor_angle_ctrl_t *const *p_ctrl*, motor_angle_encoder_info_t *const *p_info* )

Gets information of Encoder Angle Module. Implements motor_angle_api_t::infoGet.

**Return values**

| | |
|---|---|
| FSP_ERR_UNSUPPORTED | Unsupported. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_MOTOR_ESTIMATE_CyclicProcess()

fsp_err_t RM_MOTOR_ESTIMATE_CyclicProcess ( motor_angle_ctrl_t *const *p_ctrl*)

Perform induction cyclic process. Implements motor_angle_api_t::cyclicProcess.

**Return values**

| | |
|---|---|
| FSP_ERR_UNSUPPORTED | Unsupported. |

### ◆ RM_MOTOR_ESTIMATE_SensorDataSet()

fsp_err_t RM_MOTOR_ESTIMATE_SensorDataSet ( motor_angle_ctrl_t *const *p_ctrl*, motor_angle_ad_data_t *const *p_ad_data* )

Set sensor data. Implements motor_angle_api_t::sensorDataSet.

**Return values**

| | |
|---|---|
| FSP_ERR_UNSUPPORTED | Unsupported. |

### Detailed Description

Calculation process for the motor control on RA MCUs. This module implements the Motor angle Interface.

# Overview

The motor angle and speed calculation with an encoder module is used to calculate rotor angle and rotational speed in an application. This module is designed to be used with the motor current module (rm_motor_current).

### Features

The motor angle and speed calculation with an encoder module has the features listed below.

- Calculate rotor angle [radian].
- Calculate rotational speed [radian/second].

# Configuration

### Build Time Configurations for rm_motor_sense_encoder

The following build time configurations are defined in fsp_cfg/rm_motor_sense_encoder_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| Support HALL sensor | • Support<br>• Unsupport | Support | |

### Configurations for Motor > Motor Angle and Speed Calculation with encoder (rm_motor_sense_encoder)

This module can be added to the Stacks tab via New Stack > Motor > Motor Angle and Speed Calculation with encoder (rm_motor_sense_encoder).

| Configuration | Options | Default | Description |
|---|---|---|---|
| General | | | |
| Name | Name must be a valid C symbol | g_motor_sense_encoder0 | Module name. |
| Hall sensor | | | |
| sensor input port U | Manual Entry | BSP_IO_PORT_09_PIN_07 | U-phase Hall sensor input port |
| sensor input port V | Manual Entry | BSP_IO_PORT_09_PIN_05 | V-phase Hall sensor input port |
| sensor input port W | Manual Entry | BSP_IO_PORT_09_PIN_06 | W-phase Hall sensor input port |
| sensor pattern #1 | Must be a valid integer | 1 | Hall sensor pattern #1 |
| sensor pattern #2 | Must be a valid integer | 5 | Hall sensor pattern #2 |
| sensor pattern #3 | Must be a valid integer | 4 | Hall sensor pattern #3 |
| sensor pattern #4 | Must be a valid integer | 6 | Hall sensor pattern #4 |
| sensor pattern #5 | Must be a valid integer | 2 | Hall sensor pattern #5 |
| sensor pattern #6 | Must be a valid integer | 3 | Hall sensor pattern #6 |
| Motor Parameter | | | |

| | | | |
|---|---|---|---|
| Pole pairs | Must be a valid positive integer. | 7 | Pole pairs |
| Resistance (ohm) | Must be a valid non-negative value | 0.453F | Resistance |
| Inductance of d-axis (H) | Must be a valid non-negative value | 0.0009447F | Inductance of d-axis |
| Inductance of q-axis (H) | Must be a valid non-negative value | 0.0009447F | Inductance of q-axis |
| Permanent magnetic flux (Wb) | Must be a valid non-negative value | 0.006198F | Permanent magnetic flux |
| Motor Parameter > Rotor inertia (kgm^2) | Must be a valid non-negative value | 0.00000962F | Rotor inertia |
| Control Type | • Speed<br>• Position | Position | Select control Type |
| Period of Current control (kHz) | Must be a valid non-negative value | 20.0F | Period of Current control |
| Period of Speed control (sec) | Must be a valid non-negative value | 0.0005F | Period of Speed control |
| PWM Carrier Frequency (kHz) | Must be a valid non-negative value | 20.0F | PWM Carrier Frequency |
| Decimation of Interrupt | Must be a valid positive integer. | 0U | Decimation of Interrupt |
| Counts per Rotation | Must be a valid positive integer. | 1200U | Encoder Counts per One Rotation |
| Counts for Angle Adjust | Must be a valid positive integer. | 512U | Counts for Angle Adjust (as working time) |
| Zero speed counts | Must be a valid positive integer. | 20000000U | Threshold counts to judge zero speed |
| Occupancy Time | Must be a valid non-negative value | 0.30F | Occupancy time of carrier interrup |
| Carrier Time | Must be a valid non-negative value | 0.000013F | Processing time of carrier interrupt |
| Process Time | Must be a valid non-negative value | 0.000001F | Processing time of encoder interrupt |
| Highspeed Change Margin (rpm) | Must be a valid positive integer. | 150U | Margin of toggle speed for high speed mode |
| LPF parameter for Highspeed Filter | Must be a valid non-negative value | 0.1F | Highspeed mode speed LPF parameter |
| Counts to change speed | Must be a valid positive integer. | 8U | Counts for mode change of position speed calculation |
| Speed Detection Type | • Use capture | Use capture width | Select Speed detection |

| | | |
|---|---|---|
| | width<br>• Use carrier interrupt | Type |

### Clock Configuration

### Pin Configuration

# Usage Notes

### Limitations

Developers should be aware of the following limitations when using the motor angle and speed calculation with an encoder: all configurations should be set as positive values.

# Examples

### Basic Example

This is a basic example of minimal use of the motor angle and speed calculation with an encoder in an application.

```
void motor_sense_encoder_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = RM_MOTOR_SENSE_ENCODER_Open(&g_mtr_angle0_ctrl, &g_mtr_angle_set0_cfg);
    assert(FSP_SUCCESS == err);
 /* Basically run this module at A/D conversion finish interrupt.
  * This implementation is an example. */
 // while (true)
    {
 /* Application work here. */
 /* Initialize motor with the encoder */
       (void) RM_MOTOR_SENSE_ENCODER_AngleAdjust(&g_mtr_angle0_ctrl);
 /* Perform cyclic encoder process*/
       (void) RM_MOTOR_SENSE_ENCODER_CyclicProcess(&g_mtr_angle0_ctrl);
 /* Calculate information with encoder signal input */
       (void) RM_MOTOR_SENSE_ENCODER_InternalCalculate(&g_mtr_angle0_ctrl);
 /* Get angle/speed data */
       (void) RM_MOTOR_SENSE_ENCODER_AngleSpeedGet(&g_mtr_angle0_ctrl, &f_get_angle,
&f_get_speed, &f_get_phase_err);
```

```
/* Get calculated component */
      (void) RM_MOTOR_SENSE_ENCODER_InfoGet(&g_mtr_angle0_ctrl, &temp_info);
   }
/* Reset the module */
   (void) RM_MOTOR_SENSE_ENCODER_Reset(&g_mtr_angle0_ctrl);
/* Close the module */
   (void) RM_MOTOR_SENSE_ENCODER_Close(&g_mtr_angle0_ctrl);
}
```

## Enumerations

| | |
|---|---|
| enum | motor_sense_encoder_loop_t |
| enum | motor_sense_encoder_mode_t |
| enum | motor_sense_encoder_speed_detect_type_t |

## Enumeration Type Documentation

### ◆ motor_sense_encoder_loop_t

| enum motor_sense_encoder_loop_t | |
|---|---|
| Enumerator | |
| MOTOR_SENSE_ENCODER_LOOP_SPEED | Speed control mode. |
| MOTOR_SENSE_ENCODER_LOOP_POSITION | Position control mode. |

### ◆ motor_sense_encoder_mode_t

| enum motor_sense_encoder_mode_t | |
|---|---|
| Enumerator | |
| MOTOR_SENSE_ENCODER_MODE_INIT | Initialize mode (Start status) |
| MOTOR_SENSE_ENCODER_MODE_BOOT | Boot mode (Angle adjustment status) |
| MOTOR_SENSE_ENCODER_MODE_DRIVE | Drive mode (Normal work status) |

### ◆ motor_sense_encoder_speed_detect_type_t

| enum motor_sense_encoder_speed_detect_type_t | |
|---|---|
| Enumerator | |
| MOTOR_SENSE_ENCODER_SPEED_DETECT_WIDTH | Use captured width. |
| MOTOR_SENSE_ENCODER_SPEED_DETECT_CARRIER | Use carrier interrupt. |

## Function Documentation

### ◆ RM_MOTOR_SENSE_ENCODER_Open()

fsp_err_t RM_MOTOR_SENSE_ENCODER_Open ( motor_angle_ctrl_t *const *p_ctrl*, motor_angle_cfg_t const *const *p_cfg* )

Opens and configures the Angle Encoder module. Implements motor_angle_api_t::open.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Angle Encoder module successfully configured. |
| FSP_ERR_ASSERTION | Null pointer, or one or more configuration options is invalid. |
| FSP_ERR_ALREADY_OPEN | Module is already open. This module can only be opened once. |
| FSP_ERR_INVALID_ARGUMENT | Configuration parameter error. |

### ◆ RM_MOTOR_SENSE_ENCODER_Close()

fsp_err_t RM_MOTOR_SENSE_ENCODER_Close ( motor_angle_ctrl_t *const *p_ctrl*)

Disables specified Angle Encoder module. Implements motor_angle_api_t::close.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully closed. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_MOTOR_SENSE_ENCODER_Reset()

fsp_err_t RM_MOTOR_SENSE_ENCODER_Reset ( motor_angle_ctrl_t *const *p_ctrl*)

Reset variables of Angle Encoder module. Implements motor_angle_api_t::reset.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully closed. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_MOTOR_SENSE_ENCODER_InternalCalculate()

fsp_err_t RM_MOTOR_SENSE_ENCODER_InternalCalculate ( motor_angle_ctrl_t *const *p_ctrl*)

Calculate internal parameters. Implements motor_angle_api_t::internalCalculate.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully closed. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_MOTOR_SENSE_ENCODER_AngleSpeedGet()

fsp_err_t RM_MOTOR_SENSE_ENCODER_AngleSpeedGet ( motor_angle_ctrl_t *const *p_ctrl*, float *const *p_angle*, float *const *p_speed*, float *const *p_phase_err* )

Gets the current rotor's angle and rotation speed. Implements motor_angle_api_t::angleSpeedGet.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully data calculated. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_MOTOR_SENSE_ENCODER_AngleAdjust()

fsp_err_t RM_MOTOR_SENSE_ENCODER_AngleAdjust ( motor_angle_ctrl_t *const *p_ctrl*)

Angle Adjustment Process. Implements motor_angle_api_t::angleAdjust.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully data calculated. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_MOTOR_SENSE_ENCODER_EncoderCyclic()

fsp_err_t RM_MOTOR_SENSE_ENCODER_EncoderCyclic ( motor_angle_ctrl_t *const *p_ctrl*)

Encoder Cyclic Process (Call in cyclic timer). Implements motor_angle_api_t::encoderCyclic.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully data calculated. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_MOTOR_SENSE_ENCODER_CyclicProcess()

fsp_err_t RM_MOTOR_SENSE_ENCODER_CyclicProcess ( motor_angle_ctrl_t *const *p_ctrl*)

Perform cyclic process. Implements motor_angle_api_t::cyclicProcess.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully data calculated. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_MOTOR_SENSE_ENCODER_InfoGet()

fsp_err_t RM_MOTOR_SENSE_ENCODER_InfoGet ( motor_angle_ctrl_t *const *p_ctrl*, motor_angle_encoder_info_t *const *p_info* )

Gets information of Encoder Angle Module. Implements motor_angle_api_t::infoGet.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully data calculated. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_MOTOR_SENSE_ENCODER_ParameterUpdate()

fsp_err_t RM_MOTOR_SENSE_ENCODER_ParameterUpdate ( motor_angle_ctrl_t *const *p_ctrl*, motor_angle_cfg_t const *const *p_cfg* )

Update the parameters of Angle&Speed calculation with an encoder. Implements motor_angle_api_t::parameterUpdate.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully data is update. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_MOTOR_SENSE_ENCODER_CurrentSet()

fsp_err_t RM_MOTOR_SENSE_ENCODER_CurrentSet ( motor_angle_ctrl_t *const *p_ctrl*, motor_angle_current_t *const *p_st_current*, motor_angle_voltage_reference_t *const *p_st_voltage* )

Set d/q-axis Current Data & Voltage Reference. Implements motor_angle_api_t::currentSet.

**Return values**

| | |
|---|---|
| FSP_ERR_UNSUPPORTED | Motor sense encoder software currentSet is not supported. |

### ◆ RM_MOTOR_SENSE_ENCODER_SpeedSet()

fsp_err_t RM_MOTOR_SENSE_ENCODER_SpeedSet ( motor_angle_ctrl_t *const *p_ctrl*, float const *speed_ctrl*, float const *damp_speed* )

Set Speed Information. Implements motor_angle_api_t::speedSet.

**Return values**

| | |
|---|---|
| FSP_ERR_UNSUPPORTED | Motor sense encoder software speedSet is not supported. |

### ◆ RM_MOTOR_SENSE_ENCODER_FlagPiCtrlSet()

fsp_err_t RM_MOTOR_SENSE_ENCODER_FlagPiCtrlSet ( motor_angle_ctrl_t *const *p_ctrl*, uint32_t const *flag_pi* )

Set the flag of PI Control runs. Implements motor_angle_api_t::flagPiCtrlSet.

**Return values**

| | |
|---|---|
| FSP_ERR_UNSUPPORTED | Motor sense encoder software flagPiCtrlSet is not supported. |

### ◆ RM_MOTOR_SENSE_ENCODER_EstimatedComponentGet()

fsp_err_t RM_MOTOR_SENSE_ENCODER_EstimatedComponentGet ( motor_angle_ctrl_t *const *p_ctrl*, float *const *p_ed*, float *const *p_eq* )

Gets estimated d/q-axis component. Implements motor_angle_api_t::estimatedComponentGet.

**Return values**

| | |
|---|---|
| FSP_ERR_UNSUPPORTED | Motor sense encoder software estimatedComponentGet is not supported. |

### ◆ RM_MOTOR_SENSE_ENCODER_SensorDataSet()

fsp_err_t RM_MOTOR_SENSE_ENCODER_SensorDataSet ( motor_angle_ctrl_t *const *p_ctrl*, motor_angle_ad_data_t *const *p_ad_data* )

Set sensor data. Implements motor_angle_api_t::sensorDataSet.

**Return values**

| | |
|---|---|
| FSP_ERR_UNSUPPORTED | Unsupported. |

### Detailed Description

Calculation process for the motor control on RA MCUs. This module implements the Motor angle Interface.

# Overview

The motor angle and speed calculation with hall sensors module is used to calculate rotor angle and rotational speed in an application. This module is designed to be used with the motor current module (rm_motor_current).

### Features

The motor angle and speed calculation with hall sensors module has the features listed below.

- Calculate rotor angle [radian].
- Calculate rotational speed [radian/second].

# Configuration

### Build Time Configurations for rm_motor_sense_hall

The following build time configurations are defined in fsp_cfg/rm_motor_sense_hall_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

### Configurations for Motor > Motor Angle and Speed Calculation with Hall sensors (rm_motor_sense_hall)

This module can be added to the Stacks tab via New Stack > Motor > Motor Angle and Speed Calculation with Hall sensors (rm_motor_sense_hall).

| Configuration | Options | Default | Description |
|---|---|---|---|
| General | | | |
| Name | Name must be a valid C symbol | g_motor_angle0 | Module name. |
| Hall sensor | | | |
| U phase input port | Manual Entry | BSP_IO_PORT_12_PIN_04 | Hall sensor port U |
| V phase input port | Manual Entry | BSP_IO_PORT_12_PIN_05 | Hall sensor port V |
| W phase input port | Manual Entry | BSP_IO_PORT_11_PIN_01 | Hall sensor port W |
| sensor pattern #1 | Must be a valid integer | 1 | Hall sensor pattern #1 |
| sensor pattern #2 | Must be a valid integer | 5 | Hall sensor pattern #2 |
| sensor pattern #3 | Must be a valid integer | 4 | Hall sensor pattern #3 |
| sensor pattern #4 | Must be a valid integer | 6 | Hall sensor pattern #4 |
| sensor pattern #5 | Must be a valid integer | 2 | Hall sensor pattern #5 |
| sensor pattern #6 | Must be a valid integer | 3 | Hall sensor pattern #6 |
| Process Frequency (kHz) | Must be a valid value | 20.0F | Frequency to perform the process. |
| Correction parameter | Must be a valid value | 0.0F | Correction parameter |

| | | | |
|---|---|---|---|
| of rotor angle | | | of rotor angle |
| Default counts of carrier interrupt | Must be a valid non-negative value. | 300U | Default counts of carrier interrupt during a period of Hall signal change |
| Maximum counts of one rotation | Must be a valid non-negative value. | 500U | Maximum counts of carrier interrupt during one rotor rotation |
| Target value for pseudo speed (rad/s) | Must be a valid non-negative value. | 100.0 | Target value for pseudo speed (rad/s). |
| Target time until the pseudo speed update reaches (msec) | Must be a valid non-negative value. | 300.0 | Target time until the pseudo speed update reaches (msec). |
| Rotation counts to start speed estimation | Must be a valid integer | 2 | Rotation counts to start of speed estimation. |
| Carrier counts at startup | Must be a valid integer | 400 | Carrier counts to wait the start timing of pseudo speed update |
| Speed to judge start | Must be a valid non-negative value. | 250.0 | Speed to judge start PI calculation. |

**Clock Configuration**

**Pin Configuration**

# Usage Notes

### Limitations

Developers should be aware of the following limitations when using the motor angle and speed calculation with hall sensors: all configurations should be set as positive values.

# Examples

### Basic Example

This is a basic example of minimal use of the motor angle and speed calculation with hall sensors in an application.

```
void motor_sense_hall_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = RM_MOTOR_SENSE_HALL_Open(&g_mtr_angle0_ctrl, &g_mtr_angle_set0_cfg);
    assert(FSP_SUCCESS == err);
 /* Basically run this module at A/D conversion finish interrupt.
```

```
 * This implementation is an example. */
// while (true)
   {
/* Application work here. */
/* Get angle/speed data */
      (void) RM_MOTOR_SENSE_HALL_AngleSpeedGet(&g_mtr_angle0_ctrl, &f_get_angle,
&f_get_speed, &f_get_phase_err);
   }
/* Reset the module */
   (void) RM_MOTOR_SENSE_HALL_Reset(&g_mtr_angle0_ctrl);
/* Close the module */
   (void) RM_MOTOR_SENSE_HALL_Close(&g_mtr_angle0_ctrl);
}
```

## Data Structures

| | |
|---|---|
| struct | motor_sense_hall_input_t |
| struct | motor_sense_hall_extended_cfg_t |
| struct | motor_sense_hall_instance_ctrl_t |

## Enumerations

| | |
|---|---|
| enum | motor_sense_hall_direction_t |
| enum | motor_sense_hall_signal_status_t |

## Data Structure Documentation

### ◆ motor_sense_hall_input_t

| struct motor_sense_hall_input_t | | |
|---|---|---|
| This structure is provided to receive speed information. | | |
| Data Fields | | |
| float | f4_ref_speed_rad_ctrl | Speed Reference [rad/sec]. |

### ◆ motor_sense_hall_extended_cfg_t

| struct motor_sense_hall_extended_cfg_t | | |
|---|---|---|
| Optional Motor sense hall extension data structure. | | |
| Data Fields | | |
| bsp_io_port_pin_t | port_hall_sensor_u | Hall U-signal input port. |

| | | |
|---|---|---|
| bsp_io_port_pin_t | port_hall_sensor_v | Hall V-signal input port. |
| bsp_io_port_pin_t | port_hall_sensor_w | Hall W-signal input port. |
| uint8_t | u1_hall_pattern[MOTOR_SENSE_HALL_SPEED_COUNTS+1] | The order of hall signal pattern. |
| float | f_pwm_carrier_freq | PWM carrier frequency (or Decimated frequency at decimation of current process) |
| float | f_angle_correct | Coefficient to correct angle. |
| uint8_t | u1_trigger_hall_signal_count | Rotation counts to wait the stability. |
| float | f4_target_pseudo_speed_rad | Target value for pseudo speed estimates [radian/second]. |
| float | f4_reach_time_msec | Time until the pseudo speed estimate reaches the target value [msec]. |
| uint16_t | u2_trigger_carrier_count | Estimated speed 0 until this trigger. |
| uint16_t | u2_default_counts | Default counts for period of hall signal to reset. |
| uint16_t | u2_maximum_period | Maximum counts of hall signal period. |
| uint8_t | u1_hall_polepairs | Hall pole pairs. |
| float | f4_start_speed_rad | Speed to judge start [radian/second]. |

### ◆ motor_sense_hall_instance_ctrl_t

| struct motor_sense_hall_instance_ctrl_t | | |
|---|---|---|
| SENSE_HALL control block. DO NOT INITIALIZE. Initialization occurs when motor_angle_api_t::open is called. | | |
| Data Fields | | |
| uint32_t | open | |
| uint8_t | u1_hall_signal | Hall signal pattern. |
| uint8_t | u1_last_hall_signal | Last hall signal pattern. |
| motor_sense_hall_direction_t | direction | Rotation direction. |
| motor_sense_hall_direction_t | last_direction | Last rotation direction. |
| uint16_t | u2_carrier_count | Carrier count. |
| uint16_t | u2_hall_period[MOTOR_SENSE_HALL_SPEED_COUNTS] | Array of carrier count to calculate 2PI. |
| uint8_t | u1_period_counter | Counter for above array. |
| | | |

| | | |
|---|---|---|
| float | f_angle | Rotor angle [radian]. |
| float | f_angle_per_count | Angle per 1 count. |
| float | f_calculated_speed | Calculated speed [radian/second]. |
| uint8_t | u1_hall_signal_memory | Memorized hall signal at startup. |
| motor_sense_hall_signal_status_t | hall_signal_status | Hall signal status. |
| uint8_t | u1_hall_signal_count | Rotation counter. |
| float | f4_pseudo_speed_rad | Pseudo speed used for startup [radian/second]. |
| float | f4_add_pseudo_speed_rad | Step of pseudo speed to update [radian/second]. |
| uint16_t | u2_startup_carrier_count | Counter of carrier interrupt for startup. |
| motor_sense_hall_input_t | st_input | Input parameter structure. |
| uint8_t | u1_startup_flag | Flag for startup. |
| motor_angle_cfg_t const * | p_cfg | |

## Enumeration Type Documentation

### ◆ motor_sense_hall_direction_t

| enum motor_sense_hall_direction_t | |
|---|---|
| Enumerator | |
| MOTOR_SENSE_HALL_DIRECTION_CW | Rotation direction clockwise. |
| MOTOR_SENSE_HALL_DIRECTION_CCW | Rotation direction counter clockwise. |

### ◆ motor_sense_hall_signal_status_t

| enum motor_sense_hall_signal_status_t | |
|---|---|
| Enumerator | |
| MOTOR_SENSE_HALL_SIGNAL_STATUS_INITIAL | Hall signal isn't captured. (Initial) |
| MOTOR_SENSE_HALL_SIGNAL_STATUS_CAPTURED | Hall signal is captured. |

## Function Documentation

### ◆ RM_MOTOR_SENSE_HALL_Open()

fsp_err_t RM_MOTOR_SENSE_HALL_Open ( motor_angle_ctrl_t *const *p_ctrl*, motor_angle_cfg_t const *const *p_cfg* )

Opens and configures the angle hall sensor module. Implements motor_angle_api_t::open.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | MTR_ANGL_EST successfully configured. |
| FSP_ERR_ASSERTION | Null pointer, or one or more configuration options is invalid. |
| FSP_ERR_ALREADY_OPEN | Module is already open. This module can only be opened once. |

### ◆ RM_MOTOR_SENSE_HALL_Close()

fsp_err_t RM_MOTOR_SENSE_HALL_Close ( motor_angle_ctrl_t *const *p_ctrl*)

Disables specified Angle Estimation module. Implements motor_angle_api_t::close.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully closed. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_MOTOR_SENSE_HALL_Reset()

fsp_err_t RM_MOTOR_SENSE_HALL_Reset ( motor_angle_ctrl_t *const *p_ctrl*)

Reset variables of Angle Estimation module. Implements motor_angle_api_t::reset.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully reset. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_MOTOR_SENSE_HALL_CurrentSet()

fsp_err_t RM_MOTOR_SENSE_HALL_CurrentSet ( motor_angle_ctrl_t *const *p_ctrl*, motor_angle_current_t *const *p_st_current*, motor_angle_voltage_reference_t *const *p_st_voltage* )

Set d/q-axis Current Data & Voltage Reference. Implements motor_angle_api_t::currentSet.

**Return values**

| | |
|---|---|
| FSP_ERR_UNSUPPORTED | Unsupported. |

### ◆ RM_MOTOR_SENSE_HALL_SpeedSet()

fsp_err_t RM_MOTOR_SENSE_HALL_SpeedSet ( motor_angle_ctrl_t *const *p_ctrl*, float const *speed_ctrl*, float const *damp_speed* )

Set Speed Information. Implements motor_angle_api_t::speedSet.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Data get successfully. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_MOTOR_SENSE_HALL_FlagPiCtrlSet()

fsp_err_t RM_MOTOR_SENSE_HALL_FlagPiCtrlSet ( motor_angle_ctrl_t *const *p_ctrl*, uint32_t const *flag_pi* )

Set the flag of PI Control runs. Implements motor_angle_api_t::flagPiCtrlSet.

**Return values**

| | |
|---|---|
| FSP_ERR_UNSUPPORTED | Unsupported. |

### ◆ RM_MOTOR_SENSE_HALL_AngleSpeedGet()

fsp_err_t RM_MOTOR_SENSE_HALL_AngleSpeedGet ( motor_angle_ctrl_t *const *p_ctrl*, float *const *p_angle*, float *const *p_speed*, float *const *p_phase_err* )

Gets the current rotor's angle and rotation speed. Implements motor_angle_api_t::angleSpeedGet.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successful data get. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Output pointer is invalid. |

### ◆ RM_MOTOR_SENSE_HALL_EstimatedComponentGet()

fsp_err_t RM_MOTOR_SENSE_HALL_EstimatedComponentGet ( motor_angle_ctrl_t *const *p_ctrl*, float *const *p_ed*, float *const *p_eq* )

Gets estimated d/q-axis component. Implements motor_angle_api_t::estimatedComponentGet.

**Return values**

| | |
|---|---|
| FSP_ERR_UNSUPPORTED | Unsupported. |

### ◆ RM_MOTOR_SENSE_HALL_ParameterUpdate()

fsp_err_t RM_MOTOR_SENSE_HALL_ParameterUpdate ( motor_angle_ctrl_t *const *p_ctrl*, motor_angle_cfg_t const *const *p_cfg* )

Update the parameters of Angle&Speed Estimation. Implements motor_angle_api_t::parameterUpdate.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully data is update. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_MOTOR_SENSE_HALL_InternalCalculate()

fsp_err_t RM_MOTOR_SENSE_HALL_InternalCalculate ( motor_angle_ctrl_t *const *p_ctrl*)

Calculate internal parameters. Implements motor_angle_api_t::internalCalculate.

**Return values**

| | |
|---|---|
| FSP_ERR_UNSUPPORTED | Unsupported. |

### ◆ RM_MOTOR_SENSE_HALL_AngleAdjust()

fsp_err_t RM_MOTOR_SENSE_HALL_AngleAdjust ( motor_angle_ctrl_t *const *p_ctrl*)

Angle Adjustment Process. Implements motor_angle_api_t::angleAdjust.

**Return values**

| | |
|---|---|
| FSP_ERR_UNSUPPORTED | Unsupported. |

### ◆ RM_MOTOR_SENSE_HALL_EncoderCyclic()

fsp_err_t RM_MOTOR_SENSE_HALL_EncoderCyclic ( motor_angle_ctrl_t *const *p_ctrl*)

Encoder Cyclic Process (Call in cyclic timer). Implements motor_angle_api_t::encoderCyclic.

**Return values**

| | |
|---|---|
| FSP_ERR_UNSUPPORTED | Unsupported. |

### ◆ RM_MOTOR_SENSE_HALL_InfoGet()

fsp_err_t RM_MOTOR_SENSE_HALL_InfoGet ( motor_angle_ctrl_t *const *p_ctrl*, motor_angle_encoder_info_t *const *p_info* )

Gets information of Encoder Angle Module. Implements motor_angle_api_t::infoGet.

**Return values**

| | |
|---|---|
| FSP_ERR_UNSUPPORTED | Unsupported. |

### Detailed Description

Calculation process for the motor control on RA MCUs. This module implements the Motor angle Interface.

# Overview

The motor angle and speed calculation with induction sensor module is used to calculate rotor angle and rotational speed in an application. This module is designed to be used with the motor current module (rm_motor_current).

### Features

The motor angle and speed calculation with induction sensor module has the features listed below.

- Calculate rotor angle [radian].
- Calculate rotational speed [radian/second].

# Configuration

### Build Time Configurations for rm_motor_sense_induction

The following build time configurations are defined in fsp_cfg/rm_motor_sense_induction_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

### Configurations for Motor > Motor Angle and Speed Calculation with induction sensor (rm_motor_sense_induction)

This module can be added to the Stacks tab via New Stack > Motor > Motor Angle and Speed Calculation with induction sensor (rm_motor_sense_induction).

| Configuration | Options | Default | Description |
|---|---|---|---|
| General | | | |
| Name | Name must be a valid C symbol | g_motor_angle0 | Module name. |

| | | | |
|---|---|---|---|
| Control type | • Speed<br>• Position | Position | Select control Type |
| Frequency of current control (kHz) | Must be a valid non-negative value. | 20.0 | Frequency of current control |
| Decimation of Interrupt | Must be a valid integer. | 1 | Decimation of Interrupt |
| Counts to get signal | Must be a valid integer. | 10 | Counts to get analog input signal |
| Limit of signal error | Must be a valid integer. | 100 | Limit of signal error |
| Coefficient of speed LPF | Must be a valid value | 0.07 | Coefficient of speed LPF |
| A/D reference voltage | Must be a valid non-negative value. | 3.3 | Reference voltage of A/D converter |
| A/D conversion scale | Must be a valid non-negative value. | 4095.0 | Conversion scale of A/D converter |
| Openloop speed (rpm) | Must be a valid non-negative value. | 6.0 | Rotation speed at calibration openloop (rpm) |
| D-axis current at openloop (A) | Must be a valid non-negative value. | 1.0 | D-axis current at calibration openloop (A) |
| Angle adjustment times | Must be a valid integer. | 512 | Times to get signal at angle adjustment |
| Calibration enable | • Disable<br>• Enable | Enable | Select enable/disable of signal calibration |
| Induction sensor pole pairs | Must be a valid integer. | 4 | Induction sensor pole pairs |
| Motor pole pairs | Must be a valid integer. | 4 | Motor pole pairs |

**Clock Configuration**

**Pin Configuration**

# Usage Notes

### Limitations

Developers should be aware of the following limitations when using the motor angle and speed calculation with induction sensor: all configurations should be set as positive values.

# Examples

### Basic Example

This is a basic example of minimal use of the motor angle and speed calculation with induction sensor in an application.

```
void motor_sense_encoder_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = RM_MOTOR_SENSE_INDUCTION_Open(&g_mtr_angle0_ctrl, &g_mtr_angle_set0_cfg);
    assert(FSP_SUCCESS == err);
 /* Basically run this module at A/D conversion finish interrupt.
  * This implementation is an example. */
 // while (true)
    {
 /* Application work here. */
 /* Initialize motor */
       (void) RM_MOTOR_SENSE_INDUCTION_AngleAdjust(&g_mtr_angle0_ctrl);
 /* Perform cyclic process*/
       (void) RM_MOTOR_SENSE_INDUCTION_CyclicProcess(&g_mtr_angle0_ctrl);
 /* Calculate information with induction sensor signal input */
       (void) RM_MOTOR_SENSE_INDUCTION_InternalCalculate(&g_mtr_angle0_ctrl);
 /* Get angle/speed data */
       (void) RM_MOTOR_SENSE_INDUCTION_AngleSpeedGet(&g_mtr_angle0_ctrl,
&f_get_angle, &f_get_speed, &f_get_phase_err);
    }
 /* Reset the module */
    (void) RM_MOTOR_SENSE_INDUCTION_Reset(&g_mtr_angle0_ctrl);
 /* Close the module */
    (void) RM_MOTOR_SENSE_INDUCTION_Close(&g_mtr_angle0_ctrl);
}
```

## Enumerations

| | |
|---|---|
| enum | motor_sense_induction_loop_t |
| enum | motor_sense_induction_calibration_t |
| enum | motor_sense_induction_mode_t |

## Enumeration Type Documentation

### ◆ motor_sense_induction_loop_t

| enum motor_sense_induction_loop_t | |
|---|---|
| Enumerator | |
| MOTOR_SENSE_INDUCTION_LOOP_SPEED | Speed control mode. |
| MOTOR_SENSE_INDUCTION_LOOP_POSITION | Position control mode. |

### ◆ motor_sense_induction_calibration_t

| enum motor_sense_induction_calibration_t | |
|---|---|
| Enumerator | |
| MOTOR_SENSE_INDUCTION_CALIBRATION_DISABLE | Disable calibration. |
| MOTOR_SENSE_INDUCTION_CALIBRATION_ENABLE | Enable calibration. |

### ◆ motor_sense_induction_mode_t

| enum motor_sense_induction_mode_t | |
|---|---|
| Enumerator | |
| MOTOR_SENSE_INDUCTION_MODE_INIT | Initialize mode (Start status) |
| MOTOR_SENSE_INDUCTION_MODE_BOOT | Boot mode (Angle adjustment status) |
| MOTOR_SENSE_INDUCTION_MODE_DRIVE | Drive mode (Normal work status) |

## Function Documentation

### ◆ RM_MOTOR_SENSE_INDUCTION_Open()

fsp_err_t RM_MOTOR_SENSE_INDUCTION_Open ( motor_angle_ctrl_t *const *p_ctrl*, motor_angle_cfg_t const *const *p_cfg* )

Opens and configures the Angle module. Implements motor_angle_api_t::open.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Angle Induction module successfully configured. |
| FSP_ERR_ASSERTION | Null pointer, or one or more configuration options is invalid. |
| FSP_ERR_ALREADY_OPEN | Module is already open. This module can only be opened once. |
| FSP_ERR_INVALID_ARGUMENT | Configuration parameter error. |

### ◆ RM_MOTOR_SENSE_INDUCTION_Close()

fsp_err_t RM_MOTOR_SENSE_INDUCTION_Close ( motor_angle_ctrl_t *const *p_ctrl*)

Disables specified Angle module. Implements motor_angle_api_t::close.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully closed. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_MOTOR_SENSE_INDUCTION_Reset()

fsp_err_t RM_MOTOR_SENSE_INDUCTION_Reset ( motor_angle_ctrl_t *const *p_ctrl*)

Reset variables of Angle module. Implements motor_angle_api_t::reset.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully closed. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_MOTOR_SENSE_INDUCTION_InternalCalculate()

fsp_err_t RM_MOTOR_SENSE_INDUCTION_InternalCalculate ( motor_angle_ctrl_t *const *p_ctrl*)

Calculate internal parameters. Implements motor_angle_api_t::internalCalculate.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully closed. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_MOTOR_SENSE_INDUCTION_AngleSpeedGet()

fsp_err_t RM_MOTOR_SENSE_INDUCTION_AngleSpeedGet ( motor_angle_ctrl_t *const *p_ctrl*, float *const *p_angle*, float *const *p_speed*, float *const *p_phase_err* )

Gets the current rotor's angle and rotation speed. Implements motor_angle_api_t::angleSpeedGet.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully data calculated. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_MOTOR_SENSE_INDUCTION_AngleAdjust()

fsp_err_t RM_MOTOR_SENSE_INDUCTION_AngleAdjust ( motor_angle_ctrl_t *const *p_ctrl*)

Angle Adjustment Process. Implements motor_angle_api_t::angleAdjust.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully data calculated. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_MOTOR_SENSE_INDUCTION_EncoderCyclic()

fsp_err_t RM_MOTOR_SENSE_INDUCTION_EncoderCyclic ( motor_angle_ctrl_t *const *p_ctrl*)

Encoder Cyclic Process (Call in cyclic timer). Implements motor_angle_api_t::encoderCyclic.

**Return values**

| | |
|---|---|
| FSP_ERR_UNSUPPORTED | Motor sense induction software encoderCyclic is not supported. |

### ◆ RM_MOTOR_SENSE_INDUCTION_CyclicProcess()

fsp_err_t RM_MOTOR_SENSE_INDUCTION_CyclicProcess ( motor_angle_ctrl_t *const *p_ctrl*)

Induction sensor Cyclic Process (Call in cyclic timer). Implements motor_angle_api_t::cyclicProcess.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully data calculated. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_MOTOR_SENSE_INDUCTION_InfoGet()

fsp_err_t RM_MOTOR_SENSE_INDUCTION_InfoGet ( motor_angle_ctrl_t *const *p_ctrl*, motor_angle_encoder_info_t *const *p_info* )

Gets information of Angle Module. Implements motor_angle_api_t::infoGet.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully data calculated. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_MOTOR_SENSE_INDUCTION_CorrectReset()

fsp_err_t RM_MOTOR_SENSE_INDUCTION_CorrectReset ( motor_angle_ctrl_t *const *p_ctrl*)

Reset to restart calibration Angle module.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully closed. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_MOTOR_SENSE_INDUCTION_ErrorGet()

fsp_err_t RM_MOTOR_SENSE_INDUCTION_ErrorGet ( motor_angle_ctrl_t *const *p_ctrl*, motor_angle_error_t *const *p_error* )

Gets the error information about induction correction.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully data calculated. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_MOTOR_SENSE_INDUCTION_ParameterUpdate()

fsp_err_t RM_MOTOR_SENSE_INDUCTION_ParameterUpdate ( motor_angle_ctrl_t *const *p_ctrl*, motor_angle_cfg_t const *const *p_cfg* )

Update the parameters of angle & speed calculation. Implements motor_angle_api_t::parameterUpdate.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully data is update. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_MOTOR_SENSE_INDUCTION_SensorDataSet()

fsp_err_t RM_MOTOR_SENSE_INDUCTION_SensorDataSet ( motor_angle_ctrl_t *const *p_ctrl*, motor_angle_ad_data_t *const *p_ad_data* )

Set A/D Converted Data. Implements motor_angle_api_t::sensorDataSet.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully data is update. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_MOTOR_SENSE_INDUCTION_CurrentSet()

fsp_err_t RM_MOTOR_SENSE_INDUCTION_CurrentSet ( motor_angle_ctrl_t *const *p_ctrl*, motor_angle_current_t *const *p_st_current*, motor_angle_voltage_reference_t *const *p_st_voltage* )

Set d/q-axis Current Data & Voltage Reference. Implements motor_angle_api_t::currentSet.

**Return values**

| | |
|---|---|
| FSP_ERR_UNSUPPORTED | Motor sense induction software currentSet is not supported. |

### ◆ RM_MOTOR_SENSE_INDUCTION_SpeedSet()

fsp_err_t RM_MOTOR_SENSE_INDUCTION_SpeedSet ( motor_angle_ctrl_t *const *p_ctrl*, float const *speed_ctrl*, float const *damp_speed* )

Set Speed Information. Implements motor_angle_api_t::speedSet.

**Return values**

| | |
|---|---|
| FSP_ERR_UNSUPPORTED | Motor sense induction software speedSet is not supported. |

### ◆ RM_MOTOR_SENSE_INDUCTION_FlagPiCtrlSet()

fsp_err_t RM_MOTOR_SENSE_INDUCTION_FlagPiCtrlSet ( motor_angle_ctrl_t *const *p_ctrl*, uint32_t const *flag_pi* )

Set the flag of PI Control runs. Implements motor_angle_api_t::flagPiCtrlSet.

**Return values**

| | |
|---|---|
| FSP_ERR_UNSUPPORTED | Motor sense induction software flagPiCtrlSet is not supported. |

### ◆ RM_MOTOR_SENSE_INDUCTION_EstimatedComponentGet()

fsp_err_t RM_MOTOR_SENSE_INDUCTION_EstimatedComponentGet ( motor_angle_ctrl_t *const *p_ctrl*, float *const *p_ed*, float *const *p_eq* )

Gets estimated d/q-axis component. Implements motor_angle_api_t::estimatedComponentGet.

**Return values**

| | |
|---|---|
| FSP_ERR_UNSUPPORTED | Motor sense induction software estimatedComponentGet is not supported. |

### Detailed Description

Calculation process for the motor control on RA MCUs. This module implements the Motor current Interface.

# Overview

The motor current is used to control the electric current of motor rotation in an application. This module should be called cyclically after the A/D conversion of electric current of each phase in an application. This module calculates each phase voltage with input current reference, electric current and rotor angle.

### Features

The Motor Current Module has below features.

- Calculate each phase(U/V/W) voltage.
- Decoupling Control.
- Voltage Error Compensation.

# Configuration

### Build Time Configurations for rm_motor_current

The following build time configurations are defined in fsp_cfg/rm_motor_current_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

### Configurations for Motor > Motor Current Controller (rm_motor_current)

This module can be added to the Stacks tab via New Stack > Motor > Motor Current Controller (rm_motor_current).

| Configuration | Options | Default | Description |
|---|---|---|---|
| General | | | |
| Name | Name must be a valid C symbol | g_motor_current0 | Module name. |

| | | | |

| Current PI loop zeta | Must be a valid value | 1.0F | Current PI loop zeta |
| Motor Parameter | | | |
| Pole pairs | Must be a valid non-negative value. | 2 | Pole pairs |
| Resistance (ohm) | Must be a valid value | 8.5F | Resistance |
| Inductance of d-axis (H) | Must be a valid value | 0.0045F | Inductance of d-axis |
| Inductance of q-axis (H) | Must be a valid value | 0.0045F | Inductance of q-axis |
| Permanent magnetic flux (Wb) | Must be a valid value | 0.02159F | Permanent magnetic flux |
| Motor Parameter > Rotor inertia (kgm^2) | Must be a valid value | 0.0000028F | Rotor inertia |

### Clock Configuration

This module doesn't depend on clock setting, because this module is a simple calculation process.

### Pin Configuration

This module does not use I/O pins.

# Usage Notes

### Limitations

- Set the Period of Current Control with none-negative value.
- Set the Reference Voltage with none-negative value.

# Examples

### Basic Example

This is a basic example of minimal use of the Motor Current in an application.

```
void motor_current_basic_example (void)
{
 motor_current_input_current_t temp_input_current;
 motor_current_input_voltage_t temp_input_voltage;
 motor_current_get_voltage_t   temp_get_voltage;
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = RM_MOTOR_CURRENT_Open(g_test_motor_current.p_ctrl,
g_test_motor_current.p_cfg);
    assert(FSP_SUCCESS == err);
 /* Basically run this module at A/D conversion finish interrupt.
  * This implementation is an example. */
 // while (true)
    {
 /* Application work here. */
 /* Set current reference before get phase voltage */
       (void) RM_MOTOR_CURRENT_CurrentReferenceSet(g_test_motor_current.p_ctrl, 1.0F,
1.0F);
 /* Set speed and phase data before get phase voltage */
       (void) RM_MOTOR_CURRENT_SpeedPhaseSet(g_test_motor_current.p_ctrl, 104.72F,
1.0F);
       temp_input_current.iu    = 1.0F;
       temp_input_current.iv    = 1.0F;
       temp_input_current.iw    = 1.0F;
       temp_input_voltage.vdc    = 24.0F;
       temp_input_voltage.va_max = 24.0F;
 /* Set electric current and voltage before get phase voltage */
       (void) RM_MOTOR_CURRENT_CurrentSet(g_test_motor_current.p_ctrl,
temp_input_current, temp_input_voltage);
 /* Activate the process. */
```

```
      (void) RM_MOTOR_CURRENT_Run(g_test_motor_current.p_ctrl);
 /* Get d/q-axis current*/
      (void) RM_MOTOR_CURRENT_CurrentGet(g_test_motor_current.p_ctrl, &f_get_id,
&f_get_iq);
 /* Get the flag of PI control */
      (void) RM_MOTOR_CURRENT_PhaseVolageGet(g_test_motor_current.p_ctrl,
&temp_get_voltage);
 /* Get Output Parameter */
      (void) RM_MOTOR_CURRENT_ParameterGet(g_test_motor_current.p_ctrl,
&test_output);
      (void) RM_MOTOR_CURRENT_ParameterUpdate(g_test_motor_current.p_ctrl,
g_test_motor_current.p_cfg);
    }
 /* Reset the process. */
    (void) RM_MOTOR_CURRENT_Reset(g_test_motor_current.p_ctrl);
 /* Close the module. */
    (void) RM_MOTOR_CURRENT_Close(g_test_motor_current.p_ctrl);
}
```

## Enumerations

| | |
|---|---|
| enum | motor_current_shunt_type_t |

## Enumeration Type Documentation

### ◆ motor_current_shunt_type_t

| enum motor_current_shunt_type_t | |
|---|---|
| Selection of shunt type | |
| Enumerator | |
| MOTOR_CURRENT_SHUNT_TYPE_1_SHUNT | Only use U phase current. |
| MOTOR_CURRENT_SHUNT_TYPE_2_SHUNT | Use U and W phase current. |
| MOTOR_CURRENT_SHUNT_TYPE_3_SHUNT | Use all phase current. |

## Function Documentation

### ◆ RM_MOTOR_CURRENT_Open()

fsp_err_t RM_MOTOR_CURRENT_Open ( motor_current_ctrl_t *const *p_ctrl*, motor_current_cfg_t const *const *p_cfg* )

Opens and configures the Motor Current Module. Implements motor_current_api_t::open.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Motor Current successfully configured. |
| FSP_ERR_ASSERTION | Null pointer, or one or more configuration options is invalid. |
| FSP_ERR_ALREADY_OPEN | Module is already open. This module can only be opened once. |
| FSP_ERR_INVALID_ARGUMENT | Configuration parameter error. |

### ◆ RM_MOTOR_CURRENT_Close()

fsp_err_t RM_MOTOR_CURRENT_Close ( motor_current_ctrl_t *const *p_ctrl*)

Disables specified Motor Current Module. Implements motor_current_api_t::close.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully closed. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_MOTOR_CURRENT_Reset()

fsp_err_t RM_MOTOR_CURRENT_Reset ( motor_current_ctrl_t *const *p_ctrl*)

Reset variables of Motor Current Module. Implements motor_current_api_t::reset.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully reset. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_MOTOR_CURRENT_Run()

fsp_err_t RM_MOTOR_CURRENT_Run ( motor_current_ctrl_t *const *p_ctrl*)

Run(Start) the Current Control. Implements motor_current_api_t::run.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully run. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_MOTOR_CURRENT_ParameterSet()

fsp_err_t RM_MOTOR_CURRENT_ParameterSet ( motor_current_ctrl_t *const *p_ctrl*, motor_current_input_t const *const *p_st_input* )

Set (Input) Parameter Data. Implements motor_current_api_t::parameterSet.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully data is set. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input argument error. |

### ◆ RM_MOTOR_CURRENT_CurrentReferenceSet()

fsp_err_t RM_MOTOR_CURRENT_CurrentReferenceSet ( motor_current_ctrl_t *const *p_ctrl*, float const *id_reference*, float const *iq_reference* )

Set Current Reference Data. Implements motor_current_api_t::currentReferenceSet.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully data is set. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_MOTOR_CURRENT_SpeedPhaseSet()

fsp_err_t RM_MOTOR_CURRENT_SpeedPhaseSet ( motor_current_ctrl_t *const *p_ctrl*, float const *speed*, float const *phase* )

Set Current Speed & rotor phase Data. Implements motor_current_api_t::speedPhaseSet.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully data is set. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_MOTOR_CURRENT_CurrentSet()

fsp_err_t RM_MOTOR_CURRENT_CurrentSet ( motor_current_ctrl_t *const *p_ctrl*, motor_current_input_current_t const *const *p_st_current*, motor_current_input_voltage_t const *const *p_st_voltage* )

Set d/q-axis Current & Voltage Data. Implements motor_current_api_t::currentSet.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully data is set. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter error. |

### ◆ RM_MOTOR_CURRENT_ParameterGet()

fsp_err_t RM_MOTOR_CURRENT_ParameterGet ( motor_current_ctrl_t *const *p_ctrl*, motor_current_output_t *const *p_st_output* )

Get Output Parameters. Implements motor_current_api_t::parameterGet.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successful data get. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter error. |

### ◆ RM_MOTOR_CURRENT_CurrentGet()

fsp_err_t RM_MOTOR_CURRENT_CurrentGet ( motor_current_ctrl_t *const *p_ctrl*, float *const *p_id*, float *const *p_iq* )

Get d/q-axis Current. Implements motor_current_api_t::currentGet.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successful data get. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter error. |

### ◆ RM_MOTOR_CURRENT_PhaseVoltageGet()

fsp_err_t RM_MOTOR_CURRENT_PhaseVoltageGet ( motor_current_ctrl_t *const *p_ctrl*, motor_current_get_voltage_t *const *p_voltage* )

Gets the set phase voltage. Implements motor_current_api_t::phaseVoltageGet.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successful data calculation. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter error. |

### ◆ RM_MOTOR_CURRENT_ParameterUpdate()

fsp_err_t RM_MOTOR_CURRENT_ParameterUpdate ( motor_current_ctrl_t *const *p_ctrl*, motor_current_cfg_t const *const *p_cfg* )

Update the parameters of Current Control. Implements motor_current_api_t::parameterUpdate.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully data was updated. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ rm_motor_current_encoder_cyclic()

| void rm_motor_current_encoder_cyclic ( motor_current_instance_t const * *p_ctrl*) |

### Detailed Description

Control a SPM motor on RA MCUs. This module implements the Motor Encoder Vector Control (rm_motor_encoder).

# Overview

The motor encoder vector control is used to control motor rotation in an application. This module is meant to be used with Surface Permanent Magnet (SPM) motors and allows applications to start or stop motor rotation easily.

### Features

The motor encoder module has below features.

- Start/stop motor rotation
- Error detection (over current, over speed, over voltage, low voltage)

### Target Hardware

The below figure shows an example of target hardware of this Motor Encoder Module.

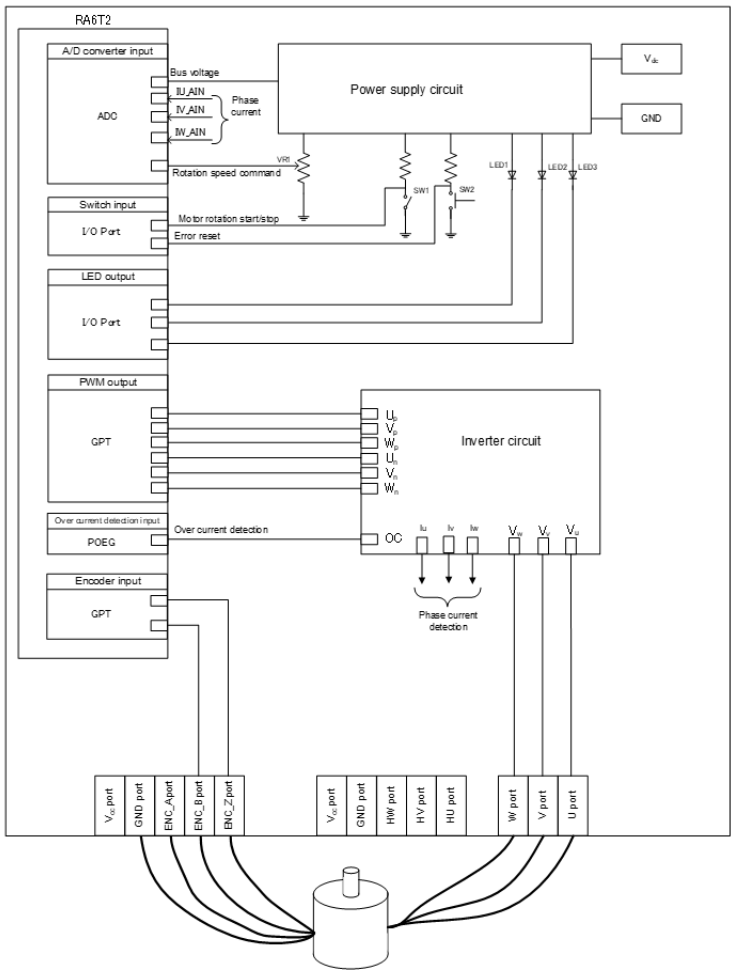

Figure 272: Example of target hardware of motor encoder module

## Block Diagram

The below figure shows block diaram of encoder vector motor control.

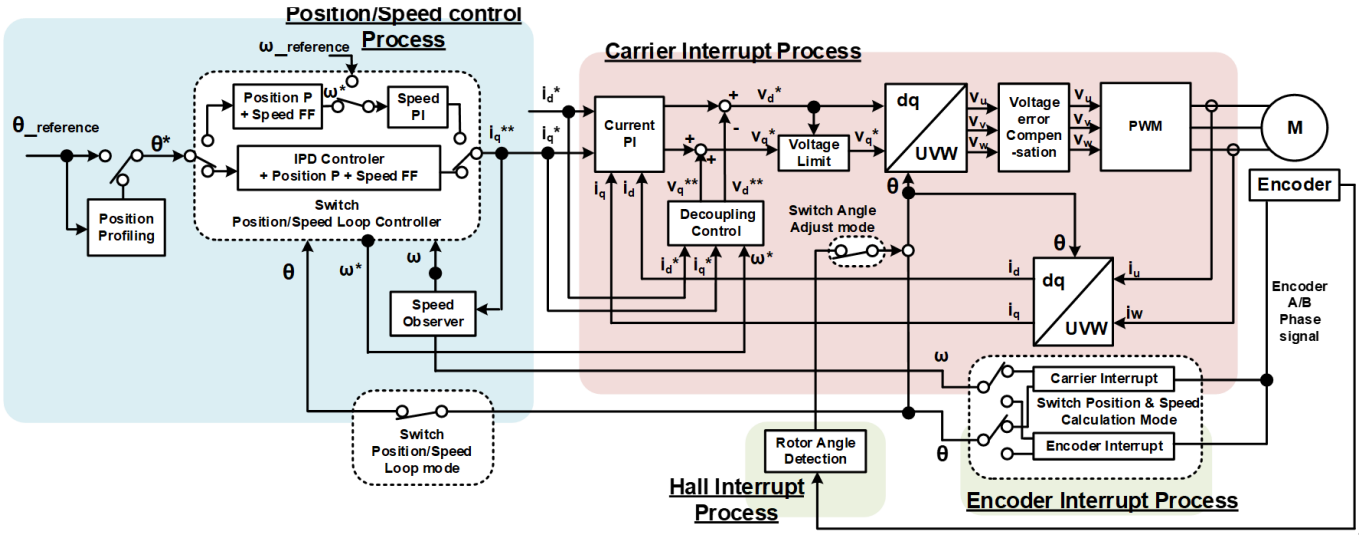

Figure 273: Block diagram of encoder vector control (PI feedback loop)

### Modulation

- Sine wave modulation The modulation factor "m" is defined as follows.

$$m = \frac{V}{E}$$

m : Modulation ratio V : Reference voltage E : Inverter input voltage

Figure 274: Modulation factor

- Space vector modulation In vector control of a permanent magnet synchronous motor, generally, the desired voltage command value of each phase is generated sinusoidally. However, if the generated value is used as-is for the modulation wave for PWM generation, voltage utilization as applied to the motor (in terms of line voltage) is limited to a maximum of 86.7 percents with respect to inverter bus voltage. As such, as shown in the following expression, the average of the maximum and minimum values is calculated for the voltage command value of each phase, and the value obtained by subtracting the average from the voltage command value of each phase is used as the modulation wave. As a result, the maximum amplitude of the modulation wave is multiplied by (square root 3)/2, while voltage utilization becomes 100 percents and line voltage is unchanged.

$$\begin{pmatrix} V_u' \\ V_v' \\ V_w' \end{pmatrix} = \begin{pmatrix} V_u \\ V_v \\ V_w \end{pmatrix} + \Delta V \begin{pmatrix} 1 \\ 1 \\ 1 \end{pmatrix}$$

$$\because \Delta V = -\frac{V_{max}+V_{min}}{2},\ V_{max} = max\{V_u, V_v, V_w\},\ V_{min} = min\{V_u, V_v, V_w\}$$

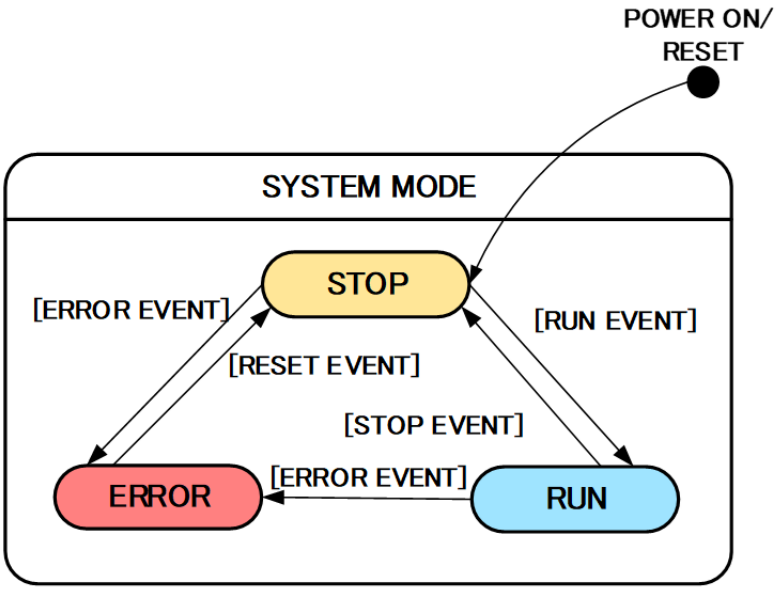
$V_u, V_v, V_w$: Command values of U-, V-, and W-phases

$V_u', V_v', V_w'$: Command values of U-, V-, and W-phases for PWM generation (modulation wave)

Figure 275: Space vector modulation

### State transition

The below figure shows a state transition diagram. Internal state is managed by "SYSTEM MODE".



| | | MODE | | |
|---|---|---|---|---|
| | | STOP | RUN | ERROR |
| EVENT | STOP | STOP | STOP | ERROR |
| | RUN | RUN | RUN | ERROR |
| | ERROR | ERROR | ERROR | ERROR |
| | RESET | STOP | RUN | STOP |

Figure 276: State transition diagram

(1) SYSTEM MODE "SYSTEM MODE" indicates the operating states of the system. The state transits on occurrence of each event (EVENT). "SYSTEM MODE" has 3 states that are motor drive stop (INACTIVE), motor drive (ACTIVE), and abnormal condition (ERROR).

(2) EVENT When "EVENT" occurs in each "SYSTEM MODE", "SYSTEM MODE" changes as shown the table in above figure, according to that "EVENT". The occurrence factors of each event are shown below.

| EVENT name | Occurrence factor |
|---|---|
| STOP | by user operation |
| RUN | by user operation |
| ERROR | when the system detects an error |
| RESET | by user operation |

**Flowchart**

The below figures show flowcharts of motor encoder module.

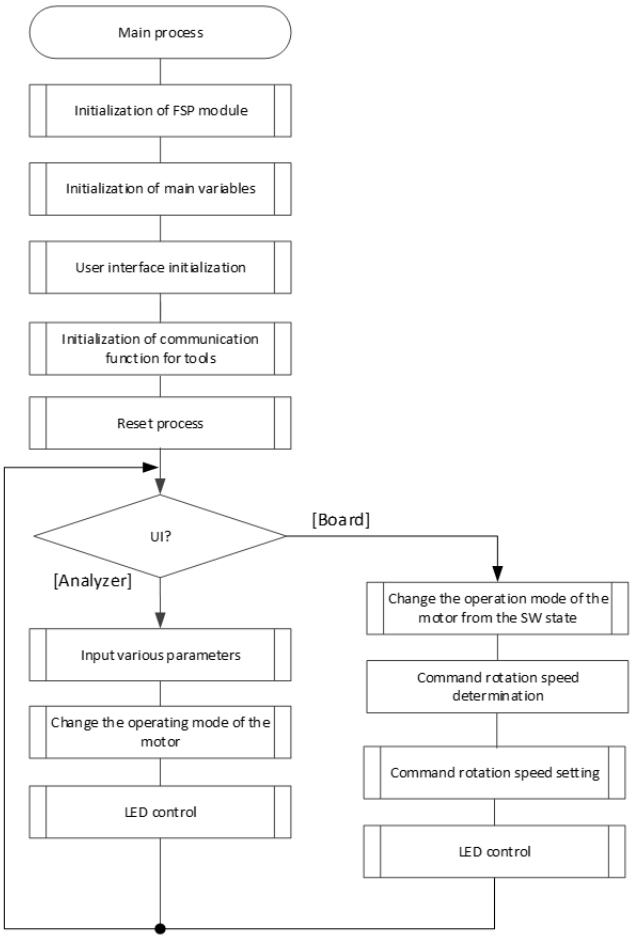


Figure 277: Main process

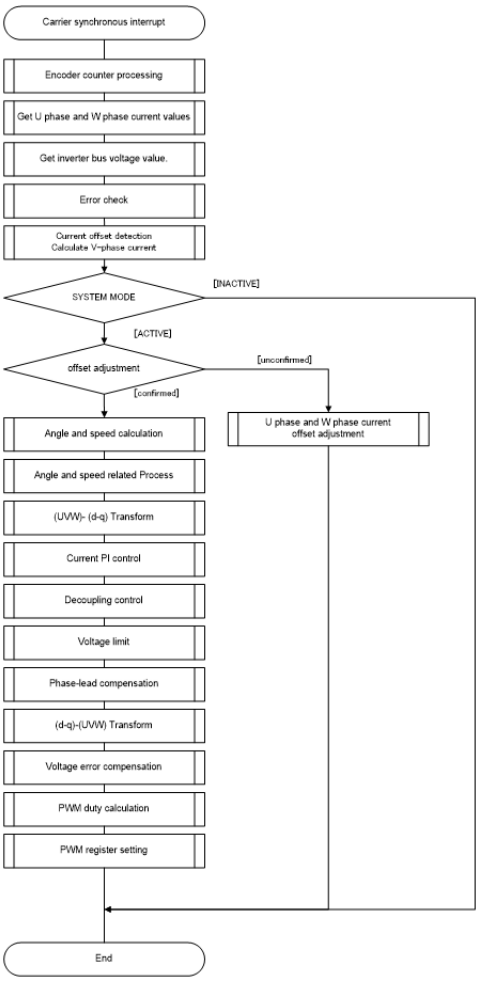

Figure 278: Current control process

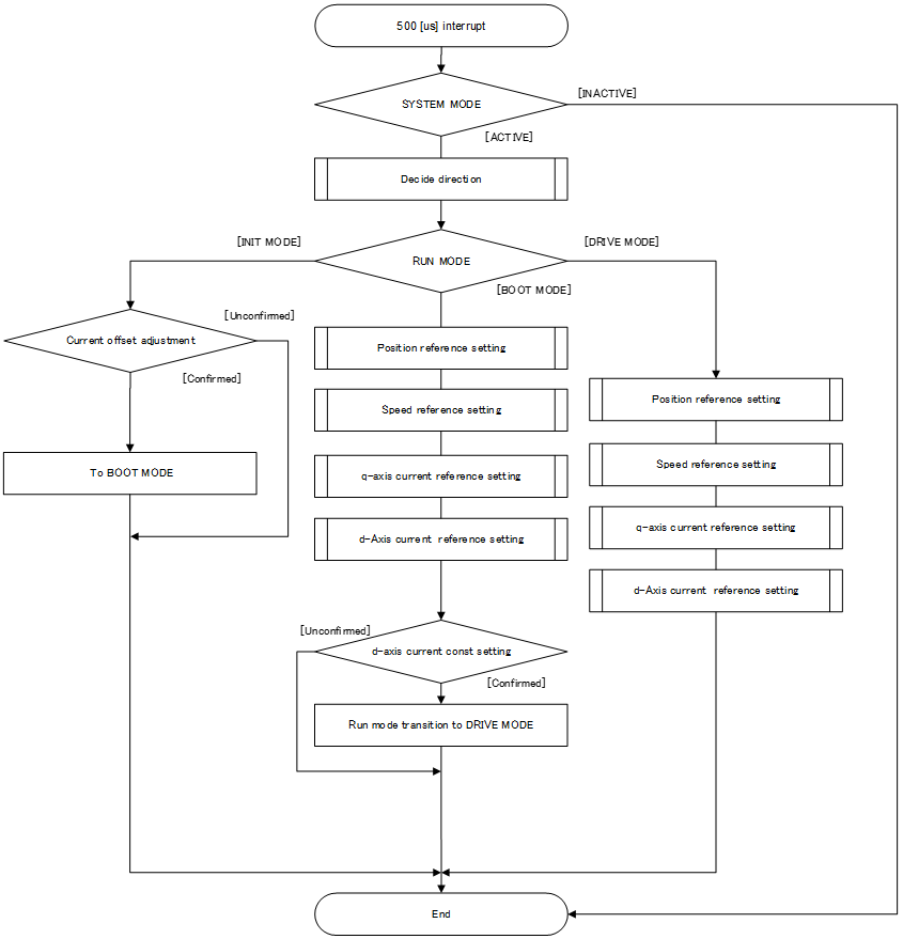

Figure 279: Speed control process

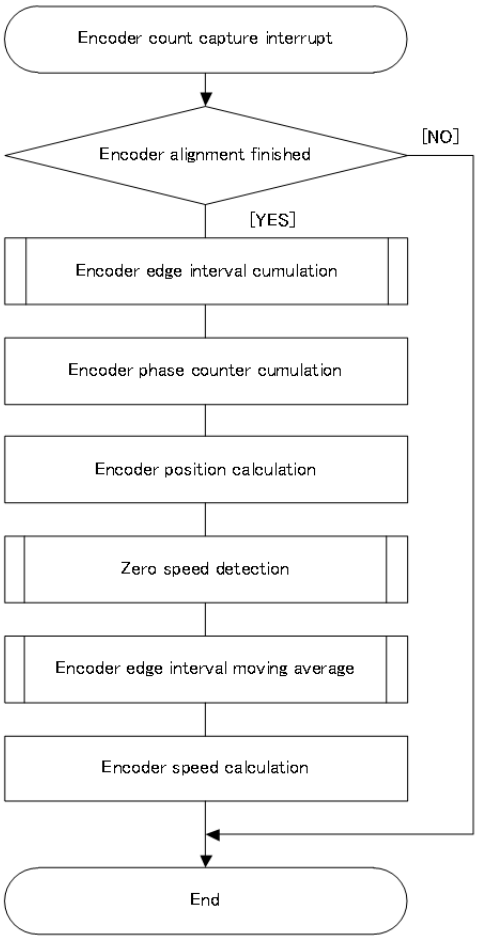

Figure 280: Encoder interrupt process

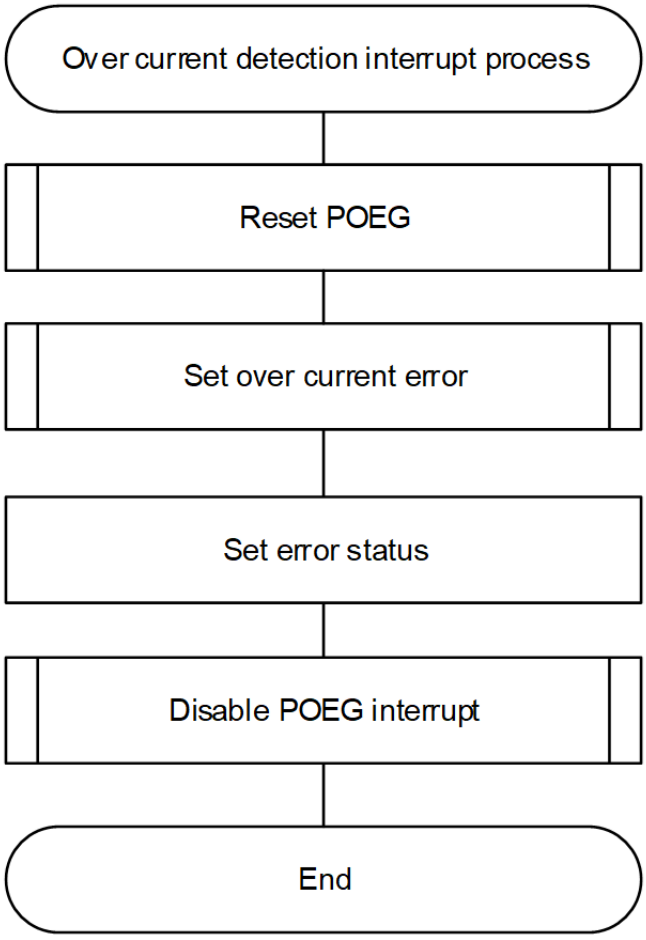

Figure 281: Over current detection interrupt process

# Configuration

### Build Time Configurations for rm_motor_encoder

The following build time configurations are defined in fsp_cfg/rm_motor_encoder_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

### Configurations for Motor > Motor Encoder Vector Control (rm_motor_encoder)

This module can be added to the Stacks tab via New Stack > Motor > Motor Encoder Vector Control (rm_motor_encoder).

| Configuration | Options | Default | Description |
|---|---|---|---|
| General | | | |

| | | | |
|---|---|---|---|
| Name | Name must be a valid C symbol | g_motor_encoder0 | Module name. |
| Limit of over current (A) | Must be a valid value | 2.0F | Limit of over current.(Detection threshold) |
| Limit of over voltage (V) | Must be a valid value | 28.0F | Limit of over voltage.(Detection threshold) |
| Limit of over speed (rpm) | Must be a valid value | 2100.0F | Limit of over speed.(Detection threshold) |
| Limit of low voltage (V) | Must be a valid value | 18.0F | Limit of low voltage.(Detection threshold) |
| Interrupts | | | |
| Callback | Name must be a valid C symbol | NULL | A user callback function. If this callback function is provided, it is called at speed control cyclic interrupt. |

### Clock Configuration

This module doesn't depend on clock setting, because this module is a simple status transition process.

### Pin Configuration

This module does not use I/O pins. Please set used pins on configuration of each hardware modules.

## Usage Notes

### Limitations

## Examples

### Basic Example

This is a basic example of minimal use of the motor encoder module in an application.

```
void motor_encoder_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = RM_MOTOR_ENCODER_Open(g_motor_encoder0.p_ctrl, g_motor_encoder0.p_cfg);
    handle_error(err);
```

```
 /* Set speed reference before motor run */
    (void) RM_MOTOR_ENCODER_SpeedSet(g_motor_encoder0.p_ctrl,
RM_MOTOR_ENCODER_TEST_OVER_SPEED_LIMIT);
 /* Set position reference before motor run */
    (void) RM_MOTOR_ENCODER_PositionSet(g_motor_encoder0.p_ctrl, &g_posref_sample1);
 /* Start motor rotation */
    (void) RM_MOTOR_ENCODER_Run(g_motor_encoder0.p_ctrl);
 /* Get current status */
    (void) RM_MOTOR_ENCODER_StatusGet(g_motor_encoder0.p_ctrl, &smpl_status);
 /* Get current rotor angle */
    (void) RM_MOTOR_ENCODER_AngleGet(g_motor_encoder0.p_ctrl, &smpl_angle);
 /* Get current motor speed */
    (void) RM_MOTOR_ENCODER_SpeedGet(g_motor_encoder0.p_ctrl, &smpl_speed);
 /* Check error */
    (void) RM_MOTOR_ENCODER_ErrorCheck(g_motor_encoder0.p_ctrl, &smpl_error);
 /* Stop motor rotation */
    (void) RM_MOTOR_ENCODER_Stop(g_motor_encoder0.p_ctrl);
 /* Stop motor rotation */
    (void) RM_MOTOR_ENCODER_ErrorSet(g_motor_encoder0.p_ctrl,
MOTOR_ERROR_OVER_CURRENT_HW);
 /* Reset Speed Control */
    (void) RM_MOTOR_ENCODER_Reset(g_motor_encoder0.p_ctrl);
 /* Close Speed Control */
    (void) RM_MOTOR_ENCODER_Close(g_motor_encoder0.p_ctrl);
}
```

## Enumerations

| | |
|---|---|
| enum | motor_encoder_ctrl_t |
| enum | motor_encoder_ctrl_event_t |

## Enumeration Type Documentation

### ◆ motor_encoder_ctrl_t

| enum motor_encoder_ctrl_t | |
|---|---|
| Enumerator | |
| MOTOR_ENCODER_CTRL_STOP | Stop mode. |
| MOTOR_ENCODER_CTRL_RUN | Run mode. |
| MOTOR_ENCODER_CTRL_ERROR | Error mode. |

### ◆ motor_encoder_ctrl_event_t

| enum motor_encoder_ctrl_event_t | |
|---|---|
| Enumerator | |
| MOTOR_ENCODER_CTRL_EVENT_STOP | Stop event. |
| MOTOR_ENCODER_CTRL_EVENT_RUN | Run event. |
| MOTOR_ENCODER_CTRL_EVENT_ERROR | Error event. |
| MOTOR_ENCODER_CTRL_EVENT_RESET | Reset event. |

## Function Documentation

### ◆ RM_MOTOR_ENCODER_Open()

fsp_err_t RM_MOTOR_ENCODER_Open ( motor_ctrl_t *const *p_ctrl*, motor_cfg_t const *const *p_cfg* )

Configure the MOTOR in register start mode. Implements motor_api_t::open.

This function should only be called once as MOTOR configuration registers can only be written to once so subsequent calls will have no effect.

Example:

```
/* Initializes the module. */
   err = RM_MOTOR_ENCODER_Open(g_motor_encoder0.p_ctrl, g_motor_encoder0.p_cfg);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | MOTOR successfully configured. |
| FSP_ERR_ASSERTION | Null pointer, or one or more configuration options is invalid. |
| FSP_ERR_ALREADY_OPEN | Module is already open. This module can only be opened once. |
| FSP_ERR_INVALID_ARGUMENT | Configuration parameter error. |

***Note***

### ◆ RM_MOTOR_ENCODER_Close()

fsp_err_t RM_MOTOR_ENCODER_Close ( motor_ctrl_t *const *p_ctrl*)

Disables specified Motor Encoder Control block. Implements motor_api_t::close.

Example:

```
/* Close Speed Control */
   (void) RM_MOTOR_ENCODER_Close(g_motor_encoder0.p_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully closed. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

***Note***

### ◆ RM_MOTOR_ENCODER_Reset()

fsp_err_t RM_MOTOR_ENCODER_Reset ( motor_ctrl_t *const *p_ctrl*)

Reset Motor Encoder Control block. Implements motor_api_t::reset.

Example:

```
/* Reset Speed Control */
   (void) RM_MOTOR_ENCODER_Reset(g_motor_encoder0.p_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

***Note***

### ◆ RM_MOTOR_ENCODER_Run()

fsp_err_t RM_MOTOR_ENCODER_Run ( motor_ctrl_t *const *p_ctrl*)

Run Motor (Start motor rotation). Implements motor_api_t::run.

Example:

```
/* Start motor rotation */
   (void) RM_MOTOR_ENCODER_Run(g_motor_encoder0.p_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

***Note***

### ◆ RM_MOTOR_ENCODER_Stop()

fsp_err_t RM_MOTOR_ENCODER_Stop ( motor_ctrl_t *const *p_ctrl*)

Stop Motor (Stop motor rotation). Implements motor_api_t::stop.

Example:

```
/* Stop motor rotation */
   (void) RM_MOTOR_ENCODER_Stop(g_motor_encoder0.p_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

***Note***

### ◆ RM_MOTOR_ENCODER_ErrorSet()

fsp_err_t RM_MOTOR_ENCODER_ErrorSet ( motor_ctrl_t *const *p_ctrl*, motor_error_t const *error* )

Set error information. Implements motor_api_t::errorSet.

Example:

```
/* Stop motor rotation */
   (void) RM_MOTOR_ENCODER_ErrorSet(g_motor_encoder0.p_ctrl,
MOTOR_ERROR_OVER_CURRENT_HW);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

***Note***

### ◆ RM_MOTOR_ENCODER_SpeedSet()

fsp_err_t RM_MOTOR_ENCODER_SpeedSet ( motor_ctrl_t *const *p_ctrl*, float const *speed_rpm* )

Set speed reference[rpm]. Implements motor_api_t::speedSet.

Example:

```
/* Set speed reference before motor run */
   (void) RM_MOTOR_ENCODER_SpeedSet(g_motor_encoder0.p_ctrl,
RM_MOTOR_ENCODER_TEST_OVER_SPEED_LIMIT);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

***Note***

### ◆ RM_MOTOR_ENCODER_PositionSet()

fsp_err_t RM_MOTOR_ENCODER_PositionSet ( motor_ctrl_t *const *p_ctrl*, motor_speed_position_data_t const *const *p_position* )

Set position reference[degree]. Implements motor_api_t::positionSet.

Example:

```
/* Set position reference before motor run */
   (void) RM_MOTOR_ENCODER_PositionSet(g_motor_encoder0.p_ctrl, &g_posref_sample1);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Data set pointer is invalid.. |

***Note***

### ◆ RM_MOTOR_ENCODER_StatusGet()

fsp_err_t RM_MOTOR_ENCODER_StatusGet ( motor_ctrl_t *const *p_ctrl*, uint8_t *const *p_status* )

Get current control status. Implements motor_api_t::statusGet.

Example:

```
/* Get current status */
   (void) RM_MOTOR_ENCODER_StatusGet(g_motor_encoder0.p_ctrl, &smpl_status);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Data received pointer is invalid.. |

***Note***

### ◆ RM_MOTOR_ENCODER_AngleGet()

fsp_err_t RM_MOTOR_ENCODER_AngleGet ( motor_ctrl_t *const *p_ctrl*, float *const *p_angle_rad* )

Get current rotor angle. Implements motor_api_t::angleGet.

Example:

```
/* Get current rotor angle */
   (void) RM_MOTOR_ENCODER_AngleGet(g_motor_encoder0.p_ctrl, &smpl_angle);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Data received pointer is invalid.. |

***Note***

### ◆ RM_MOTOR_ENCODER_SpeedGet()

fsp_err_t RM_MOTOR_ENCODER_SpeedGet ( motor_ctrl_t *const *p_ctrl*, float *const *p_speed_rpm* )

Get rotational speed. Implements motor_api_t::speedGet.

Example:

```
/* Get current motor speed */
   (void) RM_MOTOR_ENCODER_SpeedGet(g_motor_encoder0.p_ctrl, &smpl_speed);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Data received pointer is invalid.. |

***Note***

### ◆ RM_MOTOR_ENCODER_ErrorCheck()

fsp_err_t RM_MOTOR_ENCODER_ErrorCheck ( motor_ctrl_t *const *p_ctrl*, uint16_t *const *p_error* )

Check the occurunce of Error. Implements motor_api_t::errorCheck.

Example:

```
/* Check error */
   (void) RM_MOTOR_ENCODER_ErrorCheck(g_motor_encoder0.p_ctrl, &smpl_error);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Data received pointer is invalid.. |

***Note***

### ◆ RM_MOTOR_ENCODER_WaitStopFlagGet()

fsp_err_t RM_MOTOR_ENCODER_WaitStopFlagGet ( motor_ctrl_t *const *p_ctrl*, motor_wait_stop_flag_t *const *p_flag* )

Get wait stop flag. Implements motor_api_t::waitStopFlagGet.

Example:

**Return values**

| | |
|---|---|
| FSP_ERR_UNSUPPORTED | Unsupported. |

***Note***

### ◆ RM_MOTOR_ENCODER_FunctionSelect()

fsp_err_t RM_MOTOR_ENCODER_FunctionSelect ( motor_ctrl_t *const *p_ctrl*, motor_function_select_t const *function* )

Select using function. Implements motor_api_t::functionSelect.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_MODE | Mode unmatch |

***Note***

### ◆ RM_MOTOR_ENCODER_InertiaEstimateStart()

fsp_err_t RM_MOTOR_ENCODER_InertiaEstimateStart ( motor_ctrl_t *const *p_ctrl*)

Start inertia estimation function.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_MODE | Mode unmatch |

***Note***

### ◆ RM_MOTOR_ENCODER_InertiaEstimateStop()

fsp_err_t RM_MOTOR_ENCODER_InertiaEstimateStop ( motor_ctrl_t *const *p_ctrl*)

Stop(Cancel) inertia estimation function.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_MODE | Mode unmatch |

***Note***

### ◆ RM_MOTOR_ENCODER_ReturnOriginStart()

fsp_err_t RM_MOTOR_ENCODER_ReturnOriginStart ( motor_ctrl_t *const *p_ctrl*)

Start return origin function.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_MODE | Mode unmatch |

***Note***

### ◆ RM_MOTOR_ENCODER_ReturnOriginStop()

### Detailed Description

Measurement and calculation process for the motor control on RA MCUs. This module implements the Motor Inertia Estimate Interface.

# Overview

The motor inertia estimation module is used to measure and calculate rotor inertia in an application.

This module should be used with Renesas Motor Workbench (RMW) basically.

### Features

The Motor Inertia Estimation Module has below features.

- Measurement process work automatically
- Calculate rotor inertia [kgm^2].

# Configuration

### Build Time Configurations for rm_motor_inertia_estimate

The following build time configurations are defined in fsp_cfg/rm_motor_inertia_estimate_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

### Configurations for Motor > Motor inertia estimation (rm_motor_inertia_estimate)

This module can be added to the Stacks tab via New Stack > Motor > Motor inertia estimation (rm_motor_inertia_estimate).

| Configuration | Options | Default | Description |
|---|---|---|---|
| General | | | |
| Name | Name must be a valid C symbol | g_motor_inertia_estimate0 | Module name. |
| Moved position distance to measure (degree) | Must be set -360 to -10 or 10 to 360. | 360 | Moved position distance to measure inertia (degree) |
| Maximum speed (rpm) | Must be set over 60. | 500 | Maximum rotation speed (rpm) |
| Acceleration time | Must be a valid non-negative value. | 0.3 | Acceleration time |
| Motor inertia | Must be a valid non-negative value. | 0.0000041 | Motor inertia |
| Low threshold to judge speed | Must be set 0.1 to 0.5. | 0.1 | Low threshold to judge speed reached |
| High threshold to judge speed | Must be set 0.5 to 0.9, and greater than low threshold | 0.9 | High threshold to judge speed reached |
| Time to wait moving stability (sec) | Must be a valid non-negative value. | 0.8 | Time to wait moving stability |
| Cyclic period of current control (sec) | Must be a valid non-negative value. | 0.00005 | Cyclic period of current control (sec) |

| | | | |
|---|---|---|---|
| Cyclic period of speed control (sec) | Must be a valid non-negative value. | 0.0005 | Cyclic period of speed control (sec) |
| Motor pole pairs | Must be a valid non-negative value. | 4 | Motor pole pairs |
| Motor magnet flux (Wb) | Must be a valid non-negative value. | 0.00623 | Motor magnet flux (Wb) |
| Interval time | Must be a valid non-negative value. | 400.0 | Interval time. Please set same value as Position control |

### Clock Configuration

This module doesn't depend on clock setting, because this module is a simple calculation process.

### Pin Configuration

This module does not use I/O pins.

## Usage Notes

### Limitations

## Examples

### Basic Example

This is a basic example of minimal use of the Motor Inertia Estimation in an application.

```
void motor_inertia_estimate_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = RM_MOTOR_INERTIA_ESTIMATE_Open(&g_mtr_inertia_estimate0_ctrl,
&g_mtr_inertia_estimate0_cfg);
    assert(FSP_SUCCESS == err);
 /* Start process. */
    err = RM_MOTOR_INERTIA_ESTIMATE_Start(&g_mtr_inertia_estimate0_ctrl);
    temp_set_data.f_iq = 1.0F;
    temp_set_data.f_speed_radian_control = 1.04F;
    temp_set_data.s2_position_degree    = 180;
    temp_set_data.u1_position_state      = 0;
 /* Set data to the module. */
    err = RM_MOTOR_INERTIA_ESTIMATE_DataSet(&g_mtr_inertia_estimate0_ctrl,
```

```
&temp_set_data);
 /* Get information from the module. */
    err = RM_MOTOR_INERTIA_ESTIMATE_InfoGet(&g_mtr_inertia_estimate0_ctrl,
&temp_information);
 /* Stop process. */
    err = RM_MOTOR_INERTIA_ESTIMATE_Stop(&g_mtr_inertia_estimate0_ctrl);
 /* Close the module. */
    err = RM_MOTOR_INERTIA_ESTIMATE_Close(&g_mtr_inertia_estimate0_ctrl);
}
```

## Data Structures

| | |
|---|---|
| struct | motor_inertia_estimate_extended_cfg_t |
| struct | motor_inertia_estimate_instance_ctrl_t |

## Data Structure Documentation

### ◆ motor_inertia_estimate_extended_cfg_t

| struct motor_inertia_estimate_extended_cfg_t | | |
|---|---|---|
| Extended configurations for motor inertia estimate | | |
| Data Fields | | |
| int16_t | s2_move_degree | Moving position reference [degree]. |
| uint16_t | u2_J_max_speed_rpm | Maximum Speed [rpm]. |
| float | f_accel_time | Acceleration time. |
| float | f_rotor_inertia | Initialized rotor inertia value. |
| float | f_judge_low_threshold | Low threshold to judge speed. |
| float | f_judge_high_threshold | High threshold to judge speed. |
| float | f_change_mode_time | Timing value to change internal mode. |
| float | f_current_ctrl_period | Period of current control [sec]. |
| float | f_speed_ctrl_period | Period of speed control [sec]. |
| uint8_t | u1_motor_polepairs | Motor pole pairs. |
| float | f_motor_m | Motor magnet flux [Wb]. |
| float | f_position_interval | Interval counts for reference position change. |

### ◆ motor_inertia_estimate_instance_ctrl_t

| struct motor_inertia_estimate_instance_ctrl_t | | |
|---|---|---|
| Inertia estimate instance control block | | |
| Data Fields | | |
| uint32_t | open | Used to determine if the module is configured. |
| motor_inertia_estimate_start_flag_t | start_flag | start/stop flag |
| motor_inertia_estimate_mode_t | mode | Internal mode. |
| uint8_t | u1_mode_count | Use to manage internal mode. |
| motor_inertia_estimate_period_t | speed_period | Measure period. |
| motor_inertia_estimate_period_t | speed_period_buffer | Buffer of measure period to be referred by current cyclic. |
| uint32_t | u4_measure_count | Counter for speed control cycle. |
| uint32_t | u4_wait_count | Counter to wait change mode timing. |
| uint8_t | u1_position_move_mode | Position move mode (TRIANGLE/TRAPEZOID) |
| int16_t | s2_initial_position_degree | Initial position. |
| float | f_iq_ad | q-axis current [A] |
| float | f_summary_iq_ad | Summary of q-axis current. |
| float | f_position_mode_time | Summary of speed control period to judge the timing. |
| float | f_position_dt_time_sec | Differential time of move. |
| int16_t | s2_position_reference_degree | Position reference [degree]. |
| float | f_estimated_value | Estimated inertia. |
| float | f_inertia_value1 | Buffer to calculate inertia 1. |
| float | f_inertia_value2 | Buffer to calculate inertia 2. |
| float | f_interval_time | Interval time about position transition. |
| float | f_inertia_speed_ctrl1 | |
| float | f_inertia_speed_ctrl2 | |
| float | f_inertia_speed_ctrl3 | |
| float | f_inertia_speed_ctrl4 | |
| float | f_inertia_speed_ctrl5 | |
| float | f_inertia_speed_ctrl6 | |
| float | f_inertia_speed_ctrl7 | |
| | | |

| | | |
|---|---|---|
| float | f_inertia_speed_ctrl8 | |
| float | f_inertia_integ_iq1 | |
| float | f_inertia_integ_iq2 | |
| float | f_inertia_integ_iq3 | |
| float | f_inertia_integ_iq4 | |
| float | f_inertia_integ_time1 | |
| float | f_inertia_integ_time2 | |
| float | f_inertia_integ_time3 | |
| float | f_inertia_integ_time4 | |
| float | f_inverse_motor_polepairs | Inverse motor pole pairs (for calculation) |
| motor_inertia_estimate_set_data_t | receive_data | Received data set from speed(position) and current. |
| motor_inertia_estimate_cfg_t const * | p_cfg | Pointer of configuration structure. |

### Function Documentation

#### ◆ RM_MOTOR_INERTIA_ESTIMATE_Open()

fsp_err_t RM_MOTOR_INERTIA_ESTIMATE_Open ( motor_inertia_estimate_ctrl_t *const *p_ctrl*, motor_inertia_estimate_cfg_t const *const *p_cfg* )

Opens and configures the motor inertia estimate module. Implements motor_inertia_estimate_api_t::open.

Example:

```
/* Initializes the module. */
   err = RM_MOTOR_INERTIA_ESTIMATE_Open(&g_mtr_inertia_estimate0_ctrl,
&g_mtr_inertia_estimate0_cfg);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Motor inertia estimate module successfully configured. |
| FSP_ERR_ASSERTION | Null pointer, or one or more configuration options is invalid. |
| FSP_ERR_ALREADY_OPEN | Module is already open. This module can only be opened once. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter error. |

### ◆ RM_MOTOR_INERTIA_ESTIMATE_Close()

fsp_err_t RM_MOTOR_INERTIA_ESTIMATE_Close ( motor_inertia_estimate_ctrl_t *const *p_ctrl*)

Disables specified motor inertia estimate module. Implements motor_inertia_estimate_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MOTOR_INERTIA_ESTIMATE_Close(&g_mtr_inertia_estimate0_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully closed. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_MOTOR_INERTIA_ESTIMATE_Start()

fsp_err_t RM_MOTOR_INERTIA_ESTIMATE_Start ( motor_inertia_estimate_ctrl_t *const *p_ctrl*)

Start inertia estimation. Implements motor_inertia_estimate_api_t::start.

Example:

```
/* Start process. */
   err = RM_MOTOR_INERTIA_ESTIMATE_Start(&g_mtr_inertia_estimate0_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully started. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_MOTOR_INERTIA_ESTIMATE_Stop()

fsp_err_t RM_MOTOR_INERTIA_ESTIMATE_Stop ( motor_inertia_estimate_ctrl_t *const *p_ctrl*)

Stop (Cancel) inertia estimation. Implements motor_inertia_estimate_api_t::stop.

Example:

```
/* Stop process. */
   err = RM_MOTOR_INERTIA_ESTIMATE_Stop(&g_mtr_inertia_estimate0_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully stopped (canceled). |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_MOTOR_INERTIA_ESTIMATE_Reset()

fsp_err_t RM_MOTOR_INERTIA_ESTIMATE_Reset ( motor_inertia_estimate_ctrl_t *const *p_ctrl*)

Reset variables of inertia estimate module. Implements motor_inertia_estimate_api_t::reset.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully reset. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_MOTOR_INERTIA_ESTIMATE_InfoGet()

fsp_err_t RM_MOTOR_INERTIA_ESTIMATE_InfoGet ( motor_inertia_estimate_ctrl_t *const *p_ctrl*, motor_inertia_estimate_info_t *const *p_info* )

Get information of inertia estimation. Implements motor_inertia_estimate_api_t::infoGet.

Example:

```
/* Get information from the module. */
   err = RM_MOTOR_INERTIA_ESTIMATE_InfoGet(&g_mtr_inertia_estimate0_ctrl,
&temp_information);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully get data. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Argument pointer is invalid. |

### ◆ RM_MOTOR_INERTIA_ESTIMATE_DataSet()

fsp_err_t RM_MOTOR_INERTIA_ESTIMATE_DataSet ( motor_inertia_estimate_ctrl_t *const *p_ctrl*, motor_inertia_estimate_set_data_t *const *p_set_data* )

Set necessary data to inertia estimation. Implements motor_inertia_estimate_api_t::dataSet.

Example:

```
/* Set data to the module. */
   err = RM_MOTOR_INERTIA_ESTIMATE_DataSet(&g_mtr_inertia_estimate0_ctrl,
&temp_set_data);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully set data. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter error. |

### ◆ RM_MOTOR_INERTIA_ESTIMATE_SpeedCyclic()

fsp_err_t RM_MOTOR_INERTIA_ESTIMATE_SpeedCyclic ( motor_inertia_estimate_ctrl_t *const *p_ctrl*)

Cyclic process of inertia estimation at speed control period. Implements motor_inertia_estimate_api_t::speedCyclic.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully perform the process. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_MOTOR_INERTIA_ESTIMATE_CurrentCyclic()

fsp_err_t RM_MOTOR_INERTIA_ESTIMATE_CurrentCyclic ( motor_inertia_estimate_ctrl_t *const *p_ctrl*)

Cyclic process of inertia estimation at current control period (called at A/D conversion finish interrupt). Implements motor_inertia_estimate_api_t::currentCyclic.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully perform the process. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_MOTOR_INERTIA_ESTIMATE_ParameterUpdate()

fsp_err_t RM_MOTOR_INERTIA_ESTIMATE_ParameterUpdate ( motor_inertia_estimate_ctrl_t *const *p_ctrl*, motor_inertia_estimate_cfg_t const *const *p_cfg* )

Update the parameters of inertia estimate. Implements motor_inertia_estimate_api_t::parameterUpdate.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully data was updated. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter error. |

### Detailed Description

Calculation process for the motor control on RA MCUs. This module implements the Motor position Interface.

# Overview

The motor position is used to control the position of motor rotor in an application. This module should be called cyclically in an application (e.g. in cyclic timer interrupt). This module calculates speed reference with inputted position reference and current rotational speed.

**Features**

The Motor Position Module has below features.

- Calculate speed reference.

# Configuration

**Build Time Configurations for rm_motor_position**

The following build time configurations are defined in fsp_cfg/rm_motor_position_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

**Configurations for Motor > Motor Position Controller (rm_motor_position)**

This module can be added to the Stacks tab via New Stack > Motor > Motor Position Controller (rm_motor_position).

| Configuration | Options | Default | Description |
|---|---|---|---|
| General | | | |
| Name | Name must be a valid C symbol | g_motor_position0 | Module name. |
| Position dead band | Must be a valid non-negative value. | 1U | Ignored area of position control. |
| Position band limit | Must be a valid non-negative value. | 3U | Ignored area of position control. |
| Speed feedforward ratio | Must be a valid value | 0.8F | Speed feedforward ratio. |
| Encoder counts per one rotation | Must be a valid value | 1200.0F | Encoder counts per one rotation. |
| Position omega | Must be a valid value | 10.0F | Position control omega. |
| Period of speed control (sec) | Must be a valid value | 0.0005F | Period of speed control. |
| IPD | | | |
| IPD LPF | • Disable<br>• Enable | Disable | IPD LPF process enable or disable |
| Position Kp ratio | Must be a valid value | 0.3F | Position Kp ratio. |
| Position feedforward | Must be a valid value | 0.0F | Position feedforward |

| | | | |
|---|---|---|---|
| ratio | | | ratio. |
| Speed K ratio | Must be a valid value | 2.0F | Speed K ratio |
| Error Limit #1 | Must be a valid value | 10.0F | Error limitation #1 |
| Error limit #2 | Must be a valid value | 0.2F | Error limitation #2 |
| LPF omega | Must be a valid value | 500.0F | LPF omega. |
| LPF zeta | Must be a valid value | 1.0F | LPF zeta. |
| Position Profiling | | | |
| Interval time | Must be a valid non-negative value. | 400U | Interval time. |
| Accel time | Must be a valid value | 0.3F | Accel time. |
| Maximum accel time (sec) | Must be a valid value | 8117.96F | Maximum acceleration time (sec) |
| Acceleration maximum speed | Must be a valid value | 2000.0F | Acceleration maximum speed. |
| Update step of timer | Must be a valid value | 0.0005F | Update step of timer. |
| Motor Parameter | | | |
| Pole pair | Value must be non-negative | 7 | Pole pair |
| Resistance (ohm) | Must be a valid value | 0.453F | Resistance |
| Inductance of d-axis (H) | Must be a valid value | 0.0009447F | Inductance of d-axis |
| Inductance of q-axis (H) | Must be a valid value | 0.0009447F | Inductance of q-axis |
| Permanent magnetic flux (Wb) | Must be a valid value | 0.006198F | Permanent magnetic flux |
| Motor Parameter > Motor inertia (kgm^2) | Must be a valid value | 0.00000962F | Motor inertia |

### Clock Configuration

This module doesn't depend on clock setting, because this module is a simple calculation process.

### Pin Configuration

This module does not use I/O pins.

# Usage Notes

### Limitations

- Set the period of speed control with non-negative value.
- Set the limit of speed change step with non-negative value.
- Set the maximum speed with non-negative value.

# Examples

### Basic Example

This is a basic example of using the Motor Position module in an application.

```
void motor_position_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = RM_MOTOR_POSITION_Open(g_motor_position0.p_ctrl, g_motor_position0.p_cfg);
    handle_error(err);
 /* Set working mode */
    RM_MOTOR_POSITION_ModeSet(g_motor_position0.p_ctrl,
MOTOR_POSITION_CTRL_MODE_STEP);
 /* Set position reference */
 RM_MOTOR_POSITION_PositionReferenceSet(g_motor_position0.p_ctrl, 180U);
 /* Basically run this module at cyclic interrupt (e.g. AGT timer).
  * This implementation is an example. */
 // while (true)
    {
 /* Application work here. */
 /* Perform Position Control Process */
 RM_MOTOR_POSITION_PositionControl(g_motor_position0.p_ctrl);
 /* Perform Speed IPD Control Process */
 RM_MOTOR_POSITION_IpdSpeedPControl(g_motor_position0.p_ctrl, 0.0F, 0.0F,
&temp_iq_ref);
 /* Get Position */
 RM_MOTOR_POSITION_PositionGet(g_motor_position0.p_ctrl, &temp_position);
 /* Update parameters */
 RM_MOTOR_POSITION_ParameterUpdate(g_motor_position0.p_ctrl,
&g_motor_position0.p_cfg);
    }
 /* Reset Speed Control */
 RM_MOTOR_POSITION_Reset(g_motor_position0.p_ctrl);
 /* Close Speed Control */
```

```
 RM_MOTOR_POSITION_Close(g_motor_position0.p_ctrl);
}
```

## Enumerations

| | |
|---|---|
| enum | motor_position_ipd_lpf_t |

## Enumeration Type Documentation

### ◆ motor_position_ipd_lpf_t

enum motor_position_ipd_lpf_t

| Enumerator | |
|---|---|
| MOTOR_POSITION_IPD_LPF_DISABLE | ipd control is disabled |
| MOTOR_POSITION_IPD_LPF_ENABLE | ipd control is enabled |

## Function Documentation

### ◆ RM_MOTOR_POSITION_Open()

fsp_err_t RM_MOTOR_POSITION_Open ( motor_position_ctrl_t *const *p_ctrl*, motor_position_cfg_t const *const *p_cfg* )

Opens and configures the Motor Position Module. Implements motor_position_api_t::open.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Motor Position Module successfully configured. |
| FSP_ERR_ASSERTION | Null pointer, or one or more configuration options is invalid. |
| FSP_ERR_ALREADY_OPEN | Module is already open. This module can only be opened once. |
| FSP_ERR_INVALID_ARGUMENT | Set parameter is invalid. |

### ◆ RM_MOTOR_POSITION_Close()

fsp_err_t RM_MOTOR_POSITION_Close ( motor_position_ctrl_t *const *p_ctrl*)

Disables specified Motor Position Module. Implements motor_position_api_t::close.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully closed. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_MOTOR_POSITION_Reset()

fsp_err_t RM_MOTOR_POSITION_Reset ( motor_position_ctrl_t *const *p_ctrl*)

Reset the variables of Motor Position Module. Implements motor_position_api_t::reset.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully reset. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_MOTOR_POSITION_PositionGet()

fsp_err_t RM_MOTOR_POSITION_PositionGet ( motor_position_ctrl_t *const *p_ctrl*, int16_t *const *p_position* )

Get Rotor Position Data [degree]. Implements motor_position_api_t::positionGet.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully data is set. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Output pointer is NULL. |

### ◆ RM_MOTOR_POSITION_PositionSet()

fsp_err_t RM_MOTOR_POSITION_PositionSet ( motor_position_ctrl_t *const *p_ctrl*, float const *position_rad* )

Set Position Data from Encoder [radian]. Implements motor_position_api_t::positionSet.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully data is set. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_MOTOR_POSITION_PositionReferenceSet()

fsp_err_t RM_MOTOR_POSITION_PositionReferenceSet ( motor_position_ctrl_t *const *p_ctrl*, int16_t const *position_reference_deg* )

Set Position Reference Data [degree]. Implements motor_position_api_t::positionReferenceSet.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully data is set. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_MOTOR_POSITION_ControlModeSet()

fsp_err_t RM_MOTOR_POSITION_ControlModeSet ( motor_position_ctrl_t *const *p_ctrl*, motor_position_ctrl_mode_t const *mode* )

Set Position Control Mode. Implements motor_position_api_t::controlModeSet.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully data is set. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_MOTOR_POSITION_PositionControl()

fsp_err_t RM_MOTOR_POSITION_PositionControl ( motor_position_ctrl_t *const *p_ctrl*)

Calculates internal position reference.(Main process of Position Control) Implements motor_position_api_t::positionControl.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successful data calculation. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_MOTOR_POSITION_IpdSpeedPControl()

fsp_err_t RM_MOTOR_POSITION_IpdSpeedPControl ( motor_position_ctrl_t *const *p_ctrl*, float const *ref_speed_rad*, float const *speed_rad*, float *const *p_iq_ref* )

Calculates the q-axis current reference by P control. Implements motor_position_api_t::ipdSpeedPControl.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successful data calculation. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Output pointer is NULL. |

### ◆ RM_MOTOR_POSITION_SpeedReferencePControlGet()

fsp_err_t RM_MOTOR_POSITION_SpeedReferencePControlGet ( motor_position_ctrl_t *const *p_ctrl*, float *const *p_speed_ref* )

Get Speed Reference by P Control. Implements motor_position_api_t::speedReferencePControlGet.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully data is set. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Output pointer is NULL. |

### ◆ RM_MOTOR_POSITION_SpeedReferenceIpdControlGet()

fsp_err_t RM_MOTOR_POSITION_SpeedReferenceIpdControlGet ( motor_position_ctrl_t *const *p_ctrl*, float const *max_speed_rad*, float *const *p_speed_ref* )

Get Speed Reference by IPD Control. Implements motor_position_api_t::speedReferenceIpdControlGet.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully data is set. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Output pointer is NULL. |

### ◆ RM_MOTOR_POSITION_SpeedReferenceFeedforwardGet()

fsp_err_t RM_MOTOR_POSITION_SpeedReferenceFeedforwardGet ( motor_position_ctrl_t *const *p_ctrl*, float *const *p_speed_ref* )

Get Speed Reference by Feedforward. Implements motor_position_api_t::speedReferenceFeedforwardGet.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully data is set. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Output pointer is NULL. |

### ◆ RM_MOTOR_POSITION_InfoGet()

fsp_err_t RM_MOTOR_POSITION_InfoGet ( motor_position_ctrl_t *const *p_ctrl*, motor_position_info_t *const *p_info* )

Get position information.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully data is set. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Output pointer is NULL. |

### ◆ RM_MOTOR_POSITION_ParameterUpdate()

| fsp_err_t RM_MOTOR_POSITION_ParameterUpdate ( motor_position_ctrl_t *const *p_ctrl*, motor_position_cfg_t const *const *p_cfg* ) |
|---|
| Update the parameters of Position Control Calculation. Implements motor_position_api_t::parameterUpdate.<br><br>**Return values**<br>FSP_SUCCESS — Successfully data was updated.<br>FSP_ERR_ASSERTION — Null pointer.<br>FSP_ERR_NOT_OPEN — Module is not open.<br>FSP_ERR_INVALID_ARGUMENT — Configuration parameter error. |

### Detailed Description

Usual control of a SPM motor on RA MCUs. This module implements the Motor Sensorless Vector Control (rm_motor_sensorless).

# Overview

The motor sensorless vector control is used to control a motor rotation in an application. This module is implemented with using SPM motor. User can start/stop motor rotation simply.

### Features

The Motor Sensorless Module has below features.

- Start/Stop a motor rotation
- Error detection (over current, over speed, over voltage, low voltage)

### Target Hardware

The below figure shows an example of target hardware of this Motor Sensorless Module.

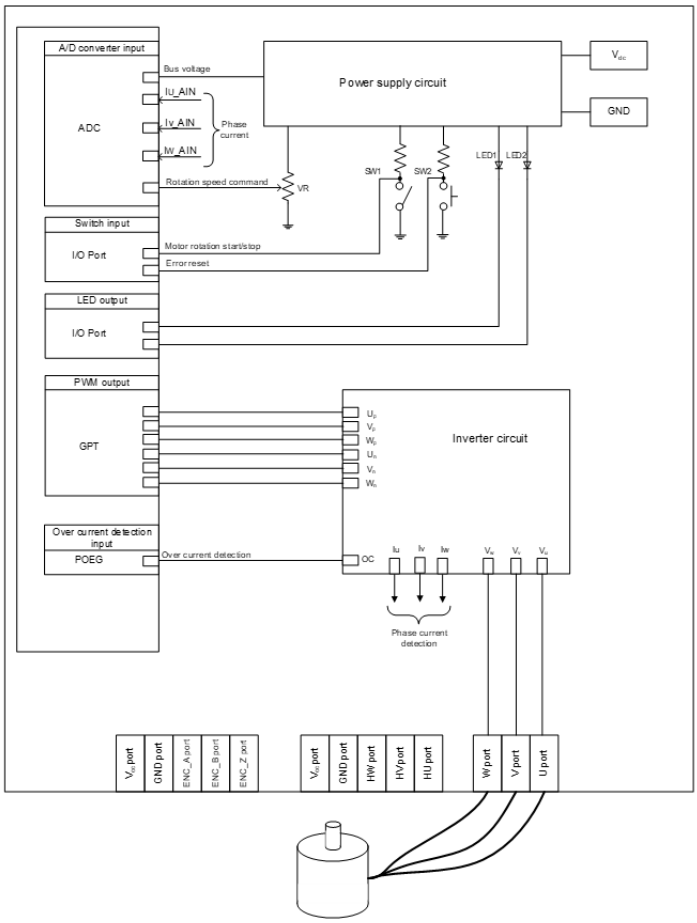

Figure 282: Example of target hardware of motor sensorless module

### Block Diagram

The below figures show block diaram of sensorless vector motor control. The 1st shows as an open-loop state, 2nd as a PI feedback loop state.

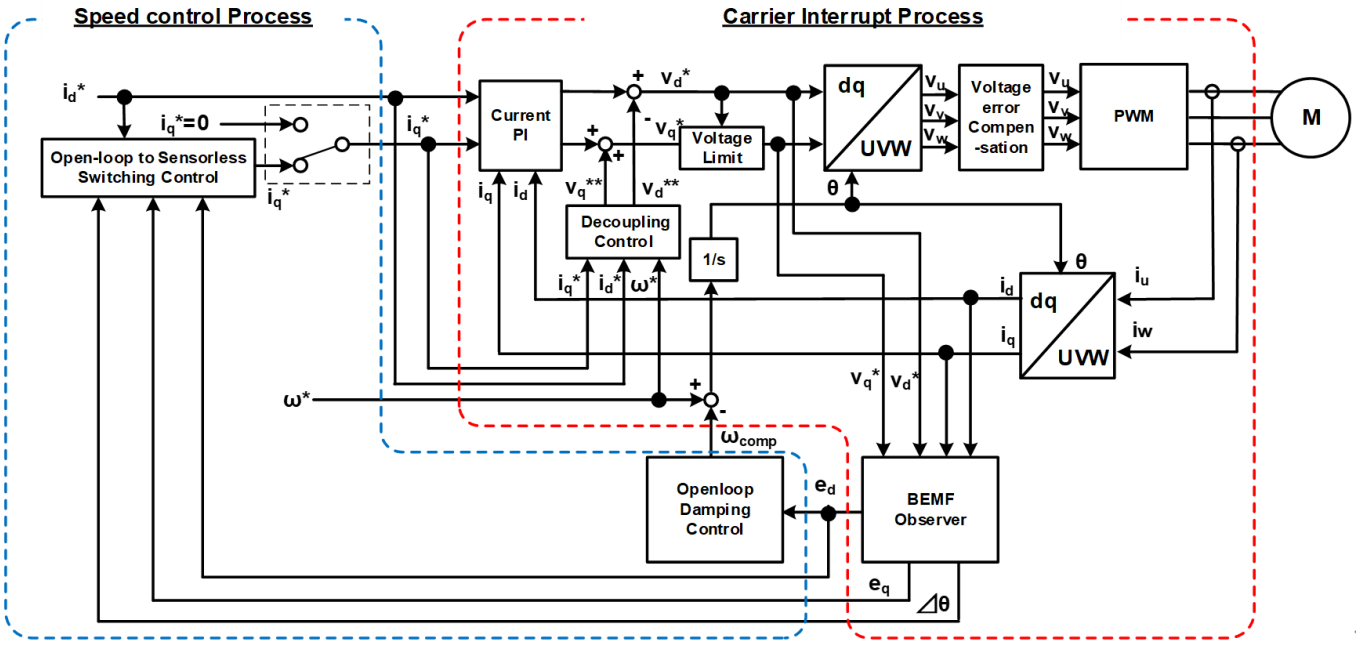

Figure 283: Block diagram of sensorless vector control (open-loop)

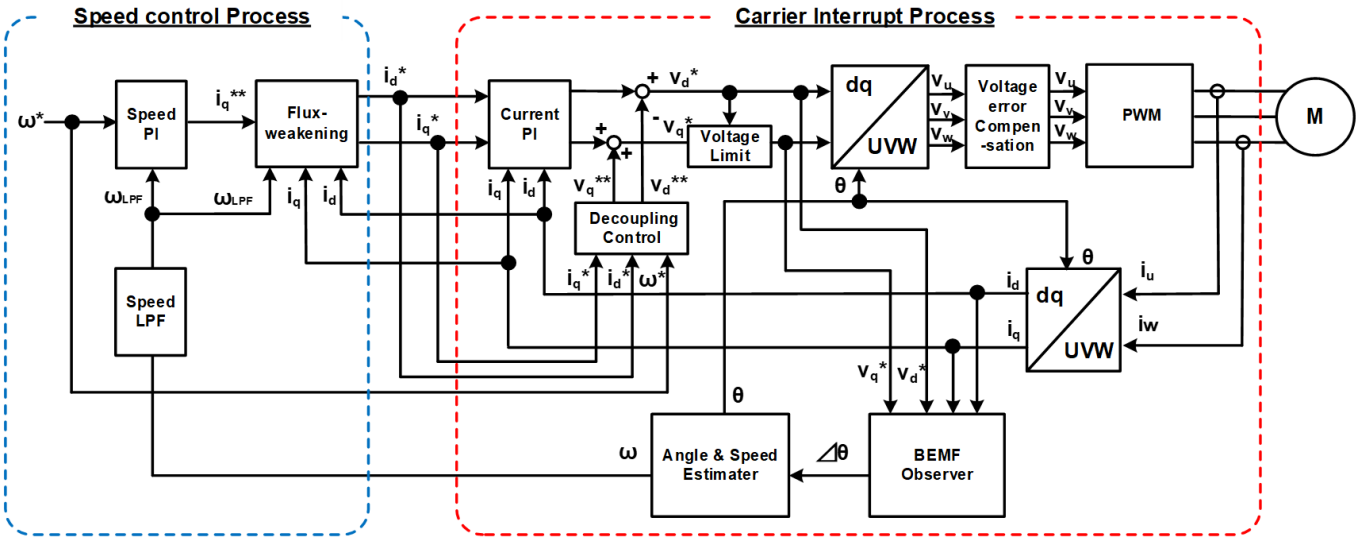

Figure 284: Block diagram of sensorless vector control (PI feedback loop)

## Modulation

- Sine wave modulation The modulation factor "m" is defined as follows.

$$m = \frac{V}{E}$$

m : Modulation ratio V : Reference voltage E : Inverter input voltage

Figure 285: Modulation factor

- Space vector modulation In vector control of a permanent magnet synchronous motor, generally, the desired voltage command value of each phase is generated sinusoidally. However, if the generated value is used as-is for the modulation wave for PWM generation, voltage utilization as applied to the motor (in terms of line voltage) is limited to a maximum of 86.7 percents with respect to inverter bus voltage. As such, as shown in the following expression, the average of the maximum and minimum values is calculated for the voltage command value of each phase, and the value obtained by subtracting the average from the voltage command value of each phase is used as the modulation wave. As a result, the maximum amplitude of the modulation wave is multiplied by (square root 3)/2, while voltage utilization becomes 100 percents and line voltage is unchanged.

$$\begin{pmatrix} V_u' \\ V_v' \\ V_w' \end{pmatrix} = \begin{pmatrix} V_u \\ V_v \\ V_w \end{pmatrix} + \Delta V \begin{pmatrix} 1 \\ 1 \\ 1 \end{pmatrix}$$

$$\because \Delta V = -\frac{V_{max}+V_{min}}{2},\ V_{max} = max\{V_u, V_v, V_w\},\ V_{min} = min\{V_u, V_v, V_w\}$$

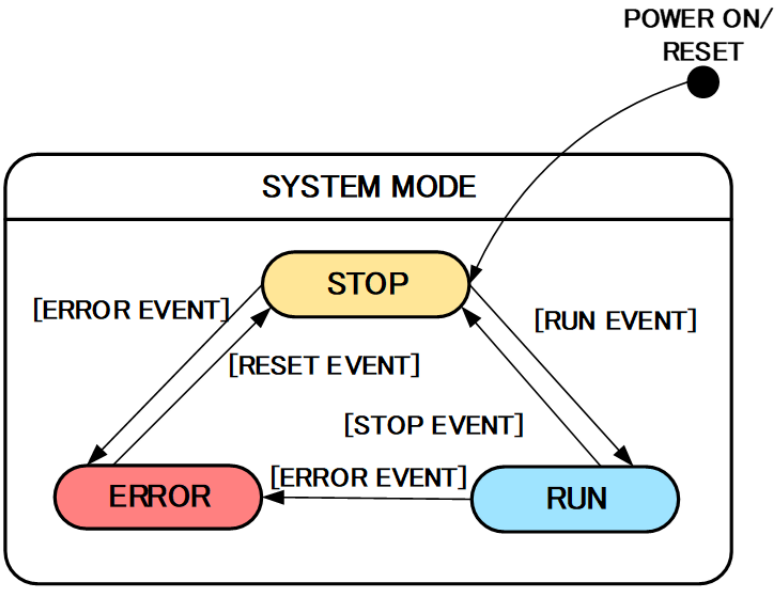
$V_u, V_v, V_w$: Command values of U-, V-, and W-phases

$V_u', V_v', V_w'$: Command values of U-, V-, and W-phases for PWM generation (modulation wave)

Figure 286: Space vector modulation

### State transition

The below figure shows a state transition diagram. Internal state is managed by "SYSTEM MODE".



| | | MODE | | |
|---|---|---|---|---|
| | | STOP | RUN | ERROR |
| EVENT | STOP | STOP | STOP | ERROR |
| | RUN | RUN | RUN | ERROR |
| | ERROR | ERROR | ERROR | ERROR |
| | RESET | STOP | RUN | STOP |

Figure 287: State transition diagram

(1) SYSTEM MODE "SYSTEM MODE" indicates the operating states of the system. The state transits on occurrence of each event (EVENT). "SYSTEM MODE" has 3 states that are motor drive stop (INACTIVE), motor drive (ACTIVE), and abnormal condition (ERROR).

(2) EVENT When "EVENT" occurs in each "SYSTEM MODE", "SYSTEM MODE" changes as shown the table in above figure, according to that "EVENT". The occurrence factors of each event are shown below.

| EVENT name | Occurrence factor |
|---|---|
| STOP | by user operation |
| RUN | by user operation |
| ERROR | when the system detects an error |
| RESET | by user operation |

**Flowchart**

The below figures show flowcharts of motor sensorless module.

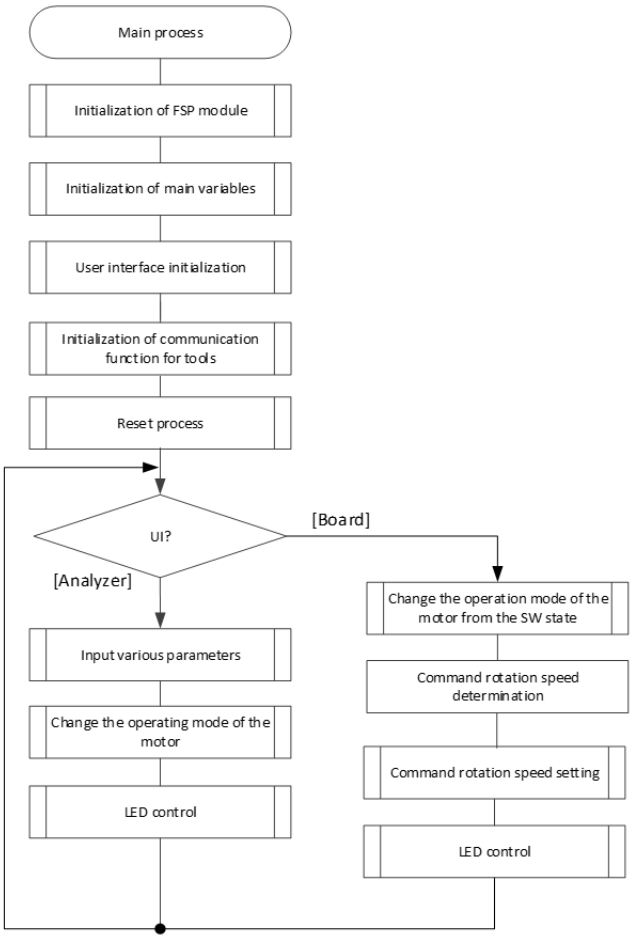


Figure 288: Main process

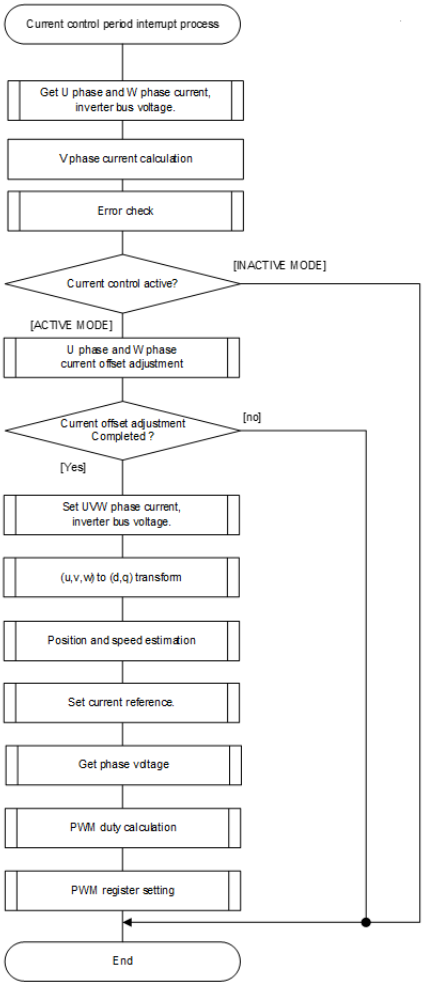

Figure 289: Current control process

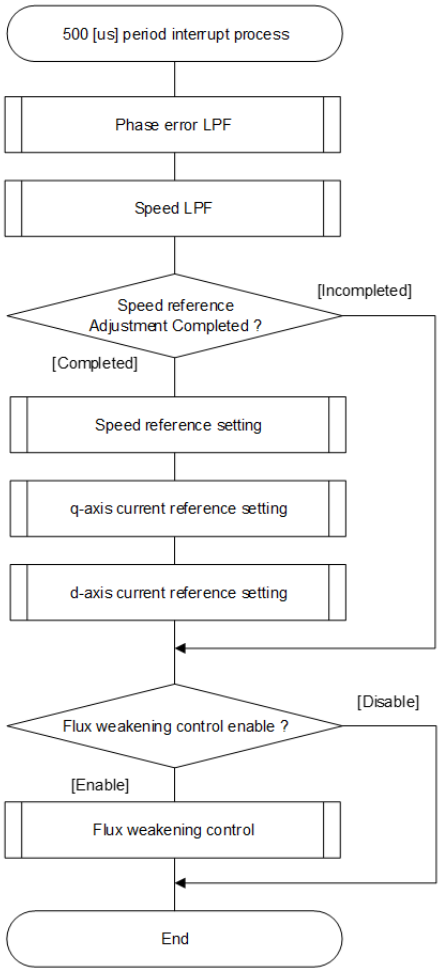

Figure 290: Speed control process

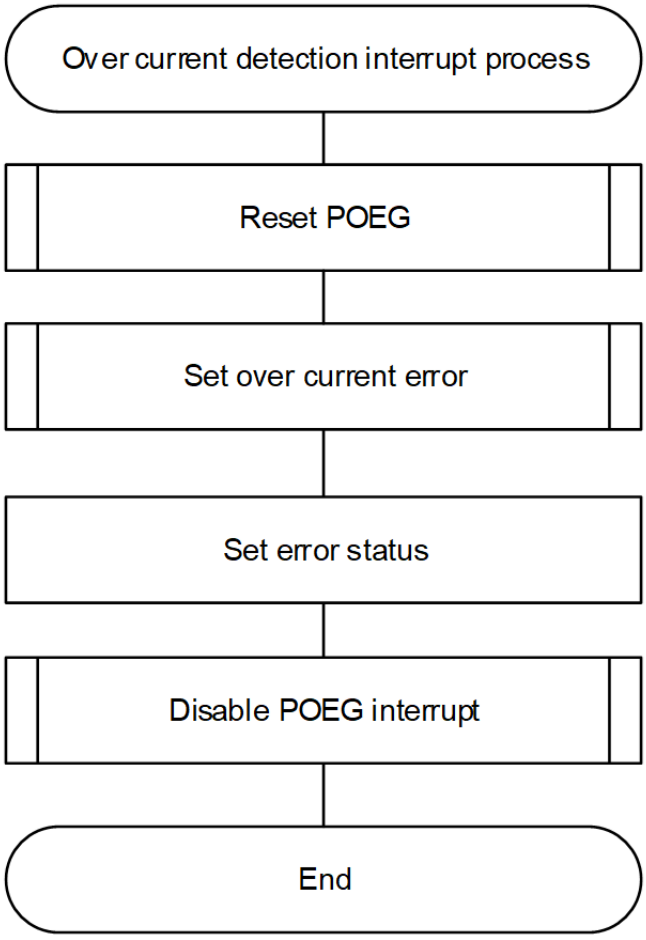

Figure 291: Over current detection interrupt process

# Configuration

### Build Time Configurations for rm_motor_sensorless

The following build time configurations are defined in fsp_cfg/rm_motor_sensorless_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

### Configurations for Motor > Motor Sensorless Vector Control (rm_motor_sensorless)

This module can be added to the Stacks tab via New Stack > Motor > Motor Sensorless Vector Control (rm_motor_sensorless).

| Configuration | Options | Default | Description |
|---|---|---|---|
| General | | | |

| | | | |
|---|---|---|---|
| Name | Name must be a valid C symbol | g_motor_sensorless0 | Module name. |
| Limit of over current (A) | Must be a valid value | 0.42F | Limit of over current.(Detection threshold) |
| Limit of over voltage (V) | Must be a valid value | 28.0F | Limit of over voltage.(Detection threshold) |
| Limit of over speed (rpm) | Must be a valid value | 3000.0F | Limit of over speed.(Detection threshold) |
| Limit of low voltage (V) | Must be a valid value | 14.0F | Limit of low voltage.(Detection threshold) |
| Interrupts | | | |
| Callback | Name must be a valid C symbol | NULL | A user callback function. If this callback function is provided, it is called at speed control cyclic interrupt. |

### Clock Configuration

This module doesn't depend on clock setting, because this module is a simple status transition process.

### Pin Configuration

This module does not use I/O pins. Please set used pins on configuration of each hardware modules.

## Usage Notes

### Limitations

- Set the limit of electric current with non-negative value.
- Set the limit of input voltage with non-negative value.
- Set the limit of rotational speed with non-negative value.

## Examples

### Basic Example

This is a basic example of minimal use of the Motor Sensorless in an application.

```
void motor_sensorless_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
```

```
    err = RM_MOTOR_SENSORLESS_Open(g_motor_sensorless0.p_ctrl,
g_motor_sensorless0.p_cfg);
    assert(FSP_SUCCESS == err);
 /* Set speed reference before motor run */
    (void) RM_MOTOR_SENSORLESS_SpeedSet(g_motor_sensorless0.p_ctrl,
DEF_SENSORLESS_TEST_OVSPD_LIM);
 /* Start motor rotation */
    (void) RM_MOTOR_SENSORLESS_Run(g_motor_sensorless0.p_ctrl);
 /* Get current status */
    (void) RM_MOTOR_SENSORLESS_StatusGet(g_motor_sensorless0.p_ctrl, &smpl_status);
 /* Get current rotor angle */
    (void) RM_MOTOR_SENSORLESS_AngleGet(g_motor_sensorless0.p_ctrl, &smpl_angle);
 /* Get current motor speed */
    (void) RM_MOTOR_SENSORLESS_SpeedGet(g_motor_sensorless0.p_ctrl, &smpl_speed);
 /* Check error */
    (void) RM_MOTOR_SENSORLESS_ErrorCheck(g_motor_sensorless0.p_ctrl, &smpl_error);
 /* Stop motor rotation */
    (void) RM_MOTOR_SENSORLESS_Stop(g_motor_sensorless0.p_ctrl);
 /* Stop motor rotation */
    (void) RM_MOTOR_SENSORLESS_ErrorSet(g_motor_sensorless0.p_ctrl,
MOTOR_ERROR_OVER_CURRENT_HW);
 /* Reset Speed Control */
    (void) RM_MOTOR_SENSORLESS_Reset(g_motor_sensorless0.p_ctrl);
 /* Close Speed Control */
    (void) RM_MOTOR_SENSORLESS_Close(g_motor_sensorless0.p_ctrl);
}
```

### Function Documentation

### ◆ RM_MOTOR_SENSORLESS_Open()

fsp_err_t RM_MOTOR_SENSORLESS_Open ( motor_ctrl_t *const *p_ctrl*, motor_cfg_t const *const *p_cfg* )

Configure the MOTOR in register start mode. Implements motor_api_t::open.

This function should only be called once as MOTOR configuration registers can only be written to once so subsequent calls will have no effect.

Example:

```
/* Initializes the module. */
   err = RM_MOTOR_SENSORLESS_Open(g_motor_sensorless0.p_ctrl,
g_motor_sensorless0.p_cfg);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | MOTOR successfully configured. |
| FSP_ERR_ASSERTION | Null pointer, or one or more configuration options is invalid. |
| FSP_ERR_ALREADY_OPEN | Module is already open. This module can only be opened once. |
| FSP_ERR_INVALID_ARGUMENT | Configuration parameter error. |

***Note***

### ◆ RM_MOTOR_SENSORLESS_Close()

fsp_err_t RM_MOTOR_SENSORLESS_Close ( motor_ctrl_t *const *p_ctrl*)

Disables specified Motor Sensorless Control block. Implements motor_api_t::close.

Example:

```
/* Close Speed Control */
   (void) RM_MOTOR_SENSORLESS_Close(g_motor_sensorless0.p_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully closed. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

***Note***

### ◆ RM_MOTOR_SENSORLESS_Reset()

fsp_err_t RM_MOTOR_SENSORLESS_Reset ( motor_ctrl_t *const *p_ctrl*)

Reset Motor Sensorless Control block. Implements motor_api_t::reset.

Example:

```
/* Reset Speed Control */
   (void) RM_MOTOR_SENSORLESS_Reset(g_motor_sensorless0.p_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

***Note***

### ◆ RM_MOTOR_SENSORLESS_Run()

fsp_err_t RM_MOTOR_SENSORLESS_Run ( motor_ctrl_t *const *p_ctrl*)

Run Motor (Start motor rotation). Implements motor_api_t::run.

Example:

```
/* Start motor rotation */
   (void) RM_MOTOR_SENSORLESS_Run(g_motor_sensorless0.p_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

***Note***

### ◆ RM_MOTOR_SENSORLESS_Stop()

fsp_err_t RM_MOTOR_SENSORLESS_Stop ( motor_ctrl_t *const *p_ctrl*)

Stop Motor (Stop motor rotation). Implements motor_api_t::stop.

Example:

```
/* Stop motor rotation */
   (void) RM_MOTOR_SENSORLESS_Stop(g_motor_sensorless0.p_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

***Note***

### ◆ RM_MOTOR_SENSORLESS_ErrorSet()

fsp_err_t RM_MOTOR_SENSORLESS_ErrorSet ( motor_ctrl_t *const *p_ctrl*, motor_error_t const *error* )

Set error information. Implements motor_api_t::errorSet.

Example:

```
/* Stop motor rotation */
   (void) RM_MOTOR_SENSORLESS_ErrorSet(g_motor_sensorless0.p_ctrl,
MOTOR_ERROR_OVER_CURRENT_HW);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

***Note***

### ◆ RM_MOTOR_SENSORLESS_SpeedSet()

fsp_err_t RM_MOTOR_SENSORLESS_SpeedSet ( motor_ctrl_t *const *p_ctrl*, float const *speed_rpm* )

Set speed reference[rpm]. Implements motor_api_t::speedSet.

Example:

```
/* Set speed reference before motor run */
   (void) RM_MOTOR_SENSORLESS_SpeedSet(g_motor_sensorless0.p_ctrl,
DEF_SENSORLESS_TEST_OVSPD_LIM);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

***Note***

### ◆ RM_MOTOR_SENSORLESS_StatusGet()

fsp_err_t RM_MOTOR_SENSORLESS_StatusGet ( motor_ctrl_t *const *p_ctrl*, uint8_t *const *p_status* )

Get current control status. Implements motor_api_t::statusGet.

Example:

```
/* Get current status */
   (void) RM_MOTOR_SENSORLESS_StatusGet(g_motor_sensorless0.p_ctrl, &smpl_status);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Data received pointer is invalid.. |

***Note***

### ◆ RM_MOTOR_SENSORLESS_AngleGet()

fsp_err_t RM_MOTOR_SENSORLESS_AngleGet ( motor_ctrl_t *const *p_ctrl*, float *const *p_angle_rad* )

Get current rotor angle. Implements motor_api_t::angleGet.

Example:

```
/* Get current rotor angle */
   (void) RM_MOTOR_SENSORLESS_AngleGet(g_motor_sensorless0.p_ctrl, &smpl_angle);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Data received pointer is invalid.. |

***Note***

### ◆ RM_MOTOR_SENSORLESS_SpeedGet()

fsp_err_t RM_MOTOR_SENSORLESS_SpeedGet ( motor_ctrl_t *const *p_ctrl*, float *const *p_speed_rpm* )

Get rotational speed. Implements motor_api_t::speedGet.

Example:

```
/* Get current motor speed */
   (void) RM_MOTOR_SENSORLESS_SpeedGet(g_motor_sensorless0.p_ctrl, &smpl_speed);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Data received pointer is invalid.. |

***Note***

### ◆ RM_MOTOR_SENSORLESS_ErrorCheck()

fsp_err_t RM_MOTOR_SENSORLESS_ErrorCheck ( motor_ctrl_t *const *p_ctrl*, uint16_t *const *p_error* )

Check the occurunce of Error. Implements motor_api_t::errorCheck.

Example:

```
/* Check error */
   (void) RM_MOTOR_SENSORLESS_ErrorCheck(g_motor_sensorless0.p_ctrl, &smpl_error);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Data received pointer is invalid.. |

***Note***

### ◆ RM_MOTOR_SENSORLESS_PositionSet()

fsp_err_t RM_MOTOR_SENSORLESS_PositionSet ( motor_ctrl_t *const *p_ctrl*, motor_speed_position_data_t const *const *p_position* )

Set position reference. Implements motor_api_t::positionSet.

**Return values**

| | |
|---|---|
| FSP_ERR_UNSUPPORTED | Unsupported. |

***Note***

### ◆ RM_MOTOR_SENSORLESS_WaitStopFlagGet()

fsp_err_t RM_MOTOR_SENSORLESS_WaitStopFlagGet ( motor_ctrl_t *const *p_ctrl*, motor_wait_stop_flag_t *const *p_flag* )

Get wait stop flag. Implements motor_api_t::waitStopFlagGet.

**Return values**

| | |
|---|---|
| FSP_ERR_UNSUPPORTED | Unsupported. |

***Note***

### ◆ RM_MOTOR_SENSORLESS_FunctionSelect()

| fsp_err_t RM_MOTOR_SENSORLESS_FunctionSelect ( motor_ctrl_t *const *p_ctrl*, motor_function_select_t const *function* ) |
|---|
| Select function. Implements motor_api_t::functionSelect.<br><br>**Return values**<br>FSP_ERR_UNSUPPORTED — Unsupported.<br><br>***Note*** |

### Detailed Description

Calculation process for the motor control on RA MCUs. This module implements the Motor speed Interface.

# Overview

The motor speed is used to control the speed of motor rotation in an application. This module should be called cyclically in an application (e.g. in cyclic timer interrupt). This module caliculates d/q-axis current reference with input speed reference, current rotational speed, and d/q-axis current.

### Features

The motor speed module has below features.

- Calculate d/q-axis electric current reference.
- Flux weakening process at high speed rotation.
- Open loop damping control when using sensorless type.
- Low pass filter of input rotational speed.
- Speed observer function when using encoder type.

# Configuration

### Build Time Configurations for rm_motor_speed

The following build time configurations are defined in fsp_cfg/rm_motor_speed_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| Position Support | • Enabled<br>• Disabled | Disabled | Enable position algorithm support. |

### Configurations for Motor > Motor Speed Controller (rm_motor_speed)

This module can be added to the Stacks tab via New Stack > Motor > Motor Speed Controller (rm_motor_speed).

| Configuration | Options | Default | Description |
|---|---|---|---|
| General | | | |
| Name | Name must be a valid C symbol | g_motor_speed0 | Module name. |
| Speed control period (sec) | Must be a valid non-negative value | 0.0005F | Period of speed control function. |
| Step of speed climbing (rpm) | Must be a valid non-negative value | 0.5F | Step of speed change at start of open-loop. |
| Maximum rotational speed (rpm) | Must be a valid non-negative value. | 2650.0F | Maximum rotational speed (Limit speed). |
| Speed LPF omega | Must be a valid non-negative value | 10.0F | Design parameter for speed LPF. |
| Limit of q-axis current (A) | Must be a valid non-negative value | 0.42F | Limit of q-axis current. |
| Step of speed feedback at open-loop | Must be a valid non-negative value | 0.20F | Step of speed feedback at open-loop. |
| Natural frequency | Must be a valid non-negative value. | 100.0F | Natural frequency for disturbance speed observer. |
| Open-loop damping | • Disable<br>• Enable | Enable | Select enable/disable Open-loop damping control. |
| Flux weakening | • Disable<br>• Enable | Disable | Select enable/disable flux weakening control. |
| Torque compensation for sensorless transition | • Disable<br>• Enable | Enable | Select enable/disable torque compensation for sensorless |

| | | | |
|---|---|---|---|
| | | | transition. |
| Speed observer | • Disable<br>• Enable | Enable | Select enable/disable Speed observer process. |
| Selection of speed observer | • Normal<br>• Disturbance | Normal | Select speed observer type. |
| Control method | • PID<br>• IPD | PID | Select the control method [PID or IPD]. |
| Control type | • Sensoreless<br>• Encoder<br>• Induction<br>• Hall | Sensoreless | |
| Open-Loop | | | |
| Step of d-axis current climbing | Must be a valid non-negative value | 0.3F | Step of d-axis current climbing |
| Step of d-axis current descending | Must be a valid non-negative value | 0.3F | Step of d-axis current descending |
| Step of q-axis current descending ratio | Must be a valid non-negative value | 1.0F | Step of q-axis current descending ratio |
| Reference of d-axis current | Must be a valid non-negative value | 0.3F | Reference of d-axis current |
| Threshold of speed control descending | Must be a valid value | 600.0F | When rotational speed reaches this speed, d-axis current is controlled descending. |
| Threshold of speed control climbing | Must be a valid value | 500.0F | Until rotational speed reaches this speed, d-axis current is controlled climbing. |
| Period between open-loop to BEMF (sec) | Must be a valid non-negative value | 0.025F | Margin time between open-loop control changes to BEMF PI control. |
| Phase error(degree) to decide sensor-less switch timing | Must be a valid value | 10.0F | Phase error(degree) to decide sensor-less switch timing. |
| Design parameter | | | |
| Speed PI loop omega | Must be a valid non-negative value | 5.0F | Speed PI loop omega |
| Speed PI loop zeta | Must be a valid non-negative value | 1.0F | Speed PI loop zeta |
| Estimated d-axis HPF omega | Must be a valid non-negative value | 2.5F | HPF cutoff frequency for ed (Hz) |
| Open-loop damping | Must be a valid non- | 1.0F | Damping ratio of open- |

| | | | |
|---|---|---|---|
| zeta | negative value | | loop damping control |
| Cutoff frequency of phase error LPF | Must be a valid non-negative value | 10.0F | Cutoff frequency of phase error LPF |
| Speed observer omega | Must be a valid non-negative value | 200.0F | Speed observer loop omega |
| Speed observer zeta | Must be a valid non-negative value | 1.0F | Speed observer loop zeta |
| Motor Parameter | | | |
| Pole pairs | Must be a valid integer. | 2 | Pole pairs |
| Resistance (ohm) | Must be a valid non-negative value | 8.5F | Resistance |
| Inductance of d-axis (H) | Must be a valid non-negative value | 0.0045F | Inductance of d-axis |
| Inductance of q-axis (H) | Must be a valid non-negative value | 0.0045F | Inductance of q-axis |
| Permanent magnetic flux (Wb) | Must be a valid non-negative value | 0.02159F | Permanent magnetic flux |
| Motor Parameter > Rotor inertia (kgm^2) | Must be a valid non-negative value | 0.0000028F | Rotor inertia |
| Interrupts | | | |
| Callback | Name must be a valid C symbol | NULL | A user callback function. If this callback function is provided, it is called at timer interrupt. |
| Input data | Name must be a valid C symbol | NULL | Structure for Speed control Input. If you set this content, Speed Control function read these data automatically. (No need to use Set API.) |
| Output data | Name must be a valid C symbol | NULL | Structure for Speed control Output. If you set this content, Speed Control function write need data automatically. (No need to use Get API.) |

### Clock Configuration

This module doesn't depend on clock setting, because this module is a simple calculation process.

### Pin Configuration

This module does not use I/O pins.

# Usage Notes

### Limitations

- Set the period of speed control with none-negative value.
- Set the limit of speed change step with none-negative value.
- Set the maximum speed with none-negative value.

# Examples

### Basic Example

This is a basic example of minimal use of the motor speed in an application.

```
void motor_speed_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = RM_MOTOR_SPEED_Open(g_motor_speed0.p_ctrl, g_motor_speed0.p_cfg);
    handle_error(err);
 /* Set speed reference before get current reference */
    (void) RM_MOTOR_SPEED_SpeedReferenceSet(g_motor_speed0.p_ctrl, 104.72F);
 /* Set position reference before get current reference
  * (Basically Exclusive to SpeedReferenceSet. This is only sample,) */
    (void) RM_MOTOR_SPEED_PositionReferenceSet(g_motor_speed0.p_ctrl,
&g_posref_sample);
 /* Basically run this module at cyclic interrupt (e.g. AGT timer).
  * This implementation is an example. */
 // while (true)
    {
 /* Application work here. */
 /* Set input parameter data before get current reference */
       (void) RM_MOTOR_SPEED_ParameterSet(g_motor_speed0.p_ctrl,
&g_test_speed_input);
 /* Activate Speed Process */
       (void) RM_MOTOR_SPEED_Run(g_motor_speed0.p_ctrl);
 /* Perform Speed Control Process */
       (void) RM_MOTOR_SPEED_SpeedControl(g_motor_speed0.p_ctrl);
```

```
 /* Get output parameters */
       (void) RM_MOTOR_SPEED_ParameterGet(g_motor_speed0.p_ctrl,
&g_test_speed_output);
 //

 /* Update parameters */
       (void) RM_MOTOR_SPEED_ParameterUpdate(g_motor_speed0.p_ctrl,
&g_motor_speed0.p_cfg);
    }
 /* Reset Speed Control */
    (void) RM_MOTOR_SPEED_Reset(g_motor_speed0.p_ctrl);
 /* Close Speed Control */
    (void) RM_MOTOR_SPEED_Close(g_motor_speed0.p_ctrl);
}
```

## Enumerations

|---|---|
| Enumerator | |
| MOTOR_SPEED_CONTROL_TYPE_SENSORLESS | Sensorless type. |
| MOTOR_SPEED_CONTROL_TYPE_ENCODER | Encoder type. |
| MOTOR_SPEED_CONTROL_TYPE_HALL | Hall type. |
| MOTOR_SPEED_CONTROL_TYPE_INDUCTION | Induction type. |

### ◆ motor_speed_openloop_damping_t

| enum motor_speed_openloop_damping_t | |
|---|---|
| Enumerator | |
| MOTOR_SPEED_OPENLOOP_DAMPING_DISABLE | Disable openloop damping. |
| MOTOR_SPEED_OPENLOOP_DAMPING_ENABLE | Enable openloop damping. |

### ◆ motor_speed_flux_weaken_t

| enum motor_speed_flux_weaken_t | |
|---|---|
| Enumerator | |
| MOTOR_SPEED_FLUX_WEAKEN_DISABLE | Disable flux-weakening control. |
| MOTOR_SPEED_FLUX_WEAKEN_ENABLE | Enable flux-weakening control. |

### ◆ motor_speed_less_switch_t

| enum motor_speed_less_switch_t | |
|---|---|
| Enumerator | |
| MOTOR_SPEED_LESS_SWITCH_DISABLE | Disable soft switching between open-loop mode and normal field oriented control mode. |
| MOTOR_SPEED_LESS_SWITCH_ENABLE | Enable soft switching between open-loop mode and normal field oriented control mode. |

### ◆ motor_speed_observer_switch_t

| enum motor_speed_observer_switch_t | |
|---|---|
| Enumerator | |
| MOTOR_SPEED_OBSERVER_SWITCH_DISABLE | Disable speed observer. |
| MOTOR_SPEED_OBSERVER_SWITCH_ENABLE | Enable speed observer. |

### ◆ motor_speed_observer_select_t

| enum motor_speed_observer_select_t | |
|---|---|
| Enumerator | |
| MOTOR_SPEED_OBSERVER_SELECT_NORMAL | Normal speed observer. |
| MOTOR_SPEED_OBSERVER_SELECT_DISTURBANCE | Disturbance speed observer. |

### ◆ motor_speed_ctrl_status_t

| enum motor_speed_ctrl_status_t | |
|---|---|
| Enumerator | |
| MOTOR_SPEED_CTRL_STATUS_INIT | Speed control status is INIT. |
| MOTOR_SPEED_CTRL_STATUS_BOOT | Speed control status is BOOT. |
| MOTOR_SPEED_CTRL_STATUS_RUN | Speed control status is RUN. |

## Function Documentation

### ◆ RM_MOTOR_SPEED_Open()

fsp_err_t RM_MOTOR_SPEED_Open ( motor_speed_ctrl_t *const *p_ctrl*, motor_speed_cfg_t const *const *p_cfg* )

Opens and configures the Motor Speed Module. Implements motor_speed_api_t::open.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Motor Speed Module successfully configured. |
| FSP_ERR_ASSERTION | Null pointer, or one or more configuration options is invalid. |
| FSP_ERR_ALREADY_OPEN | Module is already open. This module can only be opened once. |
| FSP_ERR_INVALID_ARGUMENT | Configuration parameter error. |

### ◆ RM_MOTOR_SPEED_Close()

fsp_err_t RM_MOTOR_SPEED_Close ( motor_speed_ctrl_t *const *p_ctrl*)

Disables specified Motor Speed Module. Implements motor_speed_api_t::close.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully closed. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_MOTOR_SPEED_Reset()

fsp_err_t RM_MOTOR_SPEED_Reset ( motor_speed_ctrl_t *const *p_ctrl*)

Reset the variables of Motor Speed Module. Implements motor_speed_api_t::reset.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully reset. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_MOTOR_SPEED_Run()

fsp_err_t RM_MOTOR_SPEED_Run ( motor_speed_ctrl_t *const *p_ctrl*)

Run(Start) the Motor Speed Control. Implements motor_speed_api_t::run.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully start. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_MOTOR_SPEED_SpeedReferenceSet()

fsp_err_t RM_MOTOR_SPEED_SpeedReferenceSet ( motor_speed_ctrl_t *const *p_ctrl*, float const *speed_reference_rpm* )

Set Speed Reference Data. Implements motor_speed_api_t::speedReferenceSet.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully data is set. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_MOTOR_SPEED_PositionReferenceSet()

fsp_err_t RM_MOTOR_SPEED_PositionReferenceSet ( motor_speed_ctrl_t *const *p_ctrl*, motor_speed_position_data_t const *const *p_position_data* )

Set Position Reference Data. Implements motor_speed_api_t::positionReferenceSet.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully data is set. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input structure pointer is NULL. |

### ◆ RM_MOTOR_SPEED_ParameterSet()

fsp_err_t RM_MOTOR_SPEED_ParameterSet ( motor_speed_ctrl_t *const *p_ctrl*, motor_speed_input_t const *const *p_st_input* )

Set Input parameters. Implements motor_speed_api_t::parameterSet.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully data is set. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Output pointer is NULL. |

### ◆ RM_MOTOR_SPEED_SpeedControl()

fsp_err_t RM_MOTOR_SPEED_SpeedControl ( motor_speed_ctrl_t *const *p_ctrl*)

Calculates the d/q-axis current reference.(Main process of Speed Control) Implements motor_speed_api_t::speedControl.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successful data calculation. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_MOTOR_SPEED_ParameterGet()

fsp_err_t RM_MOTOR_SPEED_ParameterGet ( motor_speed_ctrl_t *const *p_ctrl*, motor_speed_output_t *const *p_st_output* )

Get Speed Control Parameters. Implements motor_speed_api_t::parameterGet.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully the flag is gotten. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Output pointer is NULL. |

### ◆ RM_MOTOR_SPEED_ParameterUpdate()

| fsp_err_t RM_MOTOR_SPEED_ParameterUpdate ( motor_speed_ctrl_t *const *p_ctrl*, motor_speed_cfg_t const *const *p_cfg* ) |
|---|
| Update the parameters of Speed Control Calculation. Implements motor_speed_api_t::parameterUpdate.<br><br>**Return values**<br>FSP_SUCCESS — Successfully data was updated.<br>FSP_ERR_ASSERTION — Null pointer.<br>FSP_ERR_NOT_OPEN — Module is not open.<br>FSP_ERR_INVALID_ARGUMENT — Configuration parameter error. |

### Detailed Description

Usual control of a SPM motor on RA MCUs. This module implements the Motor Vector Control with hall sensors (rm_motor_hall).

# Overview

The motor vector control with hall sensors is used to control a motor rotation in an application. This module is meant to be used with Surface Permanent Magnet (SPM) motors and allows applications to start or stop motor rotation easily.

### Features

The motor vector control with hall sensors has below features.

- Start/Stop a motor rotation
- Error detection (over current, over speed, over voltage, low voltage)

### Target Hardware

The below figure shows an example of target hardware of this Motor Hall Module.

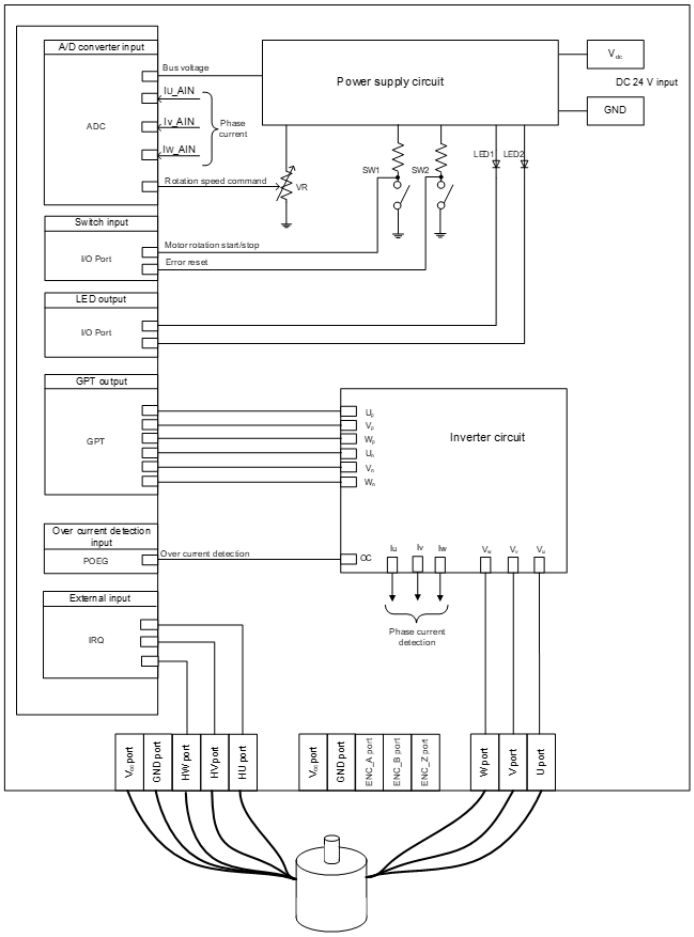

Figure 292: Example of target hardware of motor hall module

### Block Diagram

The below figure shows block diaram of vector motor control with hall sensors.

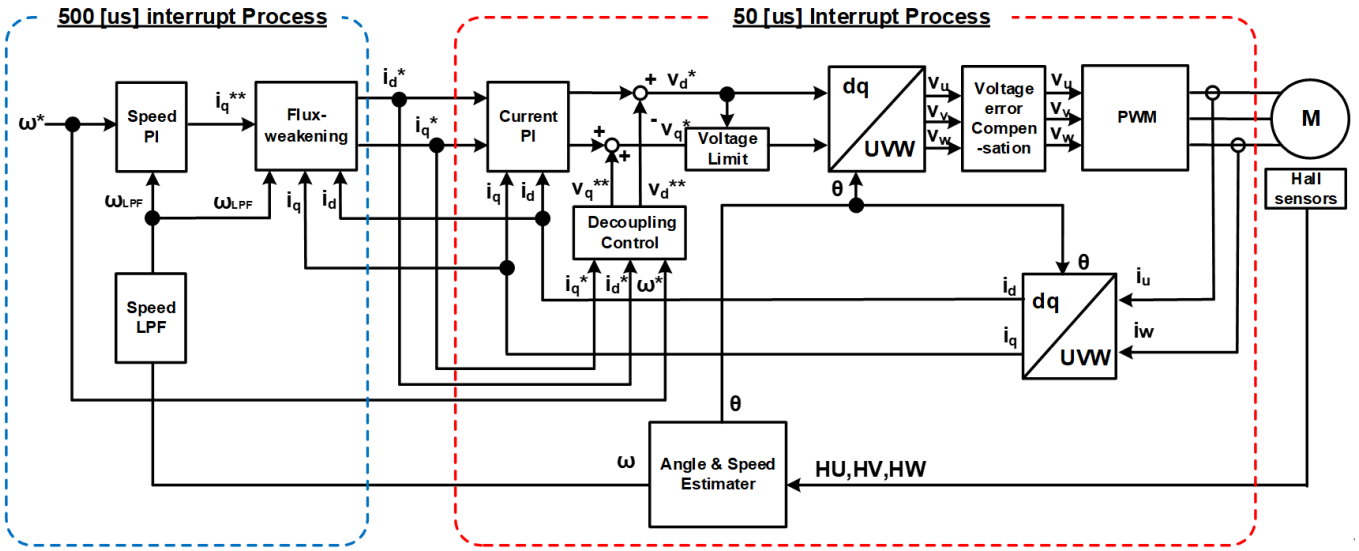

Figure 293: Block diagram of vector control with hall sensors

### Modulation

- Sine wave modulation The modulation factor "m" is defined as follows.

$$m = \frac{V}{E}$$

m : Modulation ratio V : Reference voltage E : Inverter input voltage

Figure 294: Modulation factor

- Space vector modulation In vector control of a permanent magnet synchronous motor, generally, the desired voltage command value of each phase is generated sinusoidally. However, if the generated value is used as-is for the modulation wave for PWM generation, voltage utilization as applied to the motor (in terms of line voltage) is limited to a maximum of 86.7 percents with respect to inverter bus voltage. As such, as shown in the following expression, the average of the maximum and minimum values is calculated for the voltage command value of each phase, and the value obtained by subtracting the average from the voltage command value of each phase is used as the modulation wave. As a result, the maximum amplitude of the modulation wave is multiplied by (square root 3)/2, while voltage utilization becomes 100 percents and line voltage is unchanged.

$$\begin{pmatrix} V_u' \\ V_v' \\ V_w' \end{pmatrix} = \begin{pmatrix} V_u \\ V_v \\ V_w \end{pmatrix} + \Delta V \begin{pmatrix} 1 \\ 1 \\ 1 \end{pmatrix}$$

$$\because \Delta V = -\frac{V_{max}+V_{min}}{2}\ ,\ V_{max} = max\{V_u, V_v, V_w\}\ ,\ V_{min} = min\{V_u, V_v, V_w\}$$

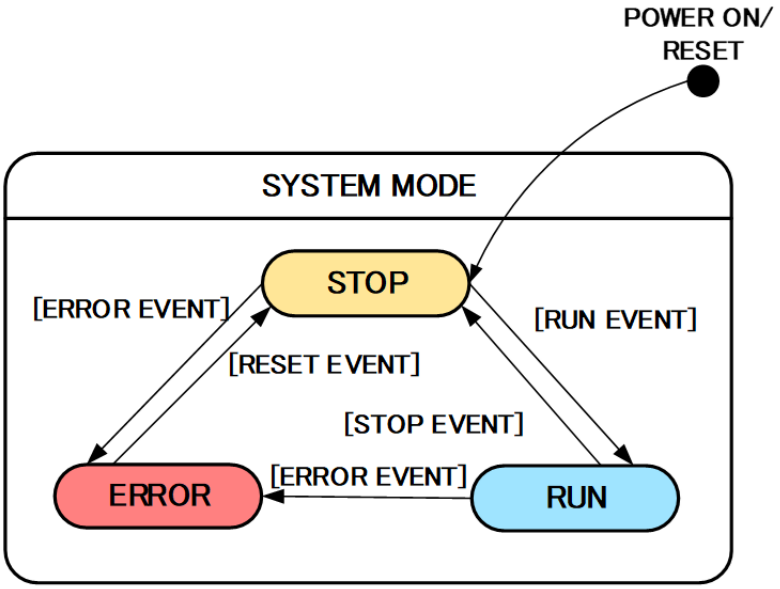
$V_u, V_v, V_w$: Command values of U-, V-, and W-phases

$V_u', V_v', V_w'$: Command values of U-, V-, and W-phases for PWM generation (modulation wave)

Figure 295: Space vector modulation

### State transition

The below figure shows a state transition diagram. Internal state is managed by "SYSTEM MODE".



| | | MODE | | |
|---|---|---|---|---|
| | | STOP | RUN | ERROR |
| EVENT | STOP | STOP | STOP | ERROR |
| | RUN | RUN | RUN | ERROR |
| | ERROR | ERROR | ERROR | ERROR |
| | RESET | STOP | RUN | STOP |

Figure 296: State transition diagram

(1) SYSTEM MODE "SYSTEM MODE" indicates the operating states of the system. The state transits on occurrence of each event (EVENT). "SYSTEM MODE" has 3 states that are motor drive stop (INACTIVE), motor drive (ACTIVE), and abnormal condition (ERROR).

(2) EVENT When "EVENT" occurs in each "SYSTEM MODE", "SYSTEM MODE" changes as shown the table in above figure, according to that "EVENT". The occurrence factors of each event are shown below.

| EVENT name | Occurrence factor |
|---|---|
| STOP | by user operation |
| RUN | by user operation |
| ERROR | when the system detects an error |
| RESET | by user operation |

**Flowchart**

The below figures show flowcharts of motor hall module.

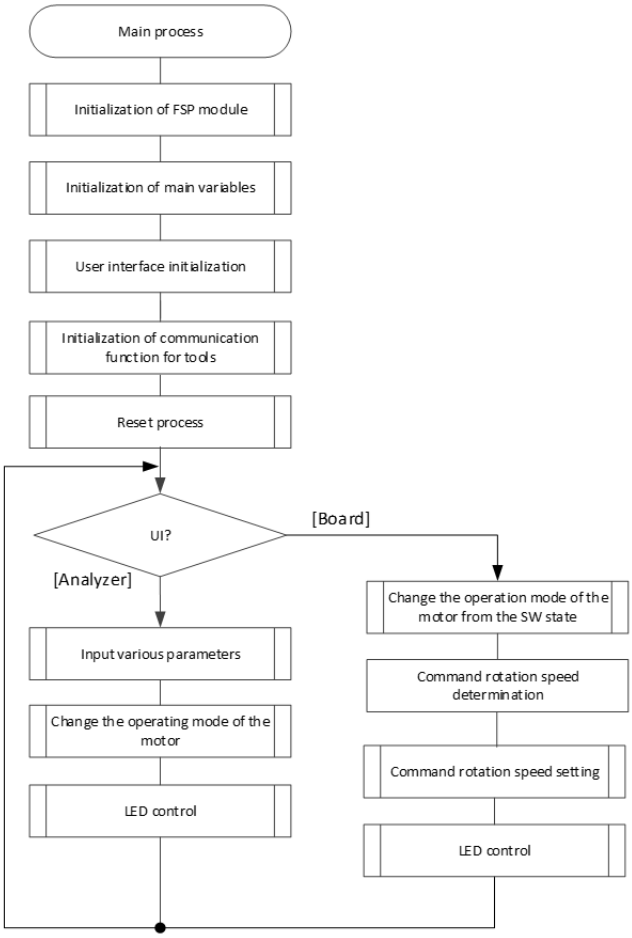


Figure 297: Main process

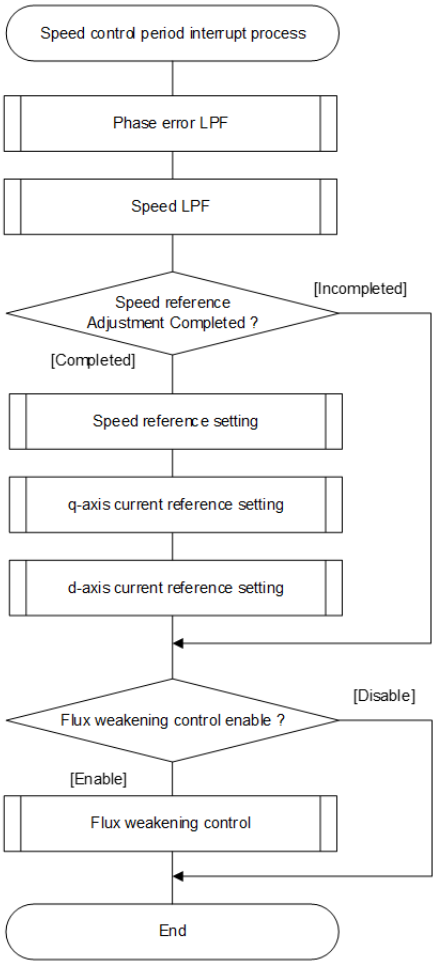

Figure 299: Speed control process

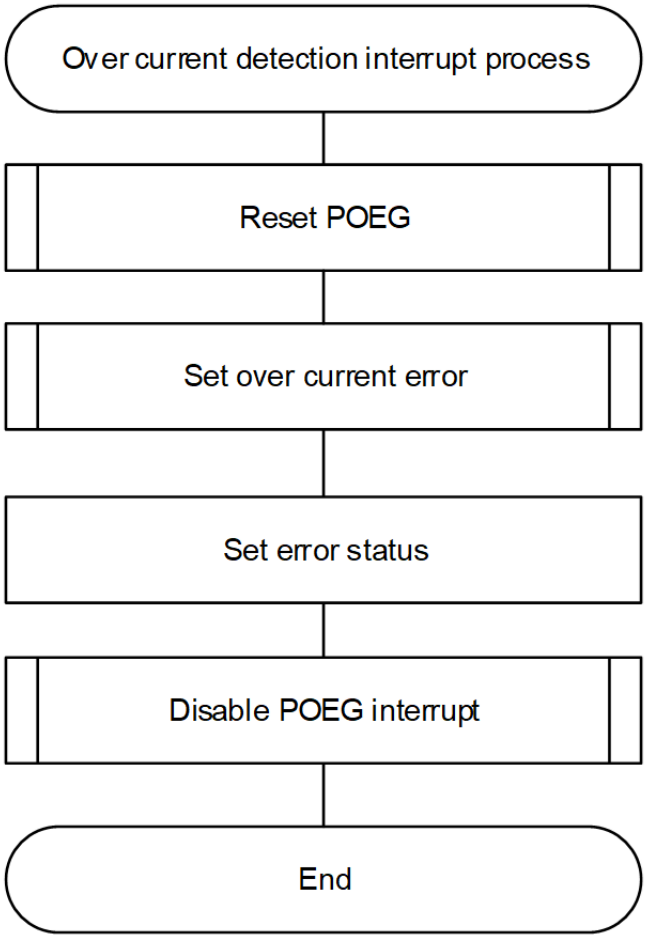

Figure 300: Over current detection interrupt process

# Configuration

### Build Time Configurations for rm_motor_hall

The following build time configurations are defined in fsp_cfg/rm_motor_hall_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

### Configurations for Motor > Motor Vector Control with hall sensors(rm_motor_hall)

This module can be added to the Stacks tab via New Stack > Motor > Motor Vector Control with hall sensors(rm_motor_hall).

| Configuration | Options | Default | Description |
|---|---|---|---|
| General | | | |

| | | | |
|---|---|---|---|
| Name | Name must be a valid C symbol | g_motor_hall0 | Module name. |
| Limit of over current (A) | Must be a valid value | 0.42F | Limit of over current.(Detection threshold) |
| Limit of over voltage (V) | Must be a valid value | 28.0F | Limit of over voltage.(Detection threshold) |
| Limit of over speed (rpm) | Must be a valid value | 3000.0F | Limit of over speed.(Detection threshold) |
| Limit of low voltage (V) | Must be a valid value | 14.0F | Limit of low voltage.(Detection threshold) |
| Interrupts | | | |
| Callback | Name must be a valid C symbol | NULL | A user callback function. If this callback function is provided, it is called at speed control cyclic interrupt. |

### Clock Configuration

This module doesn't depend on clock setting, because this module is a simple status transition process.

### Pin Configuration

This module does not use I/O pins. Please set used pins on configuration of each hardware modules.

## Usage Notes

### Limitations

- Set the limit of electric current with non-negative value.
- Set the limit of input voltage with non-negative value.
- Set the limit of rotational speed with non-negative value.

## Examples

### Basic Example

This is a basic example of minimal use of the motor vector control with hall sensors in an application.

```
void motor_hall_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
```

```
    err = RM_MOTOR_HALL_Open(g_motor_hall0_smpl.p_ctrl, g_motor_hall0_smpl.p_cfg);
    assert(FSP_SUCCESS == err);
 /* Set speed reference before motor run */
    (void) RM_MOTOR_HALL_SpeedSet(g_motor_hall0_smpl.p_ctrl,
DEF_HALL_TEST_OVSPD_LIM);
 /* Start motor rotation */
    (void) RM_MOTOR_HALL_Run(g_motor_hall0_smpl.p_ctrl);
 /* Get current status */
    (void) RM_MOTOR_HALL_StatusGet(g_motor_hall0_smpl.p_ctrl, &smpl_status);
 /* Get current rotor angle */
    (void) RM_MOTOR_HALL_AngleGet(g_motor_hall0_smpl.p_ctrl, &smpl_angle);
 /* Get current motor speed */
    (void) RM_MOTOR_HALL_SpeedGet(g_motor_hall0_smpl.p_ctrl, &smpl_speed);
 /* Check error */
    (void) RM_MOTOR_HALL_ErrorCheck(g_motor_hall0_smpl.p_ctrl, &smpl_error);
 /* Stop motor rotation */
    (void) RM_MOTOR_HALL_Stop(g_motor_hall0_smpl.p_ctrl);
 /* When error is detected with extra Hardware */
    (void) RM_MOTOR_HALL_ErrorSet(g_motor_hall0_smpl.p_ctrl,
MOTOR_ERROR_OVER_CURRENT_HW);
 /* Reset motor control (Clear error status) */
    (void) RM_MOTOR_HALL_Reset(g_motor_hall0_smpl.p_ctrl);
 /* Close motor control */
    (void) RM_MOTOR_HALL_Close(g_motor_hall0_smpl.p_ctrl);
}
```

## Function Documentation

### ◆ RM_MOTOR_HALL_Open()

fsp_err_t RM_MOTOR_HALL_Open ( motor_ctrl_t *const *p_ctrl*, motor_cfg_t const *const *p_cfg* )

Configure the MOTOR HALL in register start mode. Implements motor_api_t::open.

This function should only be called once as MOTOR configuration registers can only be written to once so subsequent calls will have no effect.

Example:

```
/* Initializes the module. */
   err = RM_MOTOR_HALL_Open(g_motor_hall0_smpl.p_ctrl, g_motor_hall0_smpl.p_cfg);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | MOTOR HALL successfully configured. |
| FSP_ERR_ASSERTION | Null pointer, or one or more configuration options is invalid. |
| FSP_ERR_ALREADY_OPEN | Module is already open. This module can only be opened once. |
| FSP_ERR_INVALID_ARGUMENT | Configuration parameter error. |

***Note***

### ◆ RM_MOTOR_HALL_Close()

fsp_err_t RM_MOTOR_HALL_Close ( motor_ctrl_t *const *p_ctrl*)

Disables specified Motor Hall Control block. Implements motor_api_t::close.

Example:

```
/* Close motor control */
   (void) RM_MOTOR_HALL_Close(g_motor_hall0_smpl.p_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully closed. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

***Note***

### ◆ RM_MOTOR_HALL_Reset()

fsp_err_t RM_MOTOR_HALL_Reset ( motor_ctrl_t *const *p_ctrl*)

Reset Motor Hall Control block. Implements motor_api_t::reset.

Example:

```
/* Reset motor control (Clear error status) */
   (void) RM_MOTOR_HALL_Reset(g_motor_hall0_smpl.p_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

***Note***

### ◆ RM_MOTOR_HALL_Run()

fsp_err_t RM_MOTOR_HALL_Run ( motor_ctrl_t *const *p_ctrl*)

Run Motor (Start motor rotation). Implements motor_api_t::run.

Example:

```
/* Start motor rotation */
   (void) RM_MOTOR_HALL_Run(g_motor_hall0_smpl.p_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

***Note***

### ◆ RM_MOTOR_HALL_Stop()

fsp_err_t RM_MOTOR_HALL_Stop ( motor_ctrl_t *const *p_ctrl*)

Stop Motor (Stop motor rotation). Implements motor_api_t::stop.

Example:

```
/* Stop motor rotation */
   (void) RM_MOTOR_HALL_Stop(g_motor_hall0_smpl.p_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

***Note***

### ◆ RM_MOTOR_HALL_ErrorSet()

fsp_err_t RM_MOTOR_HALL_ErrorSet ( motor_ctrl_t *const *p_ctrl*, motor_error_t const *error* )

Set error information. Implements motor_api_t::errorSet.

Example:

```
/* When error is detected with extra Hardware */
   (void) RM_MOTOR_HALL_ErrorSet(g_motor_hall0_smpl.p_ctrl,
MOTOR_ERROR_OVER_CURRENT_HW);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

***Note***

### ◆ RM_MOTOR_HALL_SpeedSet()

fsp_err_t RM_MOTOR_HALL_SpeedSet ( motor_ctrl_t *const *p_ctrl*, float const *speed_rpm* )

Set speed reference[rpm]. Implements motor_api_t::speedSet.

Example:

```
/* Set speed reference before motor run */
   (void) RM_MOTOR_HALL_SpeedSet(g_motor_hall0_smpl.p_ctrl,
DEF_HALL_TEST_OVSPD_LIM);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

***Note***

### ◆ RM_MOTOR_HALL_StatusGet()

fsp_err_t RM_MOTOR_HALL_StatusGet ( motor_ctrl_t *const *p_ctrl*, uint8_t *const *p_status* )

Get current control status. Implements motor_api_t::statusGet.

Example:

```
/* Get current status */
   (void) RM_MOTOR_HALL_StatusGet(g_motor_hall0_smpl.p_ctrl, &smpl_status);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Data received pointer is invalid.. |

***Note***

### ◆ RM_MOTOR_HALL_AngleGet()

fsp_err_t RM_MOTOR_HALL_AngleGet ( motor_ctrl_t *const *p_ctrl*, float *const *p_angle_rad* )

Get current rotor angle. Implements motor_api_t::angleGet.

Example:

```
/* Get current rotor angle */
   (void) RM_MOTOR_HALL_AngleGet(g_motor_hall0_smpl.p_ctrl, &smpl_angle);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Data received pointer is invalid.. |

***Note***

### ◆ RM_MOTOR_HALL_SpeedGet()

fsp_err_t RM_MOTOR_HALL_SpeedGet ( motor_ctrl_t *const *p_ctrl*, float *const *p_speed_rpm* )

Get rotational speed. Implements motor_api_t::speedGet.

Example:

```
/* Get current motor speed */
   (void) RM_MOTOR_HALL_SpeedGet(g_motor_hall0_smpl.p_ctrl, &smpl_speed);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Data received pointer is invalid.. |

***Note***

### ◆ RM_MOTOR_HALL_ErrorCheck()

fsp_err_t RM_MOTOR_HALL_ErrorCheck ( motor_ctrl_t *const *p_ctrl*, uint16_t *const *p_error* )

Check the occurunce of Error. Implements motor_api_t::errorCheck.

Example:

```
/* Check error */
   (void) RM_MOTOR_HALL_ErrorCheck(g_motor_hall0_smpl.p_ctrl, &smpl_error);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Data received pointer is invalid.. |

***Note***

### ◆ RM_MOTOR_HALL_PositionSet()

fsp_err_t RM_MOTOR_HALL_PositionSet ( motor_ctrl_t *const *p_ctrl*, motor_speed_position_data_t const *const *p_position* )

Set position reference. Implements motor_api_t::positionSet.

**Return values**

| | |
|---|---|
| FSP_ERR_UNSUPPORTED | Unsupported. |

***Note***

### ◆ RM_MOTOR_HALL_WaitStopFlagGet()

fsp_err_t RM_MOTOR_HALL_WaitStopFlagGet ( motor_ctrl_t *const *p_ctrl*, motor_wait_stop_flag_t *const *p_flag* )

Get wait stop flag. Implements motor_api_t::waitStopFlagGet.

**Return values**

| | |
|---|---|
| FSP_ERR_UNSUPPORTED | Unsupported. |

***Note***

### ◆ RM_MOTOR_HALL_FunctionSelect()

| fsp_err_t RM_MOTOR_HALL_FunctionSelect ( motor_ctrl_t *const *p_ctrl*, motor_function_select_t const *function* ) |
|---|
| Select function. Implements motor_api_t::functionSelect.<br><br>**Return values**<br>FSP_ERR_UNSUPPORTED — Unsupported.<br><br>***Note*** |

### Detailed Description

Search origin position process for the motor control on RA MCUs. This module implements the Motor Return Origin Function Interface.

# Overview

The motor return origin module is used to search origin position in an application. This module should be used with Renesas Motor Workbench (RMW) basically.

### Features

The Motor return origin module has below features.

- Search origin position automatically.

# Configuration

### Build Time Configurations for rm_motor_return_origin

The following build time configurations are defined in fsp_cfg/rm_motor_return_origin_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

**Configurations for Motor > Motor return origin function (rm_motor_return_origin)**

This module can be added to the Stacks tab via New Stack > Motor > Motor return origin function (rm_motor_return_origin).

| Configuration | Options | Default | Description |
|---|---|---|---|
| General | | | |
| Name | Name must be a valid C symbol | g_motor_return_origin0 | Module name. |
| Using mode | Search by pushing | Search by pushing | Select using mode |
| Search speed (rpm) | Must be a valid non-negative value. | 10.0 | Speed to search origin position (rpm) |
| Acceleration of speed (rpm/sec) | Must be set 1 to 10000. | 10000.0 | Acceleration of rotation speed at return moving (rpm/sec) |
| Cyclic period of speed control (sec) | Must be a valid non-negative value. | 0.0005 | Cyclic period of speed control (sec) |
| Maximum current (A) | Must be a valid non-negative value. | 1.8 | Maximum current (A). Please set to match used motor. |
| Percentage of current to judge pushing (%) | Must be a valid non-negative value. | 30.0 | Perentage of current to judge pushing (%) |
| Pushing time (sec) | Must be a valid non-negative value. | 1.0 | Time to push the stopper (sec) |
| Degree to judge none stopper | Must be set -360 to 360. | 360.0 | When the motor runs over this value, it is judged impossible to search the stopper. |
| Degree to return | Must be a valid non-negative value. | 3.0 | Degree to return from the stopper (degree) |
| Mechanical gear ratio | Must be a valid non-negative value. | 1.0 | Mechanical gear ratio |

**Clock Configuration**

This module doesn't depend on clock setting.

**Pin Configuration**

This module does not use I/O pins.

# Usage Notes

### Limitations

# Examples

### Basic Example

This is a basic example of minimal use of the Motor Return origin in an application.

```
void motor_return_origin_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = RM_MOTOR_RETURN_ORIGIN_Open(&g_mtr_return_origin0_ctrl,
&g_mtr_return_origin0_cfg);
    assert(FSP_SUCCESS == err);
 /* Start process. */
    err = RM_MOTOR_RETURN_ORIGIN_Start(&g_mtr_return_origin0_ctrl);
    temp_set_data.f_iq             = 1.0F;
    temp_set_data.f_position_degree = 180.0F;
 /* Set data to the module. */
    err = RM_MOTOR_RETURN_ORIGIN_DataSet(&g_mtr_return_origin0_ctrl, &temp_set_data);
 /* Get information from the module. */
    err = RM_MOTOR_RETURN_ORIGIN_InfoGet(&g_mtr_return_origin0_ctrl, &temp_info);
 /* Stop process. */
    err = RM_MOTOR_RETURN_ORIGIN_Stop(&g_mtr_return_origin0_ctrl);
 /* Close the module. */
    err = RM_MOTOR_RETURN_ORIGIN_Close(&g_mtr_return_origin0_ctrl);
}
```

### Data Structures

| | |
|---|---|
| struct | motor_return_origin_extended_cfg_t |
| struct | motor_return_origin_pushing_t |
| struct | motor_return_origin_instance_ctrl_t |

## Data Structure Documentation

### ◆ motor_return_origin_extended_cfg_t

| struct motor_return_origin_extended_cfg_t | | |
|---|---|---|
| Extended configurations for return origin function | | |
| Data Fields | | |
| float | f_search_speed_rpm | Speed to search origin position [rpm]. |
| float | f_return_accel_rpm | Acceleration speed when return [rpm/s]. |
| float | f_speed_ctrl_period | Period of speed control [sec]. |
| float | f_maximum_current | Maximum current [A]. |
| float | f_current_limit_percent_push | Percentage of current at pushing. |
| float | f_pushing_time | Keep pushing time [sec]. |
| float | f_over_degree | Angle to judge search impossible [degree]. |
| float | f_return_degree | Return angle from pushing position [degree]. |
| float | f_mechanical_gear_ratio | Mechanical gear ratio. |

### ◆ motor_return_origin_pushing_t

| struct motor_return_origin_pushing_t | | |
|---|---|---|
| Variables for rerutn origin with pushing | | |
| Data Fields | | |
| uint32_t | u4_time_counter | Counter of speed cyclic (to judge the time) |
| float | f_sum_position | Summary of position data. |
| uint32_t | u4_sum_counter | Counter of summary. |
| float | f_move_amount | Movement amount [degree]. |
| float | f_judge_iq | q-axis current to judge pushing |
| float | f_pushing_counts | Counts to measure pushing time. |

### ◆ motor_return_origin_instance_ctrl_t

| struct motor_return_origin_instance_ctrl_t |
|---|
| Return origin function instance control block |
| Data Fields |

| | | |
|---|---|---|
| uint32_t | open | Used to determine if the module is configured. |
| motor_return_origin_start_flag_t | start_flag | start/stop flag |
| motor_return_origin_state_t | state | State number of return origin process. |
| int8_t | s1_direction | Moving direction. |
| float | f_angle_degree_on_edge | Rotor angle on the edge [degree]. |
| float | f_current_speed | Current speed. |
| float | f_origin_position_angle_degree | Searched origin position [degree]. |
| float | f_search_speed | Speed to search origin position [rad / sampling time]. |
| float | f_accel_speed | Speed acceleration. |
| float | f_position_reference_degree | Position reference [degree]. |
| motor_return_origin_pushing_t | st_pushing | Variables for pushing. |
| motor_return_origin_set_data_t | receive_data | Received data from speed(position) & current. |
| motor_return_origin_cfg_t const * | p_cfg | Pointer of configuration structure. |

## Function Documentation

### ◆ RM_MOTOR_RETURN_ORIGIN_Open()

fsp_err_t RM_MOTOR_RETURN_ORIGIN_Open ( motor_return_origin_ctrl_t *const *p_ctrl*, motor_return_origin_cfg_t const *const *p_cfg* )

Opens and configures the motor return origin module. Implements motor_return_origin_api_t::open .

Example:

```
/* Initializes the module. */
   err = RM_MOTOR_RETURN_ORIGIN_Open(&g_mtr_return_origin0_ctrl,
&g_mtr_return_origin0_cfg);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Motor return origin module successfully configured. |
| FSP_ERR_ASSERTION | Null pointer, or one or more configuration options is invalid. |
| FSP_ERR_ALREADY_OPEN | Module is already open. This module can only be opened once. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter error. |

### ◆ RM_MOTOR_RETURN_ORIGIN_Close()

fsp_err_t RM_MOTOR_RETURN_ORIGIN_Close ( motor_return_origin_ctrl_t *const *p_ctrl*)

Disables specified motor return origin module. Implements motor_return_origin_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MOTOR_RETURN_ORIGIN_Close(&g_mtr_return_origin0_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully closed. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_MOTOR_RETURN_ORIGIN_Start()

fsp_err_t RM_MOTOR_RETURN_ORIGIN_Start ( motor_return_origin_ctrl_t *const *p_ctrl*)

Start return origin function. Implements motor_return_origin_api_t::start.

Example:

```
/* Start process. */
   err = RM_MOTOR_RETURN_ORIGIN_Start(&g_mtr_return_origin0_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully started. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_MOTOR_RETURN_ORIGIN_Stop()

fsp_err_t RM_MOTOR_RETURN_ORIGIN_Stop ( motor_return_origin_ctrl_t *const *p_ctrl*)

Stop (Cancel) return origin function. Implements motor_return_origin_api_t::stop.

Example:

```
/* Stop process. */
   err = RM_MOTOR_RETURN_ORIGIN_Stop(&g_mtr_return_origin0_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully stopped (canceled). |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_MOTOR_RETURN_ORIGIN_Reset()

fsp_err_t RM_MOTOR_RETURN_ORIGIN_Reset ( motor_return_origin_ctrl_t *const *p_ctrl*)

Reset variables of return origin module. Implements motor_return_origin_api_t::reset.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully reset. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_MOTOR_RETURN_ORIGIN_InfoGet()

fsp_err_t RM_MOTOR_RETURN_ORIGIN_InfoGet ( motor_return_origin_ctrl_t *const *p_ctrl*, motor_return_origin_info_t *const *p_info* )

Get information of return origin. Implements motor_return_origin_api_t::infoGet.

Example:

```
/* Get information from the module. */
   err = RM_MOTOR_RETURN_ORIGIN_InfoGet(&g_mtr_return_origin0_ctrl, &temp_info);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully get data. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter error. |

### ◆ RM_MOTOR_RETURN_ORIGIN_DataSet()

fsp_err_t RM_MOTOR_RETURN_ORIGIN_DataSet ( motor_return_origin_ctrl_t *const *p_ctrl*, motor_return_origin_set_data_t *const *p_set_data* )

Set necessary data to return origin function. Implements motor_return_origin_api_t::dataSet.

Example:

```
/* Set data to the module. */
   err = RM_MOTOR_RETURN_ORIGIN_DataSet(&g_mtr_return_origin0_ctrl, &temp_set_data);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully set data. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter error. |

### ◆ RM_MOTOR_RETURN_ORIGIN_SpeedCyclic()

fsp_err_t RM_MOTOR_RETURN_ORIGIN_SpeedCyclic ( motor_return_origin_ctrl_t *const *p_ctrl*)

Cyclic process of return origin function at speed control period. (Called at timer interrupt.) Implements motor_return_origin_api_t::speedCyclic.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully perform the process. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_MOTOR_RETURN_ORIGIN_ParameterUpdate()

fsp_err_t RM_MOTOR_RETURN_ORIGIN_ParameterUpdate ( motor_return_origin_ctrl_t *const *p_ctrl*, motor_return_origin_cfg_t const *const *p_cfg* )

Update the parameters of return origin function. Implements motor_return_origin_api_t::parameterUpdate.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully data was updated. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter error. |

### Detailed Description

Control a SPM motor on RA MCUs. This module implements the Motor vector control with induction sensor (rm_motor_induction).

# Overview

The motor vector control with induction sensor is used to control motor rotation in an application. This module is meant to be used with Surface Permanent Magnet (SPM) motors and allows applications to start or stop motor rotation easily.

### Features

The motor induction module has below features.

- Start/stop motor rotation
- Error detection (over current, over speed, over voltage, low voltage)

### Target Hardware

The below figure shows an example of target hardware of this Motor Induction Module.

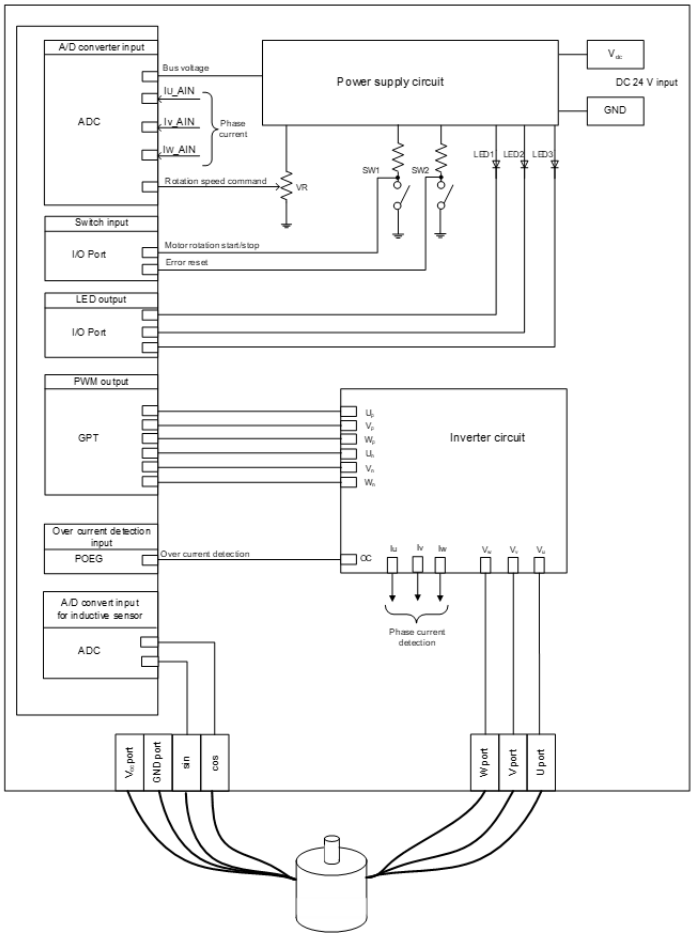

Figure 301: Example of target hardware of motor induction module

### Block Diagram

The below figures show block diaram of vector motor control with using induction sensor.

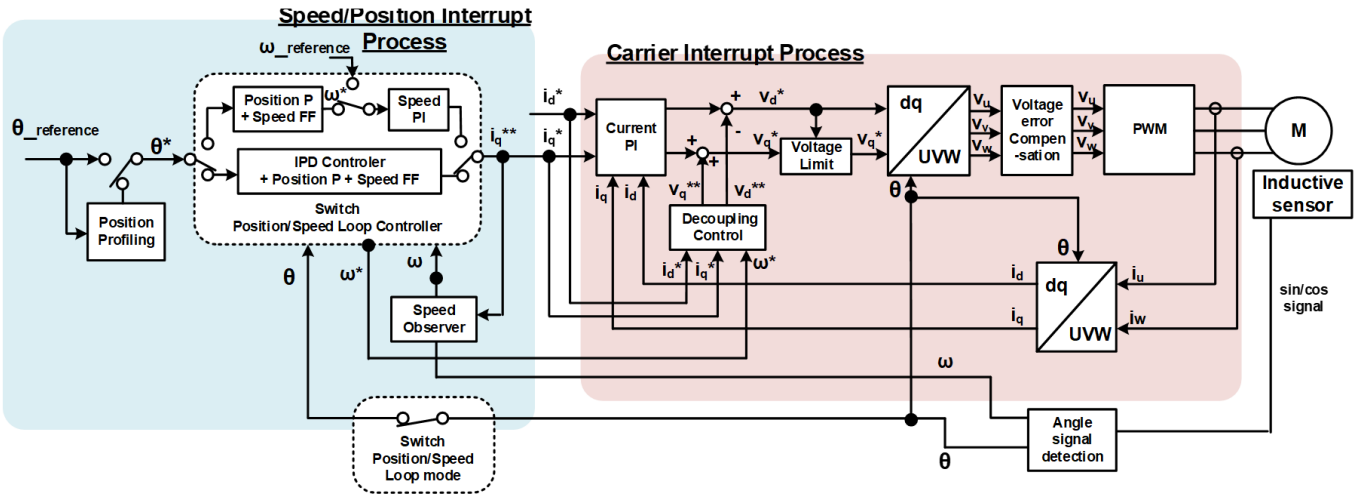

Figure 302: Block diagram of vector control with using induction sensor (PI feedback loop)

### Modulation

- Sine wave modulation The modulation factor "m" is defined as follows.

$$m = \frac{V}{E}$$

m : Modulation ratio V : Reference voltage E : Inverter input voltage

Figure 303: Modulation factor

- Space vector modulation In vector control of a permanent magnet synchronous motor, generally, the desired voltage command value of each phase is generated sinusoidally. However, if the generated value is used as-is for the modulation wave for PWM generation, voltage utilization as applied to the motor (in terms of line voltage) is limited to a maximum of 86.7 percents with respect to inverter bus voltage. As such, as shown in the following expression, the average of the maximum and minimum values is calculated for the voltage command value of each phase, and the value obtained by subtracting the average from the voltage command value of each phase is used as the modulation wave. As a result, the maximum amplitude of the modulation wave is multiplied by (square root 3)/2, while voltage utilization becomes 100 percents and line voltage is unchanged.

$$\begin{pmatrix} V_u' \\ V_v' \\ V_w' \end{pmatrix} = \begin{pmatrix} V_u \\ V_v \\ V_w \end{pmatrix} + \Delta V \begin{pmatrix} 1 \\ 1 \\ 1 \end{pmatrix}$$

$$\because \Delta V = -\frac{V_{max}+V_{min}}{2},\ V_{max} = max\{V_u, V_v, V_w\},\ V_{min} = min\{V_u, V_v, V_w\}$$

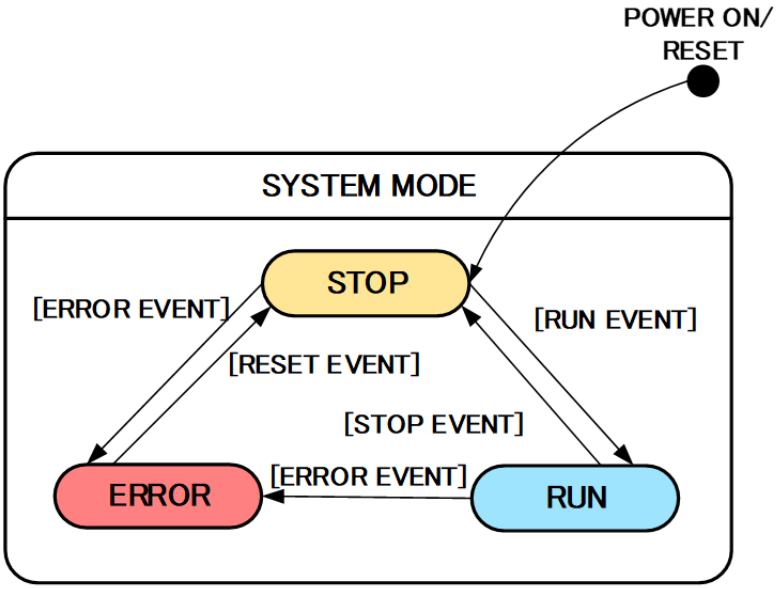
$V_u, V_v, V_w$: Command values of U-, V-, and W-phases

$V_u', V_v', V_w'$: Command values of U-, V-, and W-phases for PWM generation (modulation wave)

Figure 304: Space vector modulation

### State transition

The below figure shows a state transition diagram. Internal state is managed by "SYSTEM MODE".



| | | MODE | | |
|---|---|---|---|---|
| | | STOP | RUN | ERROR |
| EVENT | STOP | STOP | STOP | ERROR |
| | RUN | RUN | RUN | ERROR |
| | ERROR | ERROR | ERROR | ERROR |
| | RESET | STOP | RUN | STOP |

Figure 305: State transition diagram

(1) SYSTEM MODE "SYSTEM MODE" indicates the operating states of the system. The state transits on occurrence of each event (EVENT). "SYSTEM MODE" has 3 states that are motor drive stop (INACTIVE), motor drive (ACTIVE), and abnormal condition (ERROR).

(2) EVENT When "EVENT" occurs in each "SYSTEM MODE", "SYSTEM MODE" changes as shown the table in above figure, according to that "EVENT". The occurrence factors of each event are shown below.

| EVENT name | Occurrence factor |
|---|---|
| STOP | by user operation |
| RUN | by user operation |
| ERROR | when the system detects an error |
| RESET | by user operation |

**Flowchart**

The below figures show flowcharts of motor induction module.

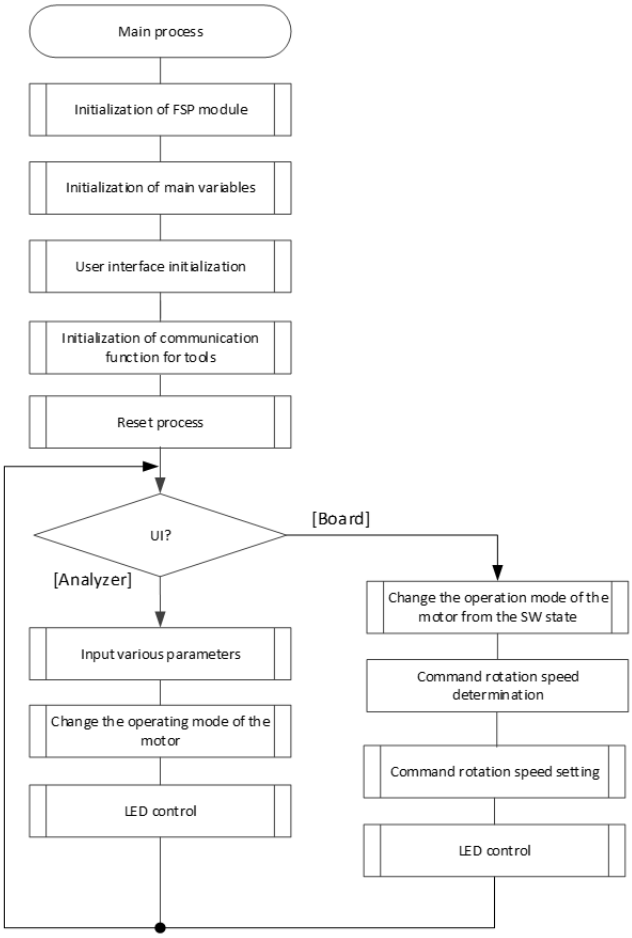


Figure 306: Main process

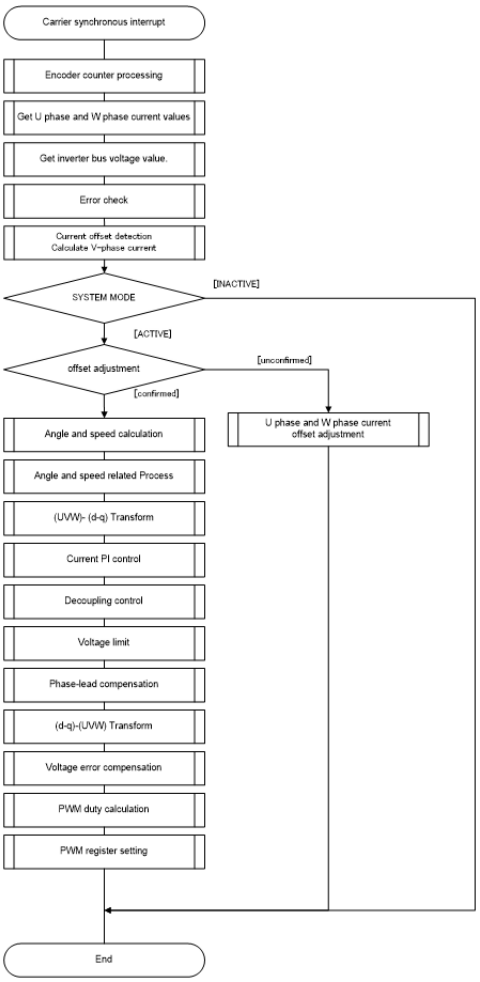

Figure 307: Current control process

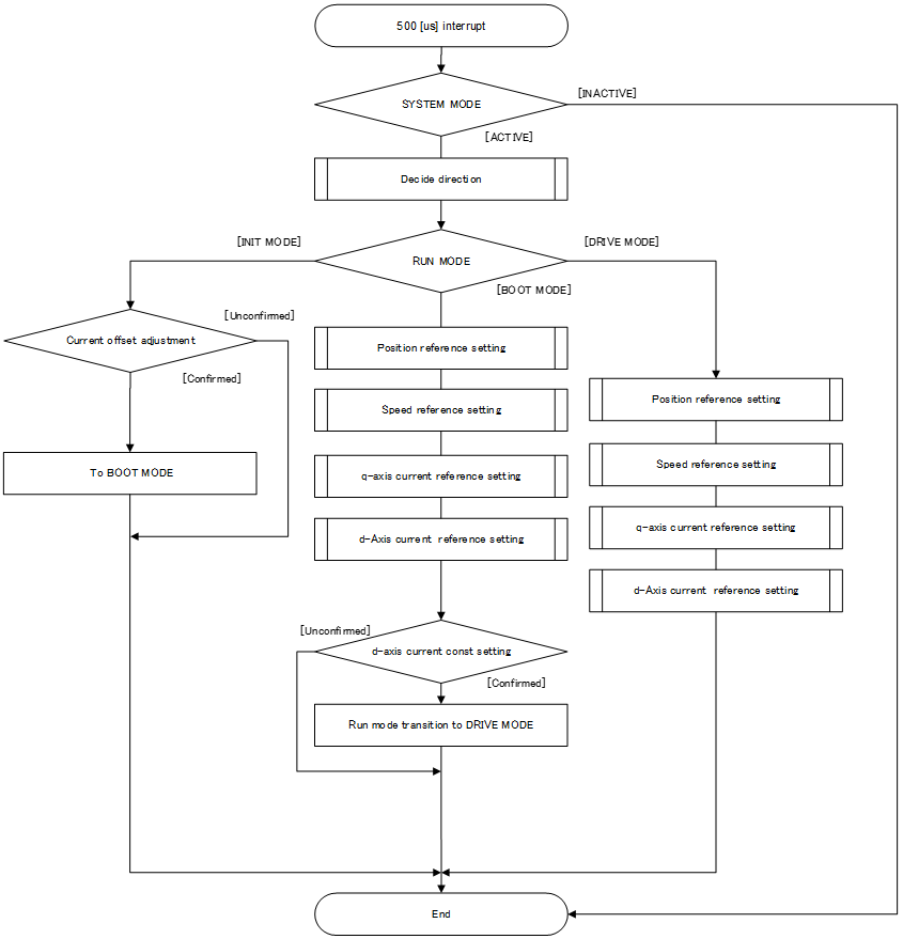

Figure 308: Speed control process

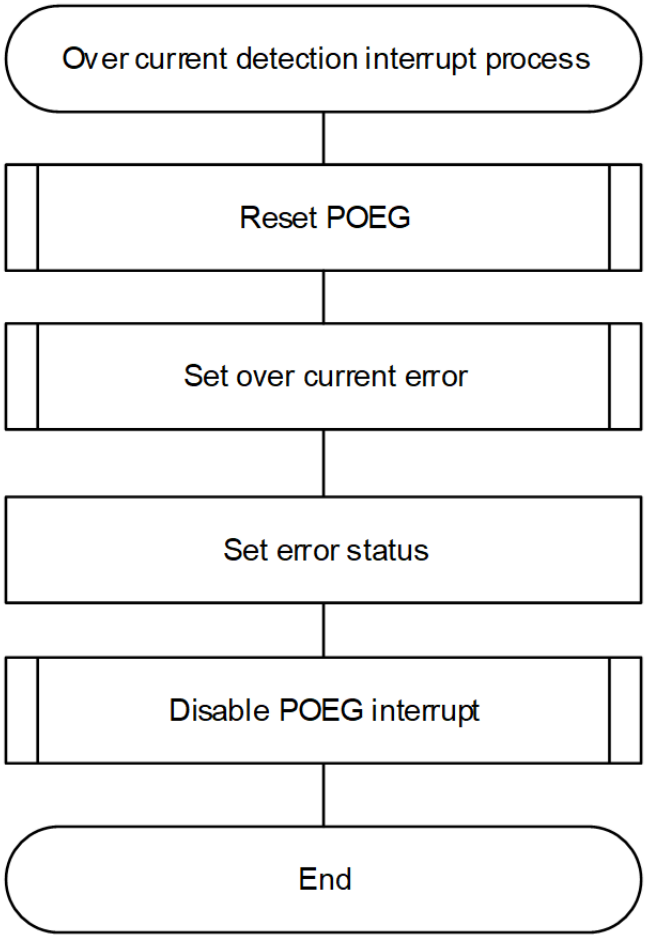

Figure 309: Over current detection interrupt process

# Configuration

### Build Time Configurations for rm_motor_induction

The following build time configurations are defined in fsp_cfg/rm_motor_induction_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

### Configurations for Motor > Motor vector control with induction sensor (rm_motor_induction)

This module can be added to the Stacks tab via New Stack > Motor > Motor vector control with induction sensor (rm_motor_induction).

| Configuration | Options | Default | Description |
|---|---|---|---|
| General | | | |

| | | | |
|---|---|---|---|
| Name | Name must be a valid C symbol | g_motor_induction0 | Module name. |
| Limit of over current (A) | Must be a valid value | 2.0F | Limit of over current.(Detection threshold) |
| Limit of over voltage (V) | Must be a valid value | 28.0F | Limit of over voltage.(Detection threshold) |
| Limit of over speed (rpm) | Must be a valid value | 3000.0F | Limit of over speed.(Detection threshold) |
| Limit of low voltage (V) | Must be a valid value | 18.0F | Limit of low voltage.(Detection threshold) |
| Interrupts | | | |
| Callback | Name must be a valid C symbol | NULL | A user callback function. If this callback function is provided, it is called at speed control cyclic interrupt. |

### Clock Configuration

This module doesn't depend on clock setting, because this module is a simple status transition process.

### Pin Configuration

This module does not use I/O pins. Please set used pins on configuration of each hardware modules.

## Usage Notes

### Limitations

- Set the limit of electric current with non-negative value.
- Set the limit of input voltage with non-negative value.
- Set the limit of rotational speed with non-negative value.

## Examples

### Basic Example

This is a basic example of minimal use of the motor induction module in an application.

```
void motor_induction_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
```

```
    err = RM_MOTOR_INDUCTION_Open(g_motor_induction0_smpl.p_ctrl,
g_motor_induction0_smpl.p_cfg);
    handle_error(err);
 /* Set speed reference before motor run */
    (void) RM_MOTOR_INDUCTION_SpeedSet(g_motor_induction0_smpl.p_ctrl,
RM_MOTOR_INDUCTION_TEST_OVER_SPEED_LIMIT);
 /* Set position reference before motor run */
    (void) RM_MOTOR_INDUCTION_PositionSet(g_motor_induction0_smpl.p_ctrl,
&g_posref_sample1);
 /* Start motor rotation */
    (void) RM_MOTOR_INDUCTION_Run(g_motor_induction0_smpl.p_ctrl);
 /* Get current status */
    (void) RM_MOTOR_INDUCTION_StatusGet(g_motor_induction0_smpl.p_ctrl,
&smpl_status);
 /* Get current rotor angle */
    (void) RM_MOTOR_INDUCTION_AngleGet(g_motor_induction0_smpl.p_ctrl, &smpl_angle);
 /* Get current motor rotational speed */
    (void) RM_MOTOR_INDUCTION_SpeedGet(g_motor_induction0_smpl.p_ctrl, &smpl_speed);
 /* Check error */
    (void) RM_MOTOR_INDUCTION_ErrorCheck(g_motor_induction0_smpl.p_ctrl,
&smpl_error);
 /* Stop motor rotation */
    (void) RM_MOTOR_INDUCTION_Stop(g_motor_induction0_smpl.p_ctrl);
 /* If need, set extra error status */
    (void) RM_MOTOR_INDUCTION_ErrorSet(g_motor_induction0_smpl.p_ctrl,
MOTOR_ERROR_OVER_CURRENT_HW);
 /* Reset motor control */
    (void) RM_MOTOR_INDUCTION_Reset(g_motor_induction0_smpl.p_ctrl);
 /* Close motor control */
    (void) RM_MOTOR_INDUCTION_Close(g_motor_induction0_smpl.p_ctrl);
}
```

## Enumerations

| | |
|---|---|
| enum | motor_induction_ctrl_t |

| | |
|---|---|
| enum | motor_induction_ctrl_event_t |

## Enumeration Type Documentation

### ◆ motor_induction_ctrl_t

| enum motor_induction_ctrl_t | |
|---|---|
| Enumerator | |
| MOTOR_INDUCTION_CTRL_STOP | Stop mode. |
| MOTOR_INDUCTION_CTRL_RUN | Run mode. |
| MOTOR_INDUCTION_CTRL_ERROR | Error mode. |

### ◆ motor_induction_ctrl_event_t

| enum motor_induction_ctrl_event_t | |
|---|---|
| Enumerator | |
| MOTOR_INDUCTION_CTRL_EVENT_STOP | Stop event. |
| MOTOR_INDUCTION_CTRL_EVENT_RUN | Run event. |
| MOTOR_INDUCTION_CTRL_EVENT_ERROR | Error event. |
| MOTOR_INDUCTION_CTRL_EVENT_RESET | Reset event. |

## Function Documentation

### ◆ RM_MOTOR_INDUCTION_Open()

fsp_err_t RM_MOTOR_INDUCTION_Open ( motor_ctrl_t *const *p_ctrl*, motor_cfg_t const *const *p_cfg* )

Configure the MOTOR in register start mode. Implements motor_api_t::open.

This function should only be called once as MOTOR configuration registers can only be written to once so subsequent calls will have no effect.

Example:

```
/* Initializes the module. */
   err = RM_MOTOR_INDUCTION_Open(g_motor_induction0_smpl.p_ctrl,
g_motor_induction0_smpl.p_cfg);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | MOTOR successfully configured. |
| FSP_ERR_ASSERTION | Null pointer, or one or more configuration options is invalid. |
| FSP_ERR_ALREADY_OPEN | Module is already open. This module can only be opened once. |
| FSP_ERR_INVALID_ARGUMENT | Configuration parameter error. |

***Note***

### ◆ RM_MOTOR_INDUCTION_Close()

fsp_err_t RM_MOTOR_INDUCTION_Close ( motor_ctrl_t *const *p_ctrl*)

Disables specified Motor Induction Control block. Implements motor_api_t::close.

Example:

```
/* Close motor control */
   (void) RM_MOTOR_INDUCTION_Close(g_motor_induction0_smpl.p_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully closed. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

***Note***

### ◆ RM_MOTOR_INDUCTION_Reset()

fsp_err_t RM_MOTOR_INDUCTION_Reset ( motor_ctrl_t *const *p_ctrl*)

Reset Motor Induction Control block. Implements motor_api_t::reset.

Example:

```
/* Reset motor control */
   (void) RM_MOTOR_INDUCTION_Reset(g_motor_induction0_smpl.p_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

***Note***

### ◆ RM_MOTOR_INDUCTION_Run()

fsp_err_t RM_MOTOR_INDUCTION_Run ( motor_ctrl_t *const *p_ctrl*)

Run Motor (Start motor rotation). Implements motor_api_t::run.

Example:

```
/* Start motor rotation */
   (void) RM_MOTOR_INDUCTION_Run(g_motor_induction0_smpl.p_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

***Note***

### ◆ RM_MOTOR_INDUCTION_Stop()

fsp_err_t RM_MOTOR_INDUCTION_Stop ( motor_ctrl_t *const *p_ctrl*)

Stop Motor (Stop motor rotation). Implements motor_api_t::stop.

Example:

```
/* Stop motor rotation */
   (void) RM_MOTOR_INDUCTION_Stop(g_motor_induction0_smpl.p_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

***Note***

### ◆ RM_MOTOR_INDUCTION_ErrorSet()

fsp_err_t RM_MOTOR_INDUCTION_ErrorSet ( motor_ctrl_t *const *p_ctrl*, motor_error_t const *error* )

Set error information. Implements motor_api_t::errorSet.

Example:

```
/* If need, set extra error status */
   (void) RM_MOTOR_INDUCTION_ErrorSet(g_motor_induction0_smpl.p_ctrl,
MOTOR_ERROR_OVER_CURRENT_HW);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

***Note***

### ◆ RM_MOTOR_INDUCTION_SpeedSet()

fsp_err_t RM_MOTOR_INDUCTION_SpeedSet ( motor_ctrl_t *const *p_ctrl*, float const *speed_rpm* )

Set speed reference[rpm]. Implements motor_api_t::speedSet.

Example:

```
/* Set speed reference before motor run */
   (void) RM_MOTOR_INDUCTION_SpeedSet(g_motor_induction0_smpl.p_ctrl,
RM_MOTOR_INDUCTION_TEST_OVER_SPEED_LIMIT);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

***Note***

### ◆ RM_MOTOR_INDUCTION_PositionSet()

fsp_err_t RM_MOTOR_INDUCTION_PositionSet ( motor_ctrl_t *const *p_ctrl*, motor_speed_position_data_t const *const *p_position* )

Set position reference[degree]. Implements motor_api_t::positionSet.

Example:

```
/* Set position reference before motor run */
   (void) RM_MOTOR_INDUCTION_PositionSet(g_motor_induction0_smpl.p_ctrl,
&g_posref_sample1);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Data set pointer is invalid.. |

***Note***

### ◆ RM_MOTOR_INDUCTION_StatusGet()

fsp_err_t RM_MOTOR_INDUCTION_StatusGet ( motor_ctrl_t *const *p_ctrl*, uint8_t *const *p_status* )

Get current control status. Implements motor_api_t::statusGet.

Example:

```
/* Get current status */
   (void) RM_MOTOR_INDUCTION_StatusGet(g_motor_induction0_smpl.p_ctrl,
&smpl_status);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Data received pointer is invalid.. |

***Note***

### ◆ RM_MOTOR_INDUCTION_AngleGet()

fsp_err_t RM_MOTOR_INDUCTION_AngleGet ( motor_ctrl_t *const *p_ctrl*, float *const *p_angle_rad* )

Get current rotor angle. Implements motor_api_t::angleGet.

Example:

```
/* Get current rotor angle */
   (void) RM_MOTOR_INDUCTION_AngleGet(g_motor_induction0_smpl.p_ctrl, &smpl_angle);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Data received pointer is invalid.. |

***Note***

### ◆ RM_MOTOR_INDUCTION_SpeedGet()

fsp_err_t RM_MOTOR_INDUCTION_SpeedGet ( motor_ctrl_t *const *p_ctrl*, float *const *p_speed_rpm* )

Get rotational speed. Implements motor_api_t::speedGet.

Example:

```
/* Get current motor rotational speed */
   (void) RM_MOTOR_INDUCTION_SpeedGet(g_motor_induction0_smpl.p_ctrl, &smpl_speed);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Data received pointer is invalid.. |

***Note***

### ◆ RM_MOTOR_INDUCTION_ErrorCheck()

fsp_err_t RM_MOTOR_INDUCTION_ErrorCheck ( motor_ctrl_t *const *p_ctrl*, uint16_t *const *p_error* )

Check the occurunce of Error. Implements motor_api_t::errorCheck.

Example:

```
/* Check error */
   (void) RM_MOTOR_INDUCTION_ErrorCheck(g_motor_induction0_smpl.p_ctrl,
&smpl_error);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Data received pointer is invalid.. |

***Note***

### ◆ RM_MOTOR_INDUCTION_WaitStopFlagGet()

fsp_err_t RM_MOTOR_INDUCTION_WaitStopFlagGet ( motor_ctrl_t *const *p_ctrl*, motor_wait_stop_flag_t *const *p_flag* )

Get wait stop flag. Implements motor_api_t::waitStopFlagGet.

Example:

**Return values**

| | |
|---|---|
| FSP_ERR_UNSUPPORTED | Unsupported. |

***Note***

### ◆ RM_MOTOR_INDUCTION_FunctionSelect()

fsp_err_t RM_MOTOR_INDUCTION_FunctionSelect ( motor_ctrl_t *const *p_ctrl*, motor_function_select_t const *function* )

Select using function. Implements motor_api_t::functionSelect.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_MODE | Mode unmatch |

***Note***

### ◆ RM_MOTOR_INDUCTION_InertiaEstimateStart()

fsp_err_t RM_MOTOR_INDUCTION_InertiaEstimateStart ( motor_ctrl_t *const *p_ctrl*)

Start inertia estimation function.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_MODE | Mode unmatch |

***Note***

### ◆ RM_MOTOR_INDUCTION_InertiaEstimateStop()

fsp_err_t RM_MOTOR_INDUCTION_InertiaEstimateStop ( motor_ctrl_t *const *p_ctrl*)

Stop(Cancel) inertia estimation function.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_MODE | Mode unmatch |

***Note***

### ◆ RM_MOTOR_INDUCTION_ReturnOriginStart()

fsp_err_t RM_MOTOR_INDUCTION_ReturnOriginStart ( motor_ctrl_t *const *p_ctrl*)

Start return origin function.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_MODE | Mode unmatch |

***Note***

### ◆ RM_MOTOR_INDUCTION_ReturnOriginStop()

| fsp_err_t RM_MOTOR_INDUCTION_ReturnOriginStop ( motor_ctrl_t *const *p_ctrl*) |
|---|
| Stop(Cancel) return origin function.<br><br>**Return values**<br>FSP_SUCCESS — Successfully resetted.<br>FSP_ERR_ASSERTION — Null pointer.<br>FSP_ERR_NOT_OPEN — Module is not open.<br>FSP_ERR_INVALID_MODE — Mode unmatch<br><br>***Note*** |

## 5.2.12 Networking

Modules

### Detailed Description

Networking Modules.

### Modules

| | |
|---|---|
| | AWS Cellular Interface on GM (rm_cellular_gm_aws)<br>Middleware implementing the AWS Cellular API for GM cellular modems. |
| | AWS MQTT<br>This module provides the AWS MQTT integration documentation. |
| | AWS OTA PAL on MCUBoot (rm_aws_ota_pal_mcuboot)<br>AWS OTA PAL layer implementation for downloading firmware updates. |
| | AWS PKCS11 PAL on LittleFS (rm_aws_pkcs11_pal_littlefs)<br>PKCS#11 PAL LittleFS layer implementation for use by FreeRTOS TLS. |

| | |
|---|---|
| | AWS coreHTTP<br>This module provides the AWS coreHTTP library. |
| | Azure Embedded Wireless Framework GM Port (rm_azure_ewf_gm) |
| | BLE Abstraction (rm_ble_abs)<br>Middleware for the Bluetooth peripheral on RA MCUs. This module implements the BLE ABS Interface. |
| | BLE Driver (r_ble_balance)<br>Driver for the Radio peripheral on RA MCUs. This module implements the BLE Interface. |
| | BLE Driver (r_ble_compact)<br>Driver for the Radio peripheral on RA MCUs. This module implements the BLE Interface. |
| | BLE Driver (r_ble_extended)<br>Driver for the Radio peripheral on RA MCUs. This module implements the BLE Interface. |
| | BLE Mesh Network Modules<br>BLE Mesh Network Modules. |
| | Cellular Comm Interface on UART (rm_cellular_comm_uart_aws)<br>Middleware implementing the AWS Cellular Comm Interface for the FSP UART API. |
| | DA16XXX Transport Layer (rm_at_transport_da16xxx_uart)<br>Transport layer implementation for linking DA16XXX Drivers with Communications layer. |
| | EtherCAT SSC Port (rm_ethercat_ssc_port)<br>Middleware for EtherCAT Slave Stack Code (SSC) on RA microprocessors. This module implements the EtherCAT SSC Interface. |

#### 5.2.12.1 AWS Cellular Interface on GM (rm_cellular_gm_aws)

Modules » Networking

Middleware implementing the AWS Cellular API for GM cellular modems.

# Overview

See AWS documentation for how the Cellular API works: https://www.freertos.org/Documentation/api-ref/cellular/index.html

**Features**

The following GM modems are supported by this port:

- GM02S (https://sequans.com/products/monarch-2-gm02s/)

Please see the data sheets for hardware configuration for modems.

All APIs are supported by the GM port with the exception of the following RAT APIs:

- Cellular_SetRatPriority
- Cellular_GetRatPriority

The following URCs are supported by the GM port:

- CEREG (Cellular_RegisterUrcNetworkRegistrationEventCallback)
- SYSSTART (Cellular_RegisterModemEventCallback)
- SHUTDOWN (Cellular_RegisterModemEventCallback)
- SQNSRING (Cellular_SocketRegisterDataReadyCallback)

Support for other GM URCs can be possibly added by request in future releases.

**Limitations**

- This module does not handle module reset pins. The user should manually configure any reset pins in order to reset the module.
- The GM can only be used in buffer reception mode, not transparent mode. When calling Cellular_SocketConnect only CELLULAR_ACCESSMODE_BUFFER is supported.
- The AWS Cellular APIs don't currently allow the local port to be set for UDP. It can be set by modifying the localPort field in CellularSocketHandle_t after calling Cellular_CreateSocket but before calling Cellular_SocketConnect.

# Configuration

### AWS Cellular Interface

### Build Time Configurations for source

The following build time configurations are defined in aws/cellular_interface/cellular_config.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Mobile Country Code Max Size | Value must be a positive integer | 3 | Mobile country code max size. |
| Mobile Network Node Max Size | Value must be a positive integer | 3 | Mobile network code max size. |
| Integrated Circuit Card Identity Max Size | Value must be a positive integer | 20 | Integrated circuit card identity max size. |
| International Mobile Subscriber Identity Max Size | Value must be a positive integer | 15 | International Mobile Subscriber Identity max size. |
| Firmware Version Max Size | Value must be a positive integer | 32 | Cellular module firmware version max size. |
| Hardware Version Max Size | Value must be a positive integer | 12 | Cellular module hardware version max size. |
| Serial Number Max Size | Value must be a positive integer | 12 | Cellular module serial number max size. |
| International Mobile Equipment Identity Max Size | Value must be a positive integer | 15 | International Mobile Equipment Identity number max size. |
| Registered Network operator Name Max Size | Value must be a positive integer | 32 | Registered network operator name max size. |
| Access Point Name Max Size | Value must be a positive integer | 64 | Access point name max size. |
| Packet Data Network Username Max Size | Value must be a positive integer | 32 | Packet data network username max size. |
| Packet Data Network Password Max Size | Value must be a positive integer | 32 | Packet data network password max size. |

| | | | |
|---|---|---|---|
| Data Network IP Address Max Size | Value must be a positive integer | 40 | Cellular data network IP address max size. |
| AT Command Max Size | Value must be a positive integer | 200 | Cellular AT command max size. |
| Max Number of Sockets | Value must be a positive integer | 6 | Cellular module number of socket max size. |
| Manufacturer ID Max Size | Value must be a positive integer | 20 | Cellular module manufacturer ID max size. |
| Model ID Max Size | Value must be a positive integer | 10 | Model ID max size. |
| EDRX List Max Size | Value must be a positive integer | 4 | EDRX list max size. |
| PDN Context ID Min Value | Value must be a positive integer | 1 | PDN context ID min value. |
| PDN Context ID Max Value | Value must be a positive integer | 16 | PDN context ID max value. |
| RAT Priority Count | Value must be a positive integer | 3 | RAT (radio access technology) priority count. |
| Socket Max Send Data Length (bytes) | Value must be in the range 1 - 1500 | 1460 | Socket max send data length. |
| Socket Max Receive Data Length (bytes) | Value must be in the range 1 - 1500 | 1500 | Socket max receive data length. |
| GetHostByName Support | • Enabled (default)<br>• Disabled | Enabled (default) | Enables/disable GetHostByName. |
| Comm Interface Send Timeout (ms) | Value must be a positive integer | 1000 | Cellular comm interface receive timeout in ms. |
| Comm Interface Receive Timeout (ms) | Value must be a positive integer | 50 | Cellular comm interface receive timeout in ms. |
| Static Allocation Context | • Enabled<br>• Disabled (default) | Disabled (default) | Use statically allocated context. |
| Comm Interface Static Allocation Context | • Enabled<br>• Disabled (default) | Disabled (default) | Use statically allocated context for comm interface. |
| Default RAT | • GSM<br>• WCDMA<br>• EDGE<br>• HSDPA<br>• HSUPA | CATM1 | Default Radio Access Technology. |

| | | | |
|---|---|---|---|
| | • HSDPAHSUPA<br>• LTE<br>• CATM1<br>• NBIOT | | |
| GSM Support | • Enabled<br>• Disabled (default) | Disabled (default) | This should be disabled when a modem doesn't support GSM or the AT+CGREG command. |
| Static Socket Context | • Enabled<br>• Disabled (default) | Disabled (default) | Use statically allocated socket. |
| AT Command Timeout (ms) | Value must be a positive integer | 5000 | Cellular common AT command timeout. |
| AT Command Raw Timeout (ms) | Value must be a positive integer | 5000 | Cellular AT command raw timeout. |
| AT Command Response prefix length | Value must be a positive integer | 5000 | Cellular AT command response prefix string length. |

**GM Cellular Interface Port**

**Configurations for Networking > AWS Cellular Interface on GM (rm_cellular_gm_aws)**

This module can be added to the Stacks tab via New Stack > Networking > AWS Cellular Interface on GM (rm_cellular_gm_aws).

| Configuration | Options | Default | Description |
|---|---|---|---|
| Module Reset Pin (Port Number) | Refer to the RA Configuration tool for available options. | 00 | Specify the reset control port for the GM module. This property is only used in devassist. |
| Module Reset Pin (Pin Number) | Refer to the RA Configuration tool for available options. | 00 | Specify the reset control pin for the GM module. This property is only used in devassist. |

# Examples

### Basic Example

```
void rm_cellular_gm_aws_basic_example (void)
{
    CellularHandle_t       cellular_handle = NULL;
    CellularSimCardStatus_t sim_card_status;
 /* Initialize Cellular Modem. */
```

```
    CellularError_t err = Cellular_Init(&cellular_handle,
&g_cellular_comm_interface_on_uart);
    assert(CELLULAR_SUCCESS == err);
 /* Get the SIM card status */
    err = Cellular_GetSimCardStatus(cellular_handle, &sim_card_status);
    assert(CELLULAR_SUCCESS == err);
    assert(CELLULAR_SIM_CARD_INSERTED == sim_card_status.simCardState);
}
```

### Socket Example

```
#define SOCKET_EXAMPLE_BUFFER_SIZE (256)
#define SOCKET_EXAMPLE_TIMEOUT (UINT32_MAX)
#define SOCKET_EXAMPLE_IP ("255.255.255.255")
#define SOCKET_EXAMPLE_PORT (80)
uint32_t g_recv_event_count = 0;
void socket_example_data_ready_callback (CellularSocketHandle_t socketHandle, void *
pCallbackContext)
{
 FSP_PARAMETER_NOT_USED(socketHandle);
 FSP_PARAMETER_NOT_USED(pCallbackContext);
    g_recv_event_count++;
}
void rm_cellular_gm_aws_socket_example (void)
{
    CellularHandle_t       cellular_handle = NULL;
 char                  * p_data          = "hello_world";
 char                   recv_buffer[SOCKET_EXAMPLE_BUFFER_SIZE] = "\0";
    uint32_t               sent_data_length    = 0;
    uint32_t               received_data_length = 0;
    uint32_t               timeout_ms          = SOCKET_EXAMPLE_TIMEOUT;
    CellularSocketHandle_t socket_handle;
    CellularSocketAddress_t socket_address =
    {
       .ipAddress =
```

```
     {
           CELLULAR_IP_ADDRESS_V4,
           SOCKET_EXAMPLE_IP
      },
      .port      = SOCKET_EXAMPLE_PORT
   };
 /* Initialize Cellular Modem. */
   CellularError_t err = Cellular_Init(&cellular_handle,
&g_cellular_comm_interface_on_uart);
   assert(CELLULAR_SUCCESS == err);
 /* Create a TCP socket */
   err = Cellular_CreateSocket(cellular_handle,
                               1,
                               CELLULAR_SOCKET_DOMAIN_AF_INET,
                               CELLULAR_SOCKET_TYPE_STREAM,
                               CELLULAR_SOCKET_PROTOCOL_TCP,
                               &socket_handle);
   assert(CELLULAR_SUCCESS == err);
 /* Register the data ready callback */
   err = Cellular_SocketRegisterDataReadyCallback(cellular_handle,
                                                  socket_handle,
                                                  socket_example_data_ready_callback
,
                                                  NULL);
   assert(CELLULAR_SUCCESS == err);
   g_recv_event_count = 0;
 /* Connect the TCP socket */
   err = Cellular_SocketConnect(cellular_handle, socket_handle,
CELLULAR_ACCESSMODE_BUFFER, &socket_address);
   assert(CELLULAR_SUCCESS == err);
 /* Send data over the socket */
   err = Cellular_SocketSend(cellular_handle, socket_handle, (uint8_t *) p_data,
strlen(p_data), &sent_data_length);
   assert(CELLULAR_SUCCESS == err);
```

```
   assert(strlen(p_data) == sent_data_length);
/* Wait for data ready callback */
   timeout_ms = SOCKET_EXAMPLE_TIMEOUT;
while (timeout_ms > 0)
   {
if (g_recv_event_count > 0)
     {
break;
      }
R_BSP_SoftwareDelay(1, BSP_DELAY_UNITS_MILLISECONDS);
      timeout_ms--;
   }
   assert(0 != timeout_ms);
/* Receive data back */
   err = Cellular_SocketRecv(cellular_handle,
                             socket_handle,
                             (uint8_t *) recv_buffer,
                             SOCKET_EXAMPLE_BUFFER_SIZE,
                             &received_data_length);
   assert(CELLULAR_SUCCESS == err);
/* Close the socket */
   err = Cellular_SocketClose(cellular_handle, socket_handle);
   assert(CELLULAR_SUCCESS == err);
}
```

### Setting UDP local port

```
#define UDP_EXAMPLE_IP ("255.255.255.255")
#define UDP_EXAMPLE_REMOTE_PORT (80)
#define UDP_EXAMPLE_LOCAL_PORT (5000)
void rm_cellular_gm_aws_udp_local_port_set_example (void)
{
    CellularHandle_t       cellular_handle = NULL;
    CellularSocketHandle_t socket_handle   = NULL;
    CellularSocketAddress_t socket_address =
```

```
    {
       .ipAddress =
      {
            CELLULAR_IP_ADDRESS_V4,
            UDP_EXAMPLE_IP
       },
       .port      = UDP_EXAMPLE_REMOTE_PORT
    };
 /* Initialize Cellular Modem. */
    CellularError_t err = Cellular_Init(&cellular_handle,
&g_cellular_comm_interface_on_uart);
    assert(CELLULAR_SUCCESS == err);
 /* Create a UDP socket */
    err = Cellular_CreateSocket(cellular_handle,
                                1,
                                CELLULAR_SOCKET_DOMAIN_AF_INET,
                                CELLULAR_SOCKET_TYPE_DGRAM,
                                CELLULAR_SOCKET_PROTOCOL_UDP,
                                &socket_handle);
    assert(CELLULAR_SUCCESS == err);
 /* Set the local port */
    socket_handle->localPort = UDP_EXAMPLE_LOCAL_PORT;
 /* Connect the UDP socket */
    err = Cellular_SocketConnect(cellular_handle, socket_handle,
CELLULAR_ACCESSMODE_BUFFER, &socket_address);
    assert(CELLULAR_SUCCESS == err);
}
```

### 5.2.12.2 AWS MQTT

Modules » Networking

This module provides the AWS MQTT integration documentation.

# Overview

The AWS MQTT library can connect to either AWS or a third party MQTT broker such as Mosquitto. The documentation for the library can be found at the following link: coreMQTT.

### Features

- MQTT connections over TLS to an AWS IoT Endpoint or Mosquitto server

# Configuration

### Memory Usage

The AWS CoreMQTT library relies heavily on dynamic memory allocation for thread/task creation as well as other uses. Depending on the configuration it may be required to provide as much as 110k heap. To decrease this it is recommended to tweak the thread stack configuration values based on usage. Notable values are:

### FreeRTOS Thread

- General|Minimal Stack Size

### FreeRTOS Plus TCP

- Stack size in words (not bytes)

# Usage Notes

- A transport interface is required to use the CoreMQTT library (https://www.freertos.org/network-interface.html).
- For FSP, a transport interface over MbedTLS is provided. This transport interface can connect to RA ethernet, WiFi, and cellular modules via sockets wrappers for each module.
- TLS_FreeRTOS_Connect should be used before calling any CoreMQTT APIs. See the example for more information.
- Not all MQTT servers support maintaining a TLS session after a MQTT disconnect. TLS_FreeRTOS_Disconnect and TLS_FreeRTOS_Connect should be called to establish a new TLS session before attempting to reconnect with CoreMQTT APIs if the server does not support TLS session resumption.

### Limitations

- aws_clientcredential.h and aws_clientcredential_keys.h need to be added manually.
- MbedTLS must be initialized and key provisioning must be done before starting a secure connection.

### Examples

### Connection example using MbedTLS/PKCS11 Transport Interface

#### 5.2.12.3 AWS OTA PAL on MCUBoot (rm_aws_ota_pal_mcuboot)

Modules » Networking

AWS OTA PAL layer implementation for downloading firmware updates.

## Overview

This module provides the hardware port layer for the AWS IoT Over-the-air Update Library. Refer to the AWS OTA documentation: https://docs.aws.amazon.com/freertos/latest/userguide/integrate-ota-agent.html.

## Configuration

#### Build Time Configurations for rm_aws_ota_pal_mcuboot

The following build time configurations are defined in fsp_cfg/rm_aws_ota_pal_mcuboot_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP) | Default (BSP) | If selected code for |

| | | | |
|---|---|---|---|
| | • Enabled<br>• Disabled | | parameter checking is included in the build. |
| Filepath to Slot ID Callback Function | Must be a valid C symbol | NULL | Callback function for determining which Slot ID the image should be downloaded to. |
| OTA code signing signature algorithm | sig-sha256-ecdsa | sig-sha256-ecdsa | Code signing algorithm used by AWS to sign the downloaded image. |

**Configurations for Storage > AWS OTA PAL (rm_aws_ota_pal_mcuboot)**

| Configuration | Options | Default | Description |
|---|---|---|---|
| Name | Name must be a valid C symbol | g_rm_aws_ota_pal_mcuboot0 | Module name. |

**Common AWS Configuration**

**Build Time Configurations for source**

The following build time configurations are defined in aws/ota_config.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Version | | | |
| Major | Value must be a non-negative integer | 0 | Major Version number used when updating. |
| Minor | Value must be a non-negative integer | 0 | Minor Version number used when updating. |
| Build | Value must be a non-negative integer | 1 | Build Version number used when updating. |
| Custom ota_config.h | Manual Entry | | Add a path to your custom ota_config.h file. It can be used to override some or all of the configurations defined here, and to define additional configurations. |
| Log2 File Block Size | Value must be a non-negative integer | 11 | Log base 2 of the size of the file data block message (excluding the header). e.g. 11: 2^11 = 2048bytes |
| Self Test Response Wait (ms) | Value must be a non-negative integer | 16000 | Milliseconds to wait for the self test phase to succeed before we force reset. |
| File Request Wait (ms) | Value must be a non- | 10000 | Milliseconds to wait |

| | | | |
|---|---|---|---|
| | negative integer | | before requesting data blocks from the OTA service if nothing is happening. |
| Max Thingname Length | Value must be a non-negative integer | 64 | The maximum allowed length of the thing name used by the OTA agent. |
| Max Num Blocks Request | Value must be a non-negative integer | 1 | The maximum number of data blocks requested from OTA streaming service. |
| Max Num Request Momentum | Value must be a non-negative integer | 32 | The maximum number of requests allowed to send without a response before we abort. |
| Ota Update Status Frequency | Value must be a non-negative integer | 64 | How frequently the device will report its OTA progress to the cloud. |
| Max Num OTA Data Buffers | Value must be a non-negative integer | 1 | The number of data buffers reserved by the OTA agent. |
| Allow Downgrade | • Allowed<br>• Disallowed | Disallowed | Flag to enable booting into updates that have an identical or lower version than the current version. |
| Ota Firmware Update File Type ID | Value must be a non-negative integer | 0 | The file type id received in the job document. |
| Enabled Control Protocol | OTA Control Over MQTT | OTA Control Over MQTT | The protocol selected for OTA control operations. |
| Enabled Data Protcols | • OTA Data Over MQTT<br>• OTA Data Over HTTP<br>• OTA Data Over MQTT and HTTP | OTA Data Over MQTT | The protocol selected for OTA data operations. |
| OTA Primary Data Protocol | • OTA Data Over MQTT<br>• OTA Data Over HTTP | OTA Data Over MQTT | The preferred protocol selected for OTA data operations. |
| OTA Events Polling Timeout (ms) | Value must be a non-negative integer | 1000 | The polling timeout (milliseconds) to receive messages from |

event queue.

# Usage Notes

The current implementation utilizes MCUboot Port (rm_mcuboot_port) for switching images.

### Limitations

- Currently only the only supported signature method is sig-sha256-ecdsa.

### 5.2.12.4 AWS PKCS11 PAL on LittleFS (rm_aws_pkcs11_pal_littlefs)

Modules » Networking

PKCS#11 PAL LittleFS layer implementation for use by FreeRTOS TLS.

# Overview

*Note*

***The PKCS#11 PAL LittleFS Interface does not provide any interfaces to the user. Consult the AWS documentation for more info: https://docs.aws.amazon.com/freertos/latest/portingguide/afr-porting-pkcs.html.***

# Configuration

There is no user configuration for this module

# Usage Notes

The current implementation utilizes LittleFS on Flash (rm_littlefs_flash) for storage.

### Limitations

- Credential access is not limited in any way.

### 5.2.12.5 AWS coreHTTP

Modules » Networking

This module provides the AWS coreHTTP library.

# Overview

The AWS coreHTTP library can be used to send HTTP and HTTPS requests. The documentation for the library can be found at the following link: coreHTTP.

### Features

- Secure and Non-secure HTTP requests
- Mutually authenticated connections

# Configuration

### Memory Usage

The AWS coreHTTP stack relies on dynamic memory allocation for thread/task creation as well as other uses. It is recommended to tweak the thread stack configuration values based on usage. Notable values are:

### FreeRTOS Thread

- General|Minimal Stack Size
- Memory Allocation|Total Heap Size

### FreeRTOS Plus TCP

- Stack size in words (not bytes)

# Usage Notes

- A transport interface is required to use the CoreHTTP library (https://www.freertos.org/network-interface.html).
- For FSP, a transport interface over MbedTLS is provided. This transport interface can connect to RA ethernet, WiFi, and cellular modules via sockets wrappers for each module.
- TLS_FreeRTOS_Connect should be used before calling any CoreHTTP APIs. See the example for more information.

### Limitations

- MbedTLS must be initialized and key provisioning must be done before starting a secure connection.

### Examples

### HTTPS GET request

```

### 5.2.12.6 Azure Embedded Wireless Framework GM Port (rm_azure_ewf_gm)

Modules » Networking

*Note*

***The Azure Embedded Wireless Framework is still in beta and not all APIs may be fully implemented yet.***

# Overview

This documentation is for the GMxxx ports of the Azure Embedded Wireless Framework.

- For more information on the framework see the documentation: https://azure.github.io/embedded-wireless-framework/html/index.html.
    - There are also various examples available for the RA6M4_EK: https://github.com/Azure/embedded-wireless-framework/tree/main/examples/EK-RA6M4.
- For more GM02S hardware information including pin and baud rate info please see the GM02S page: https://sequans.com/products/monarch-2-gm02s/.

#### Features

- Various APIs to control/access GMxxx modem features via AT commands.
- Raw AT command APIs
- IPv4 sockets using TCP/UDP
- The EWF framework is usable standalone with bare metal and ThreadX.
- The framework can also be used with NetX when coupled with a EWF NetX middleware layer.

#### Limitations

The following are the limitations of the Azure EWF Library:

- DTC is not supported. The lower level interface using R_UART relies on processing data one byte at a time via the interrupt callback and UART_EVENT_RX_CHAR.
- Server mode sockets should be supported but have not been fully tested due to APN limitations.
- There are potential issues when using the default (-Os) optimization or above with AC6. All files under embedded_wireless_framework should be set to compile with no optimization (-O0) when using AC6.
- nx_ip_status_check does not currently work for the EWF middleware.
- When using socket send functions (ewf_adapter_tcp_send and ewf_adapter_udp_send) the GM port is limited to sending only 1460 bytes at a time. Data sent using these functions should be broken into 1460 byte chunks or less.
    - When using NetX the packet size for the driver packet pool should be set to 1460

bytes or less. Using larger packet sizes will work but the NetX Middleware Driver will potentially break up the packets inefficiently.

### Unsupported NetX Duo Features

These features are handled directly on the GMxxx hardware or are not supported yet in the EWF library. NetX APIs for these features should not be used:

- IPv6 functionality (the EWF library doesn't yet support IPv6)
- ARP is handled directly by the cellular modem
- DHCP is handled directly by the cellular modem.

## Configuration

The GM02S port for the Embedded Wireless Framework can be added to the Stacks tab via New Stack > Networking > Azure EWF Adapter on GM02S.

### Build Time Configurations for Common

The following build time configurations are defined in fsp_cfg/azure/ewf/ewf.config.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Enabled<br>• Disabled | Enabled | This enables checking of function parameters. When this is disabled, parameter checking code is not present and the footprint is reduced |
| Enable Logging | • Enabled<br>• Disabled | Disabled | This enables logging and the compilation of debug code. When disabled, logging and debug code is not present and the footprint is reduced. |
| Verbose Logging | • Enabled<br>• Disabled | Disabled | This enables verbose logging. Verbose logging will only work if a EWF Log Function is set and logging is enabled. |
| EWF Log Function | Manual Entry | printf(__VA_ARGS__) | Function the library uses for standard log messages when logging is enabled. |
| EWF Log Error Function | Manual Entry | printf(__VA_ARGS__) | Function the library uses for error log messages when logging is enabled. |

## Usage Notes

The basic setup for the library is as follows:

*Note*

***The message allocator (EWF_ALLOCATOR_THREADX_STATIC_DECLARE) should be at least 1500 bytes for GM***

1. Declare an allocator, interface, and adapter using appropriate macros (EWF_ALLOCATOR_THREADX_STATIC_DECLARE/EWF_ALLOCATOR_MEMORY_POOL_STATIC_DECLARE/EWF_ALLOCATOR_C_HEAP_STATIC_DECLARE, EWF_INTERFACE_RA_UART_STATIC_DECLARE, EWF_ADAPTER_RENESAS_GM02S_STATIC_DECLARE).
2. Start the adapter with ewf_adapter_start.
3. Setup modem service if necessary with functions from ewf_adapter_api_modem.h and other included api_modem_* files.
4. Set functionality with ewf_adapter_modem_functionality_set.
5. Wait for network registration (can use ewf_adapter_modem_network_registration_check to wait).
6. Do a service activate to set desired PDP context with ewf_adapter_modem_packet_service_activate. This should be called regardless of whether context is already activated as it sets an internal library context number for functions like ewf_adapter_get_ipv4_address.
7. Call other network functions as needed from desired headers (i.e. TCP functions are in ewf_adapter_api_tcp.h).

When using NetX Duo the following must be done:

- Before creating an IP instance make sure that the modem adapter is started and connected to a network.
- After creating an IP instance the adapter pointer has to be stored manually to the IP instance: g_ip.nx_ip_interface->nx_interface_additional_link_info = adapter_ptr;.
- After creating an IP instance the gateway address should be set to the IP of the modem in order to satisfy NetX Duo's internal routing algorithms (packets are actually routed by the modem hardware): nx_ip_gateway_address_set(&g_ip, RM_NETXDUO_TESTS_IP_ADDR);.

# Examples

### Basic TCP Socket Example

*Note*

*The user should choose the relevant EWF_ALLOCATOR and EWF_ADAPTER macros from this example to use based on the hardware and RTOS being used*

```
#define EWF_LOG_BUFFER_SIZE (256)

#define EWF_MODEM_NETWORK_WAIT_TIME_SECONDS (30)

#define EWF_HTTP_GET_SERVER "www.microsoft.com"

#define EWF_HTTP_GET "GET / HTTP/1.1\r\nHost:www.microsoft.com\r\n\r\n"

#define EWF_HTTP_PORT (80)

ewf_allocator * message_allocator_ptr = NULL;

ewf_interface * interface_ptr         = NULL;

ewf_adapter   * adapter_ptr          = NULL;
```

```
char ewf_log_buffer[EWF_LOG_BUFFER_SIZE];
void rm_azure_ewf_gm_example ()
{
 static uint8_t buffer[2048];       // NOLINT
    uint32_t       buffer_length = sizeof(buffer);
 /* Azure library has macros to declare/allocate structs and pointers.
  * Different ones should be used depending on Adapter and whether the library is
being used on bare metal or ThreadX */
 /* This is for the memory allocator using ThreadX block pools */
    EWF_ALLOCATOR_THREADX_STATIC_DECLARE(message_allocator_ptr, message_allocator,
12, 2048);
 /* This is for the memory allocator using static memory on bare metal */
    EWF_ALLOCATOR_MEMORY_POOL_STATIC_DECLARE(message_allocator_ptr,
message_allocator, 12, 2048);
 /* This is for the memory allocator using the heap on bare metal */
    EWF_ALLOCATOR_C_HEAP_STATIC_DECLARE(message_allocator_ptr, message_allocator, 12,
2048);
 /* This is for the communications interface using R_UART */
    EWF_INTERFACE_RA_UART_STATIC_DECLARE(interface_ptr, sci_uart);
 /* If using GM01Q */
    EWF_ADAPTER_RENESAS_GM01Q_STATIC_DECLARE(adapter_ptr, renesas_gm01q,
message_allocator_ptr, NULL, interface_ptr);
 /* If using GM02S */
    EWF_ADAPTER_RENESAS_GM02S_STATIC_DECLARE(adapter_ptr, renesas_gm02s,
message_allocator_ptr, NULL, interface_ptr);
 /* Start the adapter */
    assert(EWF_RESULT_OK == ewf_adapter_start(adapter_ptr));
 /* Set the ME functionality */
    assert(EWF_RESULT_OK == ewf_adapter_modem_functionality_set(adapter_ptr, "1"));
 /* Wait for the modem functionality to be up */
    assert(EWF_RESULT_OK ==
          ewf_adapter_modem_network_registration_check(adapter_ptr,
EWF_ADAPTER_MODEM_CMD_QUERY_EPS_NETWORK_REG,
```

```
EWF_MODEM_NETWORK_WAIT_TIME_SECONDS));
 /* Do a service activate to set context num correctly */
    ewf_adapter_modem_packet_service_activate(adapter_ptr, 1);
    ewf_socket_tcp socket_tcp = {0};
 /* Open TCP Socket */
    assert(EWF_RESULT_OK == ewf_adapter_tcp_open(adapter_ptr, &socket_tcp));
 /* Connect to server */
    assert(EWF_RESULT_OK == ewf_adapter_tcp_connect(&socket_tcp, EWF_HTTP_GET_SERVER,
EWF_HTTP_PORT));
 /* Send HTTP GET */
    assert(EWF_RESULT_OK == ewf_adapter_tcp_send(&socket_tcp, (const uint8_t *)
EWF_HTTP_GET, strlen(EWF_HTTP_GET)));
 /* Receive HTTP GET response */
    assert(EWF_RESULT_OK == ewf_adapter_tcp_receive(&socket_tcp, buffer,
&buffer_length, true));
 /* Shutdown socket connection to server */
    assert(EWF_RESULT_OK == ewf_adapter_tcp_shutdown(&socket_tcp));
 /* Close/destroy socket */
    assert(EWF_RESULT_OK == ewf_adapter_tcp_close(&socket_tcp));
}
```

### NetX Duo Example

```
#define NETXDUO_EXAMPLE_PACKET_SIZE (1568U)
#define NETXDUO_EXAMPLE_PACKET_NUM (100U)
#define NETXDUO_EXAMPLE_PACKET_POOL_SIZE ((sizeof(NX_PACKET) +
NETXDUO_EXAMPLE_PACKET_SIZE) * \
  NETXDUO_EXAMPLE_PACKET_NUM)
#define NETXDUO_EXAMPLE_IP_STACK_SIZE (2048U)
NX_PACKET_POOL g_packet_pool;
NX_IP          g_ip;

### Detailed Description

Middleware for the Bluetooth peripheral on RA MCUs. This module implements the BLE ABS Interface .

# Overview

This module provides BLE GAP functionality that complies with the Bluetooth Core Specification version 5.0 specified by the Bluetooth SIG. This module is configured via the QE for BLE. QE for BLE provides standard services defined by standardization organization and custom services defined by user. Bluetooth LE Profile API Document User's Manual describes the APIs for standard services.

### Features

The Bluetooth Low Energy (BLE) Abstraction module supports the following features:

- following GAP Role support
  - Central: The device that sends a connection request to the Peripheral device.
  - Peripheral: The device that accepts a connection request from Central and establishes a connection.
  - Observer : The device that scans for advertising.
  - Broadcaster : The device that sends advertising.
- LE 2M PHY
  - BLE communication is supported on the 2 Msym/s PHY.
- LE Coded PHY -Supports BLE communication on the Coded PHY. This enables communication over longer distances than 1M PHY and 2M PHY.
- LE Advertising Extensions
  - Up to four independent adverts can be executed simultaneously.
  - The size of Advertising Data/Scan Response Data has been expanded to a maximum of 1650 bytes.
  - Periodic Advertising is available.
- LE Channel Selection Algorithm #2
  - With the hopping channel selection algorithm added in Version 5.0, the machine that selects the channel It is possible.
- High Duty Cycle Non-Connectable Advertising
  - The ability to support non-connectable advertising with a minimum interval of up to 20 msec.
- LE Secure Connections
  - Elliptic curve Diffie-Hellman key sharing (ECDH) for pairing with passive eavesdropping support.
- Link Layer privacy
  - This feature avoids being tracked by other BLE devices by periodically changing the Bluetooth device address.
- Link Layer Extended Scanner Filter policies
  - Scan Filter support for Resolvable private addresses.
- LE Data Packet Length Extension
  - This function expands the packet size of BLE data communications. It is possible to scale up to 251 bytes.
- LE L2CAP Connection Oriented Channel Support
  - The ability to support communication using the L2CAP credit based flow control channel.
- Low Duty Cycle Directed Advertising
  - The ability to support the advertising of the Low Duty Cycle for reconnecting to a known device.
- LE Link Layer Topology
  - It supports both Master and Slave roles and can operate as Master when connected to one remote device and as Slave when connected to another remote device.
- LE Ping
  - This function checks whether the link is maintained or not by requesting the transmission of packets containing MIC after link encryption.

### BLE Library Configuration

There are three types of BLE Protocol Stacks, and the functions provided are different depending on the type of BLE Protocol Stack you select.

| BLE library feature | Extended | Balance | Compact |
|---|---|---|---|
| GAP Role | Central Peripheral Observer Broadcaster | Central Peripheral Observer Broadcaster | Peripheral Broadcaster |
| LE 2M PHY | Yes | Yes | No |
| LE Coded PHY | Yes | Yes | No |
| LE Advertising Extensions | Yes | No | No |
| LE Channel Selection Algorithm #2 | Yes | Yes | No |
| High Duty Cycle Non-Connectable Advertising | Yes | Yes | Yes |
| LE Secure Connections | Yes | Yes | Yes |
| Link Layer privacy | Yes | Yes | Yes |
| Link Layer Extended Scanner Filter policies | Yes | Yes | No |
| LE Data Packet Length Extension | Yes | Yes | Yes |
| LE L2CAP Connection Oriented Channel Support | Yes | No | No |
| Low Duty Cycle Directed Advertising | Yes | Yes | Yes |
| LE Link Layer Topology | Yes | Yes | No |
| LE Ping | Yes | Yes | Yes |
| 32-bit UUID Support in LE | Yes | Yes | Yes |

### Target Devices

The BLE Abstraction module supports the following devices.

- RA4W1

# Configuration

### Build Time Configurations for rm_ble_abs

The following build time configurations are defined in fsp_cfg/rm_ble_abs_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enable<br>• Disable | Default (BSP) | Specify whether to include code for API parameter checking. Valid settings include. |
| Debug Public Address | Must be a valid device address | FF:FF:FF:50:90:74 | Public Address of firmware initial value. |
| Debug Random Address | Must be a valid device address | FF:FF:FF:FF:FF:FF | Random Address of firmware initial value. |
| Maximum number of connections | Value must be an integer between 1 and 7, and lower than the value defined in ble module. | 7 | Maximum number of connections. |
| Maximum connection data length | Value must be an integer between 27 and 251, and lower than the value defined in ble module. | 251 | Maximum connection data length. |
| Maximum advertising data length | Value must be an integer between 31 and 1650, and lower than the value defined in ble module. | 1650 | Maximum advertising data length. |
| Maximum advertising set number | Value must be an integer between 1 and 4, and lower than the value defined in ble module. | 4 | Maximum advertising set number. |
| Maximum periodic sync set number. | Value must be an integer between 1 and 2, and lower than the value defined in ble module. | 2 | Maximum periodic sync set number. |
| Store Security Data | • Disable<br>• Enable | Disable | Store Security Data in DataFlash. |
| Data Flash Block for Security Data | Value must be an integer between 0 and 7, and lower than the value defined in ble module. | 0 | Data Flash Block for Security Data Management. |
| Remote Device Bonding Number | Value must be an integer between 1 and 7, and lower than the value defined in ble module. | 7 | Number of remote device bonding information. |
| Connection Event Start | • Disable | Disable | Set Connection event |

| | | | |
|---|---|---|---|
| Notify | • Enable | | start notify enable/disable. |
| Connection Event Close Notify | • Disable<br>• Enable | Disable | Set Connection event close notify enable/disable. |
| Advertising Event Start Notify | • Disable<br>• Enable | Disable | Set Advertising event start notify enable/disable. |
| Advertising Event Close Notify | • Disable<br>• Enable | Disable | Set Advertising event close notify enable/disable. |
| Scanning Event Start Notify | • Disable<br>• Enable | Disable | Set Scanning event start notify enable/disable. |
| Scanning Event Close Notify | • Disable<br>• Enable | Disable | Set Scanning event close notify enable/disable. |
| Initiating Event Start Notify | • Disable<br>• Enable | Disable | Set Initiating event start notify enable/disable. |
| Initiating Event Close Notify | • Disable<br>• Enable | Disable | Set Initiating event close notify enable/disable. |
| RF Deep Sleep Start Notify | • Disable<br>• Enable | Disable | Set RF_DEEP_SLEEP start notify enable/disable. |
| RF Deep Sleep Wakeup Notify | • Disable<br>• Enable | Disable | Set RF_DEEP_SLEEP wakeup notify enable/disable. |
| Bluetooth dedicated clock | Value must be an integer between 0 and 15, and lower than the value defined in ble module. | 6 | Load capacitance adjustment. |
| DC-DC converter | • Disable<br>• Enable | Disable | Set DC-DC converter for RF part. |
| Slow Clock Source | • Use RF_LOCO<br>• Use External 32.768kHz | Use RF_LOCO | Set slow clock source for RF part. |
| MCU CLKOUT Port | • P109<br>• P205 | P109 | When BLE_ABS_CFG_RF_EXTERNAL_32K_ENABLE = 1, Set port of MCU CLKOUT. |
| MCU CLKOUT Frequency Output | • MCU CLKOUT frequency 32.768kHz | MCU CLKOUT frequency 32.768kHz | When BLE_ABS_CFG_RF_EXTERNAL_32K_ENABLE = 1, set frequency |

| | | | |
|---|---|---|---|
| | • MCU CLKOUT frequency 16.384kHz | | output from CLKOUT of MCU part. |
| Sleep Clock Accuracy(SCA) | Value must be an integer between 0 and 500, and lower than the value defined in ble module. | 250 | When BLE_ABS_CFG_RF_EXTERNAL_32K_ENABLE = 1, set Sleep Clock Accuracy(SCA) for RF slow clock. |
| Transmission Power Maximum Value | • max +0dBm<br>• max +4dBm | max +4dBm | Set transmission power maximum value. |
| Transmission Power Default Value | • High 0dBm(Transmission Power Maximum Value = +0dBm) / +4dBm(Transmission Power Maximum Value = +4dBm)<br>• Mid 0dBm(Transmission Power Maximum Value = +0dBm) / 0dBm(Transmission Power Maximum Value = +4dBm)<br>• Low -18dBm(Transmission Power Maximum Value = +0dBm) / -20dBm(Transmission Power Maximum Value = +4dBm) | High 0dBm(Transmission Power Maximum Value = +0dBm) / +4dBm(Transmission Power Maximum Value = +4dBm) | Set default transmit power. Default transmit power is dependent on the configuration of Maximum transmission power(BLE_ABS_CFG_RF_DEF_TX_POW). |
| CLKOUT_RF Output | • No output<br>• 4MHz output<br>• 2MHz output<br>• 1MHz output | No output | Set CLKOUT_RF output setting. |
| RF_DEEP_SLEEP Transition | • Disable<br>• Enable | Enable | Set RF_DEEP_SLEEP transition. |
| MCU Main Clock Frequency | Value must be an integer between 1000 and 20000, and lower than the value defined in ble module. | 8000 | Set MCU Main Clock Frequency (kHz). Set clock source according to your board environment. HOCO: don't care. / Main Clock: 1000 to 20000 kHz / PLL Circuit: 4000 to 12500 kHz |

| | | | |
|---|---|---|---|
| Code Flash(ROM) Device Data Block | Value must be an integer between -1 and 255, and lower than the value defined in ble module. | 255 | Device specific data block on Code Flash (ROM). |
| Device Specific Data Flash Block | Value must be an integer between -1 and 7, and lower than the value defined in ble module. | -1 | Device specific data block on E2 Data Flash. |
| MTU Size Configured | Value must be an integer between 23 and 247, and lower than the value defined in ble module. | 247 | MTU Size configured by GATT MTU exchange procedure. |
| Timer Slot Maximum Number | Value must be an integer between 1 and 10, and lower than the value defined in ble module. | 10 | The maximum number of timer slot. |

**Configurations for Networking > BLE Abstraction (rm_ble_abs)**

This module can be added to the Stacks tab via New Stack > Networking > BLE Abstraction (rm_ble_abs).

| Configuration | Options | Default | Description |
|---|---|---|---|
| General | | | |
| Name | Name must be a valid C symbol | g_ble_abs0 | Module name. |
| Gap callback | Name must be a valid C symbol | gap_cb | A user callback function must be provided if the BLE_ABS is configured to generate a GAP. If QE is used, set to NULL. |
| Vendor specific callback | Name must be a valid C symbol | vs_cb | A user callback function must be provided if the BLE_ABS is configured to generate a Vendor Specific. If QE is used, set to NULL. |
| GATT server callback parameter | Name must be a valid C symbol | gs_abs_gatts_cb_param | Set GATT server callback parameter. If QE is used, set to NULL. |
| GATT server callback | Must be a valid number | 2 | The number of GATT |

| | | | |
|---|---|---|---|
| number | | | Server callback functions. |
| GATT client callback parameter | Name must be a valid C symbol | gs_abs_gattc_cb_param | Set GATT client callback parameter. If QE is used, set to NULL. |
| GATT client callback number | Must be a valid number | 2 | The number of GATT Server callback functions. |
| Security | | | |
| Pairing parameters | Name must be a valid C symbol | gs_abs_pairing_param | Set pairing parameters. |
| IO capabilities of local device. | • BLE_GAP_IOCAP_DISPLAY_ONLY<br>• BLE_GAP_IOCAP_DISPLAY_YESNO<br>• BLE_GAP_IOCAP_KEYBOARD_ONLY<br>• BLE_GAP_IOCAP_NOINPUT_NOOUTPUT<br>• BLE_GAP_IOCAP_KEYBOARD_DISPLAY | BLE_GAP_IOCAP_NOINPUT_NOOUTPUT | Select IO capabilities of local device. |
| MITM protection policy. | • BLE_GAP_SEC_MITM_BEST_EFFORT<br>• BLE_GAP_SEC_MITM_STRICT | BLE_GAP_SEC_MITM_BEST_EFFORT | Select MITM protection policy. |
| Determine whether to accept only Secure Connections or not. | • BLE_GAP_SC_BEST_EFFORT<br>• BLE_GAP_SC_STRICT | BLE_GAP_SC_BEST_EFFORT | Select determine whether to accept only Secure Connections or not. |
| Type of keys to be distributed from local device. | • BLE_GAP_KEY_DIST_ENCKEY<br>• BLE_GAP_KEY_DIST_IDKEY<br>• BLE_GAP_KEY_DIST_SIGNKEY | | Select type of keys to be distributed from local device. |
| Type of keys which local device requests a remote device to distribute. | • BLE_GAP_KEY_DIST_ENCKEY<br>• BLE_GAP_KEY_DIST_IDKEY<br>• BLE_GAP_KEY_DIST_SIGNKEY | | Set type of keys which local device requests a remote device to distribute. |
| Maximum LTK size. | Valid range is 7 - 16 | 16 | Set Maximum LTK size. |

| | | | |
|---|---|---|---|
| Interrupts | | | |
| Callback provided when an ISR occurs | Name must be a valid C symbol | NULL | Callback provided when BLE ABS ISR occurs |

### Clock Configuration

*Note*

*System clock (ICLK): 8 MHz or more*
*Peripheral module clock A (PCLKA): 8MHz or more*
*The BLE Protocol Stack is optimized for ICLK and PCLKA frequencies of 32 MHz.*
*It is recommended that the clock be set so that the ICLK and PCLKA frequencies are 32MHz in order to get the best performance from the BLE.*

### Pin Configuration

This module does not use I/O pins.

### Stack Size Configuration

*Note*

*When you use BLE on RTOS environment, make sure that thread stack size must be 0x1000 or more which call R_BLE_Execute.*

# Usage Notes

### Limitations

Developers should be aware of the following limitations when using the BLE_ABS:

# Examples

### BLE_ABS Basic Example

This is a basic example of minimal use of the BLE_ABS in an application.

```
#define BLE_ABS_EVENT_FLAG_STACK_ON (0x01 << 0)
#define BLE_ABS_EVENT_FLAG_CONN_IND (0x01 << 1)
#define BLE_ABS_EVENT_FLAG_ADV_ON (0x01 << 2)
#define BLE_ABS_EVENT_FLAG_ADV_OFF (0x01 << 3)
#define BLE_ABS_EVENT_FLAG_DISCONN_IND (0x01 << 4)
#define BLE_ABS_EVENT_FLAG_RSLV_LIST_CONF_COMP (0x01 << 5)
#define BLE_ABS_EXAMPLE_SHORTENED_LOCAL_NAME 'E', 'x', 'a', 'm', 'p', 'l', 'e'
#define BLE_ABS_EXAMPLE_COMPLETE_LOCAL_NAME 'T', 'E', 'S', 'T', '_', 'E', 'x', 'a',
'm', 'p', 'l', 'e'
#define BLE_ABS_EXAMPLE_SLOW_ADVERTISING_INTERVAL (0x00000640)
void ble_abs_peripheral_example (void)
```

## Function Documentation

### ◆ RM_BLE_ABS_Open()

fsp_err_t RM_BLE_ABS_Open ( ble_abs_ctrl_t *const *p_ctrl*, ble_abs_cfg_t const *const *p_cfg* )

Host stack is initialized with this function. Before using All the R_BLE APIs, it's necessary to call this function. A callback functions are registered with this function. In order to receive the GAP, GATT, Vendor specific event, it's necessary to register a callback function. The result of this API call is notified in BLE_GAP_EVENT_STACK_ON event. Implements ble_abs_api_t::open.

Example:

```
/* Open the module. */
   err = RM_BLE_ABS_Open(&g_ble_abs0_ctrl, &g_ble_abs0_cfg);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Channel opened successfully. |
| FSP_ERR_ASSERTION | Null pointer presented. |
| FSP_ERR_ALREADY_OPEN | Requested channel is already open in a different configuration. |
| FSP_ERR_INVALID_ARGUMENT | Invalid input parameter. |
| FSP_ERR_INVALID_MODE | Invalid mode during open call |

Host stack is initialized with this function. Before using All the R_BLE APIs, it's necessary to call this function. A callback functions are registered with this function. In order to receive the GAP, GATT, Vendor specific event, it's necessary to register a callback function. The result of this API call is notified in BLE_GAP_EVENT_STACK_ON event. Implements ble_abs_api_t::open.

Example:

```
/* Open the module. */
   err = RM_BLE_ABS_Open(&g_ble_abs0_ctrl, &g_ble_abs0_cfg);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Channel opened successfully. |
| FSP_ERR_ASSERTION | Null pointer presented. |

| | |
|---|---|
| FSP_ERR_ALREADY_OPEN | Requested channel is already open in a different configuration. |
| FSP_ERR_INVALID_ARGUMENT | Invalid input parameter. |
| FSP_ERR_INVALID_MODE | Invalid mode during open call |

Host stack is initialized with this function. Before using All the R_BLE APIs, it's necessary to call this function. A callback functions are registered with this function. In order to receive the GAP, GATT, Vendor specific event, it's necessary to register a callback function. The result of this API call is notified in BLE_GAP_EVENT_STACK_ON event. Implements ble_abs_api_t::open.

Example:

```
/* Open the module. */
   err = RM_BLE_ABS_Open(&g_ble_abs0_ctrl, &g_ble_abs0_cfg);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Channel opened successfully. |
| FSP_ERR_ASSERTION | Null pointer presented. |
| FSP_ERR_INVALID_CHANNEL | The channel number is invalid. |
| FSP_ERR_ALREADY_OPEN | Requested channel is already open in a different configuration. |
| FSP_ERR_INVALID_ARGUMENT | Invalid input parameter. |

### ◆ RM_BLE_ABS_Close()

fsp_err_t RM_BLE_ABS_Close ( ble_abs_ctrl_t *const *p_ctrl*)

Close the BLE channel. Implements ble_abs_api_t::close.

Example:

```
/* Close BLE driver */
   err = RM_BLE_ABS_Close(&g_ble_abs0_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Channel closed successfully. |
| FSP_ERR_ASSERTION | Null pointer presented. |
| FSP_ERR_NOT_OPEN | Control block not open. |

Example:

```
/* Close BLE driver */
   err = RM_BLE_ABS_Close(&g_ble_abs0_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Channel closed successfully. |
| FSP_ERR_ASSERTION | Null pointer presented. |
| FSP_ERR_NOT_OPEN | Control block not open. |

Example:

```
/* Close BLE driver */
   err = RM_BLE_ABS_Close(&g_ble_abs0_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Channel closed successfully. |
| FSP_ERR_ASSERTION | Null pointer presented. |
| FSP_ERR_NOT_OPEN | Control block not open. |

### ◆ RM_BLE_ABS_Reset()

fsp_err_t RM_BLE_ABS_Reset ( ble_abs_ctrl_t *const *p_ctrl*, ble_event_cb_t *init_callback* )

This function is not implemented. To perform this function call R_BLE_Close followed by R_BLE_Open. Implements ble_abs_api_t::reset.

**Return values**

| | |
|---|---|
| FSP_ERR_UNSUPPORTED | Function is not supported |

BLE is reset with this function. The process is carried out in the following order. R_BLE_Close() -> R_BLE_GAP_Terminate() -> R_BLE_Open() -> R_BLE_SetEvent(). The init_cb callback initializes the others (Host Stack, timer, etc...). Implements ble_abs_api_t::reset.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Channel closed successfully. |
| FSP_ERR_ASSERTION | Null pointer presented. |
| FSP_ERR_NOT_OPEN | Control block not open. |

### ◆ RM_BLE_ABS_StartLegacyAdvertising()

fsp_err_t RM_BLE_ABS_StartLegacyAdvertising ( ble_abs_ctrl_t *const *p_ctrl*, ble_abs_legacy_advertising_parameter_t const *const *p_advertising_parameter* )

Start Legacy Advertising after setting advertising parameters, advertising data and scan response data. The legacy advertising uses the advertising set whose advertising handle is 0. The advertising type is connectable and scannable(ADV_IND). The address type of local device is Public Identity Address or RPA(If the resolving list contains no matching entry, use the public address.). Scan request event(BLE_GAP_EVENT_SCAN_REQ_RECV) is not notified. Implements ble_abs_api_t::startLegacyAdvertising

Example:

```
/* Start advertising. */
    err = RM_BLE_ABS_StartLegacyAdvertising(&g_ble_abs0_ctrl,
&legacy_advertising_parameter);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded |
| FSP_ERR_ASSERTION | p_instance_ctrl is specified as NULL. |
| FSP_ERR_NOT_OPEN | Control block not open. |
| FSP_ERR_INVALID_STATE | Host stack hasn't been initialized. |
| FSP_ERR_INVALID_POINTER | p_advertising_parameter is specified as NULL. |
| FSP_ERR_INVALID_ARGUMENT | The advertising parameter is out of range. |

Start Legacy Advertising after setting advertising parameters, advertising data and scan response data. The legacy advertising uses the advertising set whose advertising handle is 0. The advertising type is connectable and scannable(ADV_IND). The address type of local device is Public Identity Address or RPA(If the resolving list contains no matching entry, use the public address.). Scan request event(BLE_GAP_EVENT_SCAN_REQ_RECV) is not notified. Implements ble_abs_api_t::startLegacyAdvertising

Example:

```
/* Start advertising. */
    err = RM_BLE_ABS_StartLegacyAdvertising(&g_ble_abs0_ctrl,
&legacy_advertising_parameter);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded |
| FSP_ERR_ASSERTION | p_instance_ctrl is specified as NULL. |
| FSP_ERR_NOT_OPEN | Control block not open. |
| FSP_ERR_INVALID_STATE | Host stack hasn't been initialized. |
| | |

| | |
|---|---|
| FSP_ERR_INVALID_POINTER | p_advertising_parameter is specified as NULL. |
| FSP_ERR_INVALID_ARGUMENT | The advertising parameter is out of range. |

Start Legacy Advertising after setting advertising parameters, advertising data and scan response data. The legacy advertising uses the advertising set whose advertising handle is 0. The advertising type is connectable and scannable(ADV_IND). The address type of local device is Public Identity Address or RPA(If the resolving list contains no matching entry, use the public address.). Scan request event(BLE_GAP_EVENT_SCAN_REQ_RECV) is not notified. Implements ble_abs_api_t::startLegacyAdvertising

Example:

```
/* Start advertising. */
   err = RM_BLE_ABS_StartLegacyAdvertising(&g_ble_abs0_ctrl,
&legacy_advertising_parameter);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded |
| FSP_ERR_ASSERTION | p_instance_ctrl is specified as NULL. |
| FSP_ERR_NOT_OPEN | Control block not open. |
| FSP_ERR_INVALID_STATE | Host stack hasn't been initialized. |
| FSP_ERR_INVALID_POINTER | p_advertising_parameter is specified as NULL. |
| FSP_ERR_INVALID_ARGUMENT | The advertising parameter is out of range. |

### ◆ RM_BLE_ABS_StartExtendedAdvertising()

fsp_err_t RM_BLE_ABS_StartExtendedAdvertising ( ble_abs_ctrl_t *const *p_ctrl*, ble_abs_extend_advertising_parameter_t const *const *p_advertising_parameter* )

Start Extended Advertising after setting advertising parameters, advertising data. The extended advertising uses the advertising set whose advertising handle is 1. The advertising type is connectable and non-scannable. The address type of local device is Public Identity Address or RPA(If the resolving list contains no matching entry, use the public address.). Scan request event(BLE_GAP_EVENT_SCAN_REQ_RECV) is not notified. Implements ble_abs_api_t::startExtendedAdvertising

**Return values**

| | |
|---|---|
| FSP_ERR_ASSERTION | p_instance_ctrl is specified as NULL. |
| FSP_ERR_NOT_OPEN | Control block not open. |
| FSP_ERR_INVALID_POINTER | p_advertising_parameter is specified as NULL. |
| FSP_ERR_UNSUPPORTED | Subordinate modules do not support this feature. |

Start Extended Advertising after setting advertising parameters, advertising data. The extended advertising uses the advertising set whose advertising handle is 1. The advertising type is connectable and non-scannable. The address type of local device is Public Identity Address or RPA(If the resolving list contains no matching entry, use the public address.). Scan request event(BLE_GAP_EVENT_SCAN_REQ_RECV) is not notified. Implements ble_abs_api_t::startExtendedAdvertising

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | p_instance_ctrl is specified as NULL. |
| FSP_ERR_NOT_OPEN | Control block not open. |
| FSP_ERR_INVALID_POINTER | p_advertising_parameter is specified as NULL. |
| FSP_ERR_INVALID_STATE | Host stack hasn't been initialized. |
| FSP_ERR_INVALID_ARGUMENT | The advertising parameter is out of range. |
| FSP_ERR_UNSUPPORTED | Subordinate modules do not support this feature. |

### ◆ RM_BLE_ABS_StartNonConnectableAdvertising()

fsp_err_t RM_BLE_ABS_StartNonConnectableAdvertising ( ble_abs_ctrl_t *const *p_ctrl*, ble_abs_non_connectable_advertising_parameter_t const *const *p_advertising_parameter* )

Start Non-Connectable Advertising after setting advertising parameters, advertising data. The non-connectable advertising uses the advertising set whose advertising handle is 2. The advertising type is non-connectable and non-scannable. The address type of local device is Public Identity Address or RPA(If the resolving list contains no matching entry, use the public address.). Scan request event(BLE_GAP_EVENT_SCAN_REQ_RECV) is not notified. Secondary Advertising Max Skip is 0. Implements ble_abs_api_t::startNonConnectableAdvertising.

**Return values**

| | |
|---|---|
| FSP_ERR_ASSERTION | p_instance_ctrl is specified as NULL. |
| FSP_ERR_NOT_OPEN | Control block not open. |
| FSP_ERR_INVALID_POINTER | p_advertising_parameter is specified as NULL. |
| FSP_ERR_UNSUPPORTED | Feature not yet supported. |

Start Non-Connectable Advertising after setting advertising parameters, advertising data. The non-connectable advertising uses the advertising set whose advertising handle is 2. The advertising type is non-connectable and non-scannable. The address type of local device is Public Identity Address or RPA(If the resolving list contains no matching entry, use the public address.). Scan request event(BLE_GAP_EVENT_SCAN_REQ_RECV) is not notified. Secondary Advertising Max Skip is 0. Implements ble_abs_api_t::startNonConnectableAdvertising.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | p_instance_ctrl is specified as NULL. |
| FSP_ERR_NOT_OPEN | Control block not open. |
| FSP_ERR_INVALID_POINTER | p_advertising_parameter is specified as NULL. |
| FSP_ERR_INVALID_STATE | Host stack hasn't been initialized. |
| FSP_ERR_INVALID_ARGUMENT | The advertising parameter is out of range. |

### ◆ RM_BLE_ABS_StartPeriodicAdvertising()

fsp_err_t RM_BLE_ABS_StartPeriodicAdvertising ( ble_abs_ctrl_t *const *p_ctrl*, ble_abs_periodic_advertising_parameter_t const *const *p_advertising_parameter* )

Start Periodic Advertising after setting advertising parameters, periodic advertising parameters, advertising data and periodic advertising data. The periodic advertising uses the advertising set whose advertising handle is 3. The advertising type is non-connectable and non-scannable. The address type of local device is Public Identity Address or RPA(If the resolving list contains no matching entry, use the public address.). Scan request event(BLE_GAP_EVENT_SCAN_REQ_RECV) is not notified. Secondary Advertising Max Skip is 0. Implements ble_abs_api_t::startPeriodicAdvertising

**Return values**

| | |
|---|---|
| FSP_ERR_ASSERTION | p_instance_ctrl is specified as NULL. |
| FSP_ERR_NOT_OPEN | Control block not open. |
| FSP_ERR_INVALID_POINTER | p_advertising_parameter is specified as NULL. |
| FSP_ERR_UNSUPPORTED | Subordinate modules do not support this feature. |

Start Periodic Advertising after setting advertising parameters, periodic advertising parameters, advertising data and periodic advertising data. The periodic advertising uses the advertising set whose advertising handle is 3. The advertising type is non-connectable and non-scannable. The address type of local device is Public Identity Address or RPA(If the resolving list contains no matching entry, use the public address.). Scan request event(BLE_GAP_EVENT_SCAN_REQ_RECV) is not notified. Secondary Advertising Max Skip is 0. Implements ble_abs_api_t::startPeriodicAdvertising

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | p_instance_ctrl is specified as NULL. |
| FSP_ERR_NOT_OPEN | Control block not open. |
| FSP_ERR_INVALID_POINTER | p_advertising_parameter is specified as NULL. |
| FSP_ERR_INVALID_ARGUMENT | The advertising parameter is out of range. |
| FSP_ERR_UNSUPPORTED | This feature is not supported in this configuration. |

### ◆ RM_BLE_ABS_StartScanning()

fsp_err_t RM_BLE_ABS_StartScanning ( ble_abs_ctrl_t *const *p_ctrl*, ble_abs_scan_parameter_t const *const *p_scan_parameter* )

Start scanning after setting scan parameters. The scanner address type is Public Identity Address. Fast scan is followed by slow scan. The end of fast scan or slow scan is notified with BLE_GAP_EVENT_SCAN_TO event. If fast_period is 0, only slow scan is carried out. If scan_period is 0, slow scan continues. Implements ble_abs_api_t::startScanning.

Example:

```
/* Start scanning. */
   err = RM_BLE_ABS_StartScanning(&g_ble_abs0_ctrl, &scan_parameter);
```

**Return values**

| | |
|---|---|
| FSP_ERR_ASSERTION | p_instance_ctrl is specified as NULL. |
| FSP_ERR_NOT_OPEN | Control block not open. |
| FSP_ERR_INVALID_POINTER | p_scan_parameter is specified as NULL. |
| FSP_ERR_UNSUPPORTED | Function is not supported |

Start scanning after setting scan parameters. The scanner address type is Public Identity Address. Fast scan is followed by slow scan. The end of fast scan or slow scan is notified with BLE_GAP_EVENT_SCAN_TO event. If fast_period is 0, only slow scan is carried out. If scan_period is 0, slow scan continues. Implements ble_abs_api_t::startScanning.

Example:

```
/* Start scanning. */
   err = RM_BLE_ABS_StartScanning(&g_ble_abs0_ctrl, &scan_parameter);
```

**Return values**

| | |
|---|---|
| FSP_ERR_ASSERTION | p_instance_ctrl is specified as NULL. |
| FSP_ERR_NOT_OPEN | Control block not open. |
| FSP_ERR_INVALID_POINTER | p_scan_parameter is specified as NULL. |
| FSP_ERR_UNSUPPORTED | Function is not supported |

Start scanning after setting scan parameters. The scanner address type is Public Identity Address. Fast scan is followed by slow scan. The end of fast scan or slow scan is notified with BLE_GAP_EVENT_SCAN_TO event. If fast_period is 0, only slow scan is carried out. If scan_period is 0, slow scan continues. Implements ble_abs_api_t::startScanning.

Example:

```
/* Start scanning. */
   err = RM_BLE_ABS_StartScanning(&g_ble_abs0_ctrl, &scan_parameter);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | p_instance_ctrl is specified as NULL. |
| FSP_ERR_NOT_OPEN | Control block not open. |
| FSP_ERR_INVALID_POINTER | p_scan_parameter is specified as NULL. |
| FSP_ERR_INVALID_ARGUMENT | The scan parameter is out of range. |
| FSP_ERR_IN_USE | This API is called in scanning. |
| FSP_ERR_BLE_ABS_NOT_FOUND | Usable timer slot not found. |
| FSP_ERR_UNSUPPORTED | This feature is not supported in this configuration. |

### ◆ RM_BLE_ABS_CreateConnection()

fsp_err_t RM_BLE_ABS_CreateConnection ( ble_abs_ctrl_t *const *p_ctrl*, ble_abs_connection_parameter_t const *const *p_connection_parameter* )

Request create connection. The initiator address type is Public Identity Address. The scan interval is 60ms and the scan window is 30ms in case of 1M PHY or 2M PHY. The scan interval is 180ms and the scan window is 90ms in case of coded PHY. The Minimum CE Length and the Maximum CE Length are 0xFFFF. When the request for a connection has been received by the Controller, BLE_GAP_EVENT_CREATE_CONN_COMP event is notified. When a link has beens established, BLE_GAP_EVENT_CONN_IND event is notified. Implements ble_abs_api_t::createConnection.

Example:

```
/* Create connection with remote device. */

   err = RM_BLE_ABS_CreateConnection(&g_ble_abs0_ctrl, &g_connection_parameter);
```

**Return values**

| | |
|---|---|
| FSP_ERR_ASSERTION | p_instance_ctrl is specified as NULL. |
| FSP_ERR_NOT_OPEN | Control block not open. |
| FSP_ERR_INVALID_POINTER | p_connection_parameter is specified as NULL. |
| FSP_ERR_INVALID_ARGUMENT | The create connection parameter is out of range. |
| FSP_ERR_UNSUPPORTED | Function is not supported |

Request create connection. The initiator address type is Public Identity Address. The scan interval is 60ms and the scan window is 30ms in case of 1M PHY or 2M PHY. The scan interval is 180ms and the scan window is 90ms in case of coded PHY. The Minimum CE Length and the Maximum CE Length are 0xFFFF. When the request for a connection has been received by the Controller, BLE_GAP_EVENT_CREATE_CONN_COMP event is notified. When a link has beens established, BLE_GAP_EVENT_CONN_IND event is notified. Implements ble_abs_api_t::createConnection.

Example:

```
/* Create connection with remote device. */
   err = RM_BLE_ABS_CreateConnection(&g_ble_abs0_ctrl, &g_connection_parameter);
```

**Return values**

| | |
|---|---|
| FSP_ERR_ASSERTION | p_instance_ctrl is specified as NULL. |
| FSP_ERR_NOT_OPEN | Control block not open. |
| FSP_ERR_INVALID_POINTER | p_connection_parameter is specified as NULL. |
| FSP_ERR_INVALID_ARGUMENT | The create connection parameter is out of range. |
| FSP_ERR_UNSUPPORTED | Function is not supported |

Request create connection. The initiator address type is Public Identity Address. The scan interval is 60ms and the scan window is 30ms in case of 1M PHY or 2M PHY. The scan interval is 180ms and the scan window is 90ms in case of coded PHY. The Minimum CE Length and the Maximum CE Length are 0xFFFF. When the request for a connection has been received by the Controller, BLE_GAP_EVENT_CREATE_CONN_COMP event is notified. When a link has beens established, BLE_GAP_EVENT_CONN_IND event is notified. Implements ble_abs_api_t::createConnection.

Example:

```
/* Create connection with remote device. */
   err = RM_BLE_ABS_CreateConnection(&g_ble_abs0_ctrl, &g_connection_parameter);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | p_instance_ctrl is specified as NULL. |
| FSP_ERR_NOT_OPEN | Control block not open. |
| FSP_ERR_INVALID_POINTER | p_connection_parameter is specified as NULL. |
| FSP_ERR_INVALID_ARGUMENT | The create connection parameter is out of range. |
| FSP_ERR_IN_USE | This API is called while creating a link by previous API call. |
| FSP_ERR_BLE_ABS_NOT_FOUND | Couldn't find a valid timer. |
| FSP_ERR_UNSUPPORTED | This feature is not supported in this configuration. |

### ◆ RM_BLE_ABS_SetLocalPrivacy()

fsp_err_t RM_BLE_ABS_SetLocalPrivacy ( ble_abs_ctrl_t *const *p_ctrl*, uint8_t const *const *p_lc_irk*, uint8_t *privacy_mode* )

Generate a IRK, add it to the resolving list, set privacy mode and enable RPA function. Register vendor specific callback function, if IRK is generated by this function. After configuring local device privacy, BLE_GAP_ADDR_RPA_ID_PUBLIC is specified as own device address in theadvertising/scan/create connection API. Implements ble_abs_api_t::setLocalPrivacy

**Return values**

| | |
|---|---|
| FSP_ERR_ASSERTION | p_instance_ctrl is specified as NULL. |
| FSP_ERR_NOT_OPEN | Control block not open. |
| FSP_ERR_INVALID_ARGUMENT | The privacy_mode parameter is out of range. |
| FSP_ERR_UNSUPPORTED | Function is not supported |

Generate a IRK, add it to the resolving list, set privacy mode and enable RPA function. Register vendor specific callback function, if IRK is generated by this function. After configuring local device privacy, BLE_GAP_ADDR_RPA_ID_PUBLIC is specified as own device address in theadvertising/scan/create connection API. Implements ble_abs_api_t::setLocalPrivacy

Example:

```
/* Set local privacy. */
   err = RM_BLE_ABS_SetLocalPrivacy(&g_ble_abs0_ctrl, p_local_irk, privacy_mode);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | p_instance_ctrl is specified as NULL. |
| FSP_ERR_NOT_OPEN | Control block not open. |
| FSP_ERR_INVALID_ARGUMENT | The privacy_mode parameter is out of range. |

### ◆ RM_BLE_ABS_StartAuthentication()

fsp_err_t RM_BLE_ABS_StartAuthentication ( ble_abs_ctrl_t *const *p_ctrl*, uint16_t *connection_handle* )

Start pairing or encryption. If pairing has been done, start encryption. The pairing parameters are configured by RM_BLE_ABS_Open() or R_BLE_GAP_SetPairingParams(). If the pairing parameters are configure by RM_BLE_ABS_Open(),

- bonding policy is that bonding information is stored.
- Key press notification is not supported. Implements ble_abs_api_t::startAuthentication.

Example:

```
/* Start authentication with remote device. */
   err = RM_BLE_ABS_StartAuthentication(&g_ble_abs0_ctrl, g_connection_handle);
```

**Return values**

| | |
|---|---|
| FSP_ERR_ASSERTION | p_instance_ctrl or connection_handle are specified as NULL. |
| FSP_ERR_NOT_OPEN | Control block not open. |
| FSP_ERR_UNSUPPORTED | Function is not supported |

Start pairing or encryption. If pairing has been done, start encryption. The pairing parameters are configured by RM_BLE_ABS_Open() or R_BLE_GAP_SetPairingParams(). If the pairing parameters are configure by RM_BLE_ABS_Open(),

- bonding policy is that bonding information is stored.
- Key press notification is not supported. Implements ble_abs_api_t::startAuthentication.

Example:

```
/* Start authentication with remote device. */
   err = RM_BLE_ABS_StartAuthentication(&g_ble_abs0_ctrl, g_connection_handle);
```

**Return values**

| | |
|---|---|
| FSP_ERR_ASSERTION | p_instance_ctrl or connection_handle are specified as NULL. |
| FSP_ERR_NOT_OPEN | Control block not open. |
| FSP_ERR_UNSUPPORTED | Function is not supported |

Start pairing or encryption. If pairing has been done, start encryption. The pairing parameters are configured by RM_BLE_ABS_Open() or R_BLE_GAP_SetPairingParams(). If the pairing parameters are configure by RM_BLE_ABS_Open(),

- bonding policy is that bonding information is stored.
- Key press notification is not supported. Implements ble_abs_api_t::startAuthentication.

Example:

```
/* Start authentication with remote device. */
   err = RM_BLE_ABS_StartAuthentication(&g_ble_abs0_ctrl, g_connection_handle);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | p_instance_ctrl or connection_handle are specified as NULL. |
| FSP_ERR_NOT_OPEN | Control block not open. |
| FSP_ERR_INVALID_ARGUMENT | The connection handle parameter is out of range. |

### ◆ RM_BLE_ABS_DeleteBondInformation()

fsp_err_t RM_BLE_ABS_DeleteBondInformation ( ble_abs_ctrl_t *const *p_ctrl*, ble_abs_bond_information_parameter_t const *const *p_bond_information_parameter* )

Delete bonding information from BLE stack and storage. Implements ble_abs_api_t::deleteBondInformation.

Example:

```
/* Delete bonding information. */
   err = RM_BLE_ABS_DeleteBondInformation(&g_ble_abs0_ctrl,
&g_bond_information_parameter);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation was successful |
| FSP_ERR_ASSERTION | The parameter p_instance_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_bond_information_parameter is NULL. |
| FSP_ERR_NOT_OPEN | Control block not open. |

Delete bonding information from BLE stack and storage. Implements ble_abs_api_t::deleteBondInformation.

Example:

```
/* Delete bonding information. */
   err = RM_BLE_ABS_DeleteBondInformation(&g_ble_abs0_ctrl,
&g_bond_information_parameter);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation was successful |
| FSP_ERR_ASSERTION | The parameter p_instance_ctrl is NULL. |

| | |
|---|---|
| FSP_ERR_INVALID_POINTER | The parameter p_bond_information_parameter is NULL. |
| FSP_ERR_NOT_OPEN | Control block not open. |

Delete bonding information from BLE stack and storage. Implements ble_abs_api_t::deleteBondInformation.

Example:

```
/* Delete bonding information. */
   err = RM_BLE_ABS_DeleteBondInformation(&g_ble_abs0_ctrl,
&g_bond_information_parameter);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_instance_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_bond_information_parameter is NULL. |
| FSP_ERR_NOT_OPEN | Control block not open. |

### ◆ RM_BLE_ABS_ImportKeyInformation()

fsp_err_t RM_BLE_ABS_ImportKeyInformation ( ble_abs_ctrl_t *const *p_ctrl*, ble_device_address_t * *p_local_identity_address*, uint8_t * *p_local_irk*, uint8_t * *p_local_csrk* )

Import key information to BLE stack and storage. Implements ble_abs_api_t::importKeyInformation.

Example:

```
/* Import local key information. */
   err = RM_BLE_ABS_ImportKeyInformation(&g_ble_abs0_ctrl, &local_identity_address,
local_irk, local_csrk);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_instance_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_local_identity_address, p_local_irk or p_local_csrk is NULL. |
| FSP_ERR_NOT_OPEN | Control block not open. |
| FSP_ERR_INVALID_HW_CONDITION | Failure to access internal storage. |
| FSP_ERR_UNSUPPORTED | Not supported in this configuration. |

### ◆ RM_BLE_ABS_ExportKeyInformation()

fsp_err_t RM_BLE_ABS_ExportKeyInformation ( ble_abs_ctrl_t *const *p_ctrl*, ble_device_address_t * *p_local_identity_address*, uint8_t * *p_local_irk*, uint8_t * *p_local_csrk* )

Export key information to BLE stack and storage. Implements ble_abs_api_t::exportKeyInformation.

Example:

```
/* Export local key information. */
   err = RM_BLE_ABS_ExportKeyInformation(&g_ble_abs0_ctrl, &local_identity_address,
local_irk, local_csrk);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_instance_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_local_identity_address, p_local_irk or p_local_csrk is NULL. |
| FSP_ERR_NOT_OPEN | Control block not open. |
| FSP_ERR_BUFFER_EMPTY | Dynamic memory allocation failed. |
| FSP_ERR_OUT_OF_MEMORY | Failure to access internal storage. |
| FSP_ERR_NOT_INITIALIZED | Not initialized internal storage. |
| FSP_ERR_UNSUPPORTED | Not supported in this configuration. |

#### 5.2.12.8 BLE Driver (r_ble_balance)

Modules » Networking

Driver for the Radio peripheral on RA MCUs. This module implements the BLE Interface.

# Overview

The Bluetooth Low Energy (BLE) library in Balance configuration (r_ble) provides an API to control the Radio peripheral. This module is configured via the QE for BLE. QE for BLE provides standard services defined by standardization organization and custom services defined by user. Bluetooth LE Profile API Document User's Manual describes the APIs for standard services.

**Features**

- Common
  - Open/Close the BLE protocol stack.
  - Execute the BLE job.

    - Add an event in the BLE protocol stack internal queue.
- GAP
    - Initialization of the Host stack.
    - Start/Stop Advertising.
    - Start/Stop Scan.
    - Connect/Disconnect a link.
    - Initiate/Respond a pairing request.
- GATT Common
    - Get MTU size.
- GATT Server
    - Initialization of GATT Server.
    - Notification/Indication.
- GATT Client
    - Discovery services, characteristics.
    - Read/Write characteristic.
- Vendor Specific
    - DTM.
    - Set/Get transmit power.
    - Set/Get BD_ADDR.

### Supported functions

The supported functions are listed in the table below. Choose the configuration that best suits the functions that target system requires.

| BLE library feature | Extended | Balance | Compact |
|---|---|---|---|
| Common API | Supported | **Supported** | Supported |
| GAP API | Supported | ***1 Limited** | *1 *2 Limited |
| GATT Common API | Supported | **Supported** | Supported |
| GATT Client API | Supported | **Supported** | Supported |
| GATT Client API | Supported | **Supported** | Supported |
| L2CAP API | Supported | **Not Supported** | Not supported |
| Vendor Specific API | *3 Limited | ***3 Limited** | *3 Limited |

*Note*

1. *This configuration dose not support LE Advertising Extensions functionality APIs.*
2. *This configuration dose not support Central and Observer functionality APIs.*
3. *This configuration dose not support vender specific firmware update functionality APIs.*

### Target Devices

The Renesas BLE Library supports the following devices.

- RA4W1

# Configuration

### Clock Configuration

*Note*

*System clock (ICLK): 8 MHz or more*
*Peripheral module clock A (PCLKA): 8MHz or more*
*The BLE Protocol Stack is optimized for ICLK and PCLKA frequencies of 32 MHz.*
*It is recommended that the clock be set so that the ICLK and PCLKA frequencies are 32MHz in order to get the best performance from the BLE.*

### Pin Configuration

This module does not use I/O pins.

# Usage Notes

Figure shows the software structure of the BLE FSP module.

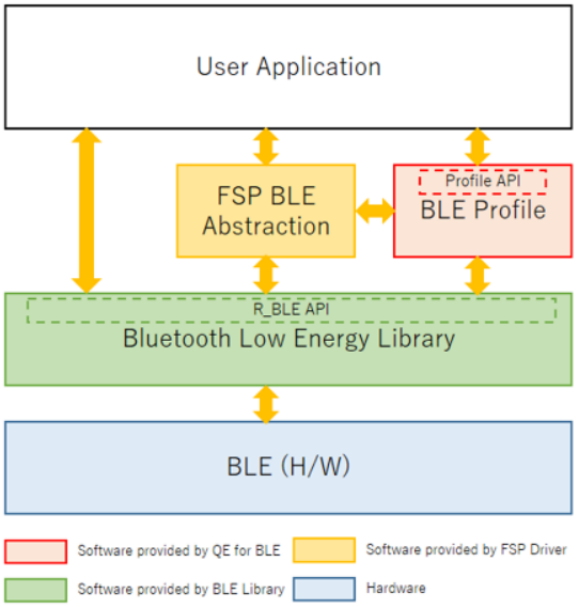

Figure 310: BLE software structure

The BLE FSP module consists of the BLE library.
The BLE Application uses the BLE functions via the R_BLE API provided by the BLE Library.
The QE for BLE generates the source codes (BLE base skeleton program) as a base for the BLE Application and the BLE Profile codes including the Profile API.

### Initialize the BLE protocol stack

*Note*

*It takes around 250msec to initialize BLE protocol stack.*
*R_BLE_Open API will be occupied MCU resources during the initialization.*

### Limitations

Developers should be aware of the following limitations when using the ble:

*Note*

*- This configuration dose not support LE Advertising Extensions functionality APIs.*

*If those functionalities need your system, select BLE Driver (r_ble_extended) configuration.*
*- This configuration dose not support L2CAP functionality APIs.*
*If those functionalities need your system, select BLE Driver (r_ble_extended) configuration.*
*- This configuration dose not support vender specific firmware update functionality APIs.*
*Those APIs are only supported by SPP BLE Abstraction (rm_ble_abs_spp) module.*

### Limitations on FreeRTOS environment

Developers should be aware of the following limitations when using the ble on FreeRTOS environment: When use deep sleep, sleep mode or standby mode, there is following two wake up option from RF module.

- Using Semaphore
- Using Event Groups

*Note*

*Event Groups is processing as a delay handler by timer task.*
*Therefore, if blocked by interrupts or if the timer task is blocked by another high-priority task, the existing connection will be broken.*

## 5.2.12.9 BLE Driver (r_ble_compact)

Modules » Networking

Driver for the Radio peripheral on RA MCUs. This module implements the BLE Interface.

# Overview

The Bluetooth Low Energy (BLE) library in Compact configuration (r_ble) provides an API to control the Radio peripheral. This module is configured via the QE for BLE. QE for BLE provides standard services defined by standardization organization and custom services defined by user. Bluetooth LE Profile API Document User's Manual describes the APIs for standard services.

### Features

- Common
  - Open/Close the BLE protocol stack.
  - Execute the BLE job.
  - Add an event in the BLE protocol stack internal queue.
- GAP
  - Initialization of the Host stack.
  - Start/Stop Advertising.
  - Initiate/Respond a pairing request.
- GATT Common
  - Get MTU size.
- GATT Server
  - Initialization of GATT Server.
  - Notification/Indication.
- GATT Client
  - Discovery services, characteristics.

    - Read/Write characteristic.
- Vendor Specific
    - DTM.
    - Set/Get transmit power.
    - Set/Get BD_ADDR.

### Supported functions

The supported functions are listed in the table below. Choose the configuration that best suits the functions that target system requires.

| BLE library feature | Extended | Balance | Compact |
|---|---|---|---|
| Common API | Supported | Supported | **Supported** |
| GATT Common API | Supported | *1 Limited | ***1 *2 Limited** |
| GATT Common API | Supported | Supported | **Supported** |
| GATT Server API | Supported | Supported | **Supported** |
| GATT Client API | Supported | Supported | **Supported** |
| L2CAP API | Supported | Not supported | **Not supported** |
| Vendor Specific API | *3 Limited | *3 Limited | ***3 Limited** |

*Note*

*1. This configuration dose not support LE Advertising Extensions functionality APIs.*
*2. This configuration dose not support Central and Observer functionality APIs.*
*3. This configuration dose not support vender specific firmware update functionality APIs.*

### Target Devices

The Renesas BLE Library supports the following devices.

- RA4W1

# Configuration

### Clock Configuration

*Note*

*System clock (ICLK): 8 MHz or more*
*Peripheral module clock A (PCLKA): 8MHz or more*
*The BLE Protocol Stack is optimized for ICLK and PCLKA frequencies of 32 MHz.*
*It is recommended that the clock be set so that the ICLK and PCLKA frequencies are 32MHz in order to get the best performance from the BLE.*

### Pin Configuration

This module does not use I/O pins.

# Usage Notes

Figure shows the software structure of the BLE FSP module.

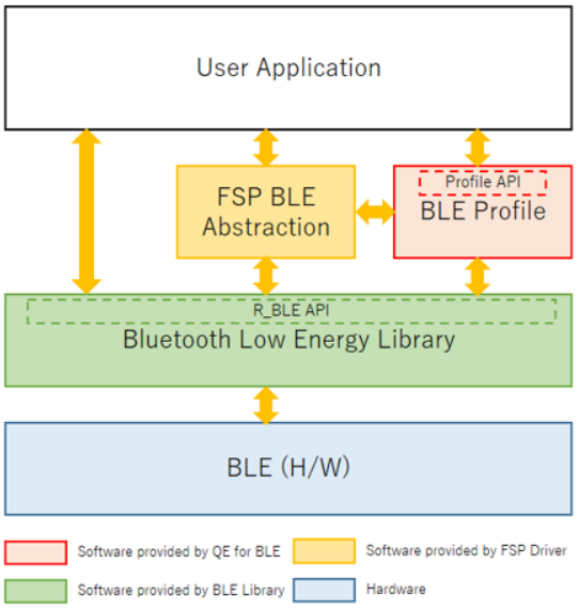

Figure 311: BLE software structure

The BLE FSP module consists of the BLE library.
The BLE Application uses the BLE functions via the R_BLE API provided by the BLE Library.
The QE for BLE generates the source codes (BLE base skeleton program) as a base for the BLE Application and the BLE Profile codes including the Profile API.

### Initialize the BLE protocol stack

*Note*

*It takes around 250msec to initialize BLE protocol stack.*
*R_BLE_Open API will be occupied MCU resources during the initialization.*

### Limitations

Developers should be aware of the following limitations when using the ble:

*Note*

*- This configuration dose not supports LE Advertising Extensions functionality APIs.*
*If those functionalities need your system, select BLE Driver (r_ble_extended) configuration.*
*- This configuration dose not supports Central and Observer functionality APIs.*
*If those functionalities need your system, select BLE Driver (r_ble_extended) or BLE Driver (r_ble_balance) configuration.*
*- This configuration dose not supports L2CAP functionality APIs.*
*If those functionalities need your system, select BLE Driver (r_ble_extended) configuration.*
*- This configuration dose not supports vender specific firmware update functionality APIs.*
*Those APIs are only supported by SPP BLE Abstraction (rm_ble_abs_spp) module.*

### Limitations on FreeRTOS environment

Developers should be aware of the following limitations when using the ble on FreeRTOS environment: When use deep sleep, sleep mode or standby mode, there is following two wake up option from RF module.

- Using Semaphore
- Using Event Groups

*Note*

*Event Groups is processing as a delay handler by timer task.*
*Therefore, if blocked by interrupts or if the timer task is blocked by another high-priority task, the existing connection will be broken.*

### 5.2.12.10 BLE Driver (r_ble_extended)

Modules » Networking

Driver for the Radio peripheral on RA MCUs. This module implements the BLE Interface.

# Overview

The Bluetooth Low Energy (BLE) library in Extended configuration (r_ble) provides an API to control the Radio peripheral. This module is configured via the QE for BLE. QE for BLE provides standard services defined by standardization organization and custom services defined by user. Bluetooth LE Profile API Document User's Manual describes the APIs for standard services.

**Features**

- Common
  - Open/Close the BLE protocol stack.
  - Execute the BLE job.
  - Add an event in the BLE protocol stack internal queue.
- GAP
  - Initialization of the Host stack.
  - Start/Stop Advertising (Support LE Advertising Extensions).
  - Start/Stop Scan.
  - Connect/Disconnect a link.
  - Initiate/Respond a pairing request.
- GATT Common
  - Get MTU size.
- GATT Server
  - Initialization of GATT Server.
  - Notification/Indication.
- GATT Client
  - Discovery services, characteristics.
  - Read/Write characteristic.
- L2CAP
  - Credit-based flow control transaction.
- Vendor Specific
  - DTM.
  - Set/Get transmit power.
  - Set/Get BD_ADDR.

**Supported functions**

The supported functions are listed in the table below. Choose the configuration that best suits the functions that target system requires.

| BLE library feature | Extended | Balance | Compact |
|---|---|---|---|
| Common API | **Supported** | Supported | Supported |
| GAP API | **Supported** | *1 Limited | *1 *2 Limited |
| GATT Common API | **Supported** | Supported | Supported |
| GATT Server API | **Supported** | Supported | Supported |
| GATT Client API | **Supported** | Supported | Supported |
| L2CAP API | **Supported** | Not supported | Not supported |
| Vendor Specific API | ***3 Limited** | *3 Limited | *3 Limited |

*Note*

*1. This configuration dose not support LE Advertising Extensions functionality APIs.*
*2. This configuration dose not support Central and Observer functionality APIs.*
*3. This configuration dose not support vender specific firmware update functionality APIs.*

### Target Devices

The Renesas BLE Library supports the following devices.

- RA4W1

# Configuration

### Clock Configuration

*Note*

*System clock (ICLK): 8 MHz or more*
*Peripheral module clock A (PCLKA): 8MHz or more*
*The BLE Protocol Stack is optimized for ICLK and PCLKA frequencies of 32 MHz.*
*It is recommended that the clock be set so that the ICLK and PCLKA frequencies are 32MHz in order to get the best performance from the BLE.*

### Pin Configuration

This module does not use I/O pins.

# Usage Notes

Figure shows the software structure of the BLE FSP module.

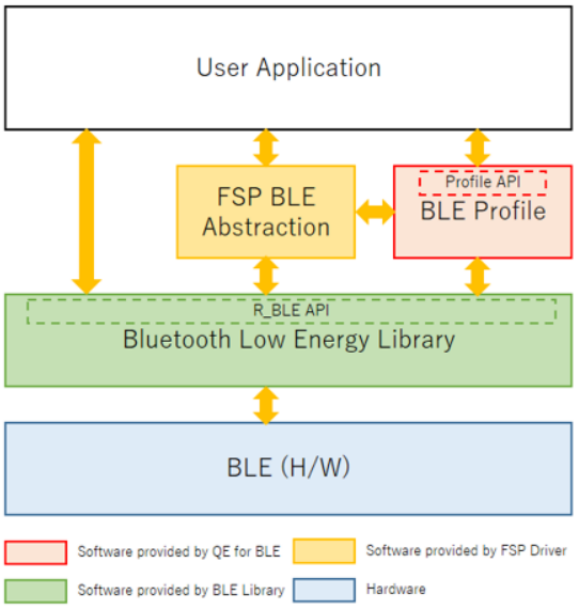

Figure 312: BLE software structure

The BLE FSP module consists of the BLE library.
The BLE Application uses the BLE functions via the R_BLE API provided by the BLE Library.
The QE for BLE generates the source codes (BLE base skeleton program) as a base for the BLE Application and the BLE Profile codes including the Profile API.

### Initialize the BLE protocol stack

*Note*

*It takes around 250msec to initialize BLE protocol stack.*
*R_BLE_Open API will be occupied MCU resources during the initialization.*

### Limitations

Developers should be aware of the following limitations when using the ble:

*Note*

*- This configuration dose not support vender specific firmware update functionality APIs.*
*Those APIs are only supported by SPP BLE Abstraction (rm_ble_abs_spp) module.*

### Limitations on FreeRTOS environment

Developers should be aware of the following limitations when using the ble on FreeRTOS environment: When use deep sleep, sleep mode or standby mode, there is following two wake up option from RF module.

- Using Semaphore
- Using Event Groups

*Note*

*Event Groups is processing as a delay handler by timer task.*
*Therefore, if blocked by interrupts or if the timer task is blocked by another high-priority task, the existing connection will be broken.*

### 5.2.12.11 BLE Mesh Network Modules

Modules » Networking

#### Detailed Description

BLE Mesh Network Modules.

#### Modules

| | |
|---|---|
| | BLE Mesh Network (rm_ble_mesh) |
| | BLE Mesh Network Access (rm_ble_mesh_access) |
| | BLE Mesh Network Bearer (rm_ble_mesh_bearer) |
| | BLE Mesh Network Bearer Platform (rm_mesh_bearer_platform) |
| | BLE Mesh Network Config Client (rm_mesh_config_clt) |
| | BLE Mesh Network Config Server (rm_mesh_config_srv) |
| | BLE Mesh Network Generic Admin Property Server (rm_mesh_generic_admin_prop_srv) |
| | BLE Mesh Network Generic Battery Client (rm_mesh_generic_battery_clt) |
| | BLE Mesh Network Generic Battery Server (rm_mesh_generic_battery_srv) |
| | BLE Mesh Network Generic Client Property Server (rm_mesh_generic_client_prop_srv) |
| | BLE Mesh Network Generic Default Transition Time Client (rm_mesh_generic_dtt_clt) |
| | BLE Mesh Network Generic Default Transition Time Server (rm_mesh_generic_dtt_srv) |
| | BLE Mesh Network Generic Level Client (rm_mesh_generic_level_clt) |
| | BLE Mesh Network Generic Level Server (rm_mesh_generic_level_srv) |
| | BLE Mesh Network Generic Location Client (rm_mesh_generic_loc_clt) |

| | |
|---|---|
| | BLE Mesh Network Generic Location Server (rm_mesh_generic_loc_srv) |
| | BLE Mesh Network Generic Manufacturer Property Server (rm_mesh_generic_mfr_prop_srv) |
| | BLE Mesh Network Generic On Off Client (rm_mesh_generic_on_off_clt) |
| | BLE Mesh Network Generic On Off Server (rm_mesh_generic_on_off_srv) |
| | BLE Mesh Network Generic Power Level Client (rm_mesh_generic_pl_clt) |
| | BLE Mesh Network Generic Power Level Server (rm_mesh_generic_pl_srv) |
| | BLE Mesh Network Generic Power On Off Client (rm_mesh_generic_poo_clt) |
| | BLE Mesh Network Generic Power On Off Server (rm_mesh_generic_poo_srv) |
| | BLE Mesh Network Generic Property Client (rm_mesh_generic_prop_clt) |
| | BLE Mesh Network Generic User Property Server (rm_mesh_generic_user_prop_srv) |
| | BLE Mesh Network Health Client (rm_mesh_health_clt) |
| | BLE Mesh Network Health Server (rm_mesh_health_srv) |
| | BLE Mesh Network Light Control Client (rm_mesh_light_ctl_clt) |
| | BLE Mesh Network Light Control Server (rm_mesh_light_ctl_srv) |
| | BLE Mesh Network Light Hsl Client (rm_mesh_light_hsl_clt) |
| | BLE Mesh Network Light Hsl Server (rm_mesh_light_hsl_srv) |
| | BLE Mesh Network Light Lightness Client (rm_mesh_light_lightness_clt) |
| | BLE Mesh Network Light Lightness Server (rm_mesh_light_lightness_srv) |
| | BLE Mesh Network Light Location Client (rm_mesh_light_lc_clt) |

| | |
|---|---|
| | BLE Mesh Network Light Location Server (rm_mesh_light_lc_srv) |
| | BLE Mesh Network Light Xyl Client (rm_mesh_light_xyl_clt) |
| | BLE Mesh Network Light Xyl Server (rm_mesh_light_xyl_srv) |
| | BLE Mesh Network Lower Trans (rm_ble_mesh_lower_trans) |
| | BLE Mesh Network Network (rm_ble_mesh_network) |
| | BLE Mesh Network Provision (rm_ble_mesh_provision) |
| | BLE Mesh Network Scene Client (rm_mesh_scene_clt) |
| | BLE Mesh Network Scene Server (rm_mesh_scene_srv) |
| | BLE Mesh Network Scheduler Client (rm_mesh_scheduler_clt) |
| | BLE Mesh Network Scheduler Server (rm_mesh_scheduler_srv) |
| | BLE Mesh Network Sensor Client (rm_mesh_sensor_clt) |
| | BLE Mesh Network Sensor Server (rm_mesh_sensor_srv) |
| | BLE Mesh Network Time Client (rm_mesh_time_clt) |
| | BLE Mesh Network Time Server (rm_mesh_time_srv) |
| | BLE Mesh Network Upper Trans (rm_ble_mesh_upper_trans) |

## BLE Mesh Network (rm_ble_mesh)

Modules » Networking » BLE Mesh Network Modules

| fsp_err_t | RM_BLE_MESH_Open (rm_ble_mesh_ctrl_t *const p_ctrl, rm_ble_mesh_cfg_t const *const p_cfg) |
| fsp_err_t | RM_BLE_MESH_Close (rm_ble_mesh_ctrl_t *const p_ctrl) |
| fsp_err_t | RM_BLE_MESH_StartTransitionTimer (rm_ble_mesh_ctrl_t *const p_ctrl, rm_ble_mesh_access_state_transition_t const *const p_transition, uint16_t *const p_transition_time_handle) |
| fsp_err_t | RM_BLE_MESH_StopTransitionTimer (rm_ble_mesh_ctrl_t *const p_ctrl, uint16_t transition_time_handle) |

| | |
|---|---|
| fsp_err_t | RM_BLE_MESH_GetRemainingTransitionTime (rm_ble_mesh_ctrl_t *const p_ctrl, uint16_t transition_time_handle, uint8_t *const p_remaining_transition_time) |
| fsp_err_t | RM_BLE_MESH_GetRemainingTransitionTimeWithOffset (rm_ble_mesh_ctrl_t *const p_ctrl, uint16_t transition_time_handle, uint32_t offset_in_ms, uint8_t *const p_remaining_transition_time) |
| fsp_err_t | RM_BLE_MESH_ConvertTransitionTimeFromMs (rm_ble_mesh_ctrl_t *const p_ctrl, uint32_t transition_time_in_ms, uint8_t *const p_transition_time) |
| fsp_err_t | RM_BLE_MESH_ConvertTransitionTimeToMs (rm_ble_mesh_ctrl_t *const p_ctrl, uint8_t transition_time, uint32_t *const p_transition_time_in_ms) |

### Detailed Description

# Overview

Bluetooth Mesh defines a managed-flood-based mesh network. Any device in the network can send a message at any time as long as there is a sufficient density of devices that are listening and relaying messages. See sample application document and start up guide for information on how to create a BLE MESH application.

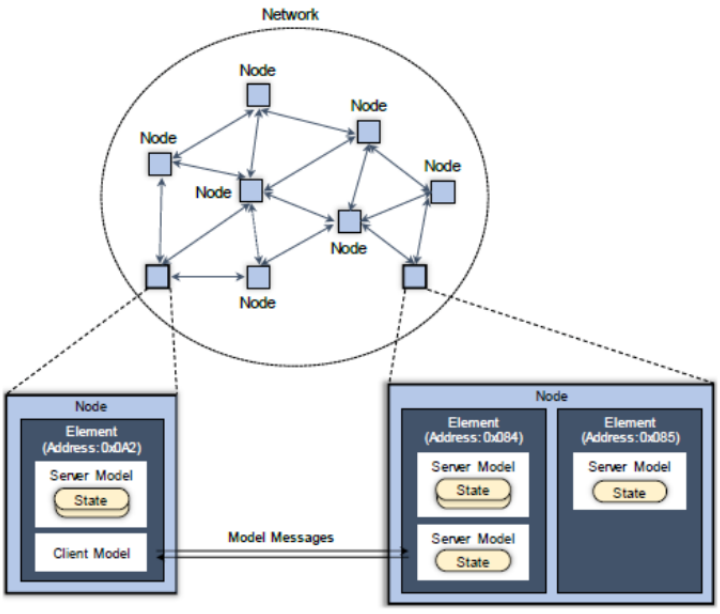

Figure 313: Overview Of Bletooth Mesh

### Features

The BLE Mesh middleware has the following features:

- Supports one-to-one and one-to-many message transmission
- Supports relay messages to other nodes
- Supports secure message transmission against the following attack
    - Wiretap attack
    - Man-in-the-middle attack
    - Replay attack
    - Trash-can attack
    - Brute Force Key attack
- Supports following optional features
    - Supports Relay feature
    - Supports Proxy feature
    - Supports Friend feature
    - Supports Low Power feature

### Target Devices

The BLE Mesh Network module supports the following devices.

- RA4W1

# Configuration

### Build Time Configurations for rm_ble_mesh

The following build time configurations are defined in fsp_cfg/rm_ble_mesh_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enable<br>• Disable | Default (BSP) | Specify whether to include code for API parameter checking. Valid settings include. |

### Configurations for Networking > BLE Mesh Network modules > BLE Mesh (rm_ble_mesh)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh (rm_ble_mesh).

| Configuration | Options | Default | Description |
|---|---|---|---|
| General | | | |
| Name | Name Must Be a Valid C Symbol | g_rm_ble_mesh0 | Module name. |
| Channel Number | Invalid Channel Number | 0 | Select channel corresponding to the channel number of the hardware. |
| Bearer | | | |
| Network Interface Number | Invalid Network Interface Number | 2 | Network interfaces number. |
| Provisioning Interface | Invalid Provisioning | 2 | Provisioning interfaces |

| | | | |
|---|---|---|---|
| Number | Interface Number | | number. |
| Provisioning | | | |
| Unprovisioned Device Beacon Timeout in Milliseconds | Invalid Unprovisioned Device Beacon Timeout in Milliseconds | 200 | Unprovisioned device beacon timeout in milliseconds. |
| Network | | | |
| Network Cache Size | Invalid Network Cache Size | 10 | Network cache size. |
| Network Sequence Number Cache Size | Invalid Network Sequence Number Cache Size | 32 | Network sequence number cache size. |
| Maximum Number of Subnet | Invalid Maximum Number of Subnets | 4 | Maximum number of subnets |
| Maximum Number of Device Key | Invalid Maximum Number of Device Keys | 4 | Maximum number of device keys. |
| Proxy Filter List Size | Invalid Proxy Filter List Size | 2 | Maximum number of addresses present in each proxy filter list. |
| Network Sequence Number Block Size | Invalid Network Sequence Number Block Size | 2048 | The distance between the network sequence numbers, for every persistent storage write. |
| Network Transmit Count for Network Packets | Invalid Network Transmit Count for Network Packets | 1 | Network transmit count for network packets. |
| Network Interval Steps for Network Packets | Invalid Network Interval Steps for Network Packets | 4 | Network interval steps for network packets. |
| Network Transmit Count for Relayed Packets | Invalid Network Transmit Count for Relayed Packets | 0 | Network transmit count for relayed packets. |
| Network Interval Steps for Relayed Packets | Invalid Network Interval Steps for Relayed Packets | 9 | Network interval steps for relayed packets. |
| Proxy ADV Network ID Timeout for Each Subnet in Milliseconds. | Invalid Proxy ADV Network ID Timeout | 100 | Proxy ADV network ID timeout for each subnet in milliseconds. |
| Proxy ADV Node Identity Timeout for Each Subnet in Milliseconds | Invalid Proxy ADV Node Identity Timeout for Each Subnet in Milliseconds | 300 | Proxy ADV node identity timeout for each subnet in milliseconds. |
| Proxy ADV Node Identity Overall Time Period in Seconds | Invalid Proxy ADV Node Identity Overall Time Period in Seconds | 60 | Proxy ADV node identity overall time period in seconds. |

| | | | |
|---|---|---|---|
| Maximum Number of Queued Messages for Transmission | Invalid Maximum Number of Queued Messages for Transmission | 64 | Maximum number of queued messages for transmission. |
| Transport | | | |
| Maximum Number of LPN | Invalid Maximum Number of LPNs | 1 | Maximum number of LPNs. |
| Replay Protection Cache Size | Invalid Replay Protection Cache Size | 10 | Replay protection cache size. |
| Reassembled Cache Size | Invalid Reassembled Cache Size | 8 | Reassembled cach size. |
| Friend Poll Retry Count | Invalid Friend Poll Retry Count | 10 | Friend poll retry count. |
| Maximum Number of Segmentation and Reassembly Context | Invalid Maximum Number of Segmentation and Reassembly Context | 8 | Number of segmentation and reassembly contexts. |
| Lower Transport Segment Transmission Timeout in Milliseconds | Invalid Lower Transport Segment Transmission Timeout in Milliseconds | 300 | Lower transport segment transmission timeout in milliseconds. |
| Lower Transport Segment Re-Transmission Count | Invalid Lower Transport Segment Re-Transmission Count | 2 | Lower transport segment re-transmission count. |
| Lower Transport Acknowledgement Timeout in Milliseconds | Invalid Lower Transport Acknowledgement Timeout in Milliseconds | 200 | Lower transport acknowledgement timeout in milliseconds. |
| Lower Transport Incomplete Timeout in Seconds | Invalid Lower Transport Incomplete Timeout in Seconds | 20 | Lower transport incomplete timeout in seconds. |
| Friendship Receive Window | Invalid Friendship Receive Window | 100 | Friendship receive window. |
| Maximum Number of Friend Message Queue | Invalid Maximum Number of Friend Messages Queue | 15 | Maximum number of messages that the friend is capabale to queue for a single Low Power Node. |
| Maximum Number of Friend Subscription List | Invalid Maximum Number of Friend Subscription List | 8 | Maximum number of subscription addresses that the friend is capable to store for a single Low Power Node. |
| Friend Clear Confirmation Timeout in Milliseconds | Invalid Friend Clear Confirmation Timeout in Milliseconds | 1000 | Friend clear confirmation timeout in milliseconds. |
| Friend Clear Retry | Invalid Friend Clear | 5 | Friend clear retry |

| | | | |
|---|---|---|---|
| Count | Retry Count | | count. |
| Friendship Retry Timeout in Milliseconds | Invalid Friendship Retry Timeout in Milliseconds | 1200 | Friendship retry timeout in milliseconds. |
| Access | | | |
| Maximum Number of Element | Invalid Maximum Number of Element | 4 | Maximum number of elements. |
| Maximum Number of Model | Invalid Maximum Number of Model | 60 | Maximum number of models. |
| Maximum Number of Application | Invalid Maximum Number of Application | 8 | Maximum number of applications (keys) the device can store information about. |
| Maximum Number of Virtual Address | Invalid Maximum Number of Virtual Address | 8 | Maximum number of virtual addresses the device can store information about. |
| Maximum Number of Non-Virtual Address | Invalid Maximum Number of Non-Virtual Address | 8 | Maximum number of non-virtual addresses the device can store information about. |
| Maximum Number of Transition Timers | Invalid Maximum Number of Transition Timers | 5 | Maximum number of transition timers. |
| Maximum Number of Periodic Step Timers | Invalid Maximum Number of Periodic Step Timers | 5 | Maximum number of periodic step timers. |
| Foundation | | | |
| Config Server Secure Network Beacon Interval | Invalid Config Server Secure Network Beacon Interval | 10 | Config server secure network beacon interval. |
| Maximum Number of Health Server Instance | Invalid Maximum Number of Health Server Instance | 2 | Maximum number of health server instances. |
| Model | | | |
| Maximum Number of Light Lightness Controller Server Instance | Invalid Maximum Number of Light Lightness Controller Server Instance | 1 | Maximum number of light lightness controller server instances. |
| ID | | | |
| Company ID | Invalid Company ID | 0x0036 | Company ID. |
| Product ID | Invalid Product ID | 0x0001 | Product ID. |
| Vendor ID | Invalid Vendor ID | 0x0100 | Vendor ID. |
| Platform | | | |

| | | | |
|---|---|---|---|
| Platform > Storage | | | |
| Block Number | Invalid Block Number | 5 | Block number. |
| Platform > Memory Pool | | | |
| Memory Pool Size | Invalid Memory Pool Size | 0x4000 | Memory pool size. |
| Platform > Logging | | | |
| Packet Bitfield | • Network<br>• Lower Trans<br>• Upper Trans<br>• Access | | Specifies if this is included in the packet_bitfield mask. |
| Module Info Bitfield | • Network<br>• Lower Trans<br>• Upper Trans<br>• Access | | Specifies if this is included in the module information bitfield mask. |
| Generic Log Bitfield | • Network<br>• Lower Trans<br>• Upper Trans<br>• Access | | Specifies if this is included in the generic log bitfield mask. |
| function | Name Must Be a Valid C Symbol | NULL | |

### Clock Configuration

*Note*

*System clock (ICLK): 8 MHz or more*
*Peripheral module clock A (PCLKA): 8MHz or more*
*The BLE Protocol Stack is optimized for ICLK and PCLKA frequencies of 32 MHz.*
*It is recommended that the clock be set so that the ICLK and PCLKA frequencies are 32MHz in order to get the best performance from the BLE.*

### Pin Configuration

This module does not use I/O pins.

# Usage Notes

### Mesh System Architecture

Purpose of each layer is,

### Model layer

Model is a standardized typical functionality so that nodes perform operations in accordance with application scenario.

### Foundation Model layer

Foundation Models are models to configure and manage operations of elements.

### Access layer

The access layer defines how higher layer applications can use the upper transport layer.

### Upper transport layer

The upper transport layer encrypts, decrypts, and authenticates application data and is designed to provide confidentiality of access messages.

### Lower transport layer

The lower transport layer defines how upper transport layer messages are segmented and reassembled into multiple Lower Transport PDUs to deliver large upper transport layer messages to other nodes.

### Network layer

The network layer defines how transport messages are addressed towards one or more elements.

### Bearer layer

The bearer layer defines how network messages are transported between nodes.

### Device Life Cycle

The device not joined in the mesh network is an Unprovisioned Device and the device joined in the mesh network is called a Node.

- Unprovisioned Device
  Unprovisioned device cannot send or receive mesh messages. However, it will advertise its presence to the provisioner. By the provisioner, Unprovisioned Devices are invited to join the mesh network and become nodes(Provisioning).
- Node
  Nodes can send and receive mesh messages. It is managed by the configuration client through the mesh network, which configures how the nodes communicate. The configuration client can also remove a Node from the mesh network, which will return the node to an Unprovisioned Device.

To communicate with other nodes by using Models, each node needs Configuration. By Configuration process, information required for Model operation such as Application Keys, Publish Address, Subscription Address is configured. Following shows a typical lifecycle of a node.

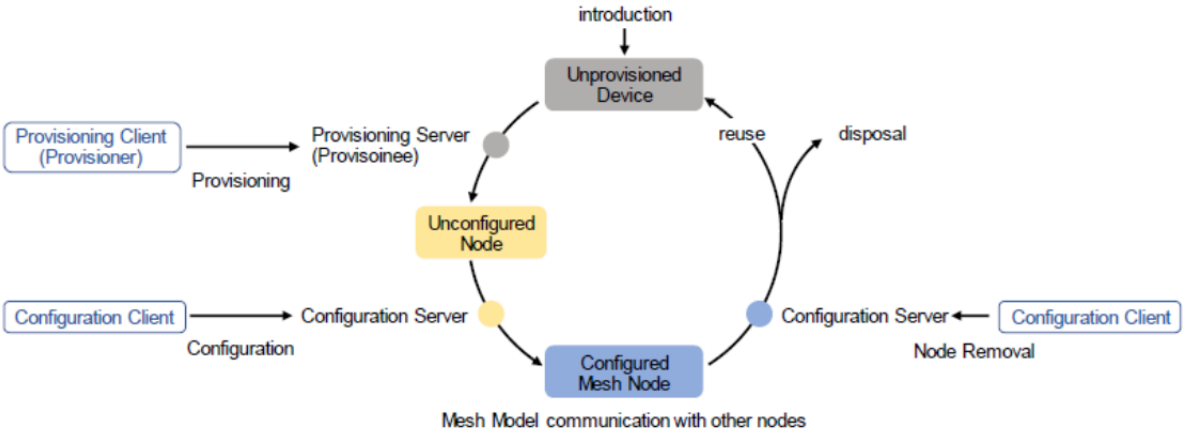

Figure 314: Device Life Cycle Image

Newly introduced device is provisioned by Provisioner and joins a network. Furthermore, this device is configured by Configuration Client and becomes to be able to communicate with other nodes with Mesh Model. Generally, Configuration Client is a smart phone or other mobile computing device. Configuration Client removes a node from a network by sending Config Node Reset message. Besides, Configuration Client updates encryption keys used in the network, and the removed node becomes unable to communicate with other nodes.

# Examples

### BLE_MESH Basic Example

This is a basic example of minimal use of the BLE_MESH in an application.

## Data Structures

| | |
|---|---|
| struct | rm_ble_mesh_instance_ctrl_t |

## Data Structure Documentation

### ◆ rm_ble_mesh_instance_ctrl_t

| struct rm_ble_mesh_instance_ctrl_t |
|---|
| RM_BLE_MESH_BEARER private control block. DO NOT MODIFY. Initialization occurs when RM_BLE_MESH_BEARER_Open() is called. |

## Function Documentation

### ◆ RM_BLE_MESH_Open()

| fsp_err_t RM_BLE_MESH_Open ( rm_ble_mesh_ctrl_t *const *p_ctrl*, rm_ble_mesh_cfg_t const *const *p_cfg* ) |
|---|
| Open ble mesh middleware. API to initialize Mesh Stack. This is the first API that the application should call before any other API. This function initializes all the internal stack modules and data structures.<br><br>Implements rm_ble_mesh_api_t::open.<br><br>Example:<br>`/* Open the module. */`<br>`err = RM_BLE_MESH_Open(&g_ble_mesh0_ctrl, &g_ble_mesh0_cfg);`<br><br>**Return values**<br>FSP_SUCCESS — Module opened successfully.<br>FSP_ERR_ASSERTION — Pointer to control block or configuration structure is NULL.<br>FSP_ERR_ALREADY_OPEN — Module is already open. |

### ◆ RM_BLE_MESH_Close()

fsp_err_t RM_BLE_MESH_Close ( rm_ble_mesh_ctrl_t *const *p_ctrl*)

Close ble mesh middleware. API to turn off Bluetooth Hardware. This API should be called after RM_BLE_MESH_Open.

Implements rm_ble_mesh_api_t::close.

Example:

```
/* Close the module. */
   err = RM_BLE_MESH_Close(&g_ble_mesh0_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Module successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_BLE_MESH_StartTransitionTimer()

fsp_err_t RM_BLE_MESH_StartTransitionTimer ( rm_ble_mesh_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_state_transition_t const *const *p_transition*, uint16_t *const *p_transition_time_handle* )

To start transition timer. API to start a transition timer.

Implements rm_ble_mesh_api_t::startTransitionTimer.

Example:

```
/* Start transition timer. */
   err = RM_BLE_MESH_StartTransitionTimer(&g_ble_mesh0_ctrl, &transition,
&transition_time_handle);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_transition is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |

### ◆ RM_BLE_MESH_StopTransitionTimer()

fsp_err_t RM_BLE_MESH_StopTransitionTimer ( rm_ble_mesh_ctrl_t *const *p_ctrl*, uint16_t *transition_time_handle* )

To stop transition timer. API to stop a transition timer.

Implements rm_ble_mesh_api_t::stopTransitionTimer.

Example:

```
/* Stop transition timer. */
   err = RM_BLE_MESH_StopTransitionTimer(&g_ble_mesh0_ctrl, transition_time_handle);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_BLE_MESH_GetRemainingTransitionTime()

fsp_err_t RM_BLE_MESH_GetRemainingTransitionTime ( rm_ble_mesh_ctrl_t *const *p_ctrl*, uint16_t *transition_time_handle*, uint8_t *const *p_remaining_transition_time* )

To get remaining Transition Time. API to get remaining Transition Time.

Implements rm_ble_mesh_api_t::getRemainingTransitionTime.

Example:

```
/* Get remaining transition time. */
   err = RM_BLE_MESH_GetRemainingTransitionTime(&g_ble_mesh0_ctrl,
transition_time_handle, &remaining_transition_time);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_remaining_transition_time is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |

### ◆ RM_BLE_MESH_GetRemainingTransitionTimeWithOffset()

fsp_err_t RM_BLE_MESH_GetRemainingTransitionTimeWithOffset ( rm_ble_mesh_ctrl_t *const *p_ctrl*, uint16_t *transition_time_handle*, uint32_t *offset_in_ms*, uint8_t *const *p_remaining_transition_time* )

To get remaining Transition Time, with offset. API to get remaining Transition Time with offset in ms.

Implements rm_ble_mesh_api_t::getRemainingTransitionTimeWithOffset.

Example:

```
/* Get remaining transition time with offset. */
   err = RM_BLE_MESH_GetRemainingTransitionTimeWithOffset(&g_ble_mesh0_ctrl,
                                                          transition_time_handle,
                                                          offset_in_ms,

&remaining_transition_time);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_remaining_transition_time is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |

### ◆ RM_BLE_MESH_ConvertTransitionTimeFromMs()

fsp_err_t RM_BLE_MESH_ConvertTransitionTimeFromMs ( rm_ble_mesh_ctrl_t *const *p_ctrl*, uint32_t *transition_time_in_ms*, uint8_t *const *p_transition_time* )

To convert transition time from millisecond. API to convert transition timer in millisecond to Generic Default Transition Time state format.

Implements rm_ble_mesh_api_t::convertTransitionTimeFromMs.

Example:

```
/* Convert transition time from milliseconds. */
   err = RM_BLE_MESH_ConvertTransitionTimeFromMs(&g_ble_mesh0_ctrl,
transition_time_in_ms, &transition_time);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_transition_time is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_BLE_MESH_ConvertTransitionTimeToMs()

fsp_err_t RM_BLE_MESH_ConvertTransitionTimeToMs ( rm_ble_mesh_ctrl_t *const *p_ctrl*, uint8_t *transition_time*, uint32_t *const *p_transition_time_in_ms* )

To convert transition time to millisecond. API to convert Generic Default Transition Time state format to required transition time value in miliseconds.

Implements rm_ble_mesh_api_t::convertTransitionTimeToMs.

Example:

```
/* Convert transition time to milliseconds. */
   err = RM_BLE_MESH_ConvertTransitionTimeToMs(&g_ble_mesh0_ctrl, transition_time,
&transition_time_in_ms);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_transition_time_in_ms is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

## BLE Mesh Network Access (rm_ble_mesh_access)

Modules » Networking » BLE Mesh Network Modules

**Detailed Description**

# Overview

### Target Devices

The BLE Mesh Network Access module supports the following devices.

- RA4W1

# Configuration

### Build Time Configurations for rm_ble_mesh_access

The following build time configurations are defined in fsp_cfg/rm_ble_mesh_access_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|

### Configurations for Networking > BLE Mesh Network modules > BLE Mesh Access (rm_ble_mesh_access)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Access (rm_ble_mesh_access).

| Configuration | Options | Default | Description |
|---|---|---|---|

General

| | | | |
|---|---|---|---|
| Name | Name Must Be a Valid C Symbol | g_rm_ble_mesh_access0 | Module name. |
| Channel Number | Invalid Channel Number | 0 | Select channel corresponding to the channel number of the hardware. |
| Location Descriptor | Invalid Descriptor | 0 | Location descriptor. |
| Element Number | Invalid Descriptor | 0 | Element number to register the model. |

### Data Structures

| | |
|---|---|
| struct | rm_ble_mesh_access_instance_ctrl_t |

## Data Structure Documentation

### ◆ rm_ble_mesh_access_instance_ctrl_t

| struct rm_ble_mesh_access_instance_ctrl_t |
|---|
| RM_BLE_MESH_ACCESS private control block. DO NOT MODIFY. Initialization occurs when RM_BLE_MESH_ACCESS_Open() is called. |

## Function Documentation

### ◆ RM_BLE_MESH_ACCESS_Open()

fsp_err_t RM_BLE_MESH_ACCESS_Open ( rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_cfg_t const *const *p_cfg* )

Open access middleware. This routine creates a new node in the device. This can be used by the application to create extra nodes if required in addition to the default primary node. And this routine registers an element that can be populated with the models information to a specific node in the device identified by the node id.

Implements rm_ble_mesh_access_api_t::open.

Example:

```
/* Open the module. */
   err = RM_BLE_MESH_ACCESS_Open(&g_ble_mesh_access0_ctrl, &g_ble_mesh_access0_cfg);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Module opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Module is already open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

### ◆ RM_BLE_MESH_ACCESS_Close()

fsp_err_t RM_BLE_MESH_ACCESS_Close ( rm_ble_mesh_access_ctrl_t *const *p_ctrl*)

Close access middleware. Implements rm_ble_mesh_access_api_t::close.

Example:

```
/* Close the module. */
   err = RM_BLE_MESH_ACCESS_Close(&g_ble_mesh_access0_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Module successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Lower layer is invalid state. |

### ◆ RM_BLE_MESH_ACCESS_RegisterModel()

fsp_err_t RM_BLE_MESH_ACCESS_RegisterModel ( rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_t const *const *p_model*, rm_ble_mesh_access_model_handle_t *const *p_model_handle* )

Register a model with the access layer. This routine registers a model associated with an element with the access layer.

Implements rm_ble_mesh_access_api_t::registerModel.

Example:

```
/* Register a model with the access layer. */
   err = RM_BLE_MESH_ACCESS_RegisterModel(&g_ble_mesh_access0_ctrl, &model,
&model_handle);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_model and p_model_handle are NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_BLE_MESH_ACCESS_GetElementHandle()

fsp_err_t RM_BLE_MESH_ACCESS_GetElementHandle ( rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_address_t *elem_addr*, rm_ble_mesh_access_element_handle_t *const *p_handle* )

Get element handle. This routine searches for the element handle associated with specific element address.

Implements rm_ble_mesh_access_api_t::getElementHandle.

Example:

```
/* Get element handle. */
   err = RM_BLE_MESH_ACCESS_GetElementHandle(&g_ble_mesh_access0_ctrl, elem_addr,
&elem_handle);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_handle is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |

### ◆ RM_BLE_MESH_ACCESS_GetElementHandleForModelHandle()

fsp_err_t RM_BLE_MESH_ACCESS_GetElementHandleForModelHandle ( rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *model_handle*, rm_ble_mesh_access_element_handle_t *const *p_elem_handle* )

Get element handle for a given model handle. This routine searches for the element handle associated with specific model handle.

Implements rm_ble_mesh_access_api_t::getElementHandleForModelHandle.

Example:

```
/* Get element handle for a given model handle. */
   err = RM_BLE_MESH_ACCESS_GetElementHandleForModelHandle(&g_ble_mesh_access0_ctrl,
model_handle, &elem_handle);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_elem_handle is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_BLE_MESH_ACCESS_GetModelHandle()

fsp_err_t RM_BLE_MESH_ACCESS_GetModelHandle ( rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_element_handle_t *elem_handle*, rm_ble_mesh_access_model_id_t *model_id*, rm_ble_mesh_access_model_handle_t *const *p_handle* )

Get model handle. This routine searches for the model handle associated with specific model ID.

Implements rm_ble_mesh_access_api_t::getModelHandle.

Example:

```
/* Get model handle. */
   err = RM_BLE_MESH_ACCESS_GetModelHandle(&g_ble_mesh_access0_ctrl, elem_handle,
model_id, &model_handle);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_handle is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

### ◆ RM_BLE_MESH_ACCESS_Publish()

fsp_err_t RM_BLE_MESH_ACCESS_Publish ( rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t const *const *p_handle*, rm_ble_mesh_access_req_msg_raw_t const *const *p_publish_message*, uint8_t *reliable* )

API to publish access layer message. This routine publishes Access Layer message to the publish address associated with the model.

Implements rm_ble_mesh_access_api_t::publish.

Example:

```
/* Publish access layer message. */
   err = RM_BLE_MESH_ACCESS_Publish(&g_ble_mesh_access0_ctrl, &model_handle,
&publish_message, reliable);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_handle and p_publish_message are NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_STATE | Lower layer is invalid state. |

### ◆ RM_BLE_MESH_ACCESS_ReliablePublish()

fsp_err_t RM_BLE_MESH_ACCESS_ReliablePublish ( rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t const *const *p_handle*, rm_ble_mesh_access_req_msg_raw_t const *const *p_publish_message*, uint32_t *rsp_opcode* )

API to reliably publish Access layer message. This routine reliably publishes Access Layer message to the publish address associated with the model.

Implements rm_ble_mesh_access_api_t::reliablePublish.

Example:

```
/* Reliably publish access layer message. */
   err = RM_BLE_MESH_ACCESS_ReliablePublish(&g_ble_mesh_access0_ctrl, &model_handle,
&req_msg_raw, rsp_opcode);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_handle and p_publish_message are NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_STATE | Lower layer is invalid state. |

### ◆ RM_BLE_MESH_ACCESS_Reply()

fsp_err_t RM_BLE_MESH_ACCESS_Reply ( rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_req_msg_context_t const *const *p_req_msg_context*, uint8_t *ttl*, rm_ble_mesh_access_req_msg_raw_t const *const *p_req_msg_raw* )

API to reply to Access Layer message. This routine replies to Access Layer message.

Implements rm_ble_mesh_access_api_t::reply.

Example:

```
/* Reply to access layer message. */
   err = RM_BLE_MESH_ACCESS_Reply(&g_ble_mesh_access0_ctrl, &req_msg_context, ttl,
&req_msg_raw);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_req_msg_context and p_req_msg_raw are NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_STATE | Lower layer is invalid state. |

### ◆ RM_BLE_MESH_ACCESS_ReplyAndPublish()

fsp_err_t RM_BLE_MESH_ACCESS_ReplyAndPublish ( rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_req_msg_context_t const *const *p_req_msg_context*, rm_ble_mesh_access_req_msg_raw_t const *const *p_req_msg_raw*, rm_ble_mesh_access_publish_setting_t const *const *p_publish_setting* )

API to reply to Access Layer message and optionally also to publish. This routine replies to Access Layer message and also publish if requested by application.

Implements rm_ble_mesh_access_api_t::replyAndPublish.

Example:

```
/* Reply to access layer message. */
   err =
RM_BLE_MESH_ACCESS_ReplyAndPublish(&g_ble_mesh_access0_ctrl, &req_msg_context,
&req_msg_raw, &publish_setting);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_req_msg_context and p_req_msg_raw are NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_STATE | Lower layer is invalid state. |

### ◆ RM_BLE_MESH_ACCESS_SendPdu()

fsp_err_t RM_BLE_MESH_ACCESS_SendPdu ( rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_pdu_t const *const *p_pdu*, uint8_t *reliable* )

API to send access PDUs. This routine sends transport PDUs to peer device.

Implements rm_ble_mesh_access_api_t::sendPdu.

Example:

```
/* Send Access PDUs. */
   err = RM_BLE_MESH_ACCESS_SendPdu(&g_ble_mesh_access0_ctrl, &pdu, reliable);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_pdu is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |

### ◆ RM_BLE_MESH_ACCESS_GetCompositionData()

fsp_err_t RM_BLE_MESH_ACCESS_GetCompositionData ( rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_buffer_t *const *p_buffer* )

Get composition data.

Implements rm_ble_mesh_access_api_t::getCompositionData.

Example:

```
/* Get composition data. */
   err = RM_BLE_MESH_ACCESS_GetCompositionData(&g_ble_mesh_access0_ctrl, &buffer);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Module successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_buffer is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

### ◆ RM_BLE_MESH_ACCESS_Reset()

fsp_err_t RM_BLE_MESH_ACCESS_Reset ( rm_ble_mesh_access_ctrl_t *const *p_ctrl*)

To reset a node. This routine resets a node (other than a Provisioner) and removes it from the network.

Implements rm_ble_mesh_access_api_t::reset.

Example:

```
/* Reset a node. */
   err = RM_BLE_MESH_ACCESS_Reset(&g_ble_mesh_access0_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_BLE_MESH_ACCESS_GetElementCount()

fsp_err_t RM_BLE_MESH_ACCESS_GetElementCount ( rm_ble_mesh_access_ctrl_t *const *p_ctrl*, uint8_t *const *p_count* )

To get the number of elements in local node. This routine retrieves the number of elements in local node.

Implements rm_ble_mesh_access_api_t::getElementCount.

Example:

```
/* Get the number of elements in local node. */
   err = RM_BLE_MESH_ACCESS_GetElementCount(&g_ble_mesh_access0_ctrl, &count);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_count is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_BLE_MESH_ACCESS_SetPrimaryUnicastAddress()

fsp_err_t RM_BLE_MESH_ACCESS_SetPrimaryUnicastAddress ( rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_address_t *addr* )

To set primary unicast address. This routine sets primary unicast address.

Implements rm_ble_mesh_access_api_t::setPrimaryUnicastAddress.

Example:

```
/* Set primary unicast address. */
   err = RM_BLE_MESH_ACCESS_SetPrimaryUnicastAddress(&g_ble_mesh_access0_ctrl,
addr);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |

### ◆ RM_BLE_MESH_ACCESS_GetPrimaryUnicastAddress()

fsp_err_t RM_BLE_MESH_ACCESS_GetPrimaryUnicastAddress ( rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_address_t *const *p_addr* )

To get primary unicast address. This routine gets primary unicast address.

Implements rm_ble_mesh_access_api_t::getPrimaryUnicastAddress.

Example:

```
/* Get primary unicast address. */
   err = RM_BLE_MESH_ACCESS_GetPrimaryUnicastAddress(&g_ble_mesh_access0_ctrl,
&addr);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_addr is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

### ◆ RM_BLE_MESH_ACCESS_SetDefaultTtl()

fsp_err_t RM_BLE_MESH_ACCESS_SetDefaultTtl ( rm_ble_mesh_access_ctrl_t *const *p_ctrl*, uint8_t *ttl* )

To set default TTL. This routine sets default TTL.

Implements rm_ble_mesh_access_api_t::setDefaultTtl.

Example:

```
/* Set default TTL. */
   err = RM_BLE_MESH_ACCESS_SetDefaultTtl(&g_ble_mesh_access0_ctrl, ttl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_BLE_MESH_ACCESS_GetDefaultTtl()

fsp_err_t RM_BLE_MESH_ACCESS_GetDefaultTtl ( rm_ble_mesh_access_ctrl_t *const *p_ctrl*, uint8_t const *const *p_ttl* )

To get default TTL. This routine gets default TTL.

Implements rm_ble_mesh_access_api_t::getDefaultTtl.

Example:

```
/* Get default TTL. */
   err = RM_BLE_MESH_ACCESS_GetDefaultTtl(&g_ble_mesh_access0_ctrl, &ttl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_ttl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

### ◆ RM_BLE_MESH_ACCESS_SetIvIndex()

fsp_err_t RM_BLE_MESH_ACCESS_SetIvIndex ( rm_ble_mesh_access_ctrl_t *const *p_ctrl*, uint32_t *iv_index*, uint8_t *iv_update_flag* )

To set IV Index. This routine sets IV Index.

Implements rm_ble_mesh_access_api_t::setIvIndex.

Example:

```
/* Set IV Index. */
   err = RM_BLE_MESH_ACCESS_SetIvIndex(&g_ble_mesh_access0_ctrl, iv_index,
iv_update_flag);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Lower layer is invalid state. |
| FSP_ERR_IN_USE | Resource is busy. |

### ◆ RM_BLE_MESH_ACCESS_GetIvIndex()

fsp_err_t RM_BLE_MESH_ACCESS_GetIvIndex ( rm_ble_mesh_access_ctrl_t *const *p_ctrl*, uint32_t *const *p_iv_index*, uint8_t *const *p_iv_update_flag* )

To get IV Index. This routine gets IV Index.

Implements rm_ble_mesh_access_api_t::getIvIndex.

Example:

```
/* Get IV Index. */
   err = RM_BLE_MESH_ACCESS_GetIvIndex(&g_ble_mesh_access0_ctrl, &iv_index,
&iv_update_flag);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_iv_index and p_iv_update_flag are NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

### ◆ RM_BLE_MESH_ACCESS_GetIvIndexByIvi()

fsp_err_t RM_BLE_MESH_ACCESS_GetIvIndexByIvi ( rm_ble_mesh_access_ctrl_t *const *p_ctrl*, uint8_t *ivi*, uint32_t *const *p_iv_index* )

To get IV Index by IVI. This routine gets IV Index based on the IVI in the received packet.

Implements rm_ble_mesh_access_api_t::getIvIndexByIvi.

Example:

```
/* Get IV Index by IVI. */
   err = RM_BLE_MESH_ACCESS_GetIvIndexByIvi(&g_ble_mesh_access0_ctrl, ivi,
&iv_index);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_iv_index is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

### ◆ RM_BLE_MESH_ACCESS_SetFeaturesField()

fsp_err_t RM_BLE_MESH_ACCESS_SetFeaturesField ( rm_ble_mesh_access_ctrl_t *const *p_ctrl*, uint8_t *enable*, uint8_t *feature* )

To enable/disable a feature. This routine enables/disables a feature field.

Implements rm_ble_mesh_access_api_t::setFeaturesField.

Example:

```
/* Enable/Disable a feature. */
   err = RM_BLE_MESH_ACCESS_SetFeaturesField(&g_ble_mesh_access0_ctrl, enable,
features);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_BLE_MESH_ACCESS_GetFeaturesField()

fsp_err_t RM_BLE_MESH_ACCESS_GetFeaturesField ( rm_ble_mesh_access_ctrl_t *const *p_ctrl*, uint8_t *const *p_enable*, uint8_t *feature* )

To get state of a feature. This routine gets the state of a feature field.

Implements rm_ble_mesh_access_api_t::getFeaturesField.

Example:

```
/* Get state of a feature. */
   err = RM_BLE_MESH_ACCESS_GetFeaturesField(&g_ble_mesh_access0_ctrl, &enable,
features);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_enable is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_BLE_MESH_ACCESS_GetFeatures()

fsp_err_t RM_BLE_MESH_ACCESS_GetFeatures ( rm_ble_mesh_access_ctrl_t *const *p_ctrl*, uint8_t *const *p_features* )

To get state of all features. This routine gets the state of all features.

Implements rm_ble_mesh_access_api_t::getFeatures.

Example:

```
/* Get state of all features. */
   err = RM_BLE_MESH_ACCESS_GetFeatures(&g_ble_mesh_access0_ctrl, &features);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_features is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_BLE_MESH_ACCESS_GetFriendshipRole()

fsp_err_t RM_BLE_MESH_ACCESS_GetFriendshipRole ( rm_ble_mesh_access_ctrl_t *const *p_ctrl*, uint8_t *const *p_friend_role* )

To get friendship role of the node. This routine gets the current friendship role of the node.

Implements rm_ble_mesh_access_api_t::getFriendshipRole.

Example:

```
/* Get friendship role of the node. */
   err = RM_BLE_MESH_ACCESS_GetFriendshipRole(&g_ble_mesh_access0_ctrl,
&friend_role);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_friend_role is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_BLE_MESH_ACCESS_SetFriendshipRole()

fsp_err_t RM_BLE_MESH_ACCESS_SetFriendshipRole ( rm_ble_mesh_access_ctrl_t *const *p_ctrl*, uint8_t *friend_role* )

To set friendship role of the node. This routine sets the current friendship role of the node.

Implements rm_ble_mesh_access_api_t::setFriendshipRole.

Example:

```
/* Set friendship role of the node. */
   err = RM_BLE_MESH_ACCESS_SetFriendshipRole(&g_ble_mesh_access0_ctrl,
friend_role);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_BLE_MESH_ACCESS_AddDeviceKey()

fsp_err_t RM_BLE_MESH_ACCESS_AddDeviceKey ( rm_ble_mesh_access_ctrl_t *const *p_ctrl*, uint8_t const *const *p_dev_key*, rm_ble_mesh_network_address_t *uaddr*, uint8_t *num_elements* )

To add Device Key. This routine adds Device Key entry, along with corresponding Primary Device Address and Number of elements.

Implements rm_ble_mesh_access_api_t::addDeviceKey.

Example:

```
/* Add Device Key. */
   err = RM_BLE_MESH_ACCESS_AddDeviceKey(&g_ble_mesh_access0_ctrl, &dev_key, uaddr,
num_elements);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_dev_key is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_OVERFLOW | Device key table is full. |

### ◆ RM_BLE_MESH_ACCESS_GetDeviceKey()

fsp_err_t RM_BLE_MESH_ACCESS_GetDeviceKey ( rm_ble_mesh_access_ctrl_t *const *p_ctrl*, uint8_t *dev_key_index*, uint8_t **const *p_dev_key* )

To get Device Key. This routine gets Device Key entry.

Implements rm_ble_mesh_access_api_t::getDeviceKey.

Example:

```
/* Get Device Key. */
   err = RM_BLE_MESH_ACCESS_GetDeviceKey(&g_ble_mesh_access0_ctrl, dev_key_index,
p_dev_key);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_dev_key is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

### ◆ RM_BLE_MESH_ACCESS_RemoveAllDeviceKeys()

fsp_err_t RM_BLE_MESH_ACCESS_RemoveAllDeviceKeys ( rm_ble_mesh_access_ctrl_t *const *p_ctrl*)

To remove all Device Keys. This routine removes all Device Keys from table.

Implements rm_ble_mesh_access_api_t::removeAllDeviceKeys.

Example:

```
/* Remove all Device Keys. */
   err = RM_BLE_MESH_ACCESS_RemoveAllDeviceKeys(&g_ble_mesh_access0_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_BLE_MESH_ACCESS_GetProvisionedDeviceList()

fsp_err_t RM_BLE_MESH_ACCESS_GetProvisionedDeviceList ( rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_provisioned_device_entry_t const *const *p_prov_dev_list*, uint16_t *const *p_num_entries* )

To get list of Provisioned Device List. This routine returns list of Provisioned Devices from the Device Key Table.

Implements rm_ble_mesh_access_api_t::getProvisionedDeviceList.

Example:

```
/* Get list of provisioned device list. */
   err = RM_BLE_MESH_ACCESS_GetProvisionedDeviceList(&g_ble_mesh_access0_ctrl,
&prov_dev_list, &num_entries);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_prov_dev_list and p_num_entries are NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

### ◆ RM_BLE_MESH_ACCESS_GetDeviceKeyHandle()

fsp_err_t RM_BLE_MESH_ACCESS_GetDeviceKeyHandle ( rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_address_t *prim_elem_uaddr*, rm_ble_mesh_access_device_key_handle_t *const *p_handle* )

To get device key handle. This routine returns Device Key Handle for a given Primary Element Address entry in Device Key Table.

Implements rm_ble_mesh_access_api_t::getDeviceKeyHandle.

Example:

```
/* Get Device Key handle. */
   err = RM_BLE_MESH_ACCESS_GetDeviceKeyHandle(&g_ble_mesh_access0_ctrl,
prim_elem_uaddr, &handle);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_handle is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

### ◆ RM_BLE_MESH_ACCESS_GetAppKey()

fsp_err_t RM_BLE_MESH_ACCESS_GetAppKey ( rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_appkey_handle_t *appkey_handle*, uint8_t **const *p_app_key*, uint8_t *const *p_aid* )

To get AppKey. This routine gets AppKey along with AID entry.

Implements rm_ble_mesh_access_api_t::getAppKey.

Example:

```
/* Get AppKey. */
   err = RM_BLE_MESH_ACCESS_GetAppKey(&g_ble_mesh_access0_ctrl, appkey_handle,
p_app_key, &aid);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_app_key and p_aid are NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

### ◆ RM_BLE_MESH_ACCESS_AddUpdateNetkey()

fsp_err_t RM_BLE_MESH_ACCESS_AddUpdateNetkey ( rm_ble_mesh_access_ctrl_t *const *p_ctrl*, uint16_t *netkey_index*, uint32_t *opcode*, uint8_t const *const *p_net_key* )

To add/update NetKey. This routine adds/updates NetKey entry. Each NetKey is associated with a subnet.

Implements rm_ble_mesh_access_api_t::addUpdateNetkey.

Example:

```
/* Add/Update NetKey. */
   err = RM_BLE_MESH_ACCESS_AddUpdateNetkey(&g_ble_mesh_access0_ctrl, netkey_index,
opcode, &net_key);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_net_key is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

### ◆ RM_BLE_MESH_ACCESS_AddFriendSecurityCredential()

fsp_err_t RM_BLE_MESH_ACCESS_AddFriendSecurityCredential ( rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *subnet_handle*, uint16_t *friend_index*, rm_ble_mesh_access_friend_security_credential_info_t *info* )

To add Security Credential of a LPN or the Friend. This routine adds NID, privacy and encryption keys associated with a friendship.

Implements rm_ble_mesh_access_api_t::addFriendSecurityCredential.

Example:

```
/* Add security credential of a LPN or the friend. */
   err =
RM_BLE_MESH_ACCESS_AddFriendSecurityCredential(&g_ble_mesh_access0_ctrl,
subnet_handle, friend_index, info);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |

### ◆ RM_BLE_MESH_ACCESS_DeleteFriendSecurityCredential()

fsp_err_t RM_BLE_MESH_ACCESS_DeleteFriendSecurityCredential ( rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *subnet_handle*, uint16_t *friend_index* )

To delete the Security Credential of a LPN or the Friend. This routine deletes NID, privacy and encryption keys associated with a friendship.

Implements rm_ble_mesh_access_api_t::deleteFriendSecurityCredential.

Example:

```
/* Delete the security credential of a LPN or the Friend. */
   err = RM_BLE_MESH_ACCESS_DeleteFriendSecurityCredential(&g_ble_mesh_access0_ctrl,
subnet_handle, friend_index);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_BLE_MESH_ACCESS_FindSubnet()

fsp_err_t RM_BLE_MESH_ACCESS_FindSubnet ( rm_ble_mesh_access_ctrl_t *const *p_ctrl*, uint16_t *netkey_index*, rm_ble_mesh_network_subnet_handle_t *const *p_subnet_handle* )

To find a Subnet associated with the NetKey. This routine finds a Subnet based on the NetKey entry. Each NetKey is associated with a subnet.

Implements rm_ble_mesh_access_api_t::findSubnet.

Example:

```
/* Find a subnet associated with the NetKey. */
   err = RM_BLE_MESH_ACCESS_FindSubnet(&g_ble_mesh_access0_ctrl, netkey_index,
&subnet_handle);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_subnet_handle is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |

### ◆ RM_BLE_MESH_ACCESS_FindMasterSubnet()

fsp_err_t RM_BLE_MESH_ACCESS_FindMasterSubnet ( rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *friend_subnet_handle*, rm_ble_mesh_network_subnet_handle_t *const* *p_master_subnet_handle* )

To find the Master Subnet associated with the friend security credential, identified by Friend Subnet Handle. This routine finds the Master Subnet based on the friend security credential, identified by Friend Subnet Handle.

Implements rm_ble_mesh_access_api_t::findMasterSubnet.

Example:

```
/* Close the module. */
   err =
RM_BLE_MESH_ACCESS_FindMasterSubnet(&g_ble_mesh_access0_ctrl, friend_subnet_handle,
&master_subnet_handle);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_master_subnet_handle is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_BLE_MESH_ACCESS_DeleteNetKey()

fsp_err_t RM_BLE_MESH_ACCESS_DeleteNetKey ( rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *subnet_handle* )

To delete NetKey. This routine deletes a NetKey entry. Each NetKey is associated with a subnet.

Implements rm_ble_mesh_access_api_t::deleteNetKey.

Example:

```
/* Delete NetKey. */
   err = RM_BLE_MESH_ACCESS_DeleteNetKey(&g_ble_mesh_access0_ctrl, subnet_handle);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_BLE_MESH_ACCESS_GetNetKey()

fsp_err_t RM_BLE_MESH_ACCESS_GetNetKey ( rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *subnet_handle*, uint8_t *const *p_net_key* )

To get NetKey. This routine fetches a NetKey entry. Each NetKey is associated with a subnet.

Implements rm_ble_mesh_access_api_t::getNetKey.

Example:

```
/* Close the module. */
   err = RM_BLE_MESH_ACCESS_GetNetKey(&g_ble_mesh_access0_ctrl, subnet_handle,
&net_key);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_net_key is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |

### ◆ RM_BLE_MESH_ACCESS_GetNetKeyIndexList()

fsp_err_t RM_BLE_MESH_ACCESS_GetNetKeyIndexList ( rm_ble_mesh_access_ctrl_t *const *p_ctrl*, uint16_t *const *p_netkey_count*, uint16_t *const *p_netkey_index_list* )

To get list of all known NetKeys. This routine returns a list of known NetKey Indices.

Implements rm_ble_mesh_access_api_t::getNetKeyIndexList.

Example:

```
/* Get list of all known NetKeys. */
   err = RM_BLE_MESH_ACCESS_GetNetKeyIndexList(&g_ble_mesh_access0_ctrl,
&netkey_count, &netkey_index_list);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_netkey_count and p_netkey_index_list are NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |

### ◆ RM_BLE_MESH_ACCESS_LookUpNid()

fsp_err_t RM_BLE_MESH_ACCESS_LookUpNid ( rm_ble_mesh_access_ctrl_t *const *p_ctrl*, uint8_t *nid*, rm_ble_mesh_network_subnet_handle_t *const *p_subnet_handle*, rm_ble_mesh_access_associated_keys_t *const *p_key_set* )

To search for NID. This routine searches for matching NID in subnet table.

Implements rm_ble_mesh_access_api_t::lookUpNid.

Example:

```
/* Search for NID. */
   err = RM_BLE_MESH_ACCESS_LookUpNid(&g_ble_mesh_access0_ctrl, nid, &subnet_handle,
&key_set);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_subnet_handle and p_key_set are NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

### ◆ RM_BLE_MESH_ACCESS_LookUpNetworkId()

fsp_err_t RM_BLE_MESH_ACCESS_LookUpNetworkId ( rm_ble_mesh_access_ctrl_t *const *p_ctrl*, uint8_t const *const *p_network_id*, rm_ble_mesh_network_subnet_handle_t *const *p_subnet_handle*, rm_ble_mesh_access_associated_keys_t *const *p_key_set* )

To search for Network ID. This routine searches for matching Network ID in subnet table.

Implements rm_ble_mesh_access_api_t::lookUpNetworkId.

Example:

```
/* Search for NID. */
   err = RM_BLE_MESH_ACCESS_LookUpNid(&g_ble_mesh_access0_ctrl, nid, &subnet_handle,
&key_set);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_network_id, p_subnet_handle and p_key_set are NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

### ◆ RM_BLE_MESH_ACCESS_LookUpAid()

fsp_err_t RM_BLE_MESH_ACCESS_LookUpAid ( rm_ble_mesh_access_ctrl_t *const *p_ctrl*, uint8_t *aid*, rm_ble_mesh_network_appkey_handle_t *const *p_appkey_handle*, uint8_t *const *p_app_key* )

To search for AID. This routine searches for matching NID in subnet table.

Implements rm_ble_mesh_access_api_t::lookUpAid.

Example:

```
/* Search for AID. */
   err = RM_BLE_MESH_ACCESS_LookUpAid(&g_ble_mesh_access0_ctrl, aid, &appkey_handle,
&app_key);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_appkey_handle and p_app_key are NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

### ◆ RM_BLE_MESH_ACCESS_SetProvisioningData()

fsp_err_t RM_BLE_MESH_ACCESS_SetProvisioningData ( rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_provision_data_t const *const *p_prov_data* )

Set Provisioning Data. This routine configures the provisioning data with Access Layer.

Implements rm_ble_mesh_access_api_t::setProvisioningData.

Example:

```
/* Set provisioning data. */
   err = RM_BLE_MESH_ACCESS_SetProvisioningData(&g_ble_mesh_access0_ctrl,
&prov_data);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_prov_data is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

### ◆ RM_BLE_MESH_ACCESS_GetSubnetNid()

fsp_err_t RM_BLE_MESH_ACCESS_GetSubnetNid ( rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *handle*, uint8_t *const *p_nid* )

To get NID associated with a subnet. This routine fetches the NID associated with a subnet.

Implements rm_ble_mesh_access_api_t::getSubnetNid.

Example:

```
/* Get NID associated with a subnet. */
   err = RM_BLE_MESH_ACCESS_GetSubnetNid(&g_ble_mesh_access0_ctrl, subnet_handle,
&nid);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_nid is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

### ◆ RM_BLE_MESH_ACCESS_GetSubnetPrivacyKey()

fsp_err_t RM_BLE_MESH_ACCESS_GetSubnetPrivacyKey ( rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *handle*, uint8_t *const *p_privacy_key* )

To get Privacy Key associated with a subnet. This routine fetches the Privacy Key associated with a subnet.

Implements rm_ble_mesh_access_api_t::getSubnetPrivacyKey.

Example:

```
/* Get Privacy Key associated with a subnet. */
   err = RM_BLE_MESH_ACCESS_GetSubnetPrivacyKey(&g_ble_mesh_access0_ctrl,
subnet_handle, &privacy_key);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_privacy_key is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

### ◆ RM_BLE_MESH_ACCESS_GetSubnetNetworkId()

fsp_err_t RM_BLE_MESH_ACCESS_GetSubnetNetworkId ( rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *handle*, uint8_t *const *p_network_id* )

To get Network ID associated with a subnet. This routine fetches the Network ID associated with a subnet.

Implements rm_ble_mesh_access_api_t::getSubnetNetworkId.

Example:

```
/* Get Network ID associated with a subnet. */
   err = RM_BLE_MESH_ACCESS_GetSubnetNetworkId(&g_ble_mesh_access0_ctrl,
subnet_handle, &network_id);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_network_id is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

### ◆ RM_BLE_MESH_ACCESS_GetSubnetBeaconKey()

fsp_err_t RM_BLE_MESH_ACCESS_GetSubnetBeaconKey ( rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *handle*, uint8_t *const *p_beacon_key* )

To get Beacon Key associated with a subnet. This routine fetches the Beacon Key associated with a subnet.

Implements rm_ble_mesh_access_api_t::getSubnetBeaconKey.

Example:

```
/* Get Beacon Key associated with a subnet. */
   err = RM_BLE_MESH_ACCESS_GetSubnetBeaconKey(&g_ble_mesh_access0_ctrl,
subnet_handle, &beacon_key);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_beacon_key is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

### ◆ RM_BLE_MESH_ACCESS_GetSubnetIdentityKey()

fsp_err_t RM_BLE_MESH_ACCESS_GetSubnetIdentityKey ( rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *handle*, uint8_t *const *p_identity_key* )

To get Identity Key associated with a subnet. This routine fetches the Identity Key associated with a subnet.

Implements rm_ble_mesh_access_api_t::getSubnetIdentityKey.

Example:

```
/* Get Identity Key associated with a subnet. */
   err = RM_BLE_MESH_ACCESS_GetSubnetIdentityKey(&g_ble_mesh_access0_ctrl,
subnet_handle, &identity_key);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_identity_key is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

### ◆ RM_BLE_MESH_ACCESS_GetSubnetEncryptionKey()

fsp_err_t RM_BLE_MESH_ACCESS_GetSubnetEncryptionKey ( rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *handle*, uint8_t *const *p_encrypt_key* )

To get Encryption Key associated with a subnet. This routine fetches the Encryption Key associated with a subnet.

Implements rm_ble_mesh_access_api_t::getSubnetEncryptionKey.

Example:

```
/* Get Encryption Key associated with a subnet. */
   err = RM_BLE_MESH_ACCESS_GetSubnetEncryptionKey(&g_ble_mesh_access0_ctrl,
subnet_handle, &encrypt_key);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_encrypt_key is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

### ◆ RM_BLE_MESH_ACCESS_GetNodeIdentity()

fsp_err_t RM_BLE_MESH_ACCESS_GetNodeIdentity ( rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *subnet_handle*, uint8_t *const *p_id_state* )

To get Node Identity. This routine gets Node Identity State of a node

Implements rm_ble_mesh_access_api_t::getNodeIdentity.

Example:

```
/* Get node identity. */
   err = RM_BLE_MESH_ACCESS_GetNodeIdentity(&g_ble_mesh_access0_ctrl, subnet_handle,
&id_state);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_id_state is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |

### ◆ RM_BLE_MESH_ACCESS_SetNodeIdentity()

fsp_err_t RM_BLE_MESH_ACCESS_SetNodeIdentity ( rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *subnet_handle*, uint8_t *const *p_id_state* )

To set Node Identity. This routine sets Node Identity State of a node.

Implements rm_ble_mesh_access_api_t::setNodeIdentity.

Example:

```
/* Set node identity. */
   err = RM_BLE_MESH_ACCESS_SetNodeIdentity(&g_ble_mesh_access0_ctrl, subnet_handle,
&id_state);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_id_state is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |

### ◆ RM_BLE_MESH_ACCESS_GetKeyRefreshPhase()

fsp_err_t RM_BLE_MESH_ACCESS_GetKeyRefreshPhase ( rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *subnet_handle*, uint8_t *const *p_key_refresh_state* )

To get Key Refresh Phase. This routine gets Key Refresh Phase State of a node

Implements rm_ble_mesh_access_api_t::getKeyRefreshPhase.

Example:

```
/* Get key refresh phase. */
   err = RM_BLE_MESH_ACCESS_GetKeyRefreshPhase(&g_ble_mesh_access0_ctrl,
subnet_handle, &key_refresh_state);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_key_refresh_state is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |

### ◆ RM_BLE_MESH_ACCESS_SetKeyRefreshPhase()

fsp_err_t RM_BLE_MESH_ACCESS_SetKeyRefreshPhase ( rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *subnet_handle*, uint8_t const *const *p_key_refresh_state* )

To set Key Refresh Phase. This routine sets Key Refresh Phase State of a node.

Implements rm_ble_mesh_access_api_t::setKeyRefreshPhase.

Example:

```
/* Set key refresh phase. */
   err = RM_BLE_MESH_ACCESS_SetKeyRefreshPhase(&g_ble_mesh_access0_ctrl,
subnet_handle, &key_refresh_state);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_key_refresh_state is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |

### ◆ RM_BLE_MESH_ACCESS_SetTransmitState()

fsp_err_t RM_BLE_MESH_ACCESS_SetTransmitState ( rm_ble_mesh_access_ctrl_t *const *p_ctrl*, uint8_t *tx_state_type*, uint8_t *tx_state* )

To set Network/Relay Transmit state. This routine sets Network/Relay Transmit state.

Implements rm_ble_mesh_access_api_t::setTransmitState.

Example:

```
/* Set network/relay transmit state. */
   err = RM_BLE_MESH_ACCESS_SetTransmitState(&g_ble_mesh_access0_ctrl,
tx_state_type, tx_state);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_BLE_MESH_ACCESS_GetTransmitState()

fsp_err_t RM_BLE_MESH_ACCESS_GetTransmitState ( rm_ble_mesh_access_ctrl_t *const *p_ctrl*, uint8_t *tx_state_type*, uint8_t *const *p_tx_state* )

To get Network/Relay Transmit state. This routine gets Network/Relay Transmit state.

Implements rm_ble_mesh_access_api_t::getTransmitState.

Example:

```
/* Get network/relay transmit state. */
   err = RM_BLE_MESH_ACCESS_GetTransmitState(&g_ble_mesh_access0_ctrl,
tx_state_type, &tx_state);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_tx_state is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_BLE_MESH_ACCESS_AddAppKey()

fsp_err_t RM_BLE_MESH_ACCESS_AddAppKey ( rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *subnet_handle*, uint16_t *appkey_index*, uint8_t const *const *p_app_key* )

To add AppKey. This routine adds AppKey entry. Each AppKey is associated with a subnet.

Implements rm_ble_mesh_access_api_t::addAppKey.

Example:

```
/* Add AppKey. */
   err = RM_BLE_MESH_ACCESS_AddAppKey(&g_ble_mesh_access0_ctrl, subnet_handle,
appkey_index, &app_key);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_app_key is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

### ◆ RM_BLE_MESH_ACCESS_UpdateAppKey()

fsp_err_t RM_BLE_MESH_ACCESS_UpdateAppKey ( rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *subnet_handle*, uint16_t *appkey_index*, uint8_t const *const *p_app_key* )

To update AppKey. This routine updates AppKey entry. Each AppKey is associated with a subnet.

Implements rm_ble_mesh_access_api_t::updateAppKey.

Example:

```
/* Update AppKey. */
   err = RM_BLE_MESH_ACCESS_UpdateAppKey(&g_ble_mesh_access0_ctrl, subnet_handle,
appkey_index, &app_key);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_app_key is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

### ◆ RM_BLE_MESH_ACCESS_DeleteAppKey()

fsp_err_t RM_BLE_MESH_ACCESS_DeleteAppKey ( rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *subnet_handle*, uint16_t *appkey_index*, uint8_t const *const *p_app_key* )

To delete AppKey. This routine deletes AppKey entry. Each AppKey is associated with a subnet.

Implements rm_ble_mesh_access_api_t::deleteAppKey.

Example:

```
/* Delete AppKey. */
   err = RM_BLE_MESH_ACCESS_DeleteAppKey(&g_ble_mesh_access0_ctrl, subnet_handle,
appkey_index, &app_key);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_app_key is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

### ◆ RM_BLE_MESH_ACCESS_GetAppKeyHandle()

fsp_err_t RM_BLE_MESH_ACCESS_GetAppKeyHandle ( rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *subnet_handle*, uint16_t *appkey_index*, uint8_t const *const *p_app_key*, rm_ble_mesh_network_appkey_handle_t *const *p_appkey_handle* )

To get AppKey Handle for a given AppKey Index. This routine gets AppKey Handle for a given AppKey Index. Each AppKey is associated with a subnet.

Implements rm_ble_mesh_access_api_t::getAppKeyHandle.

Example:

```
/* Get AppKey handle for a given AppKey index. */
   err = RM_BLE_MESH_ACCESS_GetAppKeyHandle(&g_ble_mesh_access0_ctrl,
                                            subnet_handle,
                                            appkey_index,
                                            &app_key,
                                            &appkey_handle);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_appkey_handle is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |

### ◆ RM_BLE_MESH_ACCESS_GetAppKeyIndexList()

fsp_err_t RM_BLE_MESH_ACCESS_GetAppKeyIndexList ( rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *subnet_handle*, uint16_t *const *p_appkey_count*, uint16_t *const *p_appkey_index_list* )

To get list of all known AppKeys. This routine returns a list of known AppKey Indices associated with a subnet.

Implements rm_ble_mesh_access_api_t::getAppKeyIndexList.

Example:

```
/* Get list of all known AppKeys. */
   err = RM_BLE_MESH_ACCESS_GetAppKeyIndexList(&g_ble_mesh_access0_ctrl,
                                               subnet_handle,
                                                &appkey_count,
                                                &appkey_index_list);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_appkey_count and p_appkey_index_list are NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |

### ◆ RM_BLE_MESH_ACCESS_BindModelWithAppKey()

fsp_err_t RM_BLE_MESH_ACCESS_BindModelWithAppKey ( rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *model_handle*, uint16_t *appkey_index* )

To bind a model with an AppKey. This routine binds a model with an AppKey.

Implements rm_ble_mesh_access_api_t::bindModelWithAppKey.

Example:

```
/* Bind a model with an AppKey. */
   err = RM_BLE_MESH_ACCESS_BindModelWithAppKey(&g_ble_mesh_access0_ctrl,
model_handle, appkey_index);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |

### ◆ RM_BLE_MESH_ACCESS_UnbindModelWithAppKey()

fsp_err_t RM_BLE_MESH_ACCESS_UnbindModelWithAppKey ( rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *model_handle*, uint16_t *appkey_index* )

To unbind a model with an AppKey. This routine unbinds a model with an AppKey.

Implements rm_ble_mesh_access_api_t::unbindModelWithAppKey.

Example:

```
/* Unbind a model with an AppKey. */
   err = RM_BLE_MESH_ACCESS_UnbindModelWithAppKey(&g_ble_mesh_access0_ctrl,
model_handle, appkey_index);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |

### ◆ RM_BLE_MESH_ACCESS_GetModelAppKeyList()

fsp_err_t RM_BLE_MESH_ACCESS_GetModelAppKeyList ( rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *model_handle*, uint16_t *const *p_appkey_count*, uint16_t *const *p_appkey_index_list* )

To get list of all AppKeys associated with a model. This routine returns a list of known AppKey Indices associated with a model.

Implements rm_ble_mesh_access_api_t::getModelAppKeyList.

Example:

```
/* Get list of all AppKeys associated with a model. */
   err = RM_BLE_MESH_ACCESS_GetModelAppKeyList(&g_ble_mesh_access0_ctrl,
                                               model_handle,
                                               &appkey_count,
                                               &appkey_index_list);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_appkey_count and p_appkey_index_list are NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |

### ◆ RM_BLE_MESH_ACCESS_SetModelPublication()

fsp_err_t RM_BLE_MESH_ACCESS_SetModelPublication ( rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *model_handle*, rm_ble_mesh_access_publish_info_t *const *p_publish_info* )

To set Publication information associated with a model. This routine sets Publication information associated with a model.

Implements rm_ble_mesh_access_api_t::setModelPublication.

Example:

```
/* Set publication information associated with a model. */
   err = RM_BLE_MESH_ACCESS_SetModelPublication(&g_ble_mesh_access0_ctrl,
model_handle, &publish_info);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_publish_info is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |

### ◆ RM_BLE_MESH_ACCESS_SetModelPublicationPeriodDivisor()

fsp_err_t RM_BLE_MESH_ACCESS_SetModelPublicationPeriodDivisor ( rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *model_handle*, uint8_t *period_divisor* )

To set Publication Fast Period Divisor information associated with a model. This routine sets Publication Fast Period Divisor information associated with a model.

Implements rm_ble_mesh_access_api_t::setModelPublicationPeriodDivisor.

Example:

```
/* Set publication fast period divisor information associated with a model. */
   err =
RM_BLE_MESH_ACCESS_SetModelPublicationPeriodDivisor(&g_ble_mesh_access0_ctrl,
model_handle, period_divisor);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

### ◆ RM_BLE_MESH_ACCESS_GetModelPublication()

fsp_err_t RM_BLE_MESH_ACCESS_GetModelPublication ( rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *model_handle*, rm_ble_mesh_access_publish_info_t *const *p_publish_info* )

To get Publication information associated with a model. This routine returns Publication information associated with a model.

Implements rm_ble_mesh_access_api_t::getModelPublication.

Example:

```
/* Get publication information associated with a model. */
   err = RM_BLE_MESH_ACCESS_GetModelPublication(&g_ble_mesh_access0_ctrl,
model_handle, &publish_info);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_publish_info is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |

### ◆ RM_BLE_MESH_ACCESS_AddModelSubscription()

fsp_err_t RM_BLE_MESH_ACCESS_AddModelSubscription ( rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *model_handle*, rm_ble_mesh_access_address_t const *const *p_sub_addr* )

To add an address to a model subscription list. This routine adds an address to a subscription list of a model.

Implements rm_ble_mesh_access_api_t::addModelSubscription.

Example:

```
/* Add an address to a model subscription list. */
   err = RM_BLE_MESH_ACCESS_AddModelSubscription(&g_ble_mesh_access0_ctrl,
model_handle, &sub_addr);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_sub_addr is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |

### ◆ RM_BLE_MESH_ACCESS_DeleteModelSubscription()

fsp_err_t RM_BLE_MESH_ACCESS_DeleteModelSubscription ( rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *model_handle*, rm_ble_mesh_access_address_t const *const *p_sub_addr* )

To delete an address to a model subscription list. This routine deletes an address to a subscription list of a model.

Implements rm_ble_mesh_access_api_t::deleteModelSubscription.

Example:

```
/* Delete an address to a model subscription list. */
   err = RM_BLE_MESH_ACCESS_DeleteModelSubscription(&g_ble_mesh_access0_ctrl,
model_handle, &sub_addr);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_sub_addr is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

### ◆ RM_BLE_MESH_ACCESS_DeleteAllModelSubscription()

fsp_err_t RM_BLE_MESH_ACCESS_DeleteAllModelSubscription ( rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *model_handle* )

To discard a model subscription list. This routine discards a subscription list of a model.

Implements rm_ble_mesh_access_api_t::deleteAllModelSubscription.

Example:

```
/* Discard a model subscription list. */
   err = RM_BLE_MESH_ACCESS_DeleteAllModelSubscription(&g_ble_mesh_access0_ctrl,
model_handle);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |

### ◆ RM_BLE_MESH_ACCESS_GetModelSubscriptionList()

fsp_err_t RM_BLE_MESH_ACCESS_GetModelSubscriptionList ( rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *model_handle*, uint16_t *const *p_sub_addr_count*, uint16_t *const *p_sub_addr_list* )

To get list of subscription addresses of a model. This routine returns a list of subscription addresses of a model.

Implements rm_ble_mesh_access_api_t::getModelSubscriptionList.

Example:

```
/* Get list of subscription addresses of a model. */
   err = RM_BLE_MESH_ACCESS_GetModelSubscriptionList(&g_ble_mesh_access0_ctrl,
                                                     model_handle,
                                                         &sub_addr_count,
                                                         &sub_addr_list);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_sub_addr_count and p_sub_addr_list are NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |

### ◆ RM_BLE_MESH_ACCESS_GetAllModelSubscriptionList()

fsp_err_t RM_BLE_MESH_ACCESS_GetAllModelSubscriptionList ( rm_ble_mesh_access_ctrl_t *const *p_ctrl*, uint16_t *const *p_sub_addr_count*, uint16_t *const *p_sub_addr_list* )

To get list of subscription addresses of all the models. This routine returns a consolidated list of subscription addresses of all the models.

Implements rm_ble_mesh_access_api_t::getAllModelSubscriptionList.

Example:

```
/* Get list of subscription addresses of all the models. */
   err = RM_BLE_MESH_ACCESS_GetAllModelSubscriptionList(&g_ble_mesh_access0_ctrl,
&sub_addr_count, &sub_addr_list);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_sub_addr_count and p_sub_addr_list are NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

### ◆ RM_BLE_MESH_ACCESS_IsValidElementAddress()

fsp_err_t RM_BLE_MESH_ACCESS_IsValidElementAddress ( rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_address_t *addr* )

To check if valid element address to receive a packet. This routine checks if destination address in a received packet matches with any of the known element address of local or friend device.

Implements rm_ble_mesh_access_api_t::isValidElementAddress.

Example:

```
/* Check if valid element address to receive a packet. */
   err = RM_BLE_MESH_ACCESS_IsValidElementAddress(&g_ble_mesh_access0_ctrl, addr);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |

### ◆ RM_BLE_MESH_ACCESS_IsFixedGroupAddressToBeProcessed()

fsp_err_t RM_BLE_MESH_ACCESS_IsFixedGroupAddressToBeProcessed ( rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_address_t *addr* )

To check if Fixed Group Address in receive packet to be processed. This routine checks if destination address in a received packet as a Fixed Group Address to be processed.

Implements rm_ble_mesh_access_api_t::isFixedGroupAddressToBeProcessed.

Example:

```
/* Check if fixed group address in receive packet to be processed. */
   err =
RM_BLE_MESH_ACCESS_IsFixedGroupAddressToBeProcessed(&g_ble_mesh_access0_ctrl, addr);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_BLE_MESH_ACCESS_IsValidSubscriptionAddress()

fsp_err_t RM_BLE_MESH_ACCESS_IsValidSubscriptionAddress ( rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_address_t *addr* )

To check if valid subscription address to receive a packet. This routine checks if destination address in a received packet matches with any of the known subscription address of local or friend device.

Implements rm_ble_mesh_access_api_t::isValidSubscriptionAddress.

Example:

```
/* Check if valid subscription address to receive a packet. */
   err = RM_BLE_MESH_ACCESS_IsValidSubscriptionAddress(&g_ble_mesh_access0_ctrl,
addr);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |

### ◆ RM_BLE_MESH_ACCESS_EnableIvUpdateTestMode()

fsp_err_t RM_BLE_MESH_ACCESS_EnableIvUpdateTestMode ( rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_iv_update_test_mode_t *mode* )

To set the IV Update Test Mode feature. This routine is used to set the IV Update Test Mode flag.

Implements rm_ble_mesh_access_api_t::enableIvUpdateTestMode.

Example:

```
/* Set the IV update test mode feature. */
   err = RM_BLE_MESH_ACCESS_EnableIvUpdateTestMode(&g_ble_mesh_access0_ctrl, mode);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

## BLE Mesh Network Bearer (rm_ble_mesh_bearer)

Modules » Networking » BLE Mesh Network Modules

### Functions

| | |
|---|---|
| fsp_err_t | RM_BLE_MESH_BEARER_Open (rm_ble_mesh_bearer_ctrl_t *const p_ctrl, rm_ble_mesh_bearer_cfg_t const *const p_cfg) |
| fsp_err_t | RM_BLE_MESH_BEARER_Close (rm_ble_mesh_bearer_ctrl_t *const p_ctrl) |
| fsp_err_t | RM_BLE_MESH_BEARER_RegisterInterface (rm_ble_mesh_bearer_ctrl_t *const p_ctrl, rm_ble_mesh_bearer_type_t brr_type, rm_ble_mesh_bearer_ntf_callback_result_t (*p_callback)(rm_ble_mesh_bearer_ntf_callback_args_t *p_args)) |
| fsp_err_t | RM_BLE_MESH_BEARER_RegisterBeaconHandler (rm_ble_mesh_bearer_ctrl_t *const p_ctrl, rm_ble_mesh_bearer_beacon_type_t bcon_type, void(*p_handler)(rm_ble_mesh_bearer_beacon_callback_args_t *p_args)) |

### Detailed Description

# Overview

### Target Devices

The BLE Mesh Network Bearer module supports the following devices.

- RA4W1

# Configuration

### Build Time Configurations for rm_ble_mesh_bearer

The following build time configurations are defined in fsp_cfg/rm_ble_mesh_bearer_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|

### Configurations for Networking > BLE Mesh Network modules > BLE Mesh Bearer (rm_ble_mesh_bearer)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Bearer (rm_ble_mesh_bearer).

| Configuration | Options | Default | Description |
|---|---|---|---|
| General | | | |
| Name | Name Must Be a Valid C Symbol | g_rm_ble_mesh_bearer0 | Module name. |
| Channel Number | Invalid Channel Number | 0 | Select channel corresponding to the channel number of the hardware. |

### Data Structures

| | |
|---|---|
| struct | rm_ble_mesh_bearer_instance_ctrl_t |

### Data Structure Documentation

#### ◆ rm_ble_mesh_bearer_instance_ctrl_t

| struct rm_ble_mesh_bearer_instance_ctrl_t |
|---|
| RM_BLE_MESH_BEARER private control block. DO NOT MODIFY. Initialization occurs when RM_BLE_MESH_BEARER_Open() is called. |

### Function Documentation

#### ◆ RM_BLE_MESH_BEARER_Open()

fsp_err_t RM_BLE_MESH_BEARER_Open ( rm_ble_mesh_bearer_ctrl_t *const *p_ctrl*, rm_ble_mesh_bearer_cfg_t const *const *p_cfg* )

Open bearer middleware.

Implements rm_ble_mesh_bearer_api_t::open.

Example:

```
/* Open the module. */
   err = RM_BLE_MESH_BEARER_Open(&g_ble_mesh_bearer0_ctrl, &g_ble_mesh_bearer0_cfg);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Module opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |

#### ◆ RM_BLE_MESH_BEARER_Close()

fsp_err_t RM_BLE_MESH_BEARER_Close ( rm_ble_mesh_bearer_ctrl_t *const *p_ctrl*)

Close bearer middleware. Implements rm_ble_mesh_bearer_api_t::close.

Example:

```
/* Open the module. */
   err = RM_BLE_MESH_BEARER_Close(&g_ble_mesh_bearer0_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Module successfully closed. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Lower layer is invalid state. |

### ◆ RM_BLE_MESH_BEARER_RegisterInterface()

fsp_err_t RM_BLE_MESH_BEARER_RegisterInterface ( rm_ble_mesh_bearer_ctrl_t *const *p_ctrl*, rm_ble_mesh_bearer_type_t *brr_type*, rm_ble_mesh_bearer_ntf_callback_result_t(*)( rm_ble_mesh_bearer_ntf_callback_args_t *p_args) *p_callback* )

Register interface with Bearer Layer. This routine registers interface with the Bearer Layer. Bearer Layer supports single Application, hence this rouine shall be called once.

Implements rm_ble_mesh_bearer_api_t::registerInterface.

Example:

```
/* Register Bearer interface. */
   err = RM_BLE_MESH_BEARER_RegisterInterface(&g_ble_mesh_bearer0_ctrl, brr_type,
rm_ble_mesh_bearer_ntf_callback);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

### ◆ RM_BLE_MESH_BEARER_RegisterBeaconHandler()

fsp_err_t RM_BLE_MESH_BEARER_RegisterBeaconHandler ( rm_ble_mesh_bearer_ctrl_t *const *p_ctrl*, rm_ble_mesh_bearer_beacon_type_t *bcon_type*, void(*)(rm_ble_mesh_bearer_beacon_callback_args_t *p_args) *p_handler* )

Register beacon interface with Bearer Layer. This routine registers interface with the Bearer Layer to process Beacons. Bearer Layer supports single Application, hence this rouine shall be called once.

Implements rm_ble_mesh_bearer_api_t::registerBeaconHandler.

Example:

```
/* Register beacon handler. */
   err = RM_BLE_MESH_BEARER_RegisterBeaconHandler(&g_ble_mesh_bearer0_ctrl,
RM_BLE_MESH_BEARER_TYPE_BCON,
                                                  rm_ble_mesh_bearer_beacon_callback
);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_BLE_MESH_BEARER_AddBearer()

fsp_err_t RM_BLE_MESH_BEARER_AddBearer ( rm_ble_mesh_bearer_ctrl_t *const *p_ctrl*, rm_ble_mesh_bearer_type_t *brr_type*, rm_ble_mesh_bearer_info_t const *const *p_brr_info*, rm_ble_mesh_bearer_handle_t *const *p_brr_handle* )

Add a bearer to Bearer Layer. This routine adds a bearer that is setup by the application for use by the Mesh Stack. Bearer Layer supports single Application, hence this rouine shall be called once.

Implements rm_ble_mesh_bearer_api_t::addBearer.

Example:

```
/* Add Bearer. */
   err = RM_BLE_MESH_BEARER_AddBearer(&g_ble_mesh_bearer0_ctrl,
RM_BLE_MESH_BEARER_TYPE_BCON, &brr_info, &brr_handle);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_brr_info and p_brr_handle are NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_BLE_MESH_BEARER_RemoveBearer()

fsp_err_t RM_BLE_MESH_BEARER_RemoveBearer ( rm_ble_mesh_bearer_ctrl_t *const *p_ctrl*, rm_ble_mesh_bearer_type_t *brr_type*, rm_ble_mesh_bearer_handle_t const *const *p_brr_handle* )

Remove a bearer from Bearer Layer. This routine removes a bearer from the Mesh Stack. Bearer Layer supports single Application, hence this rouine shall be called once.

Implements rm_ble_mesh_bearer_api_t::removeBearer.

Example:

```
/* Remove Bearer. */
   err = RM_BLE_MESH_BEARER_RemoveBearer(&g_ble_mesh_bearer0_ctrl,
RM_BLE_MESH_BEARER_TYPE_BCON, &brr_handle);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_brr_handle is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_BLE_MESH_BEARER_ObserveBeacon()

fsp_err_t RM_BLE_MESH_BEARER_ObserveBeacon ( rm_ble_mesh_bearer_ctrl_t *const *p_ctrl*, uint8_t *bcon_type*, uint8_t *enable* )

Observe on/off for the beacon type. This routine sends enables/disables the observation procedure for the given beacon type.

Implements rm_ble_mesh_bearer_api_t::observeBeacon.

Example:

```
/* Observe beacon. */
   err = RM_BLE_MESH_BEARER_ObserveBeacon(&g_ble_mesh_bearer0_ctrl, bcon_type,
enable);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_BLE_MESH_BEARER_BcastUnprovisionedBeacon()

fsp_err_t RM_BLE_MESH_BEARER_BcastUnprovisionedBeacon ( rm_ble_mesh_bearer_ctrl_t *const *p_ctrl*, uint8_t *type*, uint8_t const *const *p_dev_uuid*, uint16_t *oob_info*, rm_ble_mesh_buffer_t const *const *p_uri* )

API to send unprovisioned device beacon. This routine sends Unprovisioned Device Beacon.

Implements rm_ble_mesh_bearer_api_t::bcastUnprovisionedBeacon.

Example:

```
/* Broadcast unprovisioned beacon. */
   err = RM_BLE_MESH_BEARER_BcastUnprovisionedBeacon(&g_ble_mesh_bearer0_ctrl, type,
&dev_uuid, oob_info, &uri);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_dev_uuid and p_uri are NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_BLE_MESH_BEARER_BroadcastBeacon()

fsp_err_t RM_BLE_MESH_BEARER_BroadcastBeacon ( rm_ble_mesh_bearer_ctrl_t *const *p_ctrl*, uint8_t *type*, uint8_t const *const *p_packet*, uint16_t *length* )

API to broadcast a beacon. This routine sends the beacon of given type on Adv and GATT bearers.

Implements rm_ble_mesh_bearer_api_t::broadcastBeacon.

Example:

```
/* Broadcast beacon. */
   err = RM_BLE_MESH_BEARER_BroadcastBeacon(&g_ble_mesh_bearer0_ctrl, type, &packet,
length);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_packet is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Lower layer is invalid state. |

### ◆ RM_BLE_MESH_BEARER_StartProxyAdv()

fsp_err_t RM_BLE_MESH_BEARER_StartProxyAdv ( rm_ble_mesh_bearer_ctrl_t *const *p_ctrl*, uint8_t *type*, uint8_t const *const *p_data*, uint16_t *datalen* )

API to send proxy device ADV. This routine sends Proxy Device ADV.

Implements rm_ble_mesh_bearer_api_t::startProxyAdv.

Example:

```
/* Start proxy advertising. */
   err = RM_BLE_MESH_BEARER_StartProxyAdv(&g_ble_mesh_bearer0_ctrl, type, &data,
length);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_data is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Lower layer is invalid state. |

### ◆ RM_BLE_MESH_BEARER_SendPdu()

fsp_err_t RM_BLE_MESH_BEARER_SendPdu ( rm_ble_mesh_bearer_ctrl_t *const *p_ctrl*, rm_ble_mesh_bearer_handle_t const *const *p_brr_handle*, rm_ble_mesh_bearer_type_t *brr_type*, rm_ble_mesh_buffer_t const *const *p_buffer* )

Send a bearer PDU. This routine sends a PDU from the Mesh stack to over the bearer indicated by the bearer handle.

Implements rm_ble_mesh_bearer_api_t::sendPdu.

Example:

```
/* Send common Bearer PDUs. */
   err = RM_BLE_MESH_BEARER_SendPdu(&g_ble_mesh_bearer0_ctrl, &brr_handle,
RM_BLE_MESH_BEARER_TYPE_BCON, &buffer);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_brr_handle and p_buffer are NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

### ◆ RM_BLE_MESH_BEARER_GetPacketRssi()

fsp_err_t RM_BLE_MESH_BEARER_GetPacketRssi ( rm_ble_mesh_bearer_ctrl_t *const *p_ctrl*, uint8_t * *p_rssi_value* )

Get the RSSI of current received packet being processed. This routine returns the RSSI value of the received packet in its context when called from the Mesh stack.

Implements rm_ble_mesh_bearer_api_t::getPacketRssi.

Example:

```
/* Get the RSSI of current received packet being processed. */
   err = RM_BLE_MESH_BEARER_GetPacketRssi(&g_ble_mesh_bearer0_ctrl, &rssi_value);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_rssi_value is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_BLE_MESH_BEARER_Sleep()

fsp_err_t RM_BLE_MESH_BEARER_Sleep ( rm_ble_mesh_bearer_ctrl_t *const *p_ctrl*)

Put the bearer to sleep. This routine requests the underlying bearer interface to sleep. Default bearer interface is that of advertising bearer.

Implements rm_ble_mesh_bearer_api_t::sleep.

Example:

```
/* Put the bearer to sleep. */
   err = RM_BLE_MESH_BEARER_Sleep(&g_ble_mesh_bearer0_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_BLE_MESH_BEARER_Wakeup()

fsp_err_t RM_BLE_MESH_BEARER_Wakeup ( rm_ble_mesh_bearer_ctrl_t *const *p_ctrl*, uint8_t *mode* )

Wakeup the bearer. This routine requests the underlying bearer interface to wakeup. Default bearer interface is that of advertising bearer.

Implements rm_ble_mesh_bearer_api_t::wakeup.

Example:

```
/* Wakeup the bearer. */
   err = RM_BLE_MESH_BEARER_Wakeup(&g_ble_mesh_bearer0_ctrl, mode);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

## BLE Mesh Network Bearer Platform (rm_mesh_bearer_platform)

Modules » Networking » BLE Mesh Network Modules

### Functions

| | |
|---|---|
| fsp_err_t | RM_MESH_BEARER_PLATFORM_Open (rm_mesh_bearer_platform_ctrl_t *const p_ctrl, rm_mesh_bearer_platform_cfg_t const *const p_cfg) |
| fsp_err_t | RM_MESH_BEARER_PLATFORM_Close (rm_mesh_bearer_platform_ctrl_t *const p_ctrl) |
| fsp_err_t | RM_MESH_BEARER_PLATFORM_Setup (rm_mesh_bearer_platform_ctrl_t *const p_ctrl) |
| fsp_err_t | RM_MESH_BEARER_PLATFORM_CallbackSet (rm_mesh_bearer_platform_ctrl_t *const p_ctrl, rm_mesh_bearer_platform_gatt_iface_cb_t callback) |
| fsp_err_t | RM_MESH_BEARER_PLATFORM_SetGattMode (rm_mesh_bearer_platform_ctrl_t *const p_ctrl, rm_mesh_bearer_platform_gatt_mode_t mode) |
| fsp_err_t | RM_MESH_BEARER_PLATFORM_GetGattMode (rm_mesh_bearer_platform_ctrl_t *const p_ctrl, rm_mesh_bearer_platform_gatt_mode_t *p_mode) |

| | |
|---|---|
| fsp_err_t | RM_MESH_BEARER_PLATFORM_SetScanResponseData (rm_mesh_bearer_platform_ctrl_t *const p_ctrl, uint8_t *p_data, uint8_t len) |
| fsp_err_t | RM_MESH_BEARER_PLATFORM_ScanGattBearer (rm_mesh_bearer_platform_ctrl_t *const p_ctrl, rm_mesh_bearer_platform_state_t state, rm_mesh_bearer_platform_gatt_mode_t mode) |
| fsp_err_t | RM_MESH_BEARER_PLATFORM_Connect (rm_mesh_bearer_platform_ctrl_t *const p_ctrl, uint8_t *p_remote_address, uint8_t address_type, rm_mesh_bearer_platform_gatt_mode_t mode) |
| fsp_err_t | RM_MESH_BEARER_PLATFORM_DiscoverService (rm_mesh_bearer_platform_ctrl_t *const p_ctrl, uint16_t handle, rm_mesh_bearer_platform_gatt_mode_t mode) |
| fsp_err_t | RM_MESH_BEARER_PLATFORM_ConfigureNotification (rm_mesh_bearer_platform_ctrl_t *const p_ctrl, uint16_t handle, rm_mesh_bearer_platform_state_t state, rm_mesh_bearer_platform_gatt_mode_t mode) |
| fsp_err_t | RM_MESH_BEARER_PLATFORM_Disconnect (rm_mesh_bearer_platform_ctrl_t *const p_ctrl, uint16_t handle) |

**Detailed Description**

# Overview

### Target Devices

The BLE Mesh Network Bearer Platform module supports the following devices.

- RA4W1

# Configuration

### Build Time Configurations for rm_mesh_bearer_platform

The following build time configurations are defined in fsp_cfg/rm_mesh_bearer_platform_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Debug Public Address | Must be a valid device address | FF:FF:FF:50:90:74 | Public Address of firmware initial value. |
| Debug Random Address | Must be a valid device address | FF:FF:FF:FF:FF:FF | Random Address of firmware initial value. |
| Maximum number of | Value must be an | 7 | Maximum number of |

| | | | |
|---|---|---|---|
| connections | integer between 1 and 7, and lower than the value defined in ble module. | | connections. |
| Maximum connection data length | Value must be an integer between 27 and 251, and lower than the value defined in ble module. | 251 | Maximum connection data length. |
| Maximum advertising data length | Value must be an integer between 31 and 1650, and lower than the value defined in ble module. | 1650 | Maximum advertising data length. |
| Maximum advertising set number | Value must be an integer between 1 and 4, and lower than the value defined in ble module. | 4 | Maximum advertising set number. |
| Maximum periodic sync set number. | Value must be an integer between 1 and 2, and lower than the value defined in ble module. | 2 | Maximum periodic sync set number. |
| Store Security Data | • Disable<br>• Enable | Disable | Store Security Data in DataFlash. |
| Data Flash Block for Security Data | Value must be an integer between 0 and 7, and lower than the value defined in ble module. | 0 | Data Flash Block for Security Data Management. |
| Remote Device Bonding Number | Value must be an integer between 1 and 7, and lower than the value defined in ble module. | 7 | Number of remote device bonding information. |
| Connection Event Start Notify | • Disable<br>• Enable | Disable | Set Connection event start notify enable/disable. |
| Connection Event Close Notify | • Disable<br>• Enable | Disable | Set Connection event close notify enable/disable. |
| Advertising Event Start Notify | • Disable<br>• Enable | Disable | Set Advertising event start notify enable/disable. |
| Advertising Event Close Notify | • Disable<br>• Enable | Disable | Set Advertising event close notify enable/disable. |

| | | | |
|---|---|---|---|
| Scanning Event Start Notify | • Disable<br>• Enable | Disable | Set Scanning event start notify enable/disable. |
| Scanning Event Close Notify | • Disable<br>• Enable | Disable | Set Scanning event close notify enable/disable. |
| Initiating Event Start Notify | • Disable<br>• Enable | Disable | Set Initiating event start notify enable/disable. |
| Initiating Event Close Notify | • Disable<br>• Enable | Disable | Set Initiating event close notify enable/disable. |
| RF Deep Sleep Start Notify | • Disable<br>• Enable | Disable | Set RF_DEEP_SLEEP start notify enable/disable. |
| RF Deep Sleep Wakeup Notify | • Disable<br>• Enable | Disable | Set RF_DEEP_SLEEP wakeup notify enable/disable. |
| Bluetooth dedicated clock | Value must be an integer between 0 and 15, and lower than the value defined in ble module. | 6 | Load capacitance adjustment. |
| DC-DC converter | • Disable<br>• Enable | Disable | Set DC-DC converter for RF part. |
| Slow Clock Source | • Use RF_LOCO<br>• Use External 32.768kHz | Use RF_LOCO | Set slow clock source for RF part. |
| MCU CLKOUT Port | • P109<br>• P205 | P109 | When MESH_BEARER_PLATFORM_CFG_RF_EXTERNAL_32K_ENABLE = 1, Set port of MCU CLKOUT. |
| MCU CLKOUT Frequency Output | • MCU CLKOUT frequency 32.768kHz<br>• MCU CLKOUT frequency 16.384kHz | MCU CLKOUT frequency 32.768kHz | When MESH_BEARER_PLATFORM_CFG_RF_EXTERNAL_32K_ENABLE = 1, set frequency output from CLKOUT of MCU part. |
| Sleep Clock Accuracy(SCA) | Value must be an integer between 0 and 500, and lower than the value defined in ble module. | 250 | When MESH_BEARER_PLATFORM_CFG_RF_EXTERNAL_32K_ENABLE = 1, set Sleep Clock Accuracy(SCA) for RF slow clock. |
| Transmission Power Maximum Value | • max +0dBm<br>• max +4dBm | max +4dBm | Set transmission power maximum value. |

| | | | |
|---|---|---|---|
| Transmission Power Default Value | • High 0dBm(Transmission Power Maximum Value = +0dBm) / +4dBm(Transmission Power Maximum Value = +4dBm)<br>• Mid 0dBm(Transmission Power Maximum Value = +0dBm) / 0dBm(Transmission Power Maximum Value = +4dBm)<br>• Low -18dBm(Transmission Power Maximum Value = +0dBm) / -20dBm(Transmission Power Maximum Value = +4dBm) | High 0dBm(Transmission Power Maximum Value = +0dBm) / +4dBm(Transmission Power Maximum Value = +4dBm) | Set default transmit power. Default transmit power is dependent on the configuration of Maximum transmission power(MESH_BEARER_PLATFORM_CFG_RF_MAX_TX_POW). |
| CLKOUT_RF Output | • No output<br>• 4MHz output<br>• 2MHz output<br>• 1MHz output | No output | Set CLKOUT_RF output setting. |
| RF_DEEP_SLEEP Transition | • Disable<br>• Enable | Enable | Set RF_DEEP_SLEEP transition. |
| MCU Main Clock Frequency | Value must be an integer between 1000 and 20000, and lower than the value defined in ble module. | 8000 | Set MCU Main Clock Frequency (kHz). Set clock source according to your board environment. HOCO: don't care. / Main Clock: 1000 to 20000 kHz / PLL Circuit: 4000 to 12500 kHz |
| Code Flash(ROM) Device Data Block | Value must be an integer between -1 and 255, and lower than the value defined in ble module. | 255 | Device specific data block on Code Flash (ROM). |
| Device Specific Data Flash Block | Value must be an integer between -1 and 7, and lower than the value defined in ble module. | -1 | Device specific data block on E2 Data Flash. |

| | | | |
|---|---|---|---|
| MTU Size Configured | Value must be an integer between 23 and 247, and lower than the value defined in ble module. | 247 | MTU Size configured by GATT MTU exchange procedure. |
| Timer Slot Maximum Number | Value must be an integer between 1 and 10, and lower than the value defined in ble module. | 10 | The maximum number of timer slot. |

**Configurations for Networking > BLE Mesh Network modules > BLE Mesh Bearer Platform (rm_mesh_bearer_platform)**

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Bearer Platform (rm_mesh_bearer_platform).

| Configuration | Options | Default | Description |
|---|---|---|---|
| General | | | |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_bearer_platform0 | Module name. |
| Channel Number | Invalid Channel Number | 0 | Select channel corresponding to the channel number of the hardware. |
| Device Address Type | Invalid Device Address Type | 0 | Select device address type ( public : 0, random : 1). |
| GATT Server Callback Number | Invalid Callback Number | 1 | Number of GATT server callback. |
| GATT Client Callback Number | Invalid Callback Number | 1 | Number of GATT client callback. |
| Vender Specific Callback | Name Must Be a Valid C Symbol. | NULL | Vendor specific callback function name. |

**Data Structures**

| | |
|---|---|
| struct | rm_mesh_bearer_platform_instance_ctrl_t |
| struct | rm_mesh_bearer_platform_extended_cfg_t |

**Typedefs**

| | |
|---|---|
| typedef void(* | rm_mesh_bearer_platform_gatt_iface_cb_t) (uint8_t event_name, uint8_t event_param, uint16_t conn_hdl, st_ble_dev_addr_t *peer_addr)<br>Callback function for GATT interface event. More... |

## Enumerations

| | |
|---|---|
| enum | rm_mesh_bearer_platform_interface_event_t |

## Data Structure Documentation

### ◆ rm_mesh_bearer_platform_instance_ctrl_t

struct rm_mesh_bearer_platform_instance_ctrl_t

RM_BLE_MESH_BEARER private control block. DO NOT MODIFY. Initialization occurs when RM_BLE_MESH_BEARER_Open() is called.

### ◆ rm_mesh_bearer_platform_extended_cfg_t

struct rm_mesh_bearer_platform_extended_cfg_t

Bearer port extension for renesas BLE stack.

## Typedef Documentation

### ◆ rm_mesh_bearer_platform_gatt_iface_cb_t

typedef void(* rm_mesh_bearer_platform_gatt_iface_cb_t) (uint8_t event_name, uint8_t event_param, uint16_t conn_hdl, st_ble_dev_addr_t *peer_addr)

Callback function for GATT interface event.

**Parameters**

| | |
|---|---|
| event_name | The event defined by rm_mesh_bearer_platform_interface_event_t |
| event_param | The mode of GATT connection rm_mesh_bearer_platform_gatt_mode_t |
| conn_hdl | The connection handle |
| peer_addr | Pointer to the connected device address |

## Enumeration Type Documentation

### ◆ rm_mesh_bearer_platform_interface_event_t

| enum rm_mesh_bearer_platform_interface_event_t | |
|---|---|
| GATT Interface Events | |
| Enumerator | |
| RM_MESH_BEARER_PLATFORM_INTERFACE_EVENT_UP | The event GATT Bearer BLE Link Layer connected |
| RM_MESH_BEARER_PLATFORM_INTERFACE_EVENT_DOWN | The event GATT Bearer BLE Link Layer disconnected |
| RM_MESH_BEARER_PLATFORM_INTERFACE_EVENT_ENABLE | The event GATT Bearer service enabled for communication |
| RM_MESH_BEARER_PLATFORM_INTERFACE_EVENT_DISABLE | The event GATT Bearer service disabled for communication |
| RM_MESH_BEARER_PLATFORM_INTERFACE_EVENT_NOT_FOUND | The event discovery process is not completed |
| RM_MESH_BEARER_PLATFORM_INTERFACE_EVENT_SCAN | The event that connectable device having Mesh GATT Service is found |
| RM_MESH_BEARER_PLATFORM_INTERFACE_EVENT_CANCEL | The Event GATT/BLE link layer connection creation is canceled |

## Function Documentation

### ◆ RM_MESH_BEARER_PLATFORM_Open()

fsp_err_t RM_MESH_BEARER_PLATFORM_Open ( rm_mesh_bearer_platform_ctrl_t *const *p_ctrl*, rm_mesh_bearer_platform_cfg_t const *const *p_cfg* )

Open Bearer Platform middleware. Initialize underlying BLE Protocol Stack to use as a Mesh Bearer. API to initialize underlying BLE Protocol Stack to use as a Mesh Bearer. Completion of the initialization is notified by the callback function.

Implements rm_mesh_bearer_platform_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_BEARER_PLATFORM_Open(&g_mesh_bearer_platform0_ctrl,
&g_mesh_bearer_platform0_cfg);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Module opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Module is already open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

### ◆ RM_MESH_BEARER_PLATFORM_Close()

fsp_err_t RM_MESH_BEARER_PLATFORM_Close ( rm_mesh_bearer_platform_ctrl_t *const *p_ctrl*)

Close Bearer Platform middleware. Terminate BLE stack.

Implements rm_mesh_bearer_platform_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_BEARER_PLATFORM_Close(&g_mesh_bearer_platform0_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Module opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_MESH_BEARER_PLATFORM_Setup()

fsp_err_t RM_MESH_BEARER_PLATFORM_Setup ( rm_mesh_bearer_platform_ctrl_t *const *p_ctrl*)

Register ADV bearer with Mesh stack and start scan. API to register ADV bearer with Mesh stack. After registering, this routine starts Scan.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_bearer_platform control block. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

### ◆ RM_MESH_BEARER_PLATFORM_CallbackSet()

fsp_err_t RM_MESH_BEARER_PLATFORM_CallbackSet ( rm_mesh_bearer_platform_ctrl_t *const *p_ctrl*, rm_mesh_bearer_platform_gatt_iface_cb_t *callback* )

Register callback function to receive GATT interface events. API to register callback function to receive GATT interface events.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_bearer_platform control block. |
| [in] | callback | Callback function. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

### ◆ RM_MESH_BEARER_PLATFORM_SetGattMode()

fsp_err_t RM_MESH_BEARER_PLATFORM_SetGattMode ( rm_mesh_bearer_platform_ctrl_t *const *p_ctrl*, rm_mesh_bearer_platform_gatt_mode_t *mode* )

Set GATT Bearer mode.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_bearer_platform control block. |
| [in] | mode | GATT interface mode, either RM_MESH_BEARER_PLATFORM_GATT_MODE_PROVISION or RM_MESH_BEARER_PLATFORM_GATT_MODE_PROXY. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

### ◆ RM_MESH_BEARER_PLATFORM_GetGattMode()

fsp_err_t RM_MESH_BEARER_PLATFORM_GetGattMode ( rm_mesh_bearer_platform_ctrl_t *const *p_ctrl*, rm_mesh_bearer_platform_gatt_mode_t * *p_mode* )

Get current GATT Bearer mode.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_bearer_platform control block. |
| [in] | p_mode | GATT interface mode, either RM_MESH_BEARER_PLATFORM_GATT_MODE_PROVISION or RM_MESH_BEARER_PLATFORM_GATT_MODE_PROXY. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_mode is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

### ◆ RM_MESH_BEARER_PLATFORM_SetScanResponseData()

fsp_err_t RM_MESH_BEARER_PLATFORM_SetScanResponseData ( rm_mesh_bearer_platform_ctrl_t *const *p_ctrl*, uint8_t * *p_data*, uint8_t *len* )

Set scan response data in connectable and scannable undirected advertising event. API to Set Scan Response Data in Connectable and scannable undirected Advertising event. Scan Response Data can be used for indicating additional information such as << Complete Local Name>>.

Implements rm_mesh_bearer_platform_api_t::setScanResponseData.

Example:

```
 /* Set scan response data in connectable and scannable undirected advertising
event.. */
    err = RM_MESH_BEARER_PLATFORM_SetScanResponseData(&g_mesh_bearer_platform0_ctrl,
&data, length);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_data is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_MESH_BEARER_PLATFORM_ScanGattBearer()

fsp_err_t RM_MESH_BEARER_PLATFORM_ScanGattBearer ( rm_mesh_bearer_platform_ctrl_t *const *p_ctrl*, rm_mesh_bearer_platform_state_t *state*, rm_mesh_bearer_platform_gatt_mode_t *mode* )

Manage reporting connectable device having Mesh GATT service. API to manage reporting connectable device having Mesh GATT service.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_bearer_platform control block. |
| [in] | state | Notification configuration flag; enable if RM_MESH_BEARER_PLATFORM_STATE_ENABLE, or disable if RM_MESH_BEARER_PLATFORM_STATE_DISABLE. |
| [in] | mode | GATT interface mode, either RM_MESH_BEARER_PLATFORM_GATT_MODE_PROVISION or RM_MESH_BEARER_PLATFORM_GATT_MODE_PROXY. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

### ◆ RM_MESH_BEARER_PLATFORM_Connect()

fsp_err_t RM_MESH_BEARER_PLATFORM_Connect ( rm_mesh_bearer_platform_ctrl_t *const *p_ctrl*, uint8_t * *p_remote_address*, uint8_t *address_type*, rm_mesh_bearer_platform_gatt_mode_t *mode* )

Request to create connection. API to request to Create Connection. Completion of the establishing a connection is notified by RM_BLE_MESH_BEARER_IFACE_UP. After establishing a connection, RM_MESH_BEARER_PLATFORM_DiscoverService() is invoked automatically.

Implements rm_mesh_bearer_platform_api_t::connect.

Example:

```
/* Request to create connection. */
   err = RM_MESH_BEARER_PLATFORM_Connect(&g_mesh_bearer_platform0_ctrl,
                                         &remote_address,
                                         bearer_address_type,
RM_MESH_BEARER_PLATFORM_GATT_MODE_PROVISION);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_remote_address is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_MESH_BEARER_PLATFORM_DiscoverService()

fsp_err_t RM_MESH_BEARER_PLATFORM_DiscoverService ( rm_mesh_bearer_platform_ctrl_t *const *p_ctrl*, uint16_t *handle*, rm_mesh_bearer_platform_gatt_mode_t *mode* )

Start service discovery for Mesh GATT service. API to start Service Discovery for Mesh GATT Service. If Mesh GATT Service specified by the "mode" argument, this routine enables Notification of the Mesh GATT Service by invoking RM_MESH_BEARER_PLATFORM_ConfigureNotification().

Implements rm_mesh_bearer_platform_api_t::discoverService.

Example:

```
/* Start service discovery for Mesh GATT service. */
   err = RM_MESH_BEARER_PLATFORM_DiscoverService(&g_mesh_bearer_platform0_ctrl,
                                                 handle,
RM_MESH_BEARER_PLATFORM_GATT_MODE_PROVISION);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_MESH_BEARER_PLATFORM_ConfigureNotification()

fsp_err_t RM_MESH_BEARER_PLATFORM_ConfigureNotification ( rm_mesh_bearer_platform_ctrl_t *const *p_ctrl*, uint16_t *handle*, rm_mesh_bearer_platform_state_t *state*, rm_mesh_bearer_platform_gatt_mode_t *mode* )

Configure GATT notification of Mesh GATT service. API to configure GATT Notification of Mesh GATT Service.

Implements rm_mesh_bearer_platform_api_t::configureNotification.

Example:

```
/* Configure GATT notification of Mesh GATT service. */
   err =
RM_MESH_BEARER_PLATFORM_ConfigureNotification(&g_mesh_bearer_platform0_ctrl,
                                              handle,
 RM_MESH_BEARER_PLATFORM_STATE_ENABLE,
 RM_MESH_BEARER_PLATFORM_GATT_MODE_PROVISION);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_MESH_BEARER_PLATFORM_Disconnect()

fsp_err_t RM_MESH_BEARER_PLATFORM_Disconnect ( rm_mesh_bearer_platform_ctrl_t *const *p_ctrl*, uint16_t *handle* )

Terminate Connection. API to terminate connection.

Implements rm_mesh_bearer_platform_api_t::disconnect.

Example:

```
/* Terminate Connection. */
   err = RM_MESH_BEARER_PLATFORM_Disconnect(&g_mesh_bearer_platform0_ctrl, handle);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

## BLE Mesh Network Config Client (rm_mesh_config_clt)

Modules » Networking » BLE Mesh Network Modules

### Functions

| | |
|---|---|
| fsp_err_t | RM_MESH_CONFIG_CLT_Open (rm_ble_mesh_config_client_ctrl_t *const p_ctrl, rm_ble_mesh_config_client_cfg_t const *const p_cfg) |
| fsp_err_t | RM_MESH_CONFIG_CLT_Close (rm_ble_mesh_config_client_ctrl_t *const p_ctrl) |
| fsp_err_t | RM_MESH_CONFIG_CLT_SetServer (rm_ble_mesh_config_client_ctrl_t *const p_ctrl, rm_ble_mesh_network_address_t server_addr, uint8_t *p_dev_key) |
| fsp_err_t | RM_MESH_CONFIG_CLT_SendReliablePdu (rm_ble_mesh_config_client_ctrl_t *const p_ctrl, uint32_t req_opcode, void const *const p_parameter, uint32_t rsp_opcode) |

### Detailed Description

# Overview

### Target Devices

The BLE Mesh Network Config Client module supports the following devices.

- RA4W1

# Configuration

### Build Time Configurations for rm_mesh_config_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_config_clt_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|

### Configurations for Networking > BLE Mesh Network modules > BLE Mesh Config Client (rm_mesh_config_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Config Client (rm_mesh_config_clt).

| Configuration | Options | Default | Description |
|---|---|---|---|
| Interrupts | | | |
| Callback Provided when Timeout Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh config client ISR occurs |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_config_clt0 | Module name. |

### Data Structures

| | |
|---|---|
| struct | rm_mesh_config_clt_instance_ctrl_t |

### Data Structure Documentation

#### ◆ rm_mesh_config_clt_instance_ctrl_t

| struct rm_mesh_config_clt_instance_ctrl_t |
|---|
| BLE mesh config instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_CONFIG_CLT_Open() is called. |

### Function Documentation

### ◆ RM_MESH_CONFIG_CLT_Open()

fsp_err_t RM_MESH_CONFIG_CLT_Open ( rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_config_client_cfg_t const *const *p_cfg* )

Open Configuration Client middleware. This is to initialize Configuration Client model and to register with Access layer.

Implements rm_ble_mesh_config_client_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_CONFIG_CLT_Open(&g_mesh_config_clt0_ctrl, &g_mesh_config_clt0_cfg);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

### ◆ RM_MESH_CONFIG_CLT_Close()

fsp_err_t RM_MESH_CONFIG_CLT_Close ( rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*)

Close Configuration Client middleware.

Implements rm_ble_mesh_config_client_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_CONFIG_CLT_Close(&g_mesh_config_clt0_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

### ◆ RM_MESH_CONFIG_CLT_SetServer()

fsp_err_t RM_MESH_CONFIG_CLT_SetServer ( rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_address_t *server_addr*, uint8_t * *p_dev_key* )

This is to sets the information about server which is to be configured.

Implements rm_ble_mesh_config_client_api_t::setServer.

Example:

```
/* Sets the information about server which is to be configured. */
   err = RM_MESH_CONFIG_CLT_SetServer(&g_mesh_config_clt0_ctrl, server_addr,
&dev_key);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |

### ◆ RM_MESH_CONFIG_CLT_SendReliablePdu()

fsp_err_t RM_MESH_CONFIG_CLT_SendReliablePdu ( rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, uint32_t *req_opcode*, void const *const *p_parameter*, uint32_t *rsp_opcode* )

This is to initialize sending acknowledged commands.

Implements rm_ble_mesh_config_client_api_t::sendReliablePdu.

Example:

```
/* Initialize sending acknowledged commands. */
   err = RM_MESH_CONFIG_CLT_SendReliablePdu(&g_mesh_config_clt0_ctrl, req_opcode,
p_parameter, rsp_opcode);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_CONFIG_CLT_BeaconGet()

fsp_err_t RM_MESH_CONFIG_CLT_BeaconGet ( rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*)

The Config Beacon Get is an acknowledged message used to get the current Secure Network Beacon state of a node.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_config_clt control block. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_CONFIG_CLT_BeaconSet()

fsp_err_t RM_MESH_CONFIG_CLT_BeaconSet ( rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

The Config Beacon Set is an acknowledged message used to set the current Secure Network Beacon state of a node.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_beacon_set_parameter_t. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_CONFIG_CLT_CompositionDataGet()

fsp_err_t RM_MESH_CONFIG_CLT_CompositionDataGet ( rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

The Config Composition Data Get is an acknowledged message used to read one page of the Composition Data.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_composition_data_get_parameter_t. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_CONFIG_CLT_DefaultTtlGet()

fsp_err_t RM_MESH_CONFIG_CLT_DefaultTtlGet ( rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*)

Config Default TTL Get is an acknowledged message used to get the current Default TTL state of a node.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_config_clt control block. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_CONFIG_CLT_DefaultTtlSet()

fsp_err_t RM_MESH_CONFIG_CLT_DefaultTtlSet ( rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

The Config Default TTL Set is an acknowledged message used to set the Default TTL state of a node.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_default_ttl_set_parameter_t. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_CONFIG_CLT_GattProxyGet()

fsp_err_t RM_MESH_CONFIG_CLT_GattProxyGet ( rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*)

The Config GATT Proxy Get is an acknowledged message used to get the GATT Proxy state of a node.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_config_clt control block. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_CONFIG_CLT_GattProxySet()

fsp_err_t RM_MESH_CONFIG_CLT_GattProxySet ( rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

The Config GATT Proxy Set is an acknowledged message used to set the GATT Proxy state of a node.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_gatt_proxy_set_parameter_t. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_CONFIG_CLT_RelayGet()

fsp_err_t RM_MESH_CONFIG_CLT_RelayGet ( rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*)

The Config Relay Get is an acknowledged message used to get the current Relay and Relay Retransmit states of a node.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_config_clt control block. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_CONFIG_CLT_RelaySet()

fsp_err_t RM_MESH_CONFIG_CLT_RelaySet ( rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

The Config Relay Set is an acknowledged message used to set the current Relay and Relay Retransmit states of a node.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_relay_set_parameter_t. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_CONFIG_CLT_ModelPublicationGet()

fsp_err_t RM_MESH_CONFIG_CLT_ModelPublicationGet ( rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

The Config Model Publication Get is an acknowledged message used to get the publish address and parameters of an outgoing message that originates from a model.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_model_publication_get_parameter_t. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_CONFIG_CLT_ModelPublicationSet()

fsp_err_t RM_MESH_CONFIG_CLT_ModelPublicationSet ( rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

The Config Model Publication Set is an acknowledged message used to set the Model Publication state of an outgoing message that originates from a model.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_model_publication_set_parameter_t. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_CONFIG_CLT_ModelPublicationVaddrSet()

fsp_err_t RM_MESH_CONFIG_CLT_ModelPublicationVaddrSet ( rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

The Config Model Publication Set is an acknowledged message used to set the Model Publication state of an outgoing message that originates from a model.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_model_publication_virtual_address_set_parameter_t. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_CONFIG_CLT_ModelSubscriptionAdd()

fsp_err_t RM_MESH_CONFIG_CLT_ModelSubscriptionAdd ( rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

The Config Model Subscription Add is an acknowledged message used to add an address to a Subscription List of a model.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_model_subscription_add_parameter_t. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_CONFIG_CLT_ModelSubscriptionVaddrAdd()

fsp_err_t RM_MESH_CONFIG_CLT_ModelSubscriptionVaddrAdd ( rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

The Config Model Subscription Add is an acknowledged message used to add an address to a Subscription List of a model.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_model_subscription_virtual_address_add_parameter_t. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_CONFIG_CLT_ModelSubscriptionDelete()

fsp_err_t RM_MESH_CONFIG_CLT_ModelSubscriptionDelete ( rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

The Config Model Subscription Delete is an acknowledged message used to delete a subscription address from the Subscription List of a model.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_model_subscription_delete_parameter_t. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_CONFIG_CLT_ModelSubscriptionVaddrDelete()

fsp_err_t RM_MESH_CONFIG_CLT_ModelSubscriptionVaddrDelete ( rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

The Config Model Subscription Delete is an acknowledged message used to delete a subscription address from the Subscription List of a model.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_model_subscription_virtual_address_delete_parameter_t. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_CONFIG_CLT_ModelSubscriptionOverwrite()

fsp_err_t RM_MESH_CONFIG_CLT_ModelSubscriptionOverwrite ( rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

The Config Model Subscription Overwrite is an acknowledged message used to discard the Subscription List and add an address to the cleared Subscription List of a model.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_model_subscription_overwrite_parameter_t. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_CONFIG_CLT_ModelSubscriptionVaddrOverwrite()

fsp_err_t RM_MESH_CONFIG_CLT_ModelSubscriptionVaddrOverwrite ( rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

The Config Model Subscription Overwrite is an acknowledged message used to discard the Subscription List and add an address to the cleared Subscription List of a model.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_model_subscription_virtual_address_overwrite_parameter_t. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_CONFIG_CLT_ModelSubscriptionDeleteAll()

fsp_err_t RM_MESH_CONFIG_CLT_ModelSubscriptionDeleteAll ( rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

The Config Model Subscription Delete All is an acknowledged message used to discard the Subscription List of a model.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_model_subscription_delete_all_parameter_t. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_CONFIG_CLT_SigModelSubscriptionGet()

fsp_err_t RM_MESH_CONFIG_CLT_SigModelSubscriptionGet ( rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

The Config SIG Model Subscription Get is an acknowledged message used to get the list of subscription addresses of a model within the element. This message is only for SIG Models.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_sig_model_subscription_get_parameter_t. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_CONFIG_CLT_VendorModelSubscriptionGet()

fsp_err_t RM_MESH_CONFIG_CLT_VendorModelSubscriptionGet ( rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

The Config SIG Model Subscription Get is an acknowledged message used to get the list of subscription addresses of a model within the element. This message is only for Vendor Models.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_vendor_model_subscription_get_parameter_t. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_CONFIG_CLT_NetkeyAdd()

fsp_err_t RM_MESH_CONFIG_CLT_NetkeyAdd ( rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

The Config NetKey Add is an acknowledged message used to add a NetKey to a NetKey List on a node. The added NetKey is then used by the node to authenticate and decrypt messages it receives, as well as authenticate and encrypt messages it sends.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_netkey_add_parameter_t. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_CONFIG_CLT_NetkeyUpdate()

fsp_err_t RM_MESH_CONFIG_CLT_NetkeyUpdate ( rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

The Config NetKey Update is an acknowledged message used to update a NetKey on a node. The updated NetKey is then used by the node to authenticate and decrypt messages it receives, as well as authenticate and encrypt messages it sends, as defined by the Key Refresh procedure.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_netkey_update_parameter_t. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_CONFIG_CLT_NetkeyDelete()

fsp_err_t RM_MESH_CONFIG_CLT_NetkeyDelete ( rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

The Config NetKey Delete is an acknowledged message used to delete a NetKey on a NetKey List from a node.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_netkey_delete_parameter_t. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_CONFIG_CLT_NetkeyGet()

fsp_err_t RM_MESH_CONFIG_CLT_NetkeyGet ( rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*)

The Config NetKey Get is an acknowledged message used to report all NetKeys known to the node.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_config_clt control block. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_CONFIG_CLT_AppkeyAdd()

fsp_err_t RM_MESH_CONFIG_CLT_AppkeyAdd ( rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

The Config AppKey Add is an acknowledged message used to add an AppKey to the AppKey List on a node and bind it to the NetKey identified by NetKeyIndex. The added AppKey can be used by the node only as a pair with the specified NetKey. The AppKey is used to authenticate and decrypt messages it receives, as well as authenticate and encrypt messages it sends.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_appkey_add_parameter_t. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_CONFIG_CLT_AppkeyUpdate()

fsp_err_t RM_MESH_CONFIG_CLT_AppkeyUpdate ( rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

The Config AppKey Update is an acknowledged message used to update an AppKey value on the AppKey List on a node. The updated AppKey is used by the node to authenticate and decrypt messages it receives, as well as authenticate and encrypt messages it sends, as defined by the Key Refresh procedure.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_appkey_update_parameter_t. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_CONFIG_CLT_AppkeyDelete()

fsp_err_t RM_MESH_CONFIG_CLT_AppkeyDelete ( rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

The Config AppKey Delete is an acknowledged message used to delete an AppKey from the AppKey List on a node

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_appkey_delete_parameter_t. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_CONFIG_CLT_AppkeyGet()

fsp_err_t RM_MESH_CONFIG_CLT_AppkeyGet ( rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

The AppKey Get is an acknowledged message used to report all AppKeys bound to the NetKey.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_appkey_get_parameter_t. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_CONFIG_CLT_NodeIdentityGet()

fsp_err_t RM_MESH_CONFIG_CLT_NodeIdentityGet ( rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

The Config Node Identity Get is an acknowledged message used to get the current Node Identity state for a subnet.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_node_id_get_parameter_t. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_CONFIG_CLT_NodeIdentitySet()

fsp_err_t RM_MESH_CONFIG_CLT_NodeIdentitySet ( rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

The Config Node Identity Set is an acknowledged message used to set the current Node Identity state for a subnet.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_node_id_set_parameter_t. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_CONFIG_CLT_ModelAppBind()

fsp_err_t RM_MESH_CONFIG_CLT_ModelAppBind ( rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

The Config Model App Bind is an acknowledged message used to bind an AppKey to a model.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_model_app_bind_parameter_t. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_CONFIG_CLT_ModelAppUnbind()

fsp_err_t RM_MESH_CONFIG_CLT_ModelAppUnbind ( rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

The Config Model App Unbind is an acknowledged message used to remove the binding between an AppKey and a model.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_model_app_unbind_parameter_t. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_CONFIG_CLT_SigModelAppGet()

fsp_err_t RM_MESH_CONFIG_CLT_SigModelAppGet ( rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

The Config SIG Model App Get is an acknowledged message used to request report of all AppKeys bound to the SIG Model.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_sig_model_app_get_parameter_t. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_CONFIG_CLT_VendorModelAppGet()

fsp_err_t RM_MESH_CONFIG_CLT_VendorModelAppGet ( rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

The Config Vendor Model App Get is an acknowledged message used to request report of all AppKeys bound to the Vendor Model.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_vendor_model_app_get_parameter_t. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_CONFIG_CLT_NodeReset()

fsp_err_t RM_MESH_CONFIG_CLT_NodeReset ( rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*)

The Config Node Reset is an acknowledged message used to reset a node (other than a Provisioner) and remove it from the network.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_config_clt control block. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_CONFIG_CLT_FriendGet()

fsp_err_t RM_MESH_CONFIG_CLT_FriendGet ( rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*)

The Config Friend Get is an acknowledged message used to get the current Friend state of a node.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_config_clt control block. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_CONFIG_CLT_FriendSet()

fsp_err_t RM_MESH_CONFIG_CLT_FriendSet ( rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

The Config Friend Set is an acknowledged message used to set the Friend state of a node.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_friend_set_parameter_t. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_CONFIG_CLT_KeyrefreshPhaseGet()

fsp_err_t RM_MESH_CONFIG_CLT_KeyrefreshPhaseGet ( rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

The Config Key Refresh Phase Get is an acknowledged message used to get the current Key Refresh Phase state of the identified network key.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_key_refresh_phase_get_parameter_t. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_CONFIG_CLT_KeyrefreshPhaseSet()

fsp_err_t RM_MESH_CONFIG_CLT_KeyrefreshPhaseSet ( rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

The Config Key Refresh Phase Set is an acknowledged message used to set the current Key Refresh Phase state of the identified network key.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_key_refresh_phase_set_parameter_t. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_CONFIG_CLT_HeartbeatPublicationGet()

fsp_err_t RM_MESH_CONFIG_CLT_HeartbeatPublicationGet ( rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*)

The Config Heartbeat Publication Get is an acknowledged message used to get the current Heartbeat Publication state of an element.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_config_clt control block. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_CONFIG_CLT_HeartbeatPublicationSet()

fsp_err_t RM_MESH_CONFIG_CLT_HeartbeatPublicationSet ( rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

The Config Heartbeat Publication Set is an acknowledged message used to set the current Heartbeat Publication state of an element.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_heartbeat_publication_set_parameter_t. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_CONFIG_CLT_HeartbeatSubscriptionGet()

fsp_err_t RM_MESH_CONFIG_CLT_HeartbeatSubscriptionGet ( rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*)

The Config Heartbeat Subscription Get is an acknowledged message used to get the current Heartbeat Subscription state of an element.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_config_clt control block. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_CONFIG_CLT_HeartbeatSubscriptionSet()

fsp_err_t RM_MESH_CONFIG_CLT_HeartbeatSubscriptionSet ( rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

The Config Heartbeat Publication Set is an acknowledged message used to set the current Heartbeat Subscription state of an element.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_heartbeat_subscription_set_parameter_t. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_CONFIG_CLT_LpnPolltimeoutGet()

fsp_err_t RM_MESH_CONFIG_CLT_LpnPolltimeoutGet ( rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

The Config Low Power Node PollTimeout Get is an acknowledged message used to get the current value of PollTimeout timer of the Low Power node within a Friend node. The message is sent to a Friend node that has claimed to be handling messages by sending ACKs On Behalf Of (OBO) the indicated Low Power node. This message should only be sent to a node that has the Friend feature supported and enabled.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_low_power_node_polling_timeout_get_parameter_t. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_CONFIG_CLT_NetworkTransmitGet()

fsp_err_t RM_MESH_CONFIG_CLT_NetworkTransmitGet ( rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*)

The Config Network Transmit Get is an acknowledged message used to get the current Network Transmit state of a node.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_config_clt control block. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_CONFIG_CLT_NetworkTransmitSet()

fsp_err_t RM_MESH_CONFIG_CLT_NetworkTransmitSet ( rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

The Config Network Transmit Set is an acknowledged message used to set the current Network Transmit state of a node.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_network_transmit_set_parameter_t. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

## BLE Mesh Network Config Server (rm_mesh_config_srv)

Modules » Networking » BLE Mesh Network Modules

### Functions

| | |
|---|---|
| fsp_err_t | RM_MESH_CONFIG_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_model_server_cfg_t const *const p_cfg) |
| fsp_err_t | RM_MESH_CONFIG_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const p_ctrl) |

| | |
|---|---|
| fsp_err_t | RM_MESH_CONFIG_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state) |

### Detailed Description

# Overview

### Target Devices

The BLE Mesh Network Config Server module supports the following devices.

- RA4W1

# Configuration

### Build Time Configurations for rm_mesh_config_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_config_srv_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|

### Configurations for Networking > BLE Mesh Network modules > BLE Mesh Config Server (rm_mesh_config_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Config Server (rm_mesh_config_srv).

| Configuration | Options | Default | Description |
|---|---|---|---|
| Interrupts | | | |
| Callback | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh config client ISR occurs |
| Callback Provided When an Timeout ISR Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh generic admin property server timeout ISR occurs |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_config_srv0 | Module name. |

### Data Structures

| | |
|---|---|
| struct | rm_mesh_config_srv_instance_ctrl_t |

### Data Structure Documentation

#### ◆ rm_mesh_config_srv_instance_ctrl_t

struct rm_mesh_config_srv_instance_ctrl_t

BLE mesh config instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_CONFIG_SRV_Open() is called.

## Function Documentation

### ◆ RM_MESH_CONFIG_SRV_Open()

fsp_err_t RM_MESH_CONFIG_SRV_Open ( rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_server_cfg_t const *const *p_cfg* )

API to initialize configuration server model. This is to initialize configuration server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_CONFIG_SRV_Open(&g_mesh_config_srv0_ctrl, &g_mesh_config_srv0_cfg);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

### ◆ RM_MESH_CONFIG_SRV_Close()

fsp_err_t RM_MESH_CONFIG_SRV_Close ( rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*)

API to terminate configuration server model. This is to terminate configuration server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_CONFIG_SRV_Close(&g_mesh_config_srv0_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

### ◆ RM_MESH_CONFIG_SRV_StateUpdate()

fsp_err_t RM_MESH_CONFIG_SRV_StateUpdate ( rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state* )

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements rm_ble_mesh_model_server_api_t::stateUpdate.

Example:

```
/* Update server status. */
   err = RM_MESH_CONFIG_SRV_StateUpdate(&g_mesh_config_srv0_ctrl, &state);
```

**Return values**

| | |
|---|---|
| FSP_ERR_UNSUPPORTED | This function is unsupported. |

## BLE Mesh Network Generic Admin Property Server (rm_mesh_generic_admin_prop_srv)

Modules » Networking » BLE Mesh Network Modules

### Functions

| | |
|---|---|
| fsp_err_t | RM_MESH_GENERIC_ADMIN_PROP_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_model_server_cfg_t const *const p_cfg) |

| | |
|---|---|
| fsp_err_t | RM_MESH_GENERIC_ADMIN_PROP_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const p_ctrl) |

| | |
|---|---|
| fsp_err_t | RM_MESH_GENERIC_ADMIN_PROP_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state) |

**Detailed Description**

# Overview

### Target Devices

The BLE Mesh Network Generic Admin Property Server module supports the following devices.

- RA4W1

# Configuration

### Build Time Configurations for rm_mesh_generic_admin_prop_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_admin_prop_srv_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|

### Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Generic Admin Property Server (rm_mesh_generic_admin_prop_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Generic Admin Property Server (rm_mesh_generic_admin_prop_srv).

| Configuration | Options | Default | Description |
|---|---|---|---|
| Interrupts | | | |
| Callback Provided When Timeout Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh generic admin property server ISR occurs |
| Callback Provided When an Timeout ISR Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh generic admin property server timeout ISR occurs |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_generic_admin_prop_srv0 | Module name. |

**Data Structures**

| | |
|---|---|
| struct | rm_mesh_generic_admin_prop_srv_info_t |

| | |
|---|---|
| struct | rm_mesh_generic_admin_prop_srv_instance_ctrl_t |

## Data Structure Documentation

### ◆ rm_mesh_generic_admin_prop_srv_info_t

| struct rm_mesh_generic_admin_prop_srv_info_t | | |
|---|---|---|
| Generic Admin Property is a state representing a device property of an element that can be read or written | | |
| Data Fields | | |
| uint16_t | property_id | Admin Property ID field is a 2-octet Assigned Number value referencing a device property |
| uint8_t | user_access | Admin User Access field is an enumeration indicating whether the device property can be read or written as a Generic User Property |
| uint8_t * | property_value | Admin Property Value field is a conditional field |
| uint16_t | property_value_len | |

### ◆ rm_mesh_generic_admin_prop_srv_instance_ctrl_t

| struct rm_mesh_generic_admin_prop_srv_instance_ctrl_t |
|---|
| BLE mesh generic admin prop instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_GENERIC_ADMIN_PROP_SRV_Open() is called. |

## Function Documentation

### ◆ RM_MESH_GENERIC_ADMIN_PROP_SRV_Open()

fsp_err_t RM_MESH_GENERIC_ADMIN_PROP_SRV_Open ( rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_server_cfg_t const *const *p_cfg* )

API to initialize Generic_Admin_Property Server model. This is to initialize Generic_Admin_Property Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::open.

Example:

```
/* Open the module. */
   err =
RM_MESH_GENERIC_ADMIN_PROP_SRV_Open(&g_mesh_generic_admin_prop_srv0_ctrl,
&g_mesh_generic_admin_prop_srv0_cfg);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

### ◆ RM_MESH_GENERIC_ADMIN_PROP_SRV_Close()

fsp_err_t RM_MESH_GENERIC_ADMIN_PROP_SRV_Close ( rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*)

API to terminate Generic_Admin_Property Server model. This is to terminate Generic_Admin_Property Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_GENERIC_ADMIN_PROP_SRV_Close(&g_mesh_generic_admin_prop_srv0_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

### ◆ RM_MESH_GENERIC_ADMIN_PROP_SRV_StateUpdate()

fsp_err_t RM_MESH_GENERIC_ADMIN_PROP_SRV_StateUpdate ( rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state* )

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements rm_ble_mesh_model_server_api_t::stateUpdate.

Example:

```
/* Update server status. */
   err =
RM_MESH_GENERIC_ADMIN_PROP_SRV_StateUpdate(&g_mesh_generic_admin_prop_srv0_ctrl,
&state);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Updated server status successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_state is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

## BLE Mesh Network Generic Battery Client (rm_mesh_generic_battery_clt)

Modules » Networking » BLE Mesh Network Modules

### Functions

| | |
|---|---|
| fsp_err_t | RM_MESH_GENERIC_BATTERY_CLT_Open (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, rm_ble_mesh_model_client_cfg_t const *const p_cfg) |
| fsp_err_t | RM_MESH_GENERIC_BATTERY_CLT_Close |

| | |
|---|---|
| | (rm_ble_mesh_model_client_ctrl_t *const p_ctrl) |
| fsp_err_t | RM_MESH_GENERIC_BATTERY_CLT_GetModelHandle (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, rm_ble_mesh_access_model_handle_t *const p_model_handle) |
| fsp_err_t | RM_MESH_GENERIC_BATTERY_CLT_SendReliablePdu (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, uint32_t req_opcode, void const *const p_parameter, uint32_t rsp_opcode) |
| fsp_err_t | RM_MESH_GENERIC_BATTERY_CLT_Get (rm_ble_mesh_model_client_ctrl_t *const p_ctrl) |

**Detailed Description**

# Overview

### Target Devices

The BLE Mesh Network Generic Battery Client module supports the following devices.

- RA4W1

# Configuration

### Build Time Configurations for rm_mesh_generic_battery_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_battery_clt_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|

**Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Generic Battery Client (rm_mesh_generic_battery_clt)**

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Generic Battery Client (rm_mesh_generic_battery_clt).

| Configuration | Options | Default | Description |
|---|---|---|---|
| Interrupts | | | |
| Callback Provided when Timeout Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh generic battery client ISR occurs |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_generic_battery_clt0 | Module name. |

**Data Structures**

| | |
|---|---|
| struct | rm_mesh_generic_battery_clt_instance_ctrl_t |

## Data Structure Documentation

### ◆ rm_mesh_generic_battery_clt_instance_ctrl_t

| struct rm_mesh_generic_battery_clt_instance_ctrl_t |
|---|
| BLE mesh generic battery instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_GENERIC_BATTERY_CLT_Open() is called. |

## Function Documentation

### ◆ RM_MESH_GENERIC_BATTERY_CLT_Open()

fsp_err_t RM_MESH_GENERIC_BATTERY_CLT_Open ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_client_cfg_t const *const *p_cfg* )

Open Generic Battery Client middleware. This is to initialize Generic_Battery Client model and to register with Access layer.

Implements rm_ble_mesh_model_client_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_GENERIC_BATTERY_CLT_Open(&g_mesh_generic_battery_clt0_ctrl,
&g_mesh_generic_battery_clt0_cfg);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

### ◆ RM_MESH_GENERIC_BATTERY_CLT_Close()

fsp_err_t RM_MESH_GENERIC_BATTERY_CLT_Close ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Close Generic Battery Client middleware.

Implements rm_ble_mesh_model_client_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_GENERIC_BATTERY_CLT_Close(&g_mesh_generic_battery_clt0_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

### ◆ RM_MESH_GENERIC_BATTERY_CLT_GetModelHandle()

fsp_err_t RM_MESH_GENERIC_BATTERY_CLT_GetModelHandle ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *const *p_model_handle* )

This is to get the handle of Generic_Battery client model.

Implements rm_ble_mesh_model_client_api_t::getModelHandle.

Example:

```
/* Get the handle of generic battery client model. */
   err =
RM_MESH_GENERIC_BATTERY_CLT_GetModelHandle(&g_mesh_generic_battery_clt0_ctrl,
&model_handle);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Got model handle successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_POINTER | The parameter p_model_handle is NULL. |

### ◆ RM_MESH_GENERIC_BATTERY_CLT_SendReliablePdu()

fsp_err_t RM_MESH_GENERIC_BATTERY_CLT_SendReliablePdu ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, uint32_t *req_opcode*, void const *const *p_parameter*, uint32_t *rsp_opcode* )

This is to initialize sending acknowledged commands.

Implements rm_ble_mesh_model_client_api_t::sendReliablePdu.

Example:

```
/* Initialize sending acknowledged commands. */
   err =
RM_MESH_GENERIC_BATTERY_CLT_SendReliablePdu(&g_mesh_generic_battery_clt0_ctrl,
                                            req_opcode,
                                            p_parameter,
                                            rsp_opcode);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_GENERIC_BATTERY_CLT_Get()

fsp_err_t RM_MESH_GENERIC_BATTERY_CLT_Get ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Generic Battery Get message is an acknowledged message used to get the Generic Battery state of an element. The response to the Generic Battery Get message is a Generic Battery Status message. There are no parameters for this message.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_generic_battery_clt control block. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

## BLE Mesh Network Generic Battery Server (rm_mesh_generic_battery_srv)

Modules » Networking » BLE Mesh Network Modules

### Functions

| | |
|---|---|
| fsp_err_t | RM_MESH_GENERIC_BATTERY_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_model_server_cfg_t const *const p_cfg) |
| fsp_err_t | RM_MESH_GENERIC_BATTERY_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const p_ctrl) |
| fsp_err_t | RM_MESH_GENERIC_BATTERY_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state) |

### Detailed Description

# Overview

### Target Devices

The BLE Mesh Network Generic Battery Server module supports the following devices.

- RA4W1

# Configuration

### Build Time Configurations for rm_mesh_generic_battery_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_battery_srv_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|

### Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Generic Battery Server (rm_mesh_generic_battery_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Generic Battery Server (rm_mesh_generic_battery_srv).

| Configuration | Options | Default | Description |
|---|---|---|---|
| Interrupts | | | |
| Callback Provided When Timeout Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh generic battery server ISR occurs |
| Callback Provided When an Timeout ISR Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh generic battery server timeout ISR occurs |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_generic_battery_srv0 | Module name. |

### Data Structures

| | |
|---|---|
| struct | rm_mesh_generic_battery_srv_info_t |
| struct | rm_mesh_generic_battery_srv_instance_ctrl_t |

### Data Structure Documentation

#### ◆ rm_mesh_generic_battery_srv_info_t

| struct rm_mesh_generic_battery_srv_info_t |
|---|

Generic Battery state is a set of four values representing the state of a battery

| Data Fields | | |
|---|---|---|
| uint8_t | generic_battery_level | Generic Battery Level state is a value ranging from 0 percent through 100 percent |
| uint32_t | generic_battery_time_to_discharge | Generic Battery Time to Discharge state is a 24-bit unsigned value ranging from 0 through 0xFFFFFF |
| uint32_t | generic_battery_time_to_charge | Generic Battery Time to Charge state is a 24-bit unsigned value ranging from 0 through 0xFFFFFF |
| uint8_t | generic_battery_flags | Generic Battery Flags state is a concatenation of four 2-bit bit fields: Presence, Indicator, Charging, and Serviceability |

◆ **rm_mesh_generic_battery_srv_instance_ctrl_t**

struct rm_mesh_generic_battery_srv_instance_ctrl_t

BLE mesh generic_battery instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_GENERIC_BATTERY_SRV_Open() is called.

## Function Documentation

### ◆ RM_MESH_GENERIC_BATTERY_SRV_Open()

fsp_err_t RM_MESH_GENERIC_BATTERY_SRV_Open ( rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_server_cfg_t const *const *p_cfg* )

API to initialize Generic_Battery Server model. This is to initialize Generic_Battery Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_GENERIC_BATTERY_SRV_Open(&g_mesh_generic_battery_srv0_ctrl,
&g_mesh_generic_battery_srv0_cfg);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

### ◆ RM_MESH_GENERIC_BATTERY_SRV_Close()

fsp_err_t RM_MESH_GENERIC_BATTERY_SRV_Close ( rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*)

API to terminate Generic_Battery Server model. This is to terminate Generic_Battery Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_GENERIC_BATTERY_SRV_Close(&g_mesh_generic_battery_srv0_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

### ◆ RM_MESH_GENERIC_BATTERY_SRV_StateUpdate()

fsp_err_t RM_MESH_GENERIC_BATTERY_SRV_StateUpdate ( rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state* )

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements rm_ble_mesh_model_server_api_t::stateUpdate.

Example:

```
/* Update server status. */
   err = RM_MESH_GENERIC_BATTERY_SRV_StateUpdate(&g_mesh_generic_battery_srv0_ctrl,
&state);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Updated server status successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_state is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

## BLE Mesh Network Generic Client Property Server (rm_mesh_generic_client_prop_srv)

Modules » Networking » BLE Mesh Network Modules

### Functions

| | |
|---|---|
| fsp_err_t | RM_MESH_GENERIC_CLIENT_PROP_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_model_server_cfg_t const *const p_cfg) |
| fsp_err_t | RM_MESH_GENERIC_CLIENT_PROP_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const p_ctrl) |

| | |
|---|---|
| fsp_err_t | RM_MESH_GENERIC_CLIENT_PROP_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state) |

### Detailed Description

# Overview

### Target Devices

The BLE Mesh Network Generic Client Property Server module supports the following devices.

- RA4W1

# Configuration

### Build Time Configurations for rm_mesh_generic_client_prop_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_client_prop_srv_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|

### Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Generic Client Property Server (rm_mesh_generic_client_prop_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Generic Client Property Server (rm_mesh_generic_client_prop_srv).

| Configuration | Options | Default | Description |
|---|---|---|---|
| Interrupts | | | |
| Callback Provided When Timeout Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh generic client property server ISR occurs |
| Callback Provided When an Timeout ISR Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh generic client property server timeout ISR occurs |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_generic_client_prop_srv0 | Module name. |

### Data Structures

| | |
|---|---|
| struct | rm_mesh_generic_client_prop_srv_instance_ctrl_t |

### Data Structure Documentation

◆ **rm_mesh_generic_client_prop_srv_instance_ctrl_t**

| struct rm_mesh_generic_client_prop_srv_instance_ctrl_t |
| --- |
| BLE mesh generic client prop instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_GENERIC_CLIENT_PROP_SRV_Open() is called. |

### Function Documentation

#### ◆ RM_MESH_GENERIC_CLIENT_PROP_SRV_Open()

fsp_err_t RM_MESH_GENERIC_CLIENT_PROP_SRV_Open ( rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_server_cfg_t const *const *p_cfg* )

API to initialize Generic_Client_Property Server model. This is to initialize Generic_Client_Property Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_GENERIC_CLIENT_PROP_SRV_Open(&g_mesh_generic_client_prop_srv0_ctrl,
                                              &g_mesh_generic_client_prop_srv0_cfg);
```

**Return values**

| | |
| --- | --- |
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

### ◆ RM_MESH_GENERIC_CLIENT_PROP_SRV_Close()

fsp_err_t RM_MESH_GENERIC_CLIENT_PROP_SRV_Close ( rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*)

API to terminate Generic_Client_Property Server model. This is to terminate Generic_Client_Property Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::close.

Example:

```
/* Close the module. */
   err =
RM_MESH_GENERIC_CLIENT_PROP_SRV_Close(&g_mesh_generic_client_prop_srv0_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

### ◆ RM_MESH_GENERIC_CLIENT_PROP_SRV_StateUpdate()

fsp_err_t RM_MESH_GENERIC_CLIENT_PROP_SRV_StateUpdate ( rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state* )

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements rm_ble_mesh_model_server_api_t::stateUpdate.

Example:

```
/* Update server status. */
   err =
RM_MESH_GENERIC_CLIENT_PROP_SRV_StateUpdate(&g_mesh_generic_client_prop_srv0_ctrl,
&state);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Updated server status successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_state is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

## BLE Mesh Network Generic Default Transition Time Client (rm_mesh_generic_dtt_clt)

Modules » Networking » BLE Mesh Network Modules

### Functions

| | |
|---|---|
| fsp_err_t | RM_MESH_GENERIC_DTT_CLT_Open (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, rm_ble_mesh_model_client_cfg_t const *const p_cfg) |
| fsp_err_t | RM_MESH_GENERIC_DTT_CLT_Close |

| | |
|---|---|
| | (rm_ble_mesh_model_client_ctrl_t *const p_ctrl) |
| fsp_err_t | RM_MESH_GENERIC_DTT_CLT_GetModelHandle (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, rm_ble_mesh_access_model_handle_t *const p_model_handle) |
| fsp_err_t | RM_MESH_GENERIC_DTT_CLT_SendReliablePdu (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, uint32_t req_opcode, void const *const p_parameter, uint32_t rsp_opcode) |
| fsp_err_t | RM_MESH_GENERIC_DTT_CLT_Get (rm_ble_mesh_model_client_ctrl_t *const p_ctrl) |
| fsp_err_t | RM_MESH_GENERIC_DTT_CLT_Set (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter) |
| fsp_err_t | RM_MESH_GENERIC_DTT_CLT_SetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter) |

**Detailed Description**

# Overview

### Target Devices

The BLE Mesh Network Generic Default Transition Time Client module supports the following devices.

- RA4W1

# Configuration

### Build Time Configurations for rm_mesh_generic_dtt_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_dtt_clt_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|

**Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Generic Default Transition Time Client (rm_mesh_generic_dtt_clt)**

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Generic Default Transition Time Client (rm_mesh_generic_dtt_clt).

| Configuration | Options | Default | Description |
|---|---|---|---|
| Interrupts | | | |
| Callback Provided When Timeout Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh generic default transition time |

| | | | |
|---|---|---|---|
| | | | client ISR occurs |

### Data Structures

| | |
|---|---|
| struct | rm_mesh_generic_dtt_clt_instance_ctrl_t |

## Data Structure Documentation

### ◆ rm_mesh_generic_dtt_clt_instance_ctrl_t

struct rm_mesh_generic_dtt_clt_instance_ctrl_t

BLE mesh generic dtt instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_GENERIC_DTT_CLT_Open() is called.

## Function Documentation

### ◆ RM_MESH_GENERIC_DTT_CLT_Open()

fsp_err_t RM_MESH_GENERIC_DTT_CLT_Open ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_client_cfg_t const *const *p_cfg* )

Open Generic Default Transition Time Client middleware. This is to initialize Generic_Default_Transition_Time Client model and to register with Access layer.

Implements rm_ble_mesh_model_client_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_GENERIC_DTT_CLT_Open(&g_mesh_generic_dtt_clt0_ctrl,
&g_mesh_generic_dtt_clt0_cfg);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

### ◆ RM_MESH_GENERIC_DTT_CLT_Close()

fsp_err_t RM_MESH_GENERIC_DTT_CLT_Close ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Close Generic Default Transition Time Client middleware.

Implements rm_ble_mesh_model_client_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_GENERIC_DTT_CLT_Close(&g_mesh_generic_dtt_clt0_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

### ◆ RM_MESH_GENERIC_DTT_CLT_GetModelHandle()

fsp_err_t RM_MESH_GENERIC_DTT_CLT_GetModelHandle ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *const *p_model_handle* )

This is to get the handle of Generic_Default_Transition_Time client model.

Implements rm_ble_mesh_model_client_api_t::getModelHandle.

Example:

```
/* Get the handle of generic default transition time client model. */
   err = RM_MESH_GENERIC_DTT_CLT_GetModelHandle(&g_mesh_generic_dtt_clt0_ctrl,
&model_handle);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Got model handle successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_POINTER | The parameter p_model_handle is NULL. |

### ◆ RM_MESH_GENERIC_DTT_CLT_SendReliablePdu()

fsp_err_t RM_MESH_GENERIC_DTT_CLT_SendReliablePdu ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, uint32_t *req_opcode*, void const *const *p_parameter*, uint32_t *rsp_opcode* )

This is to initialize sending acknowledged commands.

Implements rm_ble_mesh_model_client_api_t::sendReliablePdu.

Example:

```
/* Initialize sending acknowledged commands */
   err = RM_MESH_GENERIC_DTT_CLT_SendReliablePdu(&g_mesh_generic_dtt_clt0_ctrl,
req_opcode, p_parameter, rsp_opcode);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_GENERIC_DTT_CLT_Get()

fsp_err_t RM_MESH_GENERIC_DTT_CLT_Get ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Generic Default Transition Time Get is an acknowledged message used to get the Generic Default Transition Time state of an element. The response to the Generic Default Transition Time Get message is a Generic Default Transition Time Status message. There are no parameters for this message.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_generic_dtt_clt control block. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_GENERIC_DTT_CLT_Set()

fsp_err_t RM_MESH_GENERIC_DTT_CLT_Set ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

Generic Default Transition Time Set is an acknowledged message used to set the Generic Default Transition Time state of an element. The response to the Generic Default Transition Time Set message is a Generic Default Transition Time Status message.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_generic_dtt_clt control block. |
| [in] | p_parameter | Pointer to transition time. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_GENERIC_DTT_CLT_SetUnacknowledged()

fsp_err_t RM_MESH_GENERIC_DTT_CLT_SetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

Generic Default Transition Time Set Unacknowledged is an unacknowledged message used to set the Generic Default Transition Time state of an element.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_generic_dtt_clt control block. |
| [in] | p_parameter | Pointer to transition time. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

## BLE Mesh Network Generic Default Transition Time Server (rm_mesh_generic_dtt_srv)

Modules » Networking » BLE Mesh Network Modules

### Functions

| | |
|---|---|
| fsp_err_t | RM_MESH_GENERIC_DTT_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_model_server_cfg_t const *const p_cfg) |
| fsp_err_t | RM_MESH_GENERIC_DTT_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const p_ctrl) |
| fsp_err_t | RM_MESH_GENERIC_DTT_SRV_GetTime |

| | |
|---|---|
| | (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_mesh_generic_dtt_srv_transtion_time_info_t *const p_info) |

### Detailed Description

# Overview

### Target Devices

The BLE Mesh Network Generic Default Transition Time Server module supports the following devices.

- RA4W1

# Configuration

### Build Time Configurations for rm_mesh_generic_dtt_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_dtt_srv_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|

### Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Generic Default Transition Time Server (rm_mesh_generic_dtt_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Generic Default Transition Time Server (rm_mesh_generic_dtt_srv).

| Configuration | Options | Default | Description |
|---|---|---|---|
| Interrupts | | | |
| Callback Provided When Tmeout Occurs | Name must Be a Valid C Symbol | NULL | Callback provided when mesh generic default transition time server ISR occurs |
| Callback Provided When an Timeout ISR Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh generic default transition time server timeout ISR occurs |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_generic_dtt_srv0 | Module name. |

### Data Structures

| | |
|---|---|
| struct | rm_mesh_generic_dtt_srv_instance_ctrl_t |

### Data Structure Documentation

#### ◆ rm_mesh_generic_dtt_srv_instance_ctrl_t

| struct rm_mesh_generic_dtt_srv_instance_ctrl_t |
| --- |
| BLE mesh generic dtt instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_GENERIC_DTT_SRV_Open() is called. |

### Function Documentation

#### ◆ RM_MESH_GENERIC_DTT_SRV_Open()

fsp_err_t RM_MESH_GENERIC_DTT_SRV_Open ( rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_server_cfg_t const *const *p_cfg* )

API to initialize Generic_Default_Transition_Time Server model. This is to initialize Generic_Default_Transition_Time Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_GENERIC_DTT_SRV_Open(&g_mesh_generic_dtt_srv0_ctrl,
&g_mesh_generic_dtt_srv0_cfg);
```

**Return values**

| | |
| --- | --- |
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

### ◆ RM_MESH_GENERIC_DTT_SRV_Close()

fsp_err_t RM_MESH_GENERIC_DTT_SRV_Close ( rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*)

API to terminate Generic_Default_Transition_Time Server model. This is to terminate Generic_Default_Transition_Time Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_GENERIC_DTT_SRV_Close(&g_mesh_generic_dtt_srv0_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

### ◆ RM_MESH_GENERIC_DTT_SRV_GetTime()

fsp_err_t RM_MESH_GENERIC_DTT_SRV_GetTime ( rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_mesh_generic_dtt_srv_transtion_time_info_t *const *p_info* )

API to get default transition time. This is to get default transition time.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_generic_dtt_srv control block. |
| [in] | p_info | rm_mesh_generic_dtt_srv status information. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |

## BLE Mesh Network Generic Level Client (rm_mesh_generic_level_clt)

| fsp_err_t | RM_MESH_GENERIC_LEVEL_CLT_DeltaSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter) |
| fsp_err_t | RM_MESH_GENERIC_LEVEL_CLT_MoveSet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter) |
| fsp_err_t | RM_MESH_GENERIC_LEVEL_CLT_MoveSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter) |

### Detailed Description

# Overview

### Target Devices

The BLE Mesh Network Generic Level Client module supports the following devices.

- RA4W1

# Configuration

### Build Time Configurations for rm_mesh_generic_level_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_level_clt_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|

### Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Generic Level Client (rm_mesh_generic_level_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Generic Level Client (rm_mesh_generic_level_clt).

| Configuration | Options | Default | Description |
|---|---|---|---|
| Interrupts | | | |
| Callback Provided When Timeout Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh generic level client ISR occurs |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_generic_level_clt0 | Module name. |

### Data Structures

| | |
|---|---|
| struct | rm_mesh_generic_level_clt_instance_ctrl_t |

### Data Structure Documentation

#### ◆ rm_mesh_generic_level_clt_instance_ctrl_t

| struct rm_mesh_generic_level_clt_instance_ctrl_t |
|---|
| BLE mesh generic level instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_GENERIC_LEVEL_CLT_Open() is called. |

### Function Documentation

### ◆ RM_MESH_GENERIC_LEVEL_CLT_Open()

fsp_err_t RM_MESH_GENERIC_LEVEL_CLT_Open ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_client_cfg_t const *const *p_cfg* )

Open Generic_Level Client middleware. This is to initialize Generic_Level Client model and to register with Access layer.

Implements rm_ble_mesh_model_client_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_GENERIC_LEVEL_CLT_Open(&g_mesh_generic_level_clt0_ctrl,
&g_mesh_generic_level_clt0_cfg);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

### ◆ RM_MESH_GENERIC_LEVEL_CLT_Close()

fsp_err_t RM_MESH_GENERIC_LEVEL_CLT_Close ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Close Generic_Level Client middleware.

Implements rm_ble_mesh_model_client_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_GENERIC_LEVEL_CLT_Close(&g_mesh_generic_level_clt0_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

### ◆ RM_MESH_GENERIC_LEVEL_CLT_GetModelHandle()

fsp_err_t RM_MESH_GENERIC_LEVEL_CLT_GetModelHandle ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *const *p_model_handle* )

This is to get the handle of Generic_Level client model.

Implements rm_ble_mesh_model_client_api_t::getModelHandle().

Example:

```
/* Get the handle of generic level client model. */
   err = RM_MESH_GENERIC_LEVEL_CLT_GetModelHandle(&g_mesh_generic_level_clt0_ctrl,
&model_handle);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Got model handle successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_POINTER | The parameter p_model_handle is NULL. |

### ◆ RM_MESH_GENERIC_LEVEL_CLT_SendReliablePdu()

fsp_err_t RM_MESH_GENERIC_LEVEL_CLT_SendReliablePdu ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, uint32_t *req_opcode*, void const *const *p_parameter*, uint32_t *rsp_opcode* )

This is to initialize sending acknowledged commands.

Implements rm_ble_mesh_model_client_api_t::sendReliablePdu.

Example:

```
/* Initialize sending acknowledged commands. */
   err =
RM_MESH_GENERIC_LEVEL_CLT_SendReliablePdu(&g_mesh_generic_level_clt0_ctrl,
req_opcode, p_parameter, rsp_opcode);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_GENERIC_LEVEL_CLT_Get()

fsp_err_t RM_MESH_GENERIC_LEVEL_CLT_Get ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Generic Level Get is an acknowledged message used to get the Generic Level state of an element. The response to the Generic Level Get message is a Generic Level Status message. There are no parameters for this message.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_generic_level_clt control block. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_GENERIC_LEVEL_CLT_Set()

fsp_err_t RM_MESH_GENERIC_LEVEL_CLT_Set ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

Generic Level Set is an acknowledged message used to set the Generic Level state of an element to a new absolute value. The response to the Generic Level Set message is a Generic Level Status message.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_generic_level_clt control block. |
| [in] | p_parameter | Pointer to Generic Level Set message. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_GENERIC_LEVEL_CLT_SetUnacknowledged()

fsp_err_t RM_MESH_GENERIC_LEVEL_CLT_SetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

Generic Level Set Unacknowledged is an unacknowledged message used to set the Generic Level state of an element to a new absolute value.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_generic_level_clt control block. |
| [in] | p_parameter | Pointer to Generic Level Set message. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_GENERIC_LEVEL_CLT_DeltaSet()

fsp_err_t RM_MESH_GENERIC_LEVEL_CLT_DeltaSet ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

Generic Delta Set is an acknowledged message used to set the Generic Level state of an element by a relative value. The message is transactional, it supports changing the state by a cumulative value with a sequence of messages that are part of a transaction. The response to the Generic Delta Set message is a Generic Level Status message.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_generic_level_clt control block. |
| [in] | p_parameter | Pointer to Generic Level Set message. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_GENERIC_LEVEL_CLT_DeltaSetUnacknowledged()

fsp_err_t RM_MESH_GENERIC_LEVEL_CLT_DeltaSetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

Generic Delta Set Unacknowledged is an unacknowledged message used to set the Generic Level state of an element by a relative value.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_generic_level_clt control block. |
| [in] | p_parameter | Pointer to Generic Level Set message. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_GENERIC_LEVEL_CLT_MoveSet()

fsp_err_t RM_MESH_GENERIC_LEVEL_CLT_MoveSet ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

Generic Move Set is an acknowledged message used to start a process of changing the Generic Level state of an element with a defined transition speed. The response to the Generic Move Set message is a Generic Level Status message.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_generic_level_clt control block. |
| [in] | p_parameter | Pointer to Generic Level Set message. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_GENERIC_LEVEL_CLT_MoveSetUnacknowledged()

fsp_err_t RM_MESH_GENERIC_LEVEL_CLT_MoveSetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

Generic Move Set Unacknowledged is an unacknowledged message used to start a process of changing the Generic Level state of an element with a defined transition speed.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_generic_level_clt control block. |
| [in] | p_parameter | Pointer to Generic Level Set message. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

## BLE Mesh Network Generic Level Server (rm_mesh_generic_level_srv)

Modules » Networking » BLE Mesh Network Modules

### Functions

| | |
|---|---|
| fsp_err_t | RM_MESH_GENERIC_LEVEL_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_model_server_cfg_t const *const p_cfg) |
| fsp_err_t | RM_MESH_GENERIC_LEVEL_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const p_ctrl) |

| | |
|---|---|
| fsp_err_t | RM_MESH_GENERIC_LEVEL_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state) |

### Detailed Description

# Overview

### Target Devices

The BLE Mesh Network Generic Level Server module supports the following devices.

- RA4W1

# Configuration

### Build Time Configurations for rm_mesh_generic_level_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_level_srv_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|

### Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Generic Level Server (rm_mesh_generic_level_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Generic Level Server (rm_mesh_generic_level_srv).

| Configuration | Options | Default | Description |
|---|---|---|---|
| Interrupts | | | |
| Callback Provided Shen Timeout Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh generic level server ISR occurs |
| Callback Provided When an Timeout ISR Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh generic level server timeout ISR occurs |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_generic_level_srv0 | Module name. |

### Data Structures

| | |
|---|---|
| struct | rm_mesh_generic_level_srv_info_t |
| struct | rm_mesh_generic_level_srv_instance_ctrl_t |

### Data Structure Documentation

#### ◆ rm_mesh_generic_level_srv_info_t

| struct rm_mesh_generic_level_srv_info_t | | |
|---|---|---|
| Generic Level state is a 16-bit signed integer (2-s complement) representing the state of an element | | |
| Data Fields | | |
| uint16_t | level | Generic Level |
| uint32_t | delta_level | Delta Level |
| uint16_t | move_level | Move Level |
| uint8_t | tid | |
| uint8_t | transition_time | |
| uint8_t | delay | |
| uint16_t | target_level | Target Level |

### ◆ rm_mesh_generic_level_srv_instance_ctrl_t

| struct rm_mesh_generic_level_srv_instance_ctrl_t |
|---|
| BLE mesh generic level instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_GENERIC_LEVEL_SRV_Open() is called. |

## Function Documentation

### ◆ RM_MESH_GENERIC_LEVEL_SRV_Open()

fsp_err_t RM_MESH_GENERIC_LEVEL_SRV_Open ( rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_server_cfg_t const *const *p_cfg* )

API to initialize Generic_Level Server model. This is to initialize Generic_Level Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_GENERIC_LEVEL_SRV_Open(&g_mesh_generic_level_srv0_ctrl,
&g_mesh_generic_level_srv0_cfg);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

### ◆ RM_MESH_GENERIC_LEVEL_SRV_Close()

fsp_err_t RM_MESH_GENERIC_LEVEL_SRV_Close ( rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*)

API to terminate Generic_Level Server model. This is to terminate Generic_Level Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_GENERIC_LEVEL_SRV_Close(&g_mesh_generic_level_srv0_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

### ◆ RM_MESH_GENERIC_LEVEL_SRV_StateUpdate()

fsp_err_t RM_MESH_GENERIC_LEVEL_SRV_StateUpdate ( rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state* )

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements rm_ble_mesh_model_server_api_t::stateUpdate.

Example:

```
/* Update server status. */
   err = RM_MESH_GENERIC_BATTERY_SRV_StateUpdate(&g_mesh_generic_battery_srv0_ctrl,
&state);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Updated server status successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_state is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

## BLE Mesh Network Generic Location Client (rm_mesh_generic_loc_clt)

Modules » Networking » BLE Mesh Network Modules

### Functions

| | |
|---|---|
| fsp_err_t | RM_MESH_GENERIC_LOC_CLT_Open (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, rm_ble_mesh_model_client_cfg_t const *const p_cfg) |
| fsp_err_t | RM_MESH_GENERIC_LOC_CLT_Close (rm_ble_mesh_model_client_ctrl_t *const p_ctrl) |

| | |
|---|---|
| fsp_err_t | RM_MESH_GENERIC_LOC_CLT_GetModelHandle (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, rm_ble_mesh_access_model_handle_t *const p_model_handle) |
| fsp_err_t | RM_MESH_GENERIC_LOC_CLT_SendReliablePdu (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, uint32_t req_opcode, void const *const p_parameter, uint32_t rsp_opcode) |
| fsp_err_t | RM_MESH_GENERIC_LOC_CLT_LocationGlobalGet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl) |
| fsp_err_t | RM_MESH_GENERIC_LOC_CLT_LocationGlobalSet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter) |
| fsp_err_t | RM_MESH_GENERIC_LOC_CLT_LocationGlobalSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter) |
| fsp_err_t | RM_MESH_GENERIC_LOC_CLT_LocationLocalGet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl) |
| fsp_err_t | RM_MESH_GENERIC_LOC_CLT_LocationLocalSet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter) |
| fsp_err_t | RM_MESH_GENERIC_LOC_CLT_LocationLocalSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter) |

**Detailed Description**

# Overview

### Target Devices

The BLE Mesh Network Generic Location Client module supports the following devices.

- RA4W1

# Configuration

### Build Time Configurations for rm_mesh_generic_loc_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_loc_clt_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|

**Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Generic**

## Location Client (rm_mesh_generic_loc_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Generic Location Client (rm_mesh_generic_loc_clt).

| Configuration | Options | Default | Description |
|---|---|---|---|
| Interrupts | | | |
| Callback Provided When Timeout Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh generic location client ISR occurs |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_generic_loc_clt0 | Module name. |

### Data Structures

| | |
|---|---|
| struct | rm_mesh_generic_loc_clt_instance_ctrl_t |

### Data Structure Documentation

#### ◆ rm_mesh_generic_loc_clt_instance_ctrl_t

| struct rm_mesh_generic_loc_clt_instance_ctrl_t |
|---|
| BLE mesh generic loc instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_GENERIC_LOC_CLT_Open() is called. |

### Function Documentation

### ◆ RM_MESH_GENERIC_LOC_CLT_Open()

fsp_err_t RM_MESH_GENERIC_LOC_CLT_Open ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_client_cfg_t const *const *p_cfg* )

Open Generic_Location Client middleware. This is to initialize Generic_Location Client model and to register with Access layer.

Implements rm_ble_mesh_model_client_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_GENERIC_LOC_CLT_Open(&g_mesh_generic_loc_clt0_ctrl,
&g_mesh_generic_loc_clt0_cfg);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

### ◆ RM_MESH_GENERIC_LOC_CLT_Close()

fsp_err_t RM_MESH_GENERIC_LOC_CLT_Close ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Close Generic_Location Client middleware.

Implements rm_ble_mesh_model_client_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_GENERIC_LOC_CLT_Close(&g_mesh_generic_loc_clt0_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

### ◆ RM_MESH_GENERIC_LOC_CLT_GetModelHandle()

fsp_err_t RM_MESH_GENERIC_LOC_CLT_GetModelHandle ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *const *p_model_handle* )

This is to get the handle of Generic_Location client model.

Implements rm_ble_mesh_model_client_api_t::getModelHandle.

Example:

```
/* Get the handle of generic_location client model. */
   err = RM_MESH_GENERIC_LOC_CLT_GetModelHandle(&g_mesh_generic_loc_clt0_ctrl,
&model_handle);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Got model handle successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_POINTER | The parameter p_model_handle is NULL. |

### ◆ RM_MESH_GENERIC_LOC_CLT_SendReliablePdu()

fsp_err_t RM_MESH_GENERIC_LOC_CLT_SendReliablePdu ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, uint32_t *req_opcode*, void const *const *p_parameter*, uint32_t *rsp_opcode* )

This is to initialize sending acknowledged commands.

Implements rm_ble_mesh_model_client_api_t::sendReliablePdu.

Example:

```
/* Initialize sending acknowledged commands */
   err = RM_MESH_GENERIC_LOC_CLT_SendReliablePdu(&g_mesh_generic_loc_clt0_ctrl,
req_opcode, p_parameter, rsp_opcode);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_GENERIC_LOC_CLT_LocationGlobalGet()

fsp_err_t RM_MESH_GENERIC_LOC_CLT_LocationGlobalGet ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Generic Location Global Get message is an acknowledged message used to get the selected fields of the Generic Location state of an element. The response to the Generic Location Global Get message is a Generic Location Global Status message. There are no parameters for this message.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_generic_loc_clt control block. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_GENERIC_LOC_CLT_LocationGlobalSet()

fsp_err_t RM_MESH_GENERIC_LOC_CLT_LocationGlobalSet ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

Generic Location Global Set is an acknowledged message used to set the selected fields of the Generic Location state of an element. The response to the Generic Location Global Set message is a Generic Location Global Status message.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_generic_loc_clt control block. |
| [in] | p_parameter | Pointer to Generic Location Global Set message. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_GENERIC_LOC_CLT_LocationGlobalSetUnacknowledged()

fsp_err_t RM_MESH_GENERIC_LOC_CLT_LocationGlobalSetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

Generic Location Global Set Unacknowledged is an unacknowledged message used to set the selected fields of the Generic Location state of an element.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_generic_loc_clt control block. |
| [in] | p_parameter | Pointer to Generic Location Global Set message. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_GENERIC_LOC_CLT_LocationLocalGet()

fsp_err_t RM_MESH_GENERIC_LOC_CLT_LocationLocalGet ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Generic Location Local Get message is an acknowledged message used to get the selected fields of the Generic Location state of an element. The response to the Generic Location Local Get message is a Generic Location Local Status message. There are no parameters for this message.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_generic_loc_clt control block. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_GENERIC_LOC_CLT_LocationLocalSet()

fsp_err_t RM_MESH_GENERIC_LOC_CLT_LocationLocalSet ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

Generic Location Local Set is an acknowledged message used to set the selected fields of the Generic Location state of an element. The response to the Generic Location Local Set message is a Generic Location Local Status message.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_generic_loc_clt control block. |
| [in] | p_parameter | Pointer to Generic Location Local Set message. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_GENERIC_LOC_CLT_LocationLocalSetUnacknowledged()

fsp_err_t RM_MESH_GENERIC_LOC_CLT_LocationLocalSetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

Generic Location Local Set Unacknowledged is an unacknowledged message used to set the selected fields of the Generic Location state of an element.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_generic_loc_clt control block. |
| [in] | p_parameter | Pointer to Generic Location Local Set message. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

| struct rm_mesh_generic_loc_srv_state_info_t | | |
|---|---|---|
| Generic Location state is a composite state that includes a Generic Location Global state and a Generic Location Local state | | |
| Data Fields | | |
| rm_mesh_generic_loc_srv_global_info_t | global_location | Global Location |
| rm_mesh_generic_loc_srv_local_info_t | local_location | Local Location |

### ◆ rm_mesh_generic_loc_srv_instance_ctrl_t

| struct rm_mesh_generic_loc_srv_instance_ctrl_t |
|---|
| BLE mesh generic loc instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_GENERIC_LOC_SRV_Open() is called. |

## Function Documentation

### ◆ RM_MESH_GENERIC_LOC_SRV_Open()

fsp_err_t RM_MESH_GENERIC_LOC_SRV_Open ( rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_server_cfg_t const *const *p_cfg* )

API to initialize Generic_Location Server model and to initialize Generic_Location_Setup Server model. This is to initialize Generic_Location Server model and to register with Access layer. And this is to initialize Generic_Location_Setup Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_GENERIC_LOC_SRV_Open(&g_mesh_generic_loc_srv0_ctrl,
&g_mesh_generic_loc_srv0_cfg);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

### ◆ RM_MESH_GENERIC_LOC_SRV_Close()

fsp_err_t RM_MESH_GENERIC_LOC_SRV_Close ( rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*)

API to terminate Generic_Location Server model. This is to terminate Generic_Location Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_GENERIC_LOC_SRV_Close(&g_mesh_generic_loc_srv0_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

### ◆ RM_MESH_GENERIC_LOC_SRV_StateUpdate()

fsp_err_t RM_MESH_GENERIC_LOC_SRV_StateUpdate ( rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state* )

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements rm_ble_mesh_model_server_api_t::stateUpdate.

Example:

```
/* Update server status. */
   err = RM_MESH_GENERIC_LOC_SRV_StateUpdate(&g_mesh_generic_loc_srv0_ctrl, &state);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Updated server status successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_state is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_GENERIC_LOC_SRV_SetupServerStateUpdate()

fsp_err_t RM_MESH_GENERIC_LOC_SRV_SetupServerStateUpdate ( rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state* )

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_generic_loc_srv control block. |
| [in] | p_state | To send reply for a request or to inform change in state. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_state is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

## BLE Mesh Network Generic Manufacturer Property Server (rm_mesh_generic_mfr_prop_srv)

Modules » Networking » BLE Mesh Network Modules

### Functions

| | |
|---|---|
| fsp_err_t | RM_MESH_GENERIC_MFR_PROP_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_model_server_cfg_t const *const p_cfg) |
| fsp_err_t | RM_MESH_GENERIC_MFR_PROP_SRV_Close |

| | |
|---|---|
| | (rm_ble_mesh_model_server_ctrl_t *const p_ctrl) |
| fsp_err_t | RM_MESH_GENERIC_MFR_PROP_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state) |

**Detailed Description**

# Overview

### Target Devices

The BLE Mesh Network Generic Manufacturer Property Server module supports the following devices.

- RA4W1

# Configuration

### Build Time Configurations for rm_mesh_generic_mfr_prop_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_mfr_prop_srv_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|

### Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Generic Manufacturer Property Server (rm_mesh_generic_mfr_prop_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Generic Manufacturer Property Server (rm_mesh_generic_mfr_prop_srv).

| Configuration | Options | Default | Description |
|---|---|---|---|
| Interrupts | | | |
| Callback Provided When Timeout Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh generic manufacturer property server ISR occurs |
| Callback Provided When an Timeout ISR Occurs | Name Must be a Valid C Symbol | NULL | Callback provided when mesh generic manufacturer property server timeout ISR occurs |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_generic_mfr_prop_srv0 | Module name. |

**Data Structures**

| | |
|---|---|
| struct | rm_mesh_generic_mfr_prop_srv_info_t |
| struct | rm_mesh_generic_mfr_prop_srv_instance_ctrl_t |

## Data Structure Documentation

### ◆ rm_mesh_generic_mfr_prop_srv_info_t

| struct rm_mesh_generic_mfr_prop_srv_info_t | | |
|---|---|---|
| Generic Manufacturer Property is a state representing a device property of an element that is programmed by a manufacturer and can be read | | |
| Data Fields | | |
| uint16_t | property_id | Manufacturer Property ID field is a 2-octet Assigned Number value that references a device property |
| uint8_t | user_access | Manufacturer User Access field is an enumeration indicating whether or not the device property can be read as a Generic User Property |
| uint8_t * | property_value | Manufacturer Property Value field is a conditional field |
| uint16_t | property_value_len | |

### ◆ rm_mesh_generic_mfr_prop_srv_instance_ctrl_t

| struct rm_mesh_generic_mfr_prop_srv_instance_ctrl_t |
|---|
| BLE mesh generic mfr prop instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_GENERIC_MFR_PROP_SRV_Open() is called. |

## Function Documentation

### ◆ RM_MESH_GENERIC_MFR_PROP_SRV_Open()

fsp_err_t RM_MESH_GENERIC_MFR_PROP_SRV_Open ( rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_server_cfg_t const *const *p_cfg* )

API to initialize Generic_Manufacturer_Property Server model. This is to initialize Generic_Manufacturer_Property Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_GENERIC_MFR_PROP_SRV_Open(&g_mesh_generic_mfr_prop_srv0_ctrl,
&g_mesh_generic_mfr_prop_srv0_cfg);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

### ◆ RM_MESH_GENERIC_MFR_PROP_SRV_Close()

fsp_err_t RM_MESH_GENERIC_MFR_PROP_SRV_Close ( rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*)

API to terminate Generic_Manufacturer_Property Server model. This is to terminate Generic_Manufacturer_Property Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_GENERIC_MFR_PROP_SRV_Close(&g_mesh_generic_mfr_prop_srv0_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

### ◆ RM_MESH_GENERIC_MFR_PROP_SRV_StateUpdate()

fsp_err_t RM_MESH_GENERIC_MFR_PROP_SRV_StateUpdate ( rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state* )

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements rm_ble_mesh_model_server_api_t::stateUpdate.

Example:

```
/* Update server status. */
   err =
RM_MESH_GENERIC_MFR_PROP_SRV_StateUpdate(&g_mesh_generic_mfr_prop_srv0_ctrl, &state);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Updated server status successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_state is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

## BLE Mesh Network Generic On Off Client (rm_mesh_generic_on_off_clt)

Modules » Networking » BLE Mesh Network Modules

### Functions

| | |
|---|---|
| fsp_err_t | RM_MESH_GENERIC_ON_OFF_CLT_Open (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, rm_ble_mesh_model_client_cfg_t const *const p_cfg) |
| fsp_err_t | RM_MESH_GENERIC_ON_OFF_CLT_Close (rm_ble_mesh_model_client_ctrl_t *const p_ctrl) |

| | |
|---|---|
| fsp_err_t | RM_MESH_GENERIC_ON_OFF_CLT_GetModelHandle (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, rm_ble_mesh_access_model_handle_t *const p_model_handle) |
| fsp_err_t | RM_MESH_GENERIC_ON_OFF_CLT_SendReliablePdu (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, uint32_t req_opcode, void const *const p_parameter, uint32_t rsp_opcode) |
| fsp_err_t | RM_MESH_GENERIC_ON_OFF_CLT_Get (rm_ble_mesh_model_client_ctrl_t *const p_ctrl) |
| fsp_err_t | RM_MESH_GENERIC_ON_OFF_CLT_Set (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter) |
| fsp_err_t | RM_MESH_GENERIC_ON_OFF_CLT_SetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter) |

**Detailed Description**

# Overview

### Target Devices

The BLE Mesh Network Generic On Off Client module supports the following devices.

- RA4W1

# Configuration

### Build Time Configurations for rm_mesh_generic_on_off_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_on_off_clt_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|

**Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Generic On Off Client (rm_mesh_generic_on_off_clt)**

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Generic On Off Client (rm_mesh_generic_on_off_clt).

| Configuration | Options | Default | Description |
|---|---|---|---|
| Interrupts | | | |
| Callback Provided When Timeout Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh generic on off client ISR occurs |

| | | | |
|---|---|---|---|
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_generic_on_off_clt0 | Module name. |

### Data Structures

| | |
|---|---|
| struct | rm_mesh_generic_on_off_clt_instance_ctrl_t |

## Data Structure Documentation

### ◆ rm_mesh_generic_on_off_clt_instance_ctrl_t

struct rm_mesh_generic_on_off_clt_instance_ctrl_t

BLE mesh generic on off instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_GENERIC_ON_OFF_CLT_Open() is called.

## Function Documentation

### ◆ RM_MESH_GENERIC_ON_OFF_CLT_Open()

fsp_err_t RM_MESH_GENERIC_ON_OFF_CLT_Open ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_client_cfg_t const *const *p_cfg* )

Open Generic_Onoff Client middleware. This is to initialize Generic_Onoff Client model and to register with Access layer.

Implements rm_ble_mesh_model_client_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_GENERIC_ON_OFF_CLT_Open(&g_mesh_generic_on_off_clt0_ctrl,
&g_mesh_generic_on_off_clt0_cfg);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

### ◆ RM_MESH_GENERIC_ON_OFF_CLT_Close()

fsp_err_t RM_MESH_GENERIC_ON_OFF_CLT_Close ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Close Generic_Onoff Client middleware.

Implements rm_ble_mesh_model_client_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_GENERIC_ON_OFF_CLT_Close(&g_mesh_generic_on_off_clt0_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

### ◆ RM_MESH_GENERIC_ON_OFF_CLT_GetModelHandle()

fsp_err_t RM_MESH_GENERIC_ON_OFF_CLT_GetModelHandle ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *const *p_model_handle* )

This is to get the handle of Generic_Onoff client model.

Implements rm_ble_mesh_model_client_api_t::getModelHandle.

Example:

```
/* Get the handle of generic on_off client model. */
   err = RM_MESH_GENERIC_ON_OFF_CLT_GetModelHandle(&g_mesh_generic_on_off_clt0_ctrl,
&model_handle);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Got model handle successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_POINTER | The parameter p_model_handle is NULL. |

### ◆ RM_MESH_GENERIC_ON_OFF_CLT_SendReliablePdu()

fsp_err_t RM_MESH_GENERIC_ON_OFF_CLT_SendReliablePdu ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, uint32_t *req_opcode*, void const *const *p_parameter*, uint32_t *rsp_opcode* )

This is to initialize sending acknowledged commands.

Implements rm_ble_mesh_model_client_api_t::sendReliablePdu.

Example:

```
/* Initialize sending acknowledged commands. */
   err =
RM_MESH_GENERIC_ON_OFF_CLT_SendReliablePdu(&g_mesh_generic_on_off_clt0_ctrl,
                                           req_opcode,
                                           p_parameter,
                                           rsp_opcode);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_GENERIC_ON_OFF_CLT_Get()

fsp_err_t RM_MESH_GENERIC_ON_OFF_CLT_Get ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

The Generic OnOff Get is an acknowledged message used to get the Generic OnOff state of an element.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_generic_on_off_clt control block. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_GENERIC_ON_OFF_CLT_Set()

fsp_err_t RM_MESH_GENERIC_ON_OFF_CLT_Set ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

The Generic OnOff Set is an acknowledged message used to get the Generic OnOff state of an element.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_generic_on_off_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_generic_on_off_set_info_t. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_GENERIC_ON_OFF_CLT_SetUnacknowledged()

fsp_err_t RM_MESH_GENERIC_ON_OFF_CLT_SetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

The Generic OnOff Set is an unacknowledged message used to get the Generic OnOff state of an element.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_generic_on_off_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_generic_on_off_set_info_t. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

## BLE Mesh Network Generic On Off Server (rm_mesh_generic_on_off_srv)

Modules » Networking » BLE Mesh Network Modules

### Functions

| | |
|---|---|
| fsp_err_t | RM_MESH_GENERIC_ON_OFF_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_model_server_cfg_t const *const p_cfg) |

**Detailed Description**

# Overview

### Target Devices

The BLE Mesh Network Generic On Off Server module supports the following devices.

- RA4W1

# Configuration

### Build Time Configurations for rm_mesh_generic_on_off_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_on_off_srv_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|

**Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Generic On Off Server (rm_mesh_generic_on_off_srv)**

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Generic On Off Server (rm_mesh_generic_on_off_srv).

| Configuration | Options | Default | Description |
|---|---|---|---|
| Interrupts | | | |
| Callback Provided When Timeout Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh generic on off server ISR occurs |
| Callback Provided When an Timeout ISR Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh generic on off server timeout ISR occurs |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_generic_on_off_srv0 | Module name. |

**Data Structures**

| | |
|---|---|
| struct | rm_mesh_generic_on_off_srv_info_t |
| struct | rm_mesh_generic_on_off_srv_instance_ctrl_t |

**Data Structure Documentation**

### ◆ rm_mesh_generic_on_off_srv_info_t

| struct rm_mesh_generic_on_off_srv_info_t | | |
|---|---|---|
| Generic OnOff state is a Boolean value that represents the state of an element | | |
| Data Fields | | |
| uint8_t | onoff | Generic On/Off |
| uint8_t | target_onoff | Target On/Off - Used in response path |
| uint8_t | last_onoff | Last On/Off |
| uint8_t | tid | TID - Used in request path |
| uint8_t | transition_time | Transition Time - Used in request path. Used as remaining time in response path. |
| uint8_t | delay | Delay - Used in request path |
| uint16_t | transition_time_handle | Transition Timer Handle |

### ◆ rm_mesh_generic_on_off_srv_instance_ctrl_t

| struct rm_mesh_generic_on_off_srv_instance_ctrl_t |
|---|
| BLE mesh generic on off instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_GENERIC_ON_OFF_SRV_Open() is called. |

## Function Documentation

### ◆ RM_MESH_GENERIC_ON_OFF_SRV_Open()

fsp_err_t RM_MESH_GENERIC_ON_OFF_SRV_Open ( rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_server_cfg_t const *const *p_cfg* )

API to initialize Generic_Onoff Server model. This is to initialize Generic_Onoff Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_GENERIC_ON_OFF_SRV_Open(&g_mesh_generic_on_off_srv0_ctrl,
&g_mesh_generic_on_off_srv0_cfg);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

### ◆ RM_MESH_GENERIC_ON_OFF_SRV_Close()

fsp_err_t RM_MESH_GENERIC_ON_OFF_SRV_Close ( rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*)

API to terminate Generic_Onoff Server model. This is to terminate Generic_Onoff Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_GENERIC_ON_OFF_SRV_Close(&g_mesh_generic_on_off_srv0_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

### ◆ RM_MESH_GENERIC_ON_OFF_SRV_StateUpdate()

fsp_err_t RM_MESH_GENERIC_ON_OFF_SRV_StateUpdate ( rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state* )

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements rm_ble_mesh_model_server_api_t::stateUpdate.

Example:

```
/* Update server status. */
   err = RM_MESH_GENERIC_ON_OFF_SRV_StateUpdate(&g_mesh_generic_on_off_srv0_ctrl,
&state);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Updated server status successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_state is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

## BLE Mesh Network Generic Power Level Client (rm_mesh_generic_pl_clt)

Modules » Networking » BLE Mesh Network Modules

### Functions

| | |
|---|---|
| fsp_err_t | RM_MESH_GENERIC_PL_CLT_Open (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, rm_ble_mesh_model_client_cfg_t const *const p_cfg) |

| fsp_err_t | RM_MESH_GENERIC_PL_CLT_DefaultSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter) |
| fsp_err_t | RM_MESH_GENERIC_PL_CLT_RangeGet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl) |
| fsp_err_t | RM_MESH_GENERIC_PL_CLT_RangeSet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter) |
| fsp_err_t | RM_MESH_GENERIC_PL_CLT_RangeSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter) |

### Detailed Description

# Overview

### Target Devices

The BLE Mesh Network Generic Power Level Client module supports the following devices.

- RA4W1

# Configuration

### Build Time Configurations for rm_mesh_generic_pl_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_pl_clt_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|

### Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Generic Power Level Client (rm_mesh_generic_pl_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Generic Power Level Client (rm_mesh_generic_pl_clt).

| Configuration | Options | Default | Description |
|---|---|---|---|
| Interrupts | | | |
| Callback Provided When Timeout Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh generic power level client ISR occurs |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_generic_pl_clt0 | Module name. |

### Data Structures

| | |
|---|---|
| struct | rm_mesh_generic_pl_clt_instance_ctrl_t |

## Data Structure Documentation

### ◆ rm_mesh_generic_pl_clt_instance_ctrl_t

| struct rm_mesh_generic_pl_clt_instance_ctrl_t |
|---|
| BLE mesh generic pl instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_GENERIC_PL_CLT_Open() is called. |

## Function Documentation

### ◆ RM_MESH_GENERIC_PL_CLT_Open()

fsp_err_t RM_MESH_GENERIC_PL_CLT_Open ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_client_cfg_t const *const *p_cfg* )

Open Generic_Power_Level Client middleware. This is to initialize Generic_Power_Level Client model and to register with Access layer.

Implements rm_ble_mesh_model_client_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_GENERIC_PL_CLT_Open(&g_mesh_generic_pl_clt0_ctrl,
&g_mesh_generic_pl_clt0_cfg);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

### ◆ RM_MESH_GENERIC_PL_CLT_Close()

fsp_err_t RM_MESH_GENERIC_PL_CLT_Close ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Close Generic_Power_Level Client middleware.

Implements rm_ble_mesh_model_client_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_GENERIC_PL_CLT_Close(&g_mesh_generic_pl_clt0_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

### ◆ RM_MESH_GENERIC_PL_CLT_GetModelHandle()

fsp_err_t RM_MESH_GENERIC_PL_CLT_GetModelHandle ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *const *p_model_handle* )

This is to get the handle of Generic_Power_Level client model. Implements rm_ble_mesh_model_client_api_t::getModelHandle.

Example:

```
/* Get the handle of generic power level client model. */
   err = RM_MESH_GENERIC_PL_CLT_GetModelHandle(&g_mesh_generic_pl_clt0_ctrl,
&model_handle);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Got model handle successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_POINTER | The parameter p_model_handle is NULL. |

### ◆ RM_MESH_GENERIC_PL_CLT_SendReliablePdu()

fsp_err_t RM_MESH_GENERIC_PL_CLT_SendReliablePdu ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, uint32_t *req_opcode*, void const *const *p_parameter*, uint32_t *rsp_opcode* )

This is to initialize sending acknowledged commands. Implements rm_ble_mesh_model_client_api_t::sendReliablePdu.

Example:

```
/* Initialize sending acknowledged commands. */
   err = RM_MESH_GENERIC_PL_CLT_SendReliablePdu(&g_mesh_generic_pl_clt0_ctrl,
req_opcode, p_parameter, rsp_opcode);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_GENERIC_PL_CLT_LevelGet()

fsp_err_t RM_MESH_GENERIC_PL_CLT_LevelGet ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Generic Power Level Get message is an acknowledged message used to get the Generic Power Actual state of an element. The response to the Generic Power Level Get message is a Generic Power Level Status message. There are no parameters for this message.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_generic_pl_clt control block. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_GENERIC_PL_CLT_LevelSet()

fsp_err_t RM_MESH_GENERIC_PL_CLT_LevelSet ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

Generic Power Level Set is an acknowledged message used to set the Generic Power Actual state of an element. The response to the Generic Power Level Set message is a Generic Power Level Status message.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_generic_pl_clt control block. |
| [in] | p_parameter | Pointer to Generic Power Level Set message. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_GENERIC_PL_CLT_LevelSetUnacknowledged()

fsp_err_t RM_MESH_GENERIC_PL_CLT_LevelSetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

Generic Power Level Set Unacknowledged is an unacknowledged message used to set the Generic Power Actual state of an element.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_generic_pl_clt control block. |
| [in] | p_parameter | Pointer to Generic Power Level Set message. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_GENERIC_PL_CLT_LastGet()

fsp_err_t RM_MESH_GENERIC_PL_CLT_LastGet ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Generic Power Last Get is an acknowledged message used to get the Generic Power Last state of an element. The response to a Generic Power Last Get message is a Generic Power Last Status message. There are no parameters for this message.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_generic_pl_clt control block. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_GENERIC_PL_CLT_DefaultGet()

fsp_err_t RM_MESH_GENERIC_PL_CLT_DefaultGet ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Generic Power Default Get is an acknowledged message used to get the Generic Power Default state of an element. The response to a Generic Power Default Get message is a Generic Power Default Status message. There are no parameters for this message.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_generic_pl_clt control block. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_GENERIC_PL_CLT_DefaultSet()

fsp_err_t RM_MESH_GENERIC_PL_CLT_DefaultSet ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

Generic Power Default Set is an acknowledged message used to set the Generic Power Default state of an element. The response to the Generic Power Default Set message is a Generic Power Default Status message.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_generic_pl_clt control block. |
| [in] | p_parameter | Pointer to Generic Power Default Set message. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_GENERIC_PL_CLT_DefaultSetUnacknowledged()

fsp_err_t RM_MESH_GENERIC_PL_CLT_DefaultSetUnacknowledged (
rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

Generic Power Default Set Unacknowledged is an unacknowledged message used to set the Generic Power Default state of an element.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_generic_pl_clt control block. |
| [in] | p_parameter | Pointer to Generic Power Default Set message. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_GENERIC_PL_CLT_RangeGet()

fsp_err_t RM_MESH_GENERIC_PL_CLT_RangeGet ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Generic Power Range Get is an acknowledged message used to get the Generic Power Range state of an element. The response to the Generic Power Range Get message is a Generic Power Range Status message. There are no parameters for this message.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_generic_pl_clt control block. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_GENERIC_PL_CLT_RangeSet()

fsp_err_t RM_MESH_GENERIC_PL_CLT_RangeSet ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

Generic Power Range Set is an acknowledged message used to set the Generic Power Range state of an element. The response to the Generic Power Range Set message is a Generic Power Range Status message.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_generic_pl_clt control block. |
| [in] | p_parameter | Pointer to Generic Power Range Set message. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_GENERIC_PL_CLT_RangeSetUnacknowledged()

fsp_err_t RM_MESH_GENERIC_PL_CLT_RangeSetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

Generic Power Range Set Unacknowledged is an unacknowledged message used to set the Generic Power Range state of an element.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_generic_pl_clt control block. |
| [in] | p_parameter | Pointer to Generic Power Range Set message. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

| Callback Provided when an Timeout ISR Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh generic power level server timeout ISR occurs |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_generic_pl_srv0 | Module name. |

### Data Structures

| | |
|---|---|
| struct | rm_mesh_generic_pl_srv_actual_state_info_t |
| struct | rm_mesh_generic_pl_srv_last_state_info_t |

| | |
|---|---|
| struct | rm_mesh_generic_pl_srv_default_state_info_t |
| struct | rm_mesh_generic_pl_srv_range_state_info_t |
| struct | rm_mesh_generic_pl_srv_state_info_t |
| struct | rm_mesh_generic_pl_srv_instance_ctrl_t |

## Data Structure Documentation

### ◆ rm_mesh_generic_pl_srv_actual_state_info_t

| struct rm_mesh_generic_pl_srv_actual_state_info_t | | |
|---|---|---|
| Generic Power Actual state determines the linear percentage of the maximum power level of an element, representing a range from 0 percent through 100 percent | | |
| Data Fields | | |
| uint16_t | power_actual | Generic Power Actual |
| uint8_t | tid | |
| uint16_t | power_target | Generic Power Target - Used only in response path |
| uint8_t | transition_time | Transition Time - Used in request path Used as Remaining Time in response path |
| uint8_t | delay | |
| uint16_t | transition_time_handle | Transition Timer Handle |

### ◆ rm_mesh_generic_pl_srv_last_state_info_t

| struct rm_mesh_generic_pl_srv_last_state_info_t | | |
|---|---|---|
| Generic Power Last state is a 16-bit value representing a percentage ranging from (1/65535) percent to 100 percent | | |
| Data Fields | | |
| uint16_t | power_last | Generic Power Last |

### ◆ rm_mesh_generic_pl_srv_default_state_info_t

| struct rm_mesh_generic_pl_srv_default_state_info_t | | |
|---|---|---|
| Generic Power Default state is a 16-bit value ranging from 0 through 65535 | | |
| Data Fields | | |
| uint16_t | power_default | Generic Power Default |

### ◆ rm_mesh_generic_pl_srv_range_state_info_t

| struct rm_mesh_generic_pl_srv_range_state_info_t |
|---|

| Generic Power Range state determines the minimum and maximum power levels of an element relative to the maximum power level an element can output | | |
|---|---|---|
| Data Fields | | |
| uint16_t | power_range_min | Generic Power Range - Minimum |
| uint16_t | power_range_max | Generic Power Range - Maximum |
| uint8_t | status | Status - Used only in the response path |

### ◆ rm_mesh_generic_pl_srv_state_info_t

| struct rm_mesh_generic_pl_srv_state_info_t | | |
|---|---|---|
| Generic Power Level state is a composite state that includes a Generic Power Actual state, a Generic Power Last state, a Generic Power Default state, and a Generic Power Range state | | |
| Data Fields | | |
| rm_mesh_generic_pl_srv_actual_state_info_t | generic_power_actual | Generic Power Actual |
| rm_mesh_generic_pl_srv_last_state_info_t | generic_power_last | Generic Power Last |
| rm_mesh_generic_pl_srv_default_state_info_t | generic_power_default | Generic Power Default |
| rm_mesh_generic_pl_srv_range_state_info_t | generic_power_range | Generic Power Range |

### ◆ rm_mesh_generic_pl_srv_instance_ctrl_t

| struct rm_mesh_generic_pl_srv_instance_ctrl_t |
|---|
| BLE mesh generic pl instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_GENERIC_PL_SRV_Open() is called. |

## Function Documentation

### ◆ RM_MESH_GENERIC_PL_SRV_Open()

fsp_err_t RM_MESH_GENERIC_PL_SRV_Open ( rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_server_cfg_t const *const *p_cfg* )

API to initialize Generic_Power_Level Server model and to initialize Generic_Power_Level_Setup Server model. This is to initialize Generic_Power_Level Server model and to register with Access layer. And this is to initialize Generic_Power_Level_Setup Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_GENERIC_PL_SRV_Open(&g_mesh_generic_pl_srv0_ctrl,
&g_mesh_generic_pl_srv0_cfg);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

### ◆ RM_MESH_GENERIC_PL_SRV_Close()

fsp_err_t RM_MESH_GENERIC_PL_SRV_Close ( rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*)

API to terminate Generic_Power_Level Server model. This is to terminate Generic_Power_Level Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_GENERIC_PL_SRV_Close(&g_mesh_generic_pl_srv0_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

### ◆ RM_MESH_GENERIC_PL_SRV_StateUpdate()

fsp_err_t RM_MESH_GENERIC_PL_SRV_StateUpdate ( rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state* )

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements rm_ble_mesh_model_server_api_t::stateUpdate.

Example:

```
/* Update server status. */
   err = RM_MESH_GENERIC_PL_SRV_StateUpdate(&g_mesh_generic_pl_srv0_ctrl, &state);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Updated server status successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_state is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_GENERIC_PL_SRV_SetupServerStateUpdate()

fsp_err_t RM_MESH_GENERIC_PL_SRV_SetupServerStateUpdate ( rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state* )

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_generic_pl_srv control block. |
| [in] | p_state | To send reply for a request or to inform change in state. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_state is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

**Detailed Description**

# Overview

### Target Devices

The BLE Mesh Network Generic Power On Off Client module supports the following devices.

- RA4W1

# Configuration

### Build Time Configurations for rm_mesh_generic_poo_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_poo_clt_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|

**Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Generic Power On Off Client (rm_mesh_generic_poo_clt)**

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Generic Power On Off Client (rm_mesh_generic_poo_clt).

| Configuration | Options | Default | Description |
|---|---|---|---|
| Interrupts | | | |
| Callback Provided when Timeout Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh generic power on off client ISR occurs |

| | | | |
|---|---|---|---|
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_generic_poo_clt0 | Module name. |

### Data Structures

| | |
|---|---|
| struct | rm_mesh_generic_poo_clt_instance_ctrl_t |

## Data Structure Documentation

### ◆ rm_mesh_generic_poo_clt_instance_ctrl_t

struct rm_mesh_generic_poo_clt_instance_ctrl_t

BLE mesh generic poo instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_GENERIC_POO_CLT_Open() is called.

## Function Documentation

### ◆ RM_MESH_GENERIC_POO_CLT_Open()

fsp_err_t RM_MESH_GENERIC_POO_CLT_Open ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_client_cfg_t const *const *p_cfg* )

Open Generic_Power_Onoff Client middleware. This is to initialize Generic_Power_Onoff Client model and to register with Access layer.

Implements rm_ble_mesh_model_client_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_GENERIC_POO_CLT_Open(&g_mesh_generic_poo_clt0_ctrl,
&g_mesh_generic_poo_clt0_cfg);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

### ◆ RM_MESH_GENERIC_POO_CLT_Close()

fsp_err_t RM_MESH_GENERIC_POO_CLT_Close ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Close Generic_Power_Onoff Client middleware.

Implements rm_ble_mesh_model_client_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_GENERIC_POO_CLT_Close(&g_mesh_generic_poo_clt0_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

### ◆ RM_MESH_GENERIC_POO_CLT_GetModelHandle()

fsp_err_t RM_MESH_GENERIC_POO_CLT_GetModelHandle ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *const *p_model_handle* )

This is to get the handle of Generic_Power_Onoff client model.

Implements rm_ble_mesh_model_client_api_t::getModelHandle.

Example:

```
/* Get the handle of generic power on off client model. */
   err = RM_MESH_GENERIC_POO_CLT_GetModelHandle(&g_mesh_generic_poo_clt0_ctrl,
&model_handle);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Got model handle successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_POINTER | The parameter p_model_handle is NULL. |

### ◆ RM_MESH_GENERIC_POO_CLT_SendReliablePdu()

fsp_err_t RM_MESH_GENERIC_POO_CLT_SendReliablePdu ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, uint32_t *req_opcode*, void const *const *p_parameter*, uint32_t *rsp_opcode* )

This is to initialize sending acknowledged commands.

Implements rm_ble_mesh_model_client_api_t::sendReliablePdu

Example:

```
/* Initialize sending acknowledged commands. */
   err = RM_MESH_GENERIC_POO_CLT_SendReliablePdu(&g_mesh_generic_poo_clt0_ctrl,
req_opcode, p_parameter, rsp_opcode);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_GENERIC_POO_CLT_OnpowerupGet()

fsp_err_t RM_MESH_GENERIC_POO_CLT_OnpowerupGet ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Generic OnPowerUp Get is an acknowledged message used to get the Generic OnPowerUp state of an element. The response to the Generic OnPowerUp Get message is a Generic OnPowerUp Status message. There are no parameters for this message.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_generic_poo_clt control block. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_GENERIC_POO_CLT_OnpowerupSet()

fsp_err_t RM_MESH_GENERIC_POO_CLT_OnpowerupSet ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

Generic OnPowerUp Set is an acknowledged message used to set the Generic OnPowerUp state of an element. The response to the Generic OnPowerUp Set message is a Generic OnPowerUp Status message.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_generic_poo_clt control block. |
| [in] | p_parameter | Pointer to Generic OnPowerUp Set message. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_GENERIC_POO_CLT_OnpowerupSetUnacknowledged()

fsp_err_t RM_MESH_GENERIC_POO_CLT_OnpowerupSetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

Generic OnPowerUp Set Unacknowledged is an unacknowledged message used to set the Generic OnPowerUp state of an element.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_generic_poo_clt control block. |
| [in] | p_parameter | Pointer to Generic OnPowerUp Set message. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

## BLE Mesh Network Generic Power On Off Server (rm_mesh_generic_poo_srv)

Modules » Networking » BLE Mesh Network Modules

### Functions

| | |
|---|---|
| fsp_err_t | RM_MESH_GENERIC_POO_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_model_server_cfg_t const *const p_cfg) |

| Configuration | Options | Default | Description |
|---|---|---|---|
| Interrupts | | | |
| Callback Provided when Timeout Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh generic power on off server ISR occurs |
| Callback Provided when an Timeout ISR Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh generic power on off server timeout ISR occurs |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_generic_poo_srv0 | Module name. |

### Data Structures

| | |
|---|---|
| struct | rm_mesh_generic_poo_srv_on_power_up_state_info_t |
| struct | rm_mesh_generic_poo_srv_instance_ctrl_t |

## Data Structure Documentation

### ◆ rm_mesh_generic_poo_srv_on_power_up_state_info_t

| struct rm_mesh_generic_poo_srv_on_power_up_state_info_t | | |
|---|---|---|
| Generic OnPowerUp state is an enumeration representing the behavior of an element when powered up | | |
| Data Fields | | |
| uint8_t | onpowerup | Generic OnPowerUp |

### ◆ rm_mesh_generic_poo_srv_instance_ctrl_t

| struct rm_mesh_generic_poo_srv_instance_ctrl_t |
|---|
| BLE mesh generic poo instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_GENERIC_POO_SRV_Open() is called. |

## Function Documentation

### ◆ RM_MESH_GENERIC_POO_SRV_Open()

| fsp_err_t RM_MESH_GENERIC_POO_SRV_Open ( rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_server_cfg_t const *const *p_cfg* ) |
|---|
| API to initialize Generic_Power_Onoff Server model and to initialize Generic_Power_Onoff_Setup Server model. This is to initialize Generic_Power_Onoff Server model and to register with Access layer. And this is to initialize Generic_Power_Onoff_Setup Server model and to register with Access layer.<br><br>Implements rm_ble_mesh_model_server_api_t::open.<br><br>Example:<br>`/* Open the module. */`<br>`err = RM_MESH_GENERIC_POO_SRV_Open(&g_mesh_generic_poo_srv0_ctrl, &g_mesh_generic_poo_srv0_cfg);`<br><br>**Return values**<br>FSP_SUCCESS — Model opened successfully.<br>FSP_ERR_ASSERTION — Pointer to control block or configuration structure is NULL.<br>FSP_ERR_ALREADY_OPEN — Model is already open.<br>FSP_ERR_NOT_FOUND — The number of models has exceeded the limit.<br>FSP_ERR_ABORTED — Model initialization is failed. |

### ◆ RM_MESH_GENERIC_POO_SRV_Close()

fsp_err_t RM_MESH_GENERIC_POO_SRV_Close ( rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*)

API to terminate Generic_Power_Onoff Server model. This is to terminate Generic_Power_Onoff Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_GENERIC_POO_SRV_Close(&g_mesh_generic_poo_srv0_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

### ◆ RM_MESH_GENERIC_POO_SRV_StateUpdate()

fsp_err_t RM_MESH_GENERIC_POO_SRV_StateUpdate ( rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state* )

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements rm_ble_mesh_model_server_api_t::stateUpdate.

Example:

```
/* Update server status. */
   err = RM_MESH_GENERIC_POO_SRV_StateUpdate(&g_mesh_generic_poo_srv0_ctrl, &state);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Updated server status successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_state is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_GENERIC_POO_SRV_SetupServerStateUpdate()

fsp_err_t RM_MESH_GENERIC_POO_SRV_SetupServerStateUpdate ( rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state* )

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_generic_poo_srv control block. |
| [in] | p_state | To send reply for a request or to inform change in state. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_state is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Generic Property Client (rm_mesh_generic_prop_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Generic Property Client (rm_mesh_generic_prop_clt).

| Configuration | Options | Default | Description |
|---|---|---|---|
| Interrupts | | | |
| Callback Provided when Timeout Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh generic property client ISR occurs |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_generic_prop_clt0 | Module name. |

**Data Structures**

| | |
|---|---|
| struct | rm_mesh_generic_prop_clt_instance_ctrl_t |

**Data Structure Documentation**

◆ **rm_mesh_generic_prop_clt_instance_ctrl_t**

| struct rm_mesh_generic_prop_clt_instance_ctrl_t |
|---|
| |

BLE mesh generic prop instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_GENERIC_PROP_CLT_Open() is called.

### Function Documentation

#### ◆ RM_MESH_GENERIC_PROP_CLT_Open()

fsp_err_t RM_MESH_GENERIC_PROP_CLT_Open ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_client_cfg_t const *const *p_cfg* )

Open Generic_Property Client middleware. This is to initialize Generic_Property Client model and to register with Access layer.

Implements rm_ble_mesh_model_client_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_GENERIC_PROP_CLT_Open(&g_mesh_generic_prop_clt0_ctrl,
&g_mesh_generic_prop_clt0_cfg);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

#### ◆ RM_MESH_GENERIC_PROP_CLT_Close()

fsp_err_t RM_MESH_GENERIC_PROP_CLT_Close ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Close Generic_Property Client middleware. Example:

```
/* Close the module. */
   err = RM_MESH_GENERIC_PROP_CLT_Close(&g_mesh_generic_prop_clt0_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

### ◆ RM_MESH_GENERIC_PROP_CLT_GetModelHandle()

fsp_err_t RM_MESH_GENERIC_PROP_CLT_GetModelHandle ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *const *p_model_handle* )

This is to get the handle of Generic_Property client model.

Implements rm_ble_mesh_model_client_api_t::getModelHandle.

Example:

```
/* Get the handle of generic property client model. */
   err = RM_MESH_GENERIC_PROP_CLT_GetModelHandle(&g_mesh_generic_prop_clt0_ctrl,
&model_handle);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Got model handle successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_POINTER | The parameter p_model_handle is NULL. |

### ◆ RM_MESH_GENERIC_PROP_CLT_SendReliablePdu()

fsp_err_t RM_MESH_GENERIC_PROP_CLT_SendReliablePdu ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, uint32_t *req_opcode*, void const *const *p_parameter*, uint32_t *rsp_opcode* )

This is to initialize sending acknowledged commands.

Implements rm_ble_mesh_model_client_api_t::sendReliablePdu.

Example:

```
/* Initialize sending acknowledged commands. */
   err = RM_MESH_GENERIC_PROP_CLT_SendReliablePdu(&g_mesh_generic_prop_clt0_ctrl,
req_opcode, p_parameter, rsp_opcode);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_GENERIC_PROP_CLT_UserPropertiesGet()

fsp_err_t RM_MESH_GENERIC_PROP_CLT_UserPropertiesGet ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Generic User Properties Get is an acknowledged message used to get the list of Generic User Property states of an element. The response to the Generic User Properties Get message is a Generic User Properties Status message. The message has no parameters.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_generic_prop_clt control block. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_GENERIC_PROP_CLT_UserPropertyGet()

fsp_err_t RM_MESH_GENERIC_PROP_CLT_UserPropertyGet ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

Generic User Property Get is an acknowledged message used to get the Generic User Property state of an element. The response to the Generic User Property Get message is a Generic User Property Status message.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_generic_prop_clt control block. |
| [in] | p_parameter | Pointer to Generic User Property Get message. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_GENERIC_PROP_CLT_UserPropertySet()

fsp_err_t RM_MESH_GENERIC_PROP_CLT_UserPropertySet ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

Generic User Property Set is an acknowledged message used to set the Generic User Property state of an element. The response to the Generic User Property Set message is a Generic User Property Status message.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_generic_prop_clt control block. |
| [in] | p_parameter | Pointer to Generic User Property Set message. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_GENERIC_PROP_CLT_UserPropertySetUnacknowledged()

fsp_err_t RM_MESH_GENERIC_PROP_CLT_UserPropertySetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

Generic User Property Set Unacknowledged is an unacknowledged message used to set the Generic User Property state of an element.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_generic_prop_clt control block. |
| [in] | p_parameter | Pointer to Generic User Property Set message. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_GENERIC_PROP_CLT_AdminPropertiesGet()

fsp_err_t RM_MESH_GENERIC_PROP_CLT_AdminPropertiesGet ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Generic Admin Properties Get is an acknowledged message used to get the list of Generic Admin Property states of an element. The response to the Generic Admin Properties Get message is a Generic Admin Properties Status message. The message has no parameters.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_generic_prop_clt control block. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_GENERIC_PROP_CLT_AdminPropertyGet()

fsp_err_t RM_MESH_GENERIC_PROP_CLT_AdminPropertyGet ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

Generic Admin Property Get is an acknowledged message used to get the Generic Admin Property state of an element. The response to the Generic Admin Property Get message is a Generic Admin Property Status message.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_generic_prop_clt control block. |
| [in] | p_parameter | Pointer to Generic Admin Property Get message. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_GENERIC_PROP_CLT_AdminPropertySet()

fsp_err_t RM_MESH_GENERIC_PROP_CLT_AdminPropertySet ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

Generic Admin Property Set is an acknowledged message used to set the Generic Admin Property state of an element. The response to the Generic Admin Property Set message is a Generic Admin Property Status message.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_generic_prop_clt control block. |
| [in] | p_parameter | Pointer to Generic Admin Property Set message. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_GENERIC_PROP_CLT_AdminPropertySetUnacknowledged()

fsp_err_t RM_MESH_GENERIC_PROP_CLT_AdminPropertySetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

Generic Admin Property Set Unacknowledged is an unacknowledged message used to set the Generic Admin Property state of an element.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_generic_prop_clt control block. |
| [in] | p_parameter | Pointer to Generic Admin Property Set message. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_GENERIC_PROP_CLT_ManufacturerPropertiesGet()

fsp_err_t RM_MESH_GENERIC_PROP_CLT_ManufacturerPropertiesGet ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Generic Manufacturer Properties Get is an acknowledged message used to get the list of Generic Manufacturer Property states of an element. The response to the Generic Manufacturer Properties Get message is a Generic Manufacturer Properties Status message. The message has no parameters.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_generic_prop_clt control block. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_GENERIC_PROP_CLT_ManufacturerPropertyGet()

fsp_err_t RM_MESH_GENERIC_PROP_CLT_ManufacturerPropertyGet ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

Generic Manufacturer Property Get is an acknowledged message used to get the Generic Manufacturer Property state of an element. The response to the Generic Manufacturer Property Get message is a Generic Manufacturer Property Status message.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_generic_prop_clt control block. |
| [in] | p_parameter | Pointer to Generic Manufacturer Property Get message. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_GENERIC_PROP_CLT_ManufacturerPropertySet()

fsp_err_t RM_MESH_GENERIC_PROP_CLT_ManufacturerPropertySet ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

Generic Manufacturer Property Set is an acknowledged message used to set the Generic Manufacturer Property User Access state of an element. The response to the Generic Manufacturer Property Set message is a Generic Manufacturer Property Status message.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_generic_prop_clt control block. |
| [in] | p_parameter | Pointer to Generic Manufacturer Property Set message. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_GENERIC_PROP_CLT_ManufacturerPropertySetUnacknowledged()

fsp_err_t RM_MESH_GENERIC_PROP_CLT_ManufacturerPropertySetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

The Generic Manufacturer Property Set Unacknowledged is an unacknowledged message used to set the Generic Manufacturer Property User Access state of an element.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_generic_prop_clt control block. |
| [in] | p_parameter | Pointer to Generic Manufacturer Property Set message. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_GENERIC_PROP_CLT_ClientPropertiesGet()

fsp_err_t RM_MESH_GENERIC_PROP_CLT_ClientPropertiesGet ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

Generic Client Properties Get is an acknowledged message used to get the list of Generic Client Property states of an element. The response to the Generic Client Properties Get message is a Generic Client Properties Status message.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_generic_prop_clt control block. |
| [in] | p_parameter | Pointer to Generic Client Properties Get message. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

## BLE Mesh Network Generic User Property Server (rm_mesh_generic_user_prop_srv)

Modules » Networking » BLE Mesh Network Modules

### Functions

| | |
|---|---|
| fsp_err_t | RM_MESH_GENERIC_USER_PROP_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_model_server_cfg_t const *const p_cfg) |
| fsp_err_t | RM_MESH_GENERIC_USER_PROP_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const p_ctrl) |

| | |
|---|---|
| fsp_err_t | RM_MESH_GENERIC_USER_PROP_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state) |

### Detailed Description

# Overview

### Target Devices

The BLE Mesh Network Generic User Property Server module supports the following devices.

- RA4W1

# Configuration

### Build Time Configurations for rm_mesh_generic_user_prop_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_user_prop_srv_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|

### Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Generic User Property Server (rm_mesh_generic_user_prop_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Generic User Property Server (rm_mesh_generic_user_prop_srv).

| Configuration | Options | Default | Description |
|---|---|---|---|
| Interrupts | | | |
| Callback Provided when Timeout Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh generic user property server ISR occurs |
| Callback Provided when an Timeout ISR Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh generic user property server timeout ISR occurs |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_generic_user_prop_srv0 | Module name. |

### Data Structures

| | |
|---|---|
| struct | rm_mesh_generic_user_prop_srv_info_t |
| struct | rm_mesh_generic_user_prop_srv_instance_ctrl_t |

### Data Structure Documentation

### ◆ rm_mesh_generic_user_prop_srv_info_t

| struct rm_mesh_generic_user_prop_srv_info_t | | |
|---|---|---|
| Generic User Property is a state representing a device property of an element | | |
| Data Fields | | |
| uint16_t | property_id | User Property ID field is a 2-octet Assigned Number value referencing a device property |
| uint8_t | user_access | User Access field is an enumeration indicating whether the device property can be read or written as a Generic User Property |
| uint8_t * | property_value | User Property Value field is a conditional field |
| uint16_t | property_value_len | |

### ◆ rm_mesh_generic_user_prop_srv_instance_ctrl_t

| struct rm_mesh_generic_user_prop_srv_instance_ctrl_t |
|---|
| BLE mesh generic user prop instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_GENERIC_USER_PROP_SRV_Open() is called. |

## Function Documentation

### ◆ RM_MESH_GENERIC_USER_PROP_SRV_Open()

fsp_err_t RM_MESH_GENERIC_USER_PROP_SRV_Open ( rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_server_cfg_t const *const *p_cfg* )

API to initialize Generic_User_Property Server model. This is to initialize Generic_User_Property Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_GENERIC_USER_PROP_SRV_Open(&g_mesh_generic_user_prop_srv0_ctrl,
&g_mesh_generic_user_prop_srv0_cfg);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

### ◆ RM_MESH_GENERIC_USER_PROP_SRV_Close()

fsp_err_t RM_MESH_GENERIC_USER_PROP_SRV_Close ( rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*)

API to terminate Generic_User_Property Server model. This is to terminate Generic_User_Property Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_GENERIC_USER_PROP_SRV_Close(&g_mesh_generic_user_prop_srv0_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

### ◆ RM_MESH_GENERIC_USER_PROP_SRV_StateUpdate()

fsp_err_t RM_MESH_GENERIC_USER_PROP_SRV_StateUpdate ( rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state* )

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements rm_ble_mesh_model_server_api_t::stateUpdate.

Example:

```
/* Update server status. */
   err =
RM_MESH_GENERIC_USER_PROP_SRV_StateUpdate(&g_mesh_generic_user_prop_srv0_ctrl,
&state);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Updated server status successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_state is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

## BLE Mesh Network Health Client (rm_mesh_health_clt)

Modules » Networking » BLE Mesh Network Modules

### Functions

| | |
|---|---|
| fsp_err_t | RM_MESH_HEALTH_CLIENT_Open (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, rm_ble_mesh_model_client_cfg_t const *const p_cfg) |
| fsp_err_t | RM_MESH_HEALTH_CLIENT_Close (rm_ble_mesh_model_client_ctrl_t *const p_ctrl) |

| | |
|---|---|
| fsp_err_t | RM_MESH_HEALTH_CLIENT_GetModelHandle (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, rm_ble_mesh_access_model_handle_t *const p_model_handle) |
| fsp_err_t | RM_MESH_HEALTH_CLIENT_SendReliablePdu (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, uint32_t req_opcode, void const *const p_parameter, uint32_t rsp_opcode) |
| fsp_err_t | RM_MESH_HEALTH_CLIENT_FaultGet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter) |
| fsp_err_t | RM_MESH_HEALTH_CLIENT_FaultClearUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter) |
| fsp_err_t | RM_MESH_HEALTH_CLIENT_FaultClear (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter) |
| fsp_err_t | RM_MESH_HEALTH_CLIENT_FaultTest (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter) |
| fsp_err_t | RM_MESH_HEALTH_CLIENT_FaultTestUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter) |
| fsp_err_t | RM_MESH_HEALTH_CLIENT_PeriodGet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl) |
| fsp_err_t | RM_MESH_HEALTH_CLIENT_PeriodSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter) |
| fsp_err_t | RM_MESH_HEALTH_CLIENT_PeriodSet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter) |
| fsp_err_t | RM_MESH_HEALTH_CLIENT_AttentionGet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl) |
| fsp_err_t | RM_MESH_HEALTH_CLIENT_AttentionSet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter) |
| fsp_err_t | RM_MESH_HEALTH_CLIENT_AttentionSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter) |

### Detailed Description

# Overview

### Target Devices

The BLE Mesh Network Health Client module supports the following devices.

- RA4W1

# Configuration

### Build Time Configurations for rm_mesh_health_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_health_clt_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|

### Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Health Client (rm_mesh_health_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Health Client (rm_mesh_health_clt).

| Configuration | Options | Default | Description |
|---|---|---|---|
| Interrupts | | | |
| Callback Provided when Timeout occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh health client ISR occurs |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_health_clt0 | Module name. |

### Data Structures

| | |
|---|---|
| struct | rm_mesh_health_clt_instance_ctrl_t |

### Data Structure Documentation

#### ◆ rm_mesh_health_clt_instance_ctrl_t

| struct rm_mesh_health_clt_instance_ctrl_t |
|---|
| BLE mesh health client instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_HEALTH_CLIENT_Open() is called. |

### Function Documentation

### ◆ RM_MESH_HEALTH_CLIENT_Open()

fsp_err_t RM_MESH_HEALTH_CLIENT_Open ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_client_cfg_t const *const *p_cfg* )

Open Health Client middleware. This is to initialize Health Client model and to register with Access layer.

Implements rm_ble_mesh_model_client_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_HEALTH_CLIENT_Open(&g_mesh_health_clt0_ctrl,
&g_mesh_health_clt0_cfg);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

### ◆ RM_MESH_HEALTH_CLIENT_Close()

fsp_err_t RM_MESH_HEALTH_CLIENT_Close ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Close Health Client middleware.

Implements rm_ble_mesh_model_client_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_HEALTH_CLIENT_Close(&g_mesh_health_clt0_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

### ◆ RM_MESH_HEALTH_CLIENT_GetModelHandle()

fsp_err_t RM_MESH_HEALTH_CLIENT_GetModelHandle ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *const *p_model_handle* )

This is to get the handle of Health client model.

Implements rm_ble_mesh_model_client_api_t::getModelHandle.

Example:

```
/* Get the handle of health client model. */
   err = RM_MESH_HEALTH_CLIENT_GetModelHandle(&g_mesh_health_clt0_ctrl,
&model_handle);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Got model handle successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_POINTER | The parameter p_model_handle is NULL. |

### ◆ RM_MESH_HEALTH_CLIENT_SendReliablePdu()

fsp_err_t RM_MESH_HEALTH_CLIENT_SendReliablePdu ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, uint32_t *req_opcode*, void const *const *p_parameter*, uint32_t *rsp_opcode* )

This is to set the handle of Health client model.

Implements rm_ble_mesh_model_client_api_t::sendReliablePdu.

Example:

```
/* Initialize sending acknowledged commands. */
   err = RM_MESH_HEALTH_CLIENT_SendReliablePdu(&g_mesh_health_clt0_ctrl, req_opcode,
p_parameter, rsp_opcode);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_HEALTH_CLIENT_FaultGet()

fsp_err_t RM_MESH_HEALTH_CLIENT_FaultGet ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

The Health Fault Get is an acknowledged message used to get the current Registered Fault state identified by Company ID of an element.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_health_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_health_clt_fault_get_clear_info_t. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_HEALTH_CLIENT_FaultClearUnacknowledged()

fsp_err_t RM_MESH_HEALTH_CLIENT_FaultClearUnacknowledged ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

The Health Fault Clear Unacknowledged is an unacknowledged message used to clear the current Registered Fault state identified by Company ID of an element.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_health_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_health_clt_fault_get_clear_info_t. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_HEALTH_CLIENT_FaultClear()

fsp_err_t RM_MESH_HEALTH_CLIENT_FaultClear ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

The Health Fault Clear is an acknowledged message used to clear the current Registered Fault state identified by Company ID of an element.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_health_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_health_clt_fault_get_clear_info_t. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_HEALTH_CLIENT_FaultTest()

fsp_err_t RM_MESH_HEALTH_CLIENT_FaultTest ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

The Health Fault Test is an acknowledged message used to invoke a self-test procedure of an element. The procedure is implementation specific and may result in changing the Health Fault state of an element.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_health_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_health_clt_fault_test_info_t. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_HEALTH_CLIENT_FaultTestUnacknowledged()

fsp_err_t RM_MESH_HEALTH_CLIENT_FaultTestUnacknowledged ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

The Health Fault Test Unacknowledged is an unacknowledged message used to invoke a self-test procedure of an element. The procedure is implementation specific and may result in changing the Health Fault state of an element.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_health_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_health_clt_fault_test_info_t. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_HEALTH_CLIENT_PeriodGet()

fsp_err_t RM_MESH_HEALTH_CLIENT_PeriodGet ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

The Health Period Get is an acknowledged message used to get the current Health Period state of an element.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_health_clt control block. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_HEALTH_CLIENT_PeriodSetUnacknowledged()

fsp_err_t RM_MESH_HEALTH_CLIENT_PeriodSetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

The Health Period Set Unacknowledged is an unacknowledged message used to set the current Health Period state of an element.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_health_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_health_clt_period_info_t. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_HEALTH_CLIENT_PeriodSet()

fsp_err_t RM_MESH_HEALTH_CLIENT_PeriodSet ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

The Health Period Set is an acknowledged message used to set the current Health Period state of an element.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_health_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_health_clt_period_info_t. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_HEALTH_CLIENT_AttentionGet()

fsp_err_t RM_MESH_HEALTH_CLIENT_AttentionGet ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

The Health Attention Get is an acknowledged message used to get the current Attention Timer state of an element.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_health_clt control block. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_HEALTH_CLIENT_AttentionSet()

fsp_err_t RM_MESH_HEALTH_CLIENT_AttentionSet ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

The Health Attention Set is an acknowledged message used to set the Attention Timer state of an element.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_health_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_health_clt_attention_info_t. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_HEALTH_CLIENT_AttentionSetUnacknowledged()

fsp_err_t RM_MESH_HEALTH_CLIENT_AttentionSetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

The Health Attention Set Unacknowledged is an unacknowledged message used to set the Attention Timer state of an element.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_health_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_health_clt_attention_info_t. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

## BLE Mesh Network Health Server (rm_mesh_health_srv)

Modules » Networking » BLE Mesh Network Modules

### Functions

| | |
|---|---|
| fsp_err_t | RM_MESH_HEALTH_SERVER_ReportFault (rm_ble_mesh_health_server_ctrl_t *const p_ctrl, const rm_ble_mesh_access_model_handle_t *const model_handle, uint8_t test_id, uint16_t company_id, uint8_t fault_code) |
| fsp_err_t | RM_MESH_HEALTH_SERVER_PublishCurrentStatus (rm_ble_mesh_health_server_ctrl_t *const p_ctrl, uint8_t *status, uint16_t length) |

**Detailed Description**

# Overview

### Target Devices

The BLE Mesh Network Health Server module supports the following devices.

- RA4W1

# Configuration

### Build Time Configurations for rm_mesh_health_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_health_srv_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|

**Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Health Server (rm_mesh_health_srv)**

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Health Server (rm_mesh_health_srv).

| Configuration | Options | Default | Description |
|---|---|---|---|
| Interrupts | | | |
| Callback Provided when Timeout Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh health server ISR occurs |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_health_srv0 | Module name. |
| Company ID | Invalid Company Id | 0 | Select company id. |
| Number of Self Tests | Invalid Number of Self Tests | 0 | Select number of self tests. |
| Self Tests | Name Must Be a Valid C Symbol | NULL | Self test |

**Data Structures**

| | |
|---|---|
| struct | rm_mesh_health_server_instance_ctrl_t |

## Data Structure Documentation

### ◆ rm_mesh_health_server_instance_ctrl_t

| struct rm_mesh_health_server_instance_ctrl_t |
|---|
| BLE mesh health server instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_HEALTH_SERVER_Open() is called. |

## Function Documentation

### ◆ RM_MESH_HEALTH_SERVER_Open()

fsp_err_t RM_MESH_HEALTH_SERVER_Open ( rm_ble_mesh_health_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_health_server_cfg_t const *const *p_cfg* )

API to initialize Health Server model. This is to initialize Health Server model and to register with Access layer.

Implements rm_ble_mesh_health_server_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_HEALTH_SERVER_Open(&g_mesh_health_srv0_ctrl,
&g_mesh_health_srv0_cfg);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

### ◆ RM_MESH_HEALTH_SERVER_Close()

fsp_err_t RM_MESH_HEALTH_SERVER_Close ( rm_ble_mesh_health_server_ctrl_t *const *p_ctrl*)

API to terminate Health Server model. This is to terminate Health Server model and to register with Access layer.

Implements rm_ble_mesh_health_server_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_HEALTH_SERVER_Close(&g_mesh_health_srv0_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

### ◆ RM_MESH_HEALTH_SERVER_ReportFault()

fsp_err_t RM_MESH_HEALTH_SERVER_ReportFault ( rm_ble_mesh_health_server_ctrl_t *const *p_ctrl*, const rm_ble_mesh_access_model_handle_t *const *model_handle*, uint8_t *test_id*, uint16_t *company_id*, uint8_t *fault_code* )

API to report self-test fault. This is to report fault observed during self-test procedure.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_health_srv control block. |
| [in] | model_handle | Model Handle identifying the Health Server model instance. |
| [in] | test_id | Identifier of the self-test. |
| [in] | company_id | Company Identifier. |
| [in] | fault_code | Fault value indicating the error. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_state is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

### ◆ RM_MESH_HEALTH_SERVER_PublishCurrentStatus()

fsp_err_t RM_MESH_HEALTH_SERVER_PublishCurrentStatus ( rm_ble_mesh_health_server_ctrl_t *const *p_ctrl*, uint8_t * *status*, uint16_t *length* )

API to publish current status.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_health_srv control block. |
| [in] | status | Current status. |
| [in] | length | Length of status. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_state is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

## BLE Mesh Network Light Control Client (rm_mesh_light_ctl_clt)

### Detailed Description

# Overview

### Target Devices

The BLE Mesh Network Light Control Client module supports the following devices.

- RA4W1

# Configuration

### Build Time Configurations for rm_mesh_light_ctl_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_light_ctl_clt_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|

### Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Light Control Client (rm_mesh_light_ctl_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Light Control Client (rm_mesh_light_ctl_clt).

| Configuration | Options | Default | Description |
|---|---|---|---|
| Interrupts | | | |
| Callback Provided when Timeout Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh light control client ISR occurs |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_light_ctl_clt0 | Module name. |

### Data Structures

| | |
|---|---|
| struct | rm_mesh_light_ctl_clt_instance_ctrl_t |

### Data Structure Documentation

#### ◆ rm_mesh_light_ctl_clt_instance_ctrl_t

| struct rm_mesh_light_ctl_clt_instance_ctrl_t |
|---|
| BLE mesh light ctl instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_LIGHT_CTL_CLT_Open() is called. |

### Function Documentation

### ◆ RM_MESH_LIGHT_CTL_CLT_Open()

fsp_err_t RM_MESH_LIGHT_CTL_CLT_Open ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_client_cfg_t const *const *p_cfg* )

Open Light_Ctl Client middleware. This is to initialize Light_Ctl Client model and to register with Access layer.

Implements rm_ble_mesh_model_client_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_LIGHT_CTL_CLT_Open(&g_mesh_light_ctl_clt0_ctrl,
&g_mesh_light_ctl_clt0_cfg);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

### ◆ RM_MESH_LIGHT_CTL_CLT_Close()

fsp_err_t RM_MESH_LIGHT_CTL_CLT_Close ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Close Light_Ctl Client middleware.

Implements rm_ble_mesh_model_client_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_LIGHT_CTL_CLT_Close(&g_mesh_light_ctl_clt0_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

### ◆ RM_MESH_LIGHT_CTL_CLT_GetModelHandle()

fsp_err_t RM_MESH_LIGHT_CTL_CLT_GetModelHandle ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *const *p_model_handle* )

This is to get the handle of Light_Ctl client model.

Implements rm_ble_mesh_model_client_api_t::getModelHandle.

Example:

```
/* Get the handle of light ctl client model. */
   err = RM_MESH_LIGHT_CTL_CLT_GetModelHandle(&g_mesh_light_ctl_clt0_ctrl,
&model_handle);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Got model handle successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_POINTER | The parameter p_model_handle is NULL. |

### ◆ RM_MESH_LIGHT_CTL_CLT_SendReliablePdu()

fsp_err_t RM_MESH_LIGHT_CTL_CLT_SendReliablePdu ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, uint32_t *req_opcode*, void const *const *p_parameter*, uint32_t *rsp_opcode* )

This is to initialize sending acknowledged commands.

Implements rm_ble_mesh_model_client_api_t::sendReliablePdu.

Example:

```
/* Initialize sending acknowledged commands. */
   err = RM_MESH_LIGHT_CTL_CLT_SendReliablePdu(&g_mesh_light_ctl_clt0_ctrl,
req_opcode, p_parameter, rsp_opcode);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_LIGHT_CTL_CLT_Get()

fsp_err_t RM_MESH_LIGHT_CTL_CLT_Get ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Light CTL Get is an acknowledged message used to get the Light CTL state of an element. The response to the Light CTL Get message is a Light CTL Status message. There are no parameters for this message.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_light_ctl_clt control block. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_LIGHT_CTL_CLT_Set()

fsp_err_t RM_MESH_LIGHT_CTL_CLT_Set ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

Light CTL Set is an acknowledged message used to set the Light CTL Lightness state, Light CTL Temperature state, and the Light CTL Delta UV state of an element. The response to the Light CTL Set message is a Light CTL Status message.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_light_ctl_clt control block. |
| [in] | p_parameter | Pointer to Light CTL Set message. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_LIGHT_CTL_CLT_SetUnacknowledged()

fsp_err_t RM_MESH_LIGHT_CTL_CLT_SetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

Light CTL Set Unacknowledged is an unacknowledged message used to set the Light CTL Lightness state, Light CTL Temperature state, and the Light CTL Delta UV state of an element

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_light_ctl_clt control block. |
| [in] | p_parameter | Pointer to Light CTL Set message. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_LIGHT_CTL_CLT_TemperatureGet()

fsp_err_t RM_MESH_LIGHT_CTL_CLT_TemperatureGet ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Light CTL Temperature Get is an acknowledged message used to get the Light CTL Temperature state of an element. The response to the Light CTL Temperature Get message is a Light CTL Temperature Status message. There are no parameters for this message.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_light_ctl_clt control block. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_LIGHT_CTL_CLT_TemperatureSet()

fsp_err_t RM_MESH_LIGHT_CTL_CLT_TemperatureSet ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

The Light CTL Temperature Set is an acknowledged message used to set the Light CTL Temperature state and the Light CTL Delta UV state of an element. The response to the Light CTL Temperature Set message is a Light CTL Temperature Status message.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_light_ctl_clt control block. |
| [in] | p_parameter | Pointer to Light CTL Temperature Set message. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_LIGHT_CTL_CLT_TemperatureSetUnacknowledged()

fsp_err_t RM_MESH_LIGHT_CTL_CLT_TemperatureSetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

The Light CTL Temperature Set Unacknowledged is an unacknowledged message used to set the Light CTL Temperature state and the Light CTL Delta UV state of an element

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_light_ctl_clt control block. |
| [in] | p_parameter | Pointer to Light CTL Temperature Set message. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_LIGHT_CTL_CLT_DefaultGet()

fsp_err_t RM_MESH_LIGHT_CTL_CLT_DefaultGet ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Light CTL Default Get is an acknowledged message used to get the Light CTL Temperature Default and Light CTL Delta UV Default states of an element. The response to the Light CTL Default Get message is a Light CTL Default Status message. There are no parameters for this message.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_light_ctl_clt control block. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_LIGHT_CTL_CLT_DefaultSet()

fsp_err_t RM_MESH_LIGHT_CTL_CLT_DefaultSet ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

The Light CTL Default Set is an acknowledged message used to set the Light CTL Temperature Default state and the Light CTL Delta UV Default state of an element. The response to the Light CTL Set message is a Light CTL Status message.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_light_ctl_clt control block. |
| [in] | p_parameter | Pointer to Light CTL Default Set message. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_LIGHT_CTL_CLT_DefaultSetUnacknowledged()

fsp_err_t RM_MESH_LIGHT_CTL_CLT_DefaultSetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

The Light CTL Default Set Unacknowledged is an unacknowledged message used to set the Light CTL Temperature Default state and the Light CTL Delta UV Default state of an element.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_light_ctl_clt control block. |
| [in] | p_parameter | Pointer to Light CTL Default Set message. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_LIGHT_CTL_CLT_TemperatureRangeGet()

fsp_err_t RM_MESH_LIGHT_CTL_CLT_TemperatureRangeGet ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

The Light CTL Temperature Range Get is an acknowledged message used to get the Light CTL Temperature Range state of an element. The response to the Light CTL Temperature Range Get message is a Light CTL Temperature Range Status message. There are no parameters for this message.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_light_ctl_clt control block. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_LIGHT_CTL_CLT_TemperatureRangeSet()

fsp_err_t RM_MESH_LIGHT_CTL_CLT_TemperatureRangeSet ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

Light CTL Temperature Range Set Unacknowledged is an unacknowledged message used to set the Light CTL Temperature Range state of an element.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_light_ctl_clt control block. |
| [in] | p_parameter | Pointer to Light CTL Temperature Range Set message. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_LIGHT_CTL_CLT_TemperatureRangeSetUnacknowledged()

fsp_err_t RM_MESH_LIGHT_CTL_CLT_TemperatureRangeSetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

Light CTL Temperature Range Set is an acknowledged message used to set the Light CTL Temperature Range state of an element. The response to the Light CTL Temperature Range Get message is a Light CTL Temperature Range Status message.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_light_ctl_clt control block. |
| [in] | p_parameter | Pointer to Light CTL Temperature Range Set message. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Light Control Server (rm_mesh_light_ctl_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Light Control Server (rm_mesh_light_ctl_srv).

| Configuration | Options | Default | Description |
|---|---|---|---|
| Interrupts | | | |
| Callback Provided when Timeout Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh light control server ISR occurs |
| Callback Provided when an Timeout ISR Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh light control server timeout ISR occurs |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_light_ctl_srv0 | Module name. |

**Data Structures**

| | |
|---|---|
| struct | rm_mesh_light_ctl_srv_info_t |

| | |
|---|---|
| struct | rm_mesh_light_ctl_srv_default_info_t |
| struct | rm_mesh_light_ctl_srv_temperature_info_t |
| struct | rm_mesh_light_ctl_srv_temperature_range_info_t |
| struct | rm_mesh_light_ctl_srv_extended_cfg_t |
| struct | rm_mesh_light_ctl_srv_instance_ctrl_t |

## Data Structure Documentation

### ◆ rm_mesh_light_ctl_srv_info_t

| struct rm_mesh_light_ctl_srv_info_t | | |
|---|---|---|
| Light CTL state is a composite state that includes the Light CTL Lightness, the Light CTL Temperature and the Light CTL Delta UV states | | |
| Data Fields | | |
| uint16_t | ctl_lightness | Light CTL Lightness |
| uint16_t | target_ctl_lightness | Target Light CTL Lightness - Used in response path |
| uint16_t | ctl_temperature | Light CTL Temperature |
| uint16_t | target_ctl_temperature | Terget Light CTL Temperature - Used in response path |
| uint16_t | ctl_delta_uv | Light CTL Delta UV |
| uint8_t | tid | TID - Used in request path |
| uint8_t | transition_time | Transition Time - Used in request path. Used as remaining time in response path. |
| uint8_t | delay | Delay - Used in request path |
| uint16_t | transition_time_handle | Transition Timer Handle |

### ◆ rm_mesh_light_ctl_srv_default_info_t

| struct rm_mesh_light_ctl_srv_default_info_t | | |
|---|---|---|
| Light CTL Default state is a composite state that includes the Light CTL Lightness, the Light CTL Temperature and the Light CTL Delta UV states | | |
| Data Fields | | |
| uint16_t | ctl_lightness | Light CTL Lightness |
| uint16_t | ctl_temperature | Light CTL Temperature |
| uint16_t | ctl_delta_uv | Light CTL Delta UV |

### ◆ rm_mesh_light_ctl_srv_temperature_info_t

| struct rm_mesh_light_ctl_srv_temperature_info_t | | |
|---|---|---|
| Light CTL Temperature state is a composite state that includes the Light CTL Temperature and the Light CTL Delta UV states | | |
| Data Fields | | |
| uint16_t | ctl_temperature | Light CTL Temperature |
| uint16_t | target_ctl_temperature | Target Light CTL Temperature - Used in response path |
| uint16_t | ctl_delta_uv | Light CTL Delta UV |
| uint16_t | target_ctl_delta_uv | Target Light CTL Delta UV - Used in response path |
| uint8_t | tid | TID - Used in request path |
| uint8_t | transition_time | Transition Time - Used in request path. Used as remaining time in response path. |
| uint8_t | delay | Delay - Used in request path |

### ◆ rm_mesh_light_ctl_srv_temperature_range_info_t

| struct rm_mesh_light_ctl_srv_temperature_range_info_t | | |
|---|---|---|
| Light CTL Temperature Range state determines the minimum and maximum color temperatures of tunable white light an element is capable of emitting | | |
| Data Fields | | |
| uint16_t | ctl_temperature_range_min | CTL Temperature Range Min |
| uint16_t | ctl_temperature_range_max | CTL Temperature Range Max |
| uint8_t | status | Status - Used in response path |

### ◆ rm_mesh_light_ctl_srv_extended_cfg_t

| struct rm_mesh_light_ctl_srv_extended_cfg_t | | |
|---|---|---|
| BLE mesh light ctl extension for BLE mesh light ctl. | | |
| Data Fields | | |
| rm_ble_mesh_access_instance_t const * | p_temperature_access_instance | Pointer to access instance for temperature model. |

### ◆ rm_mesh_light_ctl_srv_instance_ctrl_t

| struct rm_mesh_light_ctl_srv_instance_ctrl_t |
|---|
| BLE mesh light ctl instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_LIGHT_CTL_SRV_Open() is called. |

## Function Documentation

### ◆ RM_MESH_LIGHT_CTL_SRV_Open()

fsp_err_t RM_MESH_LIGHT_CTL_SRV_Open ( rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_server_cfg_t const *const *p_cfg* )

API to initialize Light_Ctl Server model and to initialize Light_Ctl_Temperature Server model. This is to initialize Light_Ctl Server model and to register with Access layer. And this is to initialize Light_Ctl_Temperature Server model and to register with Access layer. Implements rm_ble_mesh_model_server_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_LIGHT_CTL_SRV_Open(&g_mesh_light_ctl_srv0_ctrl,
&g_mesh_light_ctl_srv0_cfg);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

### ◆ RM_MESH_LIGHT_CTL_SRV_Close()

fsp_err_t RM_MESH_LIGHT_CTL_SRV_Close ( rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*)

API to terminate Light_Ctl Server model. This is to terminate Light_Ctl Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_LIGHT_CTL_SRV_Close(&g_mesh_light_ctl_srv0_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

### ◆ RM_MESH_LIGHT_CTL_SRV_StateUpdate()

fsp_err_t RM_MESH_LIGHT_CTL_SRV_StateUpdate ( rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state* )

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements rm_ble_mesh_model_server_api_t::stateUpdate.

Example:

```
/* Update server status. */
   err = RM_MESH_LIGHT_CTL_SRV_StateUpdate(&g_mesh_light_ctl_srv0_ctrl, &state);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Updated server status successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_state is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_LIGHT_CTL_SRV_TemperatureServerStateUpdate()

fsp_err_t RM_MESH_LIGHT_CTL_SRV_TemperatureServerStateUpdate ( rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state* )

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_light_ctl_srv control block. |
| [in] | p_state | To send reply for a request or to inform change in state. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_state is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

## BLE Mesh Network Light Hsl Client (rm_mesh_light_hsl_clt)

Modules » Networking » BLE Mesh Network Modules

### Functions

| | |
|---|---|
| fsp_err_t | RM_MESH_LIGHT_HSL_CLT_Open (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, rm_ble_mesh_model_client_cfg_t const *const p_cfg) |

### Detailed Description

# Overview

### Target Devices

The BLE Mesh Network Light Hsl Client module supports the following devices.

- RA4W1

# Configuration

### Build Time Configurations for rm_mesh_light_hsl_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_light_hsl_clt_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|

**Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Light HSL Client (rm_mesh_light_hsl_clt)**

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Light HSL Client (rm_mesh_light_hsl_clt).

| Configuration | Options | Default | Description |
|---|---|---|---|
| Interrupts | | | |
| Callback Provided when Timeout Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh light HSL client ISR occurs |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_light_hsl_clt0 | Module name. |

### Data Structures

| | |
|---|---|
| struct | rm_mesh_light_hsl_clt_instance_ctrl_t |

## Data Structure Documentation

### ◆ rm_mesh_light_hsl_clt_instance_ctrl_t

| struct rm_mesh_light_hsl_clt_instance_ctrl_t |
|---|
| BLE mesh light hsl instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_LIGHT_HSL_CLT_Open() is called. |

## Function Documentation

### ◆ RM_MESH_LIGHT_HSL_CLT_Open()

| fsp_err_t RM_MESH_LIGHT_HSL_CLT_Open ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_client_cfg_t const *const *p_cfg* ) |
|---|
| Open Light_Hsl Client middleware. This is to initialize Light_Hsl Client model and to register with Access layer.<br><br>Implements rm_ble_mesh_model_client_api_t::open.<br><br>Example:<br>`/* Open the module. */`<br>`err = RM_MESH_LIGHT_HSL_CLT_Open(&g_mesh_light_hsl_clt0_ctrl, &g_mesh_light_hsl_clt0_cfg);` |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

### ◆ RM_MESH_LIGHT_HSL_CLT_Close()

fsp_err_t RM_MESH_LIGHT_HSL_CLT_Close ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Close Light_Hsl Client middleware.

Implements rm_ble_mesh_model_client_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_LIGHT_HSL_CLT_Close(&g_mesh_light_hsl_clt0_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

### ◆ RM_MESH_LIGHT_HSL_CLT_GetModelHandle()

fsp_err_t RM_MESH_LIGHT_HSL_CLT_GetModelHandle ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *const *p_model_handle* )

This is to get the handle of Light_Hsl client model.

Implements rm_ble_mesh_model_client_api_t::getModelHandle.

Example:

```
/* Get the handle of light hsl client model. */
   err = RM_MESH_LIGHT_HSL_CLT_GetModelHandle(&g_mesh_light_hsl_clt0_ctrl,
&model_handle);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Got model handle successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_POINTER | The parameter p_model_handle is NULL. |

### ◆ RM_MESH_LIGHT_HSL_CLT_SendReliablePdu()

fsp_err_t RM_MESH_LIGHT_HSL_CLT_SendReliablePdu ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, uint32_t *req_opcode*, void const *const *p_parameter*, uint32_t *rsp_opcode* )

This is to initialize sending acknowledged commands.

Implements rm_ble_mesh_model_client_api_t::sendReliablePdu.

Example:

```
/* Initialize sending acknowledged commands. */
   err = RM_MESH_LIGHT_HSL_CLT_SendReliablePdu(&g_mesh_light_hsl_clt0_ctrl,
req_opcode, p_parameter, rsp_opcode);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_LIGHT_HSL_CLT_Get()

fsp_err_t RM_MESH_LIGHT_HSL_CLT_Get ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

The Light HSL Get is an acknowledged message used to get the Light HSL Lightness, Light HSL Hue, and Light HSL Saturation states of an element. The response to the Light HSL Get message is a Light HSL Status message. There are no parameters for this message.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_light_hsl_clt control block. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_LIGHT_HSL_CLT_Set()

fsp_err_t RM_MESH_LIGHT_HSL_CLT_Set ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

The Light HSL Set Unacknowledged is an unacknowledged message used to set the Light HSL Lightness state, Light HSL Hue state, and the Light HSL Saturation state of an element.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_light_hsl_clt control block. |
| [in] | p_parameter | Pointer to Light HSL Set message. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_LIGHT_HSL_CLT_SetUnacknowledged()

fsp_err_t RM_MESH_LIGHT_HSL_CLT_SetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

The Light HSL Set is an acknowledged message used to set the Light HSL Lightness state, Light HSL Hue state, and the Light HSL Saturation state of an element. The response to the Light HSL Set message is a Light HSL Status message.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_light_hsl_clt control block. |
| [in] | p_parameter | Pointer to Light HSL Set message. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_LIGHT_HSL_CLT_TargetGet()

fsp_err_t RM_MESH_LIGHT_HSL_CLT_TargetGet ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Light HSL Target Get is an acknowledged message used to get the target Light HSL Lightness, Light HSL Hue, and Light HSL Saturation states of an element. The response to the Light HSL Target Get message is a Light HSL Target Status message. There are no parameters for this message.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_light_hsl_clt control block. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_LIGHT_HSL_CLT_DefaultGet()

fsp_err_t RM_MESH_LIGHT_HSL_CLT_DefaultGet ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Light HSL Default Get is an acknowledged message used to get the Light Lightness Default, the Light HSL Hue Default, and Light HSL Saturation Default states of an element. The response to the Light HSL Default Get message is a Light HSL Default Status message. There are no parameters for this message.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_light_hsl_clt control block. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_LIGHT_HSL_CLT_DefaultSet()

fsp_err_t RM_MESH_LIGHT_HSL_CLT_DefaultSet ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

Light HSL Default Set is an acknowledged message used to set the Light Lightness Default, the Light HSL Hue Default, and Light HSL Saturation Default states of an element. The response to the Light HSL Default Set message is a Light HSL Default Status message.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_light_hsl_clt control block. |
| [in] | p_parameter | Pointer to Light HSL Default Set message. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_LIGHT_HSL_CLT_DefaultSetUnacknowledged()

fsp_err_t RM_MESH_LIGHT_HSL_CLT_DefaultSetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

Light HSL Default Set Unacknowledged is an unacknowledged message used to set the Light Lightness Default, the Light HSL Hue Default, and Light HSL Saturation Default states of an element.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_light_hsl_clt control block. |
| [in] | p_parameter | Pointer to Light HSL Default Set message. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_LIGHT_HSL_CLT_RangeGet()

fsp_err_t RM_MESH_LIGHT_HSL_CLT_RangeGet ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

The Light HSL Range Get is an acknowledged message used to get the Light HSL Hue Range and Light HSL Saturation Range states of an element. The response to the Light HSL Range Get message is a Light HSL Range Status message. There are no parameters for this message.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_light_hsl_clt control block. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_LIGHT_HSL_CLT_RangeSet()

fsp_err_t RM_MESH_LIGHT_HSL_CLT_RangeSet ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

Light HSL Range Set is an acknowledged message used to set the Light HSL Hue Range and Light HSL Saturation Range states of an element. The response to the Light HSL Range Set message is a Light HSL Range Status message.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_light_hsl_clt control block. |
| [in] | p_parameter | Pointer to Light HSL Range Set message. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_LIGHT_HSL_CLT_RangeSetUnacknowledged()

fsp_err_t RM_MESH_LIGHT_HSL_CLT_RangeSetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

Light HSL Range Set Unacknowledged is an unacknowledged message used to set the Light HSL Hue Range and Light HSL Saturation Range states of an element.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_light_hsl_clt control block. |
| [in] | p_parameter | Pointer to Light HSL Range Set message. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_LIGHT_HSL_CLT_HueGet()

fsp_err_t RM_MESH_LIGHT_HSL_CLT_HueGet ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

The Light HSL Hue Get is an acknowledged message used to get the Light HSL Hue state of an element. The response to the Light HSL Hue Get message is a Light HSL Hue Status message. There are no parameters for this message.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_light_hsl_clt control block. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_LIGHT_HSL_CLT_HueSet()

fsp_err_t RM_MESH_LIGHT_HSL_CLT_HueSet ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

The Light HSL Hue Set is an acknowledged message used to set the target Light HSL Hue state of an element. The response to the Light HSL Hue Set message is a Light HSL Hue Status message.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_light_hsl_clt control block. |
| [in] | p_parameter | Pointer to Light HSL Hue Set message. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_LIGHT_HSL_CLT_HueSetUnacknowledged()

fsp_err_t RM_MESH_LIGHT_HSL_CLT_HueSetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

The Light HSL Hue Set Unacknowledged is an unacknowledged message used to set the target Light HSL Hue state of an element.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_light_hsl_clt control block. |
| [in] | p_parameter | Pointer to Light HSL Hue Set message. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_LIGHT_HSL_CLT_SaturationGet()

fsp_err_t RM_MESH_LIGHT_HSL_CLT_SaturationGet ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

The Light HSL Saturation Get is an acknowledged message used to get the Light HSL Saturation state of an element. The response to the Light HSL Saturation Get message is a Light HSL Saturation Status message. There are no parameters for this message.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_light_hsl_clt control block. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_LIGHT_HSL_CLT_SaturationSet()

fsp_err_t RM_MESH_LIGHT_HSL_CLT_SaturationSet ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

The Light HSL Saturation Set is an acknowledged message used to set the target Light HSL Saturation state of an element. The response to the Light HSL Saturation Set message is a Light HSL Saturation Status message.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_light_hsl_clt control block. |
| [in] | p_parameter | Pointer to Light HSL Saturation Set message. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_LIGHT_HSL_CLT_SaturationSetUnacknowledged()

fsp_err_t RM_MESH_LIGHT_HSL_CLT_SaturationSetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

The Light HSL Saturation Set Unacknowledged is an unacknowledged message used to set the target Light HSL Saturation state of an element.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_light_hsl_clt control block. |
| [in] | p_parameter | Pointer to Light HSL Saturation Set message. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

## BLE Mesh Network Light Hsl Server (rm_mesh_light_hsl_srv)

Modules » Networking » BLE Mesh Network Modules

### Functions

| | |
|---|---|
| fsp_err_t | RM_MESH_LIGHT_HSL_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_model_server_cfg_t const *const p_cfg) |
| fsp_err_t | RM_MESH_LIGHT_HSL_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const p_ctrl) |
| fsp_err_t | RM_MESH_LIGHT_HSL_SRV_StateUpdate |

| | |
|---|---|
| | (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state) |
| fsp_err_t | RM_MESH_LIGHT_HSL_SRV_HueServerStateUpdate (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state) |
| fsp_err_t | RM_MESH_LIGHT_HSL_SRV_SaturationServerStateUpdate (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state) |

**Detailed Description**

# Overview

### Target Devices

The BLE Mesh Network Light Hsl Server module supports the following devices.

- RA4W1

# Configuration

### Build Time Configurations for rm_mesh_light_hsl_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_light_hsl_srv_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|

### Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Light HSL Server (rm_mesh_light_hsl_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Light HSL Server (rm_mesh_light_hsl_srv).

| Configuration | Options | Default | Description |
|---|---|---|---|
| Interrupts | | | |
| Callback Provided when Timeout Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh light HSL server ISR occurs |
| Callback Provided when an Timeout ISR Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh light HSL server timeout ISR occurs |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_light_hsl_srv0 | Module name. |

**Data Structures**

| | |
|---|---|
| struct | rm_mesh_light_hsl_srv_info_t |

| | |
|---|---|
| struct | rm_mesh_light_hsl_srv_target_info_t |
| struct | rm_mesh_light_hsl_srv_default_info_t |
| struct | rm_mesh_light_hsl_srv_hue_info_t |
| struct | rm_mesh_light_hsl_srv_saturation_info_t |
| struct | rm_mesh_light_hsl_srv_range_info_t |
| struct | rm_mesh_light_hsl_srv_extended_cfg_t |
| struct | rm_mesh_light_hsl_srv_instance_ctrl_t |

## Data Structure Documentation

### ◆ rm_mesh_light_hsl_srv_info_t

struct rm_mesh_light_hsl_srv_info_t

Light HSL state is a composite state that includes the Light HSL Lighness, the Light HSL Hue and the Light HSL Saturation states

Data Fields

| | | |
|---|---|---|
| uint16_t | hsl_lightness | The perceived lightness of a light emitted by the element |
| uint16_t | target_hsl_lightness | Target Perceived lightness - used in the response path |
| uint16_t | hsl_hue | The 16-bit value representing the hue |
| uint16_t | target_hsl_hue | Target hue - used in the response path |
| uint16_t | hsl_saturation | The saturation of a color light |
| uint16_t | target_hsl_saturation | Target saturation - used in the response path |
| uint8_t | tid | TID - Used in request path |
| uint8_t | transition_time | Transition Time - Used in request path. Used as remaining time in response path. |
| uint8_t | delay | Delay - Used in request path |
| uint16_t | transition_time_handle | Transition Timer Handle |

### ◆ rm_mesh_light_hsl_srv_target_info_t

struct rm_mesh_light_hsl_srv_target_info_t

| Light HSL Target state is a composite state that includes the Light HSL Lighness, the Light HSL Hue and the Light HSL Saturation states | | |
|---|---|---|
| Data Fields | | |
| uint16_t | hsl_lightness | The perceived lightness of a light emitted by the element |
| uint16_t | hsl_hue | The 16-bit value representing the hue |
| uint16_t | hsl_saturation | The saturation of a color light |

### ◆ rm_mesh_light_hsl_srv_default_info_t

| struct rm_mesh_light_hsl_srv_default_info_t | | |
|---|---|---|
| Light HSL Default state is a composite state that includes the Light HSL Lighness, the Light HSL Hue and the Light HSL Saturation states | | |
| Data Fields | | |
| uint16_t | hsl_lightness | The perceived lightness of a light emitted by the element |
| uint16_t | hsl_hue | The 16-bit value representing the hue |
| uint16_t | hsl_saturation | The saturation of a color light |

### ◆ rm_mesh_light_hsl_srv_hue_info_t

| struct rm_mesh_light_hsl_srv_hue_info_t | | |
|---|---|---|
| Light HSL Hue | | |
| Data Fields | | |
| uint16_t | hsl_hue | The 16-bit value representing the hue |

### ◆ rm_mesh_light_hsl_srv_saturation_info_t

| struct rm_mesh_light_hsl_srv_saturation_info_t | | |
|---|---|---|
| Light HSL Saturation | | |
| Data Fields | | |
| uint16_t | hsl_saturation | The saturation of a color light |

### ◆ rm_mesh_light_hsl_srv_range_info_t

| struct rm_mesh_light_hsl_srv_range_info_t | | |
|---|---|---|
| Light HSL Range state is a composite state that includes Minimum and Maximum of the Light HSL Hue and the Light HSL Saturation states | | |
| Data Fields | | |
| uint16_t | hue_range_min | The value of the Hue Range Min field of the Light HSL Hue |

| | | |
|---|---|---|
| | | Range state |
| uint16_t | hue_range_max | The value of the Hue Range Max field of the Light HSL Hue Range state |
| uint16_t | saturation_range_min | The value of the Saturation Range Min field of the Light HSL Saturation Range state |
| uint16_t | saturation_range_max | The value of the Saturation Range Max field of the Light HSL Saturation Range state |
| uint8_t | status | Status - Used only in response path |

### ◆ rm_mesh_light_hsl_srv_extended_cfg_t

| struct rm_mesh_light_hsl_srv_extended_cfg_t | | |
|---|---|---|
| BLE mesh light hsl extension for BLE mesh light hsl. | | |
| Data Fields | | |
| rm_ble_mesh_access_instance_t const * | p_hue_access_instance | Pointer to access instance for hue model. |
| rm_ble_mesh_access_instance_t const * | p_saturation_access_instance | Pointer to access instance for saturation model. |

### ◆ rm_mesh_light_hsl_srv_instance_ctrl_t

| struct rm_mesh_light_hsl_srv_instance_ctrl_t |
|---|
| BLE mesh light hsl instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_LIGHT_HSL_SRV_Open() is called. |

## Function Documentation

### ◆ RM_MESH_LIGHT_HSL_SRV_Open()

fsp_err_t RM_MESH_LIGHT_HSL_SRV_Open ( rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_server_cfg_t const *const *p_cfg* )

API to initialize Light_Hsl Server/Light_Hsl_Hue Server/Light_Hsl_Saturation Server model.

1. This is to initialize Light_Hsl Server model and to register with Access layer.
2. This is to initialize Light_Hsl_Hue Server model and to register with Access layer.
3. This is to initialize Light_Hsl_Saturation Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_LIGHT_HSL_SRV_Open(&g_mesh_light_hsl_srv0_ctrl,
&g_mesh_light_hsl_srv0_cfg);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

### ◆ RM_MESH_LIGHT_HSL_SRV_Close()

fsp_err_t RM_MESH_LIGHT_HSL_SRV_Close ( rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*)

API to terminate Light_Hsl Server model. This is to terminate Light_Hsl Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_LIGHT_HSL_SRV_Close(&g_mesh_light_hsl_srv0_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

### ◆ RM_MESH_LIGHT_HSL_SRV_StateUpdate()

fsp_err_t RM_MESH_LIGHT_HSL_SRV_StateUpdate ( rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state* )

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements rm_ble_mesh_model_server_api_t::stateUpdate.

Example:

```
/* Update server status. */
   err = RM_MESH_LIGHT_HSL_SRV_StateUpdate(&g_mesh_light_hsl_srv0_ctrl, &state);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Updated server status successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_state is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_LIGHT_HSL_SRV_HueServerStateUpdate()

fsp_err_t RM_MESH_LIGHT_HSL_SRV_HueServerStateUpdate ( rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state* )

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_light_hsl_srv control block. |
| [in] | p_state | To send reply for a request or to inform change in state. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_state is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_LIGHT_HSL_SRV_SaturationServerStateUpdate()

fsp_err_t RM_MESH_LIGHT_HSL_SRV_SaturationServerStateUpdate ( rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state* )

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_light_hsl_srv control block. |
| [in] | p_state | To send reply for a request or to inform change in state. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_state is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

## BLE Mesh Network Light Lightness Client (rm_mesh_light_lightness_clt)

Modules » Networking » BLE Mesh Network Modules

### Functions

| | |
|---|---|
| fsp_err_t | RM_MESH_LIGHT_LIGHTNESS_CLT_Open (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, rm_ble_mesh_model_client_cfg_t const *const p_cfg) |
| fsp_err_t | RM_MESH_LIGHT_LIGHTNESS_CLT_Close (rm_ble_mesh_model_client_ctrl_t *const p_ctrl) |

| | |
|---|---|
| fsp_err_t | RM_MESH_LIGHT_LIGHTNESS_CLT_GetModelHandle (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, rm_ble_mesh_access_model_handle_t *const p_model_handle) |
| fsp_err_t | RM_MESH_LIGHT_LIGHTNESS_CLT_SendReliablePdu (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, uint32_t req_opcode, void const *const p_parameter, uint32_t rsp_opcode) |
| fsp_err_t | RM_MESH_LIGHT_LIGHTNESS_CLT_Get (rm_ble_mesh_model_client_ctrl_t *const p_ctrl) |

### Detailed Description

# Overview

### Target Devices

The BLE Mesh Network Light Lightness Client module supports the following devices.

- RA4W1

# Configuration

### Build Time Configurations for rm_mesh_light_lightness_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_light_lightness_clt_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|

### Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Light Lightness Client (rm_mesh_light_lightness_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Light Lightness Client (rm_mesh_light_lightness_clt).

| Configuration | Options | Default | Description |
|---|---|---|---|
| Interrupts | | | |
| Callback Provided when Timeout Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh light lightness client ISR occurs |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_light_lightness_clt0 | Module name. |

### Data Structures

| | |
|---|---|
| struct | rm_mesh_light_lightness_clt_instance_ctrl_t |

### Data Structure Documentation

#### ◆ rm_mesh_light_lightness_clt_instance_ctrl_t

| struct rm_mesh_light_lightness_clt_instance_ctrl_t |
|---|
| BLE mesh light lightness instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_LIGHT_LIGHTNESS_CLT_Open() is called. |

## Function Documentation

### ◆ RM_MESH_LIGHT_LIGHTNESS_CLT_Open()

fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_Open ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_client_cfg_t const *const *p_cfg* )

Open Light_Lightness Client middleware. This is to initialize Light_Lightness Client model and to register with Access layer.

Implements rm_ble_mesh_model_client_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_LIGHT_LIGHTNESS_CLT_Open(&g_mesh_light_lightness_clt0_ctrl,
&g_mesh_light_lightness_clt0_cfg);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

### ◆ RM_MESH_LIGHT_LIGHTNESS_CLT_Close()

fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_Close ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Close Light_Lightness Client middleware.

Implements rm_ble_mesh_model_client_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_LIGHT_LIGHTNESS_CLT_Close(&g_mesh_light_lightness_clt0_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

### ◆ RM_MESH_LIGHT_LIGHTNESS_CLT_GetModelHandle()

fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_GetModelHandle ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *const *p_model_handle* )

This is to get the handle of Light_Lightness client model.

Implements rm_ble_mesh_model_client_api_t::getModelHandle.

Example:

```
/* Get the handle of light lightness client model. */
   err =
RM_MESH_LIGHT_LIGHTNESS_CLT_GetModelHandle(&g_mesh_light_lightness_clt0_ctrl,
&model_handle);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Got model handle successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_POINTER | The parameter p_model_handle is NULL. |

### ◆ RM_MESH_LIGHT_LIGHTNESS_CLT_SendReliablePdu()

fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_SendReliablePdu ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, uint32_t *req_opcode*, void const *const *p_parameter*, uint32_t *rsp_opcode* )

This is to initialize sending acknowledged commands.

Implements rm_ble_mesh_model_client_api_t::sendReliablePdu.

Example:

```
/* Initialize sending acknowledged commands. */
   err =
RM_MESH_LIGHT_LIGHTNESS_CLT_SendReliablePdu(&g_mesh_light_lightness_clt0_ctrl,
                                            req_opcode,
                                            p_parameter,
                                            rsp_opcode);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_LIGHT_LIGHTNESS_CLT_Get()

fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_Get ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Light Lightness Get is an acknowledged message used to get the Light Lightness Actual state of an element. The response to the Light Lightness Get message is a Light Lightn

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_light_lightness_clt control block. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_LIGHT_LIGHTNESS_CLT_Set()

fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_Set ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

The Light Lightness Set is an acknowledged message used to set the Light Lightness Actual state of an element. The response to the Light Lightness Set message is a Light Lightness Status message.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_light_lightness_clt control block. |
| [in] | p_parameter | Pointer to Light Lightness Set message. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_LIGHT_LIGHTNESS_CLT_SetUnacknowledged()

fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_SetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

The Light Lightness Set Unacknowledged is an unacknowledged message used to set the Light Lightness Actual state of an element.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_light_lightness_clt control block. |
| [in] | p_parameter | Pointer to Light Lightness Set message. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_LIGHT_LIGHTNESS_CLT_LinearGet()

fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_LinearGet ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Light Lightness Linear Get is an acknowledged message used to get the Light Lightness Linear state of an element. The response to the Light Lightness Linear Get message is a Light Lightness Linear Status message. There are no parameters for this message.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_light_lightness_clt control block. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_LIGHT_LIGHTNESS_CLT_LinearSet()

fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_LinearSet ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

The Light Lightness Linear Set is an acknowledged message used to set the Light Lightness Linear state of an element. The response to the Light Lightness Linear Set message is a Light Lightness Linear Status message.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_light_lightness_clt control block. |
| [in] | p_parameter | Pointer to Light Lightness Linear Set message. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_LIGHT_LIGHTNESS_CLT_LinearSetUnacknowledged()

fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_LinearSetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

The Light Lightness Linear Set Unacknowledged is an unacknowledged message used to set the Light Lightness Linear state of an element.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_light_lightness_clt control block. |
| [in] | p_parameter | Pointer to Light Lightness Linear Set message. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_LIGHT_LIGHTNESS_CLT_LastGet()

fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_LastGet ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Light Lightness Last Get is an acknowledged message used to get the Light Lightness Last state of an element. The response to the Light Lightness Last Get message is a Light Lightness Last Status message. There are no parameters for this message.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_light_lightness_clt control block. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_LIGHT_LIGHTNESS_CLT_DefaultGet()

fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_DefaultGet ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Light Lightness Default Get is an acknowledged message used to get the Light Lightness Default state of an element. The response to the Light Lightness Default Get message is a Light Lightness Default Status message. There are no parameters for this message.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_light_lightness_clt control block. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_LIGHT_LIGHTNESS_CLT_DefaultSet()

fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_DefaultSet ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

The Light Lightness Default Set is an acknowledged message used to set the Light Lightness Default state of an element. The response to the Light Lightness Default Set message is a Light Lightness Default Status message.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_light_lightness_clt control block. |
| [in] | p_parameter | Pointer to Light Lightness Default Set message. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_LIGHT_LIGHTNESS_CLT_DefaultSetUnacknowledged()

fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_DefaultSetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

The Light Lightness Default Set Unacknowledged is an unacknowledged message used to set the Light Lightness Default state of an element.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_light_lightness_clt control block. |
| [in] | p_parameter | Pointer to Light Lightness Default Set message. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_LIGHT_LIGHTNESS_CLT_RangeGet()

fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_RangeGet ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

The Light Lightness Range Get is an acknowledged message used to get the Light Lightness Range state of an element. The response to the Light Lightness Range Get message is a Light Lightness Range Status message. There are no parameters for this message.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_light_lightness_clt control block. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_LIGHT_LIGHTNESS_CLT_RangeSet()

fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_RangeSet ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

Light Lightness Range Set is an acknowledged message used to set the Light Lightness Range state of an element. The response to the Light Lightness Range Get message is a Light Lightness Range Status message.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_light_lightness_clt control block. |
| [in] | p_parameter | Pointer to Light Lightness Range Set message. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_LIGHT_LIGHTNESS_CLT_RangeSetUnacknowledged()

fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_RangeSetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

Light Lightness Range Set Unacknowledged is an unacknowledged message used to set the Light Lightness Range state of an element.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_light_lightness_clt control block. |
| [in] | p_parameter | Pointer to Light Lightness Range Set message. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

## BLE Mesh Network Light Lightness Server (rm_mesh_light_lightness_srv)

Modules » Networking » BLE Mesh Network Modules

### Functions

| | |

## Data Structure Documentation

### ◆ rm_mesh_light_lightness_srv_linear_info_t

| struct rm_mesh_light_lightness_srv_linear_info_t | | |
|---|---|---|
| Light Lightness Linear state represents the lightness of a light on a linear scale | | |
| Data Fields | | |
| uint16_t | lightness_linear | Light Lightness Linear |
| uint16_t | lightness_target | Light Lightness Target - Used in response path. |
| uint8_t | tid | TID - Used in request path |
| uint8_t | transition_time | Transition Time - Used in request path. Used as remaining time in response path. |
| uint8_t | delay | Delay - Used in request path |

### ◆ rm_mesh_light_lightness_srv_actual_info_t

| struct rm_mesh_light_lightness_srv_actual_info_t | | |
|---|---|---|
| Light Lightness Actual state represents the lightness of a light on a perceptually uniform lightness scale | | |
| Data Fields | | |
| uint16_t | lightness_actual | Light Lightness Actual |
| uint16_t | lightness_target | Light Lightness Target - Used in response path. |
| uint8_t | tid | TID - Used in request path |
| uint8_t | transition_time | Transition Time - Used in request path. Used as remaining time in response path. |
| uint8_t | delay | Delay - Used in request path |
| uint16_t | transition_time_handle | Transition Timer Handle |

### ◆ rm_mesh_light_lightness_srv_last_info_t

| struct rm_mesh_light_lightness_srv_last_info_t | | |
|---|---|---|
| Light Lightness Last state represents the lightness of a light on a perceptually uniform lightness scale | | |
| Data Fields | | |
| uint16_t | lightness_last | Light Lightness Last |

### ◆ rm_mesh_light_lightness_srv_default_info_t

| struct rm_mesh_light_lightness_srv_default_info_t | | |
|---|---|---|
| Light Lightness Default state is a value ranging from 0x0000 to 0xFFFF, representing a default lightness level for the Light Lightness Actual state | | |
| Data Fields | | |
| uint16_t | lightness_default | Light Lightness Default |

### ◆ rm_mesh_light_lightness_srv_range_info_t

| struct rm_mesh_light_lightness_srv_range_info_t | | |
|---|---|---|
| Light Lightness Range state determines the minimum and maximum lightness of an element | | |
| Data Fields | | |
| uint16_t | lightness_range_min | Light Lightness Range Min |
| uint16_t | lightness_range_max | Light Lightness Range Max |

### ◆ rm_mesh_light_lightness_srv_info_t

| struct rm_mesh_light_lightness_srv_info_t | | |
|---|---|---|
| Light Lightness state is a composite state that includes the Light Lightness Linear, the Light Lightness Actual, the Light Lightness Last, and the Light Lightness Default states | | |
| Data Fields | | |
| rm_mesh_light_lightness_srv_linear_info_t | light_lightness_linear | Light Lightness Linear state represents the lightness of a light on a linear scale |
| rm_mesh_light_lightness_srv_actual_info_t | light_lightness_actual | Light Lightness Actual state represents the lightness of a light on a perceptually uniform lightness scale |
| rm_mesh_light_lightness_srv_last_info_t | light_lightness_last | Light Lightness Last state represents the lightness of a light on a perceptually uniform lightness scale |
| rm_mesh_light_lightness_srv_default_info_t | light_lightness_default | Light Lightness Default state is a value ranging from 0x0000 to 0xFFFF, representing a default lightness level for the Light Lightness Actual state |

| | | |
|---|---|---|
| rm_mesh_light_lightness_srv_range_info_t | light_lightness_range | Light Lightness Range state. |
| uint8_t | range_status | Status field used only for the Range Status |

### ◆ rm_mesh_light_lightness_srv_instance_ctrl_t

| struct rm_mesh_light_lightness_srv_instance_ctrl_t |
|---|
| BLE mesh light lightness instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_LIGHT_LIGHTNESS_SRV_Open() is called. |

## Function Documentation

### ◆ RM_MESH_LIGHT_LIGHTNESS_SRV_Open()

| fsp_err_t RM_MESH_LIGHT_LIGHTNESS_SRV_Open ( rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_server_cfg_t const *const *p_cfg* ) |
|---|

API to initialize Light_Lightness Server model and to initialize Light_Lightness_Setup Server model. This is to initialize Light_Lightness Server model and to register with Access layer. And this is to initialize Light_Lightness_Setup Server model and to register with Access layer. Implements rm_ble_mesh_model_server_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_LIGHT_LIGHTNESS_SRV_Open(&g_mesh_light_lightness_srv0_ctrl,
&g_mesh_light_lightness_srv0_cfg);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

### ◆ RM_MESH_LIGHT_LIGHTNESS_SRV_Close()

fsp_err_t RM_MESH_LIGHT_LIGHTNESS_SRV_Close ( rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*)

API to terminate Light_Lightness Server model. This is to terminate Light_Lightness Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_LIGHT_LIGHTNESS_SRV_Close(&g_mesh_light_lightness_srv0_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

### ◆ RM_MESH_LIGHT_LIGHTNESS_SRV_StateUpdate()

fsp_err_t RM_MESH_LIGHT_LIGHTNESS_SRV_StateUpdate ( rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state* )

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements rm_ble_mesh_model_server_api_t::stateUpdate.

Example:

```
/* Update server status. */
   err = RM_MESH_LIGHT_LIGHTNESS_SRV_StateUpdate(&g_mesh_light_lightness_srv0_ctrl,
&state);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Updated server status successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_state is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_LIGHT_LIGHTNESS_SRV_SetupServerStateUpdate()

fsp_err_t RM_MESH_LIGHT_LIGHTNESS_SRV_SetupServerStateUpdate ( rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state* )

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_light_lightness_srv control block. |
| [in] | p_state | To send reply for a request or to inform change in state. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_state is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

## BLE Mesh Network Light Location Client (rm_mesh_light_lc_clt)

### Detailed Description

# Overview

### Target Devices

The BLE Mesh Network Light Location Client module supports the following devices.

- RA4W1

# Configuration

### Build Time Configurations for rm_mesh_light_lc_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_light_lc_clt_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|

### Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Light Lightness Controller Client (rm_mesh_light_lc_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Light Lightness Controller Client (rm_mesh_light_lc_clt).

| Configuration | Options | Default | Description |
|---|---|---|---|
| Interrupts | | | |
| Callback Provided when Timeout Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh light lightness controller client ISR occurs |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_light_lc_clt0 | Module name. |

### Data Structures

| | |
|---|---|
| struct | rm_mesh_light_lc_clt_instance_ctrl_t |

### Data Structure Documentation

#### ◆ rm_mesh_light_lc_clt_instance_ctrl_t

| struct rm_mesh_light_lc_clt_instance_ctrl_t |
|---|
| BLE mesh light lc instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_LIGHT_LC_CLT_Open() is called. |

### Function Documentation

### ◆ RM_MESH_LIGHT_LC_CLT_Open()

fsp_err_t RM_MESH_LIGHT_LC_CLT_Open ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_client_cfg_t const *const *p_cfg* )

Open Light_Lc Client middleware. This is to initialize Light_Lc Client model and to register with Access layer.

Implements rm_ble_mesh_model_client_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_LIGHT_LC_CLT_Open(&g_mesh_light_lc_clt0_ctrl,
&g_mesh_light_lc_clt0_cfg);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

### ◆ RM_MESH_LIGHT_LC_CLT_Close()

fsp_err_t RM_MESH_LIGHT_LC_CLT_Close ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Close Light_Lc Client middleware.

Implements rm_ble_mesh_model_client_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_LIGHT_LC_CLT_Close(&g_mesh_light_lc_clt0_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

### ◆ RM_MESH_LIGHT_LC_CLT_GetModelHandle()

fsp_err_t RM_MESH_LIGHT_LC_CLT_GetModelHandle ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *const *p_model_handle* )

This is to get the handle of Light_Lc client model.

Implements rm_ble_mesh_model_client_api_t::getModelHandle.

Example:

```
/* Get the handle of light lc client model. */
   err = RM_MESH_LIGHT_LC_CLT_GetModelHandle(&g_mesh_light_lc_clt0_ctrl,
&model_handle);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Got model handle successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_POINTER | The parameter p_model_handle is NULL. |

### ◆ RM_MESH_LIGHT_LC_CLT_SendReliablePdu()

fsp_err_t RM_MESH_LIGHT_LC_CLT_SendReliablePdu ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, uint32_t *req_opcode*, void const *const *p_parameter*, uint32_t *rsp_opcode* )

This is to initialize sending acknowledged commands.

Implements rm_ble_mesh_model_client_api_t::sendReliablePdu.

Example:

```
/* Initialize sending acknowledged commands. */
   err = RM_MESH_LIGHT_LC_CLT_SendReliablePdu(&g_mesh_light_lc_clt0_ctrl,
req_opcode, p_parameter, rsp_opcode);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_LIGHT_LC_CLT_ModeGet()

fsp_err_t RM_MESH_LIGHT_LC_CLT_ModeGet ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Light LC Mode Get is an acknowledged message used to get the Light LC Mode state of an element. The response to the Light LC Mode Get message is a Light LC Mode Status message. There are no parameters for this message.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_light_lc_clt control block. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_LIGHT_LC_CLT_ModeSet()

fsp_err_t RM_MESH_LIGHT_LC_CLT_ModeSet ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

The Light LC Mode Set is an acknowledged message used to set the Light LC Mode state of an element. The response to the Light LC Mode Set message is a Light LC Mode Status message.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_light_lc_clt control block. |
| [in] | p_parameter | Pointer to Light LC Mode Set message. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_LIGHT_LC_CLT_ModeSetUnacknowledged()

fsp_err_t RM_MESH_LIGHT_LC_CLT_ModeSetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

The Light LC Mode Set Unacknowledged is an unacknowledged message used to set the Light LC Mode state of an element.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_light_lc_clt control block. |
| [in] | p_parameter | Pointer to Light LC Mode Set message. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_LIGHT_LC_CLT_OmGet()

fsp_err_t RM_MESH_LIGHT_LC_CLT_OmGet ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Light LC OM Get is an acknowledged message used to get the Light LC Occupancy Mode state of an element. The response to the Light LC OM Get message is a Light LC OM Status message. There are no parameters for this message.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_light_lc_clt control block. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_LIGHT_LC_CLT_OmSet()

fsp_err_t RM_MESH_LIGHT_LC_CLT_OmSet ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

The Light LC OM Set is an acknowledged message used to set the Light LC Occupancy Mode state of an element. The response to the Light LC OM Set message is a Light LC OM Status message.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_light_lc_clt control block. |
| [in] | p_parameter | Pointer to Light LC OM Set message. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_LIGHT_LC_CLT_OmSetUnacknowledged()

fsp_err_t RM_MESH_LIGHT_LC_CLT_OmSetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

The Light LC OM Set Unacknowledged is an unacknowledged message used to set the Light LC Occupancy Mode state of an element.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_light_lc_clt control block. |
| [in] | p_parameter | Pointer to Light LC OM Set message. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_LIGHT_LC_CLT_LightOnOffGet()

fsp_err_t RM_MESH_LIGHT_LC_CLT_LightOnOffGet ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Light LC Light OnOff Get is an acknowledged message used to get the Light LC Light OnOff state of an element. The response to the Light LC Light OnOff Get message is a Light LC Light OnOff Status message. There are no parameters for this message.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_light_lc_clt control block. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_LIGHT_LC_CLT_LightOnOffSet()

fsp_err_t RM_MESH_LIGHT_LC_CLT_LightOnOffSet ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

The Light LC Light OnOff Set is an acknowledged message used to set the Light LC Light OnOff state of an element. The response to the Light LC Light OnOff Set message is a Light LC Light OnOff Status message.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_light_lc_clt control block. |
| [in] | p_parameter | Pointer to Light LC Light OnOff Set message. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_LIGHT_LC_CLT_LightOnOffSetUnacknowledged()

fsp_err_t RM_MESH_LIGHT_LC_CLT_LightOnOffSetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

The Light LC Light OnOff Set Unacknowledged is an unacknowledged message used to set the Light LC Light OnOff state of an element.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_light_lc_clt control block. |
| [in] | p_parameter | Pointer to Light LC Light OnOff Set message. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_LIGHT_LC_CLT_PropertyGet()

fsp_err_t RM_MESH_LIGHT_LC_CLT_PropertyGet ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

Light LC Property Get is an acknowledged message used to get the Light LC Property state of an element. The response to the Light LC Property Get message is a Light LC Property Status message.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_light_lc_clt control block. |
| [in] | p_parameter | Pointer to Light LC Property Get message. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_LIGHT_LC_CLT_PropertySet()

fsp_err_t RM_MESH_LIGHT_LC_CLT_PropertySet ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

The Light LC Property Set is an acknowledged message used to set the Light LC Property state of an element. The response to the Light LC Property Set message is a Light LC Property Status message.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_light_lc_clt control block. |
| [in] | p_parameter | Pointer to Light LC Property Set message. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_LIGHT_LC_CLT_PropertySetUnacknowledged()

fsp_err_t RM_MESH_LIGHT_LC_CLT_PropertySetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

The Light LC Property Set Unacknowledged is an unacknowledged message used to set the Light LC Property state of an element.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_light_lc_clt control block. |
| [in] | p_parameter | Pointer to Light LC Property Set message. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

**Detailed Description**

# Overview

### Target Devices

The BLE Mesh Network Light Location Server module supports the following devices.

- RA4W1

# Configuration

### Build Time Configurations for rm_mesh_light_lc_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_light_lc_srv_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|

### Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Light Lightness Controller Server (rm_mesh_light_lc_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Light Lightness Controller Server (rm_mesh_light_lc_srv).

| Configuration | Options | Default | Description |
|---|---|---|---|
| Interrupts | | | |

| | | | |
|---|---|---|---|
| Callback Provided when Timeout Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh light lightness controller server ISR occurs |
| Callback Provided when an Timeout ISR Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh light lightness controller server timeout ISR occurs |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_light_lc_srv0 | Module name. |

### Data Structures

| | |
|---|---|
| struct | rm_mesh_light_lc_srv_scenario_t |
| struct | rm_mesh_light_lc_srv_mode_info_t |
| struct | rm_mesh_light_lc_srv_om_info_t |
| struct | rm_mesh_light_lc_srv_light_onoff_info_t |
| struct | rm_mesh_light_lc_srv_property_id_info_t |
| struct | rm_mesh_light_lc_srv_property_info_t |
| struct | rm_mesh_light_lc_srv_extended_callback_args_t |
| struct | rm_mesh_light_lc_srv_instance_ctrl_t |

### Enumerations

| | |
|---|---|
| enum | rm_ble_mesh_light_lc_srv_event_t |
| enum | rm_ble_mesh_light_lc_srv_state_t |
| enum | rm_mesh_light_lc_srv_light_state_t |

## Data Structure Documentation

### ◆ rm_mesh_light_lc_srv_scenario_t

| struct rm_mesh_light_lc_srv_scenario_t | | |
|---|---|---|
| Light LC Server State Info | | |
| Data Fields | | |
| rm_ble_mesh_light_lc_srv_state_t | state | Light LC Server Current Scenario |
| uint32_t | remaining_time_in_ms | Remaining Time in current scenario |

| | | |
|---|---|---|
| uint8_t | occupancy_mode | Light LC Occupancy Mode Value |
| uint8_t | mode | Light LC Mode Value |
| rm_mesh_light_lc_srv_light_state_t | present_light_state | Current Light LC ONOFF State |
| rm_mesh_light_lc_srv_light_state_t | target_light_state | Target Light LC ONOFF State |

### ◆ rm_mesh_light_lc_srv_mode_info_t

| struct rm_mesh_light_lc_srv_mode_info_t | | |
|---|---|---|
| Light LC Mode state | | |
| Data Fields | | |
| uint8_t | present_mode | Light LC Mode state - present |
| uint8_t | target_mode | Light LC Mode state - target |

### ◆ rm_mesh_light_lc_srv_om_info_t

| struct rm_mesh_light_lc_srv_om_info_t | | |
|---|---|---|
| Light LC Occupancy Mode state | | |
| Data Fields | | |
| uint8_t | present_mode | Light LC Occupancy Mode state - present |
| uint8_t | target_mode | Light LC Occupancy Mode state - target |

### ◆ rm_mesh_light_lc_srv_light_onoff_info_t

| struct rm_mesh_light_lc_srv_light_onoff_info_t | | |
|---|---|---|
| Light LC Light OnOff State | | |
| Data Fields | | |
| uint8_t | present_light_onoff | Light LC Light OnOff State |
| uint8_t | target_light_onoff | Light LC Light OnOff State |
| uint8_t | tid | TID - Used in request path |
| uint8_t | transition_time | Transition Time - Used in request path. Used as remaining time in response path. |
| uint8_t | delay | Delay - Used in request path |
| uint16_t | transition_time_handle | Transition Timer Handle |

### ◆ rm_mesh_light_lc_srv_property_id_info_t

| struct rm_mesh_light_lc_srv_property_id_info_t |
|---|

| Property ID identifying a Light LC Property | | |
|---|---|---|
| Data Fields | | |
| uint16_t | property_id | Property ID identifying a Light LC Property |

◆ **rm_mesh_light_lc_srv_property_info_t**

| struct rm_mesh_light_lc_srv_property_info_t | | |
|---|---|---|
| Light LC Property state | | |
| Data Fields | | |
| uint16_t | property_id | Property ID identifying a Light LC Property |
| uint8_t * | property_value | Raw value for the Light LC Property |
| uint16_t | property_value_len | |

◆ **rm_mesh_light_lc_srv_extended_callback_args_t**

| struct rm_mesh_light_lc_srv_extended_callback_args_t | | |
|---|---|---|
| Light LC Property state | | |
| Data Fields | | |
| rm_ble_mesh_access_model_handle_t * | p_handle | Access model handle. |
| rm_ble_mesh_light_lc_srv_event_t | event_type | Application events defined for Light LC Server Model. |
| uint8_t * | p_event_data | Event data. |
| uint16_t | event_data_length | Event data length. |

◆ **rm_mesh_light_lc_srv_instance_ctrl_t**

| struct rm_mesh_light_lc_srv_instance_ctrl_t |
|---|
| BLE mesh light lc instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_LIGHT_LC_SRV_Open() is called. |

## Enumeration Type Documentation

### ◆ rm_ble_mesh_light_lc_srv_event_t

| enum rm_ble_mesh_light_lc_srv_event_t | |
|---|---|
| Light LC light event | |
| Enumerator | |
| RM_MESH_LIGHT_LC_SRV_LIGHT_EVENT_OFF | Light LC Server Event Off. |
| RM_MESH_LIGHT_LC_SRV_LIGHT_EVENT_STANDBY | Light LC Server Event Standby. |
| RM_MESH_LIGHT_LC_SRV_LIGHT_EVENT_FADE_ON | Light LC Server Event Fade On. |
| RM_MESH_LIGHT_LC_SRV_LIGHT_EVENT_RUN | Light LC Server Event Run. |
| RM_MESH_LIGHT_LC_SRV_LIGHT_EVENT_FADE | Light LC Server Event Fade. |
| RM_MESH_LIGHT_LC_SRV_LIGHT_EVENT_PROLONG | Light LC Server Event Prolong. |
| RM_MESH_LIGHT_LC_SRV_LIGHT_EVENT_FADE_STANDBY_AUTO | Light LC Server Event Standby Auto. |
| RM_MESH_LIGHT_LC_SRV_LIGHT_EVENT_FADE_STANDBY_MANUAL | Light LC Server Event Standby Manual. |

### ◆ rm_ble_mesh_light_lc_srv_state_t

| enum rm_ble_mesh_light_lc_srv_state_t | |
|---|---|
| Light LC state | |
| Enumerator | |
| RM_MESH_LIGHT_LC_SRV_STATE_OFF | Light LC Server State Off. |
| RM_MESH_LIGHT_LC_SRV_STATE_STANDBY | Light LC Server State Standby. |
| RM_MESH_LIGHT_LC_SRV_STATE_FADE_ON | Light LC Server State Fade On. |
| RM_MESH_LIGHT_LC_SRV_STATE_RUN | Light LC Server State Run. |
| RM_MESH_LIGHT_LC_SRV_STATE_FADE | Light LC Server State Fade. |
| RM_MESH_LIGHT_LC_SRV_STATE_PROLONG | Light LC Server State Prolong. |
| RM_MESH_LIGHT_LC_SRV_STATE_FADE_STANDBY_AUTO | Light LC Server State Standby Auto. |
| RM_MESH_LIGHT_LC_SRV_STATE_FADE_STANDBY_MANUAL | Light LC Server State Standby Manual. |

### ◆ rm_mesh_light_lc_srv_light_state_t

| enum rm_mesh_light_lc_srv_light_state_t | |
|---|---|
| Light LC light state | |
| Enumerator | |
| RM_MESH_LIGHT_LC_SRV_LIGHT_STATE_OFF | Light state Off. |
| RM_MESH_LIGHT_LC_SRV_LIGHT_STATE_ON | Light state ON. |

## Function Documentation

### ◆ RM_MESH_LIGHT_LC_SRV_Open()

fsp_err_t RM_MESH_LIGHT_LC_SRV_Open ( rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_server_cfg_t const *const *p_cfg* )

API to initialize Light_Lc Server model. This is to initialize Light_Lc Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_LIGHT_LC_SRV_Open(&g_mesh_light_lc_srv0_ctrl,
&g_mesh_light_lc_srv0_cfg);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

### ◆ RM_MESH_LIGHT_LC_SRV_Close()

fsp_err_t RM_MESH_LIGHT_LC_SRV_Close ( rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*)

API to terminate Light_Lc Server model. This is to terminate Light_Lc Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_LIGHT_LC_SRV_Close(&g_mesh_light_lc_srv0_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

### ◆ RM_MESH_LIGHT_LC_SRV_StateUpdate()

fsp_err_t RM_MESH_LIGHT_LC_SRV_StateUpdate ( rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state* )

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements rm_ble_mesh_model_server_api_t::stateUpdate.

Example:

```
/* Update server status. */
   err = RM_MESH_LIGHT_LC_SRV_StateUpdate(&g_mesh_light_lc_srv0_ctrl, &state);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Updated server status successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_state is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_LIGHT_LC_SRV_SetTimeProperty()

fsp_err_t RM_MESH_LIGHT_LC_SRV_SetTimeProperty ( rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_server_device_property_t *property*, uint32_t *time_in_ms* )

API to set Light LC Sever Specific Time Properties. This is to update the Light LC Module with any Light Control Time Properties values. Typically these LC Time properties will be needed to be updated or informed to the Light LC Module during Power-Up, Scene Recall/Restore related scenario or when ever the Local application desires to enforce an update in these device properties values. Currently this interface handles only Time related Device Properties of Light LC Module like:
RM_BLE_MESH_MODEL_SERVER_DEVICE_PROPERTY_LIGHT_CONTROL_TIME_OCCUPANCY_DELAY
RM_BLE_MESH_MODEL_SERVER_DEVICE_PROPERTY_LIGHT_CONTROL_TIME_FADE_ON
RM_BLE_MESH_MODEL_SERVER_DEVICE_PROPERTY_LIGHT_CONTROL_TIME_RUN_ON
RM_BLE_MESH_MODEL_SERVER_DEVICE_PROPERTY_LIGHT_CONTROL_TIME_FADE
RM_BLE_MESH_MODEL_SERVER_DEVICE_PROPERTY_LIGHT_CONTROL_TIME_PROLONG
RM_BLE_MESH_MODEL_SERVER_DEVICE_PROPERTY_LIGHT_CONTROL_TIME_FADE_STANDBY_AUTO
RM_BLE_MESH_MODEL_SERVER_DEVICE_PROPERTY_LIGHT_CONTROL_TIME_FADE_STANDBY_MANUAL

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | Pointer to control structure. |
| [in] | property | LC Server Device Property ID |
| [in] | time_in_ms | Related Device Property Value time in milliseconds |

Example:

```
/* Set Light LC Sever Specific Time Properties. */
   err = RM_MESH_LIGHT_LC_SRV_SetTimeProperty(&g_mesh_light_lc_srv0_ctrl, property, time_in_ms);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Set the Light Control Time Properties values successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

### ◆ RM_MESH_LIGHT_LC_SRV_SetScenario()

fsp_err_t RM_MESH_LIGHT_LC_SRV_SetScenario ( rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_mesh_light_lc_srv_scenario_t const *const *p_scenario* )

API to locally trigger the Light LC Server state machine from the application. This typically is used in Power-Up or Scene Recall/Restore Scenario where the Application could trigger the Light LC Server from any desired LC State.

Example:

```
/* Trigger to Recall/Restore the scenario. */
   err = RM_MESH_LIGHT_LC_SRV_SetScenario(&g_mesh_light_lc_srv0_ctrl, &scenario);
```

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | Pointer to control structure. |
| [in] | p_scenario | Pointer to rm_mesh_light_lc_srv_scenario_t where Light LC Server State Informations are present |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Updated scenario successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_scenario is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

### ◆ RM_MESH_LIGHT_LC_SRV_GetCurrentScenario()

fsp_err_t RM_MESH_LIGHT_LC_SRV_GetCurrentScenario ( rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_mesh_light_lc_srv_scenario_t *const *p_scenario* )

API to fetch the Light LC Server state machine related information from the Light LC Server Module. This typically is used in Power-Up or Scene Recall/Restore Scenario where the Application uses this to fetch and persistently store the Light LC State related details.

Example:

```
/* Fetch the current scenario. */
   err = RM_MESH_LIGHT_LC_SRV_GetCurrentScenario(&g_mesh_light_lc_srv0_ctrl,
&scenario);
```

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | Pointer to control structure. |
| [out] | p_scenario | Pointer to rm_mesh_light_lc_srv_scenario_t where Light LC Server State Informations are present |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Fetch information successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_scenario is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

### ◆ RM_MESH_LIGHT_LC_SRV_ReportOccupancy()

fsp_err_t RM_MESH_LIGHT_LC_SRV_ReportOccupancy ( rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*)

API to report any occupancy to Light LC Server Model.

Example:

```
/* Reports any occupancy. */
   err = RM_MESH_LIGHT_LC_SRV_ReportOccupancy(&g_mesh_light_lc_srv0_ctrl);
```

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | Pointer to control structure. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Updated server status successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

### ◆ RM_MESH_LIGHT_LC_SRV_ReportLightOnOff()

fsp_err_t RM_MESH_LIGHT_LC_SRV_ReportLightOnOff ( rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_mesh_light_lc_srv_light_state_t *state* )

API to report any Light ON or OFF to Light LC Server Model. There could be many triggering factors to this Light related ON/OFF events from the upper layer. This API could be used for the following scenarios

1. Manual/Physical trigger of Light ON/OFF
2. State Binding with Generic ON/OFF
3. Trigger of Light ON/OFF due to Ambient Light Sensor values

Example:

```
/* Reports any Light ON or OFF. */
   err = RM_MESH_LIGHT_LC_SRV_ReportLightOnOff(&g_mesh_light_lc_srv0_ctrl, state);
```

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | Pointer to control structure. |
| [in] | state | Desired state value of Light LC ONOFF. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Updated server status successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

## BLE Mesh Network Light Xyl Client (rm_mesh_light_xyl_clt)

| fsp_err_t | RM_MESH_LIGHT_XYL_CLT_RangeSet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter) |
| fsp_err_t | RM_MESH_LIGHT_XYL_CLT_RangeSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter) |

### Detailed Description

# Overview

### Target Devices

The BLE Mesh Network Light Xyl Client module supports the following devices.

- RA4W1

# Configuration

### Build Time Configurations for rm_mesh_light_xyl_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_light_xyl_clt_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|

**Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Light XYL Client (rm_mesh_light_xyl_clt)**

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Light XYL Client (rm_mesh_light_xyl_clt).

| Configuration | Options | Default | Description |
|---|---|---|---|
| Interrupts | | | |
| Callback Provided when Timeout Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh light XYL client ISR occurs |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_light_xyl_clt0 | Module name. |

**Data Structures**

| | |
|---|---|
| struct | rm_mesh_light_xyl_clt_instance_ctrl_t |

## Data Structure Documentation

### ◆ rm_mesh_light_xyl_clt_instance_ctrl_t

| struct rm_mesh_light_xyl_clt_instance_ctrl_t |
|---|
| BLE mesh light xyl instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_LIGHT_XYL_CLT_Open() is called. |

## Function Documentation

### ◆ RM_MESH_LIGHT_XYL_CLT_Open()

fsp_err_t RM_MESH_LIGHT_XYL_CLT_Open ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_client_cfg_t const *const *p_cfg* )

Open Light_Xyl Client middleware. This is to initialize Light_Xyl Client model and to register with Access layer.

Implements rm_ble_mesh_model_client_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_LIGHT_XYL_CLT_Open(&g_mesh_light_xyl_clt0_ctrl,
&g_mesh_light_xyl_clt0_cfg);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

### ◆ RM_MESH_LIGHT_XYL_CLT_Close()

fsp_err_t RM_MESH_LIGHT_XYL_CLT_Close ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Close Light_Xyl Client middleware.

Implements rm_ble_mesh_model_client_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_LIGHT_XYL_CLT_Close(&g_mesh_light_xyl_clt0_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

### ◆ RM_MESH_LIGHT_XYL_CLT_GetModelHandle()

fsp_err_t RM_MESH_LIGHT_XYL_CLT_GetModelHandle ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *const *p_model_handle* )

This is to get the handle of Light_Xyl client model.

Implements rm_ble_mesh_model_client_api_t::getModelHandle.

Example:

```
/* Get the handle of light xyl client model. */
   err = RM_MESH_LIGHT_XYL_CLT_GetModelHandle(&g_mesh_light_xyl_clt0_ctrl,
&model_handle);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Got model handle successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_POINTER | The parameter p_model_handle is NULL. |

### ◆ RM_MESH_LIGHT_XYL_CLT_SendReliablePdu()

fsp_err_t RM_MESH_LIGHT_XYL_CLT_SendReliablePdu ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, uint32_t *req_opcode*, void const *const *p_parameter*, uint32_t *rsp_opcode* )

This is to initialize sending acknowledged commands.

Implements rm_ble_mesh_model_client_api_t::sendReliablePdu.

Example:

```
/* Initialize sending acknowledged commands. */
   err = RM_MESH_LIGHT_XYL_CLT_SendReliablePdu(&g_mesh_light_xyl_clt0_ctrl,
req_opcode, p_parameter, rsp_opcode);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_LIGHT_XYL_CLT_Get()

fsp_err_t RM_MESH_LIGHT_XYL_CLT_Get ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

The Light xyL Get is an acknowledged message used to get the Light xyL Lightness, Light xyL x, and Light xyL y states of an element. Upon receiving a Light xyL Get message, the element shall respond with a Light xyL Status message. The response to the Light xyL Get message is a Light xyL Status message. There are no parameters for this message.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_light_xyl_clt control block. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_LIGHT_XYL_CLT_Set()

fsp_err_t RM_MESH_LIGHT_XYL_CLT_Set ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

The Light xyL Set is an acknowledged message used to set the Light xyL Lightness, Light xyL x state, and the Light xyL y states of an element. The response to the Light xyL Set message is a Light xyL Status message.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_light_xyl_clt control block. |
| [in] | p_parameter | Pointer to Light xyL Set message. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_LIGHT_XYL_CLT_SetUnacknowledged()

fsp_err_t RM_MESH_LIGHT_XYL_CLT_SetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

The Light xyL Set Unacknowledged is an unacknowledged message used to set the Light xyL Lightness, Light xyL x, and the Light xyL y states of an element.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_light_xyl_clt control block. |
| [in] | p_parameter | Pointer to Light xyL Set message. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_LIGHT_XYL_CLT_TargetGet()

fsp_err_t RM_MESH_LIGHT_XYL_CLT_TargetGet ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

The Light xyL Target Get is an acknowledged message used to get the target Light xyL Lightness, Light xyL x, and Light xyL y states of an element. The response to the Light xyL Target Get message is a Light xyL Target Status message. There are no parameters for this message.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_light_xyl_clt control block. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_LIGHT_XYL_CLT_DefaultGet()

fsp_err_t RM_MESH_LIGHT_XYL_CLT_DefaultGet ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Light xyL Default Get is an acknowledged message used to get the Light Lightness Default, the Light xyL x Default, and Light xyL y Default states of an element. The response to the Light xyL Default Get message is a Light xyL Default Status message. There are no parameters for this message.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_light_xyl_clt control block. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_LIGHT_XYL_CLT_DefaultSet()

fsp_err_t RM_MESH_LIGHT_XYL_CLT_DefaultSet ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

Light xyL Default Set is an acknowledged message used to set the Light Lightness Default, the Light xyL x Default, and Light xyL y Default states of an element. The response to the Light xyL Default Set message is a Light xyL Default Status message.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_light_xyl_clt control block. |
| [in] | p_parameter | Pointer to Light HSL Default Set message. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_LIGHT_XYL_CLT_DefaultSetUnacknowledged()

fsp_err_t RM_MESH_LIGHT_XYL_CLT_DefaultSetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

Light xyL Default Set Unacknowledged is an unacknowledged message used to set the Light Lightness Default, the Light xyL x Default, and Light xyL y Default states of an element.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_light_xyl_clt control block. |
| [in] | p_parameter | Pointer to Light HSL Default Set message. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_LIGHT_XYL_CLT_RangeGet()

fsp_err_t RM_MESH_LIGHT_XYL_CLT_RangeGet ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

The Light xyL Range Get is an acknowledged message used to get the Light xyL x Range and Light xyL y Range states of an element. The response to the Light xyL Range Get message is a Light xyL Range Status message. There are no parameters for this message.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_light_xyl_clt control block. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_LIGHT_XYL_CLT_RangeSet()

fsp_err_t RM_MESH_LIGHT_XYL_CLT_RangeSet ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

Light xyL Range Set is an acknowledged message used to set the Light xyL x Range and Light xyL y Range states of an element. The response to the Light xyL Range Set message is a Light xyL Range Status message.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_light_xyl_clt control block. |
| [in] | p_parameter | Pointer to Light xyL Range Set message. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_LIGHT_XYL_CLT_RangeSetUnacknowledged()

fsp_err_t RM_MESH_LIGHT_XYL_CLT_RangeSetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

Light xyL Range Set Unacknowledged is an unacknowledged message used to set the Light xyL x Range and Light xyL y Range states of an element.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_light_xyl_clt control block. |
| [in] | p_parameter | Pointer to Light xyL Range Set message. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

## BLE Mesh Network Light Xyl Server (rm_mesh_light_xyl_srv)

Modules » Networking » BLE Mesh Network Modules

### Functions

| | |
|---|---|
| fsp_err_t | RM_MESH_LIGHT_XYL_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_model_server_cfg_t const *const p_cfg) |
| fsp_err_t | RM_MESH_LIGHT_XYL_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const p_ctrl) |
| fsp_err_t | RM_MESH_LIGHT_XYL_SRV_StateUpdate |

| | |
|---|---|
| | (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state) |

**Detailed Description**

# Overview

### Target Devices

The BLE Mesh Network Light Xyl Server module supports the following devices.

- RA4W1

# Configuration

### Build Time Configurations for rm_mesh_light_xyl_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_light_xyl_srv_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|

**Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Light XYL Server (rm_mesh_light_xyl_srv)**

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Light XYL Server (rm_mesh_light_xyl_srv).

| Configuration | Options | Default | Description |
|---|---|---|---|
| Interrupts | | | |
| Callback Provided when Timeout Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh light XYL server ISR occurs |
| Callback Provided when an Timeout ISR Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh light XYL server timeout ISR occurs |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_light_xyl_srv0 | Module name. |

**Data Structures**

| | |
|---|---|
| struct | rm_mesh_light_xyl_srv_info_t |
| struct | rm_mesh_light_xyl_srv_target_info_t |
| struct | rm_mesh_light_xyl_srv_default_info_t |
| struct | rm_mesh_light_xyl_srv_range_info_t |

| | |
|---|---|
| struct | rm_mesh_light_xyl_srv_instance_ctrl_t |

## Data Structure Documentation

### ◆ rm_mesh_light_xyl_srv_info_t

struct rm_mesh_light_xyl_srv_info_t

Light xyL state is a composite state that includes the xyL Lightness, the Light xyL x and the Light xyL y states

Data Fields

| | | |
|---|---|---|
| uint16_t | xyl_lightness | The perceived lightness of a light emitted by the element |
| uint16_t | target_xyl_lightness | Target perceived lightness - used in response path |
| uint16_t | xyl_x | The 16-bit value representing the x coordinate of a CIE1931 color light |
| uint16_t | target_xyl_x | Target x coordinate - used in response path |
| uint16_t | xyl_y | The 16-bit value representing the y coordinate of a CIE1931 color light |
| uint16_t | target_xyl_y | Target y coordinate - used in response path |
| uint8_t | tid | TID - Used in request path |
| uint8_t | transition_time | Transition Time - Used in request path. Used as remaining time in response path. |
| uint8_t | delay | Delay - Used in request path |
| uint16_t | transition_time_handle | Transition Timer Handle |

### ◆ rm_mesh_light_xyl_srv_target_info_t

struct rm_mesh_light_xyl_srv_target_info_t

Light xyL target state is a composite state that includes the xyL Lightness, the Light xyL x and the Light xyL y states

Data Fields

| | | |
|---|---|---|
| uint16_t | xyl_lightness | The perceived lightness of a light emitted by the element |
| uint16_t | xyl_x | The 16-bit value representing the x coordinate of a CIE1931 color light |
| uint16_t | xyl_y | The 16-bit value representing |

| | | |
|---|---|---|
| | | the y coordinate of a CIE1931 color light |

### ◆ rm_mesh_light_xyl_srv_default_info_t

| struct rm_mesh_light_xyl_srv_default_info_t | | |
|---|---|---|
| Light xyL default state is a composite state that includes the xyL Lightness, the Light xyL x and the Light xyL y states | | |
| Data Fields | | |
| uint16_t | xyl_lightness | The perceived lightness of a light emitted by the element |
| uint16_t | xyl_x | The 16-bit value representing the x coordinate of a CIE1931 color light |
| uint16_t | xyl_y | The 16-bit value representing the y coordinate of a CIE1931 color light |

### ◆ rm_mesh_light_xyl_srv_range_info_t

| struct rm_mesh_light_xyl_srv_range_info_t | | |
|---|---|---|
| Light xyL Range state determines the minimum and maximum values of the Light xyL x and syL y state of an element | | |
| Data Fields | | |
| uint16_t | xyl_x_range_min | The minimum value of a Light xyL x state of an element |
| uint16_t | xyl_x_range_max | The maximum value of a Light xyL x state of an element |
| uint16_t | xyl_y_range_min | The minimum value of a Light xyL y state of an element |
| uint16_t | xyl_y_range_max | The maximum value of a Light xyL y state of an element |
| uint8_t | status | Status - Used in the response path |

### ◆ rm_mesh_light_xyl_srv_instance_ctrl_t

| struct rm_mesh_light_xyl_srv_instance_ctrl_t |
|---|
| BLE mesh light xyl instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_LIGHT_XYL_SRV_Open() is called. |

## Function Documentation

### ◆ RM_MESH_LIGHT_XYL_SRV_Open()

fsp_err_t RM_MESH_LIGHT_XYL_SRV_Open ( rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_server_cfg_t const *const *p_cfg* )

API to initialize Light_Xyl Server model. This is to initialize Light_Xyl Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_LIGHT_XYL_SRV_Open(&g_mesh_light_xyl_srv0_ctrl,
&g_mesh_light_xyl_srv0_cfg);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

### ◆ RM_MESH_LIGHT_XYL_SRV_Close()

fsp_err_t RM_MESH_LIGHT_XYL_SRV_Close ( rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*)

API to terminate Light_Xyl Server model. This is to terminate Light_Xyl Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_LIGHT_XYL_SRV_Close(&g_mesh_light_xyl_srv0_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

### ◆ RM_MESH_LIGHT_XYL_SRV_StateUpdate()

fsp_err_t RM_MESH_LIGHT_XYL_SRV_StateUpdate ( rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state* )

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements rm_ble_mesh_model_server_api_t::stateUpdate.

Example:

```
/* Update server status. */
   err = RM_MESH_LIGHT_XYL_SRV_StateUpdate(&g_mesh_light_xyl_srv0_ctrl, &state);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Updated server status successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_state is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

## BLE Mesh Network Lower Trans (rm_ble_mesh_lower_trans)

**Detailed Description**

# Overview

### Target Devices

The BLE Mesh Network Lower Trans module supports the following devices.

- RA4W1

# Configuration

### Build Time Configurations for rm_ble_mesh_lower_trans

The following build time configurations are defined in fsp_cfg/rm_ble_mesh_lower_trans_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|

### Configurations for Networking > BLE Mesh Network modules > BLE Mesh Lower Trans (rm_ble_mesh_lower_trans)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Lower Trans (rm_ble_mesh_lower_trans).

| Configuration | Options | Default | Description |
|---|---|---|---|
| General | | | |
| Name | Name Must Be a Valid C Symbol | g_rm_ble_mesh_lower_trans0 | Module name. |
| Channel Number | Invalid Channel Number | 0 | Select channel corresponding to the channel number of the |

| | | | |
|---|---|---|---|
| | | | hardware. |
| Notification Enable | • Enabled<br>• Disabled | Disabled | Whether to enable the notification or not. |
| Callback | Name Must Be a Valid C Symbol | NULL | Callback function name. |

### Data Structures

| | |
|---|---|
| struct | rm_ble_mesh_lower_trans_instance_ctrl_t |

## Data Structure Documentation

### ◆ rm_ble_mesh_lower_trans_instance_ctrl_t

| struct rm_ble_mesh_lower_trans_instance_ctrl_t |
|---|
| RM_BLE_MESH_LOWER_TRANS private control block. DO NOT MODIFY. Initialization occurs when RM_BLE_MESH_LOWER_TRANS_Open() is called. |

## Function Documentation

### ◆ RM_BLE_MESH_LOWER_TRANS_Open()

fsp_err_t RM_BLE_MESH_LOWER_TRANS_Open ( rm_ble_mesh_lower_trans_ctrl_t *const *p_ctrl*, rm_ble_mesh_lower_trans_cfg_t const *const *p_cfg* )

Register Inerface with Lower Transport Layer. This routine registers interface with the Lower Transport Layer. Transport Layer supports single Application, hence this rouine shall be called once.

Implements rm_ble_mesh_lower_trans_api_t::open.

Example:

```
/* Open the module. */
   err = RM_BLE_MESH_LOWER_TRANS_Open(&g_ble_mesh_lower_trans0_ctrl,
&g_ble_mesh_lower_trans0_cfg);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Module opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Module is already open. |
| FSP_ERR_INVALID_STATE | Lower layer is invalid state. |

### ◆ RM_BLE_MESH_LOWER_TRANS_Close()

fsp_err_t RM_BLE_MESH_LOWER_TRANS_Close ( rm_ble_mesh_provision_ctrl_t *const *p_ctrl*)

Unregister Inerface with Lower Transport Layer. Implements rm_ble_mesh_lower_trans_api_t::close.

Example:

```
/* Close the module. */
   err = RM_BLE_MESH_LOWER_TRANS_Close(&g_ble_mesh_lower_trans0_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Module successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Lower layer is invalid state. |

### ◆ RM_BLE_MESH_LOWER_TRANS_SendPdu()

fsp_err_t RM_BLE_MESH_LOWER_TRANS_SendPdu ( rm_ble_mesh_lower_trans_ctrl_t *const *p_ctrl*, rm_ble_mesh_lower_trans_transmit_setting_t const *const *p_transmit_setting*, rm_ble_mesh_buffer_t const *const *p_buffer*, rm_ble_mesh_lower_trans_reliable_t *reliable* )

API to send transport PDUs. This routine sends transport PDUs to peer device.

Implements rm_ble_mesh_lower_trans_api_t::sendPdu.

Example:

```
/* Send transport PDUs. */
   err = RM_BLE_MESH_LOWER_TRANS_SendPdu(&g_ble_mesh_lower_trans0_ctrl,
                                         &transmit_setting,
                                         &buffer,
RM_BLE_MESH_LOWER_TRANS_RELIABLE_ENABLE);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_transmit_setting and p_buffer are NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |

### ◆ RM_BLE_MESH_LOWER_TRANS_ClearSarContexts()

fsp_err_t RM_BLE_MESH_LOWER_TRANS_ClearSarContexts ( rm_ble_mesh_lower_trans_ctrl_t *const *p_ctrl*)

To clear all segmentation and reassembly contexts. This routine clears all segmentation and reassembly contexts.

Implements rm_ble_mesh_lower_trans_api_t::clearSarContexts.

Example:

```
/* Clear all segmentation and reassembly contexts. */
   err = RM_BLE_MESH_LOWER_TRANS_ClearSarContexts(&g_ble_mesh_lower_trans0_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_BLE_MESH_LOWER_TRANS_ClearSubnetSarContexts()

fsp_err_t RM_BLE_MESH_LOWER_TRANS_ClearSubnetSarContexts ( rm_ble_mesh_lower_trans_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *subnet_handle* )

To clear all segmentation and reassembly contexts for a given subnet. This routine clears all segmentation and reassembly contexts.

Implements rm_ble_mesh_lower_trans_api_t::clearSubnetSarContexts.

Example:

```
/* Clear all segmentation and reassembly contexts for a given subnet. */
   err =
RM_BLE_MESH_LOWER_TRANS_ClearSubnetSarContexts(&g_ble_mesh_lower_trans0_ctrl,
subnet_handle);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_BLE_MESH_LOWER_TRANS_ReinitReplayCache()

fsp_err_t RM_BLE_MESH_LOWER_TRANS_ReinitReplayCache ( rm_ble_mesh_lower_trans_ctrl_t *const *p_ctrl*)

To reinitialize all Lower Transport replay cache entries. This routine clears and reinitializes all Transport Replay Cache Entries. This needs to be invoked by the upper layer when the Network moves to a newer IV Index (Normal State) and the Sequence numbers are reset.

Implements rm_ble_mesh_lower_trans_api_t::reinitReplayCache.

Example:

```
/* Reinitialize all Lower Transport replay cache Entries. */
   err = RM_BLE_MESH_LOWER_TRANS_ReinitReplayCache(&g_ble_mesh_lower_trans0_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_BLE_MESH_LOWER_TRANS_TriggerPendingTransmits()

fsp_err_t RM_BLE_MESH_LOWER_TRANS_TriggerPendingTransmits ( rm_ble_mesh_lower_trans_ctrl_t *const *p_ctrl*)

To trigger any LTRN pending transmissions. Trigger pending transmits is an interface to check for pending segments in the tx queue and schedule for transmission, which is mainly used by the LPN operation.

Implements rm_ble_mesh_lower_trans_api_t::triggerPendingTransmits.

Example:

```
/* Trigger any Lower Transport pending transmissions. */
   err =
RM_BLE_MESH_LOWER_TRANS_TriggerPendingTransmits(&g_ble_mesh_lower_trans0_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

## BLE Mesh Network Network (rm_ble_mesh_network)

Modules » Networking » BLE Mesh Network Modules

## Functions

| | |
|---|---|
| fsp_err_t | RM_BLE_MESH_NETWORK_Open (rm_ble_mesh_network_ctrl_t *const p_ctrl, rm_ble_mesh_network_cfg_t const *const p_cfg) |

| fsp_err_t | RM_BLE_MESH_NETWORK_ConfigProxyFilter (rm_ble_mesh_network_ctrl_t *const p_ctrl, rm_ble_mesh_network_route_info_t const *const p_route_info, rm_ble_mesh_proxy_config_opcode_t opcode, rm_ble_mesh_network_proxy_address_list_t *const p_addr_list) |
| fsp_err_t | RM_BLE_MESH_NETWORK_StartProxyServerAdv (rm_ble_mesh_network_ctrl_t *const p_ctrl, rm_ble_mesh_network_subnet_handle_t subnet_handle, rm_ble_mesh_network_gatt_proxy_adv_mode_t proxy_adv_mode) |
| fsp_err_t | RM_BLE_MESH_NETWORK_StopProxyServerAdv (rm_ble_mesh_network_ctrl_t *const p_ctrl) |
| fsp_err_t | RM_BLE_MESH_NETWORK_AllocateSeqNumber (rm_ble_mesh_network_ctrl_t *const p_ctrl, uint32_t *const p_seq_num) |

| | |
|---|---|
| fsp_err_t | RM_BLE_MESH_NETWORK_GetSeqNumberState (rm_ble_mesh_network_ctrl_t *const p_ctrl, rm_ble_mesh_network_seq_number_state_t *const p_seq_num_state) |
| fsp_err_t | RM_BLE_MESH_NETWORK_SetSeqNumberState (rm_ble_mesh_network_ctrl_t *const p_ctrl, rm_ble_mesh_network_seq_number_state_t const *const p_seq_num_state) |
| fsp_err_t | RM_BLE_MESH_NETWORK_ResetNetCache (rm_ble_mesh_network_ctrl_t *const p_ctrl) |

**Detailed Description**

# Overview

### Target Devices

The BLE Mesh Network Network module supports the following devices.

- RA4W1

# Configuration

### Build Time Configurations for rm_ble_mesh_network

The following build time configurations are defined in fsp_cfg/rm_ble_mesh_network_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|

### Configurations for Networking > BLE Mesh Network modules > BLE Mesh Network (rm_ble_mesh_network)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Network (rm_ble_mesh_network).

| Configuration | Options | Default | Description |
|---|---|---|---|
| General | | | |
| Name | Name Must Be a Valid C Symbol | g_rm_ble_mesh_network0 | Module name. |
| Channel Number | Invalid Channel Number | 0 | Select channel corresponding to the channel number of the hardware. |
| Ignore Netcache Wrapping | • Processed<br>• Dropped | Dropped | Ignore netcache wrapping. |
| RX Callback Event Enable | • Enabled<br>• Disabled | Disabled | Whether to enable the RX callback event or |

| | | | |
|---|---|---|---|
| | | | not. |
| TX Callback Event Enable | • Enabled<br>• Disabled | Disabled | Whether to enable the TX callback event or not. |
| Callback | Name Must Be a Valid C Symbol | NULL | Callback function name. |

### Data Structures

| | |
|---|---|
| struct | rm_ble_mesh_network_instance_ctrl_t |

## Data Structure Documentation

### ◆ rm_ble_mesh_network_instance_ctrl_t

struct rm_ble_mesh_network_instance_ctrl_t

RM_BLE_MESH_NETWORK private control block. DO NOT MODIFY. Initialization occurs when RM_BLE_MESH_NETWORK_Open() is called.

## Function Documentation

### ◆ RM_BLE_MESH_NETWORK_Open()

fsp_err_t RM_BLE_MESH_NETWORK_Open ( rm_ble_mesh_network_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_cfg_t const *const *p_cfg* )

Register Inerface with Network Layer. This routine registers interface with the Network Layer. Network Layer supports only one upper layer, hence this routine shall be called once.

Implements rm_ble_mesh_network_api_t::open.

Example:

```
/* Open the module. */
   err = RM_BLE_MESH_NETWORK_Open(&g_ble_mesh_network0_ctrl,
&g_ble_mesh_network0_cfg);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Module opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_INVALID_STATE | Lower layer is invalid state. |
| FSP_ERR_ALREADY_OPEN | Module is already open. |

### ◆ RM_BLE_MESH_NETWORK_Close()

fsp_err_t RM_BLE_MESH_NETWORK_Close ( rm_ble_mesh_network_ctrl_t *const *p_ctrl*)

Unregister Inerface with Network Layer. Implements rm_ble_mesh_network_api_t::close.

Example:

```
/* Close the module. */
   err = RM_BLE_MESH_NETWORK_Close(&g_ble_mesh_network0_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Module successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_BLE_MESH_NETWORK_BroadcastSecureBeacon()

fsp_err_t RM_BLE_MESH_NETWORK_BroadcastSecureBeacon ( rm_ble_mesh_network_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *subnet_handle* )

API to send Secure Network Beacon. This routine sends Secure Network Beacon for the given subnet handle.

Implements rm_ble_mesh_network_api_t::broadcastSecureBeacon.

Example:

```
/* Send secure network beacon. */
   err = RM_BLE_MESH_NETWORK_BroadcastSecureBeacon(&g_ble_mesh_network0_ctrl,
subnet_handle);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |

### ◆ RM_BLE_MESH_NETWORK_SendPduOnInterface()

fsp_err_t RM_BLE_MESH_NETWORK_SendPduOnInterface ( rm_ble_mesh_network_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_route_info_t const *const *p_route_info*, rm_ble_mesh_network_header_t const *const *p_header*, rm_ble_mesh_buffer_t const *const *p_buffer* )

Extension API to send Network PDUs on selected network interfaces. This routine sends NETWORK PDUs on all or selected Network Interfaces.

Implements rm_ble_mesh_network_api_t::sendPduOnInterface.

Example:

```
/* Send network PDUs on selected network interfaces. */
   err = RM_BLE_MESH_NETWORK_SendPduOnInterface(&g_ble_mesh_network0_ctrl,
&route_info, &header, &buffer);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_route_info, p_header and p_buffer are NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

### ◆ RM_BLE_MESH_NETWORK_GetAddressType()

fsp_err_t RM_BLE_MESH_NETWORK_GetAddressType ( rm_ble_mesh_network_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_address_t *addr*, rm_ble_mesh_network_address_type_t *const *p_type* )

To get address type. This routine is to get address type for a given address.

Implements rm_ble_mesh_network_api_t::getAddressType.

Example:

```
/* Get address type. */
   err = RM_BLE_MESH_NETWORK_GetAddressType(&g_ble_mesh_network0_ctrl, addr, &type);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_type is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_BLE_MESH_NETWORK_FetchProxyState()

fsp_err_t RM_BLE_MESH_NETWORK_FetchProxyState ( rm_ble_mesh_network_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_gatt_proxy_state_t *const *p_proxy_state* )

Check if the proxy module is ready to handle proxy messages/events. This routine returns the current state of the Proxy. The valid states of proxy are:

1. RM_BLE_MESH_NETWORK_GATT_PROXY_STATE_NULL - If no callback registered by Upper Layers
2. RM_BLE_MESH_NEgTWORK_GATT_PROXY_STATE_READY - If callback registered and Proxy not connected
3. RM_BLE_MESH_NETWORK_GATT_PROXY_STATE_CONNECTED - if callback registered and Proxy connected

Implements rm_ble_mesh_network_api_t::fetchProxyState.

Example:

```
/* Check if the proxy module is ready to handle proxy messages/events. */
   err = RM_BLE_MESH_NETWORK_FetchProxyState(&g_ble_mesh_network0_ctrl,
&proxy_state);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_proxy_state is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_BLE_MESH_NETWORK_SetProxyFilter()

fsp_err_t RM_BLE_MESH_NETWORK_SetProxyFilter ( rm_ble_mesh_network_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_route_info_t const *const *p_route_info*, rm_ble_mesh_proxy_filter_type_t *type* )

Set proxy server's filter type. This function is used by the Proxy Client to set the filter type on the Proxy Server.

Implements rm_ble_mesh_network_api_t::setProxyFilter.

Example:

```
/* Set proxy server's filter type. */
   err = RM_BLE_MESH_NETWORK_SetProxyFilter(&g_ble_mesh_network0_ctrl, &route_info,
filter_type);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_route_info is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_BLE_MESH_NETWORK_ConfigProxyFilter()

fsp_err_t RM_BLE_MESH_NETWORK_ConfigProxyFilter ( rm_ble_mesh_network_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_route_info_t const *const *p_route_info*, rm_ble_mesh_proxy_config_opcode_t *opcode*, rm_ble_mesh_network_proxy_address_list_t *const *p_addr_list* )

Add or Delete/Remove addresses to/from proxy filter list. This function is used by the Proxy Client to add/delete Addresses to/from the Proxy Server's filter List.

Implements rm_ble_mesh_network_api_t::configProxyFilter.

Example:

```
/* Add or delete/remove addresses to/from proxy filter list. */
   err = RM_BLE_MESH_NETWORK_ConfigProxyFilter(&g_ble_mesh_network0_ctrl,
&route_info, opcode, &addr_list);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_route_info and p_addr_list are NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_BLE_MESH_NETWORK_StartProxyServerAdv()

fsp_err_t RM_BLE_MESH_NETWORK_StartProxyServerAdv ( rm_ble_mesh_network_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *subnet_handle*, rm_ble_mesh_network_gatt_proxy_adv_mode_t *proxy_adv_mode* )

Start connectable advertisements for a proxy server. This function is used by the Proxy Server to start Connectable Undirected Advertisements.

Implements rm_ble_mesh_network_api_t::startProxyServerAdv.

Example:

```
/* Start connectable advertisements for a proxy server. */
   err = RM_BLE_MESH_NETWORK_StartProxyServerAdv(&g_ble_mesh_network0_ctrl,
subnet_handle, proxy_adv_mode);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The internal parameter is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

### ◆ RM_BLE_MESH_NETWORK_StopProxyServerAdv()

fsp_err_t RM_BLE_MESH_NETWORK_StopProxyServerAdv ( rm_ble_mesh_network_ctrl_t *const *p_ctrl*)

Stop connectable advertisements for a proxy server. This function is used by the Proxy Server to stop Connectable Undirected Advertisements.

Implements rm_ble_mesh_network_api_t::stopProxyServerAdv.

Example:

```
/* Stop connectable advertisements for a proxy server. */
   err = RM_BLE_MESH_NETWORK_StopProxyServerAdv(&g_ble_mesh_network0_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_BLE_MESH_NETWORK_AllocateSeqNumber()

fsp_err_t RM_BLE_MESH_NETWORK_AllocateSeqNumber ( rm_ble_mesh_network_ctrl_t *const *p_ctrl*, uint32_t *const *p_seq_num* )

To allocate sequence number. This function is used to allocate Sequence Number.

Implements rm_ble_mesh_network_api_t::allocateSeqNumber.

Example:

```
/* Allocate sequence number. */
   err = RM_BLE_MESH_NETWORK_AllocateSeqNumber(&g_ble_mesh_network0_ctrl, &seq_num);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_seq_num is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_BLE_MESH_NETWORK_GetSeqNumberState()

fsp_err_t RM_BLE_MESH_NETWORK_GetSeqNumberState ( rm_ble_mesh_network_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_seq_number_state_t *const *p_seq_num_state* )

To get current sequence number state. This function is used to get current Sequence Number state.

Implements rm_ble_mesh_network_api_t::getSeqNumberState.

Example:

```
/* Get current sequence number state. */
   err = RM_BLE_MESH_NETWORK_GetSeqNumberState(&g_ble_mesh_network0_ctrl,
&seq_num_state);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_seq_num_state is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_BLE_MESH_NETWORK_SetSeqNumberState()

fsp_err_t RM_BLE_MESH_NETWORK_SetSeqNumberState ( rm_ble_mesh_network_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_seq_number_state_t const *const *p_seq_num_state* )

To set current sequence number state. This function is used to get current Sequence Number state, which acquiring lock. Used from persistent storage.

Implements rm_ble_mesh_network_api_t::setSeqNumberState.

Example:

```
/* Set current sequence number state. */
   err = RM_BLE_MESH_NETWORK_SetSeqNumberState(&g_ble_mesh_network0_ctrl,
&seq_num_state);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_seq_num_state is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_BLE_MESH_NETWORK_ResetNetCache()

fsp_err_t RM_BLE_MESH_NETWORK_ResetNetCache ( rm_ble_mesh_network_ctrl_t *const *p_ctrl*)

To reinitialize all Network Layer cache entries. This routine clears and reinitializes all Network Cache Entries. This needs to be invoked by the upper layer when the Network moves to a newer IV Index (Normal State) and the Sequence numbers are reset.

Implements rm_ble_mesh_network_api_t::resetNetCache.

Example:

```
/* Reinitialize all Network Layer cache entries. */
   err = RM_BLE_MESH_NETWORK_ResetNetCache(&g_ble_mesh_network0_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

## BLE Mesh Network Provision (rm_ble_mesh_provision)

**Detailed Description**

# Overview

### Target Devices

The BLE Mesh Network Provision module supports the following devices.

- RA4W1

# Configuration

### Build Time Configurations for rm_ble_mesh_provision

The following build time configurations are defined in fsp_cfg/rm_ble_mesh_provision_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|

**Configurations for Networking > BLE Mesh Network modules > BLE Mesh Provision (rm_ble_mesh_provision)**

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Provision (rm_ble_mesh_provision).

| Configuration | Options | Default | Description |
|---|---|---|---|
| General | | | |
| Name | Name Must Be a Valid C Symbol | g_rm_ble_mesh_provision0 | Module name. |
| Provision Capabilities | | | |
| Number of Elements | Invalid Number of Elements | 1 | Provision capabilities number of elements. |
| Supported Algorithms | Invalid Supported Algorithms | 0 | Provision capabilities supported algorithms. |
| Public Key Type | Invalid Public Key Type | 0 | Provision capabilities public key type. |
| Static OOB Type | Invalid Static OOB Type | 0 | Provision capabilities static OOB type. |
| Output OOB Action | Invalid Output OOB Action | 0 | Provision capabilities output OOB action. |
| Output OOB Size | Invalid Output OOB Size | 0 | Provision capabilities output OOB size. |
| Input OOB Action | Invalid Input OOB Action | 0 | Provision capabilities input OOB action. |
| Input OOB Size | Invalid Input OOB Size | 0 | Provision capabilities iutput OOB size. |
| Channel Number | Invalid Channel Number | 0 | Select channel corresponding to the channel number of the hardware. |
| Provision Callback | Name Must Be a Valid C Symbol. | NULL | Provision callback function name. |

### Data Structures

| | |
|---|---|
| struct | rm_ble_mesh_provision_instance_ctrl_t |

## Data Structure Documentation

### ◆ rm_ble_mesh_provision_instance_ctrl_t

| struct rm_ble_mesh_provision_instance_ctrl_t |
|---|
| RM_BLE_MESH_PROVISION private control block. DO NOT MODIFY. Initialization occurs when RM_BLE_MESH_PROVISION_Open() is called. |

## Function Documentation

### ◆ RM_BLE_MESH_PROVISION_Open()

fsp_err_t RM_BLE_MESH_PROVISION_Open ( rm_ble_mesh_provision_ctrl_t *const *p_ctrl*, rm_ble_mesh_provision_cfg_t const *const *p_cfg* )

Open access middleware. This function registers the provisioning capabilities of the application along with the application callback to notify events during the provisioning procedure.

Implements rm_ble_mesh_provision_api_t::open.

Example:

```
/* Open the module. */
   err = RM_BLE_MESH_PROVISION_Open(&g_ble_mesh_provision0_ctrl,
&g_ble_mesh_provision0_cfg);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Module opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Module is already open. |
| FSP_ERR_INVALID_STATE | Lower layer is invalid state. |

### ◆ RM_BLE_MESH_PROVISION_Close()

fsp_err_t RM_BLE_MESH_PROVISION_Close ( rm_ble_mesh_provision_ctrl_t *const *p_ctrl*)

Close access middleware. Implements rm_ble_mesh_provision_api_t::close.

Example:

```
/* Close the module. */
   err = RM_BLE_MESH_PROVISION_Close(&g_ble_mesh_provision0_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Module successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Lower layer is invalid state. |

### ◆ RM_BLE_MESH_PROVISION_Setup()

fsp_err_t RM_BLE_MESH_PROVISION_Setup ( rm_ble_mesh_provision_ctrl_t *const *p_ctrl*, rm_ble_mesh_provision_role_t *role*, rm_ble_mesh_provision_device_info_t *info*, uint16_t *timeout* )

Setup the device for provisioning. This function configures the device to get in a provisionable state by specifying the role, bearer and creating a context.

Implements rm_ble_mesh_provision_api_t::setup.

Example:

```
/* Setup the device for provisioning. */
   err = RM_BLE_MESH_PROVISION_Setup(&g_ble_mesh_provision0_ctrl, role, info,
timeout);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_POINTER | The parameter info->p_device is NULL. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_STATE | Lower layer is invalid state. |

### ◆ RM_BLE_MESH_PROVISION_Bind()

fsp_err_t RM_BLE_MESH_PROVISION_Bind ( rm_ble_mesh_provision_ctrl_t *const *p_ctrl*, rm_ble_mesh_provision_device_info_t *info*, uint8_t *attention*, rm_ble_mesh_provision_handle_t *const *p_handle* )

Bind to the peer device for provisioning. This function establishes a provisioning link with the peer device and exchanges the capabilities for provisioning.

Implements rm_ble_mesh_provision_api_t::bind.

Example:

```
/* Bind to the peer device for provisioning. */
   err = RM_BLE_MESH_PROVISION_Bind(&g_ble_mesh_provision0_ctrl, info, attention,
&provision_handle);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_POINTER | The parameter p_handle is NULL. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_STATE | Lower layer is invalid state. |

### ◆ RM_BLE_MESH_PROVISION_SendPdu()

fsp_err_t RM_BLE_MESH_PROVISION_SendPdu ( rm_ble_mesh_provision_ctrl_t *const *p_ctrl*, rm_ble_mesh_provision_handle_t const *const *p_handle*, rm_ble_mesh_provision_pdu_type_t *type*, rm_ble_mesh_buffer_t *pdu_data* )

Send provisioning PDUs to the peer. This function is used by the provisioning application to send the provisioning PDUs to the peer device during the procedure.

Implements rm_ble_mesh_provision_api_t::sendPdu.

Example:

```
/* Send provisioning PDUs to the peer. */
   err = RM_BLE_MESH_PROVISION_SendPdu(&g_ble_mesh_provision0_ctrl,
&provision_handle, type, pdu_data);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_POINTER | The parameter p_handle is NULL. |
| FSP_ERR_UNSUPPORTED | The pdu type is not supported. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

### ◆ RM_BLE_MESH_PROVISION_SetAuthVal()

fsp_err_t RM_BLE_MESH_PROVISION_SetAuthVal ( rm_ble_mesh_provision_ctrl_t *const *p_ctrl*, rm_ble_mesh_provision_handle_t const *const *p_handle*, rm_ble_mesh_buffer_t *auth_value* )

Set the display authval. This function shall be used by the provisioning application to set the authval being displayed to the user on receiving RM_BLE_MESH_PROVISION_EVENT_TYPE_OOB_DISPLAY event with the respective OOB Action and Size.

Implements rm_ble_mesh_provision_api_t::setAuthVal.

Example:

```
rm_ble_mesh_buffer_t auth_value = {.payload = NULL, .length = 0};;

/* Set the display authval. */

   err = RM_BLE_MESH_PROVISION_SetAuthVal(&g_ble_mesh_provision0_ctrl,
&provision_handle, auth_value);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_handle is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_BLE_MESH_PROVISION_Abort()

fsp_err_t RM_BLE_MESH_PROVISION_Abort ( rm_ble_mesh_provision_ctrl_t *const *p_ctrl*,
rm_ble_mesh_provision_handle_t const *const *p_handle*,
rm_ble_mesh_provision_link_close_reason_t *reason* )

Abort the provisioning procedure. This API can be used by the application to abort the ongoing provisioning procedure. This routine closes the provisioning link with the reason as specified.

Implements rm_ble_mesh_provision_api_t::abort.

Example:

```
/* Abort the provisioning procedure. */
   err = RM_BLE_MESH_PROVISION_Abort(&g_ble_mesh_provision0_ctrl, &provision_handle,
reason);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_handle is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_STATE | Lower layer is invalid state. |

### ◆ RM_BLE_MESH_PROVISION_GetLocalPublicKey()

fsp_err_t RM_BLE_MESH_PROVISION_GetLocalPublicKey ( rm_ble_mesh_provision_ctrl_t *const *p_ctrl*, uint8_t *const *p_public_key* )

Utility API to get current ECDH public key to be used for provisioning. This API can be used by the application to fetch the current ECDH P256 Public Key which is to be used for the Provisioning Procedure.

Implements rm_ble_mesh_provision_api_t::getLocalPublicKey.

Example:

```
/* Get current ECDH Public Key to be used for Provisioning. */
   err = RM_BLE_MESH_PROVISION_GetLocalPublicKey(&g_ble_mesh_provision0_ctrl,
&public_key);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_public_key is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

### ◆ RM_BLE_MESH_PROVISION_SetLocalPublicKey()

fsp_err_t RM_BLE_MESH_PROVISION_SetLocalPublicKey ( rm_ble_mesh_provision_ctrl_t *const *p_ctrl*, uint8_t const *const *p_public_key* )

Utility API to set current ECDH public key to be used for provisioning. This API can be used by the application to fetch the current ECDH P256 Public Key which is to be used for the Provisioning Procedure.

Implements rm_ble_mesh_provision_api_t::setLocalPublicKey.

Example:

```
/* Set current ECDH Public Key to be used for Provisioning. */
   err = RM_BLE_MESH_PROVISION_SetLocalPublicKey(&g_ble_mesh_provision0_ctrl,
&public_key);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_public_key is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

### ◆ RM_BLE_MESH_PROVISION_GenerateRandomizedNumber()

fsp_err_t RM_BLE_MESH_PROVISION_GenerateRandomizedNumber ( rm_ble_mesh_provision_ctrl_t *const *p_ctrl*, uint8_t *const *p_key* )

Utility API to generate 128bits (16 bytes) randomized number to be used for provisioning. The randomized number can be used for UUID, Net Key and Application Key.

Implements rm_ble_mesh_provision_api_t::generateRandomizedNumber.

Example:

```
/* Generate 128bits (16 bytes) randomized number. */
   err = RM_BLE_MESH_PROVISION_GenerateRandomizedNumber(&g_ble_mesh_provision0_ctrl,
p_net_key);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_key is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_BLE_MESH_PROVISION_SetOobPublicKey()

fsp_err_t RM_BLE_MESH_PROVISION_SetOobPublicKey ( rm_ble_mesh_provision_ctrl_t *const *p_ctrl*, uint8_t const *const *p_key*, uint8_t *size* )

Utility API to set device out of band public key for provisioning.

Implements rm_ble_mesh_provision_api_t::setOobPublicKey.

Example:

```
/* Set device out of band public key. */
   err = RM_BLE_MESH_PROVISION_SetOobPublicKey(&g_ble_mesh_provision0_ctrl,
p_public_key, size);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_key is NULL. |
| FSP_ERR_INVALID_ARGUMENT | The parameter size is more than 64. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_BLE_MESH_PROVISION_SetOobAuthInfo()

fsp_err_t RM_BLE_MESH_PROVISION_SetOobAuthInfo ( rm_ble_mesh_provision_ctrl_t *const *p_ctrl*, uint8_t const *const *p_auth_info*, uint8_t *size* )

Utility API to set device out of band authentication information for provisioning.

Implements rm_ble_mesh_provision_api_t::setOobAuthInfo.

Example:

```
/* Set device out of band authentication information. */
   err = RM_BLE_MESH_PROVISION_SetOobAuthInfo(&g_ble_mesh_provision0_ctrl,
p_auth_info, size);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_auth_info is NULL. |
| FSP_ERR_INVALID_ARGUMENT | The parameter size is more than 16. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_BLE_MESH_PROVISION_GenerateEcdhKey()

fsp_err_t RM_BLE_MESH_PROVISION_GenerateEcdhKey ( rm_ble_mesh_provision_ctrl_t *const *p_ctrl*, uint8_t *const *p_public_key* )

Utility API to generate ECDH public key to be used for provisioning.

Implements rm_ble_mesh_provision_api_t::generateEcdhKey.

Example:

```
/* Generate ECDH Public Key for Provisioning. */
   err = RM_BLE_MESH_PROVISION_GenerateEcdhKey(&g_ble_mesh_provision0_ctrl,
&public_key);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_public_key is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

# BLE Mesh Network Scene Client (rm_mesh_scene_clt)

## Detailed Description

# Overview

### Target Devices

The BLE Mesh Network Scene Client module supports the following devices.

- RA4W1

# Configuration

### Build Time Configurations for rm_mesh_scene_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_scene_clt_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|

### Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Scene Client (rm_mesh_scene_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Scene Client (rm_mesh_scene_clt).

| Configuration | Options | Default | Description |
|---|---|---|---|
| Interrupts | | | |
| Callback Provided when Timeout Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh scene client ISR occurs |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_scene_clt0 | Module name. |

### Data Structures

| | |
|---|---|
| struct | rm_mesh_scene_clt_instance_ctrl_t |

### Data Structure Documentation

#### ◆ rm_mesh_scene_clt_instance_ctrl_t

| struct rm_mesh_scene_clt_instance_ctrl_t |
|---|
| BLE mesh scene instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_SCENE_CLT_Open() is called. |

### Function Documentation

### ◆ RM_MESH_SCENE_CLT_Open()

fsp_err_t RM_MESH_SCENE_CLT_Open ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_client_cfg_t const *const *p_cfg* )

open Scene Client middleware. This is to initialize Scene Client model and to register with Access layer.

Implements rm_ble_mesh_model_client_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_SCENE_CLT_Open(&g_mesh_scene_clt0_ctrl, &g_mesh_scene_clt0_cfg);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

### ◆ RM_MESH_SCENE_CLT_Close()

fsp_err_t RM_MESH_SCENE_CLT_Close ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Close Scene Client middleware.

Implements rm_ble_mesh_model_client_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_SCENE_CLT_Close(&g_mesh_scene_clt0_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

### ◆ RM_MESH_SCENE_CLT_GetModelHandle()

fsp_err_t RM_MESH_SCENE_CLT_GetModelHandle ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *const *p_model_handle* )

This is to get the handle of Scene client model.

Implements rm_ble_mesh_model_client_api_t::getModelHandle.

Example:

```
/* Get the handle of scene client model. */
   err = RM_MESH_SCENE_CLT_GetModelHandle(&g_mesh_scene_clt0_ctrl, &model_handle);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Got model handle successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_POINTER | The parameter p_model_handle is NULL. |

### ◆ RM_MESH_SCENE_CLT_SendReliablePdu()

fsp_err_t RM_MESH_SCENE_CLT_SendReliablePdu ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, uint32_t *req_opcode*, void const *const *p_parameter*, uint32_t *rsp_opcode* )

This is to initialize sending acknowledged commands.

Implements rm_ble_mesh_model_client_api_t::sendReliablePdu.

Example:

```
/* Initialize sending acknowledged commands. */
   err = RM_MESH_SCENE_CLT_SendReliablePdu(&g_mesh_scene_clt0_ctrl, req_opcode,
p_parameter, rsp_opcode);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_SCENE_CLT_Get()

fsp_err_t RM_MESH_SCENE_CLT_Get ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Scene Get is an acknowledged message used to get the current status of a currently active scene of an element. The response to the Scene Get message is a Scene Status message. There are no parameters for this message.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_scene_clt control block. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_SCENE_CLT_Recall()

fsp_err_t RM_MESH_SCENE_CLT_Recall ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

Scene Recall is an acknowledged message that is used to recall the current state of an element from a previously stored scene. The response to the Scene Recall message is a Scene Status message.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_scene_clt control block. |
| [in] | p_parameter | Pointer to Scene Recall message. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_SCENE_CLT_RecallUnacknowledged()

fsp_err_t RM_MESH_SCENE_CLT_RecallUnacknowledged ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

Scene Recall Unacknowledged is an unacknowledged message used to recall the current state of an element from a previously stored Scene.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_scene_clt control block. |
| [in] | p_parameter | Pointer to Scene Recall message. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_SCENE_CLT_RegisterGet()

fsp_err_t RM_MESH_SCENE_CLT_RegisterGet ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Scene Register Get is an acknowledged message used to get the current status of the Scene Register of an element. The response to the Scene Register Get message is a Scene Register Status message. There are no parameters for this message.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_scene_clt control block. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_SCENE_CLT_Store()

fsp_err_t RM_MESH_SCENE_CLT_Store ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

Scene Store is an acknowledged message used to store the current state of an element as a Scene, which can be recalled later. The response to the Scene Store message is a Scene Register Status message.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_scene_clt control block. |
| [in] | p_parameter | Pointer to Scene Store message. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_SCENE_CLT_StoreUnacknowledged()

fsp_err_t RM_MESH_SCENE_CLT_StoreUnacknowledged ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

Scene Store Unacknowledged is an unacknowledged message used to store the current state of an element as a Scene, which can be recalled later.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_scene_clt control block. |
| [in] | p_parameter | Pointer to Scene Store message. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_SCENE_CLT_Delete()

fsp_err_t RM_MESH_SCENE_CLT_Delete ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

Scene Delete is an acknowledged message used to delete a Scene from the Scene Register state of an element. The response to the Scene Delete message is a Scene Register Status message.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_scene_clt control block. |
| [in] | p_parameter | Pointer to Scene Delete parameter. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_SCENE_CLT_DeleteUnacknowledged()

fsp_err_t RM_MESH_SCENE_CLT_DeleteUnacknowledged ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

Scene Delete Unacknowledged is an unacknowledged message used to delete a scene from the Scene Register state of an element.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_scene_clt control block. |
| [in] | p_parameter | Pointer to Scene Delete parameter. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

## BLE Mesh Network Scene Server (rm_mesh_scene_srv)

Modules » Networking » BLE Mesh Network Modules

### Functions

| | |
|---|---|
| fsp_err_t | RM_MESH_SCENE_SRV_Open (rm_ble_mesh_scene_server_ctrl_t *const p_ctrl, rm_ble_mesh_scene_server_cfg_t const *const p_cfg) |
| fsp_err_t | RM_MESH_SCENE_SRV_Close (rm_ble_mesh_scene_server_ctrl_t *const p_ctrl) |
| fsp_err_t | RM_MESH_SCENE_SRV_StateUpdate |

| | |
|---|---|
| | (rm_ble_mesh_scene_server_ctrl_t *const p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state) |

**Detailed Description**

# Overview

### Target Devices

The BLE Mesh Network Scene Server module supports the following devices.

- RA4W1

# Configuration

### Build Time Configurations for rm_mesh_scene_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_scene_srv_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|

### Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Scene Server (rm_mesh_scene_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Scene Server (rm_mesh_scene_srv).

| Configuration | Options | Default | Description |
|---|---|---|---|
| Interrupts | | | |
| Callback Provided when Timeout Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh scene server ISR occurs |
| Callback Provided when an Timeout ISR Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh scene server timeout ISR occurs |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_scene_srv0 | Module name. |
| Model Handle | Invalid Model Handle | 0 | Select model handle. |
| Setup Server Handle | Invalid Setup Server Handle | 0 | Select setup server handle. |

**Data Structures**

| | |
|---|---|
| struct | rm_mesh_scene_srv_number_info_t |
| struct | rm_mesh_scene_srv_status_info_t |

| | |
|---|---|
| struct | rm_mesh_scene_srv_register_status_info_t |
| struct | rm_mesh_scene_srv_ext_tid_and_transition_info_t |
| struct | rm_mesh_scene_srv_instance_ctrl_t |

## Data Structure Documentation

### ◆ rm_mesh_scene_srv_number_info_t

| struct rm_mesh_scene_srv_number_info_t | | |
|---|---|---|
| The state to identify a scene | | |
| Data Fields | | |
| uint16_t | number | The number to identify a scene |

### ◆ rm_mesh_scene_srv_status_info_t

| struct rm_mesh_scene_srv_status_info_t | | |
|---|---|---|
| The current status of a currently active scene | | |
| Data Fields | | |
| uint8_t | status_code | Status Code |
| uint16_t | current_scene | Scene Number of a current scene. |
| uint16_t | target_scene | Scene Number of a target scene. |
| uint8_t | remaining_time | |

### ◆ rm_mesh_scene_srv_register_status_info_t

| struct rm_mesh_scene_srv_register_status_info_t | | |
|---|---|---|
| The current status of scene register | | |
| Data Fields | | |
| uint8_t | status_code | Status Code |
| uint16_t | current_scene | Scene Number of a current scene. |
| uint16_t * | scenes | A list of scenes stored within an element |
| uint16_t | scenes_count | |

### ◆ rm_mesh_scene_srv_ext_tid_and_transition_info_t

| struct rm_mesh_scene_srv_ext_tid_and_transition_info_t |
|---|
| TID and Transition is a structure which contains Transaction ID (TID) as mandatory field. Other two fields, Transition Time and Delay are optional. |

TID field is a transaction identifier indicating whether the message is a new message or a retransmission of a previously sent message.

If present, the Transition Time field identifies the time that an element will take to transition to the target state from the present state.

The Delay field shall be present when the Transition Time field is present. It identifies the message execution delay, representing a time interval between receiving the message by a model and executing the associated model behaviors.

### ◆ rm_mesh_scene_srv_instance_ctrl_t

| struct rm_mesh_scene_srv_instance_ctrl_t |
|---|
| BLE mesh scene instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_SCENE_SRV_Open() is called. |

## Function Documentation

### ◆ RM_MESH_SCENE_SRV_Open()

| fsp_err_t RM_MESH_SCENE_SRV_Open ( rm_ble_mesh_scene_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_scene_server_cfg_t const *const *p_cfg* ) |
|---|
| API to initialize Scene Server model. This is to initialize Scene Server model and to register with Access layer.<br>Implements rm_ble_mesh_model_server_api_t::open.<br>Example:<br>`/* Open the module. */`<br>`err = RM_MESH_SCENE_SRV_Open(&g_mesh_scene_srv0_ctrl, &g_mesh_scene_srv0_cfg);` |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

### ◆ RM_MESH_SCENE_SRV_Close()

fsp_err_t RM_MESH_SCENE_SRV_Close ( rm_ble_mesh_scene_server_ctrl_t *const *p_ctrl*)

API to terminate Scene Server model. This is to terminate Scene Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_SCENE_SRV_Close(&g_mesh_scene_srv0_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

### ◆ RM_MESH_SCENE_SRV_StateUpdate()

fsp_err_t RM_MESH_SCENE_SRV_StateUpdate ( rm_ble_mesh_scene_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state* )

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements rm_ble_mesh_model_server_api_t::stateUpdate.

Example:

```
/* Update server status. */
   err = RM_MESH_SCENE_SRV_StateUpdate(&g_mesh_scene_srv0_ctrl, &state);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Updated server status successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_state is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

## BLE Mesh Network Scheduler Client (rm_mesh_scheduler_clt)

Modules » Networking » BLE Mesh Network Modules

### Functions

| | |
|---|---|
| fsp_err_t | RM_MESH_SCHEDULER_CLT_Open (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, rm_ble_mesh_model_client_cfg_t const *const p_cfg) |
| fsp_err_t | RM_MESH_SCHEDULER_CLT_Close (rm_ble_mesh_model_client_ctrl_t *const p_ctrl) |
| fsp_err_t | RM_MESH_SCHEDULER_CLT_GetModelHandle (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, |

| | |
|---|---|
| | rm_ble_mesh_access_model_handle_t *const p_model_handle) |
| fsp_err_t | RM_MESH_SCHEDULER_CLT_SendReliablePdu (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, uint32_t req_opcode, void const *const p_parameter, uint32_t rsp_opcode) |
| fsp_err_t | RM_MESH_SCHEDULER_CLT_Get (rm_ble_mesh_model_client_ctrl_t *const p_ctrl) |
| fsp_err_t | RM_MESH_SCHEDULER_CLT_ActionGet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter) |
| fsp_err_t | RM_MESH_SCHEDULER_CLT_ActionSet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter) |
| fsp_err_t | RM_MESH_SCHEDULER_CLT_ActionSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter) |

**Detailed Description**

# Overview

### Target Devices

The BLE Mesh Network Scheduler Client module supports the following devices.

- RA4W1

# Configuration

### Build Time Configurations for rm_mesh_scheduler_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_scheduler_clt_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|

**Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Scheduler Client (rm_mesh_scheduler_clt)**

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Scheduler Client (rm_mesh_scheduler_clt).

| Configuration | Options | Default | Description |
|---|---|---|---|
| Interrupts | | | |
| Callback Provided when Timeout Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh scheduler |

| | | | |
|---|---|---|---|
| | | | client ISR occurs |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_scheduler_clt0 | Module name. |

### Data Structures

| | |
|---|---|
| struct | rm_mesh_scheduler_clt_instance_ctrl_t |

## Data Structure Documentation

### ◆ rm_mesh_scheduler_clt_instance_ctrl_t

| |
|---|
| struct rm_mesh_scheduler_clt_instance_ctrl_t |
| BLE mesh scheduler instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_SCHEDULER_CLT_Open() is called. |

## Function Documentation

### ◆ RM_MESH_SCHEDULER_CLT_Open()

| |
|---|
| fsp_err_t RM_MESH_SCHEDULER_CLT_Open ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_client_cfg_t const *const *p_cfg* ) |
| Open Scheduler Client middleware. This is to initialize Scheduler Client model and to register with Access layer.<br>Implements rm_ble_mesh_model_client_api_t::open.<br>Example:<br>`/* Open the module. */`<br>`err = RM_MESH_SCHEDULER_CLT_Open(&g_mesh_scheduler_clt0_ctrl, &g_mesh_scheduler_clt0_cfg);`<br>**Return values**<br>FSP_SUCCESS — Model opened successfully.<br>FSP_ERR_ASSERTION — Pointer to control block or configuration structure is NULL.<br>FSP_ERR_ALREADY_OPEN — Model is already open.<br>FSP_ERR_NOT_FOUND — The number of models has exceeded the limit.<br>FSP_ERR_ABORTED — Model initialization is failed. |

### ◆ RM_MESH_SCHEDULER_CLT_Close()

fsp_err_t RM_MESH_SCHEDULER_CLT_Close ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Close Scheduler Client middleware.

Implements rm_ble_mesh_model_client_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_SCHEDULER_CLT_Close(&g_mesh_scheduler_clt0_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

### ◆ RM_MESH_SCHEDULER_CLT_GetModelHandle()

fsp_err_t RM_MESH_SCHEDULER_CLT_GetModelHandle ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *const *p_model_handle* )

This is to get the handle of Scheduler client model.

Implements rm_ble_mesh_model_client_api_t::getModelHandle.

Example:

```
/* Get the handle of scheduler client model. */
   err = RM_MESH_SCHEDULER_CLT_GetModelHandle(&g_mesh_scheduler_clt0_ctrl,
&model_handle);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Got model handle successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_POINTER | The parameter p_model_handle is NULL. |

### ◆ RM_MESH_SCHEDULER_CLT_SendReliablePdu()

fsp_err_t RM_MESH_SCHEDULER_CLT_SendReliablePdu ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, uint32_t *req_opcode*, void const *const *p_parameter*, uint32_t *rsp_opcode* )

This is to initialize sending acknowledged commands.

Implements rm_ble_mesh_model_client_api_t::sendReliablePdu.

Example:

```
/* Initialize sending acknowledged commands. */
   err = RM_MESH_SCHEDULER_CLT_SendReliablePdu(&g_mesh_scheduler_clt0_ctrl,
req_opcode, p_parameter, rsp_opcode);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_SCHEDULER_CLT_Get()

fsp_err_t RM_MESH_SCHEDULER_CLT_Get ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Scheduler Get is an acknowledged message used to get the current Schedule Register state of an element. The response to the Scheduler Get message is a Scheduler Status message. There are no parameters for this message.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_scheduler_clt control block. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_SCHEDULER_CLT_ActionGet()

fsp_err_t RM_MESH_SCHEDULER_CLT_ActionGet ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

Scheduler Action Get is an acknowledged message used to report the action defined by the entry of the Schedule Register state of an element, identified by the Index field. The response to the Scheduler Action Get message is a Scheduler Action Status message.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_scheduler_clt control block. |
| [in] | p_parameter | Pointer to Scheduler Action Get message. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_SCHEDULER_CLT_ActionSet()

fsp_err_t RM_MESH_SCHEDULER_CLT_ActionSet ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

Scheduler Action Set is an acknowledged message used to set the entry of the Schedule Register state of an element, identified by the Index field. The response to the Scheduler Action Set message is a Scheduler Action Status message.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_scheduler_clt control block. |
| [in] | p_parameter | Pointer to Scheduler Action Set message. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_SCHEDULER_CLT_ActionSetUnacknowledged()

fsp_err_t RM_MESH_SCHEDULER_CLT_ActionSetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

Scheduler Action Set Unacknowledged is an unacknowledged message used to set the entry of the Schedule Register state of an element, identified by the Index field.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_scheduler_clt control block. |
| [in] | p_parameter | Pointer to Scheduler Action Set message. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

## BLE Mesh Network Scheduler Server (rm_mesh_scheduler_srv)

Modules » Networking » BLE Mesh Network Modules

### Functions

| | |
|---|---|
| fsp_err_t | RM_MESH_SCHEDULER_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_model_server_cfg_t const *const p_cfg) |
| fsp_err_t | RM_MESH_SCHEDULER_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const p_ctrl) |
| fsp_err_t | RM_MESH_SCHEDULER_SRV_StateUpdate |

| | |
|---|---|
| | (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state) |

**Detailed Description**

# Overview

### Target Devices

The BLE Mesh Network Scheduler Server module supports the following devices.

- RA4W1

# Configuration

### Build Time Configurations for rm_mesh_scheduler_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_scheduler_srv_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|

### Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Scheduler Server (rm_mesh_scheduler_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Scheduler Server (rm_mesh_scheduler_srv).

| Configuration | Options | Default | Description |
|---|---|---|---|
| Interrupts | | | |
| Callback Provided when Timeout Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh scheduler server ISR occurs |
| Callback Provided when an Timeout ISR Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh scheduler server timeout ISR occurs |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_scheduler_srv0 | Module name. |

**Data Structures**

| | |
|---|---|
| struct | rm_mesh_scheduler_srv_schedules_info_t |
| struct | rm_mesh_scheduler_srv_entry_index_info_t |
| struct | rm_mesh_scheduler_srv_entry_info_t |
| struct | rm_mesh_scheduler_srv_instance_ctrl_t |

## Data Structure Documentation

### ◆ rm_mesh_scheduler_srv_schedules_info_t

| struct rm_mesh_scheduler_srv_schedules_info_t | | |
|---|---|---|
| The current Schedule Register state of an element. | | |
| Data Fields | | |
| uint16_t | schedules | Bit field indicating defined Actions in the Schedule Register |

### ◆ rm_mesh_scheduler_srv_entry_index_info_t

| struct rm_mesh_scheduler_srv_entry_index_info_t | | |
|---|---|---|
| The entry index of the Schedule Register state | | |
| Data Fields | | |
| uint8_t | index | Index of the Schedule Register entry |

### ◆ rm_mesh_scheduler_srv_entry_info_t

| struct rm_mesh_scheduler_srv_entry_info_t | | |
|---|---|---|
| The entry of the Schedule Register state | | |
| Data Fields | | |
| uint8_t | index | Index of the Schedule Register entry |
| uint8_t | year | Scheduled year for the action |
| uint16_t | month | Scheduled month for the action |
| uint8_t | day | Scheduled day of the month for the action |
| uint8_t | hour | Scheduled hour for the action |
| uint8_t | minute | Scheduled minute for the action |
| uint8_t | second | Scheduled second for the action |
| uint8_t | dayofweek | Schedule days of the week for the action |
| uint8_t | action | Action to be performed at the scheduled time |
| uint8_t | transition_time | Transition time for this action |
| uint16_t | scene_number | Scene number to be used for some actions |

### ◆ rm_mesh_scheduler_srv_instance_ctrl_t

| struct rm_mesh_scheduler_srv_instance_ctrl_t |
|---|
| BLE mesh scheduler instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_SCHEDULER_SRV_Open() is called. |

## Function Documentation

### ◆ RM_MESH_SCHEDULER_SRV_Open()

| fsp_err_t RM_MESH_SCHEDULER_SRV_Open ( rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_server_cfg_t const *const *p_cfg* ) |
|---|
| API to initialize Scheduler Server model. This is to initialize Scheduler Server model and to register with Access layer.<br>Implements rm_ble_mesh_model_server_api_t::open.<br>Example:<br>`/* Open the module. */`<br>`err = RM_MESH_SCHEDULER_SRV_Open(&g_mesh_scheduler_srv0_ctrl, &g_mesh_scheduler_srv0_cfg);`<br>**Return values**<br>FSP_SUCCESS — Model opened successfully.<br>FSP_ERR_ASSERTION — Pointer to control block or configuration structure is NULL.<br>FSP_ERR_ALREADY_OPEN — Model is already open.<br>FSP_ERR_NOT_FOUND — The number of models has exceeded the limit.<br>FSP_ERR_ABORTED — Model initialization is failed. |

### ◆ RM_MESH_SCHEDULER_SRV_Close()

fsp_err_t RM_MESH_SCHEDULER_SRV_Close ( rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*)

API to terminate Scheduler Server model. This is to terminate Scheduler Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_SCHEDULER_SRV_Close(&g_mesh_scheduler_srv0_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

### ◆ RM_MESH_SCHEDULER_SRV_StateUpdate()

fsp_err_t RM_MESH_SCHEDULER_SRV_StateUpdate ( rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state* )

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements rm_ble_mesh_model_server_api_t::stateUpdate.

Example:

```
/* Update server status. */
   err = RM_MESH_SCHEDULER_SRV_StateUpdate(&g_mesh_scheduler_srv0_ctrl, &state);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Updated server status successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_state is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

## BLE Mesh Network Sensor Client (rm_mesh_sensor_clt)

Modules » Networking » BLE Mesh Network Modules

### Functions

| | |
|---|---|
| fsp_err_t | RM_MESH_SENSOR_CLT_Open (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, rm_ble_mesh_model_client_cfg_t const *const p_cfg) |
| fsp_err_t | RM_MESH_SENSOR_CLT_Close (rm_ble_mesh_model_client_ctrl_t *const p_ctrl) |
| fsp_err_t | RM_MESH_SENSOR_CLT_GetModelHandle (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, |

| | |
|---|---|
| | rm_ble_mesh_access_model_handle_t *const p_model_handle) |
| fsp_err_t | RM_MESH_SENSOR_CLT_SendReliablePdu (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, uint32_t req_opcode, void const *const p_parameter, uint32_t rsp_opcode) |
| fsp_err_t | RM_MESH_SENSOR_CLT_DescriptorGet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter) |
| fsp_err_t | RM_MESH_SENSOR_CLT_Get (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter) |
| fsp_err_t | RM_MESH_SENSOR_CLT_ColumnGet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter) |
| fsp_err_t | RM_MESH_SENSOR_CLT_SeriesGet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter) |
| fsp_err_t | RM_MESH_SENSOR_CLT_CadenceGet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter) |
| fsp_err_t | RM_MESH_SENSOR_CLT_CadenceSet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter) |
| fsp_err_t | RM_MESH_SENSOR_CLT_CadenceSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter) |
| fsp_err_t | RM_MESH_SENSOR_CLT_SettingsGet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter) |
| fsp_err_t | RM_MESH_SENSOR_CLT_SettingGet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter) |
| fsp_err_t | RM_MESH_SENSOR_CLT_SettingSet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter) |
| fsp_err_t | RM_MESH_SENSOR_CLT_SettingSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter) |

### Detailed Description

# Overview

### Target Devices

The BLE Mesh Network Sensor Client module supports the following devices.

- RA4W1

# Configuration

### Build Time Configurations for rm_mesh_sensor_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_sensor_clt_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|

### Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Sensor Client (rm_mesh_sensor_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Sensor Client (rm_mesh_sensor_clt).

| Configuration | Options | Default | Description |
|---|---|---|---|
| Interrupts | | | |
| Callback Provided when Timeout Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh sensor client ISR occurs |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_sensor_clt0 | Module name. |

### Data Structures

| | |
|---|---|
| struct | rm_mesh_sensor_clt_instance_ctrl_t |

### Data Structure Documentation

#### ◆ rm_mesh_sensor_clt_instance_ctrl_t

| struct rm_mesh_sensor_clt_instance_ctrl_t |
|---|
| BLE mesh sensor instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_SENSOR_CLT_Open() is called. |

### Function Documentation

### ◆ RM_MESH_SENSOR_CLT_Open()

fsp_err_t RM_MESH_SENSOR_CLT_Open ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_client_cfg_t const *const *p_cfg* )

Open Sensor Client middleware. This is to initialize Sensor Client model and to register with Access layer.

Implements rm_ble_mesh_model_client_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_SENSOR_CLT_Open(&g_mesh_sensor_clt0_ctrl, &g_mesh_sensor_clt0_cfg);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

### ◆ RM_MESH_SENSOR_CLT_Close()

fsp_err_t RM_MESH_SENSOR_CLT_Close ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Close Sensor Client middleware.

Implements rm_ble_mesh_model_client_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_SENSOR_CLT_Close(&g_mesh_sensor_clt0_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

### ◆ RM_MESH_SENSOR_CLT_GetModelHandle()

fsp_err_t RM_MESH_SENSOR_CLT_GetModelHandle ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *const *p_model_handle* )

This is to get the handle of Sensor client model.

Implements rm_ble_mesh_model_client_api_t::getModelHandle.

Example:

```
/* Get the handle of sensor client model. */
   err = RM_MESH_SENSOR_CLT_GetModelHandle(&g_mesh_sensor_clt0_ctrl, &model_handle);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Got model handle successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_POINTER | The parameter p_model_handle is NULL. |

### ◆ RM_MESH_SENSOR_CLT_SendReliablePdu()

fsp_err_t RM_MESH_SENSOR_CLT_SendReliablePdu ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, uint32_t *req_opcode*, void const *const *p_parameter*, uint32_t *rsp_opcode* )

This is to initialize sending acknowledged commands.

Implements rm_ble_mesh_model_client_api_t::sendReliablePdu.

Example:

```
/* Initialize sending acknowledged commands. */
   err = RM_MESH_SENSOR_CLT_SendReliablePdu(&g_mesh_sensor_clt0_ctrl, req_opcode,
p_parameter, rsp_opcode);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_SENSOR_CLT_DescriptorGet()

fsp_err_t RM_MESH_SENSOR_CLT_DescriptorGet ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

Sensor Descriptor Get is an acknowledged message used to get the Sensor Descriptor state of all sensors within an element. The response to a Sensor Descriptor Get message is a Sensor Descriptor Status message.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_sensor_clt control block. |
| [in] | p_parameter | Pointer to Sensor Descriptor Get message. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_SENSOR_CLT_Get()

fsp_err_t RM_MESH_SENSOR_CLT_Get ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

Sensor Get is an acknowledged message used to get the Sensor Data state. The response to the Sensor Get message is a Sensor Status message.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_sensor_clt control block. |
| [in] | p_parameter | Pointer to Sensor Get message. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_SENSOR_CLT_ColumnGet()

fsp_err_t RM_MESH_SENSOR_CLT_ColumnGet ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

Sensor Column Get is an acknowledged message used to get the Sensor Series Column state. The response to the Sensor Column Get message is a Sensor Column Status message

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_sensor_clt control block. |
| [in] | p_parameter | Pointer to Sensor Column Get message. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_SENSOR_CLT_SeriesGet()

fsp_err_t RM_MESH_SENSOR_CLT_SeriesGet ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

Sensor Series Get is an acknowledged message used to get a sequence of the Sensor Series Column states. The response to the Sensor Series Get message is a Sensor Series Status message.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_sensor_clt control block. |
| [in] | p_parameter | Pointer to Sensor Series Get message. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_SENSOR_CLT_CadenceGet()

fsp_err_t RM_MESH_SENSOR_CLT_CadenceGet ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

Sensor Cadence Get is an acknowledged message used to get the Sensor Cadence state of an element. The response to the Sensor Cadence Get message is a Sensor Cadence Status message.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_sensor_clt control block. |
| [in] | p_parameter | Pointer to Sensor Cadence Get message. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_SENSOR_CLT_CadenceSet()

fsp_err_t RM_MESH_SENSOR_CLT_CadenceSet ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

Sensor Cadence Set is an acknowledged message used to set the Sensor Cadence state of an element. The response to the Sensor Cadence Set message is a Sensor Cadence Status message.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_sensor_clt control block. |
| [in] | p_parameter | Pointer to Sensor Cadence Set message. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_SENSOR_CLT_CadenceSetUnacknowledged()

fsp_err_t RM_MESH_SENSOR_CLT_CadenceSetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

Sensor Cadence Set Unacknowledged is an unacknowledged message used to set the Sensor Cadence state of an element.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_sensor_clt control block. |
| [in] | p_parameter | Pointer to Sensor Cadence Set message. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_SENSOR_CLT_SettingsGet()

fsp_err_t RM_MESH_SENSOR_CLT_SettingsGet ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

Sensor Settings Get is an acknowledged message used to get the list of Sensor Setting states of an element. The response to the Sensor Settings Get message is a Sensor Settings Status message

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_sensor_clt control block. |
| [in] | p_parameter | Pointer to Sensor Settings Get message. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_SENSOR_CLT_SettingGet()

fsp_err_t RM_MESH_SENSOR_CLT_SettingGet ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

Sensor Setting Get is an acknowledged message used to get the Sensor Setting state of an element. The response to the Sensor Setting Get message is a Sensor Setting Status message.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_sensor_clt control block. |
| [in] | p_parameter | Pointer to Sensor Settings Get message. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_SENSOR_CLT_SettingSet()

fsp_err_t RM_MESH_SENSOR_CLT_SettingSet ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

Sensor Setting Set is an acknowledged message used to set the Sensor Setting state of an element. The response to the Sensor Setting Set message is a Sensor Setting Status message.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_sensor_clt control block. |
| [in] | p_parameter | Pointer to Sensor Settings Set message. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_SENSOR_CLT_SettingSetUnacknowledged()

fsp_err_t RM_MESH_SENSOR_CLT_SettingSetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

Sensor Setting Set Unacknowledged is an unacknowledged message used to set the Sensor Setting state of an element.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_sensor_clt control block. |
| [in] | p_parameter | Pointer to Sensor Settings Set message. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

## BLE Mesh Network Sensor Server (rm_mesh_sensor_srv)

**Detailed Description**

# Overview

### Target Devices

The BLE Mesh Network Sensor Server module supports the following devices.

- RA4W1

# Configuration

### Build Time Configurations for rm_mesh_sensor_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_sensor_srv_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|

### Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Sensor Server (rm_mesh_sensor_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Sensor Server (rm_mesh_sensor_srv).

| Configuration | Options | Default | Description |
|---|---|---|---|
| Interrupts | | | |
| Callback Provided when Timeout Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh sensor server ISR occurs |
| Callback Provided when an Timeout ISR Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh sensor server timeout ISR occurs |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_sensor_srv0 | Module name. |

**Data Structures**

| | |
|---|---|
| struct | rm_mesh_sensor_srv_descriptor_info_t |
| struct | rm_mesh_sensor_srv_settings_info_t |
| | |

| | |
|---|---|
| struct | rm_mesh_sensor_srv_setting_info_t |
| struct | rm_mesh_sensor_srv_cadence_info_t |
| struct | rm_mesh_sensor_srv_data_info_t |
| struct | rm_mesh_sensor_srv_series_column_info_t |
| struct | rm_mesh_sensor_srv_instance_ctrl_t |

## Data Structure Documentation

### ◆ rm_mesh_sensor_srv_descriptor_info_t

struct rm_mesh_sensor_srv_descriptor_info_t

Sensor Descriptor state represents the attributes describing the sensor data

Data Fields

| | | |
|---|---|---|
| uint16_t | sensor_property_id | Sensor Property ID field is a 2-octet value referencing a device property that describes the meaning and the format of data reported by a sensor |
| uint16_t | sensor_positive_tolerance | Sensor Positive Tolerance field is a 12-bit value representing the magnitude of a possible positive error associated with the measurements that the sensor is reporting |
| uint16_t | sensor_negative_tolerance | Sensor Negative Tolerance field is a 12-bit value representing the magnitude of a possible negative error associated with the measurements that the sensor is reporting |
| uint8_t | sensor_sampling_function | Sensor Sampling Function field specifies the averaging operation or type of sampling function applied to the measured value |
| uint8_t | sensor_measurement_period | Sensor Measurement Period field specifies a uint8 value n that represents the averaging time span, accumulation time, or measurement period in seconds over which the measurement is taken |
| uint8_t | sensor_update_interval | measurement reported by a sensor is internally refreshed at |

| | | |
|---|---|---|
| | | the frequency indicated in the Sensor Update Interval field |
| uint8_t | status | Status - used in response to indicate if other fields to be included |

### ◆ rm_mesh_sensor_srv_settings_info_t

| struct rm_mesh_sensor_srv_settings_info_t | | |
|---|---|---|
| Sensor Settings state controls parameters of a sensor | | |
| Data Fields | | |
| uint16_t | sensor_property_id | Property ID of a sensor |
| uint16_t * | setting_property_ids | Property ID of a setting within a sensor |
| uint16_t | setting_property_ids_count | |

### ◆ rm_mesh_sensor_srv_setting_info_t

| struct rm_mesh_sensor_srv_setting_info_t | | |
|---|---|---|
| Sensor Setting state controls parameters of a sensor | | |
| Data Fields | | |
| uint16_t | sensor_property_id | Property ID of a sensor |
| uint16_t | sensor_setting_property_id | Property ID of a setting within a sensor |
| uint8_t | sensor_setting_access | Read/Write access rights for the setting |
| uint8_t * | sensor_setting_raw | Raw value of a setting within a sensor |
| uint16_t | sensor_setting_raw_len | |
| uint8_t | status | |

### ◆ rm_mesh_sensor_srv_cadence_info_t

| struct rm_mesh_sensor_srv_cadence_info_t | | |
|---|---|---|
| Sensor Cadence state controls the cadence of sensor reports | | |
| Data Fields | | |
| uint16_t | sensor_property_id | Property ID of a sensor |
| uint8_t | fast_cadence_period_divisor | Divisor for the Publish Period |
| uint8_t | status_trigger_type | Defines the unit and format of the Status Trigger Delta fields |
| uint8_t * | status_trigger_delta_down | Delta down value that triggers a status message |
| uint16_t | status_trigger_delta_down_len | |

| | | |
|---|---|---|
| uint8_t * | status_trigger_delta_up | Delta up value that triggers a status message |
| uint16_t | status_trigger_delta_up_len | |
| uint8_t | status_min_interval | Minimum interval between two consecutive Status messages APPLICATION NOTE: The Current Sensor Server Model implementation does not inherently check for the time interval between two consecutive status messages. The application layer which manages the data for the Sensor Server Model holds the responsibility for interleaving consecutive status messages with the configured Minimum time interval for statuses. |
| uint8_t * | fast_cadence_low | Low value for the fast cadence range |
| uint16_t | fast_cadence_low_len | |
| uint8_t * | fast_cadence_high | High value for the fast cadence range |
| uint16_t | fast_cadence_high_len | |
| uint8_t | status | Status - used in response path |

### ◆ rm_mesh_sensor_srv_data_info_t

| struct rm_mesh_sensor_srv_data_info_t | | |
|---|---|---|
| The Sensor Data state is a sequence of one or more pairs of Sensor Property ID and Raw Value fields, with each Raw Value field size and representation defined by the characteristics referenced by the Sensor Property ID | | |
| Data Fields | | |
| uint16_t | property_id_1 | ID of the 1st device property of the sensor |
| uint8_t * | raw_value_1 | Raw Value field with a size and representation defined by the 1st device property |
| uint16_t | raw_value_1_len | |
| uint16_t | property_id_2 | ID of the 2nd device property of the sensor |
| uint8_t * | raw_value_2 | Raw Value field with a size and representation defined by the 2nd device property |
| uint16_t | raw_value_2_len | |

| | | |
|---|---|---|
| uint16_t | property_id_n | ID of the nth device property of the sensor |
| uint8_t * | raw_value_n | Raw Value field with a size and representation defined by the nth device property |
| uint16_t | raw_value_n_len | |
| uint8_t | status | Status - used in response path |

### ◆ rm_mesh_sensor_srv_series_column_info_t

| struct rm_mesh_sensor_srv_series_column_info_t | | |
|---|---|---|
| Values measured by sensors may be organized as arrays (and represented as series of columns, such as histograms | | |
| Data Fields | | |
| uint16_t | sensor_property_id | Property describing the data series of the sensor |
| uint8_t * | sensor_raw_value_x | Raw value representing the left corner of a column on the X axis |
| uint16_t | sensor_raw_value_x_len | |
| uint8_t * | sensor_column_width | Raw value representing the width of the column |
| uint16_t | sensor_column_width_len | |
| uint8_t * | sensor_raw_value_y | Raw value representing the height of the column on the Y axis |
| uint16_t | sensor_raw_value_y_len | |
| uint8_t | status | Status - used in response path |

### ◆ rm_mesh_sensor_srv_instance_ctrl_t

| struct rm_mesh_sensor_srv_instance_ctrl_t |
|---|
| BLE mesh sensor instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_SENSOR_SRV_Open() is called. |

## Function Documentation

### ◆ RM_MESH_SENSOR_SRV_Open()

fsp_err_t RM_MESH_SENSOR_SRV_Open ( rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_server_cfg_t const *const *p_cfg* )

API to initialize Sensor Server model and to initialize Sensor_Setup Server model. This is to initialize Sensor Server model and to register with Access layer. And this is to initialize Sensor_Setup Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_SENSOR_SRV_Open(&g_mesh_sensor_srv0_ctrl, &g_mesh_sensor_srv0_cfg);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

### ◆ RM_MESH_SENSOR_SRV_Close()

fsp_err_t RM_MESH_SENSOR_SRV_Close ( rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*)

API to terminate Sensor Server model. This is to terminate Sensor Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_SENSOR_SRV_Close(&g_mesh_sensor_srv0_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

### ◆ RM_MESH_SENSOR_SRV_StateUpdate()

fsp_err_t RM_MESH_SENSOR_SRV_StateUpdate ( rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state* )

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements rm_ble_mesh_model_server_api_t::stateUpdate.

Example:

```
/* Update server status. */
   err = RM_MESH_SENSOR_SRV_StateUpdate(&g_mesh_sensor_srv0_ctrl, &state);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Updated server status successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_state is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_SENSOR_SRV_SetupServerStateUpdate()

fsp_err_t RM_MESH_SENSOR_SRV_SetupServerStateUpdate ( rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state* )

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_sensor_srv control block. |
| [in] | p_state | To send reply for a request or to inform change in state. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_state is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

## BLE Mesh Network Time Client (rm_mesh_time_clt)

The BLE Mesh Network Time Client module supports the following devices.

- RA4W1

# Configuration

### Build Time Configurations for rm_mesh_time_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_time_clt_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|

### Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Time Client (rm_mesh_time_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Time Client (rm_mesh_time_clt).

| Configuration | Options | Default | Description |
|---|---|---|---|
| Interrupts | | | |
| Callback Provided when Timeout Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh time client ISR occurs |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_time_clt0 | Module name. |

**Data Structures**

| | |
|---|---|
| struct | rm_mesh_time_clt_instance_ctrl_t |

## Data Structure Documentation

### ◆ rm_mesh_time_clt_instance_ctrl_t

| struct rm_mesh_time_clt_instance_ctrl_t |
|---|
| BLE mesh time instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_TIME_CLT_Open() is called. |

## Function Documentation

### ◆ RM_MESH_TIME_CLT_Open()

fsp_err_t RM_MESH_TIME_CLT_Open ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_client_cfg_t const *const *p_cfg* )

Open Time Client middleware. This is to initialize Time Client model and to register with Access layer.

Implements rm_ble_mesh_model_client_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_TIME_CLT_Open(&g_mesh_time_clt0_ctrl, &g_mesh_time_clt0_cfg);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

### ◆ RM_MESH_TIME_CLT_Close()

fsp_err_t RM_MESH_TIME_CLT_Close ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Close Time Client middleware.

Implements rm_ble_mesh_model_client_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_TIME_CLT_Close(&g_mesh_time_clt0_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

### ◆ RM_MESH_TIME_CLT_GetModelHandle()

fsp_err_t RM_MESH_TIME_CLT_GetModelHandle ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *const *p_model_handle* )

This is to get the handle of Time client model.

Implements rm_ble_mesh_model_client_api_t::getModelHandle.

Example:

```
/* Get the handle of time client model. */
   err = RM_MESH_TIME_CLT_GetModelHandle(&g_mesh_time_clt0_ctrl, &model_handle);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Got model handle successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_POINTER | The parameter p_model_handle is NULL. |

### ◆ RM_MESH_TIME_CLT_SendReliablePdu()

fsp_err_t RM_MESH_TIME_CLT_SendReliablePdu ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, uint32_t *req_opcode*, void const *const *p_parameter*, uint32_t *rsp_opcode* )

This is to initialize sending acknowledged commands.

Implements rm_ble_mesh_model_client_api_t::sendReliablePdu.

Example:

```
/* Initialize sending acknowledged commands. */
   err = RM_MESH_TIME_CLT_SendReliablePdu(&g_mesh_time_clt0_ctrl, req_opcode,
p_parameter, rsp_opcode);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_TIME_CLT_Get()

fsp_err_t RM_MESH_TIME_CLT_Get ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Time Get is a message used to get the Time state of neighbor nodes. The response to the Time Get message is a Time Status message. There are no parameters for this message.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_time_clt control block. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_TIME_CLT_Set()

fsp_err_t RM_MESH_TIME_CLT_Set ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

Time Set is an acknowledged message used to set the Time state of an element. The response to the Time Set message is a Time Status message.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_time_clt control block. |
| [in] | p_parameter | Pointer to Time Set message. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_TIME_CLT_ZoneGet()

fsp_err_t RM_MESH_TIME_CLT_ZoneGet ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Time Zone Get is an acknowledged message used to get the Time Zone Offset Current state, the Time Zone Offset New state , and the TAI of Zone Change state. The response to the Time Zone Get message is a Time Zone Status message. There are no parameters for this message.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_time_clt control block. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_TIME_CLT_ZoneSet()

fsp_err_t RM_MESH_TIME_CLT_ZoneSet ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

Time Zone Set is an acknowledged message used to set the Time Zone Offset New state and the TAI of Zone Change state.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_time_clt control block. |
| [in] | p_parameter | Pointer to Time Zone Set message. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_TIME_CLT_TaiUtcDeltaGet()

fsp_err_t RM_MESH_TIME_CLT_TaiUtcDeltaGet ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

TAI-UTC Delta Get is an acknowledged message used to get the TAI-UTC Delta Current state, the TAI-UTC Delta New state, and the TAI of Delta Change state. The response to the TAI-UTC Delta Get message is a TAI-UTC Delta Status message. There are no parameters for this message.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_time_clt control block. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_TIME_CLT_TaiUtcDeltaSet()

fsp_err_t RM_MESH_TIME_CLT_TaiUtcDeltaSet ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

TAI-UTC Delta Set is an acknowledged message used to set the TAI-UTC Delta New state and the TAI of Delta Change state.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_time_clt control block. |
| [in] | p_parameter | Pointer to TAI-UTC Delta Set message. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_TIME_CLT_RoleGet()

fsp_err_t RM_MESH_TIME_CLT_RoleGet ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Time Role Get is an acknowledged message used to get the Time Role state of an element. The response to the Time Role Get message is a Time Role Status message. There are no parameters for this message.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_time_clt control block. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

### ◆ RM_MESH_TIME_CLT_RoleSet()

fsp_err_t RM_MESH_TIME_CLT_RoleSet ( rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter* )

Time Role Set is an acknowledged message used to set the Time Role state of an element. The response to the Time Role Set message is a Time Role Status message.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | rm_mesh_time_clt control block. |
| [in] | p_parameter | Pointer to Time Role Set message. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

## BLE Mesh Network Time Server (rm_mesh_time_srv)

Modules » Networking » BLE Mesh Network Modules

### Functions

| | |
|---|---|
| fsp_err_t | RM_MESH_TIME_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_model_server_cfg_t const *const p_cfg) |
| fsp_err_t | RM_MESH_TIME_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const p_ctrl) |
| fsp_err_t | RM_MESH_TIME_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t |

| | |
|---|---|
| | *const p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state) |

### Detailed Description

# Overview

### Target Devices

The BLE Mesh Network Time Server module supports the following devices.

- RA4W1

# Configuration

### Build Time Configurations for rm_mesh_time_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_time_srv_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|

### Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Time Server (rm_mesh_time_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Time Server (rm_mesh_time_srv).

| Configuration | Options | Default | Description |
|---|---|---|---|
| Interrupts | | | |
| Callback Provided when Timeout Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh time server ISR occurs |
| Callback Provided when an Timeout ISR Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh time server timeout ISR occurs |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_time_srv0 | Module name. |

### Data Structures

| | |
|---|---|
| struct | rm_mesh_time_srv_info_t |
| struct | rm_mesh_time_srv_zone_info_t |
| struct | rm_mesh_time_srv_tai_utc_delta_info_t |
| struct | rm_mesh_time_srv_role_info_t |
| struct | rm_mesh_time_srv_instance_ctrl_t |

## Data Structure Documentation

### ◆ rm_mesh_time_srv_info_t

| struct rm_mesh_time_srv_info_t | | |
|---|---|---|
| Mesh defines times based on International Atomic Time (TAI). The base representation of times is the number of seconds after 00:00:00 TAI on 2000-01-01 (that is, 1999-12-31T23:59:28 UTC) | | |
| Data Fields | | |
| uint8_t | tai_seconds[5] | Current TAI time in seconds since the epoch. |
| uint8_t | subsecond | The sub-second time in units of 1/256s. |
| uint8_t | uncertainty | Estimated uncertainty in 10-millisecond steps. |
| uint8_t | time_authority | 0 = No Time Authority. The element does not have a trusted OOB source of time, such as GPS or NTP. 1 = Time Authority. The element has a trusted OOB source of time, such as GPS or NTP or a battery-backed, properly initialized RTC. |
| uint16_t | tai_utc_delta | Current difference between TAI and UTC in seconds |
| uint8_t | time_zone_offset | The local time zone offset in 15-minute increments |

### ◆ rm_mesh_time_srv_zone_info_t

| struct rm_mesh_time_srv_zone_info_t | | |
|---|---|---|
| Time Zone | | |
| Data Fields | | |
| uint8_t | time_zone_offset_current | Current local time zone offset. Meaningful only in 'Time Zone Status' response. |
| uint8_t | time_zone_offset_new | Upcoming local time zone offset. |
| uint8_t | tai_of_zone_change[5] | Absolute TAI time when the Time Zone Offset will change from Current to New. |

### ◆ rm_mesh_time_srv_tai_utc_delta_info_t

| struct rm_mesh_time_srv_tai_utc_delta_info_t |
|---|
| TAI-UTC Delta |

| Data Fields | | |
|---|---|---|
| uint16_t | tai_utc_delta_current | Current difference between TAI and UTC in seconds. Meaningful only in 'TAI-UTC Delta Status' response. |
| uint16_t | tai_utc_delta_new | Upcoming difference between TAI and UTC in seconds. |
| uint8_t | padding | Always 0b0. Other values are Prohibited. |
| uint8_t | tai_of_delta_change[5] | TAI Seconds time of the upcoming TAI-UTC Delta change |

### ◆ rm_mesh_time_srv_role_info_t

| struct rm_mesh_time_srv_role_info_t | | |
|---|---|---|
| The Time Role state of an element | | |
| Data Fields | | |
| uint8_t | role | Time Role |

### ◆ rm_mesh_time_srv_instance_ctrl_t

| struct rm_mesh_time_srv_instance_ctrl_t |
|---|
| BLE mesh time instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_TIME_SRV_Open() is called. |

## Function Documentation

### ◆ RM_MESH_TIME_SRV_Open()

fsp_err_t RM_MESH_TIME_SRV_Open ( rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_server_cfg_t const *const *p_cfg* )

API to initialize Time Server model. This is to initialize Time Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_TIME_SRV_Open(&g_mesh_time_srv0_ctrl, &g_mesh_time_srv0_cfg);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

### ◆ RM_MESH_TIME_SRV_Close()

fsp_err_t RM_MESH_TIME_SRV_Close ( rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*)

API to terminate Time Server model. This is to terminate Time Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_TIME_SRV_Close(&g_mesh_time_srv0_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

### ◆ RM_MESH_TIME_SRV_StateUpdate()

fsp_err_t RM_MESH_TIME_SRV_StateUpdate ( rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state* )

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements rm_ble_mesh_model_server_api_t::stateUpdate.

Example:

```
/* Update server status. */
   err = RM_MESH_TIME_SRV_StateUpdate(&g_mesh_time_srv0_ctrl, &state);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Updated server status successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_state is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

## BLE Mesh Network Upper Trans (rm_ble_mesh_upper_trans)

Modules » Networking » BLE Mesh Network Modules

### Functions

| | |
|---|---|
| fsp_err_t | RM_BLE_MESH_UPPER_TRANS_Open (rm_ble_mesh_upper_trans_ctrl_t *const p_ctrl, rm_ble_mesh_upper_trans_cfg_t const *const p_cfg) |
| fsp_err_t | RM_BLE_MESH_UPPER_TRANS_Close (rm_ble_mesh_provision_ctrl_t *const p_ctrl) |
| fsp_err_t | RM_BLE_MESH_UPPER_TRANS_SendAccessPdu |

| | |
|---|---|
| | (rm_ble_mesh_upper_trans_ctrl_t *const p_ctrl, rm_ble_mesh_upper_trans_access_layer_pdu_t const *const p_access_layer_pdu, rm_ble_mesh_lower_trans_reliable_t reliable) |
| fsp_err_t | RM_BLE_MESH_UPPER_TRANS_SendControlPdu (rm_ble_mesh_upper_trans_ctrl_t *const p_ctrl, rm_ble_mesh_upper_trans_control_pdu_t const *const p_control_pdu) |
| fsp_err_t | RM_BLE_MESH_UPPER_TRANS_LpnSetupFriendship (rm_ble_mesh_upper_trans_ctrl_t *const p_ctrl, rm_ble_mesh_upper_trans_friendship_setting_t const *const p_setting) |
| fsp_err_t | RM_BLE_MESH_UPPER_TRANS_LpnClearFriendship (rm_ble_mesh_upper_trans_ctrl_t *const p_ctrl) |
| fsp_err_t | RM_BLE_MESH_UPPER_TRANS_LpnManageSubscription (rm_ble_mesh_upper_trans_ctrl_t *const p_ctrl, rm_ble_mesh_upper_trans_control_opcode_t action, uint16_t const *const p_addr_list, uint16_t count) |
| fsp_err_t | RM_BLE_MESH_UPPER_TRANS_LpnPoll (rm_ble_mesh_upper_trans_ctrl_t *const p_ctrl) |
| fsp_err_t | RM_BLE_MESH_UPPER_TRANS_IsValidLpnElementAddress (rm_ble_mesh_upper_trans_ctrl_t *const p_ctrl, rm_ble_mesh_network_address_t addr, rm_ble_mesh_lower_trans_lpn_handle_t *const p_lpn_handle) |
| fsp_err_t | RM_BLE_MESH_UPPER_TRANS_IsValidLpnSubscriptionAddress (rm_ble_mesh_upper_trans_ctrl_t *const p_ctrl, rm_ble_mesh_network_address_t addr, rm_ble_mesh_lower_trans_lpn_handle_t *const p_lpn_handle) |
| fsp_err_t | RM_BLE_MESH_UPPER_TRANS_GetLpnPolltimeout (rm_ble_mesh_upper_trans_ctrl_t *const p_ctrl, rm_ble_mesh_network_address_t lpn_addr, uint32_t *const p_poll_timeout) |
| fsp_err_t | RM_BLE_MESH_UPPER_TRANS_GetFriendshipInfo (rm_ble_mesh_upper_trans_ctrl_t *const p_ctrl, rm_ble_mesh_upper_trans_friend_role_t role, uint16_t lpn_index, rm_ble_mesh_upper_trans_friendship_info_t *const p_node) |
| fsp_err_t | RM_BLE_MESH_UPPER_TRANS_LpnRegisterSecurityUpdate (rm_ble_mesh_upper_trans_ctrl_t *const p_ctrl, rm_ble_mesh_network_subnet_handle_t subnet_handle, uint8_t flag, uint32_t ivindex) |
| fsp_err_t | RM_BLE_MESH_UPPER_TRANS_ClearAllLpn (rm_ble_mesh_upper_trans_ctrl_t *const p_ctrl) |

| | |
|---|---|
| fsp_err_t | RM_BLE_MESH_UPPER_TRANS_SetHeartbeatPublication (rm_ble_mesh_upper_trans_ctrl_t *const p_ctrl, rm_ble_mesh_upper_trans_heartbeat_publication_info_t *const p_info) |
| fsp_err_t | RM_BLE_MESH_UPPER_TRANS_GetHeartbeatPublication (rm_ble_mesh_upper_trans_ctrl_t *const p_ctrl, rm_ble_mesh_upper_trans_heartbeat_publication_info_t *const p_info) |
| fsp_err_t | RM_BLE_MESH_UPPER_TRANS_SetHeartbeatSubscription (rm_ble_mesh_upper_trans_ctrl_t *const p_ctrl, rm_ble_mesh_upper_trans_heartbeat_subscription_info_t *const p_info) |
| fsp_err_t | RM_BLE_MESH_UPPER_TRANS_GetHeartbeatSubscription (rm_ble_mesh_upper_trans_ctrl_t *const p_ctrl, rm_ble_mesh_upper_trans_heartbeat_subscription_info_t *const p_info) |
| fsp_err_t | RM_BLE_MESH_UPPER_TRANS_TriggerHeartbeat (rm_ble_mesh_upper_trans_ctrl_t *const p_ctrl, uint8_t change_in_feature_bit) |

**Detailed Description**

# Overview

### Target Devices

The BLE Mesh Network Upper Trans module supports the following devices.

- RA4W1

# Configuration

### Build Time Configurations for rm_ble_mesh_upper_trans

The following build time configurations are defined in fsp_cfg/rm_ble_mesh_upper_trans_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|

### Configurations for Networking > BLE Mesh Network modules > BLE Mesh Upper Trans (rm_ble_mesh_upper_trans)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Upper Trans (rm_ble_mesh_upper_trans).

| Configuration | Options | Default | Description |
|---|---|---|---|
| General | | | |

| | | | |
|---|---|---|---|
| Name | Name Must Be a Valid C Symbol | g_rm_ble_mesh_upper_trans0 | Module name. |
| Channel Number | Invalid Channel Number | 0 | Select channel corresponding to the channel number of the hardware. |
| Control Message Event Enable | • Enabled<br>• Disabled | Disabled | Whether to enable the control message event or not. |
| Access Message Event Enable | • Enabled<br>• Disabled | Disabled | Whether to enable the access message event or not. |
| Callback | Name Must Be a Valid C Symbol | NULL | Callback function name. |

### Data Structures

| | |
|---|---|
| struct | rm_ble_mesh_upper_trans_instance_ctrl_t |

## Data Structure Documentation

### ◆ rm_ble_mesh_upper_trans_instance_ctrl_t

| struct rm_ble_mesh_upper_trans_instance_ctrl_t |
|---|
| RM_BLE_MESH_UPPER_TRANS private control block. DO NOT MODIFY. Initialization occurs when RM_BLE_MESH_UPPER_TRANS_Open() is called. |

## Function Documentation

### ◆ RM_BLE_MESH_UPPER_TRANS_Open()

fsp_err_t RM_BLE_MESH_UPPER_TRANS_Open ( rm_ble_mesh_upper_trans_ctrl_t *const *p_ctrl*, rm_ble_mesh_upper_trans_cfg_t const *const *p_cfg* )

Register Inerface with Transport Layer. This routine registers interface with the Transport Layer. Transport Layer supports single Application, hence this rouine shall be called once.

Implements rm_ble_mesh_upper_trans_api_t::open.

Example:

```
/* Open the module. */
   err = RM_BLE_MESH_UPPER_TRANS_Open(&g_ble_mesh_upper_trans0_ctrl,
&g_ble_mesh_upper_trans0_cfg);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Module opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Module is already open. |

### ◆ RM_BLE_MESH_UPPER_TRANS_Close()

fsp_err_t RM_BLE_MESH_UPPER_TRANS_Close ( rm_ble_mesh_provision_ctrl_t *const *p_ctrl*)

Unregister Inerface with Transport Layer. Implements rm_ble_mesh_upper_trans_api_t::close.

Example:

```
/* Close the module. */
   err = RM_BLE_MESH_UPPER_TRANS_Close(&g_ble_mesh_upper_trans0_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Module successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Lower layer is invalid state. |

### ◆ RM_BLE_MESH_UPPER_TRANS_SendAccessPdu()

fsp_err_t RM_BLE_MESH_UPPER_TRANS_SendAccessPdu ( rm_ble_mesh_upper_trans_ctrl_t *const *p_ctrl*, rm_ble_mesh_upper_trans_access_layer_pdu_t const *const *p_access_layer_pdu*, rm_ble_mesh_lower_trans_reliable_t *reliable* )

API to send Access Layer PDUs. This routine sends Access Layer PDUs to peer device.

Implements rm_ble_mesh_upper_trans_api_t::sendAccessPdu.

Example:

```
/* Send Access Layer PDUs. */
   err = RM_BLE_MESH_UPPER_TRANS_SendAccessPdu(&g_ble_mesh_upper_trans0_ctrl,
                                               &access_layer_pdu,
RM_BLE_MESH_LOWER_TRANS_RELIABLE_ENABLE);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_access_layer_pdu is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |

### ◆ RM_BLE_MESH_UPPER_TRANS_SendControlPdu()

fsp_err_t RM_BLE_MESH_UPPER_TRANS_SendControlPdu ( rm_ble_mesh_upper_trans_ctrl_t *const *p_ctrl*, rm_ble_mesh_upper_trans_control_pdu_t const *const *p_control_pdu* )

API to send transport Control PDUs. This routine sends transport Control PDUs to peer device.

Implements rm_ble_mesh_upper_trans_api_t::sendControlPdu.

Example:

```
/* Send Upper Transport control PDUs. */
   err = RM_BLE_MESH_UPPER_TRANS_SendControlPdu(&g_ble_mesh_upper_trans0_ctrl,
&control_pdu);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_control_pdu is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |

### ◆ RM_BLE_MESH_UPPER_TRANS_LpnSetupFriendship()

fsp_err_t RM_BLE_MESH_UPPER_TRANS_LpnSetupFriendship ( rm_ble_mesh_upper_trans_ctrl_t *const *p_ctrl*, rm_ble_mesh_upper_trans_friendship_setting_t const *const *p_setting* )

API to setup Friendship. This routine is used by the device acting as a low power node to setup a friendship procedure to any available friend nodes.

Implements rm_ble_mesh_upper_trans_api_t::lpnSetupFriendship.

Example:

```
/* Setup friendship. */
   err = RM_BLE_MESH_UPPER_TRANS_LpnSetupFriendship(&g_ble_mesh_upper_trans0_ctrl,
&setting);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_setting is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Lower layer is invalid state. |

### ◆ RM_BLE_MESH_UPPER_TRANS_LpnClearFriendship()

fsp_err_t RM_BLE_MESH_UPPER_TRANS_LpnClearFriendship ( rm_ble_mesh_upper_trans_ctrl_t *const *p_ctrl*)

API to terminate friendship. This routine is used by the device acting as a low power node terminate friendship with an active Friend node.

Implements rm_ble_mesh_upper_trans_api_t::lpnClearFriendship.

Example:

```
/* Terminate friendship. */
   err = RM_BLE_MESH_UPPER_TRANS_LpnClearFriendship(&g_ble_mesh_upper_trans0_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_BLE_MESH_UPPER_TRANS_LpnManageSubscription()

fsp_err_t RM_BLE_MESH_UPPER_TRANS_LpnManageSubscription ( rm_ble_mesh_upper_trans_ctrl_t *const *p_ctrl*, rm_ble_mesh_upper_trans_control_opcode_t *action*, uint16_t const *const *p_addr_list*, uint16_t *count* )

API to manage friend subscription list. This routine is used by the device acting as a low power node add/remove addresses to/from the friends subscription list.

Implements rm_ble_mesh_upper_trans_api_t::lpnManageSubscription.

Example:

```
/* Manage friend subscription list. */
   err =
RM_BLE_MESH_UPPER_TRANS_LpnManageSubscription(&g_ble_mesh_upper_trans0_ctrl,
 RM_BLE_MESH_UPPER_TRANS_CONTROL_OPCODE_FRIEND_POLL,
                                                &addr_list,
                                                count);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_addr_list is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |

### ◆ RM_BLE_MESH_UPPER_TRANS_LpnPoll()

fsp_err_t RM_BLE_MESH_UPPER_TRANS_LpnPoll ( rm_ble_mesh_upper_trans_ctrl_t *const *p_ctrl*)

To trigger Friend Poll from application. This routine enables the application to trigger a Friend Poll even before the expiry of an active poll period configured during the friendship establishment. The poll peroid will get reset at this point.

Implements rm_ble_mesh_upper_trans_api_t::lpnPoll.

Example:

```
/* Trigger friend poll from application. */
   err = RM_BLE_MESH_UPPER_TRANS_LpnPoll(&g_ble_mesh_upper_trans0_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_BLE_MESH_UPPER_TRANS_IsValidLpnElementAddress()

fsp_err_t RM_BLE_MESH_UPPER_TRANS_IsValidLpnElementAddress ( rm_ble_mesh_upper_trans_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_address_t *addr*, rm_ble_mesh_lower_trans_lpn_handle_t *const *p_lpn_handle* )

To check if address matches with any of the LPN. This routine checks if destination address in a received packet matches with any of the known element address of LPN.

Implements rm_ble_mesh_upper_trans_api_t::isValidLpnElementAddress.

Example:

```
/* Check if address matches with any of the LPN. */
   err =
RM_BLE_MESH_UPPER_TRANS_IsValidLpnElementAddress(&g_ble_mesh_upper_trans0_ctrl, addr,
&lpn_handle);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_lpn_handle is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |

### ◆ RM_BLE_MESH_UPPER_TRANS_IsValidLpnSubscriptionAddress()

fsp_err_t RM_BLE_MESH_UPPER_TRANS_IsValidLpnSubscriptionAddress ( rm_ble_mesh_upper_trans_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_address_t *addr*, rm_ble_mesh_lower_trans_lpn_handle_t *const *p_lpn_handle* )

To check if valid subscription address of an LPN to receive a packet. This routine checks if destination address in a received packet matches with any of the known subscription address of an LPN.

Implements rm_ble_mesh_upper_trans_api_t::isValidLpnSubscriptionAddress.

Example:

```
/* Check if valid subscription address of an LPN to receive a packet. */
   err =
RM_BLE_MESH_UPPER_TRANS_IsValidLpnSubscriptionAddress(&g_ble_mesh_upper_trans0_ctrl,
addr, &lpn_handle);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_lpn_handle is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |

### ◆ RM_BLE_MESH_UPPER_TRANS_GetLpnPolltimeout()

fsp_err_t RM_BLE_MESH_UPPER_TRANS_GetLpnPolltimeout ( rm_ble_mesh_upper_trans_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_address_t *lpn_addr*, uint32_t *const *p_poll_timeout* )

To get Poll Timeout of an LPN. This routine checks if LPN address is valid and then returns Poll Timeout configured for the LPN.

Implements rm_ble_mesh_upper_trans_api_t::getLpnPolltimeout.

Example:

```
/* Get poll timeout of an LPN. */
   err = RM_BLE_MESH_UPPER_TRANS_GetLpnPolltimeout(&g_ble_mesh_upper_trans0_ctrl,
addr, &poll_timeout);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_poll_timeout is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_BLE_MESH_UPPER_TRANS_GetFriendshipInfo()

fsp_err_t RM_BLE_MESH_UPPER_TRANS_GetFriendshipInfo ( rm_ble_mesh_upper_trans_ctrl_t *const *p_ctrl*, rm_ble_mesh_upper_trans_friend_role_t *role*, uint16_t *lpn_index*, rm_ble_mesh_upper_trans_friendship_info_t *const *p_node* )

To get the LPN node information. This routine fetches the node information of the LPN element at the given index

Implements rm_ble_mesh_upper_trans_api_t::getFriendshipInfo.

Example:

```
/* Get the LPN node information. */
   err = RM_BLE_MESH_UPPER_TRANS_GetFriendshipInfo(&g_ble_mesh_upper_trans0_ctrl,
RM_BLE_MESH_UPPER_TRANS_FRIEND_ROLE_FRIEND,
                                                   lpn_index,
                                                   &node);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_node is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_BLE_MESH_UPPER_TRANS_LpnRegisterSecurityUpdate()

fsp_err_t RM_BLE_MESH_UPPER_TRANS_LpnRegisterSecurityUpdate ( rm_ble_mesh_upper_trans_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *subnet_handle*, uint8_t *flag*, uint32_t *ivindex* )

To add the security update information. This routine updates the security state of the network to all the active LPN elements. This will be forwarded to the elements when it polls for the next packet available.

Implements rm_ble_mesh_upper_trans_api_t::lpnRegisterSecurityUpdate.

Example:

```
/* Add the security update information. */
   err =
RM_BLE_MESH_UPPER_TRANS_LpnRegisterSecurityUpdate(&g_ble_mesh_upper_trans0_ctrl,
subnet_handle, flag, ivindex);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_BLE_MESH_UPPER_TRANS_ClearAllLpn()

fsp_err_t RM_BLE_MESH_UPPER_TRANS_ClearAllLpn ( rm_ble_mesh_upper_trans_ctrl_t *const *p_ctrl*)

To clear information related to all LPNs. This routine clears information related to all LPNs.

Implements rm_ble_mesh_upper_trans_api_t::clearAllLpn.

Example:

```
/* Clear information related to all LPNs. */
   err = RM_BLE_MESH_UPPER_TRANS_ClearAllLpn(&g_ble_mesh_upper_trans0_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_BLE_MESH_UPPER_TRANS_SetHeartbeatPublication()

fsp_err_t RM_BLE_MESH_UPPER_TRANS_SetHeartbeatPublication ( rm_ble_mesh_upper_trans_ctrl_t *const *p_ctrl*, rm_ble_mesh_upper_trans_heartbeat_publication_info_t *const *p_info* )

To set the Heartbeat publication data. This routine configures the Heartbeat publication information

Implements rm_ble_mesh_upper_trans_api_t::setHeartbeatPublication.

Example:

```
 /* Set the heartbeat publication data. */
    err =
RM_BLE_MESH_UPPER_TRANS_SetHeartbeatPublication(&g_ble_mesh_upper_trans0_ctrl,
&ut_hp_info);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_info is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

### ◆ RM_BLE_MESH_UPPER_TRANS_GetHeartbeatPublication()

fsp_err_t RM_BLE_MESH_UPPER_TRANS_GetHeartbeatPublication ( rm_ble_mesh_upper_trans_ctrl_t *const *p_ctrl*, rm_ble_mesh_upper_trans_heartbeat_publication_info_t *const *p_info* )

To get the Heartbeat publication data. This routine retrieves the Heartbeat publication information

Implements rm_ble_mesh_upper_trans_api_t::getHeartbeatPublication.

Example:

```
/* Get the heartbeat publication data. */
   err =
RM_BLE_MESH_UPPER_TRANS_GetHeartbeatPublication(&g_ble_mesh_upper_trans0_ctrl,
&ut_hp_info);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_info is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_BLE_MESH_UPPER_TRANS_SetHeartbeatSubscription()

fsp_err_t RM_BLE_MESH_UPPER_TRANS_SetHeartbeatSubscription ( rm_ble_mesh_upper_trans_ctrl_t *const *p_ctrl*, rm_ble_mesh_upper_trans_heartbeat_subscription_info_t *const *p_info* )

To set the Heartbeat subscription data. This routine configures the Heartbeat subscription information

Implements rm_ble_mesh_upper_trans_api_t::setHeartbeatSubscription.

Example:

```
 /* Set the heartbeat subscription data. */
    err =
RM_BLE_MESH_UPPER_TRANS_SetHeartbeatSubscription(&g_ble_mesh_upper_trans0_ctrl,
&ut_hs_info);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_info is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |

### ◆ RM_BLE_MESH_UPPER_TRANS_GetHeartbeatSubscription()

fsp_err_t RM_BLE_MESH_UPPER_TRANS_GetHeartbeatSubscription (
rm_ble_mesh_upper_trans_ctrl_t *const *p_ctrl*,
rm_ble_mesh_upper_trans_heartbeat_subscription_info_t *const *p_info* )

To get the Heartbeat subscription data. This routine retrieves the Heartbeat subscription information

Implements rm_ble_mesh_upper_trans_api_t::getHeartbeatSubscription.

Example:

```
/* Get the heartbeat subscription data. */
   err =
RM_BLE_MESH_UPPER_TRANS_GetHeartbeatSubscription(&g_ble_mesh_upper_trans0_ctrl,
&ut_hs_info);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_info is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_BLE_MESH_UPPER_TRANS_TriggerHeartbeat()

fsp_err_t RM_BLE_MESH_UPPER_TRANS_TriggerHeartbeat ( rm_ble_mesh_upper_trans_ctrl_t *const *p_ctrl*, uint8_t *change_in_feature_bit* )

To trigger Heartbeat send on change in feature. This routine triggers the Heartbeat send on change in state of supported features.

Implements rm_ble_mesh_upper_trans_api_t::triggerHeartbeat.

Example:

```
/* Trigger heartbeat send on change in feature. */
   err = RM_BLE_MESH_UPPER_TRANS_TriggerHeartbeat(&g_ble_mesh_upper_trans0_ctrl,
change_in_feature_bit);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_POINTER | The internal parameter is NULL. |

## 5.2.12.12 Cellular Comm Interface on UART (rm_cellular_comm_uart_aws)

Modules » Networking

### Functions

| | |
|---|---|
| CellularCommInterfaceError_t | RM_CELLULAR_COMM_UART_AWS_Open (rm_cellular_comm_uart_aws_instance_ctrl_t *p_instance_ctrl, CellularCommInterfaceReceiveCallback_t receive_callback, void *pUserData) |
| CellularCommInterfaceError_t | RM_CELLULAR_COMM_UART_AWS_Send (CellularCommInterfaceHandle_t commInterfaceHandle, const uint8_t *pData, uint32_t dataLength, uint32_t timeoutMilliseconds, uint32_t *pDataSentLength) |
| CellularCommInterfaceError | RM_CELLULAR_COMM_UART_AWS_Receive |

| | |
|---|---|
| _t | (CellularCommInterfaceHandle_t commInterfaceHandle, uint8_t *pBuffer, uint32_t bufferLength, uint32_t timeoutMilliseconds, uint32_t *pDataReceivedLength) |
| CellularCommInterfaceError_t | RM_CELLULAR_COMM_UART_AWS_Close (CellularCommInterfaceHandle_t commInterfaceHandle) |
| void | comm_uart_aws_callback (uart_callback_args_t *p_args) |

### Detailed Description

Middleware implementing the AWS Cellular Comm Interface for the FSP UART API.

# Overview

See AWS documentation for how the Cellular Comm Interface works: https://www.freertos.org/Documentation/api-ref/cellular/cellular_porting.html#cellular_porting_comm_if

# Configuration

*Note*

*Using DTC with UART is recommended to reduce the number of interrupts in the system.*

### Build Time Configurations for rm_cellular_comm_uart_aws

The following build time configurations are defined in fsp_cfg/middleware/rm_cellular_comm_uart_aws_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | Selects if code for parameter checking is to be included in the build. |
| Receive Buffer | Size should be greater than zero | 256 | Temporary buffer for received bytes. When read function is called reamaining bytes will be read directly into buffer specified by read function argument. |
| Receive Transfer Size | Size should be greater than zero | 512 | The comm interface will break down UART reads into smaller read requests based on this number. For instance if this is set to 512 bytes then the interface will request 512 bytes at a time until the |

requested length is met or timeout. This is helpful for making use of DTC without having a long timeout period. AWS Cellular Interface Common->Comm Interface Receive Timeout is the timeout used for individual reads and should set accordingly based on this setting.

**Configurations for Networking > Cellular Comm Interface on UART (rm_cellular_comm_uart_aws)**

| Configuration | Options | Default | Description |
|---|---|---|---|
| Name | Name must be a valid C symbol | g_rm_cellular_comm_uart0 | Module name. |

**Function Documentation**

◆ **RM_CELLULAR_COMM_UART_AWS_Open()**

CellularCommInterfaceError_t RM_CELLULAR_COMM_UART_AWS_Open ( rm_cellular_comm_uart_aws_instance_ctrl_t * *p_instance_ctrl*, CellularCommInterfaceReceiveCallback_t *receive_callback*, void * *pUserData* )

Implements open for CellularCommInterface_t

**Parameters**

| | | |
|---|---|---|
| [in] | receive_callback | Callback to call upon receiving data |
| [in] | pUserData | Pointer to user data to be passed through callback |
| [in] | p_instance_ctrl | Pointer to a rm_cellular_comm_uart_aws_instance_ctrl_t |

**Return values**

| | |
|---|---|
| IOT_COMM_INTERFACE_SUCCESS | Open succeeded |
| IOT_COMM_INTERFACE_BAD_PARAMETER | Bad parameter was passed in |
| IOT_COMM_INTERFACE_FAILURE | General failure |
| IOT_COMM_INTERFACE_DRIVER_ERROR | Lower level failure |

### ◆ RM_CELLULAR_COMM_UART_AWS_Send()

CellularCommInterfaceError_t RM_CELLULAR_COMM_UART_AWS_Send ( CellularCommInterfaceHandle_t *commInterfaceHandle*, const uint8_t * *pData*, uint32_t *dataLength*, uint32_t *timeoutMilliseconds*, uint32_t * *pDataSentLength* )

Implements send for CellularCommInterface_t. This function will block the calling thread until data is sent.

**Parameters**

| | | |
|---|---|---|
| [in] | commInterfaceHandle | CellularCommInterfaceHandle_t assigned in open |
| [in] | pData | Pointer to data to send |
| [in] | dataLength | Length of data to send |
| [in] | timeoutMilliseconds | Timeout in MS to wait for data to send |
| [in] | pDataSentLength | Actual length of data sent |

**Return values**

| | |
|---|---|
| IOT_COMM_INTERFACE_SUCCESS | Send succeeded |
| IOT_COMM_INTERFACE_BAD_PARAMETER | Bad parameter was passed in |
| IOT_COMM_INTERFACE_FAILURE | General failure |
| IOT_COMM_INTERFACE_DRIVER_ERROR | Lower level failure |
| IOT_COMM_INTERFACE_TIMEOUT | Send operation timed out |

### ◆ RM_CELLULAR_COMM_UART_AWS_Receive()

CellularCommInterfaceError_t RM_CELLULAR_COMM_UART_AWS_Receive ( CellularCommInterfaceHandle_t *commInterfaceHandle*, uint8_t * *pBuffer*, uint32_t *bufferLength*, uint32_t *timeoutMilliseconds*, uint32_t * *pDataReceivedLength* )

Implements receive for CellularCommInterface_t. This function will block the calling thread until data is received.

**Parameters**

| | | |
|---|---|---|
| [in] | commInterfaceHandle | CellularCommInterfaceHandle_t assigned in open |
| [in] | pBuffer | Pointer to buffer to receive to |
| [in] | bufferLength | Length of buffer |
| [in] | timeoutMilliseconds | Timeout in MS to wait for data reception |
| [in] | pDataReceivedLength | Actual length of data received |

**Return values**

| | |
|---|---|
| IOT_COMM_INTERFACE_SUCCESS | Receieve succeeded |
| IOT_COMM_INTERFACE_BAD_PARAMETER | Bad parameter was passed in |
| IOT_COMM_INTERFACE_FAILURE | General failure |
| IOT_COMM_INTERFACE_DRIVER_ERROR | Lower level failure |

### ◆ RM_CELLULAR_COMM_UART_AWS_Close()

CellularCommInterfaceError_t RM_CELLULAR_COMM_UART_AWS_Close ( CellularCommInterfaceHandle_t *commInterfaceHandle*)

Implements close for CellularCommInterface_t

**Parameters**

| | | |
|---|---|---|
| [in] | commInterfaceHandle | CellularCommInterfaceHandle_t assigned in open |

**Return values**

| | |
|---|---|
| IOT_COMM_INTERFACE_SUCCESS | Close succeeded |
| IOT_COMM_INTERFACE_BAD_PARAMETER | Bad parameter was passed in |
| IOT_COMM_INTERFACE_FAILURE | General failure |

### ◆ comm_uart_aws_callback()

| void comm_uart_aws_callback ( uart_callback_args_t * *p_args*) |
|---|
| Callback for UART driver<br><br>**Parameters**<br>[in] p_args — Arguments from UART RX/TX callback |

### Detailed Description

Transport layer implementation for linking DA16XXX Drivers with Communications layer.

# Overview

This Transport Layer provides an abstraction interface between the DA16XXX driver and communications layers. Currently, the module supports only UART, but will support SPI in future.

Refer to WiFi Onchip DA16XXX Framework Driver (rm_wifi_da16xxx).

### Features

- Configuring internal send/receive buffers.
- Providing thread-safe access to the communications interface (mutex) when sending AT commands.
- Implementing AT command send function based on user communication option (UART or SPI (future)). This function must be able to check the module response.
- Implement a receive function based on user communication option (UART or SPI (future)). Handles income data from the communications interface and stacks it on an internal buffer.

Refer to WiFi Onchip DA16XXX Framework Driver (rm_wifi_da16xxx).

# Configuration

### Build Time Configurations for rm_at_transport_da16xxx_uart

The following build time configurations are defined in fsp_cfg/rm_at_transport_da16xxx_uart_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| Size of RX buffer for CMD Port | Manual Entry | 3000 | |
| Semaphore maximum timeout | Manual Entry | 10000 | |
| Number of retries for AT commands | Manual Entry | 10 | |
| Module Reset Port | Refer to the RA Configuration tool for available options. | 06 | Specify the module reset pin port for the MCU. |
| Module Reset Pin | Refer to the RA Configuration tool for available options. | 03 | Specify the module reset pin for the MCU. |

Refer to WiFi Onchip DA16XXX Framework Driver (rm_wifi_da16xxx).

### Interrupt Configuration

Refer to UART (r_sci_uart).

### Clock Configuration

Refer to UART (r_sci_uart).

### Pin Configuration

Refer to UART (r_sci_uart).

# Usage Notes

- This module is not designed to be used directly, users will access this module via the DA16XXX driver

### Limitations

Refer to WiFi Onchip DA16XXX Framework Driver (rm_wifi_da16xxx).

### Data Structures

| | |
|---|---|
| struct | at_transport_da16xxx_extended_cfg_t |
| struct | at_transport_da16xxx_instance_ctrl_t |

### Data Structure Documentation

#### ◆ at_transport_da16xxx_extended_cfg_t

| struct at_transport_da16xxx_extended_cfg_t | | |
|---|---|---|
| User configuration structure, used in open function | | |
| Data Fields | | |
| const uint32_t | num_uarts | Number of UART interfaces to use. |
| const uart_instance_t * | uart_instances[AT_TRANSPORT_DA16XXX_CFG_MAX_NUMBER_UART_PORTS] | SCI UART instances. |
| const bsp_io_port_pin_t | reset_pin | Reset pin used for module. |

#### ◆ at_transport_da16xxx_instance_ctrl_t

| struct at_transport_da16xxx_instance_ctrl_t | |
|---|---|
| AT_TRANSPORT_DA16XXX private control block. DO NOT MODIFY. | |
| **Data Fields** | |
| at_transport_da16xxx_cfg_t const * | p_cfg |
| | Pointer to initial configurations. |

| | |
|---|---|
| | |
| uint32_t | num_uarts |
| | number of UARTS currently used for communication with module |
| | |
| uint32_t | curr_cmd_port |
| | Current UART instance index for AT commands. |
| | |
| uint32_t | open |
| | Flag to indicate if transport instance has been initialized. |
| | |
| uint8_t | cmd_rx_queue_buf [AT_TRANSPORT_DA16XXX_CFG_CMD_RX_BUF_SIZE] |
